**Lemma (5.5.4.16) [ $p$ -adic Localization].** If  $A$  is a  $\delta$ -ring with  $p \in \text{rad}(A)$ , then the formula  $\varphi(f) = f^p + p\delta(f)$  shows if  $f$  is a unit, then  $\varphi(f)$  is also a unit (3.6.3.2), so  $S^{-1}A = T^{-1}A$ , where  $T = \{S, \varphi(S), \varphi^2(S), \dots\}$ .

Thus for any  $\delta$ -ring  $A$  and a multiplicative set  $S$ , the  $p$ -localization (5.1.1.34)  $(S^{-1}A)_{(p)}$  is the same as the  $p$ -localization of  $T^{-1}A$ . Then (5.5.4.15) shows that  $(S^{-1}A)_{(p)}$  carries a unique  $\delta$ -structure compatible with that of  $A$ .  $\lrcorner$

**Lemma (5.5.4.17) [Completions].** For a  $\delta$ -ring  $A$  and a f.g. ideal  $I$ , the  $I$ -adic completion of  $A$  has a unique  $\delta$ -structure compatible with that of  $A$ .  $\lrcorner$

*Proof:* Let  $A \rightarrow W_2(A)$  corresponds to the  $\delta$ -structure by (5.5.4.3), then there is a natural map  $A \rightarrow W_2(A) \rightarrow W_2(\tilde{A})$ , then by the universal property of complete, it extends to a map  $\tilde{A} \rightarrow W_2(\tilde{A})$ , which is a ring map and is a section, all by universal properties.  $\square$

**Lemma (5.5.4.18) [Derived Completion].** If  $A$  is a  $\delta$ -ring and  $I \subset A$  is an ideal containing  $p$ , then the derived  $I$ -completion ring  $\hat{A}$  of  $A$  admits a unique  $\delta$ -structure extending that of  $A$ .  $\lrcorner$

*Proof:* The proof is similar as (5.5.4.17).  $\square$

**Prop. (5.5.4.19) [Étale Extension].** Let  $A$  be a  $\delta$ -ring with a f.g. ideal  $I$  containing  $p$ . Assume  $B$  is a derived  $I$ -complete and  $I$ -completely étale  $A$ -algebra, then  $B$  admits a unique  $\delta$ -structure compatible with that of  $A$ .

In particular, any  $\delta$ -structure on an algebra  $A$  passes uniquely to its derived  $I$ -completion for any ideal  $I \subset A$  containing  $p$ .  $\lrcorner$

*Proof:* By Elkik's algebraization (5.9.7.9), we can write  $B$  as derived  $I$ -completion of some étale  $A$ -algebra  $B'$ . Then  $W_2(A) \rightarrow W_2(B')$  is étale by van der Kallen's theorem (5.5.2.29). Then  $W_2(B)$  is the derived  $I$ -completion of  $W_2(B')$ , with the  $A$ -algebra structure given by  $A \rightarrow W_2(A) \rightarrow W_2(B')$ . For the rest, Cf. [Scholze, Prism, 2.18].  $\square$

### Distinguished Elements

**Def. (5.5.4.20) [Distinguished Elements].** In a  $\delta$ -ring  $A$ , an element  $d$  is called a **distinguished element** if  $\delta(d)$  is a unit in  $A$ . A distinguished element is preserved by a  $\delta$ -ring map.  $\lrcorner$

**Lemma (5.5.4.21) [Distinguished up to units].** If  $A$  is a  $\delta$ -ring,  $d$  is distinguished and  $u$  is a unit, then  $ud$  is also distinguished, if  $d, p \in \text{rad}(A)$ .  $\lrcorner$

*Proof:*  $\delta(ud) = u^p\delta(d) + d^p\delta(u) + p\delta(u)\delta(d)$  is a unit.  $\square$

**Lemma (5.5.4.22) [Irreducibility of Distinguished Elements].** Let  $A$  be a  $\delta$ -ring and  $d$  be distinguished element in  $A$ . If  $d = fh$  for some  $f, h \in A$  that  $f, p \in \text{rad}(A)$ , then  $f$  is also distinguished and  $h$  is a unit.  $\lrcorner$

*Proof:* Notice that  $\delta(d) = f^p\delta(h) + h^p\delta(f) + p\delta(f)\delta(h)$ ,  $\delta(d)$  is a unit,  $f^p\delta(h) + p\delta(f)\delta(h) \in \text{rad}(A)$ , thus  $h^p\delta(f)$  is a unit, so we are done.  $\square$

**Prop. (5.5.4.23) [Characterization of Distinguished Elements].** Fix a  $\delta$ -ring  $A$  and an element  $d$  that  $d, p \in \text{rad}(A)$ , then  $d$  is distinguished iff  $p \in (d, \varphi(d))$ . In particular, distinguished elements is stable under units.  $\lrcorner$

*Proof:* If  $d$  is distinguished, then  $\delta(d)$  is a unit, thus  $\varphi(d) = d^p + d^p + p\delta(d)$  shows immediately  $p \in (d, \varphi(d))$ . Conversely, if  $p = ad + b\varphi(d)$ , we show  $\delta(d)$  is invertible. It suffices to show it is invertible modulo  $(d, p)$  as  $d, p \in \text{rad}(A)$ , or equivalently  $(p, d, \varphi(d)) = A$ . If it is not the case, then we may take a  $(p, d, \varphi(d))$ -adic completion to assume  $p, d, \varphi \in \text{rad}(A)$ , thus the equation simplifies to  $p(1 - b\delta(d)) = cd$ . The left side is distinguished, by (5.5.4.21), and then  $d$  is also distinguished, by (5.5.4.22), so truly  $(p, d, \varphi(d)) = A$ .  $\square$

**Prop. (5.5.4.24) [Examples of Distinguished Elements].** The element  $d$  is distinguished in the following cases:

- (Crystalline cohomology) Take  $A = \mathbb{Z}_{(p)}$  and  $d = p$ , then  $\delta(p) = 1 - p^{p-1}$  is a unit.
- ( $q$ -de Rham cohomology) Take  $A = \mathbb{Z}_p[[q-1]]$  and  $d = [p]_q = \sum_{i=0}^{p-1} q^i \in A$ , with the  $\delta$ -structure determined by  $\varphi(q) = q^p$ .
- (Breuil-Kisin cohomology) Fix a discretely valued field  $K/Q_p$  with uniformizer  $\pi$ ,  $W$  the maximal unramified subring of  $\mathcal{O}_K$ . Take  $A = W[[u]]$  with  $\delta(u) = u^p$ , then any generator of the kernel of the map of  $A \rightarrow \mathcal{O}_K : u \mapsto \pi$  is distinguished?  $\lrcorner$
- ( $A_{\text{inf}}$ -cohomology) Let  $A$  be the  $(p, q-1)$ -completion of  $\mathbb{Z}_p[q^{\frac{1}{p^\infty}}]$ . Then  $A$  is  $p$ -torsion free and  $\varphi(q) = q^p$  gives a  $\delta$ -structure. Then  $d = [p]_q$  defined in item2 is also distinguished. And  $\varphi^n(d)$  is distinguished for any  $n \in \mathbb{Z}$  by (5.5.4.5).  $\lrcorner$

*Proof:* 2: It is clear  $\varphi$  is continuous and  $\delta$  stabilizes  $(q-1)$ , and  $d$  is distinguished because the image of  $\delta(d)$  in  $A/(q-1) \cong \mathbb{Z}_q$  is  $\delta(p) = 1 - p^{p-1}$  is a unit, thus it is also a unit in  $A$ .  $\square$

### Perfect $\delta$ -Ring

**Def. (5.5.4.25) [Perfect  $\delta$ -Ring].** A **perfect  $\delta$ -ring** is a  $\delta$ -ring that  $\varphi$  is an isomorphism.  $\lrcorner$

**Prop. (5.5.4.26) [Perfections].** The inclusion of the category of perfect  $\delta$ -rings to the category of  $\delta$ -rings admits left and right adjoints,  $A_{\text{perf}}$  and  $A^{\text{perf}}$  with definition similar to (5.5.1.9).  $\lrcorner$

*Proof:* We use (5.5.4.3), the map  $A \rightarrow W_2(A) \rightarrow W_2(A_{\text{perf}})$  extends uniquely to a map  $A_{\text{perf}} \rightarrow W_2(A_{\text{perf}})$  lifting the  $\delta$ -action of  $A$ . Similarly, because  $(-)^{\text{perf}}$  is a limit and  $W_2(-)$  is a right adjoint, then  $W_2(-)$  commutes with  $(-)^{\text{perf}}$ . In particular, there is a natural map  $A^{\text{perf}} \rightarrow W_2(A^{\text{perf}})$ .  $\square$

**Lemma (5.5.4.27) [Frobenius Kills  $p$ -Torsion].** If  $A$  is a  $\delta$ -ring and  $x \in A$  satisfies  $px = 0$ , then  $\varphi(x) = 0$ . In particular, if  $A$  is perfect, then  $A$  is  $p$ -torsionfree.  $\lrcorner$

*Proof:* Applying  $\delta$  to  $px = 0$ , we have  $0 = p^p\delta(x) + x^p\delta(p) + p\delta(x)\delta(p) = p^p\delta(x) + \varphi(x)\delta(p)$ . As  $\delta(p)$  is a unit, and  $p^p\delta(x) = p^{p-1}(\varphi(x) - x^p) = \varphi(p^{p-1}x) - p^{p-1}x^p = 0$ , thus  $\varphi(x) = 0$ .  $\square$

**Prop. (5.5.4.28) [Perfect  $p$ -Complete  $\delta$ -Rings].** The following categories are equivalent:

- The category of perfect  $p$ -adically complete  $\delta$ -rings.
- The category  $p$ -adically complete and  $p$ -torsionfree rings  $A$  with  $A/p$  perfect.
- The perfect  $\mathbb{F}_p$ -algebras.

In particular, every perfect  $p$ -complete  $\delta$ -ring is of the form  $W(k)$  thus has Teichmüller expansions.  $\lrcorner$

*Proof:* 2 and 3 are equivalent by Witt vector construction, by (8.1.4.3), noticing that there is a natural lifting on  $W(k)$  lifting the Frobenius of  $k/\mathbb{F}_p$  that induces a  $\delta$ -functor<sup>?</sup>. There is a forgetful functor from 1 to 2, by (5.5.4.27) (notice  $A/p$  is also perfect because if  $\varphi(x) \in (p)$ , then  $x \in \varphi^{-1}(p) = (p)$  as  $\varphi(p) = p\varphi(1) = p$ ) and it is faithful. Now there is an equivalence from  $3 \rightarrow 1 \rightarrow 2$ , thus  $1 \rightarrow 2$  is essentially surjective thus is an equivalence.  $\square$

**Prop. (5.5.4.29) [Perfect Element has Rank 1].** Fix a  $\delta$ -ring  $A$  and an element  $x \in A$ , then  $\delta(x^{p^n}) \in p^n A$  for any  $n$ . In particular, if  $A$  is  $p$ -adically separated and  $y$  is perfect in  $A$ , then  $\delta(y) = 0$ .  $\lrcorner$

*Proof:* By formal calculation, it suffices to show that  $p\delta(x^{p^n}) \in p^{n+1}A$ , which is equivalent to  $\varphi(x^{p^n}) \equiv x^{p^{n+1}} \pmod{p^{n+1}A}$ , which is true by (2.6.1.10).  $\square$

**Prop. (5.5.4.30) [Distinguished Elements in Perfect  $\delta$ -Rings].** Let  $A$  be a perfect  $p$ -complete  $\delta$ -ring (or perfect  $\mathbb{F}_p$ -algebra by (5.5.4.28)), and  $d \in A$ , then  $d$  is distinguished iff its coefficient of  $p$  in the Teichmüller expansion (5.5.4.28) is a unit.

If  $d$  is distinguished, then it is a nonzero-divisor, and  $A/d[p^\infty] = A/d[p]$ .  $\lrcorner$

*Proof:* Let  $d = \sum_{i \geq 0} [a_i]p^i$ , then

$$\delta(d) = \frac{1}{p} \left( \sum_{i \geq 0} [a_i^p]p^i - \left( \sum_{i \geq 0} [a_i]p^i \right)^p \right) \equiv [a_1^p] \pmod{pA}$$

thus it is a unit iff  $a_1$  is a unit, because  $A$  is  $p$ -complete.

Now if  $d$  is distinguished, and  $fd = 0$ . If  $f \neq 0$ , we may assume  $p \nmid f$ , because  $A$  is  $p$ -torsionfree and  $p$ -adically complete (5.5.4.28). Now

$$\varphi(f)\delta(fd) = \varphi(f)(f^p\delta(d) + \delta(f)\varphi(d)) = \varphi(f)f^p\delta(d) = 0,$$

so  $f^p\varphi(f) = 0$ , and  $f^{2p} \equiv 0 \pmod{p}$ . Hence  $f \equiv 0 \pmod{p}$ , but then  $p|f$ , contradiction.

For the last assertion, it suffices to show that  $A/d[p^2] = A/d[p]$ . If  $p^2f = dg$ , then  $\varphi(g)\delta(gd) = \varphi(g)(\delta(d)g^p + \varphi(d)\delta(g)) = \varphi(g)\delta(d)g^p + \varphi(dg)\delta(g) \in pA$ , thus  $\varphi(g)g^p \in pA$ , hence  $g^{2p} \in pA$ , and hence  $g \in pA$ , showing  $pf \in dA$ .  $\square$

## 5.6 Divided Power Algebras

**Notation (5.6.0.1).**

- Let  $p \in \text{Prime}$ .

┘

### 1 Basics

**Def. (5.6.1.1) [PD-Structures, Cartan/Roby].** For  $A \in \mathcal{CRing}$  and  $I \in \text{Ideal}(A)$ , a **divided power structure** or **pd-structure** on  $I$  is a collection of maps  $I_n : I \rightarrow A, n \in \mathbb{N}$  that

- $\gamma_0(x) = 1, \gamma_1(x) = x, \gamma_n(x) \in I$  for any  $n \in \mathbb{N}$ .
- $\gamma_n(x + y) = \sum \gamma_{n-i}(x)\gamma_i(y)$ .
- $\gamma_n(\lambda x) = \lambda^n \gamma_n(x), \lambda \in A, x \in I$ .
- $\gamma_m(x)\gamma_n(x) = \binom{m+n}{n} \gamma_{m+n}(x)$ .
- $\gamma_n(\gamma_m(x)) = \frac{(mn)!}{(m!)^n n!} \gamma_{mn}(x)$ .

A **divided power ring** or a **pd-structure** is a triple  $(A, I, \gamma)$  where  $A \in \mathcal{CRing}, I \in \text{Ideal}(A)$  and  $\gamma$  is a pd-structure on  $I$ . A morphism of divided power rings is a morphism of pairs  $(A, I)$  that preserves pd-structures.

