for some  $A, B \in \mathbb{C}$ . Taking  $s \rightarrow 0$ , we get  $B = 0$  by (12.6.1.3). And  $\Gamma(1) = 1$  (12.6.1.8) implies that

$$e^{-A} = \prod_{n \in \mathbb{Z}_+} \left[ \left(1 + \frac{1}{n}\right) e^{-1/n} \right] = \lim_{N \rightarrow \infty} e^{\log(N+1) - \sum_{n=1}^N 1/n} = e^{-\gamma} \quad (35.1.2.8)$$

□

**Cor. (12.6.1.11) [Legendre Duplication Formula].**

$$\Gamma(2s-1) = \frac{4^{s-1}}{\sqrt{\pi}} \Gamma\left(s - \frac{1}{2}\right) \Gamma(s),$$

or equivalently,

$$2^{1-2s} \sqrt{\pi} \Gamma(2s) = \Gamma(s) \Gamma\left(s + \frac{1}{2}\right).$$

┘

*Proof:*

□

**Cor. (12.6.1.12) [Euler's Formula].**

$$\frac{1}{\Gamma(s)} = \lim_{n \rightarrow \infty} \frac{s(s+1) \cdots (s+n)}{n^n n!}$$

┘

*Proof:* This follows from the definition of the infinite product and the definition of Euler's constant (12.6.1.7). □

**Cor. (12.6.1.13).** Taking logarithmic derivative, we get

$$-\frac{\Gamma'(s)}{\Gamma(s)} = \gamma_0 + \frac{1}{s} + \sum_{n \in \mathbb{Z}_+} \left( \frac{1}{s+n} - \frac{1}{n} \right).$$

In particular, by (12.6.1.8),

$$\Gamma'(1) = -\gamma_0 = \int_0^\infty e^{-t} \log t dt.$$

┘

**Prop. (12.6.1.14)**[Gauss-Legendre Multiplication Formula]. For  $s \in \mathbb{C}$ ,

$$\frac{\prod_{h=0}^{m-1} \Gamma_p(\frac{s+h}{m})}{\Gamma_p(s) \prod_{h=1}^{m-1} \Gamma_p(\frac{h}{m})} = m^{1-s}.$$

┘

*Proof:*

□

**Prop. (12.6.1.15)**[Mellin-Inversion Formula]. By (12.5.4.2) applied to  $f(x) = e^{-x}$ , for any  $c \in \mathbb{R}_+$ ,

$$e^{-x} = \frac{1}{2\pi i} \int_{c-i\infty}^{c+i\infty} \Gamma(s) x^{-s} ds, x > 0.$$

┘

**Thm. (12.6.1.16)**[Stirling's Formula]. For any  $\varepsilon \in (0, \pi)$ , we have

$$\Gamma(s) = \left(\frac{2\pi}{s}\right)^{\frac{1}{2}} \left(\frac{s}{e}\right)^s \left(1 + O_\varepsilon\left(\frac{1}{|s|}\right)\right)$$

for any  $s \in \mathbb{C}^\times$  with  $|\arg(s)| < \pi - \varepsilon$ . In particular, if  $\sigma \in \mathbb{R}$  is fixed, we have

$$\Gamma(\sigma + it) = \sqrt{2\pi}(it)^{\sigma-\frac{1}{2}} e^{-\frac{\pi}{2}|t|} \left(\frac{|t|}{e}\right)^{it} \left(1 + O_\varepsilon\left(\frac{1}{|t|}\right)\right).$$

┘

*Proof:* ? Cf. [Ten15]P175.

□

**Cor. (12.6.1.17)**[Stirling's Inequality]. For any  $n \in \mathbb{Z}_+$ , we have

$$\sqrt{2\pi n} \left(\frac{n}{e}\right)^n e^{\frac{1}{12n+1}} < n! < \sqrt{2\pi n} \left(\frac{n}{e}\right)^n e^{\frac{1}{12n}}$$

┘

*Proof:* ?

□

**Cor. (12.6.1.18)**. For any  $n \in \mathbb{Z}_+$ , we have

$$n \log n - n + 1 \leq \log(n!) \leq n \log n - n + 1 + \log n.$$

┘

**Def. (12.6.1.19)**[Archimedean  $L$ -Factors]. Define

$$L_{\mathbb{R}}(s) = \pi^{-\frac{s}{2}} \Gamma\left(\frac{s}{2}\right), \quad L_{\mathbb{C}}(s) = 2(2\pi)^{-s} \Gamma(s) = L_{\mathbb{R}}(s) L_{\mathbb{R}}(s+1).$$

Notice  $L_{\mathbb{R}}(1) = 1, L_{\mathbb{C}}(1) = \pi^{-1}$ , by (12.6.1.8).

┘

### Estimations

**Prop. (12.6.1.20).** For  $n \in \mathbb{Z}_{\geq 2}$ ,

$$\binom{2n}{n} \geq 2^n, \quad \binom{2n+1}{n} > 2^{n+1}.$$

*Proof:* It is true for  $n = 2$ , and for  $n \geq 3$ , we have

$$\binom{2n+1}{n} \geq \frac{2^{2n+1} - 2}{2n} \geq 2^{n+1}, \quad \binom{2n}{n} \geq \frac{2^{2n} - 2}{2n - 1} \geq 2^n$$

┘

□

**Prop. (12.6.1.21).** There exists  $c_1, c_2 \in \mathbb{R}_+$  s.t. for any  $s \in \mathbb{C}$ ,

$$\left| \frac{1}{\Gamma(s)} \right| \leq c_1 e^{c_2 |s| \log |s|}.$$

Thus  $1/\Gamma(s)$  has order of growth 1.

┘

*Proof:* For  $\operatorname{Re}(s) > 0$

$$\Gamma(s) = \int_0^1 e^{-t} t^{s-1} dt + \int_1^\infty e^{-t} t^{s-1} dt = \sum_{n \in \mathbb{N}} \frac{(-1)^n}{n!(n+s)} + \int_1^\infty e^{-t} t^{s-1} dt,$$

and this equality holds for all  $s \in \mathbb{C}$ . Thus by (12.6.1.7),

$$\left| \frac{1}{\Gamma(s)} \right| = \left| \frac{\sin(\pi s) \Gamma(1-s)}{\pi} \right| \leq \left| \sum_{n \in \mathbb{N}} \frac{(-1)^n}{n!(n+1-s)} \right| \frac{|\sin(\pi s)|}{\pi} + \left| \int_1^\infty e^{-t} t^{-s} dt \right|.$$

Suppose  $k = \lfloor \operatorname{Re}(s) + \frac{1}{2} \rfloor$ , then

$$\left| \sum_{n \in \mathbb{N}} \frac{(-1)^n}{n!(n+1-s)} \frac{\sin(\pi s)}{\pi} \right| \leq \sum_{n \in \mathbb{N}, n \neq k} \left| \frac{1}{n!(n+1-s)} \frac{\sin(\pi s)}{\pi} \right| + \left| \frac{\sin(\pi s)}{(k-1)!(s-k)\pi} \right|$$

and the first term is bounded by  $e^{\pi|s|}$ , and the second term is bounded by a constant independent of  $k$ , because  $\sin(\pi s)$  has a zero at  $s = k$ .

Also,

$$\left| \int_1^\infty e^{-t} t^{-s} dt \right| \leq \int_1^\infty e^{-t} t^{k+1} dt = (k+1)! \leq e^{(k+1) \log(k+1)}.$$

So the assertion follows.

□

## 2 Bessel Function

**Def. (12.6.2.1) [Bessel Function].** The **Bessel function** is defined to be

$$B(r, s) = \int_0^1 (1-y)^{r-1} y^{s-1} dy.$$

┘

**Prop. (12.6.2.2).**

$$B(x, y) = \frac{\Gamma(x) \Gamma(y)}{\Gamma(x+y)}.$$

┘

*Proof:*

□

### 3 K-Bessel Function

**Def. (12.6.3.1).** The **K-Bessel function** is defined to be

$$K_s(y) = \frac{1}{2} \int_0^\infty e^{-y(t+\frac{1}{t})/2} t^s \frac{dt}{t}, \quad y > 0.$$

it satisfies  $K_{-s}(y) = K_s(y)$ . ┘

**Prop. (12.6.3.2).**  $|K_s(y)| \leq e^{-y/2} K_{\operatorname{Re} s}(2)$  when  $y > 4$ . ┘

*Proof:* This is because  $e^{-ab} < e^{-a}e^{-b}$  when  $a, b > 2$ . □

**Prop. (12.6.3.3).**

$$\frac{\partial}{\partial y} K_s(y) = \frac{1}{2} \int_0^\infty \left(-\left(t + \frac{1}{t}\right)/2\right) e^{-y(t+\frac{1}{t})/2} t^s \frac{dt}{t} = -\frac{1}{2} (K_{s+1}(y) + K_{s-1}(y))$$
┘

**Prop. (12.6.3.4).** If  $\operatorname{Re}(s) > 1/2$  and  $r \in \mathbb{R}$ ,

$$\left(\frac{y}{\pi}\right)^s \Gamma(s) \int_{-\infty}^\infty (x^2 + y^2)^{-s} e^{2\pi i r x} dx = \begin{cases} \pi^{1/2-s} \Gamma(s - \frac{1}{2}) y^{1-s} & r = 0 \\ 2|r|^{s-1/2} \sqrt{y} K_{s-1/2}(2\pi|r|y) & r \neq 0 \end{cases}$$
┘

*Proof:* By (12.6.1.1), the LHS equals

$$\int_{-\infty}^\infty \int_0^\infty e^{-t} \left(\frac{ty}{\pi(x^2 + y^2)}\right)^s e^{2\pi i r x} \frac{dt}{t} dx = \int_0^\infty \int_{-\infty}^\infty e^{-\pi t(x^2 + y^2)/y} t^s e^{2\pi i r x} dx \frac{dt}{t}$$

where we interchanged the order of integration because it is absolutely convergent, and made a change of variable. Also notice

$$\int_{-\infty}^\infty e^{-t\pi x^2/y} e^{2\pi i r x} dx = \sqrt{\frac{y}{t}} e^{-y\pi r^2/t}$$

by Fourier inversion (12.11.3.3), so we get the final answer. □

**Prop. (12.6.3.5).** If  $\operatorname{Re}(s) + k/2 > 1/2$  and  $r$  is real,

$$\left(\frac{y}{\pi}\right)^s \Gamma(s) \int_{-\infty}^\infty \frac{1}{(x + iy)^k (x^2 + y^2)^s} e^{-2\pi i r x} dx = \begin{cases} \pi^{1/2-s} \Gamma(s - \frac{1}{2}) y^{1-s} & r = 0 \\ 2|r|^{s-1/2} \sqrt{y} K_{s-1/2}(2\pi|r|y) & r \neq 0 \end{cases}$$
┘

*Proof:* By (12.6.1.1), the LHS equals

$$\int_{-\infty}^\infty \int_0^\infty e^{-t} \left(\frac{ty}{\pi(x^2 + y^2)}\right)^s e^{2\pi i r x} \frac{dt}{t} dx = \int_0^\infty \int_{-\infty}^\infty e^{-\pi t(x^2 + y^2)/y} t^s e^{2\pi i r x} dx \frac{dt}{t}$$

where we interchanged the order of integration because it is absolutely convergent, and made a change of variable. Also notice

$$\int_{-\infty}^\infty e^{-t\pi x^2/y} e^{2\pi i r x} dx = \sqrt{\frac{y}{t}} e^{-y\pi r^2/t}$$

by Fourier inversion (12.11.3.3), so we get the final answer. □

## 12.7 General Functional Analysis

Basic references are [Rudin Functional Analysis],[Nonarchimedean Functional Analysis].

This section only contains theorems that are applicable to both Archimedean and non-Archimedean valuations. For theorems specialized to non-Archimedean valuations, See [p-adic Analysis](#), for theorems specialized to Archimedean valuations, See [Archimedean Functional Analysis](#). Many propositions in Functional Analysis can be transplanted in the general case, but I haven't finish yet.

The major problem is that convexity is not definable, so Hahn-Banach fail, causing many to fail.

### Notation(12.7.0.1).

- Fix a complete valued field  $K$ (12.2.3.10).
- If  $\text{char } K \neq 0$ , then we fix a sequence of elements  $\{a_n\}$  that  $\lim |a_n| = \infty$ . This will be applied for example in the proof of Banach-Steinhaus theorem, but we will just write  $n$  instead of  $a_n$ .  $\lrcorner$

### 1 Topological Vector Space

**Def.(12.7.1.1) [Topological Vector Spaces].** A **topological vector space**(TVS) over  $\mathbb{K}$  is a  $\mathbb{K}$ -vector space with a topological structure s.t. the addition and scalar multiplications are continuous maps.  $\lrcorner$

**Def.(12.7.1.2)[Cauchy Sequences in Topological Spaces and Completeness].** For  $X \in \text{TVS}/\mathbb{K}$ , a **Cauchy-sequence(in TVS)** in  $X$  is a sequence  $(x_i)_{i \in \mathbb{Z}_+} \in X$  s.t. for any nbhd  $V$  of  $0 \in X$ , there exists some  $N \in \mathbb{Z}_+$  s.t.  $x_m - x_n \in V$  for any  $m, n \in \mathbb{Z}_{\geq N}$ . This is compatible with the notion of Cauchy-sequences in metric spaces when  $X$  is metrizable.

And  $X$  is called a **complete topological vector space** if every Cauchy-sequences in  $X$  converges.  $\lrcorner$

**Prop.(12.7.1.3).** For subsets  $K, C$  of a TVS  $X$  that  $K$  is compact and  $C$  is closed, there is a nbhd  $V$  that  $(K + V) \cap (C + V) = \emptyset$ .  $\lrcorner$

*Proof:* For each  $x \in K$ , there are symmetric nbhd  $V_x$  that  $(x + V_x + V_x + V_x) \cap C = \emptyset$ . Then  $(x + V_x + V_x) \cap (C + V_x) = \emptyset$ . Because  $K$  is compact, there are f.m.  $x_i$  that  $K \subset \cup(x_i + V_{x_i})$ , so let  $V = \cap V_{x_i}$ , then  $(K + V) \cap (C + V) = \emptyset$ .  $\square$

**Cor.(12.7.1.4)[Closed Subbasis].** Every nbhd of  $0$  in a TVS contains a closure of another nbhd of  $0$ . (Apply the above proposition for  $K = \{0\}$ ).  $\lrcorner$

**Def.(12.7.1.5)[Balanced Subsets].** A subset containing  $0$  is called **balanced subset** iff  $kU = U$  for each  $k \in K$  s.t.  $|k| = 1$ .  $\lrcorner$

**Prop.(12.7.1.6)[Balanced Subbasis].** Every nbhd  $U$  of  $0$  in a TVS contains a balanced nbhd of  $0$ . By(12.7.1.4), we can even assume  $\overline{V} \subset U$ .  $\lrcorner$

*Proof:* Since scalar multiplication is continuous, there is a  $\delta > 0$  and a nbhd  $V$  that  $\alpha V \subset U$ , for each  $|\alpha| < \delta$ . Then let  $W = \cup_{|\alpha| < \delta} \alpha V$ .  $\square$

**Def.(12.7.1.7)[F-Spaces and Fréchet spaces].** A space is called an **F-space** if its topology is induced by a complete invariant metric. F-space is of second Baire-category by(4.4.9.2)

A locally convex F-space is called a **Fréchet space**.  $\lrcorner$

**Def. (12.7.1.8) [(Semi-)Norms].** For  $X \in \text{Vect}_K$ , a **semi-norm** on a vector space  $X$  is a real-valued function  $p$  that  $p(x+y) \leq p(x) + p(y)$ , and  $p(\alpha x) = |\alpha|p(x)$  for  $\alpha \in k$ .

It is called a **norm** if moreover  $p(x) = 0 \iff x = 0$ , in which case it is called a **normed  $K$ -space**.

A family of seminorms  $\{p_i\}$  on  $X$  is called **separating** iff for each  $x$ , at least one  $p_i$  satisfies  $p_i(x) \neq 0$ .  $\lrcorner$

**Prop. (12.7.1.9).** A TVS is metrizable by a translation-invariant metric iff it has a countable basis.  $\lrcorner$

*Proof:* One direction is trivial, for the other, Cf.[Rudin P18].  $\square$

**Prop. (12.7.1.10).** If a subspace  $Y$  of a TVS  $X$  is a F-space, then it is closed in it.  $\lrcorner$

*Proof:* Choose an invariant metric  $d$  compatible with its topology, Let  $U_n$  be a nbhd of  $X$  that  $U_n \cap Y = B(0, 1/n)$ , and choose a symmetric nbhd  $V_n$  of  $X$  that  $V_n + V_n \subset U_n$ , and  $V_{n+1} \subset V_n$ .

If  $y \in \overline{Y}$ , then for any  $y_n \in Y \cap (y + V_n) = E_n$ , then  $y_n - y_m \in U_{\min(m,n)} \cap Y = B(0, 1/n)$ , so it is a Cauchy sequence in  $Y$ , hence all  $E_n$  has a unique element  $y_0$  in common. Now if we intersect each  $V_n$  by a nbhd  $W$  of  $X$ , the same argument shows that there is a unique element  $y_W$  in  $Y \cap (y + W \cap V_n)$ , and this must be just  $y_0$ , but  $y - y_W \in W$ , so we must have  $y = y_0 \in Y$ .  $\square$

**Def. (12.7.1.11) [Totally Bounded Sets].** A set  $E$  in a TVS is called **totally bounded subset** if for every nbhd  $V$  of 0, there is a finite set  $F$  that  $E \subset F + V$ .  $\lrcorner$

## 2 Completeness

**Thm. (12.7.2.1) [Banach-Steinhaus].** Let  $X, Y \in \text{TVS}$  and  $\Gamma \subset \text{Hom}(X, Y)$ . If the set

$$B = \{x \in X \mid \Gamma(x) \text{ is bounded}\}$$

is a second Baire-category set in  $X$ , then  $B = X$  and  $\Gamma$  is equicontinuous, (thus maps bounded sets to bounded sets).  $\lrcorner$

*Proof:* For an open balanced nbhd  $W$  of 0, choose a balanced nbhd  $U$  s.t.  $\overline{U} + \overline{U} \subset W$  (12.7.1.6), set  $E = \bigcap_{\Lambda \in \Gamma} \Lambda^{-1}(\overline{U})$ , then  $B \subset \bigcup_{i=1}^{\infty} nE$ , so by Baire theorem (4.4.9.2),  $E$  has a interior point thus has a nbhd  $V$  s.t.  $\Gamma(V) \subset \overline{U} + \overline{U} \subset W$ . Thus we are done.  $\square$

**Cor. (12.7.2.2) [Uniform Boundedness Theorem].** If  $X, Y \in \text{TVS}$  and  $X$  is an F-space (12.7.1.7). Suppose  $\Gamma \subset \text{Hom}(X, Y)$  satisfies  $\Gamma(x)$  is bounded for any  $x \in X$ , then  $\Gamma$  is equicontinuous.  $\lrcorner$

**Cor. (12.7.2.3).** Let  $X, Y \in \text{TVS}$  and  $X$  is an F-space. If  $(A_n) \in \text{Hom}(X, Y)^{\mathbb{Z}_+}$  is a sequence of continuous linear mapping, then  $\varinjlim A_n = A$  iff  $\{\|A_n\|\}$  is bounded and  $\varinjlim A_n x = Ax$  for  $x$  in a dense subset of  $X$ .  $\lrcorner$

*Proof:* One direction is immediate from Banach-Steinhaus and (12.7.1.7), the converse is an easy  $\varepsilon/3$ -technique.  $\square$

**Cor. (12.7.2.4) [Strong operator convergence].** Let  $X, Y \in \text{TVS} / \mathbb{K}$  and  $X$  is an F-space (12.7.1.7). If  $(A_n) \in \text{Hom}(X, Y)^{\mathbb{Z}_+}$  is a sequence of continuous linear mapping s.t.  $\varinjlim A_n x = Ax$  for any  $x \in X$ , then  $\varinjlim A_n = A$ .  $\lrcorner$

**Thm. (12.7.2.5) [Open Mapping theorem].** Let  $X, Y \in \text{TVS}/\mathbb{K}$  and  $X$  is an F-space (12.7.1.7). Suppose  $T \in \text{Hom}(X, Y)$  and  $\text{Im}(T)$  is of second Baire-category in  $Y$ , then it is a surjective open mapping and  $Y$  is an F-space.

In fact, we only need  $T$  be defined on a subspace  $D(T) \subset X$  and it is a **closed operator** in the sense that its graph is closed.  $\perp$

*Proof:* For any  $n \in \mathbb{N}$ ,  $V_n = T(B(0, \frac{1}{2^n}))$  is of second category by the definition (4.4.9.1) and the fact  $\cup_{m \in \mathbb{Z}_+} mV_n = R(T)$ . In particular  $\overline{V_n}$  has an interior. Then also it contains a nbhd of  $0 \in V$  because  $\overline{V_{n+1}} - \overline{V_{n+1}} \subset \overline{V_n}$ .

Now we show  $\overline{V_{n+1}} \subset V_n$ , which will imply that  $T$  is open.

For any  $y \in \overline{V_{n+1}}$ , since  $\overline{V_{n+1}}$  contains a nbhd of 0, we can consecutively choose  $x_m \in B(0, \frac{1}{2^{n+m}})$  s.t.

$$y - \sum_{i=0}^m T(x_i) \in \overline{V_{n+m+1}}.$$

for any  $m \in \mathbb{Z}_+$ . Then because  $X$  is complete and  $T$  is closed, we see  $\sum x_i$  converges to some  $x \in D(T) \cap B(0, \frac{1}{2^{n-1}})$ , and  $Tx = y \in V_{n-1}$ .

Any open linear mapping must be surjective, hence  $Y \cong X/\ker(T)$ , so  $Y$  is also an F-space.  $\square$

**Cor. (12.7.2.6) [Banach Theorem].** If a continuous map  $T$  between F-spaces is a bijection, then it has a continuous inverse.  $\perp$

**Cor. (12.7.2.7).** If a F-space is complete w.r.t two different topologies and one is stronger than the other, then they are equivalent.  $\perp$

**Cor. (12.7.2.8).** For every operator between F-spaces that has closed image, we have  $X/N(T) \cong R(T)$ .  $\perp$

**Cor. (12.7.2.9) [Closed Graph Theorem].** If  $T : X \rightarrow Y$  is a closed linear mapping between two F-spaces, i.e. the graph of it is closed, then it is continuous.

Notice the graph being closed is equivalent to if  $x_i \rightarrow x$  and  $Tx_i \rightarrow y$ , then  $y = Tx$ . This is very useful when proving some map is continuous.  $\perp$

*Proof:* Because the metric induced by the graph is stronger than the original one, we can use Banach Theorem.  $\square$

**Cor. (12.7.2.10).** If  $A, B, C$  are F-spaces, and  $f : A \rightarrow B, g : B \rightarrow C$ , if  $gf, g$  is continuous and  $g$  is injective, then  $f$  is continuous.  $\perp$

*Proof:* Use closed graph theorem, if  $x_i \rightarrow x, f(x_i) \rightarrow z$ , then  $gf(x_i) \rightarrow g(z)$ , so  $gf(x) = g(z)$ , so  $f(x) = z$ .  $\square$

**Cor. (12.7.2.11) [Finite Codimensional Image].** If the image of a continuous linear mapping  $T$  between F-spaces has finite codimensional image, then the image is closed and complemented.  $\perp$

*Proof:* It has finite codimension, so we can construct  $K^n \oplus X/N(T) \rightarrow Y$ , by Banach theorem (12.7.2.6) it is a homeomorphism, and the image of  $X/N(T)$  corresponds to the image, so the image is closed.  $\square$

**Prop. (12.7.2.12) [Separate Continuous].** If a bilinear map  $B : X \times Y \rightarrow Z$  where  $X$  is a F-space is closed in each coordinate, then  $B(x_n, y_n)$  converges to  $B(x_0, y_0)$ .  $\perp$

*Proof:* Use Banach-Steinhaus to prove  $B_{y_n}(x)$  is equicontinuous, then use  $B(x_n - x_0, y_n) + B(x_0, y_n - y_0)$ . ?  $\square$

### 3 Dual Space

**Prop. (12.7.3.1) [Operator Spaces].** If  $X, Y$  are normed spaces then  $L(X, Y)$  is also a normed space with the metric  $\|\Lambda\| = \sup\{\|\Lambda x\| : \|x\| \leq 1\}$ , called the **operator space** from  $X$  to  $Y$ . And if  $Y$  is Banach, then  $L(X, Y)$  is also Banach. The proof is easy.

In particular,  $X^*$  is a Banach space.  $\lrcorner$

**Prop. (12.7.3.2).** For a bounded operator  $T$ ,

$$\overline{R(T)} = N(T^*)^\perp, \quad \overline{R(T^*)} = N(T)^\perp.$$

In particular, using Hahn Banach,  $R(T)$  is dense in  $Y$  iff  $T^*$  is injective,  $T$  is injective iff  $T^*$  is weak\*-dense in  $X^*$ .  $\lrcorner$

**Prop. (12.7.3.3).** Let  $\Lambda_1, \dots, \Lambda_n, \Lambda$  are linear functionals on a vector space  $X$ , let  $N = \cap \ker f_i$ , the following are equivalent:

1.  $\Lambda = \sum \alpha_i \Lambda_i$ .
2.  $|\Lambda x| \leq \gamma |\Lambda_i x|$ .
3.  $\ker \Lambda \subset N$ .

$\lrcorner$

*Proof:* Only need to show  $3 \rightarrow 1$ : define  $\pi : X \rightarrow k^n : x \mapsto (\Lambda_1 x, \dots, \Lambda_n x)$ , then by hypothesis  $f(\pi_i(x)) = \Lambda(x)$  defined a linear functional on  $\pi(X)$ . This can be extended to a functional on  $k^n : F(u_1, \dots, u_n) = \sum \alpha_i u_i$ , so  $\Lambda$  is a linear combination of  $\Lambda_i$ .  $\square$

### Weak Convergence

**Def. (12.7.3.4) [Operator Topologies].** There are three topologies on  $L(X)$  for a normed space  $X$ :

- norm topology:  $\|T_i - T\| \rightarrow 0$ .
- strong topology:  $\|(T_i - T)x\| \rightarrow 0$  for any  $x \in X$ .
- weak topology:  $\lim f(T_n x) = f(Tx)$  for any  $x \in X$  and  $f \in X^*$ .

$\lrcorner$

**Prop. (12.7.3.5) [Weak Convergence and Boundedness].** In a normed space  $X$ , if  $x_n \rightarrow x$  weakly iff  $\{x_n\}$  is bounded and  $\lim f(x_n) = f(x)$  for  $f$  in a dense subset a dense subset  $M \subset X^*$ .  $\lrcorner$

*Proof:* This follows from (12.7.2.3), as  $X^*$  is a Banach space, by (12.7.3.1).  $\square$

### 4 Banach Spaces

**Def. (12.7.4.1) [Banach Spaces and Banach Algebras].** A completely normed (valued)  $K$ -vector space (12.7.1.8) is called a **Banach space**.

A completely normed  $K$ -algebra  $A \in \mathcal{Alg}/K$  s.t.  $\|xy\| \leq \|x\| \|y\|$  for all  $x, y \in A$  is called a **Banach-algebra**.

Denote by  $\text{BanSpa}_K$  the category of Banach spaces over  $K$ , and denote  $\text{BanAlg}_K$  the category of Banach algebras over  $K$ .  $\lrcorner$

**Prop. (12.7.4.2).** The dual space of a Banach space is a Banach space. (Immediate from (12.7.3.1)).  $\lrcorner$

**Prop. (12.7.4.3).** If  $A$  is a Banach space as well as a topological group, then there is a norm on  $A$  which induce the same topology and makes  $A$  into a Banach algebra.  $\lrcorner$

*Proof:* embed  $A$  into  $L(A)$  by left multiplication, which is injective, and  $\|x\| = \|xe\| = \|M_x e\| \leq \|M_x\| \|e\|$ , so its inverse is continuous. Now if we show the image  $\tilde{A}$  is closed in  $L(A)$ , then the open mapping theorem(12.7.2.5) shows that  $A \cong \hat{A}$ , and  $\hat{A}$  is clearly a Banach algebra.

To show it is closed, if  $T = \lim T_i$ , notice  $T_i(y) = T_i(e)y$ , so take a limit,  $T(y) = T(e)y = M_{T(e)}y$ .

□

**Cor. (12.7.4.4).** Any  $A \in \text{BanSpa}_K^{\text{fd}}$  is isomorphic to  $\text{Mat}(n; K)$  for some  $n \in \mathbb{N}$ . In particular, if  $xy = e$ , then  $yx = e$ .  $\lrcorner$

*Proof:* Embed  $A$  into  $L(A)$ .  $\square$

**Remark (12.7.4.5)[Inequivalent Banach Norms].** There exist two complete norm on a vector space that are inequivalent. For this, just choose a Banach space  $X$ , and notice if we can choose a discontinuous bijection  $X \rightarrow X$ , then the induced metric is also complete, and it cannot be equivalent by Banach theorem(12.7.2.6). For this, choose an infinite dimensional Banach space over  $\mathbb{C}$ , and choose a  $\mathbb{C}$ -basis  $x_i$  for it, and choose a sequence  $x_n$  and maps  $x_n$  to  $nx_n$ , the rest are invariant, then this is not continuous.  $\lrcorner$

### Hilbert Spaces

**Def. (12.7.4.6).** For any pre-Hilbert space  $\mathcal{H}$ , there are different topologies on  $B(\mathcal{H})$ :

- The **norm operator topology** is defined by the operator norm  $\|T\|$ .
- The **ultra-strong topology** is defined by the separating seminorms(12.7.1.8)

$$\{T \mapsto \sum_{n \in \mathbb{Z}} \|Tv_n\|^2 : v_i \in \mathcal{H}, \sum_i \|v_i\|^2 < \infty\}.$$

- The **strong operator topology** is defined by the separating seminorms

$$\{T \mapsto \|Tu\| : u \in \mathcal{H}\}.$$

- The **weak operator topology**: defined by the separating seminorms

$$\{T \mapsto (Tu, v) : u, v \in \mathcal{H}\}.$$

By default,  $B(\mathcal{H})$  is equipped with the norm operator topology.  $\lrcorner$

**Prop. (12.7.4.7).** For any pre-Hilbert space  $\mathcal{H}$ , the strong and weak operator topologies(12.7.4.6) coincide on the set  $U(\mathcal{H})$  of unitary operators on  $\mathcal{H}$ .  $\lrcorner$

*Proof:* If  $T_n$  converges to  $T$  in the weak operator topology, then

$$\|(T_n - T)u\|^2 = \|Tu\|^2 + \|T_n u\|^2 - 2\text{Re}(T_n u, Tu).$$

The right hand side is clearly bounded by the weak seminorms, so the two topologies coincide.  $\square$

**Prop. (12.7.4.8)[Hilbert Bases].** For  $(\mathcal{H}, S = \{e_\alpha\}) \in \mathcal{HilbSpa}$ , the following are equivalent:

1. For any  $x$ ,  $x = \sum(x, e_\alpha)e_\alpha$ , (notice the sum are in fact infinite sum).

2. There is a no nonzero element  $x$  that is orthogonal to all  $e_\alpha$ .

3. **Parseval equality** holds:  $\|x\|^2 = \sum |(x, e_\alpha)|^2$ .

If these are true, then  $S$  is called a **Hilbert basis** of  $H$ , a Hilbert basis always exists, by Zorn's lemma. We use the notation  $(\mathcal{H}, S = \{e_\alpha\}) \in \mathcal{HilbSpa}$  to denote that  $\mathcal{H}$  is a Hilbert space and  $S$  is a Hilbert basis of  $\mathcal{H}$ .  $\lrcorner$

*Proof:*  $1 \rightarrow 2$  : if  $(x, e_\alpha) = 0$  for all  $e_\alpha$ , then by 1,  $x = \sum (x, e_\alpha)e_\alpha = 0$ .

$2 \rightarrow 3$  : Notice  $y = x - \sum (x, e_\alpha)e_\alpha$  is orthogonal to all  $e_\alpha$ , and

$$\|y\| = \|x\|^2 - \sum |(x, e_\alpha)|^2.$$

In particular, the Parseval equality holds.

$3 \rightarrow 1$  :  $\|x - \sum (x, e_\alpha)e_\alpha\| = 0$ .  $\square$

**Prop. (12.7.4.9)[Symmetric Operators are Continuous, Hellinger-Toeplitz].** For  $\mathcal{H} \in \mathcal{HilbSpa}$ , any symmetric operator on  $\mathcal{H}$  is continuous.  $\lrcorner$

*Proof:* Use the [Closed Graph Theorem](#). Suppose  $x_i \rightarrow x$  and  $Tx_i \rightarrow y$ , then for any  $z \in \mathcal{H}$ ,  $(y, z) = \lim_i (Tx_i, z) = \lim_i (x_i, Tz) = (x, Tz) = (Tx, z)$ . Thus  $y = Tx$ . Then by [Closed Graph Theorem](#),  $T$  is continuous.  $\square$

### Ultrarnormed Banach Spaces

The ultrarnormed Banach spaces are defined in [\(19.1.6.5\)](#).

### Nuclear Maps and Spaces

## 12.8 Archimedean Functional Analysis

References are [Rud91]. Chap11,13 needs to be revisited.

This section studies functional analysis over Archimedean local fields.

**Notation(12.8.0.1).**

- Let  $\mathbb{K} \in \{\mathbb{R}, \mathbb{C}\}$ .
- Let  $\Omega \subset \mathbb{K}^n$  be a non-empty open subset.
- Use notation on general Functional Analysis defined in [General Functional Analysis](#).
- Let  $X \in \text{TVS}/\mathbb{K}$ .

┘

### 1 Topological Vector Space

**Def.(12.8.1.1)[Seminorms].** A **sublinear functional** on  $X$  is a function  $p : X \rightarrow \mathbb{R}$  s.t.

- $p(x + y) \leq p(x) + p(y)$  for any  $x, y \in X$ .
- $p(\lambda x) = \lambda p(x)$  for any  $x \in X$  and  $\lambda \in \mathbb{R}_+$ .

And  $p$  is called a **seminorm** if moreover  $p$  is a non-negative, and  $p(\alpha x) = |\alpha|p(x)$  for all  $\alpha \in \mathbb{K}$ .

┘

**Def.(12.8.1.2)[Absorbing Sets].** A **absorbing set** is a convex set  $A \subset X$  s.t.  $\cup_{k>0} kA = X$ . A convex nbhd of 0 is clearly absorbing.

┘

**Def.(12.8.1.3)[Minkowski Functional].** For an absorbing set  $A$ , the **Minkowski functional**  $\mu_A$  is defined to be  $\mu_A(x) = \inf\{t > 0, x/t \in A\}$ . It satisfies:

- $\mu_A(x + y) \leq \mu_A(x) + \mu_A(y)$ .
- $\mu_A(kx) = k\mu_A(x)$  if  $k > 0$ .
- $\mu_A$  is a seminorm if  $A$  is balanced.
- If  $B = \{x | \mu(x) < 1\}$ ,  $C = \{x | \mu(x) \leq 1\}$ , then  $B \subset A \subset C$  and  $\mu_A = \mu_B = \mu_C$ .

┘

*Proof:* Cf.[Rudin P27].

□

**Cor.(12.8.1.4)[Seminorm and Absorbing set].** A seminorm on  $X$  is exactly the Minkowski functional of a balanced absorbing set  $W$ , but the set may not be unique. and it is uniformly continuous iff 0 is an interior point.

┘

*Proof:* If  $p$  is a seminorm, then  $\{x | p(x) < 1\}$  is convex, balanced and absorbing by definition(12.7.1.8). The converse is by(12.8.1.3). The last assertion is easy.

□

**Prop.(12.8.1.5)[Minkowski Functional and Separating Seminorms].** If  $\mathfrak{B}$  is a convex local base in a TVS  $X$ , then the Minkowski functionals of elements of  $\mathfrak{B}$  forms a separating family of seminorms.

Conversely, a separation family  $\mathfrak{P}$  of seminorms on a vector space defines a convex balanced local base for a topology  $\tau$  that is locally convex. And in this topology, a sequence converges iff  $p(x_i - x) \rightarrow 0$  for  $p \in \mathfrak{P}$ , a set is bounded if each  $p$  is bounded on it.

┘

*Proof:* For any  $V \in \mathfrak{B}$ ,  $V = \{x \in X \mid \mu_V(x) < 1\}$ , because  $V$  is open and convex. (12.8.1.3) shows each  $\mu_V$  is a seminorm, and it is continuous because it is bounded on  $V$ . And they are separating because  $\mathfrak{B}$  is a local base.

Defined  $V(p, n) = \{x \in X \mid p(x) < 1/n\}$ , and let these be a local subbasis at 0, and make it a topology by translation. This is checked to be a locally convex TVS. For the last assertion, if  $E$  is bounded, then  $E \subset kV(p, 1)$  for  $k$  large, so  $p$  is bounded on  $E$ , and conversely, for each nbhd  $U$ , there are  $p_i$  and  $M_i$  and  $\cap V(p_i, M_i) \subset U$ , so  $E \subset kU$  for  $n$  large.  $\square$

**Prop. (12.8.1.6).** If  $\mathfrak{P}$  is a family of countable separating family of semi-norms on  $X$ , then the topology defined in (12.8.1.5) is in fact metrizable, by a metric  $d(x, y) = \sum \frac{1}{2^k} \frac{p_i(x-y)}{1+p_i(x-y)}$ .  $\lrcorner$

### Finite Dimensional Subspace

**Prop. (12.8.1.7) [Finite Dimensional and Locally Compact].** If  $\dim_{\mathbb{K}} X < \infty$ , then there is only one topological vector space structure on  $X$ , and  $X$  is complete in this topology.

$X$  is locally compact iff it is f.d.  $\lrcorner$

*Proof:* Cf. [Rudin P17].

For the second assertion, if  $X$  is locally compact, then 0 has a nbhd  $V$  that is precompact, so bounded, hence  $2^{-n}V$  forms a local basis. the compactness of  $\overline{V}$  shows there are f.m.  $x_i$  that  $\overline{V} \subset \cup(x_i + \frac{1}{2}V)$ . Let  $Y$  be the subspace spanned by  $x_i$ , then it is of f.d, thus closed. Now  $V \subset Y + \frac{1}{2}V$ , so  $\frac{1}{2}V \subset Y + \frac{1}{4}V$ , hence continuing this way,  $V \subset \cap(Y + 2^{-n}V)$ , so  $V \subset \overline{Y} = Y$ . But then  $Y = X$ .  $\square$

**Cor. (12.8.1.8) [Finite Subspace Closed].** A f.d subspace in a TVS over  $\mathbb{C}$  is closed, because it must be a  $F$ -space, hence it is closed by (12.7.1.10).  $\lrcorner$

**Prop. (12.8.1.9) [Finite Subspace in Banach Space].** For a finite dimensional space  $V$  in an Archimedean Banach space, there is a continuous projection onto it. In particular, any finite dimensional space in an Archimedean Banach space is complemented.

Also finite codimensional subspace in any Banach space is complemented by (12.7.2.11).  $\lrcorner$

*Proof:* Choose a basis  $e_i$  for  $V$ , consider the dual basis  $f_i$ . Because a finite dimensional space only has one topology (12.8.1.7), these  $f_i$  are bounded on  $V$ . Extend them to bounded functional on  $X$ , then consider  $p(x) = \sum f_i(x)e_i$ , then this is a continuous projection onto  $V$ .  $\square$

## 2 Various Spaces and Duality

**Example (12.8.2.1) [Various Spaces and Duality].**

- For any  $m \in \mathbb{Z}_+$ , the **Sobolev Space**  $W^{m,p}(\Omega)$  is the completion of a subspace of  $C^\infty(\Omega)$  with the norm?

$$\|u\|_{m,p} = \left( \sum_{|\alpha| \leq m} \int_{\Omega} |\partial^\alpha u(x)|^p dx \right)^{1/p}.$$

And we denote  $H^m(\Omega) \triangleq W^{m,2}(\Omega)$ . It is also a subspace of  $L^p(\Omega)$  that satisfies this, without completion (12.11.4.1).

- $C_0^\infty(\Omega)$  is the subspace of  $C^\infty(\Omega)$  that have compact support in  $\Omega$ . Its completion  $W_0^{m,p}(\Omega)$  is a closed subspace of  $W^{m,p}(\Omega)$ . And we denote  $W_0^{m,2}(\Omega)$  by  $H_0^m(\Omega)$  and the dual space of  $H_0^m(\Omega)$  by  $H^{-m}(\Omega)$ .

- For a locally convex space  $X$ ,  $C(X)$  in the topology of compact convergence is a Fréchet space(12.7.1.7).
- $\mathcal{O}(\Omega) \subset C(\Omega)$  the space of holomorphic functions in  $\Omega$  is a closed subspace of  $C(\Omega)$  by(12.4.2.15), thus it is a Fréchet space. By Hausdorff theorem(4.4.8.27), Montel's theorem says exactly that  $\mathcal{O}(\Omega)$  has the Heine-Borel property(12.7.1.7).
- $\mathcal{O}^2(\Omega)$  the space of holomorphic functions on  $\Omega$  that is also  $L^2$ . It has the  $L^2$ -norm.
- $C^\infty(\Omega)$  in the topology defined by seminorms  $p_N(f) = \max\{|D^\alpha f(x)| : x \in K_N, |\alpha| \leq N\}$ , is a Fréchet-space thus locally convex and it has the Heine-Borel property by Arzela-Ascoli.
- For  $K \subset \Omega$  compact,  $D(K)$  is the closed subspace of  $C^\infty(\Omega)$  consisting of functions  $f$  s.t.  $\text{Supp}(f) \subset K$ . It is a Fréchet-space with Heine-Borel property.
- The set of **test functions**  $\mathcal{T}(\Omega)$  is the space of smooth functions on  $\Omega$  with support contained in  $\Omega$ . It has topology defined in(12.11.2.2). s.t.  $\text{Supp}(f) \subset \Omega$  making  $\mathcal{T}(\Omega)$  into a locally convex TVS. It is complete and has Heine-Borel property, by(12.11.2.3).
- The space of **Schwartz-functions**  $\mathcal{S}(\mathbb{R}^n)$  is defined as smooth functions on  $\mathbb{R}^n$  s.t.

$$\sup_{|\alpha| \leq N, x \in \mathbb{R}^n} (1 + |x|^2)^N |(D_\alpha f)(x)| < \infty$$

for any  $N \in \mathbb{Z}_+$ . And it is a Fréchet-space defined by these seminorms. ┘

### Dual Spaces

**Prop.(12.8.2.2).**

- For a  $\sigma$ -finite measure space  $(X, \Omega, \mu)$  and  $1 \leq p < \infty$ , by(12.3.6.4),

$$L^p(X, \Omega, \mu)^* = L^q(X, \Omega, \mu).$$

- $C[0, 1]^* = BV[0, 1]$  and  $C[X]^* = \text{Meas}(X)$ , the space of complex measure on compact  $X$  with the norm of total variance, by Riesz-representation theorem(12.10.1.9). ┘

### 3 Convexity

**Prop.(12.8.3.1).** Every convex nbhd of 0 contains a balanced convex nbhd of 0. By(12.7.1.4), we can even assume  $\bar{V} \subset U$ . ┘

*Proof:* If  $U$  is convex, choose  $W$  as in(12.7.1.6), then  $W \subset A = \bigcap_{|\alpha|=1} \alpha U$  because it is balanced. Then  $W \subset A^\circ$  and  $A^\circ$  is open and balanced, satisfying the requirement. □

**Prop.(12.8.3.2).** For a compact convex set  $K$  in a TVS  $X$ , if a set  $\Gamma$  of continuous linear mapping is bounded for every  $x \in K$ , then  $\Gamma$  is equicontinuous on  $K$ . ┘

*Proof:* The proof is similar to that of Banach-Steinhaus(12.7.2.1). For  $K$  compact convex, the same argument shows that there is a nbhd  $V$  that  $K \cap (x_0 + V) \subset nE$ , fix  $p > 1$  that  $K \subset x_0 + pV$ , then for any  $x \in K$ , consider  $z = (1 - p^{-1})x_0 + p^{-1}x$ , then  $z \in K$  as  $K$  is convex and  $z - x_0 = p^{-1}(x - x_0) \in V$ , so  $z \in nE$ , and since  $x = pz - (p - 1)x_0$ ,  $\Lambda x \in pnW$  for each  $\Lambda \in \Gamma$ , so  $\Gamma$  is equicontinuous. □

**Hahn-Banach**

**Prop. (12.8.3.3) [Real Hahn].** For a sublinear functional  $p$  on a real linear space  $X$  and a subspace  $X_0$ , if a functional  $f$  satisfies  $f(x) \leq p(x)$  on  $X_0$ , then it can be extended to a functional  $\Lambda$  on  $X$  that  $|\Lambda(x)| \leq |p(x)|$ .  $\lrcorner$

*Proof:* Use Zorn's lemma, if the maximum extension is not on the whole space but on  $M$ , choose  $x_1 \in X - M$ , we want to define  $f(x_1)$ . Now let  $M_1 = \{x + tx_1 | x \in M\}$ . Since for  $x, y \in M$ ,  $f(x) + f(y) = f(x + y) \leq p(x + y) \leq p(x - y) + p(x_1 + y)$ , so

$$f(x) - p(x - x_1) \leq p(y + x_1) - f(y)$$

for  $x, y \in M$ . Let the maximum of the left side be  $\alpha$ , and define  $f(x_1) = \alpha$ , then it is clear  $f(z) \leq p(z)$  still.  $\square$

**Prop. (12.8.3.4) [Complex Hahn].** For a seminorm  $p$  (i.e. it can attain 0) on a complex linear space  $X$  and a subspace  $X_0$ , if a functional  $f$  satisfies  $|f(x)| \leq p(x)$  on  $X_0$ , then it can be extended to a functional on  $X$  with the same condition.  $\lrcorner$

*Proof:* Let  $g(x) = \operatorname{Re} f(x)$  and extend it by Hahn and set  $f(x) = g(x) - ig(ix)$ , then  $f$  is complex linear, and for any  $x$ , for some  $|\alpha| = 1$ ,  $|f(x)| = f(\alpha x) = g(\alpha x) \leq p(\alpha x) = p(x)$ .  $\square$

**Cor. (12.8.3.5) [Hahn].** In a normed space  $X$ , a bounded linear functional on a subspace  $X_0$  can be extended to a bounded functional on  $X$  with the same norm.  $\lrcorner$

**Cor. (12.8.3.6) [Extending Functional Preserving Norm].** If  $X$  is a normed space and  $N$  is a closed subspace, if  $x_0$  satisfies  $d = d(x_0, N) > 0$ , then here is a continuous functional  $f$  that  $f(x) = 0$  and  $f(x_0) = d$  and  $\|f\| = 1$ .  $\lrcorner$

*Proof:* Define  $f(m + \alpha x) = |\alpha|d$  on  $\operatorname{span}\{N, x\}$ , then  $f(m + \alpha x) = |\alpha|d = |\alpha|d(x_0, N) \leq |\alpha|(\|\frac{x'}{\alpha} + x_0\|) = \|\frac{x'}{\alpha} + x_0\| = \|x' + \alpha x\| = \|x\|$ . So  $\|f\| \leq 1$ , so we can use Hahn-Banach to extend it to a functional on  $X$ .  $\square$

**Prop. (12.8.3.7) [Geometric Hahn].**

- If  $E_1$  and  $E_2$  are two convex set that  $E_1 \cap E_2 = \emptyset$  and  $E_1$  has interior point, then there is a continuous linear functional that separate them, i.e.  $\operatorname{Re} f(E_1) < \operatorname{Re} f(E_2)$ . (The interior point is here to assure  $f$  is continuous).
- In a locally convex TVS, if  $E_1$  is convex compact and  $E_2$  is convex closed, then there is a real functional that separate them, i.e.  $\operatorname{Re} f(E_1) < \gamma_1 < \gamma_2 < \operatorname{Re} f(E_2)$ . Thus for a set  $E$  and a point  $x$ ,  $x \in \overline{\operatorname{span} E} \iff$  for all  $f$  that  $f(E) = 0$ ,  $f(x) = 0$ .  $\lrcorner$

*Proof:* The complex case follows from the real case, so assume it is real. Consider  $a_0 \in E_1, b_0 \in E_2$ , let  $x_0 = a_0 - b_0$  and let  $C = E_1 - E_2 + x_0$ , then  $C$  is a convex nbhd of 0. Let  $p$  be the Minkowski functional of  $C$ , then  $p$  is sublinear by (12.8.1.3) and  $p(x_0) \geq 1$ . Let  $f(tx_0) = t$  on the subspace  $M$  generated by  $x$ , then it extends to a functional  $\Lambda$  that  $\leq 1$  on  $C$ , thus it is bounded by 1 on  $C \cap (-C)$ , hence continuous. For any  $a \in E_1, b \in E_2$ , because  $\lambda(x_0) = 1$  and  $a - b + x_0 \in C$  open,  $\Lambda a < \Lambda b$ .

For the second, There is a convex nbhd  $V$  of 0 that  $E_1 + V \cap B = \varphi$ , so the above argument applied with  $E_1 + V$  and  $B$  shows that there is a  $f$  that separate them. And  $f(E_1 + V)$  is open and  $f(E_1)$  is compact, so the conclusion follows.  $\square$

**Cor. (12.8.3.8)[Banach-Saks].** The weak closure of a convex set in a locally convex metric space equals the original closure.

Thus if a sequence  $\{x_n\}$  weakly converges to  $x$  in a metrizable locally convex space, then a convex combination of  $\{x_n\}$  strongly converge to  $x$ , i.e.  $x \in \overline{\text{co}}(\{x_n\})$ , because metric space is first countable.  $\perp$

*Proof:* A weak closed set is closed, and to show the closure is weakly closed, use(12.8.3.7).  $\square$

**Prop. (12.8.3.9).** If  $A_i$  are compact convex sets in a TVS  $X$ , then  $\text{co}(A_1 \cup \dots \cup A_n)$  is compact.  $\perp$

*Proof:* Firstly, the image  $K$  of  $S \times A_1 \times \dots \times A_n$ ,  $(s_1, \dots, s_n) \times (a_1, \dots, a_n) \mapsto \sum s_i a_i$  is closed, where  $S = \{0 \leq x_i, \sum x_i = 1\}$ . And we show  $K$  is just the convex closure: it contains all  $A_i$ , and it is convex because each  $A_i$  is.  $\square$

**Prop. (12.8.3.10).** In  $F$ -space, a closed subset is compact iff it is totally bounded by(4.4.8.27).  $\perp$

**Prop. (12.8.3.11).** In a locally convex space, if  $E$  is totally bounded, then  $\text{co}(E)$  is totally bounded. Thus in a Fréchet space, if  $K$  is compact, then  $\overline{\text{co}}(K)$  is compact.  $\perp$

*Proof:* For a nbhd  $U$  of 0, choose a convex nbhd  $V$  that  $V + V \subset U$ , then  $E \subset F + V$  for some finite set  $F$ , hence  $\text{co}(E) \subset \text{co}(F) + V$ . But  $\text{co}(F)$  is compact by(12.8.3.9). So  $\text{co}(F) \subset F_1 + V$  for some finite set  $F_1$ , then  $\text{co}(E) \subset F_1 + U$ .

If  $K$  is compact, then it is totally bounded, and then  $\text{co}(K)$  is totally bounded and  $\overline{\text{co}(K)}$  is totally bounded by(4.4.8.25), so it is compact by(12.8.3.10).  $\square$

**Prop. (12.8.3.12)[Weakly Bounded and Locally Convex].** If  $X \in \text{TVS}$  is locally convex, then a subset  $U \subset X$  is bounded iff it is weakly bounded.  $\perp$

*Proof:* One direction is trivial, for the other, suppose  $E$  is weakly bounded and  $U$  is a closed nbhd of 0. Because  $X$  is locally convex, there is a convex, balanced nbhd of 0 that  $\overline{V} \subset U$ (12.8.3.1). Now  $\overline{V} = V^{**}$  the polar(12.8.4.1) by(12.8.3.8).

Now  $V^*$  is weak\*-compact and  $|\Lambda(x)| \leq \gamma(\Lambda)$  for each  $\Lambda \in X^*$  for some  $\gamma(\Lambda)$  because  $E$  is weakly bounded. So we can use(12.8.3.2) to show that  $|\Lambda x| \leq \gamma$  for some  $\gamma$  and all  $\Lambda \in V^*$ . So we have  $\gamma^{-1}E \subset \overline{V} \subset U$ . This proves that  $E$  is bounded.  $\square$

**Prop. (12.8.3.13)[Markov-Kakutani Fixed Point Theorem].** For a commuting family  $\mathcal{F}$  of continuous affine maps from  $K$  to  $K$  where  $K$  is a compact convex set in a TVS, then there is a fixed point in  $K$  for all maps in  $\mathcal{F}$ .  $\perp$

*Proof:* Consider the semigroup  $\mathcal{F}^*$  generated by these maps together with their average, it is also commutative because they are all affine. For any  $f, g \in \mathcal{F}^*$ ,  $f(K) \cap g(K) \supset f \circ g(K)$ , so by finite intersection property, there is a point in  $p \in K$  in all  $f(K)$ .

For this  $p$ , consider  $p = \frac{1}{n}(I + T + T^2 + \dots + T^{n-1})(x)$ , then  $p - Tp = \frac{1}{n}(x - T^n x) \in \frac{1}{n}(K - K)$ . as  $K$  is bounded and  $n$  is arbitrary, this means that  $p = Tp$  for all  $T$ .  $\square$

**Cor. (12.8.3.14)[Invariant Hahn].** For a commuting family  $\Gamma$  of operators on a normed space and  $Y$  an invariant space, then for any  $\Gamma$ -invariant continuous functional  $f$  on  $Y$ , it has a  $\Gamma$ -invariant Hahn extension.  $\perp$

*Proof:* We may assume  $\|f\| = 1$ . Let  $K$  be all extensions of  $f$  that has norm  $\leq 1$ .  $K$  is obviously convex, and it is weak\*-compact by Banach-Alaoglu(12.8.4.1). The adjoint action of  $T$  is checked to be continuous in the weak\*-topology, so by(12.8.3.13), there is some  $F \in K$  that is invariant under  $\Gamma$ .  $\square$

**Krein-Milman theorem**

**Thm. (12.8.3.15) [Krein-Milman].** For a compact convex set  $K$  in a TVS  $X$  that is weakly-Hausdorff ( $X^*$  separate points),  $K = \overline{\text{co}}(\text{Extreme}(K))$ .

If  $K$  is a compact set in a locally convex space, then  $K \subset \overline{\text{co}}(E(K)) = \overline{\text{co}}(K)$ .  $\lrcorner$

*Proof:* First show that every compact extreme set  $S$  of  $K$  contains an extreme point. Notice arbitrary intersection of compact extreme sets of  $K$  is compact extreme, because compact is closed, because  $X$  is Hausdorff. And for any functional  $\Lambda \in X^*$ , the maximal value point in  $K$  is compact extreme. Now we use Zorn's lemma to find a minimal compact extreme set in  $S$ , then it must be a point because  $X^*$  separate points.

Now use the weak topology Hahn(12.8.4.2), if  $\overline{\text{co}}(E(K)) \subset K$  is not  $K$ , then it is compact, then we can find a functional that separate  $\overline{\text{co}}(E(K))$  and some point of  $K$ . This is a contradiction because the extreme value point for any functional on  $K$  is an extreme set.

In the locally convex case, the convexity of  $K$  is not needed, and we can show using geometric Hahn(12.8.3.7) instead that,  $K \subset \overline{\text{co}}(K)$ .  $\square$

**Prop. (12.8.3.16) [Milman's Theorem].** If  $K$  is a compact set in a locally convex space  $X$  and if  $\overline{\text{co}}(K)$  is also compact (e.g. in a Fréchet space(12.8.3.11)), then every extreme point of  $\overline{\text{co}}(K)$  lies in  $K$ .  $\lrcorner$

*Proof:*  $\square$

**Def. (12.8.3.17).** For a compact Hausdorff space  $S$  and an algebra  $A \subset C(S)$ , a subset  $E$  is called  **$A$ -antisymmetric** iff every  $f \in A$  that is real on  $E$  is constant on  $E$ . There are in fact maximal  $A$ -antisymmetric subsets of  $S$ .  $\lrcorner$

**Prop. (12.8.3.18) [Bishop Theorem].** If  $A$  is a closed subalgebra of  $C(S)$ . If  $g \in C(S)$  satisfies  $g|_E \in A|_E$  for every maximal  $A$ -antisymmetric set  $E$ , then  $g \in A$ . This theorem is a generalization of Stone-Weierstrass approximation.  $\lrcorner$

*Proof:* The annihilator  $A^\perp$  of  $A$  consists of all regular complex Borel measure  $\mu$  on  $S$  that  $\int f d\mu = 0$  for all  $f \in A$  by Riesz representation(12.10.1.9). ? Cf.[Rudin P122].  $\square$

**Prop. (12.8.3.19) [Schauder Fixed Point Theorem].** If  $C$  is a closed convex subset in a metrizable TVS and continuous  $T : C \rightarrow C$  has sequentially compact image (e.g.  $C$  is compact and  $X$  is locally convex hence  $X^*$  separate points), then  $T$  has a fixed point.  $\lrcorner$

*Proof:* As  $T(C)$  is sequentially compact, for each  $n$ , there is a  $1/n$ -net  $N_n = \{y_i\} \subset T(C)$ , let  $E_n = \text{span}\{N_n\}$ .

Define a map  $T(C) \rightarrow \text{co}(N_n) : I_n(y) = \sum y_i \lambda_i(y)$ , where  $\lambda_i(y) = \frac{m_i(y)}{\sum m_i(y)}$ , and  $m_i(y) = 1 - n\|y - y_i\|$  if  $y \in B(y_i, 1/n)$ , and 0 otherwise.

Now  $\|I_n(y) - y\| = \|\sum (y_i - y) \lambda_i(y)\| \leq \sum \|y_i - y\| \lambda_i(y) \leq \frac{1}{n}$  for each  $y \in T(C)$ . As  $C$  is convex,  $\text{co}(N_n) \subset C$ , if we let  $T_n = I_n \circ T$ , then  $T_n$  has a fixed pt  $x_n$  in  $\text{co}(N_n)$  by Brouwer Fixed-Point Theorem.

As  $T(C)$  is sequentially compact and  $C$  is closed, there is a subsequence  $Tx_{n_k}$  that converges to  $x \in C$ . And then

$$\|x_{n_k} - x\| = \|I_n Tx_{n_k} - x\| \leq \|I_n Tx_{n_k} - Tx_{n_k}\| + \|Tx_{n_k} - x\| < \frac{1}{n} + \|Tx_{n_k} - x\|$$

so  $x_{n_k} \rightarrow x$ , and then by continuity,  $Tx = x$ .  $\square$

### Vector-valued Integrations

**Def. (12.8.3.20) [Vector-Valued Integrations].** Given a measure space  $(Q, \mu)$  and  $X$  is an Archimedean TVS on which  $X^*$  separate points (e.g. Fréchet space). If  $f$  is a function from  $M$  to  $X$  that  $\Lambda \circ f$  are integrable w.r.t  $\mu$  for any  $\Lambda \in X^*$ . The **vector-valued integration**  $\int_M f d\mu$  of  $f$  w.r.t  $Q$  is an element  $y$  that

$$\Lambda y = \int_Q (\Lambda f) d\mu$$

for any  $\Lambda \in X^*$ . ┘

**Prop. (12.8.3.21) [Vector-Valued Integrations of Compactly-Supported Functions].** If  $X \in \text{TVS}/\mathbb{R}$  on which  $X^*$  separate points (e.g. Fréchet space),  $Q \in \text{LCH}$  with a compactly supported Radon measure  $\mu$ , and  $f$  is continuous s.t.  $\overline{\text{Conv}(f(Q))}$  is compact (e.g. when  $X$  is Fréchet (12.8.3.11)), then the integral  $y = \int_Q f d\mu$  exists, and belongs to the closed linear span of the range of  $f$ . Moreover if  $\mu$  is positive and  $\mu(Q) = 1$ , then  $y \in \overline{\text{Conv}(f(Q))}$ . ┘

*Proof:* Cf.[Rudin P78]. □

**Cor. (12.8.3.22).** If  $Q$  is Hausdorff,  $d\mu$  is compactly supported,  $X$  is Archimedean Banach and  $f : Q \rightarrow X$  is continuous, then

$$\left\| \int_Q f d\mu \right\| \leq \int_Q \|f\| d\mu.$$

┘

*Proof:* Let  $y = \int_Q f d\mu$ . By (12.8.3.6), there is a  $\|\Lambda\| \leq 1$  that  $\Lambda y = \|y\|$ , so

$$\Lambda y = \|y\| = \int_Q \Lambda f d\mu = \left| \int_Q \Lambda f d\mu \right| \leq \int_Q |\Lambda f| d\mu \leq \int_Q \|f\| d\mu.$$

□

**Prop. (12.8.3.23).** If  $X \in \text{TVS}/\mathbb{R}$  on which  $X^*$  separate points,  $Q$  is a compact subset of  $X$ , and  $\overline{\text{co}}(Q)$  is compact, then  $y \in \overline{\text{co}}(Q)$  iff there is a regular Borel measure  $\mu$  on  $Q$  that  $y = \int_Q x d\mu(x)$ . ┘

*Proof:* Cf.[Rudin P79]. □

**Prop. (12.8.3.24) [Action of Measure].** For a fixed map  $f : Q \rightarrow X$ , assume  $X$  is a Fréchet space, then the integration functor in (12.8.3.21) induces a continuous map

$$\text{Meas}_c(Q) \rightarrow X : \mu \mapsto \int_\mu f$$

that maps  $\delta_x$  to  $f(x)$ . ┘

*Proof:* It suffices to verify continuity: for any seminorm  $\rho$ , by convexity,

$$\rho\left(\int_\mu f\right) \leq (\mu, \rho(f)),$$

thus for  $\mu \in U$  satisfying  $(\mu, \rho(f)) < 1$ ,  $\rho(\int_\mu f) < 1$ . This proves continuity. □

**Prop. (12.8.3.25) [Vector Valued Integration of  $L^1$ -Functions, Folland].** If  $V \in \text{BanSpa}/\mathbb{C}$  and  $X \in \text{LCH}$  with a Radon measure  $\mu$ . If  $g \in L^1(\mu)$  and  $f : X \rightarrow V$  is continuous with bounded image, then the vector-valued integration  $\int gf d\mu$  (12.8.3.20) exists and belongs to the closed linear span of the range of  $f$ . Moreover,

$$\left\| \int gf(x) d\mu(x) \right\| \leq \sup_{x \in X} \|f(x)\| \int |g(x)| d\mu(x).$$

□

*Proof:* Clearly  $\Lambda(gH) \in L^1(\mu)$  for all  $\Lambda \in V^*$ . And  $\mu$  is Radon, so there is a sequence  $\{g_n\} \in C_c(X)$  that converges to  $g$  in  $L^1$ , so  $\int g_n f d\mu$  is integrable by (12.8.3.21), and

$$\int \|g_n(x)f(x) - g_m(x)f(x)\| d\mu(x) \leq \int |g_n(x) - g_m(x)| d\mu(x) \rightarrow 0,$$

thus this is a Cauchy sequence, converging to some  $y$ . Now for any  $\Lambda \in V^*$ ,

$$\Lambda(y) = \lim \Lambda \left( \int g_n f d\mu(x) \right) = \lim \int \Lambda \circ (g_n f) d\mu(x) = \int \varphi \circ (gf) d\mu(x).$$

The last equality uses boundedness again.

Moreover, each  $\int g_n f d\mu(x)$  belongs to the closed range of  $f$  by (12.8.3.21), hence so does  $\int gf d\mu(x)$ . And last assertion also follows from (12.8.3.21). □

### Differentiable Vector-Valued Functions

**Def. (12.8.3.26) [Differentiable Vector-Valued Functions].** Let  $U \subset \mathbb{R}$  be open and  $X \in \text{TVS}/\mathbb{R}$  be a Fréchet space, then a function  $f : U \rightarrow X$  is called a

- **weakly smooth vector-valued function** if  $\Lambda \circ f$  is smooth for any  $\Lambda \in X^*$ .
- **strongly smooth vector-valued function** if  $f'(x_0) = \lim_{x \rightarrow x_0} \frac{f(x) - f(x_0)}{x - x_0}$  exists for each  $x_0 \in U$  and is a continuous function  $f' : U \rightarrow X$ , and similarly  $f^{(2)}$  exists and continuous and so on.

Similarly we can define weakly- $C^k$  vector-valued functions and strongly  $C^k$ -vector valued functions  $f : U \rightarrow X$  for each  $k \in \mathbb{Z}_+$  and open subsets  $U \subset \mathbb{R}^n$ .  $\lrcorner$

**Prop. (12.8.3.27) [Weakly- $C^k$  Implies Strongly- $C^{k-1}$ ].** Let  $X \in \text{TVS}/\mathbb{R}$  be a Fréchet space (12.7.1.7) and  $f : (0, 1) \rightarrow X$  is weakly- $C^k$  for  $k \in \mathbb{Z}_+$ , then  $f$  is strongly  $C^{k-1}$ .

In particular  $f$  is weakly-smooth iff it is smooth.  $\lrcorner$

*Proof:* For  $k = 1$ , this follows from (12.8.3.28). So we may assume  $k \geq 1$ .

Suppose  $k = 2$ . For any  $b \in (0, 1)$ , consider  $g(x) = \frac{f(x) - f(b)}{x - b}$  for  $x \in [0, b) \cup (b, 1]$ , then by hypothesis,  $\lambda \circ g$  extends to a  $C^1$ -function on  $(-1, 1)$  (by calculation using L'Hospital theorem). Thus  $g$  extends to a continuous function on  $(0, 1)$  by (12.8.3.28), and  $f'$  exists. Moreover,  $f'(x)$  is weakly- $C^1$  by hypothesis, so it is continuous by (12.8.3.28). Thus  $f$  is strongly- $C^1$ .

Now use induction on  $k \geq 2$ . Let  $g(x) = f'(x)$  (which exists by the above), then  $g(x)$  is weakly- $C^{k-1}$ , and then by induction hypothesis,  $g(x)$  is strongly- $C^{k-2}$ , which means  $f$  is strongly- $C^{k-1}$ .  $\square$

**Lemma (12.8.3.28).** Let  $X \in \text{TVS}/\mathbb{R}$  be a Fréchet space (12.7.1.7) and  $f : [-1, 0] \cup [0, 1] \rightarrow X$  satisfies: for each  $\Lambda \in X^*$ ,  $\Lambda \circ f$  extends to a  $C^1$ -function on  $[-1, 1]$ , then  $f(b) \in X$  can be chosen s.t.  $f$  extends to a continuous function  $[-1, 1] \rightarrow X$ .

In particular, if  $f : (-1, 1) \rightarrow X$  is weakly- $C^1$ , then it is continuous.  $\lrcorner$

*Proof:* For  $\Lambda \in X^*$ , let  $F_\Lambda$  be the  $C^1$ -extension of  $\Lambda \circ f$ . Because  $F_\Lambda$  is  $C^1$ , by mean value theorem,  $\{\frac{F_\Lambda(x) - F_\Lambda(y)}{x - y} : x \neq y \in [-1, 1]\}$  is bounded. Thus  $\{\frac{f(x) - f(y)}{x - y} : x \neq y \in [-1, b) \cup (b, 1]\} \subset X$  is weakly-bounded. Thus by (12.8.3.12), it is bounded. Thus  $\{f(x)\}_{x \rightarrow b}$  is a Cauchy net, and  $f(b)$  exists because  $X$  is complete.  $\square$

### Holomorphic Vector-Valued Functions

**Def. (12.8.3.29) [Holomorphic Vector-Valued Functions].** Let  $\Omega \subset \mathbb{C}$  be open, and  $X \in \text{TVS}/\mathbb{C}$ , then a function  $f : \Omega \rightarrow X$  is called a

- **weakly holomorphic vector-valued function** if  $\Lambda \circ f$  is holomorphic for any  $\Lambda \in X^*$ .
- **strongly holomorphic vector-valued function** if  $\lim_{w \rightarrow z} \frac{f(w) - f(z)}{w - z}$  exists for every  $z \in \Omega$ .

A strongly holomorphic function is clearly weakly holomorphic, and the converse is true when  $X$  is Fréchet space, by the following proposition (12.8.3.30).  $\lrcorner$

**Prop. (12.8.3.30) [Weak and Strong Holomorphy].** Let  $\Omega \subset \mathbb{C}$  be open, and  $X \in \text{TVS}/\mathbb{C}$  be a Fréchet space. Suppose  $f : \Omega \rightarrow X$  is weakly holomorphic (12.8.3.29), then  $f$  is strongly continuous, and the Cauchy integral formula (12.4.2.6) holds for  $f$ , and  $f$  is strongly holomorphic.  $\lrcorner$

*Proof:* We may assume  $0 \in \Omega$ , then Let  $B(0, 2r) \subset \Omega$  and  $\Gamma$  the boundary of  $B(0, 2r)$ , since  $\Lambda f$  is holomorphic,

$$\frac{(\Lambda f)(z) - (\Lambda f)(0)}{z} = \frac{1}{2\pi i} \int_{\Gamma} \frac{(\Lambda f)(\zeta)}{(\zeta - z)\zeta} d\zeta \quad 0 < |z| < 2r.$$

Therefore  $\{\frac{f(z)-f(0)}{z} | 0 < |z| \leq r\}$  is weakly bounded, so it is also bounded by (12.8.3.12), so  $f$  is strongly continuous.

The integral exists by (12.8.3.21), so  $f$  satisfies Cauchy integral formula because it satisfies this when acting with any functional  $\Lambda$ , and  $X^*$  separate points.

For the last assertion, Cf.[Rudin P84].  $\square$

**Prop. (12.8.3.31)[Liouville's Theorem].** If  $X \in \text{TVS}/\mathbb{C}$  on which  $X^*$  separate points and  $f : \mathbb{C} \rightarrow X$  is weakly holomorphic and  $f(\mathbb{C})$  is weakly bounded, then  $f$  is constant.  $\lrcorner$

*Proof:* Immediate from Liouville's theorem (12.4.2.10).  $\square$

## 4 Duality Theory

**Prop. (12.8.4.1)[Banach-Alaoglu].** For  $X \in \text{TVS}$  and a nbhd  $V$  of  $0 \in X$ , the set

$$K = \{f : |f(x)| \leq 1, \forall x \in V\}$$

is weak\*-compact in  $X^*$ , which is called the **polar**  $V^*$  of  $V$ .  $\lrcorner$

*Proof:* Consider the Minkowski function  $\gamma$  of  $V$ , then for each  $\Lambda \in K$ ,  $|\Lambda x| \leq \gamma(x)$ . If we consider the space  $P = \prod_{x \in X} [-\gamma(x), \gamma(x)]$ , then  $P$  is compact by Tychonoff (4.4.2.5).

The point is that the weak\*-topology coincides with the pointwise convergence topology on  $K$ , because they have the same generating subbasis. If we show  $K$  is a closed subspace of  $P$ , this will finish the proof that  $K$  is weak\*-compact. For this, consider any  $f_0$  in its closure, then for each  $x, y \in X$ ,  $\alpha, \beta \in K$ , there is a  $f \in K$  that is close to  $f_0$  at  $x, y$  and  $\alpha x + \beta y$ . So  $f_0$  is linear. Similarly we can show  $|f_0(x)| \leq 1$  for  $x \in V$ , so  $f_0 \in K$ .  $\square$

**Prop. (12.8.4.2).** If  $X$  is a TVS that  $X^*$  separate points (e.g. locally convex), then the weak topology  $X_w$  is a locally convex space, and  $(X_w)^* = X^*$ .  $\lrcorner$

*Proof:* If  $\Lambda$  is a functional that is continuous in  $X_w$ -topology, then  $|\lambda x| < 1$  for some set defined by elements in  $X^*$ , so by (12.7.3.3),  $\Lambda = \sum \alpha_i \Lambda_i$  which is continuous w.r.t the original topology.  $\square$

**Prop. (12.8.4.3)[Hahn Weak Topology case].** If  $X$  is a TVS that  $X^*$  separate points, then if  $A, B$  are disjoint nonempty, compact convex sets in  $X$ , then there is a  $\Lambda \in X^*$  that separate  $A$  and  $B$ , i.e.  $\text{Re } f(E_1) < \gamma_1 < \gamma_2 < \text{Re } f(E_2)$ .  $\lrcorner$

*Proof:* Let  $X_w$  be  $X$  with the weak topology, then the sets  $A$  and  $B$  are compact in  $X_w$  as it's weaker. And they are also closed because  $X_w$  is Hausdorff.  $X_w$  is convex, so we can use geometric Hahn (12.8.3.7). Now  $(X_w)^* = X^*$ , so the chosen functional is also continuous in the original topology.  $\square$

**Prop. (12.8.4.4)[Dual Banach Space].** For a normed space  $X$ ,  $x \in X$  can be seen as functional on  $X^*$ , of norm exactly  $\|x\|$ . And the closed ball  $B^*$  of the dual space  $X^*$  is weak\*-compact.  $\lrcorner$

*Proof:* The first assertion is because of (12.8.3.6), the last assertion is because of Banach-Alaoglu (12.8.4.1).  $\square$

**Prop. (12.8.4.5)[Adjoint Norm].** For  $X, Y$  normed, the adjoint of  $T : X \rightarrow Y$  satisfies  $\|T^*\| = \|T\|$ .  $\lrcorner$

*Proof:* Use (12.8.4.4),  $\|T\| = \sup\{|\langle Tx, y^* \rangle| : \|x\| \leq 1, \|y^*\| \leq 1\} = \|T^*\|$ .  $\square$

**Prop. (12.8.4.6)[Closed Range Theorem].** Let  $T$  be continuous mapping between Banach spaces  $X$  and  $Y$ , let  $U, V$  be open balls of  $X, Y$  particularly. then the following are equivalent:

1.  $\|T^*y^*\| \geq \delta \|y^*\|$  for some  $\delta$ .
2.  $\delta V \subset \overline{T(U)}$ .
3.  $\delta V \subset T(U)$ , i.e.  $T^{-1}$  is continuous.
4.  $T(X) = Y$ .
5.  $T^*$  is one-to-one and  $R(T^*)$  is closed in  $X$ .

┘

*Proof:* 1  $\rightarrow$  2: If  $\|T^*y^*\| \geq \delta \|y^*\|$ , first prove  $\delta V \subset \overline{T(U)}$ . If  $y_0 \notin \overline{T(U)}$ , since  $\overline{T(U)}$  is convex closed and balanced, geometric Hahn shows that there is a  $y^*$  that  $|y^*(y)| \leq 1$  for every  $y \in T(U)$ , and  $|y^*(y_0)| > 1$ . Then it follows  $\|T^*y^*\| \leq 1$ . So

$$\delta < \delta |y^*(y_0)| \leq \delta \|y_0\| \|y^*\| \leq \|y_0\| \|T^*y^*\| \leq \|y_0\|$$

This shows  $\delta V \subset \overline{T(U)}$ .

2  $\rightarrow$  3: may assume  $\delta = 1$ . Then  $\overline{V} \subset \overline{T(U)}$ . Then for every  $y \in Y$  and every  $\varepsilon > 0$ , there is a  $x$  that  $\|x\| \leq \|y\|$  and  $\|y - Tx\| < \varepsilon$ . For any  $y_1 \in V$ , pick  $\varepsilon_n > 0$  that  $\sum \varepsilon_n < 1 - \|y_1\|$ , then choose  $\|x_n\| \leq \|y_n\|$  that  $\|y_n - Tx_n\| < \varepsilon_n$ , and let  $y_{n+1} = y_n - Tx_n$ . Then is verified that  $x = \sum x_n \in U$  and  $Tx$ .

3  $\rightarrow$  1:  $\|T^*y^*\| = \sup\{|\langle x, T^*y^* \rangle| : x \in U\} \geq \sup\{|\langle y, y^* \rangle| : y \in V\} = \delta \|y^*\|$ .

3  $\iff$  4: follows from open mapping theorem.

4  $\rightarrow$  5:  $T^*$  is injective by (12.7.3.2). By open mapping theorem,  $T^*$  is a multiple of a dilation, so  $R(T^*)$  is closed by (4.4.8.30).

5  $\rightarrow$  4:  $R(T)$  is dense in  $Y$  by (12.7.3.2), and it is closed by the proposition (12.8.4.7) below.  $\square$

**Prop. (12.8.4.7)[Closed Range Theorem].** If  $X, Y$  are Banach spaces and  $T \in L(X, Y)$ , the following are equivalent:

1.  $R(T)$  is closed in  $Y$ .
2.  $R(T^*)$  is weak\*-closed in  $X^*$ .
3.  $R(T^*)$  is closed in  $X$ .

┘

*Proof:* 1  $\rightarrow$  2: As  $N(T)^\perp$  is the weak\*-closure of  $R(T^*)$ , it suffices to prove  $N(T)^\perp \subset R(T^*)$ . As  $R(T)$  is complete, the open mapping theorem applies to  $X \rightarrow R(T)$ , showing that each  $y \in R(T)$  corresponds to an element  $x \in X$  that  $Tx = y$  and  $\|x\| \leq K\|y\|$ .

For  $x^* \in N(T)^*$ , define a functional  $\Lambda$  on  $R(T)$  by  $\Lambda Tx = \langle x, x^* \rangle$ , this is well-defined, and  $|\Lambda y| = |\Lambda Tx| \leq K\|y\| \|x^*\|$ . So it is continuous and by Hahn-Banach some continuous functional  $y^* \in Y^*$  extends  $\Lambda$ . Then  $\langle Tx, y^* \rangle = \Lambda Tx = \langle x, x^* \rangle$ , so  $x^* = T^*y^*$  is in the image of  $T^*$ , so we are done.

3  $\rightarrow$  1: let  $Z = \overline{R(T)}$ .  $RT$  is dense in  $Z$ , so (12.7.3.2) shows  $T^* : Z^* \rightarrow X^*$  is injective. And for each  $z^* \in Z^*$ , there is an extension  $y^*$  by Hahn-Banach, and then  $\langle x, T^*y^* \rangle = \langle Tx, y^* \rangle = \langle Tx, z^* \rangle = \langle x, T^*z^* \rangle$ , so  $T^*(Y^*) = T^*(Z^*)$ , which is closed by hypothesis.

Now use open mapping theorem for  $Z^* \rightarrow R(T^*)$ , then there is a  $c$  that  $c\|z^*\| \leq \|T^*z^*\|$ . So  $T : X \rightarrow Z$  is surjective, by (12.8.4.6). So  $R(T) = Z$  is closed.  $\square$

**Prop. (12.8.4.8).** In a normed space, iff  $x_n \rightarrow x$  weakly, then  $\lim \|x_n\| \geq \|x\|$ .  $\square$

*Proof:* Choose a functional that  $\|f\| = 1$  and  $|f(x)| = 1$  by (12.8.3.6), then use the definition of weak convergence.  $\square$

**Prop. (12.8.4.9) [Eberlein-Smulian].** For a set  $A$  in a Banach space  $X$ ,  $A$  is weak\*-sequentially compact iff its weak precompact.  $\lrcorner$

*Proof:* ?

We prove here that the case that the closed unit ball of a reflexive Banach space is weakly\*-self sequentially compact.

To prove this, first we show that a bounded sequence has a subsequence that is weak\*-convergent in  $X$ . Let  $X_0 = \overline{\text{span}\{x_n\}}$ , then  $X_0$  is reflexive by (12.8.4.13), and it is separable, so  $X_0^*$  is separable by (12.8.4.11). Then the result follows from (12.8.4.14).

Finally, the weak limit  $x$  is in the closed unit ball, by (12.8.4.8).  $\square$

### Reflexive and Separable

**Def. (12.8.4.10) [Reflective Banach Space].** If  $X$  is a Banach space, there is an isometric immersion of  $X$  onto a closed subspace of  $X^{**}$  (closed because  $X$  is complete).  $X$  is called **reflexive** iff  $X \cong X^{**}$ .  $\lrcorner$

**Prop. (12.8.4.11) [Separability Banach].** For a normed space  $X$ , if  $X^*$  is separable, then  $X$  is separable.  $\lrcorner$

*Proof:* Choose a countable dense set in  $X^*$ , then their projection to the unit sphere  $S^* \{g_n\}$  are dense in  $S^*$  (easily checked), and choose for each of them a  $x_n$  that  $\|x_n\| = 1$  and  $g_n(x_n) > \frac{1}{2}$ .

Now I claim  $x_n$  are dense in  $X$ , i.e.  $X_0 = \overline{\text{span}\{x_n\}} = X$ . If this is not the case, then there is a  $\|x\| = 1$  not in  $X_0$ , so by (12.8.3.6), there is a  $f$  that  $f(X_0) = 0$  and  $\|f\| = 1$  and  $f(x) = 1$ . Then  $\|g_n - f\| = \sup_{\|x\|=1} \{|g_n(x) - f(x)|\} \geq |g_n(x_n) - f(x_n)| = |g_n(x_n)| \geq 1/2$ , contradicting the fact  $g_n$  is dense in  $S^*$ .  $\square$

**Prop. (12.8.4.12) [Duality Exact].** If  $X$  is a closed subspace of a normed space  $Y$ , and  $Y/X$  is the quotient field, then  $(Y/X)^*$  is a closed subspace of  $Y^*$ , and  $X^*$  is the quotient.  $\lrcorner$

*Proof:*  $(Y/X)^* \rightarrow Y^*$  is clearly injective, and the  $X^*$  are all functionals on  $Y$  modulo the functionals that vanish on  $X$ .  $\square$

**Cor. (12.8.4.13) [Pettis].** Closed subspace and quotient space of a reflexive normed space is reflexive.  $\lrcorner$

*Proof:* Use the fact that  $0 \rightarrow X \rightarrow Y \rightarrow Z \rightarrow 0$  induces an exact sequence  $0 \rightarrow X^{**} \rightarrow Y^{**} \rightarrow Z^{**} \rightarrow 0$ , and there is a map  $X \rightarrow X^{**}$ , so we can use snake lemma (as modules).  $\square$

**Prop. (12.8.4.14) [Separable Ball Weak\*-Sequentially Compact].** If a normed space  $X$  is separable, then the closed unit ball of  $X^*$  is weak\*-sequentially compact.  $\lrcorner$

*Proof:* Let  $x_n$  be a countable dense subset of  $X$ , then by diagonal method, for each bounded sequence of  $f_n \in X^*$ , there is a subsequence  $f_{n_k}$  that  $f_{n_k}(x_m)$  converges for each  $x_m$ . Then by (12.7.2.3),  $f_{n_k}$  converges to some  $f \in X^*$ . So the theorem is finished.  $\square$

**Prop. (12.8.4.15) [Reflexive Ball Weak\*-Sequentially Compact].** In a reflexive Banach space  $X$ , then a set in  $X$  is bounded iff it is weak\*-sequentially compact.  $\lrcorner$

*Proof:* If it is reflexive, then the unit ball is weak\*-compact by Alaoglu, so it is weak\*-sequentially compact by Eberlein(12.8.4.9). Conversely, if it is weak\*-sequentially compact, then its closure is weak\*-compact, thus bounded.  $\square$

**Prop.(12.8.4.16).** A closed convex set of a reflexive Banach space attains minimal norm.  $\lrcorner$

*Proof:* By Hahn, a closed convex set is weakly closed. let  $d = \inf\{\|x\|\}$ , then if  $d \leq \|x_n\| < d + q/n$ , then  $\{x_n\}$  is bounded, so by(12.8.4.15) it is weak-sequentially compact(12.8.4.9), thus some  $x_n \rightarrow x$  weakly. and use(12.8.4.8),  $x$  must attain minimal norm  $d$ .  $\square$

## 5 Compact Operators & Fredholm Operators

**Def.(12.8.5.1) [Compact Operators].** A **compact operator** is an operator between Banach spaces that maps bounded set to sequentially compact(equivalently precompact or totally bounded(4.4.8.27)) set. It is necessarily continuous because the norm function is continuous thus  $\|Tx\|$  is bounded on the unit ball. The set of compact operators between  $X, Y$  is denoted by  $\mathfrak{C}(X, Y)$ .  $\lrcorner$

**Prop.(12.8.5.2) [Examples of Compact Operators].**

- Let  $X$  be a compact measure space and  $Lu(x) = \int_X K(x, y)u(y)dy$  for  $K \in C(X \times X)$ . This is a compact operator on  $C(X)$  by [Arzela-Ascoli](#).
- Let  $\Omega$  be a  $\sigma$ -finite measure space and let  $\mathcal{L}u(x) = \int_\Omega K(x, y)u(y)dy$  for  $K(x, y) \in L^2(\Omega \times \Omega)$ . This is a compact operator on  $L^2(\Omega)$ , as it is Hilbert-Schmidt(12.9.4.4)(12.9.4.3).  $\lrcorner$

**Prop.(12.8.5.3) [Properties of Compact Operators].**

1. For a continuous operator, it has f.d. image iff it is compact and the image is closed.
2. The space of compact operator is a closed subspace of  $L(X, Y)$ . Thus the limit of f.d. operators is compact.
3. If one of  $A$  or  $B$  is compact and the other is continuous, then  $AB$  is compact, because continuous maps bounded to bounded and compact to compact.  $\lrcorner$

*Proof:*

1. A finite dimensional space is closed by(12.8.1.8), and a finite dimensional space is Heine-Borel(4.4.5.2), so it maps closed ball to precompact set, as it is continuous. Conversely, if it is compact and the image is closed, then it is an open map to its image, by open mapping theorem, and the image is locally compact because  $T$  is compact, so it has finite dimension(12.8.1.7).
2.  $S+T$  is continuous because sum of precompact set is precompact. To show it is closed subspace, Use totally bounded definition, for  $T$  is the closure, let  $\|S - T\| < r$ , then if  $S(x_i)$  is a  $r$ -net for  $S(B(0, 1))$ , then  $T(x_i)$  is a  $3r$ -net for  $T(B(0, 1))$ .
3. Because continuous function preserves both boundedness and (pre)compactness.  $\square$

**Prop.(12.8.5.4) [Compact Operators and Totally Convergence].** Let  $x_n \rightarrow x$  weakly, if  $T$  is compact, then  $Tx_n \rightarrow Tx$  strongly. The converse is true when  $X$  is reflexive. In particular, this applies to Hilbert space.  $\lrcorner$

*Proof:* Assume the contrary, if  $Tx_n$  doesn't converge to  $Tx$ , there is a subsequence  $x_{n_k}$  that  $\|Tx_{n_k} - Tx\| \geq \varepsilon_0$ . Now  $\{x_n\}$  is bounded by (12.7.3.5), so by  $T$  compact, there is a subsubsequence  $Tx_{n_k} \rightarrow z$  strongly. But because  $x_{n_i} \rightarrow x$  weakly,  $Tx_{n_i} \rightarrow Tx$  weakly because  $T$  is continuous, and thus  $z = Tx$ .

The converse is by Eberlein (12.8.4.9), because the bounded  $x_n$  has a weak convergent subsequence, and it is mapped to convergent sequence by  $T$ .  $\square$

**Prop. (12.8.5.5).**  $T$  is compact  $\iff T^*$  is compact.  $\lrcorner$

*Proof:* We need only to show that  $T^*y_n^*$  has a uniformly convergent subsequence on the unit sphere, but for this it suffice to prove  $y_n^*$  is sequentially compact in  $C(\overline{T(B(0,1))})$ . And we use Arzela-Ascoli because  $\overline{T(B(0,1))}$  is compact. For the other half, use the double dual space.  $\square$

**Lemma (12.8.5.6).** If there is a chain of closed subspaces  $M_1 \subset M_2 \subset \dots$  that  $T(M_n) = M_n$  and  $(T - \lambda_n I)M_n \subset M_{n-1}$  for some  $\lambda_n \in \sigma(A) - B(0, r)$ , then  $T$  is not compact.  $\lrcorner$

*Proof:* There are  $y_n \in M_n$  that  $\|y_n\| \leq 1$  and  $\|y_n - x_n\| \geq 1/2$  for  $x \in M_{n-1}$ , so if  $m < n$ ,  $\|Ty_m - Ty_n\| = \|\lambda y_n - (Ty_m - (T - \lambda_n)y_n)\| \geq \frac{|\lambda_n|}{2} \geq \frac{r}{2}$ , so  $Ty_n$  has no convergent subsequence.  $\square$

**Lemma (12.8.5.7).** If  $A$  is compact and  $T = 1 - A$ , then if  $T$  is not injective, then it is not surjective. And for any  $r > 0$ ,  $\sigma_p(A) - B(0, r)$  is a finite set.  $\lrcorner$

*Proof:* We use (12.8.5.6). If  $R(T) = X$ , then let  $M_n = N(T^n)$ , then  $M_0 \neq 0$  because there is a  $Tx_0 = 0$ , and  $M_n \subset M_{n+1}$  because there is a  $T^n x_{n+1} = x_0$ , so  $x_{n+1} \in M_{n+1} - M_n$ .

If  $\sigma_p(A) - B(0, r)$  is infinite, then choose  $M_n$  to be generated by  $n$  eigenvectors, then it is clear that a chain like above will be found.  $\square$

**Lemma (12.8.5.8).** If  $A$  is compact and  $T = 1 - A$ , then  $R(T)$  is closed.  $\lrcorner$

*Proof:* it suffices to show  $T^{-1} : R(T) \rightarrow X/N(T)$  is continuous, if this is not the case, then there is a sequence  $\|x_n\| = 1$  but  $Tx_n \rightarrow 0$ . But  $A$  is compact, so there is a subsequence that  $Ax_{n_k} \rightarrow z$ , so  $x_{n_k} \rightarrow z$ . So  $Tz = 0$  so  $z = 0$ , but then  $x_{n_k} \rightarrow 0$ , contradiction.  $\square$

**Prop. (12.8.5.9) [Riesz-Fredholm].** For a compact operator  $A \in L(X)$ , let  $T = I - A$ . Then:

1.  $0 \in \sigma(A)$  if  $X$  is not f.d.
2.  $T$  is Fredholm of index 0 (12.8.5.17). Equivalently,  $\sigma(A) \setminus \{0\} = \sigma_p(A) \setminus \{0\}$  (because either  $T$  not injective or  $T$  is surjective).
3.  $\sigma(A)$  has at most one convergent point 0 (it must attain 0 if  $X$  is a infinite-dimensional). Hence it has at most countable spectrum.  $\lrcorner$

*Proof:* 1: If 0 is a regular value, then  $T$  is invertible, thus  $T^{-1}T = \text{id}$  is compact, thus  $X$  has f.d. (12.8.1.7).

2: Firstly  $\dim N(T) < \infty$ . This is because  $T|_{N(T)} = \text{id}_{N(T)}$ , so it is compact iff it is f.d. (12.8.5.3). by [Rudin P108] ?.

3: By (12.8.5.7).  $\square$

**Prop. (12.8.5.10) [Lomonosov's Invariant Subspace Theorem].** If  $X$  is an infinite dimensional complex Banach space, and  $T \neq 0$  is a compact operator in  $L(X)$ , then there is a proper closed subspace  $M$  of  $X$  that is invariant under  $S$  for any  $S$  that commutes with  $T$ .

In particular, if  $S$  commutes with some compact operator  $T$ , then  $S$  has an invariant closed subspace.  $\lrcorner$

*Proof:* If  $\Gamma$  is the subspace of all operators that commutes with  $T$ , then it is a subalgebra of  $L(X)$ , and for each  $y \in X$ , let  $\Gamma(y) = \{Sy | S \in \Gamma\}$ , then  $S(\Gamma(y)) \subset \Gamma(y)$ , then so does the closure of  $\Gamma(y)$ . So if the proposition is false, then  $\Gamma(y)$  is dense in  $X$  for each  $y$ .

Pick  $x_0$  that  $Tx_0 \neq 0$ , then there is an open ball  $B$  of  $x_0$  that  $\|Tx\| \geq \frac{1}{2}\|Tx_0\|$  and  $\|x\| \geq \frac{1}{2}\|x_0\|$  for  $x \in B$ . Now our assumption shows that for every  $y \neq 0$ , there is a nbhd  $W$  of it that maps into  $B$  by some  $S \in \Gamma$  (notice  $\Gamma$  is a subspace).

Now  $K = \overline{T(B)}$  is compact because  $T$  is compact, so there are f.m. open sets  $W_i$  whose union cover  $K$ , and  $S_i(W_i) \in B$ , where  $S_i \in \Gamma$ . Now let  $\mu = \max\{\|S_i\|\}$ . Consider  $Tx_0 \in K$ , so there is a  $S_{i_1}Tx_0 \in B$ , then  $TS_{i_1}Tx_0 \in K$ , so there is a  $S_{i_2}TS_{i_1}Tx_0 \in B$ . Continuing this way, we get

$$\frac{1}{2}\|x_0\| \leq \|x_N\| \leq \mu^N \|T^N\| \|x_0\|,$$

so by Gelfand theorem (12.9.1.8),  $\rho(T) > 0$ , so there is a eigenvalue  $\lambda$  of  $T$  (by (12.8.5.9)) that  $N(T - \lambda I)$  is finite dimensional, so not equal to  $X$ , and it is clearly invariant under  $\Gamma$ .  $\square$

**Prop. (12.8.5.11) [Jordan Decomposition for Compact Operators].** For a compact operator  $A$  and all the non-zero eigenvalues  $\lambda_i$ , we can find a subspace

$$\bigoplus_{i=1}^{\infty} N((\lambda_i - A)^{p_i}), \quad \lambda_i \neq 0$$

on which  $A$  has a Jordan form.  $\lrcorner$

*Proof:* Let  $T = 1 - A$ , By (3.2.4.5), we only have to prove there are some  $m, n$  that There is a  $p$  that  $N(T^p) = N(T^{p+1})$  and a  $q$  that  $R(T^q) = R(T^{q+1})$ , because then we have a decomposition  $X = N((T - \lambda I)^p) \oplus R((T - \lambda I)^p)$ , and all these  $N((T - \lambda I)^p)$  are pairwise disjoint.

Now  $q < \infty$ , because if  $R(T) \supset R(T^2) \supset \dots$ , because  $T^k$  is of the form  $1 + \text{compact operator}$ ,  $R(T^k)$  are all closed by (12.8.5.8), so by (12.8.5.6), this is impossible.

For  $p$ , use Riesz-Fredholm (12.8.5.9),

$$\dim N(T^q) = \text{codim} R(T^q) = \text{codim} R(T^{q+1}) = \dim N(T^{q+1}) < \infty$$

So  $p \leq q < \infty$ .  $\square$

**Prop. (12.8.5.12).** If  $X, Y$  are Banach spaces and  $T, K \in L(X, Y)$ ,  $K$  is compact and  $R(A) \subset R(K)$ , then  $A$  is compact.  $\lrcorner$

*Proof:* Use (12.7.2.10), then we can lift the function to a map  $\tilde{T} : X \rightarrow X/N(K)$ , which is also continuous, so  $T = \tilde{K} \rightarrow \tilde{T}$  is also compact.  $\square$

### Schauder Basis

**Def. (12.8.5.13) [Schauder Basis].** Let  $X$  be a Banach space, a sequence  $e_n$  is called a **Schauder basis** iff for any  $x \in X$ , there is a unique sequence  $C_n(x)$  that  $x = \lim \sum_{n=1}^N C_n(x)e_n$ . Notice in this case  $X$  is automatically separable.  $\lrcorner$

**Prop. (12.8.5.14).** If  $X$  has a Schauder basis, then  $C_n(x)$  are continuous functional on  $X$ .  $\lrcorner$

*Proof:* Consider the module  $\|x\|_1 = \sup \|S_N x\|$ , Firstly, it is complete, because  $\|x\| = \lim \|S_N x\| \leq \|x\|_1$ , so if there is a Cauchy sequence  $\{x_i\}$  in  $|\cdot|_1$ , then it is a Cauchy sequence in  $|\cdot|$ , then it converges to some  $x$ . Now  $C_N(x) = S_N(x_i) - S_{N-1}(x_i)$  are all Cauchy sequence, uniform in  $N$ , so they converges to some sequence  $c_N$ .

It is left to verify that  $s_N = \sum_{i=1}^N c_n e_n$  converges to  $x$ , because then it is easy to verify that  $\lim \|x_i - x\|_1 = 0$ . For this, choose  $N_1$  large that  $\|x_n - x\| \leq \varepsilon$  for  $n \geq N_1$ , and choose  $N_2$  large that  $\|S_k(x_n) - s_k\| \leq \varepsilon$  for all  $k$  and  $n \geq N_2$ . Then for  $x_{N_1+N_2}$ , there is a  $N_3$  that  $\|S_n x_{N_1+N_2} - x_{N_1+N_2}\| \leq \varepsilon$ , so  $\|x - s_k\| \leq \|x - x_{N_1+N_2}\| + \|S_k x_{N_1+N_2} - x_{N_1+N_2}\| + \|S_k(x_{N_1+N_2}) - s_k\| \leq 3\varepsilon$  for  $k$  large.

Now by Banach(12.7.2.7),  $\|x\|_1 \leq M\|x\|$  for some  $M$ , so  $|C_n(x)e_n| \leq 2M\|x\|$  and  $C_n$  is continuous.  $\square$

**Prop. (12.8.5.15).** If  $X$  has a Schauder basis, then any compact operator is a limit of operators of f.d. range.  $\lrcorner$

*Proof:* Let  $S_N(x) = \sum_{n=1}^N C_n(x)e_n$ , it is continuous by(12.8.5.14). And it converges, so  $\|S_N\| \leq M$ , by Banach-Steinhaus(12.7.2.1).

For any compact operator, we want to find f.d. range operator  $T_i$  that  $T_i \rightarrow T$ . For this, given any  $\varepsilon > 0$ , because  $\overline{T(B(0,1))}$  is compact, there are operators that is a  $\varepsilon/M^2$ -net  $y_i$ , then choose  $N$  large enough that  $|S_N y_i - y_i| \leq \varepsilon/M^2$ , then for any  $x$ , there is a  $y_i$  that  $|Tx_i - y_i| < \varepsilon/M^2$ , so  $|S_N T x_i - S_N y_i| < \varepsilon/M$ , and then  $|S_N T x - T x_i| < \varepsilon$ , and notice  $S_N T$  has f.d. range.  $\square$

**Prop. (12.8.5.16)[Compact Operator as Limits of F.D. Operators].** Any compact operator on a Hilbert space is a limit of f.d. operators.  $\lrcorner$

*Proof:* Cf.[Trace Classes and Hilbert-Schmidt Operators, Thm10].  $\square$

### Fredholm Operator

**Def. (12.8.5.17)[Fredholm Operator].** A bounded operator between Banach space is called a **Fredholm operator** if  $\dim N(T) < \infty$  and  $\text{codim} R(T) < \infty$ . It necessarily has closed image by(12.7.2.11), so  $R(T) = N(T^*)^\perp$ (12.7.3.2).

The **index** of a Fredholm operator is defined as  $\text{ind}(T) = \dim N(T) - \text{codim} R(T)$ , thus for a compact operator  $A$ ,  $I - A$  has index 0, by(12.8.5.9).  $\lrcorner$

**Prop. (12.8.5.18).** For a Fredholm operator between Banach space, we have

$$X = N(T) \oplus R(T) \quad Y = Y/R(T) \oplus R(T)$$

and  $X/N(T) \cong R(T)$ .  $\lrcorner$

*Proof:* Because  $R(T)$  and  $N(T)$  are finite/cofinite hence closed and complemented by(12.8.1.9). If  $X = N(T) \oplus M_1$  and  $Y = R(T) \oplus M_2$ , then  $M_1 \cong X/N(T)$ ,  $X/N(T) \cong R(T)$  and  $M_2 \cong Y/R(T)$  by Banach theorem.  $\square$

**Prop. (12.8.5.19)[Characterizing Fredholm Operator].**  $T$  is Fredholm from  $X$  to  $Y$  iff there exist a bounded  $S_1, S_2$  from  $Y$  to  $X$  that  $S_1 T = I - A_1$ ,  $T S_2 = I - A_2$ , where  $A_1, A_2$  is compact. If this is the case,  $S_1$  and  $S_2$  can be chosen the same as  $S$ , then  $S$  is called the **regulator** of  $T$ , and  $S$  is Fredholm as well.

So the Fredholm operator is the set of operators invertible 'modulo compact ones'.  $\lrcorner$

*Proof:* By (12.8.5.18)  $T : X/N(T) \cong R(T)$ , and there is a projection of  $\pi : Y$  onto  $R(T)$ . Thus we composed them to get a  $S = T^{-1} \circ \pi : Y \rightarrow X$ . And  $ST$  and  $TS$  are both 1 minus a projection with f.d. image, hence compact (12.8.5.3).

For the converse,  $R(T) \supset R(1 - A_2)$  is of finite codimension because  $1 - A_2$  is Fredholm, and  $N(T) \subset N(1 - A_1)$  is of finite dimension because  $1 - A_1$  is Fredholm.  $\square$

**Cor. (12.8.5.20).** The set of Fredholm operators is closed under composition. Index is a locally constant function on it, and  $\text{ind}(T_1 T_2) = \text{ind}(T_1) + \text{Ind}(T_2)$ .  $\lrcorner$

*Proof:* There is a long exact sequence (use (4.8.8.4) in the category of vector spaces)

$$0 \rightarrow \ker T_2 \rightarrow \ker T_1 T_2 \rightarrow \ker T_2 \rightarrow \text{Coker } T_2 \rightarrow \text{Coker } T_1 T_2 \rightarrow \text{Coker } T_1 \rightarrow 0.$$

which shows the composition and index is additive.

For the openness and locally constancy, use (12.8.5.19), when adding a small  $R$ ,  $S(T + R) = 1 - A_1 + SR$ , and if when  $\|R\| < \|S\|^{-1}$ ,  $E_1 = (I + RS)^{-1}$  is bounded, so  $E_1 S(T + R) = I - E_1 A_1$ , and similarly does  $(T + R)SE_2$ , so  $T + R$  is Fredholm. And  $\text{ind } E_1 + \text{ind } S + \text{ind}(T + R) = \text{ind}(1 - E_1 A_1) = 0$ , and  $\text{ind } E_1 = 0$  because it is invertible, and  $\text{ind } S + \text{ind } T = \text{ind}(1 - A_1) = 0$ , so  $\text{ind } T = \text{ind}(T + R)$ .  $\square$

**Cor. (12.8.5.21).** If  $T$  is Fredholm and  $A$  is compact, then  $T + A$  is also Fredholm and  $\text{ind}(T + A) = \text{ind}(T)$ . In particular,  $\text{ind}$  is in fact defined on the quotient of  $L(X, Y)$  by compact operators.  $\lrcorner$

*Proof:* It is Fredholm by (12.8.5.19), and we notice  $S(T + A)$  and  $ST$  are both 1 minus compact operators, thus (12.8.5.20) and (12.8.5.9) gives the result.  $\square$

**Cor. (12.8.5.22).** If  $T$  is Fredholm, then  $T^*$  is Fredholm, and  $\text{ind}(T^*) = -\text{ind}(T)$ .  $\lrcorner$

*Proof:* The first follows from (12.8.5.19) and (12.8.5.5). For the second, use the fact  $R(T)$  and  $N(T)$  are all closed.  $\square$

## 6 Unbounded Operators

References are [Rud91].

**Notation (12.9.0.1).**

- Use notations on functional analysis defined in [Archimedean Functional Analysis](#).
- Every Banach space in this section is assumed to be defined over  $\mathbb{C}$ .

┘

### 1 Banach Algebras

#### Spectra of Bounded Operators

**Def. (12.9.1.1) [Spectrums].** Suppose  $X$  is Banach space and  $A \in L(X)$ . Then  $\lambda \in \mathbb{C}$  is called a:

- **point spectrum** if  $\lambda I - A$  is not injective;
- **continuous spectrum** if it is not a point spectrum and  $R(\lambda I - A) \neq X$  but  $\overline{R(\lambda I - A)} = X$ .
- **residue point** if it is not a point spectrum and  $\overline{R(\lambda I - A)} \neq X$ .
- **regular point** if  $\lambda I - A$  is injective and  $R(\lambda I - A) = X$ , in which case  $(\lambda I - X)^{-1}$  is continuous, by Banach.

denote  $\sigma(A) = \mathbb{C} \setminus \{\text{regular points of } A\}$  the **spectrum** of  $A$ , and  $\rho(A) = \sup\{|\lambda| \mid \lambda \in \sigma(A)\}$  is called the **spectral radius** of  $A$ . ┘

**Prop. (12.9.1.2).** If  $A \in \text{BanAlg}$  and  $x$  is invertible in  $A$ , and  $h \in A$  satisfies  $\|h\| < \frac{1}{2} \|x^{-1}\|^{-1}$ , then  $x + h$  is also invertible and

$$\|(x + h)^{-1} - x^{-1} + x^{-1}hx^{-1}\| \leq 2 \|x^{-1}\|^3 \|h\|^2$$

┘

*Proof:*  $x + h = x(e + x^{-1}h)$  and  $\|x^{-1}h\| < \frac{1}{2}$ , so  $x + h$  is invertible by (12.9.1.14), and

$$\|(x + h)^{-1} - x^{-1} + x^{-1}hx^{-1}\| = \left\| \left[ (e + x^{-1}h)^{-1} - e + x^{-1}h \right] x^{-1} \right\| \leq 2 \|x^{-1}\|^3 \|h\|^2$$

also by (12.9.1.14). ┘

**Cor. (12.9.1.3).** If  $A \in \text{BanSpa}$  then the invertible elements  $G(A)$  is an open subset of  $A$ , and the mapping  $x \mapsto x^{-1}$  is a homeomorphism of  $G(A)$  onto  $G(A)$ . ┘

**Prop. (12.9.1.4).** For  $X \in \text{BanSpa}$  and  $T \in L(X)$ ,  $\mathbb{C} \setminus \sigma(T)$  is an open set and  $\lambda \rightarrow (\lambda I - T)^{-1}$  is a operator-valued holomorphic function on  $\mathbb{C} \setminus \sigma(T)$ .

In particular,  $\sigma(T)$  is not empty. ┘

*Proof:* The first assertion is by (12.9.1.3), for the second, let  $f(\lambda) = (\lambda e - x)^{-1}$  is defined on  $\Omega = \mathbb{C} - \sigma(x)$  and (12.9.1.2) shows

$$\|f(\mu) - f(\lambda) + (\mu - \lambda)f^2(\lambda)\| \leq 2 \|f(\lambda)\|^3 \cdot |\mu - \lambda|^2.$$

So  $\lim_{\mu \rightarrow \lambda} \frac{f(\mu) - f(\lambda)}{\mu - \lambda} = -f^2(\lambda)$ , which means that  $f$  is strongly holomorphic in  $\Omega$ .

Now if  $|\lambda| > \|x\|$ , then  $|f(\lambda)| = |\lambda^{-1}e + \lambda^{-2}x + \dots| \leq \frac{1}{|\lambda| - \|x\|}$ , so  $\sigma(x)$  cannot be empty by Liouville theorem (12.8.3.31). ┘

**Cor. (12.9.1.5) [Gelfand-Mazur].** If  $A$  is a Banach algebra over  $\mathbb{C}$  and  $A^\times = A^*$ , then  $A = \mathbb{C}$ .  $\lrcorner$

*Proof:* Any nonzero element  $x$  has a nonempty spectrum, so there is a  $\lambda(x)$  that  $x - \lambda(x)e$  is not invertible, so it must be 0. That is, the mapping  $\mathbb{C} \rightarrow A : \lambda \mapsto \lambda e$  is bijective, so is isomorphism by Banach.  $\square$

**Prop. (12.9.1.6).** Notice  $(1-T)$  is invertible for  $\|T\| < 1$  and the inverse can be calculated by definition.

In particular, for a Banach algebra  $A$  and any  $x \in A$ , when  $\lambda > \|x\|$ ,  $e - \lambda^{-1}x$  is invertible, so the spectrum of  $x$  is bounded. Now that its complement is open as the inverse image of  $G(A)$  by  $\lambda \mapsto \lambda e - x$ , so the spectrum of  $x$  is compact.  $\lrcorner$

**Cor. (12.9.1.7) [Spectrum is Continuous].** The spectrum of an element of a Banach algebra is continuous, i.e. if  $\sigma(x) \subset \Omega$  for some open subset  $\Omega \subset \mathbb{C}$ , then there is a  $\delta > 0$  that  $\sigma(x+y) \subset \Omega$  for  $\|y\| < \delta$ .  $\lrcorner$

*Proof:* As  $\|(\lambda e - x)^{-1}\|$  is a continuous function of  $\lambda$  in the complement of  $\sigma$ , and since the norm tends to 0 as  $\lambda \rightarrow \infty$ , there is a  $M$  that  $\|(\lambda e - x)^{-1}\| < M$  for all  $\lambda \notin \Omega$ . Now if  $\|y\| < 1/M$  and  $\lambda \notin \Omega$ , then  $\lambda e - (x+y) = (\lambda e - x)[e - (\lambda e - x)^{-1}y]$  is invertible.  $\square$

**Prop. (12.9.1.8) [Gelfand].** The spectrum radius  $\rho(A) = \lim_{n \rightarrow \infty} \|A^n\|^{\frac{1}{n}} = \inf \|A^n\|^{\frac{1}{n}} \leq \|A\|$ .

This formula is remarkable, as the LHS depends only on the algebraic structure, and the RHS depends on the metric structure.  $\lrcorner$

*Proof:* For  $r > \rho(x)$

$$x^n = \frac{1}{2\pi i} \int_{\Gamma_r} \lambda^n f(\lambda) d\lambda.$$

Let  $M(r) = \max \|f(re^{i\theta})\|$ , then  $\|x^n\| \leq r^{n+1}M(r)$ , hence  $\limsup \|x^n\|^{1/n} \leq r$ , so  $\limsup \|x^n\|^{1/n} \leq \rho(x)$ .

For the converse, if  $\lambda \in \sigma(x)$ , then  $\lambda^n \in \sigma(x^n)$ , because  $\lambda^n e - x^n = (\lambda e - x)(\lambda^{n-1}e + \dots + x^{n-1})$ , and this two commutes. So  $|\lambda^n| \leq \|x^n\|$ , so  $\rho(x) \leq \inf \|x^n\|^{1/n}$ .  $\square$

**Prop. (12.9.1.9).**  $\sigma(A) = \sigma(A^*)$ .  $\lrcorner$

*Proof:* It suffices to show if  $T$  is invertible iff  $T^*$  is invertible. If  $T$  is invertible, then  $T^*$  is invertible with inverse  $(T^{-1})^*$ . Conversely, if  $T^*$  is invertible, then  $T^{**}$  is invertible, so, as the restriction of  $T^{**}$ ,  $T$  is injective and image is closed. If the image is not  $X$ , then there is a  $f$  that vanish on the image, so  $T^*f = 0$ , but then  $f = 0$ .  $\square$

**Prop. (12.9.1.10).** In a Banach algebra  $A$ ,  $e - xy$  is invertible iff  $e - yx$  is invertible, thus  $\sigma(xy) \cup \{0\} = \sigma(yx) \cup \{0\}$ .  $\lrcorner$

*Proof:* Let  $z = (e - xy)^{-1}$ , then we claim  $e + yzx$  is just the inverse of  $e - yx$ :  $(e - yx)(e + yzx) = e - yx + yzx - yxyzx = e$  and  $(e + yzx)(e - yx) = e + yzx - yx - yzxyx = e$ .  $\square$

**Lemma (12.9.1.11).** If  $A$  is a Banach algebra and  $x_n \in G(A)$  converges to  $x \notin G(A)$ , then  $\|x_n^{-1}\| \rightarrow \infty$ .  $\lrcorner$

*Proof:* If  $\|x_n^{-1}\| < M$ , choose  $n$  that  $\|x_n - x\| < 1/M$ , then  $\|e - x_n^{-1}x\| = \|x_n^{-1}(x_n - x)\| < 1$ , so  $x_n^{-1}x$  is invertible, so  $x$  is invertible.  $\square$

**Prop. (12.9.1.12).** For Banach algebra  $B$  and its closed subalgebra  $A$ ,  $\sigma_A(x)$  is obtained from  $\sigma_B(x)$  by filling some holes. So when  $\sigma_B(x)$  doesn't separate  $\overline{\mathbb{C}}$  or  $\sigma(A)$  has empty interior, then  $\sigma_A(x) = \sigma_B(x)$ .  
 $\lrcorner$

*Proof:* Cf.[Rudin P256].  $\square$

**Prop. (12.9.1.13).** if  $A$  is a Banach algebra over  $\mathbb{C}$  that  $\|x\|\|y\| \leq M\|xy\|$  for some fixed  $M$ , then  $A$  is isomorphic to  $\mathbb{C}$ .  
 $\lrcorner$

*Proof:* If  $y$  is a boundary pt of  $G(A)$ ,  $y = \lim y_n$ , then  $\|y_n^{-1}\| \rightarrow \infty$ . But  $\|y_n\|\|y_n^{-1}\| \leq M\|e\|$ , so  $y_n \rightarrow 0$ , so  $y = 0$ .

But any boundary point of  $\sigma(x)$  gives a boundary point  $\lambda e - x$  of  $G(A)$ , so  $x = \lambda e$ , so  $A \cong \mathbb{C}$ .  $\square$

### Complex Homomorphism

**Prop. (12.9.1.14).** Suppose  $A$  is a Banach algebra over  $\mathbb{C}$ ,  $x \in A$  satisfies  $\|x\| < 1$ , then  $\|(e - x)^{-1} - e - x\| \leq \frac{\|x\|^2}{1 - \|x\|}$ , and  $|\varphi(x)| < 1$  for any complex homomorphism  $\varphi$  on  $A$ . In particular, any complex homomorphism is continuous.  
 $\lrcorner$

*Proof:*  $\|(e - x)^{-1} - e - x\| = \|x^2 + x^3 + \dots\| \leq \sum_{n=2}^{\infty} \|x\|^n = \frac{\|x\|^2}{1 - \|x\|}$ .

For the second, notice  $e - \lambda^{-1}x$  is invertible for each  $|\lambda| \geq 1$ , so  $1 - \lambda\varphi(x) \neq 0$ , so  $\varphi(x) \neq \lambda$ .  $\square$

**Prop. (12.9.1.15)[Gleason-Kahane-Zelazko].** If  $\varphi$  is a linear functional on a Banach algebra  $A$  over  $\mathbb{C}$ , if  $\varphi(e) = 1$  and  $\varphi(x) \neq 0$  for every invertible element  $x \in A$ , then  $\varphi$  is a complex homomorphism.  
 $\lrcorner$

*Proof:* Cf.[Rudin P251].  $\square$

### Symbolic Calculus

**Prop. (12.9.1.16)[Symbolic Calculus].** For a Banach algebra  $A$ . For a domain  $\Omega$  in  $\mathbb{C}$ , define  $A_\Omega$  as the set of  $x$  that  $\sigma(x) \in \Omega$ , it is an open set by (12.9.1.7), then:

$$f \mapsto \tilde{f}(x) = \frac{1}{2\pi i} \int_{\Gamma} f(\lambda)(\lambda e - x)^{-1} d\lambda$$

for any contour  $\Gamma$  that surrounds  $\sigma(x)$ , is a continuous algebra isomorphism of  $H(\Omega)$  into the set of  $A$ -valued functions on  $A_\Omega$  with the compact-open topology.

We have  $\widetilde{g \circ f} = \tilde{g} \circ \tilde{f}$ .  $\lrcorner$

*Proof:* The nontrivial part is that this map is multiplicative, but for this we can use Runge's theorem to approximate any function on  $\sigma(x)$ .  $\square$

This theorem makes it possible to implant complex analysis to the study of Banach Algebra.

**Cor. (12.9.1.17).**  $\exp(x)$  is defined on  $A$  and is continuous. If  $\sigma(x)$  doesn't separate 0 from  $\infty$ , then  $\log(x)$  is defined but might not be continuous.  $\lrcorner$

**Prop. (12.9.1.18)[Spectral Mapping Theorem].**  $\tilde{f}(x)$  is invertible in  $A$  iff  $f(\lambda) \neq 0$  on  $\sigma(x)$ . Thus we have  $\sigma(\tilde{f}(x)) = f(\sigma(x))$ .  $\lrcorner$

**Prop. (12.9.1.19).** If  $f$  doesn't vanish identically on any component of  $\Omega$ , then  $f(\sigma_p(T)) = \sigma_p(\tilde{f}(T))$ .  
 Cf.[Rudin P266].  $\lrcorner$

### Commutative Banach Algebra

**Lemma (12.9.1.20).** For  $A$  a commutative Banach algebra, the set of maximal ideals has codimension 1 corresponds to kernels of complex homomorphisms to  $\mathbb{C}$ . (Consider the quotient space and use Gelfand-Mazur). Note that a complex homomorphism is all continuous because  $\lambda e - x$  maps to nonzero.

$\lambda \in \sigma(x)$  iff there is a complex homomorphism  $h$  s.t.  $h(x) = \lambda$ . (Because  $x$  is invertible iff it is not contained in any proper ideal of  $A$ .  $\lrcorner$ )

*Proof:*

$\square$

**Prop. (12.9.1.21)[Gelfand Transform].** The **spectrum**  $\Delta_A$  of a unital commutative Banach algebra  $A$  is defined to be the set  $\Delta$  of maximal ideals of  $A$ . It is a locally compact Hausdorff space w.r.t to the weak\*-topology and the Gelfand transform:  $x \mapsto \hat{x}(h) = h(x)$  is a continuous map of  $A$  into  $C(\Delta)$ . And the range of  $\hat{x}$  equals  $\sigma(x)$ , so  $\|\hat{x}\| = \rho(x) \leq \|x\|$ .  $\lrcorner$

*Proof:* First we prove it is compact Hausdorff: As  $\sigma(A) = \{h \in \text{closed ball of } A^* | h(e) = 1, h(xy) = h(x)h(y)\}$  which is a closed subset of the closed ball of  $A^*$ , so it is compact Hausdorff. The rest is clear and follows from (12.9.1.20).  $\square$

**Prop. (12.9.1.22).** For  $A = C(X)$  where  $X$  is compact Hausdorff,  $\Delta$  is homeomorphic to  $X$ . (otherwise it has finite  $f_i \neq 0$ , then  $\sum |f_i|^2$  is positive thus invertible but maps to 0). In fact, for a space  $X$ ,  $\Delta(C(X))$  is the stone-Čech compactification of  $X$ .  $\lrcorner$

**Prop. (12.9.1.23).** For  $A = L^\infty(m)$ , the spectrum of  $f$  is just the essential range of  $f$ .  $\lrcorner$

**Lemma (12.9.1.24).** If  $\hat{A} \subset C(\Delta)$  with a chosen topology that makes it compact, and  $A$  separate points, then the topology of it is the same of the weak\*-topology. (Compact to Hausdorff).  $\lrcorner$

**Prop. (12.9.1.25).** The algebra  $L^1(\mathbb{R}^n) \oplus \delta$  with the multiplication by convolution has the spectrum  $\mathbb{R}^n \cap \{\infty\}$ . (Use  $(L^p)^* = L^q$  and see when will it be homomorphism).  $\lrcorner$

## 2 Hilbert spaces

**Prop. (12.9.2.1)[Optimal Approximation].** A closed convex subset in a Hilbert space has a unique element that attains the minimum norm.  $\lrcorner$

*Proof:* Assume  $0 \notin C$ , so let  $d = \inf_{z \in C} \|z\| > 0$ , then there are  $x_n$  that  $d \leq \|x_n\| \leq d + 1/n$ . It suffices to show that  $x_n$  is a Cauchy sequence, because then it has a convergent point in  $C$ . Now

$$\|x_n - x_m\|^2 = 2(\|x_n\|^2 + \|x_m\|^2) - 4 \left\| \frac{x_n + x_m}{2} \right\|^2 \leq 2[(d + 1/n)^2 + (d + 1/m)^2] - 4d^2 \rightarrow 0.$$

For the unicity, if  $\|x_1\| = \|x_2\| = d$ , then

$$\|x_1 - x_2\|^2 = 2(\|x_1\|^2 + \|x_2\|^2) - 4 \left\| \frac{x_1 + x_2}{2} \right\|^2 \leq 4d^2 - 4d^2 = 0.$$

$\square$

**Cor. (12.9.2.2)[Orthogonal Decomposition].** The orthogonal complement of a closed subspace of a Hilbert space exists. and the projection on to a closed subspace exists. This is a good trait of Hilbert space.  $\lrcorner$

*Proof:* For any element  $x$ , let  $y$  be the optimal approximation(12.9.2.1) of  $x$ , then  $z = x - y$  is orthogonal to  $y$ .  $\square$

**Thm. (12.9.2.3) [Riesz].** Linear functionals on a Hilbert space over  $\mathbb{C}$  are all of the form  $x \mapsto (x, z)$  (Choose an orthogonal of the kernel). In other words, Hilbert spaces are reflexive.  $\lrcorner$

*Proof:* Choose a  $x_0$  orthogonal to  $N(f)$  by(12.9.2.2) and  $\|x_0\| = 1$ , then any  $x = \alpha x_0 + y$  where  $y \in N(f)$ . Inner product with  $x_0$ , we get  $\alpha = (x, x_0)$ , so  $f(x) = \alpha f(x_0) = (x, \overline{f(x_0)x_0})$ .  $\square$

**Cor. (12.9.2.4).** For Hilbert spaces  $\mathcal{H}, \mathcal{H}'$  and  $T \in \mathcal{L}(\mathcal{H}, \mathcal{H}')$ ,  $\|T\| = \sup\{(Tx, y) \mid \|x\| \leq 1, \|y\| \leq 1\}$ .  $\lrcorner$

*Proof:* Use(12.8.3.6) to find for each  $x$  a functional  $f$  of norm 1 that  $|f(Tx)| = \|Tx\|$ , then use Riesz theorem. In particular, if we define  $\square$

**Cor. (12.9.2.5)[Reproducing Kernel].** For a Hilbert space  $H$ , if elements of  $H$  are all complex valued functions on a set  $S$ , and  $J_x : f \mapsto f(x)$  is continuous functional for  $H$ , then there is a function  $K(x, y)$  on  $S \times S$  that  $K_y(x) = K(x, y) \in H$ , and  $f(y) = (f, K_y)_H$ , called the **reproducing kernel**.

And if  $e_\alpha$  is a basis for  $H$ , then  $K(x, y) = \sum e_\alpha(x) \overline{e_\alpha(y)}$ .  $\lrcorner$

*Proof:* For any  $y$ , there is a  $K_y \in H$  that  $f(y) = (f, K_y)_H$  by Riesz representation. If we let  $K(x, y) = (K_y, K_x) = K_y(x)$ , then this is the desired kernel.

If  $e_\alpha$  is a basis, then  $K_x = (K_x, e_n)e_n = \overline{e_n(x)}e_n$ , so by Parseval equality,  $K(x, y) = \sum e_\alpha(x) \overline{e_\alpha(y)}$ .  $\square$

**Prop. (12.9.2.6).** Let  $\mathcal{H}$  be a Hilbert space, then a sequence  $x_n$  converges to  $x$  iff  $x_n$  converges to  $x$  weakly and  $\|x\|_n \rightarrow \|x\|$ .  $\lrcorner$

*Proof:* One direction is trivial, for the other, notice that  $\|x_n - x\|^2 = \|x_n\|^2 + \|x\|^2 - 2\operatorname{Re}(x, x_n)$  which converges to 0.  $\square$

**Thm. (12.9.2.7) [Lax-Milgram].** If  $a(x, y)$  is a sesquilinear form on a Hilbert space  $H$  over  $\mathbb{C}$  that  $|a(x, y)| \leq M\|x\|\|y\|$ , then there is a unique continuous operator  $A \in L(H)$  that  $a(x, y) = (x, Ay)$ . If moreover  $|a(x, x)| \geq \delta\|x\|^2$ , then  $A$  is bijective and  $\|A^{-1}\| \leq \frac{1}{\delta}$ .  $\lrcorner$

*Proof:* For any  $y$ ,  $x \mapsto a(x, y)$  is a continuous functional, so by(12.9.2.3), there is an element  $Ay$  that  $a(x, y) = (x, Ay)$ .

Now  $Ay$  depends linearly on  $y$ , and  $\|Ay\| = \sup |a(x, y)|/\|x\| \leq M\|y\|$ .

If  $|a(x, x)| \geq \delta\|x\|^2$ , then  $A$  is clearly injective, and  $R(A)$  is closed, because for any  $z = \lim Av_n$ , it is easily verified that  $v_n$  is a Cauchy sequence. And  $R(A)^\perp = 0$ , because if  $(w, Av) = 0$  for any  $v \in H$ , then  $\delta\|w\|^2 \leq |a(w, w)| = 0$ .  $A^{-1}$  exists by Banach theorem(12.7.2.6), and  $\delta\|x\|^2 \leq |a(x, x)| = (x, Ax) \leq \|x\|\|Ax\|$ , so  $\delta\|x\| \leq \|Ax\|$ .  $\square$

**Cor. (12.9.2.8) [Variational Inequality].** If  $H$  is a Hilbert space that  $a(x, y)$  is an anti-symmetric bilinear function that  $\delta\|x\|^2 \leq a(x, x) \leq M\|x\|^2$ , then if  $u_0 \in H$ , and  $C$  is a closed convex subset of  $X$ , the function

$$f : x \mapsto a(x, x) - \operatorname{Re}(u_0, x)$$

attains minimum at  $C$ .  $\lrcorner$

*Proof:* Similar to the proof of (12.9.2.1).  $f(x) \geq \delta \|x\|^2 - \|u_0\| \|x\|$  is bounded below on  $C$ . if  $x_n$  is a sequence that converge to the infimum  $d$ , then

$$\begin{aligned} a(x_n - x_m, x_n - x_m) &= 2(a(x_n, x_n) + a(x_m, x_m)) - 4a\left(\frac{x_n + x_m}{2}, \frac{x_n + x_m}{2}\right) \\ &= 2(f(x_n) + f(x_m)) - 4f\left(\frac{x_n + x_m}{2}\right) \leq 2[(d + 1/n)^2 + (d + 1/m)^2] - 4d^2 \rightarrow 0. \end{aligned}$$

So  $x_n$  is a Cauchy sequence by the condition, and it contains a unique minimum.  $\square$

**Cor. (12.9.2.9) [Involutions].** For a Hilbert space  $\mathcal{H}$  over  $\mathbb{C}$ , for any  $T \in L(H)$ , there is an operator  $T^* \in L(H)$  that  $(Tx, y) = (x, T^*y)$ , which is called the **formal adjoint** or involution of  $T$ . Notice it is defined on  $H$ , not on  $H^*$ .

Moreover,  $\|T\| = \|T^*\| = \|T^*T\|^{1/2}$ .  $\lrcorner$

*Proof:* Use Lax-Milgram (12.9.2.7) for  $a(x, y) = (Tx, y)$ . For the last assertion,  $\|T\| = \|T^*\|$  by (12.9.2.4). And we notice

$$\|Tx\|^2 = (Tx, Tx) = (T^*Tx, x) \leq \|T^*T\| \|x\|^2,$$

so  $\|T\| \leq \|T^*T\|^{1/2}$ .  $\square$

**Remark (12.9.2.10) [Examples].** The dual operator of the integral operators (12.8.5.2) with kernel  $K(x, y)$  is also an integral operator with kernel  $K^*(x, y) = \overline{K(y, x)}$ , by Fubini-Tonelli theorem.  $\lrcorner$

### 3 Spectral Theory on Hilbert Spaces

#### Resolution of Identity

**Def. (12.9.3.1) [Resolution of Identity on a Hilbert Spaces].** A resolution of identity on a Hilbert space  $\mathcal{H} \in \text{HilbSpa}$  for a  $\sigma$ -algebra on a set  $\Omega$  is a  $E$  that:

1.  $E(\emptyset) = 0, E(\Omega) = 1$ .
2.  $E(\omega)$  is self-adjoint projection.
3.  $E(\omega' \cap \omega) = E(\omega')E(\omega)$ .
4.  $E(\omega \cup \omega') = E(\omega) + E(\omega')$  for disjoint  $\omega, \omega'$ .
5.  $E_{x,y}(\omega) = (E(\omega)x, y)$  is a complex measure on  $E$ .

Thus for any  $x, \omega \rightarrow E(\omega)x$  is a countably additive  $\mathcal{H}$ -valued measure.

This will generate an isometric\*-isomorphism  $\Psi$  of the Banach algebra  $L^\infty(E)$  onto a closed normal subalgebra  $A$  of  $B(H)$ . (Define on simple function first).

$$\Psi(f) = \int_{\Omega} f dE, \quad (\Psi(f)x, y) = \int_{\Omega} f dE_{x,y}.$$

$\lrcorner$

*Proof:* Cf. [Rudin P319].  $\square$

**Prop. (12.9.3.2) [Spectral Decomposition for Normal Algebra].** For any closed normal algebra  $A$  of  $B(H)$ , there is a unique resolution of identity  $E$  (12.9.3.1) on the Borel subsets of  $\Delta_A$  that the inverse of Gelfand transform extends to an isometric \*-isomorphism  $\Phi$  of the algebra  $L^\infty(E)$  to a closed subalgebra  $B$  containing  $A$ .

In fact,  $B = \Gamma(\Gamma(A))$  is normal by Fuglede theorem (12.9.3.10).  $\lrcorner$

*Proof:* Cf.[Rudin P322].  $\square$

**Cor.(12.9.3.3)[Generalized Symbolic Calculus for Normal Operator].** For a normal operator  $T$  and the minimal closed commutative  $B^*$ -algebra  $A$  it generates, the inverse of Gelfand transform gets us a map  $\Psi : C(\sigma(x)) \rightarrow A$  that  $\Psi(z) = x$ ,  $\Psi(\bar{z}) = x^*$ , by(14.1.1.4).

Then the above proposition says there is a resolution of identity on the Borel set of  $\sigma(T)$  that  $\Psi$  extends to a function that maps  $L^\infty(m)$  to  $B(H)$  and  $\|\Psi(f)\| = \|f\|_\infty$ .  $\lrcorner$

**Cor.(12.9.3.4)[Normal and Invariant Subspace].** Any closed normal algebra  $A$  has many invariant subspaces, just choose a decomposition of Borel sets  $\Delta_A = \omega \amalg \omega'$ , then  $R(E(\omega)) \oplus R(E(\omega')) = H$ .

In particular, any normal operator has an invariant subspace.  $\lrcorner$

### Normal Operators on Hilbert Space

**Lemma(12.9.3.5).** For a Hilbert space  $H$  and  $T \in L(H)$ ,  $T$  is defined by values  $(Tx, x)$ .  $\lrcorner$

*Proof:* If  $(Tx, x) = 0$ , then  $(Tx, y) + (Ty, x) = 0$ , so  $-i(Tx, y) + i(Ty, x) = 0$ , solving  $(Tx, y) = 0$  for all  $x, y$ , so  $T = 0$ .  $\square$

**Prop.(12.9.3.6)[Normal Operators].**

1. An operator is normal iff  $\|Tx\| = \|T^*x\|$ . So  $N(T) = N(T^*)$  thus  $\sigma_p(T^*) = \overline{\sigma_p(T)}$ , and  $R(T)$  is dense iff  $T$  is injective. And different eigenspaces are orthogonal.
2. An operator is unitary iff  $R(U) = H$  and  $\|Ux\| = \|x\|$  for every  $x$ . (Because an operator is defined by its value  $(Tx, y)$ ).

$\lrcorner$

*Proof:*  $\|Tx\|^2 = (T^*Tx, x)$ ,  $\|T^*x\|^2 = (TT^*x, x)$ , and they are equal iff  $T, T^*$  commutes by(12.9.3.5). In particular, for different eigenvectors,  $\alpha(x, y) = (Tx, y) = (xT^*y) = (x, \bar{\beta}y) = \beta(x, y)$ .

For unitary, one way is obvious, for the other, if  $\|Ux\| = \|x\|$ , then  $(U^*Ux, x) = (x, x)$ , so  $U^*U = id$  by(12.9.3.5), and  $U$  is a bijection. So it is invertible.  $\square$

**Cor.(12.9.3.7).** For a normal operator  $T$  on a Hilbert space  $T$  is invertible iff there is a  $\delta$  that  $\|Tx\| = \|T^*x\| \geq \delta\|x\|$ .  $\lrcorner$

*Proof:*  $T$  is injective iff  $R(T)$  is dense, and if  $\|Tx\| = \|T^*x\| \geq \delta\|x\|$ , then  $R(T)$  is closed by(4.4.8.30), so it is invertible by Banach theorem.  $\square$

**Prop.(12.9.3.8).** If  $T$  is normal, then

1.  $\|T\| = \sup\{|(Tx, x)| \mid \|x\| = 1\}$ .
2.  $T$  is self-adjoint iff  $\sigma(T)$  is real.
3.  $T$  is unitary iff  $|\sigma(T)| = 1$ .

$\lrcorner$

*Proof:* For 1,  $\|T\| = \rho(T) = \|z_0\|$  for some  $z_0 \in \rho(T)$  by Naimark(14.1.1.3), then Urysohn lemma to show  $E(U) \neq 0$  for a open  $U$  near  $x$ (because otherwise there is a continuous function supported in  $U$  that are mapped to 0), then there are  $\|x_0\| = 1$  that  $E(U)x_0 = x_0$ .

Consider now  $f = (z - z_0)i_U(z)$ , then  $f(T)(x_0) = Tx_0 - \lambda_0x_0$ , so

$$(Tx_0, x_0) - \lambda_0 = |(f(T)x_0, x_0)| \leq \|f(T)\| = \|f\| \leq \varepsilon$$

This shows that  $\|T\| = \sup\{|(Tx, x)| \mid \|x\| = 1\}$ .

For 2, 3, by generalized symbolic calculus(12.9.3.3),  $\hat{T} = \lambda$  on  $\sigma$  and  $\hat{T}^* = \bar{\lambda}$  on  $\sigma$ , so they are equal iff  $\sigma(T)$  is real, and  $TT^* = I$  iff  $\lambda\bar{\lambda} = 1$  on  $\sigma(T)$ .  $\square$

**Prop. (12.9.3.9) [Decomposition of Operators].** For  $\mathcal{H} \in \mathcal{HilbSpa}$ , every operator  $S \in B(\mathcal{H})$  is a linear combination of two self-adjoint operator and a linear combination of four unitary operator.  $\lrcorner$

*Proof:* The first assertion is easy as  $S = (S + S^*)/2 + (S - S^*)/2$ . Now any self-adjoint operator is a multiple of a self-adjoint operator of norm  $\|S\| \leq 1$ , so  $1 - S^2$  is positive, and we have  $S = \frac{1}{2}(f_+(S) + f_-(S))$ , where  $f_{\pm}(s) = s \pm i\sqrt{1 - s^2}$ .  $\square$

**Prop. (12.9.3.10) [Fuglede].** If  $N_1$  and  $N_2$  are normal operators and  $A$  is a bounded linear operator on a Hilbert space such that  $N_1 A = A N_2$ , then  $N_1^* A = A N_2^*$ .  $\lrcorner$

*Proof:* For any  $S \in B(H)$ ,  $\exp(S - S^*)$  is unitary thus  $\|\exp(S - S^*)\| = 1$ ,  $\exp(N_1)A = A\exp(N_2)$ . Because  $\exp(M)T = T\exp(N)$ , if we let  $U_1 = \exp(M^* - M)$ ,  $U_2 = \exp(N - N^*)$ , then

$$\|\exp(N_1^*)T\exp(-N_2^*)\| = \|U_1 T U_2\| \leq \|T\|,$$

because  $\lambda N_i$  is normal. Now

$$\|\exp(\lambda N_1^*)T\exp(-\lambda N_2^*)\| = \|U_1 T U_2\| \leq \|T\|$$

also holds, thus by Liouville,  $\exp(\lambda N_1^*)T\exp(-\lambda N_2^*) = T$ . Compare the coefficients of  $\lambda$ , we get the result.  $\square$

**Prop. (12.9.3.11).** An operator  $T \in B(H)$  has the same spectrum w.r.t all the closed  $B^*$ -algebras of  $B(H)$  containing it.  $\lrcorner$

*Proof:* If  $T$  is invertible, because  $TT^*$  is self-adjoint thus has real spectrum (12.9.3.8) so doesn't separate  $\mathbb{C}$  thus it is invertible in any closed  $B^*$ -algebra of  $B(H)$  (12.9.1.12). so does  $T^{-1} = T^*(TT^*)^{-1}$ .  $\square$

**Prop. (12.9.3.12).** For  $T$  normal and  $E$  its spectral decomposition, then if  $f \in C(\sigma(T))$  and  $\omega_0 = f^{-1}(0)$ , then  $N(f(T)) = R(E(\omega_0))$ .  $\lrcorner$

*Proof:*  $\chi_{\omega_0} f = 0$ , so  $f(T)R(E(\omega_0)) = 0$ , and if we let  $\omega_n = f^{-1}([1/(n-1), 1/n])$ , and let  $f_n(\lambda) = 1/f(\lambda)\chi_{\omega_n}$ , then  $f_n(T)f(T) = E(\omega_n)$ , so if  $f(T) = 0$ , then  $E(\omega_n)x = 0$ , so countable additivity shows that  $E(\sigma \setminus \omega_0)x = 0$ , so  $E(\omega_0)x = x$ . These shows the desired result.  $\square$

**Cor. (12.9.3.13).**

1.  $N(T - \lambda I) = R(\{\lambda\})$ .
2. every isolated point of  $\sigma(T)$  is point spectrum, because this point is open thus is  $E(\{x\}) \neq 0$  by Urysohn lemma.
3. if  $\sigma(T)$  is countable, then every  $x \in H$  has a unique orthogonal decomposition  $x = \sum E(\lambda_i)x$  and  $T(E(\lambda_i)x) = \lambda_i E(\lambda_i)x$ .

$\lrcorner$

**Prop. (12.9.3.14) [Normal Compact Operator].** A normal operator  $T \in B(H)$  is compact iff  $\sigma(T)$  has no limit point except possibly 0 and  $\dim N(T - \lambda I) < \infty$  for  $\lambda \neq 0$ .

In particular, a normal compact operator is a limit of f.d. operators  $\lrcorner$

*Proof:* One direction is general, by (12.8.5.9), for the other, it is a limit of operators of finite dimensional range by general symbolic calculus (12.9.3.3).  $\square$

**Cor. (12.9.3.15) [Spectral Theorem].** A compact normal operator (in particular a normal operator on a f.d linear space) is unitarily diagonalizable.  $\lrcorner$

*Proof:* it suffices to find a basis of eigenvectors, but this is easy, just by (12.9.3.13).  $\square$

**Cor. (12.9.3.16) [Hilbert-Schmidt].** For a self-adjoint compact operator  $A$  on a Hilbert space  $H$ , there is a set of orthonormal basis that  $A$  is diagonal on it. And of course, its eigenvalues are real and can only converges to 0 (12.9.3.8).  $\lrcorner$

**Prop. (12.9.3.17).** For a normal compact operator  $T \in L(H)$ , then:

1.  $T$  has an eigenvalue  $|\lambda|$  that  $|\lambda| = \|T\|$ .
2.  $f(T)$  is compact if  $f \in C(\sigma(T))$  and  $f(0) = 0$ .
3.  $f(T)$  is not compact if  $f \in C(\sigma(T))$  and  $f(0) \neq 0$  and  $\dim H = \infty$ .

$\lrcorner$

*Proof:* 1: The spectrum of maximal norm is isolated (12.8.5.9) hence a point spectrum by (12.9.3.13). And  $|\lambda| = \|T\|$  by symbolic calculus (12.9.3.3).

2: Cf. [Rudin P330].

3: The 2 sill show that  $f(0)I - f$  is compact, If  $f$  is compact, then  $f(0)I$  is compact, so  $\dim H < \infty$  (12.8.5.3).  $\square$

**Prop. (12.9.3.18) [Freudenthal Spectral Theorem].**  $\lrcorner$

**Prop. (12.9.3.19) [Positive Equivalent Definition].** A  $T \in L(H)$  is positive, i.e.  $T = T^*$  and  $\sigma(T) \subset \mathbb{R}_{\geq 0}$  iff  $(Tx, x) \geq 0$ .  $\lrcorner$

*Proof:* If  $(Tx, x) \geq 0$ , then  $(Tx, x) = (x, Tx) = (T^*x, x)$ , so  $T = T^*$  by (12.9.3.5), so  $\sigma(T)$  is real (12.9.3.8), and for  $\lambda > 0$ ,

$$\lambda \|x\|^2 = (\lambda x, x) \leq ((T + \lambda I)x, x) \leq \|(T + \lambda I)x\| \|x\|,$$

so  $T + \lambda I$  is invertible by (12.9.3.7), so  $\sigma(T) \subset \mathbb{R}_{\geq 0}$ .

Conversely, if  $T$  is positive, then it is normal, so  $(Tx, x) = \int_{\sigma(T)} \lambda dE_{x,x} \geq 0$ .  $\square$

**Prop. (12.9.3.20) [Polar Decomposition].**

1. Every positive operator  $T$  has a positive square root, which is invertible if  $T$  is.
2. Polar decomposition exists in  $B(H)$ : Any  $T \in L(H)$  invertible has a unique decomposition  $T = UP$  where  $U$  is unitary and  $P$  is positive. And  $\|Px\| = \|Tx\|$  for all  $x$ .
3. Any normal operator has commuting decomposition  $UP$ , where  $U, P, T$  commutes.

$\lrcorner$

*Proof:* 1: Use general symbolic calculus, then  $S = \sqrt{\lambda}(T)$  is the square root of  $T$ . If  $T$  is invertible, then  $S^{-1} = T^{-1}S$ .

2:  $(T^*Tx, x) = (Tx, Tx) \geq 0$ , so  $T^*T$  is positive (12.9.3.19), so let  $P = \sqrt{T^*T}$ , then it is also invertible, and  $U = TP^{-1}$  is unitary.

3: Use general symbolic calculus, let  $p(\lambda) = |\lambda|$ ,  $u(\lambda) = \lambda/|\lambda|$  if  $\lambda \neq 0$ , and  $u(0) = 0$ . Then  $T = UP$ , and they are commutative.  $\square$

**Cor. (12.9.3.21) [Similar Normal Operator].** Similar normal operators are unitarily equivalent.  $\lrcorner$

*Proof:* It suffices to show that if  $M = TNT^{-1}$ , and  $T = UP$  is the polar decomposition, then  $M = UNU^{-1}$ . Fuglede (12.9.3.10) shows  $M^*T = TN^*$ , so  $NP^2 = NT^*T = T^*MT = T^*TN = P^2N$ , so  $N$  commutes with any functions  $f(P)$ , in particular  $P$ . Hence  $M = (UP)N(UP)^{-1} = UNU^{-1}$ .  $\square$

#### 4 Hilbert-Schmidt Operators & Trace Classes

References are [Trace Classes and Hilbert-Schmidt Operators].

In this subsection, all Hilbert spaces are separable.

**Def. (12.9.4.1) [Hilbert-Schmidt Operator].** Let  $\mathcal{H}, \mathcal{K}$  be Hilbert spaces and  $T \in L(\mathcal{H}, \mathcal{K})$ . Then for any orthonormal basis  $\{e_k\}$  of  $\mathcal{H}$  and  $\{f_k\}$  of  $\mathcal{K}$ ,

$$\sum_j \|Te_j\|_{\mathcal{K}}^2 = \sum_j \|T^*f_j\|_{\mathcal{H}}^2.$$

In particular, this value is independent of the basis  $\{e_k\}$  chosen.

$T$  is called a **Hilbert-Schmidt** iff

$$\|T\|_{\text{H-S}} = \left( \sum_j \|Te_j\|_{\mathcal{K}}^2 \right)^{1/2} < \infty$$

for some/all basis  $e_j$  of  $\mathcal{H}$ . The space of all Hilbert-Schmidt maps from  $\mathcal{H}$  to  $\mathcal{K}$  is denoted by  $S_2(\mathcal{H}, \mathcal{K})$ .  $\lrcorner$

*Proof:*

$$\sum_i \|Te_i\|^2 = \sum_i \sum_j |(Te_i, f_j)|^2 = \sum_i \sum_j |(T^*f_j, e_i)|^2 = \sum_j \|T^*f_j\|^2.$$

□

**Cor. (12.9.4.2) [Properties of  $S_2(\mathcal{H}, \mathcal{K})$ ].**

- If  $A \in S_2(\mathcal{H}, \mathcal{K})$  then  $A^* \in S_2(\mathcal{K}, \mathcal{H})$  with the same HS-norm.
- For  $A \in S_2(\mathcal{H}, \mathcal{K})$ ,  $\|A\| \leq \|A\|_{\text{H-S}}$ .
- $S_2(\mathcal{H}, \mathcal{K})$  is a complete in the HS-norm. And it is moreover Hilbert space because we can define

$$(A, B)_{\text{H-S}} = \sum_{\alpha} (A^* B e_{\alpha}, e_{\alpha}).$$

- If  $\mathcal{H}_1, \mathcal{K}_1$  are separable Hilbert spaces and  $T \in S_2(\mathcal{H}, \mathcal{K})$ ,  $A \in \mathcal{L}(\mathcal{H}_1, \mathcal{H})$ ,  $B \in \mathcal{L}(\mathcal{K}, \mathcal{K}_1)$ , then  $BT A \in S_2(\mathcal{H}_1, \mathcal{K}_1)$ .  $\lrcorner$

*Proof:* 1 follows from (12.9.4.1). 2 is because we can extend  $u$  to a basis of  $\mathcal{H}$ .

3:  $\|-\|_{\text{H-S}}$  is clearly a semi-norm (12.7.1.8), and it is a norm by item 2. To show the completeness, if  $A_j$  is an HS-Cauchy sequence, then it is a Cauchy sequence in the operator norm, thus converges to an operator  $A$ . Then for any  $\varepsilon$ , there is an  $N$  that for any  $j, k \geq N$ ,  $\|A_j - A_k\|_{\text{H-S}} \leq \varepsilon$ . This implies

$$\sum_{\alpha \in S} \|(A_k - A_j)e_{\alpha}\|_{\mathcal{K}}^2 \leq \varepsilon^2$$

for any finite subset  $S \subset I$ . Then letting  $k \rightarrow \infty$  and then letting  $S$  be any subset, we get  $\|A - A_j\|_{\text{H-S}} \leq \varepsilon$ . Thus  $A$  is Hilbert-Schmidt and  $A_j \rightarrow A$  in HS-norm.

4: it is clear that  $\|BT\|_{\text{H-S}} \leq \|B\| \|T\|_{\text{H-S}}$ , and use the transpose invariance of HS-norms and operator norms (12.9.2.9). □

**Prop. (12.9.4.3) [Hilbert-Schmidt Operators are Compact].** If  $A \in S_2(\mathcal{H}, \mathcal{K})$  and  $\{f_k\}$  is an orthonormal basis of  $\mathcal{K}$ , and we denote  $\text{pr}_n$  as the projection of  $\mathcal{K}$  onto the span of  $\{f_1, \dots, f_n\}$ , then

$$\|\text{pr}_n A - A\|_{\text{H-S}} \rightarrow 0.$$

In particular,  $A$  is compact, by (12.9.4.2) and (12.8.5.3).  $\lrcorner$

*Proof:* By (12.9.4.2), it suffices to show that  $\|A^* \pi_n - A^*\|_{\text{H-S}} \rightarrow 0$ . But this norm is just  $\sum_{k>N} \|A^* f_k\|_{\mathcal{H}}^2$ , which converges to 0.  $\square$

**Prop. (12.9.4.4) [Integral Operator is Hilbert-Schmidt].** Let  $\Omega$  be a  $\sigma$ -finite measure space and  $K(x, y) \in L^2(\Omega \times \Omega)$ , then the operator  $Lu(x) = \int_{\Omega} K(x, y)u(y)dy$  defined in (12.8.5.2) is a Hilbert-Schmidt operator on  $L^2(\Omega)$ . In fact,  $\|L\|_2 = \|K\|_{L^2}$ .  $\lrcorner$

*Proof:* Let  $\mathcal{E}$  be an Hilbert basis of  $L^2(\Omega)$ , then we have

$$\|L\|_2^2 = \sum_{f_1, f_2 \in \mathcal{E}} |(Lf_1, f_2)|^2 = \sum_{f_1, f_2 \in \mathcal{E}} \left| \int_X \int_X \overline{f_2(y)} K(x, y) f_1(x) dx dy \right|^2 = \sum_{f_1, f_2 \in \mathcal{E}} (K, f_1 \otimes f_2)^2.$$

But by (12.3.6.5),  $\{f_i \otimes f_j\}$  form a Hilbert Basis for  $L^2(\Omega \times \Omega)$ , so the equation equals  $\|K\|_2^2$ .  $\square$

### Trace Classes

**Def. (12.9.4.5) [Trace Classes].** Let  $\mathcal{H}$  be a Hilbert space,  $\{e_i\}, \{f_i\}$  are two orthonormal basis,  $A \in B(\mathcal{H})$ . Let  $|A| = (A^*A)^{1/2}$  which is positive, then

$$\sum_i (|A|e_i, e_i) = \sum_i (|A|^{1/2}e_i, |A|^{1/2}e_i) = \sum_i \| |A|^{1/2}f_i \|^2 = \sum_i (|A|f_i, f_i)$$

by (12.9.4.1), thus we can define  $\|A\|_1 = \sum_i (|A|e_i, e_i)$ , and say  $A$  is a **trace class** if  $\|A\|_1 < \infty$ . The space of trace classes is denoted by  $S_1(\mathcal{H})$ .

A trace-class  $A$  is clearly compact as  $|A|$  is a limit of f.d. range operators. (Use diagonalization, then there are only countably many eigenvectors of  $|A|$ ).  $\lrcorner$

**Prop. (12.9.4.6).** If  $A \in \mathcal{B}(\mathcal{H})$ , then the following are equivalent:

- $A \in S_1(\mathcal{H})$ .
- $|A|^{1/2} \in S_2(\mathcal{H})$ .
- $|A|$  is a product of two elements in  $S_2(\mathcal{H})$ .
- $A$  is a product of two elements in  $S_2(\mathcal{H})$ .

$\lrcorner$

*Proof:*  $1 \rightarrow 2 \rightarrow 3$  is clear, for  $3 \rightarrow 4$ : if  $|A| = TS$ , then by polar decomposition  $A = U|A| = (UT)S$ , and  $UT \in S_2(\mathcal{H})$  by (12.9.4.2), so  $A$  is a product of two elements in  $S_2(\mathcal{H})$ .

$4 \rightarrow 3$  is similar to  $3 \rightarrow 4$ .

$3 \rightarrow 1$ : if  $A = BC$  where  $B, C \in S_2(\mathcal{H})$ , then  $B^* \in S_2(\mathcal{H})$  also by (12.9.4.2), and

$$\|A\|_1 = \sum_i (Ae_i, e_i) = \sum_i (Ce_i, B^*e_i) \leq \sum_i \|Ce_i\| \|B^*e_i\| \leq \|C\|_2 \|B^*\|_2 < \infty$$

$\square$

**Lemma (12.9.4.7).** if  $T$  is a positive trace-class and  $S \in \mathcal{L}(\mathcal{H})$ , then if  $x_i$  is an orthonormal basis of  $\mathcal{H}$ , then

$$\sum_i (STx_i, x_i) \leq \|S\| \|T\|_1$$

is absolutely convergent, and is independent of the basis chosen.  $\lrcorner$

*Proof:* Let  $e_i$  be the basis of eigenvectors of  $T$  of eigenvalues  $\lambda_i > 0$ , then  $\sum_i \lambda_i < \infty$  by (12.9.4.6), and

$$(STx_i, x_i) = \sum_j (x_i, e_j)(STe_j, x_i) = \sum_j \lambda_j (x_i, e_j)(Se_j, x_i)$$

And

$$\sum_i \sum_j \lambda_j |(x_i, e_j)(Se_j, x_i)| \leq \sum_j \lambda_j \|e_j\| \|Se_j\| \leq \|S\| \sum \lambda_\alpha < \infty.$$

Moreover:

$$\sum_i (STx_i, x_i) = \sum_i \sum_j ((x_i, e_j)STe_j, x_i) = \sum_i \sum_j (STe_j, (e_j, x_i)x_i) = \sum_j (STe_j, e_j).$$

□

**Prop. (12.9.4.8) [Singular Trace].** If  $\mathcal{H} \in \mathcal{HilbSpa}$  with an orthonormal Hilbert basis  $\{x_\alpha\}$  and  $T \in S_1(\mathcal{H})$ , then  $\sum (Tx_\alpha, x_\alpha)$  absolutely converges, and is independent of the basis chosen, called the **singular trace**  $\text{tr}T$  of  $T$ . The singular trace is a positive definite linear functional on  $S_1(\mathcal{H})$ .  $\lrcorner$

*Proof:* Use polar decomposition  $T = U|T|$  (12.9.3.20) and notice  $|T|$  is a positive trace class (12.9.4.6) and then use (12.9.4.7).  $\square$

**Prop. (12.9.4.9) [Trace of Integral Operators].** Let  $A, B$  be  $L^2$  integral operators on a  $\sigma$ -finite measure space  $\Omega$  with kernel  $K_1(x, y), K_2(x, y) \in L^2(\Omega \times \Omega)$ , then  $AB$  is also an integral operator with kernel

$$\int K_1(x, z)K_2(z, y)dz,$$

and

$$\text{tr}(AB) = \int \int K_1(x, y)K_2(y, x)dxdy.$$

$\lrcorner$

*Proof:* The formula for integral kernel is an immediate consequence of Fubini-Tonelli theorem. For the trace, observe that  $A^*$  is the integral operator with kernel  $\overline{K_1(y, x)}$  (12.9.2.10), thus

$$\begin{aligned} \text{tr}(AB) &= \sum_i (ABe_i, e_i) = \sum_i (Be_i, A^*e_i) \\ &= \sum_i \sum_k (e_k, A^*e_i)(Be_i, e_k) \\ &= \sum_i \sum_k (e_k \otimes \overline{e_i}, K_1^*)(K_2, e_k \otimes \overline{e_i}) \\ &= (K_2, K_1^*) = \int \int K_1(x, y)K_2(y, x)dxdy \end{aligned}$$

as  $\{e_i \otimes \overline{e_k}\}$  is a Hilbert basis for  $\Omega \times \Omega$  (12.3.6.5).  $\square$

**Prop. (12.9.4.10) [Properties of Trace Classes].**

1.  $S_1(\mathcal{H})$  is a two-sided  $*$ -ideal of  $\mathcal{L}(\mathcal{H})$ .
2.  $\|\cdot\|_1$  is a norm on  $S_1(\mathcal{H})$ .
3. If  $T \in S_1(\mathcal{H})$ , then  $\text{tr}(T^*) = \overline{\text{tr}(T)}$ .
4. For any  $T \in S_1(\mathcal{H})$  and  $S \in L(\mathcal{H})$ ,  $\text{tr}(ST) = \text{tr}(TS)$ , and  $|\text{tr}(ST)| \leq \|S\| \|T\|_1$ . In particular the singular trace is a bounded linear functional on  $S_1(\mathcal{H})$ .

□

*Proof:* Let  $S, T \in S_1(\mathcal{H})$ ,  $S = V|S|$ ,  $T = W|T|$ ,  $S + T = X|S + T|$  where  $V, W, X$  are unitary, then  $|S + T| = X^*(S + T)$  is positive compact, so it has an orthonormal eigenbasis  $e_n$  by (12.9.3.16), so

$$\sum (|S + T|x_i, x_i) = \sum (X^*V|S|x_i, x_i) + \sum (X^*W|T|x_i, x_i) \leq \|S\|_1 + \|T\|_1$$

by (12.9.4.7). So  $S + T$  is a trace class, and  $\|S + T\|_1 \leq \|S\|_1 + \|T\|_1$ .

Now if  $U$  is unitary and  $T \in S_1(\mathcal{H})$ , then  $(UT)^*UT = T^*T$ , so  $UT$  is a trace class, and  $(TU)^*TU = U^{-1}T^*U$  has  $|TU| = U^{-1}|T|U$ , so  $TU$  is also a trace class. Moreover,  $\text{tr}(TU) = \sum (TUx_i, x_i) = \sum (UTUx_i, Ux_i) = \text{tr}(UT)$ .

Then notice very  $S \in L(\mathcal{H})$  is a linear combination of four unitary operator (12.9.3.9), so the proposition is true, and if  $T$  is a trace class, then  $T = V|T|$ , and  $T^* = |T|V^*$  is also a trace class.

4:  $|\text{tr}(ST)| \leq \|SV\| \|T\|_1 = \|S\| \|T\|_1$  by (12.9.4.7). □

**Prop. (12.9.4.11) [Trace Classes form a Banach Space].** Let  $S_0(\mathcal{H})$  be the space of operators of f.d. range, then the map

$$\rho : S_1(\mathcal{H}) \rightarrow S_0(\mathcal{H})^* : \rho(A) : C \mapsto \text{tr}(CA)$$

is an isometric isomorphism. In particular,  $S_1(\mathcal{H})$  is a Banach space, by (12.7.3.1). □

*Proof:* Clearly  $\rho$  is a linear map as singular trace is. For  $T \in S_1(\mathcal{H})$ ,  $\|\rho(T)\| \leq \|T\|_1$  by (12.9.4.10).

If  $\Phi \in S_0(\mathcal{H})^*$ ,  $g, h \in \mathcal{H}$ , consider  $g \otimes h^* \in S_0(\mathcal{H})$  that  $g \otimes h^*(v) = (v, h)g$ , then  $B(g, h) = \Phi(g \otimes h^*)$  is a sesquilinear form on  $H$  that is bounded by  $\|\Phi\|$ . Thus by Lax-Milgram (12.9.2.7), there is a unique  $T \in \mathcal{B}(\mathcal{H})$  that  $B(g, h) = (g, Th)$ .

Now let  $A = T^*$  and let  $A = U|A|$  be the polar decomposition,  $\mathcal{E}$  an orthonormal basis of  $\mathcal{H}$  and  $S \subset \mathcal{E}$  a finite subset, define

$$C_S = \left( \sum_{e \in S} e \otimes e^* \right) U^* = \sum_{e \in S} e \otimes (Ue)^*.$$

Then  $C_S$  is of f.d. and  $\|C_S\| \leq 1$ . And:

$$\sum_{e \in S} (|A|e, e) = \sum_{e \in S} (U^*Ae, e) = \sum_{e \in S} (e, T Ue) = \sum_{e \in S} B(e, Ue) = \sum_{e \in S} \Phi(e \otimes (Ue)^*) = \Phi(C_S).$$

So  $\|A\|_1 \leq \|\Phi\|$ .

If  $C$  is any operator of f.d. range that  $C = \oplus g_k \otimes h_k^*$ , then

$$\Phi(C) = \sum \Phi(g_k \otimes h_k^*) = \sum B(g_k, h_k) = \sum (Ag_k, h_k) = \sum \text{tr}(A(g_k \otimes h_k^*)) = \text{tr}(AC) = \rho(A)(C)$$

so the image is  $A$  is just  $\Phi$ . This shows that  $\rho$  is surjective and moreover  $\|A\|_1 = \|\rho(A)\|$ , so we are done. □

### Tensor Product of Hilbert Spaces

References are [Fol16].

**Def. (12.9.4.12) [Hilbert-Schwartz Tensor Product].** For  $\mathcal{H}_1, \mathcal{H}_2 \in \mathcal{HilbSpa}$ , the **Hilbert space dual**  $\mathcal{H}_1^*$  is defined to be  $\mathcal{H}_1^\vee = S_2(\mathcal{H}_1, \mathbb{C}) \in \mathcal{HilbSpa}$  (12.9.4.2), and the **tensor product of Hilbert spaces** is defined to be

$$\mathcal{H}_1 \otimes \mathcal{H}_2 = S_2(\mathcal{H}_2^\vee, \mathcal{H}_1) \in \mathcal{HilbSpa} \text{ (12.9.4.2)}.$$

For  $u \in \mathcal{H}_1, v \in \mathcal{H}_2$ , we can define  $u \otimes v \in \mathcal{H}_1 \otimes \mathcal{H}_2$  as

$$(u \otimes v)(\lambda) = \lambda(u)v.$$

┘

**Prop. (12.9.4.13).** If  $\{u_\alpha\}_{\alpha \in I}$  is an orthonormal basis of  $\mathcal{H}_1$  and  $\{v_\beta\}_{\beta \in J}$  is an orthonormal basis of  $\mathcal{H}_2$ , then

$$\{u_\alpha \otimes v_\beta\}_{\alpha \in I, \beta \in J}$$

is an orthonormal basis of  $\mathcal{H}_1 \otimes \mathcal{H}_2$ .

┘

*Proof:* Cf. [Fol16]P281. □

**Prop. (12.9.4.14) [Non-Existence of Tensor Product of Hilbert Spaces].** If  $\mathcal{H}, \mathcal{K} \in \mathcal{HilbSpa}$  are two infinite dimensional separable Hilbert spaces, then there doesn't exist a tensor product of  $\mathcal{H}, \mathcal{K} \in \mathcal{HilbSpa}$  satisfying the universal property. ┘

*Proof:* We firstly prove the Hilbert-Schwartz tensor product  $\mathcal{H} \otimes \mathcal{K}$  (12.9.4.12) doesn't satisfy the universal property:

We may identify  $\mathcal{K}$  with  $\mathcal{H}^*$  and identify  $\mathcal{H} \otimes \mathcal{K}$  with  $S_2(\mathcal{H})$  (12.9.4.12). Then there is a bilinear map  $\mathcal{H} \otimes \mathcal{H}^\vee \rightarrow \mathbb{C} : (u, \lambda) \mapsto \lambda(u)$ . This map induces a map  $\mathcal{H} \otimes \mathcal{H}^\vee \rightarrow \mathbb{C}$  with is the trace map. But there are clearly elements in  $\mathcal{H} \otimes \mathcal{H}^\vee$  that the map cannot be defined continuously: Let  $\{e_i\}$  be a complete orthonormal basis of  $\mathcal{H}$ , then the trace of the element

$$\sum_{n \in \mathbb{Z}_+} \frac{1}{n} e_i \otimes e_i^\vee \in \mathcal{H} \otimes \mathcal{H}^\vee$$

cannot be defined.

Next we prove that no other Hilbert spaces  $X$  can satisfy the universal property. If  $X$  does, then there is a unique map  $T : X \rightarrow \mathcal{H} \otimes \mathcal{H}^\vee$  by universal property, and thus  $\mathcal{H} \otimes \mathcal{H}^* \rightarrow X$  is injective. And clearly  $\mathcal{H} \otimes \mathcal{H}^*$  is dense in  $X$ .

Let  $T^* : X \rightarrow \mathcal{H} \hat{\otimes} \mathcal{H}^*$  be the adjoint, then for any  $v, w \in \mathcal{H}$  and  $\lambda, \mu \in \mathcal{H}^*$ , we have

$$\langle v \otimes \lambda, T^*(w \otimes \mu) \rangle_X = \langle T(v \otimes \lambda), w \otimes \mu \rangle = \langle v \otimes \lambda, w \otimes \mu \rangle.$$

But  $v$  and  $\lambda$  are arbitrary, thus  $T^*(w \otimes \mu)$  is a multiple of  $w \otimes \mu$ . But  $w$  and  $\mu$  are arbitrary, and we can take  $w \otimes \mu = (v + w) \otimes (\mu + \lambda)$ , so  $T^*$  acts as a constant on  $V \otimes V^*$ . Thus the norm on  $X$  and  $\mathcal{H} \hat{\otimes} \mathcal{H}^*$  differ by a constant, thus  $X$  cannot have the tensor product property. □

**Prop. (12.9.4.15) [Tensor Product of Operators].** Let  $\mathcal{H}_1, \mathcal{H}_2 \in \mathcal{HilbSpa}$  and  $S, S' \in B(\mathcal{H}_1), T, T' \in B(\mathcal{H}_2)$ , then we can define

$$(S \otimes T)f = TfS^\vee, \text{ where } f \in S_2(\mathcal{H}_2^\vee, \mathcal{H}_1).$$

- $S \otimes T \in B(\mathcal{H}_1 \otimes \mathcal{H}_2)$  and  $\|S \otimes T\| = \|S\| \|T\|$ .
- $(S \otimes T)(u \otimes v) = Su \otimes Tv$  for any  $u \in \mathcal{H}_1, v \in \mathcal{H}_2$ .
- $(S \otimes T)(S' \otimes T') = (SS') \otimes (TT')$ .
- $(S \otimes T)^* = S^* \otimes T^*$ .
- If  $S$  and  $T$  are unitary, then so is  $S \otimes T$ .

┘

## 12.10 Harmonic Analysis on Locally Compact Groups

*“Harmonic analysis, in the broadest sense refers to a general principle in mathematics that links geometric objects with spectral objects.”*

–Arthur

References are [Bum97, Fol16].

All representations in this section are assumed to be over  $\mathbb{C}$ .

**Notation (12.10.0.1).**

- Use notations on Topology defined in [Topology I](#).
- Use notations on Representations defined in [Smooth Representations](#).
- Let  $G \in \text{LCG}$ .
- Let  $X \in \text{LCH}$ .

┘

### 1 Locally Compact Groups

**Def. (12.10.1.1) [Left and Right Regular Actions].** The **left regular action** and **right regular action** of  $G$  on  $C_c(G)$  are defined as follows:  $L_y f(x) = f(y^{-1}x)$ ,  $R_y f(x) = f(xy)$ .

More generally, if  $G$  acts on  $X$  on the left and  $X$  has a left- $G$ -invariant Radon measure, then  $G$  acts on  $C_c(X)$  by  $L_g(f)(x) = f(g^{-1}x)$ , and  $R_g(f)(x) = f(xg)$ . ┘

**Prop. (12.10.1.2) [Translation is Continuous].** Situation as in (12.10.1.1), then any  $f \in C_c(X)$  is left and right uniformly continuous. Equivalently,  $G \rightarrow C_c(G) : y \mapsto R_y(f)$  and  $y \mapsto L_y(f)$  are continuous group homomorphisms from  $G$  to  $C_c(G)$ . ┘

*Proof:* Cf. [Folland Abstract Harmonic Analysis P38]. □

**Def. (12.10.1.3) [Involution].** For  $f \in C_c(G)$  or  $f \in L^p(G)$  for some  $p$ , let  $\tilde{f}(x) = \overline{f(x^{-1})}$ . ┘

**Prop. (12.10.1.4).**  $G$  is a normal topological space. ┘

*Proof:* Notice that by choosing a precompact symmetric open neighbourhood  $U$  of identity, there exists a  $\sigma$ -compact clopen subgroup  $H$ . So  $H$  can  $\sigma$ -locally refine every open cover, thus  $G$  can, too. So by (4.4.7.2)  $G$  is paracompact. As a topological group,  $G$  is regular, thus  $G$  is normal by (4.4.7.6). □

**Prop. (12.10.1.5).**  $G$  has a subgroup  $G_0$  that is clopen and  $\sigma$ -compact. ┘

*Proof:* Let  $U$  be a symmetric precompact nbhd of 1 in  $G$ , then let  $U_n = U^n$ , then  $\overline{U_n} \subset U_{n+1}$ , so let  $G_0 = \cup_n U_n = \cup \overline{U_n}$ , then it is open because each  $U_n$  does, and compact because each  $\overline{U_n}$  does. □

**Prop. (12.10.1.6).** If  $H \leq G$  is a locally compact subgroup, then  $H$  is closed in  $G$ . ┘

*Proof:* By hypothesis there exists an open nbhd  $U$  of  $e \in G$  that  $U \cap H$  has compact closure  $K \subset H$ . But then  $K$  is also compact in  $G$  thus closed. So  $K$  is the closure of  $U \cap H$  in  $G$ . Choose a symmetric open nbhd  $V$  of  $e \in G$  that  $VV \subset U$ , and suppose  $x \in \overline{H}$ , then  $x^{-1} \in \overline{H}$  and  $Vx^{-1} \cap H \neq \emptyset$ . Let  $y \in Vx^{-1} \cap H$ . For any nbhd  $U_i$  of  $e \in G$ , choose  $x' \in xU_i \cap H$ , then  $yx' = yx(x^{-1}x') \in yxU_i$  and also  $yx' \in H$ ,  $yx' \in Vx^{-1}xV \subset U$ . By arbitrariness of  $U_i$ , this means  $yx \in \overline{U \cap H} = K \subset H$ , thus  $x \in H$ , and  $H$  is closed. □

### Integration on Locally Compact Groups

**Def. (12.10.1.7) [Positive Linear Functional].** A **positive linear functional** on  $X$  is a linear functional  $I$  on  $C_c(X)$  that  $I(f) \geq 0$  whenever  $f \geq 0$ . How is this definition compatible with that of (14.1.1.10)?  $\lrcorner$

**Lemma (12.10.1.8) [Positive Linear Functional is Continuous].** A positive linear functional (12.10.1.7)  $I$  on  $C_c(X)$  is automatically continuous, where  $C_c(X)$  is given compact convergence topology as in (12.8.2.1).  $\lrcorner$

*Proof:* We need to prove that for any compact subset  $K$  of  $X$ , there is a constant  $C_K$  that for any  $f \in C(G)$  with support in  $K$ , we have  $|I(f)| \leq C_K \|f\|_\infty$ .

Given any  $K$ , choose by Urysohn lemma a  $\varphi \in C_c(X, [0, 1])$  that  $\varphi = 1$  on  $K$ , so if  $\text{Supp } f \subset K$ , then  $|f| \leq \|f\|_\infty \varphi$ , thus the positivity of  $I$  shows that  $|I(f)| \leq I(\varphi) \|f\|_\infty$ .  $\square$

**Prop. (12.10.1.9) [Riesz-Markov-Kakutani Representation Theorem].**

- If  $I$  is a positive linear functional (12.10.1.7) on  $C_c(X)$ , there is a unique Radon measure  $\mu$  on  $X$  such that  $I(f) = \int f d\mu$ . Moreover,

$$\mu(U) = \sup\{I(f) : f < U\}, \text{ where } U \subset X \text{ open,}$$

$$\mu(K) = \inf\{I(f) : f > \chi_K\}, \text{ where } K \subset X \text{ compact.}$$

- If  $I$  is a continuous linear functional on  $C_0(X)$ , there is a unique regular complex Borel measure  $\mu$  on  $X$  that  $I(f) = \int f d\mu$ .

In particular the space  $\text{Meas}(X)$  of Radon measures on  $X$  is the “positive part” of the the dual space of  $C_c(X)$ .  $\lrcorner$

*Proof:* Cf. [Real Analysis Folland P212].  $\square$

**Thm. (12.10.1.10) [Haar Measure].** A left (resp. right) **Haar measure** on an arbitrary  $G \in \text{TopGrp}$  is a non-zero Radon measure (12.3.1.22)  $\mu$  on  $G$  that satisfies  $\mu(xE) = \mu(E)$  (resp.  $\mu(Ex) = \mu(E)$ ). A Radon measure  $\mu$  is a Haar measure iff it satisfies  $\int L_y f d\mu = \int f d\mu$  for any  $f \in C_c^+(G)$  and  $y \in G$  (12.10.1.2).  $\lrcorner$

Then  $G$  possesses a left Haar measure  $\mu_G$  if  $G \in \text{LCG}$ , unique up to a scalar.  $\lrcorner$

*Proof:* If  $\mu$  is a Haar measure, then  $\int L_y f d\mu = \int f d\mu$  by approximation by simple functions (12.3.8.5). Conversely, if  $\int L_y f d\mu = \int f d\mu$  for any  $f \in C_c(G)$ , then it holds for all  $f \in C_c(G)$ , hence  $\mu(xE) = \mu(E)$  by Riesz-Markov-Kakutani representation theorem (12.10.1.9).

For  $f, \varphi \in C_c^+(G)$ , define  $(f : \varphi)$  to be the infimum of all finite sums  $\sum_{i=1}^n c_i$  that  $f \leq \sum_{i=1}^n c_i L_{x_i} \varphi$  for some  $x_1, \dots, x_n \in G$ . This makes sense because  $f$  has finite support so can be covered by f.m. translation of any open set. This quantity satisfies the following properties:

- $(f : \varphi) = (L_y f : \varphi)$  for any  $y \in G$ .
- $(f_1 + f_2 : \varphi) \leq (f_1 : \varphi) + (f_2 : \varphi)$ .
- $(cf : \varphi) = c(f : \varphi)$ .
- $(f_1 : \varphi) \leq (f_2 : \varphi)$  for  $f_1 \leq f_2$ .
- $(f : \varphi) \geq \|f\|_{\text{sup}} / \|\varphi\|_{\text{sup}}$ .
- $(f : \varphi) \leq (f : \psi)(\psi : \varphi)$  for any  $\psi \in C^+(G)$ .

Now choose a  $f_0 \in C_c^+(G)$  and define  $I_\varphi(f) = \frac{(f:\varphi)}{(f_0:\varphi)}$  for  $f, \varphi \in C_c^+(G)$ . Then  $I_\varphi$  is left-invariant, sub-additive, homogeneous of degree 1, and monotone. Moreover, it satisfies  $(f_0 : f)^{-1} \leq I_\varphi(f) \leq (f : f_0)$ .

Let  $X_f$  be the interval  $[(f_0 : f)^{-1}, (f : f_0)]$ , and let  $X = \prod_{f \in C_c^+(G)} X_f$ , then for each nbhd  $V$  of  $1 \in G$ , let  $K(V)$  be the closure in  $X$  of  $\{I_\varphi | \text{Supp}(\varphi) \subset V\}$ , then these sets satisfy finite intersection property. So by compactness, there is an  $I$  contained in every  $K(V)$ . Which means for any nbhd  $V$  of  $1 \in G$  and  $\varepsilon > 0$  and  $f_1, \dots, f_n \in C_c^+(G)$ , there exists  $\varphi \in C_c^+(V)$  that  $|I(f_i) - I_\varphi(f_i)| < \varepsilon$ . Then by some argument,  $I$  commutes with left translation, addition and multiplication by positive scalars. Now extend  $I$  to a positive linear functional on  $C_c(G)$ , and then use Riesz-Markov-Kakutani representation theorem(12.10.1.9) to finish.  $\square$

**Lemma (12.10.1.11).** For any  $f_1, f_2 \in C_c^+(G)$  and  $\varepsilon > 0$ , there is a neighborhood  $V$  of  $1 \in G$  that in the notation in the proof of(12.10.1.10),  $I_\varphi(f_1) + I_\varphi(f_2) \leq I_\varphi(f_1 + f_2) + \varepsilon$  whenever  $\text{Supp}(\varphi) \subset V$ .  $\lrcorner$

*Proof:* Let  $g \in C_c^+(G)$  that  $g = 1$  on  $\text{Supp}(f_1 + f_2)$  and  $\delta > 0$ , let  $h_i = f_i/(f_1 + f_2 + \delta g)$ , then  $h_i \in C_c^+(G)$  and there is a nbhd  $V$  of  $1 \in G$  s.t.  $|h_i(x) - h_i(y)| < \delta$  for  $i = 1, 2$  and  $y^{-1}x \in V$ . Take  $\varphi \in C_c^+(G)$  with  $\text{Supp}(\varphi) \subset V$ . If  $h \leq \sum c_i L_{x_i} \varphi$ , then

$$f_i(x) = h(x)h_i(x) = \sum c_j \varphi(x_j^{-1}x)h_i(x) \leq \sum c_j \varphi(x_j^{-1}x)[h_i(x_j) + \delta]$$

because whenever  $\varphi(x_j^{-1}x) \neq 0$ ,  $|h_i(x) - h_i(x_j)| < \delta$ . As  $h_1 + h_2 < 1$ ,

$$(f_1 : \varphi) + (f_2 : \varphi) \leq \sum c_j [h_1(x_j) + \delta] + \sum c_j [h_2(x_j) + \delta] \leq \sum c_j [1 + 2\delta]$$

which implies

$$I_\varphi(f_1) + I_\varphi(f_2) \leq (1 + 2\delta)I_\varphi(h) \leq (1 + 2\delta)[I_\varphi(f_1 + f_2) + \delta I_\varphi(g)].$$

Notice  $\delta$  is arbitrary, thus we can choose  $\delta$  small enough that the assertion is true.  $\square$

**Prop. (12.10.1.12).** If  $\mu$  is a left Haar measure on  $G$ , then for any open subset  $U$  of  $G$ ,  $\mu(U) > 0$ .  $\lrcorner$

*Proof:* By inner regularity,  $\mu(K) > 0$  for some compact subset  $K$ . Suppose  $\mu(U) = 0$  for an open subset  $U$ , then f.m. translates of  $U$  covers  $K$ , contradiction.  $\square$

**Cor. (12.10.1.13).** Let  $\mu$  be a left Haar measure on  $G$ , then

- $G$  is discrete iff  $\mu(\{e\}) > 0$ .
- $G$  is compact iff  $\mu(G) < \infty$ .

$\lrcorner$

**Prop. (12.10.1.14).** Integration of a nontrivial character of  $G$  w.r.t. the Haar measure  $\mu_G$  is 0.  $\lrcorner$

*Proof:*  $\int f(x)d\mu(x) = \int f(yx)d\mu(yx) = f(y) \int f(x)d\mu(x)$ . Now choose a  $y$  that  $f(y) \neq 1$ .  $\square$

**Def. (12.10.1.15) [Modular Quasi-Characters].** For a left Haar measure  $\mu$  on  $G$ ,  $\mu_x(E) = \mu(Ex)$  is also a left Haar measure, so there is a  $\Delta_G(x) \in \mathbb{R}_+$  s.t.  $\mu_x = \Delta_G(x)\mu$ . Then the function  $\Delta_G$  is a group homomorphism from  $G$  to  $\mathbb{R}^+$ , which is called the **modular quasi-character** of  $G$ .

$G$  is called **unimodular** iff  $\Delta_G = 1$ , i.e. a left Haar measure is also a right Haar measure. Obviously, a locally compact Abelian group is unimodular.

Sometimes we use right Haar measures, so we denote  $\delta_G(g) = \Delta(g)^{-1}$ .  $\lrcorner$

**Prop. (12.10.1.16).**  $\Delta$  is a continuous group homomorphism from  $G$  to  $\mathbb{R}_+$ , and

$$\int R_y f d\mu = \Delta(y^{-1}) \int f d\mu.$$

equivalently,  $d\mu(xy_0) = \Delta(y_0)d\mu(x)$ .  $\lrcorner$

*Proof:* For the continuity of  $\Delta$ , because  $y \mapsto R_y(f)$  is continuous for each  $f$  (12.10.1.2), so  $y \mapsto \int R_y f d\lambda$  is continuous, as  $\mu$  is Radon measure, so by the equation just proved,  $\Delta$  is continuous.

Now for any measurable function  $E$ ,  $\chi_E(xy) = \chi_{Ey^{-1}}(x)$ , thus

$$\int \chi_E(xy) d\mu = \mu(Ey^{-1}) = \Delta(y^{-1})\mu(E) = \Delta(y^{-1}) \int \chi_E(x) d\mu(x),$$

which proves the equation for  $f = \chi_E$ . Then the general case follows from approximating  $f$  by simple functions (12.3.8.6).  $\square$

**Prop. (12.10.1.17)[Involution Measure].** If  $\mu$  is a left Haar measure on  $G$  and  $\rho$  is defined by  $\rho(E) = \mu(E^{-1})$ , then  $\rho$  is a right Haar measure on  $G$ , and  $d\rho(x) = d\mu(x^{-1}) = \Delta(x^{-1})d\mu(x)$ .  $\lrcorner$

*Proof:* Notice

$$\int R_y(f)(x) \Delta(x^{-1}) d\mu(x) = \Delta(y) \int f(xy) \Delta((xy)^{-1}) d\mu(x) = \int f(x) \Delta(x^{-1}) d\mu(x),$$

so  $\Delta(x^{-1})d\mu(x)$  is a right Haar measure, hence  $c d\mu(x^{-1})$  for some  $c$ . If  $c \neq 1$ , we let  $U$  be a precompact symmetric nbhd  $U$  of 1 that  $|\Delta(x^{-1}) - 1| \leq \frac{1}{2}|c - 1|$  on  $U$ . But then  $|c - 1|\mu(U) = |\int_U (\Delta(x^{-1}) - 1) d\mu(x)| \leq \frac{1}{2}|c - 1|\mu(U)$ , contradiction.  $\square$

**Prop. (12.10.1.18) [Unimodular Groups].** For a compact group  $K$  of  $G$ ,  $\Delta$  is trivial on  $K$ . So compact group is unimodular, and if  $G/[G, G]$  is compact, then it is also unimodular.

A discrete group is unimodular.  $\lrcorner$

*Proof:* These all follow from (12.10.1.16) and the fact that a compact subgroup of  $\mathbb{R}^+$  is  $\{1\}$ , and  $\mathbb{R}$  is Abelian.

A discrete group is unimodular because  $\mu(\{e\}) = \mu(\{x\}) = \Delta(x)\mu(\{e\}) > 0$  (12.10.1.13).  $\square$

**Prop. (12.10.1.19) [Analytic Variety case].** Suppose  $G$  is an open subset of  $K^N$  where  $K$  is a local field, and the left translation is given by

$$xy = A(x)y + b(x)$$

then the Haar measure of  $G$  is given by  $|\det A(x)|^{-1} dx$ , where  $dx$  is the Haar measure on  $K^N$ .

Also if we want to calculate the right Haar measure, consider the right action.

More generally, if  $G$  is an  $n$ -dimensional analytic variety over  $K$  and  $\omega$  is a non-zero left-invariant differential form on  $G$  (which is in bijection with  $\wedge^n \mathfrak{g} \setminus \{0\}$ ), then we get a left Haar measure  $|\omega|$  on  $G$  through the positive linear functional

$$f \mapsto \int_{G(F_v)} f(g) |\omega|_v(g) \text{ where } f \in C_c(G(F_v))$$

by Riesz representation theorem (12.10.1.9). It is defined locally as follows: If on a coordinate map near a point  $x_0 \in G$ ,  $\omega(x) = f(x) dx_1 \wedge \dots \wedge dx_n$ , then  $|\omega|(x) = |f(x)|_v \cdot |dx_1| \times \dots \times |dx_n|$ . (Cf. [Kna02] Section 8.2.)  $\lrcorner$

*Proof:* Use change of variable formula, because  $A(xy) = A(x)A(y)$ , and

$$|\det A(ax)|^{-1}d(ax) = |\det A(ax)|^{-1}d(A(a)x + b(x)) = |\det A(x)|^{-1}dx.$$

□

**Cor. (12.10.1.20) [Examples of Analytic Variety Measures].**

- $dx/|x|$  is the Haar measure on  $\mathbb{R}^*$ .
- $dx dy/(x^2 + y^2)$  is the Haar measure on  $\mathbb{C}^\times$ .
- $x_{11}x_{22}^2 \dots x_{nn}^n \prod_{i < j} dx_{ij}$  (resp.  $x_{11}^n x_{22}^{n-1} \dots x_{nn} \prod_{i < j} dx_{ij}$ ) are the left (resp. right) Haar measure on the group  $B(n; \mathbb{R})$  of upper-triangular matrixes in  $GL(n; \mathbb{R})$ .
- $\prod_{i < j} dx_{ij}$  is the left and right Haar measure on  $Unip(n; \mathbb{R})$ .
- $|\det T|^{-n} dT$  is the left and right Haar measure on the group  $GL(n; \mathbb{R})$ , where  $dT$  is the Lebesgue measure on  $Mat(n; \mathbb{R}) = \mathbb{R}^{n^2}$ .
- The  $ax + b$  group  $G$  of all affine (invertible) translations of  $\mathbb{R}$  has left measure  $dadb/a^2$  and right Haar measure  $dadb/a$ .

┘

*Proof:* Clear.

□

**Prop. (12.10.1.21) [Modular Quasi-Characters of Analytic Varieties].** If  $K \in \mathbf{LField}$ ,  $G/K$  is an analytic group and  $\text{Ad}$  is the adjoint action of  $G$  on  $\mathfrak{g}$ , then  $\Delta_G(x) = |\det \text{Ad}(x^{-1})|$  (12.10.1.15). ┘

*Proof:* Let  $n = \dim G$ , then the Haar measure on  $G$  is given by the absolute value of a left-invariant  $m$ -form  $\omega$  by (12.10.1.19). Now for any  $X \in \mathfrak{g}$  corresponding to a left invariant vector space  $L_X$ ,

$$d(R_g)_p((L_X)_p) = (L_{\text{Ad}(g^{-1})X})_{pg}$$

by (16.5.3.5), so  $R_g^* \omega = \det(\text{Ad}(g^{-1})) \omega$ . So  $\Delta(g) \omega = R_g^* |\omega| = |\det(\text{Ad}(g^{-1}))| |\omega|$ .

□

**Cor. (12.10.1.22) [Unimodular Algebraic Groups].** For  $K \in \mathbf{LField}$  and  $G \in \mathbf{AlgGrp}/K$ , then  $G(K)$  is unimodular if one of the following holds:

- $G$  is Abelian,
- $G(K)$  is compact.
- $G^0 \in \mathbf{RedGrp}/K$ .
- $G$  is nilpotent.

┘

*Proof:* The Abelian case is trivial.

The compact case follows from (12.10.1.18).

For the reductive case, it suffices to show that  $\Delta(G^0) = 1$ , because then  $\Delta$  factors through  $G/G^0$ , which is a finite group, thus trivial. Now suppose  $G$  is connected, we prove that in fact  $\det \text{Ad}(G) = 1$ .  $\det \text{Ad}$  is trivial on  $[G, G]$  and also on the center  $Z(G)$ . Thus by (10.4.5.21), it is trivial on  $G$ .

The nilpotent case follows directly from (12.10.1.21), as  $\det \text{Ad}(x) = \exp \text{tr}(\text{ad}(x))$  and  $\text{ad}(x)$  is nilpotent.

□

## 2 Convolutions

**Def. (12.10.2.1) [Convolution of Measures].** If  $\mu, \nu$  are two complex (hence finite) Radon measures on  $G$ , the map

$$I(\varphi) = \int \int \varphi(xy) d\mu(x) d\nu(y)$$

is clearly a linear functional on  $C_c(G)$  that satisfies  $|I(\varphi)| \leq \|\varphi\|_\infty \|\mu\| \|\nu\|$ , so it defines a measure on  $G$  by Riesz representation (12.10.1.9), called the **convolution** of  $\mu$  and  $\nu$ , denoted by  $\mu * \nu$ , that  $\|\mu * \nu\| \leq \|\mu\| \|\nu\|$ .  $\square$

**Prop. (12.10.2.2) [Measure Algebra].**

- The convolution of measure is associative.
- $\delta_x * \delta_y = \delta_{xy}$ .
- The convolution of measure is commutative iff  $G$  is commutative.
- The convolution makes the set of complex measures on  $G$  into a unital Banach algebra, called the **measure algebra** of  $G$ , denoted by  $\text{Meas}(G)$ .

$\square$

*Proof:* 1: If  $\varphi \in C_c(G)$ , then

$$\begin{aligned} \int_G \varphi d[\mu * (\nu * \sigma)] &= \int \int \varphi(xy) d\mu(x) d(\nu * \sigma)(y) \\ &= \int \int \int \varphi(xyz) d\mu(x) d\nu(y) d\sigma(z) \\ &= \int \int \varphi(yz) d(\mu * \nu)(y) d\sigma(z) \\ &= \int \varphi d[(\mu * \nu) * \sigma] \end{aligned}$$

by Fubini theorem, which shows  $\mu * (\nu * \sigma) = (\mu * \nu) * \sigma$ .

2:

$$\int \int \varphi d(\delta_x * \delta_y) = \int \int \varphi(uv) d\delta_x(u) d\delta_y(v) = \varphi(xy) = \int \varphi d\delta_{xy}.$$

3: If  $G$  is commutative, then  $\varphi(xy) = \varphi(yx)$ , then the commutativity follows from Fubini theorem. The converse follows from item 2.

4 It is a Banach algebra because  $\|\mu * \nu\| \leq \|\mu\| \|\nu\|$  (12.10.2.1). And the point measure  $\delta_1$  is the unit:

$$\int \varphi d(\delta * \mu) = \int \int \varphi(xy) d\delta(x) d\mu(y) = \int \varphi(y) d\mu(y)$$

shows  $\delta * \mu = \mu$  for any  $\mu$ , and similarly  $\mu * \delta = \mu$ , so  $\delta$  is the identity.  $\square$

**Prop. (12.10.2.3) [Involution of Measure].**  $\text{Meas}(G)$  has a canonical involution that preserves total measure:

$$\mu \mapsto \mu^* : \mu^*(E) = \overline{\mu(E^{-1})}.$$

$\square$

*Proof:*  $\mu^*$  clearly satisfies  $\|\mu^*\| = \mu^*(G) = \mu(G) = \|\mu\|$ . And for any  $\varphi \in C_c(G)$ ,

$$\varphi d(\mu * \nu)^* = \int \varphi(x^{-1}) d(\overline{\mu * \nu})(x) = \int \varphi((xy)^{-1}) d\overline{\mu}(x) d\overline{\nu}(y) = \int \int \varphi(yx) d\mu^*(x) d\nu^*(y) = \int \varphi d(\nu^* * \mu^*),$$

which shows  $(\mu * \nu)^* = \nu^* * \mu^*$ .  $\square$

**Def. (12.10.2.4)** [ $L^1(G)$  and  $\text{Meas}(G)$ ]. Fix a Haar measure  $d\mu$  on  $G$ ,  $L^1(G)$  embeds into  $\text{Meas}(G)$  (12.10.2.2) by identifying  $f$  with the measure  $f(x)d\mu(x)$ , and this is in fact an isometry.

So the convolution and involution can be defined on  $L^1(G)$ , and the outcome turns out to be a.e. defined and in  $L^1(G)$  too:

$$f * g(x) = \int f(y)g(y^{-1}x)d\mu(y).$$

by Fubini-Tonelli theorem, and the involution

$$f^*(x) = \Delta(x^{-1})\overline{f(x^{-1})}.$$

Equivalently,

$$f * g = \int f(y)L_y(g)d\mu(y) = \int g(y^{-1})R_y(f)d\mu(y) \quad (12.8.3.25)$$

as vector-valued integrations.  $\lrcorner$

*Proof:*

$$\begin{aligned} (f * g)(\varphi) &= \int \int \varphi(xy)f(x)g(y)dx dy = \int \int \varphi(y)f(x)g(x^{-1}y)dx dy = \int \varphi(y) \left( \int f(x)g(x^{-1}y)dx \right) dy. \\ (f d\mu)^* &= \overline{(f d\mu)(x^{-1})} = \overline{f(x^{-1})}\Delta(x^{-1})d\mu(x) \quad (12.10.1.17). \end{aligned}$$

For the last assertion, Cf. [Fol16]P287.  $\color{red}?$   $\square$

**Prop. (12.10.2.5).** The convolution  $f * g$  can be calculated in multiple ways by left invariance and (12.10.1.17):

$$f * g(x) = \int f(y)g(y^{-1}x)dy = \int f(xy)g(y^{-1})dy = \int f(y^{-1})g(yx)\Delta(y^{-1})dy = \int f(xy^{-1})g(y)\Delta(y^{-1})dy.$$

In particular, if  $G$  is unimodular, then it can be calculated anyway you want.  $\lrcorner$

**Prop. (12.10.2.6).** For  $1 \leq p < \infty$ , the left and right translations of  $G$  on  $L^p(G)$  are all continuous.  $\lrcorner$

*Proof:* Cf. [Fol15]P58.  $\square$

**Prop. (12.10.2.7)** [ $L^p$ -Estimate]. The convolution on  $L^1(G)$  defined in (12.10.2.4) can be extend to  $L^p$ :

If  $1 \leq p < \infty$ ,  $f \in L^1(G)$  and  $g \in L^p(G)$ , then

- $f * g \in L^p(G)$ , and  $\|f * g\|_p \leq \|f\|_1 \|g\|_p$ .
- If  $G$  is unimodular or  $f$  has compact support, then the same as above holds for  $g * f$ .

More generally, for  $\mu \in \text{Meas}(G)$  and  $f \in L^p(G)$ , we can define the convolution  $\mu * f$  as

$$\mu * f(x) = \int f(y^{-1}x)d\mu(y).$$

Then  $\|\mu * f\|_p \leq \|\mu\| \|f\|_p$ . And when  $G$  is unimodular of  $p = 1$ , we can define  $f * \mu$  similarly. In particular,  $L^1(G)$  is a two-sided ideal in  $\text{Meas}(G)$ .  $\lrcorner$

*Proof:* 1: By Minkowski's inequality (12.3.6.6),

$$\|f * g\|_p = \left\| \int f(y)L_y g dy \right\|_p \leq \int |f(y)| \|L_y g\|_p dy = \|f\|_1 \|g\|_p.$$

2: This is similar, using (12.10.2.5).  $\square$

**Prop. (12.10.2.8) [Young's Inequality for Convolutions].** The convolution in (12.10.2.7) can be further extended:

- Suppose  $G$  is unimodular and  $f \in L^p(G), g \in L^q(G)$  with  $1/p + 1/q = 1, 1 < p < \infty$ , then  $f * g \in C_0(G)$ , and  $\|f * g\|_\infty \leq \|f\|_p \|g\|_q$ .
- Suppose  $f \in L^1(G), g \in L^\infty(G)$ , then  $f * g$  is left uniformly continuous, and  $g * f$  is right uniformly continuous.

More generally, by Riesz-Thorin interpolation theorem<sup>?</sup>, if  $G$  is unimodular and  $f \in L^p(G), g \in L^q(G)$  with  $1/p + 1/q = 1/r + 1, 1 < p, q, r < \infty$ , then  $f * g \in C_0(G)$ , and  $\|f * g\|_r \leq \|f\|_p \|g\|_q$ .  $\lrcorner$

*Proof:* Cf. [Fo15]P57, P58.<sup>?</sup>

By Riesz representation (12.10.1.9), it suffices to show that: for  $\frac{1}{p} + \frac{1}{q} + \frac{1}{r} = 2$ ,

$$\int \int f(x)g(y-x)h(y) \leq \|f\|_p \|g\|_q \|h\|_r.$$

write the LHS as

$$\int \int (f^p(x)g(y-x)^q)^{1-\frac{1}{r}} (f^p(x)h^r(y))^{1-\frac{1}{q}} (g^q(y-x)h^r(y))^{1-\frac{1}{p}}$$

and use Holder inequality for three functions (12.3.6.2).  $\square$

### Dirac Sequences

**Prop. (12.10.2.9) [Approximate Identities].** Let  $\mathcal{U}$  be a neighborhood base of  $1 \in G$ . A family of functions  $\{\varphi_U\}_{U \in \mathcal{U}} \in C_c(G)$  are called an **approximate identity** if:

1.  $\text{Supp}(\Phi_U)$  is compact and contained in  $\subset U$ .
2.  $\Phi_U(x) \geq 0, \int_0^1 \Phi_U(x) dx = 1$ .
3.  $\Phi_U(x^{-1}) = \Phi_U(x)$ .

Approximation identities exist.  $\lrcorner$

*Proof:* To show existence, we can take the neighbourhood bases of  $1 \in G$  to be symmetric precompact and take  $\Phi_U(x) = \mu(U)^{-1} \mathbf{1}_U$ .  $\square$

**Prop. (12.10.2.10).** For any approximate identity, if  $1 \leq p < \infty$  and  $f \in L^p(G)$ , or  $p = \infty$  and  $f$  is left (resp. right) uniformly continuous, then  $\Phi_U * f \rightarrow f \in L^p(G)$  (resp.  $f * \Phi_U \rightarrow f \in L^p(G)$ ).  $\lrcorner$

*Proof:* Cf. [Fo15]P58.<sup>?</sup>  $\square$

**Prop. (12.10.2.11) [Dirac sequences].** A **Dirac sequence** on  $G$  is a sequence  $f_n \in C_c(G)$  that  $f_n \mu_{\text{Haar}} \rightarrow \delta_1$  in the weak topology of  $\text{Meas}_c(G)$ .

If  $G$  is second-countable, then any approximate identity (12.10.2.9) gives a Dirac sequence by (12.10.2.10).  $\lrcorner$

**Cor. (12.10.2.12).**  $C_c(G)$  is dense in  $\text{Meas}_c(G)$ .  $\lrcorner$

*Proof:* By translations of Dirac sequences, we can show that  $C_c(G)$  is dense in the space  $\text{Meas}_c^0(G)$  consisting of point measures. Then notice also that  $\text{Meas}_c^0(G)$  is dense in  $\text{Meas}_c(G)$ , because otherwise by Hahn-Banach, there is a linear functional on  $\text{Meas}_c(G)$  vanishing on  $\text{Meas}_c^0(G)$ . Clearly any linear functional on  $\text{Meas}_c^0(G)$  is evaluating on a function  $f \in C_c(G)$ . But then clearly  $f = 0$ , contradiction.  $\square$

**Prop. (12.10.2.13).** A closed subspace  $I \subset L^1(G)$  is a left ideal(resp. right ideal) iff it is invariant under left translations(resp. right translations).  $\lrcorner$

*Proof:* Suppose  $I$  is a left ideal, then for any  $f \in I$  and  $g \in G$ , let  $\{\Phi_U\}$  be an approximate identity, then  $L_x(\Phi_U * f) = L_x(\Phi_U) * f \in I$ , thus  $L_x(f) = \lim L_x(\Phi_U * f) \in I$  by (12.10.2.10). Conversely, suppose  $I$  is invariant under left translations, then for  $f \in I$  and  $g \in L^1(G)$ ,  $g * f = \int g(y)L_y(f)d\mu(y)$  (12.10.2.4) is in the closed linear span of the functions  $L_y(f)$  by (12.10.2.4) and (12.8.3.20), thus in  $I$ .  $\square$

### 3 Homogenous Spaces

**Def. (12.10.3.1)[Notations].** If  $\mu$  is a left Haar measure on  $G$  and  $H \leq G$  is a closed subgroup with a left Haar measure  $d\mu(\xi)$ , let  $q : G \rightarrow G/H$  be the quotient map.  $\lrcorner$

**Prop. (12.10.3.2).** Let  $G$  is  $\sigma$ -compact and  $S \in \text{LCH}$  is a transitive  $G$ -space. If  $s_0 \in S$  and  $\text{Stab}_G(s_0) = H$ , then  $G/H \cong S$  as  $G$ -spaces.  $\lrcorner$

*Proof:* Cf.[Folland P60].  $\square$

**Lemma (12.10.3.3).** If  $E \subset G/H$  is compact, then there is a compact  $K \subset G$  that  $q(K) = E$ .  $\lrcorner$

*Proof:* Choose a precompact nbhd  $V$  of 1 in  $G$ , since  $q$  is open, the set  $q(xV)$  is an open cover of  $E$ , so there are f.m.  $x_i$  that  $E \subset \cup q(x_iV)$ . Then let  $K = q^{-1}(E) \cap (\cup x_i\bar{V})$ , this will suffice.  $\square$

**Def. (12.10.3.4)[Fundamental Domain].** A **fundamental domain** for a group  $\Gamma$  acting discontinuously on a locally compact second countable Hausdorff space  $X$  is an Borel subset  $F \in X$  that:

- $\cup_{\gamma \in \Gamma} \gamma F = \mathcal{H}$ .
- if  $\gamma \neq 1 \in \Gamma$ , then  $\gamma F \cap F = \emptyset$ .

Then fundamental domains exist.  $\lrcorner$

*Proof:* The quotient space  $G \backslash \Gamma$  is locally compact second countable, thus there is a countable set of precompact open basis  $\{B_i\}$  for  $G \backslash \Gamma$ , and a countable set of precompact open basis  $\{C_i\}$  for  $X$ . For each  $\bar{x} \in G \backslash \Gamma$ , choose  $\bar{x} \in B_{i(\bar{x})}$  and choose a preimage  $x \in X$  and a nbhd  $C_{i(x)}$  that  $C_{i(x)} \cap \gamma(C_{i(x)}) = \emptyset$  for any  $\gamma \neq 1$ , then there is a nbhd  $B_{j(x)}$  contained in the image of  $C_{i(x)}$ . Then we can take a precompact preimages of  $B_{j(\bar{x})}$  in  $C_{i(x)}$  (by (12.10.3.3)), labeled by  $U_i$ . Then  $U_i$  maps isomorphically to their images in  $G \backslash \Gamma$  and covers  $G \backslash \Gamma$ .

Now take  $V_1 = W_1 = U_1$ , and  $W_{n+1} = U_{n+1} \setminus \cup_{\gamma \in \Gamma} \gamma(V_n)$ ,  $V_{n+1} = V_n \cup W_{n+1}$ . Then  $\cup V_i$  is a fundamental domain.  $\square$

**Prop. (12.10.3.5)[Projection of Functions].** There is a map  $P : C_c(G) \rightarrow C_c(G/H) : Pf(xH) = \int_H f(x\xi)d\mu(\xi)$ .  $Pf$  is continuous and this map is well-defined and surjective.

And  $\text{Supp}(Pf) \subset q(\text{Supp } f)$ , and if  $\varphi \in C_c(G/H)$ , then  $P((\varphi \circ q)f) = \varphi Pf$ .  $\lrcorner$

*Proof:*  $Pf$  is continuous because  $f$  is left uniformly continuous (12.10.1.2). By (12.10.3.6), there is a  $g \geq 0 \in C_c(G)$  that  $Pg = 1$  on  $\text{Supp } \varphi$ . Let  $f = (\varphi \circ f)g$ , then  $Pf = \varphi(Pg) = \varphi$ .  $\square$

**Lemma (12.10.3.6).** If  $F \in G/H$  is compact, then there is a  $f \in C_c(G)$  that  $f \geq 0$  and  $Pf = 1$  on  $F$ .  $\lrcorner$

*Proof:* Let  $E$  be a precompact nbhd of  $F$  in  $G/H$ , choose a compact  $K \subset G$  that  $q(K) = \overline{E}$  by (12.10.3.3). Choose  $g \in C_c(G) \geq 0$  that is positive on  $K$  and  $\varphi \in C_c(G/H)$  that is 1 on  $F$  and vanish outside  $E$ , then set

$$f = \frac{\varphi \circ q}{Pg \circ q}g$$

then  $f \geq 0$  and  $Pf = (\varphi/Pg)Pg = \varphi$ . □

**Prop. (12.10.3.7) [Quotient Measures in Regular cases].** If  $H \leq G$  is a closed subgroup and  $d\mu(g), d\mu(h)$  are Haar measures on  $G$  and  $H$  resp., then there is a  $G$ -invariant positive Radon measure  $\mu$  on  $G/H$  iff  $\Delta_G|_H = \Delta_H$ . If this is the case, then this measure is unique up to constant, and when suitably chose, it satisfies:

$$\int_G f(x)dx = \int_{G/H} Pf d\mu(xH) = \int_{G/H} \left( \int_H f(x\xi) d\xi \right) d\mu(xH) \quad (12.10.3.7).$$

for any  $f \in C_c(G)$ . This measure is denoted by  $\frac{d\mu(g)}{d\mu(h)}$ . ┘

*Proof:* Cf. [Fol16]P62? □

**Cor. (12.10.3.8) [Product Decomposition of Measure].** If  $G$  is a unimodular and  $P, K$  are closed subgroups s.t.  $P \cap K$  is compact and  $G = PK$ . Let  $\mu_P, \rho_K$  be the left and right Haar measure on  $P, K$  respectively, then a Haar measure on  $G$  can be given s.t.

$$\int_G f(g) d\mu_G(g) = \int_K \int_P f(pk) d\mu_P(p) d\rho_K(k), \text{ where } f \in C_c(G).$$

┘

*Proof:* Consider  $H = P \times K$  and  $M = P \cap K$  embedded diagonally in  $H$ , then there is a homeomorphism  $H/M \cong G$  given by  $(p, k) \mapsto pk^{-1}$ . Then we can verify both side are  $H$ -invariant measure on  $G \cong H/M$  (compactness of  $P \cap K$  is used to guarantee that the RHS is integrable?). Thus by uniqueness in (12.10.3.7), the equation is true. □

**Prop. (12.10.3.9) [Triple Product Decomposition of Measures].** If  $G$  is unimodular and  $H, A, U \leq G$  be closed subgroups s.t.

- The product morphism  $H \times A \times U \rightarrow G$  is a homeomorphism.
- $A$  normalizes  $U$ .
- $A, H$  are unimodular.

Then there is a Haar measure on  $G$  s.t.  $d\mu_G(hau) = \rho(a) d\mu_H(h) d\mu_A(a) d\mu_U(u)$ . ┘

*Proof:* ? □

**Def. (12.10.3.10) [Fundamental Domains].** ┘

### Non-regular Quotients

**Def. (12.10.3.11) [Rho-Functions].** Let  $H \leq G$  be a closed subgroup and  $\Delta = \Delta_G/\Delta_H$ . Let  $\mathcal{S}(G, \Delta)$  be the space of continuous functions on  $G$  that satisfies

- for any  $h \in H$ ,  $f(hg) = \Delta(h)f(g)$ .

- $f$  is compactly supported in  $H \backslash G$ .

┘

**Lemma (12.10.3.12).** Let  $H \leq G$  a closed subgroup, then there is a continuous function  $f_0 : G \rightarrow [0, \infty)$  that

- $f_0^{-1}((0, \infty)) \cap Hx \neq \emptyset$  for any  $x \in G$ .
- $\text{Supp } f_0 \cap HK$  is compact for any compact group  $K$  of  $G$ .

┘

*Proof:* Cf.[Folland, P64].

□

**Lemma (12.10.3.13).** If  $f \in C_c(G)$  and  $Pf = 0$ , then  $\int f\rho = 0$  for any rho-function  $\rho$ . In fact, this is true if  $\rho$  is allowed to take value 0.

┘

*Proof:* Cf.[Folland P65].

□

**Lemma (12.10.3.14).** There is an operator  $p : C_c(G) \rightarrow C_c(G/H)$  given by

$$p(f)(g) = \int_H f(hg) \Delta_G^{-1}(h) d\mu_H(h).$$

Then  $p$  is right  $G$ -invariant, and  $p(ff') = fp(f')$  for any  $f' \in C_c(G)$  and  $f \in C(G)$  that is  $H$ -invariant.

- The image of  $p$  is  $\mathcal{S}(G, \Delta)$ , and if  $s \geq 0 \in \mathcal{S}(G, \Delta)$ , then there is a non-negative  $f \geq 0 \in C_c(G)$  that  $p(f) = s$ .
- If  $p(f) = 0$ , then  $\int_G f(x) d\nu_G(x) = 0$ , where  $d\nu_G$  is a right Haar measure on  $G$ .

┘

*Proof:* 1: It is clearly that  $p(f)(gh) = \Delta(h)p(f)(g)$ , and let  $f_0$  be defined as in (12.10.3.12), then  $s_0 = p(f_0)$  is positive-valued. Now for any  $s \in \mathcal{S}(G, \Delta)$ ,  $p(ss_0^{-1}f_0) = ss_0^{-1}p(f_0) = s$ , and  $sf_0 \in C_c(G)$  by hypothesis.

2: If  $p(f) = 0$ , then

$$\begin{aligned} \int_G \int_H s_0^{-1}(g) f_0(g) f(hg) \Delta_G^{-1}(h) d\mu_H(h) d\nu_G(g) &= \int_G \int_H \Delta(h) s_0^{-1}(g) f_0(h^{-1}g) f(g) d\mu_H(h) d\nu_G(g) \\ &= \int_G \left[ \int_H f_0(hg) \Delta_G(h)^{-1} d\mu_H(h) \right] s_0^{-1}(g) f(g) d\nu_G(g) \\ &= \int_G f(g) d\nu_G(g) \end{aligned}$$

□

**Prop. (12.10.3.15) [Haar Measure on Rho-Functions].** There exists a unique continuous positive functorial  $\nu_{H \backslash G}$  on  $\mathcal{S}(G, \Delta)$  that for any  $f \in C_c(G)$ ,

$$\int_G f(x) d\nu_G(x) = \int_{H \backslash G} p(f)(y) d\nu_{H \backslash G}(y) = \int_{H \backslash G} \int_H f(hg) \Delta_G^{-1}(h) d\mu_H(h) d\nu_{H \backslash G}.$$

and it is invariant under the right action of  $G$ . We denote  $\nu_{H \backslash G}(s) = \int_{H \backslash G} s(g) d\nu_{H \backslash G}(g)$  for  $s \in \mathcal{S}(G, \Delta)$ .

┘

*Proof:* This follows from (12.10.3.14).

□

**Cor. (12.10.3.16).** If  $G$  is a unimodular and  $H, K$  are closed subgroups s.t.  $H \cap K$  is compact and  $G = HK$ , then the the quotient measure  $\mu_{H \backslash G}$  is given by

$$f \mapsto \int_K f(k) d\nu_K(k).$$

where  $d\nu_K(k)$  is a right Haar measure on  $K$ , by comparison with (12.10.3.8).  $\lrcorner$

**Def. (12.10.3.17) [Class Functions].** A measurable function on  $G$  is called a **class function** iff  $f(y^{-1}xy) = f(x)$  a.e.  $(x, y) \in G \times G$ . Denote  $ZL^p(G)$  the space of class functions in  $L^p(G)$  and  $ZC(G)$  the space of continuous class functions on  $G$ .  $\lrcorner$

### Restricted Direct Products

**Def. (12.10.3.18) [Restricted Direct Products].** Let  $S \in \text{Set}, \#S \leq \aleph_0$  be a set of indices and  $\{X_\lambda\}_{\lambda \in \Lambda}$  is a family of locally compact spaces, and for a.e.  $\lambda \in \Lambda$  an open compact subset  $K_\lambda \subset X_\lambda$ . Then the **restricted direct product** is defined to be

$$X = \prod' (X_\lambda, K_\lambda) \triangleq \varinjlim_{\emptyset \subset \text{fin } S \in \Lambda} \left( \prod_{\lambda \in S} X_\lambda \times \prod_{\lambda \in \Lambda \setminus S} K_\lambda \right)$$

endowed with the colimit space topology. And we denote

$$X'_S \triangleq \prod_{\lambda \in S} X_\lambda \times \prod_{\lambda \in \Lambda \setminus S} K_\lambda, \quad X^S \triangleq \prod_{\lambda \in \Lambda \setminus S} K_\lambda.$$

This topology is stronger than the product topology of  $\prod_\lambda X_\lambda$ . It has an open basis  $N = \prod_\lambda N_\lambda$ , where  $N_\lambda$  is open in  $X_\lambda$  and  $N_\lambda = K_\lambda$  for a.e.  $\lambda \in \Lambda$ . It is locally compact because each  $X'_S$  does.  $\lrcorner$

**Prop. (12.10.3.19).** Every compact subset  $N$  of  $X$  is contained in some  $\prod_\lambda M_\lambda$ , where  $M_\lambda \subset X_\lambda$  is compact and  $M_\lambda = H_\lambda$  for a.e.  $\lambda$ .  $\lrcorner$

*Proof:* This is because  $X_S$  is an open covering of  $X$ , and the union of f.m.  $X_{S_i}$  is also of the form  $X_S$ . So  $N$  is contained in some  $X_S$ , thus its projection in the  $S$ -coordinates is compact.  $\square$

**Prop. (12.10.3.20) [Tensor Product Groups].** Situation as in (12.10.3.18), if all  $X_\lambda, K_\lambda$  are topological groups, then  $X$  has a natural topological group structure, making it a locally compact group.  $\lrcorner$

**Situation (12.10.3.21).** In the following, we assume that  $X_\lambda = G_\lambda, K_\lambda = H_\lambda$  are all Abelian topological groups.  $\lrcorner$

**Prop. (12.10.3.22) [Quasi-Characters on  $G$ ].** Quasi-characters on  $G$  are of the form  $\otimes_\lambda c_\lambda$  that  $c_\lambda \in G_\lambda^\vee$  is trivial on  $H_\lambda$  for a.e.  $\lambda \in \Lambda$ .  $\lrcorner$

*Proof:* Let  $c$  be a quasi-character, choose a nbhd of  $1 \in U \subset \mathbb{C}$  that contains no subgroup, then  $c^{-1}(U)$  has contains an open basis  $\prod_{\lambda \in S} N_\lambda \times G^S$ , where  $N_\lambda$  are open nbhds of 1, so  $c(G^S) = 1$ . Thus  $c(\mathfrak{a}) = \prod_\lambda c_\lambda(a_\lambda)$  is true for any  $\mathfrak{a} \in G$ .

Conversely, clearly  $\otimes_\lambda c_\lambda$  is a quasi-character on  $G$ , it is continuous.  $\square$

**Prop. (12.10.3.23) [Dual of  $G$ ].** In each  $G_\lambda^\vee$ , by (12.11.1.8)  $H_\lambda$  is compact, so  $H_\lambda^\vee = G_\lambda^\vee / H_\lambda^\perp$  is discrete, so  $H_\lambda^\perp$  is open;  $H_\lambda$  are open, so  $H_\lambda^\perp = (G_\lambda / H_\lambda)^\vee$  are compact. So we can define the space  $\prod'(G_\lambda^\vee, H_\lambda^\perp)$ . Then the dual group  $G^\vee \cong \prod'(G_\lambda^\vee, H_\lambda^\perp)$  as a topological group.  $\lrcorner$

*Proof:* (12.10.3.22) shows that this is an algebraic isomorphism, so it suffices to prove this is a topological homeomorphism(12.11.1.7):

For any compact  $B \in G_1 = \prod_{\mathbf{p} \in S} N_\lambda \times \prod_{\mathbf{p} \notin S} H_\lambda$ , for any  $\varepsilon > 0$ , if  $c \in \prod_{\mathbf{p} \in S} N'_\lambda \times \prod_{\mathbf{p} \notin S} H_\lambda^\perp$ , where  $N'_\lambda = \{c_\lambda | |c_\lambda(N_\lambda - 1)| < \varepsilon/|S|\}$ , then  $|c(B) - 1| < \varepsilon$ .

Conversely, if  $\varepsilon$  is small enough, then if  $c(\prod_{\mathbf{p} \in S} N_\lambda \times \prod_{\mathbf{p} \notin S} H_\lambda) - 1| < \varepsilon$ , then  $c \in \prod_{\mathbf{p} \in S} N'_\lambda \times \prod_{\mathbf{p} \notin S} H_\lambda^\perp$ , where  $N'_\lambda = \{c_\lambda | |c_\lambda(N_\lambda - 1)| < \varepsilon\}$   $\square$

**Prop. (12.10.3.24)[Restricted Product Measure].** Let measures  $\mu_\lambda$  be given on  $X_\lambda$  that  $\mu_\lambda(K_\lambda) = 1$  for a.e.  $\mathbf{p}$ , define a Haar measure on  $G$  as follows:

On  $X'_S$ ,  $d\mu_S = (\prod_{\lambda \in S} d\mu_\lambda) \times d\mu^S$ , where  $\mu^S$  is the product measure on  $X^S$ .

Then these can define a positive left-invariant functional  $I$  on  $C_c(X)$  s.t.  $|I(f)| \leq \|f\|$  for any  $f$  that depends only on f.m. coordinates  $\lambda \in S$ . Then Stone-Weierstrass theorem shows these functions are dense in  $C_c(G)$ , thus  $I$  can be uniquely extended to a functional on  $C_c(G)$ , and this defines a Haar measure on  $G$  by Riesz representation(12.10.1.9), denoted by  $\mu = \prod'_\lambda \mu_\lambda$ , called the **restricted product measure**.  $\lrcorner$

**Prop. (12.10.3.25).** For a function  $f$  on  $G = \prod'(G_\lambda, H_\lambda)$  measurable, if either  $f \geq 0$  or  $f \in L^1(G)$ , then

$$\int_G f(\mathbf{a}) d\mathbf{a} = \lim_{\vec{S}} \int_{G_S} f(\mathbf{a}) d\mathbf{a}$$

as a net limit.  $\lrcorner$

*Proof:* The second case follows from the first case, as  $\int_G f = \lim_{\vec{B} \text{ compact}} \int_B f$  by monotone convergence theorem, and any  $B$  compact is contained in some  $G_S$ (12.10.3.19).  $\square$

**Cor. (12.10.3.26).** If  $f(\mathbf{a}) = \prod_\lambda f_\lambda(\mathbf{a}_\lambda)$ , where  $f_\lambda \in L_1(G_\lambda)$  and  $f_\lambda = \chi_{H_\lambda}$  a.e.  $\mathbf{p}$ , then if

$$\prod_\lambda \int_{G_\lambda} |f_\lambda(\mathbf{a}_\lambda)| d\mathbf{a}_\lambda < \infty,$$

then  $f \in L^1(G)$ , and

$$\int_G f(\mathbf{a}) d\mathbf{a} = \prod_\lambda \left( \int f_\lambda(\mathbf{a}_\lambda) d\mathbf{a}_\lambda \right).$$

$\lrcorner$

**Def. (12.10.3.27)[Dual Measure].** Notice if  $f_\lambda = \chi_{H_\lambda}$ , then

$$f_\lambda^\vee(c_\lambda) = \int_{H_\lambda} \overline{c_\lambda(\alpha_\lambda)} d\mathbf{a}_\lambda = d\mathbf{a}_\lambda(H_\lambda) \chi_{H_\lambda^\perp}(c_\lambda).$$

So by Fourier transform(12.11.1.24), if  $dc_\lambda$  is the dual measure on  $G_\lambda^\vee$ , then  $\chi_{H_\lambda^\perp} = dc_\lambda(H_\lambda^\perp) d\mathbf{a}_\lambda(H) \chi_{H_\lambda^\perp}$ , which means  $dc_\lambda(H_\lambda^\perp) = 1, a.e. \mathbf{p}$ , thus we can define a measure on  $G^\vee$  as  $dc = \prod'_\lambda dc_\lambda$ .

Then  $dc$  is the measure on  $\hat{G}$  dual to  $d\mathbf{a}$  on  $G$ .  $\lrcorner$

*Proof:* The duality is by the lemma below(12.10.3.28), applied to both  $f$  and  $\hat{f}$ .  $\square$

**Lemma (12.10.3.28)[Fourier Transform on Product].** if  $f_\lambda \in B_1(G_\lambda)$  and  $f_\lambda = \chi_{H_\lambda}$  a.e.  $\lambda$ , then  $f(\mathbf{a}) = \prod f_\lambda(\mathbf{a}_\lambda) \in B_1(G)$ , and  $f^\vee(c) = \prod f_\lambda^\vee(c_\lambda)$ .  $\lrcorner$

*Proof:* For any character  $c$ , because

$$f(\mathfrak{a})\bar{c}(\mathfrak{a}) = \prod f_\lambda(\mathfrak{a}_\lambda)\bar{c}_\lambda(\mathfrak{a}_\lambda)$$

and every  $f_\lambda(\mathfrak{a}_\lambda)\bar{c}_\lambda(\mathfrak{a}_\lambda) \in L^1(G_\lambda)$ . So (12.10.3.26) applies and shows the equations. Similarly, because  $\widehat{f}_\lambda = \chi_{H_\lambda^\perp}$  a.e.  $\mathfrak{p}$ , we have  $\widehat{f} \in L_1(\widehat{G})$ , so  $f(\mathfrak{a}) \in B_1(G)$ .  $\square$

### Compactly Generated Groups

**Def. (12.10.3.29) [Compactly Generated Groups].**  $\Gamma \in \mathcal{T}\text{op}\mathcal{G}\text{rp}$  is called a **compactly generated group** if there exists a compact subset  $C \subset \Gamma$  s.t.  $C$  is a defining set for  $\Gamma$  (3.1.5.8).  $\lrcorner$

**Prop. (12.10.3.30) [Criterion for Compactly Generatedness].** Let  $\Gamma \in \mathcal{T}\text{op}\mathcal{G}\text{rp}$  with a map  $|\cdot| : \Gamma \rightarrow \mathbb{N}$  s.t.

- $|1| \neq 0$ .
- $|g_1g_2| \leq |g_1| + |g_2|$  for any  $g_1, g_2 \in \Gamma$ .
- $|g^{-1}| = |g|$  for  $g \in \Gamma$ .
- For any  $n \in \mathbb{N}$ ,  $\Gamma_n = \{g \in \Gamma : |g| \leq n\}$  is compact.

Moreover, assume there exists  $c, b, d \in \mathbb{Z}_+$  s.t.

- If  $g \in \Gamma$  and  $|g| > c$ ; then there exists  $g_1, g_2 \in \Gamma$  s.t.  $g = g_1g_2$ ,  $|g_1| < C$  and  $|g_2| < |g| - d$ .
- If  $f, g, h \in \Gamma$  s.t.  $fgh = 1$ , then there exist

$$- t \in \mathbb{Z}_+$$

$$- g_1, \dots, g_t \in \Gamma$$

s.t.

$$- t \leq |g| + b.$$

$$- |g_i| \leq c.$$

$$- g = g_1 \dots g_t.$$

$$- |fg_1 \dots g_j| \leq \max(|f|, |h|) + d \text{ for any } j \in [t].$$

Then  $\Gamma$  is compactly generated.  $\lrcorner$

*Proof:* Cf. [P-R94]P157.  $\square$

**Prop. (12.10.3.31).** If  $H \trianglelefteq G$  is an open normal subgroup of finite index and  $H$  is compactly generated, then  $G$  is also compactly generated.  $\lrcorner$

*Proof:* Cf. [P-R94]P152.  $\square$

### Maximal Compact Subgroups

**Def. (12.10.3.32) [Maximal Compact Subgroup].** A **maximal compact subgroup** of a locally compact group  $G$  is a maximal object in the set of all compact subgroup of  $G$ .  $\lrcorner$

**Prop. (12.10.3.33) [Cartan-Iwasawa-Malcev theorem].** Maximal compact subgroups for  $G$  exist.  $\lrcorner$

*Proof:*  $\square$

#### 4 Locally Profinite Groups

**Def. (12.10.4.1) [Locally Profinite Group].** A **locally profinite group** is a locally profinite topological group. A profinite group is locally profinite, and any compact open subgroup of a locally profinite group is profinite.  $\lrcorner$

**Cor. (12.10.4.2).** A closed subgroup of a locally profinite group is locally profinite, and a quotient group is locally profinite.  $\lrcorner$

*Proof:* The proof is very similar to that of (3.1.12.4), as the result of (4.4.1.25) remains true, because any connected nbhd of  $e$  is contained in any compact open subgroup.  $\square$

**Prop. (12.10.4.3) [Compact Open Subgroups Form a Basis].** If  $G \in \text{locProfGrp}$ , then the set of compact open subgroups of  $G$  form a basis of the nbhd of 1.  $\lrcorner$

*Proof:* For any nbhd  $U$  of 1, choose a precompact nbhd  $V$  of 1 contained in  $U$ , then there is another compact open subgroup contained in  $V$ , by (4.12.1.24).  $\square$

**Prop. (12.10.4.4) [Quotient of Locally Profinite Group].** A quotient subspace of a locally profinite group is locally profinite.  $\lrcorner$

*Proof:* Consider the  $H$  action on  $G$ , then it is regular, because the graph is the preimage of  $H$  in the map  $G \times G \rightarrow G : (g_1, g_2) \mapsto g_1^{-1}g_2$ . So by (4.12.1.10)  $G/H$  is Hausdorff. But clearly  $G \rightarrow G/H$  is open and  $G/H$  is locally profinite as it has a basis of locally compact subsets.  $\square$

**Lemma (12.10.4.5).** Let  $G \in \text{locProfGrp}$  and  $H \leq G$  be a closed subgroup, then for any open compact subspace  $V \subset G/H$ , there is an open compact subspace  $U \subset G$  that  $p(U) = V$ .  $\lrcorner$

*Proof:* The preimage  $p^{-1}(V)$  is open, so there is a covering of  $p^{-1}(V)$  by open compact subsets  $U_i$ . Then  $p(U_i)$  are open and covers  $V$ , thus there are f.m.  $U_i$  that  $p(\cup U_i) = V$ .  $\square$

**Prop. (12.10.4.6) [Homogeneous Group].** Let  $G$  is a locally profinite group that is  $\sigma$ -compact. If  $G$  acts transitively on a locally profinite space  $X$ , let  $x_0 \in X$  and  $\text{Stab}(x_0) = H$ , then  $G/H \rightarrow X$  is a homeomorphism. ? Is this true for locally compact groups?  $\lrcorner$

*Proof:* Let  $N$  be a compact open subset of  $N$ , and  $g_i$  be the left coset representatives for  $N$ , which is countable. Now  $X = \cup_i \gamma(g_i N)x_0$ . Because a locally profinite space is a Baire space, some  $\gamma(g_i N)x_0$  contains a nbhd of  $\gamma(g_i n)x$ . Now left acts  $(g_i n)^{-1}$ , we see  $x_0$  is an interior point of  $\gamma(N)x_0$ . Now  $N$  is arbitrary, thus (12.10.4.3) shows  $g \mapsto \gamma(g)x$  is open, thus  $G/H \rightarrow X$  is open. It is clearly continuous, thus  $G/H \cong X$ .  $\square$

## 12.11 Harmonic Analysis on Locally Compact Abelian Groups

### 1 Locally Compact Abelian Group

**Notation(12.11.1.1).**

- In this subsection, let  $G \in \text{LCA}$ .
- Use notations on Functional Analysis defined in [Archimedean Functional Analysis](#).
- Use notations on Harmonic Analysis defined in [Harmonic Analysis on Locally Compact Groups](#).

┘

**Thm.(12.11.1.2)[Pontryagin-van.Kampen Fundamental Structure Theorem].**  $G$  is isomorphic to  $E \times \mathbb{R}^n$  for some  $n \in \mathbb{N}$  and some  $E \in \text{LCA}$  which has a compact open subgroup.

┘

*Proof:*

□

### Dual Group

**Def.(12.11.1.3)[Dual Group].** Because  $G$  is Abelian, the irreducible unitary representations of  $G$  in  $\widehat{G}$  are all 1-dimensional by (24.7.1.9). An element of  $G^\vee$  is called a **character of  $G$** . And a continuous homomorphism from  $G$  to  $\mathbb{C}^\times$  is called a **quasi-character**.

The topologies on  $G^\vee$  that makes it into a LCA group is given in (12.11.1.7).

┘

**Remark(12.11.1.4).**  $\widehat{\mathbb{R}} \cong \mathbb{R}$ , and the quasi-characters of  $\mathbb{R}$  are all of the form  $x \rightarrow e^{sx}$  for  $s \in \mathbb{C}$ .

┘

*Proof:* If  $\varphi \in \widehat{\mathbb{R}}$ , then  $\varphi(0) = 1$ , and there is an  $a > 0$  that  $\int_0^a \varphi(t)dt \neq 0 = A$ . Now  $A\varphi(x) = \int_x^{x+a} \varphi(t)dt$ , so taking derivative,

$$\varphi'(x) = \frac{\varphi(x+a) - \varphi(x)}{A} = \frac{\varphi(a) - 1}{A} \varphi(x),$$

which shows  $\varphi(x) = e^{sx}$  for some  $s \in \mathbb{C}$ .

□

**Prop.(12.11.1.5)[Dual Group as Spectrum of  $L^1(G)$ ].** The dual group  $\widehat{G}$  can be regarded as the spectrum of  $L^1(G)$ , i.e. multiplicative homomorphism of  $L^1(G)$ :

$$\xi \mapsto \left( \xi(f) = \int \overline{(x, \xi)} f(x) dx \right).$$

┘

*Proof:* First,  $\xi$  is multiplicative because

$$\xi(f * g) = \int \int f(y)g(y^{-1}x)(x, \xi) dy dx = \int \int f(y)g(x)(xy, \xi) dy dx = \xi(f)\xi(g).$$

Conversely, any continuous functional on  $L^1$  is like  $\varphi(f) = \int f(x)\varphi(x)dx$  for some  $\varphi \in L^\infty$ , and it is multiplicative, so

$$\varphi(f) \int \varphi(x)g(x) = \varphi(f)\varphi(g) = \varphi(f * g) = \int \int \varphi(y)f(yx^{-1})g(x) dx dy = \int \varphi(L_x(f))g(x) dx$$

So  $\varphi(x) = \frac{\varphi(L_x(f))}{\varphi(f)}$ , a.e., for any  $f$ . so  $\varphi(x)$  can be chosen to be continuous, as  $x \rightarrow L_x(f)$  is continuous (12.10.1.2). And clearly  $\varphi$  is multiplicative.

□

**Cor. (12.11.1.6).**  $G^\vee \subset P_1(G)$ , because  $\int (f^* * f) \varphi d\mu = |\Phi(f)|^2 \geq 0$ .  $\lrcorner$

**Cor. (12.11.1.7) [Dual Group as a LCA Group].** Now we can give  $\widehat{G}$  the compact-open topology, then the group operation is clearly continuous, and the topology coincides with that inherited by the weak\*-topology of the  $L^\infty$  by (24.7.1.27), so  $\widehat{G} \cup \{0\}$  is a compact Hausdorff space because  $\widehat{G} \subset P_1(G)$  and it is the subset of  $L^\infty$  that  $\{h(xy) = h(x)h(y)\}$  which is weak\*-closed hence weak\*-compact. In particular,  $G^\wedge$  is a locally compact topological group.  $\lrcorner$

**Prop. (12.11.1.8) [Duality between Discrete Groups and Compact Groups].** if  $G$  is discrete, then  $\widehat{G}$  is compact, if  $G$  is compact, then  $\widehat{G}$  is discrete.  $\lrcorner$

*Proof:* if  $G$  is discrete, then there is a unit  $\delta$  in  $L^1(G)$ , which is 1 on  $e$  and 0 otherwise. So the spectrum of  $L^1(G)$  is compact by (12.9.1.21).

If  $G$  is compact, then  $1 \in L^1$ , so  $U = \{f \in L^\infty(G) : |f| > \frac{1}{2}\}$  is weak\*-open, but  $U \cap G^\vee = \{1\}$  by (12.10.1.14), so  $\widehat{G}$  is discrete.  $\square$

### Fourier Transform

**Prop. (12.11.1.9) [Fourier Transforms].** The **Fourier transform** on  $G$  is defined as in (12.11.1.5) to be the map

$$L^1(G) \rightarrow C(G^\vee) : f \mapsto \mathcal{F}f(\xi) = f^\vee(\xi) = \int f(x) \overline{\chi(x, \xi)}.$$

It is a norm-decreasing \*-homomorphism from  $L^1(G)$  to  $C_0(G^\vee)$ , and its range is a dense subspace of  $C_0(G^\vee)$ .

Equivalently, the Fourier transform is just the Gelfand transform of  $L^1(G)$  (12.9.1.21) composed with an inverse map.  $\lrcorner$

*Proof:* Cf. [Fol16] P102.  $\square$

**Prop. (12.11.1.10).** There is another map from  $\text{Meas}(G^\vee)$  to bounded continuous functions on  $G$ :

$$\mu \mapsto \left( \varphi_\mu : x \mapsto \int (x, \xi) d\mu(\xi) \right).$$

This is a norm decreasing injection from  $\text{Meas}(G^\vee)$  to  $L^\infty(G)$ , and if  $\mu$  is positive, then  $\varphi_\mu$  is a function of positive type.  $\lrcorner$

*Proof:* It suffices to prove injectivity, but if  $\varphi_\mu = 0$ , then  $0 = \int \int f(x) (x, \xi) d\mu(\xi) dx = \int \widehat{f}(\xi^{-1}) d\mu(\xi)$  for all  $f \in L^1(G)$ , so but this shows  $\mu = 0$  because of (12.11.1.9) and Riesz representation.

For the positive type, notice that

$$\int \int f(x) \overline{f(y)} \varphi_\mu(y^{-1}x) dx dy = \int \int \int f(x) \overline{f(y)} \overline{(y, \xi)} (x, \xi) d\mu(\xi) dx dy = \int |\widehat{f}(\xi)|^2 d\mu(\xi) \geq 0.$$

$\square$

**Prop. (12.11.1.11) [Bochner's Theorem].** For  $\varphi \in \text{Pos}(G)$  (24.7.1.16), there exists a unique positive  $\mu \in \text{Meas}(G^\vee)$  s.t.  $\varphi = \varphi_\mu$ .  $\lrcorner$

*Proof:* We have the map defined in (12.11.1.10) injects  $M(\widehat{G})$  into  $P(G)$  (norm-decreasing), so it suffices to prove the existence. For this, we may assume  $\varphi \in P_0(G)$ . Let  $M_0$  be the set of positive measure  $\mu \in M(\widehat{G})$  that  $\mu(\widehat{G}) \leq 1$ , then  $M_0$  is weak\*-compact in  $M(\widehat{G})$ . Now

$$\int f(x)\varphi_\mu(x)dx = \int \int f(x)d\mu(\xi)dx = \int \widehat{f}(\xi^{-1})\mu(x),$$

so the mapping  $\mu \rightarrow P_0$  must be continuous w.r.t their weak\*-topologies, so the image is a compact convex subset of  $P_0$ . But the image contains all characters and 0 (by taking the point mass), which are the extreme points of  $P_0$ , by (24.7.1.25), so it contains all the  $P_0$ , by Krein-Milman (12.8.3.15).  $\square$

**Cor. (12.11.1.12).**  $\{\varphi_\mu\} = B(G)$  (24.7.1.28), by (12.11.1.11) and (12.11.1.10). Thus the inverse  $B(G) \rightarrow M(G^\vee)$  is denoted by  $f \mapsto d\mu_f$ .  $\square$

**Cor. (12.11.1.13) [Herglotz].** A sequence  $(a_n)_{n \in \mathbb{Z}_+} \in \mathbb{C}$  is positive-definite iff there is a positive measure  $\mu \in \text{Meas}(\mathbb{T}^1)$  s.t.  $a_n = \varphi_\mu(n)$ .  $\square$

**Prop. (12.11.1.14).** The set of regular Borel probability measures on a compact  $X$  is weak\*-compact in  $C(X)^*$ . (Use Alaoglu).  $\square$

**Prop. (12.11.1.15) [Fourier Inversion Formula].** (special case of (12.11.1.24)) If  $f \in B^1(G)$  (24.7.1.28), then  $\widehat{f} \in L^1(G^\vee)$ , and if the Haar measure  $d\xi$  of  $\widehat{G}$  is suitably normalized w.r.t. the Haar measure of  $G$ , then  $d\mu_f(\xi) = \widehat{f}(\xi)d\xi$  (12.11.1.12), i.e.  $f(x) = \int (x, \xi)\widehat{f}(\xi)d\xi$ . This measure  $d\xi$  is called the **dual measure** of  $dx$ .  $\square$

*Proof:* Cf. [Folland Abstract Harmonic Analysis P105].  $\square$

**Cor. (12.11.1.16).** If  $f \in L^1(G) \cap \text{Pos}(G)$ , then  $\widehat{f} \geq 0$ , as  $d\mu_f(\xi) = \widehat{f}(\xi)d\xi$  and  $\mu_f$  is positive, by Bochner's theorem (12.11.1.11).  $\square$

**Prop. (12.11.1.17) [Dual Measure of Discrete Group].** If  $\mu$  is the counting measure on a discrete group, then its dual measure satisfies  $|\widehat{G}| = 1$ , and if  $G$  is compact and  $|G| = 1$ , then the dual measure is the counting measure on  $\widehat{G}$ .  $\square$

*Proof:* First (12.11.1.8) should be noticed. If  $G$  is compact and  $|G| = 1$ , then if  $g = 1$ , then  $\widehat{g} = \chi_{\{1\}}$ , so  $g(x) = \sum (x, \xi)\widehat{g}(\xi)$ , which shows the dual measure is counting measure by definition (12.11.1.15).  $\square$

**Prop. (12.11.1.18) [Plancherel Theorem].** The Fourier transform on  $L^1(G) \cap L^2(G)$  extends uniquely to an isomorphism from  $L^2(G)$  to  $L^2(\widehat{G})$  that satisfies Fourier inversion formula.  $\square$

*Proof:* Cf. [Folland P108].  $\square$

**Cor. (12.11.1.19) [Hausdorff-Young Inequality].** Let  $1 \leq p \leq 2$  and  $p^{-1} + q^{-1} = 1$ . If  $f \in L^p(G)$ , then  $\widehat{f} \in L^q(G)$ , and  $\|\widehat{f}\|_q \leq \|f\|_p$ .  $\square$

*Proof:* Cf. [Folland, P109].  $\square$

### Schrödinger Representations

**Def. (12.11.1.20)**  $[A(G)]$ . Denote  $A(G) = G^* \times G \times \mathbb{T}^1$  with the group law

$$(v_1^*, v_1, t_1)(v_2^*, v_2, t_2) = (v_1^* + v_2^*, v_1 + v_2, t_1 t_2 \langle v_1, v_2^* \rangle).$$

Also we denote for  $w, w' \in G^* \times G$ ,  $[w, w'] = \langle v_1, v_2^* \rangle$ .

Notice the commutator

$$(v_1^*, v_1, 1)(v_2^*, v_2, 1)(v_1^*, v_1, 1)^{-1}(v_2^*, v_2, 1)^{-1} = (0, 0, \langle v_1, v_2^* \rangle \langle v_2, v_1^* \rangle^{-1}),$$

thus  $\langle v_1, v_2^* \rangle \langle v_2, v_1^* \rangle^{-1}$  defines a multiplicative skew-symmetric, bilinear and perfect pairing  $[-, -]$  of  $G^* \times G$  with itself.  $\perp$

**Thm. (12.11.1.21) [Segal-Shale-Weil].**

- There is an unitary representation of  $A(G)$  on  $L^2(G)$  given by

$$(\rho(v^*, v, t)\Phi)(u) = t \langle u, v^* \rangle \cdot \Phi(u + v),$$

called the **Schrödinger representation**. In fact, it is the induced representation  $\text{Ind}_{G \times \mathbb{T}^1}^{A(G)} \chi$ , where  $\chi(g, t) = t$ .

- This Schrödinger representation is irreducible.
- Any irreducible unitary representation of  $A(G)$  is isomorphic to the Schrödinger representation, and the isomorphism is unique up to a scalar.  $\perp$

**Remark (12.11.1.22).** This should be a direct consequence of the Stone-Von-Neumann theorem. Cf. [History of Stone Von-Neumann Theorem] ?.  $\perp$

*Proof:* Cf. [EASY PROOF OF THE STONE-VON NEUMANN-MACKEY THEOREM].

This is clearly a unitary representation.  $\rho$  induces an action of  $G^* \times G$  on  $L^2(G)$  via  $t = 1$ , thus an action of  $C_c(G^* \times G)$  on  $L^2(G)$ :

$$(\rho(\varphi)\Phi)(u) = \int_{G^* \times G} \varphi(w)(\rho(w, 1)\Phi)(u)dw = \int_G K_\varphi(u, v)\Phi(v)dv$$

where  $K_\varphi(u, u + v) = \int_{G^*} \varphi(v^*, v) \langle u, v^* \rangle dv^*$  is the Fourier transform of  $\varphi$  w.r.t.  $G^*$ . As Fourier transform is  $L^2$ -isometry,  $\varphi \mapsto K_\varphi$  extends to an isometry  $\lambda : L^2(G^* \times G) \cong L^2(G \times G)$ , whose inverse is given by

$$\varphi(v^*, v) = \int_G K_\varphi(u, u + v) \langle -u, v^* \rangle du,$$

and also the action  $\rho$  extends to all  $\varphi \in L^2(G^* \times G)$ .

It can be verified that  $\rho(\varphi_1) \circ \rho(\varphi_2) = \rho(\varphi_1 \star \varphi_2)$ , where

$$(\varphi_1 \star \varphi_2)(w) = \int_{G^* \times G} \varphi_1(w_1)\varphi_2(w - w_1)[w_1, w - w_1]dw_1.$$

Then by comparison with the equation above,  $K_{\varphi_1 \star \varphi_2} = K_{\varphi_1} \star K_{\varphi_2}$ , where  $\star$  is defined in (12.3.6.7).

$\sigma \in B_0(G)$  is of the form  $\sigma(w, t) = (s(w), f(w)t)$ , where  $w \in G^* \times G$ ,  $f : G^* \times G \rightarrow \mathbb{T}$  is a map satisfying

$$f(w_1 + w_2) = f(w_1)f(w_2)[s(w_1), s(w_2)][w_1, w_2]^{-1}.$$

Notice  $s$  preserves Haar measure on  $G^* \times G$ : it is preserved the pairing  $[\cdot, \cdot]$  as it is a commutator and  $\sigma$  fixes  $Z(A(G))$ . Thus  $s$  preserves Haar measure of  $G^* \times G$ , by (12.11.1.35).

Now we define a unitary transformation  $\Sigma$  of  $L^2(G^* \times G)$  by  $(\Sigma\varphi)(w) = f(w)^{-1}\varphi(s(w))$ , then it can be checked? by using the equations above that

$$\Sigma(\varphi_1 \star \varphi_2) = \Sigma(\varphi_1) \star \Sigma(\varphi_2).$$

Thus by the isomorphism  $\lambda : L^2(G^* \times G) \cong L^2(G \times G)$ ,  $\Sigma$  induces a unitary transformation on  $L^2(G \times G)$ , also denoted by  $\Sigma$  and it preserves  $\star$ . Then by (12.3.6.8), there is a unitary map  $\omega : L^2(G) \rightarrow L^2(G)$  that

$$\Sigma(P \otimes \overline{Q}) = \omega^{-1}(P) \otimes \overline{\omega^{-1}Q}.$$

Next, notice for any  $(w, t) \in A(G)$ ,

$$\bar{t}\lambda^{-1}(P \otimes Q)(w) = \int_G P(u)\overline{tQ(u+v)} \langle u, v^* \rangle du = (P, \rho(w, t)Q)_{L^2},$$

thus

$$\begin{aligned} (P, \rho(\sigma(w, t)))_{L^2} &= (P, \rho(s(w), f(t))Q)_{L^2} = \overline{tf(w)}\lambda^{-1}(P \otimes \overline{Q})(s(w)) \\ &= \bar{t}(\Sigma\lambda^{-1}(P \otimes \overline{Q}))(w) = \bar{t}\lambda^{-1}(\omega^{-1}(P) \otimes \overline{\omega^{-1}Q})(w) \\ &= (\omega^{-1}(P), \rho(w, t)\omega^{-1}(Q))_{L^2} \\ &= ((P), \omega\rho(w, t)\omega^{-1}(Q))_{L^2} \end{aligned}$$

Because  $P, Q$  are arbitrary, this means  $\rho(\sigma(w, t)) = \omega(\sigma) \circ \rho(w, t) \circ \omega(\sigma)^{-1}$ .

It remains to show that  $\rho$  is irreducible: For any endomorphism of  $L^2(G)$  commuting with  $\rho$ , it commutes with  $\rho(\varphi)$  for any  $\varphi \in L^2(G^* \times G)$ . Take  $\varphi = \lambda^{-1}(P \otimes \overline{Q})$ , where  $P, Q \in L^2(G)$ , then  $\rho(\varphi)\Phi = (\Phi, Q)_{L^2}P$ , so  $(T\Phi, Q)_{L^2}P = (\Phi, Q)_{L^2}TP$ . Then  $T$  is a scalar.  $\square$

### Pontryagin Duality

**Thm. (12.11.1.23) [Pontryagin Duality].** The map

$$G \rightarrow (G^\vee)^\vee : x \mapsto (\chi \mapsto \chi(x))$$

is an isomorphism of topological groups.  $\lrcorner$

*Proof:* Cf. [Folland Abstract Harmonic Analysis P110].  $\square$

**Cor. (12.11.1.24) [Fourier Inversion Theorem].** If  $f \in L^1(G)$  and  $\hat{f} \in L^1(G^\vee)$  and the measure are dual to each other (12.11.1.15), then  $f(x) = f^{\vee\vee}(x^{-1})$ , i.e.  $f(x) = \int (x, \xi) \hat{f}(\xi) d\xi$  a.e..  $\lrcorner$

*Proof:* As

$$\hat{f}(\xi) = \int \overline{(x, \xi)} f(x) dx = \int (x^{-1}, \xi) f(x) dx = \int (x, \xi) f(x^{-1}) dx,$$

so by definition  $\hat{f} \in B^1(\hat{G})$ , and  $d\mu_{\hat{f}}(x) = f(x^{-1})dx$ . Then by (12.11.1.15),  $f(x^{-1}) = f^{\wedge\wedge}(x)$ .  $\square$

**Cor. (12.11.1.25) [Fourier's Uniqueness Theorem].** If  $\mu, \nu \in M(G)$  satisfy  $\hat{\mu} = \hat{\nu}$ , then  $\mu = \nu$ . In particular, if  $f, g \in L^1(G)$  and  $\hat{f} = \hat{g}$ , then  $f = g$ .  $\lrcorner$

*Proof:* By (12.11.1.10) (norm decreasing),  $\mu$  is uniquely determined by  $\varphi_\mu(\xi) = \widehat{\mu}(\xi^{-1})$  by Fourier inversion.  $\square$

**Lemma (12.11.1.26).** If  $\varphi, \psi \in C_c(\widehat{G})$ , then  $\varphi * \psi = \widehat{h}$  where  $h \in B^1(G)$ . In particular,  $\mathcal{F}(B^1(G))$  is dense in  $L^p(\widehat{G})$  for  $p < \infty$ .  $\lrcorner$

*Proof:* Cf. [Folland, P109].  $\square$

**Prop. (12.11.1.27).**  $(fg)^\wedge = \widehat{f} * \widehat{g}$  is satisfied for  $f, g \in L^2(G)$  also.  $\lrcorner$

*Proof:* Cf. [Folland, P112].  $\square$

**Prop. (12.11.1.28) [Duality of Subgroups].**  $(H^\perp)^\perp = H$  for closed subgroup  $H$  of a locally compact Abelian group  $G$ .  $\lrcorner$

*Proof:* Suffices to prove  $(H^\perp)^\perp \subset H$ . If  $x_0 \notin H$ , then Gelfand-Raikov shows that there is a character  $\eta$  on  $G/H$  that  $\eta(q(x_0)) \neq 1$ , so  $x_0 \notin (H^\perp)^\perp$ .  $\square$

**Prop. (12.11.1.29).** If  $H$  is a closed subgroup of  $G$ , then there are natural isomorphisms of LCA groups:

$$\Phi : \widehat{(G/H)} \cong H^\perp, \quad \Psi : \widehat{G}/H^\perp \cong \widehat{H}$$

$\lrcorner$

*Proof:*  $\Phi$  is clearly algebraic isomorphism. If  $|\eta(q(K)) - 1| < \varepsilon$ , then  $|\eta(K) - 1| < \varepsilon$ , so  $\Phi$  is continuous in the compact-open topology. Similarly, to show  $\Phi$  is open, it suffices to show a compact subset of  $G/H$  has a compact inverse image in  $G$ , but this is just (12.10.3.3).

Now for  $\Psi$ , notice  $\widehat{G}/H^\perp \cong (H^\perp)^\perp \cong H$  by (12.11.1.28), so by Pontryagin duality theorem,  $\widehat{G}/H^\perp \cong \widehat{H}$ .  $\square$

**Cor. (12.11.1.30) [Hahn-Banach for LCA Groups].** By the surjectivity of  $\Psi$ , any character of  $\widehat{H}$  extends to a character of  $G$ .  $\lrcorner$

**Prop. (12.11.1.31) [Poisson Summation Formula].** For a closed subgroup  $H \leq G$  and  $f \in C_c(G)$ , define  $F(xH) = \int_H f(xy)dy$  on  $G/H$ , then  $F \in C(G/H)$  by (12.10.3.7), and:

- $\widehat{F} = \widehat{f}|_{H^\perp}$ , where  $\widehat{G}/H^\perp$  is identified with  $H^\perp$  by (12.11.1.29).
- If  $\widehat{f}|_{H^\perp} \in L^1(H^\perp)$ , then with the dual measure of  $G/H$  on  $H^\perp$  (12.11.1.15), we have

$$\int_H f(xy)dy = \int_{H^\perp} \widehat{f}(\xi)(x, \xi)d\xi.$$

In particular, take  $x = e$ , then

$$\int_H f(y)dy = \int_{H^\perp} \widehat{f}(\xi)d\xi.$$

$\lrcorner$

**Remark (12.11.1.32).** The condition that  $f \in C_c(G)$  can be loosen to  $f \in C(G) \cap L^1(G)$  if it can be proven that  $F \in C(G/H)$ . For example this is case if  $H$  is discrete and the summation w.r.t.  $H$  is locally uniformly continuous.  $\lrcorner$

*Proof:* Notice for  $\xi \in H^\perp$ ,

$$\widehat{F}(\xi) = \int_{G/H} F(xH) \overline{(x, \xi)} d(xH) = \int_{G/H} \int_H f(xy) \overline{(xy, \xi)} dy d(xH) = \int_G f(x) \overline{(x, \xi)} dx = \widehat{f}(\xi)$$

by (12.10.3.7). And 2 is just (12.11.1.24) applied to  $F(xH)$  on  $G/H$ .  $\square$

**Cor. (12.11.1.33).** In the situation of (12.11.1.31), if  $H$  is discrete in  $G$  and  $G/H$  is compact, then both  $H, H^\perp$  are discrete. By considering the dual measure using (12.11.1.17), the Poisson' summation formula reads:

$$\sum_H f(xy) = \frac{1}{\text{Vol}(G/H)} \sum_{H^\perp} \widehat{f}(\xi)(x, \xi).$$

┘

### Perfect Pairings

**Def. (12.11.1.34) [Self-Adjoint Haar Measures].** If there is an isomorphism  $G \cong G^\vee$ , or a perfect bilinear pairing  $G \times G \rightarrow \mathbb{C}^*$ , then by Fourier inversion (12.11.1.15), a Haar measure  $d\mu$  on  $G$  corresponds to a Haar measure  $d\alpha$  on  $\widehat{G}$ , but via the isomorphism,  $d\alpha$  corresponds to a measure  $\widehat{d\alpha}$  on  $G$ . Now anyway, there is a unique  $d\mu$  that  $d\mu = \widehat{d\alpha}$ , and this is called the **self-dual Haar measure** on  $G$ .

Via this pairing, we define the Fourier transform as an isomorphism

$$L^2(G) \cong L^2(G) : \Phi(f)(x) = \int_G f(y) \overline{\langle x, y \rangle} d\mu(y).$$

Then  $d\mu$  is a self-dual measure is equivalent to  $\Phi(\Phi(f))(x) = f(-x)$ , or equivalently  $f(y) = \int_G \widehat{f}(y) \langle x, y \rangle d\mu(y)$ .  $\square$

**Prop. (12.11.1.35).** If  $G$  is a locally compact Abelian group, and there is a perfect bilinear pairing  $G \times G \rightarrow \mathbb{C}^*$  and  $\sigma : G \rightarrow G$  is a group automorphism of  $G$  that preserves this pairing, then  $\sigma$  preserves the Haar measure on  $G$ .  $\square$

*Proof:* It is clear that  $\sigma^* d\mu = |\sigma| d\mu$  for some real constant  $|\sigma| > 1$ . Consider the Fourier transform w.r.t. this pairing:  $\mathcal{F}\varphi(x) = \int_G \varphi(y) \langle x, y \rangle dy$ , then  $\mathcal{F}(\varphi \circ \sigma) = |\sigma|^{-1} \mathcal{F}(x)$ . But  $\mathcal{F}$  is an isomorphism  $L^2(G) \cong L^2(G)$ , so  $|\sigma|^{-1} = |\sigma|$ , thus  $|\sigma| = 1$ .  $\square$

**Prop. (12.11.1.36) [Self Duality of Topological Fields].** Let  $K$  be a locally compact topological field. If  $X$  is a non-trivial character on the additive group  $K^+$ , then for any  $\eta \in K^+$ ,  $\xi \mapsto X(\eta\xi)$  is also a character, and

$$F_X : \eta \mapsto (\xi \mapsto X(\eta\xi))$$

is an isomorphism of topological groups of  $K^+$  and  $(K^+)^{\vee}$ .

Then by (12.11.1.34), we find a self-dual Haar measure  $dx$  on  $K^+$  w.r.t.  $X$ .

In fact, such a character  $X$  does exist, by Gelfand-Raikov (24.7.1.29).  $\square$

*Proof:* First this is clearly a homomorphism of groups, and it is injective, because if  $X(\eta\xi) = 1$  for all  $\xi$ , then  $\eta K^+ \neq K^+$  (because  $X$  is nontrivial), so  $\eta = 0$ .

Now the image of  $F$  is dense, because if  $X(\eta\xi) = 1$  for all  $\eta$ , then  $\xi = 0$ , so  $\overline{\text{Im}(F)}^\perp = 1$ . Now  $(H^\perp)^\perp = H$  for  $H$  closed (12.11.1.28) and use Pontryagin duality (12.11.1.23), so  $\text{Im } f$  is dense in  $\widehat{G}$ .

Now  $F$  is open and continuous, because: for any  $B \in G$  compact, there is a nbhd  $V$  of 0 that  $|X(V) - 1| < \varepsilon$ , so there is a nbhd  $V'$  that  $V'B \subset V$ , so if  $\eta \in V$ ,  $|X(\eta B) - 1| < \varepsilon$ , so  $F$  is continuous ( $\widehat{K^+}$  has the compact-open topology). And if we choose  $\xi_0$  that  $X(\xi_0) \neq 1$ , then choose  $B = \overline{B(0, \frac{|\varepsilon_0|}{\varepsilon})}$  compact, if  $|X(\eta B) - 1| < |X(\xi_0) - 1|$ , then  $\xi_0 \notin \eta B$ , which means that  $|\eta| < \varepsilon$ . This means  $F(\overline{B(0, \varepsilon)})$  contains  $V(B, |X(\xi_0) - 1|)$ , so  $F$  is open.

So the image of  $F$  is a locally compact subgroup of  $\widehat{G}$ , so by (12.10.1.6) it is closed, hence equals  $G$  as it is dense, so  $F$  is surjective, and is an isomorphism.  $\square$

## 2 Distributions on $\mathbb{R}^n$

Reference are [Rud91], [泛函分析张恭庆] and [Harmonic Analysis: Real Variable Methods, Orthogonality, and Oscillatory Integrals, Stein]. Notice much should be rewritten in greater generality of [Harmonic Analysis on Locally Compact Groups](#).

**Notation (12.11.2.1).**

- Let  $n \in \mathbb{Z}_+$ .
- Let  $\Omega \subset \mathbb{R}^n$  be an open subset.

┘

**Def. (12.11.2.2) [Test Functions].** The vector space

$$\mathcal{T}(\Omega) = \varinjlim_{K \subset \Omega \text{ compact}} D(K) \quad (12.8.2.1)$$

with the colimit topology is called the space of **test functions** on  $\Omega$ . Then  $(\mathcal{T}(\Omega), \tau) \in \text{TVS}(12.7.1.1)$ .

┘

**Prop. (12.11.2.3) [Test Functions].**

- $\mathcal{T}(\Omega)$  is locally convex.
- If  $E \subset \mathcal{T}(\Omega)$  is bounded, then  $E \subset D(K)$  for some compact subset  $K \subset \Omega$ , and  $\|E\|_n(12.8.2.1)$  is bounded for each  $n \in \mathbb{Z}_+$ .
- $\mathcal{T}(\Omega)$  has the Heine-Borel property.
- $\mathcal{T}(\Omega)$  is complete (12.7.1.2).

┘

*Proof:* Cf. [Rud91]P153?.

$\square$

**Prop. (12.11.2.4).** If  $\Lambda : \mathcal{T}(\Omega) \rightarrow Y \in \text{TVS}$  and  $Y$  is locally convex, then  $\Lambda$  is continuous iff it is bounded iff it is sequentially-continuous iff its restriction to each  $D(K)$  for compact subset  $K \subset \Omega$  is continuous.

┘

*Proof:* Cf. [Rud91]P155?.

$\square$

**Cor. (12.11.2.5) [Differential Operators].** For each multi-index  $\alpha$ ,  $D^\alpha$  defines a continuous map  $\mathcal{T}(\Omega) \rightarrow \mathcal{T}(\Omega)$ .

┘

**Def. (12.11.2.6) [Distributions].** The space of continuous linear functionals of  $\mathcal{T}(\Omega)$  (12.11.2.2) is called the space of **distributions** on  $\Omega$ , denoted by  $\text{Dist}(\Omega)$ . It is equivalence to the restriction to every  $D(K)$  is continuous, by (12.11.2.4).

┘

**Def. (12.11.2.7) [Order of Distributions].** For  $\Lambda \in \text{Dist}(\Omega)$  (12.11.2.6), the **order (of distribution)** of  $\Lambda$  is the infimum of all  $N \in \mathbb{N}$  s.t. for any compact subset  $K \subset \Omega$ , there exists  $C_K \in \mathbb{R}_+$  that  $|\Lambda\varphi| \leq C_K \|\varphi\|_N$  for every  $\varphi \in D(K)$ . The order might be  $\infty$ .  $\lrcorner$

**Def. (12.11.2.8) [Dirac Measure].** The **Dirac measure** at  $x \in \mathbb{R}^n$  is defined to be the distribution  $\delta_x \in D'(\Omega) : \varphi \mapsto \varphi(x)$ .  $\delta_0$  is also denoted by  $\delta$ .  $\lrcorner$

**Def. (12.11.2.9) [Differentiation of Distributions].** The **differentiation of a distribution**  $\Lambda$  is defined as  $D^\alpha \Lambda(\varphi) = (-1)^{|\alpha|} \Lambda(D^\alpha \varphi)$ .

Multiplication of a distribution by a smooth function  $f$  is defined by  $(f\Lambda)(\varphi) = \Lambda(f\varphi)$ .

The following relation holds:

$$D^\alpha(f\Lambda) = \sum_{\beta \leq \alpha} C_{\alpha\beta}(D^{\alpha-\beta}f)(D^\beta\Lambda).$$

$\lrcorner$

### Support of Distributions

**Def. (12.11.2.10) [Support of Distributions].** The **support of a distribution** is the complement  $\text{Supp}(\Lambda)$  of the open sets  $U$  that  $\Lambda(f) = 0$  for any  $f$  with support in  $U$ .

If  $\text{Supp}(\Lambda)$  is compact, then  $\Lambda$  has finite order and  $|\Lambda\phi| \leq C \|\phi\|_N$  for some  $N$ , and  $\Lambda$  extends uniquely to a continuous linear functional on  $C^\infty(\Omega)$ .  $\lrcorner$

*Proof:* This is because its support is compact so we can choose a smooth  $\psi$  that  $\equiv 1$  on  $\text{Supp} \varphi$  and has support in  $W \subset \Omega$ . Then by (12.11.2.2), there is a  $C$  that  $|\Lambda(\psi\varphi)| < C \|\psi\varphi\|_N$ , and Leibniz rule will give us the result.  $\square$

**Prop. (12.11.2.11).** If the support of a  $\Lambda$  is a pt  $p$  (thus has finite order  $m$ ), then it is a linear combination of  $D^\alpha \delta_p, |\alpha| \leq m$ . (use approximate identity and show the kernel of  $\Lambda$  is contained in the kernel of  $D^\alpha \delta_p$ ).  $\lrcorner$

*Proof:* Cf. [Rudin P165].  $\square$

**Prop. (12.11.2.12).** For any distribution  $\Lambda$ , there exist continuous functions  $g_\alpha$  in  $C^\infty(\Omega)$  that each compact  $K$  intersects support of f.m  $g_\alpha$  and  $\Lambda = \sum D^\alpha g_\alpha$ . When  $\Lambda$  has finite order, we can use only f.m  $g_\alpha$ .  $\lrcorner$

*Proof:* use partition of unity. Then for a compact  $K$ , find a compact-open  $W$ , then find a bump function between  $K \subset W$ , thus reduce to the case of  $D_{\overline{W}}$ . For the rest, Cf. [Rudin P169].  $\square$

### Convolution on $\mathbb{R}^n$

**Notation (12.11.2.13).**

- Denote  $\mathcal{D} = \mathcal{D}(\mathbb{R}^n)$  and  $\mathcal{D}' = \mathcal{D}'(\mathbb{R}^n)$ .  $\lrcorner$

**Def. (12.11.2.14) [Translations and Convolutions of Distributions].** The **translation** of a distribution  $u$  is defined as  $(\tau_x u)(\varphi) = u(\tau_{-x} \varphi)$ , where  $\tau_x \varphi(y) = \varphi(y - x)$ .

The **convolution** of a test function with a distribution  $u$  is defined as  $(u * \varphi)(x) = u(\tau_x \check{\varphi})$ , where  $\check{\varphi}(y) = \varphi(-y)$ .  $\lrcorner$

**Prop. (12.11.2.15)**[Special Case of (12.11.2.18)]. For  $u \in D', \varphi \in D, \psi \in D$ ,

- $\tau_x(u * \varphi) = (\tau_x u) * \varphi = u * (\tau_x \varphi)$ .
- $u * \varphi \in C^\infty$  and  $D^\alpha(u * \varphi) = (D^\alpha u) * \varphi = u * (D^\alpha \varphi)$ .
- $u * (\varphi * \psi) = (u * \varphi) * \psi$ .

If  $u$  has compact support, then (12.11.2.10) shows that  $u$  can extend to  $C^\infty$ , thus convolution is defined for  $\varphi \in C^\infty$  and the first two formulae still hold, and when  $\psi \in D$ ,

$$u * \psi \in D, \quad u * (\varphi * \psi) = (u * \varphi) * \psi = (u * \psi) * \varphi$$

┘

*Proof:* Cf.[Rudin P171], [Rudin P174].

□

**Cor. (12.11.2.16).**  $L : \varphi \mapsto u * \varphi$  is a continuous linear map into  $C^\infty$  that commutes with  $\tau_x$ . And any these map comes from a  $u$ : let  $u = (L\check{\varphi})(0)$ .

┘

*Proof:* It is continuous because of of closed graph theorem (12.7.2.9),  $\lim(u * \varphi_i)(x) = \lim u(\tau_x \check{\varphi}) = u(\tau_x \check{\varphi})$ .

□

**Cor. (12.11.2.17).** When  $u, v \in D'$  and one of them has compact support, then similar to (12.11.2.16),  $L\varphi = u * (v * \varphi)$  is a continuous linear map that commutes with  $\tau_x$ , so there is a unique **convolution distribution**  $u * v$  that  $(u * v) * \varphi = u * (v * \varphi)$ . This convolution is compatible with the previous one when  $v \in D$ .

┘

**Prop. (12.11.2.18)**[Convolution of Distributions]. For  $u, v, w \in D'$ ,

- if one of  $u, v$  has compact support, then  $u * v = v * u$ , and  $\text{Supp}(u * v) \subset \text{Supp}(u) + \text{Supp}(v)$ .
- if two of three of  $u, v, w$  has compact support, then  $(u * v) * w = u * (v * w)$ .
- $D^\alpha u = (D^\alpha \delta) * u$ .
- if one of  $u, v$  has compact support, then  $D^\alpha(u * v) = (D^\alpha u) * v = u * (D^\alpha v)$ .

┘

*Proof:* Cf.[Rudin P177].

□

**Def. (12.11.2.19).** A **approximate identity** here is a  $h \in D$  that  $h_k(x) = k^n h(kx)$ . Then we will have  $\lim \varphi * h_j = \varphi$  for  $\varphi \in D$ ,  $\lim u * h_j = u$  in  $D'$ .

┘

### 3 Fourier Analysis on $\mathbb{R}^n$

Reference are [Red91], [泛函分析张恭庆] and [Harmonic Analysis: Real Variable Methods, Orthogonality, and Oscillatory Integrals, Stein]. Notice much should be rewritten in greater generality of [Harmonic Analysis on Locally Compact Groups](#).

**Def. (12.11.3.1)**[Normalized Differentials]. Denote the normalized notation  $\mathbb{E}^n$  as  $dm = (\sqrt{2\pi})^{-n} dx$  and

$$D_\alpha = \frac{1}{i^{|\alpha|}} D^\alpha = \frac{1}{i^{|\alpha|}} \frac{\partial^\alpha}{\partial x^\alpha},$$

which will simplify many notations compared to  $D^\alpha$ . The **Fourier transform** here of a function  $f \in L^1(\mathbb{R}^n)$  is the function  $\mathcal{F}(f) \in C(\mathbb{R}^n)$  s.t.

$$\mathcal{F}f(t) = \int_{\mathbb{R}^n} f e_{-t} dm_n = (f * e_t)(0).$$

See (12.11.3.12) for general Fourier transform.

┘

**Prop. (12.11.3.2)[Invariant Properties].** For  $f \in L^1(\mathbb{R})$ ,

$$\mathcal{F}(\tau_x f) = e_{-x} \mathcal{F} f, \quad \mathcal{F}(e_{-x} f) = \tau_x \mathcal{F} f,$$

$$\widehat{f * g} = \widehat{f} \cdot \widehat{g}, \quad \widehat{f(x/\lambda)}(t) = \lambda^n \widehat{f}(\lambda t).$$

(Note  $\|f * g\|_1 \leq \|f\|_1 \|g\|_1$ ). ┘

**Lemma (12.11.3.3).** Let  $f = e^{-1/2|x|^2}$ , then  $f \in \mathcal{S}$ ,  $\widehat{f} = f$  and  $f(0) = \int \widehat{f}$ . ┘

*Proof:* Reduce to the 1 dimensional case, in which case,  $f^\lambda + xy = 0$ , and  $\mathcal{F} f$  also satisfies this. □

**Lemma (12.11.3.4).** For  $f, g \in L^1$ , Fubini theorem shows  $\int \widehat{f} g = \int f \widehat{g}$ . ┘

**Prop. (12.11.3.5)[Classical Fourier-Transform].**

- $\mathcal{S}(\mathbb{R}^n)$  is a Fréchet space in the topology defined by these norms.
- multiplication by  $g \in \mathcal{S}(\mathbb{R}^n)$  and derivations are continuous linear map from  $\mathcal{S}$  to  $\mathcal{S}$  (direct calculation).
- $\widehat{P(D)f}(t) = P(t)\widehat{f}(t)$  and  $\widehat{Pf} = P(-D)\widehat{f}$ .
- The Fourier-transform is a continuous linear bijection of  $\mathcal{S}$ , and  $\mathcal{F}^2(f)(t) = f(-t)$ . ┘

*Proof:* 1:

2:

3: use (12.11.2.18) for the first one, and for the second one, should use definition of derivative and dominated convergence.

4:  $\Psi f \in \mathcal{S}$  by 3, and it is continuous by closed graph theorem. By (12.11.3.4) and (12.11.3.2),  $\int \widehat{f}(t)g(t/\lambda) = \int f(t/\lambda)\widehat{g}(y)$ . If  $\widehat{f}, \widehat{g} \in L^1$ , dominant convergence shows  $g(0) \int \widehat{f} = f(0) \int \widehat{g}$ . So we only need one  $f$  that  $f(0) = \int \widehat{f}$ ,  $f = e^{-1/2|x|^2}$  will suffice (12.11.3.3). Hence  $g(0) = \int \widehat{g}$  for every such  $g$ , and the conclusion follows by translation (12.11.3.2), and (12.11.1.15) also follows. □

**Cor. (12.11.3.6).** If  $f \in L^1(\mathbb{R}^n)$ , then  $\mathcal{F} f \in C_0(\mathbb{R}^n)$ , and  $\|\mathcal{F} f\|_\infty \leq \|f\|_1$ , because  $\mathcal{S}(\mathbb{R}^n) \subset L^1(\mathbb{R}^n)$  is dense. ┘

**Prop. (12.11.3.7)[Fourier-Inversion Theorem].** If  $f \in L^1(\mathbb{R}^n)$  and  $\widehat{f} \in L^1(\mathbb{R}^n)$ , then  $\check{f} = \Psi^2 f$  a.e. ┘

*Proof:* In (12.11.3.4), let  $g \in \mathcal{S}$  and substitute  $g = \Psi g$  and use Fubini, we get  $\check{f} - \Psi^2 f$  is orthogonal to every  $\mathcal{S}$ , then every continuous function with compact support by (12.3.8.11). Thus they equal a.e. □

**Cor. (12.11.3.8).** For  $f, g \in \mathcal{S}$ , we have  $\mathcal{F}(fg) = \mathcal{F}(f) * \mathcal{F}(g)$  (apply Fourier one time and use (12.11.3.2)), and thus  $f * g \in \mathcal{S}$ . ┘

**Prop. (12.11.3.9)[Fourier-Plancherel].** If  $f, g \in \mathcal{S}$ , then

$$\int f \bar{g} = \int \bar{g}(x) \widehat{f}(t) e^{ixt} = \int \widehat{f}(t) \int \bar{g}(x) e^{ixt} = \int \widehat{f} \bar{\widehat{g}}$$

by inversion formula. And  $\mathcal{S}$  is dense in  $L^2$ , thus it extends to a linear isometry of  $L^2(\mathbb{R}^n) \rightarrow L^2(\mathbb{R}^n)$ . This coincides with the Fourier transform on  $L^1 \cap L^2$ . ┘

**Prop. (12.11.3.10) [Tempered Distributions].**  $D$  injects into  $\mathcal{S}$  and is dense. (Notice they both are complete, but the subspace topology are different) (Use scaling, Cf. [Rudin Functional Analysis P189]). So we call a distribution **tempered** iff it comes from a continuous functional of  $\mathcal{S}$ .

From (12.11.2.10), any distribution with compact support is tempered. By Hölder, every  $f \in L^p(\mathbb{R}^n), p \geq 1$  is tempered distribution, and every polynomial or functions of polynomial growth are tempered distribution.

$$D \subset \mathcal{S} \subset L^2 = (L^2)^\vee \subset \mathcal{S}' \subset D'.$$

$\mathcal{S}, \mathcal{S}'$  is complete (12.7.4.2).  $\lrcorner$

**Prop. (12.11.3.11).**  $f \in \mathcal{S}'$  iff  $f = \sum_{|\alpha| \leq m} D_\alpha(u_\alpha(1 + |x|^2)^{m/2})$  for some  $m \in \mathbb{Z}_+$ , where  $u_\alpha \in L^2(\mathbb{R}^n)$ .  $\lrcorner$

*Proof:* In fact,

$$\|\varphi\|'_m = \left( \sum_{|\alpha| \leq m} \int (1 + |x|^2)^m |D_\alpha \varphi|^2 dx \right)^{1/2}$$

is an equivalent set of norms of  $\mathcal{S}'$ , Cf. [泛函分析张恭庆 P182]. And each of them defines a Hilbert space. So by Riesz we get the result.  $\square$

**Prop. (12.11.3.12) [Fourier Transform of Tempered Distributions].** Define the **Fourier transformation** of a tempered distribution  $u \in \mathcal{S}'(\mathbb{R}^n)$  as the tempered distribution  $\mathcal{F}u(\varphi) = u(\mathcal{F}\varphi)$ .

It is easily verified this definition is compatible with previously defined Fourier transform when seen as tempered distributions by?? In particular, this is defined for compactly supported distribution,  $L^p(\mathbb{R}^n), p \geq 1$  and smooth functions of polynomial growth (12.11.3.10).  $\lrcorner$

**Prop. (12.11.3.13) [ $\mathcal{S}' = \mathcal{F}(\mathcal{S}')$ ].** For  $u \in \mathcal{S}'(\mathbb{R}^n)$ , we have

$$\mathcal{F}(P(D)u) = P \mathcal{F}u, \quad \mathcal{F}(Pu) = P(-D) \mathcal{F}u.$$

And the Fourier transformation is a continuous linear isometry of  $\mathcal{S}'$  in the weak\* topology.  $\lrcorner$

**Cor. (12.11.3.14).**  $\hat{1} = \delta$ , thus for any  $P \in \mathbb{R}[X_1, \dots, X_n]$ , we have

$$\mathcal{F}P = P(-D)\delta, \quad \mathcal{F}(P(D)\delta) = P.$$

Now (12.11.2.11) tells us a distribution is the Fourier transform of a polynomial iff it has support in the origin.  $\lrcorner$

**Prop. (12.11.3.15) [Convolution of Tempered Distributions].** For  $u \in \mathcal{S}'(\mathbb{R}^n)$  and  $\varphi, \psi \in \mathcal{S}(\mathbb{R}^n)$ ,

- $u * \varphi$  is smooth of polynomial growth and  $D^\alpha(u * \varphi) = (D^\alpha u) * \varphi = u * (D^\alpha \varphi)$ .
- $u * (\varphi * \psi) = (u * \varphi) * \psi$ .
- If  $P \in \mathbb{R}[X_1, \dots, X_n]$ , then  $D^\alpha u, Pu$  and  $\varphi u$  are all tempered.
- $\mathcal{F}(u * \varphi) = \mathcal{F}\varphi \cdot \mathcal{F}u, \mathcal{F}u * \mathcal{F}\varphi = \mathcal{F}(\varphi u)$ .

$\lrcorner$

*Proof:* Cf. [Rudin Functional Analysis P195] for the first 3.  $\square$

**Poisson's Summation Formula**

**Def. (12.11.3.16) [Poisson's Summation Formula for Lattices].** Let  $V \in \text{Vect}^n/\mathbb{R}$  with an Haar measure  $\mu$ ,  $\Gamma \subset V$  a complete lattice, and  $\Gamma' \subset V^\vee$  be its  $\mathbb{Z}$ -dual, then for any  $f \in \mathcal{S}(V)$ , we have

$$\sum_{x \in \Gamma} f(x) = \frac{1}{\text{Vol}(V/\Gamma)} \sum_{y \in \Gamma'} \mathcal{F}f(y).$$

In fact it suffices to assume that  $f(x) = O((1 + |x|)^{-d-\delta})$ ,  $\text{Fou}f(x) = O((1 + |x|)^{-d-\delta})$  for some  $\delta \in \mathbb{R}_+$ . These functions are called **admissible functions**.  $\lrcorner$

*Proof:* Use (12.11.1.33). It suffices to show that the function  $F(x) = \sum_{\gamma \in \Gamma} f(x + \gamma)$  is locally uniformly continuous, which is clear.  $\square$

**Cor. (12.11.3.17) [1-Dimensional Poisson's Summation Formula].** Suppose  $f \in \mathcal{S}(\mathbb{R})$ , then we have

$$\sum_{m \in \mathbb{Z}} f(m) = \sum_{n \in \mathbb{Z}} \mathcal{F}f(n).$$

And by changing  $f(x)$  into  $f(ux + v)$  where  $u \in \mathbb{R}_+$  and  $v \in \mathbb{R}$ , we have

$$\sum_{m \in \mathbb{Z}} f(vm + u) = \frac{1}{v} \sum_{n \in \mathbb{Z}} (\mathcal{F}f)\left(\frac{n}{v}\right) e^{2\pi i \frac{un}{v}},$$

or equivalently

$$\sum_{m \in \mathbb{Z}} f\left(\frac{n}{v}\right) e^{2\pi i \frac{un}{v}} = v \sum_{m \in \mathbb{Z}} (\mathcal{F}f)(vm + u).$$

More generally, for any  $N \in \mathbb{Z}_+$  and  $\chi \in \text{Diri}(N)$ , we have

$$\sum_{m \in \mathbb{Z}} f(m) \chi(m) = \frac{\tau(\chi)}{N} \sum_{n \in \mathbb{Z}} (\mathcal{F}f)\left(\frac{n}{N}\right) \bar{\chi}(n) \quad (35.3.6.8).$$

$\lrcorner$

*Proof:* The last assertion follows from (35.3.6.11).  $\square$

**Cor. (12.11.3.18).** For  $y \in \mathbb{R}_+$ , we have

$$\sum_{n \in \mathbb{Z}} e^{2\pi i n x} e^{-\pi n^2/y} = \sqrt{y} \sum_{m \in \mathbb{Z}} e^{-\pi(m+x)^2 y}.$$

In particular, we have

$$\sum_{n \in \mathbb{Z}} e^{-\pi n^2/y} = \sqrt{y} \sum_{m \in \mathbb{Z}} e^{-\pi m^2 y}.$$

$\lrcorner$

**Prop. (12.11.3.19) [Fourier-Transform of Radial Functions].** Let  $d \in \mathbb{Z}_+$  and let  $f \in L^1(\mathbb{R}^d)$  be a radial function, then w.r.t, the Euclidean measure,

$$\mathcal{F}(f)(t) = 2\pi |t|^{1-\frac{d}{2}} \int_0^\infty f(r) J_{d/2-1}(2\pi r|t|) r^{d/2} dr,$$

where  $J_{d/2-1}$  is the Bessel function of order  $d/2 - 1$  ?. In particular,  $\mathcal{F}(f)$  is also radial.  $\lrcorner$

*Proof:* Cf.[Andrews, R. Askey, and R. Roy, Special Functions]9.10.3? . □

**Cor. (12.11.3.20).** Let  $k \in \mathbb{Z}_+$  and let  $f = g(|x|^2)|x|^{1-k/2} \in C_c^\infty(\mathbb{R}^d)$  where  $g \in C_c^\infty(\mathbb{R}_+)$ , then

$$\mathcal{F}(f)(y) = h(|y|^2)|y|^{1-k/2},$$

where

$$h(y) = \pi \int_0^\infty J_{k/2-1}(2\pi\sqrt{xy})g(x)dx.$$

┘

*Proof:* Cf.[I-K04]P90. □

**Def. (12.11.3.21) [Spherical Harmonics].** Let  $k \in \mathbb{Z}_+$  and  $L = \frac{\partial^2}{\partial x_1^2} + \dots \frac{\partial^2}{\partial x_k^2}$  is the Laplacian-operator on  $\mathbb{R}^k$ , then a homogenous polynomial  $P \in \mathbb{C}[x_1, \dots, x_k]$  is called a **spherical harmonic polynomial** if it satisfies  $L(P) = 0$ .

If  $P$  is a spherical harmonic polynomial of degree  $d$ , then we have

$$\mathcal{F}(P(x)e^{-\pi x^2})(y) = i^d P(y)e^{-\pi y^2}.$$

┘

**Prop. (12.11.3.22) [Spherical Harmonics and Fourier-Transforms of Radial Functions].** If  $P$  is a spherical harmonic polynomial of degree  $d$ (12.11.3.21), then for any  $g \in C_c^\infty(\mathbb{R}_+)$  we have

$$\mathcal{F}\left(P(y)g(|x|^2)|x|^{1-k/2}\right) = P(y)h(|y|^2)|y|^{1-k/2},$$

where

$$h(y) = \pi \int_0^\infty J_{k/2+d-1}(2\pi\sqrt{xy})g(x)dx \text{ (12.11.3.20).}$$

┘

*Proof:* ? Compare with(12.11.3.20). □

### Paley-Wiener Theory

**Thm. (12.11.3.23) [Paley-Wiener Theorem].** For  $\varphi \in D(\mathbb{R}^n)$  with support in  $rB$ , the You-Know-How defined  $\widehat{\varphi}(z)$  is an entire function of several variable and satisfies:

$$|\varphi^\vee(z)| \leq \gamma_N(1 + |z|)^{-N} e^{r|\operatorname{Im} z|}.$$

For  $N \geq 0$ . Conversely, any such function correspond to a  $\varphi \in D(\mathbb{R}^n)$  that has support in  $rB$ . ┘

*Proof:* Cf.[Rudin P198]. □

**Prop. (12.11.3.24) [Fourier-Laplace transformation].** For  $u \in D'(\mathbb{R}^n)$  of order  $N$  that has support in  $rB$ , the  $\widehat{u}(z) = u(e_{-z})$  is an entire function of several variable and satisfies:

$$|f(z)| \leq \gamma(1 + |z|)^N e^{r|\operatorname{Im} z|}.$$

Conversely, any such function correspond to a  $u \in D'(\mathbb{R}^n)$  that has support in  $rB$ . ┘

*Proof:* Cf.[Rudin P199]. □

### Gaussian Integrals

**Notation (12.11.3.25).** Let  $V \in \text{Vect}^d/\mathbb{R}$  and  $M(V)$  be the set of non-degenerate complex symmetric bilinear forms  $B$  on  $V$  with  $\text{Re } B \geq 0$ . And let  $M^0(V) \subset M(V)$  be the open dense subset consisting of forms  $B$  with  $\text{Re } B > 0$ .

Suppose  $V$  is endowed with an Haar measure  $dx$ , so we can define  $\det B$  for  $B \in M(V)$ . As  $M(V)$  is star-shaped thus simply-connected, we can also define the principle square  $(\det B)^{1/2}$ .

Any such  $B$  induces an isomorphism  $\varphi_B : V \rightarrow V^* : x \mapsto B(x, -)$ , and thus induces an inner product on the dual space:

$$B^{-1}(l, l') = B(\varphi_B^{-1}l, \varphi_B^{-1}l') = l(\varphi_B^{-1}l').$$

And there are isomorphisms:

$$B \mapsto B^{-1} : M(V) \cong M(V^*), \quad M^0(V) \cong M^0(V^*).$$

┘

**Lemma (12.11.3.26) [Gaussian Integral].** For  $B \in M(V)$ ,  $e^{-\frac{1}{2}B(x,x)} \in \mathcal{S}(V)$ , and its Fourier transform is

$$\mathcal{F}(e^{-\frac{1}{2}B(x,x)})(p) = (\det B)^{-1/2} e^{-\frac{1}{2}B^{-1}(p,p)}, \quad p \in V^*.$$

┘

*Proof:* By continuity ?, it suffices to prove this for  $B \in M^0(V)$ . In this case  $B$  is diagonalizable and the statement is reduced to the case  $\dim V = 1$ . In this case, it suffices to show that for any  $a \in \mathbb{C}, \text{Re } a > 0$  and  $p \in \mathbb{R}$ ,

$$\frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} e^{-ipx - \frac{1}{2}ax^2} dx = \frac{1}{\sqrt{a}} e^{-\frac{1}{2a}p^2}.$$

And this follows from??.

□

**Prop. (12.11.3.27).** For  $g \in \mathcal{S}(V)$ ,  $B \in M(V)$ , consider the integral

$$I_g(\hbar) = \int_V g(\hbar x) e^{-B(x,x)} dx, \quad \hbar \geq 0,$$

then  $I_g \in C^\infty([0, \infty))$  with

$$I_g'(\hbar) = I_{\frac{1}{2}\Delta_B(g)}(\hbar) \text{ (13.1.3.2).}$$

And also

$$I_g(0) = (2\pi)^{d/2} \frac{g(0)}{\sqrt{\det B}}.$$

┘

*Proof:* The last assertion follows from (12.11.3.26) where  $p = 0$ .

Then we prove  $I_g$  is continuous: Only the continuity at  $\hbar = 0$  is non-trivial. By Plancherel formula,

$$I_g(\hbar) = \left( g(\hbar^{\frac{1}{2}}x), e^{-\frac{1}{2}B(x,x)} \right) = \hbar^{-\frac{d}{2}} (\det B)^{-\frac{1}{2}} (g^\vee(\hbar^{-\frac{1}{2}}p), e^{-\frac{1}{2}B^{-1}(p,p)}) = (\det B)^{-\frac{1}{2}} (g^\vee(p), e^{-\frac{\hbar}{2}B^{-1}(p,p)}).$$

But  $e^{-\frac{\hbar}{2}B^{-1}(p,p)} \rightarrow 1$  in  $\mathcal{S}'(V^*)$  as  $\hbar \rightarrow 0$ , so

$$\lim_{\hbar \rightarrow 0} I_g(\hbar) = (\det B)^{-\frac{1}{2}} (g^\vee(p), 1) = (2\pi)^{\frac{d}{2}} (\det B)^{-\frac{1}{2}} g(0) = I_g(0).$$

To prove smoothness: If  $\hbar > 0$ , then by differentiation,

$$I_g'(h) = \frac{1}{2}h^{-1}I_{Eg}(\hbar),$$

where  $E = \sum_i e_i^* \partial_{e_i}$  is the Euler vector field on  $V$  (13.1.3.1). So by (12.11.3.28),

$$I_g'(\hbar) = I_{\frac{1}{2}\Delta_B g}(\hbar).$$

Then it suffices to prove that  $I_g \in C^1([0, \infty))$  and use induction. For this, notice first that if  $C$  is a positive definite real form on  $V$ , then by (12.11.3.26),

$$I_{e^{-\frac{1}{2}C(x,x)}}(\hbar) = \int_V e^{-\frac{1}{2}(B+\hbar C)(x,x)} dx = (2\pi)^{\frac{d}{2}} \det(B + \hbar C)^{-\frac{1}{2}}$$

is smooth. Thus by linearity, we may assume that  $g(0) = 0$ . Then it follows from Taylor expansion (12.3.3.17) that  $g$  is a linear combination of functions of the form  $lf$ , where  $l \in V^*$  and  $f \in \mathcal{S}(V)$ . Thus we may assume  $g = lf$ , and then it follows from (12.11.3.28) that

$$\lim_{\hbar \rightarrow 0} \frac{I_g(\hbar) - I_g(0)}{\hbar} = I_{\varphi_B^{-1}(l)f}(\hbar),$$

which is just  $I_{\frac{1}{2}\Delta_B g}(\hbar)$ , because

$$\frac{1}{2}\Delta_B g(0) = \sum_j l(e_j) \partial_{\varphi_B^{-1}e_j^*} f(0) = \partial_{\varphi^{-1}(l)} f(0).$$

This proves that the assertion. □

**Lemma (12.11.3.28).** For  $f \in \mathcal{S}(V)$  and  $l \in V^*$ ,

$$I_{lf}(\hbar) = \hbar I_{\varphi_B^{-1}(l)f}(\hbar).$$

┘

*Proof:*

$$\begin{aligned} I_{lf}(\hbar) &= \hbar^{\frac{1}{2}}(l(x)f(\hbar^{\frac{1}{2}}x), e^{-\frac{1}{2}B(x,x)}) = \hbar^{\frac{1}{2}}(f(\hbar^{\frac{1}{2}}x), l(x)e^{-\frac{1}{2}B(x,x)}) \\ &= -\hbar^{\frac{1}{2}}(f(\hbar^{\frac{1}{2}}x), \partial_{\varphi_B^{-1}(l)} e^{-\frac{1}{2}B(x,x)}) = \hbar^{\frac{1}{2}}(\partial_{\varphi_B^{-1}(l)} f(\hbar^{\frac{1}{2}}x), e^{-\frac{1}{2}B(x,x)}) \\ &= \hbar((\partial_{\varphi_B^{-1}(l)} f)(\hbar^{\frac{1}{2}}x), e^{-\frac{1}{2}B(x,x)}) = \hbar I_{\varphi_B^{-1}(l)f}(\hbar) \end{aligned}$$

□

**Prop. (12.11.3.29) [Riemann's Lemma].** Let  $D \subset \mathbb{R}^n$  be a compact region with smooth boundary, and  $f, g \in C^\infty(D)$  s.t.  $g^{(n)}$  vanishes on the boundary for any  $n \in \mathbb{N}$ , and  $df \neq 0$  on  $\text{Supp}(g)$ , then the function

$$I(\hbar) = \int_D g(x) e^{\frac{if(x)}{\hbar}} dx$$

extends to a smooth function on  $[0, \infty)$ , and has rapidly decaying derivatives of all orders as  $\hbar \rightarrow 0$ .

┘

*Proof:* As  $\text{Supp } g$  is compact and  $df \neq 0$  on  $\text{Supp } g$ , we can cover  $D$  by f.m. charts s.t.  $f(x) = x_1$ . Then by using smooth partition of unity, we may reduce to the case that  $f(x) = x_1$ . Then we are reduced to the 1-dimensional case and  $f(x) = x$ . Then in this case, it suffices to notice that

$$\int_a^b g(x) e^{i\frac{x}{\hbar}} dx = i\hbar \int_a^b g'(x) e^{i\frac{x}{\hbar}} dx,$$

and use induction. □

### Steepest Descent and Stationary Phase Formulae

**Thm. (12.11.3.30) [Steepest Descent Formula].** Let  $D \subset \mathbb{R}^n$  be a compact region with smooth boundary and  $f, g \in C^\infty(D)$ . Assume that  $f$  attains a global minimal at a unique non-degenerate critical point  $c \in D$  with  $\text{Hess } f(c)$  positive definite, then

$$\int_D g(x) e^{-f(x)/\hbar} dx = \hbar^{\frac{d}{2}} e^{-f(c)/\hbar} I(\hbar)$$

where  $I(x)$  extends to a smooth function on  $[0, \infty)$  with

$$I(0) = (2\pi)^{\frac{d}{2}} \frac{g(c)}{\sqrt{\det \text{Hess } f(c)}}.$$

Moreover, this generalizes to the case that  $f$  attains global minimums at multiple non-degenerate critical points.  $\square$

*Proof:* WLOG, we may assume that  $c$  is the origin and  $f(c) = 0$ . By Morse lemma, there is a smooth coordinate near the origin that  $f(x) = \frac{1}{2} \text{Hess}(f)(x, x)$  on a nbhd of the origin. Then we can use smooth partition of function to reduce to the case  $g$  has support on a small nbhd of 0 or the case that  $g$  vanishes near 0. For the last case, it is clear by direct differentiation that  $I(\hbar)$  is rapidly decaying as  $\hbar \rightarrow 0$ . And for the first case, by a change of variable,

$$I(\hbar) = \int_{\mathbb{R}^n} g'(\hbar y) e^{-\frac{1}{2} \text{Hess } f y^2} dy.$$

Then we finish by (12.11.3.27).  $\square$

**Thm. (12.11.3.31) [Stationary Phase Formula].** Let  $D \subset \mathbb{R}^n$  be a compact region with smooth boundary, and  $f \in C^\infty(D), g \in C^\infty(D)$ . Assume that  $f$  has a unique critical point  $c \in D$  and  $f$  is non-degenerate at  $c$ , and  $g^{(n)}$  vanishes on the boundary for any  $n \in \mathbb{N}$ , then

$$\int_D g(x) e^{if(x)/\hbar} dx = \hbar^{\frac{d}{2}} e^{if(c)/\hbar} I(\hbar)$$

where  $I(x)$  extends to a smooth function on  $[0, \infty)$  with

$$I(0) = (2\pi)^{\frac{d}{2}} e^{\sigma\pi i/4} \frac{g(c)}{\sqrt{|\det \text{Hess } f(c)|}},$$

where  $\sigma$  is the signature of  $\text{Hess } f(c)$ .

Moreover, this generalizes to the case that  $f$  has multiple non-degenerate critical points.  $\square$

*Proof:* The proof is similar to that of (12.11.3.30). In particular, using the partition function to separate the near to 0 part of  $g$ . And the away-from-0 part of  $g$  is smooth and rapidly decaying by Riemann lemma (12.11.3.29). Then by Morse lemma, it reduces to the case that  $f$  is quadratic. Then the assertion follows from (12.11.3.27).  $\square$

### Fourier Analysis on $\mathbb{R}$

**Prop. (12.11.3.32).** For  $f \in L^2(\mathbb{R})$ , the Fourier-transform of  $f$  is given by

$$\mathcal{F}(f) \in C(\mathbb{R}) : y \mapsto \int_{\mathbb{R}} f(x) e^{-2\pi i xy} dx.$$

Then  $\mathcal{F}(f)$  is uniformly continuous, and  $\lim_{|y| \rightarrow \infty} f(y) = 0$  (Riemann-Lebesgue lemma).

And the map  $f \mapsto \mathcal{F}(f)$  is injective, by Fourier's uniqueness theorem (12.11.1.25).  $\square$

**Example (12.11.3.33) [Fourier-Transforms].**

•

$$\mathcal{F}(e^{-2\pi|x|})(y) = \frac{1}{\pi(1+y^2)}.$$

•

$$\mathcal{F}(e^{-\pi x^2})(y) = e^{-\pi y^2}.$$

•

$$\mathcal{F}\left(\frac{1}{\text{ch}(\pi x)}\right)(y) = \frac{1}{\text{ch}(\pi y)}.$$

- If  $Y \in \mathbb{R}_+$  and  $\rho_Y(x) = \max(1 - \frac{|x|}{Y}, 0)$ , then

$$\mathcal{F}(\rho_Y)(x) = \left( \frac{\sin(\pi Y x)}{\pi Y x} \right)^2,$$

called the **Fejér-Kernel**. ┘

**Prop. (12.11.3.34) [Fourier-Inversion Formula].** ┘

#### 4 Sobolev-Spaces

**Def. (12.11.4.1) [Sobolev-Spaces].** For  $1 \leq p < \infty$ , the **Sobolev-space**  $W^{m,p}(\Omega)$  is the space of functions  $u$  that  $D^\alpha u \in L^p(\Omega)$  for every  $|\alpha| \leq m$ , with the norm  $\|u\| = \sum_{|\alpha| \leq m} \int_\Omega |D^\alpha u(x)|^p dx$ . The **Sobolev space**  $W_0^{m,p}(\Omega)$  is the completion of the subspace  $C_0^\infty(\Omega)$ . ┘

**Prop. (12.11.4.2) [Meyers-Serrin].** The Sobolev space  $W^{m,p}(\Omega)$  is the completion of  $u \in C^\infty(\Omega)$  that  $D^\alpha u \in L^p(\Omega)$  for every  $|\alpha| \leq m$ . ┘

*Proof:* Choose a countable partition of unity  $\psi_k$ , then as in the proof of (12.3.8.12), we can choose  $\delta_k$  small enough and  $\|\psi u - (\psi u)_{\delta_k}\| < \varepsilon/2^k$  and  $\varphi = \sum (\psi u)_{\delta_k}$  is definable. □

**Prop. (12.11.4.3).** We denote  $H^m(\Omega) = W^{m,2}(\Omega)$  and  $H_0^m(\Omega) = W_0^{m,2}(\Omega)$  and  $H^{-m}(\Omega) = (H_0^m(\Omega))^*$  when  $m$  is an integer. Notice derivative is not applicable for  $H^{-m}(\Omega)$  unless  $\Omega = \mathbb{R}^n$ .

When  $\Omega = \mathbb{R}^n$ ,  $D(\mathbb{R}^n)$  is dense in  $W^{m,p}(\mathbb{R}^n)$ , thus  $W_0^{m,p} = W^{m,p}$ . Define the **Sobolev-space**

$$H^s = \{u | (1 + |y|^2)^{s/2} |\hat{u}| \in L^2\}$$

$H^s$  is a Hilbert space and  $H^s \subset \mathcal{S}'$  for every  $s$  (use Holder to show  $\hat{u} \in \mathcal{S}'$ ).  $H^m$  coincides with previously defined  $H^m$  when  $m$  is a positive integer thus also negative-integer. A linear operator on  $H = \cup H^s$  is said to have **order**  $t$  if it maps every  $H^s$  continuously into  $H^{s-t}$ . ┘

*Proof:* By Plancherel, we have

$$\|\varphi\|'_m = \left( \sum_{|\alpha| \leq m} \|D_\alpha u\|_2^2 \right)^{1/2} \quad \text{and} \quad \left( \int (1 + |x|^2)^m |\hat{u}|^2 \right)^{1/2}$$

are equivalence norms on  $H^m$ . □

**Lemma (12.11.4.4) [Poincare Inequality].** For  $\Omega$  bounded, on  $C_0^m(\Omega)$  the  $W^{m,p}$  norm is controlled by  $L^p$  norms of its  $m$ th order derivatives. ┘

*Proof:* We may assume  $\Omega \subset \prod_{i=1}^n [0, a]$ , then for any  $u \in W^{m,p}$ ,  $u(x) = \int_0^{x_1} D^1 u(t, x_2, \dots, x_n) dt$ , so by Holder inequality,

$$|u(x)| \leq a^{1/q} \left( \int_0^a |D^1 u|^p dx_1 \right)^{1/p}.$$

so

$$\int_{\Omega} |u(x)|^p dx \leq a^q \int_{\Omega} |D^1 u|^p dx_1.$$

Doing the same for all other derivatives, we can see the norm is controlled by the highest( $m$ -th) order norms.  $\square$

**Prop. (12.11.4.5).** When  $t < s$ ,  $H^s \subset H^t$ . And  $H^s$  are isometric to  $H^t$  by  $\hat{v} = (1 + |y|^2)^{t/2} \hat{u}$  and is of order  $t$ .  $D^\alpha$  is of order  $|\alpha|$ . If  $f \in \mathcal{S}$ , then  $u \rightarrow fu$  is an operator of order 0.

Every distribution of compact support is in some  $H^s$  (12.11.2.10), in particular  $D(\Omega)$ .  $\lrcorner$

*Proof:* Cf. [Rudin P217].  $\square$

**Prop. (12.11.4.6) [Sobolev's Embedding Theorem].** On a manifold of dimension  $n$  which is compact with Lipschitz boundary or complete of positive injective radius and bounded sectional curvature,

- if  $k > l$  be integers and

$$\frac{1}{p} - \frac{k}{n} = \frac{1}{q} - \frac{l}{n}$$

then  $W^{k,p}(\text{int}(M)) \subset W^{l,q}(M)$  continuously.

- if

$$\frac{1}{p} - \frac{k}{n} = -\frac{r+\alpha}{n}$$

then  $W^{k,p}(\text{int}(M)) \subset C^{r,\alpha}(M)$  continuously.  $\lrcorner$

*Proof:* Cf. [Evans P290].  $\square$

**Cor. (12.11.4.7) [Gagliardo–Nirenberg–Sobolev].** On a manifold of dimension  $n$  which is compact with Lipschitz boundary or a complete of positive injective radius and bounded sectional curvature, if  $\frac{1}{p^*} = \frac{1}{p} - \frac{1}{n}$  (Sobolev conjugate), then  $W^{1,p}(\text{int}(M)) \subset L^{p^*}(M)$  continuously.  $\lrcorner$

**Cor. (12.11.4.8).** On a manifold of dimension  $n$  which is compact with Lipschitz boundary or a complete of positive injective radius and bounded sectional curvature, if  $m > n/2$ , then  $W^{m,2}(\text{int}(M)) \subset C(\overline{\Omega})(M)$  continuously. And the functions in  $W_0^{m,2}$  are continuous and vanish at the boundary, by  $C_0$  approximation.  $\lrcorner$

*Proof:* The  $\mathbb{R}^n$  case can be directly proved: because we have the equivalent norm (12.11.4.3),  $\hat{u} \in L^2$  thus  $u \in L^2$ , and

$$\int |\hat{u}| \leq \left( \int (1 + |x|^2)^m |\hat{u}|^2 \right)^{1/2} \cdot \left( \int 1/(1 + |x|^2)^m \right)^{1/2}.$$

We have  $\hat{u} \in L^1$ , thus inversion formula applies that  $u$  is continuous and  $\|u\|_\infty \leq \|\hat{u}\|_1 \leq C\|u\|_{H^m}$ .  $\square$

**Cor. (12.11.4.9).**  $\cap_s H^s = C^\infty(M)$ .  $\lrcorner$

**Prop. (12.11.4.10)[Rellich-Kondrechov].** On a compact manifold with  $C^1$  boundary of dimension  $n$ , if  $k > l$  and

$$\frac{1}{p} - \frac{k}{n} < \frac{1}{q} - \frac{l}{n}$$

then  $W^{k,p} \subset W^{l,q}$  completely continuously.  $\lrcorner$

*Proof:* Cf.[Distributions and Operators P199], [Evans P290].  $\square$

**Cor. (12.11.4.11).** On a bounded extension domain of  $\mathbb{R}^n$ ,  $W^{1,p} \subset L^p$  completely continuously.  $\lrcorner$

*Proof:* We prove the  $p = 2$  case. For a sequence  $u_m$  in  $W^{1,2}$ , we have  $\|u_m - u_p\|_2 = \|U_m - U_p\|_2 = \|\hat{U}_m - \hat{U}_p\|_2$ . By (12.8.4.9), there is a subsequence that  $\hat{U}_m$  pointwise converge. Notice they are uniformly bounded, Now apply two region argument, for  $|x| < r$ , use Lebesgue dominant convergence, and for  $|x| > r$ , use  $\int (1 + |x|^2)|\hat{U}_m - \hat{U}_p|^2$  is bounded to conclude  $\|u_m - u_p\|_2 \rightarrow 0$ .  $\square$

**Prop. (12.11.4.12).**  $u \in D'(\Omega)$  is a locally  $H^s \iff \psi u \in H^s$  for every  $\psi \in D(\Omega) \iff D_\alpha u$  is locally  $L^2$  for every  $|\alpha| \leq s$ .

Thus every smooth function is locally  $H^s$  for every  $s$ .  $\lrcorner$

*Proof:*  $1 \rightarrow 2$  use partition of unity,  $2 \rightarrow 1$  easy, and 2, 3 are all equivalent to  $D_\alpha(\psi u) \in L^2$  for every  $\psi \in D(\Omega)$ . by Leibniz+Plancherel or (12.11.4.5).  $\square$

**Prop. (12.11.4.13).** If  $r > p + n/2$ , then if a function  $f$  on  $\Omega$  has all the distribution derivative  $D_i^k f$  locally  $L^2$ ,  $= g_{is}$ , for  $0 \leq k \leq r$ , then  $f \in C^p(\Omega)$  a.e.  $\lrcorner$

**Cor. (12.11.4.14).** If  $u \in D'(\Omega)$  is locally  $H^s$ , then  $u \in C^{s-n/2}(\Omega)$ . Thus  $\cap \text{locally } H^s = C^\infty(\Omega)$ .  $\lrcorner$

### Holder Space

**Def. (12.11.4.15).** Holder space  $C^{k,\alpha}(\Omega)$  is the subspace of  $C^k(\Omega)$  with the norm

$$\|f\|_{C^{k,\alpha}} = \|f\|_{C^k} + \max_{|\beta|=k} \sup_{x \neq y \in \Omega} \frac{|D^\beta f(x) - D^\beta f(y)|}{|x - y|^\alpha}.$$

$\lrcorner$

## 5 Fourier Analysis on Tori

**Notation (12.11.5.1).**

- Notice  $\mathbb{T} = \mathbb{R}/\mathbb{Z}$ .

$\lrcorner$

**Prop. (12.11.5.2)[Basic Properties of Fourier Analysis].**

- For  $f \in L^1(\mathbb{T})$ , we have the **Fourier-coefficients**

$$c_n(f) \triangleq \mathcal{F}(f)(n) = \int_{\mathbb{T}} f(x) e^{-2\pi i n x} dx.$$

for each  $n \in \mathbb{Z}$ . And

$$\sum_{n \in \mathbb{Z}} c_n(f) e^{2\pi i n x}$$

is called the **Fourier-series** of  $f$ .  $f$  is determined by its Fourier-coefficients, by Fourier's uniqueness theorem (12.11.1.25).

- If  $f \in L^1(\mathbb{T})$  is absolutely continuous, then  $c_n(f') = 2\pi i n \cdot c_n(f)$  for each  $n \in \mathbb{Z}$ , by (12.11.3.5).
- (Fourier-kernels) If  $f \in L^1(\mathbb{T}^n)$  with Fourier series  $\sum_{n \in \mathbb{Z}} c_n(f) e^{2\pi i n x}$ , and

$$P_N = c_n(P_N) \sum_{|n| \leq N} e^{2\pi i n x}$$

is an trigonometric polynomial, then by (12.11.3.2), the Fourier series of  $f * P_N$  is

$$\sum_{|n| \leq N} c_n(f) c_n(P_N) e^{2\pi i n x}.$$

- For  $f, g \in L^2(\mathbb{T}) \subset L^1(\mathbb{T})$  with Fourier-coefficients  $c_n(f), c_n(g)$ , we have

$$(f, g) = \sum_{n \in \mathbb{Z}} c_n(f) c_n(g) \in \mathbb{R}.$$

┘

**Prop. (12.11.5.3) [Pointwise Convergence].** If  $f$  is a periodic function on  $\mathbb{R}$  with period  $2\pi$  and of bounded variance (e.g. piecewise-differentiable), then the Fourier series of  $f$  converges to  $\frac{1}{2}(f(x+) + f(x-))$  pointwise. ┘

*Proof:* [武胜健 2, P264]. □

**Prop. (12.11.5.4) [Uniform Convergence].** If  $f$  is a periodic differentiable function on  $\mathbb{R}$  with period  $2\pi$  and  $f'$  is integrable at  $[-\pi, \pi]$ , then the Fourier series of  $f$  converges to  $f$  uniformly. ┘

*Proof:* [武胜健 2, P281]. □

## **12.12 Non-Commutative Harmonic Analysis(Reductive Groups)**

### **1 Non-Commutative Plancherel Formula(Harish-Chandra)**

## 12.13 Harmonic Analysis on Finite Groups

References are [Fourier analysis on Finite Groups and applications, Terras].

### 1 Finite Abelian Groups

**Def. (12.13.1.1) [Finite Fourier Transform].** Let  $G \in \mathcal{Ab}^{\text{fin}}$  and  $e : G \times G \rightarrow S^1$  is a perfect pairing, then for any  $f : G \rightarrow \mathbb{S}^1$ , we can define the Fourier transform of  $f$  as

$$\mathcal{F}f(\xi) = \frac{1}{\#G} \sum_{x \in G} f(x) \overline{e(x, \xi)}.$$

The matrix  $(e(x, \xi))_{x, \xi \in G}$  is called the **Fourier matrix**. ┘

**Thm. (12.13.1.2) [Uncertainty Principle].** Let  $G \in \mathcal{Ab}^{\text{fin}}$  and  $e : G \times G \rightarrow S^1$  is a perfect pairing, then for any non-zero function  $f : G \rightarrow \mathbb{C}$ , we have:

$$\# \text{Supp}(f) \cdot \# \text{Supp}(\mathcal{F}f) \geq \#G.$$

┘

*Proof:*

$$\begin{aligned} \sup_{\xi \in G} |\mathcal{F}f(\xi)| &\leq \frac{1}{\#G} \sum_{x \in G} |f(x)| \\ &\leq \sqrt{\frac{\# \text{Supp}(f)}{\#G}} \left( \frac{1}{\#G} \sum_{x \in G} |f(x)| \right) \\ &= \sqrt{\frac{\# \text{Supp}(f)}{\#G}} \left( \sum_{x \in G} |f(x)| \right) \\ &\leq \sqrt{\frac{\# \text{Supp}(f) \cdot \# \text{Supp}(f^\vee)}{\#G}} \sup_{\xi \in G} |f^\vee(\xi)| \end{aligned}$$

Thus the assertion follows. □

### Finite Fields

**Lemma (12.13.1.3).** Suppose  $p \in \text{Prime}$ ,  $n \in \mathbb{Z}_+$ ,  $P(\underline{X}) \in \mathbb{Z}[X_1, \dots, X_n]$  and  $\omega_i \in \mu_p$  s.t.  $P(\omega_1, \dots, \omega_n) = 0$ , then  $p | P(1, \dots, 1)$ . ┘

*Proof:* Suppose  $\omega_i = e^{2\pi i k_i / p}$ , and consider

$$Q(z) = P(z^{k_1}, \dots, z^{k_n}) \pmod{z^n - 1},$$

which satisfies  $Q(e^{2\pi i / p}) = 0$  and  $\deg(Q) \leq p - 1$ . Thus  $Q$  is a multiple of the polynomial  $1 + X + \dots + X^{p-1}$ . Thus  $p | P(1, \dots, 1)$  holds. □

**Thm. (12.13.1.4)**[Fourier Matrix Invertible for Prime Fields, Chebotarev(37)]. The standard pairing  $\mathbb{F}_p \times \mathbb{F}_p \rightarrow S^1 : (x, \xi) \mapsto e^{2\pi i x \xi / p}$  induces the Fourier matrix  $(e^{2\pi i x \xi / p})_{x, \xi \in \mathbb{F}_p}$  (12.13.1.1). Then all its principal minors are non-degenerate.

In particular, for any  $A, A' \subset \mathbb{F}_p$  with the same cardinality,

$$\ell^2(A) \rightarrow \ell^2(A') : f \mapsto \mathcal{F}f|_{A'}$$

is invertible. ┘

*Proof:* For any  $n \in [p]_+$  and  $\{x_1, \dots, x_n\} \subset [p-1]$ ,  $\{\xi_1, \dots, \xi_n\} \subset [p-1]$ , denote

$$D(X_1, \dots, X_n) = \det \left( X_i^{\xi_j} \right)_{i, j \in [n]_+} \in \mathbb{Z}[X_1, \dots, X_n].$$

then  $X_i - X_j | D(X_1, \dots, X_n)$  for any  $i < j \in [n]_+$  and we denote

$$D(X_1, \dots, X_n) = P(X_1, \dots, X_n) \prod_{i < j \in [n]_+} (X_i - X_j), \text{ where } P(X_1, \dots, X_n) \in \mathbb{Z}[X_1, \dots, X_n].$$

Then we have

$$\left( Z_1 \frac{\partial}{\partial Z_1} \right) \left( Z_2 \frac{\partial}{\partial Z_2} \right)^2 \cdots \left( Z_n \frac{\partial}{\partial Z_n} \right)^n D(X_1, \dots, X_n) \Big|_{(X_1, \dots, X_n) = (1, \dots, 1)} = (n-1)! \cdots 2! \cdot 1! P(1, \dots, 1).$$

And the LHS equals

$$\det \text{Van}(\xi_1, \dots, \xi_n) \neq 0 \text{ (3.5.9.18)}.$$

Thus  $P(1, \dots, 1) \neq 0$ , and by (12.13.1.3), we have  $P(e^{2\pi i x_1/p}, \dots, e^{2\pi i x_n/p}) \neq 0$ . Thus  $D(x_1, \dots, x_n) \neq 0$ , and the assertion follows. □

**Cor. (12.13.1.5)**[Tao[Tao05]]. If  $p \in \text{Prime}$  and  $f : \mathbb{F}_p \rightarrow \mathbb{C}$  is a non-zero function, then

$$\# \text{Supp}(f) + \# \text{Supp}(\mathcal{F}f) \geq p + 1.$$

Conversely, if  $A, B \subset \mathbb{Z}/(p)$  are two non-empty subsets s.t.  $\#A + \#B \geq p + 1$ , then there exists a non-zero function  $f : \mathbb{Z}/(p) \rightarrow \mathbb{C}$  s.t.  $\text{Supp}(f) = A$  and  $\text{Supp}(f^\vee) = B$ . ┘

*Proof:* If  $\# \text{Supp}(f) + \# \text{Supp}(f^\vee) \leq p$ , then there exists a subset  $A' \subset \mathbb{F}_p$  disjoint with  $\text{Supp}(\mathcal{F}f)$ . This contradicts (12.13.1.4).

Conversely, it suffices to prove that if  $A, B \subset \mathbb{Z}/(p)$  are two non-empty subsets s.t.  $\#A + \#B = p + 1$ , then there exists a non-zero function  $f : \mathbb{Z}/(p) \rightarrow \mathbb{C}$  s.t.  $\text{Supp}(f) = A$  and  $\text{Supp}(\mathcal{F}f) = B$  (because the  $\#A + \#B \geq p + 1$  case follows from taking linear combinations).

Then we choose  $A' \subset \mathbb{F}_p$  s.t.  $A' \cap B = \{\xi\}$ . Then by (12.13.1.4) there exists  $f : \mathbb{F}_p \rightarrow \mathbb{C}$  with  $\text{Supp}(f) \subset A$  and  $\mathcal{F}f$  vanishes on  $A' \setminus \{\xi\}$  and  $\mathcal{F}(f)(\xi) \neq 0$ . Then  $\text{Supp}(f) = A$  and  $\text{Supp}(\mathcal{F}f) = B$ , otherwise the uncertainty principle just proven is contradicted. □

**Cor. (12.13.1.6).** If  $p \in \text{Prime}$ ,  $k \in [p-1]$  and  $f(X) = \sum_{j=0}^k a_j X^{n_j} \in \mathbb{C}[X]^\times$  and  $0 \leq n_0 < n_1 < \dots < n_k < p$ , then  $f$  has at most  $k$ -zeros (without multiplicity) in  $\mu_p$ . ┘

*Proof:* This is because the restriction of  $f$  on  $\mu_p$  is basically the Fourier transform of a function on  $\mu_p$  whose support has cardinality  $\leq k + 1$ . □

**Prop. (13.1.1.1).**

$$x^{(2)} = f(x)$$

It can be solved. ┘

*Proof:*

$$\begin{aligned} x'x^{(2)} &= f(x)x' \\ \frac{1}{2}(x')^2 &= \int^x f(t)dt \end{aligned}$$

□

**Prop. (13.1.1.2) [Wronsky].** ┘

### 2 ODE-Theorems

**Prop. (13.1.2.1) [Existence and Uniqueness of ODE of Lipschitz Type].** If  $F(t, x)$  defined on  $[-h, .h] \times [\eta - \delta, \eta + \delta]$  is a function that is locally Lipschitz: that is,  $\exists \delta, L$ , s.t. if  $|t| \leq h, |x_i - \eta| \leq \delta$ , then

$$|F(t, x_1) - F(t, x_2)| \leq L|x_1 - x_2|.$$

Then the initial value problem:

$$(Tx)(t) = \eta + \int_0^t F(\tau, x(\tau))d\tau$$

has a unique solution on the interval  $[-h, h]$  if  $h < \min\{\delta/M, 1/L\}$ , where  $M$  is the maximum of  $F$  on  $[-h, .h] \times [\eta - \delta, \eta + \delta]$ . Because  $T$  is a contraction. ┘

**Prop. (13.1.2.2) [Existence of ODE of Continuous Type (Caratheodory)].** If  $F(t, x)$  defined on  $[-h, .h] \times [\eta - \delta, \eta + \delta]$  is a continuous function, then

$$(Tx)(t) = \eta + \int_0^t F(\tau, x(\tau))d\tau$$

has a unique solution on the interval  $[-h, h]$  if  $h < \delta/M$ , where  $M$  is the maximum of  $F$  on  $[-h, .h] \times [\eta - \delta, \eta + \delta]$ . (Use Schauder fixed point theorem and Arzela-Ascoli). ┘

**Thm. (13.1.2.3) [Existence Theorem for Complex Differential Equations].** Let  $\Omega \subset \mathbb{C}^{n+1}$  be a domain and  $f(z, \mathbf{w}) : \Omega \rightarrow \mathbb{C}^n$ , then the initial value problem

$$\mathbf{w}' = f(z, \mathbf{w}), \quad \mathbf{w}(z_0) = \mathbf{w}_0$$

has exactly one holomorphic solution locally (Thus on a simply connected domain).  $\lrcorner$

**Cor. (13.1.2.4).** So a holomorphic high-order ODE for a complex variable can be solved. And luckily it can be solved even  $\bar{z}$  appears (just regard it as a constant).  $\lrcorner$

*Proof:* Cf. [Ordinary Differential Equations, P110].  $\square$

**Prop. (13.1.2.5).** For the equation:

$$\frac{d\mathbf{y}}{d\mathbf{x}} = \mathbf{A}\mathbf{y},$$

One solution basis is:

$$\begin{cases} e^{\lambda_1 x} \mathbf{P}_1^{(1)}(x), \dots, e^{\lambda_1 x} \mathbf{P}_{n_1}^{(1)}(x); \\ \dots\dots\dots \\ e^{\lambda_s x} \mathbf{P}_1^{(d)}(x), \dots, e^{\lambda_s x} \mathbf{P}_{n_s}^{(1)}(x); \end{cases}$$

Where

$$\mathbf{P}_j^{(i)}(x) = \mathbf{r}_{j0}^{(i)} + \frac{x}{1!} \mathbf{r}_{j1}^{(i)} + \dots,$$

where  $\mathbf{r}_{j0}^{(i)}$  is a basis of solution of  $(\mathbf{A} - \lambda_i I)^n \mathbf{x} = 0$ , and  $\mathbf{r}_{k+1}^{(i)} = (\mathbf{A} - \lambda_i I) \mathbf{r}_k^{(i)}$ .  $\lrcorner$

*Proof:* Cf. [常微分方程丁同仁定理 6.6].  $\square$

**Cor. (13.1.2.6).** For the equation:

$$y^{(n)} + a_1 y^{(n-1)} + \dots + a_{n-1} y' + a_n y = 0,$$

If the characteristic equation has  $s$  different roots  $\lambda_1, \dots, \lambda_s$  and corresponding multiplicities  $n_1, \dots, n_s$ , then:

$$\begin{cases} e^{\lambda_1 x}, x e^{\lambda_1 x}, \dots, x^{n_1-1} e^{\lambda_1 x}; \\ \dots\dots\dots \\ e^{\lambda_s x}, x e^{\lambda_s x}, \dots, x^{n_s-1} e^{\lambda_s x}; \end{cases}$$

is a solution basis.  $\lrcorner$

*Proof:* Cf. [常微分方程丁同仁 P198].  $\square$

**Prop. (13.1.2.7) [Lyapunov].** Consider the Lyapunov stability of an autonomous system of the form:

$$\frac{\partial}{\partial t} x = Ax + o(|x|),$$

Then:

1. If  $A$  has a eigenvalue whose real part is positive, then the trivial solution is not weak stable.
2. If all eigenvalues of  $A$  has negative real part, then the trivial solution is strong stable.

$\lrcorner$

Stum-Liouville

**Prop. (13.1.2.8) [Stum-Liouville].** The eigenvalue BVP problem of L-S equation:

$$Lu = (pu')' + qu = \lambda u, \quad a_1 u(a) + a_2 u'(a) = 0, b_1 u(b) + b_2 u'(b) = 0, \sigma(x) > 0.$$

can be solved by the method of Green's function. For the function:

$$G(x, s) = \begin{cases} Cu_1(x)u_2(s), & x < s \\ Cu_2(x)u_1(s), & x > s \end{cases}$$

for some  $C$ , where  $u_1$  is a solution of the L-S equation with boundary value at  $a$ , and  $u_2$  with boundary value at  $b$  that are linear independent (This happens when the homogenous equation has no solution). It satisfies:  $LG(x, s) = \delta(x - s)$  and satisfies the boundary conditions.

Because  $L$  is self-adjoint, we have:

$$Gf(x) = \int f(s)G(x, s)ds, LG = \text{id}, GL = \text{id}$$

thus the eigenvalues of  $L$  is the reciprocal of the eigenvalues of  $G$ , and  $G$  is a compact self-adjoint operator on  $L^2(\sigma, \mathbb{R})$ , so by spectral theorem, the eigenvectors are countable and form an orthonormal basis.

And when the homogenous problem do have a solution  $\phi$ , then we have:  $Lu = f$  has a solution iff  $(f, \phi) = 0$ . one way is simple and the other way is because we solve the initial problem of ODE and find that it automatically satisfies the boundary condition. Cf. [Stum Liouville Theory].  $\lrcorner$

**Prop. (13.1.2.9).** More generally, if there the boundary is mixed of  $u(a), U'(a), u(b), u'(b)$ , the solution of

$$Lu = (pu')' + qu = 0, B_1(u) = \alpha, B_2(u) = \beta.$$

has a unique solution for any  $\alpha, \beta$  iff the homogenous equation has only non-trivial solution. (Because the solution space is of 2 dimensional.  $\lrcorner$

**Prop. (13.1.2.10) [Stum Seperation Theorem].**  $\lrcorner$

*Proof:*  $\square$

**Prop. (13.1.2.11) [Stum Comparison Theorem].** If  $y'' + K_i(x)y = 0$  are equations. If  $y_i(0) = 0$  and  $|y_1'(0)| = |y_2'(0)|$ , then if  $K_1(x) \geq K_2(x)$ , then  $y_1(x) \geq y_2(x)$  until  $y_2(x)$  is zero. (directly from (16.3.5.10)).  $\lrcorner$

*Proof:*  $\square$

### 3 Linear PDE

#### Linear Operators

**Def. (13.1.3.1) [Euler Differential Operator].** For  $V \in \text{Vect}/\mathbb{R}$ , the **Euler differential** is the first order linear differential operator

$$E = \sum_i e_i^* \partial_{e_i},$$

where  $\{e_i\}$  is any basis of  $V$ .  $\lrcorner$

*Proof:* □

**Def. (13.1.3.2) [Laplacians].** For  $V \in \text{Vect}/\mathbb{R}$  and a non-degenerate bilinear form  $B$  on  $V$ , the **Laplacian operator** of  $B$  is defined to be the second order linear differential operator

$$\Delta_B = \sum_i \partial_{\varphi_B^{-1} e_i^*} \circ \partial_{e_i} : \mathcal{S}(V) \rightarrow \mathcal{S}(V)$$

┘

*Proof:* □

### Existence of Solutions

**Def. (13.1.3.3) [Fundamental Solutions].** For a linear PDE with constant coefficients  $P(D)u = v$ , the **fundamental solution** is a distribution  $E \in D'(\mathbb{R}^n)$  that  $P(D)E = \delta$ . This is important because if  $v$  is a distribution with compact support,  $P(D)(E * v) = (P(D)E) * v = \delta * v = v$  (12.11.2.18), so  $u = E * v$  is a distribution solution. ┘

**Prop. (13.1.3.4).** When  $v \in D'(\mathbb{R}^n)$  has compact support,  $P(D)u = v$  has a solution  $u$  with compact support iff  $Pg = \hat{v}$  has a solution  $g$  entire. In this case,  $g = \hat{u}$  for some distribution  $u$ , and  $u$  has support in the convex hull of the support of  $v$ . ┘

*Proof:* Use (12.11.3.24), and some bound relation between  $g$  and  $Pg$ . Cf. [Rudin Functional Analysis P212]. □

**Prop. (13.1.3.5).** The fundamental solution always exist when for PDE of constant coefficients. ┘

*Proof:* For a  $\varphi \in D(\mathbb{R}^n)$ , there is at most one  $\psi$  that  $\psi = P(D)\varphi$  because  $\hat{\psi} = P\hat{\varphi}$  and they are entire function. Thus the task is to verify the functional  $u : P(D)\varphi \rightarrow \varphi(0)$  is continuous and extend to a distribution  $u \in D'(\mathbb{R}^n)$ . Cf. [Rudin Functional Analysis P215]. □

## 4 Differential Operators on Manifolds

**Def. (13.1.4.1) [Differential Operators].** For  $X \in \text{Diff}$ , define  $D_{-1,X} = 0$ , and for any  $n \in \mathbb{N}$ , define  $D_{n,X}$  to be the subbundle of  $\text{End}(\mathcal{O}_X)$  s.t. for any  $f \in \mathcal{O}_X$ ,  $[L, f] \in D_{n-1}(X)$ . Then  $D_X = \cup_n D_{n,X}$  is called the algebra of **differential operators** on  $X$ . ┘

**Prop. (13.1.4.2).** For  $X \in \text{Diff}$ ,

- $D_{1,X} \cong \mathcal{O}_X \rtimes T_X$ .
- $\text{gr } D_X = \oplus_{i \in \mathbb{N}} \text{Sym}^i T_X = \mathcal{P}\text{oly}(T_X^*)$ . In particular,  $D_X$  is left and right Noetherian.
- $\Gamma(X, D_X)$  is generated over  $\Gamma(X, \mathcal{O}_X)$  by  $L_v$  for  $v \in \text{Vect}(X)$  subject to the following relations:

$$[f, g] = 0, \quad [L_v, f] = v(f), \quad L_{fv} = fL_v, \quad [L_v, L_w] = L_{[v, w]}, \quad f, g \in \Gamma(X, \mathcal{O}_X), v, w \in \text{Vect}(X).$$

┘

**Def. (13.1.4.3) [D-Modules].** Let  $X$  be a differential manifold, then a left/right  **$D$ -module(differential)** on  $X$  is a left/right  $D_X$ -modules. ┘

**Def. (13.1.4.4) [Index Theorem P109].** has a nice definition of symbol of a differential operator on a manifold as a map from  $\text{Sym}^m T^*M \otimes \mathbb{C} \rightarrow \text{Hom}(E, F)$ . ┘

*Proof:* □

## 5 Pseudo-Differential Operator

**Def. (13.1.5.1) [Japanese Brackets].** Denote the **Japanese bracket**  $[x] = (1 + |x|^2)^{1/2} = \Theta(1 + |x|)$ .

Motivated by the formula  $(P \cdot f^\vee)^\vee = P(D)f$  for  $f \in \mathcal{S}$  and polynomial  $P$  of  $\xi$  with coefficients smooth functions of  $x$ ?? we define the **symbol class**  $S^{\mu, \beta}$  as the space of smooth functions  $a : \mathbb{R}^{2n} \rightarrow \mathbb{C}$  that

$$|D_{x, \alpha} D_{\xi, \beta} a(x, \xi)| \leq C_{\alpha, \beta} [x]^\mu [\xi]^{m-|\beta|}$$

and denote  $S^m = S^{0, m}$ .

We denote the **symbol class**  $\mathcal{A}^v$  as the space of smooth functions  $a : \mathbb{R}^{2n} \rightarrow \mathbb{C}$  that  $|D_\alpha a| \leq C_\alpha [x + \xi]^v$  for any  $\alpha$ . So  $S^{\mu, m} \subset \mathcal{A}^{|\mu|+|m|}$

And we define the **pseudo-differential operator of symbol**  $a$ :

$$(a(x, D)u)(x) = \int_{\xi} e^{ix\xi} a(x, \xi) \hat{u}$$

Moreover, we can define the **amplitude function**  $p(x, y, \xi)$  and define

$$Pu(x) = \int e^{i(x-y)\xi} p(x, y, \xi) u(y) dy.$$

┘

**Def. (13.1.5.2) [Polyhomogenous Symbols].** We define the space  $S^d$  of **polyhomogenous symbols of degree**  $d$  as the set of all symbols in  $S_{0,1}^d$  that there exists a set of  $p_{d-l}$  homogenous in  $\xi$  of degree  $d-l$  that  $p = \sum p_{d-l}$  modulo an operator in  $S^{-\infty}$ . Note that when  $p_{d-l}$  is homogenous of degree  $d-l$ , then it is automatically in  $S_{0,1}^{d-l}$ .

┘

**Def. (13.1.5.3) [Elliptic Operators].** A pseudo operator  $a$  is called **elliptic operator** if  $\sigma(a) \in S^m$  and  $\sigma(a) \geq [\xi]^{-m}$  for  $\xi$  big enough.

┘

**Prop. (13.1.5.4) [Peetre's Inequality].** For all  $v \in \mathbb{R}$ , there is a constant  $C$  that

$$[X + Y]^v < C[X]^v[Y]^v.$$

┘

*Proof:* For  $v > 0$ , just as normal. For  $v < 0$ , use  $X = (X + Y) + (-Y)$  applied to  $-v$ . □

**Prop. (13.1.5.5).** The mapping  $a(x, \xi) \times u(x) \mapsto a(x, D)u$  is continuous from  $\mathcal{A}^v \times \mathcal{S} \rightarrow \mathcal{S}$ , thus also continuous from  $S^{\mu, m} \times \mathcal{S} \rightarrow \mathcal{S}$ . Cf.[Pseudo Differential Operator P28].

┘

**Lemma (13.1.5.6) [Schur Test].** For a function  $K$  on  $\mathbb{R}^{2n}$  and  $u \in L^p(\mathbb{R}^n)$ , let  $\|K\|_1 = \sup_x \int |K(x, y)| dy$  and  $\|K(x, y)\|_2 = \sup_y \int |K(x, y)| dx$ . Let  $Au(x) = \int K(x, y) u(y) dy$ , then

$$\|Au\|_{l^p} \leq \|K\|_1^{1-1/p} \|K\|_2^{1/p} \|u\|_{L^p}.$$

by Holder. ┘

**Prop. (13.1.5.7) [Calderón-Vaillancourt].** There is a constant  $C, N_{CV}$  that for  $u \in \mathcal{A}^0$  and  $\varphi \in \mathcal{S}$ ,

$$\|Op(u)\varphi\|_{L^2} \leq C \max_{|\alpha|+|\beta| \leq N_{CV}} \|\partial_x^\alpha D_{\beta, \xi} u\|_{L^\infty} \|\varphi\|_{L^2}.$$

This in particular applies to  $u \in S^0$ . ┘

*Proof:* Cf.[Calderon-Vaillancourt]. □

**Cor. (13.1.5.8).**  $S^m$  maps  $H^s$  to  $H^{s-m}$ . Because by symbolic calculus(13.1.5.10), we have

$$Op([\xi]^{s-m})Op(u)Op([\xi]^{-s}) = Op(b) \in S^0,$$

thus  $Op(u) = Op([\xi]^{m-s})Op(b)Op([\xi]^s)$  maps  $H^s$  into  $H^{s-m}$ . ┘

### Symbolic Calculus

**Def. (13.1.5.9) [Semiclassical Operator].** For  $a \in S^{\mu,m}$  and  $h \in (0, 1]$ , we denote  $a_h(x, \xi) = a(x, h\xi)$ , it is also in  $S^{\mu,m}$ .  $\lrcorner$

**Prop. (13.1.5.10) [Composition].** If  $a \in S^{\mu_1, m_1}$  and  $b \in S^{\mu_2, m_2}$ , there is a pseudo-differential operator  $(a \# b)(h) \in S^{\mu_1 + \mu_2, m_1 + m_2}$  for every  $h \in (0, 1]$  that

$$Op(a_h)Op(b_h) = Op((a \# b)(h)_h)$$

and for all  $J > 0$ ,  $(a \# b)(h)$  can be written as

$$a \# b(h) = \sum_{j < J} h^j \left( \sum_{|\alpha|=j} \frac{1}{\alpha!} \partial_\xi^\alpha a D_x^\alpha b \right) + h^J r_J^\#(a, b, h)$$

where  $r_J^\#(a, b, h) \in S^{\mu_1 + \mu_2, m_1 + m_2 - J}$  and it is bilinear of  $a, b$  and equicontinuous independently of  $h$ .  $\lrcorner$

*Proof:* Cf. [Pseudo Differential Operator P36].  $\square$

**Prop. (13.1.5.11) [Adjoint].** If  $a \in S^{\mu,m}$  and  $u, v \in \mathcal{S}$ , there is a pseudo-differential operator  $a^*(h)$  for every  $h \in (0, 1]$  that

$$(u, Op(a_h)v) = (Op(a^*(h)_h)u, v)$$

in the  $L^2$  norm and for all  $J > 0$ ,  $a^*(h)$  can be written as

$$a^*(h) = \sum_{j < J} h^j \left( \sum_{|\alpha|=j} \frac{1}{\alpha!} \partial_\xi^\alpha D_x^\alpha \bar{a} \right) + h^J r_J^*(a, h)$$

where  $r_J^*(a, h) \in S^{\mu, m-J}$  and it is anti-linear of  $a$  and equicontinuous independently of  $h$ .  $\lrcorner$

*Proof:* Cf. [Pseudo Differential Operator P30].  $\square$

**Def. (13.1.5.12).** For  $u \in \mathcal{S}'$ , we define the action of  $a(x, \xi)$  on  $u$  by

$$(Op(a_h)u)(\bar{\varphi}) = u(\overline{Op(a^*(h)_h)\varphi}).$$

This is compatible with the definition on  $\mathcal{S}$ .  $\lrcorner$

## 6 General PDE

Cf. [Gilbarg, David; Trudinger, Neil S. Elliptic partial differential equations of second order. Reprint of the 1998 edition. Classics in Mathematics. Springer-Verlag, Berlin, 2001. xiv+517 pp. ISBN: 3-540-41160-7].