For a pd-structure  $(A, I)$ , denote  $I^{[n]}$  the ideal generated by  $\prod_i \gamma_{n_i}(x_i)$  where  $x_i \in I$  and  $\sum n_i \geq n$ . And  $(A, I)$  is called a **nilpotent pd-structure** if  $I^{[n]} = 0$  for some  $n \in \mathbb{Z}_+$ . If  $(A, I)$  is a nilpotent pd-structure, then  $I$  is nilpotent, because  $n! \gamma^n(x) = x^n$ . ┘

**Remark (5.6.1.2).** A pd-structure is a simulation of the divided powers  $\gamma_n(x) = \frac{x^n}{n!}$  in case  $1/n!$  is not definable. ┘

**Example (5.6.1.3) [PD-Structures].** For  $A \in \mathcal{CRing}$ ,

- There is a unique pd-structure on  $(0)$  given by  $\gamma_n = 0$  for any  $n \in \mathbb{N}$ .
- If  $A \in \mathcal{CRing}/\mathbb{Q}$ , then for any  $I \in \text{Ideal}(A)$  there is a unique pd-structure given by  $\gamma_n(x) = x^n/n!$ , by (5.6.1.11).
- If  $m \in \mathbb{Z}_+$  s.t.  $m!$  is invertible in  $A$  and  $I \in \text{Ideal}(A)$  s.t.  $I^{m+1} = 0$ , then there is a pd-structure on  $I$  given by  $\gamma_n = \begin{cases} x^n/n! & n \in [m] \\ 0 & n \in \mathbb{Z}_{>m} \end{cases}$ .

┘

**Def. (5.6.1.4) [Exponentials and Logarithms].** If  $(A, I, \gamma)$  is a nilpotent divided power ring (5.6.1.1), then we can define the **divided power exponential** and the **divided power logarithm** maps

$$\exp : I \mapsto 1 + I : x \mapsto \sum_{n \in \mathbb{N}} \gamma_n(x).$$

$$\log : 1 + I \mapsto I : 1 + x \mapsto \sum_{n \in \mathbb{Z}_+} (-1)^{n-1} (n-1)! \gamma_n(x).$$

Then they are mutually inverse isomorphisms between the additive group  $I$  and the multiplicative group  $(1 + I)^\times$ . ┘

**Prop. (5.6.1.5)[Limits and Colimits].** The category of divided power rings has all limits and colimits, the limits commute with forget functors but the colimits don't. However, the colimit always commutes with the functor taking  $(A, I)$  to  $A/I$ . This can be seen from the universal property of colimit applied to the pd-structures that  $I = 0$ .  $\lrcorner$

*Proof:* The construction of the limit is clear. For the colimits, we use representability criterion(4.1.1.28), Cf.[Sta]07GX?.  $\square$

**Prop. (5.6.1.6).** For a divided power ring  $(A, I, \gamma)$ (5.6.1.1), we have  $n!\gamma(x) = x^n$ .  $\lrcorner$

*Proof:*  $n\gamma_n(x) = \gamma_1(x)\gamma_{n-1}(x)$ , so we can use induction.  $\square$

**Prop. (5.6.1.7).** If  $I, J \in \text{Ideal}(A)$  and  $\gamma$  a pd-structure on  $I$  and  $\delta$  a pd-structure on  $J$ , then

- $\gamma, \delta$  agree on  $IJ$ .
- If  $\gamma, \delta$  agree on  $I \cap J$ , then they extends to a pd-structure on  $I + J$ .

$\lrcorner$

*Proof:* 1: for  $x \in I, y \in J$ ,  $\gamma_n(xy) = y^n \gamma_n(x) = n! \delta_n(y) \gamma_n(x) = \delta(xy)$ .  
2: direct calculation.  $\square$

**Prop. (5.6.1.8)[ $p$ -Nilpotent and Thickening].** Let  $(A, I, \gamma)$  a pd-structure s.t.  $p$  is nilpotent in  $A/I$ , then  $I$  is locally nilpotent iff  $p$  is nilpotent in  $A$ , or equivalently  $(A, I, \gamma)$  is a pd-thickening(27.5.1.2).  $\lrcorner$

*Proof:* If  $p^N = 0 \in A$ , then for any  $x \in I$ ,  $x^{p^N} = (pN)!\gamma_{pN}(x) = 0$ . Then converse is trivial.  $\square$

### Constructing PD-Structures

**Prop. (5.6.1.9)[ $\mathbb{Z}_{(p)}$ -Algebras].** Cf.[Sta]07GN.  $\lrcorner$

**Prop. (5.6.1.10)[PD-Structure on  $\mathbb{Z}_{(p)}$ -Algebras].** For  $A \in \mathcal{CRing}/\mathbb{Z}_{(p)}$  and  $I \in \text{Ideal}(A)$ , two pd-structures  $\gamma, \gamma'$  on  $I$  are equal iff  $\gamma_p = \gamma'_p$ . Moreover, given any map  $\delta : I \rightarrow I$  s.t.

- $p!\delta(x) = x^p$ ,
- $\delta(ax) = a^p \delta(x)$  for any  $a \in A, x \in I$ ,
- $\delta(x + y) = \delta(x) + \delta(y) + \sum_{i+j=p, i>0, j>0} \frac{1}{i!j!} x^i y^j$ .

Then there exists a unique pd-structure on  $I$  that  $\gamma_p = \delta$ .  $\lrcorner$

*Proof:* Just notice that  $\gamma_n(x) = cx\gamma_{n-1}(x)$  for some  $c$  invertible in  $\mathbb{Z}_{(p)}$ , and also  $\gamma_{pm}(x) = c\gamma_m(\gamma_p(x))$  for some  $c$  invertible in  $\mathbb{Z}_{(p)}$ , thus  $\gamma$  is uniquely determined, and we can also define  $\gamma_n$  inductively in this way, and the verification of axioms is in [Sta]07GS?.  $\square$

**Prop. (5.6.1.11).** Let  $A \in \mathcal{CRing}$  be torsion-free and  $I \in \text{Ideal}(A)$ , then:

- $I$  has at most one pd-structure(5.6.1.1).
- if  $\{\gamma_n : I \rightarrow I\}_{n \in \mathbb{N}}$  are maps, then  $\gamma$  is a pd-structure iff  $n!\gamma_n(x) = x^n$ .
- $I$  has a pd-structure iff there is a set of generators  $\{x_i\}$  of  $I$  that  $x_i^n \in n!I$ .

$\lrcorner$

*Proof:* 1 is clear from(5.6.1.6).

2: because  $A \subset A \otimes_{\mathbb{Z}} \mathbb{Q}$ , we can verify in  $A \otimes_{\mathbb{Z}} \mathbb{Q}$ , then the verifications are trivial.

3: Use the axioms to extend linearly and additively.  $\square$

**Prop. (5.6.1.12) [DVR].** If  $(\mathcal{O}_K, \mathfrak{m}_K)$  is a DVR of characteristic  $(0, p)$ , ramification index  $e$ , then  $\mathfrak{m}_K$  has a pd-structure iff  $e \leq p - 1$ .  $\lrcorner$

*Proof:*  $\mathfrak{m}_K$  has at most one pd-structure by (5.6.1.11). It suffices to show that  $x^n/n!$  is in  $\mathfrak{m}$  for any  $x \in \mathfrak{m}$ . Thus the assertion follows from (2.6.1.33).  $\square$

### Extending PD-Structure

**Def. (5.6.1.13) [Extending PD-Structure].** Let  $(A, I, \gamma)$  be a pd-structure and  $B$  is an  $A$ -algebra, we say that  $\gamma$  extends to  $B$  if  $A \rightarrow B$  extends to a morphism of pd-structures  $(A, I, \gamma) \rightarrow (B, IB, \gamma')$ .

Let  $(A, I), (B, J)$  be two pd-structures and  $B$  is an  $A$ -algebra, then these two pd-structures are said to be compatible iff the pd-structure on  $A$  extends to  $B$  and the pd-structure on  $J$  and  $IB$  coincides, or equivalently, there is a pd-structure on  $IB + J$  compatible with  $IB$  and  $J$ , by (5.6.1.7).  $\lrcorner$

**Prop. (5.6.1.14) [Extendability, Berthlot].** Let  $(A, I)$  is a pd-structure and  $B$  an  $A$ -algebra, if any of the following holds:

- $IB = 0$ ,
- $I$  is principal,
- $B[I] = 0$ , (e.g.  $A \rightarrow B$  is flat).

then  $\gamma$  extends to  $B$ .  $\lrcorner$

*Proof:* 1 is trivial.

2: if  $I = (x)$ , we define  $\gamma_n(bx) = b^n \gamma_n(x)$ . This is well defined: if  $(b - b')x = 0$ , then  $(b^n - (b')^n) \gamma_n(x) = 0$  because  $\gamma_n(x) \in (x)$ . Verifications of axioms is routine.

3: The condition shows  $I \otimes_A B \cong IB$ , thus it suffices to define  $\gamma$  on  $I \otimes_A B$ . For this we define on  $I \times B$  and descend: let  $\gamma_n((x, b)) = b^n \gamma_n(x)$  and extend by freeness and axioms in (5.6.1.1), then it is easy to show it is bi-additive and  $A$ -linear, so descend to  $I \otimes B$  by (3.2.4.13).  $\square$

**Prop. (5.6.1.15) [PD-Structure and Completions].** Let  $(A, I, \gamma)$  be a pd-structure that  $p$  is nilpotent in  $A/I$ , then each  $\gamma_n$  is continuous in the  $p$ -adic topology and extends to a pd-structure  $\hat{\gamma}$  on  $\hat{I}$ .

If moreover  $A$  is a  $\mathbb{Z}_{(p)}$ -algebra, then for  $e$  large,  $p^e A \in I$  is preserved by  $\gamma$  and

$$(\hat{A}, \hat{I}, \hat{\gamma}) = \text{colim}_e (A/p^e A, I/p^e A, \gamma).$$

$\lrcorner$

*Proof:* Let  $p^t \in I$ , then 1 follows from (5.2.3.8).  $\gamma_n$  is clearly continuous, and  $\gamma_n$  preserves  $p^e A$  because

$$\gamma_n(p^e a) = p^n \gamma_n(p^{e-1} a) = \frac{p^n}{n!} p^{n(e-1)} a^n \in p^e A.$$

The limit equation follows from (5.6.1.5).  $\square$

**Prop. (5.6.1.16) [Quotient].** Let  $(A, I, \gamma)$  be a pd-structure and  $\mathfrak{a} \subset A$  is an ideal, and  $I' = I \cap \mathfrak{a}$ , then the following are equivalent:

- $\delta$  extends to  $A/\mathfrak{a}$ .
- $I'$  is preserved by  $\gamma$ .
- There is a set of generator  $x_i$  of  $I'$  that  $\gamma_n(x_i) \in I'$  for all  $n, i$ .

┘

*Proof:*  $1 \rightarrow 2 \rightarrow 3$  is clear.  $2 \rightarrow 1$ : we can just define  $\gamma(x + I) = \gamma(x) + I$ , which is well defined by axiom2 of(5.6.1.1).  $3 \rightarrow 2$  is clear.  $\square$

**Def. (5.6.1.17) [Free PD-Algebra].** For a pd-structure  $(A, I, \delta)$ , the **free pd-algebra**  $A\langle t_1, \dots, t_n \rangle$  is defined to be the  $A$ -algebra generated by symbols  $t_i^{[n_i]}$ , where  $n_i > 0$ , modulo the algebraic relations  $t_i^{[m]} t_i^{[n]} = \binom{m+n}{n} t_i^{[m+n]}$ . Denote by  $A\langle t_1, \dots, t_n \rangle_+$  the ideal generated by  $t_i^{[n_i]}$  where  $n_i > 0$ .

Then the ideal  $J$  generated by  $I$  and  $A\langle t_1, \dots, t_n \rangle_+$ , where  $n_i > 0$  has a unique pd-structure that  $\gamma_n(t_i) = t_i^{[n]}$  and  $(A, I, \delta) \rightarrow (A\langle t_1, \dots, t_n \rangle, J, \gamma)$  is a morphism of pd-structures.

It has a universal property that  $\text{Hom}((A\langle t_1, \dots, t_n \rangle, J, \gamma), (C, K, \varepsilon))$  is the same as  $\text{Hom}((A, I, \delta), (C, K, \varepsilon))$  with specified  $n$  elements in  $K$ .  $\square$

*Proof:* Because  $IA\langle t_i \rangle \cap A\langle t_1, \dots, t_n \rangle_+ = IA\langle t_i \rangle + A\langle t_1, \dots, t_n \rangle_+$ , by(5.6.1.7), it suffices to construct pd-structures on  $IA\langle t_i \rangle$  and  $A\langle t_1, \dots, t_n \rangle_+$ . The former is by(5.6.1.14) and for the latter: if  $A$  is torsion-free, then we can use(5.6.1.11) because  $\gamma_m(x)^n = n! \gamma_n(\gamma_m(x)) = \frac{(mn)!}{(m!)^n} \gamma_{mn}(x) \in n! A\langle t_1, \dots, t_n \rangle_+$ . In general, we write  $A = R/\mathfrak{a}$  where  $R$  is a torsion-free pd-structure(can choose  $\mathbb{Z}\langle A \rangle$ ), so there is a pd-structure on  $R\langle t_i \rangle$ , and  $R\langle t_i \rangle / \mathfrak{a}\langle t_i \rangle = A\langle t_i \rangle$ , then we can use(5.6.1.16) to construct a pd-structure on  $A\langle t_i \rangle$  compatible with that of  $A$ .

The verification of universal property is omitted.  $\square$

### PD-Envelopes

**Prop. (5.6.1.18) [PD-Envelopes].** Let  $(A, I, \gamma)$  be a pd-structure, then there is a **pd-envelope** functor

$$(B, J) \rightarrow (D_B(J), \overline{J}, \overline{\delta})$$

from the the category of pairs over  $(A, I)$  to the category of pd-structures over  $(A, I, \gamma)$  that is left adjoint to the forgetful functor.

In particular, by the universal property of pd-envelope, there is a morphism  $(B, J) \rightarrow (D_B(J), \overline{J}) \rightarrow (B/J, 0)$  of pairs, so in particular  $D/\overline{J} \rightarrow B/J$  is surjective.  $\square$

*Proof:* We use adjoint functor theorem(4.1.1.35), the forgetful functor preserves limit by(5.6.1.5), and it satisfies the set-theoretical condition: for any pair  $(B, J)$  over  $(A, I)$  and a morphism  $\psi : (B, J) \rightarrow (C, K)$  over  $(A, I)$  where  $\varphi : (A, I, \gamma) \rightarrow (C, K, \delta)$  is a pd-morphism, then we can consider the subring  $C' \subset C$  generated by all  $\varphi(A)$ ,  $\psi(B)$  and  $\delta_m(J)$ , and  $K' \subset K \cap C'$  the ideal of  $C'$  generated by  $\varphi(I)$ ,  $\delta_n(\psi(J))$ , then  $|C'| < |A| \otimes |B|^{\aleph_0}$  and its type is bounded by a cardinal, so does  $(C, I)$ .  $\square$

**Prop. (5.6.1.19) [PD-Envelope of Quotients].** Let  $(A, I, \gamma)$  be a pd-structure and  $\varphi : B' \rightarrow B$  be a surjection of  $A$ -algebras with kernel  $K$ . Let  $IB \subset J \subset B$  an ideal and  $J' = \varphi^{-1}(J)$  and  $D_{B', \gamma}(J') = (D', \overline{J}', \overline{\gamma})$ , then  $D_{B, \gamma}(J) = (D'/K', \overline{J}'/K', \overline{\gamma})$  where  $K'$  is the ideal generated by all  $\overline{\gamma}_n(k)$  for  $n \geq 0$  and  $k \in K$ .  $\square$

*Proof:* There is a pd-structure on  $(D'/K', \overline{J}'/K', \overline{\gamma})$  by(5.6.1.16). A map of pairs  $(B, J) \rightarrow (T, I', \gamma)$  is equivalent to a map of pairs  $(B', J') \rightarrow (T, I', \gamma)$  that vanishes on  $K$ , or a map of pd-structures  $(D', \overline{J}', \overline{\gamma}) \rightarrow (T, I', \gamma)$  that vanishes on  $\gamma_n(K)$ , thus this is clearly represented by  $(D'/K', \overline{J}'/K', \overline{\gamma})$ .  $\square$

**Prop. (5.6.1.20).** If  $(A, I, \gamma)$  is a pd-structure and  $(B, J)$  is a pair over  $(A, I)$ , then

$$D_{B[X_i], \gamma}(JB[X_i] + (X_i)) \cong D_{B, \gamma}(J) \langle X_i \rangle.$$

⌋

*Proof:* This follows from the universal property of free pd-structure (5.6.1.17). □

**Prop. (5.6.1.21) [Extension Properties of PD-Envelopes].** Let  $(A, I, \gamma)$  be a pd-structure and  $(B, J)$  is a pair over  $(A, I)$ , then

- For each surjection of pd-structures  $(A, I, \gamma) \rightarrow (A', I', \gamma')$ , let  $B' = B \otimes_A A'$ , then we have

$$D_{B', \gamma'}(JB) = D_{B, \gamma}(J) \otimes_A A'.$$

- If  $B'$  is flat over  $B$ , then we have

$$D_{B', \gamma'}(JB') = D_{B, \gamma}(J) \otimes_B B'.$$

⌋

*Proof:* ? □

### PD-Structures and $\delta$ -Rings

**Lemma (5.6.1.22).** If  $A$  is a  $p$ -torsionfree  $\mathbb{Z}_{(p)}$ - $\delta$ -ring, denote  $\gamma_n(z) = \frac{z^n}{n!}$ . If  $z \in A$  satisfies  $\gamma_p(z) \in A$ , then  $\gamma_n(z) \in A$  for any  $n$ . ⌋

*Proof:* WARNING: this is not an easy consequence of power counting. We first prove for  $n = p^2$ : as  $A$  is a  $\delta$ -ring,  $\delta(\frac{z^p}{p}) \in A$

$$\delta\left(\frac{z^p}{p}\right) = \frac{1}{p} \left( \frac{\varphi(z)^p}{p} - \frac{z^{p^2}}{p^p} \right) = \frac{(z^p + p\delta(z))^p}{p^2} - \frac{z^{p^2}}{p^{p+1}} \in A.$$

The first term is in  $A$  by assumption, thus the second term is also in  $A$ , proving the case for  $n = p^2$ .

Now for general  $n$ , it suffices to prove for  $n = kp$ . But it can be checked that  $\gamma_{nk}(z) = u\gamma_k(\gamma_p(z))$  where  $u$  is a unit. Now by what we just proved, we can use induction hypothesis for  $z = \gamma_p(z)$ , and conclude that  $\gamma_{nk}(z) \in A$ . □

**Prop. (5.6.1.23).** The ring  $C = \mathbb{Z}_{(p)}\{x, \frac{\varphi(x)}{p}\}$  (5.5.4.10) identifies with the pd-envelope  $D = D_{\mathbb{Z}_{(p)}\{x\}}(x) = \mathbb{Z}_{(p)}\{x\}[\{\gamma_n(x)\}]$  where  $\gamma_n(x) = \frac{x^n}{n!}$ . Moreover, it also equals to  $\mathbb{Z}_{(p)}[X_1, X_2, \dots]/(pX_1 - x^p, pX_2 - X_1^p, \dots)$ . ⌋

*Proof:* It suffices to show that the smallest  $\delta$ -ring of  $\mathbb{Z}_{(p)}\{x\}[\frac{1}{p}]$  containing  $\mathbb{Z}_{(p)}\{x\}$  and  $\frac{\varphi(x)}{p}$  is the same as the smallest ring of  $\mathbb{Z}_{(p)}\{x\}[\frac{1}{p}]$  containing  $\mathbb{Z}_{(p)}\{x\}$  and  $\frac{\varphi(x)}{n!}$ .

$D \subset C$  is immediate from (5.6.1.22). To show  $C \subset D$ , notice  $\frac{x^p}{p} \in D$ , it suffices to show  $\varphi$  preserves  $D$ , or equivalently,  $\varphi(y) - y^n \in pD$  for any  $y \in D$ . Now

$$\varphi\left(\frac{x^n}{n!}\right) = \frac{(x^p + p\delta(x))^n}{n!} = \frac{\sum_{i=0}^n \binom{n}{i} (pi)! p^{n-i} \frac{x^{pi}}{(pi)!} \delta(x)^{n-i}}{n!}$$

The coefficients

$$\frac{\binom{n}{i}(pi)!p^{n-i}}{n!}$$

are all in  $p\mathbb{Z}_{(p)}$ , thus  $\varphi(\frac{x^n}{n!}) \in pD$ . On the other hand,

$$(\frac{x^n}{n!})^p = \gamma_p(\gamma_n(x)) = u\gamma_{pn}(x) \cdot p! \in pD$$

where  $u$  is a unit in  $\mathbb{Z}_{(p)}$  by (5.6.1.1), thus we are done.  $\square$

**Lemma (5.6.1.24).** If  $A$  is a  $p$ -torsionfree (equivalently, flat)  $\mathbb{Z}_{(p)}$ -algebra and  $(a, p)$  is a regular sequence in  $A$ , then  $D_A((a)) \cong A \otimes_{\mathbb{Z}_{(p)}\{x\}} D_{\mathbb{Z}_{(p)}}((x)) = A[X_1, X_2, \dots]/(pX_1 - a^p, pX_2 - X_1^p, \dots)$ .  $\square$

*Proof:* By (5.6.1.23),

$$A \otimes_{\mathbb{Z}_{(p)}\{x\}} D_{\mathbb{Z}_{(p)}}((x)) = A \otimes_{\mathbb{Z}_{(p)}\{x\}} [\{\gamma_n(x)\}] = A[X_1, X_2, \dots]/(a^p - pX_1, X_1^p - pX_2, X_2^p - pX_3, \dots)$$

thus there is a natural map from  $A \otimes_{\mathbb{Z}_{(p)}\{x\}} D_{\mathbb{Z}_{(p)}}((x))$  to  $D_A((a))$  given by

$$X_k \mapsto \frac{a^{p^k}}{p^{\text{ord}_p(n!)}} = \frac{a^{p^k}}{p^{1+p+\dots+p^{k-1}}} \in D_A((a)).$$

It is surjective, and it is an isomorphism when inverting  $p$ . Thus the kernel are all  $p^\infty$ -torsions. Then to show it is an isomorphism, it suffices to show  $A[X_1, X_2, \dots]/(a^p - pX_1, X_1^p - pX_2, X_2^p - pX_3, \dots)$  is  $p$ -torsion-free. It is a filtered colimit, so it suffices to show  $A[X_1, \dots, X_n]/(a^p - pX_1, X_1^p - pX_2, \dots, X_{n-1}^p - pX_n)$  is  $p$ -torsionfree.

For this, it suffices to prove  $A' = A[X_1, \dots, X_k]/(px_1 - a^k, px_2 - x_1^k, \dots, px_k - x_{k-1}^p)$  is  $p$ -torsion-free. If we denote  $K(R) = K(R[X_1, \dots, X_n], px_1 - a^k, px_2 - x_1^k, \dots, px_k - x_{k-1}^p)$  for any ring  $R$ , then we have a distinguished triangle

$$K(A) \xrightarrow{p} K(A) \rightarrow K(Kos(A[X_1, \dots, X_k], p)) = K(A/p)$$

as  $A$  is  $p$ -torsionfree. Now we can consider the spectral sequence associated to this distinguished triangle. Notice first that  $(px_1 - a^k, px_2 - x_1^k, \dots, px_k - x_{k-1}^p)$  is a regular sequence in  $A'/p$ , which is clear. So the  $E_1$  page looks like

$$\begin{array}{ccccc} A' & \xrightarrow{p} & A' & \longrightarrow & A'/p \\ \uparrow & & \uparrow & & \uparrow \\ * & \longrightarrow & * & \longrightarrow & 0 \\ \uparrow & & \uparrow & & \uparrow \\ * & \longrightarrow & * & \longrightarrow & 0 \\ \uparrow & & \uparrow & & \uparrow \\ \dots & \longrightarrow & \dots & \longrightarrow & \dots \end{array}$$

and the  $E_2$  page is of the form

$$\begin{array}{ccccc} A'[p] & \xrightarrow{p} & 0 & \longrightarrow & 0 \\ \uparrow & & \uparrow & & \uparrow \\ * & \longrightarrow & * & \longrightarrow & 0 \\ \uparrow & & \uparrow & & \uparrow \\ * & \longrightarrow & * & \longrightarrow & 0 \\ \uparrow & & \uparrow & & \uparrow \\ \dots & \longrightarrow & \dots & \longrightarrow & \dots \end{array}$$

This spectral sequence converges to 0, so  $A'[p] = 0$ , we win.  $\square$

**Prop. (5.6.1.25) [PD-Envelope for Regular Sequence].** Let  $A$  be a  $p$ -torsionfree  $\delta$ -ring and  $p, f_1, \dots, f_r$  define a regular sequence in  $A$ , then  $A\{\frac{\varphi(f_1)}{p}, \dots, \frac{\varphi(f_r)}{p}\}$  identifies with the pd-envelope  $D_A(I)$  of  $I = (f_1, \dots, f_r)$  as a subring of  $A[\frac{1}{p}]$ .  $\lrcorner$

*Proof:* In case  $r = 1$ ,  $A\{\frac{\varphi(f_1)}{p}\} = A \otimes_{\mathbb{Z}_{(p)}\{x\}} \mathbb{Z}_{(p)}\{x, \frac{\varphi(x)}{p}\} = A \otimes_{\mathbb{Z}_{(p)}\{x\}} D_{\mathbb{Z}_{(p)}}((x)) \cong D_A((f_1))$  by (5.6.1.24).

The general case follows from this, by considering the tower

$$\begin{aligned} (A, (f_1)) &\rightarrow (D_A(f_1), (f_2)) = (A\{\frac{\varphi(f_1)}{p}\}, (f_2)) \\ &\rightarrow (D_{A\{\frac{\varphi(f_1)}{p}\}}(f_2), (f_3)) = (A\{\frac{\varphi(f_1)}{p}, \frac{\varphi(f_2)}{p}\}, (f_3)) \\ &\rightarrow \dots = A\left\{\frac{\varphi(f_1)}{p}, \dots, \frac{\varphi(f_r)}{p}\right\} \end{aligned}$$

The equations are true because  $(p, f_k)$  are regular in  $A\{\frac{\varphi(f_1)}{p}, \dots, \frac{\varphi(f_{k-1})}{p}\}$ :

$$\begin{aligned} A\left\{\frac{\varphi(f_1)}{p}, \dots, \frac{\varphi(f_{k-1})}{p}\right\}/p &= A/p[X_{11}, X_{12}, \dots, X_{21}, X_{22}, \dots, \dots, X_{k-1,1}, X_{k-1,2}, \dots]/ \\ &\quad \left(f_1^p, f_2^p, \dots, f_{k-1}^p, X_{11}^p, X_{12}^p, \dots, X_{21}^p, X_{22}^p, \dots, \dots, X_{k-1,1}^p, X_{k-1,2}^p, \dots\right) \end{aligned}$$

and  $f_k$  is a nonzero-divisor in it because it is a non-zero divisor in  $A/(p, f_1^p, \dots, f_{k-1}^p)$ , as  $(p, f_1^p, \dots, f_k^p)$  is also a regular sequence by (5.3.4.4). then a map of pairs of rings  $(A, I) \rightarrow (C, J)$  will lift through this tower uniquely by the universal property of pd-envelop.

then we see  $A\left\{\frac{\varphi(f_1)}{p}, \dots, \frac{\varphi(f_r)}{p}\right\}$  is just the pd-envelop of  $(A, I)$  (5.6.1.18), by the universal property.  $\square$

**Lemma (5.6.1.26).** Let  $A \rightarrow B \in \mathcal{C}\text{Ring}^p$ . If  $(x_1, \dots, x_n) \in B$  is regular w.r.t.  $A$  (5.8.3.7), then  $D_B((x_1, \dots, x_n))$  is  $A$ -flat.  $\lrcorner$

*Proof:* By (5.6.1.23) and base change, it is clear that  $D_B(I)$  is a free  $B/I^p$ -algebra. Thus we need to show that  $B/I^p$  is a flat  $A$ -module. And this is true as the sequence  $x_1^p, \dots, x_n^p$  is also regular w.r.t.  $A$  (5.8.3.8).  $\square$

**Prop. (5.6.1.27) [Flatness of PD-Envelope].** If  $A \rightarrow B$  is a map of simplicial rings,  $A$  is naturally a simplicial pd-structure with  $I_\bullet = pA_\bullet$ , and  $B$  is  $p$ -completely flat over  $A$  (5.8.3.5), and  $(x_1, \dots, x_n) \in \pi_0(B)$  is  $p$ -completely regular w.r.t.  $A$  (5.8.3.7), then the completed pd-envelope  $D = D_B((x_1, \dots, x_n))^\wedge$  is  $p$ -completely flat over  $A$ .  $\lrcorner$

*Proof:* By definition (5.8.3.5), to check it is  $p$ -completely flat, it suffices to check

$$\text{Kos}(A, p) \rightarrow \text{Kos}(A, p) \otimes_A^L D$$

is flat. and by (5.8.3.4) it suffices to check that

$$\pi_0(\text{Kos}(A, p)) \rightarrow \pi_0(\text{Kos}(A, p)) \otimes_A^L D$$

is flat. The formation of pd-envelope commutes with derived base change by universal property, and tensor with  $A/p$ -algebra undoes the completions, so we are reduced to the the case  $A' = \pi_0(Kos(A, p))$  and  $B' = A' \otimes_A^L B$  is flat over  $A'$  and to show that

$$A' \rightarrow D_{B'}((x_1, \dots, x_n))$$

is flat. Notice  $B'$  is a discrete flat  $A'$ -algebra by definition(5.8.3.5), and  $(x_1, \dots, x_n)$  is a sequence in  $B'$  that  $Kos(B, x_1, \dots, x_n)$  is a sequence regular w.r.t.  $A'$ :

$$\begin{aligned} Kos(B, x_1, \dots, x_n) &= Kos(B' = A' \otimes_A^L B, x_1, \dots, x_n) = A' \otimes_A^L Kos(B, x_1, \dots, x_n) \\ &= A' \otimes_{Kos(A, p)}^L Kos(A, p) \otimes_A Kos(B, x_1, \dots, x_n) \\ &= A' \otimes_{Kos(A, p)}^L Kos(B, p, x_1, \dots, x_n) \end{aligned}$$

is flat because  $Kos(A, p) \rightarrow Kos(B, p, x_1, \dots, x_n)$  does by definition(5.8.3.7) and(5.8.3.3). So we are done by(5.6.1.26).  $\square$