### Direct Solutions

**Prop. (13.1.6.1) [Characteristic Line].** Consider a 1-dimensional parabolic equation:

$$p_t + c(p, x, t)p_x = r(p, x, t)$$

Let  $P(t) = p(X(t), t)$ , this equation is equivalent to

$$P_t = r(X(t), t, P(t)), \quad X_t = c(X(t), t).$$

an ODE equation.  $\lrcorner$

**Prop. (13.1.6.2).** A set of equations:

$$\frac{\partial}{\partial x^i} \mu = A_i \mu$$

where  $\mu$  is a  $n$ -vector. It has a solution iff

$$[A_i, A_j] = \frac{\partial}{\partial x^i} A_j - \frac{\partial}{\partial x^j} A_i.$$

┘

*Proof:*

□

**Cor. (13.1.6.3).** This seems to be able to derive Frobenius integrability theorem, but I cannot figure it out. ┘

## 7 Analysis on Manifolds

**Prop. (13.1.7.1)[Peetre's Theorem].** For a linear operator from  $C^\infty(M)$  to  $C^\infty(M)$  that  $\text{Supp}(Lu) \subset \text{Supp}(u)$  where  $M$  is a compact manifold, then on every compact subset of a coordinate chart  $L$  looks like a differential operator of finite order. ┘

*Proof:* The first thing is to prove on a chart  $\Omega$ ,  $L$  is continuous on  $C_0^\infty(\Omega)$ . In fact, it suffice to show it is continuous from  $C_0^\infty(\Omega)$  to  $C_0^0(\Omega)$  because we can apply to  $D_\alpha L$ . For this, Cf.[Pseudo Differential Operator P86].

Then we have  $|Lu| \leq C \max_{|\alpha| \leq m} \sup_K |D_\alpha \varphi|$  for every  $\varphi \in C_0(K)$ . And the functional  $\varphi \rightarrow (L\varphi)(x)$  is a distribution supported on  $x$ , thus by (12.11.2.11), it is of the form

$$Lu(x) = \sum_{|\alpha| \leq m} a_\alpha(x) D_\alpha \varphi(x).$$

We need to show  $a_\alpha$  is smooth, which we choose a bump function  $\chi$  to show  $a_0$  is smooth and then choose  $x_i \chi$  applied to  $L\varphi - a_0 \varphi$  to show  $a_i$  is smooth, etc. □

**Prop. (13.1.7.2).** The property of  $\psi$ do of order  $d$  is preserved under diffeomorphism, Cf.[Distributions and Operators P195], giving us the possibility to define  $\psi$ do differential operator on manifolds, and the principal symbol variate in this way that it forms a function from the cotangent bundle to the  $M_n(\mathbb{C})$ . And the Sobolev space is defined by the property that all of its restrictions on a atlas are Sobolev, using the partition of unity. ┘

**Prop. (13.1.7.3).** All the norms of different are commensurable up to constant factor w.r.t. each other, so it doesn't quite matter with different norms. ┘

**Prop. (13.1.7.4).** The parametrix exists for an elliptic operator on manifolds. Cf.[Distributions and Operators P207]. ┘

## 8 Elliptic Operators

**Prop. (13.1.8.1).** Elliptic operator is a Fredholm operator. And the kernel and cokernel are smooth functions, so it is also a Fredholm operator on  $C^\infty(\Omega)$ . ┘

*Proof:* It suffice to find a left and right inverse modulo compact operators, and in fact we find it module  $S^{-\infty}$ . Since  $S^{-\infty}$  are all compact operators, i.e. it has a parametrix. Cf.[Distributions and Operators, P184]. □

**Prop. (13.1.8.2)[Garding Inequality].** For an elliptic operator of order  $d$  on  $\Gamma(E)$ ,

$$\|f\|_{H^s} \leq C(\|f\|_{H^{s-d}} + \|Pf\|_{H^{s-d}})$$

┘

*Proof:*

□

**Cor. (13.1.8.3) [Elliptic Regularity Theorem].** The inverse image of a smooth function under an elliptic operator is a smooth function, because the intersection of  $H^s(E)$  is  $C^\infty(E)$ . ┘

**Cor. (13.1.8.4) [Elliptic Regularity Theorem].** For  $L = \sum_{|\alpha| \leq N} f_\alpha D_\alpha$ , where  $f_\alpha \in C^\infty(\Omega)$  and the equation  $Lu = v$  for distributions  $u$  and  $v \in D'(\Omega)$ , when  $v$  is locally  $H^s$ ,  $u$  is locally  $H^{s+N}$ . Thus if  $v \in C^\infty(\Omega)$ , then  $u \in C^\infty(\Omega)$  by (12.11.4.12)(12.11.4.14). ┘

*Proof:* We prove the case when  $L$  has leading coefficients constant. For every  $\varphi \in D(\Omega)$  that is 1 on some open ball  $B$ ,  $\varphi u$  has compact support thus in some  $H^t$  and then we use a sublemma that says if  $\psi$  is 1 on the support of  $\varphi$ , then if  $\psi u$  is in  $H^t$ , where  $t \leq s + N - 1$ , then  $\varphi u \in H^{t+1}$ . In this way, we can shrink the nbhd to reach  $H^{s+N}$ . The proof of the lemma is in [Rudin Functional Analysis P220]. □

**Prop. (13.1.8.5)[Analytic Ellipticity theorem].** Suppose  $L$  is an analytic elliptic differential operator on a domain  $M \subset \mathbb{R}^n$ , then every solution to  $L\varphi = 0$  is analytic. ┘

*Proof:*

□

**Prop. (13.1.8.6).** The formal adjoint of an elliptic operator is an elliptic operator. ┘

*Proof:*

□

**Cor. (13.1.8.7).** The index of an elliptic operator, regarded as an operator form  $L_s \rightarrow L_{s-d}$  doesn't depend on  $s$ , because all the kernel of  $P$  and  $P^*$  are smooth. ┘

**Prop. (13.1.8.8).** For an elliptic operator, It has a inverse, the Green function which is a compact operator, so it has countable eigenfunctions consisting of smooth functions on  $L^2$  with eigenvalues converging to  $\infty$ . Moreover, the eigenvalues satisfy  $|\lambda_n| \geq Cn^\delta$  for some  $\delta, C$ . ┘

*Proof:* We prove for  $P$  self-adjoint. Use (13.1.8.1),  $\ker P$  is all smooth, so there is a map  $P(H^{-2d}) \rightarrow P(H^{-d})$  which is bijective thus an isomorphism by Banach. So the inverse of this isomorphism composed with the Sobolev embedding  $H^{-d} \rightarrow L^2$  is a compact operator  $G$ . we notice that this map has the same eigenfunctions as  $P$ , thus the result from that of compact operators.

For the second assertion, it suffice to prove  $\dim N(\lambda) \leq C\lambda^M$ . Using Garding inequality and Sobolev embedding, we have for  $f \in N(\lambda)$ ,  $\|f\|_{C^0} \leq C(1 + \lambda^l)\|f\|_{L^2}$  for large  $l$ . So if we choose an orthonormal basis  $f_i$ , then  $|a_i f_i(x)| \leq C(1 + \lambda^l)\sqrt{\sum |a_i|^2}$ . Let  $a_i = f_i(x)$  and integrate over  $M$ , we get the desired result. □

**Cor. (13.1.8.9).** For a self-adjoint elliptic operator  $P$  which is not a constant,  $L^2(E)$  has a basis consisting of eigenfunctions of  $P$ . ┘

**Cor. (13.1.8.10)[Sturm-Liouville].** This can be used to solve for example eigenvalue problem for Liouville's equation:

$$(pu')' + qu = \lambda \sigma u.$$

where  $p$  and  $\sigma$  are positive. Cf. (13.1.2.8). ┘

**Cor. (13.1.8.11).** The Hermite functions  $C_n e^{x^2/2} \frac{d^n}{dx^n} e^{-x^2}$ , as the eigenvector of  $\hat{H} = x^2 - \frac{d^2}{dx^2}$ , forms a complete basis for  $L^2(\mathbb{R})$ . Because it is  $e^{-x^2}$  times the solution of the operator  $(e^{-x^2} F')' - e^{-x^2} F$ .  $\lrcorner$

**Prop. (13.1.8.12).** For a formally self-adjoint elliptic operator  $P$  of degree  $d$  on  $E$ ,  $\Gamma(E) = \text{Im } P \oplus P(\Gamma(E))$ .  $\lrcorner$

*Proof:* We know that  $L^2(E) = P(H^d E) \oplus \ker P$ , and  $\ker P$  are all smooth by (13.1.8.3), so  $\Gamma(E) = \ker P \oplus P(H^d E) \cap \Gamma(E)$ . Now use Garding's inequality (13.1.8.2), the intersection is just  $P(\Gamma(E))$ , thus the result.  $\square$

**Prop. (13.1.8.13) [Asymptotic Heat Equation].** In this case we have the series

$$h_t(A^*A) = \sum_{\lambda} e^{-\lambda t} \dim \Gamma_{\lambda}(E)$$

converges and  $h_t$  has an asymptotic expansion

$$h_t = \sum_{k \geq -n} t^{k/2m} U_k(A^*A)$$

where  $n = \dim M$  and  $U_k = \int_M \mu_k$  for a differential form on  $M$ . Cf. [Heat Equation and the Index Theorem P297].

By the proposition above, the eigenspaces of eigenvalue non-zero neutralize, so  $\text{Ind } A = h_t(A^*A) - h_t(AA^*)$ , so

$$\text{Ind } A = U_0(A^*A) - U_0(AA^*) = \int_M \mu_0(A^*A) - \mu_0(AA^*).$$

The proof consists of the following propositions,  $\lrcorner$

**Prop. (13.1.8.14).** Using the fact that an elliptic operator has a countable basis, for an elliptic operator  $P$ , when  $t > 0$ , we let  $K(t, x, y) = \sum_n e^{-t\lambda_n} \Phi_n(x) \bar{\Phi}_n(y)$ , then

$$e^{-tP} f(x) = \int K(t, x, y) f(y) dy.$$

$K(t, x, y)$  is smooth. and the trace of  $e^{-tA^*A}$  is exactly  $h_t(A^*A)$  as in the last proposition. And the trace is just  $\int_M K(t, x, x)$ , as can be easily seen.  $\lrcorner$

*Proof:* Use Garding inequality and (13.1.8.8), we can show  $\|K\|_{C^k}$  is bounded.  $\square$

## 13.2 Calculus of Variations

### 1 Euclidean case

**Def. (13.2.1.1) [Functionals on Function Spaces].** A **functional** on the space of finite curves in  $\mathbb{R}^N$  is a real-valued function on the space of smooth curves in  $\mathbb{R}^N$ .  $\lrcorner$

**Def. (13.2.1.2) [Differentiable Functionals].** A **differentiable functional** on the space of finite curves in  $\mathbb{R}^N$  is a functional on the space of curves s.t. for any  $\gamma : I \rightarrow \mathbb{R}^N$  and  $h \in C^\infty(I, \mathbb{R}^N)$ ,

$$\Phi(\gamma + h) - \Phi(\gamma) = F(h) + O(\|h\|^2 + \|h'\|^2).$$

when  $\|h\|^2 + \|h'\|^2$  is small, where  $F$  is a linear functional  $F : C^\infty(I, \mathbb{R}^N) \rightarrow \mathbb{R}$ . Such a function  $F$  (necessarily unique) is called the **variation of the functional**  $\Phi$ .  $\lrcorner$

**Def. (13.2.1.3) [Extremal Curves of a Functionals].** An **extremal curve** for a differentiable functional (13.2.1.2) is a finite curve  $\gamma : [t_0, t_1] \rightarrow \mathbb{R}^N$  s.t. the variation  $F(h) = 0$  for any  $h \in C^\infty([t_0, t_1], \mathbb{R}^N)$  s.t.  $h(t_0) = h(t_1) = 0$ .  $\lrcorner$

**Prop. (13.2.1.4).** If  $L = L(a, b, c) \in C^\infty(\mathbb{R}^N \times \mathbb{R}^N \times \mathbb{R})$ , then, the functional

$$\Phi(\gamma) = \int_{t_0}^{t_1} L(\gamma(t), \dot{\gamma}(t), t) dt, \quad \gamma : [t_0, t_1] \rightarrow \mathbb{R}^N :$$

is differentiable, and its variation is given by

$$F(h) = \int_{t_0}^{t_1} \left[ \frac{\partial}{\partial \gamma} L - \frac{\partial}{\partial t} \frac{\partial}{\partial \dot{\gamma}} L \right] \cdot h dt + \left( h \cdot \frac{\partial}{\partial \dot{\gamma}} L \right) \Big|_{t_0}^{t_1}.$$

$\lrcorner$

*Proof:*

$$\begin{aligned} \Phi(\gamma + h) - \Phi(\gamma) &= \int_{t_0}^{t_1} [L(\gamma + h, \dot{\gamma} + h', t) - L(\gamma, \dot{\gamma}, t)] dt \\ &= \int_{t_0}^{t_1} \left[ \frac{\partial}{\partial \gamma} L \cdot h + \frac{\partial}{\partial \dot{\gamma}} L \cdot h' \right] dt + O(\|h\|^2 + \|h'\|^2) \\ &= \int_{t_0}^{t_1} \left[ \frac{\partial}{\partial \gamma} L - \frac{\partial}{\partial t} \frac{\partial}{\partial \dot{\gamma}} L \right] \cdot h dt + \left( h \cdot \frac{\partial}{\partial \dot{\gamma}} L \right) \Big|_{t_0}^{t_1} + O(\|h\|^2 + \|h'\|^2) \end{aligned}$$

The last assertion follows easily from (12.3.2.12).  $\square$

**Cor. (13.2.1.5) [Euler-Lagrangian Equation].**  $\gamma$  is an extremal curve (13.2.1.3) for this functional (13.2.1.4) if

$$\frac{\partial}{\partial \gamma} L - \frac{\partial}{\partial t} \frac{\partial}{\partial \dot{\gamma}} L = \mathbf{0}$$

along the curve  $\gamma$ . This equation is called the **Euler-Lagrangian equation** for this functional.

More concretely, we can write

$$\frac{\partial}{\partial \gamma} \Phi(t) = \lim_{\varepsilon \rightarrow 0} \frac{\Phi[f(t') + \varepsilon \delta(t' - t)] - \Phi[f(t')]}{\varepsilon} = \frac{\partial}{\partial \gamma} L(t) - \frac{\partial}{\partial t} \frac{\partial}{\partial \dot{\gamma}} L(t).$$

$\lrcorner$

**Cor. (13.2.1.6).** If  $\Phi(\gamma) = \int_{\gamma} \|\nabla \gamma\|^2$ , then  $\frac{\partial}{\partial \gamma} \Phi = -2\Delta \gamma$ .  $\lrcorner$

### 2 Riemannian Manifold case

---

### 13.3 Micro-local Analysis

## 13.4 Scattering Theory

## 13.5 Differential Equations on Varieties

References are [Del70] and [Katz, Nilpotent connections and the monodromy theorem].

**Notation (13.5.0.1).**

- Use notations on complex geometry defined in [Complex Geometry](#).
- We assume that all analytic spaces(16.9.3.4) are  $\sigma$ -compact.

┘

### Analytic Spaces

**Def. (13.5.0.2) [Principle of Analytic Continuation].** For a non-empty connected locally path-connected and locally simply path-connected pointed topological space  $X \in \mathcal{Top}$  and  $\mathcal{F} \in \mathcal{Sh}(X)$ ,  $\mathcal{F}$  is said to satisfy the **principle of analytic continuation** if for any two local sections of  $\mathcal{F}$ , the set of points on  $X$  where these two sections agree is clopen in  $X$ . ┘

**Prop. (13.5.0.3).** Situation as in(13.5.0.2), if  $\mathcal{F}$  satisfies the principle of analytic continuation, then the submodule of  $\mathcal{F}$  generated by the global sections of  $\mathcal{F}$  is a constant sheaf on  $X$ . ┘

**Def. (13.5.0.4) [Multi-Valued Sections].** For a non-empty connected locally path-connected and locally simply path-connected pointed topological space  $(X, x_0) \in \mathcal{Top}$ , let  $\text{pr} : (\tilde{X}, \tilde{x}_0) \rightarrow (X, x_0)$  be the universal covering space. Then for each  $\mathcal{F} \in \mathcal{Sh}(X)$ , a **multi-valued section** of  $\mathcal{F}$  is an element of  $\Gamma(\tilde{X}, \text{pr}^* \mathcal{F})$ . ┘

**Def. (13.5.0.5) [First-Order Infinitesimal Neighbors].** For  $x, y : S \rightarrow X \in \text{AnSpa}/\mathbb{C}$ ,  $x, y$  are called **first-order infinitesimal neighbors** if the map  $(x, y) : S \rightarrow X \times X$  factors through the first-order infinitesimal neighbourhood of  $\Delta_X \subset X \times X$ . ┘

**Def. (13.5.0.6) [Holomorphic Connections].** For  $X \in \mathbb{C}\text{-Mani}$  and  $\mathcal{V} \in \mathcal{Coh}_{\text{lf}}(X)$ , a **holomorphic connection** on  $\mathcal{V}$  is a function that assigns to each tuple  $(S, x, y)$  where  $S \in \text{AnSpa}/\mathbb{C}$  and first-order infinitesimal neighbors  $x, y : S \rightarrow X \in \text{AnSpa}/\mathbb{C}$  an isomorphism  $\gamma_{x,y} : x^* \mathcal{V} \cong y^* \mathcal{V}$  s.t.

- For any such tuple  $(S, x, y)$  and  $f : T \rightarrow S \in \text{AnSpa}/\mathbb{C}$ , we have  $f^*(\gamma_{x,y}) = \gamma_{x \circ f, y \circ f}$ .

For each such tuple  $(S, x, y)$  s.t.  $x = y$ , we have  $\gamma_{x,x} = \text{id}_{x^* \mathcal{V}}$ . ┘

**Prop. (13.5.0.7) [Equivalent Definition of Connections, Koszul].** For  $X \in \mathbb{C}\text{-Mani}$  and  $\mathcal{V} \in \mathcal{Coh}_{\text{lf}}(X)$ , a holomorphic connection on  $\mathcal{V}$ (13.5.0.6) is equivalent to a map

$$\nabla : \mathcal{V} \rightarrow \Omega_X^1 \otimes \mathcal{V} \in \mathcal{Sh}(\mathbb{C}_X)$$

s.t. the **Leibniz-rule** holds for any local section  $f$  of  $\mathcal{O}_X$  and local section  $s$  of  $\mathcal{V}$ :

$$\nabla(fs) = df \otimes s + f \nabla(s).$$

The set of connections on  $\mathcal{V}$  is denoted by  $\text{Conn}(\mathcal{V})$ , and the category of pairs  $(\mathcal{V}, \nabla)$  where  $\mathcal{V} \in \mathcal{Coh}_{\text{lf}}(X)$  and  $\nabla$  is a connection of  $\mathcal{V}$  is denoted by  $\text{Conn}(X)$ . ┘

*Proof:* ?

□

**Example (13.5.0.8) [Connections].** Let  $X \in \mathbb{C}\text{-Mani}$ ,

- The **canonical connection** on  $\mathcal{O}_X$  is given by  $\nabla(f) = f$ .
- 

┘

**Def. (13.5.0.9) [Horizontal Sections].** For  $X \in \mathbb{C}\text{-Mani}$  and  $(\mathcal{V}, \nabla) \in \text{Conn}(X)$ , a **horizontal section** on  $\mathcal{V}$  is a local section  $s$  of  $\mathcal{V}$  s.t.  $\nabla(s) = 0$ . ┘

## 1 Regular Connections

### Regularity in Dimension 1

**Def. (13.5.1.1) [Regular Singularities].** Let  $U \subset \mathbb{C}$  is an domain containing 0 and

$$E : \frac{\partial^n}{\partial z^n} y + \sum_{i \in [n-1]} a_i(z) \frac{\partial^i}{\partial z^i} y = 0,$$

where  $a_i(z) \in \mathcal{O}(U \setminus \{0\})$ . Then this equation  $E$  is said to have a **regular singularity** at  $z = 0$  if  $z^{n-i} a_i(z) \in \mathcal{O}(U)$  for each  $i \in [n-1]$ . If this holds, then we can write  $E$  as

$$\left( z \frac{\partial}{\partial z} \right)^n y + \sum_{i \in [n-1]} b_i(x) \left( z \frac{\partial}{\partial z} \right)^i y = 0$$

for some  $b_i(z) \in \mathcal{O}(U)$ . ┘

### Logarithmic Poles

**Def. (13.5.1.2) [Logarithmic deRham-Complexes].** For  $X \in \text{Sch}^{\text{ft,sm}}/\mathbb{C}$  and a normal-crossing divisor  $Y \subset X$ , denote  $X^* = X \setminus Y$  and  $j : X^* \hookrightarrow X$ , the **logarithmic deRham-complex** of  $X$  along  $Y$  is the smallest subcomplex

$$\Omega_X^\bullet \langle Y \rangle \subset j_* \Omega_{X^*}^\bullet$$

s.t.

- $\Omega_X^\bullet \langle Y \rangle$  is stable under exterior product.
- $\Omega_X^\bullet \langle Y \rangle$  contains  $\Omega_{X^*}^\bullet$ .
- For any local section  $f$  of  $\mathcal{O}_{X^*}$  s.t.  $f$  is meromorphic along  $Y$ , we have  $df/f \in \Omega_X^1 \langle Y \rangle$ .

And local sections of  $\Omega_X^\bullet \langle Y \rangle$  are said to present a logarithmic pole along  $Y$ .

Then we have

- For a local section  $\alpha$  of  $j_* \Omega_{X^*}^p$ ,  $\alpha \in \Omega_X^\bullet \langle Y \rangle$  iff  $\alpha$  and  $d\alpha$  have at worst simple poles along  $Y$ .
  - $\Omega_X^1 \langle Y \rangle$  is locally free, and  $\Omega_X^p \langle Y \rangle = \wedge^p (\Omega_X^1 \langle Y \rangle)$  for each  $p \in \mathbb{Z}_+$ .
  -
- ┘

### Regularity in Higher Dimensions

**Thm. (13.5.1.3) [Regularity along Closed Analytic Subspaces, Deligne[Del70]].** Suppose

- $X \in \text{AnSpa}/\mathbb{C}$  and  $Y \subset X \in \text{AnSpa}/\mathbb{C}$  is a closed subspace s.t.  $X \setminus Y$  is smooth.
- $X' \rightarrow X$  is the normalization of  $X$  and  $Y'$  is the inverse image of  $Y$  in  $X'$ .
- Let  $(\mathcal{V}, \nabla) \in \text{Conn}(X)$  be meromorphic along  $Y$  ?.

Then the following conditions are equivalent:

- 
- For each map  $\varphi : \mathbb{D}^1 \rightarrow X \in \text{AnSpa}$  with  $\varphi^{-1}(Y) = \{0\}$ , the inverse image  $\varphi^*(\mathcal{V}, \nabla)$  is regular on  $\mathbb{D}^1$  ?.
- The multi-valued horizontal sections of  $(\mathcal{V}, \nabla)$  are of moderate growth along  $Y$  ?.

└

*Proof:* Cf. [Del70]Thm4.1.?

□

## 13.6 D-Modules

References are [HTT08].

**Notation (13.6.0.1).**

- Let  $k \in \mathbf{Field}, k = \bar{k}$ .
- Let  $X \in \mathcal{V}\mathbf{ar}^{\text{sm}}/k$ .

┘

### 1 Basics

**Def. (13.6.1.1) [Differential Operators].** Define  $D_{0,X} = \mathcal{O}_X$ , and for any  $n \in \mathbb{Z}_+$ , define  $D_{n,X}$  to be the subbundle of  $\underline{\text{Hom}}(\mathcal{O}_X, \mathcal{O}_X)$  s.t. for any local section  $f \in \mathcal{O}_X$ ,  $[L, f] \in D_{n-1}(X)$ . Then  $D_X = \cup_n D_{n,X}$  is a sheaf of algebras, called the algebra of **differential operators** on  $X$ . ┘

**Prop. (13.6.1.2).**

- $D_{1,X} \cong \mathcal{O}_X \rtimes T_X$ .
- $\text{gr } D_X = \oplus_{i \in \mathbb{N}} \text{Sym}^i T_X = \mathcal{P}\text{oly}(T_X^*)$ . In particular,  $D_X$  is left and right Noetherian.
- $\Gamma(X, D_X)$  is generated over  $\Gamma(X, \mathcal{O}_X)$  by  $L_v$  for  $v \in \mathcal{V}\text{ect}(X)$  subject to the following relations:

$$[f, g] = 0, \quad [L_v, f] = v(f), \quad L_{fv} = fL_v, \quad [L_v, L_w] = L_{[v,w]}, \quad f, g \in \Gamma(X, \mathcal{O}_X), v, w \in \mathcal{V}\text{ect}(X).$$

┘

**Def. (13.6.1.3) [D-Modules].** A left/right **D-module(algebraic)** on  $X$  is a left/right qco  $D_X$ -modules. The category of left D-modules on  $X$  is denoted by  $\text{Mod}_D(X)$ . The category of left quasi-coherent D-modules on  $X$  is denoted by  $\mathcal{Q}\text{Coh}_D(X)$ . ┘

**Def. (13.6.1.4) [Connections].** For  $M \in \text{Mod}(\mathcal{O}_X)$ , a **connection** on  $M$  is a  $k$ -linear morphism of sheaves  $\nabla : M \rightarrow M \otimes_{\mathcal{O}_X} \Omega_X^1$  s.t.

$$\nabla(fm) = f\nabla(m) + m \otimes df$$

for any local sections  $f \in \mathcal{O}_X$  and  $m \in M$ . ┘

**Prop. (13.6.1.5) [Curvatures].** Given  $M \in \text{Mod}(\mathcal{O}_X)$  and a **connection**  $\nabla$  on  $M$ , there is a  $\mathcal{O}_X$ -linear map

$$\nabla^2 : M \rightarrow M \otimes_{\mathcal{O}_X} \Omega_X^2$$

s.t. for local sections  $m \in M, v, w \in T_X$ , it is given by  $\nabla^2(m)(v, w) = ([\nabla_v, \nabla_w] - \nabla_{[v,w]})m$ , where  $\nabla_v : M \rightarrow M$  is given by  $\nabla_v(m) = \nabla(m)(v)$ . This map  $\nabla^2$  is called the **curvature** of  $\nabla$ . And  $\nabla$  is called a **flat connection** if  $\nabla^2 = 0$ . ┘

*Proof:* ?

□

**Prop. (13.6.1.6) [D-Modules and Connections].** A left  $D_X$ -module is the same thing as an  $\mathcal{O}_X$ -module with a flat connection. ┘

*Proof:* If  $M$  is a left  $D_X$ -module, then there is a  $D_X$ -action locally given by  $L_v.m = \nabla(m)(v)$ . This is an action by (13.6.1.2). Conversely, the same formula can be used to define a connection on  $M$  that is flat. ┘

**Def. (13.6.1.7)[Integrable Connections].** An **integrable connection** over  $X$  is a vector bundle with a flat connection. The category of integrable connections on  $X$  is denoted by  $\text{Conn}(X)$ .  $\lrcorner$

**Prop. (13.6.1.8)[Coherence].**

- $D_X$  is a coherent sheaf of rings.
- $M \in \text{Mod}_D(X)$  is coherent over  $D_X$  iff it is Qco and locally f.g. over  $\mathcal{O}_X$ .
- $M \in \text{Mod}_D(X)$  is coherent over  $X$  iff it is an integral connection(13.6.1.7).

$\lrcorner$

*Proof:* Cf.[D-modules, perverse sheaves, and representation theory]P27.?

$\square$

**Prop. (13.6.1.9).** The support of an irreducible  $D$ -module  $M \in \text{Mod}_D(X)$  is irreducible.  $\lrcorner$

*Proof:* If  $\text{Supp}(M) = Z_1 \cup Z_2$ , consider  $i : Z_1 \hookrightarrow X$  and  $j : X \setminus Z \hookrightarrow X$ , then there is an exact sequence

$$0 \rightarrow j_! j^* M \rightarrow M \rightarrow i_* i^* M \rightarrow 0.$$

which shows that  $M$  is reducible, contradiction.  $\square$

**Prop. (13.6.1.10) [Direct/ Inverse Images and Intermediate Extensions].** For  $\pi : X \rightarrow Y \in \mathcal{V}\text{ar}^{\text{sm}}/k$ , there are inverse image and direct image functors of  $D$ -modules as the general formalism of(7.2.2.9). the module  $D_{X/Y} = f^* D_Y$  is a left  $D_X$ -module by defining

$$\nabla_v(f \otimes L) = v(f) \otimes L + f \otimes \pi_*(v)L, \quad f \in \mathcal{O}_X, L \in D_Y.$$

In particular, for any  $M \in \text{Mod}_D(Y)$ ,  $f^*(M) = D_{X/Y} \otimes f^{-1}M$  is a left  $D_X$ -module, called the **inverse image D-module**.

And if  $\pi$  is affine, then for any right  $D_X$ -module  $M$ ,  $\pi_*(M) \otimes D_Y = \pi_*(M \otimes D_{X/Y})$  is a right  $D_Y$ -module, called the **direct image D-module**. There are derived versions in the non-affine situation?

If  $j : U \hookrightarrow X$  is an inclusion of open subschemes, then there is also a **intermediate extension D-module**  $j_! M$  for any  $D$ -module  $M \in \text{Mod}_D(X)$ (7.2.2.9).  $\lrcorner$

### Categories of D-Modules

**Def. (13.6.1.11) [D-Affine Varieties].** For  $X \in \mathcal{V}\text{ar}^{\text{sm}}/k$ , then  $X$  is called a **D-affine variety** if the functor

$$\Gamma : \mathcal{Q}\text{Coh}_D(X) \rightarrow \text{Mod}(D(X))$$

is an equivalence of categories.  $\lrcorner$

**Kashiwara's Equivalence****2 Coherent D-Modules****3 Holonomic D-Modules****Regular Holonomic D-Modules****4 Analytic D-Modules and the deRham Functor****5 Meromorphic Connections****6 Analytic D-Modules and the deRham Functor****7 Beilinson-Bernstein Localization Theorem**

**Prop. (13.6.7.1).** Partial flag varieties of semisimple groups are D-affine varieties. ┘

*Proof:* Cf.[Representation of Lie groups, Etingof]P108. □

**Thm. (13.6.7.2)**[Beilinson-Bernstein Localization Theorem]. ┘

**8 Riemann–Hilbert Correspondence**

## 13.7 Dynamical Systems

References are [Dynamical System, Katok] and [B-S02].

### 1 Topological Dynamical Systems

**Def. (13.7.1.1) [Topological Dynamic Systems].** A **topological dynamic system** is a topological space  $X$  and either a continuous map  $f : X \rightarrow X$  or a continuous (semi)flow  $f^t$  on  $X$ .  $\lrcorner$

**Def. (13.7.1.2) [Conjugacies].** Let  $(X, f), (Y, g)$  be topological dynamical systems, then a **semiconjugacy of dynamical systems** from  $(X, f)$  to  $(Y, g)$  is a surjection  $\text{pr} : X \rightarrow Y$  s.t.  $g \circ \text{pr} = \text{pr} \circ f$ . An invertible semiconjugacy is called a **conjugacy of dynamical systems**.  $\lrcorner$

**Def. (13.7.1.3) [Dynamical Notions].** Let  $f : X \rightarrow X$  be a discrete topological dynamic system (13.7.1.1), then

- $x \in X$  is called a **periodic point** for  $f$  if  $f^{(p)}(x) = x$  for some  $p \in \mathbb{Z}_+$ . And the minimal  $p \in \mathbb{Z}_+$  s.t.  $f^{(p)}(x) = x$  is called the **period** of  $f$  at  $x$ .  $x \in X$  is called a **pre-periodic point** for  $f$  if  $f^{(m)}(x) = f^{(n)}(x)$  for some  $0 < m < n \in \mathbb{Z}_+$ . The set of pre-periodic points of  $f$  is denoted by  $\text{PrePer}(f)$ .
- A **periodic cycle** is a finite set  $S \subset X$  s.t.  $f|_S$  is a transitive permutation.
- $x \in X$  is called **almost periodic** if for any nbhd  $U$  of  $x$ ,  $\{i | f^i(x) \in U\}$  is relatively dense in  $\mathbb{N}$ , i.e. appear in every  $k$  consecutive integers for some  $k$ .
- A periodic point  $x \in X$  for  $f$  with periodicity  $k$  is called **attracting** if there exists a precompact nbhd  $U$  of  $x \in X$  s.t.  $f(\overline{U}) \subset U$ , and  $\cap_{n \in \mathbb{N}} f^{(n)}(U) = \{x\}$ . Similarly,  $x$  is called **repelling** if there exists a nbhd  $U$  of  $x \in X$  s.t.  $\overline{U} \subset f(U)$ , and  $\cap_{n \in \mathbb{N}} f^{(-n)}(U) = \{x\}$ .
- For an attracting periodic point  $x \in X$  for  $f$ , the **basin of attraction** of  $x$  is defined to be the set

$$BA(x) = \{y \in X | \exists j \in \mathbb{N}, \lim_{n \rightarrow \infty} f^{(n)}(y) = f^j(x)\}.$$

If  $U$  is a nbhd of  $x \in X$  s.t.  $f(\overline{U}) \subset U$ , and  $\cap_{n \in \mathbb{N}} f^{(n)}(U) = \{x\}$ , then  $BA(x) = \cup_{n \in \mathbb{Z}_+} f^{(-n)}(x)$ , so it is open. The connected components  $BA_0(x)$  of  $BA(x)$  containing some  $f^{(j)}(x)$  for  $j \in \mathbb{N}$  is called the **intermediate basin of attraction** of  $x$ .

- For  $x \in X$ , its  **$\omega$ -limit points** are defined to be

$$\omega(x) = \bigcap_{n \in \mathbb{N}} \overline{\bigcup_{i \geq n} f^i(x)}$$

- If  $f$  is invertible, for  $x \in X$ , its  **$\alpha$ -limit points** are defined to be

$$\alpha(x) = \bigcap_{n \in \mathbb{N}} \overline{\bigcup_{i \leq -n} f^i(x)}$$

- The set of **(positively)recurrent** points for  $f$  is defined to be  $\mathcal{R}(f) = \{x \in X | x \in \omega(x)\}$ .
- The set  $NW(f)$  of **non-wandering points** are the points  $x$  that for any nbhd  $U$  of  $x$ , there is an  $n > 0$  that  $f^n(U) \cap U \neq \emptyset$ .
- Denote the orbit sets  $\mathcal{O}(x) = \bigcup_{n \in \mathbb{Z}} f^n(x)$ ,  $\mathcal{O}^+(x) = \bigcup_{n \geq 0} f^n(x)$ .

- Let  $X$  be compact, then a closed non-empty forward  $f$ -invariant  $Y \subset X$  is called a **minimal set** for  $f$  if there is no smaller such set. ┘

**Prop. (13.7.1.4).**

- $NW(f)$  is closed,  $f$ -invariant, and contains  $\alpha(x), \omega(x)$  for all  $x$ .
- Every recurrent point is non-wandering, thus  $\overline{\mathcal{R}(f)} \subset NW(f)$ .
- Let  $X$  be compact Hausdorff, then  $\overline{\mathcal{O}^+(x)}$  is minimal for  $f$  iff  $x$  is almost periodic. ┘

*Proof:* item1 is easy, 2 follows from 1 as  $x \in \omega(x)$ .

For 3: suppose  $x$  is almost periodic and  $y \in \overline{\mathcal{O}^+(x)}$ , we need to show that  $x \in \overline{\mathcal{O}^+(y)}$ . For any nbhd  $x \in U$ , there is a small nbhd  $x \in U' \subset U$  and a nbhd  $\Delta \subset V \subset X \times X$ , that if  $x_1 \in U'$  and  $(x_1, x_2) \in V$ , then  $x_2 \in U$ . Since  $x$  is periodic, there is a  $K$  that for any  $j \geq 0$ , there is a  $f^{j+k}(x) \in U'$  for some  $0 \leq k \leq K$ . Let  $V' = \cap_{i=0}^K f^{-1}(V)$ , then  $V'$  is open and contains the diagonal. Thus there is a nbhd  $W$  of  $y$  that  $W \times W \subset V'$ . Now choose  $f^n(x) \in W$  by almost periodicity, and  $f^{n+k}(x) \in U'$  for some  $0 \leq k \leq K$ , then we have  $(f^{n+k}(x), f^k(x)) \in V$  by the definition of  $V'$  and  $W$ , and hence  $f^k(x) \in U$ . This shows  $x \in \overline{\mathcal{O}^+(y)}$ .

Conversely, if  $x$  is not almost periodic, then there is a nbhd  $U$  of  $x$ , that there is a sequence  $\{a_i\} \in \mathbb{N}$ , that  $f^{a_i+j}(x) \notin U$  for  $j \leq i$ . By convergence theorem and passing to a subsequence, we assume  $y$  is the limit of  $f^{a_i}(x)$ , and  $f^j(y) \notin U$  for any  $j > 0$ , thus  $x \notin \overline{\mathcal{O}^+(y)}$ , showing  $\overline{\mathcal{O}^+(x)}$  is not minimal. □

**Prop. (13.7.1.5)[Minimal Set Exists on Compact Dynamic System].** If  $f$  is a topological dynamic system on a compact space, then there exists a minimal set. In particular, there exists an almost periodic point, in priori positively recurrent point, by (13.7.1.4). ┘

*Proof:* Use Zorn's lemma and the finite intersection property. □

**Def. (13.7.1.6)[Topologically Transitive].** A topological dynamic system  $f : X \rightarrow X$  is called **topologically transitive** if there is a point  $x$  that  $\overline{\mathcal{O}(x)} = X$ . ┘

**Prop. (13.7.1.7).** Let  $f$  be a continuous map of a locally compact Hausdorff second countable space  $X$ . Suppose that for any two non-empty open set  $U, V$ , there is  $n > 0$  that  $f^n(U) \cap V \neq \emptyset$ , then  $f$  is topologically transitive. ┘

*Proof:* For any open subset  $V$ , the hypothesis says  $\cup_{n>0} f^{-n}(V)$  is dense in  $X$ . Let  $V_i$  be a countable basis for the topology of  $X$ , and  $Y = \cap_i \cup_{n>0} f^{-n}(V_i)$ , then it is non-empty, by Baire category theorem (4.4.9.2). Now the orbit of any  $y \in Y$  enters every  $V_i$ , thus its orbit is dense in  $X$ . □

**Prop. (13.7.1.8).** Let  $f : X \rightarrow X$  be a homeomorphism of a compact metric space, and suppose  $X$  has no isolated points, then if there is a dense orbit  $\mathcal{O}(x)$ , there will be a dense orbit  $\mathcal{O}^+(x)$ . ┘

*Proof:* The hypothesis that  $X$  has no isolated points shows that  $\mathcal{O}(x)$  meets every open subset  $U$  infinitely many times, thus we can choose  $f^{n_k}(x) \in B(x, 1/k)$  that  $|n_k| \rightarrow \infty$ . Thus  $f^{n_k+l}(x) \rightarrow f^l(x)$  for any  $l$ .

If there are infinitely many  $n_k > 0$ , then we have  $\mathcal{O}(x) \subset \overline{\mathcal{O}^+(x)}$ , hence  $\mathcal{O}^+(x)$  is dense. If there are infinitely many  $n_k < 0$ , then  $\mathcal{O}^-(x)$  is dense. Then for any open subset  $U, V$ , we can find  $i < j < 0$  that  $f^i(x) \in U, f^j(x) \in V$ , thus  $f^{j-i}(U) \cap V \neq \emptyset$ . Hence we use (13.7.1.7) to conclude  $f$  is topologically transitive. □

**Def. (13.7.1.9) [Topological Mixing].** A topological dynamic system  $f : X \rightarrow X$  is called **topologically mixing** if for any two non-empty open subsets  $U, V$ , there is  $N > 0$  that  $f^n(U) \cap V \neq \emptyset$  for any  $n \geq N$ .  $\lrcorner$

**Def. (13.7.1.10).** A homeomorphism  $f : X \rightarrow X$  is called **expansive** if there is a  $\delta > 0$  that for any two distinct points  $x, y$ , there is some  $n \in \mathbb{Z}$  that  $d(f^n(x), f^n(y)) \geq \delta$ . Similarly, we can define **positively expansive** for a non-invertible continuous map  $f : X \rightarrow X$ . This constant  $\delta$  is called a **expansiveness constant** of  $f$ .  $\lrcorner$

**Prop. (13.7.1.11) [Compact Metric Space not positively expansive].** If  $f$  be a continuous map of an infinite compact metric space  $X$ , then it is not positively expansive.  $\lrcorner$

*Proof:* First assume  $f$  is invertible. Fix  $\varepsilon > 0$ , consider all  $m$  that there are points  $x \neq y$  that

$$d(f^n(x), f^n(y)) < \varepsilon, \quad 0 < n \leq m, \quad d(x, y) \geq \varepsilon.$$

If these  $m$  are infinite, then we can use convergence point theorem to find a point  $x, y$  that  $d(f^n(x), f^n(y)) < \varepsilon$  for any  $n > 0$ , thus  $f$  is not expansive.

If these  $m$  are finite, let  $M$  be a maximal, then by absolute convergence, there is a  $\delta$  that if  $d(x, y) \leq \delta$ , then  $d(f^n(x), f^n(y)) < \varepsilon$  for any  $0 \leq n \leq m$ . Then by definition of  $M$ ,  $d(f^{-1}(x), f^{-1}(y)) < \varepsilon$ , and similarly  $d(f^{-n}(x), f^{-n}(y)) < \varepsilon$  for any  $n < 0$ .

Now choose a finite  $\delta/2$ -net  $\{x_i\}$  of  $M$ , then for each  $j \in \mathbb{Z}$ , there are two  $f^j(x_s), f^j(x_t)$  in the same  $B(\delta/2, x_j)$ , thus  $d(f^n(x_s), f^n(x_t)) < \varepsilon$  for  $n \leq j$ . Now there are only f.m. pairs of elements in  $M$ , there are some pair  $(x_\alpha, x_\beta)$  appeared infinitely many times for different  $j > 0$ , thus we have  $d(f^n(x_\alpha), f^n(x_\beta)) < \varepsilon$  for any  $n \in \mathbb{Z}$ .

For the non-invertible case, the proof is the same, noticing that  $f^{-1}$  is chosen wisely when it can be defined.  $\square$

**Cor. (13.7.1.12).** Let  $f$  be an expansive homeomorphism of an infinite compact metric space  $X$ , then there are distinct points  $x_0, y_0$  that  $\lim_{n \rightarrow \infty} d(f^n(x_0), f^n(y_0)) = 0$ .  $\lrcorner$

*Proof:* Let  $\delta$  be an expansive constant of  $f$ , then by (13.7.1.11), there are  $x_0 \neq y_0 \in X$  that  $d(f^n(x_0), f^n(y_0)) \leq \delta$  for all  $n > 0$ . Suppose  $d(f^n(x), f^n(y)) \not\rightarrow 0$ , then by compactness in  $X \times X$ , there is a subsequence  $\{n_k\} \in \mathbb{N}$  that  $f^{n_k}(x) \rightarrow x', f^{n_k}(y) \rightarrow y'$  with  $x' \neq y'$ . Then this will show that  $d(f^m(x), f^m(y)) < \delta$  for any  $m \in \mathbb{Z}$ , contradicting expansiveness of  $f$ .  $\square$

**Def. (13.7.1.13).** Let  $f : X \rightarrow X$  be a homeomorphism of compact Hausdorff space, then

- two points  $x, y$  are called **proximal** if the closure of orbits  $\overline{\mathcal{O}((x, y))}$  under  $f \times f$  intersect the diagonal  $\Delta \subset X \times X$ . It is called **distal** otherwise.  $f$  is called **distal** if every two distinct points  $x, y$  are distal.
- $f$  is called **equicontinuous** if the family  $\{f^n\}_{n \in \mathbb{Z}}$  is equicontinuous.  $\lrcorner$

**Prop. (13.7.1.14).** A equicontinuous homeomorphism  $f$  of a compact metric space are distal.  $\lrcorner$

*Proof:* Suppose  $f$  is not distal, then there is a proximal pair  $(x, y)$ , thus there is a sequence  $\{n_k\} \in \mathbb{Z}$  that  $d(f^{n_k}(x), f^{n_k}(y)) \rightarrow 0$ . let  $d(x, y) = \varepsilon$ , thus for any  $\delta > 0$ , there is some  $d(f^{n_k}(x), f^{n_k}(y)) < \varepsilon$ , thus contradicting the equicontinuity of  $f^{-n}$ .  $\square$

**Def. (13.7.1.15) [Almost Periodic Set].** For a subset  $A \subset X$  and a homeomorphism  $f : X \rightarrow X$ , denote by  $f_A$  the action of  $f$  on  $\text{Map}(A, X)$ . Then  $A$  is called **almost periodic** if every  $z \in \text{Map}(A, A)$  is almost periodic for  $f_A$ . Equivalently, for any finite set of points  $\{x_i\} \in A$ , and nbhds  $x_i \in U_i$ , the set  $\{k \in \mathbb{Z} \mid f^k(x_i) \in U_i\}$  is relatively dense in  $\mathbb{Z}$ . This is compatible with the previous definition of almost periodic point (13.7.1.3).  $\lrcorner$

**Def. (13.7.1.16).** A homeomorphism of a compact Hausdorff space is called **pointwise almost periodic** if every point  $x$  is almost periodic. By (13.7.1.4), we can see that this is equivalent to  $X$  is a union of minimal sets.  $\lrcorner$

**Lemma (13.7.1.17).** Every almost periodic set  $A$  is contained in a maximal almost periodic set in  $X$ .  $\lrcorner$

*Proof:* It is because of the second definition of almost periodic set (13.7.1.15) that the sum of an ordered family of almost periodic sets is also almost periodic.  $\square$

**Prop. (13.7.1.18).** Let  $f$  be a homeomorphism of a compact Hausdorff space  $X$ , then every point  $x \in X$  is proximal to an almost periodic point.  $\lrcorner$

*Proof:* If  $x$  is almost periodic, then we are done. If not, consider a maximal almost periodic set  $A \subset X$ , then  $x \notin A$ . Then for  $z \in X^A$  with range  $A$ , consider  $(x, z) \in X \times X^A$ , and find an almost periodic point  $(x_0, z_0)$  of  $f \times f_A$  in  $\overline{\mathcal{O}(x, z)}$ , by (13.7.1.5). Because  $z$  is almost periodic,  $z \in \overline{\mathcal{O}(z_0)}$ , by (13.7.1.4). Thus we see  $(x', z) \in \overline{\mathcal{O}(x_0, z_0)}$  for some  $x'$ , by the compactness of  $X$ . Then  $(x', z)$  is also almost periodic, and we can forget about  $x_0, z_0$ .

Therefore,  $\{x'\} \cup \text{Im}(z) = \{x'\} \cup A$  is almost periodic for  $f$ , and since  $A$  is maximal,  $x' \in A = \text{Im}(z)$ . This shows  $(x', x') \in \overline{\mathcal{O}(x, x')}$ , showing  $x$  is proximal to  $x'$ .  $\square$

**Cor. (13.7.1.19) [Distal Homeomorphism is Pointwise Almost Periodic].** If  $f$  is a distal homeomorphism of a compact Hausdorff space, then  $f$  is pointwise almost periodic.  $\lrcorner$

**Prop. (13.7.1.20).**

- A homeomorphism of a compact Hausdorff space is distal iff the product system  $(X \times X, f \times f)$  is pointwise almost periodic.
  - A factor system of a pointwise almost periodic homeomorphism is pointwise almost periodic.
  - A factor system of a distal homeomorphism is distal.
- $\lrcorner$

*Proof:* 1: If  $f$  is distal, then so is  $f \times f$ , hence it is pointwise almost periodic, by (13.7.1.19). Conversely, if  $f \times f$  is pointwise almost periodic, then if  $x, y$  is proximal, then  $(z, z) \in \overline{\mathcal{O}(x, y)}$ , but since  $\overline{\mathcal{O}(x, y)}$  is minimal, by (13.7.1.4),  $(x, y) \subset \overline{\mathcal{O}(z, z)} \subset \Delta$ , hence  $x = y$ .

2: This is easy.

3: if  $f$  is a factor of  $g$ , then  $f \times f$  is a factor of  $g \times g$ , but the latter is pointwise locally periodic, thus the first is also locally periodic, by 2, and then  $f$  is distal, by 1.  $\square$

### Topological Entropy

**Def. (13.7.1.21) [Definitions].** Let  $(X, d)$  be a compact metric space, and  $f$  a continuous map  $X \rightarrow X$ , we define

- for  $x, y \in X$ ,  $d_n(x, y) = \max_{0 \leq k \leq n-1} d(f^k(x), f^k(y))$ .

- a subset  $A \subset X$  is called  $(n, \varepsilon)$ -**spanning** if it is a  $\varepsilon$ -net in  $(X, d_n)$ . Similarly, we can define  $(n, \varepsilon)$ -**separated** and  $\text{cov}(n, \varepsilon, f)$  the minimal number of covering of  $X$  of  $d_n$ -diameter  $< \varepsilon$ .  $\lrcorner$

**Lemma (13.7.1.22).**  $\text{cov}(n, 2\varepsilon, f) \leq \text{span}(n, \varepsilon, f) \leq \text{sep}(n, \varepsilon, f) \leq \text{cov}(n, \varepsilon, f)$ .  $\lrcorner$

*Proof:* Easy.  $\square$

**Prop. (13.7.1.23)[Topological Entropy].** The number

$$\lim_{n \rightarrow \infty} \frac{1}{n} \log(\text{cov}(n, \varepsilon, f)) = h_\varepsilon(f)$$

is well-defined and finite. It is increasing as  $\varepsilon$  decreases, so  $h(f) = \lim_{\varepsilon \rightarrow 0^+} h_\varepsilon(f)$  exists, which lies in  $[0, \infty]$ . It is called the **topological entropy** of  $f$ .

Notice the entropy can be calculated by either  $\text{cov}$ ,  $\text{span}$  or  $\text{sep}$ , by (13.7.1.22).  $\lrcorner$

*Proof:* For this, we need to notice if  $U$  has  $d_n$ -diameter  $< \varepsilon$  and  $V$  has  $d_m$ -diameter  $< \varepsilon$ , then  $U \cap f^{-m}(V)$  has  $d_{m+n}$ -diameter  $< \varepsilon$ . Hence

$$\text{cov}(m+n, \varepsilon, f) \leq \text{cov}(m, \varepsilon, f) \cdot \text{cov}(n, \varepsilon, f).$$

Thus we can use (12.3.5.2) to conclude.  $\square$

**Prop. (13.7.1.24).** The topological entropy doesn't depend on the metric generating the topology.  $\lrcorner$

*Proof:* This is because  $d'$  is a continuous function on  $(X \times X, d \times d)$ , thus it is uniformly continuous as  $X$  is compact, so

$$\text{cov}(n, \varepsilon, f) \leq \text{cov}(n, \delta(\varepsilon), f)$$

where  $\delta(\varepsilon) \rightarrow 0$  when  $\varepsilon \rightarrow 0$ . This shows the topological entropies are the same.  $\square$

**Cor. (13.7.1.25).** Two conjugate dynamic systems have the same topological entropy.  $\lrcorner$

**Prop. (13.7.1.26)[Properties of Entropy].** Let  $f : X \rightarrow X$  be a continuous map of a compact metric space  $X$ ,  $g : Y \rightarrow Y$  be a continuous map of a compact metric space  $Y$ , then

- $h(f^m) = m \cdot h(f)$  for  $m > 0$ .
- If  $f$  is invertible, then  $h(f^{-1}) = h(f)$ .
- Let  $A_i$  be a finite family closed forward  $f$ -invariant subsets of  $X$  whose union is  $X$ , then

$$h(f) = \max h(f|_{A_i}).$$

- $h(f \times g) = h(f) + h(g)$ , and if  $f$  is an extension of  $g$ , then  $h(f) \geq h(g)$ .  $\lrcorner$

*Proof:* 1: Use two inequalities:

$$\text{span}(n, \varepsilon, f^m) \leq \text{span}(mn, \varepsilon, f), \quad \text{span}(n, \delta(\varepsilon), f^m) \geq \text{span}(mn, \varepsilon, f)$$

where  $\delta(\varepsilon) \rightarrow 0$  if  $\varepsilon \rightarrow 0$ , and (13.7.1.22).

- 2: Because  $(n, \varepsilon)$ -separated sets for  $f$  and  $(n, \varepsilon)$ -separated sets for  $f^{-1}$  corresponds via  $f^n$ .

3: Use two inequalities:

$$\text{span}(n, \varepsilon, f) \leq \sum_{i=1}^k \text{span}_i(n, \varepsilon, f) \leq k \cdot \max \text{span}_i(n, \varepsilon, f),$$

$$\text{sep}(n, \varepsilon, f) \geq \max \text{sep}(n, \varepsilon, f).$$

4: Noticing two inequalities:

$$\text{cov}(n, \varepsilon, f \times g) \geq \text{cov}(n, \varepsilon, f) \cdot \text{cov}(n, \varepsilon, g),$$

$$\text{sep}(n, \varepsilon, f \times g) \geq \text{sep}(n, \varepsilon, f) \cdot \text{sep}(n, \varepsilon, g).$$

and the proof of the last assertion is similar to that of (13.7.1.24).  $\square$

**Prop. (13.7.1.27).** Let  $f : X \rightarrow X$  be an expansive homeomorphism of a compact metric space of expansiveness constant  $\delta$ , then  $h(f) = h_\varepsilon(f)$  for  $\varepsilon < \delta$ .  $\lrcorner$

*Proof:* For  $0 < \gamma < \varepsilon < \delta$ , we show that  $h_{2\gamma}(f) = h_\varepsilon(f)$ . For this, it suffices to prove  $\leq$ . By expansiveness, if  $x \neq y$ , then there is some  $i \in \mathbb{Z}$  that  $d(f^i(x), f^i(y)) \geq \delta > \varepsilon$ . Since the set  $\{(x, y) \in X \times X \mid d(x, y) \geq \gamma\}$  is compact, there is a  $k = k(\gamma, \varepsilon)$  that if  $d(x, y) \geq \gamma$ , then  $d(f^i(x), f^i(y)) > \varepsilon$  for some  $|i| \leq k$ . Thus if  $A$  is a  $(n, \gamma)$ -separated set, then  $f^{-k}(A)$  is a  $(n + 2k, \varepsilon)$ -separated set. Hence by (13.7.1.22),  $h_{2\gamma}(f) \leq h_\varepsilon(f)$ .  $\square$

### Application to Ramsey Theory

**Def. (13.7.1.28)[IP-System].** Let  $\mathcal{F}$  be the collection of all finite non-empty subset of  $\mathbb{N}$ . For  $\alpha, \beta \in \mathcal{F}$ , write  $\alpha < \beta$  if every element of  $\alpha$  is smaller than that of  $\beta$ .

For a commutative group  $G$ , an **IP-system** in  $G$  is a map  $T : \mathcal{F} \rightarrow G$  that  $T_{i_1, \dots, i_k} = T_{i_1} \cdot \dots \cdot T_{i_k}$ .  $\lrcorner$

**Prop. (13.7.1.29)[Furstenberg-Weiss].** Let  $G$  be a commutative group acting minimally on a compact topological space  $X$ , then for any open subset  $U$  of  $X$ ,  $n > 0$  and  $\alpha \in \mathcal{F}$ , and any IP-systems  $T^1, \dots, T^n$  on  $G$  (13.7.1.28), there is a  $\beta \in \mathcal{F}$  that  $\alpha < \beta$ , and

$$U \cap T_\beta^1(U) \cap \dots \cap T_\beta^n(U) \neq \emptyset.$$

$\lrcorner$

*Proof:* Cf. [Dynamic System, P49].  $\square$

**Cor. (13.7.1.30).** Let  $G$  be a commutative group acting homeomorphically on a compact metric space  $X$  and  $T^1, \dots, T^n$  be IP-systems on  $G$ , then for any  $\alpha \in \mathcal{F}$  and  $\varepsilon > 0$ , there are  $x \in X$  and  $\beta > \alpha$  that  $d(x, T_\beta^i(x)) < \varepsilon$  for any  $i$ .  $\lrcorner$

*Proof:* Just need to find a minimal closed subset of  $X$  for  $G$ , but this is easy by finite intersection theorem.  $\square$

**Cor. (13.7.1.31)[Multiple Recurrence Property].** Let  $T$  be a homeomorphism of a compact metric space  $X$ , then for any  $\varepsilon > 0$  and  $q > 0$ , there are  $p > 0$  and  $x \in X$  that  $d(T^{jp}(x), x) < \varepsilon$  for  $0 \leq j \leq q$ .  $\lrcorner$

*Proof:* This is a special case of (13.7.1.30), by taking  $G = \{T^k\}$ , and  $T_\alpha^i = T^{i|\alpha|}$ , where  $|\alpha|$  is the sum of elements in  $\alpha$ .  $\square$

**Cor. (13.7.1.32) [Generalized van der Waerden Theorem].** For each finite partition  $\mathbb{Z} = \cup_{i=1}^m S_k$ , one of the the subset  $S_k$  contains arbitrarily long arithmetic progressions.

More generally, let  $A$  be a finite subset of  $\mathbb{Z}^d$ , then for each partition  $\mathbb{Z}^d = \cup_{i=1}^m S_k$ , there are some  $k$ ,  $z_0 \in \mathbb{Z}^d$  and  $n > 0$  that  $z_0 + na \in S_k$  for any  $a \in A$ .  $\lrcorner$

*Proof:* Consider the product space  $\Sigma_m = \{1, 2, \dots, m\}^{\mathbb{Z}}$  with the 2-adic metric with shifting  $\sigma$ . Then a partition of  $\mathbb{Z}$  can be viewed as an element  $\xi$  in  $\{1, 2, \dots, m\}^{\mathbb{Z}}$ , with  $\xi_i = k$  if  $i \in S_k$ . Let  $X = \overline{\cup_{i=-\infty}^{\infty} \sigma^i(\xi)}$ . Let  $A_k = \{\omega \in X | \omega_0 = k\}$ , then if  $x \in A_k, y \in X$  with  $d(x, y) < 1$ , then  $y \in A_k$  also. Thus for any  $q > 0$ , we can use (13.7.1.31) to show that there is an  $\omega \in X$  that  $d(\sigma^{ip}(\omega), \omega) < 1$  for  $0 \leq i \leq q$ , thus there is an  $r \in \mathbb{Z}$  that  $\xi_j = \omega_0$  for  $j = r, r + k, \dots, r + pq$ . And this proves the theorem.

The proof of the general case is similar.  $\square$

## 2 Symbolic Dynamics

### Shifts

**Def. (13.7.2.1) [Subshifts].** A **subshift** is a closed subset  $X \subset \Sigma_m$  that is invariant under the shift  $\sigma$  and  $\sigma^{-1}$ . A map between to subshifts of  $\Sigma_m$  is called a **code** if it commutes with  $\sigma$ .  $\lrcorner$

**Prop. (13.7.2.2).** Let  $X$  be a subshift of  $\Sigma_m$  (13.7.2.1), let  $W_n(X)$  be the set of words of length  $n$  that occurs in  $X$ ,  $\sigma|_X$  is clearly expansive of constant 1, thus we have

$$h(\sigma|_X) = \lim_{n \rightarrow \infty} \frac{1}{n} \log |W_n(X)|.$$

$\lrcorner$

*Proof:* This is because every element in  $W_n$  appears in the first  $n$  term of some  $\omega \in X$ , and elements in a set of  $d_n$ -diameter  $< 1$  has first  $n$  entries the same. For the other direction, notice a  $(n, 1)$ -separated set has the first  $n$ -entries not the same, thus contribute to different elements in  $W_n(X)$ , thus  $\text{sep}(n, 1, \sigma|_X) < W_n(X)$ .  $\square$

**Def. (13.7.2.3) [block code].** Let  $X$  be a subshift,  $k, l \geq 0, n = k + l + 1$ , and  $\alpha$  be a map from  $W_n(X)$  to  $\{0, 1, \dots, m' - 1\}$ , then a  $(k, l)$ -block code is a morphism from  $X$  to  $\Sigma_{m'}$  that maps  $x$  to the sequence  $a_\alpha(x)$  that  $a_\alpha(x)_i = \alpha((x_{i-k}, \dots, x_{i+l}))$ .

When  $\{0, 1, \dots, m' - 1\}$  is chosen to be  $W_n(X)$  itself, then this is called a **higher block presentation** of  $X$ .  $\lrcorner$

**Prop. (13.7.2.4) [Every Code is a block code, Curtis-Lyndon-Hedlund].** Every code  $c : X \rightarrow Y$  is a block code.  $\lrcorner$

*Proof:* Let  $\mathcal{A}$  be the symbol set of  $Y$ , define  $\hat{c} : X \rightarrow \mathcal{A} : x \mapsto c(x)_0$ . This is a continuous map, and  $X$  is compact thus it is uniformly continuous, thus there is a  $\delta > 0$  that  $\hat{c}(x) = \hat{c}(y)$  if  $d(x, y) < \delta$ . Thus there is a large  $k$  that  $\hat{c}$  only depends on the first  $2k + 1$  term, and it commutes with shifting, thus it is a block code.  $\square$

**Def. (13.7.2.5) [SFT].** For  $k \in \mathbb{Z}_+$ , a **subshift of finite type** or SFT of  $k$ -step is a subshift  $X$  that are defined to be the elements in  $\Sigma_m$  that doesn't contain some set of words of length  $k + 1$ . When  $k = 1$ , this is also called a **topological Markov chain**.  $\lrcorner$

**Prop. (13.7.2.6).** Every SFT is isomorphic to a vertex shift.  $\lrcorner$

*Proof:* For this SFT  $X$  of step  $k$ , construct a graph, whose vertices are  $W_k(X)$ , and two element of  $W_k(X)$  are connected by an edge if they adjoint to an element in  $W_{k+1}(X)$ .  $\square$

**Cor. (13.7.2.7).** Every SFT is isomorphic to an edge shift. This is because every vertex shift can be 2-block isomorphic to its edge shift.  $\lrcorner$

**Prop. (13.7.2.8) [Perron].**  $\lrcorner$

### Sofic Shifts and Data Transmission

**Def. (13.7.2.9) [Sofic Shifts].** A subshift  $X \subset \Sigma_m$  is called **sofic** if it is a factor of a subshift of finite type.  $\lrcorner$

**Prop. (13.7.2.10).** A subshift  $X \subset \Sigma_m$  is sofic iff it is isomorphic to an infinite path shift for some directed graph  $\Gamma$  (Notice that different edge in  $\Gamma$  can be labeled the same).  $\lrcorner$

*Proof:* Clearly such a path shift is a factor of the edge shift of  $\Gamma$ , thus it is sofic. Conversely, A sofic shift is a factor of some edge shift  $c : \Sigma_A^e \rightarrow X$ , by (13.7.2.7), and  $c$  is a block code, by (13.7.2.3). Composing with the higher block code presentation, we may assume  $c$  is a  $(0, 1)$ -block code,  $\square$

## 3 Ergodic Theory

**Prop. (13.7.3.1) [Poincaré's Recurrence Theorem].** Let  $T$  be a measure-preserving transformation of a finite measure space  $X$ , if  $A$  is a measurable set, then for a.e.  $x \in A$ , there is some  $n > 0$  that  $T^n(x) \in A$ .  $\lrcorner$

*Proof:* Let  $B$  be the set of points contradicting this property,  $B = A \setminus \bigcup_{k>0} T^{-k}A$ , thus all the preimages  $T^{-k}B$  are disjoint, measurable and have the same measure as  $B$ , thus it must has measure 0 as  $X$  has finite measure.  $\square$

**Cor. (13.7.3.2) [Derivative Transformation].** Given a finite measurable space and a measure-preserving map  $T : X \rightarrow X$  and a measurable subset  $A$  of finite measure, then the **derivative transformation**  $T_A : A \rightarrow A : x \mapsto T^k(x)$ , where  $k > 0$  is the first integer that  $T^k(x) \in A$ . By Poincaré's Recurrence theorem, the derivative transformation is defined on a subset of full measure.  $\lrcorner$

**Prop. (13.7.3.3).** Let  $X$  be a second countable metric space and  $\mu$  a Borel probability measure on  $X$ , and  $f : X \rightarrow X$  is a measure preserving continuous map, then a.e. point  $x \in X$  is recurrent, i.e.  $\text{Supp } \mu \subset \mathcal{R}(f)$ .  $\lrcorner$

*Proof:* There is a countable family of basis  $\{U_i\}$  of nbhds of  $X$ , and for each  $U_i$ , elements in  $U_i$  returns to  $U_i$  except for a set  $X_i$  of measure 0. Then  $\mathcal{R}(f) = X \setminus \bigcup_i X_i$  has full measure.  $\square$

**Def. (13.7.3.4) [Ergodicity].** A measure-preserving transformation  $T$  of a measure space  $X$  is called **ergodic** if any essentially  $T$ -invariant measurable subset has measure 0 or full measure.  $\lrcorner$

**Prop. (13.7.3.5).** Let  $T$  be a measure-preserving transformation on a finite measure space  $X$  and  $p \in (0, \infty]$ , then  $T$  is ergodic iff every essentially  $T$ -invariant function  $f \in L^p(X, \mu)$  is constant.  $\lrcorner$

*Proof:*

$\square$

**Prop. (13.7.3.6).** Let  $X$  be a measure space and  $f$  is an essentially invariant function for a measure-preserving map or flow  $T$  on  $X$ , then there is a strictly invariant measurable function  $\hat{f}$  that  $f = \hat{f}$  a.e.. ┘

*Proof:* [Dynamic System P74]. □

**Def. (13.7.3.7).** A measure-preserving transformation or flow on a probability space  $X$  is called **mixing** if

$$\lim_{t \rightarrow \infty} \mu(T^{-t}A \cap B) = \mu(A)\mu(B).$$

It is called **weak mixing** if

$$\lim_{n \rightarrow \infty} \frac{1}{n} \sum_{i=0}^n |\mu(T^{-i}A \cap B) - \mu(A)\mu(B)| = 0.$$

or

$$\lim_{t \rightarrow \infty} \frac{1}{t} \int_0^t |\mu(T^{-t}A \cap B) - \mu(A)\mu(B)| = 0.$$

┘

**Prop. (13.7.3.8).** Mixing transformation is weak mixing, and weak mixing is ergodic. ┘

*Proof:* For a weak mixing transformation, if  $A$  is essentially invariant, then  $\mu(A) = \mu(A)^2$ , thus  $\mu(A) = 1$  or  $0$ . □

**Prop. (13.7.3.9) [Mixing and Topological Mixing].** Let  $X$  be a compact metric space,  $T : X \rightarrow X$  be a continuous map and  $\mu$  a  $T$ -invariant Borel measure on  $X$ , then

- If  $T$  is ergodic, then the orbit of a.e. point  $x \in X$  is dense in  $\text{Supp } \mu$ .
- If  $T$  is mixing, then  $T$  is topologically mixing on  $\text{Supp } \mu$ .

┘

*Proof:* 1: Let  $U$  be an open subset intersecting  $\text{Supp } \mu$ , then the  $T$ -invariant subset  $\cup_{k>0} T^{-k}U$  has full measure, thus the forward orbit of a.e.  $x$  intersect  $U$ . Then take a countable open basis of  $X$ , thus the forward orbit of a.e.  $x$  is dense in  $\text{Supp } \mu$ .

2: Because  $\lim_{t \rightarrow \infty} T^{-t}(A) \cap B \rightarrow \mu(A)\mu(B) > 0$ , so does  $\lim_{t \rightarrow \infty} A \cap T^t(B)$ . □

### Ergodic Theorems

**Prop. (13.7.3.10) [von Neumann Ergodic Theorem].** If  $U \in L(H)$  is unitary and  $x \in H$ , then the average  $A_n x = \frac{1}{n}(x + Ux + \dots + U^{n-1}x)$  converges to some  $Px$ , where  $P$  is the projection to the fixed space of  $U$ . ┘

*Proof:* Define  $a_n = \frac{1}{n}(1 + \lambda + \dots + \lambda^{n-1})$  on the unit circle, and  $b(1) = \chi_{\{1\}}$ , then if  $y = b(U)x = Px$ , then  $\|y - A_n x\|^2 = \int_{\sigma(U)} |b - a_n|^2 dE_{x,x}(\lambda)$ . But this integral converges to 0 by dominated convergence theorem. □

**Prop. (13.7.3.11) [Birkhoff Ergodic Theorem].** If  $T$  is a measure-preserving transformation of a finite measure space  $(X, \mu)$ , and let  $f \in L^1(X, \mu)$ , then the limit

$$\bar{f}(x) = \lim_{n \rightarrow \infty} \frac{1}{n} \sum_{i=0}^{n-1} f(T^i(x))$$

exists for a.e.  $x$  and is  $\mu$ -integrable and  $T$ -invariant, and satisfies

$$\int_X \bar{f}(x) d\mu = \int_X f(x) d\mu$$

In addition, if  $f \in L^2(X, \mu)$ , then  $\bar{f}$  is just the projection of  $f$  to the subspace of  $T$ -invariant measures.

The same thing is true for a measure-preserving flow.  $\lrcorner$

*Proof:* Let

$$A = \{x \in X | f(x) + f(T(x)) + \dots + f(T^k(x)) \geq 0, \quad \exists k \geq 0\}.$$

Then firstly we have  $\int_A f(x) d\mu \geq 0$ : Cf.[Dynamic System, P82].  $\color{red}?$   $\square$

**Cor.(13.7.3.12).** A measure-preserving map  $T : X \rightarrow X$  in a finite measure space  $(X, \mu)$  is ergodic iff for each  $f \in L^1(X, \mu)$ ,

$$\lim_{n \rightarrow \infty} \frac{1}{n} \sum_{i=0}^{n-1} f(T^i(x)) = \frac{1}{\mu(X)} \int_X f(x) d\mu, \text{ a.e. } x.$$

I.e., the time average equals the space average for any  $L^1$ -function.  $\lrcorner$

*Proof:* If  $T$  is ergodic, then the function  $\bar{f}$  defined in (13.7.3.11) is a constant, thus the equation. Conversely, if this equation holds, then if  $f$  is  $T$ -invariant, the RHS is constant.  $\square$

**Cor.(13.7.3.13).** Taking a dense subset of  $L^2(X, \mu)$  in the above corollary, we see that a measure-preserving map  $T : X \rightarrow X$  is ergodic iff for any measurable subset  $A$  and a.e.  $x \in X$ ,

$$\lim_{n \rightarrow \infty} \frac{1}{n} \sum_{i=0}^{n-1} \chi_A(T^i(x)) = \frac{\mu(A)}{\mu(X)}.$$

$\lrcorner$

## Invariant Measure for a Transformation

### 4 Chaos

#### Li-Yorke Chaos

**Prop.(13.7.4.1)** [Li-Yorke[L-Y75]]. Let  $J \subset \mathbb{R}$  be an interval,  $F : J \rightarrow J$  a continuous map and there is a point  $a \in J$  s.t.

$$F^{\circ 3}(a) \leq a < F(a) < F^{\circ 2}(a)$$

or

$$F^{\circ 3}(a) \geq a > F(a) > F^{\circ 2}(a).$$

Then

- For any  $k \in \mathbb{Z}_+$ , there exists a periodic point in  $J$  with period  $k$ .
- There is an uncountable subset  $S \subset J$  that satisfies:
  - $S$  contains no periodic points.
  - For any  $p \neq q \in S$ ,  $\limsup_n |F^{\circ n}(p) - F^{\circ n}(q)| > 0$  and  $\liminf_n |F^{\circ n}(p) - F^{\circ n}(q)| = 0$ .
  - For any  $p \in S$  and periodic point  $q \in J$ ,  $\limsup_n |F^{\circ n}(p) - F^{\circ n}(q)| > 0$ .

┘

**Remark (13.7.4.2).** Notice the hypothesis is satisfied when  $F$  has a period point with period 3. ┘

*Proof:* 1: We may assume that  $F^{\circ 3}(a) \leq a < F(a) < F^{\circ 2}(a)$  and let  $K = [a, F(a)]$ ,  $L = [F(a), F^{\circ 2}(a)]$ . For  $k \in \mathbb{Z}_+$ , define a sequence of intervals  $(I_n)_{n \in \mathbb{N}}$  s.t.

- If  $k = 1$ , define  $I_n = L$ .
- if  $k \geq 1$ , define  $I_0 = I_1 = \dots = I_{k-1} = L$ ,  $I_k = K$ , and  $I_{n+k} = I_n$  for any  $n \in \mathbb{N}$ .

Then the hypothesis of (13.7.4.3) is satisfied and we get a nested sequence of intervals  $(Q_n)_{n \in \mathbb{N}}$ . Now  $Q_k \subset Q_0 \subset I_0 = F^{(k)}(Q_k)$ , so there exists  $p_k \in Q_k \subset L$  s.t.  $F^{(k)}(p_k) = p_k$ . Then the hypothesis implies  $p_k$  has period  $k$ , because otherwise  $k \geq 2$  and  $F^{(k-1)}(p_k) = F(a)$ , thus  $p_k = F^{\circ 2}(a)$ , contradicting the fact that  $F(p_k) \subset L$ .

2: Cf. [L-Y75]P990. ?

□

**Lemma (13.7.4.3).** Let  $J \subset \mathbb{R}$  be an interval,  $F : J \rightarrow J$  a continuous map and  $(I_n)_{n \in \mathbb{N}}$  be a sequence of compact intervals contained in  $J$  s.t.  $I_{n+1} \subset F(I_n)$ . Then there is a sequence of intervals  $(Q_n)_{n \in \mathbb{N}}$  with  $Q_{n+1} \subset Q_n \subset I_0$ , and  $F^{(n)}(Q_n) = I_n$ . ┘

*Proof:* Define  $Q_0$  and define inductively  $Q_n$ . If  $Q_n$  is defined, then  $I_{n+1} \subset F^{(n+1)}(Q_n) = F(I_n)$ , so it is easy to find  $Q_{n+1} \subset Q_n$  s.t.  $F^{(n+1)}(Q_{n+1}) = I_{n+1}$ . □

**Remark (13.7.4.4).** ? Is it true that the existence of a stable periodic point implies that almost every point is asymptotically periodic? ┘

## 5 Hyperbolic Dynamics

## 13.8 Complex Dynamical Systems

See [Milnor, John Dynamics in one complex variable], [Complex Dynamics and Renormalization, McMullen] and [C-G93].

### 1 Local Behaviors

**Notation (13.8.1.1).**

- For  $d \in \mathbb{Z}_{\geq 2}$ , denote  $\text{Rat}_d$  the set of non-constant rational maps  $f : \mathbb{P}^1(\mathbb{C}) \rightarrow \mathbb{P}^1(\mathbb{C})$  of degree  $d$ . And denote  $\text{Rat} = \bigcup_{d \in \mathbb{Z}_{\geq 2}} \text{Rat}_d$ . ┘

**Def. (13.8.1.2)[Attracting and Repelling].** For a Riemann surface  $\Omega$  and  $f : \Omega \rightarrow \Omega$ , suppose  $x \in \Omega$  is a periodic point for  $f$  of periodicity  $k$ , the **Multiplier** of  $f$  at  $x$  is defined to be  $\lambda_f(x) = (f^{(k)})'(x) \in \mathbb{C}$ . Then  $x$  is called

- an **anattracting point** for  $f$  iff  $|\lambda_f(x)| < 1$ .
- a **repelling pint** for  $f$  iff  $|\lambda_f(x)| > 1$ .
- a **superattracting point** if  $\lambda_f(x) = 0$ .
- called a **rationally neutral point** if  $\lambda_f(x) \in \mu(\mathbb{C})$ .
- called an **irrationally neutral point** if  $|\lambda_f(x)| = 1$  but  $\lambda_f(x) \notin \mu(\mathbb{C})$ .

Hyperbolic points and irrationally neutral points are all called **neutral points** of  $f$ . ┘

**Def. (13.8.1.3)[Stable Points].** For a Riemann surface  $\Omega$  and  $f : \Omega \rightarrow \Omega$ , suppose  $x \in \Omega$  is a fixed point of  $f$ , then  $x$  is called a **stable point** if there exists  $0 \leq r_0, r \leq R$  s.t.  $f^{on}(z) \in \mathbb{D}(z_0, r)$  for any  $z \in \mathbb{D}(z_0, r_0)$ ,  $n \in \mathbb{Z}_+$ .

Later it will be clear that a fixed point  $z_0$  is stable iff  $z_0 \in \text{Fat}(f)$  (13.8.3.1). ┘

**Prop. (13.8.1.4)[Attracting Fixed Points, Koenigs].** Suppose  $f \in \mathcal{O}(\mathbb{C})$  has an attracting fixed point  $z_0 \in \mathbb{C}$  with  $\lambda = f'(z_0) \in B(0, (0, 1))$ . Then there is a unique conformal mapping  $\varphi$  from a nbhd of  $z_0$  to a nbhd of 0 that conjugates  $f$  to the linear function  $g(\zeta) = \lambda\zeta$ , and  $\varphi'(z_0) = 1$ . ┘

*Proof:* The uniqueness is clear. For the existence, suppose  $z_0 = 0$ . For  $n \in \mathbb{Z}_+$ , let  $\varphi_n = \lambda^{-n} f^{(n)}$ , then  $\varphi_n$  satisfies  $\varphi_n \circ f = \lambda \varphi_{n+1}$ . If there exists  $\varphi \in \mathcal{O}(\mathbb{C})$  s.t.  $\varphi_n \rightarrow \varphi$  pointwise, then  $\varphi \circ f = \lambda \varphi$ .

Notice for  $\delta \in \mathbb{R}_+$  small,  $|f(z) - \lambda z| \leq C|z|^2$  for any  $|z| \leq \delta$ . So  $|f(z)| \leq |\lambda z| + C|z|^2 \leq (|\lambda| + C\delta)|z|$ . So when  $\delta$  is small s.t.  $|\lambda| + C\delta < 1$ ,

$$|f^{(n)}(z)| \leq (|\lambda| + C\delta)^n |z|, \quad \forall |z| \leq \delta.$$

If  $\delta$  is small s.t.  $\rho = (|\lambda| + C\delta)^2 / |\lambda| < 1$ , then

$$|\varphi_{n+1}(z) - \varphi_n(z)| = \left| \frac{f(f^{(n)}(z)) - \lambda f^{(n)}(z)}{\lambda^{n+1}} \right| \leq \frac{C|f^{(n)}(z)|^2}{|\lambda|^{n+1}} \leq \frac{\rho^n C|z|^2}{|\lambda|}.$$

So  $\varphi_n$  converges uniformly for  $|z| \leq \delta$ , to some holomorphic function  $\varphi$ . □

**Cor. (13.8.1.5)[Repelling Fixed Points].** The same applies to repelling fixed points, because we can consider  $f^{(-1)}$  instead. The corresponding Schröder's equation for  $h = \varphi^{(-1)}$  is  $h(\lambda\zeta) = f(h(\zeta))$ . Then it can be verified that  $h$  can be extended to an entire function of finite order. ┘

**Prop. (13.8.1.6) [Superattracting Fixed Points, Boettcher].** Suppose  $f \in \mathcal{O}(\mathbb{C})$  has a superattracting fixed point  $z_0 \in \mathbb{C}$  of order  $p \geq 2$  s.t.  $f(z) = z_0 + a_p(z - z_0)^p + \dots$ , then there exists a conformal mapping  $\varphi$  of some nbhd of  $z_0$  to a nbhd of 0 that conjugates  $f$  to the mapping  $g(\zeta) = \zeta^p$ . And the conjugation is unique up to multiplication by a  $(p-1)$ -th roots of unity.  $\lrcorner$

*Proof:* Suppose  $z_0 = 0$ . If we change variables  $w = cz$  with  $c^{p-1} = 1/a_p$ , then  $f(w) = w^p + \dots$ . Let  $\varphi_n = (f^{(n)})^{p^{-n}}$ , then  $\varphi_{n-1} \circ f = (f^{(n-1)} \circ f)^{p^{-n+1}} = \varphi_n^p$ . If there exists  $\varphi \in \Omega(\mathbb{C})$  s.t.  $\varphi_n \rightarrow \varphi$  pointwise, then  $\varphi \circ f = \varphi^p$ .

Notice for  $\delta \in \mathbb{R}_+$  small,  $|f(z)| \leq C|z|^p$  for some  $C \in \mathbb{R}_{\geq 1}$ . So  $|f^{(n)}(z)| \leq (C|z|)^{p^n}$ . Thus

$$\frac{\varphi_{n+1}}{\varphi_n} = \left( \frac{\varphi_1 \circ f^{(n)}}{f^{(n)}} \right)^{p^{-n}} = (1 + O(|f^{(n)}|))^{p^{-n}} = 1 + O(p^{-n}(C|z|)^{p^n}) = 1 + O(p^{-n}),$$

when  $|z| \leq 1/C$ . So  $\prod_n \frac{\varphi_{n+1}}{\varphi_n}$  is uniformly bounded for  $|z| \leq 1/C$ , so  $\varphi_{n+1}$  converges to some holomorphic function  $\varphi$ .  $\square$

**Prop. (13.8.1.7) [Neutral Fixed Points].** Suppose  $f \in \mathcal{O}(\mathbb{C})$  has a neutral fixed point  $z_0 \in \mathbb{C}$  with  $f'(z_0) = \lambda$ . We may find a local conformally mapping  $h$  from a nbhd of  $z_0$  to a nbhd of 0 that conjugates  $f$  to a linear function  $g(\zeta) = \lambda\zeta$ . If  $h = \varphi^{(-1)}$ , then  $h$  must satisfy the Schröder's equation

$$h(\lambda\zeta) = f(h(\zeta)).$$

Then this equation is solvable iff  $z_0$  is a stable points for  $f$  (13.8.1.3)  $\lrcorner$

*Proof:* Suppose  $z_0$  is stable, let  $\Omega = \cup_{n \in \mathbb{Z}_+} f(\mathbb{D}(z_0, r_0))$ , then  $\Omega \subset \mathbb{D}(0, r)$  and is connected. Suppose  $\varphi : \mathbb{D} \rightarrow \Omega$  is a covering map that  $\varphi(0) = 0$  (12.4.7.10), then the map  $f : \Omega \rightarrow \Omega$  lifts to a map  $F : \mathbb{D} \rightarrow \mathbb{D}$ , thus by Schwartz lemma (12.5.1.3),  $F(z) = \lambda z$ , and the Schröder's equation has a solution  $\varphi$ .

Conversely, it is clear if the Schröder's equation has a solution  $\varphi$ , then  $z_0$  is stable.  $\square$

**Cor. (13.8.1.8).** Situation as in (13.8.1.7),  $f$  is topologically conjugate to  $g(\zeta) = \lambda\zeta$  near  $z_0$  iff  $f$  is conformally conjugate to  $g(\zeta) = \lambda\zeta$  near  $z_0$ .  $\lrcorner$

**Def. (13.8.1.9) [Siegel Disks].** A **Siegel disk** is a simply-connected  $f$ -fixed region  $\Omega \subset \mathbb{C}$  s.t. the action of  $f$  on it is conjugate to a rotation.

By (13.8.1.7), if  $f$  has a fixed point  $z_0$ , then a nbhd of  $z_0$  that is a Siegel disk iff  $z_0$  is a stable point for  $f$ .  $\lrcorner$

**Thm. (13.8.1.10) [Siegel].** Situation as in (13.8.1.7),

- If  $\lambda^n = 1$  for some  $n \in \mathbb{Z}_+$ , then  $z_0$  is stable for  $f$  iff  $f^{(m)}(z_0) = z_0$  for some  $m \in \mathbb{Z}_+$ . And if this is the case, then  $f^{(n)} = 1$ .
- If  $\lambda = e^{2\pi i \omega}$  where  $\omega$  is a Diophantine number (20.2.4.6), then  $z_0$  is a stable point for  $f(z)$ .
- There exists a case  $\lambda = e^{2\pi i \theta}$  s.t. the Schröder's equation is unsolvable.  $\lrcorner$

*Proof:* 1: If  $z = 0$  is stable, then  $f^{(n)}(z) = z$  by (13.8.1.7). Conversely, if  $f^{(n)}(z) = z$ , then clearly  $z = 0$  is stable.

3: Take  $f(z) = \lambda z + \dots + z^d$ , and suppose there is a solution  $h$  to the Schröder's equation that covers a nbhd  $\mathbb{D}(z_0, \delta)$  of  $z_0$ , then  $f^{(n)}(z) = z$  has only one zero in  $\mathbb{D}(0, \delta)$ . But

$$f^{(n)}(z) - z = z^{d^n} + \dots + (\lambda^n - 1)z,$$

so all the zeros except for  $z =$  are outside  $\mathbb{D}(0, \delta)$ . Thus

$$\delta^{d^n} \leq \prod |z_j| = |\lambda^n - 1|.$$

But if we take  $\lambda = e^{2\pi i \theta}$  and  $\theta = \sum_{k \in \mathbb{Z}} 2^{-q_k}$  where  $q_1 < q_2 < \dots$  is an sequences of integers increasing rapidly, then the above inequality is not possible.

2:(See also [C-G93]P43?) Use(13.8.1.7), the Schröder functional equation writes:

$$\sum_{k=2}^{\infty} c_k (a_1^k - a_1) \zeta^k = \sum_{l=2}^{\infty} a_l (\zeta + \sum_{r=2}^{\infty} c_r \zeta^r)^l.$$

Thus it is clear that  $c_2 = a_2/a_1(a_1 - 1)$ , and  $c_k$  is determined by  $c_2$  inductively by

$$c_k = \frac{1}{a_1^k - a_1} \sum_{l_1 + \dots + l_r = k} c_{l_1} \cdots c_{l_r}.$$

So  $\varphi$  is formally determined by  $f$ . Moreover, the modulus of  $c_k$  are bounded by the solution of the functional equation

$$\sum_{k=2}^{\infty} c_k |a_1^{k-1} - 1| \zeta^k = \sum_{l=2}^{\infty} |a_l| (\zeta + \sum_{r=2}^{\infty} c_r \zeta^r)^l,$$

and the bound depends positively on  $|a_l|$  and negatively on  $|a_1^{k-1} - 1|$ .

We have  $\overline{\lim} |a_n|^{\frac{1}{n}} = 1/R$ , so we have  $|a_n| \geq a^{n-1}$  for some  $a \in \mathbb{R}_+$  and any  $n \geq 2$ . Notice that the Schröder functional remains true under the transformation  $f(z) \mapsto af(z/a)$ ,  $\varphi(\zeta) \mapsto a\varphi(\zeta/a)$ , so we may assume that  $|a_n| \leq 1$  for  $n \geq 2$ . Then it suffices to show the solution  $\varphi(\zeta) = \zeta + \sum_{k=2}^{\infty} \tau_k \zeta^k$  of the functional equation

$$\sum_{k=2}^{\infty} c_k |a_1^{k-1} - 1| \zeta^k = \sum_{l=2}^{\infty} (\zeta + \sum_{r=2}^{\infty} c_r \zeta^r)^l$$

has positive radius of convergence. We also denote the solution of the functional equation

$$\sum_{k=2}^{\infty} c_k \zeta^k = \sum_{l=2}^{\infty} (\zeta + \sum_{r=2}^{\infty} c_r \zeta^r)^l$$

by  $\psi(\zeta) = \zeta + \sum_{k=2}^{\infty} \sigma_k \zeta^k$ . Then

$$\psi(\zeta) - \zeta = \psi(\zeta)^2 / (1 - \psi(\zeta)),$$

thus

$$4\psi(\zeta) = \zeta + 1 - \sqrt{1 - 6\zeta + \zeta^2}$$

has radius of convergence  $R = 2 - 2\sqrt{2}$ . And we can prove inductively that

$$\sigma_k \leq \delta_k \tau_k,$$

where  $\delta_k$  are defined as follows:

$$\delta_1 = 1, \quad \delta_k = |a_1^{k-1} - 1| \cdot \max_{l_1 + \dots + l_r = k} \delta_{l_1} \cdots \delta_{l_r}.$$

But then by(13.8.1.11),  $\sigma_k < k^{-2\nu} 2^{(5\nu+1)(k-1)} \tau_k$ . So  $\varphi(\zeta)$  has radius of convergence  $\geq (3-2\sqrt{2})2^{-5\nu-1}$ .

□

**Lemma (13.8.1.11).** Situation as in (13.8.1.10), suppose  $|a_1^n - 1| \leq (2n)^\nu$  for  $\nu \in \mathbb{R}_+$  and any  $n \in \mathbb{Z}_+$ , then

$$\delta_k \leq k^{-2\nu} 2^{(5\nu+1)(k-1)}.$$

┘

*Proof:* Cf. [Sie42] Lemma 3. ?

□

**Cor. (13.8.1.12).** Let  $f(z) = z + \sum_{k \geq 2} a_k z^k$  be a power series with positive radius of convergence, then  $z = 0$  is a stable point iff  $f(z) = z$ .

┘

**Prop. (13.8.1.13) [Rationally Neutral Fixed Points].** Suppose  $f \in \mathcal{O}(\mathbb{C})$  has a neutral fixed point  $z_0 \in \mathbb{C}$  with  $f(z) = \lambda z + az^{p+1} + \dots$ ,  $a \in \mathbb{C}^\times$ ,  $p \in \mathbb{Z}_+$ , then there is a conformally mapping  $\varphi$  from a “half nbhd” of  $z_0$  to a nbhd of  $\infty \in \mathcal{H} \cup \{\infty\}$  with  $g(\zeta) = \zeta + 1$ .

┘

*Proof:*

□

## 2 Rational Dynamics

**Prop. (13.8.2.1).** Any  $f \in \text{Rat}$  has infinitely many periodic points.

┘

*Proof:* Notice the degree of  $f^{(n)}(z) - z$  tends to infinity as  $n \rightarrow \infty$ , so if there are only f.m. periodic points  $\{x_1, \dots, x_r\}$ , the multiplicity of one of these points as a period point of  $f^{(n)}(z) - z$  must be large when  $n$  is large. But suppose  $f^{(n)}(\xi) - \xi = 0$  and  $\xi$  has multiplicity  $m \geq 2$  for  $f^{(n)}$ , then near  $\xi$ ,

$$f^{(n)}(z) = z + (z - \xi)^m + \dots,$$

thus for  $k \in \mathbb{Z}_+$ , by induction,

$$f^{(nk)}(z) = z + k(z - \xi)^m + \dots,$$

so  $\xi$  has multiplicity  $m$  for  $f^{(nk)}$ . Thus we can argue that for all sufficiently divisible  $N$ ,  $f^{(N)}(z) - z$  has only f.m. solutions (counting multiplicity), contradiction. □

**Thm. (13.8.2.2) [Shishikuka87].** For  $f \in \text{Rat}$ , there are at most  $2d - 2$  attracting or neutral periodic points for  $f$ .

┘

*Proof:* ?

□

**Cor. (13.8.2.3).** Any  $f \in \text{Rat}$  contains infinitely many repelling periodic points, by (13.8.2.1).

┘

## 3 Julia Sets

**Def. (13.8.3.1) [Fatou Sets and Julia Sets].** For any  $f \in \text{Rat}$ , the **Fatou set**  $\text{Fat}(f)$  is defined to be the set of points  $z \in \mathbb{P}^1(\mathbb{C})$  s.t. the family  $\{f^{(n)}\}_{n \in \mathbb{Z}_+}$  is Montel-normal at  $z$ . And the **Julia set**  $\text{Jul}(f)$  is defined to be  $\text{Jul}(f) = \mathbb{P}^1(\mathbb{C}) \setminus \text{Fat}(f)$ . Each component of  $\text{Fat}(f)$  is called a **Fatou component** of  $f$ . By (13.8.2.3) and (13.8.3.6),  $\text{Jul}(f) \neq \emptyset$ .

┘

**Prop. (13.8.3.2).** For  $f \in \text{Rat}$  and  $k \in \mathbb{Z}_+$ ,  $\text{Jul}(f) = \text{Jul}(f^{(k)})$ , by (12.5.1.11).

┘

**Thm. (13.8.3.3) [Complete Invariance of Julia Sets].** For any  $f \in \text{Rat}$ ,  $\text{Jul}(f)$  and  $\text{Fat}(f)$  are both completely invariant under  $f$ , i.e.  $f(\text{Jul}(f)) = f^{-1}(\text{Jul}(f)) = \text{Jul}(f)$ , and  $f(\text{Fat}(f)) = f^{-1}(\text{Fat}(f)) = \text{Fat}(f)$ .

┘

*Proof:* If  $\{f^{(n)}\}$  is Montel-normal at  $f(x)$ , then it is Montel-normal at  $x$  because  $f$  is continuous. Conversely, if  $\{f^{(n)}\}$  is Montel-normal at  $x$ , suppose  $f$  is Montel-normal on a nbhd  $U$  of  $x \in X$ , and let  $V$  be a nbhd of  $x$  s.t.  $x \in V \subset \bar{V} \subset U$ . Then because  $f$  is open, we can show that  $\{f^{(n)}\}$  is Montel-normal on  $f(V)$ .  $\square$

**Prop. (13.8.3.4).** For  $f \in \text{Rat}$ ,  $\text{Jul}(f)$  is either  $\mathbb{P}^1(\mathbb{C})$  or has no interior.  $\lrcorner$

*Proof:* Suppose  $U$  is open and  $U \subset \text{Jul}(f)$ , then  $\{f^{(n)}\}$  is not Montel-normal on  $U$ . Then by (12.5.1.10),  $\cup_{n \in \mathbb{N}} f^{(n)}(U) \subset \mathbb{P}^1(\mathbb{C})$  omits at most 2 points. As  $\text{Jul}(f)$  is  $f$ -invariant and closed, this implies  $\text{Jul}(f) = \mathbb{P}^1(\mathbb{C})$ .  $\square$

**Prop. (13.8.3.5)[Julia Sets and Periodic Points].** For  $f \in \text{Rat}$ ,  $\text{Jul}(f)$  contains all repelling periodic points and unstable neutral periodic points(not corresponding to Siegel disks); and  $\text{Fat}(f)$  contains all attracting periodic points and all stable neutral periodic points(corresponding to Siegel disks).  $\lrcorner$

*Proof:* This follows from (13.8.1.9) and the definition of stable points(13.8.1.3).  $\square$

**Prop. (13.8.3.6).** For  $f \in \text{Rat}$ , if  $x$  is an attracting point for  $f$ , then  $BA(x) \subset \text{Fat}(f)$ . And if  $x$  is a repelling periodic point, then  $x \in \text{Jul}(f)$ .  $\lrcorner$

*Proof:* If  $x$  is attracting, then  $\{f^{(n)}\}$  is eventually uniformly bounded on each compact subset of  $BA(x)$ , thus Montel-normal. If  $x$  is repelling, then  $|f'(z)| > 1$ , so  $|(f^{(n)})'(z)|$  tends to infinity as  $n \rightarrow \infty$ . Then it is clear that  $\{f^{(n)}\}$  is not Montel-normal at  $x$ .  $\square$

**Prop. (13.8.3.7)[Exceptional Sets].** For  $f \in \text{Rat}$  and  $z \in \text{Jul}(f)$ , the **exceptional set**  $E_z$  of  $f$  at  $z$  is defined to be

$$E_z = \cup_{z \in U} \mathbb{P}^1(\mathbb{C}) \setminus \left( \cup_{n \in \mathbb{Z}_+} f^{(n)}(U) \right).$$

Then  $\#E_z \leq 2$ , and it is in fact independent of  $z \in \text{Jul}(f)$ .

- If  $\#E = 1$ , then it can be conjugated to  $\infty$ , and then  $f$  is a polynomial.
- If  $\#E = 2$ , then it can be conjugated to  $\{0, \infty\}$ , and then  $f(z) = Cz^d, d \in \mathbb{Z} \setminus \{0, \pm 1\}$ .

In particular,  $E \subset \text{Fat}(f)$ .  $\lrcorner$

*Proof:*  $\#E_z \leq 2$  by (12.5.1.10). By definition,  $f^{-1}(E_z) \subset E_z$ , so if  $\#E_z = 2$  for some  $z$ , it can be conjugated to the form as above, and then it can be verified that  $E_z = \{0, \infty\}$  for any  $z \in \text{Jul}(f)$ . If  $\#E_z = 1$  for some  $z$ , then it can be conjugated to the form as above, and  $\#E_z \geq 1$  for any  $z \in \text{Jul}(f)$ . But we also know from the above argument that  $\#E_{z'} = 2$  cannot happen for any  $z' \in \text{Jul}(f)$ , so  $E_z = \{\infty\}$  for any  $z \in \text{Jul}(f)$ .  $\square$

**Cor. (13.8.3.8).** Suppose  $f \in \text{Rat}$ , and  $z \in \text{Jul}(f)$ , then  $\cup_{n \in \mathbb{Z}_+} f^{(-n)}(z)$  is dense in  $\text{Jul}(f)$ . In particular, any completely invariant subset of  $\text{Jul}(f)$  is dense in  $\text{Jul}(f)$ .  $\lrcorner$

*Proof:* By the definition of  $E$ , if  $z \notin E$ , then for any open subset  $U \subset \mathbb{P}^1(\mathbb{C})$  s.t.  $U \cap \text{Jul}(f) \neq \emptyset$ , there exists  $n \in \mathbb{Z}_+$  s.t.  $z \in f^{(n)}(U)$ . In particular,  $U \cap \left( \cup_{n \in \mathbb{Z}_+} f^{(-n)}(z) \right) \neq \emptyset$ . As  $E \subset \text{Fat}(f)$ , any  $z \in \text{Jul}(f)$  suffices.  $\square$

**Thm. (13.8.3.9)[Mañé-Rocha].** For  $f \in \text{Rat}$ ,  $\text{Jul}(f)$  is perfect and uniformly perfect(12.5.7.2) subset.  $\lrcorner$

*Proof:* Cf. [C-G93]P57, 64.  $\square$

**Prop. (13.8.3.10) [Repelling Periodic Points are Dense].** For  $f \in \text{Rat}$ ,  $\text{Jul}(f)$  is the closure of repelling periodic points of  $f$ .  $\square$

*Proof:* As  $f$  has only f.m. attracting or neutral periodic points (13.8.2.2), and  $\text{Jul}(f)$  is perfect (13.8.3.9), so if the assertion is wrong, we will get a non-empty open subset  $U \subset \mathbb{C}$  that intersect  $\text{Jul}(f)$ , and contains no periodic points, poles and critical points of  $f$ . Since  $\deg(f) > 1$ , there are two different branches  $h_1, h_2$  of  $f^{(-1)}$  on  $U$ , and  $h_1(z) \neq f^{(n)}(z), h_2(z) \neq f^{(n)}(z)$  for any  $z \in U$  and  $n \in \mathbb{N}$ . But then the family of functions

$$h_n(z) = \frac{f^{(n)}(z) - h_1(z)}{f^{(n)}(z) - h_2(z)} \cdot \frac{z - h_2(z)}{z - h_1(z)}$$

doesn't take values  $0, 1, \infty$ , thus is a Montel-normal family (12.5.1.10). And then also  $\{f^{(n)}\}$  is a Montel-normal family on  $U$ , contradicting the definition of  $\text{Jul}(f)$ .  $\square$

**Prop. (13.8.3.11) [Self-Similarity of Julia Sets].** For  $f \in \text{Rat}$ , if  $U$  is an open subset of  $\mathbb{P}^1(\mathbb{C})$  s.t.  $U \cap \text{Jul}(f) \neq \emptyset$  then there exists some  $N \in \mathbb{Z}_+$  s.t.  $f^N(U \cap \text{Jul}(f)) = \text{Jul}(f)$ .  $\square$

*Proof:* By (13.8.3.10), choose  $z \in U \cap \text{Jul}(f)$  a repelling periodic point with period  $n$ . Then choose a nbhd  $V$  of  $z \in \mathbb{P}^1(\mathbb{C})$  s.t.  $V \subset f^{(n)}(V)$ , so  $f^{(n(j-1))}(V) \subset f^{(nj)}(V)$  for any  $j \in \mathbb{Z}_+$ . By (13.8.3.7),

$$\text{Jul}(f) \subset \mathbb{P}^1(\mathbb{C}) \setminus E \subset \bigcup_{j \in \mathbb{Z}_+} f^{(nj)}(V),$$

so by compactness of  $\text{Jul}(f)$ ,  $\text{Jul}(f) \subset f^{(nj)}(V)$  for some  $j$ .  $\square$

## 4 Fatou Components

**Prop. (13.8.4.1).** For  $f \in \text{Rat}$  and a Fatou component  $U$  of  $f$ ,  $f(U)$  is also a Fatou component of  $f$ , and the map  $f : U \rightarrow f(U)$  is proper of degree  $\leq \deg(f)$ . And  $f^{-1}(U)$  is a disjoint union of at most  $d$  Fatou components.  $\square$

*Proof:* By (13.8.3.3), this is true for any analytic covering map.  $\square$

**Prop. (13.8.4.2).** For  $f \in \text{Rat}$ , if  $U$  is a completely invariant Fatou component for  $f$ , then  $\partial U = \text{Jul}(f)$ , and every other Fatou components is simply-connected. There are at most two completely invariant Fatou components for  $f$ .  $\square$

*Proof:* Cf. [C-G93]P70. ?  
 $\partial U = \text{Jul}(f)$  by (13.8.3.8).  $\square$

**Prop. (13.8.4.3).** For  $f \in \text{Rat}$ , there can only be 0, 1, 2 or infinitely many Fatou components.  $\square$

*Proof:* Suppose there are only f.m. Fatou components of  $f$ . Let  $U$  be a Fatou component, and suppose  $U_0 = U$ , and  $f(U_{k+1}) = U_k$  for  $k \in \mathbb{N}$ . then there are some  $U_m = U_n$  for  $n \neq m$ . In this case, we see that  $U$  is periodic. And then there exists  $N \in \mathbb{Z}_+$  s.t.  $f^{(N)}(U) = U$  for any Fatou component  $U$  of  $f$ . Then each component  $U$  is totally invariant under  $f^{(N)}$ , which implies that there are at most 2 Fatou components by (13.8.4.2).  $\square$

**Thm. (13.8.4.4) [No-Wandering-Domain Theorem, Sullivan1985].** For  $f \in \text{Rat}$ , every Fatou component  $U$  of  $f$  is eventually periodic under permutation by  $f$ , i.e. there exists  $0 < n < m \in \mathbb{Z}_+$  s.t.  $f^{(n)}(U) = f^{(m)}(U)$ .  $\square$

*Proof:* If there is a contradictory Fatou component  $U$ , call it a wandering domain. Then we have:

**Lemma (13.8.4.5) [Baker].** If  $U$  is a wandering domain, then  $f^{(n)}(U)$  is simply-connected for  $n$  sufficiently large. ┘

*Proof:* □

**Lemma (13.8.4.6).**  $B(U)$  contains a infinitely-dimensional subspace  $N(U)$  of compactly-supported Beltrami differentials with the following property: If  $\mu \in N(U)$  satisfies  $\mu = \bar{\partial}v$  for some quasi-conformal vector field  $v$  and  $v|_{\partial U} = 0$ , then  $\mu = 0$ . ┘

*Proof:* □

?

□

**Thm. (13.8.4.7).** If  $f \in \text{Rat}$ , and  $A \subset \text{Jul}(f)$  is a stable point that intersect any equivalent class of  $f$  (where  $x \sim y \iff f^{(n)}(x) = f^{(n)}(y)$  for some  $n \in \mathbb{N}$ ) in at most one point, then  $\mu(A) = 0$ . ┘

*Proof:* □

**Def. (13.8.4.8) [Parabolic Components].** For  $f \in \text{Rat}$ , a **parabolic component** for  $f$  is a Fatou component  $U$  of  $f$  of period  $n$  with a neutral fixed point  $\zeta$  for  $f^{(n)}$  on its boundary with multiplier 1, and that all points of  $U$  converges to  $\zeta$  under iterations by  $f^{(n)}$ . ┘

**Def. (13.8.4.9) [Herman Rings].** For  $f \in \text{Rat}$ , a **Herman ring** for  $f$  is a doubly-connected Fatou component of  $f$  of period  $n$  s.t. the action of  $f^{(n)}$  is conjugate to either a isometry of an annulus. ┘

**Thm. (13.8.4.10) [Classifying Periodic Fatou Components].** For  $f \in \text{Rat}$ , each Fatou component  $U$  for  $f$  is exactly one of the following:

- $U$  contains an attracting periodic point
  - $U$  is parabolic(13.8.4.8).
  - $U$  is a Sigel disk(13.8.1.9).
  - $U$  is a Herman ring(13.8.4.9).
- ┘

*Proof:* Cf.[C-G93]P74. □

**Thm. (13.8.4.11) [Sullivan].** For  $f \in \text{Rat}$ , if  $\text{Fat}(f)$  has two components and  $f$  is hyperbolic on  $\text{Jul}(f)$ , then  $\text{Jul}(f)$  is a quasi-circle(12.5.7.7). ┘

*Proof:* Cf.[C-G93]P102. □

**Prop. (13.8.4.12) [Woff-Denjoy].** ┘

## 5 Conjectures

**Conj. (13.8.5.1) [Density of Hyperbolicity].** The set of hyperbolic rational maps is dense and open in the set  $\text{Rat}_d$  of rational maps on  $\mathbb{P}^1(\mathbb{C})$  of dimension  $d$ . ┘

*Proof:* □

**Conj. (13.8.5.2) [No Invariant Line Fields].** For  $f \in C(z)$ , there are no invariant fields on  $\text{Jul}(f)$ , unless  $f$  is double covered by an integral torus endomorphism. ┘

## 6 Polynomial Iterates

**Prop. (13.8.6.1) [Julia Sets and Critical Points].** For  $P \in \text{Poly}(z)$ ,

- $\text{Jul}(P)$  is connected iff there are no finite critical points in  $AB(\infty)$ , i.e. the forward orbits of any finite critical point of  $f$  is bounded.
- $\text{Jul}(P)$  is totally disconnected if for any finite critical point  $q$ ,  $P^{(n)}(q) \rightarrow \infty$  as  $n \rightarrow \infty$ .

┘

*Proof:* Cf. [C-G93]P66, 67. □

## 7 Quadratic Maps

**Prop. (13.8.7.1).** Since any polynomial  $f \in \text{Poly}(z)$  of degree 2 can be conjugated via maps  $z \mapsto z + A$  to a map of the form  $z \mapsto z^2 + c$ , to study quadratic polynomial maps, it suffices to study maps of the form  $f(z) = z^2 + c$ .

By (13.8.6.1),  $\text{Jul}(f)$  is either connected or totally disconnected (Notice if  $\{f^{(n)}(0)\}$  is unbounded, then it tends to  $\infty$ ). ┘

**Def. (13.8.7.2) [Mandelbrot Set].** The **Mandelbrot set**  $\mathbf{Man}$  is define to be the set of  $c \in \mathbb{C}$  s.t.  $\{f_c^{(n)}(0)\}$  is bounded, where  $f_c(z) = z^2 + c$ . ┘

**Prop. (13.8.7.3).**  $\mathbf{Man} \subset \overline{\mathbb{D}}(0, 2)$ . ┘

*Proof:* This is because we can show by induction that  $|f^{(n)}(0)| \geq |a|(|a| - 1)^{n-1}$  for  $n \in \mathbb{Z}$ . □

**Prop. (13.8.7.4) [Douady – Hubbard1982].** The Mandelbrot set  $\mathbf{Man} = \{a \in \mathbb{C} \mid (z^2 + a)^{(n)}(0) \leq 2, \forall n \in \mathbb{N}\}$ , and it is compact, connected and  $\mathbb{P}^1(\mathbb{C}) \setminus \mathbf{Man}$  is connected. ┘

*Proof:* Let  $f_a(z) = z^2 + a$ . If  $|a| > 2$ , then  $a \notin \mathbf{Man}$ . If  $|a| \leq 2$ ,  $f_a^{(n)}(0) = 2 + \alpha$  for some  $\alpha \in \mathbb{R}_+$ , then it can be shown by induction that  $f_a^{(n+k)}(0) \geq 2 + 4^k \alpha$  for any  $k \in \mathbb{N}$ , so  $a \notin M$ . This implies  $\mathbf{Man} = \{a \in \mathbb{C} \mid (z^2 + a)^{(n)}(0) \leq 2, \forall n \in \mathbb{N}\}$ . In particular, it is closed.

For the last assertion, suppose  $\Omega$  is a connected component of  $\mathbb{C} \setminus M$ . Then  $\max_{a \in \overline{\Omega}} |f_a^{(n)}(0)| > 2$ . If  $\Omega$  is bounded, then by maximum principle,  $|f_a^{(n)}(0)| \geq 2$  for some  $a \in \partial\Omega \subset \mathbf{Man}$ , which contradict the first assertion. So any connected component of  $\mathbb{C} \setminus \mathbf{Man}$  is unbounded, thus  $\mathbb{P}^1(\mathbb{C}) \setminus \mathbf{Man}$  is connected.

To show that  $\mathbf{Man}$  is connected, denote  $P_n(c) = f_c^n(0)$ , let  $R \in (2, \infty)$ , then

$$\mathbf{Man} = \bigcap_{n \in \mathbb{Z}_+} P_n^{-1}(\overline{\mathbb{D}}(0, R))$$

is a nested intersection of compact sets. We may choose  $R$  s.t.  $\partial\mathbb{D}(0, R)$  contains no critical points of any  $P_n$ . Thus by (4.4.6.2), it suffices to show that each  $P_n^{-1}(\overline{\mathbb{D}}(0, R))$  is connected. Suppose  $U$  is a connected component of  $P_n^{-1}(\overline{\mathbb{D}}(0, R))$  s.t.  $0 \notin \overline{U}$ , and this  $n$  is minimum. Then we show that  $0 \notin P_k(\overline{U})$  for all  $1 \leq k \leq n$ . To show this, use induction on  $k$ :  $k = 1$  case follows from the hypothesis, suppose that this is true for  $k \leq k_0 < n$ , then for  $k = k_0$ ,

$$f_c^{k+1}(0) \neq c, \quad c \in \overline{U}.$$

Notice for  $c \in \partial U$ ,

- $f_c^{k+1-n}(\partial D(0, R))$  is a Jordan curve, which varies smoothly in  $c$ : By the minimality of  $n$ ,  $P_{n-k-1}^{-1}(\mathbb{D}(0, R))$  is connected, so for any  $c \in \overline{U}$ ,  $f_c^{k+1-n}(\partial \mathbb{D}(0, R))$  is a smooth Jordan curve (because  $f_c^{k+1-n}$  has a critical point if  $|f_c^m(0)| = R$  for some  $m < n$ , which contradicts the fact  $|f_c^n(0)| \leq R$ ), and

$$F : \{(c, z) : c \in \overline{U}, f_c^m(z) \in \partial \mathbb{D}(0, R)\} \rightarrow U \times \partial \mathbb{D}(0, R)$$

is a smooth covering map. Notice  $U$  is simply-connected so there is a map  $\partial U \times I \rightarrow \overline{U}$ . Thus the pullback of  $F$  just induces a smooth isomorphism of this family of Jordan curves with the trivial family, so it depends smoothly on  $c$ .

- $f_c^{k+1}(0) \in f_c^{k+1-n}(C_R)$ , because  $|f_c^{n-1}(c)| = R$

- $0, c \in f_c^{k+1-n}(\mathbb{D}(0, R))$ , because  $|f_c^{n-1}(c)| = R$ .

So  $n(\partial U, c \mapsto f_c^{(k+1)}(0) - c) = n(\partial U, c \mapsto f_c^{(k+1)}(0) - 0)$  by??. Thus

$$f_c^{k+1}(0) \neq 0, \quad c \in \overline{U},$$

by argument principle. Then the induction process is finished.

Finally, notice  $P_n : U \rightarrow D(0, R)$  is a branched covering, so  $0 \in D(0, R) = P_n(U)$ , contradiction.

For another proof, Cf.[Mandelbrot set is connected].?

□

**Conj. (13.8.7.5) [Locally-Connectedness].** The Mandelbrot set **Man** is locally connected. ┘

*Proof:*

□

**Prop. (13.8.7.6) [Main Cardioid].** **Man** contains the **main cardioid** which is given by

$$\{a \in \mathbb{C} : |1 + \sqrt{1 - 4a}| < 1\} \cup \{a \in \mathbb{C} : |1 - \sqrt{1 - 4a}| < 1\} = \left\{ \frac{\mu(2 - \mu)}{4} \mid \mu \in \mathbb{D} \right\}.$$

┘

*Proof:* The main cardioid is just the set  $a \in \mathbb{C}$  s.t.  $f_a(z) = z^2 + a$  has a attracting fixed point.

And in this case, it can be shown that  $\mathbb{D}(0, \frac{1}{2}) \subset BA(\frac{1+\sqrt{1-4a}}{2})$ . Thus  $a \in \mathbf{Man}$ . □

**Prop. (13.8.7.7).**  $\mathbf{Man} \cap \mathbb{R} = [-2, \frac{1}{4}]$ . ┘

*Proof:* For  $a \in \mathbb{R}$ , if  $a > 1/4$ , then  $z^2 + a > z + (a - \frac{1}{4})$ , so  $a \notin \mathbf{Man}$ . If  $a < -2$ , then  $a \notin \mathbf{Man}$  by (13.8.7.3).

And for  $a \in [0, 1/4]$ ,  $f^{(n)}(0) \in [0, 1/2]$ , so  $a \in \mathbf{Man}$ . Finally, for  $a \in [-2, 0]$ ,  $|f^{(n)}(0)| \leq a$ , so  $a \in \mathbf{Man}$ . □

**Prop. (13.8.7.8).** Any point in  $\partial \mathbf{Man}$  is an accumulation point of the set of values  $a \in \mathbb{C}$  s.t.  $f_a(z) = z^2 + a$  has a super-attracting point other than  $\infty$  (i.e. 0 is periodic for  $f_a$ ). ┘

*Proof:* Let  $U$  be an small open set of  $\mathbb{C}$  intersecting  $\partial \mathbf{Man}$  and  $0 \notin U$ . Suppose  $f_a(z)$  doesn't has a super-attracting point other than  $\infty$ , then  $f_a^{(n)}(0) \neq 0$  for any  $n \in \mathbb{Z}_+$ . In particular,  $f_a^{(n)}(0) \neq \sqrt{a}$ , where  $\sqrt{a}$  is a branch of square root. Consider the family of functions  $\{g_n(a) = f_a^{(n)}(z)/\sqrt{a}\}$  on  $a$ , then  $g_n(a) \neq \{0, 1, \infty\}$  for any  $a \in D$ . So by (12.5.1.10),  $\{g_n\}$  is normal on  $D$ . As  $D \cap \mathbf{Man} \neq \emptyset$ , there exists  $a \in D$  s.t.  $\{g_n(a)\}$  is bounded. But  $D \setminus \mathbf{Man} \neq \emptyset$ , so there exists  $\xi \in D$  and a sequence  $(g_n^{(n_i)}(\xi))$  that tends to infinity. So  $\{g_n\}$  is normal on  $D$  cannot be normal on  $D$ , contradiction. □

**Conj. (13.8.7.9)[Hyperbolicity].** Every component of the interior of the Mandelbrot set is hyperbolic. Equivalently, the set of  $c \in \mathbb{C}$  s.t.  $f_c(z) = z^2 + c$  is hyperbolic is an open dense subset of  $\mathbb{C}$ .  $\lrcorner$

*Proof:*  $\square$

**Thm. (13.8.7.10)[Yoccoz].** If  $f \in \mathbb{C}[z]$  is a quadratic polynomial, and there is an invariant line field on  $\text{Jul}(f)$ , then  $f$  is infinitely renormalizable.  $\lrcorner$

*Proof:*  $\square$

**Thm. (13.8.7.11)[Robust Rigidity].** If  $f \in \mathbb{C}[z]$  is a robust infinitely renormalizable quadratic polynomial, then there are no invariant line fields on  $\text{Jul}(f)$ .  $\lrcorner$

*Proof:* Cf.[McMullen]  $\square$

**Cor. (13.8.7.12).** If  $f \in \mathbb{C}[z]$  is a real quadratic polynomial, then there are no invariant line fields on  $\text{Jul}(f)$ .  $\lrcorner$

*Proof:*  $\square$

# 14 | Operator Algebras

## 14.1 Operator Algebras

**Notation(14.1.0.1).**

- Use notations on Archimedean Banach spaces defined in [Archimedean Banach Algebra](#).

┘

Cf.[Princeton Companion], [\[Fol16\]](#), [Non-commutative Geometry, Connes]Chap5.

The theory of operator algebras is the non-commutative analogue of measure theory.

### 1 $C^*$ -algebras

**Def. (14.1.1.1)[ $C^*$ -Algebras, Rickart(1946)/Segal(1947)].** A  $B^*$ -algebra(or  $C^*$ -algebra) is a Banach algebra  $A$  over  $\mathbb{C}$  with an involution  $*$  :  $A \rightarrow A$  s.t.  $\|xx^*\| = \|x\|^2$  for any  $x \in A$ .

┘

**Prop. (14.1.1.2).** For  $H \in \mathcal{H}ilbSpa$ , the adjoint operation serves as an involution and makes  $B(\mathcal{H})$  into a  $B^*$ -algebra, by [\(12.9.2.9\)](#).

┘

**Prop. (14.1.1.3)[Gelfand-Naimark].** For a commutative  $C^*$ -algebra, the Gelfand transform  $x \mapsto \hat{x}$  is an isomorphism from  $A$  to  $C(\Delta)$  with  $\|x\| = \|\hat{x}\|_\infty$  and  $\widehat{x^*} = \widehat{\hat{x}}$ .

┘

*Proof:* First use  $\|xx^*\| = \|x\|^2$  to prove that a Hermitian element is mapped to real function, and use Stone-Weierstrass to show that the image is dense, then let  $y = xx^*$  and  $\|y^{2^m}\| = \|y\|^{2^m}$  to prove  $\|\hat{x}\| = \|x\|$ , so its image is closed.  $\square$

**Cor. (14.1.1.4).** If  $A$  is a commutative  $B^*$ -algebra that contains an element  $x$  s.t polynomials of  $x, x^*$  are dense in  $A$ , then  $\hat{x}$  is an isomorphism from  $\Delta_A$  to  $\sigma(x)$ , in particular, the Gelfand transform [\(12.9.1.21\)](#) is an isomorphism from  $C(\sigma(x))$  to  $A$ .

┘

*Proof:* Cf.[Rudin P290].  $\square$

Now we want to apply commutative algebra methods in the non-commutative case, there are two ways.

**Prop. (14.1.1.5).** For a commutative set of elements  $S$  in  $A$ , its bicommutant [\(14.1.2.2\)](#)  $B = \Gamma(\Gamma(S))$  is commutative, closed and contains  $S$ . And  $\sigma_B(x) = \sigma_A(x)$  for  $x \in B$ .

┘

*Proof:* Because  $S \subset \Gamma(S)$ ,  $\Gamma(\Gamma(S)) \subset \Gamma(S)$ , thus  $\Gamma(\Gamma(S))$  is commutative. And if  $xy = yx$ , then  $x^{-1}y = yx^{-1}$ , so the inverse, if exists, are in  $B$ .  $\square$

**Cor. (14.1.1.6).** In a Banach algebra, if  $x, y$  commutes, then

$$\sigma(x + y) \subset \sigma(x) + \sigma(y), \quad \sigma(xy) \subset \sigma(x)\sigma(y).$$

┘

*Proof:* Because  $\sigma(x)$  is just the range of  $\hat{x}$  on  $\Delta_A$  where  $A = \Gamma(\Gamma(\{x, y\}))$  (14.1.1.5)(12.9.1.21).  $\square$

The second method applies to normal elements:

**Def. (14.1.1.7) [Normal].** In a Banach algebra with an involution, a set  $S$  is called **normal** if it is commutative and  $S^* = S$ . An element  $x$  is called:

- **normal** iff  $x$  commutes with  $x^*$ .
- **unitary** iff  $x^* = x^{-1}$ .
- **Hermitian** iff  $x^* = x$ .
- **positive** iff  $x = x^*$  and  $\sigma(x) \subset [0, \infty)$ .

┘

**Prop. (14.1.1.8).** A maximal normal set  $B$  in  $A$  is a closed subalgebra and  $\sigma_B(x) = \sigma_A(x)$  for  $x \in B$ .

┘

*Proof:* Cf.[Rudin P294].  $\square$

**Cor. (14.1.1.9) [Normalness and Spectra].** In a  $B^*$ -algebra  $A$ ,

- Hermitian elements have real spectra.
- If  $x$  is normal, then  $\rho(x) = \|x\|$ .
- If  $u, v \geq 0$ , then  $u + v \geq 0$ .
- $yy^* \geq 0$ . Thus  $e + yy^*$  is invertible.

┘

*Proof:* Cf.[Rudin P295].  $\square$

**Def. (14.1.1.10) [Positive Functional].** Let  $(A, *)$  be a Banach algebra with an involution, a **positive functional** on  $A$  is a function  $F : A \rightarrow \mathbb{C}$  such that  $F(xx^*) \geq 0$ . It has the following properties.

- $F(x^*) = \overline{F(x)}$  and  $|F(xy^*)|^2 \leq F(xx^*)F(yy^*)$ . (Use Swartz like trick).
- $|F(x)|^2 \leq F(e)F(xx^*) \leq F(e)^2\rho(xx^*)$ , because  $e = ee^*$ . Thus  $|F(x)| \leq F(e)\rho(x)$  for every normal  $x$  by (14.1.1.9), so  $\|F\| = F(e)$  if  $A$  is commutative.

┘

*Proof:* Cf.[Rudin P297].  $\square$

**Prop. (14.1.1.11) [Positive Functionals and Measures].** If  $A$  is a commutative Banach algebra with an involution that  $h(x^*) = \overline{h(x)}$ , then The map

$$\mu \rightarrow F(x) = \int_{\Delta} \hat{x} d\mu$$

is a one-to-one correspondence between the convex set of measures  $\mu$  that  $\mu(\Delta) \leq 1$  to the convex set  $K$  of positive functionals on  $A$  of norm  $\leq 1$ , i.e.  $F(e) \leq 1$ , so maps the extreme points, i.e. the point mass to extremes points, thus the extreme points of  $K$  is exactly  $\Delta$ . This can be used to prove Bochner's theorem (12.11.1.11).  $\square$

*Proof:* Use the last prop to show that there is a functional on  $C(\Delta)$  and use Riesz representation. It is positive and by Stone-Weierstrass, it is unique.  $\square$

**Thm. (14.1.1.12) [Gelfand-Naimark-Segal].** Any  $C^*$ -algebra  $A$  is isomorphic to a closed subspace of  $B(\mathcal{H})$  for some  $\mathcal{H} \in \mathcal{HilbSpa}$  as  $*$ -algebras.

Such a representation  $A \rightarrow B(\mathcal{H})$  is called a  **$*$ -representation**. It is called a **non-degenerate  $*$ -representation** if there are no  $u \in \mathcal{H}$  s.t.  $Au = 0$ .  $\lrcorner$

*Proof:* Cf. [Rudin].  $\square$

## 2 von-Neumann-Algebras

**Def. (14.1.2.1) [von-Neumann-Algebras].** A **von Neumann Algebra** is a  $C^*$ -subalgebra of  $B(\mathcal{H})$  (14.1.1.1)(14.1.1.2) that contains the identity and is closed in the weak operator topology (12.7.3.4).  $\lrcorner$

**Def. (14.1.2.2) [Bicommutant].** For  $\mathcal{S} \subset L(\mathcal{H})$ , define the **commutator**  $\Gamma(\mathcal{S})$  be the algebra of operators that commutes with any  $S \in \mathcal{S}$ , then  $\mathcal{S} \subset \Gamma(\Gamma(\mathcal{S}))$ .  $\Gamma(\Gamma(\mathcal{S}))$  is called the **bicommutant** of  $\mathcal{S}$ .

If  $\mathcal{A}$  is a  $*$ -algebra in  $L(\mathcal{H})$ , then  $\Gamma(\Gamma(\mathcal{A}))$  is a von-Neumann algebra.  $\lrcorner$

*Proof:* If  $\mathcal{A}$  is a  $*$ -algebra, then  $\Gamma(\Gamma(\mathcal{A}))$  is clearly a  $*$ -algebra, and it is weakly-closed because if  $SV_i = V_iS$  and  $V_i x \rightarrow Vx$  for any  $x$ , then  $SVx = VSx$  for any  $x$ .  $\square$

**Thm. (14.1.2.3) [von-Neumann Density Theorem].** Let  $\mathcal{A}$  be a  $*$ -subalgebra of  $L(\mathcal{H})$ , then  $\mathcal{A}$  is dense in  $\Gamma(\Gamma(\mathcal{A}))$  in the ultra-strong operator topology (12.7.4.6). i.e.  $\Gamma(\Gamma(\mathcal{A}))$  is the von-Neumann algebra generated by  $\mathcal{A}$  (14.1.2.1).  $\lrcorner$

*Proof:* Firstly we prove that  $\mathcal{A}$  is dense in  $\Gamma(\Gamma(\mathcal{A}))$  in the strong operator topology. For any  $S \in \Gamma(\Gamma(\mathcal{A}))$  and any  $x_1, \dots, x_N \in \mathcal{H}$ ,  $\varepsilon > 0$ , we need to prove there exists  $A \in \mathcal{A}$  that  $\sum \|Sx_i - Ax_i\| \leq \varepsilon^2$ .

For the case  $N = 1$  and  $x_1 = x$ , consider the closure  $\mathcal{X}$  of  $\{Ax\}$ , then the orthogonal projection  $P$  onto  $\mathcal{X}$  is an operator in  $\Gamma(\mathcal{A})$ . This implies  $A(1 - P)x = (1 - P)Ax = 0$ , thus  $x = Px$  because of non-degeneracy. Thus  $S$  commutes with  $P$ , and  $Sx = SPx = PSx \in \mathcal{X}$ , thus there exists an  $A \in \mathcal{A}$  that  $Ax$  is close to  $Sx$ . For  $N > 1$ , we can just apply the result to  $\mathcal{H}^N$ .

For the ultra-strong operator topology, consider the Hilbert space  $\mathcal{W} \in \mathcal{HilbSpa}$  consisting of sequence  $(v_n)_{n \in \mathbb{Z}_+}$  in  $\mathcal{H}$  s.t.  $\sum_n \|v_i\|^2 < \infty$ . Then  $\mathcal{A}$  acts on  $\mathcal{W}$  diagonally.

For  $S \in \Gamma(\Gamma(\mathcal{A}))$ , we prove that the diagonal action of  $S$  on  $\mathcal{W}$  commutes with the action of  $\mathcal{A}$ . Let  $\text{pr}_m : \mathcal{W} \rightarrow \mathcal{H}$  be the projection to the  $m$ -th component and  $i_n : \mathcal{H} \rightarrow \mathcal{W}$  the inclusion to the  $n$ -th component, then it suffices to show that for any  $T \in \Gamma(\mathcal{A}^\Delta)$ , we have

$$\text{pr}_m(S^\Delta T - TS^\Delta)i_n = 0$$

for any  $m, n \in \mathbb{Z}_+$ . Notice that  $\text{pr}_m Ti_n \in \Gamma(\mathcal{A})$  because for any  $x \in \mathcal{A}$  and  $v \in \mathcal{H}$ , we have

$$\text{pr}_m Ti_n Av = \text{pr}_m TA^\Delta i_n v = \text{pr}_m A^\Delta Ti_n v = A \text{pr}_m Ti_n v.$$

Thus

$$\text{pr}_m TS^\Delta i_n = \text{pr}_m Ti_n S = S \text{pr}_m Ti_n = \text{pr}_m S^\Delta Ti_n.$$

And the proved strong-operator density for  $\mathcal{W}$  implies the ultra-strong operator density of  $\mathcal{A}$  in  $\Gamma(\Gamma(\mathcal{A}))$ .  $\square$

**Def. (14.1.2.4) [Factors].** A **factor** is a non-Neumann-algebra (14.1.2.1) with center  $\mathbb{C}$ .  $\lrcorner$

### 3 Type-I Factors

**Remark (14.1.3.1).** Factors (14.1.2.4) are defined as type I, II, III depending on their lattices of orthogonal projections.  $\lrcorner$

**Def. (14.1.3.2) [Type-I Factors].** A **type-I factor** is a factor (14.1.2.4) that is isomorphic to  $B(\mathcal{H})$  for some  $\mathcal{H} \in \mathcal{HilbSpa}$ .  $\lrcorner$

**Thm. (14.1.3.3).** If  $A \leq B(\mathcal{H})$  is a type-I factor on  $\mathcal{H} \in \mathcal{HilbSpa}$  (14.1.3.2), isomorphic to  $B(\mathcal{H}_1)$  for  $\mathcal{H}_1 \in \mathcal{HilbSpa}$ , then there exists  $\mathcal{H}_2 \in \mathcal{HilbSpa}$  and unitary isomorphism  $\mathcal{H} \cong \mathcal{H}_1 \otimes \mathcal{H}_2$  s.t.

$$UAU^{-1} = B(\mathcal{H}_1) \otimes \text{id}_{\mathcal{H}_2}, \quad U\Gamma(A)U^{-1} = \text{id}_{\mathcal{H}_1} \otimes B(\mathcal{H}_2).$$

$\lrcorner$

*Proof:* Cf. [Dixmier, Von Neumann Algebras] 1.8.2, Cor3.  $\square$

**Cor. (14.1.3.4).** If  $A \leq B(\mathcal{H})$  is a type-I factor (14.1.3.2), then  $\Gamma(A)$  (14.1.2.2) is also a type I factor.  $\lrcorner$

# 15 | Geometric Topology

## 15.1 Low Dimensional Topology

### 1 Thurston's Geometrization Conjecture(3-Manifolds)

**Prop.(15.1.1.1) [Prime Decomposition Theorem, Kneser1929/Milnor[Mil62]].** Any compact manifold pos. with boundary is a connected sum of f.m. compact manifolds s.t. they are not connected sum of non-trivial manifolds, called **prime manifolds**.  $\lrcorner$

*Proof:* ? Cf.[Kneser] for proof that it can be written as a connected sum of f.m. compact manifolds.  $\square$

**Def.(15.1.1.2) [Incompressible Surfaces].** A surface  $S \in \text{Diff}_\partial$  in a 3-manifold  $M \in \text{Diff}_\partial^3$  is called a **two-sided surface** if  $\partial S \subset \partial M$  and the normal bundle of  $S$  is oriented. A **incompressible surface** is a two-sided surface  $S \subset M$  s.t. any simple curve on  $S$  that bounds a disk on  $M$  with interior disjoint from  $N$  also bounds a disk in  $M$ .  $\lrcorner$

**Def.(15.1.1.3) [Atoroidal Manifolds].**  $M \in \text{Diff}_\partial^3$  is called **geometrically atoroidal** if every incompressible torus in  $M$ (15.1.1.2) is isotopic to a boundary component.  $M$  is called **homotopically atoroidal** if every map  $\mathbb{T}^2 \rightarrow M$  that is injective on  $\pi_1$  is homotopic to a boundary component.

Homotopically atoroidal manifolds are geometrically atoroidal. ?  $\lrcorner$

**Example(15.1.1.4) [Homotopically Atoroidal Manifolds].** The following two manifolds are homotopically atoroidal(15.1.1.3):

- $M = \mathbb{T}^2 \times \mathbb{I}$ .
- $M = (\mathbb{T}^2 \times \mathbb{I}) / \{\pm 1\}$ .

$\lrcorner$

*Proof:* ?  $\square$

### Haken Manifolds

**Def.(15.1.1.5) [Haken Manifolds].** A **Haken manifold** is a 3-dimensional prime manifold(15.1.1.1) that is homeomorphic to  $\mathbb{S}^3$  or contains a 2-sided incompressible surface(15.1.1.2) not homeomorphic to  $\mathbb{S}^2$ .  $\lrcorner$

**Prop.(15.1.1.6) [Haken Manifolds].** Any 3-dimensional prime manifold with boundary(15.1.1.1) is Haken(15.1.1.5). Any 3-dimensional closed manifold  $M$  with  $H^1(M; \mathbb{Q}) \neq 0$  is Haken.  $\lrcorner$

*Proof:* ?  $\square$

### Model Geometries

**Def.(15.1.1.7) [Model Geometries].** A **model geometry** is a simply-connected smooth manifold  $X \in \mathcal{D}\text{iff}$  together with a transitive action of a Lie group  $G$ (16.5.1.1) on  $X$  with compact stabilizers, and maximal among groups acting smoothly and transitively on  $X$  with compact stabilizer  $\mathcal{K}$ .  $\lrcorner$

**Def.(15.1.1.8)[Geometric Structures].** A **geometric structure** on a manifold pos. with boundary  $M$  is a diffeomorphism from  $M$  to  $X/\Gamma$  for some model geometry  $X = G/\mathcal{K}$ (15.1.1.7), where  $\Gamma$  is a discrete subgroup of  $G$  acting freely on  $X$ .  $\lrcorner$

**Thm.(15.1.1.9) [Thurston Geometries].** There are exactly 8 3-dimensional model geometries(15.1.1.7) s.t. there exists a compact manifold(pos. with boundary) with this geometric structure(15.1.1.8):

- (Spherical geometry:) $X = \mathbb{S}^3 = \text{SO}(4; \mathbb{R})/\text{SO}(3; \mathbb{R})$ . Closed manifolds modeled on this geometry are exactly those with finite fundamental groups, these are called **spherical manifolds**. They are classified.
- (Euclidean geometry:) $X = \mathbb{R}^3 = (\text{O}(3; \mathbb{R}) \ltimes \mathbb{R}^3) / \text{O}(3; \mathbb{R})$ . There are exactly 10 finite-volume closed 3-manifolds with this geometry, 6 orientable and 4 non-orientable.
- (Hyperbolic geometry:) $X = \mathcal{H}^3 = \text{O}^+(1, 3; \mathbb{R})/\text{O}(3; \mathbb{R})$ .
- ( $X = \mathbb{S}^2 \times \mathbb{R} = ((\text{O}(3; \mathbb{R}) \times \mathbb{R}) / \{\pm 1\}) / (\text{O}(2; \mathbb{R}) \times \{\pm 1\})$ :)
- ( $\mathcal{H}^2 \times \mathbb{R}$ :)
- ( $\widetilde{\text{SL}(2; \mathbb{R})}$ :) $X = \left( \mathbb{Z} \setminus \left( \mathbb{R} \times \widetilde{\text{SL}(2; \mathbb{R})} \right) \right) / \text{SO}(2; \mathbb{R})$ .
- (Nilgeometry:) $X$  is the quotient of the Heisenberg group quotient by  $\text{O}(2; \mathbb{R})$ .
- (Solgeometry:)

$\lrcorner$

*Proof:* ?

$\square$

**Thm.(15.1.1.10) [Thurston's Geometrization Conjecture].** The interior of any compact 3-manifold pos. with boundary has a canonical decomposition into pieces with geometric structures(15.1.1.8).  $\lrcorner$

*Proof:* ?

$\square$

**Lemma(15.1.1.11)[Hyperbolic Manifolds with Boundaries].** The interior of a compact 3-manifold with boundary  $M \in \mathcal{D}\text{iff}_\partial$  has a hyperbolic structure(15.1.1.9) iff  $M$  is prime(15.1.1.1), homotopically atoroidal and not homeomorphic to  $(\mathbb{T}^2 \times \mathbb{I}) / \{\pm 1\}$ (15.1.1.4). In particular, the Thurston's geometrization conjecture holds for all compact 3-dimensional prime manifolds with boundary.

And if  $M$  has a hyperbolic structure, then the interior has finite volume iff  $\partial M$  consists of tori and not homeomorphic to  $\mathbb{T}^2 \times \mathbb{I}$ (15.1.1.4).  $\lrcorner$

*Proof:* Cf.[Hyperbolic structures on 3-manifolds, 1: deformations of acylindrical manifold, Thurston].  $\square$

**Lemma(15.1.1.12) [Haken Manifolds].** The Thurston's geometrization conjecture holds for any Haken manifold(15.1.1.5). A closed Haken manifold has a hyperbolic structure iff it is homotopically atoroidal(15.1.1.3).  $\lrcorner$

## 2 Floer Homology

**Def. (15.1.2.1) [Witten Complex].** Let  $M \in \text{Diff}_{\text{cpet}}$  and  $f \in C(M)$  is a Morse function, then at each critical point  $P$  of  $f$ , the Hessian  $H_P(f)$  is a non-degenerate quadratic form with signature  $n_P^+, n_P^-$ .

We define the **Witten complex**  $C$  as follows:

- For  $0 \leq q \leq \dim M$ ,  $C_q$  is the free group generated by the critical points with  $n_P^- = q$ .
- Choose a metric on  $M$ , define the flow generated by  $\text{grad} f$ . Then for critical points  $P, Q$  with  $n_P^- = q, n_Q^- = q - 1$ , the number of trajectories under  $\text{grad} f$  from  $P$  to  $Q$  is finite, and this gives the boundary map coefficients  $\partial_{P,Q}$ .

┘

References are [Supersymmetry and Morse Theory, Witten].

### Casson Invariants

**Def. (15.1.2.2) [Casson Invariants].** Let  $Y$  be a homological 3-sphere, the **Casson invariant**  $\lambda(Y)$  of  $Y$  is defined to be the half of the number of isomorphism classes of irreducible representation  $\pi_1(Y) \rightarrow SU(2)$ .

┘

**Prop. (15.1.2.3).** For a homological 3-sphere  $Y$ , let

- $\mathcal{A}$  be the space of  $SU(2)$ -connections for the trivial bundle on  $Y$ ,
- $\mathcal{G}$  be the group of gauge transformations  $Y \rightarrow SU(2)$ .
- $\mathcal{C} = \mathcal{A}/\mathcal{G}$ .

Then  $\mathcal{C}$  is an infinite-dimensional manifold, and the connection map  $F : \mathcal{A} \mapsto F_A$  defines a 1-form  $F$  on  $\mathcal{C}$ .

┘

*Proof:*

□

**Prop. (15.1.2.4) [Taubes].** Situation as in (15.1.2.3), the zeros of  $F$ , i.e. the set of flat connections, corresponds to irreducible representations  $\pi_1(Y) \rightarrow SU(2)$ . And we can use Fredholm perturbation to calculate the number, i.e.  $2\lambda(Y)$ .

┘

*Proof:* ?

□

### Floer Homology Groups

**Remark (15.1.2.5) [Relative Morse Indices].** The difficulty to construct Morse theory for  $Y$  lies in the fact that the Hessian of  $f : \mathcal{C} \rightarrow \mathbb{R}/\mathbb{Z}$  at critical points has both Morse indices  $n^+, n^-$  infinite. The way around is to notice for critical points  $P, Q$ , the **relative Morse index**  $n_{P,Q}^- = n_P^- - n_Q^-$  is finite.

┘

**Prop. (15.1.2.6) [Floer Homology Theory].** Using the flow generated by  $\text{grad} f$ , we can get construct a chain complex with (mod 8)-grading, which is a finite complex with the critical points of  $f$  as simplexes. The corresponding homology groups are called the **Floer homology** of  $Y$ , denoted by  $HF_q(Y)$ , where  $q \in \mathbb{Z}/(8)$ .

Notice reversing the orientation of  $Y$  induces an action on  $HF_*(Y)$  corresponding to Poincaré duality.

┘

**Prop. (15.1.2.7) [Floer Homologies and Casson Invariants].** It is clear now that  $2\lambda(M) = \sum_{q=0}^7 \dim HF(Y)$ . Thus the Floer homology groups form a refinement of  $\lambda(Z)$ .

┘

### 3 Gauge Theory

### 4 Donaldson-Floer Theory

Main references are [Geometry of 4-Manifolds, Donaldson, ICM1987].

**Prop. (15.1.4.1) [Hodge].** For an algebraic surface  $S/\mathbb{C}$ , the signature  $b_2^+$  of the intersection form on  $H_2(S(\mathbb{C}))$  satisfies

$$b_2^+ = 1 + 2p_g(S).$$

┘

**Def. (15.1.4.2) [Donaldson Invariants].** Let  $Z$  be an oriented simply-connected differentiable 4-manifold, let  $b_2^+, b_2^-$  be the signature of the intersection form on  $H_2(Z)$ . Assume  $b_2^+ > 1$  is odd, the **Donaldson invariants** are a sequence of integral polynomials  $\varphi_k$  on  $H_2(Z)$  for  $k$  sufficiently large, and  $\deg(\varphi_k) = 4k = 3\frac{b_2^++1}{2}$ . ?

┘

**Thm. (15.1.4.3).** If  $Z = Z_1 \# Z_2$  is a connected sum with  $b_2^+(Z_i) \neq 0$ , then  $\varphi_k(Z) = 0$  for all  $k$ .

┘

*Proof:*

□

**Thm. (15.1.4.4).** If  $Z$  is an algebraic surface, then for  $k$  sufficiently large,  $\varphi_k(Z(\mathbb{C})) \neq 0$ . In particular,  $Z$  is essentially indecomposable.

┘

*Proof:*

□

**Prop. (15.1.4.5) [Λ-Splitting].** Suppose the intersection form on  $H_2(Z)$  decomposes as  $H_2(Z) = A_1 \oplus A_2$ , where  $A_i^+ > 0$ . If  $\varphi_k(Z) \neq 0$  for some  $k$ , then by (15.1.4.3),  $Z$  cannot be decomposed to a connected sum  $Z_1 \# Z_2$  having intersection form  $A_i$ . However, there exists such a decomposition  $Z = Z_1 \coprod_Y Z_2$  where  $Y$  is a homotopy 3-sphere.

┘

*Proof:* Cf. [Freeman and Taylor, Λ-Splitting 4-Manifolds].

□

**Prop. (15.1.4.6).** For a Λ-splitting  $Z = Z_1 \coprod_Y Z_2$ , the Donaldson invariant polynomials are related to the Floer homology groups of  $Y$ . ?

┘

## 15.2 Other Geometries

### 1 Hyperbolic Geometry

**Prop. (15.2.1.1).** Isometries of hyperbolic ball are all given by Mobius transformations, because the distance to three non-colinear point can localize a point. Cf.[双曲几何 刘毅].  $\lrcorner$

**Def. (15.2.1.2) [Hyperbolic Disk].** The **hyperbolic disk** is a Riemannian manifold homeomorphic to  $\mathbb{D}$  endowed with the **Poincaré metric** or **hyperbolic metric**

$$d^P s = \frac{|dz|}{1 - |z|^2} = \sigma_{\mathbb{D}}(z)|dz|.$$

$\lrcorner$

**Prop. (15.2.1.3).** The Poincaré metric on  $\mathbb{D}$  is preserved by  $\text{Aut}(\mathbb{D})$ .  $\lrcorner$

*Proof:* Cf.[李忠, P26].  $\square$

**Prop. (15.2.1.4).** For any  $z_1, z_2 \in \mathbb{D}$ ,

$$d^P(z_1, z_2) = \log \frac{|1 - \bar{z}_1 z_2| + |z_1 - z_2|}{|1 - \bar{z}_1 z_2| - |z_1 - z_2|}.$$

$\lrcorner$

*Proof:* Cf.[李忠, P27].  $\square$

### Mostow Rigidity Theorem

**Conj. (15.2.1.5) [Rationality of Hyperbolic Volumes].** The volumes of hyperbolic 3-manifolds are not all rationally related.  $\lrcorner$

*Proof:*  $\square$

**Thm. (15.2.1.6) [Mostow Rigidity Theorem].**  $\lrcorner$

### Klein Groups

References are [Three-dimensional manifolds, Kleinian groups and hyperbolic geometry, Thurston].

**Def. (15.2.1.7) [Klein Groups].** A **Klein group** is a discrete subgroup of  $\text{PSL}(2; \mathbb{C})$ .

A Klein group is called a **Fuchsian group** if its limit set in  $\mathbb{C}$  is a circle. It is called a **quasi-Fuchsian group** if its limit set is a Jordan curve  $\lrcorner$

## 2 Metric Geometry(Gromov)

**Notation(15.2.2.1).**

- Use notations on metric spaces defined in [Metric Spaces](#).
- Let  $(X, \text{dist}) \in \text{MetSpa}(4.4.8.3)$ .

┘

**Def.(15.2.2.2)[Hausdorff dimension].**  $\dim^H(X)$ .

┘

**Def.(15.2.2.3)[Hausdorff Distances].** The **Hausdorff distance** for two subset  $Y_1, Y_2 \subset X$  is defined to be

$$d_X^H(Y_1, Y_2) = \inf\{r \in \mathbb{R}_+ | Y_2 \subset B(Y_1, r), Y_1 \subset B(Y_2, r)\}.$$

The **Gromov-Hausdorff metric** for two metric space is

$$d^{GH}(X_1, X_2) = \inf_Z \{d_Z^H(i_1(X_1), i_2(X_2))\}$$

where  $i_1, i_2$  are isometry of  $X_1, X_2$  into som metric space  $Z$ .

This metric makes the set of all compact metric space into a complete Hausdorff space  $\mathcal{MET}$ . ┘

**Def.(15.2.2.4).** A map from  $X$  to  $Y$  is called a  $\varepsilon$ -**approximation** iff  $B(f(X), \varepsilon) = Y$  and  $|d(x, y) - d(f(x), f(y))| \leq \varepsilon$ .

We have: if there is a  $\varepsilon$  approximation, then  $d^{GH}(X, Y) \leq 3\varepsilon$ , and if  $d^{GH}(X, Y) \leq \varepsilon$ , there is a  $3\varepsilon$  approximation. ┘

**Prop.(15.2.2.5).** Fix a function  $N : (0, 1) \rightarrow \mathbb{N}$ , the space  $\mathcal{MET}(D, N)$  of complete metric space of diameter bounded by  $D$  and for every  $\varepsilon$ , there is a  $\varepsilon$ -net with no more then  $N(\varepsilon)$  points. Then it is a compact subspace of  $\mathcal{MET}$ . ┘

*Proof:* We show it is totally bounded and closed. It is totally bounded because the space of discrete space of no more than  $N(\varepsilon)$  is compact and it  $\varepsilon$  approximate  $\mathcal{MET}(D, N)$  by definition. Thus we have it is totally bounded. And  $\square$

**Prop.(15.2.2.6).** The set of isometries of ┘

**Prop.(15.2.2.7)[Gromov Compactness Theorem].** Denote the space  $\mathcal{RIC}_{*, -1}^D(n)$  of manifold with Ricci curvature bounded below by  $-1$  and diameter bounded above by  $D$ , then it is a precompact subset of  $\mathcal{MET}$ . ┘

*Proof:* By Bishop-Gromov(16.3.6.18), there is a  $N(\varepsilon)$  that  $M$  can only have  $N(\varepsilon)$  many balls of radius  $\varepsilon$ , because  $M$  has bounded diameter (Packing argument). So  $\mathcal{RIC}_{*, -1}^D(n) \subset \mathcal{MET}(D, 2N)$  is precompact.  $\square$

**Prop.(15.2.2.8).** Any metric space  $X$  in the closure of  $\mathcal{RIC}_{*, -1}^D(n)$  has Hausdorff dimension  $\dim^H(X) \leq n$ . ┘

**Prop.(15.2.2.9)[Gromov].** If a sequence of manifold  $\{M_i\}$  in  $\mathcal{M}_{V, -k}^{D, k}(n)$ , then they has a limit point  $X \in \mathcal{MET}$ . Then  $X$  is a  $C^\infty$  manifold and there is a  $C^{1, \alpha}$ -metric for every  $\alpha < 1$ . And  $M_i$  are all diffeomorphic to  $X$  for large  $X$ .

In particular, this implies that there are only finitely many diffeomorphic classes. ┘

**Prop.(15.2.2.10)[Peterson].**  $\mathcal{M}_{*, v, k}^D(n)$  has only finitely many homotopy classes. ┘

### 3 Nilgeometry

**Def. (15.2.3.1) [Nilmanifolds].** A **nilmanifold** is a differential manifold of the form  $X = G/\Gamma$  where  $G \in \mathcal{L}\text{ieGrp}$  is a nilpotent Lie group and  $\Gamma \subset G$  is a cocompact discrete subgroup.  $\lrcorner$

### 4 Spectral Geometry

**Def. (15.2.4.1) [Spectra of Manifolds].** Let  $M$  be a manifold(possibly with boundary), then  $M$  has a Laplacian operator  $\Delta$ , defined as

$$\Delta(f) = -\operatorname{div}(\operatorname{grad} f).$$

The **spectrum of manifold** of  $M$  is defined to be the sequence of eigenvalues of  $\Delta$ .

Two manifolds are called **isospectral** if they have the same spectrum.  $\lrcorner$

**Def. (15.2.4.2) [Almost-Conjugate Subgroups].** Let  $G \in \mathcal{G}\text{rp}^{\text{fin}}$  and  $H, K$  be subgroups of  $G$ , then the following are equivalent:

- There is a bijection of sets  $f : H \rightarrow K$  s.t.  $h$  and  $f(h)$  are conjugate in  $G$  for any  $h \in H$ .
- The two Hilbert spaces  $L^2(H \backslash G)$  and  $L^2(K \backslash G)$  are isomorphic.

$\lrcorner$

**Thm. (15.2.4.3) [Isospectral Quotient Manifolds, Sunada-Berard].** Let  $M$  be a compact Riemannian manifold(possibly with boundary) and  $G \in \mathcal{G}\text{rp}^{\text{fin}}$  s.t.  $G$  acts on  $M$  by isometries. Suppose  $H, K$  are almost-conjugate(15.2.4.2) subgroups of  $G$  that acts freely on  $M$ , then the quotient orbifolds  $M_1 = H \backslash M$  and  $M_2 = K \backslash M$  are isospectral. (If they have boundary, they are isospectral both in the Dirichlet-sense and Neumann-sence.)  $\lrcorner$

*Proof:*

$\square$

### 15.3 Knots and Links

References are [Ada04], [Knot Theory, Lickorish].

**Def. (15.3.0.1) [Knots and Links].** For  $M \in \text{Mani}^3$ , a **knot**  $K$  in  $M$  is an embedding  $K : \mathbb{S}^1 \hookrightarrow M$ , and a **link** is a collection of disjoint unions knots in  $M$ . If  $M$  is piecewise-smooth or piecewise-linear,  $K$  is also assumed to be smooth or piecewise-linear.

If  $M$  is not specified, then it is assumed to be  $\mathbb{R}^3$ . If we talk about two knots, then it is assumed that they are disjoint.  $\lrcorner$

**Def. (15.3.0.2) [Unknots].** An **unknot** (or a **trivial knot**) is a knot  $K \subset M$  that is (piecewise-smoothly/linearly) null-homotopic. Two knots/links are called **equivalent knots/links** if they are isotopic.

If we consider the knots in  $\mathbb{R}^3$ , we tacitly assume that the links are piecewise-linear.  $\lrcorner$

**Def. (15.3.0.3) [Knot Diagrams].** For a (piecewise-linear) link  $L \subset \mathbb{R}^3$ , a **link diagram** of  $K$  is given by a linear projection  $\text{pr} : \mathbb{R}^3 \rightarrow \mathbb{R}^2$  s.t.

- $\#p^{-1}(x) \leq 2$  for any  $x \in \mathbb{R}^2$ .
- $\#p^{-1}(x) = 2$  for only f.m.  $x \in \mathbb{R}^2$ .
- For any vertex  $x$  of  $L$ ,  $\text{pr}^{-1}(\text{pr}(x)) = \{x\}$ .

together with a labeling of overcrossing and undercrossing at each pair  $(x, y) \in K$  s.t.  $p(x) = p(y)$ , according to their height w.r.t. the projection.  $\lrcorner$

**Def. (15.3.0.4) [Crossing Numbers].** The **crossing number**  $\text{Cr}(L)$  of a link  $L$  is the minimal number of crossings for any link diagram of  $L$ .  $\lrcorner$

**Def. (15.3.0.5) [Unknot Numbers].** The **unknot number** of a knot  $K$  is the minimal number of crossings needed to change on some knot diagram of it to make it an unknot. Why does such an unknot always exists?  $\lrcorner$

**Def. (15.3.0.6) [Sign of Crossings].** There are three kinds of crossing relation between two oriented strands:  $L_+$ ,  $L_-$ ,  $L_0$ . Cf.[Lickorish]P11Figures.  $\lrcorner$

**Def. (15.3.0.7) [Reidemeister Moves].** There are three **Reidemeister moves** on a knot diagram:

1. A local untwist/twist (i.e.  $\nleftrightarrow$  changed to  $\rightarrow$ ).
2. A local strand passing over or under a strand.
3. A local strand passing over or under a crossing.

$\lrcorner$

**Thm. (15.3.0.8).** Given two knots  $K, K'$  and two projections  $D, D'$  of them, then  $K \sim K'$  iff  $D$  and  $D'$  are connected by a finite series of Reidemeister moves.  $\lrcorner$

*Proof:* ?  $\square$

**Def. (15.3.0.9) [Connected Sums of Knots].** Given two knots  $K, K' \in \mathbb{S}^3$ , we can consider their connected sum. And a **prime knot** is a non-trivial knot that is not a connected sum of two non-trivial knots.  $\lrcorner$

**Def. (15.3.0.10) [Knot Invariants].** A **knot invariant** is a function on the set of knots that has the same value on equivalent knots. By (15.3.0.8), a knot invariant is equivalent to a function on knot diagrams that is invariant under Reidemeister moves.  $\lrcorner$

**Def. (15.3.0.11) [Knot Groups].** For any knot  $K \subset \mathbb{R}^3$ , the **knot group**  $\Pi(K)$  is defined to be  $\Pi(K) = \pi_1(\mathbb{R}^3 \setminus K)$ . This is a knot invariant.  $\lrcorner$

**Def. (15.3.0.12) [Tricolorable Knots].** A **tricoloring of a knot diagram** is a tricoloring of each stand of the diagram s.t.

- Every color is used.
  - At each crossing, the three strands are either of the same color or pairwise different colors.
- having a tricoloring is a property that is invariant under Reidemeister moves, so it is a knot invariant. A **tricolorable knot** is a knot that has a tricolorable knot diagram.  $\lrcorner$

**Def. (15.3.0.13) [Alternating Knots].** An **alternating knot** is a knot that has a diagram s.t. if one travels through the knot, the ‘up’ and ‘down’ nature of the crossing alternates.  $\lrcorner$

### Knots and Braids

**Def. (15.3.0.14) [Braids].** For  $n \in \mathbb{Z}_+$ , let  $A$  be the set of  $n$  points in  $\mathbb{R}^3$  with coordinates  $y = 0, z = 1, x = 1, 2, \dots, n$ , and  $B$  the set of  $n$  points in  $\mathbb{R}^3$  with coordinates  $y = 0 = z, x = 1, 2, \dots, n$ . Then an  $n$ -strand braid is a set of  $n$  piecewise-smooth non-intersecting paths with descending  $z$ -coordinates connecting the points in  $A$  bijectively to points in  $B$ . Two braids are called **equivalent** if there is an isotopy of  $\mathbb{R}^3$  taking one into another with the endpoints fixed.

The  $n$ -strand **braid group** is the set of equivalent classes of  $n$ -strand braids with the group structure such that: For any two braids  $X, Y$ ,  $X \circ Y$  is the braid with the bottom of  $X$  connected to the top of  $Y$ . It is easy to check that the braids form a group under this multiplication.  $\lrcorner$

**Def. (15.3.0.15) [Closure of Braids].** Given any braid  $B$ , the **closure of braid** of  $B$  is the oriented link  $L(B)$  generated by connecting each  $(k, 0, 0)$  with  $(k, 0, 1)$  by a smooth path contained in the plane  $x = k$  and non-intersecting with  $B$ , where the orientation of  $L(B)$  is given by going through the braid from the top to the bottom.  $\lrcorner$

**Prop. (15.3.0.16).** For  $n \in \mathbb{Z}_+$ , the following three groups are equivalent:

- The  $n$ -strand braid group.
- The fundamental group of the unordered  $n$ -configuration space for  $\mathbb{R}^2$ .
- The free group generated by words  $\sigma_1, \dots, \sigma_{n-1}$  under the relations:

$$\sigma_i \sigma_j = \sigma_j \sigma_i, \forall 1 \leq i \leq j-2 \leq n-1,$$

$$\sigma_i \sigma_{i+1} \sigma_i = \sigma_{i+1} \sigma_i \sigma_{i+1}, \forall 1 \leq i \leq n-2.$$

$\lrcorner$

*Proof:* 1 and 3: Any braid can be projected along the  $y$ -direction, and we can perturb it s.t. this is a link diagram, and for each  $z_0$ , there is at most one crossing with  $z = z_0$ . In this way, we can decompose any braid into a composite of braids s.t. each braid is a swap of two consecutive vertices  $i$  and  $i+1$ . Then there is a map from the free group  $\langle \sigma_1, \dots, \sigma_{n-1} \rangle$  to the  $n$ -strand braid group mapping  $\sigma_i$  to the swap of vertices  $i$  and  $i+1$  with  $i$  at front, and  $\sigma^{-1}$  mapped to the swap of vertices

$i$  and  $i + 1$  with  $i + 1$  at front. Then it can be checked that it is truly a map, and it factors through the relations

$$\begin{aligned}\sigma_i \sigma_j &= \sigma_j \sigma_i, \forall 1 \leq i \leq j - 2 \leq n - 1, \\ \sigma_i \sigma_{i+1} \sigma_i &= \sigma_{i+1} \sigma_i \sigma_{i+1}, \forall 1 \leq i \leq n - 2.\end{aligned}$$

So it remains to prove that any two equivalent braids are connected by a sequence of moves according to these relations. This proof is similar to that of Reidemeister moves (15.3.0.8) ?.

1 and 2: Connecting the top and bottom of each braid gives a loop in the  $n$ -configuration space of  $\mathbb{R}^2$ .  $\square$

**Def. (15.3.0.17) [Markov Moves].** There are three kinds of **Markov moves** on a braid:

1. Conjugation by  $\sigma_i$  for some  $i$ .
2. Make an  $n$ -strand braid to an  $n + 1$ -strand braid by adding a straight strand at the end and multiply by  $\sigma_n$  or  $\sigma_n^{-1}$  on the right.

┘

**Prop. (15.3.0.18) [Markov].** For two braids  $B, B'$  (may have different number of strands), their closure represent equivalent links iff they are connected by a finite number of Markov moves (15.3.0.17).  $\square$

*Proof:* Cf. [A study of Braids] P148. ?  $\square$

**Thm. (15.3.0.19) [Alexander].** Any oriented link  $L$  is equivalent to the closure of a braid.  $\square$

*Proof:* We only prove for piecewise-linear links. Take a link diagram  $D$  of  $L$  and take a point  $P \in \mathbb{R}^2 \setminus D$  that is not on the lines generated by any segment of  $D$ . Then we can observe each segment is clockwise or counter-clockwise w.r.t.  $P$ . We can make them all clockwise: For counter-clockwise segments we draw a general triangle that include  $P$ , and then use Reidemeister moves to make a new diagram for  $L$ . Then in this way, projection clockwise from  $P$  gives us a braid whose closure is equivalent to  $L$ .  $\square$

**Cor. (15.3.0.20) [Braid Indices].** The **braid index** of an oriented link  $L$  is the minimal  $n \in \mathbb{Z}_+$  s.t.  $L$  is equivalent to the closure of an  $n$ -strand braid.  $\square$

### Braid Groups

**Cor. (15.3.0.21) [Pure braids].** Due to the covering map  $\mathbb{C}^n \setminus \cup \{z_i = z_j\} \rightarrow \mathbb{C}^n \setminus \cup \{z_i = z_j\} / S^n$  with fiber  $S^n$ , there is a map  $B_n \rightarrow S_n$  which is easily seen to be surjective and with kernel  $P_n = \pi_1(\mathbb{C}^n \setminus \cup \{z_i = z_j\})$ , called the group of **pure braids**.  $\square$

**Prop. (15.3.0.22).** There is a group homomorphism  $B_3 \rightarrow \text{PSL}(2; \mathbb{Z})$  that maps  $a = \sigma_1 \sigma_2 \sigma_1$  to  $S$  and  $b = \sigma_1 \sigma_2$  to  $T$ . The kernel of this map is the group generated by  $c = a^2 = b^3$ .  $\square$

### Coding of Knots

**Def. (15.3.0.23) [Chessboard Coloring of Knots].** Given a knot diagram  $K$ , we can chessboard 2-color the components of the complements of  $K$ , s.t. two adjacent components have different colors. (This is because each vertex has order 4).  $\square$

**Def. (15.3.0.24) [Dowker-Thistlethwaite Notations].** Given a knot diagram, the **Dowker-Thistlethwaite notation** is given as follows: ?  $\square$

**Def. (15.3.0.25)**[Conway Notations]. ┘

**Def. (15.3.0.26)**[Gauss Codes]. Cf.[Kau99]P667. ? ┘

**Prop. (15.3.0.27)**[Gauss Codes are Evenly Intersticed]. Each Gauss code of a knot satisfies that:  
There is an even number of labels in between the two appearances of any label. ┘

*Proof:* This follows from the Jordan curve theorem in the plane. □

### Stick Numbers

**Def. (15.3.0.28)**[Stick Numbers]. For a knot  $K \in \mathbb{R}^3$ , the **stick number**  $s(K)$  is the minimal number  $n \in \mathbb{Z}_+$  s.t.  $K$  is equivalent to a piecewise-linear knot with  $n$  vertices. ┘

**Prop. (15.3.0.29)**. For any non-trivial knot  $K$ ,  $s(K) \geq 6$ . ┘

*Proof:* Use the fact that any knot diagram with  $\leq 2$  crossings is an unknot(15.3.5.1). □

**Prop. (15.3.0.30)**. For any non-trivial knot  $K$ ,

$$\frac{5 + \sqrt{8 \operatorname{Cr}(K) + 9}}{2} \leq s(K) \leq \frac{3}{2}(\operatorname{Cr}(K) + 1).$$

┘

*Proof:* Cf.[https://en.wikipedia.org/wiki/Stick\\_number](https://en.wikipedia.org/wiki/Stick_number). □

**Prop. (15.3.0.31)**[Jin]. If  $K_1, K_2$  are knots, then

$$s(K_1 \# K_2) \leq s(K_1) + s(K_2) - 3.$$

Is it possible to make it -4(which would be optimal in the case  $K_1, K_2$  being trefoil) ?. ┘

*Proof:* Cf.[Jin, Polygon Indices and Superbridge Indices of Torus Knots and links]. □

### Bridge Numbers

**Def. (15.3.0.32)**[Bridge Numbers]. The **bridge number**  $b(K)$  of a knot  $K$  is the minimal number of strands that overpass at least one other strands in some knot diagram of it. Clearly,  $b(K) \leq \operatorname{Cr}(K)$ . ┘

**Prop. (15.3.0.33)**. For any non-trivial knots,  $b(K) \geq 2$ . ┘

*Proof:* ? □

**Prop. (15.3.0.34)**[Schburt]. If  $K_1, K_2$  are knots, then

$$b(K_1 \# K_2) \leq s(K_1) + s(K_2) - 1.$$

┘

*Proof:* ?[Schburt1954]. □

**Def. (15.3.0.35)**[Two-Bridged Knots]. A **two-bridged knot** is a knot  $K \in \mathbb{R}^3$  with  $b(K) = 2$ . In particular, by(15.3.0.34), two-bridged knots are all prime knots. ┘

**Prop. (15.3.0.36)**. Two-bridged knots are just rational knots. ┘

*Proof:* ? □

### Slice Knots

**Def. (15.3.0.37) [Slice Knots].** A **slice knot** is a knot  $K \in \mathbb{S}^3 = \partial\mathbb{D}^4$  that is the boundary of an embedding  $M : \mathbb{D}^2 \hookrightarrow \mathbb{D}^4$ . ┘

**Def. (15.3.0.38) [Ribbon Knots].** A **ribbon knot** is a slice knot  $K \in \mathbb{S}^3$  which is a boundary of an embedding  $M : \mathbb{D}^2 \hookrightarrow \mathbb{D}^4$  s.t. the function  $\|x\|$  on  $\mathbb{D}^4$  restricted to  $M$  has no interior local maximum on  $M$ . ┘

## 1 Seifert Surfaces

**Def. (15.3.1.1) [Siefert Surfaces].** A **Siefert surface** of an oriented link  $L \subset \mathbb{S}^3$  is a connected compact oriented surface with boundary in  $\mathbb{S}^3$  that has  $L$  as its oriented boundary. ┘

**Thm. (15.3.1.2).** Any oriented link  $L \subset \mathbb{S}^3$  has a Siefert surface. ┘

*Proof:* Cf.[Lickorish]P16. □

**Cor. (15.3.1.3) [Genus of Knots].** For any knot  $K$ , the **genus of knot**  $g(K)$  of  $K$  is defined to be the minimal genus of a Siefert surface of  $K$ . ┘

**Prop. (15.3.1.4).** For any two disjoint knots  $K_1, K_2$ ,  $g(K_1 + K_2) = g(K_1) + g(K_2)$ . ┘

*Proof:* Cf.[Lickorish]P17. □

**Thm. (15.3.1.5) [Schönflies Theorem].** For any piecewise-linear embedding  $e : \mathbb{S}^2 \rightarrow \mathbb{S}^3$ ,  $\mathbb{S}^3 \setminus e(\mathbb{S}^2)$  has two connected components, and the closure of each of them is a piecewise-linear  $\mathbb{D}^2$ . ┘

*Proof:* Cf.[Lickorish. The irreducibility of the three-sphere]. □

## 2 Polynomial Invariants

### HOMFLY Polynomials

**Thm. (15.3.2.1) [HOMFLY].** There exists a unique knot invariant  $P$  on the equivalent classes of tame oriented links to the set of homogenous Laurent polynomials of degree 0 in  $x, y, z$ , s.t.

- $P_{\bigcirc} = 1$ .
- $xP_{L_+}(x, y, z) + yP_{L_-}(x, y, z) + zP_{L_0}(x, y, z) = 0$ , which means a local surgery of the crossing according to (15.3.0.6). ┘

**Prop. (15.3.2.2).** Given two oriented links  $L, L'$ ,

$$P_{L \# L'}(x, y, z) = P_L(x, y, z) \cdot P_{L'}(x, y, z).$$
┘

**Example (15.3.2.3).**  $P_{\coprod^n \bigcirc}(x, y, z) = \left(-\frac{x+y}{z}\right)^{n-1}$ . ┘

Kauffman PolynomialsAlexander-Conway Polynomials

**Def. (15.3.2.4)** [Alexander-Conway Polynomials]. **Alexander-Conway polynomial.** ┘

**Prop. (15.3.2.5).** The Alexander-Conway polynomial is just

$$\Delta_L(t) = P_L(1, -1, t^{1/2} - t^{-1/2}) \text{ (15.3.2.1).}$$

┘

*Proof:*

□

Jones Polynomials

Cf. [STATE MODELS AND THE JONES POLYNOMIAL, Kauffman].

**Def. (15.3.2.6)** [Kauffman Brackets]. The **Kauffman bracket** is a function from unoriented link diagrams in  $\mathbb{S}^2$  to  $\mathbb{Z}[T][\frac{1}{T}]$  defined inductively by the following rules:

- $\langle \bigcirc \rangle = 1$ .
- $\langle D \amalg \bigcirc \rangle = -(T^{-2} + T^2) \langle D \rangle$ .
- $\langle L_+ \rangle = T \cdot \langle \rangle + T^{-1} \cdot \langle \succ \rangle$ , which means a local surgery of the crossing according to (15.3.0.6).

The Kauffman bracket of a diagram is invariant under type2,3 Reidemeister moves, but changed by type1 Reidemeister moves. ┘

**Def. (15.3.2.7)** [Writhe]. The **Writhe of a link diagram**  $w(D)$  of an oriented link diagram  $D$  is the sum of sign of crossings of  $D$  (15.3.0.6). The writhe of a diagram is invariant under type2,3-Reidemeister moves, but changed by type1 Reidemeister moves.

The writhe is invariant under change of orientations of  $D$ , so it is an invariant of un-oriented link diagrams. ┘

**Thm. (15.3.2.8)** [Jones Polynomials]. Let  $D$  be a diagram of a link  $L$ , then the expression

$$X_L(T) = (-T)^{3w(D)} \langle D \rangle \text{ (15.3.2.7)(15.3.2.6)}$$

is a link invariant (15.3.0.10) of the oriented link  $L$ . The **Jone polynomial** of  $L$  is defined to be

$$V_L(t) = X_L(t^{-1/4}) \in \mathbb{Z}[t^{1/2}, t^{-1/2}].$$

┘

*Proof:* Cf. [Lickorish]P26.

It suffices to show that this  $X_L(T)$  is invariant under Reidemeister moves, and this is easy to verify (Cf. [Ada04]). ┘

**Remark (15.3.2.9).** Rewrite the definition to fit in HOMFLY's framework. Cf. [Kau99]P677?. ┘

**Prop. (15.3.2.10).** The Jones polynomial is just

$$V_L(t) = P_L(t, -t^{-1}, t^{1/2} - t^{-1/2}) \text{ (15.3.2.1).}$$

┘

*Proof:*

□

**Prop. (15.3.2.11) [Properties of Jones Polynomials].**

- If  $K$  is a knot, then  $V_K(\omega) = 1$ .
- $V_L(1) = (-2)^{\pi_0(L)-1}$ .
- if  $K$  is a knot, then  $\frac{\partial}{\partial t} V_K(1) = 0$ .
- If  $K$  is a knot, then the Arf invariant of  $K$  is just  $\text{Arf} = (1 - V_K(i))/2$ .
- $\Delta_K(-1) \equiv 1, 5 \pmod{8}$ , according to  $\text{Arf} = 0$  or  $1$ .

┘

*Proof:* Cf. [Jones].

□

**Prop. (15.3.2.12).** If  $K$  is a knot and  $|\Delta_K(i)| > 3$ , then  $K$  cannot be represented as a closed 3-braid.

If  $K$  is a knot and  $\Delta_K(e^{2\pi i/5}) > 6.5$ , then  $K$  cannot be represented as a closed 4-braid.

┘

*Proof:* Cf. [Jones].

□

**Conj. (15.3.2.13).** If  $K$  is a non-trivial knot, then  $V_K(T) \neq 1$ .

┘

*Proof:*

□

### Arf Invariants

**Def. (15.3.2.14) [Pass Moves].** A **Pass move** on an oriented knot diagram is a local strand move by passing two strands of the opposite orientation across two strands of the opposite orientation at the same time. Notice that the orientation of  $K$  doesn't influence the definition of this pass move. Two knots are called **pass-equivalent** if they can be connected by a sequence of pass moves.

┘

**Def. (15.3.2.15) [Arf Invariants].** Any knot is pass-equivalent to either the unknot or a trefoil knot (Notice the two trefoil knots are pass-equivalent), and a trefoil knot is not pass-equivalent to the unknot.

The **Arf invariant**  $\text{Arf}(K) \in \mathbb{Z}/(2)$  of a knot  $K$  is defined to 0 if it is pass-equivalent to the unknot, and 1 otherwise.

┘

*Proof:* Cf. [Ada04]P223. ?

□

**Prop. (15.3.2.16).** On a local crossing, if  $\langle L_+ \rangle$  and  $\langle L_- \rangle$  are all knots and  $\langle \rangle \langle \rangle$  is a link with two components, then

$$\text{Arf}(\langle L_+ \rangle) = \text{Arf}(\langle L_- \rangle) + \text{lk}(\langle \rangle \langle \rangle).$$

Notice the orientation on  $\langle \rangle \langle \rangle$  doesn't matter to the parity.

┘

*Proof:* This may be done using invariant polynomials. ?

□

### 3 Chirality

**Def. (15.3.3.1) [Chirality].** A knot  $K \subset \mathbb{R}^3$  is called **chiral** if it is not equivalent to its mirror image. It is called **achiral** or **amphicheiral** otherwise. ┘

**Prop. (15.3.3.2).** Any alternating knot diagram with an odd number of crossings is chiral. ┘

*Proof:* □

### 4 Linkage

**Def. (15.3.4.1) [Linking Numbers].** For an oriented link  $L \subset \mathbb{R}^3$  with two component, let  $D$  be a link diagram of it, then the **linking number** of  $L$  is defined to be half of the sum of crossing signs (15.3.0.6) between two components of  $L$ , where ‘up’ is +1 and ‘down’ is -1. Then this number is an integer, and it is independent of the diagram chosen by checking Reidemeister moves (15.3.0.7), so it is a link invariant of  $L$ .

If  $L = K \amalg K'$ , this number is denoted by  $\text{lk}(K, K')$ . ┘

**Prop. (15.3.4.2).** Suppose  $K$  be an oriented knot in  $\mathbb{S}^3$ . Let  $N$  be a tubular nbhd of  $K$ , and  $X = \mathbb{S}^3 \setminus X$ . Then  $H_1(X)$  is isomorphic to  $\mathbb{Z}$  by Alexander duality, and it is generated by a class represented by a simply closed curve  $\mu \subset \partial N$  that bounds a disk in  $N$  meeting  $K$  at a single point. Let  $C$  be another oriented simple closed curve in  $X$ , then  $\text{lk}(C, K)$  equals  $[C] = \text{lk}(C, K) \cdot \mu \in H_1(X)$ . ┘

*Proof:* Cf. [Lickorish]P12. □

### 5 Tables of Knots

For a table of knots, Cf. [Ada04]P280.

**Prop. (15.3.5.1) [2 Crossings].** Any knot diagram with  $\leq 2$  crossings determine an unknot. ┘

*Proof:* ? The only way I can think is to enumerate. □

**Prop. (15.3.5.2).** There are no knot diagrams with exact two crossings. ┘

*Proof:* □

### 6 Quandles

**Def. (15.3.6.1) [Quandles on Sets].** For  $Q \in \text{Set}$ , a **quandle** on  $Q$  is a binary map  $*$  :  $Q \times Q \rightarrow Q$  that satisfies:

- For any  $a \in Q$ ,  $a * a = a$ .
- For any  $a, b \in Q$ , there exists a unique  $c \in Q$  s.t.  $c * b = a$ .
- For any  $a, b, c \in Q$ ,  $(a * b) * c = (a * c) * (b * c)$ .

┘

## 7 Virtual Knots and Links

References are [Kau99], [CKS02], [FJSK04] and [Man10], [Kau12].

**Def. (15.3.7.1) [Virtual Link Diagrams].** A **virtual link diagram**  $D$  is a 4-regular planer graph  $D$  with decorations on the nodes which is either  $L_+, L_-$  (15.3.0.6) or virtual crossing ( $\otimes$ ). ┘

**Def. (15.3.7.2) [Virtual Reidemeister Moves].** ┘

**Def. (15.3.7.3) [Virtual Links].** The set VL of **Virtual Links** is defined to be the set of equivalence classes of virtual link diagrams where two diagrams are called equivalent if they are connected by a finite sequence of virtual Reidemeister moves (15.3.7.2). ┘

*Proof:* Cf. [Kau99]. □

### Gauss Codes

**Def. (15.3.7.4) [Gauss Codes].** The **Gauss codes** of a virtual link is defined the same as the Gauss code of a planer link (15.3.0.26) by omitting the virtual crossings. ┘

**Prop. (15.3.7.5).** There is a bijection between VL and the Reidemeister equivalence classes of Gauss codes. ┘

*Proof:* Cf. [Kau99].? □

**Prop. (15.3.7.6) [Virtual Knots and Gauss Codes].** If  $K$  is a virtual knot whose underlying Gauss code is planar and whose sign sequence is standard?, then  $K$  is equivalent to a classical knot. ┘

*Proof:* Cf. [Kau99]P669.?  
□

### Abstract Link Diagrams

References are [K-K00].

**Def. (15.3.7.7) [Abstract Link Diagrams].** ┘

**Def. (15.3.7.8) [Abstract Moves of Abstract Link Diagrams].** ┘

**Def. (15.3.7.9) [Abstract Links].** The set AL of **abstract links** is defined to be the set of equivalence classes of abstract link diagrams, where two diagrams are called equivalent if they are connected by a finite sequence of abstract moves (15.3.7.8). ┘

**Prop. (15.3.7.10) [Virtual Links and Abstract Links].** There is a bijection of sets  $\varphi : \text{VL} \cong \text{AL}$ , called the **skimming process**. ┘

*Proof:* Cf. [K-K00].?  
□

### Stable Equivalence of Link Diagrams

**Def. (15.3.7.11) [Stable Equivalence of Links on Thickened Surfaces].** Let  $\mathcal{D}$  be the set of pairs  $(\Sigma, D)$  where  $\Sigma$  is a compact oriented surface (possibly with boundaries) and  $D$  is a link diagram on  $\Sigma$ . Two objects  $(\Sigma_1, D_1), (\Sigma_2, D_2) \in \mathcal{D}$  are said to be connected by a **stable Reidemeister move** if there exists a closed oriented surface  $\Sigma_3$  and orientation-preserving embeddings  $f_1 : \Sigma_1 \rightarrow \Sigma_3, f_2 : \Sigma_2 \rightarrow \Sigma_3$  s.t. the diagrams  $f_1(D_1)$  and  $f_2(D_2)$  are related by Reidemeister moves on  $\Sigma_3$ .

Then two objects in  $\mathcal{D}$  are called **stably equivalent diagrams** if they are connected by a finite sequence of stable Reidemeister moves.  $\lrcorner$

**Prop. (15.3.7.12) [Virtual Links and Links on Thickened Surfaces].** The natural inclusion map  $\text{AL} \hookrightarrow \mathcal{D} / \sim$  (15.3.7.11) is a bijection. In particular, by (15.3.7.10), there are bijections

$$\varphi : \text{VL} \cong \text{AL} \cong \mathcal{D} / \sim .$$

$\lrcorner$

*Proof:* This follows by taking regular nbhd of a link diagram in a surface.  $\square$

**Prop. (15.3.7.13) [Kuperberg].** Every equivalence class in  $\mathcal{D} / \sim$  has a unique irreducible representative.  $\lrcorner$

*Proof:* Cf. [Kup03].  $\square$

### Fundamental Group, Crystals, Racks and Quandles

**Prop. (15.3.7.14).** If  $K$  and  $K'$  are classical knot diagrams that are equivalent under extended virtual Reidemeister moves, then  $K$  and  $K'$  are equivalent under classical Reidemeister moves.  $\lrcorner$

*Proof:* Cf. [Kau99]P675.  $\square$

**Def. (15.3.7.15) [Jones Polynomials].** The Jones polynomial is defined the same way as that of Planer links (15.3.2.8) by omitting the virtual crossings.  $\lrcorner$

**Prop. (15.3.7.16) [Trivial Jones Polynomials].** To each non-trivial classical knot diagram  $K$  there is a corresponding non-trivial virtual knot diagram  $\text{Virt}(K)$  with trivial Jones polynomial.  $\lrcorner$

*Proof:* Cf. [Kau12]Thm6.1.  $\square$

## 8 Virtual Concordance and Slices

References are [CKS02].

## 9 Links and Graphs

**Def. (15.3.9.1) [Intrinsically Linked Graphs].** An **intrinsically linked graph** is a graph  $K$  s.t. any embedding of  $K$  in  $\mathbb{R}^3$  contains a non-trivial link.  $\lrcorner$

**Def. (15.3.9.2) [Intrinsically Knotted Graphs].** An **intrinsically knotted graph** is a graph  $K$  s.t. any embedding of  $K$  in  $\mathbb{R}^3$  contains a knotted cycle.  $\lrcorner$

**Prop. (15.3.9.3) [Conway-Gordon].** Any embedding of the graph  $K_6$  in  $\mathbb{R}^3$  contains two triangles with odd linking number. In particular,  $K_6$  is intrinsically linked.  $\lrcorner$

*Proof:* In the embedding shown as in [Ada04]P216Figure8.2, it is easy to see that sum of linking numbers between the 10 pairs of 3-cycles in  $K_6$  is odd. Then the assertion follows from (15.3.9.6).  $\square$

**Lemma (15.3.9.4).** The parity of the sum of linking numbers of all the 10 pairs of 3-cycles in  $K_6$  under any embedding is invariant under a crossing change.  $\lrcorner$

*Proof:* Clearly a crossing of an edge with itself or a crossing of two adjacent edges doesn't change the sum. And a crossing of two non-adjacent edges changes two linking number by 1, so the parity of the sum is unchanged.

For a crossing of two adjacent edges,  $\square$

**Prop. (15.3.9.5)[Conway-Gordon].** Any embedding of the graph  $K_7$  in  $\mathbb{R}^3$  contains a Hamilton cycle with non-zero Arf invariant.  $\lrcorner$

*Proof:* In the embedding shown as in [Ada04]P230Figure, all Hamilton cycles except one is unknotted, and the rest one is a trefoil, so the total sum of Arf invariants of all 360 Hamilton cycles in  $K_7$  under this embedding is 1. Then the assertion follows from (15.3.9.6).  $\square$

**Lemma (15.3.9.6).** The sum of Arf invariants of all 360 Hamilton cycles in  $K_7$  under any embedding is invariant under a crossing change.  $\lrcorner$

*Proof:* Cf. [C-G83]P448.  $\square$

**Prop. (15.3.9.7).**  $K_{5,5}$  is intrinsically knotted.  $\lrcorner$

*Proof:* Cf. [Miki Shimabara1988].  $\square$

**Prop. (15.3.9.8).** Intrinsically linked graphs are intrinsically knotted.  $\lrcorner$

*Proof:* Cf. [RST93].  $\square$

**Def. (15.3.9.9)[Peterson Graphs].** A **Peterson graph** is a graph connected to  $K_6$  through  $Y - \Delta$  transforms. There are exactly 7 Peterson graphs, Cf. [Ada04]P222.  $\lrcorner$

**Thm. (15.3.9.10)[Robertson-Seymour-Thomas].** A graph is intrinsically knotted iff it contains a Peterson graph (15.3.9.9).  $\lrcorner$

*Proof:* One direction is trivial, for the other, Cf. [RST93]  $\lrcorner$ .  $\square$

**Conj. (15.3.9.11).** Any intrinsically knotted graph contains a subgroup that is an extension (splitting of vertices) of  $K_7$  or  $K_{5,5}$ .  $\lrcorner$

*Proof:*  $\square$

## 15.4 Geometric and Combinatorial Group Theory

Cf.[Princeton Companion].

### Mednykh's Formula

**Thm. (15.4.0.1).** For  $G \in \mathcal{Ab}^{\text{fin}}$ , and  $\Sigma_g$  the oriented closed surface of genus  $g$ , then

$$\# \text{Hom}(\pi_1(\Sigma_g), G) = \#G \sum_i \left( \frac{\#G}{\dim V_i} \right)^{2g-2}.$$

┘

**Prop. (15.4.0.2).** For any oriented triangulated surface  $\Sigma$  and  $G \in \mathcal{Ab}^{\text{fin}}$ , we can associate a rational number in the following way:

1. Let  $V = \mathbb{Q}[G]$  which is a non-commutative  $\mathbb{Q}$ -algebra.
2. Let  $a = \frac{1}{\#G^2} \sum_{g,h,k \in G, ghk=1} g \otimes h \otimes k \in V^{\otimes 3}$ .
3. Let  $N \in (V^{\otimes 2})^*$  be given by  $N(g, h) = \#G \delta_{gh,1}$ .
4. Label the edges  $e_1, \dots, e_E$  and given each of them an arbitrary orientation, and faces  $f_1, \dots, f_F$  with orientation given by the orientation of  $\Sigma$ .
5. For each face  $f_i$ , let the orientation on the boundary be given by the ordered pair  $(f_i(1), f_i(2), f_i(3))$  (which subjects to a 3-cycle permutation).
6. Consider the element

$$\otimes_i a \in \otimes_i (V^{\otimes 3}),$$

and for each edge  $e_j = f_x(a) = f_y(b)$ , use the element  $N \in (V^{\otimes 2})^*$  to contract the  $(x, a)$ -th and  $(y, b)$ -th component of  $\otimes_i (V^{\otimes 3})$ . Then the image of  $\otimes_i a$  under this contraction is an element in  $\mathbb{Q}$ .

Then this element is invariant under isogenies of  $\Sigma$  and Pachner moves of the triangulations. In particular, this element only depends on  $\Sigma$ , by (4.4.11.11). ┘

*Proof:* ?

□

**Prop. (15.4.0.3).** Situation as in (15.4.0.2), the number we get is just

$$(\#G)^{\chi(G)-1} \cdot \# \text{Hom}(\pi_1(\Sigma), G).$$

┘

*Proof:* ?

□

### 1 Space Symmetry Groups

**Prop. (15.4.1.1) [Finite Group of Symmetries of Euclidean Spaces].** For any  $n \in \mathbb{Z}_+$ , any finite group  $G$  of congruences of  $\mathbb{R}^n$  fixes a point. In particular, when consider finite group of symmetries, we can assume that the origin is fixed. ┘

*Proof:* Let  $P_1, \dots, P_{\#G}$  be the images of the origin, then  $\frac{1}{N}(P_1 + \dots + P_N)$  is fixed. □

**Prop. (15.4.1.2) [Spherical Area Formula].** For any  $k \in \mathbb{Z}_{\geq 3}$  and a convex  $k$ -gon  $X = v_1 \dots v_k$  on  $\mathbb{S}^2$  with  $\angle v_{i-1}v_i v_{i+1} = A_i$ , then

$$\sum_i A_i = \text{Vol}(X) + (k-2)\pi.$$

┘

*Proof:* By dividing into triangles, it suffices to prove for  $k = 3$ . In this case, the proof is easy by drawing great lines.  $\square$

## 2D Euclidean Groups

**Def. (15.4.1.3) [Orbifold Notations, Thurston-Conway].** ?

┘

**Thm. (15.4.1.4) [Magic Theorem, Conway].** There are exactly 17 discrete rigid symmetry groups of  $\mathbb{R}^2$ .

┘

*Proof:* Cf. [C-S03]P19. ?

┘

## Finite 3D Symmetry Groups

**Prop. (15.4.1.5) [Spherical Rotation Relations].** The product of rotations about the vertices of a spherical triangle through twice the angles of that triangle, is identity.

┘

*Proof:* Let  $P, Q, R$  be the reflections along the sides of the triangle, then the rotations are exactly  $PQ, QR, RP$ . So  $(PQ)(QR)(RP) = \text{id}$ .  $\square$

**Cor. (15.4.1.6) [Rotation Groups].** The 3D symmetry group generated by rotations consists all of rotations. Such groups are called **3D rotation groups**.

┘

**Thm. (15.4.1.7) [Finite 3D Reflection Groups].** Any 3D finite reflection group  $G$  is generated by the reflections along the sides of a convex spherical polygon whose angles are of the form  $\pi/n_i$  where  $n_i \in \mathbb{Z}_{\geq 2}$ . Such a reflection group is denoted by  $*n_1 \dots n_k$ , called the **orbifold notation**.

Then every 3D finite reflection group is in one of the following classes:

- $*532 = \pm I = \pm I_{60} \cong \text{Alt}(5) \times \mathbb{Z}/(2)$ .
- $*432 = \pm O = \pm O_{24} \cong \text{Sym}(4) \times \mathbb{Z}/(2)$ .
- $*332 = \pm T = \pm T_{12} \cong \text{Alt}(4) \times \mathbb{Z}/(2)$ .
- $*22n = \pm D = \pm D_{2n} \cong D_{2n} \times \mathbb{Z}/(2)$ , where  $n \in \mathbb{Z}_+$ .
- $*nn = \pm C = \pm C_n \cong C_n \times \mathbb{Z}/(2)$ , where  $n \in \mathbb{Z}_+$ .

The first three are called **polyhedral reflection groups**, and the last two classes are called **axial reflection groups**.  $\square$

*Proof:* For the first assertion, let the plane of reflections divide the sphere into convex polygons, then any two adjacent polygons are isomorphic by a reflection. This implies that  $G$  is generated by the reflections along the sides of any one of these polygons.

If  $G$  is generated by the reflection group of a convex  $k$ -gon where  $k \in \mathbb{Z}_{\geq 2}$ , then by (15.4.1.2),  $k/2\pi > (k-2)\pi$ , which means  $k = 2$  or  $k = 3$ .

If  $k = 3$ , then  $\frac{1}{a} + \frac{1}{b} + \frac{1}{c} = 1 + \text{Vol}(X)/\pi$  has solutions  $(a, b, c) \in \{(2, 2, n), (2, 3, 3), (2, 3, 4), (2, 3, 5)\}$ . If  $k = 2$ , the convex 2-gon consists of two semicircles, and the group is isomorphic to  $*nn$ .

For the description of the groups, only the icosahedral group needs a proof. ?

┘

**Thm. (15.4.1.8) [Finite 3D Rotation Groups].** Every finite 3D rotation group is generated by two rotations, and it consists of rotations in a reflection group  $*n_1 \dots n_k$ , so it is denoted by  $n_1 \dots n_k$ .

Then every 3D finite rotation group is in one of the following classes:

- $532 = I = I_{60} \cong \text{Alt}(5)$ , called the **icosahedral group**.
- $432 = O = O_{24} \cong \text{Sym}(4)$ , called the **octahedral group**.
- $332 = T = T_{12} \cong \text{Alt}(4)$ , called the **tetrahedral group**.
- $22n = D = D_{2n} \cong D_{2n}$ , where  $n \in \mathbb{Z}_+$ , called the **dihedral groups**.
- $nn = C = C_n \cong C_n$ , where  $n \in \mathbb{N}$ , called the **cyclic groups**.

The first three are called **polyhedral rotation groups**, and the last two classes are called **axial rotation groups**. ┘

*Proof:* Firstly we prove that a symmetry group generated by two rotations is contained in a reflection group with index 2: Let  $x, y$  be the rotation centers with rotations  $\rho_x, \rho_y$ , and let  $M$  be the reflection along the plane  $\langle x, y, O \rangle$ . Then  $M$  commutes with  $\rho_x, \rho_y$ , and  $\rho_x M, \rho_y M$  are all reflections. So  $\langle M, \rho_x, \rho_y \rangle$  is a finite reflection group, which contains  $G = \langle x, y \rangle$  as a subgroup of index 2.

Now any two rotation of  $G$  generates a subgroup that is isomorphic to one of the above. So we can consider the distances between the rotation centers, to show that  $G$  is in fact generated by some two elements (Cf. [C-S03]P30). □

**Def. (15.4.1.9) [Diploid and Haploid Symmetry Groups].** A subgroup of  $O(n; \mathbb{R})$  is called a **diploid symmetry group** if it contains  $-1$ . And it is called a **haploid symmetry group** otherwise. It is called a **hybrid symmetry group** if it is haploid but not contained in  $\text{SO}(n; \mathbb{R})$ . ┘

**Prop. (15.4.1.10) [Finite 3D Hybrid Symmetry Groups].** By considering the projective image, every 3D finite hybrid symmetry group is in one of the following classes:

- $CC_{2n} = +C_n - C_{2n}, n \in \mathbb{Z}_+$ , called the **cyclo-cyclic group**.
- $CD_{2n} = +C_n - D_{2n}, n \in \mathbb{Z}_+$ , called the **cyclo-dihedral group**.
- $DD_{4n} = +D_{2n} - D_{4n}, n \in \mathbb{Z}_+$ , called the **dihedral-dihedral group**.
- $TO_{24} = +T_{12} - D_{24}$ , called the **tetra-octahedral group**. ┘

*Proof:* The point is to figure out the index-2 subgroups of  $\text{Sym}(4)$  and  $D_{2n}$ . □

**Prop. (15.4.1.11) [Tabulations].** There is a tabulate of all 3D symmetry groups of polyhedrons and their orbifold notations in [C-S03]P25. ? ┘

### 1 Local Properties

**Def.(16.1.1.1) [Smooth manifolds].** For  $n \in \mathbb{N}$ , a **smooth manifold**(resp. a **smooth manifold possibly with boundaries**) of dimension  $n$  is a topological manifold(resp. topological manifold possibly with boundaries) of dimension  $n$ (4.4.11.3) with an open covering  $\{U_\alpha\}$  together with an embedding of topological spaces  $\varphi_\alpha : U_\alpha \rightarrow \mathbb{R}^n$ (resp.  $\varphi_\alpha : U_\alpha \rightarrow H^n$ ) s.t. for any  $\alpha, \beta$ ,

$$\varphi_\beta \circ \varphi_\alpha^{-1} : \varphi_\alpha(U_\alpha \cap U_\beta) \rightarrow \varphi_\beta(U_\alpha \cap U_\beta)$$

is smooth.

A morphism of smooth manifolds  $f : (M, \{U_\alpha, \varphi_\alpha\}) \rightarrow (N, \{V_{\alpha'}, \varphi_{\alpha'}\})$  is a map of manifolds s.t. for any  $\alpha, \alpha'$ , the map

$$\varphi_{\alpha'} \circ f \circ \varphi_\alpha^{-1} : \varphi_\alpha(U_\alpha \cap f^{-1}(V_{\alpha'})) \rightarrow \varphi_{\alpha'}(U_{\alpha'})$$

is smooth.

The category of smooth manifolds possibly with boundary is denoted by  $\text{Diff}_\partial$ . The subcategory of smooth manifolds is denoted by  $\text{Diff}$ .

An isomorphism in  $\text{Diff}_\partial$  is called a **diffeomorphism**.

┘

**Remark(16.1.1.2).** There must be a more categorical way to define a manifold.

┘

**Def. (16.1.1.3) [Tangent Vectors].** For  $M \in \text{Diff}_\partial(16.1.1.1)$ , a **tangent vector** at  $p \in M$  is defined to be a linear map  $v : C^\infty(M) \rightarrow \mathbb{R}$  satisfying

$$v(fg) = f(p)v(g) + g(p)v(f).$$

The vector space of all tangent vectors of  $M$  at  $p$  is denoted by  $T_p M$ . ┘

**Def. (16.1.1.4) [Differential of Smooth Maps].** For  $F : M \rightarrow N \in \text{Diff}_\partial$  and  $p \in M$ , there is a map

$$dF_p : T_p M \rightarrow T_{F(p)} N : dF_p(v)(f) = v(f \circ F), \text{ where } v \in T_p M, f \in C^\infty(N).$$

Then:

- $dF_p : T_p M \rightarrow T_{F(p)} N$  is linear,
  - (Chain rule) Taking differentials commute with compositions of maps.
  - $d(\text{id}) = \text{id}_{T_p M}$ .
- ┘

**Prop. (16.1.1.5).** For  $M \in \text{Diff}^n$  and any  $p \in M$ ,  $\dim T_p M = n$ . ┘

**Prop. (16.1.1.6).** For  $M_1, \dots, M_k \in \text{Diff}$  and  $p = (p_1, \dots, p_k) \in M = M_1 \times \dots \times M_k$ , there is a natural isomorphism  $T_p M \cong T_{p_1}(M_1) \times \dots \times T_{p_k}(M_k)$ . ┘

**Prop. (16.1.1.7) [Collar Neighborhood Theorem].** If  $X$  is a smooth paracompact manifold with boundary, then there is a nbhd of  $\partial X$  in  $X$  which is diffeomorphic to the product  $\partial X \times [0, 1]$ . ┘

*Proof:*

□

**Prop. (16.1.1.8) [Rank Theorem].** Suppose  $r \in \mathbb{N}$ ,  $f : M \rightarrow N \in \text{Diff}$  s.t.  $\text{rank } df_p = r$  for any  $p \in M$ , then for any  $p \in M$ , there exists smooth charts centered at  $p, F(p)$  s.t. the coordinate representation of  $F$  is

$$F(x_1, \dots, x_r, x_{r+1}, \dots, x_m) \mapsto (x_1, \dots, x_r, 0, \dots, 0).$$

┘

*Proof:* Cf. [Lee13]P81. □

**Def. (16.1.1.9) [Immersion].**  $f : M \rightarrow N \in \text{Diff}$  is called a **smooth immersion** of manifolds if  $df(x) : T_x(M) \rightarrow T_{f(x)}(N)$  is injective for any  $x \in M$ .

$f$  is called a **smooth embedding** if it is both a smooth immersion and a topological embedding.

$f$  is called a **smooth submersion** if it is a smooth map that  $df(p) : T_p(M) \rightarrow T_{f(p)}(N)$  is surjective for any  $p \in M$ . ┘

**Prop. (16.1.1.10).** Suppose  $f : M \rightarrow N \in \text{Diff}$  and  $p \in M$ . If  $df_p$  is surjective, then there is a nbhd  $p \in U \subset M$  s.t.  $f : U \rightarrow N$  is a submersion. And if  $df_p$  is injective, then there is a nbhd  $p \in U \subset M$  s.t.  $f : U \rightarrow N$  is an immersion. ┘

**Def. (16.1.1.11) [Local Diffeomorphism].**  $f : M \rightarrow N \in \text{Diff}_\partial$  is called a **local diffeomorphism** if for any  $p \in M$ , there exists an open subset  $p \in U \subset M$  s.t.  $U \rightarrow f(U)$  is a diffeomorphism. ┘

**Prop. (16.1.1.12) [Inverse Function Theorem for Manifolds].** Suppose  $f : M \rightarrow N \in \text{Diff}_\partial$  and  $p \in M$  s.t.  $df_p$  is invertible, then there exist  $p \in U \subset M$  s.t.  $f : U \rightarrow f(U)$  is a diffeomorphism (16.1.1.1). ┘

In particular,  $f$  is a local diffeomorphism (16.1.1.11) iff  $df_p$  is invertible for any  $p \in M$ . ┘

*Proof:* Cf. [Lee13]P79. □

**Prop. (16.1.1.13) [Local Section Theorem].**  $\text{pr} : M \rightarrow N \in \mathcal{D}\text{iff}$  is a smooth submersion iff each point of  $M$  is in the image of a local section of  $\text{pr}$ . ┘

*Proof:* If each point of  $M$  is in the image of a local section of  $F$ , the differential is surjective at every point. Conversely, use the rank theorem (16.1.1.8). □

**Prop. (16.1.1.14).** A smooth submersion  $F : M \rightarrow N \in \mathcal{D}\text{iff}$  is an open map, and a surjective smooth submersion is a quotient map. ┘

*Proof:* Let  $W \subset M$ , and  $q = \pi(p)$  where  $p \in W$ , then there is a local section  $\sigma : U \rightarrow M$  that  $\sigma(q) = p$  (16.1.1.13), thus  $\sigma^{-1}(W)$  is open in  $N$ . But for any  $y \in \sigma^{-1}(W)$ ,  $y = \pi(\sigma(y)) \in \pi(W)$ . So  $p \in \sigma^{-1}(W) \subset \pi(U)$ , which means  $\pi(W)$  is open, and  $\pi$  is an open map.  $\dagger$  The last assertion follows as any open surjective map is a quotient map (4.4.1.10). □

**Prop. (16.1.1.15) [Characteristic Property of Surjective Smooth Submersions].** Let  $\pi : M \rightarrow N$  be a smooth submersion of manifolds,  $P$  another smooth manifold, then

- Any map  $F : N \rightarrow P$  is smooth iff  $F \circ \pi$  is smooth.
  - Any smooth map  $\tilde{F} : M \rightarrow P$  that is constant on the fibers of  $\pi$  induces a smooth map  $F : N \rightarrow P$  that  $\tilde{F} = F \circ \pi$ .
- ┘

*Proof:* 1: Use local section theorem (16.1.1.13).

2: There is a constant map  $F : N \rightarrow P$  that  $\tilde{F} = F \circ \pi$  by (16.1.1.14) and universal property of quotient maps, and it is smooth by item 1. □

**Def. (16.1.1.16) [Smooth Covering Space].** A **smooth covering space** of a smooth manifold  $X$  is a space  $\tilde{X}$  together with a smooth map  $\pi : \tilde{X} \rightarrow X$  that there is a covering  $U_\alpha$  of  $X$  that for each  $\alpha$ ,  $\pi^{-1}(U_\alpha)$  is a disjoint union of open subsets of  $\tilde{X}$ , each of which is mapped diffeomorphically onto  $U_\alpha$ . ┘

**Prop. (16.1.1.17) [Proper Free Action].** Let  $\pi : E \rightarrow M$  be a smooth covering map, then with the discrete topology,  $\text{Aut}_\pi(E)$  is a discrete Lie group acting smoothly, freely and properly on  $E$ .

Conversely, suppose  $M$  is a smooth manifold and  $\Gamma$  is discrete group acting smoothly, freely and properly on a manifold, then the quotient space  $M/\Gamma$  is a topological manifold, and it has a unique smooth structure that the quotient map  $\pi : M \rightarrow M/\Gamma$  is a smooth normal covering map. ┘

*Proof:* If  $\pi : E \rightarrow M$  is a smooth covering map, then the action is continuously, freely and properly by (4.15.1.28). Smoothness can be seen by applying (16.1.1.15).  $\text{Aut}_\pi(E)$  is a Lie group because it is countable: Let  $q \in M$ , and  $U$  an evenly covered nbhd of  $q$ , then  $\pi^{-1}(U)$  is a union of open subsets each containing one element of  $\pi^{-1}(q)$ . so  $|\pi^{-1}(q)|$  is countable, and because  $\text{Aut}_\pi(E)$  acts freely, it is also countable.

Because this action is a covering map action by (4.12.1.19), (4.15.1.31) shows this is a normal covering map. The quotient space is locally Euclidean, and also Hausdorff by (4.12.1.12)(4.12.1.10), so it is a topological manifold. The smooth structure is clear. □

**Def. (16.1.1.18) [Smooth Embedding].** A **smooth embedding** of manifolds  $f : M \rightarrow N$  is a smooth immersion that is also a homeomorphism onto its image. ┘

**Prop. (16.1.1.19) [Global Rank Theorem].** Let  $F : M \rightarrow N$  be a smooth map of manifolds of constant rank, then:

- if it is an injection, then it is a submersion.
- if it is a surjection, then it is a submersion.
- if it is a bijection, then it is a diffeomorphism.

┘

*Proof:* Cf. [Lee Smooth Manifold P83].

□

**Prop. (16.1.1.20) [Local Embedding Theorem].** If  $F : M \rightarrow N$  is a smooth morphism of manifolds, then it is a smooth immersion if it is locally a smooth embedding on the source. ┘

*Proof:* Let  $p \in M$ , then there exists a nbhd  $U_1$  of  $p \in M$  that  $F$  is injective. Now choose another precompact nbhd  $U$  of  $p$  that  $\overline{U} \subset V$ , then  $F|_{\overline{U}}$  is an injective map with compact domain, so it is a topological embedding by (4.4.2.11). Thus  $F|_U$  is a smooth embedding. □

### Submanifolds

**Def. (16.1.1.21) [Submanifolds].** For a smooth manifold  $M$ , an **embedded submanifold**  $S \subset M$  is a subset  $S$  that is a manifold in the induced topology together with a smooth structure that the inclusion is a smooth embedding of manifolds (16.1.1.18).

An **immersed submanifold**  $S \subset M$  is a subset endowed with a topology and a smooth manifold structure that the inclusion is a smooth immersion (16.1.1.9).

An **weakly embedded submanifold**  $S \subset M$  is an immersed submanifold that any smooth map  $F : N \rightarrow M$  from some space  $N$  that has image in  $S$  is smooth as a map from  $N$  to  $S$ . ┘

**Remark (16.1.1.22).** Examples of immersed submanifolds that is not an embedded submanifolds are the 8-figure and the dense curve in a torus. However, an immersed submanifold is locally embedded on the source, by (16.1.1.20). ┘

**Def. (16.1.1.23) [Slice Charts].** Let  $U \subset \mathbb{R}^n$ , then a  $k$ -slice of  $U$  is the set  $S = \{(x^1, \dots, x^n) \in U \mid x^{k+1} = \dots = x^n = 0\}$ .

Let  $M$  be a manifold, a **slice chart** of a subset  $S \subset M$  is a smooth char  $(U, \varphi)$  that  $\varphi(U \cap S)$  is a  $k$ -slice of  $\varphi(U)$  for some  $k$ . ┘

**Prop. (16.1.1.24) [Local Slice Criterion for Embedded Submanifolds].** Let  $S \in \text{Diff}_0^k$  be an embedded submanifold of  $M$ , then each point of  $S$  is contained in the domain of a slice chart (16.1.1.23). Conversely, if  $S \subset M$  is a subset that each point of  $S$  is contained in the domain of a slice chart, then the induced topology makes  $S$  a topological manifold, and there is a smooth structure on  $S$  that makes it an embedded submanifold of  $M$ . ┘

*Proof:* Suppose  $S$  is an embedded submanifold, then the rank theorem (16.1.1.8) shows there exists coordinates that the image of  $i(S)$  is contained in a  $k$ -slice of  $M$ . Shrinking the open subset a little bit, we get a slice chart of  $S$ .

Conversely, if each point of  $S$  is contained in the domain of a slice chart, then we can use these smooth charts to get an atlas for  $S$ , which makes  $S$  an embedded topological submanifold of  $M$ . The transition maps are also smooth because they are restrictions of the corresponding transition map of  $M$ , so  $S$  is an embedded submanifold of  $M$ . □

**Cor. (16.1.1.25)[Boundary Submanifolds].** Suppose  $\partial M \neq \emptyset$ , then  $\partial M$  is an embedded submanifold of  $M$  of codimension 1.  $\lrcorner$

**Prop. (16.1.1.26).** If  $M$  is a compact manifold, then any injective immersion  $f : M \hookrightarrow M$  is an embedding of submanifolds.  $\lrcorner$

*Proof:* The topology of  $M$  is equivalent to the induced topology by (4.4.2.10).  $\square$

**Prop. (16.1.1.27) [Immersed Submanifolds are Locally Embedded].** If  $S \subset M$  is an immersed submanifold, then for any  $p \in S$ , there is a nbhd  $U$  of  $p \in S$  that  $U \subset M$  is an embedded submanifold.  $\lrcorner$

*Proof:* This follows immediately from (16.1.1.20). Notice that the topology on  $U$  must be the induced topology, because it is a smooth embedding thus a homeomorphism onto its image (16.1.1.18).  $\square$

**Lemma (16.1.1.28).** If  $i : S \hookrightarrow M$  is an immersed submanifold, if  $F : N \rightarrow M$  is a smooth morphism of manifolds that has image in  $S$ , if  $F : N \rightarrow S$  is continuous, then  $N \rightarrow S$  is smooth.  $\lrcorner$

*Proof:* Let  $p \in N$  mapping to  $q = F(p)$ . By (16.1.1.27), there is a nbhd  $V$  of  $q \in S$  that  $i|_V$  is an smooth embedding. Thus there is a slice chart (16.1.1.24)  $(W, \psi)$  of  $M$  that  $(V_0, \tilde{\psi})$  is a smooth chart for  $V$ , where  $V_0 = W \cap V$  and  $\tilde{\psi} = \pi \circ \psi$ , where  $\pi$  is the projection  $\mathbb{R}^n \rightarrow \mathbb{R}^k$  onto the first  $k$  coordinates, and also a smooth chart for  $S$ .

Let  $U = F^{-1}(V_0)$  be open in  $F$ , then there is a smooth chart of  $N$  contained in  $U$ . Now the coordinate representation of  $F$  in the slice chart of  $S$  is just the representation of  $F : N \rightarrow M$  composed with the projection  $\pi$ , so it is smooth.  $\square$

**Remark (16.1.1.29).**  $N \rightarrow S$  being continuous is a necessary condition, otherwise consider the figure 8.  $\lrcorner$

**Prop. (16.1.1.30) [Restricting Codomain of Smooth Morphism].** If  $S \subset M$  is an embedded submanifold and  $N \rightarrow M$  is a smooth that has image contained in  $S$ , then  $N \rightarrow S$  is smooth.  $\lrcorner$

*Proof:* Because in this case,  $S$  has the induced topology, so it is easily seen that  $N \rightarrow S$  is continuous. Then the assertion follows from (16.1.1.28).  $\square$

**Prop. (16.1.1.31) [Generalized Inverse Function Theorem].** Suppose  $f : M \rightarrow N \in \mathcal{D}\text{iff}_\partial$  and  $X \subset M$  is an embedded submanifold s.t.  $df_x$  is invertible for any  $x \in X$  and  $f$  maps  $X$  diffeomorphically onto  $f(X)$  (16.1.1.1), then there exists a nbhd  $U$  of  $X$  in  $M$  s.t.  $f : U \rightarrow f(U)$  is a diffeomorphism.

In particular,  $f$  is a local diffeomorphism (16.1.1.11) iff  $df_p$  is invertible for any  $p \in M$ .  $\lrcorner$

*Proof:* Take a local inverse on a nbhd of every  $x \in X$  using (16.1.1.12), then take a locally finite subcovering and glue them together.  $\square$

### Sard's Theorem

**Def. (16.1.1.32) [Measure-Zero Sets in Manifolds].** For  $(M, \{\varphi_\alpha\}) \in \mathcal{D}\text{iff}_\alpha$ , a subset  $A \subset M$  is called a **measure zero set** if for  $\varphi_\alpha(U_\alpha \cap A) \subset \mathbb{R}^{n_\alpha}$  has measure zero.  $\lrcorner$

**Lemma (16.1.1.33) [Invariance of Measure-Zero Sets].** If  $m, n \in \mathbb{Z}_+$  and  $S \subset \mathbb{R}^n$  has measure zero, then for any smooth map  $g : \mathbb{R}^n \rightarrow \mathbb{R}^m$ ,  $g(S)$  also has measure zero.  $\lrcorner$

**Lemma (16.1.1.34).** Cf. [Lee13]P127. ┘

**Prop. (16.1.1.35) [Measure Zero Sets].** For  $M \in \text{Diff}_\alpha$ ,

- A subset of a measure-zero set is a measure-zero set.
- A countable union of measure-zero sets is a measure-zero set.
- A measure-zero set is nowhere-dense in  $M$ .
- If  $f : M \rightarrow N \in \text{Diff}_\partial$  and  $A \subset M$  is a measure-zero set, then  $f(A) \subset N$  is also a measure-zero set, by (16.1.1.33). ┘

**Def. (16.1.1.36) [Regular Values and Critical Values].** For  $f : X \rightarrow Y \in \text{Diff}$ , a point  $x \in X$  is called a **critical point** iff  $df_x$  is not surjective, otherwise it is called a **regular point**.  $y \in Y$  is called a **critical value** if  $f^{-1}(y)$  contains a critical point, otherwise it is called a **regular value**. ┘

**Thm. (16.1.1.37) [Regular Level Set Theorem].** If  $y \in N$  is a regular value for a map  $f : M \rightarrow N \in \text{Diff}(16.1.1.36)$ , then  $f^{-1}(y) \subset M$  has a natural closed embedded submanifold structure of codimension  $\dim N$ . ┘

*Proof:* The set  $U$  of points  $p \in M$  s.t.  $\text{rank } df_p = n$  is open in  $M$  by (16.1.1.10), so  $f : U \rightarrow N$  is submersion. Then we can use rank theorem (16.1.1.8) on  $U$  and slice-chart criterion to show that  $f^{-1}(y)$  is a closed embedded submanifold of  $U$ . Thus it is also a closed embedded submanifold of  $M$ . □

**Remark (16.1.1.38).** This theorem is useful in proving some subset is a smooth manifold. ┘

**Prop. (16.1.1.39) [Stack of Records Theorem].** If  $y$  is regular value of a map  $f : X \rightarrow Y$ , where  $X$  is compact and  $\dim X = \dim Y$ , then  $f$  is a covering map locally on  $f^{-1}(U)$  for some nbhd  $U$  of  $y$ . ┘

*Proof:* □

**Thm. (16.1.1.40) [Sard Theorem].** For  $f : M \rightarrow N \in \text{Diff}_\partial$ , the set of critical values in  $N$  is a measure-zero set. In particular, the regular points are dense in  $N$  (16.1.1.35). ┘

*Proof:* Cf. [Lee13]P131. □

**Cor. (16.1.1.41).** ┘

### Whitney Theorems

**Def. (16.1.1.42) [Tubular Neighborhoods].** For an embedded submanifold  $M \subset \mathbb{R}^n$ , a **tubular neighbourhood** of  $M$  is a nbhd  $U$  of  $M \subset \mathbb{R}^n$  that is the diffeomorphic image of an open subset  $V \subset NM$  of the form

$$V = \{(x, v) \in NM : |v| < \delta(x)\}$$

where  $\delta : M \rightarrow \mathbb{R}_+$  is some continuous function. ┘

**Prop. (16.1.1.43) [TM and  $N(\Delta_M, M \times M)$ ].** For any embedded submanifold  $M \subset \mathbb{R}^n$ , there is an isomorphism  $TM \cong N(\Delta_M, M \times M)$  define by sending  $(x, v)$  to  $((x, x), (-v, v))$ . ┘

**Thm. (16.1.1.44) [Tubular Neighbourhood Theorem].** Every embedded submanifold  $M \subset \mathbb{R}^n$  admits a tubular nbhd (16.1.1.42). ┘

*Proof:* Cf.[Lee13]P139.?

□

**Cor.(16.1.1.45)[Tubular Neighbourhood of Submanifolds].** For any embedded submanifold  $M \subset \mathbb{R}^n$  and an embedded submanifold  $N \subset M$ , there is a nbhd  $U$  of  $N \subset M$  that is a diffeomorphic image of an open subset  $V \subset N_M(N)$ . ┘

*Proof:* Take a tubular nbhd  $Y_\varepsilon$  of  $M \subset \mathbb{R}^n$ , and define  $h : N_M(N) \rightarrow \mathbb{R}^n : (z, v) \mapsto z + v$ . Let  $W = h^{-1}(Y_\varepsilon)$ , then  $W \rightarrow Y_\varepsilon \rightarrow Y$  is the identity on  $Z$ . Then we can use(16.1.1.31). □

**Prop.(16.1.1.46)[A Neighbourhood of  $M$  in  $TM$ ].** For any  $M \in \text{Diff}_\partial$ , there is a diffeomorphism of a nbhd of  $M \subset TM$  with a nbhd of  $\Delta_M \subset M \times M$ , extending the diffeomorphism  $\Delta_M : M \cong \Delta_M$ . And when  $M$  is oriented, this diffeomorphism preserves the orientation given by

$$(x^1, \dots, x^n, \frac{\partial}{\partial x_1}, \dots, \frac{\partial}{\partial x^n}), \quad (x^1, \dots, x^n, x^1, \dots, x^n)$$

resp. ┘

*Proof:* By Whitney embedding(16.1.1.47), we may assume that  $M \subset \mathbb{R}^{2 \dim M + 1}$ . Then the assertion follows from the tubular nbhd theorem(16.1.1.44) and(16.1.1.43). □

**Thm.(16.1.1.47)[Whitney Embedding Theorem].** Any  $M \in \text{Diff}_\partial$  can be embedded as a closed embedded submanifold of  $\mathbb{R}^{2 \dim M + 1}$ . ┘

*Proof:* Cf.[Pollack P51]. □

**Cor.(16.1.1.48)[Whitney Immersion Theorem].** Any  $M \in \text{Diff}_\partial$  admits a smooth immersion into  $\mathbb{R}^{2 \dim M}$ . ┘

*Proof:* □

### Transversality

**Def.(16.1.1.49)[Transversality].** Let  $Z \subset Y \in \text{Diff}$  be an embedded submanifold, then  $f : X \rightarrow Y \in \text{Diff}_\partial$  is said to be **transversal** to  $Z$  if for any  $x \in f^{-1}(Z)$ , we have  $\text{Im}(df_x) + T_{f(x)}(Z) = T_{f(x)}(Y)$ . We use  $f \bar{\cap} Z$  to denote that  $f$  is transversal to  $Z$ .

More generally, if  $X, Z, Y \in \text{Diff}_\partial$  and  $Z$  is compact,  $f : X \rightarrow Y, g : Z \rightarrow Y \in \text{Diff}_\partial$  are said to be **transversal** if for any  $x \in X$  and  $z \in Z$  s.t.  $f(x) = g(z)$ , we have  $\text{Im}(df_x) + \text{Im}(dg_z) = T_{f(x)}(Y)$ . We use  $f \bar{\cap} g$  to denote that  $f$  is transversal to  $g$ . ┘

**Prop.(16.1.1.50)[Transversal Stable under Perturbations].** The property of transversality for a map  $f : X \rightarrow Y$  for a compact manifold  $X$  to a fixed submanifold  $Z \subset Y$  is stable under smooth deformation. ┘

*Proof:* We can assume the submanifold is defined by a slice, so the transversality is in fact equivalent to locally submersion in the vertical direction. Thus it is clearly stable under deformation. □

**Prop.(16.1.1.51)[Transversal Preimage are Submanifolds].** If  $Z \subset Y \in \text{Diff}$  and  $f : X \rightarrow Y \in \text{Diff}_\partial$  s.t.  $f \bar{\cap} Z, \partial f \bar{\cap} Z$ , then the preimage  $f^{-1}(Z) \subset X$  is an embedded submanifolds possibly with boundaries of codimension  $\text{codim}_Y(Z)$  in  $X$ . ┘

*Proof:* For any  $x \in f^{-1}(Z)$  with  $f(x) = z$ , we can choose a slice chart around  $z \in Z$  (16.1.1.23) by (16.1.1.24) s.t.

$$Z = \{(x^1, \dots, x^n) | x^{k+1} = \dots = x^n = 0\} \subset Y.$$

So the transversal hypothesis (16.1.1.49) exactly means that the origin is a regular value for  $f$  composed with the local projection  $\text{pr}_{(x^{k+1}, \dots, x^n)}$ . Thus  $f^{-1}(Z) = (\text{pr}_{(x^{k+1}, \dots, x^n)} \circ f)^{-1}(0)$  is an embedded submanifold of codimension  $\text{codim}_Y(Z)$  in  $X$  by (16.1.1.37).

If  $\partial X \neq \emptyset$ , Cf.[Pollack]P60. ?

□

**Cor. (16.1.1.52) [Transversal Intersection are Submanifolds].** If  $Z \subset Y \in \text{Diff}$  is an embedded submanifold and  $X \subset Y$  is a submanifolds s.t.  $X \bar{\cap} Z$ , then  $X \cap Z$  is an embedded submanifold of  $X$ , and  $\text{codim}_X(X \cap Z) = \text{codim}_Y(Z)$ . ┘

**Prop. (16.1.1.53) [Parametric Transversality Theorem].** Suppose  $N$  and  $M$  are smooth manifolds,  $X \subset M$  is an embedded submanifold, and  $F_s$  is a smooth family of maps from  $N$  to  $M$ . If the map  $F : N \times S \rightarrow M$  is transverse to  $X$ , then for a.e.  $s$ , the map  $F_s : N \rightarrow M$  is transverse to  $X$ . ┘

*Proof:* Cf.[Smooth Manifold Lee T6.35].

□

**Thm. (16.1.1.54) [Transversality Homotopy Theorem].** Suppose  $M, N \in \text{Diff}$  and  $X \subset M$  is an embedded submanifold, then every  $f : N \rightarrow M \in \text{Diff}$  is homotopic to a smooth map  $g : N \rightarrow M$  that is transverse to  $X$ . ┘

*Proof:* Embed  $M$  into an  $R^k$  and take a tubular neighbourhood, then we can construct a  $N \times D^k$  transversal to  $M$ . Cf.[Smooth Manifold Lee T6.36]. ?

□

**Prop. (16.1.1.55) [Transversality Extension Theorem].** Suppose  $X \in \text{Diff}_\partial, Y \in \text{Diff}$  and  $C \in \text{Diff}_\partial$  is a closed submanifold of  $X$ ,  $Z \in \text{Diff}$  is a closed submanifold of  $Y$ . Let  $f : X \rightarrow Y \in \text{Diff}_\partial$  s.t.  $f|_C \bar{\cap} Z$  and  $\partial f|_{C \cap \partial X} \bar{\cap} Z$ , then there exists  $g : X \rightarrow Y \in \text{Diff}_\partial$  that is smoothly homotopic to  $f$ , and  $g = f$  on a nbhd of  $C$  s.t.  $g \bar{\cap} Z$  and  $\partial g \bar{\cap} Z$ . ┘

*Proof:* Cf.[Pollack P72]. ?

□

## 2 Smooth Vector Bundles

**Def. (16.1.2.1) [Smooth Vector Bundle].** A smooth vector bundle over a  $M$  is a vector bundle over  $M$  with an atlas of smooth trivialization maps. ┘

**Def. (16.1.2.2) [Smooth Fiber Bundle].** ┘

### Tangent and Cotangent Bundles

**Lemma (16.1.2.3) [Differential in Coordinates].** Let  $F : U \rightarrow V$  be a smooth map where  $U \subset \mathbb{R}^n$  and  $V \subset \mathbb{R}^n$ , with corresponding coordinates  $(x^i)$  and  $(y^i)$ , then

$$dF_p\left(\frac{\partial}{\partial x^i}\right)_p = \sum_j \frac{\partial F^j}{\partial x^i}(p) \frac{\partial}{\partial y^j} \Big|_{F(p)}.$$

┘

*Proof:* for any smooth function  $f$ ,

$$dF_p\left(\frac{\partial}{\partial x^i}\bigg|_p\right)(f) = \frac{\partial}{\partial x^i}\bigg|_p(f \circ F) = \sum \frac{\partial f}{\partial y^j}(F(p)) \frac{\partial F^j}{\partial x^i}(p) = \left(\sum_j \frac{\partial F^j}{\partial x^i}(p) \frac{\partial}{\partial y^j}\bigg|_{F(p)}\right)(f).$$

□

**Lemma (16.1.2.4)[Change of Coordinates].** Suppose  $(U, \varphi), (V, \psi)$  be two smooth charts of a smooth manifold, and the transition function on  $U \cap V$  is denoted by

$$\psi \circ \varphi^{-1}(x) = (\tilde{x}^1(x), \dots, \tilde{x}^n(x)),$$

then (16.1.2.3) shows

$$\begin{aligned} \frac{\partial}{\partial x^i}\bigg|_p &= d(\varphi^{-1})_{\varphi(p)}\left(\frac{\partial}{\partial x^i}\bigg|_{\varphi(p)}\right) = d(\psi^{-1})_{\psi(p)} \cdot d(\psi \cdot \varphi^{-1})_{\varphi(p)}\left(\frac{\partial}{\partial x^i}\bigg|_{\varphi(p)}\right) \\ &= d(\psi^{-1})_{\psi(p)} \left( \sum_j \frac{\partial \tilde{x}^j}{\partial x^i}(\varphi(p)) \frac{\partial}{\partial \tilde{x}^j}\bigg|_{\psi(p)} \right) = \sum_j \frac{\partial \tilde{x}^j}{\partial x^i}(\varphi(p)) \frac{\partial}{\partial \tilde{x}^j}\bigg|_p \end{aligned}$$

┘

**Def. (16.1.2.5)[Tangent Vectors].** Let  $M$  be a smooth manifold, then a **tangent vector** at a point  $p$  is a linear map  $v : C^\infty(M) \rightarrow \mathbb{R}$  satisfying:

$$v(fg) = f(p)v(g) + g(p)v(f).$$

The set of tangent vectors at  $p$  is a vector space, denoted by  $T_p M$ .

┘

**Def. (16.1.2.6)[Tangent Bundle].** Let  $n = \dim M$ , the tangent bundle of  $M$  is defined to be the set  $TM = \coprod T_p M$ . It has a smooth manifold structure that makes it into a  $2n$ -dimensional manifold, and the projection  $\pi : TM \rightarrow M$  is smooth. And it is a  $n$ -dimensional vector bundle over  $M$ .

┘

*Proof:* Let  $(U, \varphi)$  be a smooth chart of  $M$ , with coordinate functions  $\varphi^1, \dots, \varphi^n$ , then we define a map  $\tilde{\varphi} : \pi^{-1}(U) \rightarrow \mathbb{R}^{2n}$  by

$$\tilde{\varphi}\left(\sum v^i \frac{\partial}{\partial x^i}\bigg|_p\right) = (x^1(p), \dots, x^n(p), v^1, \dots, v^n).$$

Then for two different open subset  $U, V$ , the transition map is

$$\tilde{\psi} \cdot \tilde{\varphi}^{-1}(x^1, \dots, x^n, v^1, \dots, v^n) = (\tilde{x}^1(x), \dots, \tilde{x}^n(x), \sum_j \frac{\partial \tilde{x}^1}{\partial x^j}(x)v^j, \dots, \sum_j \frac{\partial \tilde{x}^n}{\partial x^j}(x)v^j)$$

which is clearly smooth. So this defines a smooth vector bundle over  $M$ , called the **tangent bundle** of  $M$ .

□

**Def. (16.1.2.7)[Cotangent Bundle].** The **cotangent bundle**  $T^*M$  of a smooth manifold  $M$  is the dual of the tangent bundle  $TM$ .

┘

**Def. (16.1.2.8)[Parallelizable manifold].**  $M$  is called **parallelizable** iff  $TM$  is trivial.

┘

### Vector Fields

**Def. (16.1.2.9) [Smooth Vector Field].** A **smooth vector field** on  $M$  is a smooth global section of the tangent bundle  $TM \rightarrow M$  (16.1.2.6). The space of smooth vector fields on  $M$  is denoted by  $\mathfrak{X}(M)$ .  $\lrcorner$

**Prop. (16.1.2.10) [Check Smoothness].** Let  $X$  be a section of the vector bundle  $TM \rightarrow M$ , then  $X$  is a smooth vector field iff  $Xf \in C^\infty(M)$  for any  $f \in C^\infty(M)$ .  $\lrcorner$

*Proof:* If for any  $f \in C^\infty(M)$ ,  $Xf \in C^\infty(M)$ , let  $U$  be a trivializing nbhd of  $M$  with coordinate functions  $x^i$ , then near any point  $p \in U$ , we can use bump function to extend  $x^i$  to a smooth function on  $M$ . Then  $X(x^i) = X^i$  near  $p$ , thus the coordinates of  $X$  in this trivialization are all smooth, so  $X$  is smooth near  $p$ , thus smooth everywhere.

Conversely, for any  $f \in C^\infty(M)$ , in a trivializing nbhd  $U$  of  $M$ ,  $Xf(x) = (\sum X^i(x) \frac{\partial}{\partial x^i} |_x)(f) = \sum X^i(x) \frac{\partial f}{\partial x^i}(x)$  is smooth.  $\square$

**Def. (16.1.2.11) [Coordinate Vector Fields].** For any smooth chart  $(U, (x^i))$  of  $M$  and  $i \in [\dim M]_+$ , the map

$$p \mapsto \frac{\partial}{\partial x^i} |_p, \text{ where } p \in U$$

defines a smooth vector field on  $U$  by (16.1.2.10), called the  $i$ -th **coordinate vector field**, denoted by  $\frac{\partial}{\partial x^i}$ .  $\lrcorner$

**Def. (16.1.2.12) [Smooth Frames].** An ordered  $k$ -tuple of vector fields defined on a subset  $A \subset M$  is called **linearly independent** if  $(X_{1,p}, \dots, X_{k,p})$  is a linearly independent  $k$ -tuple in  $T_p M$ .

An ordered  $k$ -tuple of vector fields defined on an open subset  $U \subset M$  is called a **smooth local frame** if  $(X_{1,p}, \dots, X_{k,p})$  is linearly independent and spans  $T_p M$  for each  $p \in U$ . It is called a **smooth global frame** if  $U = M$ .

$M$  is called **smoothly parallelizable** if it admits a smooth global frame.  $\lrcorner$

**Prop. (16.1.2.13) [Vector Fields Simplification].** For every vector field  $X$  and every point  $X(p) \neq 0$ , there exists a coordinate nbhd  $(x_1, \dots, x_{n-1}, t)$  such that  $X = \frac{\partial}{\partial t}$ .  $\lrcorner$

*Proof:* ?  $\square$

**Def. (16.1.2.14) [Pushforward of Vector Fields].** Let  $F : M \rightarrow N \in \text{Diff}$  is a diffeomorphism, then for any  $X \in \mathfrak{X}(M)$ , there exists a  $Y \in \mathfrak{X}(N)$  that  $dF_p(X_p) = Y_{F(p)}$ .  $\lrcorner$

*Proof:* We just define  $Y_q = dF_{F^{-1}(q)}(X_{F^{-1}(q)})$ , it suffices to show this a smooth vector field. But  $Y : N \rightarrow TN$  is the composition

$$N \xrightarrow{F^{-1}} M \xrightarrow{X} TM \xrightarrow{TF} TN,$$

so it is smooth.  $\square$

**Def. (16.1.2.15) [Lie Brackets].** The **Lie bracket** of two vector fields  $X, Y \in \mathfrak{X}(M)$  is defined to be the vector field  $[X, Y] \in \mathfrak{X}(M)$  s.t.  $[X, Y](f) = (XY - YX)f$  for any  $f \in C^\infty(M)$ .

If  $X = \sum a_i \frac{\partial}{\partial x_i}$ ,  $Y = \sum b_i \frac{\partial}{\partial x_i}$ , then  $[X, Y] = \sum (X(b_i) - Y(a_i)) \frac{\partial}{\partial x_i}$ .  $\lrcorner$

*Proof:* ?  $\square$

**Prop. (16.1.2.16)[Jacobi Identity].**  $\mathfrak{X}(M)$  is a Lie algebra w.r.t. Lie Bracket defined in (16.1.2.15).  $\lrcorner$

*Proof:* Direct verification by the definition (16.1.2.15).  $\square$

**Prop. (16.1.2.17).**  $[fu, v] = f[u, v] - df(u)v$ .  $\lrcorner$

*Proof:* Direct from the definition (16.1.2.15).  $\square$

**Prop. (16.1.2.18)[Pushforward of Lie Bracket].** Let  $F : M \rightarrow N$  be a diffeomorphism and  $X_1, X_2 \in \mathfrak{X}(M)$ , then  $F_*[X_1, X_2] = [F_*X_1, F_*X_2]$  (16.1.2.14).  $\lrcorner$

*Proof:* For any  $f \in C^\infty(N)$ ,  $F_*X_i = Y_i$ , then

$$[X_1, X_2](f \circ F) = X_1X_2(f \circ F) - X_2X_1(f \circ F) = X_1(Y_2(f) \circ F) - X_2(Y_1(f) \circ F) = (Y_1Y_2(f) - Y_2Y_1(f)) \circ F,$$

which means exactly  $F_*[X_1, X_2] = [Y_1, Y_2]$ .  $\square$

### Tensor Fields

**Def. (16.1.2.19)[Lie Derivatives of Tensor Fields].** Cf. [Lee13]P321.  $\lrcorner$

## 3 Differential Forms

**Prop. (16.1.3.1)[Frobenius Theorem].** If  $X$  is an involutive distribution on  $M$ , then there is a unique maximal integration manifold passing through it. Where a distribution is involutive if it is closed under Lie bracket.  $\lrcorner$

*Proof:* The key to the proof is to prove that involutive is equivalent to integrable, i.e. flat locally as  $\{\frac{\partial}{\partial x_i}\}$  for some local coordinate. Cf. [李群讲义 项武义 P226]  $\square$

**Cor. (16.1.3.2).**  $X, Y \in \text{Lie}(M)$  commute iff their corresponding vector fields commute.  $\lrcorner$

### Interior and Exterior Derivatives

#### Lie Derivatives

**Prop. (16.1.3.3).**  $[X, Y] = \frac{\partial}{\partial t}(d(\varphi_{-t})Y)|_{t=0}$ , where  $\varphi$  is the flow of  $X$ .  $\lrcorner$

*Proof:* For any function  $f$ , set  $g(t, q) = \frac{f(\phi_t(q)) - f(q)}{t}$ ,  $g(0, q) = Xf(q)$ . Then  $g$  is differentiable (because  $g(t, q) = \int_0^1 Xf(\phi_{ts}(p))ds$ , and:

$$\begin{aligned} \lim_{t \rightarrow 0} d(\phi_{-t})Yf(p) &= \lim_{t \rightarrow 0} \frac{Yf(p) - Y(f\phi_{-t})(\phi_t(p))}{t} \\ &= \lim_{t \rightarrow 0} \frac{Yf(p) - Yf(\phi_t p) - Y(tg(-t, \phi_t(p)))}{t} \\ &= ((XY - YX)f)(p) \\ &= [X, Y]f(p) \end{aligned}$$

$\square$

**Prop. (16.1.3.4) [Derivative formula].**

$$d\omega(X, Y) = X\omega(Y) - Y\omega(X) - \omega([X, Y]).$$

┘

*Proof:*

□

**Prop. (16.1.3.5) [Cartan's magic formula].**

$$L_X\omega = \iota_X(d\omega) + d(\iota_X\omega)$$

$$\iota([X, Y]) = [L_X, \iota_Y]$$

┘

*Proof:* Notice that four of them are derivatives (check because  $\iota_X(w \wedge v) = \iota_X w \wedge v + (-1)^{|w|} w \wedge \iota_X v$ ). So by induction, we only has to verify them on dimension 0 and 1. □

**Prop. (16.1.3.6) [Stoke's theorem].**

$$\oint_{\Omega} d\omega = \oint_{\partial\Omega} i^* \omega.$$

In a 3-dimensional Riemannian manifold, If we set:

$$df = \omega^1_{\text{grad} f}, \quad d\omega^1_A = \omega^2_{\text{curl} A}, \quad d\omega^2_A = (\nabla A)\omega^3,$$

Then:

$$f(y) - f(x) = \int_l \text{grad} f \cdot dl.$$

$$\int_l A \cdot dl = \oint_S \text{curl} A \cdot dn.$$

$$\oint_U \nabla \cdot F dV = \oint_{\partial U} F \cdot ndS.$$

┘

*Proof:*

□

### Hodge Star

**Def. (16.1.3.7) [Hodge Star Operator].** given a volume-form  $\omega$  on a vector space, the Hodge star operator  $*$  is an operator from  $\bigwedge^k V \rightarrow \bigwedge^{n-k} V$  such that:

$$\alpha \wedge (*\beta) = \langle \alpha, \beta \rangle \omega.$$

On a closed oriented Riemannian manifold, given a volume form  $\omega$ , the star operator satisfies:

$$(\alpha, \beta) = \int_M \langle \alpha, \beta \rangle \omega = \int_M \alpha \wedge *\beta.$$

And  $** = (-1)^{p(n-p)}$  on  $\Omega^p M$ . ┘

**Def. (16.1.3.8).** For a operator  $d$  on  $\Omega^* M$ , we define the adjoint  $d^* = (-1)^{n(p+1)+1} * d *$  on  $\Omega^p$ , which satisfies the adjoint property by calculation:

$$(d^* \alpha, \beta) = (\alpha, d\beta).$$

The laplacian  $\Delta = d^* d + d d^*$ . It can be verified that  $\Delta$  commutes with  $*$  and  $d$ . ┘

### Orientations

**Def. (16.1.3.9) [Continuous Orientations].** A **continuous orientation** on  $M$  is a choice of orientation on  $T_p M$  for each  $p \in M$  s.t. for each  $p \in M$ , there exists a nbhd  $U \subset M$  and a local frame  $(E^1, \dots, E^n)$  on  $U$  s.t. for each  $p \in U$ , the orientation on  $T_p M$  is induced from the ordered tuple  $(E_{1,p}, \dots, E_{n,p})$ .

$M$  is called an **orientable smooth manifold** if it admits a continuous orientation, and called a **non-orientable smooth manifold** if not. A **oriented smooth manifold** is an orientable smooth manifold together with an orientation on it.  $\lrcorner$

**Prop. (16.1.3.10) [Orientation Forms].** For  $M \in \text{Diff}_\partial^n$ , a continuous orientation on  $M$  determines and is determined by a non-vanishing  $n$ -form on  $M$ .

In particular, any parallelizable smooth manifold is orientable.  $\lrcorner$

*Proof:* Cf. [Lee13]P381.  $\square$

**Cor. (16.1.3.11).** If  $M$  is connected and oriented, then it has exactly two orientations. If two orientations on  $M$  agree on one point, then they are equal.  $\lrcorner$

**Def. (16.1.3.12) [Orientation-Preserving Maps].** A local diffeomorphism (16.1.1.11)  $f : M \rightarrow N \in \text{Diff}_\partial$  is called **orientation preserving** if for any  $p \in M$ ,  $df_p$  takes oriented bases of  $T_p M$  to oriented bases of  $T_{f(p)} N$ . And it is called **orientation-reversing** if for any  $p \in M$ ,  $df_p$  takes oriented bases of  $T_p M$  to negatively-oriented bases of  $T_{f(p)} N$ .  $\lrcorner$

**Prop. (16.1.3.13) [Orientation of Hypersurfaces].** Suppose  $M \in \text{Diff}_\partial^n$  is oriented,  $S \subset M \in \text{Diff}_\partial$  is an immersed hypersurface, and  $n$  is a vector field along  $S$  that is nowhere tangent to  $S$ , then there is a unique orientation on  $S$  s.t. for each  $p \in S$ ,  $(E^1, \dots, E^{n-1})$  is an oriented basis for  $T_p S$  iff  $(n, E^1, \dots, E^{n-1})$  is an oriented basis for  $T_p M$ . And if  $\omega$  is an orientation form for  $M$ , then  $\iota_S^*(N \lrcorner \omega)$  is an orientation form for the induced orientation on  $S$ .  $\lrcorner$

*Proof:* Cf. [Lee13]P385.  $\square$

**Cor. (16.1.3.14) [Boundary Orientations].** Suppose  $\partial M \neq \emptyset$ , then  $\partial M \subset M$  is an embedded hypersurface by (16.1.1.25), thus orientable by (16.1.3.13), with the induced orientation defined by any outward-pointing vector fields along  $\partial M$ , called the **induced orientation** on  $\partial M$ .  $\lrcorner$

*Proof:* Cf. [Lee13]P386.  $\square$

**Prop. (16.1.3.15).** If  $M \in \text{Diff}$  is oriented, then as oriented manifolds, we have

$$\partial(I \times M) = M \times \{1\} - M \times \{0\}.$$

$\lrcorner$

References are [Mil97].

### Intersection Numbers Modulo 2

**Def. (16.1.4.1) [Intersection Numbers Modulo 2].** Suppose  $X, Y \in \mathcal{D}\text{iff}$ ,  $X$  compact and  $Z \subset Y$  a closed submanifold s.t.  $\dim X + \dim Z = \dim Y$ . For any  $f : X \rightarrow Y \in \mathcal{D}\text{iff}$  s.t.  $f \bar{\cap} Z$ , define  $I_2(f, Z)$  as the number of points of  $f^{-1}(Z)$  modulo 2, called the **intersection number modulo 2** of  $f$  and  $Z$ .  $\lrcorner$

**Lemma (16.1.4.2) [Boundary Theorem].** Situation as in (16.1.4.10), if  $X = \partial W$  for some  $W \in \mathcal{D}\text{iff}_\partial$  compact and  $f : X \rightarrow Y \in \mathcal{D}\text{iff}$  extends to some  $g : W \rightarrow Y \in \mathcal{D}\text{iff}_\partial$ , then  $I_2(f, Z) = 0$ .  $\lrcorner$

*Proof:* Use extension theorem (16.1.1.55), (16.1.1.51) and (16.1.12.3).  $\square$

**Prop. (16.1.4.3) [Homotopy Invariance].** Situation as in (16.1.4.10), for any  $f, f' : X \rightarrow Y$  s.t.  $f \bar{\cap} Z, f' \bar{\cap} Z$ , if  $f$  is smoothly homotopic to  $f'$ , then  $I_2(f, Z) = I_2(f', Z)$ .  $\lrcorner$

*Proof:* Immediate from boundary theorem (16.1.4.2).  $\square$

**Def. (16.1.4.4) [General Intersection Numbers Modulo 2].** Suppose  $X, Y \in \mathcal{D}\text{iff}$ ,  $X$  compact and  $Z \subset Y$  a closed submanifold s.t.  $\dim X + \dim Z = \dim Y$ , then for any  $f : X \rightarrow Y \in \mathcal{D}\text{iff}$ , we can choose  $f' : X \rightarrow Y \in \mathcal{D}\text{iff}$  smoothly homotopic to  $f$  s.t.  $f' \bar{\cap} Z$  by (16.1.1.54), and define  $I_2(f, Z) = I_2(f', Z)$ . This definition is well-defined and is compatible with the definition in (16.1.4.10) by (16.1.4.3).  $\lrcorner$

**Def. (16.1.4.5) [Intersection Number modulo 2 of Two Maps].** Suppose  $X, Z \in \mathcal{D}\text{iff}_{\text{cpct}}, Y \in \mathcal{D}\text{iff}$ ,  $f : X \rightarrow Y, g : Z \rightarrow Y$  s.t.  $\dim X + \dim Z = \dim Y$ , then we can choose  $f' : X \rightarrow Y$  s.t.  $f' \sim_{\text{sm}} f$  and  $g' : Z \rightarrow Y$  s.t.  $g \sim_{\text{sm}} g'$  ?. Then  $(f')^{-1}(g'(Z))$  is a finite set of points, so we can define the **intersection number modulo 2 of two maps**  $I_2(f, g) \in \mathbb{Z}/(2)$  to be the parity of  $\#(f')^{-1}(g'(Z))$ , called the **intersection number modulo 2 of two maps**. Then:

- This is well-defined.
- $f, g$  are transversal iff  $f \times g : X \times Z \rightarrow Y \times Y$  are transversal to  $\Delta_Y$ .
- $I_2(f, g) = (-1)^{\dim Z} I_2(f \times g, \Delta_Y)$ .
- If  $g : Z \rightarrow Y$  is an immersed submanifold, then  $I_2(f, g) = I_2(f, g(Z))$ .

$\lrcorner$

*Proof:* This a simple local tangent vector calculation, Cf. [Pollack]P113, 115.  $\square$

**Prop. (16.1.4.6) [Properties of Intersection Numbers of Two Maps].** Situation as in (16.1.4.5),

- If  $f' \sim_{\text{sm}} f, g' \sim_{\text{sm}} g$ , then  $I_2(f, g) = I_2(f', g')$ , because  $f \times g \sim_{\text{sm}} f' \times g'$ .

$\lrcorner$

**Prop. (16.1.4.7) [Mod 2 Brouwer Degree of Maps].** If  $f : X, Y \in \mathcal{D}\text{iff}$  s.t.  $\dim X = \dim Y$ ,  $X$  is compact and  $Y$  is connected, then  $I_2(f, \{y\})$  (16.1.4.4) is the same for each  $y \in Y$ , called the **mod 2 degree of  $f$** . If  $f$  is smoothly homotopic to  $f'$ , then  $I(f, Z) = I(f', Z)$ , and  $I(f, Z) = 0$  if  $f$  is a boundary map, by (16.1.4.3)(16.1.4.2).  $\lrcorner$

*Proof:* Cf. [Pollack P80]. ?  $\square$

### Orientable Intersection Numbers

**Prop. (16.1.4.8) [Transversal Preimage Orientation].** Let  $Y \in \text{Mani}$  be oriented and  $Z \subset Y$  an oriented closed submanifold. If  $X \in \text{Diff}_\partial$  is oriented and  $f : X \rightarrow Y \in \text{Diff}_\partial$  satisfies  $f \pitchfork Z, \partial f \pitchfork Z$ , then the orientation of  $Z, Y, Z$  defines canonically an orientation on  $S = f^{-1}(Z)$  s.t. for any  $x \in f^{-1}(Z)$  and any subspace  $H \subset T_x(X)$  complementary to  $T_x(S)$ , the orientation on  $S$  is defined by the following decompositions:

$$H \oplus T_x(S) = T_x(X), \quad df_x(H) \oplus T_{f(x)}(Z) = T_{f(x)}(Y).$$

called the **preimage orientation** of  $f^{-1}(Z)$ . ┘

*Proof:* Cf.[Pollack]P100. ? □

**Prop. (16.1.4.9).** Situation as in (16.1.4.8), as oriented manifolds,

$$\partial[f^{-1}(Z)] = (-1)^{\text{codim } Z} (\partial f)^{-1}(Z).$$

*Proof:* Cf.[Pollack]P101. □

**Def. (16.1.4.10) [Intersection Numbers].** Suppose  $X, Y \in \text{Diff}$ ,  $X$  compact and  $Z \subset Y$  a closed submanifold s.t.  $\dim X + \dim Z = \dim Y$ . For any  $f : X \rightarrow Y \in \text{Diff}$  s.t.  $f \pitchfork Z, f^{-1}(Z)$  is a finite set of points with orientations give in (16.1.4.8). So we can define  $I(f, Z)$  to be the sum of the orientations or  $f^{-1}(Z)$ , called the **intersection number** of  $f$  and  $Z$ . ┘

**Lemma (16.1.4.11) [Boundary Theorem].** If  $W \in \text{Diff}_\partial$ ,  $Y \in \text{Diff}$  is oriented and  $Z \subset Y$  is an oriented closed subscheme s.t.  $\dim \partial W + \dim Z = \dim Y$ . If  $f : W \rightarrow Y$  is a map of smooth manifolds s.t.  $\partial f \pitchfork Z$ , then  $I(\partial f, Z) = 0$ . ┘

*Proof:* The same as the proof of (16.1.4.2). □

**Prop. (16.1.4.12) [Homotopy Invariance].** Homotopic transversal maps always have the same intersection number w.r.t  $Z$ . ┘

**Def. (16.1.4.13) [General Intersection Numbers].** Suppose  $X, Y \in \text{Diff}$ ,  $X$  compact and  $Z \subset Y$  a closed submanifold s.t.  $\dim X + \dim Z = \dim Y$ , then for any  $f : X \rightarrow Y \in \text{Diff}$ , we can choose  $f' : X \rightarrow Y \in \text{Diff}$  smoothly homotopic to  $f$  s.t.  $f' \pitchfork Z$  by (16.1.1.54), and define  $I(f, Z) = I(f', Z)$ . This definition is well-defined and is compatible with the definition in (16.1.4.10) by (16.1.4.12). ┘

**Prop. (16.1.4.14) [Intersection Numbers of Two Maps].** Suppose  $X, Y, Z \in \text{Diff}_{\text{or mtd}}$  s.t.  $\dim X + \dim Z = \dim Y$  and  $X, Z$  are compact. Let  $f : X \rightarrow Y, g : Z \rightarrow Y$  be transversal maps. Then we can choose  $f' : X \rightarrow Y$  s.t.  $f' \sim_{\text{sm}} f$  and  $g' : Z \rightarrow Y$  s.t.  $g \sim_{\text{sm}} g'$  ?. Then  $f^{-1}(g(Z))$  is a finite set of points with orientations given in (16.1.4.8). So we can define the **intersection number**  $I(f, g)$  to be the sum of the orientations or  $f^{-1}(Z)$ . Then:

- This is well-defined.
- $f, g$  are transversal iff  $f \times g : X \times Z \rightarrow Y \times Y$  are transversal to  $\Delta_Y$ .
- $I(f, g) = (-1)^{\dim Z} I(f \times g, \Delta_Y)$ .
- If  $g : Z \rightarrow Y$  is an immersed submanifold, then  $I(f, g) = I(f, g(Z))$ .

┘

*Proof:* This is a simple local tangent vector calculation, Cf.[Pollack]P113, 115. □

**Prop. (16.1.4.15)[Properties of Intersection Numbers of Two Maps].** Situation as in (16.1.4.14),

- If  $f' \sim_{\text{sm}} f, g' \sim_{\text{sm}} g$ , then  $I(f, g) = I(f', g')$ , because  $f \times g \sim_{\text{sm}} f' \times g'$ .
- $I(f, g) = (-1)^{\dim X \cdot \dim Z} I(g, f)$ , by definition (16.1.4.8).

┘

*Proof:* ? □

**Cor. (16.1.4.16)[Self-Intersections].** If  $X \subset Y \in \text{Diff}$  and  $X$  is compact with  $\dim X \in 2\mathbb{N} + 1$  and  $\dim Y = 2 \dim X$ , then  $I(X, X) = 0$ . If this fails, then  $Y$  is not orientable, for example the Möbius band with the central circle. ┘

### Degrees and Indices of Vector Fields

**Prop. (16.1.4.17)[Brouwer Degrees].** If  $X, Y \in \text{Diff}_{\text{orntd}}$  s.t.  $\dim X = \dim Y$  and  $X$  is compact, and  $f : X \rightarrow Y \in \text{Diff}$ , then  $I(f, \{y\})$  (16.1.4.13) is the same for each  $y \in Y$  by (16.1.4.15), called the **Brouwer degree** of  $f$ . If  $f$  is smoothly homotopic to  $f'$ , then  $I(f, Z) = I(f', Z)$ , and  $I(f, Z) = 0$  if  $f$  is a boundary map, by (16.1.4.11)(16.1.4.12). ┘

*Proof:* The proof is the same as that of (16.1.4.7). □

**Prop. (16.1.4.18)[Compositions].** If  $X, Y, Z \in \text{Diff}_{\text{orntd}}$  s.t.  $\dim X = \dim Y = \dim Z$  and  $f : X \rightarrow Y, g : Y \rightarrow Z \in \text{Diff}$ , then  $\deg(g \circ f) = \deg(f) \deg(g)$ . ┘

**Def. (16.1.4.19)[Indices].** For  $V \in \mathfrak{X}(M)$  and an isolated zero  $x \in M$  of  $V$ , choose a local chart  $\varphi$  of  $U \subset M$  centered at  $x$  containing no other zeros of  $V$ , and choose a chart sphere  $S_\varepsilon^{\dim M - 1}$  in this chart. By identifying the tangent vectors of points in  $U$  with those in  $\varphi(U)$ , we have a map

$$S_\varepsilon^{\dim M - 1} \rightarrow \mathbb{S}^{\dim M - 1} : z \mapsto v(z) / \|v(z)\|.$$

Then we can define  $\text{ind}_x(V)$  to be the degree of this map.

Notice that this is independent of this  $\varepsilon$  chosen, because it is continuous in  $\varepsilon$  and the degree is an integer. Also it is independent of the local charts chosen, because a local transition map between charts maps a sufficiently small chart sphere to a topological sphere homotopic to a chart sphere preserving orientation. So the degrees are the same because it is preserved under homotopy (16.1.4.17). ┘

**Prop. (16.1.4.20)[Non-degenerate Vanishing Points].** Situation as in (16.1.4.19), for each vanishing point  $x$  of  $V$ , consider  $V$  as a map  $M \rightarrow TM$ , then at a vanishing point  $x \in X$  of  $V$ , the image of  $dV_x : T_x M \rightarrow T_x(TM)$  is contained in  $TM$ , because otherwise  $x$  is not an isolated zero (by looking locally). Then  $x$  is called a **non-generate zero** if  $dV_x : T_x M \rightarrow T_x M$  is non-degenerate.

For a non-degenerate zero  $x \in M$  of  $V$ , by looking at the definition (16.1.4.19), we see  $\text{ind}_x(V) = 1$  if  $dV_x$  preserves orientation and  $\text{ind}_x(V) = -1$  if  $dV_x$  reverses orientation. ┘

**Prop. (16.1.4.21)[Vector Fields with Isolated Zeros].** If  $M$  is compact, then there exists a vector field  $M$  with only isolated zeros. And a vector bundle over a  $k$  dimensional manifold splits to components of dimension no bigger than  $k$ , determined by its Chern class. ┘

*Proof:* This follows from (4.15.2.21).  $\square$

**Thm. (16.1.4.22) [Poincare-Hopf Index theorem].** For  $M \in \text{Diff}_{\text{cpct}}$  and  $V \in \mathfrak{X}(M)$  with only f.m. zeros, the sum of indices of  $V$  (16.1.4.19) equals  $I(\Delta_M, \Delta_M)$ .  $\lrcorner$

*Proof:* We can smoothly perturb  $V$  s.t. it has only non-degenerate vanishing points (16.1.4.20) as follows: It suffices to prove for a small nbhd of a vanishing point  $x$ , so we may assume  $x \in U \subset \mathbb{R}^n$  for some  $n \in \mathbb{Z}_+$ . Choose a bump function supported on  $U$  and has value 1 on a nbhd of  $x$ , and define

$$V_a(z) = V(z) - \rho(z)\mathbf{a}, \text{ where } z \in U.$$

Because  $x$  is an isolated zero, when  $\|\mathbf{a}\|$  is small,  $V_a(z)$  can have zero only when  $\rho(z) = 1$ . Thus for  $\mathbf{a}$  sufficiently small. Thus if we choose  $\mathbf{a}$  small s.t.  $\mathbf{a}$  is a regular value of  $V$ , then  $V_a$  has only non-degenerate zeros.

By (16.1.1.46), there is an oriented diffeomorphism of a nbhd of  $M \subset TM$  with  $\Delta_M \subset M \times M$  identifying  $M$  with  $\Delta_M$ . Thus it is clear from the definition that

$$I_{M \times M}(\Delta_M, \Delta_M) = I_{TM}(M, V(M)),$$

and the latter is a sum of local orientations at the vanishing points of  $V$ . By homotopy invariance, we may assume  $V$  has only non-degenerate zeros, then it is easy to see  $M \overline{\cap} V(M)$ , and the local intersection numbers (16.1.4.10) are just indices by (16.1.4.20). Thus  $I_{M \times M}(\Delta_M, \Delta_M)$  equals the sum of indices of  $V$ .  $\square$

**Prop. (16.1.4.23) [Euler Characteristics and Self-Intersection of Diagonals].** The Euler character of an orientable compact manifold  $Y$  equals the intersection of the diagonals  $I(\Delta, \Delta)$ .  $\lrcorner$

*Proof:* For this, we use the Poincare-Hopf theorem (16.1.4.22). It is clear that on a triangulation, we can place a source on the center of each face/edge/..., thus producing a smooth vector fields, thus it is clear the sum of their indices equals both the combinatorial Euler character and the defined character.

Alternatively, we can use Morse theory to construct a non-degenerate vector field?  $\square$

**Cor. (16.1.4.24).** The Euler character of an odd dimensional compact smooth manifold  $Y$  is 0, by (16.1.4.16).  $\lrcorner$

### Lefschetz Fixed Point Theorems

**Def. (16.1.4.25) [Lefschetz Numbers].** For  $X \in \text{Diff}_{\text{cpct, orntd}}$  and  $f : X \rightarrow X \in \text{Diff}$ , the (global) smooth Lefschetz number of  $f$  is defined to be

$$L(f) \triangleq I(\text{Graph}(f), \Delta_X).$$

$L(f)$  is invariant under homotopy of  $f$  by (16.1.4.14).  $\lrcorner$

**Thm. (16.1.4.26) [Lefschetz Fixed Point Theorem].** Situation as in (16.1.4.25), if  $L(f) \neq 0$ , then  $f$  has a fixed point on  $X$ .  $\lrcorner$

*Proof:* If  $f$  has no fixed point on  $X$ , then  $I(\text{Graph}(f), \Delta_X) = 0$ .

There are topological proofs.?  $\square$

**Cor. (16.1.4.27) [Euler Characteristics and Lefschetz Numbers].** Situation as in (16.1.4.25), if  $f$  is smoothly homotopic to  $\text{id}_X$ , then  $L(f) = \chi(X)$ . In particular, if  $f$  has no fixed points on  $X$ , then  $\chi(X) = 0$ .  $\lrcorner$

*Proof:*  $L(f) = L(\text{id}_X) = I(\Delta_X, \Delta_X) = \chi(X)$  (16.1.4.23).  $\square$

**Remark (16.1.4.28).** This is useful for calculating Euler characteristics.  $\lrcorner$

**Prop. (16.1.4.29) [Lefschetz Maps].** For  $X \in \text{Diff}_{\text{cpct, orntd}}$  and  $f : X \rightarrow X \in \text{Diff}$ , there exists  $f' : X \rightarrow X$  s.t.  $f \sim_{\text{sm}} f'$  and  $\text{Graph}(f) \cap \Delta_X$ . Such an  $f'$  is called a **Lefschetz map**.  $\lrcorner$

*Proof:* Cf. [Pollack]P120. ?  $\square$

**Def. (16.1.4.30) [Local Lefschetz Numbers].**  $\lrcorner$

**Prop. (16.1.4.31) [Local and Global Lefschetz Numbers].** Situation as in (16.1.4.25), if  $f$  has only f.m. fixed points, then

$$L(f) = \sum_{x \in X, f(x)=x} L_x(f) \text{ (16.1.4.30).}$$

$\lrcorner$

*Proof:* Cf. [Pollack]P130. ?  $\square$

**Prop. (16.1.4.32).** The only finite group  $G \in \text{Grp}^{\text{fin}}$  that can act freely on  $S^{2n}$  is  $\mathbb{Z}/(2)$  or 1.  $\lrcorner$

*Proof:* Consider the degree map, then it is a homomorphism from  $G$  to  $\mathbb{Z}$ , thus the image is just  $\pm 1$ . Now it is by Lefschetz fixed point theorem that  $\deg(g) = -1$  for  $g \neq 1$ , thus it is injective to  $\pm$ .  $\square$

### Framed Cobordism

**Def. (16.1.4.33) [Smooth Cobordisms].** For  $M \in \text{Diff}$ , two smooth submanifolds  $N, N' \subset M \in \text{Diff}$  is called **smoothly cobordant** if the subset

$$N \times [0, \frac{1}{4}) \cup N' \times (\frac{3}{4}, 1]$$

can be extended to a compact smooth manifold

$$X \subset M \times [0, 1]$$

s.t.  $\partial X = N \times \{0\} \cup N' \times \{1\}$ .  $\lrcorner$

**Def. (16.1.4.34) [Framings].** For  $N \subset M \in \text{Diff}$ , a **framing** of  $N$  in  $M$  is a smooth function that assigns to each  $x \in N$  a basis of  $N_M(N)_x$ . A submanifold of  $M$  with a framing is called a **framed manifold**.  $\lrcorner$

**Def. (16.1.4.35) [Framed Cobordisms].** For  $M \in \text{Diff}$ , two smooth embedded submanifolds  $N, N' \subset M \in \text{Diff}$  is called **smoothly framed cobordant** if the subset

$$N \times [0, \frac{1}{4}) \cup N' \times (\frac{3}{4}, 1]$$

can be extended to a compact smooth manifold

$$X \subset M \times [0, 1]$$

s.t.  $\partial X = N \times \{0\} \cup N' \times \{1\}$ , and there exists a framing on  $X$  that restricts to the framing on  $N$  and  $N'$  resp..  $\lrcorner$

**Prop. (16.1.4.36) [Pontryagin Framed Manifolds].** For  $f : M \in \mathbb{S}^n \in \text{Diff}_{\text{cpct}}$ , take a regular value  $y \in \mathbb{S}^n$  for  $f$  (16.1.1.40), then  $S = f^{-1}(y)$  is a smooth manifold by (16.1.1.37), and for each  $x \in S$ ,  $N_M(S)_x \cong T_x M / T_x S$  is naturally isomorphic to  $T_y(\mathbb{S}^n)$ , so any basis of  $T_y(\mathbb{S}^n)$  gives a framing on  $f^{-1}(y)$ . Then:

- For a different regular value  $y' \in \mathbb{S}^n$ , the framed manifolds  $f^{-1}(y)$  and  $f^{-1}(y')$  are smoothly framed cobordant. Any of these framed manifolds is called a **Pontryagin framed manifold** associated to  $f$ .
- For  $f, g : M \rightarrow \mathbb{S}^n \in \text{Diff}_{\text{cpct}}$ ,  $f$  and  $g$  are smoothly homotopic iff their associated Pontryagin framed manifolds (16.1.4.36) are framed cobordant.
- Any compact framed submanifold  $N$  of codimension  $r$  in  $M$  occurs as a Pontryagin manifold for some smooth  $f : M \rightarrow \mathbb{S}^r$ .

In particular, the set of smooth homotopy classes of maps from  $M$  to  $\mathbb{S}^n$  are in bijection with the set of framed cobordism classes of framed submanifolds of  $M$  of codimension  $r$ .  $\lrcorner$

*Proof:* Firstly it is clear that different bases of  $T_y(\mathbb{S}^n)$  give the same cobordant classes, because  $\text{GL}(n; \mathbb{R})^+$  is connected.

If  $f, g$  are smoothly homotopic by a homotopy  $F : M \times [0, 1] \rightarrow \mathbb{S}^n$ , then their Pontryagin framed manifolds  $f^{-1}(y)$  and  $g^{-1}(y)$  are cobordant by choosing a common regular value  $y'$  for both  $f$  and  $g$  that is close enough to  $y$  by Sard's theorem (16.1.1.40) and (16.1.4.37).

Now for any rotation  $\tau$  of  $\mathbb{S}^n$ ,  $\tau \circ f$  is homotopic to  $\tau$ , so  $f^{-1}(y)$  is framed cobordant to  $f^{-1}(z)$  for any regular values  $y, z \in \mathbb{S}^n$  for  $f$ .

For any compact framed submanifold  $N$  of codimension  $r$  in  $M$ , we may embed  $M$  into  $\mathbb{R}^n$ , and take the tubular nbhd of  $U$  in  $M$ . Then by a smooth  $\text{GL}(n)$ -action, we can assume that the map

$$V \subset N \times \mathbb{R}^r \rightarrow U \subset M \rightarrow N_M(N)$$

maps the canonical basis of  $\mathbb{R}^r$  to the chosen frame. Then we can take the smooth map  $M \rightarrow \mathbb{S}^r$  by compactifying the map  $U \rightarrow N \times \mathbb{R}^r \rightarrow \mathbb{R}^r$  and map  $M \setminus U$  to the north pole. Then the Pontryagin framed manifold of this map is just the framed manifold  $N$ .

Finally, if the associated Pontryagin framed manifolds for  $f$  and  $g$  are framed cobordant, then there is a framed cobordism  $X \subset M \times [0, 1]$  between  $f^{-1}(y)$  and  $g^{-1}(y)$ , then the tubular nbhd argument as above shows that there is a homotopy  $F : M \times [0, 1] \rightarrow \mathbb{S}^n$  whose Pontryagin manifold  $F^{-1}(y)$  is exactly the framed manifold  $X \subset M \times [0, 1]$ . Then because  $F_0^{-1}(y) = f^{-1}(y)$  and  $F_1^{-1}(y) = g^{-1}(y)$ , we have  $F_0 \sim_{\text{sm}} f, F_1 \sim_{\text{sm}} g$  by (16.1.4.38), and thus  $f \sim_{\text{sm}} g$ .  $\square$

**Lemma (16.1.4.37).** For  $f : M \rightarrow \mathbb{S}^n \subset \text{Diff}_{\text{cpct}}$ , if  $y \in \mathbb{S}^n$  is a regular value for  $f$ , then for every regular value  $z$  for  $f$  in a nbhd of  $y$ ,  $f^{-1}(z)$  and  $f^{-1}(y)$  are framed cobordant.  $\lrcorner$

*Proof:* Because  $M$  is compact, the set of regular values of  $\mathbb{S}^n$  for  $f$  is compact, so there exists a nbhd  $U$  of  $y$  consisting of regular values. Then for any  $z \in U$ , we can take a one-parameter family of rotations  $r_t$  of  $\mathbb{S}^n$  taking  $y$  to  $z$ , and let

$$F : M \times [0, 1] \rightarrow \mathbb{S}^n : (x, t) \mapsto r_t f(x),$$

then  $F^{-1}(y)$  is a framed cobordism between  $f^{-1}(y)$  and  $f^{-1}(z)$ .  $\square$

**Lemma (16.1.4.38).** For  $f, g : M \rightarrow \mathbb{S}^n \subset \text{Diff}_{\text{cpct}}$ , if  $y \in \mathbb{S}^n$  is a common regular value for  $f$  and  $Y$ , and  $f^{-1}(y)$  is equal to  $g^{-1}(y)$  as framed manifolds, then  $f \sim_{\text{sm}} g$ .  $\lrcorner$

*Proof:* Denote  $N = f^{-1}(y)$ . Firstly, if  $f$  coincides with  $g$  on a nbhd of  $N$ , then we may linearly deform  $f$  to  $g$  in  $\mathbb{S}^n \setminus \{y\}$ . Take a tubular nbhd  $V$  of  $N$  in  $M$  with a product representation

$$N \times \mathbb{R}^p \cong V$$

s.t.  $V$  is small enough that neither  $f(V)$  or  $g(V)$  contains the antipode of  $y$ . Identifying  $\mathbb{S}^n \setminus \{y\}$  with  $\mathbb{R}^n$ , we get maps

$$F, G : N \times \mathbb{R}^n \rightarrow \mathbb{R}^n$$

s.t.  $F^{-1}(0) = G^{-1}(0) = N \times \{0\}$  and  $dF_{(x,0)} = dG_{(x,0)} = \text{pr}_2$  for any  $x \in N$ .

Then we can find  $c \in \mathbb{R}_+$  s.t.  $F(x, u) \cdot u > 0, G(x, u) \cdot u > 0$  for any  $u \in \mathbb{R}^n$  s.t.  $0 < \|u\| < c$ . So the line between  $F(x, u)$  and  $G(x, u)$  doesn't contain 0.

Now take a smooth function  $\lambda : \mathbb{R}^n \rightarrow \mathbb{R}$  s.t.  $\lambda(u) = 1$  if  $\|u\| \leq c/2$  and  $\lambda(u) = 0$  for  $\|u\| \geq c$ , then the homotopy

$$F_t(x, u) = [1 - \lambda(u)t]F(x, u) + \lambda(u)tG(x, u)$$

deforms  $F = F_0$  into a mapping  $F_1$  that coincides with  $G$  in a nbhd of  $N$ , and  $F^{-1}(0) = N$ . Then  $F_1$  corresponds to a map  $f_1 : M \rightarrow \mathbb{S}^n$ , and we can use the initial method to deform  $f_1$  into  $g$ . Thus  $f \sim_{\text{sm}} g$ .  $\square$

**Cor. (16.1.4.39)[Smooth Hopf Theorem].** For  $M \in \text{Diff}_{\text{cpct, orntd}}^n$ , two maps  $f, g : M \rightarrow \mathbb{S}^n \in \text{Diff}_{\text{cpct}}^n$  are smooth homotopic iff they have the same Brouwer degree.

For  $M \in \text{Diff}_{\text{cpct, non-orntd}}^n$ , two maps  $f, g : M \rightarrow \mathbb{S}^n \in \text{Diff}_{\text{cpct}}^n$  are smooth homotopic iff they have the same mod 2 Brouwer degree(16.1.4.7).  $\lrcorner$

*Proof:* For the orient case, this is because it is clear that two framed 0-dimensional submanifolds of  $M$  are cobordant iff they have the same signature.

For the non-orient case, this is because any framed point of  $M$  is cobordant to its opposite framed point along some loop in  $M$ , because otherwise  $M$  is orientable.  $\square$

## 5 Flow

**Def. (16.1.5.1)[Integral Curves].** Let  $V$  be a vector field over a smooth manifold  $M$ , then an **integral curve** of  $V$  is a smooth curve  $\gamma : J \rightarrow M$  that  $\gamma'(t) = V_{\gamma(t)}$  for any  $t \in J$ .  $\lrcorner$

**Def. (16.1.5.2)[Flow].** Let  $M$  be a manifold, then a **flow** on  $M$  is a continuous map  $\theta : D \rightarrow M$ , where

- $D \in \mathbb{R} \times M$  is an open subset.
- for any  $p \in M, D^p = \{t | (t, p) \in D\}$  is an open interval containing 0.
- When it is defined,  $\theta(s, \theta(t, p)) = \theta(s + t, p)$ .

If  $\theta$  is a flow, we define  $\theta_t(p) = \theta^{(p)}(t) = \theta(t, p)$ .

If  $\theta$  is smooth, then we can define the **infinitesimal generator** of  $\theta$  to be the vector field  $V_p = \theta^{(p)'}(0)$ .  $\lrcorner$

**Def. (16.1.5.3)[Complete Vector Fields].** A complete vector field on a smooth manifold is a vector field that generates a global flow.  $\lrcorner$

**Prop. (16.1.5.4).** If  $\theta : D \rightarrow M$  is a smooth flow, then the infinitesimal generator  $V$  of  $\theta$  is a smooth vector field, and each  $\theta^{(p)}$  is an integral curve of  $V$ .  $\lrcorner$

*Proof:* Cf. [Lee13]P212.  $\square$

**Prop. (16.1.5.5) [Isotopy Extension Theorem].** Let  $A \subset M$  be a compact subset, then any isotopy  $F : A \times \mathbb{I} \rightarrow M$  can be extended to an diffeotopy of  $M$ .  $\lrcorner$

*Proof:* Consider  $F(A \times I) \subset M \times I$  is a compact set, and  $TM \times I \rightarrow M \times I$  is a vector bundle. The time lines generate a section  $F(A \times I) \rightarrow TM \times I$ , so ?? guarantees an extension  $M \times I \rightarrow TM \times I$ , and because manifolds are locally compact, this section can be chosen to be compactly supported, then the flow it generates is a diffeotopy.  $\square$

## 6 Distributions and Foliations

Cf. [Lee13] Chap19.

## 7 Smooth Isotopies

**Def. (16.1.7.1) [Smooth Isotopies].** For  $V, M \in \mathcal{D}\text{iff}$ , a **smooth isotopy** is an isotopy (4.13.2.1)  $F : V \times I \rightarrow M$  that is smooth.

If  $V = M$ ,  $F_0 = \text{id}_M$ , and each  $F_t$  is a diffeomorphism of  $M$ , then this is called a **diffeotopy**.  $\lrcorner$

**Prop. (16.1.7.2).** Any orientation preserving self-diffeomorphism  $f$  of  $\mathbb{R}^n$  is diffeotopic to  $\text{id}_{\mathbb{R}^n}$ .  $\lrcorner$

*Proof:* We may assume  $f(0) = 0$ . And we can define an isotopy

$$F : \mathbb{R}^n \times [0, 1] \rightarrow \mathbb{R}^n : (x, t) \mapsto \begin{cases} f(tx)/t & t \neq 0 \\ df_0(x) & , t = 0 \end{cases},$$

then clearly each  $F_t : \mathbb{R}^n \rightarrow \mathbb{R}^n$  is a diffeomorphism, and  $F$  is smooth because by (12.3.4.1) we can write

$$f(x) = x_1 g_1(x) + \dots + x_n g_n(x), \text{ where } g_i(x) \in C^\infty(\mathbb{R}^n),$$

so  $f(tx)/t = x_1 g_1(tx) + \dots + x_n g_n(tx)$  is smooth.

So  $F$  is diffeotopic to a non-degenerate linear map, and then clearly diffeotopic to  $\text{id}_{\mathbb{R}^n}$ .  $\square$

**Thm. (16.1.7.3) [Isotopy Extension Theorem].** Let  $M \in \mathcal{D}\text{iff}_\partial$  and  $V \subset M$  a compact submanifold. If  $F : V \times I \rightarrow M$  is a smooth isotopy of  $V$  (16.1.7.1), then  $F$  extends to a diffeotopy of  $M$  with compact support.  $\lrcorner$

*Proof:* [Hirsch, Differential Topology] P180.  $\square$

**Cor. (16.1.7.4) [Smooth Homogeneity Lemma].** If  $M \in \mathcal{D}\text{iff}_{\text{cntd}, \partial}$  and  $x, y \in \text{Int}(M)$ , then there is a self-diffeomorphism of  $M$  that is diffeotopic to  $\text{id}_M$  and takes  $x$  to  $y$ .  $\lrcorner$

**Thm. (16.1.7.5) [Isotopy Extension Theorem].** let  $M \in \mathcal{D}\text{iff}$ ,  $U \subset M$  be an open subset and  $A \subset U$  a compact set. Let  $F : U \times I \rightarrow M$  be an isotopy s.t.  $\hat{F}(U \times I) \subset M \times I$  is open, then there is a diffeotopy of  $M$  with compact support, which agrees with  $F$  on a nbhd of  $A \times I$ .  $\lrcorner$

*Proof:* [Hirsch, Differential Topology] P180.  $\square$

## 8 DeRham Theory

References are [Bott-Tu].

## 9 Čech-DeRahm Complexes

References are [Bott-Tu].

## 10 Spectral Sequence

References are [Bott-Tu].

## 11 Characteristic Classes

References are [Bott-Tu].

In this subsection, we study characteristic classes of manifolds, especially of tangent bundles.

**Prop.(16.1.11.1)[Antipodal Map of  $\mathbb{S}^n$ ].** The antipodal map of  $\mathbb{S}^n$  has degree  $(-1)^{n+1}$ , because it is a composition of  $(n+1)$  reflections. In particular, if  $n$  is even, then this antipodal map is not homotopic to  $\text{id}_{\mathbb{S}^n}$ .  $\lrcorner$

**Prop.(16.1.11.2)[Non-Vanishing Vector Fields].**

- If  $n \in 2\mathbb{Z}_+ + 1$ , then  $\mathbb{RP}^n$  and  $\mathbb{S}^n$  admit a non-vanishing vector field.
- If  $n \in 2\mathbb{Z}_+$ , then  $\mathbb{S}^n$  and  $\mathbb{RP}^n$  admit no non-vanishing vector field.

$\lrcorner$

*Proof:* If  $n = 2k + 1$ , consider the non-vanishing vector field on  $\mathbb{S}^{2k+1} : (x_1, \dots, x_{2k+2}) \mapsto (x_2, -x_1, x_4, -x_3, \dots, x_{2k+2}, -x_{2k+1})$ . Then This descends to a non-vanishing vector field on  $\mathbb{RP}^{2k+1}$ .

Conversely, if  $n = 2k$ , then a non-vanishing vector field defines an homotopy between the antipodal map to  $\text{id}_{\mathbb{S}^n}$ . But the former has degree  $-1$  by (16.1.11.1) and the latter has degree 1.  $\square$

## 12 Classifying Smooth Manifolds

**Prop.(16.1.12.1)[0-Dimensional Manifolds].** Any 0-dimensional connected manifold is smooth and diffeomorphic to pt.  $\lrcorner$

**Prop.(16.1.12.2)[1-Dimensional Manifolds].** Any 1-dimensional connected smooth manifold possibly with boundaries is diffeomorphic to one of the following:

$$\mathbb{S}^1, [0, 1], (0, 1], (0, 1).$$

$\lrcorner$

*Proof:* For a finite interval  $I \subset \mathbb{R}$ , we call a map  $f : I \rightarrow M$  a **parametrization** if it maps  $I$  diffeomorphically onto an open subset of  $M$ , and in any smooth chart  $U \subset M$ , the velocity vector of the map  $f : f^{-1}(U) \rightarrow U$  has length bounded below by some positive constant  $c \in \mathbb{R}_+$  depending on  $U$ .

Take any parametrization by arc length  $f : I \rightarrow M$  that is maximal in the sense it cannot be extended to a parametrization on a larger interval  $I'$  containing  $I$  (which exists because  $\mathbb{R}$  is well-ordered).

If  $f$  is onto, then  $M \cong I$ . If  $f$  is not onto, then there exists a limit point  $x \in M \setminus f(I)$  of  $f(I)$ . There exists another parametrization  $g : J = (-1, 1) \rightarrow M$  with  $g(0) = x$ .

Consider the graph  $\Gamma \subset I \times J$  consisting of all  $(s, t)$  s.t.  $f(s) = g(t)$ , then the graph is smooth and it is always from upper-left to lower-right or from lower-left to upper-right. So it is clear that it

has at most two components. (To be rigorous, we can normalize the domain of  $f$  or  $g$  s.t.  $f^{-1} \circ g$  has constant velocity).

it is clear that if it has two components, then we can glue  $f$  and  $g$  to get a diffeomorphism  $\mathbb{S}^1 \rightarrow M$ . And if it has only one component, then we can extend  $f$  using  $g$ , contradicting the hypothesis that  $f$  is maximal. So the assertion is proved.  $\square$

**Cor. (16.1.12.3).** The boundary of any smooth manifold of dimension 1 consists of even number of points.  $\lrcorner$

**Thm. (16.1.12.4) [2-Dimensional Manifolds].** Every compact oriented manifold is diffeomorphic to  $\Sigma_g$  for a unique  $g \in \mathbb{N}$ .  $\lrcorner$

*Proof:* ?  $\square$

**Thm. (16.1.12.5) [3-Dimensional Manifolds].**  $\lrcorner$

## 13 Others

### Real Algebraic Geometry

**Prop. (16.1.13.1).** Any compact smooth manifolds in  $\mathbb{R}^n$  can be approximated by a real algebraic variety.  $\lrcorner$

*Proof:* Cf. [Nash's work on Algebraic Geometry].  $\square$

**Prop. (16.1.13.2).** Let  $Y$  be a projective variety over  $\mathbb{R}$  and  $Z \subset Y$  a closed subvariety, then there exists a triangulation of the pair  $(Y(\mathbb{R}), Z(\mathbb{R}))$ .  $\lrcorner$

*Proof:* Cf. [Hironaka1975, Triangulations of Algebraic Sets] and [Lojasiewicz1964, Triangulation of semi-analytic sets].  $\square$

## 16.2 Locally Symmetric Spaces

### 1 Symmetric Spaces

Main references are [Hel78], [Mil17b] and [Lan20].

**Def. (16.2.1.1) [Symmetric Spaces].** A Riemannian manifold is called **locally symmetric** at  $p$  if  $\nabla R(p) = 0$ . Locally symmetric is equivalent to the fact that every local reversing map is an isometry.

A **symmetric space** is a Riemannian manifold that  $\nabla R = 0$  everywhere.

A symmetric space is complete because two folding is an extension of geodesics. In particular, a symmetric space is homogenous, and to check symmetrically, it suffices to show it is homogenous and locally symmetric at a point.  $\lrcorner$

*Proof:*  $\square$

**Prop. (16.2.1.2).** A Lie group with a bi-invariant metric is a symmetric space.  $\lrcorner$

*Proof:*  $\square$

**Prop. (16.2.1.3).** The conjugate points in a symmetric space is easy to calculate, they are  $\exp(\frac{\pi k}{\sqrt{e_i}} V)$ , counting multiplicity, where  $e_i$  is the eigenvalue of the self-adjoint operator  $K_V(W) = R(V, W)V$  at  $p$ .  $\lrcorner$

**Prop. (16.2.1.4) [Lie Group of Isometries].** Let  $M$  be a symmetric space, then the group of isometries  $\text{Isom}(M^\infty, g)$  of  $M$  has a natural structure of a Lie group.  $\lrcorner$

*Proof:* Cf. [Helgason, homogenous Spaces, 4.3.2].  $\square$

**Prop. (16.2.1.5) [Symmetric Space is a Homogenous Space].** Let  $(M, g)$  be a symmetric space, and  $p \in M$ , then the subgroup  $K_p \subset \text{Aut}(M, g)^0$  fixing  $p$  is compact, and the natural map

$$\text{Isom}(M, g)^0 / K_p \rightarrow M^\infty$$

is an isomorphism of smooth manifolds, where  $\text{Isom}(M, g)^0 / K_p$  is given the homogenous space structure (16.2.1.4). In particular,  $\text{Isom}(M, g)^0$  acts transitively on  $M$ .  $\lrcorner$

*Proof:* Cf. [Mil17c] P12.  $\square$

### 2 Decompositions of Symmetric Spaces

#### 3 Non-Compact Type

#### 4 Compact Type

#### 5 Hermitian Symmetric Spaces

**Def. (16.2.5.1) [Hermitian Symmetric Spaces].** A **Hermitian symmetric space** is a Hermitian manifold that is a symmetric space (16.2.1.1) and that the local symmetries are all holomorphic.  $\lrcorner$

**Prop. (16.2.5.2) [Lie Group of Isometries].** For a Hermitian symmetric space, the group of holomorphic symmetries  $\text{Aut}(M, g)$  is closed in the group of isometries  $\text{Aut}(M^\infty, g)$ , which is a Lie group by (16.2.1.4), so it is also a Lie group.  $\lrcorner$

**Prop. (16.2.5.3) [Basic Hermitian Symmetric Spaces].** There are three different families of Hermitian symmetric spaces (but not complete):

- (Non-compact Type): These spaces are non-compact and simply connected, with negative curvatures, and  $\text{Isom}(M, g)^0$  is adjoint and non-compact.
- (Compact Type): These spaces are compact and simply-connected, with positive curvatures, and  $\text{Isom}(M, g)^0$  is adjoint and compact.
- (Euclidean Type): These spaces have constant curvature 0.

┘

*Proof:* Cf. Helgason 1978, Chap8.

□

**Prop. (16.2.5.4) [Decomposition].** Any Hermitian symmetric space  $M$  decomposes into a product  $M^0 \times M^+ \times M^-$  of Hermitian symmetric spaces with  $M^0$  Euclidean,  $M^-$  of non-compact type and  $M^+$  of compact type.

┘

*Proof:*

□

**Prop. (16.2.5.5).** Any Hermitian symmetric space of Euclidean type is a quotient of  $\mathbb{C}^g$  by a discrete subgroup of translations.

┘

*Proof:*

□

**Example (16.2.5.6).** The projective space  $\mathbb{P}^n(\mathbb{C})$  with the Fubini-Study metric is a Hermitian symmetric space. For any  $p$ , the (descent of) the rotation through  $\pi$  about the axis through  $p$  and its polar opposite is the geodesic isomorphism at  $p$ .

┘

*Proof:* See (16.10.1.6).

□

## 6 Hermitian Symmetric Domains

**Def. (16.2.6.1) [Hermitian Symmetric Domain].** A Hermitian symmetric space (16.2.5.1) of non-compact type (16.2.5.3) is called a **Hermitian symmetric domain**. In particular, a Hermitian symmetric domain is simply-connected. A **bounded symmetric domain** is a bounded open connected symmetric subset of  $\mathbb{C}^n$ .

┘

**Prop. (16.2.6.2) [Hermitian Symmetric Domains are Bounded].** Every Hermitian symmetric domain can be embedded into  $\mathbb{C}^n$  for some  $n$ , and the image is bounded.

┘

*Proof:*

□

**Prop. (16.2.6.3) [Bergman Metric].** Every bounded symmetric domain has a canonical Hermitian metric called the **Bergman metric**, it is invariant under holomorphic automorphisms, and it has negative curvatures.

┘

*Proof:* Cf. [Mil17]P11 and [Hel78]8.3.3.

□

**Cor. (16.2.6.4).** Every Hermitian symmetric domain  $D$  has a unique Hermitian metric that maps to the Bergman metric under any isomorphism of  $D$  onto a bounded symmetric domain.

┘

**Cor. (16.2.6.5).** A complex manifold is a symmetric Hermitian domain iff it is biholomorphic to a bounded symmetric domain.

┘

*Proof:*

□

**Def. (16.2.6.6) [Siegel Upper Half Space  $\mathcal{H}_g$ ].** For  $g \in \mathbb{Z}_+$ , the **Siegel upper half space**  $\mathcal{H}_g$  is defined to be

$$\mathcal{H}_g = \{Z \in \text{Mat}(n, \mathbb{C}) \mid Z^t = Z, \text{Im}(Z) \in \text{Pos}(g, \mathbb{C})\}.$$

It is identified with an open subset of  $\mathbb{C}^{g(g+1)/2}$ . We also define  $\mathcal{H}_g^\pm = \mathcal{H}_g \cup \overline{\mathcal{H}_g}$ .

The  $\text{Sp}(2g; \mathbb{R})$  (16.6.1.1) acts transitively on  $\mathcal{H}_g$  via

$$\begin{bmatrix} A & B \\ C & D \end{bmatrix} Z = (AZ + B)(CZ + D)^{-1}$$

and induces isomorphisms

$$\text{Sp}(2g; \mathbb{R})/\text{U}(n) \cong \mathcal{H}_g, \quad \text{GSp}(2g; \mathbb{R})/\text{U}(n) \cong \mathcal{H}_g^\pm.$$

The matrix  $\begin{bmatrix} 0 & -I \\ I & 0 \end{bmatrix}$  acts as an involution on  $\mathcal{H}_g$ , and has  $i\mathbf{1}_g$  as its fixed point, so  $\mathcal{H}_g$  is homogeneous and symmetric.

The injection into  $\mathbb{C}^g$  is not holomorphic, so we cannot see from this that  $\mathcal{H}_g$  is holomorphic, but we can see from ?

┘

*Proof:* ? Cf. [Lan20]P15.

□

**Cor. (16.2.6.7) [Upper Half Plane].** By (16.6.1.10), the group  $\text{GL}(2; \mathbb{R})$  acts continuously on  $\mathbb{C}$  by

$$\gamma(z) = \frac{az+b}{cz+d} \text{ where } \gamma = \begin{bmatrix} a & b \\ c & d \end{bmatrix}.$$

The groups  $\text{GL}(2; \mathbb{R})$  preserves the upper plane  $\mathcal{H}$ , by (12.4.1.9). The action of  $\text{SL}(2; \mathbb{R})$  on  $\mathcal{H}$  is transitive and the stabilizer of  $i$  is  $\text{SO}(2, \mathbb{R})$ , thus we have  $\mathcal{H} \cong \text{SL}(2; \mathbb{R})/\text{SO}(2; \mathbb{R})$ , and  $\text{PSL}(2; \mathbb{R})$  is the group of holomorphic automorphisms of  $\mathcal{H}$  by (12.4.7.8).

Also, the Riemannian metric  $\frac{dx dy}{y^2}$  on  $\mathcal{H}$  is fixed by the action of  $\text{GL}(2; \mathbb{R})$ .

┘

**Def. (16.2.6.8) [Siegal Unit Disk  $\mathbb{D}_g$ ].** Let  $\mathbb{D}_g$  be the set of symmetric complex matrixes that  $I - Z^*Z$  is positive definite, then it is identified with an open subset of  $\mathbb{C}^{g(g+1)/2}$ , this is a holomorphic embedding.

There is an isomorphism from  $\mathcal{H}_g$  (16.2.6.6) to  $\mathbb{D}_g$ :

$$Z \mapsto (Z - iI_g)(Z + iI_g)^{-1}.$$

This is an isomorphism, so  $\mathbb{D}_g$  is symmetric, and  $\mathcal{H}_g$  has an invariant metric, so they are both Hermitian symmetric domains ?

┘

*Proof:* ? [Lan20]P15.

□

**Prop. (16.2.6.9).** Let  $(M, g)$  be a Hermitian symmetric domain, then the inclusions

$$\text{Aut}(M^\infty, g) \supset \text{Aut}(M, g) \subset \text{Aut}^{\text{Hol}}(M)$$

induce equalities

$$\text{Aut}(M^\infty, g)^0 = \text{Aut}(M, g)^0 = \text{Hol}(M)^0$$

Then  $\text{Hol}(M)^0$  acts transitively on  $M$ , the stabilizer  $K_p$  of  $p$  in  $\text{Aut}^{\text{Hol}}(M)^0$  is compact, and

$$\text{Hol}(M)^0/K_p \cong M^\infty.$$

┘

*Proof:* Cf.[?Mil17b]P12. □

**Prop. (16.2.6.10).** The Lie group  $\text{Aut}^{\text{Hol}}(M)$  in (16.2.6.9) is a real semisimple Lie group with only f.m. connected components and trivial center. ?

If  $G$  is a connected simple real algebraic group with trivial center s.t.  $D = G(\mathbb{R})^0/K$  for some maximal compact subgroup  $K \subset G(\mathbb{R})^0$ , then  $\text{Aut}(D) \cap G(\mathbb{R}) = G(\mathbb{R})^0$ , and  $G(\mathbb{R})$  has one or two connected components. ┘

*Proof:* ? □

**Prop. (16.2.6.11) [Rotation at a Point].** Let  $D$  be a Hermitian symmetric domain and  $p \in D$ , then there is a unique homomorphism  $u_p : U_1 \rightarrow \text{Hol}(D)$  that  $u_p(z)$  fixes  $p$  and acts on  $T_p(D)$  as multiplication by  $z$ . ┘

**Prop. (16.2.6.12) [Classification of Hermitian Symmetric Domains].** The isomorphism classes of irreducible Hermitian symmetric domains are classified by the special nodes on connected Dynkin diagrams. ┘

*Proof:* Cf.[Mil17]P20. □

## 7 Locally Symmetric Varieties

**Prop. (16.2.7.1) [ $D(\Gamma)$ ].** Let  $D$  be a Hermitian symmetric domain, and let  $\Gamma$  be a discrete subgroup of  $\text{Aut}^{\text{Hol}}(D)^0$ . If  $\Gamma$  is torsion-free, then  $\Gamma$  acts freely on  $D$ , and there is a unique complex manifold structure on  $\Gamma \backslash D$  that the quotient map  $\pi : D \rightarrow \Gamma \backslash D$  is a holomorphic covering space.

In this case, denote  $D(\Gamma) = \Gamma \backslash D$ , and  $D$  is a universal covering of  $D(\Gamma)$ , by (16.2.5.3) and (16.2.6.1). ┘

*Proof:* Cf.[?Mil17b]P32. □

**Prop. (16.2.7.2).** Let  $D$  be a Hermitian symmetric domain and  $\Gamma \subset \text{Hol}(D)^0$  is a discrete subgroup, then by (16.2.6.9),  $\Gamma$  has finite covolume in  $\text{Hol}(D)^0$  iff  $\Gamma \backslash D$  has finite covolume, ┘

*Proof:* □

**Prop. (16.2.7.3).**  $D(\Gamma)$  has only f.m. automorphisms, as a complex manifold. ┘

*Proof:* Cf.[?Mil17b]P41. □

**Thm. (16.2.7.4) [Satake-Baily-Borel Compactifications].** Let  $D$  be a locally symmetric Hermitian space and  $\Gamma \subset \text{Hol}(D)^0$  an arithmetic subgroup (20.4.4.1), then  $D(\Gamma)$  can be realized as an open subset of a projective variety  $\overline{D(\Gamma)}$  over  $\mathbb{C}$ , and it is a normal algebraic variety. If moreover  $\Gamma$  is torsion-free, then it is smooth, by (16.2.7.1).

Such a projective variety  $D(\Gamma)$  is called a **locally symmetric variety**. ┘

*Proof:* Cf. [BAILY-BOREL, Compactification of arithmetic quotients of bounded symmetric domains. 84:442–528. 1966] and [CASSELMAN, Geometric rationality of Satake compactifications, pp. 81–103.1997].

Cf.[?Mil17b]P38 for a history. □

**Thm. (16.2.7.5) [Borel].** Let  $D(\Gamma)$  be a quotient variety (16.2.7.4) of a Hermitian symmetric domain by a torsion-free arithmetic subgroup  $\Gamma$  in  $\text{Aut}^{\text{Hol}}(D)^0$ , then for any other smooth quasi-projective variety  $V$  over  $\mathbb{C}$ , any holomorphism map  $V^{\text{an}} \rightarrow D(\Gamma)^{\text{an}}$  comes from a morphism. ┘

*Proof:*

□

**Cor. (16.2.7.6)[Algebraic Structure is Unique].** The algebraic variety structure on  $D(\Gamma)$  is unique. Any variety of the form is called a **locally symmetric variety**. ┘

*Proof:* If there is another structure, then by GAGA it is a smooth variety, then the holomorphic map extends to a bijective morphism, which must be an isomorphism, by [Milne, Algebraic Geometry, P188] ?. □

**Cor. (16.2.7.7)[Borel].** The Satake-Baily-Borel compactification (16.2.7.4)  $\overline{D(\Gamma)}$  is minimal in the sense that it factors through any compactification  $D(\Gamma) \subset V$  s.t.  $V \setminus D(\Gamma)$  is a divisor with only normal crossings as singularities. ┘

*Proof:* Cf.[Borel 1972] ?

□

## 16.3 Riemannian Geometry

References are [Riemannian Geometry Do Carmo], [Geometric Analysis Jost] and [Differential Geometry Loring Tu].

**Notation (16.3.0.1).**

- Use notations on smooth manifolds defined in [Smooth Manifolds I: Generalities](#).
- Let  $M \in \mathcal{D}\text{iff}_{\text{cntd}}$ .

┘

### 1 Euclidean Geometry

**Thm. (16.3.1.1) [Ptolemy].** Let  $A, B, C, D \in \mathbb{R}^2$ , then

$$d(A, C) \cdot d(B, D) \leq d(A, B) \cdot d(C, D) + d(A, D) \cdot d(B, C).$$

And the equality holds if  $A, B, C, D$  are consequence points on a circle.

┘

*Proof:* Use complex numbers. there is an identity

$$(A - B)(C - D) + (A - D)(B - C) = (A - C)(B - D),$$

thus by triangle inequality,

$$|(A - C)(B - D)| \leq |(A - B)(C - D)| + |(A - D)(B - C)|,$$

where the equality holds if  $A, B, C, D$  are consequence points on a circle.

□

**Thm. (16.3.1.2) [Euclid].** There are only five Platonic solids: tetrahedron, hexahedron, octahedron, dodecahedron and the icosahedron.

┘

*Proof:*

□

**Thm. (16.3.1.3) [Pappus Hexagon Theorem].** Let 1, 2, 3, 4, 5 be five points in  $\mathbb{TP}^2$ , and define the cross products:

$$a = 1 \otimes 4, b = 2 \otimes 4, c = 3 \otimes 4, a' = 1 \otimes 5, b' = 2 \otimes 5, c' = 3 \otimes 5,$$

$$6 = b \otimes c', 7 = a' \otimes c, 8 = a \otimes b', a'' = 1 \otimes 6, b'' = 2 \otimes 7, c'' = 3 \otimes 8.$$

Then the three tropical lines  $a'', b'', c''$  are concurrent.

┘

*Proof:*

□

### Higher Dimensions

**Remark (16.3.1.4).** Instead of using time to visualize higher dimensions, we can also use color to visualize higher dimensions. In fact, human eyes are even 3-color based, which means theoretically we can visualize  $\mathbb{R}^3$  simply using colors.

┘

## 2 Basics

**Def. (16.3.2.1) [Riemannian Manifolds].** A **Riemannian metric** on  $M$  is a smooth symmetric covariant 2-tensor field on  $M$  that is positive-definite at each point. A **Riemannian manifold** (possibly with boundaries) is a pair  $(M, g)$  where  $M \in \text{Diff}_\partial$  and  $g$  is a Riemannian metric on  $M$ .

The category of Riemannian manifolds is denoted by  $\text{RieMani}$ .  $\lrcorner$

**Prop. (16.3.2.2) [Existence of Riemannian Metrics].** Every smooth manifold  $M \in \text{Diff}_\partial$  admits a Riemannian metric.  $\lrcorner$

*Proof:* Use a Euclidean open covering and partition of unity (4.4.7.8).  $\square$

**Def. (16.3.2.3).** For  $(M, g) \in \text{RieMani}$ , in any local coordinate  $(x^i)$ ,  $g$  can be written as a symmetric tensor  $g = \sum g_{ij} x^i \otimes x^j$ .

For  $p \in M$  and  $v, w \in T_p M$ ,

- The **length** of  $v$  is defined to be

$$|v|_g^2 \triangleq \langle v, v \rangle_g^{1/2} \triangleq g_p(v, v)^{1/2}.$$

- The **angle** of  $v, w$  is defined to be the unique  $\theta \in [0, \pi]$  s.t.

$$\cos \theta = \frac{\langle v, w \rangle_g}{|v|_g |w|_g}.$$

- $v, w$  is said to be **orthogonal** if  $\langle v, w \rangle_g = 0$ .  $\lrcorner$

**Def. (16.3.2.4) [Orthonormal Frames].** For  $(M, g) \in \text{RieMani}$  and  $U \subset M$ , an **smooth orthonormal frame** is a local frame  $(E_1, \dots, E_n)$  on  $U$  s.t.  $(E_1|_p, \dots, E_n|_p)$  is an orthonormal frame for  $T_p M$  at each  $p \in U$ .  $\lrcorner$

**Prop. (16.3.2.5) [Constructing Orthonormal Frames].** For  $(M, g) \in \text{RieMani}$  and  $U \subset M$  with a smooth local frame  $(X_1, \dots, X_n)$  on  $U$ , there exists a smooth orthonormal frame  $(E_1, \dots, E_n)$  on  $U$  s.t.  $\text{span}(E_{1,p}, \dots, E_{j,p}) = \text{span}(X_{1,p}, \dots, X_{j,p})$  for each  $j \in [n]_+$  and  $p \in U$ .  $\lrcorner$

**Prop. (16.3.2.6).** If the metric tensor on the tangent space is  $g$  in a coordinate, then it is  $g^{-1}$  in the cotangent space. (Follows from??).  $\lrcorner$

**Def. (16.3.2.7) [Riemannian Volume Forms].** Suppose  $(M, g)$  is an oriented Riemannian manifold possibly with boundaries, then there is a unique smooth form  $\omega_g \in \Omega^n(M)$  s.t.

$$\omega_g(E_1, \dots, E_n) = 1$$

for each oriented local orthonormal from  $(E^1, \dots, E^n)$  on  $M$  (16.3.2.4), called the **Riemannian volume form**.

In any oriented smooth local chart  $(x^i)$ , this Riemannian volume form is given by

$$\omega_g = \sqrt{\det(g_{ij})} dx^1 \wedge \dots \wedge dx^n.$$

$\lrcorner$

*Proof:* Cf. [Lee13] P389.  $\square$

### Pseudo-Riemannian Manifolds

**Def. (16.3.2.8) [Pseudo-Riemannian Metrics].** A **pseudo-Riemannian metric** on  $M$  is a smooth symmetric covariant 2-tensor field on  $M$  that is non-degenerate at each point. A **pseudo-Riemannian manifold** (possibly with boundaries) is a pair  $(M, g)$  where  $M \in \text{Diff}_\partial$  and  $g$  is a pseudo-Riemannian metric on  $M$ .

A pseudo-Riemannian metric of signature  $(1, n-1)$  at each point is called a **Lorentz metric**. A **Lorentz manifold** (possibly with boundaries) is a pair  $(M, g)$  where  $M \in \text{Diff}_\partial$  and  $g$  is a Lorentz metric on  $M$ .  $\lrcorner$

## 3 $\mathbb{R}^3$ -Geometry

### Different Coordinates

**Prop. (16.3.3.1).** In a polar coordinate,

$$g_{11} = 1, g_{12} = 0, g_{22} = \left| \frac{\partial}{\partial \theta} f \right|^2, \quad K = -\frac{(\sqrt{g_{22}})_{\rho\rho}}{\sqrt{g_{22}}}$$

And  $\sqrt{g_{22}} \sim \rho$ . (Use the formula relating Jacobi Field with curvature)  $\lrcorner$

### Moving Frame Method

**Thm. (16.3.3.2) [Theorema Egregium, Gauss 1827].**

$$R_{1212} = K(g_{11}g_{22} - g_{12}^2)$$

Which is a special case of the definition of curvature.  $\lrcorner$

*Proof:*  $\square$

**Prop. (16.3.3.3) [Gauss-Bonnet].** Let  $M$  be a compact oriented 2-dimensional Riemannian manifold, then

$$\chi(M) = \frac{1}{2\pi} \int_M K \text{ Vol.}$$

*Proof:* Should be an direct corollary of (16.7.5.6).  $\square$

### Topology and Geometry

**Prop. (16.3.3.4).** Every compact orientable surface of genus  $p > 1$  can be provided with a metric of constant negative curvature.  $\lrcorner$

*Proof:*  $\square$

**Remark (16.3.3.5) [Hilbert Theorem].** There exist complete surfaces with  $K \leq 0$  in  $\mathbb{R}^3$ , but the hyperbolic surface cannot be immersed into  $\mathbb{R}^3$ .  $\lrcorner$

#### 4 Connections

**Def. (16.3.4.1) [Affine Connection].** An **affine connection** on a vector bundle  $E$  is a map  $D : \Gamma(E) \rightarrow \Gamma(E) \otimes \Gamma(T^*M)$  that satisfies differential-like properties, it can be written as  $D = d + \omega$ , with  $\omega \in \Omega^1(\text{End}(E))$ .  $\lrcorner$

**Prop. (16.3.4.2) [Transformation Law].** In two coordinates  $\bar{e} = ea$  for  $a : U \rightarrow GL(r, \mathbb{R})$ ,  $d_A = d + \omega, d + \bar{\omega}$ , then  $\bar{\omega} = a^{-1}\omega a + a^{-1}da$ .

Moreover, giving any locally compatible  $d + \omega, \omega \in \Omega^1(\mathfrak{g})$  in the sense above, then for any  $G$ -associated bundle  $E$ , where  $G$  has lie algebra  $\mathfrak{g}$ , there is a connection that locally looks like  $d + \omega$ , (where  $\mathfrak{g}$  embeds into  $\mathfrak{gl}(E)$ ).  $\lrcorner$

**Cor. (16.3.4.3) [Local Nature of Connection].** From the description of connection given above, it's easy to say if there is a local connection that satisfies these transformation laws, then it generate a global connection. So by partition of unity (4.4.7.8), connection exists in any vector bundle over a manifold.  $\lrcorner$

**Cor. (16.3.4.4) [Simplification].**  $d_{gA}(s) = g d_A(g^{-1}(s))$ , So for any connection  $d_A$  and any point  $x_0$ , there is a gauge transformation that makes  $d_A = d$  at  $x_0$ .  $\lrcorner$

*Proof:* Just need to have  $s(x_0) = \text{id}$ ,  $ds(x_0) = -A(x_0)$ . this is possible because  $A \in \Omega^1(\text{Ad}E)$  which is the fiber of the frame bundle, use  $\exp$ .  $\square$

**Prop. (16.3.4.5) [Induced connections].** The connection action  $d_A = d + \omega$  on a vector bundle  $E$  induces connection on many relevant bundles. the action on dual bundle is by

$$d_A(s^*) = ds^* - \omega^t(s^*) = ds^* - s^* \circ \omega.$$

And the connection on  $\text{End } E$  by

$$d_A(\alpha) = d\alpha + [\omega, \alpha] = [\nabla, \alpha]$$

And they act on  $\Omega^*(E)$  by Leibniz rule thus the formula looks the same. (Note that the convention is section write on the left of the differential forms, so for example,  $[\omega, \omega] = 2\omega \wedge \omega$ ).  $\lrcorner$

*Proof:* Cf. [Jost P110].  $\square$

**Cor. (16.3.4.6).** For a line bundle  $L$ , for a connection on it with curvature  $\Omega$ , the induced on the dual line bundle  $L^*$  has connection  $-\Omega$ . (because  $\Omega = d\omega$  and  $\omega' = -\omega$ ).  $\lrcorner$

**Prop. (16.3.4.7) [Second Bianchi's Identity].** A affine connection on  $E$  looks locally like  $d_A = d + \omega$ , where  $\omega \in \Omega^1(\text{End } E)$ . And  $F_A = d_A \circ d_A \in \Omega^2(\text{End}(E))$  satisfies

$$d_A F_A = dF_A + [\omega, F_A] = 0.$$

$\lrcorner$

*Proof:* Notice  $dF_A = dd\omega + d(\omega \wedge \omega) = d\omega \wedge \omega - \omega \wedge d\omega$ , and  $\omega(d\omega + \omega \wedge \omega) - (d\omega + \omega \wedge \omega)\omega = \omega \wedge d\omega - d\omega \wedge \omega$ .  $\square$

**Def. (16.3.4.8) [Christoffel Symbol].** The **Christoffel symbol** of a connection is defined by the equations:  $\nabla_{X_i} X_j = \sum_k \Gamma_{ij}^k X_k$ .

The **geodesic equations** is  $\frac{D}{dt}(\frac{d\gamma}{dt}) = \ddot{x}_k + \sum_{i,j} \Gamma_{ij}^k \dot{x}_i \dot{x}_j = 0 \quad \forall k$ .  $\lrcorner$

**Def. (16.3.4.9).** The **torsion tensor** of a connection  $\nabla$  on  $TM$  is defined as  $T(X, Y) = \nabla_X Y - \nabla_Y X - [X, Y]$ . The connection is called **torsion-free** if  $T = 0$ . This is equivalent to  $\Gamma_{i,j}^k = \Gamma_{j,i}^k$ .

A connection is called **metric** if it preserves metric. i.e.  $\nabla g = 0$ .  $\lrcorner$

*Proof:*  $T$  is a tensor because it is skew-symmetric, and

$$T(fX, Y) = f\nabla_X Y - f\nabla_Y X - df(Y)X - (f[X, Y] - df(Y)X) = fT(X, Y),$$

where (16.1.2.17) is used.  $\square$

**Prop. (16.3.4.10).** If  $\nabla$  is torsion-free connection on  $TM$ , then its induced connection on  $T^*M$  satisfies

$$(d\alpha)(v_1, \dots, v_k) = \sum (-1)^i (D_{v_i} \alpha)(v_1, \dots, \widehat{v_i}, \dots, v_k).$$

$\lrcorner$

*Proof:*  $\square$

**Def. (16.3.4.11) [Curvature Tensor].** The **curvature tensor** of a (affine) connection  $d_A$  is  $F_A = d_A \circ d_A \in \Omega^2(\text{End}(E))$ . The curvature tensor it induced is

$$F_A(Z)(X, Y) = R(X, Y)Z = D_Y D_X Z - D_X D_Y Z + D_{[X, Y]} Z.$$

In particular, the curvature depends only on the point, and locally  $F_A = d\omega + \omega \wedge \omega$

In two coordinates  $\bar{e} = ea$  for  $a : U \rightarrow GL(r, \mathbb{R})$ ,  $\overline{F_A} = a^{-1} F_A a$ .

The connection is called **flat** if  $F_A = 0$ .  $\lrcorner$

*Proof:* To verify the equation, check first the left side is pointwise, and the third component of the right side assures it is pointwise, too, thus we can check for a local coordinate vector field  $([X_i, X_j] = 0)$ , then because  $\nabla s = \sum_i \nabla_i s dx_i$ ,

$$\nabla^2 s = \nabla \left( \sum_i \nabla_i s dx_i \right) = \sum_{ij} \nabla_j \nabla_i s dx_j dx_i = \sum_{i < j} (\nabla_i \nabla_j - \nabla_j \nabla_i) s dx_i \wedge dx_j$$

$\square$

**Prop. (16.3.4.12) [Flat coordinate].** A connection on  $TM$  assumes near every point a flat coordinate, i.e.  $\nabla(\partial/\partial x^i) = 0$ , iff it is flat and torsion-free.  $\lrcorner$

*Proof:* One side is easy because its Christoffels vanish. On the other side, use integrability theorems (13.1.6.2). Cf. [Jost P115].  $\square$

**Prop. (16.3.4.13).**

$$\Delta \langle \varphi, \varphi \rangle = 2(\langle D^* D \varphi, \varphi \rangle - \langle D \varphi, D \varphi \rangle).$$

$\lrcorner$

*Proof:* Cf. [Jost P118].  $\square$

**Prop. (16.3.4.14).** For a flat connection, there is a bundle isomorphism (Gauge transform) that transforms  $d_A$  into natural  $d$ .  $\lrcorner$

*Proof:* Because  $d_{gA}(s) = gd_A(g^{-1}(s))$ ,  $d_{gA} = d - dg \cdot g^{-1} + g \cdot \omega \cdot g^{-1}$ . Solve this PDE directly. (Cf.[Topics in Geometry Xie Yi week3]).  $\square$

**Cor. (16.3.4.15).** For a flat connection, by (16.3.4.14), the parallel transportation only depends on the homotopy type of the loop, thus gives an action of  $\pi(X)$  on  $SO(T_p(X))$  (or  $SU(T_p(X))$ ). (because it is locally constant).

In this way, connections module gauge equivalence (preserving matrix) equals representation of  $\pi(X)$  module conjugations. The reverse map is giving by principal bundle.  $\lrcorner$

*Proof:*  $\square$

### Levi-Civita Connection

**Def. (16.3.4.16) [Levi-Civita Connection].** The Levi-Civita connection is the unique connection on  $M$  that is metric and torsion-free:

$$X\langle Y, Z \rangle = \langle \nabla_X Y, Z \rangle + \langle Y, \nabla_X Z \rangle, \quad \nabla_X Y - \nabla_Y X = [X, Y].$$

It satisfies:

$$\langle Z, \nabla_Y X \rangle = 1/2 \{ X\langle Y, Z \rangle + Y\langle Z, X \rangle - Z\langle X, Y \rangle - \langle [X, Z], Y \rangle - \langle [Y, Z], X \rangle - \langle [X, Y], Z \rangle \}.$$

Then

$$\Gamma_{ij}^m = 1/2 \sum_k \{ g_{jk,i} + g_{ki,j} - g_{ij,k} \} g^{km}$$

Thus geodesic is a solution that only depends on the metric (16.3.4.8), so a local isometry preserves geodesics.  $\lrcorner$

**Prop. (16.3.4.17).** Now the Lie derivative has the form:

$$L_X(S)(Y_1, \dots, Y_p) = \nabla_X(S)(Y_1, \dots, Y_p) + \sum_{i=1}^p S(Y_1, \dots, Y_{i-1}, \nabla_{Y_i} X, \dots, Y_p).$$

The exterior derivative  $d$  and its adjoint  $d^*$  has the form:

$$d\omega(Y_i) = \sum (-1)^p \nabla_{Y_i} \omega(\check{Y}_p), \quad d^* \omega(Y_i) = - \sum \nabla_{e_j} \omega(e_j, Y_i)$$

where  $e_i$  is an orthonormal basis. Cf.[Jost P140].  $\lrcorner$

**Prop. (16.3.4.18) [Covariant Differential Symmetry].** For a parametrized surface:  $s : (u, v) \rightarrow M$ ,

$$\frac{D}{\partial u} \frac{\partial s}{\partial v} = \frac{D}{\partial v} \frac{\partial s}{\partial u}.$$

$\lrcorner$

*Proof:*

$$\frac{D}{\partial u} \frac{\partial s}{\partial v} = \frac{D}{\partial u} \left( \sum \frac{\partial s_i}{\partial v} X_i \right) = \frac{\partial^2 s_i}{\partial u \partial v} + \sum \frac{\partial s_i}{\partial v} \left( \sum \frac{\partial s_j}{\partial u} \nabla_j X_i \right) = \frac{\partial^2 s_i}{\partial u \partial v} + \sum_{ij} \frac{\partial s_i}{\partial v} \frac{\partial s_j}{\partial u} \nabla_j X_i.$$

But now the Levi-Civita connection is symmetric, thus  $\nabla_j X_i = \nabla_i X_j$ , showing the symmetry in  $u$  and  $v$ .  $\square$

**Lemma (16.3.4.19) [Gauss].** Let  $p \in M$  and  $v \in T_p M$  s.t.  $\exp_p v$  is defined,  $w \in T_p M$ , then

$$\langle (d\exp_p)_v(v), (d\exp_p)_v(w) \rangle = \langle v, w \rangle.$$

┘

*Proof:* Cf.[Do Carmo P69].

□

**Prop. (16.3.4.20) [Geodesic Locally Minimizing].** In a normal nbhd of  $p$ , the geodesic starting at  $p$  is the minimal line. ┘

*Proof:* And curve  $c(t)$  can be written as  $\exp_p(r(t)v(t)) = f(r(t), t)$ , where  $f(s, t) = \exp_p(sv(t))$ , so by Gauss lemma,  $\langle \frac{\partial f}{\partial r}, \frac{\partial f}{\partial t} \rangle = 0$ . Now  $dc/dt = \partial f / \partial r r'(t) + \partial f / \partial t$ , so

$$|dc/dt|^2 = |r'(t)|^2 + |\partial f / \partial t|^2 \geq |r'(t)|^2.$$

Integrate this will give us the desired result. □

**Prop. (16.3.4.21) [Totally normal nbhd].** For any point  $p$ , there exists a nbhd  $W$  and a number  $\delta > 0$  s.t. for every  $q \in W$ ,  $\exp_q$  is a diffeomorphism on  $B_\delta(0)$  and  $\exp_q(B_\delta(0)) \supset W$ . Thus, fine cover exists in every smooth manifold, because Riemannian metric exists on these manifolds. ┘

*Proof:* Cf.[Do Carmo P72].

□

- **(Geodesic Frame)** In a neighborhood of every point  $p$ , there exists  $n$  vector fields, orthonormal at each point, and  $\nabla_{E_i} E_j(p) = 0$ . (Choose normal nbhd and parallel a orthonormal basis to every point. (WARNING: this is not a flat coordinate, it only helps when dealing with point-wise properties).)

**Def. (16.3.4.22) [Killing Fields].** A **Killing field** is a vector field which generates an infinitesimal isometry.  $X$  is killing  $\iff L_X(g) = 0 \iff \langle \nabla_Y X, Z \rangle + \langle \nabla_Z X, Y \rangle = 0$  for all  $Y, Z$ , which is called the **Killing equation**. ┘

*Proof:* Use Lie formula,

$$L_X(g)(Y, Z) = X\langle Y, Z \rangle - \langle [X, Y], Z \rangle - \langle Y, [X, Z] \rangle$$

. and Levi-Civita connection is torsion-free. □

**Prop. (16.3.4.23).** Let  $M$  be a compact Riemannian manifold of even dimension with positive sectional curvatures, then every Killing field on  $M$  has a singularity. ┘

*Proof:* Cf.[Do Carmo P104].

□

**Def. (16.3.4.24) [Geometric Differential Notations].** For  $f \in C^\infty(M)$ ,  $X \in \Gamma(M, TM)$ ,

- The **gradient** of  $f$  is defined to be the tangent field  $\text{grad} f \in \Gamma(M, TM)$  s.t. for any  $X \in \Gamma(M, TM)$ ,  $\langle \text{grad} f, X \rangle_p = X(f)(p)$ .
- The **divergence** of  $X$  is defined to be a function  $\text{div} X \in C^\infty(M)$  s.t. for any  $p \in M$ ,  $\text{div} X(p) = \text{trace of the linear map } Y(p) \rightarrow \nabla_Y X(p) = \sum_i \langle \nabla_{E_i} X, E_i \rangle$ . It measures the variation of the volume and it depends only on the point.
- The **Hessian** of  $f$  is defined to be a symmetric form  $\text{Hess} f \in \Gamma(M, T^*M^{\otimes 2}) \cong \text{Hom}(TM, TM)$  s.t. for any  $Y, Z \in \Gamma(M, TM)$ ,  $(\text{Hess} f)(Y, Z) = \langle (\text{Hess} f)Y, Z \rangle$  where  $(\text{Hess} f)Y = \nabla_Y \text{grad} f$ .

- The **Laplacian** of  $f$  is defined to be the function  $\Delta f = \operatorname{div} \operatorname{grad} f = \operatorname{tr}(\operatorname{Hess} f) \in C^\infty(M)$ .

┘

**Prop. (16.3.4.25).** In a geodesic frame,

$$\operatorname{grad} f(p) = \sum_{i=1}^n (E_i(f)) E_i(p)$$

$$\operatorname{div} X(p) = \sum_{i=1}^n E_i(f_i)(p), \text{ where } X = \sum_i f_i E_i.$$

$$\Delta f = \sum_i E_i(E_i(f))(p).$$

┘

**Cor. (16.3.4.26).**

$$\Delta(f \cdot g) = f \Delta g + g \Delta f + 2\langle \operatorname{grad} f, \operatorname{grad} g \rangle,$$

because these only depends on the point.

┘

**Prop. (16.3.4.27).**  $d(i(X)m) = (\operatorname{div} X)m$ . where  $m$  is the volume form.

┘

*Proof:* Choose a geodesic frame  $E_i$ ,  $\theta_i$  is a dual form of  $E_i$ , let  $X = \sum f_i E_i$ , then  $\iota(X)m = \sum_i (-1)^{i+1} f_i \theta_i$ , so

$$d(\iota(X)m) = \sum (-1)^{i+1} df_i \wedge \theta_i + \sum (-1)^{i+1} f_i \wedge d\theta_i = \left( \sum E_i(f_i) \right) m + \sum (-1)^{i+1} f_i \wedge d\theta_i.$$

Notice that  $d\theta_i = 0$ , because  $d\theta_k(E_i, E_j) = E_i \theta_k(E_j) - E_j \theta_k(E_i) - \theta_k([E_i, E_j]) = 0$  (16.1.3.4), as it is a geodesic frame. And  $\sum E_i(f_i) = \operatorname{div}(X)$  (16.3.4.25).  $\square$

**Prop. (16.3.4.28) [Hopf theorem].** If  $f$  is a differentiable function on a compact orientable manifold with  $\Delta f \geq 0$ , then  $f$  is constant.

┘

*Proof:* Let  $\operatorname{grad}(f) = X$ , then

$$\int_M \Delta f dm = \int_M \operatorname{div}(X) dm = \int_M d(\iota(X)m) = 0.$$

So  $\Delta f = 0$ . Now

$$0 = \int_M \Delta(f^2/2) dm = \int_M f \Delta f dm + \int_M |\operatorname{grad}(f)|^2 dm$$

by (16.3.4.26), thus  $\operatorname{grad}(f) = 0$ , so  $f$  is constant.  $\square$

**Def. (16.3.4.29) [Riemannian Curvatures].**

- The **sectional curvature**  $K(X, Y) = \frac{\langle R(X, Y)X, Y \rangle}{|X \wedge Y|^2}$ .
- The **Ricci curvature**  $\operatorname{Ric}(x) = \operatorname{Ric}(x, x)$ , where  $\operatorname{Ric}(x, y)$  is the symmetric form of  $\frac{1}{n}$  of trace of the map  $z \rightarrow R(x, z)y$ .  
Thus  $\operatorname{Ric}_p(x) = \frac{1}{n-1} \sum \langle R(x, z_i)x, z_i \rangle$ , for  $x$  a unit vector, where  $z_i$  is an orthonormal basis orthogonal to  $x$ .
- The **scalar curvature**  $K(p) = 1/n \sum \operatorname{Ric}_p(z_i)$ , where  $z_i$  is an orthonormal basis.

The curvatures only depends on the point (16.3.4.11).  $\square$

**Lemma (16.3.4.30).**

$$\frac{D}{\partial t} \frac{D}{\partial s} V - \frac{D}{\partial s} \frac{D}{\partial t} V = R\left(\frac{\partial f}{\partial s}, \frac{\partial f}{\partial t}\right)V.$$

┘

*Proof:* Obvious because  $\frac{\partial}{\partial s}, \frac{\partial}{\partial t}$  commutes. ?

□

**Prop. (16.3.4.31) [Sectional Curvature Define Curvature].** The curvature tensor is determined by its sectional curvature.

In particular, if  $M$  is isotropic at a point  $p$  (The sectional curvature depends only on the point), then

$$R(X, Y, W, Z) = K_0(\langle X, W \rangle \langle Y, Z \rangle - \langle X, Z \rangle \langle Y, W \rangle).$$

┘

*Proof:* Cf.[Do Carmo P95], should use the cyclicity of the first three terms.

□

**Prop. (16.3.4.32) [Bianchi Identities].** Recall the covariant differential

$$\nabla R(Y_i, Z) = Z(R(Y_i)) - \sum_i R(\nabla_Z Y_i, Y_j) \quad (16.3.4.5).$$

We have

- (Bianchi Identity)  $\sum_{(X,Y,Z)} R(X, Y)Z = 0$ .
- (Second Bianchi Identity)  $\sum_{(Z,W,T)} \nabla R(X, Y, Z, W, T) = 0$ .

┘

*Proof:* 1: Cf.[Do Carmo P91], should reduce to Jacobi identity.

2:

□

**Prop. (16.3.4.33) [Schur's Theorem].** Suppose  $\dim M \geq 3$  and the sectional curvature only depends on  $p$ , then  $M$  has constant curvature.

┘

*Proof:* Use the second Bianchi Identity and geodesic frame and (16.3.4.31). Cf.[Do Carmo P106].

□

**Def. (16.3.4.34) [Eisenstein Curvature].**  $M$  is called a **Eisenstein manifold** iff its Ricci curvature  $\lambda(p)$  only depends on the point. Then

- If  $M$  is connected and Eisenstein of dimension  $\geq 3$ , then it has constant Ricci curvatures everywhere every direction.
- If  $M$  is connected and Eisenstein of dimension 3, then it has constant sectional curvatures.

┘

*Proof:* 1: Cf.[Do Carmo P108].

2: Now it has constant Ricci curvature, then

$$R_{1212} + R_{1313} = \lambda = R_{1212} + R_{2323} = R_{1313} + R_{2323}.$$

So we can solve these curvatures out.

□

**Prop. (16.3.4.35) [Riemannian Curvature Identities].**

•

- $R(X, Y, Z, W) = R(Z, W, X, Y)$ ,  $R(X, Y, Z, W) = R(X, Y, W, Z)$ .

┘

*Proof:* Cf.[DO Carmo P91].

□

- $B(X, Y) = \bar{\nabla}_X \bar{Y} - \nabla_X Y$ . It is bilinear and symmetric.
- $H_\eta(x, y) = \langle B(x, y), \eta \rangle$ . Thus  $B(x, y) = \sum H_i(x, y) E_i$  for an orthonormal frame  $E_i$  in  $\mathfrak{X}(U)^\perp$ .
- $S_\eta(x) = -(\bar{\nabla}_x \eta)^T$ . It satisfies:  $\langle S_\eta(x), y \rangle = H_\eta(x, y) = \langle B(x, y), \eta \rangle$ . It is self-adjoint. When codimension 1, it is the derivative of the Gauss mapping.
- (**Gauss Formula**): let  $x, y$  be orthonormal tangent vector. Then:

$$K(x, y) - \bar{K}(x, y) = \langle B(x, x), B(y, y) \rangle - |B(x, y)|^2.$$

- An immersion is called **geodesic** at  $p$  if the second fundamental form  $S_\eta$  is zero for all  $\eta$ , (which means  $\nabla_X Y$  has no normal component). It is called **minimal** if the trace of  $S_\eta$  is zero.
- An immersion is called umbilic if there exists a normal unit field  $\eta$  s.t.  $\langle B(X, Y), \eta \rangle(p) = \lambda(p) \langle X, Y \rangle$ .
- If the ambient space has constant sectional curvature and the immersed manifold is totally umbilic, then  $\lambda$  is constant.
- mean curvature tensor of immersion  $f = 1/n \sum_i (\text{tr } S_i) E_i = 1/n \text{tr } B$ . It is zero if  $f$  is minimal.
- normal connection  $\nabla_X^\perp \eta = (\bar{\nabla}_X \eta)^N = \bar{\nabla}_X \eta + S_\eta(X)$ .

**Prop.(16.3.4.36).** • (Gauss equation)

$$\langle \bar{R}(X, Y)Z, T \rangle = \langle R(X, Y)Z, T \rangle - \langle B(Y, T), B(X, Z) \rangle + \langle B(X, T), B(Y, Z) \rangle.$$

- (Ricci equation)

$$\langle \bar{R}(X, Y)\eta, \zeta \rangle - \langle R^\perp(X, Y)\eta, \zeta \rangle = \langle [S_\eta, S_\zeta]X, Y \rangle.$$

- (Codazzo equation)

$$\langle \bar{R}(X, Y)Z, \eta \rangle = (\bar{\nabla}_Y B)(X, Z, \eta) - (\bar{\nabla}_X B)(Y, Z, \eta). \quad (\text{Lie bracket})$$

┘

### Parallel Transportations

**Def.(16.3.4.37)[Parallel Transportation].**

┘

**Def.(16.3.4.38)[Holonomy Group].** The **holonomy group**  $Hol_x(g)$  of a Riemannian manifold  $M$  w.r.t to the Levi-Civita connection is defined to be the subgroup of  $O(T_x(M))$  induced by the parallel transportation along a loop. If  $M$  is connected, For different points, holonomy groups are conjugate, so holonomy group is defined up to conjugation.

┘

**Prop.(16.3.4.39)[Trivial Holonomy Group].** If  $M$  is a Riemannian manifold and the holonomy group is trivial, then for any  $X, Y, Z \in X(M)$ ,  $R(X, Y)Z = 0$ .

┘

*Proof:* Cf.[Do Carmo P105].

□

**Prop. (16.3.4.40) [Berger].** In fact, the groups that can be realized as a holonomy group of a simply connected complete Riemannian manifold can be classified.  $\lrcorner$

*Proof:* Cf. [Complex geometry Daniel P214].  $\square$

**Def. (16.3.4.41).** The **Geodesic flow** for a connection on  $TM$  is the flow on  $TM$  whose trajectories are  $t \mapsto (\gamma(t), \gamma'(t))$ , where  $\gamma$  is a geodesic on  $M$ .  $\lrcorner$

**Prop. (16.3.4.42) [The smoothness of geodesics].** For every point  $p$ , there exists a nbhd  $V$  and a  $C^\infty$  mapping

$$\gamma : (-\delta, \delta) \times V \times B(0, \epsilon) \rightarrow M,$$

s.t.  $\gamma(t, q, v)$  is the geodesic passing through  $p$  with velocity  $v$ .  $\lrcorner$

**Prop. (16.3.4.43) [Curvature and Metric, Cartan].** Let  $M, \widetilde{M}$  be two Riemannian manifold of dimension  $n$  and let  $p \in M, \tilde{p} \in \widetilde{M}$ . Choose a linear isometry  $i : T_p(M) \cong T_{\tilde{p}}(\widetilde{M})$ . Let  $V$  be a normal neighbourhood of  $p$  that  $\exp_p$  is defined on  $i \circ \exp_p^{-1}(V)$ . Define a mapping  $f : V \rightarrow \widetilde{M}$  by  $f(q) = \exp_{\tilde{p}} \circ i \circ \exp_p^{-1}(q)$ .

For any  $q \in V$ , there is a unique normalized geodesic  $\gamma : [0, t] \rightarrow M$  that  $\gamma(0) = p, \gamma(t) = q$ . Denote by  $P_t$  the parallel transportation along  $\gamma$ , and the map  $\varphi_t : T_q(M) \rightarrow T_{f(q)}(\widetilde{M})$  by  $\varphi_t(v) = \tilde{P}_t \circ i \circ P_t^{-1}(v)$ .

If for all  $q \in V$  and all  $x, y, u, v \in T_q(M)$ , we have

$$\langle R(x, y)u, v \rangle = \langle \tilde{R}(\varphi_t(x), \varphi_t(y)\varphi_t(u), \varphi_t(v)) \rangle,$$

then  $f : V \rightarrow f(V) \subset \widetilde{M}$  is an isometry and  $df_p = i$ .  $\lrcorner$

*Proof:* Cf. [Do Carmo P157]. Use Jacobi fields. The point is that the hypothesis implies that the map of a Jacobi field is also a Jacobi field.  $\square$

**Cor. (16.3.4.44).** Let  $M, \widetilde{M}$  be Riemannian manifolds with the same dimension  $n$  in which parallel transportation preserves sectional curvature. Let  $p \in M, \tilde{p} \in \widetilde{M}$ . If there is a linear isometry  $i : T_p(M) \cong T_{\tilde{p}}(\widetilde{M})$  s.t.  $K(p, E) = K(\tilde{p}, i(E))$  for any 2-dimensional subspace  $E \subset T_p(M)$ , then there exist nbhd  $V$  of  $p$ , nbhd  $\tilde{V}$  of  $\tilde{p}$  and an isometry  $f : V \rightarrow \tilde{V}$  that  $df_p = i$ .  $\lrcorner$

**Cor. (16.3.4.45).** If in situation (16.3.4.44),  $M$  and  $\widetilde{M}$  are moreover complete and simply connected, then there is a unique isometry  $f : M \rightarrow \widetilde{M}$  s.t.  $f(p) = \tilde{p}$  and  $df_p = i$ .  $\lrcorner$

### Complete manifold

**Thm. (16.3.4.46) [Hopf-Rinow theorem].** The following is equivalent definition of **completeness** for  $M \in \text{Diff}_{\text{cnd}}$ :

1.  $\exp_p$  is defined for all of  $T_p(M)$  and all  $p \in M$ .
2. The closed and bounded sets of  $M$  are compact.
3.  $M$  is complete as a metric space.
4.  $M$  is  $\sigma$ -compact and if  $q_n \notin K_n$ ,  $d(p, q_n) \rightarrow \infty$ .
5. The length of any divergent (compact escaping) curve is unbounded.

and if  $M$  is complete, then for any  $p, q \in M$ , there exists a minimizing geodesic between  $p, q$ . In particular, any compact submanifold of a complete manifold is complete.  $\lrcorner$

*Proof:* Cf.[Do Carmo P147]. □

- For any two manifold of the same constant curvature and any two orthogonal basis, there is a local isometry (It is locally isotropic).
- Any complete manifold with a sectional curvature is like  $\tilde{M}/\Gamma$ , where  $\tilde{M}$  is  $\mathbf{H}^n$ ,  $\mathbf{R}^n$  or  $\mathbf{S}^n$ .

**Prop.(16.3.4.47) [Cartan].** in any nontrivial homotopy class in a compact manifold , there exists a closed geodesic. ┘

*Proof:* □

## 5 Jacobi Field and Comparison Theorems

**Def.(16.3.5.1) [Jacobi Field].** The **Jacobi field equation** along a normalized geodesic  $\gamma$  is defined to be

$$D^2 J(t) + R(\dot{\gamma}(t), J(t))\dot{\gamma}(t) = 0.$$

It is defined by its initial condition  $J(0)$  and  $J'(0)$ . It can be used to detect the sectional curvature, the critical point of  $\exp_p$  and calculate variation of energy. ┘

**Prop.(16.3.5.2) [Constant Curvature Case].** On a manifold with constant curvature  $K$ , the Jacobi field equation for a vector field  $J$  normal to  $\gamma$  is equivalent to

$$D^2 J(t) + KJ(t) = 0.$$

┘

*Proof:* Use(16.3.4.31), we have

$$\langle R(\gamma', J)\gamma', T \rangle = K\{\langle \gamma', \gamma' \rangle \langle J, T \rangle - \langle \gamma', T \rangle \langle J, \gamma' \rangle\} = K \langle J, T \rangle$$

So  $R(\gamma', J)\gamma' = KJ$ . □

**Prop.(16.3.5.3).** The Jacobi field along a point with initial velocity 0 all has the form

$$J(t) = (d\exp_p)_{t\dot{\gamma}(0)}(tJ'(0)).$$

┘

*Proof:* Cf.[Do Carmo P113]. Should use uniqueness theorem of ODE. □

**Cor.(16.3.5.4) [Conjugate Points].** If two points  $p, q$  are connected by a geodesic  $\gamma$ , and  $q = \exp_p(v_0)$ , then  $p, q$  are called **conjugate** along  $\gamma$ , if there is a non-trivial Jacobi field on  $\gamma$  that  $J(p) = J(q) = 0$ .

Then  $q$  is conjugate to  $p$  iff  $v_0$  is the critical point of  $\exp_p$ , and the multiplicity of conjugacy is equal to the kernel of  $(\exp_p)_{v_0}$ . ┘

**Prop.(16.3.5.5).** For a Jacobi field  $J$  along  $\gamma$ ,  $\langle J(t), \gamma'(t) \rangle$  is linear in  $t$ . ┘

*Proof:* Take second derivatives. □

- If  $J$  is a Jacobi field  $J(t) = (d\exp_p)_{tv}(tw)$ ,  $|v| = |w| = 1$ , then

$$|J(t)| = t - \frac{1}{6}K_p(v, w)t^3 + o(t^3).$$

**Prop. (16.3.5.6).** There are no conjugate points on a Riemannian manifold of non-positive curvature.  $\perp$

*Proof:* Cf.[Do Carmo P119].  $\square$

**Prop. (16.3.5.7)[Killing Field is everywhere Jacobi].** A Killing field is a Jacobi field along geodesics. And if  $X(p) = 0$ , then  $X$  is tangent to the geodesic sphere near  $p$ , because  $X$  preserves length.  $\perp$

*Proof:*  $\square$

### Energy Analysis

**Def. (16.3.5.8)[Energy].** The **energy** of a geodesic  $\gamma : [0, a] \rightarrow M$  is defined to be

$$E(s) = \int_0^a \left| \frac{\partial}{\partial t} \gamma(s, t) \right|^2 dt.$$

$\perp$

**Prop. (16.3.5.9).** A minimizing geodesic must minimize energy.  $\perp$

*Proof:*  $\square$

- **(First Variation of Energy)**

$$1/2E'(0) = - \int_0^a \langle V(t), D\dot{c}(t) \rangle dt + \langle V(a), \dot{c}(a) \rangle - \langle V(0), \dot{c}(0) \rangle.$$

A piecewise differentiable curve is a geodesic iff every proper variation has first derivative 0.