**Cor. (5.6.1.28).** If  $A$  is a  $p$ -complete simplicial  $\delta$ -ring and  $B$  is a  $p$ -completely flat simplicial  $\delta$ - $A$ -algebra, and if  $x_1, \dots, x_r \in \pi_0(B)$  is  $p$ -completely regular w.r.t.  $A$ , then

$$C_\bullet = B_\bullet \left\{ \frac{x_1}{p}, \dots, \frac{x_r}{p} \right\}$$

is  $p$ -completely flat over  $A$ .  $\lrcorner$

*Proof:* Let  $C'_\bullet = B_\bullet \left\{ \frac{\varphi(x_1)}{p}, \dots, \frac{\varphi(x_r)}{p} \right\}^\wedge$ , then  $C'_\bullet$  is  $p$ -completely flat over  $A$ , by(5.6.1.25)(? why  $B$  is  $p$ -torsionfree and  $(p, x_1, \dots, x_n)$  is regular sequence) and(5.6.1.27). Now there is a commutative diagram

$$\begin{array}{ccccccc} A & \longrightarrow & A\{x_1, \dots, x_r\} & \longrightarrow & B & \longrightarrow & B\left\{ \frac{x_1}{p}, \dots, \frac{x_r}{p} \right\} \longrightarrow C_\bullet \\ \parallel & & \downarrow \psi & & \downarrow \psi_B & & \downarrow \psi' & \downarrow \psi_C \\ A & \longrightarrow & A\{\varphi(x_1), \dots, \varphi(x_r)\} & \longrightarrow & B' & \longrightarrow & B'\left\{ \frac{\varphi(x_1)}{p}, \dots, \frac{\varphi(x_r)}{p} \right\} \longrightarrow C'_\bullet \end{array}$$

where  $\psi$  is the relative Frobenius and  $\psi_B, \psi_C$  is the derived base change and completed derived base change. Then  $\psi$  is f.f. as it is the base change of the Frobenius on the free  $\delta$ -ring  $\mathbb{Z}\{x_1, \dots, x_r\}$ (5.5.4.10), thus so does  $\psi'$ . Then  $\psi_C$  is  $p$ -completely flat, because it is the completion(use(5.9.7.2)(5.9.7.4)). Now the conclusion follows, by completely f.f. descent(5.9.7.2).  $\square$

## 2 PD-deRham-Complexes

**Def. (5.6.2.1)[Modules of PD-Differentials].** Let  $B$  be an  $A$ -algebra and  $(B, J, \delta)$  be a pd-structure and  $M$  a  $B$ -module, then a **pd- $A$ -derivation** from  $B$  to  $M$  is a an element  $\theta$  of  $\text{Der}_A(B, M)$  that  $\theta(\delta_n(x)) = \delta_{n-1}(x)\theta(x)$  for  $n \geq 1$  and  $x \in J$ .

As in(5.4.3.4), there is a **module of pd-differential**  $\Omega_{B/A, \delta} \in \text{Mod}_A$  with a **universal pd-differential**  $d_{B/A, \delta} : B \rightarrow \Omega_{B/A, \delta}$  s.t.

$$\text{Hom}_B(\Omega_{B/A, \delta}, M)$$

is isomorphic to the set of pd- $A$ -derivations of  $B$  to  $M$ , functorially in  $M$ .  $\lrcorner$

**Prop. (5.6.2.2) [PD-Differential of PD-Envelope].** Let  $(A, I, \gamma)$  be a pd-structure and  $(B, J)$  be a pair over  $(A, I)$ , and let  $D_{B/A, \gamma}(J) = (D, \bar{J}, \bar{\gamma})$  be the pd-envelope, then  $\Omega_{D/A, \bar{\gamma}} = \Omega_{B/A} \otimes_B D$ .  $\lrcorner$

*Proof:* It suffices to show that for any  $M \in \text{Mod}_A$ , the set of  $A$ -derivations  $B \rightarrow M$  is isomorphic to the set of pd- $A$ -derivations  $D \rightarrow M$ .

Let  $D \otimes M$  be the ring that  $M^2 = 0$  and a pd-structure on  $\bar{J} \oplus M$  is given by  $\delta_n(x+m) = \delta_n(x) + \delta_{n-1}(x)m$ . Then a pd- $A$ -derivations  $D \rightarrow M$  is equivalent to a pd-ring map  $(D, \bar{J}) \rightarrow (D \oplus M, \bar{J} \oplus M)$ , and an  $A$ -derivations  $B \rightarrow M$  is also equivalent to a map of pairs  $(B, J) \rightarrow (D \oplus M, \bar{J} \oplus M)$ , thus we are done by the universal property of  $D$ .  $\square$

**Prop. (5.6.2.3).** Let  $B \in \mathcal{C}\text{Ring}/A$  and  $(B, J, \delta)$  be a pd-structure, then

- if  $(B[X], JB[X], \delta')$  is the  $\delta$ -structure extended from that of  $(B, J, \delta)$  as in (5.6.1.14), then

$$\Omega_{B[X]/A, \delta'} = \Omega_{B/A, \delta} \otimes_B B[X] \oplus B[X]dx.$$

- Let  $B\langle x \rangle$  be the free pd-algebra over  $B$  (5.6.1.17), then

$$\Omega_{B\langle x \rangle/A, \delta'} = \Omega_{B/A, \delta} \otimes_B B\langle x \rangle \oplus B\langle x \rangle dx.$$

- Let  $K \subset J$  be an ideal preserved by  $\delta$  and then consider the quotient  $(B' = B/K, \bar{J} = J/K, \bar{\delta})$ , then  $\Omega_{B'/A, \bar{\delta}}$  is quotient of the module  $\Omega_{B/A, \bar{\delta}} \otimes_B B'$  by the  $B'$ -submodule generated by  $dk$  where  $k \in K$ .  $\lrcorner$

*Proof:* These are all somewhat trivial.  $\square$

**Prop. (5.6.2.4) [PD-Differential and Completion].** Let  $A$  be a  $\mathbb{Z}_{(p)}$ -algebra,  $B$  be an  $A$ -algebra and  $(B, J, \delta)$  be a pd-structure and  $p$  is nilpotent in  $B/J$ , then

$$\lim_e \Omega_{B_e/A, \bar{\delta}} = (\Omega_{B/A, \delta})^\wedge = (\Omega_{\widehat{B}/A, \widehat{\delta}})^\wedge.$$

where  $B_e = B/p^e$ .  $\lrcorner$

*Proof:* By (5.6.1.15), the terms make sense. Now by (5.6.2.3) and the observation  $d(p^e) = 0$ , we have  $\Omega_{B_e/A, \bar{\delta}} = \Omega_{B/A, \delta}/p^e = \Omega_{\widetilde{B}/A, \widetilde{\delta}}/p^e$ , thus we are done.  $\square$

**Def. (5.6.2.5) [PD-de Rham Complex].** Let  $\Omega_{B/A, \delta}^i = \wedge^i \Omega_{B/A, \delta}$ , then the surjection  $\Omega_{B/A} \rightarrow \Omega_{B/A, \delta}$  satisfies the condition of (9.2.1.2), thus there is a **pd-de Rham complex**  $\Omega_{B/A, \delta}^\bullet$ .  $\lrcorner$

### PD-Poincaré Lemma

**Lemma (5.6.2.6) [PD-Poincaré Lemma].** Let  $A \in \mathcal{C}\text{Ring}$  and  $P = A\langle X_i \rangle$  is the free PD-algebra over  $A$ , then for any  $A$ -module, the complex

$$0 \rightarrow M \rightarrow M \otimes_A P \rightarrow M \otimes_A \Omega_{P/A, \delta}^\wedge \rightarrow \dots$$

is exact. And if  $D = \widehat{P}$  and let  $\Omega_D^n = \Omega_{P/A, \delta}^n$ , then for any  $p$ -complete  $A$ -module  $M$ , the complex

$$0 \rightarrow M \rightarrow M \widehat{\otimes}_A P \rightarrow M \widehat{\otimes}_A \Omega_{P/A, \delta}^\wedge \rightarrow \dots$$

is exact.  $\lrcorner$

*Proof:* It suffices to show that  $0 \rightarrow M \rightarrow M \otimes_A P \rightarrow M \otimes_A \Omega_{P/A,\delta}^1 \rightarrow \dots$  is homotopic to 0. For this, notice every element of  $\Omega_{P/A,\delta}^n$  is of the form  $\sum P \prod_{j=0}^n dx_{i_0} dx_{i_1} \dots dx_{i_n}$ , so we can let

$$f(\omega) = f(\gamma_{n_{i_0}}(x_{i_0}) dx_{i_0} \wedge \omega) = \gamma_{n_{i_0}+1}(x_{i_0}) \omega$$

where  $\omega$  doesn't divide  $dx_k$  for  $k < i_0$ . Then it can be checked that  $df + fd = \text{id}$ , so we are done.  $\square$

**Prop. (5.6.2.7).** If  $A$  is a ring and  $(B, J, \delta)$  is a pd-structure, and let  $P = B\langle X_i \rangle$  be the free pd-structure (5.6.1.17). Let  $M$  be a  $B$ -module endowed with an integrable connection  $\nabla : M \rightarrow M \otimes_B \Omega_{B/A,\delta}^1$ , then the map of de Rham complexes

$$M \otimes_B \Omega_{B/A,\delta}^* \rightarrow M \otimes_B \Omega_{P/A,\delta}^*$$

is a quasi-isomorphism. And if we denote  $D, D'$  the  $p$ -adic completions of  $B, P$ , and  $\Omega_D, \Omega_{D'}$  the  $p$ -adic completion of  $\Omega_{B/A,\delta}, \Omega_{P/A,\delta}$ , and  $M$  is a  $p$ -complete  $B$ -module endowed with an integrable connection  $\nabla : M \rightarrow M \otimes_D \Omega_D$ , then the map of de Rham complexes

$$M \otimes_D \Omega_D^* \rightarrow M \otimes_{D'} \Omega_{D'}^*$$

is a quasi-isomorphism.  $\square$

*Proof:* Consider the filtration  $F^*$  on  $\Omega_{B/A,\delta}^\bullet$  given by the stupid truncation  $\sigma_{\geq i} \Omega_{B/A,\delta}^\bullet$ , and consider the filtration on  $\Omega_{P/A,\delta}^\bullet$  given by

$$F^*(\Omega_{P/A,\delta}^\bullet) = F^*(\Omega_{B/A,\delta}^\bullet) \wedge \Omega_{P/A,\delta}^\bullet.$$

Notice that we have a split exact sequence

$$0 \rightarrow \Omega_{B/A,\delta}^1 \otimes_B P \rightarrow \Omega_{P/A,\delta}^1 \rightarrow \Omega_{P/B,\delta}^1 \rightarrow 0$$

and  $\Omega_{P/B,\delta}^1$  is free on  $X_i$  over  $B$  (pondering the universal property, this is for the same reason as (5.4.3.7)).

Then we see that  $F^i(\Omega_{P/A,\delta}^\bullet) \rightarrow \Omega_{P/A,\delta}^\bullet$  is termwise split injection for any  $i$ , and the graded is  $\Omega_{B/A,\delta}^i \otimes_B \Omega_{P/B,\delta}^\bullet$ . Thus if we let  $F^i(M \otimes_B \Omega_{P/A,\delta}^\bullet) = M \otimes F^i(\Omega_{P/A,\delta}^\bullet)$ , then the graded is  $M \otimes_B \Omega_{B/A,\delta}^i \otimes_B \Omega_{P/B,\delta}^\bullet$ , which is quasi-isomorphic to  $M \otimes_B \Omega_{B/A,\delta}^i$  by (5.6.2.6). Then the original map is a filtered complexes that induces quasi-isomorphism on gradeds, so it induces a quasi-isomorphism, because it induces an morphism between two convergent spectral sequences, by (4.10.7.6) and (4.10.7.5).  $\square$

## 5.7 Almost Ring Theory

References are [Almost Ring Theory Gabber/Ramero] and [Almost Ring Theory Foundations Gabber/Ramero].

**Notation (5.7.0.1).**

- The setup of almost mathematics is an flat ideal  $I \in \text{Ideal}(R)$  s.t.  $I^2 = I$ . In particular,  $I \otimes I \cong I^2 = I$ .
- Denote  $i : R \rightarrow R/I$ . Then there is a map  $i_* : M \mapsto M_R : \text{Mod}_{R/I} \rightarrow \text{Mod}_R$ , which has a left adjoint  $i^* : N \mapsto N/IN$ , and a right adjoint  $i^! : N \mapsto \text{Hom}(R/I, N)$ .

┘

### 1 Homological Theory

#### Almost Modules

**Prop. (5.7.1.1) [Examples].**

- If  $K \in \text{PerfdField}$ ,  $R = K^0$ ,  $I = K^{00}$ , then  $I$  is flat over  $R$ , because if  $\varpi$  is a pseudo-uniformizer of  $K$  (12.2.8.9), then  $I = (\pi^{\frac{1}{p^\infty}})$ , which is a colimit of free modules thus flat, and  $I^2 = I$  clearly.
- Let  $R \in \mathbb{C}\text{Ring}$  and  $f$  is an arbitrary element with compatible  $p^n$ -th roots, let  $I = (f^{\frac{1}{p^\infty}})$ , then  $I^2 = I$ . To show  $I$  is flat, consider:

$$M_0 \xrightarrow{f^{1-\frac{1}{p}}} M_1 \xrightarrow{f^{\frac{1}{p}-\frac{1}{p^2}}} M_2 \rightarrow \dots \rightarrow M_n \xrightarrow{\frac{1}{p^n}-\frac{1}{p^{n+1}}} M_{n+1} \rightarrow \dots$$

where  $M_i \cong R$ , and  $M = \text{colim } M_i$ , then  $M$  is flat, and there is a map  $M \rightarrow I : 1 \in M_n \rightarrow f^{\frac{1}{p^n}}$ , then this map is surjective, and it is injective: if  $\alpha$  maps to 0, then  $\alpha f^{\frac{1}{p^n}} = 0$ , so  $\alpha p^m f = 0$  for all  $m \geq n$ , and by perfectness of  $R$ ,  $\alpha f^{\frac{1}{p^m}} = 0$ , so in particular,  $\alpha = 0 \in M_{n+1}$ .

┘

**Prop. (5.7.1.2) [The Category of Almost  $R$ -Modules in disguise].** Let  $\mathcal{A} \subset \text{Mod}_R$  be the category of all  $R$ -modules  $M$  that the action  $I \otimes M \rightarrow M$  is an isomorphism (By  $I \otimes I = I$  this is equivalent to  $M = I \otimes N$  for some  $N$ ) then:

- The inclusion  $j_! : \mathcal{A} \rightarrow \text{Mod}_R$  is exact, i.e. the cokernel, kernel of objects in  $\mathcal{A}$  are also in  $\mathcal{A}$ .
- $j_!$  has a right adjoint  $j^* : M \mapsto I \otimes M$ , and the unit map  $N \rightarrow j^* j_! N$  is an isomorphism on  $\mathcal{A}$ .
- $j^*$  has its right adjoint  $j_*(M) = \text{Hom}(I, M)$ , and the counit  $j^* j_* M \rightarrow M$  is an isomorphism on  $\mathcal{A}$ .

┘

*Proof:* 1: an easy consequence of five-lemma.

2: We need to show for  $N \in \mathcal{A}$ ,  $\text{Hom}(N, I \otimes M) \cong \text{Hom}(N, M)$ . Notice there is a distinguished triangle

$$I \otimes M \rightarrow M \rightarrow M \otimes R/I,$$

as  $- \otimes_R^L M$  is a derived functor and  $I$  is flat. So it suffices to show

$$R\text{Hom}_R(N, M \otimes_R^L R/I) = 0 = R\text{Hom}_{R/I}(N \otimes_R^L R/I, M \otimes_R^L R/I).$$

And in fact  $N \otimes_R^L R/I = 0$ , because  $N \otimes_R^L R/I = N \otimes_R^L I \otimes_R^L R/I$ , and  $I \otimes_R^L R/I = I \otimes_R R/I = I/I^2 = 0$  by flatness and hypothesis.

$N \cong j^* j_! N$  is an easy consequence of  $I \otimes I = I$ .

3: The adjointness is just Tor-Hom-adjunction, and for the isomorphism  $I \otimes \text{Hom}(I, M) \cong M$ , as  $I$  is flat, it suffices to prove the stronger result that  $I \otimes_R^L R \text{Hom}(I, M) = M[0]$ . As there is an exact triangle

$$R \text{Hom}(R/I, M) \rightarrow M \rightarrow R \text{Hom}(I, M),$$

so it suffices to show  $I \otimes_R^L R \text{Hom}(R/I, M) = 0$ , because  $I \otimes_R^L M = M$ . But this is because  $I \otimes_R^L R \text{Hom}(R/I, M) = I \otimes_R^L R/I \otimes_R^L R \text{Hom}(R/I, M)$ , and  $I \otimes_R^L R/I = 0$  as before.  $\square$

**Prop. (5.7.1.3)[Category of Almost  $R$ -modules].**

- The image of the functor  $i_* : \text{Mod}_{R/I} \rightarrow \text{Mod}_R$  is a Serre subcategory of  $\text{Mod}_R$ , so the quotient  $\text{Mod}_R^a = \text{Mod}_R / \text{Mod}_{R/I}$  exists by (4.8.3.15),
- The quotient  $q : \text{Mod}_R \rightarrow \text{Mod}_R^a$  admits fully faithful left and right adjoints. In particular,  $q$  preserves all limits and colimits.
- The image of  $i$  is a 'tensor ideal' of  $\text{Mod}_R$ , so the quotient  $\text{Mod}_R^a$  inherits a natural symmetric monoidal  $\otimes$ -product structure.
- There is a functor  $\text{alHom} : (\text{Mod}_R^a)^{\text{op}} \times \text{Mod}_R^a \rightarrow \text{Mod}_R^a : (X, Y) \rightarrow \text{alHom}(X, Y)$  that  $\text{alHom}(X, -)$  is right adjoint to  $- \otimes X$ :

$$\text{Hom}(Z \otimes X, Y) \cong \text{Hom}(Z, \text{alHom}(X, Y)).$$

┘

*Proof:* 1: the image of  $i_*$  is just the category of modules killed by  $I$ , if  $M$  is killed by  $I$ , then subobjects and quotients of  $M$  is killed by  $I$ , and if  $M$  is an extension of two elements killed by  $I$ , then  $IM = I^2M = 0$ .

2: In fact we show that the category  $\mathcal{A}$  in (5.7.1.2) and the functor  $j^*$  is just equivalent to  $\text{Mod}_R^a$ : First:  $j^*(\text{Mod}_{R/I}) = 0$ , because  $I \otimes M = I \otimes_R R/I \otimes_{R/I} M = I/I^2 \otimes_{R/I} M = 0$  as  $I = I^2$ , and  $j^*$  is exact because  $I$  is flat.

And for any  $R$ -module  $M$ , consider  $I \otimes M \rightarrow M$ , it has kernels and cokernels, then tensoring  $I$ , it becomes  $I \otimes M \rightarrow I \otimes M$  (5.7.0.1). as  $I$  is flat, the kernel and cokernels are killed by  $I$ , so for any functor  $q$  to another category that kills  $\text{Mod}_{R/I}$ ,  $q(M) = q(I \otimes M) = qj_!j^*(M)$ , so  $q$  factors through  $M$ , uniquely, as  $j^*$  is surjective.

Now the left/right adjoints exist by (5.7.1.2).

3: if  $IM = 0$ , then  $IM \otimes N = 0$ , so the tensor products pass to the quotient, and  $j^*$  is a map between symmetric monoidal categories.

4:  $\text{alHom}$  is defined by  $\text{alHom}(j^*M, j^*N) = j^*(\text{Hom}(M, N)) = \text{Hom}(M, N)^a$ . This is well defined, because if  $IM = 0$  or  $IN = 1$ , then  $I \text{Hom}(M, N) = 0$ .  $\square$

**Cor. (5.7.1.4).**

- $i^* j_! = 0$ .
- $i^! j_* = 0$ .
- $j^* i_* = 0$ , and the kernel of  $j^*$  is just  $i_*(\text{Mod}_{R/I})$ .

┘

*Proof:* 1:  $R/I \otimes I \otimes M = 0$ , because  $I \otimes R/I = 0$ .  
 2:  $\text{Hom}(R/I, \text{Hom}(I, M)) = 0$ , because  $I \otimes R/I = 0$ .  
 3: This is by 2 of the proposition(5.7.1.3).  $\square$

**Remark(5.7.1.5).** The construction above can be summarized as the following diagram:

$$\text{Mod}_{R/I} \begin{array}{c} \xleftarrow{i^*} \\ \xrightarrow{i_*} \\ \xleftarrow{i^!} \end{array} \text{Mod}_R \begin{array}{c} \xleftarrow{j^!} \\ \xrightarrow{j^*} \\ \xleftarrow{j_*} \end{array} \text{Mod}_R^a$$

with four adjoint pair and three vanishing. This should be seen as an analogy of the case of topology:  $X$  is a space and  $i : U \rightarrow X$  is open in  $X$ , and  $j : Z \rightarrow X$  is closed,  $Z = X - U$ , then the defined sheaf operations are the same as written above.

However, one should not consider  $\text{Mod}_R^a$  as the sheaf of modules on the open subscheme  $\text{Spec } R_f$  for some pseudo-uniformizer, because the map  $M \rightarrow M \otimes R_f$  factors through  $\text{Mod}_R^a$  as it vanishes on  $\text{Mod}_{R/I}$ , but it is not  $\text{Mod}_{R/I}^a$ . For example, if  $k$  is a perfect field, and consider  $R = k[t^{\frac{1}{p^\infty}}]$ , then the module  $M = R/(t)$  is also killed by  $\otimes R_f$ , but it is not killed by  $I$ .

Then one may consider it is the category of Qco sheaves on  $D(I)$ , but first this is not an affine scheme, and second this is false, anyway. And we should imagine an non-existent open subscheme  $\overline{U}$  bigger than  $U$ , as it contains any affine opens of  $U$ .  $\lrcorner$

**Remark(5.7.1.6).** Notice  $j^*$  is both left exact and right exact, so it preserves both arbitrary limits and colimits, so almostification nearly loses anything. In particular, the category  $\text{Mod}_R^a$  has all colimits and limits.  $\lrcorner$

**Def.(5.7.1.7)[Almost Commutative Algebras].** As  $\text{Mod}_R^a$  has a symmetric monoidal structure, it is possible to define the category of **almost commutative algebras** as the category of commutative unitary monids in  $\text{Mod}_R^a$ , denoted by  $\mathcal{C}\text{Ring}_R^a$ . Notice that its unit object is  $I = R^a$ .

There is an obvious map

$$(-)^a : \mathcal{C}\text{Ring}_R \rightarrow \mathcal{C}\text{Ring}_R^a,$$

and yet another functor

$$(-)_* : \mathcal{C}\text{Ring}_R^a \rightarrow \mathcal{C}\text{Ring}_R,$$

because  $M \rightarrow M_*$  is lax symmetric monoidal, i.e. there are natural map  $M_* \otimes N_* \rightarrow (M \otimes N)_*$ . This is a right adjoint of  $(-)^a$ , as  $j^*$  and  $j_*$  is adjoint.

Finally there is a functor

$$(-)_{!!} : \mathcal{C}\text{Ring}_R^a \rightarrow \mathcal{C}\text{Ring}_R,$$

whose construction is a little complicated, first notice the functor  $(-)_!$  preserves multiplication but it has no units, so in order to give it a unit, consider the module pushout:  $(A_! \oplus V)/I$ , which has a natural multiplicative structure that can be made into a  $R$ -module, and  $(-)_!$  is left adjoint to  $(-)^a$ , Cf.[Almost Ring Theory P22].  $\lrcorner$

**Prop.(5.7.1.8).**  $(-)_!$  preserves faithfully flatness.  $\lrcorner$

*Proof:* Cf.[Almost Ring theory P52] ?  $\square$

**Def.(5.7.1.9).** For an almost commutative algebra  $A$ , a **left module** is an almost module  $M \subset \text{Mod}_R^a$  that has a left action  $A \otimes M \rightarrow M$  that has natural commutative diagrams as one expects. And for any  $R$ -algebra  $A$ , there are natural maps  $\text{Mod}_A \rightarrow \text{Mod}_A^a$ .  $\lrcorner$

## Almost Homological Algebra

### 2 Almost Commutative Algebra

**Def. (5.7.2.1)[Almost Notations].** Given a  $R$ -module  $M$ , an element  $f \in M$  is called **almost zero** if  $I \cdot f = 0$ , and  $M$  is called **almost zero** if all  $f \in M$  is almost zero.

Denote

$$M^a = j^* M \in \text{Mod}_R^a, \quad M_* = j_* M^a = \text{Hom}(I, M), \quad M_{\dagger} = j_{\dagger} M^a = I \otimes M.$$

Then there are morphisms  $M_{\dagger} \rightarrow M \rightarrow M_*$ , which becomes isomorphisms after almostification.  $\lrcorner$

**Prop. (5.7.2.2).** If  $I = (f^{\frac{1}{p^\infty}})$ , then  $M_* = \{x \in M[f^{-1}] \mid f^{\frac{1}{p^n}} x \in A\}$  for all  $n$ .  $\lrcorner$

**Prop. (5.7.2.3).** If  $M \rightarrow N$  is almost surjective maps of  $K^0$ -algebras that  $M/I \rightarrow N/I$  is surjective, then  $M \rightarrow N$  is surjective.  $\lrcorner$

*Proof:* As  $I$  is flat over  $K^0$ , if  $M \rightarrow N \rightarrow Q \rightarrow 0$  is the cokernel, tensoring  $A/I$ , as  $M/I \rightarrow N/I$  is surjective,  $Q/IQ = 0$ , but  $Q$  is almost zero thus  $IQ = 0$ , so  $Q = 0$ .  $\square$

**Def. (5.7.2.4)[Almost Properties].** Something is called **almost XXX** if it is XXX when passed to the category of almost  $R$ -modules. For example,

- elements of  $M_*$  are called **almost elements** of  $M$ .
- $M$  is called **almost flat** iff  $M^a \otimes -$  is exact on  $\text{Mod}_R^a$ , equivalently,  $\text{Tor}_{>0}^R(M, N)$  is almost zero for all  $N$ .
- $M$  is called **almost projective** iff  $\text{alHom}(M, -)$  is exact on  $\text{Mod}_R^a$ , which is equivalent to  $\text{Ext}_R^{>0}(M, N)$  is almost zero for all  $N$ .  
Notice this is not equivalent to projective in  $\text{Mod}_R^a$ , because  $R$  is almost projective, but  $\text{Hom}_{R^a}(R^a, M^a) = \text{Hom}(I, M)$  is not exact as  $I$  is not projective:  $\text{Ext}_{R^a}^1(R^a, R^a) = \text{Ext}_R^1(I, R) = \text{Ext}^2(k, R)$ , which is not 0 if  $R$  is the valuation ring of a non-spherically complete perfectoid field  $K$ , like  $\widehat{\mathbb{Q}_p}$ ?.
- $M$  is called **almost finitely generated/almost finitely presented** if for any  $\varepsilon \in I$ , there is a f.g./f.p.  $M_\varepsilon \rightarrow M$  with  $N_\varepsilon$  generators that the kernel and cokernel are killed by  $\varepsilon$ . It is called **uniformly almost finitely generated** iff  $N_\varepsilon$  is independent of  $\varepsilon$ .  
Notice this definition doesn't depends on  $M$  chosen?.
- If  $\text{char } S > 0$ ,  $S$  is called **almost perfect** iff  $S_*$  is perfect.  $\lrcorner$

**Prop. (5.7.2.5)[Enough Almost Injectives].** The category  $\text{mod}_R^a$  has enough injectives. In fact  $j^*, j_*$  both preserves injectives, because they has exact left adjoints, so  $I$  is injective  $R$ -module iff  $I^a$  is injective  $R^a$ -module, and  $J$  is injective  $R^a$ -module iff  $J_*$  is injective  $R$ -module. So to construct an injective resolution in  $R^a$ , pass to  $R$ -modules using either  $(-)_*$  or  $(-)_{\dagger}$  and find an injective resolution, then almostificate it.  $\lrcorner$

**Prop. (5.7.2.6)[Derived Functors of  $(-)_*$ ].** Notice that  $\text{Hom}_{R^a}(M^a, N^a) = \text{Hom}_R(I \otimes M, N)$  by adjointness, so using (5.7.2.5),

$$\text{Ext}_{R^a}^k(M^a, N^a) = \text{Ext}_R^k(M_*, N) = \text{Ext}_R^k(M, R \text{Hom}(I, N)),$$

then as  $M_* = \text{Hom}(I, M)$ , the derived functor of  $(-)_*$  is just  $\text{Ext}_R^k(I, M) = \text{Ext}_{R^a}^k(R^a, M^a)$ .

Notice that  $\text{Ext}_{R^a}^k(M, N)$  are all almost zero, as  $j^a j_* = \text{id}$ , and use trivial Grothendieck spectral sequence.  $\perp$

**Prop. (5.7.2.7) [(Example) A Quadratic Extension of a Perfectoid Field].** If  $K = \widehat{Q_p[p^{\frac{1}{p^\infty}}]}$  and  $L = K(\sqrt{p})$  with  $p \neq 2$ , then  $L^0$  is a uniformly almost f.p. projective  $K^0$ -module.  $\perp$

*Proof:* It suffices to find for each  $n$  a  $K^0$ -module  $R_n$  of rank 2 that  $R_n \rightarrow L^0$  is injective with cokernel annihilated by  $p^{\frac{1}{p^n}}$ . For this, consider  $R_n = K^0 \oplus K^0 p^{\frac{1}{2p^n}}$ , then  $L^0 = \widehat{\text{colim}_n R_n}$ .