- **(Second Variation of Energy)** If  $\gamma$  is a geodesic,

$$1/2E''(0) = \int_0^a \{ \langle DV(t), DV(t) \rangle - \langle R(\dot{\gamma}, V)\dot{\gamma}, V \rangle \} dt + \langle D_s V(a), \dot{\gamma}(a) \rangle - \langle D_s V(0), \dot{\gamma}(0) \rangle.$$

- a variation is equivalent to a vector field along the curve, and a variation that  $f_s(t)$  are all piecewise geodesics corresponds to a piecewise Jacobi field(Choose a normal partition).

**Prop. (16.3.5.10)[Rauch Comparison theorem].** Let  $M$  and  $\tilde{M}$  be manifolds,  $\dim \tilde{M} \geq \dim M$ .

If  $J$  and  $\tilde{J}$  be two normal Jacobi fields along geodesics  $\gamma$  and  $\tilde{\gamma}$  that  $|J(0)| = |J'(0)| = 0$  and  $|J'(0)| = |\tilde{J}'(0)|$ . If  $\tilde{\gamma}$  has no conjugate point or focal point free and  $\tilde{K}(\tilde{x}, \dot{\tilde{\gamma}}(t)) \geq K(x, \dot{\gamma})$  for any vector  $x, \tilde{x}$ , then  $|\tilde{J}| \leq |J|$ .  $\perp$

**Cor. (16.3.5.11)[Injectivity Radius Estimate].** If the sectional curvature of  $M$  satisfies:  $0 < L \leq K \leq H$ , then the distance between any two conjugate points satisfies:  $\frac{\pi}{\sqrt{H}} \leq d \leq \frac{\pi}{\sqrt{L}}$ .  $\perp$

**Prop. (16.3.5.12).** If two manifold  $M$  and  $M'$  satisfy  $K \leq K'$ , then in a normal nbhd of a point  $p$  in  $M$  and a nbhd of  $p'$  that exp is nonsingular, the transformation of a curve  $c$  shortens length.

Note that this is not Toponogov theorem, because if you try to map from a large curvature manifold to a small curvature, then you cannot guarantee that the mapped curve is the shortest.  $\perp$

**Cor. (16.3.5.13).** In a complete simply connected manifold of non-positive curvature,

$$A^2 + B^2 - 2AB \cos \gamma \leq C^2$$

thus  $\alpha + \beta + \gamma \leq \pi$ .  $\perp$

**Prop. (16.3.5.14) [Moore theorem].** Let  $\bar{M}$  be a complete simply connected manifold of sectional curvature  $\bar{K} \leq -b \leq 0$ ,  $M$  a compact manifold of sectional curvature satisfying  $K - \bar{K} \leq b$ . If  $\dim \bar{M} < \dim M$ ,  $M$  cannot be immersed into  $\bar{M}$ . (use Hadamard theorem to choose the furthest geodesic and calculate the second variation of energy and use Gauss formula).  $\lrcorner$

**Cor. (16.3.5.15).** Let  $\bar{M}$  be a complete simply connected manifold of sectional curvature  $\bar{K} \leq 0$ ,  $M$  a compact manifold of sectional curvature satisfying  $K \leq \bar{K}$ . If  $\dim \bar{M} < \dim M$ ,  $M$  cannot immerse into  $\bar{M}$ .  $\lrcorner$

**Lemma (16.3.5.16) [Klingenberg Lemma].** Let  $M$  be a complete manifold of sectional curvature  $K \geq K_0$ , let  $\gamma_0, \gamma_1$  be two homotopic geodesics from  $p$  to  $q$ , then there exists a middle curve  $\gamma_s$  s.t.

$$l(\gamma_0) + l(\gamma_s) \geq \frac{2\pi}{\sqrt{K_0}}.$$

$\lrcorner$

*Proof:* Assume  $l(\gamma_0) < \frac{2\pi}{\sqrt{K_0}}$ , otherwise we are done. Then by Rauch comparison (16.3.5.10), the  $\exp_p : T_p M \rightarrow M$  has no critical point in the open ball  $B$  of radius  $\pi/\sqrt{K_0}$ . Now we want to lift  $\gamma_s$  to  $T_p M$ . It is clear that we cannot lift  $\gamma_1$ , because otherwise it is not a curve. Hence for every  $\varepsilon > 0$ , there is a curve  $\alpha_{t(\varepsilon)}$  that can be lifted and has a point with distance smaller than  $\varepsilon$  to the boundary  $\partial B$ , otherwise the  $s$  that can be lifted will be open and closed in  $[0, 1]$ , thus containing 1.

So now if we choose a sequence of lifts curves  $\gamma_s$  converging to the boundary, then  $s$  has a convergent point, then we have  $l(\gamma_0) + l(\gamma_{t_0}) \geq \frac{\pi}{\sqrt{K_0}}$ .  $\square$

**Prop. (16.3.5.17) [Klingenberg].** Let  $M$  be a simply connected compact manifold of dimension  $n \geq 3$  such that  $\frac{1}{4} < K \leq 1$ , then  $i(M)$  (The infimum of distance to the cut locus)  $\geq \pi$ .  $\lrcorner$

**Cor. (16.3.5.18).** If  $M$  is a compact orientable manifold of even dimension satisfying  $0 < K \leq 1$ , then  $i(M) \geq \pi$ .  $\lrcorner$

**Prop. (16.3.5.19) [1/4-pinch Sphere Theorem].** Let  $M$  be a compact simply connected manifold satisfying  $0 < 1/4K_{\max} < K \leq K_{\max}$ , then  $M$  is homeomorphic to a sphere.

(Use Klingenberg Theorem, this is a special case of diameter geodesic sphere theorem). Cf. (16.3.5.29).

It can be shown that in this case, this sphere is even diffeomorphic to  $S^n$  using Ricci flow.  $\lrcorner$

**Remark (16.3.5.20).**  $0 < 1/4K_{\max} < K$  cannot be changed to  $\geq$ . In fact, the Funibi-Study metric on  $CP^n$  has sectional curvature  $1 \geq K \geq 4$ . Cf. ??  $\lrcorner$

$\text{Hess}\rho(X, Y)$  where  $\rho$  is the distance to a fixed point, is important.

**Prop. (16.3.5.21).**  $\text{Hess}\rho(X, Y)$  is positive definite on the tangent space of the geodesic sphere within the injective radius, and its principal value is  $|\frac{J'}{J}|$  for a Jacobi field in that direction. And it is zero on the normal direction.

So there would be a Riccati comparison theorem on the eigenvalue of  $\Pi_2 : \lambda' \leq -K - \lambda^2, \text{Hess}(\rho)$  is bounded.  $\lrcorner$

*Proof:* Notice that

$$\text{Hess}\rho(X, Y) = (\nabla_X \text{grad}\rho, Y) = XY\rho - (\nabla_X Y)\rho$$

so if choose a normal geodesic  $\gamma$  of initial vector  $X$ , then

$$\begin{aligned} \text{Hess}\rho(X, X) &= X\langle \dot{\gamma}, d\rho \rangle - (\nabla_X \dot{\gamma})\rho = X\langle \dot{\gamma}, d\rho \rangle = \langle \dot{\gamma}, d\langle \dot{\gamma}, d\rho \rangle \rangle = E''(0) \\ &= I_q(X, X) = ((\nabla_{\dot{\gamma}} X)(q), X(q)) = \frac{\langle J', J \rangle}{|J|^2} \end{aligned}$$

□

**Prop. (16.3.5.22) [Toponogov].** Let  $M$  be a complete manifold with  $K \geq H$ .

If a hinge satisfies  $\gamma_1$  is minimal and  $\gamma_2 \geq \frac{\pi}{\sqrt{H}}$  if  $H > 0$ ., then on  $M^H$  the same hinge has smaller distance of endpoints than this hinge

┘

*Proof:* Cf. [Cheeger Comparison Theorems in Riemannian Geometry P42]. And there is another triangle version: For a minimal geodesic triangle, the comparison triangle has smaller angles. NOTE this theorem cannot be derived from Rauch Comparison Theorem. □

### Critical Point for Distance Function

**Prop. (16.3.5.23).** The critical point for distance function on a complete manifold is that for every direction  $v$ , there is a minimal geodesic  $\gamma$  s.t.  $\langle \gamma'(l), v \rangle \leq \frac{\pi}{2}$ .

The set of regular point is open and there exists a smooth gradient like vector field (i.e. acute angle with every minimal geodesic) on this open subset .

┘

**Prop. (16.3.5.24) [Berger's Lemma].** A maximal point for the distance function is a critical point. ┘

*Proof:* If not, choose a convergent point  $v$  of the minimal geodesics with endpoint in a curve of that direction, then exp near  $v$  will generate a Jacobi field with endpoint Jacobi is the sam of that direction. So the distance will increase by  $\cos \theta$  along that direction, contradiction. □

**Prop. (16.3.5.25) [Soul Lemma].** Let  $M$  is a Riemannian manifold and  $A$  is a closed submanifold. If  $\text{dist}(A, -)$  has no critical point on  $D(A, R) \setminus A$ , then  $B(A, R)$  is diffeomorphic to the normal bundle of  $A \rightarrow M$ .

┘

*Proof:*  $A$  has a normal exp radius  $\epsilon$ , and we can vary the gradient-like vector field to be identical to the normal vector near  $A$ , and use Morse lemma (the flow) to get a diffeomorphism. □

**Cor. (16.3.5.26) [Disk Theorem].** If  $A$  is a point then  $M$  is diffeomorphic to a disk. ┘

**Lemma (16.3.5.27) [Generalized Schoenflies Theorem].** Easy to do, just use the fact that exp is continuous to find a boundary sphere depending continuously on the direction (both  $p$  and  $q$ ). ┘

**Prop. (16.3.5.28) [Sphere Theorem].** If  $M$  is a closed manifold and has a distance function with only one critical point (the furthest one), then  $M$  is homeomorphic to a twisted ball. ┘

*Proof:* There exists a  $\epsilon$  and  $r$  that  $B(q, \epsilon)$  and  $B(p, r)$  covering  $M$ , (Use the convergent point argument). Then use the generalized Schoenflies theorem. □

**Prop. (16.3.5.29) [Diameter Sphere Theorem].** If a closed manifold  $M$  satisfies  $\text{sec } M \geq K > 0$ , and  $\text{diam}(M) > \frac{\pi}{2\sqrt{K}}$ , then  $M$  is homeomorphic to  $S^n$ . ┘

*Proof:* First, if there are two maximal distance point, then use Toponogov to show contradiction. Second, at other points  $x$ ,

$$\angle pqx > \frac{\pi}{2}$$

(Regular domain) because of Toponogov and The formula

$$\cos \tilde{\alpha} = \frac{\cos l - \cos l_1 \cos l_2}{\sin l_1 \sin l_2}.$$

So the geodesic direction  $\vec{xq}$  will serve as a geodesic-like vector field (might need paracompactness).  
□

**Prop. (16.3.5.30) [Critical Principle].** In a complete manifold  $M$  of sectional curvature  $> K$ , if  $q$  is a critical point of  $p$ , then for any point  $x$  with  $d(p, x) > d(p, q)$  and any minimal geodesic from  $p$  to  $x$ , the  $\angle xpq$  is smaller than the  $\cosh_K^{-1}(\frac{d(p, x)}{d(p, q)})$ . ┘

*Proof:* Use Toponogov for the hinge  $xpq$ . Then notice that there is a different minimal geodesic from  $p \rightarrow q$  that makes the  $\angle pqx < \pi/2$  by the definition of critical point, thus there is another Toponogov inequality, this two inequality contradicts. □

**Cor. (16.3.5.31).** For a complete open manifold whose  $K$  are lower bounded, then it is homeomorphic to the interior of a manifold with boundary. (Use Soul lemma, otherwise there will be a sequence of critical point whose angles are big). ┘

**Prop. (16.3.5.32).** ray construction and Line construction ? ┘

**Prop. (16.3.5.33) [Soul Theorem].** If  $M$  is an open manifold with  $K \geq 0$ , then there is a totally geodesic submanifold  $S$  that  $M$  is diffeomorphic to the normal bundle over  $S$ . ┘

*Proof:* Use the ray construction to get a totally convex compact subset, hence it is a manifold or with boundary, if it has boundary, then find to set of maximal distance to the distance to boundary, the distance to the boundary is a convex function, so it is a smaller totally geodesic manifold. So a  $S$  without boundary must exist and this constitutes a stratification, all the level set is strongly convex. Thus all point outside  $S$  is not critical, hence the soul lemma applies. Cf.[GeJian Comparison theorems in Riemannian Geometry Lecture7]. □

**Prop. (16.3.5.34) [Perelman].** There is a distance non-increasing contraction unto the soul, and it must be just the projection along the normal bundle. Moreover, for any geodesic on the soul and a parallel vector field in the normal bundle along it, it spans a flat surface (by Rauch comparison). ┘

**Cor. (16.3.5.35) [Soul Conjecture].** For an open(non-compact) complete manifold  $M$  with  $K \geq 0$ , if it has a point  $p$  s.t. sectional curvature at  $p$  are all positive, then  $M$  is diffeomorphic to  $\mathbb{R}^n$ . (It's enough to show that its soul is a point, otherwise for any point, it must has a direction that is flat,  $K = 0$ ). ┘

## 6 Curvature Inequalities and Topology

### Sectional Curvature

**Prop. (16.3.6.1) [Hadamard theorem].**  $M$  a complete simply connected Riemann manifold of sectional curvature  $\leq 0$ , then  $\exp_p : T_p M \rightarrow M$  is an isomorphism of  $M$  to  $\mathbb{R}^n$ . (negative sectional curvature to show  $\exp$  is a local isomorphism, complete to show it is a covering map) ┘

**Prop. (16.3.6.2) [Liouville Theorem].** Any conformal mapping for an open subset of  $\mathbb{R}^n, n > 2$  is restriction of a composition of isometry, dilations and/or inversions, at most once.  $\lrcorner$

**Prop. (16.3.6.3) [Positive Curved, Closed Geodesic not Minimal].** If  $M$  is an even dimensional orientable Riemannian manifold with positive sectional curvature, let  $\sigma : [0, 1] \rightarrow M$  be a closed geodesic curve, then there exists an  $\varepsilon > 0$  that parametrized closed curves  $F; [0, 1] \times (-\varepsilon, \varepsilon) \rightarrow M$  near  $\sigma$  with lengths less than that of  $\sigma$ .  $\lrcorner$

*Proof:* Cf. [Solution to Yau Test Geometry Individual 2013 Prob5].  $\square$

**Prop. (16.3.6.4) [Synge].**  $f$  is an isometry of a compact oriented manifold  $M^n$  of positive sectional curvature,  $f$  alter orientation by  $(-1)^n$ , then  $f$  has a fixed pt.  $\lrcorner$

*Proof:* Cf. [Do Carmo P203].  $\square$

**Cor. (16.3.6.5).**  $M$  a compact manifold of positive sectional curvature, then

1. If  $M$  is orientable and  $n$  is even, then  $M$  is simply connected. So If  $M$  is compact and even dimension, then  $\pi(M) = 1$  or  $\mathbb{Z}_2$ .
2. If  $n$  is odd, then  $M$  is orientable.

(Use the universal cover and covering transformation.)  $\lrcorner$

**Conj. (16.3.6.6) [Hopf Conjecture].** If  $M$  is a compact Riemannian manifold of even dimension that  $K > 0$ , then it has positive Euler characteristic.  $\lrcorner$

### Morse Index

**Prop. (16.3.6.7) [Index Lemma].** Among the piecewise differentiable vector fields along a geodesic without conjugate point or without focal point, with initial value 0 and fixed end value, the Jacobi field attain minimum of the index form:

$$I_a(V, V) = \int_0^a \{ \langle DV(t), DV(t) \rangle - \langle R(\dot{\gamma}, V)\dot{\gamma}, V \rangle \} dt.$$

$\lrcorner$

**Cor. (16.3.6.8).**  $I_l(J, J) = \langle J, J' \rangle(l)$  for a Jacobi field.  $\lrcorner$

**Prop. (16.3.6.9).** a focal point is a critical value of  $\exp^\perp$ . For an embedded manifold, the focal point equals  $x + 1/t\eta$ , where  $\eta$  is a vertical vector and  $t$  is a principal value of  $S_e ta$ .  $\lrcorner$

**Prop. (16.3.6.10) [Morse Index theorem].** The index of the the index form  $I_a(V, W)$  on the space of vector fields 0 at the endpoints, equal to the number of points conjugate to  $\gamma(0)$  in  $[0, a)$ .  $\lrcorner$

**Cor. (16.3.6.11).** If  $\gamma$  is minimizing,  $\gamma$  has no conjugate points on  $(0, a)$ ,  $\gamma$  has a conjugate point, it is not minimizing.  $\lrcorner$

**Prop. (16.3.6.12) [Morse].** If  $M$  is complete with non-negative sectional curvature, then  $\pi_1(M)$  have no finite non-trivial cyclic group and  $\pi_k(M) = 0$ .  $\lrcorner$

*Proof:* because universal cover of  $M$  is contractible, so the higher homotopy group vanish and  $H^k(M) = H^k(\pi_1(M))$ , so if a subgroup is finite cyclic, its homology is periodic, contradiction.  $\square$

**Prop. (16.3.6.13) [Preissman].** For a compact manifold with  $K < 0$ , any nontrivial abelian subgroup of  $\pi_1$  is infinite cyclic.  $\lrcorner$

**Prop. (16.3.6.14).** If  $M$  is compact and  $K < 0$ ,  $\pi_1(M)$  is not abelian.  $\lrcorner$

Assuming  $M$  complete,

- The cut point of  $p$  along  $\gamma$  is the maximum  $\gamma(t)$  s.t.  $d(p, \gamma(t)) = t$ . It is either the first conjugate point of  $p$  or the intersection of two minimizing geodesics.
- Conversely, if a point is a conjugate point of  $p$  or is intersection of two geodesics of equal length, then there is a cut point before it. So, if intersection of two minimizing geodesics happens, it must happen before the occurrence of conjugate point.
- thus the cut point relation is reflexive, and if  $q \in M \setminus C_m(p)$ , then there exists a unique minimizing geodesic joining  $p$  and  $q$ .
- $M \setminus C_m(p)$  is homeomorphic to an open ball through  $\exp$ .
- the distance of  $p$  to the cut locus is continuous, thus  $C_m(p)$  is closed.
- If  $M$  is complete and there is a  $p$  which has a cut point for every geodesic, then  $M$  is compact.
- for  $q$  the closest of  $C_m(p)$  to  $p$ , either there exists a minimizing geodesic and  $q$  is conjugate to  $p$  or there is to minimizing geodesic connecting at  $q$ .

**Prop. (16.3.6.15).** The index of a geodesic will decrease when transferred to a manifold of smaller sectional curvature  $K$ .  $\lrcorner$

**Prop. (16.3.6.16).** In a complete manifold, if there is a sequence of points  $\{p_i\}$  converging to a point  $p$ , choose for each point a minimal geodesic, then a subsequence of them will converge to a minimal geodesic to  $p$ .  $\lrcorner$

*Proof:* The convergence is by smoothness and of  $\exp$  and Hadamard. The minimality is by comparing distance.  $\square$

### Ricci Curvature

**Prop. (16.3.6.17) [Ricci Comparison].** Volume comparison, Laplacian Comparison, Mean Curvature comparison. Cf. [葛健 Week13].  $\lrcorner$

**Prop. (16.3.6.18) [Bishop-Gromov].** Let  $M$  be an open manifold with  $\text{Ric} \geq H$ , let  $\tilde{M}(H)$  be a complete simply connected manifold of constant sectional curvature  $H$ , then

$$\text{Vol}(B_r(x)) \leq \text{Vol}(B_r(\tilde{p})), \quad \frac{\text{Vol}(B_R(x))}{\text{Vol}(B_r(x))} \leq \frac{\text{Vol}(B_R(\tilde{p}))}{\text{Vol}(B_r(\tilde{p}))}.$$

Cf. [葛健 Week13].  $\lrcorner$

**Prop. (16.3.6.19) [Bonnet-Myer].**  $M$  a complete manifold of Ricci curvature  $\text{Ric}_p(v) \geq \frac{1}{r^2}$ , Then  $M$  is compact and have diameter  $\leq \pi r$ .

And if the identity is achieved,  $M \cong \mathbb{S}^n$ .  $\lrcorner$

*Proof:* Use Laplacian comparison  $\Delta r \leq (n-1) \cot r$ . Cf. [葛健 week13].  $\square$

**Cor. (16.3.6.20) [Positive Ricci Finite Fundamental Groups].**  $M$  is a complete manifold of Ricci curvature  $\geq \delta > 0$ , then the universal cover is compact thus  $\pi_1(M)$  is finite. This can be seen as an obstruction for a compact manifold to have positive Ricci curvature.  $\lrcorner$

**Cor. (16.3.6.21) [Calabi-Yau].** For an open manifold with non-negative Ricci curvature, for any point,  $\text{Vol}(B(p, r)) \geq c_p r$ .  $\lrcorner$

**Prop. (16.3.6.22) [Milnor].** Let  $M$  be an open manifold of non-negative Ricci curvature of dimension  $n$ , then any f.g. subgroup of  $\pi_1(M)$  has polynomial growth  $\leq n$ . Milnor conjectured that  $\pi_1(M)$  in fact is f.g..  $\lrcorner$

**Prop. (16.3.6.23) [First Betti Number Theorem].** There is a number  $f(n, \lambda, D)$ ,  $f(n, 0, D) = n$ ,  $f(n, \lambda, D) = 0$  for  $\lambda > 0$  that for a manifold of diameter  $\leq D$  and Ricci curvature  $\geq \lambda$ ,  $b_1(M) \leq f(n, \lambda, D)$ .  $\lrcorner$

**Cor. (16.3.6.24) [Splitting Theorem].** The universal cover of a compact Riemannian manifold with non-negative Ricci curvature splits isometrically as a product  $\widetilde{M} = N \times \mathbb{R}^k$  where  $N$  is a compact manifold manifold.  $\lrcorner$

### Scalar Curvature

## 16.4 Smooth Manifolds II: Differential Topology

This section uses the tool of differential forms to analyze algebraic topology.

References are [Differential Forms in Algebraic Geometry Bott-Tu] and [G-P74].

**Notation(16.4.0.1).**

- Use notations on smooth manifolds defined in [Smooth Manifolds I: Generalities](#).

┘

### 1 Basics

**Prop.(16.4.1.1)[Cohomological Generator of Sphere].** Let  $v : x \mapsto x/|x|$  be the outward-pointing vector field on  $\mathbb{R}^n \setminus \{0\}$ , then the differential form

$$v \lrcorner dm = \frac{1}{|x|} \sum x_i (-1)^{i-1} dx_1 \wedge dx_2 \wedge \dots \widehat{dx_i} \wedge \dots dx_n$$

restricts to a differential form on  $S^{n-1}$  that is a generator of  $H^{n-1}(\mathbb{S}^{n-1})$ .

┘

*Proof:* First we calculate  $d(\iota(v)(dm)) = \operatorname{div}(v)dm = \frac{n-1}{|r|}dm$  (16.3.4.27). Consider using Stoke's formula:

$$\int_{\partial B_1} \iota(v)(dm) - \int_{\partial B_\varepsilon} \iota(v)(dm) = \int_{B(0,1) - B(0,\varepsilon)} \frac{n-1}{|r|} dm = 0.$$

Letting  $\varepsilon \rightarrow 0$ ,  $\int_{\partial B_\varepsilon} \iota(v)(dm)$  converges to 0 as  $|\iota(v)(dm)|$  is bounded and  $V(B_\varepsilon)$  converges to 0. And using the polar coordinate  $dm = r^{n-1}drd\omega$ , the right hand side is just

$$\int_{\mathbb{S}^{n-1}} \int_0^1 (n-1)r^{n-2}drd\omega = \operatorname{Vol}(\mathbb{S}^{n-1}).$$

□

**Prop.(16.4.1.2)[Degree Formula].** For any  $f : X \rightarrow Y \in \mathcal{M}\text{ani}_{\text{cpct,orntd}}^k$  and any  $k$ -form  $\omega \in \Omega^k(Y)$ , we have

$$\int_X f^* \omega = \deg(f) \int_Y \omega.$$

┘

*Proof:*  $\deg$  is defined in (16.1.4.17). Cf.[Pollack P188] ?

□

**Prop.(16.4.1.3)[Hopf Invariant].** For  $n \in \mathbb{Z}_{\geq 2}$  and any map  $\mathbb{S}^{2n-1} \rightarrow \mathbb{S}^n$ , let  $\alpha$  be a generator of  $H^n(\mathbb{S}^n)$ , then  $f^* \alpha = d\omega$  on  $\mathbb{S}^{2n-1}$  for some  $\omega$ . Define the **Hopf invariant** of  $f$  to be  $\operatorname{Hopf}(f) = \int_{\mathbb{S}^{2n-1}} \omega \wedge d\omega$ , then:

- The definition of Hopf invariant is independent of  $\omega$  chosen.
- For  $n \in 2\mathbb{Z} + 1$ , the Hopf invariant is 0.
- Homotopic maps  $f, g$  have the same Hopf invariant.

┘

*Proof:* 1: If  $d\omega = d\omega'$ , then

$$\int_{\mathbb{S}^{2n-1}} \omega' \wedge d\omega' - \int_{\mathbb{S}^{2n-1}} \omega \wedge d\omega = \int_{\mathbb{S}^{2n-1}} (\omega' - \omega) \wedge d\omega = \pm \int_{\mathbb{S}^{2n-1}} d((\omega - \omega') \wedge \omega) = 0.$$

2: If  $n$  is odd, then  $\omega$  is of even dimensional, thus  $\omega \wedge d\omega = \frac{1}{2}d(\omega \wedge \omega)$ , so  $H(f) = 0$  by Stokes.

3: If  $F : S^{2n-1} \times I \rightarrow S^n$  is a homotopy of  $f, g$ , then  $F^*\alpha = d\omega$  for some  $\omega$  on  $S^{2n-1} \times I$ . Thus consider

$$H(f) - H(g) = \int_{S^{2n-1}} \omega_1 \wedge d\omega_1 - \int_{S^{2n-1}} \omega_0 \wedge d\omega_0 = \int_{\partial(S^{2n-1} \times I)} \omega \wedge d\omega = \int_{S^{2n-1} \times I} d\omega \wedge d\omega,$$

But  $d\omega \wedge d\omega = F^*(\alpha \wedge \alpha)$ , and  $\alpha \wedge \alpha = 0$ . □

## 2 Morse Theory(Milnor)

References are [Mil63] and [Supersymmetry and Morse Theory, Witten].

**Def. (16.4.2.1) [Non-Degenerate Critical Point].** For  $X \in \text{Diff}$ ,  $f \in C^\infty(X)$ , a critical point of  $f$  is called a **non-degenerate critical point** iff the Hessian matrix is non-singular at  $x$ .

The notion of non-degenerate critical is independent of the coordinate chosen. ┘

*Proof:* Cf.[Pollack P42]. □

**Prop. (16.4.2.2) [Non-Degeneracy is Generic].** Non-degenerate critical points are the general situation in the following sense: For a manifold  $M \subset \mathbb{R}^n$ , for any smooth function  $f$  on  $M$ , consider the functions  $f_a = f + \sum a_i x_i$ , then for almost all  $(a_i)$ , all critical points of  $f_a$  is non-degenerate. ┘

*Proof:* Cf.[Pollack P43] □

**Prop. (16.4.2.3) [Morse Lemma].** In a non-degenerate critical point of  $f$ , there is a coordinate that

$$f = f(p) + x_1^2 + \cdots + x_{n-\lambda}^2 - y_1^2 - \cdots - y_\lambda^2.$$

┘

*Proof:* By induction on  $n$ , it suffices to show the following: If  $f$  is a smooth function on  $\mathbb{R}^n$  s.t.  $f(0) = 0$  and the origin is a non-degenerate critical point of  $f$ , then there is a local coordinate system near 0 s.t.  $f(x_1, \dots, x_n) = \pm x_1^2 + f(0, x_2, \dots, x_n)$ .

By linear algebra, after a linear change of variable, we may assume that the quadratic part of  $f$  is of the form  $\pm x_1^2 + Q(x_2, \dots, x_n)$ . Then consider the function  $g(x) = \frac{\partial}{\partial x_1} f(x)$ , then the linear part of  $g$  at the origin is  $\pm 2x_1$ . So by implicit function theorem(12.3.4.2),  $\{g(x) = 0\}$  is a smooth hypersurface near the origin with the tangent plane at the origin given by the equation  $x_1 = 0$ . Then by Taylor's expansion, for any  $y = (x_2, \dots, x_n)$ ,

$$f(u, y) = f(0, y) + \frac{\partial}{\partial u} f(0, y) x_1 + h(x_1, y) x_1^2 = f(0, y) + h(x_1, y) x_1^2,$$

where  $h$  is a smooth function near the origin with  $h(0, 0) = \pm 1$ . Thus with a change of variable  $\tilde{x}_1 = \sqrt{|h(x_1, y)|} x_1$  and  $y$  unchanged, we may assume that  $h = \pm 1$ . So  $f(x_1, y) = \pm u^2 + f(0, y)$ , as desired. □

**Prop. (16.4.2.4).** If  $M \in \text{Diff}$ ,  $f \in C^\infty(M)$  s.t.  $f^{-1}([a, b])$  is compact and with no critical points of  $f$ , then  $F^{-1}(a)$  is a deformation retracts of  $f^{-1}(b)$  using the flow  $\text{grad} f / |\text{grad} f|^2$ . ┘

*Proof:* □

**Prop. (16.4.2.5) [Morse Main Lemma].** If  $f$  is a smooth function with  $p$  a non-degenerate critical point and  $\lambda$  downward pointing direction. If for some  $f^{-1}([c - \epsilon, c + \epsilon])$  is compact, then  $M^{c+\epsilon}$  is homotopic to  $M^{c-\epsilon}$  gluing a  $\lambda$  dimensional cell.  $\lrcorner$

*Proof:* Cf.[Milnor Prop3.2].  $\square$

**Prop. (16.4.2.6).** For an embedded manifold and almost all point  $p$ , the distance to  $p$  is a morse function. (Use Sard theorem and degenerate  $\iff p$  is a focal point.  $\lrcorner$

**Cor. (16.4.2.7).** smooth manifold has CW type; on a compact manifold any vector field with discrete singular points has its index sum equal to  $\chi(M)$  (Hopf-Rinow), and there exists one.  $\lrcorner$

**Prop. (16.4.2.8).** for  $\Omega(p, q)^c$  the path space of energy  $< c$ , the piecewise geodesic path space  $B$  (piece fixed), the energy function is smooth and  $B^a$  is compact and is the deformation contraction of  $\text{int}\Omega^a$  for  $a < c$ .  $E$  has the same critical point and same index and nullity on  $B$  and  $\Omega^c$ . (Just geodesicize any path in  $\Omega$ .

So for two point not conjugate in  $B^a$ ,  $\Omega^a$  has a finite CW complex type and a  $\lambda$ -dimensional cell for every geodesic of index  $\lambda$  in  $B^a$ .  $\lrcorner$

**Prop. (16.4.2.9)[Morse Main Theorem].** If  $p$  and  $q$  are not conjugate along any geodesic, then  $\Omega(p, q)$  has a countable CW complex type and has a  $\lambda$ -cell for every geodesic of index  $\lambda$ .

If  $M$  has nonnegative Ricci curvature, then  $M$  has only finite cell for every dimension.  $\lrcorner$

*Proof:* Cf.[Mil63]Prop17.3.  $\square$

**Cor. (16.4.2.10).** The path space homotopy type only depend on the homotopy type of  $M$  (use the two homotopy to id to get a composition of homotopy of the two path space), so one can get the information of path space of  $M$  by looking at the homotopy type of  $M$ .  $\lrcorner$

**Prop. (16.4.2.11) [Minimal Geodesics].** If  $p, q$  in a complete manifold  $M$  has distance  $\sqrt{d}$  and the minimal geodesics form a topological manifold, and if all non-minimal geodesic has index  $\geq \lambda$ , then for  $0 \leq i < \lambda$ ,  $\pi_i(\Omega, \Omega^d) = 0$ .  $\lrcorner$

**Lemma (16.4.2.12).** In  $SU(2m)$ , the minimal geodesic from  $I$  to  $-I$  is homeomorphic to Grassmannian  $G_m(\mathbb{C}^{2m})$  and non-minimal geodesic has index  $\geq 2m + 2$ .

Similarly, The space of minimal geodesic from  $I$  to  $-I$  in  $O(2m)$  is homeomorphic to the space of complex structures in  $\mathbb{R}^{2m}$ , and any non-minimal geodesic has index  $\geq 2m - 2$ .  $\lrcorner$

*Proof:* Cf.[Milnor Morse Theory Lemma23.1 Lemma24.4].  $\square$

**Lemma (16.4.2.13).**  $\Omega_{k+1}$  is homotopic to the space of minimal geodesics in  $\Omega_k$  from  $J$  to  $-J$ . (The same way, calculate the index of geodesics from  $J$  to  $-J$  and use (16.4.2.11)). Cf.[Milnor Morse Theory Prop24.5] for definition of  $\Omega_{k+1}$ .  $\lrcorner$

## 16.5 Lie Groups

*“In these days the angel of topology and the devil of abstract algebra fight for the soul of every individual discipline of mathematics.”*

–H. Weyl

References are [?Kna96, Lee13, ?Eti21]. For classical groups, see [Classical Groups](#).

**Notation(16.5.0.1).**

- Let  $\mathbb{K} \in \{\mathbb{R}, \mathbb{C}\}$ .
- Let  $G \in \mathcal{LieGrp}/\mathbb{K}$  with Lie algebra  $\mathfrak{g}$ (16.5.1.1).

┘

### 1 Basics

**Def.(16.5.1.1)[Lie Groups].** A **Lie group** is a group object in the category of smooth  $\mathbb{K}$ -manifolds. Notice it suffices to check that multiplication is smooth. The left and right translations  $L_g, R_g$  are all smooth morphisms hence diffeomorphisms.

A **homomorphism of Lie groups** is a smooth morphism that is also a group homomorphism. By translation invariance, a group homomorphism always has constant ranks, so a homomorphism of Lie groups that is a bijection is an isomorphism by global rank theorem(16.1.1.19).

The tangent space of  $G$  at  $e$  is denoted by  $\mathfrak{g}$ .  $\mathfrak{g}$  is naturally an Lie algebra?.

┘

*Proof:* We show if a topological group  $G$  that is a smooth manifold satisfies  $m : G \times G \rightarrow G$  is smooth, then  $G$  is a smooth manifold: consider the map  $F : G \times G \rightarrow G \times G : (g, h) \mapsto (g, gh)$ , it is a smooth map that is bijective.

The tangent map of  $F$  at  $(g, h)$  is  $(X, Y) \mapsto (X, (dR_h)_g(X) + (dL_g)_h(Y))$ , which is surjective because  $L_g$  is a diffeomorphism by(16.1.1.19). Then  $F^{-1} : G \times G \rightarrow G \times G : (g, h) \mapsto (g, g^{-1}h)$  is smooth, and  $g \mapsto g^{-1}$  is smooth.  $\square$

**Prop.(16.5.1.2).** A connected Lie group is automatically second countable.

┘

*Proof:* This follows from the fact that a connected Lie group is a manifold hence locally second-countable and it is a union of products of a nbhd of  $e$ (4.12.1.3).  $\square$

**Prop.(16.5.1.3).** Any homomorphism of smooth manifolds has constant rank.

┘

*Proof:*  $F$  being a homomorphism means that  $F \circ L_g = L_{F(g)} \circ F$ . Taking derivative and noticing the fact  $L_g, L_{F(g)}$  are diffeomorphisms shows  $dF_{g_0}$  and  $dF_e$  have the same rank for any  $g$ .  $\square$

**Prop.(16.5.1.4)[Discrete Subgroups].** Any discrete subgroup  $\Gamma \leq G$  is a closed Lie subgroup of dimension 0.

┘

*Proof:* Firstly  $\Gamma$  is countable: Let  $U$  be a nbhd of  $e$  containing no other points, choose another nbhd of  $e$  that  $VV \subset U$ , then  $\{gV\}_{g \in \Gamma}$  is a family of disjoint open subsets of  $G$ , so there are countably many because  $G$  is second countable. Secondly  $\Gamma$  is closed in  $G$ , because

$\Gamma$  is closed in  $G$ : Let  $U$  be a nbhd of  $e$  containing no other points, choose another nbhd of  $e$  that  $VV \subset U$ , then  $\{gV\}_{g \in \Gamma}$  is a family of disjoint open subsets of  $G$  each containing an element of  $\Gamma$ . Then it is clear  $\Gamma$  is closed. Then(16.5.1.22) shows  $\Gamma$  is a closed Lie subgroup of dimension 0.  $\square$

**Def. (16.5.1.5) [Adjoint Representation].** The conjugation map  $C_g : G \rightarrow G : h \mapsto ghg^{-1}$  is a Lie group homomorphism. Let  $\text{Ad}(g) : \mathfrak{g} \rightarrow \mathfrak{g}$  denote its derivative, then  $\text{Ad} : g \mapsto \text{Ad}(g)$  is an action of  $G$  on  $\mathfrak{g}$ . Because  $C_{g_1g_2} = C_{g_1}C_{g_2}$ ,  $\text{Ad}(g_1g_2) = \text{Ad}(g_1)\text{Ad}(g_2)$ . This action is called the **adjoint representation** of  $G$ .  $\lrcorner$

**Prop. (16.5.1.6).** Suppose  $G$  is connected and  $\Gamma \subset G$  is a discrete normal subgroup, then  $\Gamma$  is in the center of  $G$ .  $\lrcorner$

*Proof:* For  $\gamma \in \Gamma$ , consider the map  $G \rightarrow G : g \mapsto g\gamma g^{-1}$ , then it is a map with images in  $\Gamma$ . But  $\Gamma$  is discrete, so its image must be a single point, which is  $\gamma$  because  $e\gamma e^{-1} = \gamma$ . This means  $\gamma$  is in the center of  $G$ .  $\square$

**Prop. (16.5.1.7) [Aut( $\mathfrak{g}$ )].** For  $\mathfrak{g} \in \text{LieAlg}^{\text{fin}}$ ,  $\text{Aut}(\mathfrak{g})$  is a closed Lie subgroup of  $\text{GL}(\mathfrak{g})$ , and its Lie algebra is  $\text{Der}(\mathfrak{g})$ . Denote  $\text{Int}(\mathfrak{g}) = \text{Der}(\mathfrak{g})^0$ .  $\lrcorner$

*Proof:* For the Lie algebra, it suffices to show for  $A \in \text{End}(\mathfrak{g})$ ,  $[e^{tA}X, e^{tA}Y] = e^{tA}[X, Y]$  iff  $A([X, Y]) = [A(X), Y] + [X, A(Y)]$ .

One direction is by taking derivative w.r.t.  $t$ , for the other, we can show  $y_1(t) = [e^{tA}X, e^{tA}Y]$  and  $y_2(t) = e^{tA}[X, Y]$  both satisfy the ordinary differential equation  $y_i'(t) = Ay_i(t)$ .  $\square$

### Exponential Map

**Def. (16.5.1.8) [One-Parameter Subgroup].** A **one-parameter subgroup** of  $G$  is a Lie group homomorphism  $\mathbb{K} \rightarrow G$ .  $\lrcorner$

**Prop. (16.5.1.9).** Let  $X \in \mathfrak{g}$ , then there exists a unique morphism of Lie groups  $\gamma : \mathbb{K} \rightarrow G$  that  $\gamma'(0) = X$ .  $\lrcorner$

*Proof:* If  $\gamma$  is such a group homomorphism, then  $\gamma(s+t) = \gamma(s)\gamma(t)$ . Differentiating for  $s$ , we get

$$\gamma'(t) = d(L_{\gamma(s)})_0(X).$$

Thus  $\gamma$  is an integral curve of the left-invariant vector field on  $G$  corresponding to  $X$  (16.5.3.3), which is unique.

Now to construct such a homomorphism, we use ODE theorems to construct a  $\gamma$  satisfying this for  $|t| < \varepsilon$ , and then check  $\gamma(s+t) = \gamma(s)\gamma(t)$  because they are both integral curves for  $t$  starting at  $\gamma(s)$ . In particular,  $d(L_{\gamma(t)})(X) = d(R_{\gamma(t)})(X)$ . Now we can extend this  $\gamma$  to whole of  $\mathbb{K}$  by defining  $\gamma(2^n s) = \gamma(s)^{2^n}$ , then we check by induction on  $n$  that

$$\gamma'(t) = \frac{1}{2} (d(R_{\gamma(\frac{t}{2})})\gamma'(\frac{t}{2}) + d(L_{\gamma(\frac{t}{2})})\gamma'(\frac{t}{2}))(X) = d(R_{\gamma(\frac{t}{2})})d(R_{\gamma(\frac{t}{2})})(X) = d(R_{\gamma(t)})(X).$$

$\square$

**Cor. (16.5.1.10) [One-Parameter Subgroup and Lie Algebras].** One-parameter subgroups of  $G$  correspond to maximal integral curves of left invariant vector fields starting at  $e$ . In particular, the one-parameter subgroups of  $G$  corresponds to  $\mathfrak{g}$  and also  $T_e(G)$ .

Also, the flow of the right-invariant vector field  $R_X$  is given by  $(g, t) \mapsto \exp(tX)g$ , and the flow of the left-invariant vector field  $L_X$  is given by  $(g, t) \mapsto g\exp(tX)$ .  $\lrcorner$

**Def. (16.5.1.11) [Exponential Map].** Let  $G$  be a Lie group with Lie algebra  $\mathfrak{g}$ , then we can define an **exponential map**  $\exp : \mathfrak{g} \rightarrow G$  that for any  $X \in \mathfrak{g}$ ,  $\exp(X) = \gamma_X(1)$ , where  $\gamma_X$  is the one-parameter subgroup of  $G$  generated by  $X$  (16.5.1.10). It can be shown that  $\gamma(sX)$  is the one-parameter subgroup of  $G$  generated by  $X$ .  $\lrcorner$

**Prop. (16.5.1.12) [Properties of Exponential Maps].**

1.  $\exp : \mathfrak{g} \rightarrow G$  is a smooth map which is a local diffeomorphism near  $e$  that  $\exp(0) = e$ ,  $\exp_* = \text{id}_{\mathfrak{g}}$ .
2.  $\exp(s + t) = \exp(s)\exp(t)$  for  $s, t \in \mathbb{K}$ .
3. For any group homomorphism  $\varphi : G \rightarrow H$  and  $X \in \mathfrak{g}$ ,  $\varphi(\exp(X)) = \exp(\varphi_*(X))$ .
4.  $g \exp(tX) g^{-1} = \exp(\text{Ad}(g)X)$ . Also,  $\text{Ad}_* = \text{ad}$ , or equivalently by item3,  $\text{Ad}(\exp(X)) = \exp(\text{ad}(X))$  as operators.
5. If we identify  $\mathfrak{gl}(n; \mathbb{K})$  with  $\text{GL}(n; \mathbb{K})$ , then we can check directly that the exponential map of  $\text{GL}_n(\mathbb{K})$  is

$$\exp(A) = \sum_{k=0}^{\infty} \frac{1}{k!} A^k.$$

$\lrcorner$

*Proof:* 1: The smoothness follows from the smoothness of the solution of ODE. The smooth inverse theorem shows it is a local diffeomorphism at identity.

2: trivial.

3: Both  $\varphi(\exp(tX))$  and  $\exp(t\varphi_*(X))$  are integral curves of the vector field  $L_{\varphi_*(X)}$  and have the same initial point.

4: The first assertion is just item3 applied to the conjugate action  $C_g$ . For the Lie algebra homomorphism,

$$d(\text{Ad})(X)Y = \frac{\partial}{\partial s} \frac{\partial}{\partial t} \exp(sX) \exp(tY) \exp(-sX) = [X, Y].$$

by (16.5.1.14).  $\square$

**Prop. (16.5.1.13).** Let  $\mathfrak{g} = A \oplus B$  a decomposition into subspaces, then the map

$$F : A \oplus B \rightarrow G : (X, Y) \mapsto \exp(X) \exp(Y)$$

is a local diffeomorphism at  $0 \in \mathfrak{g}$ .  $\lrcorner$

*Proof:* Identify  $\mathfrak{g}$  and the tangent space of  $G$  at  $e$ , then the differential  $F$  is identity, so it is a local diffeomorphism.  $\square$

**Thm. (16.5.1.14) [Baker-Campbell-Hausdorff].** For  $X, Y \in \mathfrak{g}$ ,

$$\exp(tX) \exp(tY) = \exp\left(\sum_{n=1}^{\infty} \frac{t^n}{n!} \mu_n(X, Y)\right).$$

where  $\mu_n(X, Y)$  can be written as  $\mathbb{Q}$ -Lie polynomials of  $X$  and  $Y$  that is invariant of  $G$ .

In particular,  $\mu_1(X, Y) = X + Y$ ,  $\mu_2(X, Y) = \frac{1}{2}t^3([X, [X, Y]] + [Y, [Y, X]])$  and so on.  $\lrcorner$

*Proof:* By the Lie correspondence(16.5.3.15), we can first assume that  $G$  is simply-connected, then there is a mapping of  $G$  onto some subgroup of  $GL(n, \mathbb{K})$  with discrete kernel. If we can prove the formula for  $G = GL(n, \mathbb{K})$ , then

$$\exp\left(\sum_{n=1}^{\infty} \frac{t^n}{n!} \mu_n(X, Y)\right) \exp(tY)^{-1} \exp(tX)^{-1}$$

is contained the kernel, but it is a smooth function in  $t$ , and its value is 1 for  $t = 0$ , thus it holds for any  $t$ .

Now let  $T\mathbb{K}^2 = \mathbb{K}\langle x, y \rangle$  be the free non-commutative algebra in variables  $x, y$ , the series  $\exp(x) = \sum_{n=0}^{\infty} \frac{x^n}{n!}$  can be viewed as an element in  $\widehat{\mathbb{K}\langle x, y \rangle}$ . Then we can define

$$\mu = \log(\exp(x) \exp(y)) \in \widehat{\mathbb{K}\langle x, y \rangle},$$

where  $\log(A) = -\sum_{n=1}^{\infty} \frac{(1-A)^n}{n!}$ . Then  $\mu = \sum_{n=1}^{\infty} \frac{\mu_n}{n!}$ , where  $\mu_n \in \mathbb{K}\langle x, y \rangle$  are polynomials in  $x, y$  of degree  $n$  with coefficients in  $\mathbb{Q}$ .

Then it remains to show that  $\mu_n$  can be written as Lie polynomials in  $x, y$ . Notice  $\Delta(x) = x \otimes 1 + 1 \otimes x$ , thus  $\Delta(\exp(x)) = \exp(x) \otimes \exp(x)$ , thus  $\Delta(\exp(x) \exp(y)) = \exp(x) \exp(y) \otimes \exp(x) \exp(y)$ , and

$$\begin{aligned} \Delta(\log(\exp(x) \exp(y))) &= \log(\Delta(\exp(x) \exp(y))) = \log((\exp(x) \exp(y) \otimes 1)(1 \otimes \exp(x) \exp(y))) \\ &= \log(\exp(x) \exp(y)) \otimes 1 + 1 \otimes \log(\exp(x) \exp(y)). \end{aligned}$$

then by separating degrees, each  $\mu_n$  is primitive(3.11.2.4), thus they are contained in the free Lie-algebra generated by  $x, y$ , by(3.7.8.16) and(3.7.8.19).

The calculation is invariant of  $n$  in  $GL(n; \mathbb{R})$ , thus it is invariant of  $G$ . □

**Cor. (16.5.1.15).** Let  $G$  be a Lie group with Lie algebra  $\mathfrak{g}$ ,  $X, Y \in \mathfrak{g}$ , then

$$\lim_{n \rightarrow \infty} \left( \exp\left(\frac{1}{n}X\right) \exp\left(\frac{1}{n}Y\right) \right)^n = \exp(X + Y).$$

┘

*Proof:*

$$\left( \exp\left(\frac{1}{n}X\right) \exp\left(\frac{1}{n}Y\right) \right)^n = \left( \exp\left(\frac{1}{n}(X + Y) + O\left(\frac{1}{n^2}\right)\right) \right)^n = \exp\left(X + Y + O\left(\frac{1}{n}\right)\right).$$

Taking  $n \rightarrow \infty$ , we get the desired result. □

**Prop. (16.5.1.16).** Let  $G, H \in \mathcal{LieGrp}/\mathbb{K}$ , then

- A continuous homomorphism  $\gamma : \mathbb{K} \rightarrow H$  is smooth.
- A continuous homomorphism between smooth Lie groups  $F : G \rightarrow H$  is smooth.
- There is at most one smooth structure on  $G$  that makes it a Lie group.

┘

*Proof:* 1: Let  $V$  be a nbhd of  $0 \in \mathfrak{h}$  that  $\exp$  is a diffeomorphism on  $2V$ (16.5.1.12). Choose  $t_0$  small that  $\gamma(t) \in \exp(V)$  for any  $|t| \leq t_0$ , and let  $X \in V$  that  $\exp(X) = \gamma(t_0)$ , then we can show  $\gamma(t) = \exp(tX)$  for any  $t = \frac{m}{2^n}$ , so this holds for any  $t$  by continuity/anlyticity, and  $\gamma$  is smooth.

2: By the proof of 1, we can construct a map(not necessary continuous)  $F_* : \mathfrak{g} \rightarrow \mathfrak{h}$  with commutative diagram

$$\begin{array}{ccc} \mathfrak{g} & \xrightarrow{F_*} & \mathfrak{h} \\ \downarrow \exp & & \downarrow \exp \\ G & \xrightarrow{F} & H \end{array}$$

Now using (16.5.1.15) and the continuity of  $F$ , we can show  $F_*$  is linear:

$$\begin{aligned} \exp(F_*(X + Y)) &= F(\exp(X + Y)) = F\left(\lim_{n \rightarrow \infty} \exp\left(\frac{1}{n}X\right) \exp\left(\frac{1}{n}Y\right)\right)^n \\ &= \lim_{n \rightarrow \infty} \left(\exp\left(\frac{1}{n}F_*X\right) \exp\left(\frac{1}{n}F_*Y\right)\right)^n = \exp(F_*(X + Y)) \end{aligned}$$

Thus  $F$  is smooth at a nbhd of  $G$ , and smooth everywhere by translation.  $\square$

### Group Aspects

**Def. (16.5.1.17) [Lie Subgroup].** A Lie subgroup of  $G$  is a subgroup that is also an immersed submanifold (16.1.1.21).

An **embedded Lie subgroup** of  $G$  is a subgroup that is also an immerse submanifold (16.1.1.21).

┘

**Prop. (16.5.1.18) [Lie subgroup is Weakly Embedded].** Any Lie subgroup of  $G$  is weakly embedded.

┘

*Proof:* Cf. [Lee13] P506.  $\square$

**Lemma (16.5.1.19).** Let  $H \leq G$  be a subgroup that is also an embedded submanifold, then  $H$  is an embedded Lie subgroup.  $\square$

*Proof:* We need to show the multiplication and inverse on  $H$  is smooth:  $H \times H \rightarrow G$  is smooth and has image in  $H$ , thus  $H \times H \rightarrow H$  is also smooth, by (16.1.1.30).  $\square$

**Lemma (16.5.1.20).** Let  $H \leq G$  be a Lie subgroup that is also an embedded submanifold, then  $H$  is closed in  $G$ .  $\square$

*Proof:* Assume  $H$  is an embedded submanifold of  $G$ , then it is locally compact in the induced topology, so (12.10.1.6) shows  $H$  is closed in  $G$ .  $\square$

**Lemma (16.5.1.21).** Let  $H \leq G$  that is also a closed subset of  $G$ , then  $H$  is an embedded Lie subgroup.  $\square$

*Proof:* By (16.5.1.20), it suffices to show that  $H$  is an embedded submanifold of  $G$ . Let  $\mathfrak{g}$  be the Lie algebra of  $G$ , and define a subspace  $\mathfrak{h} \subset \mathfrak{g}$  that  $\mathfrak{h} = \{X \in \mathfrak{g} \mid \exp(tX) \in H, \forall t \in \mathbb{R}\}$ . By (16.5.1.15) and the fact  $H$  is closed in  $G$ ,  $\mathfrak{h}$  is a linear subspace of  $\mathfrak{g}$ .

Next we show that there exists a nbhd  $U$  of  $0 \in \mathfrak{g}$  that  $\exp$  is a diffeomorphism and also  $\exp(U \cap \mathfrak{h}) = \exp(U) \cap H$ : Let  $U$  be any open nbhd of  $0 \in \mathfrak{g}$  that  $\exp$  is a diffeomorphism  $U \rightarrow \exp(U)$ , then  $\exp(U \cap \mathfrak{h}) \subset \exp(U) \cap H$  by definition.

Let  $\mathfrak{b} \subset \mathfrak{g}$  be chosen s.t.  $\mathfrak{h} \oplus \mathfrak{b} = \mathfrak{g}$ , then  $F : \mathfrak{h} \oplus \mathfrak{b} \rightarrow G : (X, Y) \mapsto \exp(X) \exp(Y)$  is a local diffeomorphism. Choose nbhd  $U$  of  $0 \in \mathfrak{g}$  and  $\tilde{U}$  of  $0 \in \mathfrak{h} \oplus \mathfrak{b}$  that both  $\exp|_U$  and  $F|_{\tilde{U}}$  are diffeomorphisms, and choose a countable nbhd basis  $\{U_i\}$  of  $0 \in \mathfrak{g}$ . Denote  $V_i = \exp(U_i)$  and  $\tilde{U}_i = F^{-1}(V_i)$ , then  $V_i$  is a nbhd basis of  $e \in G$  and  $\tilde{U}_i$  is a nbhd basis of  $0 \in \mathfrak{h} \oplus \mathfrak{b}$ . We may assume  $U_i \subset U$  and  $\tilde{U}_i \subset \tilde{U}$ .

If  $\exp(U_i \cap \mathfrak{h}) \subset \exp(\tilde{U}_i) \cap H$  for any  $i$ , then we can choose  $h_i = \exp(Z_i) \in H$  that  $h_i \notin \exp(U_i \cap \mathfrak{h})$ . Because  $\exp(U_i) = F(\tilde{U}_i)$ , set  $h_i = \exp(X_i) \exp(Y_i)$ , where  $(X_i, Y_i) \in \tilde{U}_i$ . Now  $Y_i \neq 0$ , otherwise  $\exp(Z_i) = \exp(X_i)$ , which implies  $Z_i = X_i$  and  $h \in \exp(U_i \cap \mathfrak{h})$ . Notice  $\exp(Y_i) = \exp(X_i)^{-1} h_i \in H$ .

Because  $\tilde{U}_i$  is a basis of  $\mathfrak{h} \oplus \mathfrak{b}$ ,  $Y_i \rightarrow 0$ . Choose an inner product on  $\mathfrak{b}$ , and let  $c_i = |Y_i|$ , then  $c_i^{-1} Y_i$  lies on the unit sphere of  $\mathfrak{b}$ . Replacing by a subsequence, we can assume  $c_i^{-1} Y_i \rightarrow Y$  for some  $Y \in \mathfrak{b}$ . Then  $|Y| = 1$  by continuity.

For any  $t \in \mathbb{R}$ , let  $n_i = \lfloor \frac{t}{c_i} \rfloor$ , then  $|nc_i - t| \leq c_i \rightarrow 0$ , which means  $n_i Y_i \rightarrow tY$ , so  $\exp(n_i Y_i) \rightarrow \exp(tY)$ . But  $\exp(n_i Y_i) = \exp(Y_i)^{n_i} \in H$ , so  $\exp(tY) \in H$  because  $H$  is closed. Thus  $Y \in \mathfrak{h}$ , contradiction.

Thus in this way we can construct a slice chart  $\varphi$  of  $H$  at  $e$ , and for any  $h \in H$ , because

$$L_h((\exp(U) \cap H)) = L_h(\exp(U)) \cap H,$$

$\varphi \circ L_{h^{-1}}$  is a slice chart of  $H$  at  $h$ . Thus  $H$  is an embedded submanifold of  $G$  by (16.1.1.24).  $\square$

**Prop. (16.5.1.22) [Closed Subgroup Theorem].** Let  $H \leq G$  be a subgroup, then the following are equivalent:

- $H$  is closed in  $G$ .
- $H$  is an embedded submanifold.
- $H$  is an embedded Lie subgroup.

┘

*Proof:*  $3 \rightarrow 2$  is trivial,  $3 \rightarrow 1$  is (16.5.1.20).  $1 \rightarrow 3$  is (16.5.1.21),  $2 \rightarrow 3$  is (16.5.1.19).  $\square$

**Remark (16.5.1.23).** A dense line of the torus is a Lie subgroup that is not a closed Lie subgroup.  $\perp$

**Lemma (16.5.1.24) [One-Parameter subgroup of Subgroups].** Let  $H \leq G$  be a Lie subgroup, then the one-parameter subgroups of  $H$  are exactly those of  $G$  with initial velocity in  $T_e(H)$ .  $\perp$

*Proof:* This is because a one-parameter subgroup of  $H$  is naturally a one-parameter subgroup of  $G$ , and two one-parameter subgroups with the same initial velocity is identical.  $\square$

**Prop. (16.5.1.25).** Let  $H \leq G$  be a Lie subgroup, then the exponential map of  $H$  is the exponential map of  $G$  restricted to  $\mathfrak{h}$ , and

$$\mathfrak{h} = \{X \in \mathfrak{g} \mid \exp(tX) \in H, \forall t \in \mathbb{R}\}.$$

┘

*Proof:* The first assertion is an immediate corollary of (16.5.1.24). Now if  $X \in \mathfrak{h}$ , then the first assertion shows  $\exp(tX) \in H$  for all  $t$ . Conversely, if  $\exp(tX) \in H$  for all  $t$ , then  $\exp(tX)$  is a smooth map to  $H$ , by (16.5.1.18), thus its derivative at  $e$  is in  $\mathfrak{h}$ , which means  $X \in \mathfrak{h}$ .  $\square$

**Prop. (16.5.1.26) [Semidirect Product].** Let  $G, H \in \text{LieGrp}/\mathbb{K}$  and  $\tau$  is an action of  $G$  on  $H$ , then the Lie algebra of  $G \ltimes_{\tau} H$  is  $\mathfrak{g} \ltimes_{d\tau} \mathfrak{h}$ .  $\perp$

*Proof:* Notice the differential of the action  $\tau(g)$  on  $H$  defines a map  $G \rightarrow GL(\mathfrak{h})$ , and then the differential of this map gives a map  $d\tau : \mathfrak{g} \rightarrow \text{Der}(\mathfrak{h})$ , so we can form  $\mathfrak{g} \ltimes_{d\tau} \mathfrak{h}$  (3.7.1.6).

For the rest, Cf. [Knapp, P60].  $\square$

**Prop. (16.5.1.27).** Let  $G, H$  be simply-connected Lie groups with Lie algebra  $\mathfrak{g}, \mathfrak{h}$ , and let  $\pi : \mathfrak{g} \rightarrow \text{Der}(\mathfrak{h})$  be a Lie algebra homomorphism, then there is an action  $\tau$  of  $G$  on  $H$  by automorphisms that  $d\tau = \pi$ , and  $G \ltimes_{\tau} H$  is a simply-connected Lie group with Lie algebra  $\mathfrak{g} \ltimes_{\pi} \mathfrak{h}$ .  $\lrcorner$

*Proof:* Cf.[Knapp, P60].  $\square$

**Prop. (16.5.1.28)[Quotient Theorem for Lie Groups].** Let  $H \leq G$  be a normal closed Lie subgroup, then the quotient  $G/H$  is a Lie group, and the quotient map  $\pi$  is a surjective Lie group homomorphism with kernel  $H$ .  $\lrcorner$

*Proof:* By(16.5.2.6),  $G/H$  is a smooth manifold that the quotient map is surjective, smooth, and is a group homomorphism with kernel  $H$ . It suffices to show the multiplication of  $G/H$  is smooth, which is easy by(16.1.1.15).  $\square$

**Prop. (16.5.1.29)[First Isomorphism Theorem for Lie Groups].** Let  $\varphi : G \rightarrow H \in \text{LieGrp}$ , then there kernel of  $F$  is an closed Lie subgroup of  $G$  with Lie algebra  $\ker(\varphi_*)$ . The image of  $\varphi$  has a unique smooth structure making it a Lie subgroup of  $H$  that  $G/\ker(F) \rightarrow \text{Im}(\varphi)$  is a diffeomorphism, and it is a closed Lie subgroup when it is embedded in  $H$ , e.g. when  $\varphi$  induces a proper action(16.5.2.3).  $\lrcorner$

*Proof:* This follows from(16.5.2.2) and(16.5.1.22).  $\square$

**Def. (16.5.1.30)[Adjoint Group].** The center  $Z(G)$  of  $G$  is a closed Lie subgroup because it the kernel of  $\text{Ad}$ (16.5.1.29). We call the group  $G/Z(G)$  the **adjoint group** of  $G$ , which is an immersed subgroup of  $GL(\mathfrak{g})$  by(16.5.1.29).  $\lrcorner$

### Lie Groups and Analytic Groups

**Prop. (16.5.1.31).** What condition makes a Lie group a complex Lie group?  $\lrcorner$

**Prop. (16.5.1.32).** Any connected Lie group has a compact subgroup as deformation retraction.  $\lrcorner$

*Proof:*  $\square$

**Prop. (16.5.1.33) [Gleason; Montgomery-Zippin].** A real topological group  $G$  admits a (unique) Lie group structure iff the underlying topological space  $G$  is a topological manifold.  $\lrcorner$

*Proof:* Cf.<https://terrytao.wordpress.com/2011/06/17/hilberts-fifth-problem-and-gleason-metrics/>,  $\square$

**Prop. (16.5.1.34)[Lie Groups and Analytic Groups].** A real Lie group admits a unique real analytic structure, So it is not important to distinguish between a Lie group and an analytic Lie group, and call it **analytic group** if it is a connected Lie group. The uniqueness follows from(16.5.1.16).  $\lrcorner$

*Proof:* Use(16.5.1.14) to show that in a local exp char  $(U, \varphi)$  of 1,  $U \times U \rightarrow U$  is analytic, then we can choose an analytic atlas on  $G$  given by  $\{(gU, \varphi \circ L_{g^{-1}})\}$ . This is an analytic atlas, because the transition function is  $\varphi L_{g^{-1}h} \varphi^{-1}$  on  $U \cap h^{-1}gU$ . Because  $hU \cap gU \neq \emptyset$ , let  $x = hu_1 = gu_2$ , then  $L_{g^{-1}h} = L_{u_2u_1^{-1}}$ , which is analytic.

To show multiplication is analytic w.r.t. this atlas: ?  $\square$

**Cor. (16.5.1.35).** The proof above can be used to show that any  $C^k$ -group manifold be upgraded uniquely to a Lie group structure. So basically the study of  $C^0$ -Group manifold and analytic groups are the same.  $\lrcorner$

## 2 Homogeneous Spaces

### Actions of Lie Groups

**Prop. (16.5.2.1) [Fundamental Theorem on Lie Group Actions].** Let  $\theta$  be a right smooth action of  $G$  on a smooth manifold  $M$ , then we can define a complete Lie algebra homomorphism

$$\tilde{\theta} : \mathfrak{g} \rightarrow \mathfrak{X}(M) : \theta(X)_p = \frac{d}{dt}\bigg|_{t=0} p \cdot \exp(tX) = d(\theta^{(p)})_e(X_e),$$

called the **infinitesimal generator** of  $\theta$ . where a Lie homomorphism  $\tilde{\theta} : \mathfrak{g} \rightarrow \mathfrak{X}(M)$  is called complete iff for any  $X \in \mathfrak{g}$ ,  $\tilde{\theta}(X)$  is a complete vector field (16.1.5.3).

Conversely, if  $G$  is simply-connected and  $\tilde{\theta} : \mathfrak{g} \rightarrow \mathfrak{X}(M)$  is a complete Lie algebra homomorphism, then there exists a unique smooth right action  $\theta$  of  $G$  on  $M$  with infinitesimal generator  $\tilde{\theta}$ .  $\lrcorner$

*Proof:*  $\theta(X)$  is smooth because it is the infinitesimal generator of the smooth flow  $\mathbb{R} \times M \rightarrow M : (t, p) \mapsto p \exp(tX)$  (16.1.5.4).  $\tilde{\theta}$  is a Lie algebra homomorphism by (16.1.2.18).?  $\square$

**Prop. (16.5.2.2) [Isotropy Group and Orbits].** Let  $\theta$  be a smooth action of  $G$  on a smooth manifold  $M \in \text{Diff}$ , let  $\theta_x : \mathfrak{g} \rightarrow T_x M$  be given by  $\tilde{\theta}_x(X) = \tilde{\theta}(X)_x$ . Then

- The stabilizer  $G_x$  is a closed subgroup of  $G$  with Lie subalgebra  $\mathfrak{g}_x = \ker(\tilde{\theta}_x)$ .
- $Gx$  has a unique smooth structure making it an immersed subgroup of  $M$  that  $G/G_x \rightarrow Gx$  is a diffeomorphism, and  $T_x(Gx) \cong \text{Im}(\tilde{\theta}_x) \cong \mathfrak{g}/\mathfrak{g}_x$ .

$\lrcorner$

*Proof:* Cf. [?Eti21]P48.  $\square$

**Prop. (16.5.2.3).** If  $G$  acts smoothly and properly on a smooth manifold  $M \in \text{Diff}$ , then each orbit is a closed submanifold of  $M$ , and each isotropy group is compact, by (4.12.1.15) and (4.12.1.17).  $\lrcorner$

**Prop. (16.5.2.4) [Quotient Map Theorem].** Let  $G$  act smoothly, freely and properly on a smooth manifold  $M \in \text{Diff}$ , then the quotient space  $M/G$  is a topological manifold with dimension  $\dim M - \dim G$ , and it has a unique smooth structure that  $M \rightarrow M/G$  is a smooth submersion.  $\lrcorner$

*Proof:* Cf. [Lee13]P544.  $\square$

### Homogeneous Spaces and Fiber Bundles

**Def. (16.5.2.5) [Homogeneous Spaces].** A **homogeneous space** for  $G$  is a smooth manifold  $M \in \text{Diff}$  with a smooth transitive  $G$ -action.  $\lrcorner$

**Prop. (16.5.2.6) [Characterizing Homogeneous Spaces].**

- If  $H$  is a closed subgroup of  $G$ , then the left coset space  $G/H$  is a topological manifold of dimension  $\dim G - \dim H$ , and has a unique smooth structure that the quotient map  $G \rightarrow G/H$  is a smooth submersion. With this smooth structure, the left action of  $G$  on  $G/H$  turns it into a homogeneous space.
- If  $M$  is a homogeneous  $G$ -space, and  $p \in M$ , then the isotropy group  $G_p$  of  $M$  is a closed subgroup of  $G$ , and  $G/G_p \rightarrow M$  is a diffeomorphism of  $G$ -spaces.

$\lrcorner$

*Proof:* Cf. [Lee13]P551, P552.  $\square$

**Cor.(16.5.2.7) [Homogeneous Space Structure on Sets].** Suppose  $X$  is a set with a transitive action of  $G$  that for some point  $p \in X$ , the isotropy group  $G_p$  is closed in  $G$ . Then  $X$  has a unique smooth manifold structure with respect to which the given action is smooth. With this structure,  $\dim X = \dim G - \dim G_p$ .  $\lrcorner$

*Proof:* This is because  $G/G_p$  is a smooth manifold that is  $G$ -equivariantly isomorphism to  $X$ , and the uniqueness also follows from the proposition.  $\square$

**Prop.(16.5.2.8) [Quotients of Lie Groups by Discrete Subgroups].** Let  $\Gamma \leq G$  be a discrete subgroup, then  $G/\Gamma \in \text{Diff}$ , and the quotient map  $G \rightarrow G/\Gamma$  is a smooth normal covering.  $\lrcorner$

*Proof:* (16.5.1.4) and the proof of (16.5.2.6) shows  $\Gamma$  acts smoothly, freely, and properly on  $G$  on the right. Then the theorem is a consequence of (16.1.1.17).  $\square$

**Prop.(16.5.2.9) [Contractible Homogeneous Space].** If  $X$  is a homogeneous  $G$ -manifold that is contractible,  $x \in X$ , then  $G$  is diffeomorphic to  $G_x \times X$ .  $\lrcorner$

*Proof:*  $\square$

**Prop.(16.5.2.10) [Orientability of Homogenous Spaces].** Let  $X$  be a homogeneous manifold of  $G$ . Let  $x \in X$  and  $H = \text{Stab}_G(x)$ .

1.  $X$  is orientable iff values of  $\text{Ad}(h_i)$  are of the same sign for any two element  $h_1, h_2 \in H$  lying in a same connected component of  $G$ .
2. Show that when  $H$  is connected,  $X$  is orientable.
3. There exist a  $G$ -invariant volume form on  $X$  iff  $\text{Ad}(H) \subset \text{SL}(\mathfrak{g}/\mathfrak{h})$ .

$\lrcorner$

**Prop.(16.5.2.11) [Fiber Bundle of Homogenous Spaces].** Let  $G \in \text{LieGrp}_{\text{cpct}}$ ,  $K \leq H \leq G$  be closed subgroups, then the map  $G/K \rightarrow G/H$  is a  $G$ -locally trivial fiber bundle.  $\lrcorner$

*Proof:* ?  $\square$

**Prop.(16.5.2.12) [Examples of Homogeneous Spaces].** Let  $\mathbb{K} = \mathbb{R}$  or  $\mathbb{C}$ .

- The **Grassmannian manifold**  $\text{Gr}(k, \mathbb{K}^n)$  is defined to be the set of  $k$ -dimensional spaces in  $\mathbb{K}^n$ .  $U(n, \mathbb{K})$  acts transitively on  $\text{Gr}(k, \mathbb{K}^n)$ , and the stabilizer is  $U(k, \mathbb{K}) \times U(n-k, \mathbb{K})$ . Thus  $\text{Gr}(k, \mathbb{K}^n)$  is a homogeneous  $U(n, \mathbb{K})$ -space by (16.5.2.7), and  $U(n, \mathbb{K}) \rightarrow \text{Gr}(k, \mathbb{K}^n)$  is a fiber bundle with fiber  $U(k, \mathbb{K}) \times U(n-k, \mathbb{K})$  by (16.5.2.11).
- The **Stiefel manifold**  $V_k(\mathbb{K}^n)$  of orthonormal  $k$ -frames in  $\mathbb{K}^n$  is defined to be the set of tuples  $(v_1, \dots, v_n)$  in  $\mathbb{K}^n$  that  $(v_i, v_j) = \delta_{ij}$ .  $U(n, \mathbb{K})$  acts transitively on  $V_k(\mathbb{K}^n)$  with stabilizer  $U(n-k, \mathbb{K})$ , Thus  $V_k(\mathbb{K}^n)$  is a homogeneous  $U(n, \mathbb{K})$ -space by (16.5.2.7), and  $U(n, \mathbb{K}) \rightarrow V_k(\mathbb{K}^n)$  is a fiber bundle with fiber  $U(n-k, \mathbb{K})$ , and  $V_k(\mathbb{K}^n) \rightarrow \text{Gr}(k, \mathbb{K}^n)$  is a fiber bundle with fiber  $U(k, \mathbb{K})$ .
- The **flag variety**. ?

$\lrcorner$

*Proof:* 1: Let  $\dim X = n$ .  $X$  is orientable iff there is a non-vanishing  $n$ -form on  $X$ . Because  $o_x : G \rightarrow X$  is submersive, choose  $n$  left invariant vector fields  $X_1, \dots, X_n$  that  $(do_x)_e(v_i)$  generate  $T_x(X)$ , then by homogeneity,  $(do_x)_g(X_{ig})$  generate  $T_g(X)$  for any  $g \in G$ . Thus  $X$  is orientable iff

there is a  $n$ -form  $\omega$  on  $G$  that satisfies  $r_h^* \omega = \omega$ ,  $\omega_g = \Delta(g)l_{g^{-1}}^* \omega_e$  for some  $\Delta(g) \in \mathbb{R}^*$ , and for any  $h \in H$ , and  $\omega(X_1, \dots, X_n) \neq 0$ .

If such a form exists, then  $\Delta(gh)l_{(gh)^{-1}}^* \omega_e = r_h^* l_{g^{-1}}^* \omega_e$ , which is equivalent to  $\Delta(g)\text{Ad}(h)^* \omega_e = \Delta(gh)\omega_e$  for any  $h \in H$ , thus values of  $\text{Ad}(h_i)$  are of the same sign for any two element  $h_1, h_2 \in H$  lying in a same connected component of  $G$ .

Conversely, if values of  $\text{Ad}(h_i)$  are of the same sign for any two element  $h_1, h_2 \in H$  lying in a same connected component of  $G$ , then we can define  $\omega$  as above, where  $\Delta(h) = \det(\text{Ad}(h)|(\mathfrak{g}/\mathfrak{h}))$ , and extend  $\Delta$  to  $G$  that satisfy  $\Delta(gh) = \Delta(g)\Delta(h)$ . This can be because  $G$  is a fiber bundle over  $G/H$ .

2: When  $H$  is connected, clearly the values of  $\text{Ad}(H)$  are of the same sign.

3: The proof is the same as that of item1. In this case, all  $\Delta(g) = 1$ , thus the existence of  $G$ -invariant volume form on  $X$  is equivalent to  $\text{Ad}(H) \subset SL(\mathfrak{g}/\mathfrak{h})$ .  $\square$

### 3 Lie Theory

#### Lie Algebras of Lie Groups

**Def.(16.5.3.1) [Invariant Vector Fields].** A smooth vector field  $X \in \mathfrak{X}(G)$  is called left-invariant if  $d(L_g)_{g'}(X_{g'}) = X_{gg'}$  for any  $g, g' \in G$ . The set of left-invariant vector fields on  $G$  is denoted by  $\text{Lie}(G)$ .  $\lrcorner$

**Prop.(16.5.3.2).** If  $X, Y$  are left-invariant vector fields over  $G$ , then  $[X, Y]$  is also left-invariant, by (16.1.2.18).  $\lrcorner$

**Prop.(16.5.3.3) [Invariant Vector Fields and Tangent Spaces].** Let  $G$  be a Lie group, then the evaluation map  $\text{Lie}(G) \rightarrow \mathfrak{g} : X \mapsto X_e$  is a vector space isomorphism.  $\lrcorner$

*Proof:* The inverse map is given by  $X \mapsto (L_X)_g = d(L_g)_e(X)$ . This is clearly a left-invariant vector field. It suffices to show that this  $\tilde{X}$  is smooth. By (16.1.2.10), it suffices to show  $L_X(f)$  is smooth for any smooth function  $f$ .

$$L_X(f)(g) = d(L_g)_e(X)(f)(g) = X(L_g f)(0) = \left( \frac{d}{dt} f(g \exp(tX)) \right) \Big|_{t=0}$$

which is a differential of a smooth map  $\mathbb{R} \times G \rightarrow \mathbb{R} : (t, g) \mapsto f(g \exp(tX))$ , so it is smooth in  $g$ .  $\square$

**Cor.(16.5.3.4) [Lie Group is Parallelizable].**  $G$  admits a left-invariant smooth global frame, thus in particular parallelizable.  $\lrcorner$

**Prop.(16.5.3.5).** If  $X \in \mathfrak{g}$  corresponds to a left-invariant vector field  $L_X$ , then for any  $g \in G$ ,

$$d(R_g)_p((L_X)_p) = (L_{\text{Ad}(g^{-1})X})_{pg}.$$

$\lrcorner$

*Proof:*

$$\begin{aligned} d(R_g)_p((L_X)_p)(f)(pg) &= (L_X)_p(R_g f) = d(L_p)_e(X)(R_g f) \\ &= X(L_p R_g(f)) = \left( \frac{d}{dt} (f(p \exp(tX)g)) \right) \Big|_{t=0} \end{aligned}$$

$$\begin{aligned}
&= \left( \frac{d}{dt} f \left( p \exp(t \operatorname{Ad}(g^{-1})X) \right) \right) \Big|_{t=0} \\
&= \operatorname{Ad}(g^{-1}X)(L_p(f)) \\
&= (L_{\operatorname{Ad}(g^{-1})X})_{pg}(f)(pg)
\end{aligned}$$

□

**Def. (16.5.3.6) [Lie Algebra of a Lie Group].**  $\operatorname{Lie}(G) \in \operatorname{LieAlg}$  w.r.t. the Lie bracket (16.1.2.15). It is called the **Lie algebra associated to  $G$** . ┘

*Proof:* This is clear from the definition  $[X, Y](f) = XY(f) - YX(f)$ . □

**Prop. (16.5.3.7) [Induced Map of Lie Algebras].** Any homomorphism  $f : G \rightarrow H$  induces a homomorphism of their Lie algebras via the tangent space. ┘

*Proof:* For any  $X \in \operatorname{Lie}(G)$ , define  $f_*(X)_g = (dL_g)_e(df_e(X_e))$ , then this is a left-invariant vector field on  $H$ , and it clearly corresponds to the tangent map via isomorphism in (16.5.3.3). This map is a Lie algebra map by a variant of (16.1.2.18). □

**Cor. (16.5.3.8).** If  $H \leq G$  is a Lie subgroup, then there is a natural isomorphism

$$\mathfrak{h} \cong \{X \in \operatorname{Lie}(G) \mid X_e \in T_e H\}.$$

In particular, the tangent space  $\mathfrak{h}$  of  $H$  is a Lie subalgebra of  $\mathfrak{g}$ . ┘

*Proof:* There is a commutative diagram □

$$\begin{array}{ccc}
\operatorname{Lie}(H) & \xrightarrow{X \mapsto X_e} & \mathfrak{h} \\
\downarrow \iota_* & & \downarrow (\iota_*)_e \\
\operatorname{Lie}(G) & \xrightarrow{X \mapsto X_e} & \mathfrak{g}
\end{array}$$

**Prop. (16.5.3.9) [Covering of Lie Groups].** For  $F : G \rightarrow H \in \operatorname{LieGrp}_{\text{cnd}}$ , the following are equivalent:

- $F$  is surjective with discrete kernel.
- $F$  is a smooth covering map.
- $F$  is a local diffeomorphism.
- The induced homomorphism  $F_* : \mathfrak{g} \rightarrow \mathfrak{h}$  is an isomorphism.

┘

*Proof:* 1  $\rightarrow$  2:  $F$  is surjective thus  $H$  is a homogeneous  $G$ -space, so (16.5.2.6) shows  $H \cong G/\ker(F)$ . And  $G \rightarrow G/\ker(F)$  is a smooth covering map by (16.5.2.8).

2  $\rightarrow$  3 is trivial.

3  $\rightarrow$  1: If  $F$  is a local diffeomorphism, then  $\ker(F)$  is discrete, and  $F$  is open. Thus  $F(G)$  is an open subgroup of  $H$ , thus all of  $H$  because  $H$  is connected (4.12.1.3).

3  $\rightarrow$  4 is trivial. 4  $\rightarrow$  3 is by inverse function theorem. □

**Cor. (16.5.3.10) [Homomorphism with Discrete Kernel].** Let  $G, H \in \operatorname{LieGrp}$  with  $\dim G = \dim H$ ,  $H$  is connected, and  $f : G \rightarrow H \in \operatorname{LieGrp}$  with discrete kernel, then  $f$  is a covering space map and  $\ker(f) \subset Z(G)$ , by (16.5.1.6). ┘

*Proof:* This homomorphism is locally injective at 1, so it has rank  $\dim G = \dim H$ , so it is local diffeomorphism. In particular, the image contains a nbhd of 1 in  $H$ , thus it contains all  $H$  by (4.12.1.3).  $\square$

**Prop. (16.5.3.11) [Universal Covering Lie Group].** If  $G \in \text{LieGrp}_{\text{cntd}}$ , then its universal covering space  $\tilde{G}$  can be given a Lie group structure that the covering map is a group homomorphism. Moreover, the group structure is unique up to isomorphism over  $G$ . Moreover, the kernel of  $\tilde{G} \rightarrow G$  is a discrete central subgroup of  $\tilde{G}$ .  $\lrcorner$

*Proof:* Because  $\tilde{G}$  is simply connected, so does  $\tilde{G} \times \tilde{G}$ , let  $\tilde{e}$  be an element over  $e$ , we can lift the map  $\tilde{G} \times \tilde{G} \rightarrow G \times G \xrightarrow{m} G$  to a map  $\tilde{m} : \tilde{G} \times \tilde{G} \rightarrow \tilde{G}$  that  $\tilde{m}(\tilde{e}, \tilde{e}) = \tilde{e}$ . Similar we can lift an inverse map  $\tilde{i}$  that  $\tilde{i}(\tilde{e}) = \tilde{e}$ . These maps are smooth because  $\pi : \tilde{G} \rightarrow G$  is a local diffeomorphism.

It's left to show that  $(\tilde{m}, \tilde{i})$  makes  $\tilde{G}$  into a Lie group: For example, the map  $L_{\tilde{e}} : \tilde{G} \rightarrow \tilde{G}$  is a lift of  $\text{id}_G$  and it coincides with  $\text{id}_{\tilde{G}}$  on a point  $\tilde{e}$ , thus it is just  $\text{id}_{\tilde{G}}$ , which means  $\tilde{e}$  is a left identity. The rest is easy.

For the uniqueness: By the universal property of covering, if there are two coverings, we can lift it to a map connecting them that maps identity to identity, then show it is a group homomorphism.

The last assertion follows from (16.5.3.10).  $\square$

**Prop. (16.5.3.12) [Lie Subalgebras and Subgroups].** For any lie subalgebra  $\mathfrak{h} \subset \mathfrak{g}$ , there exists uniquely a connected Lie subgroup  $H \leq G$  s.t.  $\mathfrak{h}$  is the lie algebra of  $H$ .  $\lrcorner$

*Proof:* By (16.1.3.1), there is a maximal connected manifold  $H$  corresponding to  $\mathfrak{h}$ , we only need to show that it is a group. But the left invariance of  $\mathfrak{h}$  shows that  $HH \subset H$  because  $H$  is maximal.

Cf. [Lee13]P506.  $\textcolor{red}{?}$   $\square$

**Cor. (16.5.3.13).** If  $G_1$  is a simply connected Lie group and  $G_2$  is a connected Lie group, then any Lie algebra homomorphism  $\tilde{h} : \mathfrak{g}_1 \rightarrow \mathfrak{g}_2$  can be lifted to a unique Lie group homomorphism.  $\lrcorner$

*Proof:* Consider the image of  $\tilde{h} : \Gamma(\tilde{h}) \subset \mathfrak{g}_1 \times \mathfrak{g}_2$ , which is a Lie subalgebra. First notice a Lie group homomorphism  $h$  is equivalent to a Lie subgroup  $G_h$  of  $G_1 \times G_2$  that  $\pi_1|_{G_h}$  is a diffeomorphism onto  $G_1$ . And this Lie homomorphism induces the desired Lie algebra homomorphism iff the Lie algebra of  $G_h$  is just  $\tilde{h}$ .

(16.5.3.12) shows that there exists a unique Lie group  $G$  in  $G_1 \times G_2$  with Lie subalgebra  $\Gamma(\tilde{h})$ . The projection  $\pi_1|_G$  is a diffeomorphism onto  $G_1$ , because the tangent map at  $e$  is an isomorphism, thus a local diffeomorphism and by (16.5.3.10) a covering map, so it must be an isomorphism because  $G_1$  is simply connected and  $G$  is connected.  $\square$

**Cor. (16.5.3.14) [Representations of Simply-Connected Lie Groups].** The category of representations of simply-connected Lie groups is equivalent to the category of representations of its Lie algebra.  $\lrcorner$

**Thm. (16.5.3.15) [The Lie Correspondence].**

- The category of finite dimensional Lie algebras is equivalent to the category of simply connected Lie groups.
- For a f.d. Lie algebra  $\mathfrak{g}$ , the connected Lie groups with Lie algebras isomorphic to  $\mathfrak{g}$  corresponds to  $G/\Gamma$ , where  $G$  is a simply connected subgroup with Lie algebra  $\mathfrak{g}$ , and  $\Gamma$  is a discrete central subgroup of  $G$ .

$\lrcorner$

*Proof:* 1: By (16.5.3.12)(16.5.3.13) together with Ado's theorem??.

2: (16.5.3.11) and (16.5.3.9) shows any Lie group is a quotient of its universal covering Lie group by a discrete central subgroup. Conversely, for any discrete central subgroup,  $G/\Gamma$  is a Lie subgroup and  $\pi : G \rightarrow G/\Gamma$  is a homomorphism with kernel  $\Gamma$  by (16.5.1.4) and (16.5.1.28), thus  $\text{Lie}(G) = \text{Lie}(G/\Gamma) \cong \mathfrak{g}$  (16.5.1.28).  $\square$

**Prop. (16.5.3.16) [Ideals and Normal Subgroups].** Let  $G$  be a connected Lie group and  $H$  a connected Lie subgroup, then  $H$  is a normal subgroup of  $G$  iff  $\mathfrak{h}$  is an ideal of  $\mathfrak{g}$ .  $\lrcorner$

*Proof:* Because  $G, H$  are both connected, (4.12.1.3) shows  $H$  is normal in  $G$  iff for any  $X \in \mathfrak{g}, Y \in \mathfrak{h}$ ,  $\exp(X)\exp(Y)\exp(X)^{-1} \in H$ . Taking derivative w.r.t.  $Y$ , this is equivalent to  $d(\text{Ad}(\exp(X)))(Y) = \text{ad}(X)Y \in \mathfrak{h}$  (16.5.1.12), by (16.5.1.25), which is equivalent to  $\mathfrak{h}$  being an ideal of  $\mathfrak{g}$ .  $\square$

**Prop. (16.5.3.17) [Center].** Let  $G$  be a connected subgroup with Lie algebra  $\mathfrak{g}$  and  $Z$  the center of  $G$ ,  $\mathfrak{z}$  the center of  $\mathfrak{g}$ , then  $Z$  is a closed Lie subgroup of  $G$  with Lie algebra  $\mathfrak{z}$ .  $\lrcorner$

*Proof:* Because  $G$  is connected,  $g \in Z$  iff  $g$  commutes with all  $\exp(tX), X \in \mathfrak{g}$ . Thus  $Z = \ker \text{Ad}$ . Now the assertion follows from (16.5.1.29).  $\square$

**Prop. (16.5.3.18) [Chevalley's Theorem].** Let  $G$  be a complex connected Lie group and  $\mathfrak{g}$  the Lie algebra of  $G$ ,  $\mathfrak{h}$  the Cartan subalgebra of  $\mathfrak{g}$ , and  $W$  the Weyl group, then the restriction of functions induces a graded algebra isomorphism

$$\mathbb{C}[\mathfrak{g}]^G \cong \mathbb{C}[\mathfrak{h}]^W.$$

$\lrcorner$

*Proof:* ?  $\square$

### Classifications

**Prop. (16.5.3.19) [Simply-Connected Compact Lie Groups].** Any simply connected compact Lie groups is a product of the following types:

- $\text{Spin}(n)$  for  $n \geq 3$ .
- $\text{SU}(2)$  for  $n \geq 2$ .
- $\text{Sp}(n)$  for  $n \geq 1$ .
- $E_6, E_7, E_8, F_4, G_2$ .

$\lrcorner$

*Proof:* ?  $\square$

## 4 Compact Lie Groups and Representations

**Prop. (16.5.4.1).** Any compact connected complex Lie group is Abelian. And it is a complex tori. So we only consider only compact real Lie groups.  $\lrcorner$

*Proof:* Mimic the proof that Abelian variety is commutative (20.9.1.5), using a similar rigidity lemma.  $\square$

**Cor. (16.5.4.2).**  $U(n)$  is not a complex Lie group, in particular not a complex algebraic variety.  $\lrcorner$

**Prop. (16.5.4.3).** Let  $G$  be a compact connected Lie group with Lie algebra  $\mathfrak{g}$  and center  $Z$ . Let  $G_{ss}$  be the connected subgroup of  $G$  corresponding to the Lie subalgebra  $[\mathfrak{g}, \mathfrak{g}]$  (16.5.3.12), then  $G_{ss}$  has finite center, and  $Z^0, G_{ss}$  are closed in  $G$ , and  $G = Z^0 G_{ss}$ .  $\lrcorner$

*Proof:* Cf. [Kna96] P198.  $\square$

**Prop. (16.5.4.4) [Compact Lie Group and Representations].** A compact topological group  $G$  is a real Lie group iff it has a faithful real f.d. representation. And in this case, it is a closed subgroup of  $U(n)$  for some  $n$ .  $\lrcorner$

*Proof:* If it has a faithful f.d. representation, then  $G \subset GL(n, \mathbb{R})$  compact hence closed, thus a Lie subgroup by (16.5.1.22).

Conversely, if  $G$  is a Lie group, then we can choose a small nbhd  $U$  of  $e \in G$  that contains no non-trivial subgroup of  $G$  (choose  $\exp(\frac{1}{2}V)$  where  $\exp$  is an diffeomorphism on  $V$ ). Consider kernel  $K_\pi$  for irreducible representations  $\pi$  of  $G$ , then  $\cap_\pi K_\pi = \emptyset$  by Gelfand-Raikov (24.7.1.29), in particular  $\cap_\pi (K_\pi - U) = \emptyset$ . But  $G - U$  is compact, hence there are f.m.  $\pi_i$  that  $\cap_i K_{\pi_i} \in U$ , but by definition of  $U$ ,  $\cap_i K_{\pi_i} = \{e\}$ , which gives a f.d. faithful representation of  $G$ , by (24.7.3.5).  $\square$

**Prop. (16.5.4.5) [Reduction to Faithful Representations].** Let  $V$  be a faithful f.d. representation of a compact Lie group  $G$  and  $Y$  is an irreducible f.d. representation of  $G$ , then  $Y$  is a direct summand of  $V^{\otimes n} \otimes V^{*\otimes m}$  for some  $m, n \geq 0$ . Moreover, if  $G$  is unimodular, we can take  $m = 0$ .  $\lrcorner$

*Proof:* Cf. [Etingof, P175].  $\square$

**Remark (16.5.4.6).** Theory of representations of compact Lie groups are a special case of abstract harmonic analysis 12.10.  $\lrcorner$

### Maximal Tori

**Prop. (16.5.4.7) [Tori].** Any connected compact Abelian real Lie group is a torus.  $\lrcorner$

*Proof:* By (16.6.4.1), the exponential map realizes  $\mathfrak{g}$  as the universal cover of  $G$ , and the kernel is then a complete lattice  $\Lambda$  in  $\mathbb{R}^n$ , so  $G \cong \mathbb{R}^n / \Lambda \cong (S^1)^n$ .  $\square$

**Prop. (16.5.4.8).** The maximal tori in a compact Lie group  $G$  corresponds to the maximal Abelian subalgebras of  $\mathfrak{g}$ .  $\lrcorner$

*Proof:* Let  $T$  be a maximal tori, then  $\mathfrak{t}$  is maximal Abelian by fundamental theorem of Lie (16.5.3.12). Conversely, if  $\mathfrak{t}$  is a maximal tori, then the corresponding Lie subgroup  $T$  is Abelian, and  $\overline{T}$  is also Abelian. The Lie algebra of  $T, \overline{T}$  are the same by maximality of  $\mathfrak{t}$ , so  $T = \overline{T}$ , and it is a torus by (16.5.4.7), and it is clearly maximal.  $\square$

**Prop. (16.5.4.9).** Let  $G$  be a compact connected Lie group with Lie algebra  $\mathfrak{g}$ , then any two maximal Abelian subalgebra of  $\mathfrak{g}$  are conjugate via  $\text{Ad}(G)$ .  $\lrcorner$

*Proof:* Let  $\mathfrak{t}, \mathfrak{t}'$  be two maximal Abelian subalgebra of  $\mathfrak{g}$ . As  $\mathfrak{g}$  is reductive (3.7.5.3), if we choose  $X \in \mathfrak{t}, X' \in \mathfrak{t}'$  that are not zero for any roots, then  $Z_{\mathfrak{g}}(X) = \mathfrak{t}, Z_{\mathfrak{g}}(X') = \mathfrak{t}'$ . Let  $(\cdot, \cdot)$  be a invariant inner product on  $\mathfrak{g}$  defined in (16.5.7.2), choose a  $g_0 \in G$  that  $(\text{Ad}(g_0)X, X')$  is maximal, then  $0 = ([Z, \text{Ad}(g_0)X, X'] = (Z, [\text{Ad}(g_0)X, X']$  for any  $Z \in \mathfrak{g}$ , so  $\text{Ad}(g_0)X \in Z_{\mathfrak{g}}(X') = \mathfrak{t}'$ . Thus  $\mathfrak{t}' \subset Z_{\mathfrak{g}}(\text{Ad}(g_0)X) = \text{Ad}(g_0)Z_{\mathfrak{g}}(X) = \text{Ad}(g_0)\mathfrak{t}$ , and the equality holds as  $\mathfrak{t}'$  is maximal.  $\square$

**Cor. (16.5.4.10) [Maximal Tori are Conjugate].** Let  $G$  be a compact connected Lie group, then any two maximal tori of  $G$  are conjugate via  $\text{Ad}(G)$ .  $\lrcorner$

**Prop. (16.5.4.11).** Let  $G$  be a compact connected Lie group, then any element of  $G$  is connected in a maximal torus.  $\lrcorner$

*Proof:* By (16.6.4.1), this element is contained in a 1-parameter subgroup  $T$  of  $G$ , and  $\bar{T}$  is also Abelian, so is a torus by (16.5.4.7). Then choose a maximal torus containing  $\bar{T}$ .  $\square$

**Cor. (16.5.4.12).**  $Z(G)$  is contained in any maximal torus, by (16.5.4.10).  $\lrcorner$

**Prop. (16.5.4.13).** Let  $S$  be a torus in a compact Lie group  $G$  and  $g \in G$  that commutes with elements in  $S$ , then there is a torus containing both  $S$  and  $g$ .  $\lrcorner$

*Proof:* Let  $A$  be the closure of  $\cup_{i \in \mathbb{Z}} g^i S$ , and  $A_0$  the identity component of  $A$ , then as  $A$  is compact,  $A_0$  is open in  $A$  and compact, so  $\cup_{i \in \mathbb{Z}} g^i A_0 = A$ , and also  $A/A_0$  is a cyclic group. As  $A_0$  is a torus, we can find  $a \in A$  that the closure of  $\{a^n | n \in \mathbb{Z}\}$  is  $A$ . By (16.6.4.1), let  $a = \exp_G(X)$ , then the closure of the 1-parameter group generated by  $X$  is a torus containing both  $S$  and  $g$ .  $\square$

**Cor. (16.5.4.14).** In a compact connected Lie group  $G$ , then centralizer of a torus  $T$  is connected. In fact, it is the union of maximal tori containing  $T$ . In particular, a maximal torus is self-centralizing.  $\lrcorner$

### Highest Weight Theory

Cf. [Compact Lie Groups, Sepanski]. Chap 7.

### Examples of Representations

**Prop. (16.5.4.15) [Representations of  $\text{SU}(2)$ ].**  $\text{SU}(2) \cong \mathbb{S}^3$  is simply connected with Lie algebra  $\mathfrak{sl}_2(\mathbb{R})$  (16.6.1.6), thus we can use (16.5.3.14) and (24.4.1.14) to see that the representations of  $\text{SU}(2)$  are all of the form  $W_n$ , where  $W_n$  is the representation of  $\text{SU}(2)$  on the space of homogenous polynomials of degree  $n$  in two variables  $x, y$  induced by  $\begin{bmatrix} a & b \\ c & d \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix} = \begin{bmatrix} ax + by \\ cx + dy \end{bmatrix}$ .  $\lrcorner$

*Proof:* Check the central character of the induced representations of Lie algebra.  $\square$

**Prop. (16.5.4.16).** Let  $G = \text{SO}(n)$  for  $n \not\equiv 2 \pmod{4}$ . Show that:

1. For any element  $g \in G$ ,  $g$  and  $g^{-1}$  are conjugate in  $\text{SO}(n)$ .
2. Any  $(\rho, V) \in \text{Irr}(G)$  is isomorphic to its dual.

$\lrcorner$

*Proof:* 1: By (3.5.11.19), if  $n = 2m + 1$ ,  $g$  is orthogonally diagonal to a matrix of the form  $\text{diag}\{\text{SO}(2; \mathbb{R}), \dots, \text{SO}(2; \mathbb{R}), 1\}$ . Notice  $\text{SO}(2; \mathbb{R}) = \{k_\theta, \theta \in (0, 2\pi]\}$ , where  $k_\theta = \begin{bmatrix} \cos \theta & \sin \theta \\ -\sin \theta & \cos \theta \end{bmatrix}$ , and  $k_\theta^{-1} = k_{-\theta} = k_\theta^t$ . If we take  $W = \text{diag}\left\{\begin{bmatrix} 1 & \\ & 1 \end{bmatrix}, \dots, \begin{bmatrix} 1 & \\ & 1 \end{bmatrix}, (-1)^m\right\}$ , then  $W \in \text{SO}(n, \mathbb{R})$  and  $WgW^{-1} = g^{-1}$ .

If  $n = 4k$ , then  $g$  is orthogonally diagonal to a matrix of the form  $\text{diag}\{\text{SO}(2; \mathbb{R}), \dots, \text{SO}(2; \mathbb{R})\}$ . If we take  $W = \text{diag}\left\{\begin{bmatrix} 1 & \\ & 1 \end{bmatrix}, \dots, \begin{bmatrix} 1 & \\ & 1 \end{bmatrix}\right\}$ , then  $W \in \text{SO}(n; \mathbb{R})$  and  $WgW^{-1} = g^{-1}$ .

2: Because  $\chi_{V^*}(g) = \chi_V(g^{-1}) = \chi_V(g)$  as  $g, g'$  are in the same conjugacy class,  $V$  and  $V^*$  are isomorphic, because f.d. representations are determined by characters(3.6.2.13)(applied to the group algebra  $\mathbb{C}[G]$ ).  $\square$

### Maximal Compact Subgroup

For maximal compact subgroup of general locally compact subgroups, see [Maximal Compact Subgroups](#).

**Prop.(16.5.4.17) [Uniqueness for Semisimple Lie group].** Maximal compact subgroup exists by(12.10.3.33), and for a semisimple Lie group  $G$ , the maximal compact subgroup is unique up to conjugation.  $\lrcorner$

*Proof:* Cf.[Wiki].  $\square$

**Prop.(16.5.4.18)[Examples of Maximal Compact Subgroups].**

- $O(n)$  is the maximal compact subgroup of  $GL(n, \mathbb{R})$ .
- $SO(n)$  is the maximal compact subgroup of  $SL(n, \mathbb{R})$ .
- $SO(m, n)$  is the maximal compact subgroup of  $S(O(m) \times O(n))$ .
- $SO(n)$  is the maximal compact subgroup of  $SL(n, \mathbb{R})$ .
- $SU(n)$  is the maximal compact subgroup of  $SL(n, \mathbb{C})$ .
- $SU(m, n)$  is the maximal compact subgroup of  $S(U(m) \times U(n))$ .
- $SO(n)$  is the maximal compact subgroup of  $SO(n, \mathbb{C})$ .
- $U(n)$  is the maximal compact subgroup of  $GL(n, \mathbb{C})$ .
- $SU(n)$  is the maximal compact subgroup of  $SL(n, \mathbb{C})$ .
- $Sp(n)$  is the maximal compact subgroup of  $Sp(n, \mathbb{C})$ , by(16.6.1.15).
- $Sp(m, n)$  is the maximal compact subgroup of  $Sp(m) \times Sp(n)$ .
- $Sp(n)$  is the maximal compact subgroup of  $SL(n, \mathbb{H})$ , by(16.6.1.15).
- $U(n)$  is the maximal compact subgroup of  $O^*(n)$ , by(16.6.1.15).

And the above maximal compact subgroups are also deformation retractions.  $\lrcorner$

*Proof:* This follows from polar decomposition(16.5.5.2), notice that the projection of a compact group is a compact group in  $\mathbb{R}^n$ , so it is trivial.  $\square$

## 5 Decompositions

**Prop.(16.5.5.1) [Cartan Decomposition].** Let  $G = GL(n; \mathbb{R})$ ,  $K = O(n)$  or  $G = GL(n, \mathbb{R})^+$ ,  $K = SO(n)$ , then every double coset  $K \backslash G / K$  has a unique representation of diagonal matrix  $D$  with decreasing positive entries.  $\lrcorner$

*Proof:* For the existence, given  $g$ , consider  $S = g^t g = k_1^{-1} \text{diag}(\lambda_1, \dots, \lambda_n) k_1$ , where  $k_1 \in SO(n)$ (3.5.11.9). Then consider

$$k_2 = g k_1^{-1} \text{diag}(\lambda_1^{-1/2}, \dots, \lambda_n^{-1/2})$$

it is orthogonal and  $g = k_2 \operatorname{diag}(\lambda_1^{1/2}, \dots, \lambda_n^{1/2}) k_1$ .

For the uniqueness, consider  $g k_1^{-1} \operatorname{diag}(\lambda_1^{-1/2}, \dots, \lambda_n^{-1/2})$  is orthogonal, thus  $k_1 S k_1^{-1}$  is diagonal with decreasing positive entries, thus uniquely defined.  $\square$

**Prop. (16.5.5.2) [Polar Decomposition for Linear Groups].** Let  $G \subset \operatorname{GL}(n; \mathbb{C})$  be a closed linear group that is defined by the a family of real valued polynomials in the real and imaginary parts of entries of  $G$ , and  $G$  is closed under conjugation. Let  $K = G \cap U(n)$ , and let  $\mathfrak{p}$  be the subspace of Hermitian matrices in  $\mathfrak{g}$ , then the map  $K \times \mathfrak{p} \rightarrow G : (k, X) \mapsto k \exp(X)$  is a homeomorphism. In particular,  $G$  has  $K$  as deformation retracts.  $\lrcorner$

*Proof:* The  $\operatorname{GL}(n; \mathbb{C})$  case follows from (12.9.3.20) and (16.6.4.1), and for the general case, it suffices to show if  $g \in G$  and  $g = k \exp(X)$ , then  $X \in \mathfrak{g}$ : By hypothesis,  $g^* g = e^{2X} \in G$ . Take a basis that  $2X = \operatorname{diag}(a_1, \dots, a_n)$  with  $a_i$  real, then  $e^{2kX} = \operatorname{diag}(e^{ka_1}, \dots, e^{ka_n})$  are all in  $G$ . Then it can be easily shown any polynomial that vanishes at all such  $e^{2kX}$  vanishes on all  $e^{2tX}$ , thus  $X \in \mathfrak{g}$ .  $\square$

**Cor. (16.5.5.3).**  $\operatorname{GL}(n, \mathbb{R}) \cong P \cdot \operatorname{O}(n)$ , where  $P$  is the set of positive symmetric matrix, by (16.6.4.1).  $\lrcorner$

**Prop. (16.5.5.4) [QR-Decompositions].**

- Any real matrix  $A$  has the form  $A = QR$  where  $Q$  is orthogonal and  $R$  is upper triangular with positive diagonal entries. Moreover, if  $A$  is invertible, then the decomposition is unique.
- Any complex matrix  $A$  has the form  $A = QR$  where  $Q$  is unitary and  $R$  is upper triangular with positive diagonal entries. Moreover, if  $A$  is invertible, then the decomposition is unique.
- Any Quaternion matrix  $A$  has the form  $A = QR$  where  $Q \in \operatorname{U}(n; \mathbb{H})$  (16.6.1.15) and  $R$  is upper triangular with positive diagonal entries. Moreover, if  $A$  is invertible, then the decomposition is unique.

$\lrcorner$

*Proof:* We only prove for  $\operatorname{GL}(n; \mathbb{R})$ , the rest is similar. Use Gram-Schmidt orthogonalization: choose a basis  $v = \{v_1, \dots, v_n\}$  of  $V$  and  $A$  acts on  $V$ , then  $A$  maps  $\{v_1, \dots, v_n\}$  to a set  $\{w_1, \dots, w_n\}$ . Then we can define an orthonormal basis  $\{e_1, \dots, e_n\}$  that  $v_k \in \operatorname{span}\{e_1, \dots, e_k\}$ . Now let  $\{w_1, \dots, w_n\} = \{e_1, \dots, e_n\}R$ , then  $R$  is upper triangular, and  $Q = [e_1, \dots, e_n]_v$  is orthogonal, and  $A = QR$ . We can make diagonal entries of  $R$  positive by left multiplying a diagonal orthogonal matrix.

To show the uniqueness when  $A$  is invertible, let  $A = Q_1 R_1 = Q_2 R_2$ , then  $A^t A = R_1^t R_1 = R_2^t R_2$ . Then  $(R_2)^{-t} R_1^t = R_2 R_1^{-1}$ , where the LHS is lower-triangular and the RHS is upper-triangular, which means both of them are diagonal. Then if  $\alpha_i$  are the diagonal entries of  $R_1$  and  $\beta_i$  are the diagonal entries of  $R_2$ , then  $\alpha_i / \beta_i = \beta_i = \alpha_i$ , which means  $\alpha_i = \beta_i$ , and  $R_2 R_1^{-1} = 1$ .  $\square$

**Prop. (16.5.5.5) [Smith Normal Form].** Let  $(\mathcal{O}_K, K)$  be a PID. Choose a representative  $\mathcal{P}$  for associativity classes of any prime in  $R$  (to eliminate the distraction of units), then there is complete set of representatives for the double cosets of  $\operatorname{GL}(n; \mathcal{O}_K) \backslash \operatorname{GL}(n, K) / \operatorname{GL}(n; \mathcal{O}_K)$  consisting of diagonal matrices  $\operatorname{diag}(f_1, \dots, f_n)$ , where  $f_i \in K$  are products of elements in  $\mathcal{P}$ , and  $f_k$  divides  $f_{k+1}$ . Notice  $\operatorname{GL}(n, R)$  is the matrices with unit determinants in  $\mathcal{O}_K$ .  $\lrcorner$

*Proof:* For the uniqueness, clearly the row operators doesn't change the greatest common divisor of  $k \times k$  minors of  $M$  for any  $k$  (change by a scalar but the diagonal entries are monic), thus the entries are determined by the minors of  $M$ .

For the existence, for any  $g \in \operatorname{GL}(n; K)$  there is an  $r \in \mathcal{O}_K$ , that  $rg$  has coefficients in  $R$ , and also  $r$  is a product of elements in  $\mathcal{P}$ . let  $M$  be the submodule of  $R^n$  generated by the rows of  $rg$ , then

by the elementary divisor theorem(3.2.4.24), there exists a basis  $\xi_i$  for  $R^n$  and  $d_i \in R$  that  $d_i | d_{i+1}$ , and  $\{d_i \xi_i\}$  form a basis of  $M$ . we may assume  $d_i$  are products of elements in  $\mathcal{P}$ . Then the matrix  $\xi$  with rows  $\xi_i$  are in  $\text{GL}(n; \mathcal{O}_K)$ , and the rows of the matrix  $\text{diag}(d_1, \dots, d_n)\xi$  span the same module as  $rg$ . Then

$$K_1 rg = \text{diag}(d_1, \dots, d_n)\xi$$

for some  $K_1 \in \text{GL}(n; \mathcal{O}_K)$ , so  $g$  are in the same double coset as  $\text{diag}(r^{-1}d_1, \dots, r^{-1}d_n)$ .  $\square$

**Def.(16.5.5.6)[Generalized Upper Half Plane].** The generalized **upper half plane**  $\mathfrak{h}^n$  associated to  $\text{GL}(n; \mathbb{R})$  is defined to be the subset of  $\text{GL}(n; \mathbb{R})$  of the form  $z = xy$  where

$$x = \begin{bmatrix} 1 & x_{1,2} & x_{1,3} & \dots & x_{1,n} \\ & 1 & x_{2,3} & \dots & x_{2,n} \\ & & \ddots & & \dots \\ & & & 1 & x_{n-1,n} \\ & & & & 1 \end{bmatrix}, \quad y = \text{diag}(y_1 y_2 \dots y_{n-1}, y_1 y_2 \dots y_{n-2}, \dots, y_2 y_1, y_1, 1).$$

where  $x_{i,j} \in \mathbb{R}$  and  $y_i \in \mathbb{R}_+$ .  $\lrcorner$

**Thm.(16.5.5.7)[Iwasawa Decomposition].** For  $n \geq 2$ , each matrix  $g \in \text{GL}(n; \mathbb{R})$  has a factorization of the form  $g = \tilde{g} \cdot d \cdot k$  where  $\tilde{g} \in \mathfrak{h}^n$ ,  $k \in \text{O}(n; \mathbb{R})$  and  $d$  is diagonal. Moreover,  $\tilde{g}$  is uniquely determined and  $(d, k)$  is uniquely determined up to  $\{\pm 1\}$ .  $\lrcorner$

*Proof:* Cf.[Gol06]Prop1.2.6. ?  $\square$

**Def.(16.5.5.8)[Action of  $\text{GL}(n; \mathbb{R})$  on  $\mathfrak{h}^n$ ].** There is an action of  $\text{GL}(n; \mathbb{R})$  on  $\mathfrak{h}^n$ (16.5.5.6) defined by

$$g.z = \widetilde{g}.z(16.5.5.7).$$

$\lrcorner$

*Proof:* ?  $\square$

## 6 Semisimple Lie Groups

**Def.(16.5.6.1)[Semisimple Lie Group].** A **semisimple/solvable/nilpotent/simple Lie group** is a Lie group with a semisimple/solvable/nilpotent/simple Lie algebra.  $\lrcorner$

**Def.(16.5.6.2)[Adjoint Lie Group].** An **adjoint Lie group** is a semisimple real Lie group(16.5.6.1) with trivial center.  $\lrcorner$

**Prop.(16.5.6.3).** Let  $G$  be a semisimple complex Lie group, then the center  $Z$  of  $G$  is contained in  $G^c$ , thus the restriction of f.d. representations of  $G$  to  $G^c$  is an equivalence of categories.  $\lrcorner$

*Proof:* Cf.[Etingof, P209]  $\square$

### Maximal Tori

**Prop.(16.5.6.4).** Let  $G$  be a complex semisimple Lie group with Lie algebra  $\mathfrak{g}$ , compact form  $\mathfrak{g}^c$  and compact part  $G^c$ , then  $\lrcorner$

## 7 Analysis

**Lemma (16.5.7.1).** Let  $H$  be a Lie subgroup of  $G$  and  $g \notin H$ , then there is a smooth function  $\Phi$  on  $G$  that  $\Phi(xh) = \Phi(x)$  for any  $x \in G, h \in H$ , and  $\Phi(H) = 0$ , yet  $\Phi(g) \neq 0$ .  $\lrcorner$

*Proof:* Because  $H$  is closed, there is a nbhd  $U$  of  $g$  disjoint from  $H$  and a function  $\varphi$  supported in  $U$ . Then  $\Phi(x) = \int_H \varphi(xh)dh$  satisfies the desired condition.  $\square$

### Bi-Invariant Metric

**Lemma (16.5.7.2).** Bi-invariant metric exists in a compact Lie group.  $\lrcorner$

*Proof:* Because the Haar measure on a compact metric is bi-invariant. Choose a Riemann metric and set

$$\langle V, W \rangle = \int_{G \times G} \langle L_{\sigma^*} R_{\tau^*}(V), L_{\sigma^*} R_{\tau^*}(W) \rangle d\mu(\sigma) d\mu(\tau).$$

Note that  $L_*$  and  $R_*$  commute.  $\square$

**Prop. (16.5.7.3).** For a left-invariant metric on a connected Lie group  $G$ , if it is bi-invariant, then the inner product at the origin  $e$  is invariant under  $\mathfrak{g}$ (3.7.1.13), and the converse is also true if  $G$  is connected.  $\lrcorner$

*Proof:* If the metric is invariant, then for any  $X, Y, Z \in \mathfrak{g}$ ,  $\langle \text{Ad}(\exp(tX))Y, \text{Ad}(\exp(tX))Z \rangle = \langle X, Y \rangle$ , so we take derivation w.r.t.  $t$  to get

$$\langle \text{ad}(X)Y, Z \rangle + \langle Y, \text{ad}(X)Z \rangle = 0$$

by(16.5.1.12).

Conversely, if this is invariant, then using  $\exp(tX) = \exp((t - t_0)X) \exp(t_0X)$ , we get

$$\frac{\partial}{\partial t} \langle \text{Ad}(\exp(tX))Y, \text{Ad}(\exp(tX))Z \rangle = 0$$

for all  $t$ , thus  $\langle \text{Ad}(\exp(tX))Y, \text{Ad}(\exp(tX))Z \rangle = \langle X, Y \rangle$ , and it is invariant under right actions by  $\exp(tX)$  also. As  $G$  is generated by the elements  $\exp(X)$ (4.12.1.3), it is right-invariant under  $G$ .  $\square$

**Prop. (16.5.7.4).** If  $G$  has a bi-invariant metric, then

$$\nabla_X Y = 1/2[X, Y], \quad R(X, Y)Z = 1/4[[X, Y], Z], \quad K(\sigma) = 1/4|[X, Y]|^2.$$

So it has non-positive sectional curvature, and its curvature is non-negative, and all 1-parameter subgroups are geodesics from  $e$ .  $\lrcorner$

*Proof:* It suffices to show that  $\langle Z, \nabla_X Y \rangle = 1/2 \langle Z, [X, Y] \rangle$  for any  $Z$ , and this follows from(16.3.4.16). The second follows from the first and the definition(16.3.4.11).  $\square$

**Cor. (16.5.7.5).** A bi-invariant Lie group with  $Z(\mathfrak{g}) = 1$  is compact and  $\#\pi_1(G) < \infty$ .  $\lrcorner$

*Proof:* The Ricci curvature has a positive lower bound, otherwise for some  $X$ ,  $[X, Y] = 0$  for all  $Y$ , thus  $X$  is in the center. Hence we use Myer theorem(16.3.6.20).  $\square$

**Cor. (16.5.7.6).** If  $G$  is connected and has a bi-invariant metric, then  $\exp : \mathfrak{g} \rightarrow G$  is surjective. In particular, this holds if  $G$  is compact, by(16.5.7.2).  $\lrcorner$

*Proof:* Because  $\exp$  is defined for any  $X \in \mathfrak{g}$ , and for any  $g \in G$  and  $v \in T_g(G)$ ,  $\exp_p(v) = L_g(\exp(dL_{g^{-1}})_g(v))$  because  $L_g$  is an isomorphism of Riemann manifolds. So by Hopf-Rinow(16.3.4.46),  $G$  is complete. Thus for any  $q$ , there is a geodesic connecting  $e, q$ , which is a 1-parameter subgroup, thus  $q = \exp(X)$  for some  $X \in \mathfrak{g}$ .  $\square$

**Prop. (16.5.7.7) [Structure of bi-invariant Lie groups].** A simply-connected Lie group with a bi-invariant metric is equal to  $G' \times R^k$ ,  $G'$  compact.  $\lrcorner$

*Proof:* Because the orthogonal complement of the center of  $\mathfrak{g}$  is a Lie algebra,  $G$  is like  $G' \times R^k$ , and a simply connected abelian Lie group is  $R^k$  ?.  $\square$

## 16.6 Classical Groups

In this subsection, classical groups(10.5.3.2) over Archimedean fields and related Lie groups are studied.

References are [Symmetry, Representations and Invariants].

For more classical groups, Cf.[Classical Groups Baker].

**Notation(16.6.0.1).**

- Use notations on Lie groups defined in [Lie Groups](#).

┘

### 1 Basics

**Def.(16.6.1.1)[Examples of Classical Groups].** Let  $\mathbb{K}$  be either  $\mathbb{R}$  or  $\mathbb{C}$ ,

- For any associative algebra  $\mathbb{K}$  over a field, the **general linear group**  $GL(n; \mathbb{K})$  is the subgroup of  $Mat(n; \mathbb{K})$  consisting of invertible matrices.
- The **unitary group**  $U(n; \mathbb{C})$  is the subgroup of  $GL(n; \mathbb{C})$  consisting of matrices fixing a non-degenerate Hermitian form.
- The **special unitary group**  $SU(n; \mathbb{C}) = U(n) \cap SL_n(\mathbb{C})$ .
- The **pseudo-unitary groups**  $U(p, q, \mathbb{K})$ : If  $\mathbb{K} = \mathbb{R}$ , it is the subgroup of  $GL(n; \mathbb{R})$  consisting of matrices preserving a bilinear form of signature  $(p, q)$ . If  $\mathbb{K} = \mathbb{C}$ , it is the subgroup of  $GL(n; \mathbb{C})$  consisting of matrices preserving a Hermitian form of signature  $(p, q)$ . If  $\mathbb{K} = \mathbb{H}$ , it is the subgroup of  $GL(n; \mathbb{H})$  consisting of matrices preserving a non-degenerate quaternionic Hermitian form of signature  $(p, q)$ (3.5.11.1).
- The **quaternionic orthogonal group**  $O^*(2n)$  is the subgroup of  $GL(n; \mathbb{H})$  consisting of matrices preserving a non-degenerate quaternionic skew-Hermitian form(3.5.11.1).  $SO^*(2n)$  is the subgroup of  $O^*(2n)$  consisting of elements of determinant 1.
- $PU(n; \mathbb{C})$  is the quotient group of  $SU(n)$ (or  $U(n; \mathbb{C})$ ) by scalar matrices.

┘

*Proof:*  $GL(n; \mathbb{K})$  has a natural smooth structure as an open subset of  $\mathbb{K}^{n^2}$ , and the multiplication map is clearly smooth, so it is a Lie group by(16.5.1.1). The other groups are closed subgroups of  $GL(n; \mathbb{K})$ , so they have unique smooth manifold structure making them Lie subgroups of  $GL(n; \mathbb{K})$ , by(16.5.1.22)(16.5.1.16). Finally the quotient group by normal closed subgroups have natural Lie group structure by(16.5.1.28).  $\square$

**Prop.(16.6.1.2)[Classification of  $2 \times 2$  Matrices].** Let  $\mathbf{1} \neq \alpha \in SL(2; \mathbb{R})$ , then by Jordan decomposition,  $\alpha$  is conjugate to a matrix of one the two following types:

$$\begin{bmatrix} \lambda & 1 \\ & \lambda \end{bmatrix}, \quad \begin{bmatrix} \lambda & \\ & \mu \end{bmatrix}, \lambda \neq \mu,$$

according as it has repeated eigenvalues or distinct eigenvalues. In the first case,  $\alpha$  is called **parabolic transform**, and in the second case, if  $\mu = \bar{\lambda} \in \mathbb{S}^1$ , it is called **elliptic transform**, If  $\lambda/\mu$  is real and positive, it is called **hypobolic transform**.

Consider the action of  $SL(2; \mathbb{R})$  on  $\mathcal{H} \cup \mathbb{P}^1(\mathbb{R})$ , then:

- If  $\alpha \in \mathrm{SL}(2; \mathbb{R})$  is parabolic, then it has a unique real eigenvector, which means it has a unique fixed point in  $\mathbb{P}^1(\mathbb{R})$ .
- If  $\alpha \in \mathrm{SL}(2; \mathbb{R})$  is elliptic, then  $\alpha$  has two conjugate eigenvectors, which means it has exactly one fixed point  $z$  in  $\mathcal{H}$ , and a second fixed point, namely  $\bar{z}$ , in the lower half plane.
- If  $\alpha \in \mathrm{SL}(2; \mathbb{R})$  is hyperbolic, then it has two real eigenvectors, which means it has two distinct fixed points in  $\mathbb{P}^1(\mathbb{R})$ .

┘

**Prop. (16.6.1.3) [Iwasawa Decomposition].** Any element of  $\mathrm{GL}(2; \mathbb{R})^+$  has a unique representation of the form (16.5.5.4):

$$g = \begin{bmatrix} u & \\ & u \end{bmatrix} \begin{bmatrix} y^{1/2} & xy^{-1/2} \\ & y^{-1/2} \end{bmatrix} k_\theta$$

where  $k_\theta = \begin{bmatrix} \cos \theta & \sin \theta \\ -\sin \theta & \cos \theta \end{bmatrix}$ . So by (12.10.3.8) and (12.10.1.19) the Haar measure is calculated to be  $dg = \frac{1}{2\pi} \frac{du}{u} \frac{dxdy}{y^2} d\theta$ , and it is unimodular by (12.10.1.22). (Notice the upper triangular matrix group  $B \subset \mathrm{GL}(2; \mathbb{R})^+$  is not unimodular).

┘

*Proof:* For the calculation of Haar measure, notice that it suffices to calculate for  $u, x, y$  and it is

$$\frac{d(uy^{1/2})d(uy^{-1/2})d(uxy^{-1/2})}{(uy^{1/2})^2uy^{-1/2}} = \frac{dxd(uy^{1/2})d(uy^{-1/2})}{u^2y} = \frac{dxdydu}{uy^2}$$

□

**Cor. (16.6.1.4).** Any element of  $\mathrm{SL}(2; \mathbb{R})$  has a unique representation of the form

$$g = \begin{bmatrix} e^{\frac{u}{2}} & 0 \\ 0 & e^{-\frac{u}{2}} \end{bmatrix} \begin{bmatrix} 1 & x \\ & 1 \end{bmatrix} k_\theta.$$

And the Haar measure is given by  $dg = \frac{1}{2\pi} du dx d\theta$  by similar calculation, which is unimodular. ┘

**Prop. (16.6.1.5).**  $\mathcal{H}$  is a homogenous space for  $\mathrm{PGL}(2; \mathbb{R})$ , and  $\mathrm{Stab}_{\mathrm{PGL}(2; \mathbb{R})}(\mathbf{i}) = \mathrm{SO}(2; \mathbb{R})$ . Also it fixes the hyperbolic metric  $ds^2 = y^{-2}dxdy$ . ┘

*Proof:* This follows from the Iwasawa decomposition (16.6.1.3). □

**Prop. (16.6.1.6) [SU(2)].**

$$\mathrm{SU}(2) = \{A_{\alpha, \beta} = \begin{bmatrix} \alpha & \beta \\ -\bar{\beta} & \bar{\alpha} \end{bmatrix}, \alpha, \beta \in \mathbb{C}, |\alpha|^2 + |\beta|^2 = 1\}$$

is isomorphic to the group of unit quaternions and diffeomorphic to  $S^3$ . The Lie algebra of  $\mathrm{SU}(2)$  is isomorphic to  $\mathfrak{sl}_2(\mathbb{R})$ . ┘

*Proof:* Let  $A = \begin{bmatrix} a & b \\ c & d \end{bmatrix} \in \mathrm{SU}(2)$ , then

$$a\bar{a} + b\bar{b} = 1, \quad a\bar{c} + b\bar{d} = 0, \quad c\bar{c} + d\bar{d} = 1, \quad ac - bd = 1.$$

So  $(c, d) = \lambda \cdot (-\bar{b}, \bar{a})$ , and we can calculate  $\lambda = 1$ . So the first assertion follows.

By (3.5.11.34),  $\mathrm{SU}(2)$  is isomorphic to the group of unit quaternions, which is clearly isomorphic to  $S^3$ . □

**Prop. (16.6.1.7)**[Actions of  $SU(2)$ ].

- There is a double covering of Lie groups  $SU(2) \rightarrow SO(3)$  with kernel  $\{\pm 1\}$ .
- There is a double covering of Lie groups  $SU(2) \times SU(2) \rightarrow SO(4)$  with kernel  $\{\pm 1\}$ .

⌋

*Proof:* 1: Regard  $SU(2)$  as the unit quaternions and  $SO(3)$  the transformation group of pure unit quaternions, then  $SU(2) \rightarrow SO(3)$  is given by

$$u \mapsto (v \mapsto uv\bar{u}).$$

Because  $u \cdot \bar{u}$  preserves orthogonality relations, it preserves the space of pure quaternions, so it has image in  $O(3)$ . But it has image in  $SO(3)$  because  $SU(2) \cong S^3$  is connected. Its kernel is the center of  $\mathbb{H}$ , which is  $\pm 1$ . Now (16.5.3.10) shows this is a covering space map.

2: Consider the action  $SU(2) \times SU(2)$  on the section of unit vectors of  $\mathbb{H}$ :  $(u, v)(z) = uzv^{-1}$ . if  $(u, v)$  is in the kernel of this map, then  $uv^{-1} = 1$ , so  $u = v$ , and  $u$  is in the center of  $\mathbb{H}$ , so  $u = v = \pm 1$ . Because  $\dim SU(2) = 3$  and  $\dim SO(4) = 6$ , (16.5.3.10) shows this is a double cover.  $\square$

**Prop. (16.6.1.8).**

- There is a double cover  $SU(4) \rightarrow SO(6; \mathbb{R})$  with kernel  $\{\pm 1\}$ .
- There is a double cover  $SL(4; \mathbb{C}) \rightarrow SO(6; \mathbb{C})$  with kernel  $\{\pm 1\}$ .
- There is a double cover  $Sp(4; \mathbb{C}) \rightarrow SO(5; \mathbb{C})$  with kernel  $\{\pm 1\}$ .

⌋

*Proof:* 1:  $SU(4)$  acts on a 4-dimensional Hermitian space  $V$ . Then it acts on the Hermitian space  $\wedge^2 V$ . Consider the Hodge star operator  $*$ :  $\wedge^2 V \rightarrow \wedge^2 V$  (16.1.3.7), it is an anti-linear operator,  $*^2 = \text{id}$  and  $*$  commutes with  $SU(4)$  action. Then  $W = \ker(* - \text{id})$  is a real vector space of dimension 6 that  $SU(4)$  acts on. This kernel of this action is the same as the kernel of the action  $\wedge^2 V$ , which is  $\{\pm 1\}$ .

The Hermitian form induces a symmetric form on  $W$ : Take a conjugation on  $V$ , because  $V = W \oplus iW$ ,  $W = \text{Im}(* + \text{id})V$ . So for  $a, b \in W$ , let  $a = *c + c, b = *d + d$ , then  $(a, b)\omega = ((*a, *b) + (*a, b) + (a, *b) + (a, b))\omega = *a \wedge b + \overline{*a} \wedge \overline{b} + a \wedge b + *a \wedge \overline{b}$  is a real form. Then this representation induces a map  $SU(4) \rightarrow SO(6)$  (because  $SU(4)$  is connected). Because  $\dim SU(4) = \dim SO(6) = 6$ , it is a double cover by (16.5.3.10).

2:  $SL(4, \mathbb{C})$  acts on a 4-dimensional complex vector space  $V$ , then it acts on the space  $W = \wedge^2 V^*$ . We construct a non-degenerate bilinear form on  $W$  given by  $\wedge : W \times W \rightarrow \wedge^4 V^* \cong \mathbb{C}$ . Then  $SL(4, \mathbb{C})$  preserves this bilinear form, thus induces a map  $SL(4, \mathbb{C}) \rightarrow SO(6, \mathbb{C})$ . The kernel of this map is  $\{\pm 1\}$ , because if  $A$  preserves all  $v_1^* \wedge v_2^*$ , then  $Av_1^* \wedge Av_2^* = v_1^* \wedge v_2^*$ , so  $Av_1^* \wedge Av_2^* \wedge v_i^* = 0$ , so  $Av_1^* \in \{v_1^*, v_2^*\}$ , or  $Av_2^* \in \{Av_1^*, v_1^*\} \cap \{Av_1^*, v_2^*\} = Av_1^*$ , then  $Av_1^* \wedge Av_2^* = 0$ , contradiction. So  $Av_1^* \in \{v_1^*, v_2^*\}$ .  $v_1, v_2$  is arbitrary, thus  $A$  is diagonal, and it is clear  $A = \pm 1$ . Finally,  $SL(4, \mathbb{C}) \rightarrow SO(6, \mathbb{C})$  is a double cover by (16.5.3.10).

3: The representation of  $SL(4, \mathbb{C})$  on  $W = \wedge^2 V^*$  restricts to a representation of  $Sp(4, \mathbb{C})$ , and it fixes the vector  $\sigma = v_1^* \wedge v_2^* + v_3^* \wedge v_4^*$  by definition, so it also fixes the orthogonal  $\{\sigma\}^\perp$ , thus inducing a map  $Sp(4, \mathbb{C}) \rightarrow SO(5, \mathbb{C})$  with kernel  $\{\pm 1\}$ , which is a double cover by (16.5.3.10).  $\square$

**Prop. (16.6.1.9)**[ $SU(1, 1)$  and  $SL(2; \mathbb{R})$ ]. Let  $SL(2; \mathbb{C})$  act continuously on  $\mathbb{P}^1(\mathbb{C})$  by  $\gamma(z) = \frac{az+b}{cz+d}$  where

$$\gamma = \begin{bmatrix} a & b \\ c & d \end{bmatrix}, \text{ then}$$

- The stabilizer of the unit disk  $\mathbb{D}$  is

$$SU(1, 1) = \left\{ \begin{bmatrix} a & b \\ \bar{b} & \bar{a} \end{bmatrix} \mid |a|^2 - |b|^2 = 1 \right\}.$$

- $SU(1, 1)$  is conjugate to  $SL(2, \mathbb{R})$  in  $SL(2, \mathbb{C})$ .
- The subgroup of  $SU(1, 1)$  fixing  $0 \in \mathbb{D}$  is the subgroup of rotations  $\{\text{diag}(e^{i\theta/2}, e^{-i\theta/2})\}$ .

┘

*Proof:* 3: This follows from Schwartz lemma(12.5.1.3).

1, 2: We first describe  $SU(1, 1)$ :

$$SU(1, 1) = \left\{ \begin{bmatrix} a & b \\ c & d \end{bmatrix} : |a|^2 - |c|^2 = 1, \quad a\bar{b} - c\bar{d} = 0, \quad |b|^2 - |d|^2 = -1, \quad ad - bc = 1 \right\}$$

which means  $(b, d) = \lambda(\bar{c}, \bar{a})$ , and  $\lambda = 1$ .

Let  $C = \frac{1}{\sqrt{2}e^{2\pi i/4}} \begin{bmatrix} 1 & -i \\ 1 & i \end{bmatrix}$ , then  $C$  induces an isomorphism between  $\mathcal{H}$  and  $\mathbb{D}$ , because  $\frac{z-i}{z+i} \in \mathbb{D}$  iff  $|z-i| < |z+i|$  iff  $z$  is in the upper half plane. By this isomorphism and item 3, the element of  $SL(2, \mathbb{C})$  stabilizing  $\mathbb{D}$  and fixing  $i$  is of the group  $SO(2; \mathbb{R}) \subset SL(2; \mathbb{R})$ .

Notice that  $SL(2; \mathbb{R})$  preserves  $\mathcal{H}$  by(12.4.1.9), and it acts transitively on it because  $\sqrt{y} \begin{bmatrix} y & x \\ 1 & 1 \end{bmatrix}$  maps  $i$  to  $x + iy \in \mathcal{H}$ . Now if  $\gamma \in SL(2; \mathbb{C})$  stabilizes  $\mathcal{H}$ , then  $\gamma g$  fixes  $i$  for some  $g \in SL(2, \mathbb{R})$ , thus  $\gamma g \in SL(2; \mathbb{R})$ , thus  $\gamma \in SL(2, \mathbb{R})$ . Thus we have shown the stabilizer of  $\mathcal{H}$  is  $SL(2, \mathbb{R})$ . Then the stabilizer of  $\mathbb{D}$  is

$$\begin{aligned} C \cdot SL(2, \mathbb{R})C^{-1} &= \left\{ \frac{1}{2i} \begin{bmatrix} 1 & -i \\ 1 & i \end{bmatrix} \begin{bmatrix} a & b \\ c & d \end{bmatrix} \begin{bmatrix} i & i \\ -1 & 1 \end{bmatrix} \mid a, b, c, d \in \mathbb{R}, ad - bc = 1 \right\} \\ &= \left\{ \frac{1}{2} \begin{bmatrix} a+d+(b-c)i & a-d-(b+c)i \\ a-d+(b+c)i & a+d-(b-c)i \end{bmatrix} \mid a, b, c, d \in \mathbb{R}, ad - bc = 1 \right\} \end{aligned}$$

which is exactly  $SU(1, 1)$ . So we get 1 and 2. □

**Cor. (16.6.1.10)[Upper Half Plane  $\mathcal{H}$ ].** By(12.4.7.8), the groups  $GL(2; \mathbb{R})$  preserves the upper plane  $\mathcal{H}$ , by(12.4.1.9). The action of  $SL(2; \mathbb{R})$  on  $\mathcal{H}$  is transitive and the stabilizer of  $i$  is  $SO(2; \mathbb{R})$ , thus we have  $\mathcal{H} \cong SL(2; \mathbb{R})/SO(2; \mathbb{R})$ . ┘

**Prop. (16.6.1.11)[ $Sp(2; \mathbb{K})$  and  $SL(2; \mathbb{K})$ ].** For any field  $\mathbb{K}$ ,  $Sp(2; \mathbb{K}) \cong SL(2; \mathbb{K})$ : They both consists of linear maps preserving the differential form  $dx \wedge dy$ . ┘

**Prop. (16.6.1.12)[Center of  $SU(p, q)$ ].**  $Z_{U(p, q)}(SU(p, q))$  are all scalar matrices. ┘

*Proof:* Firstly we consider  $Z_{U(2)}(SU(2))$ , if  $A \in Z(SU(2))$ , then it commutes with  $\text{diag}(i, -i)$ , so  $A$  is a scalar. Similarly, If  $A \in Z_{U(1, 1)}(SU(1, 1))$ , then  $A$  commutes with  $\text{diag}(i, -i)$ , thus  $A$  is a scalar.

If  $X \in Z(SU(p, q))$  is not a scalar matrix, then it has two eigenvectors  $s, t$  with different eigenvalues. Consider the space  $V$  generated by  $s, t$  and its orthogonal complement, then  $X$  restricted to this space is in the center of  $U(V)$ . Now  $SU(V) \cong SU(1, 1)$  or  $SU(2)$ , both have the set of scalar matrices as center, so  $X$  cannot have different eigenvalue, contradiction. Thus  $X$  is a scalar matrix. □

**Prop. (16.6.1.13)**[PGL(2;  $\mathbb{C}$ )  $\cong$  SO(3)].  $V \cong \mathbb{C}^2$  has a natural symmetric form  $(x, y) \mapsto x \wedge y \cong \mathbb{C}$ , and this form is preserved by  $\text{SL}(2; \mathbb{C})$  by definition. The kernel of this map is  $\{\pm 1\}$ . Thus  $\text{SL}(2; \mathbb{C})$  acts on  $\text{Sym}^2(V)$ , thus induces a map  $\text{PGL}(2; \mathbb{C}) \rightarrow \text{SO}(3)$ , which an isomorphism by (16.5.3.10).  $\lrcorner$

**Prop. (16.6.1.14)**[Real and Complex Matrices].  $\text{GL}(n; \mathbb{C})$  can be embedded into  $\text{GL}(2n; \mathbb{R})$ , with determinant  $|\det|^2$ . And in this way,  $U(n)$  is mapped into  $O(2n; \mathbb{R})$ . Also,  $O(n; \mathbb{R})$  embeds into  $U(n)$  diagonally.  $\lrcorner$

*Proof:*

$$X + iY \mapsto \begin{bmatrix} X & -Y \\ Y & X \end{bmatrix} \sim \begin{bmatrix} X & -Y \\ iX + Y & X - iY \end{bmatrix} \sim \begin{bmatrix} X + iY & Y \\ 0 & X - iY \end{bmatrix}$$

$\square$

**Prop. (16.6.1.15)**[Symplectic Groups].

- $U(p, q; \mathbb{H}) = \text{Sp}(2n; \mathbb{C}) \cap U(2p, 2q, \mathbb{C})$ .  $U(n, \mathbb{H}) = U(n, 0, \mathbb{H})$  is also denoted by  $\text{Sp}(n)$ , called the **compact symplectic group**.
- $O^*(2n) = U(n, n) \cap O(2n; \mathbb{C})$ .
- $\text{Sp}(2n; \mathbb{C}) = \text{SL}(n; \mathbb{H})$ .
- $\text{Sp}(2n, \mathbb{R}) \cap O(2n; \mathbb{R}) = \text{Sp}(2n, \mathbb{R}) \cap \text{GL}(n; \mathbb{C}) = O(2n, \mathbb{R}) \cap \text{GL}(n; \mathbb{C}) = U(n) = \left\{ \begin{bmatrix} X & -Y \\ Y & X \end{bmatrix}, X + iY \in U(n) \right\}$ .

$\lrcorner$

*Proof:* 1: By (3.5.11.38), notice that any  $\mathbb{C}$ -linear automorphism preserving  $B_1$  and  $B_2$  is  $\mathbb{H}$ -linear.

2: By (3.5.11.38), notice that any  $\mathbb{C}$ -linear automorphism preserving  $B_1$  and  $B_2$  is  $\mathbb{H}$ -linear.

3: If  $A \in \text{Sp}(2n; \mathbb{R}) \cap O(2n; \mathbb{R})$ , then  $AA^t = A^t A = 1$ ,  $A^t J A = 1$ , then  $AJ = JA$ . The rest and the other identities are easy by (16.6.1.14).  $\square$

## 2 Spin Groups

**Notation (16.6.2.1).**

- Use notations on Clifford algebras defined in [Clifford Algebras](#).

$\lrcorner$

**Prop. (16.6.2.2).** For  $n$  even,  $\mathbb{C}(V)$  is naturally isomorphic to  $\text{End}_{\mathbb{C}}(\wedge^* W)$ , where  $W = \{\frac{1}{\sqrt{2}}(e_{2i-1} - ie_{2i})\}$ . This isomorphism is not obvious and restrict to a Spinor representation of  $\text{Spin}(n)$  and  $\rho(\Gamma)^2 = 1$  induce two representations of  $Cl(n)^0$ , in particular  $\text{Spin}(n)$ , called the **(half Spinor representations)**. This has a unique extension to representation of  $\text{Spin}^c$ .  $\wedge^* W$  comes with a Hermitian metric which is preserved by the action of  $\text{Pin}(n)$  (check). So the image is  $\text{SO}(n)$  is in  $\text{SO}(\wedge^* W)$ . Cf. [Jost Geometric analysis P72].  $\lrcorner$

**Def. (16.6.2.3)**[Spin Groups  $\text{Spin}(n)$ ]. Denote by  $\text{Pin}(n)$  as the group in  $\text{Cl}_n(\mathbb{R})$  generated by vectors  $v_i$  of norm 1. Because  $v_i \cdot v_i = -1$ , it is a group. And denote  $\text{Spin}(n)$  as the subgroup of  $\text{Pin}(n)$  generated by even numbers of  $v_i$ s.  $\lrcorner$

**Prop. (16.6.2.4)**[Action of  $\text{Spin}(n)$ ]. The conjugation action  $\text{Ad}(v) = v(-)v = \text{reflection w.r.t } v$ , maps  $\text{Pin}(n)$  to  $O(n)$  and  $\text{Spin}(n)$  to  $\text{SO}(n)$ . The kernel of this mapping is  $\{\pm 1\}$  when  $n$  is even. This is a double covering of  $\text{SO}(n)$  and  $O(n)$ , it is nontrivial because  $1, -1$  is connected by  $(\cos te_1 + \sin te_2)(\cos te_1 - \sin te_2)$ .

In particular,  $\text{Spin}(n)$  is a universal covering of  $\text{SO}(n)$  and thus simply-connected for  $n \geq 3$ .  $\lrcorner$

*Proof:* Let  $\alpha = e_i\beta + \gamma$ , then  $\beta, \gamma \in Cl^0$  and so  $\alpha = ce_1 \dots e_n + d$ , and  $c$  can happen only when  $n$  is odd.  $\square$

$$\text{Prop. (16.6.2.5) [Center of Spin}(n)\text{]}. Z(\text{Spin}(n)) = \begin{cases} S^1 & n = 2 \\ \mathbb{Z}/2\mathbb{Z} & n = 2k + 1, \\ \mathbb{Z}/2\mathbb{Z} \oplus \mathbb{Z}/2\mathbb{Z} & n = 4k, \\ \mathbb{Z}/4\mathbb{Z} & n = 4k + 2, \end{cases} \quad \lrcorner$$

*Proof:*  $\square$

**Prop. (16.6.2.6) [Low Dimensional Accidental Isomorphisms].**

- $\text{Spin}(2) \cong \text{SO}(2) \cong \text{U}(1)$ .
- $\text{Spin}(3) \cong \text{SU}(2) \cong \text{Sp}(1)$
- $\text{Spin}(4) \cong \text{SU}(2) \times \text{SU}(2)$  because they are both universal coverings of  $\text{SO}(4)$ , by (16.6.3.1) and (16.6.2.4).
- $\text{Spin}(5) \cong \text{Sp}(2)$ .
- $\text{Spin}(6) \cong \text{SU}(4)$ .

$\lrcorner$

*Proof:* 2: because  $\text{Spin}(3), \text{SU}(2)$  are both universal covering of  $\text{SO}(3)$ , by (16.6.3.1) and (16.6.2.4), and  $\text{Sp}(1)$  acts transitively on the set of unit vectors in  $\mathbb{H}$  with trivial kernel.  $\square$

### 3 Fundamental Groups

**Prop. (16.6.3.1).**

- $\text{SU}(n-1) \rightarrow \text{SU}(n) \rightarrow \mathbb{S}^{2n-1}$  shows  $\text{SU}(n)$  are connected and simply connected. Also  $\pi_2(\text{SU}(n)) \cong \pi_2(\text{SU}(2)) \cong \pi_2(\mathbb{S}^3) = 0$ .
- $\text{SO}(n-1) \rightarrow \text{SO}(n) \rightarrow S^{n-1}$  shows  $\text{SO}(n)$  are connected and  $\pi_1(\text{SO}(n)) \cong \pi_1(\text{SO}(3)) = \mathbb{Z}/(2)$  for  $n \geq 3$  by (16.6.1.7) and (16.6.1.6). And  $\pi_1(\text{SO}(2)) = \mathbb{Z}$ .
- $\text{U}(n-1) \rightarrow \text{U}(n) \rightarrow S^{2n-1}$  shows  $\text{U}(n)$  are connected and  $\pi_1(\text{U}(n)) \cong \mathbb{Z}$ .
- $\text{SO}(n; \mathbb{R})$  is a deformation retraction of  $\text{SL}(n, \mathbb{R})$ , and  $\text{SU}(n)$  is a deformation retraction of  $\text{SL}(n; \mathbb{C})$ .

$$\bullet \pi_1(\text{PSO}(n)) = \begin{cases} \mathbb{Z} & n = 2 \\ \mathbb{Z}/2\mathbb{Z} & n = 2k + 1, \\ \mathbb{Z}/2\mathbb{Z} \oplus \mathbb{Z}/2\mathbb{Z} & n = 4k, \\ \mathbb{Z}/4\mathbb{Z} & n = 4k + 2, \end{cases} \text{ . Because for } n \geq 3, \text{ its universal covering is } \text{Spin}(n), \text{ so } \pi_1(\text{PS}(n)) = Z(\text{Spin}(n)) \text{ (16.6.2.5).}$$

- $\pi_1(\text{PU}(n)) = \mathbb{Z}/(n)$ .
- $\text{Sp}(n-1) \rightarrow \text{Sp}(n) \rightarrow \mathbb{S}^{4n-1}$  shows  $\text{Sp}(n)$  are connected and simply connected.
- $\pi_1(\text{Sp}(2n; \mathbb{R})) = \pi_1(\text{U}(n)) = \mathbb{Z}$  and the determinant induces an isomorphism onto  $\pi_1(S^1)$ . In fact, this is used to define the Maslov index.

$\lrcorner$

## 4 Generals

**Prop. (16.6.4.1)[Image of Exponential Maps].**

1. The exponential map for  $\mathrm{GL}(n; \mathbb{C})$  is surjective.
2. The image of the exponential map for  $\mathrm{GL}(n; \mathbb{R})$  is  $\mathrm{GL}(n; \mathbb{R})^2$ .
3. The image of exponential map for  $B_+$  (the subgroup of  $\mathrm{GL}(n; \mathbb{R})$  consisting of upper-triangular matrices with positive entries), is surjective.
4. The exponential defines a diffeomorphism from the space of Hermitian (symmetric) matrices to positive definite Hermitian (resp. symmetric) matrices in  $\mathrm{GL}(n; \mathbb{C})$  (resp.  $\mathrm{GL}(n; \mathbb{R})$ ).
5. The exponential for a compact connected Lie group is surjective, by (16.5.7.6). In particular, this applies to  $G \in \{\mathrm{SO}(n), \mathrm{U}(n), \mathrm{SU}(n)\}$ .
6. The exponential for  $\mathrm{SL}(2; \mathbb{R})$  is not surjective. ?

┘

*Proof:* 1: Use Jordan forms. Notice the logarithm of  $(cI + N)$ ,  $c \neq 0$  is definable for  $N$  nilpotent, and it is a polynomial function of the matrix itself.

2: It is clear the image is contained in  $\mathrm{GL}(n; \mathbb{R})^2$ , conversely, we see from the complex case that any  $B \in \mathrm{GL}(n; \mathbb{R})$  is of the form  $\exp(P(B))$  for some polynomial  $P \in \mathbb{C}[X]$ , then  $T = B^2 = \exp(P(B) + \overline{P}(B)) \in \exp(\mathrm{GL}(n; \mathbb{R}))$ .

3: Use Jordan forms. Notice the logarithm of  $(cI + N)$ ,  $c \neq 0$  is definable for  $N$  nilpotent and  $c > 0$ , and it is a polynomial function of the matrix itself, so it is also upper-triangular.

4: By (3.5.11.9) it is clearly surjective. For injectivity, consider  $\exp(X) = \exp(Y)$ , then at least  $X, Y$  are both unitarily conjugate to the same diagonal matrix  $\mathrm{diag}(d_1, \dots, d_n)$ , and we may assume  $Y = \mathrm{diag}(d_1, \dots, d_n)$ , then

$$X = \tau^{-1} Y \tau, \quad \mathrm{diag}(D_1, \dots, D_n) = \tau^{-1} \mathrm{diag}(D_1, \dots, D_n) \tau,$$

where  $D_i = e^{d_i}$ . Consequently,  $\mathrm{diag}(D_1^k, \dots, D_n^k) = \tau^{-1} \mathrm{diag}(D_1^k, \dots, D_n^k) \tau$ , and we can choose  $c_i$  that  $\sum c_i D_j^i = d_j$  for any  $j$ , because the Vandermonde matrix is nonsingular. Hence  $\mathrm{diag}(d_1, \dots, d_n) = \tau^{-1} \mathrm{diag}(d_1, \dots, d_n) \tau$ , so  $X = Y$ .

5:

□

**Prop. (16.6.4.2)[Injectivity of Exponential Maps].** There is a characterization of when  $\exp : \mathfrak{g} \rightarrow G$  is injective:

<https://math.stackexchange.com/questions/475385/under-what-conditions-is-the-exponential-map-injective>

┘

## 16.7 Geometric Analysis II

References are [L-W89, Jos11].

### 1 Spin Structures

**Notation(16.7.1.1).**

- Use notations on real Clifford algebras defined in [Clifford Algebras](#).
- Use notations on spin groups defined in [Spin Groups](#).
- Use notations on fiber bundles defined in [Fiber Bundles & Topological K-Theory](#).
- Use notations on Riemannian geometry defined in [Riemannian Geometry](#).
- Let  $M \in \text{RieMani}_{\text{cpct}, \text{cntd}, \partial}$ .

┘

#### Spin Structures

**Def.(16.7.1.2) [Spin Structures].** For  $X \in \text{Mani}$ ,  $n \geq 2$  and  $E \in \text{Vect}_{\mathbb{R}, \text{orntd}}^n(X)$ , let  $P_{\text{SO}}(E)$  be the principle  $\text{SO}(n)$ -bundle of orthonormal frames in  $E$ , then a **spin structure** on  $E$  is a principle  $\text{Spin}(n)$ -bundle  $P_{\text{Spin}}(E)$  over  $M$  with a 2-sheeted covering:

$$\xi : P_{\text{Spin}}(E) \rightarrow P_{\text{SO}}(E)$$

s.t.  $\xi(pg) = \xi(p)\xi_0(g)$  for any  $p \in P_{\text{Spin}}(E)$  and  $g \in \text{Spin}(n)$ . Where if  $n = 2$ , we assume  $\text{Spin}(2) = \text{SO}(2) \xrightarrow{\xi_0 = \times 2} \text{SO}(2)$ .

It is clear that the spin structures on  $E$  are in bijection with double coverings of  $P_{\text{SO}}(E)$  that are non-trivial on each fiber of  $E$ . ┘

**Cor.(16.7.1.3) [Invariance of the Metric].** The set of spin structures on  $E$  are independent of the metric on  $E$ , because  $P_{\text{SO}}(E) \subset P_{\text{GL}^+}(E)$  is a homotopy equivalence. ┘

**Prop.(16.7.1.4) [Spin Structure Obstruction].** Situation as in (16.7.1.2), then by (4.15.4.6),  $E$  has a spin structure iff  $w_2(E) = 0$ , and in this case, the spin structures on  $E$  are in bijection with  $H^1(M, \mathbb{Z}/(2))$ . ┘

**Cor.(16.7.1.5).** For  $X \in \text{Mani}$ , if  $E, E' \in \text{Vect}_{\mathbb{R}}^n(X)$  with  $E = E_1 \oplus E_2$ , then a choice of orientations on two of  $\{E, E_1, E_2\}$  will determine a choice of orientation on the third.

Similarly, a choice of spin structures on two of  $\{E, E_1, E_2\}$  will determine a choice of spin structure on the third. ┘

*Proof:* It is easy to see that two of  $\{E, E_1, E_2\}$  is spin implies the rest is also spin. For the determination of the rest spin structure, Cf. [L-W89]P85. ? ┘

**Def.(16.7.1.6) [Spinor Bundles].** Let  $X \in \text{Mani}$  and  $E/X \in \text{Vect}_{\text{Riem}, \partial}^n(X)$  with a spin structure  $\xi : P_{\text{Spin}}(E) \rightarrow P_{\text{SO}}(E)$ , then for any real (resp. complex) left  $\text{Cl}(\mathbb{R}^n)$ -module  $M$ , we get an associate bundle (4.15.3.4) which is a real (resp. complex) **spinor bundle**  $S_\mu(E) = P_{\text{Spin}}(E) \times M$ . ┘

**Example(16.7.1.7) [Spinor Bundles].** Let  $E/X \in \text{Vect}_{\text{Riem}, \partial}^n(X)$  with a spin structure  $\xi : P_{\text{Spin}}(E) \rightarrow P_{\text{SO}}(E)$ ,

- When  $M = \text{Cl}(\mathbb{R}^n)$  with the adjoint action of  $\text{Cl}(\mathbb{R}^n)$ , the the associated spinor bundle is denoted by

$$\text{Cl}(E) \triangleq P_{\text{Spin}}(E) \times_{\text{Ad}} \text{Cl}(\mathbb{R}^n) = P_{\text{SO}}(E) \times_{\rho_n} \text{Cl}(\mathbb{R}^n)$$

is a principle  $\text{Cl}(\mathbb{R}^n)$ -bundle, called the **Clifford bundle** of  $E$ . And  $\text{Cl}(E)$  is locally just defined by the Clifford construction.

- When  $M = \text{Cl}(\mathbb{R}^n)$  with the left action of  $\text{Cl}(\mathbb{R}^n)$ , then the associated spinor bundle is denoted by

$$\text{Cl}_{\text{Spin}}(E) \triangleq P_{\text{Spin}}(E) \times_L \text{Cl}(\mathbb{R}^n)$$

is a principle  $\text{Cl}(\mathbb{R}^n)$ -bundle, called the **canonical spinor bundle** of  $E$ . ┘

**Prop. (16.7.1.8).** Situation as in (16.7.1.6), any spinor bundle  $S(E)$  is a bundle of left modules over the bundle of algebras  $\text{Cl}(E)$ . ┘

*Proof:* The action is just  $P_{\text{Spin}}(E) \times_L \text{Cl}(\mathbb{R}^n) \times M \rightarrow P_{\text{Spin}}(E) \times M$ . □

**Prop. (16.7.1.9) [Spin<sup>c</sup>-structure].** The group  $\text{Spin}^c$  is the covering space of  $\text{SO}(n) \times S^1$  ( $n > 2$ ) that corresponds to the group of elements mod 0 mod 2 in  $\mathbb{Z}_2 \times \mathbb{Z}$ , i.e.  $\text{Spin}(n) \times S^1 / \{\pm 1\}$ .

For example,  $\text{Spin}^c(4) = \{(A_1, A_2) \in U(2) \times U(2) \mid \det A_1 = \det A_2\}$ , and  $\text{Spin}^C(3) = U(2)$ .

Then a  $\text{SO}(n)$  bundle can be lift to be a  $\text{Spin}^c$ -bundle if the line bundle determined by  $S^1$  is determine the same  $w_2$  as it, i.e.  $w_2 = c_1(L) \bmod 2$ , This is equivalent to  $w_2$  is in the image of  $H^2(X, \mathbb{Z})$ , and this is equivalent to the Bockstein image of it is zero.

Use a variant of Wu's formula:  $w_2(TM)[\alpha] = \alpha \cdot \alpha \bmod 2$  for  $M$  orientable of dimension 4, we have any orientable manifold of dimension 4 has a  $\text{Spin}^c$ -structure. Cf.[XieYi 几何学专题 Homework3]. ┘

There is a connection on the Clifford bundle and on the Spinor bundle induced by the Levi-Civita connection of  $M$  (16.3.4.2). This is compatible with the Clifford action. and it is also metric because the connection 1-form is in  $\mathfrak{so}(n)$  because the action of  $\text{SO}(n)$  preserves metric.

### Spin Manifolds

**Def. (16.7.1.10) [Spin Manifolds].**  $M$  is called a **spin manifold** if  $M$  is oriented and  $TM$  has a spin structure (16.7.1.2).

By (16.7.1.4),  $M$  has a spin structure if  $w_2(M) = 0$ , and if  $w_2(M) = 0$ , then the spin structures on  $M$  are in bijection with  $H^1(M, \mathbb{Z}/(2))$ .

By (16.7.1.3), the spin structure doesn't depend on the Riemannian metric of  $M$ , and it is even homotopy-invariant by (4.15.4.10). For this reason, we define a **topological spin manifold** to be a topological compact manifold with  $w_1 = w_2 = 0$  (which doesn't depend on the smooth structure). ┘

**Cor. (16.7.1.11).** If  $M$  is a complex manifold, then  $M$  is spin iff  $c_1(M) \equiv 1 \pmod{2}$ , by (4.15.3.31). ┘

**Cor. (16.7.1.12).** If  $M$  is 2-connected, then there exists a unique spin-structure on  $M$ . ┘

**Prop. (16.7.1.13).** If  $M, M'$  are spin manifolds, then  $M \times M'$  is also a spin manifold.

If  $M$  is a spin manifold and  $N \subset M$  is a submanifold with a spin structure on  $\mathcal{N}_{N/M}$ , then  $N$  is a spin manifold. In particular, if  $M$  is a spin manifold and  $\partial M \neq \emptyset$ , then  $\partial M$  is also a spin manifold. ┘

**Prop. (16.7.1.14) [Signature of Topological Spin Manifolds].** If  $X$  is a topological spin manifold (16.7.1.10), then the intersection form on  $H^2(X, \mathbb{Z})$  is even. In particular,  $\text{sgn}(X) \in 8\mathbb{Z}$  by (19.5.8.1).

Moreover, by [The topology of 4-manifolds, Freedman], there exists a compact topological spin 4-manifold  $X$  of signature 8.  $\lrcorner$

*Proof:* Cf. [L-W89]P89?  $\square$

## Spin Cobordisms

### Dirac Operators

## 2 $\text{Spin}^c$ -Structures

**Def. (16.7.2.1) [ $\text{Spin}^c$ -Structures].** Let  $X \in \text{Mani}$  and  $P_{\text{SO}(n)}$  be a principal  $\text{SO}(n)$ -bundle over  $X$ , then  $\lrcorner$

**Prop. (16.7.2.2) [Spin Structure Obstructions].** A principle  $\text{SO}(n)$ -bundle  $P$  carries a  $\text{Spin}^c$ -structure iff  $w_2(P)$  is the mod2 reduction of an integral class, i.e.  $W_3(P) = 0$  (Cf. [L-W89]Appendix B.13?).  $\lrcorner$

*Proof:* ?  $\square$

**Def. (16.7.2.3) [ $\text{Spin}^c$ -Manifolds].**  $M$  is called a  $\text{Spin}^c$ -manifold if  $M$  is oriented and  $TM$  has a  $\text{Spin}^c$ -structure??.

By??,  $M$  has a spin structure if  $W_3(M) = 0$ . and if  $W_2(M) = 0$ , then the spin structures on  $M$  are in bijection with  $2H^1(M; \mathbb{Z}) \oplus H^1(M, \mathbb{Z}/(2))$ .

? By (16.7.1.3), the  $\text{Spin}^c$ -structure doesn't depend on the Riemannian metric of  $M$ , and it is even homotopy-invariant by (4.15.4.10). For this reason, we define a **topological spin manifold** to be a topological compact manifold with  $w_1 = w_2 = 0$  (which doesn't depend on the smooth structure).  $\lrcorner$

**Thm. (16.7.2.4).** If  $M$  is a compact  $\text{Spin}^c$ -manifold of even dimension and  $D$  is the Dirac operator of the fundamental complex spinor bundle, then

$$\text{ind}(D^+) = \{e^{\frac{c}{2}} \hat{A}(X)\}[X],$$

where  $c$  is the canonical class of the  $\text{Spin}^c$ -structure (16.7.2.1).  $\lrcorner$

*Proof:* ?  $\square$

## 3 Yang-Mills Equation & Seiberg-Witten Equation

[Atiyah, M. F.; Bott, R. The Yang-Mills equations over Riemann surfaces. Philos. Trans. Roy. Soc. London Ser. A 308 (1983), no. 1505, 523–615].

**Def. (16.7.3.1) [Young-Mills].** The Young-Mills functional on connections  $A$  on a bundle  $E$  on a compact oriented space:

$$YM(A)^2 = \|F_A\|^2 = - \int_X \text{tr}(F_A \wedge *F_A)$$

it is a critical point when  $d_A \star F_A = 0$  and  $d_A F_A = 0$ .  $\lrcorner$

**Prop. (16.7.3.2) [2-dim Case].**  $\star F \in \Omega^0(\mathfrak{su}(E))$  is parallel thus its characteristic spaces is orthogonal and a stable under parallel transport. So an irreducible YM  $SU(2)$ -connection must be flat, thus correspond to irreducible  $SU(2)$  representation of  $\pi_1(X)$ .  $\lrcorner$

**Prop. (16.7.3.3) [4-dim Case].**  $** = (-1)^{2*2} = \text{id}$  on  $\Omega^2(E)$  on  $E$  a  $SU(n)$ -bundle, so  $\Omega^2(E) = \Omega^+ \oplus \Omega^-$ . We have

$$\|F_A^+\|^2 + \|F_A^-\|^2 \geq \|F_A^-\|^2 - \|F_A^+\|^2 = \int_X \text{tr}(F_A \wedge F_A) = 8\pi^2 c_2(E)$$

Cf. [谢毅 Lecture5]. So it attains minimum at the connection that  $\star F_A = \pm F_A$  and  $d_A F_A = 0$  ((Anti)self-dual((anti)instanton)) depending on the sign of  $c_2(E)$ .  $\lrcorner$

**Prop. (16.7.3.4) [Anti-Instanton Connection on Complex Line Bundle].** For a  $U(1)$ -bundle,  $d_A F_A = dF_A$ , so  $F_A$  is harmonic, thus  $c_1(L) = [\frac{-1}{2\pi i} F_A] \in H^2(X, \mathbb{Z}) \cap \mathcal{H}_-^2(X, \mathbb{R})$ . In fact, this is equivalent to the existence of a anti-self-dual connection on this bundle.

If this is the case, then we have the ASD-connections module Gauge equivalence is isomorphic to  $H^1(X, \mathbb{R})/H^1(X, \mathbb{Z}) = T^{b_1(X)}$ .  $\lrcorner$

*Proof:* Because a gauge is just a  $X \rightarrow S^1$ , and its connected component thus equals  $[X, S^1] = H^1(X, \mathbb{Z})$  (MacLane space), and its identity is just the map that is homotopic to id. and  $d(gA) = dA - g^{-1}dg = dA - idu$ , for  $g = \exp(iu)$ , so  $\Omega^1/\mathcal{G} = H^1(X, \mathbb{R}/H^1(X, \mathbb{Z}) = T^{b_1(X)}$ .  $\square$

**Lemma (16.7.3.5) [Weizenbock Formula].** On a Riemannian manifold  $M$ , the Laplace operator has the form:

$$\Delta = -\nabla_{e_i e_i}^2 - \xi^i \wedge \iota(e_j) R(e_i, e_j)$$

where  $\nabla_{X,Y}^2 = \nabla_X \nabla_Y - \nabla_{\nabla_X Y}$ .

$$\int |\mathcal{D}_A \varphi|^2 = \int |\nabla_A \varphi|^2 + \frac{1}{4} R |\varphi|^2 + \frac{1}{2} \langle F_A^+ \varphi, \varphi \rangle.$$

If  $M$  is a spin manifold, then the Dirac operator  $D$  satisfies:

$$D^2 = -\nabla_{e_i e_i}^2 + \frac{1}{4} R$$

where  $R$  is the scalar curvature form on  $M$ . If  $M$  is a  $Spin^c$  manifold with a  $Spin^c$  connection  $\nabla_A$ , then the Dirac operator satisfies

$$D_A^2 = -\nabla_{A, e_i e_i}^2 + \frac{1}{4} R + \frac{1}{2} F_A$$

Cf. [Geometric Analysis Jost P143,153].  $\lrcorner$

**Prop. (16.7.3.6) [Seiberg-Witten].** The Seiberg-Witten equation functional for a unitary connection  $A$  on the determinant bundle of a  $Spin^c$  structure of  $M$  and a section of  $\mathcal{S}^+$  is:

$$\begin{aligned} SW(\varphi, A) &= \int \left( |\nabla_A \varphi|^2 + |F_A^+|^2 + \frac{R}{4} |\varphi|^2 + \frac{1}{8} |\varphi|^2 \right) Vol. \\ &= \int \left( |\mathcal{D}_A \varphi|^2 + |F_A^+ - \frac{1}{4} \langle e_j e_k \varphi, \varphi \rangle e^j \wedge e^k|^2 \right) Vol \end{aligned}$$

So the Seiberg-Witten equation is the lowest topological possible value of the Seiberg-Witten functional. It writes:

$$\mathcal{D}_A \varphi = 0, \quad F_A^+ = \frac{1}{4} \langle e_j e_k \varphi, \varphi \rangle e^j \wedge e^k.$$

Cf. [Jost Chapter 7].  $\lrcorner$

**Cor. (16.7.3.7).** If a compact oriented  $\text{Spin}^c$  manifold  $M$  has nonnegative scalar curvature, then the only possible solution is  $\varphi = F_A^+ = 0$ . (See from the equivalence of forms of Seiberg-Witten functional.)  
 $\lrcorner$

#### 4 Index Theorems(Atiyah-Singer)

References are [Heat equation and the Index Theorem Atiyah] and [Index Theorem].

**Prop. (16.7.4.1) [Gilkey].** For a natural transformation  $\omega$  from the functor  $p : M \rightarrow$  the Riemannian structure on  $M$  to the functor  $q : M \rightarrow k$ -forms on  $M$ , if it is homogenous of weight 0 w.r.t to metric  $g$  (i.e.  $\omega(\lambda^2 g) = \omega(g)$ ) and in local coordinates it has the coefficients of  $\omega(g)$  generated by  $g_{ij}$  and  $\det g^{-1}$  and their derivatives, then is a polynomial of Pontryagin classes of the given dimension. (not only up to homology).  
 $\lrcorner$

*Proof:* Cf.[Heat equation and the Index Theorem Atiyah P284].  $\square$

**Prop. (16.7.4.2) [Gilkey Generalized].** For a natural transformation  $\omega$  from the functor  $p : M \rightarrow$  Riemannian structures on  $M$  with a Hermitian bundle  $E$  with a Hermitian connection and the functor  $q : M \rightarrow k$ -forms on  $M$ , if it is homogenous of weight  $(0, 0)$  w.r.t to metric  $g, h$  and the Hermitian structure (i.e.  $\omega(\lambda^2 g, \mu^2 \xi) = \omega(g, \xi)$ ) and in local coordinates it has the coefficients of  $\omega(g, \xi)$  generated by  $g_{ij}, h_{ij}, \det h^{-1}, \det g^{-1}$  and  $\Gamma_k^{ij}$  (the connection form) and their derivatives, then is a polynomial of Pontryagin classes and Chern classes of  $E$  of the given dimension. (not only up to homology).  
 $\lrcorner$

*Proof:* Cf.[Heat equation and the Index Theorem Atiyah P290].  $\square$

**Cor. (16.7.4.3).** For a natural transformation  $\omega$  from the functor  $p : M \rightarrow$  Hermitian bundle  $E$  on  $M$  with a Hermitian connection and the functor  $q : M \rightarrow k$ -forms on  $M$ , if it is homogenous of weight 0 w.r.t to metric  $h$  and the Hermitian structure (i.e.  $\omega(\mu^2 \xi) = \omega(\xi)$ ) and in local coordinates it has the form  $\omega(g, \xi)$  generated by  $h_{ij}, \det h^{-1}$  and  $\Gamma_k^{ij}$  (the connection form) and their derivatives, then is a polynomial of Chern classes of  $E$  of the given dimension. Because when composed with the forgetful functor, it gives a transformation as above. And it is obviously independent of  $g$ .  
 $\lrcorner$

**Prop. (16.7.4.4) [Hodge].** For any differential operator  $A$  from a vector bundle  $E$  to a vector bundle  $F$ , we form two operators  $AA^*$  and  $A^*A$ , then they are both self adjoint elliptic operators, let these corresponding eigenspace be  $\Gamma_\lambda(E)$  and  $\Gamma_\lambda(F)$ , then  $A$  and  $A^*$  define an isomorphism between  $\Gamma_\lambda(E)$  and  $\Gamma_\lambda(F)$ .  
 $\lrcorner$

*Proof:*  $\square$

**Prop. (16.7.4.5) [Hirzebruch Signature Formula].** On a  $4n$ -dimensional orientable manifold  $M$ , the Poincare duality defines a bilinear pairing  $H^{2n}(M) \times H^{2n}(M) \rightarrow \mathbb{R}$ , its signature  $\sigma(M)$  is given by:

$$\sigma(M) = \int_M L_n(p_1, \dots, p_n).$$

Where  $L_n$  is the degree  $n$  part of the Taylor expansion of  $\prod_{i=1}^r \frac{\sqrt{x_i}}{\tanh \sqrt{x_i}}$  in terms of the symmetric polynomial.  
 $\lrcorner$

*Proof:* We consider the operator  $\tau : \alpha \mapsto i^{l+p(p-1)} * \alpha$ ,  $\tau^2 = 1$ , thus  $\Gamma^*$  is decomposed into two eigenspaces of  $\tau$ . We define the **signature operator**  $A$  as the restriction of  $\Delta = d - \tau d \tau$  to  $\Gamma_+$ .  $\Delta$  anti commutes with  $\tau$  thus maps  $\Omega_+$  to  $\Omega_-$ , then we have  $\ker A = \ker \Delta \cap \Omega_+$ , which is the positive harmonic forms  $H_+$ . So

$$\text{Ind} A = \dim H_+ - \dim H_-.$$

And we notice the positive and negative harmonic forms neutralize each other unless on the  $2n$ -forms, so only need to consider them. In fact, if we consider  $4n+2$  manifolds, then  $\tau$  is pure imaginary and the conjugation neutralize even the  $2n+1$  forms, so there are no signature.

Now the inner product  $\alpha \rightarrow \int \alpha \wedge * \alpha$  is positive definite for a real form  $\alpha$ , so this index of  $A$  is just the signature of the intersection form defined by cup product.  $\square$

**Cor. (16.7.4.6).** For a  $4n$ -dimensional  $M$  which is a boundary of a manifold, its signature is 0.  $\lrcorner$

*Proof:* By Stokes theorem, if  $M$  is a boundary of a manifold, then all its Pontryagin numbers, i.e.  $\int_M \prod p_i^{n_i}, \sum n_i = n$ , vanish.  $\square$

**Prop. (16.7.4.7) [Generalized Hirzebruch Signature Formula].** Let  $M$  be a  $2l$  dimensional smooth manifold and  $E$  be a Hermitian bundle over  $M$ , then The index of the generalized signature operator is giving by

$$\text{Ind} A_\eta = 2^l \cdot \text{ch}(E) L(p_1, \dots, p_l).$$

where  $L(M)(p_i) = \prod \frac{x_i/2}{\tanh x_i/2}$ .  $\lrcorner$

**Prop. (16.7.4.8) [Hirzebruch-Riemann-Roch].** For a  $n$ -dimensional complex line bundle  $L$  over a compact Kähler manifold  $M$ ,

$$\chi(M, L) = \int_M [\text{ch}(E) \text{td}(T^{1,0} M)]_n.$$

Where  $\chi(M, L) = \sum_{q=0}^n (-1)^q \dim H^q(M, E)$ ,  $\text{ch}$  is the Chern character (16.7.5.5) and  $\text{td}(T^{1,0} M)$  is the Todd polynomial, i.e. Taylor expansion of  $\prod_{i=1}^r \frac{t_i}{1 - e^{-t_i}}$  in terms of the symmetric polynomial, applied to  $c_i(T^{1,0} M)$ .  $\lrcorner$

**Cor. (16.7.4.9) [Riemann-Roch].** For a  $n$ -dimensional complex vector bundle  $E$  over a Riemann Surface  $M$ , let  $\deg E = \int_M c_1(E)$ , then

$$\chi(M, E) = H^0(M, E) - \dim H^1(M, E) = \deg E + \text{rk}(E)(1 - g).$$

Cf. [Index Theorem P115].  $\lrcorner$

### Hodge Theory

**Prop. (16.7.4.10) [Hodge].** By (13.1.8.12), if we investigate the Laplace operator  $\Delta_d$  on a compact orientable Riemannian manifold, we get that

$$\Omega^i = \mathcal{H}^i \oplus \text{Im } \Delta_d = \mathcal{H}^i \oplus \text{Im } d \oplus \text{Im } d^*.$$

Thus  $H^i$  can be uniquely represented by elements of  $\mathcal{H}^i$ .  $\lrcorner$

*Proof:* It suffice to prove  $\Delta_d$  is self-adjoint elliptic.

$\text{Im } \Delta_d \subset \text{Im } d \oplus \text{Im } d^*$ , and the result follows if we show  $\mathcal{H}^i, \text{Im } d, \text{Im } d^*$  are orthogonal. In fact, let  $\omega$  be harmonic, then  $(\omega, d^* \xi) = (d\omega, \xi) = 0$ ,  $(\omega, d\eta) = (d^* \omega, \eta) = 0$ ,  $(d\eta, d^* \xi) = (dd\eta, \xi) = 0$ .  $\square$

**Cor. (16.7.4.11) [Poincare Duality for deRham Cohomology].** If  $M$  is a  $n$ -dimensional compact orientable Riemannian manifold, then

$$H_{dR}^p(M) \cong H_{dR}^{n-p}(M)$$

Induced by  $*$ , because  $** = \pm 1$  and  $*$  commutes with  $\Delta_d$  (16.1.3.8), so it induce an isomorphism  $\mathcal{H}^p \cong \mathcal{H}^{n-p}$ .

Moreover,  $*$  in fact induces a perfect pairing:

$$H_{dR}^k(M) \times H^{n-k}(M) \rightarrow \mathbb{R}$$

induced by the map

$$*: \mathcal{H}^k(M) \times \mathcal{H}^{n-k}(M) \rightarrow \mathbb{R} : (\alpha, \beta) \mapsto \int_M \alpha \wedge * \beta$$

As  $\int_M \alpha \wedge * \alpha = \|\alpha\|^2 \neq 0$ .  $\lrcorner$

**Prop. (16.7.4.12).** On a compact complex manifold, the formal adjoint of  $\bar{\partial}$  is  $*\bar{\partial}*$ . (By direct calculation). Also  $d^* = (-1)^{n(p+1)+1} * d * = - * d *$ .  $\lrcorner$

**Prop. (16.7.4.13) [Hodge].** Given a compact Hermitian complex manifold  $(X, J, g)$  and a holomorphic line bundle  $E$  over it, there is a Hermitian metric on  $A^{p,q}E$ , and an operator  $\bar{\partial}$  on it. Then  $\bar{\partial}$  has a formal adjoint  $\bar{\partial}^*$ , and  $\Delta_{\bar{\partial}_E}$  can be defined. Let  $\mathcal{H}_E^{p,q}$  be the kernel of  $\Delta_{\bar{\partial}_E}$  on  $A^{p,q}E$ , called the  **$E$ -valued  $(p, q)$ -forms**, then there is a orthonormal decomposition

$$A^{p,q}E = \mathcal{H}_E^{p,q} \oplus \text{Im } \Delta_{\bar{\partial}_E} = \mathcal{H}_E^{p,q} \oplus \text{Im } \bar{\partial}_E \oplus \text{Im } \bar{\partial}_E^*$$

And thus  $\mathcal{H}^{p,q}(X, E) \cong H_{\bar{\partial}}^{p,q}(X, E)$ .  $\lrcorner$

*Proof:* It suffice to prove  $\Delta_{\bar{\partial}_E}$  is self-adjoint elliptic. The rest is verbatim as the proof of (16.7.4.10).  $\square$

**Cor. (16.7.4.14) [Hodge].** In case  $E = \mathcal{O}_X$ ,  $\mathcal{H}^{p,q}(X) \cong H_{\bar{\partial}}^{p,q}(X)$ .  $\lrcorner$

**Cor. (16.7.4.15) [Kodaira-Serre Duality].** For a Hermitian line bundle over a compact Hermitian complex manifold  $X$ , from Hodge theorem and (16.9.5.2), we get

$$H^p(X, \Omega^q(E)) \cong H^{n-p}(X, \Omega^{n-q}(E^*))$$

induced by  $\bar{*}_E$  and  $\bar{*}_{E^*}$ .  $\lrcorner$

## 5 Characteristic Classes of Manifolds

### Chern-Weil Theory

**Prop. (16.7.5.1) [Chern-Weil].** An **Invariant polynomial** of the entries of  $M_n(k)$  is one that is invariant under the conjugation action (3.3.4.5).

For any connection on  $E$ , the **Chern-Weil** map  $CW$  from invariant polynomial ring to  $H^*(X) : P \mapsto [P(\Omega)]$  is a ring homomorphism independent on the connection  $A$ .

There are relations between  $c_i$  and  $\text{tr}(\Omega^k)$ , they can be derived formally by considering diagonal elements.  $\lrcorner$

*Proof:* To prove  $P(\Omega)$  is closed, notice by (3.3.4.5), it suffice to show  $\text{tr}(\Omega^k)$  is closed. By (16.3.4.7),  $d\text{tr}(\Omega^k) = \text{tr}(\omega \wedge \Omega^k - \Omega^k \wedge \omega) = 0$ , which is zero because  $\Omega$  is of even dimension.

For the independence of connections, use (4.14.3.29). For two connection  $\nabla_i$ ,  $\nabla = t\nabla_0 + (1-t)\nabla_1$  (you can smooth it) is a connection on the vector bundle  $\pi^*E$  on  $M \times I$ , and the section 0 and 1 induces the connection  $\nabla_0$  and  $\nabla_1$ . Thus  $s_0^*$  and  $s_1^*$  are the same map, thus  $CW_M(p) = s_i^*CW_{M \times I}(p)$  are all the same map.  $\square$

**Cor. (16.7.5.2).** For a complex line bundle of degree  $r$  over a complex manifold,

$$\det\left(1 - \frac{1}{2\pi i}F_A\right) = 1 + c_1 + \dots + c_r$$

gives out the **Chern class**, because it satisfies the axioms of Chern class (4.15.4.17). In other words,  $c_k = \text{tr}((- \frac{1}{2\pi i}F_A)^k)$ .

For a real line bundle of degree  $r$ ,

$$\det\left(1 - \frac{1}{2\pi i}F_A\right) = 1 + p_1 + \dots + p_{\lfloor \frac{r}{2} \rfloor}$$

gives out the **Pontryagin class**, where  $p_k \in H^{4k}(X)$ . (Notice the  $\omega$  thus  $\Omega$  can be chosen to be skew-symmetric, thus for odd  $k$  the classes  $\text{tr}(\Omega^k) \in H^{2k}(X)$  vanish).

For an oriented real bundle of degree  $2r$ , the  $\omega$  and thus  $\Omega$  can be chosen to be skew-symmetric and the transformation matrix in  $SO(2r)$ , then

$$\text{Pf}\left(\frac{1}{2\pi}\Omega\right) \in H^{2r}(X)$$

is well-defined and closed and gives the **Euler class**  $e(E)$  (recall  $e(E)^2 = p_r(E)$ ). (Use  $\text{Pf}^2 = \det$  to get that  $[\frac{\partial \text{Pf}}{\partial \Omega_{ij}}]^t$  commutes with  $\Omega$ , then calculate  $d\text{Pf}(\Omega) = 0$ ).  $\lrcorner$

*Proof:* In fact, the construction is natural w.r.t the connection because connection can be pulled back and summed. Then the only task is the normality, which is direct calculation on  $\mathbb{CP}^1$ .  $\square$

**Cor. (16.7.5.3).**

$$c_1(E) = c_1(\wedge^{\dim E} E).$$

Direct from the formula.  $\lrcorner$

**Cor. (16.7.5.4) [Whitney Product Formula].**

$$c(E \oplus F) = c(E)c(F), \quad p(E \oplus F) = p(E)p(F)$$

Directly from the product connection on  $E \oplus F$ .  $\lrcorner$

**Prop. (16.7.5.5) [Chern Character].** The Chern character

$$ch(E) = [\text{tr} \exp(\frac{i}{2\pi}F_A)]$$

satisfies  $ch(E \oplus F) = ch(E) + ch(F)$  and  $ch(E \otimes F) = ch(E)ch(F)$  by simple calculation. So it defines a ring homomorphism from  $K(X)$  to  $H^*(X)$ .  $\lrcorner$

**Prop. (16.7.5.6) [Chern-Gauss-Bonnet].** For a  $2n$ -dimensional orientable manifold  $M$ ,

$$\int_M e(TM) = \chi(M).$$

┘

**Prop. (16.7.5.7).** For a vector bundle and a flat connection  $d_A$  on a manifold, i.e.  $d_A^2 = 0$ , we have a deRham like cohomology, and there is a sheaf of flat sections.

$$H^*(X, A) = H^*(X, E).$$

┘

### Integrality of Characteristic Numbers

**Thm. (16.7.5.8) [Atiyah-Hirzebruch].** If  $k \in \mathbb{Z}_+$  and  $M$  is a compact spin manifold of dimension  $4k$ , then  $\hat{A}(M) \in \mathbb{Z}$ . Moreover, if  $k \in 2\mathbb{Z} + 1$ , then  $\hat{A}(M) \in 2\mathbb{Z}$ .

┘

**Cor. (16.7.5.9) [Rochlin].** If  $M$  is a compact spin 4-manifold, then the signature of  $M$  is a multiple of 16. Notice the smoothness is necessary by (16.7.1.14).

┘

*Proof:* This is because for 4-manifolds, the signature is always 8 times the  $\hat{A}$ -genus, Cf. [L-W89]2.6.17?.

□

**Thm. (16.7.5.10) [ $\hat{A}$ -Genus of  $\text{Spin}^c$ -manifolds are Integral].** Let  $X$  be a compact orientable manifold and  $c \in H^2(X, \mathbb{Z})$  s.t.  $c \equiv w_2(X) \pmod{2}$  (hence  $X$  is a  $\text{Spin}^c$ -manifold (16.7.2.3)), then

$$\{e^{\frac{c}{2}} \hat{A}(X)\}[X] \in \mathbb{Z}.$$

┘

*Proof:* Cf. [L-W89]P400?.

□

**Thm. (16.7.5.11) [Bott].** If  $E \in \mathcal{V}\text{ect}^{\text{fin}}_{\mathbb{C}}(\mathbb{S}^{2n})$ , then

$$\frac{1}{(n-1)!} c_n(E)[\mathbb{S}^{2n}] \in \mathbb{Z}.$$

┘

*Proof:* Cf. [L-W89]P281?.

### 1 Basics

#### Symplectic Forms

**Def. (16.8.1.1) [Symplectic Forms and Symplectic Manifolds].** For  $X \in \text{Diff}$ , a **symplectic form**  $\omega$  on  $X$  is a closed 2-form on  $X$  that is non-degenerate on any point. A smooth manifold with a symplectic form is called a **symplectic manifold**. A symplectic manifold must be even dimensional and orientable, by [Darboux's Theorem](#).

┘

**Prop. (16.8.1.2) [Cotangent Space is a Symplectic Manifold].** For any  $X \in \text{Diff}$ , a coordinate chart  $\varphi = (p_1, \dots, p_n)$  of  $X$  gives a **Lagrangian coordinate chart**  $(p_1, \dots, p_n, dp_1, \dots, dp_n)$  of  $T^*X$ . We can denote  $q_i = dp_i$ , then there is a symplectic form on  $T^*X$  given in this coordinate chart by

$$\omega^2 = dp \wedge dq.$$

┘

*Proof:* Consider the 1-form  $\omega^1$  on  $T^*M$  s.t. for any  $p \in T^*M$  with  $x = \text{pr}(p) \in M$  and  $\xi \in T(T^*M)$ ,  $\omega^1(\xi) = \langle p, \text{pr}_*(\xi) \rangle$ . Then it can be verified that in the coordinate chart  $(x_1, \dots, x_n, dx_1, \dots, dx_n)$  it is just  $\omega^1 = p dq$ . Thus  $d\omega^1 = \omega^2$  is closed.

Finally, it is clearly non-degenerate. □

**Prop. (16.8.1.3).** A Hamiltonian phase flow preserves the symplectic form.  $g^{t*}\omega = \omega$ . ┘

*Proof:* by Cartan's magic formula,

$$\frac{d}{dt}(g^t)^*\omega = L_X\omega = \iota_X(d\omega) + d(\iota_X\omega) = d(\iota_X\omega)$$

because  $\omega$  is closed. And by definition,  $d(\iota_X\omega)(\eta) = \omega(JdH, \eta) = \langle dH, \eta \rangle$ , so  $d(\iota_X\omega) = dH$ , Thus the theorem. □

For the following Cf. [辛几何讲义范辉军 lecture3].

**Prop. (16.8.1.4) [Moser's Stability].** If  $\omega_t$  is a smooth family of cohomologous forms on a closed manifold  $M$ , then there exists an isotopy  $\Psi_t$  s.t.

$$\Psi_t^*(\omega_t) = \omega_0.$$

┘

**Prop. (16.8.1.5) [Relative Moser Stability].** If  $M$  is a closed manifold and  $S$  is a compact submanifold, then if two closed 2-form equals on  $S$ , then there is an open neighborhood  $N_0, N_1$  of  $S$  and a diffeomorphism  $\Psi : N_0 \rightarrow N_1$  that

$$\Psi|_S = \text{id}, \quad \Psi^*\omega_1 = \omega_0.$$

┘

**Cor. (16.8.1.6) [Darboux's Theorem].** Every symplectic form  $\omega$  on  $M$  is locally diffeomorphic to the standard form  $\omega_0$  on  $\mathbb{R}^{2n}$ .

┘

*Proof:* Choose  $S = \text{pt}$  and uses relative Moser stability.

□

**Prop. (16.8.1.7).** For a compact symplectic manifold  $M$ , its even dimensional cohomology groups doesn't vanish, because  $\omega^k$  are nontrivial.

┘

*Proof:* This is because  $\omega^n$  is a volume form on  $M$  that never vanish, so it gives  $M$  an orientation and  $\int_M \omega^n \neq 0$ . If  $\omega^k$  is exact, then  $\omega^n$  is exact, so  $\int_M \omega^n = 0$  by Stokes', contradiction.

□

## 2 Poisson Structure

**Prop. (16.8.2.1) [Legendre Transform and Hamiltonian Systems].** [https://en.wikipedia.org/wiki/Legendre\\_transformation#Legendre\\_transformation\\_on\\_manifolds](https://en.wikipedia.org/wiki/Legendre_transformation#Legendre_transformation_on_manifolds)

┘

*Proof:* ?

□

**Def. (16.8.2.2) [Hamiltonian Vector Fields].** A **Hamiltonian function** is a smooth function on  $M$ . For any Hamiltonian function  $H$ , the symplectic form  $\omega$  maps  $dH$  to a vector field  $L_H \in \mathfrak{X}(M)$  s.t.  $\xi(H) = \omega(\xi, L_H)$  for any  $\xi \in \mathfrak{X}(M)$ , called the **Hamiltonian vector field** of  $H$ .

┘

**Def. (16.8.2.3) [Poisson Brackets].** For any

In particular, for  $X \in \text{Diff}$  and any Lagrangian coordinate chart  $(\mathbf{p}, \mathbf{q})$ , the Poisson bracket of  $f, g \in C^\infty(T^*X)$  is given by

$$\{f, g\}_{\text{Pois}} = \frac{\partial}{\partial \mathbf{q}} f \frac{\partial}{\partial \mathbf{p}} g - \frac{\partial}{\partial \mathbf{p}} f \frac{\partial}{\partial \mathbf{q}} g.$$

┘

## 16.9 Complex Geometry

References are [Voi02, Huy05], [Principle of Algebraic Geometry Griffith/Harris], more advanced stuffs to add from [Kähler Geometry]. Even more advanced is [Demailly Complex Analytic and Differential Geometry].

### 1 Complex Manifolds

**Def. (16.9.1.1) [Complex Manifold].** A **complex manifold** is an even dimensional manifold that the transformation matrices are holomorphic. The category of complex manifolds are denoted by  $\mathbb{C}\text{-Mani}$ .  $\lrcorner$

**Prop. (16.9.1.2) [Andreotti-Franzcel].** Let  $M^n \subset \mathbb{C}^n \in \mathbb{C}\text{-Mani}^n$ , then  $M$  is homotopic to a CW complex of real dimension  $\leq n$ .  $\lrcorner$

*Proof:*  $\square$

**Prop. (16.9.1.3) [Adjunction Formula].** The normal sheaf of a submanifold  $Y \subset X$  is defined the same as the case of nonsingular varieties (7.12.1.17), then the same is true of the adjunction formula:

$$\mathcal{K}_Y \cong \mathcal{K}_X \otimes \det \mathcal{N}_{Y/X}$$

In case  $Y$  is of codimension 1,  $\mathcal{N}_{Y/X} \cong \mathcal{L}(Y)|_Y = \mathcal{O}_Y(Y)$ .  $\lrcorner$

**Prop. (16.9.1.4) [Remmert].** A non-compact complex manifold admits a proper holomorphic embedding into  $\mathbb{C}^N$  for some  $N$  iff it is a Stein manifold.  $\lrcorner$

*Proof:* ?  $\square$

**Prop. (16.9.1.5) [Siegel].** Let  $X \in \mathbb{C}\text{-Mani}^n$ , then the field  $R(X)$  of meromorphic functions on  $X$  has transcendence degree  $\leq n$  over  $\mathbb{C}$ . And in case  $\text{tr.deg}[R(X) : \mathbb{C}] = n$ , it is a f.g. field extension of  $\mathbb{C}$ . Then we define the **algebraic dimension** of a compact connected complex manifold  $X$  to be  $\dim^{\text{alg}}(X) = \text{tr.deg } R(X)$ .  $\lrcorner$

*Proof:* It suffices to show that given any meromorphic functions  $f_1, \dots, f_{n+1}$ , there is an algebraic relation between them.

Now for each  $x$ , there is a nbhd  $U_x$  that any  $f_i$  writes as the quotient of two holomorphic functions  $\frac{g_{i,x}}{h_{i,x}}$ . And assume  $W_x \subset V_x \subset \overline{V}_x \subset U_x$  are the metric balls  $B(x, \frac{1}{2}) \subset B(x, 1)$ . As  $X$  is compact, there are  $N$   $x_k$  that  $X = \cup W_{x_k}$ .

As on the intersections,  $\frac{g_{i,k}}{h_{i,k}} = \frac{g_{i,l}}{h_{i,l}}$ , any we can assume they are all prime, so  $\frac{g_{i,k}}{g_{i,l}} = \varphi_{i,kl}$  is a unit. Let  $\varphi_{kl} = \prod_i \varphi_{i,kl}$ , as  $X$  is compact, let  $C = \max_{k,l} \varphi_{kl} \geq 1$ .

For any homogenous polynomial  $F \in \mathbb{C}[X_1, \dots, X_{n+1}]$  of deg  $m$ , let  $G_k = F(\frac{g_{1,k}}{h_{1,k}}, \dots, \frac{g_{n,k}}{h_{n,k}})(\prod_i h_{ik})^m$ . Then  $G_k$  are holomorphic and  $G_k = \varphi_{lk}^m G_l$  on the intersection. Now I claim for any  $M > 0$ , there is a  $F$  that  $G_k$  vanishes up to at least order  $M$  at  $x_k$ .

For this, just consider the dimension of all homogenous polynomials of degree  $m$  is  $C_{m+n+1}^m$ , and the number of desired equations of elements needs to be vanish is  $N \cdot C_{m'-1+n}^{m'-1}$ , so this always can be achieved when  $m$  is sufficiently large.

By Schwartz lemma (12.5.8.5),  $|G_k(x)| \leq (\frac{1}{2})^{m'} C'$ , where  $C' = \max\{|G_k(x)| | k = 1, \dots, n, x \in \overline{V}_k\}$ .

If  $C' = |G_k(x)|$ , and  $x \in W_l$ , then  $C' = |G_l(x)| |\varphi_{lk}^m(x)| \leq \frac{C'}{2^{m'}} \cdot C^m$ . If for some  $m, m'$ ,  $C^m < 2^{m'}$ , then this shows  $C' = 0$  which will finish the proof.

Look back at the condition of  $m, m'$ ,  $C_{m+n+1}^m > N \cdot C_{m'-1+n}^{m'-1}$  can be achieved together with  $m < \lambda m'$  for any  $\lambda$ , because the left hand is degree  $n+1$  in  $m$  and the right hand is degree  $n$  in  $m'$ .  
 $\square$

### Almost Complex Structure

**Def. (16.9.1.6) [Almost Complex Structures].** For  $M$  a real orientable manifold of dimension  $2n$ , an **almost complex structure** is a real bundle map  $J : T_{\mathbb{C}}M \rightarrow T_{\mathbb{C}}M$  satisfying  $J^2 = -1$ . A manifold with an almost complex structure is called an **almost complex manifold**.

A complex manifold has an almost complex structure, just define

$$J\left(\frac{\partial}{\partial x_i}\right) = \frac{\partial}{\partial y_i}, \quad J\left(\frac{\partial}{\partial y_i}\right) = -\frac{\partial}{\partial x_i}.$$

┘

**Def. (16.9.1.7) [Complex Differentials].** Situation as in (16.9.1.6),  $J$  will define a bundle map  $J : T^*M \rightarrow T^*M$ , and it has two eigenvalues  $\pm i$ , denoted by  $T^{*1,0}M$  and  $T^{*0,1}M$ . The **formal differential forms**  $\wedge^k T^*M \cong \bigoplus_{0 \leq p \leq k} \wedge^{p,k-p} T^*M$ .

Define  $\partial = \text{pr}_{p+1,q} \circ d$  on  $\wedge^{p,q} T^*M$ , and  $\bar{\partial} = \text{pr}_{p,q+1} \circ d$  on  $\wedge^{p,q} T^*M$ .

┘

**Def. (16.9.1.8) [Integrability].** An almost complex structure  $(M, J)$  is called **integrable** iff it satisfies the following equivalent conditions:

- $d\alpha = \partial\alpha + \bar{\partial}\alpha$ .
- $d\alpha = \partial\alpha + \bar{\partial}\alpha$  is true for  $\alpha \in \Omega^{1,0}(M)$
- $[T^{0,1}X, T^{0,1}X] \subset T^{0,1}X$ .
- $\bar{\partial}^2 f = 0$  for functions  $f$ .

┘

*Proof:* 1  $\iff$  3 is because by (16.1.3.4), if  $u, v \in T^{0,1}X$ ,

$$d\alpha(u, v) = u(\alpha(v)) - v(\alpha(u)) - \alpha([u, v]) = -\alpha([u, v]).$$

3  $\iff$  4 is because by (16.1.3.4), if  $\alpha = \bar{\partial}f$  and  $u, v \in T^{0,1}X$ , then

$$\bar{\partial}^2 f(u, v) = u(\bar{\partial}f(v)) - v(\bar{\partial}f(u)) - \bar{\partial}f([u, v]) = u(df(v)) - v(df(u)) - \bar{\partial}f([u, v]) = \partial f([u, v])$$

$\square$

**Thm. (16.9.1.9) [Nirenberg-Newlander].** Given an almost complex manifold  $(M, J)$ , it is integrable iff it comes from a complex structure.

┘

*Proof:* Cf. [Foundation of Differential Geometry Kobayashi Chap9.2].

$\square$

**Cor. (16.9.1.10).** For  $M \in \mathbb{C}\text{-Mani}$ ,

$$\bar{\partial}^2 = 0, \quad \partial\bar{\partial} + \bar{\partial}\partial = 0, \quad \partial^2 = 0.$$

┘

## 2 Deformation of Complex Structures

Cf.[Kähler Geometry] and [Complex Geometry, Daniel Chap6], should be completed as soon as possible.

## 3 Analytic Spaces and Coherence Sheaves

Cf.[Demailly] and [GAGA Serre].

### Analytic Subvarieties

**Def. (16.9.3.1)[Analytic subvariety].** An **analytic subvariety** is a closed subset of a complex manifold that is locally defined by f.m. holomorphic functions. The **regular points** of an analytic subvariety locally defined by  $k$  functions is the points that  $\text{rank}((\frac{\partial}{\partial z_j} f_i)_{i \leq k, j \leq n}) = k$ .  $\lrcorner$

**Prop. (16.9.3.2) [Proper Mapping Theorem].** If  $U, M$  are complex manifolds and  $M \subset U$  is an analytic subvariety, then if  $f : U \rightarrow N$  is a holomorphic mapping whose restriction on  $M$  is proper, then  $f(M)$  is an analytic subvariety of  $N$ .  $\lrcorner$

*Proof:* Cf.[Griffith/harris P395].  $\square$

**Def. (16.9.3.3) [Local Analytic Spaces].** An **analytic subspace of  $\mathbb{C}^n$**  is an analytic subvariety of  $\mathbb{C}^n$ . On an analytic space, there is a sheaf of holomorphic functions  $\mathcal{O}_U$ . So we can define **holomorphic map  $\varphi$**  as continuous functions that maps holomorphic germs to holomorphic germs, which is equivalent to the coordinates of  $\varphi$  are all holomorphic.  $\lrcorner$

**Def. (16.9.3.4)[Analytic Spaces].** An **analytic space** is a Hausdorff local-ringed space  $(X, \mathcal{O}_X)$  that is locally isomorphic to an analytic subspace of  $\mathbb{C}^n$  (16.9.3.3). Morphisms are continuous maps that are locally holomorphic. Sub-analytic spaces are defined as usual.

The products of analytic spaces can be defined, and it has the product topology, unlike the case of schemes.  $\lrcorner$

**Prop. (16.9.3.5)[Analytic Modules].** Let  $(X, \mathcal{O}_X)$  be an analytic space (16.9.3.4), an **analytic module** over  $X$  is just an  $\mathcal{O}_X$ -module. For a sub-analytic space  $Y$ , we have a sheaf of ideals  $\mathcal{I}_Y$  which is the sheaf of germs vanishing at  $Y$ , and  $\mathcal{O}_X/\mathcal{I}_Y$  is a sheaf on  $X$  that is zero outside  $Y$ , and we identify it with  $\mathcal{O}_Y$ .  $\lrcorner$

**Def. (16.9.3.6)[Coherent Analytic Sheaves].**  $\textcolor{red}{?}$   $\lrcorner$

**Prop. (16.9.3.7)[Coherence of Structure Sheaf].** If  $(X, \mathcal{O}_X)$  is an analytic space, then  $\mathcal{O}_X$  is coherent  $\textcolor{red}{?}$ , and the sheaf of ideals  $\mathcal{I}_Y$  of any sub-analytic-space  $Y$  is also coherent.  $\lrcorner$

*Proof:* First prove for  $X$  is an open subset of  $\mathbb{C}^n$ , Cf.[GAGA Serre P4]. And by definition  $\mathcal{O}_X$  is a  $\mathcal{O}_X$ -module of f.t., and it is also coherent  $\textcolor{red}{?}$ , so  $\mathcal{O}_X$  is coherent.  $\mathcal{I}_Y$  is coherent because it is a kernel of  $\mathcal{H}_X \rightarrow \mathcal{H}_Y$ .  $\square$

## 4 Positive Current

## 5 Hermitian Vector Bundles

**Def. (16.9.5.1)[Holomorphic and Hermitian Vector Bundles].** H A **holomorphic vector bundle** is a vector bundle on a complex manifold that the transition functions are holomorphic. A **Hermitian vector bundle** is a holomorphic vector bundle endowed with a Hermitian metric<sup>?</sup>. Any holomorphic vector bundle has a Hermitian structure, by partition of unity method.  $\lrcorner$

**Prop. (16.9.5.2) [Hodge Star for Hermitian bundles].** If  $\mathcal{E}$  is a Hermitian vector bundle over a compact complex manifold  $X$  of complex dimension  $n$ , we define a conjugate-linear operator  $\bar{*} : A^{p,q}(\mathcal{E}) \rightarrow A^{n-p,n-q}(\mathcal{E}) : \eta \mapsto \bar{*}\eta$ , and a conjugate-linear functor  $\tau E \rightarrow E^*$  induced by the Hermitian metric on  $E$ .

Then we can define  $\bar{*}_E : A^{p,q}(E) \rightarrow A^{n-p,n-q}E : \eta \otimes s \mapsto \bar{*}(\eta) \otimes \tau(s)$ . It can be checked that

$$(\alpha, \beta) * 1 = \alpha \wedge *_E \beta,$$

$$\bar{\partial}_E^* = -\bar{*}_{E^*} \bar{\partial}_{E^*} \bar{*}_E, \quad \bar{*}_E \Delta_{\bar{\partial}_E} = \Delta_{\bar{\partial}_{E^*}} \bar{*}_{E^*}, \quad \bar{*}_{E^*} \bar{*}_E = (-1)^{p+1} \text{ on } \Omega^{p,q}(E).$$

$\lrcorner$

### Hermitian Manifold

**Def. (16.9.5.3) [Holomorphic Tangent Bundle].** Let  $M$  be a complex manifold, the complexified tangent bundle  $T_{\mathbb{C}}M$  is defined as  $TM \otimes_{\mathbb{R}} \mathbb{C}$ , the **holomorphic tangent bundle**  $T^{1,0}M$  and anti-holomorphic bundle  $T^{0,1}M$  are defined to be the vectors generated resp. by  $\frac{\partial}{\partial z_i}$  and  $\frac{\partial}{\partial \bar{z}_i}$ . The **holomorphic cotangent bundle** and anti-holomorphic cotangent bundle is defined to be the covectors generated by  $dz_i$  and  $d\bar{z}_i$ .  $\lrcorner$

**Def. (16.9.5.4) [Hermitian Metric].** Let  $M$  be an almost complex manifold, a **Hermitian metric** on  $T_{\mathbb{C}}M$  is a metric that is  $J$ -invariant, that is  $g(Ju, Jv) = g(u, v)$ . Notice(3.5.11.31) shows a Hermitian metric is equivalent to a non-degenerate Hermitian form on  $T_{\mathbb{C}}M$ , where  $g$  appears as the real part of the Hermitian form.  $\lrcorner$

**Def. (16.9.5.5) [Hermitian Manifolds].** A complex manifold with a Hermitian metric is called a **Hermitian manifold**.  $\lrcorner$

**Def. (16.9.5.6) [the Kähler Form].** Given a Hermitian manifold  $M$ , define the **Kähler form**  $\omega_g$  as  $\omega_g(u, v) = g(Ju, v)$ . Then it is a real 2-form on  $M$ .

Notice  $g(u, v) = \omega_g(u, Jv)$ , so  $g$  can be constructed by  $\omega_g$ , iff  $\omega_g$  is positive(16.10.6.1).  $\lrcorner$

### Analytic Picard Groups

**Def. (16.9.5.7) [Analytic Picard Groups].** The group of isomorphisms of holomorphic line bundles on a complex manifold  $X$  is denoted by  $\text{Pic}_{\mathbb{C}}(X)$ , called the **analytic Picard group** of  $X$ .  $\lrcorner$

**Prop. (16.9.5.8) [First Chern Class].** For a connected space  $X$ , there is an exact sequence

$$0 \rightarrow \mathbb{Z} \rightarrow \mathcal{O}_X \xrightarrow{f \mapsto e^{2\pi i f}} \mathcal{O}_X^* \rightarrow 0,$$

and it induces a map  $\text{Pic}_{\mathbb{C}}(X) = H^1(X, \mathcal{O}_X^*) \rightarrow H^2(X, \mathbb{Z})$ , which is a just the first Chern class(same proof as in(4.15.4.20)).

**WARNING:** in this case it is not necessarily isomorphism, not as in the case of topological line bundles.

in particular, The image of the first Chern class is trivial in  $H^2(X, \mathcal{O}_X)$ .  $\lrcorner$

**Def. (16.9.5.9).** The dual of the universal line bundle on  $\mathbb{CP}^n$  is called the **hyperplane line bundle**, denoted by  $H$  or  $\mathcal{O}(1)$ .  $\lrcorner$

**Prop. (16.9.5.10).**  $\text{Pic}_{\mathbb{C}}(\mathbb{CP}^n) \cong \mathbb{Z}$ , with  $\mathcal{O}(1)$  as a generator.  $\lrcorner$

*Proof:* As  $\mathbb{CP}^n$  is Kähler, use (16.11.5.5), then  $H^{0,k}(X, \mathbb{C}) \cong H^k(X, \mathcal{O}_X) = H^k(X, \mathcal{K}_X \otimes \mathcal{O}(2)) = 0$  for  $k \geq 1$  by Kodaira vanishing (16.10.7.3), and then  $\text{NS}(X) = H^{1,1}(X) = H^2(X, \mathbb{Z}) = \mathbb{Z}$  by Lefschetz (1,1)-form theorem (16.11.5.6). It remains to prove  $c_1(\mathcal{O}(1))$  is the generator, for this, Cf. [Demailly P280].  $\square$

**Prop. (16.9.5.11).** Let  $S_d$  be the set of homogenous polynomials of degree  $d$ , then

$$H^0(\mathbb{CP}^n, \mathcal{O}(d)) = \begin{cases} S_d & d \geq 0 \\ 0 & d < 0 \end{cases}$$

$\lrcorner$

*Proof:* This is because it is sections that satisfy  $f_{\alpha}([z]) = (\frac{z_{\beta}}{z_{\alpha}})^k f_{\beta}([z])$ , which says  $f_{\alpha}$  glue together to give a holomorphic function homogenous of degree  $k$  on  $\mathbb{C}^n \setminus \{0\}$ , which extends to a function on  $\mathbb{C}^n$  by (12.5.8.4), then it is easy to see it is a homogenous polynomial using the power series expansion.  $\square$

**Def. (16.9.5.12)[Complex Neron-Severi Group].** For a compact complex manifold  $X$ , the **complex Néron-Severi group**  $\text{NS}_{\mathbb{C}}(X)$  is the image of  $\text{Pic}_{\mathbb{C}}(X) \rightarrow H^2(X, \mathbb{Z})$ .  $\text{rank}(\text{NS}(X))$  is called the **Picard number** of  $X$ .

There is a good description of  $\text{NS}(X)$  in case  $X$  is Kähler, See Lefschetz theorem (16.11.5.6).

This is compatible with the algebraic Néron-Severi group (10.9.3.39), i.e.  $\text{NS}_{\mathbb{C}}(X) = \text{Pic}_{\mathbb{C}}(X) / \text{Pic}_{\mathbb{C}}^0(X)$  Cf. [G-H94]P457, [Vak17]P484.  $\lrcorner$

### Chern Connection

**Prop. (16.9.5.13)[Chern Connection].** Given a Hermitian holomorphic bundle  $E \rightarrow M$  on a complex manifold, there is a unique **Chern connection**  $\nabla$  on  $E$ , that  $\nabla$  is holomorphic (i.e. the connection matrix is holomorphic w.r.t a holomorphic frame), and it is compatible with the Hermitian metric.  $\lrcorner$

*Proof:* Write out the requirement: if  $H = h_{ij}$  is the matrix of the Hermitian metric, so  $H$  is Hermitian, and we need  $dh_{ij} = (\nabla e_i, e_j) + (e_i, \nabla e_j) = \sum_k \omega_{ik} h_{kj} + \sum_k \overline{\omega_{jk}} h_{ik} \omega$  is holomorphic, so must

$$\partial H = \theta H, \quad \bar{\partial} H = H \bar{\theta}^t.$$

But  $H^t = \bar{H}$  so these two equations are equivalent and  $\theta = \partial H H^{-1}$ .  $\square$

**Cor. (16.9.5.14).** The curvature of the Chern connection is  $\Omega = \bar{\partial}(\partial(h)h^{-1})$ . In particular, it is a skew-symmetric matrix of  $(1,1)$ -forms. If it is of dimension 1, then  $\Omega = \bar{\partial}\partial \log h$ .  $\lrcorner$

*Proof:*  $\Omega$  is locally  $d\omega + \omega \wedge \omega$ , so if we choose a unitary basis, then  $\omega$  is skew-symmetric by definition and  $\omega \wedge \omega$  is also skew-symmetric, so  $\Omega$  is skew-symmetric. The calculation is direct calculation.  $\square$

**Prop. (16.9.5.15).** The transformation matrix of a complex manifold is holomorphic, so it is possible to define globally  $\bar{\partial}$  operator. And locally on a nbhd,  $\partial$  is defined as  $d - \bar{\partial}$ .  $\lrcorner$

**Prop. (16.9.5.16) [Normal Coordinate].** For a Hermitian vector bundle  $E$  over a complex manifold  $X$ , given any coordinate frame  $(z_j)$ , there exists a holomorphic frame  $(e_\lambda)$  that

$$\langle e_\lambda, e_\mu \rangle = \delta_{\lambda,\mu} - \sum c_{jk\lambda\mu} z_j \bar{z}_k + O(|z|^3)$$

where  $c_{ij\lambda\mu}$  is the coefficient of the Chern connection  $\Omega$ . Such a coordinate is called the **normal coordinate frame** of  $E$  at  $x$ .  $\lrcorner$

*Proof:* Cf. [Demailly P270].  $\square$

## 6 Cohomology

**Lemma (16.9.6.1) [Dolbeault Complex,  $\bar{\partial}$ -Poincaré Lemma].** If  $X$  is a complex manifold of dimension  $n$ , and  $\mathcal{E}$  a holomorphic vector bundle, then there is an exact sequence:

$$0 \rightarrow \Omega^{p,0}(\mathcal{E}) \xrightarrow{\bar{\partial}_\mathcal{E}} \Omega^{p,1}(\mathcal{E}) \xrightarrow{\bar{\partial}_\mathcal{E}} \dots \xrightarrow{\bar{\partial}_\mathcal{E}} \Omega^{p,n-p}(\mathcal{E}) \rightarrow 0$$

If  $p = 0$ , it is called the **Dolbeault complex** of  $\mathcal{E}$ .  $\lrcorner$

*Proof:* Because tensoring  $\mathcal{E}$  is exact, it suffices to show for  $\mathcal{E} = \mathbb{C}_X$ . As  $\bar{\partial}^2 = 0$  (16.9.1.10), and the sequence is clearly exact at  $\Omega^{p,0}(\mathcal{E})$ , it suffices to show that if  $\alpha \in \Omega^{p,q}(X)$ ,  $q > 0$  satisfies  $\bar{\partial}\alpha = 0$ , then  $\alpha = \bar{\partial}\beta$  for some  $\beta \in \Omega^{p,q-1}(X)$ . Let

$$\alpha = \sum_I \sum_J \alpha_{I,J} dz_I \wedge d\bar{z}_J = \sum_I dz_I \left( \sum_J \alpha_{I,J} d\bar{z}_J \right),$$

then it is clear it suffices to prove for  $(\sum_J \alpha_{I,J} d\bar{z}_J)$ , and the question is reduced to the case  $p = 0$ .

Suppose  $\alpha = \sum_J \alpha_J \wedge d\bar{z}_J$ , then we use induction on  $k$  which equals the maximal number s.t. there is a  $J$  with  $k \in J$  and  $\alpha_J \neq 0$ . Notice  $k \geq q$ . If  $k = q$ , then

$$\alpha = f d\bar{z}_1 \wedge \dots \wedge d\bar{z}_q,$$

and  $f$  is holomorphic in the variables  $z_l, l > q$ . Then the proof of (12.4.1.12) gives us a smooth function  $g$  s.t.  $\frac{\partial}{\partial \bar{z}_q} g = f$  that is holomorphic in the variables  $z_l, l > q$ . So

$$\bar{\partial}((-1)^{q-1} g d\bar{z}_1 \wedge \dots \wedge d\bar{z}_{q-1}) = f d\bar{z}_1 \wedge \dots \wedge d\bar{z}_q.$$

So the case  $k = q$  is proved. Suppose the assertion is true for  $k - 1 \geq q$ , suppose

$$\alpha = \alpha_1 + \alpha_2 \wedge d\bar{z}_k,$$

where only the coordinates of index  $< k$  appear in  $\alpha_i$ . Then  $\alpha_2$  is holomorphic in the same argument as above shows that for each  $J$ ,  $\alpha_{2,J} = \frac{\partial}{\partial \bar{z}_k} \beta_{2,J}$  that each  $\beta_{2,J}$  is holomorphic in the variables  $z_l, l > q$ . Then

$$\bar{\partial} \left( \sum_J \beta_{2,J} d\bar{z}_J \right) = (-1)^{q-1} \alpha_2 \wedge d\bar{z}_k + \alpha'_1$$

where  $\alpha'_1$  involves only the coordinates  $z_l$  for  $l < k$ . Then we eliminated  $d\bar{z}_k$  and can use induction hypothesis from now.  $\square$

**Def. (16.9.6.2)[Dolbeault Cohomology].** The **Dolbeault cohomology group**  $H_{\bar{\partial}}^{p,q}(X, \mathcal{E})$  of a holomorphic vector bundle  $\mathcal{E}$  over a complex manifold  $X$  is defined to be the  $q$ -th cohomology group of the complex

$$0 \rightarrow \Omega^{p,0}(\mathcal{E}) \xrightarrow{\bar{\partial}_{\mathcal{E}}} \Omega^{p,1}(\mathcal{E}) \xrightarrow{\bar{\partial}_{\mathcal{E}}} \dots \xrightarrow{\bar{\partial}_{\mathcal{E}}} \Omega^{p,n-p}(\mathcal{E}) \rightarrow 0$$

and  $H_{\bar{\partial}}^{p,q}(X)$  is defined to be  $H_{\bar{\partial}}^{p,q}(X, \underline{\mathbb{C}}_X)$ . By (16.9.6.5),  $H_{\bar{\partial}}^{p,q}(X, \mathcal{E}) \cong H_{\bar{\partial}}^q(M, \Omega_{\text{hol}}^p \otimes_{\mathcal{O}_X} \mathcal{E})$ .  $\lrcorner$

**Cor. (16.9.6.3).** If  $X$  is a complex manifold of dimension  $n$ , there are exact sequences:

$$0 \rightarrow \underline{\mathbb{C}}_X \xrightarrow{\partial} \mathcal{O}_X \xrightarrow{\partial} \Omega_{\text{hol}}^1 \xrightarrow{\partial} \dots \xrightarrow{\partial} \Omega_{\text{hol}}^n \rightarrow 0$$

$\lrcorner$

*Proof:* This follows from the Poincaré lemma (7.3.5.10) and  $\bar{\partial}$ -Poincaré lemma (16.9.6.1), by applying the spectral sequence (I mean in the category of sheaves).  $\square$

**Prop. (16.9.6.4)[Holomorphic Cohomology].** For  $X \in \mathbb{C}\text{-Mani}$ ,

$$H^p(X, \underline{\mathbb{C}}) = H^p(X, \Omega_{\text{hol}}^{\bullet}).$$

$\lrcorner$

**Prop. (16.9.6.5)[Dolbeault].** For  $X \in \mathbb{C}\text{-Mani}$  and  $\mathcal{E}$  a holomorphic bundle,

$$H_{\bar{\partial}}^{p,q}(X, \mathcal{E}) \cong H^q(M, \Omega_{\text{hol}}^p \otimes_{\mathcal{O}_X} \mathcal{E}),$$

where the left is Dolbeault cohomology and the right is sheaf cohomology. (Use the fact that smooth sheaf is fine so adapted to sheaf cohomology (7.3.5.4), and  $\bar{\partial}$ -Poincaré lemma (16.9.6.1)).

Moreover, there is a spectral sequence of

$$E_1^{p,q} = H_{\bar{\partial}}^{p,q}(X) \Rightarrow E^n = H_{dR}^n(X, \mathbb{R}) \times_{\mathbb{R}} \mathbb{C}.$$

$\lrcorner$

**Prop. (16.9.6.6)[Cartan].** The class of Coh-Acyclic subsets of an analytic space is exactly the class of Stein manifolds.  $\lrcorner$

*Proof:*  $\square$

### De.Rham Cohomology

**Prop. (16.9.6.7).** The Frölicher spectral sequence of a compact Kähler manifold generates at  $E_1$ .  $\lrcorner$

*Proof:*  $\square$

## 7 GAGA

Main references are [Ser55].

### Analytification of Algebraic Varieties and Sheaves

**Prop. (16.9.7.1)[Analytification].** For any variety over  $\mathbb{C}$ , any open affine subset is isomorphic to an analytic space of  $\mathbb{C}^n$ , hence can be given an analytic structure  $X^{\text{an}}$  called the **analytification** of  $X$ . It is a locally ringed space, together with a map  $X^{\text{an}} \rightarrow X$  of local ringed spaces.

This construction extends to a functor

$$\text{Sch}^{\text{loc.ft,sep}}/\mathbb{C} \rightarrow \text{AnSpa}/\mathbb{C}.$$

An **algebraic analytic space** is an analytic space that is in the essential image of this functor.

Notice  $X^{\text{an}}$  and  $X$  have in fact the same underlying sets.  $\lrcorner$

**Remark (16.9.7.2).** There is in fact a more general analytification for any scheme locally of finite type over  $\mathbb{C}$ . That is, we define it as the right adjoint to the forgetful functor from analytic spaces to local ringed spaces. Where an analytic space is a local ringed space that locally has immersions into  $\mathbb{C}^n$ . Should consult [Grothendieck EGA1-7].  $\lrcorner$

*Proof:* Notice the schemes that have an analytification is stable under open subscheme, closed subscheme and products, and we can make a glue a large space from open subschemes by the unicity. So we only need to consider  $\text{Spec } \mathbb{C}[T]$ , whose analytification is  $\mathbb{C}$ .  $\square$

**Def. (16.9.7.3)[Betti Cohomologies].** For any variety defined over  $\mathbb{C}$ , and  $\mathbb{R}$  a ring, let  $H_{\text{Betti}}^i(X, R) = H^i(X^{\text{an}}, R)$  be the **Betti cohomology** of  $X$  with coefficients in  $R$ .  $\lrcorner$

**Prop. (16.9.7.4)[Transfer of Properties].**

- $X^{\text{an}}$  is locally compact and  $\sigma$ -compact.
- $X^{\text{an}}$  is Hausdorff
- A morphism  $f : X \rightarrow Y$  is smooth/étale iff  $f^{\text{an}}$  is smooth/a local isomorphism.  $X$  is smooth over  $\mathbb{C}$  iff  $X^{\text{an}}$  is a complex manifold.
- A morphism  $f : X \rightarrow Y$  is proper iff  $X^{\text{an}} \rightarrow Y^{\text{an}}$  is proper. In particular,  $X$  is complete(proper) iff  $X^{\text{an}}$  is compact.
- If  $X$  is projective and connected, then  $X^{\text{an}}$  is connected iff  $X$  is connected.  $\lrcorner$

*Proof:* 1:  $X$  is qc hence covered by f.m. affine subsets hence second-countable and use(4.4.2.23).  $X^{\text{an}}/X$  is flat because completion of Noetherian rings are flat(5.2.3.24).

2: Because analytification preserves products and morphisms, and separatedness of  $X$  shows that  $\Delta(X)$  is closed in  $X \times X$ , hence it is also closed in the analytification.

3: This follows from the Jacobian criterion(5.4.5.24).

4: Cf.[GAGA Serre P8].

5: This follows from(16.9.7.16), as  $H^0(X, \mathcal{O}_X) = H^0(X^{\text{an}}, \mathcal{O}_X)$ .  $\square$

**Prop. (16.9.7.5).** There is a natural map from  $\mathcal{O}_x$  to  $\mathcal{H}_x$  that maps  $\mathfrak{m}_x$  to  $\mathfrak{m}_x \mathcal{H}_x$ , thus inducing a map  $\hat{\theta} : \hat{\mathcal{O}}_x \rightarrow \hat{\mathcal{H}}_x$ . This is an isomorphism. In particular,  $\theta : \Omega_x \rightarrow \mathcal{H}_x$  is injective.

Moreover, if  $Y$  is a locally closed subscheme of  $X$ , then the local ideal of functions vanishing at  $Y$  maps to  $\mathcal{A}_x(Y)$ , and  $\mathcal{A}_x(Y)$  is generated by  $\theta(\mathcal{I}_x(Y))$ . Moreover,  $\mathcal{H}_{x,Y} = \mathcal{H}_x/\mathcal{I}_x(Y)$ .  $\lrcorner$

*Proof:* [GAGA Serre P6].  $\square$

**Cor. (16.9.7.6).** The inclusion  $\mathcal{O}_x \subset \mathcal{H}_x$  is flat ring extension, by (5.4.1.19) and the fact  $\hat{A}/A$  is flat. And  $\dim \mathcal{O}_x = \dim \mathcal{H}_x$  because  $\dim A = \dim \hat{A}$  (5.2.4.16).  $\lrcorner$

**Cor. (16.9.7.7).** Given an open and dense subscheme  $U$  of an algebraic variety  $X$  over  $\mathbb{C}$ ,  $U^{\text{an}}$  is dense in  $X^{\text{an}}$ .  $\lrcorner$

*Proof:* Consider the complement  $Y$ , if  $U^{\text{an}}$  is not dense in  $X^{\text{an}}$ , then there exists a  $x$  that  $\mathcal{A}_x(Y) = 0$ , so by (16.9.7.5),  $\mathcal{I}_x(Y) = 0$ , so  $Y$  is not dense near  $x$ , contradicton.  $\square$

**Cor. (16.9.7.8).** For a morphism  $f$  of algebraic varieties over  $\mathbb{C}$ ,  $\overline{f(X)^{\text{an}}} = \overline{f(X)}^{\text{an}}$ .  $\lrcorner$

*Proof:* By Chevalley theorem (7.6.1.6), there is a open dense subscheme  $U$  of  $\overline{f(X)}$  that is contained in  $f(X)$ , then (16.9.7.7) shows  $U^{\text{an}}$  is dense in  $\overline{f(X)}^{\text{an}}$ , so  $\overline{f(X)}^{\text{an}} \subset \overline{f(X)^{\text{an}}}$ . The converse is obvious.  $\square$

**Def. (16.9.7.9) [Analytification of Sheaves].** Denote for a sheaf  $\mathcal{F}$  over  $X$   $\mathcal{F}'$  the inverse image sheaf over  $X^{\text{an}}$  pulled back along  $X^{\text{an}} \rightarrow X$ . Define  $\mathcal{F}^{\text{an}}$  the **analytification of  $\mathcal{F}$**  as the sheaf  $\mathcal{F}' \otimes_{\mathcal{O}_X} \mathcal{H}_X$ .  $\lrcorner$

**Prop. (16.9.7.10).**  $\mathcal{F} \rightarrow \mathcal{F}^{\text{an}}$  is exact from the category of sheaves on  $X$  to the category of analytic sheaves on  $X^{\text{an}}$ ,  $\mathcal{F}' \rightarrow \mathcal{F}^{\text{an}}$  is injective, and it maps coherent sheaves to coherent analytic sheaves.  $\lrcorner$

*Proof:* The first two follows from the fact that  $\mathcal{H}_X$  is flat over  $X^{\text{an}} \rightarrow X$  (16.9.7.6). For the last assertion, notice if  $\mathcal{O}_X^p \rightarrow \mathcal{O}_X^q \rightarrow \mathcal{F} \rightarrow 0$ , then  $\mathcal{H}_X^p \rightarrow \mathcal{H}_X^q \rightarrow \mathcal{F}^{\text{an}} \rightarrow 0$ , so it is coherent because  $\mathcal{H}_X$  is coherent (16.9.3.7) (7.2.2.28).  $\square$

**Prop. (16.9.7.11).** Let  $i : Y \rightarrow X$  be a closed subscheme, then for a coherent sheaf  $\mathcal{F}$  on  $Y$ ,  $(i^{\text{an}})_* \mathcal{F}^{\text{an}} \cong (i_* \mathcal{F})^{\text{an}}$ .  $\lrcorner$

*Proof:* These two sheaves are both 0 outside  $Y^{\text{an}}$ , consider a point of  $Y$ , their stalks are respectively  $\mathcal{F}_x \otimes_{\mathcal{O}_{x,X}} \mathcal{H}_{x,X}$  and  $\mathcal{F}_x \otimes_{\mathcal{O}_{x,Y}} \mathcal{H}_{x,Y}$ . By (16.9.7.5) we notice

$$\mathcal{H}_{x,Y} = \mathcal{H}_{x,X} / \mathcal{I}_x(Y) \mathcal{H}_{x,X} = \mathcal{H}_{x,X} \otimes_{\mathcal{O}_{x,X}} \mathcal{O}_{x,Y}.$$

So this two are equal by associativity of tensor product.  $\square$

**Prop. (16.9.7.12).** By Leray Spectral sequence (7.3.1.9), for an analytic sheaf  $\mathcal{G}$ , there is a boundary map  $H^k(X, \mathcal{G}) \rightarrow H^k(X^{\text{an}}, \mathcal{G})$ . So for a sheaf  $\mathcal{F}$  on  $X$ , there is a map

$$\varepsilon : H^k(X, \mathcal{F}) \rightarrow H^k(X, \text{an}_* \mathcal{F}^{\text{an}}) \rightarrow H^k(X^{\text{an}}, \mathcal{F}^{\text{an}})$$

$\lrcorner$

### Equivalence between Algebraic Variety and Analytic Spaces

**Remark (16.9.7.13) [GAGA Principle].** In principal, any complete analytic object in  $\mathbb{CP}^n$  is algebraic.  $\lrcorner$

**Prop. (16.9.7.14).** Let  $X, Y$  be algebraic varieties over  $\mathbb{C}$  and  $f : X \rightarrow Y$  is morphism that is bijective, if  $f^{\text{an}}$  is an analytic isomorphism, then  $f$  is an isomorphism.  $\lrcorner$

*Proof:* Cf. [GAGA Serre P9].  $\square$

**Cor. (16.9.7.15).** Let  $X, Y$  be algebraic varieties over  $\mathbb{C}$ , iff  $f : X^{\text{an}} \rightarrow Y^{\text{an}}$  is holomorphic map and the image of  $f$  in  $X^{\text{an}} \times Y^{\text{an}} = (X \times Y)^{\text{an}}$  comes from an algebraic subscheme, then  $f$  comes from an algebraic morphism. (Because  $X^{\text{an}} \rightarrow \Gamma(X)$  is an analytic isomorphism).  $\lrcorner$

**Prop. (16.9.7.16) [GAGA on Coh(X)].** Let  $X$  be a proper scheme over  $\mathbb{C}$ , then  $\mathcal{F} \rightarrow \mathcal{F}^{\text{an}}$  defines an equivalence of categories between  $\text{Coh}(X)$  and  $\text{Coh}^{\text{an}}(X^{\text{an}})$ .  $\lrcorner$

*Proof:* Cf. [GAGA Serre P13], [SGA1, Chap12]..  $\square$

**Prop. (16.9.7.17) [GAGA on Projective Varieties].**

- (Chow) Any analytic subvariety of  $\mathbb{CP}^n$  is algebraic.
- Any meromorphic function on an algebraic variety  $V \subset \mathbb{CP}^n$  is rational.
- Any meromorphic differential form on a smooth variety is algebraic.
- Any holomorphic map between smooth varieties can be given by rational maps.
- Any holomorphic vector bundle on a smooth variety is algebraic, i.e. transition function can be made rational.

Cf. [Griffith/Harris P168,170]. ?  $\lrcorner$

**Cor. (16.9.7.18).** If the analytification of a variety  $X$  is a compact complex manifold, i.e.  $X$  is smooth (16.9.7.4), then  $K(X) = K(X^{\text{an}})$ , as they are both morphism to  $\mathbb{P}^1$ .  $\lrcorner$

### Applications

**Prop. (16.9.7.19) [Generalized Riemann Existence Theorem].** Let  $X$  be a normal scheme of finite type over  $\mathbb{C}$ . Given any finite morphism of analytic spaces (i.e. proper and has finite fibers) form a normal complex analytic space  $f : X' \rightarrow X^{\text{an}}$ , then there is a unique normal scheme  $X'$  and a finite morphism  $g : X' \rightarrow X$  that  $g^{\text{an}} = f$ .  $\lrcorner$

*Proof:* Cf. [SGA1, Chap12], using resolution of singularities.  $\square$

**Cor. (16.9.7.20) [Algebraic Fundamental Group].**  $\lrcorner$

## 8 Algebraic Compact Complex Manifolds

**Def. (16.9.8.1) [Moishezon Manifolds].** A compact complex manifold is called a **Moishezon manifold** iff  $\text{tr. deg. } K(X) = \dim X$ , by (16.9.1.5) this is the highest degree it can have. When  $X$  is an analytification of an algebraic variety  $X^{\text{an}}$ ,  $K(X^{\text{an}}) = K(X)$  by (16.9.7.18), so Moishezon is a necessary condition for a compact complex manifold to be algebraic.  $\lrcorner$

**Prop. (16.9.8.2) [Chow-Kodaira].** Any Moishezon manifold of dimension 2 is algebraic and projective.  $\lrcorner$

*Proof:*  $\square$

**Prop. (16.9.8.3) [Moishezon].** Any Moishezon manifold becomes algebraic and projective after a finite number of monoidal transformations with non-singular centers.  $\lrcorner$

*Proof:*  $\square$

**Prop. (16.9.8.4) [Artin].** The category of smooth proper algebraic spaces over  $\mathbb{C}$  is equivalent to the category of Moishezon manifolds.

In particular, there are non-algebraic Moishezon manifolds in dimension  $\geq 3$ . Examples are given in [Har77]P444.  $\lrcorner$

*Proof:*  $\square$

**Prop. (16.9.8.5) [Moishezon].** Every Moishezon manifold that is Kähler is projective and algebraic.  $\lrcorner$

*Proof:* Cf. [Moishezon On  $n$ -dimensional compact varieties with  $n$  algebraically independent meromorphic functions].  $\square$

## 9 Riemann Surfaces

**Prop. (16.9.9.1) [Genus].**  $\lrcorner$

**Thm. (16.9.9.2) [Uniformization Theorem, Poincaré-Klein-Koebe].** Any simply-connected Riemann surface is analytically isomorphic to one of the following:

$$\mathcal{H} \cong \mathbb{D}, \mathbb{C}, \mathbb{P}^1(\mathbb{C}).$$

$\lrcorner$

*Proof:*  $\square$

**Cor. (16.9.9.3) [Classifying Riemann Surfaces].** For any Riemann surface  $S$  with universal covering space  $\tilde{S}$ ,

- If  $\tilde{S} \cong \overline{\mathbb{C}}$ , then  $S$  is compact, so by (16.9.9.6) and Riemann-Hurewitz (7.13.1.33),  $\tilde{S} \rightarrow S$  is an isomorphism. So in this case  $S \cong \overline{\mathbb{C}}$ .
- If  $\tilde{S} \cong \mathbb{C}$ , then  $\pi_1(S) \subset \text{Aut}(\tilde{S}) = \mathbb{C} \ltimes \mathbb{C}^\times$  by (12.4.7.8). But  $\pi_1(S)$  can have no fixed point, so they are all of the form  $\tau : z \mapsto z + b$ . So it is a lattice of  $\mathbb{C}$ , thus isomorphic to  $\mathbb{1}, \mathbb{Z}$  or  $\mathbb{Z}^2$ . The corresponding  $S$  is  $\mathbb{C}, \mathbb{C}^\times$  or  $\mathbb{C}/\Lambda$  a torus.
- If  $\tilde{S} \cong \mathcal{H}$ , then  $S = \mathcal{H}/\Gamma$  where  $\Gamma \subset \text{PSL}(2, \mathbb{R})$  is a Fuchs group ?. Such  $S$  are called a **hyperbolic Riemann surface**.  $\lrcorner$

**Cor. (16.9.9.4).** If  $S$  is a Riemann surface with a non-constant meromorphic function omitting at most 3 points, then  $S$  is of hyperbolic type.  $\lrcorner$

*Proof:* This is because  $\mathbb{C}$  or  $\mathbb{P}^1(\mathbb{C})$  cannot be mapped into  $\mathbb{D}$ .  $\square$

**Prop. (16.9.9.5) [Metrics on Riemann Surfaces].** For a Riemann surface  $S$ ,

- If  $S = \overline{\mathbb{C}}$ , then  $S$  has a natural Fubini-Study metric

$$ds^2 = \frac{4|dz|^2}{(1 + |z|^2)^2}.$$

with curvature 1.

- If  $\tilde{S} = \mathbb{C}$ , then  $\pi_1(S) \subset \text{Aut}(\mathbb{C})$  are all translations so preserves the Euclidean metric  $ds^2 = |dz|^2$ , thus  $S$  has a flat metric.
- If  $\tilde{S} = \mathcal{H}$ , then  $\pi_1(S) \subset \text{Aut}(\mathbb{C}) \cong \text{PSL}(\mathbb{R})$  preserves the hyperbolic metric  $ds^2 = y^{-2}dx dy$  by (16.6.1.5), thus inducing a hyperbolic metric on  $S$  with curvature  $-1$ .  $\lrcorner$

### Compact Riemann Surfaces

References are [Li04].

**Prop. (16.9.9.6) [Riemann Existence Theorem].** Any compact Riemann Surface is a Hodge manifold, thus projective algebraic, by (16.10.8.6) and Chow's lemma??. And the category of compact Riemann surfaces is equivalent to the category of compact algebraic curves, by GAGA (16.9.7.17).  $\lrcorner$

*Proof:* Because  $H^{1,1}(X) = H^2(X, \mathbb{Z})$ , so it clearly contains integral classes. And it is positive because there is a basis generated by any Hermitian metric on  $X$ . So the theorem follows from (16.10.8.6).  $\square$

**Remark (16.9.9.7).** In fact the same argument shows that any Kähler manifold with  $H^{0,2}(X) = 0$  is projective.  $\lrcorner$

**Cor. (16.9.9.8).** Any compact Riemann surface of genus 0 is analytically isomorphic to  $\overline{\mathbb{C}}$ .  $\lrcorner$

**Prop. (16.9.9.9).**

- For any meromorphic function  $f$  on a compact Riemann surface,  $(f) = (f)_0 - (f)_\infty$  has degree 0.
- Let  $\omega$  be a differential form on a compact Riemann surface, then the sum of residues of  $\omega$  at its poles is zero.

$\lrcorner$

*Proof:* 2: Choose a triangularization of the Riemann surface, then use the fact for any simple region  $\Omega$  be boundary  $C$ ,

$$\int_C \omega = 2\pi i \left( \sum_{\text{poles}} \text{res}_p \omega \right).$$

And the integrals cancel out.

- 1: This is a direct consequence of 2 applied to the differential form  $\omega = df/f$ .  $\square$

### Abel's Theorem and Reciprocity Law

**Prop. (16.9.9.10) [Reciprocity Law I].** Cf. [Griffith/Harris P230].  $\lrcorner$

**Prop. (16.9.9.11) [Weil].**  $f, g$  are meromorphic functions on a compact Riemann surface that  $(f), (g)$  are disjoint, then

$$\prod f(p)^{v_p(g)} = \prod g(p)^{v_p(f)}.$$

$\lrcorner$

*Proof:* Cf. [Griffith/Harris, P242].  $\square$

**Prop. (16.9.9.12) [Differentials on Plane Curves].**  $\lrcorner$

## 10 Conformal Geometry

## 16.10 Kähler Geometry

Basic References are [Voi02], [Principle of Algebraic Geometry Griffith/Harris], more advanced stuffs to add from [Kähler Geometry] and [Huy05]. Even more advanced is [Demailly Complex Analytic and Differential Geometry].

**Notation(16.10.0.1).**

- Use notations as in [Complex Geometry](#).

┘

### 1 Kähler Metric

**Def.(16.10.1.1)[Kähler Manifolds].** A metric  $g$  on a manifold  $M$  is called a **Kähler metric** if the metric form  $\omega_g$  is closed. In which case, it is called the **Kähler class** or Kähler form of  $g$  in  $H_{\text{dR}}^2(M)$ . A complex manifold with a Kähler metric is called a **Kähler manifold**.

If  $g_{ij} = g(\frac{\partial}{\partial z_i}, \frac{\partial}{\partial \bar{z}_j})$ , then  $\omega_g = \sum_{ij} g_{ij} dz_i \wedge d\bar{z}_j$ . Then the condition of  $\omega_g$  being closed can in fact be written in derivatives of  $g$ .

┘

**Prop.(16.10.1.2).** If  $g$  is Hermitian, then  $\omega_g$  is real, non-degenerate and  $\frac{1}{n!}\omega^n$  is a volume form on  $M$ . In particular, if  $\omega$  is Kähler, then it is a symplectic form.

┘

*Proof:* If  $g = \sum \varphi_i \otimes \bar{\varphi}_i$ , then  $\omega = i \sum \varphi_i \wedge \bar{\varphi}_i$ , so it is clear that  $\bar{\omega} = \omega$ .  $\omega$  is non-degenerate as  $g$  is. The last assertion follows from (3.5.11.26).  $\square$

**Cor.(16.10.1.3).** If  $M$  is a compact Kähler manifold, then its even dimensional cohomology group doesn't vanish (16.8.1.7).

┘

**Remark(16.10.1.4).** Notice there are notions like almost Hermitian and almost Kähler, similar to the definition of Hermitian and Kähler, but they are just defined using an almost complex structure on  $M$ . And an almost Kähler structure is Kähler iff  $\nabla J = 0$ , Cf.[Foundation of Differential Geometry Kobayashi].

┘

**Example(16.10.1.5)[Kähler Manifolds].**

- If  $M = \mathbb{R}^{2n}$ ,  $g = \sum dx_i \wedge dx_i + \sum dy_i \wedge dy_i$ , then  $\omega_g = \frac{i}{2} \sum dz_i \wedge d\bar{z}_i$  is Kähler.
- The metric  $\omega_g = \sum dz_i \wedge d\bar{z}_i$  on a complex tori  $\mathbb{C}^n/\Lambda$  is Kähler.
- Any Riemann surface is Kähler, because  $d\omega$  is a 3-form so vanish.
- if  $M = B(0, 1) \subset \mathbb{C}^n$  and  $\omega_g = i\partial\bar{\partial} \log \frac{1}{1-|z|^2}$ , then it is Kähler.
- The product metric on the product space  $M \times N$  of two Kähler manifold is Kähler.
- A submanifold of a Kähler manifold is Kähler, as the Kähler form is the pullback of the Kähler form of the large manifold.

┘

**Prop.(16.10.1.6)[Fubini-Study Metric].** The **Fubini-Study metric** form on  $\mathbb{CP}^n$  is defined locally to be  $i\partial\bar{\partial}|s|^2$ , for any local lifting  $s$  of the projection  $\mathbb{C}^n \setminus \{0\} \rightarrow \mathbb{CP}^n$ . This doesn't depend on the lifting, as  $\partial\bar{\partial}(\log f + \log \bar{f}) = 0$ , so they glue together to be a global form on  $\mathbb{CP}^n$ . It can be checked,  $\omega$  is translation invariant and on the coordinate  $(1, w_1, \dots, w_n) \rightarrow (w_1, \dots, w_n)$ ,  $\omega|_{(0, \dots, 0)} = \sum dw_i \wedge d\bar{w}_i$ , so it is positive definite.

┘

**Cor. (16.10.1.7).** Any projective manifold is Kähler. ┘

**Prop. (16.10.1.8).** the Fubini-Study metric on  $\mathbb{CP}^n$  has sectional curvature  $1 \leq K \leq 4$ . ┘

*Proof:* Cf.[Do Carmo P188]. ? □

**Prop. (16.10.1.9)[Kähler Normal Coordinate].** For a Hermitian metric  $g$  on  $M$ ,  $g$  is Kähler iff for any point  $p$  of  $M$ , there is a holomorphic coordinate centered at  $p$ ,  $\omega_g = \sum g_{ij} dz_i \wedge d\bar{z}_j$  satisfying  $g_{ij}(p) = 0$  and  $dg_{ij}(p) = 0$ . This coordinate is called **Kähler normal coordinate**. (Notice this is different from Darboux theorem, because this coordinate should be holomorphic). ┘

*Proof:* Cf.[Complex Geometry P210]. □

## 2 Geometry of Kähler Manifolds

**Prop. (16.10.2.1).** Let  $(M, J, g)$  be a Kähler manifold, then the complexification of the Levi-Civita connection of  $g$  restricts to the Chern connection on  $T^{1,0}M$ . ┘

*Proof:* Cf.[Complex Geometry note 石亚龙 48] and [Complex geometry Daniel Chap4.A]. □

**Prop. (16.10.2.2).** For a Kähler manifold,  $\nabla J = 0$ . ┘

*Proof:* The problem depends only on first derivative, so choosing a Kähler normal nbhd(16.10.1.9), we may choose  $J$  to be constant, so obviously  $\nabla J(p) = 0$ ,  $P$  is arbitrary, so  $\nabla J = 0$ . □

**Cor. (16.10.2.3).**  $\nabla(JX) = J\nabla X$ , so  $R(X, Y)JZ = JR(X, Y)Z$ , thus

$$\langle R(JX, JY)Z, W \rangle = \langle R(Z, W)JX, JY \rangle = \langle R(Z, W)X, Y \rangle = \langle R(X, Y)Z, W \rangle,$$

so  $R(JX, JY)Z = R(X, Y)Z$ . ┘

**Prop. (16.10.2.4).** The curvature tensor of the complexified Levi-Civita connection on a Kähler manifold can be calculated in terms of  $\partial_i, \bar{\partial}_j$ , Cf.[Complex Geometry note 石亚龙 50]. ┘

## 3 Kähler Identities

**Notation (16.10.3.1).**

- Let  $X$  be a compact complex Kähler manifold. ┘

**Def. (16.10.3.2).** Introduce some operators:

- $d^c = i(\bar{\partial} - \partial)$ , then  $dd^c = 2i\partial\bar{\partial}$ .
- The **Lefschetz operator**  $L(\eta) = \omega \wedge \eta$ .  $\Lambda$  is defined as the formal adjoint of  $L$  as  $A^{p,q}$  is an inner space. In fact,  $\Lambda = \pm * L*$ .
- $h = (k - n)$  on  $\mathcal{A}^k(X)$ . ┘

**Prop. (16.10.3.3).**  $[L, \Lambda] = p + q - n$  on  $(p, q)$ -forms. ┘

*Proof:* The problem doesn't depends on the derivatives, so using the Kähler normal coordinate(16.10.1.9), it suffice to prove for  $\mathbb{C}^n$ , for this, Cf.[Griffith/Harris P120] or [Complex Geometry P34]. □

**Prop. (16.10.3.4)**[Kähler Identities].

$$[\Lambda, \partial] = i\bar{\partial}^*, \quad [\Lambda, \bar{\partial}] = -i\partial^*.$$

┘

*Proof:* The second one follows from the first because  $\omega$  is a real form. For the first, notice only first derivation are involved, so by using the Kähler normal coordinate, it suffice to prove for  $\mathbb{C}^n$ , and this is by [Complex Geometry 石亚龙 P61].  $\square$

**Cor. (16.10.3.5).**

$$[\Lambda, d^c] = d^*, \quad [\Lambda, d] = -d^{c*}.$$

┘

**Prop. (16.10.3.6).**  $\Delta_d$  commutes with both  $L$  and  $\Lambda$ .

┘

*Proof:*  $L$  commutes with  $d$  because  $\omega$  is closed, so taking adjoints,  $\Lambda$  commutes with  $d^*$ . Now by Kähler identities,

$$\Lambda\Delta_d = \Lambda(dd^* + d^*d) = -d^{c*}d^* + dd^*\Lambda - dd^{*c} + d^*d\Lambda = \Delta_d\Lambda.$$

So taking adjoints,  $\Delta_d$  also commutes with  $L$ .  $\square$

**Prop. (16.10.3.7).** In the Kähler case,  $\Delta_\partial = \Delta_{\bar{\partial}} = \frac{1}{2}\Delta_d$ .

┘

*Proof:*

$$\Delta_d = (\partial + \bar{\partial})(\partial^* + \bar{\partial}^*) + (\partial^* + \bar{\partial}^*)(\partial + \bar{\partial}) = \Delta_\partial + \Delta_{\bar{\partial}} + (\partial\bar{\partial}^* + \bar{\partial}^*\partial) + (\bar{\partial}\partial^* + \partial^*\bar{\partial})$$

So it suffice to prove  $\partial\bar{\partial}^* + \bar{\partial}^*\partial = 0$  (so  $\bar{\partial}\partial^* + \partial^*\bar{\partial} = 0$  by conjugation), and  $\Delta_\partial = \Delta_{\bar{\partial}}$ . For the first, use Kähler identities, then

$$i(\partial\bar{\partial}^* + \bar{\partial}^*\partial) = \partial[\Lambda, \partial] + [\Lambda, \partial]\partial = 0$$

For the second, using Kähler identities,

$$i\Delta_{\bar{\partial}} = \bar{\partial}[\Lambda, \partial] + [\Lambda, \partial]\bar{\partial} = \bar{\partial}\Lambda\partial + \partial\bar{\partial} - \Lambda\bar{\partial}\partial - \partial\Lambda\bar{\partial}$$

and the same is miraculous true for  $\Delta_\partial$ , so the result is true.  $\square$

## 4 Hodge Theory

**Thm. (16.10.4.1)**[Hodge Decomposition for compact Kähler-Manifolds]. For a compact Kähler manifold  $X$ ,

$$H_{\text{dR}}^r(X, \mathbb{C}) = \bigoplus_{p+q=r} H_{\bar{\partial}}^{p,q}(X) \cong \bigoplus_{p+q=r} H^q(X, \Omega^p)$$

and  $\overline{H_{\bar{\partial}}^{p,q}(X)} \cong H_{\bar{\partial}}^{q,p}(X)$ . Moreover, this decomposition doesn't depends on the Kähler metric.  $\square$

*Proof:* (16.10.3.7) shows that  $\Delta_d$  maps  $A^{p,q}$  to  $A^{p,q}$ , so  $\mathcal{H}_d^{p+q} \cap A^{p,q} = H_{\bar{\partial}}^{p,q}(X)$ . The last assertion is seen using the  $\Delta_d$  definition.

If chosen two different Kähler metric  $g, g'$ , there  $\mathcal{H}^{p,q}(X, g) \cong H^{p,q}(X) \cong H^{p,q}(X, g')$ . If  $\alpha, \alpha'$  be  $g, g'$   $\bar{\partial}$ -harmonic respectively, so by definition  $\alpha - \alpha' = \bar{\partial}\gamma$  for some  $\gamma$ , and they are both  $d$ -harmonic, so  $d\bar{\partial}\gamma = 0$ , and  $\bar{\partial}\gamma$  is  $g$ -orthogonal to  $\mathcal{H}^k(X, g)$  by Hodge decomposition for  $\bar{\partial}$  with metric  $g$ , so by Hodge theorem for  $d$  with metric  $g$ ,  $\partial\gamma$  is  $d$ -exact, so  $[\alpha] = [\alpha']$ .  $\square$

**Cor. (16.10.4.2).** Betti number  $b_r = \sum_{p+q=r} h^{p,q}$ ,  $h^{p,q} = h^{q,p}$ . In particular,  $b_{2k+1}$  is always even.  $\lrcorner$

**Cor. (16.10.4.3)[Holomorphic Forms on Kähler Manifolds are Closed].**  $\mathcal{H}_{\bar{\partial}}^{p,0}(X) = H^0(X, \Omega^p)$ .

Now a  $(p, 0)$ -form is automatically  $\bar{\partial}^*$ -closed, so it is  $\bar{\partial}$ -harmonic iff it is holomorphic. So we conclude any holomorphic  $p$ -form on a Kähler manifold is  $d$ -closed, even  $d$ -harmonic.  $\lrcorner$

**Lemma (16.10.4.4) [ $\partial\bar{\partial}$ -lemma].** A closed differential form  $\eta$  on a compact Kähler manifold  $M$  is  $d$ -exact iff it is  $\partial$ -exact iff it is  $\bar{\partial}$ -exact iff it is  $\partial\bar{\partial}$ -exact.  $\lrcorner$

*Proof:* Now  $\Delta_d, \Delta_{\bar{\partial}}, \Delta_{\partial}$  are all the same, By Hodge theorem, it suffice to prove, if a form is orthogonal to  $\mathcal{H}^{p,q}(X)$ , then it is  $\partial\bar{\partial}$ -exact (this implies other exactness).

Noe  $\eta$  is  $d$ -closed hence  $\partial$  and  $\bar{\partial}$ -closed, then  $\eta = \partial\gamma$  for some  $\gamma$ , and then  $\gamma = \bar{\partial}\beta + \bar{\partial}^*\beta' + \beta''$  for  $\beta''$  harmonic. So  $\eta = \partial\bar{\partial}\beta + \partial\bar{\partial}^*\beta'$ , and then  $\bar{\partial}\eta = \bar{\partial}\partial\bar{\partial}^*\beta = 0$ , but then inner product with  $\partial\beta$  shows  $\bar{\partial}^*\partial\beta = 0$ , so  $\eta = \partial\bar{\partial}\beta$ .  $\square$

**Cor. (16.10.4.5)[Kodaira-Serre Duality].** By (16.7.4.15), For a Hermitian line bundle over a compact Hermitian complex manifold  $X$ , from Hodge theorem and (16.9.5.2), we get

$$H^p(X, \Omega^q(E)) \cong H^{n-p}(X, \Omega^{n-q}(E^*))$$

induced by  $\bar{*}_E$  and  $\bar{*}_{E^*}$ . Moreover, there is a perfect pairing

$$H^p(X, \Omega^q(E)) \times H^{n-p}(X, \Omega^{n-q}(E^*)) \rightarrow \mathbb{C}$$

induced by

$$\mathcal{H}^{p,q}(X, E) \times \mathcal{H}^{n-p, n-q}(X, E^*) \rightarrow \mathbb{C} : (\alpha, \beta) \mapsto \int_X \alpha \wedge \bar{*}_E \beta$$

In fact,  $\int_X \alpha \wedge \bar{*}_E \alpha = \|\alpha\|^2 \neq 0$ .  $\lrcorner$

**Prop. (16.10.4.6).** Holomorphic 1-forms on a compact complex surface is closed. ?  $\lrcorner$

**Prop. (16.10.4.7)[Hard Lefschetz Theorem].** For a compact Kähler manifold  $M$ , the map

$$L^k : H^{n-k}(M) \rightarrow H^{n+k}(M) \quad (16.10.3.2)$$

is an isomorphism, (notice it is defined because  $L$  commutes with  $\Delta_d$  (16.10.3.6)).

Define the **primitive cohomology class**  $H_{\text{prm}}^{n-k}(M) = \ker(L^{k+1}|_{H^{n-k}})$ , then

$$H^m(M) = \oplus_k L^k H_{\text{prm}}^{m-2k}(M).$$

$\lrcorner$

*Proof:* Cf. [Griffith/Harris P122], using representation theory of  $\mathfrak{sl}_2$ .  $\square$

**Thm. (16.10.4.8)[Hodge-Riemann Bilinear Relation].** Let  $(X, \omega)$  be a Kähler manifold of dimension  $n$ , then for  $k \leq n$ , we can define a Hermitian form

$$H(\alpha, \beta) = i^k \int_X \omega^{n-k} \wedge \alpha \wedge \beta = i^k \langle L^{n-k} \alpha, \beta \rangle$$

on  $H^k(X; \mathbb{R})$ . Then it satisfies:

- The Hodge decomposition (16.10.4.1) is orthogonal for  $H$ .

- If  $\alpha \neq 0 \in H_{\text{prim}}^{p,q}(X)$ , then

$$i^{p-q-k}(-1)^{\frac{k(k-1)}{2}}H(\alpha) > 0$$

┘

*Proof:* Cf.[Griffith/Harris] or [Complex Geometry Daniel P138] or[Hodge Theory, Chap6.3.2].  $\square$

**Cor. (16.10.4.9).** For a compact Kähler manifold of complex dimension  $2m$ ,

$$\text{sgn}(X) = \sum_{p,q=0}^m (-1)^p h^{p,q}(m)$$

┘

*Proof:* Cf.[Complex Geometry Daniel P140].  $\square$

**Prop. (16.10.4.10) [Hirzebruch-Riemann-Roch].** By(16.7.4.8), for a  $n$ -dimensional complex line bundle  $L$  over a compact Kähler manifold  $M$ ,

$$\chi(M, L) = \int_M [\text{ch}(E)\text{td}(T^{1,0}M)]_n.$$

Where  $\chi(M, L) = \sum_{q=0}^n (-1)^q \dim H^q(M, E)$ ,  $\text{ch}$  is the Chern character(16.7.5.5) and  $\text{td}(T^{1,0}M)$  is the Todd polynomial, i.e. Taylor expansion of  $\prod_{i=1}^r \frac{t_i}{1 - e^{-t_i}}$  in terms of the symmetric polynomial, applied to  $c_i(T^{1,0}M)$ .  $\square$

**Cor. (16.10.4.11) [Riemann-Roch].** By(16.7.4.9), for a complex vector bundle  $E$  over a Riemann surface  $M$ , let  $\deg E = \int_M c_1(E)$ , then

$$\chi(M, E) = H^0(M, E) - \dim H^1(M, E) = \deg E + \text{rk}(E)(1 - g).$$

┘

**Cor. (16.10.4.12).** For other examples of corollaries of Hirzebruch-Riemann-Roch theorem, Cf.[Complex Geometry P232].  $\square$

## 5 Complex Tori

**Def. (16.10.5.1) [Complex Tori].** A **complex torus** is a pointed complex manifold isomorphic to the complex manifold  $V/\Lambda$ , where  $V$  is a f.d. vector space over  $\mathbb{C}$  and  $\Lambda$  is a complete lattice in  $V$ .  $\square$

**Prop. (16.10.5.2).** Let  $X = V/\Lambda, X' = V'/\Lambda'$  be complex tori, then any  $\mathbb{C}$ -linear map  $\alpha : V \rightarrow V'$  s.t.  $\alpha(\Lambda) \subset \Lambda'$  defines a holomorphic map  $X \rightarrow X'$  sending 0 to 0. And any holomorphic map  $X \rightarrow X'$  sending 0 to 0 is of this form.  $\square$

*Proof:* Any  $\varphi : X \rightarrow X'$  lifts to a continuous map  $\psi : V \rightarrow V'$ , and it is holomorphic because the morphisms  $V \rightarrow X, V' \rightarrow X'$  are locally biholomorphic,  $\psi$  is also holomorphic. For any  $\omega \in \Lambda$ ,  $\psi(z + \omega) - \psi(z)$  has value in  $\Lambda'$  for any  $z$ , so  $\psi(z + \omega) = \psi(z) + a(\omega)$ . From here it is easy to see that  $\psi$  is linear.  $\square$

**Def. (16.10.5.3) [Riemann Pairs].** A **Riemann pair** is a pair  $(\Lambda, J)$  where  $\Lambda$  is a finite  $\mathbb{Z}$ -module of finite rank, and  $J$  is a complex structure on  $\Lambda \otimes \mathbb{R}$ . A homomorphism of Riemann pairs is a group homomorphism  $\Lambda \rightarrow \Lambda'$  that preserves the complex structure.  $\lrcorner$

**Prop. (16.10.5.4) [Riemann Pairs and Abelian Varieties].** There is an equivalence of the category of Riemann pairs with  $\mathcal{AbVar}/\mathbb{C}$  by

$$(\Lambda, J) \mapsto (\Lambda \otimes \mathbb{R})/\Lambda.$$

 $\lrcorner$ 

*Proof:* It is fully faithful by (16.10.5.2), and it is clearly essentially surjective.  $\square$

**Prop. (16.10.5.5) [Cohomology of Complex Tori].** For any complex torus  $X = V/\Lambda$ ,  $H_1(X, \mathbb{Z}) \cong \Lambda$ , so  $H^1(X, \mathbb{Z}) \cong \text{Hom}(\Lambda, \mathbb{Z})$ , and by Künneth formula,

$$H^n(X, \mathbb{Z}) \cong \wedge^n H^1(X, \mathbb{Z}) \cong \wedge^n \text{Hom}(\Lambda, \mathbb{Z}).$$

Then

$$H^n(X, \mathbb{C}) \cong \wedge^n \text{Hom}_{\mathbb{R}}(V, \mathbb{C}) \cong \wedge^n (\text{Hom}_{\mathbb{C}}(V, \mathbb{C}) \oplus \text{Hom}_{\mathbb{C}}(\bar{V}, \mathbb{C})) = \bigoplus_{p+q=n} \wedge^p V^* \otimes \wedge^q \bar{V}^*$$

and

$$H_1(X, \mathbb{C}) \cong \Lambda \otimes_{\mathbb{Z}} \mathbb{C} \cong V \otimes_{\mathbb{R}} \mathbb{C} \cong V \otimes \bar{V} = \text{Lie}(X) \oplus \overline{\text{Lie}(X)}.$$

 $\lrcorner$ 

**Cor. (16.10.5.6) [Complex Tori are Kähler].** A complex torus (16.10.5.1)  $X = V/\Lambda$  is a Kähler manifold, and  $H^2(X, \mathbb{R}) \cong \wedge^2 \text{Hom}_{\mathbb{R}}(V, \mathbb{R})$ , by (16.10.5.5).  $\lrcorner$

**Prop. (16.10.5.7) [Hodge-Theory of Complex Tori].** Let  $X = V/\Lambda$  be a complex torus, as  $X$  is Kähler (16.10.5.6), there is a canonical decomposition

$$H_{\text{dR}}^n(X, \mathbb{C}) \cong \bigoplus_{p+q=n} H^q(X, \Omega^p)$$

by (16.10.4.1). Then this decomposition corresponds to the decomposition in (16.10.5.5) via the isomorphism  $H_{\text{dR}}^n(X, \mathbb{C}) \cong H^n(X, \mathbb{C})$ . In particular, there is a canonical isomorphism

$$H^q(X, \Omega^p) \cong \wedge^p V^* \otimes \wedge^q \bar{V}^*.$$

In particular,

$$H^1(X, \mathcal{O}_X) \cong \bar{V}^*.$$

 $\lrcorner$ 

*Proof:*  $\square$

**Def. (16.10.5.8) [Dual Complex Tori].** Let  $X = V/\Lambda$  be a complex torus with a Riemann form, then we can define the **dual complex torus** as

$$X^\vee = V^*/\Lambda^*$$

where  $V^* = \text{Hom}_{\mathbb{C}}(V, \mathbb{C})$  and  $\Lambda^* = \{f \in V^* \mid f(\Lambda) \subset \mathbb{Z}\}$ .  $\lrcorner$

**Riemann Forms**

**Prop. (16.10.5.9) [Riemann Forms].** For a complex torus  $V/\Lambda$ , it is projective iff there exists a **Riemann form** on  $V$ , which is an alternating bilinear form  $\omega : V \times V \rightarrow \mathbb{R}$  that:

- $\omega(iu, iv) = \omega(u, v)$ .
- $\omega(v, iv) > 0$  for  $v \neq 0$ .
- $\omega(u, v) \in \mathbb{Z}$  for  $u, v \in \Lambda$ .

Notice  $\omega$  is clearly non-degenerate. ┘

*Proof:* Use (16.10.5.6). The conditions are just equivalent to  $\omega$  being an integral positive Kähler form (16.10.8.6). ? How to interpret? □

**Cor. (16.10.5.10).** Notice these conditions are equivalent to the fact the Hermitian form

$$\lambda(x, y) = \omega(ix, y) + i\omega(x, y)$$

is Hermitian and positive definite. ┘

*Proof:* □

**Cor. (16.10.5.11) [Riemann Relations].** Let  $X = V/\Lambda$  be a complex torus of dimension  $g$ . Choose a complex basis  $e_1, \dots, e_g$  of  $V$  and a  $\mathbb{Z}$ -basis  $u_1, \dots, u_{2g}$  of  $\Lambda$ . Let  $\Pi \in \text{Mat}(n \times 2n, \mathbb{C})$  be the basis of  $(u_1, \dots, u_{2g})$  in  $(e_1, \dots, e_g)$ , so  $X \cong \mathbb{C}^g / \Pi \mathbb{Z}^{2g}$ . Then  $X \in \mathcal{AbVar}/\mathbb{C}$  iff there exists a non-degenerate skew-symmetric matrix  $A \in \text{GL}(2g, \mathbb{Z})$  satisfying the **Riemann relations**

$$\Pi A^{-1} \Pi^t = 0, \quad i\Pi A^{-1} \bar{\Pi}^t \in \text{Pos}(g, \mathbb{C}).$$

┘

*Proof:* By (16.10.5.9), it suffices to show that if  $\omega$  is the alternating form on  $\Lambda$  corresponding to  $A$ , then these two conditions are equivalent to the condition that  $\omega$  is a Riemann form.

Notice that  $E(\Pi x, \Pi y) = x^t A y$  for any  $x, y \in \mathbb{R}^{2g}$ , and if

$$I = \begin{bmatrix} \Pi \\ \bar{\Pi} \end{bmatrix}^{-1} \begin{bmatrix} i\mathbf{1} & \\ & -i\mathbf{1} \end{bmatrix}^{-1} \begin{bmatrix} \Pi \\ \bar{\Pi} \end{bmatrix},$$

then

$$\begin{bmatrix} \Pi \\ \bar{\Pi} \end{bmatrix} I = i \begin{bmatrix} \Pi \\ -\bar{\Pi} \end{bmatrix},$$

so  $i\Pi = \Pi I$ . Then  $\omega(iu, iv) = \omega(u, v)$  is equivalent to  $I^t A I = A$ , or equivalently

$$\begin{bmatrix} i\mathbf{1} & \\ & -i\mathbf{1} \end{bmatrix} \left( \begin{bmatrix} \Pi \\ \bar{\Pi} \end{bmatrix} A^{-1} \begin{bmatrix} \Pi \\ \bar{\Pi} \end{bmatrix}^t \right)^{-1} \begin{bmatrix} i\mathbf{1} & \\ & -i\mathbf{1} \end{bmatrix} = \left( \begin{bmatrix} \Pi \\ \bar{\Pi} \end{bmatrix} A^{-1} \begin{bmatrix} \Pi \\ \bar{\Pi} \end{bmatrix}^t \right)^{-1}.$$

By comparing blocks, this is equivalent to  $\Pi A^{-1} \Pi^t = 0$ .

And if  $x, y \in \mathbb{R}^{2g}$  and  $u = \Pi x, v = \Pi y$ , using the fact  $\Pi A^{-1} \Pi^t = 0$ ,

$$\omega(iu, u) = x^t I^t A x = \begin{bmatrix} u \\ \bar{u} \end{bmatrix}^t \begin{bmatrix} i\mathbf{1} & \\ & -i\mathbf{1} \end{bmatrix} \left( \begin{bmatrix} \Pi \\ \bar{\Pi} \end{bmatrix} A^{-1} \begin{bmatrix} \Pi \\ \bar{\Pi} \end{bmatrix}^t \right)^{-1} \begin{bmatrix} v \\ \bar{v} \end{bmatrix}$$

$$\begin{aligned}
&= \begin{bmatrix} u \\ \bar{u} \end{bmatrix}^t \begin{bmatrix} 0 & i(\bar{\Pi}A^{-1}\Pi^t)^{-1} \\ i(\Pi A^{-1}\bar{\Pi}^t)^{-1} & 0 \end{bmatrix} \begin{bmatrix} v \\ \bar{v} \end{bmatrix} \\
&= iu^t(\bar{\Pi}A^{-1}\Pi^t)^{-1}\bar{v} - i\bar{u}^t(\Pi A^{-1}\bar{\Pi}^t)^{-1}v
\end{aligned}$$

And because  $\omega$  is alternating,

$$u^t(\bar{\Pi}A^{-1}\Pi^t)^{-1}\bar{u} + \bar{u}^t(\Pi A^{-1}\bar{\Pi}^t)^{-1}u = 0,$$

so

$$\omega(iu, u) = 2\bar{u}i(\bar{\Pi}A^{-1}\Pi^t)^{-1}\bar{u},$$

and it is positive definite iff  $i\Pi A^{-1}\bar{\Pi}^t \in \text{Pos}(n, \mathbb{C})$ .  $\square$

## 6 Positivity

**Def. (16.10.6.1) [Positive Line Bundle].** A 2-form  $\omega$  on a Hermitian complex manifold  $M$  is called **positive** iff  $\omega(u, Ju) \geq 0$  for  $u \neq 0 \in TM$ , which is equivalent to  $-i\omega(v, \bar{v}) > 0$  for all  $v \in T^{1,0}X$ .

A holomorphic vector bundle is called **(Griffith-)positive** iff there exists a Hermitian metric on it that the curvature form  $\Omega$  for the Chern connection (16.9.5.13) satisfies  $h(\Omega(s), s)(v, \bar{v}) > 0$  for all  $s \in E$  and  $v \in T^{1,0}X$ .

The pullback of a positive line bundle along an immersion is positive.  $\lrcorner$

**Prop. (16.10.6.2) [Positivity on Kähler Manifolds].** On a compact Kähler manifold, being positive is a topological property for line bundles. It is equivalent to the first Chern class of  $L$  can be represented by a positive form in  $H_{dR}^2(M)$ .  $\lrcorner$

*Proof:*  $c_1(L) = [\frac{i}{2\pi}\Omega]$ , so one direction is trivial, and if  $c_1(L) = [\frac{i}{2\pi}\theta]$ , choose an arbitrary Hermitian metric  $h$  on  $L$ , then by  $\partial\bar{\partial}$ -lemma (16.10.4.4),  $\theta = \Omega + \bar{\partial}\partial\rho$  for some smooth function  $\rho$ . Then  $e^\rho h$  has  $\Omega = \theta$  by formula (16.9.5.14).  $\square$

**Cor. (16.10.6.3).** On a compact Kähler manifold, if  $L$  is positive, then for any other Hermitian line bundle  $L'$ ,  $kL + L'$  is positive.  $\lrcorner$

**Prop. (16.10.6.4).** The hyperplane line bundle  $\mathcal{O}(1)$  (16.9.5.9) is positive.  $\lrcorner$

*Proof:* The hyperplane line bundle is dual to the tautological line bundle. The metric on the tautological line bundle is given by locally  $g_i = \frac{1}{|z_i|^2} \sum |z_i|^2$ . It is compatible with the transition map, and then by (16.9.5.14), the Chern curvature is

$$\bar{\partial}\partial\left(\frac{1}{|z_i|^2} \sum |z_i|^2\right) = \bar{\partial}\partial\left(\sum |z_i|^2\right).$$

So by (16.3.4.6) the curvature of the hyperplane line bundle times  $i$  is just the Fubini-Study metric form (16.10.1.6), so it is positive.  $\square$

**Prop. (16.10.6.5).** For  $\tilde{X} \rightarrow X$  the blowing-up of  $X$  at a point  $x$ , If  $L$  is a positive line bundle on  $X$ , then for any integer  $n$ , there exists a  $k > 0$  that  $\pi^*L^k - nE$  is a positive line bundle on  $\tilde{X}$ , where  $E$  is the exceptional divisor.  $\lrcorner$

*Proof:* Involves explicit metric calculation, Cf. [Kodaira Embedding Theorem P11] and [Complex Geometry P249]..  $\square$

## 7 Kodaira Vanishing Theorem

**Prop. (16.10.7.1) [Nakano Identities].** For a holomorphic vector bundle over a compact Kähler manifold  $(M, \omega)$  with Hermitian metric  $h$ , introduce operators  $L$  and  $\Lambda$  as before. If we denote the  $(1, 0)$  and  $(0, 1)$ -part of the Chern connection on  $E$  by  $D'$  and  $D'' = \bar{\partial}$ , then

$$[\Lambda, \bar{\partial}] = -iD'^*, \quad [\Lambda, D'] = i\bar{\partial}^*$$

┘

*Proof:* The question is local, choose normal coordinate frame at  $x$  (16.9.5.16), then by the formula of Chern connection (16.9.5.14),  $\nabla_E = d + A$ ,  $A(x) = 0$ , and  $\nabla_{E^*} = d + B$ ,  $B(x) = 0$ . so

$$[\Lambda, \bar{\partial}_E] + iD'^* = [\Lambda, \partial] + i\partial^* + [\Lambda, A^{0,1}] + iB^{0,1}$$

where the usual Kähler identities (16.10.3.4) are used. Then it is zero when evaluated at  $x$ , Cf. [Demailly Complex Analytic and Differential Geometry P329].  $\square$

**Cor. (16.10.7.2) [Bochner-Kodaira-Nakano Identity].**

$$\Delta_{\bar{\partial}, E} - \Delta_{D', E} = i[\Omega, \Lambda]$$

┘

*Proof:*

$$-i\Delta_{D', E} = D'[\Lambda, \bar{\partial}] + [\Lambda, \bar{\partial}]D' = D'\Lambda\bar{\partial} - D'\bar{\partial}\Lambda + \Lambda\bar{\partial}D' - \bar{\partial}\Lambda D'$$

and similar calculation for  $i\Delta_{\bar{\partial}, E}$ , so

$$i\Delta_{\bar{\partial}, E} - i\Delta_{D', E} = \Lambda(\bar{\partial}D' + D'\bar{\partial}) - (\bar{\partial}D' + D'\bar{\partial})\Lambda = -[\Omega, \Lambda].$$

$\square$

**Prop. (16.10.7.3) [Kodaira-Akizuki-Nakano Vanishing Theorem].** If  $\mathcal{L}$  is a positive line bundle on a compact Kähler manifold  $M$ , then

$$H^p(M, \Omega^q(\mathcal{L})) = 0$$

for  $p + q > n$ . In particular,  $H^p(M, \mathcal{K}_M \otimes \mathcal{L}) = 0$  for  $p > 0$ .  $\square$

*Proof:* By Hodge theorem (16.7.4.13), it suffice to prove there are no harmonic  $(p, q)$ -forms  $\in \mathcal{H}^{p,q}(X, L)$  on  $L$ .

As  $i\Omega = \omega$  is positive, we may endow  $M$  with the metric  $\omega$ , then by (16.10.7.2) and (16.10.3.3),  $\Delta_{\bar{\partial}} - \Delta_{D'} = [L, \Lambda] = p + q - n$  on  $A^{p,q}$ .

So if  $s \in \mathcal{H}^{p,q}(X, L)$ , then  $(\Delta_{\bar{\partial}}s - \Delta_{D'}s, s) = (p + q - n)||s||^2 \geq 0$ , but  $(\Delta_{\bar{\partial}}s - \Delta_{D'}s, s) = -(\Delta_{D'}s, s) = -||D's||^2 - ||D'^*s||^2 \leq 0$ , so  $s = 0$ .  $\square$

**Cor. (16.10.7.4) [Serre's Theorem].** Let  $\mathcal{L}$  be a positive line bundle on a compact complex Kähler manifold  $M$ , then for any holomorphic vector bundle  $\mathcal{E}$ , for  $m$  large,  $H^q(M, \mathcal{L}^m \otimes \mathcal{E}) = 0$ .  $\square$

*Proof:* Same notation as in the proof of (16.10.7.3), choose Hermitian structure on  $E$  and  $L$  and their Chern connections by  $\nabla_E, \nabla_L$ , the corresponding Chern connection on  $E \otimes L^m$  is denoted by  $\nabla$ , and make sure  $\frac{i}{2\pi}F_{\nabla_L}$  is the Kähler form  $\omega$ , then for any harmonic form  $\alpha \in \mathcal{H}^{p,q}(X, E \otimes L^m)$ , by (16.10.7.2),  $\frac{i}{2\pi}([\Lambda, F_{\nabla}](\alpha), \alpha) \geq 0$ , but  $\frac{i}{2\pi}F_{\nabla} = \frac{i}{2\pi}F_{\nabla_E} + m\omega$ , so

$$0 \leq \frac{i}{2\pi}([\Lambda, F_{\nabla_E}](\alpha), \alpha) + m(n - p - q)\|\alpha\|^2$$

Notice  $|([\Lambda, F_{\nabla_E}](\alpha), \alpha)|$  has a bound by Schwartz inequality, then if  $p + q > n$  and  $m$  sufficiently large,  $\alpha$  must be 0. In this case  $\mathcal{H}^{p,q}(X, E \otimes L^m) = 0$ , but  $\mathcal{H}^{0,q}(X, \mathcal{K}_X \otimes E \otimes L^m) \subset \mathcal{H}^{n,q}(X, E \otimes L^m)$ , so it is 0. Now we've proved  $H^q(X, \mathcal{K}_X \otimes E \otimes L^m) = 0$  for any  $E$  if  $m$  is large. But  $E$  is arbitrary, so the conclusion is true.  $\square$

**Cor. (16.10.7.5) [Grothendieck's Lemma].** Every holomorphic vector bundle  $E$  over  $\mathbb{CP}^1$  is uniquely isomorphic to a finite direct sum of  $\mathcal{O}(a_i)$ .  $\lrcorner$

*Proof:* If  $E$  has rank 1, this is the content of (16.9.5.10), so use induction on rank of  $E$ . Choose a maximal  $a$  that  $\text{Hom}(\mathcal{O}(a), E) = H^0(\mathbb{CP}^1, E(-a)) \neq 0$ . This  $a$  exists because Serre's Theorem (16.10.7.4) shows that  $H^1(\mathbb{CP}^1, E(-a)) = 0$  for  $a$  sufficiently small, and Riemann-Roch (16.7.4.9) shows that  $\chi(\mathbb{CP}^1, E(-a)) = \deg E + \text{rk}(E)(1 - a)$  is positive for  $a$  sufficiently small, so  $H^0(\mathbb{CP}^1, E(-a)) \neq 0$ . Conversely, if  $a$  is sufficiently large, then  $H^0(\mathbb{CP}^1, E(-a)) \cong H^1(\mathbb{CP}^1, E^*(a - 2)) = 0$  (Notice  $\mathcal{K}_{\mathbb{CP}^n} = \mathcal{O}(-n - 1)$ ).

So now there is an exact sequence of sheaves

$$0 \rightarrow \mathcal{O}(a) \xrightarrow{s} E \rightarrow E_1 \rightarrow 0$$

I claim  $E_1$  is also a vector bundle, because  $s$  never vanishes, otherwise if it vanishes at some  $x$ , then we can divide by a linear factor  $s_x \in H^0(\mathbb{CP}^1, \mathcal{O}(1))$  to get a map  $\mathcal{O}(a + 1) \rightarrow E$ , contradicting the maximality. So by induction  $E_1 = \oplus \mathcal{O}(a_i)$ , then I claim  $a_i \leq a$ , because otherwise  $H^0(\mathbb{CP}^1, E_1(-a - 1)) \neq 0$ , and by the exact sequence  $0 \rightarrow \mathcal{O}(-1) \rightarrow E(-a - 1) \rightarrow E_1(-a - 1) \rightarrow 0$ ,  $H^0(\mathbb{CP}^1, E(-a - 1)) \neq 0$ , contradiction.

Then we want to show the above sequence splits, this is equivalent to

$$0 \rightarrow E_1^*(a) \rightarrow E^*(a) \rightarrow \mathcal{O} \rightarrow 0$$

splits, and this follows from the fact  $H^1(\mathbb{CP}^1, E_1^*(a)) = H^1(\mathbb{CP}^1, \oplus \mathcal{O}(a - a_i)) = 0$ , by Serre duality. So there is a section lifting  $\mathcal{O} \rightarrow E^*(a)$ , which splits the sequence.  $\square$

**Prop. (16.10.7.6) [Weak Lefschetz Theorem].** Let  $X$  be a compact Kähler manifold and  $Y$  be a submanifold that the line bundle  $\mathcal{L}(Y)$  is positive, then the canonical restriction map  $H^k(X, \mathbb{C}) \rightarrow H^k(Y, \mathbb{C})$  is isomorphism for  $k \leq n - 2$  and injective for  $k = n - 1$ .  $\lrcorner$

*Proof:* In fact, using Hodge decomposition, it suffices to prove on the level of  $H^q(X, \Omega_X^p)$ . Tensoring the exact sequence

$$0 \rightarrow \mathcal{O}_X(-Y) \rightarrow \mathcal{O}_X \rightarrow i_*i_Y^*\mathcal{O}_X \rightarrow 0$$

with  $\Omega_X^p$  and taking the cohomology. By Serre duality and Kodaira vanishing (16.10.7.3), the map  $H^q(X, \Omega_X^p) \rightarrow H^q(X, \Omega^p i_*i_Y^*\mathcal{O}_X)$  is isomorphism for  $p + q < n - 1$  and injection for  $p + q = n - 1$ .

Next consider the exact sequence  $0 \rightarrow TY \rightarrow TX \rightarrow \mathcal{N}_{Y/X} \rightarrow 0$ . By (7.5.1.26) there is an exact sequence

$$0 \rightarrow \wedge^p TY \rightarrow \wedge^p TX|_Y \rightarrow \wedge^{q-1} TY \mathcal{N}_{Y/X} \rightarrow 0$$

Taking dual and applying adjunction formula(16.9.1.3), it becomes:

$$0 \rightarrow \Omega_Y^{q-1} \otimes \mathcal{O}(-N) \rightarrow \Omega_X^q|_Y \rightarrow \Omega_Y^q \rightarrow 0$$

Taking cohomology and use Serre duality and Kodaira vanishing as before, the result follows, and the composition is also true.  $\square$

**Remark(16.10.7.7).** There is a topological proof of weak Lefschetz theorem in [Bott, On a Theorem of Lefschetz].  $\lrcorner$

## 8 Kodaira Embedding

**Prop.(16.10.8.1)[Kodaira map].** For a holomorphic line bundle  $L$  on a compact complex manifold  $M$ , if  $s_0, \dots, s_n$  be a basis of  $H^0(X, L)$ , we try to define a map from  $M$  to  $\mathbb{CP}^n : x \rightarrow [s_0(x), \dots, s_n(x)]$ . This is independent of the change of coordinates because  $g_{\alpha\beta}$  is invertible, and it is definable iff  $L$  is basepoint-free. This map is holomorphic where it is definable.  $\lrcorner$

**Def.(16.10.8.2)[Ample Holomorphic Line Bundles].** A holomorphic line bundle  $\mathcal{L}$  on a compact complex manifold  $X$  is called a

- **semi-ample holomorphic line bundle** iff for  $m$  large,  $\mathcal{L}^m$  is basepoint-free.
  - **very ample holomorphic line bundle** iff  $L$  is basepoint-free and the Kodaira map  $\iota_L : X \rightarrow \mathbb{CP}^N$  is a holomorphic embedding.
  - **ample holomorphism line bundle** iff for  $m$  large,  $L^m$  is very ample.
- $\lrcorner$

**Lemma(16.10.8.3)[Cohomological Method for Very Ampleness].** For the above Kodaira map to be a holomorphic embedding, it suffice to show that the map is definable, injective and surjective on cotangent space. For these, it is equivalent to  $H^0(X, L) \rightarrow L_x$  surjective,  $H^0(X, L) \rightarrow L_x \oplus L_y$  surjective, and  $L \otimes \mathcal{I}_x \rightarrow L_x \otimes T^{1,0*}(X)_x$  surjective. And they are true if

$$H^1(X, L \otimes \mathcal{I}_x) = 0, \quad H^1(X, L \otimes \mathcal{I}_{x,y}) = 0, \quad H^1(X, L \otimes \mathcal{I}_x^2) = 0.$$

respectively.  $\lrcorner$

*Proof:* Basepoint-free at  $x$  is easily seen to be equivalent to  $H^0(X, L) \rightarrow L_x$  surjective. And there is an exact sequence of sheaves:

$$0 \rightarrow L \otimes \mathcal{I}_x \rightarrow L \rightarrow L_x \rightarrow 0$$

where  $L_x$  means the skyscraper sheaf. So  $H^1(X, L \otimes \mathcal{I}_x^2) = 0$  induces the result.

Injective is easily seen to be equivalent to  $H^0(X, L) \rightarrow L_x \oplus L_y$  surjective. And there is an exact sequence of sheaves:

$$0 \rightarrow L \otimes \mathcal{I}_{x,y} \rightarrow L \rightarrow L_x \oplus L_y \rightarrow 0$$

where  $\mathcal{I}_{x,y}$  is the sheaf of functions vanishing at  $x$  and  $y$ , and  $L_x \oplus L_y$  means the skyscraper sheaf. So  $H^1(X, L \otimes \mathcal{I}_{x,y}) = 0$  induces the result.

For the surjection on cotangent spaces, given any point  $x$ , choose a basis  $s_1, \dots, s_n$  of sections in  $H^0(X, L)$  vanishing at  $x$ , and by basepoint-free, there is a  $s_0$  not vanishing at  $x$ , then on a coordinate, the Kodaira map is given by  $x \rightarrow (s_1/s_0, \dots, s_n/s_0)$ , then it need to be checked  $d_x(s_i/s_0) = d_x(x_i)/s_0$  span  $T^{1,0*}(X)_x$ . But there are exact sequences of sheaves:

$$0 \rightarrow L \otimes \mathcal{I}_x^2 \rightarrow L \otimes \mathcal{I}_x \xrightarrow{d_x} L_x \otimes T_x^{1,0*} \rightarrow 0$$

where  $d_x$  is given by  $d_x(s \otimes f) = s(x) \otimes d_x(f)$  (by the universal property of skyscraper sheaf), it suffice to give a map  $(L \otimes \mathcal{I}_x \rightarrow L_x \otimes T_x^{1,0*})$ , notice this is independent of the coordinate because  $d_x(s_\alpha) = d_x(g_{\alpha\beta}s_\beta) = g_{\alpha\beta}d_x(s_\beta)$ , as  $s_\alpha$  vanishes at  $x$ , so this is truly a sheaf map, and its kernel is  $L \otimes \mathcal{I}_x^2$ . So  $H^1(X, L \otimes \mathcal{I}_x^2) = 0$  induces the result.  $\square$

**Prop. (16.10.8.4) [Ampleness and Positivity].** A holomorphic line bundle  $\mathcal{L}$  on a compact Kähler manifold is ample iff it is positive.  $\lrcorner$

*Proof:* If  $L$  is ample, then  $L^m$  is the pullback of the hyperplane bundle by the Kodaira map. The hyperplane line bundle is positive by (16.10.6.4), so  $L^m$  is positive with the induced metric, so  $L$  is also positive given the  $m$ -th roots of the induced metric (notice the metric of line bundle is just locally a number compatible with transition map).

Conversely, using (16.10.8.3), we want to find a  $L^k$  that  $H^1(X, L^k \otimes \mathcal{I}_x) = 0$ ,  $H^1(X, L^k \otimes \mathcal{I}_{x,y}) = 0$ ,  $H^1(X, L^k \otimes \mathcal{I}_x^2) = 0$ . First notice it suffice to prove for single points when  $k$  is sufficiently large, because the holomorphic embedding is an open property and  $X$  is compact so a sufficiently large  $k$  will suffice.

Consider the blowing-up  $\tilde{X}$  at a point  $x$ , there is a commutative diagram

$$\begin{array}{ccc} H^0(X, L^k) & \longrightarrow & L_x^k \\ \downarrow \pi^* & & \downarrow \cong \\ H^0(\tilde{X}, \pi^* L^k \otimes L_x^k) & \longrightarrow & H^0(E, \mathcal{O}_E) \otimes L_x^k \end{array}$$

The right vertical map is isomorphism as  $E \cong \mathbb{CP}^n$ , so  $H^0(E, \mathcal{O}_E) = \mathbb{C}$ . The left exact sequence is also isomorphism: it is injective because  $\pi$  is surjective, and it is surjective because: if  $\dim X = 1$ , then  $\pi = \text{id}$  so trivially true, and if  $\dim X \geq 2$ , then because  $\pi : \tilde{X} - E \cong X - \{x\}$ , any holomorphic function on  $\tilde{X}$  induces a holomorphic function on  $X - \{x\}$  and by Hartog's theorem (12.5.8.4), it comes from a holomorphic function on  $X$ .

Now the second horizontal line is part of the cohomology exact sequence of (7.5.3.15)

$$0 \rightarrow \pi^* L^k \otimes \mathcal{O}_{\tilde{X}}(-E) \rightarrow \pi^* L^k \rightarrow \pi^* L^k|_E \rightarrow 0$$

So it is reduced to prove  $H^1(\tilde{X}, \pi^* L^k \otimes \mathcal{O}(-E)) = 0$ , but by (7.8.2.8),  $\pi^* L^k - E = \pi^* L^k - E + \mathcal{K}_{\tilde{X}} - \pi^* \mathcal{K}_X - (n-1)E = \mathcal{K}_{\tilde{X}} + (\pi^* L^k - E) + \pi^*(L^k - \mathcal{K}_X)$ , and by (16.10.6.5)(16.10.6.3) the last two are positive when  $k$  is large, so the conclusion follows from Kodaira vanishing (16.10.7.3).

The proof of  $H^1(X, L^k \otimes \mathcal{I}_{x,y}) = 0$  is verbatim, just use blowing-up at two different points.

To prove  $H^1(X, L^k \otimes \mathcal{I}_x^2) = 0$ , consider the blowing-up  $\tilde{X}$  at a point  $x$ , notice there is a commutative diagram

$$\begin{array}{ccc} H^0(X, L^k \otimes \mathcal{I}_x) & \xrightarrow{d_x} & L_x^k \otimes T^{1,0*} X_x \\ \downarrow \pi^* & & \downarrow \cong \\ H^0(\tilde{X}, \pi^* L^k - E) & \longrightarrow & L_x^k \otimes H^0(E, -E) \end{array}$$

In fact this comes from the two commuting exact sequences twisted with  $\pi^* L^k$ :

$$\begin{array}{ccccccc} 0 & \longrightarrow & \pi^* \mathcal{I}_x^2 & \longrightarrow & \pi^* \mathcal{I}_x & \xrightarrow{d_x} & \pi^* T^{1,0*} X_x \longrightarrow 0 \\ & & \downarrow & & \downarrow & & \downarrow \\ 0 & \longrightarrow & \mathcal{O}(-2E) & \longrightarrow & \mathcal{O}(-E) & \longrightarrow & \mathcal{O}_E(-E) \longrightarrow 0 \end{array}$$

The second line is (7.5.3.15) and the fact a section vanishing at  $x$  lifts to a section vanishing at  $E$  thus equivalent to a section in the twisted sheaf  $- \otimes \mathcal{O}(-E)$ . These two exact sequences commutes because

Back to the commutative diagram, the above argument also shows that the first vertical map is isomorphism. To show the second vertical map is isomorphism, notice by (7.8.2.7)  $\mathcal{O}(-E)$  is just the hyperplane line bundle on  $E$ , so  $H^0(E, -E) \cong T^{1,0*}X_x$ , we need to know the vertical map is the natural map  $V^* \rightarrow H^0(\mathbb{P}(V), \mathcal{O}(1))$ . This in fact need some careful calculation using coordinates in (7.8.2.7).?

Now the map  $d_x$  is surjective iff the second horizontal map is surjective, with is part of the cohomology exact sequence of

$$0 \rightarrow \pi^* L^k \otimes \mathcal{O}_{\tilde{X}}(-2E) \rightarrow \pi^* L^k \mathcal{O}_{\tilde{X}}(-E) \rightarrow \pi^* L^k|_E \rightarrow 0$$

So it is reduced to prove  $H^1(\tilde{X}, \pi^* L^k \otimes \mathcal{O}(-wE)) = 0$ , which is by Kodaira vanishing theorem the same reason as before.  $\square$

**Cor. (16.10.8.5) [Kodaira Embedding Theorem].** If a compact complex manifold  $M$  has a positive line bundle, then it is projective.  $\lrcorner$

**Def. (16.10.8.6) [Hodge Manifolds].** A compact Kähler manifold  $X$  is projective iff it has a closed positive  $(1, 1)$ -form  $\omega$  whose cohomology class  $[\omega]$  is rational (resp. integral) (i.e. in  $H^2(X, \mathbb{Q})$  (resp.  $H^2(X, \mathbb{Z})$ )). In fact, a compact Kähler manifold with a Hodge metric is called a **Hodge manifold**. A pair  $(X, [\omega])$  where  $X$  is a compact Kähler manifold and  $[\omega] \in H^2(X, \mathbb{Z})$  is called a **polarized manifold**.

So compact Hodge manifolds are just those compact Kähler manifolds together with an ample line bundle class.  $\lrcorner$

*Proof:* if  $\omega$  is rational, then a multiple of it is integral, then there is a  $L$  that  $c_1(L) = k[\omega]$  by Lefschetz theorem on  $(1, 1)$ -forms (16.11.5.6), so  $L$  is positive by (16.10.6.2), which is equivalent to ampleness by (16.10.8.4), so  $X$  is projective. Conversely, the Chern class of the pullback of the hyperplane line bundle is positive and rational (16.10.6.4) (16.11.5.6).  $\square$

**Cor. (16.10.8.7) [Compact Riemann Surfaces are Hodge Manifolds].** A **Riemann surface** is a complex variety of dimension 1. Any compact Riemann surface is a compact Hodge manifold.  $\lrcorner$

*Proof:* This is because  $H^2(X, \mathbb{C}) = H^2(X, \mathbb{Q}) \otimes_{\mathbb{Q}} \mathbb{C} \cong \mathbb{C}$  is generated by the metric form  $\omega$ , so there must be a multiple of  $\omega$  that is integral.  $\square$

**Cor. (16.10.8.8).** if  $\tilde{X}$  is the blowing-up of a Kähler manifold  $X$  at a point  $x$ , then if  $X$  is projective, then  $\tilde{X}$  is also projective, because by (16.10.6.5)  $\pi^* L^k \setminus E$  is positive for  $k$  large.  $\lrcorner$

**Cor. (16.10.8.9).** For a finite unbranched cover of compact Kähler manifolds  $\tilde{X} \rightarrow X$ ,  $\tilde{X}$  is projective iff  $X$  is projective.  $\lrcorner$

*Proof:* A positive rational closed  $(1, 1)$ -form on  $X$  pull backs to a positive rational closed  $(1, 1)$ -form on  $\tilde{X}$ , and it can even be pulled forward:  $\omega' = \sum_{y \in \pi^{-1}(x)} (\pi^{-1})^* \omega(y)$ , then it is also positive closed.

It is rational because  $\int_X \omega' \wedge \eta = \frac{1}{d} \int_{\tilde{X}} \omega \wedge \pi^* \eta$ , where  $\tilde{X} \rightarrow X$  is branched of degree  $d$ .  $\square$

**Def. (16.10.8.10) [the Kähler Cone].** For a Kähler manifold  $X$ , the **Kähler cone**  $K_X$  is defined to be the set of closed real positive  $(1, 1)$ -forms. Then  $K_X$  is an open convex cone in  $H^{1,1}(X) \cap H^2(X, \mathbb{R})$ . Then (16.10.8.6) says  $X$  is projective iff  $K_X \cap H^2(X, \mathbb{Z}) \neq 0$ .  $\lrcorner$

## 9 Fujiki Manifolds

## 16.11 Hodge Theory

### 1 Hodge Structures

Cf. [Huy05] Chap3.A, [Del71], [Hodge 2, 3, Deligne] and [Shimura Varieties, Milne].

**Def. (16.11.1.1) [Mixed Hodge Structures].** An integral **mixed Hodge structure** is given by a f.g. Abelian group  $\Lambda$  together with

- An increasing **weight filtration**  $W_\bullet$  of  $\Lambda_{\mathbb{Q}}$ .
- A decreasing **Hodge filtration**  $F^\bullet$  of  $\Lambda_{\mathbb{C}}$ .
- A bigradation  $V^{\bullet,\bullet}$  of  $\Lambda_{\mathbb{C}}$ .

such that

- For any  $k \in \mathbb{Z}$ ,  $W_k \otimes \mathbb{C} = \bigoplus_{p+q \leq k} V^{p,q}$ .
- For any  $p \in \mathbb{Z}$ ,  $F^p = \bigoplus_{r \geq p} V^{r,s}$ .
- $\overline{V^{p,q}} = V^{q,p}$ .

It is called a **pure Hodge structure** if the weight filtration  $W_\bullet$  splits over  $\mathbb{Q}$ .  $\lrcorner$

**Prop. (16.11.1.2).** For any subring  $Q \subset \mathbb{C}$ , we can naturally define morphisms between  $Q$ -mixed Hodge structures. Then integral Hodge structures form an Abelian category, denoted by  $m\text{Hdg}_{\mathbb{Q}}$ .

And it is easy to define tensor products of mixed integral Hodge structures.  $\lrcorner$

*Proof:* Cf. [Theorie de Hodge, Deligne].  $\square$

**Def. (16.11.1.3) [Integral Hodge Structures].** For  $k \in \mathbb{Z}$ , an integral **Hodge structure** of weight  $k$  is a mixed Hodge structure pure of weight  $k$ .

Equivalently, it is a f.g. free Abelian group  $\Lambda$  together with a **Hodge decomposition** of graded  $\mathbb{R}$ -vector spaces

$$\Lambda_{\mathbb{C}} = \bigoplus_{p+q=k} V^{p,q}$$

satisfying  $\overline{V^{p,q}} = V^{q,p}$ .

This is because given an integral Hodge structure of weight  $k$ , we can associate a **Hodge filtration**  $F^\bullet V : F^p V = \bigoplus_{r \geq p} V^{r,k-r}$ . It satisfies

$$V_{\mathbb{C}} = F^p \Lambda \oplus \overline{F^{k-p+1} \Lambda}$$

for any  $p$ , and for any  $p+q=k$ ,

$$V^{p,q} = F^p \Lambda \cap \overline{F^q \Lambda}.$$

Thus giving the Hodge decomposition is equivalent to giving the Hodge filtration.

The category of pure  $Q$ -Hodge structures of weight  $k$  is denoted by  $\text{Hdg}_Q^k$ .  $\lrcorner$

**Prop. (16.11.1.4) [Hodge Structure as Representations of Deligne Torus].** Giving a real representation  $h : \mathbb{S} \rightarrow \text{GL}(V)_{\mathbb{R}}$  (7.1.5.33) is equivalent to giving a bigradation  $V^{p,q}$  of  $V_{\mathbb{C}}$  s.t.  $\overline{V^{p,q}} = V^{q,p}$  by (10.2.3.23), thus equivalent to a Hodge structure.

And in this correspondence,  $V$  is pure of weight  $n$  iff  $h \circ w : \mathbb{G}_m \rightarrow \text{GL}(V)$  acts as character  $z \mapsto z^n$ .

Then for any subring  $Q \subset \mathbb{R}$ , this defines an equivalence of categories:  $\text{Rep}_Q(\mathbb{S}) \cong \text{Hdg}_Q$ .  $\lrcorner$

**Def. (16.11.1.5) [Weil Operator].** Given a Hodge structure  $(V, h)$ , the **Weil operator** is defined to be the real homomorphism  $C = h(i)$  (16.11.1.4). Equivalently,  $C$  acts by  $i^{q-p}$  on  $V^{p,q}$ .  $\perp$

**Def. (16.11.1.6) [Tate Hodge Structure].** A **Tate Hodge Structure** is the Hodge structure  $\mathbb{Z}(1)$  pure of type  $(-1, -1)$  s.t.

$$\mathbb{Z}(1) = 2\pi i\mathbb{Z} \subset \mathbb{Z}(1)_{\mathbb{C}} \cong \mathbb{C}.$$

Also denote  $\mathbb{Z}(n) = \mathbb{Z}(1)^{\otimes n}$ . In the correspondence (16.11.1.4),  $\mathbb{Z}(n)$  correspond to the representation

$$\mathbb{S} \rightarrow \mathbb{G}_m : z \mapsto (z\bar{z})^n.$$

In particular, the Weil operator is identity on a Tate Hodge structure.  $\perp$

**Def. (16.11.1.7) [Hodge Group].** For  $V \in \text{Hdg}_Q$  with the corresponding map  $\mathbb{S} \rightarrow \text{GL}(V)_{\mathbb{R}}$ , the **Hodge group**  $\text{Hdg}(V)$  is the smallest subgroup  $H \subset \text{GL}(V)$  s.t. the map  $h|_{\mathbb{S}^1}$  factors through  $H_{\mathbb{R}}$ .  $\perp$

**Prop. (16.11.1.8) [Hodge Structures of Type  $(-1, 0), (0, -1)$ ].** A Hodge structure of type  $(-1, 0), (0, -1)$  is equivalent to a complex vector space. And the Weil operator is just acting by  $i$ .  $\perp$

*Proof:* This follows from (3.5.11.30).  $\square$

**Prop. (16.11.1.9) [Mixed Hodge Structure from Algebraic Geometry].** For any f.g. field  $Q \subset \mathbb{C}$ , there is a functor  $\text{Var}/K \rightarrow m\text{Hdg}_Q$ .  $\perp$

*Proof:* Cf. [Deligne, Hodge Theory]  $\color{red}{?}$   $\square$

### Polarizations

**Def. (16.11.1.10) [Hodge Tensors].** For  $(V, h) \in \text{Hdg}_Q^n$ , an  $r$ -**Hodge tensor** is a map of  $Q$ -Hodge-structures

$$T : V^{\otimes r} \rightarrow Q(-\frac{nr}{2}).$$

In particular,  $T(C_V v_1, \dots, C_V v_r) = T(v_1, \dots, v_r)$ .  $\perp$

**Def. (16.11.1.11) [Polarizations].** For  $(V, h) \in \text{Hdg}_Q^n$ , a **Hodge polarization** is a Hodge tensor  $\psi : V \times V \rightarrow Q(-n)$  s.t.

$$\psi_C(u, v) = (2\pi i)^n \psi(u, Cv)$$

is symmetric and positive-definite. In particular,

$$\psi(u, v) = \psi(Cu, Cv) = (-1)^n \psi(v, u).$$

A isomorphism of Hodge structures preserving their polarization is called a **Hodge isometry**.  $\perp$

**Def. (16.11.1.12) [Polarizations].**  $\color{red}{?}$  An integral **polarized Hodge structure** of weight  $k \in \mathbb{Z}$  is given by an integral Hodge structure  $(\Lambda, F^p \Lambda)$  of weight  $k$  (16.11.1.3) together with a Hermitian form  $H$  on  $\Lambda_{\mathbb{C}}$  s.t.

- The Hodge decomposition (16.11.1.3) is orthogonal for  $H$ .
- If  $\alpha \neq 0 \in V^{p,q}(X)$ , then

$$i^{p-q-k} (-1)^{\frac{k(k-1)}{2}} H(\alpha) > 0$$

┘

**Example (16.11.1.13) [Smooth Projective Varieties].** If  $X \in \text{SmProjVar}/\mathbb{C}$ , then any embedding  $X \hookrightarrow \mathbb{P}_{\mathbb{C}}^n$  induces a polarized rational Hodge structure on the primitive part of  $H^n(X, \mathbb{Q})$  for each  $n$ , by the Hodge index theorem. ┘

*Proof:* Cf.[Voison]Thm6.3.2..? ┘

**Example (16.11.1.14) [Complex Abelian Varieties].** [Frobenius-Lefschetz-Poincaré-Riemann-Weierstrass] By Riemann theorem(16.10.5.9) and(16.11.1.12), for any  $n \in \mathbb{Z}_+$ , there is an equivalence of categories:

$$\text{AbVar}^{\text{polar}}/\mathbb{C} \cong \text{int-Hdg}^{-1, \text{polar}}.$$

┘

**Def. (16.11.1.15) [ $K$ -Hodge-deRham Structures].** For a subfield  $\iota : K \subset \mathbb{C}$ , a  **$K$ -Hodge-deRham structure** is a quadruple  $V = (V_K, \{V^{p,q}\}_{p,q \in \mathbb{Z}}, V_{\mathbb{Q}}, u)$  where

- $V_{\mathbb{Q}} \in \text{Vect}_{\mathbb{Q}}$ ,
- $(V_K, \{V^{p,q}\}_{p,q \in \mathbb{Z}})$  is a  $K$ -mixed Hodge structure(16.11.1.2).
- $u$  is an isomorphism

$$u : V_K \otimes_K \mathbb{C} \cong V_{\mathbb{Q}} \otimes_{\mathbb{Q}} \mathbb{C},$$

endowing  $V_K \otimes_K \mathbb{C}$  with a real structure. ┘

**Def. (16.11.1.16) [Primitive Parts].** ┘

### Hodge-Classes

**Def. (16.11.1.17) [Hodge-Classes].** For  $\Lambda \in \text{int-Hdg}^{2p}$ , define the space of **Hodge-classes** of degree  $2p$  to be

$$\text{Hdg}^{2p}(\Lambda) \triangleq \Lambda \cap V^{p,p} = \ker(\Lambda \rightarrow \Lambda_{\mathbb{C}}/F^p V).$$

And if  $X$  is a compact Kähler manifold and  $k \in \mathbb{N}$ , the **Hodge-classes** of  $X$  of degree  $2k$  is defined to be  $\text{Hdg}^{2k}(X) = \text{Hdg}^{2k}(H^{2k}(X, \mathbb{Z})) = H^{2k}(X, \mathbb{Z}) \cap H_{\text{Betti}}^{k,k}(X)$ . ┘

**Prop. (16.11.1.18) [Lelong1957].** If  $X$  is a compact Kähler manifold, then the cohomology classes of analytic subsets of  $X$  and the Chern classes of holomorphic vector bundles on  $X$  are Hodge classes(16.11.1.17). And these two subsets are equal. ┘

*Proof:* Cf.[Voisin, Hodge]P273, 280.? ┘

**Prop. (16.11.1.19) [Lelong].** If  $X$  is a projective complex manifold and  $\mathcal{L}$  is a holomorphic line bundle on  $X$  and  $\sigma$  a non-zero section of  $\mathcal{L}$ , then the cohomology class of  $\text{Div}(\sigma)$  is equal to  $c_1(\mathcal{L})$  in  $H^2(X, \mathbb{Z})$ .

In particular, the Chern classes of line bundles and the cohomology class of divisors on  $X$  are the same. ┘

*Proof:* Cf.[Voisin, Hodge]P281.? ┘

For the last assertion, use the fact that any line bundle has a meromorphic section(using the ample line bundle). ┘

**Def. (16.11.1.20) [Künneth Hodge Classes].** If  $X$  is a compact Kähler manifold of dimension  $n$ , then the Hodge decomposition and the Künneth decomposition on  $H^*(X \times X)$  are compatible. In particular, for  $a, b \in \mathbb{N}$ ,  $a+b = n$ , the Künneth components  $\text{cl}(\Delta)_{a,b} \in H^a(X) \otimes H^b(X) \subset H^{2n}(X \times X)$  is a Hodge class by (16.11.1.18).  $\lrcorner$

**Example (16.11.1.21) [Künneth Hodge Classes].** If  $X$  is a compact Kähler manifold of dimension  $n$ , then the Hodge decomposition and the Künneth decomposition on  $H^*(X \times X)$  are compatible. In particular, for  $a, b \in \mathbb{N}$ ,  $a+b = n$ , the Künneth components  $\text{cl}(\Delta)_{a,b} \in H^a(X) \otimes H^b(X) \subset H^{2n}(X \times X)$  is a Hodge class by (16.11.1.18).  $\lrcorner$

**Example (16.11.1.22) [Inverse Hyperplane Section Hodge Classes].** If  $X \in \text{SmProjVar}^n/\mathbb{C}$ , and  $\eta \in H^2(X, \mathbb{Z})$  is the class of a hyperplane section, then by hard lefschetz, for any  $p \in \mathbb{N}$ ,  $\cup \eta^p : H^{n-p}(X, \mathbb{C}) \rightarrow H^{n+p}(X, \mathbb{C})$  is an isomorphism. Let  $\mathfrak{z} \in H^{n-p}(X, \mathbb{C}) \times H^{n+p}(X, \mathbb{C}) \subset H^{2n}(X \times X)$  s.t.

$$(\eta^p)^{-1}(c) = \text{pr}_{1!}(\mathfrak{z} \cup \text{pr}_2^* c),$$

then  $\mathfrak{z}$  is a Hodge class.  $\lrcorner$

### Variations of Hodge Structures

**Thm. (16.11.1.23).** Let  $S \in \text{Var}/\mathbb{C}$  and  $X \in \text{SmProjVar}/S$ . Given an integral class  $c$  on a typical fiber  $X_0$ , then the locus where  $c$  is  $\lrcorner$

## 2 Mumford-Tate Groups

**Def. (16.11.2.1) [Mumford-Tate Groups].** For  $V \in \text{Hdg}_{\mathbb{Q}}$  with the corresponding homomorphism  $\$ \rightarrow \text{GL}(V)_{\mathbb{R}}$ , The **Mumford-Tate group**  $\text{MT}(V)$  is defined to be the minimal algebraic subgroup  $M \leq \text{GL}(V)$  s.t.  $h$  factors through  $M_{\mathbb{R}}$ .

More generally, the **big Mumford-Tate group** is defined to be  $\text{MT}^{\sharp}(V) = \text{MT}(V \oplus \mathbb{Q}(1))$ .

For  $X \in \text{SmProj}/\mathbb{C}$ , define the Mumford-Tate group of  $X$  to be  $\text{MT}^r(X) = \text{MT}(H_{\text{Betti}}^{2r}(X, \mathbb{Q}(r)))$ .  $\lrcorner$

**Prop. (16.11.2.2).** For  $V \in \text{Hdg}_{\mathbb{Q}}$ ,

- $\text{MT}(V)$  is connected.
- Suppose  $V$  is pure of weight  $m$ . Then if  $m = 0$ ,  $\text{MT}(V) \subset \text{SL}(V)$ , and if  $m \neq 0$ ,  $\text{MT}(V)$  contained  $\mathbb{G}_m$ .
- Suppose  $V$  is pure of weight  $m$ . Then if  $m = 0$ ,  $\text{MT}^{\sharp}(V) \cong \text{MT}(V) \times \mathbb{G}_m$ , and if  $m \neq 0$ , then  $\text{MT}^{\sharp}(V) \rightarrow \text{MT}(V)$  is an isogeny. Moreover, if  $m = 1$ , then this isogeny is an isomorphism.  $\lrcorner$

*Proof:* ? Cf.[Mumford-Tate Groups, Moonen]P9.  $\square$

**Prop. (16.11.2.3).** The Mumford-Tate group of a polarizable Hodge structure is a reductive group.  $\lrcorner$

*Proof:* Cf.[Hodge Cycles on Abelian Varieties, Deligne-Milne]P24?.

Use the fact that in characteristic 0, an algebraic group is reductive iff it has a completely reducible faithful representation?. Then use the fact that  $\text{Hdg}_{\mathbb{Q}}^{\text{polar}}$  is a semisimple category?. And the fact that sub-Hodge structure of  $V$  are exactly  $\text{MT}(V)$ -submodules.  $\square$

**Prop. (16.11.2.4).** If  $m \in \mathbb{Z}, n \in \mathbb{Z}_+$  and  $V \in \text{Hdg}_{\mathbb{Q}}^m$ , then  $\text{MT}(V^n) = \text{MT}(V)$ , where  $\text{MT}(V)$  is the diagonal embedded in  $\text{GL}(V^n)$ . ┘

*Proof:* ? □

**Prop. (16.11.2.5) [Mumford-Tate Group of Abelian Varieties].** For  $A \in \text{AbVar}/\mathbb{C}$ ,  $A$  has CM iff  $\text{MT}(A)$  is a torus. ┘

*Proof:* Cf. [Mumford-Tate Groups, Moonen] P11. ? □

### 3 Hodge Conjecture

References are [Hodge cycles on abelian varieties, Deligne] and [Voisin].

**Conj. (16.11.3.1) [Hodge].** For  $X \in \text{SmProj}/\mathbb{C}$ , then  $\text{Hdg}^{2k}(X) \otimes \mathbb{Q}$  is generated by cohomology class of an algebraic cycle of  $X$  (16.11.1.18). ┘

WARNING: The hodge conjecture is wrong without the hypothesis that  $X$  is projective. ┘

*Proof:* □

**Thm& Conj. Cor. (16.11.3.2) [Lefschetz (1,1)-Form].** The Hodge conjecture is true in codimension 1 by Lefschetz (1, 1)-form theorem (16.11.5.6). ┘

*Proof:* □

**Thm& Conj. Cor. (16.11.3.3) [Simple Abelian Varieties, Tankeev].** If  $A \in \text{AbVar}/\mathbb{C}$  is a simple Abelian variety s.t.  $\dim(A) \in \text{Prime}$ , then the Hodge conjecture (16.11.3.1) holds for any powers of  $A$ . ┘

*Proof:* □

**Conj. (16.11.3.4) [Generalized Hodge Conjecture, Grothendieck].** Let  $X \in \text{SmProj}/\mathbb{C}$ , and  $L \subset H^{2k+l}(X, \mathbb{Q})$  is a  $\mathbb{Q}$ -sub-Hodge structure contained in  $F^k H^{2k+l}(X)$ , then there exist subvarieties  $Y_i \subset X$  of codimension  $k$  s.t.  $L$  is contained in  $\sum_i j_{i*} H_{2n-l}(Y_i, \mathbb{Q})$ . ┘

*Proof:* Cf. [Hodge Theory, Voisin] P285. ? □

### Arithmetic Theory

**Conj. (16.11.3.5) [Deligne].** ┘

*Proof:* □

**Thm& Conj. Cor. (16.11.3.6) [Deligne].** Let  $k \in \text{Field}^0, k = \bar{k}, A \in \text{AbVar}/k$ , and let  $t \in H_{\mathbb{A}}^{2p}(A)(p)$ . Then if  $t$  is a Hodge cycle w.r.t. one embedding  $\sigma : k \rightarrow \mathbb{C}$ , then it is absolutely Hodge. ┘

*Proof:* □

**Def. (16.11.3.7) [deRham-Hodge Classes].** Let  $k \in \text{Field}^0, k = \bar{k}$ , and  $X \in \text{SmProj}/k$ , then for any embedding  $\sigma : k \hookrightarrow \mathbb{C}$ ,  $H_{\text{dR}}^n(X/k)$  satisfies

$$H_{\text{dR}}^n(X/k) \otimes_{k, \sigma} \mathbb{C} \cong H_{\text{dR}}^n(X, \mathbb{C}) \cong H_{\text{Betti}}^n(X, \mathbb{C}). ??$$

Thus we can define the space  $\text{Hdg}_{\text{dR}}^{2k}(X)$  of **deRham-Hodge classes** on  $X$  of degree  $2k$  w.r.t.  $\sigma$  as the subspace of elements in  $H_{\text{dR}}^{2k}(X/k)$  that are mapped to  $(2\pi i)^k$  times a Hodge class of  $\sigma X$  of degree  $2k$  (16.11.1.17). ┘

This notion is independent of the embedding  $\sigma$ . ┘

*Proof:* ? □

**Prop. (16.11.3.8)**[Tate+Deligne  $\implies$  Hodge Conjectures]. If the Tate conjecture holds for  $X$ , then every absolutely Hodge class of  $X$  is algebraic. In particular, if the Deligne conjecture is true (e.g. for Abelian varieties), the Tate conjecture implies the Hodge conjecture. ┘

*Proof:* Cf.[Tate conjecture over Finite fields, Milne]P11. ? □

## 4 Absolute Hodge Cycles

**Thm. (16.11.4.1)** [Principle A, Deligne]. Let  $(X_\alpha/\mathbb{C})$  be a family of varieties, and let  $\mathcal{T}$  be the category of the spaces obtained from tensors and duals of  $H_{\text{Betti}}^*(X_\alpha, \mathbb{Q})$  and  $\mathbb{Q}(1)$ . Let  $t_i \in T_i \in \mathcal{T}, i = 1, \dots, N$  be absolute Hodge cycles and let

$$G \subset \prod_{\alpha, n_\alpha} \text{GL}(H_{\text{Betti}}^{n_\alpha}(X_\alpha, \mathbb{Q})) \times \mathbb{G}_m$$

be the subgroup fixing  $t_i$ . Then any  $t \in T \in \mathcal{T}$  that is fixed by  $G$  is an absolute Hodge cycle. ┘

*Proof:* Cf.[Absolute Hodge Cycles on Abelian Varieties, Deligne-Milne]P26. ? □

## 5 Abel-Jacobi Maps

### Intermediate Jacobians

**Def. (16.11.5.1)**[Intermediate Jacobians]. For any integral Hodge structure of weight  $2k-1$ , we can define

$$J^{2k-1}(\Lambda) = \Lambda_{\mathbb{C}} / (F^k \Lambda \oplus \overline{F^k \Lambda}).$$

This is a complex torus. ┘

*Proof:* We have a decomposition

$$\Lambda_{\mathbb{C}} = F^k \Lambda \oplus \overline{F^k \Lambda},$$

so  $F^k \Lambda \cap \Lambda_{\mathbb{R}} = \{0\}$ , thus the map

$$\Lambda_{\mathbb{R}} \rightarrow \Lambda_{\mathbb{C}} / F^k \Lambda$$

is an isomorphism of  $\mathbb{R}$ -vector spaces. □

**Prop. (16.11.5.2)**. If  $(\Lambda, F^\bullet \Lambda) \rightarrow (\Lambda', F^\bullet \Lambda')$  is a morphism of Hodge-structure of bidegree  $(r, r)$ , then it induces a morphism of complex tori

$$J^{2p-1}(\Lambda) \rightarrow J^{2(p+r)-1}(\Lambda').$$

┘

**Def. (16.11.5.3)**[Jacobian and Albanese Varieties]. If  $X$  is a compact Kähler manifold of dimension  $n$ , then  $J^1(X)$  is also denoted by  $\text{Jac}(X)$ , called the **Jacobian variety of  $X$** , and  $J^{2n-1}(X)$  is denoted by  $\text{Alb}(X)$ , called the **Albanese variety of  $X$** . ┘

**Prop. (16.11.5.4)[Jacobian].** The **Jacobian**  $\text{Jac}(X)$  of a compact Kähler manifold  $X$  is defined to be  $H^1(X, \mathcal{O}_X)/H^1(X, \mathbb{Z})$ , so it is a complex torus of dimension  $b_1(X)$  by (16.11.5.1), it is also the kernel of the first Chern class map by the long exact sequence (16.9.5.8), i.e.

$$0 \rightarrow \text{Jac}(X) \rightarrow \text{Pic}(X) \xrightarrow{c_1} \text{NS}(X) \rightarrow 0$$

┘

**Lemma (16.11.5.5).** if  $X$  is compact Kähler, then the natural map  $H^k(X, \mathbb{C}) \rightarrow H^k(X, \mathcal{O}_X)$  is just the projection onto the  $(0, k)$ -part. In particular, the image is in  $H^{0,k}(X)$ . ┘

*Proof:* This follows from Hodge decomposition, the definition of Dolbeault cohomology and the following commutative diagram:

$$\begin{array}{ccccccc} \mathbb{C} & \longrightarrow & \mathcal{A}^0(X) & \xrightarrow{d} & \mathcal{A}^1(X) & \xrightarrow{d} & \mathcal{A}^2(X) \dots \\ \downarrow & & \downarrow = & & \downarrow \pi_{0,1} & & \downarrow \pi_{0,2} \\ \mathcal{O}_X & \longrightarrow & \mathcal{A}^0(X) & \xrightarrow{\bar{\partial}} & \mathcal{A}^1(X) & \xrightarrow{\bar{\partial}} & \mathcal{A}^2(X) \dots \end{array}$$

□

**Thm. (16.11.5.6) [Lefschetz theorem on  $(1, 1)$ -forms].** By (16.9.5.8), the image of  $\text{Pic}_{\mathbb{C}}(X) \rightarrow H^2(X, \mathbb{Z})$  is trivial in  $H^2(X, \mathcal{O}_X)$ . And if  $X$  is compact Kähler, there is Hodge decomposition (16.10.4.1)  $H^2(X, \mathcal{O}_X) = H^{2,0}(X) \oplus H^{1,1}(X) \oplus H^{0,2}(X)$ .

So the image of  $\text{Pic}_{\mathbb{C}}(X)$  is contained in  $H^{1,1}(X, \mathbb{Z}) = H^2(X, \mathbb{Z}) \cap H^{1,1}(X)$  by (16.11.5.5) and duality. Then it is also surjective, this is to say,  $\text{NS}(X) = H^{1,1}(X, \mathbb{Z})$  (16.9.5.12). ┘

*Proof:* Because by the long exact sequence of (16.9.5.8) and (16.11.5.5) again, an  $\alpha \in H^2(X, \mathbb{C})$  is in  $H^{1,1}(X, \mathbb{Z})$  iff  $\alpha$  is in the image of  $\text{Pic}_{\mathbb{C}}(X) \rightarrow H^{1,1}(X, \mathbb{Z})$ . □

### Abel-Jacobi Maps

**Def. (16.11.5.7)[Abel-Jacobi Map].** For any  $k \in \mathbb{Z}_+$ , there is an **Abel-Jacobi map**

$$\Phi_X^k : Z^k(X)_{\text{hom}} \rightarrow J^{2k-1}(X).$$

┘

*Proof:* Cf.[Voison, P292]. ? □

**Thm. (16.11.5.8) [Griffiths1968].** Let  $X$  is a compact Kähler manifold,  $Y$  be a connected complex manifold and  $y_0 \in Y$ ,  $Z \subset Y \times X$  a cycle of codimension  $k$  s.t. each component  $Z_i$  of  $Z$  is smooth and the projection  $Z_i \rightarrow Y$  is a submersion. Then the map

$$Y \rightarrow J^{2k-1}(X) : y \mapsto \Phi_X^k(Z_y - Z_{y_0})$$

is holomorphic. ┘

*Proof:* Cf.[Voison, P294]. ? □

**Def. (16.11.5.9) [Albanese Maps].** Fix a base point  $x_0$  of  $X$ , by Griffith's theorem (16.11.5.8) applied to  $\Delta \subset X \times X$ , we get an **Albanese map**

$$\text{Alb}_X : X \rightarrow \text{Alb}(X) : x \mapsto \Phi_X^{2n-1}(x - x_0)$$

that is holomorphic and functorial in  $(X, x_0)$ .  $\lrcorner$

**Prop. (16.11.5.10).** if  $T$  is a torus, then the Albanese map  $\text{Alb}_T : T \rightarrow \text{Alb}(T)$  is an isomorphism.  $\lrcorner$

*Proof:*  $\square$

**Prop. (16.11.5.11) [Universal Properties].** The Albanese map satisfies the following universal property: Any complex torus  $T$  and a map  $f : X \rightarrow T$  s.t.  $f(x_0) = 0$  factors through the Albanese map.  $\lrcorner$

*Proof:*  $\square$

**Lemma (16.11.5.12).** For  $k \in \mathbb{Z}_+$  sufficiently large,

$$\text{Alb}^k : X^k \rightarrow \text{Alb}(X)$$

is surjective.  $\lrcorner$

*Proof:* Cf. [Voison, P298].  $\square$

**Prop. (16.11.5.13).** If  $X \in \text{SmProj}/\mathbb{C}$ , then  $\text{Alb}(X) \in \text{AbVar}/\mathbb{C}$ .  $\lrcorner$

*Proof:* Cf. [Voison, P300].  $\square$  The factorized map is

$$g : \text{Alb}(X) = H^0(X, \Omega_X)^*/H_1(X, \mathbb{Z}) \rightarrow T = H^0(T, \Omega_T)^*/H_1(T, \mathbb{Z}).$$

$\square$

## 6 Deligne Cohomology

Cf. [Voisin1, 2] and [Esnault-Viehweg, Deligne-Beilinson Cohomology].

**Def. (16.11.6.1) [Deligne Complex].** Let  $X$  be a complex manifold and  $p \in \mathbb{Z}_+$ , the (real) **Deligne complex**  $\mathbb{R}_{\text{Del}}(p)$  is the complex

$$0 \rightarrow \mathbb{R}[0] \xrightarrow{(2\pi i)^p} \mathcal{O}_X \xrightarrow{d} \Omega_X \xrightarrow{d} \dots \xrightarrow{d} \Omega_X^{p-1} \rightarrow 0.$$

Similarly we can define the Deligne complex with coefficients in  $A$  for any ring  $A \subset \mathbb{R}$ .  $\lrcorner$

**Def. (16.11.6.2) [Deligne Cohomologies].** Let  $X$  be a complex manifold and  $p \in \mathbb{Z}, k \in \mathbb{N}$ , the **Deligne cohomology**  $H_{\text{Del}}^k(X, \mathbb{R}(p))$  is defined to be the hypercohomology  $\mathbb{H}^k(X, \mathbb{R}_{\text{Del}}(p))$  (16.11.6.1). Similarly we can define the Deligne cohomology with coefficients in  $A$  for any ring  $A \subset \mathbb{R}$ .  $\lrcorner$

**Example (16.11.6.3).** For  $p = 1$ ,  $\mathbb{Z}_{\text{Del}}(1)$  is quasi-isomorphic to  $\mathcal{O}_X^*[-1]$ , so  $H_{\text{Del}}^{k+1}(X, \mathbb{Z}(1)) \cong H^k(X, \mathcal{O}_X^*)$ .

For  $p = 2$ , there is a quasi-isomorphism

$$\begin{array}{ccccc} (2\pi i)^2 \mathbb{Z} & \longrightarrow & \mathcal{O}_X & \longrightarrow & \Omega_X^1 \\ & & \downarrow \exp((2\pi i)^{-1}(-)) & & \downarrow (2\pi i)^{-1} \\ & & \mathcal{O}_X^* & \xrightarrow{f \mapsto \text{dlog}(f)} & \Omega_X^1 \end{array}$$

so  $H_{\text{Del}}^1(X, \mathbb{Z}(2)) = \mathbb{C}^\times$ , and  $H_{\text{Del}}^2(X, \mathbb{Z}(2))$  corresponds to holomorphic line bundles with a holomorphic connection.  $\lrcorner$

**Prop. (16.11.6.4).** If  $X$  is a compact Kähler manifold and  $A \subset \mathbb{R}$ , then there is a long exact sequence

$$\dots \rightarrow H_{\text{Del}}^k(X, A(p)) \rightarrow H^k(X, A) \rightarrow H^k(X, \mathbb{C}) / \text{Fil}^p H^k(X, \mathbb{C}) \rightarrow H_{\text{Del}}^{k+1}(X, A(p)) \rightarrow \dots$$

$\lrcorner$

*Proof:* There is an exact sequence of complexes

$$0 \rightarrow \Omega_X^{\leq p-1}[-1] \rightarrow A_{\text{Del}}(p) \rightarrow A(p) \rightarrow 0,$$

which induces a long exact sequence

$$\dots \rightarrow H_{\text{Del}}^k(X, A(p)) \rightarrow H^k(X, A(p)) \rightarrow \mathbb{H}^k(X, \Omega_X^{\leq p-1}) \rightarrow H_{\text{Del}}^{k+1}(X, A(p)) \rightarrow \dots$$

And the exact sequence of complexes

$$0 \rightarrow \Omega_X^{\geq p} \rightarrow \Omega_X^\bullet \rightarrow \Omega_X^{\leq p-1} \rightarrow 0$$

and the fact  $\mathbb{H}^k(X, \Omega_X^{\geq p}) \cong \text{Fil}^p H^k(X, \mathbb{C}) \subset H^k(X, \mathbb{C})$  ? implies that  $\mathbb{H}^k(X, \Omega_X^{\leq p-1}) \cong H^k(X, \mathbb{C}) / F^p H^k(X, \mathbb{C})$ .  $\square$

**Cor. (16.11.6.5).** There is an exact sequence

$$0 \rightarrow J^{2p-1}(X) \rightarrow H_{\text{Del}}^{2p}(X, \mathbb{Z}(p)) \rightarrow \text{Hdg}^{2p}(X, \mathbb{Z}) \rightarrow 0. \text{(16.11.5.1)(16.11.1.17)}$$

$\lrcorner$

**Prop. (16.11.6.6).** Let  $X$  be compact Kähler of dimension  $p$  and  $i < 2p$ , then

$$H^i(X, \mathbb{R}(i)) \hookrightarrow H^k(X, \mathbb{C}) / \text{Fil}^p H^k(X, \mathbb{C}).$$

So there are exact sequences

$$0 \rightarrow H^{i-1}(X, \mathbb{R}(p)) \rightarrow H^{i-1}(X, \mathbb{C}) / \text{Fil}^p H^{i-1}(X, \mathbb{C}) \rightarrow H_{\text{Del}}^i(X, \mathbb{R}(p)) \rightarrow 0.$$

And because  $\mathbb{C} = \mathbb{R}(p) \oplus \mathbb{R}(p-1)$ , there are exact sequences

$$0 \rightarrow \text{Fil}^p H^{i-1}(X, \mathbb{C}) \rightarrow H^{i-1}(X, \mathbb{R}(p-1)) \rightarrow H_{\text{Del}}^i(X, \mathbb{R}(p)) \rightarrow 0$$

is injective.  $\lrcorner$

*Proof:* This is because  $\mathbf{c}$  acts as multiplication by  $(-1)^p$  on the LHS, and  $\text{Fil}^p H^k(X, \mathbb{C}) \cap \overline{\text{Fil}^p H^k(X, \mathbb{C})} = \oplus_{r,s \geq p} H^{r,s}(X)$ , so the kernel is  $\{0\}$ .  $\square$

**Prop. (16.11.6.7) [Comparison of Complex Conjugations].** For  $X \in \text{SmProj}/\mathbb{R}$ , the canonical isomorphism

$$H_{\text{Betti}}(X, \mathbb{R}) \otimes_{\mathbb{R}} \mathbb{C} = H_{\text{Betti}}(X, \mathbb{C}) \xrightarrow{I_{\text{dR}}} H_{\text{dR}}^i(X^{\text{an}}) \xrightarrow{GAGA} H_{\text{dR}}^i(X) \otimes_{\mathbb{R}} \mathbb{C}$$

is an isomorphism that identifies the complex conjugation  $\mathbf{c}^* \otimes \mathbf{c}$  on the LHS with  $\mathbf{c}$  on the RHS, so  $\perp$

*Proof:* Deligne, Prop1.4.  $\square$

**Cor. (16.11.6.8).** By taking the complex conjugation fixed part, we get an exact sequence

$$0 \rightarrow \text{Fil}^p H_{\text{Betti}}^{i-1}(X, \mathbb{R}) \rightarrow H_{\text{Betti}}^{i-1}(X, \mathbb{R}(p-1))^{\mathbf{c}^* = (-1)^{p-1}} \rightarrow H_{\text{Del}}^i(X/\mathbb{R}, \mathbb{R}(p)) \rightarrow 0$$

$\perp$

### Differential Characters

**Def. (16.11.6.9) [Differential Characters].** Let  $X$  be a differential manifold and  $Z_l^\infty$  be the subgroup of closed singular differentiable chains, and  $\Xi_\infty^l(X) \subset \text{Hom}(Z_l^\infty, \mathbb{R}/\mathbb{Z})$  consisting of characters  $\chi$  s.t. there exists  $\omega \in \Omega^{l+1}(X)$  s.t.

$$\chi(\partial\varphi) = \int_{\Delta_{l+1}} \varphi^* \omega \in \mathbb{R}/\mathbb{Z}, \quad \forall \varphi \in C_{l+1}^\infty(X).$$

Such an  $\omega$  is clearly uniquely determined by  $\chi$ .  $\perp$

**Prop. (16.11.6.10).** For any  $\chi \in \Xi_\infty^l(X)$ ,  $\omega_\chi$  is an integral closed form.  $\perp$

*Proof:* Cf. [Voisin, P306].  $\textcolor{red}{?}$   $\square$

**Prop. (16.11.6.11).** If  $X$  is a complex manifold, and  $\mu \in \Omega_{\mathbb{R}}^{l-1}(X)$ , then for any closed chain  $\varphi \in C_l^\infty(X)$ ,

$$\overline{\int_{\Delta_l} \varphi^*(i\partial\mu)} = \int_{\Delta_l} \varphi^*(-i\bar{\partial}\mu) = \int_{\Delta_l} \varphi^*(-i d\mu + i\partial\mu) = \int_{\Delta_l} \varphi^*(i\partial u),$$

so  $\int_{\Delta_l} \varphi^*(i\partial u) \in \mathbb{R}$ , and we can define a differential character

$$\int i\partial\mu \in \Xi_\infty^l(X) : \varphi \mapsto \int_{\Delta_l} \varphi^*(i\partial u).$$

$\perp$

**Prop. (16.11.6.12).** For a compact Kähler manifold  $X$  and  $p \in \mathbb{N}$ , consider the subgroup  $\Xi_\infty^{2p-1}(X)^{p,p} \subset \Xi_\infty^{2p}(X)$  consisting of differential characters  $\chi$  s.t.  $\omega_\chi$  is of the type  $(p, p)$ . Then

$$H_{\text{Del}}^{2p-1}(X)^{p,p} \cong K_\infty^{2p-1}(X) = \Xi_\infty^{2p-1}(X)^{p,p} / \left\{ \int i\partial\mu \mid \mu \in \Omega^{p-1,p-1}(X) \right\}.$$

$\perp$

*Proof:* Cf. [Voisin, P307].  $\textcolor{red}{?}$   $\square$

### Properties of the Deligne Cohomology

**Prop. (16.11.6.13) [Cup Products].** There are cup products

$$H_{\text{Del}}^p(X, \mathbb{Z}(q)) \times H_{\text{Del}}^{p'}(X, \mathbb{Z}(q')) \rightarrow H_{\text{Del}}^{p+p'}(X, \mathbb{Z}(q+q')).$$

┘

*Proof:*

□

**Prop. (16.11.6.14) [Cycle Class Maps].** For  $X \in \text{SmProj}/\mathbb{C}$  and  $p \in \mathbb{N}$ , there are class maps

$$\text{CH}^p(X) \rightarrow H_{\text{Del}}^{2p}(X, \mathbb{Z})$$

that lifts the class  $[Z] \in H^{2p}(X, \mathbb{Z})$  (16.11.6.4), and commutes with products and cup products. ┘

*Proof:* Cf. [Voisin, P311]. ?

□

### Modified Hodge Conjecture (Clausen)

#### 7 Coniveau

**Def. (16.11.7.1) [Coniveau].** The **coniveau** of  $\alpha \in H_{\text{Betti}}^\bullet(X, \mathbb{Q})$  is the smallest number  $c$  s.t. there is a closed algebraic subscheme  $Y \subset X$  s.t.  $\alpha|_{X \setminus Y} = 0 \in H_{\text{Betti}}^\bullet(X \setminus Y, \mathbb{Q})$ . ┘

**Thm. (16.11.7.2) [Deligne].** If  $\alpha \in H_{\text{Betti}}^\bullet(X, \mathbb{Q})$  is mapped to  $0 \in H_{\text{Betti}}^\bullet(X \setminus Y, \mathbb{Q})$  where  $Y$  is pure of codimension  $c$ , then  $\alpha = j_*\beta$ , where  $j : \tilde{Y} \rightarrow Y \rightarrow X$  is a resolution of singularities of  $Y$  and  $\beta \in H_{\text{Betti}}^{\bullet-2c}(\tilde{Y}, \mathbb{Q})$ . ┘

*Proof:*

□

# 17 | Non-Commutative Geometry(Connes)

## 17.1 Non-Commutative Geometry

References are [Connes, Geometry from the spectral point of view], [Connes, Noncommutative geometry], [Bost-Connes, Hecke Algebras, Type 3 factors and phase transitions with spontaneous symmetry breaking in number theory].

### 1 Spectral Triples

**Def. (17.1.1.1) [Spectral Triples].** A **spectral triple** is a triple  $(\mathcal{A}, \mathcal{H}, D)$  where  $\mathcal{A}$  is a  $*$ -algebra,  $\rho : \mathcal{A} \rightarrow B(\mathcal{H})$  is a representation on a Hilbert space  $\mathcal{H}$ , and  $D \in L(\mathcal{H})$  (not necessarily bounded), s.t.

- $D$  is self-adjoint.
- For each  $\lambda \in \mathbb{C} \setminus \mathbb{R}$ ,  $(D - \lambda)^{-1}$  is compact on  $\mathcal{H}$ .
- For each  $a \in \mathcal{A}$ , the commutator  $[a, D] \in B(\mathcal{H})$ .

┘

## 17.2 Supersymmetry

**Def. (17.2.0.1) [Supermanifolds].** A **supermanifold** of dimension  $(n, m)$  is a smooth manifold  $|M|$  together with a sheaf  $\mathcal{O}_M$  of  $\mathbb{Z}/(2)$ -graded algebras that is locally isomorphic to  $\mathcal{O}_{|M|} \otimes \Lambda[\xi_1, \dots, \xi_m]$ . The odd functions on  $M$  generate a nilpotent ideal  $\mathcal{J} \subset \mathcal{O}_M$ , with  $(|M|, \mathcal{O}_M/\mathcal{J})$  a manifold, called the underlying manifold of  $M$ , denoted by  $M_{\text{red}}$ .

A map of supermanifolds  $\varphi : M \rightarrow N$  is a map of manifolds  $\varphi_0 : M_0 \rightarrow N_0$  together with a map of supervectors spaces  $\varphi_0^* \mathcal{O}_N \rightarrow \mathcal{O}_M$ .  $\lrcorner$

**Remark (17.2.0.2).** In a similar fashion, we can define complex supermanifold, analytic supermanifolds or superschemes.  $\lrcorner$

**Prop. (17.2.0.3) [Morphisms between Supermanifolds].** Let  $M$  be a supermanifold and  $U \subset \mathbb{R}^{p|q}$  an open submanifold, then a map of supermanifolds  $f : M \rightarrow U$  is equivalent to a tuple  $(f_1, \dots, f_p, \varphi_1, \dots, \varphi_q)$  s.t. for any  $x \in |M|$ ,  $(f_1(x), \dots, f_p(x)) \in |U|$ .

In fact, giving such a tuple, suppose  $f_i = f_i^0 + r_i$  where  $f_i^0 \in \mathcal{O}_{|M|}$  and  $r_i \in \mathcal{J}$ , then in local coordinates, the pullback of  $F = \sum_I F_I \theta^I$  is

$$F(f_1, \dots, f_p, \varphi_1, \dots, \varphi_q) = \sum_I \left( \sum \partial^\alpha F(f_1^0, \dots, f_p^0, \varphi_1, \dots, \varphi_q) \frac{r^\alpha}{\alpha!} \right) \varphi^I.$$

$\lrcorner$

**Def. (17.2.0.4) [Super Vector Bundles].** A **super-vector bundle** over a supermanifold  $M$  is an  $\mathcal{O}_M$ -sheaf  $\mathcal{E}$ , locally free of dimension  $p|q$ .  $\lrcorner$

### 1 Real Structures

### 2 Super Lie Groups

**Def. (17.2.2.1) [Super Classical Groups].**

- $\text{GL}(p|q)$ .
- There is a Berezinian map  $\text{Ber} : \text{GL}(p|q) \rightarrow \text{GL}(1|0)$ , and the kernel is denoted by  $\text{SL}(p|q)$ .
- $\text{OSp}(n|2m)$  is the group fixing an even supersymmetric non-degenerate bilinear form  $\Phi$ .
- $\pi \text{Sp}(n|n)$  is the group fixing an odd super-anti-symmetric non-degenerate bilinear form  $\Phi$ .
- The kernel of  $\text{Ber} : \pi \text{Sp}(n|n) \rightarrow \text{GL}(1|0)$  is called the group of P-series.
- Let  $D = \mathbb{R}[\eta]$  be the super division algebra with  $\eta$  odd and  $\eta^2 = -1$ , then there is a odd determinant map

$$\text{odet} : \text{GL}(n; D) \rightarrow \mathbb{R}^{0|1},$$

the kernel of  $\text{odet}$  is called the group of Q-series.  $\lrcorner$

*Proof:* Cf.[Deligne, Supersymmetry]P70.  $\square$

## 18.1 Hamiltonian Mechanics

References are [Arn89] and [Notes on Quantum Field Theory, Etingof].

**Notation(18.1.0.1).**

- Use notations on Riemannian geometry defined in [Riemannian Geometry](#).
- Use notations on symplectic geometry defined in [Symplectic Geometry](#).

┘

### 1 Hamiltonian Mechanics

#### Newtonian Mechanics

**Physical Law(18.1.1.1)[Space and Time in Newtonian Mechanics].** The **Galilean space-time structure** is a 4-dimensional real vector space. Its points are called world points or events.

The **time** is a projection from the space to  $\mathbb{R}$ :  $t : \mathbb{R}^N \rightarrow \mathbb{R}$ . Two events  $a, b$  are called **simultaneous** if  $t(a) = t(b)$ .

The set of events simultaneous to a given event forms a 3-dimensional affine subspace of  $\mathbb{R}^3$ , called a **space of simultaneous events**.

┘

**Def.(18.1.1.2) [Galilean Transformations].** By(18.1.1.1), we can assume that the Galilean space-time is isomorphic to  $\mathbb{R} \times \mathbb{R}^3$ , where the first coordinate is time. Any such isomorphism determines a **Galilean coordinate system** on the space-time structure. Thus on the Galilean space-time, we can define the Eisenstein metric  $ds^2 = dx_1^2 + dx_2^2 + dx_3^2 - dt^2$ .

The **Galilean group** is the group of automorphisms of the Galilean space preserving the Eisenstein metric. The transformations of a Galilean coordinate system is also the class of **inertia coordinate systems** w.r.t. this coordinate system.

┘

**Prop.(18.1.1.3).** Any Galilean transformation  $g$  can be written as a product  $g_1 \circ g_2 \circ g_3$  where

- $g_1$  is a **uniform motion** with velocity  $v$ :  $g_1(t, x) = (t, x + tv)$ .
- $g_2$  is a **translation of the origin**:  $g_2(t, x) = (t + s, x + x')$ .
- $g_3$  is a **rotation of coordinate axis**:  $g_3(t, x) = g_3(t, Gx)$ , where  $G \in O(3, \mathbb{R})$ .

┘

*Proof:*

□

**Def.(18.1.1.4)[Motion, Velocity and Acceleration].** A **motion** in  $\mathbb{R}^N$  is a smooth curve  $x : I \rightarrow \mathbb{R}^N$ , where  $I \subset \mathbb{R}$  is an interval.

For  $t_0 \in I$ , the **velocity of a motion**  $x : I \rightarrow \mathbb{R}^N$  is defined to be the derivative  $\dot{x} = \frac{\partial}{\partial t}x|_{t=t_0}$ . And the **acceleration vector** of  $t_0$  is defined to be the the second derivative  $\ddot{x} = \frac{\partial^2}{\partial t^2}x|_{t=t_0}$ .  $\lrcorner$

**Physical Law (18.1.1.5)[Newtonian Mechanics and Newton's Principle of Determinacy]**. Any motion of a newtonian mechanical system uniquely determined by its initial positions(i.e.  $x(t_0) \in \mathbb{R}^N$ ) and its initial states(i.e.  $\dot{x}(t_0) \in \mathbb{R}^N$ ).

The study of motions in a newtonian system is called a **Newtonian mechanics**(of particles).  $\lrcorner$

**Def. (18.1.1.6)[Newton's Equation]**. In a given Galilean coordinate system, it follows from the newton's principle of determinacy(18.1.1.5) that there is a function  $F : \mathbb{R}^N \times \mathbb{R}^N \times \mathbb{R} \rightarrow \mathbb{R}$  s.t. for any motion  $x$  in  $\mathbb{R}^N$ ,

$$\ddot{x}(t) = F(x, \dot{x}, t).$$

This is called the **Newton's equation**.  $\lrcorner$

**Axiom (18.1.1.7)[Galileo's Principle of Relativity]**. The Newton's equations(18.1.1.6) are invariant under the action of Galilean group(18.1.1.2). Equivalently,

$$F(x, \dot{x}, t) = F(x, \dot{x}, t + s),$$

$$F(x + tv, \dot{x} + v, t) = F(x + tv, \dot{x} + v, t),$$

$$GF(x, \dot{x}, t) = F(Gx, G\dot{x}, t), \quad G \in O(3, \mathbb{R}).$$

$\lrcorner$

**Def. (18.1.1.8)[Forces]**. A **force** is a vector field on the configuration space.

A **conservative force** is a force  $F$  s.t. there exists a potential energy  $U$  s.t.  $\text{grad}U = F$ .  $\lrcorner$

**Def. (18.1.1.9)[Work of a Force]**. The **work** of a force  $F$  on a path  $\gamma$  is defined to be

$$A = (F, \gamma) = \int_{\gamma} (F, d\gamma).$$

$\lrcorner$

**Prop. (18.1.1.10)**. If the configuration space is simply-connected(e.g.  $\mathbb{R}^N$ ), then a force is conservative iff its work along any path only depends on the endpoints.  $\lrcorner$

### Hamiltonian Mechanics

**Def. (18.1.1.11)[Lagrangian Dynamical System]**. A **Lagrangian (dynamical) system** of particles consists of the following:

- A differentiable manifold  $M \in \text{Mani}$ .
- A differentiable function  $\mathcal{L} \in C^\infty(TM \times \mathbb{R})$  called the **Lagrangian of the system**.

If  $\mathcal{L}$  factors through the projection to  $TM$ , then it is called an **autonomous Lagrangian system**, otherwise it is called a **non-autonomous Lagrangian system**.

In particular, a Lagrangian system is a classical field theory(18.6.0.2).  $\lrcorner$

**Def. (18.1.1.12)[Generalized Positions and Momentums]**. Given a Lagrangian system  $(M, \mathcal{L})$ , any smooth chart  $\varphi_\alpha : U_\alpha \subset M \cong V_\alpha \subset \mathbb{R}^n$  defines a **generalized position coordinate**  $q_i = (\varphi_\alpha)_i$  on  $U_\alpha$ . And  $p_i \triangleq \frac{\partial}{\partial \dot{q}_i} \mathcal{L}$  are called the **generalized momentum coordinate**.  $\lrcorner$

**Def. (18.1.1.13) [Lagrangian Mechanics and the Principle of Least Action].** For any Lagrangian dynamical system (18.1.1.11) and any generalized coordinate  $\mathbf{q}$ , then a **motion** in this system is a path  $\gamma : [t_0, t_1] \rightarrow TM$  s.t.  $\gamma$  is a extremal curve (13.2.1.3) of the functional

$$\Phi(\gamma) = \int_{t_0}^{t_1} \mathcal{L}(\mathbf{q}(\gamma), \dot{\mathbf{q}}(\gamma), t) dt.$$

Equivalently, it satisfies the Euler-Lagrangian equation (13.2.1.5)

$$\frac{\partial}{\partial t} \frac{\partial}{\partial \dot{\mathbf{q}}} \mathcal{L} = \frac{\partial}{\partial \mathbf{q}} \mathcal{L}$$

along  $\gamma$ .

The study of motions satisfying this equation in a Lagrangian system is called a **Lagrangian mechanics**. ┘

**Def. (18.1.1.14) [Natural Lagrangians].** For a Lagrangian system with phase space  $M$  (18.1.1.11), a Riemannian structure on  $M$  will give a **kinetic energy**

$$T = \frac{1}{2} \langle v, v \rangle_x, \quad v \in T_x M,$$

and a **potential energy** is a function  $U \in C^\infty(M)$  that is viewed as a function on  $TM$  via projection.

Then the Lagrangian  $\mathcal{L}$  is called a **natural Lagrangian** if it is of the form  $\mathcal{L} = T - U$  for some kinetic energy  $T$  and some potential energy  $U$ . ┘

**Thm. (18.1.1.15) [Hamilton's Equations and Hamiltonian Systems].** Situation as in (18.1.1.13), we define its **Hamiltonian** to be

$$\mathcal{H}(\mathbf{p}, \mathbf{q}, t) = \mathbf{p} \cdot \dot{\mathbf{q}} - \mathcal{L}(\mathbf{q}, \dot{\mathbf{q}}, t).$$

and the Euler-Lagrangian equation (18.1.1.13) rewrites as

$$\dot{\mathbf{q}} = \frac{\partial}{\partial \mathbf{p}} \mathcal{H}, \quad \dot{\mathbf{p}} = -\frac{\partial}{\partial \mathbf{q}} \mathcal{H}.$$

(This is because by Legendre transform (16.8.2.1),  $(\mathbf{p}, \mathbf{q})$  is a new coordinate for  $TM$ ).

This implies that we can just start with a Hamiltonian  $\mathcal{H}$ , and consider a **Hamiltonian mechanics** where the motion in a Hamiltonian system is a path  $\gamma : I \rightarrow T^*M$  that is a extremal curve of the functional

$$S(\gamma) = \int_I (\mathbf{p} \cdot \dot{\mathbf{q}} - \mathcal{H}(\mathbf{p}, \mathbf{q}, t)) dt.$$

Then a Hamilton's system is dual to a Lagrangian system. ┘

**Cor. (18.1.1.16) [Hamiltonian Fixed in Autonomous Systems].** In a Lagrangian system, if the Lagrangian  $\mathcal{L}$  is independent of the time, then the Hamiltonian is fixed in a Hamiltonian mechanical system. ┘

*Proof:*

$$\dot{\mathcal{H}} = \frac{\partial}{\partial \mathbf{p}} \mathcal{H} \cdot \dot{\mathbf{p}} + \frac{\partial}{\partial \mathbf{q}} \mathcal{H} \cdot \dot{\mathbf{q}} = \dot{\mathbf{q}} \cdot \dot{\mathbf{p}} - \dot{\mathbf{p}} \cdot \dot{\mathbf{p}} = 0.$$

□

### Poisson Brackets

**Prop. (18.1.1.17) [Preserved Scalar Fields].** For a Hamiltonian system, if  $F(\mathbf{p}, \mathbf{q}) \in C^\infty(TM)$  doesn't depend on  $t$ , then

$$\dot{F} = \frac{\partial}{\partial \mathbf{p}} F \cdot \dot{\mathbf{p}} + \frac{\partial}{\partial \mathbf{q}} F \cdot \dot{\mathbf{p}} = \{F, \mathcal{H}\}_{\text{Pois}} \quad (18.1.1.15)(16.8.2.3).$$

In particular, if  $\{F, \mathcal{H}\} = 0$ , then  $F$  is preserved in any Hamiltonian motion.  $\lrcorner$

### Examples

**Def. (18.1.1.18) [Energy-Momentum Coordinates for  $\mathbb{R}^n$ ].** When considering particles in  $\mathbb{R}^n$ , we can use another coordinate other than the usual coordinate  $(\mathbf{x}, t)$ : Consider its Fourier transform:

$$\tilde{f}(\omega, \mathbf{k}) = \int_{\mathbb{R}^n \times \mathbb{R}} e^{i(\omega t - \mathbf{k} \cdot \mathbf{x})} f(\mathbf{x}, t) d\mathbf{x} dt.$$

where  $\omega$  is the **temporal frequency coordinate** and  $\mathbf{k}$  is the **spatial frequency coordinate**. Also  $E = \hbar\omega$  is called the **energy coordinate** and  $\mathbf{p} = \hbar\mathbf{k}$  is called the **momentum coordinate**.

Then we have the Fourier inversion:

$$f(\mathbf{x}, t) = \frac{1}{(2\pi)^{\frac{n+1}{2}}} \int_{\mathbb{R}^n \times \mathbb{R}} e^{i(\mathbf{x} \cdot \mathbf{k} - t\omega)} \tilde{f}(\omega, \mathbf{k}) d\mathbf{k} d\omega.$$

or the partial Fourier inversion:

$$f(\mathbf{x}, t) = \frac{1}{(2\pi)^{\frac{n}{2}}} \int_{\mathbb{R}^n} e^{i\mathbf{x} \cdot \mathbf{k}} \tilde{f}(t, \mathbf{k}) d\mathbf{k}.$$

$\lrcorner$

**Example (18.1.1.19) [Free Particles].** In the system of a free mass point of weight  $m$  in  $\mathbb{R}^3$ , if  $\mathbf{q}$  is the usual position coordinate, then

$$\mathcal{L} = T = \frac{m \|\dot{\mathbf{q}}\|^2}{2}.$$

Thus the generalized momenta are  $\mathbf{p} = m\dot{\mathbf{q}}$ ,  $\mathcal{H} = \frac{\|\mathbf{p}\|^2}{2m}$ , and the Hamiltonian equation is

$$\dot{\mathbf{q}} = \frac{1}{m} \mathbf{p}, \quad \dot{\mathbf{p}} = 0.$$

$\lrcorner$

**Example (18.1.1.20) [Central Potential Fields].** In the system of a free mass point in  $\mathbb{R}^2$  with a central potential field  $U = U(r)$  in the polar coordinate  $(r, \varphi)$ . Then in this coordinate  $q_1 = r, q_2 = \varphi$ ,

$$\mathcal{L}(q, \dot{q}) = T(q, \dot{q}) - U(q) = \frac{m}{2} (\dot{q}_1^2 + q_1^2 \dot{q}_2^2) - U(q_1).$$

Then the generalized momentum coordinates are

$$p_1 = m\dot{r}, \quad p_2 = mr^2\dot{\varphi}$$

and the Hamiltonian equations are

$$\dot{p}_1 = q_1 \dot{q}_2^2 - \frac{1}{m} \frac{\partial}{\partial r} U, \quad \dot{p}_2 = 0.$$

Notice the second equation is called the **law of conservation of angular momentum**. This is a special case of (18.1.1.22).  $\lrcorner$

**Example (18.1.1.21) [String Waves].** For a small perturbation of a string of mass  $m$  and length  $l$  and tension  $k$  with coordinate given by  $\varphi(x, t)$ , the kinetic energy and potential energy is given by

$$T = \frac{m}{2l} \int_0^l \frac{\partial}{\partial t} \psi(x, t) dx, \quad U = \frac{k}{2} \int_0^l \frac{\partial}{\partial x} \psi(x, t).$$

Where the potential is calculated by noticing the small distortion and Hooke's formula ?. Then the Euler-Lagrangian equation (18.1.1.13) is given by

$$\frac{\partial^2}{\partial x^2} \psi = \frac{1}{v^2} \frac{\partial^2}{\partial t^2} \psi, \quad v = \sqrt{kl/m}.$$

┘

**Prop. (18.1.1.22) [Generalized Law of Conservation of Angular Momentum].** A coordinate  $q_i$  not appearing in the Lagrangian (i.e.  $\frac{\partial}{\partial q_i} \mathcal{L} = 0$ ) is called a **cyclic coordinate**. Then it follows from ?? that the generalized momentum corresponding to a cyclic coordinate remains constant. ┘

### Symmetries

**Thm. (18.1.1.23) [Noether's Theorem].** ┘

**Thm. (18.1.1.24) [Continuity Equation].** ┘

**Prop. (18.1.1.25) [Dimensional Analysis].** In an equation raising from a physical problem, we can normalize all the indeterminants to get a non-dimensional one, giving the equation some kind of characteristic length. ┘

## 2 Symplectic Structure

### 3 Unit System

**Fact (18.1.3.1) [International System of Quantities].** The **international system of quantities** use the following 7 fundamental measurements of reality: time(T), length(L), mass(M), electric current(I), absolute temperature( $\Theta$ ), amount of substance(N), and luminous intensity (J).

We can define a unit system by solving the equation asserting the values of 7 constants (with linearly independent measure dimensions). (So basically the base units can be expressed in these units). ┘

**Def. (18.1.3.2) [Base of International System of Units(SI)].** The **international system of units** is a unit system defined by choose the base units

- (mole)mol : N.
- (second)s : T.
- (metre)m : L.
- (kilogram)kg : M.
- (ampere)A : I.
- (Kelvin)K :  $\Theta$ .
- (candela)cd: J.

s.t.

- The **Avogadro constant**:  $N_A = 6.02214076 \cdot 10^{23} \text{mol}^{-1} : \text{N}^{-1}$ .
- The **hyperfine transition frequency** of Cs:  $\Delta\nu_{Cs} = 9192631770 \text{s}^{-1} : \text{T}^{-1}$ .
- The **speed of light in vacuum**:  $c = 299792458 \text{m} \cdot \text{s}^{-1} : \text{LT}^{-1}$ .
- The **plank constant**:  $h = 6.62607015 \cdot 10^{-34} \text{kg} \cdot \text{m}^2 \cdot \text{s}^{-1} : \text{ML}^2 \text{T}^{-1}$ .
- The **elementary particle**:  $e = 1.602176634 \cdot 10^{-19} \text{A} \cdot \text{s} : \text{IT}$ .
- The **Boltzmann constant**:  $k_B = 1.380649 \cdot 10^{-23} \text{K}^{-1} \cdot \text{kg} \cdot \text{m}^2 \cdot \text{s}^{-2} : \Theta^{-1} \text{ML}^2 \text{T}^{-2}$ .
- The luminous efficacy of 540 THz radiation:  $K_{\text{cd}} = 683 \text{lm/W} : \text{JM}^{-1} \text{L}^{-2} \text{T}^3$ .

┘

**Def. (18.1.3.3) [Derived SI Units].**

- (Herz)  $\text{Hz} = \text{s}^{-1} : \text{T}^{-1}$ .
- (Newton)  $N = \text{kg} \cdot \text{m} \cdot \text{s}^{-2} : \text{MLT}^{-2}$ .
- (Pascal)  $\text{Pa} = \text{kg} \cdot \text{m}^{-1} \cdot \text{s}^{-2} : \text{ML}^{-1} \text{T}^{-2}$ .
- (joule)  $J = \text{kg} \cdot \text{m}^2 \cdot \text{s}^{-2} : \text{ML}^2 \text{T}^{-2}$ .
- (Watt)  $W = \text{kg} \cdot \text{m}^2 \cdot \text{s}^{-3} : \text{ML}^2 \text{T}^{-3}$ .
- (Coulomb)  $C = \text{A} \cdot \text{s} : \text{IT}$ .
- (Tesla)  $T = \text{A}^{-1} \cdot \text{kg} \cdot \text{s}^{-2} : \text{I}^{-1} \text{MT}^{-2}$ .
- (volt)  $V = \text{A}^{-1} \cdot \text{kg} \cdot \text{m}^2 \cdot \text{s}^{-3} : \text{I}^{-1} \text{ML}^2 \text{T}^{-3}$ .
- (farad)  $F = \text{A}^2 \cdot \text{kg}^{-1} \cdot \text{m}^{-2} \cdot \text{s}^4 : \text{I}^2 \text{M}^{-1} \text{L}^{-2} \text{T}^4$ .
- (Ohm)  $\Omega = \text{A}^{-2} \cdot \text{kg} \cdot \text{m}^2 \cdot \text{s}^{-3} : \text{I}^2 \text{ML}^2 \text{T}^{-3}$ .
- (lumen)  $\text{lm} = \text{cd} \cdot \text{sr} : \text{J}$ .

┘

**Fact (18.1.3.4) [Physical Constants].**

- The **reduced plank constant**:  $\hbar = h/2\pi : \text{ML}^2 \text{T}^{-1}$ .
- The **Newtonian constant of gravitation**:  $G = 6.67430(15) \cdot 10^{-11} \text{kg}^{-1} \cdot \text{m}^3 \cdot \text{s}^{-2} : \text{M}^{-1} \text{L}^3 \text{T}^{-2}$ .
- The **vacuum magnetic permeability**(or the **magnetic constant**):

$$\mu_0 = 1.25663706212(19) \cdot 10^{-6} \text{A}^{-2} \cdot \text{kg} \cdot \text{m} \cdot \text{s}^{-2} \approx 4\pi \cdot 10^{-7} \text{A}^{-2} \cdot \text{kg} \cdot \text{m} \cdot \text{s}^{-2} : \text{I}^{-2} \text{MLT}^{-2}.$$

- The **vacuum permittivity constant**:

$$\varepsilon_0 = \frac{1}{\mu_0 c^2} \approx \frac{625000}{22468879468420441\pi} \text{A}^2 \cdot \text{kg}^{-1} \cdot \text{m}^{-3} \cdot \text{s}^4 : \text{I}^2 \text{M}^{-1} \text{L}^{-3} \text{T}^4.$$

┘

**Fact (18.1.3.5) [Dimensionless Physical Constants].**

- The **fine structure constant**

$$\alpha = \frac{e^2}{4\pi\varepsilon_0\hbar c} \approx \frac{1}{137.035999084} \approx 0.0072973525693.$$

There is no exhaustive list of such constants but it does make sense to ask about the minimal number of fundamental constants necessary to determine a given physical theory. Thus, the Standard Model requires 25 physical constants, about half of them are the masses of fundamental particles (which become dimensionless when expressed relative to the Planck mass or, alternatively, as coupling strength with the Higgs field along with the gravitational constant).

Fundamental physical constants cannot be derived and have to be measured. Developments in physics may lead to either a reduction or an extension of their number: discovery of new particles, or new relationships between physical phenomena, would introduce new constants, while the development of a more fundamental theory might allow the derivation of several constants from a more fundamental constant.

A long-sought goal of theoretical physics is to find first principles (theory of everything) from which all of the fundamental dimensionless constants can be calculated and compared to the measured values.

The large number of fundamental constants required in the Standard Model has been regarded as unsatisfactory since the theory's formulation in the 1970s. The desire for a theory that would allow the calculation of particle masses is a core motivation for the search for "Physics beyond the Standard Model".

┘

## 18.2 Gauge Theory

## 18.3 General Relativity(Gravity Fields)

### 1 Basics

**Prop.(18.3.1.1)[Maxwell's Equation].** Normal Maxwell's equation reads:

$$\begin{cases} \operatorname{div} E = q & (\text{Coulomb's law}) \\ \operatorname{div} H = 0 & (\text{Gaussian law}) \\ \operatorname{curl} E = -\frac{1}{c} \frac{\partial H}{\partial t} & (\text{Faraday's law}) \\ \operatorname{curl} H = j + \frac{1}{c} \frac{\partial E}{\partial t} & (\text{Ampère-Maxwell law}) \end{cases}$$

where  $E$  is the magnetic field,  $H$  is the electric field,  $q$  the charge density,  $j$  the electric current.

In Minkowski space, we define the electromagnetic 2-form

$$F = \frac{1}{2} F_{\alpha\beta} dx^\alpha \wedge dx^\beta,$$

where  $F_{i0} = E_i$ ,  $F_{ij} = H_k$ , and electric current  $J$ ,  $J^i = -j^i$ ,  $J^0 = q$ .

Maxwell's equation can be re-written as:

$$d^*F = J \quad dF = 0.$$

Where  $d^* = *d*$ . ┘

*Proof:* The Minkowski space is flat, the equivalence can be seen by direct calculation. □

## 18.4 Quantum Mechanics

References are [B-L14, Nap].

### 1 Basics

**Remark (18.4.1.1).** Quantum mechanics are all about **probability amplitudes** or the **propagator**. Any physical observable  $X$  in quantum mechanics can be written as an operator  $\lrcorner$

**Meta Def. (18.4.1.2) [Equivalent Quantum Pictures].** A **quantum picture** is a way to explain reality and allows calculations to making predictions about reality that can be experimentally verified.

Two quantum pictures are called **experimentally equivalent** if they give the same predictions for reality that can be experimentally verified.  $\lrcorner$

### Evolution of Quantum Systems

**Prop. (18.4.1.3).** There are several ways to put time in a quantum system:

- The Schrödinger picture, where all the time dependence is located in the operators.
- The Heisenberg picture, where the wave functions carry the time dependence.
- The Diract picture(interaction representation), where both the operators and wave functions carry the time dependence.  $\lrcorner$

**Physical Law (18.4.1.4) [Schrödinger Picture of Quantum Mechanics].** The Schrödinger equation can be derived from the Dirac-von.Neumann axioms:

The **states of particles** is a countable dimensional Hilbert space, and

- The **observables** of a quantum system are defined to be the (possibly unbounded) Hermitian operators  $A$  on  $\mathbb{H}$ . Then any continuous observable is unitarily diagonalizable, with real eigenvalues by Hilbert-Schmidt(12.9.3.16). The eigenvalues of the matrix corresponding to an observable is called the **observations**.
- The **state**  $\varphi$  of the quantum system is a unit vector of  $\mathbb{H}$ , up to scalar multiples.
- The expectation value of an observable  $A$  for a system in a state  $\varphi$  is given by the inner product  $(\varphi, A\varphi)$ .
- (Unitarity) The time evolution of a quantum state according to the Schrodinger equation is mathematically represented by a unitary operator  $U(t)$  (depends only on the state an relative time)(one-parameter subgroup).

Now that  $\varphi(t) = \hat{U}(t)\varphi(t_0)$ , so  $\hat{U}(t)\varphi(t_0) = e^{-i\hat{\mathcal{H}}t}$ , where  $\hat{\mathcal{H}}$  is Hermitian, called the **quantum Hamiltonian**.

So now take derivative w.r.t  $t$ , we get  $i\frac{\partial}{\partial t}\varphi = \hat{\mathcal{H}}\varphi$ . By **quantum correspondence principle**, it is possible to derive the expression of  $\hat{\mathcal{H}}$  by classical methods.  $\lrcorner$

**Physical Law (18.4.1.5) [Heisenberg Picture of Quantum Mechanics].** ? For any quantum observable  $\hat{\mathcal{O}}$ , the **Heisenberg equation of motion**:

$$\dot{\hat{\mathcal{O}}}(t) = -i[\hat{\mathcal{O}}, \hat{\mathcal{H}}].$$

$\lrcorner$

**Def. (18.4.1.6) [Qubits].** A **qubit** is a state that is complex combination of  $|0\rangle$  and  $|1\rangle$ , i.e.  $|\varphi\rangle = \alpha|0\rangle + \beta|1\rangle$ .  $\lrcorner$

**Def. (18.4.1.7) [Quantum Entanglement and Singlets].** Any tensor in a tensor space of two Hilbert space that is not a pure tensor is called a **quantum entanglement state**. The simplest quantum entanglement is the **singlet state**

$$|\Psi_{-}\rangle = \frac{1}{\sqrt{2}}|01\rangle - \frac{1}{\sqrt{2}}|10\rangle \in (\mathbb{C}\{|0\rangle, |1\rangle\})^{\otimes 2} \cong \mathbb{C}^4.$$

$\lrcorner$

**Def. (18.4.1.8) [Pauli Observables].** The observables on a two dimensional Hilbert space, i.e. a qubit state space, are all combinations of **Pauli observables** plus **1**:

$$\sigma_z = \begin{bmatrix} 1 & 0 \\ 0 & -1 \end{bmatrix} \quad \sigma_x = \begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix} \quad \sigma_y = \begin{bmatrix} 0 & -i \\ i & 0 \end{bmatrix}$$

Their corresponding eigenvalues are denoted by

$$\uparrow = \begin{bmatrix} 0 \\ 1 \end{bmatrix} \quad \downarrow = \begin{bmatrix} 1 \\ 0 \end{bmatrix}, \quad \rightarrow = \frac{1}{\sqrt{2}} \begin{bmatrix} 1 \\ 1 \end{bmatrix} \quad \leftarrow = \frac{1}{\sqrt{2}} \begin{bmatrix} 1 \\ -1 \end{bmatrix}, \quad \otimes = \frac{1}{\sqrt{2}} \begin{bmatrix} 1 \\ i \end{bmatrix} \quad \odot = \frac{1}{\sqrt{2}} \begin{bmatrix} 1 \\ -i \end{bmatrix}.$$

The Pauli differentials are special because  $\{i\sigma_x, i\sigma_y, i\sigma_z\} = \mathfrak{su}(2; \mathbb{C})$  gives the standard representation of  $SU(2)$ .  $\lrcorner$

**Remark (18.4.1.9).** The solution of a Schrodinger equation for a non Relativistic particle is assumed to be a Schwartz function (Vanish fast enough at infinity). The coefficients is assumed smooth enough to guarantee at least uniqueness and existence locally.  $\lrcorner$

**Prop. (18.4.1.10).** The wave function on the  $(p, t)$  coordinates is the Fourier Transform of the wave function on the  $(x, t)$  coordinates, because the eigenstate of the  $p$ -operator  $i\hbar \frac{\partial}{\partial x}$  is  $e^{ikx}$ , the coefficients of which is the value (probability) of the wave function of the  $(p, t)$  coordinates.  $\lrcorner$

**Prop. (18.4.1.11) [Schrödinger Uncertainty Principle].** Set  $\sigma_A = \sqrt{\langle \hat{A}^2 \rangle - \langle \hat{A} \rangle^2}$ , then:

$$\sigma_A^2 \sigma_B^2 \geq \left| \frac{1}{2} \langle \hat{A}\hat{B} + \hat{B}\hat{A} \rangle - \langle \hat{A} \rangle \langle \hat{B} \rangle \right|^2 + \left| \frac{1}{2i} \langle [\hat{A}, \hat{B}] \rangle \right|^2.$$

$\lrcorner$

*Proof:* Derived from definition and Schwarz inequality, Cf.[Wiki].  $\square$

**Cor. (18.4.1.12) [Heisenberg Uncertainty Principle].**  $\sigma_x \sigma_p \geq \frac{\hbar}{2}$ .  $\lrcorner$

*Proof:*

$$[x, i\hbar \frac{\partial}{\partial x}] = i\hbar.$$

$\square$

**Prop. (18.4.1.13) [Spectral Decomposition].** In Quantum physics, one need to use spectral decomposition of the Hamiltonian operator. But at most cases, there are only countably many eigenstate and the eigenvalue has a lower bound and tends to infinity. In this case,  $(\hat{H} + A)^{-1}$  is a compact operator thus by spectral theorem(12.9.3.15) the eigenstate of  $\hat{H}$  forms a set of complete basis.  $\lrcorner$

**Prop. (18.4.1.14) [No-Cloning Theorem]. ?**  $\lrcorner$

### Quantizations

**Def. (18.4.1.15) [First Quantizations].** A **first quantization** of a Hamiltonian system (18.1.1.13) is a Hilbert space  $\mathcal{H} \in \mathcal{HilbSpa}$  with an map  $f \mapsto \hat{f}$  from all classical dynamical variables to linear Hermitian operators on  $\mathcal{H}$  s.t.

- $(\alpha f + \beta g)^\wedge = \alpha \hat{f} + \beta \hat{g}$ .
- The dynamical variable 1 that is unity everywhere is mapped to the identity operator  $\mathbf{1}_{\mathcal{H}}$ .
- $[\hat{f}, \hat{g}] = i\hbar\{f, g\}^\wedge + O(\hbar^2)$ .

┘

**Remark (18.4.1.16).** ? The intuition comes from the comparison of the equations:

$$\dot{F} = \{F, \mathcal{H}\}_{\text{Pois}}, \quad \{q_j, p_k\} = \delta_{jk}$$

in classical Hamiltonian system and the equations:

$$\langle \dot{\hat{F}} \rangle = \frac{1}{i} \langle [\hat{F}, \hat{\mathcal{H}}] \rangle, \quad \{\hat{q}_j, \hat{p}_k\} = i\delta_{jk}.$$

┘

**Remark (18.4.1.17) [Canonical Quantizations].** Canonical quantizations of a Hamiltonian system (18.1.1.15) work as follows:

- Write down the classical Lagrangian density in terms of fields.
- Calculate the momentum density and work out the Hamiltonian density in terms of fields.
- Treat the fields and momentum density as operators. Impose commutation relations on them to make them quantum mechanical.
- Expand the fields in terms of creation/annihilation operators. This will allow us to use occupation numbers and stay sane.

?

┘

**Example (18.4.1.18).** We can quantize the energy functor  $E$  as  $\hat{E} = i\hbar \frac{\partial}{\partial t}$ . Then the Hamilton's equation quantize to the Schrödinger equation

$$i\hbar |\dot{\psi}(t)\rangle = \hat{H} |\psi(t)\rangle.$$

And we have

$$[\hat{q}^i, \hat{q}^j] = 0, \quad [\hat{p}_i, \hat{p}_j] = 0, \quad [\hat{q}^i, \hat{p}_j] = i\hbar \delta_{i,j}.$$

$$(\dot{p}_i)^\wedge = -\frac{\partial}{\partial \hat{q}^i} \hat{H}, \quad (\dot{q}^i)^\wedge = -\frac{\partial}{\partial \hat{p}_i} \hat{H}.$$

┘

**Example (18.4.1.19) [State-Space for Non-Relativistic 3-dimensional Quantum Particles].**

Firstly, the Hilbert space  $\mathcal{H}_x$  for a single 1-dimensional quantum particle can be represented by  $L^2$ -functions on  $\mathbb{R}$ :  $|\psi_x\rangle \in \mathcal{H}_x$  is of the form

$$|\psi\rangle = \int_{\mathbb{R}} \psi(x) |x\rangle dx, \quad \int_{\mathbb{R}} |\psi(x)|^2 dx < \infty,$$

where  $\psi(x) = \langle x|\psi\rangle$ . And the position and momentum Hermitian operators  $\widehat{x}, \widehat{p}_x$  acts on  $|\psi\rangle \in \mathcal{H}_x$  via the integral representation

$$\widehat{x}|\psi\rangle = \int_{\mathbb{R}} \widehat{x}\psi(x)|x\rangle dx, \quad \widehat{p}|\psi\rangle = \int_{\mathbb{R}} -i\hbar \frac{\partial}{\partial x}\psi(x)|x\rangle dx.$$

And the Hilbert space  $\mathcal{H}_1$  for a single 3-dimensional quantum particle can be represented by

$$\mathcal{H}_1 = \mathcal{H}_x \otimes \mathcal{H}_y \otimes \mathcal{H}_z.$$

with position and momentum Hermitian operators  $\widehat{\mathbf{r}} = \widehat{x} \otimes \widehat{y} \otimes \widehat{z}$ ,  $\widehat{\mathbf{p}} = \widehat{p}_x \otimes \widehat{p}_y \otimes \widehat{p}_z$ .

Similarly, for  $n \in \mathbb{Z}_+$ , the Hilbert space  $\mathcal{H}_1$  for a single 3-dimensional quantum particles can be defined to be  $\mathcal{H}_n = (\mathcal{H}_1)^{\otimes n}$ .  $\lrcorner$

### Second Quantizations: Particle-Like Waves

**Def. (18.4.1.20) [Phonons].** Particle-like waves modes are called **phonons**.  $\lrcorner$

**Def. (18.4.1.21) [Quantum Harmonic Oscillators].** The **quantum harmonic oscillator** is a quantization of the usual 1-dimensional oscillator ?: A usual oscillator with mass  $m$  and spring constant  $K$  is give by

$$\frac{1}{2m}p^2 + \frac{1}{2}Kx^2 = E.$$

in the  $x$ -coordinate where  $E$  is the fixed energy. Then the quantization is given by the Schrödinger equation

$$\left(-\frac{1}{2m}\widehat{p}^2 + \frac{1}{2}Kx^2\right)\psi = \left(-\frac{1}{2m}\frac{\partial^2}{\partial x^2} + \frac{1}{2}Kx^2\right)\psi = E\psi$$

of the waveform  $\psi$ .

If we denote  $K = m\omega^2$ , then the quantum Hamiltonian is given by  $\widehat{H} = \frac{1}{2m}\widehat{p}^2 + \frac{1}{2}m\omega^2\widehat{x}^2$ .

If we define the annihilation and creation operators:

$$\widehat{a} = \sqrt{\frac{m\omega}{2}}\left(\widehat{x} + \frac{i}{m\omega}\widehat{p}\right), \quad \widehat{a}^* = \sqrt{\frac{m\omega}{2}}\left(\widehat{x} - \frac{i}{m\omega}\widehat{p}\right),$$

then

$$[\widehat{a}, \widehat{a}^*] = 1, \quad \widehat{H} = \omega\left(\widehat{a}\widehat{a}^* + \frac{1}{2}\right).$$

Then by [B-L14]P23, there are unique eigenstate  $E_n = |n\rangle$  with eigenvalue  $n + 1/2$  for any  $n \in \mathbb{N}$ , and

$$|n\rangle = \frac{(\widehat{a}^*)^n}{n!} |0\rangle.$$

$\lrcorner$

**Example (18.4.1.22) [Phonons in Coupled Quantum Harmonic Oscillators].** Consider a linear chain of  $N$  atoms each of mass  $m$  connected by springs of unstretched length  $a$  and which have spring constant  $K$ . The Hamiltonian for this system is

$$\widehat{H} = \frac{1}{2m} \sum_j \widehat{p}_j^2 + \sum_j \frac{K}{2} (\widehat{x}_{j+1} - \widehat{x}_j)^2.$$

If we take discrete Fourier transform

$$\hat{x}'_k = \frac{1}{\sqrt{N}} \sum_j x_j e^{-2\pi i k j / N}, \quad \hat{p}'_k = \frac{1}{\sqrt{N}} \sum_j p_j e^{-2\pi i k j / N},$$

then

$$\hat{p}'_k = \hat{p}'_{-k}, \quad \hat{x}'_k = \hat{x}'_{-k}, \quad [\hat{x}'_k, \hat{p}'_{k'}] = i\delta_{k, -k'},$$

and

$$\hat{H} = \sum_k \left[ \frac{1}{2m} \hat{p}'_k \hat{p}'_{-k} + \frac{m\omega_k^2}{2} \hat{x}'_k \hat{x}'_{-k} \right], \quad \omega_k = \frac{4K}{m} \sin^2\left(\frac{2\pi k}{2N}\right).$$

Define the creation and annihilation operators as

$$\hat{a}_k = \frac{\sqrt{m\omega_k}}{2} \left( \hat{x}'_k + \frac{i}{m\omega_k} \hat{p}'_k \right), \quad \hat{a}_k^* = \frac{\sqrt{m\omega_k}}{2} \left( \hat{x}'_{-k} - \frac{i}{m\omega_k} \hat{p}'_{-k} \right),$$

then

$$[\hat{a}_k, \hat{a}_{k'}] = 0, \quad [\hat{a}_k^*, \hat{a}_{k'}^*] = 0, \quad [\hat{a}_k, \hat{a}_{k'}^*] = \delta_{k, k'},$$

and

$$\hat{H} = \sum_k \frac{\omega_k}{2} (\hat{a}_k \hat{a}_k^* + \hat{a}_{-k} \hat{a}_{-k}^*) = \sum_{k=1}^N \omega_k \left( \hat{a}_k \hat{a}_k^* + \frac{1}{2} \right).$$

So in this Fourier coordinate, the motion is just like  $N$  uncoupled quantum harmonic oscillators (18.4.1.21). Thus the phonons in this case are just these  $\hat{x}'_k$ .  $\lrcorner$

### Calculations

**Prop. (18.4.1.23)[Virial Theorem].** For a system that  $V(r) \sim r^n$ , the average kinetic energy and the average potential energy has the relation :

$$2 \langle T \rangle = n \langle V \rangle.$$

$\lrcorner$

*Proof:* ?

$\square$

### Spin

## 2 Relativistic Quantum Mechanics

### Klein-Gordon Equation

## 3 Quantum Computations

### Classical Logic Gates

**Def. (18.4.3.1)[Boolean Functions].** A **Boolean function** is a function  $f : \mathbb{F}_2^n \rightarrow \mathbb{F}_2$ .  $\lrcorner$

**Def. (18.4.3.2)[Classical Logic Gates].** There are four classical logic gates, if we let  $0, 1 \in \mathbb{F}_2$ , then:

- **AND gate:**  $(a, b) \mapsto ab$ .
- **OR gate:**  $(a, b) \mapsto ab + a + b$ .

- **NOT gate:**  $a \mapsto a + 1$ .
- **COPY gate:**  $a \mapsto (a, a)$ .

┘

**Def. (18.4.3.3) [Reversible Gates].** A gate is called **reversible** iff it is a bijection from  $\mathbb{F}_2^n$  to  $\mathbb{F}_2^n$ . ┘

**Def. (18.4.3.4) [Simulations].** A set of gates is said to be able to **simulate** a boolean function  $f$  iff there is a composition of these gates that maps

$$(x_1, \dots, x_{m+n}) \rightarrow (g_1(x_1, \dots, x_{m+n}), \dots, g_k(x_1, \dots, x_{m+n}))$$

such that if we let  $x_{i_1} = a_1, x_{i_2} = a_2, \dots, x_{i_m} = a_m$  be fixed, where  $\{0, 1, \dots, m+n\} - \{i_1, \dots, i_m\} = \{j_1, \dots, j_n\}$  (in some order), then  $g_1(x_1, \dots, x_{m+n}) = f(x_{j_1}, \dots, x_{j_n})$ .

A set of gates is called **universal** iff they can simulate all Boolean function  $f : \mathbb{F}_2^n \mapsto \mathbb{F}_2$ . ┘

**Prop. (18.4.3.5) [Classical Gates are Universal].** The four classical gates are universal. In fact,  $\text{And}(x, y) = \text{OR}(\text{NOT}(x), \text{NOT}(y))$ , so even AND is disposable, and COPY is not used as well. ┘

*Proof:* Just use OR gate to juxtapose all possible combinations that are mapped to 1. □

**Example (18.4.3.6) [Reversible Gates].**

- The **CNOT gate** is defined to be  $\text{CNOT} : (a, b) \mapsto (a, b + a)$ .
- The **Toffoli gate** is defined to be  $\text{CCNOT} : (a, b, c) \mapsto (a, b, c + ab)$ .
- The **Fredkin gate** or CSWAP gate is a three-bit gate defined as the quantization of the gate given by:  $(a, b, c) \mapsto (a, (1 - a)c + ab, (1 - a)b + ac)$ .

┘

**Prop. (18.4.3.7).** CNOT gate cannot simulate AND. In particular, CNOT is not universal. ┘

*Proof:* It can be shown that any Boolean function that can be simulated by CNOT gate is of the form  $(x_1, \dots, x_n) \mapsto \sum a_i x_i + b$ . But AND is of the form  $(a, b) \mapsto ab$ , which is not of the form, so it is not simulated by CNOT. □

**Prop. (18.4.3.8).** The Toffoli gate (18.4.3.6) is universal (18.4.3.4). ┘

*Proof:* By (18.4.3.5), it suffices to show that it can simulate AND and NOT, then it can simulate OR because  $\text{OR}(x, y) = \text{NOT}(\text{NOT}(x), \text{NOT}(y))$ .

AND is outputted in the third bit with  $c = 0, a = x, b = y$ , NOT is outputted in the third bit with  $a = 1 = c, b = x$ . □

**Prop. (18.4.3.9).** The Fredkin gate (18.4.3.6) is universal (18.4.3.4). ┘

*Proof:* If we set the third input to be 0, then the second output of  $\text{CSWAP}(x, y, 0)$  is  $\text{And}(x, y)$ , and if we set the second input to be 0 and the third input to be 1, then the second output of  $\text{CSWAP}(x, 0, 1)$  is  $\text{NOT}(x)$ . Thus the Fredkin gate can simulate both AND and NOT gates, thus universal, by (18.4.3.5). □

### Quantum Logic Gates

Our model of quantum computation is quantum logic gates.

**Def. (18.4.3.10) [Quantum Logic Gates].** A **quantum logic gate** is a unitary matrix. In particular a quantum logic gate is always reversible.  $\lrcorner$

**Prop. (18.4.3.11) [Examples of Quantum Gates].**

- The **Hadamard gate**  $H$  is a rotation on one single qubit given by the matrix  $\begin{bmatrix} \frac{1}{\sqrt{2}} & \frac{1}{\sqrt{2}} \\ \frac{1}{\sqrt{2}} & -\frac{1}{\sqrt{2}} \end{bmatrix}$ .
- If a classical gate is reversible and its matrix is unitary, then the same matrix will give out a quantum gate with all entries 0 and 1, called the **quantization of classical gates**.  $\lrcorner$

## 4 Quantum Algorithms

**Algo. (18.4.4.1) [Deutsch-Jozsa Algorithm].** The **Deutsch-Jozsa problem** is that: given a function  $f : \mathbb{F}_2^n \rightarrow \mathbb{F}_2$ , which is either a constant function or a function that takes half value 0 and half value 1,

Consider the gate  $U_f : (x_1, \dots, x_n, x) \mapsto (x_1, \dots, x_n, x + f(x_1, \dots, x_n))$ , then there is a **Deutsch-Jozsa algorithm** that can determine if  $f$  is a constant function just using the gate  $U_f$  once.  $\lrcorner$

*Proof:* Make the state

$$H^{\otimes n+1} \circ U_f \circ H^{\otimes(n+1)}(0, 0, \dots, 0, 1) = \left( \frac{1}{2^n} \sum_{(a_1, \dots, a_n) \in \mathbb{F}_2^n} \left( \sum_{(x_1, \dots, x_n) \in \mathbb{F}_2^n} (-1)^{f(a_1 \dots a_n) + \sum_i a_i x_i} \right) |a_1 \dots a_n\rangle \right) \otimes |0\rangle,$$

and then measure all the first  $n$  bits in the  $|0\rangle/|1\rangle$ -basis. Then the result is  $(0, 0, \dots, 0)$  iff  $f$  is constant.  $\square$

### Making Classical Algorithms Reversible

Because quantum computers can only deal with reversible algorithms, we need to spend either time or space to make classical algorithms revertible. This is because by von-Neumann-Landauer limit, it takes energy to erase a bit of information.

For example, The modular exponentiation algorithm(2.10.2.1) can be made revertible as in [Sho97].

### Quantum Fourier Transform

**Def. (18.4.4.2) [Quantum Fourier Transform].** The (inverse)quantum Fourier transform is an algorithm represented by the matrix

$$U_{\text{QFT}} = \frac{1}{\sqrt{N}} \text{Van}(1, \zeta_N, \zeta_N^2, \dots, \zeta_N^{N-1}).$$

*Proof:* It suffices to prove this matrix is unitary, which is easy.  $\square$

**Lemma (18.4.4.3) [Tensor Representation].** The trick of the quantum Fourier transform lies in its connection with the 2-adic decimal representation:

$$\begin{aligned} U_{\text{QFT}}(|x_n x_{n-1} \dots x_1\rangle) &= \frac{1}{\sqrt{N}} (|0\rangle + \exp(2\pi i \cdot 0.x_1)|1\rangle \\ &\quad \otimes (|0\rangle + \exp(2\pi i \cdot 0.x_2 x_1)|1\rangle \\ &\quad \otimes \dots \\ &\quad \otimes (|0\rangle + \exp(2\pi i \cdot 0.x_n x_{n-1} \dots x_1)|1\rangle) \end{aligned}$$

┘

*Proof:* Direct calculation. ?

□

**Algo. (18.4.4.4) [Quantum Fourier Transform Algorithm, Shor].** Because of the tensor representation of quantum Fourier transform, it is anticipated that the transformation can be represented using Hadamard gate and phase change gates. The circuit given in [https://en.wikipedia.org/wiki/Quantum\\_Fourier\\_transform](https://en.wikipedia.org/wiki/Quantum_Fourier_transform) shows that for  $n \in \mathbb{Z}_+$ ,  $U_{\text{QFT}}$  on  $N = 2^n$  can be represented by a circuit with  $n(n+1)/2$  gates up to a swap. And there are  $O(n^2)$  qbit swaps to be performed, which shows that the quantum Fourier transform has complexity  $O(n^2)$ . ┘

### Shor's Algorithms

References are [Sho94], [Sho97]

**Def. (18.4.4.5).** For a number  $M = pq$ , where  $p, q$  are different odd prime numbers,  $x \in (\mathbb{Z}/(M))^*$  is called **good** iff  $r = \text{ord}(x)$  is even, and neither of  $x^{r/2} \pm 1$  is divisible by  $M$ .

Then at least half of  $(\mathbb{Z}/(M))^*$  is good. ┘

*Proof:* It suffices to consider a fixed order  $2a$ , and this is additive in  $\mathbb{Z}/(2a, p-1)\mathbb{Z} \times \mathbb{Z}/(2a, q-1)\mathbb{Z}$ . ?

□

**Algo. (18.4.4.6) [Shor's Algorithm for Computing Orders].** If we find a good  $x$  for  $M$ , then  $x^{r/2} \pm 1$  contains separately a prime  $p$  or  $q$ , so we can use Euclidean algorithm to extract a prime of  $M$ . This is just the idea of Shor's algorithm (18.4.4.7). ┘

**Algo. (18.4.4.7) [Shor's Prime Factorization Algorithm].** For  $M = pq$ , we can factor  $p, q$  out with high probability in  $O((\log M)^2)$  time. ┘

*Proof:* Cf. [Napkin P274].

□

**Algo. (18.4.4.8) [Shor's Discrete Logarithm Algorithm].** ┘

### Grover's Algorithm

**Prop. (18.4.4.9).** ┘

**Prop. (18.4.4.10) [Grover's Selection Algorithm].** If there are  $n$  items labeled  $\{0, \dots, n-1\}$ , and there is a marked item  $w$ . then there is a quantum algorithm that find  $w$  in  $O(\sqrt{n})$  times. ┘

*Proof:* Cf. [Quantum Algorithm MIT P33,35].

## 18.5 Statistical Mechanics

### 1 Basics

**Def. (18.5.1.1) [Statistical Ensembles, Gibbs].** A **statistical ensemble** is a probability distribution over the microstates of particles used in statistical mechanics to describe a single system. It formalizes the notion that an experimenter repeating an experiment again and again under the same macroscopic conditions.  $\lrcorner$

**Def. (18.5.1.2) [Statistical Equilibriums].** A **statistical equilibrium** is a system that doesn't change over time.

A **thermodynamic ensemble** is a statistical ensemble (18.5.1.1) that each microstate of particles is in statistical equilibrium.  $\lrcorner$

**Def. (18.5.1.3) [Gibbs Distribution].** In a system with Hamiltonian (classical or quantum)  $\mathcal{H}_0$  that has eigenstates  $|\lambda\rangle$  with energy eigenvalues  $E_\lambda$  for  $\lambda \in M$ . Suppose this system is parametrized by a parameter  $\beta$  (usually  $\beta = \frac{1}{k_B T}$ .)

Then the **Gibbs distribution** is a function on  $M$  whose value at  $|\lambda\rangle$  is given by

$$p_\lambda = \frac{e^{-\beta E_\lambda}}{Z}, \quad Z(\beta) = \int_M e^{-\beta E_\lambda} = \text{tr}(e^{-\beta \mathcal{H}_0}).$$

This  $Z(\beta)$  is called the **partition function** of this system. And  $\rho = e^{-\beta \mathcal{H}_0}/Z$  is called the **probability density** (operator).  $\lrcorner$

**Prop. (18.5.1.4).** The Hammersley-Clifford theorem implies that any probability measure that satisfies a Markov property is a Gibbs measure for an appropriate choice of (locally defined) energy function. Therefore, the Gibbs measure applies to widespread problems outside of physics, such as Hopfield networks, Markov networks, Markov logic networks, and boundedly rational potential games in game theory and economics. A Gibbs measure in a system with local (finite-range) interactions maximizes the entropy density for a given expected energy density; or, equivalently, it minimizes the free energy density.  $\lrcorner$

*Proof:* ?  $\square$

**Prop. (18.5.1.5) [Principle of Maximum Entropy].** Gibbs measure serves to maximize the entropy of a system, subject to a set of constraints.  $\lrcorner$

*Proof:* ?  $\square$

**Def. (18.5.1.6) [Generating Functions].** For any  $n$  observables (operators)  $\varphi_i$ , we want to calculate their correlations functions on a statistical system  $G_{ij} = \mathbf{E}(\varphi_i \varphi_j)$ . This can be done by writing  $\mathcal{H} = \mathcal{H}_0 - \frac{1}{\beta} \sum_k J_k \varphi_k$ . and consider

$$Z(\mathbf{J}) = \text{tr}(e^{-\beta \mathcal{H}_0 + \sum_k J_k \varphi_k}).$$

In this way,

$$G_{ij} = \frac{1}{Z(\mathbf{0})} \frac{\partial^2}{\partial J_i \partial J_j} Z(\mathbf{J}).$$

And similarly for higher correlation functions.  $\lrcorner$

## 2 Evolution of Statistical Systems

### Liouville's Equation

## 3 Ising Models and Potts Models

Cf.[The Knot Book, Adams].

**Prop.(18.5.3.1) [Potts Models and Tutte Polynomials].** Let  $G$  be a planer graph and  $q \in \mathbb{Z}_+$ , then the Potts model on  $G$  with  $q$ -state and interaction energy  $E(S_i, S_j) = \delta_{i,j}$  has partition function

$$Z = T_G(q, e^{-\frac{1}{kT}} - 1),$$

where  $T_G(q, t)$  is the Tutte polynomial of  $G$ . ┘

*Proof:* Cf.[Adams, P240]. ? □

**Prop.(18.5.3.2) [Potts Models and Jones Polynomials].** Any knot diagram can be turned into a signed planer graph  $G$ . Then for  $q \in \mathbb{Z}_+$ , there is aa Potts model on  $G$  with  $q$ -state and suitable choice of signed interaction energies  $E_{\pm}(S_i, S_j)$  s.t. the partition function is just

$$Z = V_G(t)$$

where  $V_G(t)$  is the Jones polynomial, and  $t \in \mathbb{C}$  satisfies  $q = 2 + t + t^{-1}$ . ┘

*Proof:* Cf.[Adams, P213]. ? □

## 4 Statistical Quantum Mechanics

## 5 Thermodynamical Systems

## 18.6 Field Theory

Field theory are continuum limits of Hamiltonian mechanics 18.1, which are discrete systems.

**Notation (18.6.0.1).**

- Use notations on smooth manifolds defined in [Smooth Manifolds I: Generalities](#).
- Choose the Heaviside-Lorentz system of units s.t.  $c = \hbar = \mu_0 = 1$  (18.1.3.4)(18.1.3.2), which can be done because their measure dimensions are independent. And then  $\varepsilon_0 = \frac{1}{\mu_0 c^2} = 1$ .
- We use the notation  $\dot{X} = \frac{\partial}{\partial t} X$  for any function  $X$  depending on the time  $t$ .

┘

**Def. (18.6.0.2) [Field Theories].** A **field theory** consists of the following:

- A differentiable manifold  $M \in \text{Diff}$  called the **space-time**.
- A differential vector bundle  $E/M$  called the **physical field**.
- A **Lagrangian**  $\mathcal{L}$  which is a differential functional on  $C^\infty(M, E)$  (13.2.1.2).

Moreover, it is called a **field theory of order**  $\leq k$  if  $\mathcal{L} = \mathcal{L}(\{\partial_I \varphi\}_{|I| \leq k})$  is smooth function on the  $k$ -th jet space of  $M$  valued in  $E$ .

A field theory of order  $\leq 1$  is also called a **classical field theory**. A field theory of order  $\leq 2$  is called a **semi-classical field theory**.

┘

### 1 Classical Field Theory

**Example (18.6.1.1) [Gravity Fields, Kepler/Newton].**

┘

**Example (18.6.1.2) [Electromagnetic Fields, Faraday/Maxwell].** The Maxwell equations are

$$\begin{cases} \nabla \cdot \mathbf{E} = \rho \\ \nabla \times \mathbf{E} = -\dot{\mathbf{B}} \\ \nabla \cdot \mathbf{B} = 0 \\ \nabla \times \mathbf{B} = \mathbf{J} + \dot{\mathbf{E}} \end{cases}$$

┘

**Example (18.6.1.3) [Velocity Fields, Euler].**

┘

### 2 Semi-Classical Field Theory

TBA

**Prop. (18.6.2.1).** Yang-Mills Fields.

┘

### 3 Perturbative Field Theory

**Remark (18.6.3.1) [Path Integrals].**

┘

## 4 Conformal Field Theory

## 5 Symmetry Breaking

**Remark (18.6.5.1).** When symmetry breaks, there are four features one should look out for:

**Phase transition:** The transition separates two distinct states of different symmetry. The low-temperature phase has lost some symmetry, more precisely it is missing a symmetry element.

**New excitations:** New particles known as Goldstone modes can emerge upon symmetry breaking.

**Rigidity:** Any attempt to deform the field in the broken symmetry state results in new forces emerging. Examples of rigidity include phase stiffness in superconductors, spin stiffness in magnets and the mechanical strength of crystalline solids.

**Defects:**

└

**Example (18.6.5.2) [Landau's Theory of Magnets].**

└

## 6 Statistical Field Theory

### Generating Functionals

One of the marvelous things about field theory is that even when we can't solve a theory exactly, the generating functional  $Z[J]$  and the Green's functions  $G(n)(x_1, \dots, x_n)$  can be expressed in terms of Feynman diagrams.

## 7 Higgs Fields

## 8 Dualities

**Def. (18.6.8.1).** Two field theory are called **equivalent field theories** if expectation values in both theories equal. In particular, the partition function should equal. ?

└

## 18.7 Quantum Field Theory

*“The mathematical problems that have been solved or techniques that have arisen out of physics in the past have been the lifeblood of mathematics.”*

–*M. Atiyah*

References are [Witten, Super-symmetry and Morse Theory]. [Witten, Topological Quantum Field Theory, 1988]. [Witten, Elliptic Genera and Quantum Field Theory], [Quantum Field Theory and the Jones Polynomial, Witten], [Supersymmetry and Morse Theory, Witten], [Etingof’s notes], [Skinner’s notes, <https://www.damtp.cam.ac.uk/user/dbs26/AQFT.html>]. [Undergraduate Lecture Notes in Topological Quantum Field Theory].

**Def. (18.7.0.1) [Quantum Field Theory].** A quantum field theory consists of the following:

- Two Riemannian manifold  $(M, g), (N, g_1) \in \text{RieMani}_\partial$ .
- A space  $\mathcal{C}$  of maps from  $M$  to  $N$ , called the **configuration space** on  $M$ . Each  $\varphi \in \mathcal{C}$  is called a **quantum field**.

┘

### Photons

#### 1 Path Integrals(Feynmann1942)

**Def. (18.7.1.1) [Actions of Quantum Field Theory].** An action of a quantum field theory(18.7.0.1) is a map  $S : \mathcal{C} \rightarrow \mathbb{R}$ . The critical points of  $S$  corresponds to classical Euler-Lagrangian equations. Usually  $S$  is assumed to be local, i.e. can be written as functions of  $\varphi$  and its derivatives.

The main tool to study QFT is the path integral

$$\int_{\mathcal{C}} g(\varphi) e^{-S(\varphi)/\hbar} d\varphi.$$

If  $g = \mathbf{1}$ , this is called the path integral  $Z(M, g, S)$ , and if  $\mathcal{O}_i$  are some operators(functions on  $\mathcal{C}$ ), the integral

$$\left\langle \prod_i \mathcal{O}_i(\varphi) \right\rangle = \int_{\mathcal{C}} \prod_i \mathcal{O}_i(\varphi) e^{-S(\varphi)/\hbar} d\varphi$$

is called the **correlation function** between the  $\mathcal{O}_i$ s.

For example, analogous as in [Brownian Motion](#) or [Generating Functions](#), the motion  $q = q(t)$  of a quantum particle in  $\mathbb{R}^N$  (1-dimensional QFT) is determined by the correlation functions

$$\text{Cor}(q_{j_1}(t_1), \dots, q_{j_n}(t_n)) = \int_{P_{a,b}} q_{j_1}(t_1) \cdot \dots \cdot q_{j_n}(t_n) e^{-S(q)/\hbar} Dq, \quad S(q) = \int_a^b \left( \frac{1}{2} \dot{q}^2 - U(q) \right) dt.$$

┘

**Def. (18.7.1.2) [Path Integral on Manifolds with Boundaries].** When  $\partial M \neq \emptyset$ , the possible fields on each boundary component  $B_i$  form a Hilbert space  $\mathcal{H}_i$ . Thus path integral defines a map

$$\otimes \mathcal{H}_i \rightarrow \mathbb{C} : \otimes \psi_i \mapsto \int_{\varphi, \varphi|_{B_i} = \psi_i} e^{-S(\varphi)/\hbar} d\varphi.$$

In particular if  $M = N \times \mathbb{I}$ , then by duality it defines a map

$$U : \mathcal{H} \rightarrow \mathcal{H} : (U\psi_0, \psi_1) = \int_{\varphi, \varphi|_{N \times \{0\}} = \psi_0, \varphi|_{N \times \{1\}} = \psi_1} e^{-S(\varphi)/\hbar} d\varphi.$$

┘

**Def. (18.7.1.3) [Feynman's Action-Amplitudes Formalism].** Feynman's amplitudes is a space-time version of the Schrödinger picture of quantum mechanics(18.4.1.4). ┘

### Instantons and Tunnelling

**Def. (18.7.1.4) [Instantons].** Instantons are constant energy solutions to quantum mechanical equations of motion with a characteristic, stable structure localized in time associated with critical points in the action. ┘

## 2 Perturbative QFT

### 0-dimensional QFT, Feynman Calculus

**Notation (18.7.2.1).**

- Consider the 0-dimensional quantum field theory for  $M = \text{pt}$  and  $N = \mathbb{R}^n$ .

┘

**Remark (18.7.2.2) [Steepest Descent Approximations].** By(12.11.3.30) with  $f(x) = S(x)$ , we get a smooth function  $I(x) \in C^\infty([0, \infty))$  s.t.

$$I(\hbar) = \hbar^{-\frac{d}{2}} e^{\frac{S(c)}{\hbar}} \int_D g(x) e^{-\frac{S(x)}{\hbar}} dx,$$

and by(12.11.3.27), the expansion of  $I(\hbar)$  at  $\hbar = 0$  only depends on derivatives of  $g$  at  $c$ . Thus to understand the expansion of  $I(\hbar)$ , it suffices to understand the **correlation functions**:

$$\langle l_1, \dots, l_N \rangle = \hbar^{-\frac{d}{2}} \int_D l_1(x) \dots l_N(x) e^{-\frac{S(x)}{\hbar}} dx$$

for any  $N \in \mathbb{N}$  and  $l_1, \dots, l_N \in V^*$ . When  $N = 0$ , this is just the partition function(18.5.1.3).

Notice in view of the expansion of  $\hbar$ , we may replace  $D$  with  $V$ (by reason as in the proof of(12.11.3.30)), and WLOG, we may assume that  $c = 0$ , and the Taylor expansion of  $S(x)$  at  $x = 0$  is

$$S(x) = S(0) + \frac{B(x, x)}{2} - \sum_{i \geq 3} \frac{B_i(x, \dots, x)}{i!}, B_i = \partial^i f(0),$$

where  $B^{-1}$  is called the **propagator**, and  $B_i/i!$  are called the **interaction terms**. ┘

**Def. (18.7.2.3) [Feynman Graphs].** A **Feynman graph** is a finite multi-graph s.t. there are no vertices of valence 2. For  $N \in \mathbb{N}$ , let  $\text{Feyn}_{\geq 3}(N)$  be the isomorphism classes of Feynman graphs with  $N$  fixed vertices of valence 1 with a labeling of them.

And if  $\underline{n} = (n_0, \dots, n_k, \dots)$ , let  $\text{Feyn}(\underline{n})$  be the isomorphism classes of finite multi-graphs s.t. for any  $k \in \mathbb{N}$ , there are exactly  $n_k$ -many vertices of valence  $k$ . ┘

**Def. (18.7.2.4) [Feynman Amplitudes].** Situation as in (12.11.3.25), given

- $B_k \in \text{Sym}^k(V^*)$  for each  $k \in \mathbb{Z}_{\geq 3}$ ,
- $N \in \mathbb{N}$ , and  $l_1, \dots, l_N \in V^*$ ,
- a Feynman graph  $\Gamma \in \text{Feyn}(N)$ ,

let the **Feynman amplitude**  $\text{Feyn}_\Gamma(l_1, \dots, l_N)$  to be defined by the following procedure:

- For  $i \in [N]_+$ , put  $l_i$  on the  $i$ -th labeled vertex of  $\Gamma$  of valence 1,
- For  $k \in \mathbb{Z}_+$ , put  $B_k$  on each unlabeled vertex of  $\Gamma$  of valence  $k$ .
- Put  $B^{-1}$  on each edge of  $\Gamma$ .
- Tensor the tensors on the vertices together, and contract them using the  $B^{-1}$  on the edges. The resulting tensor is a real number.

┘

**Lemma (18.7.2.5) [Wick's Theorem].** Situation as in (12.11.3.25), if  $N \in \mathbb{Z}_+$  and  $l_1, \dots, l_N \in V^*$ , then

$$\int_V l_1(x) \dots l_N(x) e^{-\frac{B(x,x)}{2}} dx = \begin{cases} \frac{(2\pi)^{d/2}}{\det B} \sum_{\sigma \in \Pi_{N/2}} \prod_{i \in \{1, \dots, n\}/\sigma} B^{-1}(l_i, l_{\sigma(i)}) & 2|N \\ 0 & 2 \nmid N \end{cases},$$

where  $\Pi_{N/2}$  is the set of matching on  $[N/2]_+$ .

┘

*Proof:* If  $2 \nmid N$ , this is obvious because the integrand is an odd function. Suppose  $n = 2k$ , then both sides are symmetric and multilinear in  $(l_1, \dots, l_N)$ , so it suffices to show for  $l_1 = l_2 = \dots = l_n = l$ . And by change of variable, we may assume that there is a basis  $\{x_1, \dots, x_n\}$  of  $V$  s.t.  $l(x) = x_1$ , and  $B(x_1, \dots, x_n) = x_1^2 + \dots + x_n^2$ . Then by integrating out  $x_2, \dots, x_n$  using (12.11.3.27), it suffices to show that

$$\int_{-\infty}^{\infty} x^{2k} e^{-x^2/2} dx = \sqrt{2\pi} (2k-1)!!,$$

which is true by integration by part and ??.

□

**Thm. (18.7.2.6) [Feynman Calculus, Variational Form].** Suppose

$$S(x) = \frac{B(x,x)}{2} + \tilde{S}(x),$$

where  $\tilde{S}(x) = -\sum_{i \in \mathbb{N}} g_i B_i(x, \dots, x)/i!$ ,  $g_i$  being formal parameters ( $g_0$  is called the **vacuum energy**,  $g_1$  is called the **tadpole**,  $g_2$  is called the **mass**), and consider the partition function

$$Z = \hbar^{-\frac{d}{2}} \int_V e^{-S(x)/\hbar}.$$

Then

$$Z_S = \frac{(2\pi)^{\frac{d}{2}}}{\sqrt{\det B}} \sum_{\underline{n} \in (\mathbb{N})^{\mathbb{N}}} \left( \prod_i g_i^{n_i} \right) \sum_{\Gamma \in \text{Feyn}(\underline{n})} \frac{\hbar^{b(\Gamma)}}{\# \text{Aut}(\Gamma)} \text{Feyn}_\Gamma,$$

where  $b(\Gamma) = \#E(\Gamma) + N - \#V(\Gamma)$ .

And by decomposing  $\Gamma$  into connected components, there is also a logarithmic form:

$$\log \frac{Z_S}{Z_0} = \sum_{\underline{n} \in (\mathbb{N})^{\mathbb{N}}} \left( \prod_i g_i^{n_i} \right) \sum_{\Gamma \in \text{Feyn}_{\text{cnd}}(\underline{n})} \frac{\hbar^{b(\Gamma)}}{\# \text{Aut}(\Gamma)} \text{Feyn}_\Gamma, \quad Z_0 = \frac{(2\pi)^{\frac{d}{2}}}{\sqrt{\det B}}.$$

This is called the **loop expansion**, because for  $\Gamma$  connected,  $b(\Gamma) + 1$  is the number of loops in  $\Gamma$ . ┘

**Cor.(18.7.2.7) [Feynman Calculus, Taylor Expansion Form].** Situation as in (18.7.2.2), for any  $N \in \mathbb{N}$  and  $l_1, \dots, l_N \in V^*$ , we have

$$\langle l_1, \dots, l_N \rangle = \frac{(2\pi)^{\frac{d}{2}}}{\sqrt{\det B}} \sum_{\Gamma \in \text{Feyn}(N)} \frac{\hbar^{b(\Gamma)}}{\# \text{Aut}(\Gamma)} \text{Feyn}_{\Gamma}(l_1, \dots, l_N)$$

as a formal power series in  $\hbar$ , . ┘

*Proof:* As both sides are symmetric and multilinear in  $(l_1, \dots, l_N)$ , it suffices to show for  $l_1 = \dots = l_n = l$ . Then it suffices to calculate the Taylor expansion of

$$\langle e^{l(x)}, \dots, e^{l(x)} \rangle = \hbar^{-\frac{d}{2}} \int_V e^{l(x) - \frac{S(x)}{\hbar}} dx$$

which is exactly calculated by (18.7.2.6). And the conclusions match, noticing that one is labeled and one is unlabeled so there is a multiple by  $N!$ . □

### Matrix Integrals

**Remark(18.7.2.8) [Situations].** For  $N \in \mathbb{Z}_+$ , let  $\text{Herm}^N$  be the set of Hermitian matrices of size  $N$ , with the inner product form  $(A_1, A_2) = \text{tr}(A_1 A_2)$ , with a Lebesgue measure  $d\mu$  normalized s.t.

$$\int_{\text{Herm}^N} e^{-\frac{\text{tr}(A^2)}{2}} d\mu A = 1.$$

Consider the path integral

$$Z_N = \hbar^{-N^2/2} \int_{\text{Herm}_N} e^{-\frac{S(A)}{\hbar}} d\mu A,$$

where the action functional is

$$S(A) = \frac{\text{tr}(A^2)}{2} - \sum_{m \in \mathbb{N}} g_m \frac{\text{tr}(A^m)}{m}.$$

We are interested in the behavior of the coefficients of the expansion of  $Z_N$  in  $g_i$  for large  $N$ . ┘

**Remark (18.7.6.1).** It now seems clear that the way to investigate the subtleties of low-dimensional manifolds is to associate to them suitable infinite-dimensional manifolds (e.g. spaces of connections) and to study these by standard linear methods (homology, etc.). In other words we use quantum field theory as a refined tool to study low-dimensional manifolds. —Atiyah.  $\lrcorner$

**Def. (18.7.6.2) [Topological Quantum Field Theory].** A **topological quantum field theory** (or TQFT for short) in dimension  $d$  defined over a ground ring  $\Lambda \in \mathcal{CAlg}$  consists of the following data:

- For any  $\Sigma \in \text{Diff}_{\text{orntd}, \text{cpct}}^d$ , there is a finite  $\Lambda$ -module  $Z(\Sigma)$ , called the **states of particles of  $\Sigma$** .
- For any  $M \in \text{Diff}_{\text{orntd}, \partial}^{d+1}$ , there is an element  $Z(M) \in Z(\partial M)$ , called the **vacuum state defined by  $M$** .

s.t.

- $Z$  are functorial in orientation-preserving diffeomorphisms of  $\Sigma$  or  $M$ .
- $Z$  are involutory, i.e.  $Z(\Sigma^*) = Z(\Sigma)^*$ , where  $\Sigma^*$  is  $\Sigma$  with the dual orientation and  $Z(\Sigma)^*$  is the dual module of  $Z(\Sigma)$ .
- $Z$  is multiplicative, i.e.  $Z(\Sigma_1 \amalg \Sigma_2) = Z(\Sigma_1) \otimes Z(\Sigma_2)$ , and if  $\partial M_1 = \Sigma_1 \amalg \Sigma_3$ ,  $\partial M_2 = \Sigma_3 \amalg \Sigma_2$ ,  $M = M_1 \amalg_{\Sigma_3} M_2$ , then

$$Z(M) = \langle Z(M_1), Z(M_2) \rangle$$

where the pairing is the natural pairing  $Z(\Sigma_3) \times Z(\Sigma_3)^* \rightarrow \Lambda$ .

- $Z(\emptyset^d) = \Lambda$ , and  $Z(\emptyset^{d+1}) = 1 \subset \Lambda = Z(\emptyset^d)$ .

$\lrcorner$

**Prop. (18.7.6.3) [Cobordisms].** If For  $M \in \text{Diff}_{\text{orntd}, \partial}^{d+1}$ , if  $\partial M = \Sigma_1^* \amalg \Sigma_2$ , then  $Z(M) \in Z(\Sigma_1)^* \otimes Z(\Sigma_2)$  can be regarded as a homomorphism  $Z(M) : Z(\Sigma_1) \rightarrow Z(\Sigma_2)$ , and this is compatible with composition of cobordisms. In particular, if  $\Sigma \in \text{Diff}_{\text{orntd}, \text{cpct}}^d$ ,  $M = \Sigma \times [0, 1]$ , then  $Z(M) = \text{id} \in \text{End}(Z(\Sigma))$ .

In particular, the states of particles and the vacuum states (18.7.6.2) can be calculated by cut-and-paste.  $\lrcorner$

**Def. (18.7.6.4) [Vacuum-Vacuum Expectation Values].** For  $M \in \text{Diff}_{\text{orntd}, \text{cpct}}^{d+1}$ ,  $Z(M) \in Z(\partial M = \emptyset) = \Lambda$  is an element, called the **vacuum-vacuum expectation value of  $M$** .  $\lrcorner$

**Prop. (18.7.6.5) [Homotopy Invariance].** Let  $\Sigma, \Sigma' \in \text{Diff}_{\text{orntd}, \text{cpct}}^d$ ,  $M = \Sigma \times [0, 1]$ ,  $M' = \Sigma' \times [0, 1]$ , and  $F : M \rightarrow M'$  is a homotopy of morphisms between  $f_1, f_2 : \Sigma \rightarrow \Sigma'$ , then  $Z(f) = Z(f') : Z(\Sigma') \rightarrow Z(\Sigma)$ , by (18.7.6.3).  $\lrcorner$

## Examples of Topological QFT

**Remark (18.7.6.6).** For  $d = 1$ , there are Floer/Gromov theory and holomorphic conformal field theories.  $\lrcorner$

**Remark (18.7.6.7).** For  $d = 2$ , there are Jones/Witten theory, Casson theory, Johnson theory, and “Thurston” theory.  $\lrcorner$

**Remark (18.7.6.8).** For  $d = 3$ , there are Floer/Donaldson theory.  $\lrcorner$

## 7 Vector Operator Algebras and Haag-Kastler Axioms

Cf.[Princeton Companion].

**Def.(18.7.7.1)[Haag-Kastler Axioms].** An **algebraic quantum field theory** consists of a Hilbert space  $\mathcal{H} \in \mathcal{HilbSpa}$  and for each open bounded subset  $\mathcal{O}$  of the Minkowski space a von.Neumann algebra  $\mathcal{A}(\mathcal{O})$  s.t. the following holds:

- (Isotony) If  $\mathcal{O}_1 \subset \mathcal{O}_2$ , then  $\mathcal{A}(\mathcal{O}_1) \subset \mathcal{A}(\mathcal{O}_2)$ .
- (Causality) If  $\mathcal{O}_1$  is space-like separated from  $\mathcal{O}_2$ , then  $[\mathcal{A}(\mathcal{O}_1), \mathcal{A}(\mathcal{O}_2)] = 0$ .
- (Poincaré invariance) There is a unitary representation of the Poincaré group  $\mathcal{P}$  (affine automorphism group of  $\mathbb{R}^4$ ) on  $\mathcal{H}$  s.t.  $\mathcal{A}(g\mathcal{O}) = g\mathcal{A}(\mathcal{O})g^*$  for any  $g \in \mathcal{P}$ .
- (Spectrum Condition) The joint spectrum  $\text{Spec}(P)$  of the energy-momentum operator  $P$  (i.e. the generator of space-time translations) is contained in the closed forward lightcone.
- (Existence of a vacuum vector) A cyclic Poincaré-invariant vector  $\Omega \in \mathcal{H}$  exists.

For such an algebraic quantum field theory,  $\mathcal{A} = \overline{\cup_{\mathcal{O}} \mathcal{A}(\mathcal{O})}$  is called the **quasi-local algebra**. ┘

## 8 Wightman QFT

**Def.(18.7.8.1)[Double Covering of the Poincaré Group].** The Poincaré group  $\mathbf{P}$  of the affine translations of  $\mathbb{R}^3$  has a double covering  $\tilde{\mathbf{P}}$ . ┘

**Def.(18.7.8.2)[Positive Energy Representations].**  $(\pi, \mathcal{H}) \in \text{Rep}^{\text{uni}}(\tilde{\mathbf{P}})$  is called a **positive energy representation** if the spectrum of the Hermitian (pos.unbounded) operator  $\hat{H}_\pi = it|_{t=0}\pi(t)$  is bounded below. ┘

## 18.8 Renormalization

## 18.9 Mirror Symmetry

Cf.[Princeton Companions].

## 18.10 Standard Model

### Non-Commutative Geometry Approach

References are [Gravity and the standard model with neutrino mixing, Connes].

starting with a certain noncommutative manifold, described by an algebra, one can derive the full Standard Model of high-energy physics, including the Higgs field, via a so-called spectral action principle applied to a generalized noncommutative Laplacian on this manifold. The commutative counterpart of this is the derivation of the Einstein equations (for positive-definite signature of the metric) from the spectrum of the ordinary Laplacian on a Riemannian manifold.

#### 1 Higgs Fields

#### 2 Beyond Standard Model

## 18.11 String Theory

### 1 Basics

**Def. (18.11.1.1)[B-Models].** For a Calabi-Yau manifold  $X$  with  $\dim_{\mathbb{C}} X \in 2\mathbb{Z} + 1$ , a **B-model string theory** is a ?

┘

**Def. (18.11.1.2)[Branes].** For any complex submanifold  $Y \subset X$  of dimension  $k$ , there is a brane ?.

┘

**Def. (18.11.1.3)[Open-String States].** ?

┘

**Example (18.11.1.4).** The open-string states connecting  $\mathbb{C}^k \subset \mathbb{C}^d$  with itself is the polynomial ring over the Dolbault complex

$$\Omega^{0,*}(\mathbb{C}^k)[\varepsilon_1, \dots, \varepsilon_{d-k}].$$

This is a differential graded algebra with differential  $\bar{\partial}$ .

Moreover, if there are  $N$  subcomplexes, the open-string states are

$$\mathcal{A} = \mathrm{GL}(N; \Omega^{0,*}(\mathbb{C}^k)[\varepsilon_1, \dots, \varepsilon_{d-k}]),$$

and we have a trace map

$$\mathrm{tr} : \mathcal{A} \rightarrow \mathbb{C} : A \mapsto \int_{\mathbb{C}^{k|d-k}} \mathrm{tr} A dz_1 \dots dz_k d\varepsilon_1 \dots d\varepsilon_{d-k}.$$

┘

**Def. (18.11.1.5)[Open-String Field Theory].** The **open-string field theory** has

- Fields:  $\prod \mathcal{A}$ ,
- Action:  $S(\alpha) = \frac{1}{2} \mathrm{tr}(\alpha \bar{\partial} \alpha) + \frac{1}{3} \mathrm{tr} \alpha^3$ .

## Part IV

# Number Theory and Arithmetic Geometry

## 19 | Algebraic Number Theory

## 19.1 $p$ -adic Analysis

References are [Non-Archimedean Analysis Part A] and [Kob84].

This section should only contain theorems that are only applicable to non-Archimedean valuations. Theorems that are applicable to both Archimedean and non-Archimedean valuations should be put into 12.7.

Many properties proved in Functional Analysis independent of complex analysis has counterparts in the non-Archimedean setting, and in fact the goal of this section is to build an analytic theory parallel to complex analysis.

**Notation (19.1.0.1).**

- Let  $p \in \text{Prime}$ .
- Use notations on topological commutative algebra defined in [Topological Commutative Algebra \(Adic Rings\)](#).
- In this section, all norms are non-Archimedean.

┘

### 1 Ultr norms and (Non-Archimedean) Valuations

#### Ultr norms Groups

**Def. (19.1.1.1) [(Semi-)Normed Abelian Groups].** A **semi-normed (Abelian) group** is an Abelian group  $G \in \mathcal{Ab}$  with a function  $- : G \rightarrow \mathbb{R}_{\geq 0}$  s.t.

- $|0| = 0$ .
- $|x - y| \leq \max\{|x|, |y|\}$  for all  $x, y \in R$ .

Such a function is called an **ultrametric valuation**. We can similarly define additive versions s.t.  $v : G \rightarrow \mathbb{R} \cup \{\infty\}$  is an **additive ultrametric valuation** if  $\exp \circ (-v)$  is an ultrametric valuation.

And a semi-normed group  $(G, |-|)$  is called a **normed group** if  $\ker(|-|) = 0$ .

┘

**Cor. (19.1.1.2) [Topological Structures].** For a semi-normed group  $G$  (19.1.1.1),  $G$  has a natural topological structure given by the inverse topology via  $|-|$ . Then  $G$  is a topological Abelian group (12.2.1.1) in this topology. If  $G$  is a normed group, then it is totally disconnected, because open balls at 0 are subgroups hence closed.

$G$  is called a **complete semi-normed group** if  $G$  is a complete metric space.

┘

#### Ultr norms Rings

**Def. (19.1.1.3) [(Semi-)ultr normed Ring].** A **(semi-)ultr normed ring** is a commutative ring  $A \in \mathcal{CRing}$  with a function  $|-| : A \rightarrow \mathbb{R}_{\geq 0}$  s.t.

- $(A^+, |-|)$  is a (semi-)normed Abelian group.
- $|1| = 1$  or  $|-|$  is identically zero.
- $|ab| \leq |a| \cdot |b|$  for any  $a, b \in A$ .

Such a function is called an **ultrametric valuation**. We can similarly define additive versions s.t.  $v : G \rightarrow \mathbb{R} \cup \{\infty\}$  is an **additive ultrametric valuation** if  $\exp \circ (-v)$  is an ultrametric valuation.

An **(ultra)valued ring** is a ultr normed ring with  $|ab| = |a| \cdot |b|$  for any  $a, b \in A$ . Clearly an ultravalued ring is just a ring with a non-Archimedean valuation (12.2.3.10).

It is called **degenerate (semi-)ultr normed ring** if all non-zero valuation value  $\geq 1$ .

A (non-Archimedean) **Banach-ring** is a normed ring that is complete under the valuation.  $\lrcorner$

**Prop. (19.1.1.4).** In an ultranormed ring (19.1.1.3), every triangle is an acute isosceles triangle. (This is because the biggest is smaller than the maximal of the other two, thus the biggest two are equal). Hence we have, for a circle  $B(O, r)$ , any interior point  $P$  is a center of circle, because  $OP < r$ .  $\lrcorner$

**Def. (19.1.1.5) [Bald Rings].** A normed ring  $R$  is call a **B-ring** if elements of valuation 1 is invertible, it is called **bald ring** if there is a  $\varepsilon$  that no elements has valuation in  $(1 - \varepsilon, 1)$ .  $\lrcorner$

**Prop. (19.1.1.6).** If  $K$  is a normed field with valuation ring  $R$ , the smallest subring containing a zero sequence  $a_0, a_1, \dots$  is bald (19.1.1.5).  $\lrcorner$

*Proof:* Cf. [Formal and Rigid Geometry P25].  $\square$

**Def. (19.1.1.7) [Topologically Nilpotent Elements].** An element  $a$  in a normed ring  $A$  is called **topologically nilpotent** iff  $\lim a^n = 0$ . The set of all topological nilpotent elements in  $A$  are denoted by  $A^0$ .  $\lrcorner$

**Prop. (19.1.1.8).**  $A^0$  is a subgroup of  $A^+$ , which is multiplicatively closed, and  $A^0$  is clopen in  $A$ . In particular,  $A^0$  is complete if  $A$  is complete.  $\lrcorner$

*Proof:* Cf. [Non-Archimedean analysis P27].  $\square$

**Prop. (19.1.1.9) [Nakayama's Lemma].** If  $A$  is complete normed ring and  $M$  is a  $A$ -module, if there are f.m. elements  $x_i$  of  $M$  that  $M = N + \sum x_i M$ , then  $M = N$ .  $\lrcorner$

*Proof:* The proof is verbatim as the proof of the usual Nakayama lemma.  $\square$

## 2 Normed Modules

**Def. (19.1.2.1) [Ultranormed Module].** For a normed ring  $(A, |-\|) \in \mathcal{CRing}(19.1.1.1)$ ,  $M \in \text{Mod}_A$  with an ultrametric valuation  $\|-\| : M \rightarrow \mathbb{R}_{\geq 0}$  is called **normed module** if

- $(M, \|-\|)$  is a normed Abelian group (19.1.1.1).
- $\|ax\| \leq |a| \|x\|$  for any  $a \in A, m \in M$ .

Such a function is called an **ultrametric valuation** on  $M$ . We can similarly define additive versions s.t.  $v : G \rightarrow \mathbb{R} \cup \{\infty\}$  is an **additive ultrametric valuation** if  $\exp \circ (-v)$  is an ultrametric valuation.

If  $A$  is a valued ring and the equality always holds, we call it a **faithfully ultranormed module** or a **valued module**.

If  $A$  is a valued field, any normed module is valued.  $\lrcorner$

**Remark (19.1.2.2).** This is the non-Archimedean analogue of (12.7.1.8).  $\lrcorner$

**Prop. (19.1.2.3) [Ultranormed Algebra].** A normed algebra is an  $A$  algebra  $B$  with  $A \rightarrow B$  bounded of norm 1.  $\lrcorner$

**Prop. (19.1.2.4).** For two valued module over  $A$ , if  $A$  is non-degenerate, a morphisms is bounded iff it is continuous. This is because we can multiply by elements of  $A$  to reduce to a nbhd of 0.

This applies to the case when  $A$  contains a field where the valuation is non-trivial, because we can use (19.1.2.1).  $\lrcorner$

**Def. (19.1.2.5)[Completed Tensor Product].** For two normed modules over a normed ring  $R$ , there is a complete normed  $R$ -module  $M \hat{\otimes} N$  called the **completed tensor product**, satisfying the following universal properties:  $M \times N \rightarrow M \hat{\otimes} N$  is bounded by 1, and for any complete normed  $R$ -module  $T$  and a  $R$ -map  $M \times N \rightarrow T$  bounded by  $a$ , then it factor through a  $R$ -map  $M \hat{\otimes} N \rightarrow T$  bounded by  $a$ .

It satisfies many universal properties as you can imagine.  $\lrcorner$

*Proof:* Cf.[Formal and Rigid Geometry P238].  $\square$

**Cor. (19.1.2.6).** By (19.1.2.4), when  $A$  is non-degenerate, then the amalgamated sum is just the fibered pushout when restricted to the category of complete valued module over  $A$  with continuous maps as morphisms, because it satisfies the universal property.  $\lrcorner$

**Prop. (19.1.2.7)[Amalgamated Sum].** For two normed  $R$ -algebras there is an operation of **amalgamated sum** which satisfies universal properties similar to (19.1.2.5). In fact, it is just the completed tensor product when seen as modules.  $\lrcorner$

*Proof:* Cf.[Formal and Rigid Geometry P242].  $\square$

### Weakly Cartesian Space

**Def. (19.1.2.8)[Weakly Cartesian Vector Spaces].** A normed  $K$ -vector space over a valued field  $K$  is called **weakly Cartesian** if?  $\lrcorner$

**Prop. (19.1.2.9).** If  $K$  is a complete valued field, then each normed  $K$ -vector space  $V$  is weakly Cartesian.  $\lrcorner$

*Proof:* Cf.[Non-Archimedean Analysis P92].  $\square$

### Completeness

**Prop. (19.1.2.10)[Cauchy Sequence of Non-Archimedean field].** For a sequence  $\sum a_i$  in a non-Archimedean field, it is a Cauchy sequence iff  $\lim |a_i| = 0$ .

In particular, convergent sequence are all absolutely convergent and for a Cauchy sequence not converging to 0, the valuations of the terms stabilize.  $\lrcorner$

*Proof:* One way is easy, the other way, notice  $|\sum_{v=i}^j a_i| \leq \max_{i,i+1,\dots,j} |a_v| < \varepsilon$ .  $\square$

**Prop. (19.1.2.11)[Completion of a Field].** The completion of a non-Archimedean field is preferred to choose the definition of Cauchy sequence, so we see by (19.1.2.10) that  $v(\widehat{K}) = v(K)$ .  $\lrcorner$

**Prop. (19.1.2.12).** For a complete field  $K$  and any finite vector space  $L$ ,  $L$  has only one norm up to equivalence and it is complete.  $\lrcorner$

*Proof:* Cf.[Formal and Rigid Geometry P230].  $\square$

**Prop. (19.1.2.13).** A complete valuation on a field can extend uniquely to a valuation on its alg.closure. And in the finite case, it is  $|\alpha| = |\text{Nm}(\alpha)|^{\frac{1}{d}}$ . This is an immediate consequence of (19.1.2.24) and (19.1.2.21), and  $|\alpha| \leq 1$  iff it is integral over valuation ring  $R$  of  $K$ .  $\lrcorner$

**Prop. (19.1.2.14).** Any infinite separable algebraic extension of a complete field is never complete.  $\lrcorner$

*Proof:* We use Krasner's lemma(19.1.2.26). By Ostrowski theorem(12.2.3.18), we can assume it is non-Archimedean, otherwise it cannot be infinite dimensional. Choose an infinite linearly independent basis of decreasing value rapidly enough, then we can see the field generated by the limit contains all the partial sums, contradiction.  $\square$

**Prop. (19.1.2.15)**  $[\mathbb{C}_K]$ . If  $K = \overline{K}$ , then  $\widehat{K} = \overline{\widehat{K}}$ , denoted by  $\mathbb{C}_K$ .  $\lrcorner$

*Proof:* Let  $L = \overline{\widehat{K}}$ , then we can extend to a valuation on  $L$ , now let  $f$  be a monic polynomial with coefficients in  $\widehat{K}$ , we show its root  $\alpha \in L$  can be approximated by elements in  $K$ , now let  $g$  monic in  $K[X]$  be an approximation of  $f$  that  $|g(\alpha)| \leq \varepsilon^n$ , then there is a root  $\beta$  of  $g$  that  $|\alpha - \beta| < \varepsilon$ , and  $\beta \in K$  by alg.closedness.  $\square$

**Prop. (19.1.2.16)**. If  $K$  is a complete, then  $K^{\text{sep}}$  is dense in  $\overline{K}$ .  $\lrcorner$

*Proof:* Assume  $F$  is non-Archimedean, then for  $y \in F^{\text{alg}}$ , there is a  $n$  that  $y^{p^n} = \alpha \in F^{\text{sep}}$ . We may assume  $|\alpha| \leq 1$ , then let  $\pi$  be an element that  $|\pi| < 1$ , then if  $y_i$  is a root of the separable polynomial  $Y^{p^n} - \pi^i Y - \alpha = 0$ , then  $(y - y_i)^{p^n} = \pi^i y_i$ . So  $|y - y_i| \rightarrow 0$ .  $\square$

**Def. (19.1.2.17)**  $[\mathbb{Q}_p, \text{Hensel1897}]$ .  $\mathbb{Q}_p$  is defined to be the  $p$ -adic completion of  $\mathbb{Q}$ , called the **field of  $p$ -adic numbers**. Its ring of integer is  $\mathbb{Z}_p$ , which equals the  $p$ -adic completion of  $\mathbb{Z}$ , called the **ring of  $p$ -adic integers**.  $\lrcorner$

**Prop. (19.1.2.18)**. There is a non-canonical isomorphism  $\overline{\mathbb{Q}_p} \cong \mathbb{C}$ , not compatible the topology.  $\lrcorner$

*Proof:* This follows from(3.2.7.5) and the fact they both have the same cardinality  $\aleph_1$ .  $\square$

**Cor. (19.1.2.19)**. The  $p$ -adic valuation on  $\mathbb{Q}$  can be extended to  $\mathbb{C}$  non-canonically.  $\lrcorner$

### Henselian Valued Fields

**Def. (19.1.2.20)** **[Henselian Valued Field]**. A **Henselian valued field** is a valued field  $K$  that the valuation ring  $\mathcal{O}_K$  is a Henselian local ring(5.3.10.1).  $\lrcorner$

**Prop. (19.1.2.21)**. A valued field  $K$  is Henselian(19.1.2.20) iff the valuation of  $K$  has a unique extension to any finite extension  $L/K$ .  $\lrcorner$

*Proof:* Cf.[Algebraic Number Theory Neukirch P144].  $\square$

**Def. (19.1.2.22)** **[Ramification Degrees]**. If  $L/K$  is a finite extension of valued field of degree  $n$ , then  $v$  extends uniquely to  $w(\alpha) = \frac{1}{n}v(N_{L/K}(\alpha))$ , now we define the **ramification degree** as  $[w(L^*) : v(K^*)]$ , and the **inertia degree** as the degree of the residue field extension.  $\lrcorner$

Thus for a normal extension,  $x$  and  $\sigma(x)$  has the same valuation. Hence any polynomial in  $K[X]$  has a decomposition into polynomials where all their roots has the same valuation.  $\lrcorner$

**Prop. (19.1.2.23)** **[Generalized Hensel's Lemma]**. Let  $(K, \mathcal{O}_K)$  be a complete valued non-Archimedean field. If  $P, Q, R \in \mathcal{O}_K[X]$  and  $0 \leq \lambda < 1$  that  $\deg P = m + n$ ,  $\deg Q = n$ ,  $\deg R = m$ , and

$$\deg(P - QR) \leq m + n - 1, \quad \|P - QR\|_G \leq \lambda |\text{res}(Q, R)|^2$$

where  $\|-\|_G$  is the Gauss norm on  $K[X]$ . Then there exist polynomials  $U, V$  that

$$\bullet \quad \|U\|_G, \|V\|_G \leq \lambda |\text{res}(Q, R)|,$$

- $\deg U \leq n - 1, \quad \deg V \leq m - 1.$
- $P = (Q + U)(R + V).$

┘

*Proof:* If  $\rho = |\text{res}(Q, R)| = 0$ , then  $P = QR$ . Otherwise, the map  $\theta_{Q,R} : W_m \oplus W_n \rightarrow W_{m+n}$  is invertible (3.3.1.7) where  $W_t$  is the free  $K$ -vector space of polynomials of degree  $< t$ , and we can define  $\varphi(U, V) = \theta_{Q,R}^{-1}(P - QR - UV)$ .

If  $U, V \in B(0, \lambda\rho)$ , then  $|\varphi(U, V)|_G \leq \lambda\rho$ . And it can be proved  $\varphi$  is a contraction map from  $B(0, \lambda\rho)^2$  to itself with contraction factor  $\lambda$ , so it has a fixed point  $(U, V)$  by (4.4.8.29). Then  $QU + RV = P - QR - UV$ , and we are done.  $\square$

**Cor. (19.1.2.24) [Hensel's Lemma].** Let  $(K, \mathcal{O}_K)$  be a complete valued non-Archimedean field,  $P(X) \in \mathcal{O}_K[X]$  and  $\alpha_0 \in \mathcal{O}_K$  s.t.  $|P(\alpha_0)| < |P'(\alpha_0)|^2$ , then there exists a  $\alpha \in \mathcal{O}_K$  that  $P(\alpha) = 0$  and  $|\alpha - \alpha_0| \leq |P(\alpha_0)/P'(\alpha_0)|$ .

In particular, this holds when  $|P'(\alpha_0)| = 1$  and  $|P(\alpha_0)| < 1$ , in which case we can pass to the residue field. In particular, a complete valued field is Henselian (19.1.2.20).  $\square$

*Proof:* Let  $\lambda = \|P(\alpha_0)\| / \|P'(\alpha_0)\|^2$ . Notice if we let  $P(X) = Q(X)(X - \alpha_0) + P(\alpha_0)$  where  $Q(X) \in \mathcal{O}_K[X]$ , then  $\text{res}(Q(X), X - \alpha_0) = Q(\alpha_0) = P'(\alpha_0)$  (3.3.1.9). So we can use the generalized Hensel's lemma (19.1.2.23) to conclude.  $\square$

**Cor. (19.1.2.25).** Let  $(K, \mathcal{O}_K)$  be a complete valued non-Archimedean field. If  $Q, R \in \mathcal{O}_K[X]$  are relatively prime in  $\kappa[X]$ , then there exists  $U, V \in \mathcal{O}_K[X]$  s.t.

- $\deg U \leq m - 1, \deg V \leq n - 1.$
- $QU + RV = 1.$

┘

*Proof:* Use the fact  $\theta_{Q,R} : W_n \times W_m \rightarrow W_{m+n}$  is invertible where  $W_t$  is free  $\mathcal{O}_K$ -module of polynomials of degree  $< t$ .  $\square$

**Thm. (19.1.2.26) [Krasner's Lemma].** Let  $(\mathcal{O}_K, K) \in \text{DVR}$  be a Henselian and  $\alpha, \beta \in \overline{K}$  s.t.  $|\beta - \alpha| < |\alpha - \sigma(\alpha)|$  for all  $\sigma$ , then  $K(\alpha, \beta)/K(\beta)$  is purely inseparable. In particular, if  $\alpha$  is separable over  $K$ , we have  $K(\alpha) \subset K(\beta)$ .  $\square$

*Proof:* It suffice to prove  $\tau(\alpha) = \alpha$  for all field morphism  $\tau : K(\alpha, \beta) \rightarrow \overline{K}$  fixing  $K(\beta)$ . This is because  $|\tau(\alpha) - \beta| = |\alpha - \beta| < |\alpha - \sigma(\alpha)|$ , thus  $|\tau(\alpha) - \alpha| \leq \max\{|\tau(\alpha) - \beta|, |\beta - \alpha|\} < |\alpha - \sigma(\alpha)|$ .  $\square$

**Cor. (19.1.2.27).** If  $f$  is a separable irreducible polynomial and  $\alpha$  is a root, then for  $g$  closed enough to  $f$ , there is a root  $\beta$  of  $g$  that  $K(\beta) = K(\alpha)$ . (Immediate consequence of (12.2.3.19)).  $\square$

**Cor. (19.1.2.28).** Any finite separable extension  $\mathcal{L}/\widehat{K}$  is of the form  $L_0\widehat{K}$  for some finite separable extension  $L_0/K$ , by primitive element theorem (3.2.6.18).  $\square$

**Cor. (19.1.2.29).** If  $K \subset K^{\text{sep}}$  is dense, then  $K = K^{\text{sep}}$ .  $\square$

### 3 Extensions of Norms and Valuations

See [BGR84] Chap3.

## 4 Extensions of Henselian Valued Fields

**Notation (19.1.4.1).**

- Let  $(K, v, \mathcal{O}_K, \mathfrak{m}_v, \varpi, k)$  be a Henselian non-Archimedean valued field of residue characteristic  $p \in \text{Prime}$ . If  $\mathcal{O}_K$  is DVR, assume  $(\varpi) = \mathfrak{m}_v k m_v$ .

┘

**Lemma (19.1.4.2) [Extension is Monogenous].** For a finite extension of CDVR, if the residue field extension  $\lambda/k$  is separable, then there exists a  $x \in \mathcal{O}_L$  that  $\mathcal{O}_K[x] = \mathcal{O}_L$ .

┘

*Proof:* If  $\bar{x}$  is an element of  $\lambda$  that generate  $\lambda$  over  $k$ , by primitive element theorem, then let  $\bar{f}$  be the minipoly of  $\bar{x}$ , then let  $f, x$  be lifting of them, then  $f(x)$  is a uniformizer, otherwise  $f'(x)$  has valuation 0, so  $f(x + \varpi_L)$  is a uniformizer. Now we see that  $x^i f(x)^j$  is a basis of  $\mathcal{O}_L$  over  $\mathcal{O}_K$ ,  $\square$

**Prop. (19.1.4.3).** If  $K \subset_{\text{fin}} L$  is a finite separable extension and if  $I \in \text{Ideal}(\mathcal{O}_L)$ , then  $v_K(\text{tr}_{L/K}(I)) = [v_K(I \cdot \mathfrak{D}_{L/K})]$ .

┘

*Proof:* By definition,  $\text{tr}_{L/K}(x\mathcal{O}_L) \subset \mathcal{O}_K$  iff  $x \in \mathcal{D}_{L/K}^{-1}$ , thus  $\text{tr}_{L/K}(I) \subset J$  iff  $I \subset \mathcal{D}_{L/K}^{-1}J$ , i.e.  $\text{tr}_{L/K}(I)$  is the smallest ideal  $J$  of  $\mathcal{O}_K$  that contains  $I \cdot \mathcal{D}_{L/K}$ , thus the result.  $\square$

**Prop. (19.1.4.4) [Galois Group of Completions].** If  $K$  is a DVR, then for any  $L \subset K^{\text{sep}}$ , we have  $\widehat{L} = L \otimes_K \widehat{K}$ , and this induces an equivalence between finite separable extensions of  $K$  and finite separable extensions of  $\widehat{K}$ . In particular,  $\text{Gal}_K \cong \text{Gal}_{\widehat{K}}$ .

┘

*Proof:* Cf. [Ber93]P45. ?

┘

### Unramified Extensions

**Def. (19.1.4.5) [Unramified Extensions].** A finite extension  $L/K$  is called **unramified extension** if the residue field extension  $\lambda/k$  is separable and  $[L : K] = [\lambda : k]$ . Any algebraic extension is called **unramified** iff any finite extension is unramified.

This is compatible because unramified extensions form a distinguished class. So we can talk about the **maximal unramified extension**  $T$  of  $K$ , and a field extension  $L/K$  is called **unramified** if all finite subextensions are unramified.

┘

*Proof:* It is faithfully transitive because the field extension degree is transitive, and for base change, as the residue field is separable, we let  $\lambda = k[\bar{\alpha}]$ , and choose a lift  $\alpha \in \mathcal{O}_L$ , the minipoly of  $\alpha$  is  $f(X) \in \mathcal{O}_K[X]$ . Then we have

$$[\lambda : k] \leq \deg \bar{f} = \deg f = [K(\alpha) : K] \leq [L : K] = [\lambda : k]$$

So  $L = K(\alpha)$  and  $\bar{f}$  is the minipoly of  $\bar{\alpha}$ . Then  $L' = K'(\alpha)$ , and let  $g(X)$  be the minipoly of  $\alpha$  over  $K'$ , then  $\bar{g}$  is a factor of  $\bar{f}$  so separable, hence irreducible by Hensel's lemma. Noe:

$$[\lambda' : k'] \leq [L' : K'] = \deg g = \deg \bar{g} = [k'(\alpha) : k'] \leq [\lambda' : k].$$

So  $[\lambda' : k'] = [L' : K']$ .

┘

**Prop. (19.1.4.6) [Maximal Unramified Extension].** The residue field of the maximal unramified extension  $K^{\text{ur}}/K$  is  $\bar{k}$ , and the value group is the same as  $K$ .

┘

*Proof:* The first assertion is because for any separable polynomial, it has a lift which is irreducible has a root lifting  $\bar{\alpha}$ , contradicting the maximality. For the second, look at finite subextensions, then it results from the fundamental inequality (12.2.3.20).  $\square$

### Tamely Ramified Extensions

**Def. (19.1.4.7) [Tamely Ramified Extension].** For  $K$  a Henselian non-Archimedean valued field,  $K \subset_{\text{fin}} L \in \text{Field}$  is called a **tamely ramified extension** if the residue field extension is separable and  $(e_{L/K}, p) = 1$ .  $\lrcorner$

**Prop. (19.1.4.8).** Tamely unramified extensions form a distinguished class, so we can talk about the maximal tamely unramified extensions, and a field extension  $L/K$  is called **tamely ramified** if all finite subextensions are tamely unramified.  $\lrcorner$

*Proof:* Cf.[Algebraic Number Theory Neukirch P156].  $\square$

**Prop. (19.1.4.9).**  $L/K^{\text{ur}} \subset K^{\text{sep}}/K^{\text{ur}}$  is tamely ramified iff the extension is generated by radicals over the maximal unramified extension:  $L = K^{\text{ur}}(\sqrt[p]{a_i}), (m, p) = 1$ , where  $a_i \in K^{\text{ur}}$ , (WARNING: make sure if  $a_i \in K$  or not?).  $\lrcorner$

*Proof:* Cf.[Algebraic Number Theory Neukirch P155].  $\square$

**Prop. (19.1.4.10).** The value field of tamely ramified extensions. Cf.[Neukirch P157].  $\lrcorner$

### Totally Ramified Extensions

**Def. (19.1.4.11) [Eisenstein Polynomial].** For  $(K, \mathcal{O}_K) \in \text{DVR}$ , an **Eisenstein polynomial** in  $\mathcal{O}_K[T]$  is a polynomial of the form

$$f(T) = T^n + a_{n-1}T^{n-1} + \dots + a_1T + a_0$$

where  $a_i \in \mathfrak{m}$  for any  $i$  and  $a_0 \in \mathfrak{m} \setminus \mathfrak{m}^2$ .  $\lrcorner$

**Prop. (19.1.4.12) [Totally Ramified Extensions via Eisenstein Polynomials].** If  $e(T)$  is an Eisenstein polynomial in  $\mathcal{O}_K[T]$  and  $\Pi$  is a root of  $e(T)$  in  $\overline{K}$ , then  $L = K(\Pi)$  is a totally ramified extension of  $K$  with uniformizer  $\Pi$ . Conversely, if  $L/K$  is a totally ramified and  $\Pi \in L$  is a uniformizer, then  $L = K(\Pi)$  and the minimal polynomial of  $\Pi$  is an Eisenstein polynomial.  $\lrcorner$

*Proof:*  $\square$

**Remark (19.1.4.13).** More about totally ramified extensions are discussed in [Totally Ramified Extensions](#).  $\lrcorner$

### Ramification Groups

**Def. (19.1.4.14) [Ramification Groups].** For a Galois extension  $L/K$  of CVDRs, denote  $\lambda/k$  residue fields extension of  $w|v$ , and denote  $\mathfrak{p}_w, \mathfrak{p}_v$  by  $\mathfrak{P}, \mathfrak{p}$ . Define:

The **inertia group** is  $I(L/K) = \{\sigma \in \text{Gal}(L/K) | \sigma(x) \equiv x \pmod{\mathfrak{P}}\}$ .

The **ramification group** is  $R(L/K) = \{\sigma \in \text{Gal}(L/K) | \sigma(x)/x \equiv 1 \pmod{\mathfrak{P}}\}$ .  $\lrcorner$

**Prop. (19.1.4.15).** For local fields, the ramification degree  $e$  equals the order of inertia group  $|I_{L/K}|$ .  $\lrcorner$

**Prop. (19.1.4.16).** The residue field extension  $\lambda/k$  is normal and there is an exact sequence

$$1 \rightarrow I(L/K) \rightarrow \text{Gal}(L/K) \rightarrow \text{Gal}(\lambda/k) \rightarrow 1.$$

$\lrcorner$

*Proof:* Cf.[Neukirch P172].  $\square$

**Prop. (19.1.4.17).**  $R(L/K)$  is the unique pro- $p$ -Sylow subgroup of  $\text{Gal}(L/K)$  (3.1.12.11).  $\lrcorner$

*Proof:* Cf.[Neukirch P174].  $\square$

**Prop. (19.1.4.18).** There is an exact sequence

$$1 \rightarrow R(L/K) \rightarrow I(L/K) \rightarrow \chi(L/K) \rightarrow 0$$

where  $\chi_v(L/K) = \text{Hom}(\Delta/\Gamma, \lambda^\times)$  and  $\Delta = w(L^\times), \Gamma = v(K^\times)$ . Moreover, in case  $L/K$  is a finite extension, this exact sequence splits.  $\lrcorner$

*Proof:* For any  $\sigma \in I_w$ , define the map  $\chi_\sigma : \Delta/\Gamma \rightarrow \lambda^*$  as follows: for any  $\delta \in \Delta/\Gamma$ , let  $\delta = w(x)$  for some  $x \in L^*$ , let  $\chi_\sigma(\delta) = \frac{\sigma(x)}{x} \bmod \mathfrak{P}_w$ . This is independent of  $x$  chosen, because if  $w(x) \equiv w(x') \bmod \Gamma$ , then  $w(x) = w(ax)$  for some  $a \in K^*$ , thus  $x = axu$  for some  $u \in \mathcal{O}_w^*$ . Now  $\frac{\sigma(u)}{u} \equiv 1 \bmod \mathfrak{P}$  as  $\sigma \in I_w$ , so  $\frac{\sigma(x)}{x} = \frac{\sigma(x')}{x'} \in \lambda^*$ . And the kernel of this map is  $R_w$  by definition.  $\square$

The sequence is exact on the right by [Neukirch P175].  $\textcolor{red}{?}$

### Higher Ramification Groups

**Notation (19.1.4.19).**

- Let  $(L, \mathcal{O}_L)/(K, \mathcal{O}_K) \in \text{CDVR}$  be a finite Galois extension.

$\lrcorner$

**Def. (19.1.4.20) [Higher Ramification Groups].** For  $s \in \mathbb{R}_+$ , define the  $s$ -th ramification group  $G_s(L/K) = \{\sigma \in G \mid v_L(\sigma(x) - x) \geq s + 1 \text{ for all } a \in \mathcal{O}_L\}$ .

Then we have  $G = G_{-1} \supset G_0 \supset G_1 \supset \dots$ . And  $G_0$  is the inertia group.  $\lrcorner$

**Prop. (19.1.4.21).** When  $K$  has finite residue field,  $G_1$  is the ramification group  $R_w$  (19.3.1.22). In this case, we have

$$G_s(L/K) = \{\sigma \in G_0 \mid \frac{\sigma(\varpi_L)}{\varpi_L} \in U_L^s\}, \text{ for } s \geq 0.$$

So there are injective morphism  $G_s/G_{s+1} \rightarrow U_L^s/U_L^{s+1} : \sigma \mapsto \sigma(\varpi_L)/\varpi_L$  for  $s \geq 0$ . (This is independent of  $\varpi_L$  chosen because units are mapped mod  $U_L^{s+1}$ ).  $\lrcorner$

*Proof:*  $G_1 = R_w$ : one direction is trivial, for the other, we use Teichmüller representatives, then  $R_w$  preserves all them, and  $\sigma(x) - x \equiv 0 \bmod \mathfrak{P}^2$  is true for  $\pi$ , so it is true for all.  $\square$

**Prop. (19.1.4.22).** For local fields  $L/K$ , if  $\sigma$  is in the inertia group, then

$$v_L\left(\frac{\sigma(x)}{x} - 1\right) \geq v_L\left(\frac{\sigma(\varpi_L)}{\varpi_L} - 1\right) + \delta_{v_L(x), 0}$$

for any  $x \in \mathcal{O}_L$  and a uniformizer  $\varpi_L$ . Equality holds when  $v_L(x) = 1$ .  $\lrcorner$

*Proof:* if  $L$  has residue field  $\mathbb{F}_q$ , then any element of  $\mathcal{L}$  can be written as  $\sum \xi_n \varpi_L^n$ , where  $\xi_n$  are all  $q - 1$ -th roots of unity. And because  $\sigma$  is inertia group, all  $q - 1$ -th roots of unity are preserved, so  $\sigma(\xi_n \varpi_L^n) - \xi_n \varpi_L^n = \xi_n \varpi_L \left(\frac{\sigma(\varpi_L)}{\varpi_L} - 1\right) (\sigma(\varpi_L)^{n-1} + \sigma(\varpi_L)^{n-2} \varpi_L + \dots + \varpi_L^{n-1})$  has valuation  $\geq v\left(\frac{\sigma(\varpi_L)}{\varpi_L} - 1\right) + n$ . Thus the result.  $\square$

In the sequel, we assume that the residue field extension is separable, as to use the proposition (19.1.4.2).

**Lemma (19.1.4.23).** We define  $i_{L/K}(\sigma) = v_L(\sigma x - x)$ , where  $x$  is the generator of  $\mathcal{O}_L/\mathcal{O}_K$ . If  $L/L'/K$  are Galois extensions that  $e$  is the ramification index of  $L/L'$ . Then

$$i_{L'/K}(\sigma') = \frac{1}{e} \sum_{\sigma|_{L'}=\sigma'} i_{L/K}(\sigma).$$

┘

*Proof:* Cf.[Neukirch Algebraic Number Theory P178].

□

**Def. (19.1.4.24) [Upper Numbering].** We define the **Herbrand function**  $\varphi_{L/K}(u) = \int_0^u \frac{dx}{(G_0:G_x)}$ . It maps  $\{x \geq 1\}$  to itself and is strictly increasing.

If  $m \leq s < m+1$ , then it is just  $\varphi_{L/K}(s) = \frac{1}{g_0}(g_1 + g_2 + \dots + g_m + (s-m)g_{m+1})$ , where  $g_i = |G_i|$ . By a double counting, it is

$$\varphi_{L/K}(s) = \frac{1}{g_0} \sum_{\sigma \in G} \min\{i_{L/K}(\sigma), s+1\} - 1.$$

The derivative of  $\varphi_{L/K}$  is  $\varphi'_{L/K}(s) = \frac{|G_s|}{g_0}$ .

Let  $\psi_{L/K}$  be the inverse function of  $\varphi_{L/K}$ . We define  $G^t = G_{\psi_{L/K}(t)}$ , this is called the **upper numbering**.

┘

**Lemma (19.1.4.25).** For  $L/L'/K$  Galois extensions, one has  $G_s(L/K)H/H = G_t(L'/K)$ , where  $t = \varphi_{L/L'}(s)$ . Equivalently,  $G_s/H_s = (G/H)_{\varphi_{L/L'}(s)}$ . ┘

*Proof:* For  $\sigma' \in G(L'/K)$ , we choose a inverse image  $\sigma \in G(L/K)$  of maximal  $i_{L/K}(\sigma)$ , then  $i_{L'/K}(\sigma') - 1 = \varphi_{L/L'}(i_{L/K}(\sigma) - 1)$ . To prove this, let  $i_{L/K}(\sigma) = m$ , then we see  $i_{L/K}(\sigma\tau) = \min\{i_{L/K}(\tau), m\}$ , so by (19.1.4.23),  $i_{L'/K}(\sigma') = \frac{1}{e} \sum_{\tau \in H} \min\{i_{L/K}(\tau), m\}$ . And  $e = |H_0|$  by (19.1.4.15). So the assertion follows from (19.1.4.24).

Now  $\sigma'$  is in the image of  $G_s$  is equivalent to  $i_{L/K}(\sigma) - 1 \geq s \iff \varphi_{L/L'}(i_{L/K}(\sigma) - 1) \geq \varphi_{L/L'}(s)$ , which by what proved is equivalent to  $\sigma' \in G_t(L'/K)$ . ┘

**Cor. (19.1.4.26).** For  $L/L'/K$  Galois extensions,  $\varphi_{L/K} = \varphi_{L'/K} \circ \varphi_{L/L'}$ , hence similar formula holds for  $\psi$ . ┘

*Proof:* By the proposition and multiplicity of ramification index  $e$ , we get

$$\frac{1}{e_{L/K}} |G_s| = \frac{1}{e_{L'/K}} |(G/H)_t| \frac{1}{e_{L/L'}} |H_s|.$$

where  $t = \varphi_{L/L'}(s)$ , which is equivalent to the derivative

$$\varphi'_{L/K}(s) = \varphi'_{L'/K}(t) \varphi'_{L/L'}(s) = (\varphi_{L'/K} \circ \varphi_{L/L'})'(s),$$

and they are equal at  $s = 0$ , so the conclusion follows. ┘

**Prop. (19.1.4.27) [Herbrand's Theorem].** For  $L/L'/K \in \mathbf{Field}$  s.t.  $L/K, L'/K \in \mathbf{GalField}$  and any  $t \in \mathbb{R}$ ,  $G^t(L'/K)$  is the image of  $G^t(L/K)$  under the quotient. ┘

*Proof:* Let  $r = \varphi_{L'/K}(t)$ , by the above lemme and corollary,

$$G^t H/H = G_{\varphi_{L/K}(t)} H/H = G'_{\varphi_{L/L'}(\psi_{L/K}(t))} = G'_{\varphi_{L/L'}(\psi_{L/L'}(r))} = G_r(L'/K) = G^t(L'/K)$$

□

**Prop. (19.1.4.28) [Hasse-Arf].** For an Abelian extension of CDVRs  $L/K$  that the residue field extension is separable, the jump in the upper numbering of higher ramification group  $G^v$  must happen at integers. (Note: The proof in the case where  $K$  is a local field is much easier by Lubin-Tate group, See(19.7.2.33)).

┘

*Proof:* The theorem is just saying that if  $G_s \neq G_{s+1}$  for  $s$  integer, then  $\varphi_{L/K}(s)$  is an integer.

This follows from the following lemma, because if  $G$  is not totally ramified, then we can change it to the Galois field of  $G_0$ , this didn't change anything by the definition of(19.1.4.24), and the fact  $\varphi(0) = 0$ . And when  $G^v \neq G^{v+}$ , then we consider splitting  $G/G^{v+}$  into product of cyclic groups, thus there is one cyclic group  $H$  that the projection of  $G^v$  into  $H$  is not trivial. Now  $H$  is a Galois group of some  $L'/K$ , and Herbrand's theorem shows that  $H^v \neq H^{v+}$ , hence  $v$  is an integer by the following lemma.

□

**Lemma (19.1.4.29).** For a cyclic totally ramified extension  $L/K \in \text{CDVR}$  s.t. the residue field extension is separable, if  $\mu$  is the maximal integer that  $G_\mu \neq 1$ , then  $\varphi_{L/K}(G_\mu)$  is an integer.

┘

*Proof:* Cf.[Serre Local Fields P94].

□

**Example (19.1.4.30).** If  $K_n = \mathbb{Q}_p(\mu_{p^n})$ , then

$$\text{Gal}_s(K_n/\mathbb{Q}_p) = \text{Gal}(F_n/F_t) \quad \text{for } p^t - 1 \leq s < p^{t+1} - 2.$$

Thus  $\text{Gal}^i(K_n/\mathbb{Q}_p) = \text{Gal}(K_n/K_i)$ .

┘

*Proof:* This is because  $\zeta_{p^n} - 1$  is a uniformizer of  $K_n$ (19.1.5.28).

□

## 5 Local Fields

### $p$ -adic Fields

**Def. (19.1.5.1) [ $p$ -adic Fields].** A  $p$ -adic field is a CDVR  $(K, v, \mathcal{O}_K, \mathfrak{p}_v, \varpi_K, \kappa)$  s.t.  $\text{char } K = 0$ ,  $\text{char } \kappa = p$ ,  $\kappa = \kappa^{\text{perf}}$ . A  $p$ -adic local field(19.1.5.10) is a  $p$ -adic field(19.1.5.1). The category of  $p$ -adic fields is denoted by  $p\text{-Field}$ .

┘

**Def. (19.1.5.2) [Topological Completion].** For  $K \in p\text{-Field}$ (19.1.5.1), define  $\mathbb{C}_K = \widehat{\overline{K}}$ , which is an alg.closed complete valued field, by(19.1.2.24)(19.1.2.21) and(19.1.2.15). Also denote  $\mathbb{C}_p = \mathbb{C}_{\mathbb{Q}_p}$ .

┘

**Lemma (19.1.5.3).** If  $K \in p\text{-Field}$  and  $P(X) \in \overline{K}[X]$  is a monic polynomial of degree  $n$ , and all of its roots satisfied  $v_p(\alpha) \geq c$  for some constant  $c$ . Let  $q = p^k$  if  $n = p^k d$ ,  $d \neq 1$  or  $n = p^{k+1}$ .

Then the derivative  $P^{(q)}(X)$  has a root  $\beta$  with  $v_p(\beta) \geq c$  or in case  $n = p^{k+1}$ ,  $v_p(\beta) \geq c - \frac{1}{p^k(p-1)}$ .

┘

*Proof:* Let  $P = X^n + a_{n-1}X^{n-1} + \dots + a_0$ , then  $v_p(a_i) \geq (n-i)c$ . And

$$1/q! \cdot P^{(q)}(X) = \sum_{i=0}^{n-1} C_{n-i}^q a_{n-i} X^{-i-q}.$$

So at least one root  $\beta$  satisfies

$$v_p(\beta) \geq \frac{1}{n-q}((n-q)c - v_p(C_n^q)) = c - \frac{1}{p^k(p-1)}.$$

□

**Lemma (19.1.5.4).** If  $K$  is a  $p$ -adic field and  $\alpha \in \overline{K}$ , let  $\Delta_K(\alpha) = \inf_{g \in \text{Gal}_K} v_p(g(\alpha) - \alpha)$ , then there exists a  $\delta \in K$  that  $v_p(\alpha - \delta) \geq \Delta_K(\alpha) - p/(p-1)^2$ . ┘

*Proof:* We strengthen the assertion and use induction on  $n = [K(\alpha) : K]$  to prove that there is a  $\delta$  that  $v_p(\alpha - \delta) \geq \Delta_K(\alpha) - \sum_{k=0}^m \frac{1}{p^k(p-1)}$ , where  $p^{m+1}$  is the largest power of  $p$  that  $\leq n$ .

$n = 1$  is sure, let the minipoly of  $\alpha$  over  $K$  be  $P(X)$ . By lemma (19.1.5.3), there is a root  $\beta$  of  $P^{(q)}$  that  $v_p(\beta - \alpha) \geq v_p(\alpha)$  or minus a factor when  $n = p^{k+1}$ . Then for any  $\sigma$ ,  $v_p(\sigma(\beta) - \beta) \geq v_p(\sigma(\alpha) - \alpha)$  or minus a factor. Then  $\Delta(\beta) \geq \Delta(\alpha)$  or minus a factor. Now  $[K(\beta) : K] < [K(\alpha) : K] = n$ , so we can use induction hypothesis to get the result. □

**Remark (19.1.5.5).** The constant  $p/(p-1)^2$  can be replaced by  $1/(p-1)$ , and it is optimal: this is a theorem of Borgne in [Bor10]. ┘

**Thm. (19.1.5.6) [Ax-Sen-Tate].** If  $K \in p\text{-Field}$  and  $K \subset L \subset K^{\text{sep}}$ , then  $(\mathbb{C}_K)^{\text{Gal}_L} = \widehat{L}$ . ┘

*Proof:* Any  $\alpha \in \widehat{K}$  can be written as  $\sum \alpha_n$  with  $\alpha_n \in \overline{K}$ . Then  $\Delta_L(\alpha_n) \rightarrow \infty$ , and  $\alpha_n$  can be approximated by  $\delta_n \in L$  by lemma (19.1.5.4), thus  $\alpha \in \widehat{L}$ . □

**Prop. (19.1.5.7).** For any  $K \in p\text{-Field}$ ,  $\mathcal{O}_K^*$  thus also  $K^\times$  are locally compact. ┘

*Proof:* For  $n$  large,  $U^n \cong \mathfrak{m}_K^n$  by the  $p$ -adic logarithm map (19.1.5.16), so it is compact. □

### Local Fields

**Notation (19.1.5.8).**

- Let  $p \in \text{Prime}$  and  $(K, \mathcal{O}_K, \mathfrak{m}_K, \kappa) \in p\text{-NField}$  (19.1.5.12). ┘

**Def. (19.1.5.9) [Local Fields].** A **local field** is a locally compact valued field. A local field is clearly complete. The category of local fields is denoted by **LField**. ┘

**Prop. (19.1.5.10) [Complete Valued Fields].** A complete Archimedean valued field must be  $\mathbb{R}$  or  $\mathbb{C}$ , by (12.2.3.18).

Any complete non-Archimedean valued field is discretely valued, and has finite residue fields of characteristic  $p \in \text{Prime}$ . Such a field is called a  **$p$ -adic local fields**. The category of  $p$ -adic local fields is denoted by  $p\text{-LField}$ . ┘

*Proof:* Cf. [Sutherland, L9]. ? □

**Remark (19.1.5.11).** The valuation ring of a  $p$ -adic local field is a DVR, thus the theory of Dedekind domains<sup>7</sup> applies to this case. ┘

**Prop. (19.1.5.12) [ $p$ -adic Local Fields].**  $p$ -adic local fields are precisely the finite extensions of the field  $\mathbb{Q}_p$  or  $\mathbb{F}_p((t))$ , called  **$p$ -adic number field** and  **$p$ -adic function field** respectively.

The category of  $p$ -adic number fields are denoted by  $p\text{-NField}$ , and the category of  $p$ -adic function fields are denoted by  $p\text{-FField}$ . ┘

*Proof:* Cf. [Neukirch Algebraic Number Theory P135]. □

### Group Structures

**Prop. (19.1.5.13).** For  $m > 0$ , there is an isomorphism  $(-)^m : U^n \cong U^{n+v(m)}$  when  $n$  is sufficiently large.  $\lrcorner$

*Proof:* Let  $m = u\pi^{v(m)}$ . For surjectivity, we need to find  $x$ , that  $1 + a\pi^{n+v(m)} = -(1 + x\pi^n)^m$ . i.e.

$$-a + ux + \pi^{n-v(m)}f(x) = 0.$$

This has a solution  $x$  by Hensel's lemma.  $\square$

**Cor. (19.1.5.14).**  $(K^*)^m$  is an open subgroup of  $K^*$ , and  $\bigcap_m (K^*)^m = 1$ . (Because if  $a \in \bigcap_m (K^*)^m = 1$ , then  $a$  is a unit, thus  $a \in \bigcap_m (U)^m = 1$ , thus  $a \in U^n$  for every  $n$  thus  $a = 1$ ).  $\lrcorner$

**Prop. (19.1.5.15).**  $[K^\times : (K^\times)^m] = m \cdot |m|_{\mathfrak{p}}^{-1} \cdot |\mu_m(K)|$ .  $\lrcorner$

*Proof:* Use the multiplicative Herbrand quotient (4.8.8.7),  $(K^* : (K^*)^m) = q_{0,m}(K^*)|\mu_m(K)|$ .  $q_{0,m}$  is additive, thus

$$q_{0,m}(K^*) = q_{0,m}(K/U)q_{0,m}(U/U^n)q_{0,m}(U^n).$$

$q_{0,m}(K/U) = m$ ,  $q_{0,m}(U/U^n) = 1$  as  $U/U^n$  is finite (4.8.8.9). It For  $q_{0,m}(U^n)$ , when  $n$  is large, it equals  $(U^n : U^{n+v(m)})$  by (19.1.5.13), which is  $|m|_{\mathfrak{p}}^{-1}$ .  $\square$

**Prop. (19.1.5.16) [ $p$ -adic Logarithm].** There is a unique multiplicative  $p$ -adic logarithm function  $\log : K^\times \rightarrow K$  that  $\log(\varpi_K) = 0$ , and for  $x \in \mathfrak{m}_K$ ,

$$\log(1+x) = x - \frac{x^2}{2} + \frac{x^3}{3} - \dots$$

Moreover, for  $t > \frac{e_K}{p-1}$ , there is a map  $\exp : \mathfrak{p}^t \rightarrow U^t$  : which is an inverse to  $\log$  on  $U^t$ , inducing an isomorphism  $U^t \cong \mathfrak{p}^t$ .

Moreover, because of the uniqueness and continuity, this map in fact can be defined to be a locally analytic from  $\mathbb{C}_p^\times$  to  $\mathbb{C}_p$  with derivative  $1/x$ .  $\lrcorner$

*Proof:* This follows from (10.7.4.22). Notice that any such function must vanish on the Teichmüller lifts of elements in  $\kappa$ .  $\square$

**Prop. (19.1.5.17) [Multiplicative Group Structures].** For  $K \in p\text{-LField}$ ,

- If  $\text{char } K = 0$ , then  $\mathcal{O}_K^* \cong \mathbb{Z}/(p-1) \oplus \mathbb{Z}/(p^a) \oplus \mathbb{Z}_p^d$ , where  $d = [K : \mathbb{Q}_p]$  and  $a \in \mathbb{N}$ .
- If  $\text{char } K = p$ , then  $\mathcal{O}_K^* \cong \mathbb{Z}/(p-1) \oplus \mathbb{Z}_p^{\mathbb{N}}$ .

$\lrcorner$

*Proof:* Cf. [Neukirch P140].  $\square$

**Prop. (19.1.5.18) [Multiplicative Group Structures].** For  $p \in \mathbf{P}$ ,

$$\mathbb{Q}_p^\times \cong \begin{cases} \mathbb{Z} \times \mathbb{Z}_p \times \mathbb{Z}/(p-1) & , p \neq 2 \\ \mathbb{Z} \times \mathbb{Z}_2 \times \mathbb{Z}/(2) & , p = 2 \end{cases}$$

$\lrcorner$

**Cor. (19.1.5.19).** For  $p \neq \ell \in \mathbf{P}$ ,  $\mathbb{Q}_p \not\cong \mathbb{Q}_\ell$ .  $\lrcorner$

*Proof:* Because  $\mathbb{Q}_p^\times \not\cong \mathbb{Q}_\ell^\times$ : Firstly look at the torsion groups, then also look at  $\mathbb{Q}_p^\times/(\mathbb{Q}_p^\times)^2 \not\cong \mathbb{Q}_\ell^\times/(\mathbb{Q}_\ell^\times)^2$ .  $\square$

**Prop. (19.1.5.20).** Any automorphism of  $\mathbb{R}$  or a  $p$ -adic number field is identity.  $\lrcorner$

*Proof:* It suffices to show that an automorphism is continuous. For  $\mathbb{R}$ , this is because  $a > 0 \iff a = b^2 \iff \sigma(a) = \sigma(b)^2 \iff \sigma(a) > 0$ , and  $\mathbb{Q}$  is dense in  $\mathbb{R}$ .

For a local field, we prove that  $\sigma(\mathcal{O}_K^*) \subset \mathcal{O}_K^*$ .  $\mathcal{O}_K^*$  is characterized by the property that  $\{n|y^n = x\}$  are infinite. This is because  $x^p = a$  has a root for  $a \in \mathcal{O}_K^*$  for  $p$  large prime, by Henselian lemma.  $\square$

**Def. (19.1.5.21) [Norm Groups].** For any extension of local fields  $L/K$ ,  $\text{Nm}_{L/K}$  is open, and  $\mathcal{N}_{L/K} = \text{Nm}_{L/K} L^\times \subset K^\times$  is called the **norm group** of  $L/K$ .  $\lrcorner$

### Extension Fields

**Prop. (19.1.5.22).**  $[\mathbb{Q}_p^{\text{ab,tame}} : \mathbb{Q}_p^{\text{ab,ur}}] < \infty$ .  $\lrcorner$

*Proof:*  $\square$

**Prop. (19.1.5.23).** The maximal unramified extension of  $\mathbb{F}_p((t))$  is  $T = \overline{\mathbb{F}_p}((t))$ , and the maximal tamely unramified extension of  $\mathbb{F}_p((t))$  is  $T(\sqrt[m]{t} | m \geq 1, (m, p) = 1)$ .  $\lrcorner$

*Proof:*  $\square$

**Prop. (19.1.5.24).** Any finite quotient group of  $\text{Gal}_K$  is solvable.  $\lrcorner$

*Proof:* This follows from (19.1.4.17)(19.1.4.16)(19.1.4.18) and (3.1.12.12) and (3.1.6.2).  $\square$

**Def. (19.1.5.25) [Tame Characters].** There is an isomorphism

$$\hat{t} : I_K/R_K \cong \text{Gal}(K^{\text{tame}}/K^{\text{ur}}) \cong \prod_{\ell \neq p} \mathbb{Z}_\ell$$

and the projection to  $\mathbb{Z}_\ell$  is called the  $\ell$ -adic (additive) **tame character** of  $I_K$ .

Equivalently, if  $\ell \in \mathbf{P} \setminus \{p\}$ , for any compatible system of  $\ell^\infty$ -th roots  $\{\varpi_{\ell^n}\}$  of  $\varpi$  in  $\overline{K}$ , it is the character  $t_\ell$  of  $\text{Gal}_K$  that  $\sigma(\varpi_{\ell^n}) = \zeta_{p^n}^{t_\ell(\sigma)} \varpi_{\ell^n}$ .  $\lrcorner$

### Ramifications of Cyclotomic Fields

References are [Tat67].

**Prop. (19.1.5.26) [Unramified cases].** Let  $\#\kappa = q$  and  $n \in \mathbb{Z}_+ \setminus (p)$ , consider  $L = K(\zeta_n)$ . Then  $L/K$  is unramified of inertia degree  $f$  where  $f$  is the minimal number that  $q^f \equiv 1 \pmod n$ . And  $\mathcal{O}_L = \mathcal{O}_K[\zeta_n]$ .  $\lrcorner$

*Proof:*  $\zeta_n$  is a root of  $\Psi_n(X)|X^n - 1$ , which is separable over  $\kappa$ , so  $\Psi_n$  and  $\overline{\Psi_n}$  are both irreducible of the same degree by Hensel's lemma. So it is unramified, and  $\lambda$  is the minimal extension of  $\mathbb{F}_q$  that contains the  $n$ -th roots and are generated by it, thus the result by the theory of finite fields.

For the last assertion, notice it is unramified so  $\mathcal{O}_L = \mathcal{O}_K[\zeta_n] + p\mathcal{O}_L$  hence the result follows from Nakayama's lemma.  $\square$

**Cor. (19.1.5.27).** The maximal unramified extension of  $K$  is generated by adjoining all  $n$ -th roots where  $(n, p) = 1$ . This is because there is an inclusion relation and their residue field  $\overline{\mathbb{F}}_p$  is already generated by roots of unity.  $\lrcorner$

**Prop. (19.1.5.28)[Totally Ramified cases].** Consider  $\mathbb{Q}_p$  (other local fields behave different), we have the  $\mathbb{Q}(\zeta_{p^n})/\mathbb{Q}$  is totally ramified of degree  $\varphi(p^n)$  the Galois group is  $(\mathbb{Z}/(p^n))^*$ . The ring of valuation of  $\mathbb{Q}_p(\zeta_{p^n})$  is  $\mathbb{Z}_p[\zeta_{p^n}]$  and  $1 - \zeta_{p^n}$  is a uniformizer.  $\lrcorner$

*Proof:* Notice

$$\Psi_{p^n}(X) = \frac{X^{p^n} - 1}{X^{p^{n-1}} - 1} \equiv (X - 1)^{p^{n-1}(p-1)} \pmod{p}$$

and  $\Phi(1) = p$ . So  $\text{Nm}(1 - \zeta_{p^n}) = \prod(1 - \sigma(\zeta_{p^n})) = \Phi(1) = p$ . Thus  $\mathbb{Q}(\zeta_{p^n})/\mathbb{Q}$  is totally ramified of degree  $p^{n-1}(p-1)$  and  $1 - \zeta_{p^n}$  is a uniformizer. The ring of integer is generated by a uniformizer by (12.2.3.20) as the extension is totally ramified.  $\square$

**Prop. (19.1.5.29)[Infinite Cyclotomic Field].** Let  $K_n = K(\zeta_{p^n})$  and  $K_\infty = \cup K_n$ . Let  $\chi_{\text{cycl}}$  be the cyclotomic character, then  $\chi(\text{Gal}_K)$  is an open subgroup of  $\mathbb{Z}_p^*$ , thus contains a  $U_n$  for some  $n$ . Thus there is an isomorphism of groups:  $\chi^{-1}(U_n) \cap \text{Gal}_K / \chi^{-1}(U_{n+1}) \cap \text{Gal}_K \cong U_n / U_{n+1}$  which has order  $p$ , for  $n$  large.

So  $K_{n+1}/K_n$  is totally ramified of degree  $p$ , because  $K_n = K(\mu_{p^n})$ , and its value group extension is of degree  $p$ , too.

And  $[K_n : \mathbb{Q}(\mu_{p^n})]$  is decreasing and eventually equals to  $[K_\infty : \mathbb{Q}(\mu_{p^\infty})]$ . This is because its order equals  $\chi^{-1}(U_n)/\chi^{-1}(U_n) \cap \text{Gal}_K \cong \chi^{-1}(U_n) \text{Gal}_K / \text{Gal}_K$ , which is eventually  $\ker(\chi) \text{Gal}_K / \text{Gal}_K$ , because  $U_n \subset \chi(\text{Gal}_K)$ .  $\lrcorner$

**Cor. (19.1.5.30).** For  $n$  large, if  $x_i$  is a set of basis of  $\mathcal{O}_{K_n}$  over  $\mathcal{O}_{\mathbb{Q}(\mu_{p^n})}$ , then they form a basis of  $K_N$  over  $F_N$  for all  $N \geq n$ . This is because it generate  $K_N$  over  $F_N$  and  $[K_N : F_N] = [K_n : F_n]$ .  $\lrcorner$

**Prop. (19.1.5.31).**  $p^n v_p(\mathfrak{D}_{K_n/F_n})$  is bounded and eventually constant. In particular  $v_p(\mathfrak{D}_{K_n/F_n})$  converges to 0.  $\lrcorner$

*Proof:* Cf.[Galois representation Berger P20].  $\square$

**Cor. (19.1.5.32).** If  $L/K$  is a finite extension, then  $\text{tr}_{L_\infty/K_\infty}(\mathfrak{m}_{L_\infty}) = \mathfrak{m}_{K_\infty}$ .  $\lrcorner$

*Proof:* By (19.1.4.3) and the fact  $\text{Gal}(L_\infty/K_\infty) \cong \text{Gal}(L_n/K_n)$  for  $n$  large by (19.1.5.29), we have  $\text{tr}_{L_\infty/K_\infty}(\mathfrak{m}_{L_n}) = \mathfrak{m}_{K_n}^{c_n}$ , where  $c_n = [v_{K_n}(\mathfrak{m}_{L_n} \mathcal{D}_{L_n/K_n})]$ . By the above proposition,  $c_n$  is bounded by a  $c$ . But if  $x \in \mathfrak{m}_{K_\infty}$ ,  $x \in \mathfrak{m}_{K_n}^c$  for  $n$  large, so  $x \in \text{tr}_{L_\infty/K_\infty}(\mathfrak{m}_{L_\infty})$ .  $\square$

**Lemma (19.1.5.33).** For any  $\delta > 0$ , when  $n$  is large, if  $x \in \mathcal{O}_{K_{n+1}}$  and  $g \in \text{Gal}(K_{n+1}/K_n)$ ,  $v_p(g(x) - x) \geq \frac{1}{p-1} - \delta$ . In particular,  $v(N_{K_{n+1}/K_n}(x) - x^p) \geq \frac{1}{p-1} - \delta$ .  $\lrcorner$

*Proof:* Choose a basis  $e_i$  of  $\mathcal{O}_{K_n}/\mathcal{O}_{F_n}$ , then  $e_i^*$  is a basis for  $\mathcal{D}_{K_n/F_n}$ , and if  $x_i = \text{tr}_{K_{n+1}/F_{n+1}}(xe_i)$ , then  $x_i \in \mathcal{O}_{F_{n+1}}$  and  $x = \sum x_i e_i$ , by (19.1.5.30), and we have by (19.1.4.30),  $v(g(x_i) - x_i) \geq 1/(p-1)$ , so when  $n$  is large, by (19.1.5.31),  $v(x_i) \geq -\delta$ , so the require is satisfied.  $\square$

**Prop. (19.1.5.34).** if  $\delta > 0$  and  $I$  is the ideal of elements of valuation  $\geq 1/(p-1) - \delta$ , then for  $n$  large, there is a map  $x \mapsto x^p : \mathcal{O}_{K_{n+1}}/I \cap \mathcal{O}_{K_{n+1}} \rightarrow \mathcal{O}_{K_n}/I \cap \mathcal{O}_{K_n}$ , and it is surjective.  $\lrcorner$

*Proof:* For  $n$  large, choose a uniformizer  $\pi_{n+1}$  of  $K_{n+1}$ , then  $\pi_n = N_{K_{n+1}/K_n}(\pi_{n+1})$  is the uniformizer of  $K_n$  because it is totally ramified (19.1.5.29), so any element  $x \in \mathcal{O}_{K_{n+1}}$  can be written as  $\sum \pi_{n+1}^i [x_i]$ , where  $x_i \in k_{K_{n+1}} = k_{K_\infty}$ . Then  $x^p \equiv \sum \pi_{n+1}^{pi} [x_i]^p \equiv \sum \pi_n^i [x_i^p] \pmod{I}$  by the above proposition. And the surjection is verbatim.  $\square$

**Def. (19.1.5.35) [Tate's Normalized Trace, [Tat67]].** The function  $R_n(x) = p^{-k} \text{tr}_{\mathbb{Q}(\mu_{p^{n+k}})/\mathbb{Q}(\mu_{p^n})}(x)$  is compatible with varying  $k$  and defines a  $\mathbb{Q}(\mu_{p^n})$ -linear projection from  $\mathbb{Q}(\mu_{p^\infty})$  to  $\mathbb{Q}(\mu_{p^n})$ , and it commutes with the  $\text{Gal}_{\mathbb{Q}}$ -action, called the **Tate's normalized trace**.

From (19.1.5.36) it's easily verified that  $R_n(\mathcal{O}_{\mathbb{Q}(\mu_{p^{n+k}})}) \subset \mathcal{O}_{\mathbb{Q}(\mu_{p^n})}$ , thus  $R_n(\pi_n^j \mathcal{O}_{\mathbb{Q}(\mu_{p^{n+k}})}) \subset \pi_n^j \mathcal{O}_{\mathbb{Q}(\mu_{p^n})}$ . So we have  $v(R_n(x)) \geq v(x) - v(\pi_n)$ . So  $R_n$  extends by continuity to a map  $R_n : \widehat{\mathbb{Q}(\mu_{p^\infty})} \rightarrow \widehat{\mathbb{Q}(\mu_{p^n})}$ . If  $x \in \mathbb{Q}(\mu_{p^\infty})$ , then  $R_n(x) = x$  for  $n$  large, thus  $R_n(x) \rightarrow x$  for any  $x \in \widehat{\mathbb{Q}(\mu_{p^\infty})}$ .

Now for  $K \in p\text{-NField}$ , when  $n$  is large, if  $e_i$  is a set of basis of  $\mathcal{O}_{K_n}/\mathcal{O}_{\mathbb{Q}(\mu_{p^n})}$ , then for any  $x \in \mathcal{O}_{K_{n+k}}$ ,  $x = \sum x_i e_i^*$ , where  $x_i = \text{tr}_{K_{n+k}/F_{n+k}}(x e_i) \in \mathcal{O}_{F_{n+k}}$ , as in the proof of (19.1.5.33). So we can define  $R_n(x) = \sum R_n(x_i) e_i^*$ . Notice this is defined only for  $n$  large, and is independent of  $e_i$  chosen, and by the following lemma, it is continuous and extends to a  $K_n$ -linear projection  $R_n : \widehat{K_\infty}$  to  $K_n$ .  $\lrcorner$

**Lemma (19.1.5.36).** Let  $k \geq 0$  and  $n \geq 1$ , then  $R_n(\zeta_{p^{n+k}}^j) = 1$  for  $j = 0$  and vanishes otherwise.  $\lrcorner$

*Proof:* This is clear from the fact  $\text{tr}_{\mathbb{Q}(\mu_{p^{n+k}})/\mathbb{Q}(\mu_{p^n})}(\zeta_{p^{n+k}}^j) = \zeta_{p^{n+k}}^j \sum_{\eta^{p^k}=1} \eta^j$ .  $\square$

**Lemma (19.1.5.37).** for any  $\delta \in \mathbb{R}_+$ , when  $n$  is large,  $v(R_n(x)) \geq v(x) - \delta$ .  $\lrcorner$

*Proof:* We have  $v(x_i) \geq v(x) - v(\pi_{n+k})$  by  $\mathbb{Q}(\mu_{p^{n+k}})$ -linearity, and  $v(R_n(x_i)) \geq v(x_i) - v(\pi_n)$  as in (19.1.5.35), and  $v(e_i^*) \geq -\delta$  when  $n$  is large, by (19.1.5.31). Thus the result.  $\square$

**Prop. (19.1.5.38) [Refinement of Hilbert's Theorem90].** There is a decomposition of  $\widehat{K_\infty} = K_n \oplus X_n$ , where  $X_n = \ker R_n$ . If  $\delta > 0$ , then for  $n$  large,  $\alpha \in \mathbb{Z}_p^*$  and  $\gamma_n$  that  $\chi(\gamma_n)$  is a topological generator of  $\Gamma_{F_n}$ ,  $1 - \alpha\gamma_n : X_n \rightarrow X_n$  (because  $\gamma_n$  commutes with  $R_n$ ) is invertible and

$$v_p((1 - \alpha\gamma_n)^{-1}x) \geq v_p(x) - 1/(p-1) - \delta,$$

unless  $\alpha = -1$  and  $p = 2$ , in which case it is only invertible on  $X_{n+1}$ .  $\lrcorner$

*Proof:* As usual,  $x_i$  is a basis of  $\mathcal{O}_{K_n}/F_n$ , then  $x = \sum x_i e_i^*$ ,  $x_i = \text{tr}_{K_\infty/F_\infty}(x e_i) \in \widehat{F_\infty}$ , and  $R_n(x) = 0$ . Then  $(1 - \alpha\gamma_n)$  acts on  $x_i$ , so it reduce to the case  $K = \mathbb{Q}_p$ .

**Injectivity:** If  $\alpha = 1$ , this is Ax-Sen-Tate theorem. In other situations,  $(1 - \alpha\gamma_n)(R_{n+k}(x)) = 0$  for all  $k \geq 0$ , so  $R_{n+k}(x) = \alpha^{p^k} \gamma_n^{p^k}(R_{n+k}(x)) = \alpha^{p^k} R_{n+k}(x)$ , so  $R_{n+k}(x) = 0$ , hence  $x = 0$  by continuity.

**Surjectivity:** Let  $F_{n+k}^* = \bigoplus_{j=1, p \nmid j}^{p^k-1} F_n \zeta_{p^{n+k}}^j$ , then  $F_{n+k} = F_n^* \oplus F_{n+1}^* \oplus \dots \oplus F_{n+k}^*$ , and  $F_{n+k} \cap X_n = F_{n+1}^* \oplus \dots \oplus F_{n+k}^*$ . Now if  $x = \sum_{j=1, p \nmid j}^{p^k-1} x_j \zeta_{p^{n+k}}^j$  with  $x_j \in \mathcal{O}_{F_n}$ , then

$$x = (1 - \alpha^{p^{k-1}} \gamma_n^{p^{k-1}}) \sum_{j=1, p \nmid j}^{p^{k-1}-1} x_j \frac{\zeta_{p^{n+k}}^j}{1 - \alpha^{p^{k-1}} \zeta_p^j}.$$

Now  $v_p(1 - \alpha^{p^{k-1}} \zeta_p^j) \leq 1/(p-1)$ , and

$$(1 - \alpha\gamma_n)^{-1} = \frac{1 - \alpha^{p^{k-1}} \gamma_n^{p^{k-1}}}{1 - \alpha\gamma_n} (1 - \alpha^{p^{k-1}} \gamma_n^{p^{k-1}})^{-1},$$

so  $\alpha_n : 1 - \alpha\gamma_n : F_{n+k}^* \rightarrow F_{n+k}^*$  is invertible and

$$v_p((1 - \alpha\gamma_n)^{-1}x) \geq v_p(x) - 1/(p-1) - v_p(\zeta_{p^n} - 1)$$

holds. And the assertion holds by uniform continuity.  $\square$

### Miscellaneous

**Def. (19.1.5.39) [Lattices].** If  $K \in \mathbf{LField}$  and  $V \in \mathbf{Vect}^{\text{fd}}/K$ , then a **lattice in**  $V$  is

- a compact open  $\mathcal{O}_K$ -submodule of  $V$  if  $K$  is non-Archimedean. Equivalently, it is a f.g.  $\mathcal{O}_K$ -submodule that contains a  $K$ -basis of  $V$ .
- a discrete subgroup  $\Lambda$  of  $V$  s.t.  $V/\Lambda$  is compact if  $K$  is Archimedean.

┘

**Prop. (19.1.5.40).** If  $K \in p\text{-Field}$ ,  $V \in \mathbf{Vect}_K^{\text{fd}}$  and  $\Lambda$  be an  $\mathcal{O}_K$ -submodule of  $V$ , then  $\Lambda$  is a lattice in  $V$  iff it is a finite  $\mathcal{O}_K$ -module and generate  $V$  as a  $K$ -vector space. ┘

*Proof:* If  $\Lambda$  is an  $\mathcal{O}_K$ -submodule, then it clearly generates  $V$  as a  $K$ -vector space, and the f.g.  $\mathcal{O}_K$ -submodules of  $\Lambda$  is a cover of  $\Lambda$ , which has a finite subcover as  $\Lambda$  is compact open, thus  $\Lambda$  is f.g. over  $\mathcal{O}_K$ .

Conversely, if  $\Lambda$  is a f.g.  $\mathcal{O}_K$ -submodule that generate  $V$  as a  $K$ -vector space, then it is a quotient of  $\mathcal{O}_K^n$  for some  $n$ , thus compact. And let  $S$  be a  $K$ -basis of  $V$  contained in  $\Lambda$ , then  $\mathcal{O}_K S$  is an open nbhd of  $0 \subset \Lambda$ , which means it is open. ┘

**Prop. (19.1.5.41).** Let  $V \in \mathbf{Vect}_{\mathbb{R}}^{\text{fd}}$  and  $\Lambda < V$ , then the following are equivalent:

- $\Lambda$  is a lattice in  $V$ .
- $\Lambda$  is discrete and contains an  $\mathbb{R}$ -basis of  $V$ .
- $\Lambda$  has a  $\mathbb{Z}$ -basis that is also an  $\mathbb{R}$ -basis of  $V$ .

┘

**Remark (19.1.5.42).** WARNING: These are not equivalent to  $\Lambda$  is a f.g.  $\mathbb{Z}$ -module and generated  $V$  as an  $\mathbb{R}$ -vector space: Consider  $\mathbb{Z}\{1, \alpha\} \subset \mathbb{R}$ . ┘

*Proof:*  $1 \rightarrow 2$ : Let  $W$  be a complementary subspace of  $\Lambda \otimes_{\mathbb{Z}} \mathbb{R} \subset V$ , then  $W \cong \overline{W}$  is closed thus compact in  $V/\Lambda$ , which implies  $W = 0$ .

$2 \rightarrow 3$ : We may assume  $V = \mathbb{R}^n$  and  $\Lambda$  contains the canonical basis  $e_1, \dots, e_n$ , then  $\Lambda$  is generated by  $S = \{\lambda \in \Lambda \mid \max_i |\lambda_i| \leq 1\}$ . Because  $\Lambda$  is discrete thus closed in  $V$ ,  $S$  is finite. Thus  $\Lambda$  is a f.g.  $\mathbb{Z}$ -module, and has no torsion, thus a free Abelian group. But  $\Lambda/\mathbb{Z}\{e_i\}$  is finite, thus  $\Lambda \cong \mathbb{Z}^n$ . Hence a basis of  $\Lambda$  must also be a basis of  $V$ .

$3 \rightarrow 1$  is clear. ┘

**Def. (19.1.5.43) [Dual Lattice].** If  $K \in p\text{-Field}$  and  $V \in \mathbf{Vect}_K^{\text{fd}}$ ,  $B$  is a non-degenerate bilinear form on  $V$  and  $\psi$  is a non-trivial character of  $K$ , then for any lattice  $L \subset V$ , the **dual lattice**  $L' = \{u \in V \mid \psi(2(B(u, v))) = 1, \forall v \in L\}$  is also a lattice in  $V$ . ┘

*Proof:* It is an open group by no-small-subgroup argument, as  $\psi, B$  are continuous. it is compact because take any basis  $\{v_1, \dots, v_n\}$  of  $V$  that  $v_i \in L$ ,  $\{u \in V \mid \psi(2(B(u, v_i))) = 1, \forall i\}$  is compact. ┘

## 6 Ultrarnormed Banach Spaces

**Notation (19.1.6.1).**

- Let  $(K, v, \mathcal{O}_K, \mathfrak{p}_v, \varpi, k)$  be a complete non-Archimedean valued field (of rank 1),  $K^0 = \mathfrak{p}_v$ , and  $\varpi \in K^\times, |\varpi| < 1$  a uniformizer. If  $\mathcal{O}_K$  is DVR, assume  $(\varpi) = \mathfrak{p}_v$ .

┘

### Ultrarnormed $K$ -modules

**Prop. (19.1.6.2).** Any normed  $K$ -module is weakly-Cartesian.  $\lrcorner$

*Proof:* Cf.[Non-Archimedean Analysis P92].  $\square$

**Cor. (19.1.6.3).** Any two valuation on a finite  $K$ -vector space are equivalent.  $\lrcorner$

*Proof:* Cf.[Non-Archimedean Analysis P93].  $\square$

**Prop. (19.1.6.4).** If  $V$  is a normed  $\mathbb{Q}_p$  vector space and  $V_0 = \{x \in V \mid |x| \leq 1\}$ , then  $V^\wedge \cong (V_0)_p^\wedge[p^{-1}]$ .  $\lrcorner$

### Ultrarnormed Banach Spaces

**Def. (19.1.6.5) [Ultrarnormed Banach Spaces].** In the non-Archimedean case, an **ultrarnormed Banach algebra** is defined as in (12.7.4.1), but additionally  $|a + b| \leq \max\{|a|, |b|\}$ .  $\lrcorner$

**Def. (19.1.6.6) [Uniform Banach Space].** For a complete non-Archimedean field  $K$  and a Banach algebra  $R$ , define  $R^0$  to be the ring of **power bounded elements**. Then it is a subring, and it is open, as it contains the closed ball  $\overline{D}(0, 1)$ .

Recall  $R$  is called uniform if  $R^0$  is itself bounded in  $R$  (12.2.1.5). Notice a uniform Banach space must be reduced, because a nilpotent element is clearly power bounded, and any scalar multiple of it is nilpotent.  $\lrcorner$

**Lemma (19.1.6.7).** Fix a uniformizer  $t$  in a non-Archimedean complete field  $K$ , if  $|K^*|$  is discrete, then if  $A$  is a  $t$ -adically complete and  $t$ -torsion-free  $K^0$ -algebra, let  $R = A[t^{-1}]$ , then the norm

$$|f| = \inf\{|t|^n \mid f \in t^n A\},$$

then this makes  $R$  into a  $K$ -Banach space that the  $t$ -adic topology of  $A$  is the same as the metric topology of  $A$ , so  $A \subset R_{\leq 1} \subset R^0$ .

Notice if  $|K^*|$  is not discrete but there is a pseudo-uniformizer  $t$  that has a compatible system of  $p^n$ -th roots, if  $A$  is a  $t$ -adically complete and  $t$ -torsion-free  $K^0$ -algebra, let  $R = A[t^{-1}]$ , then the norm

$$|f| = \inf\{|t|^{\frac{n}{p^k}} \mid f \in t^{\frac{n}{p^k}} A\},$$

then this makes  $R$  into a  $K$ -Banach space that the  $t$ -adic topology of  $A$  is the same as the metric topology of  $A$ , so  $A \subset R_{\leq 1} \subset R^0$ , and in this case  $R^0 = A_* = \text{Hom}((t^{\frac{1}{p^\infty}}), A)$  (5.7.2.2).  $\lrcorner$

**Prop. (19.1.6.8) [Uniform  $K$ -Banach Space and  $K^0$ -Algebra].** Fix a pseudo-uniformizer  $t$  in a non-Archimedean complete field  $K$ , the following category are equivalent:

- The category  $\mathcal{C}$  of uniform Banach  $K$ -algebras  $R$ .
- The category  $\mathcal{D}_{tic}$  of  $t$ -adically complete and  $t$ -torsionfree  $K^0$ -algebras  $A$  with  $A$  totally integrally closed (5.2.1.1) in  $A[t^{-1}]$ .

$\lrcorner$

*Proof:* The functor  $F : \mathcal{C} \rightarrow \mathcal{D}_{tic} : \text{if } R \text{ is uniform Banach space, then } F(R) = R^0$ :  $R^0$  is open subring by (19.1.6.6), and  $R^0 \in B(0, r]$  for some  $r > 0$  by uniformity. As  $R$  is  $K$ -Banach,  $\cap t^n B(0, r] = 0$ , so  $R^0$  is  $t$ -adically separated, and also it is complete. If  $f^\mathbb{N} \in t^{-k} R^0 \subset t^{-k} B(0, r]$ ,

then clearly  $f$  is power bounded thus  $f \in R^0$ , so  $R^0$  is totally integrally closed in  $R$ .  $R \rightarrow R^0$  is preserved by continuous mappings, so  $F$  is truly a functor.

Conversely, lemma above(19.1.6.7) shows  $R = A[t^{-1}]$  is a  $K$ -Banach algebra, this is a functor  $G : \mathcal{D}_{tic} \rightarrow \mathcal{C}$ , and  $A \subset R^0$ . We show  $A = R^0$ , as this is equivalent to  $FG \cong \text{id}$ : as the  $t$ -adic topology and metric topology are the same(19.1.6.7), if  $t^c f^{\mathbb{N}} \subset A$  for some  $c$ , thus  $f$  is totally integral over  $A$ , thus  $f \in A$  by tic.

Finally, we need to show  $GF \cong \text{id}$ , which in fact that the given Banach algebra norm on  $R$  is equivalent to the norm  $|\cdot|'$  given in(19.1.6.7) w.r.t  $R^0$ .  $R'_{<1} \subset R^0 \subset R_{\leq c}$  by uniformity, and conversely,  $R_{\leq 1} \subset R^0 \subset R'_{\leq 1}$ , thus this two norms are equivalent.  $\square$

**Prop.(19.1.6.9).** Let  $\varphi : A \rightarrow B$  be a  $k$ -homomorphism between  $k$ -Banach algebras that there is a family  $\mathfrak{B}$  of ideals of  $B$  that for each  $b \in \mathfrak{B}$ :

- $B$  is closed and  $\varphi^{-1}(b)$  is closed in  $A$ .
- $\dim_k B/b < \infty$ .
- $\cap_{b \in \mathfrak{B}} b = (0)$ .

Then  $\varphi$  is continuous.  $\lrcorner$

*Proof:* Consider the map  $A/\varphi^{-1}(b) \rightarrow B/b$  with the residue norms, Cf.[non-Archimedean analysis P167].  $\square$

**Cor.(19.1.6.10).** Let  $\varphi : A \rightarrow B$  be a  $k$ -homomorphism between Noetherian  $k$ -Banach algebras that there is a family  $\mathfrak{B}$  of ideals of  $B$  that for each  $b \in \mathfrak{B}$ ,  $\dim_k B/b < \infty$  and  $\cap_{b \in \mathfrak{B}} b = (0)$ , then  $\varphi$  is continuous. (Because the closedness condition is automatic by(19.1.6.13)).  $\lrcorner$

**Cor.(19.1.6.11).** All complete  $k$ -algebra norms on a Noetherian  $k$ -algebra  $B$  satisfying the condition of(19.1.6.10) are equivalent.  $\lrcorner$

### Modules over $K$ -Banach Spaces

**Prop.(19.1.6.12).** If  $M$  is a normed module over a  $k$ -Banach algebra  $A$ , if the completion of  $M$  is a finite  $A$ -module, then  $M$  is complete.  $\lrcorner$

*Proof:* There are morphism  $\pi : A^n \rightarrow \widehat{M}$  that are surjective continuous, so by open mapping theorem(12.7.2.5), this map is open, so  $\sum \check{A}x_i = \pi(A^n)$  is a nbhd of 0 in  $\widehat{M}$ , because  $\check{A}$  is open(19.1.1.8) and then  $\widehat{M} = M + \sum \check{A}x_i$ , because  $M$  is dense in  $\check{M}$ , then we are done by(19.1.1.9).  $\square$

**Cor.(19.1.6.13) [Noetherian and Submodule Closed].** For a complete normed module over a  $k$ -Banach algebra  $A$ ,  $M$  is Noetherian iff all submodules of  $M$  are closed. In particular,  $A$  is Noetherian iff all ideals of  $A$  are closed.  $\lrcorner$

*Proof:* If  $M$  is Noetherian, then the completion of any submodule is finite over  $A$ , so it is complete hence closed by(19.1.6.12). Conversely, if any ideal of  $M$  is closed, then for a chain of ideals of  $M : \cup M_i = M'$ ,  $M'$  is complete hence Baire space by(4.4.9.2), so some  $M_i$  must contain a nbhd of  $M'$ , because it is an ideal, but then  $M_i = M'$ .  $\square$

## 7 $p$ -adic Power Series

References are [ $p$ -adic Analysis, Robert] and [Kob84].

**Notation(19.1.7.1).**

- Let  $p \in \text{Prime}$ .
- Let  $K \in p\text{-Field}$ (19.1.5.1).

┘

### Power Series

References are [Dwo60, Kob84, Gou20].

**Prop. (19.1.7.2) [ $p$ -adic Cauchy-Hadamard].** Let  $(R, \mathfrak{m})$  be a CDVR of mixed characteristic  $(0, p)$ , then for any power series  $a_0 + a_1x + \dots + a_nx^n + \dots$  in  $R$ , take  $1/r = \overline{\lim} |a_n|^{1/n}$ , where we assume  $1/0 = \infty$  and  $1/\infty = 0$ , then

- The series converges absolutely for every  $|x| < r$ , and if  $\rho < r$ , then the convergence is uniform for  $|x| \leq \rho$ . In particular, the series converges to a continuous function on  $\mathbb{D}(0, r)$  by (4.4.8.21).
- If  $|x| \geq r$ , the terms are unbounded, and the series diverges.

By analogy with (19.1.7.2),  $r$  is called the **radius of convergence** of the sequence. ┘

*Proof:* The proof is the same as that of (19.1.7.2). □

**Cor. (19.1.7.3) [Convergence of Power Series].** Let  $(R, \mathfrak{m})$  be a CDVR of mixed characteristic  $(0, p)$ , then

- If  $f(T) = \sum_{n \geq 1} \frac{a_n}{n} T^n \in (R \otimes \mathbb{Q})[[T]]$  with  $a_i \in R$ , then  $r(f) \geq 1$ .
- If  $g(T) = \sum_{n \geq 1} \frac{b_n}{n!} T^n \in (R \otimes \mathbb{Q})[[T]]$  with  $b_i \in R$ , then  $r(f) \geq |p|^{1/(p-1)}$ .

┘

*Proof:* 1:  $v(a_n x^n / n) \geq nv(x) - v(n) \geq nv(x) - \log_p(n)v(p)$  converges to  $\infty$  for  $n \rightarrow \infty$  when  $v(x) > 0$ .

2:  $v(b_n x^n / n!) \geq nv(x) - v(n!) \geq nv(x) - (n-1)v(p)/(p-1)$  (2.6.1.33) converges to  $\infty$  for  $n \rightarrow \infty$  when  $v(x) > v(p)/(p-1)$  □

**Prop. (19.1.7.4) [Taylor Expansions give no Analytic Extensions].** If  $f(T) \in \mathbb{C}_K[[T]]$  converges for some  $\alpha \in \mathbb{C}_K$ , then its Taylor expansion at  $T = \alpha$

$$g(T) = \sum_{m \in \mathbb{N}} b_m (T - \alpha)^m \in \mathbb{C}_K[[T]] \text{ where } b_m = \sum_{n \geq m} \binom{n}{m} a_n \alpha^{n-m}$$

has the same region of convergence as  $f$ , and they are equal on this region. ┘

*Proof:* Use the non-Archimedean inequality to prove that  $g$  converges whenever  $f$  converges, and then the assertion follows by switching  $f$  and  $g$ . □

**Prop. (19.1.7.5) [Euclidean Division].** Let  $f, g \in \mathcal{O}_K[[T]]$  and assume  $f = a_0 + a_1T + \dots$  where  $a_i \in \mathfrak{m}_K$  for  $0 \leq i \leq n-1$ , and  $a_n \in \mathcal{O}_K^*$ , then we can uniquely write

$$g = qf + r$$

where  $q \in \mathcal{O}_K[[T]]$  and  $r \in \mathcal{O}_K[T]$  is a polynomial of degree  $\leq n-1$ . ┘

*Proof:* Cf. [Mazur Control Theorem, P4]. □

**Def. (19.1.7.6) [Distinguished Polynomials].**  $P(T) \in \mathcal{O}_K[T]$  is called a **distinguished polynomial** if  $P(T) = T^n + a_{n-1}T^{n-1} + \dots + a_0$ , where  $a_i \in \mathfrak{m}_K$  for  $0 \leq i \leq n-1$ . ┘

**Prop. (19.1.7.7) [ $p$ -adic Weierstrass Preparation].** Every power series  $f(T) \in \mathcal{O}_K[[T]]^\times$  can be written uniquely as  $f(T) = \varpi_K^\mu P(T)U(T)$ , where  $\mu \in \mathbb{N}$ ,  $P(T)$  is a distinguished polynomial (19.1.7.6), and  $U(T) \in \mathcal{O}_K[[T]]^*$ .  $\lrcorner$

*Proof:* Cf. [Mazur Control Theorem, P5].  $\square$

**Cor. (19.1.7.8).** If  $f(T) \in \mathcal{O}_K[[T]]^\times$ , there are only f.m.  $x \in \mathcal{O}_{\mathbb{C}_K}$  with  $f(x) = 0$ .  $\lrcorner$

**Cor. (19.1.7.9).** If  $P(T) \in \mathcal{O}_K[T]$  is a distinguished polynomial, and  $g(T) \in \mathcal{O}_K[T]$ . Suppose  $g(T)/P(T) \in \mathcal{O}_K[[T]]$ , then  $g(T)/P(T) \in \mathcal{O}_K[T]$ .  $\lrcorner$

*Proof:* Let  $g(T) = f(T)P(T) \in \mathcal{O}_K[[T]]$ . Suppose  $x \in \mathbb{C}_K$  is a root of  $P(T)$ , then  $|x| < 1$ , thus  $f(x)$  converges, and  $g(x) = 0$ . Then we can divide both  $g(T)$  and  $P(T)$  by  $(T - x)$ , and by induction (and change  $K$  by a larger field), we can get  $P(T)$  divides  $g(T)$  as polynomials.  $\square$

**Prop. (19.1.7.10).**  $\mathcal{O}_K[[T]]$  is a UFD.  $\lrcorner$

*Proof:* It follows from  $p$ -adic Weierstrass preparation theorem (19.1.7.7) that each element can be written as products of  $\pi_K$  and irreducible distinguished polynomials. And irreducible distinguished polynomials are all primes: if  $P(T)$  is irreducible distinguished and  $a, b \in \mathcal{O}_K[[T]]$  s.t.  $P(T) \mid ab$ , then we can use (19.1.7.5) to assume  $a, b$  are polynomials, and then by (19.1.7.9),  $P_n(T) \mid ab$  as polynomials. Then  $P(T) \mid a$  or  $P(T) \mid b$  because  $P(T)$  is irreducible and  $\mathcal{O}_K[T]$  is a UFD (3.2.3.8). Then  $\mathcal{O}_K[[T]]$  is a UFD, by (3.2.3.6).  $\square$

**Cor. (19.1.7.11).** If  $f \in \mathcal{O}_K[[T]]$  is not invertible, then  $\mathcal{O}_K[[T]]/(f)$  is infinite.  $\lrcorner$

**Lemma (19.1.7.12).** Let  $f, g \in \mathcal{O}_K[[T]]$  be relatively prime (3.2.3.4), then the ideal  $(f, g)$  is of finite index in  $\mathcal{O}_K[[T]]$ .  $\lrcorner$

*Proof:* Cf. [Mazur Control Theorem, P8].  $\square$

**Prop. (19.1.7.13)** [ $\text{Spec}(\mathcal{O}_K[[T]])$ ]. The prime ideals of  $\mathcal{O}_K[[T]]$  are  $0, (\varpi_K, T), (\varpi_K)$ , and the ideal  $(P(T))$  where  $P(T)$  is distinguished and irreducible. And the ideal  $(p, T)$  is the unique maximal ideal.  $\lrcorner$

*Proof:* The above ideals are all primes by (19.1.7.10). And if  $\mathfrak{p}$  is a non-zero prime, suppose  $f$  is a non-zero polynomial in  $\mathfrak{p}$  of minimal degree, which exists by  $p$ -adic Weierstrass preparation theorem (19.1.7.7). Then because  $\mathfrak{p}$  is a prime ideal, by Weierstrass preparation, we can assume that  $f = p$  or  $f$  is a distinguished irreducible polynomial. Suppose  $(f) \neq \mathfrak{p}$ , then there exists  $g \in \mathfrak{p} \setminus (f)$ . Then  $f, g$  are relatively prime, then  $\mathcal{O}_K[[T]]/(f, g)$  is finite (19.1.7.12). Thus  $\mathfrak{p}$  is also of finite index in  $\mathcal{O}_K[[T]]$ . Then  $p^n \in \mathfrak{p}$  for some  $n$ , and by primality,  $p \in \mathfrak{p}$ . And there are two  $T^i, T^j$  that are equal in  $\mathcal{O}_K[[T]]/\mathfrak{p}$ , so  $(1 - T^{j-i})T^i \in \mathfrak{p}$ . But  $(1 - T^{j-i})$  is invertible, so  $T \in \mathfrak{p}$ . Then  $(p, T) \subset \mathfrak{p}$ , and  $\mathfrak{p} = (p, T)$ .  $\square$

For the last assertion, notice if  $P(T)$  is distinguished, then  $P(T) \in (p, T)$ .  $\square$

**Prop. (19.1.7.14) [Characterizing Integral Power Series, Dwork [Dwo60]].** Let  $R \in \mathbb{C}\text{Ring}_{\mathbb{Z}_p}$  be integral domain,  $\varphi : R \rightarrow R$  be a lift of the Frobenius of  $R/(p)$ , and  $R_0 = R[\frac{1}{p}]$ . Let  $F(\underline{X}) \in 1 + (\underline{X})R_0[[\underline{X}]]$ , then  $F(\underline{X}) \in 1 + (\underline{X})R[[\underline{X}]]$  iff

$$\frac{F^\varphi(X_1^p, \dots, X_n^p)}{(F(\underline{X}))^p} \in 1 + p(\underline{X})R[[\underline{X}]].$$

$\lrcorner$

*Proof:* If  $F(\underline{X}) \in R[[\underline{X}]]$ , then  $F^\varphi(X_1^p, \dots, X_n^p) \equiv F(\underline{X})^p \pmod{p}$ . For the other direction, denote  $F(\underline{X}) = \sum_{\alpha} a_{\alpha} X^{\alpha}$ , then

$$\sum_{\alpha} \varphi(a_{\alpha}) X^{p\alpha} = \left( \sum_{\alpha} a_{\alpha} X^{\alpha} \right)^p (1 + pT \sum_{\alpha} b_{\alpha} X^{\alpha})$$

where  $b_{\alpha} \in R$ . We use induction on  $k$  to show that  $a_{\alpha} \in R$  for any  $|\alpha| \leq n$ . The case  $k = 0$  is true, and if the cases  $k < n$  are all true, for  $k = n$  consider the above equation modulo  $(p, \{X^{\alpha}\}_{|\alpha| \geq n+1})$ , then we get

$$\sum_{|\alpha| < n} \varphi(a_{\alpha}) X^{p\alpha} \equiv \left( \sum_{|\alpha| \leq n} a_{\alpha} X^{\alpha} \right)^p \equiv \sum_{|\alpha| < n} a_{\alpha}^p T^{p\alpha} + p \sum_{|\alpha| = n} a_{\alpha} X^{\alpha}.$$

Thus for any  $|\alpha| = n$ , we get  $a_{\alpha} \in R$ . The induction process is completed.  $\square$

### Examples of Power Series

For power series with  $\mathbb{Q}$  coefficients, see [Formal Power Series](#).

**Def. (19.1.7.15)**  $[F(X, Y)]$ . Define

$$\begin{aligned} F(X, Y) &= B_X(Y) B_{(X^p - X)/p}(Y^p) \cdots B_{(X^{p^2} - X^p)/p^2}(Y^{p^2}) \cdots \quad (10.7.1.21) \\ &= (1 + Y)^X (1 + Y^p)^{\frac{X^p - X}{p}} (1 + Y^{p^2})^{\frac{X^{p^2} - X^p}{p^2}} \cdots \in \mathbb{Q}_p[[X, Y]]. \end{aligned}$$

Then  $F(X, Y)$  is well-defined and  $F(X, Y) \in 1 + (X, Y)\mathbb{Z}_p[[X, Y]]$ . Moreover,

$$F(X, Y) = \sum_{n \in \mathbb{N}} \left( X^n \sum_{m=n}^{\infty} a_{m,n} Y^m \right), \quad a_{m,n} \in \mathbb{Z}_p.$$

┘

*Proof:* It is clear that  $F(X, Y)$  is well-defined. to show that  $F(X, Y) \in \mathbb{Z}_p[[X, Y]]$ , use [\(19.1.7.14\)](#), it suffices to show that

$$\frac{F(X^p, Y^p)}{(F(X, Y))^p} = \frac{(1 + Y^p)^X}{(1 + Y)^{pX}} \in 1 + p(X, Y)\mathbb{Z}_p[[X, Y]].$$

Because  $1 + Y \in 1 + Y\mathbb{Z}_p[[Y]]$ , by [\(19.1.7.14\)](#),  $(1 + Y^p)/(1 + Y)^p \in 1 + pY\mathbb{Z}_p[[Y]]$ . Thus it is also clear to see that

$$\frac{(1 + Y^p)^X}{(1 + Y)^{pX}} = \left( \frac{1 + Y^p}{(1 + Y)^p} \right)^X \in 1 + p(X, Y)\mathbb{Z}_p[[X, Y]].$$

For the last assertion, notice that in each term of the definition, the degree of  $X$  is no more than the degree of  $Y$ .  $\square$

**Prop. (19.1.7.16) [Dwork Splitting Function].** For  $s \in \mathbb{Z}_+$ ,  $q = p^s$ , there exists a **Dwork splitting function**  $\Theta(T) = \sum a_n T^n \in \mathbb{Q}_p(\zeta_p)[[T]]$  s.t.  $v_p(a_n) \geq n/(p-1)$ , and for any  $a \in \mathbb{F}_q$ ,

$$\Theta([a])\Theta([a^p]) \cdots \Theta([a^{p^{s-1}}]) = \zeta_p^{\text{tra}},$$

where  $[a]$  is the Teichmüller lift of  $a$ .  $\square$

*Proof:* Let  $t = [a]$ , Set  $\Theta(T) = F(T, \zeta_p - 1) = \sum_{n \in \mathbb{N}} a_n T^n$ , where  $a_n = \sum_{m=n}^{\infty} (\zeta_p - 1)^m \in \mathbb{Q}_p(\zeta_p)$ . Thus clearly  $v_p(a_n) \geq n/(p-1)$  and  $\Theta(T)$  converges for  $T \in \mathbb{D}(0; p^{1/(p-1)})$ .

It is easy to verify by using the fact  $t^{p^s} = t$  and the definition of (19.1.7.15) that

$$(1 + Y)^{t+t^p+\dots+t^{p^{s-1}}} = F(t, Y)F(t^p, Y) \dots F(t^{p^{s-1}}, Y) \in \overline{\mathbb{Q}_p}[[Y]].$$

In particular, take  $Y = \zeta_p - 1$ , then we get

$$F(t, \zeta_p - 1)F(t^p, \zeta_p - 1) \dots F(t^{p^{s-1}}, \zeta_p - 1) = \zeta_p^{t+t^p+\dots+t^{p^{s-1}}},$$

which implies the desired identity.  $\square$

### Laurent Series

References are [Kob84].

#### Notation (19.1.7.17).

- Denote by  $\mathcal{L}_K$  the set of (possibly infinite) Laurent series with coefficients in  $K$ .

┘

**Def. (19.1.7.18) [Convergences].** For  $f = \sum_{n \in \mathbb{Z}} a_n T^n \in \mathcal{L}_K$  and  $r \in \mathbb{R}$ ,  $f$  is called convergent on the radius  $r$  if for any  $a \in \mathbb{C}_K$  with  $v_p(a) = r$ ,  $f(a)$  converge. And  $f$  is said to converge on  $\infty$  (resp.  $-\infty$ ) if  $a_n = 0$  for  $n$  sufficiently large (resp. sufficiently small). Denote  $\text{Conv}(f) \subset [-\infty, \infty]$  to be the set of radius that  $f$  is convergent on. Then  $\text{Conv}(f)$  is an interval of  $[-\infty, +\infty]$ .

Let  $\mathcal{A}(I)$  denote the set of elements in  $K$  of valuation in  $I$ . And if  $f$  is bounded at  $r_1$  and  $r_2$ , then it is convergent on  $(r_1, r_2)$ .  $\perp$

**Def. (19.1.7.19) [Valuations].** For  $f \in \mathcal{L}_K$  and  $r \in [-\infty, \infty]$ , define  $v^{(r)}(f) = \inf_{n \in \mathbb{Z}} \{v(a_n) + nr\} \in [-\infty, \infty]$ .

And if  $r \in \text{Conv}(f) \cap \mathbb{R}$ , denote  $n(f, r)$  and  $N(f, r)$  to be the smallest and largest integer s.t.  $v^{(r)}(f) = v_p(a_i(f)) + ir$ .  $\perp$

**Def. (19.1.7.20) [Boundedness].**  $f \in \mathcal{L}_K$  is called bounded on the radius  $r \in \mathbb{R}$  if  $v^{(r)}(f) > -\infty$ . If  $f$  is convergent on radius  $r$ , then it is bounded on radius  $r$ .  $\perp$

**Def. (19.1.7.21).** Denote  $\mathcal{L}_K[r_1, r_2] = \{f | f \text{ is convergent on } [r_1, r_2]\}$ .

$$\mathcal{L}_K(r_1, r_2) = \{f | f \text{ is convergent on } (r_1, r_2)\}.$$

$$\mathcal{L}_K]r_1, r_2] = \{f | f \text{ is convergent on } (r_1, r_2] \text{ and bounded at } r_1\}.$$

$$\mathcal{L}_K\{r\} = \mathcal{L}_K[r, r].$$

$\mathcal{B}_L(I)$  is the subset of bounded functions. These are all rings under addition and multiplication.

┘

*Proof:* Cf. [Foundations of Theory of  $(\varphi, \Gamma)$ -modules over the Robba Ring P31]. ?  $\square$

**Prop. (19.1.7.22).** For  $I = [r_1, r_2]$  or  $(r_1, r_2]$ ,  $\mathcal{L}_K I$  is an integral domain. Moreover, for  $r \in I$  and  $f, g \in \mathcal{L}_K I^\times$ ,

$$v^{(r)}(fg) = v^{(r)}(f) + v^{(r)}(g),$$

$$n(fg, r) = n(f, r) + n(g, r),$$

$$N(fg, r) = N(f, r) + N(g, r).$$

┘

*Proof:* Cf.[Foundations of Theory of  $(\varphi, \Gamma)$ -modules over the Robba Ring]P32. ? □

**Prop. (19.1.7.23).** If  $f, g \in \mathcal{L}_K$  is bounded at  $r \in \mathbb{R}$ , then for  $f, g$  bounded on radius  $r$ ,

- $v^{(r)}(f) = \infty \iff f = 0$ .
- $v^{(r)}(f + g) \geq \min(v^{(r)}(f), v^{(r)}(g))$ .
- For  $\lambda \in L$ ,  $v^{(r)}(\lambda f) = v_p(\lambda) + v^{(r)}(f)$ .

┘

**Cor. (19.1.7.24).** By (19.1.7.22) and (19.1.7.23), if  $I = [r_1, r_2]$  or  $(r_1, r_2]$  and  $r \in I$ , then  $v^{(r)}$  is an additive valuation on  $\mathcal{L}_K I$ . ┘

**Def. (19.1.7.25).** If we set for  $\mathcal{L}_K[r_1, r_2]$  the the valuation  $v^{[r_1, r_2]}(f) = \min\{v^{(r_1)}(f), v^{(r_2)}(f)\}$ , then this is a valuation on it. ┘

**Prop. (19.1.7.26).**  $\mathcal{L}_K(\{r\})$  is complete under valuation  $v^{(r)}$ . Similarly the valuation  $v^{[r_1, r_2]}(f)$  makes  $\mathcal{L}_K[r_1, r_2]$  a Banach space unless  $r_1 = r_2 = \infty$ . ┘

*Proof:* We let  $r = 0$ . For a Cauchy sequence of Laurent series, we see that each coefficient is a Cauchy sequence, hence converge to some element in  $L$ , so it converge term-wise to a Laurent series  $f$ , so it converge to  $f$  in  $v^{(r)}$ . □

**Cor. (19.1.7.27)[Fréchet Topology].** We consider  $\mathcal{L}_K(0, r]$ , then it has a countable sequence of norms  $v^{1/n, r}$ , which makes it a locally convex space, and the last proposition shows that these valuations are complete, and a Cauchy sequence must converge to the term-wise limit, so  $\mathcal{L}_K(0, r]$  is a complete Fréchet space in the Fréchet topology. ┘

**Cor. (19.1.7.28).** The same method shows that  $\mathcal{L}_K(I)$  is a Fréchet space for any interval  $I$ . ┘

**Def. (19.1.7.29) [Newton Polygon].** For  $P(X) = a_0 + a_1X + \dots + a_dX^d + \dots \in K[[X]]$ , its **Newton polygon** is defined to be the lower convex hull of the set of points  $\{(0, v(a_0)), (1, v(a_1)), \dots, (d, v(a_d)), \dots\}$ . ┘

**Prop. (19.1.7.30) [Roots and Newton Polygons].** For  $P(T) \in K[[T]]$ , if the newton polygon of  $P$  has a segment of slope  $-\lambda$  and finite length  $N$ , then there are  $N$  roots of  $P$  in  $\mathbb{C}_K$  with valuation  $\lambda$ . ┘

*Proof:* Firstly if  $P$  is a polynomial, we may assume  $P$  is monic, then its coefficients are elementary polynomials of roots of  $P$ . Thus the conclusion follows as  $K$  is non-Archimedean.

Next, we can use  $p$ -adic Weierstrass preparation (19.1.7.7) to get the desired results. ? □

**Prop. (19.1.7.31).** If  $I = ]0, +\infty]$  and  $f(X) \in \mathcal{H}(I)$ , then the number of zeros of  $f(X)$  in  $\mathcal{A}(I)$  equals the length of the segment of  $NP(f)$  whose slope is  $-s$ , and these roots gives a  $P_s(X) \in K[X]$  that  $f(X) = P_s(X)G(X)$ ,  $G(X) \in \mathcal{H}(I)$ . ┘

*Proof:* Cf.[Zeros of Power Series over complete Valued Field Lazard]. □

**Cor. (19.1.7.32).** If  $f(X) \in \mathcal{H}(I)$ , then  $f(X) \in \mathcal{B}_L(I)$  iff it has f.m. zeros in  $\mathcal{A}(I)$ . ┘

*Proof:* Let  $r = \inf I$  and  $s = \sup I$ . First notice that  $f \in \mathcal{L}_K(I)$  is in  $\mathcal{B}(I)$  iff  $v(a_n) + nr$  is bounded from below as  $n \rightarrow +\infty$  and  $v(a_n) + ns$  is bounded below as  $n \rightarrow -\infty$ . And from the graph of  $NP(f)$ , this is equivalent to  $f$  has f.m. zeros in  $\mathcal{A}(I)$ . □

**Prop. (19.1.7.33).**  $\mathcal{H}(I)$  is a Bezout domain. ┘

*Proof:* [Lazard]. □

**Robba Ring**

**Def. (19.1.7.34)** [Robba Ring and Overconvergent Elements]. Define

$$\mathcal{E}_K = \left\{ f = \sum_{n \in \mathbb{Z}} a_n T^n \in \mathcal{L}_K[0[: \lim_{n \rightarrow -\infty} v(a_n) = \infty \right\} \quad (19.1.7.21),$$

and also the **overconvergent elements**  $\mathcal{E}^\dagger$  and **Robba ring**  $\mathcal{R}$  as

$$\mathcal{E}_K^\dagger = \bigcup_{r>0} \mathcal{L}_K]0, r], \quad \mathcal{R}_K = \bigcup_{r \in (0,1)} \mathcal{L}_K(r, 1]$$

and equip them with the final topology w.r.t. the Fréchet topologies on  $\mathcal{L}_K(0, r]$  (19.1.7.27). Then  $\mathcal{E}_K^\dagger = \mathcal{R}_K \cap \mathcal{E}_K$ . Also denote

$$\mathcal{E}_K^\pm = \mathcal{E}_K^\dagger \cap K[[T]], \quad \mathcal{R}_K^\pm = \mathcal{R}_K \cap K[[T]].$$

┘

**Prop. (19.1.7.35)** [Lazard].

- $\mathcal{R}_K$  is a Bezout-domain.
- Any finite submodule of  $\mathcal{R}_K^n$  admits elementary divisors.

┘

*Proof:* Cf. [Ber02].

□

**Prop. (19.1.7.36)**. There is a Frobenius action  $\varphi$  and an action of  $\mathbb{Z}_p^*$  on  $\mathcal{R}_K$  defined by

$$\varphi(f)(T) = f((T+1)^p - 1), \quad \gamma(f)(T) = f((T+1)^\gamma - 1).$$

Also denote  $t = \log(T+1) = \sum_{n \geq 1} (-1)^{n+1} \frac{T^n}{n} \in \mathcal{R}_K$ , then  $\varphi(t) = pt, \gamma(t) = \gamma t$ .

┘

*Proof:*

□

**Prop. (19.1.7.37)**. The only principle ideals of  $\mathcal{R}_K$  stable under the action of  $\varphi$  and  $\mathbb{Z}_p^*$  are  $t^i \mathcal{R}_K$ ,  $i \in \mathbb{N}$ .

┘

*Proof:* Cf. [L. Berger, Equations différentielles p-adiques et  $(\phi, \Gamma)$ -modules filtrés].

- Let  $(K, \mathcal{O}_K, \mathfrak{m}_K, \varpi) \in \mathbf{LField}$ .
- Let  $L/K \in \mathbf{LField}$  be a finite separable extension.
- Let  $(F, \mathcal{O}_F) \in \mathbf{GField}(19.3.1.1)(19.3.1.2)$ .
- Let  $E/F \in \mathbf{GField}$  be a finite separable extension.

┘

## 1 Global Fields

**Def.(19.3.1.1)[Global Fields].** A **global field** is a finite extension of  $\mathbb{Q}$  or  $\mathbb{F}_p((t))$ , without a valuation. The former is called a **number field** and the latter a **function field**. The set of global fields is denoted by  $\mathbf{GField}$ . The partially ordered set of number fields is denoted by  $\mathbf{NField}$ . The partially ordered set of function fields is denoted by  $\mathbf{FField}$ .

┘

**Def.(19.3.1.2)[Ring of Integers].**  $\mathbb{Z} \subset \mathbb{Q}$  and  $\mathbb{F}_p[t] \subset \mathbb{F}_p((t))$  are PIDs, thus Dedekind domains, thus for a global field  $F(19.3.1.1)$ , we can define the **ring of integers**  $\mathcal{O}_F$  of  $F$  to be the integral closure of  $\mathbb{Z}$  or  $\mathbb{F}_p[t]$  in  $F$ , which is an Dedekind domain, by(5.2.7.12) and(3.2.3.17).

┘

**Remark(19.3.1.3).** The section [Dedekind-Domains](#) applies to the ring of integers  $\mathcal{O}_F$  for  $F \in \mathbf{GField}$ .

┘

**Def.(19.3.1.4)[Roots of Unity].** For  $F \in \mathbf{GField}$ ,  $\#F_{\text{tor}}^\times < \infty$ .

┘

*Proof:* ?

□

**Def.(19.3.1.5)[Places].**

- $\Sigma_F^{\text{fin}}$  is the equivalent classes of (non-Archimedean)valuations of  $F$ , called the **finite places** of  $F$ .
- $\Sigma_F^\infty$  is the equivalent classes of (Archimedean valuations) $|\cdot|_v = -\log|\tau(\cdot)|$  of  $F$  corresponding to embeddings  $\tau: K \rightarrow \mathbb{C}(12.2.3.16)$ , called the **infinite places** of  $F$ .
- $\Sigma_F^\mathbb{R}$  is the set of infinite places  $v$  of  $F$  corresponding to embeddings  $F \rightarrow \mathbb{R}$ , called the set of **real places** of  $F$ . Denote  $r_1 = \#\Sigma_F^\mathbb{R}$  if it is finite.

- $\Sigma_F^{\mathbb{C}}$  is the set of infinite places  $v$  of  $F$  that is non-real, called the set of **complex places** of  $F$ . Notice two embeddings corresponds to the same place iff they are conjugate. Denote  $r_2 = \#\Sigma_F^{\mathbb{C}}$  if it is finite.
- For  $\mathfrak{p} \in \text{Spec}(\mathcal{O}_F)$ ,  $v_{\mathfrak{p}}$  is the valuation of  $F$  corresponding to  $\mathfrak{p}$ . Most of the time we will not distinguish between a maximal prime  $\mathfrak{p}$  and its corresponding valuation.
- For a finite extension  $L/F$  and  $v \in \Sigma_F$ ,  $\Sigma_L^v$  is the set of finite places over  $L$  over  $v$ .
- For  $v \in \Sigma_F$ , denote  $F_v$  the completion of  $F$  w.r.t.  $v$ .
- For any non-zero ideal  $\mathfrak{a} \neq 0 \in \text{Ideal}(\mathcal{O}_F)$ , denote  $\|\mathfrak{a}\| = \#\mathcal{O}_F/\mathfrak{a}$ , called the **norm of ideal  $\mathfrak{a}$** .

┘

**Def. (19.3.1.6) [Constant Fields].**

┘

**Prop. (19.3.1.7) [Valuations].** For  $F \in \mathbf{GField}$ ,  $v \in \Sigma_F$ , let  $\mathfrak{p} \in \mathbf{Prime} \cup \{\infty\}$  s.t.  $v|\mathfrak{p}$ , then define the **inertia degree**

$$f_v = \begin{cases} [\kappa(v) : \kappa(\mathfrak{p})] & , v \in \Sigma_F^{\text{fin}} \\ [F_v : F_{\mathfrak{p}}] & , v \in \Sigma_F^{\infty} \end{cases}, \quad \|v\| = \begin{cases} \mathfrak{p}^{f_v} & , v \in \Sigma_F^{\text{fin}} \\ e^{f_v} & , v \in \Sigma_F^{\infty} \end{cases}, \quad |\cdot|_v = \|\cdot\|^{-v(a)}$$

This is compatible with the definition in (5.2.7.20) when  $v \in \Sigma_F^{\text{fin}}$ .

┘

**Thm. (19.3.1.8) [Product Formula].** Let  $F \in \mathbf{GField}$  and  $a \in F^{\times}$ , then  $|a|_w = 1$  for a.e.  $w \in \Sigma_F$ , and

$$\prod_{w \in \Sigma_F} |a|_w = 1.$$

┘

*Proof:* Let  $F_0 = \mathbb{Q}$  or  $\mathbb{F}_p(t)$  be the constant field of  $F$  (19.3.1.6), then the assertion is easy to verify for  $F_0$ , and

$$\prod_{w \in \Sigma_F} |a|_w = \prod_{v \in F_0} \prod_{w|v} |a|_w = \prod_{v \in F_0} |\text{Nm}_{F/F_0}(a)|_v = 1.$$

□

**Prop. (19.3.1.9) [Artin-Whaples].** Let  $F \in \mathbf{Field}$  and  $\Sigma_F$  the set of places of  $F$ , then  $F \in \mathbf{GField}$  iff

- There exists representatives  $|\cdot|_v$  for  $v \in \Sigma_F$  s.t. the product formula  $\prod_{v \in \Sigma_F} |a|_v = 1$  for any  $a \in F^{\times}$ .
- $F_v \in \mathbf{LField}$  (19.1.5.9) for any  $v \in \Sigma_F$ .

┘

*Proof:*

□

**Prop. (19.3.1.10) [Local to Global Fields].** Let  $F \in \mathbf{GField}$ ,  $\emptyset \subset_{\text{fin}} S \subset \Sigma_F$  and  $k \in \mathbb{Z}_+$ . Suppose for each  $v \in S$ , there is given a separable field extension  $F'_v/F_v$  of degree  $k$ , then there exists  $L/F \in \mathbf{GField}$  of degree  $k$  s.t. for each  $v \in S$  s.t.  $L_v/F_v$  is inert, and  $L_v \cong F'_v$ .

┘

*Proof:* This follows from weak approximation, Krane's lemma (19.1.2.26) and continuity of roots. Notice Krasner's lemma also holds for  $v \in \Sigma_F^{\infty}$ .

□

**Def. (19.3.1.11) [Algebraic Numbers and Algebraic Integers].** An element  $\alpha \in \overline{\mathbb{Q}}$  is called an **algebraic number**. It is called an **algebraic integer** iff it satisfies a monic polynomial equation  $p(X) \in \mathbb{Z}[T]$ . Notice the set of algebraic integers equals

$$\mathcal{O}_{\overline{\mathbb{Q}}} = \bigcup_{F \subset \mathbb{C}} \mathcal{O}_F.$$

where the union is taken over all number fields  $F$ . ┘

**Prop. (19.3.1.12) [Characterizing Roots of Unity].** If  $\alpha$  is an algebraic integer s.t. any of its conjugate has absolute value 1, then  $\alpha$  is a root of unity. ┘

*Proof:* For any power  $\alpha^r$  of  $\alpha$ , its minimal polynomial over  $\mathbb{Q}$  has bounded degree and bounded coefficients independent of  $r$ , so there are only f.m. such polynomial and f.m. such roots. Thus  $\alpha^i = \alpha^j$  for some  $i \neq j \in \mathbb{Z}_+$ , and  $\alpha \in \mu(\mathbb{Q})$ . □

**Prop. (19.3.1.13) [Discriminants].** For  $F \in \mathbf{NField}$ , there is a discriminant  $\mathfrak{d}_{F/\mathbb{Q}} \in \text{Ideal}(\mathbb{Z})$  (5.2.7.36), and if  $\alpha_1, \dots, \alpha_n$  is a  $\mathbb{Z}$ -basis of  $\mathcal{O}_F$ , then  $\mathfrak{d}_{F/\mathbb{Q}} = (d(\alpha_1, \dots, \alpha_n))$ . And this  $\text{disc}(F) = d(\alpha_1, \dots, \alpha_n) \in \mathbb{Z}^\times$  is invariant of the basis chosen. So it is also called the **discriminant of  $F$** .

Then  $\text{disc}(F) \equiv 0, 1 \pmod{4}$ . ┘

*Proof:* □

**Prop. (19.3.1.14) [Sign of Discriminants].** For  $F \in \mathbf{NField}$ , we have  $\text{disc}(F) \in (-1)^{r_2} \mathbb{Z}_+$ . ┘

*Proof:*  $d(F) \neq 0$  by (3.2.6.34), and by definition,  $d(F) = \det((\sigma\alpha_i)_{\sigma,i})^2$ , where  $\sigma$  runs through embeddings  $F \hookrightarrow \mathbb{C}$ , and  $\alpha_1, \dots, \alpha_n$  is a  $\mathbb{Z}$ -basis of  $\mathcal{O}_F$ . Then notice

$$\overline{\det((\sigma\alpha_i)_{\sigma,i})} = (-1)^{r_2} \det((\sigma\alpha_i)_{\sigma,i}),$$

so if  $r_2$  is odd, then  $\det((\sigma\alpha_i)_{\sigma,i})$  is purely imaginary, and if  $r_2$  is even,  $\det((\sigma\alpha_i)_{\sigma,i})$  is real. Thus the assertion follows. □

### Special Algebraic Numbers

**Def. (19.3.1.15) [Pisot and Salem Numbers].** A **Pisot number** is an algebraic number  $\alpha \in \overline{\mathbb{Z}} \cap \mathbb{R}_{>1}$  s.t. all the Galois conjugates  $\alpha_i$  of  $\alpha$  except  $\alpha$  itself satisfy  $|\alpha_i| < 1$ .

A **Salem number** is algebraic number  $\alpha \in \overline{\mathbb{Z}} \cap \mathbb{R}_{>1}$  s.t. all the Galois conjugates  $\alpha_i$  of  $\alpha$  except  $\alpha$  itself satisfy  $|\alpha_i| \leq 1$ , and  $|\alpha_i| = 1$  for some  $i$ . By (3.3.1.6), this implies the minimal polynomial of  $\alpha$  is reciprocal, and also the conjugates of  $\alpha$  is  $\{\alpha, \alpha^{-1}, \alpha_1, \dots, \alpha_r\}$  where  $|\alpha_i| = 1$ . ┘

**Def. (19.3.1.16) [Weil-Numbers].** For  $p \in \mathbf{Prime}$ ,  $q \in p^{\mathbb{Z}}$ , a  **$q$ -Weil-integer** of weight  $w$  is an algebraic integer  $\alpha \in \mathcal{O}_{\overline{\mathbb{Q}}}$  that for any embedding  $\iota : \mathbb{Q}(\alpha) \rightarrow \mathbb{C}$ ,  $|\iota(\alpha)| = q^{w/2}$ . The set of Weil  $q$ -numbers of weight  $w$  is denoted by  $\text{Weil}(q^{w/2})$ .

A  **$q$ -Weil-number** of weight  $w$  is an algebraic number  $\alpha \in \overline{\mathbb{Q}}$  s.t. for  $|\alpha|_v = 0$  for each  $v \in \Sigma_{\mathbb{Q}(\alpha)}^{\text{fin}} \setminus S_{\mathbb{Q}(\alpha)}(p)$ , and  $|\iota(\alpha)| = q^{w/2}$  for each embedding  $\iota : \mathbb{Q}(\alpha) \rightarrow \mathbb{C}$ . ┘

**Prop. (19.3.1.17) [Smyth].** Let  $\alpha \in \overline{\mathbb{Z}}$  with absolute conjugate  $\alpha = \alpha_1, \alpha_2, \dots, \alpha_d$ , and  $P(X)$  is the minimal polynomial of  $\alpha$ . If

$$\prod_i \min(1, |\alpha_i|) < \theta_0,$$

where  $\theta_0 \approx 1.32472$  is the real root of the polynomial  $\theta^3 - \theta - 1 = 0$ , then  $P(X)$  is a reciprocal polynomial. ┘

*Proof:* Cf.[Product of the Conjugates Outside the Unit Circle of an Algebraic Integer, Smyth].  $\square$

**Cor.(19.3.1.18).**  $\theta_0$ (19.3.1.17) is smallest Pisot number(19.3.1.15).  $\lrcorner$

*Proof:* If  $\alpha$  is a smaller Pisot number, then by(19.3.1.17), the minimal polynomial of  $\alpha$  is reciprocal, so it must have degree 2, and of the form  $X^2 - aX + 1$ . Then it is easy to verify that  $\alpha > \theta_0$ , contradiction.  $\square$

**Def.(19.3.1.19)[Lehmer's Number].** Consider the **Lehmer's polynomial**

$$f(X) = X^{10} + X^9 - X^7 - X^6 - X^5 - X^4 - X^3 + X + 1 \in \mathbb{Z}[X],$$

then its largest real root  $\lambda \approx 1.17628 \in \overline{\mathbb{Z}}$  is called the **Lehmer's number**.  $\lrcorner$

**Def.(19.3.1.20)[Mahler measures].** For a monic polynomial  $f(X) \in \mathbb{Z}[X]^\times$ , the **Mahler measure**  $M(f)$  is defined to be the absolute value of the product of roots of  $f$  with norm greater than one.  $\lrcorner$

**Conj.(19.3.1.21)[Lehmer].** For any monic polynomial  $f(X) \in \mathbb{Z}[X]^\times$ ,  $M(f) \geq \lambda$  where  $\lambda$  is the Lehmer's number(19.3.1.19), and the equality holds exactly when  $f$  is the Lehmer's polynomial(19.3.1.19).  $\lrcorner$

*Proof:*  $\square$

### Galois Theory of Extensions

**Def.(19.3.1.22)[Ramification Groups].** For a Galois extension of global fields  $L/K \in \mathbf{GField}$  and a valuation extension  $w|v$ , denote  $\lambda/k$  residue fields extension of  $w|v$ , and denote  $\mathfrak{p}_w, \mathfrak{p}_v$  by  $\mathfrak{P}, \mathfrak{p}$ .

Then the **decomposition group** is  $G_w(L/K) = \{\sigma \in G(L/K) | w \circ \sigma = w\}$ . The **decomposition field**  $Z_w$  is the fixed field of  $G_w$ .

When  $w$  is non-Archimedean, we further define:

The **inertia group** is  $I_w(L/K) = \{\sigma \in G_w(L/K) | \sigma(x) \equiv x \pmod{\mathfrak{P}}\}$ . The **inertia field**  $T_w$  is the fixed field of  $I_w$ .

The **ramification group** is  $R_w(L/K) = \{\sigma \in G_w(L/K) | \sigma(x)/x \equiv 1 \pmod{\mathfrak{P}}\}$ . The **ramification field**  $V_w$  is the fixed field of  $R_w$ .

Similarly we can define for higher ramification groups  $G_{w,s}(L/F)$ .  $\lrcorner$

**Prop.(19.3.1.23)[Local and Global Ramification Groups].** Let  $L/F$  be a Galois extension of global fields,  $v \in \Sigma_F, w \in \Sigma_L^v$ , then any embedding  $L \rightarrow \overline{F}_v$  induces isomorphisms

$$G_{w,s}(L/F) \cong G_s(L_w/F_v)$$

by natural restriction.  $\lrcorner$

*Proof:* Cf.[ANT, Neukirch].  $\square$

**Cor.(19.3.1.24)[Local and Global Galois Groups].** There is an embedding  $\mathrm{Gal}(L_w/F_v) \hookrightarrow \mathrm{Gal}(L/F)$  that is determined up to conjugation. In particular, there is an embedding

$$\mathrm{Gal}_{F_v} \hookrightarrow \mathrm{Gal}_F$$

determined up to conjugation.  $\lrcorner$

*Proof:* It is determined up to conjugation because  $\text{Gal}(L/F)$  acts transitively on the places over  $v$ : For finite places this follows from (5.2.7.22), and for infinite places this means  $\text{Gal}(L/F)$  acts transitively on the extension of embedding to  $\mathbb{C}$ , which is clearly true.  $\square$

**Prop. (19.3.1.25)**  $[Z_w]$ .

- The restriction  $w_Z$  of  $w$  to  $Z_w$  extends uniquely to  $L$ .
- If  $v$  is non-Archimedean,  $w_Z$  has the same residue field and value group as  $v$ . In particular,  $w_Z/v$  is unramified.
- $Z_w = L \cap K_v \subset L_w$ .

┘

*Proof:* Cf. [Neukirch P171].  $\square$

**Prop. (19.3.1.26)**.  $T_w/Z_w$  is the maximal unramified subextension of  $L/Z_w$ .  $\text{┘}$

*Proof:* Cf. [Neukirch P173].  $\square$

**Prop. (19.3.1.27)**.  $V_w/Z_w$  is the maximal tamely ramified subextension of  $L/Z_w$ .  $\text{┘}$

*Proof:* Cf. [Neukirch P175].  $\square$

### Discriminants

**Def. (19.3.1.28) [Lattices]**. Let  $(\mathcal{O}_K, K)$  be a Dedekind domain and  $V \in \text{Vect}^{\text{fin}}/K$ , then an  $\mathcal{O}_K$ -lattice in  $V$  is a f.g.  $\mathcal{O}_K$ -module  $\Lambda$  s.t.  $\Lambda \otimes_{\mathcal{O}_K} K = V$ .

Any  $\mathcal{O}_F$ -lattice in  $F^n$  is of the form  $\Lambda = \mathcal{O}_F x_1 \oplus \mathcal{O}_F x_2 \oplus \dots \oplus \mathcal{O}_F x_{n-1} \oplus \mathfrak{a} x_n$  where  $\mathfrak{a} \in \text{Ideal}(\mathcal{O}_F)$  (Cf. [P-R94]P42, may have to do with (5.2.7.15)?), and it is called a **free lattice** if  $L \cong \mathcal{O}_F^n$ . Notice this is always the case if  $\text{cl}(\mathcal{O}_F) = 1$ , e.g. when  $F = \mathbb{Q}$  or  $F \in p\text{-LField}$ .  $\text{┘}$

**Prop. (19.3.1.29) [Local to Global Compatibility for Lattices]**. Let  $F \in \text{NField}$ , then

1. If  $\Lambda$  is an  $\mathcal{O}_F$ -lattice in  $F^n$ , then for any  $v \in \Sigma_F$ , its completion in  $F_v$  is an  $\mathcal{O}_{F_v}$ -lattice in  $F_v^n$ , and for a.e. place  $v$ ,  $\Lambda_v = \mathcal{O}_{F_v}^n$ .
2. Conversely, if for any  $v \in \Sigma_F^f$ ,  $\Lambda_v$  is an  $\mathcal{O}_{F_v}$ -lattice in  $F_v^n$ , and  $\Lambda_v = \mathcal{O}_{F_v}^n$  for a.e.  $v$ , then there is a unique  $F$ -lattice  $\Lambda \in F^n$  s.t.  $\Lambda_v$  is the closure of  $\Lambda$  in  $F_v$ . In fact,  $\Lambda = \bigcap_{v \in \Sigma_F^f} (F^n \cap \Lambda_v)$ .
3.  $\Lambda$  is determined by  $\Lambda_v$  for each  $v \in \Sigma_F^f$ .

┘

*Proof:* 1 is easy. For 2, notice that  $\mathcal{O} = \bigcap_{v \in \Sigma_F^f} (\mathcal{O}_{F_v})$ , so  $\Lambda$  defined as above is commensurable with  $\mathcal{O}_F^n$ , so it is clearly a lattice, because  $\mathcal{O}_F$  is Noetherian. 3 follows from 2. (I think this argument also holds for global function fields?)  $\square$

**Prop. (19.3.1.30) [Lower Bounds for Discriminant]**. If  $F \in \text{NField}$  and  $n = [F : \mathbb{Q}]$ , then

$$|\text{disc}(F)| \geq \frac{n^{2n}}{(n!)^2} \left(\frac{\pi}{4}\right)^{2r_2} \geq \frac{n^{2n}}{(n!)^2} \left(\frac{\pi}{4}\right)^n \geq \frac{1}{2\pi e^{\frac{1}{6}n}} \left(\frac{\pi e^2}{4}\right)^n \geq \frac{0.1347}{n} \cdot (5.8)^n \text{ (12.6.1.17)}.$$

┘

*Proof:* Cf. [Neukirch, P204].?  $\square$

**Cor. (19.3.1.31) [Hermite's Theorem].** There are only f.m. number fields with a given discriminant.  $\lrcorner$

*Proof:* (19.3.1.30) shows the degree is controlled by the discriminant, thus the theorem follows from (20.8.1.8).  $\square$

**Cor. (19.3.1.32) [Minkowski's Theorem].** For  $\mathbb{Q} \neq F \in \mathbf{NField}$ , we have  $\text{disc}(F) \neq \pm 1$ .  $\lrcorner$

**Cor. (19.3.1.33).**  $\mathbb{Q}$  doesn't have any non-trivial unramified extensions, by (5.2.7.39).  $\lrcorner$

### Orders

References are [Neu99]Chap1.12, [P-R94]P42 and [Vig80].

**Def. (19.3.1.34) [Orders].** An **order** is a Noetherian integral domain  $\mathcal{O}$  of dimension 1 whose conductor (5.2.7.17) is non-zero, or equivalently its integral closure in the fraction field is finite over  $\mathcal{O}$  by (5.2.7.18). A Dedekind domain is an order.  $\lrcorner$

**Def. (19.3.1.35) [A-Ideals and A-Orders].** If  $(A, K)$  is Dedekind domain and  $B \in \mathbf{Ring}^{\text{fd}}/K$ , then

- An **A-ideal** in  $B$  is a complete  $A$ -lattice in  $B$  (19.3.1.28).
- An **A-order** in  $B$  is an  $A$ -ideal in  $B$  that is also a subring.
- An **Eichler A-order** in  $B$  is the intersection of two distinct maximal  $A$ -orders in  $B$ .

$\lrcorner$

**Prop. (19.3.1.36) [Orders in Number Fields].** Situation as in (5.2.7.13), if  $L/K$  is separable, then a subring  $\mathcal{O}$  of  $L$  is an  $\mathcal{O}_K$ -order iff it is an order in  $L$  (19.3.1.34) with integral closure  $\mathcal{O}_L$ . in particular,  $\mathcal{O}_L$  is the maximal  $\mathcal{O}_K$ -order in  $L$ .

In particular, for  $F \in \mathbf{NField}$ , the  $\mathbb{Z}$ -orders in  $F$  are exactly subrings of  $\mathcal{O}_F$  that contains a basis of  $F$ , and they all have finite indexes in  $\mathcal{O}_F$ .  $\lrcorner$

*Proof:* If  $\mathcal{O}$  is an  $\mathcal{O}_K$ -order, then every element of  $\mathcal{O}$  is integral over  $\mathcal{O}_K$ , by acting on  $\mathcal{O}$ .  $\mathcal{O}_K$  is contained in  $\mathcal{O}$ , and  $\mathcal{O} \otimes_{\mathcal{O}_K} K = L$ , so the fraction field of  $\mathcal{O}$  is  $L$ . Thus the integral closure of  $\mathcal{O}$  in  $L$  is  $\mathcal{O}_L$ . Then  $\dim \mathcal{O} = 1$  as  $\dim \mathcal{O}_L = 1$  (5.2.4.14), and it is Noetherian because it is f.g. over  $A$  (5.1.1.43). And  $\mathcal{O}_L$  is finite over  $\mathcal{O}_K$  by (5.2.7.21), thus is also f.g. over  $\mathcal{O}$ . Thus  $\mathcal{O}$  is an order.

If  $\mathcal{O}$  is an order with integral closure  $\mathcal{O}_L$ , then it is f.g. over  $\mathcal{O}_K$  as it is contained in the f.g.  $\mathcal{O}_K$ -module  $\mathcal{O}_L$ . And it contains a  $K$ -basis of  $L$  because  $L = K\mathcal{O}_L$  and  $a\mathcal{O}_L \subset \mathcal{O}$  for some  $a \in \mathcal{O}^\times$  because  $\mathcal{O}$  is an order. Thus  $\mathcal{O}$  is an  $A$ -lattice in  $L$  that is a ring, so it is an  $A$ -order.

For the last assertion, notice that one direction is clear, and if  $\mathcal{O}_F$  contains a basis of  $F$  and is contained in  $\mathcal{O}_F$ , then it must be a  $\mathbb{Z}$ -lattice of  $F$ , as  $\mathcal{O}_F$  is free because it is finite over  $\mathbb{Z}$  (5.2.7.21). Then it is clear  $\mathcal{O}$  is an order with integral closure  $\mathcal{O}_F$ .  $\square$

**Cor. (19.3.1.37).** If  $F \in \mathbf{NField}$  and  $L = F(\alpha_i)$  where  $\alpha_i \in \mathcal{O}_L$ , then  $\mathcal{O} = \mathcal{O}_F[\alpha_i]$  is an  $\mathcal{O}_K$ -order in  $L$ .  $\lrcorner$

**Prop. (19.3.1.38) [Multiplier Orders].** Let  $(A, K)$  be a Dedekind domain,  $B \in \mathbf{Ring}^{\text{fd}}/K$  and  $I$  be an  $A$ -ideal of  $B$ , then the ring of left and right multipliers

$$\mathcal{O}_l = \{\alpha \in B \mid \alpha I \subset I\}, \quad \mathcal{O}_r = \{\alpha \in B \mid I\alpha \subset I\}$$

are  $A$ -orders in  $B$ . And  $I$  is called

- a **normal ideal** if  $\mathcal{O}_l$  and  $\mathcal{O}_r$  are maximal orders,
- an **integral ideal** if  $I \subset \mathcal{O}_l, \Lambda \subset \mathcal{O}_r$ .
- A **principal ideal** if there exists  $a \in A^\times$  s.t.  $\Lambda = \mathcal{O}_l a = a \mathcal{O}_r$ .

The **inverse ideal** of  $I$  is the ideal  $I^{-1} = \{b \in B : IbI \subset I\}$ .  $\lrcorner$

*Proof:* For any  $\alpha \in B$ , we have  $\alpha I \subset B = I \otimes K$ , so there exists  $b \in A$  s.t.  $b\alpha \in \mathcal{O}_l$ . So  $\mathcal{O}_l \otimes K = B$ .

Let  $0 \neq a \in A \cap I$ , then  $a\mathcal{O}_l \in I$ , so  $\mathcal{O}_l \leq a^{-1}I$  is a lattice in  $B$  because  $A$  is Noetherian.  $\square$

**Prop. (19.3.1.39) [Properties of Orders].** Let  $(A, K)$  be a Dedekind domain,  $B \in \text{Ring}^{\text{fd}}/K$ , then

- An  $A$ -order in  $B$  is equivalent to a subring  $\mathcal{O}$  of  $B$  consisting of elements integral over  $A$ , containing  $A$ , and satisfying  $K\mathcal{O} = B$ .
- There exist  $A$ -orders in  $B$ .
- Every  $A$ -order in  $B$  is contained in a maximal  $A$ -order.  $\lrcorner$

*Proof:* •  $\square$

**Prop. (19.3.1.40) [Local Properties of Maximal Orders].** Let  $F \in \text{NField}$  and  $B \in \text{Ring}^{\text{fd}}/F$ , then an order  $\mathcal{O}$  in  $B$  is maximal iff for each  $v \in \Sigma_F^f$ ,  $\mathcal{O}_v \subset B_{F_v}$  is maximal. Similar arguments work for  $\mathcal{O}_r$ .  $\lrcorner$

*Proof:* This is clear from (19.3.1.29) and the definition (19.3.1.35).  $\square$

**Def. (19.3.1.41) [Discriminants of Orders].** Compatible with (19.3.1.13), if  $F \in \text{NField}$  and  $\mathcal{O} \subset \mathcal{O}_F$  is an order, then we define the **discriminant of the order**  $\mathcal{O}$  to be the  $d(\mathcal{O}) = d(\alpha_1, \dots, \alpha_n)$  where  $\alpha_1, \dots, \alpha_n$  is a  $\mathbb{Z}$ -basis of  $\mathcal{O}$ . Notice this is invariant of the basis chosen.  $\lrcorner$

**Lemma (19.3.1.42).** For  $K \in p\text{-LField}$ ,

- $\text{Mat}(n; \mathcal{O}_K)$  is a maximal order in  $\text{Mat}(n; K)$ .
- Any two maximal orders in  $\text{Mat}(n; K)$  are conjugate.
- Any order  $\mathcal{O} \subset \text{Mat}(n; K)$  is contained in some maximal order. And it is contained in f.m. maximal orders.  $\lrcorner$

*Proof:* 1: If another order contains  $\text{Mat}(n; \mathcal{O}_K)$  and also an element  $x$ , then we can clearly see that it contains an element of the form  $A = \text{diag}(x_1, \dots, x_n)$  s.t.  $x_1 \notin \mathcal{O}_K$ . Then  $\{A^{\mathbb{Z}}\}$  is not bounded.

3: As  $\mathcal{O}$  is compact and  $\text{Mat}(n; \mathcal{O}_K)$  is open, there exists f.m.  $x_i$  s.t.  $B \subset \cup_i (x_i + \text{Mat}(n; \mathcal{O}_K))$ . Then it follows that  $\Lambda = \oplus \mathcal{O}_K^n x_i$  is a lattice stable under  $\mathcal{O}$ , thus  $\mathcal{O} \subset \text{Stab}(\Lambda)$  is conjugate to  $\text{Mat}(n; \mathcal{O}_K)$  thus maximal.

Next we show  $\mathcal{O}$  is contained in f.m. maximal orders: Suppose  $\mathcal{O} \subset C = \text{Stab}(\Lambda)$  and  $\mathcal{O} \subset C' = \text{Stab}(\Lambda')$ , then there exists some  $\alpha$  that  $\varpi^\alpha \text{Stab}(\Lambda) \subset \mathcal{O} \subset \text{Stab}(\Lambda')$ . Replacing  $\Lambda$  by a constant doesn't change stabilizer, so we may assume  $\Lambda \subset \Lambda'$ , and assume  $\Lambda = \mathcal{O}_K \{e_1, \dots, e_n\}$  and  $\Lambda' = \mathcal{O}_K \{e_1, \varpi^{\alpha_2} e_2, \dots, \varpi^{\alpha_n} e_n\}$ . Since  $\varpi^\alpha \text{Stab}(\Lambda) \subset \text{Stab}(\Lambda')$ ,  $\text{Stab}(\Lambda)(\Lambda') \subset \varpi^{-\alpha} \Lambda'$ . Also by using the matrices permuting  $e_1$  and  $e_i$ , we see  $\alpha_i < \alpha$  for each  $i$ , so  $\varpi^\alpha \Lambda \subset \Lambda'$ , and then  $\varpi^n \text{Stab}(\Lambda')(\Lambda) \subset \text{Stab}(\Lambda')(\Lambda') = \Lambda' \subset L$ . This implies  $\varpi^\alpha \text{Stab}(\Lambda') \subset \text{Stab}(\Lambda)$ . From this it is clear that there are only f.m. maximal orders containing  $\mathcal{O}$ .

2: It follows from the proof of item3 that any order is contained in a stabilizer, then it suffices to show that if  $\text{Stab}(\Lambda) = \text{Stab}(\Lambda')$ , then  $\Lambda = \Lambda'$ . But this is already implicit in the proof of item2: In this case,  $\alpha = 0$ .  $\square$

**Thm. (19.3.1.43)[Maximal Orders in Semisimple Algebras over Local Fields].** If  $K \in p\text{-LField}$  and  $B$  is a semisimple algebra over  $K$ , then any  $\mathcal{O}_K$ -order  $\mathcal{O} \subset B$  is contained in a maximal order. And there are only f.m. maximal orders containing it.  $\lrcorner$

*Proof:* Writing  $B$  as a product of simple algebras, it suffices to prove for  $B$  simple, and by base change to the center  $L$  of  $B$ , it suffices to show for  $B$  central simple: This is because if two orders are isomorphic after extension by  $\mathcal{O}_L$ , then their transformation matrix has coefficients in  $\mathcal{O}_L \cap K = \mathcal{O}_K$ . Then we need to show that there are only f.m. orders containing  $\mathcal{O}$ . Choose a splitting field  $L/K$  for  $B$ , it reduces to prove for  $B = \text{Mat}(n; K)$ : This reason is the same as above. Then the assertion follows from (19.3.1.42).  $\square$

**Thm. (19.3.1.44)[Maximal Orders in Semisimple Algebras over Global Fields].** If  $F \in \text{NField}$  and  $B$  is a semisimple algebra over  $F$ , then any order  $\mathcal{O} \subset B$  is contained in some maximal order. And there are only f.m. maximal orders containing it.  $\lrcorner$

*Proof:* Writing  $B$  as a product of simple algebras, it suffices to prove for  $B$  simple, and by base change to the center  $L$  of  $B$ , it suffices to show for  $B$  central simple: This is because if two orders are isomorphic after extension by  $\mathcal{O}_L$ , then their transformation matrix has coefficients in  $\mathcal{O}_L \cap F = \mathcal{O}_F$ . Then we need to show that there are only f.m. orders containing  $\mathcal{O}$ . Choose a splitting field  $L/F$  for  $B$ , it reduces to prove for  $B = \text{Mat}(n; F)$ : This reason is the same as above.

And for  $B = \text{Mat}(n; F)$ , by (19.3.1.42) and (19.3.1.29),  $\mathcal{O}$  is already maximal at a.e. place, so the assertion follows from (19.3.1.29) and the local case (19.3.1.43).  $\square$

### Quadratic Fields

**Def. (19.3.1.45)[ $\mathcal{O}_D$ ].** For  $D \in \mathbb{Z}^\times$  s.t.  $D \equiv 0, 1 \pmod{4}$ , denote  $\mathcal{O}_D = \mathbb{Z}[\frac{D+\sqrt{D}}{2}]$ , which is an order in  $\mathbb{Q}(\sqrt{D})$ .  $\lrcorner$

**Prop. (19.3.1.46)[Ring of Integers in Quadratic Fields].** Let  $n \in \mathbb{Z}^\times$  be a square-free, and let  $\mathcal{K} = \mathbb{Q}(\sqrt{n})$ .

- If  $n \equiv 2, 3 \pmod{4}$ , then  $\mathcal{O}_{\mathcal{K}} = \mathbb{Z}[\sqrt{n}]$ , and  $\text{disc}(\mathcal{K}) = 4n$ .
- If  $n \equiv 1 \pmod{4}$ , then  $\mathcal{O}_{\mathcal{K}} = \mathbb{Z}[\frac{1+\sqrt{n}}{2}]$ , and  $\text{disc}(\mathcal{K}) = n$ .

In particular,  $\mathcal{O}_{\mathcal{K}} = \mathcal{O}_{\text{disc}(\mathcal{K})} = \mathbb{Z}[\frac{\text{disc}(\mathcal{K})+\sqrt{\text{disc}(\mathcal{K})}}{2}]$ .  $\lrcorner$

*Proof:* 1: the minimal polynomial of  $\sqrt{n}$  is  $X^2 - n$ , whose discriminant is  $4n$ , which doesn't have a proper divisor  $\beta$  that  $4n/\beta$  is a square and  $\beta \equiv 0, 1 \pmod{4}$ , so by (19.3.1.13)  $\mathbb{Z}[\sqrt{n}]$  is the ring of integers.

2: the minimal polynomial of  $\frac{1+\sqrt{n}}{2}$  is  $X^2 - X + \frac{1-n}{4}$ , whose discriminant is  $n$ , which doesn't have a proper divisor  $\beta$  that  $4n/\beta$  is a square, so by (19.3.1.13)  $\mathbb{Z}[\frac{1+\sqrt{n}}{2}]$  is the ring of integers.

For the last assertion, given the basis for the ring of integers, we can easily calculate the discriminant as in (3.2.6.33). It equals  $4n$  in the first case and  $n$  in the second case. Thus the assertion follows.  $\square$

**Def. (19.3.1.47)[Fundamental Discriminants].** A **fundamental discriminant** is an element  $d \in \mathbb{Z}^\times$  s.t.  $d$  is the discriminant of quadratic field  $\mathcal{K} \in \text{NField}$ .

Then any fundamental discriminant is a product of distinct elements in  $\{-4, 8, -8\} \cup \{(\frac{-1}{p})p\}_{p \in \text{Prime}_{\geq 3}}$ , by (19.3.1.46).  $\lrcorner$

**Def. (19.3.1.48) [Imaginary Quadratic Orders].**

- $\mathcal{O}_{-1} = \mathbb{Z}[i]$  is called the ring of **Gaussian integers**.
- $\mathcal{O}_{-3} = \mathbb{Z}\left[\frac{1+\sqrt{-3}}{2}\right]$  is called the ring of **Eisenstein integers**.
- $\mathcal{O}_{-7} = \mathbb{Z}\left[\frac{1+\sqrt{-7}}{2}\right]$  is called the ring of **Kleinian Integers**.

These are all PIDs. ┘

**Thm. (19.3.1.49) [Primes in Quadratic Fields].** Let  $\mathcal{K}$  be a quadratic field with discriminant  $\text{disc}(\mathcal{K})$ .

Then for  $p \in \text{Prime}$ ,

- If  $p \mid \text{disc}(\mathcal{K})$ , then  $p\mathcal{O}_{\mathcal{K}} = \mathfrak{p}^2$ , where  $\mathfrak{p}$  is a prime in  $\mathcal{O}_{\mathcal{K}}$ , and  $\mathfrak{p} = (p, \sqrt{\text{disc}(\mathcal{K})})$  if  $p$  is odd.
- If  $\left(\frac{\text{disc}(\mathcal{K})}{p}\right) = 1$ , then  $p\mathcal{O}_{\mathcal{K}} = \mathfrak{p}\mathfrak{p}'$ , where  $p, \mathfrak{p} \neq \mathfrak{p}'$  are primes in  $\mathcal{O}_{\mathcal{K}}$ .
- If  $\left(\frac{\text{disc}(\mathcal{K})}{p}\right) = -1$ , then  $p\mathcal{O}_{\mathcal{K}}$  is a prime in  $\mathcal{O}_{\mathcal{K}}$ .

And every maximal prime in  $\mathcal{O}_{\mathcal{K}}$  are of the form.

In particular,  $p$  ramifies in  $\mathcal{K}$  iff  $p \mid \text{disc}(\mathcal{K})$ , and  $p$  splits completely in  $\mathcal{K}$  iff  $\left(\frac{\text{disc}(\mathcal{K})}{p}\right) = 1$ . ┘

*Proof:* 1 is easy.

2, 3: Cf. [Cox13]P92.

To show that every maximal prime  $\mathfrak{p} \subset \mathcal{O}_{\mathcal{K}}$  is of this form, notice that  $\mathfrak{p} \mid \text{Nm}(\mathfrak{p})$  which is an ideal in  $\mathbb{Z}$ , so its prime factors are all of the form above. □

**Cor. (19.3.1.50).** For  $p \in \text{Prime}_{\geq 3}$ ,  $\mathbb{Q}\left(\sqrt{\left(\frac{-1}{p}\right)p}\right)$  is the unique quadratic extension of  $\mathbb{Q}$  unramified outside  $p$ . ┘

**Prop. (19.3.1.51) [Differents].** For a quadratic field  $\mathcal{K}$ , by (5.2.7.32) and (19.3.1.46), we have:

$$\mathfrak{d}_{\mathcal{K}} = (\sqrt{\text{disc}(\mathcal{K})}), \quad \|\mathfrak{d}_{\mathcal{K}}\| = |\text{disc}(\mathcal{K})|.$$

┘

**Prop. (19.3.1.52) [Primitive Ideals].** For a quadratic field  $\mathcal{K}$  with  $D = \text{disc}(\mathcal{K})$ , an ideal  $\mathfrak{a} \in \text{Ideal}^{\times}(\mathcal{O}_{\mathcal{K}})$  is called a **primitive ideal** if  $\mathfrak{a} \mid (m)$  implies  $m = 1$  for any  $m \in \mathbb{Z}_+$ . Then every primitive ideal is of the form

$$\mathfrak{a} = \mathbb{Z}\left\{a, \frac{b + \sqrt{D}}{2}\right\},$$

where  $a = \|\mathfrak{a}\|$  and  $b \in \mathbb{Z}_+$  is determined by  $-a < b \leq a, b^2 \equiv D \pmod{4a}$ . ┘

*Proof:* Clearly  $a = \|\mathfrak{a}\|$  is contained in  $\mathfrak{a}$ , and it is the smallest positive integer contained in  $\mathfrak{a}$ . Thus there must be another element  $\frac{b + \sqrt{D}}{2}$  s.t.  $\left\{a, \frac{b + \sqrt{D}}{2}\right\}$  is a basis of  $\mathfrak{a}$ . But then  $b^2 \equiv D \pmod{4a}$ , and we may assume  $-a < b \leq a$ . And conversely, if  $(b')^2 \equiv D \pmod{4a}$ , then it is easy to verify  $\mathbb{Z}\left\{a, \frac{b + \sqrt{D}}{2}\right\}$  is a primitive ideal with norm  $\mathfrak{a}$ . Which implies that  $b' \equiv b \pmod{2a}$ . So the solution of  $b$  is unique. □

### Orders in Imaginary Quadratic Fields

**Prop. (19.3.1.53) [Orders in Quadratic Fields].** Let  $\mathcal{K}$  be a quadratic field, then for any  $f \in \mathbb{Z}_+$ , there exists a unique order in  $\mathcal{O}_{\mathcal{K}}$  of index  $f$ , which is

$$\mathcal{O}_{\mathcal{K},f} = \mathbb{Z}[1, f \frac{\text{disc}(\mathcal{K}) + \sqrt{\text{disc}(\mathcal{K})}}{2}].$$

And  $\text{disc}(\mathcal{O}_{\mathcal{K},f}) = f^2 \text{disc}(\mathcal{K})$  (19.3.1.41).  $\lrcorner$

*Proof:* Let  $\mathcal{O}$  be an order of index  $f$  in  $\mathcal{O}_{\mathcal{K}}$ , then it is clear that  $f\mathcal{O}_{\mathcal{K}} + \mathbb{Z} = \mathcal{O}_{\mathcal{K},f} \subset \mathcal{O}$ . And this one has index  $f$ . The last assertion is clear from the definition of discriminant.  $\square$

**Prop. (19.3.1.54) [Proper Fractional Ideals].** Let  $F \in \mathbf{NField}$  and  $\mathcal{O} \subset \mathcal{O}_F$  an order. A fractional ideal  $\mathfrak{a}$  of  $\mathcal{O}$  is called a **proper fractional ideal** if

$$\mathcal{O} = \{\beta \in \mathcal{K} | \beta \mathfrak{a} \subset \mathfrak{a}\}.$$

Then any invertible fraction ideal is proper.

Moreover, if  $F$  is a quadratic field, then a fractional ideal is invertible iff it is proper.  $\lrcorner$

*Proof:* Cf. [Cox13]P122.  $\square$

**Lemma (19.3.1.55) [ $\mathcal{O}$ -Ideals Prime to Conductor].** Let  $\mathcal{K}$  be a quadratic field,  $f \in \mathbb{Z}_+$  and  $\mathcal{O} = \mathcal{O}_{\mathcal{K},f}$ , then an  $\mathcal{O}$ -ideal  $\mathfrak{a}$  is prime to  $f$  iff  $(\|\mathfrak{a}\|, f) = 1$ . And any such  $\mathcal{O}$ -ideal  $\mathfrak{a}$  is proper (19.3.1.54).  $\lrcorner$

*Proof:* If  $\beta \in \mathcal{K}$  and  $\beta \mathfrak{a} = \mathfrak{a}$ , then  $\beta \in \mathcal{O}_{\mathcal{K}}$ , and  $\beta \mathcal{O} = \beta(\mathfrak{a} + f\mathcal{O}) = \beta \mathfrak{a} + \beta f\mathcal{O} \subset \mathfrak{a} + f\mathcal{O}_{\mathcal{K}} \subset \mathfrak{D}$ . Thus  $\beta \in \mathcal{O}$ . And then  $\mathfrak{a}$  is proper.  $\square$

**Lemma (19.3.1.56).** Let  $\mathcal{K}$  be an imaginary quadratic field,  $f \in \mathbb{Z}_+$  and  $\mathcal{O} = \mathcal{O}_{\mathcal{K},f}$ , then any ideal class of  $\text{Cl}(\mathcal{O})$  contains a proper  $\mathcal{O}$ -ideal that is relatively prime to  $f$ .  $\lrcorner$

*Proof:* Cf. [Cox13]P128. ?  $\square$

**Prop. (19.3.1.57) [Class Groups of Imaginary Quadratic Orders].** Let  $\mathcal{K}$  be an imaginary quadratic field and  $f \in \mathbb{Z}_+$ ,  $\mathcal{O} = \mathcal{O}_{\mathcal{K},f}$ . Denote

- $I(\mathcal{O}, f)$  the subgroup of  $I(\mathcal{O})$  generated by  $\mathcal{O}$ -ideals  $\alpha \subset \mathcal{O}$  that is prime to  $f$ .
- $P(\mathcal{O}, f)$  the group of  $P(\mathcal{O})$  generated by  $\alpha \in \mathcal{O}$  s.t.  $(\text{Nm}(\alpha), f) = 1$ .
- $I_{\mathcal{K}}(f)$  the subgroup of  $I(\mathcal{O}_{\mathcal{K}})$  generated by  $\mathcal{O}_{\mathcal{K}}$ -ideals  $\mathfrak{a} \in \text{Ideal}(\mathcal{O}_{\mathcal{K}})$  that is prime to  $f$ .
- $P_{\mathcal{K},\mathbb{Z}}(f)$  the subgroup of  $P(\mathcal{K})$  generated by  $\alpha \in \mathcal{O}_{\mathcal{K}}$  s.t.  $\alpha \equiv a \pmod{f\mathcal{O}_{\mathcal{K}}}$  for some  $a \in \mathbb{Z} \setminus (f)$ .

Then  $\mathfrak{a} \mapsto \mathfrak{a} \cap \mathcal{O}$  induces an isomorphism  $I_{\mathcal{K}}(f) \cong I(\mathcal{O}, f)$  with inverse given by  $\mathfrak{a} \mapsto \mathfrak{a}\mathcal{O}_{\mathcal{K}}$ , and  $\|\mathfrak{a}\| = \|\mathfrak{a} \cap \mathcal{O}\|$ . Moreover, there is an isomorphism

$$\text{Cl}(\mathcal{O}) \cong I(\mathcal{O}, f) / P(\mathcal{O}, f) \cong I_{\mathcal{K}}(f) / P_{\mathcal{K},\mathbb{Z}}(f).$$

$\lrcorner$

*Proof:* The map  $I(\mathcal{O}, f) \rightarrow I(\mathcal{O})$  is surjective by (19.3.1.56), and the kernel of  $I(\mathcal{O}, f) \rightarrow \text{Cl}(\mathcal{O})$  is  $P(\mathcal{O}) \cap I(\mathcal{O}, f)$ . It is easy to show that this group is just  $P(\mathcal{O}, f)$ .

If  $\mathfrak{a} \in \text{Ideal}(\mathcal{O}_K)$  is prime to  $f$ , then  $\mathfrak{a} \cap \mathcal{O}$  is also prime to  $f$  because there is a natural injection  $\mathcal{O} \cap (\mathfrak{a} \cap \mathcal{O}) \hookrightarrow \mathcal{O}_K/\mathfrak{a}$ . And this map is also a surjective because multiplying by  $f$  is a bijection on  $\mathcal{O}_K/\mathfrak{a}$  and  $f\mathcal{O}_K \subset \mathcal{O}$ . And also  $\mathfrak{a}\mathcal{O}_K \cap \mathcal{O} = \mathfrak{a}$  because

$$\mathfrak{a}\mathcal{O}_K \cap \mathcal{O} = (\mathfrak{a}\mathcal{O}_K \cap \mathcal{O})\mathcal{O} = (\mathfrak{a}\mathcal{O}_K \cap \mathcal{O})(\mathfrak{a} + f\mathcal{O}) \subset \mathfrak{a} + \mathfrak{a} \cdot f\mathcal{O}_K \subset \mathfrak{a}.$$

If  $\mathfrak{a} \in \text{Ideal}(\mathcal{O})$  is prime to  $f$ , then  $\mathfrak{a}\mathcal{O}_K + f\mathcal{O}_K = (\mathfrak{a} + f\mathcal{O})\mathcal{O}_K = \mathcal{O}\mathcal{O}_K = \mathcal{O}_K$ . So  $\mathfrak{a}\mathcal{O}_K$  is also prime to  $f$ . And also  $(\mathfrak{a} \cap \mathcal{O})\mathcal{O}_K = \mathfrak{a}$  because  $\mathfrak{a} = \mathfrak{a}\mathcal{O} = \mathfrak{a}(\mathfrak{a} \cap \mathcal{O} + f\mathcal{O}) \subset (\mathfrak{a} \cap \mathcal{O})\mathcal{O}_K + f\mathfrak{a} \subset (\mathfrak{a} \cap \mathcal{O})\mathcal{O}_K$ .

The bijection given above is clearly multiplicative, thus induces a homomorphism  $I(\mathcal{O}, f) \rightarrow I_K(f)$ . Then it suffices to show that subgroup  $P(\mathcal{O}, f)$  is mapped onto  $P_{K, \mathbb{Z}}(f)$ : This follows from the fact that: For  $\alpha \in \mathcal{O}_K$ ,  $\alpha \equiv a \pmod{f\mathcal{O}_K}$  for some  $a \in \mathbb{Z} \setminus (f)$  iff  $\alpha \in \mathcal{O}$  and  $(\text{Nm}(\alpha), f) = 1$ .  $\square$

## 2 Cyclotomic Fields

**Def. (19.3.2.1) [Cyclotomic Units].** A compatible system of roots of unity is a system  $\{\zeta_n, n \in \mathbb{Z}_+\} \subset \overline{\mathbb{Q}}$  s.t.

- $\zeta_m \neq 1$  for  $m > 1$ .
- For  $k, n \in \mathbb{Z}_+$ ,  $\zeta_{kn}^k = \zeta_n$ .
- $\zeta_4 = i$ .

We fix a choice of compatible system of unity throughout this book.  $\lrcorner$

**Prop. (19.3.2.2).**  $\text{Gal}(\mathbb{Q}(\zeta_n)/\mathbb{Q}) \cong (\mathbb{Z}/(n))^*$ .  $\lrcorner$

*Proof:* We choose a prime  $p$  prime to  $n$  and show that  $\zeta_n^p$  is conjugate to  $\zeta_n$ .

Let  $X^n - 1 = f(X)h(X)$  with  $f(X)$  minimal polynomial of  $\zeta_n$ . If  $f(\zeta_n^p) \neq 0$ , then  $h(\zeta_n^p) = 0$ , thus  $h(X^p) = f(X)g(X)$ . So modulo  $p$ ,  $X^n - 1$  has a multi root, which is impossible.  $\square$

**Lemma (19.3.2.3).** For  $p \in \mathbf{P}$ ,  $r \in \mathbf{Z}_+$ , consider  $\mathbb{Q}(\zeta_{p^r})$ , then  $(p) = (1 - \zeta_{p^r})^{p^{r-1}(p-1)}$ , and

$$\text{disc}(1, \zeta_{p^r}, \dots, \zeta_{p^r}^{p^{r-1}(p-1)-1}) = \pm p^{p^{r-1}(r(p-1)-1)},$$

where the sign is positive if  $p^r = 4$  or  $p \equiv 3 \pmod{4}$ .  $\lrcorner$

*Proof:* As  $\Psi_{p^r}(X) = X^{p^{r-1}(p-1)} + X^{p^{r-1}(p-2)} + \dots + X^{p^{r-1}} + 1$ , by taking  $X = 1$ , we get

$$p = \prod_{g \in (\mathbb{Z}/(n))^*} (1 - \zeta_{p^r}^g).$$

But it is easy to see that for any  $g, g' \in (\mathbb{Z}/(n))^*$ ,  $1 - \zeta_{p^r}^g$  and  $1 - \zeta_{p^r}^{g'}$  differ by a unit, so by (3.2.6.35), if  $\zeta_i$  are the conjugates of  $\zeta_{p^r}$ , then

$$d(1, \dots, \theta^{p^{r-1}(p-1)-1}) = \prod_{i < j} (\zeta_i - \zeta_j)^2 = \pm \prod_i \Psi_{p^r}^\vee(\zeta_i) = \pm \text{Nm}_{\mathbb{Q}(\zeta_{p^r})/\mathbb{Q}}(\Psi_{p^r}^\vee(\zeta_{p^r})).$$

Differentiating the equation

$$(X^{p^{r-1}} - 1)\Psi_{p^r}(X) = X^{p^r} - 1,$$

we get

$$(\zeta_p - 1)\Psi_{p^r}^\vee(\zeta_{p^r}) = p^r \zeta_{p^r}^{-1}.$$

Then notice as  $p$  is totally ramified in  $\mathbb{Q}(\zeta_p)$  (19.1.5.28),

$$\mathrm{Nm}_{\mathbb{Q}(\zeta_{p^r})/\mathbb{Q}}(\zeta_p - 1) = (\mathrm{Nm}_{\mathbb{Q}(\zeta_p)/\mathbb{Q}}(\zeta_p - 1))^{p^{r-1}} = \pm p^{p^{r-1}},$$

and the assertion follows. The last assertion follows from (19.3.1.14).  $\square$

**Prop. (19.3.2.4).** For  $n \in \mathbb{Z}_+$ ,  $\mathcal{O}_{\mathbb{Q}(\zeta_n)} = \mathbb{Z}[\zeta_n]$ .  $\lrcorner$

*Proof:* First consider the case  $n = p^r$  a prime power. By (19.3.2.3),  $d(1, \zeta_{p^r}, \dots, \zeta_{p^r}^{p^{r-1}(p-1)-1}) = \pm p^s$  for some  $s \in \mathbb{Z}_+$ , so  $p^s \mathcal{O} \subset \mathbb{Z}[\zeta_{p^r}] \subset \mathcal{O}$ . Because  $p$  totally ramifies by (19.1.5.28),  $\mathcal{O} = \mathbb{Z}[\zeta_{p^r}] + (1 - \zeta_{p^r})\mathcal{O}$ , thus  $\mathcal{O} = \mathbb{Z}[\zeta]$  by Nakayama.

In general, if  $n = \prod_i p_i^{r_i}$ , for different  $p_i$ , and  $\mathbb{Q}(\zeta_n) = \prod \mathbb{Q}(\zeta_{p_i^{r_i}})$  by Chinese remainder theorem, and the fields  $\mathbb{Q}(\zeta_{p_i^{r_i}})$  are disjoint and the discriminant are pairwise coprime, thus by (5.2.7.16), the products of the integral basis form an integral basis.  $\square$

**Cor. (19.3.2.5).**  $\mathcal{O}_{\mathbb{Q}(\zeta_n + \zeta_n^{-1})} = \mathbb{Z}[\zeta_n + \zeta_n^{-1}]$ .  $\lrcorner$

**Prop. (19.3.2.6).** By (35.3.6.16), for  $p \geq 3 \in \mathbf{P}$ ,  $\mathbb{Q}(\sqrt{(-1)^{\frac{p-1}{2}} p}) \subset \mathbb{Q}(\mu_p)$ .  $\lrcorner$

**Prop. (19.3.2.7).** For  $p \in \mathbf{P}$ , if  $\varepsilon \in (\mathbb{Z}[\zeta_p])^*$ , then there exists  $\varepsilon_1 \in \mathbb{Q}(\zeta_p + \zeta_p^{-1})$  and  $r \in \mathbb{Z}$  s.t.  $\varepsilon = \zeta_p^r \varepsilon_1$ .  $\lrcorner$

*Proof:* The case  $p = 2$  is clear. Assume  $p \geq 3$ , and  $\alpha = \bar{\varepsilon}/\varepsilon$ , then any conjugate of  $\alpha$  has absolute value 1. Thus  $\alpha$  is a root of unity (19.3.1.12), Assume  $\alpha = \pm \zeta_p^a$  ?. Let  $\varepsilon = b_0 + b_1 \zeta_p + \dots + b_{p-2} \zeta_p^{p-2}$ , if  $\alpha = -\zeta_p^a$ , then

$$\bar{\varepsilon} = b_0 + b_1 \zeta_p^{-1} + \dots \equiv b_0 + b_1 + \dots \equiv \varepsilon = -\zeta_p^a \bar{\varepsilon} \equiv \bar{\varepsilon} \pmod{1 - \zeta_p}.$$

Then  $2\bar{\varepsilon} \in (1 - \zeta_p)$ , which is not possible.

Thus  $\alpha = \zeta_p^a$ . Assume  $a \equiv 2r \pmod{p}$ , and  $\varepsilon_1 = \zeta^{-r} \varepsilon$ , then  $\bar{\varepsilon}_1 = \varepsilon_1$ , and  $\varepsilon = \varepsilon_1 \zeta_p^r$ .  $\square$

**Prop. (19.3.2.8).**  $p \in \mathbf{P}$  splits in  $\mathbb{Q}(\zeta_n)$  iff  $p \equiv 1 \pmod{n}$ .  $\lrcorner$

*Proof:* First, if it splits, then  $f_p = 1$ . Because the ring of integers is  $\mathbb{Z}[\zeta_n]$ , so  $X^n - 1$  splits in  $\mathbb{F}_p$  (19.3.2.4), thus  $p \equiv 1 \pmod{n}$ . And if  $p \equiv 1 \pmod{n}$ , it is unramified and  $X^n - 1$  splits in  $\mathbb{F}_p$ , so  $f_p = 1$ .  $\square$

**Prop. (19.3.2.9) [Ramifications].**  $p \in \mathbf{Prime}$  is ramified in  $\mathbb{Q}(\mu_n)$  iff  $p|n$ .  $\lrcorner$

*Proof:* This follows from (19.1.5.26) and (19.1.5.28).  $\square$

**Cor. (19.3.2.10).** If  $m, n \in \mathbb{Z}_+$  are coprime, then  $\mathbb{Q}(\mu_m) \cap \mathbb{Q}(\mu_n) = \mathbb{Q}$ .  $\lrcorner$

*Proof:* This follows from Minkowski's theorem (19.3.1.32).  $\square$

**Prop. (19.3.2.11).** If  $n \in \mathbb{Z}_+$  has at least two prime divisors, then  $1 - \zeta_n$  is a unit in  $\mathbb{Q}(\mu_n)$ .  $\lrcorner$

*Proof:* By (3.3.2.11),  $\mathrm{Nm}(1 - \zeta_n) = \Psi_n(1) = 1$ .  $\square$

**Prop. (19.3.2.12).**

- If  $n \in \mathbb{Z}_+$  is not of the form  $p^r$  or  $2p^r$  for  $p \in \mathbf{P}$ , then  $\mathbb{Q}(\zeta_n)/\mathbb{Q}(\zeta_n + \zeta_n^{-1})$  is unramified at finite places.

- If  $p \in \mathbf{P}$  and  $n \in p^{\mathbb{Z}_+}$  or  $n \in 2p^{\mathbb{Z}_+}$ , then  $\mathbb{Q}(\zeta_n)/\mathbb{Q}(\zeta_n + \zeta_n^{-1})$  is ramified at any places above  $p$ , and unramified at other finite places.  $\lrcorner$

*Proof:* For the first case, let  $p, q$  are two prime divisors of  $n$  (or  $q = 2$ , in which case take  $q = 4$ ). Then  $\zeta_p, \zeta_q$  are not in  $\mathbb{Q}(\zeta_n + \zeta_n^{-1})$ , so  $\mathbb{Q}(\zeta_n) = \mathbb{Q}(\zeta_n + \zeta_n^{-1}, \zeta_p) = \mathbb{Q}(\zeta_n + \zeta_n^{-1}, \zeta_q)$ . But then  $\mathbb{Q}(\zeta_n)/\mathbb{Q}(\zeta_n + \zeta_n^{-1})$  can only ramify at finite places that are both over  $p$  and over  $q$ , so it is unramified at all finite places.

For the second case, use the fact that  $\mathbb{Q}(\zeta_n)/\mathbb{Q}$  is totally ramified at  $p$  and unramified at other places (19.1.5.26) and (19.1.5.28).  $\square$

**Prop. (19.3.2.13) [No Unramified Extensions].** Let  $m, n \in \mathbb{Z}_+$  and  $\mathbb{Q}(\zeta_m) \subset F \subset \mathbb{Q}(\zeta_n)$  s.t.  $F/\mathbb{Q}(\zeta_m)$  is unramified, then  $F = \mathbb{Q}(\zeta_m)$ .  $\lrcorner$

*Proof:* This follows from class field theory.  $\square$

### $\mathbb{Z}_p$ -Extensions

**Def. (19.3.2.14) [ $\text{cycl}_p(K)$ ].** For  $p \in \mathbf{P}$  and  $K \in p\text{-Field}$  or  $K \in \mathbf{GField}$ , Denote  $K_{p^\infty} = K(\zeta_{p^\infty})$ . Then by (19.3.2.2) and (19.1.5.17),  $\text{Gal}(K_{p^\infty}/K) \subset \mathbb{Z}_p^* \cong \mathbb{Z}_p \oplus G$  is a subgroup of finite index, where  $G$  is a finite group. So there is a unique subextension  $\text{cycl}_p(K) \subset K(\mu_{p^\infty})$  with  $\text{Gal}(\text{cycl}_p(K)/K) \cong \mathbb{Z}_p$ , called the **cyclotomic  $\mathbb{Z}_p$ -extension** of  $K$ .

Also denote  $\text{cycl}_{p,n}(K) \subset \text{cycl}_p(K)$  the subextension of degree  $p^n$ .  $\lrcorner$

**Prop. (19.3.2.15).** If  $\ell$  is a  $p$  is totally ramified in  $\text{cycl}_p(\mathbb{Q})$ , and any  $\ell \in \mathbf{P} \setminus \{p\}$  is unramified in  $\text{cycl}_p(\mathbb{Q})$ .  $\lrcorner$

*Proof:* Cf. [Washington, P265].  $\square$

### Others

**Prop. (19.3.2.16) [Sum of Primitive Roots of Unity].** For  $n \in \mathbb{Z}_+$ , the sum of primitive  $n$ -th roots of unity equals  $\mu(n)$  (2.6.1.25).  $\lrcorner$

*Proof:* The assertion is multiplicative, so it suffices to prove for prime powers. Let  $p \in \mathbf{Prime}, k \in \mathbb{Z}_+$ . If  $k = 1$ , then clearly the sum is -1. If  $k \geq 2$ , then the sum equals

$$\sum_{i=0}^{p^k-1} \zeta_{p^k}^i - \sum_{i=0}^{p^{k-1}-1} \zeta_{p^{k-1}}^i = 0.$$

$\square$

**Prop. (19.3.2.17).** Find all  $n \in \mathbb{Z}_+$  and primitive  $n$ -th roots of unity  $\zeta_1, \dots, \zeta_4$  s.t.

$$\zeta_1 + \zeta_2 + \zeta_3 + \zeta_4 = 1.$$

$\lrcorner$

*Proof:* By (19.3.2.16),

$$4\mu(n) = \sum_{k \in (\mathbb{Z}/(n))^*} \sum_{i=1}^4 \zeta_i^k = \phi(n).$$

Thus  $\varphi(n) = 4$  and  $\mu(n) = 1$ . Then  $n$  can only be 5, 8, 10, 12, and  $n$  can only be 10.

Now  $\Psi_{10}(X) = X^4 - X^3 + X^2 - X + 1$ , so the identity  $\zeta_1 + \zeta_2 + \zeta_3 + \zeta_4 = 1$  must be essentially identical to this one. So the only possibility is

$$\{\zeta_1, \zeta_2, \zeta_3, \zeta_4\} = \{e^{2\pi i \frac{1}{10}}, e^{2\pi i \frac{3}{10}}, e^{2\pi i \frac{7}{10}}, e^{2\pi i \frac{9}{10}}\}.$$

□

### 3 Class Numbers

**Def. (19.3.3.1) [Class Groups and Class Numbers].** The **class group of  $F$**  is defined to be the class group  $\text{Cl}(\mathcal{O}_F)$  of  $\mathcal{O}_F$ . It is denoted by  $\text{Cl}(F)$ . The cardinality of  $\text{Cl}(F)$  is called the **class number of  $F$** , denoted by  $\text{cl}(F)$ .

$$\text{Also denote } h(D) = \begin{cases} \text{cl}(\mathcal{O}_D) & , D \equiv 0, 1 \pmod{4} \\ 0, & \text{otherwise} \end{cases} \text{ and } \text{Cl}(D) = \begin{cases} \text{Cl}(\mathcal{O}_D) & , D \equiv 0, 1 \pmod{4} \\ 0, & \text{otherwise} \end{cases} . \quad \lrcorner$$

**Lemma (19.3.3.2).** For  $\mathfrak{a} \neq 0 \in \text{Ideal}^\times(\mathcal{O}_F)$ , there exists  $a \in \mathfrak{a}^\times$  s.t.

$$|\text{Nm}_{F/\mathbb{Q}}(a)| \leq \left(\frac{2}{\pi}\right)^s \sqrt{|\text{disc}(F)|} \cdot \|\mathfrak{a}\| .$$

□

*Proof:* This follows immediately from (20.8.1.4). □

**Thm. (19.3.3.3) [Class Numbers are Finite].**  $\text{cl}(F) = \# \text{Cl}(F) < \infty$ . □

*Proof:* It is clear that there are only f.m. ideals  $\mathfrak{a} \in \text{Ideal}(\mathcal{O}_F)$  of bounded norm. Thus it suffices to prove that each ideal class is represented by an integral ideal  $\mathfrak{b} \in \text{Ideal}(\mathcal{O}_F)$  with  $\|\mathfrak{b}\| \leq \left(\frac{2}{\pi}\right)^s$ . For this, let the ideal class be represented by  $\mathfrak{a}$ , and let  $\gamma \in \mathcal{O}_F^\times$  s.t.  $\mathfrak{b} = \gamma \mathfrak{a}^{-1} \subset \mathcal{O}_F$ . Then by (19.3.3.2), there exists  $\alpha \in \mathfrak{b}^\times$  s.t.  $|\text{Nm}_{F/\mathbb{Q}}(\alpha)| \leq \left(\frac{2}{\pi}\right)^s \sqrt{|d_F|} \|\mathfrak{b}\|$ . Then  $\mathfrak{a} = \alpha \mathfrak{b}^{-1} = \alpha \gamma^{-1} \mathfrak{a}$  is contained in  $\mathcal{O}_F$ , and

$$\|\mathfrak{a}\| = |\text{Nm}_{F/\mathbb{Q}}(\alpha)| / \|\mathfrak{b}\| \leq \left(\frac{2}{\pi}\right)^s \sqrt{|d_F|} .$$

□

**Conj. (19.3.3.4).** There are infinitely many real quadratic field with class number 1. □

*Proof:*

□

**Conj. Cor. (19.3.3.5).** There are infinitely many number fields with class number 1. □

*Proof:*

### Class Numbers of Imaginary Quadratic Orders

References are [Gol85], [Sta67], [Cox13].

**Thm. (19.3.3.6)** [Dirichlet's Class Number Formula]. Let  $\mathcal{K}$  be an imaginary quadratic field with discriminant  $d_{\mathcal{K}}$ , then

$$\text{cl}(\mathcal{K}) = -\frac{\#\mu(\mathcal{K})}{2|d_{\mathcal{K}}|} \sum_{n=1}^{|d_{\mathcal{K}}|-1} \left(\frac{d_{\mathcal{K}}}{n}\right)_n.$$

┘

*Proof:* Cf. [Cox13]P134. □

**Thm. (19.3.3.7).** Let  $\mathcal{K}$  be an imaginary quadratic field and  $f \in \mathbb{Z}_+$ , then  $\text{cl}(\mathcal{O}_{\mathcal{K}}) \mid \text{cl}(\mathcal{O}_{\mathcal{K},f})$ , and

$$\text{cl}(\mathcal{O}_{\mathcal{K},f}) = \frac{\text{cl}(\mathcal{O}_{\mathcal{K}})f}{[\mu(\mathcal{O}_{\mathcal{K}}) : \mu(\mathcal{O}_{\mathcal{K},f})]} \prod_{p \mid f} \left(1 - \left(\frac{d_{\mathcal{K}}}{p}\right)\frac{1}{p}\right).$$

┘

*Proof:* Cf. [Cox13]P132. □

**Prop. (19.3.3.8).** Let  $p \equiv 3 \pmod{4} \in \text{Prime}$ , then for  $D = -p$  or  $-4p$ ,  $\text{cl}(\mathcal{O}_D)$  (19.3.1.45) is odd. ┘

*Proof:* Cf. [Cox, Prop3.11 and Thm7.7(ii)]. ? □

**Thm. (19.3.3.9)** [Siegel]. Let  $\mathcal{K}$  denote an imaginary quadratic field with discriminant  $d_{\mathcal{K}}$ , then

$$\lim_{d_{\mathcal{K}} \rightarrow -\infty} \frac{\text{cl}(\mathcal{K})}{\log |d_{\mathcal{K}}|} = \frac{1}{2}.$$

┘

*Proof:* Cf. [Sie35]. □

**Thm. (19.3.3.10)** [Gauss Class Number Problem1801, Siegel [Sie35]/Goldfeld(1976)/Gross-Zagier(1983)].

For any imaginary quadratic field  $\mathbb{Q}(\sqrt{D})$  with discriminant  $D < 0$ , we have

$$\text{cl}(\mathcal{O}_D) \geq \frac{1}{55} \log(|D|) \prod_{p \in S(D)} \left(1 - \frac{[2\sqrt{p}]}{p+1}\right).$$

┘

*Proof:* This follows from (35.5.3.4) and (35.4.4.10). See also [Goldfeld, The class numbers of quadratic fields and the conjectures of Birch and Swinnerton-Dyer]. □

**Def. (19.3.3.11)** [Hurwitz's Class Numbers]. Let  $\mathcal{K}$  be an imaginary quadratic field and  $\mathcal{O} \subset \mathcal{O}_{\mathcal{K}}$  be an imaginary quadratic order, then define the **Hurwitz's class number**

$$H(\mathcal{O}) = \sum_{\mathcal{O}' \subset \mathcal{O}_{\mathcal{K}}} \frac{2 \text{cl}(\mathcal{O}')}{\#\mathcal{O}'^*}.$$

And if  $\mathcal{O}_D$  has discriminant  $D$ , then also denote

$$H(D) = H(\mathcal{O}_D) = \sum_{f^2 \mid D} \hat{h}(D/f^2)$$

where  $\hat{h}(\Delta) = 2h(\Delta)/\#\mathcal{O}_{\Delta}^*$  (19.3.3.1). In particular, if  $D \neq -3, -4$  is a fundamental discriminant, then  $H(D) = h(D)$ . ┘

### Quadratic Forms and Class Numbers

**Def. (19.3.3.12) [Primitive Binary Quadratic Forms].** A **primitive binary quadratic form** is a binary quadratic form of the form  $\varphi(x, y) = ax^2 + bxy + cy^2$  s.t.  $a, b, c \in \mathbb{Z}$  and  $(a, b, c) = 1$ .  $\lrcorner$

**Def. (19.3.3.13) [Representing Numbers].** For a binary quadratic form  $\varphi(x, y) = ax^2 + bxy + cy^2$ , an integer  $m \in \mathbb{Z}$  is said to be **represented by the form**  $\varphi$  if  $m = \varphi(x, y)$  for some  $x, y \in \mathbb{Z}$ . And  $m$  is said to be **properly represented by the form**  $\varphi$  if  $m = \varphi(x, y)$  for some  $x, y \in \mathbb{Z}$  s.t.  $(x, y) = 1$ .  $\lrcorner$

**Prop. (19.3.3.14).** A binary quadratic form  $\varphi(x, y) = ax^2 + bxy + cy^2$  properly represents an integer  $m \in \mathbb{Z}$  iff  $\varphi$  is equivalent to a form  $\phi(x, y) = mx^2 + Bxy + Cy^2$  for some  $B, C \in \mathbb{Z}$ .  $\lrcorner$

*Proof:* One direction is clear, for the other, if  $f(p, q) = m$  and  $(p, q) = 1$ , then we can find  $r, s \in \mathbb{Z}$  s.t.  $ps - qr = 1$ , then we have

$$\varphi(px + ry, qx + sy) = f(p, q)x^2 + (2apr + bps + brq + 2cqs)xy + f(r, s)y^2.$$

□

**Def. (19.3.3.15) [Equivalence between Binary Quadratic Forms].** Two binary quadratic forms  $f(x, y), g(x, y)$  are called **equivalent** if there exists  $\begin{bmatrix} a & b \\ c & d \end{bmatrix} \in \text{GL}(2; \mathbb{Z})$  s.t.  $f(x, y) = g(ax + by, cx + dy)$ .

And  $f, g$  are called **properly equivalent** if there exists  $\begin{bmatrix} a & b \\ c & d \end{bmatrix} \in \text{SL}(2; \mathbb{Z})$  s.t.  $f(x, y) = g(ax + by, cx + dy)$ .  $\lrcorner$

**Def. (19.3.3.16) [Reduced Primitive Binary Quadratic Forms].** A **reduced primitive binary quadratic form** is a primitive binary quadratic form  $\varphi(x, y) = ax^2 + bxy + cy^2$  (19.3.3.15) s.t.  $|b| \leq a \leq c$ , and  $b \geq 0$  if either  $|b| = a$  or  $a = c$ .  $\lrcorner$

**Prop. (19.3.3.17).** Every primitive binary quadratic form  $\varphi(x, y) = ax^2 + bxy + cy^2$  is properly equivalent to a unique reduced primitive binary quadratic form.  $\lrcorner$

*Proof:* Cf. [Cox13]P25?  $\lrcorner$

**Prop. (19.3.3.18).** For  $D \in \mathbb{Z}_-$ , there are only f.m. reduced primitive binary quadratic forms  $\varphi(x, y) = ax^2 + bxy + cy^2$  (19.3.3.16) with discriminant  $b^2 - 4ac = D$ . Let  $h(D)$  be this number.  $\lrcorner$

*Proof:* Because  $\varphi(x, y)$  is reduced, we have  $-D = 4ac - b^2 \geq 4a^2 - a^2 = 3a^2$ , so  $a \leq \sqrt{-D/3}$ , so there are only f.m. choices of  $a$ , and then for each  $a$ , because  $|b| \leq a$ , there are only f.m. choices of  $b$ , and we notice that  $c$  is determined by  $a$  and  $b$ .  $\lrcorner$

**Exercise (19.3.3.19).** If  $p \in \text{Prime}$  is represented by two binary quadratic forms  $f(x, y)$  and  $g(x, y)$  of the same discriminant, show that  $f$  and  $g$  are equivalent. And if  $f(x, y) = x^2 + ny^2$  for some  $n \in \mathbb{Z}_+$  and  $g$  is reduced, show that  $f = g$ .  $\lrcorner$

**Exercise (19.3.3.20).** Given a primitive binary quadratic form  $\varphi(x, y) = ax^2 + bxy + cy^2$ , show that  $-\varphi = [\tilde{\varphi}]$  in the class group, where  $\tilde{\varphi}(x, y) = ax^2 - bxy + cy^2$ .  $\lrcorner$

**Thm. (19.3.3.21)[Class Groups of Binary Quadratic Forms].** Let  $D \in \mathbb{Z}_-$  s.t.  $D \equiv 0, 1 \pmod{4}$ , and  $C(D)$  the set of equivalence classes of primitive positive definite forms of discriminant  $D$ , then the Dirichlet composition is a well-defined binary operation on  $C(D)$  which makes  $C(D)$  into a finite Abelian group, whose identity element is given by

$$\begin{cases} x^2 - \frac{D}{4}y^2 & , D \equiv 0 \pmod{4} \\ x^2 + xy + \frac{1-D}{4}y^2 & , D \equiv 1 \pmod{4} \end{cases}.$$

And the inverse of the class containing  $ax^2 + bxy + cy^2$  is the class containing  $ax^2 - bxy + cy^2$ .  $\lrcorner$

*Proof:* Cf.[Cox13]P45.  $\square$

**Prop. (19.3.3.22)[ $\#C(D)[2]$ ].** Situation as in (19.3.3.21), let  $r = \#S(D)$ , then there are exact  $(2^\mu - 1)$ -many classes in  $C(D)$  of order  $\leq 2$ , where

$$\mu = r + \begin{cases} 0 & , D \equiv 1 \pmod{4} \\ 0 & , D = -4n \ \& \ n \equiv 3 \pmod{4} \\ 1 & , D = -4n \ \& \ n \equiv 1, 2 \pmod{4} \\ 1 & , D = -4n \ \& \ n \equiv 4 \pmod{8} \\ 1 & , D = -4n \ \& \ n \equiv 0 \pmod{8} \end{cases}.$$

$\lrcorner$

*Proof:* Cf.[Cox13]P47.  $\square$

**Prop. (19.3.3.23)[Siegel's Mass Formula].** Let  $D \in \mathbb{Z}_-$  s.t.  $D \equiv 0, 1 \pmod{4}$  and let  $m \in \mathbb{Z}_+ \setminus (D)$ , and denote  $R_D(m)$  the number of representations of  $m$  by a complete system of inequivalent forms of discriminant  $D$ , then we have

$$R_D(m) = w(D) \sum_{d \in \mathbb{Z}_+, d|m} \left( \frac{D}{d} \right), \text{ where } w(D) = \begin{cases} 6 & , D = -3 \\ 4 & , D = -4 \\ 2 & , D < -4 \end{cases}.$$

$\lrcorner$

*Proof:*  $\color{red}{?}$  Cf.[Cox13]Lemma3.25.  $\square$

**Conj. (19.3.3.24)[Euler's Convenient Number Conjecture].** If  $D = -4N$  where  $N \in \mathbb{Z}_+$  satisfies  $h_1(D) = 1$ , i.e.  $C(D)$ (19.3.3.21) has one class in each genus  $\color{red}{?}$ , then one of the cases happen:

$$\begin{cases} N \in \{1, 2, 3, 4, 7\} & , h(D) = 1 \\ N \in \{5, 6, 8, 9, 10(\text{and } 10 \text{ more})\} & , h(D) = 2 \\ N \in \{21, 24, 30, 33(\text{and } 20 \text{ more})\} & , h(D) = 4 \\ N \in \{105, 120(\text{and } 15 \text{ more})\} & , h(D) = 8 \\ N \in \{840, 1320, 1365, 1848\} & , h(D) = 16 \end{cases}.$$

$\lrcorner$

### List of Imaginary Quadratic Fields by Class Number

**Thm. (19.3.3.25)**[Imaginary Quadratic Fields with Class Number 1, Baker-Heegner-Stark].

- Let  $\mathcal{K}$  be an imaginary quadratic field with discriminant  $d_{\mathcal{K}}$ , then

$$\text{cl}(\mathcal{O}_{\mathcal{K}}) = 1 \iff d_{\mathcal{K}} \in \{-3, -4, -7, -8, -11, -19, -43, -67, -163\}.$$

These numbers are called **Heegner-numbers**.

- Let  $D \in \mathbb{Z}_{<0}$  and  $D \equiv 0, 1 \pmod{4}$ , then

$$\text{cl}(\mathcal{O}_D) = 1 \iff D \in \{-3, -4, -7, -8, -11, -12, -16, -19, -27, -28, -43, -67, -163\}.$$

┘

*Proof:* 1: Cf.[Cox, P247] ?

2: Let  $\mathcal{K} = \mathbb{Q}(\sqrt{D})$  and  $D = f^2 d_{\mathcal{K}}$ ,  $f \in \mathbb{Z}_+$ , then by (19.3.3.7),  $\text{cl}(\mathcal{O}_{\mathcal{K}}) = 0$ , thus

$$d_{\mathcal{K}} \in \{-3, -4, -7, -8, -11, -19, -43, -67, -163\}.$$

If  $\mu(\mathcal{K}) = \{\pm 1\}$ , then by (19.3.3.7) again,  $f \leq 2$ . And it can be checked directly that  $f = 2$  only happens when  $d_{\mathcal{K}} \equiv \pm 1 \pmod{8}$ , so  $d_{\mathcal{K}} = -7$ .

If  $|\mu(\mathcal{K})| > 2$ , then  $d_{\mathcal{K}} = -3$  or  $-4$ . For  $d_{\mathcal{K}} = -4$ ,  $f \leq 2$ , and it can be checked that  $f = 2$  works, and  $D = -16$ . If  $d_{\mathcal{K}} = -3$ , then  $f \leq 3$ , and it can be checked that  $f = 2$  or  $f = 3$  works.  $\square$

**Prop. (19.3.3.26)**[Imaginary Quadratic Fields with Class Number 2]. For  $n \in \mathbb{Z}_+$  that is square-free,

$$\text{cl}(\mathbb{Q}(\sqrt{-n})) = 2 \iff n \in \{5, 6, 10, 13, 15, 22, 35, 37, 51, 58, 91, 115, 123, 187, 235, 267, 403, 427\}.$$

┘

*Proof:* Cf.[Ribenoim, Classical Theory of Algebraic Numbers].  $\square$

**Prop. (19.3.3.27)**[Imaginary Quadratic Fields with Class Number 3]. Let  $\mathcal{K}$  be an imaginary quadratic field with discriminant  $d_{\mathcal{K}}$ , then

$$\text{cl}(\mathcal{O}_{\mathcal{K}}) = 3 \iff d_{\mathcal{K}} \in \left\{ \begin{array}{l} -23, -31, -59, -83, -107, -139, -211, -283, \\ -307, -331, -379, -499, -547, -643, -883, -907 \end{array} \right\}.$$

┘

*Proof:* Cf.[Arno-Robinson-Wheeler, Imaginary quadratic fields with small odd class number].  $\square$

**Prop. (19.3.3.28)**[Imaginary Quadratic Fields with Class Number 4, Arno]. For  $n \in \mathbb{Z}_+$  that is square-free,

$$\text{cl}(\mathbb{Q}(\sqrt{-n})) = 4 \iff n \in \left\{ \begin{array}{l} 14, 17, 21, 30, 33, 34, 39, 42, 46, 55, 57, 70, 73, 78, 82, 85, 93, \\ 97, 102, 130, 133, 142, 155, 177, 190, 193, 195, 203, 219, 253, \\ 259, 291, 323, 355, 435, 483, 555, 595, 627, 667, 715, 723, 763, \\ 795, 955, 1003, 1027, 1227, 1243, 1387, 1411, 1435, 1507, 1555 \end{array} \right\}.$$

┘

*Proof:* Cf.[Arno, The imaginary quadratic fields of class number 4].  $\square$

**Prop.(19.3.3.29) [Imaginary Quadratic Fields with Class Number 5].** Let  $\mathcal{K}$  be an imaginary quadratic field with discriminant  $d_{\mathcal{K}}$ , then

$$\text{cl}(\mathcal{O}_{\mathcal{K}}) = 5 \iff -d_{\mathcal{K}} \in \left\{ \begin{array}{l} 47, 79, 103, 127, 131, 179, 227, 347, 443, 523, 571, 619, 683, 691, \\ 739, 787, 947, 1051, 1123, 1723, 1747, 1867, 2203, 2347, 2683 \end{array} \right\}.$$

┘

*Proof:* Cf.[Arno-Robinson-Wheeler, Imaginary quadratic fields with small odd class number].  $\square$

**Prop.(19.3.3.30) [Imaginary Quadratic Fields with Class Number 6].** Let  $\mathcal{K}$  be an imaginary quadratic field with discriminant  $d_{\mathcal{K}}$ , then

$$\text{cl}(\mathcal{O}_{\mathcal{K}}) = 6 \iff -d_{\mathcal{K}} \in \left\{ \begin{array}{l} 87, 104, 116, 152, 212, 244, 247, 339, 411, 424, 436, 451, 472, 515, \\ 628, 707, 771, 808, 835, 843, 856, 1048, 1059, 1099, 1108, 1147, 1192, \\ 1203, 1219, 1267, 1315, 1347, 1363, 1432, 1563, 1588, 1603, 1843, 1915, \\ 1963, 2227, 2283, 2443, 2515, 2563, 2787, 2923, 3235, 3427, 3523, 3763. \end{array} \right\}.$$

┘

*Proof:* Cf.[Wagner, Class number 5,6 and 7].  $\square$

*Proof:* [Arno-Robinson-Wheeler, Imaginary quadratic fields with small odd class number].  $\square$

**Prop. (19.3.3.39) [Imaginary Quadratic Fields with Class Number 23, Arno].** Let  $\mathcal{K}$  be an imaginary quadratic field with discriminant  $d_{\mathcal{K}}$ , then

$$\text{cl}(\mathcal{O}_{\mathcal{K}}) = 23 \iff -d_{\mathcal{K}} \in \left\{ \begin{array}{l} 647, 1039, 1103, 1279, 1447, 1471, 1811, 1979, 2411, 2671, 3491, \\ 3539, 3847, 3923, 4211, 4783, 5387, 5507, 5531, 6563, 6659, 6703, \\ 7043, 9587, 9931, 10867, 10883, 12203, 12739, 13099, 13187, 21019, \\ 15307, 15451, 16267, 17203, 17851, 18379, 20323, 20443, 20899, \\ 21163, 22171, 22531, 24043, 25147, 25579, 25939, 26251, 26947, \\ 27283, 28843, 30187, 31147, 31267, 32467, 34843, 35107, 37003, \\ 40627, 40867, 41203, 42667, 43003, 45427, 45523, 47947, 90787 \end{array} \right\}.$$

┘

*Proof:* [Arno-Robinson-Wheeler, Imaginary quadratic fields with small odd class number].  $\square$

### Class Number of Cyclotomic Fields

**Prop. (19.3.3.40) [Regular Primes, Kummer].** For  $p \geq 3 \in \text{Prime}$ ,  $p \mid \text{cl}(\mathbb{Q}(\zeta_p))$  iff there exists some  $k \in \mathbb{Z}_+$  s.t.  $k \leq \frac{p-3}{2}$  and  $p$  divides the denominator of  $B_{2k}$  (10.7.1.12). Such primes  $p$  are called **regular primes**.  $\square$

*Proof:* ?  $\square$

**Prop. (19.3.3.41) [Montgomery/Uchida].** For  $p \in \text{Prime}$ ,  $\text{cl}(\mathbb{Q}(\zeta_p)) = 1$  iff  $p \leq 19$ .  $\square$

*Proof:*  $\square$

**Prop. (19.3.3.42) [Iwasawa [Iwa56]].** Let  $E/F \in \text{NField}$  be Galois, then

- If  $E/F$  is totally ramified at some place  $v \in \Sigma_F^{\text{fin}}$ , then  $\text{cl}(F) \mid \text{cl}(E)$ .
- If moreover  $p \in \text{Prime}$  and  $E/F$  is a cyclic extension of  $p$ -power degree and is ramified only at  $v$ , then  $p \nmid \text{cl}(F) \implies p \nmid \text{cl}(E)$ .

┘

*Proof:* 1: Let  $H_1/F, H_2/E$  be the Hilbert class fields of  $F, E$  resp.. Then  $H_1 \cap E = F$  because  $v$  is totally ramified in  $E$ . Thus  $\text{Gal}(H_1E/E) \cong \text{Gal}(H_1/F)$  is Abelian, and  $H_1E/E$  is also unramified by?? So  $H_1E \subset H_2$ , which implies that  $\text{cl}(F) = [H_1 : F][H_2 : E] = \text{cl}(E)$ .

2: Let  $H_1/F, H_2/E$  be the Hilbert class fields of  $F, E$  resp., and let  $E \subset H' \subset H_2$  s.t.  $[H_2 : H']$  is prime to  $p$  and  $[H' : E]$  is a  $p$ -power. If  $p \mid \text{cl}(E)$ , then  $H' \neq E$ . Let  $N = \text{Gal}(H'/E)$  and  $G = \text{Gal}(H'/F)$ . Because  $G$  is a  $p$ -group thus nilpotent(3.1.8.11), there is a normal subgroup  $M$  of  $G$  contained in  $N$  s.t.  $[N : M] = p$ . Then  $N/M$  is contained in the center of  $G/M$ . Now  $G/N$  is cyclic, we get that  $G/M$  is Abelian by(3.1.7.1).

Let  $E \subset E' \subset H'$  corresponds to  $M$ , then  $E'/F$  is Abelian, and all the places of  $E'$  over  $v$  have the same inertia field(19.3.1.22)  $F'$ . Because  $v$  is totally ramified in  $E$  and  $E'/E$  is unramified, we have  $[F' : F] = p$ . No places of  $F$  other than  $v$  is ramified in  $F'/F$ , so  $F'/F$  is cyclic unramified of degree  $p$  and is contained in  $H_1$ . Thus  $\text{cl}(F) = [H_1 : F]$  is therefore divisible by  $p = [F' : F]$ .  $\square$

**Cor. (19.3.3.43).**

- If  $p \in \text{Prime}$  is a regular prime(19.3.3.40), and  $F/\mathbb{Q}$  is an Abelian extension with conductor  $p^e$ , then  $p \nmid \text{cl}(F)$ .
- If  $F/\mathbb{Q}$  is a cyclic extension of degree  $p^{e-1}$  and conductor  $p^e$ , then  $p \nmid \text{cl}(F)$ .

┘

*Proof:* These are just the proposition applied to the extensions  $\mathbb{Q}(\zeta_{p^e})/\mathbb{Q}(\zeta_p)$ ,  $\mathbb{Q}(\zeta_{p^e})/F$  or  $F/\mathbb{Q}$ .  $\square$

## 19.4 Adeles and Ideles

*“Adeles make life possible.”*

– J. Arthur.

**Notation (19.4.0.1).**

- Use notations defined in [Global Fields](#).

┘

### 1 Adeles

**Notation (19.4.1.1) [Adeles, Artin-Whaples [A-W45]].** For  $S \in \Sigma_F$ ,  $\#S < \infty$ ,

- The **adele group** (adele=additive element) of  $F$  is defined to be  $\mathbf{A}_F = \prod'_v (F_v, \mathcal{O}_v)$  [\(12.10.3.18\)](#).
- $\mathbf{A}_{F,S} = \prod_{v \in S} F_v$ .
- $\mathbf{A}_F^S = \prod'_{v \notin S} (F_v, \mathcal{O}_v)$ , called the group of  $S$ -**adeles** of  $F$ .
- $\mathbf{A}'_{F,S} = \mathbf{A}_{F,S} \times (\prod_{v \notin S} \mathcal{O}_{F_v})$ .
- The **finite adeles**  $\mathbf{A}_{F,f} = \mathbf{A}_F^{S_\infty} = \prod'_{v \notin S_\infty} (F_v, \mathcal{O}_v)$ .
- The **infinite adeles**  $\mathbf{A}_{F,\infty} = \mathbf{A}_{F,S_\infty} = \prod_{v \in S_\infty} F_v$ .
- For  $v \in \Sigma_F$ ,  $x \in F_v$ , let  $[x]_{\mathfrak{p}}^\oplus$  be the image of  $x$  under the map  $F_{\mathfrak{p}} \rightarrow \mathbf{A}_F$ .

┘

**Prop. (19.4.1.2) [Extension of Adeles].** If  $L/F$  is separable, then

$$\mathbf{A}_F \otimes_F L \cong \mathbf{A}_L$$

via diagonal embedding.

┘

*Proof:*  $\mathbf{A}_F \otimes_F L \cong \prod'_v (F_v, \mathcal{O}_v \otimes_{\mathcal{O}_F} \mathcal{O}_L)$ , because for any element  $x \in L$ ,  $|\text{Nm}_{L/F}(x)|_v \neq 0$  for only f.m.  $v$ . And there are isomorphisms by diagonal maps.

$$F_v \otimes_F L \cong \prod_{w|v} L_w, \quad \mathcal{O}_v \otimes_{\mathcal{O}_F} \mathcal{O}_L \cong \prod_{w|v} \mathcal{O}_w \text{ (5.2.7.26)}.$$

□

**Prop. (19.4.1.3) [ $F$  Cocompact in  $\mathbf{A}_F$ ].**  $F$  is discrete in  $\mathbf{A}_F$  and  $F \backslash \mathbf{A}_F$  is compact.

┘

*Proof:* Let  $\infty$  be any prime, consider  $U = \{\mathfrak{a} \in \mathbf{A}_F \mid |a|_\infty < 1, |a|_v \leq 1\}$ , then  $U \cap K = 0$  by [\(19.4.1.5\)](#).

Now we show  $\mathbf{A}_F/F$  is compact. By [\(19.4.1.2\)](#), it suffices to prove for  $F = \mathbb{Q}$  or  $\mathbb{F}_p(t)$ . Let  $U_\infty = \{x \in F_\infty \mid |x|_\infty \leq 1\}$ , and Cf. [MIT notes, 22.12]. ?

□

### Ideles

**Notation (19.4.1.4) [Ideles, Chevalley [Che34]].** For  $\emptyset \subset_{\text{fin}} S \subset \Sigma_F$ .

- The **idele group** (idele=ideal element) of  $F$  is defined to be  $\mathbf{I}_F = \prod'_v (F_v^\times, \mathcal{O}_{F_v}^*)$  [\(12.10.3.18\)](#), which is set-theoretically just  $\mathbf{A}_F^\times$ . Notice the topology on  $\mathbf{I}_K$  is stronger than the subspace topology induced from  $\mathbf{A}_K$ .

- The **idele class group**  $C_F = \mathbf{I}_F / F^\times$ .
- $\mathbf{I}_F$  is naturally a valuation ring with valuation  $|\cdot|$ , called the **idelic norm**.
- $\mathbf{I}_F^1 \subset \mathbf{I}_F$  is the subgroup consisting of elements of idelic norm 1, called the set of **unit ideles**.
- $\mathbf{I}_F^S = \prod'_{v \notin S} (F_v^\times, \mathcal{O}_v^*)$ , called the group of  **$S$ -ideles** of  $F$ .
- $\mathbf{I}_{F,S} = \prod_{v \in S} F_v^\times$ .
- $\mathbf{I}'_{F,S} = \mathbf{I}_{F,S} \times \left( \prod_{v \notin S} \mathcal{O}_{F_v}^* \right)$ .
- $F^S = \mathcal{O}_{F,S}^* = F^\times \cap \mathbf{I}'_{F,S}$  is the set of **S-units** of  $F$  (5.2.7.10).
- The **finite ideles**  $\mathbf{I}_{F,f} = \mathbf{I}_F^{\Sigma_F^\infty} = \prod'_{v \notin \Sigma_\infty} (F_v^\times, \mathcal{O}_v^*)$ .
- The **infinite ideles**  $\mathbf{I}_{F,\infty} = \mathbf{I}_{F,S_\infty} = \prod_{v \in S_\infty} F_v^\times$ .
- For  $v \in \Sigma_F$ ,  $x \in F_v^\times$ , let  $[x]_v$  be the image of  $x$ , and similarly for the embedding  $F_v \hookrightarrow \mathbf{A}_F$ .

┘

**Prop. (19.4.1.5) [Product Formula].** If  $\mathfrak{a} \in F^\times \subset \mathbf{I}_F$ , then  $|\mathfrak{a}|_F = 1$ . In other words,  $F^\times \subset \mathbf{I}_F^1$ .

┘

*Proof:* Consider the restricted product measure  $d\mu$  on  $\mathbf{A}_F$ , then clearly  $d\mu(\mathfrak{a}x) = \|\mathfrak{a}\| d\mu(x)$ , and multiplying by  $\mathfrak{a}$  induces an isomorphism of  $\mathbf{A}_F$ , but preserves the counting measure on  $F$ . But  $\mathbf{A}_F$  is compact (19.4.1.3) thus has finite volume, so  $\|\mathfrak{a}\| = 1$ .  $\square$

**Prop. (19.4.1.6).** If  $F \in \mathbf{FField}$ , the norm group  $|\mathbf{I}_F|$  of the Adelic norm is  $|\mathbf{I}_F| = q^\mathbb{Z}$ , where  $q = \#F_0$  and  $F_0$  is the maximal finite field contained in  $F$ .

┘

*Proof:* This is because in this case,  $F$  corresponds to smooth curve over the prime field  $F_0$ . Then by Weil conjecture (31.1.3.4), there exists a point of  $F_0$  with residue order  $q^n$  for any  $n$  large. Then their quotient gives  $q$ .  $\square$

**Prop. (19.4.1.7) [Splitting of  $\mathbf{I}_F$ ].**

- If  $F \in \mathbf{NField}$ , take  $v \in \Sigma_F^\infty$ , then the exact sequence  $1 \rightarrow \mathbf{I}_F^1 \rightarrow \mathbf{I}_F \xrightarrow{|\cdot|_{\mathbf{A}}} \mathbb{R}_+ \rightarrow 1$  splits, so there are a non-canonical isomorphisms

$$\mathbf{I}_F \cong \mathbf{I}_F^1 \times \mathbb{R}_+, \quad F^\times \backslash \mathbf{I}_F \cong (F^\times \backslash \mathbf{I}_F^1) \times \mathbb{R}_+.$$

- If  $F \in \mathbf{FField}$ , take  $v \in \Sigma_F$ , then for some  $q \in \|v\|^{\mathbb{Z}_+}$ , the exact sequence  $1 \rightarrow \mathbf{I}_F^1 \rightarrow \mathbf{I}_F \xrightarrow{|\cdot|_{\mathbf{A}}} q^\mathbb{Z} \rightarrow 1$  splits, so there are a non-canonical isomorphisms

$$\mathbf{I}_F \cong \mathbf{I}_F^1 \times q^\mathbb{Z}, \quad F^\times \backslash \mathbf{I}_F \cong (F^\times \backslash \mathbf{I}_F^1) \times q^\mathbb{Z}.$$

In particular, any Hecke character of  $F$  is of the form  $\chi = \chi_0 \cdot \|\cdot\|_{\mathbf{A}}^{\lambda_i}$  for some  $\lambda \in \mathbb{R}$ .

┘

**Lemma (19.4.1.8).**  $\mathbf{I}_F^1$  is closed in  $\mathbf{A}_F$ , and the subspace topologies from  $\mathbf{A}_F$  and  $\mathbf{I}_F$  are the same on  $\mathbf{I}_F^1$ .

┘

*Proof:* ?  $\square$

**Lemma (19.4.1.9) [Blichfeldt-Minkowski].** There exists  $\kappa_F > 0$  s.t.: For any  $x \in \mathbf{I}_F$  s.t.  $|x|_F \geq \kappa_F$ , if

$$W(x) = \{y \in \mathbf{I}_F : |y_v|_v \leq |x_v|_v, \forall v \in \Sigma_F\}.$$

then  $W(x) \cap F^\times \neq \emptyset$ .

┘

*Proof:* ?

□

**Prop. (19.4.1.10) [Fujisaki's Lemma].**  $F^\times$  is discrete and cocompact in  $\mathbf{I}_F$ . Thus  $C_F = F^\times \backslash \mathbf{I}_F$  is Hausdorff and locally compact. ┘

*Proof:*  $F^\times$  is discrete in  $\mathbf{I}_F$  because it is already discrete in  $\mathbf{A}_F$  (19.4.1.3). By (19.4.1.8), using (19.4.1.9), it suffices to show that for  $\|x\|_F \geq C$ ,  $W(x) \cap \mathbf{I}_F^1 \rightarrow \mathbf{I}_F^1/F^\times$  is surjective: If  $y \in \mathbf{I}_F^1$ , then  $\|x/y\| = \|x\| \geq C$ , thus there exists  $z \in K^\times \cap W(x/y)$ , thus  $zy \in W(x)$ , and  $y$  is in the image of  $W(x) \cap \mathbf{I}_F^1$ . □

**Cor. (19.4.1.11) [Shimura Varieties for  $G_m$ ].**

- If  $F \in \mathbf{NField}$ , then  $F^\times \backslash \mathbf{I}_F / \mathbf{I}_{F,\infty}$  is compact.
- For any open compact subgroup  $\mathcal{K} \subset \mathbf{I}_{F,f}$ , the set

$$X_{\mathcal{K}} = F^\times \backslash \mathbf{I}_F / \mathcal{K} \mathbf{I}_{F,\infty}$$

is a finite set. ┘

*Proof:* 1 follows from (19.4.1.7)(19.4.1.10) and the fact  $\text{val}(I_{F,\infty}) = \mathbb{R}_+$ .

2: Notice that  $\mathcal{K} \mathbf{I}_{F,\infty}$  is open in  $\mathbf{I}_F$ , thus  $\mathbf{I}_F / \mathcal{K} \mathbf{I}_{F,\infty}$  is discrete. If  $F \in \mathbf{NField}$ , then by 1,  $X_{\mathcal{K}}$  is both discrete and compact, thus finite. If  $F \in \mathbf{FField}$ , then notice first that there is an exact sequence

$$1 \rightarrow F^\times \backslash \mathbf{I}_F^1 / \mathcal{K}^1 \rightarrow F^\times \backslash \mathbf{I}_F / \mathcal{K} \xrightarrow{\text{val}_F} \text{val}_F(\mathbf{I}_F) / \text{val}_F(\mathcal{K}) \rightarrow 1,$$

and then use (19.4.1.10) and the fact  $\# \text{val}_F(\mathbf{I}_F) / \text{val}_F(\mathcal{K}) < \infty$ . □

**Prop. (19.4.1.12).** If  $L/F$  is Galois, then  $\mathbf{I}_F \subset \mathbf{I}_L$ , and  $\mathbf{I}_L^{\text{Gal}(L/F)} = \mathbf{I}_F$ , this is be the diagonal inclusion to all the primes above a given prime, and the action is by  $(\sigma \mathfrak{a})_{\mathfrak{p}} = \sigma \mathfrak{a}_{\sigma^{-1}\mathfrak{p}}$ . This induces an inclusion  $\mathbf{C}_F \subset \mathbf{C}_L$  and  $\mathbf{C}_L^{\text{Gal}(L/F)} = \mathbf{C}_F$ . The last assertion uses long exact sequence and  $H^1(\text{Gal}(L/F), L^\times) = 0$ . ┘

**Lemma (19.4.1.13).** The map  $\mathbf{I}_F \rightarrow \mathbf{A}_F \times \mathbf{A}_F : x \mapsto (x, x^{-1})$  is a homeomorphism of  $\mathbf{I}_F$  onto a closed subspace of  $\mathbf{A}_F \times \mathbf{A}_F$ . ┘

*Proof:* Compare their topological basis. □

**Prop. (19.4.1.14) [Idele Groups and Extensions].** For an extension of global fields  $L/F$ ,

- the diagonal embedding  $\mathbf{A}_F \rightarrow \mathbf{A}_L$  induces a closed embedding, and also a closed embedding  $\mathbf{I}_F \rightarrow \mathbf{I}_L$  by (19.4.1.13), thus also a closed embedding  $\mathbf{I}_F / F^\times \rightarrow \mathbf{I}_L / L^\times$ .
- $\mathbf{A}_L$  is a finite  $\mathbf{A}_F$ -module, thus there is a norm map  $\text{Nm}_{L/K} : \mathbf{A}_L \rightarrow \mathbf{A}_F$ , which restricts to  $\text{Nm}_{L/K} : \mathbf{I}_L \rightarrow \mathbf{I}_F$ , which is compatible with  $\text{Nm}_{L/K} : L^\times \rightarrow K^\times$ , thus inducing a map  $\text{Nm}_{L/K} : \mathbf{C}_L \rightarrow \mathbf{C}_F$ . Then this map is continuous, open and proper.
- $[n] : \mathbf{C}_F \rightarrow \mathbf{C}_F$  is continuous and proper. ┘

*Proof:* 2: It is continuous because it is compatible with the local norms  $\text{Nm}_{L_{\mathfrak{p}}/F_{\mathfrak{p}}}$ , and  $\text{Nm}_{L_{\mathfrak{p}}/F_{\mathfrak{p}}}^{-1}(\mathcal{O}_{F,\mathfrak{p}}^\times) = \mathcal{O}_{L,\mathfrak{p}}^\times$ . To show it is open, use the fact the local norms are open and for unramified places  $\text{Nm}_{L_{\mathfrak{p}}/F_{\mathfrak{p}}} \mathcal{O}_{L,\mathfrak{p}} = \mathcal{O}_{F,\mathfrak{p}}$  (19.1.5.21)(19.7.2.21). To show it is proper, use the splitting  $\mathbf{C}_F \cong F^\times \backslash \mathbf{I}_F^1 \times q^{\mathbb{Z}}$  (19.4.1.7) and the fact  $F^\times \backslash \mathbf{I}_F^1$  is proper (19.4.1.10). □

3: Use the splitting (19.4.1.7).

$\mathbf{C}_F$

**Def. (19.4.1.15) [Hecke Character, Hecke[[Hec20](#)]].** A **Hecke character** of  $F$  is a character of  $\mathbf{C}_F$ .

┘

**Def. (19.4.1.16) [Unramified Places].** Let  $\chi$  be a Hecke character of  $\mathbf{C}_F$ , then for a.e.  $v \in \Sigma_F^{\text{fin}}$ , the conductor of  $\chi_v$  is  $\mathcal{O}_v^*$ . For these  $v$ ,  $\chi$  is said to be **unramified** at  $v$  (which is compatible with the definition in [\(19.4.2.2\)](#)).

┘

**Prop. (19.4.1.17).** Let  $p \in \text{Prime}$ ,  $F \in p\text{-FField}$ , and  $\ell \in \text{Prime} \setminus \{p\}$ ,  $E \in \ell\text{-NField}$ , then any continuous homomorphism  $\chi : \mathbf{C}_F \rightarrow \mathcal{O}_E^*$  that is unramified outside a finite set of places is of the form  $\chi = \chi_1 \cdot c^{\deg(\cdot)}$ , where  $\chi_1 : \mathbf{C}_F \rightarrow \mathcal{O}_E^*$  is of finite order and  $c \in \mathcal{O}_E^*$ .

┘

*Proof:* Let  $\sigma \in \mathbf{C}_F^{\text{ab}}$  s.t.  $\deg(\sigma) = 1$ , let  $c = \chi(\sigma)$ , and  $\chi_1 = \chi \cdot c^{-\deg(\cdot)}$ , then  $\chi_1(\mathbf{C}_F) = \chi_1(\mathbf{I}_F)$ . But as  $\#\text{Cl}(F) < \infty$ , by [\(19.7.4.8\)](#), it suffices to show that  $\chi_1(F^\times U^1/F^\times)$  is finite. Then it suffices to show that  $\#\chi(U^1) < \infty$ . But if  $\chi$  is unramified outside a finite set  $S$  of places, then it suffices to show that  $\#\chi(\prod_{v \in S} \mathcal{O}_v^*) < \infty$ . But this is because  $\prod_{v \in S} \mathcal{O}_v^*$  has a pro- $p$ -group of finite index and  $\mathcal{O}_E^*$  has a pro- $\ell$ -group of finite index.  $\square$

**Def. (19.4.1.18) [Norm Groups].** Let  $\mathcal{N}_{E/F} = \text{Nm}_{E/F} \mathbf{C}_E$ , called the **norm group** of  $E/F$ .

┘

**Prop. (19.4.1.19) [Connected Component of identity of  $\mathbf{C}_F$ ].** If  $F \in \text{NField}$ , let  $\mathbf{I}_{F,\infty}^0 \cong \mathbb{R}_+^{r_1} \times (\mathbb{C}^\times)^{r_2}$  be the connected component of identity of  $\mathbf{I}_{F,\infty}$ ,  $D_F \subset \mathbf{C}_F$  the closure of  $\mathbf{I}_{F,\infty}^0 \subset \mathbf{C}_F$ , then

- $D_F$  is the connected component of identity of  $\mathbf{C}_F$ .
- $D_F = \cap_{n \in \mathbb{Z}_+} \mathbf{C}_F^n$  is the group of divisible elements of  $\mathbf{C}_F$ .
- $\mathbf{C}_F/D_F$  is a profinite group. (which will be isomorphic to  $\text{Gal}_F^{\text{ab}}$ , as we will see in [\(19.7.3.29\)](#)).

┘

*Proof:*  $\mathbf{I}_{F,\infty}^0$  is divisible, thus so does its image in  $\mathbf{C}_F$ . Then  $D_F$  is also divisible as  $[n] : \mathbf{C}_F \rightarrow \mathbf{C}_F$  is continuous and proper [\(19.4.1.14\)](#).

Consider the map  $\prod_{v \in \Sigma_F^{\text{fin}}} \mathcal{O}_{F,v}^* \rightarrow \mathbf{C}_F/D_F$ , its cokernel is finite because  $\mathbf{C}_F/\prod_{v \in \Sigma_F^{\text{fin}}} \mathbf{I}_{F,\infty} \cong \text{Cl}(\mathcal{O}_F)$  is finite and  $\mathbf{I}_{F,\infty}/\mathbf{I}_{F,\infty}^0$  is finite. But  $\prod_{v \in \Sigma_F^{\text{fin}}} \mathcal{O}_{F,v}^*$  is a profinite group, thus  $\mathbf{C}_F/D_F$  is also a profinite group.

To show  $D_F = \mathbf{C}_F^0$ , firstly  $\mathbf{C}_F^0 \subset D_F$  by the fact  $\mathbf{C}_F/D_F$  is connected thus totally disconnected, and the reverse is true because  $D_F$  is connected.

To show  $D_F = \cap_{n \in \mathbb{Z}_+} \mathbf{C}_F^n$ , notice any divisible element is in  $D_F$  as a profinite group  $\mathbf{C}_F/D_F$  doesn't contain non-trivial divisible elements.  $\square$

**Thm. (19.4.1.20) [Class Numbers and Unit Theorems].** For  $\Sigma_F^\infty \subset_{\text{fin}} S \subset \Sigma_F$  s.t.  $S \neq \emptyset$ ,

1. The  $S$ -class group  $\text{Cl}(\mathcal{O}_{F,S}) \cong F^\times \backslash \mathbf{I}_F / \mathbf{I}_{F,S}'$  is finite. In particular,  $\mathbf{I}_\mathbb{Q} = \mathbb{Q}^\times \times \mathbb{R}_+^\times \times \prod_{p \in \text{Prime}} \mathbb{Z}_p^\times$ .
2. If  $x \in F^\times$  and  $|x|_v = 1$  for any  $v \in \Sigma_F$ , then  $x \in F_{\text{tor}}^\times$ .
3. The  $S$ -unit group [\(5.2.7.10\)](#)  $\mathcal{O}_{F,S}^* \cong F_{\text{tor}}^\times \times \mathbb{Z}^{\#S-1}$ .

┘

*Proof:* 1 follows from [\(19.4.1.11\)](#).

2, 3: Consider the regulator map

$$\text{Reg}^S : \prod_{v \in S} F_v^\times \rightarrow \mathbb{R}^{\#S} : (x_v) \mapsto (-\log |x_v|_v).$$

Then this map restricted to  $F^S$  has image a discrete subset of the hyperplane  $H = \{\sum x_i = 0\}$ . In fact the image is a full lattice in  $H$ : let  $n_1$  be the number of infinite places in  $S$  and  $n_2$  the number of finite places in  $S$ , then  $\text{Reg}^S((\prod_{v \in S} F_v^\times)^1) \cong \mathbb{R}^{n_1-1} \times \mathbb{Z}^{n_2}$  if  $n_1 > 0$  and  $\mathbb{Z}^{\#S-1}$  if  $n_1 = 0$ . Then notice  $(\prod_{v \in S} F_v)^1 / F^S$  is finite, which is true as  $(\mathbf{I}_F^S)^1 / F^S$  is compact, so the image of  $F^S$  is a full lattice of  $H$ .

Also notice if  $x \in F^S$  is in the kernel of  $\text{Reg}^S$ , then  $|x|_v = 1$  for any  $v \in \Sigma_F$ , so  $\{x^n | n \in \mathbb{Z}\}$  is a bounded subset in  $\mathbf{I}'_{F,S}$ , but it is also contained in the discrete subset  $F^S$  (19.4.1.3), thus it is a finite subset, and  $x$  is a root of unity.  $\square$

**Cor. (19.4.1.21).** If  $S \subset \Sigma_F$  is sufficiently large, then  $\mathbf{I}_F = \mathbf{I}_F^S \cdot F^\times$ , and  $\mathbf{C}_F = \mathbf{I}_F^S \cdot F^\times / F^\times$ .  $\lrcorner$

*Proof:* The ideal class group is finite, hence we can find a finite set of representative for it. Only finite set of primes are involved in it, thus we let  $S$  contain all these primes and infinite primes, then for any  $\mathfrak{a}$ ,  $\prod_{p \nmid \infty} a_p = A_i \cdot (x)$ , and  $A_i \in \mathbf{I}_F^S$ , hence  $\mathfrak{a} \in \mathbf{I}_F^S \cdot F^\times$ .  $\square$

**Prop. (19.4.1.22) [Hecke Characters as Dirichlet Characters].** For an finite modulus  $\mathfrak{m} \in \text{Ideal}^\times(\mathcal{O}_F)$ , we may define a **Dirichlet character** as a character

$$\chi_0 : (\mathcal{O}_F / \mathfrak{m})^* \rightarrow \mathbb{C}^\times.$$

There is an exact sequence

$$1 \rightarrow \mathcal{O}_F^* \rightarrow \prod_{\mathfrak{p}} \mathcal{O}_{\mathfrak{p}}^* \times F_\infty^\times \rightarrow \mathbf{C}_F \rightarrow \text{Cl}(F) \rightarrow 1.$$

For any Hecke character  $\chi$  of  $F$ ,  $\chi_f$  factors through  $\prod_{\mathfrak{p}} \mathcal{O}_{\mathfrak{p}}^* \rightarrow (\mathcal{O}_F / \mathfrak{m})^*$  for some finite modulus  $\mathfrak{m} = \mathfrak{p}_1^{e_1} \dots \mathfrak{p}_k^{e_k}$  by continuity constraint, thus inducing a Dirichlet character  $\chi_0$  modulo  $\mathfrak{m}$ , called the **Dirichlet component of  $\chi$** .

However, not every naive Dirichlet character  $\chi_0$  and an infinite character  $\chi_\infty$  can form a Hecke character. For example, they must satisfy  $\chi_0(\varepsilon)\chi_\infty(\varepsilon) = 1$  for any unit  $\varepsilon \in \mathcal{O}_F^*$ . And if  $\chi_0(\varepsilon)\chi_\infty(\varepsilon) = 1$ , then there exists exactly  $\text{cl}(F)$ -many Hecke character  $\chi$  extending  $\chi_0$  and  $\chi_\infty$ , because the surjection

$$F^\times \backslash \mathbf{I}_F / \prod_{\mathfrak{p}} (1 + \mathfrak{p}^{e_{\mathfrak{p}}}) \rightarrow \text{Cl}(F) \rightarrow 1$$

has sections (take case of the infinite places).  $\lrcorner$

**Def. (19.4.1.23) [Hecke Characters and Ideal Characters].** Any Hecke character  $\chi$  of  $F$  (19.4.1.15) is of the form  $\chi = \chi_f \times \chi_\infty$ , where  $\chi_f : \mathbf{I}_{F,f} \rightarrow \mathbb{C}$  and  $\chi_\infty : (F \otimes \mathbb{R})^\times \rightarrow \mathbb{C}$ . Then by continuity, there exists a smallest modulus  $\mathfrak{m} = \prod_{v \in \Sigma_F^{\text{fin}}} \mathfrak{p}_v^{e_v}$  s.t.  $\chi_f$  is trivial on

$$\prod_{v \in \Sigma_F^{\text{fin}}} (1 + \mathfrak{p}_v^{e_v}).$$

Thus the restriction of  $\chi$  to  $\mathbf{I}^{\text{m}\infty}$  gives us a ideal class map  $J^{\text{m}} \rightarrow \mathbb{C}$  which we also denote by  $\chi$ . And the restriction of  $\chi$  to  $\prod_{v \in \Sigma_F^{\text{fin}}} \mathcal{O}_{F_v}^*$  gives a Dirichlet character  $\chi_0^{-1} : (\mathcal{O}_F / \mathfrak{m})^* \rightarrow \mathbb{C}$ .

Then we have  $\chi((\alpha))\chi_\infty(\alpha) = \chi_0(\alpha)$  for any  $\alpha \in \mathcal{O}$  that is prime to  $\mathfrak{m}$ .  $\lrcorner$

**Example (19.4.1.24) [Dirichlet Characters and Hecke Characters for  $\mathbb{Q}$ ].** Hecke characters of  $\mathbb{Q}$  are exactly of the form  $\chi(x) = \chi_1(x)|x|^\lambda$  for some  $\lambda \in i\mathbb{R}$ , where  $\chi_1$  a Hecke character of finite order.

And a Hecke character of finite order with conductor  $N$  corresponding to a primitive Dirichlet character  $\chi_0 \in \text{Diri}'(N)$  via (19.4.1.20):

$$\chi : \mathbf{I}_{\mathbb{Q}} \rightarrow \prod_p \mathbb{Z}_p^* \rightarrow (\mathbb{Z}/(N))^* \xrightarrow{\chi_0^{-1}} \mathbb{C}^\times.$$

In this way,  $\chi([p]_p) = \chi_0(p)$  for any  $p \in \text{Prime}$  s.t.  $(p, N) = 1$ . ┘

### Algebraic Hecke-Characters

References are [CCO14], [Serre-Tate, Good reduction of abelian varieties], [Serre, Abelian l-adic representations and elliptic curves], [Milne, Canonical models of (mixed) Shimura varieties and automorphic vector bundles], [Milne-Shih, Langlands' construction of the Taniyama group].

**Def. (19.4.1.25) [Algebraic Characters].** For  $K'/K, F/K \in \text{Field}$  s.t.  $\#K = \infty$  and  $K'/K$  is separable, a homomorphism  $\chi : (K')^\times \rightarrow F^\times$  is called an **algebraic character**(w.r.t.  $K$ ) if one of the following equivalent conditions holds:

- $\chi$  is induced by a homomorphism  $\varphi : (\text{Res}_{K'/K}(\mathbb{G}_m))_F \rightarrow \mathbb{G}_m \in \text{AlgGrp}/F$ , which is equivalent to a homomorphism  $\varphi' : \text{Res}_{K'/K}(\mathbb{G}_m) \rightarrow \text{Res}_{F/K}(\mathbb{G}_m)$  when  $F/K$  is finite.
- If  $e_1, \dots, e_n$  is a  $K$ -basis of  $K'$ , then there exists  $f(X_1, \dots, X_n) \in F(\mathbf{X})$  defined on each non-zero element of  $K^n$ , s.t.  $\chi(\sum x_i e_i) = f(x_1, \dots, x_n)$ .
- There exists a  $\text{Gal}_F$ -invariant function  $m : \text{Hom}_K(K', F^{\text{sep}}) \rightarrow \mathbb{Z}$  s.t.

$$\chi(x) = \prod_{\tau \in \text{Hom}_K(K', F^{\text{sep}})} \tau(x)^{m(\tau)}, \text{ where } x \in (K')^\times.$$

┘

*Proof:* Cf. [CCO14]P117? □

**Remark (19.4.1.26).** Situation as in (19.4.1.25), if  $K \subset F \subset K'$ , then the only algebraic character  $(K')^\times \rightarrow F^\times$  is  $\text{Nm}_{K'/F}$ . ┘

**Def. (19.4.1.27) [Algebraic Idele-Characters].** For  $F \in \text{NField}$ , an **algebraic idele-character** is a continuous homomorphism  $\epsilon : \mathbf{I}_F \rightarrow L^\times$  where  $L \in \text{Field}^0$  is endowed with discrete topology, s.t. its restriction to  $F^\times \subset \mathbf{I}_F$  is an algebraic character  $\epsilon_{\text{alg}}$  w.r.t.  $\mathbb{Q}$  (19.4.1.25), called the **algebraic part of the algebraic idele-character**.

And for each  $\mathfrak{m} \in \text{Ideal}(\mathcal{O}_F)^\times$ , a homomorphism  $\chi : I_{\mathfrak{m}} \rightarrow L^\times$  for some field  $L \in \text{Field}^0$  is called an **algebraic idele-character with conductor  $\mathfrak{m}$**  if there exists an algebraic character  $\chi_{\text{alg}} : F^\times \rightarrow L^\times$  (19.4.1.25) s.t.

$$\chi((x)) = \chi_{\text{alg}}(x)$$

for each  $x \in F^\times$  s.t.  $x \in 1 + \mathfrak{m}$  and is positive at all real places of  $F$ . Such  $\chi_{\text{alg}}$  is called the **algebraic part of the algebraic idele-character**. ┘

**Def. (19.4.1.28) [Serre-Tori].** ┘

**Prop. (19.4.1.29) [Algebraic Idele-Characters and Serre-Tori, Serre].** Let  $F, L \in \text{NField}$  and  $\mathfrak{m} \in \text{Ideal}(\mathcal{O}_F)^\times$ .

- For each  $\rho : S_F \rightarrow \text{Res}_{L/\mathbb{Q}}(\mathbb{G}_m) \in \text{GrpSch}/\mathbb{Q}$ , the composition

$$\mathbf{I}_F \rightarrow S_F(\mathbb{Q}) \xrightarrow{\rho} L^\times$$

is an algebraic Hecke-character (19.4.1.27), and every algebraic Hecke-character  $\mathbf{I}_F \rightarrow L^\times$  is of this form.

- For each  $\rho_m : S_m \rightarrow \text{Res}_{L/\mathbb{Q}}(\mathbb{G}_m) \in \text{GrpSch}/\mathbb{Q}$ , the composition

$$\mathbf{I}_m = \mathbf{I}_F^{S(m^\infty)} / \prod_{v \in \Sigma_F^{\text{fin}} \setminus S(m)} \mathcal{O}_{F_v}^* \rightarrow \mathbf{I}_F/U_{m^\infty} \rightarrow S_m(\mathbb{Q}) \xrightarrow{\rho_m} L^\times$$

is an algebraic Hecke-character with conductor  $\mathfrak{m}$ , and every algebraic Hecke-character  $\mathbf{I}_m \rightarrow L^\times$  is of this form.

┘

*Proof:* Cf. [Abelian  $l$ -adic representations and elliptic curves]2.2.6. □

**Def. (19.4.1.30) [Algebraic Hecke-Characters].** For  $F \in \mathbf{NField}$ , an (complex-valued) **algebraic Hecke-character** of  $F$  is a Hecke-character  $\chi : \mathbf{C}_F \rightarrow \mathbb{C}^\times$  s.t. there exists a map  $a : \text{Hom}(F, \mathbb{C}) \rightarrow \mathbb{Z}$  that

$$\chi|_{(\mathbf{I}_{F,\infty})^0}(\mathbf{x}) = \prod_{\tau \in \text{Hom}(F, \mathbb{C})} x_\tau^{a_\tau}.$$

┘

**Prop. (19.4.1.31) [Global Class Field Theory for Algebraic Hecke-Characters].** Suppose  $F \in \mathbb{C}$ ,  $\chi$  is an algebraic Hecke-character of  $F$ , then

- For each  $\ell \in \mathbf{Prime}$  and an isomorphism  $\iota_\ell : \overline{\mathbb{Q}_\ell} \cong \mathbb{C}$ , there is a unique continuous character

$$r_{\ell, \iota_\ell}(\chi) : \text{Gal}_F \rightarrow \mathbb{C}^\times$$

s.t. for each  $v \in \Sigma_F^{\text{fin}} \setminus S(\ell)$ , we have

$$\iota \circ r_{\ell, \iota_\ell}(\chi)|_{W_{F_v}} \circ \text{Art}_{F_v} = \chi_v.$$

- There exists  $\text{wt}(\chi) \in \mathbb{Z}$  s.t.  $|\chi| = \|\cdot\|_F^{-\text{wt}(\chi)/2} : \mathbf{C}_F \rightarrow \mathbb{C}^\times$ .

And every geometric  $\ell$ -adic characters of  $\text{Gal}_F$  (30.1.2.1) arises in this way. ┘

*Proof:* Cf. [Potential automorphy and change of weight, Gee-Geraghty-Taylor]Appendix A.2. □

## 2 Fourier Analysis on Adeles

References are [Tat67b, R-V99, Poo15].

### Local Notations

**Def. (19.4.2.1) [Normalized Valuations].** Let  $d\mu$  a Haar measure on  $K$ , let the valuation on  $K$  be given by  $d\mu(\alpha\xi) = |\alpha|d\mu(\xi)$ . Then for  $k \in K$ ,

$$|k| = \begin{cases} |k| & K = \mathbb{R} \\ |k|^2 & K = \mathbb{C} \\ \frac{1}{\|\mathfrak{p}\|^{v(k)}} & K \in p\text{-LField} \end{cases}.$$

┘

*Proof:* If  $K = \mathbb{R}, \mathbb{C}$ , this is routine calculation. If  $K$  is non-Archimedean, then by the translation invariance of  $\mu$ ,  $\mu(\alpha\mathcal{O}) = \frac{\mu(\mathcal{O})}{N(\alpha)} = |\alpha|\mu(\mathcal{O})$ .  $\square$

**Def. (19.4.2.2)[Unramified Quasi-Character].** The multiplicative group  $K^\times$  is also a locally compact group. For a quasi-character  $\chi$  of  $K^\times$ , it is called **unramified(quasi-character)** iff  $\chi(\mathcal{O}_K^*) = 1$ .

An unramified quasi-character on  $K^\times$  is all of the form  $|\cdot|^s$  for  $s \in \mathbb{C}$ .  $\lrcorner$

*Proof:* An unramified quasi-character is equivalent to a continuous group homomorphism from  $\text{val}(K^\times) \rightarrow \mathbb{Z}$ . But  $\text{val}(K^\times)$  must be isomorphic to  $\mathbb{Z}$  or  $\mathbb{R}$ , so the assertion follows from (12.11.1.4).  $\square$

**Lemma (19.4.2.3)[Canonical Character of Local Fields].** Consider  $k$  the closure of the base field of  $K$ , which is  $\mathbb{R}, \mathbb{Q}_p$  or  $\mathbb{F}_p((t))$  by Ostrowski (12.2.3.18). Now let

$$\lambda(x) = \begin{cases} x \pmod{1} & k = \mathbb{R} \\ \text{a rational number } \lambda(x) \text{ that } \lambda(x) - x \in \mathbb{Z}_p \text{ in } \mathbb{Q}/\mathbb{Z} & k = \mathbb{Q}_p \\ a_{-1}/p = \text{res}(x)/p & k = \mathbb{F}_p((t)) \end{cases}$$

Then  $\lambda$  is a continuous additive function on  $k$ . Now let

$$\Lambda(x) = \begin{cases} \lambda(\text{tr}_{K/k}(x)) & \text{number field case} \\ \lambda(\text{tr}_{K_v/k_v}(x\omega_v)) & \text{function field case, where } \omega \text{ is a chosen global meromorphic form on } X. \end{cases}$$

And  $X(x) = e^{2\pi i \Lambda(x)}$ . Notice that this is just a rigorous definition of the character  $e^{2\pi i \text{tr}_{K/k}(x)}$ .  $\lrcorner$

**Cor. (19.4.2.4).**  $F(\eta) = e^{2\pi i \Lambda(\eta\xi)}$  is trivial on  $\mathcal{O}_K$  is equivalent to  $\xi \in \mathfrak{d}^{-1}$ , where  $\mathfrak{d} = \mathfrak{d}_{K/k}$ . In other words, adopting the isomorphism of (12.11.1.36),  $\mathcal{O}^\perp = \mathfrak{d}^{-1}$ ,  $(\mathfrak{d}^{-1})^\perp = \mathcal{O}$ . And  $\mathfrak{c}(\Lambda) = \mathfrak{d}^{-1}$ .  $\lrcorner$

*Proof:* Because  $\Lambda(\eta\mathcal{O}) = 0$  iff  $\text{tr}_{K/k}(\eta\mathcal{O}) \subset \mathcal{O}_k$ , which is equivalent to  $\eta \in \mathfrak{d}^{-1}$ .  $\square$

**Prop. (19.4.2.5)[Canonical Self-Adjoint Haar Measures].** We can calculate the self-adjoint Haar measure w.r.t. the canonical character on  $K^+$  (19.4.2.3) as follows:

$$d\mu = \begin{cases} d\mathbf{m} & , K = \mathbb{R} \\ 2 d\mathbf{m} & , K = \mathbb{C} \\ \text{the measure that } \mu(\mathcal{O}_K) = \|\mathfrak{d}\|^{-1/2} & , \text{otherwise} \end{cases}$$

$\lrcorner$

*Proof:* We only calculate for the  $p$ -adic fields **?**.

Let  $f = \mathbf{1}_{\mathcal{O}}$ , then

$$\widehat{f}(\eta) = \int_{\mathcal{O}} e^{-2\pi i \Lambda(\eta\xi)} d\mu(\xi) = \begin{cases} \mu(\mathcal{O}) & \eta \in \mathfrak{d}^{-1} \\ 0 & \text{otherwise} \end{cases} = \mu(\mathcal{O}) \mathbf{1}_{\mathfrak{d}^{-1}}(\eta).$$

By (19.4.2.4) and (12.10.1.14). So

$$I_{\mathcal{O}}(\xi) = \int_G \widehat{f}(F(\eta))(\xi, F(\eta)) d\mu(\eta) = \int_{\mathfrak{d}^{-1}} \mu(\mathcal{O}) e^{2\pi i \Lambda(\eta\xi)} d\mu(\eta) = \mu(\mathcal{O}) \mu(\mathfrak{d}^{-1}) I_{\mathcal{O}}(\eta).$$

So  $\mu(\mathcal{O}) \mu(\mathfrak{d}^{-1}) = N(\mathfrak{d}) \mu(\mathcal{O})^2 = 1$ , which shows the desired result.  $\square$

**Remark (19.4.2.6).** In fact, if we use other characters  $\psi$  of  $K^+$ , then  $\mu(\mathcal{O}_K) = \|\mathfrak{c}_\psi\|^{1/2}$ .  $\lrcorner$

**Cor. (19.4.2.7) [Quasi-Character of  $K^\times$ ].** There is a continuous morphism from  $K^\times \rightarrow \mathcal{O}_K^*$ :  $\tilde{\alpha} = \alpha/\pi^{v(\alpha)}$  when  $\alpha$  is non-Archimedean or  $\tilde{\alpha} = \alpha/|\alpha|$  if  $K$  is Archimedean. So any quasi-character  $c$  is of the form  $c(\alpha) = c(\tilde{\alpha})$  times an unramified quasi-character, which is of the form  $|\cdot|^s$ , where  $\operatorname{Re}(s)$  is called the **exponent** of  $c$ . Now  $\mathcal{O}_K^*$  is a compact group, so continuous quasi-characters  $\tilde{c}$  on it must be a character.  $\lrcorner$

**Def. (19.4.2.8) [Haar Measure on  $K^\times$ ].** Notice that if  $g(\alpha) \in C_c(K^\times)$ , then  $\frac{g(\alpha)}{|\alpha|} \in C_c(K^+ \setminus \{0\})$ , so if we define  $\Phi(g) = \int_{K^+ \setminus \{0\}} g(\xi) |\xi|^{-1} d\xi$ , then

$$\Phi(ag) = \int_{K^+ \setminus \{0\}} g(a\xi) |a\xi|^{-1} |a| d\xi = \int_{K^+ \setminus \{0\}} g(a\xi) |a\xi|^{-1} da\xi = \Phi(g).$$

By (19.4.2.1). So By Riesz representation, there is a Haar measure  $d_1^\times \mu$  on  $K^\times$  that  $\int_{K^\times} g(\alpha) d_1^\times \mu(\alpha) = \int_{K^+ \setminus \{0\}} g(\xi) |\xi|^{-1} d\mu(\xi)$ , for any  $g \in C_c(K^\times)$ .

But when  $K$  is non-Archimedean, renormalize  $d^\times \mu = (1 - \frac{1}{\|\mathfrak{p}\|})^{-1} d_1^\times \mu$ .  $\lrcorner$

**Remark (19.4.2.9).** The reason behind this normalization is when  $d\mu$  is the canonical measure (19.4.2.5), we want to make  $\mu^\times(\mathcal{O}^*) = \|\mathfrak{d}\|^{-1/2}$ :

$$\int_{\mathcal{O} \setminus \{0\}} d\xi = \sum_{k=0}^{\infty} \int_{\pi^k \mathcal{O}^*} d\xi = (1 + \frac{1}{N\mathfrak{p}} + \frac{1}{N\mathfrak{p}^2} + \dots) \int_{\mathcal{O}^*} d\xi = \frac{1}{1 - \frac{1}{N\mathfrak{p}}} \int_{\mathcal{O}^*} d\xi$$

so

$$\int_{\mathcal{O}^*} d_1^\times \alpha = \int_{\mathcal{O}^*} |\xi|^{-1} d\xi = \frac{\|\mathfrak{p}\| - 1}{\|\mathfrak{p}\|} \int_{\mathcal{O} \setminus \{0\}} d\xi = \frac{\|\mathfrak{p}\| - 1}{\|\mathfrak{p}\|} \|\mathfrak{d}\|^{-1/2} \quad (19.4.2.5)$$

$\lrcorner$

**Def. (19.4.2.10) [Schwartz-Bruhat Function].** Define the set  $\mathcal{S}(K)$  of **Schwartz-Bruhat function** on  $K$  as Schwartz functions on  $K$  if  $K \cong \mathbb{R}, \mathbb{C}$  (12.8.2.1) and locally constant functions with compact support if  $K \in p\text{-LField}$ .  $\lrcorner$

**Prop. (19.4.2.11) [Local Schwarz Functions].** The space  $\mathcal{S}(K)$  of Schwartz functions satisfy the following properties: If  $f \in \mathcal{S}(K)$ ,

- $f, f^\vee \in L^1(K^+)$ .
- $f(\alpha) |\alpha|^\sigma, f^\vee(\alpha) |\alpha|^\sigma \in L^1(K^\times)$  for  $\sigma > 0$ .
- $f^\vee \in \mathcal{S}(K)$  too.

$\lrcorner$

*Proof:* 3:  $p$ -adic case: Let  $\mathfrak{p}^n$  be the conductor of  $\psi$ , then the Fourier transform of  $\chi_{\mathfrak{p}^{-k}}$  is  $V(\mathfrak{p}^{-k}) \chi_{\mathfrak{p}^{n+k}}$ . Then for  $k$  large,  $\chi_{\mathfrak{p}^{-k}} v = V(\mathfrak{p}^{-k}) V(\mathfrak{p}^{n+k}) v$ , thus  $v \in C_c^\infty(F)$ .

Archimedean case: (12.11.3.5).  $\square$

### Global notations

**Notation (19.4.2.12).**

- There are natural Haar measures  $d\mu_K, d^\times \mu_K$  on  $\mathbf{A}_F$  and  $\mathbf{I}_F$  defined by (12.10.3.24) and (19.4.2.5) (19.4.2.8). They satisfy  $d^\times \mu_K = \frac{1}{|\cdot|_K} d\mu_K$ .

- Let  $\mathfrak{d} = \mathfrak{d}_{F/\mathbb{Q}}$  when  $F \in \mathbf{NField}$ , or  $\mathfrak{d} = \{x | \text{tr}(\text{res}(x\mathcal{O})) = 0\}^{-1}$  when  $F \in \mathbf{FField}$ .
- Fix  $\psi = \prod_v \psi_v$  an additive character of  $\mathbf{A}_F/F$ .

┘

**Def. (19.4.2.13)[Global Fourier Transform].** (12.11.1.36) shows  $\psi$  induces a canonical isomorphism

$$\mathbf{A}_F \cong \mathbf{A}_F^\vee : \eta \mapsto (\xi \rightarrow \psi(\eta\xi)),$$

and we choose the corresponding self-dual Haar measure  $d\mu$ , then the Fourier transform and inversion formula on  $\mathbf{A}_F$  is then written as:

$$f^\vee(y) = \int_{\mathbf{A}_F} f(x) \overline{\psi(xy)} dx, \quad f(x) = \int_{\mathbf{A}_F} f^\vee(y) \psi(xy) dy.$$

In fact  $dx = \prod dx_{\mathfrak{p}}$  is the restricted product measure on  $\mathbf{A}_F$  (12.10.3.24), where  $dx_{\mathfrak{p}}$  is the self-dual measure w.r.t  $\psi_{\mathfrak{p}}$  in (19.4.2.5), then  $dx$  is the self-dual Haar measure w.r.t the global canonical character  $\psi$  by (12.10.3.27), called the **Tamagawa measure** on  $\mathbf{A}_F$ .

┘

**Def. (19.4.2.14)[Global Schwartz-Bruhat Functions].** For a global field  $F$ , the set  $\mathcal{S}(F)$  of global Schwartz-Bruhat functions is defined to be

$$\mathcal{S}(F) = \bigotimes_{v \in \Sigma_F}^{\prime} \mathcal{S}(F_v) \text{ (3.6.5.13)}.$$

┘

**Prop. (19.4.2.15)[Schwartz-Bruhat Functions].** A Schwartz-Bruhat function  $f \in \mathcal{S}(\mathbf{A}_F)$  (19.4.2.14) satisfies:

- $f(x), f^\vee \in L^1(\mathbf{A}_F)$  and they are continuous.
- $\sum_{\xi \in K} f(\mathfrak{a}(x + \xi))$  and  $\sum_{\xi \in K} \widehat{f}(\mathfrak{a}(x + \xi))$  converges uniformly absolutely on compact sets of  $\mathbf{A}_F$ .
- $f(\mathfrak{a})|\mathfrak{a}|^\sigma, \widehat{f}(\mathfrak{a})|\mathfrak{a}|^\sigma \in L^1(\mathbf{I}_F)$  for  $\sigma \in \mathbb{R}_{>1}$ .

┘

*Proof:* 1, 2 is the same as in (19.4.2.23), for 3:  $\int_{\mathbf{I}_F} |f||\mathfrak{a}|^\sigma d\mathfrak{a} = \prod_{\mathfrak{p}} \int_{F_{\mathfrak{p}}^\times} |f_{\mathfrak{p}}||\mathfrak{a}|^\sigma d\mathfrak{a}_{\mathfrak{p}}$ , and for a.e.  $\mathfrak{p}$ ,

$$\int_{F_{\mathfrak{p}}^\times} |f_{\mathfrak{p}}||\mathfrak{a}|^\sigma d\mathfrak{a}_{\mathfrak{p}} = \int_{\mathcal{O}_{\mathfrak{p}}^\times} |\mathfrak{a}_{\mathfrak{p}}|_{\mathfrak{p}}^\sigma d\mathfrak{a}_{\mathfrak{p}} = \frac{1}{1 - \frac{1}{\|\mathfrak{p}\|^\sigma}} \int_{\mathcal{O}_{\mathfrak{p}}^*} d\mathfrak{a}_{\mathfrak{p}} = \frac{1}{1 - \frac{1}{\|\mathfrak{p}\|^\sigma}}.$$

Thus the global integral converges by comparison with the Dedekind Zeta function (29.5.2.1). □

**Def. (19.4.2.16)[Global Standard Character].** Define the **global standard character**

$$X : \mathbf{A}_F \rightarrow \mathbb{C}^\times : x \mapsto e^{2\pi i \Lambda(x)}, \quad \Lambda(x) = \sum_{\mathfrak{p} \in \Sigma_F} \Lambda_{\mathfrak{p}}(x_{\mathfrak{p}}) \text{ (19.4.2.3)}.$$

Notice this is definable because  $x_{\mathfrak{p}} \in \mathcal{O}_{\mathfrak{p}}$  a.e.  $\mathfrak{p}$ , thus  $\Lambda_{\mathfrak{p}}(x_{\mathfrak{p}}) = 1$  a.e..

Then  $X(F) = 1$ .

┘

*Proof:* In the number field case,

$$\Lambda(\xi) = \sum_p \sum_{\mathfrak{p}|p} \lambda_p(\mathrm{tr}_{\mathfrak{p}/p}(\xi)) = \sum_p \lambda_p(\mathrm{tr}_{K/\mathbb{Q}}(\xi))$$

so to show  $\lambda$  is an integer, it suffices to show  $\Lambda(a)$  is a  $q$ -adic integer for any  $q$  and any  $a \in \mathbb{Q}$ , but for this, notice

$$\sum \lambda_{\mathfrak{p}}(x) = \sum_{p \neq q, \infty} \lambda_p(x) + \lambda_q(x) - x$$

is a  $q$ -adic integer, by definition(19.4.2.3).

In the function field case, this follows from the fact that the sum of residues of a meromorphic 1-form is 0? .  $\square$

**Prop. (19.4.2.17).**  $F^\perp = F$ , i.e.  $X(xy) = 0, \forall y \in F \iff x \in F$ .  $\lrcorner$

*Proof:* Because  $F^\perp \cong \widehat{\mathbf{A}/F}$  and  $\mathbf{A}_F/F$  is compact(19.4.1.3),  $F^\perp$  is discrete(12.11.1.8) and contains  $F$ . So  $F^\perp/F$  is discrete hence finite in  $\mathbf{A}/F$ . But  $F^\perp$  is clearly a vector space over  $F$ , thus  $F^\perp = F$  must be true, because  $\#F = \infty$ .  $\square$

**Cor. (19.4.2.18).** By(12.11.1.36) and(19.4.2.17), any non-trivial character on  $\mathbf{A}_F/F$  is of the form  $\mathfrak{a} \mapsto X(k\mathfrak{a})$  for some  $k \in K$ .

In particular, for any such character  $\psi$ ,  $\psi_v$  is non-trivial.  $\lrcorner$

**Def. (19.4.2.19)[Unramified Places].** Let  $\chi$  be a Hecke character of  $F$ , then  $v \in \Sigma_F$  is called **unramified** if  $v \in \Sigma_F^{\mathrm{fin}}$ ,  $\mathfrak{d}_v = 1$ ,  $\mathfrak{c}(\psi_v) = \mathcal{O}_v$ ,  $\chi_v$  is unramified(19.4.2.2). Notice a.e. place  $v$  is unramified.  $\lrcorner$

*Proof:* To show that for any unramified character  $\psi$ , the conductor of  $\varphi_v$  is  $\mathcal{O}_v$ , consider the canonical character  $X$  defined(19.4.2.16), it can be verified the conductor of  $X_v$  is  $\mathcal{O}_v$  for a.e.  $v$ , and  $\psi$  must be of the form  $\psi(x) = X(ax)$  for some  $a \in K$  by(19.4.2.13) and(19.4.2.17), thus this is also true for  $\psi$ .  $\square$

**Prop. (19.4.2.20).**

$$\mathrm{Vol}(\mathbf{I}_F^1/F^\times) = \frac{2^{r_1}(2\pi)^{r_2}}{w_F \sqrt{|\mathrm{disc}(F)|}} \mathrm{cl}(F) \mathrm{Reg}(F),$$

where  $w_F = \#F_{\mathrm{tor}}^\times$ ,  $\mathrm{cl}(F)$  is the class number, and  $\mathrm{Reg}(F)$  is the regulator(20.8.1.7).

In particular, for  $F = \mathbb{Q}$ , this equals 1.  $\lrcorner$

*Proof:* Cf.[Tate Thesis, P337] or[GTM186, P281].?  $\square$

**Lemma (19.4.2.21)[Poisson Formula].** If

- $f \in C(\mathbf{A}_F) \cap L^1(\mathbf{A}_F)$ ,
- $F(x) = \sum_{\xi \in F} f(x + \xi)$  is locally absolutely continuous,
- $\sum_{\xi \in F} |f^\vee(\xi)| < \infty$ .

Then w.r.t. the self-dual Haar measure,

$$\sum_{\xi \in F} f^\vee(\xi) = \sum_{\xi \in F} f(\xi).$$

and  $V(\mathbf{A}_F/F) = 1$ .  $\lrcorner$

*Proof:* By (19.4.2.17) and (19.4.1.3), this is a special case of (12.11.1.31). In fact, we know it is true for a constant  $V(\mathbf{A}_F/F)$ . But it is symmetric, so  $V(\mathbf{A}_F/F)^2 = 1$ .  $\square$

**Prop. (19.4.2.22) [Riemann-Roch].** If for any idele  $\mathfrak{a} \in \mathbf{I}_F$ ,

- $f(\mathfrak{a}x) \in C(\mathbf{A}_F) \cap L^1(\mathbf{A}_F)$ .
- $F(x) = \sum_{\xi \in F} f(x + \xi)$  is locally absolutely continuous,
- $\sum_{\xi \in F} |f^\vee(\mathfrak{a}\xi)| < \infty$ .