Notice that the cokernel of  $R_n \rightarrow R_{n+1}$  is killed by  $p^{\frac{1}{p^n}}$ , because

$$p^{\frac{1}{p^n}} \cdot p^{\frac{1}{2p^{n+1}}} = p^{\frac{(p+1)/2}{p^{n+1}}} \cdot p^{\frac{1}{2p^n}} \subset R_n.$$

So by killing one by one, the cokernel of  $R_n \rightarrow \text{colim}_n R_n$  is killed by any  $p$ -power with power larger than  $\sum \frac{1}{p^n}$ , in particular by  $p^{\frac{1}{p^{n-1}}}$ . So  $\text{colim}_n R_n$  is an extension of  $R_0$  by a cokernel killed by  $p$ , so it is also  $p$ -adically complete, and  $L^0 = \text{colim}_n R_n$ . Now Consider  $0 \rightarrow R_n \rightarrow \text{colim}_n R_n \rightarrow \text{Coker}$ , then  $\text{Ext}^n(\text{colim}_n R_n, N) = \text{Ext}^n(\text{Coker}, N)$  is killed by  $p^{\frac{1}{p^{n-1}}}$  for all  $n$ , so it is killed by  $I$ , thus  $\text{colim}_n R_n$  is almost projective.  $\square$

### Completions and Closures

**Prop. (5.7.2.8) [prc and Completion].** If  $A$  is a ring with a nonzero-divisor  $f$  that  $A \subset A[f^{-1}]$  is  $p$ -root closed(prc), then:

- $\widehat{A} \subset \widehat{A}[f^{-1}]$  is  $p$ -root closed.
- If  $f$  admits a compatible  $p$ -power roots, then  $A_* \subset A_*[f^{-1}]$  is  $p$ -root closed (where almost mathematics is performed w.r.t  $(f^{\frac{1}{p^\infty}})$ ).  $\perp$

*Proof:* We first replace  $A$  with its maximal separated quotient  $A/(\cap_n f^n A = I)$ :  $f$  is still non-zero-divisor, because if  $fg \in I$ , then  $fg \in f^n A$  for all  $n$ , so  $g \in f^{n-1} A$  as  $f$  is non-zero-divisor. And it is  $p$ -root closed, because if  $a^p \in A/I[f^{-1}]$ , then  $a^p = b + f^{-c}d$  for  $c$  integer and  $d \in I$ . Notice  $I = fI = f^c I$  by (5.2.2.16), so  $f^{-c}d \in I$  as well, so  $a \in A$ .

Now  $A$  is  $f$ -separated, in particular,  $A \hookrightarrow \widehat{A}$ .

1: If  $g \in \widehat{A}[f^{-1}]$  and  $g^p \in \widehat{A}$ , then  $f^N g \in \widehat{A}$  for some  $N$  and choose a  $m \geq N(p-1)$ , then by the density,  $g = g_0 + f^m g_1$  for some  $g_0 \in A[f^{-1}]$ ,  $g_1 \in \widehat{A}$ . Notice  $f^N g_0 \in \widehat{A}$ , now

$$g^p = g_0^p + p g_0^{p-1} f^m g_1 + \dots + (f^m g_1)^p,$$

By definition of  $m$ , all terms except  $g_0^p$  are in  $\widehat{A}$ , so  $g_0^p \in A$ , so  $g_0 \in A$ , and  $g \in \widehat{A}$ .

2: Use the convention (5.7.2.2), if  $g \in A_*[f^{-1}]$  that  $g^p \in A_*$ , then  $f^{\frac{1}{p^n}} g^p \in A$  for all  $n$ , so  $(f^{\frac{1}{p^{n+1}}} g)^p \in A$ , thus  $f^{\frac{1}{p^{n+1}}} g \in A$ , hence  $g \in A_*$ .  $\square$

**Prop. (5.7.2.9) [ic and Completion].** Let  $A$  be a ring with a non-zero-divisor  $f$ , if  $A \subset A[f^{-1}]$  is integrally closed, then:

- $\widehat{A} \subset \widehat{A}[f^{-1}]$  is integrally closed.
- If  $f$  admits a compatible  $p$ -power roots, then  $A_* \subset A_*[f^{-1}]$  is integrally closed (where almost mathematics is performed w.r.t  $(f^{\frac{1}{p^\infty}})$ ).

┘

*Proof:* We first replace  $A$  with its maximal separated quotient  $A/(\cap_n f^n A = I)$ :  $f$  is still non-zero-divisor and  $I$  is  $f$ -divisible as in the proof of (5.7.2.8). And it is integrally closed, because if  $g$  satisfies a monic polynomial  $h(X) \in A/I[f^{-1}][X]$ , then choose a lifting,  $h(g) \in I[f^{-1}] = I \subset A$ , so  $g$  is integral over  $A$  thus  $g \in A$ , and  $g \in A/I$ . Now  $A$  is  $f$ -separated and  $A \hookrightarrow \hat{A}$ .

1: If  $g \in \hat{A}[f^{-1}]$  satisfies a polynomial  $H \in \hat{A}[X]$ , then  $g = f^{-c}h$  for  $h \in \hat{A}$ , and then  $h$  satisfies a polynomial  $H(f^c x)$ , and choose an approximation of coefficients of  $H(x)$  and  $h_0$  of  $h \bmod f^{cn}$ , then it is clear that  $H(f^c h_0) \in f^{cn} \hat{A} \cap A = f^{cn} A$ , so when dividing back,  $g_0 = f^{-c} h_0$  is integral over  $A$  thus  $g_0 \in A$ , thus  $h_0 \in f^c A$ , and  $h \equiv h_0 \bmod f^{cn}$ , thus  $h \in f^c \hat{A}$ , and  $g \in A$ .

2: Use the convention (5.7.2.2), if  $g \in A_*[f^{-1}]$  is integral over  $A_*$ , then there are polynomial  $H$  that  $H(g) = 0$ , now if  $\varepsilon = f^{\frac{1}{p^k}}$  consider another polynomial  $H(x/\varepsilon)$ , then its coefficients are all in  $A$ , thus  $\varepsilon g$  is integral over  $A$  thus  $\varepsilon g \in A$ , and then  $g \in A_*$ .  $\square$

**Prop. (5.7.2.10) [tic and Completion].** Let  $A$  be a ring with a non-zero-divisor  $f$  that admits a compatible system of  $p$ -power roots  $f^{\frac{1}{p^n}}$  for all  $n > 0$ , and  $A$  is totally integrally closed(tic) in  $A[f^{-1}]$ , then  $\hat{A}$  is totally integrally closed in  $\hat{A}[f^{-1}]$  and  $A = A_*$ .  $\square$

*Proof:* 1: Notice totally integrally closed is  $p$ -root closed, so  $\hat{A} \subset \hat{A}[f^{-1}]$  is  $p$ -root closed. Now if  $f^k g^{\mathbb{N}} \subset \hat{A}$  for some  $k$ , then by prc,  $f^{\frac{k}{p^n}} g \in \hat{A}$  for all  $n$ , thus  $g$  in an almost zero element in  $\hat{A}[f^{-1}]/\hat{A} \cong A[f^{-1}]/A$ , and then  $g$  is totally integrally closed over  $A$ , because for any  $n$ , let  $n < p^k$ , then  $f^{\frac{1}{p^k}} g \in A$ , thus  $f^{\frac{n}{p^k}} g \in A$ , and  $fg^n \in A$ .

2: Because  $f^{\frac{1}{p^k}} A_* \subset A$  by convention (5.7.2.2), clearly  $A_*$  is totally integrally closed in  $A$ , thus  $A_* \subset A$ .  $\square$

### Almost Étale Map

**Def. (5.7.2.11).** A map  $A \rightarrow B \in \mathcal{C}\text{Ring}_R$  is called **almost étale** iff:

- $B$  is almost f.p. projective over  $A$ .
- (Unramifiedness (5.4.6.10)) There exists a diagonal idempotent  $e \in (B \otimes_A B)_*$ . i.e.  $e^2 = e$  and  $\mu_*(e) = 1$ , and  $\ker(\mu)_* \cdot e = 0$ , where  $\mu : B \otimes_A B \rightarrow B$  is the multiplication map.

┘

**Prop. (5.7.2.12) [Example of Almost Étale Maps].** Let  $K = \widehat{Q_p[p^{\frac{1}{p^\infty}}]}$  and  $L = K(\sqrt[p]{p})$  with  $p \neq 2$ , then  $L^0/K^0$  is uniformly almost f.p projective  $K^0$ -module, by (5.7.2.7). We show it is finite étale: flatness is clear, as  $L^0/K^0$  is torsion-free and  $K^0$  is a valuation ring and use (5.7.3.3).

For unramifiedness, notice that

$$L \otimes_K L \cong L \times L : (a, b) \mapsto (ab, a\sigma(b)).$$

by (3.2.8.8), the diagonal idempotent  $e$  is given by

$$e = \frac{1}{2p^{\frac{1}{2p^n}} \otimes 1} (1 \otimes p^{\frac{1}{2p^n}} + p^{\frac{1}{2p^n}} \otimes 1)$$

for any  $n \geq 0$ , then we see  $p^{\frac{1}{p^n}} e \in L^0 \otimes_{K^0} KL^0$  for all  $n$ , thus  $e \in (L^0 \otimes_{K^0} L^0)_*$ .  $\square$

**Lemma (5.7.2.13)** [Lemma for Almost Purity in Characteristic  $p$ ]. If  $\eta : R \rightarrow S$  is an integral map of perfect rings. If  $\eta[t^{-1}]$  is finite étale for some  $t \in R$ , then  $\eta$  is almost finite étale w.r.t the ideal  $I = (t^{\frac{1}{p^\infty}})$ .  $\lrcorner$

*Proof:* Firstly, we may assume  $R, S$  are both  $t$ -torsion-free, because the  $t$ -torsion part  $R[t^\infty]$  and  $S[t^\infty]$  is almost zero: if  $t^c \alpha = 0$ , then  $t^c \alpha^{p^n} = 0$ , so  $t^{\frac{c}{p^n}} \alpha = 0$ . So we reduce to  $R/R[t^\infty] \rightarrow S/S[t^\infty]$ , which doesn't change anything.

Now we reduce to the case that  $R, S$  are integrally closed in  $R[t^{-1}]$  and  $S[t^{-1}]$ : it suffices to show that  $R_{int} \subset R_*$ , thus they are almost isomorphic. For this, an element  $f \in R_{int}$  satisfies  $f^{\mathbb{N}} t^k \in R$  for some  $k$ , so by perfectness,  $f t^{\frac{k}{p^n}} \in R$  for all  $n$ , so  $f \in R_*$ .

Now check unramifiedness: let  $e \in (S \otimes_R S)[t^{-1}]$  be a diagonal idempotent, then  $t^c e \in S \otimes_R S$  for some  $c$ , now  $e^2 = e$ , so easily  $e \in (S \otimes_R S)_*$ .

Now check almost finite projective: for  $m > 0$ , represent  $t^{\frac{1}{p^m}} e = \sum a_i \otimes b_i \in S \otimes_R S$ , then use the map  $S \xrightarrow{\alpha} R^n \xrightarrow{\beta} S$  as in (5.4.7.14), then  $\beta \alpha = t^{\frac{1}{p^m}}$  on  $S$ , as  $S$  is  $t$ -torsion free,  $R^n \rightarrow S$  is injective with  $t^{\frac{1}{p^m}}$ -torsion cokernel, for any  $m$ . So  $S$  is almost finite projective.  $\square$

**Prop. (5.7.2.14)** [Almost Purity in Characteristic  $p$ ]. If  $R \in \text{Perfd}_p$ , then using the almost mathematics w.r.t.  $I = (t^{\frac{1}{p^\infty}})$ ,  $S \rightarrow S_*[t^{-1}]$  gives an isomorphism of categories:  $R_{af\acute{e}t} \cong R[t^{-1}]_{f\acute{e}t}$ .  $\lrcorner$

*Proof:* As in the proof of (5.7.2.13), we may assume  $R$  is  $t$ -torsion-free. Notice that any integral extension of  $R[t^{-1}]$  comes from an integral extension of  $R$  (choose the integral closure), so the lemma above (5.7.2.13) tells us the functor is essentially surjective.

Now we construct an inverse functor,  $S_*[t^{-1}]$  maps to  $T^a$ , where  $T$  is the integral closure of  $R$  in  $S_*[t^{-1}]$ . By lemma (5.7.2.15) below,  $S$  is almost perfect. So  $S_*$  is  $t$ -torsion-free, as if  $t^c f = 0$ , then  $t^{\frac{c}{p^n}} f = 0$  for all  $n$ , so  $f = 0 \in (S_*)_* = S_*$ . So now  $S_* \subset S_*[t^{-1}]$ . Clearly  $T$  is also perfect and  $t$ -torsion-free. So  $R \rightarrow T$  is an integral extension that is identified with  $R[t^{-1}] \rightarrow S_*[t^{-1}]$  after inversion of  $t$ .

To show that  $T^a = S$ , it suffices to show  $T_* = S_*$ . for  $f \in T$ ,  $f^{\mathbb{N}}$  spans a finite module of  $T[t^{-1}] = S_*[t^{-1}]$ , so  $t^c f^{\mathbb{N}} \subset S_*$ , then by perfectness,  $f \in (S_*)_* = S_*$ , so  $T_* \in S_*$ . Conversely, if  $g \in S_*$ , then  $tg^{\mathbb{N}}$  lies in a f.g.  $R$ -module of  $S_*[t^{-1}]$ , by almost f.g.. So  $t^c g^{\mathbb{N}} \subset T$ , and then by perfectness  $g \in T_*$ .  $\square$

**Lemma (5.7.2.15)**. Almost finite étale map of rings of char  $p$  is almost relatively perfect.  $\lrcorner$

*Proof:* Cf. [Bhatt notes on Perfectoid Spaces P28].  $\square$

### 3 Almost Mathematics on Perfectoid Fields

**Prop. (5.7.3.1)** [Almost Elements]. If  $K \in \text{PerfdField}$ ,  $R = K^0$ ,  $I = K^{00}$  and  $M \in \text{Mod}_R$ , then

- If  $M$  is torsion-free, then  $M_* = \{m \in M \otimes_{K^0} K \mid Im \in M\} = \{m \in M \otimes_{K^0} K \mid t^{\frac{1}{p^n}} m \in M\}$ , by (12.2.8.12) and (5.7.2.2).
- $I_* = R_* = R$ . More generally, for an ideal  $J \subset R$ , let  $c = \sup\{|x| \mid x \in J\}$ , then  $J_* = \{a \in K, |a| \leq c\}$ .