Then for any  $\mathfrak{a} \in \mathbf{I}_F$ ,

$$\frac{1}{|\mathfrak{a}|} \sum_{\xi \in F} f^\vee\left(\frac{\xi}{\mathfrak{a}}\right) = \sum_{\xi \in F} f(\mathfrak{a}\xi).$$

┘

*Proof:* Consider  $g(x) = f(\mathfrak{a}x)$ , then

$$g^\vee(x) = \int_{\mathbf{A}_F} f(\mathfrak{a}\eta) e^{-2\pi i \lambda(x\eta)} d\eta = \frac{1}{|\mathfrak{a}|} \int_{\mathbf{A}_F} f(\eta) e^{-2\pi i \lambda(x\eta/\mathfrak{a})} d\eta = \frac{1}{|\mathfrak{a}|} f^\vee(x/\mathfrak{a}).$$

Then apply Poisson formula (19.4.2.21) to  $g$ .  $\square$

**Prop. (19.4.2.23).** Schwartz-Bruhat functions (19.4.2.14) satisfy the condition in (19.4.2.22).  $\square$

*Proof:*  $\int_{\mathbf{A}_F} |f| = \prod_v \int_{F_v} |f_v| dx_v < \infty$ , noticing (19.4.2.5) and  $N(\mathfrak{d}_v) = 1$  for a.e.  $v$ . And for any Schwartz function  $f$  and any  $x$ , the set of  $k$  that  $f_v(x_v + k_v) \neq 0$  is  $v$ -bounded for  $v$  non-Archimedean and  $|k|_v \leq 1$  a.e., so in the function case, these  $k$  are finite because  $F$  is discrete in  $\mathbf{A}_F$ .

And in the number field case, these  $k$  is contained in some fractional ideal  $I$ , but  $I$  is then a lattice in  $F_\infty$  by Minkowski theory, so

$$\sum_{\xi \in K} |f(x + \xi)| \leq C \sum_{x \in K} \prod_{\mathfrak{p} \in S_\infty} |f_{\mathfrak{p}}(x + \xi)|$$

but  $f_{\mathfrak{p}}$  is an Archimedean Schwartz function, thus this is absolutely convergent.

Now we also showed that  $\int_{\xi \in F} f^\vee(\xi) < \infty$ , because  $f^\vee \in \mathcal{S}(\mathbf{A}_F)$ , by (19.4.2.11).  $\square$

**Prop. (19.4.2.24) [True Riemann-Roch For Function Fields].** Cf. [Fourier Analysis on Number Fields, P267]. ?  $\square$

## 19.5 Quadratic Forms

References are [Lam05], [Quadratic Forms Clark] and [Algebraic and Geometric Theory of Quadratic Forms].

**Notation(19.5.0.1).**

- Let  $K \in \text{Field}$  s.t.  $\text{char } K \neq 2$ .
- Use notations on quadratic forms defined in [Quadratic Forms on Modules](#).

┘

### 1 Quadratic Forms

This subsection is a continuation of [Sesqui-linear Forms](#). In fact, most materials in this subsection are trivial facts.

**Def. (19.5.1.1)[Discriminants].** For a quadratic form  $Q$  on a finite  $K$ -module  $V$  valued in  $K$  [\(3.2.4.30\)](#), the **discriminant of forms**  $\text{disc}(Q)$  is defined to be the determinant of the Gram matrix [\(3.5.11.3\)](#) of this quadratic form w.r.t. any basis of  $V$ . It is a function from the set of quadratic forms to  $K^\times / (K^\times)^2$  that is invariant under congruences. ┘

**Def. (19.5.1.2)[Quadratically Closed].**  $K$  is called a **quadratically closed field** if  $(K^\times)^2 = K^\times$ , or equivalently  $K$  has no quadratic field extensions. ┘

**Def. (19.5.1.3)[Quadratic Spaces].** The category of **quadratic spaces** is a category with objects as finite dimensional spaces with a quadratic form, and its morphisms are isometric embeddings. ┘

**Def. (19.5.1.4)[Universal Quadratic Form].** For a quadratic form  $A$ , let  $D_F(A)$  be the set of elements representable by  $A$ . A **universal quadratic form** is a quadratic form that represents every element of  $K^*$ . ┘

**Prop. (19.5.1.5).** If every binary quadratic form over  $K$  is universal, then any two non-degenerate quadratic forms over  $K$  are isomorphic iff they have the same rank and discriminant [\(19.5.1.1\)](#). ┘

*Proof:* This is because  $\langle a, b \rangle \cong \langle 1, ab \rangle$  and then use induction. □

#### Non-Degeneracy

**Def. (19.5.1.6) [Non-degeneracy].** A quadratic space is called **non-degenerate** if  $v \mapsto B(v, \cdot)$  is an isomorphism from  $V$  to  $V^*$ . Notice if  $\dim V = \infty$ , this cannot happen, because  $\dim V^* > \dim V$  [\(3.5.3.9\)](#). And in case  $\dim V < \infty$ ,  $\dim V = \dim V^*$ , so it suffices to show  $v \mapsto B(v, \cdot)$  is injective, i.e. if  $v \neq 0$ , then there is a  $w$  that  $B(v, w) \neq 0$ . ┘

**Prop. (19.5.1.7)[Radical Splitting].** The **radical** of a quadratic space is defined to be  $\text{rad}(V) = V^\perp$ . Then for any quadratic form  $V$ , there is an orthogonal decomposition  $V = \text{rad}(V) \oplus W$ , where  $W$  is a non-degenerate form. ┘

*Proof:* In fact, by the definition, any complement space of  $\text{rad}(V)$  in  $V$  can be chosen as the orthogonal complement  $W$ . □

**Prop. (19.5.1.8).** If  $W$  is a non-degenerate sub-quadratic space of  $V$ , then  $W \oplus W^\perp = V$ . ┘

*Proof:* Since  $W$  is non-degenerate,  $W \cap W^\perp = 0$ . and for any  $v \in V$ ,  $B(v, \cdot) \in W^*$ , so by degeneracy, there is a  $w \in W$  that  $B(v, \cdot) = B(w, \cdot)$ , then  $z = v - w \in W^\perp$  and  $v = w + z$ .  $\square$

**Prop.(19.5.1.9) [Orthogonal Complement and Non-Degeneracy].** If  $V$  is a non-degenerate quadratic space, then for any non-degenerate subspace  $W$ ,  $\dim W + \dim W^\perp = \dim V$ , and  $(W^\perp)^\perp = W$ .  $\lrcorner$

*Proof:* The first is immediate from the fact  $\dim \ker + \dim \text{Coker} = \dim V$ . The second is by dimensional reason.  $\square$

**Cor.(19.5.1.10).** A subspace  $W$  of a non-degenerate quadratic space  $V$  is a non-degenerate quadratic space iff  $W \cap W^\perp = 0$ .  $\lrcorner$

**Remark(19.5.1.11).** We basically only care about non-degenerate forms, so from now on, we only care about non-degenerate forms.  $\lrcorner$

### Diagonalizability

**Prop.(19.5.1.12) [Quadratic Form Representable].** Any quadratic forms  $Q$  over  $K$  of  $\text{char} \neq 2$  is diagonalizable, and if  $\alpha \in K^\times$  is represented by  $Q$ , then it is diagonalizable to a matrix with first entry  $\alpha$ .

We will use the notation  $\langle \alpha_1, \dots, \alpha_n \rangle$  for the diagonal quadratic form  $\sum \alpha_i x_i^2$ .  $\lrcorner$

*Proof:* Use(3.5.11.11), since in this case, a quadratic form is equivalent to a symmetric form. And if  $\alpha = B(v, v)$ , then we can choose  $v$  in the first place in the proof of(3.5.11.11).  $\square$

**Cor.(19.5.1.13).** If  $K$  is quadratically-closed, any non-degenerate quadratic form is congruent to  $x_1^2 + \dots + x_n^2$ .  $\lrcorner$

*Proof:* Because in this case, we can make  $\sum a_i x_i^2$  into  $\sum (\sqrt{a_i} x_i)^2$ .  $\square$

**Prop.(19.5.1.14) [Pfister].** For any  $n \in \mathbb{Z}_+$ , the product of two element of  $k$  that are sums of  $2^n$  squares is another such number.  $\lrcorner$

*Proof:* Cf.[C-S03]P78.  $\square$

**Cor.(19.5.1.15).** If  $N \in \mathbb{Z}_+$  is a minimal number s.t.  $-1$  can be expressed as a sum of  $N$  squares in  $k$ , then  $N \in 2^{\mathbb{Z}_+}$ .  $\lrcorner$

*Proof:* Suppose  $N = 2^n + k$  where  $n, k \in \mathbb{Z}_+, k < 2^n$ , and

$$-1 = x_1^2 + \dots + x_{2^n}^2 + y_1^2 + \dots + y_k^2,$$

then  $s = x_1^2 + \dots + x_{2^n}^2 \neq 0$ . So

$$-s = y_1^2 + \dots + y_k^2 = y_1^2 + \dots + y_{2^n}^2.$$

But then

$$-s^2 = (x_1^2 + \dots + x_{2^n}^2)(y_1^2 + \dots + y_{2^n}^2) = z_1^2 + \dots + z_{2^n}^2$$

by(19.5.1.14), contradiction.  $\square$

### Isotropic and Hyperbolic Spaces

**Def. (19.5.1.16) [Isotropic].** Given a non-degenerate quadratic space  $V$ , a vector  $v$  is called **isotropic** if  $B(v, v) = 0$ .  $V$  is itself called **isotropic** if it is non-degenerate and there exists an isotropic vector, otherwise it is called **anisotropic**.  $\lrcorner$

**Def. (19.5.1.17) [Hyperbolic Plane].** The **hyperbolic plane**  $\mathbb{H}$  is the 2-dimensional space with quadratic form  $H(x, y) = xy$ , which is congruent to  $\frac{1}{2}(x^2 - y^2)$ .

A quadratic space is called **hyperbolic** if it is isomorphic to a direct sum of hyperbolic planes.  $\lrcorner$

**Lemma (19.5.1.18).** If  $V$  is a non-degenerate isotropic space, then there is an isometric imbedding of the hyperbolic plane into  $V$ .  $\lrcorner$

*Proof:* There is a  $u \in V$  that  $B(u, u) = 0$ . By non-degeneracy, there is a  $w$  that  $B(u, w) \neq 0$ . We may assume  $B(u, w) = 1$ . Now I claim there is an  $\alpha$  that  $q(\alpha u + w) = 0$ : in fact,  $q(\alpha u + w) = 2\alpha B(u, w) + q(w)$ , so take  $\alpha = -q(w)/2$ . Let  $v = \alpha u + w$ , then  $q(u) = q(v) = 0$ , and  $B(u, v) = 1$ , so it is isomorphic to  $\mathbb{H}$ .  $\square$

**Prop. (19.5.1.19) [Isotropic Complement].** If  $V$  is a non-degenerate quadratic space, and  $W \subset V$  is an isotropic space with basis  $u_1, \dots, u_m$ , then there is another isotropic space  $W'$  with basis  $v_1, \dots, v_m$  that  $B(u_i, v_j) = \delta_{ij}$ .  $\lrcorner$

*Proof:* Use induction on  $m$ . The  $m = 1$  case is lemma(19.5.1.18) above. If this is true for  $n < m$ , let  $W = \{u_2, \dots, u_m\}$ , then if  $W^\perp \subset \{u_1\}^\perp$ , then  $u_1 \in W$  by(19.5.1.9), contradiction, so there is a  $v \in W^\perp$  that  $B(u_1, v) \neq 0$ , so by the same proof as(19.5.1.18), there is a  $\alpha u_1 + v$  that is isotropic, and a  $\mathbb{H} \subset W^\perp$ , so by(19.5.1.9),  $W \subset \mathbb{H}^\perp$ , so by induction, we can find in  $\mathbb{H}^\perp$  elements  $v_2, \dots, v_m$  that satisfies the requirement.  $\square$

**Cor. (19.5.1.20).**  $\langle a, -a \rangle \cong \mathbb{H}$ , because it is isotropic, and it has dimension 2.  $\lrcorner$

**Cor. (19.5.1.21) [Isotropic Forms are Universal].** A non-degenerate isotropic space is universal, because hyperbolic plane does.  $\lrcorner$

**Cor. (19.5.1.22).** A maximal totally isotropic space in a non-degenerate quadratic space  $V$  has dimension at most  $\frac{1}{2} \dim V$ , and equality holds if  $V$  is hyperbolic.  $\lrcorner$

**Prop. (19.5.1.23) [First Representation Theorem].** If  $q$  is a non-degenerate quadratic form, then  $q$  represents  $\alpha \in K^\times$  iff  $q \oplus \langle -\alpha \rangle$  is isotropic.  $\lrcorner$

*Proof:* If  $q$  represent  $\alpha$ , then by(19.5.1.12) shows that  $q$  is equivalent to  $\langle \alpha, \alpha_1, \dots, \alpha_n \rangle$ , so  $q \oplus \langle -\alpha \rangle$  contains a  $\langle \alpha, -\alpha \rangle$  which is isomorphic to  $\mathbb{H}$  by(19.5.1.18).

Conversely, if  $q \oplus \langle -\alpha \rangle$  is isotropic, then there is a  $-\alpha x_0^2 + \sum \alpha_i x_i^2 = 0$ . If  $x_0 \neq 0$ , then  $q$  represent  $\alpha$ , and if  $x_0 = 0$ , then  $q$  is isotropic, thus represent any element(19.5.1.21).  $\square$

**Cor. (19.5.1.24).** The following are equivalent:

- Any  $n$ -quadratic form over  $K$  is universal.
- Any  $(n + 1)$ -quadratic form over  $K$  is isotropic.

$\lrcorner$

**Cor. (19.5.1.25) [Transform of Binary Forms].** For any  $a, b \in F^*$  that  $a + b \in F^*$ ,  $\langle a, b \rangle \cong \langle a + b, (a + b)ab \rangle$ .  $\lrcorner$

**Prop. (19.5.1.26) [Isotropy Criterion].** For two non-degenerate forms  $f, g$  over  $K$ ,  $h = \langle f, -g \rangle$  is isotropic iff there is an  $\alpha \in K^*$  that is represented by both  $f$  and  $g$ .  $\lrcorner$

*Proof:* Easy, notice to use isotropic form is universal (19.5.1.21).  $\square$

## 2 Witt Theory

**Prop. (19.5.2.1) [Witt Cancellation Theorem].** If  $U_1, U_2, V_1, V_2$  are quadratic spaces and  $V_1 \cong V_2$ ,  $V_1 \oplus U_1 \cong V_2 \oplus U_2$ , then  $U_1 \cong U_2$ .  $\lrcorner$

*Proof:* We may identify  $V_1 = V_2 = V$ , and  $W = U_1 \oplus V = U_2 \oplus V$ .

First if  $V$  is totally isotropic and  $U_1$  is non-degenerate, then there is a matrix  $M = \begin{bmatrix} A & B \\ C & D \end{bmatrix}$  that

$$M^t \begin{bmatrix} 0 & 0 \\ 0 & B_2 \end{bmatrix} M = \begin{bmatrix} 0 & 0 \\ 0 & B_1 \end{bmatrix}$$

So  $B_1 = D^t B_2 D$ . As  $B_1$  is non-singular, so is  $D$ , thus  $U_1 \cong U_2$ .

Now if  $V$  is isotropic but  $U_1, U_2$  are not non-degenerate, then we may assume in their diagonalization,  $U_1$  has less 0s, it has  $r$  0s, then we can extract from both  $U_i$  a zero part, thus reducing to the above case.

Now if  $\dim V = 1$ ,  $V = \langle a \rangle$ , if  $a = 0$ , then we are done by the above argument, and if  $a \neq 0$ , then find  $q(x) = a$ , then by (19.5.2.12), we can find a  $\tau \in O(W)$  that  $\tau(V_1) = V_2$ , so now  $U_1, U_2$  as the orthogonal complement of  $V_1, V_2$ , they are isometric under the map  $\tau$ .

So now in general, we can cancel  $V$  out by moving its diagonal part once a time.  $\square$

**Cor. (19.5.2.2).** If  $X$  is a quadratic space and  $V_1, V_2$  are non-degenerate subspaces of  $X$ , then any isometry  $V_1 \cong V_2$  extends to an isometry of  $X$ .  $\lrcorner$

*Proof:*  $V_i \oplus V_i^\perp = X$  by (19.5.1.8).  $\square$

**Cor. (19.5.2.3) [Witt's Extension Theorem].** If  $X$  is a non-degenerate quadratic space and  $f : W_1 \rightarrow W_2$  is an isometry of two subspaces of  $X$ , then  $f$  extends to an isometry of  $X$ .

Notice this also holds for symplectic spaces  $X$ , by the same method of proof.  $\lrcorner$

*Proof:* If  $W_1$  is non-degenerate, then so does  $W_2$ , and we can use (19.5.2.2). By (19.5.1.7), we can write  $W_i = U_i \oplus V_i$  where  $U_i$  is totally isotropic and  $V_i$  is non-degenerate. Now  $X, V_i$  are non-degenerate,  $V_i^\perp$  is non-degenerate also, so there is an isotropic complement  $U'_i \subset V_i^\perp$  (19.5.1.19). Let  $T_i = \langle U_i, U'_i \rangle V_i$ , then  $T_i$  is non-degenerate and  $W \subset T$ . As  $U_i$  is the radical of  $W_i$ ,  $U_1 \cong U_2$ , and then  $\langle U_1, U'_1 \rangle \cong \langle U_2, U'_2 \rangle$ . By Witt cancellation,  $W_1 \cong W_2$ . So we reduced to the non-degenerate case.  $\square$

**Cor. (19.5.2.4).** If  $V$  is a non-degenerate quadratic space, then the group of isometries of  $X$  acts transitively on the set of all totally isotropic subspaces of a fixed dimension  $d$ .  $\lrcorner$

**Thm. (19.5.2.5) [Witt's Decomposition Theorem].** For any quadratic space  $V$ , there is an orthogonal decomposition

$$V \cong \text{rad}(V) \oplus \mathbb{H}^{\oplus k} \oplus V'$$

where  $V'$  is anisotropic (19.5.1.16). Moreover the number  $k = \text{ind}(V)$  which is called the **Witt index** of  $V$  and the isometry class of  $V' = w(V)$  which is called the **non-isotropic kernel** is independent of the decomposition.  $\lrcorner$

*Proof:* The existence of the decomposition follows from (19.5.1.7) and an easy induction using (19.5.1.18). The uniqueness is an easy corollary of (19.5.1.18) and Witt's cancellation theorem.  $\square$

**Cor. (19.5.2.6).** The Witt index equals the maximal dimension of a maximal totally isotropic subspace of  $W$ , by (19.5.1.19).  $\lrcorner$

**Remark (19.5.2.7).** This is a good reason that we will only consider non-degenerate quadratic forms from now on.  $\lrcorner$

**Cor. (19.5.2.8) [Sylvester's Law of Signature].** Let  $q_{r,s} = [r]\langle 1 \rangle \oplus [s]\langle 1 \rangle$ , then any non-degenerate quadratic form  $q$  over  $\mathbb{R}$  is congruent to exactly one of  $q_{r,s}$ , and  $r - s$  is called the **signature** of  $q$ .  $\lrcorner$

**Prop. (19.5.2.9) [Witt's Chain Equivalence Theorem].** Two quadratic forms  $q_1 = \langle a_1, \dots, a_n \rangle$  and  $q_2 = \langle b_1, \dots, b_n \rangle$  are called **simply equivalent** iff there are two indices that  $\langle a_i, a_j \rangle \cong \langle b_i, b_j \rangle$ . Two quadratic forms are called **chain equivalent** iff there is a chain of simply equivalence between them.

Then two diagonal quadratic forms over  $K$  are equivalent iff they are chain equivalent.  $\lrcorner$

*Proof:* Chain equivalent is clearly equivalent, Conversely, by Witt's decomposition theorem, it is easy to reduce to the non-degenerate case.

Now if  $q = \langle \alpha_1, \dots, \alpha_n \rangle \cong q' = \langle \beta_1, \dots, \beta_n \rangle$ , any form  $q = \langle \gamma_1, \dots, \gamma_n \rangle$  that is chain equivalent to  $q$  is equivalent to  $q'$ , so  $\beta_1$  is represented by it, choose a form that there is a minimal  $l$  that  $\beta_1$  is represented by  $\langle \gamma_1, \dots, \gamma_l \rangle$ , we prove that  $l = 1$ :

if the minimal  $l$  is not 1, then  $d = \gamma_1 a_1^2 + \gamma_2 a_2^2 \neq 0$  (otherwise  $l$  can be smaller), so  $\langle \gamma_1, \gamma_2 \rangle \cong \langle d, \gamma_1 \gamma_2 d \rangle$  by (19.5.1.12) and invariance of  $\det$ . so  $q \cong \langle d, \gamma_3, \dots, \gamma_n, d \gamma_1 \gamma_2 \rangle$  (notice permutation is chain equivalence), and this is smaller, contradiction.

Now  $l = 1$ , so we may assume  $\alpha_1 = \beta_1$ , and then Witt's cancellation (19.5.2.1) shows that  $\langle \alpha_2, \dots, \alpha_n \rangle \cong \langle \beta_2, \dots, \beta_n \rangle$ , so we win by induction.  $\square$

## Orthogonal Group

**Def. (19.5.2.10) [Orthogonal Groups].** The **orthogonal group** of a quadratic space  $(V, Q) \in \text{QuadSpa}/K$  is the set of matrixes  $M$  that  $g(Mx) = q(x)$ . And it is clear  $\det M = \pm 1$ , so we can also define  $O^+(V)$  and  $O^-(V)$ .  $\lrcorner$

**Def. (19.5.2.11).** A **hyperplane reflection** for a non-isotropic vector  $v$  is defines by  $x \mapsto x - \frac{2B(x,v)}{q(v)}v$ , it is an element in  $O(V)$ .  $\lrcorner$

**Prop. (19.5.2.12).** If  $x, y$  are two non-isotropic vectors that  $q(x) = q(y)$ , then there is a  $\tau \in O(V)$  that  $\tau(x) = y$ .  $\lrcorner$

*Proof:* First notice  $q(x+y) + q(x-y) = 2q(x) + 2q(y) = 4q(x) \neq 0$ , so one of  $x+y, x-y$  is non-isotropic. And it can be easily calculated that  $\tau_{x-y}(x) = y$  or  $-\tau_{x+y}(x) = y$ .  $\square$

**Prop. (19.5.2.13) [Cartan-Dieudonné].** Let  $V$  be a non-degenerate quadratic form of dimension  $n$ , then every element of the orthogonal group  $O(V)$  can be represented as a product of  $n$  reflections.  $\lrcorner$

*Proof:* Cf. [Quadratic Forms Clark P22].  $\square$

### 3 Witt Rings

References are [Quadratic Forms 2, Clark].

**Def. (19.5.3.1) [Witt Ring].** The **Witt ring**  $W(K)$  of  $K$  is a free commutative ring over  $\mathbb{Z}$  generated by equivalent classes of anisotropic(19.5.1.16) quadratic forms over  $K$ , modulo the relations  $[q_1] + [q_2] = [q_1 \oplus q_2]$  and  $[q_1] \cdot [q_2] = [q_1 \otimes q_2]$ .

There is another ring, the **Grothendieck-Witt ring**  $\widehat{W}(K)$  which is defined as the ring generated by all non-degenerate quadratic forms over  $K$ .  $\lrcorner$

**Cor. (19.5.3.2) [Rank Functor].** There are rank functors from  $\widehat{W}(K) \rightarrow \mathbb{Z}$ , which is a ring homomorphism. In particular, two elements of the same rank are equal in  $\widehat{W}(K)$  iff they are equal in  $W(K)$ , by Witt's cancellation theorem(19.5.2.1).  $\lrcorner$

**Prop. (19.5.3.3).** The rank functor is an isomorphism  $\widehat{W}(K) \rightarrow \mathbb{Z}$  iff  $K$  is quadratically closed. In this case,  $W(K) \cong \mathbb{Z}/2\mathbb{Z}$ .  $\lrcorner$

*Proof:* This is equivalent to  $\langle a \rangle \cong \langle 1 \rangle$  for any  $a \in K^*$ , which means  $K$  is quadratically closed.  $\square$

**Prop. (19.5.3.4).** The subgroup  $[\mathbb{H}]$  generated by the hyperbolic plane is an ideal of  $\widehat{W}(K)$ . And  $\widehat{W}(K)/\mathbb{Z}[\mathbb{H}] \cong W(K)$ .  $\lrcorner$

*Proof:*  $\mathbb{Z}[\mathbb{H}]$  is an ideal because  $[\mathbb{H}] \cdot [\langle a_1, \dots, a_n \rangle] \cong \sum \langle a_i, -a_i \rangle$  which is a multiple of  $[\mathbb{H}]$ , by(19.5.1.20). The last assertion follows from Witt's decomposition(19.5.2.5).  $\square$

**Cor. (19.5.3.5).**  $[\langle a_1, \dots, a_n \rangle] + [\langle -a_1, \dots, -a_n \rangle] = 0 \in W(K)$ , by(19.5.1.20).  $\lrcorner$

**Prop. (19.5.3.6) [Presentation of the Witt Ring].**  $\widehat{W}(K)$  is isomorphic to the quotient of the free commutative ring generated by  $\{[a] \mid a \in K^\times\}$  module the following relations:

- $[1] - 1$ .
- $[ab] - [a] - [b]$ .
- $[a] + [b] - [a + b](1 + [ab])$ ,  $a, b, a + b \in K^\times$ .

$\lrcorner$

*Proof:* Cf.[Lam, P39].  $\square$

### 4 over Finite Fields

**Notation (19.5.4.1).**

- Let  $k \in \text{Field}^{\text{fin}}$  with  $\text{char } k \neq 2$ .
- Let  $1 \neq \psi \in k^\vee$ .

$\lrcorner$

**Notation (19.5.4.2).**

- Let  $(K, \mathcal{O}_K, \varpi_K, \kappa) \in p\text{-LField}$  with  $\text{char } \kappa \neq 2$ .
- Let  $1 \neq \psi \in K^\vee$ .

$\lrcorner$

**Prop. (19.5.4.3)  $[W(\mathbb{F}_q)]$ .**

- If  $q \equiv 1 \pmod{4}$ , then  $W(\mathbb{F}_q)$  is isomorphic to  $\mathbb{Z}/(2)[F^\times/(F^\times)^2] \cong \mathbb{Z}/2\mathbb{Z}[\mathbb{F}_2]$  as rings.

- If  $q \equiv 3 \pmod{4}$ , then  $W(\mathbb{F}_q)$  is isomorphic to  $\mathbb{Z}/(4)$  as rings.  $\lrcorner$

*Proof:* 1: In this case,  $-1$  is a square, let  $s$  be a non-square, then there are only three anisotropic forms:  $\langle 1 \rangle, \langle s \rangle, \langle 1, s \rangle$ . Thus the assertion is clear.

2: In this case, we can take  $s = -1$ , thus any anisotropic form must be of the form  $\langle 1, \dots, 1 \rangle$  or  $\langle -1, \dots, -1 \rangle$ . As  $\langle 1, 1 \rangle$  is universal by (37.6.1.8),  $\langle 1, 1, 1 \rangle \cong \langle -1 \rangle$  by representation theorem (19.5.1.23), thus  $4[\langle 1 \rangle] = 0$ .  $\square$

**Prop. (19.5.4.4) [Binary Quadratic Forms over Finite Fields are Universal].** Every non-degenerate binary quadratic form over a finite field  $\mathbb{F}_q$  is universal.  $\lrcorner$

*Proof:* By (19.5.4.3), there are essentially three quadratic forms,  $\langle 1, 1 \rangle, \langle s, s \rangle, \langle 1, s \rangle$ , where  $s$  is a non-square. By (37.6.1.8), these are all universal.  $\square$

**Cor. (19.5.4.5) [Quadratic Forms over Finite Fields].** Any non-degenerate quadratic form over a finite field  $k$  is equivalent to the form  $Q(x_1, \dots, x_r) = x_1^2 + \dots + x_{n-1}^2 + sx_n^2$  for some  $s \in \mathbb{F}_q$ . And two non-degenerate quadratic forms over  $\mathbb{F}_q$  are equivalent iff they have the same rank and discriminant.  $\lrcorner$

*Proof:* This follows from (19.5.4.4) and (19.5.1.12).  $\square$

**Cor. (19.5.4.6).** Any quaternion algebra over a finite field splits, by Hilbert's criterion (19.6.1.16).  $\lrcorner$

## 5 over Local Fields

**Prop. (19.5.5.1) [ $W(\mathbb{R})$ ].**

- There exists two anisotropic forms at each rank  $n$ :  $\langle 1, \dots, 1 \rangle$  and  $\langle -1, \dots, -1 \rangle$ .
- $W(\mathbb{R}) \cong \mathbb{Z}$ .
- Two non-degenerate forms over  $\mathbb{R}$  are equivalent iff they have the same rank and signature, by (19.5.2.8).
- $\widehat{W}(\mathbb{R}) \cong \mathbb{Z}[\mathbb{F}_2]$  as a ring.  $\lrcorner$

*Proof:* Only 4 need a proof: It suffices to show  $[\langle 1 \rangle]$  and  $[\langle -1 \rangle]$  are linearly independent in  $\widehat{W}(\mathbb{R})$ , because they generate all other rings. But if  $a[\langle 1 \rangle] + b[\langle -1 \rangle] = 0$ , then  $a + b = 0$  by rank reason, but when pass to  $W(F)$ ,  $a - b = 0$ , thus  $a = b = 0$ .  $\square$

**Prop. (19.5.5.2).** Let  $\langle a_1, \dots, a_n \rangle_K$  be a quadratic space over  $K \in p\text{-LField}$ , we may assume  $a_i \in \mathcal{O}_F$ . If  $\langle a_1, \dots, a_n \rangle_{\mathcal{O}_K/\mathfrak{p}^n}$  is isotropic for all  $n$ , then  $\langle a_1, \dots, a_n \rangle_K$  is isotropic.  $\lrcorner$

*Proof:* This is because we can find non-zero elements  $v_n \in (\mathcal{O}_F/\mathfrak{p}^n)^d$  that  $q(v_n) = 0 \in \mathcal{O}_F/\mathfrak{p}^n$ , thus we can find elements  $v \in \mathcal{O}_F^d$  that  $q(v) = 0$ .  $\square$

**Prop. (19.5.5.3) [Unique Quaternion Algebra].** If  $\mathbb{C} \not\cong K \in \text{LField}$ , then there is a unique non-split quadratic algebra over  $F$ , which is of the form  $Q_K(a, b)$  where  $a, b \in K^\times$  with  $(a, b)_K = -1$ .  $\lrcorner$

*Proof:* Cf. [Lam, P156].  $\square$

**Cor. (19.5.5.4).** For this unique quaternion algebra  $A$  in (19.5.5.3), the valuation  $|N(x)|$  is a valuation of  $A$ , i.e. defines the topology.  $\lrcorner$

*Proof:* This is because  $|N(-)|$  is bounded on the compact subset  $\{x \mid |x| = 1\}$ .  $\square$

**Prop. (19.5.5.5) [Hilbert Symbol].** The Hilbert symbol (19.6.1.20)  $(-, -)_K : K^\times / (K^\times)^2 \times K^\times / (K^\times)^2 \rightarrow \{\pm 1\}$  satisfies

- It is symmetric and bi-multiplicative for both terms.
- It is non-degenerate: if  $F \not\cong \mathbb{C}$  is a local field, for any  $y \in F^* \setminus (F^*)^2$ , then there exists a  $z \in F^*$  that  $(y, z)_F = -1$ .
- $(a, -a) = 1$ .
- If  $a(a-1) \neq 0$ ,  $(a, 1-a) = 1$ .

┘

*Proof:* 1: To show it is multiplicative, by (19.6.1.16),  $(a, b)_F = 1$  iff  $a \in \text{Nm}_{E/F}(E^\times)$ , where  $E = F(\sqrt{b})$ . Notice  $\text{Nm}_{E/F}(E^\times)$  has index 1 or 2 in  $F^\times$  by class field theory (19.7.2.9), thus  $a \mapsto (a, b)_F$  is a character of  $a$  in any case.

2: Cf. [Lam, P160]. ?

3: By (19.6.1.17).  $\square$

**Def. (19.5.5.6) [Hasse-Invariants].** If  $(V, Q)$  is a quadratic space over  $K$  that is equivalent to the diagonal form  $a_1x_1^2 + \dots + a_nx_n^2$ , then the **Hasse invariant** or the  **$\epsilon$ -invariant** of  $V$  is defined to be

$$\epsilon(V) = \prod_{i < j} (a_i, a_j)_K \in \{\pm 1\}.$$

Then this  $\epsilon(V)$  is well-defined and is an invariant of  $V$ .  $\square$

*Proof:* Cf. [Ser73]P35. ?  $\square$

**Prop. (19.5.5.7).** If  $(V, Q)$  is a quadratic space over  $K$  of rank  $n$ , then  $Q$  represents 0 iff

- $n = 2$  and  $\text{disc}(V) = -1$ .
- $n = 3$  and  $(-1, -d)_K = \epsilon$ .
- $n = 4$  and either  $d \neq 1$  or  $d = 1$  and  $\epsilon(V) = (-1, -1)_K$ .
- $n \geq 5$  and  $K \in p\text{-LField}$ .

┘

*Proof:* Cf. [Ser73]P36. ?

If  $n = 2$ , then  $Q$  represents 0 iff  $-a_1/a_2 = -\text{disc}(Q) = 1 \in K^\times / (K^\times)^2$ .  $\square$

**Cor. (19.5.5.8).** If  $(V, Q) \in \text{QuadSpa}^n / K$ , then  $Q$  represents  $a \in K^\times / (K^\times)^2$  iff

- $n = 1$  and  $a = \text{disc}(V)$ .
- $n = 2$  and  $(a, -\text{disc}(V))_K = \epsilon(V)$ .
- $n = 3$  and either  $a \neq -\text{disc}(V)$  or  $a = -\text{disc}(V)$  and  $(-1, -d)_K = \epsilon(V)$ .
- $n \geq 4$  and  $K \in p\text{-LField}$ .

┘

*Proof:* This follows from the theorem because for  $a \in K^\times / (K^\times)^2$ , the form  $Q_a = Q - aZ^2$  has a zero iff  $a$  is representable by  $Q$ , and  $\text{disc}(Q_a) = -a\text{disc}(Q)$ ,  $\epsilon(Q_a) = (-a, \text{disc}(Q))_K \epsilon(Q)$ .  $\square$

**Prop. (19.5.5.9) [Classifying Quadratic Forms over  $\mathbb{Q}_p$ ].** Two quadratic spaces over  $\mathbb{Q}_p$  are equivalent iff they have the same rank, discriminant and  $\epsilon$ -invariants.

And two quadratic forms over  $\mathbb{R}$  are equivalent iff they have the same rank  $\leq 3$ , discriminant and  $\epsilon$ -invariants.  $\lrcorner$

*Proof:* It follows from (19.5.5.8) that two quadratic forms over  $K$  has the same rank, discriminant and  $\epsilon$ -invariants represents the same set of elements in  $K^\times / (K^\times)^2$ , thus we can use (19.5.1.12) to do an induction on the rank.  $\square$

**Cor. (19.5.5.10).** There exists a unique anisotropic quadratic space of rank 4 over  $\mathbb{Q}_p$ , which has discriminant 1 and  $\epsilon$ -invariant  $= -(-1, -1)_{\mathbb{Q}_p}$ . It is of the form  $Q = z^2 - ax^2 - by^2 + abt^2$  for some  $a, b \in K^\times$  with  $(a, b)_K = -1$ . This is the reduced form of the unique quaternion algebra over  $K$  (19.5.5.3).  $\lrcorner$

**Prop. (19.5.5.11) [Classifying Hermitian Forms over  $K$ ].** If  $K/\mathbb{Q}_p$  is a field extension of degree 2 and  $Q$  is a non-degenerate  $c$ -Hermitian form of rank  $m$  over  $K/\mathbb{Q}_p$ , then

- If  $m = 2k + 1$ , then  $Q$  is equivalent to

$$\sum_{i=1}^k q_0(z_{2i-1}, z_{2i}) + (-1)^k \text{disc}(Q) \text{Nm}(z_{2k+1}).$$

- If  $m = 2k$ , then  $Q$  is equivalent to

$$\sum_{i=1}^{k-1} q_0(z_{2i-1}, z_{2i}) + \text{Nm}(z_{2k-1}) + (-1)^{k-1} \text{disc}(Q) \text{Nm}(z_{2k}).$$

where  $q_0$  is the hyperbolic form  $q_0(x, y) = (xc(y) + yc(x))/2$ .  $\lrcorner$

*Proof:* Because any quadratic form over  $\mathbb{Q}_p$  of rank  $\geq 5$  represents 0 by (19.5.5.7), so if  $m \geq 3$ ,  $Q$  contains a  $q_0$ . So it suffices to prove for  $m \leq 2$ . The case  $m = 1$  is trivial, and for  $m = 2$ , apply the above argument for the Hermitian form  $Q((z_1, z_2)) - \text{Nm}(z_3)$ , we get that  $Q$  represents 1, and then the theorem follows, by the same reasoning as in the proof of (19.5.1.12).  $\square$

### $\gamma$ -Invariants

**Prop. (19.5.5.12) [Weil].** Let  $(V, B) \in \text{QuadSpa}^d/K$ , then  $V$  be identified with  $V^*$  via  $(v, v^*) \mapsto \psi(-2B(v, v^*))$ . Denote the Fourier transform  $\mathcal{F}$  to be compatible with this identification.

Let  $F_B(v) = \psi(B(v, v))$ , then for any  $a \in K^\times$ , then  $\varphi * F_{aB} \in \mathcal{S}(V)$  for any  $\varphi \in \mathcal{S}(V)$ , and there is a complex number  $\gamma(aB)$  with norm 1 that for any  $\varphi \in \mathcal{S}(V)$ ,

$$\mathcal{F}(\varphi * F_{aB}) = |a|^{-d/2} \gamma(aB) \mathcal{F}(\varphi) F_{-a^{-1}B},$$

which means  $|a|^{-d/2} \gamma(aB) F_{-a^{-1}B}$  is formally the Fourier transform of  $F_{aB}$ . This number  $\gamma(B)$  is called the  $\gamma$ -invariant of  $V$ .  $\lrcorner$

*Proof:* We only prove for  $a = 1$ :

$$(\Phi * F_B)(v) = \int_V \Phi(u) \psi(B(v - u, v - u)) du = F_B(v) \mathcal{F}(\Phi * F_B)(-v)$$

is an element of  $\mathcal{S}(V)$ , as  $\mathcal{F}(\mathcal{S}(V)) = \mathcal{S}(V)$  (19.4.2.11). Now use the last equation of (3.1.5.9) for  $z = 1$  and the projective unitary representation  $\omega_1$  of  $\mathrm{SL}(2; F)$  on  $L^2(V)$  (26.8.1.5),

$$\omega_1(w_1)\omega_1(n(1))\omega_1(w_1)\omega_1(n(1))\omega_1(-1)\Phi = \gamma(B)\omega_1(n(-1))\omega_1(w_1)\Phi$$

for some  $|\gamma(B)| = 1$ . Then it can be computed that the LHS equals  $\widehat{\Phi * F_B}$ , and the RHS equals  $F_B \cdot \widehat{\Phi}$ , thus we are done.  $\square$

**Cor. (19.5.5.13) [Analytic Interpretation of Isotropy].** For  $(V_1, B_1), (V_2, B_2) \in \mathrm{QuadSpa}_K$ ,

- $\gamma(B_1 \oplus B_2) = \gamma(B_1)\gamma(B_2)$ .
- $\gamma(-B) = \gamma(B)^{-1}$ .
- If  $(V_1, B_1)$  is hyperbolic (19.5.1.17), then  $\gamma(B_1) = 1$ .
- $\gamma$  is a group homomorphism  $W(F) \rightarrow \mathbb{C}^*$  (19.5.3.1).

┘

*Proof:* 1, 2 follow from taking test functions  $\varphi$  to be  $\varphi_1 \otimes \varphi_2$  or  $\bar{\varphi}$ . 3 follows from the fact  $\gamma(\langle -1, 1 \rangle) = \gamma(\langle 1 \rangle)\gamma(\langle -1 \rangle) = 1$ . 4 follows from 1 and 3.  $\square$

**Prop. (19.5.5.14).** Situation as in (19.5.5.12),

- For any  $\Phi \in \mathcal{S}(V)$ ,  $\int_V (\Phi * F_B)(v) dv = \gamma(B) \int_V \Phi(v) dv$ .
- If  $K \in p\text{-LField}$ , then for any lattice in  $V$  (19.1.5.39) sufficiently large,  $\gamma(B) = \int_L F_B(v) dv$ .
- If  $\#K < \infty$ , then  $\gamma(B) = \int_V F_B(v) dv$ .

┘

*Proof:* 1 follows from (19.5.5.12) evaluated at  $a = 1$  and  $v = 0$ .

2: Consider the dual lattice  $L^\vee$  (19.1.5.43), if  $L$  is sufficiently large, then  $L'$  is sufficiently small, s.t.  $F_B(u) = 1$  for all  $u \in L'$ . Then

$$(\chi_{L'} * F_B)(v) = \int_{L'} F_B(v - u) du = \psi(B(v, v)) \int_{L'} \psi(-2B(u, v)) du,$$

which equals  $V(L')\chi_L F_B$ . Then let  $\Phi = \chi_{L'}$  in item 1, we get the desired assertion.

3: This is the same as 2, take  $\Phi = 1$ .  $\square$

**Prop. (19.5.5.15) [Weil's Characterization of Hilbert Symbol].** Let  $a, b \in K^\times$  and  $q : Q_K(a, b) \rightarrow K$  be the norm form, then  $\gamma(q) = (a, b)_K$  (19.6.1.20).

In particular,  $(a, b)_F = \gamma(\langle 1, -a, -b, ab \rangle)$ .  $\square$

*Proof:* By (19.5.5.13) and (19.5.5.5), it suffices to show for a non-split  $Q_F(a, b)$ ,  $\gamma(\langle 1, -a, -b, ab \rangle) = -1$ .

If  $K$  is Archimedean or finite, then the existence of a non-split  $Q_F(a, b)$  over  $A$  shows  $F = \mathbb{R}$ , and  $a = b = -1$ , and  $\gamma(\langle 1, 1, 1, 1 \rangle) = (\gamma(\langle 1 \rangle))^4$ . Let  $\psi : \mathbb{R} \rightarrow \mathbb{C} : x \mapsto e^{2\pi i x}$  as in (19.4.2.3), and  $\Phi(x) = e^{-\pi x^2}$ , then it can be calculated using (19.5.5.12) that  $\gamma(B)$  is an 8-th roots of unity, thus we are done.

If  $K \in p\text{-LField}$ , denote the Haar measure on  $A = Q_K(a, b)$  by  $dz$ , and then by (19.6.1.12) and (12.10.1.19), the Haar measure on  $A^*$  is of the form  $d^\times z = |N(z)|^{-2} dz$ . By (19.5.5.4), for large  $n$ ,  $L = N^{-1}(\mathfrak{p}^{-n})$  is a sufficiently large lattice in  $V$ , thus we can use (19.5.5.14) to evaluate the sign of

$$\gamma(N) = \int_{L \setminus \{0\}} \psi(N(z)) |N(z)|^2 d^\times z.$$

But this integrand factors through  $N : L \setminus 0 \rightarrow \mathfrak{p}^{-n}$ , thus it suffices to evaluate the sign of

$$\int_{\mathfrak{p}^{-n} \setminus 0} \psi(x) |x|^2 d^\times x = \int_{\mathfrak{p}^{-n}} \psi(x) |x| dx,$$

which is  $-q^{1-2r}(1-q^{-1})^{-1}$ , where the conductor of  $\psi$  is  $\mathfrak{p}^r$ . So  $\gamma(N) = -1$ .  $\square$

**Cor. (19.5.5.16).** Let  $r_i \in F^*$ , then  $\gamma(\langle ar_1, \dots, ar_{2n} \rangle) = ((-1)^n r_1 \dots r_{2n}, a)_F \gamma(\langle r_1, \dots, r_{2n} \rangle)$ .  $\lrcorner$

*Proof:* By (19.5.5.15), it suffices to show for  $n = 1$ .  $\gamma(\langle r_1, r_2 \rangle) = (r_1, r_2)_F \gamma(\langle 1, r_1 r_2 \rangle)$ , thus also  $\gamma(\langle ar_1, ar_2 \rangle) = (ar_1, ar_2)_F \gamma(\langle 1, a^2 r_1 r_2 \rangle)$ , so

$$\gamma(\langle ar_1, ar_2 \rangle) / \gamma(\langle r_1, r_2 \rangle) = (ar_1, ar_2)_F / (r_1, r_2)_F = (a, -r_1 r_2)$$

by (19.5.5.5).  $\square$

**Cor. (19.5.5.17).** Let  $(V, Q)$  has dimension  $2n$ , then  $\gamma(Q)^2 = ((-1)^n \text{disc}(Q), -1)_F$ .  $\lrcorner$

*Proof:* It reduces to  $n = 1$ , in which case, it suffices to show that  $\gamma(\langle r_1, r_2 \rangle)^2 = (-1, -r_1 r_2)_F$ . But  $(-1, -r_1 r_2)_F = \gamma(\langle 1, 1, r_1 r_2, r_1 r_2 \rangle) = \gamma(\langle 1, r_1 r_2 \rangle)^2$ . By (19.5.5.15),  $\gamma(\langle 1, -r_1, -r_2, r_1 r_2 \rangle)^2 = 1$ , thus  $\gamma(\langle 1, r_1 r_2 \rangle)^2 = \gamma(\langle r_1, r_2 \rangle)^2$ .  $\square$

## 6 over Global Fields

References are [Quadratic Forms over Global Fields, Clark].

**Prop. (19.5.6.1).** Suppose  $k = \bar{k}$  and  $F = k(t)$ , then any binary quadratic form  $Q$  over  $F$  is universal.  $\lrcorner$

*Proof:* We may assume  $Q = \langle 1, f \rangle$ , where  $f \in F^\times$ . We can assume  $f \notin -(F^\times)^2$ , otherwise this is clearly universal. It is easy to see that the  $\mathbb{F}_2$  vector space  $F^* / (F^*)^2$  has a basis  $\{t - a | a \in k\}$ . Notice  $D_F(Q)$  is a subgroup of  $F^*$  as it is the norm group of  $F(\sqrt{-f})$ , it suffices to show that  $t - a \in D_F(Q)$ . After a change of variable, it suffices to show that  $t \in D_F(Q)$ , or  $\langle 1, f, -t \rangle$  is isotropic, or equivalently  $-f \in \langle 1, -t \rangle$  for any  $f$ . The same argument show that it suffices to show that  $\langle 1, -t, t - a \rangle$  is isotropic. But  $t - a + (-t) + (\sqrt{a})^2 = 0$ .  $\square$

**Cor. (19.5.6.2).** Any quaternion algebra over  $\bar{k}(t)$  splits, by Hilbert's criterion (19.6.1.16).  $\lrcorner$

**Prop. (19.5.6.3) [Examples].**

- $Q_{\mathbb{Q}}(-1, -1) \cong Q_{\mathbb{Q}}(-2, -3)$ .
- $Q_{\mathbb{Q}}(-1, -1) \not\cong Q_{\mathbb{Q}}(-2, -5)$ .
- Let  $p$  be a prime number,  $Q_{\mathbb{Q}}(-1, p)$  splits iff  $p = 2$  or  $p \equiv 1 \pmod{4}$ .
- Let  $p$  be a prime number,  $Q_{\mathbb{Q}}(-2, p)$  splits iff  $p = 2$  or  $p \equiv 1, 3 \pmod{8}$ .
- $Q_{\mathbb{Q}}(-3, 5)$  is a division ring, but splits over  $K = \mathbb{Q}(\sqrt{17})$ .

$\lrcorner$

*Proof:* 1: By (19.5.1.25),  $Q_{\mathbb{Q}}(1, 1, 1, 1) \cong (1, 1, 2, 2) \cong (1, 3, 6, 2)$ , thus  $Q_{\mathbb{Q}}(-1, -1) \cong Q_{\mathbb{Q}}(-2, -3)$  by (19.6.1.16).

2: if they are isomorphic, then  $\langle 2, 5, 10 \rangle \cong \langle 1, 1, 1 \rangle \cong \langle 2, 2, 1 \rangle$ , thus  $\langle 5, 10 \rangle \cong 1, 2$ , which is impossible as 1 is not representable by  $\langle 5, 10 \rangle$ .

3: By Hilbert's criterion(19.5.1.25), if  $Q_{\mathbb{Q}}(-1, p)$  splits, then  $-x^2 + py^2 = z^2$  for some  $x, y, z \in \mathbb{Z}$  that  $(x, y, z) = 1$ , thus  $-1$  is a square in  $\mathbb{F}_p$ , which means  $p \equiv 1 \pmod{4}$  or  $p = 2$ . Conversely, if  $p \equiv 1 \pmod{4}$ , then by(35.5.1.8),  $p = x^2 + y^2$  for some  $x, y \in \mathbb{Z}$ , thus  $\langle -1, p \rangle$  represents 1, so  $Q_{\mathbb{Q}}(-1, p)$  splits. if  $p = 2$ , then  $\langle -1, 2 \rangle$  represents 1, thus it splits.

4: By Hilbert's criterion(19.5.1.25), if  $Q_{\mathbb{Q}}(-1, p)$  splits, then  $-2x^2 + py^2 = z^2$  for some  $x, y, z \in \mathbb{Z}$  that  $(x, y, z) = 1$ , thus  $-2$  is a square in  $\mathbb{F}_p$ , which means  $p \equiv 1, 3 \pmod{8}$  or  $p = 2$ . Conversely, if  $p \equiv 1 \pmod{4}$ , then by(35.5.1.8),  $p = x^2 + y^2$  for some  $x, y \in \mathbb{Z}$ , thus  $\langle -1, p \rangle$  represents 1, so  $Q_{\mathbb{Q}}(-1, p)$  splits. If  $p = 2$ , then it splits as above.

5: If it splits, then  $-3x^2 + 5y^2 = z^2$  for some  $x, y, z \in \mathbb{Z}$  that  $(x, y, z) = 1$ . This is a contradiction modulo 3. In  $K = \mathbb{Q}(\sqrt{17})$ , however,  $5 \cdot 2^2 - 3 = 17$ , thus  $Q_{\mathbb{Q}(\sqrt{17})}(-3, 5)$  splits.  $\square$

**Prop. (19.5.6.4)[Hasse-Minkowski Principle].** If  $F \in \mathbf{GFie}ld$ ,  $\text{char } F \neq 2$ , and  $Q$  is a quadratic form over  $F$ , then  $Q$  is isotropic over  $F$  iff  $Q$  is isotropic over  $F_{\mathfrak{p}}$  for all place  $\mathfrak{p}$ .  $\lrcorner$

*Proof:* Cf.[Lam, P170].? Also [Vigneras]P57 has an analytic proof.  $\square$

**Prop. (19.5.8.1)[Signatures of Even Bilinear Forms, van.der.Blij].** The signature of a unimodular even integral bilinear form is divisible by 8.  $\lrcorner$

*Proof:* Cf.[Symmetric Bilinear forms, Milnor-Husemoller]P242?  $\square$

### Counting Representations by Sums of Square

**Prop. (19.5.8.2)**  $[r_2(n)]$ . For  $n \in \mathbb{Z}_+$ ,

$$r_2(n) = 4 \sum_{d \in \mathbb{Z}_+, d|n} \chi_{-4}(d) = 4 \sum_{d \in 2\mathbb{Z}_+ - 1, d|n} (-1)^{(d-1)/2} \text{(35.3.6.4)}.$$

$\lrcorner$

*Proof:* It is clear that

$$\sum_{n \in \mathbb{Z}_+} r_2(n) n^{-s} = \zeta_{\mathbb{Q}(i)}(s) = 4\zeta(s)L(\chi_{-4}; s)$$

$\square$

**Prop. (19.5.8.3)**  $[r_3(n), \text{Legendre/Gauss}]$ . For  $n \in \mathbb{Z}_+$ ,

$$r_3(n) = \begin{cases} 24H(-n) & , n \equiv 3 \pmod{8} \\ 12H(-4n) & , n \equiv 1, 2 \pmod{4} \\ 0 & , n \equiv 7 \pmod{8} \\ r_3(n/4) & , n \equiv 0 \pmod{4} \end{cases}.$$

where  $H(D)$  is the Hurwitz class number(19.3.3.11). In particular,  $r_3(n) > 0$  iff  $n$  is not of the form  $n = 4^a(8k + 7)$ .  $\lrcorner$

*Proof:*

□

**Prop. (19.5.8.4)** [ $r_4(n)$ , **Lagrange**]. For  $n \in \mathbb{Z}_+$ ,

$$r_4(n) = 8(2 + (-1)^n) \sum_{d|n, 2 \nmid d} d > 0.$$

┘

*Proof:*

□

**Prop. (19.5.8.5)** [ $r_6(n)$ ]. For  $n \in \mathbb{Z}_+$ ,

$$r_6(n) = 4 \sum_{d|n} (4\chi_{-4}\left(\frac{n}{d}\right) - \chi_{-4}(d))d^2,$$

where  $\chi_{-4}$  is the Kronecker character (35.3.6.4).

┘

*Proof:*

□

**Prop. (19.5.8.6)** [ $r_8(n)$ , **Jacobi**]. For  $n \in \mathbb{Z}_+$ ,

$$r_8(n) = 16 \sum_{d|n} (-1)^{n+d} d^3,$$

where  $\chi_{-4}$  is the Kronecker character (35.3.6.4).

┘

*Proof:*

□

**Prop. (19.5.8.7).** There are closed form formulas for  $r_{4s^2}(n)$  and  $r_{4s(s+1)}(n)$ , Cf. [Infinite Families of Exact Sums of Squares Formulas, Jacobi Elliptic Functions, Continued Fractions, and Schur Functions].

┘

*Proof:*

□

**Prop. (19.5.8.8)** [Estimating Sums of  $r_k(n)$ ]. For  $X \in \mathbb{R}_+$  and  $k \in \mathbb{Z}_{\geq 4}$ , we have

$$\sum_{n \in [X^2]_+} r_k(n) = \frac{\pi^{k/2}}{\Gamma(k/2 + 1)} X^k + O(X^{k-2} \log X).$$

┘

*Proof:* For  $k = 4$ , use the formula (19.5.8.4), then

$$\begin{aligned} \sum_{n \in [X^2]_+} r_k(n) &= 8(2 + (-1)^m) \sum_{dm \leq X, 2 \nmid d} \left( \frac{X^4}{4m^2} + O\left(\frac{X}{m}\right) \right) \\ &= 2X^4 \sum_{m \in \mathbb{Z}_+} (2 + (-1)^m) m^{-2} + O(X^2 \log X) \\ &= 3\zeta(2)X^4 + O(X^2 \log X) \\ &= \frac{1}{2}\pi^2 X^4 + O(X^2 \log X). \end{aligned}$$

For general  $k$ ,  $r_k = r_4 * r_{k-4}$ , so we approximate the summation on the other  $k - 4$  terms via integration. ?

### Hilbert's 11th Problem

Hilbert's 11th problem is to classify quadratic forms over integral rings of number fields

## 19.6 Arithmetic of Quaternions and Octonions

References are [Vig80, C-S03].

**Notation (19.6.0.1).**

- Use notations on global fields defined in [Global Fields](#).
- Let  $K \in \text{Field}$ .

┘

### 1 Quaternion Algebras

References are [Quaternion Algebras].

**Notation (19.6.1.1).**

- In this subsection,

┘

**Def. (19.6.1.2) [Quaternion Algebras].** A **quaternion algebra** over  $K$  is a central simple algebra over  $K$  of dimension 4.

┘

**Prop. (19.6.1.3) [ $L\{\sqrt{\theta}\}$ ].** For a quaternion algebra  $Q/K$  (19.6.1.2), if  $L/K$  is a separable quadratic algebra contained in  $Q$ , then there exists  $u \in Q$  s.t.  $u^2 = \theta \in K^\times$ , and  $um = \overline{m}u$  for any  $m \in L$ , where  $\overline{(-)}$  is the unique non-trivial  $K$ -automorphism of  $L$ . Denote this quaternion algebra by  $L\{\sqrt{\theta}\}$ . In particular, by (3.6.4.20), any quaternion algebra over  $K$  has a representation of this type.

┘

*Proof:* If  $L \cong K \times K$ , then by Wedderburn theorem,  $Q \cong \text{Mat}(2; K)$ , and we can take  $u = \begin{bmatrix} & 1 \\ 1 & \end{bmatrix}$  with  $u^2 = 1$ . If  $L \in \text{Field}$ , then by Skolem-Noether (3.6.4.11), then non-trivial  $K$ -automorphism of  $L$  is induced by some inner isomorphism of  $Q$ , which is  $h \mapsto uhu^{-1}$ . Then  $u^2 \in C_Q(L) = L$  (3.6.4.15). Thus  $u^2 - \theta = 0 \in Q$  for some  $\theta \in L^\times$ . But  $u$  also satisfies  $u^2 - \text{trrd}(u)u + \text{Nmrd}(u) = 0 \in Q$ , which implies that  $\text{trrd}(u) = 0$ , otherwise  $u \in L$ , which is impossible, and thus  $\theta \in K^\times$ .  $\square$

**Def. (19.6.1.4) [Bar Involution].** There is an anti-involution of  $L\{\sqrt{\theta}\}$  given s.t.  $\overline{\{m_1 + m_2u\}} = \overline{m_1} - m_2u$  for  $m_1, m_2 \in L$ , called the **bar involution**.

Thus if we define the **reduced norm map** and **trace map**

$$\text{Nmrd}(x) = x\overline{x}, \quad \text{trrd}(x) = x + \overline{x},$$

then they have images in  $K$ . More explicitly,

$$\text{Nmrd}(m_1 + m_2u) = \text{Nm}(m_1) + \theta \text{Nm}(m_2), \quad \text{trrd}(m_1 + m_2u) = \text{tr}(m_1).$$

In particular, for  $Q = \text{Mat}(2; K)$ ,  $\overline{\begin{bmatrix} a & b \\ c & d \end{bmatrix}} = \begin{bmatrix} d & -b \\ -c & a \end{bmatrix}$ , and  $\text{trrd}, \text{Nmrd}$  are usual trace and determinant, resp.

┘

**Cor. (19.6.1.5) [Invariance of Bar Involutions].** Notice the bar involution can be defined intrinsically, by defining pure vectors, which are vectors  $x$  s.t.  $x^2 \in F$  but  $x \notin F$ . In particular, the bar involution, trace and determinants are independent of the form given.

It is clear that if  $\alpha \in Q_K(a, b) \setminus K$ , then the minimal polynomial of  $\alpha$  over  $K$  is  $T^2 - \text{tr}(\alpha)T + \text{Nmrd}(\alpha) = 0$ .

┘

**Prop. (19.6.1.6)[Characterizing  $\text{Mat}(2; K)$ ].** For a quadratic algebra  $Q = L\{\sqrt{\theta}\}/K$ ,  $Q \cong \text{Mat}(2; K)$  iff  $L$  is not a field or  $\theta \in \text{Nm}(L^\times)$ .  $\lrcorner$

*Proof:* If  $L \cong K \times K$ , then by Wedderburn theorem,  $Q \cong \text{Mat}(2; K)$ . Suppose  $L \in \mathbf{Field}$ . If  $\theta \in \text{Nm}(L^\times)$ , then there exists some  $m \in L$  s.t.  $(mu)^2 = 1$  but  $\mu \neq \pm 1$ , so  $Q \cong \text{Mat}(2; K)$ . Conversely, if  $Q \cong \text{Mat}(2; K)$ , then  $\text{Nmrd}(m_1 + m_2u) = \text{Nm}(m_1) + \text{Nm}(m_2)\theta$ , thus the norm map is injective. But the norm map of  $\text{Mat}(2; K)$  is clearly not injective, thus  $Q \not\cong \text{Mat}(2; K)$ .  $\square$

$Q_K(a, b)$

**Notation (19.6.1.7).**

- In this subsubsection, we assume  $\text{char } K \neq 2$ .  $\lrcorner$

**Prop. (19.6.1.8).** Let  $a, b \in K^\times$ , define a  $K$ -algebra  $Q(a, b)$  as

$$Q_K(a, b) = Q \langle X, Y \rangle / (X^2 - a, Y^2 - b, XY + YX).$$

Denote  $\overline{X} = i, \overline{Y} = j, \overline{XY} = k$ . Then:

- $\dim_K Q_K(a, b) = 4$ , thus any element of  $Q_K(a, b)$  is of the form  $x + yi + zj + wk$ .
- $Q_K(ax^2, by^2) \cong Q_K(a, b)$  for  $x, y \in K^\times$ .
- $Q_K(-1, 1) \cong \text{Mat}(2; K)$ .
- $Q_K(a, b)$  is a quaternion algebra over  $F$ .  $\lrcorner$

*Proof:* 1:  $Q_K(a, b) \otimes_F \overline{F} = Q_{\overline{F}}(a, b) \cong Q_{\overline{F}}(-1, 1) \cong M_2(\overline{F})$  has dimension 4 over  $\overline{F}$ , by item2 and3.

2: trivial.

3: The map is given by  $\varphi : Q_K(-1, 1) \rightarrow \text{Mat}(2; F) : i \mapsto \begin{bmatrix} & 1 \\ -1 & \end{bmatrix}, j \mapsto \begin{bmatrix} & \\ 1 & \end{bmatrix}$ . The verification is straightforward.

4: Consider  $Q_K(a, b) \otimes_K \overline{K} \cong \text{Mat}(2, \overline{K})$  by item2, which simple with center  $\overline{K}$ , the center of  $Q_K(a, b)$  has to be  $K$ , and also  $Q_K(a, b)$  has to be simple.  $\square$

**Def. (19.6.1.9)[Pure Tensors].** A quaternion element of the form  $yi + zj + wk$  is called a **pure tensor**. The space of pure tensor is denoted by  $A_0$ .

Let  $v \neq 0 \in Q_K(a, b)$ , then  $v \in A_0$  iff  $v \notin F$  but  $v^2 \in F$ .  $\lrcorner$

*Proof:* By direct calculation,

$$(x + yi + zj + wk)^2 = (x^2 + ay^2 + bz^2 - abw) + 2x(yi + zj + wk).$$

$\square$

**Def. (19.6.1.10)[Bar Involution].** There is an anti-involution of  $Q_K(a, b) = Q \langle X, Y \rangle / (X^2 - a, Y^2 - b, XY + YX)$  given by  $X \mapsto -X, Y \mapsto -Y$  (thus  $XY \mapsto (-Y)(-X) = YX$ ), called the **bar involution**.

Thus if we define the **reduced norm map** and **trace map**

$$\text{Nmrd}(x) = x\bar{x}, \quad \text{trrd}(x) = x + \bar{x},$$

then they have images in  $K$ . If  $\alpha = x + yi + zj + wk$ , then  $\text{tr}(\alpha) = 2x, \text{Nmrd}(\alpha) = x^2 - ay^2 - bz^2 + abw^2$ .

$\lrcorner$

**Cor. (19.6.1.11) [Invariance of Bar Involutions].** Notice the bar involution can be defined intrinsically, by defining pure vectors, which are vectors  $x$  s.t.  $x^2 \in F$  but  $x \notin F$ . In particular, the bar involution, trace and determinants are invariant under isomorphisms of quaternion algebras.

It is clear that if  $\alpha \in Q_K(a, b) \setminus K$ , then the minimal polynomial of  $\alpha$  over  $K$  is  $T^2 - \text{tr}(\alpha)T + \text{Nmrd}(\alpha) = 0$ .  $\lrcorner$

**Cor. (19.6.1.12).** For  $x \in Q_K(a, b)$ , if we let  $T(x)$  be the left(or right) multiplication by  $x$  on  $Q_K(a, b)$ , then the determinant of  $T(x)$  equals  $\text{Nmrd}(x)^2$ .  $\lrcorner$

*Proof:* After base change, all the values won't change, thus it suffices to prove for  $\text{Mat}(2; K)$ , in which case, it can be verified by (19.6.1.8) that  $\det(x) = \text{Nmrd}(x)$ , and the  $T(x)$  has determinant  $\det(x)^2$ .  $\square$

**Prop. (19.6.1.13) [Norm Forms].** If  $\text{char } k \neq 2$ , define a quadratic form on  $Q_K(a, b)$ :  $B(x, y) = \text{trrd}(x\bar{y})/2$ . Its norm form is just  $\text{Nmrd}(x)$ .

Thus this quadratic space has  $\{1, i, j, k\}$  as an orthonormal basis. It is non-degenerate and isomorphic to

$$\langle 1, -a, -b, ab \rangle \cong \langle 1, -a \rangle \otimes \langle 1, -b \rangle.$$

$\lrcorner$

**Prop. (19.6.1.14).** Let  $A, A'$  be two quaternion algebras over  $K$ , then the following are equivalent:

- $A, A'$  are isomorphic as quaternion algebras.
- $A, A'$  are isomorphic as quadratic spaces (19.6.1.13).
- $A_0, A'_0$  (19.6.1.9) are isomorphic as quadratic spaces.

$\lrcorner$

*Proof:* Cf. [Lam, P57].  $\square$

**Cor. (19.6.1.15).**  $Q_K(a, -1) \cong Q_K(a, a)$ .  $\lrcorner$

*Proof:* These algebras have norm forms  $\langle 1, -a, -1, -a \rangle$  and  $\langle 1, -a, -a, a^2 \rangle$ , which are clearly isometric quadratic spaces.  $\square$

**Prop. (19.6.1.16) [Split or Division Ring].** Let  $A = Q_K(a, b)$ , then the following are equivalent:

1.  $A \cong \text{Mat}(2; F)$ .
2.  $A$  is not a division algebra.
3.  $A$  is isotropic as a quadratic space.
4.  $A$  is hyperbolic as a quadratic space.
5.  $A_0$  is isotropic as a quadratic space.
6.  $(\langle a \rangle - 1)(\langle b \rangle - 1) = 0$  in  $W(F)$  (or  $\widehat{W}(F)$ , by (19.5.3.2)).
7. (Hilbert's Criterion) The binary form  $\langle a, b \rangle$  represents 1.
8.  $a \in \text{Nm}_{E/F}(E^*)$ , where  $E = F(\sqrt{b})$ .

$\lrcorner$

*Proof:*  $4 \rightarrow 5 \rightarrow 3$  is clear. As  $Q_K(-1, 1) \cong M(2, F)$ , 1, 4, 6, 7 are equivalent by (19.5.1.12) and (19.6.1.14). Also  $3 \iff 4$  as the the norm form of  $A$  has determinant in  $(F^*)^2$ . Also  $1 \rightarrow 2 \rightarrow 3$  is clear, as  $x \in A$  is invertible iff  $\text{Nmrd}(x) \neq 0$ . Thus 1 to 7 are all equivalent.

Now we show  $7 \iff 8$ : Firstly assume  $b \notin (F^\times)^2$ , otherwise both are true. Let  $E = F(\sqrt{b})$ , then  $\text{Nm}_{E/F}(x + y\sqrt{b}) = x^2 - by^2$ , thus 8 says  $a \in D_F(\langle 1, -b \rangle)$ , which is equivalent to  $\langle 1, -b, -a \rangle$  isotropic, which is equivalent to  $\langle a, b \rangle$  represents 1, by representation theorem (19.5.1.23).  $\square$

**Cor. (19.6.1.17).** Let  $a \in F^\times$ ,

- $Q_K(1, -a) \cong Q_K(a, -a) \cong \text{Mat}(2; F)$ .
- If  $a \neq 1$ , then  $Q_K(a, 1 - a)$  splits.
- $Q_K(-1, a)$  splits iff  $a$  is a sum of two squares in  $F$ .

┘

*Proof:* These follows from Hilbert's criterion (19.6.1.16) and representation theorem (19.5.1.23).  $\square$

**Prop. (19.6.1.18) [Characterizing Quaternion Algebras].**

- If  $A \neq K$  is a central simple algebra over  $K$  of dimension  $\leq 4$ , then  $A$  is a quaternion algebra and is isomorphic to  $Q_K(a, b)$  for some  $a, b \in K^\times$ .
- If  $B \neq K$  is a f.d. central simple  $K$ -algebra equipped with an  $K$ -algebra involution  $x \mapsto \bar{x}$  s.t.  $x + \bar{x} \in K, x\bar{x} \in K$  for any  $x \in B$ , then  $B$  is isomorphic to a quaternion algebra over  $K$ .

┘

*Proof:* 1: By Wedderburn's theorem, then  $A \cong \text{Mat}(n; D)$  where  $D$  is a central division ring over  $K$ . Then  $A = M(2, F) \cong Q_K(1, -1)$  or  $D$ . If  $A = D$ , choose  $i \notin F$ , and  $K = F(i)$  a subfield of  $D$ . Then  $F \subset K \subset D$ , thus  $\dim K = 2$ , thus we may modify  $i$  that  $i^2 = a \in F$ . The conjugation of  $i$  on  $D$  satisfies  $(\text{ad}(i))^2 = \text{id}$ , thus  $A = A^+ \oplus A^-$  where  $\text{ad}(i)$  acts by 1 and  $-1$  resp.. Let  $j \neq 0 \in A^-$ , then  $ij = -ji, j^2i = ij^2$ , thus  $j^2 \in A^+$ . Now  $K(j)$  is also a quadratic field over  $F$ , thus  $j^2 + cj - b = 0$  for  $c, b \in F$ . Then  $cj = b - j^2 \in A^+ \cap A^- = 0$  shows  $c = 0$ . Then  $A = F \oplus Fi \oplus Fj \oplus Fij$  is the quaternion algebra  $Q_K(a, b)$ .

2: By Wedderburn's theorem,  $A \cong \text{Mat}(n, D)$  where  $D$  is a central division ring over  $K$ . The hypothesis shows every element of  $B$  satisfies a degree 2 equation  $x^2 - (x + \bar{x})x + x\bar{x} = 0$ , thus  $n \leq 2$ . If  $n = 2$ , consider the diagonal elements, then we get  $D = F$ . If  $B = D$ , then the same argument as above shows we can find  $i, j$  that  $ij = -ji$  and  $i^2 = a, j^2 = b, a, b \in F^*$ . Then  $j$  induces an isomorphism  $A^+ \cong A^-$ . If there are some  $l \in A^+ \setminus F(i)$ , then  $\bar{l} = \bar{i}l = il$ , thus  $il + \bar{l} = 2il \in F$ , contradiction. Thus  $A^+ = F(i)$ , and  $D = Q_K(a, b)$ .  $\square$

**Prop. (19.6.1.19) [Classifying Binary Forms].** Let  $q = \langle a, b \rangle, q' = \langle a', b' \rangle$  be non-singular binary forms, then they are isomorphic iff  $\det(q) = \det(q')$  and  $Q_K(a, b) \cong Q_K(a', b')$ .  $\square$

*Proof:* If  $q \cong q'$ , then  $ab = a'b' \in F^\times / (F^\times)^2$ , thus  $\langle 1, -a, -b, ab \rangle \cong \langle 1, -a', -b', a'b' \rangle$ , thus  $Q_K(a, b) \cong Q_K(a', b')$  by (19.6.1.16). The converse follows the same way by cancellation theorem (19.5.2.1).  $\square$

**Def. (19.6.1.20) [Hilbert Symbol].** For  $a, b \in K^\times$ , define the **Hilbert symbol**

$$\{a, b\}_K = \begin{cases} 1 & Q_K(a, b) \cong \text{Mat}(2; K) \\ -1 & \text{otherwise} \end{cases}.$$

┘

**Prop. (19.6.1.21) [Computing Hilbert Symbols].** Cf. [Vigneras]P27.

For  $\mathbb{Q}_2$ , we can calculate using the reciprocity formula (19.6.5.4).  $\square$

### Splitting Fields

**Def. (19.6.1.22) [Splitting Fields].** A quaternion algebra  $A$  over  $F$  is said to **split** in a field extension  $K/F \in \mathbf{Field}$  if  $A \otimes_F K \cong \mathrm{Mat}(2, K)$ .  $K$  is said to be a **splitting field** for  $A$ .  $\lrcorner$

**Prop. (19.6.1.23).** Let  $A = Q_K(a, b)$  and  $K = F(\sqrt{c})$ ,  $c \in F^\times$ , then the following are equivalent:

- $A$  splits over  $K$ .
- $A \cong Q_K(c, d)$  for some  $d \in F^\times$ .
- $K$  is a subalgebra of  $A$  over  $F$ .

$\lrcorner$

*Proof:*  $1 \rightarrow 2$ : Consider the pure tensor space  $A_0 \cong \langle -a, -b, ab \rangle$ . If it is isotropic, then  $A_0 \cong \langle -c, -d, cd \rangle$  for some  $d \in F^\times$ . If it is anisotropic, then because  $A_K \cong \mathrm{Mat}(2; K)$ , by (19.6.1.16), there exists  $x_i, y_i$  not all zero s.t.

$$-a(x_1 + \sqrt{a}y_1)^2 - b(x_2 + \sqrt{a}y_2)^2 + ab(x_3 + \sqrt{a}y_3)^2 = 0$$

Thus  $\mathbf{x}$  is orthogonal to  $\mathbf{y}$  and  $N(\mathbf{x}) + cN(\mathbf{y}) = 0$ .  $\mathbf{y} \neq 0$ , because otherwise  $N(\mathbf{x}) = 0$  and  $\mathbf{x} = 0$ . Thus there is an orthogonal basis  $\{x, y, z\}$ , and

$$A_0 \cong \langle N(z), N(y), -cN(y) \rangle,$$

and because  $\det(A_0) = 1$ ,  $N(z) \in c(K^\times)^2$ , thus item2 holds.

$2 \rightarrow 3$ : In fact, if  $i^2 = c \in A$ , then  $F(i) \cong K$ .

$3 \rightarrow 1$ : This follows from (3.6.4.18).  $\square$

**Prop. (19.6.1.24).**  $\lrcorner$

### Orders and Ideals

**Notation (19.6.1.25).**

- Let  $(\mathcal{O}_K, K)$  be a Dedekind domain.
- Let  $Q/K$  be a quadratic algebra.

$\lrcorner$

**Def. (19.6.1.26) [Ideals and Orders].** An element  $x \in Q$  is called a **integral element** over  $\mathcal{O}_K$  if  $\mathbb{Z}[x]$  is a  $\mathcal{O}_K$ -lattice. Equivalently, the reduced trace and reduced norm of  $x$  lies in  $\mathcal{O}_K$ .  $\lrcorner$

## 2 Real Quaternions and Octonions

References are [C-S03].

**Prop. (19.6.2.1).**  $\mathrm{Aut}(\mathbb{H}) = \mathrm{SO}(3)$ .  $\lrcorner$

**Prop. (19.6.2.2).** For a coordinate-wise description of the octonion ring, see [C-S03]P75  $\lrcorner$

*Proof:*

$\square$

**Cor. (19.6.2.3).**  $\mathrm{Aut}(\mathbb{O}) = G_2$ .  $\lrcorner$

*Proof:* see[C-S03]P76. □

**Cor. (19.6.2.4).** Any subalgebra of  $\mathbb{O}$  generated by two elements is associative. ┘

*Proof:* This is because we can always use automorphism to assume that the two generators are of the form  $a + i_1x$  and  $c + i_1d + i_2f$ . And then we can use the fact  $\langle 1, i_1, i_2, i_4 \rangle \cong \mathbb{H}$ . □

**Prop. (19.6.2.5) [Finite Subgroups of  $\mathbb{H}$ ].** the finite groups of  $\mathbb{H}^\times$  are just

$$2I, \quad 2O, \quad 2T, \quad 2D_{2n}, \quad 2C_n, \quad C_{2k+1}$$

where  $n, k \in \mathbb{N}$ . ┘

*Proof:* By considering the covering map  $\mathbb{H}^\times \rightarrow \mathrm{SO}(3)$ , the image of the finite group can be only  $I, O, T, D_{2n}, C_n$  where  $n \in \mathbb{Z}$  (15.4.1.8). Then notice if the image contains an order-2 rotation  $g$ , then if  $[q] = g$ ,  $q^2 = 1$ , and so  $q = -1$ . So the finite group is just the inverse image of  $I, O, T, D_{2n}, C_n$  except for  $C_{2k+1}$  where  $k \in \mathbb{1}$ . □

### 3 Real Division Algebras

**Thm. (19.6.3.1) [Hopf/Bott-Milnor/Kervaire].** Every f.d. possibly non-associative division rings over  $\mathbb{R}$  has dimension  $\in \{1, 2, 4, 8\}$ . ┘

*Proof:* □

**Thm. (19.6.3.2) [Fobenius1878/Zorn1931].** Any alternative (3.6.9.1) division algebra  $D$  over  $\mathbb{R}$  is isomorphic to  $\mathbb{R}, \mathbb{C}, \mathbb{H}$  or  $\mathbb{O}$ . And  $\mathbb{O}$  is not associative. ┘

*Proof:* We use (3.6.9.2). For any  $x \in D$ , the map  $R[T] \rightarrow D : T \mapsto x$  is an algebraic homomorphism, so by finite dimensionality of  $D$ ,  $x$  is algebraic over  $\mathbb{R}$ , thus  $x^2 \in \mathbb{R} + \mathbb{R}x$ . But then if  $D \neq \mathbb{R}$ , we can find some  $i \in D$  with  $i^2 = -1$ . And  $C = \mathbb{R} + \mathbb{R}i$  is isomorphic to  $\mathbb{C}$ .

Then also  $C = \{x \in D | xi = ix\}$ . This is because if  $x \in D$  and  $xi = ix$ , we may assume  $x \notin \mathbb{R}$ , so  $(x - a)^2 = (ic)^2$  for some  $a, c \in \mathbb{R}$ . But then  $(x - a - ci)(x - a + ci) = 0$ , which shows  $x \in C$ .

Now suppose  $D \neq C$ . Let  $C^- = \{x \in D | xi = -ix\}$ , then  $D = C \oplus C^-$ , because we have

$$x = \frac{1}{2}(x - ixi) + \frac{1}{2}(x + ixi), \quad x \in D.$$

Let  $x \in C^- \setminus \{0\}$ , then  $x^2 \in C \cap (\mathbb{R} + \mathbb{R}x) = \mathbb{R}$ . And also  $x^2 \in \mathbb{R}_{<0}$ . So we find some  $j \in C^-$  s.t.  $j^2 = -1$ . Then  $ij = -ji$ , and so  $\langle 1, i, j \rangle \cong \mathbb{H}$ . Denote  $ij = k$ .

Define  $H = \{x \in D | xk = (xi)j\}$ , then

**Lemma (19.6.3.3).**  $H = C + Cj$ . ┘

*Proof:* Firstly  $C + Cj \subset H$ . And  $H = C \oplus (C^- \cap H)$ , because of the identity  $x = \frac{1}{2}(x - ixi) + \frac{1}{2}(x + ixi)$  above and the fact  $x + ixi \in H$  as

$$(x + ixi)k = xk - i(xk)i = xk - (ix)(ki) = xk - (ix)j = ((x + ixi)i)j.$$

Notice the linear transformation  $T : x \mapsto xj$  preserves  $H$ : If  $x \in H$ , then  $(xj)k = -(xk)j = -((xi)j)j = xi$ , and  $((xj)i)j = -((xj)j)i = xi$ .

Also notice that if  $x \in H$ , then  $0 = \text{Asso}(x, i, j) = -\text{Asso}(i, x, j) = -i(xj) + (ix)j$ , so if  $x \in C^- \cap H$ , then

$$(xj)i = -(xi)j = (ix)j = i(xj),$$

so  $xj \in H$ . In this way we get  $\dim H \leq 4$ , so  $H = C + Cj$ .  $\square$

Now suppose  $D \neq H$ , and let  $H^- = \{x \in D \mid xk = -(xi)j\}$ , then  $D = H \oplus H^-$ , because we have

$$x = \frac{1}{2}(x - ((xi)j)k) + \frac{1}{2}(x + ((xi)j)k), \quad x \in D,$$

and also

$$(((xi)j)k)i)j = (((xii)j)k)j = -((xj)k)j = -xk$$

by (3.6.9.2) item4 and Moufang law.

**Lemma (19.6.3.4).** Elements in  $H^-$  anti-commute with  $i, j, k$ .  $\lrcorner$

*Proof:* If  $x \in H^-$ , then  $xk = -(xi)j$ , so  $x = [(xi)j]k$ , and

$$kx = [k(xi)](jk) = [(ij)(xi)]i = (i(jx)i)i = -i(jx).$$

So  $kx = -\frac{1}{2}\text{Asso}(i, j, x) = -\frac{1}{2}\text{Asso}(x, i, j) = -xk$ .

The proof of  $jx = -jx$  is similar using the fact  $x = -[(xi)k]j$ .

The proof of  $ix = -ix$  is similar.  $\square$

Then  $H^- \subset C^-$ , and there by the same argument as above, there exists  $h \in H^-$  s.t.  $h^2 = -1$ . Now we prove that  $H^- = Hh$ : By (3.6.9.2) item4, if  $x \in H$ , then

$$(xh)k = -(xk)h = -((xi)j)h = -((xh)i)j,$$

so  $xh \in H^-$ . Conversely, if  $x \in H^-$ , we can prove that  $xh \in H$ .

So  $D = \mathbb{R}\{1, i, j, k, h, hi, hj, hk\}$ , and by Moufang equality,  $(ih)(kh) = -(hi)(kh) = -h(ik)h = hjh = -(jh)h = j$ . Similarly we can calculate the multiplication of any two elements in  $D$ . And in this way, it is isomorphic to  $\mathbb{O}$ .  $\square$

**Def. (19.6.3.5) [Composite Rings].** A (possibly non-associative) composite ring over  $\mathbb{R}$  is defined to be a unital ring  $D \in \text{naAlg}/\mathbb{R}$  with a (non-degenerate and positive-definite) scalar product  $\langle -, - \rangle$  s.t. the norm  $\text{Nm}(x) = \langle x, x \rangle$  is multiplicative from  $D$  to  $\mathbb{R}$ .

For any such composite ring  $D$ , every element  $x \in D$  has a decomposition  $x = a + x'$  where  $a \in \mathbb{R}$  and  $\langle x', 1 \rangle = 0$ . Then we can define the **involution** of  $D$ :  $\bar{x} = a - x'$ .  $\lrcorner$

**Prop. (19.6.3.6).** For any possibly non-associative composite ring  $D$  over  $\mathbb{R}$  and  $x, u, v \in D$ , we have

$$\langle xu, v \rangle = \langle u, \bar{x}v \rangle, \quad \langle xu, xv \rangle = \text{Nm}(x) \langle u, v \rangle$$

And also  $\text{Nm}(x) = \bar{x}x = x\bar{x}$ .  $\lrcorner$

*Proof:* It follows from the relation  $\langle x, y \rangle = \frac{1}{2}(\text{Nm}(x+y) - \text{Nm}(x) - \text{Nm}(y))$  and the multiplicativity of  $\text{Nm}$  that

$$\langle xy, xz \rangle = \text{Nm}(x) \langle y, z \rangle.$$

So if  $\langle x, 1 \rangle = 0$ , then  $\langle x'y, y \rangle = 0$  for any  $y$ . This implies that  $\langle x'u, v \rangle = -\langle x'v, u \rangle$  for any  $u, v$ . Now any element  $x \in D$  is of the form  $x = a + x'$  where  $a \in \mathbb{R}$  and  $\langle x', 1 \rangle = 0$ , then the assertion follows.

For the last assertion, notice

$$\langle \bar{x}x, y \rangle = \langle x, xy \rangle = \langle \text{Nm}(x), y \rangle,$$

so  $\bar{x}x = \text{Nm}(x)$ .  $\square$

**Prop. (19.6.3.7)[Composite Algebras, Hurwitz1898].** Any f.d. possibly non-associative composite ring  $D$  over  $\mathbb{R}$  is alternative and isomorphic to  $\mathbb{R}, \mathbb{C}, \mathbb{H}$  or  $\mathbb{O}$  by (19.6.3.2).  $\lrcorner$

*Proof:* It follows from the fact  $\text{Nm}(x) = \bar{x}x$  that  $D$  is a division ring. to show alternativity, notice

$$\langle z, (\bar{x}x)y \rangle = \text{Nm}(x) \langle z, y \rangle \stackrel{(19.6.3.6)}{=} \langle xz, xy \rangle = \langle z, \bar{x}(xy) \rangle.$$

Thus  $(\bar{x}x)y = \bar{x}(xy)$ . But because  $x + \bar{x} \in \mathbb{R}$ , we get  $x^2y = x(xy)$ . The right-alternativity is similar.  $\square$

**Thm. (19.6.3.8)[Benkart-Britten-Osborn].** Classify real flexible division algebras.  $\lrcorner$

*Proof:*  $\square$

## 4 Quaternions over Local Fields

**Notation (19.6.4.1).**

- Let  $p \in \text{Prime}$ .
- Let  $(K, \mathcal{O}_K, \varpi_K) \in p\text{-LField}$ .

$\lrcorner$

**Prop. (19.6.4.2)[Hasse Invariants].** If  $K \not\cong \mathbb{C}$ , then there exist a unique quaternion field over  $K$ .

In particular, for a quaternion algebra  $Q/K$ , we can define its **Hasse invariant of quaternion algebra** to be  $\epsilon(Q) = 1$  if  $Q$  is a quaternion field, and  $-1$  otherwise.  $\lrcorner$

*Proof:* ?  $\square$

**Prop. (19.6.4.3)[Properties of the Quaternion Algebra].** Let  $Q/K$  be the unique quadratic field, then

- The map  $|h| = |\text{Nmrd}(h)|^{1/2}$  is a discrete valuation on  $K_{\text{ur}}\{\sqrt{\pi}\}$ . Denote its valuation ring by  $\mathcal{O}$ , then it is the maximal order of  $K_{\text{ur}}\{\sqrt{\varpi}\}$ .
- The quaternion field is isomorphic to  $K_{\text{ur}}\{\sqrt{\varpi}\}$ , where  $K_{\text{ur}}$  is the unramified extension of  $K$ , and its prime ideal  $\mathfrak{P} + \mathcal{O}\sqrt{\varpi}$  satisfies  $\mathfrak{P}^2 = (\varpi)$ .
- 

$\lrcorner$

*Proof:* 1: To show that  $w$  is a discrete valuation, but this follows from considering the subfield  $K(h) \subset K_{\text{ur}}\{\sqrt{\pi}\}$ .

2: Firstly, we show that the unramified quadratic extension  $K_{\text{ur}}$  is contained in  $Q$ : Cf.[Vigneras]P25 ?  $\square$

**Prop. (19.6.4.4).** If  $Q/K$  is the unique quaternion field, then a finite separable extension  $L/K$  is a splitting field for  $Q$  iff  $[F : K]$  is even.  $\lrcorner$

*Proof:* If  $[L : K]$  is even, then either  $e_{L/K}$  is even or  $f_{L/K}$  is even. In the former case,  $\varpi_K$  is a square in  $L$ , so  $Q \otimes F \cong \text{Mat}(2; F)$  by??

If  $[L : K]$  is odd, then  $LK_{\text{ur}}$  is the unramified quadratic extension of  $L$ , and  $\varpi_K$  is not a uniformizer of  $L$ , so  $\square$

## Maximal Orders

### 5 Quaternions over Global Fields

**Notation (19.6.5.1).**

- Let  $F \in \mathbf{GField}$ .

┘

**Def. (19.6.5.2) [Ramified Places].** Let  $Q/F$  be a division algebra of dimension  $n^2$ , then  $v \in \Sigma_F$  is said to be a **ramified place** for  $Q$  if  $Q \otimes_F F_v$  is not isomorphic to  $\text{Mat}(n; F_v)$ .

The set of ramified places of  $Q$  is denoted by  $\text{Ram}_F(Q)$ . Denote  $\text{disc}(H) = \prod_{v \in \text{Ram}_F(Q) \cap \Sigma_F^{\text{fin}}} \mathfrak{p}_v$ , called the **reduced discriminant** of  $Q$ .

┘

**Thm. (19.6.5.3).** For a quaternion algebra  $Q/F$ ,  $\text{Ram}_F(Q)$  is finite, and  $\# \text{Ram}_F(Q)$  is even.

Conversely, for any  $\emptyset \subset_{\text{fin}} S \subset \Sigma_F$ , there exists a unique quaternion algebra  $Q/F$  s.t.  $S = \text{Ram}_F(Q)$ .

┘

*Proof:* The first assertion follows from (11.2.4.1) and (11.2.2.3). To show the existence, by the multiplicative structure of  $\text{Br}(F)[2]$ , it suffices to construct for  $S = \{v, w\}$ : Take a quadratic extension  $L/F$  that  $v, w$  are inert in  $L$  (which exists by (19.3.1.10)), then  $[\mathbf{I}_F : F^\times \text{Nm}_{L/F} \mathbf{I}_L] = 2$ . Take  $a_v \in F_v \setminus \text{Nm}(L_v), a_w \in F_w \setminus \text{Nm}(F_w)$ , then

$$[a_v]_v [a_w]_w \subset F^\times \text{Nm}_{L/F} \mathbf{I}_L,$$

which means there exists  $\theta \in F^\times$  s.t.  $\theta$  is not a norm in  $L_v$  or  $L_w$ , but for any  $u \in \Sigma_F \setminus \{v, w\}$ , either  $L_u$  is not a field or  $\theta$  is a norm in  $L_u$ . Thus  $L\{\sqrt{\theta}\}$  is ramified exactly at  $v, w$ .  $\square$

**Cor. (19.6.5.4) [Reciprocity Formula for Hilbert Symbols].** If  $\text{char } F \neq 2$ , then for any  $a, b \in F^\times$ , we have

$$\prod_{v \in \Sigma_F} \{a, b\}_v = 1 \text{ (19.6.1.20).}$$

┘

**Prop. (19.6.5.5) [Hasse-Weil Principle].** For a quaternion algebra  $Q/F$ ,  $Q$  is split iff  $Q \otimes F_v$  is split for each  $v \in \Sigma_F$ .

┘

*Proof:* Here is an analytic proof: By (29.5.4.17) and (29.5.4.16), if  $Q$  is non-split, then  $\text{ord}_{s=1/2} \Lambda(Q; s) \geq 0$ , which means  $\# \text{Ram}_F(Q) \geq 2$ .  $\square$

**Cor. (19.6.5.6).** For a quaternion algebra  $Q/F$  and  $L/F \in \mathbf{Field}$ ,  $L$  is a splitting field for  $Q$  iff  $L_v$  is a splitting field for  $Q \otimes F_v$  for each  $v \in \Sigma_F$ .

┘

**Thm. (19.6.5.7) [Norm Theorem].** Let  $Q/F$  be a quaternion algebra, then  $\text{Nm}(Q)$  is exact the set of elements of  $F$  which are positive at all the ramified real places of  $F$ .

┘

*Proof:* ?

$\square$

**Cor. (19.6.5.8).** Let  $Q/F$  be a quaternion algebra, then  $\text{Nm}(\mathcal{O}_Q) = \text{Nm}(Q) \cap \mathcal{O}_F$ .

┘

*Proof:* ?

$\square$

**Thm. (19.6.5.9) [Strong Approximation].** Let  $\emptyset \subset_{\text{fin}} S \subset \Sigma_F$  s.t.  $S$  contains at least one infinite place of  $F$  if  $F \in \text{NField}$ . Suppose  $Q/F$  is a quaternion algebra s.t.  $Q_S^1$  is not compact, then  $Q_K^1 Q_S^1 = Q_A^1$ .  $\lrcorner$

*Proof:* ?  $\square$

**Def. (19.6.5.10) [Eichler Condition].** For a quaternion algebra  $Q/F$ ,  $\emptyset \subset_{\text{fin}} S \subset \Sigma_F$  is said to satisfy the **Eichler condition** for  $Q$  if  $S$  contains at least one place of  $F$  that is unramified in  $Q$ .  $\lrcorner$

### Hurwitz and Lipschitz Integers

**Def. (19.6.5.11) [Hurwitz and Lipschitz Integers].** The **Lipschitz integers** is defined to be  $\mathbb{H}(\mathbb{Z})$ . And the **Hurwitz integers**  $\mathbb{H}$  is defined to be

$$\mathbb{H} = \{a + bi + cj + dk \in \mathbb{H} \mid a, b, c, d \in \mathbb{Z} \text{ or } a, b, c, d \in \frac{1}{2} + \mathbb{Z}\},$$

which contains  $\mathbb{H}(\mathbb{Z})$  as an index-2 sub-lattice.  $\lrcorner$

**Prop. (19.6.5.12).** Let  $D_4$  be the set of Lipschitz integers of even norm (19.6.5.11), then we have a coset decomposition

$$\mathbb{H}(\mathbb{Z}) = D_4 \cup (1 + D_4), \quad \mathbb{H} = D_4 \cup (1 + D_4) \cup (\omega + D_4) \cup (\omega^2 + D_4)$$

where  $\omega = \frac{1+i+j+k}{2}$ . And the multiplications between the cosets are compatible.  $\lrcorner$

**Prop. (19.6.5.13).** Every left or right ideal of  $\mathbb{H}$  is principle.  $\lrcorner$

*Proof:* This is because the Euclid division holds in  $\mathbb{H}$ .  $\square$

**Prop. (19.6.5.14) [Unique Factorization of Primitive Hurwitz Quaternions].** A **primitive Hurwitz integer** is a Hurwitz integer  $Q \in \mathbb{H}$  that is not divisible by a rational  $n \in \mathbb{Z}_{\geq 2}$ . Then for any primitive integer  $Q \in \mathbb{H}$  and a prime factorization  $\text{Nm}(Q) = p_1 \dots p_k$  where  $p_i \in \text{Prime}$ , up to units there is a unique decomposition

$$Q = P_1 \dots P_k, \quad \text{Nm}(P_i) = p_i.$$

$\lrcorner$

*Proof:* By (19.6.5.13), the ideal  $p_1 H + QH$  is a principle ideal  $P_1 H$ . Then  $\text{Nm}(P_1) \mid \text{Nm}(p_1) = p_1^2$ . So  $\text{Nm}(P_1) = 1, p_1$  or  $p_1^2$ . But it cannot be 1 because any element  $p_1 a + Qb$  has norm  $p_1^2 \text{Nm}(a) + p_1 \dots p_k \text{Nm}(b) + (2p_1 a, Qb)$  which divides  $p_1$ . But it can be  $p_1^2$  neither, because if this is the case, then  $p_1 = P_1 U$  where  $U$  is a unit, so  $p_1 \mid U$ , contradicting the fact  $U$  is primitive.

So we get  $P_1$ . Now by induction, we get  $P_2, \dots, P_k$ .  $\square$

**Prop. (19.6.5.15) [Factorization of Lipschitz Integers].** Any factorization of a Lipschitz integer into Hurwitz integers is equivalent up to units to a factorization into Lipschitz integers.  $\lrcorner$

*Proof:* In fact, by the coset decomposition as in (19.6.5.12), any such factorization can be made to a factorization into Lipschitz integers just by multiplying by  $\omega$ .  $\square$

## 6 Applications to Arithmetic Groups

### 7 Without Eichler Condition

## 19.7 Cohomology of Arithmetic Fields

References are [Neu15, Mil20], [Cohomology of Number Fields, Neukirch], <http://www.math.columbia.edu/~chaoli/docs/ClassFieldTheory.html#sec28> and [Arithmetic Duality Theory, Milne].

**Notation (19.7.0.1).**

- Use notations on profinite groups defined in [Profinite Groups](#).
- Use notations on cohomologies on profinite groups defined in [Cohomology of Profinite Groups](#).
- Use notations on number fields defined in [Global Fields](#).

┘

### 1 Abstract Class Field Theory

**Def. (19.7.1.1) [Class Formations].** A **profinite formation** consists of a profinite group  $G \in \text{ProfGrp}$  regarded as a Galois group of a field  $\text{Gal}_K$  and  $A \in T_G$ . It is called a **field formation** iff for any normal extension  $L/K$ ,  $H^1(L/K, A^L) = 0$ .

For a field extension, by (9.8.1.14),  $\text{inf}$  is an injection on  $H^2$ . We denote  $H^2(K)$  as the profinite cohomology group  $H^2(G, A) = \text{Br}(K)$ . Inflation should be thought of as inclusions.

It is called a **class formation** if moreover for every normal extension  $L/K$ , there is an canonical isomorphism

$$\text{inv}_{L/K} : H^2(L/K) \rightarrow \frac{1}{[L : K]} \mathbb{Z}/\mathbb{Z}$$

that is compatible with inflation and restriction in the sense that:

- If  $N/L/K$  with  $N/K$  and  $L/K$  normal, then  $\text{inv}_{L/K} = \text{inv}_{N/K}|_{H^2(L/K)}$  via inflation.
- If  $N/L/K$  with  $N/L$  and  $N/K$  normal, then  $\text{inv}_{N/L} \circ \text{res}_L = [L : K] \cdot \text{inv}_{N/K}$ .

$\text{inv}_{L/K}^{-1}(\frac{1}{[L:K]} + \mathbb{Z}) \in H^2(L/K)$  is called the **fundamental class**  $u_{L/K}$ .

┘

**Prop. (19.7.1.2).**  $\text{inv}$  also commutes with  $\text{cor}$  and conjugation:

$$\text{inv}_{N/K}(\text{cor}_K c) = \text{inv}_{N/L} c, \quad \text{inv}_{\sigma N/\sigma K}(\sigma^* c) = \text{inv}(c).$$

The first is because  $\text{inv}$  commutes with  $\text{res}$  thus  $\text{res}$  is surjective, thus there is a  $c'$  that  $c = \text{res } c'$ . Because of  $\text{cor } \text{res} = [L : k]$ , we have  $\text{cor}_K(c) = c'^{[L:K]}$ . Thus  $\text{inv}_{N/K}(\text{cor}_K c) = [L : K] \text{inv}_{N/K}(c') = \text{inv}_{N/L}(\text{res}_L c') = \text{inv}_{N/L}(c)$ .

For the conjugation, Cf. [Neu15]P69?

┘

**Cor. (19.7.1.3).** From this we easily get that

$$u_{L/K} = (u_{N/K})^{[N:L]}, \quad \text{res}_L(u_{N/K}) = u_{L/K}$$

$$\text{cor}_K(u_{N/L}) = (u_{N/K})^{[L:K]}, \quad \sigma^*(u_{N/K}) = u_{\sigma N/\sigma K}.$$

┘

**Prop. (19.7.1.4) [Class Formation Main Theorem].** Tate's theorem (9.8.1.25) tells us for a class formation, for  $L/K$  normal extension, there is a **Nakayama isomorphism**

$$\theta_{L/K} = u_{L/K} \cup - : H^q(\text{Gal}(L/K), \mathbb{Z}) \cong H^{q+2}(L/K).$$

Especially, for  $q = -2$ , there is a canonical isomorphism  $\text{Gal}^{\text{ab}}(L/K) \cong A_K / \text{Nm}_{L/K} \mathbf{A}_L$ . Its inverse is called the **Artin reciprocity isomorphism** and induces a **norm residue symbol** map  $(-, L/K)$

$$1 \rightarrow \text{Nm}_{L/K} A_L \rightarrow A_K \xrightarrow{(-, L/K)} \text{Gal}^{\text{ab}}(L/K) \rightarrow 1.$$

This norm residue symbols induce an **Artin map**

$$\text{Art}_K = (-, K) : A_K \rightarrow \text{Gal}_K^{\text{ab}} = \varprojlim_{L/K} \text{Gal}^{\text{ab}}(L/K)$$

that has dense image. ┘

**Lemma (19.7.1.5).** Let  $L/K$  be a normal extension,  $a \in A_K$  and  $\chi \in \text{Gal}^{\text{ab}}(L/K)^\vee = H^1(G(L/K), \mathbb{Q}/\mathbb{Z})$  is a character, then

$$\chi((a, L/K)) = \text{inv}_{L/K}(a \smile \delta\chi) \in \frac{1}{[L : K]} \mathbb{Z}/\mathbb{Z}.$$

┘

*Proof:* Cf.[Neukirch CFT P71]. □

**Prop. (19.7.1.6) [Properties of Norm Residue Symbols].** For formal field extensions  $N/L/K$  with  $N/K$  normal, there are commutative diagrams:

$$\begin{array}{ccccc} A_K & \xrightarrow{(-, N/K)} & \text{Gal}(N/K)^{\text{ab}} & & A_K & \xrightarrow{(-, N/K)} & \text{Gal}(N/K)^{\text{ab}} & & A_L & \xrightarrow{(-, N/L)} & \text{Gal}(N/L)^{\text{ab}} \\ \downarrow \text{id} & & \downarrow \text{pr} & & \downarrow \text{Nm}_{L/K} & & \downarrow i & & \downarrow \sigma & & \downarrow \sigma^* \\ A_K & \xrightarrow{(-, L/K)} & \text{Gal}(L/K)^{\text{ab}} & & A_L & \xrightarrow{(-, N/L)} & \text{Gal}(N/L)^{\text{ab}} & & A_{\sigma L} & \xrightarrow{(-, \sigma N / \sigma L)} & \text{Gal}(\sigma N / \sigma L)^{\text{ab}} \end{array}$$

Where Ver is the transfer map defined in?? ┘

*Proof:* Cf.[Neukirch CFT P72]. ? □

**Remark (19.7.1.7) [Non-Abelian Problems].** For a finite normal extension  $L/K$ ,  $\text{Nm}_{L/K} A_L = \text{Nm}_{L^{\text{ab}}/K} A_{L^{\text{ab}}}$ . This is because the quotient both correspond to  $\text{Gal}(L/K)^{\text{ab}}$ . So class field theory doesn't tell about non-Abelian extension. ┘

**Prop. (19.7.1.8) [Norm Groups and Abelian Extension].** The map  $L \mapsto \mathcal{N}_{L/K} = \text{Nm}_{L/K} A_L$  defines a inclusion reversing isomorphism between the lattice of Abelian extension  $L$  of  $K$  and the lattice of norm groups of  $A_K$ , i.e.:

$$\mathcal{N}_{L_1 L_2 / K} = \mathcal{N}_{L_1 / K} \cap \mathcal{N}_{L_2 / K}, \quad \mathcal{N}_{L_1 \cap L_2 / K} = \mathcal{N}_{L_1 / K} \cdot \mathcal{N}_{L_2 / K}.$$

And any group that contains a norm group is a norm group. ┘

*Proof:* By the first commutative diagram of inv, if  $(a, L_i/K) = 0$ , then  $(a, L_1 L_2 / K)$  is trivial on  $\text{Gal}(L_i/K)$ , thus trivial on  $\text{Gal}(L_1 L_2 / K)$ , thus  $a \in \mathcal{N}_{L_1 L_2}$ . so  $\mathcal{N}_{L_1} \cap \mathcal{N}_{L_2} \subset \mathcal{N}_{L_1 L_2}$ , the other side is easy. the second is because  $|\mathcal{N}_{L_1 \cap L_2} / \mathcal{N}_{L_1}| = |G_{L_1 / L_1 \cap L_2}| = |G_{L_1 L_2 / L_2}| = |I_{L_1} I_{L_2} / I_{L_1}|$ . Also we deduce  $I_{L_1} \subset I_{L_2} \iff L_2 \subset L_1$ , thus by canonical isomorphism, groups containing  $\mathcal{N}_{L/K}$  are in bijection with middle fields of  $L/K$  by counting numbers. □

**Remark (19.7.1.9).** This shows the philosophy of CFT, i.e. the property of Abelian extensions of a field is can be read from its multiplicative group structure. Of course, determining and characterizing these norm groups requires some work. ┘

### Abstract Weil Groups

References are [A-T09] and [Tat79].

**Def. (19.7.1.10)** [Abstract Weil Groups]. ┘

**Def. (19.7.1.11)** [Essentially Inner Automorphisms]. ┘

## 2 Local Class Field Theory

**Notation (19.7.2.1).**

- Let  $p \in \text{Prime}$ ,
  - Let  $(K, \mathcal{O}_K, \mathfrak{p}_K, \varpi_K) \in p\text{-LField}$ ,
  - Let  $L/K$  be a finite separable extension.
- ┘

### Unramified Extensions

**Lemma (19.7.2.2).** If  $L/K$  is unramified, then  $H^q(\text{Gal}(L/K), \mathcal{O}_L^*) = 0$  for all  $q \in \mathbb{Z}$ . ┘

*Proof:* Cf. [Neukirch P83]. □

**Prop. (19.7.2.3)** [Unramified Class Formations]. The unramified extensions of  $K$  form a class formation. ┘

*Proof:* We first define the inv map: use the exact sequence  $1 \rightarrow \mathcal{O}_L^* \rightarrow L^\times \xrightarrow{v_L} \mathbb{Z} \rightarrow 0$ , using the lemma (19.7.2.2), we have an isomorphism

$$H^2(\text{Gal}(L/K), L^\times) \xrightarrow{v_L} H^2(\text{Gal}(L/K), \mathbb{Z}) \xrightarrow{\delta^{-1}} H^1(\text{Gal}(L/K), \mathbb{Q}/\mathbb{Z}) = \text{Gal}(L/K)^\vee.$$

And there is an isomorphism

$$\varphi : \text{Gal}(L/K)^\vee \cong \frac{1}{[L; K]} \mathbb{Z}/\mathbb{Z}, \quad \varphi(\chi) = \chi(\sigma_{L/K})$$

where  $\sigma_{L/K}$  is the geometric Frobenius which generates  $\text{Gal}(L/K)$ . Then define

$$\text{inv}_{L/K} = \varphi \circ \delta^{-1} \circ v_L : H^2(\text{Gal}(L/K), L^\times) \cong \frac{1}{[L : K]} \mathbb{Z}/\mathbb{Z}$$

To verify this is a class formation, we should verify (19.7.1.1), Cf. [Neukirch P85] ?. □

**Prop. (19.7.2.4)** [Local Norm Symbol is given by Geometric Frobenius]. If  $L/K$  is unramified, then  $(a, L/K) = \sigma_{L/K}^{v_K(a)}$ . The same holds for  $L$  replaces by  $K^{\text{ur}}$ , in which case

$$1 \rightarrow \mathcal{O}_K^* \rightarrow K^\times \rightarrow \text{Gal}(K^{\text{ur}}/K) \rightarrow 0$$

is exact. ┘

*Proof:* We use (19.7.1.5). For any  $\chi$ ,

$$\chi(a, L/K) = \text{inv}_{L/K}(\bar{a} \cup \delta \chi) = \varphi \circ \delta^{-1} \circ v_K(\bar{A} \cup \delta \chi) = \varphi(\delta^{-1}(v_K(a) \delta \chi)) = \varphi(v_K(a) \chi) = v_K(a) \chi(\sigma_{L/K}) = \chi(\sigma_{L/K}^{v_K(a)}),$$

The second assertion follows from the last prop (19.7.2.21). □

### Ramified Extensions

**Lemma (19.7.2.5).** If  $L/K$  is normal, then  $\#H^2(L/K) \mid [L : K]$ . ┘

*Proof:* Cf.[Neukirch CFT P89]. Should use the fact that  $G_{L/K}$  is solvable and Herbrand quotient. □

**Lemma (19.7.2.6) [Invariant Maps].** If  $L/K$  is normal and  $L'/K$  is another unramified extension of the same degree, then  $H^2(L/K) = H^2(L'/K) \subset \text{Br}(K)$ . In particular, we can define an invariant map  $\text{inv} : \text{Br}(K) \rightarrow \mathbb{Q}/\mathbb{Z}$ . ┘

*Proof:* In view of (19.7.2.5) and (19.7.2.3), we only need to prove  $H^2(L'/K) \subset H^2(L/K)$ . For this, we let  $N = LL'$ , then there is an exact sequence (9.8.1.14)

$$1 \rightarrow H^2(L/K) \rightarrow H^2(N/K) \xrightarrow{\text{res}_L} H^2(N/L)$$

then we only need to prove  $\text{res}_L(c) = 0$ , and this follows from  $\text{inv}_{N/L}(\text{res}_L c) = 0$ . This will follow, if we have

$$\text{inv}_{N/L}(\text{res}_L c) = [L : K] \cdot \text{inv}_{L'/K} c.$$

This follows from (19.7.2.7). □

**Lemma (19.7.2.7).** For two subextensions  $L/K, L'/K$  in  $M/L$  normal with  $L'/K$  unramified extension,  $N = LL'$ , for  $c \in H^2(L'/K)$ ,

$$\text{inv}_{N/L}(\text{res}_L c) = [L : K] \cdot \text{inv}_{L'/K} c.$$

┘

*Proof:* Cf.[Neukirch CFT P90]. □

**Lemma (19.7.2.8).**  $(\text{Gal}_K, (K^{\text{sep}})^{\times}, \text{inv}_K)$  forms a class formation. ┘

*Proof:* This almost follows from that of unramified extensions (19.7.2.3). We verify axioms (19.7.1.1) that  $\text{inf}$  is natural and commutes with  $\text{res}$ . It is natural because it is natural on unramified extensions, it commutes with  $\text{res}$  because we can assume  $c \in H^2(L'/K)$  unramified and use (19.7.2.7). □

**Cor. (19.7.2.9) [Local Artin's Reciprocity Law].** If  $L/K$  is normal, then the homomorphism

$$u_{L/K} \cup - : H^q(\text{Gal}(L/K), \mathbb{Z}) \cong H^{q+2}(L/K)$$

is an isomorphism. ┘

**Cor. (19.7.2.10).**  $H^3(L/K) = 1, H^4(L/K) = \text{Gal}^{\text{ab}}(L/K)^{\vee}$ , by (9.8.1.7). ┘

**Thm. (19.7.2.11) [Artin's Reciprocity Law].** By (19.7.1.4), cup product with the fundamental class in  $H^2(L/F)$  defines an isomorphism

$$\theta_{L/K} : \text{Gal}^{\text{ab}}(L/K) \cong H^{-2}(\text{Gal}(L/K), \mathbb{Z}) \rightarrow H^0(L/K) = K^{\times} / \text{Nm}_{L/K} L^{\times},$$

called the **Nakayama map**. And the reverse map is called the **norm residue symbol**  $(-, L/K)$

$$1 \rightarrow \text{Nm}_{L/K} L^{\times} \rightarrow K^{\times} \xrightarrow{(-, L/K)} \text{Gal}^{\text{ab}}(L/K) \rightarrow 1.$$

This norm residue symbols induce an **Artin map**

$$\text{Art}_K = (-, K) : K^{\times} \rightarrow \text{Gal}_K^{\text{ab}}$$

with dense image. ┘

**Cor. (19.7.2.12).** By (19.7.1.6), there are commutative diagrams

$$\begin{array}{ccccc}
 K^\times & \xrightarrow{(-, N/K)} & \text{Gal}(N/K)^{\text{ab}} & & L^\times & \xrightarrow{(-, N/L)} & \text{Gal}(N/L)^{\text{ab}} \\
 \downarrow \text{id} & & \downarrow \text{pr} & \text{Nm}_{L/K} \updownarrow i & \downarrow \sigma & & \downarrow \sigma^* \\
 K^\times & \xrightarrow{(-, L/K)} & \text{Gal}(L/K)^{\text{ab}} & & \sigma L^\times & \xrightarrow{(-, \sigma N/\sigma L)} & \text{Gal}(\sigma N/\sigma L)^{\text{ab}}
 \end{array}$$

Where Ver is the transfer map defined in (3.1.9.6).  $\lrcorner$

**Cor. (19.7.2.13)[Geometric Frobenius].** By (19.7.2.4),  $(\varpi_K, K)$  is the image of an element  $\sigma_K \in \text{Gal}_K$  which is a lift of  $\text{Frob}_K^{-1}$ , i.e. a **geometric Frobenius element**, which is unique up to  $I_K$ .  $\lrcorner$

**Cor. (19.7.2.14)[Quadratic Character].** If  $L/K$  is a quadratic extension, then  $\mathcal{N}_{L/K}$  is a subgroup of  $K^\times$  of order 2. Let  $\chi$  be the non-trivial character of  $K^\times$  that is trivial on  $\mathcal{N}_{L/K}$ , called the **quadratic character** of  $K^\times$  attached to  $L/K$ .  $\lrcorner$

**Prop. (19.7.2.15)[Higher Ramification Groups].** If  $L/K$  is Abelian, the higher principal units  $U_K^n$  are mapped under the higher ramification groups of  $\text{Gal}(L/K)$  under the upper numbering. **?**  $\lrcorner$

*Proof:*  $\square$

**Def. (19.7.2.16)[Conductors].** If  $L/K$  is Abelian, define the **conductor(local Abelian extension)**  $f_{L/K} \in \mathbb{Z}_+$  to be the smallest  $n \in \mathbb{Z}_+$  s.t.  $U_K^n \subset \mathcal{N}_{L/K}$ .  $\lrcorner$

**Cor. (19.7.2.17).** For an Abelian extension  $L/K$ ,  $f_{L/K} = 1$  iff  $L/K$  is unramified, by (19.7.2.21).  $\lrcorner$

### Characterize the Norm Groups of $K^\times$

**Prop. (19.7.2.18)[Norm Group and Abelian Extension].** The map  $L \mapsto \mathcal{N}_{L/K}$  defines an inclusion reversing isomorphism between the lattice of Abelian extension  $L$  of  $K$  and the lattice of norm groups of  $K^\times$ , i.e.:

$$\mathcal{N}_{L_1 L_2/K} = \mathcal{N}_{L_1/K} \cap \mathcal{N}_{L_2/K}, \quad \mathcal{N}_{L_1 \cap L_2/K} = \mathcal{N}_{L_1/K} \cdot \mathcal{N}_{L_2/K}.$$

And any group that contains a norm group is a norm group.  $\lrcorner$

*Proof:* This follows from (19.7.1.8) and (19.7.2.8).  $\square$

**Prop. (19.7.2.19).** The norm groups are precisely the open(closed) subgroups of finite index in  $K^\times$ . In fact finite index are itself open because it contains  $(K^\times)^n$  which is open.  $\lrcorner$

*Proof:* One part follows from (19.7.2.18) and the fact that  $(K^\times)^m$  is open (19.1.5.14). For the converse, we only need to prove  $(K^\times)^m$  is a norm group. This uses Kummer theory and Cf.[Neukirch CFT P96].  $\square$

**Prop. (19.7.2.20)[Norm Groups of Local Fields].** The norm groups of  $K^\times$  are exactly the groups containing  $U_K^n \times (\varpi_K^f)$  for some  $n, f$ .  $\lrcorner$

*Proof:*  $U_K^n \times (\varpi_K^f)$  is a norm group because it is closed of finite index. Conversely, any norm group contains some  $U_K^n$  because it is open and contains some  $(\varpi_K^f)$  because it is of finite index.  $\square$

**Cor. (19.7.2.21)[Norm Group of Unramified Extensions].** The norm group of an unramified extension of degree  $f$  is

$$\mathcal{O}_K^* \times (\varpi_K^f)^{\mathbb{Z}}.$$

In particular,  $L/K$  is unramified iff  $\mathcal{O}_K^* \subset \mathcal{N}_{L/K}$ .  $\lrcorner$

*Proof:* This follows from (19.7.2.4) and (19.7.2.18).  $\square$

### Local Weil Groups

**Prop. (19.7.2.22)** [Local Weil Group, Weil[Wei51]]. The Weil group defined in (19.7.1.10) is a topological group that fits into the exact sequence

$$1 \rightarrow I_K \rightarrow W_K \rightarrow \mathbb{Z} \rightarrow 0.$$

And the relative Weil group  $W_{L/K}$  a topological group that fits into the exact sequence

$$1 \rightarrow \text{Gal}(\bar{L}/K^{\text{ur}}) \rightarrow W_{L/K} \rightarrow \mathbb{Z} \rightarrow 0.$$

In particular, there is a natural isomorphism

$$W_K \cong \varprojlim_{L/K} W_{L/K}.$$

┘

*Proof:*

□

**Prop. (19.7.2.23).**  $W_L = \text{Gal}_L \cap W_K$ .

┘

*Proof:* The group  $W_K \cap \text{Gal}_L \subset \text{Gal}_K$  consists of elements that fixes  $L$  and induces a residual morphism  $\varphi_\kappa^n$  for some  $n \in \mathbb{Z}$ . Thus  $[\kappa_L : \kappa] | n$ , and it induces a residual morphism  $\varphi_{\kappa_L/\kappa}^{n/[\kappa_L:\kappa_K]}$ , which means that is in  $W_L$ . □

**Prop. (19.7.2.24)** [Artin Maps and Weil Groups]. The Artin map  $\text{Art}_K : K^\times \rightarrow \text{Gal}_K^{\text{ab}}$  is injective because  $(K^\times)^n$  are all norm groups by (19.7.2.19), so the kernel is contained in their intersection with 1 by (19.1.5.14). Its image is just  $W_K^{\text{ab}}$ . ┘

*Proof:*

□

**Def. (19.7.2.25)** [Norm on Weil Groups]. The Artin map (19.7.2.24) gives a norm  $|x| = |\text{Art}^{-1}(x)|$  on  $W_K^{\text{ab}}$ , which maps a lift of the geometric Frobenius in  $\text{Gal}_\kappa$  to  $q^{-1}$ . ┘

### Totally Ramified Extensions

References are [L-T65].

**Notation (19.7.2.26).**

- Use notations defined in Lubin-Tate Formal Group Law.

┘

**Prop. (19.7.2.27)** [Tate Modules]. There is an isomorphism of  $\mathcal{O}$ -modules  $\Lambda_{f,n} \cong \mathcal{O}_K/(\varpi^n)$ , Cf.[Neukirch CFT P101]. Thus the automorphism of  $\Lambda_{f,n}$  is all of the form  $u_f$  for units, isomorphic to  $U_K/U_K^n$ .

So we can define a **Tate module**  $TG = \varprojlim \ker[\varpi_K^n]$ , it is a free  $\mathcal{O}_K$ -module of rank 1. ┘

**Def. (19.7.2.28)** [Lubin-Tate Character]. As  $TG$  is a free  $\mathcal{O}_G$ -module of dimension 1, and  $\text{Gal}_K$  acts on  $TG$ , there can be attached a **Lubin-Tate character**  $\chi_K : \text{Gal}_K \rightarrow \mathcal{O}_K^*$  by  $g(\alpha) = [\chi_K(g)](\alpha)$ , this depends on  $\pi_K$ , but its restriction on  $I_K$  doesn't depend on  $\pi_K$ , and is just the local CFT isomorphism composed with  $x \rightarrow x^{-1}$ . ┘

*Proof:*  $[\chi_K(g)]$  is, by definition, the morphism that is  $\text{id}$  on  $K^{\text{ur}}$  and  $g$  on  $L_\pi$ . So it equals  $g$  on all  $K^{\text{ab}}$  iff  $g$  is  $\text{id}$  on  $K^{\text{ur}}$ , that is,  $g \in I_K$ . So if  $g \in I_K$ , by local CFT,  $(\chi(g))^{-1}$  corresponds to  $g$ , uniquely.  $\square$

**Prop. (19.7.2.29).**  $G_{\pi,n} \cong \mathcal{O}_K^*/U_K^n$ , thus we have  $G_\pi \cong \mathcal{O}_K^*$ .  $L_{\pi,n}/K$  (10.7.3.28) is Abelian totally ramified of degree  $p^{n-1}(p-1)$  generated by a Eisenstein polynomial with constant coefficient  $\varpi$ . In particular,  $\varpi$  is in the norm group.  $\lrcorner$

*Proof:* For this, first note Galois action induce an isomorphism on  $\Lambda_{f,n}$ , thus correspond to an element of  $U_K/U_K^n$  by (19.7.2.27), this is an injection because  $\Lambda_{f,n}$  generate  $L_{\pi,n}$ . Then we use the canonical polynomial  $f(Z) = \pi Z + Z^q$ ,  $f^n = f^{n-1}\varphi(n)$ , where  $\varphi(n)$  is a Eisenstein polynomial, thus  $L_{\pi,n}/K$  is totally ramifies with  $|G_{\pi,n}| = q^{n-1}(q-1) = |U_K/U_K^n|$ , thus the result.  $\square$

**Prop. (19.7.2.30)[Explicit Local Norm Residue Symbol].** Now we can write the universal residue symbol little bit more explicitly. For  $a = u\varpi^m$ ,  $(a, K)$  acts as  $\varphi^m$  on  $K^{\text{ur}}$ , and on  $L_{\pi,n}$ , its action is generated by the action  $(u^{-1})_f$  on the generating set  $\Lambda_{f,n}$ .

Thus the norm group of  $L_{\pi,n}$  is just  $U_K^n$  by (19.7.2.29).  $\lrcorner$

*Proof:* Cf. [Neukirch CFT P106].  $\square$

**Cor. (19.7.2.31)[Norm Groups of Totally Ramified Extensions].** The norm groups of the totally ramified Abelian extension are precisely the groups that contains some  $U_K^n \times \varpi^{\mathbb{Z}}$  for some uniformizer  $\pi$ . And every totally ramified Abelian extension  $L/K$  is contained in some  $L_{\varpi,n}$ .  $\lrcorner$

*Proof:* For any totally ramified extension, choose a uniformizer, then its norm is a uniformizer  $\varpi$  of  $K$ . And  $\text{Nm}_{L/K}$  is open, thus it contains some  $U^n$ . The rest follows from local CFT (19.7.2.18).  $\square$

**Cor. (19.7.2.32)[Maximal Abelian Extension of  $p$ -adic Local Fields].** Let  $L_\pi = \cup L_{\pi,n} = K(\Lambda_f)$ , where  $\Lambda_f = \cup \Lambda_{f,n}$ , then  $T \cdot L_\pi$  is the maximal Abelian extension of  $K$ . Hence  $G_K^{\text{ab}} = G_{T,K} \times G_\pi$ .  $\lrcorner$

*Proof:* This follows immediately from (19.7.2.20).  $\square$

**Cor. (19.7.2.33)[Hasse-Arf].** We can prove Hasse-Arf in the case where  $K$  is a local field. This is because we already know the maximal Abelian extension, and  $\text{Gal}(K^{\text{ab}}/T) \cong \text{Gal}(L_\pi/K) \cong \mathbb{Z}_p$  for which we know the Galois action well (19.7.2.27)(19.7.2.29), so  $i(\sigma) = v(\sigma(\alpha_n) - \alpha_n) = v([\sigma - 1](\alpha))$ , which jumps at  $U_K^n$  (the same pattern as  $K = \mathbb{Q}_p$  (19.1.4.30)), thus the result.  $\lrcorner$

**Example (19.7.2.34)[Cyclotomic Fields].** When  $K = \mathbb{Q}_p$ , we can choose  $f(T) = (1+T)^p - 1$ , thus  $L_{\varpi,n}$  is just  $\mathbb{Q}_p(\zeta_{p^n})$ . And we have  $r_f = (1+T)^r - 1$ , thus we have

$$(a, \mathbb{Q}_p(\zeta_{p^n})/\mathbb{Q}_p)(\zeta_{p^n}) = \zeta_{p^n}^r$$

where  $a = up^m$ , and  $r \equiv u^{-1} \pmod{p^n}$ .  $\lrcorner$

### 3 Global Class Field Theory

**Notation (19.7.3.1).**

- Let  $L/F \in \text{GField}$ .

$\lrcorner$

**Prop. (19.7.3.2).** Let  $\mathfrak{P}$  be a prime of  $L$  lying over  $\mathfrak{p}$ , then  $H^q(G, I_L^{\mathfrak{p}}) \cong H^q(G_{\mathfrak{P}}, L_{\mathfrak{P}}^*)$ . If  $\mathfrak{p}$  is a finite unramified prime of  $L$ , then  $H^q(G, U_L^{\mathfrak{p}}) = 1$  for all  $q$ .  $\lrcorner$

*Proof:* Notice  $I_L^{\mathfrak{p}} = \prod_{\sigma \in G/G_{\mathfrak{P}}} L_{\sigma\mathfrak{P}}^* = \prod_{\sigma \in G/G_{\mathfrak{P}}} \sigma L_{\mathfrak{P}}^*$  is an induced module, so by (9.8.2.8), we have  $H^q(G_{\mathfrak{P}}, L_{\mathfrak{P}}^*)$ , and similarly for  $U_{\mathfrak{p}}$ , which vanish by (19.7.2.2).  $\square$

**Cor. (19.7.3.3) [Cohomology of Ideles].**

$$H^q(G, \mathbf{I}_L^S) = \bigoplus_{p \in S} H^q(G_{\mathfrak{P}/\mathfrak{p}}, L_{\mathfrak{P}}^*), \quad H^q(G, \mathbf{I}_L) = \bigoplus_p H^q(G_{\mathfrak{P}}, L_{\mathfrak{P}}^*).$$

And the isomorphism is natural, by restriction to components.  $\lrcorner$

*Proof:* For this, just notice  $\mathbf{I}_L = \cup_S \mathbf{I}_L^S$ , then use the last proposition, notice group cohomology commutes with colimits (9.8.2.3).  $\square$

**Cor. (19.7.3.4).**  $H^1(G, \mathbf{I}_L) = H^3(G, \mathbf{I}_L) = 0$ , by (19.7.2.10).  $\lrcorner$

**Cor. (19.7.3.5).** An idele  $\mathbf{a} \in \mathbf{I}_F$  is the norm of an idele  $\mathbf{b}$  in  $\mathbf{I}_L$  if each component  $\mathbf{a}_{\mathfrak{p}}$  is the norm of an element  $b_{\mathfrak{p}} \in L_{\mathfrak{P}}^*$ .  $\lrcorner$

**Prop. (19.7.3.6).** The decomposition commutes with inf, res and cor. Cf. [Neukirch CFT P125].  $\lrcorner$

### Cyclic Class Formations

**Lemma (19.7.3.7).** For a cyclic extension  $L/F$  of order  $p$ ,  $\mathbf{C}_L$  is a Herbrand module with Herbrand quotient  $h(\mathbf{C}_L) = p$ .  $\lrcorner$

*Proof:*  $\square$

**Prop. (19.7.3.8) [First Fundamental Inequality].**  $[\mathbf{C}_F : \text{Nm}_{L/F} \mathbf{C}_L] \geq p$   $\lrcorner$

*Proof:*  $\square$

**Prop. (19.7.3.9) [Second Fundamental Inequality, Chevalley [Che40]].** If  $\mathbb{Q}(\zeta_p) \subset F$  and  $L/F$  is a cyclic extension of order  $p$ , then  $[\mathbf{C}_F : \text{Nm}_{L/F} \mathbf{C}_L] \leq p$ .  $\lrcorner$

*Proof:*  $\square$

**Cor. (19.7.3.10).** If  $L/F$  is a cyclic extension of order  $p \in \text{Prime}$ , then  $[\mathbf{C}_F : \text{Nm}_{L/F} \mathbf{C}_L] = p$ .  $\lrcorner$

*Proof:*  $\square$

**Cor. (19.7.3.11) [Hasse Principle for Norms for Cyclic Extensions].** If  $L/F$  is a cyclic extension and  $a \in F^\times$ , then  $a \in \text{Nm}_{L/F} L^\times$  iff  $a \in \text{Nm}_{L/F}(\mathbf{I}_L)$ .  $\lrcorner$

*Proof:* Use the long exact sequence for  $1 \rightarrow L^\times \rightarrow \mathbf{I}_L \rightarrow \mathbf{C}_L \rightarrow 1$ , we see that  $H^0(G, L^\times) \rightarrow H^0(G, \mathbf{I}_L)$  is an injection, which is

$$F^\times / \text{Nm}_{L/F} L^\times \hookrightarrow \bigoplus_p F_{\mathfrak{p}}^\times / \text{Nm}_{L_{\mathfrak{P}}/F_{\mathfrak{p}}} L_{\mathfrak{P}}^\times.$$

In fact, by (19.7.3.4), we say that this is equivalent to  $H^1(\text{Gal}(L/K), \mathbf{C}_L) = 1$ , which is equivalent to second fundamental inequality.  $\square$

**Remark (19.7.3.12).** WARNING: the Hasse norm principle is not true for non-cyclic Galois extensions, for examples  $\mathbb{Q}(\sqrt{13}, \sqrt{17})/\mathbb{Q}$ .  $\lrcorner$

**Prop. (19.7.3.13).** If  $L/F$  is cyclic, then there is an exact sequence

$$1 \rightarrow H^2(\text{Gal}(L/F), L^\times) \rightarrow H^2(\text{Gal}(L/F), \mathbf{I}_L) \xrightarrow{\text{inv}_{L/F}} \frac{1}{[L:F]} \mathbb{Z}/\mathbb{Z} \rightarrow 0.$$

 $\lrcorner$ 

*Proof:* Cf.[Neukirch]P143.  $\square$

### General Class Formations

**Prop. (19.7.3.14).** For  $L/F$  normal,  $\#H^2(G, \mathbf{C}_L) | [L:F]$ .  $\lrcorner$

*Proof:* Cf.[Neukirch P137].  $\square$

**Prop. (19.7.3.15)** [Reduction to Cyclic cases].

$$\text{Br}(F) = \bigcup_{L/F \text{ cyclic}} H^2(\text{Gal}(L/F), L^\times), \quad H^2(\text{Gal}_K, \mathbf{I}_{\bar{K}}) = \bigcup_{L/K \text{ cyclic}} H^2(\text{Gal}(L/K), \mathbf{I}_L).$$

 $\lrcorner$ 

*Proof:* Cf.[Neukirch P127].  $\square$

**Def. (19.7.3.16)** [Invariant Maps]. For  $c = (c_p) \in H^2(\text{Gal}(L/K), \mathbf{I}_L)$ , define the **invariant map**

$$\text{inv}_{L/K} c = \sum_{\mathfrak{p}} \text{inv}_{L_{\mathfrak{p}}/K_{\mathfrak{p}}} c_{\mathfrak{p}} \text{ (19.7.2.8)}.$$

 $\lrcorner$ 

**Prop. (19.7.3.17).** If  $c \in H^2(\text{Gal}(L/F), L^\times)$ , then  $\text{inv}_{L/F} c = 0$ .  $\lrcorner$

*Proof:* Cf.[Neukirch P141].  $\square$

**Cor. (19.7.3.18).** Now we can define the inv map for  $H^2(\text{Gal}(L/K), \mathbf{C}_L)$ . From the exact sequence  $1 \rightarrow L^\times \rightarrow \mathbf{I}_L \rightarrow \mathbf{C}_L \rightarrow 1$ , we get an exact sequence:

$$1 \rightarrow H^2(\text{Gal}(L/K), L^\times) \rightarrow H^2(\text{Gal}(L/K), \mathbf{I}_L) \rightarrow H^2(\text{Gal}(L/K), \mathbf{C}_L) \rightarrow H^3(G_{L/K}, L^\times).$$

The last one is 1 if  $L/F$  is cyclic, thus by this proposition, inv is defined for  $H^2(G_{L/K}, \mathbf{C}_L)$ .  $\lrcorner$

**Prop. (19.7.3.19).** The homomorphism

$$\text{inv}_F : H^2(\text{Gal}(\Omega/F), \mathbf{I}_\Omega) \rightarrow \mathbb{Q}/\mathbb{Z}$$

is surjective.  $\lrcorner$

*Proof:* Cf.[Neukirch]P145.  $\square$

**Prop. (19.7.3.20)** [Reduce to Cyclic Case]. If  $L/K$  is normal and  $L'/K$  is cyclic with the same degree, then  $H^2(L'/K) = H^2(L/K) \subset H^2(\bar{K}/K)$ .  $\lrcorner$

*Proof:*

□

**Cor. (19.7.3.21).**  $H^2(\overline{K}/K) = \cup_{L/K \text{ cyclic}} H^2(L/K)$ , thus the homomorphism  $H^2(\text{Gal}_K, I_{\overline{K}}) \rightarrow H^2(\overline{K}/K)$  is surjective by (19.7.3.18).  $\lrcorner$

*Proof:* Why can always find such a cyclic extension?  $\color{red}?$

□

**Cor. (19.7.3.22).** The inv map is defined for  $H^2(\overline{K}/K)$ , and  $\text{inv}_{L/K} : H^2(L/K) \rightarrow \frac{1}{[L:K]} \mathbb{Z}/\mathbb{Z}$  is an isomorphism for every normal extension  $L/K$ .  $\lrcorner$

**Lemma (19.7.3.23) [Main Lemma].** The formation  $(\text{Gal}_F, \mathbf{C}_{F^{\text{sep}}}, \text{inv}_F)$  is a class formation (19.7.1.1).  $\lrcorner$

*Proof:*

□

**Thm. (19.7.3.24) [Artin's Reciprocity Law, Artin1927].** By (19.7.1.4), cup product with fundamental classes  $u_{L/F} \in H^2(L/F)$  define an isomorphism

$$\theta_{L/F} : \text{Gal}^{\text{ab}}(L/F) \cong H^{-2}(\text{Gal}(L/F), \mathbb{Z}) \rightarrow H^0(L/F) = \mathbf{C}_F / \text{Nm}_{L/F} \mathbf{C}_L,$$

called the **Nakayama isomorphism**. And the reverse map is called the **norm residue symbol** map  $(-, L/F)$

$$1 \rightarrow \text{Nm}_{L/F} \mathbf{C}_L \rightarrow \mathbf{C}_F \xrightarrow{(-, L/F)} \text{Gal}^{\text{ab}}(L/F) \rightarrow 1.$$

These norm residue symbols induce an **Artin map**

$$\text{Art}_F = (-, F) : \mathbf{C}_F \rightarrow \text{Gal}_F^{\text{ab}}$$

□

**Thm. (19.7.3.25) [Local-Global Compatibility].** For  $L/F$  Abelian and  $\mathfrak{a} \in \mathbf{I}_F$ :

$$(\mathfrak{a}, L/F) = \prod_{\mathfrak{p}} (a_{\mathfrak{p}}, L_{\mathfrak{p}}/K_{\mathfrak{p}}) \in \text{Gal}^{\text{ab}}(L/F) \text{ (19.7.2.11)}.$$

In particular, if  $v \in \Sigma_F^{\text{fin}}$  is unramified in  $L$ , then

$$([\varpi_{\mathfrak{p}}]_{\mathfrak{p}}, L/F) = \text{Frob}_{L_{\mathfrak{p}}/F_{\mathfrak{p}}} \in \text{Gal}_{L_{\mathfrak{p}}/F_{\mathfrak{p}}} \subset \text{Gal}_F.$$

□

*Proof:* Cf. [Neukirch CFT P154].

□

**Prop. (19.7.3.26).** There are commutative diagrams:

$$\begin{array}{ccccc} \mathbf{C}_F & \xrightarrow{(-, N/F)} & \text{Gal}(N/F)^{\text{ab}} & & \mathbf{C}_F & \xrightarrow{(-, N/F)} & \text{Gal}(N/F)^{\text{ab}} & & \mathbf{C}_L & \xrightarrow{(-, N/L)} & \text{Gal}(N/L)^{\text{ab}} \\ \downarrow \text{id} & & \downarrow \text{pr} & & \uparrow \text{Nm}_{L/F} \begin{array}{c} \uparrow i \\ \downarrow i \end{array} & & \uparrow \text{Ver} & & \downarrow \sigma & & \downarrow \sigma^* \\ \mathbf{C}_F & \xrightarrow{(-, L/F)} & \text{Gal}(L/F)^{\text{ab}} & & \mathbf{C}_L & \xrightarrow{(-, N/L)} & \text{Gal}(N/L)^{\text{ab}} & & \mathbf{C}_{\sigma L} & \xrightarrow{(-, \sigma N / \sigma L)} & \text{Gal}(\sigma N / \sigma L)^{\text{ab}} \end{array}$$

Where Ver is the transfer map defined in??.

□

*Proof:*

□

**Cor. (19.7.3.27).** By (19.7.1.8), the map  $L \mapsto \mathcal{N}_{L/F} = \text{Nm}_{L/F} \mathbf{C}_L$  defines a inclusion reversing isomorphism between the lattice of Abelian extension  $L/K$  and the lattice of norm groups of  $\mathbf{C}_F$ , i.e.:

$$\mathcal{N}_{L_1 L_2/F} = \mathcal{N}_{L_1/F} \cap \mathcal{N}_{L_2/F}, \quad \mathcal{N}_{L_1 \cap L_2/F} = \mathcal{N}_{L_1/F} \cdot \mathcal{N}_{L_2/F}.$$

And any group that contains a norm group is a norm group.

┘

**Prop. (19.7.3.28) [Existence Theorem].** The norm groups of  $\mathbf{C}_F$  are precisely the (open)closed subgroups of finite index.

┘

*Proof:* Cf. [Neukirch P162] or notes taken by Chao Li. ?

□

**Cor. (19.7.3.29) [The Kernel of  $\text{Art}_F$ ].**

- If  $F \in \mathbf{NField}$ , the kernel  $\cap_{L/F} \mathcal{N}_{L/F}$  of  $\text{Art}_F$  is exactly the connected component  $(\mathbf{C}_F)^0$  of  $1 \in \mathbf{C}_F$ , which is the group of divisible elements in  $\mathbf{C}_F$  (19.4.1.19). Moreover,  $\text{Art}_F : \mathbf{C}_F / (\mathbf{C}_F)^0 \rightarrow \text{Gal}_F^{\text{ab}}$  is an isomorphism.
- If  $F \in \mathbf{FField}$ , then  $\text{Art}_F$  is injective but not surjective. In fact, there is an exact sequence (by etale fundamental group)

$$\begin{array}{ccccccc} 0 & \longrightarrow & \mathbf{I}_F^1 / F^\times & \longrightarrow & \mathbf{I}_F / F^\times & \longrightarrow & q^\mathbb{Z} \longrightarrow 0 \\ & & \downarrow \cong & & \downarrow (-, F) & & \downarrow \\ 0 & \longrightarrow & \mathbf{I}_F^{\text{ab}} & \longrightarrow & \text{Gal}_F^{\text{ab}} & \longrightarrow & \text{Gal}_k \cong \widehat{\mathbb{Z}} \longrightarrow 0 \end{array}$$

thus  $\mathbf{C}_F$  can be regarded as the Weil group of  $F$ .

┘

*Proof:* 1: As  $\text{Gal}_F^{\text{ab}}$  is totally disconnected, it must factors through  $D_F$ . But  $\mathbf{C}_F / (\mathbf{C}_F)^0$  is a profinite group, thus  $(\mathbf{C}_F)^0$  is an intersection of open subgroups of finite index, thus it is in the kernel, by (19.7.3.28).

2: The map is injective because by splitting it is a product of  $q^\mathbb{Z}$  and a profinite group, thus the intersection of open subgroups of finite index is trivial (19.7.3.28). To show the diagram is commutative, it suffices to show that  $(x, F)$  acts as  $\text{Frob}_k^{|x|_F}$  on  $\bar{k}$ : This is because on any finite unramified Abelian extension  $L/F$ ,  $(x, F)$  acts via  $\varphi_{L_w/F_v}^{|x_v|_v}$  by definition (19.7.2.4), and these add up to  $|x|_v$  as  $L/F$  is cyclic.

□

## 4 Decomposition Law

**Notation (19.7.4.1).**

- Let  $L/F$  be an Abelian extension of Global fields.

┘

**Prop. (19.7.4.2).**  $\mathcal{N}_{E/K} \cap F_{\mathfrak{p}}^\times = \mathcal{N}_{L_{\mathfrak{p}}/F_{\mathfrak{p}}}.$

┘

*Proof:* For the non-trivial part, notice if  $\mathfrak{a} \in N_{\mathfrak{p}} L_{\mathfrak{p}}^*$  is a norm times a  $a \in K^*$ , then it is a norm at all primes except  $\mathfrak{p}$ , thus it is also norm at  $\mathfrak{p}$  by the multiplicative definition of the inv map (19.7.3.16).

□

**Cor. (19.7.4.3) [Ramifications].** Let  $\mathcal{N} = \text{Nm}_{L/K} \mathbf{C}_L$  be the norm group, then

- $\mathfrak{p}$  is unramified in  $L$  iff  $\mathcal{O}_{F,\mathfrak{p}}^* \subset \mathcal{N}_{L/F}$ .
- $\mathfrak{p}$  splits completely in  $L$  iff  $F_{\mathfrak{p}}^\times \subset \mathcal{N}_{L/F}$ .

┘

*Proof:*

□

**Prop. (19.7.4.4) [Decomposition Law].** Let  $n = [L : F]$  and  $\mathfrak{p} \in \text{Unr}(F)$  and  $\varpi_{\mathfrak{p}}$  is a uniformizer, then if  $f$  is the smallest positive integer s.t.  $[\varpi_{\mathfrak{p}}]_{\mathfrak{p}}^f \in \mathcal{N}_{L/F}$ , then  $\mathfrak{p}$  factors in the extension  $L$  into  $r = n/f$  distinct primes of degree  $f$ .

Notice to determine whether a place is ramified or not, we can use criterion (19.7.4.17). ┘

*Proof:* The degree the extension of  $\mathfrak{p}$  is just the order of the Frobenius automorphism of  $G_{\mathfrak{p}/\mathfrak{p}}$ , which is just the order in  $\text{Gal}(L/F) \cong \mathbf{C}_F / \text{Nm}_{L/F} \mathbf{C}_L$ . The Frobenius of  $\mathfrak{p}$  correspond exactly to  $(\dots, 1, \pi, 1, \dots)$  by (19.7.3.25) and (19.7.2.4), so the result follows. □

**Prop. (19.7.4.5) [Unramified Kummer Extensions are Rare].** Let  $F$  be a global field or the function field of a smooth curve over an alg.closed field  $k$ , and  $S \subset \Sigma_F$  be a finite set of places, and  $m \in \mathbb{Z} \cap F^*$ , then there are only f.m. Kummer extensions over  $F$  that have Galois group of exponent  $m$  and are unramified at all finite places outside  $S$ . ┘

*Proof:* We may add all the  $m$ -th roots of unity to  $F$ . Then by Kummer theory (3.2.8.15), Kummer extensions of exponent  $m$  over  $F$  corresponds to  $F(\sqrt[m]{a})$ , where  $a \in F$ . But we can only add those  $a$  s.t.  $\text{ord}_v(a) \equiv 0 \pmod{m}$  in order to get unramified extensions, so the desired Kummer extensions correspond to

$$T_S = \{a \in F^\times / (F^\times)^n \mid \text{ord}_v(a) \equiv 0 \pmod{m}, \forall v \in \Sigma_K^0 \setminus S\}.$$

If  $F \in \mathbf{GField}$ , after enlarging  $S$ , we may assume  $\mathcal{O}_{K,S}$  is PID, then this group is a quotient of  $\mathcal{O}_{K,S}^* / \mathcal{O}_{K,S}^m$ , which is finite by unit theorem (19.4.1.20). If  $F = K(C)$ , where  $C$  is a complete non-singular curve, then by Riemann-Roch there is an exact sequence

$$0 \rightarrow T_\emptyset \rightarrow T_S \rightarrow (\mathbb{Z}/(m))^{\#S} \rightarrow 0$$

And for  $f \in T_\emptyset$ ,  $\text{div}(f) = mD_f$  for some  $D_f \in \text{Pic}(C)[m]$ . Notice  $\#\text{Pic}(C)[m] < \infty$  by (7.13.2.18), thus the theorem follows. □

### Ray Class Fields

**Def. (19.7.4.6) [Notations].**

- A **modulus**  $\mathfrak{m}$  is a formal product  $\prod_{v \in \Sigma_F} \mathfrak{p}_v^{e_v}$  where  $e_v \geq 0$ , and  $e_v = 0$  if  $v \in \Sigma_F^{\mathbb{C}}$ , and  $e_v = 0, 1$  if  $v \in \Sigma_F^{\mathbb{R}}$ .
- For a modulus  $\mathfrak{m}$ , define

$$U^{\mathfrak{m}} = \prod_{v \in \Sigma_F^{\text{fin}}, e_v=0} F_{\mathfrak{p}} \times \prod_{v \in \Sigma_F^{\text{fin}}, e_v>0} (1 + \mathfrak{p}_v^{e_v}) \times \prod_{v \in \Sigma_F^{\infty}, e_v=0} F_v^\times \times \prod_{v \in \Sigma_F^{\mathbb{R}}, e_v=1} \mathbb{R}_+^\times \subset \mathbf{I}_F$$

and  $\mathbf{C}^{\mathfrak{m}}$  is the image of  $U^{\mathfrak{m}}$  in  $\mathbf{C}_F$ , which is an open subgroup of finite index. ┘

**Def. (19.7.4.7) [Ray Class Fields].** For a modulus  $\mathfrak{m}$ ,

- $F_{\mathfrak{m}}$  is defined to be the Abelian extension of  $F$  corresponding to  $\mathbf{C}^{\mathfrak{m}}$  via (19.7.3.28), called the **ray class field** modulo  $\mathfrak{m}$ . In particular,  $\text{Gal}(F_{\mathfrak{m}}/F) \cong \mathbf{C}_F/\mathbf{C}^{\mathfrak{m}}$  via Artin's map (19.7.3.24).
- $J^{\mathfrak{m}}$  is defined to be the multiplicative subgroup generated by ideals  $\mathfrak{a} \in \text{Ideal}^{\times}(\mathcal{O}_F)$  relatively prime to  $\mathfrak{m}$ .
- Define  $P^{\mathfrak{m}} \triangleq F^{\times} \cap U^{\mathfrak{m}}$ , called the **ray mod  $\mathfrak{m}$** .

⌋

**Def. (19.7.4.8) [Ray Class Groups].**

$$\text{Cl}^{\mathfrak{m}}(F) \triangleq J^{\mathfrak{m}}/P^{\mathfrak{m}} \cong \mathbf{C}_F/\mathbf{C}^{\mathfrak{m}} \cong \text{Gal}(F^{\mathfrak{m}}/F) \text{ (19.7.4.7)(19.7.4.6)}$$

is a finite group, called the **ray class group** modulo  $\mathfrak{m}$ .

⌋

*Proof:*  $\mathbf{C}_F/\mathbf{C}^{\mathfrak{m}} \cong F^{\times} \backslash \mathbf{I}_F/U^{\mathfrak{m}}$ , and by weak approximation,  $\mathbf{I}_F = \mathbf{I}^{\mathfrak{m}}U^{\mathfrak{m}}F^{\times}$ , so

$$\mathbf{C}_F/\mathbf{C}^{\mathfrak{m}} \cong F^{\times} \backslash \mathbf{I}^{\mathfrak{m}}U^{\mathfrak{m}}F^{\times}/U^{\mathfrak{m}} = \mathbf{I}^{\mathfrak{m}}/\mathbf{I}^{\mathfrak{m}} \cap (U^{\mathfrak{m}}F^{\times}) \xrightarrow{\cong} J^{\mathfrak{m}}/P^{\mathfrak{m}}.$$

where the final map is given by

$$\mathbf{I}^{\mathfrak{m}} \rightarrow J^{\mathfrak{m}} : (a_v)_{v \in \Sigma_F} \mapsto \prod_{v \in \Sigma_F^{\text{fin}}} \mathfrak{p}_v^{v(a_v)}.$$

$\text{Cl}^{\mathfrak{m}}(F)$  is finite because it is a quotient group of  $\mathbf{I}_F/U^{\mathfrak{m}}$ , which is finite.

□

**Cor. (19.7.4.9) [Cyclotomic Fields].** When  $F = \mathbb{Q}$ ,  $m \in \mathbb{Z}_+$  and  $\mathfrak{m} = m \cdot \infty$ ,  $\mathbf{Q}_{\mathfrak{m}} = \mathbb{Q}(\mu_m)$ .

In particular, we can think of the ray classes fields for general function fields as “generalized cyclotomic fields”.

⌋

*Proof:* For any  $p \in \text{Prime}$ , let  $m = p^{e_p} \times m'$ , then  $\mathbb{Q}(\zeta_m) = \mathbb{Q}(\zeta_{p^{e_p}})\mathbb{Q}(\zeta_{m'})$ . Notice both  $\mathcal{N}_{\mathbb{Q}(\zeta_{p^{e_p}})/\mathbb{Q}}$  and  $\mathcal{N}_{\mathbb{Q}(\zeta_{m'})/\mathbb{Q}}$  contains  $(1 + \mathfrak{p}^{e_p})$  by (19.7.2.34)(19.7.2.30) and (19.7.2.21). Thus by (19.7.3.27), the  $\mathcal{N}_{\mathbb{Q}(\zeta_m)/\mathbb{Q}}$  also contains  $(1 + \mathfrak{p}^{e_p})$ . Thus  $U^{\mathfrak{m}}$  is contained in  $\text{Nm}_{\mathbb{Q}(\zeta_m)/\mathbb{Q}} \mathbf{I}_{\mathbb{Q}(\zeta_m)}$ .

To show the reverse inclusion, we calculate  $(\mathbf{C}_{\mathbb{Q}} : \mathbf{C}^{\mathfrak{m}})$ . As  $(\mathbf{C}_{\mathbb{Q}} : \mathbf{C}_{\mathbb{Q}}^1) = \text{Cl}(\mathbb{Q}) = 1$ ,

$$[\mathbf{C}_{\mathbb{Q}} : \mathbf{C}^{\mathfrak{m}}] = [U_{\mathbb{Q}}^1 \mathbb{Q}^{\times} : U_{\mathbb{Q}}^{m\infty} \mathbb{Q}^{\times}] = [U_{\mathbb{Q}}^1 : U_{\mathbb{Q}}^{m\infty}] [U_{\mathbb{Q}}^1 \cap \mathbb{Q}^{\times} : U_{\mathbb{Q}}^{m\infty} \cap \mathbb{Q}^{\times}] = \varphi(m) = [\mathbb{Q}(\zeta_m) : \mathbb{Q}].$$

□

**Cor. (19.7.4.10) [Kronecker].** Every Abelian extension  $F/\mathbb{Q}$  is a subfield of  $\mathbb{Q}(\zeta_m)$  for some  $m \in \mathbb{Z}_+$ .

⌋

**Def. (19.7.4.11) [Hilbert Class Fields].** The ray class field of  $F$  mod 1 is called the **Hilbert class field** of  $F$ , denoted by  $F_1$  or  $H(F)$ . Its Galois group is isomorphic to  $\mathbf{C}_F/\mathbf{C}_F^1 \cong J_F/P_F = \text{Cl}(F)$  (19.7.4.8). In particular,  $[F_1 : F] = \text{cl}(F)$ .

⌋

## Conductors

**Def. (19.7.4.12) [Admissible Modulus].**

- An **admissible modulus** for  $L/F$  is a modulus  $\mathfrak{m}$  s.t.  $\mathbf{C}^{\mathfrak{m}} \subset \mathcal{N}_{L/F}$  or equivalently  $L \subset F_{\mathfrak{m}}$  (19.7.4.7).

- All subgroups of  $\text{Cl}_{\mathfrak{m}}(F)$  (19.7.4.8) are called **ideal groups defined mod  $\mathfrak{m}$** .
- If  $\mathfrak{m}$  is an admissible modulus for  $L/F$ , then  $H_{L/F}^{\mathfrak{m}} = \text{Nm}_{L/F} J_L^{\mathfrak{m}} \cdot P_F^{\mathfrak{m}}$  is called the **ideal group defined mod  $\mathfrak{m}$** . ┘

**Prop. (19.7.4.13).** A modulus  $\mathfrak{m}$  is admissible for  $L/F$  iff  $U^{\mathfrak{m}} \subset \text{Nm}_{L/F}(\mathbf{I}_L)$ . ┘

*Proof:* This is because  $\mathcal{N}_{L/F} \cap K_p = \mathcal{N}_{L_{\mathfrak{p}}/K_p}$  by (19.7.4.2). □

**Cor. (19.7.4.14).** The norm subgroups of  $\mathbf{C}_F$  are exactly those containing some  $C^{\mathfrak{m}}$ . ┘

*Proof:* This is because  $\mathcal{N}_{L/F} \mathbf{A}_L$  is open in  $\mathbf{A}_K$ , by (19.4.1.14), so it must contain some  $U^{\mathfrak{m}}$ . The converse is also clear. □

**Def. (19.7.4.15) [Conductors].** By (19.7.4.14), there is a minimal admissible modulus for  $L/F$  (19.7.4.12), called the **conductor(global Abelian extension)** of  $L/F$ , denoted by  $\mathfrak{f}_{L/F}$ . ┘

**Prop. (19.7.4.16) [Local and Global Conductors].**

$$\mathfrak{f}_{L/F} = \prod_{v \in \Sigma_F} \mathfrak{f}_{L_w/F_p} \quad (19.7.2.16).$$

┘

*Proof:* This follows from (19.4.1.14). □

**Cor. (19.7.4.17) [Conductor Detects Ramifications].**  $v \in \Sigma_F$  is ramified in  $L/F$  iff  $v | \mathfrak{f}_{L/F}$ , by (19.7.2.16). In particular,  $\text{Ram}(F_{\mathfrak{m}}/F) = S(\mathfrak{m})$ . ┘

**Prop. (19.7.4.18).** If  $S$  is a finite set of primes that contains all the infinite primes and all the primes lying above the primes dividing  $n$ , and  $\mathbf{I}_F = \mathbf{I}_F^S \cdot F^{\times}$ , then  $\mathbf{C}_F^n \cdot U_F^S$  is a norm group. If  $\mu_n \subset F$ , then it corresponds to the Kummer extension  $T = F(\sqrt[n]{F^S}/F)$ . ┘

### Hilbert Class Fields

**Prop. (19.7.4.19).** The Hilbert class field  $F_1$  (19.7.4.11) is the maximal unramified Abelian extension of  $F$ , by (19.7.4.17). ┘

**Def. (19.7.4.20) [Hilbert Class Field Tower].** Let  $F_1$  be the Hilbert class field of  $F$ , and for any  $n \in \mathbb{Z}_+$ , let  $F_{n+1}$  be the Hilbert class field of  $F_n$ , then such a series of extensions is called the **Hilbert class field tower** of  $F$ .

Similarly for  $p \in \text{Prime}$ , we can consider the maximal Abelian  $p$ -extensions of  $F$ , which gives us a series

$$F \subset F_1^{(p)} \subset F_2(p) \subset \dots \subset F_{\infty}^{(p)}.$$

┘

**Prop. (19.7.4.21).** Each  $F_n$  is Galois over  $F$ , and  $F_1$  is the largest Abelian subfield of  $F_2/F$ . ┘

*Proof:* For the last assertion, notice that that largest Abelian subfield of  $F_2/F$  is unramified Abelian over  $F$ , then use (19.7.4.19). □

**Prop. (19.7.4.22) [Principal Ideal Theorem].** In the Hilbert class field over  $F$ , every ideal  $\mathfrak{a}$  of  $F$  becomes a principal ideal. ┘

*Proof:* As  $J_F/P_F \cong \mathbf{C}_F/\mathbf{C}_F^1$ , It suffices to show that the map  $i : \mathbf{C}_F \rightarrow \mathbf{C}_{F_1}$  has image in  $\mathbf{C}_{F_1}^1$ . By the commutative diagram(19.7.3.26)

$$\begin{array}{ccccccc} & & \mathbf{C}_F & \xrightarrow{(-, F_2/F)} & \mathrm{Gal}(F_2/F)^{\mathrm{ab}} & & \\ & & \downarrow i & & \downarrow \mathrm{Ver} & & \\ 0 & \longrightarrow & \mathbf{C}_{F_1}^1 & \longrightarrow & \mathbf{C}_{F_1} & \xrightarrow{(-, F_2/F_1)} & \mathrm{Gal}(F_2/F_1)^{\mathrm{ab}} \longrightarrow 0 \end{array}$$

It suffices to show that  $\mathrm{Ver}$  is trivial. Then this follows from(19.7.4.21) and(3.1.9.3).  $\square$

**Thm. (19.7.4.23) [Brumer].** Let  $F \in \mathbf{NField}$ ,  $p \in \mathbf{Prime}$ , and  $t_F^{(p)}$  be the number of primes  $\ell \in \mathbf{Prime}$  s.t.  $p|e_{\mathfrak{L}/\ell}$  for any prime  $\mathfrak{L}$  above  $\ell$ , then

$$\dim_{\mathbb{F}_p} \mathrm{Cl}(F)/(p) \geq t_F^{(p)} - 2(d-1)$$

┘

*Proof:*

$\square$

**Prop. (19.7.4.24) [Golod-Šafarevič].** Let  $F \in \mathbf{NField}$  with  $[F : \mathbb{Q}] = d$  and  $p \in \mathbf{Prime}$ , if  $[F_{\infty}^{(p)} : F] < \infty$ , then

$$\dim_{\mathbb{F}_p} \mathrm{Cl}(F)/(p) \leq 1 + 2\sqrt{d+1}.$$

┘

*Proof:*

$\square$

**Cor. (19.7.4.25).** By(19.7.4.23), if  $t_F^{(p)} \geq 2d + 2\sqrt{d+1}$ , then  $[F_{\infty}^{(p)} : F] = \infty$ .

For example, if we take  $F = \mathbb{Q}(\sqrt{d})$  where  $d$  is square-free with at least 8 different prime factors, then  $[F_{\infty}^{(p)} : F] = \infty$ .  $\square$

### Classical Formulation

**Def. (19.7.4.26) [Artin Symbols].** There is a homomorphism  $J^{\mathfrak{m}} \rightarrow \mathrm{Gal}(L/K)$  called the **Artin symbol**  $\left(\frac{L/K}{-}\right)$ . On primes  $\mathfrak{p}$ , it maps a prime  $\mathfrak{p}$  which is unramified by(19.7.4.12) to its local Frobenius  $\mathrm{Frob}_{\mathfrak{p}} \in \mathrm{Gal}(\mathfrak{P}/\mathfrak{p}) \subset \mathrm{Gal}(L/K)$ . This is well-defined only up to conjugacy in  $\mathrm{Gal}(L/K)$ , and thus well-defined when  $L/K$  is Abelian.  $\square$

**Lemma (19.7.4.27).** If  $\mathfrak{m}$  is an admissible modulus for  $L/F$ , the restriction to finite part defines isomorphism  $\mathcal{N}_{L/F}/\mathbf{C}_F^{\mathfrak{m}} \cong H_{L/F}^{\mathfrak{m}}/P^{\mathfrak{m}}$ (19.7.4.12).  $\square$

*Proof:* Cf.[Neukirch CFT P176].  $\square$

**Prop. (19.7.4.28) [Classical Artin Reciprocity Law].** If  $\mathfrak{m}$  is an admissible modulus, then there is a commutative diagram

$$\begin{array}{ccccccc} 1 & \longrightarrow & \mathcal{N}_{L/F} & \longrightarrow & \mathbf{C}_F & \xrightarrow{(-, L/F)} & G_{L/F} \longrightarrow 1 \\ & & \downarrow & & \downarrow & & \parallel \\ 1 & \longrightarrow & H_{L/F}^{\mathfrak{m}}/P^{\mathfrak{m}} & \longrightarrow & J^{\mathfrak{m}}/P^{\mathfrak{m}} & \xrightarrow{\left(\frac{L/K}{-}\right)} & \mathrm{Gal}(L/F) \longrightarrow 1 \end{array}$$

Thus the second row is exact by(19.7.3.24), and  $\mathrm{Gal}(L/F) \cong J^{\mathfrak{m}}/H_{L/F}^{\mathfrak{m}}$ .  $\square$

*Proof:* Cf.[Neukirch CFT, P178]. □

**Prop. (19.7.4.29)[Decomposition Law].** Let  $n = [L : F]$  and  $\mathfrak{m}$  be an admissible modulus for  $L/F$  (e.g. the conductor) and  $\mathfrak{p} \nmid \mathfrak{m}$ . If  $f$  is the smallest number that  $\mathfrak{p}^f \in H_{L/F}^{\mathfrak{m}}$ , then  $\mathfrak{p}$  factors in the extension  $L$  into  $r = n/f$  distinct primes of degree  $f$ . ┘

*Proof:* The degree the extension of  $\mathfrak{p}$  is just the order of the Frobenius automorphism of  $G_{\mathfrak{p}/\mathfrak{p}}$ , which is just the order in  $\text{Gal}(L/F) \cong J^{\mathfrak{m}}/H_{L/F}^{\mathfrak{m}}$ . The Frobenius of  $\mathfrak{p}$  correspond exactly to  $\mathfrak{p}$  by (19.7.2.4), so the result follows. □

### $n$ -th Powers

Cf.[?A-T67]Chap9,10.

**Prop. (19.7.4.30) [Grünwald-Wang].** Let  $n = 2^t \cdot m \in \mathbb{Z}_+$ , and assume  $F \in \mathbf{FField}$  or  $F(\zeta_{2t})/F$  is cyclic. Then  $a \in F$  is in  $F^n$  iff  $a \in F_v^n$  for a.e.  $v \in \Sigma_F$ . ┘

*Proof:* Cf.[Chao Li's notes] or [Mil20]P229. □

**Thm. (19.7.4.31) [Grünwald-Wang].** For any  $\emptyset \subset_{\text{fin}} S \subset \Sigma_F$ , if for each  $v \in S$ ,  $\chi'_v$  is a continuous character of  $F_v^\times$  of finite order  $n_v$ , then there exists a Hecke character  $\chi$  of  $F$  with the  $\chi_v = \chi'_v$ . Moreover, if  $n = \text{lcm}(n_v)$ ,  $t = \text{ord}_2(n)$ , and assume  $F \in \mathbf{FField}$  or  $F(\zeta_{2t})/F$  is cyclic, then  $\chi$  can be taken to be of order  $n$ . ┘

*Proof:* Cf.[Chao Li's notes] or [Artin-Tate, Class Field Theory, Thm10.5]. ? □

**Cor. (19.7.4.32)[Local-Global Compatibility for Cyclic Extensions].** For each  $v \in \Sigma_F$ , a positive integer  $n_v$  is given s.t.

- For a.e.  $v$ ,  $n_v = 1$ .
  - For  $v \in \Sigma_F^{\mathbb{R}}$ ,  $n_v \in \{1, 2\}$ .
  - For  $v \in \Sigma_F^{\mathbb{C}}$ ,  $n_v = 1$ .
- ┘

*Proof:* The point is that we can choose  $\chi_v$  s.t. the exceptions in (19.7.4.31) can be avoided, and then get a Hecke character  $\chi$  of  $F$  of order  $n$  which corresponds to a cyclic extension via cyclic class formation. ? Cf.[Artin-Tate, Class Field Theory, Thm10.5, P105]. ? □

### Higher Reciprocity Law

References are [Mil20]Chap8 and [Cox13]P149. Contributors include: Kronecker/Weber/Hilbert/-Furtwangler/Takagi.

**Def. (19.7.4.33)[Higher Hilbert Symbols].** ┘

**Prop. (19.7.4.34)[Quadratic Reciprocity].** For any  $p \in \text{Prime}$  and  $n \in \mathbb{Z}$ , we have

$$\left( \frac{\left( \frac{-1}{p} \right) p}{n} \right) = \left( \frac{n}{p} \right) \text{ (2.6.1.27).}$$
┘

*Proof:* By multiplicity, it suffices to prove for  $n \in \{0, -1\} \cup \text{Prime}(2.6.1.27)$ . For  $n \in \{0, -1, 2\}$  or  $p = 2$  this is trivial. Assume  $p \geq 3$  and  $n = q \in \text{Prime}$ , then this follows from the Artin reciprocity for  $\mathbb{Q}(\sqrt[p]{\left(\frac{-1}{p}\right)})$  or from (35.3.5.4) and (35.3.5.2) by calculating  $G_{pq}(1; 2)$  twice.  $\square$

**Prop. (19.7.4.35)[Cubic Reciprocity].**  $\lrcorner$

**Prop. (19.7.4.36)[Quadric Reciprocity].**  $\lrcorner$

### Ring Class Fields for Imaginary Quadratic Fields

References are [Cox13]Chap9.

**Def. (19.7.4.37) [Ring Class Fields].** If  $\mathcal{K}$  is an imaginary quadratic field,  $f \in \mathbb{Z}_+$ , the **ring class field** of  $\mathcal{K}$  corresponding to  $\mathcal{O}_{\mathcal{K},f}$  (19.3.1.53) is an Abelian extension  $L/K$  corresponding to  $I_K(f)/P_{\mathcal{K},\mathbb{Z}}(f) \cong \text{Cl}(\mathcal{O}_{\mathcal{K},f})$  under the Artin map (19.3.1.57)(19.7.4.7).  $I_K(f)/P_{\mathcal{K},\mathbb{Z}}(f) \cong \text{Cl}(\mathcal{O}_{\mathcal{K},f})$  is a quotient group of  $\text{Cl}^f(\mathcal{K})$ , so  $L \subset \mathcal{K}_{\mathfrak{m}_f}$ , the ray class group modulo  $f$  (19.7.4.7).  $\lrcorner$

**Thm. (19.7.4.38)[Generalized Dihedral Extensions].** If  $\mathcal{K}$  is an imaginary quadratic field, then for any order  $\mathcal{O} \subset \mathcal{O}_{\mathcal{K}}$ , the ring class field  $L/K$  is Galois over  $\mathbb{Q}$ , and

$$\text{Gal}(L/\mathbb{Q}) \cong \text{Gal}(L/\mathcal{K}) \rtimes \text{Gal}(\mathcal{K}/\mathbb{Q}),$$

where  $\text{Gal}(\mathcal{K}/\mathbb{Q}) = \{1, c\}$  and  $c$  acts on  $\text{Gal}(L/\mathcal{K})$  via  $\sigma^c = \sigma^{-1}$ .

Such an  $L$  is said to be **generalized dihedral over  $\mathbb{Q}$** . Then conversely, any Abelian extension  $L/K$  s.t.  $L$  is generalized dihedral over  $\mathbb{Q}$  is contained in a ring class field of  $\mathcal{K}$ .  $\lrcorner$

*Proof:* Cf. [Cox13]P163 and P172. ?  $\square$

## 5 $L$ -Functions

**Notation (19.7.5.1).**

- Let  $L/F$  be an Abelian extension of Global fields.
- For two functions  $f(s), g(s) : (1, \infty) \rightarrow \mathbb{C}$ , write  $f \stackrel{1}{\sim} g$  iff  $f - g$  is bounded on  $(1, 1 + \varepsilon)$  for some  $\varepsilon > 0$ .

$\lrcorner$

**Thm. (19.7.5.2)[Effective Chebotarev].** For any subset  $C \subset \text{Gal}(L/F)$  that is stable under conjugation, for  $X > 0$ , let

$$\pi_C(X) = \{v \in \Sigma_F | e_v = 1, (\mathfrak{p}_v, L/F) \in C, \|v\| \leq X\},$$

then

$$\#\pi_C(X) = \frac{\#C}{\#\text{Gal}(L/F)} \frac{X}{\log X} + O\left(\frac{X^{\beta_0}}{\log X}\right).$$

$\lrcorner$

*Proof:* Cf. [Lagarias and Odlysko, Effective Chebotarev].  $\square$

**Cor. (19.7.5.3)[Chebotarev].** Let  $L/F \in \mathbf{NField}$  be a Galois extension, then for any subset  $C \subset \text{Gal}(L/F)$  that is stable under conjugation, let

$$T = \{\mathfrak{p} \in \text{Unr}(F) | (\mathfrak{p}, L/F) \in C\},$$

then  $T$  has Dirichlet density  $\delta(T) = \#C/\#\text{Gal}(L/F)$ .  $\lrcorner$

*Proof:* This follows from (19.7.5.2) and the prime ideal theorem (35.5.9.2).  $\square$

**Prop. (19.7.5.4) [Polar Chebotarev Density Theorem].** ?  $\lrcorner$

**Prop. (19.7.5.5) [Chebotarev for Function Fields].** Cf. [Sta].  $\lrcorner$

*Proof:*  $\square$

**Prop. (19.7.5.6) [Every Ideal Class Contains a Prime].** For  $F \in \mathbf{NField}$ , each ideal class of  $F$  contains a prime ideal. In fact, the primes contained in any fixed ideal class has natural density  $1/\text{cl}(F)$ .  $\lrcorner$

*Proof:* Consider the Hilbert class field  $H(F)$  of  $F$  (19.7.4.11), then  $\text{Cl}(F) \cong \text{Gal}(H(F)/F)$  via the norm residue map. Then the assertion follows from (19.7.5.2).  $\square$

### Splitting of Primes

**Def. (19.7.5.7) [Splitting Sets].** Let  $\text{Spl}(L/F) \subset \Sigma_F^{\text{fin}}$  be the set of finite places of  $F$  that splits completely in  $L$ . By (5.2.7.28), If  $N/F$  is the Galois closure of  $L/F$ , then  $\text{Spl}(N/F) = \text{Spl}(L/F)$ .  $\lrcorner$

**Prop. (19.7.5.8) [Splitting in Cyclotomic Fields].** Let  $L/\mathbb{Q}$  be Galois, then  $L \in \mathbb{Q}(\zeta_m)$  for some  $m \in \mathbb{Z}_+$  by (19.7.4.10), and let  $\Lambda = \mathcal{N}_{L/\mathbb{Q}}/\mathbb{C}^m \subset (\mathbb{Z}/(m))^*$  corresponds to  $L$ , then  $p \in \mathbf{Prime}$  splits in  $L$  iff  $p(\bmod m) \in \Lambda$ .  $\lrcorner$

**Cor. (19.7.5.9) [Dirichlet's Problem].** By (19.7.5.2) and (19.7.5.8), for any  $m \in \mathbb{Z}_+$  and  $[a] \in (\mathbb{Z}/(m))^\times$ , there exists i.m.  $p \in \mathbf{Prime}$  s.t.  $p \equiv a(\bmod m)$ .  $\lrcorner$

**Prop. (19.7.5.10) [Frobenius].**  $\text{Spl}(L/K)$  has Dirichlet density  $1/[L : K]$ .  $\lrcorner$

*Proof:* For  $v \in \Sigma_F^{\text{fin}}$  unramified, it splits in  $L$  iff  $(\mathfrak{p}_v, L/F) = \text{id}$ , by (19.7.3.25). So we can use Chebotarev theorem (19.7.5.3) for  $C = \{\text{id}\}$ .  $\square$

**Cor. (19.7.5.11).** If  $L/F, L/F'$  satisfies  $\text{Spl}(L/F) = \text{Spl}(L'/F)$ , then  $L = L'$ .  $\lrcorner$

*Proof:* The hypothesis implies that  $\text{Spl}(L/F) = \text{Spl}(LL'/F) = \text{Spl}(L'/F)$ , which then implies  $L = LL' = L'$ , by (19.7.5.10).  $\square$

**Cor. (19.7.5.12).** If  $L/K$  is a finite separable extension of global fields s.t.  $\text{Spl}(L/K)$  has Dirichlet density  $[L : K]$ , then  $L/K$  is Galois, by (19.7.5.7).  $\lrcorner$

**Cor. (19.7.5.13).** If  $L/K$  is a finite separable extension of global fields s.t.  $\text{Spl}(L/K)$  has Dirichlet density 1, then  $L = K$ , by (19.7.5.7).  $\lrcorner$

## 6 Explicit Construction of Class Fields

The explicit class field theory is the subject that tries to write the maximal Abelian extension of a field  $K$  as splitting field of polynomials.

**Prop. (19.7.6.1) [Known Cases].**

- $\mathbb{Q}^{\text{ab}} = \mathbb{Q}(\zeta_\infty)$  (19.7.4.10).
- If  $F \in \mathbf{FField}$ , the theory of Drinfeld modules gives most Abelian extensions of  $F$  ?.

- If  $K \in p\text{-NField}$ ,  $K^{\text{ab}}$  is given by adjoining all torsion points of Lubin-Tate formal groups over  $K$  (19.7.2.32).
- If  $F \in \text{NField}$  is a CM field, then by Kronecker's Jugendtraum (21.2.7.9), the Abelian extensions of  $F$  are given by  $j$ -invariants and torsion points of elliptic curves over  $F$  with CM.
- If  $F \in \text{NField}$  is totally real, the conjecture of Stark gives all the Abelian extensions. ?

## 19.8 Inverse Galois Problem

References are [\[Ser97\]](#).

**Prop. (19.8.0.1) [Specialization Methods].** Let  $K \in \mathbf{Field}$  be Hilbertian and  $G \in \mathbf{Grp}^{\text{fin}}$ . If there exists  $n \in \mathbb{N}$  and a Galois extension  $F/K(T_1, \dots, T_n)$  with Galois group  $G$ , then there is a Galois extension of  $K$  with Galois group  $G$ . Moreover, if  $K$  is alg.closed in  $F$ , then there exists infinitely many Galois extension of  $K$  with Galois group  $G$  that are linearly disjoint.  $\lrcorner$

*Proof:* Cf. [\[Ser97\]](#)P137. ?  $\square$

**Remark (19.8.0.2) [Noether's method].** If  $G \in \mathbf{Grp}^{\text{fin}}$  acts on a finite set  $E \in \mathbf{finSet}$ , then we can consider the action of  $G$  on  $\mathbb{Q}(\{T_{x_i}\}_{x_i \in E})$  via the action on the subscript. Then if the fixed field  $F$  is a purely transcendental extension of  $\mathbb{Q}$ , then we can use [\(19.8.0.1\)](#) to get a Galois extension of  $\mathbb{Q}$  with Galois group  $G$ .  $\lrcorner$

**Thm. (19.8.0.3) [Large Sieve Bounds on Galois Groups of Polynomials, van.der.Waerden(1936)/Gallagher[\[Gal73\]](#).** Let  $n \in \mathbb{Z}_+$ . For each  $N \in \mathbb{Z}_+$ , denote by  $D_N$  the set of monic polynomials of degree  $n$  with integer coefficients whose absolute values bounded by  $N$ . Then

- For each sequence  $r = (r_1, \dots, r_k)$  with  $r_1 + 2r_2 + \dots + kr_k = n$ , if we denote  $C_r \subset D_N$  the subset consisting of polynomials  $f$  s.t.  $f$  doesn't factor as a product of  $r_1$ -many linear factors,  $r_2$ -many irreducible quadratic factors,  $r_3$ -many cubic irreducible factors and so on. Then For each  $\varepsilon \in \mathbb{R}_+$ , there exists  $c_{r,\varepsilon} \in \mathbb{R}_+$  s.t. for each  $N \in \mathbb{Z}_+$  we have

$$\#C_r \leq c_{r,\varepsilon} N^{n-1/2} \log^{1-\delta_r+\varepsilon} N, \text{ where } \delta_r = \frac{1}{1^{r_1}(r_1)!2^{r_2}(r_2)! \dots k^{r_k}(r_k)!}.$$

- For each  $\varepsilon \in \mathbb{R}_+$ , there exists  $c_{n,\varepsilon} \in \mathbb{R}_+$  s.t. for each  $N \in \mathbb{Z}_+$  we have

$$\#\{f \in D_N : \text{the Galois-group of } f \text{ is not } \text{Sym}_n\} \leq c_{n,\varepsilon} N^{n-1/2} \log^{1-\frac{1}{n!}+\varepsilon} N.$$

$\lrcorner$

*Proof:* 1: We use the large sieve method[\(35.1.6.14\)](#). Notice that

$$\#C_r = \prod_{f \in \mathbb{Z}_+} \binom{\pi_p(f)}{r_f},$$

where  $\pi_p(f)$  is the number of degree- $f$  irreducible polynomials in  $\mathbb{F}_p[X]$ . By Möbius-inversion, we have

$$\pi_p(f) = \frac{1}{f} \sum_{d|f} \mu(d) p^{f/d},$$

which is a polynomial in  $p$  with leading term  $p^f/f$ . So the number  $\omega_p(r)$  of polynomials in  $\mathbb{F}_p[X]$  of type- $r$  is a polynomial in  $p$  with leading term

$$\prod_{f \in \mathbb{Z}_+} \frac{1}{r_f!} \left( \frac{p^f}{f} \right)^{r_f} = \delta_r p^n,$$

So there exists  $M_\varepsilon \in \mathbb{Z}_+$  s.t.  $\omega_p(r) \geq (\delta_r - \varepsilon) p^n$  for each  $p \in \mathbf{Prime}_{>M_\varepsilon}$ .

Then with notation as in (35.1.6.14), we have

$$L(Q) \geq L''(Q) \triangleq \sum_{n \in [Q]_+^b, (n, \prod_{p \in \text{Prime} \leq M_\varepsilon} p) = 1} \left( \frac{\delta_r}{1 - \delta_r} \right)^{\#S(n)}.$$

Then It follows from Tauberian theorem (35.1.1.5) as in the proof of (35.9.3.5) that

$$L''(Q) \sim \frac{1}{\Gamma\left(\frac{\delta_r}{1-\delta_r}\right)} \prod_{p \in [M_\varepsilon]_+} \left(1 - \frac{1}{p}\right)^{\delta_r/(1-\delta_r)} \prod_{p \in \text{Prime} > M_\varepsilon} \left(1 + \frac{\delta_r/(1-\delta_r)}{p}\right) \left(1 - \frac{1}{p}\right)^{\delta_r/(1-\delta_r)}$$

Taking  $Q = \sqrt{N}$ , the assertion follows from (35.1.6.14).

2: If the Galois-group of  $f$  is not  $\text{Sym}_n$ , then there exists a conjugacy class of  $\text{Sym}_n$  that is disjoint from the Galois-group of  $f$ , by (3.1.2.12). Thus there exists some  $r = (r_1, \dots, r_k)$  with  $r_1 + 2r_2 + \dots + kr_k = n$  s.t.  $f \in C_r$ . Thus the assertion follows from item1 and the fact  $\delta_r \geq 1/n!$ .  $\square$

## 1 $p$ -adic Case

**Prop. (19.8.1.1) [Abhyankar's conjecture, Raynaud].** A finite group  $\Gamma \in \mathcal{Ab}^{\text{fin}}$  is the Galois group of an unramified Galois covering of  $\mathbb{A}_{\mathbb{F}_p}^1$  iff it is generated by its  $p$ -Sylow subgroups.  $\lrcorner$

*Proof:*

$\square$

## 2 Solvable Groups

**Thm. (19.8.2.1) [Šafarevič].** For  $F \in \mathbf{GField}$  and  $G \in \mathcal{Ab}^{\text{fin}}$  is solvable, then there exists a Galois extension  $L/F$  s.t.  $\text{Gal}(L/F) \cong G$ .  $\lrcorner$

*Proof:* Cf. [Cohomology of Number Fields, Neukirch].

$\square$

**Conj. (19.9.1.7) [Modular Conjecture, Bertrand].** Denote  $j(\tau) = J(e^{2\pi i \tau})$ . Suppose  $\tau_1, \dots, \tau_n \in \mathcal{H}$  s.t.

$$\{J(e^{2\pi i \tau_1}), J'(e^{2\pi i \tau_1}), J''(e^{2\pi i \tau_1}), \dots, J(e^{2\pi i \tau_n}), J'(e^{2\pi i \tau_n}), J''(e^{2\pi i \tau_n})\}$$

are alg.independent over  $\mathbb{Q}$ , then there exists two  $\tau_i, \tau_j$  that are linearly independent.

┘

*Proof:*

□

**Thm. (19.9.1.8) [Gelfond-Schneider].** If  $\alpha, \beta \in \overline{\mathbb{Q}} \setminus \mathbb{Q}$  with  $\alpha \neq 0, 1$ , then  $\alpha^\beta \notin \overline{\mathbb{Q}}$ .

┘

*Proof:* Cf.[Sil16]P286.

□

**Cor. (19.9.1.9).**  $(\sqrt{2})^{\sqrt{2}} \notin \overline{\mathbb{Q}}$ .

┘

### Logarithmic Forms

**Thm. (19.9.1.10) [Baker-Wüstholz].** Suppose  $n \in \mathbb{Z}_+$ ,  $\alpha_1, \dots, \alpha_n \in \overline{\mathbb{Q}} \setminus \{0, 1\}$ ,  $K = \mathbb{Q}(\alpha_1, \dots, \alpha_n)$ , and  $d = [K : \mathbb{Q}]$ . Let  $b_1, \dots, b_n \in \mathbb{Z}$ , and  $L(z_1, \dots, z_n) = \sum b_i z_i$  be the linear form. If  $\log(\alpha_i)$  is any logarithmic root of  $\alpha_i$  for any  $i$ , and we define the modified heights

$$h'(\alpha_i) = \max(h^+(\alpha_i), \frac{1}{d}|\log \alpha_i|, \frac{1}{d}), \quad h'(L) = \max(h(L), \frac{1}{d}).$$

If  $L(\log(\alpha_1), \dots, \log(\alpha_n)) \neq 0$ , then we have

$$\log |L(\log(\alpha_1), \dots, \log(\alpha_n))| > -18(n+1)!n^{n+1}(32d)^{n+2} \log(2nd)h'(\alpha_1) \dots h'(\alpha_n)h'(L).$$

┘

*Proof:* Cf. [Logarithmic Forms and Group Varieties].

□

**Cor. (19.9.1.11).** Situation as above, if each  $\log(\alpha_i)$  is a principle value, and  $B = \max(|b_i|, e)$ ,  $A = \max(H(\alpha_i), e)$ , then

$$\log |L(\log(\alpha_1), \dots, \log(\alpha_n))| > -(16nd)^{2(n+2)}(\log A)^n \log B.$$

┘

*Proof:*

□

**Thm. (19.9.1.12) [Six Exponential Theorem].** If  $x_1, x_2, x_3$  are three complex numbers that are linearly independent over the rational numbers, and  $y_1, y_2$  are two complex numbers that are also linearly independent over the rational numbers, then at least one of the following numbers is transcendental:

$$e^{x_1 y_1}, e^{x_2 y_1}, e^{x_3 y_1}, e^{x_1 y_2}, e^{x_2 y_2}, e^{x_3 y_2}.$$

┘

*Proof:* ?

## 2 Periods

References are [Periods, Zagier].

**Def. (19.9.2.1) [Algebraic Functions].** Let  $F$  be a field contained in  $\mathbb{C}$ , then an **algebraic function** of degree  $d \in \mathbb{Z}_+$  in  $n$  variable over  $F$  is a function  $f(\underline{X}) \in C(\mathbb{R}^n)$  that is continuous in its domain and satisfies an equation  $P(\underline{X}, f(\underline{X})) = 0$  where  $P \in F[\underline{X}, T]$  that is of degree  $d$  in  $T$ .

┘

**Def. (19.9.2.2) [Periods].** A **period number** is a complex number that is an integral combinations of real numbers of the form  $\int_U f(x)dx$  where  $f$  is an algebraic function over  $\mathbb{Q}$  (19.9.2.1) and  $U$  is a precompact connected open domain of  $\mathbb{R}^n$  defined by polynomial inequalities with rational coefficients, for some  $n \in \mathbb{N}$ . The set of periods is denoted by  $\mathbb{P}$ . The **extended Period ring** is defined to be  $\widehat{\mathbb{P}} = \mathbb{P}[\frac{1}{2\pi i}]$ .

Clearly  $\overline{\mathbb{Q}} \subset \mathbb{P} \subset \mathbb{C}$ , and they form an algebra. Also,  $\#\mathbb{P} = \aleph_1$ .

┘

**Prop. (19.9.2.3).** In defining periods, we can even consider domains defined by inequalities by algebraic functions over  $\mathbb{Q}$  (19.9.2.1) defined on a larger open subset.

┘

*Proof:* If  $U$  satisfies  $f < a$  and  $f$  satisfies a polynomial function  $P(\underline{X}, f(\underline{X})) = 0$ , then  $U$  satisfies  $P(\underline{X}, a) > 0$  or  $P(\underline{X}, a) < 0$ . We can assume the first one holds, and we can isolate the part  $P(\underline{X}, a) > 0, f(\underline{X}) < a$  and the part  $P(\underline{X}, a) > 0, f(\underline{X}) > a$  by segments, so we are reduced to the polynomial case.  $\square$

**Prop. (19.9.2.4) [Algebraic Varieties].** If  $X$  is a smooth variety of dimension  $d$  over  $\mathbb{Q}$  and  $D \subset X$  a divisor with normal crossing,  $\omega \in \Omega^d(X)$  vanishing on  $D$ , and  $\gamma \in H_d(X(\mathbb{C}), D(\mathbb{C}), \mathbb{Q})$  is a singular  $n$ -chain with boundary in  $Y(\mathbb{C})$ , then the integral  $\int_C \omega \in \mathbb{P}$ .

In fact, any integration on a variety over  $\mathbb{Q}$  can be reduced to this case, by resolution of singularity and restriction of divisors, and any period number comes from these.  $\textcolor{red}{?}$   $\lrcorner$

*Proof:* Roughly because we can represent  $\gamma$  by a semi-algebraic chain.  $\textcolor{red}{?}$   $\square$

**Example (19.9.2.5).**

- $\sqrt{2} = \int_{2x^2 < 1} dx \in \mathbb{P}$ .
- $\pi = \int_{x^2 + y^2 < 1} dx dy \in \mathbb{P}$ .
- $\log 2 = \int_1^2 \frac{dx}{x} \in \mathbb{P}$ .

$\lrcorner$

**Prop. (19.9.2.6).** For  $n \in \mathbb{Z}_+, n \geq 2$ ,  $\zeta(n) \in \mathbb{P}$ .  $\lrcorner$

**Conj. (19.9.2.7) [Non-Examples].** There are no natural examples of numbers proven to be non-period.  $e$ ,  $1/\pi$  and Euler-Mascheroni constant  $\gamma$  are conjectured to be non-periods. Notice  $e$  is known to be transcendental but  $\gamma$  is not known to be rational or not yet!  $\lrcorner$

**Remark (19.9.2.8) [How to Distinguish Different Periods].** There may be numbers that can be written in different ways, such as

$$\sqrt{11 + 2\sqrt{29}} + \sqrt{16 - 2\sqrt{29} + 2\sqrt{55 - 10\sqrt{29}}} = \sqrt{5} + \sqrt{22 + 2\sqrt{5}}.$$

But as they are both algebraic numbers we can check this by brutal force:

1. Find polynomials satisfied by them and use Euclidean division to find their common divisor, and use inequalities to bound its roots.
2. Calculate these two numbers to sufficiently high precision and use the fact two algebraic numbers of bounded degree cannot be too close to each other by Diophantine geometry.

But how to do this for periods?  $\lrcorner$

*Proof:* They are both equal to the expression

$$\sqrt{11 + 2\sqrt{29}} + \sqrt{11 - 2\sqrt{29}} + \sqrt{5}$$

by using the equality  $\sqrt{a} + \sqrt{b} = \sqrt{a + b + 2\sqrt{ab}}$ .  $\square$

**Conj. (19.9.2.9) [Periods Conjecture].** Any two integral representations of a period can be transformed to each other by means of cut-and-paste, change of variables and Stoke's formula.  $\lrcorner$

*Proof:*  $\square$

**Remark (19.9.2.10).** A tip of thinking from this conjecture is that: Whenever you want to prove some two period numbers are equal, write them as integrals and then try to apply change of cut-and-paste, change of variables and Stoke's formula.  $\lrcorner$

**Example (19.9.2.11) [Calabi].** We give one indication of this conjecture by proving  $\zeta(2) = \pi^2/6$ :

$$(1 - \frac{1}{4})\zeta(2) = 1^{-2} + 3^{-2} + 5^{-2} + \dots = \int_{(0,1)^2} \frac{1}{(1-x^2y^2)} dx dy.$$

But the change of variables

$$(x, y) = (\frac{\sin u}{\cos v}, \frac{\sin v}{\cos u})$$

has Jacobian  $(1 - x^2y^2)$  and maps the triangle  $T = \{u, v > 0, u + v < \pi/2\}$  bijectively to  $(0, 1)^2$ , so

$$\int_{(0,1)^2} \frac{1}{(1-x^2y^2)} dx dy = \int_T du dv = \text{Vol}(T) = \pi^2/8$$

$\lrcorner$

**Def. (19.9.2.12) [Exponential Periods].** An **exponential period number** is a complex number that is an integral combinations of real numbers of the form  $\int_U f(x) \exp(g(x)) dx$  where  $f, g$  are algebraic functions over  $\mathbb{Q}$  (19.9.2.1) and  $U$  is a precompact connected open domain of  $\mathbb{R}^n$  defined by polynomial inequalities with rational coefficients, for some  $n \in \mathbb{N}$ . The set of periods is denoted by  $\mathbb{P}_{\text{exp}}$ .  $\lrcorner$

## 20 | Algebraic Geometry over Dedekind Schemes

### 20.1 Pseudo-Algebraically Closed Fields

References are [Field Arithmetic].

**Notation (20.1.0.1).**

- Let  $k \in \mathbf{Field}$ .

┘

#### 1 Pseudo-Algebraically Closed Fields

**Def. (20.1.1.1).**  $k \in \mathbf{Field}$  is called a **pseudo-algebraically closed field** or **PAC field** if every variety over  $k$  has a  $k$ -point.

┘

**Example (20.1.1.2) [PAC Fields].**

- Separably closed fields are PAC.
- Infinite algebraic extensions of finite fields are PAC.
- Ultraproducts of distinct finite fields are PAC.

┘

*Proof:*

□

#### 2 Hilbertian Fields

Cf. [Field Arithmetics] and [Ser97].

#### Thin Sets

**Def. (20.1.2.1) [Thin Sets].** For  $X \in \mathbf{Sch}_{\text{int}}^{\text{ft,sep}}/k$ , a subset  $\Omega \subset X(k)$  is called a **thin set** if there exists  $Y \in \mathbf{Sch}^{\text{ft,sep}}/k$  and a map  $f : Y \rightarrow X \in \mathbf{Sch}/k$  s.t.

- $\Omega \subset f(Y(k))$ .
- $f$  is generically quasi-finite and separable (7.4.5.6).
- $f$  has no rational sections.

┘

**Prop. (20.1.2.2).** For  $X \in \text{Sch}_{\text{int}}^{\text{ft,sep}}/k$  and  $U \subset X$  an non-empty open subscheme,  $\Omega \subset X(k)$  is a thin set in  $X$  iff  $\Omega \cap U(k)$  is a thin set in  $U$ .

A finite union of thin sets is a thin set. ┘

**Def. (20.1.2.3) [Two Types of Thin Sets].** For  $X \in \text{Sch}_{\text{int}}^{\text{ft,sep}}/k$ , there are two types of thin sets:

- A type 1 thin set is a set contained in a proper closed subscheme of  $X$  (because we can take the projection  $\text{id} : X \rightarrow X$ ).
- A type 2 thin set is a set of the form  $f(Y(k))$  where  $Y \in \text{Sch}_{\text{int}}^{\text{ft,sep}}/k$  and  $f : Y \rightarrow X$  is dominant finite separable of degree  $d \geq 2$  (7.4.5.6). We may assume that  $Y \in \text{Var}/k$ , because otherwise by (5.3.6.5)  $R(Y)$  contains a finite separable extension  $k'$  of  $k$ , and for any  $y \in Y(k)$ ,  $\mathcal{O}_{Y,y}$  doesn't contain  $k'$ , thus is non-normal (because  $k'$  is contained in its fraction field), and thus  $y$  is contained in the non-normal locus of  $Y$  (7.4.2.2), thus  $f(Y(k))$  is contained in a properly-contained closed subscheme.

Then every thin set of  $X(k)$  is contained in a finite union of thin sets of type1 or type2, by Zariski's main theorem (7.4.5.1). ┘

**Thm. (20.1.2.4).** Let  $X \in \text{Sch}/k$  be irreducible and  $f : X \rightarrow \mathbb{P}^n$  be a dominating morphism, then there exists a thin set  $\Omega \subset \mathbb{P}^n(k)$  for  $X$  (20.1.2.1) s.t. for all  $t \in \mathbb{P}^n(k) \setminus \Omega$ ,  $f^{-1}(t)$  is a finite set of points that are conjugate over  $k$ . ┘

*Proof:* Cf. [Ser97] P132. □

**Prop. (20.1.2.5) [Thin Sets and Linear Subspaces].** For  $k \in \text{Field}$  and  $1 \leq d \leq n \in \mathbb{Z}_+$  and any thin subset  $\Omega \subset \mathbb{P}^n(k)$ , there exists a non-empty open subset  $U \subset \text{Gr}(n; d)_k$  s.t.  $\Omega \cap L$  is a thin set in  $L$  for each  $L \in U(k)$  representing a rational linear subspace of  $\mathbb{P}^n$ . ┘

*Proof:* ? □

**Prop. (20.1.2.6) [Thin Sets and Field Extensions].** For a finite separable extension  $k'/k \in \text{Field}$ , if  $\Omega_1 \subset \mathbb{P}^n(k_1)$  is thin in  $\mathbb{P}^n/k_1$ , then  $\Omega = \Omega_1 \cap \mathbb{P}^n(k)$  is thin in  $\mathbb{P}^n/k$ . ┘

*Proof:* Cf. [Field Arithmetic, P223] or [Ser97]. □

**Remark (20.1.2.7).** The converse is false, Cf. [Field Arithmetic, 13.9.5]. ┘

### Hilbertian Fields

**Def. (20.1.2.8) [Hilbertian Fields].**  $k \in \text{Field}$  is called a **Hilbertian field** if  $\mathbb{P}^1(k)$  is not a thin set in the projective line  $\mathbb{P}^1/k$ . ┘

**Prop. (20.1.2.9).** For  $k \in \text{Field}$ ,

- If  $\mathbb{P}^1(k)$  is not a thin set in  $\mathbb{P}^1/k$ , then  $k$  is Hilbertian, by (20.1.2.5).
- If  $k$  is Hilbertian, then for each  $d \in \mathbb{Z}$  s.t.  $d \neq 0 \in k^\times$ , we have  $k^\times/(k^\times)^d$  is infinite. In particular, local fields are all non-Hilbertian.
- If  $k$  is Hilbertian and  $k'/k \in \text{Field}$  is a finite separable extension, then  $k_1$  is Hilbertian, by (20.1.2.6).
- If  $k$  is Hilbertian, then  $k(T)$  is also Hilbertian. (Cf. [Field Arithmetics] Chap13 ?). ┘

**Def. (20.1.2.10) [Hilbert Subsets].** For  $k \in \mathbf{Field}$  and a set of variables  $T_1, \dots, T_n$ , let  $f(\underline{T}, \underline{X}) \in k[\underline{T}, \underline{X}]$  be irreducible in  $k(\underline{T})[\underline{X}]$  and separable in  $\underline{X}$ , and let  $g \in k[\underline{T}]^\times$ . Then a subset of  $\mathbb{P}^n(k)$  the form

$$\{(t_1, \dots, t_r) \in k^r \mid g(\underline{t}) \neq 0, f(\underline{t}, \underline{X}) \text{ is irreducible}\}$$

is called a **separable Hilbert subset** of  $k^n$ . More generally, every finite intersection of such sets is also called a separable Hilbert subset of  $k^n$ .  $\perp$

**Prop. (20.1.2.11) [Hilbertian Fields and Separable Hilbert Subsets].** For  $k \in \mathbf{Field}$ ,  $k$  is a Hilbertian field iff every separable Hilbert subset of  $k^n$  is non-empty.  $\perp$

*Proof:* By (20.1.2.3), each separable Hilbertian subset of  $k^n$  is contained in the complement of a thin set in  $\mathbb{A}^n$ , thus  $k$  is a Hilbertian field if every separable Hilbert subset of  $k^n$  is non-empty.

Conversely, by (20.1.2.5), It suffices to show that every separable Hilbert subset of  $k^n$  contains a complement of a thin set in  $\mathbb{P}^n$ : Let  $f(\underline{T}, \underline{X})$  decompose as

$$f(\underline{T}, \underline{X}) = a_n(\underline{T}) \prod_{i=1}^n (X - \alpha_i(\underline{T}))$$

in  $\overline{k(\underline{T})}[\underline{X}]$ , then each  $(t_1, \dots, t_r)$  s.t.  $a_n(t_1, \dots, t_n) \neq 0$  and  $f(t_1, \dots, t_n, \underline{X})$  is reducible corresponds to a decomposition  $f(\underline{T}, \underline{X}) = g(\underline{T}, \underline{X})h(\underline{T}, \underline{X})$  in  $\overline{k(\underline{T})}[\underline{X}]$  s.t.  $g(t_1, \dots, t_n, \underline{X})$  has coefficients in  $k$ . But  $f$  is irreducible in  $k(\underline{T})[\underline{X}]$ , so  $g(\underline{T}, \underline{X})$  must have coefficients  $y \in \overline{k(\underline{T})} \setminus k(\underline{T})$ . Thus the curve  $\text{Spec}(k[x, y])$  which is separable over  $\mathbb{A}^n$  has a rational point mapping to  $(t_1, \dots, t_n)$ . Since there are only f.m. decompositions  $f(\underline{T}, \underline{X}) = g(\underline{T}, \underline{X})h(\underline{T}, \underline{X})$  in  $\overline{k(\underline{T})}[\underline{X}]$ , we know that this Hilbert subset contains the complement of a thin set, and the assertion follows.  $\square$

**Prop. (20.1.2.12) [Separable Extensions].** If  $L/K$  is a finite separable extension, then any separable Hilbert subset of  $L^r$  contains a separable Hilbert subset of  $K^r$ . In particular, if  $K$  is Hilbertian, then so is  $L$ .  $\perp$

### Examples of Hilbertian Fields

**Example (20.1.2.13) [Hilbertian Fields].**

- Global fields are Hilbertian.
- If  $k \in \mathbf{Field}$  and  $K$  is a f.g. transcendental extension of  $k$ , then  $K$  is Hilbertian.  $\perp$

*Proof:* Cf. [Field Arithmetic, Chap13].  $\square$

## 20.2 Heights and Diophantine Approximations

References are [Galois Cohomology, Serre]Chap2.4.5, [Wei50, B-G06], [Fundamentals of Diophantine Geometry, Lang].

### 1 Heights

**Def. (20.2.1.1) [Equivalent Height function].** Let  $X$  be a projective scheme, two height functions  $X(\overline{K}) \rightarrow \mathbb{R}$  are called equivalent iff they differ by a bounded function.  $\lrcorner$

**Prop. (20.2.1.2).** There is a way of constructing the Weil heights as a special case of the global heights, which are sum of local heights, Cf.[Diophantine Geometry, Chap2].  $\lrcorner$

### Heights on Projective Spaces

**Def. (20.2.1.3) [Canonical Heights on Projective Spaces].** For  $K \in \mathbf{LField}$  with base field  $K_0$  and  $x = (x_0, \dots, x_n) \in K^{n+1} \setminus \{0\}$ , suppose  $u$  is a normalized place on  $K^{\text{sep}}$  and  $v$  a normalized place of  $K$  s.t.  $u|v$ , denote  $\log(0) = -\infty$  and define

$$h_u((x_0, \dots, x_n)) = \max_i (\log |x_i|_u), \quad H_u((x_0, \dots, x_n)) = \exp(h_u((x_0, \dots, x_n))),$$

$$h_v((x_0, \dots, x_n)) = [K : K_0] h_u((x_0, \dots, x_n)), \quad H_v((x_0, \dots, x_n)) = \exp(h_v((x_0, \dots, x_n))).$$

And for  $F \in \mathbf{GField}$  over base field  $F_0$  and  $x \in \mathbb{P}^n(F)$ , define

$$h(x) = \frac{1}{[F : F_0]} \sum_{v \in \Sigma_F} h_v((x_0, \dots, x_n)), \quad H(x) = \exp(h(x)).$$

Equivalently,

$$H(x) = \|\mathbf{a}\|^{-1/[F:F_0]} \prod_{\tau \in \Sigma_F^\infty} \max_i |x_i|_\tau^{1/[F:F_0]}.$$

Then

- $h_u((x_0, \dots, x_n))$  is invariant under finite separable extensions of fields  $K'/K$ , thus this local height is defined on all  $(K^{\text{sep}})^{n+1}$ .
- $h(x)$  is well-defined.
- $h(x) \geq 0$ .
- $h(x)$  is invariant under extensions  $F'/F \in \mathbf{GField}$ , thus the height is defined on  $\mathbb{P}^n(F^{\text{sep}})$ .
- For  $\sigma \in \text{Gal}_F$ ,  $h(\sigma(x)) = h(x)$ .

These are called **canonical heights** and **multiplicative canonical heights** on  $\mathbb{P}^n$ .  $\lrcorner$

*Proof:* 1 is a consequence of the product formula(19.4.1.5). 2 follows from 1 because we can divide a constant to make a coordinate unit in  $K^*$ , thus clearly  $h(x) \geq 0$ . 3 follows from the fundamental identity.  $\square$

**Prop. (20.2.1.4).** For  $K \in \mathbf{LField}$  and  $P_1, \dots, P_r \in (K^{\text{sep}})^n$ ,

$$h_u(P_1 + \dots + P_r) \leq h_u(P_1) + \dots + h_u(P_r) + \varepsilon_u \log |r|_u,$$

where  $\varepsilon_u = 0$  if  $u$  is non-Archimedean and 1 otherwise.  $\lrcorner$

**Def. (20.2.1.5) [Height on Affine Spaces].** For  $F \in \mathbf{NField}$  and  $\underline{x} = (x_1, \dots, x_n) \in F^n$ , the **affine height** is defined to be:

$$h^+(\underline{x}) = h([1, \underline{x}]),$$

where  $[1, \underline{x}] \in \mathbb{P}^n(F)$ , and similarly we define  $H^+(\underline{x})$ .

In particular, if  $\alpha \in F$ , then the height of  $\alpha$  is

$$h^+(\alpha) = \frac{1}{[F : \mathbb{Q}]} \sum_{v \in \Sigma_F} \max(0, \log |\alpha|_v).$$

┘

**Lemma (20.2.1.6).** For  $\alpha \in \overline{\mathbb{Q}}$  and  $\lambda \in \mathbb{Q}$ , we have  $h(\alpha^\lambda) = |\lambda| h(\alpha)$ . ┘

*Proof:* For  $\lambda > 0$ , this is easy. So it suffices to consider  $\lambda = -1$ . Notice

$$\log |\alpha|_v = \max\{0, \log |\alpha|_v\} - \max\{0, \log |1/\alpha|_v\},$$

summing over all places  $v$  and use the product formula, we get the desired results.  $\square$

**Lemma (20.2.1.7) [Northcott].** Let  $F \in \mathbf{GField}$  and  $C > 0, d > 0$ , then  $\#\{x \in \mathbb{P}^n(\overline{F}) | h(x) \leq C, \deg(x) \leq d\} < \infty$ . ┘

*Proof:* We first reduce to the case  $k(x) = \mathbb{Q}$  or  $\mathbb{F}_p(t)$ : for a point  $x$  with  $[k(x) : \mathbb{Q}] \leq d$ , consider the point  $(X_0, \dots, X_m)$  in the projective space  $\mathbb{P}^m$  of forms of degree  $\deg(x)$  in  $n+1$  variables corresponding to  $\text{Nm}(\sum x_i T_i)$ . Notice the inverse image of any closed point in  $\mathbb{P}^m$  is a finite set in  $\mathbb{P}^n(\overline{K})$ , and the height of  $h((X_0, \dots, X_m)) \leq d!(n+1)h(x)$ , so it suffices to prove for  $\mathbb{P}^m(\mathbb{Q})$ . In this case, we normalize a point to a unique point with integral coordinates with no common divisors, then  $\max_i \log |x_i|_p = 0$  for any  $p$ , thus  $h(x) = h_\infty(x)$ , and clearly only f.m. points has bounded heights.  $\square$

**Prop. (20.2.1.8) [Change of Coordinates].** Let  $h_1, h_2$  be heights of  $\mathbb{P}(F^{\text{sep}})$  defined w.r.t. two coordinates systems, then  $h_1 - h_2 = O(1)$ . Thus we can consider heights in any particular coordinates that is convenient. ┘

*Proof:* The proof is straightforward.  $\square$

### Heights of Polynomials

**Def. (20.2.1.9) [Heights and Mahler Heights].** The height of a polynomial  $f(T) = x_0 + x_1 T + \dots + x_d T^d$  is defined to be  $h^+(f) = h^+((x_0, \dots, x_d))$ , and similarly for  $H^+(f)$ .

The **Mahler height** of  $f$  is defined to be? ┘

**Lemma (20.2.1.10) [Gelfond].** ┘

**Prop. (20.2.1.11).** Let  $f_1, \dots, f_m \in \overline{\mathbb{Q}}[X_1, \dots, X_n]$  of degree  $d$ , then

$$-d \log 2 + \sum_{j=1}^m h(f_j) \leq h(f) \leq d \log 2 + \sum_{j=1}^m h(f_j).$$

┘

*Proof:* Cf. [Bombieri, P28].?  $\square$

**Cor. (20.2.1.12).** Let  $d \in \mathbb{Z}_+$ , then there exists constants  $C_1, C_2 \in \mathbb{R}_+$  depending on  $d$  s.t. for any  $\alpha \in \overline{\mathbb{Q}}$  with  $\deg(\alpha) = d$ , if  $f_\alpha \in \mathbb{Z}[T]$  be a minimal polynomial of  $\alpha$  with coprime coefficients, then

$$dh^+(\alpha) - C_1 \leq h(f_\alpha) \leq dh^+(\alpha) + C_2.$$

┘

### House Heights

**Def. (20.2.1.13) [House Heights].** For  $F \in \mathbf{GField}$  and  $x = (x_1, \dots, x_n) \in \mathcal{O}_F^{\oplus n}$ , define

$$\overline{|x|} = \max_i \max_{\tau: F \rightarrow \mathbb{C}} |\tau(x)|.$$

┘

**Prop. (20.2.1.14) [House Heights and Projective Points].** For  $F \in \mathbf{NField}$  with  $[F : \mathbb{Q}] = d$  and  $n \in \mathbb{Z}_+$ , there exists  $c(F, n) \in \mathbb{R}_+$  s.t. any point  $x \in \mathbb{P}^n(F)$  is representable by  $x' = (x_0, \dots, x_n) \in \mathbb{A}^{n+1}(\mathcal{O}_F)$  s.t.

$$\overline{|x'|} \leq c(F, n) H(x) \text{ (20.2.1.13).}$$

┘

*Proof:* Let  $\mathfrak{c}_1, \dots, \mathfrak{c}_h \in \text{Ideal}(\mathcal{O}_F)^\times$  be a set of representative for the ideal class of  $F$ . Then we may choose  $x_0, \dots, x_n$  s.t.  $(x_0, \dots, x_n) = \mathfrak{c}_i$  for some  $i \in [h]_+$ . Then

$$H(x) = \|\mathfrak{c}_i\|^{-1/d} \prod_{\tau \in \Sigma_F^\infty} \max_j |x_j|_\tau^{1/d} \text{ (20.2.1.3).}$$

Now by property of the regulator map (20.8.1.6), there exists  $t \in \mathbb{R}_+$  and  $\varepsilon \in \mathcal{O}_F^\times$  s.t.

$$\log t + \log |\tau(\varepsilon)| = \max_j \log |\tau(x_j)| + O_F(1), \forall \tau : F \rightarrow \mathbb{C}.$$

Thus after multiplying each  $x_i$  by  $\varepsilon^{-1}$ , we get  $\max_j \log |x_j|_\tau = \log t + O_F(1)$  for each  $\tau$ . Then the assertion is clear.  $\square$

### Arakelov Heights

**Def. (20.2.1.15) [Arakelov Heights].** Let  $K \in \mathbf{LField}$  with base field  $K_0$  and  $x = (x_0, \dots, x_n) \in K^n$ , then for a normalized place  $u$  on  $K^{\text{sep}}$  and a normalized place  $v$  of  $K$  that  $u|v$ , define

$$h_u^{Ar}((x_0, \dots, x_n)) = \begin{cases} \log \max_i (|x_i|_u) & , K \in p\text{-Field} \\ \log \sqrt{\sum_{j=0}^n |x_j|_u^2} & , K \in \{\mathbb{R}, \mathbb{C}\} \end{cases}, \quad H_u^{Ar}((x_0, \dots, x_n)) = \exp(h_u^{Ar}((x_0, \dots, x_n)))$$

$$h_v^{Ar}((x_0, \dots, x_n)) = [K_v : K_0] h_u((x_0, \dots, x_n)), \quad H_v^{Ar}((x_0, \dots, x_n)) = \exp(h_v^{Ar}((x_0, \dots, x_n))).$$

And if  $F \in \mathbf{GField}$  over base field  $F_0$ , for  $x \in \mathbb{P}^n(F)$ , define

$$h^{Ar}(x) = \frac{1}{[F : F_0]} \sum_{v \in \Sigma_F} h_v(x), \quad H^{Ar}(x) = \exp(h^{Ar}(x)).$$

Then  $h^{Ar}(x), H^{Ar}(x)$  are well-defined, positive, and invariant under finite extensions of fields for the same reason as (20.2.1.3). Then they extends to the algebraic closure, called the **Arakelov heights** and **multiplicative Arakelov heights** on  $\mathbb{P}^n$ .  $\square$

**Cor. (20.2.1.16).** The Arakelov height is the height associated to the locally bounded metrized line bundle on  $\mathcal{O}_{\mathbb{P}^n}(1)$  with Fubini-Study metrics in the Archimedean places and standard metric in the non-Archimedean places, so it is equivalent to the canonical height.  $\square$

**Def. (20.2.1.17) [Arakelov Heights on Matrices].** The Arakelov heights induces a height function on the Grassmannians by the canonical embedding, and for any matrix  $A \in M_{n \times m}(\overline{F})$  of rank  $m$ , let the Arakelov heights of  $A$  be defined as the height of the point in the Grassmannian  $\text{Gr}_m(\overline{F})$  associated to the space spanned by the columns of  $A$ . And if  $A \in M_{m \times n}(F)$  of rank  $m$ , then its Arakelov height is defined to be  $H^{Ar}(A) = H^{Ar}(A^t)$ .

Equivalently, it is the height of the point in  $\mathbb{P}^{\binom{n}{m}-1}(F)$  represented by the  $m \times m$ -minors of  $A$ . And we can also define the local heights of  $A$  in this form.  $\perp$

**Prop. (20.2.1.18).** Let  $K = \mathbb{R}$  or  $\mathbb{C}$  and  $A \in M_{n \times m}(\overline{K})$  has rank  $m$ , then  $H_u(A) = \det(A^*A)^{1/2}$ , by Binet's formula (3.5.9.8).  $\perp$

**Prop. (20.2.1.19).** Let  $K$  be a local field and  $A = [B, C] \in M_{n \times m}(\overline{K})$  has rank  $m$ , then

$$H_u^{Ar}(A) \leq H_u^{Ar}(B)H_u^{Ar}(C).$$

$\perp$

**Prop. (20.2.1.20).** Let  $F \in \mathbf{GField}$  and  $W$  be a subspace of  $F^n$  and  $W^\perp \in (F^n)^* \cong F^n$  be the annihilator of  $W$ , then  $h^{Ar}([W]) = h^{Ar}([W^\perp])$ .  $\perp$

*Proof:* Cf. [B-G06]P68.  $\square$

**Prop. (20.2.1.21).** Let  $K$  be a local field and  $V, W$  be subspaces of  $\overline{K}^n$ , then

$$h_u^{Ar}([V + W]) + h_u^{Ar}([V \cap W]) \leq h_u^{Ar}([V]) + h_u^{Ar}([W]).$$

$\perp$

*Proof:* Cf. [B-G06]P69.  $\square$

**Prop. (20.2.1.22) [Metric on Projective Space].** Let  $K$  be a local field, for a normalized place  $u$  on  $\overline{K}$  and a normalized place  $v$  of  $K$  that  $u|v$ , for  $x, y \in (\overline{K})^n \setminus \{0\}$ , define

$$\delta_u(x, y) = \frac{H_u^{Ar}(x \wedge y)}{H_u^{Ar}(x)H_u^{Ar}(y)}, \quad \delta_v(x, y) = \delta_u(x, y)^{[K_v:(K_0)_{v_0}]},$$

then  $\delta(x, y) \in [0, 1]$  by (20.2.1.21), and defines a metric on  $\mathbb{P}^n(\overline{K})$ , called the **projective metric on  $\mathbb{P}^n$** . In the complex case, it is just the Fubini-Study metric.

And if  $F$  is a global field over base field  $F_0$ , for  $x, y \in \mathbb{P}^n(\overline{F})$ , define

$$\delta(x) = \prod_v \delta_v(x, y)^{\frac{1}{[F:F_0]}}.$$

$\perp$

*Proof:* Cf. [B-G06]P70.  $\square$

**Prop. (20.2.1.23).** Let  $F$  be a global field and  $x, y \in \mathbb{P}^1(\overline{F})$ , then

- If  $O = [0, 1]$ , then  $H^{Ar}(x) = \frac{1}{\delta(x, O)}$ .
- If  $x = [1, \alpha], y = [1, \beta]$ , then  $\delta(x, y) = \frac{1}{H^{Ar}(\alpha)H^{Ar}(\beta)}$ .

$\perp$

### Weil Heights

**Prop. (20.2.1.24).** Let  $X \in \mathcal{V}\text{ar}^{\text{Proj}}/k$  and  $\varphi : X \rightarrow \mathbb{P}^k, \psi : X \rightarrow \mathbb{P}^l \in \text{Sch}/k$ . If  $\varphi^*(\mathcal{O}_{\mathbb{P}^k}(1)) \cong \psi^*(\mathcal{O}_{\mathbb{P}^l}(1))$ , then the induced height function  $h_\varphi - h_\psi$  is bounded on  $X(k^{\text{sep}})$ .  $\lrcorner$

*Proof:* Let  $\varphi^*(\mathcal{O}_{\mathbb{P}^k}(1)) \cong \psi^*(\mathcal{O}_{\mathbb{P}^l}(1)) \cong L$ , then  $L$  is very ample. Consider a basis  $\{s_0, \dots, s_n\}$  of  $\Gamma(X, L)$ , then it induces a closed embedding  $\chi : X \rightarrow \mathbb{P}^n : x \mapsto [s_0(x), \dots, s_n(x)]$  and  $\chi^*(\mathcal{O}_{\mathbb{P}^n}(1)) \cong L$ . Then it suffices by symmetry to prove  $h_\varphi \sim h_\chi$ .

We may assume  $\varphi(X)$  is not contained in any proper linear subspace of  $X$ , so we can choose a basis  $T_0, \dots, T_k$  of  $\varphi^*(\Gamma(\mathbb{P}^k, \mathcal{O}_{\mathbb{P}^k}(1)))$ , and let  $s_0, \dots, s_k = T_0, \dots, T_k$ . Let  $x \in X(\overline{K})$ , let  $(x_0, \dots, x_n)$  be the coordinate of  $\chi(x)$  and  $(x_0, \dots, x_k)$  the coordinates of  $\varphi(x)$ . Then by the formula (20.2.1.3) clearly  $h_\varphi \leq h_\chi$ .

For the converse, let  $I$  be the homogenous ideal corresponding to  $X \subset \mathbb{P}^n$ , then  $X$  has coordinate ring  $R = K[T_0, \dots, T_n]/I$ . The  $T_0, \dots, T_k$  generates a radical ideal equal to  $(T_0, \dots, T_n)$ , because they have no common zero on  $X$ . Now there is an integer  $q$  and homogenous ideals  $F_{ij}$  that

$$T_{k+i}^q - \sum_{j=0}^k F_{ij}(T_0, \dots, T_n) T_j \in I$$

so

$$q \log |x_{k+i}|_v \leq (q-1) \max_{j \leq n} \log |x_j|_v + \max_{j \leq k} \log |x_j|_v + C_v$$

where  $C_v = 0$  unless  $v$  is Archimedean. Hence

$$\max_{j \leq n} \log |x_j|_v \leq \max_{j \leq k} \log |x_j|_v + C_v \Rightarrow h_\chi \leq h_\varphi + C.$$

$\square$

**Prop. (20.2.1.25) [Weil Height Functions].** Let  $F \in \mathbf{GField}$  and  $X \in \mathcal{V}\text{ar}^{\text{Proj}}/F$ , then for each element  $\mathcal{L} \in \text{Pic}(X)$ , we can assign a unique **Weil height**  $h_{\mathcal{L}} : X(F^{\text{sep}}) \rightarrow \mathbb{R}$ , determined up to bounded functions, s.t.

- $h_{\mathcal{L}_1 \otimes \mathcal{L}_2} - h_{\mathcal{L}_1} + h_{\mathcal{L}_2} = O(1)$ .
- If  $X = \mathbb{P}^n$ , then  $h_{\mathcal{O}(1)}$  is the height defined in (20.2.1.3).
- For any  $f : X \rightarrow Y \in \mathcal{V}\text{ar}^{\text{Proj}}/F$  and  $\mathcal{L} \in \text{Pic}(Y)$ , we have  $h_{f^*(\mathcal{L})} - h_{\mathcal{L}} \circ f = O(1)$ .

$\lrcorner$

*Proof:* The uniqueness follows from the fact that  $\text{Pic}(X)$  is generated by very ample line bundles because  $X$ . For the existence, we may take item2, 3 as definition of  $h_{\mathcal{L}}$  for  $\mathcal{L}$  very ample, and extend it to all  $\text{Pic}(X)$ . Then it suffices to verify item1.

Let  $L_1 = \varphi^*(\mathcal{O}(1)), L_2 = \psi^*(\mathcal{O}(1))$ , where  $\varphi : X \rightarrow \mathbb{P}^k, \psi : X \rightarrow \mathbb{P}^l$ . Denote  $\sigma : \mathbb{P}^k \times \mathbb{P}^l \rightarrow \mathbb{P}^{kl+k+l}$  the Segre embedding, then  $L_1 \otimes L_2 \cong \chi^*(\mathcal{O}_{\mathbb{P}^{kl+k+l}}(1))$  where  $\chi : X \xrightarrow{(\varphi, \psi)} \mathbb{P}^k \times \mathbb{P}^l \xrightarrow{\sigma} \mathbb{P}^{kl+k+l}$ . And we check  $h_\chi \sim h_\varphi + h_\psi$ .  $\square$

**Thm. (20.2.1.26) [Northcott].** Let  $F \in \mathbf{GField}$  and  $X \in \mathcal{V}\text{ar}^{\text{Proj}}/F$ , and let  $h_{\mathcal{L}}$  be a Weil height function associated to an ample class  $\mathcal{L} \in \text{Pic}(X)$  (20.2.1.25), then the set

$$\{P \in X(\overline{K}) | h_{\mathcal{L}}(P) \leq C, [K(P) : K] \leq d\}$$

is finite for any constant  $C, d$ .  $\lrcorner$

*Proof:* There is a  $m > 0$  that  $mc$  is very ample. Because  $mh_{\mathcal{L}} \sim h_{m\mathcal{L}}$  (20.2.1.25), we can assume that  $\mathcal{L}$  is very ample, thus reducing to  $X = \mathbb{P}^n$  and  $\mathcal{L} = \mathcal{O}(1)$  by (20.2.1.25). This follows from (20.2.1.7).  $\square$

**Prop. (20.2.1.27).** Let  $F \in \mathbf{NField}$ ,  $X \in \mathbf{SmProjVar}/F$  and  $\mathcal{L} \in \mathbf{Pic}(X)$  s.t.  $h_{\mathcal{L}} = O(1)$  on  $X(F^{\text{sep}})$ , then  $\mathcal{L} \in \mathbf{Pic}^0(X)$ .  $\lrcorner$

*Proof:* ? Cf. [Ser97]P46.  $\square$

**Prop. (20.2.1.28).** Let  $F \in \mathbf{GField}$ ,  $X \in \mathbf{SmProjVar}/F$  and  $c \in \mathbf{Pic}(X)$  an ample line bundle,  $c' \in \mathbf{Pic}^0(X)$ , then

$$h_{c'} = O(|h_c|^{1/2} + 1).$$

$\lrcorner$

*Proof:* By base change of fields, we may assume  $X$  has a rational point  $P_0$ . Consider the double Picard map  $\varphi : X \rightarrow \widehat{\mathbf{Pic}^0(X)} = \widehat{A}$ . Viewing  $c'$  as a rational point of  $A$ , consider  $c'' = (p_A)_{c'} \in \mathbf{Pic}(\widehat{A})$ , then  $\varphi^*(c'') = (\text{id} \times \varphi)^*(p_A)|_{c'} = (p_X)_{c'} = c'$ . Thus  $h_{c'} \sim h_{c''}$ .

Let  $\widehat{c}$  be an even ample line bundle on  $\widehat{A}$  (20.9.1.32), then for some  $n$  large,  $nc - \varphi^*(\widehat{c})$  is base-point-free, thus by (20.2.1.25),  $h_{\widehat{c} \circ \varphi} = O(|h_c| + 1)$ . Thus it suffices to prove for  $c', c$  changed to  $c'', \widehat{c}$ , which is true by (21.1.3.10).  $\square$

**Prop. (20.2.1.29)** [Weil Heights in Intersection Theory]. Cf. [B-G06]P44 ?  $\lrcorner$

### Bounded Sets

**Def. (20.2.1.30)** [Bounded Sets]. Let  $k \in \mathbf{Field}$  s.t.  $k = \overline{k}$  and  $|\cdot|$  be a valuation on  $k$ , Then:

- For  $X \in \mathbf{Aff}^{\text{ft}}/k$ , a subset  $E \subset X(\overline{k})$  is called **bounded** if for any  $f \in \mathcal{O}_X(X)$ ,  $|f|$  is bounded on  $E$ .
- For  $X \in \mathbf{Sch}^{\text{ft}}/k$ , a subset  $E \subset X(\overline{k})$  is called **bounded** if there exists a finite open affine covering  $U_i$  of  $X$  and sets  $E_i \subset U_i(\overline{k})$  that  $E_i$  is bounded in  $U_i$  and  $E = \cup E_i$ .

$\lrcorner$

**Prop. (20.2.1.31)** [Properties of Bounded Sets]. Let  $k \in \mathbf{Field}$ ,  $k = \overline{k}$  and  $|\cdot|$  valuation on  $k$ ,  $X \in \mathbf{Sch}^{\text{ft}}/k$  and  $E \subset X(\overline{k})$ , then:

- If  $k$  is locally compact, then  $E$  is bounded in  $X$  iff  $E \subset X(k)$  is relative compact in the  $k$ -topology.
- For a bounded set  $E$  in  $X$  and any finite open affine covering  $U_i$  of  $X$ , there is a division of  $E$ :

$$E = \cup E_i, \quad E_i \subset U_i(k)$$

and  $E_i$  being bounded in  $U_i$ .

- If  $E$  is bounded in  $X$  and  $Y$  is a closed subscheme of  $X$ , then  $E \cap Y(\overline{k})$  is bounded in  $Y$ .
- The image of a bounded set under a morphism is also bounded.
- $\mathbb{P}^n(\overline{k})$  is bounded in  $\mathbb{P}^n$ .
- The inverse image of bounded set under a proper morphism is bounded. In particular, if  $X/k$  is proper, then  $X(\overline{k})$  is bounded in  $X$ .

┘

*Proof:* 1: Because  $X$  is separated, it suffices to prove for  $X$  affine. And we can also take a refinement of the covering, thus assuming  $U_i = X_{h_i}$ . Suppose  $\sum g_i h_i = 1$ , and let  $E_i = \{P \in E \mid |h_i(P)| = \max_k |h_k(P)|\}$ , then  $E_i \subset U_i(\overline{K})$ . To show  $E_i$  is bounded in  $U_i$ , it suffices to show  $|1/h_i|$  is bounded in  $E_i$ . But this is clear, because  $|g_i|$  is bounded on  $E$ .

2: Use local coordinates.

4: Use the affine open covering  $X_i = \{x_i \neq 0\}$ , and let  $E_i = \{|x_i| = \max_{j=0,\dots,n} |x_j|\}$ , then clearly  $E_i$  is bounded in  $X_i$ .

5: Cf.[Diophantine Geometry, P55], may use Chow's lemma ?. □

**Prop. (20.2.1.32).** Let  $k \in \mathbf{Field}$  be a CDVR, and  $V \subset \mathbb{A}^n \in \mathbf{Sch}/k$  is a closed subscheme with no  $k$ -points at infinite, then  $V(k)$  is bounded in  $V$ . ┘

*Proof:* Let  $\overline{V}$  be the closure of  $V$  in  $\mathbb{P}^n$ , then we may assume that  $V$  is defined over  $\mathcal{O}_K$ . Then by Greenberg's theorem[Rational points in Henselian discrete valuation rings] ?, there exists  $n \in \mathbb{Z}_+$  s.t.  $(\overline{V} \setminus V)(\mathcal{O}_K/\mathfrak{m}_K^n) = \emptyset$ , which means that  $\min(v(x_i)) \leq n - 1$  for any  $x = (x_1, \dots, x_n) \in V(k)$ . □

**Prop. (20.2.1.33) [Σ-Bounded Sets].** Let  $F \in \mathbf{Field}$  and  $\Sigma$  is a set of places on  $K$  that any  $\alpha \in F^\times$  has only f.m. of nonzero valuations. Then  $(E^u)_{u \in \Sigma}$  is said to be **Σ-bounded** in an affine variety  $X$  if for any  $f \in K[X]$ ,

$$C_v(f) = \sup_{u \in M, u|v} \sup_{P \in E^u} |f(P)|_u$$

is finite for any  $v \in M_K$  and  $C_v(f) > 1$  for only f.m.  $v$ .

And we can also define  $\Sigma$ -bounded subsets of any variety  $X/K$  as in (20.2.1.30). Then similar properties as in (20.2.1.31) hold for  $M$ -bounded sets. ┘

**Def. (20.2.1.34) [Locally Bounded Functions].** Situation as in (20.2.1.33), a function  $f : X(\overline{K}) \rightarrow \mathbb{R}$  is called **locally bounded** if  $f(E)$  is bounded for every  $\Sigma$ -bounded set  $E$  in  $X$ . ┘

### Distance Functions

**Def. (20.2.1.35) [Distance Function on Curves].** Let  $C$  be a curve over a valued field  $K$ , let for  $P, Q \in C(K)$ , the  $v$ -**adic distance** function  $d_v(P; Q)$  be defined to be  $d_v(P; Q) = \min(|t_Q(P)|_v^{1/e}, 1)$ , where  $t_Q$  is a function with only one zero of order  $e$  at  $Q$ .

To understand this definition, it is just same as the pullback of the local height via  $t_Q$ . It is a special case of local heights. ┘

**Prop. (20.2.1.36).** Let  $C$  be a curve over a valued field  $K$  and  $F \in K(C)$ , then

$$\lim_{P \in C(K), d_v(P, Q) \rightarrow 0} \frac{\log |F(P)|_v}{\log d_v(P, Q)} = \text{ord}_Q(F).$$

┘

*Proof:* In taking limit, scaling  $t_Q$  by a constant doesn't matter, so If we change  $h_{\mathcal{O}(-Q)}$  to  $h_{\mathcal{O}(-kQ)}^{1/k}$ , the limit won't change, so we will do so and assume  $k$  is large enough s.t. there is a function that has only zeros at  $P$  of order  $k$ , so  $f^* \mathcal{O}(1) = \mathcal{O}(-kP)$ , and thus we may change  $\mathcal{O}(kP)$  to  $f^* \mathcal{O}(1)$  and then we see  $f^{\text{ord}_Q(F)} / F^k$  is regular and non-vanishing at  $Q$ , thus we can easily get the desired result. □

**Prop. (20.2.1.37).** If  $\varphi : C_1 \rightarrow C_2$  is a non-constant map of curves over a valued field  $K$ , then for  $Q \in C_1$ ,

$$\lim_{P \in C(K), d_v(P, Q) \rightarrow 0} \frac{\log d_v(\varphi(P), \varphi(Q))}{\log d_v(P, Q)} = e_Q(\varphi).$$

┘

*Proof:* Similar as that of (20.2.1.36). In fact (20.2.1.36) can be derived from this one.  $\square$

## Metricized Line Bundles

### Chevalley-Weil Theorem

References are [B-G06].

**Prop. (20.2.1.38) [Local Chevalley-Weil Theorem].** Let  $K$  be a non-Archimedean valued field,  $f : Y \rightarrow X \in \mathcal{V}\text{ar}/K$  be a finite unramified morphism of  $K$ -varieties and  $E$  a bounded set in  $X(\overline{K})$  (20.2.1.30). Then there is an  $\alpha \in \mathcal{O}_K^\times$  s.t.  $\alpha \in \widehat{\text{disc}}(P/Q)$  whenever  $P \in Y(\overline{K})$  and  $Q = f(P) \in E$ .  $\square$

*Proof:* An unramified map is locally of the form a closed embedding of a standard étale morphism<sup>?</sup>, thus there are f.m.  $U_i, V_i$  covering  $X, Y$  respectively that  $V_i \rightarrow U_i$  is closed embedding  $V_i \rightarrow W_i$  of a standard étale morphism  $W_i \rightarrow U_i$ . Because  $\varphi$  is finite hence proper,  $\varphi^{-1}(E)$  is bounded by (20.2.1.31), thus there is a decomposition of  $\varphi^{-1}(E)$  into bounded sets  $E'_i \subset V_i$ . Then it suffices to prove for standard étale morphisms, because we can then multiply them.

The image of  $E_i$  in  $W_i$  is also bounded. Let  $W_i \rightarrow U_i : \text{Spec}(A[t]/f) \rightarrow \text{Spec } A$ , where

$$f = t^d + a_1 t^{d-1} + \dots + a_d, \quad a_i \in A.$$

By boundedness, there is an  $a \neq 0 \in R$  that

$$\max_{i=1, \dots, d} \sup_{P \in E'} |a_i(\varphi(P))| \leq |a|^{-1}.$$

Then  $\xi = at_P$  is a root of the polynomial

$$g_Q(t) = t^d + aa_1(Q)t^{d-1} + \dots + a^d a_d(Q),$$

and it is easily verified that  $|\xi| \leq 1$  thus  $\xi \in R_P$ . Now let  $g_\xi$  be the minimal polynomial of  $\xi$  over  $\widehat{K(Q)}$ , then  $g_Q = g_\xi h$ ,  $h \in \widehat{K(Q)}[t]$ . By Gauss lemma in fact  $g_\xi, h \in \widehat{R_Q}[t]$ .

Now the elements  $1, \xi, \dots, \xi^{d-1}$  form a basis of  $\widehat{K(P)}/\widehat{K(Q)}$ , so the discriminant  $D_{g_\xi} \in \delta_{\widehat{K(P)}/\widehat{K(Q)}}$ .

By?? and (5.2.7.37),  $|D_{g_\xi}| = |N_{\widehat{K(P)}/\widehat{K(Q)}}(g'_\xi(\xi))| = |g'_\xi(\xi)|^{\widehat{d}}$ . But

$$g'_\xi(\xi)h(\xi) = g'_Q(\xi) = a^{d-1}f'_Q(\xi) = a^{d-1}f'_Q(t_P) = a^{d-1}f'(P).$$

Because  $f'$  is unit, we have  $|D_{g_\xi}^{-1}|$  is bounded on  $E'$ . So there is an  $\alpha \neq 0 \in R$  that  $|D_{g_\xi}| \geq |\alpha|$ , independent of  $P$ . Then we are done, as  $D_{g_\xi} \in \delta_{\widehat{K_P}/\widehat{K_Q}}$ .  $\square$

**Lemma (20.2.1.39) [Global Chevalley-Weil].** Let  $F \in \text{Field}$  and  $\Sigma$  be a set of discrete valuations of  $F$  s.t. any  $\alpha \in F^\times$  has only f.m. nonzero valuations. Suppose  $f : Y \rightarrow X \in \mathcal{V}\text{ar}^{\text{proper}}/K$  is an unramified finite map, and  $(E^u)_{u \in \Sigma}$  is a  $\Sigma$ -bounded family in  $X$  (20.2.1.33), then for every  $v \in \Sigma$  there exists  $\alpha_v \in \mathcal{O}_{F,v}^\times$  that  $\alpha_v \in \delta_{P/Q}^u$  whenever  $u|v$  and  $P \in Y(\overline{K})$  with  $\varphi(P) = Q \in E^u$ . Moreover,  $\alpha_v = 1$  for a.e.  $v \in \Sigma$ .  $\square$

*Proof:* The proof is exactly the same as that of (20.2.1.38), noticing that  $a, \alpha$  depend only on  $v$  but not  $u|v$ , and also  $a = \alpha = 1$  for a.e.  $v$  by (20.2.1.33).  $\square$

**Lemma (20.2.1.40) [Global Chevalley-Weil Theorem for Discrete Valuations].** Let  $F \in \text{Field}$  and  $\Sigma$  be a set of discrete valuations of a field  $F$  s.t. any  $\alpha \in F^\times$  has only f.m. nonzero valuations. Suppose  $f : Y \rightarrow X \in \text{Var}^{\text{proper}}/K$  is an unramified finite map, then there exists  $\emptyset \subset_{\text{fin}} S \subset \Sigma$  and for any  $v \in S$  a nonzero element  $\alpha_v \in \mathfrak{p}_v$  s.t. for any  $P \in Y(F^{\text{sep}})$  and  $Q = f(P)$ , and any place  $w_0|v$  of  $K(Q)$ ,  $\kappa(P)/\kappa(Q)$  is unramified outside  $S$  and if  $v \in S$  we have  $\alpha_v \in \delta_{P/Q}^{w_0}$ .  $\lrcorner$

*Proof:* We may assume  $f$  is surjective because it is closed (finite is proper). Notice  $X(\overline{K})$  is  $M$ -bounded in  $X$  (20.2.1.31), where  $M$  is the set of valuations of  $\overline{K}$  extending that of  $M_K$ . Then we can use global Chevalley-Weil theorem (20.2.1.39) to find elements  $\alpha_v$  for  $v \in M_K$ . Now notice

$$\text{disc}(P/Q)^{w_0} = \prod_{w|w_0} (\widehat{\text{disc}(P/Q)}^w \cap \mathcal{O}_{Q,v})$$

by (5.2.7.40), and the number of  $w \in M_{K(P)}, w|w_0$  is bounded by  $[K(P) : K(Q)]$ , which is further bounded by  $\deg(f)$  as in (20.2.1.38). Hence we can take  $\alpha_v = \alpha_v^{\deg(f)}$  to finish the proof.  $\square$

**Lemma (20.2.1.41).** Let  $F$  be a global field or the function field of a non-singular curve over a field  $k$ , and let  $f : Y \rightarrow X \in \text{Var}^{\text{proper}}/K$  be unramified and finite. Then there exists  $\alpha \in \mathcal{O}_F^\times$  s.t. for any  $P \in X(F^{\text{sep}})$  and  $Q = \varphi(P)$ , we have  $\alpha \in \text{disc}_{P/Q}$ .  $\lrcorner$

*Proof:* By (7.13.1.15), we can use the above lemma (20.2.1.40) to  $\Sigma = \Sigma_F$ . Notice that because

$$\text{disc}(P/Q) = \prod_{w_0 \in \Sigma_{\kappa(Q)}^{\text{fin}}} (\text{disc}(P/Q)^{w_0} \cap \mathcal{O}_{X,Q}),$$

we can assume  $\alpha_v \in \mathcal{O}_{X,Q}$ , and take  $\alpha = \prod_{v \in \Sigma} \alpha_v$ , which is a finite product by (20.2.1.40).  $\square$

**Thm. (20.2.1.42) [Chevalley-Weil].** Let  $F$  be a global field or the function field of a non-singular curve over a field  $k$ , and let  $f : Y \rightarrow X \in \text{Var}^{\text{proper}}/K$  be an unramified finite map. Then there exists  $L/K \in \text{GalField}^{\text{fin}}$  s.t. for any  $P \in Y(K^{\text{sep}})$  with  $f(P) \in X(K)$ , we have  $P \in Y(L)$ .  $\lrcorner$

*Proof:* By Chevalley-Weil theorem (20.2.1.41), there is an  $\alpha \in \mathcal{O}_F^\times$  that  $\alpha \in \text{disc}(P/Q)$  for any  $P \in Y(F^s)$  with  $f(P) \in X(K)$ . Thus  $\kappa(P)/\kappa(Q)$  is unramified outside  $S_F(\alpha)$ . But then Hemite's theorem (20.8.1.8) shows there are only f.m. possibilities of  $\kappa(P)$ , and the assertion follows.  $\square$

## 2 Canonical Heights

References are [Call-Silverman. Canonical heights on varieties with morphisms].

**Prop. (20.2.2.1) [Tate's Limiting argument].**  $\lrcorner$

*Proof:* Cf. [B-G06] P285. ?  $\square$

**Cor. (20.2.2.2).** Tate's limiting argument gives another way of constructing Néron-Tate heights. More generally, for any projective variety  $X$  over a global field  $K$ , if  $\varphi : X \rightarrow X$  a morphism over  $K$ ,  $\mathcal{L}$  a line bundle on  $X$  and  $k, l \in \mathbb{Z}, |k| > |l|$  that

$$l\varphi^*(\mathcal{L}) = k\mathcal{L},$$

then there is a unique function  $\widehat{h}_{\varphi, \mathcal{L}}$  in the equivalent class of  $h_{\mathcal{L}}$  that

$$l\widehat{h}_{\varphi, \mathcal{L}}(\varphi(x)) = k\widehat{h}_{\varphi, \mathcal{L}}(x).$$

In particular, the Néron-Tate heights on an Abelian variety for an even or odd line bundle is obtained by taking  $\varphi = [m]$  for some  $m \geq 2$ .  $\lrcorner$

*Proof:* Assume  $l \neq 0$ , consider the subgroup  $\mathcal{N} = \{\lambda^r | r \in \mathbb{N}\}$ , where  $\lambda = k/l$ , and  $\mathcal{N}$  acts on  $X(\overline{K})$  by  $\lambda^r \cdot x = \varphi^r(x)$ , then  $h_{\mathcal{L}}$  is quasi-homogenous of degree 1, so Tate's limiting argument (20.2.2.1) shows

$$\widehat{h}_{\varphi, \mathcal{L}}(x) = \lim_{r \rightarrow \infty} \lambda^{-r} h_{\mathcal{L}}(\varphi^r(x))$$

satisfies the requirement. And similarly, it is non-negative if  $c$  is ample or base-free.  $\square$

### 3 Approximations of Algebraic Numbers

#### Subspace Theorem

References are [Sch70, F-W94, Eve96, E-S02, B-G06].

**Lemma (20.2.3.1).**  $\lrcorner$

**Thm. (20.2.3.2) [Subspace Theorem, Schmidt/Vojta].** For  $F \in \mathbf{NField}$  and  $S \subset \Sigma_F$  a finite subset of places,  $n \in \mathbb{N}, \varepsilon \in \mathbb{R}_+$ . For  $v \in S$ , let  $\{L_{v0}, \dots, L_{vm_v}\}$  be a set of linear forms in  $\overline{F}_v[X_0, \dots, X_n]$  in general position. Then

- If  $\Sigma_F^\infty \subset S$ , then there are f.m. rational linear hyperspaces  $T_1, \dots, T_h$  of  $\mathbb{A}_F^{n+1}$  s.t.

$$\left\{ \underline{x} \in \mathcal{O}_{F,S}^{n+1} \setminus \{0\} \mid \prod_{v \in S} \prod_{i=0}^{m_v} |L_{vi}(\underline{x})|_v < H([\underline{x}])^{-\varepsilon} \right\} \subset T_1 \cup \dots \cup T_h.$$

- There exists f.m. rational hyperplanes  $T_1, \dots, T_h$  of  $\mathbb{P}_F^n$  s.t.

$$\left\{ [\underline{x}] \in \mathbb{P}^n(F) \mid \prod_{v \in S} \prod_{i=0}^{m_v} \frac{|L_{vi}(\underline{x})|_v}{H_v(\underline{x})} < H([\underline{x}])^{-n-1-\varepsilon} \right\} \subset T_1 \cup \dots \cup T_h.$$

$\lrcorner$

*Proof:* 2: Firstly, it suffices to prove for  $m_v = n$  for any  $v$ : We may assume  $m_v \geq n$  by adding coordinate functions. And after partitioning into f.m. cases and reordering, we may assume that

$$|L_{v0}(\underline{x})|_v \leq |L_{v1}(\underline{x})|_v \leq \dots \leq |L_{vm_v}(\underline{x})|_v.$$

As  $L_{v0}, \dots, L_{vn}$  are linearly independent, they form a basis for  $\mathcal{O}_{\mathbb{P}^n}(1)$ , so there are constants  $C_v$  s.t.

$$H_v(\underline{x}) \leq C_v \max_{0 \leq i \leq n} |L_{vi}(\underline{x})|_v = C_v |L_{vn}(\underline{x})|_v \leq C_v |L_{vk}(\underline{x})|_v, \forall k > n.$$

Thus

$$\prod_{v \in S} \prod_{i=0}^n \frac{|L_{vi}(\underline{x})|_v}{H_v(\underline{x})} \leq C \prod_{v \in S} \prod_{i=0}^{m_v} \frac{|L_{vi}(\underline{x})|_v}{H_v(\underline{x})},$$

and the assertion follows from the case  $m_v = n$ , as the constant  $C$  can be eliminated by applying Northcott's theorem (20.2.1.26).

Secondly, item2 implies item1: For  $\underline{x} \in \mathcal{O}_{F,S}^{n+1}$ ,

$$H([\underline{x}]) = \prod_{v \in \Sigma_F} H_v(\underline{x}) \leq \prod_{v \in S} H_v(\underline{x}),$$

so  $[\underline{x}]$  is in the set considered in item2. And any two  $\underline{x}, \underline{x}'$  with  $[\underline{x}] = [\underline{x}']$  are contained in the same hyperplane.

Conversely, item1 implies item2: We may assume that  $S$  is sufficiently large that  $\Sigma_F^\infty \subset S$  and  $\text{cl}(\mathcal{O}_{F,S}) < \infty$ , because if we add a place  $v$  and take  $L_{vi}(\underline{x}) = x_i$ , then  $|L_{vi}(\underline{x})|_v \leq H_v(\underline{x})$  for each  $i$ . Then for any  $[\underline{x}]$  satisfying the inequality of item2, take the fractional ideal

$$\mathfrak{X} = \sum x_i \mathcal{O}_{F,S},$$

then  $\mathfrak{X} = (\delta)$  for some  $\delta \in K^\times$ . And If  $v \notin S$ , we can see that  $|\delta|_v = \max_i |x_i|_v = H_v(\underline{x})$ . So we may change  $\underline{x}$  to  $\underline{x}' = \delta^{-1} \underline{x}$ , in which case,  $\underline{x}' \in \mathcal{O}_{F,S}^{n+1} \setminus \{0\}$ , and  $H_v(\underline{x}') = 1$  for  $v \notin S$ . So  $\prod_{v \in S} H_v(\underline{x}') = H([\underline{x}']) = H([\underline{x}])$ , and the inequality in item2 implies  $\underline{x}'$  is in the subset in item1. Thus we are done.

Thus it suffices to prove item1: For this, Cf. [B-G06]P197. ?

□

**Cor. (20.2.3.3) [Schmidt].** Let  $\alpha_0, \dots, \alpha_n \in \overline{\mathbb{Q}}$ , then for any  $\varepsilon \in \mathbb{R}_+$ , there are only f.m.  $\underline{x} \in \mathbb{Z}^{n+1}$  s.t.

$$0 < |\alpha_0 x_0 + \dots + \alpha_n x_n| \leq H(\underline{x})^{-n-\varepsilon}.$$

┘

*Proof:* Use induction on  $n$ . For  $n = 0$ , this is trivial. For  $n \geq 1$ , the subspace theorem (20.2.3.2) with

$$F = \mathbb{Q}, S = \{\infty\}, L_{v0} = \alpha_0 X_0 + \dots + \alpha_n X_n, \quad L_{vi} = X_i, 1 \leq i \leq n$$

implies that the desired set is contained in f.m. rational linear subspaces of  $\mathbb{A}_{\mathbb{Q}}^{n+1}$ . Thus we can assume that the desired set all satisfy a linear relation of the form  $\sum_j A_j X_j = 0$ , with  $A_n \neq 0$ . Then with  $\beta_n = \alpha_i - \alpha_n A_i / A_n$ ,

$$0 < |\alpha_0 x_0 + \dots + \alpha_n x_n| = |\beta_0 x_0 + \dots + \beta_{n-1} x_{n-1}| \leq H(x)^{-n-\varepsilon} \leq H(x)^{-n+1-\varepsilon}.$$

Thus the assertion follows from induction hypothesis.

□

**Cor. (20.2.3.4) [Schmidt].** Let  $\alpha \in \overline{\mathbb{Q}}$  and  $d \in \mathbb{Z}_+, \varepsilon \in \mathbb{R}_+$ , then there exists only f.m.  $\xi \in \overline{\mathbb{Q}}$  with  $\deg(\xi) = d$  and

$$|\alpha - \xi| \leq H^+(\xi)^{-d(d+1)-\varepsilon},$$

┘

*Proof:* For any such  $\xi$ ,  $|\xi - \alpha| \leq 1$ , and we may assume that  $\xi$  is not conjugate to  $\alpha$ , so  $f_\xi(\alpha) \neq 0$ . Suppose  $f_\xi = x_0 + x_1 T + \dots + x_d T^d \in \mathbb{Z}[T]$  with coprime coefficients, then  $H(f_\xi) = \Theta(H^+(\xi)^d)$  by (20.2.1.12). Thus by mean-value theorem,

$$0 < |f_\xi(\alpha)| = |x_0 + x_1 \alpha + \dots + x_d \alpha^d| \leq C_\alpha |\alpha - \xi| H(f_\xi) \leq H(f_\xi)^{-d-\frac{\varepsilon}{d}} = H(\underline{x})^{-d-\frac{\varepsilon}{d}}.$$

So the assertion follows from (20.2.3.3).

□

**Prop. (20.2.3.5) [Absolute Subspace Theorem, Evertse-Schlickewei].** [B-G06]P228. ?

┘

**Roth's Theorem****Prop. (20.2.3.6).** ┘**Lemma (20.2.3.7) [Roth's Lemma].** ┘**Thm. (20.2.3.8) [Roth].** Let  $F \in \mathbf{NField}$  and  $\Sigma_F^\infty \subset S \subset \Sigma_F$  be finite, and for each  $v \in S$  a number  $\alpha_v \in \overline{F}_v$ . Then for any  $\varepsilon > 0$ , there are only f.m.  $\beta \in F$  that

$$\prod_{v \in S} H_v(\beta - \alpha_v) = \prod_{v \in S} \min(1, |\beta - \alpha_v|_v) \leq H^+(\beta)^{-2-\varepsilon} \quad (20.2.1.5).$$

Moreover,  $\alpha_v$  can be  $\infty$  as well, in the sense that  $|\beta - \alpha_v|_v = |\beta|_v^{-1}$ . ┘*Proof:* It is clear that it suffices to show that there are only f.m.  $\beta \in F$  s.t.

$$\prod_{v \in S} |\beta - \alpha_v|_v \leq H^+(\beta)^{-2-\varepsilon}, \quad |\beta - \alpha_v|_v < 1.$$

Let  $x = [1, \beta] \in \mathbb{P}^1(K)$  and let  $L_{v0} = X_1 - \alpha_v X_0$  (If  $\alpha_v = \infty$ , take  $L_{v0} = X_0$ ), then for any such  $\beta$ ,

$$\prod_{v \in S} \frac{|L_{v0}(x)|_v}{H_v(\underline{x})} = \prod_{v \in S} |\beta - \alpha_v|_v \max(1, |\beta|_v)^{-1} \leq H^+(\beta)^{-2-\varepsilon}.$$

Thus the assertion follows from the subspace theorem (20.2.3.2). □**Remark (20.2.3.9).** The exponent in Roth's theorem is the best possible, by (20.2.4.4).This theorem is ineffective in the sense it doesn't give a maximal bound on  $H(\beta)$  for a solution  $\beta$ , but it is effective in the sense it gives a bound for the number of solutions. ┘**Remark (20.2.3.10).** This is not true for function fields, as if we choose  $F$  to be the splitting field of the separable polynomial  $x^q - x + t$  over  $\mathbb{F}_p(t)$ , then there is a valuation  $w$  over the valuation  $v$  corresponding to  $(t)$  s.t.  $F_w = \mathbb{F}_p((t))$ , and  $\alpha = t + t^q + t^{q^2} + \dots$ . Take  $\beta_k = t + t^q + \dots + t^{q^k}$ , then  $|\beta_k - \alpha|_v = c^{-q^{k+1}}$  with  $H(\beta_k) = c^{q^k} = H(\beta)^{-q}$ , thus cannot have a Roth's theorem. ┘*Proof:* □**Cor. (20.2.3.11) [Classical Roth's Theorem].** For any  $\alpha \in \overline{\mathbb{Q}}$  and  $\varepsilon > 0$ , there are only f.m.  $p/q \in \mathbb{Q}$  s.t.  $|p/q - \alpha| \leq |q|^{-2-\varepsilon}$ . ┘*Proof:* Take  $F = \mathbb{Q}$ ,  $S = \{\infty\}$  and  $\alpha_\infty = \alpha$ , then use Roth's theorem (20.2.3.8). □**Cor. (20.2.3.12).** For  $p \in \mathbf{Prime}$ ,  $\alpha \in \mathbb{Q}_p$  and  $\varepsilon > 0$ , there are only f.m.  $n \in \mathbb{Z}$  s.t.  $|n - \alpha|_p \leq |n|^{-1-\varepsilon}$ . ┘*Proof:* Take  $F = \mathbb{Q}$ ,  $S = \{\infty, p\}$  and  $\alpha_\infty = \infty$ ,  $\alpha_p = \alpha$ , then use Roth's theorem (20.2.3.8). □**Cor. (20.2.3.13) [Another Interpretation].** Let  $F \in \mathbf{GField}$  and  $v$  a valuation of  $\overline{F}$ ,  $C$  be a complete curve over  $F$  and  $Q \in C(\overline{F})$ , then for  $f \in K(C)^*$ ,

$$\lim_{P \in C(F), d_v(P, Q) \rightarrow 0} \frac{\log d_v(P; Q)}{\log H_F(f(P))} \geq -2.$$

┘

*Proof:* Replacing  $f$  by  $1/f$  if necessary, we can assume  $f(Q) \neq \infty$ . Let  $f - f(Q)$  has order  $e$  at  $Q$ , then by (20.2.1.36),

$$\lim_{P \in C(F), d_v(P, Q) \rightarrow 0} \frac{\log |f(P) - f(Q)|_v}{\log d_v(P, Q)} = e.$$

And Roth's theorem implies

$$H_K(f(P))^{2+\varepsilon} |f(P) - f(Q)|_v \geq 1$$

for a.e.  $P$ . Thus by taking limit and varying  $\varepsilon$ , the conclusion follows.  $\square$

**Cor. (20.2.3.14) [Thue's Equation].** Let  $F(x, y) \in \mathbb{Z}[x, y]$  be a homogenous polynomial that has at least three different linear factors in  $\mathbb{C}[x, y]$ , then for any  $m \in \mathbb{Z}^\times$ , there are only f.m. solutions of  $F(x, y) = m$  in  $\mathbb{Z}^2$ .  $\lrcorner$

*Proof:* Let  $F_1, \dots, F_r$  be non-isomorphic irreducible polynomials in  $\mathbb{Z}[x, y]$  dividing  $F$ , suppose there are i.m. solutions to  $F(x, y) = m$ , then there are inf.m. rational points  $x_n/y_n$  converging but not equal to a root of  $F_i$  for each  $i$ . Thus  $r = 1$ , and  $\deg F_1 \geq 3$  by hypothesis. And it is clear that for some root  $\alpha$  of  $F_1$  and some constant  $C > 0$ , there are i.m. rational points  $n$  s.t.  $|x_n/y_n - \alpha| \leq C|y_n|^{-3}$ , contradicting Roth's theorem (20.2.3.11).  $\square$

**Prop. (20.2.3.15) [Quantitative Bounds for Roth's Theorem].** Cf. [B-G06] Chap 6.5.  $\lrcorner$

**Prop. (20.2.3.16) [Liouville].** Let  $\alpha \in \overline{\mathbb{Q}}, d = \deg(\alpha) \geq 2$ , then there is a constant  $C > 0$  s.t. for all  $p/q \in \mathbb{Q}$ ,  $|p/q - \alpha| \geq C/q^d$ . Notice only the  $d = 2$  case is not covered by Roth's theorem (20.2.3.11).  $\lrcorner$

*Proof:* We can assume  $\alpha \in \mathbb{R}$ , because otherwise  $C = \text{Im } \alpha$  works. Let  $f(T) \in \mathbb{Z}[T]$  be a minimal polynomial of  $\alpha$  over  $\mathbb{Q}$ , then  $f$  has no roots in  $\mathbb{Q}$ . Suppose  $C_1$  is the maximum of  $|f'(t)|$  for  $t \in [\alpha - 1, \alpha + 1]$ . Suppose  $|p/q - \alpha| \leq 1$ , then  $|f(p/q)| = |f(p/q) - f(\alpha)| \leq C_1|p/q - \alpha|$ , and also  $q^d f(p/q) \in \mathbb{Z}$  thus  $|q^d f(p/q)| \geq 1$ . Thus we get  $|p/q - \alpha| \geq 1/C_1 q^d$ . Thus for general  $p/q$ ,  $C = \min(C_1^{-1}, 1)$  works.  $\square$

### Diophantine Approximation on Abelian Varieties

**Prop. (20.2.3.17) [Product Theorem, Faltings].** Suppose  $k \in \text{Field}^0, k = \overline{k}, m, n_1, \dots, n_m \in \mathbb{Z}_+$ ,  $P = \mathbb{P}_k^{n_1} \times \dots \times \mathbb{P}_k^{n_m}$ , for any  $f \in \Gamma(P, \mathcal{O}_P(d_1, \dots, d_m)) \setminus \{0\}$  where  $d_1 > d_2 > \dots > d_m$  are positive integers, denote

$$Z_\sigma(f) = \{x \in P(K) : \frac{\partial^\alpha}{\partial x^\alpha} f = 0, \quad \forall \alpha, \alpha/d < \sigma\}, \sigma \in \mathbb{R}_+.$$

Then for any  $\varepsilon \in \mathbb{R}_+$ , there exists  $C > 0$  satisfying the following: If  $d_h/d_{h+1} \geq C$  for  $h = 1, 2, \dots, m-1$ , then for any  $\sigma \in \mathbb{R}_+$ , any irreducible component  $Z$  of  $Z_\sigma \cap Z_{\sigma+\varepsilon}$  is of the form  $Z = Z_1 \times \dots \times Z_m$ , where  $Z_i$  are closed subvarieties of  $\mathbb{P}_K^{n_i}$  with  $\deg(Z_i)$  bounded in terms of  $\varepsilon$  and  $n_1 + \dots + n_m$  only.  $\lrcorner$

*Proof:* ?  $\square$

## 4 Approximations by Algebraic Numbers

### Rational Approximations and Continued Fractions

**Def. (20.2.4.1) [Best Rational Approximations].** For  $\alpha \in \mathbb{R}$ ,  $\frac{a}{b} \in \mathbb{Q}$  is called a **best rational approximation** for  $\alpha$  if

$$|b\alpha - a| = ||b\alpha|| < ||d\alpha||$$

for any  $d \in \mathbb{Z}_+$ ,  $d < b$ . ┘

**Thm. (20.2.4.2) [Dirichlet].** For any  $\alpha \in \mathbb{R}$  and  $n \in \mathbb{Z}_+$ , there exists  $b \in \mathbb{Z}_+$ ,  $b \leq n$  s.t.

$$||b\alpha|| < \frac{1}{n+1}.$$

So there exists  $\frac{a}{b} \in \mathbb{Q}$  with  $1 \leq b \leq n$  s.t.

$$|\alpha - \frac{a}{b}| \leq \frac{1}{b(n+1)}.$$

┘

*Proof:* Consider the  $n+1$  numbers

$$0, \alpha, 2\alpha, \dots, n\alpha \in \mathbb{R}/\mathbb{Z},$$

then there are two of them with distance  $\leq \frac{1}{n+1}$ . Thus their difference gives such a  $b$ . □

**Cor. (20.2.4.3) [Characterizing Rational Numbers].** For  $\alpha \in \mathbb{R}$ , the following are equivalent:

- $\alpha \in \mathbb{Q}$ .
- There exists  $C \in \mathbb{R}_+$  s.t. for any  $q \in \mathbb{Z}_+$ ,  $\{q\alpha\} > 0 \implies \{q\alpha\} \geq C$ .
- There are only f.m.  $q \in \mathbb{Z}_+$  s.t.  $0 < q\{q\alpha\} < 1$ .

┘

**Thm. (20.2.4.4) [Dirichlet-Hurewitz].** For any  $\alpha \in \mathbb{R} \setminus \mathbb{Q}$ , there are infinitely many  $\frac{p}{q} \in \mathbb{Q}$  s.t.  
 $|\frac{p}{q} - \alpha| \leq \frac{1}{\sqrt{5}q^2}$ . ┘

*Proof:* Cf. [G. H. Hardy and E. M. Wright. An introduction to the theory of numbers]Thm194<sup>?</sup>. We prove here for a weaker result:

For  $N > 0$ , consider the sets  $\{\{q\alpha\} | q = 0, \dots, N\}$ , where  $\{\beta\}$  are the fractional part of  $\beta$ . Then by pigeonhole principle gives two  $0 \leq q_1 < q_2 \leq N$  s.t.  $|(q_1 - q_2)\alpha - p| \leq 1/N \leq (q_2 - q_1)$ . Let  $q = q_2 - q_1$ , then  $|p/q - \alpha| \leq 1/q^2$ . □

**Def. (20.2.4.5) [Continued Fractions].** ┘

**Def. (20.2.4.6) [Diophantine Numbers].** For  $\mu \in \mathbb{R}_{\geq 2}$ , a  $(C, \mu)$ -**Diophantine number** is a number  $\theta \in \mathbb{R}$  s.t. there exists  $C \in \mathbb{R}_+$  s.t. for any  $p, q \in \mathbb{Z}_+$ ,  $q \neq 0$ ,

$$|\theta - \frac{p}{q}| \geq \frac{C}{q^\mu}.$$

And a **badly approximable number** is a  $(C, 2)$ -Diophantine number for some  $C \in \mathbb{R}_+$ . ┘

**Prop. (20.2.4.7).**  $\xi \in \mathbb{R}$  is badly approximable iff the fractional expansion  $\xi = [a_0; a_1, a_2, \dots]$  satisfies  $(a_n)_{n \in \mathbb{N}}$  is bounded.  $\lrcorner$

*Proof:* Cf. [Distributions Modulo 1]P245.  $\square$

**Prop. (20.2.4.8) [Approximation and Fractional Expansions].** Let  $M \in \mathbb{Z}_+$ ,  $\kappa, \mu \in [0, 1]$ ,  $A \in \mathbb{R}_+$ ,  $B \in \mathbb{R}_{>1}$ , and  $\frac{p}{q}$  is a fractional approximation of  $\kappa$  s.t.  $q > 6M$ . Let  $\varepsilon = ||q\mu|| - M||q\kappa||$ , then

- If  $\varepsilon > 0$ , then there is no solution of the inequality

$$|m\kappa - n + \mu| < AB^{-m}$$

for  $m, n \in \mathbb{Z}$  with  $\frac{\log(Aq/\varepsilon)}{\log B} \leq m \leq M$ .

- (This may apply when  $\kappa + \mu$  is close to 1) If  $\varepsilon < 1/3$  but  $\lfloor q\mu + 0.5 \rfloor = q - p$ , then there is no solution of the inequality

$$|m\kappa - n + \mu| < AB^{-m}$$

for  $m, n \in \mathbb{Z}$  with  $\max(\frac{\log(3Aq)}{\log B}, 1) < m \leq M$ .  $\lrcorner$

*Proof:* 1: Assume  $0 \leq m \leq M$ , then

$$|m(q\kappa - p) + (mp - nq) + q\mu| < qAB^{-m},$$

so

$$qAB^{-m} > |mp - nq + q\mu| - m\{\{q\kappa\}\} \geq \{\{q\mu\}\} - M\{\{q\kappa\}\} = \varepsilon.$$

2: Assume  $0 \leq m \leq M$ , then

$$|m(q\kappa - p) + (mp - nq + r) + (q\mu - r)| < qAB^{-m},$$

so

$$|mp - nq + r| < qAB^{-m} + ||q\mu|| + M||q\kappa|| < qAB^{-m} + 2/3.$$

If  $qAB^{-m} \leq 1/3$ , then  $mp - nq + r = 0$ . But then the hypothesis implies that  $m \equiv 1 \pmod{q}$ . As  $q > 6M$ , this means  $m = 1$ .  $\square$

### Higher Degree case

**Prop. (20.2.4.9) [Dirichlet-Hurewitz/Davenport-Schmidt].** For  $d \in \mathbb{Z}_+$ , let  $k_d \in [-1, \infty]$  be the supremum of numbers  $w \in \mathbb{R}_+$  s.t. for any  $\alpha \in \mathbb{R}$  not an algebraic number of degree  $\leq d$  and any  $\varepsilon \in \mathbb{R}_+$ , there exists a constant  $C = C(\alpha, \varepsilon)$  s.t. there are inf.m. real algebraic number  $\xi$  of degree  $d$  satisfying

$$|\alpha - \xi| \leq CH^+(\xi)^{-dk_d + \varepsilon}.$$

Then

- $k_1 = 2$  by (20.2.4.4).
- $k_2 = 3$ .
- $k_d \leq d + 1$ .

$\lrcorner$

*Proof:* 2: One direction is by (20.2.3.4), the other by [Davenport-Schmidt, Approximation to real number by quadratic irrationals] **?**.

3 follows from (20.2.3.4). □

**Prop. (20.2.4.10) [Dirichlet-Hurewitz/Davenport-Schmidt/Roy].** For  $d \in \mathbb{Z}_+$ , let  $k_d \in [-1, \infty]$  be the supremum of numbers  $w \in \mathbb{R}_+$  s.t. for any  $\alpha \in \mathbb{R}$  not an algebraic integer of degree  $\leq d$  and any  $\varepsilon \in \mathbb{R}_+$ , there exists a constant  $C = C(\alpha, \varepsilon)$  s.t. there are inf.m. real algebraic number  $\xi$  of degree  $d$  satisfying

$$|\alpha - \xi| \leq CH^+(\xi)^{-dk_d + \varepsilon}.$$

Then

- $k_1 = -1$  trivially.
  - $k_2 = 3$ .
  - $k_3 = \frac{3+\sqrt{5}}{2}$ .
  - $\lfloor \frac{d+1}{2} \rfloor \leq k_d \leq d+1$ .
- ┘

*Proof:* 2: One direction is Roth's theorem, the other is [Davenport-Schmidt, Approximation to real number by algebraic integers].

3: [Davenport-Schmidt, Approximation to real number by algebraic integers] and [Approximation by cubic algebraic integers, Roy].

4: (20.2.3.4) and [Davenport-Schmidt, Approximation to real number by algebraic integers] and [Approximation by cubic algebraic integers, Roy]. □

### Equidistributions

**Thm. (20.2.5.1) [Weyl's Criterion].** Given  $n \in \mathbb{Z}_+$  and a sequence  $(x_n) \in (\mathbb{R}^n)^{\mathbb{Z}_+}$ , the following are equivalent:

- $(x_n)$  is equidistributed modulo  $\mathbb{Z}^n$ .
- For any  $\mathbb{Z}^n$ -periodic function  $f \in C(\mathbb{R}; \mathbb{C})$ ,

$$\lim_{N \rightarrow \infty} \frac{1}{N} \sum_{n=1}^N f(x_n) = \int_{[0,1]^n} f(x) dx.$$

- For any  $h \in \mathbb{Z}^n \setminus 0$ ,

$$\lim_{N \rightarrow \infty} \frac{1}{N} \sum_{n=1}^N e^{2\pi i \sum_{i=1}^n h_i x_i} = 0.$$
┘

*Proof:* 1 and 2 follows easily from the definition of Riemann integration.

2 and 3 follows from the Stone-Weierstrass theorem that the set of trigonometric functions is dense in  $\mathbb{C}_C([0, 1])$  (12.3.8.4). □

**Cor. (20.2.5.2).** For any  $m \in \mathbb{Z}_+$ , if  $\alpha_1, \dots, \alpha_m \in \mathbb{R}$  and  $\{1, \alpha_1, \dots, \alpha_m\}$  is linearly independent over  $\mathbb{Q}$ , then  $(n\alpha_1, \dots, n\alpha_m)_{n \in \mathbb{Z}_+}$  is equidistributed modulo  $\mathbb{Z}^m$ .  $\lrcorner$

*Proof:* The hypothesis implies that for any  $h \in \mathbb{Z}^n \setminus 0$ ,  $\sum h_i \alpha_i \notin \mathbb{Q}$ . Thus it is easy to see that

$$\lim_{N \rightarrow \infty} \frac{1}{N} \sum_{n=1}^N e^{2\pi i \sum_{i=1}^N h_i x_i} = 0.$$

□

**Cor. (20.2.5.3).** If  $(x_n) \in \mathbb{R}^{\mathbb{Z}_+}$  is a sequence that is equidistributed modulo 1, and  $(y_n) \in \mathbb{R}^{\mathbb{Z}_+}$  is a convergent sequence, then  $(x_n + y_n)_{n \in \mathbb{Z}_+}$  is also equidistributed modulo 1.  $\lrcorner$

**Thm. (20.2.5.4) [Weyl].** Let  $d \in \mathbb{Z}_+$  and  $P(X) = a_d X^d + \dots + a_1 X + a_0 \in \mathbb{R}[X]$  s.t. at least one of  $a_1, \dots, a_d$  is irrational, then the sequence  $(P(n))_{n \in \mathbb{Z}_+}$  is equidistributed modulo 1.  $\lrcorner$

*Proof:* Cf. [Bug12]P2. ?

□

**Prop. (20.2.5.5).** Given any sequence  $(x_n)_{n \in \mathbb{Z}_+} \in \mathbb{R}^{\mathbb{Z}_+}$  s.t.

$$\liminf_{n \rightarrow \infty} (x_{n+1} - x_n) > 0,$$

then for Lebesgue-a.e.  $\xi \in \mathbb{R}$ , the sequence  $(\xi x_n)_{n \in \mathbb{Z}_+}$  is equidistributed modulo 1.

In particular, this is true for  $x_n = \alpha^n$  where  $\alpha \in \mathbb{R}$ ,  $|\alpha| > 1$ .  $\lrcorner$

*Proof:* Cf. [Distribution modulo 1]P6. ?

□

**Prop. (20.2.5.6).** Given any  $\xi \in \mathbb{R}^\times$ , then for Lebesgue-a.e.  $\alpha \in \mathbb{R}$  with  $|\alpha| > 1$ , the sequence  $(\xi \alpha^n)_{n \in \mathbb{Z}_+}$  is equidistributed modulo 1.  $\lrcorner$

*Proof:* Cf. [Distribution modulo 1]P8. ?

□

### Discrepancy of Distributions

**Def. (20.2.5.7) [Discrepancy].** For  $N \in \mathbb{Z}_+$  and  $x_1, \dots, x_N \in \mathbb{R}$ , the **discrepancy** between  $x_1, \dots, x_N$  is defined to be

$$D_N(x_1, \dots, x_N) \triangleq \sup_{0 \leq u < v \leq 1} \left| \frac{\#\{k \in [N]_+ \mid \{x_k\} \in [u, v)\}}{N} - (v - u) \right|.$$

□

**Prop. (20.2.5.8).** A sequence  $(x_N) \in \mathbb{R}^{\mathbb{Z}_+}$  is equidistributed modulo 1 iff  $\lim_{N \rightarrow \infty} D_N(x_1, \dots, x_N) = 0$ .  $\lrcorner$

*Proof:* This follows from the uniform convergence theorem.  $\square$

**Prop. (20.2.5.9).** For any sequence  $(x_N) \in \mathbb{R}^{\mathbb{Z}_+}$ , there are infinitely many  $N \in \mathbb{Z}_+$  s.t.

$$D_N(x_1, \dots, x_N) \geq \frac{\log N}{25N}.$$

□

*Proof:* Cf. [Sequences, Discrepancies and Applications] or [Uniform distribution of sequences].  $\square$

### Multiplication by Rational Numbers

**Prop. (20.2.5.10).** If  $b \in \mathbb{Z}_{\geq 2}$  and  $\xi \in \mathbb{R} \setminus \mathbb{Q}$ , the numbers  $\{\xi b^n\}_{n \in \mathbb{Z}_+}$  cannot be contained in an interval of length strictly shorter than  $1/b$ .

And this bound is strict, by considering the Sturmian words(37.7.1.4).  $\lrcorner$

*Proof:* Let  $\{\xi\} = [0.a_1a_2\dots]_b$ , then we may assume that there exists some  $l \in [b-2]$  s.t.  $a_i \in \{l, l+1\}$  for any  $i \in \mathbb{Z}_+$ , otherwise it is easy to see that the assertion is true. In this case, by(37.7.1.3), for any  $m \in \mathbb{Z}_+$ , there exists a sequence  $W_m$  of  $m$ -blocks s.t.  $0 \amalg W_m$  and  $1 \amalg W_m$  both appear in the sequence  $a_1, a_2, \dots$ . Then this will imply that there exists two  $u_m, v_m \in \mathbb{Z}_+$  s.t.  $\{\xi b^{u_m}\} - \{\xi b^{v_m}\} > b^{-1} - b^{-m}$ . As  $m$  can be arbitrarily large, the assertion follows.  $\square$

**Prop. (20.2.5.11)** [Mahler[Mah57]]. For any  $\varepsilon \in \mathbb{R}_+$ ,  $p, q \in \mathbb{Z}, p > q \geq 2$ , and  $\gcd(p, q) = 1$ , there exists  $N \in \mathbb{Z}_+$  s.t.  $||(\frac{p}{q})^n|| \geq 2^{-\varepsilon n}$  for any  $n \in \mathbb{Z}_{\geq N}$ .  $\lrcorner$

*Proof:* Apply Roth's theorem(20.2.3.8) with  $K = \mathbb{Q}, S = \{\infty, 2, 3\}$  with  $\alpha_\infty = 1, \alpha_2 = \infty, \alpha_3 = 0$ , and  $\beta_k = 3^k/n2^k$  with  $n = \lceil (\frac{3}{2})^k \rceil$ . Then  $|\beta - \alpha_2|_2 \leq 2^{-k}, |\beta - \alpha_3|_3 \leq 3^{-k}|n|_3^{-1}$ , and  $H(\beta_k) = 3^k|n|_3$ . Thus Roth's theorem says for any  $\varepsilon > 0$ ,

$$|1 - 3^k/n2^k|_\infty \leq 2^k 3^k |n|_3 (3^k |n|_3)^{-2-\varepsilon}$$

holds for only f.m.  $k$ .  $\square$

**Def. (20.2.5.12)** [Mahler's **Z-Numbers**].  $\xi \in \mathbb{R}_+$  is called a **Mahler's Z-number** if  $0 < \{\xi(\frac{3}{2})^n\} < 1/2$  holds for any  $n \in \mathbb{Z}_+$ .  $\lrcorner$

### Multiplication by Algebraic Numbers

**Prop. (20.2.5.13)** [Pisot]. Let  $\alpha \in \mathbb{R}_{>1}, \xi \in \mathbb{R}^\times$  s.t.

$$\sum_{n \in \mathbb{Z}_+} ||\xi \alpha^n||^2$$

converges, then  $\alpha$  is a Pisot-number(19.3.1.15), and  $\xi \in \mathbb{Q}(\alpha)$ .  $\lrcorner$

*Proof:* Cf.[Distribution Modulo 1]P16. **?**  $\square$

**Thm. (20.2.5.14)** [Vijayaraghavan]. Let  $\alpha \in \mathbb{R}_{>1}, \xi \in \mathbb{R}^\times$  s.t.  $(\{\xi \alpha^n\})_{n \in \mathbb{Z}_+}$  has only f.m. limit points, then  $\alpha$  is a Pisot number(19.3.1.15), and  $\xi \in \mathbb{Q}(\alpha)$ .  $\lrcorner$

*Proof:*  $\square$

**Cor. (20.2.5.15).** If  $\xi \in \mathbb{R}^\times$  and  $p, q \in \mathbb{Z}, p > q \geq 2$ , then the sequence  $(\{\xi(\frac{p}{q})^n\})$  has infinitely many limit points.  $\lrcorner$

**Prop. (20.2.5.16).** If  $\alpha \in \mathbb{R}_{\geq 1} \cap \overline{\mathbb{Q}}$  with minimal polynomial  $q_d X^d + \dots + q_1 X + q_0 \in \mathbb{Z}[X]$ , and

$$\limsup_{n \rightarrow \infty} ||\xi \alpha^n|| < \frac{1}{|q_0| + \dots + |q_n|},$$

then  $\alpha$  is a Pisot or Salem number, and  $\xi \in \mathbb{Q}(\alpha)$ .  $\lrcorner$

*Proof:*  $\square$

**Prop. (20.2.5.17).** For any Salem number  $\alpha \in \mathbb{R}$ , the sequence  $(\alpha^n)_{n \in \mathbb{Z}_+}$  is dense modulo 1, but not equidistributed modulo 1. ┘

*Proof:* Cf.[Distributions Modulo 1]P57. □

**Prop. (20.2.5.18).** If  $\alpha \in \mathbb{R}$  is a Pisot or Salem number, then there are infinitely many composite numbers in the sequence  $(\lfloor \alpha^n \rfloor)_{n \in \mathbb{Z}_+}$ . ┘

*Proof:* Cf.[Integer parts of powers of Pisot and Salem numbers] ?. □

### Littlewood Conjecture

**Conj. (20.2.5.19) [Littlewood].** For any  $(\xi, \eta) \in \mathbb{R}^2$ ,  $\inf_{q \in \mathbb{Z}_+} q \cdot \{\{q\xi\}\} \cdot \{\{q\eta\}\} = 0$ . ┘

*Proof:* □

**Conj. (20.2.5.20) [Mixed Littlewood Conjecture, Mathan-Teulié].** For any  $p \in \text{Prime}$  and  $\xi \in \mathbb{R}$ ,  $\inf_{q \in \mathbb{Z}_+} q \cdot |q|_p \cdot \{\{q\xi\}\} = 0$ . ┘

## 20.3 Reductions of Schemes

References are [BLR90, Sta].

**Notation (20.3.0.1).**

- Let  $(\mathcal{O}_K, K)$  be a Dedekind domain.
- Let  $X, Y \in \text{Sch}^{\text{ft, sep}}/K$ .

┘

### 1 Schemes over DVR

**Def. (20.3.1.1) [Integral Models].** A **integral model** over  $\mathcal{O}_K$  for  $X$  is a scheme  $X \in \text{Sch}^{\text{ft, sep, flat}}/\mathcal{O}_K$  s.t.  $\mathcal{X} \times_{\mathcal{O}_K} K \cong X$ . It is called a **proper model** if  $\mathcal{X}/\mathcal{O}_K$  is proper, etc..

┘

**Prop. (20.3.1.2) [Models Exist].**  $X$  has a model over some open dense subset of  $\text{Spec } \mathcal{O}_K$ .

┘

*Proof:* Choose a finite covering  $X_i$ , and the transformation isomorphisms  $\varphi_{ij}$  are defined over a finite localization ring of  $\mathcal{O}_K$ . We can take a further localization to make it flat. It is clearly of f.t.

□

**Prop. (20.3.1.3) [Affine Integral Models].** If  $\mathcal{X} \in \text{Sch}/\mathcal{O}_K$  is an affine integral model for  $X \in \text{Aff}/K$ , then  $\Gamma(\mathcal{X}) \rightarrow \Gamma(X)$  is injective (because flatness is equivalent to torsion-free). Thus if  $\mathcal{Y} \in \text{Sch}/\mathcal{O}_K$  is an affine integral model of  $Y$ , then a morphism  $X \rightarrow Y$  extends to a morphism

┘

**Prop. (20.3.1.4) [Generalized Valuation Criterion].**

- If  $X \in \text{Sch}^{\text{sep}}/\mathcal{O}_K$ , then the natural map  $X(\mathcal{O}_K) \rightarrow X(K)$  is injective.
- If  $X \in \text{Sch}^{\text{proper}}/\mathcal{O}_K$ , then the natural map  $X(\mathcal{O}_K) \rightarrow X(K)$  is bijective.

┘

*Proof:* 1: This follows from (7.4.5.42) because  $\text{Spec } K \rightarrow \text{Spec } \mathcal{O}_K$  is dominant.

2: For the last assertion: for any  $f : \text{Spec } K \rightarrow X$ , we can spread out  $f$  into a map  $f : U \rightarrow X$  for some non-empty open subset  $U \subset \text{Spec } \mathcal{O}_K$ .  $\text{Spec } \mathcal{O}_K \setminus U$  is a finite set of closed points  $\mathfrak{p}_i$ . But for each  $\mathfrak{p}_i$ ,  $f$  can be extended to  $f : (\mathcal{O}_K)_{\mathfrak{p}_i} \rightarrow X$  by valuation criterion. This again spread out into a map  $f : V \rightarrow X$  for some non-empty open subset  $V \subset \text{Spec } \mathcal{O}_K$ . The restriction of these two maps to  $U \cap V$  are identical by item 1. So  $f$  extends to  $f : \text{Spec } \mathcal{O}_K \rightarrow X$ .

□

**Prop. (20.3.1.5) [Schematic Closures and Flat Models].** Let  $(\mathcal{O}_K, \mathfrak{m}_K, K) \in \text{CDVR}$  and  $X \in \text{Aff}/K$  with an affine integral model  $\mathcal{X} \in \text{Sch}/\mathcal{O}_K$  (20.3.1.1), then

- If  $Y \subset X$  is a closed subscheme, then the schematic closure  $\mathcal{Y}$  of  $Y$  in  $\mathcal{X}$  (7.4.5.13) is an affine integral model of  $Y$ .
- For any  $R \in \mathbb{C}\text{Ring}^{\text{flat}}/\mathcal{O}_K$ , we have  $\mathcal{Y}(R) = \mathcal{X}(R) \cap Y(R \otimes_{\mathcal{O}_K} K)$  inside  $X(R \otimes_{\mathcal{O}_K} K)$ .
- $(-)_K$  is a bijection between the set of closed flat subschemes of  $\mathcal{X}$  and the set of closed subschemes of  $Y$ , with inverse given by taking schematic closure.

┘

*Proof:* 1: The schematic closure is just  $\mathcal{Y} = \text{Spec}(\Gamma(X)/I(\mathcal{Y})) \text{Spec}(I(Y) \cap \Gamma(\mathcal{O}_X))$ , so  $\Gamma(\mathcal{Y})$  is a subring of  $\Gamma(Y)$ , thus  $\mathfrak{m}_K$ -torsion-free.

2:  $\mathcal{X}(R) \cap Y(R \otimes_{\mathcal{O}_K} K)$  is exactly the set of  $\mathcal{O}_K$ -homomorphism  $\varphi : \Gamma(X) \rightarrow \mathcal{O}_K$  s.t. its  $K$ -linear extension kills  $I(Y)$ , but then this is equivalent to  $\varphi(I(Y)) \text{Spec}(I(Y) \cap \Gamma(\mathcal{O}_X)) = 0$ , because  $R$  is  $\mathfrak{m}_K$ -torsion-free.

3: For a flat subscheme  $\mathcal{Y} \subset \mathcal{X} \in \text{Sch}/\mathcal{O}_K$ , there are exact sequences

$$\begin{array}{ccccccc} 0 & \longrightarrow & I(\mathcal{Y}) & \longrightarrow & \Gamma(\mathcal{X}) & \longrightarrow & \Gamma(\mathcal{Y}) \longrightarrow 0 \\ & & \downarrow & & \downarrow & & \downarrow \\ 0 & \longrightarrow & I(\mathcal{Y}) \otimes_{\mathcal{O}_K} K & \longrightarrow & \Gamma(X) & \longrightarrow & \Gamma(\mathcal{Y}_K) \longrightarrow 0 \end{array}$$

where the vertical maps are all injective.  $\square$

**Prop. (20.3.1.6).** Let  $(\mathcal{O}_K, K) \in \text{DVR}$  be Henselian and  $f : \mathcal{X} \rightarrow \mathcal{Y} \in \text{Sch}/\mathcal{O}_K$ . If  $f$  is of f.t.,  $f_K$  is smooth and  $\mathcal{X}(\widehat{\mathcal{O}_K}) \rightarrow \mathcal{Y}(\widehat{\mathcal{O}_K})$  is surjective, then  $\mathcal{X}(\mathcal{O}_K) \rightarrow \mathcal{Y}(\mathcal{O}_K)$  is also surjective.  $\lrcorner$

*Proof:* For  $y : \text{Spec}(\mathcal{O}_K) \rightarrow \mathcal{Y}$ , let  $\mathcal{X}_y \in \text{Sch}/\mathcal{O}_K$  be the base change of  $y$  along  $f$ . The generic fiber of  $\mathcal{X}_y$  is smooth by assumption, and it has a  $\widehat{\mathcal{O}_K}$ -valued point  $\hat{x}$ .  $\square$

## 2 Smooth Reductions

**Prop. (20.3.2.1) [Smoothness over DVRs].** For  $(\mathcal{O}_K, K, \varpi_K, \kappa) \in \text{DVR}$  and  $\mathcal{X} \in \text{Sch}^{\text{ft}}/\mathcal{O}_K$ ,

- If  $\mathcal{X}/\mathcal{O}_K$  is flat, then it is smooth iff both  $\mathcal{X}_K/K$  and  $\mathcal{X}_\kappa/\kappa$  are smooth.
- If  $\mathcal{X}$  is integral, then it is smooth iff  $\mathcal{X}_K \neq \emptyset$  and both  $\mathcal{X}_K/K$  and  $\mathcal{X}_\kappa/\kappa$  are smooth.

$\lrcorner$

*Proof:* This follows from (7.6.4.5). Notice that when  $\mathcal{X}$  is integral,  $\mathcal{X}/\mathcal{O}_K$  is flat iff  $\varpi_K$  is non-torsion on  $\mathcal{X}$  iff  $\varpi_K \neq 0$  on  $X$ , which means  $X_K \neq \emptyset$ .  $\square$

**Def. (20.3.2.2) [Good Reduction].** If  $(\mathcal{O}_K, K, \kappa) \in \text{DVR}$ ,  $X$  is said to have **good reduction** over  $\mathcal{O}_K$  if there is a smooth integral model  $\mathcal{X}/\mathcal{O}_K$  for  $X$  (20.3.1.1). If this is the case, then  $\tilde{X} = \mathcal{X}_k$  is a smooth scheme over  $k$ , called the **good reduction of  $X$** .

In this case, the reduction map  $X(\overline{K}) \cong \mathcal{X}(\overline{K}) \rightarrow \tilde{X}(\overline{k})$  is surjective, by valuation criterion and formal smoothness criterion.  $\lrcorner$

**Def. (20.3.2.3) [Relative Identity Component Groups].** For a Dedekind scheme  $(S, K)$  and  $\mathcal{G} \in \text{GrpSch}^{\text{sm}}/S$ , the **relative identity component**  $\mathcal{G}^0$  is defined to be the open subgroup scheme of  $\mathcal{G}$  deleting all non-identity components of  $\mathcal{G}_{\kappa(s)}$  for all  $s \in |S|_0$ .

If  $\mathcal{G}$  is affine, then so is  $\mathcal{G}^0$ , Cf. [Prasad-Yu, On quasi-reductive group schemes] Lemma 3.5. ?  $\lrcorner$

**Prop. (20.3.2.4) [Smooth Affine Integral Models].** Let  $(\mathcal{O}_K, K, \kappa) \in \text{DVR}$  be Henselian and  $X \in \text{Aff}/K$ . If  $\mathcal{X}/\mathcal{O}_K$  is a smooth affine integral model for  $X$  (20.3.1.1), then

$$\Gamma(\mathcal{X}) = \{f \in \Gamma(X) : f(\mathcal{X}(\mathcal{O}_{\tilde{K}})) \subset \mathcal{O}_{\tilde{K}}\}.$$

$\lrcorner$

*Proof:* One direction is clear. For the other, suppose  $f \in \Gamma(X)$  s.t.  $f(\mathcal{X}(\mathcal{O}_{\tilde{K}})) \subset \mathcal{O}_{\tilde{K}}$  but  $f \notin \Gamma(\mathcal{X})$ , then there exists a smallest  $n \in \mathbb{Z}_+$  s.t.  $\varpi_K^n f \in \Gamma(\mathcal{X})$ . Then  $\varpi_K^n f$  reduces to a function  $g$  on  $\mathcal{X}_{\kappa^{\text{sep}}}$  s.t.  $g$  vanishes on the image of the map  $\mathcal{X}(\mathcal{O}_{\tilde{K}}) \rightarrow \mathcal{X}(\kappa^{\text{sep}})$ , by hypothesis on  $f$ . But by smoothness, this image is just  $\mathcal{X}(\kappa^{\text{sep}})$  (5.4.5.1), thus  $g$  vanishes, by (7.4.3.3).  $\square$

**Cor. (20.3.2.5).** Let  $(\mathcal{O}_K, K, \kappa) \in \text{DVR}$  and  $\mathcal{X}, \mathcal{Y} \in \text{Sch}/\mathcal{O}_K$  be integral models of  $X = \mathcal{X}_K$  and  $Y = \mathcal{Y}_K$  resp. (20.3.1.1) s.t.  $\mathcal{X}$  is smooth and  $\mathcal{Y}$  is affine. Then a morphism  $\varphi : X \rightarrow Y$  (uniquely) extends to a morphism  $\varphi : \mathcal{X} \rightarrow \mathcal{Y}$  iff  $\varphi(X(\mathcal{O}_{\check{K}})) \subset Y(\mathcal{O}_{\check{K}})$  as subsets of  $Y(\check{K})$  (20.3.1.4).  $\lrcorner$

**Cor. (20.3.2.6).** The case  $X$  is affine follows from (20.3.2.4), and the general case follows by glueing and uniqueness.  $\lrcorner$

**Prop. (20.3.2.7) [Schematic Subsets].** Let  $(\mathcal{O}_K, K, \kappa) \in \text{DVR}$  and  $X \in \text{Aff}/K$ . If  $\mathcal{U} \subset X(\check{K})$  is  $\text{Gal}(\check{K}/K)$ -invariant and there exists a smooth integral model  $\mathcal{X} \in \text{Sch}/\mathcal{O}_{\check{K}}$  of  $X_{\check{K}}$  s.t.  $\mathcal{U} = \mathcal{X}(\mathcal{O}_{\check{K}})$ , then  $\mathcal{X}$  is defined over  $\mathcal{O}_K$ .

Such a subset is called a **schematic subset** of  $X(\check{K})$ .  $\lrcorner$

*Proof:* By unramified Galois descent, Cf. [BLR90] Section 6.2. Example B.  $\square$

**Prop. (20.3.2.8).** Let  $(\mathcal{O}_K, K) \in \text{DVR}$  be Henselian.

- If  $X \in \text{Sch}^{\text{sm}}/K$ , then  $X(K)$  is dense in  $X(\widehat{K})$ .
- If  $\mathcal{X} \in \text{Sch}^{\text{sm}}/\mathcal{O}_K$ , then  $\mathcal{X}(\mathcal{O}_K)$  is dense in  $\mathcal{X}(\widehat{\mathcal{O}_K})$ .

$\lrcorner$

*Proof:* 1: By (7.6.6.7), we can assume that  $X$  is standard étale over  $\mathbb{A}_K^n$ , i.e. if  $R = K[T_1, \dots, T_n]$ , then  $X = \text{Spec}(R[Y]_{h,f}/f)$  where  $f(T, Y) \in R[Y]$  is monic in  $Y$  and  $h(T, Y) \in R[Y]$ . Thus a point of  $X(\widehat{K})$  is a tuple  $\mathbf{c} = (c_1, \dots, c_n) \in \widehat{K}^{\oplus n}$  and a simple root  $y \in \widehat{K}$  of  $f(\mathbf{c}, Y)$  with  $h(\mathbf{c}, y) \neq 0$ .

Take  $\mathbf{c}' \in K^{\oplus n}$  close enough to  $\mathbf{c}$ , then by continuity of separable roots,  $f(\mathbf{c}', Y)$  has a unique simple root  $y' \in (\widehat{K})^{\text{sep}}$  that is close to  $y$ . When it is close enough we have  $h(\mathbf{c}', y') \neq 0$ , and then the uniqueness of  $y'$  and (19.1.4.4) implies that  $y \in K$ .

2: This follows from item 1.  $\square$

### 3 Greenberg Functors

**Notation (20.3.3.1).**

- Let  $(K, \mathcal{O}_k, \mathfrak{m}_K, \varpi_K, \kappa) \in p\text{-NField}$ .

$\lrcorner$

### 4 Néron Models

References are [Serre-Tate, Good Reduction of Abelian Varieties], [BLR90] and <http://virtualmath1.stanford.edu/~conrad/mordellsem/Notes/L11.pdf>.

**Def. (20.3.4.1) [Néron Models].** Let  $(S, K)$  be a Dedekind scheme and  $X \in \text{Sch}^{\text{sm,sep,ft}}/K$ , then a **Néron model** for  $X$  is a smooth scheme  $\mathcal{X} \in \text{Sch}^{\text{sm,sep,ft}}/S$  representing the functor

$$\text{Sch}^{\text{sm}}/S \rightarrow \text{Set} : \mathcal{Y} \mapsto \text{Hom}_K(\mathcal{Y} \otimes_S K, X).$$

In particular, the natural map  $\mathcal{X}(S) \rightarrow X(K)$  is a bijection.  $\lrcorner$

**Cor. (20.3.4.2) [Group Structures].** Let  $(S, K)$  be a Dedekind scheme and  $X \in \text{Grp}^{\text{sm,sep,ft}}/K$ , then any Néron model for  $X$  is naturally equipped with a group structure extending that of  $X$ .  $\lrcorner$

*Proof:* This follows from the universal properties.  $\square$

**Prop. (20.3.4.3) [Étale Valuation Criterion for Néron Models].** Let  $(R, K)$  be a DVR and  $X \in \text{Sch}^{\text{sm,sep,ft}}/K$ , then if  $\mathcal{X}/R$  is a Néron model for  $X$ , then  $\mathcal{X}$  satisfies valuation criterion for any  $R'$  that is the integral closure of  $R$  in an unramified field extension  $K'/K$ .

Conversely, if  $\mathcal{G} \in \text{GrpSch}^{\text{sm,ft}}/R$ , then  $\mathcal{G}$  is a Néron model of its generic fiber iff the natural map  $\mathcal{G}(R^{\text{sH}}) \rightarrow \mathcal{G}(K^{\text{sH}})$  is an isomorphism.  $\lrcorner$

*Proof:* Cf. [BLR90] Prop. 7.1.1.  $\square$

**Prop. (20.3.4.4) [Étale Base Change].** Let  $(R, K)$  be a Dedekind domain and  $\lrcorner$

*Proof:*  $\square$

**Prop. (20.3.4.5) [Unramified Base Change].** Let  $(R, K)$  be a DVR and  $X \in \text{Sch}^{\text{sm,sep,ft}}/K$ ,  $K'/K$  an unramified field extension,  $R'$  the integral closure of  $R$  in  $K'$ , then if  $\mathcal{X}$  is a Néron model for  $X$ , then  $\mathcal{X}_{R'}$  is a Néron-model for  $X_{K'}$ .  $\lrcorner$

*Proof:* Because  $R'/R$  is smooth (by (20.3.2.1) and the definition of unramifiedness (19.1.4.5)), for any  $\mathcal{Y}'/R'$  smooth,

$$\text{Mor}_{R'}(\mathcal{Y}', \mathcal{X}_{R'}) = \text{Mor}_R(\mathcal{Y}', \mathcal{X}) = \text{Mor}_K(\mathcal{Y}'_K, X) = \text{Mor}_{K'}(\mathcal{Y}'_{K'}, X_{K'}).$$

$\square$

**Prop. (20.3.4.6) [Étale Descent].** Let  $(R, K) \subset (R', K') \subset (R^{\text{sH}}, K^{\text{sH}}) \in \text{DVR}$ . If  $G \in \text{AlgGrp}^{\text{sm}}/K$  and  $G_{K'}$  has a Néron model  $\mathcal{G}'/R'$ , then  $\mathcal{G}'$  descends to a Néron model  $\mathcal{G}/R$  of  $G$ .  $\lrcorner$

*Proof:* Cf. [BLR90] Prop. 6.5.4.  $\square$

**Cor. (20.3.4.7).** Let  $(R, K) \subset (R', K') \in \text{DVR}$  be an unramified extension and  $G \in \text{Grp}^{\text{sm,ft}}/K$ , then  $G$  has a Néron model iff  $G_{K'}$  has a Néron model.  $\lrcorner$

*Proof:* Cf. [BLR90] Prop. 6.5.4.  $\square$

**Prop. (20.3.4.8) [Localness of Néron Property].** Let  $(S, K)$  be a Dedekind scheme and  $X \in \text{Sch}^{\text{sm,sep,ft}}/K$ .

- If  $(S_i)$  is an open cover of  $S$ , then  $X$  has a Néron model over  $S$  iff it has a Néron model over each  $S_i$ .
- $\mathcal{X} \in \text{Sch}^{\text{ft,sep}}/S$  is a Néron model for  $X$  iff for each closed point  $s \in S$ ,  $\mathcal{X} \times_S \text{Spec } \mathcal{O}_{S,s}$  is a Néron model for  $X$  over  $\mathcal{O}_{S,s}$ .  $\lrcorner$

*Proof:* 1: One direction follows from (20.3.4.4), for the other, notice they can be glued by universal properties.

2: Cf. [BLR, Prop 1.2.4]. If  $\mathcal{X}/S$  is a Néron model, then for any closed point  $s \in S$  and any  $\varphi : \mathcal{Y}_{(s)} \in \text{Sch}^{\text{sm}}/\mathcal{O}_{S,s}$  with a morphism  $Y_{(s),K} \rightarrow X$ , we need to show that it can be extended uniquely to a morphism over  $\mathcal{O}_{S,s}$ . We may assume that  $Y_{(s)}$  is f.p., and then it extends to a scheme  $Y/S'$  on a nbhd  $S'$  of  $s$ . Then because  $X/S_i$  is a Néron model by item 1, we can extend the  $\varphi$  over  $S'$ , which restricts to a morphism over  $\mathcal{O}_{S,s}$ . The uniqueness is clear.

The converse is similar. Just notice that smoothness is a stalkwise properties (7.6.4.5).  $\square$

**Prop. (20.3.4.9) [Extending Néron Models].** Let  $(S, K)$  be a Dedekind scheme and  $X \in \text{Sch}^{\text{sm,sep,ft}}/K$ , then  $X$  has a Néron model over  $S$  (20.3.4.1) iff there exists an open dense subscheme  $S' \subset S$  s.t.  $X$  has a Néron model over  $S'$ , and for any  $s \in S \setminus S'$ ,  $X$  has a Néron model over  $\mathcal{O}_{S,s}$ .  $\lrcorner$

*Proof:* One direction is obvious by (20.3.4.8), for the other, for each  $s_i \in S \setminus S'$ ,  $\mathcal{X}_i/\mathcal{O}_{S,s_i}$  extends to smooth scheme on a nbhd  $S_i$  of  $s_i$ , and since  $\mathcal{X}_i$  and  $\mathcal{X}/S'$  has isomorphic generic fibers, we can assume that they are isomorphic on  $S_i \cap S'$  after shrinking  $S_i$ . Then the glue together to a Néron model over  $\mathcal{O}_{S,s}$ . Then the assertion follows from (20.3.4.8).  $\square$

### Dilatations

**Thm. (20.3.4.10) [Dilatations].** Suppose  $(\mathcal{O}_K, K, \varpi_K, \kappa) \in \text{DVR}$  and  $\mathcal{X} \in \text{Aff}/\mathcal{O}_K$  is an affine integral model of  $X \in \text{Aff}/K$  (20.3.1.1). For a closed subscheme  $\mathbf{Y} \subset \mathcal{X}_\kappa$ , consider the **affine blow-up algebra**

$$A_{\mathbf{Y}} \triangleq A\left[\frac{I}{\varpi_K}\right] \triangleq \Gamma(\mathcal{X})\{\varpi^{-1}f : f \in I(\mathbf{Y})\} \subset \Gamma(X),$$

then  $\mathcal{X}_{\mathbf{Y}} \triangleq \text{Spec}(A_{\mathbf{Y}}) \in \text{Sch}/\mathcal{O}_K$  is an affine integral model of  $X$  with a natural map  $i_{\mathbf{Y}} : \mathcal{X}_{\mathbf{Y}} \rightarrow \mathcal{X}$ , and represents the functor

$$\mathbb{C}\text{Ring}^{\text{flat}}/\mathcal{O}_K \rightarrow \text{Set} : R \mapsto \{x \in \mathcal{X}(R) | x_\kappa \in Y(R \otimes_{\mathcal{O}_K} \kappa)\},$$

called the **dilatation** of  $\mathcal{X}$  w.r.t.  $\mathbf{Y}$ .  $\lrcorner$

*Proof:*  $A_{\mathbf{Y}}$  is  $\mathfrak{m}$ -torsion-free and f.g. over  $\mathcal{O}_K$ , so  $\mathcal{X}_{\mathbf{Y}}$  is flat and f.g. over  $\mathcal{O}_K$ , and  $A_{\mathbf{Y}}[\varpi_K^{-1}] = \Gamma(X)$ , so  $\mathcal{X}_{\mathbf{Y}}$  is an integral model of  $X$ .

For any  $R \in \mathbb{C}\text{Ring}^{\text{flat}}/\mathcal{O}_K$ ,  $\mathcal{X}_{\mathbf{Y}}(R) \rightarrow \mathcal{X}(R)$  is injective because its composition with  $\mathcal{X}(R) \rightarrow X(K)$  is injective. And it is clear that  $x : \Gamma(\mathcal{X}) \rightarrow R$  extends to a map  $A_{\mathbf{Y}} \rightarrow R$  iff  $x(I) \subset \mathfrak{m}R$ , or equivalently  $x_\kappa \in Y(R \otimes_{\mathcal{O}_K} K)$ .  $\square$

**Cor. (20.3.4.11) [Universal Property].** Situation as in (20.3.4.10), if  $\mathcal{Z} \in \text{Sch}^{\text{flat}}/\mathcal{O}_K$  and  $f : \mathcal{Z} \rightarrow \mathcal{X} \in \text{Sch}/\mathcal{O}_K$  satisfies  $f_\kappa$  factors through  $\mathbf{Y} \subset \mathcal{X}_\kappa$ , then  $f$  factors through  $\mathcal{X}_{\mathbf{Y}}$ .  $\lrcorner$

**Cor. (20.3.4.12) [Dilatations and Blowing-Ups].** Situation as in (20.3.4.10),  $\mathcal{X}_{\mathbf{Y}}$  is the open subscheme of  $\mathbf{Bl}_{\mathbf{Y}}(\mathcal{X})$  (7.8.2.1) consisting of the points where the exceptional invertible sheaf is generated by  $\varpi_K$ .  $\lrcorner$

**Prop. (20.3.4.13) [Smooth Dilatations].** Situation as in (20.3.4.10), if  $\mathcal{X}$  is smooth and  $\mathbf{Y}$  is smooth, then

- $\mathcal{X}_{\mathbf{Y}}/\mathcal{O}_K$  is an affine open subscheme of  $\mathbf{Bl}_{\mathbf{Y}}(\mathcal{X})$  (7.8.2.1), and is smooth.
- $(\mathcal{X}_{\mathbf{Y}})_\kappa \rightarrow \mathbf{Y}$  is an affine open sub-bundle of the projective bundle  $\mathbf{E}_{\mathbf{Y}}(X) \rightarrow \mathbf{Y}$ .
- If moreover the fibers of  $\mathcal{X}$  are connected,  $\mathbf{Y}$  is connected and  $\mathcal{X}_{\mathbf{Y}}(\mathcal{O}_K) \neq \emptyset$ , then the fibers of  $\mathcal{X}_{\mathbf{Y}}$  are connected.  $\lrcorner$

*Proof:*  $\mathcal{X}_{\mathbf{Y}}/\mathcal{O}_K$  is an affine open subscheme of  $\mathbf{Bl}_{\mathbf{Y}}(\mathcal{X})$  by definition, and the special fiber of the map  $i_{\mathbf{Y}} : \mathcal{X}_{\mathbf{Y}} \rightarrow \mathcal{X}$  is given by

$$\Gamma(\mathcal{X})_\kappa \subset \Gamma(\mathcal{X})_\kappa\{\varpi^{-1}f : f \in I(\mathbf{Y})\}/(f_1, \dots, f_n),$$

which clearly factors through  $\Gamma(\mathcal{X})/(f_1, \dots, f_n)$ , which means  $(i_{\mathbf{Y}})_\kappa$  factors through  $\mathbf{Y}$ .

The embedding  $\mathbf{Y} \rightarrow \mathcal{X}$  is a regular immersion (7.6.7.1), because both  $\mathbf{Y}$  and  $\mathcal{X}$  are smooth ?. Thus  $\mathbf{E}_{\mathbf{Y}}(\mathcal{X}) \rightarrow \mathbf{Y}$  is a projective bundle by (7.8.2.9), and  $(\mathcal{X}_{\mathbf{Y}})_\kappa \rightarrow \mathbf{Y}$  is an affine open sub-bundle.

Thus  $(\mathcal{X}_{\mathbf{Y}})_\kappa$  is smooth, and then  $\mathcal{X}_{\mathbf{Y}}$  is smooth by (20.3.2.1). And when  $\mathcal{X}_{\mathbf{Y}}(\mathcal{O}_K) \neq \emptyset$ ,  $(\mathcal{X}_{\mathbf{Y}})_\kappa$  is a non-empty open subset of  $\mathbf{E}_{\mathbf{Y}}(\mathcal{X})$ , thus connected.  $\square$

### Smoothing

**Def. (20.3.4.14) [Smoothing].** For  $(\mathcal{O}_K, K) \in \text{DVR}$  and  $\mathcal{X} \in \text{Sch}^{\text{ft}}/\mathcal{O}_K$  s.t.  $X = \mathcal{X}_K$  is smooth over  $K$ , a **smoothing** of  $\mathcal{X}$  is a map  $f : \mathcal{X}' \rightarrow \mathcal{X} \in \text{Sch}/\mathcal{O}_K$  s.t.

- $f$  is proper and  $f_K$  is an isomorphism.
- For each  $R' \in \mathbb{C}\text{Ring}/\mathcal{O}_K$  étale, the map  $\mathcal{X}'_{\text{sm}}(\mathcal{O}_K) \rightarrow \mathcal{X}(\mathcal{O}_K)$  is a bijection.

Notice that when  $\mathcal{X}'_{\text{sm}}/\mathcal{O}_K$  is affine and separated of f.t., then such  $\mathcal{X}'_{\text{sm}}$  is uniquely determined by (20.3.2.4), and denoted by  $\mathcal{X}^\infty \triangleq \mathcal{X}'_{\text{sm}}$ .  $\lrcorner$

**Thm. (20.3.4.15) [Smoothing Exists].** For  $(\mathcal{O}_K, K) \in \text{DVR}$  and  $\mathcal{X} \in \text{Sch}^{\text{ft}}/\mathcal{O}_K$  s.t.  $X = \mathcal{X}_K$  is smooth over  $K$ , a finite sequence of blowing-up centered in the special fibers gives a smoothing of  $\mathcal{X}$  (20.3.4.14). In particular, if  $X$  is quasi-projective, then so is  $\mathcal{X}'$ .

If  $\mathcal{X}$  is an affine group scheme, we construct inductively the a projective system of integral models  $\{\mathcal{X}^{(i)}\}$  as follows: Let  $\mathbf{Y}^{(i)}$  be the schematic closure of the image of the reduction map  $\mathcal{X}^{(i)}(\mathcal{O}_{K^{\text{sh}}}) \rightarrow \mathcal{X}^{(i)}(\kappa^{\text{sep}})$ , and let  $\mathcal{X}^{(i+1)}$  be the dilatation of  $\mathcal{X}^{(i)}$  w.r.t.  $\mathbf{Y}^{(i)}$  (20.3.4.10).

Notice that  $\mathbf{Y}^{(i)}$  is smooth  $\color{red}?$ , and  $\mathcal{X}^{(i+1)}(\mathcal{O}_{K^{\text{sh}}}) \rightarrow \mathcal{X}^{(i)}(\mathcal{O}_{K^{\text{sh}}})$  is bijective. Then there exists some  $i \in \mathbb{Z}_+$  s.t.  $\mathcal{X}^{(i)}$  is smooth, in particular, the system  $\{\mathcal{X}^{(i)}\}$  stabilizes.  $\lrcorner$

*Proof:*  $\color{red}?$  Cf. [BLR90] Prop 3.3.5. The crux is to show that after each dilatation, the Néron measure of the failure of smoothness at the origin, i.e. the valuation of the minors of the Jacobi matrix decreases.  $\square$

**Cor. (20.3.4.16) [Universal Property in the Affine case].** For  $(\mathcal{O}_K, K) \in \text{DVR}$  and  $\mathcal{X} \in \text{Sch}^{\text{ft}}/\mathcal{O}_K$  s.t.  $X = \mathcal{X}_K$  is smooth affine over  $K$ , the smoothing  $\mathcal{X}^\infty \rightarrow \mathcal{X}$  is the terminal element in the category of all maps from smooth  $\mathcal{O}_K$ -schemes to  $\mathcal{X}$ .  $\lrcorner$

*Proof:* By the formal smoothness property, any  $f : \mathcal{Z} \rightarrow \mathcal{X} \in \text{Sch}/\mathcal{O}_K$  with  $\mathcal{Z}$  smooth affine will lift inductively through the projective system  $\mathcal{X}^{(i)}$  by the universal property of dilatations (20.3.4.11).  $\square$

## 5 Semistable Reductions

## 6 Reductive of Groups

**Prop. (20.3.6.1) [Lie Algebras].** Let  $(\mathcal{O}_K, K, \kappa) \in \text{DVR}$  and  $X \in \text{AlgGrp}/K$ . If  $\mathcal{X} \in \text{Grp}/\mathcal{O}_K$  is an affine integral model of  $X$  (20.3.1.1) compatible with the group structure, denote  $\mathcal{I}_e \subset \Gamma[\mathcal{X}]$  the kernel of the identity section  $\Gamma(\mathcal{X}) \rightarrow \mathcal{O}_K$ , then  $f \mapsto df \otimes 1$  is an isomorphism of  $\mathcal{O}_K$ -modules

$$\mathcal{I}_e/\mathcal{I}_e^2 \cong \Omega_{\mathcal{X}/\mathcal{O}_K}^1 \otimes_{\Gamma(\mathcal{X})} \mathcal{O}_K,$$

which is just the cotangent space  $\omega_{\mathcal{X},e}$  of  $\mathcal{X}$  at  $e$ .

Then  $\text{Lie}(\mathcal{X}) = \text{Hom}_{\mathcal{O}_K}(\omega_{\mathcal{X},e}, \mathcal{O}_K)$  and  $\text{Lie}(X) = \text{Hom}_{\mathcal{O}_K}(\omega_{\mathcal{X},e}, K)$ , so the natural map  $\text{Lie}(\mathcal{X}) \otimes_{\mathcal{O}_K} K \rightarrow \text{Lie}(X)$  is an isomorphism and  $\text{Lie}(\mathcal{X})$  is an  $\mathcal{O}_K$ -lattice of  $\text{Lie}(X)$ .

In particular,  $\mathcal{X}$  is smooth iff  $\omega_{\mathcal{X},e}$  is free iff  $\dim_F \text{Lie}(X) = \dim_\kappa \text{Lie}(\mathcal{X}_\kappa)$  iff  $\text{Lie}(\mathcal{X})_\kappa \rightarrow \text{Lie}(\mathcal{X}_\kappa)$  is surjective.  $\color{red}?$   $\lrcorner$

**Prop. (20.3.6.2) [Schematic Closures of Subgroups].** If  $K \in \text{CDVR}$  and  $\mathcal{G} \in \text{GrpSch}^{\text{aff,ft,flat}}/\mathcal{O}_K$  is an integral model of  $G = \mathcal{G}_K \in \text{AlgGrp}/K$ , and  $H \leq G \in \text{AlgGrp}/K$  is an algebraic subgroup, then the schematic closure  $\mathcal{H}$  of  $H$  in  $\mathcal{G}$  is an integral model of  $H$  and a subgroup scheme of  $\mathcal{G}$ , and  $\text{Lie}(\mathcal{H}) = \text{Lie}(H) \cap \text{Lie}(\mathcal{G})$  inside  $\text{Lie}(G)$ .  $\lrcorner$

*Proof:*  $\mathcal{H} \times_{\mathcal{O}_K} \mathcal{H}$  is an integral model of  $H \times H$ , and the multiplication map  $\text{mul.} : \mathcal{G} \times_{\mathcal{O}_K} \mathcal{G} \rightarrow \mathcal{G}$  is the composition of the isomorphism  $(x, y) \mapsto (xy, y)$  and  $\text{pr}_1$ , so it is flat, hence  $\text{mul.}^{-1}(\mathcal{H})$  is an integral model of  $\text{mul.}^{-1}(H)$ , thus  $\mathcal{H} \times_{\mathcal{O}_K} \mathcal{H} \subset \text{mul.}^{-1}(\mathcal{H})$  by (20.3.1.5). Similarly we can prove that the inverse of  $\mathcal{H}$  is in  $\mathcal{H}$  and the identity map factors through  $\mathcal{H}$ , thus proving that  $\mathcal{H}$  is a subgroup scheme of  $\mathcal{G}$ .

For the Lie algebra, we can apply (20.3.1.5) to  $\mathcal{O}_K[\varepsilon]/(\varepsilon^2)$  and notice  $\text{Lie}(\mathcal{H}) = \ker(\mathcal{H}(\mathcal{O}_K[\varepsilon]/(\varepsilon^2)) \rightarrow \mathcal{H}(\mathcal{O}_K))$ .  $\square$

**Prop. (20.3.6.3) [Dilatations of Groups].** Situation as in (20.3.4.10), if  $\mathcal{G} \in \text{GrpSch}/\mathcal{O}_K$  and  $\mathcal{U} \leq \mathcal{G}_\kappa$  is an algebraic subgroup, then  $\mathcal{G}_\mathcal{U} \in \text{GrpSch}/\mathcal{O}_K$  and  $i_\mathcal{U} : \mathcal{G}_\mathcal{U} \rightarrow \mathcal{G}$  is a group homomorphism.

In particular, the smoothing  $\mathcal{G}^\infty \rightarrow \mathcal{G}$  is a group homomorphism.  $\lrcorner$

*Proof:* Use the universal property (20.3.4.11).  $\square$

**Def. (20.3.6.4) [Congruence Group Schemes].** Situation as in (20.3.4.10), if  $\mathcal{G} \in \text{GrpSch}/\mathcal{O}_K$ ,

- For  $n \in \mathbb{N}$ , define  $\mathcal{G}(1 + \mathfrak{m}^n) = \ker(\mathcal{G}(\mathcal{O}_K) \rightarrow \mathcal{G}(\mathcal{O}_K/\mathfrak{m}_K^n))$ .
- Define  $\mathcal{G}_0 = \mathcal{G}$ , and define inductively  $\mathcal{G}_{i+1}$  the dilatation of  $\mathcal{G}_i$  w.r.t. the trivial subgroup of the special fiber. These  $\mathcal{G}_n$  are called **congruence group schemes** of  $\mathcal{G}$ .

$\lrcorner$

### Smooth Reductions

**Prop. (20.3.6.5) [Schematic Subgroups].** Let  $(\mathcal{O}_K, K, \kappa) \in \text{DVR}$  and  $X \in \text{linAlgGrp}^{\text{sm}}/K$ . Then a  $\text{Gal}(\check{K}/K)$ -invariant subgroup  $\mathcal{U} \leq X(\check{K})$  is schematic (20.3.2.7) iff there exists an integral model  $\mathcal{X} \in \text{GrpSch}/\mathcal{O}_{\check{K}}$  of  $X_{\check{K}}$  preserving the group structure s.t.  $\mathcal{U} = \mathcal{X}(\mathcal{O}_{\check{K}})$ , because we can take the smoothing  $\mathcal{X}^\infty$  of  $\mathcal{X}$  (20.3.4.15)(20.3.6.3).  $\lrcorner$

**Cor. (20.3.6.6) [Intersection of Schematic Subgroups].** Situation as in (20.3.6.5), if  $\mathcal{U}_1, \mathcal{U}_2 \subset X(\check{K})$  are schematic, then so is  $\mathcal{U}_1 \cap \mathcal{U}_2$ .  $\lrcorner$

*Proof:* Let  $\mathcal{X}_i \in \text{GrpSch}/\mathcal{O}_K$  be smooth integral models of  $X$  s.t.  $\mathcal{X}_i(\mathcal{O}_{\check{K}}) = \mathcal{U}_i$ , which are naturally group schemes by (20.3.2.5), then we can take  $\mathcal{X}_3$  to be the schematic closure of the diagonal of  $X \times_K X$  in  $\mathcal{X}_1 \times_{\mathcal{O}_{\check{K}}} \mathcal{X}_2$ , which is an affine integral model of  $X$  with  $\mathcal{X}_3(\mathcal{O}_{\check{K}}) = \mathcal{U}_1 \cap \mathcal{U}_2$  by (20.3.1.5). And notice  $\mathcal{X}_3$  is a subgroup of  $\mathcal{X}_1 \times_{\mathcal{O}_K} \mathcal{X}_2$ , which can be checked at the generic fiber by the definition of schematic closure. Then we use (20.3.6.5).  $\square$

**Thm. (20.3.6.7) [Schematic Subgroups, Bruhat-Tits-Deligne].** Suppose

- $(\mathcal{O}_K, K) \in \text{DVR}$  is strictly-Henselian,
- $G \in \text{GrpSch}^{\text{aff,sm}}/K$  and  $\mathcal{U} \leq \mathcal{V} \leq G(K)$  are two subgroups,  $\mathcal{U}$  is normal in  $\mathcal{V}$ .
- $\mathcal{U}$  is schematic with smooth affine integral model  $\mathcal{U} \in \text{GrpSch}/\mathcal{O}_K$  (20.3.2.7).

Then

- There exists a smooth separated group scheme  $\mathcal{V} \in \text{GrpSch}/\mathcal{O}_K$  with generic fiber  $G$  s.t.  $\mathcal{V}(\mathcal{O}) = \mathcal{V}$ .
- There exists an open immersion  $\mathcal{U} \rightarrow \mathcal{V} \in \text{GrpSch}/\mathcal{O}_K$  that extends the inclusion  $\mathcal{U} \rightarrow \mathcal{V}$ , and induces isomorphism  $\mathcal{U}^0 \cong \mathcal{V}^0$ .
- If  $[\mathcal{V} : \mathcal{U}] < \infty$ , then  $\mathcal{V}$  is affine, thus is an integral model of  $H$  and  $\mathcal{V}$  is schematic.
- For any local ring extension  $R/\mathcal{O}_K$ , we have  $\mathcal{V}(R) = \mathcal{U}(R) \cdot \mathcal{V}$ .

- If  $(\mathcal{O}_{K'}, K') \in \text{DVR}$  is Henselian and  $(K')^{\text{sh}} = K$ ,  $G$  is defined over  $K$ , and  $\mathcal{V}$  is  $\text{Gal}(K/K')$ -invariant, then  $\mathcal{V}$  is defined over  $\mathcal{O}_{K'}$ . ┘

*Proof:* Cf. [K-P23]P647. □

**Prop. (20.3.6.8) [No  $\mathcal{G}$ -Torsors].** Let  $(\mathcal{O}_K, K, \kappa) \in \text{DVR}$  be Henselian and  $\mathcal{G} \in \text{GrpSch}^{\text{aff}, \text{sm}}/\mathcal{O}_K$  with connected fibers, then the map  $H^1(\text{Gal}_\kappa, \mathcal{G}(\mathcal{O}_{\check{K}})) \rightarrow H^1(\text{Gal}_\kappa, \mathcal{G}(\kappa^{\text{sep}}))$  is injective. In particular, if  $\kappa$  is a cd-1 field (9.8.3.18), then  $H^1(\text{Gal}_\kappa, \mathcal{G}(\mathcal{O}_{\check{K}})) = \mathbf{1}$ . ┘

*Proof:* Cf. [K-P23]P285. □

## 7 Reduction of Curves

References are [Sta]Chap55 and [Qing Liu].

**Def. (20.3.7.1) [Semistable and Stable Unions of Curves].** Let  $k \in \text{Field}$ ,  $k$ ,  $C$  an algebraic union of curves over  $k$ , then  $C$  is called a **semistable union of curves** iff  $C_{\bar{k}}$  is reduced and the singular points of  $C_{\bar{k}}$  are all ordinary double points.  $C$  is called a **stable union of curves** if moreover it satisfies:

- $C_{\bar{k}}$  is connected and projective, with  $p_a(C) \geq 2$ .
- Let  $\Gamma$  be an integral component of  $C$  that is isomorphic to  $\mathbb{P}_k^1$ , then it meets other integral components at at least 3 points. ┘

### Minimal Models

**Def. (20.3.7.2) [Minimal Models].** Let  $R$  be a DVR with fraction field  $K$ . Let  $C$  be a smooth projective curve over  $K$ , then a **minimal model for  $C$**  is a regular proper model  $\mathcal{C}$  for  $C$  s.t. for any other such model  $\mathcal{C}'$ , any birational map of models  $\mathcal{C} \rightarrow \mathcal{C}'$  is an isomorphism.

Equivalently,  $\mathcal{C}$  is a regular proper model that doesn't contain an exceptional curve of the first kind, i.e. cannot be blown down? Cf. [Sta]0C21. ┘

**Prop. (20.3.7.3) [Resolution of Singularities for Arithmetic Surfaces].** Let  $(R, K)$  be a DVR,  $C$  a smooth projective curve over  $K$  of genus  $g$ . Then there exists a proper regular model for  $C$ . ┘

*Proof:* Cf. [Sil99] □

**Thm. (20.3.7.4) [Minimal Model for Curves].** If  $(\mathcal{O}_K, K) \in \text{DVR}$ , and  $C$  a smooth projective precurve over  $K$  of genus  $\geq 1$ , then there exists a unique minimal model  $\mathcal{C}$  for  $C$  (20.3.7.2).

In particular, for any other regular proper model  $\mathcal{C}'$ , there exists a unique domination map  $\mathcal{C}' \rightarrow \mathcal{C}$ . ┘

*Proof:* Cf. [Sil99]. □

**Prop. (20.3.7.5) [Semistable Reductions].** If  $(\mathcal{O}_K, K) \in \text{DVR}$ , for  $C \in \text{Cur}^{\text{sm}, \text{proper}}/K$ , the following are equivalent:

- There exists a proper model of  $C$  that is at-most-model of relative dimension 1 over  $\mathcal{O}_K$ .
- There exists a minimal model of  $C$  that is at-most-model of relative dimension 1 over  $\mathcal{O}_K$ .
- Any minimal model of  $C$  that is at-most-model of relative dimension 1 over  $\mathcal{O}_K$ .

If this is the case, then  $C$  is said to have **semistable reduction**. ┘

*Proof:* Cf.[Sta]0CDG. □

**Prop. (20.3.7.6) [Good Reductions].** Let  $R$  be a DVR with fraction field  $K$ , for a smooth projective curve  $C$  over  $K$ , the following are equivalent:

- $C$  has good reduction over  $R$ .
- There exists a minimal model of  $C$  that is smooth over  $R$ .
- Any minimal model of  $C$  is smooth over  $R$ .

┘

*Proof:* Cf.[Sta]0CDI. □

### Good Reduction for Curves

**Prop. (20.3.7.7) [Reduction of Morphisms].** For any morphism  $\varphi : C \rightarrow C'$  of smooth projective curves over  $\mathbb{Q}$  with good reduction at  $p$  and  $g(C') > 0$ , there exists a unique reduction morphism  $\tilde{\varphi} : \tilde{C} \rightarrow \tilde{C}'$  that commutes with the reduction map(20.3.2.2). This defines a functor from the category of smooth projective curves of positive genus with good reduction to the category of smooth curves over  $\mathbb{F}_p$ .

Moreover,  $\deg(\varphi) = \deg(\tilde{\varphi})$ , and by(20.3.2.2), if  $\varphi$  is surjective,  $\tilde{\varphi}$  is also surjective. And  $\varphi$  is an isomorphism iff  $\tilde{\varphi}$  is an isomorphism. ┘

*Proof:* Cf.[BLR90]Prop 9.5.1 ? □

**Cor. (20.3.7.8).** If  $\varphi : E \rightarrow E'$  is an isogeny of elliptic curves over  $\mathbb{Q}$  with good reduction at  $p$ , then the reduction morphism  $\tilde{\varphi} : \tilde{E} \rightarrow \tilde{E}'$  is also an isogeny. ┘

*Proof:* Because it maps  $\tilde{O}_E$  to  $\tilde{O}_{E'}$  and is surjective, this follows from(20.9.1.4). □

**Prop. (20.3.7.9) [Pushforward of Divisors].** Let  $C$  be a smooth projective curve over  $\mathbb{Q}$  with good reduction at  $p$ , then the reduction map  $X(\overline{K}) \rightarrow \tilde{X}(\overline{F}_p)$  induces a map

$$\mathrm{Div}^0(X) \rightarrow \mathrm{Div}^0(\tilde{X})$$

that maps principal divisors to principal divisors, so inducing a map  $\varphi_* : \mathrm{Pic}^0(C) \rightarrow \mathrm{Pic}^0(C')$ , which is compatible with pushforward of divisors along morphisms of curves: if  $h : C \rightarrow C'$  is a morphism of smooth projective curves over  $\mathbb{Q}$  with good reductions at  $p$ , then the following digram is commutative:

$$\begin{array}{ccc} \mathrm{Pic}^0(C) & \xrightarrow{h_*} & \mathrm{Pic}^0(C') \\ \downarrow & & \downarrow \\ \mathrm{Pic}^0(\tilde{C}) & \xrightarrow{\tilde{h}_*} & \mathrm{Pic}^0(\tilde{C}') \end{array}$$

┘

*Proof:* Cf.[BLR90]Prop 9.5.1 ? □

### Classification of Special Fibers of the Minimal Regular Models of Curves of Genus 2

Cf.[Y. Namikawa, K. Ueno, The complete classification of fibers in pencils of curves of genus two, Manuscripta Math. 9 (1973), 143–186.] and [A. P. Ogg, On pencils of curves of genus two, Topology 5 (1966), 355–362.].

## 20.4 Arithmetic Subgroups(Fundamental Domains)

References are [P-R94, Mor15].

**Notation (20.4.0.1).**

- Let  $F \in \mathbf{NField}$ .

┘

**Def. (20.4.0.2)[Arithmetic Subgroups].** For  $G \in \mathbf{linAlgGrp}/\mathbb{Q}$ , an **arithmetic subgroup**  $\Gamma \leq G(\mathbb{Q})$  is a subgroup that is commensurable with  $G(\mathbb{Q}) \cap \mathrm{GL}(n, \mathbb{Z})$  for some embedding  $G \hookrightarrow \mathrm{GL}(n)_{\mathbb{Q}}$ . This notion is independent of the embedding chosen.

If  $G \subset \mathrm{GL}(V)$  and  $L \subset V$  be a lattice, then the arithmetic subgroup  $G(\mathbb{Q}) \cap \mathrm{GL}(n, \mathbb{Z})$  is also denoted by  $G(\mathbb{Z}; L)$ , called the **group of units of  $G$** . If no confusion is make, it is also denoted by  $G(\mathbb{Z})$ .

┘

*Proof:* Cf.[P-R94]P171.

□

**Lemma (20.4.0.3) [Invariance of Arithmetic Subgroups].** For  $\varphi : G \rightarrow G' \in \mathbf{linAlgGrp}/\mathbb{Q}$ , the kernel of an arithmetic subgroup is an arithmetic subgroup.

┘

*Proof:*

□

**Cor. (20.4.0.4).** If  $G = H \ltimes N \subset \mathrm{GL}(V) \in \mathbf{linAlgGrp}/\mathbb{Q}$ , then  $H(\mathbb{Z}) \ltimes N(\mathbb{Z}) \subset G(\mathbb{Z})$  has finite index.

┘

*Proof:* Let  $\mathrm{pr} : G \rightarrow H$  be the projection, then  $H(\mathbb{Z}) \ltimes N(\mathbb{Z}) = \mathrm{pr}^{-1}(H(\mathbb{Z}))$ .

□

**Prop. (20.4.0.5).** If  $\varphi : G \rightarrow G' \in \mathbf{linAlgGrp}/\mathbb{Q}$  is surjective, then  $\varphi$  maps an arithmetic subgroup to an arithmetic subgroup.

┘

*Proof:* ?

□

**Prop. (20.4.0.6).** There exists arithmetic subgroups not of the form  $G(\mathbb{Z}; L)$ .

┘

*Proof:* ? By the proof of(20.4.0.3), any  $G_{\mathbb{Z}}^L$  must contain some congruence subgroup  $G_{\mathbb{Z}}(d)$ , but there are examples of subgroups of finite index of  $SL(2, \mathbb{Z})$  not of this form, Cf.[?R-P94]Chap9.5. □

**Prop. (20.4.0.7).** Let  $G \in \mathbf{linAlgGrp}/\mathbb{Q}$  and  $\Gamma$  be an arithmetic subgroup, then for any f.d. representation  $\rho \in \mathrm{Rep}_{\mathbb{Q}}^{\mathrm{fd}}(G)$ , there exists a  $\Gamma$ -invariant lattice.

┘

*Proof:* Cf.[?R-P94]P173.

□

### 1 Reduction Theory

References are [P-R94]Chap4.

**Thm. (20.4.1.1) [Borel Density Theorem].** Let  $G \in \mathbf{linAlgGrp}/\mathbb{Q}$  be semisimple of non-compact type, then any arithmetic subgroup  $\Gamma$ (20.4.0.2) is Zariski-dense in  $G$ .

┘

*Proof:* Cf.[?R-P94]P205. ?

□

### Fundamental Domains

**Thm. (20.4.1.2)[Open Fundamental Domains].** If  $G \in \mathcal{AlgGrp}/F$ , then there exists an open fundamental set  $\Omega \subset G(\mathbf{A}_{F,\infty})$  relative to  $G_{\mathcal{O}_F}$ , i.e.

- $\mathcal{K}\Omega = \Omega$  for suitable maximal compact subgroup  $\mathcal{K} \subset G(\mathbf{A}_{F,\infty})$ .
- $\Omega G_{\mathcal{O}_F} = G(\mathbf{A}_{F,\infty})$ .
- $\#\Omega^{-1}.\Omega \cap xG_{\mathcal{O}_F}y < \infty$  for any  $x, y \in G(K)$ .

┘

*Proof:* Cf.[P-R94]P277.

□

**Thm. (20.4.1.3)[Finite Presentedness].** If  $G \in \mathcal{AlgGrp}/F$ , then  $G_{\mathcal{O}_F}$  is f.p..

┘

*Proof:* Cf.[P-R94]P277.

□

### Compactness of $G(\mathbf{A}_{F,\infty})/G_{\mathcal{O}_F}$

**Prop. (20.4.1.4).** Let  $S \in \text{lin}\mathcal{AlgGrp}/\mathbb{Q}$  be a torus, then the following are equivalent:

- $S$  is  $\mathbb{Q}$ -anisotropic.
- $S(\mathbb{R})/S(\mathbb{Z})$  is compact.

┘

*Proof:* Cf.[?R-P94]P205.?

□

**Thm. (20.4.1.5)[Mostow-Tamagawa[M-T62]].** Let  $G \in \mathcal{AlgGrp}/F$ , then the following conditions are equivalent:

- $G(\mathbf{A}_{F,\infty})/G_{\mathcal{O}_F}$  is compact.
- The reductive part of  $G^0$  is anisotropic over  $F$ .

┘

*Proof:* Cf.[?R-P94]P210.?

□

**Prop. (20.4.1.6)[Mahler's Criterion].** A subset  $\Omega \subset GL(n; \mathbb{R})$  is compact modulo  $GL(n; \mathbb{Z})$  iff it satisfies:

- $\{\det(g) | g \in \Omega\}$  is bounded.
- $[\Omega.(\mathbb{Z}^n \setminus \{0\})] \cap U = \emptyset$  for some nbhd  $U$  of  $0 \in \mathbb{R}^n$ .

┘

*Proof:* Cf.[?R-P94]P211.?

□

### Finiteness of the Volume of $G(\mathbf{A}_{F,\infty})/G_{\mathcal{O}_F}$

**Thm. (20.4.1.7).**  $G(\mathbf{A}_{F,\infty})/G_{\mathcal{O}_F}$  has finite volume iff  $X(G^0) = 1$ , e.g.  $G \in \text{RedGrp}^{\text{ss}}/F$ .

┘

*Proof:* Cf.[?R-P94]P220.

□

### Finite Arithmetic Groups

**Prop. (20.4.1.8).** Let  $G \in \text{AlgGrp}/F$ , then there exists only f.m. conjugacy classes of finite subgroups of  $G_{\mathcal{O}_F}$ . ┘

*Proof:* ? □

**Conj. (20.4.1.9).** If  $G \leq \text{GL}(n)_{\mathbb{Q}} \in \text{AlgGrp}/\mathbb{Q}$  is of compact-type, then for any totally real extension  $F/\mathbb{Q}$ ,  $G(\mathcal{O}_F) = G(\mathbb{Z})$ . ┘

*Proof:* □

**Remark (20.4.1.10).** By (20.4.1.11), it suffices to prove this conjecture for  $\text{O}(V)$  for any inner space  $V/\mathbb{Q}$ . ┘

**Prop. (20.4.1.11).** If  $G \leq \text{GL}(n) \in \text{AlgGrp}/\mathbb{Q}$  satisfies  $G(\mathbb{R})$  is compact and Zariski dense in  $G$ , then  $G$  preserves a quadratic definite quadratic form  $f$ . ┘

*Proof:* Cf. [R-P94]P230. □

**Prop. (20.4.1.12) [Bartels-Kitaoka].** Let  $F/\mathbb{Q}$  be a totally real nilpotent Galois extension, and  $\Gamma \leq \text{GL}(n; \mathcal{O})$  is a finite  $\text{Gal}(F/\mathbb{Q})$ -invariant subgroup, then  $\Gamma \subset \text{GL}(n; \mathbb{Z})$ . ┘

*Proof:* Cf. [R-P94]P234. □

**Prop. (20.4.1.13).** Let  $V/\mathbb{Q}$  be an inner space and  $A = (a_{ij}) \in \text{GL}(n; \mathbb{Z})$  be an integral Gram matrix for  $V$ . If  $a_{ii} \leq 4\lambda$  for any  $i$ , where  $\lambda$  is the smallest eigenvalue of  $A$ , then for any totally real extension  $F/\mathbb{Q}$ ,  $\text{O}(V; \mathcal{O}_F) = \text{O}(V; \mathbb{Z})$ . ┘

*Proof:* Cf. [R-P94]P236. □

## 2 Congruence Subgroups

**Def. (20.4.2.1) [Congruence Subgroups].** Let  $G \in \text{AlgGrp}/\mathbb{Q}$  with an embedding  $G \hookrightarrow \text{GL}(n)_{\mathbb{Q}}$ , for  $N \in \mathbb{Z}_+$ , define

$$\Gamma(N) = G(\mathbb{Q}) \cap \ker(\text{GL}(n; \mathbb{Z}) \rightarrow \text{GL}(n; \mathbb{Z}/(N)))$$

and a **congruence subgroup** of  $G(\mathbb{Q})$  is any subgroup of  $G(\mathbb{Q})$  that contains some  $\Gamma(N)$  as a finite index subgroup.

The notion is compatible with that defined in (20.5.3.24). In particular, the set of congruence subgroups of  $G$  doesn't depend on the embedding ?. ┘

**Prop. (20.4.2.2) [Congruence Subgroup Problem].** Let  $G \in \text{RedGrp}/\mathbb{Q}$ .

- If  $G$  is split simply connected other than  $\text{SL}(2)$ , then every arithmetic subgroup of  $G$  is a congruence subgroup.
  - If  $G = \text{SL}(2)$  or non-simply connected, there are many arithmetic subgroups of  $G$  that is not congruence subgroups.
- ┘

*Proof:* Cf. [MATSUMOTO 1969. Sur les sous-groupes arithmetiques des groupes semi-simples deployes]. [SURY, B. 2003. The congruence subgroup problem, volume 24 of Texts and Readings in Mathematics. Hindustan Book Agency, New Delhi.] □

**Prop. (20.4.2.3).** The image of a congruence subgroup may not be a congruence subgroup.  $\lrcorner$

*Proof:*

□

**Prop. (20.4.2.4)[Minkowski].** The congruence subgroup  $1+p\mathrm{GL}(n;\mathbb{Z})$  is torsion-free for  $p \in \mathrm{Prime}_{\geq 3}$ .

$\lrcorner$

*Proof:* Cf.[P-R94]P232.

□

### 3 Adelic $S$ -Arithmetic Subgroups

References are [P-R94]Chap5.4.

### 4 Arithmetic Subgroup of Lie Groups

**Def. (20.4.4.1)[Arithmetic Subgroups].** Let  $H$  be a connected real Lie group, then an **arithmetic subgroup**  $\Gamma \subset H$  is a subgroup s.t. there exists an algebraic group  $G \in \mathrm{AlgGrp}/\mathbb{Q}$ , a surjective homomorphism  $G(\mathbb{R})^0 \rightarrow H$  with compact kernel, and  $\Gamma_0 \subset G(\mathbb{Q})$  an arithmetic subgroup(20.4.0.2) s.t.  $\Gamma_0 \cap G(\mathbb{R})^0$  is mapped to  $\Gamma$ .  $\lrcorner$

**Prop. (20.4.4.2).** Let  $H$  be a semisimple real Lie group that admits a faithful f.d. representation, then every arithmetic subgroup of  $H$  is discrete of finite covolume, and contains a torsion-free subgroup of finite index.  $\lrcorner$

*Proof:* Cf.[?Mil17b]P34.

□

**Prop. (20.4.4.3).** In any connected real Lie group there are only countably many arithmetic subgroups up to conjugacy.  $\lrcorner$

*Proof:* Cf.[Mor15]5.1.20.

□

**Thm. (20.4.4.4)[Margulis].** Every discrete subgroup of finite volume in a non-compact simple real Lie group  $H$  is arithmetic unless  $H$  is isogenous to  $SO(1, n)$  or  $SU(1, n)$ .

Note that  $SL(2, \mathbb{R})$  is isogenous to  $SO(1, 2)$ , so the theorem doesn't apply to it.  $\lrcorner$

*Proof:* Cf.[Mor15]5.2.?

□

### 5 Fuchsian Groups of $\mathrm{PGL}(2; \mathbb{R})$

References are [Miy06].

**Def. (20.4.5.1)[Limitin points].** For a subgroup  $\Gamma \leq \mathrm{PGL}(2; \mathbb{C})$ , denote  $\Lambda(\Gamma) \subset \mathbb{P}^1(\mathbb{C})$  the set of points  $z \in \mathbb{P}^1(\mathbb{C})$  s.t. there exists  $w \in \mathcal{H}$  and a infinite sequence  $(\gamma_n)_{n \in \mathbb{Z}_+}$  of distinct elements in  $\Gamma$  s.t.  $\lim_n \gamma_n w = z$ .

Then it is the smallest non-empty closed  $\Gamma$ -invariant subset of  $\mathbb{P}^1(\mathbb{C})$ . And we denote  $\Omega(\Gamma) = \mathbb{P}^1(\mathbb{C}) \setminus \Lambda(\Gamma)$ .  $\lrcorner$

*Proof:* ?

□

**Def. (20.4.5.2)[Fuchsian Groups].**  $\Gamma \leq \mathrm{PGL}(2; \mathbb{R})$  is called a **Fuchsian group** if?  $\lrcorner$

**Def. (20.4.5.3)[Geometrically Generated Fuchsian Groups].** A geometrically generated Fuchsian group  $\Gamma \leq \mathrm{SL}(2; \mathbb{R})$  is a Fuchsian group (20.4.5.2) s.t. a Dirichlet fundamental domain for  $\Gamma$  has f.m. edges.  $\lrcorner$

**Def. (20.4.5.4)[Elliptic Points].** A point  $z \in \mathcal{H}$  is called a **elliptic point** if it is the fixed point of an elliptic element  $\gamma$  of  $\Gamma$  (16.6.1.2).  $\lrcorner$

**Prop. (20.4.5.5).** Let  $\Gamma$  be a discrete subgroup of  $\mathrm{SL}(2, \mathbb{R})$  and  $z$  an elliptic point of  $\Gamma$ , then the stabilizer  $\Gamma_z$  of  $z$  in  $\Gamma$  is a finite cyclic subgroup.  $\lrcorner$

*Proof:* Because  $\mathrm{SL}(2, \mathbb{R})$  acts transitively on  $\mathcal{H}$ , by conjugacy we can assume the elliptic point is  $i$  for another  $\Gamma'$ . Then the stabilizer of  $i$  in  $\mathrm{SL}(2, \mathbb{R})$  is  $\mathrm{SO}(2, \mathbb{R}) \cong S^1$ , and  $\mathrm{SO}(2, \mathbb{R}) \cap \Gamma'$  is a compact and discrete subgroup, so it is finite cyclic.  $\square$

**Def. (20.4.5.6)[Fuchsian Groups of the First Kind].** For  $n \in \mathbb{Z}_+$ , a **Fuchsian group of the first kind** is a discrete subgroup  $\Gamma \subset \mathrm{SL}(n; \mathbb{R})$  s.t.  $\mathrm{Vol}(\mathrm{SL}(n; \mathbb{R})/\Gamma) < \infty$ .  $\lrcorner$

**Prop. (20.4.5.7)[Classifying Fuchsian Groups].** Suppose  $\Gamma \leq \mathrm{SL}(2; \mathbb{R})$  is a Fuchsian group (20.4.5.2), and let  $\Lambda(\Gamma) \subset \mathbb{P}^1(\mathbb{R})$  denote the limit points of  $\Gamma$ , then

- Any  $x \in \mathbb{P}^1(\mathbb{R})$  that is fixed by some element in  $\Gamma \setminus Z(\Gamma)$  lies in  $\Lambda(\Gamma)$ . In particular,  $\Lambda(\Gamma)$  contains all elliptic and cusp points of  $\Gamma$ .
- $\Gamma$  is countable because it is discrete in  $\mathrm{SL}(2; \mathbb{R})$ , thus there are uncountably many non-elliptic points in  $\mathcal{H}$ . For any non-elliptic point  $w \in \mathcal{H}$ ,  $\Lambda(\Gamma)$  equals the set of limit points of  $\Gamma.w$ . In particular,  $\Lambda(\Gamma)$  is  $\Gamma$ -invariant.
- If  $x \in \Lambda(\Gamma)$  is fixed by a hyperbolic  $\gamma \in \Gamma$  and  $y \in \Lambda(\Gamma)$  is not fixed by  $\gamma$ , then either  $\lim_{n \rightarrow \infty} \gamma^n y = x$  or  $\lim_{n \rightarrow \infty} \gamma^{-n} y = x$ . In particular,  $x$  is a limit point of  $\Lambda(\Gamma)$ .
- If  $x \in \Lambda(\Gamma)$  is not a hyperbolic point and  $\Gamma$  contains a hyperbolic  $\gamma$ , then  $x$  is a limit of hyperbolic points.
- If  $\#\Lambda(\Gamma) > 2$ , then  $\Gamma$  contains a hyperbolic element  $\gamma$  and  $\Lambda(\Gamma)$  is perfect, thus uncountable.
- If  $\#\Lambda(\Gamma) \neq \mathbb{P}^1(\mathbb{R})$  is perfect, then it is nowhere dense.

In particular, there are three kinds of Fuchsian groups:

- **elementary Fuchsian groups** are those with  $\#\Lambda(\Gamma) \leq 2$ .
- **Fuchsian groups of first kind** are those with  $\#\Lambda(\Gamma) = \mathbb{P}^1(\mathbb{R})$ .
- **Fuchsian groups of second kind** are those with  $\#\Lambda(\Gamma) \subset \mathbb{P}^1(\mathbb{R})$  perfect and nowhere dense.  $\lrcorner$

*Proof:* ?

4: Let  $y$  be a fixed point of  $\gamma$ . Choose  $w \in \mathcal{H}$  be non-elliptic for  $\Gamma$ , then there exists different  $\alpha_n \in \Gamma$  s.t.  $\lim_n \alpha_n w = y$ , and also different  $\beta_n \in \Gamma$  s.t.  $\lim_n \beta_n w = x$ , Then  $\lim_n \beta_n \alpha_n^{-1} y = x$ , and each  $\beta_n \alpha_n^{-1} y$  is a hyperbolic point.  $\square$

## Modular Groups

**Def. (20.4.5.8)[Principle Congruence Subgroups].** For  $n \in \mathbb{Z}_+$ , there are Fuchsian subgroups:

$$\Gamma(N) \subset \Gamma_1(N) \subset \Gamma_0(N) = \mathrm{SL}(n; \mathbb{Z})$$

where

$$\Gamma(N) = \ker(\mathrm{SL}(n; \mathbb{Z}) \rightarrow \mathrm{SL}(n; \mathbb{Z}/(n)),$$

$$\Gamma_1(N) = \left\{ \begin{bmatrix} A & B \\ C & d \end{bmatrix} \in \mathrm{GL}(n; \mathbb{Z}) \mid A \in \Gamma(N)_{n-1}, d \in \Gamma(N)_1, c \in N \cdot \mathrm{Mat}(1 \times n; \mathbb{Z}) \right\}.$$

$$\Gamma_0(N) = \left\{ \begin{bmatrix} A & B \\ C & d \end{bmatrix} \in \mathrm{GL}(n; \mathbb{Z}) \mid A \in \mathrm{Mat}(n; \mathbb{Z}), d \in \mathbb{Z}, c \in N \cdot \mathrm{Mat}(1 \times n; \mathbb{Z}) \right\}.$$

┘

**Def. (20.4.5.9) [Congruence Subgroups].** A **congruence subgroup** is a Fuchsian subgroup  $\Gamma \subset \mathrm{SL}(n; \mathbb{Z})$  that contains  $\Gamma(N)$  for some  $N \in \mathbb{Z}_+$ . In particular, a congruence subgroup has finite index in  $\Gamma(1)$ . ┘

**Def. (20.4.5.10) [Dirichlet Character for  $\Gamma_0(N)$ ].** For  $N \in \mathbb{Z}_+$  and  $\chi \in \mathrm{Diri}(N)$ , we can define a character of  $\Gamma_0(N)$ :

$$\chi_d \left( \begin{bmatrix} A & B \\ C & d \end{bmatrix} \right) = \chi(d).$$

┘

**Def. (20.4.5.11) [Fricke Involution].** For  $N \in \mathbb{Z}_+$ , denote

$$w_N = \begin{bmatrix} & -1 \\ N & \end{bmatrix}, \quad W_N = \frac{1}{\sqrt{N}} w_N.$$

Then  $W_N^2 = -1$ , and  $\Gamma_0(N)$  is stabilized by  $w_N$  and  $W_N$ . Denote

$$\Gamma_0^+(N) = \langle \Gamma_0, W_N \rangle \subset \mathrm{SL}(2, \mathbb{R}).$$

┘

*Proof:*

$$w_N \begin{bmatrix} a & b \\ c & d \end{bmatrix} w_N^{-1} = \frac{-1}{N} \begin{bmatrix} Nd & c \\ N^2b & Na \end{bmatrix} = \begin{bmatrix} -d & -c/N \\ -Nb & -a \end{bmatrix}.$$

□

**Prop. (20.4.5.12).**  $\Gamma_0^+(4) = \left\langle T = \begin{bmatrix} 1 & 1 \\ & 1 \end{bmatrix}, W_4 \right\rangle$ . In fact, if  $\tilde{T} = W_4 T W_4^{-1} = \begin{bmatrix} 1 & \\ 4 & 1 \end{bmatrix}$ , then  $\overline{\Gamma_0(4)} = \overline{\langle T, \tilde{T} \rangle} \in \mathrm{PSL}(2; \mathbb{R})$ . ┘

*Proof:*

□

**Lemma (20.4.5.13) [Cartan Decomposition].** There is a complete set of coset representatives for

$$\mathrm{SL}(2, \mathbb{Z}) \backslash \mathrm{GL}(2, \mathbb{Q})^+ / \mathrm{SL}(2, \mathbb{Z})$$

consisting of the diagonal matrices  $\mathrm{diag}(d_1, d_2)$ , where  $d_1, d_2 \in \mathbb{Q}^\times$  and  $d_1/d_2$  is a positive integer.

More generally, for  $N > 0$ ,

$$\mathrm{GL}(2, \mathbb{Q})^+ = \coprod_{d_1, d_2 \in \mathbb{Q}^\times, d_1/d_2 \in \mathbb{Z}_+} \mathrm{SL}(2, \mathbb{Z}) \begin{bmatrix} d_1 & \\ & d_2 \end{bmatrix} \Gamma_0(N).$$

Also, let  $\Sigma$  be the set of primes dividing  $N$ ,  $\mathbb{Z}_\Sigma$  be the localization of  $\mathbb{Z}$  at these primes, and  $G_0(N)$  be the subgroup of  $\mathrm{GL}(2, \mathbb{Z}_\Sigma)^+$  consisting of matrices  $\begin{bmatrix} a & b \\ c & d \end{bmatrix}$  s.t.  $c \in N\mathbb{Z}_\Sigma$ . Then

$$G_0(N) = \coprod_{d_1, d_2 \in \mathbb{Z}_\Sigma, d_1/d_2 \in \mathbb{Z}_+} \Gamma_0(N) \begin{bmatrix} d_1 & \\ & d_2 \end{bmatrix} \Gamma_0(N).$$

┘

*Proof:* The first assertion follows from (16.5.5.5), noticing the sign.

For the second assertion, for any  $g \in G_0(N)$ , let  $g = \gamma_1 \mathrm{diag}(d_1, d_2) \gamma_2$  where  $D = d_1/d_2 \in \mathbb{Z}$  and  $(D, N) = 1$ . Then for any  $\begin{bmatrix} a & b \\ Dc & d \end{bmatrix} \in \Gamma_0(N)$ , we can change  $(\gamma_1, \gamma_2)$  to  $(\gamma_1 \begin{bmatrix} a & Db \\ c & d \end{bmatrix}, \begin{bmatrix} a & b \\ Dc & d \end{bmatrix} \gamma_2)$ , in this way if  $\gamma_2 = \begin{bmatrix} x & y \\ z & w \end{bmatrix}$ , we can change  $z$  to  $Dxc + dz$ . Now take  $k$  s.t.  $(kx + z, N) = 1$ , and let  $c$  be chosen s.t.  $N \mid D(kz + x)c + z$ , and  $d = kDc + 1$ , then  $(Dc, d) = 1$ , and we can find  $a, b$  s.t.  $ad - Dbc = 1$ . Then for this  $(a, b, c, d)$ ,  $\begin{bmatrix} a & b \\ Dc & d \end{bmatrix} \gamma_2 \in \Gamma_0(N)$ .

Finally, if  $g \in G_0(N)$  and  $\gamma_2 \in \Gamma_0(N)$ , then automatically  $\gamma_1 \in \Gamma_0(N)$ . □

**Prop. (20.4.5.14) [Conjugate of Congruence Subgroup].** If  $\Gamma$  is a congruence subgroup of level  $N$  and  $\alpha \in \mathrm{GL}(2, \mathbb{Q})^+$ , then  $\alpha^{-1}\Gamma\alpha$  is a congruence subgroup.

In particular,  $\alpha\Gamma\alpha^{-1} \cap \Gamma$  is also a congruence subgroup, and if  $\alpha \in \mathrm{SL}(2, \mathbb{Z})$  with  $\delta(\alpha) = D$ , then  $\alpha^{-1}\Gamma\alpha$  is a congruence subgroup of level  $DN$ . ┘

*Proof:* Let  $M_1, M_2$  be positive integers s.t.  $M_1\alpha, M_2\alpha^{-1} \in \mathrm{Mat}(2; \mathbb{Z})$ . (In the second case we can take  $M_1 = 1, M_2 = D$ ). If  $A$  is a matrix that  $A \equiv 1 \pmod{M_1M_2N}$ , then  $\alpha^{-1}(A - 1)\alpha \equiv 1 \pmod{N}$ . Thus  $\alpha^{-1}\Gamma\alpha$  contains  $\Gamma(M_1M_2N)$ . □

**Cor. (20.4.5.15) [Congruence Topology].** We can define a topology on the group  $\mathrm{GL}(2, \mathbb{Q})^+$  given by a basis at the origin given by the open subgroup  $\Gamma(N)$ . Then (20.4.5.14) can be used to show that this is truly a topology. In fact, its restriction on  $\mathrm{SL}(2, \mathbb{Z})$  is the same as the topology given by the inclusion  $\mathrm{SL}(2, \mathbb{Z}) \subset \mathrm{SL}(2, \widehat{\mathbb{Z}})$ .

But unfortunately,  $\mathrm{SL}(2, \mathbb{Z})$  is not compact in this topology, because otherwise  $\mathrm{SL}(2, \mathbb{Z})$  is closed in  $\mathrm{SL}(2, \widehat{\mathbb{Z}})$ , contradiction. ┘

**Lemma (20.4.5.16).** The action of  $\Gamma(1) = \mathrm{SL}(2, \mathbb{Z})$  on  $\mathcal{H}$  is properly discontinuous (4.12.1.13). ┘

*Proof:* Cf. [Bump P18]. □

**Prop. (20.4.5.17).** The subset  $F = \{z \in \mathcal{H} \mid |\mathrm{Re}(z)| < 1/2, |z| > 1\}$  is a fundamental domain for  $\Gamma(1) = \mathrm{SL}(2, \mathbb{Z})$ , and moreover, let  $S = \begin{bmatrix} 0 & -1 \\ 1 & 0 \end{bmatrix}$  and  $T = \begin{bmatrix} 1 & 1 \\ 0 & 1 \end{bmatrix}$ , then  $S^2 = -1$ ,  $(ST)^3 = (TS)^3 = -1$ , and

(1) two elements  $z, z'$  of  $\overline{F}$  are equivalent under  $\Gamma(1)$  iff

- (a)  $\operatorname{Re}(z) = -1/2$  and  $z' = z + 1$ , then  $z' = T(z)$ .  
 (b)  $|z| = 1$  and  $z' = -\frac{1}{z}$ , then  $z' = S(z)$ .  
 (2) Let  $z \in \overline{F}$ , if the stabilizer of  $z$  is not  $\pm 1$ , then  
 (a)  $z = i$  and  $\operatorname{Stab}(i) = \langle S \rangle$ .  
 (b)  $z = \rho = e^{2\pi i/6}$  and  $\operatorname{Stab}(\rho) = \langle TS \rangle$ .  
 (c)  $z = \omega$ , and  $\operatorname{Stab}(\omega) = \langle ST \rangle$ .

┘

*Proof:* 1: Let  $\Gamma'$  be the subgroup of  $\Gamma(1)$  generated by  $S$  and  $T$ . By (12.4.1.9),

$$\operatorname{Im}(\gamma(z)) = \frac{\operatorname{Im}(z)}{|cz + d|^2}.$$

and there is a  $\gamma \in \Gamma'$  that  $|cz + d|$  attains the minimal value, then  $\operatorname{Im}(\gamma(z))$  attains a maximal value. Now there is a  $n$  that  $z' = \operatorname{Re}(T^n \gamma(z)) \in [-1/2, 1/2]$ . Now I claim that  $|z'| \geq 1$ , because otherwise

$$\operatorname{Im}(Sz') = \operatorname{Im}(-1/z') = \frac{\operatorname{Im}(z')}{|z'|^2} > \operatorname{Im}(z'),$$

contradiction.

2: Suppose  $z, z' \in \overline{F}$  are  $\Gamma$ -conjugate, we can assume  $\operatorname{Im}(z) \leq \operatorname{Im}(z')$ . Suppose  $z' = \gamma(z)$  and  $z = x + iy$ , then

$$(cx + d)^2 + (cy)^2 \leq 1.$$

Then  $|c| < 2$ . If  $c = 0$ , then  $d = \pm 1$ , and  $\gamma$  is a translation, thus we are in case 1.(a). If  $c = 1$ , then  $d = 0$ , unless  $z = \rho$  or  $\omega$ . If  $d = 0$ , then  $\gamma = \begin{bmatrix} a & 1 \\ -1 & \end{bmatrix}$ , thus  $\gamma(z) = a - \frac{1}{z}$ . If  $a = 0$ , then we are in case 1.(b), and if  $a \neq 0$ , then  $z = \rho$  or  $\omega$ . and the  $c = -1$  case is similar.  $\square$

**Prop. (20.4.5.18)[Cusps and Elliptic Points for  $\Gamma(1)$ ].**

- The cusps of  $\Gamma(1)$  are exactly  $\mathbb{P}^1(\mathbb{Q})$ , and each of them is  $\Gamma(1)$ -equivalent to  $\infty$ .
- The elliptic points of  $\Gamma(1)$  are exactly those that are  $\Gamma(1)$ -conjugate to  $i$  or  $\rho = e^{\pi i/3}$ , with corresponding stabilizer group cyclic of order 4 and 6.

┘

*Proof:* 1: Clearly  $\infty$  is fixed by the parabolic matrix  $T = \begin{bmatrix} 1 & 1 \\ & 1 \end{bmatrix}$ . Now for any  $m/n$  that  $m, n$  is coprime, there exists integers  $r, s$  that  $rm - sn = 1$ . Let  $\gamma = \begin{bmatrix} m & s \\ n & r \end{bmatrix}$ , then  $\gamma(\infty) = m/n$  thus  $m/n$  is also a cusp. Conversely, every parabolic matrix is conjugate to  $T$ , thus its fixed point is conjugate to  $\infty$ , which means the fixed point is in  $\mathbb{Q} \cup \{\infty\}$ .

2: For the elliptic points of  $\Gamma(1)$ , use (20.4.5.17).  $\square$

## 6 Schottky Groups of $\operatorname{PGL}(2; \mathbb{C})$

References are [Mumford, An analytic construction of degenerating curves over complete local fields].

**Def. (20.4.6.1)[Schottky Groups].** A **Schottky group** is a discrete f.g. free subgroup  $\Gamma \subset \mathrm{PSL}(2; \mathbb{C})$  that is purely loxodromic (i.e. has eigenvalues  $\lambda, \lambda^{-1}$  where  $|\lambda| \neq 1$ ).  $\lrcorner$

**Thm. (20.4.6.2)[Maskit].** If  $\Gamma \subset \mathrm{PSL}(2; \mathbb{C})$  is a Schottky group, then  $\mathcal{H}^3 \cup \Omega(\Gamma)/\Gamma$  (20.4.5.1) is homeomorphic to a split torus with  $n$ -handles with boundary  $X = \Omega(\Gamma)/\Gamma$  which is homeomorphic to a surface of genus  $n = \mathrm{rank}(\Gamma_{\mathrm{ab}})$ . This is called a **Schottky uniformization** of  $X$ .  $\lrcorner$

*Proof:* Cf.[Mumford, An analytic construction of degenerating curves over complete local fields]. ?  
 $\square$

## 20.5 Arithmetic of Algebraic Groups

### 1 over Valued Fields

References are [Tit79].

### Notation(20.5.1.1).

- Let  $K \in \mathbf{Field}^0$  be a valued field.
- Let  $H \leq G \in \mathbf{AlgGrp}/K$ .
- $G(K)$  is a topological group with the topology coming from  $K$ .

┘

### Bounded Subgroups

**Def. (20.5.1.2)**  $[G(K)^1]$ . For  $G \in \mathbf{AlgGrp}/K$ , define

$$G(K)^1 = \bigcap_{\chi \in X^*(G)} \ker(|-| \circ \chi : G(K) \rightarrow \mathbb{R}_+).$$

┘

**Def. (20.5.1.3)** **[Bounded Subsets]**. For any  $X \in \mathbf{Aff}^{\text{sep}}/K$ , a subset  $B \subset X(K)$  is called a **bounded subset** if for any  $f \in \Gamma(X)$ , the set  $\{|f(b)| : b \in B\}$  is bounded.

Notice that if  $K \in \mathbf{LField}$ , then a subset  $B \subset X(K)$  is bounded iff it is pre-compact in the analytic topology.

┘

**Prop. (20.5.1.4)** **[Bounded Subsets and Finite Maps]**. For any  $X \rightarrow Y \in \mathbf{Aff}^{\text{ft}}/K$  is a finite map, then the inverse image of a bounded subset of  $Y(K)$  is a bounded subset of  $X(K)$ .

┘

*Proof:* We can write  $X$  as a closed subscheme of  $Y \times \mathbb{A}^n$  defined by  $n$  monic polynomials  $f_i(y)(T) \in \Gamma(Y)[T]$ . Then it suffices to notice that: The valuation of roots of any monic polynomial of bounded degree is dominated by the valuations of its coefficients.  $\square$

**Prop. (20.5.1.5)** **[Integral Points are Bounded]**. If  $\mathcal{G} \in \mathbf{Sch}^{\text{ft}}/\mathcal{O}_K$ , then  $\mathcal{G}(\mathcal{O}_K)$  is bounded in  $\mathcal{G}(K)$ .

┘

**Thm. (20.5.1.6)** **[Anisotropic Groups are Bounded]**. If  $K \in \mathbf{CDVR}$  and  $G \in \mathbf{RedGrp}/K$ ,  $G(K)$  is bounded(20.5.1.3) iff  $G$  is anisotropic(10.4.2.24).

┘

*Proof:* If  $G$  has a split torus, then it cannot be bounded by (20.5.1.4). Conversely, if  $G(K)$  is unbounded, then ? Cf. [K-P23]P73.  $\square$

**Cor. (20.5.1.7) [Largest Bounded Subgroups].** If  $G \in \text{RedGrp}/K$  and  $[G, G]$  is anisotropic (10.4.2.24), then  $G(K)^1$  (20.5.1.2) is the maximal bounded subgroup of  $G(K)$   $\lrcorner$

*Proof:* Let  $G_a$  be the inverse image in  $G$  of the maximal anisotropic subtorus of  $G_{\text{ab}}$ , then  $G_a$  is the maximal normal anisotropic subgroup variety of  $G$  (10.4.2.24). And if  $S$  is the maximal split central torus of  $G$ , then  $G = SG_a$  is an almost-direct product (10.1.5.9).  $\square$

### Topology and Analytic Structure

**Prop. (20.5.1.8) [Analytic Structures].** For any  $X \in \text{Sch}^{\text{ft}}/K$ ,  $X_{\text{sm}}(K)$  is an analytic variety over  $K$ . And for any map  $f : X \rightarrow Y \in \text{Sch}^{\text{ft}}/K$ ,  $f^{\text{an}} : X_{\text{sm}}(K) \cap f^{-1}(Y_{\text{sm}}(K)) \rightarrow Y_{\text{sm}}(K)$  is a map of analytic varieties over  $K$ .  $\lrcorner$

**Prop. (20.5.1.9) [Cartan-Serre].** Let  $K \in \{\mathbb{R}\} \cup \{\mathbb{Q}_p\}_{p \in \text{Prime}}$ , then closed subgroups of a Lie group over  $K$  is a Lie group, and every continuous maps between Lie groups over  $K$  is analytic.  $\lrcorner$

*Proof:* Cf. [Groupes algebriques et corps de classes, Serre]P260-263.  $\square$

**Prop. (20.5.1.10) [Normal Subgroups are Open].** If  $G$  is simple, then every normal subgroup of  $G(K)$  is open.  $\lrcorner$

**Prop. (20.5.1.11) [Reductive Groups are Unimodular].**  $G(K)$  is unimodular, by (12.10.1.22).  $\lrcorner$

**Thm. (20.5.1.12) [Compactness].**  $G(K)/H(K)$  is bounded iff  $H$  contains a maximal connected split solvable subgroup of  $G^0$ . In particular,  $G(K)$  is bounded iff  $G^0$  is reductive anisotropic (which also follows from (20.5.1.6)).  $\lrcorner$

*Proof:* Cf. [P-R94]P108. ?  $\square$

## 2 over Local Fields

References are [Tit79, K-P23]. For Bruhat-Tits theory, see ??.

### Valuation Homomorphisms

**Notation (20.5.2.1).**

- Let  $p \in \text{Prime}$ .
- Let  $(K, \mathcal{O}_K, \varpi, \kappa) \in p\text{-LField}$ .
- Let  $G \in \text{RedGrp}/K$ .

$\lrcorner$

**Prop. (20.5.2.2) [Valuation Homomorphism].** For  $G \in \text{RedGrp}/K$ , there is a homomorphism

$$\omega_G : G(K) \rightarrow \text{Hom}(X^\bullet(G)^{\text{Gal}_K}, \mathbb{Z}) : g \mapsto (\chi \mapsto -\text{ord}_K(\chi(g))).$$

The kernel is exactly  $G(K)^1$  (20.5.1.2). Let  $A_G \leq G$  be the maximal central split torus, then the restriction map  $X^\bullet(G)^{\text{Gal}_K} \rightarrow X^\bullet(A_G)$  is injective with finite cokernel by (10.4.4.7), thus composing  $\omega_G$  with the map

$$\text{Hom}(X^\bullet(G)^{\text{Gal}_K}, \mathbb{Z}) \hookrightarrow \text{Hom}(X^\bullet(G)^{\text{Gal}_K}, \mathbb{Q}) = \text{Hom}(X^\bullet(A_G), \mathbb{Q}) = X_\bullet(A_G) \otimes \mathbb{Q},$$

we get a map

$$\omega_G : G(K) \rightarrow X_\bullet(A_G) \otimes \mathbb{Q},$$

called the **valuation homomorphism**.  $\lrcorner$

**Cor. (20.5.2.3).** For a torus  $T/K$ , the image of the valuation homomorphism  $\omega_T$  (20.5.2.2) contains  $X_*(T)$  as a subgroup of finite index. And if  $T$  splits over  $\check{K}$ , then the image is exactly  $X_*(T)$ .  $\lrcorner$

*Proof:* If  $T$  is split, then the assertion is clear. And if  $S \leq T$  is a maximal split torus, then  $X_*(S) = X_*(T)$ , so the image of  $\omega_T$  contains  $X_*(S)$  by functoriality. If  $L/K$  is a finite Galois extension s.t.  $T_L$  is split, then by functoriality the image of  $\omega_T$  is exactly  $\frac{1}{e_{L/K}} X_*(T)$ .  $\square$

**Prop. (20.5.2.4) [Functoriality].** For  $f : G \rightarrow H \in \text{RedGrp}/k$ ,

- For any  $g \in G(K)$ ,  $\omega_H(f(g)) = f_* \omega_G(g)$ .
- $G(K)^1 = \{g \in G(K) : |\chi(g)| = 1 \forall \chi \in X^*(G)\} = \{g \in G(K) : |\chi(g)| = 1 \forall \chi \in X^\bullet(G)\}$ .

$\lrcorner$

*Proof:* 1:  $f$  induces a map of torus  $G/[G, G] \rightarrow H/[H, H]$ , so the functoriality is clear from the definition.

2: By item1 and the fact  $G/[G, G]$  is a torus, we are reduced to the case when  $G = T$  is a torus. Then notice that if  $L/K \in \text{GalField}^{\text{fin}}$  is a splitting field for  $T$ , then  $\omega_T = \omega_{T_L}|_{T(K)}$  by Galois invariance.  $\square$

**Prop. (20.5.2.5) [Maximal Bounded Subgroups of Tori].** For  $T \in \mathcal{Tori}/K$ ,

$$T(K)^1 = \ker(\omega_T) = \{t \in T(K) \mid \text{ord}_K(\chi(t)) = 0 \forall \chi \in X^\bullet(T)\}$$

is the unique maximal bounded subgroup of  $T(K)$ . In particular,  $T(K)$  is bounded iff  $T$  is anisotropic.  $\lrcorner$

*Proof:* The second equality follows from the fact . And  $T(K)^1$  is the unique maximal bounded subgroup by (20.5.1.7).  $\square$

**Cor. (20.5.2.6).** For  $G \in \text{RedGrp}/k$ ,  $?$   $\lrcorner$

**Prop. (20.5.2.7).** Let  $\kappa = \kappa^{\text{sep}}$  and  $f : T_1 \rightarrow T_2 \in \mathcal{Tori}/K$ , then  $f(T_1(K)^1) \subset T_2(K)^1$ . Moreover,

- If  $\ker(f)^0$  is anisotropic, then  $T_1(K)^1 = f^{-1}(T_2(K)^1)$ .
- If  $f$  is a quotient map and  $\ker(f)$  is connected, then  $f(T_1(K)^1)$  has finite index in  $T_2(K)^1$ .
- If  $f$  is a quotient map and  $\ker(f)$  is connected and anisotropic, then  $f(T_1(K)^1) = T_2(K)^1$ .

$\lrcorner$

*Proof:* 1: In this case,  $X^*(K)$  is finite by (10.4.4.5), There is an exact sequence

$$0 \rightarrow X^\bullet(\text{Coker}(f)) \rightarrow X^\bullet(T_2) \rightarrow X^\bullet(T_1) \rightarrow X^\bullet(\ker(f)) \rightarrow 0,$$

of  $\text{Gal}_K$ -modules. Suppose  $L \subset K^{\text{sep}}$  is a splitting field for both  $T_1$  and  $T_2$ , then the fact that  $\#X^*(K) < \infty$  and  $\#H^1(\text{Gal}(L/K), X^\bullet(\text{Coker}(f))) < \infty$  implies that  $X^*(T_2) \otimes \mathbb{Q} \rightarrow X^*(T_1) \otimes \mathbb{Q}$  is surjective, and  $X_*(T_1) \otimes \mathbb{Q} \rightarrow X_*(T_2) \otimes \mathbb{Q}$  is injective. So the assertion follows by functoriality of  $\omega_T$ .

3: It follows from (10.5.2.4) that  $T_1(K) \rightarrow T_2(K)$  is surjective, so this follows from item1.

2: By (20.5.2.3), there exists  $e \in \mathbb{Z}_+$  s.t.  $\omega_{T_i}(T_i(K)) \subset \frac{1}{e}X_*(T_i)$ , thus there is a commutative diagram

$$\begin{array}{ccccccc} 0 & \longrightarrow & \ker(f)(K) & \longrightarrow & T_1(K) & \longrightarrow & T_2(K) \longrightarrow 0 \\ & & \downarrow \omega & & \downarrow \omega & & \downarrow \omega \\ 0 & \longrightarrow & \frac{1}{e}X_*(\ker(f)) & \longrightarrow & \frac{1}{e}X_*(T_1) & \longrightarrow & \frac{1}{e}X_*(T_2) \end{array}$$

Then it follows from the snake lemma?? and (20.5.2.3) that  $f(T_1(K)^1)$  has finite index in  $T_2(K)^1$ .  $\square$

**Prop. (20.5.2.8) [Finite Integral Subgroups].** Suppose  $n \in \mathbb{Z}_+$  and  $G \leq \mathrm{GL}(n)$ , then  $G \cap \mathrm{GL}(n; \mathcal{O}_K)$  has only f.m. conjugacy classes of finite subgroups.  $\lrcorner$

*Proof:* Cf. [P-R94]P117.  $\square$

**Thm. (20.5.2.9) [Sylow Pro- $p$ -Subgroups, Matsumoto].** If  $G \in \mathrm{RedGrp}^{\mathrm{ss}}/K$ , then any open subgroup  $H$  of  $G(K)$  contains a Sylow pro- $p$ -subgroup, unique up to conjugacy.  $\lrcorner$

*Proof:* Cf. [P-R94]P139. ?  $\square$

**Prop. (20.5.2.10) [An Algebraicity Theorem].**  $X \in \mathrm{Sch}^{\mathrm{ft}}/K$ , then  $X(K) \in \mathrm{locProf}$  in the  $K$ -topology (because varieties are closed, and use (4.4.4.6)). Let  $G \in \mathrm{linAlgGrp}/K$  and  $G \times X \rightarrow X$  is an action of  $G$  on  $X$ , then  $G(F) \times X(F) \rightarrow X(F)$  is a continuous constructible action (4.12.1.21).  $\lrcorner$

*Proof:* Cf. [Bernstein-Zelevinsky, Appendix].  $\square$

### Kottwitz-Maps ( $p$ -adic cases)

References are [Kot85, Kot86].

**Notation (20.5.2.11).**

- Let  $(K, \mathcal{O}_K, \kappa) \in \mathrm{DVR}$  s.t.  $K$  is Henselian and  $\kappa = \kappa^{\mathrm{perf}}$ .
- Let  $G \in \mathrm{RedGrp}/K$ .

$\lrcorner$

**Def. (20.5.2.12) [Kottwitz-Maps, Kottwitz [Kot85]].** There is a continuous homomorphism

$$\kappa_G : G(K) \rightarrow (\pi_1(G)_{I_K})^{\mathrm{Gal}_\kappa} \cong \left( X^\bullet(Z(\widehat{G}))_{I_K} \right)^{\mathrm{Gal}_\kappa} \quad (10.4.5.24)(10.4.5.25)$$

as follows:

1. If  $\kappa = \bar{\kappa}$  and  $G = T$  is a torus, there is a unique such  $\kappa_G$  s.t. for any  $L/K \in \mathrm{GalField}^{\mathrm{fin}}$  splitting  $T$ , the following diagram is commutative:

$$\begin{array}{ccc} T(L) & \xrightarrow{\omega_T} & X_\bullet(T) \\ \downarrow \mathrm{Nm}_{L/K} & & \downarrow \\ T(K) & \xrightarrow{\kappa_T} & X_\bullet(T)_{I_K} \end{array}$$

And this map is functional from the category of tori over  $K$  to  $\mathrm{Ab}_{\mathrm{Gal}_\kappa}^{\mathrm{fg}}$ .

2. If  $\kappa = \bar{\kappa}$  and  $[G, G]$  is simply-connected,  $G \rightarrow G_{\text{ab}} = G/[G, G]$  induces an isomorphism  $\pi_1(G) = \pi_1(G_{\text{ab}})$  by (10.4.5.26). Define  $\kappa_G$  to be the composite  $G(K) \rightarrow G_{\text{ab}}(K) \xrightarrow{\kappa_{G_{\text{ab}}}} \pi_1(G_{\text{ab}})_{I_K}$ .
3. If  $\kappa = \bar{\kappa}$ , choose a  $z$ -extension  $1 \rightarrow Z \rightarrow \tilde{G} \rightarrow G \rightarrow 1$  (10.4.5.28), then  $[\tilde{G}, \tilde{G}]$  is simply-connected and  $\pi_1(\tilde{G}) \rightarrow \pi_1(G)$  is surjective by (10.4.5.26). Also  $\tilde{G}(K) \rightarrow G(K)$  is surjective by Steinberg's theorem (10.5.2.3). Then there is a unique map  $\kappa_G : G(K) \rightarrow \pi_1(G)_{I_K}$  s.t. the following diagram

$$\begin{array}{ccc} \tilde{G}(K) & \longrightarrow & G(K) \\ \downarrow \kappa_{\tilde{G}} & & \downarrow \kappa_G \\ \pi_1(\tilde{G})_{I_K} & \xrightarrow{=} & \pi_1(G)_{I_K} \end{array}$$

is commutative. And this  $\kappa_G$  doesn't depend on the choice of  $\tilde{G}$ .?

4. Define  $\kappa_G$  as the restriction of  $\kappa_{G_{K^{\text{sh}}}}$  to  $G(K)$ .

Then this  $\kappa_G$  induces a functor  $\mathcal{R}\text{edGrp}/K \rightarrow \mathcal{A}\text{b}^{\text{fg}}$ , called the **Kottwitz-map**.  $\square$

*Proof:* 1: The uniqueness follows from the fact that  $\text{Nm}_{L/K}(T(L)) = T(K)$ . For the existence, notice that it suffices to prove for a single Galois extension  $L/K$ , because if  $L'/K \in \mathcal{G}\text{alField}^{\text{fin}}$  and  $L \subset L'$ , then there is a commutative diagram

$$\begin{array}{ccc} T(L') & \xrightarrow{\omega_{T_{L'}}} & X_{\bullet}(T) \\ \downarrow \text{Nm}_{L'/L} & & \downarrow \\ T(L) & \xrightarrow{\omega_{T_L}} & X_{\bullet}(T) \end{array}$$

because  $L'/L$  is totally ramified. Now it suffices to prove that  $\text{Nm}_{L/K}$  induces an isomorphism  $T(L)_{I_K} \cong T(K)$ . For this, Cf. [K-P23]P421.?

3: Given a  $z$ -extension  $1 \rightarrow Z \rightarrow \tilde{G} \rightarrow G \rightarrow 1$ , there is an exact sequence  $1 \rightarrow \pi_1(Z) \rightarrow \pi_1(\tilde{G}) \rightarrow \pi_1(G) \rightarrow 1$  by (10.4.5.26), so there is a commutative diagram with exact rows:

$$\begin{array}{ccccccc} 1 & \longrightarrow & Z(K) & \longrightarrow & \tilde{G}(K) & \longrightarrow & G(K) \longrightarrow 1 \\ & & \downarrow \kappa_Z & & \downarrow \kappa_{\tilde{G}} & & \\ & & \pi_1(Z)_{I_K} & \longrightarrow & \pi_1(\tilde{G})_{I_K} & \longrightarrow & \pi_1(G)_{I_K} \longrightarrow 1 \end{array}$$

where the first row is exact by Steinberg's theorem (10.5.2.3) and the square is commutative by the definition of  $\kappa_{\tilde{G}}$  and the functoriality of Kottwitz-maps for tori applied to the map  $Z \rightarrow \tilde{G}/[\tilde{G}, \tilde{G}]$ . Thus the uniqueness and existence of  $\kappa_G$  is clear.

For the independence of  $\tilde{G}$ , notice that fiber product of  $z$ -extensions are  $z$ -extensions (10.4.5.29), and the functoriality follows from (10.4.5.29).  $\square$

**Prop. (20.5.2.13) [Kottwitz-Maps and Valuation Maps].** There is a commutative diagram

$$\begin{array}{ccc} G(K) & \xrightarrow{\omega_G} & V(A_G) \\ \downarrow = & & \downarrow \cong \\ G(K) & \xrightarrow{\kappa_G \otimes \mathbb{Q}} & (X_{\bullet}(T)_{\mathbb{Q}}/\mathbb{R} \cdot \Phi^{\vee})_{I_K} \end{array}$$

In particular,  $G(K)^1 = \ker(\kappa_G \otimes \mathbb{Q})$ .  $\lrcorner$

*Proof:* By (20.5.2.12) and (20.5.2.4) it suffices to prove for  $G$  s.t.  $[G, G]$  is simply-connected. But in this case it suffices to prove for  $G/[G, G]$ , which is a torus, and the assertion follows by definition.  $\square$

**Prop. (20.5.2.14) [Kottwitz-Maps and Extension].** If  $L/K \in \mathbf{Field}$  is a finite separable extension, and  $T$  is a torus over  $K$ , then the following diagrams commute:

$$\begin{array}{ccc} T(L) & \xrightarrow{\kappa_{T_L}} & X_\bullet(T)_{I_L} \\ \downarrow \text{Nm}_{L/K} & & \downarrow \\ T(K) & \xrightarrow{\kappa_T} & X_\bullet(T)_{I_K} \end{array} \quad \begin{array}{ccc} T(L) & \xrightarrow{\kappa_{T_L}} & X_\bullet(T)_{I_L} \\ \uparrow i & & \uparrow \\ T(K) & \xrightarrow{\kappa_T} & X_\bullet(T)_{I_K} \end{array}$$

$\lrcorner$

*Proof:* By definition (20.5.2.12) it suffices to prove for  $\kappa = \bar{\kappa}$ . Choosing an exact sequence  $1 \rightarrow T_0 \rightarrow T_1 \rightarrow T \rightarrow 1 \in \mathbf{RedGrp}/k$  where  $T_0$  is a torus and  $T_1$  is an induced torus (10.2.3.13), we see that  $T_1(\check{K}) \rightarrow T(\check{K})$  is surjective by Steinberg's theorem (10.5.2.3). Then it suffices to prove for  $T_1$ , in which case  $X_\bullet(T)_{I_K}$  is torsion-free, and the assertion follows from (20.5.2.13) and (20.5.2.2).  $\square$

**Prop. (20.5.2.15) [Completions].** There is a commutative diagram

$$\begin{array}{ccc} G(K) & \xrightarrow{\kappa_G} & (\pi_1(G)_{I_K})^{\text{Gal}_\kappa} \\ \downarrow & & \downarrow \cong \\ G(\widehat{K}) & \longrightarrow & (\pi_1(G)_{I_{\widehat{K}}})^{\text{Gal}_\kappa} \end{array}$$

$\lrcorner$

*Proof:* Reduce to tori as in (20.5.2.13), in which case it follows from the uniqueness when defining  $\kappa_G$ .  $\square$

**Prop. (20.5.2.16) [Kottwitz-Maps and Restrictions].** If  $L/K \in \mathbf{Field}$  is a finite separable extension and  $G \in \mathbf{RedGrp}/L$ ,  $G' = \text{Res}_{L/K} G$ , then the following diagram are commutative:

$$\begin{array}{ccc} G'(K) & \xrightarrow{\kappa_{G'}} & \pi_1(G')_{I_K}^{\text{Gal}_\kappa} \\ \downarrow = & & \downarrow = \\ G(L) & \xrightarrow{\kappa_G} & \pi_1(G)_{I_L}^{\text{Gal}(\check{L}/L)} \end{array}$$

$\lrcorner$

*Proof:* Cf. [K-P23]P423.  $\square$

**Cor. (20.5.2.17).** If  $G = T$  is an induced torus (10.2.3.11), then  $\kappa_T$  is surjective.  $\lrcorner$

*Proof:* by (20.5.2.16) it suffices to prove for  $T = \mathbb{G}_m$ , which is trivial.  $\square$

**Def. (20.5.2.18) [Kottwitz-Kernel,  $G(K)^0$ , Kaletha-Prasad [K-P23]].** Define

$$G(K)^0 = \ker(\kappa_G) \text{ (20.5.2.12).}$$

Then  $G(K)^0 \leq G(K)^1$  (20.5.1.2) has finite index, and  $G(K)^0 \leq G(K)$  is normal and open. Moreover,

1. If  $G = T$  is a torus,  $\kappa = \bar{\kappa}$  and  $L/K \in \mathbf{GalField}^{\text{fin}}$  is a splitting field for  $T$ , then  $T(K)^0$  is the image of  $T(L)^1$  under the norm map  $\text{Nm}_{L/K}$ .
2. If  $1 \rightarrow T_1 \rightarrow T_2 \rightarrow T_3 \rightarrow 1$  is an exact sequence of tori, then  $T_2(K)^0 \rightarrow T_3(K)^0$  is surjective. And if  $T_1$  is an induced torus, then  $1 \rightarrow T_1(K)^0 \rightarrow T_2(K)^0 \rightarrow T_3(K)^0 \rightarrow 1$  is exact.
3. If  $1 \rightarrow Z \rightarrow \tilde{G} \rightarrow G \rightarrow 1$  is a z-extension(10.4.5.28), then the maps  $\tilde{G}(K) \rightarrow G(K), \tilde{G}(K)^0 \rightarrow G(K)^0$  are surjective.
4. If  $M_0 \leq G$  is a minimal Levi-subgroup, then  $G(K)^0 = G(K)^{\natural} M_0(K)^0$ , where  $G(K)^{\natural} = \text{Im}(G_{\text{sim.cntd}}(K) \rightarrow G(K))$ .

Using these, we can reconstruct  $G(K)^0$  as

$$G(K)^0 = G(K) \cap G(\check{K})^0 = G(K) \cap \left( G(\check{K})^{\natural} T(\check{K})^0 \right) = G(K) \cap \left( G(\check{K})^{\natural} \cdot \text{Nm}_{L/\check{K}} T(L)^1 \right),$$

where  $T \leq G_{\check{K}}$  is a maximal torus and  $L/\check{K} \in \mathbf{GalField}^{\text{fin}}$  is a splitting field for  $T$ .  $\lrcorner$

*Proof:* 1: By definition  $\text{Nm}_{L/K}(T(L)^0) \leq T(K)^0$ . For the converse, if  $t \in T(L)$  s.t.  $\text{Nm}_{L/K}(t) \in T(K)^0$ , then  $\kappa_{T_L}(t)$  is a sum of elements of the form  $y - \sigma(y)$  where  $y \in X_{\bullet}(T), \sigma \in I_K$ . But notice that  $\kappa_{T_L}(y(\varpi_L)/\sigma(y(\varpi_L))) = y - \sigma(y)$  and  $\text{Nm}_{L/K}(y(\varpi_L)/\sigma(y(\varpi_L))) = 1$ , so we can modify  $t$  to  $t'$  s.t.  $\text{Nm}_{L/K}(t) = \text{Nm}_{L/K}(t')$  and  $\kappa_{T_L}(t') = 0$ .

2: Cf.[K-P23]P91?.

3: The exact sequence  $1 \rightarrow Z(\check{K}) \rightarrow \tilde{G}(\check{K}) \rightarrow G(\check{K}) \rightarrow 1$  induces an exact sequence  $1 \rightarrow Z(K) \rightarrow \tilde{G}(K) \rightarrow G(K) \rightarrow 1$  by Szpiro's lemma. And in the exact sequence  $X_{\bullet}(Z)_{I_K} \rightarrow \pi_1(\tilde{G})_{I_K} \rightarrow \pi_1(G)_{I_K} \rightarrow 1$ , the first map is injective because  $X_{\bullet}(Z)_{I_K}$  is torsion-free(? Cf.[K-P23]Prop2.5.20). Now the  $\text{Gal}_{\kappa}$ -module  $X_{\bullet}(Z)_{I_K}$  is also induced, so we get an exact sequence  $(X_{\bullet}(Z)_{I_K})^{\text{Gal}_{\kappa}} \rightarrow (\pi_1(\tilde{G})_{I_K})^{\text{Gal}_{\kappa}} \rightarrow (\pi_1(G)_{I_K})^{\text{Gal}_{\kappa}} \rightarrow 1$ . Now the assertion follows from snake's lemma and(20.5.2.17).

4: We firstly prove for  $G$  quasi-split and  $[G, G]$  simply-connected:  $G(K)^{\natural} T(K)^0 \leq G(K)^0$  by functoriality. For the other direction, let  $T \leq G$  be a maximally split maximal torus and let  $T_{\text{sim.cntd}} = T \cap [G, G]$ , then  $1 \rightarrow T_{\text{sim.cntd}} \rightarrow T \rightarrow G/[G, G] \rightarrow 1$  is an exact sequence. Then  $T(K)^0 \rightarrow (G/[G, G])(K)^0$  is surjective by item2, and the assertion follows.

Next, if  $G$  is quasi-split, take a z-extension  $1 \rightarrow Z \rightarrow \tilde{G} \rightarrow G \rightarrow 1$ (10.4.5.28), then  $\tilde{G}$  is also quasi-split. Let  $T \leq G$  be a maximally split maximal torus,  $\tilde{T} \leq \tilde{G}$  the inverse image of  $T$ . Then  $\tilde{G}(K)^{\natural} = [\tilde{G}, \tilde{G}](K)$  is mapped into  $G(K)^{\natural}$ , and  $\tilde{T}(K)^0$  is mapped into  $T(K)^0$  by functoriality, and  $G(K)^{\natural} T(K)^0 \leq G(K)^0$  by functoriality. But we also have  $\tilde{G}(K)^0 = \tilde{G}(K)^{\natural} \tilde{T}(K)^0$  and  $\tilde{G}(K) \rightarrow G(K)$  is surjective by item3, so the assertion follows from the assertion for  $\tilde{G}$ , which is just proved.

Finally, for general  $G$ , it suffices to prove that if  $S \leq G$  is a maximal split torus and  $T \leq G$  is a special torus containing  $S$ (20.6.5.2), then

$$G(K)^{\natural} \left( T(\check{K})^0 \cdot Z_G(S)(\check{K})^{\natural} \right)^0 = G(K) \cap \left( G(\check{K})^{\natural} T(\check{K})^0 \right),$$

because then we are reduced to  $G_{\check{K}}$ , which is quasi-split by Steinberg's theorem. For this, Cf.[K-P23]Prop9.3.24?  $\square$

**Prop.(20.5.2.19) [Kottwitz-Maps are Surjective].** If  $\kappa$  is a cd-1 field, and  $C \subset \mathcal{B}(G_{K^{\text{sh}}})$  is a  $\text{Gal}_{\kappa}$ -invariant chamber(which exists by(20.5.2.31)), and  $G(K)_C$  the stablizer of  $C$  in  $G(K)$ , then  $\kappa_G(G(K)_C) = (\pi_1(G)_{I_K})^{\text{Gal}_{\kappa}}$ . In particular, by(20.5.2.13) it induces isomorphisms

$$G(K)_C / \left( G(K)_C \cap G(K)^0 \right) \cong (\pi_1(G)_{I_K})^{\text{Gal}_{\kappa}}, \quad \left( G(K)_C \cap G(K)^1 \right) / \left( G(K)_C \cap G(K)^0 \right) \cong ((\pi_1(G)_{I_K})_{\text{tor}})^{\text{Gal}_{\kappa}}.$$

$\lrcorner$

*Proof:* Firstly, if  $\kappa = \bar{\kappa}$ , then  $\kappa_G$  is surjective: By definition(20.5.2.12), this reduces to tori, in which case it is surjective by definition. Next notice that  $G(K)^{\natural} = \text{Im}(G_{\text{sim.cntd}}(K) \rightarrow G(K))$  acts transitively on chambers of  $\mathcal{B}(G_{K^{\text{SH}}})$ , and  $G(K)^{\natural} \leq G(K)^0$ , so  $\kappa_G : G(K)_C \rightarrow (\pi_1(G)_{I_K})^{\text{Gal}_{\kappa}}$  is also surjective.

Now for general  $\kappa$ , there is an exact sequence

$$1 \rightarrow G(K^{\text{SH}})_C^0 \rightarrow G(K^{\text{SH}})_C \rightarrow \pi_1(G)_{I_K} \rightarrow 1,$$

and  $G(K^{\text{SH}})_C^0 = \mathcal{G}_C^0(\mathcal{O}_{K^{\text{SH}}})$  where  $\mathcal{G}_C^0$  is the Bruhat-Tits group scheme(20.6.4.19), so it follows from(20.3.6.8) that  $G(K)_C \rightarrow (\pi_1(G)_{I_K})^{\text{Gal}_{\kappa}}$  is surjective.  $\square$

**Prop. (20.5.2.20).** For  $T \in \mathcal{T}\text{ori}/K$ , the Kottwitz-map  $\kappa_T$ (20.5.2.12) induces injective homomorphisms

$$T(K)^1/T(K)^0 \hookrightarrow ((X_{\bullet}(T)_{I_K})_{\text{tor}})^{\text{Gal}_{\kappa}}, \quad T(K)/T(K)^0 \hookrightarrow (X_{\bullet}(T)_{I_K})^{\text{Gal}_{\kappa}}.$$

which are isomorphism when  $\kappa$  is a cd-1 field, by(20.5.2.19).  $\perp$

*Proof:* Injectivity is clear from(20.5.2.13) and(20.5.2.18).  $\square$

**Prop. (20.5.2.21).** If  $\kappa$  is a cd-1 field and  $1 \rightarrow A \rightarrow B \rightarrow C \rightarrow 1 \in \mathcal{T}\text{ori}/K$  is an exact sequence s.t.  $A$  has induced ramification?, then the sequence  $1 \rightarrow A(K)^0 \rightarrow B(K)^0 \rightarrow C(K)^0 \rightarrow 1$  is exact.  $\perp$

*Proof:* Cf.[K-P23]P434?.  $\square$

**Prop. (20.5.2.22) [Levi-Subgroups].** If  $M \leq G$  is a Levi subgroup, then  $M(K)^1 \cap G(K)^0 = M(K)^0$ .  $\perp$

*Proof:*  $M(K)^1 = M(K^{\text{SH}})^1 \cap M(K)$  by(20.5.2.2) and  $G(K)^0 = G(K^{\text{SH}})^0 \cap G(K)$  by(20.5.2.12), so it suffices to prove for  $K = K^{\text{SH}}$ . In particular,  $G, M$  are quasi-split by Steinberg's theorem(10.5.2.3).

One direction is clear. For the other, if  $m \in M(K)^1 \cap G(K)^0$ , then by(20.5.2.13)  $\kappa_M(m) \in (\pi_1(M)_{I_K})_{\text{tor}}$  has trivial image in  $\pi_1(G)_{I_K}$ . Notice there is an exact sequence

$$H_1(I_K, \pi_1(G)) \rightarrow (\ker(\pi_1(M) \rightarrow \pi_1(G)))_{I_K} \rightarrow \pi_1(M)_{I_K} \rightarrow \pi_1(G)_{I_K} \rightarrow 1.$$

So  $m$  lifts to a torsion element in  $(\ker(\pi_1(M) \rightarrow \pi_1(G)))_{I_K}$ . Then it suffices to prove that  $\ker(\pi_1(M) \rightarrow \pi_1(G))$  is a torsion-free induced module, then  $(\ker(\pi_1(M) \rightarrow \pi_1(G)))_{I_K}$  is non-torsion. For this, Cf.[K-P23]P432?.  $\square$

The map  $\pi_1(M) \rightarrow \pi_1(G)$  is clearly surjective, and

For more on Kottwitz-maps, see [B\(G\) and Isocrystals with Structures](#).

### Kottwitz-Maps for Archimedean Places

**Thm. (20.5.2.23).** For  $\mathbb{K} \in \{\mathbb{R}, \mathbb{C}\}$ , there is a unique extension of the Tate-Nakayama map to a functorial map

$$\kappa_G : \text{RedGrp}/\mathbb{K} \rightarrow (\pi_1(G)_{\text{Gal}_{\mathbb{K}}})_{\text{tor}}.$$

And if  $\mathbb{K} = \mathbb{R}$ , then

$$\ker(\kappa_G) = \text{Im} \left( H^1(\mathbb{R}, G_{\text{sim.cntd}}) \rightarrow H^1(\mathbb{R}, G) \right), \quad \text{Im}(\kappa_G) = \ker \left( \pi_1(G)_{\text{Gal}_{\mathbb{R}}} \xrightarrow{\text{Nm}_{\mathbb{C}/\mathbb{R}}} \pi_1(G) \right).$$

$\perp$

*Proof:* Cf.[Kot86]P368.?.  $\square$

### Unramified Groups

**Notation (20.5.2.24).**

- Let  $(K, \mathcal{O}_K, \kappa) \in \text{DVR}$  s.t.  $K$  is Henselian and  $\kappa = \kappa^{\text{perf}}$ .
- Let  $G \in \text{RedGrp}/K$ .

┘

**Def. (20.5.2.25) [Unramified Reductive Groups].**  $G$  is called an **unramified reductive group** over  $K$  if  $G$  is quasi-split and splits over  $K^{\text{sh}}$ . By (20.7.2.13),  $G$  is unramified reductive iff it has a reductive model  $\mathcal{G} \in \text{RedGrp}/\mathcal{O}_K$ .

┘

**Prop. (20.5.2.26) [Borel and Maximal Tori Exist].** For  $\mathcal{G} \in \text{RedGrp}/\mathcal{O}_K$ , there exists a Borel subgroup scheme  $\mathcal{B} \leq \mathcal{G}$  and a maximal  $\mathcal{O}$ -torus  $\mathcal{T} \leq \mathcal{B}$ .

┘

*Proof:* By (10.5.6.25), the moduli  $\text{Bor}_{\mathcal{G}/\mathcal{O}_K}$  of Borel subgroups of  $\mathcal{G}$  are smooth proper over  $\mathcal{O}_K$ , thus  $\text{Bor}_{\mathcal{G}/\mathcal{O}}(\mathcal{O}_K) = \text{Bor}_{\mathcal{G}/\mathcal{O}}(K) \neq \emptyset$  by valuation criterion of properness and (20.5.2.25). The maximal torus  $\mathcal{T} \leq G$  exists by ? Cf. [Getz, automorphic representations]P549.  $\square$

**Prop. (20.5.2.27) [Kottwitz Maps for Unramified Groups].** Let  $G$  be unramified with a maximal split torus  $S \leq G$  and  $x \in \mathcal{A}(T)$  a hyperspecial point with corresponding hyperspecial subgroup  $\mathcal{K}$ . Then for any  $b \in G(K)$ , there exists  $\mu \in X_{\bullet}(T)$  s.t.  $b \in \mathcal{K}\mu(\varpi_K)\mathcal{K}$  by Cartan-decomposition (20.7.2.14). Then  $\kappa_G(b)$  equals the image of  $\mu \in X_{\bullet}(T)$  in  $(\pi_1(G)_{I_K})^{\text{Gal}_{\kappa}}$  (20.5.2.12).

┘

*Proof:* This follows from the functoriality of Kottwitz-maps (20.5.2.12) and the fact that  $\mathcal{K} \leq G(K)^0$ .  $\square$

**Prop. (20.5.2.28) [Iwasawa-Decompositions].** For  $(\mathcal{G}, \mathcal{B}, \mathcal{T}) \in \text{RedGrp}/\mathcal{O}_K$  with  $(G, B, T) = (\mathcal{G}, \mathcal{B}, \mathcal{T})_K$ ,  $\mathcal{T}(\mathcal{O}_K)$  is a maximal compact subgroup of  $T(F)$ , and

$$G(K) = B(F)\mathcal{T}(\mathcal{O}_K), \quad B(\mathcal{O}_K) = \mathcal{T}(\mathcal{O}_K)\mathcal{N}(\mathcal{O}_K),$$

where  $\mathcal{N}(\mathcal{O}_K)$  is the smooth connected unipotent radical subscheme of  $\mathcal{B}$ .

┘

*Proof:* Cf. [Getz]P549.  $\square$

**Prop. (20.5.2.29) [Maximal Tori are Conjugate].** If  $\mathcal{H} \in \text{GrpSch}^{\text{ft}}/\mathcal{O}_K$  with connected special fiber, then any two maximal split  $\mathcal{O}_K$ -tori of  $\mathcal{H}$  are  $\mathcal{H}(\mathcal{O}_K)$ -conjugate.

┘

*Proof:* For maximal tori  $\mathcal{T}, \mathcal{T}' \leq \mathcal{G}$ , the transporter subgroup  $\text{Transp}_{\mathcal{G}}(\mathcal{T}, \mathcal{T}')$  is a smooth closed subgroup of  $\mathcal{H}$  (10.5.6.2), and  $\text{Transp}_{\mathcal{G}}(\mathcal{T}, \mathcal{T}')(\kappa) \neq 0$  by (10.4.1.7). Thus  $\text{Transp}_{\mathcal{G}}(\mathcal{T}, \mathcal{T}')(\mathcal{O}_K) \neq 0$  by valuation criterion of properness.  $\square$

### Residually Split and Residually Quasi-Split Groups

**Notation (20.5.2.30).**

- Let  $(K, \mathcal{O}_K, \kappa) \in \text{DVR}$  s.t.  $K$  is Henselian and  $\kappa = \kappa^{\text{perf}}$ .
- Let  $G \in \text{RedGrp}/K$ .

┘

**Prop. (20.5.2.31) [Residually Quasi-Split Groups].** The following are equivalent:

- There exists a  $\text{Gal}(K^{\text{sh}}/K)$ -stable chamber in the Bruhat-Tits building  $\mathcal{B}(G_{K^{\text{sh}}})$  (20.6.4.8).
- All maximal  $\text{Gal}(K^{\text{sh}}/K)$ -stable simplexes of  $\mathcal{B}(G_{K^{\text{sh}}})$  are chambers.
- For any maximal  $\text{Gal}(K^{\text{sh}}/K)$ -stable simplex  $C$ ,  $\bar{\mathcal{G}}_C^0$  is solvable.
- For any  $x \in \mathcal{B}(G)$ ,  $\bar{\mathcal{G}}_x^0$  is quasi-split.

If these conditions hold, then  $G$  is called a **residually quasi-split reductive group**. In particular, if  $\kappa$  is a cd-1 field, then  $G$  is always residually quasi-split, by Steinberg's theorem (10.5.2.3).  $\lrcorner$

*Proof:* 1  $\rightarrow$  2: This follows from (20.6.5.5).

2  $\rightarrow$  3: It follows from (20.6.4.20) and (10.4.2.34) that the absolute root system of the reductive quotient of  $\bar{\mathcal{G}}_C^0$  is empty, thus  $\bar{\mathcal{G}}_C^0$  is solvable.

3  $\rightarrow$  4: Choose a maximal  $\text{Gal}(K^{\text{sh}}/K)$ -stable simplex  $C$  containing  $x$ , then the image of  $\bar{\mathcal{G}}_C^0 \rightarrow \bar{\mathcal{G}}_x^0$  is a parabolic subgroup by (20.6.4.20), and also solvable, thus a Borel subgroup (10.4.1.1).

4  $\rightarrow$  1: By (20.6.4.20) and (10.4.2.35), for any  $x \in |\mathcal{B}(G)|$ , the set of  $\bar{\kappa}$ -Borel subgroups of  $\bar{\mathcal{G}}_x^0$  are in bijection with the set of chambers of  $\mathcal{B}(G_{\bar{\kappa}})$  containing  $x$ , and this map is  $\text{Gal}(K^{\text{sh}}/K)$ -equivariant ?. Thus item 4 implies that there exists a  $\text{Gal}(K^{\text{sh}}/K)$ -stable chamber in  $\mathcal{B}(G_{\bar{\kappa}})$ .  $\square$

**Prop. (20.5.2.32) [Quasi-Split Groups are Residually Quasi-Split].** If  $G$  is quasi-split, then it is residually quasi-split.  $\lrcorner$

*Proof:* For any special torus  $T \leq G$  containing a maximal split torus  $S \leq T$  (20.6.5.2), and  $x \in \mathcal{A}(S)$ , consider the tori  $\mathbf{S} \leq \mathbf{T} \leq \mathbf{G}_x$  corresponding to  $S \subset T$ , where  $\mathbf{S}$  is a maximal split torus and  $\mathbf{T}$  is a maximal torus (20.6.4.20). The assumption that  $G$  is quasi-split implies that the restriction of elements of  $\Phi(G, T)$  to  $S$  are non-trivial, in particular the restriction of elements of the sliced root system  $\Phi(G, T)_x$  to  $S$  is non-trivial. But  $\Phi(G, T)_x$  is canonical isomorphic to  $\Phi((\mathbf{G}_x)_{\bar{\kappa}}, \mathbf{T}_{\bar{\kappa}})$ , so the restriction of elements of  $\Phi((\mathbf{G}_x)_{\bar{\kappa}}, \mathbf{T}_{\bar{\kappa}})$  to  $\mathbf{S}$  is non-trivial, and  $\mathbf{G}_x$  is quasi-split (10.4.4.19).  $\square$

**Prop. (20.5.2.33).** Suppose  $G$  is residually quasi-split with  $\text{rank}_k(G) \geq 1$ , and

- $T \leq G$  is a special torus containing a maximal split torus  $S \leq T$ ,
- $\Psi \subset \mathcal{A}(T_{K^{\text{sh}}})^*$  the absolute affine root system and  $\Psi_K \subset \mathcal{A}(S)^*$  the relative affine root system,
- $C \subset \mathcal{A}(T_{K^{\text{sh}}})$  a  $\text{Gal}(K^{\text{sh}}/K)$ -stable chamber,  $\mathcal{C} = C^{\text{Gal}(K^{\text{sh}}/K)}$  the corresponding chamber of  $\mathcal{B}(G)$ ,
- $\Delta \subset \Psi$  the set of simple affine roots corresponding to  $C$ .

Then the set  $\Delta_K$  of the restrictions of elements of  $\Delta$  to  $\mathcal{A}(S)$  is the set of simple affine roots corresponding to  $\mathcal{C}$ . In particular, no elements of  $\Delta$  has constant restriction to  $\mathcal{A}(S)$ , and two elements has equal restriction iff they are  $\text{Gal}(K^{\text{sh}}/K)$ -conjugate.  $\lrcorner$

*Proof:* It suffices to prove for  $G$  almost simple ?.

Clearly two  $\text{Gal}(K^{\text{sh}}/K)$ -conjugate elements in  $\Delta$  has the same restriction to  $\mathcal{A}(S)$ , and each element of  $\Delta$  is non-negative on  $\mathcal{C}$ . As  $\text{rank}_k(G) \geq 1$ , each element of  $\Delta_K$  vanishes at some vertex of  $\mathcal{C}$ , thus are contained in the set of simple affine roots corresponding to  $\mathcal{C}$ .

If  $\text{Gal}(K^{\text{sh}}/K)$  has  $r$ -orbits on vertices of  $C$ , then  $\dim \mathcal{C} = r - 1$ , and each element of  $\Psi_K$  is a sum of elements of  $\Delta_K$ , thus  $\Delta_K$  is exactly the set of simple affine roots corresponding to  $\mathcal{C}$ , and two elements has equal restriction iff they are  $\text{Gal}(K^{\text{sh}}/K)$ -conjugate.  $\square$

**Prop. (20.5.2.34) [Characterizing Residually Split Groups].** The following are equivalent:

- The action of  $\text{Gal}(K^{\text{sh}}/K)$  on any special apartment of  $\mathcal{B}(G_{K^{\text{sh}}})$  is trivial, and the maximal central split torus of  $G_{K^{\text{sh}}}$  is defined over  $K$ .
- $\text{rank}_K(G) = \text{rank}_{K^{\text{sh}}}(G)$  (10.4.1.18).
- For any maximal  $\text{Gal}(K^{\text{sh}}/K)$ -stable simplex  $C \subset \mathcal{B}(G_{K^{\text{sh}}})$ ,  $\overline{\mathcal{G}}_C^0$  is split solvable.
- For any simplex  $\sigma \subset \mathcal{B}(G)$ ,  $\overline{\mathcal{G}}_\sigma^0$  is a split group (10.4.1.1).

If these conditions hold, then  $G$  is called a **residually split group**.  $\lrcorner$

*Proof:* 1  $\iff$  2: If the action of  $\text{Gal}(K^{\text{sh}}/K)$  on a special apartment  $\mathcal{A}(T_{K^{\text{sh}}})$  is trivial, then  $\text{rank}(T') = \text{rank}(S')$  where  $T'$  is the maximal  $K^{\text{sh}}$ -split torus contained in  $T \cap [G, G]$  and  $S'$  is the maximal split torus contained in  $S \cap [G, G]$ . Then  $\text{rank}_K(G) = \text{rank}_{K^{\text{sh}}}(G)$  by (10.4.2.27). The converse is also true by (10.4.2.27).

2  $\iff$  3: As  $\overline{\mathcal{G}}_\sigma^0$  is solvable by (20.6.4.20), and for any special torus  $T \leq G$  s.t.  $C \subset \mathcal{A}(T_{K^{\text{sh}}})$ ,  $\overline{\mathcal{T}}$  is a maximal torus of  $\overline{\mathcal{G}}_C^0$ , thus  $\overline{\mathcal{G}}_C^0$  is split solvable iff  $\overline{\mathcal{T}}$  is a maximal torus by (10.2.7.2), which is equivalent to  $T$  being split.

3  $\iff$  4: Let  $C$  be a  $\text{Gal}(K^{\text{sh}}/K)$ -stable simplex containing  $\sigma$ , then the image of  $\rho_{C,\sigma} : \overline{\mathcal{G}}_C^0 \rightarrow \overline{\mathcal{G}}_\sigma^0$  is a split Borel subgroup by (20.6.4.20) and (10.2.7.9).  $\square$

**Prop. (20.5.2.35) [Residually Split Groups are Quasi-Split].** Residually split groups are quasi-split, in particular residually quasi-split (20.5.2.32).  $\lrcorner$

*Proof:* This follows from (20.5.2.34) and (20.5.2.31).  $\square$

### Rigid Inner Forms

References are [Kal16].

**Notation (20.5.2.36).**

- Let  $K \in \text{LField}^0$ .
- Let  $G \in \text{linAlgGrp}/K$ .

$\lrcorner$

**Def. (20.5.2.37) [Canonical Galois Gerbes].** Define

$$P_K^{\text{rig}} \triangleq \varprojlim_{n \in \mathbb{Z}_+, L/K \in \text{GalField}^{\text{fin}}} \text{Res}_{L/K} \mu_n / \mu_n,$$

then there are canonical identifications:

$$H_{\text{cont}}^1(K, P_K^{\text{rig}}) = 1, \quad H_{\text{cont}}^2(K, P_K^{\text{rig}}) = \begin{cases} \widehat{\mathbb{Z}} & , K \in p\text{-NField} \\ \mathbb{Z}/(2) & , K = \mathbb{R} \\ 0 & , K = \mathbb{C} \end{cases}.$$

In particular, there is a unique isomorphism of continuous extensions

$$1 \rightarrow P_K^{\text{rig}} \rightarrow W_K^{\text{rig}} \rightarrow \text{Gal}_K \rightarrow 1,$$

and the group of automorphisms of this extension are exactly inner automorphisms coming from  $P_K^{\text{rig}}$ . And we can define  $H^1(W_K^{\text{rig}}, G) \triangleq H^1(W_K^{\text{rig}}, G(K^{\text{sep}}))$  independent of  $W$  chosen.  $\lrcorner$

*Proof:* Cf. [Kal16].  $\square$

**Def. (20.5.2.38) [Twisted Cohomology Groups].** Let  $\mathcal{A}_K$  be the category of injections  $Z \rightarrow G$  where  $G \in \text{linAlgGrp}/K$  and  $Z \leq Z(G)$  is a finite central subgroup. For  $[Z \rightarrow G] \in \mathcal{A}_K$ , let  $H^1(P_K^{\text{rig}} \rightarrow W_K^{\text{rig}}, Z \rightarrow G) \in \text{Set}$  be the cohomology classes of those 1-cocycles in  $Z^1(W_K^{\text{rig}}, G)$  (20.5.2.37) whose restriction to  $P_K^{\text{rig}}$  takes image in  $Z$ . Then there is a functorial map of sets

$$H^1(P_K^{\text{rig}} \rightarrow W_K^{\text{rig}}, Z \rightarrow G) \rightarrow H^1(K, G/Z).$$

And when  $Z(G)$  is finite, we denote  $H^1(W_K^{\text{rig}}, G)_{\text{bas}} \triangleq H^1(P_K^{\text{rig}} \rightarrow W_K^{\text{rig}}, Z(G) \rightarrow G)$ .  $\lrcorner$

**Thm. (20.5.2.39) [Properties of Twisted Cohomology Groups].** For each finite central subgroup  $Z \leq G$ , there is a commutative diagram

$$\begin{array}{ccccccc}
 1 & \longrightarrow & H^1(K, Z) & \xrightarrow{\text{inf}} & H^1(P_K^{\text{rig}} \rightarrow W_K^{\text{rig}}, Z \rightarrow Z) & \xrightarrow{\text{res}} & \text{Hom}(P_K^{\text{rig}}, Z) \\
 & & \downarrow & & \downarrow & & \downarrow = \\
 1 & \longrightarrow & H^1(K, G) & \xrightarrow{\text{inf}} & H^1(P_K^{\text{rig}} \rightarrow W_K^{\text{rig}}, Z \rightarrow G) & \xrightarrow{\text{res}} & \text{Hom}(P_K^{\text{rig}}, Z) \longrightarrow * \\
 & & \downarrow = & & \downarrow & & \downarrow b \\
 & & H^1(K, G) & \xrightarrow{\text{inf}} & H^1(K, G/Z) & \xrightarrow{\text{res}} & H^2(K, Z) \longrightarrow * \\
 & & \downarrow & \swarrow & \downarrow & & \downarrow \\
 & & H^1(K, G/Z(G)) & & 1 & & 1
 \end{array}
 \quad (20.5.2.38)$$

with exact rows and columns, where  $*$  is to be taken as  $H^2(K, G)$  if  $G$  is commutative and disregarded otherwise. In particular

- $\#\text{Hom}(P_K^{\text{rig}}, Z)^{\text{Gal}_K} < \infty$  and  $\#H^1(P_K^{\text{rig}} \rightarrow W_K^{\text{rig}}, Z \rightarrow Z) < \infty$ .
- Each fiber of the map  $H^1(P_K^{\text{rig}} \rightarrow W_K^{\text{rig}}, Z \rightarrow Z) \xrightarrow{\text{res}} \text{Hom}(P_K^{\text{rig}}, Z)$  is naturally identified with  $H^1(K, G^\dagger)$  for some inner form  $G^\dagger$  of  $G$ .

*Proof:* Cf. [Kal16](3.6).  $\square$

**Def. (20.5.2.40) [Rigid Inner Twists].** For  $G \in \text{RedGrp}/K$ , a **rigid inner twist** of  $G$  is pair  $(G', \xi, z)$  where  $G' \in \text{RedGrp}/K$  and  $\xi : G_{K^{\text{sep}}} \cong G'_{K^{\text{sep}}}$  is an inner twist, and  $z \in Z^1(P_K^{\text{rig}} \rightarrow W_K^{\text{rig}}, Z(G) \rightarrow G)$  (20.5.2.38) s.t.  $\xi^{-1}\sigma(\xi) = \text{Ad}(\bar{z}(\sigma))$  for each  $\sigma \in \text{Gal}_K$ , where  $\bar{z}$  is the image of  $z$  in  $H^1(K, G_{\text{ad}})$ .

And an isomorphism of rigid inner twists  $(G'_1, \xi_1, z_1) \cong (G'_2, \xi_2, z_2)$  is a pair  $(f, \delta)$  where  $f : G'_1 \cong G'_2$  is an isomorphism and  $\delta \in G(K^{\text{sep}})$  s.t.  $\xi_2^{-1}f\xi_1 = \text{Ad}(\delta)$  and  $z_1(w) = \delta^{-1}z_2(w)\sigma_w(\delta)$  for any  $w \in W_K^{\text{rig}}$ , where  $\sigma_w$  is the image of  $w$  in  $\text{Gal}_K$  (20.5.2.37).  $\lrcorner$

**Prop. (20.5.2.41) [Rigid Inner Twists and Strong Rational Forms].** If  $K = \mathbb{R}$  and  $G \in \text{RedGrp}/K$ , then there is an equivalence between the groupoid of rigid inner twists of  $G$  and the groupoid of strong rational forms defined by [Adams-Barbasch-Vogan, The Langlands classification and irreducible characters for real reductive groups]  $\square$ .

*Proof:* Cf. [Kal16]P5.2. □

**Def. (20.5.2.42) [Twisted Cohomology Groups of Reductive Groups].** Let  $\mathcal{R}_K \subset \mathcal{A}_K$  (20.5.2.38) be the subcategory of injections  $Z \rightarrow G$  s.t.  $G \in \text{RedGrp}/K$ . For each  $[Z \rightarrow G] \in \mathcal{A}_K$ , denote  $\overline{G} = G/Z$ , then there is an isogeny  $\widehat{\overline{G}} \rightarrow \widehat{G}$ . Denote  $Z(\widehat{\overline{G}})^+$  to be the preimage of  $Z(\widehat{G})^{\text{Gal}_K}$  in  $\widehat{\overline{G}}$ , then we get a functor

$$\mathcal{R}_K \rightarrow \text{Set} : [Z \rightarrow G] \rightarrow \pi_0(Z(\widehat{\overline{G}}))^{\vee}.$$

┘

**Thm. (20.5.2.43) [Kaletha-Maps, Kaletha [Kal16]].** Situation as in (20.5.2.42),

- There exists a unique functorial map of sets

$$H^1(P_K^{\text{rig}} \rightarrow W_K^{\text{rig}}, Z \rightarrow G) \rightarrow \pi_0(Z(\widehat{\overline{G}}))^{\vee} \text{ (20.5.2.42),}$$

from  $\mathcal{R}_K$  to  $\text{Set}$  s.t.

- Its restriction to objects of the form  $[1 \rightarrow T]$  where  $T \in \text{Tori}/K$  is the Tate-Nakayama map (10.5.2.2).
- It satisfies the commutative diagram of functors

$$\begin{array}{ccc} H^1(P_K^{\text{rig}} \rightarrow W_K^{\text{rig}}, Z \rightarrow G) & \xrightarrow{\text{res}} & \text{Hom}(P_K^{\text{rig}}, Z) \\ & \searrow & \swarrow f \\ & \text{Hom}(P_K^{\text{rig}}, Z) & \end{array} \quad (20.5.2.39),$$

where  $f$  is the natural map ?

- The above map is an isomorphism when  $G \in \text{Tori}/K$ .
- The above map is an isomorphism when  $K \in p\text{-NField}$ . In particular,  $H^1(P_K^{\text{rig}} \rightarrow W_K^{\text{rig}}, Z \rightarrow Z)$  has a canonical Abelian group structure.
- The kernel and cokernel of the above map is can be explicitly described when  $K \in \{\mathbb{R}, \mathbb{C}\}$ .
- When  $Z = 1$ , the above map is the Kottwitz-map  $\kappa_G : H^1(K, G) \rightarrow \pi_0(Z(\widehat{G}))^{\vee}$  (28.6.1.30).

┘

*Proof:* Cf. [Kal16]Section4. ? □

### 3 over Adeles

References are [Weil and Grothendieck approaches to adelic points, Conrad] where he has more canonical way to define the topology, and [P-R94],

**Notation (20.5.3.1).**

- Let  $F \in \text{GField}$ .
- Let  $X, Y \in \text{Aff}^{\text{ft}}/F$ .
- Let  $G \in \text{linAlgGrp}/F$ .

┘

**Prop. (20.5.3.2)[Adelization of Affine Schemes].** Suppose  $X \subset \mathbb{A}^n$ , the f.m. defining equations has coefficients in  $\mathcal{O}_{F_v}$  for a.e.  $v \in \Sigma_F^{\text{fin}}$ , so it is clear to see that there is a bijection

$$X(\mathbf{A}_F) \cong \prod_{v \in \Sigma_F}^I (X(F_v), X(\mathcal{O}_{F_v})).$$

Then we endow the topology on  $X(\mathbf{A}_F)$  with that of the RHS.  $\square$

**Lemma (20.5.3.3).** If  $X \subset \mathbb{A}^m, Y \subset \mathbb{A}^n$  and  $f : X \rightarrow Y \in \text{Sch}$ , then  $f_{\mathbf{A}}(X(\mathbf{A}_F)) \subset Y(\mathbf{A}_F)$  (20.5.3.2), and this is a continuous map.  $\square$

*Proof:* The coordinates of  $f$  has coefficients in  $\mathcal{O}_{F_v}$  for a.e.  $v \in \Sigma_F$ , so  $f_{F_v}(X(\mathcal{O}_{F_v})) \subset Y(\mathcal{O}_{F_v})$  for a.e.  $v$ . This implies that  $f_{\mathbf{A}}$  is continuous.  $\square$

**Prop. (20.5.3.4)[Adelization of Algebraic Schemes].** For any  $X \in \text{Sch}^{\text{ft}}/F$ , choose a finite covering  $X = \cup_i X_i$  by affine open subschemes and choose embeddings  $f_i : X_i \rightarrow \mathbb{A}_F^{n_i}$ . Then define

$$X(\mathbf{A}_F) = \bigcup_i f_i^{-1}(\mathbf{A}_F^{n_i}) \quad (20.5.3.2)$$

as a topological space. Then this construction is independent of the choices of  $f_i$ , and any  $f : X \rightarrow Y \in \text{Sch}^{\text{ft}}/F$  induces a map of adele spaces  $f_{\mathbf{A}} : X(\mathbf{A}_F) \rightarrow Y(\mathbf{A}_F)$ .  $\square$

*Proof:* As in the proof of (20.5.3.3), it suffices to show that  $f_{F_v}(X(\mathcal{O}_{F_v})) \subset Y(\mathcal{O}_{F_v}) = \cup_j Y_j(\mathcal{O}_{F_v})$  for a.e.  $v \in \Sigma_F$ . By the definition of  $X(\mathbf{A}_F)$ , it suffices to assume that  $X \subset \mathbb{A}_F^n$  is affine.

Let the coordinates of the map  $X \rightarrow Y_j$  be given by  $y_1^j, \dots, y_{n_i}^j \in R(X)$ , and let  $I_j$  be the ideal of  $F[X_1, \dots, X_n]$  consisting of functions  $\psi$  s.t. each  $y_i^j$  can be written as  $y_i^j = \varphi_i^j/\psi$  where  $\varphi_i^j \in F[X_1, \dots, X_n]$  (such a representation may not be unique). Then  $\cap_j V(I_j) = \emptyset$ , because any  $x \in X$  is mapped to some  $Y_j$ , which means that some nbhd of  $x$  is mapped to  $Y_j$ , which means  $y_i^j$  can be represented by rational functions with denominator non-vanishing at  $x$ .

So there exists  $\psi_j \in I_j$  s.t.  $\sum_j \psi_j = 1$ . And let  $y_i^j = \varphi_i^j/\psi_j$  for each  $i \in [n_j]_+$  where  $\varphi_i^j \in F[X_1, \dots, X_n]$ . There are only f.m. polynomials, so for a.e.  $v \in \Sigma_F$ , all the coefficients of these functions are in  $\mathcal{O}_{F_v}$ .

If  $v$  is such a place, then  $f_{F_v}(X(\mathcal{O}_{F_v})) \subset \cup_j Y_j(\mathcal{O}_{F_v})$ : Because  $\psi_j(x) \in \mathcal{O}_{F_v}$  for each  $j$  and  $\sum_j \psi_j(x) = 1$ , there must be some  $j$  s.t.  $\psi_j(x) \in \mathcal{O}_{F_v}^*$ , and then  $y_i^j = \varphi_i^j/\psi_j \in \mathcal{O}_{F_v}$  for each  $i \in [n_j]_+$ .  $\square$

**Cor. (20.5.3.5).**

- If  $X \in \text{Sch}^{\text{ft}}/F$  and  $X = \cup X_i$  is a covering by open subschemes, then  $X(\mathbf{A}_F) = X_i(\mathbf{A}_F)$ .
- If  $X \rightarrow Y, Z \rightarrow Y \in \text{Sch}^{\text{ft}}/F$ , then  $(X \times_Y Z)(\mathbf{A}_F) = X(\mathbf{A}_F) \times_{Y(\mathbf{A}_F)} Z(\mathbf{A}_F)$ .
- If  $X \hookrightarrow Y \in \text{Sch}^{\text{ft}}/F$  is a closed embedding, then  $X(\mathbf{A}_F) \hookrightarrow Y(\mathbf{A}_F)$  is a closed embedding.
- If  $X \rightarrow Y \in \text{Sch}^{\text{ft}}/F$  is proper, then  $X(\mathbf{A}_F) \rightarrow Y(\mathbf{A}_F)$  is proper. ?
- If  $X \rightarrow Y \in \text{Sch}^{\text{ft}}/F$  is smooth surjective with geo.connected fibers, then  $X(\mathbf{A}_F) \rightarrow Y(\mathbf{A}_F)$  is open. ?
- Notice that for open immersions, the induced inclusion may not be immersions. For example, the embedding  $\mathbb{G}_m \subset \mathbb{A}^1$  induces  $\mathbf{I}_F \subset \mathbf{A}_F$ , which is not an immersion(it has finer topology).  $\square$

*Proof:* Cf.[Weil and Grothendieck approached to adelic points, Conrad].  $\square$

**Prop. (20.5.3.6) [Surjection of Adelic Points].** Let  $f : X \rightarrow Y \in \text{Sch}^{\text{ft}}/F$  be a morphism s.t. there exists a local section at each  $y \in Y$ , then  $f_{\mathbf{A}}$  is surjective.  $\lrcorner$

*Proof:* There exists a finite open covering  $Y_i$  of  $Y$  and subschemes  $X_i$  of  $X$  s.t.  $X_i \xrightarrow{f_i} Y_i$ , then by (20.5.3.4),  $Y(\mathbf{A}_F) = \cup_i Y_i(\mathbf{A}_F) = \cup_i f(X_i(\mathbf{A}_F)) \subset f(X(\mathbf{A}_F))$ .  $\square$

**Cor. (20.5.3.7).** If  $f : X \rightarrow Y \in \text{Sch}^{\text{ft}}/F$  is surjective on  $L$ -points for each  $L/F \in \mathbf{Field}$  and  $Y$  is irreducible, then  $f_{\mathbf{A}_F}$  is surjective.  $\lrcorner$

*Proof:* Apply the hypothesis to  $L = R(Y)$  gives that there exists a local section to  $f$  at each  $y \in Y$ .  $\square$

**Prop. (20.5.3.8).**  $G(\mathbf{A}_F)/G^0(\mathbf{A}_F)$  is compact.  $\lrcorner$

*Proof:* As  $G^0$  has finite index in  $G$ , for each  $v \in \Sigma_F$ , there exists a finite set  $C_v \in G(F_v)$  s.t.  $G(F_v) = C_v G^0(F_v)$ . It suffices to show that for a.e.  $v$ , such a  $C_v$  can be chosen to be contained in  $G(\mathcal{O}_{F_v})$ . For this, it suffices to show that  $G(F_v) = G(\mathcal{O}_{F_v})G^0(F_v)$ . Cf.[P-R94]P252?  $\square$

### Integral Models

**Prop. (20.5.3.9) [Smooth Group Models Exist for Affine Schemes].** For  $G \in \text{GrpSch}^{\text{aff,ft}}/F$ , there exists some  $\Sigma_F^\infty \subset_{\text{fin}} S \subset \Sigma_F$  and  $\mathcal{G} \in \text{GrpSch}^{\text{sm,ft}}/\mathcal{O}_{F,S}$  that is a smooth model for  $G$  (20.3.1.1). Any two such  $\mathcal{G}$  are isomorphic over  $\mathcal{O}_{F,S}$  for some  $\Sigma_F^\infty \subset_{\text{fin}} S \subset \Sigma_F$ .  $\lrcorner$

*Proof:* There exists  $\mathcal{G} \in \text{GrpSch}^{\text{ft}}/\mathcal{O}_{F,S}$  s.t.  $\mathcal{G}_F \cong G$  because the multiplication  $G \times G \rightarrow G$  is defined by f.m. equations. Then we can enlarge  $S$  to assume that  $G$  is smooth by (7.6.4.5). Any two model are isomorphic over  $F$ , and the isomorphism is given by f.m. equations, so they are isomorphic over  $\mathcal{O}_{F,S}$  for some  $\Sigma_F^\infty \subset_{\text{fin}} S \subset \Sigma_F$ .  $\square$

**Prop. (20.5.3.10) [Integral Models Exist and are a.e. Hyperspecial].** For  $G \in \text{RedGrp}/F$  and  $\Sigma_F^\infty \subset_{\text{fin}} S \subset \Sigma_F$ , if  $\mathcal{G} \in \text{GrpSch}/\mathcal{O}_{F,S}$  is a smooth model of  $G$  (20.3.1.1), then after enlarging  $S$ , we can assume  $\mathcal{G} \in \text{RedGrp}/\mathcal{O}_{F,S}$ . In particular,  $\mathcal{G}(\mathcal{O}_{F_v})$  is a hyperspecial subgroup of the reductive group  $G_{F_v} \in \text{RedGrp}/F_v$  for a.e.  $v \in \Sigma_F^{\text{fin}}$ .  $\lrcorner$

*Proof:* After enlarging  $S$ , we may assume  $\mathcal{G}/\mathcal{O}_{F,S}$  is smooth by (7.6.4.5). Then by (10.5.6.8) and (10.5.6.11),  $\mathcal{G} \in \text{RedGrp}/\mathcal{O}_{F,S}$ .  $\square$

**Cor. (20.5.3.11) [Compact Open Subsets are a.e. Hyperspecial].** For  $G \in \text{RedGrp}/F$ ,  $\Sigma_F^\infty \subset_{\text{fin}} S \subset \Sigma_F$  and  $\mathcal{G} \in \text{RedGrp}/\mathcal{O}_{F,S}$  a model for  $G$  (which exists by (20.5.3.10)), if  $\mathcal{K}^S \leq G(\mathbf{A}_F^S)$  is a compact open subgroup, then there exists  $S \subset_{\text{fin}} S' \subset \Sigma_F$  s.t.  $\mathcal{K}^S = \mathcal{K}_{S'}^S \mathcal{K}^{S'}$ , where  $K_{S'}^S \leq G(\prod_{v \in S' \setminus S} F_v)$  and  $\mathcal{K}^{S'} \cong \mathcal{G}(\widehat{\mathcal{O}_F}^{S'})$ . In particular,  $\mathcal{K}_v \leq G(F_v)$  is a hyperspecial subgroup for  $v \in \Sigma_F \setminus S'$ .  $\lrcorner$

*Proof:* This follows from the definition of  $G(\mathbf{A}_F)$  (20.5.3.2).  $\square$

### Class Groups

**Thm. (20.5.3.12)** [Class Numbers are Finite, Borel/Conrad/Oesterle/Prasad]. For any  $\Sigma_F^\infty \subset_{\text{fin}} S \subset \Sigma_F$  and any compact open subgroup  $\mathcal{K}^S \leq G(\mathbf{A}_F^S)$ , we have

$$\#G(F) \backslash G(\mathbf{A}_F^S) / \mathcal{K}^S < \infty.$$

The **class number (of algebraic group)** of  $G$  is defined to be

$$\text{cl}(G) = \#G(K) \backslash G(\mathbf{A}_{F,f}) / G\left(\prod_{v \in \Sigma_F^{\text{fin}}} \mathcal{O}_v\right) < \infty.$$

┘

*Proof:* ? Cf. [P-R94]P251 and [Conrad, Finiteness theorems for algebraic groups over Function Fields].

By (20.5.3.8), we can assume that  $G$  is connected. And by restriction of scalars, we can assume that  $F = \mathbb{Q}$ .

? The double coset is finite because for any  $(g_v) \in G(\mathbf{A}_{F,f})$ , by strong approximation for  $\mathbb{G}_a$ , we can choose a  $g \in G(F)$  s.t.  $g^{-1}g_v \in K_v$  for any  $v \in \Sigma_F^{\text{fin}}$ , then the image is finite as  $U$  is compact open and  $\prod_v K_v$  is compact.  $\square$

**Lemma (20.5.3.13).** If  $G = N \rtimes H$  and  $N$  satisfies strong approximation for  $S_F(\infty)$  (20.5.3.15), then  $\text{cl}(G) \leq \text{cl}(H)$ .  $\square$

*Proof:* For any  $x \in G(\mathbf{A}_F)$ , because  $x^{-1}N'_{F,\infty}x$  is open in  $N(\mathbf{A}_F)$ , by strong approximation, we have  $N(\mathbf{A}_F) = (x^{-1}N'_{F,\infty}x)N(\mathbf{A}_{F,\infty})N(F) = x^{-1}N'_{F,\infty}xN(F)$ . In particular,  $N(\mathbf{A}_F) = N'_{F,\infty}N(F)$ , and

$$xN'_{F,\infty}N(F) = N'_{F,\infty}xN(F).$$

Thus

$$G(\mathbf{A}_F) = H(\mathbf{A}_F)N(\mathbf{A}_F) = H(\mathbf{A}_F)N'_{F,\infty}N(F) = N'_{F,\infty}H(\mathbf{A}_F)N(F).$$

Now if  $H(\mathbf{A}_F) = \cup_i H'_i x_i H(F)$ , then

$$G(\mathbf{A}_F) = \bigcup_i N'_{F,\infty} H'_i x_i H(F) N(F) = G'_{F,\infty} x_i G(F).$$

$\square$

**Def. (20.5.3.14)** [Hasse-Principle].  $G$  is said to satisfy the **Hasse-principle** if the map of sets:

$$H^1(F, G) \rightarrow \prod_{v \in \Sigma_F} H^1(F_v, G)$$

is injective.  $\square$

### Approximations

**Def. (20.5.3.15)** [Weak and Strong Approximations]. For  $\emptyset \subset_{\text{fin}} S \subset \Sigma_F$ ,  $X \in \text{Sch}^{\text{sep}, \text{ft}}$  is said to satisfy

- The **strong approximation** w.r.t.  $S$  if the image of  $X(F) \rightarrow X(\mathbf{A}_F^S)$  is dense.

- The **weak approximation** w.r.t.  $S$  if the image of  $X(F) \rightarrow X(\mathbf{A}_{F,S})$  is dense.  
If  $X = G$  is an algebraic group, then the following are equivalent:
- The image of  $G(F)$  is dense in  $G(\mathbf{A}_F^S)$ ,
- $G(F)G(\mathbf{A}_{F,S})$  is dense in  $G(\mathbf{A}_F)$ .
- For any compact open subgroup  $U^S \subset G(\mathbf{A}^S)$ ,  $G(\mathbf{A}_F) = G(F)G(\mathbf{A}_{F,S})U^S$ .

In particular,

$$\Gamma \backslash G(\mathbf{A}_{F,S}) \cong G(F) \backslash G(\mathbf{A}_F) / U^S.$$

where  $\Gamma$  is the image of  $G(F) \cap (G(\mathbf{A}_{F,S}) \times U^S)$  in  $G(\mathbf{A}_{F,S})$ . ┘

**Prop. (20.5.3.16) [Strong Approximation for  $G_a$ ].** For any  $\emptyset \subset_{\text{fin}} S \subset \Sigma_F$ , strong approximation holds for  $S$  (20.5.3.15). In other words, the image of  $F$  is dense in  $\mathbf{A}_F^S$ , or equivalently,  $FF_v U = \mathbf{A}_F$  for any non-empty open subset  $U \subset \mathbf{A}_F^S$ . ┘

*Proof:* Cf. [MIT notes, 22.14]. ? □

**Cor. (20.5.3.17) [Strong Approximation for Unipotent Groups].** If  $U \in \text{AlgGrp}/F$  is unipotent, then  $U$  satisfies the strong approximation w.r.t. any  $\emptyset \subset_{\text{fin}} S \subset \Sigma_F$ . ┘

*Proof:*  $U$  is isomorphic to  $\text{Lie}(U)$  as schemes ?, so the assertion follows from (20.5.3.16). □

**Cor. (20.5.3.18) [Weak Approximation for Parabolic Subgroups].** If  $F \in \text{NField}$  and  $G$  is connected and has a Levi decomposition  $G = LU$  where  $U$  is the unipotent, then for any  $\emptyset \subset_{\text{fin}} S \subset \Sigma_F$ ,  $G$  admits weak (resp. strong) approximation w.r.t.  $S$  iff  $M$  does. ┘

*Proof:* Cf. [P-R94] Chap7. □

**Thm. (20.5.3.19) [Weak Approximations].** If  $F \in \text{NField}$  and  $G \in \text{RedGrp}^{\text{ss}}/F$  is simply-connected or adjoint, then  $G$  admits weak approximation (20.5.3.15) for any  $\emptyset \subset_{\text{fin}} S \subset \Sigma_F$ . ┘

*Proof:* Cf. [P-R94] Chap7.3. □

**Thm. (20.5.3.20) [Weak Approximations for Homogenous Spaces].** If  $F \in \text{NField}$  and  $G$  is connected s.t.  $G_{\text{s, st}}$  is simply-connected and  $G_{\text{tor}}$  is quasi-trivial (Cf. [Getz] P65 ?), and  $H \leq G$  is a connected subgroup s.t.  $H_{\text{tor}}$  splits over a cyclic extension of  $F$ , then  $G/H$  satisfies weak approximation w.r.t. any non-empty  $\emptyset \subset_{\text{fin}} S \subset \Sigma_F$ . ┘

*Proof:* Cf. [Borovoi. The defect of weak approximation for homogeneous spaces] Cor3.14. □

**Thm. (20.5.3.21) [Strong Approximation].** If  $G$  is semisimple and simply-connected (10.4.3.1), and  $G(\mathbf{A}_{F,S})$  is non-compact for some  $\Sigma_F^\infty \subset_{\text{fin}} S \subset \Sigma_F$ , then  $G$  satisfies strong approximation for  $S$ . ┘

*Proof:* Cf. [Algebraic Groups and Number Theory, P427]. □

**Remark (20.5.3.22).** This is not true for non-semisimple or non-simply connected: for  $\mathbb{G}_m$ ,  $\mathbb{Q}^\times$  is not dense in  $\mathbf{I}_{\mathbb{Q},f}^\times$ .

For  $\text{PGL}(2)$ , the determinant of  $\text{PGL}(2; \mathbb{Q})$  is  $\mathbb{Q}^\times / (\mathbb{Q}^\times)^2$  and the determinant of  $\text{PGL}(2; \mathbf{A}_{\mathbb{Q},f})$  is  $\mathbf{I}_{\mathbb{Q},f} / \mathbf{I}_{\mathbb{Q},f}^2$ , which is not dense. ┘

**Cor. (20.5.3.23) [Strong Approximation for  $\text{SL}(n)$ ].**

- $\text{SL}(n)_F$  satisfies strong approximation for  $\Sigma_F^\infty$ .

- Let  $\mathcal{K}_0$  be an open compact subgroup of  $\mathrm{GL}(n; \mathbf{A}_{F,f})$ , then

$$\mathrm{GL}(n; F) \mathrm{GL}(n; A_\infty) \mathcal{K}_0 T_1(A) = \mathrm{GL}(n; A).$$

- Let  $\mathcal{K}_0$  be an open compact subgroup of  $\mathrm{GL}(n; \mathbf{A}_{F,f})$  that the image of  $\mathcal{K}_0$  under the determinant map is  $\prod_{v \in \Sigma_F^{\mathrm{fin}}} \mathcal{O}_v^*$ , then

$$\det : \mathrm{GL}(n; F) \mathrm{GL}(n; \mathbf{A}_\infty) \backslash \mathrm{GL}(n; \mathbf{A}_F) / \mathcal{K}_0 \rightarrow F^\times \mathbf{I}_{F,\infty} \backslash \mathbf{I}_F / \prod_{v \in \Sigma_F^{\mathrm{fin}}} \mathcal{O}_{F_v}^* = \mathrm{Cl}(F)$$

is an isomorphism. ┘

*Proof:* 1 is a direct consequence of (20.5.3.21).

2 is a direct consequence of 1.

3:  $\det$  is clearly surjective. To show it is injective, if  $\det(a) = \det(b) \in \mathrm{Cl}_1(F)$ , then  $\det(a) = \det(g_1 g_\infty b k_0)$  where  $g_1 \in \mathrm{GL}(n; F)$ ,  $g_\infty \in \mathrm{GL}(n; \mathbf{A}_{F,\infty})$ ,  $k_0 \in \mathrm{GL}(n; \mathbf{A}_{F,f})$  by hypothesis. Then  $g_1 g_\infty b k_0 a^{-1} \in \mathrm{SL}(n; \mathbf{A}_F)$ , and by item 1 it is of the form  $h_1 h_\infty k_0$  where  $h_1 \in \mathrm{SL}(n; F)$ ,  $h_\infty \in \mathrm{SL}(n; \mathbf{A}_{F,\infty})$ ,  $k_1 \in a(\mathcal{K}_0 \cap \mathrm{SL}(n; \mathbf{A}_{F,f}))a^{-1}$ . Then the assertion follows. □

**Prop. (20.5.3.24) [Passage From Archimedean to Adele via Congruence Subgroups].** For  $F \in \mathbf{NField}$  and  $\mathcal{K} \leq G(\mathbf{A}_{F,f})$  be a compact open subgroup, let  $\{g_i\} \subset G(\mathbf{A}_{F,f})$  be a finite set of double-coset representatives for  $G(F) \backslash G(\mathbf{A}_{F,f}) / \mathcal{K}$  (20.5.3.12), then

$$\coprod_i \Gamma_i \backslash G(F \otimes \mathbb{R}) \cong G(F) \backslash G(\mathbf{A}_F) / \mathcal{K}$$

where  $\Gamma_i$  is the image of  $(g_i \mathcal{K} g_i^{-1} \times G(F \otimes \mathbb{R})) \cap G(F)$  in  $G(F \otimes \mathbb{R})$ , which is an arithmetic subgroup of  $G(F)$  (20.4.0.2). ┘

*Proof:* The map  $\Gamma_i \backslash G(F \otimes \mathbb{R}) \rightarrow G(F) \backslash G(\mathbf{A}_F) / \mathcal{K}$  is given by

$$\Gamma_i g_\infty \mapsto G(F) g_\infty g_i \mathcal{K}.$$

□

**Thm. (20.5.3.25) [Strong Approximation for Homogenous Spaces].** If  $F \in \mathbf{NField}$ ,  $G \in \mathbf{RedGrp}^{\mathrm{ss}} / F$  is geometrically almost-simple (10.4.2.6) and  $H \leq G$  is a simply-connected semisimple subgroup, then for any  $\emptyset \subset_{\mathrm{fin}} S \subset \Sigma_F$ ,  $G/H$  satisfies strong approximation for  $S$  iff  $(G/H)(\mathbf{A}_{F,S})$  is non-compact. ┘

*Proof:* Cf. [Strong approximation for algebraic groups, Rapinchuk2014] Prop 2.4. □

## 4 Adelic Quotients

**Notation (20.5.4.1).**

- Let  $F \in \mathbf{GField}$ .
- Let  $X, Y \in \mathcal{A}^{\mathrm{ft}} / F$ .
- Let  $G \in \mathbf{linAlgGrp} / F$ .

┘

**Prop. (20.5.4.2).** For  $X \in \text{Sch}^{\text{ft}}/F$ ,  $X(F)$  is discrete and closed in  $X(\mathbf{A}_F)$ . ┘

*Proof:* It suffices to check for an affine covering so we can assume that  $X$  is affine, and the assertion reduces to  $\mathbb{A}^n$  and reduces to (19.4.1.3). □

**Def. (20.5.4.3) [Adelic Quotients].** Define

$$G(\mathbf{A}_F)^1 = \bigcap_{\chi \in X^*(G)} \ker(|-|_{\mathbf{A}} \circ \chi : G(\mathbf{A}_F) \rightarrow \mathbb{R}_+)$$

. Then  $G(F) \subset G(\mathbf{A}_F)$  is discrete and closed by product formula.

If  $F \in \mathbf{NField}$ , let  $A(G) \leq G(F_{\infty}) \leq G(\mathbf{A}_F)$  be the neutral component of the  $\mathbb{R}$ -point of the largest  $\mathbb{Q}$ -split torus  $A_G \leq \text{Res}_{F/\mathbb{Q}}(Z(G))$ . And for  $F \in \mathbf{FField}$  it is defined in [Getz]P68.

Define  $[G]_F = A(G)G(F) \backslash G(\mathbf{A}_F)$ , called the **adelic quotient** of  $G$ . ┘

**Prop. (20.5.4.4).** If  $G \in \text{RedGrp}/F$ , then  $A_G G(\mathbf{A}_F)^1 \leq G(\mathbf{A}_F)$  (20.5.4.3) is of finite index. And if  $F \in \mathbf{NField}$  we have  $A(G)G(\mathbf{A}_F)^1 = G(\mathbf{A}_F)$ .

In particular, if  $F \in \mathbf{NField}$  then there is a right  $G(\mathbf{A}_F)^1$ -equivariant homeomorphism

$$G(F) \backslash G(\mathbf{A}_F)^1 \cong [G] (20.5.4.3).$$

┘

*Proof:* ? □

### Tamagawa-Numbers

References are [Kottwitz. Tamagawa numbers], [Oesterlé. Nombres de Tamagawa et groupes unipotents en caractéristique  $p$ ], [P-R94]Chap5.3.

**Def. (20.5.4.5) [Tamagawa-Measures].** Suppose  $G$  is smooth and  $\dim G = n$ , take a  $F$ -rational differential  $n$ -form  $\omega \in \wedge^n \mathfrak{g}^*$ , then  $\omega$  induces a left-invariant measure  $\omega_v$  on  $G(F_v)$  for any  $v \in \Sigma_F$ . Thus it induces a Haar measure  $\mu_v$  on  $G(F_v)$  by (12.10.1.19).

Choose  $\lambda_v \in \mathbb{R}^+$  s.t.  $\prod_{v \in \Sigma_F} (\lambda_v \mu_v(G(\mathcal{O}_{F_v})))$  converges absolutely, then we get a **Tamagawa-measure**  $d\mu = \prod'_{v \in \Sigma_F} (\lambda_v d\mu_v)$  on  $G(\mathbf{A}_F)$ .

This Tamagawa-measure is independent of the choice of  $\omega$  by product formula (19.3.1.8), but depends on the normalizing factors  $\lambda_v$ . But usually there is a natural way to choose  $\lambda_v$  (Cf. [Oesterlé. Nombres de Tamagawa et groupes unipotents en caractéristique  $p$ ], [Weil, Adeles and Algebraic groups, Appendix 2] and [Kottwitz. Tamagawa numbers]). For example,  $G \in \text{RedGrp}^{\text{ss}}/F$ , then we can (and do) take  $\lambda_v = 1$  for each  $v \in \Sigma_F$ . ? ┘

**Prop. (20.5.4.6).** If  $G$  is smooth, then  $\Delta_{G(\mathbf{A}_F)}$  is trivial on  $G(\mathbf{A}_F)^1$  (and thus on  $G(F)$ ). In particular,  $G(\mathbf{A}_F)^1$  is unimodular by (12.10.3.7) because there is a  $G(\mathbf{A}_F)$ -invariant measure on  $G(\mathbf{A}_F)/G(\mathbf{A}_F)^1$  (which is isomorphic to  $\mathbb{R}_+^m$  or  $\mathbb{Z}_+^m$ ). And if  $G^0$  is reductive, then  $G(\mathbf{A}_F)$  is unimodular. ┘

*Proof:* Because the Haar measures on  $G(\mathbf{A}_F)$  are products of Haar measures on  $G(F_v)$  for  $v \in \Sigma_F$ , we have

$$\Delta_{G(\mathbf{A}_F)}(g) = \prod_{v \in \Sigma_F} \delta_{G(F_v)}(g_v) = |\det(\text{Ad}(g) : \mathfrak{g} \otimes_F \mathbf{A}_F \rightarrow \mathfrak{g} \otimes_F \mathbf{A}_F)| = 1.$$

Notice that  $\det \text{Ad} : G \rightarrow \mathbb{G}_m$  is a character, so by the formula as above,  $\Delta_{G(\mathbf{A}_F)}$  is trivial on  $G(\mathbf{A}_F)^1$ .

The last assertion follows from (12.10.1.22). □

**Def. (20.5.4.7) [Tamagawa-Measures].** For  $G \in \mathcal{G}\mathcal{r}\mathcal{p}\mathcal{V}\mathcal{a}\mathcal{r}/F$ , choose the right Tamagawa measure on  $G(\mathbf{A}_F)$  (20.5.4.5) and a suitably chosen measure on  $A_G$  ? and the discrete measure on  $G(F)$ , we get a canonical quotient measure on the adelic quotient  $[G]$  (20.5.4.3) by (20.5.4.6), called the **Tamagawa-measure** on  $[G]$ .  $\lrcorner$

**Thm. (20.5.4.8) [Tamagawa-Numbers, Borel/Oesterlé/Conrad12].** If  $G \in \mathcal{G}\mathcal{r}\mathcal{p}\mathcal{V}\mathcal{a}\mathcal{r}/F$ , then  $\tau(G) = \text{Vol}([G]_F) < \infty$  with the Tamagawa measure on  $[G]$  (20.5.4.7). This number is called the **Tamagawa-number** of  $G$ . And  $[G]$  is compact iff any  $F$ -split torus  $T \leq G$  satisfies  $T_{\overline{F}} \leq R(G_{\overline{F}})$ .  $\lrcorner$

*Proof:* Cf. [Finiteness theorems for algebraic groups over function fields, Conrad] Thm1.3.6. and ThmA.5.5.  $\square$

**Cor. (20.5.4.9).**

- $G(F) \backslash G(\mathbf{A}_F)$  is compact iff the reductive part of  $G^0$  is anisotropic (10.4.2.24) (e.g.  $G \in \text{Red}\mathcal{G}\mathcal{r}\mathcal{p}^{\text{ss}}/F$ ).
- $G(F) \backslash G(\mathbf{A}_F)$  has finite volume if  $X_*(G^0) = e$ .

$\lrcorner$

*Proof:* Cf. [P-R94] P260. ?  $\square$

### Tamagawa-Number Conjecture

**Prop. (20.5.4.10) [Tamagawa-Number of Inner Forms, Kottwitz[Kot88]].** If  $F \in \mathcal{N}\mathcal{F}\mathcal{i}\mathcal{e}\mathcal{l}\mathcal{d}$ ,  $G \in \text{Red}\mathcal{G}\mathcal{r}\mathcal{p}/F$  and  $G_0 \in \text{Red}\mathcal{G}\mathcal{r}\mathcal{p}/F$  is a quasi-split inner form of  $G$ , then  $\tau(G) = \tau(G_0)$ .  $\lrcorner$

*Proof:* Cf. [Kot88] ?  $\square$

**Lemma (20.5.4.11) [Ono/Kottwitz[Kot84]].** For  $G \in \text{Red}\mathcal{G}\mathcal{r}\mathcal{p}/F$ , we have

$$\tau(G) = \frac{\#\pi_0\left(Z(\widehat{G})^{\text{Gal}_F}\right)}{\#\text{III}(F, Z(\widehat{G}))} \quad (20.5.4.8).$$

$\lrcorner$

*Proof:* Cf. [Kottwitz, Trace formula: cuspidal tempered terms].  $\square$

**Thm. (20.5.4.12) [Tamagawa Number Conjecture, Weil; Demazure/Langlands/Lai/-Mars/Ono/Tamagawa/Weil/Kottwitz[Kot88]].** If  $G \in \text{Red}\mathcal{G}\mathcal{r}\mathcal{p}^{\text{ss}}/F$  is simply-connected, then  $\tau(G) = 1$  (20.5.4.8).  $\lrcorner$

*Proof:* ? [Langlands, The volume of the fundamental domain for some arithmetical subgroups of Chevalley group], [Lai, Tamagawa number of reductive algebraic group]. [Ono, Tamagawa numbers, in Algebraic Groups and Discontinuous Subgroups].  $\square$

### Reduction Theory of $[G]_F$ (Fundamental Domains)

Reduction theory allows us to control the adelic quotient  $[G]$  when it is non-compact.

**Notation (20.5.4.13).**

- Let  $G \in \text{Red}\mathcal{G}\mathcal{r}\mathcal{p}/F$ .

┘

**Def. (20.5.4.14) [Siegel Sets].** A Siegel set in  $G(\mathbf{A}_F)^1$  is a set of the form

$$\mathfrak{S}(t) = \Omega_N \Omega_M A_{T_0}(t) \mathcal{K}$$

where ? Cf. [Getz]P71.

┘

**Prop. (20.5.4.15) [Fundamental Domain].**  $\mathrm{GL}(n; F) \backslash \mathrm{GL}(n; \mathbf{A}_F)$  has a fundamental domain which can be covered by a sufficiently large Siegel sets  $\mathfrak{S}_{c,d}$ .

┘

*Proof:*

□

**Def. (20.5.4.16) [Global Siegel Sets].** For  $c, d > 0$ , then the global Siegel set  $\mathfrak{S}_{c,d} = K_f \times \mathfrak{S}_{c,d,\infty}$ ??  
And denote  $\overline{\mathfrak{S}_{c,d}}$  its image in  $Z(\mathbf{A}_F) \backslash \mathrm{GL}(2; \mathbf{A}_F)$ .

┘

**Prop. (20.5.4.17).** For  $c, d$  suitable chosen,  $\mathrm{GL}(2; \mathbf{A}_F) = \mathrm{GL}(2; F) \mathfrak{S}_{c,d}$ .

┘

*Proof:* We prove only for  $F = \mathbb{Q}$ ?: This is true for  $c \leq \sqrt{3}/2$  and  $d \geq 1$  because of the shape of the fundamental domain of  $\mathrm{GL}(2; \mathbb{R})$  for  $\mathrm{SL}(2; \mathbb{Z})$  (20.4.5.17).

□

## 5 over Number Fields

**Notation (20.5.5.1).**

- Let  $F \in \mathbf{GField}$ .

┘

**Def. (20.5.5.2) [Groups of Non-Compact Types].** Let  $G \in \mathbf{AlgGrp}/\mathbb{Q}$  be semisimple, then  $G$  is said to be a **group of compact type** if  $G(\mathbb{R})$  is compact, and said to be a **group of non-compact type** if it doesn't contain a non-trivial normal subgroup of compact type.

┘

**Prop. (20.5.5.3) [Real Approximations].** If  $G \in \mathbf{AlgGrp}/\mathbb{Q}$  satisfies each connected components of  $G$  contains a rational point, then  $G(\mathbb{Q})$  is dense in  $G(\mathbb{R})$ .

┘

*Proof:* Cf. [Mil17]P54.

□

### Global Kottwitz-Maps

**Cor. (20.5.5.4).** For  $F \in \mathbf{GField}$  and  $G \in \mathbf{RedGrp}/F$ , there is a natural exact sequence of pointed set

$$H^1(F, G) \rightarrow \bigoplus_{v \in \Sigma_F} H^1(F_v, G) \xrightarrow{\oplus_{v \in \Sigma_F} \kappa_{G_v}} \pi_0 \left( Z(\widehat{G})^{\mathrm{Gal}_F} \right)^\vee,$$

┘

*Proof:* Cf. [Kot86]P377?.

□

### Global Rigid Inner Twists

References are [Kal16, Kal16a] and [Kaletha, Global rigid inner forms and multiplicities of discrete automorphic representations].

**Def. (20.5.5.5) [Global Galois Gerbes].** Cf. [Kal16a]P31.?

┘

**Def. (20.5.5.6) [Global Rigid Inner Twists, Kal16a].** For  $G^* \in \mathbf{RedGrp}/F$ , a **rigid inner twist** of  $G^*$  is a triple  $(G, \xi, z)$  where  $\xi : G^* \rightarrow G$  is an inner twist and  $z \in Z^1(P^{\mathrm{rig}} \rightarrow \mathcal{E}^{\mathrm{rig}}, Z \rightarrow G^*)$  where  $Z \leq G$  is a finite central subgroup, s.t. the image of  $z$  in  $Z^1(F, G_{\mathrm{ad}}^*)$  equals  $z_{\mathrm{ad}}(\sigma) = \xi^{-1} \sigma(\xi)$ .

┘

## 20.6 Bruhat-Tits Theory

References are [I-M65, Tit79, B-T72, B-T84, B-T84a, B-T87, B-T87a, ?H-R08, Yu09, Yu15, K-P23], [Landvogt, A Compactification of the Bruhat-Tits Building], [the Bruhat-Tits Buildings of a  $p$ -adic Chevalley Group and an Application to Representation Theory, Rabinoff], [Buildings and Classical Groups, Garrett], [Period mappings and differential equations. From  $\mathbb{C}$  to  $\mathbb{C}_p$ , Andre],

### Notation (20.6.0.1).

- Let  $p \in \text{Prime}$ .
- Let  $(K, \mathcal{O}_K, \varpi_K, \kappa) \in \text{DVR}$  be Henselian with  $\kappa = \kappa^{\text{perf}}$  (if  $\# \kappa = \infty$ , use the notion of bounded subsets (20.5.1.3)).
- Let  $\Gamma_K = \{\text{ord}_K(x) | x \in K^\times\}$ .
- Use notations on reductive groups defined in [Group Theory III: Reductive Groups](#).
- Use notations on cohomology of reductive groups defined in [Group Theory III: Reductive Groups](#). Let  $G \in \text{RedGrp}/K$ .
- Let  $A_G \leq G$  be the maximal central split torus of  $G$ .
- Let  $H \leq G \in \text{AlgGrp}/K$ .
- $G(K)$  is a topological group with the topology coming from  $K$ .
- Use notations on (poly-)simplicial complexes defined in [Simplicial Complexes](#).

┘

### 1 Tits-Systems

References are [Bourbaki] and [K-P23].

**Def. (20.6.1.1) [Tits-Systems].** For  $G \in \text{Grp}$ , a **Tits-system** or a **BN-pair** in  $G$  is a tuple  $(B, N, S)$  where

- $B, N$  are subgroups of  $G$ ,  $S \subset N/(B \cap N)$ ,
- $G = \langle B \cup N \rangle$  and  $B \cap N \trianglelefteq N$ ,
- $S$  consists of elements of order 2, and generates  $W = N/(B \cap N)$ ,
- $BsBwB \subset BwB \cup BswB$  for any  $s \in S$  and  $w \in W$ ,
- $BsBsB \not\subseteq B$  for any  $s \in S$ ,

where for each  $w \in W$ , we denote  $Bw = Bn$  and  $wB = nB$  for any lift  $n \in N$  of  $w$ , which are well-defined cosets of  $B$  in  $G$ .

The group  $W = N/(B \cap N)$  is called the **Weyl-group of the Tits-system**. And  $B \cap N$  is usually denoted by  $T$ .

And  $(G, B, N, S)$  is called a **saturated Tits-system** if moreover we have

$$\bigcap_{n \in N} n^{-1}Bn = B \cap N.$$

┘

**Prop. (20.6.1.2)[Parabolic Subgroups].** In a Tits system  $(G, B, N, S)$ , any subgroup  $P \leq G$  containing  $B$  is of the form  $P = BW_X B$  where  $X \subset S$  and  $W_S$  is the subgroup of  $W$  generated by  $S$ . If  $P \neq G$ , then it is called a group is called a **standard parabolic subgroup** of  $G$  (w.r.t.  $B$ ). And any conjugate of a standard parabolic subgroup is called a **parabolic subgroup** of  $G$ .

Moreover, for  $X, X' \subset S$ ,  $BW_X B$  is conjugate to  $BW_{X'} B$  by  $g \in G$  iff  $X = X'$  and  $g \in BW_X B$ . Thus any parabolic subgroup  $P \leq G$  is conjugate to  $BW_X B$  for a unique subset  $X \leq S$ . This  $X$  is called the **type(parabolic subgroup)** of  $P$ .  $\lrcorner$

*Proof:* ? Cf.[Bourbaki, Lie Groups and Lie Algebras. Chapters 4-6, Elements of Mathematics]Cor4.2.5.  $\square$

**Cor. (20.6.1.3)[ $S$  is Uniquely Determined].** In a Tits system  $(G, B, N)$  (20.6.1.1),  $S \subset W$  consists exactly of elements  $s \in W$  s.t.  $B \cup BsB$  is a subgroup of  $G$ . In particular,  $S$  is determined by  $(B, N)$ .  $\lrcorner$

**Prop. (20.6.1.4)[Bruhat Decomposition].** Let  $(G, B, N)$  be a Tits system (20.6.1.1), then

$$G = \coprod_{w \in W} BwB.$$

$\lrcorner$

*Proof:* By (20.6.1.2), it suffices to show that these  $BwB$  are disjoint. ?  $\square$

**Prop. (20.6.1.5)[Parabolic Subgroups].** Let  $(G, B, N)$  be a Tits system, then

- Any parabolic subgroup of  $G$  (20.6.1.2) is equal to its normalizer.
- If  $Q \leq G$  is a parabolic subgroup containing two parabolic subgroups  $Q_1, Q_2 \leq G$ , then any  $g \in G$  s.t.  $gQ_1g^{-1} = Q_2$  satisfies  $g \in Q$ .

$\lrcorner$

*Proof:* ? Cf.[Bourbaki]Chap4.2.  $\square$

**Prop. (20.6.1.6)[Maps between Tits-Systems].** Let  $(G, B, N)$  be a Tits-system (20.6.1.1),

- If  $Z \leq T$  is a subgroup that is normal in  $G$ , set  $G' = G/Z, B' = B/Z, N' = N/Z$ , then  $(G', B', N')$  is a Tits-system with  $W' = W$ , and it is saturated iff  $(G, B, N)$  is (20.6.1.1).
- Suppose  $G \trianglelefteq G'$  and  $T' \leq G'$  normalizes  $B$  and  $N$ , and  $N$  normalizes  $T'$ , and  $G' = G.T'$  and  $T' \cap G = T$ . Set  $B' = B.T'$  and  $N' = N.T'$ , then  $(G', B', N')$  is a Tits-system with  $W' = W$ , and it is saturated iff  $(G, B, N)$  is.

$\lrcorner$

*Proof:* 1: This is clear as  $Z$  is normal in all groups under consideration.

2: Cf.[Kaletha-Prasad]P51.  $\square$

**Prop. (20.6.1.7).** Let  $(G, B, N, S), (G', B', N', S')$  be Tits-systems s.t.  $(G, B, N, S)$  is saturated, and  $f : G \rightarrow G'$  is a group homomorphism s.t.

- $\ker(f) \subset T$  (20.6.1.1).
- $f(G) \trianglelefteq G'$  and  $G'/f(G)$  is Abelian.
- $T'$  normalizes  $f(B)$ .
- $B' = f(B).T', N' = f(N).T'$ .

Then

- $G' = f(G).T'$ .
- $f^{-1}(T') = T$ .
- $T'$  normalizes  $f(BwB)$  for any  $w \in W$ .
- The map  $W \rightarrow W'$  induced by  $f$  (20.6.1.1) is an isomorphism that carries  $S$  bijectively onto  $S'$ .
- If  $P \leq G$  is parabolic (20.6.1.2), then so is  $P' = N_{G'}(f(P)) = f(P).T'$ , and  $P = f^{-1}(P')$ . This induces a type-preserving, order-preserving, conjugation-equivariant bijection between parabolic subgroups of  $G$  and  $G'$ .

┘

*Proof:* Cf. [Kaletha-Prasad]P52, 53. □

### Spherical Tits-Systems

**Prop. (20.6.1.8) [Tits-System from Reductive Groups].** Let  $k \in \mathbf{Field}$ ,  $G \in \mathbf{RedGrp}/k$  and  $P \leq G$  a minimal parabolic and  $N$  is the normalizer of a maximal  $k$ -split torus  $S \leq P$ , then  $(P(k), N(k))$  is a Tits-system in  $G(k)$  with finite Weyl group (20.6.1.1). And  $P \cap N = C_G(S)$ , which is a Levi  $k$ -subgroup of  $P$ . These Tits-systems are called **spherical Tits-systems**. ┘

*Proof:* Cf. [Borel, Linear Algebraic Groups]Prop21.15? □

**Prop. (20.6.1.9).** If  $k \in \mathbf{Field}$ ,  $\#k = \infty$ , then for  $G \in \mathbf{RedGrp}/k$ , any Tits-system in  $G(k)$  with finite Weyl group that satisfies a mild condition is a spherical Tits-system for some minimal parabolic  $P \leq G$  and some  $S$  (20.6.1.8). ┘

*Proof:* [Prasad, Weakly-split spherical Tits systems in quasi-reductive groups]Theorem B. □

### Decomposition into Irreducible Tits-Systems

**Prop. (20.6.1.10) [Coxeter-Systems].** For any Tits-system  $(G, B, N, S)$  (20.6.1.1),  $(W, S)$  is a Coxeter-system (3.9.1.1). And  $(G, B, N, S)$  is called an **irreducible Tits-system** if  $(W, S)$  is irreducible (3.9.1.2). ┘

## 2 Buildings

**Def. (20.6.2.1) [Buildings].** A **building** is a thick chamber complex  $X$  (4.13.4.2) with a family of chamber subcomplexes of  $X$  (4.13.4.2) called **apartments** of  $X$  s.t.

- Each apartment is a thin chamber complex (4.13.4.2) s.t. any two chambers of  $X$  is contained in some common apartment.
- For any two apartments  $a, a'$  containing a chamber  $C$  and a simplex  $\sigma$  (4.13.4.2), there is a simplicial isomorphism  $f : a \cong a'$  fixing vertices of  $C$  and  $\sigma$ .

More generally, we can define buildings for polysimplicial chamber complexes.

$X$  is called a **spherical building** if all apartments are spheres.  $X$  is called an **affine building** if all apartments are contractible. ┘

**Prop. (20.6.2.2) [Uniqueness Lemma].** Let  $X, Y$  be chamber complexes of the same dimension s.t. each codimension-1 simplex of  $Y$  is a subcomplex of at most 2 chambers. Let  $f, g : X \rightarrow Y$  be simplicial maps that sends non-stutter galleries (4.13.4.2) to non-stutter galleries, and agree on a chamber  $C$  of  $X$ , then  $f = g$ . ┘

*Proof:* Let  $D$  be any chamber of  $X$  and let  $(C = C_0, C_1, \dots, C_{r-1}, C_r = D)$  be a non-stutter gallery in  $X$ , then we can prove inductively that  $f$  and  $g$  agree on each  $C_i$ .  $\square$

**Cor. (20.6.2.3).** For any two apartments  $a, a'$  in a building  $X$  (20.6.2.1) containing a common chamber  $C$ , there exists a simplicial isomorphism  $f : a \cong a'$  fixing vertices of  $a \cap a'$ .

In fact, this is equivalent to the condition2 in the definition of buildings (20.6.2.1).  $\lrcorner$

*Proof:* For any simplex  $\sigma \subset a \cap a'$ , there is an isomorphism  $f_\sigma : a \rightarrow a'$  fixing vertices of  $C$  and  $D$  by the building axiom. But then by the uniqueness lemma these  $f_\sigma$  are all the same, thus inducing an isomorphism  $f : a \rightarrow a'$  fixing all vertices of  $a \cap a'$ .  $\square$

**Thm. (20.6.2.4) [Canonical Contractions].** Given an apartment  $\mathcal{A}$  in a building  $X$  (20.6.2.1) and a chamber  $C \subset a$ , there is a unique polysimplicial retraction  $\rho : X \rightarrow \mathcal{A}$  (4.13.4.1) sending non-stutter galleries starting at  $C$  to non-stutter galleries starting at  $C$ , called a **canonical contraction** from  $X$  to  $a$  centered at  $C$ . Moreover,

- This canonical contraction induces an isomorphism  $a' \rightarrow a$  for any apartment of  $X$  containing  $C$ .
- For any vertex  $x \in C$ , we have  $\rho^{-1}(x) = x$ .

$\lrcorner$

*Proof:* For any chamber  $D$  not contained in  $\mathcal{A}$ , let  $\mathcal{A}'$  be an apartment containing  $C, D$ , and let  $f : \mathcal{A}' \rightarrow \mathcal{A}$  be an isomorphism that fixes vertices of  $\mathcal{A}' \cap \mathcal{A}$  constructed in (20.6.2.3). Then  $\rho|_D$  doesn't depend on  $D$  chosen, by uniqueness lemma (20.6.2.2). It is clear that these maps for each  $D$  glue together to a contraction  $\rho : X \rightarrow \mathcal{A}$ .

For the last assertion, if  $\rho(y) = x$  is a vertex of  $C$ , let  $a'$  be an apartment containing  $y$  and  $C$ , then  $\rho$  is injective on  $\mathcal{A}'$ , thus we have  $y = x$ .  $\square$

**Cor. (20.6.2.5).** For two apartments  $C, D$  in a building  $X$  contained in a common apartment  $\mathcal{A}$ , a shortest gallery from  $C$  to  $D$  must be contained in  $\mathcal{A}$ .  $\lrcorner$

*Proof:* If  $C_0 = C, C_1, \dots, C_n = D$  is a shorted gallery from  $C$  to  $D$  that is not contained in  $a$ , then there exists  $j \in \mathbb{N}$  s.t.  $C_j \subset a$  but  $C_{j+1} \not\subset a$ . Let  $C'_{j+1}$  be the unique chamber in  $a$  different from  $C_{j+1}$  that  $C_{j+1} \cap C_j = C'_{j+1} \cap C_j$ , which exists because  $a$  is a thin chamber complex (20.6.2.1). Let  $\rho$  be the canonical retraction of  $X$  unto  $a$  with center  $C'_{j+1}$  (20.6.2.4), then  $\rho(C_{j+1}) = C_j$ , thus  $C_0 = C, \rho(C_1), \dots, \rho(C_{n-1}), C_n = D$  is a shorter path from  $C$  to  $D$ , contradiction.  $\square$

**Def. (20.6.2.6) [Foldings].** For a building  $X$ , a **folding** on an apartment  $a \in X$  is a simplicial map  $f : a \rightarrow a$  that is two-to-one and is a retraction onto its image. Two foldings  $f, f' : a \rightarrow a$  are called **opposite foldings** of each other if for any chamber  $C$  of  $X$  we have  $f^{-1}(f(C)) = f(C) \cup f'(C)$ .

The image of a folding is called a **half-apartment**.  $\lrcorner$

**Thm. (20.6.2.7) [Existence and Uniqueness of Foldings].** For a building  $X$  and two adjacent chambers  $C, D$  of  $X$  contained in a common apartment  $a$ , there exists mutually-opposite foldings (20.6.2.6)  $f, g : a \rightarrow a$  s.t.  $f(D) = C, g(C) = D$ .

Moreover, if we denote  $H = f(a), H' = g(a)$ , then  $f : H' \rightarrow H, g : H \rightarrow H'$  are isomorphisms,  $H \cup H' = a$ , and  $\dim(H \cap H') < \dim X$ . And we have

$$H = \bigcup_{E \text{ chambers of } a, \text{dist}(C,E) < \text{dist}(D,E)} E.$$

In particular,  $(f, g)$  are determined by  $(C, D)$ .  $\lrcorner$

*Proof:* Cf.[Buildings, Bruhat decompositions, unramified principal series, Garrett]P16.?

For the last assertion, for any chamber  $E \subset a$  s.t.  $f(E) = E$ , the image under  $f$  of any gallery  $(C_i)$  in  $a$  connecting  $D$  to  $E$  stutters: This is because there exists some  $i$  s.t.  $f(C_i) \neq C_i, f(C_{i+1}) = C_{i+1}$ , thus  $f(C_i) = f(C_{i+1}) = C_{i+1}$ . In particular,  $d(C, E) < d(D, E)$ . The converse inclusion follows from the same argument for  $g$ . Thus  $H$  is determined and  $f$  is identity on  $H$  and is an isomorphism on  $H'$ , thus  $f$  is determined by uniqueness lemma(20.6.2.2). Similarly  $g$  is determined.  $\square$

**Cor.(20.6.2.8)[Reflections].** Situation as in(20.6.2.7), there is a unique automorphic  $s : a \rightarrow a$  s.t.  $s$  fixes  $C \cap D$ ,  $s(C) = D$  and  $s(D) = C$ , called the **apartment reflection** along  $C \cap D$ . It follows that  $s^2 = \text{id}$ . In fact it is given by

$$s(x) = \begin{cases} f(x) & , x \in H' \\ g(x) & , x \in H \end{cases}.$$

┘

*Proof:*  $s$  is unique by the uniqueness lemma(20.6.2.2). The described function  $s$  satisfied the conditions because  $C \cap D \subset H \cap H'$ .  $\square$

### Metrics

**Prop.(20.6.2.9).** If  $X$  is an affine building and  $Y \subset X$  is bounded or has non-empty interior, then  $Y$  is contained in an apartment of  $X$  iff it is isometric to a subset of an apartment.  $\square$

*Proof:* [Buildings, Abramenko-Brown]Thm11.53.  $\square$

## 3 Groups Actioning on Buildings

**Def.(20.6.3.1)[Labeling of Chamber Complexes].** A **labeling of a chamber complex**  $X$  is a polysimplicial map  $\lambda : X \rightarrow \Delta^{\dim X}$ .  $\square$

**Def.(20.6.3.2)[Special Automorphisms].** A **special automorphism** of a chamber complex  $X$  is a polysimplicial isomorphism  $f : X \rightarrow X$  s.t. if  $f$  fixes a chamber, then it fixes all its vertices.  $\square$

**Def.(20.6.3.3)[Strongly-Transitive Group Actions].** If  $X$  is a building and  $G \in \text{Grp}$  acts on  $X$  by polysimplicial automorphisms, then the action is called a **strongly-transitive action on buildings** if given any two pairs  $(\mathcal{A}, C), (\mathcal{A}', C')$  where  $\mathcal{A}, \mathcal{A}' \subset X$  are apartments and  $C, C'$  are chambers in  $\mathcal{A}, \mathcal{A}'$  resp., there exists  $g \in G$  s.t.  $g(\mathcal{A}, C) = (\mathcal{A}', C')$ , and  $g$  fixes vertices of  $C \cap C'$ .  $\square$

**Prop.(20.6.3.4)[Labelings Exist for Buildings].** Any building  $X$  has a labeling(20.6.3.1).  $\square$

*Proof:* Let  $C \subset X$  be a chamber contained in an apartment  $a$ . Let  $r : X \rightarrow a$  be the canonical contraction(20.6.2.4). Let  $f_0, \dots, f_n$  be the foldings along the adjacent chambers  $D_i$  onto  $C$ (20.6.2.7), and let  $\varphi = f_0 \circ f_1 \dots f_n$ .

By(20.6.2.7), any chamber in  $a$  that is closer to  $D_i$  than to  $C$  is moved closer to  $C$  by  $f_i$ , and any chamber in  $a$  that is closer to  $C$  than to  $D$  is fixed by  $f$ . Thus we can define a labelings

$$\varphi^{\circ\infty} \circ r : X \rightarrow C.$$

$\square$

**Def. (20.6.3.5) [Parabolic Subgroups].** Let  $\lambda : X \rightarrow \Delta^{\dim X}$  be a building with a labeling, and let  $G$  be a group acting on  $X$  preserving labeling, s.t. the action is strongly transitive in the sense that it acts transitively on the pairs  $(C, a)$  where  $C$  is a chamber in an apartment  $a$ . Then a **parabolic subgroup** of  $G$  is a stabilizer of some simplex  $\sigma \subset X$ . A minimal parabolic subgroup (i.e. a stabilizer of a chamber) is called a **Iwahori subgroup** of  $G$ .

Iwahori subgroups of  $G$  are all conjugate by action of  $G$ .  $\lrcorner$

**Def. (20.6.3.6) [Weyl Groups].** Let  $\lambda : X \rightarrow \Delta^{\dim X}$  be a building with a labeling, and let  $G$  be a group acting on  $X$  preserving labeling. For an apartment  $a \in X$ , denote  $\mathcal{N}(a)$  the stabilizer of  $a$  in  $G$ ,  $A(a)$  the centralizer of vertices of  $a$  in  $G$ , and  $W(a) = \mathcal{N}(a)/A(a)$  the **Weyl group** of  $a$ .  $\lrcorner$

**Prop. (20.6.3.7) [Reflections Generate Weyl Groups].** Situation as in (20.6.3.6), for any chamber  $C \subset a$ , the set  $S$  of reflections along codimension-1 faces of  $C$  (20.6.2.8) generate  $W(a)$ .  $\lrcorner$

*Proof:* Cf. [Buildings, Bruhat decompositions, unramified principal series, Garrett]P15.  $\square$

**Def. (20.6.3.8) [Length Functions].** Situation as in (20.6.3.6), fix a chamber  $C$  contained in  $a$ , define the length of  $w \in W$  to be the distance from  $C$  to  $w(C)$  in  $a$ .  $\lrcorner$

**Prop. (20.6.3.9) [Lengths].** Situation as in (20.6.3.7), for any  $w \in W(a)$  and  $s \in S$ , we have

$$|\text{length}(ws) - \text{length}(w)| = |\text{length}(sw) - \text{length}(w)| = 1 \text{ (20.6.3.8)}.$$

$\lrcorner$

*Proof:* Cf. [Buildings, Bruhat decompositions, unramified principal series, Garrett]P20.  $\square$

### Tits System and $G$ -Buildings

**Thm. (20.6.3.10) [Tits-Buildings].** Let  $X = (G, B, N, S)$  be a Tits-system with  $\#S < \infty$ , and let  $\text{Par}(X)$  be the set of all maximal parabolic subgroups of the Tits-system (20.6.1.2), and let  $\mathcal{B}(X) \subset \mathcal{P}(\text{Par}(X))$  be the family of finite sets  $\{P_0, \dots, P_n\}$  of maximal parabolic subgroups s.t.  $\cap_i P_i$  is also a parabolic subgroup.  $G$  acts by conjugation on  $(\text{Par}(X), \mathcal{B}(X))$  on the left. Then

- $(\text{Par}(X), \mathcal{B}(X))$  is a simplicial complex (4.13.4.1).
- Let  $C \in \mathcal{B}(X)$  be the simplex corresponding to the set of all standard maximal parabolic subgroups (20.6.1.2), then it is a chamber of  $\mathcal{B}$ , called the **standard chamber** of  $\mathcal{B}$ .
- If  $g \in G$  fixes a simplex of  $\mathcal{B}$ , then it fixes all vertices of it. In particular,  $G$  acts by special automorphisms (20.6.3.2).
- Let  $\mathcal{A} \subset \mathcal{B}$  be the union of all  $N$ -conjugates of  $C$ , then  $\mathcal{B}$  is a building with set of apartments  $\{g \cdot \mathcal{A}\}_{g \in G}$ , called the **Tits-building** associated to  $X$ . The apartment  $\mathcal{A}$  is called the **standard apartment** of  $\mathcal{B}$ .
- If  $\sigma, \sigma'$  are faces of  $C$  and  $g \in G, n \in N$  s.t.  $\sigma \cup n\sigma' \subset g \cdot \mathcal{A}$ , then there exists  $g' \in G$  s.t.  $g \cdot a = g' \cdot a$  and  $g$  fixes vertices of  $\sigma \cup n\sigma'$ .
- (Parabolic Subgroups) For a simplex  $\sigma = \{P_0, \dots, P_n\} \in \mathcal{B}$ , denote  $P_\sigma = \cap_{i=0}^n P_i$ , then the map  $\sigma \mapsto P_\sigma$  induces a  $G$ -equivariant inclusion-reversing bijection from the set of simplexes of  $\mathcal{B}$  to the set of proper parabolic subgroups of  $G$  (20.6.1.2). In particular, the chambers corresponds to conjugates of  $B$ .
- $G$  acts strongly-transitively on  $\mathcal{B}(X)$  (20.6.3.3).

*Proof:* Cf.[Kaletha-Prasad]P56.?  
 $\mathcal{B}$  is clearly a simplicial complex.

┘

□

**Cor. (20.6.3.11) [Properties of Tits-Buildings].** Situation as in (20.6.3.10),

1.  $\mathcal{B}$  is spherical (20.6.2.1) iff it has finite Weyl group  $W$  (20.6.1.1).
2. Given any two apartments  $\mathcal{A}, \mathcal{A}'$  of  $\mathcal{B}$  containing a simplex  $\sigma \in \mathcal{B}$ , there exists  $g \in G$  s.t.  $g(\mathcal{A}) = \mathcal{A}'$  and fixes all vertices of  $\sigma$ . Equivalently,  $P_\sigma$  acts transitively on the set of apartments containing  $\sigma$ .
3. For any simplex  $\sigma \in \mathcal{B}$  and  $x$  in the interior of  $|\sigma|$ , we have  $P_x = P_\sigma$  (20.6.3.10), and the fixed point set of  $P_x$  is  $|\sigma|$ .
4. If  $\sigma, \tau$  are facets of the same chamber and  $g \in G$  s.t.  $g\sigma = \tau$ , then  $\sigma = \tau$  and  $g \in P_\sigma$ .
5. Two facets  $\sigma, \tau \in \mathcal{A}$  are conjugate under  $G$  iff they are conjugate under  $N$ .
6. If  $\mathcal{A} \subset \mathcal{B}$  is the standard apartment (20.6.3.10) and  $\sigma, \tau \in \mathcal{A}$  are simplexes, then  $G = P_\sigma N P_\tau$ .

┘

*Proof:* 1: ?

- 2: This follows from (20.6.3.10).
- 3: This follows from the bijection  $\sigma \mapsto P_\sigma$  (20.6.3.10) and the fact that any parabolic subgroup is self-normalizing (20.6.1.5).
- 4: This follows from the bijection  $\sigma \mapsto P_\sigma$  (20.6.3.10) and (20.6.1.2).
- 5: Choose a chamber  $C \subset \mathcal{A}$  containing  $\sigma$  and  $n \in N$  s.t.  $n^{-1}F \subset C$ , then by item 4 we get  $\sigma = n^{-1}\tau$ .
- 6: This follows easily from the Bruhat decomposition (20.6.1.4).

□

**Cor. (20.6.3.12) [Types of Simplexes].** Situation as in (20.6.3.10), via the bijection  $\sigma \mapsto P_\sigma$ , we can associate to each  $\sigma \in \mathcal{B}$  a **type** which is the type of  $P_\sigma$  (20.6.1.2).

┘

**Def. (20.6.3.13) [Restricted Tits-Buildings].** Situation as in (20.6.3.10), let  $S = S_1 \coprod \dots \coprod S_n$  with  $S_i$  irreducible and pairwise commuting, then we call  $X \subset S$  admissible if  $S_i \cap X \subsetneq S_i$  for each  $i$ . And we call a simplex  $\sigma \in \mathcal{B}$  admissible if the type of  $\sigma$  is an admissible subset of  $S$  (20.6.3.12). Then

- The subset  $\mathcal{B}' \subset \mathcal{B}$  consisting of admissible simplexes of  $\mathcal{B}$  form a (poly)building, with apartments given by intersection of apartments of  $\mathcal{B}$ .
- Every chamber of  $\mathcal{B}$  is admissible thus contained in  $\mathcal{B}'$ .
- $\mathcal{B}'$  is invariant under action of  $G$ , and the action is polysimplicial.
- The vertices of  $\mathcal{B}'$  are simplexes of  $\mathcal{B}$  of type  $X = X_1 \coprod \dots \coprod X_n$  where each  $X_i \subset S_i$  is a maximal properly-contained subset.
- The properties of  $\mathcal{B}$  (20.6.3.10) (20.6.3.11) all hold for  $\mathcal{B}'$ .

This  $\mathcal{B}'$  is called the **restricted Tits-building** of  $(G, B, N)$ .

┘

*Proof:* Cf.[Kaletha-Prasad]P62.

□

**Thm. (20.6.3.14) [BN-pair from a Building, Tits [Tit74]].** Let  $G$  be a group acting on a building  $\mathcal{B}$  (20.6.2.1) by special automorphisms (20.6.3.2) s.t. the action is strongly-transitive (20.6.3.3).

Choose a chamber  $C$  in an apartment  $\mathcal{A} \subset \mathcal{B}$ , and let  $B = \text{Stab}_G(C)$ ,  $N = \text{Stab}_G(\mathcal{A})$ , then  $(B, N)$  is a saturated Tits system in  $G$  (20.6.1.1).

┘

*Proof:* Cf.[Kaletha-Prasad]P54?.

□

**Cor. (20.6.3.15) [Contractuions are Induced by Group Actions].** Situation as in (20.6.3.14), if  $a \subset \mathcal{B}$  is an apartment and  $C \subset a$  is a chamber, let  $\rho : \mathcal{B} \rightarrow \mathcal{A}$  be the canonical contraction with center  $C$  (20.6.2.4), then for each apartment  $a'$  containing  $C$ , there exists a unique  $g \in G$  s.t.  $\rho(x) = gx$  for all  $x \in a'$ .  $\lrcorner$

*Proof:* By the hypothesis there exists a unique  $g \in G$  s.t.  $g$  fixes vertices of  $C$  and maps  $a'$  to  $a$ . The composition  $\rho \circ g^{-1}$  is a polysimplicial automorphism of  $a$  that fixes vertices of  $C$ , thus  $\rho \circ g^{-1}$  is trivial on  $a$  by uniqueness lemma (20.6.2.2). The uniqueness of  $g$  follows from the same argument.  $\square$

## 4 Bruhat-Tits Buildings

**Def. (20.6.4.1) [Maximal  $K$ -Split Tori].** For any maximal split torus  $S \leq G$ ,

- Let  $S' \leq S$  be the maximal split torus contained in  $[G, G]$ .
- Let  $V(S) = X_{\bullet}(S) \otimes \mathbb{R}, V(S') = X_{\bullet}(S') \otimes \mathbb{R}$ .
- $S' \rightarrow S \rightarrow S/A_G$  is an isogeny, so  $V(S') \rightarrow V(S) \rightarrow V(S/A_G)$  is an isomorphism, providing a canonical splitting  $V(S) = V(S') \oplus V(A_G)$ .?
- Let  $\Phi(G, S) \subset X^*(S)$  be the relative root datum of  $G$  w.r.t.  $S$  (10.4.4.14).
- Let  $W(G, S) = N_G(S)/Z_G(S)$  be the Weyl group of the relative root datum  $\Phi(G, S)$  (10.4.4.14).
- Let  $U_{\alpha}$  the unipotent root group w.r.t.  $S$ .

⌋

**Def. (20.6.4.2) [Spherical Buildings for Reductive Groups].** Let  $k \in \text{Field}, G \in \text{RedGrp}/k$  and  $P \leq G$  a minimal parabolic subgroup,  $S \leq P$  a maximal  $k$ -split torus, then the Tits-building (20.6.3.10) associated to the spherical Tits-system  $(P(k), N(k))$  (20.6.1.8) is called the **spherical building** of  $G/k$ . Its simplexes are in bijection with parabolic subgroups of  $G$  (20.6.4.13) by (20.6.3.10) and (10.4.1.6).  $\lrcorner$

**Prop. (20.6.4.3) [Tits-System for  $G(K)$ ].** Let  $S \leq G$  be a maximal  $K$ -split torus,  $N = N_G(S)(K)$ , and

$$H = \{x \in Z_G(S)(K) : \chi(x) \in \mathcal{O}_K^* \forall \chi \in X(Z_G(S))\}.$$

Then there exists an Iwahori subgroup  $B \subset G$  (20.6.4.13) s.t.  $B \cap N = H$  and  $(B, N)$  form a Tits system for  $G(K)$  (20.6.1.1).

Moreover, the Weyl group  $W$  for this Tits system is naturally an affine Weyl group of a root system?  $R_0$  of rank  $\dim S$ . In particular, there is a subset  $R \subset W$  consists of  $\dim S + 1$  elements  $r_1, \dots, r_{\dim S+1}$  s.t.  $W = \langle r_1, \dots, r_{\dim S+1} \rangle$ , and  $W_0 = \langle r_1, \dots, r_{\dim S} \rangle = N_G(S)/Z_G(S)$ .  $\lrcorner$

*Proof:* ?

□

**Cor. (20.6.4.4).** There are exactly  $\text{rank}_K G + 1$  many conjugacy classes of maximal parahoric proper subgroups of  $G$ .  $\lrcorner$

*Proof:* This follows from (20.6.6.20) (20.6.4.3) and (20.6.1.2).  $\square$

**Thm. (20.6.4.5) [Compactly-Generatedness, Behr [Beh67]].** For an arbitrary  $G \in \text{RedGrp}/K$ ,  $G(K)$  is compactly generated (12.10.3.29).  $\lrcorner$

*Proof:* Cf. [P-R94]P152. □

**Cor. (20.6.4.6).** For an arbitrary  $G \in \mathcal{R}\text{edGrp}/K$ , there are only f.m. conjugacy classes of maximal compact subgroups of  $G$ . ┘

*Proof:* This follows from (20.6.6.20)(20.6.4.3) and (20.6.1.2). □

**Thm. (20.6.4.7) [Cartan-Decompositions].** Situation as in (20.6.4.3), let  $\mathcal{K} = BW_0B$  be a maximal subgroup of  $G$ , then  $W = W_0 \ltimes T$ , where  $T$  is an Abelian group of rank  $\dim S$  generate by roots from  $R_0$ . Let  $T^+ \subset T$  be the set of positive roots. Let  $\nu : N \rightarrow W$  be the projection, then  $G(K) = \mathcal{K}\nu^{-1}(T^+)\mathcal{K}$ , and there is a bijection between  $T^+$  and  $[\mathcal{K} \backslash G(K) / \mathcal{K}]$  given by  $t \mapsto \mathcal{K}\nu^{-1}(t)\mathcal{K}$ . ┘

*Proof:* ? □

### Axiomatic Bruhat-Tits Buildings

**Axiom (20.6.4.8) [Bruhat-Tits Buildings].** The **Bruhat-Tits building**  $\mathcal{B}(G)$  is a building (20.6.2.1) s.t.

- $G(K)$  acts by polysimplicial automorphisms on  $\mathcal{B}(G)$  on the left.
- The set of apartments of  $\mathcal{B}(G)$  is  $G(K)$ -equivariantly bijective to the set of maximal split tori of  $G$ , and for a maximal split torus  $S \leq G$  corresponding to an apartment  $\mathcal{A}(S)$ , the stabilizer of  $\mathcal{A}(S)$  is  $N_G(S)(K)$ .

And a central isogeny  $G \rightarrow G' \in \mathcal{R}\text{edGrp}/K$  induces an equivariant isomorphism  $\mathcal{B}(G(K)) \cong \mathcal{B}(G'(K))$ . In particular, the buildings of  $G, G_{\text{ad}}, [G, G], G_{\text{sim.cntd}}$  are canonical identified, and the action of  $G(K)$  on  $\mathcal{B}(G)$  factors through  $G_{\text{ad}}(K)$ . ┘

*Proof:* This is Axiom4.1.1. of [Kaletha-Prasad]. If  $G$  is quasi-split, this follows from (20.6.4.28). In general it follows from Steinberg's theorem (10.5.2.3) and (20.6.5.7). □

**Axiom (20.6.4.9) [Functoriality].** Axiom (20.6.4.8) is satisfied, and  $\mathcal{B}(G)$  is functorial w.r.t. automorphisms of the field  $K$ . In particular, the  $G(K)$ -action on  $\mathcal{B}(G)$  extends to an action of  $\text{Aut}(K) \ltimes G(K)$ . ┘

*Proof:* This is proved in [K-P23]Prop7.9.5?. Basically it gives an intrinsic construction of the parabolic subgroups  $G(K)_{\Omega}^0$  (20.6.4.13). □

**Axiom (20.6.4.10) [Affine Structure on Apartments].** Axiom (20.6.4.8) holds, and for any maximal split torus  $S \leq G$ , notation as in (20.6.4.1), the apartment  $\mathcal{A}(S)$  corresponding to  $S$  satisfies

- $\mathcal{A}(S)$  is an affine  $V(S')$ -torsor.
- $N_G(S)(K)$  acts on  $\mathcal{A}(S)$  by affine automorphisms, whose derivative is induced by the Weyl group action on  $X_{\bullet}(S')$ . In particular,  $z \in Z_G(S)(K)$  acts on  $\mathcal{A}(S)$  by translation vector  $\nu(z) \in V(S')$ , where  $\nu(z)$  is the image of  $\omega_{Z_G(S)}(z)$  (20.5.2.2) under the projection  $V(S) \rightarrow V(S')$  (20.6.4.1).
- For any  $g \in G(K)$ , the isomorphism  $g : \mathcal{A}(S) \cong \mathcal{A}(gSg^{-1})$  is affine whose derivative  $dg : V(S) \rightarrow V(gS'g^{-1})$  is the natural isomorphism. ┘

*Proof:* ? This is Axiom4.1.4. of [Kaletha-Prasad].

If  $G$  is quasi-split, this follows from (20.6.4.28). □

**Cor. (20.6.4.11) [Uniqueness of  $\mathcal{A}(S)$ ].** For a maximal split torus  $S \leq G$ , notation as in (20.6.4.1), there is an exact sequence

$$1 \rightarrow Z_{[G,G]}(S')(K)/Z'(K)^1 \rightarrow N'(K)/Z'(K)^1 \rightarrow W(G, S) \rightarrow 1.$$

The valuation homomorphism  $\nu : Z(K) \rightarrow V(S')$  is  $W(G, S)$ -equivariant<sup>?</sup>, thus the pushout of the above sequence along  $\nu|_{Z_{[G,G]}(S')(K)}$  gives an exact sequence

$$1 \rightarrow V(S') \rightarrow \widetilde{W}_{\mathbb{R}} \rightarrow W \rightarrow 1. \quad (\star)$$

Then

- The set of splitting of the exact sequence $(\star)$  is an affine  $V(S')$ -torsor satisfying properties of axiom (20.6.4.10).
- If  $\mathcal{A}$  is an affine  $V(S')$ -torsor satisfying properties of  $\mathcal{A}(S)$  as in (20.6.4.10), then the following three affine  $V(S')$ -torsors are uniquely  $N_G(S)(K)$ -equivariantly isomorphic:
  - $\mathcal{A}$ .
  - The set of splittings of the the exact sequence $(\star)$ .
  - The set of maximal finite subgroups of the Lie group  $\widetilde{W}_{\mathbb{R}}$ .

In particular,  $\mathcal{A}(S)$  is uniquely determined by its properties listed in (20.6.4.10). ┘

*Proof:* Cf. [Kaletha-Prasad]P181.<sup>?</sup> □

**Axiom (20.6.4.12) [Stabilizers are Bounded].** The stabilizer  $G(K)_x^1 \triangleq \text{Stab}_{G(K)^1}(x)$  (20.5.1.2) for any  $x \in |\mathcal{B}(G)|$  is an open bounded (20.5.1.3) subgroup of  $G(K)$ . ┘

*Proof:* <sup>?</sup> This is Axiom 4.1.2 of [Kaletha-Prasad]. □

**Def. (20.6.4.13) [Parahoric Subgroups].** For any non-empty bounded (20.5.1.3) subcomplex of an apartment  $\mathcal{A} \subset \mathcal{B}(G)$  (20.6.4.28), let  $G(K)_{\Omega}^1$  denote the centralizer of  $\Omega$  in  $G(K)^1$ , and  $G(K)_{\Omega}^0$  the centralizer of  $\Omega$  in  $G(K)^0$ , which are open bounded subgroups of  $G(K)$  by (20.6.4.12) and (20.6.4.14).

For  $x \in |\mathcal{B}(G)|$ ,  $G(K)_x^0$  is called a **parahoric subgroups** of  $G(K)$  associated to  $x$ . Minimal parahoric subgroups (i.e. those associated to chambers) are called **Iwahori-subgroups** of  $G(K)$ . ┘

**Axiom (20.6.4.14) [Tits-Systems].** Axiom (20.6.4.8) holds, and for any maximal split torus  $S \leq G$  corresponding to an apartment  $\mathcal{A}(S) \subset \mathcal{B}(G)$  and  $C \subset \mathcal{A}(S)$  a chamber, then

$$(G(K)^0, G(K)_C^0, N_G(S)(K) \cap G(K)^0) \quad (20.6.4.13)$$

is a saturated Tits-system (20.6.1.1) with associated restricted Tits-building  $\mathcal{B}(G)$  (20.6.3.13).

In particular, the parahoric subgroups of  $G(K)$  (20.6.4.13) are exactly parabolic subgroups of this Tits-system (20.6.1.2), and for any simplex  $\sigma \in \mathcal{B}(G)$ ,  $G(K)_{\sigma}^0 = \text{Stab}_{G(K)^0}(\sigma)$ , and it follows from (20.6.3.11) (20.6.3.10) (20.6.3.13) that

- $G(K)^0$  acts by special automorphisms on  $\mathcal{B}(G)$  (20.6.3.2).
- $G(K)^0$  acts strongly-transitively on  $\mathcal{B}(G)$  (20.6.3.10).
- $N_G(S)(K)$  acts transitively on the set of chambers in  $\mathcal{A}(S)$ .
- For any maximal split torus  $S \leq G$ ,  $N_G(S)(K)$  acts transitively on the chambers of  $\mathcal{A}(S)$ .

- For any simplex  $\sigma \in \mathcal{B}$  and  $x$  in the interior of  $|\sigma|$ , we have  $P_x = P_\sigma$  (20.6.3.10), and the fixed point set of  $P_x$  is  $|\sigma|$ .

┘

*Proof:* ? This is Axiom 4.1.9. of [Kaletha-Prasad].

If  $G$  is quasi-split, this follows from (20.6.4.28). □

**Cor. (20.6.4.15).** If axiom (20.6.4.14) holds, then any  $G^0(K)$ -equivariant automorphism of  $|\mathcal{B}(G)|$  is identity. ┘

*Proof:* This follows immediately from the fact that the fixed point of  $P_x$  for a vertex  $x \in \mathcal{B}(G)$  is just  $x$ . □

**Axiom (20.6.4.16) [Affine Root Systems].** Axioms (20.6.4.8)(20.6.4.10) hold, and for any maximal torus  $S \leq G$ ,  $\alpha \in \Phi(G, S)$  and  $u \in U_\alpha(K) \setminus \{1\}$ , let  $u', u'' \in U_{-\alpha}(K) \setminus \{1\}$  and  $m(u) = u'uu'' \in N_G(S)(K)$  as in (10.4.4.22), then

- The action of  $m(u)$  on  $\mathcal{A}(S)$  fixes a hyperplane  $H_u$  that is an affine  $\ker(\alpha)$ -sub-torsor of  $\mathcal{A}(S)$ .
- Let  $\psi_\alpha^u \in \mathcal{A}(S)^*$  be the unique linear function with derivative  $\alpha$  and vanishes on  $H_u$ , then  $\Psi'(G, S) = \{\psi_\alpha^u | \alpha \in \Phi, u \in U_\alpha(K) \setminus \{1\}\}$  form an affine root system on  $\mathcal{A}(S)$  (3.9.8.2) with derived root system  $\Phi(G, S)$  (3.9.8.5).
- For  $\psi \in \mathcal{A}(S)^*$  with  $\dot{\psi} \in \Phi(G, S)$ , define  $\mathcal{U}_\psi = \{u \in U_\alpha(K) \setminus \{1\} | \psi_\alpha^u \geq \psi\}$  and  $\mathcal{U}_{\psi+} = \{u \in U_\alpha(K) \setminus \{1\} | \psi_\alpha^u > \psi\}$ . Then

$$\Psi(G, S) = \left\{ \psi \in \Psi'(G, S) \mid \mathcal{U}_\psi \subsetneq \mathcal{U}_{\psi+} \cdot U_{2\dot{\psi}}(K) \right\}$$

is an affine root system on  $\mathcal{A}(S)$ .

- $\Psi'(G, S) \subset \Psi(G, S) \cup \frac{1}{2}\Psi(G, S)$ .
- The image of the action map  $N_G(S)(K) \rightarrow \text{Aff}(\mathcal{A}(S))$  contains  $W(\Psi)$  (3.9.8.3), and is contained in  $W(\Psi(G, S))^{\text{ext}}$  (3.9.8.4). If  $G$  is simply-connected, then the image is just  $W(\Psi)$ , and if  $G$  is quasi-split and adjoint, the image is just  $W(\Psi(G, S))^{\text{ext}}$ .
- The polysimplicial structure on  $\mathcal{A}(S)$  induced by the affine root system  $\Psi(G, S)$  (3.9.8.11) is exactly the structure restricted from  $\mathcal{B}(G)$ .

┘

*Proof:* ? This is Axiom 4.1.6 of [Kaletha-Prasad]. □

**Axiom (20.6.4.17) [Action of  $\mathcal{U}_\psi$ ].** Axioms (20.6.4.8)(20.6.4.10)(20.6.4.16) hold, and for any maximal split torus  $S \leq G$  and any affine root  $\psi \in \Psi \subset \mathcal{A}^*$  (20.6.4.16),

- The action of  $\mathcal{U}_\psi$  on  $\mathcal{B}(G)$  fixes the half-apartment  $\mathcal{A}^{\psi \geq 0}$ .
- For any subcomplex  $\Omega \subset \mathcal{A}$ , the group  $G(K)_\Omega^0$  (20.6.4.13) is generated by  $Z_G(S)^0(K)$  and  $\mathcal{U}_\psi$  for all  $\psi \in \Psi$  with  $\psi(\Omega) \subset \mathbb{R}_{\geq 0}$ .
- For  $a \in \Phi$ ,  $U_a(K) \cap G(K)_\Omega^0 = \mathcal{U}_\psi$ , where  $\psi \in \Psi'$  is the smallest element with  $\dot{\psi} = a$  and  $\psi(\Omega) \subset \mathbb{R}_{\geq 0}$ .

┘

*Proof:* ? This is Axiom 4.1.8. of [Kaletha-Prasad]. □

**Cor. (20.6.4.18) [Uniqueness of  $\mathcal{B}(G)$ ].** Let  $\mathcal{B}, \mathcal{B}'$  be buildings satisfying Axioms (20.6.4.8) (20.6.4.10) (20.6.4.14) (20.6.4.16) (20.6.4.17), then there is a unique bijection  $F : \mathcal{B} \cong \mathcal{B}'$  that restricts to the canonical  $N_G(S)(k)$ -equivariant bijection  $f : \mathcal{A}(S) \cong \mathcal{A}'(S)$  for all maximal split torus  $S \leq G$  (20.6.4.11).  $\square$

*Proof:* Choose a maximal split torus  $S \leq G$ . Firstly we show that for any simplex  $\sigma \in \mathcal{A}(S)$ , the stabilizer of  $\sigma$  and  $f(\sigma)$  are equal.  $\color{red}?$  Cf. [Kaletha-Prasad]P184.

Now define  $F : \mathcal{B} \rightarrow \mathcal{B}'$  as follows: for any  $g \in G(K)$ ,  $F|_{g\mathcal{A}(S)} = g.f|_{\mathcal{A}(S)}$ . This map is well-defined by the claim we just proved, and it is surjective because  $G(K)$  acts transitively by (20.6.4.14). It is bijective because for  $g_i \in G(K)$  and simplexes  $\sigma_i \in \mathcal{A}(S)$ ,  $g_1\sigma_1 = g_2\sigma_2$  iff  $g_1.f(\sigma_1) = g_2.f(\sigma_2)$ : Write  $\sigma_2 = n\sigma_1$  for some  $n \in N_G(S)(K)$  (20.6.4.14), this assertion follows from what we just proved.

The uniqueness of the bijection is clear, because any automorphism of  $\mathcal{B}'$  that is  $G(k)$ -equivariant and fixes vertices of  $\mathcal{A}(S)$  automatically fixes  $\mathcal{B}'$  because  $G(K)$  acts transitively by (20.6.4.14).  $\square$

**Axiom (20.6.4.19) [Bruhat-Tits Group Schemes].** Axiom (20.6.4.8) holds, and for any non-empty bounded (20.5.1.3) subcomplex  $\Omega$  of an apartment  $\mathcal{A}(S)$  of  $\mathcal{B}(G)$ ,

- There exists  $\mathcal{G}_\Omega^1 \in \text{GrpSch}^{\text{sm,aff}}/\mathcal{O}_K$  s.t.  $(\mathcal{G}_\Omega^1)_K \cong G$  and  $\mathcal{G}_\Omega^1(\mathcal{O}_K) = G(K)_\Omega^1$  (20.6.4.13).
- Let  $\mathcal{G}_\Omega^0$  be the relative identity component of  $\mathcal{G}_\Omega^1$  (which is affine (20.3.2.3)), then  $\mathcal{G}_\Omega^0(\mathcal{O}_K) = G(K)_\Omega^0$  (20.6.4.13).
- If  $\mathcal{G}$  is semisimple and simply-connected, then  $\mathcal{G}_\Omega^1 = \mathcal{G}_\Omega^0$ .
- There is a closed  $\mathcal{O}_K$ -split torus  $\mathcal{S} \leq \mathcal{G}_\Omega^0$  with generic fiber  $S$ , whose special fiber is a maximal split torus of  $\overline{\mathcal{G}}_\Omega^0$ .

For  $x \in |\mathcal{B}(G)|$ ,  $\mathcal{G}_x^0 \in \text{GrpSch}/\mathcal{O}_K$  is called the **Bruhat-Tits parahoric subgroup** of  $G$  associated to  $x$ . Sometimes  $\mathcal{G}_x^0(\mathcal{O}_K)$  is also called the Bruhat-Tits parahoric subgroup of  $G$  associated to  $x$ .  $\square$

*Proof:*  $\color{red}?$  This is Axiom 4.1.20 of [Kaletha-Prasad].  $\square$

**Axiom (20.6.4.20) [Reductive Quotients of Special Fibers].** Axioms (20.6.4.8) (20.6.4.19) hold, and for any bounded sub-complexes  $\Omega \subset \Omega' \subset \mathcal{B}(G)$ , there is a unique homomorphism  $\rho_{\Omega, \Omega'} : \mathcal{G}_{\Omega'}^1 \rightarrow \mathcal{G}_\Omega^1 \in \text{GrpSch}/\mathcal{O}_K$  that induces identity on generic fiber, and on  $\mathcal{O}$ -points induces the natural inclusion  $G(K)_\Omega^1 \subset G(K)_{\Omega'}^1$ . Then we have:

- The kernel of the special fiber  $\overline{\rho}_{\Omega, \Omega'} : \overline{\mathcal{G}}_{\Omega'}^0 \rightarrow \overline{\mathcal{G}}_\Omega^0$  is a smooth connected unipotent subgroup of  $\overline{\mathcal{G}}_{\Omega'}^0$ .

And if  $\Omega = \sigma, \Omega' = \sigma'$  are simplexes of  $\mathcal{B}(G)$ , and let  $S \leq G$  is a maximal split torus s.t.  $\sigma' \subset \mathcal{A}(S)$  and  $\mathcal{S} \leq \mathcal{G}_\sigma^0$  the  $\mathcal{O}_K$ -split torus as in (20.6.4.19), then

1. The image  $p_\sigma(\sigma') = \overline{\rho}_{\sigma, \sigma'}(\overline{\mathcal{G}}_{\sigma'}^0)$  is a parabolic subgroup of  $\overline{\mathcal{G}}_\sigma^0$ , and the inverse image of  $p_\sigma(\sigma')(\kappa)$  under the the reduction map  $\mathcal{G}_\sigma^0(\mathcal{O}_K) \rightarrow \overline{\mathcal{G}}_\sigma^0(\kappa)$  is  $\mathcal{G}_{\sigma'}^0(\mathcal{O}_K)$ .
2. The special fiber  $\overline{\mathcal{S}}$  is a maximal split torus of  $\overline{\mathcal{G}}_{\sigma'}^0$  as well as  $\overline{\mathcal{G}}_\sigma^0$ , and its image in the reductive quotient  $\mathbf{G}_\sigma = \overline{\mathcal{G}}_\sigma^0/R_u(\overline{\mathcal{G}}_\sigma^0)$  is a maximal split torus  $\mathbf{S}$ .
3. Denote the image of  $p_\sigma(\sigma')$  in  $\mathbf{G}_\sigma$  by  $\mathbf{p}_\sigma(\sigma')$ . Then if  $x$  is in the interior of  $\sigma$  and  $v \in V(S)$  s.t.  $x + v$  is in the interior of  $\sigma'$ , then  $\Phi(\mathbf{p}_\sigma(\sigma'), \mathbf{S}) = \{\alpha \in \Phi(\mathbf{G}_\sigma, \mathbf{S}) : \langle v, \alpha \rangle \geq 0\}$ .
4. The map  $\sigma' \rightarrow \mathbf{p}_\sigma(\sigma')$  is an inclusion-reversing map from the poset of all simplexes properly containing  $\sigma$  to the poset of parabolic subgroups of  $\mathbf{G}_\sigma$ . In particular, the  $\kappa$ -rank of  $\mathbf{G}_\sigma$  equals the codimension of  $\sigma$  in  $X$ .

5. The root datum of  $G_\sigma$  w.r.t.  $S$  is given by  $(X^\bullet(S), \Phi_\sigma(G, S), X_\bullet(S), \Phi_\sigma^\vee)$ , where  $\Phi_\sigma(G, S) \subset \Phi(G, S) \subset X^\bullet(S)$  is the sliced root system(3.9.8.22). In particular, If  $C \subset \mathcal{B}(G)$  is a chamber containing  $\sigma$  and  $\Delta$  is the set of simples affine roots determined by  $C$ (3.9.8.14), then  $\Delta_\sigma = d(\Delta \cap \Psi_\sigma)$  is a basis of  $\Phi_\sigma$ , and the Dynkin diagram of  $G_\sigma$  is obtained by removing from the affine Dynkin diagram of  $\Psi$ (3.9.8.26) all vertices of  $\sigma$ , by(3.9.8.28).
6. Let  $G(K)_\sigma^{0+}$  be the inverse image of  $R_u(\bar{\mathcal{G}}_\sigma^0)(\kappa)$  under the the reduction map  $\mathcal{G}_\sigma^0(\mathcal{O}_K) \rightarrow \bar{\mathcal{G}}_\sigma^0(\kappa)$ , then  $G(K)_\sigma^{0+} \leq G(K)_{\sigma'}^{0+}$ .

┘

*Proof:* ? This is Axiom4.1.22 of [Kaletha-Prasad].

### Constructing Apartments

**Def. (20.6.4.21) [Valuation of Root Data].** If  $G$  is semisimple, for a maximal split torus  $S \leq G$ , a **valuation of root datum** of  $(G, S)$  is a collection  $\varphi = (\varphi_\alpha)_{\alpha \in \Phi(G, S)}$  of morphisms  $\varphi_\alpha : U_\alpha(K) \rightarrow \mathbb{R} \cup \{\infty\}$  s.t.

- For each  $\alpha \in \Phi(G, S)$ ,  $\#\text{Im}(\varphi_\alpha) \geq 3$ .
- For each  $\alpha \in \Phi(G, S)$  and  $r \in \mathbb{R}$ ,  $U_{\alpha, \varphi, r} = \varphi_\alpha^{-1}([r, \infty])$  is a subgroup of  $U_\alpha(K)$ , and  $U_{\alpha, \varphi, \infty} = \mathbf{1}$ .
- For each  $n \in N_G(S)(K)$  realizing  $s_\alpha$ , the function  $u \mapsto \varphi_\alpha(u) - \varphi_{-\alpha}(nun^{-1})$  is constant on  $U_\alpha(K) \setminus \{1\}$ .
- For  $\alpha, \beta \in \Phi(G, S)$  and  $r, s \in \mathbb{R}$  s.t.  $\beta \notin \mathbb{R}_{-}\alpha$ , the commutator subgroup  $[U_{\alpha, \varphi, r}, U_{\beta, \varphi, s}]$  is contained in the group generated by  $U_{p\alpha+q\beta, pr+qs}$  for all  $p, q \in \mathbb{Z}_+$  s.t.  $p\alpha + q\beta \in \Phi(G, S)$ .
- If  $\alpha, 2\alpha \in \Phi(G, S)$ , then  $\varphi_{2\alpha} = 2\varphi_\alpha|_{U_{2\alpha}(K)}$ .

If  $G$  is quasi-split, for a maximal split torus  $S \leq G$ , a **valuation of root datum** of  $(G, S)$  is defined to be a valuation of root datum of  $([G, G], S')$ .

Moreover, A valuation  $\varphi$  of root datum of  $(G, S)$  is said to be

- compatible with  $\text{ord}_K$  if for each  $\alpha \in \Phi(G, S)$  and  $z \in Z_G(S)(K)$ ,  $\varphi_\alpha(z^{-1}uz) = \varphi_\alpha(u) + \alpha(\nu(z))$ (20.6.4.10). In particular,  $\varphi_\alpha(s^{-1}us) = \varphi_\alpha(u) - \text{ord}_K(a(s))$  for  $s \in S(K)$ .
- compatible with topology on  $K$  if for each  $\alpha \in \Phi(G, S)$ , the subgroups  $\{U_{\alpha, \varphi, r}\}_{r \in \mathbb{R}}$  are bounded open subgroups of  $U_\alpha(K)$ , and form a nbhd base of  $\mathbf{1} \in U_\alpha(K)$ .

┘

**Def. (20.6.4.22) [Equipollence of Valuations of Root Data].** for a maximal split torus  $S \leq G$ ,  $V(S')$  acts on the set of valuations of root datum of  $(G, S)$ , by

$$(v.\varphi)_\alpha(u) = \varphi_\alpha(u) + \alpha(v), \text{ where } \alpha \in \Phi(G, S), u \in U_\alpha(K).$$

Cf. [K-P23]P200?.

Two valuations of root data  $\varphi, \varphi'$  are called **equipollent** if there exists  $v \in V(S')$  s.t.  $\varphi' = v.\varphi$ .

┘

**Def. (20.6.4.23) [Chevalley-Valuations].** Cf. [K-P23]6.1.20.?

┘

**Def. (20.6.4.24) [Apartments].** If  $G$  is semisimple, for a maximal split torus  $S \leq G$ , define the apartment  $\mathcal{A}(S)$  to be the affine  $V(S)$ -torsor whose elements are valuations of the root datum  $\Phi(G, S)$  that are equipollent to a Chevalley-valuation(20.6.4.23).

If  $G$  is quasi-split, for a maximal split torus  $S \leq G$ , define  $\mathcal{A}(S) = \mathcal{A}(S')$ .

┘

**Def. (20.6.4.25) [Apartments  $A(G(K), S)$ ].** Let  $\nu : S(K) \rightarrow X_*(S)_{\mathbb{R}}$  be the homomorphism defined by the following relation:

$$\langle \nu(z), \chi \rangle = -\text{ord}_K(\chi(z)), \text{ where } z \in Z_G(S)(K), \chi \in X^*(Z_G(S)).$$

Let  $\Lambda = \nu(Z_G(S)(K))$  which is a lattice in  $X_*(S)_{\mathbb{R}}$ , then  $\text{Hom}(X^*(S), \Gamma_K) \subset \Lambda \subset \text{Hom}(X^*(Z_G(S)), \Gamma_K)$  (20.7.0.1), and when  $G$  is unramified, then the first inclusion is an equality?, and if  $G$  is split both inclusions are equalities.  $\lrcorner$

**Def. (20.6.4.26) [Apartments  $A(G(K), S)$ ].** We can associate

- An affine space  $A(G(K), S)$ , which is a  $X_*(S)_{\mathbb{R}}$ -torsor on which  $N(K)$  acts on the right.
- A system  $\Phi_{\text{aff}}(G(K), S)$  of affine functions  $\alpha(x) = A(\alpha)X + v(\alpha)$  on  $A(G(K), S)$ .
- A map  $\alpha \mapsto X_\alpha$  mapping  $\alpha \in \Phi_{\text{aff}}(G(K), S)$  to a subgroup  $X_\alpha \leq G(K)$

s.t.

- $s^{-1}X_\alpha s = X_{\alpha^s}$  for any  $\alpha \in \Phi_{\text{aff}}(G(K), S)$  and  $s \in N(K)$ .
- For  $\alpha \in \Phi_{\text{aff}}(G(K), S)$ , the vector part  $v(\alpha)$  are elements of  $\Phi(G, S)$  (20.6.4.1).
- For  $a \in \Phi$ , the groups  $\{X_\alpha : v(\alpha) = a\}$  form a filtration of  $U_a(K)$ .

$\lrcorner$

**Def. (20.6.4.27) [Dynkin-Diagrams]. ?**

Since the chambers are permuted simply transitively by  $W$ , the isomorphism class of the Dynkin diagram doesn't depend on the choice of the chamber  $C$ .  $\lrcorner$

*Proof:* Cf. [Tit79]P36. ?  $\square$

### Constructing Buildings

**Def. (20.6.4.28) [Iwahori-Tits Systems and Bruhat-Tits Buildings].** The Tits-system  $(\mathcal{G}, \mathcal{I}, n, R)$  is called the **Iwahori-Tits system** of  $G$ . And define  $\mathcal{B}(G)$  to be the restricted Tits-building associated to this system (20.6.3.13).

In particular, axioms (20.6.4.8) (20.6.4.10) (20.6.4.14) hold for  $\mathcal{B}(G)$ .  $\lrcorner$

*Proof:* Cf. [K-P23]Chap7.5, 7.6. ?  $\square$

**Prop. (20.6.4.29) [Base Change].** If  $G$  is quasi-split, then for any finite field extension  $K'/K \in \text{Field}$ , there is a natural embedding  $|\mathcal{B}(G_K)| \hookrightarrow |\mathcal{B}(G_{K'})|$ .

We will see in (20.7.1.1) that the same holds when  $G$  is not quasi-split.  $\lrcorner$

*Proof:* Cf. [K-P23]P275. ?  $\square$

**Remark (20.6.4.30).** Notice that this map may not be polysimplicial.  $\lrcorner$

**Prop. (20.6.4.31) [Pass to Completions, Guy Rousseau].** If  $K \in \text{DVR}$  is a Henselian and  $G \in \text{RedGrp}/K$  is quasi-split, then the natural map  $|\mathcal{B}(G_K)| \rightarrow |\mathcal{B}(G_{\widehat{K}})|$  (20.6.4.29) is isomorphism of chamber complexes.  $\lrcorner$

*Proof:* Cf. [K-P23]P277.  $\square$

**Remark (20.6.4.32).** Notice however  $\mathcal{B}(G_{\widehat{K}})$  may have more apartments than  $\mathcal{B}(G)$  because  $G_{\widehat{K}}$  may have more maximal split tori than that of  $G$ .  $\lrcorner$

### Constructing Bruhat-Tits Group Schemes

**Notation (20.6.4.33).**

- In this subsection, notice that  $G_{K^{\text{SH}}}$  is quasi-split by Steinberg's theorem (10.5.2.3), so  $\mathcal{B}(G_{K^{\text{SH}}})$  (20.6.4.8) exists. ┘

**Thm. (20.6.4.34) [Bruhat-Tits Group Schemes].**

- For any non-empty bounded (20.5.1.3) subcomplex  $\Omega$  of an apartment  $\mathcal{A}$  of  $\mathcal{B}(G_{K^{\text{SH}}})$ , there exists  $\mathcal{G}_\Omega^1 \in \text{GrpSch}^{\text{sm}, \text{aff}}/\mathcal{O}_{K^{\text{SH}}}$  s.t.  $(\mathcal{G}_\Omega^1)_{K^{\text{SH}}} \cong G$  and  $\mathcal{G}_\Omega^1(\mathcal{O}_{K^{\text{SH}}}) = G(K^{\text{SH}})_\Omega^1$  (20.6.4.13).
- For any non-empty bounded (20.5.1.3) subset  $\Omega$  of an apartment  $\mathcal{A}$  of  $\mathcal{B}(G_{K^{\text{SH}}})$ , the groups  $G(K^{\text{SH}})_\Omega^1$  and  $G(K^{\text{SH}})_\Omega^\dagger$  are schematic and their smooth affine integral models share the same relative identity component group scheme. (20.6.4.13). ┘

*Proof:* Cf. [K-P23]P295, 296. ? □

**Prop. (20.6.4.35) [Pass to Completions].** For a bounded subset  $\Omega \subset |\mathcal{B}(G_{K^{\text{SH}}})|$  and its image  $\widehat{\Omega} \subset |\mathcal{B}(G_{\widehat{K}})|$ , the base change from  $\mathcal{O}_{K^{\text{SH}}}$  to  $\mathcal{O}_{\widehat{K}}$  of the Bruhat-Tits group schemes  $\mathcal{G}_\Omega^1, G_\Omega^0, G_\Omega^\dagger$  are the corresponding Bruhat-Tits group schemes exactly the Bruhat-Tits group schemes  $\mathcal{G}_{\widehat{\Omega}}^1, G_{\widehat{\Omega}}^0, G_{\widehat{\Omega}}^\dagger$ . ┘

*Proof:* Cf. [K-P23]P321 ? □

## 5 Unramified Descent

**Prop. (20.6.5.1) [Maximal  $K^{\text{SH}}$ -Split Tori].** Let  $\widetilde{Z}_G^0$  be the maximal split central torus of  $G_{K^{\text{SH}}}$ , then it is defined over  $K$  by Galois descent as  $\text{Gal}_{K^{\text{SH}}}$  is normal in  $\text{Gal}_K$ .

Then  $T' \mapsto T' \widetilde{Z}_G^0$  is a bijection between the set of maximal  $K^{\text{SH}}$ -split tori of  $[G, G]$  to the set of maximal  $K^{\text{SH}}$ -split tori of  $G$ . ┘

*Proof:* ? □

**Def. (20.6.5.2) [Special Tori].** A **special torus** is a torus  $T \leq G$  s.t.  $T$  contains a maximal split torus of  $G$  and  $T_{K^{\text{SH}}}$  is a maximal split torus of  $G_{K^{\text{SH}}}$ . Then

- Any maximal split torus  $S \leq G$  is contained in a special torus of  $G$ .
- $T' \mapsto T' \widetilde{Z}_G^0$  (20.6.5.1) is a bijection between the set of special tori of  $[G, G]$  to the set of special tori of  $G$ . ┘

*Proof:* Cf. [?K\_P23]Prop9.3.4. ? □

**Prop. (20.6.5.3) [Galois Actions].** As  $G_{K^{\text{SH}}}$  is quasi-split by Steinberg's theorem (10.5.2.3),  $\mathcal{B}' = \mathcal{B}(G_{K^{\text{SH}}})$  is defined by (20.6.4.8), and  $\text{Gal}(K^{\text{SH}}/K)$  acts on  $\mathcal{B}' = \mathcal{B}(G_{K^{\text{SH}}})$  by polysimplicial maps by (20.6.4.9). Then

1. If  $\mathcal{A} \subset \mathcal{B}'$  is an apartment and  $\gamma \in \text{Gal}(K^{\text{SH}}/K)$ , then  $\gamma(\mathcal{A})$  is also an apartment, and  $\gamma : \mathcal{A} \rightarrow \gamma(\mathcal{A})$  is an affine map.
2. If  $T \leq G_{K^{\text{SH}}}$  is a maximal torus and  $T$  is defined and splits over a subfield  $K' \subset K^{\text{SH}}$  containing  $K$ , then  $\mathcal{A}(T)$  is fixed by  $\text{Gal}(K^{\text{SH}}/K')$ . (? Cf. [K-P23]P325.)

3. For any  $x \in |\mathcal{B}(G)|$ ,  $\text{Gal}(K^{\text{sh}}/K).x$  is finite. (this follows easily from the last one). In particular,  $|\mathcal{B}^{\text{Gal}(K^{\text{sh}}/K)}| \neq \emptyset$  by Bruhat-Tits fixed-point theorem (20.6.6.12).

An apartment of  $\mathcal{B}'$  corresponding to a special torus of  $G$  (20.6.5.2) is called a **special apartment**.

⌋

*Proof:* ?

□

**Prop. (20.6.5.4) [Fixed Points  $|\mathcal{B}^{\text{Gal}(K^{\text{sh}}/K)}|$  and Special Apartments].** Situation as in (20.6.5.3), denote  $|\mathcal{B}| = |\mathcal{B}(G_{K^{\text{sh}}})|^{\text{Gal}(K^{\text{sh}}/K)}$ . Then

1.  $|\mathcal{B}|$  is a non-empty closed, convex subset of  $|\mathcal{B}(G_{K^{\text{sh}}})|$ , equipped with the restricted metric of that of  $|\mathcal{B}(G_{K^{\text{sh}}})|$  (20.6.6.5).
2. Every special apartment of  $\mathcal{B}(G_{K^{\text{sh}}})$  (20.6.5.3) contains a  $\text{Gal}(K^{\text{sh}}/K)$ -stable simplex of maximal dimension (among all  $\text{Gal}(K^{\text{sh}}/K)$ -stable simplexes).
3. Any two simplexes of  $\mathcal{B}(G_{K^{\text{sh}}})$  is contained in a common special apartment.

⌋

*Proof:* 1: This follows from the fact  $\text{Gal}(K^{\text{sh}}/K)$ -action preserves metric and  $|\mathcal{B}(G_{K^{\text{sh}}})|$  is a unique-geodesic space. It is non-empty by (20.6.5.3).

2: Cf. [K-P23] Prop 9.3.6. ?

3: Cf. [K-P23] Prop 9.3.8. ?

□

**Prop. (20.6.5.5) [Polysimplicial Structure on  $|\mathcal{B}|$ ].** Situation as in (20.6.5.4),  $|\mathcal{B}|$  may not be the underlying space of a subcomplex of  $\mathcal{B}(G_{K^{\text{sh}}})$ . But:

1. If  $\sigma \neq \sigma'$  are  $\text{Gal}(K^{\text{sh}}/K)$ -stable simplexes of  $\mathcal{B}(G_{K^{\text{sh}}})$ , then  $|\sigma| \cap |\mathcal{B}| \neq |\sigma'| \cap |\mathcal{B}|$ .
2. There is a polysimplicial structure on  $|\mathcal{B}|$  s.t. its simplexes are exactly intersections of  $\text{Gal}(K^{\text{sh}}/K)$ -stable simplexes of  $\mathcal{B}(G_{K^{\text{sh}}})$  with  $|\mathcal{B}|$ . And if  $G$  is simple, then this is a simplicial structure. This polysimplicial structure is denoted by  $\mathcal{B}$ .
3.  $\mathcal{B}$  is a chamber complex (4.13.4.2).
4.  $G(K)$  acts by polysimplicial automorphisms on  $\mathcal{B}$ , and is continuous w.r.t. the metric (20.6.5.4).

⌋

*Proof:* Cf. [K-P23] P 9.3.10. ?

2: By (20.6.4.8), we may replace  $G$  with  $G_{\text{ad}}$ , and then a decomposition of  $G_{\text{ad}}$  into a product of simple groups (10.4.5.20) induces a product decomposition of  $\mathcal{B}(G_{K^{\text{sh}}})$  and  $|\mathcal{B}|$ , so it suffices to prove for  $G$  simple.

If  $\sigma$  is a  $\text{Gal}(K^{\text{sh}}/K)$ -stable simplexes of  $\mathcal{B}(G_{K^{\text{sh}}})$ , we prove that  $\sigma \cap \mathcal{B}$  is a single point: Let  $\mathcal{A}$  be a special apartment containing  $\sigma$  (20.6.5.4), then  $\text{Gal}(K^{\text{sh}}/K)$  stabilizes  $\mathcal{A}$  and acts on it by affine automorphism (20.6.5.3). The barycenter of  $\sigma$  is clearly fixed by  $\text{Gal}(K^{\text{sh}}/K)$ , and if  $x, y \in \sigma$  are two points fixed by  $\text{Gal}(K^{\text{sh}}/K)$ , then the whole line through  $x, y$  are fixed, thus meeting the boundary of  $\sigma$ , contradiction.

Also notice that any two  $\text{Gal}(K^{\text{sh}}/K)$ -stable simplexes of minimal dimension doesn't intersect. So for any  $\text{Gal}(K^{\text{sh}}/K)$ -stable simplex of  $\mathcal{B}(G_{K^{\text{sh}}})$ , its vertices are disjoint union of minimal  $\text{Gal}(K^{\text{sh}}/K)$ -stable simplexes. By (10.4.5.20),  $G_{K^{\text{sh}}}$  is a product of copies of simple  $K^{\text{sh}}$ -groups permuted transitively by  $\text{Gal}(K^{\text{sh}}/K)$ , so any  $\text{Gal}(K^{\text{sh}}/K)$ -stable simplex of  $\mathcal{B}(G_{K^{\text{sh}}})$  is a product of copies of a single simplex permuted by  $\text{Gal}(K^{\text{sh}}/K)$ , so to consider the intersection with  $\mathcal{B}$  we are reduced to the case that  $G_{K^{\text{sh}}}$  is simple. In this case, it is easy to see that for any  $\text{Gal}(K^{\text{sh}}/K)$ -stable simplex  $\sigma$  of  $\mathcal{B}(G_{K^{\text{sh}}})$  and any set  $S$  of minimal  $\text{Gal}(K^{\text{sh}}/K)$ -stable simplexes of  $\sigma$ , the facet

of  $\sigma$  whose vertices are union of simplexes in  $S$ , is also a  $\text{Gal}(K^{\text{sh}}/K)$ -stable simplex because  $|\mathcal{B}|$  is convex. Thus we get a simplicial structure on  $|\mathcal{B}|$ .

3: Because any two simplexes of  $\mathcal{B}$  are contained in an apartment and  $|\mathcal{B}|$  is a convex subset (20.6.5.4), we see by Euclidean geometry that the interiors of simplexes of  $\mathcal{B}(G_{K^{\text{sh}}})$  intersecting  $\mathcal{B}$  are all of the same dimension, and are connected by a gallery.

4: This is easy, because  $G(K)$  preserves  $\text{Gal}(K^{\text{sh}}/K)$ -stable simplexes of  $\mathcal{B}(G_{K^{\text{sh}}})$ .  $\square$

**Prop. (20.6.5.6) [Apartments].** Situation as in (20.6.5.5), for any maximal split torus  $S \leq G$ , denote  $\mathcal{B}(G_{K^{\text{sh}}})_S$  the set of  $|\mathcal{B}(G_{K^{\text{sh}}})|$  fixed by  $S(K)^1$ , which is a non-empty closed convex subset because  $S(K)^1$  is bounded (20.5.2.5)(20.6.6.19). And  $\mathcal{B}(G_{K^{\text{sh}}})_S$  is  $\text{Gal}(K^{\text{sh}}/K)$ -stable, so the fixed point  $\mathcal{A}(S) = \mathcal{B}(G_{K^{\text{sh}}})_S^{\text{Gal}(K^{\text{sh}}/K)}$  is a non-empty closed convex subset by (20.6.5.3). Then:

1. For any maximal split torus  $S \leq G$  and two points  $x, y \in \mathcal{A}(S)$ , there exists a special torus  $T \leq G$  (20.6.5.2) containing  $S$  s.t.  $x, y \in \mathcal{A}(T_{K^{\text{sh}}})$ .
2.  $\mathcal{B}(G_{K^{\text{sh}}})_S$  is the union of apartments of  $\mathcal{B}(G_{K^{\text{sh}}})$  corresponding to maximal split torus  $T \leq G_{K^{\text{sh}}}$  containing  $S_{K^{\text{sh}}}$ .
3. For any maximal split torus  $S \leq G$  contained in a special torus  $T \leq G$ , we have  $\mathcal{A}(S) = \mathcal{A}(T_{K^{\text{sh}}})^{\text{Gal}(K^{\text{sh}}/K)}$ , and the action of  $N_G(S)(K)$  and  $V(S')$  on  $\mathcal{A}(T_{K^{\text{sh}}})$  preserves  $\mathcal{A}(S)$ , making it an affine  $V(S')$ -torsor satisfying axiom (20.6.4.10).
4. For a maximal split torus  $S \leq G$ ,  $Z_G(S)(K)^1$  consists of all elements of  $N_G(S)(K) \cap G(K)^1$  that acts trivially on  $\mathcal{A}(S)$ .
5. The map  $S \mapsto \mathcal{A}(S)$  is a  $G(K)$ -equivariant bijection the set of maximal split torus of  $G$  and the set of special tori of  $G$  (20.6.5.2), and the set of special apartments of  $\mathcal{B}$  (20.6.5.3). In particular, the stablizer of  $\mathcal{A}(S)$  in  $G(K)$  is  $N_G(S)(K)$ .

## 6 Metrics and More Properties

**Notation (20.6.6.1).**

- Suppose that  $G$  satisfies all axioms in [Axiomatic Bruhat-Tits Buildings](#).

┘

**Def. (20.6.6.2) [Canonical Metrics].** By choosing a maximal split torus  $S \leq G$  and a  $W(G, S)$ -invariant metric on  $V(S')$  (20.6.4.1), we get a metric on  $V(S'_1)$  for each maximal split torus  $S_1 \leq G$ , s.t. conjugation by  $G(K)$  induces isometries between them. Such a choice is called a **canonical metric** on each  $V(S')$ .

┘

**Prop. (20.6.6.3).** Given a canonical metric on  $V(S')$  for each maximal split torus  $S \leq G$  (20.6.6.2), there exists a unique function  $\text{dist} : |\mathcal{B}(G)| \times |\mathcal{B}(G)| \rightarrow \mathbb{R}_{\geq 0}$  whose restriction on the apartment  $\mathcal{A}(S)$  for each maximal split torus  $S \leq G$  coincides with the metric induced by the  $V(S')$ -torsor structure (20.6.4.10). Moreover,  $\text{dist}$  is preserved by the action of  $G(K)$ .

┘

*Proof:* For any  $x, y \in |\mathcal{B}(G)|$ , there exists an apartment  $\mathcal{A}$  containing both  $x$  and  $y$  (20.6.2.1), so we can define the distance  $\text{dist}(x, y)$  as the distance in this apartment. This definition is independent of the apartment chosen, because for any other apartment  $\mathcal{A}'$  containing  $x$  and  $y$ , there exists  $g \in G(K)$  s.t.  $g\mathcal{A}' = \mathcal{A}$  and  $g$  preserves  $x$  and  $y$ , by (20.6.4.14), and this action preserves the canonical metric by (20.6.6.2). □

**Cor. (20.6.6.4) [Metric and Contractions].** For a chamber  $C$  contained in an apartment  $\mathcal{A} \subset \mathcal{B}(G)$ , let  $\rho : \mathcal{B}(G) \rightarrow \mathcal{A}$  be the canonical contraction centered at  $C$  (20.6.2.4), then

- The restriction of  $\rho$  to any apartment containing  $C$  is an isometry.
- If  $x, y \in |\mathcal{B}(G)|$  and either  $x \in C$  or  $x, y$  are contained in a common chamber, then  $\text{dist}(\rho(x), \rho(y)) = \text{dist}(x, y)$ .
- For any  $x, y \in |\mathcal{B}(G)|$ , we have  $\text{dist}(\rho(x), \rho(y)) \leq \text{dist}(x, y)$ .

┘

*Proof:* 1: This follows from the fact that the restriction of  $\rho$  on each apartment coincides with the action of some  $g \in G(K)$  by (20.6.3.15)(20.6.4.14), so it is an isometry by the constriction of  $\text{dist}$  (20.6.6.3).

2: This follows from item1 because in this case  $x, y$  is contained in an apartment containing  $C$ .

3: Let  $\mathcal{A}'$  be an apartment containing  $x, y$ , then the line segment  $[x, y]$  is divided into segments by the chambers contained in  $\mathcal{A}'$ . But  $\rho$  is an isometry on each segment by item2, so the assertion follows.  $\square$

**Cor. (20.6.6.5) [Metric and Line Segments].**  $\text{dist}$  (20.6.6.3) is a metric on  $|\mathcal{B}(G)|$ , and for any  $x, y \in |\mathcal{B}(G)|$ , the set

$$D_{x,y} = \{z \in |\mathcal{B}(G)| : \text{dist}(x, y) = \text{dist}(x, z) + \text{dist}(z, y)\}$$

lies in every apartment  $\mathcal{A}$  containing both  $x$  and  $y$ , and equals the line segment  $[x, y]$  there.  $\square$

*Proof:* To prove  $\text{dist}$  is a metric, it suffices to show that for any  $x, y, z \in |\mathcal{B}(G)|$ , we have  $\text{dist}(x, y) \leq \text{dist}(x, z) + \text{dist}(z, y)$ . For this, choose an apartment  $\mathcal{A} \subset \mathcal{B}(G)$  containing both  $x, y$ , and a chamber  $C \subset \mathcal{A}$ . Let  $\rho : \mathcal{B}(G) \rightarrow \mathcal{A}$  be the canonical contraction centered at  $C$  (20.6.2.4), then by (20.6.6.4), we have

$$\text{dist}(x, y) = \text{dist}(\rho(x), \rho(y)) \leq \text{dist}(\rho(x), \rho(z)) + \text{dist}(\rho(z), \rho(y)) \leq \text{dist}(x, z) + \text{dist}(z, y).$$

For the second assertion, for any apartment  $\mathcal{A}$  containing  $x, y$  and  $z \in D_{x,y}$ , take  $t$  in the line segment  $[x, y] \subset \mathcal{A}$  s.t.  $\text{dist}(x, t) = \text{dist}(x, z)$ ,  $\text{dist}(y, t) = \text{dist}(y, z)$ , and take an apartment  $C \subset \mathcal{A}$  containing  $t$ . Let  $\rho : \mathcal{B}(G) \rightarrow \mathcal{A}$  be the canonical contraction centered at  $C$ , then it follows from the contraction property (20.6.6.4) that  $\rho(z) = t$ . But then it follows from (20.6.2.4) that  $z = t$ .  $\square$

**Remark (20.6.6.6).** WARNING: The topology on  $|\mathcal{B}(G)|$  given by the metric may be weaker than the topology given by the CM-complex structure when  $\# \kappa = \infty$ .  $\square$

**Prop. (20.6.6.7).** The action  $G(K) \times |\mathcal{B}(G)| \rightarrow |\mathcal{B}(G)|$  is continuous w.r.t. the topology given by the metric (20.6.6.5)  $\square$

*Proof:* For any  $g, g' \in G(K)$  and  $x, x' \in \mathcal{B}(G)$ ,

$$\text{dist}(gx, g'x') \leq \text{dist}(gx, gx') + \text{dist}(gx', g'x') = \text{dist}(x, x') + \text{dist}(x', g^{-1}g'x'),$$

Now because  $G(K)_x^1$  is open (20.6.4.12), we see that this action is continuous.  $\square$

**Prop. (20.6.6.8) [ $|\mathcal{B}(G)|$  is Negatively-Curved].**  $|\mathcal{B}(G)|$  is a non-positively-curved metric space (4.4.8.13). In particular it is uniquely-geodesic (4.4.8.10).  $\square$

*Proof:* Cf. [K-P23]P170?.

Firstly  $|\mathcal{B}(G)|$  is uniquely-geodesic by (20.6.6.5) and the fact Euclidean spaces are uniquely-geodesic.

To show it is non-positively-curved, for any  $x, y \in |\mathcal{B}(G)|$ , let  $\mathcal{A}$  be an apartment containing  $x, y$ , and let  $m$  be the midpoint of  $[x, y]$ , then  $m \in |\mathcal{A}|$  (20.6.6.5). Choose an apartment  $C \subset \mathcal{A}$  containing  $m$ , and  $\rho : \mathcal{B}(G) \rightarrow \mathcal{A}$  the canonical contraction centered at  $C$  (20.6.2.4), then  $\text{dist}(m, z) = \text{dist}(m, \rho(z))$  for any  $z \in |\mathcal{B}(G)|$  by (20.6.6.4). Now it follows from Euclidean geometry that

$$\text{dist}(x, z)^2 + \text{dist}(y, z)^2 \geq 2\text{dist}(m, z)^2 + \frac{1}{2}\text{dist}(x, y)^2.$$

□

**Prop. (20.6.6.9) [ $|\mathcal{B}(G)|$  is Contractible, Solomon-Tits].** The map

$$\mathbb{I} \times |\mathcal{B}(G)| \times |\mathcal{B}(G)| \rightarrow |\mathcal{B}(G)| : (t, x, y) \mapsto tx + (1 - t)y$$

is continuous. In particular,  $|\mathcal{B}(G)|$  is a contractible topological space. ┘

*Proof:* The assertion will follow from the following claim: If  $x, y, z, z' \in |\mathcal{B}(G)|$  s.t.  $z \in [x, y]$  (20.6.6.5) and there exists  $\varepsilon \in \mathbb{R}_+$  s.t.

$$\text{dist}(x, z') \leq \text{dist}(x, z) + \varepsilon \text{dist}(x, y), \quad \text{dist}(y, z') \leq \text{dist}(y, z) + \varepsilon \text{dist}(x, y),$$

then we have

$$\text{dist}(z, z')^2 \leq 4\varepsilon \text{dist}(x, z) \text{dist}(y, z) + \varepsilon^2 \text{dist}(x, y)^2.$$

To prove this, choose an apartment  $\mathcal{A}$  containing  $x, y$  and a chamber  $C \subset \mathcal{A}$  containing  $z$ , then  $[x, y] \in \mathcal{A}$  by (20.6.6.5). Let  $\rho : \mathcal{B}(G) \rightarrow \mathcal{A}$  is canonical contraction centered at  $C$  (20.6.2.4), and let  $z'' = \rho(z')$ , then by (20.6.6.4) we have  $\text{dist}(z, z') = \text{dist}(z, z'')$ , and the same inequalities hold for  $z'$  replaced by  $z''$ . Thus we are reduced to Euclidean geometry, which is easy. □

**Thm. (20.6.6.10) [ $|\mathcal{B}(G)|$  is Complete].**  $|\mathcal{B}(G)|$  is a complete metric space. And any subcomplex is closed in  $|\mathcal{B}(G)|$ . ┘

*Proof:* We first prove that

**Lemma (20.6.6.11).** For any  $x \in |\mathcal{B}(G)|$ , there exists an open ball  $D = \mathbb{D}(x, \delta)$  for some  $\delta \in \mathbb{R}_+$  s.t.

- Every simplex intersecting  $D$  contains  $x$ .
- If  $g \in G(K)^0$  satisfies  $g.x \in D$ , then  $g$  fixes  $x$ .

┘

*Proof:* Let  $C$  be a chamber containing  $x$  and  $\mathcal{A}(S)$  be an apartment containing  $C$  corresponding to a maximal split torus  $S \leq G$ . By (20.6.4.16) and (3.9.8.2) and the fact that  $\#\Phi(G, S) < \infty$ , we can find a metric ball  $D(x, \delta)$  of  $x$  that only meets simplexes of  $\mathcal{A}(S)$  containing  $x$ .

Now if  $\sigma$  is a simplex of  $\mathcal{B}(G)$  that meets  $D$ , and  $\mathcal{A}'$  an apartment containing  $C$  and  $\sigma$ , then there exists  $g \in G(K)^0$  s.t.  $g\mathcal{A}' = \mathcal{A}$  and  $g$  fixes vertices of  $C$ , by (20.6.3.11). Thus  $g$  stabilizes  $D$ , and  $g\sigma$  intersects with  $D$ , which implies that  $x \in g\sigma$ , thus  $x \in \sigma$ .

And if  $g \in G(K)^0$  s.t.  $gx \in D$ , then the smallest simplex  $\sigma$  containing  $gx$  intersects with  $D$ , thus contains  $x$ . So  $g\sigma = \sigma$ , and then  $g$  fixes vertices of  $\sigma$  because  $G(K)^0$  acts by special automorphisms (20.6.4.14). So  $g$  fixes  $x$ . □

To prove the original assertion, it suffices to prove that any subcomplex  $M$  of  $\mathcal{B}(G)$  is complete. Let  $C$  be a chamber of  $\mathcal{B}(G)$ . For any Cauchy-sequence  $(x_n)_{n \in \mathbb{Z}_+}$  in  $M$ , let  $g_n \in G(K)^0$  s.t.  $y_n = g_n^{-1} \cdot x_n \in C$ . Passing to a subsequence, we may assume that  $y_n$  converges to some  $y \in C$ . Let  $D_y$  be the open ball satisfying (20.6.6.11). Because

$$\text{dist}(g_m y, g_n y) \leq \text{dist}(g_m y, g_m y_m) + \text{dist}(g_m y_m, g_n y_n) + \text{dist}(g_n y_n, g_n y) = \text{dist}(y, y_m) + \text{dist}(x_m, x_n) + \text{dist}(y, y_n),$$

we have  $g_m^{-1} g_n y \in D_y$  for  $m, n$  large, hence  $g_m y = g_n y$  for  $m, n$  large. Define this to be  $x$ , then clearly  $(x_n)$  converges to  $x$ . To show that  $x \in |M|$ , we can take an open ball  $D_x$  of  $x$  satisfying (20.6.6.11), then  $x_n \in D_x$  for  $n$  large, which means the simplex containing  $x_n$  contains  $x$ .  $\square$

**Cor. (20.6.6.12) [Bruhat-Tits Fixed-Point Lemma].**

- Any non-empty closed bounded (4.4.8.5) and convex (4.4.8.15) subset  $M \subset |\mathcal{B}(G)|$  has a unique barycenter (4.4.8.15).
- If  $M \subset X$  is a non-empty bounded subset and  $H \in \mathcal{G}rp$  acts on  $|\mathcal{B}(G)|$  by isometries and preserves  $M$ , then  $H$  has a fixed point in  $X$ .
- If  $H \in \mathcal{G}rp$  is a bounded group of isometric actions (4.4.8.8) on  $|\mathcal{B}(G)|$ , then  $H$  has a fixed point.  $\lrcorner$

*Proof:* This follows from (20.6.6.10) (20.6.6.8) and (4.4.8.31).  $\square$

**Prop. (20.6.6.13) [No Tubular Neighborhoods].** Let  $\mathcal{A}_1, \mathcal{A}_2$  be two apartments of  $\mathcal{B}(G)$  and there exists  $r \in \mathbb{R}_+$  s.t. for any  $x \in |\mathcal{A}_1|$  there exists  $x_2 \in |\mathcal{A}_2|$  s.t.  $\text{dist}(x_1, x_2) \leq r$ , then  $\mathcal{A}_1 = \mathcal{A}_2$ .  $\lrcorner$

*Proof:* Let  $\text{pr}_i : \mathcal{B}(G) \rightarrow \mathcal{A}_i$  be the closest-point map (4.4.8.34), then  $f = \text{pr}_2 \circ \pi_2 : \mathcal{A}_1 \rightarrow \mathcal{A}_1$  satisfies  $\text{dist}(x, f(x)) \leq 2r$ .

Choose an isomorphism of metric spaces  $\mathcal{A}_1 \cong \mathbb{R}^n$ , and for each  $y \in \mathbb{R}^n$ , define  $f_y : \mathbb{R}^n \rightarrow \mathbb{R}^n : f_y(x) = f(y - x) - (y - x)$ , then  $f_y$  maps  $\overline{\mathbb{D}}(0, 2r)$  into itself. Thus by Brouwer's fixed point theorem (4.14.4.2),  $f_y$  has a fixed point, which means  $f$  is surjective.

But this implies that  $\mathcal{A}_2$  contains  $\mathcal{A}_1$ , otherwise the closest-point map cannot map into the interiors of the chambers of  $\mathcal{A}_1$ . The same argument for  $\mathcal{A}_2$  implies that  $\mathcal{A}_1 = \mathcal{A}_2$ .  $\square$

**Prop. (20.6.6.14).** For any  $x \in |\mathcal{B}(G)|$ , the convex hull of  $G(K) \cdot x$  (4.4.8.17) equals  $|\mathcal{B}(G)|$ .  $\lrcorner$

*Proof:* Let  $S \leq G$  be a maximal split torus s.t.  $x \in |\mathcal{A}(S)|$ , and let  $C \subset \mathcal{A}(S)$  be a chamber containing  $x$ , then  $N_G(S)(K)$  acts transitively on the chambers of  $\mathcal{A}(S)$  (20.6.4.14). So it is clear that the convex hull of  $G(K) \cdot x$  contains  $\mathcal{A}(S)$ . But  $G(K)$  acts transitively on the set of apartments, so the assertion follows.  $\square$

**Prop. (20.6.6.15).** Let  $\mathcal{A}_1, \mathcal{A}_2$  be two apartments of  $\mathcal{B}(G)$ . There exists  $g \in G(K)^0$  s.t.  $g\mathcal{A}_1 = \mathcal{A}_2$  and fixes points of  $\mathcal{A}_1 \cap \mathcal{A}_2$ .  $\lrcorner$

*Proof:* Notice that  $\mathcal{A}_1 \cap \mathcal{A}_2$  is a closed convex subcomplex of  $\mathcal{B}(G)$ . If  $\sigma \subset \mathcal{A}_1 \cap \mathcal{A}_2$  is a simplex of maximal dimension, then by (20.6.3.11), there exists  $g \in G(K)^0$  s.t.  $g\mathcal{A}_1 = \mathcal{A}_2$  and  $g$  fixes vertices of  $\sigma$ .

But then this  $g$  in fact fixes every point of  $\mathcal{A}_1 \cap \mathcal{A}_2$ : If  $\sigma$  is a vertex, then  $\mathcal{A}_1 \cap \mathcal{A}_2$  is a vertex and there is nothing to prove, and if  $\dim \sigma > 0$ , we can take  $x_0$  in the interior of  $\sigma$ , then for any  $y \in \mathcal{A}_1 \cap \mathcal{A}_2$ , the geodesic segment  $[x_0, y]$  is fixed  $g$ .  $\square$

**Cor. (20.6.6.16).** For any maximal split torus  $S \leq G$  and  $g \in G(K)$ , there exists  $n \in N_G(S)(K)$  s.t.  $g \cdot x = n \cdot x$  for all  $x \in \mathcal{A}(S) \cap g^{-1} \mathcal{A}(S)$ .  $\lrcorner$

*Proof:* By (20.6.6.15) we can take  $h \in G(K)$  s.t.  $h.\mathcal{A}(S) = g^{-1}\mathcal{A}(S)$  and  $h$  fixes all vertices of  $\mathcal{A}(S) \cap g^{-1}\mathcal{A}(S)$ . Then  $n = gh$  stabilizes  $\mathcal{A}(S)$  thus belongs to  $N_G(S)(K)$  by (20.6.4.8).  $\square$

**Cor. (20.6.6.17).** If  $S_1, S_2 \leq G$  are maximal split tori,  $x \in \mathcal{A}(S_1) \cap \mathcal{A}(S_2)$  and  $C \leq S_1$  is a subtorus s.t.  $C(K).x \subset \mathcal{A}(S_2)$ , then  $C \leq S_2$ .  $\lrcorner$

*Proof:* Cf. [K-P23] Prop 4.2.26.  $\square$

**Prop. (20.6.6.18) [Bounded Subsets and Bounded Actions].** For a subset  $X \subset G(K)^1$ , the following are equivalent:

- $X$  is a bounded subset of  $G(K)$  (20.5.1.3).
- For some (hence any) pair  $(C, \mathcal{A})$  where  $\mathcal{A} \subset \mathcal{B}$  is an apartment and  $C \subset \mathcal{A}$  is a chamber, corresponding to Iwahori subgroup  $\mathcal{I}$  and maximal split torus  $S$  correspondingly (20.6.4.8) (20.6.4.13), there exists f.m.  $n_i \in N_G(S)(K)$  s.t.  $X \subset \cup_i \mathcal{I} n_i \mathcal{I}$ .
- $X$  is a bounded set of isometric actions of  $|\mathcal{B}(G)|$  (4.4.8.8).  $\lrcorner$

*Proof:* 1  $\iff$  2:  $\mathcal{I}$  is bounded by (20.6.4.12), so  $X$  is bounded iff  $\mathcal{I}X\mathcal{I}$  is bounded, which is equivalent to  $X \subset \mathcal{I}Y\mathcal{I}$  for some bounded subset  $Y \leq N(K)$ , by (20.7.1.4). Now because  $Z_G(S)$  has finite index in  $N_G(S)$ ,  $Z_G(S)(K)^1$  is bounded in  $Z_G(S)(K)$ , and  $\mathcal{I}$  contains  $Z_G(S)^0$ , which has finite index in  $Z_G(S)^1$ , we see that item1 and item2 are equivalent.

2  $\iff$  3: For any  $x \in |C|$ ,  $n_i \in N_G(S)(K)$  and  $g \in \mathcal{I} n_i \mathcal{I}$ , we have  $\text{dist}(gx_0, x_0) = \text{dist}(n_i x_0, x_0)$ , so  $\mathcal{I} n_i \mathcal{I} x_0$  is a bounded subset. So if  $X \subset \cup_i \mathcal{I} n_i \mathcal{I}$  for f.m.  $n_i \in N_G(S)(K)$ , we then  $X.x_0$  is bounded for any  $x_0 \in C$ . Conversely, if there are infinitely many  $n_i \in N_G(S)(K)$  s.t.  $\mathcal{I} n_i \mathcal{I} \cap G(K) \neq \emptyset$ , then  $G(K).x_0$  intersect infinitely many chambers  $n_i.C \subset \mathcal{A}$ , thus it is unbounded. This proves that 2  $\iff$  3, by (4.4.8.8).  $\square$

**Cor. (20.6.6.19) [Bounded Subgroups Has Fixed Points].** Any bounded subgroup  $\mathcal{G} \leq G(K)$  has a fixed point on  $|\mathcal{B}(G)|$ , and if  $\mathcal{G}$  preserves a non-empty closed convex subset, then it has a fixed point in that subset.  $\lrcorner$

*Proof:* This follows from (20.6.6.18) and (20.6.6.12).  $\square$

**Prop. (20.6.6.20) [Maximal Bounded Subgroups and Parahorics].**

- If  $x \in \mathcal{B}(G)$  is a vertex, then  $G(K)_x^1$  is a maximal bounded subgroup of  $G(K)$ .
- Any maximal bounded subgroup of  $G(K)$  is of the form  $G(K)_x^1$  for some  $x \in |\mathcal{B}(G)|$ . And if  $G(K)^0 = G(K)^1$ , then this  $x$  is a vertex.
- Maximal parahoric subgroups of  $G(K)$  (20.6.4.13) are exactly maximal bounded subgroups of  $G(K)^0$ .  $\lrcorner$

*Proof:* 1: If  $x \in |\mathcal{B}(G)|$  is a vertex, then  $G(K)_x^1$  is maximal because if  $\mathcal{K}$  is bounded and contains  $G(K)_x^1$ , then  $\mathcal{K}$  fixes some point  $y \in |\mathcal{B}(G)|$  by (20.6.6.19). But  $G(K)_x^0$  fixes only  $x$  by (20.6.4.14) (20.6.3.11), so  $y = x$  and  $\mathcal{K} = G(K)_x^1$ .

2: For any  $y \in |\mathcal{B}(G)|$ ,  $G(K)_y^1$  is open bounded by (20.6.4.12). If  $\mathcal{K} \leq G(K)$  is a bounded subgroup, then it fixes a point  $y \in |\mathcal{B}(G)|$  by (20.6.6.19). Thus  $\mathcal{K} = G(K)_y^1$  if  $\mathcal{K}$  is maximal. And if  $G(K)^0 = G(K)^1$ , then  $G(K)^1$  acts by special automorphisms on  $\mathcal{B}(G)$ , so  $G(K)^1$  fixes a vertex  $x$ , and then  $\mathcal{K} = G(K)_x^1$  by maximality.

3: The proof is verbatim as the proof of item1 and item2.  $\square$

**Remark (20.6.6.21).** When  $G(K)^0 \neq G(K)^1$ , there can exist maximal bounded subgroups of  $G(K)_x^1$  s.t.  $x$  is not a vertex of  $\mathcal{B}(G)$ . For example, when  $G = \mathrm{PGL}(2)$ , the **standard(extended) Iwahori-subgroup**, which is generated by the inverse image of the standard Borel subgroup of  $\mathrm{PGL}(2; \kappa)$  and  $\begin{bmatrix} & 1 \\ \varpi_K & \end{bmatrix}$ , stabilizes the midpoint of the standard chamber.  $\lrcorner$

**Prop. (20.6.6.22).** Suppose the Tits-system  $(G(K)^0, G(K)_C^0, N_G(S)(K) \cap G(K)^0)$  (20.6.4.14) is irreducible (20.6.1.10). If  $\mathcal{P} \neq \mathcal{P}'$  are two maximal parahoric subgroups of  $G(K)^0$ , then  $\mathcal{P} \cap \mathcal{P}'$  is a parahoric subgroup iff it is a maximal properly-contained subgroup of  $\mathcal{P}$ .  $\lrcorner$

*Proof:* If  $\mathcal{P} \cap \mathcal{P}'$  is a parahoric subgroup, then by (20.6.1.2) we can conjugate it into a subgroup containing  $\mathcal{G} = G(K)_C^0$  (i.e. a standard parahoric subgroup (20.6.1.2)). Since the Tits-system is irreducible, there exists  $r \neq r' \in S = N_G(S)(K) \cap G(K)^0$  s.t.  $\mathcal{P} = \mathcal{G}_{S \setminus \{r\}}, \mathcal{P}' = \mathcal{G}_{S \setminus \{r'\}}$ . Then  $\mathcal{P} \cap \mathcal{P}' = \mathcal{G}_{S \setminus \{r\}}, \mathcal{P}' = \mathcal{G}_{S \setminus \{r, r'\}}$  is a maximal properly-contained subgroup of  $\mathcal{P}$ .

Conversely, suppose  $\mathcal{P} \cap \mathcal{P}'$  is a maximal properly-contained subgroup of  $\mathcal{P}$ , and let  $x, x'$  be vertices of  $\mathcal{B}(G)$  fixed by  $\mathcal{P}, \mathcal{P}'$  resp. (20.6.4.13). Then  $\mathcal{P} \cap \mathcal{P}'$  fixes the simplex  $\sigma = [x, x']$ , and the parahoric subgroup corresponding to  $\sigma$ , then it contains  $\mathcal{P} \cap \mathcal{P}'$ , thus equals  $\mathcal{P} \cap \mathcal{P}'$  by maximality. So  $\mathcal{P} \cap \mathcal{P}'$  is parahoric.  $\square$

### 1 Properties of Bruhat-Tits Buildings

**Prop. (20.7.1.1) [Finite Base Change].** If  $L/K \subset K^{\text{sep}}/K \in \text{Field}$  is a finite extension, the natural base change map  $\mathcal{B}(G_{K^{\text{SH}}}) \hookrightarrow \mathcal{B}(G_{L^{\text{SH}}})$  (20.6.4.29) induced a natural injection  $\mathcal{B}(G) \hookrightarrow \mathcal{B}(G_L)$ , because  $\text{Gal}(L^{\text{SH}}/L) \subset \text{Gal}(K^{\text{SH}}/K)$ . ┘

*Proof:* This is because the injection  $\mathcal{B}(G_{K^{\text{SH}}}) \hookrightarrow \mathcal{B}(G_{L^{\text{SH}}})$  is compatible with Galois action. ┐

**Prop. (20.7.1.2).**  $\mathcal{B}(G)$  (20.6.4.28) is locally-finite if  $\#\kappa < \infty$ . ┘

*Proof:* For each simplex  $\sigma \in \mathcal{B}(G)$  contained in a chamber  $C$ , the chambers containing  $\sigma$  are in bijection with  $G(K)_C^0/G(K)_\sigma^0$ , by (20.6.3.10)(20.6.3.11). Because  $\#\kappa < \infty$ , both  $\mathcal{P}_C$  and  $\mathcal{P}_\sigma$  are open compact (20.6.4.12), so this set is finite. ┐

**Prop. (20.7.1.3) [Parahoric Subgroups and pro- $p$ -Subgroups, Matsumoto].** When  $K \in p\text{-LField}$ , a Iwahori subgroup of  $G(K)$  (20.6.4.13) is a normalizer of a Sylow pro- $p$ -subgroup of  $G(K)$ . By (20.5.2.9), such a group is uniquely up to conjugacy. And a parahoric subgroup is a subgroup  $P \leq G(K)$  that is a finite union of double cosets of an Iwahori subgroup. ┘

*Proof:* Cf. [Kaletha-Prasad]P476 ? . ┐

### Iwahori-Decompositions

**Prop. (20.7.1.4) [Bruhat-Decompositions].** Assume axiom (20.6.4.14) holds. If  $C$  is a chamber in an apartment  $\mathcal{A} \subset \mathcal{B}(G)$ , and let  $\mathcal{I} \leq G(K)$  be the corresponding Iwahori subgroup (20.6.4.13) and  $S \leq G$  the maximal split torus (20.6.4.8), then

$$G(K) = \mathcal{I}.N_G(S)(k).\mathcal{I}.$$

┘

*Proof:* It follows from (20.6.4.14) and Bruhat-decomposition (20.6.1.4) that  $G(K)^0 = \mathcal{I}(N_G(S)(k) \cap G(K)^0) \mathcal{I}$ . Then the assertion follows from the fact that  $G(K) = Z_G(S)(K)G(K)^0$  (Cf. [KP23] 2.6.22).  $\square$

**Axiom (20.7.1.5) [Iwahori Decompositions].** Axiom (20.6.4.8)(20.6.4.10)(20.6.4.16) hold, and if  $S \leq G$  be a maximal split torus and  $C \subset \mathcal{A}(S)$  is a chamber with corresponding Iwahori subgroup  $\mathcal{I} = G(K)_C^0$  (20.6.4.13), then for any positive system of roots  $\Phi^+ \subset \Phi(G, S)$ ,

- The product map

$$(U^+(K) \cap \mathcal{I}) \times Z_G(S)(K)^0 \times (U^-(K) \cap \mathcal{I}) \rightarrow \mathcal{I}$$

is a bijection, where  $U^+$  (resp.  $U^-$ ) is the unipotent radical of the minimal parabolic subgroup containing  $S$  corresponding to  $\Phi^+$  ( $\Phi^-$ ) (10.4.4.18),

- The product map

$$\prod_{\alpha \in \Phi^{\pm, \text{short}}} u_{\psi_\alpha} \rightarrow U^\pm(K) \cap \mathcal{I} \quad (20.6.4.16)$$

is a bijection, where the product is taken in any order, and  $\psi_\alpha \in \Psi$  is the smallest affine functional on  $\mathcal{A}(S)$  with derivative  $\alpha$  that is non-negative on  $C$ .  $\lrcorner$

*Proof:*  $\color{red}{?}$  This is Axiom 4.1.16 of [Kaletha-Prasad].  $\square$

### Enlarged Buildings

**Def. (20.7.1.6) [Enlarged Bruhat-Tits Buildings].** The **enlarged Bruhat-Tits building**  $\tilde{\mathcal{B}}(G)$  is defined to be  $\mathcal{B}(G) \times V(A_G)$  (20.6.4.8) (where  $V(A_G) = X_*(A_G) \otimes \mathbb{R}$ ). And for a maximal split torus  $S \leq G$ , the **enlarged apartment** associated to  $S$  is defined to be  $\tilde{\mathcal{A}}(S) = \mathcal{A}(S) \times V(A_G)$ .

There is a canonical decomposition  $V(S) = V(S') \oplus V(A_G)$  (20.6.4.1), so  $\tilde{\mathcal{A}}(S)$  is naturally an affine  $V(S)$ -torsor. And choosing any Euclidean metric on  $V(A_G)$  makes  $|\mathcal{B}(G)|$  a complete non-positively-curved and uniquely-geodesic space, by the same arguments in [Metrics and More Properties](#).  $\lrcorner$

**Cor. (20.7.1.7).**  $Z(G)^0 \rightarrow G_{\text{ab}}$  is an isogeny, so  $V(A_G) \cong V(G_{\text{ab}})^{\text{Gal}_K}$ , and we get the evaluation map  $\nu : G(K) \rightarrow G_{\text{ab}}(K) \rightarrow V(G_{\text{ab}})^{\text{Gal}_K} \rightarrow V(A_G)$ . Then  $G(K)$  acts on  $V(A_G)$  (20.7.1.6) by translation by  $\nu(G)$ , in particular,

$$\langle g \cdot \lambda, \chi \rangle = \langle \lambda, \chi \rangle - \text{ord}(\chi(g)), \text{ where } \lambda \in V(A_G) \cong V(A_{\text{ab}})^{\text{Gal}_K}, \chi \in X^*(G).$$

Thus  $G(K)$  acts diagonally on  $\tilde{\mathcal{B}}(G)$ , and for any simplex  $\tilde{\sigma} \in \tilde{\mathcal{B}}(G)$  with image  $\sigma \in \mathcal{B}(G)$ , the stabilizer  $G(K)_{\tilde{\sigma}}$  equals  $G(K)_x^1$  (20.6.4.13).  $\lrcorner$

**Cor. (20.7.1.8).** Any bounded subgroup  $\mathcal{G} \subset G(K)$  has a fixed point in  $\tilde{\mathcal{B}}(G)$ , and if  $\mathcal{G}$  preserves a non-empty closed convex subset, then it has a fixed point in that subset.  $\lrcorner$

*Proof:* As  $\mathcal{G}$  is bounded, it is contained in  $G(K)^1$ , thus acts trivially on  $V(A_G)$ . So the assertions follow from (20.6.6.19).  $\square$

### Iwahori-Weyl Groups

See [P-R08, Ric16].

**Def. (20.7.1.9) [Iwahori-Weyl Group].** For a maximal split torus  $S \leq G$ , define the **Iwahori-Weyl group**  $\tilde{W}(G, S) = N_G(S)(K)/Z_G(S)(K)^0$ , with a natural surjection  $\tilde{W}(G, S) \rightarrow W(G, S)$ .  $\lrcorner$

## 2 Special Points

**Def. (20.7.2.1) [Special Points].** For  $x \in \mathcal{B}(G)$ , choose a maximal split torus  $S \leq G$  s.t.  $x \in \mathcal{A}(S)$ , then  $x$  is called a **special point** if  $x$  is a special point for the affine root system  $\Psi(G, S)$  (20.6.4.16)(3.9.8.23). By (20.6.4.10), this notion doesn't depend on  $S$  chosen. By (3.9.8.23), special points are vertices.

The parahoric subgroup corresponding to a special vertex (20.6.4.13) is called a **special maximal parahoric subgroup**.  $\lrcorner$

**Prop. (20.7.2.2).** Let  $S \leq G$  be a maximal split torus and  $x \in \mathcal{A}(S)$ , the following are equivalent:

- $x$  is special.
- The Weyl-group  $W(G_x)$  is canonically isomorphic to the Weyl-group  $W(G)$ .
- $N_G(S)(K) \cap G(K)_x^0$  maps onto  $W(G)$ .

$\lrcorner$

*Proof:* 1  $\iff$  2 follows from (3.9.8.24) and (20.6.4.20).  $\square$

**Prop. (20.7.2.3) [Special Point for  $\mathcal{B}(G_{K^{\text{sh}}})$ ].** If  $x \in \mathcal{B}(G)$  is special for  $\mathcal{B}(G_{K^{\text{sh}}})$ , then it is special for  $\mathcal{B}(G)$ .  $\lrcorner$

*Proof:* Let  $S \leq G$  be a maximal split torus s.t.  $x \in \mathcal{A}(S)$ . Let  $T \leq G$  be a special torus containing  $S$  (20.6.5.2). Because  $x$  is special, for any  $\beta \in \Phi(G, S)$ , there exists some  $\psi_\beta \in \Psi(G_{K^{\text{sh}}}, T_{K^{\text{sh}}})$  s.t.  $\psi_\beta(z) = 0$  and  $\psi_\beta$  is a non-constant multiple of  $\beta$ . Because  $\Phi(G_{K^{\text{sh}}}, T_{K^{\text{sh}}}) \rightarrow \Phi(G, S) \cup \{0\}$  is surjective, this implies that  $z$  is special for  $\mathcal{B}(G)$ .  $\square$

**Def. (20.7.2.4) [Super-special Points].** A point  $x \in \mathcal{B}(G)$  is called

- a **super-special point** if  $x$  is special (20.7.2.1) over any finite unramified extension  $K'/K \in \text{Field}$  (20.7.1.1). (By (20.7.2.3), this is equivalent to  $x$  special for  $\mathcal{B}(G_{K^{\text{sh}}})$ , Zhu called these very special points)
- an **absolutely special point** if  $x$  is special over any finite separable extension  $K'/K$ .
- a **hyperspecial point** if  $x$  is super-special and  $G$  splits over  $K^{\text{sh}}$ .

In particular, if  $G$  splits over  $K^{\text{sh}}$ , super-special, absolutely special and hyperspecial are equivalent.  $\textcolor{red}{?}$ .  $\lrcorner$

**Prop. (20.7.2.5) [Absolutely Special Points and Chevalley-Valuations].** Assume  $G$  is quasi-split. Let  $T \leq G$  is a maximally-split maximal torus (10.4.1.15) containing a maximal split torus  $S \leq G$  and  $\mathcal{A}$  the corresponding apartment, and  $o \in \mathcal{A}(S)$  is a Chevalley-valuation (20.6.4.23). Then for a point  $x = a + v \in \mathcal{A}(S)$ , the following are equivalent:

- $x$  is an absolutely-special point (20.7.2.4).
- $\alpha(v) \in v_\alpha \mathbb{Z}$  for all  $\alpha \in \Phi(G, T)$   $\textcolor{red}{?}$
- $x = t.o$  for some  $t \in T_{\text{ad}}(K)$ .
- $x$  is a Chevalley-valuation.

In particular, absolutely special points exist.  $\lrcorner$

*Proof:* Cf. [K-P23]P279.  $\square$

**Cor. (20.7.2.6) [Absolutely Special Points are Conjugate].** If  $G$  is quasi-split and adjoint (10.4.2.1), then any two absolutely special points are conjugate under action of  $G(K)$ .  $\lrcorner$

*Proof:* Cf. [K-P23]P280. ?

□

**Example (20.7.2.7) [Special Points of  $\mathcal{B}(\mathrm{SU}(3))$ ].** Cf. [K-P23]P280.

┘

**Prop. (20.7.2.8) [Super Special Points imply Quasi-Splitness].** Suppose  $\kappa$  is a cd-1 field (9.8.3.18). If  $x \in \mathcal{B}(G)$  is special in  $\mathcal{B}(G_{K^{\mathrm{sh}}})$ , then  $G$  is quasi-split. ┘

*Proof:* Let  $T \leq G$  be a special torus containing a maximal split torus  $S \leq G$  s.t.  $x \in \mathcal{A}(T) \subset \mathcal{B}(G_{K^{\mathrm{sh}}})$ . Let  $\mathbf{S} \leq \mathbf{T}$  be the tori of  $\mathbf{G}_x \in \mathrm{RedGrp}/\kappa$  corresponding to  $S \subset T$ , then  $\mathbf{S}$  is a maximal split torus and  $\mathbf{T}$  is a maximal torus by (20.6.4.20).

By Steinberg's theorem (10.5.2.3),  $\mathbf{G}_x$  is quasi-split, thus the restriction map  $\Phi((\mathbf{G}_x)_{\overline{\kappa}}, \mathbf{T}_{\overline{\kappa}}) \rightarrow \Phi(\mathbf{G}_x, \mathbf{S})$  is surjective. By the definition of specialness, for each  $\beta \in \Phi(G_{K^{\mathrm{sh}}}, T_{K^{\mathrm{sh}}})$ , some constant multiple of  $\beta$  belongs to  $\Phi((\mathbf{G}_x)_{\overline{\kappa}}, \mathbf{T}_{\overline{\kappa}})$ , thus  $\beta$  has a non-trivial restriction to  $S$ . This implies that  $Z_G(S) = Z_G(T)$ , which is a torus because  $G_{K^{\mathrm{sh}}}$  is quasi-split by Steinberg's theorem (10.5.2.3) and (10.4.4.19). So  $G$  is also quasi-split by (10.4.4.19). □

**Prop. (20.7.2.9) [Special Points and Absolutely-Special Points].** If  $G$  is quasi-split and  $\Phi(G)$  is reduced, then every special vertex is absolutely special. ┘

*Proof:* Cf. [K-P23]P280. ?

□

### Hyperspecial Points

**Thm. (20.7.2.10).** If  $\mathcal{G} \in \mathrm{RedGrp}/\mathcal{O}_K$  with  $\mathcal{G}_K \cong G$ , then

- $G$  splits over  $K^{\mathrm{sh}}$ .
- There exists a unique point  $x \in \mathcal{B}(G_{K^{\mathrm{sh}}})$  fixed by  $\mathcal{G}(\mathcal{O}_{K^{\mathrm{sh}}})$ , and it is a special point.
- There is a unique isomorphism  $\mathcal{G}_{\mathcal{O}_{K^{\mathrm{sh}}}} \rightarrow \mathcal{G}_x^0$  (20.6.4.34) extending the identity homomorphism on the generic fiber.

┘

*Proof:* Cf. [K-P23]P301. ?

□

**Cor. (20.7.2.11) [Reductive Integral Models and Hyperspecial Points].** For  $x \in \mathcal{B}(G_{K^{\mathrm{sh}}})$ ,  $\mathcal{G}_x^0 \in \mathrm{RedGrp}/\mathcal{O}_K$  iff  $x$  is a hyperspecial vertex. And any  $\mathcal{G} \in \mathrm{RedGrp}/\mathcal{O}_K$  with  $\mathcal{G}_K \cong G$  is of the form  $\mathcal{G}_x^0$  for some hyperspecial vertex  $x \in \mathcal{B}(G)$ . ┘

*Proof:* If  $\mathcal{G}_x^0$  is reductive, then  $(\mathcal{G}_x^0)_{\mathcal{O}_{K^{\mathrm{sh}}}}$  is also reductive, then  $G$  splits over  $K^{\mathrm{sh}}$  by (20.7.2.10), and,  $x$  is special for  $\mathcal{B}(G_{K^{\mathrm{sh}}})$  by (20.7.2.10), which implies  $x$  is hyperspecial for  $G$  by (20.7.2.3). Conversely, if  $x$  is hyperspecial, then this is [K-P23]Prop8.4.14. ?

And if  $\mathcal{G} \in \mathrm{RedGrp}/\mathcal{O}_K$  with  $\mathcal{G}_K \cong G$ , then by (20.7.2.10)  $G$  splits over  $K^{\mathrm{sh}}$ , and the unique point  $x \in \mathcal{B}(G_{K^{\mathrm{sh}}})$  fixed by  $\mathcal{G}(\mathcal{O}_{K^{\mathrm{sh}}})$  is contained in  $\mathcal{B}(G)$  by uniqueness, thus hyperspecial for  $G$  by (20.7.2.3). And the unique isomorphism  $\mathcal{G}_{\mathcal{O}_{K^{\mathrm{sh}}}} \rightarrow \mathcal{G}_x^0$  descends to an isomorphism  $\mathcal{G} \rightarrow \mathcal{G}_x^0$  by uniqueness. □

**Cor. (20.7.2.12) [Hyperspecial Parahorics are Conjugate].** Suppose  $\kappa$  is a cd-1 field (9.8.3.18). Hyperspecial points of  $\mathcal{B}(G)$  are conjugate to each other under action of  $G_{\mathrm{ad}}(K)$ , thus so are hyperspecial parahoric subgroups of  $G(K)$ . ┘

*Proof:* Notice  $\mathcal{B}(G) \rightarrow \mathcal{B}(G_{\mathrm{ad}})$  is an isomorphism inducing isomorphism of affine root systems (20.6.4.8), so the assertion follows from (20.7.2.4) (20.7.2.8) and (20.7.2.6). □

**Cor. (20.7.2.13)[Characterizing Hyperspecial Points].** If  $G$  is quasi-split and splits over  $K^{\text{sh}}$ , then  $G$  admits reductive integral models and hyperspecial points, by (20.7.2.4)(20.7.2.11) and (20.7.2.5). And the converse is true if  $\kappa$  is a cd-1 field, by (20.7.2.8), in which case all hyperspecial points are conjugate under  $G_{\text{ad}}(K)$  (20.7.2.12).  $\lrcorner$

### Cartan-Decompositions

**Thm. (20.7.2.14)[Cartan-Decomposition, Tits[Tit79]].** Let  $S \leq G$  be a maximal split torus,  $W = W(G, S)$ , and  $\Phi^+ \subset \Phi(G, S)$  a positive system of roots. Define

$$\mathcal{Z} = \{z \in Z_G(S)(K) \mid \alpha(\omega_{Z_G(S)}(z)) \geq 0, \forall \alpha \in \Phi^+\} \text{ (20.5.2.2),}$$

and let  $x \in \mathcal{A}(S)$  be a special vertex with corresponding parahoric subgroup  $\mathcal{P}_x$  (20.7.2.1), then

- $G(K) = \mathcal{P}_x \mathcal{Z} \mathcal{P}_x$ .
- For  $z, z' \in \mathcal{Z}$ ,  $\mathcal{P}_x z \mathcal{P}_x = \mathcal{P}_x z' \mathcal{P}_x$  iff  $z^{-1}z' \in Z(K)^0$ .

In particular,

$$\mathcal{H}(G(K), \mathcal{P}_x) \cong \mathbb{Z}[Z_G(S)(F)/Z_G(S)(F)^0]^W \xrightarrow{\kappa_{Z_G(S)}, \cong} \mathbb{Z} \left[ \left( X^\bullet \left( Z(\widehat{M}) \right)_{\text{Gal}_{\bar{K}}} \right)^{\text{Gal}_{\kappa}} \right].$$

In particular, if  $\mathcal{G} \in \text{RedGrp}/\mathcal{O}_K$ ,  $G = \mathcal{G}_K$ . If  $S \leq \mathcal{G}$  is a maximal split torus and  $B \leq G$  is a Borel subgroup containing  $S = \mathcal{S}_K$ , then

$$G(K) = \coprod_{\lambda \in P^+(\Phi(G, S))} \mathcal{G}(\mathcal{O}_K) \lambda(\varpi) \mathcal{G}(\mathcal{O}_K).$$

$\lrcorner$

*Proof:* 1: Let  $C \subset \mathcal{A}(S)$  be a chamber containing  $x$ , and  $\mathcal{I}$  the corresponding Iwahori subgroup. Because  $x$  is special,  $N_G(S)(K) \cap \mathcal{P}_x \rightarrow W(G, S)$  is surjective by (20.6.4.16) and (3.9.8.23) ?. Thus  $\mathcal{I} \mathcal{N}_x \subset \mathcal{P}_x Z_G(S)(K)$ , and the affine Bruhat-decomposition (20.7.1.4) implies that  $G(K) = \mathcal{P}_x Z_G(S)(K) \mathcal{I}$ . The fact that  $N_G(S)(K) \cap \mathcal{P}_x \rightarrow W(G, S)$  is surjective also implies that  $Z_G(S)(K) \subset \cup_{n \in N_G(S)(K) \cap \mathcal{P}_x} n \mathcal{Z} n^{-1}$ , so the assertion follows.

2: One direction is clear because  $Z_G(S)(K)^0 \subset \mathcal{P}_x$  (20.6.4.10). Conversely, if  $\mathcal{P}_x z \mathcal{P}_x = \mathcal{P}_x z' \mathcal{P}_x$ , then  $z^{-1}z' \in G(K)^0$ , and by (20.5.2.22), it suffices to show that  $z^{-1}z' \in Z(K)^1$ . By assumption there exists  $g, g' \in \mathcal{P}_x$  s.t.  $gz = z'g'$ . Thus  $x \in \mathcal{A}(S) \cap g\mathcal{A}(S)$ , and  $z'x = gzx \in \mathcal{A}(S) \cap g\mathcal{A}(S)$ . Thus it follows from (20.6.6.15) that there exists  $g_0 \in \mathcal{P}_x \cap z' \mathcal{P}_x (z')^{-1}$  s.t.  $g\mathcal{A}(S) = g_0\mathcal{A}(S)$ . So if we denote  $n_x = N_G(S)(K) \cap \mathcal{P}_x$ , we have  $g_0^{-1}g \in n_x$  by (20.6.4.8) and  $(z')^{-1}g_0z' \in \mathcal{P}_x$ . Thus

$$h = g_0^{-1}gz = g_0^{-1}z'g' = z'((z')^{-1}g_0^{-1}z')g' \in n_x z \cap z' \mathcal{P}_x = n_x z \cap z' n_x.$$

So we see there exists  $n_1, n_2 \in N_G(S)(K)$  s.t.  $z' = n_1 z n_2$ . Denote  $z'' = n_2^{-1} z n_2 \in Z_G(S)(K)$ , then  $z_0 = z'(z'')^{-1} = n_1 n_2 \in Z_G(S)(K) \cap n_x \leq Z_G(S)(K)^1$  (20.5.2.7). Thus

$$\omega_{Z_G(S)}(z), \omega_{Z_G(S)}(z'), \omega_{Z_G(S)}(z'') \in \{v \in X_\bullet(S) \otimes \mathbb{Q} \mid \alpha(v) \geq 0, \forall \alpha \in \Phi^+\}.$$

This is a fundamental domain for the action of  $W(G, S)$ , and  $z'' = n_2^{-1} z n_2$ , so there exists  $c \in Z_G(S)(K)^1$  s.t.  $z'' = cz$ , and  $z_0 = z'(z'')^{-1} = z'z^{-1}c^{-1}$ , and  $z'z^{-1} = z_0 c \in Z_G(S)(K)^1$ .

For the second assertion, Cf.[Satake Isomorphisms for Special Maximal Parahoric Hecke Algebras] ?

If  $G$  is unramified, then  $T = Z_G(S)$  is a maximal torus that splits over  $K^{\text{sh}}$ , so by (20.5.2.20),

$$\omega_G : T(K)/T(K)^0 \cong X_*(T), \quad \mathcal{Z}/T(K)^0 \cong P^+(\Phi(G, S)),$$

and a set-theoretical inverse of  $\omega_G$  is given by  $\lambda \mapsto \lambda(\varpi)$ .  $\square$

**Cor. (20.7.2.15) [ $G(K)$  is  $\sigma$ -Compact].**  $G(K)$  is  $\sigma$ -compact, by (20.7.2.5).  $\lrcorner$

### Iwasawa-Decompositions

**Thm. (20.7.2.16) [Iwasawa-Decomposition].** Let  $S \leq G$  be a maximal split torus, and  $\Phi^+ \subset \Phi(G, S)$  a system of positive roots with the corresponding unipotent radical  $U \leq G$ . Let  $C \subset \mathcal{A}(S)$  be a chamber and  $\mathcal{I}$  the corresponding Iwahori subgroup, then

$$G(K) = U(K) \cdot N_G(S)(K) \mathcal{I}.$$

$\lrcorner$

*Proof:* Cf. [K-P23] P189?  $\square$

**Thm. (20.7.2.17) [Iwasawa-Decomposition].** If  $x \in \mathcal{B}(G)$  is a special vertex with the corresponding parahoric subgroup  $\mathcal{P}_x \leq G(K)$ , and  $P \leq G$  is a parabolic subgroup, then  $G(K) = P(K) \mathcal{P}_x$ . In particular, when  $\#\kappa < \infty$ ,  $G(K)/P(K)$  is compact.  $\lrcorner$

*Proof:* Let  $C$  be a chamber containing  $x$  and let  $S \leq G$  be a maximal split torus s.t.  $C \subset \mathcal{A}(S)$ . Let  $\Phi^+ \subset \Phi(G, S)$  be a system of positive roots with the corresponding unipotent radical  $U \leq G$ .

Because  $x$  is special,  $N_G(S)(K) \cap \mathcal{P}_x \rightarrow W(G, S)$  is surjective by (20.6.4.16) and (3.9.8.23), thus  $Z_G(S)(K) \mathcal{P}_x = N_G(S)(K) \mathcal{P}_x$ . Then it follows from (20.7.2.16) that  $G(K) = U(K) N_G(S)(K) \mathcal{P}_C = U(K) Z_G(S)(K) \mathcal{P}_x$ .

As  $U Z_G(S)$  is a minimal parabolic subgroup of  $G$ , by (10.4.1.6) there exists  $g \in G(K)$  s.t.  $g^{-1} U Z_G(S) \subset P$ . Take  $h \in U(K) Z_G(K)$  s.t.  $hg \in \mathcal{P}_x$ , then

$$\begin{aligned} P(K) \mathcal{P}_x &\supset g^{-1} (U(K) Z_G(S)(K)) g \mathcal{P}_x \\ &= (hg)^{-1} (U(K) Z_G(S)(K)) (hg) \mathcal{P}_x \\ &= (hg)^{-1} (U(K) Z_G(S)(K)) \mathcal{P}_x (hg) \\ &= G(K). \end{aligned}$$

$\square$

**Cor. (20.7.2.18).** Let  $S \leq G$  be a maximal split torus, and  $\Phi^+ \subset \Phi(G, S)$  a system of positive roots with the corresponding unipotent radical  $U \leq G$ . If  $\mathcal{K} \subset G(K)^0$  is a bounded subgroup containing  $Z(K)^0$  and  $z, z' \in Z_G(S)(K)$  s.t.  $U(K) z \mathcal{K} = U(K) z' \mathcal{K}$ , then  $z' = Z_G(S)(K)^0 z$ .  $\lrcorner$

*Proof:* As  $Z_G(S)$  normalizes  $U$ , there exists  $u \in U(K)$  s.t.  $uz^{-1}z' \in \mathcal{K}$ . Then  $uz^{-1}z'$  lies in a bounded subgroup  $\mathcal{K} \cap (U \rtimes Z)(K)$ , and then its image  $z^{-1}z'$  under the natural map  $U \rtimes Z \rightarrow Z$  lies in  $Z(K)^1$ . But  $z^{-1}z' \in U \mathcal{P} \subset G(K)^0$ ?, hence  $z^{-1}z' \in Z(K)^1 \cap G(K)^0 = Z(K)^0$  (20.5.2.22).  $\square$

**Thm. (20.7.2.19) [Iwasawa-Decompositions].** Suppose  $F \in \mathbf{GField}$ ,  $G \in \mathbf{RedGrp}/F$ ,  $P \leq G$  is a parabolic subgroup with unipotent radical  $U$  and a Levi factor  $L$ , then there exists a maximal compact subgroup  $\mathcal{K} = \prod_{v \in \Sigma_F} \mathcal{K}_v \leq G(\mathbf{A}_F)$  s.t. for any  $v \in \Sigma_F$ , we have

$$G(F_v) = P(F_v) \mathcal{K}_v, \quad P(F_v) \cap \mathcal{K}_v = (L(F_v) \cap \mathcal{K}_v)(U(F_v) \cap \mathcal{K}_v).$$

$\lrcorner$

*Proof:* Cf. [Getz] P541.  $\square$

## 3 Buildings for Classical Groups

References are [B-T84a, B-T87a].

$\mathrm{SL}(n)$

**Def. (20.7.3.1) [Splitting Bases].** Let  $X \in \mathcal{V}\mathrm{ect}^{\mathrm{fin}}/K$  and  $\alpha : X \rightarrow \mathbb{R} \cup \{\infty\}$  be an additive norm on  $X$  (19.1.2.1), then

- $\alpha$  is said to be **split** over a direct-sum decomposition  $X = X_1 \oplus \dots \oplus X_r$  if  $\alpha(\sum_{i=1}^r v_i) = \min\{\alpha(v_1), \dots, \alpha(v_r)\}$  for  $v_i \in X_i$ .
- A basis  $\{v_1, \dots, v_n\}$  of  $X$  is called a **splitting basis** for  $\alpha$  if  $\alpha$  splits over the direct-sum decomposition  $X = K.v_1 \oplus \dots \oplus K.v_n$ .
- $\alpha$  is called a **splitting additive norm** if it admits a splitting basis.

┘

**Prop. (20.7.3.2).** Situation as in (20.7.3.1), if  $\{v_1, \dots, v_r\}$  is a subset of  $X \setminus \{0\}$  s.t.  $\alpha(v_i) \nmid \alpha(v_j) \pmod{\mathbb{Z}}$ , then  $v_1, \dots, v_r$  are linearly independent, and  $v_1, \dots, v_r$  is splitting basis for  $\alpha|_{K\{v_1, \dots, v_r\}}$ .

In particular,  $\alpha(X \setminus \{0\})$  is a closed and discrete subset of  $\mathbb{R}$ .

┘

*Proof:* This follows from ultrametric inequality. □

**Prop. (20.7.3.3).** Situation as in (20.7.3.1),

- $\alpha$  is splitting iff  $L_{\alpha,0} = \{v \in X | \alpha(v) \geq 0\}$  is a lattice in  $X$ .
- If  $\alpha$  is splitting and  $Y \leq X$  is a subspace, then  $\alpha|_Y$  is also splitting, and there exists a complement  $Y'$  of  $Y$  in  $X$  s.t.  $\alpha$  splits over the direct-sum decomposition  $X = Y \oplus Y'$ .

┘

*Proof:* If  $\alpha$  is a splitting additive norm, then it is clear that  $L_{\alpha,0}$  is a lattice. We prove the converse of this and item2 together by inducting on  $\dim X$ .

If  $\dim X = 1$  this is clear. If  $\alpha$  is splitting, then  $L_{\alpha,0}$  is a lattice in  $X$ , so  $L_{\alpha,0} \cap Y$  is a lattice in  $Y$ , and  $\alpha|_Y$  is splitting by induction hypothesis.

Now if  $L_{\alpha,0}$  is a lattice and  $Y \subset X$  is a subspace, we find a complement  $Y'$  of  $Y$  in  $X$  s.t.  $\alpha$  splits over the direct-sum decomposition  $X = Y \oplus Y'$ . An easy induction shows it suffices to prove for  $\dim Y = \dim X - 1$ . In this case, take  $x_0 \in X \setminus Y$ , then there exists some  $n \in \mathbb{Z}_+$  s.t.  $(x_0 + \varpi^n L_{\alpha,0}) \cap Y = \emptyset$ . Thus  $\alpha(x_0 + Y) \subset \mathbb{R}$  is bounded above. But it is a closed discrete set by (20.7.3.2), so there exists a  $x \in x_0 + Y$  s.t.  $\alpha(x) \geq \alpha(x + y)$  for any  $y \in Y$ . Thus  $\alpha(x + y) = \min\{\alpha(x), \alpha(y)\}$  for any  $y \in Y$ . Then we can just take  $Y' = K.x$ .

So if  $L_{\alpha,0}$  is a lattice, we take a proper subspace  $Y \subset X$ , and find a complement  $Y'$  of  $Y$  in  $X$  s.t.  $\alpha$  splits over the direct-sum decomposition  $X = Y \oplus Y'$ , then  $L_{\alpha,0} \cap Y, L_{\alpha,0} \cap Y'$  are lattices in  $Y$  and  $Y'$  resp., so by hypothesis  $\alpha|_Y$  and  $\alpha|_{Y'}$  are splitting, so  $\alpha$  is also splitting. □

**Prop. (20.7.3.4).** Situation as in (20.7.3.1), if  $K = \widehat{K}$ , then  $\alpha$  is split. ┘

*Proof:* Cf. [K-P23]P516. □

**Def. (20.7.3.5) [Periodic Lattice Chains].** For  $X \in \mathcal{V}\text{ect}^{\text{fin}}/K$ , a **periodic lattice chain** in  $X$  is a totally-ordered set of lattices in  $X$  s.t. if  $L \in \mathcal{L}$ , then  $x.L \in \mathcal{L}$  for ally  $x \in K$ . Any period chain of lattices  $\mathcal{L}$  is of the form

$$\dots \subset L_0 \subset L_1 \subset \dots \subset L_r \subset \varpi_K^{-1}L_0 \subset \varpi_K^{-1}L_1 \subset \dots,$$

and the **rank** of  $\mathcal{L}$  is defined to be  $r + 1$ .

And if  $\mathcal{L}$  is a periodic chain, then a **grading** on  $\mathcal{L}$  is a inclusion-decreasing map  $c : \mathcal{L} \rightarrow \mathbb{R}$  s.t.  $c(\varpi_K L) = c(L) + 1$ . ┘

**Def. (20.7.3.6) [Adapted Bases].** For  $X \in \mathcal{V}\text{ect}^{\text{fin}}/K$  and  $\mathcal{L}$  a periodic chain of lattice in  $X$ , a basis  $(v_1, \dots, v_n)$  of  $X$  is said to be **adapted to  $\mathcal{L}$**  if for any  $L \in \mathcal{L}$ , there exists  $x_1, \dots, x_n \in K^\times$  s.t.  $(x_1 v_1, \dots, x_n v_n)$  is a basis of  $L$ . ┘

**Prop. (20.7.3.7).** For  $X \in \mathcal{V}\text{ect}^{\text{fin}}/K$ , every periodic lattice chain in  $X$  has a basis adapted to it. ┘

*Proof:* For a periodic lattice chain  $\mathcal{L}$ :

$$\dots \subset L_0 \subset L_1 \subset \dots \subset L_r \subset \varpi_K^{-1}L_0 \subset \varpi_K^{-1}L_1 \subset \dots,$$

denote  $\bar{L}_i = L_i/L_0$ , then there is a basis  $(\bar{v}_1, \dots, \bar{v}_n)$  adapted the flat  $\bar{L}_1 \subset \bar{L}_2 \subset \dots \subset \bar{L}_0$  in the sense that for each  $i \in [r]$  there exists  $k_i \in [n]$  s.t.  $\bar{L}_i = \kappa v_1 \oplus \dots \oplus \kappa v_{k_i}$ . Then any liftings of  $(v_1, \dots, v_n)$  is a basis adapted to  $L_0$  by Nakayama's lemma, and

$$L_i = \mathcal{O}_K v_1 \oplus \dots \oplus \mathcal{O}_K v_{k_i} \oplus \varpi_K^{-1} v_{k_{i+1}} \oplus \dots \oplus \varpi_K^{-1} v_n.$$

□

**Prop. (20.7.3.8) [Splitting Additive Norms and Periodic Lattice Chains].** Let  $X \in \mathcal{V}\text{ect}^{\text{fin}}/K$ . If  $\alpha$  is a splitting additive norm on  $X$ , for each  $r \in \mathbb{R}_+$ , define  $L_{\alpha,r} = \{v \in X | \alpha(v) \geq r\}$ , then  $L_{\alpha,r}$  is a lattice in  $X$  by (20.7.3.3), and  $\mathcal{L}_\alpha = \{L_{\alpha,r}\}_{r \in \mathbb{R}}$  is a periodic lattice chain (20.7.3.5), with grading  $c(L) = \inf_{v \in L} \alpha(v)$ . And if  $(\mathcal{L}, c)$  is a period lattice chain with a grading (20.7.3.5), then  $\alpha_{\mathcal{L}}(v) = \sup_{L \in \mathcal{L}, v \in L} c(L)$  is a splitting additive norm on  $X$  by (20.7.3.3).

The above construction gives mutually inverse bijections between the set of splitting additive norms (20.7.3.1) on  $X$  and the set of periodic lattice chains of  $X$  (20.7.3.5). And a basis of  $X$  is a splitting basis for an additive norm  $\alpha$  iff it is adapted to  $\mathcal{L}_\alpha$  (20.7.3.6). ┘

*Proof:* It is easy to see that these two maps are mutually inverse to each other. And the last assertion is also easy. □

**Prop. (20.7.3.9) [ $\mathcal{B}(\text{PGL}(n))$ ].** Let  $X \in \mathcal{V}\text{ect}^{\text{fin}}/K$ .

- If  $X = \ell_1 \oplus \dots \oplus \ell_n$  be a direct sum decomposition, define  $\tilde{\mathcal{A}}(\ell_1, \dots, \ell_n)$  to be the set of all additive norms that splits over this decomposition (20.7.3.1), then it is naturally an affine  $\mathbb{R}^n$ -torsor.
- Let  $\tilde{\mathcal{B}}(X)$  be the set of all splitting additive norms, then  $\mathbb{R}$ -acts on  $\tilde{\mathcal{B}}(X)$  by  $(\alpha + r)(x) = \alpha(x) + r$ . This action preserves all  $\tilde{\mathcal{A}}(\ell_1, \dots, \ell_n) \subset \tilde{\mathcal{B}}(X)$ , and we denote  $\mathcal{A}(\ell_1, \dots, \ell_n) = \tilde{\mathcal{A}}(\ell_1, \dots, \ell_n)/\mathbb{R}$  and  $\mathcal{B}(X) = \tilde{\mathcal{B}}(X)/\mathbb{R}$ .

- For each periodic lattice chain  $\mathcal{L}$  of  $X$ , define  $\Delta_{\mathcal{L}} \subset \mathcal{B}(X)$  the set of all additive norms  $\alpha \in \mathcal{B}(X)$  s.t.  $\mathcal{L}_{\alpha} = \mathcal{L}$  (20.7.3.8). For any splitting  $X = \ell_1 \oplus \dots \oplus \ell_n$  adapted to  $\mathcal{L}$  (20.7.3.6), which is the interior of a simplex of dimension  $\text{rank } \mathcal{L} - 1$  in each  $\mathcal{A}(\ell_1, \dots, \ell_n)$  s.t.  $\alpha_{\mathcal{L}}$  splits over the direct-sum decomposition  $X = \ell_1 \oplus \dots \oplus \ell_n$  (20.7.3.1). In this way, we defined a simplicial structure on  $\mathcal{B}(X)$  of dimension  $n - 1$ .
- In this way, each lattice in  $X$  corresponds to a vertex of  $\mathcal{B}(X)$ , and vertices corresponding to a set of lattices  $\{L_0, \dots, L_r\}$  constitute a simplex of dimension  $r$  iff up to permutation we have

$$L_0 \subset L_1 \subset \dots \subset L_r \subset \varpi_K^{-1} L_0.$$

- $\text{GL}(X)$  acts on  $\widetilde{\mathcal{B}(X)}$  by  $(g.\alpha)(x) = \alpha(g^{-1}x)$ . This induces an action of  $\text{PGL}(X)$  on  $\mathcal{B}(X)$  that preserves the simplicial structures.
- There is a canonical  $\text{PGL}(X)$ -equivariant isomorphism  $\mathcal{B}(X) \cong \mathcal{B}(\text{PGL}(X))$ , because we can compare stabilizers corresponding to each point. (Cf. [K-P23]P523?). And there is a non-canonical  $\text{GL}(X)$ -equivariant isomorphism  $\widetilde{\mathcal{B}}(X) \cong \widetilde{\mathcal{B}}(\text{GL}(X))$ .

┘

**Cor. (20.7.3.10).** If  $K \in \text{LField}$ , then

- $\text{GL}(n; \mathcal{O}_K)$  is the unique maximal compact subgroup of  $\text{GL}(n; K)$  up to conjugacy.
- $\text{SL}(n; K)$  has exactly  $n$ -many maximal compact subgroups up to conjugacy:

$$\text{SL}(2; \mathbb{Z}_p), \quad \begin{bmatrix} p & \\ & 1 \end{bmatrix}^{-1} \text{SL}(2; \mathbb{Z}_p) \begin{bmatrix} p & \\ & 1 \end{bmatrix}, \dots, \begin{bmatrix} p^{n-1} & \\ & 1 \end{bmatrix}^{-1} \text{SL}(2; \mathbb{Z}_p) \begin{bmatrix} p^{n-1} & \\ & 1 \end{bmatrix}$$

┘

*Proof:* This follows from (20.6.6.20)(20.7.2.13) and the fact these groups are clearly non-conjugate to each other.  $\square$

**Example (20.7.3.11) [Spherical Bruhat-Tits Buildings for  $\text{GL}(n+1; K)$ ].** For  $n \in \mathbb{Z}$ ,  $\mathcal{B}(\text{GL}(n+1; K))$  (20.6.4.28) is described as follows:

- The vertices of  $\mathcal{B}(\text{GL}(n+1; K))$  are proper subspaces of  $K^{\oplus(n+1)}$ .
- vertices  $x_1, \dots, x_r$  corresponding to subspaces  $V_1, \dots, V_r$  of  $K^{\oplus(n+1)}$  form a simplex of  $\mathcal{B}(\text{GL}(n+1; K))$  iff there exists a permutation  $\sigma \in \text{Sym}_r$  s.t.

$$V_{\sigma(1)} \subset V_{\sigma(2)} \subset \dots \subset V_{\sigma(r)}.$$

- For any unordered set  $S$  of 1-dimensional subspaces of  $K^{\oplus(n+1)}$  of cardinality  $n+1$ , there is an apartment of  $\mathcal{B}(\text{GL}(n+1; K))$  which is the chamber subcomplex spanned by vertices corresponding to a subspace  $V$  that is spanned by some subset of  $S$ .

Thus each apartment in  $\mathcal{B}(\text{GL}(n+1; K))$  is a simplicial  $n$ -sphere.  $\square$

*Proof:* Proof that  $\mathcal{B}(\text{GL}(n; K))$  is a building: it is clearly thick. And any apartment is clearly thin, and any two chambers are connected by a gallery, thus a chamber complex.

To prove that any two apartment is contained in a common apartment, Cf. [Garrett, Buildings, Bruhat decompositions, unramified principal series]P8.

To prove that for any two apartments  $a, a'$  in a building  $X$  (20.6.2.1) containing a common chamber  $C$ , there exists a simplicial isomorphism  $f : a \cong a'$  fixing vertices of  $a \cap a'$ , Cf. [Garrett, Buildings, Bruhat decompositions, unramified principal series]P9.  $\square$

**Example (20.7.3.12)**[Spherical Buildings for  $\mathrm{PGL}(n; K)$ ].  $\mathcal{B}(\mathrm{PGL}(n+1; K))$  (20.6.4.28) is described as follows:

- The vertices of  $\mathcal{B}(\mathrm{PGL}(n+1; K))$  are given by homothety classes of  $\mathcal{O}_K$ -lattices in  $K^{n+1}$  (19.3.1.28).
- A collection  $\{\Lambda_0, \dots, \Lambda_s\}$  is a  $s$ -simplex of  $\mathcal{B}(\mathrm{PGL}(n+1; K))$  if there exists  $M_i$  in the homothety class of  $\Lambda_i$  s.t. up to permutation, we have

$$M_0 \supsetneq M_1 \supsetneq \dots \supsetneq M_s \supsetneq \varpi_K M_0.$$

In particular, for any  $\mathcal{O}_K$ -lattice  $M$  in  $K^{n+1}$ , the set of  $s$ -simplexes of  $\mathcal{B}(\mathrm{PGL}(n+1; K))$  containing  $[M]$  is in bijection with the set of length- $(s+1)$ -flags in  $M/\varpi_K M$ .  $\lrcorner$

**Example (20.7.3.13)**[ $\mathrm{SL}(n; \mathbb{Q}_p)$ ]. The subgroup

$$\{(x_{ij}) \in \mathrm{SL}(n; \mathbb{Z}_p) : x_{ii} \equiv 1 \pmod{p}, x_{ij} \equiv 0 \pmod{p} \forall i < j\}$$

is a pro- $p$ -Sylow subgroup of  $\mathrm{SL}(n; \mathbb{Q}_p)$ , with corresponding Iwahori subgroup

$$B = \{(x_{ij}) \in \mathrm{SL}(n; \mathbb{Z}_p) : x_{ij} \equiv 0 \pmod{p} \forall i < j\}.$$

Let  $S \leq \mathrm{SL}(n; \mathbb{Q}_p)$  be the diagonal torus and  $N = N_G(S)$ , then  $(B, N)$  is a Tits system for  $\mathrm{SL}(n; \mathbb{Q}_p)$  (20.6.1.1).

A standard set  $R$  of generators of the Weyl group  $W$  is represented by the following matrices:

$$r_1 = \mathrm{diag}\left(\begin{bmatrix} & 1 \\ -1 & \end{bmatrix}, 1, \dots, 1\right), \quad r_2 = \mathrm{diag}\left(1, \begin{bmatrix} & 1 \\ -1 & \end{bmatrix}, 1, \dots, 1\right), \dots, r_n = \begin{bmatrix} 0 & 0 & p^{-1} \\ 0 & \mathbf{1}_{n-1} & 0 \\ p & 0 & 0 \end{bmatrix}.$$

Let  $W_0 = \langle r_1, \dots, r_{n-1} \rangle$ , then  $P = BW_0B = \mathrm{SL}(n; \mathbb{Z}_p)$ . The other maximal compact subgroups  $P_i$  are equal to  $BW_iB$  where  $W_i = \langle r_1, \dots, \hat{r}_i, \dots, r_{n-1}, r_n \rangle$ , which is the stabilizer of the lattice  $\{e_1, \dots, e_{n-i}, pe_{n-i+1}, \dots, pe_n\}$ .

$W = W_0 \rtimes T$  where  $W_0 \cong S_n$  and  $T = S \cap \mathrm{SL}(n; p^{\mathbb{Z}})$ . Moreover,  $T^+ = \{(x_1, \dots, x_n) \in T : x_1 \leq x_2 \leq \dots \leq x_n\}$ .  $\lrcorner$

### $\mathrm{SU}(n)$ and $\mathrm{SO}(n)$

**Notation (20.7.3.14).**

- Suppose  $\mathrm{char} \kappa \neq 2$ .
- Let  $\sigma$  be an involution on  $K$  with  $K_0 = K^\sigma$ .
- Let  $\epsilon \in \{\pm 1\}$ .
- Let  $(X, \langle -, - \rangle) \in \mathcal{V}\mathrm{ect}^{\mathrm{fin}}/K$  be a  $\epsilon$ -Hermitian space.
- $\langle -, - \rangle$  induces an isomorphism  $X^\sigma \cong X^* : x \mapsto \langle -, x \rangle$ .

$\lrcorner$

**Def. (20.7.3.15)**[Dual Splitting Additive Norms]. For  $X \in \mathcal{V}\mathrm{ect}^{\mathrm{fin}}/K$  and a splitting additive norm  $\alpha$  on  $X$  (20.7.3.1), define  $\alpha^* : X^* \setminus \{0\} \rightarrow \mathbb{R}$ :

$$\alpha^*(\lambda) = \inf_{x \in X \setminus \{0\}} (\mathrm{ord}_K(\lambda(x)) - \alpha(x)) \in \mathbb{R} \setminus \{-\infty\}.$$

Then

- $\alpha^*(\lambda) \in \mathbb{R}$  for any  $\lambda \in X^* \setminus \{0\}$ ,
- If  $\{v_1, \dots, v_n\}$  is a splitting basis for  $\alpha$ , then  $\{v_1^*, \dots, v_n^*\}$  is a splitting basis for  $\alpha^*$ , and  $\alpha^*(v_i^*) = -\alpha(v_i)$ .
- Under the identification  $X^{**} = X$ , the equality  $\alpha^{**} = \alpha$  holds.

┘

*Proof:* If  $\{v_1, \dots, v_n\}$  is a splitting basis for  $\alpha$ , then for  $x = \sum_i x_i v_i \in X$ , we have

$$\text{ord}_K(\lambda(x)) \geq \min_i (\text{ord}_K(x_i) + \text{ord}_K(\lambda(v_i))), \quad \alpha(x) = \min_i (\text{ord}_K(x_i) + \alpha(v_i)).$$

so

$$\text{ord}_K(\lambda(x)) - \alpha(x) \geq \min_i (\text{ord}_K(\lambda(v_i)) - \alpha(v_i)).$$

Thus  $\alpha^*(\lambda) = \min_i (\text{ord}_K(\lambda(v_i)) - \alpha(v_i))$ . Taking  $\lambda = v_i^*$  implies that  $\alpha^*(v_i^*) = -\alpha(v_i)$ , which implies that  $\alpha^*(\lambda) = \min_i (\text{ord}_K(\lambda(v_i)) + \alpha^*(v_i^*))$ , and  $\{v_1^*, \dots, v_n^*\}$  is a splitting basis for  $\alpha^*$ .  $\square$

**Def. (20.7.3.16) [Self-Dual Additive Norms].** For a splitting additive norm  $\alpha$  on  $X$  (20.7.3.1), let  $\alpha^\vee$  be the splitting additive norm on  $X^\sigma$  induced by  $\alpha^*$  (20.7.3.15) and the isomorphism  $X^\sigma \cong X^*$  (20.7.3.14). Then  $\alpha$  is called a **self-dual splitting additive norm** if  $\alpha^\sigma = \alpha^\vee$ , i.e. for any  $y \in X \setminus \{0\}$ , we have

$$\alpha(y) = \inf_{x \in X \setminus \{0\}} (\text{ord}_K(\langle x, y \rangle) - \alpha(x)).$$

┘

**Cor. (20.7.3.17).** If  $\alpha$  is a self-dual splitting additive norm on  $X$  (20.7.3.16), then  $\alpha(x) + \alpha(y) \leq \text{ord}_K(\langle x, y \rangle)$  for any  $x, y \in X$ .  $\square$

**Prop. (20.7.3.18).** If  $X$  is anisotropic, then there is a unique self-dual splitting additive norm  $\alpha$  on  $X$  (20.7.3.16), which is  $\alpha(x) = \frac{1}{2} \text{ord}_K(\langle x, x \rangle)$ .  $\square$

*Proof:* Firstly, we prove that  $2 \text{ord}_K(\langle x, y \rangle) \geq \text{ord}_K(\langle x, x \rangle) + \text{ord}_K(\langle y, y \rangle)$ : ?

Clearly  $\alpha(x) = \frac{1}{2} \text{ord}_K(\langle x, x \rangle)$  is an additive norm on  $X$  because

$$\alpha(x+y) = \frac{1}{2} (\text{ord}_K(\langle x, x \rangle) + \text{ord}_K(\langle x, y \rangle) + \text{ord}_K(\langle y, x \rangle) + \text{ord}_K(\langle y, y \rangle)) \geq \min\{\alpha(x), \alpha(y)\},$$

and it is self-dual by what we proved ?. And if  $\beta$  is another self-dual splitting additive norm on  $X$ , then we have  $\beta \leq \alpha$  by (20.7.3.17), which implies that  $\beta^\vee \geq \alpha^\vee$ , thus  $\beta = \alpha$ .  $\square$

**Prop. (20.7.3.19) [SU(3)].** Let  $L/K \in p\text{-LField}$  be a separable quadratic extension. There are two conjugacy classes of maximal compact subgroups in  $\text{SU}(3, L/K)$ :

$$\begin{bmatrix} \mathcal{O}_L & \mathcal{O}_L & \mathcal{O}_L \\ \mathcal{O}_L & \mathcal{O}_L & \mathcal{O}_L \\ \mathcal{O}_L & \mathcal{O}_L & \mathcal{O}_L \end{bmatrix}, \quad \begin{bmatrix} \mathcal{O}_L & \mathfrak{m}_L & \mathfrak{m}_L \\ \mathcal{O}_L & \mathcal{O}_L & \mathfrak{m}_L \\ \mathfrak{m}_L^{-1} & \mathcal{O}_L & \mathcal{O}_L \end{bmatrix}$$

These two subgroups are not conjugate under action of  $\text{PU}(3; L/K)$ .  $\square$

$\mathrm{SO}(n)$

### Non-Quasi-Split Groups

## 4 Finite Group Actions and Tamely-Ramified Descent

**Thm. (20.7.4.1) [Galois Descent].** For any  $K_1/K \in \mathrm{GalField}$  contained in  $K^{\mathrm{sep}}$ ,

- There is a unique  $G(K)$ -invariant injections  $\varphi : |\mathcal{B}(G)| \hookrightarrow |\mathcal{B}(G_{K_1})|$  (20.6.4.29) has image contained in  $|\mathcal{B}(G_{K_1})|^{\mathrm{Gal}(K_1/K)}$  (20.6.4.9), s.t. the restriction of  $\varphi$  to any apartment of  $\mathcal{B}(G)$  is an affine mapping into an apartment of  $\mathcal{B}(G_{K_1})$ .

┘

*Proof:* ? Cf. [K-P23]Chap7.9.

□

**Remark (20.7.4.2).** If  $K_1/K$  is not tamely-ramified, it may happen that  $\varphi : |\mathcal{B}(G)| \hookrightarrow |\mathcal{B}(G_{K_1})|^{\mathrm{Gal}(K_1/K)}$  is not surjective.

### Anisotropic Groups

**Thm. (20.7.7.2) [Kneser/Bruhat-Tits [BT87]].** If  $G$  is absolutely almost-simple and anisotropic, then it splits over  $\check{K}$ , and is of type  $A_n$  for some  $n \in \mathbb{Z}_+$ .

And if  $K \in p\text{-LField}$ , then  $G$  is of inner type  $A_n$  for some  $n \in \mathbb{Z}_+$ . If  $G$  is moreover simply-connected, then  $G$  is isomorphic to  $\mathrm{SL}_{1,D}$  for some division algebra over  $K$ .

┘

*Proof:* Cf. [K-P23]P391 ?.

□

**Lemma (20.7.7.3) [Existence of Anisotropic Maximal Tori].** If every finite extension of  $\kappa$  admits cyclic Galois-extensions of every finite degree (e.g.  $\#\kappa < \infty$ ), then every quasi-split semisimple  $\kappa$ -group has an anisotropic maximal torus.

┘

*Proof:* Cf. [K-P23]P396.

□

**Thm. (20.7.7.4) [Existence of Elliptic Maximal Tori].** Suppose every finite extension of  $\kappa$  admits cyclic Galois-extensions of every finite degree (e.g.  $\#\kappa < \infty$ ). If  $G$  is semisimple, then  $G$  contains an anisotropic maximal torus  $T$  which contains a subtorus  $S \leq T$  s.t.  $S_{\check{K}}$  is a maximal  $\check{K}$ -split torus of  $G_{\check{K}}$ .

In particular, any  $G \in \mathrm{RedGrp}/K$  admits an elliptic maximal torus (10.4.2.25).

┘

*Proof:* Cf. [K-P23]P395.

□

List of Central-Isogeny Classes

**Thm.(20.7.7.5) [List of Central-Isogeny Classes of Absolutely Quasi-Simple Groups, Kneser65/ Bruhat-Tits[Tit79]].** Let  $K \in \mathbf{LField}$ . where

- A name of the shape  ${}^aX_n$  means  $X$  represents the absolute Dynkin diagram  $D(\Psi(G_{K^{\mathrm{sh}}}))$  (3.9.8.26) and  $a$  is the order of the automorphism group of  $\Delta_1$  induced by  $\mathrm{Gal}(K^{\mathrm{sh}}/K)$ . If  $a = 1$  (i.e. residually-split), it is omitted, and  $n = \mathrm{rank}_{K^{\mathrm{sh}}}(G)$ .
- 

┘

*Proof:* ?

□

- $C - B_n$  is the ramified even orthogonal group.
- $B - C_n$  and  $C - BC_n$  are ramified unitary groups.

## 20.8 Geometry of Numbers

References are [Cassels, Geometry of Numbers] and [Venkatesh's notes].

### 1 Minkowski Theory

Cf. [B-G06].

**Thm. (20.8.1.1) [Minkowski's Lattice Point Theorem].** Let  $V \in \text{Vect}_{\mathbb{R}}^n$  equipped with a Haar measure  $dx$  and  $\Gamma \subset V$  be a complete lattice. Suppose  $X \subset V$  is a centrally symmetric and convex measurable subset of  $V$  s.t.

$$\text{Vol}(X) > 2^n \|\Gamma\|,$$

then  $\#X \cap \Gamma > 1$ . ┘

*Proof:* Consider the lattice  $2\Gamma \subset \mathbb{R}^n$ , which has norm  $\leq \text{Vol}(X)$ . Thus the projection of  $X$  onto  $\mathbb{R}^n/2\Gamma$  must have two overlapping points, i.e. there exists  $z_1, z_2 \in X$  s.t.  $z_1 - z_2 \in 2\Gamma$ . Thus  $(z_1 - z_2)/2 \in X \cap \Gamma$ . □

**Def. (20.8.1.2) [Minkowski Spaces].** For  $F \in \text{NField}$ ,  $\mathbb{F}_{\mathbb{C}} \cong \prod_{\sigma: F \rightarrow \mathbb{C}} \mathbb{C}$ , and  $\text{Gal}_{\mathbb{R}}$  acts on  $\mathbb{F}_{\mathbb{C}}$  via permuting the coordinates. Then define

$$\mathbb{F}_{\mathbb{R}} = (\mathbb{F}_{\mathbb{C}})^{\text{Gal}_{\mathbb{R}}}.$$

And it is equipped with a symmetric inner space structure via restriction from  $\mathbb{F}_{\mathbb{C}} \cong \prod_{\sigma: F \rightarrow \mathbb{C}} \mathbb{C}$ . Such a space  $F_{\mathbb{R}}$  is called the **Minkowski space attached to  $F$** . ┘

**Prop. (20.8.1.3) [Embedding in Minkowski Spaces].** For  $F \in \text{NField}$ , there is a natural map  $j: \mathbb{F} \hookrightarrow \mathbb{F}_{\mathbb{R}}$ , and for  $\mathfrak{a} \in \text{Ideal}^{\times}(\mathcal{O}_F)$ ,  $j(\mathfrak{a})$  is a complete lattice in  $F_{\mathbb{R}}$  with

$$\|j(\mathfrak{a})\| = \sqrt{|\text{disc}(F)|} \|\mathfrak{a}\|.$$

┘

*Proof:* Cf. [Neukirch]P31. □

**Prop. (20.8.1.4).** Let  $F \in \text{NField}$  and  $\text{Ideal}^{\times}(\mathcal{O}_F)$ , and for each  $\tau \in \Sigma_F^{\infty}$ , let  $c_{\tau} \in \mathbb{R}_{+}$  s.t.  $c_{\tau} = c_{\bar{\tau}}$ , and

$$\prod_{\tau} c_{\tau} > \left(\frac{2}{\pi}\right)^s \sqrt{|\text{disc}(F)|} \|\mathfrak{a}\|,$$

then there exists  $a \in \mathfrak{a}^{\times}$  s.t. for any  $\tau \in \Sigma_F^{\infty}$ , we have

$$|\tau(a)| < c_{\tau}.$$

┘

*Proof:* Cf. [Neu99]P32. □

**Cor. (20.8.1.5).** For  $\mathfrak{a} \in \text{Ideal}^{\times}(\mathcal{O}_F)$ , there exists  $a \in \mathfrak{a}^{\times}$  s.t

$$|\tau(a)| < \left(\frac{2}{\pi}\right)^{\frac{s}{n}} |\text{disc}(F)|^{\frac{1}{2n}} \|\mathfrak{a}\|^{\frac{1}{n}}$$

for any  $\tau \in \Sigma_F^{\infty}$ . ┘

**Prop. (20.8.1.6) [Regulator Map].** There is a **regulator map**

$$\mathrm{Reg}_F : \mathcal{O}_F^* \rightarrow \left[ \prod_{\tau \in \Sigma_F^\infty} \mathbb{R} \right]^+ \cong \mathbb{R}^{r_1+r_2} : x \mapsto (\log |x|_\tau)_{\tau \in \Sigma_F^\infty}$$

such that the kernel is  $F_{\mathrm{tor}}^\times$ , and the image is a complete lattice in  $H = \{(x_i) \mid \sum x_i = 0\}$ .  $\lrcorner$

*Proof:* Cf.[Neukirch, P43].  $\square$

**Cor. (20.8.1.7) [Regulators].** Let  $\{\varepsilon_1, \dots, \varepsilon_t\}_{t=r_1+r_2-1}$  be a system of fundamental units in  $F$ , define  $\mathrm{Reg}(F)$  the **regular of  $F$**  to be the absolute value of any  $t \times t$  minor of the following matrix

$$\begin{bmatrix} \mathrm{Reg}^{(1)}(\varepsilon_1) & \dots & \mathrm{Reg}^{(1)}(\varepsilon_t) \\ \vdots & & \vdots \\ \mathrm{Reg}^{(t+1)}(\varepsilon_1) & \dots & \mathrm{Reg}^{(t+1)}(\varepsilon_t) \end{bmatrix},$$

then the covolume of  $\mathrm{Reg}(\mathcal{O}_F^*) \subset H$  (20.8.1.6) is

$$\mathrm{Vol}(\mathrm{Reg}(\mathcal{O}_F^*)) = \sqrt{r_1 + r_2} \mathrm{Reg}(F).$$

$\lrcorner$

*Proof:* Cf.[Neukirch, P43].  $\square$

**Thm. (20.8.1.8) [Bounded Ramifications are Rare, Hermite].** For  $n \in \mathbb{Z}_+$  and  $\Sigma_F^\infty \subset_{\mathrm{fin}} S \subset \Sigma_F$ , there are only f.m. field extensions  $L/F$  of degree  $n$  that are unramified outside  $S$ .  $\lrcorner$

*Proof:* The power of a prime  $\mathfrak{P}$  in the discriminant is controlled by  $n$  by (5.2.7.35). Together with (5.2.7.37), this shows the power of  $\mathfrak{p}$  in the discriminant of the extension is controlled by  $n$ , independent of the field. Also we can assume  $\sqrt{-1} \in F$ , because it changes the discriminant by a bounded factor, by (5.2.7.38). So it suffices to prove there are only f.m. field extension with fixed degree and discriminant. By (5.2.7.38), it suffices to prove for  $F = \mathbb{Q}$ .

For the rest, we use Minkowski's theorem (20.8.1.4), Cf.[Neukirch, P203] **?**.  $\square$

**Prop. (20.8.1.9) [Minkowski's Second Theorem].** Let  $F \in \mathrm{NField}$ ,  $\deg(F) = d$ ,  $n \in \mathbb{Z}_+$ ,  $V \in \mathrm{Vect}^n/F$ , and  $\Lambda$  a lattice in  $V$ . For any  $v \in \Sigma_F^\infty$ , let  $S_v$  be a non-empty open convex symmetric bounded subset  $S_v$  of  $V_v$ . For  $\lambda > 0 \in \mathbb{R}$ , denote  $\lambda S = \prod_{v \mid \infty} \lambda S_v \times \prod_{v \nmid \infty} \lambda \Lambda_v$ . For  $n \geq 1$ , denote the  **$n$ -th successive minimum** of  $S$  to be

$$\lambda_n = \inf\{t > 0 \mid tS \text{ contains } n \text{ linearly independent vectors of } \Lambda \text{ over } K\}.$$

Then

$$\left( \prod_{i=1}^n \lambda_i \right) \mathrm{Vol}(S)^{1/d} \leq 2^N,$$

where the volume is calculated w.r.t. the adelic measure given by (19.4.2.5).

Moreover, if  $S_v$  are totally symmetric, then

$$\frac{2^{dn} \pi^{sn}}{(n!)^r ((2n)!)^s} N(d_{K/\mathbb{Q}})^{n/2} \leq \left( \prod_i \lambda_i \right)^d \mathrm{Vol}(S).$$

$\lrcorner$

*Proof:* Cf.[B-G06]P611.  $\square$

## 20.9 Abelian Varieties

*“Think geometrically, prove algebraically.”*

–J. Tate

References are [Abelian Varieties notes Conrad], [BLR90, B-G06, Mil08, Sta], [Abelian Variety van der Geer]. See [Bhatt’s notes] for everything done in the relative setting. A history of Abelian varieties can be found in [Mil08]P125.

**Notation(20.9.0.1).**

- Let  $k \in \mathbf{Field}$ .
- Let  $S \in \mathbf{Sch}$ .

┘

### 1 Basics

**Def.(20.9.1.1) [Abelian Schemes].** For  $S \in \mathbf{Sch}$ , an **Abelian scheme** over  $S$  is a proper smooth group variety  $A \in \mathbf{GrpVar}/S$  (7.12.5.1). Denote  $\mathbf{AbVar}/S$  the subcategory of  $\mathbf{AlgGrp}/S$  consisting of Abelian schemes over  $S$ .

Being an Abelian scheme is stable under base change of fields, by (7.12.1.3). ┘

**Prop.(20.9.1.2).** For  $X \in \mathbf{AbVar}/S$ , any global tangent vector on a group variety is left invariant. ┘

*Proof:* Because  $\Gamma(X, \mathcal{O}_X) = k$  (7.12.1.12), so by (10.1.4.38),  $\Gamma(X, \mathcal{O}_X \otimes T_{X,e}) = T_{X,e}$  are all generated by left invariant vectors (left and right translation commutes). ┘

**Thm.(20.9.1.3) [Abelian Varieties are Projective, Weil].** Abelian varieties over  $k$  are projective, by (10.1.4.9) and (7.4.6.3). ┘

**Thm.(20.9.1.4) [Rigidity].** Let  $S \in \mathbf{Sch}$  and  $f : X \rightarrow Y \in \mathbf{AlgGrp}/S$  be a morphism from an Abelian varieties to a group variety, then it is a group homomorphism followed by a translation  $t_{f(e_X)}$ . ┘

*Proof:* Set  $y = i_Y(f(e_X))$  and consider  $h = t_y \circ f$ , then  $h(e_X) = e_Y$ , and consider the morphism:

$$g : X \times X \rightarrow Y : (x, x') \mapsto h(xx')(h(x)h(x'))^{-1}.$$

then  $g(e_X, X) = g(X, e_X) = e_Y$ , so the rigidity lemma (7.12.1.20) shows  $g$  is constant with value  $e_Y$ . Thus  $h \circ m_X = m_Y \circ (h \times h)$ , thus  $h$  is a group homomorphism. ┘

**Cor.(20.9.1.5) [Abelian Varieties are Commutative].**

- If  $A \in \mathbf{Var}/S$ , then the Abelian variety structure on  $A$  is determined by  $e_A$ .
- If  $A \in \mathbf{AbVar}/S$ , the group law on  $A$  is commutative, justifying the name.

┘

**Remark(20.9.1.6).** The completeness of  $A$  is essential for the proof. In fact, there are many non-commutative group varieties, like  $\mathrm{GL}(n)$ .

From now, use the additive notation for Abelian varieties. ┘

*Proof:* 1: If there are two Abelian variety structures  $(m, i), (n, j)$ , then consider  $X \times X \rightarrow X \rightarrow X : (x, y) \mapsto m(x, y)(n(x, y)^{-1})$ , then it is constant on  $e_X \times X$  and  $X \times e_X$ , thus it is constant, so  $m = n$ . And  $i = j$  is also clear by the associativity.

2: The inverse  $i$  is a group homomorphism by (20.9.1.4), thus it is commutative. ┘

**Prop. (20.9.1.7) [Rigidity of Morphism from Smooth Varieties].** If  $k \in \mathbf{Field}$  and  $X \in \mathcal{AbVar}/k$ , then any rational map from a smooth  $k$ -variety  $Y$  extends to a morphism  $Y \rightarrow X$ .  $\lrcorner$

*Proof:* By (7.4.6.15), a rational map is defined on a set whose complement has codimension  $\geq 2$ , but then (10.1.1.18) shows it must be defined on all of  $X$ .  $\square$

**Prop. (20.9.1.8).** For  $S \in \mathcal{Sch}$  and  $X, Y \in \mathcal{AbVar}/S$ . If  $f : X \rightarrow Y$  is a homomorphism over  $S$  s.t. for any arithmetic point  $s \in S$ ,  $f_s : X_s \rightarrow Y_s$  has finite kernel, then  $f$  is surjective, thus is an isogeny.  $\lrcorner$

*Proof:* ?  $\square$

**Cor. (20.9.1.9) [Quotient by Finite Subgroups].** Quotients of an Abelian variety  $A$  are also an Abelian varieties.  $\lrcorner$

*Proof:* It is a group variety of dimension 1 with a rational point by (10.1.5.33). And it is complete by (7.4.6.3).  $\square$

**Remark (20.9.1.10).** WARNING: it is not true that the quotient of an Abelian variety by any finite group of automorphisms is an Abelian variety, as the quotient of an elliptic curve by the hyperelliptic involution (i.e.  $-1$ ) is just  $\mathbb{P}^1$ .  $\lrcorner$

**Cor. (20.9.1.11) [Even Functions].** For  $E \in \mathcal{EllCur}/k$  and  $f \in R(E)$ ,  $f$  is even iff  $f \in K(x)$ .  $\lrcorner$

*Proof:* Write  $f(x, y) = g(x) + h(x)y$ , then the condition says  $(2y + a_1x + a_3)h(x) = 0$  for any  $(x, y) \in E(\bar{K})$ . Thus  $h(x) = 0$ , otherwise  $E$  is degenerate, which is not possible.  $\square$

**Def. (20.9.1.12) [Isogenies of Abelian Schemes].** A homomorphism  $\varphi : A \rightarrow B \in \mathcal{AbVar}/S$  is called an **isogeny between Abelian schemes** if it is surjective with finite fibers. This is compatible with the definition of isogenies of algebraic groups over fields (10.1.5.12), by (10.1.5.16).  $\lrcorner$

**Prop. (20.9.1.13) [Weil-Restriction of Abelian Varieties].** if  $K'/K$  is a finite separable field extension and  $A' \in \mathcal{AbVar}/K'$ , then  $A = \text{Res}_{K'/K}(A')$  is also an Abelian variety over  $K$  s.t.  $\dim A = [K' : K] \dim A'$ .  $\lrcorner$

*Proof:* Cf. [CCO14]P22?  $\square$

### Pseudo-Abelian Varieties

**Def. (20.9.1.14) [Pseudo-Abelian varieties].** A **pseudo-Abelian variety** over  $k$  is a group variety over  $k$  with no non-trivial affine normal group subvarieties.  $\lrcorner$

**Prop. (20.9.1.15).** Abelian varieties over  $k$  are pseudo-Abelian varieties (20.9.1.14).  $\lrcorner$

*Proof:* Every normal group subvariety is closed thus complete, hence if it is affine, it equals  $e$ .  $\square$

**Prop. (20.9.1.16).** Being a pseudo-Abelian variety over  $k$  is stable under separable base change of fields.  $\lrcorner$

*Proof:* Cf. [Mil17]P149.  $\square$

**Prop. (20.9.1.17).** Let  $G \in \mathcal{GrpVar}/k$ , then there exists a unique affine normal group subvariety  $N$  s.t.  $G/N$  is a pseudo-Abelian variety. And this  $N$  is stable under base change.  $\lrcorner$

*Proof:* This follows from (10.1.4.37) and (10.1.5.34)(10.1.5.33).  $\square$

**Prop. (20.9.1.18) [Barsotti-Chevalley].** If  $k = k^{\text{perf}}$ , then any pseudo-Abelian variety over  $k$  is complete hence is an Abelian variety.  $\lrcorner$

*Proof:* Cf. [Mil17]P154.  $\square$

**Cor. (20.9.1.19).** If  $k = k^{\text{perf}}$  and  $G \in \text{GrpVar}/k$ , then there exists a unique affine normal group subvariety  $N \trianglelefteq G$  s.t.  $G/N \in \text{AbVar}/k$ , by (20.9.1.17).  $\lrcorner$

**Thm. (20.9.1.20) [Algebraic Groups are Extensions of Abelian Varieties, Chevalley].** For any  $G \in \text{AlgGrp}_{\text{cnd}}/k$ , there is a unique maximal connected affine normal algebraic subgroup  $N \trianglelefteq G$  s.t.  $G/N \in \text{AbVar}/k$ .  $\lrcorner$

*Proof:* Cf. [Mil17]P155.  $\square$

**Cor. (20.9.1.21).** Any pseudo-Abelian variety  $G$  is commutative.  $\lrcorner$

*Proof:* As  $G$  is smooth and connected, so is  $[G, G]$  (10.1.4.29), so it is a group variety (10.1.4.37). Let  $N$  be given by (20.9.1.20), then because  $G/N$  is an Abelian variety,  $[G, G] \subset N$ . Thus  $[G, G]$  is affine, which implies  $[G, G] = e$ .  $\square$

**Prop. (20.9.1.22) [Totaro(2013)].** Any pseudo-Abelian variety is an extension of a connected unipotent group variety  $U$  by an Abelian variety  $A$  in a unique way.  $\lrcorner$

*Proof:*  $\square$

### Semi-Abelian Varieties

**Def. (20.9.1.23) [Semi-Abelian Varieties].** For  $k \in \text{Field}$ , a **semi-Abelian variety** over  $k$  is a group variety  $A \in \text{GrpVar}/k$  that is an extension of an Abelian variety by a torus.  $\lrcorner$

**Def. (20.9.1.24) [Semi-Abelian Schemes].** For  $S \in \text{Sch}$ , a **semi-Abelian scheme**  $S$  is a commutative smooth group variety  $\mathcal{A} \in \text{GrpVar}/S$  s.t. each fiber is a semi-Abelian variety (20.9.1.23).  $\lrcorner$

### Line Bundles

**Remark (20.9.1.25).** As Abelian varieties over  $k$  are regular,  $\text{Cl}(X) \cong \text{Pic}(X)$ , by (7.5.3.15).  $\lrcorner$

**Prop. (20.9.1.26) [Theorem of the Cube].** If  $X$  is an Abelian variety, and  $L$  is a line bundle over  $X$ , then

$$\Theta(L) = \text{pr}_{123}^*(L) \otimes \text{pr}_{12}^*(L^{-1}) \otimes \text{pr}_{13}^*(L^{-1}) \otimes \text{pr}_{23}^*(L^{-1}) \otimes \text{pr}_1^*(L) \otimes \text{pr}_2^*(L) \otimes \text{pr}_3^*(L)$$

is trivial.  $\lrcorner$

*Proof:* This is trivial on  $0 \times X \times X, X \times 0 \times X, X \times X \times 0$ , so it is trivial, by (7.12.1.23).  $\square$

**Cor. (20.9.1.27).** There is a form of morphisms from a scheme to  $X$ , just by considering  $(f, g, h) : Y \times Y \times Y \rightarrow X \times X \times X$ , i.e.

$$(f + g + h)^*L \otimes (f + g)^*L^{-1} \otimes (f + h)^*L^{-1} \otimes (g + h)^*L^{-1} \otimes f^*L \otimes g^*L \otimes h^*L$$

is trivial.  $\lrcorner$

**Cor. (20.9.1.28) [Theorem of the Square].** Let  $A$  be an Abelian variety that  $\mathcal{L}$  is a line bundle, then for any  $x, y \in A$ ,

$$t_{x+y}^* L \otimes L \cong t_x^* L \otimes t_y^* L \in \text{Pic}(A_{k(x)k(y)}).$$

Notice this isomorphism is defined under the field generated by the residue fields of  $x$  and  $y$ .  $\lrcorner$

*Proof:* Apply the theorem of the cube (20.9.1.27) for  $f = \text{id}_X$  and  $g, h$  the function with constant value  $x, y$ .  $\square$

**Cor. (20.9.1.29).** For a line bundle  $L$  on an Abelian variety  $X$ , then the map  $\varphi_L : X \rightarrow \text{Pic}(X) : x \mapsto [t_x^* L \otimes L^{-1}]$  is a homomorphism.  $\lrcorner$

**Cor. (20.9.1.30).** For any  $\mathcal{L} \in \text{Pic}(A)$ ,

$$[n]^* L \cong L^{n(n+1)/2} \otimes [-1]^* L^{n(n-1)/2}.$$

$\lrcorner$

*Proof:* Use (20.9.1.27) in case  $f = [n], g = [1], h = [-1]$ , then we have:

$$n^* L^2 \otimes (n+1)^* L^{-1} \otimes (n-1)^* L^{-1} \cong (L \otimes [-1]^* L)^{-1}.$$

So we can use induction.  $\square$

**Def. (20.9.1.31) [Even Line Bundle].** Consider the involution  $[-1]$  of  $X$  and its action on the line bundles, then a **even/odd line bundle** is defined to be a line bundle  $L$  that  $[-1]^* \mathcal{L} \cong \mathcal{L}$  (resp.  $\mathcal{L}^{-1}$ ).  $\lrcorner$

**Prop. (20.9.1.32).** On an Abelian variety, there is an even very ample line bundle.  $\lrcorner$

*Proof:* Abelian variety is projective by (20.9.1.3), thus there is a very ample line bundle  $L$ , and  $[-1]^* L$  is also very ample, so  $L \otimes [-1]^* L$  is even and very ample, by (7.5.4.23).  $\square$

**Prop. (20.9.1.33).** For  $F \in \mathbf{NField}$ ,  $A \in \mathbf{AbVar}/F$  and  $c \in \text{Pic}(A)$ , there are an odd line bundle  $c^-$  and an even line bundle  $c^+$  that  $c = c_- + c_+$ .  $\lrcorner$

*Proof:* Consider  $2c = (c + [-1]^*(c)) + (c - [-1]^*(c))$ .  $c - [-1]^*(c)$  is odd thus is in  $\text{Pic}^0(X)$  by (20.9.4.12), thus by (20.9.6.18), there is a  $c^* \in \text{Pic}^0(X)$  that  $2c^* = c - [-1]^*(c)$ . Then  $c = (c - c^*) + c^*$  satisfies the requirement.  $\square$

**Lemma (20.9.1.34).** Let  $S \in \mathbf{Sch}$ ,  $A \in \mathbf{AbVar}/S$  and  $\text{pr}_i : A \times A \rightarrow A$  be the projections and  $m$  be the multiplication, then the following are equivalent:

- $m^*(c) \cong \text{pr}_1^*(c) + \text{pr}_2^*(c)$ .
- $\tau_a^*(c) \cong c$  for  $a \in A$ .

And if these are satisfied,  $c$  is even.  $\lrcorner$

*Proof:* The equivalence is a consequence of the formula  $(m^*(c) - \text{pr}_1^*(c) - \text{pr}_2^*(c))|_{A \times \{a\}} = \tau_a^*(c) - c$  and the see-saw principle (7.12.1.22). the last assertion is a consequence of the first equation pulled back via the morphism

$$A \rightarrow A \times A : a \mapsto (a, -a).$$

$\square$

**Prop. (20.9.1.35) [Projective Embeddings].** No Abelian varieties of dimension  $g$  can be embedded into  $\mathbb{P}^{2g-1}$ . No Abelian variety except for elliptic curves and Abelian surfaces of degree 10 in  $\mathbb{P}^4$  can be embedded into  $\mathbb{P}^{2g}$ .  $\lrcorner$

*Proof:* Cf. [Van de Geer P26], where algebraic topologies are used.  $\square$

## 2 Formal Groups

**Def. (20.9.2.1) [Formal Group Law of Abelian Varieties].** Given  $k \in \mathbf{Field}$ ,  $A \in \mathcal{AbVar}/k$ , the group structure on  $A$  induces a homomorphism  $\mathcal{O}_{A,e} \rightarrow (\mathcal{O}_{A,e} \times \mathcal{O}_{A,e})_{e \times e}$ , whose completion is a formal group law of dimension  $n$ .  $\lrcorner$

## 3 over Alg.Closed Fields

**Notation (20.9.3.1).**

- Let  $k \in \mathbf{Field}$ ,  $k = \bar{k}$ .

$\lrcorner$

**Prop. (20.9.3.2).** There is a closed pt 0 in  $X$  that corresponds to 0 in the group  $X(k)$ , if we denote  $\Omega_0$  the cotangent space at 0, it is the stalk of the differential  $\Omega_{X/k}$  at 0 (7.5.5.6).  $\lrcorner$

**Prop. (20.9.3.3).** Suppose  $k = \bar{k}$ , then for each Albert-algebra  $(D, *)$  (21.2.1.21), there exists  $A \in \mathcal{AbVar}^{\text{sim}}/k$  with a polarization  $\lambda$  s.t.  $(\text{End}^0(A), \text{Ros}_\lambda) \cong (D, *)$ .  $\lrcorner$

*Proof:* Cf. [CCO14]P28.  $\square$

**Prop. (20.9.3.4).** Suppose  $k = \bar{k}$  and  $A \in \mathcal{AbVar}^g/k$ , then  $\dim_k H^1(A, \mathcal{O}_A) \leq g$ . In fact, equality holds by (20.9.4.19).  $\lrcorner$

*Proof:* This follows from Borel's classification of Hopf-algebras (3.11.3.14). Cf. [Van de Geer P94] or [Conrad Notes, P45]. ?  $\square$

**Prop. (20.9.3.5).** Suppose  $k = \bar{k}$ ,  $A \in \mathcal{AbVar}/k$ , and  $X \subset A$  is an integral subvariety. Suppose  $\{a \in A(k) | a + X = X\} = 0$ , then for  $m$  large, the map

$$\alpha_m : X^m \rightarrow A^{m-1} : (x_1, \dots, x_m) \mapsto (x_1 - x_2, x_2 - x_3, \dots, x_{m-1} - x_m)$$

is quasi-finite with generic degree 1.  $\lrcorner$

*Proof:* Cf. [Equidistribution of Small points, Shou-wu]P163. ?  $\square$

## p-Divisible Groups

**Prop. (20.9.3.6).** For  $k \in \mathbf{Field}$ ,  $\text{char } k = p$ ,  $A \in \mathcal{AbVar}/k$ ,  $\ell \in \mathbf{P} \setminus \{p\}$ ,  $A(k^{\text{sep}})$  is an Abelian group and  $A[\ell^n] \cong (\mathbb{Z}/(\ell^n))^{2g}$  and  $A[p^n] \cong (\mathbb{Z}/(p^n))^r$  for some  $r \geq 1$ .  $\lrcorner$

**Prop. (20.9.3.7).** There is an isomorphism

$$H_{\text{ét}}^m(A_{k^{\text{sep}}}, \mathbb{Q}_\ell) \cong \bigwedge_{\mathbb{Q}_\ell}^m (V_\ell(A))^*.$$

$\lrcorner$

*Proof:* Cf. [Grothendieck Monodromy theorem].  $\square$

## 4 Dual Abelian Varieties

References are [CCO14]Section1.4.2.

**Def. (20.9.4.1) [Dual Abelian Varieties].** For  $S \in \text{Sch}$  and  $A \in \text{AbVar}/S$ , the **dual Abelian variety**  $A^\vee$  is defined to be its Picard-scheme  $\text{Pic}_{A/S}^0 \in \text{Sch}^{\text{sep, loc. pf}}/S$  (10.9.3.23), which represents the sheaf  $\widetilde{\text{Pic}}_{A/S}^0 \in \text{Sh}(\text{Sch}_{\text{fppf}}/S)$  (i.e. line bundles with  $e$ -rigidifications (10.9.3.6)). We will see it is an Abelian variety (i.e. smooth) in (20.9.4.19).

By definition, there is a universal line bundle  $p_A \in \text{Pic}(A \times A^\vee)$  with a rigidification along  $e$ .  $\lrcorner$

**Lemma (20.9.4.2).** For  $k \in \text{Field}$  and  $A \in \text{AbVar}/k$ ,  $\mathcal{L} \in \text{Pic}(A)$ , consider the double Picard-map (10.9.3.38)  $\kappa_A : A \rightarrow A^{\vee\vee}$ , then  $\lambda_{\mathcal{L}} = \lambda_{\mathcal{L}}^\vee \circ \kappa_A : A \rightarrow A^\vee$ .  $\lrcorner$

*Proof:* Cf. [van Der Geer, P100].  $\square$

**Lemma (20.9.4.3) [Double Duality Theorem].** For  $k \in \text{Field}$  and  $A \in \text{AbVar}/k$ , the double Picard-map (10.9.3.38)  $\kappa_A : A \rightarrow A^{\vee\vee}$  is an isomorphism.  $\lrcorner$

*Proof:* Cf. [van Der Geer, P101].  $\textcolor{red}{?}$   $\square$

**Prop. (20.9.4.4) [Dual Abelian Schemes].** If  $S \in \text{Sch}$  and  $A \in \text{AbVar}/S$ , then

- $\text{Pic}_{A/S}^0 = \text{Pic}_{A/S}^\tau$  is a projective Abelian scheme over  $S$ , called the **dual Abelian scheme** of  $A/S$ .
- the double Picard-map (10.9.3.38)  $A \rightarrow A^{\vee\vee}$  is an isomorphism.  $\lrcorner$

*Proof:* By reducing to the fiber, these reduces to the case that  $S$  is a field, and this case follows from (20.9.4.19) and (20.9.4.3).  $\square$

**Def. (20.9.4.5) [Symmetric Homomorphisms].** For  $S \in \text{Sch}$  and  $A \in \text{AbVar}/S$ , a homomorphism  $\alpha : A \rightarrow A^\vee$  over  $S$  is called a **symmetric homomorphism** if

$$\alpha = \alpha^\vee \circ \kappa_{A/S} : A \rightarrow (A^\vee)^\vee \rightarrow A^\vee \text{ (20.9.4.3).}$$

$\lrcorner$

### Ample Line Bundles

**Prop. (20.9.4.6) [ $A \rightarrow A^\vee$  Induced by Line Bundles].** Let  $S \in \text{Sch}$  and  $A \in \text{AbVar}/S$ . For any  $\mathcal{L} \in \text{Pic}_{A/S}(S)$  (line bundles with a rigidification (10.9.3.2)), there is a **Mumford line bundle** on  $A \times A$  given by

$$\Lambda(\mathcal{L}) = m^* \mathcal{L} - \text{pr}_1^* \mathcal{L} - \text{pr}_2^* \mathcal{L},$$

where  $m : A \times A \rightarrow A$  is the product. It is in  $\text{Pic}^0(A)$  because  $u : \Lambda(c)|_{e \times A} \cong \mathcal{O}_S$  and  $\Lambda(\mathcal{L})|_{A \times a} = \tau_a^* c - c$ . Then by definition, this line bundle corresponds to a morphism  $\lambda_{\mathcal{L}} : A \rightarrow A^\vee$  over  $S$ , and by (10.9.3.35)  $\lambda_c(a) = \tau_a^* c - c \in A^\vee(k(a))$ . This is also a homomorphism of Abelian schemes, by (20.9.1.4), as  $\varphi_c(e) = e$ .

It is clear that  $\mathcal{L} \mapsto \lambda_{\mathcal{L}}$  is a group homomorphism  $\text{Pic}_{A/S}(S) \mapsto \text{Hom}_S(A, A^\vee)$ . Also, denote  $K(\mathcal{L}) = \ker(\lambda_{\mathcal{L}})$ .  $\lrcorner$

**Cor. (20.9.4.7).** Situation as in (20.9.4.6),  $\lambda_{\mathcal{L}}$  is symmetric.  $\lrcorner$

*Proof:* This is because  $\Lambda(\mathcal{L})$  is symmetric(20.9.4.5).  $\square$

**Cor. (20.9.4.8).** For  $x \in A(k)$ ,  $\lambda_{\tau_x^* \mathcal{L}} = \lambda_{\mathcal{L}}$ .  $\lrcorner$

*Proof:* This follows from see-saw lemma, by observing that stalks of the line bundles in(20.9.4.6) are  $\tau_{a+x}^* \mathcal{L} - \tau_x^* \mathcal{L}$  and  $\tau_a^* \mathcal{L} - \mathcal{L}$  resp..  $\square$

**Cor. (20.9.4.9).**  $(\text{id}_A, \varphi_{\mathcal{L}})^* p_A = \mathcal{L} \otimes [-1]^* \mathcal{L}$ .  $\lrcorner$

*Proof:*

$$(\text{id}_A, \varphi_{\mathcal{L}})^* p_A = \Delta_A^*(\text{id} \times \lambda_{\mathcal{L}})^* p_A = \Delta_A^*(m^* \mathcal{L} - \text{pr}_1^* \mathcal{L} - \text{pr}_2^* \mathcal{L}) = [2]^* \mathcal{L} \otimes \mathcal{L}^{-2} \cong \mathcal{L} \otimes [-1]^* \mathcal{L} \text{ (20.9.1.30)}.$$

$\square$

**Prop. (20.9.4.10) [Poincaré-Classes are Even].** The Poincaré-class  $p_A \in \text{Pic}(A \times A^\vee)$  is even.  $\lrcorner$

*Proof:* Let  $b \in A^\vee$ , then

$$([-1]^*(p))|_{A \times \{b\}} = [-1]^*(p|_{A \times \{-b\}}) = [-1]^*(-b) = b.$$

and

$$([-1]^*(p))|_{\{0\} \times A^\vee} = [-1]^*(p|_{\{0\} \times \widehat{A}}) = 0.$$

Thus  $[-1]^* p \cong p$  by(10.9.3.35) and the see-saw principle(7.12.1.22).  $\square$

**Lemma (20.9.4.11).** If  $b \in \text{Pic}(A)$  and  $\lambda_b = 0$ , then for any ample  $c \in \text{Pic}(A)$ , there is some  $a \in A(K)$  that  $b = \tau_a^*(c) - c$ .  $\lrcorner$

*Proof:* [Mumford, P77].  $\square$

**Thm. (20.9.4.12) [Characterizing  $A^\vee$ ].** For  $\mathcal{L} \in \text{Pic}(A)$ ,  $[-1]^*(\mathcal{L}) \otimes \mathcal{L}^{-1} \in \text{Pic}^0(A)$ , and the following are equivalent:

1.  $\mathcal{L} \in \text{Pic}^0(A)$ .
2.  $\lambda_{\mathcal{L}} = 0$ .
3. For every ample line bundle  $c \in \text{Pic}(A)$ , there is an  $a \in A$  that  $\mathcal{L} \cong \tau_a^*(c) - c$ .
4. There is an ample line bundle  $c \in \text{Pic}(A)$  and an  $a \in A$  s.t.  $\mathcal{L} \cong \tau_a^*(c) - c$ .
5.  $\mathcal{L}$  is odd.
6. For any scheme  $X$ , the map  $\text{Mor}(X, A) \rightarrow \text{Pic}(X) : \varphi \mapsto \varphi^*(c)$  is a group homomorphism.

$\lrcorner$

*Proof:*  $2 \rightarrow 3$  is lemma(20.9.4.11).  $4 \rightarrow 1$  is by(20.9.4.6).  $3 \rightarrow 4$  is trivial.

$1 \rightarrow 2$ :  $\mathcal{L} \in \text{Pic}^0(A)$  corresponds to a section  $[\mathcal{L}] : k \rightarrow \underline{\text{Pic}}_A^0$ . Let

$$\Lambda(p_A) = (m \times \text{id}_{\underline{\text{Pic}}^0(A)})^*(p_A) - (\text{pr}_1 \times \text{id}_{\underline{\text{Pic}}^0(A)})^*(p_A) - (\text{pr}_2 \times \text{id}_{\underline{\text{Pic}}^0(A)})^*(p_A),$$

then it corresponds to a map  $\Lambda : A \times \underline{\text{Pic}}_A^0 \rightarrow \underline{\text{Pic}}_A^0$  s.t.

$$\lambda_{\mathcal{L}} = \Lambda \circ (i_1 \times [\mathcal{L}]) : A \rightarrow \underline{\text{Pic}}_A^0.$$

But  $\Lambda(A \times \{0\}) = 0$ , so by rigidity lemma(7.12.1.20) it factors through the projection  $\text{pr}_1$ . Thus  $\lambda_{\mathcal{L}} = 0$ .

$6 \rightarrow 5$  is trivial, and 6 is clearly equivalent to the assertion when  $X = A$ , and it is equivalent to 2 by (20.9.1.34).

We next prove  $[-1]^*(c) - c \in \text{Pic}^0(A)$ : because  $[-1]\tau_a = \tau_{-a}[-1]$ , we have

$$\tau_a^*([-1]^*(c)) - [-1]^*(c) = [-1](\tau_{-a}^*(c) - c).$$

since  $\tau_{-a}^*(c) - c \in \text{Pic}^0(X)$  by (20.9.4.6), the equation is equal to  $c - \tau_{-a}^*(c)$  by implication  $1 \rightarrow 2 \rightarrow 6$ . and this further equals  $\tau_a^*(c) - c$  by the theorem of square (20.9.1.28). Then

$$\tau_a^*([-1]^*(c) - c) - ([-1]^*(c) - c) = 0.$$

Hence  $[-1]^*(c) - c \in \text{Pic}^0(A)$  by the implication  $2 \rightarrow 3 \rightarrow 4 \rightarrow 1$ .

$5 \rightarrow 1$ : Let  $c$  be an odd element, then  $-2c = [-1]^*(c) - c \in \text{Pic}^0(A)$  by what just proved, we have  $c \in \text{Pic}^0(A)$ , then  $\varphi_c$  has image in the kernel of  $[2]$  on  $\hat{A}$ , by the implication  $1 \rightarrow 2$ , thus it has trivial image, by (20.9.6.18).  $\square$

**Cor. (20.9.4.13).**  $\mathcal{L} \mapsto \lambda_{\mathcal{L}}$  induces an injection

$$\text{NS}(A_{\bar{k}}) = \text{Pic}(A_{\bar{k}}) / \text{Pic}^0(A_{\bar{k}}) \hookrightarrow \text{Hom}(A_{\bar{k}}, A_{\bar{k}}^{\vee}).$$

┘

**Cor. (20.9.4.14) [Abelian Varieties are Finite Torsion-Free].** For  $k \in \text{Field}$  and  $A \in \text{AbVar}/k$ ,  $\text{NS}(A_{\bar{k}})$  is a finite free  $\mathbb{Z}$ -module. (Although this is true for any complete variety?).  $\square$

*Proof:* This follows from (20.9.4.13) and (20.9.6.12).  $\square$

**Cor. (20.9.4.15).** Let  $S \in \text{Sch}$  and  $A \in \text{AbVar}/S$ . If  $b$  is a section of  $\underline{\text{Pic}}_{A/S}^0 \rightarrow S$ , and  $\mathcal{L} = b^*(p_A) \in \text{Pic}(A)$ , then  $\lambda_A = 0$ .  $\square$

*Proof:*  $\square$

**Cor. (20.9.4.16).** For  $\mathcal{L} \in \text{Pic}(A)$  and  $n \in \mathbb{Z}$ ,  $\lambda_{[n]\mathcal{L}} = n^2 \lambda_{\mathcal{L}}$ .  $\square$

*Proof:* By (20.9.1.30), it suffices to prove for  $n = -1$ . And this follows from (20.9.4.12) and the fact  $[-1]^*\mathcal{L} \otimes \mathcal{L}^{-1} \in \text{Pic}^0(A)$ .  $\square$

**Prop. (20.9.4.17).** Let  $k \in \text{Field}$ ,  $A \in \text{AbVar}/k$ . For  $\lambda \in \text{Hom}(A, A^{\vee})$ , consider  $\mathcal{M} = (\text{id}, \lambda)^* p_A$ , then  $\lambda_{\mathcal{M}} = \lambda + \lambda^{\vee}$ . In particular, if  $\lambda$  is symmetric, then  $\varphi_{\mathcal{M}} = 2\lambda$ .  $\square$

*Proof:* [Geer]P159.  $\square$

**Prop. (20.9.4.18) [Ample Implies Non-Degenerate].**  $\mathcal{L} \in \text{Pic}(A)$  is ample iff it is non-degenerate and  $H^0(A, \mathcal{L}) \neq 0$ .  $\square$

In particular, an effective line bundle on  $A$  is ample iff it is non-degenerate.  $\square$

*Proof:* Cf. [Diophantine Geometry, P253] or [Conrad notes].  $\square$

**Cor. (20.9.4.19) [Dual Abelian Variety].** Let  $k \in \text{Field}$  and  $A \in \text{AbVar}/k$ , then

$$A^{\vee} = \underline{\text{Pic}}_{X/S}^0 = \underline{\text{Pic}}_{X/S, \text{red}}^0 = \underline{\text{Pic}}_{X/S}^{\tau}$$

is also an Abelian variety, and  $\dim A = \dim A^{\vee} = \dim_k H^1(A, \mathcal{O}_A)$ .  $\square$

*Proof:* Take an ample line bundle  $\mathcal{L}$  on  $A$ , then  $\varphi_{\mathcal{L}} : A \rightarrow A^\vee$  has finite kernel, thus  $\dim \hat{A} \geq \dim A$ , but by (20.9.3.4) and (10.9.3.25),  $\dim_k H^1(A, \mathcal{O}_A) = T_e(A^\vee) \leq \dim A$ , thus it is regular by (5.3.5.18).

$\underline{\text{Pic}}_{X/S}^\tau = \underline{\text{Pic}}_{X/S}^0$  because we can pass to the  $k = \bar{k}$ , and use the fact Abelian varieties are torsion-free (20.9.4.14).  $\square$

**Def. (20.9.4.20) [Non-Degenerate Line Bundles].** For  $S \in \text{Sch}$  and  $A \in \text{AbVar}/S$ , a **non-degenerate line bundle** is a rigidified line bundle  $\mathcal{L} \in \underline{\text{Pic}}_{A/S}(S)$  s.t.  $K(\mathcal{L}) = \ker \varphi_{\mathcal{L}}$  is a finite flat group scheme, i.e.  $\varphi_{\mathcal{L}}$  is an isogeny.  $\lrcorner$

## 5 Cohomology on Abelian Varieties

**Thm. (20.9.5.1) [Cohomology of the Poincaré Class].** For  $k \in \text{Field}$  and  $A \in \text{AbVar}^g/k$ , Let  $\text{pr}_2 : A \times A^\vee \rightarrow A^\vee$  be the projection, then

$$R^n \text{pr}_{2*} p_A = e_*(k)^{\delta_{n,g}}, \quad H^n(A \times A^\vee, p_A) = k^{\delta_{n,g}}.$$

$\lrcorner$

*Proof:* Cf. [Conrad, P62] or [Geer, P126]  $\color{red}?$ .  $\square$

**Thm. (20.9.5.2) [Cohomology of Line Bundles].** Let  $k \in \text{Field}$  and  $A \in \text{AbVar}^g/k$ ,  $\mathcal{F} \in \text{Coh}(A)$ , then

1.  $\chi(\mathcal{F}) = \deg(\text{ch}_g(\mathcal{F}))$ .
2. If  $\mathcal{L} \in \text{Pic}(A)$ , then  $\chi(\mathcal{L}) = \deg(c_1(\mathcal{L})^g)/g!$ . In particular,  $\chi(\mathcal{L}^m) = m^g \chi(\mathcal{L})$ .
3.  $\deg(\lambda_{\mathcal{L}}) = \chi(\mathcal{L})^2$ . In particular,  $\deg(\lambda_{\mathcal{L}})$  is a square. Notice if  $\mathcal{L}$  is degenerate, then  $\deg(\lambda_{\mathcal{L}}) = 0$ .
4. If  $\mathcal{L} \in \text{Pic}(A)$  is a non-degenerate line bundle, then there is a unique integer  $0 \leq i \leq g$  s.t.  $H^i(X, \mathcal{L}) \neq 0$ . Such an  $i$  is called the **index of  $\mathcal{L}$** . And  $\text{ind}(\mathcal{L}^{-1}) + \text{ind}(\mathcal{L}) = g$ . Notice  $\text{ind}(\mathcal{L}) = 0$  is equivalent to it is effective or equivalent to it being ample (20.9.4.18).
5. Moreover, if  $k = \mathbb{C}$ , and  $A = \text{Lie}(A)/\Lambda$ ,  $\mathcal{L} \in \text{Pic}(A)$ , then  $c_1(\mathcal{L})$  corresponds to a Hermitian form  $H$   $\color{red}?$ , and  $\text{ind}(\mathcal{L})$  is just the number of negative eigenvalues of  $H$ .

$\lrcorner$

*Proof:* 1, 2: Because  $\mathcal{T}_{A/k}$  is trivial, the Todd class  $\text{Todd}(\mathcal{T}_{A/k}) = 1$ , so the assertions follows from [Hirzebruch-Riemann-Roch \(9.1.9.3\)](#).

3, 4. For the last assertion, Cf. [Van de Geer, P131]  $\color{red}?$

$$\dim_k H^n(X \times X, \Lambda(\mathcal{L})) = \deg(\lambda_{\mathcal{L}}) \delta_{n,g},$$

$$H^n(X \times X, \Lambda(\mathcal{L})) \cong H^n(X \times X, m^* \mathcal{L} \otimes \text{pr}_1^* \mathcal{L}^{-1}) \cong H^n(X \times X, \text{pr}_1^* \mathcal{L} \otimes \text{pr}_2^* \mathcal{L}^{-1}) \cong \bigoplus_{p+q=n} H^p(X, \mathcal{L}) \otimes H^q(X, \mathcal{L}^{-1}).$$

So item 4 follows from the two equations above.

5:  $\color{red}?$   $\square$

**Cor. (20.9.5.3).** Let  $k \in \text{Field}$  and  $f : X \rightarrow Y \in \text{IsogAbVar}_k$ , then  $\chi(f^* \mathcal{L}) = \deg(f) \chi(\mathcal{L})$ .  $\lrcorner$

*Proof:* We may base change to  $k = \bar{k}$ . By the proposition and the fact  $c_1(f^*(\mathcal{L})^g) = f^*(c_1(\mathcal{L})^g)$ , it suffices to show that  $\deg(f^*([P])) = \deg(f)$  for any point  $P \in Y(k)$ , which is trivial.  $\square$

**Prop. (20.9.5.4) [Properties of Indices].** For  $k \in \text{Field}$  and  $A \in \text{AbVar}/k$ , then

- The index is a locally constant function in algebraic families of non-degenerate line bundles. In particular, if  $\mathcal{L} \in \text{Pic}(A)$  is non-degenerate and  $\mathcal{L}' \in \text{Pic}^0(A)$ ,  $\text{ind}(\mathcal{L}) = \text{ind}(\mathcal{L} \otimes \mathcal{L}')$ .
- If  $f : B \rightarrow A \in \text{IsogAbVar}_k$ , and  $\mathcal{L} \in \text{Pic}(A)$  a non-degenerate line bundle, then  $\text{ind}(\mathcal{L}) = \text{ind}(f^*\mathcal{L})$ .
- If  $\mathcal{L}$  is non-degenerate, then for  $m \in \mathbb{Z}_+$ ,  $\mathcal{L}^{\otimes m}$  is non-degenerate too, and  $\text{ind}(\mathcal{L}^{\otimes m}) = \text{ind}(\mathcal{L})$ .
- If  $\mathcal{L}_1, \mathcal{L}_2, \mathcal{L}_1 \otimes \mathcal{L}_2 \in \text{Pic}(A)$  are all non-degenerate, then  $\text{ind}(\mathcal{L}_1 \otimes \mathcal{L}_2) \leq \text{ind}(\mathcal{L}_1) + \text{ind}(\mathcal{L}_2)$ .
- If  $\mathcal{L}, \mathcal{L}' \in \text{Pic}(X)$  and  $\mathcal{L}, \mathcal{L} \otimes \mathcal{L}'$  are both non-degenerate, then  $\text{ind}(\mathcal{L} \otimes \mathcal{L}') \leq \text{ind}(\mathcal{L})$ .

⌋

*Proof:* Cf.[Geer, P134].?

□

**Prop. (20.9.5.5).** Let  $k \in \text{Field}$  and  $A \in \text{AbVar}/k$ . Suppose  $\mathcal{L}, \mathcal{H} \in \text{Pic}(A)$  and  $\mathcal{L}, \mathcal{L} \otimes \mathcal{H}$  are both non-degenerate, and that  $\text{ind}(\mathcal{L}) \neq \text{ind}(\mathcal{L} \otimes \mathcal{H})$ , then the polynomial  $P(t) = \deg((c_1(\mathcal{L}) + tc_1(\mathcal{H}))^g)$  has a root  $t \in [0, 1]$ .

⌋

*Proof:* Cf.[Geer, P136].?

□

**Cor. (20.9.5.6).** Let  $k \in \text{Field}$  and  $A \in \text{AbVar}/k$ . Then for any  $\mathcal{L} \in \text{Pic}(A)$  non-degenerate and  $m \in \mathbb{Z}_+$ ,  $\text{ind}(\mathcal{L}^m) = \text{ind}(\mathcal{L})$ .

⌋

*Proof:* ?

□

**Thm. (20.9.5.7) [Kempf-Mumford-Ramanujam].** Let  $\mathcal{L}$  be a line bundle on an Abelian variety  $A$ , and fix an ample line bundle  $H$  on  $A$ , let  $\Phi$  be the Hilbert polynomial of  $\mathcal{L}$  w.r.t.  $H$ , then

- The multiplicity of 0 in  $\Phi$  equals  $\dim K(\mathcal{L})$ .
- If  $\mathcal{L}$  is non-degenerate, then all roots of  $\Phi$  in  $\mathbb{C}$  are real, and the number of positive roots equals  $\text{ind}(\mathcal{L})$ .

⌋

*Proof:* Cf.[Van de Geer, P139,140].

□

**Prop. (20.9.5.8).** For any ample line bundle  $\mathcal{L}$  on  $A$ ,  $\mathcal{L}^{\otimes m}$  is basepoint-free for  $m \geq 2$  and very ample for  $m \geq 3$ .

⌋

*Proof:*

□

**Prop. (20.9.5.9).** Let  $S \in \text{Sch}$  is connected and  $X \in \text{AbVar}/S$ . If  $\mathcal{L} \in \text{Pic}(X)$  is non-degenerate, and there exists an arithmetic point  $s \in S$  s.t.  $\mathcal{L}_s$  is ample on  $X_s$ , then  $\mathcal{L}$  is relatively ample on  $X/S$ . ⌋

*Proof:*

□

## 6 Isogenies and Tate Modules

### Isogenies

**Prop. (20.9.6.1) [Isogenies of Abelian Varieties].** Let  $k \in \text{Field}$  and  $f : X \rightarrow Y \in \text{AbVar}/k$ , the following are equivalent:

- $f$  is an isogeny.

- $f$  is surjective and  $\dim X = \dim Y$ .
- $\ker f$  is a finite group scheme and  $\dim X = \dim Y$ .
- $f$  is finite.

The set of isogenies from  $X$  to  $Y$  is denoted by  $\text{IsogAbVar}(X, Y)$ .  $\text{IsogAbVar}(X, X) \cup \{0\}$  is denoted by  $\text{IsogAbVar}(X)$ .  $\lrcorner$

*Proof:* This follows from the theory of algebraic groups.  $\square$

**Prop. (20.9.6.2) [Separable Isogenies].** For  $f : X \rightarrow Y \in \text{IsogAbVar}_k$ ,

- For any  $Q \in Y(\bar{k})$ ,  $\#f^{-1}(Q)(\bar{k}) = \deg_s(f)$ , and for any  $P \in X$ ,  $e_P(f) = \deg_i(f)$ .
  - The map:  $X[f] \rightarrow \text{Gal}(K(X_{\bar{k}})/\varphi^*(K(Y_{\bar{k}}))) : P \mapsto \tau_P^*$  is an isomorphism of groups.
  - $f$  is unramified iff it is étale iff it is separable, and in this case,  $K(X_{\bar{k}})/K(Y_{\bar{k}})$  is an Abelian Galois extension of degree  $\deg(f)$ .
- $\lrcorner$

*Proof:* 1: By (7.12.3.5), this holds for  $Q$  in a dense open subset of  $Y$ , thus by homogeneity, it holds for all  $Q$ . The second assertion follows from the fact after shrinking  $f$  is finite locally free of rank  $\deg(f)$  by using homogeneity on  $X$ .

2: This is clearly a group homomorphism. By Galois theory, it suffices to show it is injective, which is clear.

3: This follows from (20.9.6.1) and generic unramifiedness (7.6.5.9).  $\square$

**Prop. (20.9.6.3) [Inverse Isogenies].** If  $k \in \text{Field}$ ,  $X, Y \in \text{AbVar}/k$  and  $f \in \text{IsogAbVar}(X, Y)$  with  $d = \deg(f)$ , then there exists  $g \in \text{IsogAbVar}(Y, X)$  s.t.  $g \circ f = [d]_X$ ,  $f \circ g = [d]_Y$ .

In particular, we can write  $X \sim Y$  to denote that  $X, Y$  are isogenous. This is an equivalence relation.  $\lrcorner$

*Proof:* As  $\ker(f)$  is a finite group scheme of rank  $d$ ,  $[d]\ker(f) = 0$  by Deligne's theorem (10.1.2.19), so  $[d]$  factors through  $f$  via  $g : Y \rightarrow X$ , so  $g \circ f = [d]_X$ . Then also  $[d]_Y \circ f = f \circ [d]_X = f \circ (g \circ f) = (f \circ g) \circ f$ , thus  $[d]_Y = f \circ g$  as  $f$  is a quotient map.  $\square$

**Def. (20.9.6.4) [Dual Isogenies].** Let  $\varphi : A \rightarrow B$  in  $\text{IsogAbVar}/S$ , we get a **dual homomorphism**  $\varphi^\vee \in \text{Hom}(B^\vee, A^\vee)$ . Then:

- $\widehat{\widehat{\varphi}} = \varphi$ .
  - $\deg(\varphi^\vee) = \deg(\varphi)$ .
  - $(\varphi + \psi)^\vee = \varphi^\vee + \psi^\vee$ .
  - $[m]_E^\vee = [m]_{E^\vee}$ .
- $\lrcorner$

*Proof:* 1: This is formal.

2: [Conrad, P66]. ?

3: This is clear from the modular description of  $\widehat{A}$ .

4: This follows from 3.  $\square$

**Thm. (20.9.6.5) [Kernels of Dual isogenies].** For  $f : A \rightarrow B \in \text{AbVar}/S$ , there is a canonical isomorphism

$$\ker(f)^D \cong \ker(f^\vee) \in \text{finAbSch}/k.$$

And double duality for Abelian varieties and Cartier-duality are compatible up to a sign: If we identify  $f$  with  $(f^\vee)^\vee$  using  $\kappa_{A/S}$  and  $\kappa_{B/S}$  (20.9.4.3), then the natural isomorphism

$$(\ker(f)^D)^D \cong \ker((f^\vee)^\vee) \cong \ker(f)$$

is the negative of the canonical isomorphism provided by Cartier-duality.