$\lrcorner$

**Prop. (5.7.3.2).** Let  $K$  be a perfectoid field with a pseudo-uniformizer  $\varpi$ . If  $\alpha : M \rightarrow N$  is an almost surjective map of  $K^0$ -algebras that  $M$  is  $\pi$ -adically separated and  $N$  is  $\pi$ -torsion-free that  $\alpha \bmod \pi$  is an almost isomorphism, then  $\alpha$  is an almost isomorphism.  $\square$

*Proof:* We may replace  $N$  with the image of  $\alpha$  as to assume  $\alpha$  is surjective. Now if  $L = \ker \alpha$ , then the  $\pi$ -torsion-freeness of  $N$  shows  $L/\pi$  is the kernel of  $(\alpha \bmod \pi)$ , and  $L/\pi$  is almost zero, thus  $L$  is almost  $\pi$ -divisible, but it is also  $\pi$ -separated, thus it is almost zero (using  $t \sum_i \frac{1}{p^{a_i}} m \in \cap_n t^n L$ ).  $\square$

**Prop. (5.7.3.3) [Almostification and Completeness].** Let  $K$  be a perfectoid field with a pseudo uniformizer  $t$  and  $R = K^0, I = K^{00}$ , let  $M \in \text{Mod}_R^a$ , then:

- $M$  is almost flat iff  $M_*$  is  $R$ -flat iff  $M_!$  is  $R$ -flat.
- Assume  $M$  is almost flat, then  $M$  is  $t$ -adically complete iff  $M_*$  does.
- Assume  $M$  is almost flat, then for each  $f \in K^0$ ,  $fM_* \cong (fM)_*$ , and  $M_*/fM_* \subset (M/fM)_*$ . And for any  $\varepsilon \in I$ , the image of  $(M/f\varepsilon M)_*$  and  $M_*/fM_*$  in  $(M/fM)_*$  are identical.

$\square$

*Proof:* 1:  $R$  is a valuation ring, so  $M_*$  is  $R$ -flat iff  $M_*[t]$  is flat by (5.4.1.12), as  $t$  is a pseudo uniformizer. As  $(-)_*$  is left exact,  $M_*[t] = (M[t])_*$ , so if  $M$  is almost flat, then  $M[t] = 0$  as  $t$  is nonzero-divisor, so  $M_*$  is  $R$ -flat. The converse is true as  $M = (M_*)^a$ , and the tensor is compatible.

For  $(-)_!$ , this follows from the observation that  $(-)_!$  and  $(-)^a$  are both exact and commute with tensor products, and notice  $M_! \otimes N = (M \otimes N^a)_!$ .

2: As  $(-)^a$  commutes with all limits and colimits, if  $M_*$  is  $t$ -adically complete then so does  $M = (M_*)^a$ . Conversely, if  $M$  is  $R$ -flat and  $t$ -adically complete, then  $M_!, M_*$  are also  $R$ -flat, and consider the commutative diagram:

$$\begin{array}{ccc} M_! & \xrightarrow{a} & \lim(M/t^n M)_! = \lim M_!/t^n M_! = \widehat{M_!} \\ \downarrow d & & \downarrow b \\ M_* & \xrightarrow{c} & \lim(M/t^n M)_* \end{array}$$

then  $d$  is almost isomorphism by (5.7.1.2) and so does  $b$  because  $(-)^a$  commutes with all limits, and  $c$  is an isomorphism as  $(-)_*$  commutes with limits and  $M$  is  $t$ -adically complete. So  $a$  is also almost isomorphism.

Now notice  $M_!$  is flat hence  $t$ -torsion-free, so the kernel of  $a, d$  must be 0, with almost zero cokernels. Now (5.2.3.9) shows first  $M_!$  is complete and next  $M_*$  is complete.

3: Notice  $(fM_*)^a = fM$  as  $(-)^a$  is exact, so

$$(fM)_* = \text{Hom}(I, fM_*) = \{y \in M_*[t^{-1}] \mid Iy \subset fM_*\} = f\{y \in M_*[t^{-1}] \mid Iy \subset M_*\} = fM_*$$

and  $M_*/fM_* \subset (M/fM)_*$  follows from the left exactness of  $(-)_*$ .

For the last assertion, consider the commutative diagram

$$\begin{array}{ccccccc} 0 & \longrightarrow & M & \xrightarrow{f} & M & \longrightarrow & M/fM \longrightarrow 0 \\ & & \downarrow & & \downarrow & & \parallel \\ 0 & \longrightarrow & M/\varepsilon M & \xrightarrow{f} & M/f\varepsilon M & \longrightarrow & M/fM \longrightarrow 0 \end{array}$$

and apply  $(-)_* = \text{Hom}_{R^a}(R^a, -)$  and use (5.7.2.6), then

$$\begin{array}{ccccccc} 0 & \longrightarrow & M_*/fM_* & \xrightarrow{a} & (M/fM)_* & \longrightarrow & \text{Ext}_{R^a}^1(R^a, M)[f] \longrightarrow 0 \\ & & \downarrow & & \parallel & & \downarrow c \\ 0 & \longrightarrow & (M/f\varepsilon M)_* & \xrightarrow{b} & (M/fM)_* & \longrightarrow & \text{Ext}_{R^a}^1(R^a, M/\varepsilon M) \end{array}$$

To show  $a, b$  has the same image, it suffices to show that  $c$  is injective. For this, it suffices to show  $\text{Ext}_{R^a}^1(R^a, M) \rightarrow \text{Ext}_{R^a}^1(R^a, M/\varepsilon M)$  is injective. Consider the exact sequence  $0 \rightarrow M \xrightarrow{\varepsilon} M \rightarrow M/\varepsilon M \rightarrow 0$ , it suffices to show that  $\varepsilon \text{Ext}_{R^a}^1(R^a, M) = 0$ , and this is obvious as  $\varepsilon \in I$  (5.7.2.6).  $\square$

**Prop. (5.7.3.4)[General Completeness and Almostification].** More generally, if  $J = (f_1, \dots, f_r) \subset R$  is a f.g. ideal, then an  $R^a$ -module  $M$  is  $J$ -adically complete iff  $M_*$  does.  $\lrcorner$

*Proof:* Cf.[Perfectoid Spaces Bhatt P32].  $\square$

### Banach Space

**Prop. (5.7.3.5)[Uniform Banach  $K$ -Algebra].** If  $K \in \text{PerfdField}$  with a pseudo uniformizer  $t$ , then the following categories are equivalent:

- The category of uniform Banach  $K$ -algebras.
- The category  $\mathcal{D}_{tic}$  of  $t$ -adically complete and  $t$ -torsionfree  $K^0$ -algebras  $A$  with  $A$  totally integrally closed in  $A[t^{-1}]$  (5.2.1.1).
- The category  $\mathcal{D}_{ic}$  of  $t$ -adically complete and  $t$ -torsionfree  $K^0$ -algebras that  $A$  is integrally closed in  $A[t^{-1}]$  and  $A = A_*$ .
- The category  $\mathcal{D}_{prc}$  of  $t$ -adically complete and  $t$ -torsionfree  $K^0$ -algebras that  $A$  is  $p$ -root closed in  $A[t^{-1}]$  and  $A = A_*$ .

$\lrcorner$

*Proof:* The last three are equivalent, because if  $A \in \mathcal{D}_{tic}$ , then  $A = A_*$  by (5.7.2.10), as  $K$  is perfect by (12.2.8.4). So  $\mathcal{D}_{tic} \subset \mathcal{D}_{ic} \subset \mathcal{D}_{prc}$ , so it suffices to show that  $\mathcal{D}_{prc} \subset \mathcal{D}_{tic}$ . Now for any  $f$  that  $f^{\mathbb{N}} \subset t^{-k}A$ , then  $t^k f^{p^n} \subset A$ , and  $A$  is  $p$ -root closed, so  $t^{\frac{k}{p^n}} f \subset A$  for all  $n$ , so  $f \in A_*$  (5.7.2.3), but  $A_* = A$ .

The equivalence of 1, 2 is general, by (19.1.6.8).  $\square$

**Prop. (5.7.3.6).** If  $K \in \text{PerfdField}$ , then the category of uniform Banach spaces has all colimits and limits.  $\lrcorner$

*Proof:* Cf.[Bhatt P38].  $\square$

## 5.8 Simplicial Commutative Algebras

Main references are [Model Categories and Simplicial Methods, Paul Goerss and Kristen Schemmerhorn], [Simplicial Commutative Rings, Mathew].

### 1 Simplicial Groups

**Prop. (5.8.1.1).** A morphism of simplicial groups, when regarded as simplicial set, is a Kan fibration iff

$$X \rightarrow \pi_0 X \otimes_{\pi_0(Y)} Y$$

is surjective. In particular, any simplicial group is a Kan complex.  $\lrcorner$

*Proof:* Cf.[Simplicial Homology Theory Jardine P12]  $\square$

**Def. (5.8.1.2) [Simplicial Modules].** A **simplicial module** over a simplicial ring  $R_\bullet$  is a map of simplicial map  $R_\bullet \times M_\bullet \rightarrow M_\bullet$  that is a ring action.  $\lrcorner$

### 2 Simplicial $R$ -Modules and Resolutions

**Def. (5.8.2.1) [Moore Complex].** Giving a simplicial object in an Abelian category, we can have a **Moore chain complex** with Čech-like differentials.  $\partial_n = \sum_1^n (-1)^i d_i$ . And we have  $\partial^2 = 0$ .  $\lrcorner$

*Proof:* Should use  $d_i d_j = d_{j-1} d_i$  for  $i < j$ .  $\square$

**Def. (5.8.2.2) [Normalized Moore complex of a simplicial  $R$ -Module].** The **normlized Moore complex** of a simplicial  $R$ -module  $M$  is the chain complex

$$NM : \cdots \rightarrow NM_n \xrightarrow{(-1)^n d_n} NM_{n-1} \rightarrow \cdots$$

where  $NM_n = \bigcap_{i=0}^{n-1} \ker(d_i) \in M_n$ . This is a chain complex because  $d_{n-1} d_n = d_{n-1} d_{n-1}$  is 0 on  $NM_n$ . In fact  $NM$  is preserved by all injections.

The **homotopy groups**  $\pi_*(M)$  of  $M$  is defined to be the homology of the normalization of  $M$ . And it can be shown that as a set  $\pi_n(M)$  is just the  $n$ -th homotopy group of the geometrization of the

The **degenerate complex** of a Moore complex  $DM$  is the chain complex that  $D_n = \sum_{i=0}^{n-1} s_i M_{n-1}$  is a sub chain complex of  $M$  by the relation of  $d_i, s_j$ .  $\lrcorner$

**Def. (5.8.2.3).** A morphism of simplicial Abelian groups is called a **weak equivalence** is it induces an isomorphism on the homotopy groups.  $\lrcorner$

**Prop. (5.8.2.4) [Differential Graded Structures].** For any simplicial commutative  $R$ -algebra  $A$ , the homotopy groups  $\pi_*(A)$  form a graded commutative  $R$ -ring.  $\lrcorner$

*Proof:* The group structure on  $\pi_*(A)$  is given by smash products. Cf.[Simplicial Commutative Algebras, Mathew, P2].  $\square$

**Cor. (5.8.2.5) [ $\pi_0$  is an Algebra].** If  $Y$  is a simplicial commutative  $R$ -algebra, then  $\pi_0(Y) = Y_0 / (\text{Im}(d_0 - d_1))$ , which is an algebra.  $\lrcorner$

*Proof:* It suffices to show  $\text{Im}(d_0 - d_1)$  is an ideal of  $Y_0$ : If  $a \in Y_0$ , then

$$(d_0 - d_1)(s_0(a)y) = d_0 s_0(a) d_0(y) - d_1 s_0(a) d_1(y) = a(d_0 - d_1)(y).$$

□

**Prop. (5.8.2.6).** if  $R_\bullet$  is a simplicial ring and  $M_\bullet$  is a simplicial  $R_\bullet$ -ring, then  $\pi_*(M)$  is a graded  $\pi_*(R)$ -module. ┘

**Prop. (5.8.2.7).** The simplicial homology of the Moore complex of the bar resolution  $BG$  of group homology with coefficient in  $R$  is just the group homology  $H_n(G, R)$  for the trivial module  $R$ . And it has the same homology with the geometrization  $|BG|$ . ┘

**Lemma (5.8.2.8).**  $A_* \cong NA_* \oplus DA_*$  as a complex,  $NA_*$ ,  $A_*$ ,  $(A/DA_*)$  are all homotopically equivalent. ┘

*Proof:* We define similarly  $N_k A_*$  and  $D_k A_*$  and induct on  $k$ , our conclusion is the case  $k = n - 1$ . When  $k = 0$ ,  $\text{Im } d_0 \oplus \ker s_0 A_n = A_n$  because  $d_0 s_0 = id_{n-1}$  thus  $A_{n-1} \xrightarrow{s_0} A_n$  is a split injection.

There are two split exact rows by simplicial relations:

$$\begin{array}{ccccccc} 0 & \longrightarrow & N_{k-1} A_{n-1} & \xrightarrow{s_k} & N_{k-1} A_n & \xrightarrow{1-s_k d_k} & N_k A_n \longrightarrow 0 \\ & & \downarrow & & \downarrow & & \downarrow \\ 0 & \longrightarrow & A_{n-1}/D_{k-1} A_{n-1} & \xrightarrow{s_k} & A_n/D_{k-1} A_n & \longrightarrow & A_n/D_k A_n \longrightarrow 0 \end{array}$$

The first one split because it has a right section, the second one split because it has a left section. So by induction,  $N_k A_n \rightarrow A_n/D_k A_n$  is an isomorphism, thus  $N_k A_n \oplus D_k A_n = A_n$  because it splits.

For the homotopy equivalence, Cf.[Jardine P150]. □

**Prop. (5.8.2.9)[Dold-Kan Correspondence].** For  $R \in \text{Ring}$ , the normalized Moore complex(5.8.2.2) functor  $N$  gives an equivalence of categories:

$$N_* : s\text{Mod}_R \cong Ch_{\geq 0}(\mathcal{A}).$$

and the inverse is given by

$$(\sigma C_\bullet)_n = \bigoplus_{[n] \rightarrow [k]} C_k$$

and a morphism  $\sigma_n \rightarrow \sigma_m$  for a morphism  $[m] \rightarrow [n]$  is defined as follows: For  $[n] \rightarrow [k]$ , write  $[m] \rightarrow [n] \rightarrow [k]$  as  $[m] \rightarrow [r] \xrightarrow{\psi} [k]$  where  $\varphi$  is injective, thus maps  $a \in C_k$  in  $\sigma C_n$  to  $\psi^*(a) \in C_r$  in  $\sigma C_m$ , where  $\psi^*$  is zero unless  $\psi = d^n : \Delta[n-1] \rightarrow \Delta[n]$ . And homotopy groups and homology groups correspond via this equivalence, so does weak equivalences. ┘

*Proof:*  $\sigma(\mathcal{C}_\bullet)$  defines a simplicial Abelian group because of the uniqueness of the the canonical decomposition. There is a natural map from  $\sigma(NA)$  to  $\mathcal{A}$ .

Now the task is to show that  $\sigma(NA) \cong A$  and  $N(\sigma C) \cong C$ . We has  $N(\sigma C)_n = C_n$  because  $d^i C_n$  is 0 for  $i \neq n$  and the other components are all degeneracies thus are not in  $N(\sigma C)_n = C_n$  by(5.8.2.8).