In particular, for each  $n \in \mathbb{Z}_+$ , by (20.9.6.4), there are canonical isomorphisms

$$A[n]^D \cong A^\vee[n].$$

┘

*Proof:* ? Cf. [Abelian Varieties, van der Geer]P100 for the case  $S \in \mathbf{Field}$ , and [Oda, The first de Rham cohomology group and Dieudonne modules]Thm. 1.1, Cor. 1.3 for the general case.  $\square$

**Prop. (20.9.6.6) [Being Isogeny is Clopen].** For  $\varphi : A \rightarrow B \in \mathcal{AbVar}/S$ , the set  $\{s \in S \mid \varphi_s \text{ is an isogeny}\}$  is clopen in  $S$ .  $\square$

*Proof:* Cf. [CC014]P146.  $\square$

Hom( $X, Y$ )

**Def. (20.9.6.7) [Simple Abelian Varieties].** A **simple Abelian variety** is an Abelian variety that has no non-trivial Abelian subvarieties.  $\square$

**Def. (20.9.6.8) [Isotypic Abelian-Varieties].**  $A \in \mathcal{AbVar}/k$  is called an **isotypic Abelian variety** if it is isogenous to  $C^e$  for some  $e \in \mathbb{Z}_+$  and  $C \in \mathcal{AbVar}^{\text{sim}}/k$  (20.9.6.7).  $\square$

**Prop. (20.9.6.9) [Hom( $A, B$ ) and Inseparable Extensions, Chow].** If  $K'/K \in \mathbf{Field}$  and  $K$  is separably closed in  $K'$ , then for any  $A, B \in \mathcal{AbVar}/K$ , the map  $\text{Hom}(A, B) \rightarrow \text{Hom}(A_{K'}, B_{K'})$  is an isomorphism.  $\square$

*Proof:* Cf. [Conrad, Chow's  $K/k$ -image and  $K/k$ -trace, and the Lang-Neron theorem].  $\square$

**Thm. (20.9.6.10) [Poincaré's Complete Reducibility Theorem].** Let  $B$  be an Abelian subvariety of  $A$ , then there exists an Abelian subvariety  $C$  of  $A$  that the addition gives an isogeny

$$B \times C \rightarrow A.$$

┘

*Proof:* Choose an ample line bundle  $c$  on  $A$ , let  $\iota : B \rightarrow A$  be the inclusion and  $\hat{\iota} : \hat{A} \rightarrow \hat{B}$  the dual map, then

$$(\hat{\iota} \circ \lambda_c)|_B = \lambda_{\iota^*(c)}.$$

Since  $\iota^*(c)$  is also ample,  $\varphi_{\iota^*(c)}$  is an isogeny, thus has finite kernel. Let  $C = \ker(\iota \circ \varphi_c)$ , then we have  $C \cap B$  is finite, whence  $B \times C \rightarrow A$  has finite kernel. The dimension theorem (10.1.4.39) applied to  $\iota \circ \varphi_c$  shows

$$\dim C + \dim B^\vee = \dim A^\vee.$$

and this together with (20.9.4.19) shows  $B \times C \rightarrow A$  is a surjection, because  $A$  is irreducible. Thus it is an isogeny.  $\square$

**Cor. (20.9.6.11).** For  $k \in \mathbf{Field}$ ,  $A \in \mathcal{AbVar}/k$ , there are simple Abelian subvarieties  $B_1, \dots, B_n$  of  $A$  that the inclusions give an isogeny

$$B_1 \times \dots \times B_n \rightarrow A.$$

┘

**Prop. (20.9.6.12)**[Hom( $A, A'$ ) is **Finite Free**]. Let  $k$  be a field and  $A, A' \in \mathcal{AbVar}/k$ , then  $\mathrm{Hom}(A_1, A_2)$  w.r.t. the addition is a finite free Abelian group of rank at most  $4g^2$ . ┘

*Proof:* Assume  $[m] \circ \varphi = 0$ , then  $\varphi \circ [m] = 0$ , and use the fact  $[m]$  is surjective (20.9.6.18). The last assertion follows from (21.1.4.3). □

**Def. (20.9.6.13)** [Quasi-Isogenies]. For  $A, A' \in \mathcal{AbVar}/k$ ,  $\mathrm{IsogAbVar}(A, A') \otimes \mathbb{Q}$  is called the set of **quasi-isogenies** from  $A$  to  $A'$ .

Define the category  $\mathrm{IsogAbVar}/k$  to be the category consisting of Abelian varieties over  $k$  with morphisms  $\mathrm{Mor}(A, A') = \mathrm{IsogAbVar}(A, A') \otimes \mathbb{Q}$ . Notice  $f : A \rightarrow A' \in \mathcal{AbVar}/k$  is an isogeny iff  $f$  is an isomorphism in  $\mathrm{IsogAbVar}/k$ , by (7.4.4.20).

Thus by (20.9.6.11),  $\mathrm{IsogAbVar}/k$  is a semisimple  $\mathbb{Q}$ -linear Abelian category. ┘

**Prop. (20.9.6.14)** [ $\mathrm{End}(A)_{\mathbb{Q}}$  is **Semi-Simple**]. For  $A, A' \in \mathcal{AbVar}/k$ , if  $A \sim A'$ , then  $\mathrm{End}(A)_{\mathbb{Q}} = \mathrm{End}(A')_{\mathbb{Q}}$ . Moreover,  $\mathrm{End}_{\mathbb{Q}}(A)$  is a semi-simple  $\mathbb{Q}$ -algebra, and it is simple iff  $A$  is isotypic (20.9.6.8). ┘

*Proof:* These follow from (20.9.6.3) and (20.9.6.11). □

**Def. (20.9.6.15)** [Abelian Varieties of  $\mathrm{GL}(2)$ -Type].  $A \in \mathcal{AbVar}/\mathbb{Q}$  is called an **Abelian variety of  $\mathrm{GL}(2)$ -type** if  $A$  is simple and  $\mathrm{End}(A)_{\mathbb{Q}}$  contains some  $E \in \mathbf{NField}$  with  $[E : \mathbb{Q}] = \dim A$ . ┘

**Thm. (20.9.6.16).**  $A \in \mathcal{AbVar}/\mathbb{Q}$  is of  $\mathrm{GL}(2)$ -type iff it is a simple quotient of  $J_1(N)/\mathbb{Q}$ . ┘

*Proof:* Cf. [Ribet, Abelian Varieties over  $\mathbb{Q}$  and Modular Forms]. And [Serre's Modularity Conjecture 1]P502. ? □

### Tate-Modules

**Prop. (20.9.6.17).** For  $S \in \mathbf{NSch}$ ,  $A \in \mathcal{AbVar}^g/S$ ,  $n \in \mathbb{Z}_+$  and  $n$  is invertible on  $S$ , then  $A[n]$  is a finite locally free  $S$ -group scheme of order  $n^{2g}$ . ┘

*Proof:* ? □

**Prop. (20.9.6.18)** [Multiplication Map, Weil]. Let  $k \in \mathbf{Field}$ ,  $A \in \mathcal{AbVar}/k$ , and  $n \in \mathbb{Z} \cap k^\times$ , then  $[n] : A \rightarrow A$  is finite faithfully flat of degree  $n^{2 \dim A}$ . In particular it is an isogeny (20.9.6.1), and

- If  $n \in \mathbb{Z} \setminus (\mathrm{char} k)$ , then  $[n]$  is finite étale and  $|A[n]| \cong (\mathbb{Z}/n\mathbb{Z})^{2 \dim A}$ .
- If  $n = 0 \in k$ , then  $[n]$  is not separable.
- If  $\mathrm{char} k = p \in \mathbf{P}$ , then  $|A(p)| \cong (\mathbb{Z}/p\mathbb{Z})^r \times \alpha_p^{2g-2r} \times \mu_p^r$  for some  $0 \leq r \leq g$ . In particular,  $A[p^e] = (\mathbb{Z}/(p^e))^r$  for any  $e \geq 0$ . This  $r$  is called the  **$p$ -rank** of  $A$ . It is invariant under isogenies.

┘

*Proof:* 1, 2: Let  $Z = \ker([n])$ , then it is proper. By (20.9.1.30), choose an ample line bundle  $\mathcal{L} = \mathcal{L}(D) \in \text{Pic}(A)$ , then  $\mathcal{O}_Z = \mathcal{L}_Z^{n(n+1)/2} \otimes [-1]^* \mathcal{L}_Z^{n(n-1)/2}$ . As  $\mathcal{L}_Z$  and  $[-1]^* \mathcal{L}_Z$  are both ample,  $\mathcal{O}_Z$  is ample. Now (7.4.4.20) shows  $Z$  is finite. Thus by dimension equation,  $[n]$  is finite and faithfully flat.

The action of  $[n]$  on the tangent space at the origin is given by multiplying by  $n$  by (10.2.2.2), thus it is unramified at the origin iff  $n \in \mathbb{Z} \cap k^*$  by (7.6.5.12), and also on any other closed points by homogeneity. Thus if  $n \in \mathbb{Z} \cap k^*$ ,  $[n]$  is finite étale, and otherwise  $[n]$  is not separable, by (7.6.5.12), as it is not generically unramified.

To calculate  $A[n]$  in the étale case, notice  $[n]^* D = n^2 D$ , and the intersection number formula

$$n^{2g}(D \cdot D \cdot \dots \cdot D) = ([n]^* D \cdot [n]^* D \cdot \dots \cdot [n]^* D) = \deg([n])(D \cdot D \cdot \dots \cdot D)$$

where the intersection is  $g$ -fold, thus  $(D \cdot D \cdot \dots \cdot D)$  equals the degree of the projection embedding of  $X$  via  $\mathcal{L}(D)$  thus positive, so we get  $\deg([n]) = n^{2g} = \#A[n]$  as  $[n]$  is finite étale. To see the structure of  $A[n]$ , notice this is true for any  $m|n$ .

3: ? Cf.[Conrad]. The last assertion follows from the fact the fact  $[p]$  is surjective and the structure theory of Abelian groups.  $\square$

**Def. (20.9.6.19) [Tate-Modules].** For  $A \in \text{AbVar}/k$  and  $\ell \in \text{Prime} \setminus \text{char } k$ , define  $T_\ell(A) \stackrel{\triangle}{=} \varprojlim_{n \geq 0} A[\ell^n]$ , called the **Tate module** of  $A$ . Then it is naturally a  $\mathbb{Z}_\ell$ -module and isomorphic to  $\mathbb{Z}_\ell^{2g}$  by (20.9.6.18).

Also define  $V_\ell(A) = T_\ell(A) \otimes_{\mathbb{Z}_\ell} \mathbb{Q}_\ell$ . There are  $\text{Gal}_k$  actions on them, as  $[\ell^n]$  is étale and  $\text{Gal}_k$  preserves  $A[\ell^n]$  because  $O$  is  $\text{Gal}_k$ -invariant.

For  $\ell = \text{char } k = p > 0$ , we can also define  $T_p(A)$ , which is isomorphic to  $\mathbb{Z}_p^r$  for some  $0 \leq r \leq g$  by (20.9.6.18), but there is not Galois action on it.  $\lrcorner$

**Def. (20.9.6.20) [Adelic Tate Modules].** Situation as in (20.9.6.19), if  $\text{char } k = 0$ , define the **Adelic Tate module** to be

$$T_f(A) = \prod_{\ell \in \text{Prime}} T_\ell(A), \quad V_f(A) = \prod'_{\ell \in \text{Prime}} (V_\ell(A), T_\ell(A)).$$

$\lrcorner$

**Prop. (20.9.6.21) [Étale Cohomology and Tate Modules].** If  $k = k^{\text{sep}}$ ,  $A \in \text{AbVar}^g/k$ , and  $\ell \in \text{Prime} \setminus \text{char } k$ , then

- There are canonical isomorphisms  $H_{\text{ét}}^1(A, \mathbb{Z}_\ell) \cong \text{Hom}_{\mathbb{Z}_\ell}(T_\ell(A), \mathbb{Z}_\ell) \cong T_\ell(A)(1)$ . Thus  $H_{\text{ét}}^1(A, \mathbb{Z}_\ell) \cong \mathbb{Z}_\ell^{2g}$  by (20.9.6.18).
- The cup product defines isomorphisms  $\wedge^r H_{\text{ét}}^1(A, \mathbb{Z}_\ell) \cong H^r(A, \mathbb{Z}_\ell)$  for any  $r > 0$ .

$\lrcorner$

*Proof:* Cf.[Mil08]P55. ?  $\square$

**Cor. (20.9.6.22).** There is a natural  $\text{Gal}_k$ -invariant pairing  $\wedge^r T_\ell(A) \times H_{\text{ét}}^r(A, \mathbb{Z}_\ell) \rightarrow \mathbb{Z}_\ell$ .  $\lrcorner$

**Prop. (20.9.6.23).** For  $A \in \text{AbVar}/k$ ,  $\ell \in \text{Prime} \setminus \{\text{char } k\}$  and  $f \in \text{End}(A)_\mathbb{Q}$ , the representation  $\rho_\ell : \text{End}(A)_\mathbb{Q} \rightarrow \text{End}(V_\ell)$  satisfies:

$$\deg(f) = \det(\rho_\ell(f)).$$

In particular,  $\deg([n] - f) = \det(n - \rho_\ell(f))$  for any  $n \in \mathbb{Z}$ .  $\lrcorner$

*Proof:* ? □

**Thm. (20.9.6.24) [Semisimplicity].** Let  $F \in \mathbf{GField}$ ,  $\ell \in \mathbf{Prime} \setminus \text{char } F$ ,  $A \in \mathbf{AbVar}/F$ , then the action of  $\text{Gal}_F$  on  $V_\ell(A)$  is semisimple. ┘

*Proof:* □

## 7 Polarizations and Weil-Pairings

### Polarizations and Rosati-Involutions

**Def. (20.9.7.1) [Polarizations].** For  $A \in \mathbf{AbVar}/S$ , a **polarization of Abelian variety** of  $X/S$  is a symmetric isogeny  $\lambda : A \rightarrow A^\vee$  s.t. étale-locally  $\lambda$  is of the form  $\lambda_{\mathcal{L}}$  (20.9.4.6) for a relatively ample rigidified line bundle  $\mathcal{L} \in \text{Pic}(A/S)$ . Polarizations are symmetric, by (20.9.4.7).

A **principal polarization of an Abelian variety** is a polarization of degree 1.

The category of Abelian varieties over  $k$  of dimension  $g$  together with a polarization of degree  $d$  is denoted by  $\mathbf{AbVar}^{g, \text{polar}=d}/k$ . ┘

**Prop. (20.9.7.2) [Zarhin's Trick].** For any  $A \in \mathbf{AbVar}/k$ ,  $(A \times A^\vee)^4$  is canonically principally polarized. ┘

*Proof:* Cf. [Mil08] P60. □

**Thm. (20.9.7.3) [Finitely Many Polarizations].** For any  $A \in \mathbf{AbVar}/k$  and  $d \in \mathbb{Z}_+$ , there are only f.m. isomorphism classes of polarizations on  $A$  of degree  $d$ . ┘

*Proof:* Cf. [Mil08] P63. □

**Def. (20.9.7.4) [Rosati-Involutions].** For  $A \in \mathbf{AbVar}/k$  and  $\lambda : A \rightarrow A^\vee$  a polarization (20.9.7.1), the inverse  $\lambda^{-1} \in \text{Hom}(A^\vee, A)_{\mathbb{Q}}$  is definable by (20.9.6.3). Then the **Rosati-involution** corresponding to  $\lambda$  is defined to be the map

$$\text{End}(A)_{\mathbb{Q}} \rightarrow \text{End}(A)_{\mathbb{Q}} : \alpha \mapsto \lambda^{-1} \circ \alpha^\vee \circ \lambda.$$

Then it is an involution. ┘

**Prop. (20.9.7.5) [Rosati Involutions are Positive].** For  $A \in \mathbf{AbVar}/k$ , the bilinear form

$$(\alpha, \beta) \mapsto \text{tr}(\alpha \circ \beta^\dagger) : \text{End}(A)_{\mathbb{Q}}^2 \rightarrow \mathbb{Q}$$

is positive definite. ┘

*Proof:* □

**Prop. (20.9.7.6).** Let  $k \in \mathbf{Field}$  and  $(A, \lambda) \in \mathbf{AbVar}/k$ , then

- $\# \text{Aut}((A, \lambda)) < \infty$ .
  - for any  $n \geq 3$ , any automorphism of  $(A, \lambda)$  acting trivially on  $A[n]$  is the identity.
- ┘

*Proof:* Cf. [Milne, P62] ? □

**Weil-Pairings**

**Thm. (20.9.7.7)[Weil-Pairings].** Let  $S \in \text{Sch}$  and  $X, Y \in \text{AbVar}/S$ , then for any isogeny  $\alpha : X \rightarrow Y$ , there is a perfect pairing

$$e_\alpha : \ker(\alpha) \times \ker(\alpha^\vee) \rightarrow \mathbb{G}_m.$$

┘

*Proof:* Cf.[Mumford, P143] **?**.

□

**Def. (20.9.7.8)[Induced Pairings].** For  $k \in \text{Field}$ ,  $A \in \text{AbVar}$ , if  $e_m$  is any Weil pairing, and  $\lambda : A \rightarrow A^\vee \in \text{IsogAbVar}/k$ , denote

$$e_m^\lambda = e_m \circ (\text{id} \times \lambda) : A[m] \times A[m] \rightarrow \mu_m(1).$$

┘

**Def. (20.9.7.9).** Let  $k \in \text{Field}$ ,  $\ell \in \mathbb{P}$  and  $\text{char } k \neq 2, \ell$ . Then for  $A \in \text{AbVar}/k$ ,  $\lambda \in \text{Hom}(A, A^\vee)$  is

┘

**Prop. (20.9.7.10)[Weil-Pairings for Elliptic Curves].** Let  $E \in \text{EllCur}/k$ , then for any  $m \in \mathbb{Z} \cap k^*$ , there is a non-degenerate pairing

$$e_m : E[m] \times E[m] \rightarrow \mu_m$$

that is alternating, non-degenerate and  $\text{Gal}_k$ -invariant.

Moreover,  $e_{mm'}(S, T) = e_m([m']S, T)$  for  $S \in E[mm']$  and  $S \in T[m]$ . In particular, for  $\ell \in \mathbb{P} \setminus \text{char } k$ , we can define a Weil pairing on the Tate module

$$e : T_\ell(E) \times T_\ell(E) \rightarrow \mu_{\ell^\infty}.$$

┘

*Proof:* Let  $T \in E[m]$ , then by (21.3.1.23), there exists some  $f \in \overline{K}(E)^*$  s.t.  $\text{div}(f) = m[E] - m[O]$ . Let  $T' \in E[m^2]$  s.t.  $mT' = T$ , then there exists a function  $g \in \overline{K}(E)^*$  s.t.

$$\text{div}(g) = [m]^*(T) - [m]^*(O) = \sum_{R \in E[m]} ([T' + R] - [R]).$$

Notice  $f \circ [m]$  and  $g^m$  have the same divisor, so we may assume  $f \circ [m] = g^m$ . Then for any  $S \in E[m]$  and  $X \in E$ ,  $g(S + X)^m = f(mX) = g(X)^m$ , so  $E \rightarrow \mathbb{P}^1 : g(X + S)/g(X)$  is constant and has value in  $\mu_m$ , denote it by  $e(T, S)$ .

For bilinearity, Cf.[Sil16]P94 **?**.

For alternating, Cf.[Sil16]P94 **?**.

For non-degeneracy, if  $e_m(S, T) = 1$  for any  $T \in E[m]$ , then  $g$  is  $E[m]$ -invariant, which implies  $g = h \circ [m]$  for some  $h \in \overline{K}(E)^*$  by (20.9.6.2) and the fact  $[m]$  is separable. Then  $(h \circ [m])^m = f \circ [m]$ , so  $f = h^m$ , and  $\text{div}(h) = [T] - [O]$ , so  $T = O$ .

Galois invariance is clear.

The last assertion follows by taking  $g' = g \circ [m']$  and  $f' = f^{m'}$ .

□

**Cor. (20.9.7.11)[Primitive Pairing].** Let  $E \in \text{EllCur}/k$ , then for any  $m \in \mathbb{Z} \cap k^*$ ,  $\mu_m \subset K(E[m])$ , and there exists some  $S, T \in E[m]$  s.t.  $e_m(S, T)$  is a primitive  $m$ -th roots of unity.

┘

*Proof:* If the subgroup generated by all  $e_m(S, T)$  is  $\mu_d$ , then  $e_m([d]S, T) = 1$  for any  $S, T \in E[m]$ , so  $[d]S = 0$  by non-degeneracy, so  $d = m$  because  $\#E[m] = (\mathbb{Z}/(m))^2$ . Then the  $\text{Gal}_k$ -invariance of  $e$  shows  $\mu_m \subset K(E[m])$ .  $\square$

**Prop. (20.9.7.12) [Duality with Isogenies].** Let  $k \in \mathbf{Field}$  and  $\varphi : E_1 \rightarrow E_2 \in \text{IsogAbVar}_k^1$ ,  $m \in \mathbb{Z} \in k^*$ , then for  $S \in E_1[m], T \in E_2[m]$ ,

$$e_m(S, \varphi^\vee(T)) = e_m(\varphi(S), T).$$

In particular, for  $S \in T_\ell(E_1)$  and  $T \in T_\ell(E_2)$ ,  $e(S, \varphi^\vee(T)) = e(\varphi(S), T)$ .  $\lrcorner$

*Proof:* Cf. [Sil16]P97?.  $\square$

**Prop. (20.9.7.13).** Let  $E \in \text{EllCur}/k$  and  $\varphi \in \text{End}(E)$ ,  $\ell \in \mathbf{P} \setminus \text{char } k$ , then  $\det(\varphi_\ell) = \deg(\varphi)$ ,  $\text{tr}(\varphi_\ell) = 1 + \deg(\varphi) - \deg(1 - \varphi)$ .  $\lrcorner$

*Proof:* For any  $v, v' \in T_\ell(E)$ , use the Weil pairing:

$$e(v, v')^{\deg(\varphi)} = e([\deg(\varphi)]v, v') = e(\varphi_\ell v, \varphi_\ell v') = e(v, v')^{\det(\varphi_\ell)},$$

thus  $\deg(\varphi) = \det(\varphi_\ell)$ . The latter equality follows from the identity  $\text{tr}(A) = 1 + \det(A) - \det(1 - A)$  for any  $A \in M_2(R)$ .  $\square$

## 8 over Archimedean Local Fields

**Prop. (20.9.8.1) [Complex Abelian Varieties and Complex Tori].** By (16.10.5.9) and GAGA (16.9.7.17),  $\text{AbVar}/\mathbb{C}$  is the same as the category of complex tori  $V/\Lambda$  with a Riemann form  $\omega : \wedge^2 \Lambda \rightarrow \mathbb{Z}$  (16.10.5.9).

Such a complex tori  $V/\Lambda$  is called a **polarizable integral Hodge structure**.  $\lrcorner$

**Def. (20.9.8.2) [Types of Polarizations].** Given a complex tori  $X = V/\Lambda$  of dimension  $d$  with a Riemann form  $\omega$ , there exists a basis of  $\Lambda$  and  $d_1 | d_2 | \dots | d_n \in \mathbb{Z}_+$  s.t. the matrix  $\omega$  w.r.t. this basis is

$$\begin{bmatrix} & D \\ -D & \end{bmatrix}, \quad D = \text{diag}(d_1, \dots, d_n),$$

then  $X$  is said to have type  $D$ .  $\lrcorner$

**Prop. (20.9.8.3) [Abelian Varieties with Polarizations].** For  $n \in \mathbb{Z}_+$  and  $d_1 | d_2 | \dots | d_n \in \mathbb{Z}_+$ , the set of polarized Abelian varieties over  $\mathbb{C}$  of type  $D = \text{diag}(d_1, \dots, d_n)$  with a symplectic basis is in bijection with the set of  $\text{GL}(n, \mathbb{C})$  orbits of isomorphisms of real vector spaces  $\Pi_{\mathbb{R}} : U_D \otimes \mathbb{R} \rightarrow \mathbb{C}^g$  s.t. for any  $x, y \in V$ ,

$$(\Pi_{\mathbb{R}}^{-1}ix, \Pi_{\mathbb{R}}^{-1}iy)_D = (\Pi_{\mathbb{R}}^{-1}x, \Pi_{\mathbb{R}}^{-1}y)_D,$$

and the symmetric form

$$(x, y) \mapsto (\Pi_{\mathbb{R}}^{-1}ix, \Pi_{\mathbb{R}}^{-1}y)_D$$

is positive definite.

And it is moreover canonical in bijection to the Siegel upper half space  $\mathcal{H}_n$  (16.2.6.6).  $\lrcorner$

*Proof.* For any  $X = V/U \in \text{AbVar}^n/\mathbb{C}$  with a Riemann form  $\omega$  of type  $D$  and a basis  $\{u_1, \dots, u_n, v_1, \dots, v_n\}$  of  $U$  s.t. the matrix of  $\omega$  is  $\begin{bmatrix} & D \\ -D & \end{bmatrix}$ . Then by choosing any complex basis  $e_1, \dots, e_n$  of  $V$ , we get an isomorphism  $U \otimes \mathbb{R} \cong \mathbb{C}^g$ , and we can represent  $\{u_i\}$  in the basis  $\{e_i\}$  s.t.

$$(e_1, \dots, e_n, ie_1, \dots, ie_n) = \Pi_{\mathbb{R}}(u_1, \dots, u_n, v_1, \dots, v_n), \quad \Pi_{\mathbb{R}} = \begin{bmatrix} \Pi_{11} & \Pi_{12} \\ \Pi_{21} & \Pi_{22} \end{bmatrix} \in \text{Mat}(2n, \mathbb{R}).$$

Then

$$(e_1, \dots, e_n)(\Pi_{11} + i\Pi_{21}, \Pi_{21} + i\Pi_{22})(u_1, \dots, u_n),$$

and  $\Pi = (\Pi_{11} + i\Pi_{21}, \Pi_{21} + i\Pi_{22})$  as in (16.10.5.11). Then the first assertion follows from (16.10.5.9). Notice the  $\text{GL}(n, \mathbb{C})$ -orbit relation comes from the arbitrariness of the choice of basis  $e_1, \dots, e_n$ .

For the second assertion, notice that in each  $\text{GL}(n, \mathbb{C})$ -orbit, there is a canonical choice of basis  $\{e_1, \dots, e_n\}$  s.t.  $e_i = \frac{1}{d_i}v_i$ . Then in this basis,

$$\Pi_{\mathbb{R}} = \begin{bmatrix} \Pi_{11} & D \\ \Pi_{21} & 0 \end{bmatrix}, \quad \Pi = (\Pi_{11} + i\Pi_{12}, D).$$

So if  $Z = \Pi_{11} + i\Pi_{12}$ , the Riemann relations (16.10.5.11) are just equivalent to

$$\{Z^t = Z, \quad \text{Im}(Z) \in \text{Pos}(n, \mathbb{C})\}.$$

□

**Cor. (20.9.8.4).** For  $n \in \mathbb{Z}_+$  and  $d_1|d_2|\dots|d_n \in \mathbb{Z}_+$ , the set of polarized Abelian varieties over  $\mathbb{C}$  of type  $D = \text{diag}(d_1, \dots, d_n)$  with a symplectic basis is in bijection with the set of homomorphisms of real algebraic groups  $h_1 : S_1 \rightarrow \text{Sp}_{\mathbb{R}}(U_D)$  satisfying

- The complexification  $h_{1,\mathbb{C}} : \mathbb{C}^\times \rightarrow \text{Sp}_{\mathbb{R}}(U_D \otimes \mathbb{C})$  has weights  $\pm 1$  with multiplicities  $n$ .
- the symmetric form  $(x, y) \mapsto (h_1(i)x, y)_D$  is positive definite.

┘

**Cor. (20.9.8.5) [Classifying Abelian Varieties with Polarizations].** It follows from (20.9.8.3) that for  $n \in \mathbb{Z}_+$  and  $d_1|d_2|\dots|d_n \in \mathbb{Z}_+$ , the set of isomorphisms of Abelian varieties over  $\mathbb{C}$  of type  $D = \text{diag}(d_1, \dots, d_n)$  with a symplectic basis is bijection with the set

$$\text{Sp}_D(\mathbb{Z}) \backslash \mathcal{H}_n.$$

┘

**Prop. (20.9.8.6) [Dual Riemann Forms].** If  $X = V/\Lambda$  is a complex torus with a Riemann form  $\omega$ , then the dual complex torus (16.10.5.8)  $X^\vee$  also has a Riemann form defined as follows: any  $f \in V^*$  corresponds to an element  $v_f$  s.t.  $f(u) = \omega(u, v_f)$ . Thus we can define  $\omega'(f, g) = \omega(v_f, v_g)$ . And there is an isogeny (i.e. surjective isomorphism with finite kernel)

$$A \rightarrow A^\vee : \bar{a} \mapsto [x \mapsto \omega(x, a)]$$

which is compatible with the Riemann forms.

┘

**Prop. (20.9.8.7) [Rosati-Involutions are Positive].** Let  $X = V/\Lambda \in \mathcal{AbVar}/\mathbb{C}$ , then for any  $\alpha \in \text{End}_{\mathbb{Q}}(X)$ , there exists  $\alpha' \in \text{End}_{\mathbb{Q}}(X)$  s.t.

$$\omega(\alpha x, y) = \omega(x, \alpha' y).$$

And this determines an involution on  $\text{End}_{\mathbb{Q}}(X)$ , called the **Rosati-involution**. Notice this is compatible with that defined in (20.9.7.4), by using (20.9.8.6).

Then this is a positive involution on  $\text{End}_{\mathbb{Q}}(X)$ .  $\lrcorner$

*Proof:* Notice the form  $\omega_J : (x, y) \mapsto \omega(x, Jy)$  is symmetric and positive, and

$$\omega_J(\alpha x, y) = \omega(\alpha x, Jy) = \omega(x, \alpha' Jy) = \omega(x, J\alpha' y) = \omega_J(x, \alpha' y).$$

So this involution is positive by (21.2.1.20).  $\square$

### Elliptic Curve Case

**Prop. (20.9.8.8) [Complex Tori as Elliptic Curves].** Let  $\Lambda$  be a complete lattice of  $\mathbb{C}$ , then we can make  $\mathbb{C}/\Lambda$  into a Riemannian surface as the quotient space of  $\mathbb{C}$ . Then it is positive by??t is a smooth curve of genus 1 with the origin as the rational point, which means it is an elliptic curve.  $\lrcorner$

**Prop. (20.9.8.9) [Elliptic Curve as Complex Tori].** For an elliptic curve  $\mathbb{C}/\Lambda$  over  $\mathbb{C}$ , by (12.5.6.7), the Weierstrass functions (12.5.6.5)  $\wp, \wp'$  are just the rational functions in (21.3.1.7), so the map

$$z \mapsto [\wp(z), \wp'(z), 1]$$

is biholomorphic from  $\mathbb{C}/\Lambda$  to the elliptic curve defined by the equation  $y^2 = 4x^3 - g_2(\Lambda)x - g_3(\Lambda)$  that  $g_2^3 - 27g_3^2 \neq 0$ . And it also preserves the group structure.  $\lrcorner$

*Proof:* To show that the homomorphism preserves group structure, notice that if  $z_1, z_2, z_3$  maps to three points that is colinear, then they satisfy a equation

$$f(z) = a\wp(z) + b\wp'(z) + c.$$

If  $b \neq 0$ , then this is a meromorphic function with three poles, thus three zeros, which is exactly  $z_1, z_2, z_3$ , so by (12.5.6.2),  $z_1 + z_2 + z_3 \equiv 0 \pmod{\Lambda}$ . If  $b = 0$ , then  $z_3 = 0$ , which corresponds to the point  $(1, 0, 0) \in \mathbb{P}^2$ , then the same argument shows  $z_1 + z_2 + 0 \equiv 0 \pmod{\Lambda}$ .  $\square$

**Lemma (20.9.8.10) [Isogenies and Homogeneities].** If  $E_1, E_2$  are elliptic curves in  $\mathbb{P}^2$  corresponding to  $\Lambda_1, \Lambda_2$  via (20.9.8.9) resp., then the natural map

$$\{\text{isogenies } E_1 \rightarrow E_2\} \rightarrow \{\text{non-constant holomorphic maps } \varphi : \mathbb{C}/\Lambda_1 \rightarrow \mathbb{C}/\Lambda_2, \varphi(0) = 0\}$$

is a bijection.  $\lrcorner$

*Proof:* By (16.10.5.2), it suffices to show for any lattices  $\Lambda_1, \Lambda_2$  and  $\alpha \in \mathbb{C}^*$  that  $\alpha\Lambda_1 \subset \Lambda_2$ , the map

$$[\wp(z, \Lambda_1), \wp'(z, \Lambda_1), 1] \rightarrow [\wp(\alpha z, \Lambda_2), \wp'(\alpha z, \Lambda_2), 1]$$

is a morphism. For this, notice  $\wp(\alpha z, \Lambda_2)$  is an elliptic function for  $\Lambda_1$ , thus by (12.5.6.7), it is a rational function of  $\wp(z, \Lambda_1)$  and  $\wp'(z, \Lambda_1)$ .  $\square$

**Lemma (20.9.8.11).** Let  $E \in \text{EllCur}/\mathbb{C}$  be contained in  $\mathbb{P}^2$ , defined by a Weierstrass equation, then there exists a lattice  $\Lambda \subset \mathbb{C}$ , unique up to homothety, that the embedding given in (20.9.8.9) induces an isomorphism  $\mathbb{C}/\Lambda \cong E(\mathbb{C})$ .  $\lrcorner$

*Proof:* This is a consequence of (12.5.6.8) and (21.3.1.15).  $\square$

**Thm. (20.9.8.12) [Elliptic Curves and Complex Tori, Weierstrass].** The following categories are equivalent:

- $\text{IsogAbVar}^1/\mathbb{C}$ .
- Category of complex tori with morphisms homomorphisms preserving 0.
- Category of lattices in  $\mathbb{C}$  with homotheties as morphisms.

$\lrcorner$

*Proof:* This is a consequence of (20.9.8.9)(20.9.8.10) and (16.10.5.2).  $\square$

**Cor. (20.9.8.13) [ $j$ -Functions Coincide].** In this correspondence, If  $E \cong E_\tau = \mathbb{C}/(\mathbb{Z} + \mathbb{Z}\tau)$  for some  $\tau \in \mathcal{H}$ , then  $E$  is given by the Weierstrass equation

$$W : y^2 = x^4 - \frac{g_2(\Gamma)}{4}x - \frac{g_3(\Gamma)}{4}.$$

Then

$$\Delta(W) = \Delta(\tau), \quad j(E) = j(\tau).$$

$\lrcorner$

*Proof:* Comparing the definitions and use the definitions of  $E_4, E_6, G_4, G_6, g_2, g_3$  (26.3.4.5)(12.5.6.7), we get

$$g_2 = 60G_4 = 120\zeta(4)E_4 = \frac{4}{3}\pi^4 E_4 \text{ (31.3.5.3),}$$

$$g_3 = 140G_6 = 280\zeta(6)E_6 = \frac{8}{27}\pi^6 E_6 \text{ (31.3.5.3).}$$

So by (21.3.1.6),

$$j(W) = j(\tau) = 1728 \frac{E_4(\tau)^3}{E_4^3(\tau) - E_6^2(\tau)}.$$

And for  $\Delta$ , because  $\Delta(\tau) = (2\pi)^{12} E_4^3(\tau)/j(\tau)$  and  $\Delta(W) = c_4^3/j(\tau)$  (21.3.1.5), it suffices to show that  $c_4 = (2\pi)^4 E_4$ . But

$$c_4 = 48g_2 = (2\pi)^4 E_4.$$

$\square$

**Prop. (20.9.8.14).** Let  $E \in \text{EllCur}/\mathbb{C}$  and  $\Lambda$  a lattice in  $\mathbb{C}$  that  $E(\mathbb{C}) \cong \mathbb{C}/\Lambda$ , then

- there is a natural isomorphism  $H_1(E(\mathbb{C}), \mathbb{Z}) \cong \Lambda : \gamma \mapsto \int_\gamma dz$ .
- There is a natural isomorphism  $H_1(E(\mathbb{C}), \mathbb{Z}/(m)) \cong E[m]$ .

$\lrcorner$

*Proof:* Cf. [Sil16]P176.  $\square$

Over  $\mathbb{R}$ 

**Prop. (20.9.8.15).** Let  $E \in \text{EllCur}/\mathbb{R}$ , then there exists a unique  $\tau$  in the set

$$\mathcal{C} = \{it | t \geq 1\} \cup \{e^{i\theta} | \pi/3 \leq \pi/2\} \cup \{1/2 + it | t \geq \sqrt{3}/2\}.$$

s.t.  $j(\tau) = j(E)$ . And by (21.3.6.3), each  $\tau \in \mathcal{C}$  corresponds to exactly two isomorphism classes of elliptic curves over  $\mathbb{R}$ .  $\lrcorner$

*Proof:* Firstly these  $\tau$  satisfies  $j(\tau) \in \mathbb{R}$  because by the power expansions of  $j(\tau)$  (26.3.4.22), for  $\tau = it$  or  $1/2 + it$ ,  $q \in \mathbb{R}$ , thus  $j(\tau) \in \mathbb{R}$ . For  $\tau = e^{i\theta}$ ,  $\overline{j(e^{i\theta})} = j(-e^{-i\theta}) = j(e^{i\theta})$  as  $j \in M_0(\Gamma(1))$ .

Next it can be proven  $j(i\infty) = +\infty$  and  $j(1/2 + i\infty) = -\infty$ , and  $j$  is injective on  $\mathcal{C}$  by (26.3.4.22). Thus the assertion follows by continuity.  $\square$

**Remark (20.9.8.16).** Notice by action of  $\alpha = \begin{bmatrix} 0 & -1 \\ 1 & -1 \end{bmatrix} \in \text{SL}(2, \mathbb{Z})$  on  $\{e^{i\theta} | \pi/3 \leq \pi/2\}$ , we can also replace  $\mathcal{C}$  by

$$\mathcal{C}' = \{it | t \geq 1\} \cup \{1/2 + it | t > 1/2\}.$$

 $\lrcorner$ **9 char  $k > 0$  Case**

**Def. (20.9.9.1) [Newton-Polygons of Abelian Varieties].** For  $p \in \text{Prime}$ ,  $k \in \text{Field}^p$  and  $A \in \text{AbVar}^g/k$ , define the **Newton-polygon of Abelian variety** of  $A$  to be  $\text{NP}(A) = \text{NP}(A[p^\infty])$  (27.10.1.38). Notice the slopes appear in pairs because  $A$  is isogenous to  $A^\vee$ , and using (27.10.1.37) (27.10.1.3).

$A$  is called an **ordinary Abelian variety** if  $\text{NP}(A) = 0^g 1^g$ . And  $A$  is called a **supersingular Abelian variety** if  $\text{NP}(A) = (\frac{1}{2})^{2g}$ .  $\lrcorner$

**Prop. (20.9.9.2) [Base Change of Isotypic Abelian Varieties].** If  $k'/k \in \text{Field}^{\text{fin}}$  and  $A \in \text{AbVar}/k$  is isotypic (20.9.6.8), then  $A_{k'}$  is also isotypic. (This doesn't holds true for  $k'/k = \mathbb{C}/\mathbb{R}$ ).  $\lrcorner$

*Proof:* We may assume that  $A$  is simple. By (20.9.6.14), it suffices to show that  $\text{End}(A_{k'})_{\mathbb{Q}}$  is simple. By (20.9.6.9), we may assume that  $k'/k$  is algebraic. And because  $\text{End}(A_{k'})$  is f.g. (20.9.6.12), we may assume that  $k'/k$  is finite.

If  $B'$  is a simple isogeny factor of  $A_{k'}$ , then  $\text{Res}_{k'/k}(B')$  is an isogeny factor of  $\text{Res}_{k'/k}(A_{k'}) \sim A^{[k:k]}$ , so  $\text{Res}_{k'/k}(B')$  is isogenous to a power of  $A$ . Then  $(\text{Res}_{k'/k}(B'))_{k'} = \prod_{\sigma \in \text{Gal}(k'/k)} \sigma^*(B') \sim (B')^{[k':k]}$  is isogenous to a power of  $A_{k'}$ . So  $B'$  is isogenous to a non-trivial power of  $A$ , which implies that  $A_{k'}$  is isotypic.  $\square$

**Prop. (20.9.9.3) [Finiteness over Finite Fields].** If  $k \in \text{Field}^{\text{fin}}$ , then for any  $g \in \mathbb{Z}_+$ ,  $\#\text{AbVar}^g/k < \infty$ .  $\lrcorner$

*Proof:* Firstly we show for  $A$  principally polarized by an ample line bundle  $\mathcal{L}$ . Then  $\chi(\mathcal{L}) = 1$  by (20.9.5.2), and  $\mathcal{L}^{\otimes 3}$  is very ample by (20.9.5.8), so it embeds  $A$  as a variety of degree  $3^g \cdot g!$  in  $\mathbb{P}^{3^g - 1}$  by (20.9.5.2). Such a variety is determined by its Chow form, which is a homogenous polynomial of degree  $3^g \cdot g! \cdot d$  in each of  $g + 1$  sets of  $3^g$  variables **?**. And the number of such polynomials are finite.

The general case can be reduced to the principal polarized case by Zarhin's trick (20.9.7.2).  $\square$

**Prop. (20.9.9.4).** Let  $p \in \text{Prime}$ ,  $q \in p^{\mathbb{Z}}$ , and  $(A, \lambda) \in \mathcal{AbVar}^{\text{polar}}/\mathbb{F}_q$  with Rosati involution  $\dagger$ , then

$$\text{Frob}_{q,A}^{\dagger} \circ \text{Frob}_{q,A} = [q].$$

┘

*Proof:* Cf. [Mil08]P76. ?

□

### Honda-Tate Theory

References are [Tat66, Hon68].

**Prop. (20.9.9.5) [Weil-Conjecture for Abelian Varieties].** For  $p \in \text{Prime}$ ,  $r \in \mathbb{Z}_+$ ,  $q = p^r$ ,  $\ell \in \text{Prime} \setminus \ell$ , and  $A \in \mathcal{AbVar}^g/\mathbb{F}_q$ , let  $\varphi_A = \varphi^r$  be the Frobenius of  $A$ , and let  $P_{\varphi}(X)$  be the characteristic polynomial of the action of  $\varphi_A$  on  $T_{\ell}(A)$ , then

- $P_{A,\ell}(X) \in \mathbb{Z}[X]$ , and is invariant of  $\ell$  chosen. Thus we omit  $\ell$  from now on.
- $P_A(X) = \prod_{i=1}^{2g} (X - \alpha_i)$ , where  $\alpha_i \in \mathbb{C}$  and  $|\alpha_i| = q^{1/2}$ .
- $\#A(\mathbb{F}_{q^m}) = \prod_{i=1}^{2g} (1 - \alpha_i^m)$ .

In particular,

$$|\#A(\mathbb{F}_{q^m}) - q^{mg}| \leq 2gq^{m-\frac{1}{2}} + (4g - 2g - 1)q^{m(g-1)}.$$

┘

*Proof:* These follow from (20.9.6.21) and Weil-conjecture (9.6.2.13)(31.1.3.5). □

**Prop. (20.9.9.6) [Tate].** For  $k \in \text{Field}^{\text{fin}}$  and  $A \in \mathcal{AbVar}/k$ , we have

$$Z(\text{End}^0(A)) = \mathbb{Q}(\varphi_{A/k}).$$

┘

*Proof:* Cf. [Mumford, Abelian Varieties]App.I, Thm. 3(a). ?

□

**Thm. (20.9.9.7) [Honda-Tate].** For  $k \in \text{Field}^{\text{fin}}$  and  $A \in \mathcal{AbVar}^{\text{sim},g}/k$ , by (20.9.9.5), for any embedding  $\mathbb{Q}(\varphi_A) \hookrightarrow \mathbb{C}$ ,  $\iota(\alpha)$  is a Weil  $q$ -integer (19.3.1.16), and we get a map of sets

$$A \mapsto [\varphi_A] : \text{IsogAbVar}^{\text{sim}}/k \rightarrow \text{Weil}(\#k^{1/2})/(\sim \text{conjugations}).$$

Then this is a bijection.

┘

*Proof:* The injectivity follows from (21.1.4.5) and the irreducibility of the action of  $\varphi_A$  on  $V_{\ell}(A)$  ?, and the surjectivity is proven by Honda ?? ? (or [Oort, Abelian varieties over finite fields], [Chai-Oort]). The proof of surjectivity uses abelian varieties in characteristic 0 (in fact, it uses descents to number fields of CM abelian varieties over  $\mathbb{C}$ ). □

**Cor. (20.9.9.8).** For  $k \in \text{Field}^{\text{fin}}$ ,  $\ell \in \text{Prime} \setminus \{\text{char } k\}$ , two Abelian varieties  $A, B \in \mathcal{AbVar}^g/k$  are isogenous iff  $\det(\varphi_A|H^1(A_{\bar{k}}, \mathbb{Q}_{\ell})) = \det(\varphi_B|H^1(B_{\bar{k}}, \mathbb{Q}_{\ell}))$ . ┘

*Proof:* ?

□

**Cor. (20.9.9.9)**[Description of  $\text{End}(A)_{\mathbb{Q}}$  in terms of  $\varphi_A$ , Tate[Tat66]]. For  $p \in \text{Prime}$ ,  $q \in p^{\mathbb{Z}_+}$  and  $A \in \text{AbVar}^{\text{sim},g}/\mathbb{F}_q$ , let  $D = \text{End}(A)_{\mathbb{Q}}$ ,  $\varpi = \varphi_A \in D$ , then  $[D : \mathbb{Q}]_{\text{red}} = 2g$ (3.6.4.22), and exactly one of the following happens:

- $\varpi = \sqrt{q} \in \mathbb{Z}_+$ , and  $D$  is the unique central quaternion division algebra over  $\mathbb{Q}$  ramified exactly at  $\{p, \infty\}$ . In which case  $A$  is a supersingular elliptic curve, and  $\text{End}^0(E_{\overline{\mathbb{F}_p}}) = \text{End}^0(E)$ .
- $\varpi = \sqrt{q} \notin \mathbb{Z}_+$ , and  $D$  is the unique central quaternion division algebra over  $\mathbb{Q}(\sqrt{p})$  ramified exactly at the two infinite places. In which case  $A = \text{Res}_{\mathbb{F}_{q^2}/\mathbb{F}_q}(E)$  where  $E \in \text{EllCur}/\mathbb{F}_{q^2}$  is supersingular and  $\text{End}^0(E_{\overline{\mathbb{F}_p}}) = \text{End}^0(E)$ .
- $\mathbb{Q}(\varpi)$  is a CM-field, and  $D \in \text{Az}_{\mathbb{Q}(\varpi)}$  s.t.  $D$  is split at all places away from  $p$ , and for  $v \in S_{\mathbb{Q}(\varpi)}(p)$ ,  $\text{inv}_v(D) = \frac{\text{ord}_v(\varpi)}{\text{ord}_v(q)}[\mathbb{Q}(\varpi)_v : \mathbb{Q}_p] \in \mathbb{Q}/\mathbb{Z}$ .

In particular,  $A$  is a strictly CM Abelian variety(21.2.2.1). ┘

*Proof:* ? Cf.[Tat66] or [Waterhouse and Milne, 1971] or [CCO14]P71. □

## 10 Jacobian Varieties and Abanese Varieties

**Notation (20.9.10.1).**

- Let  $k \in \text{Field}$ .
- ┘

**Prop. (20.9.10.2)**[Picard Schemes of Curves]. Let  $C \in \text{Cur}/k$  be a smooth complete precurve of genus  $g$  with a rational point, then

- $\underline{\text{Pic}}_{C/k}$  is representable by a disjoint union of smooth complete varieties  $\underline{\text{Pic}}_{C/k}^d$ ,  $d \in \mathbb{Z}$  where  $\underline{\text{Pic}}_{C/k}^d$  corresponds to relative line bundles of degree  $d$ .
  - $\underline{\text{Pic}}_{C/k}^0$  is an Abelian variety over  $k$ .
  - for  $d \geq 0$ , the Abel map  $\text{Div}_{C/k}^d \rightarrow \underline{\text{Pic}}_{C/k}^d$  is surjective for  $d \geq g$  and smooth for  $d \geq 2g - 1$ .
  - The morphism  $\text{Div}_{C/k}^g \rightarrow \underline{\text{Pic}}_{C/k}^g$  is birational.
- ┘

**Prop. (20.9.10.3)**[Picard Scheme of Relative Curves]. If  $X/S$  is locally projective, flat with fibers all curves,  $m \in \mathbb{Z}$ , let  $\underline{\text{Pic}}_{X/S}^m$  denote the subfunctor of  $\underline{\text{Pic}}_{X/S}$  representing invertible sheaves  $\mathcal{L}$  with  $\deg(\mathcal{L}) = m$ , then

- $\underline{\text{Pic}}_{X/S}^m$  are clopen subschemes of  $\underline{\text{Pic}}_{X/S}$  of f.t. and form a disjoint cover of it, and forming it commutes with base change.
  - $\underline{\text{Pic}}_{X/S}^{(0)} = \underline{\text{Pic}}_{X/S}^0 = \underline{\text{Pic}}_{X/S}^{\tau}$ , and each  $\underline{\text{Pic}}_{X/S}^m$  is a fppf-torsor under  $\underline{\text{Pic}}_{X/S}^0$ .
  - If  $X/S$  is projective and  $S$  is Noetherian, then each  $\underline{\text{Pic}}_{X/S}^m$  is quasi-projective over  $S$ .
- ┘

*Proof:* Cf.[Kle05]P60. ? □

**Def. (20.9.10.4)**[Jacobians of Curves]. For a smooth complete precurve over  $k$ , its **Jacobian variety**  $\text{Jac}(C)$  is just its Picard variety  $\underline{\text{Pic}}_{C/k}^0$ (20.9.10.2). ┘

**Cor. (20.9.10.5).** For a smooth complete precurve  $C/k$  with a rational point,  $x \in \text{Pic}_{C/k}$  is in  $\text{Jac}(C)$  iff the corresponding line bundle  $x$  on  $C_{k(x)}$  has degree 0, by (20.9.10.2).  $\lrcorner$

**Prop. (20.9.10.6).** If  $C$  is a smooth complete curve of dimension  $g$ , then  $\text{Jac}(C)$  has dimension  $g$ , by (10.9.3.25) and (10.9.3.23).  $\lrcorner$

**Def. (20.9.10.7)[Symmetric Product].** Let  $C$  be a smooth curve, then the symmetric product  $C^{(r)} = C^r/S_r$  is a smooth variety of dimension  $r$  by considering the symmetric functions.  $\lrcorner$

**Prop. (20.9.10.8)[Generic Riemann-Roch].**  $\lrcorner$

**Prop. (20.9.10.9)[Polarization of Jacobians].**  $\lrcorner$

**Prop. (20.9.10.10)[Push and Pull].** For a non-constant morphism  $\varphi : C_1 \rightarrow C_2$  of pointed smooth curves over  $k$ , the push and pull induce maps

$$\varphi_* : \text{Jac}(C_1) \rightarrow \text{Jac}(C_2), \quad \varphi^* : \text{Jac}(C_2) \rightarrow \text{Jac}(C_1).$$

$$\text{s.t. } \varphi_* \circ \varphi^* = [\deg(\varphi)].$$

*Proof:*

$\square$

**Prop. (20.9.10.11)[Abel-Jacobi].** Let  $X/\mathbb{C}$  be a smooth curve with a rational point  $x_0$ , then  $\text{Jac}(C)$  is isomorphic to  $\Omega_{\text{hol}}^1(X)^\vee/H_1(X, \mathbb{Z})$  as complex manifolds via

$$\mathcal{L}(\sum_x n_x x) \mapsto \sum_x n_x \int_{x_0}^x.$$

$\lrcorner$

*Proof:*

$\square$

**Prop. (20.9.10.12).** Let  $C/k$  be a smooth complete curve and  $P \in C(k)$ , then for any  $\ell \in \mathbf{P}$ , the map  $f_P : C \rightarrow \text{Jac}(C)$  induce isomorphisms

$$H^1(\text{Jac}(C), \mathcal{O}_{\text{Jac}(C)}) \cong H^1(C, \mathcal{O}_C), \quad H^1(\text{Jac}(C), \mathbb{Z}_\ell) \cong H^1(C, \mathbb{Z}_\ell).$$

$\lrcorner$

*Proof:* Cf. [Mil08]P114.  $\square$

**Prop. (20.9.10.13)[Surjection by Jacobians].** For any  $A \in \text{AbVar}/k$ , there exists a smooth complete curve  $C$  over  $k$  and a surjection  $\text{Jac}(C) \rightarrow A$ .  $\lrcorner$

*Proof:* We only prove for  $\#k = \infty$ . For  $k$  finite, Cf. [Gabber, On space filling curves and Albanese varieties], [Poonen, Bjorn, Bertini theorems over finite fields. Ann. of Math]. ?

Since elliptic curves are their own Jacobians, we can assume that  $\dim A > 1$ . Choose a projective embedding  $A \rightarrow \mathbb{P}_k^n$ , then by Bertini and the fact  $\#k = \infty$ , there is a hyperplane cut  $A \cap H$  that is also a smooth complete  $k$ -variety. By repeating  $\dim A - 1$  times, we get a  $k$ -curve  $C$  on  $A$ . This curve gives a map  $\text{Jac}(C) \rightarrow A$  by (20.9.10.9) and double duality (20.9.4.3). The image is an Abelian subvariety of  $A$ . If it is not the whole of  $A$ , then by Poincaré's reducibility theorem (20.9.6.10),

there exists another Abelian subvariety  $A_2 \subset A$  s.t.  $\text{Jac}(C) \times A_2 \rightarrow A$  is an isogeny. In particular,  $\text{Jac}(C) \cap A_2$  is finite.

Using the embedding  $C \subset \text{Jac}(C)$ ,  $C$  is regarded as a subscheme of  $\text{Jac}(C)$ . Take  $n \in \mathbb{Z} \cap k^*$  large, the composition  $\text{Jac}(C) \times A_2 \xrightarrow{(1,n)} \text{Jac}(C) \times A_2 \rightarrow A$  is finite, and the inverse image of  $C$  projects to  $[n]^{-1}(A_1 \cap A_2) \subset A_2$ , which is finite and disconnected. So the inverse image of  $C$  is not connected, which contradicts the fact it is an ample divisor by (7.5.4.12) and (7.9.2.24).  $\square$

**Conj. (20.9.10.14) [Resolution Conjecture].** Let  $k \in \mathbf{Field}$ ,  $k = \bar{k}$ , and  $A \in \mathcal{AbVar}/k$ , we can find a surjective homomorphism  $J_1 \rightarrow A$  where  $J_1$  is a Jacobian of a curve by (20.9.10.13). Then the identity component of the kernel is also an Abelian variety. Then we can do the same process again. is it possible to choose the Jacobians s.t. the process terminate after finite steps?  $\perp$

*Proof:*  $\square$

**Thm. (20.9.10.15) [Tonelli].** Let  $k \in \mathbf{Field}$  and  $k = \bar{k}$ , and  $(C, P), (C', P')$  be pointed complete smooth curves over  $k$ . Let  $f : C \rightarrow \text{Jac}(C)$  and  $f' : C' \rightarrow \text{Jac}(C')$  be the maps corresponding to  $P, P'$ . Then if  $\beta : (\text{Jac}(C), \lambda) \cong (\text{Jac}(C'), \lambda')$  is an isomorphism of polarized Jacobians, then

- There exists an isomorphism  $\alpha : C \rightarrow C'$  s.t.  $f' \circ \alpha = \pm \beta \circ f + c$  for some  $c \in \text{Jac}(C')(k)$ .
- If  $g(C) \geq 2$  and  $C$  is non-hyperelliptic, then  $\alpha, \pm 1, c$  are determined by  $\beta, P, P'$ . And if  $g(C) \geq 2$ , then  $\pm 1$  can be arbitrary, and  $\alpha, c$  is determined by  $\beta, \pm 1, P, P'$ .  $\perp$

*Proof:* Cf. [Mil08]P120.  $\square$

**Cor. (20.9.10.16).**

- If  $k \in \mathbf{Field}$ ,  $C, C'$  are complete smooth curves over  $k$  with rational points s.t. their polarized Jacobians are isomorphic, then  $C, C'$  are isomorphic over  $k$ .
- If  $k \in \mathbf{Field}$  is perfect,  $C, C'$  are complete smooth curves of genus  $\geq 2$  over  $k$ , then if their polarized Jacobians are isomorphic, then  $C, C'$  are also isomorphic over  $k$ .  $\perp$

*Proof:* Let  $\beta : (\text{Jac}(C), \lambda) \cong (\text{Jac}(C'), \lambda')$  is an isomorphism, for any  $P \in C(\bar{k}), P' \in C'(\bar{k})$ , there is a unique isomorphism  $\alpha : C_{\bar{k}} \cong C'_{\bar{k}}$  s.t.  $f^{P'} \circ \alpha = \pm \beta \circ f^P + c$ , and if  $C$  is hyperelliptic, take  $\pm = +$ . Then if  $Q, Q'$  are different points,  $f^P = f^Q + d, f^{Q'} = f^{P'} + e$  for some  $d \in \text{Jac}(C)(\bar{k}), e \in \text{Jac}(C')(\bar{k})$ . So  $\alpha$  is invariant of the points  $P, P'$  chosen. In particular,

$$f^{\sigma(P')} \circ \alpha = \sigma(f^{P'}) \circ \alpha = \pm \beta \circ \sigma(f^P) + \sigma(c) = \pm \beta f^{\sigma(P)} + \sigma(c).$$

for any  $\sigma \in \text{Gal}_k$ . So  $\alpha$  is invariant under  $\text{Gal}_k$ , which means  $C, C'$  are isomorphic over  $k$ .  $\square$

### Albanese Varieties

**Prop. (20.9.10.17) [Albanese Varieties].** For  $X \in \mathbf{SmProjVar}/k$  with a rational point  $p$ , the **Albanese variety** of  $(X, p)$  is an Abelian variety  $J_X \in \mathcal{AbVar}/k$  with a morphism  $\nu : X \times X \rightarrow J_X$  s.t.

- $\nu(x, y) + \nu(y, z) = \nu(x, z)$ , and
- Any map  $\varphi : X \times \rightarrow A \in \mathcal{Sch}/k$  for an Abelian variety  $A \in \mathcal{AbVar}/k$  satisfying  $\varphi(x, y) + \varphi(y, z) = \varphi(x, z)$  factors through  $\nu$  by a homomorphism  $J_X \rightarrow A \in \mathcal{AbVar}/k$ .

If  $X$  has a rational point  $p$ , then the map  $X \rightarrow X \times \{p\} \xrightarrow{\nu} J_X$  satisfies the universal property to  $\mathcal{A}b\mathcal{V}ar/k$ . Equivalently, there is an adjunction

$$J_{(-)} : \mathcal{S}m\mathcal{P}roj\mathcal{V}ar^{\text{pointed}}(k) \rightleftarrows \mathcal{A}b\mathcal{V}ar/k : \text{Forgetful Functor}.$$

┘

*Proof:*    **?**

□

### Arithmetics

**Prop. (20.9.10.18).** If  $F \in \mathbf{GField}$  and  $C$  is a complete smooth curve over  $F$  with good reduction at a place  $P$  of  $F$ , then  $\text{Jac}(C)$  has good reduction at  $P$ .    ┘

*Proof:*    The hypothesis implies  $C$  extends to a smooth proper curve  $\mathcal{C}$  over  $\text{Spec } R_P$ . Then the Picard scheme  $\mathcal{J}$  of  $\mathcal{C}/\text{Spec } R_P$  (20.9.10.3) has generic fiber  $\text{Jac}(C)$ , which implies  $\text{Jac}(C)$  has good reduction at  $P$ .    □

┘

#### 1 Néron-Models for Abelian Varieties

##### Néron Models for Abelian Varieties

References are [Serre-Tate, Good Reduction of Abelian Varieties], [BLR90] and <http://virtualmath1.stanford.edu/~conrad/mordellsem/Notes/L11.pdf>.

**Prop. (21.1.1.1) [Néron-Models for Abelian Varieties].** Let  $K \in \mathbf{Field}$  and  $A$  be any ring of integers in the field  $K$ , and  $X \in \mathbf{AbVar}/K$ . Then there exists an open subset  $Y = \mathrm{Spec} A_S \subset \mathrm{Spec} A$ , and a scheme  $\tilde{X}$  projective over  $Y$ , and morphisms  $\tilde{m} : \tilde{X} \times \tilde{X} \rightarrow \tilde{X}$  over  $Y$  and  $\tilde{e} : Y \rightarrow \tilde{X}$  that:

- The fiber of  $\tilde{X}$  over a generic point of  $Y$  with the morphisms  $\tilde{m}, \tilde{e}$  are Abelian varieties isomorphic to  $X$ .
- $\tilde{X}$  is a group scheme over  $Y$ , and its fiber over any closed point of  $Y$  with the morphisms  $\tilde{m}, \tilde{e}$  are Abelian varieties.
- The mapping in item1 induces an isomorphism of groups  $\tilde{X}(Y) \cong X(K)$ .

┘

*Proof:* 1: Consider for any qc scheme over a field  $K$ , it is glued together from f.m. affine schemes, and these glueing involves f.m. polynomials and rational transition functions, and the coefficients of them are contained in a subring  $A_S \subset K$  of f.t. over  $A$ . Thus this variety can be seen as a variety over  $A_S$  with the same equations, satisfying item1. The situation is similar for morphisms between qc schemes, in particular  $\tilde{m}$  and  $\tilde{e}$ , thus constructing  $\tilde{X}$ .

2: Cf. [Mumford, P265]. ?

3: Cf. [Mumford, P265]. ?

□

**Cor. (21.1.1.2).** Let  $x \in \tilde{X}(Y)$ , consider  $x$  as a closed subscheme of  $\tilde{X}$  and denote  $n^{-1}(x)$  the closed subscheme in  $\tilde{X}$  the inverse image of  $x$  under the morphism  $[n]_Y$ . Then the natural projection  $n^{-1}(x) \rightarrow Y$  is étale over all points  $y \in Y$  that  $\mathrm{char} k(y) \nmid n$ .

┘

*Proof:* [Mumford, P265].? □

**Cor. (21.1.1.3) [Néron Differentials].** Let  $(S, K)$  be a Dedekind scheme and  $E \in \text{AbVar}/K$  with Néron model  $\mathcal{E}/S$  (20.3.4.1), then  $\mathcal{K}_{\mathcal{E}/S}$  is free of rank 1. A generator of it is called a **Néron differential** of  $E$ . It is defined up to units on  $S$ . ┘

**Thm. (21.1.1.4) [Good Reduction of Abelian Varieties].** Let  $(S, K)$  be a Dedekind scheme,  $A \in \text{AbVar}/K$  and  $\mathcal{A} \in \text{Sch}/S$  is proper smooth with generic fiber  $A$ , then the group structure extends to  $\mathcal{A}$ , making it a Néron model of  $A$ . ┘

*Proof:* Cf. [BLR90]P19 or [L11, Neron Model]P8.? □  
By (20.3.4.8), we may assume that  $S$  is local.

**Thm. (21.1.1.5) [Néron Model of Abelian Varieties].** Let  $(S, K)$  be a Dedekind scheme and  $A \in \text{AbVar}/K$ , then  $A$  has a Néron model  $\mathcal{A}/S$ . Moreover, let  $S' \subset S$  be the set of good points for  $A$ , then  $\mathcal{A}_{S'} \in \text{AbVar}/S'$ . ┘

*Proof:* We show that  $A$  extends to an Abelian scheme over a nbhd of each good point of  $S$  for  $A$ . This will suffice combining with (21.1.1.4)(21.1.1.8)(20.3.4.8) and (20.3.4.9).

By hypothesis,  $A$  extends to a smooth proper scheme  $A_{(s)}$  over  $\mathcal{O}_{S,s}$ , and then we can extend it to a scheme of f.t. over a nbhd of  $s$ . By shrinking if necessary, we can assume it is smooth and proper, by (7.8.4.6). □

**Prop. (21.1.1.6) [Strong Néron Extension Property].** Let  $(S, K)$  be a Dedekind domain, and  $A \in \text{AbVar}/K$  with a Néron model  $\mathcal{A}/S$ , then for any  $\mathcal{Y} \in \text{Sch}^{\text{sm}}/S$  and a rational map  $\varphi : \mathcal{Y}_K \rightarrow A$ , there exists uniquely an  $S$ -morphism  $\mathcal{Y} \rightarrow \mathcal{A}$  extending  $\varphi$ . ┘

*Proof:* This follows from (20.9.1.7). □

### Proof of the Existence of Néron Models for Abelian Varieties

Cf. [BLR]Chap3-6.

**Remark (21.1.1.7).** In this subsection, let  $(\mathcal{O}_K, K, k)$  be a DVR. ┘

**Prop. (21.1.1.8) [Local Néron Models for Abelian Varieties].** (21.1.1.5) is true when  $S$  is a DVR. ┘

**Def. (21.1.1.9) [Weak Néron Models].** For  $X \in \text{Sch}^{\text{sm,sep,ft}}/K$ , a **weak Néron model** for  $X$  is a family  $(X_i) \in \text{Sch}^{\text{sm,sep,ft}}/R$  s.t. each  $K^{\text{sh}}$ -point of  $X$  extends to a  $R^{\text{sh}}$ -point of some  $X_i$ . ┘

**Thm. (21.1.1.10).** For  $X \in \text{Sch}^{\text{sm,sep,ft}}/K$ , if  $X(K^{\text{sh}})$  is bounded in  $X$ , then there exists a weak Néron model for  $X$ . ┘

*Proof:* Cf. [BLR90]P74. □

**Prop. (21.1.1.11) [Weak Néron Property].** Let  $X \in \text{Sch}^{\text{sm,sep,ft}}/K$  and  $(X_i)$  is a weak Néron model for  $X$ . If  $Z \in \text{Sch}^{\text{sm}}/\mathcal{O}_K$  s.t.  $Z_k$  is irreducible, then any rational map  $Z_k \rightarrow X_k$  extends to a rational map  $Z \rightarrow X_i$  over  $R$  for some  $i$ . ┘

*Proof:* Cf. [BLR90]P74. □

### Properties of Néron Models

**Prop. (21.1.1.12).** If  $(\mathcal{O}_K, K)$  is a DVR, then for  $\mathcal{G} \in \mathcal{G}\text{rp}^{\text{sm}, \text{ft}}/\mathcal{O}_K$ , the following are equivalent:

- $\mathcal{G}$  is a Néron model of its generic fiber.
- $\mathcal{G}(\mathcal{O}_K^{\text{sh}}) \rightarrow \mathcal{G}(K^{\text{sh}})$  is an isomorphism.
- $\mathcal{G}$  is separated and  $\mathcal{G}(\mathcal{O}_K^{\text{sh}}) \rightarrow \mathcal{G}(K^{\text{sh}})$  is surjective.

┘

*Proof:*  $1 \rightarrow 2$  is trivial.  $2 \rightarrow 3$  is valuation criterion.  $2 \rightarrow 1$  follows from [Weil's Extension Theorem](#) and [Weak Néron Property](#).

For  $3 \rightarrow 2$ : Cf. [BLR]7.1.1. ?

□

**Prop. (21.1.1.13).** If  $R$  has mixed characteristic  $(0, p)$  and absolute ramification  $e < p - 1$ ,  $0 \rightarrow A' \rightarrow A \rightarrow A'' \rightarrow 0 \in \mathcal{A}\text{bVar}/K$  is an exact sequence, and  $A$  has good reduction, then the sequence of Néron models

$$0 \rightarrow \mathcal{A}' \rightarrow \mathcal{A} \rightarrow \mathcal{A}'' \rightarrow 0$$

is exact.

┘

*Proof:* Cf. [BLR]Prop7.5.4.

□

## 2 Reductions

Cf. [L13, Semistable Reductions for Abelian Varieties].

**Prop. (21.1.2.1).** If  $S \in \text{Sch}$  is an integral schemes with generic fiber  $\eta$ , and  $A, B \in \mathcal{A}\text{bVar}/S$ , then the map  $\text{Hom}(A, B) \rightarrow \text{Hom}(A_\eta, B_\eta)$  is injective with torsion-free cokernels.

┘

*Proof:* Cf. [CCO14]P86.

□

**Prop. (21.1.2.2) [Lifting Endomorphisms to Normal Domains].** If  $R$  is a normal domain with fraction field  $K$ , then the functor  $\mathcal{A}\text{bVar}/R \rightarrow \mathcal{A}\text{bVar}/K$  is fully faithful.

┘

*Proof:* Cf. [Fal83]Section2.1. ?

□

### over DVRs

**Notation (21.1.2.3).**

- Let  $(\mathcal{O}_K, K, \kappa) \in \text{DVR}$  with  $\kappa = \kappa^{\text{perf}}$ .

┘

**Prop. (21.1.2.4) [Reduction of Faithful].** For  $(R, \kappa) \in \text{locCRing}$ , the functor  $\mathcal{A}\text{bVar}/R \rightarrow \mathcal{A}\text{bVar}/\kappa$  is faithful.

┘

*Proof:* Cf. [CCO14]P44. ?

□

**Prop. (21.1.2.5) [Reduction Types of Abelian Varieties].** Let  $A \in \mathcal{A}\text{bVar}/K$  with Néron model  $\mathcal{A}/\mathcal{O}_K$  (21.1.1.5), then by (20.9.1.20)(10.2.7.2) and (10.3.4.13), there exists a filtration of subgroups

$$\mathcal{A}_k \supset \mathcal{A}_k^0 \supset \mathcal{A}_k^1$$

where  $\mathcal{A}_k^0$  is the identity component of  $\mathcal{A}_k$ , and  $\mathcal{A}_k^1$  is affine commutative s.t.  $\mathcal{A}_k^0/\mathcal{A}_k^1 \in \mathcal{A}\text{bVar}/k$ . Then  $A$  is said to have:

- **good reduction** if  $\mathcal{A}_k \in \text{AbVar}/k$ . This is compatible with the definition as in (20.3.2.2) by (20.3.2.1).
- **semistable reduction** if  $\mathcal{A}_k^1$  is a torus, in which case  $\mathcal{A}_k^0$  is a semi-Abelian variety (20.9.1.23).
- **bad reduction** or **additive reduction** if  $\mathcal{A}^1$  contains a copy of  $\mathbb{G}_a$ .

There are not other possibilities.  $\square$

**Def. (21.1.2.6) [Tamagawa-Numbers].** For  $A \in \text{AbVar}/K$  with Néron model  $\mathcal{A}/\mathcal{O}_K$  (21.1.1.5), define the **component group** of  $A$  to be  $\pi_0(\mathcal{A}_k)$ , denoted by  $\Phi(A)$ . And  $c(A) = \#\Phi(A) < \infty$  is called the **Tamagawa number** of  $A$ .

Then  $c(A)$  equals the number of geo.connected components of  $\mathcal{A}_k$ . And if  $k$  is finite, it also equals the connected components of  $\mathcal{A}_k$  with a rational point.  $\square$

*Proof:* Cf. [Liu Qing, 10.2.21(a)].  $\square$

**Thm. (21.1.2.7) [Semistable Reduction Theorem].** Let  $K \subset_{\text{fin}} K' \in \text{Field}$ , and  $\mathcal{O}_{K'}$  the alg.closure of  $\mathcal{O}_K$  in  $K'$ . For  $A \in \text{AbVar}/K$ ,

- If  $A$  has stable or semistable reduction, then the reduction type of  $A_{K'}$  is the same as that of  $A$ .
- If  $K'/K$  is unramified, then the reduction type of  $A_{K'}$  is the same as that of  $E$ .
- There exists such a finite extension  $K'/K$  s.t.  $A_{K'}$  is of stable or split semistable reduction type.

$\square$

*Proof:* We only prove for elliptic curves. ?

1: For these two cases,  $c_4$  and  $\Delta$  cannot be reduced anymore to another minimal Weierstrass equation by (21.3.4.5).

2: It suffices to consider the additive reduction case: ? The short Weierstrass equation case is clear, for the general case, use Tate's algorithm.

3: Use the Legendre or Deuring form (21.3.1.18)(21.3.1.19) to analyze  $\Delta$  and  $c_4$ .  $\square$

**Thm. (21.1.2.8) [Néron-Ogg-Shafarevich Criterion].** Let  $A \in \text{AbVar}/K$  and  $\ell \in \text{Prime} \setminus \text{char } \kappa$ , then the following are equivalent:

- $A$  has good reduction.
- The module  $A[m](K^{\text{sep}})$  is unramified as a  $\text{Gal}_K$ -module, for all  $m \in \mathbb{Z} \setminus \text{char } \kappa$ .
- The Tate module  $T_\ell(A)$  is unramified for all (some) primes  $\ell \in \text{Prime} \setminus \text{char } \kappa$ .
- The module  $A[m]$  is unramified for infinitely many  $m \in \mathbb{Z} \setminus \text{char } \kappa$ .

$\square$

*Proof:*  $2 \rightarrow 3 \rightarrow 4$  are obvious.

For the rest, Cf. <http://virtualmath1.stanford.edu/~conrad/mordellsem/Notes/L11.pdf> P20 or [Mil08] P141. ?

$1 \rightarrow 2$ : Let  $K'$  be the finite extension of  $K$  generated by  $E[m]$ , then (21.1.2.7) implies  $E_{K'}$  has the same reduction type as  $E$ . Then by (21.3.4.20),  $E[m] \rightarrow \bar{E}_{K'}(k')$  is an injection. So clearly  $I_v$  acts trivially on  $E[m]$ .

$4 \rightarrow 1$ : Let  $m \in \mathbb{Z} \setminus \text{char } k$  s.t.  $E[m]$  is unramified and  $m > \#E(K^{\text{ur}})/E_0(K^{\text{ur}})$ , where  $\#E(K^{\text{ur}})/E_0(K^{\text{ur}}) < \infty$  by (21.3.4.15). Then because  $E[m] \cong (\mathbb{Z}/(m))^2 \subset E(K^{\text{ur}})$ ,  $E_0(K^{\text{ur}})$  contains

some subgroup isomorphic to  $(\mathbb{Z}/(\ell))^2$  for some  $\ell \in \text{Prime} \setminus \text{char } k$ , thus by (21.3.4.20),  $\tilde{E}_{\text{sm}}(\bar{k})$  contains some subgroup isomorphic to  $(\mathbb{Z}/(\ell))^2$ . But by (21.3.1.17), this is possible only when  $\tilde{E}_{\text{sm}} = \tilde{E}$ . Thus  $E_{K^{\text{ur}}}$  has good reduction, so  $E$  also has good reduction by (21.1.2.7).  $\square$

**Cor. (21.1.2.9).** If  $0 \rightarrow A' \rightarrow A \rightarrow A'' \rightarrow 0$  are exact sequences of Abelian varieties over  $K$  and  $A$  has good reduction, then  $A', A''$  also have good reductions.  $\lrcorner$

**Cor. (21.1.2.10) [Isogeny and Good Reductions].** If  $A, A' \in \text{AbVar}/K$  are isogenous, then  $A$  has good reduction iff  $A'$  does.  $\lrcorner$

*Proof:* Use (21.1.2.8) and the fact if  $\ell \in \text{Prime} \setminus \text{char } k$  is prime to  $\deg \varphi$ , then  $\varphi_\ell : T_\ell(A) \rightarrow T_\ell(A')$  is an isomorphism of  $\text{Gal}_K$ -modules.  $\square$

**Prop. (21.1.2.11).** If  $K \in p\text{-LField}$ ,  $\ell \in \text{Prime} \setminus \{p\}$  and  $A \in \text{AbVar}/K$  satisfies  $\rho_{\ell,A}(\text{Gal}_K)$  has finite image, then  $A$  has potential good reduction.  $\lrcorner$

*Proof:* It follows from class field theory that the image of  $I_K$  is a quotient of  $\mathcal{O}_K^*$ , which contains a pro- $p$ -group of finite index, and  $\text{End}(T_\ell(A))$  contains a pro- $\ell$ -group of finite index, so the image is finite. Then  $A$  has potential good reduction by (21.1.2.8).  $\square$

**Thm. (21.1.2.12) [Néron-Ogg-Shafarevich Criterion for Elliptic Curves].** For  $\ell \in \text{Prime} \setminus \{\text{char } k\}$  and  $A \in \text{AbVar}/K$ ,

- $A$  has good reduction iff  $T_\ell(A)$  is an unramified  $\text{Gal}_K$ -module.
- $A$  has good or semistable reduction iff  $I_K$  acts unipotently on  $T_\ell(A)$ .
- $A$  has potential good reduction iff  $T_\ell(E)$  is potentially unramified, i.e.  $\rho_{\ell,A}(I_K)$  is finite.

$\lrcorner$

*Proof:* 1 follows from (21.1.2.8).

2: We only prove for  $\dim A = 1$  case ?: As  $I_K$  acts trivially on  $\det(T_\ell(E))$  by (25.1.6.3), it acts unipotently on  $T_\ell(E)$  iff it has a fixed vector. If it has a fixed vector, then  $\tilde{E}_{\text{sm}}(\bar{k})$  contains a subgroup isomorphic to  $\mathbb{Z}/(\ell)$ , which is possible only if  $E$  has semistable or good reduction, by (21.3.1.17) and (21.1.2.7). The converse is proved the same way as that of (21.1.2.8).

3 follows from (3.2.6.9).  $\square$

**Cor. (21.1.2.13).** If  $\text{char } k = p$  and  $\varphi : E \rightarrow E' \in \text{EllCur}/K$  is an isogeny of degree  $p$ , then  $E$  has good reduction of ordinary type/supersingular type iff  $E'$  does.  $\lrcorner$

*Proof:* By (21.1.2.10) we can assume both  $E, E'$  have good reductions, then their minimal Weierstrass equations are their Néron models, thus by definition  $\varphi$  extends to a map  $\tilde{\varphi} : \tilde{E} \rightarrow \tilde{E}'$ . Let  $\psi = \tilde{\varphi}$ , then we also have  $\tilde{\psi} : \tilde{E}' \rightarrow \tilde{E}$  s.t.  $\tilde{\psi} \circ \tilde{\varphi} = [p]_{\tilde{E}}$ , and  $\tilde{\varphi} \circ \tilde{\psi} = [p]_{\tilde{E}'}$ . Thus  $[p]_{\tilde{E}'} \circ \tilde{\varphi} = \tilde{\varphi} \circ [p]_{\tilde{E}}$ , which implies  $\deg_s([p]_{\tilde{E}}) = \deg_s([p]_{\tilde{E}'})$ , thus we are done by (21.3.3.5).  $\square$

**Prop. (21.1.2.14) [Isogeny and Semistability].** If  $A, B \in \text{AbVar}/k$  are isogenous, then  $A$  is semistable iff  $B$  is semistable.  $\lrcorner$

*Proof:* ?  $\square$

**Prop. (21.1.2.15) [Multiplication Maps].** If  $\mathcal{A} \in \text{AbVar}/K$  has semistable reduction  $\mathcal{A}/\mathcal{O}_K$ , then for any  $m \in \mathbb{Z}_+$ ,  $\mathcal{A}[m]$  is a quasi-finite flat separated group scheme over  $\mathcal{O}_K$  (7.4.4.44). Thus by (10.1.2.36), there is a filtration

$$0 \subset \mathcal{A}[m]_t \subset \mathcal{A}[m]^0 \subset F(\mathcal{A}[m]) \subset \mathcal{A}[m],$$

where  $F(\mathcal{A}[m])$  is finite flat over  $\mathcal{O}_K$ , and  $\mathcal{A}[m]_t \subset \mathcal{A}^0$  is the largest torus.  $\lrcorner$

### Good Reductions

**Thm. (21.1.2.16) [Extending Abelian Variety Structures].** Let  $S \in \mathbf{NSch}_{\text{cpct, cntd}}$  and  $X \in \mathbf{SmPrpr}/S$  with a section  $e : S \rightarrow X$ . If for some geometric point  $s \in S$ ,  $X_s \in \mathbf{AbVar}/\kappa(s)$  with unit point  $e(s)$ , then  $X \in \mathbf{AbVar}/S$  with unit section  $e$ .  $\lrcorner$

*Proof:* Cf. [Ngo, Shimura Varieties]P16.  $\square$

**Prop. (21.1.2.17).** Let  $(\mathcal{O}_K, K, k)$  be a DVR,  $A \in \mathbf{AbVar}/K$  with Néron model  $\mathcal{A}/\mathcal{O}_K$ , then the following are equivalent:

- $\mathcal{A}$  is an Abelian scheme.
- $A$  has good reduction over  $\mathcal{O}_K$ .
- $\mathcal{A}_k^0$  is proper hence in  $\mathbf{AbVar}/k$ .

$\lrcorner$

*Proof:*  $1 \rightarrow 2, 2 \rightarrow 3$  is clear.

$3 \rightarrow 1$ : By (7.12.5.4)  $\mathcal{A}_0$  (21.1.1.5) is an Abelian scheme, so  $\mathcal{A}_0 = \mathcal{A}$  is the Néron model by (21.1.1.4).  $\square$

**Prop. (21.1.2.18) [Exactness].** Let  $(R, K)$  be a DVR with mixed characteristic  $(0, p)$  and ramification index  $e < p - 1$ . If  $0 \rightarrow A' \rightarrow A \rightarrow A'' \rightarrow 0$  is an exact sequence in  $\mathbf{AbVar}/K$ , and  $A$  has good reduction, then so does  $A'$  and  $A''$  by (21.1.2.8). Then the Néron models

$$0 \rightarrow \mathcal{A}' \rightarrow \mathcal{A} \rightarrow \mathcal{A}'' \rightarrow 0$$

for an exact sequence.  $\lrcorner$

*Proof:* Cf. [BLR90]Prop7.5.4..  $\square$

**Prop. (21.1.2.19) [Extending Polarizations].** Let  $(R, K)$  be a DVR and  $A \in \mathbf{AbVar}/K$  has good reduction over  $R$ , then any polarization  $\lambda : \mathcal{A} \rightarrow \mathcal{A}^\vee$  extends to a polarization on  $\mathcal{A}$ .  $\lrcorner$

*Proof:* See [Artin 1986, 4.4 in Arithmetic Geometry], and [Chai and Faltings 1990]. ?  $\square$

### over Dedekind Domains

**Def. (21.1.2.20) [Local Conductors].** The conductor of  $E$  is defined in [Sil99]P380.  $\lrcorner$

*Proof:*  $\square$

**Def. (21.1.2.21) [Conductor].** For  $F \in \mathbf{GField}$  and  $E \in \mathbf{EllCur}/F$ , the **conductor(elliptic curve)** of  $E$  is defined to be the integral ideal of  $F$  given by

$$N(E/F) = \prod_{v \in \Sigma_F^0} \mathfrak{p}_v^{f_v}$$

where  $f_v$  is the local conductors (21.1.2.20).

If  $F = \mathbb{Q}$ , then the conductor  $N_E = \prod_{p \in \mathbf{P}} p^{f_p}$ , where

$$f_p = \begin{cases} 0, & E \text{ has good reduction at } p \\ 1, & E \text{ has multiplicative reduction at } p \\ 2, & E \text{ has additive reduction at } p \text{ \& } p \neq 2, 3 \\ 2 + \delta_p, & E \text{ has additive reduction at } p \text{ \& } p = 2, 3 \end{cases}$$

where  $0 \leq \delta_2 \leq 6, 0 \leq \delta_3 \leq 3$ .  $\lrcorner$

**Conj. (21.1.2.22)**[Szpiro]. For any  $F \in \mathbf{NField}$  and  $\varepsilon > 0$ , there exists  $C_\varepsilon > 0$  s.t.

$$|\mathrm{Nm}_{F/\mathbb{Q}}(\Delta_E)| \leq C_\varepsilon |\mathrm{Nm}_{F/\mathbb{Q}}(N_E)|^{6+\varepsilon}$$

for any  $E \in \mathbf{EllCur}/F$ , where  $N_E$  is the conductor of  $E$  (21.1.2.21).  $\lrcorner$

*Proof:*  $\square$

**Thm. (21.1.2.23)** [No Everywhere Good Reduction over  $\mathbb{Q}$ , Fontaine(85)/ Brumer-Kramer(01)/ Schoof[Sch05]]. For  $p \in \mathbf{Prime}$ , there exists an Abelian variety  $A \in \mathbf{AbVar}/\mathbb{Q}$  of positive dimension with good reductions outside  $p$  and semi-stable reduction at  $p$  iff  $p \notin \{2, 3, 5, 7, 13\}$ .

In particular, the minimal conductor of an Abelian variety over  $\mathbb{Q}$  is 11, which is given by the elliptic curve  $E: y^2 + y = x^3 - x^2$ .

There are 24 elliptic curves over  $\mathbb{Q}$  with good reductions away from 2.

There are 784 elliptic curves over  $\mathbb{Q}$  with good reduction away from 6.  $\lrcorner$

*Proof:* Firstly, if  $N \in \mathbf{Prime}_{>13}$ , then the modular Jacobian variety  $\mathrm{Jac}(X_0(N))$  has good reduction outside  $N$  and has semistable reduction at  $N$ .

We only prove that there are no elliptic curves with everywhere good reductions. ?

Let  $E: y^2 + a_1xy + a_3y = x^3 + a_2x^2 + a_4x + a_6$  be an elliptic curve over  $\mathbb{Q}$  with  $a_i \in \mathbb{Z}$  and  $\Delta = \pm 1$ , then  $a_1$  must be odd, otherwise  $\Delta \equiv 5b_6^2 \equiv \pm 1 \pmod{8}$  is impossible. Thus  $c_4 = b_2^2 - 24b_4 \equiv 1 \pmod{8}$ . And  $c_4^3 - c_6^2 = (\pm 12)^3$  shows that  $c_4 \pm 12$  is a square or 3 times a square, which are both impossible by modulo 8.

For good reduction away from 2, 3 ?  $\square$

**Prop. (21.1.2.24)**[Schoof]. Every semi-stable Abelian variety over  $\mathbb{Q}$  that has good reduction outside 11 is isogenous to a power of  $\mathrm{Jac}(X_0(11))$ .  $\lrcorner$

*Proof:*  $\square$

**Prop. (21.1.2.25)**[Schoof]. For  $p \in \{2, 3, 5\}$ , there are no Abelian varieties over  $\mathbb{Q}$  of positive dimension that has good reduction outside  $p$  and acquire semi-stable reduction at  $p$  over an extension of  $\mathbb{Q}$  that is at most tamely ramified at  $p$ .  $\lrcorner$

*Proof:*  $\square$

**Prop. (21.1.2.26)**[Conductors for Modular Abelian Varieties]. If  $g \in \mathbb{Z}_+$  and  $A \in \mathbf{AbVar}^g/\mathbb{Q}$  s.t.  $L(A; s)$  is an entire analytic  $L$ -function, then we have

$$N(A) \geq e^{1.24g} > 3.$$

*Proof:* Apply the formula (35.4.8.2) at  $s = \sigma \in \mathbb{R}_{>1}$  and take the real part to get

$$\frac{1}{2} \log q + g \mathrm{dlog} \Gamma(\sigma + \frac{1}{2}) - g \log(2\pi) + \mathrm{dlog} L(A; \sigma) \geq 0.$$

Notice that  $\mathrm{Re}(b) = \mathrm{Re}(\rho^{-1})$  is cancelled by (35.4.8.3).  $\lrcorner$

Also by Ramanujan-Peterson bound ( $|\alpha_i(p)| \leq 1$ ), we get  $|\mathrm{dlog} L(A; \sigma)| \leq g \mathrm{dlog} \zeta(\sigma)$ .  
So we get

$$\frac{1}{2g} \log N(A) \geq \log(2\pi) - \mathrm{dlog} \Gamma(\sigma + \frac{1}{2}) - \mathrm{dlog} \zeta(\sigma).$$

If we take  $\sigma = 2.3$ , then the RHS is greater than 0.62.  $\square$

**Prop. (21.1.2.27).** Let  $F \in \mathbf{NField}$  and  $A, B \in \mathbf{AbVar}/F$ , and  $S \subset \Sigma_F$  is a finite set of places of  $F$  containing  $\Sigma_F^\infty$  and all places s.t.  $A$  or  $B$  has bad reduction, then for any  $\ell \in \mathbf{Prime}$  s.t.  $S(\ell) \cap S = \emptyset$ , there exists a finite set  $T = T(S, \ell, g) \in \Sigma_\infty^0$  s.t.  $T \cap (S \cup S(\ell)) = \emptyset$ , and

$$P_\ell(\tilde{A}_v, t) = P_\ell(\tilde{B}_v, t) \Rightarrow A \sim B$$

┘

*Proof:* Cf. [Mil08]P142.  $\square$

### Semi-stable Reductions

**Prop. (21.1.2.28) [Fundamental Semi-stable Reduction Theorem].** For any  $F \in \mathbf{NField}$ ,  $A \in \mathbf{AbVar}/F$ , there exists a finite extension  $L/F$  s.t.  $A_L$  is semistable, by (21.1.2.7).  $\square$

### 3 Néron-Tate Heights

**Prop. (21.1.3.1) [Néron-Tate Heights].** Let  $F \in \mathbf{GField}$ ,  $X \in \mathbf{AbVar}/F$ ,  $\mathcal{L} \in \mathbf{Pic}(X)$ , then there are uniquely defined bilinear form  $b_{\mathcal{L}}$ , additive homomorphism  $l_{\mathcal{L}}$  on  $X(F^{\mathrm{sep}})$  s.t.

$$\hat{h}_{\mathcal{L}}(x) = \frac{1}{2} b_{\mathcal{L}}(x, x) + l_{\mathcal{L}}(x) \sim h_{\mathcal{L}}(x).$$

Such a  $\hat{h}_{\mathcal{L}}(x)$  is called the **Néron-Tate height** of  $\mathcal{L}$ .  $\square$

*Proof:* We want to use (3.2.4.37) for the Weil height (20.2.1.25)  $h_{\mathcal{L}}$  on  $X(F^{\mathrm{sep}})$ : Apply the theorem of the cube (20.9.1.26) to the projections  $\pi_i : X \times X \times X \rightarrow X$  and pullback to  $X$  via the diagonal map, then taking the Weil heights, we will get the desired relation

$$h_{\mathcal{L}}(\sum_{i=1}^3 x_i) - \sum_{1 \leq i < j \leq 3} h_{\mathcal{L}}(x_i + x_j) + \sum_{i=1}^3 h_{\mathcal{L}}(x_i) \sim 0.$$

Thus the condition of (3.2.4.37) is satisfied and we get the desired height  $\hat{h}_{\mathcal{L}}(x)$ .  $\square$

**Remark (21.1.3.2).** Another way to get this is through Tate's limiting argument (21.8.3.2).  $\square$

**Cor. (21.1.3.3).** The Néron-Tate height is a refinement of Weil heights (20.2.1.25) made for Abelian varieties:

- The map  $\hat{h} : \mathbf{Pic}(X) \mapsto \mathbb{R}^{X(\bar{K})} : \mathcal{L} \mapsto \hat{h}_{\mathcal{L}}$  is an additive homomorphism.
- (Symmetry) If  $\varphi : A \rightarrow B$  is a homomorphism of Abelian varieties, then  $\hat{h}_{\varphi^*(\mathcal{L})} = \hat{h}_{\mathcal{L}} \circ \varphi$ .
- (Positivity) Let  $\mathcal{L} \in \mathbf{Pic}(X)$  be even. If  $\mathcal{L}$  is base-free or ample, then  $\hat{h}_{\mathcal{L}} \geq 0$ .
- (Boundedness) Let  $\mathcal{L} \in \mathbf{Pic}(X)$  be even and ample (such an  $\mathcal{L}$  exists by (20.9.1.32)), then  $\hat{h}_{\mathcal{L}}$  induces a symmetric bilinear form on  $X(K)$  satisfying  $\{x \in X(\bar{K}) \mid \deg(x) \leq d, (x, x) < C\}$  is finite for all  $C > 0$

┘

*Proof:* 1, 2 follow from the corresponding property of Weil heights(20.2.1.25) and the uniqueness in(3.2.4.37).

3: Notice that the fact  $\mathcal{L}$  is even implies  $\hat{h}_{\mathcal{L}} = \frac{1}{2}b(x, x)$ . The ample case reduces to the base-free case, because there is a multiple  $m\mathcal{L}$  that is very ample, and then  $\hat{h}_{m\mathcal{L}} = m\hat{h}_{\mathcal{L}}$ . For the base-free case,  $c$  is the pullback of  $\mathcal{O}(1)$  for some morphism  $X \rightarrow \mathbb{P}^n$ , thus  $h_{\mathcal{L}}$  is non-negative by(20.2.1.3), and  $h_{\mathcal{L}} \sim \hat{h}_{\mathcal{L}}$ , thus  $\hat{h}_{\mathcal{L}}$  must also be non-negative.

4 follows from Northcott's theorem(20.2.1.26). □

**Cor. (21.1.3.4) [Positive Definiteness].** For any ample line bundle  $\mathcal{L} \in \text{Pic}(A)$ ,  $b_{\mathcal{L}}$  induces a positive definite symmetric bilinear form on  $A(\bar{F}) \otimes_{\mathbb{Z}} \mathbb{R}$  ┘

*Proof:* We want to use(3.2.4.38). Notice  $b_{\mathcal{L}}$  is just  $2\hat{h}_{\mathcal{L} \otimes [-1]^*\mathcal{L}}$ , thus satisfies the conditions by(21.1.3.3). □

**Prop. (21.1.3.5) [Zero of Heights and Torsion].** If  $F \in \mathbf{GField}$ ,  $A \in \mathbf{AbVar}/F$  and  $\mathcal{L}$  is ample, then  $\hat{h}_{\varphi, \mathcal{L}}(x) = 0$  iff  $x$  is preperiodic, i.e. the sequence  $\{x, \varphi(x), \varphi^2(x), \dots\}$  is finite.

In particular,  $\hat{h}_{\mathcal{L}}(x) = 0$  iff  $x$  is torsion. ┘

*Proof:* Assume  $l \neq 0$ . If  $x$  is preperiodic, then clearly  $\hat{h}_{\varphi, \mathcal{L}}(x) = \lim_{r \rightarrow \infty} \lambda^{-r} h_{\mathcal{L}}(\varphi^r(x)) = 0$ . Conversely, if  $\hat{h}_{\varphi, \mathcal{L}}(x) = 0$ , then  $\hat{h}_{\varphi, \mathcal{L}}(\varphi^r(x)) = 0$  for any  $r$ , then  $|h_{\mathcal{L}}(\varphi^r(x))| \leq |\hat{h}_{\varphi, \mathcal{L}}(\varphi^r(x))| + C(\varphi, \mathcal{L}) = C(\varphi, \mathcal{L})$  is bounded and also  $\varphi^r(x) \in X(k(x))$ , thus has bounded degree. So by Northcott's theorem(20.2.1.26), there are only f.m. such points. □

**Cor. (21.1.3.6) [Kronecker].** For  $\zeta \in \bar{\mathbb{Q}}$ ,  $h^+(\zeta) = 0$ (20.2.1.5). ┘

*Proof:* This is a special case of(21.1.3.5), where  $\varphi : \mathbb{P}^1 \rightarrow \mathbb{P}^1 : [x, y] \mapsto [x^n, y^n]$  and  $\mathcal{L} = \mathcal{O}(1)$ , thus the preperiodic points are just  $0, \infty$  and all the roots of unity. □

**Prop. (21.1.3.7) [Néron-Tate Pairings].** Let  $F \in \mathbf{NField}$  and  $A \in \mathbf{AbVar}/F$ , then  $A \times \hat{A}$  is also an Abelian variety with the even Poincaré class  $p$ (20.9.4.10), thus generating a function:

$$\hat{h}_{A \times A^\vee, p} : A(\bar{F}) \times \hat{A}(\bar{F}) \rightarrow \mathbb{R}.$$

Then in fact this pairing is bilinear, called the **Néron-Tate pairing**  $\langle \cdot, \cdot \rangle_{A, \text{N-T}}$ .

The Weil-Tate pairing satisfies the functoriality property: If  $f : A \rightarrow B$  is a homomorphism of Abelian varieties, then  $\langle f(a), b \rangle_{B, \text{N-T}} = \langle a, \hat{f}(b) \rangle_{A, \text{N-T}}$ . ┘

*Proof:* Use functoriality of heights for  $A \rightarrow A \times \hat{A}$ , then  $\hat{h}_{A \times \hat{A}, p}((a, 0)) = \hat{h}_{A, 0}(a) = 0$ . Similarly,  $\langle 0, a \rangle_{A, K} = 0$ . Thus  $\hat{h}_{A \times \hat{A}, p}$  is bilinear by(3.2.4.32).

The last assertion follows from(10.9.3.37). □

**Prop. (21.1.3.8).** Let  $\mathcal{L} \in \text{Pic}(A)$  and  $\varphi_{\mathcal{L}} : A \rightarrow \hat{A}$  the associated homomorphism(20.9.4.6), then for any  $a, a' \in A(\bar{K})$ ,

- $\hat{h}_{\tau_a^*, \mathcal{L}}(a) = \hat{h}_{\mathcal{L}}(a) + b(a, a')$ .
- $\hat{h}_{\mathcal{L}}(a) = \langle a, \mathcal{L} \rangle_{A, \text{N-T}}$ .
- $b_{\mathcal{L}}(a, a') = \langle a, \varphi_{\mathcal{L}}(a') \rangle_{A, \text{N-T}} = \hat{h}_{\varphi_{\mathcal{L}}(a')}(a)$ .

┘

*Proof:* 1:  $b_{\mathcal{L}}(a, a') = \widehat{h}_{\mathcal{L}}(a + a') - \widehat{h}_{\mathcal{L}}(a) - \widehat{h}_{\mathcal{L}}(a') = \widehat{h}_{\mathcal{L}}(\tau_{a'}a) - \widehat{h}_{\mathcal{L}}(a) - \widehat{h}_{\mathcal{L}}(a')$ . Then  $b(\cdot, a') + \widehat{h}_{\mathcal{L}}$  is a representative in the class  $h_{\tau_{a'}^*(\mathcal{L})}$  by functoriality. And it is a quadratic function, thus by uniqueness, we are done.

2: Because the pullback of  $p$  to  $A \times \{\mathcal{L}\}$  is  $\mathcal{L}$  by (10.9.3.35), and thus this follows from functoriality and (21.1.3.7).

3: By (20.9.4.6) and item1,  $b(a, a') = \widehat{h}_{\varphi_{\mathcal{L}}(a')}(a)$ . Thus we are done by item2.  $\square$

**Cor. (21.1.3.9)[Regulator].** The Néron-Tate pairing induces a non-degenerate pairing  $A(K)/A(K)_{\text{tor}} \times \widehat{A}(K)/\widehat{A}(K)_{\text{tor}} \rightarrow \mathbb{R}$ . The discriminant of this pairing is called the **regulator** of  $A$ , denoted by  $R(A/K)$ .  $\square$

*Proof:* Let  $\mathcal{L} \in \text{Pic}(A)$  be ample, then  $\varphi_{\mathcal{L}} : A \rightarrow \widehat{A}$  is an isogeny, thus  $\varphi_{\mathcal{L}} : A(K)/A(K)_{\text{tor}} \rightarrow \widehat{A}(K)/\widehat{A}(K)_{\text{tor}}$  is injective, and by (21.7.1.7), the image is a subgroup of  $\widehat{A}(K)/\widehat{A}(K)_{\text{tor}}$  of the same rank, thus we are done by (21.1.3.8) item3 and (21.1.3.4).  $\square$

**Cor. (21.1.3.10).** Let  $A$  be an Abelian variety,  $c \in \text{Pic}(A)$  an even ample class,  $c' \in \text{Pic}(A)$ , then  $\widehat{h}_{c'} = O(\widehat{h}_c^{1/2})$ .  $\square$

*Proof:* By (20.9.4.18),  $\varphi_c$  is isogeny thus surjective, thus we can assume  $c' = \varphi_c(a')$  for some  $a' \in A(K)$ . Then by (21.1.3.8),  $\widehat{h}_{c'}(a) = b_c(a, a')$ . Because  $b_c$  is positive semi-definite by (21.1.3.3), by Cauchy-Schwartz (3.2.4.31),  $|\widehat{h}_{c'}(a)|^2 \leq b(a, a)b(a', a') = 4\widehat{h}_c(a)\widehat{h}_c(a')$ .  $\square$

### Hilbert's Irreducibility Theorem

**Prop. (21.1.3.11)[Runge's Theorem].**  $\square$

**Prop. (21.1.3.12) [Hilbert's Irreducibility Theorem].** Let  $C$  be a smooth irreducible projective curve over a number field  $K$  and let  $f : C \rightarrow \mathbb{P}^1$  be a surjective rational function on  $C$  over  $K$ , then for all  $n \in \mathbb{N}$  except for a set of natural density 0, the divisor  $f^*[n]$  is a prime divisor over  $K$ .  $\square$

*Proof:* Cf.[Diophantine Geometry, P319].  $\square$

### Local Height Pairings

Cf.[Sil99]Chap6 or [Local Heights on Curves, Gross, in Arithmetic Geometry] and [B-G06] or [Introduction to Diophantine Geometry, Lang].

### Canonical Heights on Semi-Abelian Varieties

Cf.[Points of small height on semiabelian varieties]Section3 or [Poonen, Bogomolov plus Mordell-Lang].

**Def. (21.1.3.13)[Canonical Height on Semi-Abelian Varieties].**  $\square$

## 4 Isogenies

**Thm. (21.1.4.1) [Masser-Wüstholz/Pellarin].** Let  $F \in \mathbf{NField}$ ,  $d = [F : \mathbb{Q}]$ . If  $E, E' \in \mathbf{EllCur}/F$  are isogenous, then there exists an isogeny  $\psi : E \rightarrow E'$  over  $F$  with  $\text{degree} \leq \kappa(d)(1 + h^+(j(E)))^2$ , where  $\kappa(d)$  depends only on  $d$  and is effective.  $\lrcorner$

*Proof:* ?  $\square$

**Cor. (21.1.4.2) [Bounded on Rational Isogenies].** Let  $F \in \mathbf{NField}$ ,  $d = [F : \mathbb{Q}]$  and  $E \in \mathbf{EllCur}/F$  without CM, and there is a cyclic isogeny  $\varphi : E \rightarrow E'$  over  $F$  with degree  $\delta$ , then  $\delta \leq \kappa(d)(1 + h^+(j(E)))^2$ .  $\lrcorner$

*Proof:* Let  $\psi : E \rightarrow E'$  be an isogeny of  $\text{degree} \leq \kappa(d)(1 + h^+(j(E)))^2$ . In fact we can assume that  $\psi$  is cyclic. Then  $\varphi^\vee \circ \psi \in \text{End}(E) = \mathbb{Z}$ . Thus  $\varphi = \pm\psi$  has  $\text{degree} \leq \kappa(d)(1 + h^+(j(E)))^2$ .  $\square$

### Tate's Hom Conjecture

References are [Tat66, Fal83].

**Lemma (21.1.4.3) [Faithfulness of  $p$ -Divisible Groups].** Let  $k \in \mathbf{Field}$ ,  $A_1, A_2 \in \mathbf{AbVar}/k$ , and  $\ell \in \mathbf{Prime}$ , the natural map

$$\text{Hom}(A_1, A_2) \otimes \mathbb{Z}_\ell \rightarrow \text{Hom}_{\mathbb{Z}_\ell[\text{Gal}_k]}(A_1[\ell^\infty], A_2[\ell^\infty])$$

is injective with torsion-free cokernel.  $\lrcorner$

*Proof:* Choose a  $\mathbb{Z}$ -basis  $\{f_1, \dots, f_n\}$  of  $\text{Hom}(A_1, A_2)$  (20.9.6.12).

To prove the cokernel is torsion-free, suppose  $c_i \in \mathbb{Z}_\ell$  and  $\varphi \in \text{Hom}_{\mathbb{Z}_\ell[\text{Gal}_k]}(A_1[\ell^\infty], A_2[\ell^\infty])$  s.t.  $\ell^m \varphi = \sum c_i f_i[\ell^\infty]$ , then we may choose  $n_i \in \mathbb{Z}$  s.t.  $c_i = n_i + \ell^m d_i$  with  $d_i \in \mathbb{Z}_\ell$ . Then  $f = \sum n_i f_i \in \text{Hom}(A_1, A_2)$  satisfies

$$f[\ell^\infty] = \ell^m(\varphi - \sum d_i f_i[p^\infty]),$$

which means  $f$  vanishes on  $A_1[\ell^m]$ , so  $f = g \circ [\ell^m]$  for some  $g \in \text{Hom}(A_1, A_2)$ , and then  $\varphi = g[\ell^\infty] + \sum d_i f_i[p^\infty]$  is in the image of the natural map, because  $A[\ell^\infty] \in p\text{Div}/k$ .

To prove injectivity, it suffices to show that if  $c_i \in \mathbb{Z}_\ell$  and  $\sum c_i f_i$  kills  $A[\ell]$ , then  $\ell | c_i$  for each  $i$ . Because if this is proved, then whenever  $\sum c'_i f_i$  kills  $A[\ell^\infty]$ , we get  $\ell | c_i$ , so  $(\sum c'_i f_i) \circ \ell$  kills  $A[p^n]$  for each  $n \in \mathbb{Z}_+$ . But  $[\ell] : A[p^{n+1}] \rightarrow A[p^n]$  is faithfully flat (20.9.6.18), so  $\sum c'_i f_i$  kills  $A[p^\infty]$  too. In this way, we prove that  $c_i = 0$  for each  $i$ .

To prove the desired assertion, we may assume that  $c_i \in \mathbb{Z}$ , and then  $\sum c_i f_i : A_1 \rightarrow A_2$  factors through  $A \xrightarrow{[\ell]} A$  as  $\sum c_i f_i = \ell(\sum b_i f_i)$ , so  $\ell | c_i$  for each  $c_i$ .  $\square$

**Thm. (21.1.4.4) [Tate's Hom Conjecture, Mumford/Tate [Tat66]/Faltings [Fal83]].** If  $k \in \mathbf{Field}$  is f.g. over its prime field and  $A_1, A_2 \in \mathbf{AbVar}/k$ , then

$$\text{Hom}(A_1, A_2) \otimes \mathbb{Z}_\ell \rightarrow \text{Hom}_{\mathbb{Z}_\ell[\text{Gal}_k]}(A_1[\ell^\infty], A_2[\ell^\infty])$$

is an isomorphism.  $\lrcorner$

*Proof:* Cf.[Tat66] and[CCO14]Appendix A.1.?. Passing to  $A \times B$ , we may assume that  $A = B$ .  
First notice that

$$\mathrm{Hom}(A_1, A_2) \otimes \mathbb{Q}_\ell \rightarrow \mathrm{Hom}_{\mathbb{Z}_\ell[\mathrm{Gal}_K]}(A_1[\ell^\infty], A_2[\ell^\infty]) \otimes \mathbb{Q}_\ell$$

is injective(This follows from(21.1.4.3) and the fact  $\mathbb{Q}_\ell$  is flat over  $\mathbb{Z}_\ell$ .), so it suffices to show this is surjective.

?

□

**Cor.(21.1.4.5)[Faltings Isogeny Theorem].** Let  $k \in \mathbf{Field}^{\mathrm{fin}}$  or  $k \in \mathbf{GField}$ ,  $\ell \in \mathbf{Prime}$ ,  $A_1, A_2 \in \mathbf{AbVar}/k$ , then  $A_1, A_2$  are isogenous iff  $T_\ell(A_1) \cong T_\ell(A_2) \in \mathrm{Rep}_{\mathbb{Z}_p}^{\mathrm{fd}}(\mathrm{Gal}_K)$ . ┘

## 5 Heights of Abelian Varieties

Cf.[Milne, Abelian Varieties] and [Faltings Height].

**Def.(21.1.5.1)[Faltings Heights].** Let  $F \in \mathbf{NField}$  and  $A \in \mathbf{AbVar}/F$ , take the Néron model  $\mathcal{A}/\mathcal{O}_F$ , then  $\mathcal{K}_{A/\mathcal{O}_F}$  is an invertible sheaf, and thus  $\omega_{A/\mathcal{O}_F}$  is an invertible  $\mathcal{O}_F$ -sheaf, represented by a fractional ideal  $M \subset F$ , and  $M \otimes_R F = \Gamma(A, \mathcal{K}_{A/F})$  by(10.1.1.12).

We define a norm on  $M \otimes_F F_v = \Gamma(A_v, \mathcal{K}_{A_v/F_v})$  for each  $v \in \Sigma_F^\infty$ :

$$\|\omega\|_v = \left( \left( \frac{i}{2} \right)^g \int_{A(\overline{F}_v)} \omega \wedge \overline{\omega} \right)^{1/2}.$$

This make  $\widetilde{M}$  a metrized line bundle on  $\mathcal{O}_F$ (23.2.1.1).

Then we define the **Faltings height** of  $A$ :

$$H_{\mathrm{Fal}}(A) = H((\widetilde{M}, |\cdot|)) \quad (23.2.1.2), \quad h_{\mathrm{Fal}}(A) = \frac{1}{[F : \mathbb{Q}]} \log H_{\mathrm{Fal}}(A).$$

More explicitly, take a non-zero holomorphic  $g$ -form  $\omega$  on  $A$ , and for  $v \in \Sigma_F^0$ , let  $\omega_v$  be a Néron differential on  $A_v$ , then

$$h_{\mathrm{Fal}}(A) = \frac{-1}{[F : \mathbb{Q}]} \left( \sum_{v \in \Sigma_F^0} \log \left| \frac{\omega}{\omega_v} \right|_v + \sum_{v \in \Sigma_F^\infty} \frac{[F_v : \mathbb{Q}_v]}{2} \log \left| \left( \frac{i}{2} \right)^g \int_{A(\overline{F}_v)} \omega \wedge \overline{\omega} \right| \right).$$

┘

**Def.(21.1.5.2)[Stable Faltings Heights].** Let  $F \in \mathbf{NField}$  and  $A \in \mathbf{AbVar}/F$ , then by?? there exists a finite extension  $L/F$  s.t.  $A_L$  is semistable. Then the Néron model of  $A_L$  are stable under base change?. Then we can define the **stable Faltings height**  $h_{\mathrm{st}}(A) = h(A_L)$ , which is invariant of  $L$  chosen. ┘

**Prop.(21.1.5.3).** Let  $F \in \mathbf{NField}$  and  $A \in \mathbf{AbVar}/F$ , then  $h_{\mathrm{Fal}}(A) = h_{\mathrm{Fal}}(A^\vee)$ . ┘

*Proof:* Cf.[Szpiro, La Conjecture de Mordell, Séminaire Bourbaki, 1983/84]. □

**Thm.(21.1.5.4)[Faltings Heights and Isogenies].** Let  $F \in \mathbf{NField}$ ,  $\mathcal{A}_1, \mathcal{A}_2$  be semi-Abelian schemes over  $\mathcal{O}_F$  of relative dimension  $g$  with proper generic fiber  $A_1, A_2 \in \mathbf{AbVar}/F$ . Let  $\varphi : \mathcal{A}_1 \rightarrow \mathcal{A}_2$  be an isogeny with kernel  $\mathcal{G}/\mathcal{O}_F$ , then

$$h_{\mathrm{st}}(A_2) = h_{\mathrm{st}}(A_1) + \frac{1}{2} \log \deg(\varphi) - [F : \mathbb{Q}] \log e^* \Omega_{\mathcal{G}/\mathcal{O}_F}^1.$$

┘

*Proof:* Cf.[Faltings, Lemma5] or [Faltings height].? □

**Prop. (21.1.5.5) [Lower Bounds of Faltings Heights].** There exists  $c \in \mathbb{R}_+$  s.t.  $h_{\text{st}}(A) \leq cg$  for any  $A \in \text{AbVar}^g/\overline{\mathbb{Q}}$ . ┘

*Proof:* Cf.[Bost, Arakelov geometry of abelian varieties, 1996]. □

**Thm. (21.1.5.6) [Finiteness of Heights in an Isogeny Class].** Let  $F \in \text{NField}$  and  $A \in \text{AbVar}/F$  be semistable, then the set of Faltings heights of  $B \in \text{AbVar}/F$  isogenous to  $A$  is finite. ┘

*Proof:* This is the hardest part of the proof.? Cf.[Conrad Seminar, L20]. □

### Modular Heights

**Def. (21.1.5.7) [Modular Heights].** Consider the Siegel modular varieties  $\mathcal{M}_{g,d}/\mathbb{Q}$  parametrizing Abelian schemes(28.1.3.4), then for any  $F \in \text{NField}$ ,  $(A, \lambda) \in \text{AbVar}^{\dim=g, \text{polar}=d}/F$  defines a  $F$ -point  $j((A, \lambda))$  of  $\mathcal{M}^{g,d}$ . Then we can define the **modular height**  $h_M(A, \lambda)$  to be  $h(j((A, \lambda)))$ , where  $h$  is the Weil height associated to the canonical ample divisor on  $\mathcal{M}^{g,d}$ (28.1.3.5), which is defined up to a bounded function on  $\mathcal{M}^{g,d}$ . ┘

**Prop. (21.1.5.8) [Comparison of Heights].** For  $F \in \text{NField}$ , there are constants  $c_1, c_2, c_3$  s.t. for any semistable  $(A, \lambda) \in \text{AbVar}^{\text{polar}}/F$ ,

$$|h_{\text{Fal}}(A) - c_1 h_M(A, \lambda)| < c_2 \log h_M(A, \lambda) + c_3.$$

┘

*Proof:* ? Hard. Cf. [Chai and Faltings, 1990]. □

**Prop. (21.1.5.9) [Height I].** Let  $F \in \text{NField}$  and  $g, d, C \in \mathbb{Z}_+$ , then up to isomorphism, there are only f.m. semistable  $(A, \lambda) \in \text{AbVar}^{g, \text{polar}=d}/k$  s.t.  $h_M(A, \lambda) < C$ . ┘

*Proof:* By the definition of Siegel modular varieties, two objects in  $(A, \lambda) \in \text{AbVar}^{g, \text{polar}=d}/F$  corresponds to the same point of  $\mathcal{M}^{g,d}$ (21.1.5.7) iff they are isomorphic over  $\overline{F}$ . And by Northcott's theorem(20.2.1.26) the image of polarized Abelian varieties with bounded modular heights is finite. Thus the assertion follows from(21.1.7.2). □

**Cor. (21.1.5.10) [Height II].** Let  $F \in \text{NField}$  and  $g, C \in \mathbb{Z}_+$ , then up to isomorphism, there are only f.m. semistable  $A \in \text{AbVar}^g/F$  s.t.  $h_{\text{Fal}}(A) < C$ , by(21.1.5.8).

(Is this true for non-semistable varieties?). ┘

*Proof:* By the proposition(21.1.5.9) and(21.1.5.8), the set of isomorphism classes of semistable Abelian varieties  $(B, \lambda) \in \text{AbVar}^{g, \text{polar}=d}/F$  is finite. Now notice for any  $A \in \text{AbVar}/F$ ,  $B = (A \times A^\vee)^4$  is principally polarized by(20.9.7.2), and  $h(B) = 8h(A)$  by(21.1.5.3), so we are done. □

### Elliptic Curve case

**Prop. (21.1.5.11) [Heights of Elliptic Curves].** For  $F \in \text{NField}$  and  $E \in \text{EllCur}/F$ . For each  $v \in \Sigma_F^\infty$ , let  $\tau_v \in \mathcal{H}$  in the fundamental domain s.t.  $E_{\overline{K}_v} \cong E_{\tau_v}$ . Then

$$12[F : \mathbb{Q}]h_{\text{Fal}}(E/F) = \log \left| \text{Nm}_{F/\mathbb{Q}} N_{E/F} \right| - \sum_{v \in \Sigma_F^\infty} [F_v : \mathbb{Q}_v] \log \left| \Delta(\tau_v)(\text{Im } \tau_v)^6 \right|.$$

┘

*Proof:* Choose any Weierstrass model  $W : y^2 + a_1xy + a_3y = x^3 + a_2x^2 + a_4x + a_6$ , and let  $\Delta$  be its discriminant, and take

$$\omega = \Delta \cdot \left( \frac{dx}{2y + a_1x + a_3} \right)^{\otimes 12}.$$

Then notice this  $\omega$  is invariant under change of variables, thus  $-\sum_{v \in \Sigma_F^0} \log |\frac{\omega}{\omega_v}|_v = |\mathrm{Nm}_{F/\mathbb{Q}} N_{E/F}| \text{ ?}$ .  
 $\square$

**Prop. (21.1.5.12).** For  $F \in \mathbf{NField}$ ,  $E \in \mathbf{EllCur}/F$ ,

$$O(1) \leq h^+(j(E)) + \frac{1}{[F:\mathbb{Q}]} \log |\mathrm{Nm}_{F/\mathbb{Q}} \Upsilon_{E/F}| - 12h_{\mathrm{Fal}}(E/F) \leq 6 \log(1 + h^+(j(E))) + O(1).$$

In particular, if  $E/F$  is semistable, then

$$|h^+(j(E)) - 12h_{\mathrm{Fal}}(E/F)| \leq 6 \log(1 + h^+(j(E))) + O(1),$$

which is a special case of (21.1.5.8).  $\lrcorner$

*Proof:* Cf. [Heights and Elliptic Curves, P258] ?  $\square$

**Cor. (21.1.5.13).** For any  $\varepsilon \in \mathbb{R}_+$ , we have:  $E \in \mathbf{EllCur}/\mathbb{Q}$ ,

$$h_{\mathrm{Fal}}(E/\mathbb{Q}) + O(1) \leq \frac{1}{12} \max(|j(E)|, |\Delta_E^{\min} j(E)|) \leq (1 + \varepsilon) h_{\mathrm{Fal}}(E/\mathbb{Q}) + O_\varepsilon(1),$$

$$h_{\mathrm{Fal}}(E/\mathbb{Q}) + O(1) \leq \frac{1}{12} \max(|c_4(E)|^3, |c_6(E)|^2) \leq (1 + \varepsilon) h_{\mathrm{Fal}}(E/\mathbb{Q}) + O_\varepsilon(1).$$

$\lrcorner$

*Proof:* By definition,  $h^+(j(E)) + \log |\Upsilon_E| = \log \max(|j\Delta_E^{\min}|, |\Delta_E^{\min}|)$ . So the first inequality follows from (21.1.5.12) and the fact  $\log(1 + h) < \varepsilon h + O_\varepsilon(1)$  for  $h \in \mathbb{R}_+$ .

The second inequality follows from the first by the definition of  $\Delta$  and  $j$  (21.3.1.5).  $\square$

**Cor. (21.1.5.14) [Northcott Property for Elliptic Curves].** For  $d, C \in \mathbb{R}_+$ , there exists only f.m. pairs  $(F, E)$  where  $F \in \mathbf{NField}$ ,  $E \in \mathbf{EllCur}/F$  s.t.  $F = \mathbb{Q}(j(E))$ ,  $\deg(F) \leq d$  and  $h_{\mathrm{Fal}}(E/F) \leq C$ .  
 $\lrcorner$

*Proof:* It follows from (21.1.5.12) that for such pairs  $(F, E)$ ,  $h^+(j(E))$  is bounded from above, so by Northcott, there are only f.m. possibilities for  $j(E)$ . Then it suffices to show that for any  $E \in \mathbf{EllCur}/\overline{\mathbb{Q}}$ , there are only f.m.  $E' \in \mathbf{EllCur}/\mathbb{Q}(j(E))$  s.t.  $j(E') = j(E)$  and  $h(E'/\mathbb{Q}(j(E))) \leq C$ .

Denote  $F = \mathbb{Q}(j(E))$ , it follows from (21.1.5.12) that for any such  $E'$ ,  $|\mathrm{Nm}_{F/\mathbb{Q}} \Upsilon_{E'/F}|$  is bounded.

Choose  $S \in \Sigma_F$  s.t.  $S(6) \cup \Sigma_F^\infty \cup \mathrm{Ram}_{E/F} \subset S$  and  $\mathrm{cl}(\mathcal{O}_{F,S}) = 1$ , ?  $\square$

## 6 Small Points

**Notation (21.1.6.1).**

- Let  $F \in \mathbf{NField}$  and  $G \in \mathbf{semiAbVar}/F$  with maximal subtorus  $T$  of dimension  $t$  and quotient  $A = G/T$  of dimension  $g$ .
- Let  $\mathcal{L}$  be the canonical line bundle and  $h$  be a canonical height on  $A$  (21.1.3.13).
- For each  $x \in G(\overline{\mathbb{Q}})$ , use  $\mathcal{O}(x)$  to denote the Galois orbit of  $x$ .

- A **torsion subvariety** is a subvariety  $Y \subset G$  of the form  $Y = x + B$  where  $x$  is a torsion point and  $B \subset G$  is an semi-Abelian subvariety.

┘

**Def. (21.1.6.2) [Small Sequences].** A sequence  $(x_n)_{n \in \mathbb{N}} \subset G(\overline{F})$  is called

- **strict** if no infinite subsequence is contained in a proper torsion subvariety of  $A$ .
- **generic** if no infinite subsequence is contained in a proper subvariety of  $A$ .
- **small** if  $\lim_{n \rightarrow \infty} h(x_n) = 0$ .

┘

**Prop. (21.1.6.3).** If  $X \in \text{Var}/\overline{\mathbb{Q}}$  and  $(x_n) \in X^{\mathbb{N}}$  is a Zariski dense sequence in  $X$ , then  $(x_n)$  has a generic sequence.

┘

*Proof:* This follows from the fact that there are only countably many proper subvarieties of  $X$ .  $\square$

**Thm. (21.1.6.4) [Strong Equidistribution Conjecture, Bilu/Szpiro-Ullmo-Zhang/Kuhne].** For any strict small sequence (21.1.6.2)  $(x_i) \in A^{\mathbb{N}}$ , there is a weak convergence of measures on  $G_{\mathbb{C}_v}^{\text{an}}$ :

$$\frac{1}{\#\mathcal{O}_v(x_i)} \sum_{y \in \mathcal{O}_v(x_i)} \delta_y \rightharpoonup \frac{1}{\deg_{\mathcal{L}}(\overline{G})} c_1(\overline{\mathcal{L}_v})^{\wedge(g+t)}.$$

Notice for  $v \in \inf \Sigma_F$ ,  $c_1(\overline{\mathcal{L}_v})^{\wedge(g+t)}$  is a Haar measure on  $G_{\mathbb{C}_v}^{\text{an}}$ .

┘

*Proof:* Cf. [Points of small height on semiabelian varieties]P2078<sup>?</sup>. The proof is Arakelov, and is similar to that of the Abelian variety case.  $\square$

**Cor. (21.1.6.5) [Mordell-Lang plus Bogomolov, Poonen/Remond].** Let  $\Gamma \subset G(\overline{F})$  be a f.g. subgroup, with divisible hull  $\Gamma'$ . For  $\varepsilon \in \mathbb{R}_+$ , denote  $\mathbb{D}(\Gamma', \varepsilon) \subset G(\overline{F})$  the metric nbhd in the metric defined by the canonical height<sup>?</sup>. Then for any closed subvariety  $X \subset A$ , there exists some  $\varepsilon \in \mathbb{R}_+$  s.t.  $X(\overline{F}) \cap \Gamma'_{\varepsilon}$  is contained in a finite union  $\cup_j Z_j$  where each  $Z_j \subset X_{\overline{F}}$  is a torsion subvariety (21.1.6.1).

┘

*Proof:* <sup>?</sup>. Cf. [Poonen].  $\square$

**Cor. (21.1.6.6) [Bogomolov Conjecture, Ullmo-Zhang].** If  $X \subset A$  is subvariety but not a torsion subvariety, then there exists  $\varepsilon \in \mathbb{R}_+$  s.t.  $\{P \in X(\overline{F}) | h(P) \leq \varepsilon\}$  is not Zariski-dense in  $X$ .

┘

*Proof:* <sup>?</sup>  $\square$

**Cor. (21.1.6.7) [Manin-Mumford-Lang Conjecture, Raynaud].** By Bogomolov conjecture (21.1.6.6) and (21.1.3.5), if  $X \subset G$  is subvariety but not a torsion subvariety (21.1.6.1), then  $X(\overline{\mathbb{Q}}) \cap G(\overline{\mathbb{Q}})_{\text{tor}}$  is not Zariski-dense in  $X$ .

This is a special case of the Mordell-Lang conjecture (21.1.7.5).

┘

**Thm. (21.1.6.8) [Equidistribution of Small Points, Zhang].** If  $(x_n)_{n \in \mathbb{N}}$  is a small and strict sequence in  $A$ , then for any continuous function on  $A^{\text{an}}$ ,

$$\lim_{n \rightarrow \infty} \frac{1}{\#\mathcal{O}(x_n)} \sum_{y \in \mathcal{O}(x_n)} f(y) = \int_{A^{\text{an}}} f dx.$$

┘

*Proof:* Firstly  $(x_n)$  is generic: If there is an infinite subsequence with Zariski closure a proper subvariety  $X \subset A$ , then it follows from Bogomolov's conjecture (21.1.6.6) that  $X$  is a torsion subvariety. Then  $(x_n)$  is not strict, contradiction.  $\square$

**Cor. (21.1.6.9).** Let  $S \subset A^{\text{an}}$  be a closed subset, then  $S$  contains only f.m. non-Galois-conjugate maximal torsion subvarieties. And if  $S'$  is the complement in  $S$  of all the Galois orbits of maximal torsion subvarieties contained in  $S$ , then there exists  $\varepsilon \in \mathbb{R}_+$  s.t. for any  $x \in A(\overline{\mathbb{Q}})$  s.t.  $O(x) \subset S'$ ,  $h(x) > \varepsilon$ .  $\lrcorner$

*Proof:* ?  $\square$

**Thm. (21.1.6.10) [Theorem of Successive Minima, Zhang].** Let  $F \in \mathbf{NField}$ ,  $X \in \mathcal{V}\text{ar}^d/F$ , and  $\mathcal{L}$  an ample line bundle on  $X$  with a semipositive adelic metric  $\|\cdot\|$ . For  $1 \leq i \leq d$ , define

$$\lambda_i = \sup_{Y \subset X, \dim Y = i} \left( \inf_{P \in X(\overline{\mathbb{Q}}) \setminus Y(\overline{\mathbb{Q}})} h_{\mathcal{L}}(P) \right),$$

then

$$\lambda_d \geq h_{\mathcal{L}}(X) \geq \frac{1}{d}(\lambda_1 + \dots + \lambda_d).$$

$\lrcorner$

*Proof:* Cf. [Small Points and Adelic metric, Shouwu Zhang]. ?  $\square$

### Small Points on $\mathbb{G}_m^n$

References are [Sch96] and [B-G06].

### Small Points on Elliptic Curves

**Conj. (21.1.6.11) [Lang's Height Conjecture].** For any  $F \in \mathbf{NField}$ , there exists  $c_1(F), c_2(F) \in \mathbb{R}_+$  s.t. for any  $E \in \mathbf{EllCur}/F$  and  $P \in E(F) \setminus E(F)_{\text{tor}}$ ,

$$h_{\text{N-T}}(P) \geq c_1(F) \log |\text{Nm}_{F/\mathbb{Q}} \Delta_{E/F}^{\min}| + c_2(F). \quad (21.3.4.24)$$

$\lrcorner$

**Thm& Conj. Cor. (21.1.6.12) [Silverman].** This conjecture is true when we restrict to  $E \in \mathbf{EllCur}/F$  with  $j(E) \in \mathbb{Z}$ .  $\lrcorner$

*Proof:* Cf. [Sil86] P263.  $\square$

## 7 Finiteness Theorems

**Prop. (21.1.7.1).** Let  $L/F \in \mathbf{NField}$  be Galois, then for any  $A \in \mathbf{AbVar}/F$ , there exists f.m. isomorphism classes of  $B \in \mathbf{AbVar}/F$  s.t.  $A_L \cong B_L$ .  $\lrcorner$

*Proof:* Cf. [Conrad note, L14] ?  $\square$

**Prop. (21.1.7.2) [Weak Finiteness, Faltings].** Let  $F \in \mathbf{NField}$  and  $(A, \lambda) \in \mathbf{AbVar}^{g, \text{polar}=d}/F$ , then there exists only f.m. isomorphism classes of  $(B, \lambda') \in \mathbf{AbVar}^{g, \text{polar}=d}/F$  s.t.  $(A_{\overline{F}}, \lambda) \cong (B_{\overline{F}}, \mu)$ .  $\lrcorner$

*Proof:* Firstly, by (21.1.2.14), any such  $B$  is also semistable, so the set of good reductions are stable under base change, thus the set of good reductions of  $A$  and  $B$  in  $\Sigma_F$  are the same.

Then by (21.7.1.1) and (20.8.1.8), for  $\ell \in \mathbf{P} \setminus \{2\}$ , there is a finite extension  $L/F$  s.t. every  $\ell$ -torsion points of such  $B$  are in  $B(L)$ .

Now any such  $B$  are isomorphic to  $A$  over  $L$  as above: Given any isomorphism  $\alpha : (A_{\overline{F}}, \lambda) \cong (B_{\overline{F}}, \mu)$ , for  $\alpha \in \text{Gal}_L$ ,  $\alpha$  and  $\sigma(\alpha)$  has the same action on  $\ell$ -torsion points, as all these points are  $L$ -rational, so  $\sigma(\alpha)^{-1} \circ \alpha$  acts trivially on  $A[\ell]$ , which implies by (20.9.7.6) that  $\sigma = \alpha(\sigma)$ , so  $\sigma$  is defined over  $L$  and we are done.

Finally we finish using (21.1.7.1) and (20.9.7.3).  $\square$

**Thm. (21.1.7.3) [Finitely Many Isogenous Varieties, Mazur [Maz78]/Faltings [Fal83]].** Let  $F \in \mathbf{NField}$  and  $A \in \mathcal{AbVar}/F$ , then there are only f.m. isomorphism classes of Abelian varieties  $B \in \mathcal{AbVar}/F$  isogenous to  $A$ .  $\lrcorner$

*Proof:* If  $A$  is semistable, then by (21.1.2.14), any  $B \in \mathcal{AbVar}/F$  isogenous to  $A$  is also semistable. Then we are done by (21.1.5.10) and (21.1.5.6).

For a general  $A$ , there exists a finite extension  $L/F$  s.t.  $A_L$  is semistable by??. Then the general case reduced to the semistable case by using (21.1.7.1).  $\square$

**Thm. (21.1.7.4) [Good Reductions are Rare, Shafarevich/Faltings].** For  $F \in \mathbf{NField}$  and  $\Sigma_F^\infty \subset_{\text{fin}} S \subset \Sigma_F$ , there are only f.m. isomorphism classes of  $A \in \mathcal{AbVar}^g/F$  having good reduction at all finite places outside  $S$ .  $\lrcorner$

*Proof:* By (21.1.7.3), it suffices to show that there are only f.m. isogeny classes of  $A \in \mathcal{AbVar}^g/F$  having good reduction at all finite places outside  $S$ . But then we can use (21.1.2.27) and the fact there are only f.m. such polynomials  $P_\ell(A_v, t)$  because of Weil conjecture.  $\square$

### Mordell-Lang Conjecture

**Thm. (21.1.7.5) [Mordell-Lang Conjecture, Laurent [Lau84]/Falting-Vojta/Hindry/Raynaud/McQuillan].**

Let  $F \in \mathbf{NField}$  and  $G/F$  be a semi-Abelian variety. Suppose  $X \subset A$  is a closed subvariety that is not a translate of a semi-Abelian subvariety of  $A$ , and  $\Gamma \subset A(\overline{F})$  is a subgroup s.t.  $\text{rank } \Gamma_{\mathbb{Q}} < \infty$ , with divisible hull  $\Gamma'$ , then  $X(\overline{F}) \cap \Gamma'$  is not Zariski dense in  $X$ .  $\lrcorner$

*Proof:* ?  $\square$

**Remark (21.1.7.6).** This can also be proved by using Zhang's equidistribution theorem (21.1.6.8).  $\lrcorner$

**Conj. Cor. (21.1.7.7) [Multiplicative Manin-Mumford, Conjecture of Lang].** If  $V \subset (\mathbb{C}^\times)^n$  is an algebraic subvariety, then there are f.m. torsion cosets  $X_i \subset V$  that accounts for all the torsion points of  $(\mathbb{C}^\times)^n$  that is contained in  $V$ .  $\lrcorner$

*Proof:* There is a direct proof in [Pila, AWS notes]Thm1.8.

It suffices to prove that if the torsion points are dense in  $V$ , then  $V$  is a torsion coset. In this case,  $V$  is defined over  $\overline{\mathbb{Q}}$ , because the torsion points are roots of unity.  $\square$

## 8 Galois-Cohomologies of Abelian Varieties

**Prop. (21.1.8.1) [Fundamental Exact Sequence].** Let  $k \in \mathbf{Field}$  and  $\varphi : X \rightarrow X' \in \text{IsogAbVar}_k$  be an étale isogeny, then there is an exact sequence

$$0 \rightarrow \ker(\varphi)(k^s) \rightarrow X(k^s) \rightarrow X'(k^s) \rightarrow 0$$

by (10.1.5.6), thus taking Galois cohomology, there is an exact sequence

$$0 \rightarrow X'(k)/\varphi(X(k)) \xrightarrow{\delta} H^1(\text{Gal}_k, X[\varphi]) \rightarrow H^1(\text{Gal}_k, X)[\varphi] \rightarrow 0.$$

┘

**Cor. (21.1.8.2).** By (20.9.6.18), if  $n \in \mathbb{Z} \cap K^\times$ , then there is an exact sequence

$$0 \rightarrow X(k^s)/(n) \xrightarrow{\delta} H^1(\text{Gal}_k, X[n]) \rightarrow H^1(\text{Gal}_k, X)[n] \rightarrow 0.$$

And the first map is described as follows: for  $P \in X(k^s)$ , let  $[n]Q = P$  where  $Q \in X(k^s)$ , then  $P$  is mapped to the 1-cocycle  $f(\sigma) = \sigma(Q) - Q$ . ┘

**Def. (21.1.8.3) [(Classical) Selmer Groups].** Let  $F$  be a global field or the function field of a non-singular smooth curve over an alg.closed field  $k$ ,  $\varphi : A \rightarrow A' \in \text{AbVar}/F$  an étale isogeny, then by restriction (9.8.1.11), there is an exact sequence

$$\begin{array}{ccccccc} 0 & \longrightarrow & A'(F)/\varphi(X(F)) & \longrightarrow & H^1(F, A[\varphi]) & \longrightarrow & H^1(F, A)[\varphi] \longrightarrow 0 \\ & & \downarrow & & \downarrow \text{res} & & \downarrow \text{res} \\ 0 & \longrightarrow & \prod_{v \in \Sigma_F} X'(F_v)/\varphi(A(F_v)) & \longrightarrow & \prod_{v \in \Sigma_F} H^1(F_v, A[\varphi]) & \longrightarrow & \prod_{v \in \Sigma_F} H^1(F_v, A)[\varphi] \longrightarrow 0 \end{array}$$

Where  $v$  are extended to  $F^s$  arbitrarily. Then the  $\varphi$ -**Selmer group** of  $A/F$  is a subgroup of  $H^1(\text{Gal}_F, A[\varphi])$  defined by

$$\text{Sel}_\varphi(A/F) = \ker \left( H^1(F, A[\varphi]) \xrightarrow{\text{res}} \prod_{v \in \Sigma_F} H^1(F_v, A)[\varphi] \right).$$

Notice the kernel is independent of the extension of  $v$  to  $F^{\text{sep}}$ , because any two such extensions induce conjugate groups  $\text{Gal}_{F_v}$  in  $\text{Gal}_F$  and use (9.8.1.13). ┘

**Prop. (21.1.8.4) [Selmer Groups and Šafarevič -Tate Groups].** Let  $C$  be a proper Dedekind scheme or a non-singular curve over a field  $k$  with fraction field  $F$ ,  $\varphi : A \rightarrow A'$  an étale isogeny of Abelian varieties over  $F$ , then there is an exact sequence

$$0 \rightarrow A'(K)/\varphi(A(K)) \rightarrow \text{Sel}_\varphi(A/K) \rightarrow \text{III}(A/K)[\varphi] \rightarrow 0 \quad (9.8.3.28).$$

┘

*Proof:* This exact sequence is a consequence of (21.1.8.3) and (21.1.8.3)(9.8.3.28). ┘

**Remark (21.1.8.5) [Computability].** It is difficult to characterize  $A'(K)/\varphi(A(K)) \subset \text{Sel}_\varphi(A/K)$ . ┘

**Prop. (21.1.8.6) [Sel $_\varphi(A)$  is Finite].** Let  $F \in \text{GField}$  or the function field of a non-singular smooth curve over an alg.closed field  $k$ ,  $\varphi : A \rightarrow A'$  an étale isogeny of Abelian varieties over  $F$ , then if  $S$  is a finite set of places of  $F$  containing all the places dividing  $\deg(\varphi)$ , and the places that  $A$  has bad reductions, then any element in  $\text{Sel}_\varphi(A/F)$  is unramified at all finite places outside  $S$ . In particular,  $\# \text{Sel}_\varphi(A/F) < \infty$  by (9.8.3.11). ┘

*Proof:* By definition of  $\text{Sel}_\varphi$  and (21.1.8.3), if  $\xi \in \text{Sel}_\varphi(A/F)$ , then for any  $v \in \Sigma_F^{\text{fin}}$ , there is some  $P \in A(F_v^s)$  s.t.  $\xi_\sigma = \sigma(P) - P \in A[\varphi]$  for any  $\sigma \in G_v$ . But if  $A$  has good reduction at  $v$  and  $\sigma \in I_v$ , then  $\sigma(P) - P \mapsto \tilde{O} \in \tilde{A}_v$ . But notice  $A[\varphi] \subset A[m]$  which maps injectively into  $\tilde{A}_v(k_v)$  by (21.3.4.20) if  $v$  is not dividing  $\deg(\varphi)$ . Thus in this case,  $\xi_\sigma = 0$  for any  $\sigma \in I_v$ .  $\square$

**Cor. (21.1.8.7) [ $\ell^\infty$ -Selmer Groups].** If  $\ell \in \text{Prime} \setminus \text{char } F$ , then the  $\ell$ -primary part  $\text{III}(A/F)[\ell^\infty] = \varinjlim_{n \geq 1} \text{III}(A/F)[\ell^n]$  is isomorphic to  $(\mathbb{Q}_\ell/\mathbb{Z}_\ell)^{\delta_\ell} \times T_\ell$  for some  $\delta_\ell \in \mathbb{N}$  and  $T_\ell \in \text{Ab}^{\text{fin}}$ . And define

$$\text{Sel}_{\ell^\infty}(A/F) = \varinjlim_{n \geq 1} \text{Sel}_{\ell^n}(A/F),$$

called the  $\ell^\infty$ -Selmer group. Then by taking limits of the exact sequence in (21.1.8.4), there is an exact sequence

$$0 \rightarrow A(F) \otimes \mathbb{Q}_\ell/\mathbb{Z}_\ell \rightarrow \text{Sel}_{\ell^\infty}(A/F) \rightarrow \text{III}(A/F)[\ell^\infty] \rightarrow 0.$$

If we define the  $\ell$ -Selmer rank  $\text{rank}_\ell(A/F) = \text{rank}(A/F) + \delta_\ell$ , then

$$\text{Sel}_{\ell^\infty}(A/F) = (\mathbb{Q}_\ell/\mathbb{Z}_\ell)^{\text{rank}_\ell(A/F)} \cdot \widetilde{\text{III}}(A/F)[\ell^\infty],$$

for some finite group  $\widetilde{\text{III}}(A/F)[\ell^\infty]$ .  $\lrcorner$

**Prop. (21.1.8.8) [ $\text{Sel}_p(A/F)$  and  $\text{Sel}_{p^\infty}(A/F)$ ].** If  $p \nmid \text{char } F$  and  $A(F)[p] = 0$ , then for any  $m \leq n \in \mathbb{Z}_+$ ,

- The inclusion  $A[p^m] \subset A[p^n]$  induces an isomorphism  $H^1(F, A[p^m]) = H^1(F, A[p^n])[p^m]$ .
- $\text{Sel}_{p^m}(A/F) = \text{Sel}_{p^n}(A/F)[p^m] = \text{Sel}_{p^\infty}(A/F)[p^m]$ .

$\lrcorner$

*Proof:* 1: Taking cohomology of the exact sequence  $0 \rightarrow A[p^m](F^s) \rightarrow A[p^n](F^s) \xrightarrow{p^m} A[p^{n-m}](F^s) \rightarrow 0$  implies that

$$H^1(F, A[p^m]) = \ker \left( H^1(F, A[p^n]) \xrightarrow{p^m} H^1(F, A[p^{n-m}]) \right).$$

And replacing  $m$  with  $n - m$  implies that  $A[p^{n-m}] \subset A[p^n]$  induces an inclusion  $H^1(F, A[p^{n-m}]) \subset H^1(F, A[p^n])$ . Then the composition  $A[p^n] \xrightarrow{p^m} A[p^{n-m}] \subset A[p^n]$  induces a composition  $H^1(F, A[p^n]) \xrightarrow{p^m} H^1(F, A[p^{n-m}]) \hookrightarrow H^1(F, A[p^n])$  that equals multiplication by  $m$ . Thus

$$H^1(F, A[p^m]) = \ker \left( H^1(F, A[p^n]) \xrightarrow{p^m} H^1(F, A[p^{n-m}]) \right) = H^1(F, A[p^n])[p^m].$$

2: This follows from 1 and the definition of  $\text{Sel}_{p^m}(A/F)$ .  $\square$

**Prop. (21.1.8.9) [Poonen-Rains[?P-R15]/Bhargava-Kane-Lenstra-Poonen-Rains[BKLPR]].** For  $E \in \text{EllCur}/\mathbb{Q}$  and  $n \in \mathbb{Z}_+$ , there is an exact sequence

$$\begin{array}{ccc} E(\mathbb{Q})/(n) & \longrightarrow & H^1(\mathbb{Q}, E[n]) \\ \downarrow & & \downarrow \beta \\ E(\mathbf{A})/(n) & \xrightarrow{\alpha} & H^1(\mathbf{A}, E[n]) \end{array},$$

and

- Each of  $\text{Im}(\alpha), \text{Im}(\beta)$  is a maximal isotropic subspace of  $H^1(\mathbf{A}, E[n])$  w.r.t.  $Q$ ?
- If  $n \in \text{Prime}$  or the map  $\text{Gal}_{\mathbb{Q}} \rightarrow \text{GL}(2; \mathbb{Z}/(n))$  is a surjection, then  $\beta$  is injective.

In particular, for  $p \in \text{Prime}$ ,  $\text{Sel}_p(E) = \beta^{-1} \text{Im}(\alpha)$  is the intersection of two maximal isotropic subspaces of  $H^1(\mathbf{A}, E[n])$ .  $\lrcorner$

*Proof:* Cf. [?P-R15] and [BKLPR].?  $\square$

### Tate-Shafarevich Groups

**Conj. (21.1.8.10)** [Tate-Šafarevič]. For any  $A \in \mathcal{AbVar}/F$ , we have  $\#\text{III}(A/F) < \infty$  (9.8.3.28). ┘

*Proof:* □

**Remark (21.1.8.11).** There are still no  $E \in \text{EllCur}/\mathbb{Q}$  with  $\text{rank}_{\text{an}}(E/\mathbb{Q}) \geq 2$  s.t.  $\text{III}(E/\mathbb{Q})$  can be proven to be finite. ┘

**Thm. (21.1.8.12)** [Cassels-Tate Pairing, Tate[Tat63]/Cassels[?Cas65]]. Let  $A \in \mathcal{AbVar}/F$  and  $A^\vee$  its dual, then there is a bilinear **Cassels-Tate pairing**  $\text{III}(A/K) \times \text{III}(A^\vee/K) \rightarrow \mathbb{Q}/\mathbb{Z}$  (9.8.3.28) and the radical on both sides are the set of divisible elements. ┘

*Proof:* Cf.[Birch and Swinnerton-Dyer Conjecture, P10]. ? □

**Cor. (21.1.8.13)** [Principally Polarized Šafarevič Groups, Cassels/Poonen]. If  $K \in \mathcal{AbVar}/F$  has a principal polarization  $\lambda$  that comes from a rational divisor  $D$ , then the pullback pairing  $\text{III}(A/K) \times \text{III}(A/K) \rightarrow \mathbb{Q}/\mathbb{Z}$  is alternating. In particular, if  $\#\text{III}(A/F) < \infty$ , then it is a perfect square, by (3.2.4.40).

In particular, if  $E \in \text{EllCur}/F$  and  $\#\text{III}(E/F) < \infty$ , then it is a perfect square. ┘

*Proof:* ? □

**Remark (21.1.8.14).** For a general Abelian variety  $A$ ,  $\#\text{III}(A/\mathbb{Q})$  may not be a square. ┘

The discussion of Selmer groups and ranks are continued in B-S.D Conjecture 31.4.

## 21.2 Complex Multiplication Theory

*“The theory of complex multiplication...is not only the most beautiful part of mathematics but also of all science.”*

–D. Hilbert

References are [S-T61, CCO14, Mil20b], [Lang, Complex Multiplication], [Abelian varieties with complex multiplication and modular functions, Shimura(1998)] and [The Fundamental Theorem of Complex Multiplication, Milne, 2007].

**Notation (21.2.0.1).**

- Use notations defined in [Abelian Varieties](#).

⌋

Abelian varieties with complex multiplication correspond to special points on the moduli variety of abelian varieties, and their arithmetic is intimately related to that of the values of modular functions and modular forms at those points.

### 1 CM-Algebras and CM-Types

**Def. (21.2.1.1) [CM-Fields].** A **CM-field** is a number field that is a totally imaginary quadratic extension of a totally real field.

⌋

**Prop. (21.2.1.2) [Characterizing CM-Fields].** For  $E \in \mathbf{NField}$ , then  $E$  is a CM-field or totally real iff there exists exactly one  $c_E \in \text{Aut}(E)$  s.t. for any  $\rho \in \text{Hom}(E, \mathbb{C})$ ,  $\rho \circ c_E = \bar{\rho}$ . And it is CM iff  $c_E \neq \text{id}_E$ .

⌋

*Proof:* If  $\rho \circ c_E = \bar{\rho}$  for any  $\rho \in \text{Hom}(E, \mathbb{C})$ , then  $\rho \circ c_E^2 = \rho$ , so  $c_E^2 = \text{id}$ . if  $F$  is the fixed field of  $c_E$ , then  $[E : F] = 2$ , and clearly  $F$  is totally real. Conversely, if  $E$  is a CM-field or totally real, then clearly there exists a unique such  $c_E$ , which is the identity if  $E$  is totally real and the unique involution fixing the totally real subfield  $F$ .

In this case, if  $c_E \neq \text{id}_E$ , then  $\rho(E) \not\subseteq \mathbb{R}$  for any  $\rho \in \text{Hom}(E, \mathbb{C})$ , thus  $E$  is totally imaginary. And if  $c_E = \text{id}_E$ , then  $E$  is also totally real.  $\square$

**Cor. (21.2.1.3).** A finite composite of CM-fields is a CM-field. In particular, the Galois closure of a CM-field is a CM-field.

And the composite of all CM-fields in  $\mathbb{C}$  are the field  $\mathbb{Q}^{\text{cm}} \subset \overline{\mathbb{Q}}$  corresponding to the subgroup of  $\text{Gal}_{\mathbb{Q}}$  generated by all the elements  $\{[\sigma, c] | \sigma \in \text{Gal}_{\mathbb{Q}}\}$ , which is a normal subgroup.  $\square$

*Proof:* The complex involutions on these CM-fields is compatible on their intersections, thus defines a complex involution on their composite.  $\square$

**Cor. (21.2.1.4).** Any CM-field  $E$  is of the form  $E = F(\alpha)$ , where  $F$  is totally real,  $\alpha^2 \in F$ , and  $\rho(\alpha^2) \in \mathbb{R}_-$  for any homomorphism  $\rho : F \rightarrow \mathbb{C}$ .

⌋

*Proof:* If  $F$  is the totally real field contained in  $E$  and  $\alpha \in E$  generates  $E$  over  $F$ , then by completing the square, we can assume  $\alpha^2 \in F$ . Then  $\rho(\alpha^2) \in \mathbb{R}_-$  for any  $\rho : F \rightarrow \mathbb{C}$ , otherwise  $E$  is not totally imaginary.  $\square$

**Def. (21.2.1.5) [CM-Algebras].** A **CM-algebra** is a finite product of CM-fields.

⌋

**Def. (21.2.1.6) [CM-Types].** A **CM-type** for a CM-algebra (21.2.1.5)  $E$  is a subset  $\Phi \subset \text{Hom}(E, \mathbb{C})$  s.t.  $\text{Hom}(E, \mathbb{C}) = \Phi \amalg \Phi \circ c_E$  (21.2.1.2).

A pair  $(E, \Phi)$  where  $E$  is a CM-algebra and  $\Phi$  is a CM-type on  $E$  is called a **CM-pair**.

More generally, if  $E$  is an étale algebra over  $\mathbb{Q}$ , then a **CM-type** on  $E$  is a subset  $\Phi \subset \text{Hom}(E, \mathbb{C})$  s.t.  $\text{Hom}(E, \mathbb{C}) = \sigma\Phi \amalg c \circ \sigma\Phi$  for any  $\sigma \in \text{Gal}_{\mathbb{Q}}$ .  $\perp$

**Prop. (21.2.1.7).** Let  $E$  be an étale algebra over  $\mathbb{Q}$  and  $F$  the product of the largest totally real subfields of the factors of  $E$ , then choosing a CM-type is equivalent to choosing an extension  $\rho'$  to  $E$  of any homomorphism  $\rho : F \rightarrow \mathbb{R}$ . Thus a CM-pair  $(E, \Phi)$  defines an isomorphism

$$E \otimes_{\mathbb{Q}} \mathbb{R} \xrightarrow[\cong]{\Phi} \prod_{\rho: F \rightarrow \mathbb{R}} \mathbb{C} \cong \mathbb{C}^{\Phi} : a \otimes r \mapsto (\rho'(a)r)_{\rho}, \quad \Phi = \{\rho' | \rho : F \rightarrow \mathbb{R}\}$$

$\perp$

**Def. (21.2.1.8) [Primitive CM-Fields].** If  $E_0$  is a CM-field and  $E/E_0$  is a finite extension, then a CM-type  $\Phi_0$  on  $E_0$  extends to a CM-type on  $E$  (21.2.1.6) by defining

$$\Phi = \{\varphi \in \text{Hom}(E, \mathbb{C}) | \varphi|_{E_0} \in \Phi_0\}.$$

A **primitive CM-field** is a CM-pair (21.2.1.6)  $(E, \Phi)$  where  $E \in \text{Field}$  and there doesn't exist a proper subfield  $E_0 \subset E$  s.t.  $\Phi$  is the extension of a CM-type on  $E_0$ .  $\perp$

**Prop. (21.2.1.9).** Every CM-pair  $(E, \Phi)$  where  $E$  is a field is an extension of a unique primitive CM-pair  $(E_0, \Phi_0)$  s.t.  $E_0 \subset E$ . Moreover, for any Galois CM-field  $E_1$  containing  $E$ ,  $E$  is the fixed field of  $E$  defined by the subgroup

$$H = \{\sigma \in \text{Gal}(E_1/\mathbb{Q}) : \Phi_1^{\sigma} = \Phi_1\},$$

where  $\Phi_1$  is the extension of  $\Phi$  to  $E_1$ .  $\perp$

*Proof:* If  $E$  is Galois over  $\mathbb{Q}$ , and  $E_0$  is defined as above, then  $\Phi c_E = c\Phi \neq \Phi$ , so  $c_E \notin H$ , thus  $c_E$  acts non-trivially on  $E_0$ . And  $c_E$  preserves  $E_0$ : We need to show that  $\sigma c_E a = c_E a$  for any  $a \in E_0$ . For which it suffices to show that  $c_E \sigma c_E \in H$ . For this, notice

$$\Phi c_E \sigma c_E = c\Phi \sigma c_E = c\Phi c_E = \Phi.$$

Thus  $E_0$  is CM-subfield of  $E$ . And  $\Phi_0 = \Phi|_{E_0}$  is a CM-type on  $E_0$ , because if  $\varphi'|_{E_0} = c\varphi|_{E_0}$  for different  $\varphi, \varphi' \in \Phi$ , then  $c\varphi \in \varphi'H \subset \Phi$ , contradiction.

And if  $E_0$  is extended from another CM-subfield  $E'$ , then any  $\sigma \in \text{Gal}(E/\mathbb{Q})$  fixing  $E'$  will fix  $\Phi$  and lies in  $H$ . This shows  $E_0 \subset E'$ . So  $(E_0, \Phi_0)$  is primitive.

For the general case, it suffices to notice that this  $E_0$  is contained in  $E$  because any  $\sigma \in \text{Gal}(E_1/\mathbb{Q})$  fixing  $E$  will fix  $\Phi_1$  thus fixes  $E_0$  by definition. And  $\Phi$  clearly extends  $\Phi_0$ .  $\square$

**Cor. (21.2.1.10).** A CM-pair  $(E, \Phi)$  where  $E$  is a field is primitive iff there exists a Galois CM-field  $E_1$  containing  $E$  s.t.  $E$  is the fixed field of  $E$  defined by the subgroup

$$H = \{\sigma \in \text{Gal}(E_1/\mathbb{Q}) : \Phi_1^{\sigma} = \Phi_1\},$$

where  $\Phi_1$  is the extension of  $\Phi$  to  $E_1$ .  $\perp$

**Prop. (21.2.1.11) [Shimura-Taniyama].** Let  $E$  be a CM-field,  $F = E^{\mathbf{c}_E}$  (21.2.1.2) and  $E = F(\alpha)$  where  $\alpha^2 \in F$  is totally negative. Then

$$\Phi = \{\varphi \in \text{Hom}(E, \mathbb{C}) : \text{Im}(\varphi(\alpha)) > 0\}$$

is a CM-type on  $E$ . And  $(E, \Phi)$  is a primitive CM-pair iff

- $E = \mathbb{Q}(\alpha)$ .
- $\sigma(\alpha)/\alpha$  is not totally positive for any  $\sigma \in \text{Gal}(E/\mathbb{Q})$ .

┘

*Proof:*  $\Phi$  is a CM-type on  $E$  because for any  $\varphi \in \Phi$ ,  $\varphi \mathbf{c}_E \notin \Phi$  because  $\text{Im}(\varphi \mathbf{c}_E(\alpha)) = -\text{Im}(\varphi(\alpha)) < 0$ .

Let  $F_1$  be the Galois closure of  $F$  and  $E_1 = F_1(\alpha)$ , and  $\Phi_1$  is the extension of  $\Phi$  to  $E_1$ , then

$$\Phi_1 = \{\varphi \in \text{Hom}(E_1, \mathbb{C}) : \text{Im}(\varphi(\alpha)) > 0\}.$$

and if

$$H = \{\sigma \in \text{Gal}(E_1/\mathbb{Q}) : \Phi_1^\sigma = \Phi_1\},$$

then  $H$  is exactly the group of  $\sigma \in \text{Gal}(E_1/\mathbb{Q})$  s.t.  $\sigma(\alpha)/\alpha \in \mathbb{R}_+$ . Then the assertion follows from (21.2.1.10).  $\square$

### Reflex Fields and Reflex Norms

**Def. (21.2.1.12) [Reflex Fields of CM Pairs].** Let  $(E, \Phi)$  be a CM-pair, then the **reflex field**  $E^*$  of  $(E, \Phi)$  is the subfield of  $\overline{\mathbb{Q}}$  generated by the elements  $\left\{ \sum_{\varphi \in \Phi} \varphi(a) \mid a \in E \right\}$ . Then:

- $E^*$  is the fixed field of the group  $\{\sigma \in \text{Gal}_{\mathbb{Q}} \mid \sigma(\Phi) = \Phi\}$ .
- $E^*$  is a CM-field.
- If  $(E_1, \Phi_1)$  is an extension of  $(E, \Phi)$  (21.2.1.8), then the reflex field of  $(E_1, \Phi_1)$  is just  $E^*$ .

┘

*Proof:* 1: The group  $\{\sigma \in \text{Gal}_{\mathbb{Q}} \mid \sigma(\Phi) = \Phi\}$  fixes every element in  $E$ , so it is clearly contained in the fixed group of  $E^*$ , and if  $\sigma$  is in the fixed group of  $E^*$ , then

$$\sum_{\varphi \in \Phi} \varphi(a) = \sum_{\varphi \in \Phi} \sigma \varphi(a)$$

for each  $a \in E$ , so  $\sigma(\Phi) = \Phi$  by the linear independence of characters.

2: For  $\sigma \in \text{Gal}_{\mathbb{Q}}$  and  $a \in E$ ,

$$\mathbf{c}_\sigma \left( \sum_{\varphi \in \Phi} \varphi(a) \right) = \mathbf{c}_\sigma \left( \sum_{\varphi \in \Phi} \sigma \varphi(a) \right) = \sum_{\varphi \in \Phi} \sigma \varphi(\mathbf{c}_\sigma(a)) = \sigma \left( \sum_{\varphi \in \Phi} \varphi(\mathbf{c}_\sigma(a)) \right) = \sigma \mathbf{c}_\sigma \left( \sum_{\varphi \in \Phi} \varphi(a) \right).$$

Thus  $E$  is a CM-field or totally real by (21.2.1.2). The latter case is not possible by item 1 and the fact  $\Phi \circ \mathbf{c}_E \neq \Phi$ .

3 is trivial.  $\square$

**Def. (21.2.1.13) [Reflex CM-Pairs].** Let  $(E, \Phi)$  be a CM-pair that  $E$  is contained in  $\mathbb{Q}$ , let  $E_1$  be the Galois closure of  $E$ , and  $\Phi_1$  the extension of  $\Phi$  to  $E_1$ . Then  $(E_1, \Phi_1^{-1})$  is also a CM-pair. Then the primitive subfield  $(E^*, \Phi^*)$  satisfies  $E^*$  is the reflex field of  $(E, \Phi)$ .

$(E^*, \Phi^*)$  is called the **reflex CM-pair** of  $(E, \Phi)$ .  $\square$

**Prop. (21.2.1.14)[Reflex Modules].** For a CM-pair  $(E, \Phi)$ , the reflex field  $E^*$  (21.2.1.12) is the smallest subfield  $K \subset \overline{\mathbb{Q}}$  s.t. there exists an  $E \otimes K$ -module  $V$  with

$$V \otimes_K \overline{\mathbb{Q}} \cong \prod_{\varphi \in \Phi} \overline{\mathbb{Q}}_{\varphi}$$

as  $E \otimes \overline{\mathbb{Q}}$ -modules. Such a  $E \otimes E^*$ -module  $V_{\Phi}$  is uniquely determined, called the **reflex-module** of  $\Phi$ .  $\lrcorner$

*Proof:* Such a module is equivalent to a  $k$ -vector space with  $E$  acting by  $k$ -linear endomorphism s.t.  $\text{tr}_k(a|V) = \sum_{\varphi \in \Phi} \varphi(a)$  for each  $a \in E$ . Then clearly  $k$  contains each  $\sum_{\varphi \in \Phi} \varphi(a)$  and thus contains  $E^*$ .

Conversely, the  $E \otimes \overline{\mathbb{Q}}$ -vector space  $\prod_{\varphi \in \Phi} \overline{\mathbb{Q}}_{\varphi}$  with  $E$  acting on each component  $\overline{\mathbb{Q}}_{\varphi}$  by  $\varphi$ . This module is  $\text{Gal}(\overline{\mathbb{Q}}/E)$ -equivariant where  $\sigma \in \text{Gal}(\overline{\mathbb{Q}}/E)$  acts on the second component of  $E \otimes \overline{\mathbb{Q}}$  and acts on  $\prod_{\varphi \in \Phi} \overline{\mathbb{Q}}_{\varphi}$  via

$$\sigma(x_{\varphi}) = (\sigma x_{\sigma^{-1} \circ \varphi}).$$

So it descends to a  $E \otimes E^*$ -module by Galois-descent.  $\square$

**Def. (21.2.1.15)[Reflex Norms].** Situation as in (21.2.1.14), the **reflex-norm**

$$\text{Nm}_{\Phi} : \text{Res}_{E/\mathbb{Q}}(\mathbb{G}_m) \rightarrow \text{Res}_{L/\mathbb{Q}}(\mathbb{G}_m)$$

is the determinant of the  $L$ -linear actions by  $E$ .  $\lrcorner$

### Classification of Primitive CM-Pairs

**Prop. (21.2.1.16).** Milne, Prop1.30. ?  $\lrcorner$

**Cor. (21.2.1.17).** Milne, Prop1.31. ?  $\lrcorner$

### Positive Involutions

**Def. (21.2.1.18)[Positive Involutions].** Let  $k \subset \mathbb{R} \in \mathbf{Field}$  and  $B \in \mathbf{Ring}^{\text{fin}}/k$ , then a **positive involution** w.r.t.  $\text{tr}$  is an involution  $\iota$  on  $B$  s.t.

$$\text{tr}(x) = \text{tr}(\iota(x)), \quad \text{tr}(\iota(x) \cdot x) > 0$$

for any nonzero  $x \in B$ .  $\lrcorner$

**Prop. (21.2.1.19)[Positive Involutions are Semisimple].** Let  $k \subset \mathbb{R} \in \mathbf{Field}$  and  $B \in \mathbf{CRing}$  is of f.d. over  $k$  with a positive involution  $\iota$ , then  $B$  is semisimple. And if  $Z$  is the center of  $B$ , then  $Z = \prod_i K_i$  where  $K_i \in \mathbf{NField}$ , and each  $K_i$  are stable under  $\iota$ .  $\lrcorner$

*Proof:* By (3.6.3.8), it suffices to show that  $B$  is Jacobson semisimple: If  $\mathfrak{a}$  is a nonzero nilpotent two-sided ideal of  $B$ ,  $a \neq 0 \in \mathfrak{a}$  is nilpotent, then  $b = a\iota(a) \neq 0$  because  $\text{tr}(a\iota(a)) > 0$ . Thus  $b \neq 0 \in \mathfrak{a}$ , and  $\iota(b) = b$ . So by the same reason  $b^2 \neq 0$ , and so on, so  $b$  is not nilpotent, contradicting (3.6.3.6).

The center is clearly invariant under the isomorphism given, so it is also semisimple, which is then a product of fields. To show each factor is stable under  $\iota$ , notice that if  $1 = \sum_i e_i$  is a decomposition w.r.t. this product, then  $1 = \sum_i \iota(e_i)$ , so  $\{\iota(e_i)\} = \{e_i\}$ . Moreover,  $\iota(e_i) = e_i$  for each  $i$ , because otherwise  $e_i \iota(e_i) = 0$ , and  $\text{tr}(e_i \iota(e_i)) = 0$ .  $\square$

**Prop. (21.2.1.20).** Let  $k \subset \mathbb{R}$  be a field and  $B$  a f.d.  $k$ -algebra with an involution  $\iota$ , then the following are equivalent:

- There is a faithful f.d.  $B$ -module  $V$  with a positive definite symmetric  $k$ -bilinear form  $(-, -) : V \times V \rightarrow k$  s.t.

$$(bu, v) = (u, \iota(b)v), \quad b \in B, u, v \in V.$$

- For any f.d.  $B$ -module  $V$ , there exists a positive definite symmetric  $k$ -bilinear form  $(-, -) : V \times V \rightarrow k$  s.t.

$$(bu, v) = (u, \iota(b)v), \quad b \in B, u, v \in V.$$

- There exists a  $k$ -linear functional  $\text{tr}$  on  $B$  s.t.  $\iota$  is positive w.r.t.  $\text{tr}$ .

⌋

*Proof:* 1  $\rightarrow$  2: As  $B$  is semisimple (21.2.1.19), any f.d.  $B$ -module is a direct summand of a direct sum of the faithful module  $V$ .

2  $\rightarrow$  3: Apply item2 to the  $B$ -module  $B$  itself, then we find a positive definite symmetric  $k$ -bilinear form  $(-, -)$  on  $B$ , and an orthonormal basis  $(e_1, \dots, e_n)$  of  $B$ . Then we define

$$\text{tr} : B \rightarrow \mathbb{Q} : \text{tr}(b) = \sum_i (bb_i, b_i)$$

then  $\text{tr}(b) = \text{tr}(\iota(b))$ , and

$$\text{tr}(b\iota(b)) = \sum_i (b\iota(b)b_i, b_i) = \sum_i (\iota(b)b_i, \iota(b)b_i) > 0.$$

3  $\rightarrow$  1:  $B$  is semisimple by (21.2.1.19), and then we can take  $V = B$ , and the positive definite symmetric  $k$ -bilinear form

$$(x, y) \mapsto \text{tr}_{B/k}(\iota(y)x).$$

then  $(bx, y) = \text{tr}(\iota(y)bx) = \text{tr}(\iota(\iota(b)y)x) = (x, \iota(b)y)$ . □

**Def. (21.2.1.21) [Albert-Algebras].** An **Albert-algebra** is a division ring  $D$  of f.d. over  $\mathbb{Q}$  equipped with a positive involution  $*$  (21.2.1.18). ⌋

**Thm. (21.2.1.22) [Classifying Albert-Algebras].** For each Albert-algebra  $(D, *)$  (21.2.1.21), exactly one of the following happens:

- $D = \mathbb{Z}$  is a totally real field and  $*$  =  $\text{id}_D$ .
- $D$  is a central quaternion algebra over a totally real field  $Z$ , and  $D$  splits at each real place of  $Z$ .
- $D$  is a central quaternion algebra over a totally real field  $Z$ , and  $D$  is non-split at each real place of  $Z$ .
- $D$  is a central division algebra over a CM-field  $Z$ , and for each  $v \in \Sigma_Z^{\text{fin}}$ ,  $\text{inv}_v(D) + \text{inv}_{v*}(D) = 0$ . Moreover,  $D$  splits at  $v \in \Sigma_Z^{\text{fin}}$  if  $v = v^*$ .

⌋

*Proof:* Cf. [Mumford, Abelian varieties] 21.2. ? □

**Prop. (21.2.1.23) [Commutative Albert-Algebras].** Every Albert-algebra  $(A, *)$  (21.2.1.21) is a product of the following two:

- $F$  is a totally real field and  $\iota = \text{id}_F$ .

- $E$  is a CM-field and  $\iota = c_E$ .

┘

*Proof:* Firstly, any product of these two are positive involutions. Conversely, if  $(B, \text{tr})$  is a f.d.  $\mathbb{Q}$ -algebra with a positive involution, then by (21.2.1.19),  $B$  is semisimple, thus a finite product of number fields. Then by (21.2.1.19), each factor is fixed by the involution, so it suffices to consider the case  $B \in \mathbf{NField}$ . Let  $F$  be the fixed field of  $\iota$ . Because the trace form  $\text{tr}_{B/\mathbb{Q}}$  is non-degenerate, we can assume  $\text{tr}(x) = \text{tr}(\alpha x)$  for some  $\alpha \in B^\times$ .

If  $F = B$ , then  $F$  is totally real: if there exists a non-real embedding  $\sigma : F \rightarrow \mathbb{C}$ , then we can use weak approximation to find  $x \in F^\times$  s.t.  $\sigma(\alpha x^2)$  is near  $-1$  and  $\varphi(\alpha x^2)$  is near  $0$  for any other embedding  $\varphi : F \rightarrow \mathbb{C}$ . Then clearly  $\text{tr}(\alpha x^2) < 0$ , contradiction.

If  $F \neq B$ , then  $[B : F] = 2$ , and  $\text{tr}_{B/\mathbb{Q}}(\alpha x \iota(x)) > 0$  for any  $x \in B^\times$ . Take  $x = 1$ , we see  $\text{tr}_{B/\mathbb{Q}}(\alpha) > 0$ . In particular,  $\alpha + \iota(\alpha) \neq 0 \in F$ . Then in particular,  $\text{tr}_{B/\mathbb{Q}}(\alpha x \iota(x)) = \text{tr}_{F/\mathbb{Q}}((\alpha + \iota(\alpha))x \iota(x)) > 0$ . So by the argument above,  $F$  is totally real. And  $B$  is totally imaginary: If there exists a real embedding  $\sigma : B \rightarrow \mathbb{C}$ , then  $\sigma$  and  $\sigma \circ \iota$  corresponds to different places, and by weak approximation, we can find  $x \in B$  s.t.  $\sigma((\alpha + \iota(\alpha))x)$  is near  $-1$  and  $\sigma(\iota(x))$  is near  $1$ , and  $\varphi(x)$  is near  $0$  for any other  $\varphi : B \rightarrow \mathbb{C}$ . Then  $\text{tr}_{F/\mathbb{Q}}((\alpha + \iota(\alpha))x \iota(x)) < 0$ , contradiction. So in this case  $B$  is a CM-field, and  $\iota = c_B$ . □

**Cor. (21.2.1.24).** There exists uniquely a positive involution on any CM-algebra, which is  $c_E$ . ┘

### Weil $q$ -Integers

**Prop. (21.2.1.25) [Weil  $q$ -Integers and CM Fields].** If  $p \in \mathbf{Prime}$ ,  $q \in p^{\mathbb{Z}}$  and  $\varpi \in \text{Weil}(q^{1/2})$ , then  $\mathbb{Q}(\varpi)$  is either isomorphic to  $\mathbb{Q}$  or  $\mathbb{Q}(\sqrt{q})$  or a CM-field. ┘

*Proof:* For any embedding  $\rho : \mathbb{Q}(\pi) \rightarrow \mathbb{C}$ ,

$$\rho(\pi) \overline{\rho(\pi)} = q = \rho(\pi) \rho(q/\pi),$$

so  $\overline{\rho(\pi)} = \rho(q/\pi)$ , and  $E = \mathbb{Q}(\pi)$  is a CM-field with the endomorphism  $c_E : \pi \mapsto q/\pi$ . □

**Prop. (21.2.1.26).** Let  $p \in \mathbf{P}$ ,  $q \in p^{\mathbb{Z}}$ ,  $F \in \mathbf{NField}$  and  $\pi, \pi' \in F \cap \text{Weil}(q^{1/2})$ . If  $\text{ord}_v(\pi) = \text{ord}_v(\pi')$  for any  $v \in \Sigma_F^p$ , then  $\pi/\pi'$  is a roots of unity in  $E$ . ┘

*Proof:* This is because there is an endomorphism of  $F$  (the conjugation) taking  $\pi$  to  $q/\pi$ , so for any  $v \notin \Sigma_F^p$ ,  $\text{ord}_v(\pi) = 0$ . Since the same is true for  $\pi'$ , and  $\text{ord}_v(\pi) = \text{ord}_v(\pi')$  for  $v \in \Sigma_F^\infty$  too, by the definition of Weil  $q$ -integers. Thus  $|\pi/\pi'|_v = 1$  for any  $v \in \Sigma_F$ , and the assertion follows from (19.4.1.20). □

## 2 CM-Abelian Varieties

**Def. (21.2.2.1) [Complex Multiplications].** For  $k \in \mathbf{Field}$  and  $A \in \mathbf{AbVar}/k$ ,

$$[\text{End}(A)_{\mathbb{Q}} : \mathbb{Q}]_{\text{red}} \leq 2 \dim A.$$

And  $A$  is called an Abelian variety with **strict complex multiplication** or a **strictly CM Abelian variety** if the equality holds.

And  $A$  is called an Abelian variety with **complex multiplication** or a **CM-Abelian variety** if  $A_{k^{\text{sep}}}$  is a strictly CM Abelian variety. ┘

*Proof:* Take  $\ell \in \text{Prime} \setminus \{\text{char } k\}$ , then  $\text{End}(A)_{\mathbb{Q}}$  acts faithfully on  $T_{\ell}(A, \mathbb{Q}_{\ell})$  by (21.1.4.3), which has dimension  $2 \dim A$  (20.9.6.19), so we finish by (20.9.6.14) and (3.6.4.25).  $\square$

**Prop. (21.2.2.2) [Complex Multiplication and CM-Algebras].** For  $k \in \text{Field}$  and  $A \in \text{AbVar}/k$ , the following are equivalent:

- $A$  is strictly CM.
- $\text{End}(A)_{\mathbb{Q}}$  contains an étale subalgebra of rank  $2 \dim A$  over  $\mathbb{Q}$ .
- For any Weil cohomology  $\mathcal{H}^*$  with coefficients in  $\Omega \in \text{Field}^0$ , the centralizer of  $\text{End}(A)_{\mathbb{Q}}$  in  $\text{End}_{\Omega}(H^1(A))$  is commutative (and equals  $Z(\text{End}(A)) \otimes \Omega$ ).

And if  $P \leq \text{End}(A)_{\mathbb{Q}}$  is an étale subalgebra of rank  $2 \dim A$  over  $\mathbb{Q}$ , then  $P = Z_{\text{End}(A)_{\mathbb{Q}}}(P)$ . If moreover  $P$  is a field, then  $A$  is isotypic, and  $P$  is a maximal commutative subfield of  $\text{End}(A)_{\mathbb{Q}}$ .  $\lrcorner$

*Proof:* 1  $\iff$  2 follows from the fact the maximal étale subalgebra of  $\text{End}(A)_{\mathbb{Q}}$  has degree  $[\text{End}(A)_{\mathbb{Q}} : \mathbb{Q}]_{\text{red}}$  (3.6.4.24).

2  $\iff$  3 follows by noticing  $\dim_{\Omega}(\mathcal{H}^1(A)) = 2 \dim A$ , and  $\text{End}_{\Omega}(A)$  acts faithfully on it  $?$ . Then use (3.6.4.25).

For the last assertion, Cf. [CCO14]P1.3.1.1.  $\square$

**Lemma (21.2.2.3).** Let  $A \in \text{AbVar}/\mathbb{C}$  and  $F \subset \text{End}(A)_{\mathbb{Q}}$ . If  $F$  has a real place, then  $[F : \mathbb{Q}] \mid \dim A$ .  $\lrcorner$

*Proof:*  $?$   $\square$

**Prop. (21.2.2.4) [CM-Abelian Varieties and CM-Algebras, Tate].** For  $k \in \text{Field}$  and  $A \in \text{AbVar}/k$ ,

- if  $A$  is simple, then  $A$  is CM iff  $\text{End}(A)_{\mathbb{Q}}$  is a CM-field of degree  $2 \dim A$  over  $\mathbb{Q}$ .
- If  $A$  is isotypic, then  $A$  is CM iff  $\text{End}(A)_{\mathbb{Q}}$  contains a CM-field of degree  $2 \dim A$  over  $\mathbb{Q}$ , which is invariant under some Rosati involution.
- $A$  is CM iff  $\text{End}(A)_{\mathbb{Q}}$  contains a CM-algebra of degree  $2 \dim A$  over  $\mathbb{Q}$ , which is invariant under some Rosati-involution. And in this case, for  $\ell \in \text{Prime} \setminus \{\text{char } k\}$ ,  $T_{\ell}(A)$  is free of rank 1 over this algebra.

$\lrcorner$

*Proof:* We use (21.2.2.2).

1: It suffices to show that if  $\text{End}(A)_{\mathbb{Q}}$  is a field of degree  $2 \dim A$ , then it is CM.  $?$

2:  $?$  Cf. [CCO14]Thm1.3.4.

3 follows from 2.  $\square$

**Thm. (21.2.2.5) [Grothendieck].** For  $k \in \text{Field}$ , any CM abelian variety over  $k$  (21.2.2.1) is defined over a finite extension of the prime field of  $k$ .  $\lrcorner$

*Proof:* Cf. [C.-F. 2004. The isomorphism classes of abelian varieties of CM-type].  $\square$

### Complex CM-Abelian Varieties

**Prop. (21.2.2.6) [Isogeny and CM-Types].** If  $K \in \text{Field}^0$  s.t.  $K = \overline{K}$  and  $L$  is a CM field and  $A \in \text{AbVar}/K$  has CM with an embedding  $j : L \hookrightarrow \text{End}(A)_{\mathbb{Q}}$ , then the  $L$ -linear isogeny class of  $A$  is uniquely determined by the  $K$ -valued CM-type  $\Phi$  on  $L$  associated to  $(A, j)$ . Moreover, every CM-type on  $L$  arises in this way for some  $(A, j)$  over  $K$ .  $\lrcorner$

*Proof:* Cf. [CCO14]P67. ?

□

**Prop. (21.2.2.7) [CM-Types of Complex Abelian Varieties].** Let  $E$  be a CM-algebra, and  $(A, i : E \rightarrow \text{End}(A)_{\mathbb{Q}}) \in \text{AbVar}^g/\mathbb{C}$  is a CM-Abelian variety, then the action of  $E$  on  $\text{Lie}(A)$  is faithful, so

$$\text{Lie}(A) \cong \bigoplus_{\varphi \in \Phi} \mathbb{C}_{\varphi}$$

where  $\Phi$  is a set of homomorphisms from  $E$  to  $\mathbb{C}$ . Then it follows from the decomposition (16.10.5.5)

$$H_1(A(\mathbb{C}), \mathbb{C}) \cong \text{Lie}(A) \bigoplus \overline{\text{Lie}(A)}$$

and the fact  $H_1(A(\mathbb{C}), \mathbb{Q})$  is a free  $E$ -module of rank 1 (21.2.2.4), we see  $\Phi \coprod \Phi \circ c_E = \text{Hom}(E, \mathbb{C})$ . So  $\Phi$  is a CM-type on  $E$  (21.2.1.6).

Thus  $A$  is said to have **CM-type**  $(E, \Phi)$  if  $\Phi$  is a CM-type on  $E$  and

$$\text{Lie}(A) \cong \prod_{\Phi} \mathbb{C}$$

as  $E$ -algebras. ┘

**Def. (21.2.2.8) [Dual CM-Abelian Varieties].** Let  $E$  be a CM-algebra, and  $(A, i : E \rightarrow \text{End}(A)_{\mathbb{Q}}) \in \text{AbVar}^g/\mathbb{C}$  is a CM-Abelian variety, then we can define a **dual CM-Abelian structure** on  $A^{\vee}$  as

$$j : E \rightarrow \text{End}(A^{\vee})_{\mathbb{Q}} : x \mapsto i(c_E(x))^t.$$

In this way,  $(A^{\vee}, j : E \rightarrow \text{End}(A^{\vee})_0)$  has CM-type  $\Phi$  as well, by the decomposition (16.10.5.5)

$$H_1(A(\mathbb{C}), \mathbb{R}) \cong \text{Lie}(A) \bigoplus \overline{\text{Lie}(A)}$$

and the argument in (21.2.2.7). ┘

**Def. (21.2.2.9) [Reflex Field of a CM-Abelian Variety].** Let  $A \in \text{AbVar}/\mathbb{C}$  be CM, then if  $E_0$  is the center of  $\text{End}(A)_{\mathbb{Q}}$ , by (21.2.2.4) and (21.2.2.7),  $E_0$  is a CM-algebra, and there exists a CM-type  $\Phi_0$  on  $E_0$  s.t. for any CM-pair  $E$  s.t.  $A$  is of CM-type  $(E, \Phi)$ , there  $\Phi$  is the extension of  $\Phi_0$  to  $E$ .

Then the reflex field of  $(E_0, \Phi)$  equals that of  $(E, \Phi)$  for any  $(E, \Phi)$ , called the **reflex field** of  $A$ .

? ┘

**Prop. (21.2.2.10) [Abelian Varieties attached to CM-Pairs].** Let  $(E, \Phi)$  be a CM-pair (21.2.1.6) and  $\Lambda$  is a  $\mathbb{Z}$ -lattice in  $E$ , then

$$\Lambda \otimes_{\mathbb{Z}} \mathbb{R} \cong E \otimes_{\mathbb{Q}} \mathbb{R} \xrightarrow[\cong]{\Phi} \prod_{\Phi} \mathbb{C} \text{ (21.2.1.7).}$$

So  $\Lambda \otimes_{\mathbb{Z}} \mathbb{R}$  has a complex structure. Then  $\mathcal{O} = \{x \in E \mid a\Lambda \subset \Lambda\} \subset \text{End}(A_{\Phi})$  is an order in  $E$  (19.3.1.38), and then  $E \subset \text{End}_{\mathbb{Q}}(A_{\Phi})$ .

Then there is a Riemann-form on  $(\Lambda, J_{\Phi})$  whose associated positive Rosati-involution (20.9.8.7) stabilizes  $E$  (and thus equals  $c_E$  on  $E$  by (21.2.1.24)). In particular,  $A_{\Phi}$  is a complex Abelian variety (20.9.8.1). ┘

*Proof:* To give such a Riemann-form, by (16.10.5.9), it suffices to give a non-degenerate bilinear form  $\psi : E \times E \rightarrow \mathbb{Q}$  that satisfies

1.  $\psi(ax, y) = \psi(x, \bar{a}y)$  for  $a, x, y \in E$ .
2.  $\psi(x, y) = -\psi(y, x)$  for  $x, y \in E$ .
3.  $\psi(J_\Phi x, J_\Phi y) = \psi(x, y)$  for  $x, y \in E \otimes_{\mathbb{Q}} \mathbb{R}$ .
4.  $\psi(x, J_\Phi x) > 0$  for any non-zero  $x \in E \otimes_{\mathbb{Q}} \mathbb{R}$ .

Now because the trace form  $\text{tr} : E \times E \rightarrow \mathbb{Q}$  is non-degenerate, non-degenerate  $\mathbb{Q}$ -bilinear forms of  $E$  are exactly of the form

$$\psi(x, y) = \text{tr}_{E/\mathbb{Q}}(\bar{y}\alpha x), \alpha \in E^\times.$$

And the conditions (1) is automatic, and (3) is automatic because in the isomorphism

$$E \otimes_{\mathbb{Q}} \mathbb{R} \xrightarrow[\cong]{\Phi} \prod_{\rho: F \rightarrow \mathbb{R}} \mathbb{C} \cong \mathbb{C}^\Phi : a \otimes r \mapsto (\rho'(a)r)_\rho, \quad \Phi = \{\rho' | \rho : F \rightarrow \mathbb{R}\}, \quad (21.2.1.7)$$

$\psi_{\mathbb{R}}$  corresponds to

$$\psi'((x_\varphi), (y_\varphi)) = \sum_{\varphi \in \Phi} \text{tr}_{\mathbb{C}/\mathbb{R}}(\varphi(a)\bar{y}_\varphi x_\varphi)$$

and  $J_\Phi$  corresponds to the isomorphism

$$(x_\varphi)_{\varphi \in \Phi} \mapsto (ix_\varphi)_{\varphi \in \Phi}.$$

Thus it suffices to choose  $\alpha$  s.t.  $\varphi(\alpha) \in i\mathbb{R}_+$  for any  $\varphi \in \Phi$ .

By (21.2.1.4), there exists  $\alpha \in E^\times$  s.t.  $E = F(\alpha)$  s.t.  $\varphi(\alpha) \in i\mathbb{R}$  for any  $\varphi \in \Phi$ , and we can then use weak approximation on  $F$  to modify  $\alpha$  s.t.  $\varphi(\alpha) \in i\mathbb{R}_+$  for any  $\varphi \in \Phi$ . So this  $\alpha$  clearly exists. Moreover, any other element  $\alpha'$  is  $\alpha$  times some element  $a \in F$  that is totally positive.  $\square$

**Thm. (21.2.2.11) [Classifying Complex CM Abelian Varieties up to Isogeny].** For each CM-algebra  $E$ , the map  $(A, i) \rightarrow (E, \Phi)$  (21.2.2.7) defines a bijection between the set of  $E$ -linear isogeny classes of CM-Abelian varieties  $A/\mathbb{C}$  with an embedding  $i : E \rightarrow \text{End}(A)_{\mathbb{Q}}$  and the set of CM-types over  $E$  (21.2.1.6) with inverse  $(E, \Phi) \mapsto (A_\Phi, i_\Phi)$  which is the Abelian variety corresponding to the lattice  $\Lambda = \mathcal{O}_E$  defined in (21.2.2.10), called the **principally-CM Abelian variety** of type  $(E, \Phi)$ .

Moreover, each principally-CM Abelian variety is defined over  $\bar{\mathbb{Q}}$ .  $\lrcorner$

*Proof:* Notice in (21.2.2.10), any two choice of the lattice  $\mathfrak{a}$  give isogenous Abelian varieties, and because  $H_1(A, \mathbb{Q})$  is free of rank 1 over  $E$ , let  $e \in H_1(A, \mathbb{Q})$  be a basis vector, then  $\mathfrak{a}e = H_1(A, \mathbb{Z})$  for some lattice  $\mathfrak{a} \subset E$ . Then this  $e$  defines an isomorphism

$$Ee \cong H_1(A, \mathbb{Z}) \otimes \mathbb{Q} = H_1(A, \mathbb{Q})$$

thus the isomorphism

$$A \cong H_1(A, \mathbb{C})/H_1(A, \mathbb{Z}) \xrightarrow[\cong]{e^{-1}} E \otimes_{\mathbb{Q}} \mathbb{C}/\mathfrak{a} \xrightarrow[\cong]{\Phi} \mathbb{C}^\Phi/\Phi(\mathfrak{a}) \sim \mathbb{C}^\Phi/\Phi(\mathcal{O}_E).$$

This is clearly a bijection.

For the last assertion, Cf. [CCO14]P67?  $\square$

**Prop. (21.2.2.12) [Classifying Simple Complex CM-Abelian Varieties].** Let  $A$  be a simple CM-Abelian variety over  $\mathbb{C}$  and  $E = \text{End}(A)_{\mathbb{Q}}$ , then  $E$  is a CM-field, and the map  $A \mapsto (E, \Phi_A)$  defines a bijection between the set of isomorphism classes of simple complex Abelian varieties with CM and the set of isomorphism classes of primitive CM-paris.  $\lrcorner$

*Proof:*  $E \in \mathbf{Field}$  by (21.2.2.4), and if it is not primitive, then  $(E, \Phi)$  is extended from a primitive CM-field  $(E_0, \Phi_0)$ , and a choice of  $E_0$ -basis of  $E$  defines an embedding  $E \subset \mathrm{Mat}([E : E_0], E_0) \subset \mathrm{End}_0(A_{\Phi_0}^{[E:E_0]})$ , and

$$E \otimes_{\mathbb{Q}} \mathbb{R} = E \otimes_{E_0} (E_0 \otimes_{\mathbb{Q}} \mathbb{R}) \cong E \otimes_{E_0} (\mathbb{C}^{\Phi_0}) \cong \mathbb{C}^{\Phi}$$

shows  $A_{\Phi_0}^{[E:E_0]}$  is also of type  $(E, \Phi)$ . Thus  $A \sim A_{\Phi_0}^{[E:E_0]}$  by (21.2.2.11), contradicting the fact  $A$  is simple.  $\square$

**Cor. (21.2.2.13).** The simple Abelian varieties with complex multiplications are classified up to conjugacy by the  $\mathrm{Gal}_{\mathbb{Q}}$ -orbits of CM-types on  $\mathbb{Q}^{\mathrm{cm}}$ , by (21.2.1.17).  $\lrcorner$

### Good Reductions

**Prop. (21.2.2.14) [Potential Good Reduction of CM-Abelian Varieties].** Let  $E \in \mathbf{NField}$ ,  $A \in \mathbf{AbVar}/\mathbb{C}$  has complex multiplication by  $E$ , then  $A$  is defined over some number field  $F$ . And  $F$  can be chosen s.t.  $A_F$  has good reduction everywhere.  $\lrcorner$

*Proof:* Cf. [Milne, Abelian Varieties, P55] or [Serre-Tate, Good reduction of abelian varieties]Thm6.  $\square$

### 3 Fundamental Theorem of Complex Multiplication

**Thm. (21.2.3.1) [Fundamental Theorem of Complex Multiplication, Shimura-Taniyama].** Let  $A \in \mathbf{AbVar}/\mathbb{F}_q$  be the reduction from an complex Abelian variety of CM-type  $(E, \Phi)$ , then the Weil- $q$ -integers of  $A$  can be constructed as follows:  $\square$

*Proof:* Cf. [Milne, Abelian Varieties, P83].  $\square$

**Thm. (21.2.3.2) [CM-Abelian Varieties are defined over Number Fields, Shimura-Taniyama].** If  $K \in \mathbf{Field}^0$  s.t.  $K = \overline{K}$  and  $A \in \mathbf{AbVar}/K$  has CM, then  $A$  is defined over a number field contained in  $K$ .  $\lrcorner$

*Proof:* Cf. [CCO14]P77.  $\square$

**Prop. (21.2.3.3) [Shimura].** If  $A \in \mathbf{AbVar}/\mathbb{Q}$  is of  $\mathrm{GL}(2)$ -type and  $A_{\overline{\mathbb{Q}}}$  has CM Abelian subvariety, then  $A$  is isogenous to a power of CM elliptic curves.  $\lrcorner$

*Proof:* Cf. [Rib04]Prop5.1.  $\square$

### 4 Main Theorem of Complex Multiplication

References are [CCO14].

**Thm. (21.2.4.1) [Main Theorem of Complex Multiplications, Shimura-Taniyama[S-T61]].** Let  $(A, \alpha : L \rightarrow \mathrm{End}(A)_{\mathbb{Q}})$  be a CM-Abelian variety over  $F \in \mathbf{NField}$  with CM-type  $(L, \Phi)$  s.t.  $L$  is a CM-field, then

- The reflex field  $E = E(L, \Phi)$  is contained in  $F$ .
- There exists a unique algebraic Hecke-character  $\epsilon_A : \mathbf{A}_E^{\times} \rightarrow L^{\times}$  s.t. for each  $\ell \in \mathbf{Prime}$ , the continuous homomorphism  $\psi_{\epsilon_A} : \mathrm{Gal}_F \rightarrow L_{\ell}^{\times}$  attached to  $\epsilon_A$  is equal to the  $\ell$ -adic Galois-representation attached to  $A[\ell^{\infty}]$ .

- The algebraic part of  $\epsilon$  is the map  $\text{Nm}_\Phi \circ \text{Nm}_{F/E}$  (21.2.1.15).
- For each  $v \in \Sigma_F^{\text{fin}}$ ,  $A$  has good reduction at  $v$  iff  $\epsilon_A$  is unramified at  $v$ . In which case, we have  $\epsilon_A(\varpi_v) = F_{\tilde{A}, \kappa_v}^\sim$ , where  $\tilde{A} \in \text{AbVar}/\kappa$  is the reduction of  $A$  at  $v$ .

┘

*Proof:* Cf. [CCO14]P127?.

□

**Thm. (21.2.4.2) [Converse to the Main Theorem of Complex Multiplications, Shimura].** Let  $(L, \Phi)$  be a CM-pair with  $L \in \text{NField}$  of degree  $2g$  with reflex field  $E$ . Let  $F/E \in \text{NField}$  and  $\epsilon : \mathbf{I}_K \rightarrow L^\times$  an algebraic Hecke-character with algebraic part being  $\text{Nm}_\Phi \circ \text{Nm}_{F/E}$  (21.2.1.15), then there exists CM-Abelian variety  $(A, i : E \rightarrow \text{End}(A)_\mathbb{Q}) \in \text{AbVar}^g/K$  s.t.  $\epsilon$  is the algebraic Hecke-character associated to  $(A, i)$  as in (21.2.4.1). Moreover, such  $(A, i)$  is unique up to  $L$ -linear isogenies.

┘

*Proof:* Cf. [CCO14]A.3?.

□

## 5 over Finite Fields

**Thm. (21.2.5.1) [Honda-Tate].** For any  $\kappa \in \text{Field}^{\text{fin}}$  and  $A \in \text{AbVar}/\kappa$ , there exists a finite extension  $\kappa'/\kappa \in \text{Field}$  and some  $(K, \mathcal{O}_K, \kappa) \in p\text{-Field}$  and some  $\mathcal{A} \in \text{AbVar}/\mathcal{O}_K$  s.t.  $\mathcal{A}_{\kappa'} \cong A_{\kappa'}$ .

┘

*Proof:* Cf. [CCO14]P75?.

□

## 6 CM-Liftings

### CM-Liftings of $p$ -Divisible Groups

### CM-Liftings of Abelian Varieties

## 7 Elliptic Curves

References are [Deu58, Ser67].

**Prop. (21.2.7.1) [Complex Elliptic Curves with CM].** If  $E \cong E_\tau \in \text{EllCur}/\mathbb{C}$  has CM, then  $\mathcal{K} = \mathbb{Q}(\tau)$  is an imaginary quadratic extension of  $\mathbb{Q}$  and  $\text{End}(E)$  is isomorphic to an order of  $\mathcal{K}$ .

By (21.3.1.29), if  $E \in \text{EllCur}/\mathbb{C}$  has CM (21.2.2.1), then  $\text{End}(E)$  is an  $\mathbb{Z}$ -order in  $\mathcal{K}$ , which by (19.3.1.53) must be of the form  $\mathcal{O}_{\mathcal{K},f} = \mathbb{Z} + f\mathcal{O}_K$ , where  $f = [\mathcal{O}_K : \text{End}(E)]$ .

┘

*Proof:* Cf. [Sil16]P176?.

□

**Thm. (21.2.7.2) [Classifying CM Elliptic Curves].** Given any imaginary quadratic field  $\mathcal{K}$  and an  $\mathbb{Z}$ -order  $\mathcal{O}_{\mathcal{K},f} \subset \mathcal{K}$ , the isomorphism classes of elliptic curves over  $\mathbb{C}$  with maximal CM by  $\mathcal{O}_{\mathcal{K},f}$  is in bijection with  $\text{Cl}(\mathcal{O}_{\mathcal{K},f})$ , denoted by  $\text{EllCur}_\mathbb{C}(\mathcal{O}_{\mathcal{K},f})$ .

In particular,  $\#\text{EllCur}_\mathbb{C}(\mathcal{O}_{\mathcal{K},f}) < \infty$ . The  $j$ -values of elliptic curves with maximal CM by  $\mathcal{O}_{\mathcal{K},f}$  are called singular moduli **associated to**  $\mathcal{O}_{\mathcal{K},f}$ .

┘

*Proof:* If  $E \cong \mathbb{C}/\Lambda \cong E_\tau$ , then  $\mathbb{Z} + \mathbb{Z}\tau$  is an  $\mathcal{O}_{\mathcal{K},f}$ -module of rank 1, and by definition it is a proper fractional ideal of  $\mathcal{O}_{\mathcal{K},f}$  thus invertible (19.3.1.54). Conversely, any such an invertible fractional ideal  $\mathfrak{a}$  is a lattice in  $\mathcal{K}$  thus defines an elliptic curve  $E_{\mathfrak{a}}$  with  $\text{End}(E_{\mathfrak{a}}) = \mathcal{O}$  by (19.3.1.54). Finally it follows from (16.10.5.2) that two such  $E_{\mathfrak{a}}$  and  $E_{\mathfrak{a}'}$  are isomorphic iff  $\mathfrak{a}, \mathfrak{a}'$  differ by a principle ideal.

□

**Prop. (21.2.7.3).** Let  $\mathcal{K}$  be an imaginary quadratic field,  $E \in \text{EllCur}_{\mathbb{C}}(\mathcal{O}_{\mathcal{K}})$ , and  $\mathfrak{a} \in \text{Ideal}(\mathcal{O}_{\mathcal{K}})$ , then

- $E[\alpha]$  is the kernel of the isogeny  $E \rightarrow \bar{\mathfrak{a}} * E$ .
- $E[\alpha]$  is a free  $\mathcal{O}_{\mathcal{K}}/\mathfrak{a}$ -module of rank 1.
- The degree of isogeny  $E \rightarrow \bar{\mathfrak{a}} * E$  is  $\text{Nm}_{\mathcal{K}/\mathbb{Q}}(\mathfrak{a})$ .
- For  $\alpha \in \mathcal{O}_{\mathcal{K}}^{\times}$ ,  $\deg([\alpha]_E) = \text{Nm}_{\mathcal{K}/\mathbb{Q}}(\alpha)$ .

┘

*Proof:* Cf.[Sil99]P102.

□

**Thm. (21.2.7.4) [Singular Moduli are Integral, Weber-Fueter].** Let  $E \in \text{EllCur}_{\mathbb{C}}(\mathcal{O}_{\mathcal{K},f})$ , then

- $j(E) \in \mathcal{O}_{\overline{\mathbb{Q}}}$ , and  $\mathcal{K}(j(E))$  is the ray class field  $\mathcal{K}_f$  of  $\mathcal{K}$ .
- $\text{Gal}(\mathcal{K}_f/\mathcal{K})$  acts transitively on the  $j$ -values associated to  $\mathcal{O}_{\mathcal{K},f}$  (21.2.7.2).

In particular,  $\deg(j(E)) = \text{cl}(\mathcal{O}_{\mathcal{K},f})$ .

┘

*Proof:* Cf.[Serre] or [Sutherland]L21. or [Silverman]P447 or [Cox, Chap11]. Notice this should be a special case of Shimura-Taniyama.

□

**Cor. (21.2.7.5).** There are 13 elliptic curves  $E \in \text{EllCur}/\mathbb{Q}$  with CM, namely they are associated to  $\mathcal{O}_{\mathcal{K},f}$  with

- $f = 1, \mathcal{K} = \mathbb{Q}(\sqrt{-d})$  with  $d \in \{1, 2, 3, 7, 11, 19, 43, 67, 163\}$ , with corresponding  $j$ -invariances  
 $j = 2^6 \cdot 3^3, \quad 2^6 \cdot 5^3, \quad 0, \quad -3^3 \cdot 5^3, \quad -2^{15}, \quad -2^{15} \cdot 3^3, \quad -2^{18} \cdot 3^3 \cdot 5^3, \quad -2^{15} \cdot 3^3 \cdot 5^3 \cdot 11^3, \quad -2^{18} \cdot 3^3 \cdot 5^3 \cdot 23^3 \cdot 29^3.$
- $f = 2, \mathcal{K} = \mathbb{Q}(\sqrt{-d})$  with  $d \in \{1, 3, 7\}$ , with corresponding  $j$ -invariances  
 $j = 2^3 \cdot 3^3 \cdot 11^3, \quad 2^4 \cdot 3^3 \cdot 5^3, \quad 3^3 \cdot 5^3 \cdot 17^3.$
- $f = 3, \mathcal{K} = \mathbb{Q}(\sqrt{-3})$  with corresponding  $j$ -invariances  $j = 2^{15} \cdot 3 \cdot 5^3$ .

┘

*Proof:*

□

**Thm. (21.2.7.6) [Hasse].** For  $[\Lambda] \in \text{Pic}(\mathcal{O}_{\mathcal{K},f})$ , denoted  $j(\Lambda) = j(\mathbb{C}/\Lambda)$ , then if  $\mathfrak{p}$  is a prime ideal of  $\mathcal{O}_{\mathcal{K}}$  prime to the conductor and  $\mathfrak{p}_f = \mathfrak{p} \cap \mathcal{O}_{\mathcal{K},f}$ , then

$$(\text{Art}(\text{Frob}_{\mathfrak{p}}))(j(\Lambda)) = j(\Lambda \cdot \mathfrak{p}_f^{-1}).$$

┘

*Proof:* ?

□

**Prop. (21.2.7.7) [CM  $j$ -Invariants are Integral].** For  $K \in p\text{-LField}$  and  $E \in \text{EllCur}/K$  with CM,  $j(E) \in \mathcal{O}_{\overline{K}}$ .

┘

*Proof:*

□

**Prop. (21.2.7.8).** If  $k \in \text{Field}^p$ , and  $E \in \text{EllCur}/k$  has CM, then  $j(E) \in \overline{\mathbb{F}}_q \cap k$ , by (21.3.3.5).

┘

**Thm. (21.2.7.9) [Kronecker's Jugendtraum].** Let  $\mathcal{K}$  be an imaginary quadratic field and  $E \in \text{EllCur}(\mathcal{O}_{\mathcal{K}})$ , then

$$\mathcal{K}^{\text{ab}} = \mathcal{K}(j(E), \{x_{\text{tor}}(E)\}),$$

where  $\{x_{\text{tor}}(E)\}$  is the set of  $x$ -coordinates of torsion points of  $E$ .

┘

*Proof:* ?

□

**CM-Lifting**

**Thm. (21.2.7.10)**[Honda/Chai-Conrad-Oort2014]. For any  $A \in \text{AbVar}/\mathbb{F}_q$ , there exists an isogeny  $A \sim B_0$  s.t.  $B_0$  admits a CM lift to characteristic 0.  $\lrcorner$

*Proof:*  $\square$

**Thm. (21.2.7.11)** [Deuring CM-Lifting Lemma]. Let  $p \in \mathbf{P}$  and  $E \in \text{EllCur}/\overline{\mathbb{F}}_p$ , and  $\alpha_0 \in \text{End}(E_0) \setminus \mathbb{Z}$ , then there exists  $F \in \text{NField}$ ,  $\mathcal{E} \in \text{EllCur}/\mathcal{O}_F$  and  $\alpha \in \text{End}(\mathcal{E})$ ,  $\mathfrak{p} \in \Sigma_F^p$  s.t.

$$\mathcal{E}_{\overline{\kappa(\mathfrak{p})}} \cong E_0$$

s.t.  $\alpha_{\overline{\kappa(\mathfrak{p})}}$  corresponds to  $\alpha_0$ .  $\lrcorner$

*Proof:* Cf.[Suw19]P5?  $\square$

**Hilbert Class Polynomials**

**Def. (21.2.7.12)** [Hilbert Class Polynomials]. Let  $\mathcal{O}$  be a order in an imaginary quadratic field  $\mathcal{K}$ , the **Hilbert class polynomial** associated to  $\mathcal{O}$  is defined to be

$$H_{\mathcal{O}}(X) = \prod_{E \in \text{EllCur}_{\mathbb{C}}(\mathcal{O})} (X - j(E)).$$

And for  $D \in \mathbb{Z}$ ,  $D \equiv 0, 1 \pmod{4}$ , the **Hilbert class polynomial** of discriminant  $D$  is defined to be the class polynomial for the order  $\mathcal{O}_D$ .  $\lrcorner$

**Lemma (21.2.7.13)**. For  $\ell \equiv -1 \pmod{4} \in \mathbf{P} \setminus \{3\}$  and  $D = -\ell$  or  $-4\ell$ ,  $H_D(1728) \equiv 0 \pmod{\ell}$ .  $\lrcorner$

*Proof:* Consider the curve  $E : y^2 = x^3 - x$ , it is supersingular by (21.3.3.12) or (21.2.7.20), and has  $j$ -invariant 1728. Thus  $\varphi_E^2 = -\ell$  by (21.3.3.9)(21.3.3.3). Notice  $E[2] = \{\infty, (0, 0), (\pm 1, 0)\}$ , which are all defined over  $\mathbb{F}_p$ , so  $2 \mid (1 + F)$ , and  $\mathbb{Z}[\frac{1+\varphi_E}{2}] \cong \mathcal{O}_{\ell}$ . Thus by Deuring CM-lifting lemma (21.2.7.11), there is an elliptic curve over some  $\mathcal{O}_F$  with maximal CM by  $\mathcal{O}_{-\ell}$  whose  $j$ -invariant is mapped to  $1728 \pmod{\ell}$ , so  $H_{-\ell}(1728) \equiv 0 \pmod{\ell}$ .

Similarly,  $E$  has endomorphism  $I : (x, y) \mapsto (-x, iy)$ ,  $I^2 = -1$ ,  $IF = -FI$ , so we can lift  $IF$  to get an elliptic curve over some  $\mathcal{O}_F$  with CM by  $\mathcal{O}_{-4\ell}$ . And it is maximal CM, because  $\frac{1+IF}{2} \notin \text{End}(E)$ , as  $(1 + IF)(P = (1, 0)) = (1, 0) + (-1, 0) \neq O$ .  $\square$

**Lemma (21.2.7.14)**. For  $\ell \equiv -1 \pmod{4} \in \mathbf{P} \setminus \{3\}$  and  $D = -\ell$  or  $-4\ell$ , let  $\mathcal{K}_D$  be the ray class field of  $\mathcal{O}_D$ , then for any root  $x_0$  of  $H_D(X)$  s.t.  $x_0 \equiv 1728 \pmod{\ell}$ , there exists a unique  $\mathfrak{l} \in \Sigma_{\mathcal{K}_D}^{\ell}$  s.t.  $x_0 - 1728 \in \mathfrak{l}$ . The  $j$ -invariant of this elliptic curve is mapped to  $1728 \pmod{\ell}$ , so  $H_{-\ell}(1728) \equiv 0 \pmod{\ell}$ .  $\lrcorner$

*Proof:* The existence follows from (21.2.7.13), and if there are two primes  $\mathfrak{l}, \mathfrak{l}'$  that divides  $x - 1728$ , then there exists  $\sigma \neq \text{id}$  s.t.  $x_1 = \sigma(x_1) \equiv 1728 \pmod{\ell}$ . Then there are two elliptic curves  $E_1, E_2/\overline{\mathbb{Q}}$  with  $j$ -invariants  $x_0, x_1$  that reduces to the elliptic  $E/\mathbb{F}_{\ell} : y^2 = x^3 - x$ . Then we get a degree-preserving injection  $\text{Hom}(E_1, E_2) \hookrightarrow \text{End}(E_{\overline{\mathbb{F}}_{\ell}}) = A$ .

For the rest, see [Suw19]P8?  $\square$

**Prop. (21.2.7.15)**. For  $\ell \equiv -1 \pmod{4} \in \mathbf{P} \setminus \{3\}$ , there exists  $R, S \in \mathbb{Z}[X]$  s.t.

$$H_{-\ell}(X) = (X - 1728)R(X)^2, \quad H_{-4\ell}(X) = (X - 1728)S(X)^2.$$

$\lrcorner$

*Proof:* Notation as in (21.2.7.14), there exists an involution  $\tau$  of  $\mathcal{K}_D$  s.t.  $\sigma(x_0) = x_0$ . Thus by the lemma,  $\tau(\mathfrak{l}) = \mathfrak{l}$ , and  $f(\mathfrak{l}/\ell)$  is odd because  $\text{Gal}(\mathcal{K}_D/\mathcal{K})$  does (19.3.3.8). So  $\sigma$  acts trivially on  $\kappa(\mathfrak{l})$ . But  $\tau$  doesn't fix any roots  $x$  of  $H_D(X)$  other than  $x_0$  (because  $x_i$  corresponds to ideal classes of  $\mathcal{O}_D$  where  $x_0$  corresponds to the trivial class, and  $\tau$  acts by  $[I] \mapsto [I]^{-1}$ ), so the other roots come in pairs, and the assertion follows.  $\square$

**Prop. (21.2.7.16).** For  $\ell \equiv -1 \pmod{4} \in \mathbf{P} \setminus \{3\}$ , the only real roots of  $H_\ell(X)$  and  $H_{4\ell}(X)$  are  $j(\frac{1}{2}(1 + \sqrt{-\ell}))$  and  $j(\sqrt{-\ell})$  resp..  $\lrcorner$

*Proof:* For  $D = \ell$  or  $-4\ell$ , since the complex conjugation is compatible with the correspondence in (21.2.7.2), and because  $\overline{I\overline{I}} = \text{Nm}(I)\mathcal{O}_D$ , so the fixed points of  $\mathfrak{c}$  are just 2-torsions in  $\text{Pic}(\mathcal{O}_D)$ . But  $\text{Pic}(\mathcal{O}_D)$  is odd by (19.3.3.8), thus the only real  $j$ -value corresponds to the trivial class.  $\square$

**Cor. (21.2.7.17).** For any  $j \in \mathbb{R}$ , for  $\ell \equiv -1 \pmod{4} \in \mathbf{P} \setminus \{3\}$  sufficiently large,  $H_{-\ell}(j) > 0$  and  $H_{-4\ell}(j) < 0$ .  $\lrcorner$

*Proof:* This is because  $j(\frac{1}{2}(1 + \sqrt{-\ell})) \rightarrow -\infty$  and  $j(\sqrt{-\ell}) \rightarrow \infty$  as  $\ell \rightarrow \infty$ , by the power expansion (26.3.4.22).  $\square$

### Applications

**Prop. (21.2.7.18).** For  $p \in \mathbf{P}$ ,

•

$$\sum_{x \in \mathbb{F}_p} \left( \frac{x^3 + x}{p} \right) = \begin{cases} 0 & , p \equiv 3 \pmod{4} \\ -2a & , p = a^2 + 4b^2, a \equiv 1 \pmod{4} \end{cases}.$$

•

$$\sum_{x \in \mathbb{F}_p} \left( \frac{x^3 + 1}{p} \right) = \begin{cases} 0 & , p \equiv 2 \pmod{3} \\ -2a & , p = a^2 + 3b^2, a \equiv 1 \pmod{3} \end{cases}.$$

•

$$\sum_{x \in \mathbb{F}_p} \left( \frac{x^3 + x}{p} \right) = \begin{cases} 0 & , \left( \frac{p}{7} \right) = -1 \\ -2a & , p = a^2 + 7b^2, \left( \frac{a}{7} \right) = 1 \end{cases}.$$

$\lrcorner$

*Proof:* Because these corresponds to elliptic curves with CM by an imaginary quadratic field with class number 1, thus there exists , so the trace of  $\varphi_p$  can be determined. ( ? How, can it be lifted into  $\mathcal{O}_{\mathcal{K}}?$ ).  $\square$

### Supersingular Primes

References are [Elk87] and [Suw19].

**Lemma (21.2.7.19).** Let  $k \in \text{Field}^p$  and  $E \in \text{EllCur}/k$ ,  $E$  is supersingular iff there exists an order  $\mathcal{O}$  of an imaginary quadratic field  $\mathcal{K}$  s.t.  $\mathcal{O} \subset \text{End}(E)$  and  $p$  doesn't split in  $\mathcal{K}$ .  $\lrcorner$

*Proof:* By (21.3.3.6), if it is ordinary, then  $\text{End}(\mathcal{O})$  is a  $\mathbb{Z}$ -order in an imaginary quadratic field  $\mathcal{K}$ . Then consider the  $p$ -adic representation

$$\mathcal{K} \otimes \mathbb{Q}_p = \text{End}(E) \otimes \mathbb{Q}_p \rightarrow \text{End}_{\mathbb{Q}_p}(V_p(E)) \cong \mathbb{Q}_p.$$

Then this map has a kernel, so  $\mathcal{K} \otimes \mathbb{Q}_p$  is not a field, and  $p$  splits in  $\mathcal{K}$ .  $\square$

**Thm. (21.2.7.20) [Supersingular Criterion for CM Elliptic Curves, Deuring].** Let  $F \in \mathbf{NField}$  and  $E \in \mathbf{EllCur}/F$  with CM by an imaginary quadratic field  $\mathcal{K}$ . If  $\mathfrak{p} \in \Sigma_F^p$  is a good reduction for  $E$ , then  $\tilde{E}/\kappa(\mathfrak{p})$  is ordinary/supersingular iff  $p$  is split/non-split in  $\mathcal{K}$ .  $\lrcorner$

*Proof:* Cf. [Lang, Elliptic Functions, Thm13.12]. ?  $\square$

**Cor. (21.2.7.21) [Supersingular Reductions for CM Elliptic Curves].** For  $E \in \mathbf{EllCur}/\mathbb{Q}$  with CM by  $\mathcal{K}$ , then

$$\#\{p \in \mathbf{P}, p \leq X \mid \tilde{E}/\mathbb{F}_p \text{ is supersingular elliptic}\} = \frac{X}{2 \log X} + O\left(\frac{X}{\log X}\right).$$

$\lrcorner$

*Proof:* This follows from the effective Chebotarev density theorem (19.7.5.2).  $\square$

**Prop. (21.2.7.22) [Elkies].** For any  $E \in \mathbf{EllCur}/\mathbb{Q}$ , there are infinitely many  $p \in \mathbf{P}$  s.t.  $\tilde{E}/\mathbb{F}_p$  is supersingular elliptic. (This is also true if  $\mathbb{Q}$  is replaced by a real field, Cf. [Elkies, 1989]).  $\lrcorner$

*Proof:* By Deuring's CM-lifting lemma (21.2.7.11), for  $D = -\ell$  or  $-4\ell$ ,  $\tilde{E}/\mathbb{F}_p$  has CM by  $\mathcal{O}_D$  iff  $H_D(j(E)) = 0 \in \mathbb{F}_p$ . So by (21.2.7.19),  $p$  is a supersingular prime for  $E$  if

- $H_{-\ell}(j(E)) \in p\mathbb{Z}_p$  or  $H_{-4\ell}(j(E)) \in p\mathbb{Z}_p$ , and
- $\text{ord}_p(\ell)$  is odd or  $-\ell$  is a quadratic non-residue modulo  $p$ .

Suppose that there is a finite set  $S$  containing all the supersingular primes of  $E$ , assume  $2 \in S$ . By Dirichlet's theorem, there exists  $\ell \in \mathbf{P}$  sufficiently large s.t.

$$\ell \equiv 3 \pmod{4}, \quad \left(\frac{p}{\ell}\right) = 1, \quad p \in S.$$

Then by quadratic reciprocity, if  $p \in \mathbf{P}$  and  $H_{-\ell}(j(E)) \in p\mathbb{Z}_p$  or  $H_{-4\ell}(j(E)) \in p\mathbb{Z}_p$ , then  $p \neq \ell$  and  $\left(\frac{p}{\ell}\right) = 1$ , otherwise there would be a new supersingular prime for  $E$  that is not in  $S$ .

As  $H_{-\ell}, H_{-4\ell} \in \mathbb{Z}[X]$ , for any  $p \in \mathbf{P}$ ,

$$H_{-\ell}(j(E))^{-1} \in p\mathbb{Z}_p \iff j(E)^{-1} \in p\mathbb{Z}_p \iff H_{-4\ell}(j(E))^{-1} \in p\mathbb{Z}_p,$$

and if  $j(E)^{-1} \in p$ , then

$$\text{ord}_p(H_{-\ell}(j(E))^{-1}) + \text{ord}_p(H_{-4\ell}(j(E))^{-1}) = \text{ord}_p(j(E)^{-1}) \cdot (\deg(H_{-\ell}) + \deg(H_{-4\ell}))$$

which is even by (21.2.7.15). And  $H_{-\ell}(j(E))H_{-4\ell}(j(E)) < 0$  by (21.2.7.17). So  $H_{-\ell}(j(E))H_{-4\ell}(j(E))$  would be a quadratic non-residue modulo  $\ell$  by our hypothesis. But this contradicts (21.2.7.15).  $\square$

### Without CM case

**Thm. (21.2.7.23) [Serre].** For  $F \in \mathbf{NField}$  and  $E \in \mathbf{EllCur}/F$  without CM,  $\rho_E(\text{Gal}_F) \subset \text{GL}(2; \mathbf{A}^f)$  has finite index.  $\lrcorner$

*Proof:* Cf. [Abelian l-adic representations and elliptic curves, Serre]. or [Bounds for Serre's open image theorem for elliptic curves over number fields].  $\square$

**Conj. (21.2.7.24) [Lang-Trotter].** For  $E \in \text{EllCur}/\mathbb{Q}$  without CM,

$$\#\{p \in \mathbf{P}, p \leq X \mid \tilde{E}/\mathbb{F}_p \text{ is supersingular elliptic}\} \sim \frac{\sqrt{X}}{\log X}.$$

┘

*Proof:*

□

**Prop. (21.2.7.25) [Serre-Elkies].** For  $E \in \text{EllCur}/\mathbb{Q}$  without CM,

$$\#\{p \in \mathbf{P}, p \leq X \mid \tilde{E}/\mathbb{F}_p \text{ is supersingular elliptic}\} \ll X^{3/4}.$$

In particular, supersingular primes have density 0.

┘

## 8 Singular Moduli

References are [Zag08], [Traces of Singular Moduli, Zagier], and [On Singular Moduli, Gross-Zagier].

**Def. (21.2.8.1) [Singular Moduli].** A **singular modulus** is a number  $j(\tau) \in \mathbb{C}$  where  $\tau \in \mathcal{K} \setminus \mathbb{Q}$  and  $\mathcal{K}$  is an imaginary quadratic field.

┘

**Prop. (21.2.8.2).** Any singular modulus (21.2.8.1) belongs to  $\overline{\mathbb{Q}}$ .

┘

*Proof:*

□

**Remark (21.2.8.3).** The singular moduli generate class fields of imaginary quadratic fields, and can in fact be applied to solve Hilbert’s 12th problem over imaginary quadratic fields.

Zagier’s proof of Borchers’ theorem is the beautiful observation that the generating functions for traces of singular moduli are essentially weight  $3/2$  weakly holomorphic modular forms.

┘

**Def. (21.2.8.4).** For  $d \in \mathbb{Z}_{<0}$ , let  $\mathcal{Q}_d$  be the set of integral binary forms of discriminant  $d$ . And for each  $Q \in \mathcal{Q}_d$ , let  $\tau_Q$  be the root of  $Q$  in  $\mathcal{H}$ .

┘

## 9 CM Modular Forms

**Def. (21.2.9.1) [CM Modular Forms].** A **CM modular form** is a modular form constructed from a binary quadratic form  $Q(a, b)$  and a spherical polynomial  $P(a, b)$  of order  $d$ .

For example,

$$f(z) = \sum_{a \equiv 1 \pmod{4}, 2 \mid b} a q^{a^2 + b^2}$$

is a modular form, which corresponds exactly to  $L(E, s)$ , where  $E \in \text{EllCur}/\mathbb{Q} : y^2 = x^3 + x$ .

┘

*Proof:* Cf. [1-2-3 of Modular Forms, P93].

?

□

**Prop. (21.2.9.2).** For  $n \in 2\mathbb{Z}_+$ ,  $\eta(z)^n$  is a CM modular form iff  $n \in \{2, 4, 6, 8, 10, 14, 26\}$ . For example,

$$\eta(z) =$$

┘

*Proof:* Cf. [Serre1985, Sur la lacunarité des puissances de ].

## 10 Real Multiplications

**Def. (21.2.10.1) [Real Multiplications, Hida].**  $A \in \mathcal{AbVar}/\overline{\mathbb{Q}}$  is said to have **real multiplication** if there exists a totally real field  $F \in \mathbf{NField}$  with  $[F : \mathbb{Q}] = \dim A$  s.t.

$$F \subset \mathrm{End}(A)_{\mathbb{Q}}, \quad F = \mathrm{End}^F(A)_{\mathbb{Q}}.$$

┘

**Def. (21.2.10.2) [Q-Real-Multiplications, Hida].**  $A \in \mathcal{AbVar}/\overline{\mathbb{Q}}$  is said to be a **Q-real-multiplication Abelian variety** if it has real multiplication by a totally real field  $F$  (21.2.10.1) and there is a  $F$ -linear isogeny  $A^{\sigma} \rightarrow A$  for any  $\sigma \in \mathrm{Gal}_{\mathbb{Q}}$ . ┘

## 21.3 Arithmetic of Elliptic Curves

References are [Sil99, Sil11, ?SI116]. Should add Sutherland's notes <https://math.mit.edu/classes/18.783/2017/lectures.html> L2-11, 13-14, 17-24. and Snowden's notes <http://www-personal.umich.edu/~asnowden/teaching/2013/679/index.html> L5,6,7,9,11, 14, 15, 17-23.

**Notation (21.3.0.1).**

- Use notations defined in [Abelian Varieties](#).
- Use notations defined in [Global Fields](#).

┘

### 1 Basics

**Def. (21.3.1.1) [Elliptic Schemes].** For  $k \in \mathbf{Field}$ , an **elliptic curve**  $E$  over  $k$  is a complete non-singular curve of genus 1 over a field  $k$ , together with a specified rational pt  $O$ . In (21.3.1.10), we will see an elliptic curve is smooth.

More generally, for  $S \in \mathbf{Sch}$ , an **Elliptic scheme**  $f : E \rightarrow S$  is an Abelian scheme over  $S$  of relative dimension 1 (20.9.1.1). The category of elliptic schemes over  $S$  is denoted by  $\mathbf{EllCur}/S$ . ┘

**Remark (21.3.1.2).** Elliptic curves are Abelian varieties by (21.3.1.10). Thus the theory of Abelian varieties apply to elliptic curves. ┘

**Prop. (21.3.1.3) [Invertible Sheaf].** Let  $S \in \mathbf{Sch}$ ,  $E \in \mathbf{EllCur}/S$ , and  $e \in E(S)$  be the unit, then we can define

$$\omega_{E/S} = e^* \Omega_{E/S} = f_* \Omega_{E/S} \cong R^1 f_* \mathcal{O}_E \in \mathbf{Mod}(\mathcal{O}_S),$$

┘

*Proof:*

### Weierstrass Theory

**Def. (21.3.1.4) [Weierstrass Equations].** A **Weierstrass equations** is an equation of the form

$$y^2 + a_1 xy + a_3 y = x^3 + a_2 x^2 + a_4 x + a_6.$$

┘

**Def. (21.3.1.5) [Important Invariants].** Let  $k \in \mathbf{Field}$ ,  $E \in \mathbf{EllCur}/k$ , given any Weierstrass equation as in (21.3.1.4), we can define

- $b_2 = a_1^2 + 4a_2$ ,  $b_4 = a_1 a_3 + 2a_4$ ,  $b_6 = a_3^2 + 4a_6$ ,  $b_8 = a_1^2 a_6 - a_1 a_3 a_4 + a_2 a_3^2 + 4a_2 a_6 - a_4^2$ .
- $\Delta = -b_2^2 b_8 - 8b_4^3 - 27b_6^2 + 9b_2 b_4 b_6$  the **discriminant of  $E$** , to determine whether  $E$  is singular.
- the quantity  $c_4 = b_2^2 - 24b_4$ , used in the singular case to determine iff it has a node or cusp.
- the quantity  $c_6 = -b_2^3 + 36b_2 b_4 - 216b_6$ , used to determine twisted elliptic curves (21.3.6.3).
- the  **$j$ -invariant**  $j = c_4^3/\Delta$ , which is used to in the non-singular case to characterize  $E$ .

They satisfy the equations:

$$4b_8 = b_2 b_6 - b_4^2, \quad 1728\Delta = c_4^3 - c_6^2.$$

┘

**Prop. (21.3.1.6)[Reduced Weierstrass Equations].** Let  $k \in \mathbf{Field}$ ,  $E \in \mathbf{EllCur}/k$ , given any Weierstrass equation as in (21.3.1.4),

- If  $\text{char } k \neq 2$ , we can replace  $(x, y)$  by  $(x, y - (a_1x + a_3)/2)$  to eliminate  $a_1, a_3$  to transform the original Weierstrass equation to

$$y^2 = x^3 + \frac{b_2x^2 + 2b_4x + b_6}{4}.$$

- If  $\text{char } k \neq 2, 3$ , then we can further replace  $(x, y)$  to  $((x - 3b_2)/36, y/216)$  to eliminate  $b_2$  to transform the Weierstrass equation to

$$y^2 = x^3 - 27c_4x - 54c_6.$$

In particular,  $E$  has a Weierstrass equation of the form

$$y^2 = x^3 + a_4x + a_6, \quad \Delta = -16(4a_4^3 + 27a_6^2), \quad j = 1728 \frac{4a_4^3}{4a_4^3 + 27a_6^2}$$

- If  $\text{char } k = 3$ , then  $E$  has a Weierstrass equation of the form

$$y^2 = x^3 + a_2x^2 + a_6, \quad \Delta = -a_2^3a_6, \quad j = -a_2^3/a_6, \text{ or } y^2 = x^3 + a_4x + a_6, \quad \Delta = -a_4^3, \quad j = 0$$

- If  $\text{char } k = 2$ , then  $E$  has a Weierstrass equation of the form

$$y^2 + xy = x^3 + a_2x^2 + a_6, \quad \Delta = a_6, \quad j = 1/a_6, \text{ or } y^2 + a_3y = x^3 + a_4x + a_6, \quad \Delta = a_3^4, \quad j = 0.$$

┘

**Prop. (21.3.1.7)[Explicit Embedding of Elliptic Curves].** Any  $E \in \mathbf{EllCur}/k$  is isomorphic to a plane curve in  $\mathbb{P}_k^2$  defined by an affine Weierstrass equation in  $k[x, y]$ .

And any isomorphism between elliptic curves defined by affine Weierstrass equations over  $k$  and fixes  $[0, 1, 0]$  are linear maps of the form

$$(X, Y) \mapsto (u^2X + r, u^3Y + su^2X + t), \quad u \in k^*, s, r \in k.$$

┘

*Proof:* If  $E$  is an elliptic curve over  $k$ , consider a rational point  $O \in E(k)$ , Riemann-Roch (7.13.2.9) tells  $l(nP) = \deg(nP) = n$  for  $n \geq 1$ . Now  $L(kP) = k$  by Riemann-Roch (7.13.2.9). So we choose a basis  $1, x$  for  $\mathcal{O}_X(2O)$ , and extend it to a basis  $1, x, y$  of  $L(3P)$ . Since  $L(6O) = 6$ , there is a linear relation between the seven elements  $1, x, x^2, xy, y^2, x^3$ . And  $y^2, x^3$  must occur by observing the pole order at  $P$ . Thus by rescaling, we can write the relation as

$$y^2 + a_1xy + a_3y = x^3 + a_2x^2 + a_4x + a_6.$$

So  $x, y$  defines a rational map of  $E$  to  $\mathbb{P}^2 : a \mapsto (x(a), y(a), 1)$ . This map extends to an embedding of  $E$  into  $\mathbb{P}^2$ , by (7.13.1.16). Moreover, by the above proof, if  $E'$  is another Weierstrass form, then  $1, x'$  are basis for  $\mathcal{O}_X(2O)$  and  $1, x', y'$  are basis for  $\mathcal{O}_X(3O)$ . Thus we have the linear relation between  $(X, Y)$  and  $(X', Y')$ .

To define an Abelian structure on  $E$ , first notice that the map

$$E(k) \rightarrow \text{Cl}^0(E) : Q \mapsto [Q] - [P]$$

is a bijection. Using Riemann-Roch, it is injective because  $l(Q) = 1$  for  $Q \in E(k)$ , and for any divisor  $A$  of degree 0,  $L(A + P) > 0$ , so there exists an effective divisor that is equivalent to  $A + P$ , but this must be a rational point  $Q \in E(k)$ , thus this map is surjective. Thus we can endow  $E(k)$  with a group structure inherited from  $\text{Cl}^0(E)$ . By (21.3.1.9), there is a group variety structure prolonging this construction, so  $E$  is a group scheme.  $\square$

**Remark (21.3.1.8).** There is a more advanced way to prove that this is a group structure, in [Qing Liu]P492. ?

And this group structure coincides with the group structure defined using intersection of a line, because “ $P, Q, R$  is on a line just means that  $[P] + [Q] + [R] - 3[O] = 0 \in \text{Cl}^0(E)$ .”  $\lrcorner$

**Lemma (21.3.1.9) [Explicit Group Structure].** Let  $E$  be an elliptic curve given by a Weierstrass equation

$$y^2 + a_1xy + a_3y = x^3 + a_2x^2 + a_4x + a_6,$$

then the group addition on  $E \setminus O$  is given by

- $-(x_0, y_0) = (x_0, -y_0 - a_1x - a_3)$ .
- $(x_1, y_1) + (x_2, y_2) = O$  iff  $x_1 = x_2$  and  $y_1 + y_2 + a_1x_2 + a_3 = 0$ . Otherwise

$$(x_1, y_1) + (x_2, y_2) = (\lambda^2 + a_1\lambda - a_2 - x_1 - x_2, -(\lambda + a_1)x_3 - y_3 - a_3)$$

where

$$\lambda = \begin{cases} \frac{y_1 - y_2}{x_1 - x_2} & x_1 \neq x_2 \\ \frac{3x^2 + 2a_2x + a_4 - a_1y_1}{2y_1 + a_1x_1 + a_3} & x_1 = x_2 \end{cases}, \quad \nu = \begin{cases} \frac{y_2x_1 - y_1x_2}{x_1 - x_2} & x_1 \neq x_2 \\ \frac{-x_1^3 + a_4x_1 + 2a_6 - a_3y_1}{2y_1 + a_1x_1 + a_3} & x_1 = x_2 \end{cases}$$

- (Doubling Formula)  $x([2]P) = \frac{x^4 - b_4x^2 - 2b_6x - b_8}{4x^3 + b_2x^2 + 2b_4x + b_6}$ .

Thus the group actions defined in (21.3.1.7) are all morphisms. In particular,  $E$  is a group variety.  $\lrcorner$

*Proof:* Cf. [Sil16]P53.  $\square$

**Cor. (21.3.1.10) [Elliptic Curves and Abelian Varieties].** If  $X$  is an Abelian variety of dimension 1, then  $X$  is an elliptic curve. The converse is also true, by (21.3.1.7). In particular, the theory of Abelian varieties 20.9 applies to elliptic curves. And we will use notations for Abelian varieties.  $\lrcorner$

*Proof:* By (10.1.4.38)(10.1.4.37), the tangent space  $\mathcal{T}_{X/k}$  is trivial of rank 1, thus it is a curve of genus 1 by (7.13.1.25). it is also regular, by (7.6.4.15).  $\square$

**Cor. (21.3.1.11) [Homomorphisms between Elliptic Curves].** A map of schemes between two elliptic curves over  $k$  is a homomorphism iff it preserves the origin.  $\lrcorner$

*Proof:* If  $E, E' \in \text{EllCur}/k$  and  $f : E \rightarrow E'$  is a map of schemes preserving the origin, there is a commutative diagram

$$\begin{array}{ccccc} E(k) & \xrightarrow{\cong} & \text{Cl}^0(E) & \xrightarrow{\cong} & \text{Pic}^0(E) \\ \downarrow f & & & & \uparrow f^* \\ E'(k) & \xrightarrow{\cong} & \text{Cl}^0(E') & \xrightarrow{\cong} & \text{Pic}^0(E') \end{array}.$$

$\square$

**Prop. (21.3.1.12) [Normalized Invariant Differential Form].** Let  $k \in \mathbf{Field}$  and  $E$  a plane cubic over  $k$  defined by the equation  $W : y^2 + a_1xy + a_3y = x^3 + a_2x^2 + a_4x + a_6$ . Then the differential form given by

$$\omega = \frac{dx}{2y + a_1x + a_3} = \frac{dy}{3x^2 + 2a_2x + a_4 - a_1y}$$

is a non-zero section of  $\mathcal{K}_{E_{\text{sm}}}$ . It is normalized s.t. at the origin, with the uniformizer  $z = -x/y$ , it has value 1.

Moreover, it is invariant under translation. It is called the **normalized invariant differential form** on  $E$  w.r.t  $W$ .  $\lrcorner$

*Proof:* Firstly we show  $\text{div}(\omega) = 0$ : consider a finite smooth point  $P_0 = (x_0, y_0)$ , then it cannot have pole, otherwise  $P_0$  is singular. Because  $x - x_0 \in L(2O)$ ,  $\text{ord}_{P_0}(x - x_0) \leq 2$ , and if  $\text{ord}_{P_0}(x - x_0) = 2$ ,  $\text{ord}_{P_0}(y - y_0) \geq 2$  also by inspecting the Weierstrass equation. Thus  $\text{ord}_P(\omega) = 0$ . Then consider the situation at  $O$ :  $\text{ord}_O(x) = -2, \text{ord}_O(y) = -3$ , thus  $\text{ord}_O(\frac{dx}{2y+a_1x+a_3}) = 0$  except possibly  $\text{char } k = 2$ . But the same calculation shows  $\text{ord}_O(\frac{dy}{3x^2+2a_2x+a_4-a_1y}) = 0$  except possibly when  $\text{char } k = 3$ . Thus we are done.

Now any translation action induces a map  $\tau_x^*\omega = a(x)\omega$ , where  $a \in K(C)^\times$ . But  $a(x)$  has no pole and zeros, thus  $a(x) \in k^\times$ . But then  $a(x)$  is rational function with no zero and poles, thus  $a(x) = a(O) = 1$ .  $\square$

**Cor. (21.3.1.13).**  $[m]_E^*\omega = \text{pr}_1^*\omega + \text{pr}_2^*\omega$ .  $\lrcorner$

*Proof:* It follows from this and the see-saw principal that  $m_E^*\mathcal{K}_E \cong \text{pr}_1^*\mathcal{K}_E \otimes \text{pr}_2^*\mathcal{K}_E$ .  $\square$

**Prop. (21.3.1.14) [Change of Variables].** A change of variables of the form  $(x, y)$  replaced by  $(u^2x + a, u^3y + bx + c)$  changes  $c_4$  to  $u^{-4}c_4$ ,  $c_6$  to  $u^{-6}c_6$ ,  $\Delta$  to  $u^{-12}\Delta$ , and preserves  $j$ .  $\lrcorner$

*Proof:* This is just a equation of identities, so it suffices to prove for  $k$  of characteristic 0, then in this case, by (21.3.1.6),  $c_4, c_6$  is just the coefficients of the Weierstrass equation transformed into the reduced form (times a constant). So it suffices to prove for transformation between reduced Weierstrass equations. In this case,  $a = b = c = 0$ , and the assertion is clear.  $\square$

**Prop. (21.3.1.15) [Characterizing Singularities].** Let  $k \in \mathbf{Field}$ , then

- The plane cubic  $E$  over  $k$  defined by a Weierstrass formula  $f$  is never singular at  $O = [0, 1, 0]$ , and it is a curve.
- $E$  is smooth iff its determinant  $\Delta \neq 0$ . And in this case it is an elliptic curve by genus formula.
  - $E$  has a node iff  $\Delta = 0$  and  $c_4 \neq 0$ .
  - $E$  has a cusp iff  $\Delta = c_4 = 0$ .
- For  $E, E' \in \mathbf{EllCur}/k$ ,  $E_{\bar{k}} \cong E'_{\bar{k}}$  iff  $j(E) = j(E')$ . In fact, they are isomorphic over a separable field extension  $k'/k$  of degree 24, and if  $j \neq 0, 1728$ , then they are isomorphic over a separable field extension  $k'/k$  of degree 2.

$\lrcorner$

*Proof:* 1: Firstly,  $E$  is never singular at  $[0, 1, 0]$ : On  $U(z)$ , the curve is given by  $z + a_1xz + a_3z^2 = x^3 + a_2x^2z + a_4xz^2 + a_6z^3$ , which is not singular at  $(0, 0)$ . Secondly,  $E$  has genus 1. Finally it is a curve by (3.2.3.14) and checking  $f$  doesn't has a root  $y \in \bar{k}(x)$ : This is true by degree reasons using reduced Weierstrass equations (21.3.1.6).

2: (1): By(21.3.1.10), non-singular is equivalent to smoothness. So we may base change to  $\bar{k}$ . If  $P$  is non-singular, linearly transform it to  $(0,0)$ , then by Jacobian criterion,  $\frac{\partial}{\partial x}f = \frac{\partial}{\partial y}f = 0$ , so  $a_3 = a_4 = a_6 = 0$ , and it can be verified that  $\Delta = 0$ . Conversely, if  $\Delta = 0$ , then use the reduced Weierstrass equations and argue case by case, we can find a singular point.

(2), (3): In this case, assume  $a_3 = a_4 = a_6 = 0$ , then  $c_4 = (a_1^2 + 4a_2)^2$ , and  $E : y^2 + a_1xy - a_2x^2 - x^3 = 0$ , so the assertion is clear.

2: We use the reduced Weierstrass equations, derive an equation between their coefficients, and take a suitable change of variables. Details are omitted.  $\square$

**Prop. (21.3.1.16) [Fields of Moduli].** For any element  $j_0 \in \bar{k}$ , there exists an elliptic curve over  $k(j_0)$  with  $j$ -invariant  $j_0$ . In particular, any elliptic curve over  $k$  is defined over  $k(j(E))$ , by(21.3.1.15).  $\lrcorner$

*Proof:* If  $j_0 \neq 0, 1728$ , then we can take the curve

$$E : y^2 + xy = x^3 - \frac{36}{j_0 - 1728}x - \frac{1}{j_0 - 1728}$$

with  $\Delta(E) = \frac{j_0^3}{(j_0 - 1728)^3}$ ,  $j(E) = j_0$ .

If  $j = 0$  or  $1728$ , we can take one of the curves

$$E : y^2 + y = x^3, \quad \Delta = -27, \quad j = 0$$

$$E : y^2 = x^3 + x, \quad \Delta = -64, \quad j = 1728.$$

Notice for  $\text{char } k = 2$  or  $3$ ,  $0 = 1728$ , and at least one of these are elliptic curves.  $\square$

**Prop. (21.3.1.17) [Singular Weierstrass].** If  $k \in \text{Field}$  is perfect or  $\text{char } k \neq 2, 3$ ,  $E \in \mathbb{P}_k^2$  is a plane cubic given by a Weierstrass equation  $W$  is singular, then

- $E$  has a unique singular point, and it is a rational point.
- $E$  is birational to  $\mathbb{P}_k^1$ , i.e. its non-singular projective model is  $\mathbb{P}^1$ (7.13.1.19).
- $E_{\text{sm}}$  is a commutative  $k$ -group under the group action given in(21.3.1.9) with origin  $O = [0, 1, 0]$ , and  $E_{\text{sm}} \cong \mathbb{G}_m$  if  $E$  has a split node, and  $E_{\text{sm}} \cong \mathbb{G}_a$  if  $E$  has a cusp.  $\lrcorner$

*Proof:* 1: By(21.3.1.15), the singular points must be a finite point, and  $\Delta = 0$ . Over  $\bar{k}$ , the singular points of  $E$  is characterized by the equations  $W = \frac{\partial}{\partial x}W = \frac{\partial}{\partial y}W = 0$ . Then we can use the reduced Weierstrass equations(21.3.1.6): If  $\text{char } k \neq 2, 3$ , then clearly  $(x_0, y_0) \in k^2$ . The perfect case is similar.

2: Because the curve is never singular at  $O$  by(21.3.1.15), by a linear change, we can assume that one of the singular point is  $(0,0)$ . Then by Jacobian criterion, it must be of the form

$$y^2 + a_1xy = x^3 + a_2x^2.$$

Then the projection along  $(0,0)$  is an isomorphism? this is wrong! it may not be rational.

$$E \setminus \{0, \infty\} \rightarrow \mathbb{P}_k^1 \setminus \{[0 : 1]\} : (x, y) \mapsto [x : y]$$

with inverse

$$[1, t] \mapsto (t^2 + a_1t - a_2, t^3 + a_1t^2 - a_2t).$$

$E_{\text{sm}}$  is a group scheme because we can verify on closed points, and the fact any line through  $(0,0)$  has multiplicity more than 1. To determine the group structure, Cf.[Sil16]Exercise3.5.?.  $\square$

**Prop. (21.3.1.18) [Legendre Forms].** Suppose  $\text{char } K \neq 2$ , then

- Every elliptic curve over  $\overline{K}$  is isomorphic to an elliptic curve in **Legendre form**

$$E_\lambda : y^2 = x(x-1)(x-\lambda), \quad \lambda \neq 0, 1 \in \overline{K}.$$

- $\Delta(E_\lambda) = 16\lambda^2(\lambda-1)^2, j(E_\lambda) = 2^8 \frac{(\lambda^2-\lambda+1)^3}{\lambda^2(\lambda-1)^2}, c_4 = 16(1-\lambda(1-\lambda)).$
- If  $K$  is a valued field, we may take  $v(\lambda) \geq 0$  as  $j(E_\lambda) = j(E_{\lambda^{-1}})$ .
- The map  $\overline{K} \rightarrow \overline{K} : \lambda \mapsto j(E_\lambda)$  is 6 to 1 except above the points 0 and 1728, where for  $\text{char } K \neq 2, 3, \#j^{-1}(0) = 2, \#j^{-1}(1728) = 3$ , and for  $\text{char } K = 3, j^{-1}(0 = 1728) = 1$ .

┘

*Proof:* 1: put the Weierstrass equation of  $E$  in the reduced form (21.3.1.6), then it is of the form

$$y^2 = (x - e_1)(x - e_2)(x - e_3)$$

in  $\overline{K}[x, y]$ , and because  $\Delta = 16(e_1 - e_2)^2(e_2 - e_3)^2(e_3 - e_1)^2 \neq 0$ , so  $e_1, e_2, e_3$  are pairwise distinct. Thus the linear transform

$$x \mapsto (e_2 - e_1)x' + e_1$$

makes the Weierstrass equation in the Legendre form with  $\lambda = \frac{e_3 - e_1}{e_2 - e_1}$ .

2: Direct calculation.

3: Directly calculating the differential of  $j$ . ?

□

**Prop. (21.3.1.19) [Duering Normal Form].** Every elliptic curve over  $\overline{K}$ , except possibly  $\text{char } K = 3$  and  $j(E) = 0$ , is isomorphic to an elliptic curve in **Duering normal form**

$$E_\alpha : y^2 + \alpha xy + y = x^3, \quad \alpha \in \overline{K}, \quad \Delta(E_\alpha) = \alpha^3 - 27 \neq 0, \quad j(E_\alpha) = \frac{\alpha^3(\alpha^3 - 24)^3}{\alpha^3 - 27}, \quad c_4 = \alpha(\alpha^3 - 24).$$

And if  $K$  is a valued field, we can take  $v(\alpha) > 0$ .

┘

*Proof:* Use (21.3.1.15), it suffices to show that  $j(\alpha)$  can take any value  $j \in \overline{K}$ .

The last assertion is because if  $v(\alpha) < 0$ , then the product of roots of  $\frac{x(x-24)^3}{x-27} = \frac{\alpha^3(\alpha^3-24)^3}{\alpha^3-27}$  other than  $\alpha$  is  $-72^3/(\alpha-27)$  has positive valuations.

□

**Prop. (21.3.1.20) [Automorphism Group].** Let  $k \in \text{Field}, E \in \text{EllCur}/k$ , then the the automorphic group of  $E$  is

$$\text{Aut}(E) \cong \begin{cases} \mu_2(k) & j(E) \neq 0, 1728 \\ \mu_4(k) & j(E) = 1728, \text{char } k \neq 2, 3 \\ \mu_6(k) & j(E) = 0, \text{char } k \neq 2, 3 \\ D_{12} & j(E) = 0 = 1728, \text{char } k = 3, k = \overline{k} \\ C_3 \rtimes Q_8 & j(E) = 0 = 1728, \text{char } k = 2, k = \overline{k} \end{cases}$$

┘

*Proof:* Any automorphism of  $E$  is defined by a linear maps of the form

$$(X, Y) \mapsto (u^2X + r, u^3Y + su^2X + t), \quad u \in k^\times, s, r \in K.$$

If  $\text{char } k \neq 2, 3$ , use the reduced Weierstrass form  $E : y^2 = x^3 + Ax + B$ , so it is of the form  $(X, Y) \mapsto (u^2X, u^3Y)$ , which is possible iff  $u^{-4}A = A, u^{-6}B = B$ . Thus by arguing case by case, we are done.

The  $\text{char } k = 2, 3$  cases are similar, use reduced Weierstrass forms (21.3.1.6) and argue case by case.

□

**Prop. (21.3.1.21) [Dual Elliptic Curves].** An elliptic curve  $E$  is canonically isomorphic to its dual  $\widehat{E}$ , by the mapping  $P \mapsto \mathcal{L}(P - O)$ .  $\lrcorner$

*Proof:* This morphism is induced by the ample line bundle  $\mathcal{L}(O)$  (20.9.4.6), and it is an isomorphism because it has degree 1, by Riemann-Roch (20.9.5.2).  $\square$

**Cor. (21.3.1.22).** For any  $\mathcal{L} \in \text{Pic}(E)$  of degree  $d$ ,  $\varphi_{\mathcal{L}} = [d] : E \rightarrow E$  via the canonical duality, because  $\text{Pic}^0(E)$  induces trivial maps by (20.9.4.12) and (9.1.11.5).  $\lrcorner$

**Cor. (21.3.1.23) [Characterizing Principal Divisors].** Let  $E \in \text{EllCur}/k$  and  $D = \sum n_i [P_i] \in \text{Div}(E)$ , where  $P_i$  are rational points, then  $D$  is a principal divisor iff  $\sum n_i = 0$  and  $\sum [n_i] P_i = O$ .  $\lrcorner$

*Proof:* Of course  $\sum n_i = 0$ . In this case,  $\sum [n_i] P_i$  is mapped to the line bundle corresponding to  $[D] \in \widehat{E}$  via  $E \rightarrow \widehat{E}$ , so  $[D] = 0$  iff  $\sum [n_i] P_i = O$ .  $\square$

### Isogenies

**Prop. (21.3.1.24).** Let  $\varphi, \varphi' : E' \rightarrow E$  be isogenies of elliptic curves over  $k$ , and let  $\omega$  be an invariant differential on  $E$ , then by (21.3.1.13),

$$(\varphi + \varphi')^* \omega = \varphi^* \omega + (\varphi')^* \omega.$$

**Cor. (21.3.1.25).**  $[m]^* \omega = m\omega$ .  $\lrcorner$

**Cor. (21.3.1.26) [End( $E$ ) is Commutative in Characteristic 0].** Let  $E \in \text{EllCur}/k$  with the normalized invariant differential form  $\omega$ , then there is a ring homomorphism

$$\text{End}(E_{\overline{k}}) \rightarrow \overline{k} : \varphi \mapsto a_{\varphi}, \text{ where } \varphi^* \omega = a_{\varphi} \omega.$$

And the kernel is the set of inseparable endomorphisms of  $E_{\overline{k}}$ . In particular, if  $\text{char } k = 0$ , then  $\text{End}(E_{\overline{k}})$  is commutative.  $\lrcorner$

*Proof:* Cf. [Sil16] P79. ?  $\square$

**Prop. (21.3.1.27) [Dual Isogenies].** Let  $k \in \text{Field}$ ,  $E, E' \in \text{EllCur}/k$  and  $\varphi \in \text{Hom}(E, E')$ , then under the canonical isomorphism (21.3.1.21), the dual map  $\widehat{\varphi}$  can be regarded as a map  $\widehat{\varphi} : E' \rightarrow E$ . Then

$$\widehat{\varphi} \circ \varphi = [\deg(\varphi)]_E, \varphi \circ \widehat{\varphi} = [\deg(\varphi)]_{E'}.$$

$\text{End}(E) \rightarrow \text{End}(E) : \varphi \mapsto \widehat{\varphi}$  is additive, and defines an involution on  $\text{End}(E)$ .  $\lrcorner$

*Proof:* Let  $d = \deg(\varphi)$ . By unwinding definition,  $\widehat{\varphi} \circ \varphi : E \rightarrow E' \rightarrow \widehat{E}' \rightarrow \widehat{E}$  is just  $\varphi_{\varphi^* \mathcal{L}(O)}$ . But for elliptic curves,  $\varphi_{\mathcal{L}}$  only depends on  $\deg(\mathcal{L})$ , thus  $\varphi_{\varphi^* \mathcal{L}(O)} = \varphi_{\mathcal{L}(dO)} = [d] \varphi_{\mathcal{L}(O)}$ . The second assertion follows by noticing  $\varphi = \widehat{\widehat{\varphi}}$  and  $\deg(\varphi) = \deg(\widehat{\varphi})$  (20.9.6.4).  $\square$

**Cor. (21.3.1.28) [End( $E$ )].** Let  $k$  be a field and  $E \in \text{EllCur}/k$ , then  $\text{End}(E) \otimes \mathbb{Q}$  is a division ring.  $\lrcorner$

**Prop. (21.3.1.29) [Classification of End( $E$ )].** Let  $k \in \text{Field}$ ,  $E \in \text{EllCur}/k$ , then  $\text{End}(E)$  has the following three possibilities:

- $\mathbb{Z}$ .
- an  $\mathbb{Z}$ -order in an imaginary quadratic extension over  $\mathbb{Q}$ .
- an  $\mathbb{Z}$ -order in a definite quaternion algebra over  $\mathbb{Q}$ .

And the third case won't happen in characteristic 0, by (21.3.1.26).  $\lrcorner$

*Proof:* This follows from (3.6.10.1) and (21.1.4.3).  $\square$

## 2 Formal Groups of Elliptic Curves

In this subsection, the formal group structure of an elliptic is studied.

In this subsection,  $E$  is an elliptic curve over a field  $K$  given by Weierstrass equation  $y^2 + a_1xy + a_3y = x^3 + a_2x^2 + a_4x + a_6$ .

**Prop. (21.3.2.1) [Calculation of Formal Group Law].** Make a change of variable  $z = -x/y, w = -1/y$  to the Weierstrass equation of  $E$ , the equation becomes

$$w = z^3 + (a_1z + a_2z^2)w + (a_3 + a_4z)w^2 + a_6w^3 = f(z, w).$$

Then

- $\hat{\mathcal{O}}_{E,O} \cong K[[z]]$ .
- There is a unique power series  $w(z) \in \mathbb{Z}[a_1, \dots, a_6][[z]]$  satisfying  $w(0) = 0$  and  $w(z) = f(z, w(z))$ .
- $w(z) = z^3(1 + A_1z + A_2z^2 + \dots)$ , where  $A_n$  is a homogenous polynomial in  $a_1, \dots, a_6$ , where  $a_i$  has weight  $i$ .

•

$$\begin{aligned} x(z) &= z/w(z) = z^{-2} - a_1z^{-1} - a_2 - a_3z - (a_4 + a_1a_3)z^2 + \dots \in \mathbb{Z}[a_1, \dots, a_6][[z]] \\ y(z) &= -1/w(z) = -z^{-3} + a_1z^{-2} + a_2z^{-1} + a_3 + (a_4 + a_1a_3)z + \dots \in \mathbb{Z}[a_1, \dots, a_6][[z]] \end{aligned}$$

- The formal group law of  $E$  (20.9.2.1) is given by

$$\begin{aligned} F(z_1, z_2) &= z_1 + z_2 - a_1z_1z_2 - a_2(z_1^2z_2 + z_1z_2^2) \\ &\quad + (-2a_3z_1^3z_2 + (a_1a_2 - 3a_3)z_1^2z_2^2 - 2a_3z_1z_2^3) + \dots \in \mathbb{Z}[a_1, \dots, a_6][[z_1, z_2]]. \end{aligned}$$

- The normalized invariant differential form (21.3.1.12)

$$\begin{aligned} \omega(z) &= \frac{dx(z)}{2y(z) + a_1x(z) + a_3} = [1 + a_1z + (a_1^2 + a_2)z^2 + (a_1^3 + 2a_1a_2 + 2a_3)z^3 \\ &\quad + (a_1^4 + 3a_1^2a_2 + 6a_1a_3 + a_2^2 + 2a_4)z^4 + \dots] dz \in \mathbb{Z}[a_1, \dots, a_6][[z]]dz \end{aligned}$$

•

$$i(z) = \frac{x(z)}{y(z) + a_1x(z) + a_3} = \frac{z^{-2} - a_1z^{-1} + \dots}{-z^{-3} + 2a_1z^{-2} + \dots} \in \mathbb{Z}[a_1, \dots, a_6][[z]].$$

In particular, this formal group law is defined over  $\mathbb{Z}[a_1, \dots, a_6]$ . ┘

*Proof:*  $\omega(z) \in \mathbb{Z}[a_1, \dots, a_6][[z]]dz$  by (10.7.3.18).

For  $F(z_1, z_2)$ : ? □

**Prop. (21.3.2.2) [Inseparable Degree and Heights].** Let  $K$  be a field of characteristic  $p > 0$  and  $E_1/K, E_2/K$  be two elliptic curves, and  $\varphi : E_1 \rightarrow E_2$  a non-zero isogeny of elliptic curves over  $K$ , and let  $\hat{\varphi} : \hat{E}_1 \rightarrow \hat{E}_2$  be the homomorphism of formal group schemes, then

$$\deg_i(\varphi) = p^{\text{ht}(\hat{\varphi})}.$$

┘

*Proof:* Cf. [Sil16] P134. ? □

**Cor. (21.3.2.3).** Let  $K$  be a field of characteristic  $p > 0$ , then  $\text{ht}(\hat{E}) = 1$  or  $2$ , because  $\deg([p]_E) = p^2$  (20.9.6.18). ┘

**3 char  $k > 0$  case****Notation (21.3.3.1).**

- Let  $k \in \mathbf{Field}^p$ ,
- Let  $E \in \mathbf{EllCur}/k$  be given by a Weierstrass equation  $y^2 + a_1xy + a_3y = x^3 + a_2x^2 + a_4x + a_6$ .

┘

**Prop. (21.3.3.2).** Let  $k = \mathbb{F}_q$ ,  $\#E(k) \equiv 0 \pmod{4}$ .

┘

*Proof:* There are two involutions on  $E$ :  $(x, y, z) \mapsto (x, -y, z)$ ,  $(x, y, z) \mapsto (z, y/x, x)$ . The fixed points of these elements contain

$$(0, 1, 0), \quad (0, 0, 1), \quad (\varepsilon_1, \varepsilon_2\sqrt{2\varepsilon_1}, 0), \quad (\varepsilon_3\sqrt{-1}, 0, 1).$$

Considering either cases s.t.  $-1 \in \mathbb{F}_q^2$  or  $2 \in \mathbb{F}_q^2$ , the number of these points are divisible by 4, thus we are done.  $\square$

**Prop. (21.3.3.3) [Hasse-Weil].** Let  $p \in \mathbf{P}$ ,  $q = p^r$ ,  $k = \mathbb{F}_q$  and  $E \in \mathbf{EllCur}/k$ , then

- If  $a = 1 + q - \#E(\mathbb{F}_q)$ ,  $\alpha, \beta$  be the two roots of  $T^2 - aT + q = 0$ , then  $\#E(\mathbb{F}_{q^n}) = 1 + q^n - \alpha^n - \beta^n$ .
- $|\#E(\mathbb{F}_q) - 1 - q| \leq 2\sqrt{q}$ .
- The Frobenius map  $\varphi_E : E \rightarrow E$  satisfies  $\varphi^2 - a\varphi + [q] = 0$ .
- $a = 1 + q - \deg(1 - \varphi)$ , and  $[a] = \varphi + \hat{\varphi}$ .

┘

*Proof:* 1, 2 are special cases of (20.9.9.5). 3, 4 follow from (20.9.7.13) and (20.9.6.21).  $\square$

**Cor. (21.3.3.4).** Let  $k = \mathbb{F}_q$ ,  $p \neq 2$  and  $E$  is given by  $y^2 = x^3 + a_2x^2 + a_4x + a_6$ , then

$$\left| \sum_{x \in \mathbb{F}_q} \left( \frac{x^3 + a_2x^2 + a_4x + a_6}{\mathbb{F}_q} \right) \right| \leq 2\sqrt{q}.$$

┘

*Proof:* This is because  $\#E(\mathbb{F}_q) = \sum_{x \in \mathbb{F}_q} \left( 1 + \left( \frac{x^3 + a_2x^2 + a_4x + a_6}{\mathbb{F}_q} \right) \right)$ .  $\square$

**Supersingular Elliptic Curves**

Main references are [Igu58].

**Def. (21.3.3.5) [Supersingular Elliptic Curve].** Let  $p \in \mathbf{Prime}$ ,  $k \in \mathbf{Field}^p$ ,  $F_{E/k,r} : E \rightarrow E^{(p^r)}$  the relative Frobenius (7.2.10.1), and  $\hat{F}_{E/k}$  be its dual. Then the following are equivalent:

- $E[p^r] = 1$  for all  $r \geq 1$ .
- $E[p^r] \not\cong \mathbb{Z}/p^r\mathbb{Z}$  for some  $r \geq 1$ .
- $\hat{F}_{E/k,r}$  is purely inseparable for one (thus all)  $r$ .
- $[p] : E \rightarrow E$  is purely inseparable, and  $j(E) \in \mathbb{F}_{p^2}$ .
- $\text{End}(E)$  is an order in a quaternion algebra.
- The formal group  $\hat{E}/K$  associated to  $E$  has height  $2 (\neq 1)$ .

Such curves are called **supersingular elliptic curves**, otherwise  $E$  is called an **ordinary elliptic curve**.

Being supersingular is stable and reflective under base change.  $\lrcorner$

*Proof:* Cf.[Silverman P144].  $\textcolor{red}{?}$   $\square$

**Prop. (21.3.3.6) [Ordinary Elliptic Curves].** Let  $k \in \mathbf{Field}$ ,  $\text{char } k = p > 0$ ,  $E \in \mathbf{EllCur}/k$  be an ordinary elliptic curve, then

- If  $j(E) \in \overline{\mathbb{F}}_p$ , then  $\text{End}(E)$  is an order in an imaginary quadratic field. In particular, this is the case when  $k$  is a finite field.
- If  $j(E) \notin \overline{\mathbb{F}}_p$ , then  $\text{End}(E) \cong \mathbb{Z}$ .

$\lrcorner$

*Proof:* 1: If  $j(E) \in \overline{\mathbb{F}}_p$ , then  $E$  is defined over some  $\mathbb{F}_q$ . Let  $\varphi = \varphi_q$ , then if  $\varphi^r \in \mathbb{Z}$ ,  $\varphi^r = [\pm q^r]$ , so  $\#E[\varphi^r] = \deg_s(\varphi^r) = 1$  by (20.9.6.2), contradicting the fact  $E$  is ordinary. Thus the assertion follows from (21.3.1.29).

2:  $\textcolor{red}{?}$   $\square$

**Cor. (21.3.3.7).** For  $E \in \mathbf{EllCur}/\overline{\mathbb{F}}_p$ ,  $E$  is ordinary iff  $\text{End}(E)$  is an order in an imaginary quadratic field, and  $E$  is supersingular iff  $\text{End}(E)$  is an order in a quaternion algebra.  $\lrcorner$

**Def. (21.3.3.8) [Hasse Invariant].** The **Hasse invariant** for  $E$  is a number which is 0 if  $E$  is supersingular and 1 if  $E$  is ordinary. The definition of it is in [Katz, p-adic Modular Forms].  $\textcolor{red}{?}$   $\lrcorner$

**Prop. (21.3.3.9) [Supersingular and Trace].** Let  $E \in \mathbf{EllCur}/\mathbb{F}_q$  and  $\varphi_E$  be the Frobenius of  $E/\mathbb{F}_q$ , then

- $E$  is supersingular iff  $\#E(\mathbb{F}_q) \equiv 1 \pmod{p}$ , iff  $a_p = \alpha + \beta \equiv 0 \pmod{p}$  in (21.3.3.3).
- If  $q = p \geq 5$  is a prime, then  $E$  is supersingular iff  $\#E(\mathbb{F}_p) = p + 1$ . This is false for  $p = 2$  or  $p = 3$ .

$\lrcorner$

*Proof:* 1: By (21.3.3.3), let  $a = 1 + q - \#E(\mathbb{F}_q)$ , then  $\widehat{\varphi}_E = [a] - \varphi$  is separable iff  $a = 0 \in \mathbb{F}_q$  by??. Thus the assertion follows from (21.3.3.5).

2: Because  $|\alpha + \beta| \leq 2\sqrt{p} < p$  in this case.  $\square$

**Cor. (21.3.3.10).** Let  $p \geq 5$  and  $E \in \mathbf{EllCur}/\mathbb{F}_p$  be supersingular, then

$$\#E(\mathbb{F}_{p^n}) = \begin{cases} p^n + 1 & , n = 2k + 1 \\ (p^{n/2} - (-1)^{n/2})^2 & , n = 2k \end{cases}$$

$\lrcorner$

*Proof:* This is because  $\alpha = -\beta = \sqrt{p}i$ .  $\square$

**Prop. (21.3.3.11) [Supersingular in Characteristic 2].** Let  $k$  be a field of characteristic 2, then  $E/k$  is supersingular iff  $j(E) = 0$ . In particular,  $y^2 + y = x^3$  is the only supersingular elliptic curve over  $\overline{k}$ .  $\lrcorner$

*Proof:* We use the condition  $\#E(\mathbb{F}_2) = 2$ . We use the reduced Weierstrass equations in (21.3.1.5). By doubling formula (21.3.1.9), this is equivalent to the non-existence of a point  $(x, y) \in E(\overline{k}) \setminus O$  s.t.  $a_1x + a_3 = 0$ . And it can be checked this is true iff  $j(E) = 0$ .  $\square$

**Prop. (21.3.3.12)**[Supersingular Elliptic Curves over Finite Fields, Igusa]. Let  $p \in \text{Prime}$  and  $E \in \text{EllCur} / \overline{\mathbb{F}}_p$ .

1. If  $p = 2$ , the only supersingular elliptic curve over  $\overline{\mathbb{F}}_2$  is isomorphic to  $y^2 + y = x^3$ .
2. If  $p \geq 3$  and  $E$  is given by a Weierstrass form  $y^2 = f(x)$ , then  $E$  is supersingular iff  $\text{Coef}\left(\frac{f(x)^{(p-1)/2}}{x^{p-1}}\right) = 0 \in \overline{\mathbb{F}}_p$ .
3. If  $p \geq 3$  and  $E$  is given by a Legendre form  $y^2 = x(x-1)(x-\lambda)$ , then  $E$  is supersingular iff

$$H_p(\lambda) = \sum_{i=1}^{(p-1)/2} \binom{\frac{(p-1)}{2}}{i}^2 \lambda^i = 0.$$

4. If  $p \geq 3$ , the polynomial  $H_p$  has distinct roots in  $\overline{\mathbb{F}}_p$ , and the number of isomorphism classes of supersingular elliptic curves over  $\overline{\mathbb{F}}_p$  is

$$\begin{cases} 1 & , p = 3 \\ \lfloor \frac{p}{12} \rfloor & , p \equiv 1 \pmod{12} \\ \lfloor \frac{p}{12} \rfloor + 1 & , p \equiv 5, 7 \pmod{12} \\ \lfloor \frac{p}{12} \rfloor + 2 & , p \equiv 11 \pmod{12} \end{cases}$$

5. (Mass Formula)

$$\sum_{E/\overline{\mathbb{F}}_p \text{ supersingular}} \frac{1}{\text{Aut}(E)} = \frac{p-1}{24}.$$

┘

**Remark (21.3.3.13).** This has relations to the class number of normal quaternion algebras over  $\mathbb{Q}$  ramified at  $p$ , Cf. [Igu58].

┘

*Proof:* 1: This follows from (21.3.3.11).

2: Let  $E \in \text{EllCur} / \mathbb{F}_q$ , denote  $A_q = \text{Coef}\left(\frac{f(x)^{(q-1)/2}}{x^{q-1}}\right)$ , then

$$\#E(\mathbb{F}_q) \equiv \sum_{x \in \mathbb{F}_q} \left(1 + \left(\frac{x^3 + a_2x^2 + a_4x + a_6}{\mathbb{F}_q}\right)\right) \equiv 1 - A_q \pmod{p}.$$

Then  $A_q \equiv a_E \pmod{p}$ , and the assertion follows from (21.3.3.9).

Finally, it can be seen from the equation  $f(x)^{(p^{r+1}-1)/2} = f(x)^{(p^r-1)/2} [f(x)^{(p-1)/2}]^{p^r}$  that  $A_{p^{r+1}} = A_{p^r} A_p^{p^r}$ . So by an induction argument,  $A_q = 0$  iff  $A_p = 0$ .

3:

$$\text{Coef}\left(\frac{(x(x-1)(x-\lambda))^{(p-1)/2}}{x^{p-1}}\right) = \text{Coef}\left(\frac{(x-1)^{(p-1)/2}(x-\lambda)^{(p-1)/2}}{x^{(p-1)/2}}\right) = \sum_{i=1}^{(p-1)/2} \binom{\frac{(p-1)}{2}}{i}^2 \lambda^i = H_p(\lambda).$$

- 4: Consider the **Picard-Fuchs differential operator**

$$D = 4t(t-1) \frac{\partial^2}{\partial t^2} + 4(1-2t) \frac{\partial}{\partial t} - 1.$$

Direct calculation shows

$$DH_p(t) = p \sum_{i=1}^{(p-1)/2} (p-2-4i) \binom{\frac{(p-1)}{2}}{i} t^i = 0.$$

Thus possible multiple roots of  $H$  can only be 1 or 0. But  $H_p(0) = 1$ , and  $H_p(1) = \left(\frac{p-1}{2}\right) = (-1)^{\frac{p-1}{2}}$ , thus  $H_p(t)$  has no multiple roots.

Let  $\varepsilon_p(j) = 1$  if the elliptic curve  $E$  with the indicated  $j$ -invariant is supersingular, and  $\varepsilon_p(j) = 0$  otherwise. Notice for  $p \geq 5$ ,  $j : \lambda \rightarrow j(E_\lambda)$  is 6 to 1 except  $\#j^{-1}(0) = 2$  and  $\#j^{-1}(1728) = 3$ , thus by counting the number of zeros of  $H_p(\lambda)$ , the number of supersingular elliptic curves is

$$\frac{1}{6} \left( \frac{p-1}{2} - 2\varepsilon_p(0) - 3\varepsilon_p(1728) \right) + \varepsilon_p(0) + \varepsilon_p(1728) = \frac{p-1}{12} + \frac{2}{3}\varepsilon_p(0) + \frac{1}{2}\varepsilon_p(1728).$$

Thus the assertion follows from determining elliptic curves of  $j$ -invariants 0 and 1728 are supersingular or not, which is done by (21.3.3.14).

5: It follows from the proof of item4 that this number is  $1/2$  of number of roots of  $H_p(\lambda) = \frac{p-1}{24}$ .

□

**Lemma (21.3.3.14) [Examples of Supersingular Elliptic Curves].**

- For  $p \geq 5$ , the elliptic curve  $E : y^2 = x^3 + 1$  with  $j$ -invariant 0 is supersingular iff  $p \equiv 2 \pmod{3}$ .
- For  $p \geq 3$ , the elliptic curve  $E : y^2 = x^3 + x$  with  $j$ -invariant 1728 is supersingular iff  $p \equiv 3 \pmod{4}$ .

┘

*Proof:* These follows from calculating the  $x^{p-1}$ -term of  $(x^3 + 1)^{(p-1)/2}$  or  $(x^3 + x)^{(p-1)/2}$  and (21.3.3.12) item2. □

## 4 Reduction of Elliptic Curves

References are [Liu02].

In this subsection, let  $(S, K)$  be a Dedekind scheme with generic point  $\eta$ .

**Prop. (21.3.4.1) [Minimal Models of Elliptic Curves].** Let  $E \in \text{EllCur}/K$  and  $\mathcal{E}/S$  be a minimal model for  $E$ , then

- $\mathcal{E}_{\text{sm}}(S) = \mathcal{E}(S) = E(K)$ .
- The automorphism  $(m, \text{pr}_2) : E \times_K E \rightarrow E \times_K E$  extends to an automorphism  $t : \mathcal{E} \times_S \mathcal{E}_{\text{sm}} \rightarrow \mathcal{E} \times_S \mathcal{E}_{\text{sm}}$ .
- $t$  induces an automorphism  $\mathcal{E}_{\text{sm}} \times_S \mathcal{E}_{\text{sm}} \rightarrow \mathcal{E}_{\text{sm}} \times_S \mathcal{E}_{\text{sm}}$ , and  $\text{pr}_1 \circ E$  makes  $\mathcal{E}_{\text{sm}}$  a smooth group scheme over  $S$  extending that of  $E$ .

┘

*Proof:* Cf. [Liu02] P492. □

**Thm. (21.3.4.2) [Minimal Models and Néron Models].** Let  $(K, \mathcal{O}_K) \in \text{DVR}$ ,  $E \in \text{EllCur}/K$  with minimal model  $\mathcal{E}/\mathcal{O}_K$  (20.3.7.4), then  $\mathcal{E}_{\text{sm}}$  is a Néron model of  $E$ . ┘

*Proof:* Cf. [Liu, Prop10.2.12] or [BLR, 1.5/1].

To show universal property, let  $X/S$  be smooth, and  $f : X_\eta \rightarrow E$  be a morphism considered as a rational morphism  $X \rightarrow \mathcal{E}_{\text{sm}}$ . Let  $\xi \in X$  be a point of codimension 1, and  $T = \text{Spec } \mathcal{O}_{X,\xi}$ , then by (21.4.6.7) and the proof of (21.3.4.1),  $\mathcal{E} \times_S T \rightarrow T$  is an arithmetic surface with smooth locus  $\mathcal{N} \times_S T$ ?, so by (21.4.2.8),  $\mathcal{N}(T) = \mathcal{N}_T(T) = E(K)$ , which means  $f$  can be extended to  $\xi$ . Then in fact  $f$  is a morphism by (10.1.1.18).  $\square$

### over DVRs

In this subsubsection, let  $(K, \mathcal{O}_K, \mathfrak{m}, \kappa)$  be a DVR,  $S = \text{Spec}(\mathcal{O}_K)$ .

**Prop. (21.3.4.3) [Weierstrass Models are Normal].** Let  $E \in \text{EllCur}/K$ , then any Weierstrass equation for  $E$  over  $R$  is normal.  $\lrcorner$

*Proof:* Cf. [Conrad, Minimal model for Elliptic Curves].  $\square$

**Def. (21.3.4.4) [Minimal Weierstrass Equation].** Let  $E \in \text{EllCur}/K$ , then a **minimal Weierstrass equation** for  $E$  is an Weierstrass equation for  $E$  in  $R[X, Y]$  with determinant  $\Delta$  with minimal valuation.  $\lrcorner$

**Prop. (21.3.4.5) [Uniqueness of Minimal Weierstrass Equations].** Let  $E \in \text{EllCur}/K$ , then  $E$  has a minimal Weierstrass equation, and it is unique up to change of variables of the form

$$(X, Y) \mapsto (u^2X + r, u^3Y + su^2X + t), \text{ where } u \in \mathcal{O}_K^*, r, s, t \in \mathcal{O}_K.$$

Moreover, given any Weierstrass equation, then any change of coordinates that is used to produce a minimal Weierstrass equation is of the form

$$(X, Y) \mapsto (u^2X + r, u^3Y + su^2X + t), \text{ where } u, r, s, t \in R.$$

$\lrcorner$

*Proof:* Cf. [Sil16]P186.  $\square$

**Cor. (21.3.4.6) [Weierstrass Models].** Let  $E \in \text{EllCur}/K$ , a minimal Weierstrass of  $E$  defines a model  $\mathcal{W}/R$  of  $E$ , and it is invariant of the Weierstrass equation chosen, called the **Weierstrass model** of  $E$ .  $\lrcorner$

**Prop. (21.3.4.7) [Weierstrass Model of Elliptic Curves].** If  $E \in \text{EllCur}/K$ , then a Weierstrass equation with  $a_i \in R$  defines a scheme  $\mathcal{W} \in \mathbb{P}_R^2$ . Then

- Both  $\mathcal{W}_{\text{sm}}$  and  $\mathcal{W}$  has generic fiber  $E$ . If  $E$  has good reduction and  $W$  is a minimal Weierstrass equation, then  $\mathcal{W} = \mathcal{W}_{\text{sm}}$  is smooth.
- The natural map  $\mathcal{W}(\mathcal{O}_K) \rightarrow E(K)$  is a bijection. If  $\mathcal{W}$  is regular, then  $\mathcal{W}_{\text{sm}}(R) \rightarrow \mathcal{W}(R)$  is also a bijection.
- The group structure on  $E/K$  extends to a group structure on  $\mathcal{W}_{\text{sm}}/R$ , and the addition further extends to a group action of  $\mathcal{W}_{\text{sm}}/R$  on  $\mathcal{W}/R$ .

$\lrcorner$

*Proof:* Cf. [Mil199]P321.  $\square$

**Prop. (21.3.4.8) [Weierstrass Model and Minimal Models].** If  $E \in \text{EllCur}/K$  with minimal model  $\mathcal{E}$ , then any minimal Weierstrass model  $\mathcal{W}$  can be obtained by blowing down the finitely many components of  $\mathcal{E}_k$  which are disjoint from the closure in  $\mathcal{E}$  of  $\mathbf{0}_E$ . In particular, by (21.3.4.2),  $\mathcal{W}_{\text{sm}}$  is isomorphic to the relative identity component (20.3.2.3)  $\mathcal{N}_0$  of the Néron model of  $E$ .  $\square$

*Proof:* Cf. [Liu Qing, Thm. 9.4.35]  $\square$

**Def. (21.3.4.9) [Reduction Types].** For  $E \in \text{EllCur}/K$ ,

- $E$  has good reduction iff  $(\mathcal{N}_0)_\kappa \in \text{EllCur}/\kappa$  (21.3.4.8).
- $E$  has semistable reduction (21.1.2.5) iff  $(\mathcal{N}_0)_{\kappa^{\text{sep}}} \cong \mathbb{G}_m$ . And it is called a **split multiplicative reduction** if  $(\mathcal{N}_0)_\kappa \cong \mathbb{G}_m$ , otherwise it is called a **non-split multiplicative reduction**.
- $E$  has bad reduction or **additive reduction** iff  $(\mathcal{N}_0)_\kappa \cong \mathbb{G}_a$ .

$\square$

*Proof:* These follow from (21.1.2.5) (21.3.1.17) and the fact  $\mathcal{N}_0 \cong \mathcal{W}_{\text{sm}}$  for any minimal Weierstrass model for  $E$  (21.3.4.8).  $\square$

**Def. (21.3.4.10) [Reduction of Elliptic Curves].** Let  $E \in \text{EllCur}/K$  with Néron model  $\mathcal{N}/\mathcal{O}_K$  (20.3.4.1), then  $\mathcal{N}(\mathcal{O}_K) = E(K)$ , and by infinitesimal lifting property of smoothness?, the reduction map  $r : \mathcal{N}(\mathcal{O}_K) \rightarrow \mathcal{N}_0(\kappa)$  is surjective. Define

$$E_0(K) = r^{-1}(\mathcal{N}_0(\kappa)) \text{ (21.3.4.8)}, \quad E_1(K) = \ker(r).$$

$E_1(K)$  is called the **kernel of the reduction**. In particular,

$$\mathcal{N}_0(\kappa) \cong E_0(K)/E_1(K).$$

$\square$

**Prop. (21.3.4.11) [Formal Group is the Kernel].** Let  $E \in \text{EllCur}/K$ , then with notations as in (21.3.2.1),

$$\widehat{E}(\mathfrak{m}) \rightarrow E_1(K) : z \mapsto [z, -1, w(z)]$$

is an isomorphism of groups.  $\square$

*Proof:* By (21.3.2.1),  $\omega(z) \in z^3 R[[z]]$ , and by the definition of  $w(z)$ ,  $[z, -1, w(z)] \in E_1(K)$ , and it is a group homomorphism by the definition of formal group law associated to  $E$ . It remains to prove that this map is surjective:

Clearly  $\mathbf{0}$  is in the image, suppose  $(x_0, y_0) \in E_1(K)$ , then  $v(x_0) < 0, v(y_0) < 0$ , thus by inspecting the Weierstrass equation,  $v(x_0) = -2r, v(y_0) = -3r$  for some  $r > 0 \in \mathbb{Z}$ . Then  $z_0 = x_0/y_0 \in \mathfrak{m}$ , and  $(x_0, y_0)$  is the image of  $z_0$ .  $\square$

**Prop. (21.3.4.12) [Characterizing Reductions].** Let  $E \in \text{EllCur}/K$  be given by a minimal Weierstrass equation (21.3.4.4)  $E : y^2 + a_1xy + a_3y = x^3 + a_2x^2 + a_4x + a_6$  over  $\mathcal{O}_K$ , then by (21.3.1.15),

- $\widetilde{E}$  is a good reduction iff  $\Delta \in \mathcal{O}_K^*$ .
- $\widetilde{E}$  is a semistable reduction iff  $\Delta \in \mathfrak{m}$  and  $c_4 \in \mathcal{O}_K^*$ .
- $\widetilde{E}$  is an additive reduction iff  $\Delta, c_4 \in \mathfrak{m}$ .

$\square$

**Prop. (21.3.4.13)[Characterizing Potentially Good Reduction].**  $E$  has potentially good reduction iff  $j(E) \in \mathcal{O}_K$ .

In particular, an elliptic curve with complex multiplication over  $K$  has potentially good reduction.

┘

*Proof:* If  $E_{\bar{k}}$  has good reduction, then  $j(E) = (c'_4)^3/\Delta' \in R'$ . Conversely, if  $j(E) \in R$ , use Legendre form or Deuring form (21.3.1.18)(21.3.1.19), the equation

$$j = 2^8 \frac{(\lambda^2 - \lambda + 1)^3}{\lambda^2(\lambda - 1)^2} \text{ or } j = \frac{\alpha^3(\alpha^3 - 24)^3}{\alpha^3 - 27}$$

implies  $\lambda \in \mathcal{O}_K^*$ ,  $\lambda(\lambda - 1) \in \mathcal{O}_K^*$  (or  $\alpha \in \mathcal{O}_K^*$ ,  $\alpha^3 - 27 \in \mathcal{O}_K^*$ ), so  $E_{\bar{k}}$  has good reduction.  $\square$

**Prop. (21.3.4.14) [Tamagawa Numbers].** Let  $E \in \text{EllCur}/K$  with a minimal model  $\mathcal{E}/\mathcal{O}_K$ , then  $c(E)$  equals the number of geo.integral components occuring with multiplicity 1 in  $\mathcal{E}_k$ .  $\square$

*Proof:* Cf.[Liu Qing, 10.2.24].  $\square$

**Prop. (21.3.4.15)[Tamagawa Numbers].** Let  $E \in \text{EllCur}/K$ . If  $E$  has split multiplicative reduction over  $K$ , then  $E(K)/E_0(K)$  is a cyclic group of order  $v(\Delta) = -v(j)$ . And in other cases, the group is finite and has order at most 4.  $\square$

*Proof:*  $\square$

**Cor. (21.3.4.16).** If  $K \in p\text{-Field}$  and  $E \in \text{EllCur}/K$ , then  $E(K)$  contains a subgroup of finite index that is isomorphic to  $\mathcal{O}_K$ .  $\square$

*Proof:* Because  $E(K)/E_0(K)$  and  $E_0(K)/E_1(K) \cong \tilde{E}_{ns}(k)$  are all finite by (21.3.4.15), it suffices to prove that  $E_1(K) \cong \hat{E}(\mathfrak{m})$  has a subgroup of finite index that is isomorphic to  $\mathcal{O}_K$ . But this follows from the fact  $\hat{E}(\mathfrak{m}^r) \cong \mathfrak{m}^r$  for  $r$  large (10.7.4.21).  $\square$

### Tate Algorithm

References are [Sil99].

**Notation (21.3.4.17).**

- Suppose  $\kappa$  is perfect.

┘

**Thm. (21.3.4.18)[Kodaira-Néron].** Suppose  $\kappa = \bar{k}$  and  $E \in \text{EllCur}/K$  with a minimal proper regular model  $\mathcal{E}/\mathcal{O}_K$  (20.3.7.4), then  $\mathcal{C}_\kappa$  is isomorphic to one of the following:

- (Type  $I_0$ ) An elliptic curve.
- (Type  $I_1$ ) A rational curve with a node.
- (Type  $I_n, n \geq 2$ )  $n$  smooth rational curves intersecting transversally at a single point one-by-one in the shape of a  $n$ -gon.
- (Type II) A rational curve with a cusp.
- (Type III) Two non-singular rational curves which intersects tangentially at a single point.
- (Type  $I_0^*$ ) A non-singular rational curve of multiplicity 2 with 4 non-singular rational curves of multiplicity 1 attached.

- (Type  $I_n^*$ ) A chain of  $n + 1$  non-singular rational curves of multiplicity 2, with two non-singular curves of multiplicity 1 attached at each end.
- (Type  $IV^*$ ) ?
- (Type  $III^*$ ) ?
- (Type  $II^*$ ) ?

┘

*Proof:* Cf. [Sil99] P354.

□

Figure (21.3.4.1): Kodaira Types

**Prop. (21.3.4.19) [Tate Algorithm].** There is an algorithm that determines if a Weierstrass equation for  $E$  is minimal. ?

┘

### Torsion Points

**Prop. (21.3.4.20) [Controlling Torsion Points].** Let  $m \in \mathbb{Z} \cap k^\times$ , then

- $E_1(K)[m] = O$
- The reduction map  $E_0(K)[m] \rightarrow \tilde{E}_{\text{sm}}(k)[m]$  is injective.
- If  $E$  has good reduction and  $K = K^{\text{sep}}$ , then it is also an isomorphism.

┘

*Proof:* 1: By (21.3.4.11),  $E_1(K)[m] \cong \hat{E}(\mathfrak{m})[m]$ , which has only one element because  $[m]_{\hat{E}}$  is an isomorphism (10.7.3.5).

2 follows from 1 and the exact sequence in (21.3.4.10).

3 follows as they have the same cardinality.

□

**Prop. (21.3.4.21) [Controlling Torsion Points].** Let  $\text{char } K = 0$  and  $\text{char } k = p > 0$ , let  $E$  be given by a Weierstrass equation

$$E : y^2 + a_1xy + a_3y = x^3 + a_2x^2 + a_4x + a_6 \in R[X, Y].$$

Let  $P = (x_0, y_0) \in E(K)$  be a torsion point of exact order  $m$ , then

- If  $m$  is not a  $p$ -power, then  $x_0, y_0 \in R$ .
- If  $m = p^n$ , then  $v(x) \geq -2 \lfloor \frac{v(p)}{p^n - p^{n-1}} \rfloor$ ,  $v(y) \geq -3 \lfloor \frac{v(p)}{p^n - p^{n-1}} \rfloor$ .

┘

*Proof:* Change the Weierstrass equation to a minimal Weierstrass equation, then by (21.3.4.4), the coordinates in the new equation satisfies  $v(x') \leq v(x_0), v(y') \leq v(y_0)$ , thus it suffices to prove for minimal Weierstrass equations.

If  $v(x_0) \geq 0$ , then  $v(y_0) \geq 0$ . Suppose  $v(x_0) < 0$ , then  $v(y_0) < 0$ , and  $v(x_0) = -2r, v(y_0) = -3r$  for some  $r > 0$ . thus  $P \in E_1(K)$  and thus corresponds to  $z \in \hat{E}(\mathfrak{m})$  (21.3.4.11). Then the theorem follows from (10.7.4.20). □

### Over Dedekind Domains

**Def. (21.3.4.22) [Canonical Heights].** For  $F \in \mathbf{NField}$  and  $E \in \mathbf{EllCur}/F$ , by (20.9.10.5) and (20.9.4.12),  $\hat{h}_{\mathcal{L}}$  only depends on  $\deg(\mathcal{L})$ . And by (7.13.2.20), any degree 1 line bundle is ample, and the Néron-Tate bilinear form  $\langle \cdot, \cdot \rangle_{\mathbf{N-T}}$  given by this line bundle is called the **canonical height pairing** of  $E$ . It is a positive-definite quadratic form on  $E(\overline{K}) \otimes \mathbb{R}$  by (21.1.3.4). And for  $P \in E(\overline{K})$ ,  $\langle P, P \rangle_{\mathbf{N-T}}$  is called the **canonical height** of  $P$ .

In particular we can take the line bundle  $\mathcal{O}(O)$ , then  $\langle O, O \rangle_{\mathbf{N-T}} = 0$ , and for any  $P \neq 0$  in  $\mathcal{L}(O)$ ,

$$\langle P, P \rangle_{\mathbf{N-T}} = \lim_{n \rightarrow \infty} h(x([2^n]P))/4^N.$$

┘

*Proof:* For the final assertion, apply (20.2.1.25) to the morphism  $\varphi : E \rightarrow \mathbb{P}^1$  associated to the rational function  $x$ :

$$\langle P, P \rangle_{\mathbf{N-T}} = \lim_{n \rightarrow \infty} \hat{h}_{\mathcal{O}(2O)}([2^n]P)/4^N = \lim_{n \rightarrow \infty} h_{\mathcal{O}_{\mathbb{P}^1}(1)}(\varphi([2^n]P))/4^N = \lim_{n \rightarrow \infty} h(x([2^n]P))/4^N.$$

□

**Prop. (21.3.4.23) [Elliptic Regulators].** Let  $F$  be a number field and  $E \in \mathbf{EllCur}/F$ , then the **elliptic regulator** is the volume of a fundamental domain of  $E(K)/E(K)_{\text{tor}}$  computed using the canonical height. In particular, it is the discriminant of  $(\langle X_i, X_j \rangle_{E,F})_{i,j}$  where  $\{X_i\}$  is a basis for  $E(K)/E(K)_{\text{tor}}$ .

┘

**Def. (21.3.4.24) [Minimal Discriminants].** For  $F \in \mathbf{GField}$  and  $E \in \mathbf{EllCur}/F$ , define the **minimal discriminant**  $\Delta_{E/F}^{\min}$  to be  $\Delta_{E/F}^{\min} = \prod_{v \in \Sigma_F^{\text{fin}}} \mathfrak{p}_v^{\text{ord}(\Delta_v^{\min})}$ , where  $\Delta_v^{\min}$  is the discriminant of a minimal Weierstrass equation for  $E_v$ .

Then for any Weierstrass equation  $W$  for  $E$ , by (21.3.1.14),  $\mathfrak{D}_{E/F} = \Delta_{E/F}^{\min} (\mathfrak{a}_W)^{12}$  for some ideal  $\mathfrak{a}$  of  $F$ , and the ideal class of  $\mathfrak{a}_{\Delta}$  is stable under change of Weierstrass equations, called the **Weierstrass class** of  $E$ , denoted by  $\overline{\mathfrak{a}}_{E/F}$ .

┘

**Def. (21.3.4.25) [Unstable Minimal Discriminants].** For  $F \in \mathbf{GField}$  and  $E \in \mathbf{EllCur}/F$ , suppose  $(j_E) = \mathfrak{a}\mathfrak{b}^{-1}$  where  $\mathfrak{a}, \mathfrak{b} \in \text{Ideal}^*(\mathcal{O}_F)$  are relatively prime, then the **unstable minimal discriminant** of  $E$  is defined to be

$$\Upsilon_{E/F} = \Delta_{E/F}^{\min} \cdot \mathfrak{b}^{-1}.$$

Then

- $\Upsilon_{E/F} \in \text{Ideal}^*(\mathcal{O}_F)$ .
- For  $v \in \Sigma_F^{\text{fin}}$ ,  $v(\Upsilon_{E/F}) = 0$  iff  $E$  has good or semistable reduction at  $v$ .
- $v \in \Sigma_F^{\text{fin}}$ ,  $v(\Upsilon_{E/F}) < 12 + 12v(2) + 6v(3)$ .

┘

*Proof:* 1, 2: These follow from the fact  $j(E) = c_4^3/\Delta$  (21.3.1.5) and (21.3.4.12).

3: For any minimal Weierstrass equation, maybe it follows from the change of variable formula (21.3.1.14)?

□

**Prop. (21.3.4.26) [A Curve Related to Fermat's Last Theorem].** Let  $a, b, c \in \mathbb{Z}^{\times}$  satisfy  $(a, b, c) = 1$ , let  $E$  be the elliptic curve defined by the Weierstrass equation

$$E : y^2 = x(x + a)(x - b),$$

then

- the minimal discriminant (21.3.4.24)  $\Delta_{E/K}^{\min}$  of  $E$  is either  $2^4|abc|^2$  or  $2^{-8}|abc|^2$ .
- $E$  has semistable reduction for any odd prime.

┘

*Proof:* By calculation

$$\begin{aligned} \mathfrak{D}_W &= 2^4(abc)^2, \quad c_4 = 2^4(a^2 + ab + b^2), \quad c_6 = -2^5(2a^3 + 3a^2b + 3ab^2 + 2b^3), \\ (22a^2 - 8ab - 8b^2)c_4 + (a + 2b)c_6 &= 288a^2, \quad -(8a^2 + 8ab - 22b^2)c_4 - (2a + b)c_6 = 288b^2. \end{aligned}$$

1: Any change of variable of  $E$  to the minimal Weierstrass equation satisfies  $u^4|c_4, u^6|c_6$ , so

$$u^4|(288a^2, 288b^2)$$

so  $u = 1$  or  $2$ , and  $\Delta_E^{\min} = u^{-12}\mathfrak{D}_W = 2^4|abc|^2$  or  $2^{-8}|abc|^2$ .

2: If  $p \in S(\Delta_E^{\min}) \setminus \{2\}$ , then  $p$  divides  $a$  or  $b$  or  $c$ . In each case,  $p \nmid c$ , so  $E$  has multiplicative reduction at these  $p$  (21.3.4.12).  $\square$

**Prop. (21.3.4.27) [Global Minimal Weierstrass Equation].** For  $F \in \mathbf{NField}$  and  $E \in \mathbf{EllCur}/F$ ,  $E$  has a global minimal Weierstrass equation if its Weierstrass class is trivial.

In particular, if  $\text{cl}(F) = 1$ , e.g.  $F = \mathbb{Q}$ , then any  $E \in \mathbf{EllCur}/F$  has a global minimal Weierstrass equation.  $\square$

*Proof:* Choose any Weierstrass equation for  $E$  over  $K$ , let

$$x = u_v^2x + r_v, \quad y = u_v^3y + s_vu_v^2x + t_v, \quad \text{where } u_v, r_v, s_v, t_v \in \mathcal{O}_{K_v}$$

be the local change of variable to get the minimal Weierstrass equation at place  $v$ , then by hypothesis,  $(u_v)_v$  is principal, which means there is some  $u \in K$  s.t.  $v(u) = v(u_v)$  for any  $v$ . Then choose by Chinese remainder theorem  $r, s, t \in \mathcal{O}_K$  that is closed to  $r_v, s_v, t_v$  for each relevant  $v$ , then the change of variables

$$x = u^2x + r, \quad y = u^3y + su^2x + t$$

changes the coordinates to a minimal Weierstrass equation.  $\square$

**Cor. (21.3.4.28).** Let  $F \in \mathbf{GField}$  with  $6 \nmid \text{cl}(F)$  and  $E \in \mathbf{EllCur}/F$  with everywhere good reduction, then  $E$  has a minimal model.  $\square$

*Proof:* Because in this case the Weierstrass class  $\mathfrak{a}_\Delta$  is a 12-torsion in  $\text{Cl}(F)$ , which implies it is trivial.  $\square$

**Cor. (21.3.4.29).** If  $F \in \mathbf{NField}$  and  $S$  is a finite set of places of  $K$  s.t.  $\text{Cl}(\mathcal{O}_{F,S}) = 1$ , then any elliptic curve over  $F$  has a minimal Weierstrass equation of the form  $W : y^2 = x^3 + Ax + B$  with  $A, B \in \mathcal{O}_{K,S}$  satisfying  $\mathfrak{D}_W\mathcal{O}_{F,S} = \Delta_{E/F}^{\min}\mathcal{O}_{F,S}$ .  $\square$

*Proof:* The proof is easier than that (21.3.4.27).  $\square$

**Prop. (21.3.4.30).** If  $F \in \mathbf{NField}$  with  $\text{Cl}(F) \neq 1$ , then there exists  $E \in \mathbf{EllCur}/F$  with no global minimal Weierstrass equations.  $\square$

*Proof:* Cf. [Weierstrass equations and the minimal discriminant of an elliptic curve", Mathematika 31 (1984), no. 2, 245–251].  $\square$

**Prop. (21.3.4.31) [Density of Global Minimal Models].**  $\square$

*Proof:* Cf. [The density of elliptic curves having a global minimal Weierstrass equation", J. Number Theory 109 (2004), no. 1, 41–58.].  $\square$

## 5 Tate Curve

**Def. (21.3.5.1).** Define formal power series

$$\begin{aligned} s_k(q) &= \sum_{n \geq 1} \sigma_k(n) q^n = \sum_{n \geq 1} \frac{n^k q^n}{1 - q^n} \in \mathbb{Z}[[q]], \\ a_4(q) &= -5s_3(q), \quad a_6(q) = -\frac{5s_3(q) + 7s_5(q)}{12} \in \mathbb{Z}[[q]], \\ X(u, q) &= \sum_{n \in \mathbb{Z}} \frac{q^n u}{(1 - q^n u)^2} - 2s_1(q), \quad Y(u, q) = \sum_{n \in \mathbb{Z}} \frac{(q^n u)^2}{(1 - q^n u)^3} + s_1(q) \in \mathbb{Z}[u][[q]]. \end{aligned}$$

┘

**Prop. (21.3.5.2).**

$$\begin{aligned} s_1(q) &= \sum_{n \geq 1} \frac{q^n}{(1 - q^n)^2} \in \mathbb{Z}[[q]], \\ X(u, q) &= \frac{u}{(1 - u)^2} + \sum_{n \geq 1} \left[ \frac{q^n u}{(1 - q^n u)^2} + \frac{q^n u^{-1}}{(1 - q^n u^{-1})^2} - \frac{2q^n}{(1 - q^n)^2} \right] \in \mathbb{Z}[u][[q]], \\ Y(u, q) &= \frac{u^2}{(1 - u)^3} + \sum_{n \geq 1} \left[ \frac{(q^n u)^2}{(1 - q^n u)^3} + \frac{q^n u^{-1}}{(1 - q^n u^{-1})^3} + \frac{q^n}{(1 - q^n)^2} \right] \in \mathbb{Z}[u][[q]], \end{aligned}$$

Thus

$$X(qu, q) = X(u, q) = X(u^{-1}, q), \quad Y(qu, q) = Y(u, q) \in \mathbb{Z}[u, u^{-1}][[q]].$$

┘

*Proof:* The first one follows from (10.7.2.2). □

**Prop. (21.3.5.3) [Relation to Weierstrass  $\wp$ -Functions].** Let  $\wp(z; \tau)$  be the Weierstrass  $\wp$ -function associated to the lattice  $\Lambda_z = \text{span}\{1, \tau\}$  (12.5.6.5), then  $X(e^{2\pi iz}, q(\tau))$ ,  $Y(e^{2\pi iz}, q(\tau))$  converges and uniformly and absolutely on  $\mathbb{C} \setminus \Lambda_z$  in  $\mathbb{C}$  to holomorphic functions, and

$$\frac{1}{(2\pi i)^2} \wp(z; \tau) = X(e^{2\pi iz}, q(\tau)) + \frac{1}{12}, \quad \frac{1}{(2\pi i)^3} \wp'(z; \tau) = X(e^{2\pi iz}, q(\tau)) + 2Y(e^{2\pi iz}, q(\tau)).$$

┘

*Proof:* The convergence of  $X, Y$  is clear. By (21.3.5.1),  $X(e^{2\pi iz}, q(\tau))$  is  $\{1, \tau\}$ -doubly periodic, and clearly it has a double pole at the origin. Also the Laurent part of  $X(e^{2\pi iz}, q(\tau))$  at  $z = 0$  is the Laurent part of  $\frac{e^{2\pi iz}}{(1 - e^{2\pi iz})^2}$ , which is  $\frac{1}{(2\pi i)^2 z^2} - \frac{1}{12}$ . Then by comparison with that of  $\wp(z; \tau)$  (12.5.6.6) and use Liouville's theorem.

The second identity follows from applying  $\frac{\partial}{\partial z}$ . □

**Prop. (21.3.5.4) [Formal Identities].** There are identities

1.

$$-a_6(q) + a_4^2(q) + 72a_4a_6 - 64a_4^3 - 432a_6^3 = \Delta(q) \in \mathbb{Z}[[q]].$$

2.

$$Y(u^{-1}, q) = -Y(u, q) - X(u, q) \in \mathbb{Z}[u, u^{-1}][[q]].$$

3.

$$Y(u, q)^2 + X(u, q)Y(u, q) = X(u, q)^3 + a_4(q)X(u, q) + a_6(q) \in \mathbb{Z}[u][[q]].$$

4.

$$(X(u_2, q) - X(u_1, q))^2 X(u_1 u_2, q) = (Y(u_2, q) - Y(u_1, q))^2 + (Y(u_2, q) - Y(u_1, q))(X(u_2, q) - X(u_1, q)) \\ - (X(u_2, q) - X(u_1, q))^2 (X(u_2, q) + X(u_1, q))$$

$$(X(u_2, q) - X(u_1, q))Y(u_1 u_2, q) = -[(Y(u_2, q) - Y(u_1, q)) + (X(u_2, q) - X(u_1, q))]X(u_1 u_2, q) \\ - (Y(u_1, q)X(u_2, q) - Y(u_2, q)X(u_1, q))$$

┘

*Proof:* Verify these in the complex analytic case. **?**

3: By (12.5.6.7) and (21.3.5.3)(26.3.4.5),

$$\wp'(z)^2 = 4\wp(z)^3 - g_2\wp(z)^2 - g_3\wp(z)$$

implies the desired equation.

□

**Cor. (21.3.5.5) [Tate Curve].** Notation as in (21.3.5.1),  $\text{Tate}(q) : y^2 + xy = x^3 + a_4(q)x + a_6(q)$  is an elliptic scheme over  $\mathbb{Z}[[q]]$ , called the **Tate curve**. The discriminant and  $j$ -invariant of  $\text{Tate}(q)$  is given by

$$\Delta(\text{Tate}(q)) = \Delta(q) : q \prod_{n \geq 1} (1 - q^n)^{24} \text{ (26.3.4.20)}, \quad j(\text{Tate}(q)) = j(q) \text{ (26.3.4.22)}.$$

And it has the normalized differential form  $\omega = dx/(2y + x)$ . Also denote  $\omega_{\text{can}} = 2\pi i \omega$ .

┘

**Prop. (21.3.5.6) [N-Torsion Points].** It can be shown formally from (21.3.5.10) that

$$\text{Tate}(q^N)[N] = \{(X(\zeta_N^i q^j, q^N), Y(\zeta_N^i q^j, q^N))\} \text{ **?**},$$

which are all defined over  $\mathbb{Z}[[q]][\frac{1}{N}, \zeta_N]$ . In particular, all the level  $N$  structures of  $\text{Tate}(q^N)$  are defined over  $\mathbb{Z}[[q]][\frac{1}{N}, \zeta_N]$ .

┘

*Proof:*

□

**Prop. (21.3.5.7) [Tate Curve over  $\mathbb{C}$ ].** Notation as in (21.3.5.1), then for  $q \in \mathbb{C}, 0 < |q| < 1$ ,

- $E_q : y^2 + xy = x^3 + a_4(q)x + a_6(q)$  is an elliptic curve over  $\mathbb{C}$ , and

$$\varphi : \mathbb{C}^\times / q^{\mathbb{Z}} \rightarrow E_q^{\text{an}} : u \mapsto [X(u, q), Y(u, q), 1]$$

is a complex analytic isomorphism.

- The discriminant of  $E_q$  is given by

$$\Delta(E_q) = \Delta(q) : q \prod_{n \geq 1} (1 - q^n)^{24} \text{ (26.3.4.20)}, \quad j(E_q) = j(q) \text{ (26.3.4.22)}$$

- For any elliptic curve  $E/\mathbb{C}$ , there exists a  $q \in \mathbb{C}^*$ ,  $|q| < 1$  s.t.  $E$  is isomorphic to  $E_q$ .

┘

*Proof:* Cf. [Sil99]P410.?

□

**Prop. (21.3.5.8) [Tate Curve over  $\mathbb{R}$ ].** For  $E \in \text{EllCur}/\mathbb{R}$ , there exists a unique  $q \in \mathbb{R}$ ,  $0 < |q| < 1$  s.t.

- $E$  is isomorphic to  $E_q : y^2 + xy = x^3 + a_4(q)x + a_6(q)$  over  $\mathbb{R}$ .
- the isomorphism composed with

$$\varphi : \mathbb{C}^*/q^{\mathbb{Z}} \cong E_q^{\text{an}} : u \mapsto (X(u, q), Y(u, q))$$

as in (21.3.5.10) induces an isomorphism of complex Lie groups  $\psi : \mathbb{C}^*/q^{\mathbb{Z}} \rightarrow E_{\mathbb{C}}^{\text{an}}$  that commutes with complex conjugation. In particular,  $\psi$  induces an isomorphism of real Lie groups

$$\psi : \mathbb{R}^*/q^{\mathbb{Z}} \cong E_{\mathbb{R}}^{\text{an}}.$$

┘

*Proof:* 1: By (20.9.8.15) and (20.9.8.16), there are exactly on  $\tau \in \mathcal{C}' = \{it|t \geq 1\} \cup \{1/2 + it|t > 1/2\}$  s.t.  $j(\tau) = j(E) \in \mathbb{R}$ , and

$$\mathcal{J} = \{it|t > 0\} \cup \{1/2 + it|t > 0\}.$$

corresponds to  $q \in \mathbb{R}$ ,  $0 < |q| < 1$  via  $\tau \mapsto q = e^{2\pi i \tau}$ . Also there are identifications

$$\begin{bmatrix} 1 & -1 \\ 1 & \end{bmatrix} \{it|t > 1\} = \{it|t < 1\}, \quad \begin{bmatrix} 1 & -1 \\ 2 & -1 \end{bmatrix} \{1/2 + it|t > 1/2\} = \{1/2 + it|t < 1/2\}, \quad \begin{bmatrix} 1 & -1 \\ 1 & -1 \end{bmatrix} (i) = \frac{1}{2} + \frac{i}{2},$$

thus it suffices to show that for any two  $q, q' \in \mathcal{J}$  with  $q \neq q'$ ,  $E_q \not\cong E_{q'}$ . It suffices to show for the twists, where we can use (21.3.6.3) to show that their  $c_4, c_6$  changed sign, so they are not isomorphic over  $\mathbb{R}$ .

2: This follows from (21.3.5.10).

□

**Cor. (21.3.5.9) [Connected Components].** Let  $E \in \text{EllCur}/\mathbb{R}$ , then

$$E(\mathbb{R}) \cong \begin{cases} \mathbb{R}/\mathbb{Z} & \Delta(E) < 0 \\ \mathbb{R}/\mathbb{Z} \times \mathbb{Z}/(2) & \Delta(E) > 0 \end{cases}$$

as real Lie groups.

┘

*Proof:* Notice  $\text{sgn}(\Delta) = \text{sgn}(q)$  by (21.3.5.10). The  $q > 0$  case is clear. For  $q < 0$ , notice there is an isogeny  $E_{q^2} \rightarrow E_q$  with kernel  $q$ , so  $E_{\mathbb{R}}^{\text{an}} \cong [\mathbb{R}/\mathbb{Z} \times \mathbb{Z}/(2)]/(1/2, -1) \cong \mathbb{R}/\mathbb{Z}$ .

□

**Prop. (21.3.5.10) [over Complete Valued Fields].** Notation as in (21.3.5.1), let  $K$  be a complete non-Archimedean valued field, then for  $q \in K$ ,  $0 < |q| < 1$ ,

- $E_q : y^2 + xy = x^3 + a_4(q)x + a_6(q) \in \text{EllCur}/K$ . The discriminant of  $E_q$  is given by

$$\Delta(E_q) = \Delta(q) : q \prod_{n \geq 1} (1 - q^n)^{24} \quad (26.3.4.20), \quad j(E_q) = j(q) \quad (26.3.4.22)$$

•

$$\varphi : \overline{K}^\times \rightarrow E_q(\overline{K}) : u \mapsto [X(u, q), Y(u, q), 1]$$

is a continuous surjective homomorphism with kernel  $q^\mathbb{Z}$ , and it is  $\text{Gal}_K$ -invariant, thus for any  $K \subset L \subset \overline{K}$  inducing a continuous surjective homomorphism

$$\varphi : L^\times \rightarrow E_q(L)$$

with kernel  $q^\mathbb{Z}$ .

┘

*Proof:* 1: This follows from (21.3.5.5) by base change.

2: Clearly  $X(u, q), Y(u, q)$  converges for any  $u \in K^\times / q^\mathbb{Z}$ , and by (21.3.5.1) it suffices to consider the case  $|q| < |u| < |q|^{-1}$ . In this case, the formal power series for  $X(u, q), Y(u, q)$  are convergent in the complete field  $K(u)$ , and it follows from (21.3.5.4) that  $\varphi(\overline{K}^*) \in E$ . It is clearly continuous for  $u \neq 1$ , and if  $u$  converges to 1,  $X(u, q)/Y(u, q) \rightarrow 0$  by the expansion in (21.3.5.4), so  $\varphi(1) = O$ .

To show  $\varphi$  is a homomorphism, it suffices to verify for  $1 < |u_1| < |q|^{-1}, |q| < |u_2| < 1$  that  $\varphi(u_1) + \varphi(u_2) = \varphi(u_1 u_2)$ . Notice by the argument above,  $\varphi(u) = O$  iff  $u = 1$ . If  $u_1 = 1$  or  $u_2 = 1$ , then  $\varphi(u_1) + \varphi(u_2) = \varphi(u_1 u_2)$  is clear, and if  $u_1 u_2 = 1$ , then  $\varphi(u_1) + \varphi(u_2) = O$  by the identities in (21.3.5.4) and (21.3.1.9). When  $u_1 \neq 1, u_2 \neq 1, u_1 u_2 \neq 1$ ,  $\varphi(u_1) \neq \varphi(u_2)$ ,  $\varphi(u_1) + \varphi(u_2)$  are determined by polynomial equations with coordinates of  $\varphi(u_1), \varphi(u_2)$ , and we can show this equation holds for  $\varphi(u_1 u_2)$  because it holds in the complex case (21.3.5.10). For the case  $\varphi(u_1) = \varphi(u_2)$ , notice that  $\text{Im}(\varphi)$  is infinite, as for  $|t| < 1$ ,  $|X(1+t)| = |t|^{-2}$  by the formula in (21.3.5.4). Now this case follows from (3.1.2.14).

Next, we show  $\varphi : L^\times \rightarrow E_q(L)$  is surjective. As  $K$  is arbitrary, we may assume  $L = K$ . For this, Cf. [Tate, a review of non-Archimedean Elliptic Functions] ?

□

**Cor. (21.3.5.11).**  $\text{Tate}(q)(\mathbb{Q}((q))) \cong \mathbb{Q}((q))^\times / q^\mathbb{Z}$ .

┘

**Lemma (21.3.5.12).** Let  $\alpha \in K$  with  $|\alpha| > 1$ , then there exists a unique  $q \in K$  s.t.  $|q| < 1$  s.t.  $j(q) = \alpha$ . Moreover,  $q \in \mathbb{Z}[[\frac{1}{\alpha}]]$ .

┘

*Proof:* Let  $f(q) = j(q)^{-1} \in q + q^2 \mathbb{Z}[[q]]$ , thus by (10.7.1.3) there exists a  $g \in q\mathbb{Z}[[q]]$  s.t.  $f(g(q)) = q = g(f(q))$ . So if  $f(q) = \frac{1}{\alpha}$ , then  $q = f(\frac{1}{\alpha})$ . And this  $q$  do satisfies  $j(q) = \alpha$ .

□

**Thm. (21.3.5.13) [p-Adic Uniformization, Tate].** Let  $K$  be a complete valued field,  $E \in \text{EllCur}/K$  with  $|j(E)| > 1$ , then

- There exists a unique  $q \in K$  s.t.  $E_{\overline{K}} \cong (E_q)_{\overline{K}}$ .
- For this  $q$ , the following are equivalent:
  - $E \cong E_q$ .
  - $\gamma(E) = 1$  (21.3.6.3).
  - $E$  has split multiplicative reduction.

┘

*Proof:* 1 follows from (21.3.5.12) and (21.3.1.15).

2: Firstly  $\gamma(E_q) = 1$ , because

$$c_4(E_q) = 1 - 48a_4(q) = 1 + 240s_3(q), \quad -c_6(E_q) = 1 - 72a_4(q) - 864a_6(q) = 1 - 504s_5(q)$$

are all of the form  $1 + 4\alpha$ ,  $|\alpha| < 1$ , thus they are both squares in  $K^\times$ , as  $1 + 4\alpha = [(1 + 4\alpha)^{1/2}]^2$ ??

Next,  $|a_4(q)|, |a_6(q)| \leq 1$ , so  $\tilde{E}_q : y^2 + xy = x^3$  has split multiplicative reduction. Then  $1 \iff 2$  by (21.3.6.3), and to show  $1 \iff 3$ , it suffices to show that if  $E$  has split multiplicative reduction, then  $\gamma(E) = 1$ : Let the valuation ring of  $K$  be  $R$  with maximal ideal  $\mathfrak{m}$  and residue field  $k$ . Let  $y^2 + a_1xy + a_3 = x^3 + a_2x^2 + a_4x + a_6$  be a minimal polynomial. We may assume the singular point is  $(0, 0) \in \tilde{E}(k)$ , then  $a_3 \equiv a_4 \equiv a_6 \equiv 0 \pmod{\mathfrak{m}}$ , thus  $b_4 = a_1a_3 + 2a_4 \equiv 0 \pmod{\mathfrak{m}}$ , and  $c_4 = b_2^2 - 2b_4 \equiv b_2^2 \pmod{\mathfrak{m}}$ . Thus  $b_2 \in R^*$ , and

$$\gamma(E) = -\frac{c_4}{c_6} = \frac{1}{b_2} \frac{1 - 24b_4/b_2^{-2}}{1 - 36b_4/b_2^2 + 216b_6/b_2^3} \pmod{(K^\times)^2}.$$

So by gain,  $\gamma(E) \equiv b_2 \pmod{(K^\times)^2}$ .

Because  $E$  has multiplicative split reduction,  $y^2 + \bar{a}_1xy - \bar{a}_2x^2 = (y - \bar{\alpha}x)(y - \bar{\beta}x) \in k$ ,  $\bar{\alpha} \neq \bar{\beta}$ . Thus by Henselian lifting,  $y^2 + a_1xy - a_2x^2 = (y - \alpha x)(y - \beta x) \in K$  for some  $\alpha, \beta$ , and  $b_2 = a_1^2 + 4a_2 = (\alpha - \beta)^2 \in (K^\times)^2$ .  $\square$

**Cor. (21.3.5.14).** If  $\gamma(E) \neq 1$ , let  $L = K(\sqrt{\gamma(E)})$ , then  $E_L \cong (E_q)_L$ , and

$$E(K) \cong \{u \in L^\times / q^\mathbb{Z} \mid \text{Nm}_{L/K}(u) \in \mathbb{Z}\}.$$

┘

*Proof:* Cf. [Sil99]P444.  $\square$

## 6 Twists of Elliptic Curves

Cf. [Sil16]Chap10.6.

**Prop. (21.3.6.1) [Twists of Elliptic Curves].** Because the category of smooth curves is an algebraic stack, for  $k \in \mathbf{Field}$  and  $C \in \mathbf{Cur}^{\text{sm}}/k$ , the set  $\text{Twist}(C/k)$  of twisted smooth curves of  $C$  is in bijection with  $H^1(k, \text{Isom}(C_{k^s}))$  by (7.1.5.2).

Also the category of elliptic curves (with the origin fixed) is an algebraic stack, thus the set  $\text{Twist}((E, O)/k)$  of twisted elliptic curves of an elliptic curve over  $k$  is in bijection with  $H^1(k, \underline{\text{Aut}}(E))$ .

┘

**Remark (21.3.6.2).** [Sil16]P318,342 has a direct proof, and can find the twist corresponding to a cocycle explicitly. ?  $\square$

**Prop. (21.3.6.3) [Twist((E, O)/k)].** Let  $k \in \mathbf{Field}$ ,  $\text{char } k \neq 2, 3$  and  $E \in \mathbf{EllCur}/k$ . Denote  $n = \# \text{Aut}(E_{\bar{k}})$ , then

- $\text{Twist}((E, O)/k)$  is canonically isomorphic to  $k^\times / (k^\times)^n$ .
- For  $E/k$  given by Weierstrass equation  $y^2 = x^3 + Ax + B$ , the twisted elliptic curve of  $E$  corresponding to  $D \pmod{(K^\times)^n}$  has the Weierstrass equation

$$E^{(D)} : \begin{cases} y^2 = x^3 + D^2Ax + D^3B, & j(E) \neq 0, 1728 \\ y^2 = x^3 + DAx, & j(E) = 1728 \\ y^2 = x^3 + DB, & j(E) = 0 \end{cases}.$$

- In case  $j(E) \neq 0, 1728$ ,  $n = 2$ , define  $\gamma(E) = -c_4/c_6 \in \mathbb{K}^\times/(\mathbb{K}^\times)^2$  (which equals  $A/B$  in the short form), then for  $E, E' \in \mathbf{EllCur}/k$  with  $j(E), j(E') \neq 0, 1728$ ,

$$E \cong E' \iff j(E) = j(E') \text{ \& } \gamma(E) = \gamma(E').$$

┘

*Proof:* This is because the Kummer sequence and (21.3.1.20) implies  $H^1(k, \underline{\mathrm{Aut}}(E)) \cong H^1(k, \mu_n) = k^\times/(k^\times)^n$ . For the corresponding elliptic curve, Cf. [Sil16]P343. ? □

**Def. (21.3.6.4) [Weil-Châtelet Groups].** For  $k \in \mathbf{Field}$ ,  $E \in \mathbf{EllCur}/k$ , define the **Weil-Châtelet Group**  $\mathrm{WC}(E/k)$  to be the isomorphism classes of  $E$ -torsors on  $\mathrm{Sch}_{\mathrm{\acute{e}t}}/k$ .

There is a bijection of pointed sets  $\mathrm{WC}(E/k) \cong H^1(k, E)$ , by (7.3.2.18). So  $\mathrm{WC}(E/k) \subset \mathrm{Twist}(E/k)$  (21.3.6.1). ┘

**Prop. (21.3.6.5).** If  $k \in \mathbf{Field}$ ,  $E \in \mathbf{EllCur}/k$  and  $C \in \mathrm{WC}(E/k)$ , then  $\mathrm{Jac}(C) \cong E$ . ┘

*Proof:* Because  $C$  is a smooth curve, let  $p \in C$  be a geometric point, and take the line bundle  $\mu^* \mathcal{L}(p) - \mathrm{pr}_2^* \mathcal{L}(p) - \mathrm{pr}_1^* \mathcal{L}(O)$ , where  $\mu : E \times C \rightarrow C$  is the action. Then after a base change to  $k(p)$ , this map corresponds to the canonical isomorphism  $E \cong E^\vee$  (21.3.1.21), thus it is also an isomorphism because  $\mathrm{Sch}_X$  is a prestack over  $\mathrm{Sch}_{\mathrm{fpqc}}$ . □

**Prop. (21.3.6.6).** Let  $E \in \mathbf{EllCur}/\mathbb{R}$ , then

$$\mathrm{WC}(E/\mathbb{R}) \cong \begin{cases} 0 & \Delta(E) > 0 \\ \mathbb{Z}/(2) & \Delta(E) < 0 \end{cases}.$$

┘

*Proof:* By (21.3.6.4) and (21.3.5.8), the Galois cohomology of the exact sequence  $1 \rightarrow q^\mathbb{Z} \rightarrow \mathbb{C}^\times \rightarrow E(\mathbb{C}) \rightarrow 1$  says

$$0 \rightarrow \mathrm{WC}(E/\mathbb{R}) \rightarrow H^2(\mathrm{Gal}(\mathbb{C}/\mathbb{R}), q^\mathbb{Z}) \rightarrow H^2(\mathrm{Gal}(\mathbb{C}/\mathbb{R}), \mathbb{C}^\times),$$

and  $H^2(\mathrm{Gal}(\mathbb{C}/\mathbb{R}), q^\mathbb{Z}) \cong q^\mathbb{Z}/q^{2\mathbb{Z}}$ ,  $H^2(\mathrm{Gal}(\mathbb{C}/\mathbb{R}), \mathbb{C}^\times) \cong \mathbb{R}^\times/(\mathbb{R}^\times)^2$  by (9.8.3.5)(9.8.1.21). So we are done by observing  $\mathrm{sgn}(\Delta) = \mathrm{sgn}(q)$  by (21.3.5.10). □

**Prop. (21.3.6.7) [Tate Duality on Weil-Châtelet Groups].** Let  $K \in p\text{-}\mathbf{LField}$  and  $E \in \mathbf{EllCur}(K)$ , then there is a perfect pairing of LCA groups

$$E(K) \times \mathrm{WC}(E/K) \rightarrow \mathbb{Q}/\mathbb{Z}.$$

┘

*Proof:* Cf. [Tate. WC-groups over p-adic fields] or [Sil99]Ex.10.24. ? □

**Prop. (21.3.6.8) [Rational Point of Genus 1 Curves].** Let  $E \in \mathbf{EllCur}/\mathbb{Q}$  and  $C \in \mathrm{WC}(E/\mathbb{Q})$ . Suppose the following holds:

- $C(\mathbb{Q}_\ell) \neq \emptyset$  for any  $\ell \in \mathbf{Prime}$ .
- Either  $E/\mathbb{Q}$  is semistable or  $\mathrm{rank}_{\mathrm{an}}(E/\mathbb{Q}) \leq 1$ .

Then  $C$  has a rational point over a solvable extension of  $\mathbb{Q}$ . ┘

*s Proof:* [Ciperiani-Wiles, Solvable points on genus one curves]. □

## 7 Integral Points

**Thm.(21.3.7.1) [Finiteness of Integral Points on Elliptic Curves, Siegel].** Let  $F \in \mathbf{NField}, \Sigma_F^\infty \subset_{\text{fin}} S \subset \Sigma_F$ , and  $C \in \mathbf{Cur}^{\text{sm}^{\text{Jprpr}}}/F$  with genus 1. Suppose  $f \in R(C) \setminus F$ , then

$$\#\{P \in C(F) : f(P) \in \mathcal{O}_{F,S}\} < \infty.$$

┘

*Proof:* WLOG, we can enlarge  $F$  and  $S$ . So we may assume that  $C(F)$  contains a pole  $Q$  of  $f$  and  $(C, Q)$  is thus an elliptic curve with a Weierstrass form  $y^2 = x^3 + Ax + B$ . So  $f$  can be written as

$$f(x, y) = \frac{\varphi(x) + \psi(x)y}{\eta(x)},$$

where  $\varphi(X), \psi(X), \eta(X) \in F[X]$ . So

$$(f\eta(x) - \varphi(x))^2 = (\psi(x)y)^2 = \psi(x)^2(x^3 + Ax + B).$$

Since  $\text{ord}_Q(x) = -2, \text{ord}_Q(y) = -3, \text{ord}_Q(f) < 0$ , it follows that  $2 \deg(\eta) < \max(2 \deg \varphi, 2 \deg \psi + 3)$ . So regarding the above equation as a equation of  $X$  with  $f$  being constant, then the highest term of  $x$  comes from either  $\psi(x)^2 x^3$  or  $\varphi(x)^2$ , thus it is non-vanishing.

So by enlarging  $S$ , we see that  $x$  is integral over  $\mathcal{O}_{F,S}[f]$ . So if  $P \in C(F)$  s.t.  $f(P) \in \mathcal{O}_{F,S}$ , then  $x$  is integral over  $\mathcal{O}_{F,S}$ , which means  $x \in \mathcal{O}_{F,S}$ .

So we are reduced to proving for  $f = x$ . And this follows from [\(21.6.4.15\)](#). □

## 21.4 Surfaces and Arithmetic Surfaces

References are [Sil99], [Liu Qing].

### Notation (21.4.0.1).

- In this section, let  $S \in \text{Sch}$  be a Dedekind scheme with generic point  $\eta$  or a spectrum of a field, and  $\eta = S$ .

┘

### 1 over Fields

References are [Liu Qing, Algebraic Geometry and Arithmetic Curves].

**Prop. (21.4.1.1) [27-Lines].** Any smooth cubic surface in  $\mathbb{P}_k^3$  contains exactly 27 lines.

┘

*Proof:*

□

**Prop. (21.4.1.2).** Any birational transformation of non-singular surfaces will be factorized into f.m blowing-ups and blowing-downs of points.

┘

*Proof:*

□

**Prop. (21.4.1.3).** Any smooth surface over a field  $k$  is projective.

┘

*Proof:* Cf.[Badescu, Algebraic Surfaces]Thm1.28.

□

**Prop. (21.4.1.4) [Non-Projective Smooth Proper Threefold].** Cf.[Vak17]P671.

┘

*Proof:*

□

### Resolution of Surfaces

Cf.[Sta]Chap51.

### Regular Surfaces

### 2 Fibered Presurfaces

**Def. (21.4.2.1) [fibered presurfaces].** Let  $S \in \text{Sch}$  be Dedekind, a **fibered presurface** over  $S$  is proper **?** flat  $S$ -scheme integral of dimension 2.

┘

**Prop. (21.4.2.2).** Let  $S \in \text{Sch}$  be Dedekind,  $X$  a fibered presurface over  $S$ , then  $X_s$  has dimension 1 for any  $s \in S$ , and  $X_\eta$  is a precurve.

┘

*Proof:* Cf.[Qing Liu]P348.

□

**Example (21.4.2.3).** Let  $q \in \mathbb{Z}_+$  be a square-free integer, then  $\mathcal{C} = \mathbf{Proj}(\mathbb{Z}[X, Y, Z]/(X^q + Y^q + Z^q))$  is a normal fibered presurface over  $\text{Spec } \mathbb{Z}$ .

┘

*Proof:* Cf.[Qing Liu]P455.

□

**Prop. (21.4.2.4) [Horizontal and Vertical Divisors].** Let  $S \in \text{Sch}$  be Dedekind,  $X$  a fibered presurface over  $S$ , then

- If  $x$  is a closed point of  $X_\eta$ , then  $\overline{\{x\}}$  is an integral closed subscheme of  $X$  that is finite surjective over  $S$ , called a **horizontal divisor**.
- If  $D \subset X$  is a prime Weil divisor, then  $D$  is either a horizontal divisor, or an integral component of a special fiber, called a **vertical divisor**.
- If  $x_0 \in X$  is closed, then  $\dim \mathcal{O}_{X, x_0} = 2$ .

Moreover, call a Weil divisor  $D$  on  $X$  horizontal or vertical if it consists of horizontal or vertical prime divisors.  $\lrcorner$

*Proof:* Cf.[Qing Liu]P349.  $\square$

**Prop. (21.4.2.5) [Generically Smoothness].** Let  $S \in \text{Sch}$  be Dedekind and  $\pi : X \rightarrow S$  be a fibered presurface s.t.  $X_\eta$  is smooth, then there is a dense open subscheme  $V \subset S$  s.t.  $\pi^{-1}(V) \rightarrow V$  is smooth.  $\lrcorner$

*Proof:* Cf.[Qing Liu]P352.  $\square$

### Regular Fibered Presurfaces

**Prop. (21.4.2.6) [Regular Fibered Presurfaces are Projective].** Let  $S$  be affine and  $X/S$  be a flat morphism with fibers of dimension 1, then  $X/S$  is projective. In particular, a regular fibered presurface is projective.  $\lrcorner$

*Proof:* Cf.[Qing Liu]P353.  $\square$

**Prop. (21.4.2.7) [Sections are Regular].** Let  $\pi : \mathcal{C} \rightarrow S$  be a regular fibered presurface and  $s \in S$ , then

- If  $s \in S$  is closed and  $x \in \mathcal{C}_s$  is closed, then  $\mathcal{C}_s$  is regular at  $x$  iff  $\pi^\#(\mathfrak{p}_s) \not\subset \mathfrak{m}_x^2$ .
- If  $P : U \rightarrow \mathcal{C}$  is a rational section, then  $\mathcal{C}_P$  is smooth at  $P(s)$  for  $s \in U$ .  $\lrcorner$

*Proof:* 1: This is because  $\mathcal{O}_{\mathcal{C}_s, x} = \mathcal{O}_{\mathcal{C}, x} / \pi^\#(\mathfrak{p}_s)$ ,  $\mathfrak{m}_{\mathcal{C}_s, x} = \mathfrak{m}_{\mathcal{C}, x} / \pi^\#(\mathfrak{p}_s)$  and use the definition of regularity.

2: We show that  $\pi^\#(\mathfrak{p}_s) \not\subset \mathfrak{m}_x^2$ : Suppose otherwise, then

$$\mathfrak{p}_s = (\pi \circ P)^\#(\mathfrak{p}_s) \subset \pi^\#(\mathfrak{m}_x^2) = \mathfrak{p}^2,$$

which is impossible.  $\square$

**Cor. (21.4.2.8).** Let  $\mathcal{C}/S$  be a regular fibered presurface, then  $\mathcal{C}(S) = \mathcal{C}_{\text{sm}}(S)$ . If moreover  $\mathcal{C}/S$  is proper, then  $\mathcal{C}(S) = \mathcal{C}_{\text{sm}}(S) = \mathcal{C}_\eta(K)$ .  $\lrcorner$

**Example (21.4.2.9).**

- $\mathcal{C} \subset \mathbb{P}_{\mathbb{Z}}^2$  defined by the equation  $y^2 = x^3 + 2x^2 + 6$  is a regular fibered presurface over  $\mathbb{Z}$  with 3 singular points.
- $\mathcal{C} \subset \mathbb{P}_{\mathbb{Z}}^2$  defined by the equation  $y^2 = x^3 + 2x^2 + 6$  is not regular at  $(x, y, 2)$ .  $\lrcorner$

*Proof:* 1: The determinant  $\Delta = -2^6 \cdot 3 \cdot 97$ , so it has three singular fibers  $\mathcal{C}_2, \mathcal{C}_3, \mathcal{C}_{97}$ :

$$\mathcal{C}_2 : y^2 = x^3, \quad \mathcal{C}_3 : y^2 = x^2(x+2), \quad \mathcal{C}_{97} : y^2 = (x+66)^2(x+64).$$

By (21.3.1.17), they are singular at a single point, and we check these points are regular in  $\mathcal{C}$ :

For  $\mathcal{C}_2$ , the singular point is defined by  $(x, y, 2)$ , and has residue field  $\mathbb{F}_2$ . To show it is regular, it suffices to show that  $(x, y, 2)/(x, y, 2)^2$  is generated by 2 elements  $x, y$ :  $2 = 3^{-1}(y^2 - x^3 - 3x^2)$ . The  $\mathcal{C}_3, \mathcal{C}_{97}$  cases are similar.  $\square$

### 3 Arithmetic Surfaces

**Def. (21.4.3.1) [Arithmetic Surfaces].** An **arithmetic surface** is a flat of f.t. over  $S$  that is integral normal and excellent, such that its generic fiber is a non-singular projective curve, and its special fibers are unions of curves.  $\lrcorner$

**Prop. (21.4.3.2).** Any arithmetic surface is regular in codimension 1.  $\lrcorner$

### 4 Elliptic Surfaces

In this subsection the elliptic curves over a function field of residue characteristic 0 is studied.

**Notation (21.4.4.1).**

- Let  $k \in \text{Field}^0$ .

**Def. (21.4.4.2) [Elliptic Surfaces].** For  $C \in \text{Cur}^{\text{SmPrpr}}/k$ , an **elliptic surface** over  $C$  is a triple  $(\mathcal{E}, \text{pr}, \sigma_0)$  where

- $\mathcal{E}/k$  is a projective surface.
- $\text{pr} : \mathcal{E} \rightarrow C$  is a morphism s.t. for a.e.  $t \in C(\bar{k})$ , the fiber  $\mathcal{E}_t = \text{pr}^{-1}(t)$  is a non-singular curve of genus 1.
- $\sigma_0 : C \rightarrow \mathcal{E}$  is a section of  $\text{pr}$ .

It is called a **non-singular elliptic surface** if  $\mathcal{E}$  is non-singular.  $\lrcorner$

**Prop. (21.4.4.3).** Let  $F \in \text{NField}$ ,  $C \in \text{Cur}^{\text{SmPrpr}}/F$ ,  $K = R(C)$ , and  $\mathcal{E} \rightarrow C$  a non-split elliptic surface, and  $\delta \in \text{Div}(C)$  s.t.  $\deg(\delta) > 0$ . Then the set of points  $t \in C(\bar{F})$  s.t.

$$\sigma_t : E(K) \rightarrow \mathcal{E}_t(\bar{F})$$

is non-injective is a set of bounded height.  $\lrcorner$

*Proof:*  $\square$

### Split Elliptic Surfaces

**Thm. (21.4.4.4) [Nothcott for non-Split Elliptic Surfaces].** Let  $k = \bar{k}, C \in \text{Cur}^{\text{SmPrpr}}/k$  with  $K = R(C)$ , and  $\mathcal{E} \rightarrow C$  an elliptic surface over  $k$ . Suppose  $\kappa \in \mathbb{R}_+$  s.t.

$$\#\{P \in E(K) : h(P) \leq d\} = \infty,$$

then  $\mathcal{E}$  splits over  $k$ .  $\lrcorner$

*Proof:* By (21.4.4.5), it suffices to show that there exists  $\Gamma \in \mathcal{C}ur^{\text{SmPrpr}}/k$  and  $\varphi : \Gamma \times C \rightarrow \mathcal{E}$  a dominant rational map over  $C$ .

For the rest, Cf. [Sil99]P222. ?

□

**Lemma (21.4.4.5).** Let  $\mathcal{E} \rightarrow C$  be an elliptic surface over  $k$ . Suppose  $\Gamma \in \mathcal{C}ur^{\text{SmPrpr}}/k$  and  $\varphi : \Gamma \times C \rightarrow \mathcal{E}$  is a dominant rational map over  $C$ , then  $\mathcal{E}$  splits over  $k$ . ┘

*Proof:* [Sil99]P228.

□

### Integral Points

**Prop. (21.4.4.6) [Manin].** Let  $C \in \mathcal{C}ur^{\text{SmPrpr}}/k$  with  $K = R(C)$ . Let  $E : y^2 = x^3 + Ax + B$  be an elliptic curve over  $K$  that doesn't split over  $\bar{k}$ . Then for any  $t \in C(k)$ ,  $v_t$  is bounded on  $E(K)$ . ┘

*Proof:* Cf. [Sil99]P275. ?

□

**Thm. (21.4.4.7) [Finiteness of Integral Points on Elliptic Curves].** Let  $C \in \mathcal{C}ur^{\text{SmPrpr}}/k$  of genus  $g$ ,  $K = R(C)$ , and  $S \subset C(\bar{k})$  is a non-empty finite set. Let  $E/K$  be an elliptic curve that doesn't split over  $\bar{k}$ , then for any  $f \in R(E) \setminus K$ ,

$$\#\{P \in E(K) : f(P) \in \mathcal{O}_{K,S}\} < \infty.$$

┘

*Proof:* The same reduction argument as in the proof of (21.3.7.1) shows that we can assume  $f = x$  for some Weierstrass model of  $E$ . Then the result follows from (21.4.4.8). □

**Prop. (21.4.4.8) [Finiteness of Integral Points on Hyperelliptic Curves].** Let  $C \in \mathcal{C}ur^{\text{SmPrpr}}/k$  of genus  $g$ ,  $K = R(C)$ , and  $\varphi \subset_{\text{fin}} S \subset C(\bar{k})$ . Let  $f \in \mathcal{O}_{K,S}[X]$  be a monic polynomial with  $\Delta(f) \in \mathcal{O}_{K,S}^*$ . Suppose  $x, y \in \mathcal{O}_{K,S}$  s.t.  $y^2 = f(x)$ , then

$$\deg(y^4/\Delta) \leq 4n(n-1) \max(2g-2 + \#S, 0).$$

┘

*Proof:* Cf. [The canonical height and integral points on elliptic curves]Prop8.2 ?

The same reduction argument as in the proof of Siegel's theorem (21.3.7.1) shows that the assertion reduces to bounding the degree of  $u \in \mathcal{O}_{F,S}^*$  in the equation

$$u + v = 1.$$

Then this follows from (21.6.4.16). □

## 5 Intersection Theory

**Def. (21.4.5.1) [Canonical Divisors].**  $K_{X/S}$ , Cf. [Qing Liu]P389. ┘

**Def. (21.4.5.2) [Vertically Nef].** Let  $X/S$  be a regular fibered presurface, then  $D \in \text{Cl}(X)$  is called **vertically nef** if  $D \cdot C \geq 0$  for any vertical divisor  $C$ . ┘

**Prop. (21.4.5.3) [Factorization Theorem].** Any birational morphism of regular fibered presurfaces over  $S$  is a finite composition of blowing-up along a single closed point. ┘

*Proof:* Cf. [Qing Liu]P395. □

### Arithmetic Surfaces

**Prop. (21.4.5.4) [Intersection between Vertical Divisors].** Let  $X/S$  be an arithmetic surface and  $s \in S$  a closed point, then for any  $\Gamma \in \text{Div}_s(X)$ ,  $\Gamma \cdot X_s = 0$ . In particular, if  $\Gamma_1, \dots, \Gamma_r$  are irreducible components of  $X_s$  of multiplicities  $d_1, \dots, d_r$ , then

$$\Gamma_i^2 = -\frac{d_j}{d_i} \sum_{j \neq i} \Gamma_i \cdot \Gamma_j \leq 0.$$

┘

## 6 Minimal Arithmetic Surfaces

**Def. (21.4.6.1) [Exceptional Divisors].** Let  $X/S$  be a regular fibered presurface, then an **exceptional divisor** or **(-1)-curve**  $E \subset X$  is a prime divisor s.t. there is a morphism of regular fibered presurfaces  $f : X \rightarrow Y$  s.t.  $f(E)$  is a closed point. Notice an exceptional divisor must be a vertical divisor. ┘

**Prop. (21.4.6.2) [Castelnuovo's criterion, Lichtenbaum/Shafarevich].** Let  $X/S$  be a regular fibered presurface,  $E \subset X_s$  a vertical prime divisor. Let  $k' = H^0(E, \mathcal{O}_E)$ , then  $E$  is an exceptional divisor iff  $E \cong \mathbb{P}_{k'}^1$ . And this is the case if  $E^2 = -[k' : k(s)]$ . ┘

*Proof:* Cf.[Qing Liu]P416. ┘

**Prop. (21.4.6.3) [Characterizing Exceptional Divisors].** Let  $X/S$  be a regular fibered presurface, then for a vertical prime divisor  $E$  on  $X$ ,

- $E$  is exceptional iff  $K_{X/S} \cdot E < 0$  (21.4.5.1) and  $E^2 < 0$ . And in this case,  $K_{X/S} \cdot E = E^2$ .
- If  $\dim S = 0$  and  $H^0(X, [\omega_{X/S}]^q) \neq 0$  for some  $q \geq 1$  or  $\dim S = 1$  and  $p_a(X_\eta) > 0$ , then  $E$  is exceptional iff  $K_{X/S} \cdot E < 0$ . ┘

*Proof:* Cf.[Qing Liu]P417. ┘

**Def. (21.4.6.4) [Minimal Surfaces].** A **relatively minimal surface** over  $S$  is a regular fibered presurface  $\mathcal{C}/S$  s.t. for any other such regular fibered presurface  $\mathcal{C}'$  and any birational morphism  $\mathcal{C} \rightarrow \mathcal{C}'$  is an isomorphism. Equivalently,  $\mathcal{C}$  is a regular proper model that doesn't contain an exceptional curve of the first kind, i.e. cannot be blown down by (21.4.5.3). Cf.[Sta]0C21.

A **minimal surface** over  $S$  is a regular fibered presurface  $\mathcal{C}/S$  s.t. for any other such regular fibered presurface  $\mathcal{C}'$  and any birational map  $\mathcal{C}' \rightarrow \mathcal{C}$  is a birational morphism. In particular, a minimal surface  $\mathcal{C}/S$  is relatively minimal, and  $\text{Aut}_S(\mathcal{C}) \cong \text{Aut}_K(\mathcal{C}_\eta)$  is an isomorphism. ┘

**Cor. (21.4.6.5).** If a relatively minimal arithmetic surface over  $S$  is birational to a minimal surface over  $S$ , then they are isomorphic over  $S$ . ┘

**Prop. (21.4.6.6) [Étale Descent].** Let  $X/S$  be an arithmetic surface with  $p_a(X_\eta) > 0$ , and  $S' \rightarrow S$  is an étale covering or  $S = \text{Spec } R$  where  $R$  is a DVR and  $S' = \text{Spec } \hat{R}$ , then  $X/S$  is minimal iff  $X \times_S S'/S'$  is minimal. ┘

*Proof:* Cf.[Qing Liu]P423. ┘

**Cor. (21.4.6.7).** Let  $X/S$  be an arithmetic surface with  $p_a(X_\eta) > 0$  and  $T \rightarrow S$  is a smooth morphism, then for any  $\xi \in T$  of codimension 1,  $X \times_S \mathcal{O}_{T,\xi}$  is a minimal regular surface over  $\mathcal{O}_{T,\xi}$ . ┘

*Proof:* Cf.[Qing Liu]P424. ┘

### Minimal Models

**Prop. (21.4.6.8) [Minimal Models].** Let  $\mathcal{C}/S$  be a normal fibered presurface, then a **regular model** for  $\mathcal{C}/S$  is a regular fibered presurface  $\mathcal{C}'/S$  with a birational map  $\mathcal{C}' \rightarrow \mathcal{C}$  over  $S$ . Notice  $\mathcal{C}'_\eta \rightarrow \mathcal{C}_\eta$  is a birational map of regular projective precurve, thus an isomorphism.

A (relatively) **minimal model** for  $\mathcal{C}/S$  is a regular model for  $\mathcal{C}/S$  that is (relatively) minimal. Notice if a minimal model exists, it is unique up to a unique isomorphism.  $\lrcorner$

**Lemma (21.4.6.9).** If  $X/S$  is an arithmetic surface, then there exists only f.m. fibers  $X_s$  containing an exceptional divisor.  $\lrcorner$

*Proof:* Cf.[Qing Liu]P420.  $\square$

**Prop. (21.4.6.10) [Blowing Down to Relatively Minimal Surfaces].** If  $X/S$  is an arithmetic surface, then  $X$  is a finite blowing-up of relatively minimal arithmetic surface over  $S$ .  $\lrcorner$

*Proof:* The number of exceptional divisors decreases along contractions **?**  $\square$

**Prop. (21.4.6.11) [Lichtenbaum/Shafarevich].** Let  $X/S$  be an arithmetic surface with  $p_a(X_\eta) \geq 1$ , then  $X$  admits a unique minimal model over  $S$ .  $\lrcorner$

*Proof:* Cf.[Qing Liu]P422.  $\square$

**Remark (21.4.6.12).** This is not true for  $p_a(X_\eta) = 0$ , Cf.[Qing Liu]P422.  $\lrcorner$

**Cor. (21.4.6.13) [Minimal and Relatively Minimal Surfaces].** If  $X/S$  is an arithmetic surface s.t.  $p_a(X_\eta) > 1$ , then  $X$  is minimal iff it is relatively minimal iff  $K_{X/S}$  is vertically nef, by (21.4.6.5) and (21.4.6.4)(21.4.6.3). **?** In the field case, why the hypothesis is satisfied?  $\lrcorner$

**Cor. (21.4.6.14).** If  $X/S$  is a smooth arithmetic surface, then  $X/S$  is relatively minimal by (21.4.5.4) as in this case  $X_s$  is a disjoint union of irreducible curves. And if  $p(X_\eta) > 0$ , then  $X$  is minimal.  $\lrcorner$

## 21.5 Arithmetic of K3 Surfaces

References are [Arithmetic and Geometry of K3 surfaces and Calabi-Yau Threefolds].

### 1 over Finite Fields

**Thm. (21.5.1.1) [Liedtke].** If  $p \in \text{Prime}_{\geq 5}$ , then any supersingular(27.5.7.1) K3 surface over  $\mathbb{F}_p$  is unirational(i.e. has a rational dominant map  $\mathbb{P}^2 \rightarrow X$ ).  $\lrcorner$

*Proof:* Cf.[Supersingular K3 surfaces are unirational].  $\square$

### 2 over Local Fields

### 3 over Global Fields

**Conj. (21.5.3.1) [Shafarevich].** For  $d, g \in \mathbb{Z}_+$ , consider all K3 surfaces defined over a number field of degree  $d$ , then there are only f.m. isomorphism classes among  $\text{NS}(X_{\overline{\mathbb{Q}}})$ .

By [Rational quadratic forms, Cassels]Chap9, Thm1.1, there are only finitely many lattices of bounded rank and discriminant. Thus this conjecture is equivalent to the boundedness of discriminant of  $\text{NS}(X_{\overline{\mathbb{Q}}})$ .  $\lrcorner$

*Proof:*  $\square$

**Prop. (21.5.3.2) [Coleman's Conjecture  $\implies$  Shafarevich Conjecture].** The Coleman's conjecture(21.7.11.1) implies Shafarevich's conjecture(21.5.3.1).  $\lrcorner$

**Conj. (21.5.3.3) [Br(K3)].** Let  $d \in \mathbb{Z}_+$ , then there exists  $C(d) \in \mathbb{R}_+$  s.t. if  $F \in \mathbf{NField}$ ,  $[F : \mathbb{Q}] \leq d$  and  $X \in \text{K3}/F$ , then  $\# \text{Br}(X_{\overline{k}})^{\text{Gal}_F} < \infty$ .

This would imply that  $\# \text{Br}(X)/\text{Br}_0(X)$  is uniformly bounded.Cf.[Uniformity Conjectures for Abelian Varieties and K3 Surfaces]P3.  $\lrcorner$

*Proof:*  $\square$

## 21.6 Diophantine Geometry

*“Mathematik ist die Königin von Wissenschaften und Arithmetik die Königin von Mathematik. ...in allen Relationen sie wird zum ersten Rank erlaubt.”*

–C. F. Gauss

References are [Galois Cohomology, Serre]Chap2.4.5, [Wei50, B-G06], [Fundamentals of Diophantine Geometry, Lang].

Arithmetic of varieties(i.e. varieties over absolutely f.g. fields) that are not necessarily Abelian varieties are studied in this section. The Abelian variety case is studied in [Abelian Varieties](#).

### 1 Hilbert’s 10-th Problem

#### Diophantine Sets

**Def. (21.6.1.1) [Diophantine Sets].** For  $m \in \mathbb{Z}_+$ , a subset  $E \subset (\mathbb{Z}_+)^m$  is called a **Diophantine set** if there exists  $n \in \mathbb{N}$  and a polynomial

$$P(T_1, \dots, T_m, X_1, \dots, X_n) \in \mathbb{Z}[T_1, \dots, T_m, X_1, \dots, X_n]$$

s.t.

$$(t_1, \dots, t_m) \in E \iff \exists (x_1, \dots, x_n) \in \mathbb{Z}^n, P(t_1, \dots, t_m, x_1, \dots, x_n) = 0.$$

┘

**Prop. (21.6.1.2).** Any Diophantine set is recursively denumerable([2.7.2.7](#)). ┘

**Prop. (21.6.1.3).** The class of Diophantine sets contains the level sets of integral polynomials, and is closed under finite direct sums, finite intersections and projections. ┘

**Prop. (21.6.1.4) [Diophantine Sets in  $\mathbb{Z}_+$ ].**  $S \subset \mathbb{Z}_+$  is a Diophantine subset iff there exists  $n \in \mathbb{Z}_+$  and  $P \in \mathbb{Z}[X_1, \dots, X_n]$  s.t.

$$S = \{m \in \mathbb{Z}_+ | \exists (X_1, X_2, \dots, X_n) \in \mathbb{Z}^n | P(X_1, \dots, X_n) = m\}$$

┘

*Proof:* One direction is clear. For the other, notice if there exists  $n \in \mathbb{N}$  and  $Q \in \mathbb{Z}[X_1, \dots, X_n]$  s.t.

$$S = \{m \in \mathbb{Z}_+ | \exists (X_1, X_2, \dots, X_n) \in \mathbb{Z}^n | P(m, X_1, \dots, X_n) = 0\},$$

then take  $P(X_0, X_1, \dots, X_n) = X_0(1 - P^2(X_0, X_1, \dots, X_n))$ . ┘

**Prop. (21.6.1.5) [Examples of Diophantine Sets].**

- For  $a, n \in \mathbb{Z}_+$ , suppose

$$(a + \sqrt{a^2 - 1})^n = x_n(a) + y_n(a)\sqrt{a^2 - 1},$$

where  $x_n(a), y_n(a) \in \mathbb{Z}_+$ , then the set  $E = \{(y, n, a) \in (\mathbb{Z}_+)^3 | y = y_n(a)\}$  is a Diophantine set.

- The set  $E_0 = \{(y, n, a) \in (\mathbb{Z}_+)^3 | y = a^n\}$  is a Diophantine set.
- The set  $E = \{(r, k, n) \in (\mathbb{Z}_+)^3 | r = \binom{n}{k}, n \geq k\}$  is a Diophantine set.

- The set  $E = \{(m, k) | m = k!\}$  is a Diophantine set.
- The set  $E = \{(x, y, p, q, k) | \frac{x}{y} = \binom{p/q}{k}, p > qk\}$  is a Diophantine set.

┘

*Proof:* Cf.[Manin, P99].

1:

□

**Cor. (21.6.1.6)[Prime is Diophantine].**  $\text{Prime} \subset \mathbb{Z}_+$  is a Diophantine set.

┘

*Proof:* This is because by Wilson's theorem(2.6.1.35), for  $p \in \mathbb{Z}_+$ ,  $p$  is a prime iff it is the first coordinate of the following Diophantine equation

$$\{(p, f, a) \in \mathbb{Z}_+ | p = f + 1, \quad q = f!, \quad q - ap = 1\}.$$

□

**Thm. (21.6.1.7)[Matiyasevich].** Any recursively denumerable subset of  $(\mathbb{Z}_+)^n$  is a Diophantine subset.

┘

*Proof:* Cf.[M. Davis, J. Matijasevic, and J. Robinson, Hilbert's 10th Problem. Diophantine equations: Positive aspects of a negative solution, in Mathematical Developments from Hilbert's Problems, F. Browder, ed., American Mathematical Societ, Providence, RI, 1976.]

□

**Cor. (21.6.1.8)[Hilbert's 10-th Problem, Matiyasevich].** Hilbert's 10-th problems is undecidable/-computable/recursive(2.7.2.6).

┘

*Proof:*

□

**Def. (21.6.1.9)[Simple Diophantine Sets].** A **simple Diophantine set** is a Diophantine set  $G \subset \mathbb{Z}_+$  s.t.  $\mathbb{Z}_+ \setminus G$  is not Diophantine, and for any infinite Diophantine subset  $D \subset \mathbb{Z}_+$ ,  $D \cap G \neq \emptyset$ .

┘

**Prop. (21.6.1.10).** There exists a simple Diophantine set(21.6.1.9).

┘

### Diophantine Coding

**Prop. (21.6.1.11)[Cantor Numbering of Tuples].** We can encode the pair of natural numbers in the following way:

$$(0, 0), (0, 1), (1, 0), (0, 2), (1, 1), (2, 0), (0, 3), \dots$$

Equivalently, the **Cantor numbering** is defined to be

$$\text{Cant}(a, b) = \frac{(a + b)^2 + 3a + b}{2}.$$

And

$$\text{Cant}(a, b) = c \iff \exists y[(a + y)^2 + 3a + y = 2c], \quad \text{Cant}(a, b) = c \iff \exists x[(x + b)^2 + 3x + b = 2c].$$

Similar, for  $n \in \mathbb{Z}_+$ , we can define numbering for  $n$ -tuples inductively as

$$\text{Cant}_1(a_1) = a_1, \quad \text{Cant}_2(a_1, a_2) = \text{Cant}(a_1, a_2), \quad \text{Cant}_{k+1}(a_1, \dots, a_{k+1}) = \text{Cant}_k(a_1, \dots, a_{k-1}, \text{Cant}_2(a_k, a_{k+1})).$$

┘

### Unsolvability

#### Diophantine Forms of Problems

**Prop. (21.6.1.12) [Riemann Hypothesis].** For a Diophantine form of the negation of Riemann hypothesis, Cf.[The Riemann Hypothesis and Diophantine Equations].  $\lrcorner$

## 2 Conjectures

**Def. (21.6.2.1) [Arithmetic Varieties].** An **arithmetic variety** is a regular scheme that is projective and flat over  $\mathbb{Z}$ .  $\lrcorner$

### Weak Approximation

**Prop. (21.6.2.2).** If  $X$  is a smooth complete intersection of two quadrics in  $\mathbb{P}_F^N$  for  $N \geq 5$ , and  $X(F) \neq \emptyset$ , then  $X$  satisfies weak approximation.  $\lrcorner$

*Proof:* Cf.[Colliot-Thelene-Skorobogatov1987, R-equivalence on cubic bundles of degree 4].  $\square$

### Mazur's Conjecture

**Conj. (21.6.2.3) [Mazur].** Let  $X/\mathbb{Q}$  be a smooth algebraic scheme over a field, then the topological closure of  $X(\mathbb{Q})$  in  $X(\mathbb{R})$  consist of a finite union of connected components.  $\lrcorner$

*Proof:*  $\square$

**Remark (21.6.2.4).** As the kernel of the Brauer-pairing(11.2.7.1) vanishes on all the infinite places, when the Brauer-Manin obstruction is sufficient, Mazur's conjecture holds.  $\lrcorner$

### Artin's Conjecture

**Def. (21.6.2.5) [ $C_d$ -Fields].** A field  $K$  is called  $C_k$  or for any homogenous polynomial  $F(X_1, \dots, X_n)$  of degree  $d$  with coefficient in  $K$  s.t.  $n > d^k$  has a non-zero solution in  $K^n$ .

$C_0$ -fields are just alg.closed fields,  $C_1$ -fields are also called **quasi-algebraically-closed field**.  $\lrcorner$

**Prop. (21.6.2.6).** Algebraic extensions of a  $C_1$  field are  $C_1$ .  $\lrcorner$

*Proof:* For a homogenous polynomial  $F(X_1, \dots, X_n)$ , its coefficient lies in a finite extension of  $K$  contained in  $L$ , so we may assume  $L/K$  is finite. Then choose a basis  $\{e_1, \dots, e_m\}$  of  $L$  over  $K$ , then consider the function

$$f(x_{11}, \dots, x_{1m}, \dots, x_{n1}, \dots, x_{nm}) = \text{Nm}_{L/K}(F(x_{11}e_1 + \dots + x_{1m}e_m, \dots, x_{n1}e_1 + \dots + x_{nm}e_m)),$$

which is a homogenous polynomial of degree  $nm$  with coefficient in  $K$ , because it has values all in  $K$ . So it has a nonzero solution in  $K^{nm}$  by(7.12.2.3), Krull's height theorem and  $k$  is alg.closed.  $\square$

**Thm. (21.6.2.7) [Finite Fields are  $C_1$ , Chevalley-Waring].** Any finite field  $\mathbb{F}_q$  is quasi-algebraically closed. In fact, for any system of homogenous polynomials  $f_i$  of  $n$  variables, if  $\sum_{i=1}^r \deg f_i < d$ , then the number of solutions to this equation on  $\mathbb{F}_q$  is divisible by  $p$ , where  $q$  is a  $p$ -power.  $\lrcorner$

*Proof:* The number of solutions to this system is equivalent to

$$\sum_{x \in \mathbb{F}_q^n} \prod (1 - f_i^{q-1}(x))$$

modulo  $p$ .

But notice that if  $i < q-1$ , then  $\sum_{x \in \mathbb{F}_q} x^i = 0$  in  $\mathbb{F}_q$  by (2.6.1.29), but as the degree of the highest term of  $\sum_{x \in \mathbb{F}_q^n} \prod (1 - f_i^{q-1}(x))$  modulo  $p$  is smaller than  $n(q-1)$ , some  $x_i$  has power smaller than  $q-1$ , thus when summed over  $\mathbb{F}_q$ , it vanishes.  $\square$

**Remark (21.6.2.8).** This may follow from the fact any smooth projective Fano variety over  $\mathbb{F}_q$  has a rational point (21.7.7.3).  $\lrcorner$

**Thm. (21.6.2.9) [Tsen].** If  $K = \overline{K}$ , then algebraic function fields of dimension 1 over  $K$  is quasi- $\text{alg.closed}$  (21.6.2.5).  $\lrcorner$

*Proof:* By (21.6.2.6), it suffice to consider the case  $K = k(t)$  purely transcendental. for a polynomial  $F$  with coefficient in  $k(t)$ , we can assume it has coefficient in  $k[t]$ , then let  $\delta$  be their maximal degree. If substituted with  $X_i = \sum_{j=0}^N a_{ij} t^j$ , the function becomes a system of  $\delta + dN + 1$  homogenous equation with  $n(N+1)$  unknowns  $a_{ij}$ , since  $d < n$ ,  $\delta + dN + 1 < n(N+1)$  for  $N$  large. In this case,  $\square$

**Thm. (21.6.2.10) [Almost all  $\mathbb{Q}_p$  are  $C_1$ , Ax-Kochen].** For any  $d \in \mathbb{Z}_+$ , there is a  $N_d$  that if  $p > N_d$ , then any homogenous polynomial  $f(X_1, \dots, X_n)$  of degree  $d$  with coefficient in  $\mathbb{Q}_p$  that  $d^k < n$  has a non-zero solution in  $\mathbb{Q}_p^n$ .  $\lrcorner$

*Proof:* The proof uses Model theory. ?  $\square$

**Thm. (21.6.2.11) [Lang].** If  $(\mathcal{O}_K, K, \kappa) \in \text{DVR}$  is Henselian with  $\kappa = \overline{\kappa}$ , and  $\widehat{K}$  is separable over  $K$ , then  $K$  is  $C_1$ .

In particular, the maximal unramified extension of a  $p$ -adic local field is  $C_1$ .  $\lrcorner$

*Proof:* [Lang, On quasi algebraic closure].  $\square$

### 3 Rational Points

#### Congruent Number Problem

**Def. (21.6.3.1) [Congruent Numbers].** For  $n \in \mathbb{Z}_+$ ,  $n$  is called a **congruent number** if there exists  $(x, y, z) \in \mathbb{Q}^2$  s.t.  $x^2 + y^2 = z^2$  and  $\frac{xy}{2} = n$ .

By (21.6.5.2), this is equivalent to the existence of  $(r, s, t) \in \mathbb{Z}_+$  s.t.

$$rs(r^2 - s^2) = nt^2.$$

$\lrcorner$

**Prop. (21.6.3.2).** For any  $n \in \mathbb{Q}_+$ , there is a bijection of sets:

$$\{x < y < z \in \mathbb{Q}_+ | x^2 + y^2 = z^2, \frac{xy}{2} = n\} \longleftrightarrow \{a \in \mathbb{Q} | a \in \mathbb{Q}^2, a + n \in \mathbb{Q}^2, a - n \in \mathbb{Q}^2\}$$

given by

$$(x, y, z) \mapsto a = \left(\frac{z}{2}\right)^2, \quad a \mapsto (\sqrt{a+n} - \sqrt{a-n}, \sqrt{a+n} + \sqrt{a-n}, 2\sqrt{a}).$$

In particular,  $n \in \mathbb{Z}_+$  is a congruent number iff there exists  $x \in \mathbb{Q}_+$  s.t.  $x, x+n, x-n$  are all rational squares.  $\lrcorner$

**Prop. (21.6.3.3) [Congruent Numbers and Elliptic Curves].** For any  $n \in \mathbb{Q}_+$ , there is a bijection of sets:

$$\{a, b, c \in \mathbb{Q} \mid a^2 + b^2 = c^2, \frac{ab}{2} = n\} \longleftrightarrow \{x, y \in \mathbb{Q} \mid ny^2 = x^3 - x, y \neq 0\}$$

given by

$$(a, b, c) \mapsto a = \left(-\frac{b}{a+c}, \frac{2}{a+c}\right), \quad (x, y) \mapsto \left(\frac{1-x^2}{y}, \frac{-2x}{y}, \frac{1+x^2}{y}\right).$$

And it can be shown that the elliptic curve  $E^{(n)} : ny^2 = x^3 - x$  satisfies

$$E^{(n)}(\mathbb{Q})_{\text{tor}} = \{O, (0, 0), (1, 0), (-1, 0)\} \text{ ?}.$$

So  $n$  is a congruence number iff  $\text{rank}(E^{(n)}/\mathbb{Q}) \geq 1$ . ┘

**Thm. (21.6.3.4) [Tunnell].** Let  $n \in \mathbb{Z}_+$  be square-free, and  $a = \begin{cases} 1 & , 2 \nmid n \\ 2 & , 2 \mid n \end{cases}$ . Then if  $n$  is a congruent number, we have

$$\#\{x, y, z \in \mathbb{Z} \mid \frac{n}{a} = 2ax^2 + y^2 + 8z^2, 2 \mid z\} = \#\{x, y, z \in \mathbb{Z} \mid \frac{n}{a} = 2ax^2 + y^2 + 8z^2, 2 \nmid z\}.$$

And the converse is also true if we assume the rank part of B-S.D. conjecture for the elliptic curve  $E^{(n)}/\mathbb{Q} : y^n = x^3 - n^2x$ . ┘

*Proof:* □

**Cor. (21.6.3.5) [Fibonacci1220/Fermat1640].**

- 1, 2, 3 are not a congruent number.
  - 5, 6, 7 are congruent numbers.
- ┘

*Proof:* 1: We give a direct proof: If 1 is a congruent number, then by (21.6.3.1), there exists  $r, s \in \mathbb{Z}_+$  s.t.  $\gcd(r, s) = 1$ ,  $r \not\equiv s \pmod{2}$ , and  $rs(r-s)(r+s)$  is a square.

Then  $r, s, r+s, r-s$  are pairwise coprime, so there exists  $x, y, u, v \in \mathbb{Z}_+$  s.t.

$$r = x^2, \quad s = y^2, \quad r+s = u^2, \quad r-s = v^2,$$

and ? □

**Conj. (21.6.3.6) [Congruence Number Problem].** Any  $n \in \mathbb{Z}_+$  s.t.  $n \equiv 5, 6, 7 \pmod{8}$  is a congruence number. ┘

*Proof:* □

**Remark (21.6.3.7).** For  $n \in \mathbb{Z}_+$  square-free, the  $L$ -function of  $E^{(n)}$  has root number

$$\epsilon(n) = \begin{cases} 1 & , n \equiv 1, 2, 3 \pmod{8} \\ -1 & , n \equiv 5, 6, 7 \pmod{8} \end{cases}, \quad N(n) = \begin{cases} 32n^2 & , 2 \nmid n \\ 16n^2 & , 2 \mid n \end{cases}.$$

In particular, the parity conjecture of B-S.D (31.4.1.8) implies the congruence number problem (21.6.3.6). ┘

*Proof:* ? □

**Conj. (21.6.3.8).**

$$\lim_{X \rightarrow \infty} \frac{\#\{n \in \mathbb{Z}_+ | n \equiv 1, 2, 3 \pmod{8} \text{ \& } n \text{ is congruent}\} \cap [1, X]}{\#\{n \in \mathbb{Z}_+ | n \equiv 1, 2, 3 \pmod{8}\} \cap [1, X]} = 0.$$

┘

*Proof:* □

### Cube Sum Problems

**Conj. (21.6.3.9)[Sum of Three Rational Cubes, Heath-Brown].** Any  $n \in \mathbb{Z}_+$  s.t.  $n \not\equiv 4, 5 \pmod{9}$  has infinitely many representations as sums of three integral cubes. ┘

*Proof:* ? □

*Proof:* Cf.[density of zeros of forms for which weak approximation fails, Heath-Brown]. ? □

**Conj.Cor. (21.6.3.10).** The question that whether  $n \in \mathbb{Z}_+$  is a sum of three cubes is decidable. ┘

*Proof:* □

**Prop. (21.6.3.11)[Sum of Two Rational Cubes].** For  $n \in \mathbb{Z}_{\geq 3}$ ,  $n$  is a sum of two rational cubes iff for the elliptic curve over  $\mathbb{Q}$ :

$$E_n : y^2 = x^3 - 432n^2,$$

we have  $\text{rank}(E_n/\mathbb{Q}) \geq 1$ .

And if the B-S.D conjecture holds for  $E_n$ , then any primes  $p \in \text{Prime}$  s.t.  $p \equiv 4, 7, 8 \pmod{9}$  is a sum of three rational cubes. ┘

*Proof:* ? □

**Thm. (21.6.3.12) [Alpöge-Bhargava-Shnidman2022].** The set of natural integers expressible as a sum of two rational cubes has natural density  $\geq 2/21$ , and the set of natural integers not expressible as a sum of two rational cubes has natural density  $\geq 1/6$ . ┘

*Proof:* Cf.[Integers expressible as the sum of two rational cubes]. □

## 4 Integral Points

### Simple Cases

**Thm. (21.6.4.1)[Pell's Equations].** A **Pell's equation** is a Diophantine equation of the form

$$\{x, y \in \mathbb{Z}_+ | x^2 - dy^2 = N\}$$

where  $d \in \mathbb{Z}_+ \setminus (\mathbb{Z}_+)^2$  and  $N \in \mathbb{Z}^\times$ .

- For  $N = 1$ , there exists a solution  $(x_0, y_0)$  s.t. every solution  $(x, y)$  satisfies  $(x + \sqrt{d}y) = (x_0 + \sqrt{d}y_0)^k$  for some  $k \in \mathbb{Z}_+$ . Such a  $(x_0, y_0)$  is called a **fundamental solution**.

- In general, if  $(x_0, y_0)$  is any solution to the equation for  $x^2 - dy^2 = 1$ , then every solution  $(x, y)$  for  $x^2 - dy^2 = N$  satisfies  $(x + \sqrt{d}y) = (x' + \sqrt{d}y')(x_0 + \sqrt{d}y_0)^k$  for some  $k \in \mathbb{N}$ , where  $x', y' \in \mathbb{Z}$ , and

$$(x')^2 - d(y')^2 = N, \quad |x'| \leq \frac{\sqrt{|N|}(\sqrt{u_0} + \sqrt{u_0}^{-1})}{2}, \quad |y'| \leq \frac{\sqrt{|N|}(\sqrt{u_0} + \sqrt{u_0}^{-1})}{2\sqrt{|d|}}, \quad u_0 = x_0 + \sqrt{d}y_0.$$

Moreover, if  $N > 0$ , we even can restrict to  $|y'| \leq \frac{\sqrt{|N|}(\sqrt{u_0} - \sqrt{u_0}^{-1})}{2\sqrt{|d|}}$ . And if  $N < 0$ , then  $y' > 0$ .  $\perp$

*Proof:* 1: If  $N = 1$ , then the solutions of this equations are a subgroup of group of units in  $\mathcal{O}_{\mathbb{Q}(\sqrt{d})}$ . It follows from unit theorem that the group of units in  $\mathcal{O}_{\mathbb{Q}(\sqrt{d})}$  is isomorphic to  $\{\pm 1\} \times \mathbb{Z}$ . So because we are restricted to the case that  $x, y \in \mathbb{Z}_+$ , it follows that the group of solutions is isomorphic to  $\mathbb{Z}_+$ , and it is in fact generated by a single minimal solution  $(x_0, y_0)$ .

2: We use the regulator map

$$\text{Reg} : \mathbb{Q}(\sqrt{d})^\times \rightarrow \mathbb{R}^2 : u \mapsto (\log u, \log \sigma(u)),$$

where  $\sigma$  is the non-trivial element of  $\text{Gal}(\mathbb{Q}(\sqrt{d})/\mathbb{Q})$ . Then  $\text{Reg}(u_0) = \log(u_0)(1, -1)$ , which is linearly independent to  $(1, 1)$ . Thus for any solution  $(x, y)$ , there exists  $c_1, c_2 \in \mathbb{R}$  s.t.

$$L(x + \sqrt{d}y) = c_1(1, 1) + c_2 L(u_0).$$

In particular,  $c_1 = \frac{\log |x + \sqrt{d}y| + \log |x - \sqrt{d}y|}{2} = \frac{\log |N|}{2}$ . And we can find  $k \in \mathbb{Z}$  s.t.  $c_2 = k + \delta$  with  $|\delta| \leq 1/2$ . Therefore if  $x' + \sqrt{d}y' = (x + \sqrt{d}y)(x_0 - \sqrt{d}y_0)^{-k}$ , then

$$\max(\log |x' + \sqrt{d}y'|, \log |x' - \sqrt{d}y'|) \leq \log \sqrt{|N|u_0}.$$

From which we can get the desired bound on  $x', y'$ . Finally, notice the hypothesis  $x, y \in \mathbb{Z}_+$  implies that we can assume  $k \geq 0$ .  $\square$

### Diophantine Sequences

**Def. (21.6.4.2) [Diophantine Sequences].** For  $m \in \mathbb{Z}_+$ , a sequence of positive integers  $a_1 \leq a_2 \leq \dots \leq a_m \in \mathbb{Z}_+$  is called a **Diophantine sequence** of length  $m$  if for any  $1 \leq i < j \leq m$ ,

$$a_i a_j + 1 \in (\mathbb{Z}_+)^2.$$

$\perp$

**Conj. (21.6.4.3).** Every Diophantine sequence of length 3 can be extended to a Diophantine quadruple:  
If  $(a, b, c)$  is a Diophantine triple,

$$ab + 1 = r^2, \quad ac + 1 = s^2, \quad bc + 1 = t^2, \quad a, b, c, r, s, t \in \mathbb{Z}_+,$$

then  $(a, b, c, d)$  is a Diophantine quadruple where  $d = a + b + c + 2abc \pm 2rst$ .

Then it is conjectured that these are the only two ways of extension.  $\perp$

*Proof:* For example,

$$(at \pm rs)^2 - 1 = a^2(bc + 1) + (ac + 1)(ab + 1) \pm 2arst - 1 = a(a + b + c + 2abc \pm 2rst).$$

For the conjecture, ?

□

**Thm. (21.6.4.4) [Baker-Davenport/Kedlaya/Dujella-Pethö].**

- If  $\{1, 3, c\}$  is a Diophantine triple, then there exists  $k \in \mathbb{Z}_+$  s.t.

$$c = c_k = \frac{1}{6}[(2 + \sqrt{3})(7 + 4\sqrt{3})^k + (2 - \sqrt{3})(7 - 4\sqrt{3})^k - 4].$$

Notice  $c_0 = 0, c_1 = 8, c_2 = 120$ .

- $(1, 3, c, d)$  is a Diophantine quadruple iff  $\{c, d\} = \{c_k, c_{k+1}\}$  for some  $k \in \mathbb{Z}_+$ .

┘

*Proof:* 1:

2: Given item1, it suffices to show that if  $k \in \mathbb{Z}_+$ , the set of equations

$$\{d, x, y, z \in \mathbb{Z}_+ | d + 1 = x^2, \quad 3d + 1 = y^2, \quad c_k d + 1 = z^2\}$$

has only solutions  $d \in \{c_{k-1}, c_{k+1}\}$ .

It's equivalent to solve the Pell'e equation set:

$$\{z^2 - c_k x^2 = 1 - c_k, \quad 3z^2 - c_k y^2 = 3 - c_k\}.$$

We first prove for  $k = 1$ :

**Lemma (21.6.4.5) [The  $k = 1$  case, Baker-Davenport].**  $(1, 3, 8, d)$  is a Diophantine sequence iff  $d = 120$ . ┘

*Proof:* If  $(1, 3, 8, n)$  is a Diophantine sequence, then  $n = x^2 - 1$  for some  $x \in \mathbb{Z}_+$ . Then there exists  $y, z \in \mathbb{Z}_+$  s.t.

$$\{3x^2 - 2 = y^2, \quad 8x^2 - 7 = z^2\}.$$

Thus it suffices to show that such a set of equations has solutions in  $\mathbb{Z}_+$  iff  $x \in \{1, 11\}$ .

First, by (21.6.4.1), we can show that positive integral solutions to  $y^2 - 3x^2 = -2$  are all of the form

$$y + \sqrt{3}x = (1 + \sqrt{3})(2 + \sqrt{3})^m, \quad m \in \mathbb{N},$$

thus

$$x = \frac{1 + \sqrt{3}}{2\sqrt{3}}(2 + \sqrt{3})^m - \frac{1 - \sqrt{3}}{2\sqrt{3}}(2 - \sqrt{3})^m.$$

If  $m = 0, x = 1$ , and if  $m = 2, x = 11$ .

Similarly, positive integral solutions to  $z^2 - 8x^2 = -7$  are all of the form

$$z + \sqrt{8}x = (1 + \sqrt{8})(3 + \sqrt{8})^n, \quad n \in \mathbb{N}$$

or

$$z + \sqrt{8}x = (5 + 2\sqrt{8})(3 + \sqrt{8})^n = (-1 + \sqrt{8})(3 + \sqrt{8})^{n+1}, \quad n \in \mathbb{N},$$

thus

$$x = \frac{1 + \sqrt{8}}{2\sqrt{8}}(3 + \sqrt{8})^n - \frac{1 - \sqrt{8}}{2\sqrt{8}}(3 - \sqrt{8})^n$$

or

$$x = \frac{-1 + \sqrt{8}}{2\sqrt{8}}(3 + \sqrt{8})^n - \frac{-1 - \sqrt{8}}{2\sqrt{8}}(3 - \sqrt{8})^n.$$

Let  $P = \frac{1+\sqrt{3}}{2\sqrt{3}}(2 + \sqrt{3})^m$ ,  $m \geq 3$  and  $Q = \frac{1+\sqrt{8}}{2\sqrt{8}}(3 + \sqrt{8})^n$  or  $Q = \frac{-1+\sqrt{8}}{2\sqrt{8}}(3 + \sqrt{8})^n$ , then we want a solution to

$$P + \frac{2}{3P} = Q + \frac{7}{8Q}.$$

For any such solution,  $P > 80$ , and

$$P - Q > \frac{2}{3P} - \frac{2}{3Q} = \frac{2(P - Q)}{PQ},$$

so  $P > Q$ . And also  $Q > P - \frac{7}{8Q} > P - \frac{7}{8}$ , so

$$P - Q = \frac{7}{8Q} - \frac{2}{3P} < \frac{7}{8(P - \frac{7}{8})} - \frac{2}{3P} < \frac{1}{4P}.$$

Thus

$$0 < \log \frac{P}{Q} < -\log\left(1 - \frac{1}{4P^2}\right) < \frac{1}{4P^2} + \frac{1}{16P^4} < 0.26P^{-2},$$

which means that

$$0 < m \log(2 + \sqrt{3}) - n \log(3 + \sqrt{8}) + \log \frac{(1 + \sqrt{3})\sqrt{8}}{(\pm 1 + \sqrt{8})\sqrt{3}} < 0.26P^{-2} < \frac{0.11}{(2 + \sqrt{3})^{2m}}.$$

Then it follows from Baker's theory(19.9.1.11) that  $m < 10^{40}$ .

Finally, using(20.2.4.8) twice, it can be shown that no such  $m \geq 3$  exists(Cf. [B-D69]).  $\square$

After this, assume  $k$  is the smallest natural number s.t. the assertion is wrong. Then  $k \geq 2$  because  $k = 1$  is true by the above lemma(21.6.4.5). Fix  $c = c_k \geq 120$ . The hypothesis implies that there exists  $s, t \in \mathbb{Z}_+$  s.t.  $c + 1 = s^2$ ,  $3c + 1 = t^2$ . So Neither  $c$  nor  $3c$  is a square. Then it follows from(21.6.4.1) that there exists  $z', x' \in \mathbb{Z}$ ,  $m \in \mathbb{N}$ ,  $z'', y'' \in \mathbb{Z}$ ,  $n \in \mathbb{N}$  s.t.

$$z + x\sqrt{c} = (z' + x'\sqrt{c})(s + \sqrt{c})^m, \quad z\sqrt{3} + y\sqrt{c} = (z''\sqrt{3} + y''\sqrt{c})(t + \sqrt{3c})^n,$$

and

$$|z'| \leq \sqrt{c-1} \frac{\sqrt{s+\sqrt{c}} + \sqrt{s+\sqrt{c}}^{-1}}{2} < \sqrt{c} \frac{\sqrt{2s+3}}{2} < \frac{c}{4},$$

$$|z''| \leq \sqrt{3(c-3)} \frac{\sqrt{t+\sqrt{3c}} + \sqrt{t+\sqrt{3c}}^{-1}}{6} < \sqrt{t^2-10} \frac{\sqrt{2t+3}}{6} < \frac{c}{6}.$$

If we define sequences

$$\{v_p\} : v_0 = z', v_1 = sz' + cx', v_{p+2} = 2sv_{p+1} - v_p\},$$

$$\{w_q\} : w_0 = z'', w_1 = tz'' + cx'', w_{q+2} = 2tw_{q+1} - w_q\},$$

then  $z = v_m = w_n$ . Moreover, we can use induction to show that

$$v_{2p} \equiv z' + 2c(p^2 z' + psx') \pmod{c^2}, \quad v_{2p+1} \equiv sz' + c[2p(p+1)sz' + (2p+1)x'] \pmod{c^2}, \quad p \in \mathbb{N}.$$

$$w_{2q} \equiv z'' + 2c(3q^2 z'' + qty'') \pmod{c^2}, \quad w_{2q+1} \equiv tz'' + c[6q(q+1)tz'' + (2q+1)y''] \pmod{c^2}, \quad q \in \mathbb{N}.$$

Then we claim:

**Lemma (21.6.4.6).** Let  $k \in \mathbb{Z}_{\geq 2}$  be the minimal number s.t. there exists  $t \in \mathbb{Z}_+$  s.t.  $(1, 3, c_k, c_t)$  is a Diophantine sequence, then with  $c = c_k$ ,

- If  $v_{2m} = w_{2n}$  has a solution, then  $z' = z'' = \pm 1$ .
- If  $v_{2m+1} = w_{2n}$  has a solution, then  $z'' = sz' = \pm s$ .
- If  $v_{2m} = w_{2n+1}$  has a solution, then  $z' = tz'' = \pm t$ .
- If  $v_{2m+1} = w_{2n+1}$  has a solution, then  $z'/t = z''/s = \pm 1$ .

┘

*Proof:* Cf. [D-P98]P294. ? Use minimality of  $k$ . □

After this, it is easy to show that  $v_{2m} = w_{2n+1}$  or  $v_{2m+1} = w_{2n}$  has no solutions by parity reason (notice  $c$  is even). For the next two cases:

**Lemma (21.6.4.7).**

- If  $v_{2m} = w_{2n}$ , then

$$0 < 2m \log(s + \sqrt{c}) - 2n \log(t + \sqrt{3c}) + \log \frac{\sqrt{3}(\sqrt{c} \pm 1)}{\sqrt{c} \pm \sqrt{3}} < \frac{3}{2}(s + \sqrt{c})^{-4m}.$$

- If  $v_{2m+1} = w_{2n+1}$ , then

$$0 < (2m+1) \log(s + \sqrt{c}) - (2n+1) \log(t + \sqrt{3c}) + \log \frac{\sqrt{3}(2\sqrt{c} \pm t)}{2\sqrt{c} \pm s\sqrt{3}} < 22(s + \sqrt{c})^{-4m-2}.$$

In particular, in both cases,  $m \geq n$ . ┘

*Proof:* Cf. [D-P98]P298. ? The derivation is similar to the  $k = 1$  case. □

**Cor. (21.6.4.8).**

- If  $v_{2m} = w_{2n}$ , and  $m, n \neq 0$ , then  $n > 0.105\sqrt{c}$ .
- If  $v_{2m+1} = w_{2n+1}$ , and  $m, n \neq 0$ , then  $n > 0.156\sqrt[4]{c}$ .

┘

*Proof:* Cf. [D-P98]P300. ? □

Then it follows from (21.6.4.7) and Baker's theory (19.9.1.11) that if  $v_{2m} = w_{2n}$ , then

$$\frac{3}{2}m \log c < 3.822 \cdot 10^{15} \cdot 0.33 \log c \cdot 0.38 \log c \cdot 0.64 \log c \cdot \log(2m),$$

thus

$$\frac{m}{\log(2m)} < 2.045 \cdot 10^{14} (\log c)^2.$$

Combining(21.6.4.8), we get

$$m < 2.045 \cdot 10^{14} \log(2m) [\log(91m^2)]^2,$$

which implies  $m < 9 \cdot 10^{19}$  and so  $c < 8 \cdot 10^{41}$  and  $k \leq 36$ .

Similarly, if  $v_{2m+1} = w_{2n+1}$ , then

$$2m \log c < 3.822 \cdot 10^{15} \cdot 0.33 \log c \cdot 0.38 \log c \cdot 0.73 \log c \cdot \log(2m+1),$$

thus

$$\frac{m}{\log(2m+1)} < 1.75 \cdot 10^{14} (\log c)^2.$$

Combining(21.6.4.8), we get

$$m < 1.75 \cdot 10^{14} \log(2m+1) [\log(1689m^4)]^2,$$

which implies  $m < 4 \cdot 10^{20}$  and so  $c < 5 \cdot 10^{85}$  and  $k \leq 75$ .

So to complete the proof, it suffices to show that:

**Lemma (21.6.4.9).**

- For  $k \leq 36$ , the equation  $v_{2m} = w_{2n}$  with  $0 \leq n \leq m < 9 \cdot 10^{19}$  has only one solution  $m = n = 0$ .
- For  $k \leq 75$ , the equation  $v_{2m+1} = w_{2n+1}$  with  $0 \leq n \leq m < 4 \cdot 10^{20}$  has only one solution  $m = n = 0$  (in which case  $z = 2c \pm st$ , corresponding to  $d = c_{k \pm 1}$ , in view of(21.6.4.3)).

┘

*Proof:* Use(20.2.4.8) twice, with  $M = 9 \cdot 10^{19}$  and  $M = 9$ . Cf.[D-P98]P303.

□

□

**Thm. (21.6.4.10) [Bo-Alain-Volker].** There are no Diophantine sequences of length 5.

┘

*Proof:* Cf.[There is no Diophantine quintuple. (English summary) Trans. Amer. Math. Soc. 371 (2019), no. 9, 6665–6709.]

□

### Siegel's Theorem

References are [Sie35, C-Z02].

**Thm. (21.6.4.11) [Siegel].** Let  $F \in \mathbf{NField}$ ,  $\Sigma_F^\infty \subset_{\text{fin}} S \subset \Sigma_F$  and  $\overline{C} \in \mathcal{C}ur^{\text{smProj}}/F$ . Let  $C \subset \overline{C}$  be an affine non-empty subset. Suppose  $g(\overline{C}) > 0$  or  $\#\overline{C} \setminus C \geq 3$ , then  $\#C(\mathcal{O}_{F,S}) < \infty$ .

┘

*Proof:* Firstly, it suffices to prove for  $\overline{C}$  smooth: As the normalization is finite and birational(7.4.2.8), by omitting f.m. points, we may assume that all rational points of  $C$  lift to rational points of  $C$ . Moreover, if  $\Gamma(C_{\text{sm}}) = \Gamma(C)[f_1, \dots, f_r]$ , where  $f_i$  are integral over  $C_{\text{sm}}$ . We can enlarge  $S$  s.t.  $C$  has an integral model over  $\mathcal{O}_{F,S}$ , and each  $f_i$  is integral over  $\Gamma(C/\mathcal{O}_{F,S})$ . Then each  $\mathcal{O}_{F,S}$ -points of  $C$  lifts to  $C_{\text{sm}}$ , and the assertion reduces to  $C_{\text{sm}}$ .

For  $g(\overline{C}) \geq 2$ , this is a special case of Faltings' Theorem(21.7.10.2).

For  $g = 1$ , the assertion follows from(21.3.7.1).

For  $g = 0$ , then  $\#\tilde{C} \setminus C_{\text{sm}} \geq 3$  (in fact, any other cases can be reduced to the case  $\#\overline{C} \setminus C_{\text{sm}} \geq 3$ , Cf.[B-G06]P184.) Then ?

□

**Remark (21.6.4.12).** By using Baker's theorem, we can make this theorem effective. ?

┘

### $S$ -Unit Equations

References are [Eve86] and [B-G06]

**Thm. (21.6.4.13) [S-Unit Equation, Evertse[Eve86]].** Let  $F \in \mathbf{NField}$ ,  $\Sigma_F^\infty \subset_{\text{fin}} S \subset \Sigma_F$  and  $a, b \in F^\times$ , then the equation

$$aX + bY = 1$$

has at most  $3 \cdot 7^{[F:\mathbb{Q}] + 2\#S}$  many solutions with  $X, Y \in \mathcal{O}_{F,S}^*$ . ┘

*Proof:*

□

**Thm. (21.6.4.14) [Effective  $S$ -Unit Equation].** The  $S$ -unit equation theorem can be made effective, Cf. [Sil99]P289 or [B-G06].? ┘

*Proof:*

□

**Thm. (21.6.4.15) [Finiteness of Integral Points on Hyperelliptic Curves, Siegel].** Let  $F \in \mathbf{NField}$ ,  $\Sigma_F^\infty \subset_{\text{fin}} S \subset \Sigma_F$  and  $f(X) \in \mathbb{F}[X]$  be a separable polynomial of degree  $d \geq 3$ , then the equation

$$Y^2 = f(X)$$

has only f.m. solutions with  $X, Y \in \mathcal{O}_{F,S}^*$ . ┘

*Proof:* Enlarging  $F$ , we may assume that  $f$  splits as  $f(x) = a(x - \alpha_1) \dots (x - \alpha_d)$ . By enlarging  $S$ , we may assume that

- $a \in \mathcal{O}_{F,S}^*$ ,
- $\alpha_i - \alpha_j \in \mathcal{O}_{F,S}^*$  for any  $i \neq j$ ,
- $\text{cl}(\mathcal{O}_{F,S}) = 1$ .

Suppose  $x, y \in \mathcal{O}_{F,S}$  s.t.  $y^2 = f(x)$ , then for any  $\mathfrak{p} \in \text{Spec}(\mathcal{O}_{F,S})$ ,  $\mathfrak{p}$  cannot divide two  $x - \alpha_i$  and  $x - \alpha_j$ . And also  $v_{\mathfrak{p}}(x - \alpha_i)$  is odd. So for each  $i$ , there are  $z_i \in \mathcal{O}_{F,S}$  and  $b_i \in \mathcal{O}_{F,S}^*$  s.t.  $x - \alpha_i = b_i z_i^2$ . By passing to the extension  $E/F$  adjoining all square roots of  $\mathcal{O}_{F,S}$  (which is a finite extension by Dirichlet's  $S$ -unit theorem), we may assume that  $b_i = 1$ . Then

$$\alpha_j - \alpha_i = (z_i - z_j)(z_i + z_j),$$

thus each  $z_i \pm z_j \in \mathcal{O}_{F,S}^*$ . Then the finiteness of  $S$ -unit equation (21.6.4.14)

$$\frac{z_1 \pm z_2}{z_1 - z_3} \mp \frac{z_2 \pm z_3}{z_1 - z_3} = 1$$

implies that there are only f.m. possibilities for  $\frac{z_1 \pm z_2}{z_1 - z_3}$ . Multiplying them we find that there are only f.m. possibilities for  $(\alpha_2 - \alpha_1)/(z_1 - z_3)^2$ . Thus there are only f.m. possibilities for  $z_1 - z_3$ , and the same for  $z_1 = \frac{1}{2}(z_1 - z_3 + \frac{\alpha_3 - \alpha_1}{z_1 - z_3})$ . Thus there are only f.m. possibilities of  $x$ , and also  $y$ . □

**Thm. (21.6.4.16) [S-Unit Equation over Function Fields, Mason/Silverman[Sil84]].** Let  $k \in \mathbf{Field}$ ,  $k = \bar{k}$ ,  $C \in \text{Cur}^{\text{SmPrpr}}/k$  with genus  $g$ ,  $K = R(C)$ , and  $\emptyset \subset_{\text{fin}} S \subset C(k)$ . Suppose  $u, v \in \mathcal{O}_{F,S}^*$  s.t.  $u + v = 1$ , then either  $u \in k^*$  or

$$\deg_s(u) \leq 2g - 2 + \#S.$$

Notice this inequality is sharp by taking  $C = \mathbb{P}^1$ ,  $S = \{0, \infty\} \cup \mu_n$  and  $u = T^n$ . ┘

*Proof:* Assume  $u \notin k^*$ . Choose  $n \in \mathbb{Z}$  s.t.  $(n, \text{char } k) = 1$  if  $\text{char } k > 0$ . Consider  $x = u^{1/n}, y = v^{1/n}$ , and consider  $K' = K(x, y)$ , corresponding to some non-singular complete curve  $C'/k$  of genus  $g'$  with a map  $\varphi : C' \rightarrow C$  whose degree divides  $n^2$ , thus separable.

As  $u, v$  are  $S$ -units,  $\varphi$  are unramified outside  $S$ . Thus the Riemann-Hurewitz(7.13.1.33) implies that

$$2g' - 2 = \deg(\varphi)(2g - 2) + \sum_{p \in \varphi^{-1}(S)} (e_p(\varphi) - 1) \leq \deg(\varphi)(2g - 2 + \#S).$$

There is also a natural map  $\psi : C' \rightarrow F_n$  where  $F_n : x^n + y^n = 1$  is the Fermat curve. Then Riemann-Hurewitz implies that

$$2g' - 2 \geq \deg_s(\psi)(2g(F_n) - 2) = (n^2 - 3n) \deg_s(\psi).$$

Finally, if

$$\lambda : F_n \rightarrow \mathbb{P}^1 : (X, Y) \mapsto X^n$$

is the separable map of degree  $n^2$ , then there is a commutative diagram

$$\begin{array}{ccc} C' & \xrightarrow{\varphi} & C \\ \downarrow \psi & & \downarrow u \\ F_n & \xrightarrow{\lambda} & \mathbb{P}^1 \end{array}$$

which implies that  $n^2 \deg_s(\psi) = \deg_s(u) \deg(\varphi)$ . Combining the above, we get that

$$(1 - 3/n) \deg_s(u) \leq 2g - 2 + \#S.$$

The desired assertion then follows by letting  $n \rightarrow \infty$ . □

### abc-Conjecture

**Conj. (21.6.4.17) [Strong *abc*-Conjecture, Masser-Oesterlé1985].** Given  $F \in \mathbf{NField}$ , for any  $\varepsilon > 0$ , there is a constant  $C_\varepsilon$  that for any  $a, b, c \in \mathcal{O}_F$  that  $a + b = c$ ,

$$H_F([a, b, c]) \leq C_\varepsilon |\text{Nm}_{K/\mathbb{Q}}(\prod_{\mathfrak{p}|abc} \mathfrak{p})|^{1+\varepsilon}.$$

┘

*Proof:* □

## 5 Ternary Diophantine Equations

**Def. (21.6.5.1) [Ternary Diophantine Equations].** A **ternary diophantine equation** is a Diophantine equation of the form

$$\{x, y, z \in \mathbb{Z} \mid Ax^p + By^q = Cz^r\}$$

where  $A, B, C \in \mathbb{Z}^\times$ . A **non-trivial solution** is a solution that  $xyz \neq 0$ . A **primitive solution** is a solution s.t.  $\gcd(x, y, z) = 1$ . ┘

**Prop. (21.6.5.2) [Pythagorean Triples].** A triple  $(x, y, z) \in \mathbb{Z}^3$  s.t.  $\gcd(x, y, z) = 1$  and  $x^2 + y^2 = z^2$  is called a **Pythagorean triple**. Then for any  $a > b \in \mathbb{Z}_+$  s.t.  $\gcd(a, b) = 1$  and  $a \not\equiv b \pmod{2}$ ,

$$(x, y, z) = (a^2 - b^2, 2ab, a^2 + b^2)$$

is a Pythagorean triple. Conversely, any Pythagorean triple is of this form (after possibly switching  $x$  and  $y$ ).  $\square$

*Proof:* It is easy to verify that  $(a^2 - b^2, 2ab, a^2 + b^2)$  is a Pythagorean triple. Conversely, for a Pythagorean triple  $(x, y, z)$ , we may assume  $y \neq 2$ , and  $y^2 = (z - x)(z + x)$ . Notice  $\gcd(z - x, z + x) | 2$ , but  $2 \nmid y$ , so  $\gcd(z - x, z + x) = 1$ . Thus there exists  $r, s \in \mathbb{Z}_+$  s.t.

$$z + x = r^2, z - x = s^2.$$

Then  $r \equiv s \pmod{2}$ . Denote  $a = \frac{r+s}{2}, b = \frac{r-s}{2} \in \mathbb{Z}$ , then  $z = \frac{r^2+s^2}{2} = a^2 + b^2, x = \frac{r^2-s^2}{2} = 2ab$ , and  $y = rs = a^2 - b^2$ .  $\square$

**Def. (21.6.5.3) [Hellegouarch-Frey Curve].** Let  $a, b, c \in \mathbb{Z}$  satisfy  $a^p + b^p = c^p, p \geq 3 \in \text{Prime}, abc \neq 0$ , the **Frey curve** for  $a, b, c$  is the elliptic curve  $E_{a^p, b^p, c^p} \in \text{EllCur}/\mathbb{Q}$  defined by the Weierstrass equation

$$W_{a^p, b^p, c^p} : y^2 = x(x + a^p)(x - b^p).$$

Then it satisfies:

- $\mathfrak{D}_{W_{a^p, b^p, c^p}} = 16a^{2p}b^{2p}(a^p + b^p)^2 = 16(abc)^{2p}$ .
- $\Delta_{E_{a^p, b^p, c^p}/\mathbb{Q}}^{\min}$  satisfies  $\Delta_{a^p, b^p, c^p}^{\min} \geq \frac{|abc|^{2p}}{2^8}$  by (21.3.4.26).

$\square$

*Proof:*  $\square$

**Prop. (21.6.5.4) [Galois Representation of the Hellegouarch-Frey Curve].** Let  $\rho_{a^p, b^p, c^p; p} : \text{Gal}_{\mathbb{Q}} \rightarrow \text{GL}(2; \mathbb{F}_p)$  be the mod  $p$  Galois representation of  $\text{Gal}_{\mathbb{Q}}$  corresponding to the Hellegouarch-Frey curve  $E_{a^p, b^p, c^p}$  (21.6.5.3), and let  $\bar{\rho}_{a^p, b^p, c^p; p}$  be its reduction modulo  $p$ . Suppose that  $a \equiv -1 \pmod{4}$  and  $2|b$ , then

- $\bar{\rho}_{a^p, b^p, c^p; p}$  is absolutely irreducible.
- $\bar{\rho}_{a^p, b^p, c^p; p}$  is odd.
- $\bar{\rho}_{a^p, b^p, c^p; p}$  is unramified outside  $2p$ , finite flat at  $p$  (30.3.2.3), and semistable at 2?.

$\square$

*Proof:* ? Cf. [Serre, Galois representations arising from Modular Forms] Section 4.1..  $\square$

**Remark (21.6.5.5).** One suspects that such a Galois representation doesn't even exist.  $\square$

**Thm. (21.6.5.6) [Fermat's Last Theorem, Ribet [Rib90]/Wiles [Wil95]/Wiles-Taylor [T-W95]].** If  $p \in \text{Prime}_{\geq 5}$ , then there are no integral solution to the equation  $a^p + b^p = c^p$ .  $\square$

*Proof:* If there exists an integral solution s.t.  $abc \neq 0$ , consider the Hellegouarch-Frey curve  $E_{a^p, b^p, c^p}$  (21.6.5.3), then by (21.6.5.4),  $\bar{\rho}_{a^p, b^p, c^p; p}$  is absolutely irreducible, odd and unramified outside  $2p$ , and flat at  $p$ .

Then it follows from modularity theorem (30.4.3.7) that  $\bar{\rho}_{a^p, b^p, c^p}$  is attached to some newform  $f \in \text{SF}_2^{\text{new}}(\Gamma_0(2p))$ . Then it follows from Ribet's level-lowering theorem (30.3.2.6) that  $\bar{\rho}_{a^p, b^p, c^p} = \bar{\rho}_{g, p}$  for some newform  $g \in \text{SF}_2^{\text{new}}(\Gamma_0(2))$ . But there is no cuspidal form of level  $\Gamma_0(2)$  and weight 2 because  $X_0(2) = \mathbb{P}^1$ , and  $H^0(\mathbb{P}^1, \Omega_{\mathbb{P}^1}^1) = 0$ , contradiction.  $\square$

**Remark (21.6.5.7) [Szpiro's Conjecture and Fermat's Last Theorem].** The Szpiro's conjecture (21.1.2.22) implies Fermat's last theorem for sufficiently large  $n$  (depending on the effectiveness of Szpiro's conjecture).  $\lrcorner$

*Proof:* Let  $a, b, c \in \mathbb{Z}$  satisfy  $a^n + b^n = c^n, n \geq 2, abc \neq 0$ , the conductor  $N_{a,b,c}$  of the Frey's curve (21.6.5.3)  $E_{a,b,c}$  satisfies  $N_{a,b,c} \leq 2^8(abc)$  by (21.3.4.26). Szpiro's conjecture implies

$$\frac{|abc|^{2n}}{2^8} \leq |\Delta_{a,b,c}^{\min}| \leq \kappa_1 N_E^7 \leq 2^{56} \kappa_1 |abc|^7,$$

so  $|abc|^{2n-7} \leq 2^{64} \kappa$ . As  $|abc| \geq 2$ , this gives an upper bound for  $n$ .  $\square$

**Prop. (21.6.5.8) [Fermat's Curve over  $\mathbb{F}_p$ ].** For any  $d \in \mathbb{Z}_+$ , the affine **Fermat's curve**  $X^d + Y^d = 1$  has a solution modulo  $p$  s.t.  $XY \neq 0$ , for any  $p \in \mathbf{Prime}$  sufficiently large.  $\lrcorner$

*Proof:* This follows from Weil's conjecture, because the number of solutions of the Fermat's curve is  $N_p = p + O(\sqrt{p})$ .  $\square$

**Prop. (21.6.5.9) [Fermat's Equation in Function Case].** If  $n \geq 2$ , then any non-trivial solutions to the equation in  $\mathbb{C}[T]$  of

$$X^n + Y^n = Z^n$$

are of the form  $n = 2, X = (a^2 - b^2)/2, Y = ab, Z = (a^2 + b^2)/2$ , where  $a, b, c \in \mathbb{C}[T]$ .  $\lrcorner$

*Proof:* The  $n = 2$  case is easy. If  $n > 2$ , we show there are no non-trivial solutions: Differentiate it to get:

$$X^{n-1}X' + Y^{n-1}Y' = Z^{n-1}Z',$$

And cancelling  $X^{n-1}$ , we get

$$Y^{n-1}(X'Y - Y'X) = Z^{n-1}(X'Z - Z'X).$$

Now  $X'Z - Z'X \neq 0$  because  $X, Z$  are not linearly equivalent, and  $Y, Z$  is coprime, so  $Y^{n-1} | X'Z - Z'X$ . But then if we assume  $\dim Y \geq \dim X$ , then  $(n-1)\dim Y \leq 2\dim Y - 1$ , which implies  $n \leq 2$ , contradiction.  $\square$

**Prop. (21.6.5.10) [Darmon].**

- For  $n \in \mathbb{Z}_{\geq 3}$ , the equation  $\{x, y, z \in \mathbb{Z} | x^n + y^n = 2z^n\}$  has no non-trivial primitive solution.
- For  $n \in \mathbb{Z}_{\geq 4}$ , the equation  $\{x, y, z \in \mathbb{Z} | x^n + y^n = z^2\}$  has no non-trivial primitive solution.
- For  $n \in \mathbb{Z}_{\geq 3}$ , the equation  $\{x, y, z \in \mathbb{Z} | x^n + y^n = z^3\}$  has no non-trivial primitive solution.

$\lrcorner$

*Proof:*

2: The case  $n = 4$  is proved by Fermat. The case  $n = 5, 6, 9$  is proved by [Poonen, Some diophantine equations of the form]. Thus it suffices to prove the case  $n = p \in \mathbf{P}_{\geq 7}$ . If  $2|ab$ , assume  $2|a$ , and  $c \equiv 1 \pmod{4}$ . And if  $2 \nmid ab$ , by replacing  $c$  with  $-c$  if necessary, we can assume  $a \equiv -1 \pmod{4}$ . Then consider the Frey curve  $E \in \mathbf{EllCur}/\mathbb{Q}$  given by the Weierstrass equation

The case  $n = 4$  is proved by Lucas [Theory of Numbers, Dickson]P630. The case  $n = 5$  is proved by [Poonen, Some diophantine equation of the form].  $\square$

**Prop. (21.6.5.11) [Darmon].** For  $p \in \text{Prime}_{\geq 11}$ , the ternary Diophantine equation

$$\{x, y, z \in \mathbb{Z} \mid x^4 - y^4 = z^p\}$$

has no non-trivial primitive solution s.t.  $z \in 2\mathbb{Z}$ . And it has no non-trivial primitive solution if  $p \equiv 1 \pmod{4}$ .  $\perp$

*Proof:* Let  $(a, b, c)$  be a solution of this equation. If  $c$  is odd, we can assume  $a$  is odd and  $b$  is even (otherwise change  $c$  to  $-c$ ). Then  $a - b, a + b, a^2 + b^2$  are all  $p$ -th powers up to powers of 2. Consider the Frey curve  $E \in \text{EllCur}/\mathbb{Q}$  given by the Weierstrass equation

$$W : y^2 = x(x + (a + b)^2)(x - (a - b)^2) = x^3 + 4abx^2 - (a^2 - b^2)^2x.$$

Then

$$j(E) = 2^6 \frac{(a^2 + 3b^2)^3(3a^2 + b^2)^3}{c^{2p}(a^2 - b^2)^3}, \mathfrak{D} = 2^6 c^{2p}(a^2 - b^2)^2.$$

Then the conductor  $N_E$  of  $E$  can be calculated by Tate's algorithm ?.

$$\text{ord}_p(N_E) = \begin{cases} 1 & , p \mid c \\ 0 & , p \neq 2, p \nmid c \\ 5 & , p = 2, 2 \nmid c \end{cases}$$

By a result of Mazur ?,  $\bar{\rho}_{E,2}$  is irreducible, and by [Serre, Sur les repr'esentations modulaires de degre 2 de  $\text{Gal}(\bar{\mathbb{Q}}/\mathbb{Q})$ ],  $\rho$  is unramified outside  $2p$ , and is finite at  $p$ .  $\square$

### Catalan's Equation

References are [Bil04], [Mih04] and [Catalan's Conjecture, Schoof].

**Notation (21.6.5.12).**

- Use notations on the Cyclotomic fields  $\mathbb{Q}(\zeta_p)$  as in q-Primary Units.

$\perp$

**Thm. (21.6.5.13) [Catalan's Conjecture, Lebesgue/Cassels/Ko/Tijdeman/Mihăilescu].**

$(X, Y, U, V) = (3, 2, 2, 3)$  is the only solution of the equation

$$X^U - Y^V = 1$$

with  $X, Y, U, V \in \mathbb{Z}_+, U, V \geq 2$ .  $\perp$

*Proof:* It suffices to prove for  $p = U, q = V \in \text{Prime}$ ,

The case  $q = 2$  is excluded by (21.6.5.14). The case  $p = 2$  is treated by (21.6.5.15). Thus it suffices to consider  $p, q \geq 3$ , and show that this equation has no non-zero solution in  $\mathbb{Z}$ .

Suppose  $(x, y, p, q)$  is a solution. There is clearly no solution with  $p = q$ , so by changing  $(x, y, p, q)$  to  $(-y, -x, q, p)$  if necessary, we may assume that  $p > q$ . Then by (21.6.5.21), we have  $q > 10^5$ , and by (21.6.5.22), we have  $p \not\equiv 1 \pmod{q}$ . Thus we can use the notation as in q-Primary Units.

Then (21.6.5.24) and (21.6.5.25) implies that  $N^\perp(1 + \mathfrak{c})I_1I_3 = 0$ . As  $R$  is a product of fields, this implies  $I_1I_3 \subset ((1 + \mathfrak{c})N^\perp)^\perp = (1 - \mathfrak{c}) + (N) = I_1I_2I_3$  (33.1.4.6). But because  $I_2$  are prime to  $I_1I_3$ ,

$$1 \subset I_2 + I_1I_3 = I_2 + I_1I_2I_3 = I_2.$$

So  $I_2 = 0$ , which means that  $C = C_p$ . So all the  $p$ -cyclotomic units are  $q$ -primary (33.1.4.4). But then this implies that  $p < q$  by (33.1.4.5), contradiction.  $\square$

**Lemma (21.6.5.14) [Lebesgue1850].** For  $p \in \text{Prime}$ , the equation  $x^p - y^2 = 1$  has no solution in  $\mathbb{Z}_+$ .  
 $\lrcorner$

*Proof:* We may assume that  $p \neq 2$ . It is clear that  $y$  is even and  $x$  is odd. In particular,  $1 + iy$  and  $1 - iy$  are coprime in  $\mathbb{Z}[i]$ . As  $\mathbb{Z}[i]$  is a PID (19.3.1.48), there exists  $c \in \mathbb{Z}[i]$  s.t.  $1 + iy = c^p$ . Thus  $c + \bar{c}|c^p + \bar{c}^p = \pm 2$ . Because  $c + \bar{c}$  is even, this means that  $c + \bar{c} = \pm 2$ . It follows that  $c = \pm(1 + bi)$ .

Because  $y$  is even,  $c$  is not divisible by  $1 + i$ , thus also  $b$  is even. The equation

$$(1 + bi)^p + (1 - bi)^p = \pm 2$$

shows that in fact  $(1 + bi)^p + (1 - bi)^p = 2$ . So

$$\binom{p}{2}(bi)^2 + \binom{p}{4}(bi)^4 + \dots + \binom{p}{p-1}(bi)^{p-1} = 0.$$

But the first term has 2-adic order strictly smaller than the rest: For any  $k \geq 4$  even,

$$\binom{p}{k} \binom{p}{2}^{-1} (bi)^{k-2} = \binom{p-2}{k-2} \frac{2}{k(k-1)} (bi)^{k-2}$$

has positive 2-adic order. Thus the first term vanishes, contradiction.  $\square$

**Lemma (21.6.5.15) [Ko].** The equation  $x^2 - y^n = 1$  has only one solution:  $(x, y, n) = (3, 2, 3)$ .  
 $\lrcorner$

*Proof:* [New Proof of Ko Chao's Theorem]. ?  $\square$

**Lemma (21.6.5.16) [Cassell's Relations].** For any solution  $(x, y, p, q)$  to Catalan's equation (21.6.5.13) with  $p > q \in \text{Prime}_{\geq 3}$ , there is no solution with  $(p, \frac{X^p-1}{X-1}) = 1$  or  $(q, \frac{Y^q-1}{Y-1}) = 1$ . In particular, there exists  $a, b \in \mathbb{Z}, u, v \in \mathbb{Z}_+$  s.t.  $(pa, u) = (qb, v) = 1$ , and

$$x - 1 = p^{q-1}a^q, \quad \frac{x^p - 1}{x - 1} = pv^q, \quad y = pav.$$

$$y + 1 = q^{p-1}b^p, \quad \frac{y^q + 1}{y + 1} = qu^p, \quad x = qbu.$$

$\lrcorner$

*Proof:* [Cassels, On the equation  $a^x - b^y = 1$ , 953, 1960] ?.  $\square$

**Lemma (21.6.5.17).** For any solution  $(x, y, p, q)$  to Catalan's equation (21.6.5.13) with  $p > q \in \text{Prime}_{\geq 3}$ ,  $\lambda = \frac{x - \zeta_p}{1 - \zeta_p} \in \mathbb{Z}[\zeta_p]$ , and  $(\lambda)$  is a  $p$ -th power of an ideal of  $\mathbb{Z}[\zeta_p]$ .  
 $\lrcorner$

*Proof:* Since  $p|x - 1$  by Cassel's relation, we have  $\mathfrak{p} = (1 - \zeta_p)|x - \zeta_p$ , but  $\mathfrak{p}^2 \nmid x - \zeta_p$ . Thus  $\lambda$  is an algebraic integer not divisible by  $\mathfrak{p}$ . Thus the same is true for its conjugate  $\lambda^\sigma$ .

Now the identities  $(1 - \lambda^\sigma)\lambda^\sigma - (1 - \lambda^\tau)\lambda^\tau = \zeta_p^\tau - \zeta_p^\sigma$  implies that for  $\sigma \neq \tau \in \text{Gal}(\mathbb{Q}(\zeta_p)/\mathbb{Q})$ , the greatest common divisor of  $\lambda^\sigma$  and  $\lambda^\tau$  divides  $\mathfrak{p}$ . Thus the numbers  $\lambda^\sigma$  are pairwise coprime.

Cassel's relation also implies that  $\prod_\sigma \lambda^\sigma = v^q$ . As the  $\lambda^\sigma$  are pairwise coprime, each of them is a  $q$ -th power of an ideal.  $\square$

**Lemma (21.6.5.18)**[double Wieferich Relations, Mihăilescu]. For any solution  $(x, y, p, q)$  to Catalan's equation(21.6.5.13) with  $p > q \in \text{Prime}_{\geq 3}$ , we have  $q^2|x$ , and also

$$p^{q-1} \equiv 1 \pmod{q^2}.$$

┘

*Proof:* Firstly we show that for any  $\Theta \in (1 - \mathfrak{c})\mathcal{I}$  where  $\mathcal{I}$  is the Stickelberger ideal(33.3.2.4), the element  $(x - \zeta_p)^\Theta$  is a  $q$ -th power in  $\mathbb{Q}(\zeta_p)$ : Let  $\Theta = (1 - \mathfrak{c})\Theta'$  and  $\lambda = (x - \zeta_p)/(1 - \zeta_p)$ . Then by(21.6.5.17),  $(\lambda) = \mathfrak{a}^q$  for some  $\mathfrak{a} \in \text{Ideal}(\mathbb{Z}[\zeta_p])$ . By Stickelberger's theorem(33.3.2.6),  $\mathfrak{a}^{\Theta'} = (\alpha)$  is principal. So  $(\lambda^{\Theta'}) = (\alpha)^p$ , or equivalently, there exists  $\eta \in \mathbb{Z}[\zeta_p]^*$  s.t.  $\lambda^{\Theta'} = \eta\alpha^p$ . Then we have:

$$(x - \zeta)^\Theta = \left(\frac{1 - \zeta_p}{1 - \zeta_p}\right)^{\Theta'} \frac{\eta}{\bar{\eta}} \left(\frac{\alpha}{\bar{\alpha}}\right)^p.$$

Both  $\frac{1 - \zeta_p}{1 - \zeta_p}$  and  $\frac{\eta}{\bar{\eta}}$  are roots of unity because they are algebraic integers and all conjugates has absolute value 1(19.3.1.12). In particular, they are  $q$ -th powers. So the assertion follows.

Then notice that  $(1 - \zeta_p x)^\Theta$  is also a  $q$ -th power. On the other hand,  $q|x$ (by Cassel's relation(21.6.5.16)) implies that  $(1 - \zeta_p x)^\Theta \equiv 1 \pmod{q}$ . But then because it is a  $q$ -th power and  $q$  is unramified in  $\mathbb{Q}(\zeta_p)$ , we have  $(1 - \zeta_p x)^\Theta \equiv 1 \pmod{q^2}$ .

Notice then that if  $\Theta = \sum_{\sigma} n_{\sigma}\sigma$ ,

$$(1 - \zeta_p x)^\Theta \equiv 1 - x \sum_{\sigma} n_{\sigma} \zeta_p^{\sigma} \pmod{q^2}.$$

If  $q^2 \nmid x$ , then  $q|n_{\sigma}$  for any  $\sigma$ .

But for  $\Theta = (1 - \mathfrak{c})\Theta_2$ (33.3.2.5),  $\Theta = -\sigma_1^{-1} - \dots - \sigma_{(p-1)/2}^{-1} + \sigma_{(p+1)/2}^{-1} + \dots + \sigma_{p-1}^{-1}$ , contradiction.

For the last assertion, notice that by Cassel's relation(21.6.5.16),  $p^{q-1}a^q \equiv -1 \pmod{q^2}$ . Thus  $a^q \equiv -1 \pmod{q}$ . But then  $a^q \equiv -1 \pmod{q^2}$ , which in turn implies that  $p^{q-1} \equiv 1 \pmod{q^2}$ .  $\square$

**Lemma (21.6.5.19)**[Tijdeman's Inequality, [Tij76]]. For any solution  $(x, y, p, q)$  to Catalan's equation(21.6.5.13) with  $p > q \in \text{Prime}_{\geq 3}$ , we have

$$p \leq 24.34q \left( \max \left( \log \frac{p+1}{\log q} + 0.14, 21 \right) \right)^2 \cdot \log q.$$

┘

*Proof:* Cf.[Catalan's Conjecture, Bilu]P9. ?

$\square$

**Lemma (21.6.5.20).** For any solution  $(x, y, p, q)$  to Catalan's equation(21.6.5.13) with  $p > q \in \text{Prime}_{\geq 3}$ , either  $q < 28000$  or  $p \leq 4q^2$ .  $\square$

*Proof:* Use Tijdeman's Inequality, [Tij76]. If  $\log \frac{p+1}{\log q} + 0.14 \leq 21$ , then  $p < 10734q \log q$ . Suppose  $p > 4q^2$ , then  $q < 683.5 \log q$ , which implies that  $q < 28000$ .

If  $\log \frac{p+1}{\log q} + 0.14 \geq 21$ , then

$$p \leq 24.34q \left( \log \frac{p+1}{\log q} + 0.14 \right)^2 \cdot \log q.$$

Suppose  $q \geq 28000$  and  $p > 4q^2$ , then  $0.14 - \log \log q \leq -2.18$ , and

$$\frac{p}{(\log(p+1) - 2.18)^2} \leq 24.34q \log q.$$

But for  $p \geq 67$ , the LHS is an increasing function of  $p$ , so substituting  $p$  by  $4q^2$ , we get

$$q \leq 6.085(\log(4q^2 + 1) - 2.18)^2 \log q.$$

$q \geq 28000$  Implies that  $\log(4q^2 + 1) - 2.27 \leq \log q^2$ , so we get  $q \leq 24.34(\log q)^3$ , which is however not true for  $q \geq 28000$ .  $\square$

**Lemma (21.6.5.21) [Lower Bounds for  $p, q$ , Mignotte-Roy [M-R95]].** For any solution  $(x, y, p, q)$  to Catalan's equation (21.6.5.13) with  $p > q \in \text{Prime}_{\geq 3}$ , we have

$$p, q \geq 10^5.$$

┘

*Proof:* Cf. [Catalan's equation has no new solutions with either exponent less than 10651, Mignotte-Roy] ?.  $\square$

**Lemma (21.6.5.22).** For any solution  $(x, y, p, q)$  to Catalan's equation (21.6.5.13) with  $p > q \in \text{Prime}_{\geq 3}$ , we have  $p \not\equiv 1 \pmod{q}$ .  $\square$

*Proof:* Suppose  $p \equiv 1 \pmod{q}$ , then Weiferich's relation (21.6.5.18) will imply that  $p \equiv 1 \pmod{q^2}$ . So  $p \geq 1 + 4q^2$  because  $1 + q^2, 1 + 2q^2, 1 + 3q^2$  are not primes. But (21.6.5.21) together with (21.6.5.20) imply that  $p \leq 4q^2$ , contradiction.

Notice there are purely algebraic proof of this fact, Cf. [Bilu –Catalan without logarithmic forms] or [Mihailescu, On the class group of cyclotomic extensions in the presence of a solution to Catalan's equation]. ?  $\square$

**Lemma (21.6.5.23) [Lower Bounds on  $x$ , Mignotte-Bugeaud].** For any solution  $(x, y, p, q)$  to Catalan's equation (21.6.5.13) with  $p > q \in \text{Prime}_{\geq 3}$ , we have

$$|x| \geq q^{p-1}.$$

┘

*Proof:* Cassel's relation (21.6.5.16) implies that

$$((-y)^{q-1} - 1) + ((-y)^{q-2} - 1) + \dots + (-y - 1) = q(u^q - 1),$$

thus  $q^{p-1} | (y+1)q(u^q - 1)$ . Then  $u^q \equiv 1 \pmod{q^{p-2}}$ . As the multiplicative group  $(\mathbb{Z}/(q^{p-2}))^*$  has order prime to  $q$  (since  $p > q$ ), this implies that  $u \equiv 1 \pmod{q^{p-2}}$ . In particular,  $u \geq q^{p-2} + 1$ . And then  $|x| = |qbu| \geq q^{p-1}$ .  $\square$

**Lemma (21.6.5.24) [Catalen's Equation and Cyclotomic Units].** For any solution  $(x, y, p, q)$  to Catalan's equation (21.6.5.13) with  $p > q \in \text{Prime}_{\geq 3}$ , we know that  $p \not\equiv 1 \pmod{q}$ , so we can use notations as in q-Primary Units.

Then for any  $\Theta \in N^\perp(1 + \mathfrak{c})I_1 I_3$ , we have  $(x - \zeta_p)^\Theta \in (\mathbb{Z}[\zeta_p])^q$ .  $\square$

*Proof:* Cf. [Catalan's Conjecture, Bilu] P17. ?  $\square$

**Lemma (21.6.5.25) [Catalen's Equation and Cyclotomic Units].** For any solution  $(x, y, p, q)$  to Catalan's equation (21.6.5.13) with  $p > q \in \text{Prime}_{\geq 3}$ , we know that  $p \not\equiv 1 \pmod{q}$ , so we can use notations as in q-Primary Units.

Assume  $q \geq 7$ , and for some  $\Theta \in N^\perp(1 + \mathfrak{c})$ , we have  $(x - \zeta_p)^\Theta \in (\mathbb{Z}[\zeta_p])^q$ , then  $\Theta = 0$ .  $\square$

*Proof:* Cf.[Catalan's Conjecture, Bilu]P17.?

□

**Conj. (21.6.5.26).** For  $k \in \mathbb{Z}_+$ , there exists  $C(k), N(k) \in \mathbb{Z}_+$  s.t. for any  $k$ -itinerary integral sequence  $U_n, V_m$  and  $C \in \mathbb{Z}$ , there are at most  $N(k)$  solutions  $(n, m)$  to the equation  $U_n - V_m = c$ . ┘

*Proof:* Tentative approach: See [Chim-Pink-Ziegler] [DIOPHANTINE EQUATION  $U^n b^m = c$ ] and [An upper bound for the number of solutions of ternary purely exponential diophantine equations, 1, 2]. Prove for when the determining equation has coefficient too large(which implies that some root is large), there are at most  $N(k)$  solutions.

Even generalize to several series.

### 1 Mordell-Weil Theorem

**Prop. (21.7.1.1) [Local Chevalley-Weil Theorem for Abelian Varieties].** Let  $S$  be a Dedekind scheme with function field  $F$ , Let  $A$  be an Abelian variety over  $F$  and  $m \in \mathbb{Z} \cap F^*$ . Let  $s \in S$  be a closed point s.t.  $A$  has good reduction over  $\mathcal{O}_{S,s}$  and  $m \neq 0 \in \kappa(s)$ , then for any  $P \in A(\overline{F})$ , the extension  $\kappa(P)/\kappa([m]P)$  is unramified at all places over  $v$ .  $\lrcorner$

*Proof:* By base change, we may assume  $Q = [m]P$  is a rational point. Let  $w$  be a place of  $\kappa(P)$  that  $w|v_s$  with valuation ring  $R_w$ . As  $A$  has good reduction in  $v$ ,  $A$  extends to an Abelian scheme  $\overline{A}$  over  $\mathcal{O}_{S,s}$ , then the valuation criterion of properness shows  $P$  extends to a  $R_w$ -valued point of  $\overline{A}$ . Now the theorem follows from (20.9.6.18) and (7.6.5.16).  $\square$

**Cor. (21.7.1.2).** Let  $F \in \mathbf{GField}$ ,  $X \in \mathbf{AbVar}/F$  and  $n \in \mathbb{Z} \cap F^*$ ,  $L = K(X[n](\overline{F}))$ , i.e. the composite of all fields in  $\overline{F}$  obtained by adjoining  $[n]^{-1}x, x \in X(F)$ , then  $L$  is a finite field extension of  $F$ .  $\lrcorner$

*Proof:* This follows from the proposition and (20.8.1.8).  $\square$

**Lemma (21.7.1.3) [Weak Mordell-Weil Theorem].** Let  $F \in \mathbf{GField}$  and  $X \in \mathbf{AbVar}/F$ , then for  $n \in \mathbb{Z} \cap F^*$ ,  $X(F)/(n)$  is finite.  $\lrcorner$

*Proof:* This follows from the finiteness of the Selmer group (21.1.8.6) and (21.1.8.4).  $\square$

**Thm. (21.7.1.4) [Mordell[Mor22]/Weil[Wei29]].** Let  $F \in \mathbf{GField}$ , then the group  $X(F)$  of rational points of an Abelian variety  $X$  is f.g.  $\lrcorner$

*Proof:* Because of (21.7.1.3) and (21.1.3.3), this follows from (3.2.4.39) applied to  $M = X(F)$  and the symmetric bilinear form on  $X(F)$  given by (21.1.3.3).  $\square$

**Remark (21.7.1.5) [Computability].** The difficulty of computing  $X(F)$  lies entirely at computing  $X(F)/nX(F)$  for some  $n$ , for which, see (21.1.8.5).  $\lrcorner$

**Cor. (21.7.1.6) [Rank].**  $X(F) \cong \mathbb{Z}^r \oplus X(F)_{\text{tor}}$ , where  $X(F)_{\text{tor}}$  is a finite group, and  $r$  is called the **rank** of  $X$ .  $\lrcorner$

**Cor. (21.7.1.7) [Isogenous Varieties have the same Rank].** Let  $F \in \mathbf{GField}$  and  $X, X' \in \mathbf{AbVar}/F$  are isogenous, then  $\text{rank}(X) = \text{rank}(X')$ . In particular,  $\text{rank}(X) = \text{rank}(\widehat{X})$ .  $\lrcorner$

*Proof:* The isogeny implies  $X(F)/X(F)_{\text{tor}} \rightarrow \widehat{X}(F)/\widehat{X}(F)_{\text{tor}}$  is injective. Thus  $\text{rank}(X) \leq \text{rank}(\widehat{X})$ . The converse follows from (20.9.6.3).  $\square$

### 2 Lang-Néron Theorem

References are [Con06].

**Def. (21.7.2.1) [Regular Extensions].** A field extension  $K/k$  is called **primary** if  $k$  is separably closed in  $K$ . It is called **regular** if it is separable and primary.  $\lrcorner$

**Prop. (21.7.2.2).** Let  $K/k$  be a primary extension, then

- If  $A \in \mathcal{A}b\mathcal{V}ar/k$ , then any Abelian subvariety of  $A_K$  is defined over  $k$ .
- If  $A, B \in \mathcal{A}b\mathcal{V}ar/k$ , then any homomorphism  $A_K \rightarrow B_K$  is defined over  $k$ .

┘

*Proof:*

□

**Prop. (21.7.2.3) [ $K/k$ -Images and  $K/k$ -Traces].** For a field extension  $K/k$ , the  $K/k$ -**image** is a functor  $\mathrm{Im}_{K/k} : \mathcal{A}b\mathcal{V}ar/K \rightarrow \mathcal{A}b\mathcal{V}ar/k$  left adjoint to the base change functor, and  $K/k$ -**trace** is a functor  $\mathrm{tr}_{K/k} : \mathcal{A}b\mathcal{V}ar/K \rightarrow \mathcal{A}b\mathcal{V}ar/k$  right adjoint to the base change functor.

Then for  $K/k$  primary,  $\mathrm{Im}_{K/k}$  and  $\mathrm{tr}_{K/k}$  exist, and are resp. left and right inverses to the base change functor. Also there is a natural isomorphism

$$(\mathrm{Im}_{K/k}(A))^\vee \cong \mathrm{tr}_{K/k}(A^\vee).$$

The adjunction maps are denoted by

$$\tau_{A,K/k} : (\mathrm{tr}_{K/k} A)_K \rightarrow A, \quad \lambda_{A,K/k} : A \rightarrow (\mathrm{Im}_{K/k} A)_K.$$

┘

*Proof:* It suffices to prove for  $\mathrm{Im}_{K/k}$ , and  $\mathrm{tr}_{K/k}$  follows by double duality theorem(20.9.4.3). For this, Cf.[Con06]P16?.

□

**Prop. (21.7.2.4).** Let  $K/k$  be a primary extension and  $A \in \mathcal{A}b\mathcal{V}ar/K$ , the unique map  $\mathrm{tr}_{K/k} A \rightarrow \mathrm{Im}_{K/k} A$  descending  $\lambda_{A,K/k} \circ \tau_{A,K/k}$  is an isogeny.

┘

*Proof:* Cf.[Con06]P22?.

□

**Prop. (21.7.2.5).** Let  $K/k$  be a regular extension(21.7.2.1), then for any  $A \in \mathcal{A}b\mathcal{V}ar/K$ , the finite group  $\ker(\tau_{A,K/k})$  is connected and coconnected. In particular,  $\tau_{A,K/k}(K) : \mathrm{tr}_{K/k}(A)(k) \rightarrow A(K)$  is injective.

┘

*Proof:* ?

□

**Thm. (21.7.2.6) [Lang-Néron].** Let  $K/k$  be a f.g. regular extension and  $A \in \mathcal{A}b\mathcal{V}ar/K$ , then  $A(K)/\mathrm{tr}_{K/k}(A)(k)$  is a f.g. Abelian group.

┘

*Proof:* Cf.[Con06]P23?.

□

**Cor. (21.7.2.7).** Let  $K/k$  be a f.g. regular extension and  $A \in \mathcal{A}b\mathcal{V}ar/k$ , then  $A(K)/A(k)$  is a f.g. Abelian group.

┘

**Thm. (21.7.2.8) [Mordell-Weil over Function Fields].** Let  $k \in \mathbf{Field}$ ,  $C/k$  a complete non-singular curve with  $K = R(C)$ , and  $\mathcal{E} \rightarrow C$  an elliptic surface, and let  $E/K$  be the generic fiber. Suppose  $\mathcal{E}/C$  doesn't split or  $k$  is f.g. over its prime field, then  $E(K)$  is f.g.

┘

*Proof:* Cf.[Advanced Arithmetic Elliptic Curves, Silverman]P230. ? Is this a consequence of Lang-Néron?.

□

**Prop. (21.7.2.9) [Grothendieck].** Let  $K \in \mathbf{Field}$ ,  $K = K^s$ , with prime field  $k$ , then any Abelian variety of CM-type over  $K$  is isogenous to an Abelian variety defined over a finite extension of  $k$ .

┘

*Proof:* Cf.[Oort, The isogeny class of a CM-type abelian variety is defined over a finite extension of the prime field].

□

### 3 Elliptic Curves

#### Torsion Points

References are [\[Maz78\]](#).

**Prop. (21.7.3.1) [Controlling Torsion Points].** For  $F \in \mathbf{NField}$  and  $E \in \mathbf{EllCur}/F$  given by a Weierstrass equation

$$E : y^2 + a_1xy + a_3y = x^3 + a_2x^2 + a_4x + a_6 \in \mathcal{O}_F[X, Y].$$

Let  $P = (x_0, y_0) \in E(F)$  be a torsion point of exact order  $m$ , then

- If  $m$  is not a  $p$ -power, then  $x_0, y_0 \in \mathcal{O}_F$ .
- If  $m = p^n$ , then for any place  $v$  of  $F$ ,  $v(x) \geq -2\lfloor \frac{v(p)}{p^n - p^{n-1}} \rfloor$ ,  $v(y) \geq -3\lfloor \frac{v(p)}{p^n - p^{n-1}} \rfloor$ .

┘

*Proof:* This follows by base change  $E$  to each  $\mathcal{O}_{K,v}$  and use [\(21.3.4.21\)](#). □

**Cor. (21.7.3.2) [Integrality of Torsion Points in  $\mathbb{Q}$ ].** Let  $E \in \mathbf{EllCur}/\mathbb{Q}$  and  $P = (x_0, y_0) \in E(\mathbb{Q})$  a torsion point of exact order  $m$ . then if  $m$  is not a  $p$ -power,  $x_0, y_0 \in \mathbb{Z}$ . If  $m = p^n$ , then  $\lfloor \frac{v(p)}{p^n - p^{n-1}} \rfloor = 0$  unless  $p = 2$  and  $n = 1$ . Thus  $x_0 \in \frac{1}{4}\mathbb{Z}$ ,  $y_0 \in \frac{1}{8}\mathbb{Z}$ , and if  $m \geq 3$ ,  $x_0, y_0 \in \mathbb{Z}$ .

The former case can occur, for example

$$E : y^2 + xy = x^3 + 4x + 1, \quad \left(-\frac{1}{4}, \frac{1}{8}\right) \in E(\mathbb{Q})[2].$$

┘

**Prop. (21.7.3.3) [Nagell–Lutz].** Let  $E \in \mathbf{EllCur}/\mathbb{Q}$  be given by a Weierstrass equation

$$E : y^2 = x^3 + Ax + B \in \mathbb{Z}[x, y],$$

Let  $P = (x_0, y_0) \in E(\mathbb{Q})_{\text{tor}}$ , then

- $x_0, y_0 \in \mathbb{Z}$ .
- Either  $y_0 = 0$ , i.e.  $[2](P) = O$  or  $y_0^2$  divides  $4A^3 + 27B^2$ .

┘

*Proof:* 1: Let  $P$  has exact order  $m$ . If  $m = 2$ , then  $y_0 = 0$ , and then  $x_0 \in \mathbb{Z}$  as it is integral over  $\mathbb{Z}$ . If  $m \geq 3$ , the results follows from [\(21.7.3.1\)](#).

2: Suppose  $[2](P) = (x_1, y_1) \neq O$ , then  $y_0 \neq 0$ , and  $x_0, y_0, x_1 \in \mathbb{Z}$ . Now [\(21.3.1.9\)](#) shows  $x_1 = \varphi(x_0)/4\psi(x_0)$  where

$$\varphi(X) = X^4 - 4AX^2 - 8BX + A^2, \quad \psi(X) = X^3 + AX + B.$$

And they satisfy a polynomial equation

$$f(X)\varphi(X) - g(X)\psi(X) = 4A^2 + 27B^2$$

where  $f(X) = 3X^2 + 4A$ ,  $g(X) = 3X^3 - 5AX - 27B$ . Then because  $y_0^2 = x_0^3 + Ax_0 + B$ , we get

$$y_0^2(4f(x_0)x_1 - g(x_0)) = 4A^2 + 27B^2.$$

□

### Ranks

**Conj. (21.7.3.4) [Unboundedness Conjecture].** For  $F \in \mathbf{GField}$ , the rank of elliptic curves over  $F$  can take arbitrary large values.  $\lrcorner$

*Proof:*  $\square$

**Remark (21.7.3.5).** For  $F \in \mathbf{FField}$ , this is proven by Tate-Šafarevič[?T-\vS67] and Ulmer[Ulm02].

For  $F = \mathbb{Q}$ , this is a consequence of the conjecture: for any  $k \in \mathbb{Z}_+$ , there exists a cube-free integer  $D$  s.t.  $D$  can be written as a sum of two positive cubes in at least  $k$  ways. Cf. [Silverman, Integral Points on Curves of Genus 1].  $\lrcorner$

**Prop. (21.7.3.6) [Park-Poonen-Voight-Wood(2016)].** For any  $n \in \mathbb{Z}_+$ , there exists  $F \in \mathbf{NField}$  and  $E \in \mathbf{EllCur} / F$  s.t.  $\text{rank}(E/F) \geq [F : \mathbb{Q}] \geq n$ .  $\lrcorner$

*Proof:* Cf.[A heuristic for boundedness of ranks of elliptic curves]Theorem 12.4.2.  $\square$

**Conj. (21.7.3.7) [Lang].** For any  $\varepsilon > 0$ , there exists a constant  $C_\varepsilon > 0$  s.t. for any  $E \in \mathbf{EllCur} / \mathbb{Q}$ , there exists a basis  $\{P_1, \dots, P_r\}$  of the free part of  $E(\mathbb{Q})_{\text{lf}}$  satisfying

$$\max_{1 \leq i \leq r} \hat{h}(P_i) \leq C_\varepsilon^r |D_{E/\mathbb{Q}}|^{\frac{1}{12} + \varepsilon}.$$

where  $D_{E/\mathbb{Q}}$  is the minimal discriminant of  $E/\mathbb{Q}$  and  $\hat{h}$  is the canonical height.  $\lrcorner$

*Proof:*  $\square$

## 4 Modular Curves

References are [M-T73, Maz76, Maz77, Maz78].

**Thm. (21.7.4.1) [Mazur].** Let  $p \in \mathbf{Prime}_{\geq 5}$ , and  $n$  be the nominator of  $\frac{N-1}{12}$ , then  $\text{Jac}_0(p)(\mathbb{Q})_{\text{tor}}$  is a cyclic group of order  $n$ , generated by the class  $[(0) - (\infty)]$ .  $\lrcorner$

*Proof:* Cf.[Maz78]Chap3.1.2..  $\square$

**Thm. (21.7.4.2) [Mazur].** Let  $N \in \mathbb{Z}_+$  s.t.  $g(X_1(N)) > 0$  (i.e.  $N = 11$  or  $N \geq 13$ ), then  $Y_1(N)(\mathbb{Q}) = \emptyset$ .  $\lrcorner$

*Proof:* Cf.[Maz78]Chap3.5.3.  $\square$

**Thm. (21.7.4.3) [Mazur].** If  $p \in \{11\} \cup \mathbf{Prime}_{\geq 17}$ , then  $\#X_{\text{split}}(p)(\mathbb{Q}) < \infty$ .  $\lrcorner$

*Proof:* Cf.[Maz78]Chap3.6.  $\square$

**Thm. (21.7.4.4) [Mazur/Momose/Merel].** If  $p \in \{11\} \cup \mathbf{Prime}_{\geq 17}$ , then for any  $P \in Y_{\text{split}}(p)(\mathbb{Q})$ ,  $j(P) \in \mathbb{Z}$ .  $\lrcorner$

*Proof:* Cf.[Bilu-Parent].  $\square$

**Def. (21.7.4.5) [Modular Units on  $X_{\text{split}}(p)$ ].** As the  $\lrcorner$

**Prop. (21.7.4.6).** Situation as in ?,  $\tau \in \mathcal{H}$  s.t.  $|q(\tau)| \leq 1/p$ , then

- If  $p|c$ , then

$$\left| \log |U_c(\tau)| - (p-1)^2 \log |q(\tau)| \right| \leq 4\pi^2 \frac{p^2}{\log |q(\tau)^{-1}|} + O(p \log p).$$

- If  $p \nmid c$ , then

$$\left| \log |U_c(\tau)| + 2(p-1) \log |q(\tau)| \right| \leq 8\pi^2 \frac{p^2}{\log |q(\tau)^{-1}|} + O(p).$$

┘

*Proof:*

□

**Prop. (21.7.4.7).** For any  $p \in \text{Prime}_{\geq 3}$  and  $P \in Y_{\text{split}}(\mathbb{C})$ ,

$$\log |j(P)| \leq 2\pi\sqrt{p} + \max \left( 6 \log p, \frac{1}{2(p-1)} \left| \log |U(P)| \right| - 6 \log p \right) + O(1).$$

┘

*Proof:*

□

**Cor. (21.7.4.8).** For any  $p \in \text{Prime}$  and  $P \in Y_{\text{split}}(p)(\mathbb{Z})$ ,  $0 \leq \log |U(P)| \leq 24p \log p$ .

In particular, by (21.7.4.7), there exists constant  $C > 0$  s.t. for any  $p \in \mathbf{P}$  and  $P \in Y_{\text{split}}(p)(\mathbb{Z})$ ,  $\log |j(P)| \leq 2\pi p^{1/2} + 6 \log p + C$ .

┘

*Proof:*

□

**Prop. (21.7.4.9).** There exists an effective constant  $\kappa > 0$  s.t. for any  $p \in \mathbf{P}$  and an elliptic curve  $E \in \text{EllCur}/\mathbb{Q}$  without CM and endowed with a structure of normalizer of split Cartan subgroup in level  $p$ , then  $h^+(j(E)) \geq \kappa p$ .

┘

*Proof:* For such an elliptic curve  $E$  with two  $p$ -isogenies  $\varphi_1 : E \rightarrow E_1, \varphi_2 : E \rightarrow E_2$ . Then  $\varphi = \varphi_1^\vee \circ \varphi_2 : E_1 \rightarrow E_2$  is a cyclic  $p^2$ -isogeny. Then it follows from (21.1.4.2) that  $h^+(j(E)) \geq \kappa_1 p$  for some constant  $\kappa_1$  independent of  $p$  and  $E$ .

(21.1.5.4) shows that  $h_{\text{st}}(E_1) \leq h_{\text{st}}(E) + \frac{1}{2} \log p$ , and (21.1.5.12) shows that for any  $X \in \text{EllCur}/F$ ,

$$|h^+(j(X)) - 12h_{\text{st}}(X/F)| \leq 6 \log \left( 1 + h^+(j(X)) \right) + O(1).$$

Thus the assertion follows.

□

**Thm. (21.7.4.10)** [Bilu-Parent/Bilu - Parent - Rebolledo/Balakrishnan-Dogra-Müller-Tuitman-Vonk]. For  $p \in \text{Prime}$ , every point in  $X_{\text{split}}(p)(\mathbb{Q})$  is either a CM point or a cusp iff  $p > 7$ .

┘

*Proof:* Firstly it follows from (21.7.4.4) (21.7.4.8) and (21.7.4.9) that this holds for  $p$  large. Then ? □

**Lemma (21.7.4.11).**  $X_{\text{split}}(13)(\mathbb{Q})$  consists of 6 CM-points and one cusp. Moreover,  $X_{\text{nonsplit}}(13)(\mathbb{Q})$  consists of 7 CM-points.

┘

*Proof:*

□

### Quotients of Modular Curves

**Thm. (21.7.4.12) [Rational Points of Quotients of Modular Curves].** Situation as in (28.3.5.1), if  $g(X_H(p)) > 0$ , and  $X_H(p)$  is defined over  $\mathbb{Q}$ , then

- $X_H(p) = X_0(p)$  has only f.m.  $\mathbb{Q}$ -points, and they can be calculated.
- $X_H(p) = X_{\text{split}}(p)$  has only f.m.  $\mathbb{Q}$ -points for  $p \neq 13$ .
- For  $X_H(p) = X_{\text{nonsplit}}(p)$ , nothing is known. ?
- $X_H(p) = X_{\text{Sym}_4}(p)$  has no rational points for  $p > 13$ .

┘

*Proof:*

□

**Thm. (21.7.4.13) [Formal Immersions and  $q$ -Expansions, Kamienny].** Let  $A$  be a quotient of  $\text{Jac}_0(p)_{\mathbb{Q}}$  by an ideal  $I \in \text{Ideal}^{\times}(\mathbb{T})$ . Then the following are equivalent:

- $\varphi_{A, \mathbb{F}_{\ell}}^{(d)}$  is formal immersion at  $\infty_{\mathbb{F}_{\ell}}^{(d)}$ .
- There exists  $d$  weight 2 cusp forms  $f_1, \dots, f_d$  annihilated by  $I$  s.t. the vectors  $(a_1(f_i), \dots, a_d(f_i))$  are linearly independent mod  $\ell$ .
- The image of  $T_1, \dots, T_d$  in  $\mathbb{T}/(I + \ell T)$  are linearly independent.

┘

*Proof:* [Merel's theorem on the boundedness of the torsion of elliptic curves] P6. ?

□

**Thm. (21.7.4.14) [Mazur-Kamienny].**

┘

### Isogenies of Elliptic Curves

**Prop. (21.7.4.15) [Potential Good Reductions].** Let  $F \in \mathbb{N}\text{Field}$ ,  $N \in \mathbb{Z}_+$  be square-free and  $v \in \Sigma_F^{\text{fin}}$  with  $e_v(F/\mathbb{Q}) \leq \text{char } v - 1$ . Then for any  $x = (E, C_N) \in X_0(N)(F)$ , if there exists an optimal quotient  $f : \text{Jac}_0(N)^{\text{new}} \rightarrow A \in \text{AbVar}$  s.t.  $f(x) \in A(F)$  is of finite order, then  $E$  has potentially good reduction at  $v$ .

┘

*Proof:* •

□

**Cor. (21.7.4.16) [Potential Good Reductions, Mazur [Maz78]].** For  $p \in \text{Prime}_{\geq 11} \setminus \{13\}$  and  $E \in \text{EllCur}/\mathbb{Q}$ , if  $E$  has a  $\mathbb{Q}$ -rational isogeny of order  $p$ , then  $E$  has potentially good reduction at any  $\ell \in \text{Prime}_{\geq 3}$ .

┘

*Proof:* This is because the Eisenstein quotient  $\text{Jac}_0(N) \rightarrow A_{\text{Eis}}$  satisfies  $\text{rank } A_{\text{Eis}}(\mathbb{Q}) = 0$  (28.3.6.2), so the hypothesis in (21.7.4.15) is automatically satisfied.

□

**Cor. (21.7.4.17) [Potential Good Reductions, Mazur].** If  $\mathcal{K}$  is an imaginary quadratic field, then there exists a finite set  $\emptyset \subset_{\text{fin}} S_{\mathcal{K}} \subset \text{Prime}$  s.t. if  $E \in \text{EllCur}/\mathcal{K}$  has a rational isogeny of order  $p$  for some  $p \in \text{Prime} \setminus S_{\mathcal{K}}$  that is inert in  $\mathcal{K}$ , then  $E$  has potentially good reduction at all  $v \in \Sigma_{\mathcal{K}}^{\text{fin}}$  with  $\text{char } v \geq 5$  (and also at all  $v \in \Sigma_{\mathcal{K}}^{\text{fin}}$  with  $\text{char } v \geq 3$  if 3 is unramified in  $\mathcal{K}$ ).

┘

*Proof:* This follows from (21.7.4.15) and (28.3.6.3).

□

**Thm. (21.7.4.18) [Mazur].** For  $p \in \text{Prime}$  s.t.  $g(X_0(N)) > 0$  (i.e.  $p = 11$  or  $p \geq 17$ ), then there are no  $E \in \text{EllCur}/\mathbb{Q}$  possessing a  $\mathbb{Q}$ -rational isogeny of order  $p$ , unless  $p \in \{11, 17, 19, 37, 43, 67, 163\}$ .

A table of examples of rational isogenies is given in [Maz78].

┘

*Proof:* ? □

**Cor. (21.7.4.19) [Mazur-Serre].** For any  $E \in \mathbf{EllCur}/\mathbb{Q}$  and  $p \in \mathbf{Prime}$ , one has the following three possibilities:

- $\bar{\rho}_{E,p} : \mathrm{Gal}_{\mathbb{Q}} \rightarrow \mathrm{GL}(2; \mathbb{F}_p)$  is surjective.
- $\mathrm{Im}(\rho_{E,p})$  is contained in the normalizer of a Cartan subgroup of  $\mathrm{GL}(2; \mathbb{Z}/(p))$ .
- $p \leq 19$  or  $p \in \{7, 43, 67, 163\}$ .

┘

*Proof:* If  $\bar{\rho}_{E,p}$  is not surjective, then by (28.3.5.1), the image is contained in either:

- Normalizer of a Cartan subgroup of  $\mathrm{GL}(2; \mathbb{Z}/(p))$ .
- A Borel subgroup, in which case  $\mathrm{Gal}_{\mathbb{Q}}$  fixes a subgroup of  $E[p]$  of order  $p$  thus  $E$  has an isogeny of order  $p$ , thus  $p \leq 19$  or  $p \in \{7, 43, 67, 163\}$  by (21.7.4.18).
- An exceptional subgroup  $H \leq \mathrm{GL}(2; \mathbb{F}_p)$ , in which case  $p < 17$  by (28.3.5.3).

□

**Cor. (21.7.4.20).** There exists  $C \in \mathbb{Z}_+$  s.t. every  $E \in \mathbf{EllCur}/\mathbb{Q}$  is isogenous to at most  $C$ -many mutually non-isomorphic elliptic curves over  $\mathbb{Q}$ . ┘

*Proof:* ? □

**Cor. (21.7.4.21) [Mazur-Serre].** If  $E \in \mathbf{EllCur}/\mathbb{Q}$  is semistable and  $p \in \mathbf{Prime}_{\geq 11}$ , then  $\bar{\rho}_{E,p}$  is surjective. ┘

*Proof:* ? This is a direct consequence of [Ser72]Prop21 and Mazur's theorem (21.7.5.8). □

**Conj. (21.7.4.22) [Mazur].** Is it true that for any  $F \in \mathbf{NField}$ , the  $j$ -invariants of an elliptic curve  $E \in \mathbf{EllCur}/F$  with an  $F$ -rational cyclic group of order  $N$  s.t.  $g(X_0(N)) \geq 2$  (equivalently,  $N > 21$  and  $N \neq 24, 25, 27, 32, 36, 49$ ) ? ┘

*Proof:* □

**Prop. (21.7.4.23) [Mazur].** For an imaginary quadratic field  $\mathcal{K}$ , there exists a finite set  $\emptyset \subset_{\mathrm{fin}} S_{\mathcal{K}} \subset \mathbf{Prime}$  s.t. for any  $p \in \mathbf{Prime} \setminus S_{\mathcal{K}}$  that is inert in  $\mathcal{K}$ , there are no elliptic curve  $E \in \mathbf{EllCur}/\mathcal{K}$  with a rational isogeny of order  $p$ . ┘

*Proof:* Cf. [Maz78]Prop8.1. □

## 5 Uniformity Conjecture for Torsion Points

**Conj. Cor. (21.7.5.1) [Uniform-Boundedness for Torsion Points of Abelian Varieties].** The Morton-Silverman boundedness conjecture (21.8.4.1) implies that for any  $D, g \in \mathbb{Z}_+$ , there exists  $\eta(D, g) \in \mathbb{Z}_+$  s.t. for any  $F \in \mathbf{NField}$  with  $[F : \mathbb{Q}] = D$  and  $A \in \mathbf{AbVar}/F$ ,  $\#A(F)_{\mathrm{tor}} \leq \eta(D, g)$ . ┘

*Proof:* Cf. [Fak03]P3. ? □

### Mazur's Approach: Eisenstein Quotients

**Prop. (21.7.5.2).** If  $p \in \text{Prime}$  and  $E \in \text{EllCur}/\mathbb{Q}$  has a rational torsion point of order  $p$ , then  $E$  is isogenous to  $E'/\mathbb{Q}$  with a rational point of order  $p$  and  $\mathbb{Q}(E'[p])$  is a ramified extension of  $\mathbb{Q}(\mu_p)$ .  $\lrcorner$

*Proof:* Cf.[Elliptic Curves, Group Schemes and Mazur's Theorem, P26] ?.  $\square$

**Prop. (21.7.5.3).** If  $p \in \text{Prime}_{>11}$  and  $E \in \text{EllCur}/\mathbb{Q}$  has a rational torsion point of order  $p$ , then  $\mathbb{Q}(E[p])$  is an unramified extension of  $\mathbb{Q}(\mu_p)$ .  $\lrcorner$

*Proof:* Cf.[Elliptic Curves, Group Schemes and Mazur's Theorem, P29] ?.  $\square$

**Prop. (21.7.5.4) [Specialization Lemma].**  $\lrcorner$

**Lemma (21.7.5.5) [Mazur].** If  $E \in \text{EllCur}/\mathbb{Q}$  and  $p \in \text{Prime}_{\geq 11} \setminus \{13\}$ , then  $E[p] = 0$ .  $\lrcorner$

*Proof:* If  $0 \neq x \in E[p]$ , then by (21.7.4.16),  $E$  has potentially good reduction at  $p = 3$ . The specialization of  $x$  to  $\tilde{E}_{\mathbb{F}_3}$  is non-zero by the specialization lemma (21.7.5.4).

Then  $\tilde{E}_{\mathbb{F}_3}$  cannot be of additive reduction, because if it is of additive reduction, by looking at the Kodaira-Néron classification of the fiber (21.3.4.18), we see that  $\#\pi_0(\tilde{E}_{\mathbb{F}_3}) \leq 4$ , so the specialization of  $x$  is contained in  $(\tilde{E}_{\mathbb{F}_3})^0$  which is isomorphic to  $\mathbb{G}_a$ , a contradiction because  $p \geq 7$ .

So  $\tilde{E}$  is a good reduction, and thus  $\#\tilde{E}_{\mathbb{F}_3} \leq 7$ , contradiction again.  $\square$

**Lemma (21.7.5.6) [Mazur-Tate [M-T73]].** If  $E \in \text{EllCur}/\mathbb{Q}$ , then  $E[13] = 0$ .  $\lrcorner$

*Proof:* Cf. <http://www-personal.umich.edu/~asnowden/teaching/2013/679/index.html>.  $\square$

**Lemma (21.7.5.7) [Kubert].** For  $E \in \text{EllCur}/\mathbb{Q}$ ,

- $E$  doesn't contain a rational torsion point of exact order  $N$  where  $N \in \{14, 15, 16, 18, 20, 21, 24, 25, 27, 35, 49\}$ .
- $E(\mathbb{Q})_{\text{tor}}$  doesn't contain a subgroup isomorphic to  $\mathbb{Z}/(2) \times \mathbb{Z}/(10)$  or  $\mathbb{Z}/(2) \times \mathbb{Z}/(12)$ .  $\lrcorner$

*Proof:* Cf.[Kubert. Universal bounds on the torsion of elliptic curves.] ?

Firstly, notice for  $N \in \{11, 14, 15, 17, 19, 20, 21, 24, 27, 32, 36, 49\}$ ,  $X_0(N)$  has genus 1 (26.3.3.18). And by taking the cusp as the origin,  $X_0(N)$  is an elliptic curve. Then Kubert finds that  $\text{rank}(X_0(N)) = 0$ , and can find all the rational points. Only for  $N = 21$  or  $N = 27$  there are non-cusp rational points. So it suffices to show that for  $X_0(21)$  and  $X_0(27)$ , the quadratic twists of the elliptic curves corresponding to the rational non-cusp points of  $X_0(N)$  don't have rational 21 torsion-points.

For  $N = 21$ , the non-cusp rational points of  $X_0(N)$  are given by quadratic twists of

$$y^2 = x^3 + 45x - 18$$

$$y^2 = x^3 - 75x - 262$$

$$y^2 = x^3 - 1515x - 46106$$

$$y^2 = x^3 - 17235x - 870894.$$

For  $N = 27$ , the non-cuspidal rational points of  $X_0(N)$  are given by quadratic twists of

$$y^2 + y = x^3 - 30x - 5.$$

For the second case, let  $P$  be a generator of  $\mathbb{Z}/(2)$  and  $Q$  a generator of  $\mathbb{Z}/(10)$  or  $\mathbb{Z}/(12)$ , then the dual map  $E/P \rightarrow E \rightarrow E/Q$  is a cyclic isogeny, thus corresponds to a rational point on  $Y_0(20)$  or  $Y_0(24)$ , which in fact has no rational point.

For  $N = 16$ , ?

For  $N = 18$ , ?

For  $N = 25$ , ?

For  $N = 35$ , let  $E = X_0(35)/w_5$ , where  $w_5$  is the Atkin-Lehner involution. Then  $E$  is an elliptic curve, and  $E(\mathbb{Q}) \cong \mathbb{Z}/(3)$ . Then Kubert computed that the preimages of these points are cusps.  $\square$

**Thm. (21.7.5.8) [Ogg's Conjecture, Mazur[Maz77]].** For  $E \in \text{EllCur}/\mathbb{Q}$ ,  $E(\mathbb{Q})_{\text{tor}}$  can only be isomorphic to one of the following 15 groups:

- $\mathbb{Z}/(n)$  for  $n \in [10]_+$  or  $n = 12$ .
- $\mathbb{Z}/(2) \oplus \mathbb{Z}/(2n)$  for  $n \in [4]_+$ .

Moreover, each of these groups occur, by (21.7.5.9).  $\perp$

*Proof:* This follows from (21.7.5.5)(21.7.5.6) and (21.7.5.7). Notice the existence of elliptic curves with these torsion groups can also be shown using modular curves ?  $\square$

**Prop. (21.7.5.9) [Bounding Torsion Points].** Proposition (21.3.4.20) is useful in controlling torsion points of  $E$ . For example: If  $E/\mathbb{Q}$  is an elliptic curve with Weierstrass equation

- $E : y^2 + y = x^3 - x + 1$ , then  $\Delta = -13 \cdot 47$ , so  $E$  has good reduction modulo 2. But it can be calculated that  $\tilde{E}(\mathbb{F}_2) = \tilde{O}$ ,  $E(\mathbb{Q})[2] = O$ , thus  $E(\mathbb{Q})_{\text{tor}} = O$ .
- $E : y^2 = x^3 + 3$ , then  $\Delta = -2^4 \cdot 3^5$ , so  $E$  has good reduction modulo  $p$  for  $p \geq 5$ . But it can be calculated that  $\#\tilde{E}(\mathbb{F}_5) = 6$ ,  $\#\tilde{E}(\mathbb{F}_7) = 13$ , so  $E(\mathbb{Q})[p] = O$  for any prime  $p$ , and  $E(\mathbb{Q})_{\text{tor}} = O$ . In particular,  $(1, 2) \in E(\mathbb{Q})$  has infinite order.
- $E : y^2 = x^3 + x$ , then  $\Delta = -2^6$ , so  $E$  has good reduction modulo  $p$  for  $p \geq 3$ . But it can be calculated that  $\tilde{E}(\mathbb{F}_3) \cong \mathbb{Z}/(4)$ ,  $\tilde{E}(\mathbb{F}_5) \cong \mathbb{Z}/(2) \times \mathbb{Z}/(2)$ , thus  $E(\mathbb{Q})_{\text{tor}} \cong 0$  or  $\mathbb{Z}/(2)$ . The latter case is right, as  $(0, 0) \in E(\mathbb{Q})$ .
- $E : y^2 = x^3 + 2$ .
- $E : y^2 = x^3 + 8$ .
- $E : y^2 = x^3 + 4$ .
- $E : y^2 = x^3 + 4x$ .
- $E : y^2 - y = x^3 - x^2$ .
- $E : y^2 = x^3 + 1$ .
- $E : y^2 = x^3 - 43x + 166$ . then  $\Delta = -2^{19} \cdot 13$ , thus  $E$  has good reduction modulo 3, 5. But it can be calculated that  $\#\tilde{E}(\mathbb{F}_3) = 7 = \#\tilde{E}(\mathbb{F}_5)$ , thus  $E(\mathbb{Q})_{\text{tor}} \cong 0$  or  $\mathbb{Z}/(7)$ . By (21.7.3.3), for any torsion point  $(x, y)$ ,  $y|2^7$ , thus we can find rational points

$$\{(3, \pm 8), \quad (-5, \pm 16), \quad (11, \pm 32)\}.$$

And using doubling formula (21.3.1.9) for  $P = (3, 8)$ ,

$$x([2](P)) = -5, \quad x([4](P)) = 11, \quad x([8](P)) = 3.$$

Thus  $P$  must have order 7, and  $E(\mathbb{Q})_{\text{tor}} \cong \mathbb{Z}/(7)$ .

- $E : y^2 + 7xy = x^3 + 16x.$
- $E : y^2 + xy + y = x^3 - x^2 - 14x + 29.$
- $E : y^2 + xy = x^3 - 45x + 81.$
- $E : y^2 + 43xy - 210y = x^3 - 210x^2.$
- $E : y^2 = x^3 - 4x.$
- $E : y^2 = x^3 + 2x^2 - 3x.$
- $E : y^2 + 5xy - 6y = x^3 - 3x^2.$
- $E : y^2 + 17xy - 120y = x^3 - 60x^2.$

┘

### Merel's Approach: Winding Quotients

**Thm. (21.7.5.10)** [Uniform Boundedness of Torsion Groups, Merel[Mer96]/Oesterlé]. For any  $d \in \mathbb{Z}_+$  there exists  $N(d) \in \mathbb{Z}_+$  s.t. for any  $F \in \mathbf{NField}$  of degree  $d$  and any  $E \in \mathbf{EllCur}/F$ , we have

$$\#E(F)_{\text{tor}} \leq N(d).$$

┘

*Proof:* By [Mazur and Kamienny95]?, this follows from the lemma(21.7.5.11) below. □

**Lemma (21.7.5.11)** [Merel[Mer96]]. Let  $\mathbb{Q} \neq F \in \mathbf{NField}$  and  $p \in \mathbf{Prime}$ , then for any  $E \in \mathbf{EllCur}/F$ , if  $E(K)[p] \neq 0$  implies  $p < (3^{d/2} + 1)^2$ . ┘

*Proof:* □

### Abelian Variety Case

## 6 Rational Points on Curves(Chabauty)

### Finiteness Results for Curves(Faltings)

**Prop. (21.7.6.1)** [Genus 0 Curves]. For  $F \in \mathbf{GField}$  of characteristic  $\neq 2$  and any smooth complete curve  $C/F$  genus 0 is a conic in  $\mathbb{P}^2$ . Thus by(7.13.8.2), it is isomorphic to  $\mathbb{P}^1$  iff it has a rational point. But by Hasse-Weil principle, this is equivalent to it having a rational point over each local field of  $F$ , and this can be understood via Hilbert symbol. ┘

**Thm. (21.7.6.2)** [Shafarevich's Conjecture, Faltings]. Let  $F \in \mathbf{GField}$  and  $S \subset \Sigma_F$  a finite set of places,  $g \in \mathbb{Z}_+$ , then there are only f.m. isomorphism classes of smooth curves over  $k$  of genus  $g$  having good reduction at all finite places outside  $S$ . ┘

*Proof:* This follows from(20.9.10.18)(20.9.10.16) and(20.9.7.3)(21.1.7.4). □

**Prop. (21.7.6.3)** [Kodaira-Parshin]. Let  $F \in \mathbf{NField}$  and  $S$  is a finite set of places of  $F$  containing all places over 2, then for any complete non-singular curve  $C/F$  of genus  $\geq 1$  having good reduction at non-Archimedean places outside  $S$ , there exists a finite extension  $L/F$  and a constant  $N$ , s.t.: For any  $P \in C(F)$ , there exists a complete smooth curve  $C^P$  over  $L$  and a finite map  $\varphi^P : C^P \rightarrow C_L$ , that satisfies

- $C^P$  has good reduction at places not above  $S$ .
- $g(C^P) \leq N$ .
- $\varphi_P$  is ramified exactly at  $P$ .

┘

*Proof:* Cf. [Mil08]P115, 145. ?

□

**Thm. (21.7.6.4) [Uniform Mordell Conjecture 1922, Faltings 1983].** For  $g \in \mathbb{Z}_{\geq 2}$  and  $d \in \mathbb{Z}$ , there exists  $C(g, d) \in \mathbb{Z}_+$  s.t. for any  $F \in \mathbf{NField}$  with  $\deg(F) = d$  and  $C/F$  be a complete non-singular curve of genus  $g$ , we have

$$\#C(F) \leq C(g, d).$$

┘

*Proof:* We only prove that  $\#C(F)$  is finite ?.

Using the construction of Kodaira-Parshin (21.7.6.3), there is a finite extension  $L/F$  s.t. any  $P \in C(F)$  corresponds to a curve  $C^P$  over  $L$  and a map  $\varphi_P : C^P \rightarrow C_L$ . By Shafarevich's conjecture applied to  $L$  (21.7.6.2), there are only f.m. isomorphism classes of  $C^P$ . But for different  $P, Q$  s.t.  $C^P \cong C^Q$ , the maps  $\varphi_P, \varphi_Q$  are non-isomorphic, as they are ramified at different places. So we are done by de Franchis' theorem (7.13.1.35). □

**Prop. (21.7.6.5) [Manin-Mumford].** Let  $F \in \mathbf{NField}$  and  $C/F$  be a complete non-singular curve of genus  $g \geq 2$ , and  $J$  the Jacobian of  $C$ . Fix an embedding  $C \hookrightarrow J$  over  $F$ , then  $\#C(\overline{F}) \cap J(\overline{F})_{\text{tor}} < \infty$ .  
┘

*Proof:* This follows from the Manin-Mumford-Lang conjecture (21.1.6.7), as  $C$  is not a torsion subvariety. □

### Chabauty-Coleman Methods

The idea is: By the embedding  $X \rightarrow J(X)$ , to calculate  $X(\mathbb{Q})$ , calculate  $J(X)(\mathbb{Q})$  first, then determine which points are in  $X(\mathbb{Q})$ .

**Prop. (21.7.6.6).** Let  $F \in \mathbf{NField}$ ,  $v \in \Sigma_F^{\text{fin}}$  s.t.

- $\text{char } v > 2g$ ,
- $v \in \text{Unr}_{F/\mathbb{Q}}(F)$ .

Let  $g \in \mathbb{Z}_+$ ,  $C \in \mathcal{C}ur^{\text{SmPrpr}}/F$  of genus  $g$  s.t.

- $C$  has good reduction at  $v$ .
- $\text{rank}(J(C)(F)) \leq g - 1$ .

Then  $\#C(F) \leq \|v\| + 2g(\|v\|^{1/2} + 1) - 1$ .  
┘

*Proof:*

□

### Coleman Integration

References are [p-adic abelian integrals and torsion points on curves, Coleman].

**Prop. (21.7.6.7) [p-adic Primitives].** Let  $K \in p\text{-Field}$ ,  $K \subset \mathbb{C}_p$  and  $A \in \mathcal{AbVar}/K$ , then for any  $\omega \in H^0(A, \Omega_{A/K}^1)$ , there exists a unique locally analytic homomorphism  $\lambda_\omega : A(\mathbb{C}_p) \rightarrow \mathbb{C}_p$  s.t.  $d\omega = \omega$ .  
┘

*Proof:* Cf.[p-adic abelian integrals and torsion points on curves, Coleman]Chap2.  $\square$

**Prop. (21.7.6.8)[Coleman Integration].** For  $J \in \mathcal{AbVar}/\mathbb{Q}_p$ , there is a **Coleman integration map**:

$$J(\mathbb{Q}_p) \times H^0(J/\mathbb{Q}_p, \Omega^1) \rightarrow \mathbb{Q}_p : (Q, \omega) \mapsto \int_0^Q \omega.$$

s.t. on an open subset  $U \subset J$ , the integration can be calculated locally by writing  $\omega$  in power series.

⌋

*Proof:*  $\square$

**Prop. (21.7.6.9).** Let  $K \in p\text{-Field}$ ,  $K \subset \mathbb{C}_p$  and  $j : (C, c_0) \rightarrow (A, 0)$  is a morphism over  $K$  of pointed curves into an Abelian variety, both with good reduction. If  $G \subset A(K)$  is a subgroup, denoted  $V_G = \{\omega \in H^0(A, \Omega_{A/K}^1) : \lambda_\omega(G) = 0\}$ . Then any  $x \in j(C(K)) \cap G$  satisfies:  $\int_{c_0}^x \omega = 0$  for any  $\omega \in j^*V_G$ .  $\square$

*Proof:* Cf.[p-adic abelian integrals and torsion points on curves, Coleman]Thm2.7.  $\square$

**Prop. (21.7.6.10)[Upper Bounds for Solutions].** Let  $(K, \mathcal{O}_K, \kappa) \in p\text{-NField}$  and  $\mathcal{C} \in \text{Cur}^{\text{SmPrpr}}/\mathcal{O}_K$  with  $\omega \in H^0(\mathcal{C}, \Omega_{\mathcal{C}/\mathcal{O}_K}^1)$  s.t. the reduction  $\tilde{\omega} \neq 0$ . Let  $\lambda_\omega$  be the  $p$ -adic primitive of  $\omega$  (21.7.6.7), then the number of zeros of  $\lambda_\omega$  in  $C(K)$  is at most

$$\sum_{x \in C(\kappa)} N(\text{ord}_x(\tilde{\omega}), |p|^{1/e_K}).$$

In particular, if  $e_K = 1$ , and  $\text{ord}_x(\tilde{\omega}) \leq p - 3$  for any  $x \in C(\kappa)$ , then the number of zeros of  $\lambda_\omega$  is at most

$$\#\kappa - 1 + 2g(\sqrt{\#\kappa} + 1).$$

⌋

*Proof:*  $\square$

### Chabauty-Kim Method

**Thm. (21.7.6.11) [Chabauty-Coleman].** Let  $X \in \text{Cur}^g/\mathbb{Q}$ , and  $p \in \text{Prime}$  a good reduction of  $X$ . Suppose  $r' < g$  (e.g.  $r < g$ )  $\color{red}?$ , then

•

- If  $p > 2g$ , then  $\#X(\mathbb{Q}) \leq \#X(\mathbb{F}_p) + 2r' \leq \#X(\mathbb{F}_p) + (2g - 2)$ .  $\square$

⌋

## 7 Finite Fields

**Prop. (21.7.7.1) [Esnault].** Let  $p \in \text{Prime}$ ,  $q \in p^{\mathbb{Z}}$ ,  $X \in \text{SmProjVar}/\mathbb{F}_q$  s.t.  $\text{CH}_0(X_{\overline{R(X)}}) = \mathbb{Z}$ , then  $\#X(\mathbb{F}_q) \equiv 1 \pmod{q}$ . In particular,  $X$  has a rational point.  $\square$

*Proof:* Cf.[Weil 1 Proof].  $\square$

**Cor. (21.7.7.2).** Any rationally chain connected varieties over a finite field  $k = \mathbb{F}_q$  s.t.  $\text{CH}_0(X_{\overline{R(X)}}) = \mathbb{Z}$ , then  $\#X(K) \equiv 1 \pmod{q}$ . In particular,  $X$  has a rational point.  $\square$

**Cor. (21.7.7.3) [Manin-Lang].** If  $X/\mathbb{F}_q$  is a smooth projective Fano variety, then  $\#X(\mathbb{F}_q) \equiv 1 \pmod{q}$ .  $\square$

⌋

*Proof:* This is because by (7.12.4.4), any Fano variety is rationally chain connected.  $\square$

## 8 Hilbert's Theorem

Cf.[Mordell-Lang theorem, Serre].

## 9 Vojta's Conjecture

## 10 Bombieri-Lang Conjecture

**Conj. (21.7.10.1) [Bombieri-Lang].** Let  $F \in \mathbf{NField}$  and  $X \in \mathbf{Var}/F$  is of general type (i.e. with maximal Kodaira dimension (7.12.3.6)), then there are f.m. subvarieties  $X_i \subset X$  of lower dimensions s.t.  $X(F) = \cup_i X_i(F)$ .  $\lrcorner$

*Proof:*

□

**Thm. (21.7.10.2) [Mordell Conjecture, Faltings].** By (21.7.6.4), for  $F \in \mathbf{NField}$  and  $C \in \mathbf{SmProjCur}/F$  with genus  $g \geq 2$ , we have  $\#C(F) < \infty$ .  $\lrcorner$

## 11 Coleman's Conjecture

**Conj. (21.7.11.1) [Coleman].** For  $d, g \in \mathbb{Z}_+$ , consider all Abelian varieties  $A$  of dimension  $g$  and defined over a number field of degree  $d$ , then there are only f.m. isomorphism classes among  $\text{End}(A_{\overline{\mathbb{Q}}})$ .  $\lrcorner$

*Proof:*

□

**Prop. (21.7.11.2) [Equivalent Statements of Coleman's Conjecture].** The following are equivalent:

- Coleman's conjecture for  $\text{End}(A_{\overline{\mathbb{Q}}})$  (21.7.11.1).
- Coleman's conjecture for  $\text{End}(A)$ .
- $\text{disc}(A)$  is uniformly bounded for all Abelian varieties  $A$  of dimension  $g$  and defined over a number field of degree  $d$ .
- $\delta(A)$  is uniformly bounded for all Abelian varieties  $A$  of dimension  $g$  and defined over a number field of degree  $d$ .
- $\Delta_A$  is uniformly bounded for all Abelian varieties  $A$  of dimension  $g$  and defined over a number field of degree  $d$ .

□

*Proof:* Cf.[Uniformity Conjectures for Abelian Varieties and K3 Surfaces]Prop3.2, 3.4. □

**Prop. (21.7.11.3).** Coleman's conjecture implies the uniform boundedness conjecture for  $A(F)_{\text{tor}}$ .  $\lrcorner$

*Proof:* Cf.[Conjectures uniformes sur les varietes abeliennes]Thm1.1. ?

□

**Conj. (21.7.11.4) [Br(AbVar)].** Let  $d \in \mathbb{Z}_+$ , then there exists  $C(d) \in \mathbb{R}_+$  s.t. if  $F \in \mathbf{NField}$ ,  $[F : \mathbb{Q}] \leq d$  and  $A \in \mathbf{AbVar}/F$ , then  $\# \text{Br}(A_{\overline{k}})^{\text{Gal}_F} < \infty$ .  $\lrcorner$

*Proof:*

□

## 12 Hilbert's 10-th Problem

**Conj. (21.7.12.1) [Hilbert's 10-th Problem].** Let  $F \in \mathbf{NField}$ ,  $X$  be a projective scheme over  $\mathcal{O}_K$ , it there an algorithm to determine in a finite number of operations whether  $X(K) = \emptyset$ .  $\lrcorner$

*Proof:*

□

**Remark (21.7.12.2) [Mazur-Rubin].** If the BSD conjecture holds for all elliptic curves over any number fields, then Hilbert's 10-th problem has a negative answer for any number field.  $\lrcorner$

*Proof:*

□

## 21.8 Arithmetic Dynamical Systems

References are [Sil07] and [Fak03].

**Def. (21.8.0.1) [Rational Maps].** A map  $\varphi : \mathbb{P}^N \rightarrow \mathbb{P}^M$  is called a **rational map of degree  $d$**  if  $\lrcorner$

**Prop. (21.8.0.2) [Fakhruddin's Trick].** Let  $k \in \mathbf{Field}$ ,  $\#k = \infty$ ,  $X$  a projective variety over  $k$ ,  $\varphi : X \rightarrow X$  a morphism,  $\mathcal{L} \in \mathbf{Pic}(X)$  a very ample line bundle and  $d \in \mathbb{Z}_+$  s.t.  $\varphi^*(\mathcal{L}) \cong \mathcal{L}^{\otimes d}$ , then there exists  $N \in \mathbb{Z}_+$  and an embedding  $\iota : X \rightarrow \mathbb{P}_k^N$  with a morphism  $\psi : \mathbb{P}_k^N \rightarrow \mathbb{P}_k^N$  s.t.  $\psi \circ \iota = \iota \circ \varphi$ .  $\lrcorner$

*Proof:* Cf. [Fak03]P2.  $\square$

**Thm. (21.8.0.3).** For  $k \in \mathbf{Field}$ ,  $k = \bar{k}$ ,  $A \in \mathbf{AbVar}/k$  with a group  $G$  acting freely, then  $X = A/G$  has a line bundle  $\mathcal{L}$  and a morphism  $\varphi : X \rightarrow X$  s.t.  $\varphi^*(\mathcal{L}) \cong \mathcal{L}^{\otimes d}$  for some  $d \in \mathbb{Z}_{\geq 2}$ . And if  $\text{char } k = 0$ , then for any  $X \in \mathbf{SmProj}/k$  with  $\text{Kod}(X) \geq 0$  and a line bundle  $\mathcal{L}$  and a morphism  $\varphi : X \rightarrow X$  s.t.  $\varphi^*(\mathcal{L}) \cong \mathcal{L}^{\otimes d}$  for some  $d \in \mathbb{Z}_{\geq 2}$  is of the form  $X = A/G$  for  $A \in \mathbf{AbVar}/k$  with a group  $G$  acting freely.  $\lrcorner$

*Proof:* Cf. [Fak03]P8.  $\square$

### 1 over Finite Fields

### 3 over Global Fields

#### Heights

#### Canonical Heights

**Def. (21.8.3.1) [Quasi-Homogenous Functions].** Let  $N \subset \mathbb{R}$  be a multiplicatively-closed subset of  $\mathbb{R}$  acting on a set  $S \in \mathbf{Set}$ . Then a function  $h : S \rightarrow \mathbb{R}$  is called a **quasi-homogenous function** of degree  $d \in \mathbb{R}_+$  iff for any  $n \in N$ , there exists  $C(n) \in \mathbb{R}_+$  s.t.

$$|h(nx) - n^d h(x)| \leq C(n), \forall x \in S.$$

$\lrcorner$

**Prop. (21.8.3.2) [Tate's Limiting Argument, [Man64]].** Situation as in (21.8.3.1), there exists a unique homogenous function  $\hat{h} : S \rightarrow \mathbb{R}$  of degree  $d$  s.t.  $\hat{h} - h$  is bounded, which is given by

$$\hat{h}(x) = \lim_{|n| \rightarrow \infty} \frac{h(nx)}{n^d}.$$

$\lrcorner$

*Proof:* Cf. [B-G06]P285.  $\square$

**Prop. (21.8.3.3).** For  $F \in \mathbf{NField}$  and  $f : \mathbb{P}_F^1 \rightarrow \mathbb{P}_F^1$  of degree  $> 1$ , then the canonical height

$$\hat{h}_f : \alpha \mapsto \lim_{n \rightarrow \infty} \frac{h(f^{(n)}(\alpha))}{d^n}$$

is the unique function s.t.  $\hat{h}_f \circ f = d\hat{h}_f$ , and  $\hat{h}_f \sim h$ .  $\lrcorner$

**Prop. (21.8.3.4).** For  $F \in \mathbf{NField}$ ,  $E \in \mathbf{EllCur}/F$  and  $f = \varphi_{E,2}$ ,  $\hat{h}_f(\text{pr}(P)) = 2\hat{h}_E(P)$  for any  $P \in E(F)$ .  $\lrcorner$

## 4 Uniform-Boundedness

**Conj. (21.8.4.1)**[Uniform-Boundedness Conjecture, Morton-Silverman]. For  $D, N, d \in \mathbb{Z}_+$  and  $d \geq 3$ , there exists  $\kappa(D, N, d) \in \mathbb{Z}_+$  s.t. for any  $F \in \mathbf{NField}$  with  $[F : \mathbb{Q}] = D$  and each morphism  $\psi : \mathbb{P}_F^N \rightarrow \mathbb{P}_F^N$  defined by homogenous polynomials of degree  $d$ ,  $\# \text{PrePer}(\psi; F) \leq \kappa(D, N, d)$ .  $\lrcorner$

*Proof:*  $\square$

**Remark (21.8.4.2).** By[Fak03]P4, by restriction of scalars, it suffice to consider the case  $F = \mathbb{Q}$ .  $\lrcorner$

**Conj. (21.8.4.3).** For  $F \in \mathbf{NField}$  and  $N \in \mathbb{Z}_+, d \in \mathbb{Z}_{\geq 2}$ , there exists a finite set  $S(d, N, F) \subset \mathbb{P}^N(F)$  s.t. for any morphism  $f : \mathbb{P}_F^N \rightarrow \mathbb{P}_F^N$  defined by homogenous polynomials of degree  $d$ ,  $S(d, N, F) \not\subseteq f(\mathbb{P}^N(F))$ .  $\lrcorner$

*Proof:*  $\square$

**Prop. (21.8.4.4).** This conjecture is a consequence of the Bombieri-Lang conjecture(21.7.10.1), by[Fak03]P4.  $\lrcorner$

*Proof:*  $\square$

## 5 Arithmetic Dynamical Mordell-Lang Conjecture

References are [Poo14].

**Prop. (21.8.5.1)**[ $p$ -adic Interpolation of Iterates, Poonen]. Let  $K$  be a valued field s.t.  $|p| = 1/p$ , and  $f \in \mathcal{O}_K \langle X_1, \dots, X_d \rangle^d$  (12.2.4.2) satisfies  $f(\underline{X}) \equiv \underline{X} \pmod{p^c}$  for some  $c > 1/(p-1)$ . Then there exists  $g \in \mathcal{O}_K \langle X_1, \dots, X_d, T \rangle$  s.t.  $g(\underline{X}, n) = f^{\circ n}(\underline{X}) \in \mathcal{O}_K \langle \underline{X} \rangle^d$  for any  $n \in \mathbb{N}$ . Moreover,  $g(\underline{X}, T+1) = f(g(\underline{X}, T))$  holds.  $\lrcorner$

*Proof:* The hypothesis implies that  $h(f(\underline{X})) \equiv f(\underline{X}) \pmod{p^c}$  for any  $h(\underline{X}) \in \mathcal{O}_K[\underline{X}]^d$ , and by taking limits this is also true for any  $h \in \mathcal{O}_K \langle \underline{X} \rangle^d$ . Thus if we define the linear operator

$$\Delta(h)(\underline{X}) = h(f(\underline{X})) - f(\underline{X}),$$

then for any  $m \in \mathbb{N}$ ,  $\Delta^m$  maps  $\mathcal{O}_K \langle \underline{X} \rangle^d$  into  $p^{mc} \mathcal{O}_K \langle \underline{X} \rangle^d$ . Then because  $|m!| > p^{-m/(p-1)}$  (2.6.1.33), so the Mahler series

$$g(\underline{X}, T) = \sum_{m \in \mathbb{N}} \binom{T}{m} \Delta^m(\underline{X})$$

converges in  $\mathcal{O}_K \langle \underline{X} \rangle^d$ . And

$$g(\underline{X}, n) = \sum_{m=0}^n \binom{n}{m} \Delta^m(\underline{X}) = (\Delta + \text{id})^n(\underline{X}) = f^{\circ n}(\underline{X}).$$

For the last assertion, the equation clearly holds for  $T \in \mathbb{N}$ , so by comparing coefficients, it holds for any  $T$ .  $\square$

## 6 Dynamics Associated to Algebraic Groups

### Power Maps

### Chebyshev Maps

### Lattès Maps

References are [On Lattès Maps, Milnor].

**Def. (21.8.6.1) [Lattès Maps].** A rational function  $f : \mathbb{P}^1 \rightarrow \mathbb{P}^1$  is called a **Latte map** if there exists  $E \in \text{EllCur}/\mathbb{C}$  s.t. it is a quotient of an endomorphism  $\varphi \in \text{End}(E)$  through a finite map  $\text{pr} : E \rightarrow \mathbb{P}^1$ . ┘

**Prop. (21.8.6.2).** For any Lattès map  $f : \mathbb{P}^1 \rightarrow \mathbb{P}^1$  corresponding to an endomorphism  $\varphi \in \text{End}(E)$  of degree  $\geq 2$  ?,  $\text{Jul}(f) = \mathbb{P}^1(\mathbb{C})$ . ┘

*Proof:* This is because the Julia set is the closure of repelling periodic points, and the set of periods of  $E \in \text{EllCur}/\mathbb{C}$  are dense and it is expanding everywhere. □

### 22.1 Motives

References are [Sta]Chap45, [Kle94, Sch94, Ful98, Mil12], and [Lectures on Pure Motives, Murre]. [Jannsen, Uwe Motivic sheaves and filtrations on Chow groups1994], [Jannsen, Uwe Equivalence relations on algebraic cycles2000], [Jannsen, Uwe Mixed motives and algebraic  $K$ -theory1990].

**Notation (22.1.0.1).**

- Let  $k \in \text{Field}$ .

┘

#### 1 Correspondences

**Def. (22.1.1.1).** The full subcategory of  $\text{Sch}/k$  consisting of smooth projective schemes over  $k$  is denoted by  $\text{SmProj}/k$ .

Any  $X \in \text{SmProj}/k$  has a decomposition  $X = \coprod_n X_n$  into clopen subschemes that  $X_n$  is equidimensional of dimension  $n$  by (9.1.1.28). Thus we can talk about Rings  $\text{CH}^*(X)$  and  $\text{CH}_{\text{num}}^*(X)$  (9.1.1.29).

┘

**Def. (22.1.1.2) [Adequate Equivalent Relations of Cycles].** An adequate equivalent relation on cycles is an equivalence relation on  $Z^*(X)$  for each  $X \in \text{SmProj}/k$  s.t.

- it is compatible with gradings and additions.
- it is compatible with products:  $Z \sim 0 \implies Z \times Y \sim 0$ .
- it is compatible with intersections:  $Z_1 \sim 0 \implies Z \cdot W = 0$ .
- it is compatible with projections: If  $Z \sim 0 \in Z^*(X \times Y) \implies (\text{pr}_X)_*(Z) \sim 0$ .
- it satisfies moving lemma: Given  $Z, W_1, \dots, W_\ell \in Z^*(X)$ , there exists  $Z' \sim Z$  s.t.  $Z'$  and  $W_i$  intersect properly for any  $i$ .

┘

**Def. (22.1.1.3) [(Rational)Correspondences].** Let  $X, Y \in \text{SmProj}/k$  the group of (rational) correspondences from  $X$  to  $Y$  of degree(codimension)  $r \in \mathbb{Z}$  is defined to be

$$\text{Corr}_{\text{rat}}^r(X, Y) = \bigoplus_d \text{CH}^{d+r}(X_d \times_k Y)_{\mathbb{Q}} \subset \text{CH}^*(X \times Y)_{\mathbb{Q}}.$$

Similarly we can define the groups of **Grothendieck correspondences**  $\text{Corr}_{\text{num}}^r(X, Y) \subset \text{CH}_{\text{num}}^*(X \times Y)_{\mathbb{Q}}$ .

┘

**Def. (22.1.1.4) [Compositions of Correspondences].** Let  $X, Y, Z \in \text{SmProj}/k$ , there is a **composition of correspondences** map

$$\text{Corr}^s(Y, Z) \times \text{Corr}^r(X, Y) \rightarrow \text{Corr}^{r+s}(X, Z) : (c', c) \mapsto c' \circ c = \text{pr}_{13*}(\text{pr}_{23}^* c' \cdot \text{pr}_{12}^* c).$$

Then composition of correspondences are  $\mathbb{Q}$ -linear and associative.  $\lrcorner$

*Proof:* Cf. [Sta]0FG0.  $\square$

**Prop. (22.1.1.5) [Tensor Product of Correspondences].** Let  $X, Y, X', Y' \in \text{SmProj}/k$ , there is a **tensor product of correspondences** map

$$\otimes : \text{Corr}^r(X, Y) \times \text{Corr}^s(X', Y') \rightarrow \text{Corr}^{r+s}(X \times_k X', Y \times_k Y') : (c, c') \mapsto \text{pr}_{13}^*(c) \cdot \text{pr}_{24}^*(c').$$

which is  $\mathbb{Q}$ -linear and associative, and commutes with compositions in both coordinates.  $\lrcorner$

**Prop. (22.1.1.6).**  $\text{Corr}^0(\mathbb{P}_k^1) = \text{CH}^1(\mathbb{P}_k^1 \times \mathbb{P}_k^1)_{\mathbb{Q}} \cong \mathbb{Q} \oplus \mathbb{Q}$ , where a basis is given by  $c_0 = [\{0\} \times \mathbb{P}^1]$  and  $c_2 = [\mathbb{P}^1 \times \{0\}]$ . And the diagonal  $\Delta = c_0 + c_2$ .

Also  $c_0 \circ c_0 = c_0$ ,  $c_2 \circ c_2 = c_2$ ,  $c_0 \circ c_2 = 0 = c_2 \circ c_0$ , so  $\text{Corr}^0(\mathbb{P}_k^1) \cong \mathbb{Q} \oplus \mathbb{Q}$  as a  $\mathbb{Q}$ -algebra.  $\lrcorner$

**Def. (22.1.1.7) [Push and Pull via Correspondences].** Let  $c \in \text{Corr}_{\text{rat}}^r(X, Y)$ , we can define the

- (Pullback):  $\text{CH}_k(Y) \rightarrow \text{CH}_{k-r}(X) : \beta \mapsto c^*(\beta) = \text{pr}_{1,*}(c \cdot \text{pr}_2^* \beta)$ .
- (Pushforward):  $\text{CH}^k(X) \rightarrow \text{CH}^{k+r}(Y) : \alpha \mapsto c_*(\alpha) = \text{pr}_{2,*}(c \cdot \text{pr}_1^* \alpha)$ .

by using stratification and (9.1.1.12)(9.1.1.9).  $\lrcorner$

**Prop. (22.1.1.8) [Correspondences and Chow Groups].**

- There are canonical isomorphisms

$$\text{CH}_{-r}(X)_{\mathbb{Q}} \cong \text{Corr}_{\text{rat}}^r(X, \text{Spec } k)$$

s.t. pullbacks by correspondences correspond to compositions.

- There are canonical isomorphisms

$$\text{CH}^r(X)_{\mathbb{Q}} \cong \text{Corr}_{\text{rat}}^r(\text{Spec } k, X)$$

s.t. pushforwards by correspondences correspond to compositions.  $\lrcorner$

*Proof:* Cf. [Sta]0FG0.  $\square$

**Cor. (22.1.1.9).** Pushforwards and pullbacks by correspondences commute with compositions, by (22.1.1.8) and (22.1.1.4).  $\lrcorner$

**Prop. (22.1.1.10) [Graphs].** For  $f : X \rightarrow Y \in \text{SmProj}/k$ , the transposed graph  $\Gamma_f^t$  defines a correspondence  $[\Gamma_f^t] \in \text{Corr}^0(Y, X)$ .  $[\Gamma_{\text{id}_X}] \in \text{Corr}^0(X, X)$  is denoted by  $[\Delta_X]$ .  $\lrcorner$

**Def. (22.1.1.11) [Transpose].** Let  $X, Y \in \text{SmProj}/k$  be equidimensional, then the isomorphism  $X \times_k Y \cong Y \times_k X$  induces a **transpose isomorphism**

$$(-)^t : \text{Corr}^r(X, Y) \rightarrow \text{Corr}^{\dim X - \dim Y + r}(Y, X).$$

In particular, when  $f : X \rightarrow Y \in \text{SmProj}/k$  and  $X, Y$  are equidimensional, then  $[\Gamma_f^t]^t = [\Gamma_f]$ .  $\lrcorner$

**Prop. (22.1.1.12).** Let  $\alpha \in \text{Corr}^*(X, Y), \beta \in \text{Corr}^*(Y, Z)$ , then

1.  $(\beta \circ \alpha)^t = \alpha^t \circ \beta^t$ .
2. If  $\beta = [\Gamma_g^t]$ , then  $\beta \circ \alpha = (\text{id}_X \times g)^! \alpha$ .
3. If  $\alpha = [\Gamma_f^t]$ , then  $\beta \circ \alpha = (f \times \text{id}_Z)_* \beta$ .
4. If  $\alpha = [\Gamma_f^t], \beta = [\Gamma_g^t]$ , then  $\beta \circ \alpha = [\Gamma_{fg}^t]$ .
5.  $\Delta_Y \circ \alpha = \alpha, \quad \beta \circ \Delta_Y = \beta$ .

┘

*Proof:* 1: This follows from commutativity and naturality of intersection products.

2: By (9.1.3.6) and (9.1.7.9),

$$[\Gamma_g^t] \circ \alpha = \text{pr}_{13*}(\text{pr}_{23}^*[\Gamma_g^t] \cdot \text{pr}_{12}^* \alpha) = \text{pr}_{13*}(1, g, 1)_*((1, g, 1)^! \text{pr}_{12}^* \alpha) = (1, g)^! \alpha.$$

3 is similar to item 2.

4, 5 follow from item 2, 3. □

**Prop. (22.1.1.13) [Push and Pull by Graphs].** Let  $f : X \rightarrow Y \in \text{SmProj}/k$ , then

- Pushforward by  $[\Gamma_f]^t$  agrees with the Gysin map  $f^! : \text{CH}^*(Y) \rightarrow \text{CH}^*(X)$ .
- Pullback by  $[\Gamma_f]^t$  agrees with the pushforward  $f_* : \text{CH}_*(X) \rightarrow \text{CH}_*(Y)$ .

┘

*Proof:* These follows from (22.1.1.8) and (22.1.1.12). □

**Prop. (22.1.1.14).** Let  $f : Y \rightarrow X \in \text{SmProj}/k$  where  $X, Y$  are equidimensional, then there are commutative diagram of correspondences

$$\begin{array}{ccccc} X \times Y & \xrightarrow{[\Gamma_f^t] \otimes \Delta_Y} & Y \times Y & \xrightarrow{[\Gamma_{\Delta_Y}^t]} & Y \\ \downarrow \Delta_X \otimes [\Gamma_f] & & & & \downarrow [Y] \\ X \times X & \xrightarrow{[\Gamma_{\Delta_X}^t]} & X & \xrightarrow{[X]} & \text{Spec } k \end{array}$$

┘

*Proof:* By (22.1.1.12), it suffices to show that  $(\text{id}_X \times f)^!(\Delta_X)_*[X] = (f \times \text{id}_Y)_*(\Delta_Y)_*[Y]$ . But both sides equal  $[\Gamma_f^t]$ .  $((\text{id}_X \times f)^![\Delta_X] = [\Gamma_f^t])$  follows from [Sta]0FF7? □

**Prop. (22.1.1.15) [Virtual Number of Coincidences].** Let  $X, Y \in \text{SmProj}/k, \alpha, \beta \in \text{Corr}^*(X, Y)$ , then

$$\text{pr}_{1*}(\alpha \cdot \beta) = (\beta^t \circ \alpha) \cdot \Delta_X = (\alpha^t \circ \beta) \cdot \Delta_X.$$

In particular, if  $X, Y$  are equidimensional of dimension  $n$ , and  $\alpha, \beta \in \text{Corr}^0(X, Y)$ , then the **virtual number of coincidence** of  $\alpha$  and  $\beta$ , defined as  $\int_{X \times Y} \alpha \cdot \beta$ , equals the virtual number of fixed points of  $\beta^t \circ \alpha$ . ┘

*Proof:* Cf. [Ful98]P309. □

**Def. (22.1.1.16) [Degenerate Correspondences].** Let  $X, Y \in \text{SmProj}/k$ , then the subgroup of **degenerate correspondences** from  $X$  to  $Y$  is the subgroup of  $\text{Corr}^*(X, Y)$  generated by exterior products  $\text{CH}^*(X) \times \text{CH}^*(Y)$  (9.1.7.3). The subgroup of degenerate correspondences from  $X$  to  $Y$  is denoted by  $I(X, Y)$ .

Then  $I(X, X)$  is a two-sided ideal in  $\text{Corr}^*(X, X)$ , and is stable under transpose if  $X$  are equidimensional.  $\lrcorner$

**Def. (22.1.1.17) [Valence].** Let  $X \in \text{SmProj}^n/k$ , then  $\alpha \in \text{Corr}^0(X, X)$  is said to be of **valence**  $\nu$  iff  $\alpha + \nu[\Delta_X] \in I(X, X)$ .  $\lrcorner$

**Def. (22.1.1.18) [Degree of Correspondences].** Let  $X, Y, Z \in \text{SmProj}^n/k$  be irreducible, then for  $\alpha \in \text{Corr}^n(X, Y)$ , the **degrees of**  $\alpha$  is defined to

$$\alpha_*[X] = \text{pr}_{2*}(\alpha) = d_2(\alpha)[Y], \quad \alpha^*[Y] = \text{pr}_{1*}(\alpha) = d_1(\alpha)[X].$$

Then

- Let  $\beta \in \text{Corr}^n(Y, Z)$ , then  $d_i(\beta \circ \alpha) = d_i(\alpha)d_i(\beta)$ .
- If  $P \subset X$  is a rational point, then  $d_1(\alpha) = \int_{X \times Y} \alpha \cdot [P \times Y]$ .

$\lrcorner$

*Proof:* 1 is clear. 2 follows by composing with the correspondence  $[\Gamma_P] \in \text{Corr}^{-n}(P, X)$ .  $\square$

## 2 Weil Cohomology Theories

### Pre-Weil Cohomology Theories

**Prop. (22.1.2.1) [Non-Existence of a  $\mathbb{Q}$ -Cohomology Theory].** For any  $p \in \text{Prime} \cup \{0\}$ , there exists  $k \in \text{Field}^p$  s.t.  $k = \bar{k}$  and there doesn't exist a cohomology theory on the category of smooth projective varieties over  $k$  with coefficients in  $\mathbb{Q}$  that specializes to the étale cohomology with  $\mathbb{Q}_\ell$  coefficients, where  $\ell \in \text{Prime} \setminus \{p\}$ .  $\lrcorner$

*Proof:* For  $p = 0$ , take  $k = \mathbb{C}$ . For a smooth projective variety  $X$  over  $k$ , it is defined over a subfield  $k_0$  finite over  $\mathbb{Q}$ . Let  $\Gamma = \text{Gal}(k/k_0)$ , then  $\Gamma$  acts on  $H^*(X, \mathbb{Q}_\ell)$ . If  $H^*(X, \mathbb{Q}_\ell)$  is specialized from a  $\mathbb{Q}$ -cohomology  $\tilde{H}^*(-, \mathbb{Q})$ , then the continuous  $\Gamma$ -action on  $H_{\text{ét}}^*(X, \mathbb{Q}_\ell)$  stabilizes  $\tilde{H}^*(X, \mathbb{Q})$ . But it is known that

$$H_{\text{ét}}^*(X, \mathbb{Q}_\ell) \cong H_{\text{Betti}}^*(X, \mathbb{Q}) \oplus \mathbb{Q}_\ell,$$

so  $\dim_{\mathbb{Q}} \tilde{H}^*(X, \mathbb{Q}) = \dim H_{\text{Betti}}^*(X, \mathbb{Q}) < \infty$ . Then because infinite Galois group is uncountable,  $\Gamma$  acts  $\tilde{H}^*(X, \mathbb{Q})$  through a finite quotient. But this is not true in general. ? In fact, This contradicts Tate's conjecture.

If  $p > 0$ , let  $k = \overline{F}_p$  and  $E$  be an supersingular elliptic curve over  $\bar{k}$ , which exists by (21.3.3.12), then  $\text{End}(E) \otimes \mathbb{Q}$  is a definite quaternion algebra  $Q$  over  $\mathbb{Q}$ , and  $\dim_{\mathbb{Q}_\ell} H_{\text{ét}}^1(E, \mathbb{Q}_\ell) = 2$  (20.9.6.19), so if  $H^*(X, \mathbb{Q}_\ell)$  is specialized from a  $\mathbb{Q}$ -cohomology  $\tilde{H}^*(-, \mathbb{Q})$ ,  $\dim_{\mathbb{Q}} \tilde{H}^1(E, \mathbb{Q}) = 2$ , and  $\text{End}(E) \otimes \mathbb{Q}$  acts on it. But there is no ring homomorphism  $Q \rightarrow \text{Mat}(2; \mathbb{Q})$ .  $\square$

**Def. (22.1.2.2) [Weil Cohomology Theories].** For  $F \in \text{Field}^0$ , a **pre-Weil cohomology theory** over  $k$  with coefficients in  $F$  is given by a tuple  $(F(1), H^*, \gamma, \text{tr})$ , where

- $F(1)$  is a 1-dimensional vector space over  $F$ . And denote  $F(n) = F(1)^{\otimes n}$ ,  $F(-n) = F(n)^*$ , and for any  $V \in \text{Vect}_F$ , define  $V(n) = V \otimes F(n)$ .

- $H^*$  is a functor  $H^* : \text{SmProj}/k \rightarrow \mathcal{C}\text{Ring}^{\text{gr}}/F$ .  $H^*(X)$  is called the **cohomology ring** of  $X$ , and its multiplication is denoted by  $\cup$ .
- For every  $X \in \text{SmProj}/k$  and  $i \in \mathbb{N}$ ,  $\gamma_X$  is a family of homomorphisms  $\gamma_X : \text{CH}^i(X) \rightarrow H^{2i}(X)(i)$  for each  $i \in \mathbb{N}$ , called the **cycle class maps** of  $X$ .
- For any  $X \in \text{SmProj}^d/k$ ,  $\text{tr}_X$  is a map  $\text{tr}_X : H^{2d}(X)(d) \rightarrow F$ , called the **trace map** of  $X$ . The trace map is sometimes also denoted by  $\int_X$ .

that satisfy the following properties:

**Poincaré duality:** For any  $X \in \text{SmProj}^d/k$ ,

1.  $\dim_F H^i(X) < \infty$  for any  $i$  and  $H^i(X) = 0$  unless  $0 \leq i \leq 2n$ .
2.  $H^i(X) \otimes_F H^{2d-i}(X)(d) \xrightarrow{\cup} H^{2d}(X)(d) \xrightarrow{\text{tr}_X} F$  is a perfect pairing, called the **Poincaré pairing**.

**Künneth formula:** For any  $X, Y \in \text{SmProj}/k$ ,

$$H^*(X) \otimes_F H^*(Y) \rightarrow H^*(X \times_k Y) : (a, b) \mapsto \text{pr}_1^* a \cup \text{pr}_2^* b$$

is an isomorphism in  $\mathcal{C}\text{Ring}^{\text{gr}}/F$ .

**Cycle class map is natural:**

1. For any  $f : X \rightarrow Y \in \text{SmProj}/k$ ,  $\gamma_X(f^! \beta) = f^* \gamma_Y(\beta)$  for  $\beta \in H^*(Y)$  and  $\gamma_Y(f_* \alpha) = f_* \gamma_X(\alpha)$  for  $\alpha \in H^*(X)$ , where  $f_*$  on  $H^*$  is defined in (22.1.2.3).
2.  $\gamma_{X \times Y}(a \cdot b) = \gamma_X(a) \cup \gamma_Y(b)$ .
3.  $\int_{\text{Spec } k} \gamma(\text{Spec } k) = 1$ .

**Weak Lefschetz theorem** For any  $X \in \text{SmProj}^d/k$  and a smooth hyperplane section  $h : W \subset X$ , the induced map  $h^* : H^i(X) \rightarrow H^i(W)$  is an isomorphism for  $i \leq d-2$  and an injection for  $i = d-1$ .

**Strong Lefschetz theorem** For any  $X \in \text{SmProj}^d/k$  and a smooth hyperplane section  $h : W \subset X$ , define the Lefschetz operator

$$L : H^i(X) \rightarrow H^{i+2}(X) : x \mapsto x \cdot \gamma_X(W),$$

then for  $i \in [d]$ ,  $L^{d-i} : H^i(X) \rightarrow H^{2d-i}(X)$  is an isomorphism.

$H^*$  is called a **Weil cohomology theory** if moreover it satisfies:

- For  $X \in \text{SmProj}/k$  and  $\Gamma(X, \mathcal{O}_X) = k'$ , then the natural map  $H^0(\text{Spec } k') \rightarrow H^0(X)$  is an isomorphism.

┘

**Prop. (22.1.2.3)[Pushforward].** Let  $k \in \text{Field}$ ,  $F \in \text{Field}^0$  and  $H^*$  be a pre-Weil cohomology theory over  $k$  with coefficients in  $F$  (22.1.2.2). For  $f : X \rightarrow Y \in \text{SmProj}/k$  where  $\dim X = d$ ,  $\dim Y = e$ , we can define a **pushforward map of cohomology**  $H^{2d-*}(X)(d) \rightarrow H^{2e-*}(Y)(e)$  via Poincaré duality, i.e.

$$\int_X f^* b \cup a = \int_Y b \cup f_* a$$

for any  $a \in H^{2d-i}(X)(d)$ ,  $b \in H^i(Y)$ . Then

- $f_*(f^* b \cup a) = b \cup f_* a$ .
- $g_* f_* = (gf)_*$ .

┘

*Proof:* Use duality and the corresponding properties of  $f^*$ . □

**Prop. (22.1.2.4) [ $H^*(\text{Spec } k)$ ].** Let  $k \in \mathbf{Field}$ ,  $F \in \mathbf{Field}^0$  and  $H^*$  be a pre-Weil cohomology theory over  $k$  with coefficients in  $F$  (22.1.2.2), then  $H^i(\text{Spec } k) = 0$  unless  $i = 0$ , and there is a unique  $F$ -algebra isomorphism  $H^0(\text{Spec } k) \cong F$ , sending  $\gamma([\text{Spec } k])$  to 1 and  $\text{tr}_{\text{Spec } k}$  is identity under this identification.  $\lrcorner$

*Proof:* Cf. [Sta]0FHE.  $\square$

**Prop. (22.1.2.5) [Coproducts].** Let  $k \in \mathbf{Field}$ ,  $F \in \mathbf{Field}^0$  and  $H^*$  be a pre-Weil cohomology theory over  $k$  with coefficients in  $F$  (22.1.2.2), then for  $X, Y \in \mathbf{SmProj}/k$ ,  $H^*(X \amalg Y) \rightarrow H^*(X) \times H^*(Y)$  is an isomorphism.  $\lrcorner$

*Proof:* Cf. [Sta]0FHJ.  $\square$

**Def. (22.1.2.6) [Lefschetz Operators].**  $\lrcorner$

### Weil Cohomology Theories

**Prop. (22.1.2.7) [Characterizing Weil Cohomology Theories].** Let  $k, F \in \mathbf{Field}$  and  $H^*$  be a pre-Weil cohomology theory, for  $X \in \mathbf{SmProj}/k$  and  $\Gamma(X, \mathcal{O}_X) = k'$ , the following are equivalent:

- There exists f.m. geometric points  $x_1, \dots, x_r \in X$  s.t.  $H^0(X) \rightarrow H^0(x_1) \oplus \dots \oplus H^0(x_r)$  is injective.
- The map  $H^0(\text{Spec } k') \rightarrow H^0(X)$  is an isomorphism.

If these hold, then  $H^0(X)$  is finite étale over  $F$ . Moreover, if  $X$  is equidimensional of dimension  $d$ , then these are further equivalent to

- The classes of closed points of  $X$  generate  $H^{2d}(X)(d)$  as a module over  $H^0(X)$ .

$\lrcorner$

*Proof:*  $\square$

**Prop. (22.1.2.8) [Non-negativeness].** Let  $k, F \in \mathbf{Field}$  and  $H^*$  be a Weil cohomology theory, then for any  $Y \in \mathbf{SmProj}/k$ ,  $H^i(Y) = 0$  for  $i < 0$ .  $\lrcorner$

*Proof:* If  $H^i(Y) \neq 0$  for some  $Y \in \mathbf{SmProj}/k$  and  $i < 0$ , we may assume  $Y$  is irreducible by (22.1.2.5), and also we may assume  $i = -2j$  is even by changing  $Y$  to  $Y \times Y$  using Künneth formula. Then take  $X = Y \times (\mathbb{P}_k^1)^j$ , then Künneth formula shows

$$H^0(Y) \oplus H^i(Y) \otimes H^2(\mathbb{P}_k^1)^{\otimes j} \subset H^0(X),$$

so  $H^0(X)$  cannot be isomorphic to  $H^0(\text{Spec } \Gamma(X, \mathcal{O}_X)) = H^0(\text{Spec } \Gamma(Y, \mathcal{O}_Y)) \cong H^0(Y)$ .  $\square$

**Prop. (22.1.2.9). ?** Let  $k, F \in \mathbf{Field}$  and  $H^*$  be a Weil cohomology theory, then

- If  $X \in \mathbf{SmProj}^d/k$ , then  $\text{tr}_X \circ \gamma = \text{deg} : \text{CH}^d(X) \rightarrow F$  (9.1.1.27).
- If  $X, Y \in \mathbf{SmProj}/k$ , then  $\text{tr}_{X \times_k Y} = \text{tr}_X \otimes \text{tr}_Y$  via Künneth formula (22.1.2.2). In particular, for  $a \in H^{2\dim X}(X)(\dim X)$ ,  $b \in H^*(\dim Y)$ ,  $\text{pr}_{2,*}(a \otimes b) = (\int_X a) b \in H^*(Y)$ .

$\lrcorner$

*Proof:* 1: This holds for  $X = \text{Spec } k$  by hypothesis, and also for any other  $x \in X(k)$  by pushforward.

2: For any  $x \in X(k), y \in Y(k)$ , by item1,  $\gamma([x \times y]) \in H^{\text{top}}(X \times Y)$  is mapped to  $1 \in F$  via  $\text{tr}_{X \times Y}$ , and it equals  $\gamma([x]) \otimes \gamma([y])$  by (22.1.2.2) as  $[a \times b] = \text{pr}_1^!(a) \cdot \text{pr}_2^!(b)$ . The latter is also mapped to  $1 \in F$  by  $\text{tr}_X \otimes \text{tr}_Y$ .

For the last assertion, notice  $\int_Y \text{pr}_{2,*}(a \otimes b) \cup c = \int_{X \times Y} (a \otimes b) \cup (1 \otimes c) = (\int_X a) \int_Y (b \cup c)$   $\square$

**Prop. (22.1.2.10).** If  $Z \in \mathrm{CH}^*(X)$  satisfies  $mZ$  is algebraically trivial for some  $m \in \mathbb{Z}^\times$ , then  $\gamma_X(Z) = 0$ . ┘

*Proof:* Cf. [Algebraic Cycles and the Weil Conjecture, Kleiman, Prop1.2.1]. □

**Prop. (22.1.2.11) [Lefschetz Trace Formula].** Let  $k, F \in \mathbf{Field}$  and  $H^*$  be a Weil cohomology theory, then for  $X \in \mathrm{SmProj}/k$  and  $\alpha, \beta \in H^{2*}(X \times X)(*)$ , then

$$(\alpha \cdot \beta) = \sum_i (-1)^i \mathrm{tr}(\beta \circ \alpha | H^i(X)).$$

┘

*Proof:* Cf. [Sta]0FH0. ? □

**Cor. (22.1.2.12).** Let  $k, F \in \mathbf{Field}$  and  $H^*$  be a Weil cohomology theory, then for  $X \in \mathrm{SmProj}/k$ ,

$$\sum_{i=0}^{2 \dim X} (-1)^i \dim_F H^i(X) = \deg([\Delta_X] \cdot [\Delta_X]) = \deg(c_d(\mathcal{T}_X) \cap [X]).$$

┘

**Conj. (22.1.2.13) [Betti Numbers].** Let  $k, F \in \mathbf{Field}$ ,  $k = \bar{k}$  and  $H^*$  be a Weil cohomology theory, is it true that for a smooth projective variety over  $k$ , the numbers  $\beta_i = \dim_F H^i(X)$  are independent of  $F$  and the cohomology theory? ┘

*Proof:* ? □

### 3 Pure Motives

**Conj. (22.1.3.1) [Category of Motives as a Universal Cohomology Theory].** There should be a category of motives  $\mathrm{Mot}(k)$  s.t.

- $\mathrm{Mot}(k)$  is a neutral Tannakian category (4.2.1.14).
- There is a functor  $h : \mathrm{SmProj}/k \rightarrow \mathrm{Mot}(k)$ .
- Every correspondence  $X \rightarrow Y$  of degree 0 defines a map  $hX \rightarrow hY$ .
- Every Weil cohomology theory (22.1.2.2) on the  $\mathrm{SmProj}/k$  factors uniquely through  $h$ .

┘

*Proof:* ? □

**Def. (22.1.3.2) [Chow Motives].** The category  $\mathrm{Mot}_{\mathrm{rat}}(k)$  of **Chow motives** over  $k$  consists of triples  $(X, e, m)$  where  $X \in \mathrm{SmProj}/k$ ,  $e$  is an idempotent in  $\mathrm{Corr}_{\mathrm{rat}}^0(X, X)_{\mathbb{Q}}$  and  $m \in \mathbb{Z}$ . And morphisms in  $\mathrm{Mot}_{\mathrm{rat}}(k)$  are defined to be

$$\mathrm{Hom}((X, e, m), (Y, f, n)) = f \circ \mathrm{Corr}_{\mathrm{rat}}^{n-m}(X, Y) \circ e.$$

The category  $\mathrm{Mot}_{\mathrm{rat}}^{\mathrm{eff}}(k)$  of **effective Chow motives** over  $k$  is defined to be the full subcategory of  $\mathrm{Mot}_{\mathrm{rat}}(k)$  consisting of triples  $(X, e, 0)$ .

There is a contravariant functor  $\mathrm{SmProj}/k \rightarrow \mathrm{Mot}_{\mathrm{rat}}^{\mathrm{eff}}(k) : X \mapsto (X, [\Delta_X], 0)$  and  $f \mapsto [\Gamma_f^t]$ . ┘

**Def. (22.1.3.3)[Grothendieck Motives].** The category  $\text{Mot}_{\text{num}}(k)$  of **Grothendieck motives** over  $k$  consist of triples  $(X, e, m)$  where  $X \in \text{SmProj}/k$ ,  $e$  is an idempotent in  $\text{Corr}_{\text{num}}^0(X, X)_{\mathbb{Q}}$  and  $m \in \mathbb{Z}$ . And morphisms in  $\text{Mot}_{\text{num}}(k)$  are defined to be

$$\text{Hom}((X, e, m), (Y, f, n)) = f \circ \text{Corr}_{\text{num}}^{n-m}(X, Y) \circ e.$$

The category  $\text{Mot}_{\text{num}}^{\text{eff}}(k)$  of **effective Grothendieck motives** over  $k$  is defined to be the full subcategory of  $\text{Mot}_{\text{num}}(k)$  consisting of triples  $(X, e, 0)$ .  $\lrcorner$

**Prop. (22.1.3.4).** There is a natural functor  $\text{Mot}_{\text{rat}}^{\text{eff}}(k) \rightarrow \text{Mot}_{\text{num}}^{\text{eff}}(k)$  and  $\text{Mot}_{\text{rat}}(k) \rightarrow \text{Mot}_{\text{num}}(k)$ , by definition(22.1.1.3).  $\lrcorner$

**Def. (22.1.3.5)[Tate Twists and the Lefschetz Motive].** In  $\text{Mot}_{\text{rat}}(k)$  or  $\text{Mot}_{\text{num}}(k)$ , define  $\mathbf{1}(n) = (\text{Spec } k, \text{id}, n)$ , and for any object  $M$ , define  $M(n) = M \otimes \mathbf{1}(n)$ .  $\lrcorner$

$\mathbf{1}(-1)$  is also denoted by  $\mathbb{L}$ , called the **Lefschetz motive**.  $\lrcorner$

**Prop. (22.1.3.6).**  $\text{Mot}_{\text{rat}}(k)$  and  $\text{Mot}_{\text{num}}(k)$  are Karoubian categories(4.8.1.16) and symmetric monoidal categories with identity  $\mathbf{1}(0)$ (22.1.3.5).  $\lrcorner$

*Proof:* The symmetric monoidal structure is given by(22.1.1.5). It is clearly an additive category. To show it is Karoubian, for  $M = (X, e, m) \in \text{Mot}_{\text{rat}}(k)$ ,  $p \in \text{End}(M)$  be an idempotent, then  $p = epe$ ,  $N = (X, p, m) \in \text{Mot}_{\text{rat}}(k)$ , and  $p : N \rightarrow M$  is a morphism.  $\square$

**Prop. (22.1.3.7).**  $h(\mathbb{P}_k^1) = \mathbf{1} \oplus \mathbb{L} \in \text{Mot}_{\text{rat}}(k)$ .  $\lrcorner$

*Proof:* Cf.[Sta]0FGG.  $\square$

**Prop. (22.1.3.8) [Mot<sub>rat</sub>(k) as Inverting  $c_2$ ].** For any  $\mathbb{Q}$ -Karoubian category  $\mathcal{C}$  and a symmetric monoidal functor  $f : \text{Mot}_{\text{rat}}^{\text{eff}}(k) \rightarrow \mathcal{C}$  s.t.  $f(c_2) \in f(\mathbb{P}_k^1)$  is an invertible object,  $f$  factors through uniquely through a symmetric monoidal functor  $\text{Mot}_{\text{rat}}(k) \rightarrow \mathcal{C}$ .  $\lrcorner$

*Proof:* Cf.[Sta]0FGH.  $\square$

**Prop. (22.1.3.9)[Left Duals].** Let  $X \in \text{SmProj}^d/k$ , then  $h(X)(d)$  is a left dual of  $h(X)$ . In particular, every element in  $\text{Mot}_{\text{rat}}(k)$  has a left dual.  $\lrcorner$

*Proof:* Cf.[Sta]0FGI, 0FGJ.  $\square$

**Def. (22.1.3.10)[Chow Groups of Motives].** Let  $M = (X, e, m) \in \text{Mot}_{\text{rat}}(k)$ , the  $i$ -th **Chow group of motives** of  $M$  is defined to be

$$\text{CH}^i(M) = e \circ \text{CH}^{i+m}(X)_{\mathbb{Q}} = \text{Hom}(\mathbb{L}, M).$$

Then each  $\text{CH}^i$  defines a functor  $\text{Mot}_{\text{rat}}(k) \rightarrow \text{Vect}_{\mathbb{Q}}$  via pushforwards  $\square$ .

**Prop. (22.1.3.11) [Manin].** If  $M \in \text{Mot}_{\text{rat}}(k)$  and  $c : M \rightarrow N \in \text{Mot}_{\text{rat}}(k)$  satisfies that: For  $X \in \text{SmProj}/k$ , the map  $c \otimes \text{id} : M \otimes h(X) \rightarrow N \otimes h(X)$  induces isomorphisms on Chow groups, then  $c$  is an isomorphism.  $\lrcorner$

*Proof:* Cf.[Sta]0FGN.  $\square$

**Prop. (22.1.3.12)[Weil Cohomologies and Chow Motives].** Suppose  $k = \bar{k}$  and let  $F \in \text{Field}^0$ , then a classical Weil cohomology over  $k$  with coefficients in  $F$  is equivalent to a  $\mathbb{Q}$ -linear monoidal functor  $G : \text{Mat}_{\text{rat}}(k) \rightarrow \mathcal{C}\text{Ring}^{\text{gr}}/F$  together with an isomorphism  $F[2] \rightarrow G(\mathbf{1}(1))$  s.t.

- $G(h(X)) \subset \mathcal{C}\text{Ring}^{\text{gr} \geq 0}/F$ .
- $\dim_F G^0(h(X)) = 1$ .

$\lrcorner$

*Proof:* Cf.[Sta]0FH3.  $\square$

### Theorems

**Thm. (22.1.3.13)** [Voisin-Voevodsky]. For  $X \in \text{SmProj}/k$ ,  $Z_{\text{alg}}^i(X)_{\mathbb{Q}} \subset Z_{\times}^i(X)_{\mathbb{Q}}$ . ┘

*Proof:* Cf. [Lectures on Pure Motives, Murre]P19. □

**Prop. (22.1.3.14)** [Mot<sub>rat</sub>( $k$ ) is not Abelian]. If  $\text{char } k = 0$  or  $\text{char } k$  is not algebraic over its base field, then Mot<sub>rat</sub>( $k$ ) is not an Abelian category. ┘

*Proof:* ? Cf. [Sch94]P11. □

**Thm. (22.1.3.15)** [Mot<sub>num</sub>( $k$ ) is Abelian Semisimple, Jannsen]. Suppose  $k = \bar{k}$ , let  $\sim$  be an adequate equivalence relation (22.1.1.2), and  $F \in \text{Field}^0$ , then the following are equivalent:

- Mot <sub>$\sim$</sub> ( $k$ ) is an Abelian semisimple category.
- $\sim$  is the numerical equivalence relation.
- For all  $X \in \text{SmProj}/k$ ,  $\text{Corr}_{\sim}^0(X, X)_F$  is a f.d. semisimple  $F$ -algebras.

┘

*Proof:* Cf. [Lectures on Pure Motives, Murre]P39 or [Jan92]. □

**Prop. (22.1.3.16)** [Mot<sub>num</sub>( $k$ ) is a Tannakian Category]. The usual symmetric monoidal structure on Mot<sub>num</sub>( $k$ ) is not a Tannakian category, because the trace of  $\Delta_X$  on  $h(X)$  may be negative. But if the Künneth standard conjectures (22.1.5.6) holds ad we change the monoidal structure s.t. the canonical isomorphism is given by

$$h^i(X) \otimes h^i(X) \cong (-1)^{ij} h^j(X) \otimes h^i(X),$$

then Mot<sub>num</sub>( $k$ ) becomes a Tannakian category (4.2.1.13), and it is neutral (4.2.1.14) if  $\text{char } k = 0$ . ┘

*Proof:* □

### Realizations

**Cor. (22.1.3.17)** [Realization Functors]. Suppose Mot( $k$ ) exists (22.1.3.1), then there should be **realization functors**

- $\text{Real}_p : \text{Mot}(k) \rightarrow \text{Rep}_{\mathbb{Q}_p}(\text{Gal}_k)$  s.t.  $H^i(-, \mathbb{Q}_p) = \text{Real}_p \circ h^i$ ,
- $\text{Real}_{\iota, \text{Betti}} : \text{Mot}(k) \rightarrow \text{Hdg}_{\text{int}}$  s.t.  $H_{\iota, \text{Betti}}^i(-, \mathbb{Z})_{\text{lf}} = \text{Real}_{\iota} \circ h^i$ , for each embedding  $\iota : k \rightarrow \mathbb{C}$ .
- $\text{Real}_{\text{dR}} : \text{Mot}(k) \rightarrow \text{Fil}_K$  s.t.  $H_{\text{dR}}^i(-) = \text{Real}_{\text{dR}} \circ h^i$ .

And comparison isomorphisms

$$I_{\ell} : \text{Real}_{\iota} \otimes \mathbb{Q}_{\ell} \cong \text{Real}_{\ell} : \text{Mot}(k) \rightarrow \text{Vect} / \mathbb{Q}_{\ell}$$

$$I_{\text{dR}} : \text{Real}_{\iota, \text{Betti}} \otimes \mathbb{C} \cong \text{Real}_{\text{dR}} \otimes_{k, \iota} \mathbb{C} : \text{Mot}(k) \rightarrow \text{Fil}_{\mathbb{C}}^{\bullet}$$

and the Tate twist (22.1.3.5) acts on the relations via

- $\text{Real}_{\iota, \text{Betti}}(M(r)) = (\Lambda, \Lambda_{\mathbb{C}}^{p, q})$  is given as follows:

$$\Lambda = (2\pi i)^r \text{Real}_{\iota, \text{Betti}}(M), \quad \Lambda_{\mathbb{C}}^{p, q} = (2\pi i)^r \text{Real}_{\iota, \text{Betti}}(M)^{p-r, q-r}.$$

- $\text{Real}_p(M(r)) = \text{Real}_p(M)(r) = \text{Real}_p(M) \otimes \mu_p^{\otimes r}$ .
- $\text{Real}_{\text{dR}}(M(n)) = \text{Real}_{\text{dR}}(M)$ .

┘

*Proof:* It suffices to show that these are all Wei cohomology theories, ? □

**Prop. (22.1.3.18).** By (16.11.6.7), if  $\iota : k \rightarrow \mathbb{C}$  factors through  $\mathbb{R}$ , then

$$I_{\text{dR}} : \text{Real}_{\iota, \text{Betti}} \otimes \mathbb{C} \cong \text{Real}_{\text{dR}} \otimes_{k, \iota} \mathbb{C}$$

identifies  $\mathfrak{c}^* \otimes \mathfrak{c}$  on the LHS with  $\mathfrak{c}$  on the RHS. ┘

**Prop. (22.1.3.19)[Tate Conjecture and Motives].** The Tate conjecture (22.3.2.2) and Grothendieck-Serre conjecture (9.4.6.39) hold iff the functor  $\text{Mot}(k) \rightarrow \mathcal{R}\text{ep}_{\mathbb{Q}_p}(\text{Gal}_K) : M \mapsto H_{\text{ét}}^*(M)$  is fully faithful.

┘

*Proof:* ? □

**Prop. (22.1.3.20).** The functor  $\text{Mot}(k) \rightarrow \text{Hdg}(M)$  is fully faithful iff the Hodge conjecture holds for  $k$ . ┘

*Proof:* Cf. [Hodge-de Rham Structure and Periods of Automorphic Forms, Michael Harries, in Motives 2] Prop 1.2. ? □

### Motives of Curves and Jacobians

**Prop. (22.1.3.21).** Let  $C, C' \in \text{SmProjCur}/k$  with Jacobians  $J, J' \in \text{AbVar}/k$ , then

$$\text{Hom}_{\sim}(h^1(C), h^1(C')) = \text{Hom}(J, J') \otimes \mathbb{Q}.$$

And

$$\text{Hom}_{\sim}(\mathbb{L}, h^1(X)) = \begin{cases} 0 & , \sim = \text{num}, \text{hom} \\ J(k) \otimes \mathbb{Q} & , \sim = \text{rat} \end{cases}.$$

┘

*Proof:* ? □

**Cor. (22.1.3.22)[Abelian Motives].** The full subcategory of  $\text{Mot}_{\text{rat}}(k)$  whose objects are direct summands of the form  $h^1(X)$  for some  $X \in \text{SmProjVar}^1/k$  is equivalent to  $\text{IsogAbVar}_k$ . ┘

### Dimension 1 and Codimension 1 Motives

#### 4 André's Pure Motives

André's category of pure motives is the category of motives modulo homological equivalences with the Lefschetz involutions added. It is known that this is a semisimple Tannakian category.

## 5 Standard Conjectures

References are [Kle94] and [Standard conjectures on algebraic cycles, Grothendieck].

**Remark (22.1.5.1).** The standard conjectures over  $k$  are necessary conditions to make the  $\text{Mot}_{\text{num}}(k)$  a semistable universal cohomology theory(22.1.3.1).  $\lrcorner$

**Conj. (22.1.5.2) [Standard Conjecture D,  $\sim_{\text{hom}} \iff \sim_{\text{num}}$ ].** Suppose  $k = \bar{k}$  and let  $F \in \text{Field}$  and  $H^*$  be a Weil cohomology theory with coefficient in  $F$ (22.1.2.2), then for  $X \in \text{SmProj}/k$ , a cycle  $Z \in \text{CH}^*(X)$  is numerically trivial iff  $\gamma_X(Z) = 0$ . Equivalently, every Weil cohomology factors through  $\text{Mot}_{\text{num}}(k)$ .

This is an existence theorem for algebraic cycles.  $\lrcorner$

*Proof:*  $\square$

**Thm& Conj.Cor. (22.1.5.3) [Lieberman].** If  $\text{char } k = 0$ , this conjecture is true for varieties of dimension  $\leq 4$  and for Abelian varieties(which is implied by Hodge conjecture).  $\lrcorner$

*Proof:* ?  $\square$

### Lefschetz Standard Conjectures

**Conj. (22.1.5.4) [Lefschetz Standard Conjecture].** Suppose  $k = \bar{k}$  and let  $F \in \text{Field}$  and  $H^*$  be a Weil cohomology theory with coefficient in  $F$ (22.1.2.2),  $X \subset \text{SmProj}^d/k$ , then the Lefschetz operator  $L : \text{CH}^i(X) \rightarrow \text{CH}^{i+2}(X)$  satisfies for any  $i \leq d$ ,

$$L^{d-i} : H^i(X) \rightarrow H^{2d-i}(X)$$

is an isomorphism by(22.1.2.2). and for  $i \leq d$  we can define operators

$$\Lambda = (L^{d-i+2})^{-1} \circ L \circ (L^{d-i}) : H^i(X) \rightarrow H^{i-2}(X), \quad \Lambda = L^{n-i} \circ L \circ (L^{d-i+2})^{-1} : H^{2d-i+2}(X) \rightarrow H^{2n-i}(X),$$

then we have the following conjectures:

$A(X, L)$  : The restriction of  $L^{d-i} : \gamma_X(\text{CH}^i(X)) \rightarrow \gamma_X(\text{CH}^{2d-i}(X))$  is an isomorphism.

$B(X)$  :  $\Lambda$  is induced from a correspondence from  $X$  to  $X$  of degree  $-1$ .

$B^c(X)$  : The operator  $\Lambda^c$ (22.1.2.6) is algebraic.  $\lrcorner$

**Conj.Cor. (22.1.5.5) [Relations between Lefschetz Standard Conjectures].** Situation as in(22.1.5.4), we have the following relations between the Lefschetz standard conjecture:

- 
- The following are equivalent:

$$A(X \times X, L \otimes 1 + 1 \otimes L), \quad B(X), \quad B(X \times X).$$

$\lrcorner$

**Conj.Cor. (22.1.5.6) [Künneth Standard Conjecture].** Assume the conjecture  $D$ (22.1.5.2) holds, then it is conjectured that for any  $X \in \text{SmProj}^d/k$ , there exists a decomposition of  $\Delta_X \in \text{Corr}_{\text{num}}^d(X \times X)$  into orthogonal idempotents

$$\Delta_X = h^0(X) + \dots + h^{2d}(X)$$

s.t. it induces the decomposition

$$H^*(X) = H^0(X) \oplus H^1(X) \oplus \dots \oplus H^{2d}(X)$$

for any Weil cohomology theory  $H^*$ .

By Deligne's purity theorem, any homomorphism  $H_{\text{ét}}^i(X) \rightarrow H_{\text{ét}}^j(Y)$  induced by an algebraic cycle is zero unless  $i = j$  ?, thus such a decomposition, if exists, would be unique. ┘

*Proof:* □

**Remark (22.1.5.7) [Murre].** A **Chow-Künneth decomposition** of  $\Delta_X$  is defined to be a decomposition

$$\Delta_X = \sum_{i=0}^{2d} \pi_i \in \text{CH}^{\dim X}(X \times X, \mathbb{Q})$$

that induces the decomposition  $\Delta_X = h^0(X) + \dots + h^{2\dim X}(X)$  in  $\text{CH}_{\text{num}}^{\dim X}(X \times X)$ .

Murre conjectured that such a decomposition exists with certain properties, which is equivalent to the conjectural existence of Beilinson-Bloch filtration on  $\text{CH}^*(X)$ . ? ┘

**Thm& Conj.Cor. (22.1.5.8).** the Lefschetz standard conjecture is proved for

- Curves.
- Abelian varieties and Hilbert schemes of smooth surfaces (where the multiplication map can be used to decompose motives),
- A generalized flag variety  $X = G/P$ .

The Künneth standard conjecture is proved for

- Varieties over finite fields (where the Frobenius map can be used to decompose motives).

┘

*Proof:* ? □

### Hodge Standard Conjectures

**Conj. (22.1.5.9) [Hodge Standard Conjecture].** Suppose  $k = \bar{k}$  and let  $F \in \text{Field}^0$  and  $H^*$  be a Weil cohomology theory over  $k$  with coefficients in  $F$  (22.1.2.2). If  $X \in \text{SmProj}^d/k$ ,  $P^k(X) = \ker(L|H^k(X))$  be the set of primitive cohomology classes,  $A^i(X) = \gamma_X(\text{CH}^i(X))$ , then for any  $i < d/2$ , the  $\mathbb{Q}$ -valued pairing on  $A^i(X) \cap P^{2i}(X)$ :

$$(x, y) \mapsto (-1)^i \langle L^{r-2i}x, y \rangle$$

is positive definite.

Equivalently, the pairing on  $A^i(X) : (x, y) \mapsto \langle x, *y \rangle$  (22.1.2.6) is positive-definite. ┘

*Proof:* □

**Thm& Conj.Cor. (22.1.5.10).** This conjecture is true in characteristic 0 by Hodge theory. This conjecture is shown for surfaces by Grothendieck(1958). This conjecture is shown for Abelian varieties of dimension 4 by Ancona(2020). ┘

*Proof:* ? □

**Prop. (22.1.5.11) [Conjecture  $D$  and Lefschetz Conjectures].** The conjecture  $D(22.1.5.2)$  implies the Lefschetz standard conjecture  $B(X)(22.1.5.9)$ . And the Hodge standard conjecture plus the Lefschetz standard conjecture  $B(X)$  imply conjecture  $D$ .  $\lrcorner$

*Proof:* For  $X \in \text{SmProj}^d/k$ , If  $B(X)$  holds, then by (22.1.5.5),  $A(X, L)$  holds, and  $*$  clearly maps  $\gamma_X(\text{CH}^i(X))$  into  $\gamma_X(\text{CH}^{2d-i}(X))$ .  $\square$

**Prop. (22.1.5.12) [Hodge Conjecture and Lefschetz Standard Conjecture].** If  $\text{char } k = 0$ , the Hodge conjecture (16.11.3.1) implies the Lefschetz and Künneth standard conjectures.  $\lrcorner$

*Proof:*  $\square$

**Prop. (22.1.5.13).** If the Lefschetz standard conjecture and the Hodge standard conjecture hold, then for any  $X \in \text{SmProj}/k$ ,

- $\text{Corr}_{\text{num}}^*(X, X)$  is a semisimple  $\mathbb{Q}$ -algebra.
- (Generalized Riemann Hypothesis) If  $k$  is a finite field with Frobenius  $\varphi$ , then for any Weil cohomology  $H^*$ , the Frobenius action  $\Phi$  on  $H^i(X)$  is semisimple with characteristic polynomial in  $\mathbb{Z}[T]$ , and eigenvalues of absolute value  $q^{i/2}$ .

$\lrcorner$

*Proof:* Cf. [Kle94] P19.  $\square$

**Prop. (22.1.5.14) [Tate Conjecture and Standard Conjectures].** If  $k$  is f.g., the Tate conjecture implies Lefschetz, Künneth standard conjectures (22.1.5.6) and conjecture  $D(22.1.5.2)$  for  $\ell$ -adic étale cohomology.  $\lrcorner$

*Proof:*  $\square$

## 6 Mixed Motives

**Conj. (22.1.6.1) [Mixed Motives, Lichtenbaum(84)/Beilinson[Bei87]/Lichtenbaum(90)].** The motives are conjectured to be the subcategory of semisimple objects in a larger category of **mixed motives**.

There is at present no definition of a category of mixed motives, but several mathematicians have constructed triangulated categories that are candidates to be its derived category; it remains to define a  $T$ -structure on one of these categories whose heart is the category of mixed motives. ?  $\lrcorner$

Beilinson conjectured that his theory would have deep links to Quillen's algebraic  $K$ -theory.

### Motivic t-Structures

References are [Remarks on Grothendieck's standard Conjecture, Beilinson].

### Beilinson-Bloch-Murre Filtration Conjecture

**Conj. (22.1.6.2) [Beilinson].** For  $X \in \text{Var}/k$ , there exists a descending filtration  $\text{Fil}^\bullet \text{CH}^\bullet(X)_{\mathbb{Q}}$  s.t.

- $\text{Fil}^0 \text{CH}^j(X)_{\mathbb{Q}} = \text{CH}^j(X)_{\mathbb{Q}}$ ,  $\text{Fil}^1 \text{CH}^j(X)_{\mathbb{Q}} = \text{CH}^j(X)_{\mathbb{Q}} = \text{CH}^j(X)_{\text{hom } 0, \mathbb{Q}}$ .
- this filtration is multiplicative.
- $\text{gr}^v \text{CH}^j(X)_{\mathbb{Q}}$  only depends on the motive modulo homological equivalence,  $h^{2j-v}(X)$ .

- $\mathrm{Fil}^{j+1} \mathrm{CH}^j(X)_{\mathbb{Q}} = 0$ .

And moreover, if  $k = \mathbb{Q}$ , then  $\mathrm{Fil}^2 = 0$ . ┘

*Proof:* □

### Multiple Zeta Values

**Def. (22.1.7.1) [Multiple Zeta Values].** A **multiple zeta value** is a number in  $\mathbb{R}_+$  of the form

$$\zeta(n_1, \dots, n_r) = \sum_{0 < k_1 < \dots < k_r} \frac{1}{k_1^{n_1} \dots k_r^{n_r}} \in \mathbb{R}_+$$

where  $r \in \mathbb{Z}_+$  and  $n_1, \dots, n_r \in \mathbb{Z}_+, n_r \geq 2$ . The **weight** of the tuple  $(n_1, \dots, n_r)$  is defined to be  $w = \sum_i n_i$ , and the **depth** is defined to be  $r$ . ┘

**Prop. (22.1.7.2) [Space of Multiple Zeta Values].** Let  $\mathcal{Z} \subset \mathbb{R}$  be the  $\mathbb{Q}$ -subspace generated by multiple zeta values, then  $\mathcal{Z}$  is closed under multiplication. ┘

*Proof:* ? □

**Prop. (22.1.7.3).** ┘

### Periods and Multiple Zeta Values

**Thm. (22.1.7.4).** The periods of mixed Tate motives over  $\mathbb{Z}$  lies in  $\mathcal{Z}[\frac{1}{2\pi i}]$  (22.1.7.2). ┘

*Proof:* □

**Thm. (22.1.7.5).** Every multiple zeta value of weight  $N \in \mathbb{Z}_+$  is a  $\mathbb{Q}$ -linear combination of

$$\{\zeta(a_1, \dots, a_r) : a_i \in \{2, 3\}, a_1 + \dots + a_r = N\}.$$

┘

*Proof:* □

## 8 Motivic Galois Theory

**Thm. (22.1.8.1) [André].** The motivic Galois group attached to the subcategory  $\mathrm{Mot}^{\mathrm{abCM}}$  of category of André's motives consisting of CM Abelian varieties satisfies

$$G^{\mathrm{abCM}} \cong \mathbb{S}_{\mathrm{Serre}}$$

where  $\mathbb{S}_{\mathrm{Serre}}$  is Serre's pro-torus characterizing CM-types. ┘

*Proof:* □

### Mixed Motivic Galois Groups

**Def.(22.1.8.2)** [**Mixed Motivic Galois Groups**]. If the conjectural category of mixed motives  $\text{MMot}(K)$  exist [\(22.1.6.1\)](#), then the **mixed motivic Galois group**  $G_{\text{Mot},K}$  is defined to be the Tannakian Galois group of the fiber functor  $H_{\text{Betti}} : \text{MMot}(K) \rightarrow \text{Vect}_{\mathbb{C}}$ .  $\lrcorner$

## 9 Periods

**Prop.(22.1.9.1).**  $\lrcorner$

## 22.2 $\mathbb{P}^1 \setminus \{0, 1, \infty\}$

### 1 Dessins d'Enfant

**Def. (22.2.1.1) [Dessins d'Enfant].** A **dessin d'enfant** is a tuple  $(G, \{s_v\}_{v \in V(G)})$  where  $G \in \mathbf{Graph}^{\text{fin}}$  is a connected bipartite simple graph and for each  $v \in V(G)$ ,  $s_v$  is a cyclic ordering of the edges meeting  $v$ .  $\lrcorner$

**Prop. (22.2.1.2) [Dessins d'Enfant and Riemann Surfaces].** If  $X$  be a Riemann surface and  $f : X \rightarrow \mathbb{P}^1(\mathbb{C})$  is a map finite étale map that is unramified outside  $\{0, 1, \infty\}$ . Then we get a dessin d'enfant  $G_X$  by taking  $V(G) = f^{-1}(\{0, 1\})$ , and  $E(G) = f^{-1}([0, 1])$ . Moreover, the cyclic ordering comes from the natural orientation of  $\mathbb{P}^1(\mathbb{C})$ . We called vertices in  $f^{-1}(0)$  the **black vertices** and vertices in  $f^{-1}(1)$  the **white vertices**.

To show that  $G$  is connected, notice there is an action of  $\pi(\frac{1}{2}, \mathbb{P}^1(\mathbb{C}) \setminus \{0, 1, \infty\})$  on the edges of  $X$ . Where the loop around 0 rotates the edges around each black vertex, and the loop around 1 rotates the edges around each white vertex. Then for any two  $u, v \in V(G)$ , take a path  $\gamma$  in  $X$  connecting  $u$  to  $v$  that avoids  $V(G)$ , then the image of  $\gamma$  is a path in  $\mathbb{P}^1(G)$ . If we “shrink” it in  $\mathbb{P}^1 \setminus \{0, 1, \infty\}$ , we will get a path that loops around 1 or 0 several times, and this indicates a path from  $u$  to  $v$ .

Conversely, for any dessin d'enfant  $G$ , we can use the rotations at black and white vertices to get a action of the free group  $F_2$  on the edges. The action of transitive because  $G$  is connected. Then the stabilizer of either edge is a finite index subgroup, which are all conjugate. By the Galois theory of covering maps, we get a covering  $X \setminus V(G) \rightarrow \mathbb{P}^1 \setminus \{0, 1, \infty\}$ . And it extends to a map  $X \rightarrow \mathbb{P}^1$ .  $\lrcorner$

**Thm. (22.2.1.3) [Belyĭ [Bel79]].** Let  $\overline{\mathbb{Q}} \subset k \in \mathbf{Field}$  and  $X \in \mathbf{SmPrprVar}^1/k$ , then  $X$  is defined over  $\overline{\mathbb{Q}}$  iff it is branched over  $\mathbb{P}^1$  with three branching points. Such a map is called a **Belyĭ map**.

In particular, every algebraic curve over  $\overline{\mathbb{Q}}$  contains an embedded dessin d'enfant by (22.2.1.2).  $\lrcorner$

*Proof:* If  $X$  is defined over  $\overline{\mathbb{Q}}$ , then by (7.13.1.4)  $X$  is projective thus there is a rational map  $f : X \rightarrow \mathbb{P}_{\overline{\mathbb{Q}}}^1$ .

Let  $S \subset \mathbb{P}^1(\overline{\mathbb{Q}})$  be the critical values of  $f$ , then we can find a map  $\varphi : \mathbb{P}_{\overline{\mathbb{Q}}}^1 \rightarrow \mathbb{P}_{\overline{\mathbb{Q}}}^1$  s.t. the critical values of  $\varphi \circ f$  are contained in  $\mathbb{P}^1(\overline{\mathbb{Q}})$ : Enlarge  $S$  s.t.  $S$  is  $\text{Gal}_{\overline{\mathbb{Q}}}$ -invariant.

We use induction on  $\#S$  to show that there exists a map  $\varphi : \mathbb{P}_{\overline{\mathbb{Q}}}^1 \rightarrow \mathbb{P}_{\overline{\mathbb{Q}}}^1$  s.t. the critical values of  $\varphi \circ f$  are in  $\mathbb{P}^1(\mathbb{Q})$ . If  $\#S \leq 1$ , then  $S \subset \mathbb{Q}$  and we are done. If  $\#S > 1$ , then we can define  $P(X) = \prod_{s \in S \setminus \{\infty\}} (X - s) \in \mathbb{Q}[X]$ . Let  $S_1 = P(\{r \in \overline{\mathbb{Q}} : P(r) = 0\})$  be the set of critical values of  $P$ , which is also  $\text{Gal}_{\overline{\mathbb{Q}}}$ -invariant and  $\#S_1 < n - 1$ . Then we can use induction hypothesis to find a  $\varphi'$  that maps  $S$  into  $\mathbb{P}^1(\mathbb{Q})$  and also has critical values in  $\mathbb{Q}$ . Then  $\varphi' \circ \varphi$  satisfies the requirement. Then the induction is complete.

We then find a map  $g : X \rightarrow \mathbb{P}_{\overline{\mathbb{Q}}}^1$  with the set of critical values  $T \subset \mathbb{P}^1(\mathbb{Q})$ . Then we use induction on  $\#T$  to show that there exists a function  $\psi : \mathbb{P}_{\overline{\mathbb{Q}}}^1 \rightarrow \mathbb{P}_{\overline{\mathbb{Q}}}^1$  s.t. the critical values of  $\psi \circ g$  are in  $\{0, 1, \infty\}$ . If  $\#T \leq 3$ , then we can choose  $\psi$  to be a fractional transformation. And if  $\#T > 3$ , we can use a fractional transformation to make  $\{0, 1, \infty\} \subset T$  and  $T$  also contains a point  $\frac{m}{m+n}$  where  $m, n \in \mathbb{Z}_+$ . Consider the polynomial

$$p_{m,n}(z) = \frac{(m+n)^{m+n}}{m^m n^n} z^m (1-z)^n \in \mathbb{Q}[X],$$

then it maps  $\{0, 1, \frac{n}{m+n}, \infty\}$  into  $\{0, 1, \infty\}$  and it has critical values  $\{0, 1, \infty\}$ . Then the set  $T'$  of critical values of  $p_{m,n} \circ g$  has cardinality smaller than  $T$ , which means we can use induction hypothesis to find  $\psi$  s.t.  $\psi \circ p_{m,n} \circ g$  has critical values in  $\{0, 1, \infty\}$ .

Conversely, if  $X$  is branched over  $\mathbb{P}^1$  with three branching points, composing with a fractional transformation, we may assume that  $\varphi : X \rightarrow \mathbb{P}^1$  is finite and branched over  $\{0, 1, \infty\}$ . Then for any  $\sigma \in \text{Aut}(\mathbb{C})$ ,  $\varphi^\sigma$  is also finite and branched over  $\{0, 1, \infty\}$ . But there are only f.m. isomorphism of branched covers with the same branching points by (7.13.1.41). Thus there is a finite subgroup  $H \leq \text{Aut}(\mathbb{C})$  s.t.  $X^\sigma \cong X$  for any  $\sigma \in H$ . By (3.2.8.13),  $\mathbb{C}^H/\mathbb{Q}$  is a finite extension, thus the moduli field of  $X$  is contained in  $\overline{\mathbb{Q}}$ . So, by (10.9.1.2),  $X$  is defined over  $\overline{\mathbb{Q}}$ .  $\square$

**Cor. (22.2.1.4).** A compact Riemann surface  $X$  is defined over  $\overline{\mathbb{Q}}$  iff  $X = \overline{\Gamma \backslash \mathcal{H}}$  for some subgroup  $\Gamma \leq \text{PSL}(2; \mathbb{Z})$  of finite index.  $\lrcorner$

*Proof:* This follows from the fact that  $\mathcal{H}$  is a universal covering space of  $\mathbb{P}^1(\mathbb{C}) \setminus \{0, 1, \infty\}$  with fundamental group  $\text{PSL}(2; \mathbb{Z})$ .  $\square$

### Galois Theory of Dessins

How to effectively whether two dessins belong to the same  $\text{Gal}_{\mathbb{Q}}$ -orbit?

## 3 Multiple Zeta Functions

## 22.3 Tate Conjecture & Hodge Conjecture

References are [Tat94], [Tat65b], [Recent Progress on the Tate Conjecture, Totaro] and [Tate Conjecture over Finite Fields, Milne].

**Notation (22.3.0.1).**

- Let  $k \in \mathbf{Field}$  that is f.g. over its prime field.
- Let  $k^s$  be a separable closure of  $k$ .
- Let  $\ell \in \mathbf{Prime} \setminus \{\text{char } k\}$ .

┘

### 1 Hodge-Tate Classes and Monodromy Groups

**Def. (22.3.1.1) [Hodge-Tate Structure].** A **Hodge-Tate structure** (over  $\mathbb{Q}$ ) is a (pure) Hodge structure  $V \in \mathbf{Hdg}_{\mathbb{Q}}$  together with a continuous action of  $\text{Gal}_{\mathbb{Q}}$ -action on  $V \otimes \mathbb{Q}_{\ell}$ . ┘

**Def. (22.3.1.2) [ $\ell$ -adic Monodromy Groups].** For  $(V, \rho) \in \mathbf{Rep}_{\mathbb{Q}_p}^{\text{fd}}(\text{Gal}_k)$ , let  $G_{\ell}(V) \subset \text{GL}(V)_{\mathbb{Q}_{\ell}}$  be the Zariski closure of the image of  $\rho$ , called the  **$\ell$ -adic Monodromy group** of  $V$ . And also define  $H_{\ell}(V) = (G_{\ell}(V) \cap \text{SL}(V))^0$ .

For  $X \in \mathbf{SmProjVar}/k$  and  $r \in \mathbb{N}$ , define the corresponding  $\ell$ -adic monodromy group of  $X$  to be  $G_{\ell}^r(X) = G_{\ell}(H_{\text{ét}}^r(X, \mathbb{Q}_{\ell}))$ . ┘

**Thm. (22.3.1.3) [Serre].** If  $k = F \in \mathbf{NField}$ ,  $X \in \mathbf{AbVar}/F$  and  $V = V_{\ell}(X) \in \mathbf{Rep}_{\mathbb{Q}_p}^{\text{fd}}(\text{Gal}_F)$ , then

$$\ker(\text{Gal}_F \rightarrow G_{\ell}(V)/G_{\ell}(V)^0)$$

is independent of  $\ell$ . And there exists a finite extension  $F'/F$  s.t.  $\text{Gal}_{F',\ell} = \text{Gal}_{F,\ell}^0$  for any  $\ell$ . ┘

*Proof:* Cf. [Lettres a Ken Ribet, in Oeuvres, Serre]. □

**Def. (22.3.1.4) [Tate Classes].** For  $X \in \mathbf{SmProjVar}/k$  and  $r \in \mathbb{N}$ , the space  $\text{Tate}^r(X, \ell)$  of **Tate classes** of degree  $m$  is defined to be the subspace of  $H_{\text{ét}}^{2r}(X_{k^s}, \mathbb{Q}_{\ell})$  consisting by the elements whose stablizer in  $\text{Gal}_k$  is open. ┘

### 2 Tate Conjectures

*“This stuff is too beautiful not to be true.”*

–J. Tate

**Prop. (22.3.2.1) [ $\ell$ -adic Cycle Classes].** Let  $X \in \mathbf{SmProjVar}/k$ , then there exists a cycle map

$$c^r : \text{CH}^r(X_{k^s}) \rightarrow H_{\text{ét}}^{2r}(X_{k^s}, \mathbb{Q}_{\ell}(r)),$$

as étale cohomology is a Weil cohomology theory ?. Let  $\text{Ch}_{\text{hom},\ell}^r(X_{k^s})$  be the image, and  $\text{Ch}_{\text{hom},\ell}^r(X)$  be the image of  $\text{CH}^r(X) \subset \text{CH}^r(X_{k^s})$  under this map. Then there are maps

$$\text{Ch}_{\text{hom},\ell}^r(X_{k^s}) \otimes \mathbb{Q}_{\ell} \subset H_{\text{ét}}^{2r}(\overline{X}, \mathbb{Q}_{\ell}(r)), \quad \text{Ch}_{\text{hom},\ell}^r(X) \otimes \mathbb{Q}_{\ell} \subset H_{\text{ét}}^{2r}(X_{k^s}, \mathbb{Q}_{\ell}(r))^{\text{Gal}_k}.$$

┘

**Conj. (22.3.2.2) [Tate].** Situation as in (22.3.2.1), then

$T^r(X/k, \ell)$ :  $\text{Ch}_{\text{hom}, \ell}^r(X) \otimes \mathbb{Q}_\ell = H_{\text{ét}}^{2r}(X_{k^s}, \mathbb{Q}_\ell(r))^{\text{Gal}_k}$ .

$E^r(X/k, \ell)$ :  $\text{Ch}_{\text{hom}, \ell}^r(X) \cong \text{Ch}_{\text{num}}^r(X_{k^s})$ . In particular,  $\text{Ch}_{\text{hom}, \ell}^r(X)$  doesn't depend on  $\ell$ .

$SS^r(X/k, \ell)$ :  $\text{Gal}_F$  acts semisimply on  $H_{\text{ét}}^{2r}(X_{k^s}, \mathbb{Q}_\ell(r))$ . (If  $\text{char } k = 0$ , this means that  $G_\ell(X)^0$  is reductive).

$S^r(X/k, \ell)$ : The map  $H_{\text{ét}}^{2r}(X_{k^s}, \mathbb{Q}_\ell(r))^{\text{Gal}_k} \rightarrow H_{\text{ét}}^{2r}(X_{k^s}, \mathbb{Q}_\ell(r))_{\text{Gal}_k}$  is bijective. (If  $\#k < \infty$ , this means that 1 is a semisimple eigenvalue for  $\text{Fr}_X$ ).

┘

*Proof:*

□

**Thm& Conj. Cor. (22.3.2.3).**

1.  $T^r(X/k, \ell)$  holds trivially for  $r \in \{0, \dim X\}$ . In particular,  $T^*(X/k, \ell)$  holds for  $X \in \mathcal{C}_{\text{ur}}^{\text{SmPrpr}}/k$ .
2.  $T^1(A/k, \ell)$  holds for any  $A \in \text{AbVar}/k$ .
3. If  $\text{char } k = 0$ , then  $T^*(A/k, \ell)$  holds for any  $\ell \in \text{Prime}$  and  $A \in \text{AbVar}/F$  whose simple factors are all of dimension  $\leq 2$ .
4. If  $k = \mathbb{Q}$ , then  $T^*(X/k, \ell)$  holds for any  $\ell \in \text{Prime}$  and  $X$  a K3 surface over  $\mathbb{Q}$ .
5. If  $\text{char } k = F \in \text{NField}$ , then  $T^*(A/F)$  holds for any  $A \in \text{AbVar}^g/F$  when  $g \in \text{Prime} \cup \{1\}$ , and largely true for  $g = 4$  by [Hodge classes and Tate classes on simple abelian Fourfolds, Moonen-Zarhin1995].
6.  $T^1(X/k, \ell)$  holds for Hilbert modular surfaces.
7.  $T^1(X/k, \ell)$  holds for many quaternionic Shimura surface.
8.  $T^1(X/k, \ell)$  holds for Picard modular surface.
9.  $T^1(X/k, \ell)$  holds for Siegel modular threefold.

┘

*Proof:*

1. trivial.
2. Cf.[Families of Motives and the Mumford–Tate Conjecture, Moonen]P269 or using the Rosati involution in [Abelian Varieties, Milne]Prop14.2?
3. Cf.[Li-Zhang].? This is deduced from recent progress on Hodge conjectures and Mumford-Tate conjectures.
4. This follows from (22.3.5.1).
- 5.
6. Cf.[Period relations and the Tate conjecture for Hilbert modular surfaces].
7. ?
8. Cf.[Tate classes and arithmetic quotients of the two-balls].
9. Cf.[Tat94]P80.

□

**Conj. (22.3.2.4) [Integral Tate Conjecture].** Situation as in (22.3.2.1), we may ask if

$$\mathrm{Ch}_{\mathrm{hom}, \ell}^r(X) \otimes \mathbb{Z}_\ell = H_{\mathrm{et}}^{2r}(X_{k^s}, \mathbb{Z}_\ell(r))^{\mathrm{Gal}_k}.$$

Cf. [Tate Conjecture, Milne, P3]. ┘

*Proof:* □

**Conj. (22.3.2.5) [Integrated Tate Conjectures].** If  $k'/k$  is a finite Galois extension, then  $T^r(X/k', \ell)$  implies  $T^r(X/k, \ell)$  by Galois descent, so we can state the integrated version of Tate's conjecture: For any  $\Omega \in \mathbf{Field}$  s.t.  $\Omega^{\mathrm{sep}} = \Omega$  and  $X \in \mathbf{SmProjVar}/\Omega$ , the cycle class map

$$\mathrm{cl} : \mathrm{CH}^*(X) \otimes \mathbb{Q}_\ell \rightarrow \mathrm{Tate}^*(X, \ell).$$

is surjective. This is equivalent to  $T^r(X/k, \ell)$  for all f.g. subalgebra of  $\Omega$  (Cf. [Families of Motives and the Mumford–Tate Conjecture, Moonen]P286). ┘

*Proof:* □

**Prop. (22.3.2.6) [Moonen].** If the integrated Tate conjecture (22.3.2.5) holds whenever  $\mathrm{char} k = 0$  and  $X \in \mathbf{SmProjVar}/k$ , then  $SS^*(X/k, \ell)$  holds whenever  $\mathrm{char} k = 0$  and  $X \in \mathbf{SmProjVar}/k$ . ┘

*Proof:* Cf. [A remark on the Tate conjecture, Moonen] ?. □

**Thm. (22.3.2.7).**  $(SS^*(A/k), \ell)$  is true for any Abelian variety  $A \in \mathbf{AbVar}/k$ . ┘

*Proof:* □

**Prop. (22.3.2.8) [( $E^1(X/k)$ ) Holds].** The Kummer exact sequence of étale sheaves on  $X_{k^s} : 0 \rightarrow \mu_{\ell^n} \rightarrow \mathbb{G}_m \xrightarrow{\ell^n} \mathbb{G}_m \rightarrow 0$  induces an injection  $\mathrm{Pic}(\overline{X})/(\ell^n) \hookrightarrow H^2(\overline{X}, \mu_{\ell^n})$ . Taking limits gives an injection  $\mathrm{Pic}(\overline{X}) \otimes \mathbb{Q}_\ell \hookrightarrow H^2(\overline{X}, \mathbb{Q}_\ell(1))$ . And  $c^1$  is just

$$c^1 : Z^1(\overline{X}) \rightarrow \mathrm{Pic}(\overline{X}) \rightarrow \mathrm{Pic}(\overline{X}) \otimes \mathbb{Q}_\ell \hookrightarrow H_{\mathrm{et}}^2(\overline{X}, \mathbb{Q}_\ell(1)).$$

Thus the kernel of  $c^1$  is just the  $\mathrm{Pic}(X)$  modulo  $\ell^\infty$ -divisible elements and torsion elements, but  $\mathrm{Pic}^0(\overline{X})$  is  $\ell^\infty$ -divisible as it is the  $k^s$ -points of an Abelian variety over  $k^s$ . And also  $\mathrm{Pic}(\overline{X})/\mathrm{Pic}_{\mathrm{num}=0}(\overline{X}) \rightarrow \mathrm{Pic}(X_{\overline{k}})/\mathrm{Pic}^\tau(X_{\overline{k}}) = N^1(X_{\overline{k}})$  is injective by [Sta]0CC5 ?, and  $N^1(X_{\overline{k}})$  is finite free, so  $\mathrm{Pic}_{\mathrm{num}=0}(\overline{X}) = \mathrm{Pic}(\overline{X})_{\mathrm{tor}}$ , and  $A_{\mathrm{et}, \ell}^1(\overline{X}) = GH^1(X)$ . ┘

**Prop. (22.3.2.9).** Situation as in (22.3.2.2), let  $X, Y \in \mathbf{SmProjVar}/k$ , then  $T^1(X \times Y, \ell) \iff T^1(X/k, \ell) \wedge T^1(Y/k, \ell)$ . ┘

*Proof:* Cf. [Chao Li] ?. □

**Prop. (22.3.2.10) [Birational Invariance].** Situation as in (22.3.2.2), let  $f : X \rightarrow Y \in \mathbf{SmProjVar}/k$  be a dominant rational map, then  $(T^1(X/k)) \Rightarrow (T^1(Y/k))$ . In particular,  $(T^1)$  is birationally invariant. ┘

*Proof:* Cf. [Tat94]P79. □

**Cor. (22.3.2.11).** A Fermat curve  $S_n : a_0 z_0^n + a_1 z_1^n + a_2 z_2^n + a_3 z_3^n = 0$  is dominated by the product of two curves

$$C_1 : a_0 x_0^n + a_1 x_1^n = y^n, \quad C_2 : a_2 x_2^n + a_3 x_3^n = -z^n$$

by

$$C_1 \times C_2 \rightarrow S : ([x_0, x_1, y], [x_2, x_3, z]) \mapsto [x_0 z, x_1 z, x_2 y, x_3 y],$$

so by (22.3.2.10) and (22.3.2.3),  $(T^1(S_n))$  holds.

More generally,  $T^1(X/k, \ell)$  holds for any  $X$  that is dominated by a product of curves and Abelian varieties.  $\lrcorner$

**Thm. (22.3.2.12)[Tate Implies Künneth Decomposition, Deligne].** If  $d = \dim X$  and  $T^d(X \times X)$  holds, then the Künneth components of the diagonal  $\Delta \in H_{\text{ét}}^{2d}(X \times X, \overline{\mathbb{Q}}_\ell(d))$  are algebraic.  $\lrcorner$

*Proof:* Cf.[Tate1994]P75. ?

$\square$

### 3 over Finite Fields

References are [Milne, Tate Conjecture over Finite Fields], and [Endomorphisms of Abelian varieties over finite fields, Tate, 1966].

**Prop. (22.3.3.1)[ $(T^1)$  and Brauer Groups].** Let  $\#k < \infty$  and  $X \in \text{SmProjVar}/k$ , Tate proved that  $H_{\text{ét}}^{2r}(X_{k^s}, \mathbb{Q}_\ell(r))^{\text{Gal}_k} \cong H_{\text{ét}}^{2r}(X, \mathbb{Q}_\ell(r))$ , and the Kummer sequence gives an exact sequence

$$0 \rightarrow \text{Pic}(X) \otimes \mathbb{Z}_\ell \rightarrow H^2(X, \mathbb{Z}_\ell(1)) \rightarrow T_\ell \text{Br}(X) \rightarrow 0,$$

so the integral  $(T^1(X/k))$  is equivalent to  $T_\ell \text{Br}(X) = 0$ , i.e.  $\# \text{Br}(X)[\ell^\infty] < \infty$ .  $\lrcorner$

*Proof:* Cf.[Chao Li].

$\square$

**Prop. (22.3.3.2)[ $(T^1)$  and BSD].** Let  $\#k < \infty$  and  $C/k$  a non-singular complete curve with function field  $K$ ,  $\mathcal{E}/C$  is a regular elliptic surface with generic fiber  $E \in \text{EllCur}/K$ , then  $(T^1(\mathcal{E}/k))$  is equivalent to the BSD conjecture for  $E/K$ .  $\lrcorner$

*Proof:* Cf.[Chao Li].

$\square$

**Prop. (22.3.3.3)[Grothendieck].** Let  $\#k < \infty$  and  $C$  a smooth complete curve over  $k$  with function field  $K$ ,  $\mathcal{E}/C$  is a regular elliptic surface with generic fiber  $E \in \text{EllCur}/K$ , then

$$\text{Br}(\mathcal{E}/k) \cong \text{III}(E/K).$$

$\lrcorner$

*Proof:* Cf.[Grothendieck, Alexander, Le groupe de Brauer. III. 1968].

$\square$

**Prop. (22.3.3.4)[Tate].** Let  $\#k < \infty$ ,  $X \in \text{SmProjVar}/k$ , then  $(T^r(X/k))$  and  $(E^r(X/k))$  hold iff

$$\text{ord}_{s=r}(Z(X, s)) = -\text{rank CH}_{\text{hom}}^r(X).$$

$\lrcorner$

*Proof:* Cf.[Tat94].

$\square$

**Prop. (22.3.3.5) [Tate Conjecture for Jacobians].** Let  $\#k < \infty$ ,  $C \in \mathcal{C}ur^{\text{SmProj}}/k$ ,  $X$  a smooth projective surface over  $k$ , and  $f : X \rightarrow C$  a morphism with finite fibers. Assume  $X_{k(C)}$  is smooth, and  $J = \text{Jac}(X_{k(C)})$ . Then the following are equivalent:

- $T^1(X/k, \ell)$ .
- $\#\text{Br}(X) < \infty$ .
- $\#\text{III}(J) < \infty$ .
- BSD conjecture holds for  $J/k(C)$ .

⌋

*Proof:* Cf. [Curves and Jacobians over function fields, Ulmer] Prop5.1.2 and Prop6.3.1. □

#### 4 Connection with B-S.D

**Conj. (22.3.4.1) [( $P^r(X/F)$ )].** If  $k = F \in \mathbf{NField}$  and  $X \in \mathbf{SmProjVar}/F$ , then for any  $r \in \mathbb{N}$ ,

$$\text{ord}_{s=1} L(H^{2r}(X)(r); s) = -\text{rank } \text{CH}_{\text{hom}}^r(X).$$

⌋

*Proof:* ? □

**Thm& Conj. Cor. (22.3.4.2).** Let  $F \in \mathbf{NField}$ ,  $E_1, E_2, E_3, E_4 \in \mathbf{EllCur}/F$  and  $A \in \mathbf{AbVar}^2/F$ , then  $(P^r(X/F))$  (22.3.4.1) holds in the following cases:

- $F$  is totally real or imaginary CM, and  $X = E_1^{n_1} \times E_2^{n_2}$  with  $n_1 \in \mathbb{Z}_+, n_2 \in \mathbb{N}$ ,
- $F$  is totally real or imaginary CM, and  $X = E_1^{n_1} \times E_2^{n_2} \times E_3$  with  $n_1 \in \mathbb{Z}_+, n_2 \in \{1, 2\}$ .
- $F$  is totally real or imaginary CM, and  $X = E_1^{n_1} \times E_2^{n_2} \times E_3 \times E_4$  with  $n_1, n_2 \in \{1, 2\}$ .
- $F$  is totally real and  $X \in \{A, A^2\}$ .

⌋

*Proof:* By (22.3.2.3), it suffices to prove that

$$\text{ord}_{s=1} L(H_{\text{ét}}^{2r}(X)(r); s) = -\text{rank } H_{\text{ét}}^{2r}(\overline{X}, \overline{\mathbb{Q}}_\ell(r))^{\text{Gal}_k}$$

for some  $\ell \in \mathbf{Prime}$ .

1: By Künneth formula and the decomposition of  $\bigotimes^{k_i} H_{\text{ét}}^1(E_{i,\overline{F}}, \overline{\mathbb{Q}}_\ell)$  into symmetric powers (because  $\dim H_{\text{ét}}^1(E_{i,\overline{F}}, \overline{\mathbb{Q}}_\ell) = 2$ ), we have an isomorphism of  $\text{Gal}_F$ -representations

$$H_{\text{ét}}^{2r}(X_{\overline{F}}, \overline{\mathbb{Q}}_\ell(r)) \cong \bigoplus_{0 \leq k_i \leq n_i} m_{k_1, k_2} \left( \text{Sym}^{k_1} H_{\text{ét}}^1(E_{1,\overline{F}}, \overline{\mathbb{Q}}_\ell) \otimes \text{Sym}^{k_2} H_{\text{ét}}^1(E_{2,\overline{F}}, \overline{\mathbb{Q}}_\ell) \right) \left( \frac{k_1 + k_2}{2} \right),$$

where  $m_{k_1, k_2} \in \mathbb{N}$  is non-zero only when  $k_1 + k_2 \leq 2r$  a even. So the assertion follows from (30.1.4.5) and (30.1.4.3).

2, 3, 4 are similar, by the same references as above. □

## 5 Hyper-Kähler Varieties

References are [The Tate Conjecture For K3 Surfaces In Odd Characteristic, Pera], [The Tate Conjecture For K3 Surfaces—A Survey Of Some Recent Progress], [2-adic integral canonical models and the Tate conjecture in characteristic 2].

**Thm. (22.3.5.1)[Tate Conjecture for K3 Surfaces].** Tate and Weil’s conjecture holds for  $X \in \text{K3}/\mathbb{Q}$ .  
 $\lrcorner$

*Proof:* Use the Kuga-Satake construction, we get a Kuga-Satake Abelian variety  $A \in \text{AbVar}/F$  for some  $F \in \text{NField}$ . By Tate’s isogeny theorem, any  $\xi \in \text{Tate}^1(X, \ell) \subset (\text{End}(H_{\text{ét}}^1(A_{\mathbb{C}}, \mathbb{Q}_{\ell})))^{\text{Gal}_F}$  is induced by an isogeny of  $A$ , thus is contained in

$$(\text{End}(H_{\text{Betti}}^1(A, \mathbb{Q})))_{\mathbb{Q}_{\ell}}^{(0,0)} \cap H_{\text{ét}}^2(X, \mathbb{Q}_{\ell}(1)) = (H_{\text{Betti}}^2(X, \mathbb{Q}(1)))_{\mathbb{Q}_{\ell}}^{(0,0)}.$$

Then the Lefschetz  $(1, 1)$ -form theorem implies that  $\xi$  is a divisor  $D$  on  $X_{\mathbb{C}}$ . And the  $\text{Aut}(\mathbb{C}/\mathbb{Q})$ -invariance of the  $\ell$ -adic realization of  $D$  implies that  $D$  is defined over  $\mathbb{Q}$ . (In fact, by (22.3.2.5), it suffices to prove over  $\mathbb{C}$ ).  $\square$

**Thm. (22.3.5.2)[Artin-Swinnerton-Dyer/Nygaard/Nygaard-Ogus/Maulik/Pera/Charles/Kim-Pera].**  $(T^1(X/k))$  (22.3.2.2) holds if  $X/k$  is a K3 surface.  
 $\lrcorner$

*Proof:* Cf.[The Tate Conjecture For K3 Surfaces In Odd Characteristic, Pera] and [2-adic integral canonical models and the Tate conjecture in characteristic 2]. ?  $\square$

**Cor. (22.3.5.3)[Lieblich-Maulik-Snowden].** There are only finitely many isomorphism classes of K3 surfaces over a finite field of characteristic  $\geq 5$ .  
 $\lrcorner$

*Proof:* [Finiteness of K3 surfaces and the Tate conjecture, Lieblich-Maulik-Snowden].  $\square$

**Thm. (22.3.5.4) [Moonen].** Let  $\text{char } k = 0$  and  $X \in \text{SmProj}/k$  s.t.  $h^{2,0}(X) = 1$ . If  $\iota : K \rightarrow \mathbb{C}$  is an embedding and  $X_{\mathbb{C}}$  has a smooth deformation s.t. the Hodge structure  $H^2(X_{\mathbb{C}}, \mathbb{Q})$  varies non-trivially, then  $T^1(X/k, \ell)$  holds for any  $\ell$ .  
 $\lrcorner$

*Proof:* Cf.[Tate and Mumford-Tate conjectures in codimension 1 for varieties with  $h^{2,0} = 1$ , Moonen]. ?  $\square$

### Kuga-Satake Construction

**Notation (22.3.5.5).**

- Use notations on Clifford algebras defined in [Clifford Algebras](#).  
 $\lrcorner$

**Def. (22.3.5.6)  $[L_d]$ .** Let  $g \in \mathbb{Z}_{\geq 2}$ ,  $d = 2(g - 1)$  and let  $L_d$  be the complement of a vector of length  $d$  in  $\Lambda_{\mathbb{Q}}^{K3}$ , which has signature  $(2, 19)$ .  
 $\lrcorner$

**Prop. (22.3.5.7).** Any map  $h_{\infty} : \$ \rightarrow SO((\Lambda_d^{K3})_{\mathbb{R}})$  lifts to a map  $h_{\infty} : \$ \rightarrow \text{GSpin}((\Lambda_d^{K3})_{\mathbb{R}})$ . In particular, we have a map of Shimura datum  $\pi : (\text{GSpin}(L_d), \mathbb{D}) \rightarrow \text{SO}(L_d, \mathbb{D})$ .  
 $\lrcorner$

*Proof:* For any  $h \in \mathbb{D} \subset \text{Hom}(\mathbb{C}^\times, \text{SO}(L_d))$  corresponding to a Hodge structure, let  $v = x + yi \in V^{2,0}$  s.t.  $q(x) = 1$ . Because  $q(v) = 0$ , we get  $q(y) = 1$  and  $x \perp y$ , i.e.  $\{x, y\}$  is an orthonormal basis for  $N = V^{2,0} \oplus V^{0,2} \cap V_{\mathbb{R}}$ . So if we let  $J = ab \in \text{Cl}^+(L_d)$ , which is independent of the choice of  $v$ , then  $J^2 = -\text{id}$ ,  $J' = -J$ , and

$$h' : \mathbb{C}^\times \rightarrow \text{Cl}^+(L_d) : a + bi \mapsto a + bJ$$

has image in  $\text{GSpin}(L_d)$ . The conjugation by the image of  $h'$  gives  $N_{\mathbb{C}}$  the Hodge structure of  $(1, -1) \oplus (-1, 1)$  while fixes the orthogonal complement of  $N$ :

$$(\cos \theta + \sin \theta ab)(a + bi)(\cos \theta - \sin \theta ab) = e^{2i\theta}(a + bi).$$

$$(\cos \theta + \sin \theta ab)(a - bi)(\cos \theta - \sin \theta ab) = e^{-2i\theta}(a - bi).$$

So it is just the Hodge structure of  $h$ . Notice both period domain for  $\text{GSpin}$  and  $\text{SO}$  are  $\mathbb{D} = \{\text{negative 2-planes in } L_d\}$ .  $\square$

**Prop. (22.3.5.8) [Kuga-Satake Map].** The form on  $\text{Cl}^+(L_d)$ :

$$\langle x, y \rangle_J = \text{tr}(xJy)$$

is symplectic, unimodular and  $\text{Spin}(L_d)$ -invariant, so left multiplication by  $\text{GSpin}(L_d)$  induces a map  $\text{GSpin}(L_d) \rightarrow \text{GSp}(\text{Cl}^+(L_d), \langle -, - \rangle_J)$ . Moreover,  $(x, y) = \langle x, Jy \rangle_J = -\text{tr}(xJy'J)$  is symmetric and definite, thus  $J$  belongs to  $\mathcal{H}_{220}^\pm$ , because the period space for  $\text{GSp}$  is the space of complex structures  $J$  s.t.  $\langle Ju, Jv \rangle = \langle u, v \rangle$ , and  $\langle -, J- \rangle$  is positive definite. Thus we defined a morphism of Shimura datum

$$(\text{GSpin}(L_d), \mathbb{D}) \rightarrow (\text{GSp}(\text{Cl}^+(L_d), \mathcal{H}_{220}^\pm).$$

┘

*Proof:*

$\square$

**Prop. (22.3.5.9).** By (22.3.5.7) and (22.3.5.8), there are maps between Shimura data:

$$\begin{array}{ccc} \{\text{Sh}_K(\text{GSpin}(\Lambda_d^{\text{K3}}, \mathbb{D}))\} & \xrightarrow{\iota_{\text{KS}}} & \{\text{Sh}_K(\text{GSp}_{221}, \mathbb{H}_{220}^\pm)\} \\ \downarrow \tilde{\pi} & & \\ \{\text{Sh}_K(\text{SO}(\Lambda_d^{\text{K3}}, \mathbb{D}))\} & & \end{array}$$

that induces maps between the corresponding Shimura varieties

$$\begin{array}{ccc} \{\text{Sh}_K(\text{GSpin}(\Lambda_d^{\text{K3}}, \mathbb{D}))\} & \xrightarrow{\iota_{\text{KS}}} & \{\text{Sh}_K(\text{GSp}_{221}, \mathcal{H}_{220}^\pm)\} \\ \downarrow \tilde{\pi} & & \\ \{\text{Sh}_K(\text{SO}(\Lambda_d^{\text{K3}}, \mathbb{D}))\} & & \end{array}$$

Then if we equip the Shimura varieties with models over  $\mathbb{Q}$  where

- $\{\text{Sh}_K(\text{SO}(\Lambda_d^{\text{K3}}, \mathbb{D}))\}$  is associated the moduli space  $\{M_K^{\text{K3}}\}_K$  of K3 surfaces, which is a canonical model.
- $\{\text{Sh}_K(\text{GSp}_{221}, \mathcal{H}_{220}^\pm)\}$  is associated the moduli space  $\mathcal{A}^{g,d}$  of Abelian varieties.
- $\{\text{Sh}_K(\text{GSpin}(\Lambda_d^{\text{K3}}, \mathbb{D}))\}$  is associated the induced model by the model  $\mathcal{A}^{g,d}$ , which is also defined over  $\mathbb{Q}$  and is a canonical model.

┘

*Proof:* The fact that  $M_K^{K3}$  is a canonical model follows from the theorem of complex multiplications on K3 surface, the proof is the same as proving that  $\mathcal{A}^{g,K}$  is the canonical from the CM theory of Abelian varieties. ? □

**Cor. (22.3.5.10) [Kuga-Satake Construction, Deligne[K-S67]].** If  $X \in \text{K3}/\mathbb{Q}$ , then there exists  $F \in \mathbf{NField}$ ,  $A \in \mathbf{AbVar}/F$  and an embedding of Hodge-Tate structures

$$H_{\text{Betti}}^2(X, \mathbb{Q}(1)) \rightarrow \text{End}(H_{\text{Betti}}^1(A, \mathbb{Q})).$$

┘

*Proof:* This follows from (28.1.2.12). To show there is an embedding, notice that the representation  $\text{Std}_{\text{SO}} \circ \pi$  of  $\text{GSpin}(\Lambda_d^{K3})$  induces the pullback of the Hodge-Tate structure  $H_{\text{Betti}}^2(X, \mathbb{Q}(1))$ , and the representation  $\text{End}(\text{Std}_{\text{GSp}} \circ \iota_{\text{KS}})$  of  $\text{GSpin}(\Lambda_d^{K3})$  induces the pullback of the Hodge-Tate structure  $\text{End}(H_{\text{Betti}}^1(A, \mathbb{Q}))$ , so it suffices to show that there is an embedding of representations

$$\text{Std}_{\text{SO}} \circ \pi \hookrightarrow \text{End}(\text{Std}_{\text{GSp}} \circ \iota_{\text{KS}}).$$

For this, let  $\Lambda^\sharp = \Lambda_d^{K3} \oplus \mathbb{Z}$ , then  $\Lambda_d^{K3} \subset (\text{Cl}^+(\Lambda^\sharp))^{\text{Ad}} \subset \text{End}(\text{Cl}^+(\Lambda^\sharp))$ . But  $\text{Cl}^+(\Lambda^\sharp) \cong \text{Cl}^+(\Lambda)^2$  as  $\text{GSpin}$ -representations, so  $\Lambda_d^{K3} \subset \text{End}(\text{Cl}^+(\Lambda_d^{K3}))^4$ . As  $\Lambda_d^{K3}$  is a simple representation, there must be a embedding  $\Lambda_d^{K3} \subset \text{End}(\text{Cl}^+(\Lambda_d^{K3}))$ .

To sum up, For any K3 surface  $X/\mathbb{Q}$  polarized of degree  $d$ , let  $x \in \text{Sh}_K(\text{GSpin}(L_d, \mathbb{D}))(\mathbb{Q})$  be a point that maps under  $\tilde{\pi}$  (22.3.5.9) to the point parametrizing  $X/\mathbb{Q}$ . Then  $\tilde{\iota}(x) \in \mathcal{A}^{g,d}$  is a point parametrizing some Abelian variety  $A/F$  for some  $F \in \mathbf{NField}(K$  needs to be small enough to make  $\mathcal{A}_K^{g,d}$  representable). Then this  $A/F$  is the Kuga-Satake variety of  $X/\mathbb{Q}$ . □

## 6 Mumford-Tate Conjectures

**Conj. (22.3.6.1) [Mumford-Tate Conjectures].** For  $X \in \text{SmProj}/\mathbb{C}$  and  $r \in \mathbb{N}$ , we have the Mumford-Tate group  $\text{MT}^r(X)$  (16.11.2.1) and the  $\ell$ -adic monodromy group  $G_\ell^r(X)$  (22.3.1.2). Then

$$\text{MT}^r(X) \otimes \mathbb{Q}_\ell = G_\ell^r(X)^0.$$

┘

*Proof:* □

**Prop. (22.3.6.2) [Hodge  $\wedge$  Tate  $\implies$  Mumford-Tate Conjecture].** For  $X \in \text{SmProj}/\mathbb{C}$ , if the Hodge conjecture (16.11.3.1) holds for  $X^m$  for any  $m \in \mathbb{Z}_+$  and the Tate conjecture  $T^*(X^m, \ell)$  (22.3.2.2) holds for  $X^m$  for any  $m \in \mathbb{Z}_+$ , then the Mumford-Tate conjecture (22.3.6.1) also holds for  $X^m$  for any  $m \in \mathbb{Z}_+$ . ┘

*Proof:* This is because  $\text{MT}(X)$  and  $G_\ell^0(X)$  are determined by their invariant classes (because they are reductive groups ?), and the Hodge (resp. Tate) conjecture together with the comparison isomorphism implies that these classes are all combinations of cycle classes. □

**Prop. (22.3.6.3) [Mumford-Tate Conjecture  $\implies$  (Hodge  $\iff$  Tate)].** For  $X \in \text{SmProjVar}/\mathbb{C}$  and  $\ell \in \mathbf{Prime}$ , if the Mumford-Tate conjecture holds for  $X$  in codimension  $r$ , then the Hodge conjecture for  $X$  in codimension  $r$  is equivalent to  $(T^r(X, \ell))$ . ┘

*Proof:* If the Mumford-Tate conjecture is true for  $X$ , then the comparison isomorphism  $H_{\text{Betti}}^{2r}(X, \mathbb{Q}(r)) \otimes \mathbb{Q}_\ell \cong H_{\text{ét}}^{2r}(X, \mathbb{Q}_\ell(r))$  implies that

$$\text{Hdg}^r(X) \otimes \mathbb{Q}_\ell \cong \text{Tate}^r(X).$$

So the two conjectures are equivalent.  $\square$

**Prop. (22.3.6.4) [Tate Numbers Bounded by Hodge Numbers].** Let  $X \in \text{SmProj}/\mathbb{Q}$ , then

$$\text{Tate}^r(X) \subset \left( H_{\text{ét}}^{2r}(X, \mathbb{Q}_\ell(r)) \otimes_{\mathbb{Q}_\ell} \mathbb{C}_\ell \right)^{\text{Gal}_{\mathbb{Q}_\ell}} \cong H^r(X_{\mathbb{Q}_\ell}, \Omega_{X_{\mathbb{Q}_\ell}/\mathbb{Q}_\ell}^r)$$

In particular,  $\dim_{\mathbb{Q}_\ell} \text{Tate}^r(X, \ell) \leq h^{r,r}(X_{\mathbb{C}})$ .  $\lrcorner$

*Proof:* This follows from the deRham comparison (27.7.3.3) and invariance of deRham cohomology.  $\square$

## 7 for Drinfeld Modules

**Conj. (22.3.7.1) [Tate Conjecture for  $\varphi$ -Modules].** Let  $F \in \text{FField}$  with prime field  $\mathbb{F}_q$  and  $v \in \Sigma_F$ , then for any f.g. field  $k/\mathbb{F}_q$  and any  $\varphi$ -module  $M$  over  $F \otimes k$ , the natural map

$$F_v \otimes_K M^\varphi \rightarrow ((F \otimes k)_v \otimes_{F_v} M)^\varphi$$

is an isomorphism.  $\lrcorner$

*Proof:*  $\square$

**Remark (22.3.7.2).** It suffices to show that: For any  $A \in \text{Mat}(r; K \otimes k)$ , every solution of the equation

$$AX^\sigma = X$$

for  $X \in (K_v \otimes k)^{\oplus r}$  is a  $K_v$ -linear combination of solutions for  $X \in (K \otimes k)^{\oplus r}$ . Then notice that if  $K'/K$  is a finite extension field with the same base field  $\mathbb{F}_q$ , then if the Tate conjecture holds for  $(K, \pi)$ , then it holds for  $(K', \pi')$  for any  $\pi'|\pi$ , because  $K_\pi \otimes_K K' \cong \prod_{\pi'|\pi} K'_{\pi'}$ .

Thus it suffices to assume that  $K = \mathbb{F}_q(t)$ . and shrinking more, we may assume that  $\mathfrak{m}_v = (t)$ .  $\lrcorner$

**Thm& Conj. Cor. (22.3.7.3) [Taguchi].** The Tate conjecture for  $\varphi$ -modules are true if  $k/\mathbb{F}_q$  is a function field and  $M$  comes from a  $t$ -motive of characteristic different from  $\text{char } v$ , i.e. in case  $K = \mathbb{F}_q(t)$ ,  $M$  is represented by a matrix

$$A \in \text{GL}(r; k[t, \frac{1}{t-\theta}])$$

for some  $\theta \in k^\times$ . (Notice this is slightly more general, because  $A$  may not be in  $\text{Mat}(r; K \times k)$ ).  $\lrcorner$

*Proof:* It suffices to show that for any solution of  $A\hat{X}^\sigma = \hat{X}$  with  $\hat{X} \in (K_v \otimes k)^{\oplus r}$ , we can get a solution  $X \in (K \otimes k)^{\oplus r}$  that is sufficiently close to  $\hat{X}$ . In this way, any  $n$  independent solutions  $\{\hat{X}_i\}$  will give  $n$  independent solutions  $\{X_i\}$ , thus proving the assertion.

For this, Cf. [Tag95].  $\square$

## 22.4 Motivic Cohomology(Voevodsky-Suslin)

References are [Motivic Cohomology, Voevodsky], [ $\mathbb{A}^1$ -Homology of Schemes, Voevodsky], [Bloch-Kato conjecture and motivic cohomology with finite coefficients, Suslin-Voevodsky] and [Voe02].

**Def. (22.4.0.1) [Bloch's Motivic Cohomology Groups].** For  $k \in \mathbf{Field}$  and  $X \in \mathbf{SmProj}/k$ , define the complex

$$C_{\mathrm{Blo},\bullet}^p(X) = C^p(X \times \mathbb{A}^\bullet),$$

and it is a complex via the pullback along the embedding from edges of  $\Delta^n \subset \mathbb{A}^n$ . And in fact the cycles must satisfy that the intersections are all proper. (This is what makes it impossible to work with.)

Then define

$$H_{\mathrm{Mot}}^{2p-q}(X, \mathbb{Z}(p)) = \mathrm{CH}^p(X, q).$$

┘

**Def. (22.4.0.2) [Beilinson's Motivic Cohomology Groups].** For  $X \in \mathbf{SmProj}/\mathbb{Q}$ ,

$$H_{\mathrm{Mot}}^p(X, \mathbb{Q}(q)) = (K_{2q-p}(X)_{\mathbb{Q}})^{(q)},$$

where the RHS is the Adams operator  $q$ -part.

Then this definition is compatible with Bloch's definition (22.4.0.1).<sup>?</sup> In particular,  $H_{\mathrm{Mot}}^{2q}(X, \mathbb{Q}(q)) = \mathrm{CH}^q(X)_{\mathbb{Q}}$ , and

$$\bigoplus \mathrm{CH}^p(X, q) \otimes \mathbb{Q} \cong K_q(X).$$

┘

*Proof:*

□

**Prop. (22.4.0.3) [Comparison Maps].** There are  $\ell$ -adic comparison maps

$$H_{\mathrm{Mot}}^p(X, \mathbb{Q}(q)) \rightarrow H_{\mathrm{\acute{e}t}}^p(X, \mathbb{Q}_{\ell}(q)), \ell \in \mathbf{P},$$

and Deligne comparison maps

$$H_{\mathrm{Mot}}^p(X, \mathbb{Q}(q)) \rightarrow H_{\mathrm{Del}}^p(X, \mathbb{Q}(q)).$$

┘

*Proof:*

□

**Conj. (22.4.0.4) [Integral Motivic Cohomology Groups].** For  $X \in \mathbf{SmProj}/\mathbb{Q}$ , define

$$H_{\mathrm{Mot}}^p(X_{\mathbb{Z}}, \mathbb{Q}(q)) = H_{\mathrm{Mot}}^p(\mathcal{X}, \mathbb{Q}(q)),$$

Where  $\mathcal{X}/\mathbb{Z}$  is a proper flat model of  $X$ , which always exists.<sup>?</sup>

┘

*Proof:* Cf. [Bei85] 2.4.2.<sup>?</sup>

□

**Conj. (22.4.0.5) [Beilinson].** For  $k \in \mathbf{Field}$  and any  $n \in \mathbb{N}$ , there exists sheaf  $\mathbb{Z}(n) \in K(\mathrm{Sh}(\mathrm{Var}_{\mathrm{Zar}}^{\mathrm{sm}, \mathrm{quasi-proj}}/k))$  s.t.

1.  $\mathbb{Z}(0) = \mathbb{Z}[0]$ ,  $\mathbb{Z}(1) = \mathcal{O}^*[-1]$ ,
2.  $H^n(\mathrm{Spec} F, \mathbb{Z}(n)) = K_{\mathrm{Mil}}^n(F)$  for any  $F \in \mathbf{Field}$ .
3.  $H^{2n}(X, \mathbb{Z}(n)) = \mathrm{CH}^n(X)$ .
4.  $H^p(X, \mathbb{Z}(n)) = 0$  for  $p < 0$ .
5. There are spectral sequences

$$H^{p-q}(X, \mathbb{Z}(-q)) \implies K_{-p-q}(X).$$

6. For  $\ell \in \mathfrak{P} \setminus \{\mathrm{char} k\}$ ,

$$\mathbb{Z}(n) \otimes^{\mathbb{L}} \mathbb{Z}/(\ell) \cong \tau_{\leq n}(R\pi_* \mu_\ell^{\otimes n}).$$

7.  $H^i(X, \mathbb{Z}(n)) \otimes \mathbb{Q} \cong H_{\mathrm{Mot}}^i(X, \mathbb{Q}(n))$  (22.4.0.2).

┘

*Proof:* ? Voevodsky constructed candidates  $\mathbb{Z}(n)$  satisfying these conditions except for item 4.  $\square$

**Def. (22.4.0.6) [Absolute Chern Class Maps].** There are Chern class maps:

$$c_{j,m} : K_j(X) \rightarrow H_{\mathrm{Del}}^{2m-j}(X/\mathbb{R}, \mathbb{R}(m)),$$

$$\mathrm{ch}_j = \sum_{m \geq 0} \frac{(-1)^{m-1}}{(m-1)!} c_{j,m} : K_j(X) \otimes \mathbb{Q} \rightarrow \bigoplus_{m \geq 0} H_{\mathrm{Del}}^{2m-j}(X/\mathbb{R}, \mathbb{R}(m)).$$

such that  $\mathrm{ch}_j$  maps  $(K_j(X)_{\mathbb{Q}})^m$  to  $H_{\mathrm{Del}}^{2m-j}(X/\mathbb{R}, \mathbb{R}(m))$ .

┘

*Proof:* Cf. [Notes on Beilinson's Conjecture, Yihang] or [Nekovar].  $\square$

### Curve case

**Prop. (22.4.0.7).** Let  $k \in \mathbf{Field}$ ,  $X$  a non-singular complete curve over  $k$ , and  $C \subset X$  a finite subscheme,  $U = X \setminus C$ . Suppose  $\mathrm{Pic}^0(C)$  is of finite order in  $\mathrm{Jac}(X)$ , then

$$H_{\mathrm{Mot}}^2(U, \mathbb{Q}(2)) = H_{\mathrm{Mot}}^2(X, \mathbb{Q}(2)) + \{\mathcal{O}(U)^\times, k^\times\}.$$

┘

## 22.5 Schemes over $\mathbb{F}_1$

References are [Connes, Schemes over  $\mathbb{F}_1$  and Zeta-Functions], [Sou04].

### 1 Geometry of Monoids

Cf.[Toric Singularities, Kato].

**Notation(22.5.1.1).**

- In this section, monoids are assumed to be commutative and have a zero element and neutral element.

┘

**Def.(22.5.1.2) [Ideals in Monoids].** For  $M \in \mathcal{CMon}^{0,1}$ , an **ideal(of monoids)** of  $M$  is a subset  $I \subset M$  s.t.

- $0 \in I$ .
- $x \in I, y \in M \implies xy \in I$ .

And a **prime ideal(of monoids)** of  $M$  is an ideal  $\mathfrak{p} \subset M$  s.t.  $M \setminus \mathfrak{p}$  is a multiplicative subset of  $M$ .

┘

**Def.(22.5.1.3) [Spectrum of Monoids].** For  $M \in \mathcal{CMon}^{0,1}$  and  $I \in \text{Ideal}(M)$ , let  $D(I)$  be the set of primes ideals of  $M$  not containing  $I$ . Then if  $\text{Spec}(M)$  is the set of prime ideals of  $M$ ,  $D(I)$  defines a the Zariski topology on  $\text{Spec}(M)$ .

┘

**Prop.(22.5.1.4)[Abelian Groups and Monoids].** For  $H \in \mathcal{Ab}$ , denote  $\mathbb{F}_1[H] = H \cup \{0\} \in \mathcal{CMon}^{0,1}$ . Then this defines  $\mathcal{Ab}$  as a full subcategory of  $\mathcal{CMon}^{0,1}$ , and the inclusion is left adjoint to taking invertible elements: For any  $H \in \mathcal{Ab}, M \in \mathcal{CMon}^{0,1}$ ,

$$\text{Hom}_{\mathcal{CMon}^{0,1}}(\mathbb{F}_1[H], M) = \text{Hom}_{\mathcal{Ab}}(H, M^\times).$$

┘

### Mon-Functors

#### $\mathbb{F}_1$ -Schemes

**Def.(22.5.1.5) [ $\mathbb{F}_1$ -Schemes].** An  **$\mathbb{F}_1$ -scheme** is a topological space with a sheaf of monoids that is locally isomorphic to the spectrum of a commutative monoids. The category of  $\mathbb{F}_1$ -schemes is denoted by  $\text{Sch}/\mathbb{F}_1$ .

┘

**Def.(22.5.1.6).** An **finitely generated  $\mathbb{F}_1$ -scheme** is a scheme that has a finite cover by affine schemes  $U_i = \text{Spec } A_i$  s.t. each  $A_i$  are f.g. monoids.

┘

**Def.(22.5.1.7)[Ascend Functor].** The functor  $\mathcal{CMon}^{0,1} \rightarrow \mathcal{CRing} : A \mapsto \mathbb{Z}[A]$  defines a functor

$$- \otimes \mathbb{Z} : \text{Sch}/\mathbb{F}_1 \rightarrow \text{Sch}.$$

┘

**Prop.(22.5.1.8).** For  $X \in \text{Sch}/\mathbb{F}_1$ ,  $X$  is f.g. iff  $X_{\mathbb{Z}}$  is finitely generated.

┘

*Proof:* ?

□

**Def. (22.5.1.9) [Ring Monoids].** For  $R \in \mathcal{C}\text{Ring}$ , define  $\text{Spec } R \in \text{Sch}/\mathbb{F}_1$  to be the affine scheme corresponding to the multiplicative monoid  $(R, \times)$ .

Then we have  $\text{Hom}_{\mathbb{F}_1}(\text{Spec } R, X) = \text{Hom}_{\text{Sch}}(\text{Spec } R, X_{\mathbb{Z}})$  for any  $X \in \text{Sch}/\mathbb{F}_1$ .  $\lrcorner$

**Prop. (22.5.1.10) [Zeta Polynomials].** For any  $X \in \text{Sch}^{\text{fg}}/\mathbb{F}_1$ , there exists  $e \in \mathbb{Z}_+$  and  $N(T) \in \mathbb{Z}[T]$  s.t. for any  $p \in \text{Prime}$ ,  $q \in p^{\mathbb{Z}_+}$ , if  $(q-1, e) = 1$ , then

$$\#X(\mathbb{F}_q) = N(q).$$

Such  $N$  is called the **zeta polynomial** of  $X$ .  $\lrcorner$

*Proof:* This is quite easy, Cf.[Remarks on zeta functions and K-theory over  $\mathbb{F}_1$ , Dietmar].  $\square$

**Def. (22.5.1.11) [Zeta Functions of  $\mathbb{F}_1$ -Schemes].** For  $X \in \text{Sch}^{\text{fg}}/\mathbb{F}_1$ , if  $N_X(T) = a_0 + a_1T + \dots + a_nT^n$  is the zeta polynomial of  $X$  (22.5.1.10), then the **zeta function**( $\mathbb{F}_1$ ) of  $X$  is defined to be

$$\zeta_X(s) = \lim_{q \rightarrow 1} Z_q(X, q^{-s})(q-1)^{N(1)} = s^{a_0}(s-1)^{a_1} \dots (s-n)^{-a_n}.$$

And the **Euler characteristic**( $\mathbb{F}_1$ ) of  $X$  is defined to be

$$\chi(X) = N_X(1) = \sum a_i.$$

**Prop. (22.5.1.12).** This zeta function so defined (22.5.1.11) fulfills the requirement of the motivic zeta function as in [Manin, Zeta functions].  $\textcolor{red}{?}$   $\lrcorner$

**Prop. (22.5.1.13).** Let  $\underline{X}$  be a Mon-scheme and  $X$  its geometric realization, then the restriction of  $\underline{X}$  to  $\mathcal{A}\text{b}$  via  $\mathbb{F}_1$  is:

$$\underline{X}(\mathbb{F}_1[H]) = \prod_{x \in X} \text{Hom}_{\mathcal{A}\text{b}}(\mathcal{O}_{X,x}^\times, H), \quad H \in \mathcal{A}\text{b}.$$

## 2 Zeta Functions

**Conj. (22.5.2.1).** For any  $n \in \mathbb{Z}_+$ , there should be a field  $\mathbb{F}_{1^n}$ , s.t.

- $\text{Spec } \mathbb{Z}$  is over  $\mathbb{F}_{1^n}$ , and
- $\mathbb{F}_{1^n} \otimes_{\mathbb{F}_1} \mathbb{Z} = \mathbb{Z}[T]/(T^n - 1)$ .

*Proof:*  $\square$

**Conj. (22.5.2.2).** There exists a “curve”  $C = \overline{\text{Spec } \mathbb{Z}}$  over  $\mathbb{F}_1$  whose zeta-function is  $Z_C(s) = \Lambda(s)$ .  $\lrcorner$

*Proof:*  $\square$

**Prop. (22.5.2.3).** One expects  $\overline{\text{Spec } \mathbb{Z}}$  to be of infinite genus.  $\lrcorner$

*Proof:* [Manin, Zeta Functions and Motives].  $\square$

### 3 Absolute Motives via Zeta Functions

**Remark (22.5.3.1) [Absence of Absolute Motives].** Because of the absence of direct products of  $\mathbb{Z}$ -schemes, we cannot use correspondence to define morphisms between absolute motives. As a result, we can only observe them through the zeta function, and observe the imaginary morphisms between by their induced morphisms on zeta functions.  $\lrcorner$

### 4 K-Theory of $\mathbb{F}_1$ -Schemes

**Def. (22.5.4.1) [ $K_n^+(A)$ ].** For  $A \in \mathcal{CMon}$ , define  $GL(n; A)$  to be the set of group of  $n \times n$  matrices s.t. each row and column has exactly one non-zero element which lies in  $A^\times$ . Then  $GL(n; A) \cong A^\times \rtimes \text{Sym}_n$ , and there are natural embeddings  $GL(n; A) \hookrightarrow GL(n+1; A)$ .

Then we can define  $GL(A) = \varinjlim_n GL(n; A)$ , and define the **K-group of monoids** as  $K_j^+(A) = \pi_j(\mathbf{BGL}(A)^+)$ , where  $+$  is the Quillen's plus construction.  $\lrcorner$

**Cor. (22.5.4.2).**  $K_j(\mathbb{F}_1) = \pi_j^{\text{st}}(\mathbb{S})$ .  $\lrcorner$

*Proof:* ?  $\square$

**Def. (22.5.4.3) [ $K_n^Q(A)$ ].** For  $A \in \mathcal{CMon}$ , let  $\mathcal{P}$  be the category of f.g. pointed projective  $A$ -modules, and  $\mathcal{E}$  be the class of split exact sequences in  $\mathcal{P}$ , then  $(\mathcal{P}, \mathcal{E})$  is a quasi-exact category, and we can define the **K-group of monoids** as  $K_i^Q(A) = K_i(\mathcal{P}, \mathcal{E})$  (11.1.2.5).  $\lrcorner$

**Prop. (22.5.4.4).** For  $A \in \mathcal{Ab}$ ,  $K_n^+(A) = K_n^Q(A)$  (22.5.4.1)(22.5.4.3) for any  $n \in \mathbb{N}$ .

In particular,

$$K_i^+(A) = K_i(A^\times) = \begin{cases} Z \times A^\times & , i = 0 \\ \pi_i^{\text{st}}(\mathbb{S}) & , i > 0 \end{cases}.$$

And there are maps  $K_i^+(A) = K_i(A^\times) \rightarrow K_i^Q(A)$ .  $\lrcorner$

*Proof:* Any projective pointed  $A$ -module is free ?, so the usual proof for  $A \in \mathcal{CRing}$  pass through ? Cf. Higher K-theory, 2).

And then  $\mathcal{P}$  is just the product of the category of pointed sets and  $\{A\}$ . Thus  $\mathbf{BQ}(\mathcal{P}) = \mathbf{BQ}(\text{Set}_{\text{pt}}) \times \mathbf{BA}$ , and the assertion follows.

The map  $K_i(A^\times) \rightarrow K_i^Q(A)$  comes from the fact any projective  $A^\times$ -modules are free.  $\square$

## 23 | Arakelov Geometry

### 23.1 Arithmetic Intersection Theory

#### 1 Néron's Symbol

Cf.[Lang, Arithmetic Geometry] and [Hriljac].

**Prop. (23.1.1.1) [Néron's Symbol].** For  $(K, v)$  a valued field and  $C \in \text{Cur}^{\text{sm}, \text{proper}}/K$  s.t.  $C(K)$  is Zariski-dense in  $C$ , then there is a unique pairing  $\langle D, E \rangle_v \in \mathbb{R}$  for any pair of degree 0 rational divisors  $D, E$  on  $C$  with disjoint divisors s.t.

- This pairing is bilinear and symmetric.
- If  $D = \text{div}(f)$  where  $f \in R(C)^\times$ , then  $\langle D, E \rangle_v = v(f(E))$ .
- For any  $P_0 \in C(K) \setminus \text{Supp}(D)$ , the map

$$C(K) \setminus \text{Supp}(D) \rightarrow \mathbb{R} : P \mapsto \langle D, P - P_0 \rangle_v$$

is continuous and locally bounded.

This pairing is called the **Néron symbol**. ┘

*Proof:* Cf.[Lang, Diophantine Geometry, P281]. □

**Remark (23.1.1.2).** The Néron symbols is compatible with base change of valued fields. So if we consider extending the field  $K$  to its algebraic closure of the completion, we can drop the assumption that  $C(K)$  is Zariski-dense in  $C$ . ┘

**Cor. (23.1.1.3).** Situation as in (23.1.1.1), suppose for any pair of divisors  $D, E \in Z_0(C)_K$  with disjoint supports, there is a real number  $[D, E] \in \mathbb{R}$  satisfying the following:

- The pairing is bilinear and symmetric.
- If  $D = \text{div}(f)$  for  $f \in R(C)^\times$ , then  $[D, E] = v(f(E))$ .
- If  $\tau(D, E) = [D, E] - \langle D, E \rangle_v$ , then for any fixed  $D$ , the number  $[D, E]$  is bounded by  $\deg^+(E)$  (where  $E_{\bar{K}} = E_+ - E_-$  and  $\deg^+(E) = \deg(E_+)$ ). ┘

*Proof:* Cf.[Lang, Diophantine Geometry, P282]. □

**Prop. (23.1.1.4) [Global Néron Symbols].** The sum of the global Néron symbols is just the Néron-Tate pairing on the ┘

### Neron Functions

**Def. (23.1.1.5) [Néron Functions].** For  $(K, v) = (\mathbb{R}, |\cdot|)$  or  $(K, v) = (\mathbb{C}, |\cdot|^2)$ , and  $X \in \mathcal{C}ur^{sm, proper}/K$ , a **Néron function** is an association, which to each divisor  $D \in \text{Div}(X)$  associates a function

$$\lambda_D : X(\mathbb{C}) \setminus \text{Supp}(D) \rightarrow \mathbb{R}$$

satisfying the following:

- $\lambda_D$  depends additively on  $D$ .
- If  $D = \text{div}(f)$  for  $f \in R(X)^\times$ , then  $\lambda_D = -\log |f|_v + \text{constant}$ .
- For  $P, Q \in X(\mathbb{C})$ ,  $\lambda_P(Q) = \lambda_Q(P)$ .
- If  $D = \text{div}(f)$  on an open subset  $U \subset X$ , then  $\lambda_D - \log |f|_v$  is continuous on  $U$ .

┘

## 2 Arithmetic Intersections

References are [Points of small height on semiabelian varieties, Kuhne],

### Arithmetic Intersection on Curves

References are [Ara74], [Intersection Theory of Divisors on an Arithmetic Surface, Arakelov], [Heights and Arakelov's Intersection Theory, Hriljac], [Calculus on Arithmetic Surfaces, Faltings].

**Notation (23.1.2.1).**

- Let  $F \in \mathbf{NField}$ .
- Let  $X \in \mathcal{C}ur^{sm, proper, g}/F$  with a smooth proper model  $\mathcal{X}/\mathcal{O}_F$  with no degenerate fibers.

┘

**Def. (23.1.2.2) [Arakelov-Divisors].** Situation as in (23.1.2.1), choose for each  $v \in \Sigma_F^\infty$  a Hermitian metric  $ds_\alpha^2$  on  $X_v$  s.t.  $X_v$  has volume 1 w.r.t. the corresponding volume element  $d\mu_v$ .

Then a **Arakelov-divisor** on  $\mathcal{X}$  is a formal sum of the form

$$D \in \text{CH}^1(\mathcal{X}) \oplus \bigoplus_{v \in \Sigma_F^\infty} \mathbb{R}X_v.$$

The group of Arakelov-divisors is denoted by  $\text{Div}_{\text{Ar}}(\mathcal{X})$ .

┘

**Def. (23.1.2.3) [Degree of Arakelov-Divisors].** The **degree of Arakelov-divisor**  $D = \sum_{\mathfrak{p} \in \Sigma_F^{\text{fin}}} n_{\mathfrak{p}} \cdot [\mathfrak{p}] + \sum_{v \in \Sigma_F^\infty} \lambda_v[v]$  is defined to be

$$\deg(D) = \sum_{\mathfrak{p} \in \Sigma_F^{\text{fin}}} n_{\mathfrak{p}} \cdot \log \|\mathfrak{p}\| + \sum_{v \in \Sigma_F^\infty} \lambda_v.$$

┘

**Def. (23.1.2.4) [Principle Arakelov Divisors].** Situation as in (23.1.2.2), for any  $\varphi \in R(X)^\times$ , define the **Arakelov divisor** of  $\varphi$  as

$$\text{div}_{\text{Ar}}(\varphi) = \text{div}(\varphi) \oplus \bigoplus_{v \in \Sigma_F^\infty} \left( - \int_{X_v} \log |\varphi| d\mu_v \right) \cdot X_v.$$

The group of c-divisors modulo principle divisors is denoted by  $\text{Pic}_c(\mathcal{X})$ .

┘

**Remark (23.1.2.5) [Alternative Principle Divisors].** But notice that Hriljac defined the Archimedean part differently: For a choice of Néron functions on  $X_v$  for each  $v \in \Sigma_F^\infty$  (23.1.1.5), define

$$\operatorname{div}_{\operatorname{Ar}}(\varphi) = \operatorname{div}(\varphi) \oplus \bigoplus_{v \in \Sigma_F^\infty} \gamma_v(\varphi) \cdot X_v,$$

where  $\gamma_v(\varphi)$  is constant  $-\log |\varphi|_v - \lambda_{\operatorname{div}(\varphi)}$  (23.1.1.5). Why is this compatible with the form above?  $\lrcorner$

**Def. (23.1.2.6) [Canonical Metrics].** Situation as in (23.1.2.2), there is a canonical metric  $ds^2$  on  $X_v$  induced by the invariant metric  $ds_{J,v}^2$  on  $J(X_v)$  defined by the  $\Theta$ -polarization? via the pullback  $X_v \rightarrow J(X_v)$ .  $\lrcorner$

**Def. (23.1.2.7) [Arithmetic Line Bundles].** For  $D = D_f + D_\infty \in \operatorname{Div}_{\operatorname{Ar}}(\mathcal{X})$ , the **Arakelov line bundle**  $\mathcal{O}(E)$  is defined to be the line bundle  $\mathcal{O}(E_f)$  together with the Hermitian metrics on the induced line bundle on  $X_v$  for  $v \in \Sigma_F^\infty$ , where if  $E_\infty = \sum_{v \in \Sigma_F^\infty} r_v \cdot v$ , we multiply the metric on  $\mathcal{O}(E_f)$ ? Cf. [Calculus on Arithmetic Surfaces, Faltings]P391) by  $\exp(-r_v)$ .  $\lrcorner$

**Def. (23.1.2.8) [Arithmetic Intersections].** Let  $D, E$  be disjoint horizontal divisors on  $X$ , then the **Arithmetic intersection** of  $D, E$  is defined to be the sum of finite intersections and infinite intersections, where

- the finite intersections of two divisors in  $X_v$  is defined to be  $\log ||v||$  times the usual intersections?.
- the infinite intersections depends on a choice of Néron functions on  $X_v$  for  $v \in \Sigma_F^\infty$  (23.1.1.5), and is defined by decomposing  $D, E$  into  $\mathbb{C}$ -points  $P_i, Q_j$  and sum up  $\lambda_v(P_i, Q_j) = \lambda_{P_i}(Q_j) = \lambda_{Q_j}(P_i)$ .

And for the Archimedean divisors  $X_v$ , they intersect null with vertical divisors and among themselves, and if  $D$  is a horizontal prime divisor and  $v \in \Sigma_F^\infty$ , then  $(X_v \cdot D) = \deg_K(D)$ .  $\lrcorner$

**Prop. (23.1.2.9).** The intersection number is independent of the metric chosen.  $\lrcorner$

*Proof:* ?  $\square$

**Prop. (23.1.2.10) [Pullbacks].** Under a inverse image homomorphism of a finite map of degree  $d$ , the intersection number is multiplied by  $d$ .  $\lrcorner$

*Proof:* ?  $\square$

**Prop. (23.1.2.11) [Rational Invariance of Intersection Numbers].** If  $f \in R(X)^\times$ , then

$$(\operatorname{div}_{\operatorname{Ar}}(f) \cdot E) = 0.$$

$\lrcorner$

*Proof:* Cf. [Hriljac]P33.  $\square$

**Def. (23.1.2.12) [Canonical Divisors].**  $\lrcorner$

**Prop. (23.1.2.13) [Avoiding Special Fibers].** For  $K \in p\text{-LField}$  and  $s \in \text{Spec } \mathcal{O}_K$  be the special point, denote  $\text{Div}_s(X)$  the divisor group generated by components of  $X_s$ . Then the radical of the intersection pairing on  $\text{Div}_s(X) \otimes \mathbb{Q}$  is the space generated by  $X_s$ .

In particular, there exists a unique linear map

$$\Phi_s : \text{Div}_0(X)_K \rightarrow \text{Div}_s(X) \otimes \mathbb{Q}/\mathbb{Q}X_s$$

s.t. for any  $D \in \text{Div}_0(X_K)$ , the divisor  $\overline{D} + \Phi_s(D)$  is orthogonal to  $\text{Div}_s(X)$ .  $\lrcorner$

*Proof:* Cf.[Lang, Arithmetic Geometry, Chap12, Thm4.5].  $\color{red}?$   $\square$

**Cor. (23.1.2.14).** Situation as in(23.1.2.13), if  $D \in \text{Div}_0(X)_K$  is a principle fiber, then  $\overline{D} + \Phi_s(D)$  is also a principle fiber.  $\lrcorner$

**Thm. (23.1.2.15).** Local situation as in(23.1.1.1), for  $D, E \in \text{Div}_0(X)_K$  with disjoint supports, we have

$$\langle D, E \rangle_v = I(\overline{D} + \Phi_s(D), \overline{E}).$$

$\lrcorner$

*Proof:*  $\square$

### Arithmetic Riemann-Roch Formula

**Def. (23.1.2.16) [Euler Character of Arithmetic Modules].** Let  $F \in \text{NField}$  and  $M \in \text{Mod}_{\mathcal{O}_F}^{\text{fg}}$ , together with a Haar measure on  $M \otimes \mathbb{R}$ , then define

$$\chi(M) = -\log \text{Vol}(M \otimes \mathbb{R}/M) + \log(\#M_{\text{tor}}) + \text{rank}_{\mathcal{O}_F} M \cdot \log(F \otimes \mathbb{R}/\mathcal{O}_F),$$

which is independent of the Haar measure chosen.  $\lrcorner$

**Def. (23.1.2.17) [Euler Character of Admissible Line Bundles].** For  $X \in \text{Cur}^{\text{sm,proper}}/F$  with a smooth proper model  $\mathcal{X}/\mathcal{O}_F$ , if  $\mathcal{L}$  is an admissible line bundle on  $\mathcal{X}$ , then we can define

$$\chi(\mathcal{L}) = \chi(H^0(\mathcal{X}, \mathcal{L})) - \chi(H^1(\mathcal{X}, \mathcal{L})).$$

$\lrcorner$

**Thm. (23.1.2.18) [Arithmetic Riemann-Roch Formula, Faltings].** Situation as in(23.1.2.17), then

$$\chi(\mathcal{L}) = \frac{1}{2} \langle \mathcal{L}, \mathcal{L} - \omega_{\mathcal{X}} \rangle + \chi(\mathcal{O}_{\mathcal{X}}).$$

$\lrcorner$

*Proof:* Cf.[Calculus on Arithmetic Surfaces, Faltings]P405.  $\color{red}?$   $\square$

**Cor. (23.1.2.19) [Positivity of Admissible Line Bundles].** Let  $\mathcal{L}$  be an admissible Hermitian line bundle on  $\mathcal{X}$  with  $\langle \mathcal{L}, \mathcal{L} \rangle > 0, \deg(\mathcal{L}) > 0$ , then when  $n$  large,  $\mathcal{L}^{\otimes n}$  is isomorphic to  $\mathcal{O}(D)$  for a positive Arakelov divisor  $D$ .  $\lrcorner$

*Proof:* Cf.[Calculus on Arithmetic Surfaces, Faltings]P406.  $\color{red}?$   $\square$

Arithmetic Hodge Index TheoremArithmetic Noether's FormulaPositivity of the Arithmetic Relative Dualizing Sheaf  $\omega_{\mathcal{X}}$ **3 Green Functions****Notation (23.1.3.1).**

- Let  $(X, \omega)$  be a Kähler manifold.
- 

┘

**Def. (23.1.3.2) [Admissible Green Functions].** For a divisor  $Z \subset X$ , an **admissible Green function** for  $Z$  is a function  $g_Z \in C^\infty(X)$  s.t.

$$\mathrm{dd}^c g_Z + \delta_Z = \omega_Z$$

where  $\omega_Z$  is a harmonic  $(1, 1)$ -form on  $X$ .

Then admissible Green functions exists for any divisor  $Z \subset X$  and is unique up to a locally constant function.

┘

*Proof:*

□

**4  $S$ -Punctured Arithmetic Chow Groups****Notation (23.1.4.1).**

- Let  $F \in \mathbf{NField}$ ,
- Let  $S \in \Sigma_F$  be a finite set of places.
- Let  $\mathcal{X}/\mathrm{Spec} \mathcal{O}_F[S^{-1}]$  be a regular flat proper scheme with smooth generic fiber  $X$ .
- 

┘

**Def. (23.1.4.2) [Arithmetic Chow Groups].** The **arithmetic Chow group**  $\widehat{\mathrm{Ch}}^1(\mathcal{X})_{\mathbb{Q}}$  is defined to be the  $\mathbb{Q}$ -linear combinations of tuples  $(Z, g_Z)$  where  $Z$  is a divisor on  $\mathcal{X}$  and  $g_Z = (g_{Z,v})_{v \in \Sigma_F^\infty}$  is a tuple of Green functions for the divisor  $Z_v(\mathbb{C}) \subset X_v(\mathbb{C})$ , modulo principle divisors  $\mathrm{div}_{\mathrm{Ar}}(f)$  for  $f \in R(X)^\times$ .

┘

**Def. (23.1.4.3) [Admissible Chow Groups].** The **admissible Chow group**  $\widehat{\mathrm{Ch}}^{1, \mathrm{adm}}(\mathcal{X})_{\mathbb{Q}}$  is the subgroup of  $\widehat{\mathrm{Ch}}^1(\mathcal{X})_{\mathbb{Q}}$  generated by all the tuples  $(Z, g_Z)$  where  $g_Z$  is a tuple of admissible Green functions for  $Z$  (23.1.3.2).

And let  $\widehat{\mathrm{Ch}}_\infty^1(\mathcal{X})$  be the subgroup of  $\widehat{\mathrm{Ch}}^{1, \mathrm{adm}}(\mathcal{X})_{\mathbb{Q}}$  generated by the tuples  $(Z, g_Z)$  s.t.  $Z = 0$ . Then there is a natural map

$$\widehat{\mathrm{Ch}}^{1, \mathrm{adm}}(\mathcal{X})_{\mathbb{Q}} / \widehat{\mathrm{Ch}}_\infty^1(\mathcal{X}) \rightarrow \mathrm{Ch}^1(X).$$

┘

**Prop. (23.1.4.4) [Admissible Extension of Divisors].** If  $\mathcal{X} \rightarrow \operatorname{Spec} \mathcal{O}_F[S^{-1}]$  is smooth, then the natural map

$$\widehat{\operatorname{Ch}}^{1, \operatorname{adm}}(\mathcal{X})_{\mathbb{Q}} / \widehat{\operatorname{Ch}}_{\infty}^1(\mathcal{X}) \rightarrow \operatorname{Ch}^1(X) \quad (23.1.4.3)$$

is an isomorphism.  $\square$

*Proof:* Cf. [Arithmetic Fundamental Lemma Conjecture over a general p-Adic Field, Mihatsch-Zhang]P18.  $\square$

**Def. (23.1.4.5) [Cycles and Vertical Cycles].** Denote  $\tilde{\mathcal{Z}}_1(\mathcal{X})$  the group of 1-cycles on  $\mathcal{X}$ , and denote  $\mathcal{Z}_1(\mathcal{X})$  the quotient group of  $\tilde{\mathcal{Z}}_1(\mathcal{X})$  by the subgroup generated by vertical principle divisors, i.e.  $\operatorname{div}(f)$  where  $f \in R(Y)^{\times}$  and  $Y \subset X_v$  is a 2-dimensional integral closed subscheme of a special fiber.  $\square$

### S-Punctured Intersection Pairings

References are [Bost-Gillet-Soule, Heights of projective varieties and positive Green forms].

**Def. (23.1.4.6) [S-Punctured Intersection Pairing].** Denote  $\mathbb{R}_S = \mathbb{R} / \{\mathbb{Q}||v||\}_{v \in S}$ , then if  $\mathcal{X} \rightarrow \operatorname{Spec} \mathcal{O}_F[S^{-1}]$  is smooth, there is a **punctured arithmetic intersection pairing**

$$\widehat{\operatorname{Ch}}^1(\mathcal{X}) \times \tilde{\mathcal{Z}}_1(\mathcal{X}) \rightarrow \mathbb{R}_S$$

s.t. if  $(Z, g_Z) \in \operatorname{Ch}^1(\mathcal{X})$  and  $C \subset \mathcal{X}$  is a closed curve s.t.  $Z \cap C$  is Artinian, then

$$((Z, g_Z), C) = \log |\mathcal{O}_{Z \cap C}| + \frac{1}{2} \sum_{v \in \Sigma_F} g_v(C_v(\mathbb{C})).$$

$\square$

**Prop. (23.1.4.7) [S-Punctured Admissible Intersection Pairing].** Denote  $\mathcal{Z}_1(\mathcal{X})_{\deg=0}$  the subgroup of  $\mathcal{Z}_1(\mathcal{X})$  generated by 1-cycles with vanishing degree on each connected component of  $X$ , then the intersection pairing (23.1.4.6), when restricted to  $\mathcal{Z}_1(\mathcal{X})_{\deg=0}$ , induces a pairing

$$(-, -) : \widehat{\operatorname{Ch}}^1(\mathcal{X}) / \widehat{\operatorname{Ch}}_{\infty}^1 \times \tilde{\mathcal{Z}}_1(\mathcal{X}) \rightarrow \mathbb{R}_S.$$

So by (23.1.4.4) induces a pairing

$$(-, -)^{\operatorname{adm}} : \operatorname{Ch}^1(X) / \widehat{\operatorname{Ch}}_{\infty}^1 \times \tilde{\mathcal{Z}}_1(\mathcal{X}) \rightarrow \mathbb{R}_S.$$

$\square$

*Proof:* ?  $\square$

## 5 Arithmetic Standard Conjectures

References are [Arithmetic Analogs of the Standard Conjectures, Gillet-Soule].

## 23.2 Arakelov Geometry

### 1 Metrized Line Bundles

**Def. (23.2.1.1) [Metrized Line Bundles].** For  $F \in \mathbf{NField}$ , a **metrized line bundle**  $(\mathcal{L}, |\cdot|)$  is a line bundle on  $\mathcal{O}_F$  together with norms  $\|\cdot\|_v$  on the free  $F_v$ -module  $M \otimes_R F_v$  of rank 1 for  $v \in \Sigma_F^\infty$ .  $\lrcorner$

**Def. (23.2.1.2) [Heights and Degree of Metrized Line Bundles].** Let  $F$  be a number field and  $(\mathcal{L}, |\cdot|)$  be a metrized line bundle on  $\mathcal{O}_F$  (23.2.1.1), for each  $v \in \Sigma_F^0$ ,  $\mathcal{L}_v = \mathcal{O}_{F,v} m_v$  for some  $m_v \in \mathcal{L}_v$ , so we define  $\|m\|_v = |m/m_v|_v$  for  $m \in \mathcal{L}_v$ , and define the **height of  $\mathcal{L}$**  to be

$$H((\mathcal{L}, |\cdot|)) = \prod_{v \in \Sigma_F} \|m\|_v^{-1}, \quad m \neq 0 \in M$$

which is independent of  $m$  by product formula. Also we define

$$h(M) = \frac{1}{[F : \mathbb{Q}]} \log H(M),$$

called the **degree of  $\mathcal{L}$** .  $h((\mathcal{L}, |\cdot|))$  is invariant under change of number fields.  $\lrcorner$

## 24 | Representation Theory

### 24.1 Smooth Representations

*“A tremendous effort has been made by mathematicians for more than a century to clear up the chaos in group theory. Still, we cannot answer some of the simplest questions.”*

–R. Brauer

In this section the representation theory over field  $\mathbb{C}$  are studied (at least over a discrete field of characteristic 0). Modular representations are studied in [Positive Characteristic Representations](#).

**Notation (24.1.0.1).**

- Let  $G \in \text{TopGrp}$ .
- Use notations on non-commutative algebras defined in [More on \(Non-Commutative\) Algebras](#).

┘

#### 1 Topological Representations

**Def. (24.1.1.1) [Representations].** Let  $R$  be a topological ring with a continuous  $G$ -action, then an  **$R$ -representation** of  $G$  is a free topological  $R$ -module  $V$  with an  $R$ -covariant action of  $G$  on  $M$  s.t.  $G \times M \rightarrow M$  is continuous, i.e.  $g(r.m) = g(r).g(m)$  for any  $g \in G, r \in R, m \in M$ . The category of such representations is denoted by  $\text{Rep}_R(G)$ . Also denote  $\text{Rep}(G) \triangleq \text{Rep}_{\mathbb{C}}(G)$  to the category of representations on any Fréchet space over  $\mathbb{C}$ .

An **irreducible representation** is a representation that has no non-trivial invariant closed  $R$ -submodules. A non-irreducible representation is called a **reducible representation**. The category of irreducible  $R$ -representations of  $G$  is denoted by  $\text{Irr}_R(G)$ .

A representation  $(\rho, V) \in \text{Rep}_R(G)$  is called a **finite dimensional representation** if  $\dim_R V < \infty$ . The subcategory of f.d.  $R$ -representations is denoted by  $\text{Rep}_R^{\text{fd}}(G)$ .

An **indecomposable representation** is a representation that is not a direct sum of two sub-representations.

┘

**Def. (24.1.1.2) [Free Representations].** Situation as in (24.1.1.1),  $V \in \text{Rep}_R(G)$  is called a **free  $R$ -representation** if  $V$  is free over  $B$ . And it is trivial iff  $V \cong B^n \in \text{Rep}_B(G)$ .

┘

**Def. (24.1.1.3) [Constructing Representations].** For  $(\rho, M), (\rho', M') \in \text{Rep}_R(G)$ ,

- The **dual representation**  $(\rho^*, M^*) \in \text{Rep}_R(G)$  is defined as follows:  $M^* = \text{Hom}_R(M, R)$ , and  $\rho^*(g)(f)(m) = g(f(g^{-1}(m)))$ . It is  $R$ -semi-linear because

$$\rho^*(g)(f)(r.m) = g(f(g^{-1}(r.m))) = g(g^{-1}(r)f(g^{-1}m)) = g(r).\rho^*(g)(f)(m).$$

- The **tensor product representation**  $(\rho \otimes \rho', M \otimes M')$  is defined as follows:  $g(m \otimes m') = g(m) \otimes g(m')$ .
- The **symmetric tensor representation** and **exterior tensor representation** is defined as tensor product, and symmetric and exterior tensors.  $\lrcorner$

**Def. (24.1.1.4) [Projective Representations].** A **projective representation** of a topological group  $G$  on a TVS  $V$  is a continuous map  $G \times \mathbb{P}(V) \rightarrow \mathbb{P}(V)$ , where the topology on  $\mathbb{P}(V)$  is induced from  $V \setminus \{0\} \subset V$ .  $\lrcorner$

**Prop. (24.1.1.5) [F.D. Schur's Lemma].** Let  $(\pi_1, V_1), (\pi_2, V_2) \in \text{Irr}^{\text{fd}}(G)$ , then  $\text{Hom}_G(V_1, V_2) = \mathbb{C}$  if  $\pi_1 \cong \pi_2$ , and 0 otherwise.  $\lrcorner$

*Proof:* This is because  $\pi_i$  are irreducible as representations with discrete topology of  $G$ : Any subspace of  $V_i$  is closed. So we reduce to (24.1.1.10).  $\square$

**Def. (24.1.1.6) [Types of Representations].** For  $V \in \text{Rep}^{\text{fd}}(G)$ , there are three possibilities:

- $V \not\cong V^*$ , called a **representation of complex type**.
- There is an invariant symmetric form on  $V$  inducing an isomorphism  $V \cong V^*$ , called a **representation of real type**.
- There is an invariant alternating form on  $V$  inducing an isomorphism  $V \cong V^*$ , called a **representation of quaternion type**.

The category of representation of  $\mathbb{K}$ -type is denoted by  $\text{Rep}(G)_{\mathbb{K}}$ .  $\lrcorner$

*Proof:* By Schur's lemma (24.1.1.5), either  $V \not\cong V^*$  or there is a unique isomorphism  $V \cong V^*$  up to scalar, which is equivalent to an invariant form  $B$  on  $V$ . The two coordinate of this invariant form induces two isomorphisms  $V \cong V^*$ , which must be proportional, so  $B(x, x) = cB(x, x)$ , so  $c = 0$  or  $B(x, x) = 0$  for all  $x$ , which means  $B$  is symmetric or alternating.  $\square$

**Def. (24.1.1.7) [Unitary Representations].** Usually we consider unitary representations on a Hilbert space. A **unitary representation** of  $G$  on a Hilbert space  $\mathcal{H} \in \mathcal{H}\text{ilbSpa}$  is defined to be a homomorphism from  $G$  to the group  $U(\mathcal{H})$  of unitary operators of  $\mathcal{H}$  continuous in the strong operator topology (12.7.4.6). Notice by (12.7.4.7), this is equivalent to the unitary and continuous in the weak operator topology.

The category of unitary representations of  $G$  is denoted by  $\text{Rep}^{\text{uni}}(G)$ .  $\lrcorner$

**Def. (24.1.1.8) [Projective Unitary Representation].** A **projective unitary representation** of  $G$  on a Hilbert space  $\mathcal{H} \in \mathcal{H}\text{ilbSpa}$  is defined to be a continuous homomorphism from  $G$  to the group  $PU(\mathcal{H})$  of unitary operators of  $\mathcal{H}$ , where the topology of  $PU(\mathcal{H})$  is induced from the strong operator topology of  $U(\mathcal{H})$  (12.7.4.6). Notice by (12.7.4.7), this is equivalent to the unitary and continuous in the weak operator topology.  $\lrcorner$

**Def. (24.1.1.9) [Character].** Let  $(\rho, V) \in \text{Rep}^{\text{fd}}(G)$ . Then the **character** of  $\chi_\rho$  is defined to be  $\chi_\rho(g) = \text{tr}(\rho(g))$ .

Suppose  $g, h \in G$  are conjugate, then  $\chi_\rho(g) = \chi_\rho(h)$ .  $\lrcorner$

**Prop. (24.1.1.10) [Schur's lemma].** If  $(\pi, V)$  is an at most countable dimensional irreducible  $\mathbb{C}$ -representation of a topological  $\mathbb{C}$ -algebra, then  $\text{End}_A(V) \cong \mathbb{C}$ . In particular this holds for  $\dim A$  countable.  $\lrcorner$

*Proof:* First the dimension of  $\dim_{\mathbb{C}} \text{End}(V)$  is at most countable, because  $V$  is acyclic by irreducibly, so  $\dim_{\mathbb{C}} \text{End}(V) \leq \dim_{\mathbb{C}} V$ . And  $\text{End}(V)$  is a skew field, by irreducibility. So the result follows from (3.6.1.2).  $\square$

**Cor. (24.1.1.11).** Any irreducible representation of a commutative group has dimension 1.  $\lrcorner$

**Cor. (24.1.1.12) [Index 2 Subgroup].** Let  $H$  be an open (normal) subgroup of index 2,  $G = H \rtimes \{\sigma\}$ .

Let  $(\pi, V)$  be an irreducible representation of  $H$  of at most countable dimensional, then

- $\text{res}_H^G \text{ind}_H^G \pi \cong \pi \oplus \pi^\sigma$ .
- $\pi \cong \pi^\sigma$  iff  $\pi$  is the restriction of an irreducible representation of  $G$ , called **type I**. And there are exactly two such extensions to  $G$ .
- $\pi \not\cong \pi^\sigma$  iff  $\text{ind}_H^G \pi$  is an irreducible representation of  $G$ , called **type II**.

All these are true for unitarizable representations.  $\lrcorner$

*Proof:* 1: This is clear.

2: If  $\pi$  is a restriction of an irreducible smooth representation of  $G$ , then  $\sigma$  intertwines  $\pi$  and  $\pi^\sigma$ . Conversely, if  $\pi \cong \pi^\sigma$ , then there is an operator  $A$  on  $V$  that intertwines  $\pi$  and  $\pi^\sigma$ , and then  $A^2 = \text{id}$  by Schur's lemma (24.1.1.10). Let  $\sigma$  acts by  $A$ , then this representation extends to  $G$ .

3: If  $\pi$  extends to  $G$ , then clearly  $\pi$  appear in  $\text{ind}_H^G \pi$  but not surjective, so  $\text{ind}_H^G \pi$  is not irreducible. Conversely, if  $\text{ind}_H^G \pi$  is not irreducible, notice  $\text{res}_H^G \text{ind}_H^G \pi \cong \pi \oplus \pi^\sigma$ , thus  $\pi \cong \pi^\sigma$ , otherwise any  $G$ -invariant subspace can only be  $\pi$  or  $\pi^\sigma$ , so  $\pi$  or  $\pi^\sigma$  extends to representations of  $G$ , contradicting 2.  $\square$

**Prop. (24.1.1.13) [Kolchin].** Let  $k \in \mathbf{Field}$  and  $(\rho, V) \in \text{Rep}_k^{\text{fd}}(G)$  s.t. each  $\rho(g)$  is unipotent, then there exists a basis of  $V$  s.t.  $\rho(G) \in \text{Unip}(n; k)$ .  $\lrcorner$

*Proof:* It suffices to show that there is a non-zero vector of  $V$  fixed by  $G$ . We can pass to  $\bar{k}$ , and also assume that  $\rho$  is simple. Let  $A \subset \text{End}_{\bar{k}}(V)$  be the algebra generated by  $G$ , then  $V$  is simple over  $A$ , and  $\text{End}_A(V) = k$ . Thus by (3.6.2.9),  $A = \text{End}_k(V)$ .

The  $k$ -subspace  $J$  of  $A$  spanned by the elements  $\{g - 1\}_{g \in G}$  is a two-sided ideal of  $A$ , and it consists of elements of trace 0, so it cannot be  $A$ . But  $A$  is simple (3.6.2.21), so  $J = 0$ , which means each  $g$  acts as a scalar, so  $\dim V = 1$ .  $\square$

**Prop. (24.1.1.14) [B-Trivial Representations].** For  $B \in \text{TopCRing}$  with a  $G$ -action,  $n \in \mathbb{N}$ , there is a bijection between the set of equivalence classes of  $B$ -trivial representations  $V$  of  $G$  of rank  $n$  and the category of  $H^1(G, \text{GL}(n; B))$ . Moreover,  $V$  is trivial iff it is mapped to the distinguished point of  $H^1(G, \text{GL}(n; B))$ .  $\lrcorner$

*Proof:* This follows by taking the matrix of  $g \in G$  w.r.t. a  $B$ -basis of  $V$ .  $\square$

**Cor. (24.1.1.15).** Let  $L/K \in \mathbf{GalField}$ , then any  $\rho \in \text{Rep}_L^{\text{fd}}(\text{Gal}(L/K))$  is trivial.  $\lrcorner$

*Proof:* This follows from Hilbert's theorem90 (10.2.5.12).  $\square$

### Admissible Representations

**Def. (24.1.1.16) [Admissible Representations].** Let  $E$  a topological field that  $G$  acts trivially and  $B$  a topological  $E$ -algebra s.t.  $B \in \text{Rep}_E(G)$ . Then  $V \in \text{Rep}_E^{\text{fd}}(G)$  is called a  **$B$ -admissible** representation if  $B \otimes_E V \in \text{Rep}_B(G)$  is trivial, i.e. isomorphic to  $B^{\oplus \dim V}$ .

The category  $\text{Rep}_E^{B\text{-adm}}(G)$  is the full subcategory of  $\text{Rep}_E(G)$  consisting of f.d.  $B$ -admissible  $E$ -representations of  $G$ .  $\lrcorner$

**Prop. (24.1.1.17) [Inclusions and Admissibility].** Let  $E$  be a topological field that  $G$  acts trivially and  $B_1, B_2, B$  a topological  $E$ -algebra s.t.  $B_1, B_2, B \in \text{Rep}_E(G)$ , and  $B_1 \subset B, B_2 \subset B, B_1 \cap B_2 = B_0$ , and  $B^G \subset B_0$ , then

$$\text{Rep}_E^{B_1\text{-adm}}(G) \cap \text{Rep}_E^{B_2\text{-adm}}(G) = \text{Rep}_E^{B_0\text{-adm}}(G).$$

┘

*Proof:* The RHS is contained in LHS trivially. For the converse inclusion, if  $V \in \text{Rep}_E^{B_1\text{-adm}}(G) \cap \text{Rep}_E^{B_2\text{-adm}}(G)$ , there exists elements  $\{u_i\} \subset (B_1 \otimes_E V)^G$  and  $\{v_i\} \subset (B_2 \otimes_E V)^G$  s.t.

$$B \otimes_E V = Bu_1 \oplus \dots Bu_n = Bv_1 \oplus \dots Bv_n.$$

Then the transformation matrix from  $\{u_i\}$  to  $\{v_i\}$  is an element in  $\text{GL}(n; B)$  that is invariant under  $G$ , so contained in  $\text{GL}(n; B^G)$ . Thus it is clear that

$$\{v_i\} \subset (B_2 \otimes_E V)^G \cap (B_1 \otimes_E V)^G = (B_0 \otimes_E V)^G,$$

and then  $B_0 \otimes_E V = B_0v_1 \oplus \dots B_0v_n$ , and  $V$  is  $B_0$ -admissible. □

### Gal<sub>K</sub>-Regularity

**Def. (24.1.1.18) [ $G$ -Regularity].** Situation as in (24.1.1.16), we want to establish a numerical criterion for recognizing  $B$ -admissible representations.  $B$  is called  **$G$ -regular** if it satisfies the following three conditions:

H1 :  $B$  is a domain.

H2 :  $(\text{Frac}(B))^G = B^G$ , in particular,  $B^G$  is a field.

H3 : if  $b \neq 0 \in B$  and  $Eb$  is stable under  $G$ -action, then  $b \in B^*$ .

Notice a field is clearly  $G$ -regular. ┘

**Cor. (24.1.1.19).** Notice that (H3) implies  $B^G \in \text{Field}$ , because for  $b \in B^{\text{Gal}_K}$ ,  $Eb$  is clearly stable under  $G$ -action, thus  $b$  is invertible.

Also the morphism

$$\alpha_B(W) : B \otimes_{B^G} W^G \rightarrow W$$

is injective for all finite free  $W \in \text{Rep}_B(G)$ . In particular, this is true for  $W = B \otimes_E V, V \in \text{Rep}_E^{\text{fd}}(G)$ , and we get a functor

$$D_B : \text{Vect}_E \rightarrow \text{Vect}_{B^G}$$

such that

$$\dim_{B^G} D_B(V) \leq \dim_E V.$$

┘

*Proof:* To show  $\alpha_W$  is injective, it suffices to show a linear basis  $\{e_i\}$  of  $W^G$  over  $B^G$  is linearly independent over  $B$ : Suppose  $\sum a_i e_i = 0$ , where  $a_i \in B$ , with the number of nonzero coefficients minimal, and  $a_1 \neq 0$ , then dividing  $a_1 \in \text{Frac}(B)$ , we assume  $a_1 = 1$ , and then acting by  $g - \text{id}$ , we get

$$\sum (g(a_i) - a_i) e_i = 0$$

and this has smaller non-zero elements, unless  $a_i$  is fixed by  $g$  for any  $g \in G$ , so  $a_i \in \text{Frac}(B)^G = B^G$  by (H2), contradiction. □

**Prop. (24.1.1.20) [B-Admissible Representations].** If  $B$  is  $G$ -regular (24.1.1.18),  $V \in \mathcal{R}\text{ep}_E^{\text{fd}}(G)$  and  $W = B \otimes_E V$ , then the following are equivalent:

- $W$  is trivial, i.e.  $V$  is  $B$ -admissible.
- $\alpha_B(W)$  (24.1.1.19) is an isomorphism.
- $\dim_{B^G} D_B(V) = \dim_E V$ .

┘

*Proof:* 1, 2 are equivalent by (24.1.1.19), as  $B^{\text{Gal}K}$  is a field. Also  $2 \rightarrow 3$  is clear.

$3 \rightarrow 2$ :  $\alpha_W : B \otimes_{B^G} W^G \rightarrow B \otimes_E V$  is a  $B$ -linear morphism of two finite free  $B$ -modules, then it suffices to show the determinant map is an isomorphism. Let  $v_1, \dots, v_d$  be a  $E$ -basis of  $V$  and  $w_1, \dots, w_d$  a  $B^G$ -basis of  $W^G$ . Let  $b$  be the unique element of  $B$  that

$$\alpha_W(v_1) \wedge \dots \wedge \alpha_W(v_d) = bw_1 \wedge \dots \wedge w_d$$

then  $gb = \eta b$  for  $g \in G$  where  $\eta$  is determined by the identity  $\alpha_W(gv_1) \wedge \dots \wedge \alpha_W(gv_d) = \eta \alpha_W(v_1) \wedge \dots \wedge \alpha_W(v_d)$ . Now the  $E$ -space of  $v_1, \dots, v_d$  is  $V$ , which is stable under  $G$  action, thus  $\eta \in E$ , and then by (H3)  $b \in B^*$ , so we are done.  $\square$

**Cor. (24.1.1.21) [ $\mathcal{R}\text{ep}_E^{B\text{-adm}}(G)$ ].** If  $B$  is  $G$ -regular, then

- $\mathcal{R}\text{ep}_E^{B\text{-adm}}(G) \subset \mathcal{R}\text{ep}_E(G)$  is stable under subobjects and quotients.
- $D_B : \mathcal{R}\text{ep}_E^B(G) \rightarrow \text{Vect}_{B^G}$  is exact and faithful.
- $\mathcal{R}\text{ep}_E^{B\text{-adm}}(G) \subset \mathcal{R}\text{ep}_E(G)$  is stable under taking dual and tensor products. And if  $V, V_1, V_2 \in \mathcal{R}\text{ep}_E^{B\text{-adm}}(G)$ , then there is a natural isomorphism

$$D_B(V_1) \otimes D_B(V_2) \cong D_B(V_1 \otimes V_2)$$

and

$$D_B(V) \otimes D_B(V^\vee) \cong D_B(V \otimes V^\vee) \rightarrow D_B(E) = B^G$$

is a perfect pairing between  $D_B(V)$  and  $D_B(V^\vee)$ .

┘

*Proof:* 1: Given an exact sequence  $0 \rightarrow V_1 \rightarrow V \rightarrow V_2 \rightarrow 0 \in \mathcal{R}\text{ep}_E(G)$ , tensoring  $B$  and taking  $G$ -fixed points, we get an exact sequence

$$0 \rightarrow D_B(V_1) \rightarrow D_B(V) \rightarrow D_B(V_2)$$

from which we derive the inequality  $\dim_{B^G} D_B(V) \leq \dim_{B^G} D_B(V_1) + \dim_{B^G} D_B(V_2)$ . Now we have  $\dim_{B^G} D_B(V_i) \leq \dim_E V_i$  by (24.1.1.19), so

$$\dim_{B^G} D_B(V) \leq \dim_{B^G} D_B(V_1) + \dim_{B^G} D_B(V_2) \leq \dim_E V_1 + \dim_E V_2 = \dim_E V.$$

But this is an equality because  $V$  is  $B$ -admissible, thus  $V_1, V_2$  are all  $B$ -admissible, and the exact sequence is in fact an isomorphism by dimension reason.

2:  $D_B$  is faithful because  $B \otimes_{B^G} D_B(V) \cong B \otimes_E V$ .

3: There is a natural map

$$D_B(V_1) \otimes_{B^G} D_B(V_2) = (B \otimes_E V_1)^G \otimes (B \otimes_E V_2)^G \rightarrow (B \otimes_E (V_1 \otimes_E V_2))^G = D_B(V_1 \otimes_E V_2),$$

and  $\dim_{B^G} D_B(V_1 \otimes_E V_2) \leq \dim_E(V_1) \cdot \dim_E(V_2)$ , so it suffices to show that this map is injective. For this, notice that  $D_B(V_1 \otimes_E V_2) \subset B \otimes_E (V_1 \otimes_E V_2)$ , and after tensoring  $B$ ,

$$D_B(V_1) \otimes_{B^G} D_B(V_2) \subset B \otimes_{B^G} (D_B(V_1) \otimes_{B^G} D_B(V_2)) \cong (B \otimes_E V_1) \otimes_B (B \otimes_E V_2) \rightarrow B \otimes_E (V_1 \otimes_E V_2)$$

is an isomorphism.

To show for the dual preserves  $B$ -admissibility, notice that  $\text{Rep}_E^{B\text{-adm}}(G)$  is also stable under exterior products, as exterior products are quotient of tensor products. Notice there is an isomorphism

$$\wedge(V^\vee) \otimes \wedge^{\dim V - 1}(V) \cong V^\vee,$$

so it suffices to show for  $\dim V = 1$ . Let  $v_0$  be an  $E$ -basis of  $V$ ,  $g(v_0) = \eta(g)v_0$ , then  $D_B(V) = B^G(b \otimes v_0)$  for some  $b \neq 0 \in B$ . Thus  $b/g(b) = \eta(g)$ . And it is easy to show that  $D_B(V^\vee) = B^G(b^{-1} \otimes v_0)$ , and the natural pairing is perfect. In general, the pairing is also perfect because perfectness of a pairing can be checked after passing to the determinant space.  $\square$

## Unitary Representations of Locally Compact Groups

For unitary representations of locally compact groups, see [Harmonic Analysis on Locally Compact Groups](#).

## 2 Smooth Representations

**Notation (24.1.2.1).**

- Let  $G \in \text{LCG}$ .

┘

**Prop. (24.1.2.2) [Smooth Representations].** A **smooth representation** of  $G$  on a complex vector space is a continuous representation w.r.t the discrete topology.

The category  $\text{Rep}^{\text{alg}}(G)$  of smooth representations is a full Abelian subcategory of the category of continuous representations on Fréchet spaces, and there is a right adjoint to the forgetful functor:

$$\text{Rep}(G) \rightarrow \text{Rep}^{\text{alg}}(G) : V \mapsto V^{\text{alg}} = \bigcup_{K \subset G \text{ pre-compact open}} V^K.$$

So it preserves injectives and  $\mathcal{M}(G)$  has enough injectives.  $\square$

**Prop. (24.1.2.3) [ $V^{\text{alg}}(G)$  is Dense].** For  $(\pi, V) \in \text{Rep}(G)$ ,  $V^{\text{alg}} \subset V$  (24.1.2.2) is dense.  $\square$

*Proof:* For any pre-compact open subset  $U \subset G$ ,  $\mu(U)^{-1} \mathbf{1}_U \cdot v \in V^{\text{alg}}$  (12.8.3.21), and  $\mu(U)^{-1} \mathbf{1}_U \cdot v$  converges to  $v$  as a net by continuity.  $\square$

**Def. (24.1.2.4) [Equivariant Sheaves].** Let  $a : G \times X \rightarrow X$  be an action of  $G$  on a space  $X$  and  $p : G \otimes X \rightarrow X$  be the projection, then a **equivariant sheaf** on  $X$  is a pair  $(\mathcal{F}, \rho)$ , where  $\mathcal{F}$  is a locally constant complex sheaf on  $X$  and  $\rho$  is an isomorphism of sheaves  $p^*(\mathcal{F}) \cong a^*(\mathcal{F})$  that:

- $\rho$  is identity on  $e \otimes X$ .
- $p_{23}^* \rho \circ (\text{id}_G \times a)^* \rho = (m \times \text{id}_X)^* \rho$  on  $G \times G \times X$ .

┘

**Prop. (24.1.2.5).** If  $X \cong \text{pt}$ , then a equivariant sheaf on  $X$  is equivalent to a representation of  $G$ .  $\square$

*Proof:* For any equivariant sheaf on  $X$ , the pullback are just locally constant functions of  $G$  with value in  $V$ . Then  $\rho$  on each stalk  $g$  defines an action of  $g$  on  $V$ . Compatibility with the  $G$ -action shows that this is a group action. And consider the stalk at  $e$ , because  $\rho$  is id at  $e$ , for each  $v$ , there is an open nbhd  $U$  that  $\rho(u)v = v$  on for  $u \in U$ , thus it is smooth. The converse is obvious.  $\square$

**Def. (24.1.2.6) [Jacquet Functors].** The **Jacquet functor**  $J_G : \mathcal{R}\text{ep}(G) \rightarrow \mathcal{V}\text{ect}_{\mathbb{C}}$  is the functor mapping a representation  $V$  of  $G$  to  $V/V(G)$ , where  $V(G)$  is spanned by  $\pi(g)v - v$ . It is equivalent to the functor  $V \mapsto V \otimes_G \mathbb{C}$ .

Let  $\psi$  be a character of  $G$ , then we can more generally define  $J_{G,\psi} : \mathcal{R}\text{ep}(G) \rightarrow \mathcal{V}\text{ect}_{\mathbb{C}}$  is the functor mapping a representation  $V$  of  $G$  to  $V/V_{G,\psi}$ , where  $V_{G,\psi}$  is spanned by  $\pi(g)v - \psi v$ . It is equivalent to the functor  $V \mapsto V \otimes_G \mathbb{C}_{\psi}$ , or equivalently  $J_{G,\psi} = J_G \circ (\psi^{-1} \otimes -)$ .  $\lrcorner$

**Prop. (24.1.2.7).** If  $G$  is compact, then  $e_G V = V^G = V/V(G)$ .

And if  $G$  is a union of increasing family of compact groups, then  $J_G$  is exact, so is  $J_{G,\psi}$ .  $\lrcorner$

*Proof:*  $J_G$  is clearly right exact. And if  $G$  is compact,  $e_G V = V^G = V/V(G)$ : if  $\pi(G)v = v$ , then  $v = e_G v$ , and if  $e_G v = 0$ , then because  $v$  is smooth,  $\sum_{h_i \in G/K} h_i v = 0$ , thus  $v = \frac{1}{[G:K]}(v - h_i v)$  is in  $V(G)$ .

If  $G$  is a union of compact groups  $K_i$ , then  $V/V(G) = \text{colim } V/V(K_i)$  is exact.  $\square$

**Prop. (24.1.2.8).** If  $G$  is a union of increasing family of compact open subgroups  $\{K_{\alpha}\}$ , then  $v \in V(G, \psi)$  ( $\psi$  can be trivial) iff for some  $K_{\alpha}$ ,  $\int_{K_{\alpha}} \psi^{-1}(h)\pi(h)v dh = 0$ .  $\lrcorner$

*Proof:* We can assume  $\psi$  is trivial. If  $v = \pi(h)w - w$  and  $h \in K_{\alpha}$ , then  $\int_{K_{\alpha}} \psi^{-1}(h)\pi(h)v dh = 0$ . Conversely, by the proof of (24.1.2.7),  $V(G) = \cup V(K_{\alpha}) = \cup \ker(e_{K_{\alpha}})$ , which is equivalent to  $\int_{K_{\alpha}} \pi(h)v dh = 0$ .  $\square$

**Def. (24.1.2.9) [Contragradient Representations].** For  $V \in \mathcal{R}\text{ep}^{\text{alg}}(G)$ , the **contragradient smooth representation**  $V^{\vee} = (V^*)^{\text{alg}}$  is the smooth part of  $V^*$ .  $\lrcorner$

**Prop. (24.1.2.10).** Let  $E$  be a smooth or f.d. representation of  $G$ , then

- $E$  has an irreducible subquotient.
- If  $E$  is f.g., then it has an irreducible quotient.

$\lrcorner$

*Proof:* 2: Use Zorn's lemma for the set of proper  $G$ -subspaces of  $U$ , the union of an ascending chain of proper  $G$ -subspaces is proper, because  $E$  is f.g.. So it has a maximal proper  $G$ -space, and then the quotient is irreducible.

1 follows from item2 by choosing a f.g. submodule.  $\square$

**Def. (24.1.2.11) [Matrix Coefficients of Smooth Representations].** For  $(\pi, V) \in \mathcal{R}\text{ep}^{\text{alg}}(G)$ , a **matrix coefficient** for  $V$  is a function on  $G$  of the form  $g \mapsto (\pi(g)u, v)$ , where  $u \in V$  and  $v \in V^{\vee}$  (24.1.2.9).  $\lrcorner$

**Def. (24.1.2.12) [Induced Representations of Discrete Groups].**  $\lrcorner$

**Prop. (24.1.2.13) [Induced Representation].** Situation as in (24.1.6.40), there are algebraic isomorphisms

$$\text{Ind}_H^G(V) = \text{Hom}_{\mathbb{Z}[H]}(\mathbb{Z}[G], V), \quad \text{ind}_H^G(V) = \mathbb{Z}[G] \otimes_{\mathbb{Z}[H]} V.$$

I.e., if  $H$  acts on  $V$  by  $\rho$ , then  $\text{ind}_H^G(\rho)$  is the space  $\oplus_{\gamma \in G/H} V_{\gamma}$  where  $V_{\gamma} \cong V \in \text{Mod}_H$ , and that for  $v_{\gamma} \in V_{\gamma}$ ,  $(\text{Ind}(\rho)g)v_{\gamma} = \rho(h)v_{\gamma'} \in V_{\gamma'}$  where  $g\gamma = \gamma'h$  that  $\gamma' \in G/H, h \in H$ .  $\lrcorner$

*Proof:* Choose a set of left coset representatives  $\Gamma$  of  $G/H$ , then  $\Gamma^{-1}$  is a set of right coset representatives for  $H \backslash G$ . Now  $\mathbb{Z}[G] = \bigoplus_{\gamma \in \Gamma} \mathbb{Z}[H]\gamma^{-1}$ , and we define the space  $V_\gamma \cong V$  of maps from  $\mathbb{Z}[G]$  to  $V$  determined by:  $v_\gamma(g) = \rho(g\gamma)v \in V$  if  $g \in H\gamma^{-1}$  and 0 otherwise.

Then  $\text{Ind}(\rho)(V) = \bigoplus_{\gamma \in \Gamma} V_\gamma$  that for  $v_\gamma \in V_\gamma$ ,  $(\text{Ind}(\rho)g)v_\gamma$  is the map  $\mathbb{Z}[G]$  to  $V$  determined by:  $((\text{Ind}(\rho)g)v_\gamma)(g') = \rho(g'\gamma'h)v \in V$  if  $g' \in H(\gamma')^{-1}$ , and 0 otherwise, where  $g\gamma = \gamma'h$ . Then  $(\text{Ind}(\rho)g)v_\gamma = \rho(h)v_{\gamma'}$ , which is the same as the formula for  $\text{Ind}(\rho)$  as in (24.1.2.13). So the map  $v_\gamma \rightarrow v_\gamma : \text{Ind}(\rho) \rightarrow \text{Ind}(\rho)$  is an isomorphism in  $\text{Mod}_{\mathbb{Z}[G]}$ .  $\square$

**Prop. (24.1.2.14) [Projection Formula].** Let  $H \leq G$ , then for any  $\rho \in \text{Rep}(G), \sigma \in \text{Rep}(H)$ , we have

$$\text{ind}_H^G(\rho|_H \otimes \sigma) \cong \rho \otimes \text{ind}_H^G(\sigma).$$

┘

*Proof:* For any  $\tau \in \text{Rep}(G)$ ,

$$\begin{aligned} \text{Hom}_G(\text{ind}_H^G(\rho \otimes \sigma), \tau) &= \text{Hom}_H(\rho \otimes \sigma, \tau) \\ &= \text{Hom}_H(\sigma, \text{Hom}(\rho, \tau)) \\ &= \text{Hom}_G(\text{ind}_H^G(\sigma), \text{Hom}(\rho, \tau)) \\ &= \text{Hom}_G(\rho \otimes \text{ind}_H^G(\sigma), \tau) \end{aligned}$$

Thus the assertion follows from Yoneda lemma.  $\square$

**Prop. (24.1.2.15) [Restrictions, Clifford's Theorem].** If  $k \in \text{Field}, H \trianglelefteq G$  and  $(\rho, V) \in \text{Rep}_k^{\text{fd}}(G)$  is completely reducible, then  $\rho|_H$  is also completely reducible.  $\square$

*Proof:* Use definition (3.6.2.4), we may assume  $V$  is simple.  $G$  maps a simple  $H$ -subrepresentation of  $V$  to another simple  $H$ -subrepresentation of  $V$  because  $H$  is normal in  $G$ . So if  $W$  is the sum of all simple  $H$ -subrepresentations of  $V$ , then  $W \neq 0$  and  $G$  preserves  $W$ , which implies  $W = V$ . And then  $V$  is  $H$ -semisimple by (3.6.2.4).  $\square$

**Prop. (24.1.2.16) [Restrictions].** Let  $k \in \text{Field}$  and  $H \leq G$  is an open normal subgroup of  $G$  of finite index  $n$  s.t.  $n$  is invertible in  $k$ . Let  $(\pi, V) \in \text{Rep}_k^{\text{alg}}(G) \cup \text{Rep}_k^{\text{fd}}(G)$ , then

- If  $\pi|_H$  is completely reducible, then  $\pi$  is also completely reducible.
- If  $(\pi, V)$  is irreducible, then  $\pi|_H = \pi_1 \oplus \dots \oplus \pi_k$  where  $\pi$  are irreducible representations of  $H$  and  $k \leq [G : H]$ .
- If  $(\pi, V)$  is irreducible, the isotropy parts of  $H$  are all of the same dimension, and if there are more than 1 isotropy classes, then  $\pi$  is an induced representation.

Moreover, item 2, 3 are also true for  $H$  open normal in  $G$  s.t.  $HZ(G)$  is of finite index  $n$ .  $\square$

*Proof:* Let  $g_1, \dots, g_n$  be a coset representation of  $G/H$ .

1: If  $V_1$  is a  $G$ -submodule of  $V$ , then  $V_1$  has a complementary  $H$ -submodule  $V_1^\perp$ . Let  $P_0$  be the projection of  $V$  onto  $V_1$  along  $V_1^\perp$ , then  $P = \frac{1}{p} \sum \pi(g_i)P_0\pi(g_i)^{-1}$  is a projection of  $V$  onto  $V_1$  that commutes with  $G$ -action. Therefore the kernel of  $P$  is a  $G$ -submodule of  $V$  that is complementary to  $V_1$ .

2: Let  $v \in V$ , then  $\{\pi(g_i)v\}$  generates  $V$  as a  $H$ -representation, thus by (24.1.2.10) there is an  $H$ -submodule  $V' \subset V$  that  $V/V'$  is irreducible. Let  $V_i = \pi(g_i)V'$ , then  $V/V_i$  are also irreducible representations of  $H$ . Consider the  $H$ -invariant map  $V \mapsto \bigoplus V/V_i$ , its kernel is  $G$ -invariant, thus trivial, thus  $V$  is a submodule of  $\bigoplus V/V_i$ , and the assertion follows.

3: The  $G$ -action permutes with isotropy classes. And if there are more than 1 classes, choose the stabilizer  $G_\rho$  of one  $V[\rho]$ , then  $V = \text{Ind}_{G_\rho}^G(V[\rho])$  by (24.1.2.13).  $\square$

### 3 Finite Groups

References are [Ser77, A-B95]. [群表示论 notes 薛航].

**Notation (24.1.3.1).**

- Let  $G \in \mathcal{G}rp^{\text{fin}}$ .
- Let  $k \in \mathcal{F}ield^0$ , e.g. a subfield of  $\mathbb{C}$ .
- The representations in this subsection is assumed to be of f.d. over  $\bar{k}$ . In particular, there is no need to consider topologies. And we denote  $\mathcal{R}ep(G) = \mathcal{R}ep_{\bar{k}}(G)$ .
- Because a finite group is compact, the representation theory of compact groups [Compact Group](#) apply.
- Because a finite group is locally profinite, the representation theory of locally profinite groups [Smooth Representations](#) apply.

┘

**Prop. (24.1.3.2) [Orthogonality of Characters].** The characters  $\chi_i$  of irreducible representations of  $G$  form a basis of  $ZL^2(G)$  by (24.7.3.30). Also, for  $s \in G$ , let  $c(s)$  be the number of elements in the conjugacy class of  $s$ , then:

- $\int_i |\chi_i(s)|^2 = g/c(s)$ .
- If  $t$  is not conjugate to  $s$ , then  $\sum_i \chi_i(s)^* \chi_i(t) = 0$ .

┘

*Proof:* The last assertion follows from the first one, if you consider a matrix with conjugacy classes as column and characters as rows, and place  $\sqrt{c(s)/g} \chi_i(s)$  in the entries, then it is an orthogonal matrix.  $\square$

**Cor. (24.1.3.3) [Representations Determined by Characters].** Any  $\rho \in \mathcal{R}ep^{\text{fd}}(G)$  is determined by its character, by (3.6.2.13).  $\square$

**Cor. (24.1.3.4) [Number of Representations].**  $\#\hat{G}$  equals the number of conjugacy classes of  $G$ , and  $\sum_{\rho \in \hat{G}} \dim(\rho)^2 = \#G$ .  $\square$

*Proof:* Both  $\{\chi_\pi\}$  and the characteristic functions of the conjugate classes of  $G$  are basis for  $L^2(G)$ . And the second assertion follows from the Peter-Weyl theorem (24.7.3.16) as  $\sum_{\pi \in \hat{G}} d_\pi^2$  is the dimension of  $L^2(G)$ .  $\square$

**Cor. (24.1.3.5).**  $G \in \mathcal{A}b^{\text{fin}}$  iff  $\hat{G} = G^\vee$ .  $\square$

*Proof:* This follows immediately from the equation  $\sum_{\pi \in \hat{G}} d_\pi^2 = |G|$  (24.1.3.4), as  $G$  is Abelian iff it has  $|G|$  conjugacy classes iff  $\hat{G} = G^\vee$  iff  $d_\pi = 1$  for any  $\pi \in \hat{G}$ .  $\square$

**Prop. (24.1.3.6) [Decomposition of Regular Representations].** By (24.7.3.7), the regular representation of  $G$  on  $L^2(G)$  admits a decomposition

$$L^2(G) = \bigoplus_{\rho \in \text{Irr}(G)} \dim(\rho) \rho.$$

┘

**Prop. (24.1.3.7).** If  $G$  is a finite  $p$ -group and  $A$  is a nonzero  $p$ -torsion  $G$ -module, then  $A^G \neq 0$ .  $\square$

*Proof:* We may consider  $A$  generated by a single element. Because  $A$  is  $p$ -torsion,  $|A| = p^n$  for some  $n$ . Now consider the orbit, then if the orbit is not a single element, then its order is divisible by  $p$ , so  $|A^G|$  is divisible by  $p$ . But 0 is fixed, so  $A^G \neq 0$ .  $\square$

### Group Algebra $k[G]$

**Prop. (24.1.3.8) [Total Decomposition of Representations, Maschke].** If  $k \in \text{Field}^p$  and  $(\#G, p) = 1$ , then any  $(\rho, V) \in \text{Rep}_F^{\text{fd}}(G)$  is a direct sum of irreducible representations.  $\lrcorner$

*Proof:* For any subrepresentation  $U \subset V$ , choose an arbitrary projection  $\pi$  of  $U$  to  $V$ , and let  $\rho(v) = 1/\#G \sum g^{-1}\pi(g(v))$ , then it can be checked  $\rho$  commutes with  $G$ -actions, thus its kernel is also a  $G$ -modules, and it is identity on  $V$ , so  $U = V \oplus \ker \rho$ .  $\square$

**Cor. (24.1.3.9) [Semisimple Ring].** If  $k \in \text{Field}$  and  $\#G$  is invertible in  $k$ , then  $k[G]$  is a semisimple ring (3.6.2.17).  $\lrcorner$

**Prop. (24.1.3.10) [Brauer-Nesbitt].** If two finite dimensional semisimple representations over a field has the same characteristic polynomial for any element  $g \in G$ , then they are isomorphic.  $\lrcorner$

*Proof:* Just use the irreducible representations are orthogonal and that they have the same and for char  $p$ , we can use divide by  $p$  and the char poly becomes  $p$ -th power and we can do this forever, contradiction.  $\square$

**Prop. (24.1.3.11) [Integrality of Characters].** For any  $\rho \in \text{Rep}^{\text{fd}}(G)$ , the values of  $\chi_\rho$  are sums of roots of unity.  $\lrcorner$

*Proof:* This is because for any  $g \in G$ ,  $g^m = 1$  for some  $m \in \mathbb{Z}_+$ . Thus  $\rho(g)^k = 1$ , and the eigenvalues of  $\rho(g)$  are all in  $\mu_k$ .  $\square$

**Prop. (24.1.3.12) [Schur Indices].**  $\lrcorner$

### Induced Representations and Mackey Theory

**Remark (24.1.3.13).** The induced representation  $\text{Ind}_H^G$  (24.1.2.13) is the same as the (compact) induction defined in (24.1.6.40). In particular, all the results there holds in the finite group case.  $\lrcorner$

**Prop. (24.1.3.14) [Character of Induced Representations].** Character of induced representations, Cf. [Serre, P30].  $\lrcorner$

**Prop. (24.1.3.15) [Normal Subgroup Dichotomy].** Let  $A \trianglelefteq G$  be a normal subgroup, and  $\rho \in \text{Irr}(G)$ , then

- either there exists  $A \subset H \subsetneq G$  s.t.  $\rho$  is induced from a representation of  $H$ ,
- or  $\rho|_A$  is not isotypic.

$\lrcorner$

*Proof:* Let  $\rho|_A = \otimes \rho_i$  be the decomposition into  $A$ -isotypic representations, then  $G$  permutes these  $V_i$ , and acts transitively because  $\rho$  is irreducible. If  $V = V_1$ , then we are in case 2. Otherwise, let  $H$  be the stabilizer of  $V_i$  under this transition map, then  $\rho = \text{Ind}_H^G(V_1)$ , so we are in case 1.  $\square$

**Cor. (24.1.3.16) [Dimensions Bounds of Representations, Tate].** If  $A \trianglelefteq G$  is an Abelian normal subgroup, then dimension of any irreducible representations  $(\rho, V) \in \text{Rep}^{\text{fd}}(G)$  divides  $[G : A]$ . In particular, they divide  $[G : Z(G)]$ .  $\lrcorner$

*Proof:* Use induction on  $G$  and consider (24.1.3.15). If we are in case 1, then we can use induction hypothesis on  $H$ . If we are in case 2, then there are surjective maps  $G/A \rightarrow \rho(G)/\rho(A)$ , where  $\rho(A) \subset \text{GL}(V)$  are scalar multiplications, thus  $\rho(A) \subset Z(\rho(G))$ .

Then we are reduced to the case  $A = Z(G)$ . Cf. [Ser77]P53. ? □

**Cor. (24.1.3.17).** If  $G$  is a  $p$ -group, then the dimension of any irreducible representations of  $G$  is a  $p$ -power. ┘

**Prop. (24.1.3.18) [Representations of Supersolvable Groups].** If  $G$  is supersolvable, then any irreducible representation of  $G$  is induced from a character of a subgroup of  $G$ . ┘

*Proof:* We may use induction on  $\#G$ . Thus it suffices to consider a faithful representation  $\rho$ . If  $G$  is Abelian this is trivial, and if  $G$  is non-Abelian, then by (3.1.8.10),  $G$  contains a normal Abelian subgroup  $A \leq G$  that is not contained in the center. Because  $\rho$  is faithful, some  $a \in A$  satisfies  $\rho(a)$  is not a scalar multiplication. Thus the restriction of  $\rho$  to  $A$  is not isotypic. □

### Rationality Problems

**Def. (24.1.3.19) [ $R_k(G)$  and  $\overline{R}_k(G)$ ].** Let  $R_k(G) \subset ZC(G)$  be the  $\mathbb{Z}$ -module generated by the characters of  $\rho \in \text{Rep}_k(G)$ , which is a subring of  $R(G)$

Also define the  $\mathbb{Z}$ -module  $\overline{R}_k(G) \subset R(G)$  to be the submodule generated by characters of  $\text{Rep}(G)$  that is valued in  $k$ . Clearly  $R_k(G) \subset \overline{R}_k(G)$ . ┘

**Prop. (24.1.3.20).**  $[\overline{R}_k(G) : R_k(G)] < \infty$ . In fact, we can take a finite extension  $k'/k$  s.t.  $\text{Rep}(K) = \text{Rep}_{k'}(G)$ , and  $d\overline{R}_k(G) \subset R_k(G)$ . ┘

*Proof:*  $k'$  exists because there are only f.m. irreducible representations of  $G$ . Now for any  $\rho \in \text{Rep}_{k'}^{\text{fd}}(G)$ , if  $\rho$  is regarded as a  $k$ -representation, then the new representation has character  $\text{tr}_{k'/k}\chi_\rho$  ? . Thus the last assertion follows. □

**Prop. (24.1.3.21).** Let  $\{\rho_i\}$  be the isomorphism classes of all irreducible representations of  $G$  over  $k$ , then their characters  $\{\chi_i\}$  form an orthogonal basis of  $R_k(G)$ . ┘

*Proof:* □

**Cor. (24.1.3.22).**  $\rho \in \text{Rep}(G)$  is realizable over  $k$  iff its character belongs to  $R_k(G)$ . ┘

*Proof:* One direction is trivial, for the other, if  $\chi \in R_k(G)$ , then  $\chi = \sum n_i \chi_i$ , and  $(\chi, \chi_i) = n_i(\chi_i, \chi_i)$ . As  $(\chi, \chi_i) \geq 0$  as they are representations of  $G$ , we have  $n_i \geq 0$ , thus  $\rho = \sum n_i \rho_i$  is realizable over  $K$ , by (24.1.3.3). □

**Prop. (24.1.3.23).** Let  $m_i$  be the Schur indices of  $G$ , then the characters  $\psi = \chi_i/m_i$  form a basis of  $\overline{R}_K(G)$ . In particular,  $R_k(G) = \overline{R}_k(G)$  iff  $k[G]$  is quasi-split. ┘

*Proof:* Cf. [Ser77]P93. ? □

**Def. (24.1.3.24) [Galois Action on  $G$ ].** Let  $k' = k(\mu_m)$ , where  $m$  divides the orders of all elements in  $G$ , then  $\text{Gal}(k'/k) \leq (\mathbb{Z}/(m))^*$ . Then this group can act on  $G$  by  $\sigma_t(x) = x^n$  as a set, and we call two elements  $s, s' \in G$   $\text{Gal}(k'/k)$ -conjugate iff they are in the same  $\text{Gal}(k'/k)$  orbits of  $G$ . ┘

**Thm. (24.1.3.25) [Galois Descent of Characters].** Situation as in (24.1.3.24), then for  $f \in ZC(G)$  valued in  $k'$ ,

$$\sigma_t(f(g)) = f(g^t)$$

- $f \in R(G) \otimes k$  iff  $\sigma_t(f)(g) = f(g^t)$  for any  $\sigma_t \in \text{Gal}(k'/k)$  and  $g \in G$ .
- $f \in R_k(G) \otimes k$  iff  $f(g) = f(g^t)$  for any  $\sigma_t \in \text{Gal}(k'/k)$  (i.e.  $f(x) = f(y)$  if  $\langle x \rangle = \langle y \rangle \leq G$ ).

In particular,  $R(G) = \overline{R}_k(G)$  iff  $f(x) = f(y)$  for any  $x, y \leq G$  generating the same subgroup of  $G$ .  $\lrcorner$

*Proof:* 1: If  $f = \chi_\rho \in R(G)$ , then  $\sigma_t(f)(g) = \sigma_t \chi_\rho(g) = \sigma_t(\sum \omega_i) = \sum \omega_i^t = \chi_\rho(g^t)$ . Conversely, if  $\sigma_t(f)(g) = f(g^t)$  for any  $\sigma_t \in \text{Gal}(k'/k)$  and  $g \in G$ , then

$$f = \sum_{\rho \in \text{Irr}(G)} c_\rho \chi_\rho, \quad c_\rho = \langle f, \chi_\rho \rangle.$$

And

$$c_\rho = \langle f, \chi_\rho \rangle = \langle \Psi^t f, \Psi^t \chi_\rho \rangle = \langle \sigma_t(f), \sigma_t(\chi_\rho) \rangle = \sigma_t \langle f, \chi \rangle = \sigma_t c_\rho.$$

Thus  $c_\rho \in k$  and  $f \in R(G) \otimes k$ .

2: This is because the fixed points of  $\text{Gal}(k'/k)$  acting on  $R(G) \otimes k$  is just  $\overline{R}_k(G) \otimes k = R_k(G) \otimes k$  (24.1.3.20).  $\square$

**Cor. (24.1.3.26) [Number of  $k$ -Representations].**  $\# \text{Irr}_k(G)$  equals the number of  $(\mathbb{Z}/(m))^*$ -orbits of conjugacy classes of  $G$ , and  $R_k(G)$  forms a basis for the functions on  $G$  that is constant on  $(\mathbb{Z}/(m))^*$ -orbits of conjugacy classes of  $G$ .  $\lrcorner$

**Cor. (24.1.3.27) [Brauer].** If  $m$  is the least common multiples of the orders of the elements of  $G$  and  $\mu_m \subset k$ , then  $R_k(G) = R(G)$ .  $\lrcorner$

*Proof:* By (24.1.3.36), any  $\chi \in R(G)$  is of the form  $\chi = \sum n_i \text{Ind}_{H_i}^G(\varphi_i)$  where  $H_i \leq G$  and  $\varphi_i \in H_i^\vee$ .  $\varphi_i$  are valued in  $\mathbb{Q}(\mu_m)$ , thus  $\varphi_i \in R_k(H_i)$ . Then by (24.1.3.32),  $\chi \in R_k(G)$ .  $\square$

**Cor. (24.1.3.28) [Bounds on Schur Indices].** If  $m$  is the least common multiple of the orders of the elements of  $G$ , then all the Schur indices of  $G$  divides the Euler function  $\varphi(m)$ .  $\lrcorner$

*Proof:* This follows from (24.1.3.27) and (3.6.4.19) by considering the field extension  $k(\mu_m)$ .  $\square$

**Cor. (24.1.3.29) [Rational Characters].** Let  $m \in \mathbb{Z}_+$  be a multiple of all orders of elements in  $G$  and  $f \in ZC(G)$  valued in  $\mathbb{Q}(\mu_m)$ , then by (24.1.3.25),

- $f \in R(G) \otimes \mathbb{Q}$  iff  $\sigma_t(f)(x) = f(x^t)$  for any  $t \in \mathbb{Z} \setminus (m)$ .
- $f \in R_{\mathbb{Q}}(G) \otimes \mathbb{Q}$  iff  $f(x) = f(x^t)$  for any  $t \in \mathbb{Z} \setminus (m)$  (i.e.  $f(x) = f(y)$  if  $\langle x \rangle = \langle y \rangle \leq G$ ).