Then we prove  $\sigma(NA) \cong A$ . It is a surjection by(5.8.2.8) and induction. For the injectivity, if  $(a_\varphi) \neq 0$  is mapped to 0,  $a_{\text{id}_n}$  is 0 by(5.8.2.8). And we choose an ordering on the  $\varphi : [n] \rightarrow [k]$  by dominating, and suppose  $\psi$  is a minimal one. Now choose a section  $\xi$  of  $\psi$  that  $\xi$  is the maximal section, thus  $\varphi \xi$  cannot be  $\text{id}_k$  for any other  $\varphi$ . Now by induction we have  $a_\psi = 0$ , contradiction. □

**Cor. (5.8.2.10) [Trivial Simplicial Algebra].** There is a functor from an  $R$ -algebra  $S$  to a trivial simplicial  $R$ -algebra  $s(S)$ , it is a fully faithful embedding and  $\pi_0$  is left adjoint to it.  $\lrcorner$

*Proof:* This is the adjointness of (4.10.1.12) under the equivalence  $\sigma$  (5.8.2.9).  $\square$

**Cor. (5.8.2.11) [Model Structure on  $s\text{Mod}_R$ ].** By (4.5.4.2) applied to the equivalence with  $Ch_{\geq 0}R$ ,  $s\text{Mod}_R$  has the structure of a model category where a morphism  $X \rightarrow Y$  is

- an equivalence if it is a weak equivalence,
- a fibration if  $NX_n \twoheadrightarrow NY_n$  for any  $n \geq 1$ .
- a cofibration if the maps of the degenerate diagrams is of the form

$$X_n \rightarrow Y_n = X_n \oplus \bigoplus_{\varphi: [n] \rightarrow [k]} \varphi^* P_k$$

compatible with the differential, and  $P_k$  are all projectives.  $\lrcorner$

**Prop. (5.8.2.12) [Fibrations].** A fibration of simplicial  $R$ -modules is a fibration iff it is a fibration of simplicial sets. Moreover, by (5.8.1.1), this is equivalent to  $X \rightarrow \pi_0 X \otimes_{\pi_0(Y)} Y$  is surjective.  $\lrcorner$

*Proof:*  $\square$

**Prop. (5.8.2.13) [Simplicial Model Structure].**  $s\text{Mod}_R$  admits a simplicial model category structure.  $\lrcorner$

*Proof:* Firstly  $s\text{Mod}_R$  is a simplicial category tensored and cotensored over  $\text{Set}_\Delta$  (4.2.2.7) by (4.6.1.6), then it suffices to show (4.5.5.3)  $?$ .  $\square$

**Prop. (5.8.2.14) [Model Structure on  $s\mathcal{C}\text{Ring}_R$ ].** By (4.5.4.2) applied to the forgetful functor to  $\text{Set}_\Delta$ , Let  $R$  be a commutative algebra, then the category of simplicial commutative algebras  $s\mathcal{C}\text{Alg}_R$  has a simplicial model category structure where a morphism is

- a weak equivalence if it is a weak equivalence of simplicial sets.
- a fibration if it is fibration of simplicial sets.

*Proof:*  $\square$

**Cor. (5.8.2.15).** For a ring map  $R \rightarrow S$ , the tensor product  $S \otimes_R -$  and forgetful functor form a Quillen adjunction between  $s\mathcal{C}\text{Ring}_R$  and  $s\mathcal{C}\text{Ring}_S$ .  $\lrcorner$

**Def. (5.8.2.16) [Free Morphisms].** A morphism of simplicial  $R$ -algebras is called **free** if it is  $s$ -free (4.6.1.5) on the a set of objects  $P_k$  where  $P_k$  are projective  $R$ -modules.  $\lrcorner$

**Prop. (5.8.2.17) [Cofibrations in  $s\text{Alg}_R$ ].** A morphism in  $s\text{Alg}_R$  is a cofibration iff it is a retraction of a free morphism (5.8.2.16). In particular, a cofibrant simplicial  $R$ -algebra is the symmetrization of a chain of projective  $R$ -modules.  $\lrcorner$

*Proof:* This follows from (4.5.4.2) (4.2.2.10) and notice the free morphisms just corresponds free commutative algebra applied to the attaching cell morphism in the category of sets.  $\square$

### Simplicial Resolutions

**Def. (5.8.2.18) [Simplicial Resolutions].**

- Let  $M \in \text{Mod}_R$ , a **simplicial resolution** of  $M$  is a cofibrant replacement of  $M$ , or equivalently, it is an augmented simplicial  $R$ -module  $X \rightarrow M$  that  $NX \rightarrow M$  is a projective resolution.
- Let  $M \in \text{CRing}_R$ , a **free resolution** of  $M$  is free cofibrant replacement of  $M$ , or equivalently, it is an augmented simplicial commutative  $R$ -algebras  $X \rightarrow M$  that  $NX \rightarrow M$  is a resolution of  $R$ -modules, and  $P_n$  are all projective (4.1.1.22) in  $\text{Alg}_R$ . Notice we can always choose a free resolution only only cofibrant resolution by (4.5.8.3) and Dold-Kan complex.

┘

**Def. (5.8.2.19) [Bar Resolution].** Let  $\mathcal{C}$  be a category and  $T : \mathcal{C} \rightarrow \mathcal{C}$  a monad, and  $X$  is an algebra over  $T$  (4.3.1.2), then we can form a simplicial  $T$ -algebras where  $B(T, X)_n = T^{n+1}X$  where the simplicial operators come from the action of  $T$  on itself and the action of  $T$  on  $X$ .

Then there is a simplicial morphism  $B(T, X) \rightarrow X$ , which is a simplicial homotopy.

┘

**Remark (5.8.2.20).** If  $\mathcal{C}$  is the category of sets,  $R$  is an algebra and  $T$  is a functor that sends a set  $S$  to  $R[S]$ , then a  $T$ -algebra is just an  $R$ -algebra, and the bar resolution is just the canonical resolution, and it is a cofibrant replacement, by (5.8.2.17).

┘

**Prop. (5.8.2.21).** If  $f, g : A^\bullet \rightarrow B^\bullet$  are two homotopic maps of cosimplicial Abelian groups, then  $f, g$  induces an isomorphism between their totalizations.

┘

*Proof:* Cf. [[Sta]019S].

□

### 3 Properties

**Def. (5.8.3.1).** If  $A$  is a ring and  $f_1, \dots, f_n \in A$ , the Koszul complex is defined to be

$$\text{Kos}(A, f_1, \dots, f_n) = A \otimes_{\mathbb{Z}[X_1, \dots, X_n]}^L \mathbb{Z}.$$

We want to extend this definition to the case of simplicial commutative rings.

Now if  $A$  is a simplicial ring and  $f_1, \dots, f_n \in \pi_0(A)$ , let  $g_1, \dots, g_n$  in  $A_0$  lifting  $f_i$ , then we define

$$\text{Kos}(A, f_1, \dots, f_n) = A \otimes_{\mathbb{Z}[X_1, \dots, X_n]}^L \mathbb{Z}.$$

Then we need to check that this is independent of the lifting: if there is another set of lifting  $h_i$ , because we have identities

$$A \otimes_{\mathbb{Z}[X_1, \dots, X_n]}^L \mathbb{Z} \cong (A \otimes_{\mathbb{Z}[X_1, \dots, X_n]}^L \mathbb{Z}[X_1]) \otimes_{\mathbb{Z}[X]}^L \mathbb{Z}$$

it suffices to prove for  $n = 1$ . Then there is a  $\gamma \in A_1$  that  $d_0(\gamma) = g, d_1(\gamma) = h$ . Then we consider the evaluating maps

$$e_0, e_1 : \underline{\text{Hom}}(\Delta_1, A) \rightarrow A$$

are weak equivalences ?, and then the maps

$$e_0 : \underline{\text{Hom}}(\Delta_1, A) \otimes_{\gamma, \mathbb{Z}[X]}^L \mathbb{Z} \rightarrow A \otimes_{g, \mathbb{Z}[X]}^L \mathbb{Z}$$

$$e_1 : \underline{\text{Hom}}(\Delta_1, A) \otimes_{\gamma, \mathbb{Z}[X]}^L \mathbb{Z} \rightarrow A \otimes_{h, \mathbb{Z}[X]}^L \mathbb{Z}$$

are also weak equivalences, so we are done.

And if  $M$  is a simplicial  $A$ -module, then we define

$$Kos(M, f_1, \dots, f_n) = M \otimes_A^L Kos(A, f_1, \dots, f_n)$$

┘

**Def. (5.8.3.2) [Flatness].** A map  $A \rightarrow B$  of simplicial rings is called **(faithfully)flat** if  $\pi_0(B)$  is (faithfully)flat over  $\pi_0(A)$  and  $\pi_i(A) \otimes_{\pi_0(A)} \pi_0(B) \rightarrow \pi_i(B)$  is an isomorphism for any  $i$ . ┘

**Prop. (5.8.3.3).** Flatness is stable under base change. ┘

*Proof:* Cf.[Emerton note, completely flatness, P12]. □

**Prop. (5.8.3.4).** If  $\pi_0(A) \otimes_A^L M$  is (faithfully)flat over  $\pi_0(A)$ , then  $M$  is (faithfully)flat over  $A$ . ┘

*Proof:* Cf.[Emerton note, completely flatness, P12]. □

**Def. (5.8.3.5).** If  $A$  is a simplicial ring and  $M$  is a simplicial  $A$ -module, if  $I = (f_1, \dots, f_n)$  is an ideal of  $\pi_0(A)$ , then  $M$  is called  **$I$ -completely flat** over  $A$  if  $Kos(M, f_1, \dots, f_n)$  is flat over  $Kos(A, f_1, \dots, f_n)$ .

Clearly if  $M$  is  $A$ -flat, then it is  $I$ -completely flat. ┘

**Prop. (5.8.3.6) [Flatness and Derived Completion].** If  $A$  is a simplicial ring,  $M$  is a flat simplicial  $A$ -module, and  $I = (f_1, \dots, f_n)$  is an ideal of  $\pi_0(A)$ , then its derived  $I$ -completion  $\widehat{M} = \text{holim}_n Kos(M, f_1^N, \dots, f_n^N)$  is  $I$ -completely flat. The proof is similar to that of (5.9.7.4). ┘

**Prop. (5.8.3.7) [Relative Regular Sequence].** If  $A \rightarrow B$  is a map of simplicial rings, then  $x_1, x_2, \dots, x_n \in \pi_0(B)$  is called **regular with respect to  $A_\bullet$**  if

$$A \rightarrow Kos(B, x_1, \dots, x_n)$$

is flat. And if  $I = (f_1, \dots, f_m) \in \pi_0(A)$ , then it is called  **$I$ -completely regular** if

$$Kos(A, f_1, \dots, f_m) \rightarrow Kos(A, f_1, \dots, f_m) \otimes_A^L Kos(B, x_1, \dots, x_n) = Kos(B, f_1, \dots, f_m, x_1, \dots, x_n)$$

is flat. In particular, regular relative to  $A_\bullet$  implies  $I$ -completely regular relative to  $A_\bullet$ . ┘

**Prop. (5.8.3.8).** If  $(f_1, \dots, f_{r-1}, f)$  is regular w.r.t.  $A$  and  $(f_1, \dots, f_{r-1}, g)$  is regular w.r.t.  $A$ , then  $(f_1, \dots, f_{r-1}, fg)$  is also regular w.r.t.  $A$ . In particular, for any  $n_i > 0$ ,  $f_1^{n_1}, \dots, f_r^{n_r}$  is also regular w.r.t.  $A$ . ┘

*Proof:* Similarly as in (5.4.4.6), we have a distinguished triangle

$$Kos(M, f_1, \dots, f_{r-1}, f) \rightarrow Kos(M, f_1, \dots, f_{r-1}, fg) \rightarrow Kos(M, f_1, \dots, g).$$

Then we can use induction. □

**Prop. (5.8.3.9) [Regular and Derived Completion].** If  $x_1, \dots, x_n \in \pi_0(B)$  is regular w.r.t.  $A$ , then they are  $I$ -completely regular w.r.t.  $A$  in the derived  $I$ -completion  $\widehat{B}$ . The proof is similar to that of (5.8.3.6). ┘

#### 4 Non-Abelian Derived Functors

**Def. (5.8.4.1) [ $\infty$ -Category of Chain Complexes].** Let  $\mathcal{A}$  be an additive category, then  $\mathrm{Ch}(\mathcal{A})$  is enriched over  $\mathrm{Ch}(\mathcal{A}b)$ , and the Dold-Kan correspondence can be made into a right-lax monoidal functor by [?](#) [S. Schwede and B. Shipley. Equivalences of monoidal model categories.], so  $N_*(\mathrm{Ch}(\mathcal{A}))$  is enriched over  $s\mathcal{A}b$ , which consists of Kan complexes [\(5.8.1.1\)](#). Thus  $N_*(\mathrm{Ch}(\mathcal{A}))$  is Bergner-fibrant, and we can define the  $\infty$ -category of chain complexes

$$\mathrm{Ch}_\infty(\mathcal{A}) = N_\Delta(N_*(\mathrm{Ch}(\mathcal{A}))),$$

which is an  $\infty$ -category by [\(4.6.4.9\)](#). ⌋

**Prop. (5.8.4.2) [Left Derived Functor].** Let  $F : \mathrm{Poly}_A \rightarrow \mathcal{C}$  be a functor where  $\mathcal{C}$  is any  $\infty$ -category admitting all colimits (e.g.  $D_\infty(\mathcal{A}b)$ ), then there exists a left Kan extension  $LF$  of  $F$  along  $\mathrm{Poly}_A \subset \mathcal{C}\mathrm{Ring}_A$  that

- $LF$  commutes with filtered colimit.
- $LF$  commutes with geometric realization of simplicial resolutions: given  $B \in \mathcal{C}\mathrm{Ring}_A$  and a simplicial resolution  $P_\bullet \rightarrow B$  by  $A$ -algebras, the geometric realization  $|LF(P_\bullet)|$  is equivalent to  $LF(B)$ .

which is called the **left derived functor** of  $F$ . ⌋

*Proof:* Cf. [Bhatt, Prism, 7.1.2]. □

## 5.9 Derived Commutative Algebras

References are [Sta].

[Sta]Chap15 contains many beautiful results working on the derived category of rings, and is used heavily in Scholze's Thesis.

The basic construction of  $R\text{tensor}$  and  $R\text{Hom}$  should be redone at the level of ringed sites, Cf. [Sta]Chap21.

This section is obsolete and should be redone in the language of  $\infty$ -categories.

### 1 Basics

**Prop. (5.9.1.1) [Product in  $D(R)$ ].** Let  $R$  be a ring and  $K_n \in D(R)$ , then the product in  $D(R)$  of  $K_n$  is given by  $\prod I_n$ , where  $I_n$  are  $K$ -injective resolutions of  $K_n$ .  $\lrcorner$

*Proof:* This is immediate from (4.10.2.7).  $\square$

**Def. (5.9.1.2) [Homotopy Fiber Square].** A square of Abelian groups is called a **homotopy fiber square** if it is a homotopy fiber square in the derived category, or equivalently, the kernel of the two rows (or the two columns) are isomorphic.

This notion is identical to the notion of pullback square when the rows or the columns are surjective.  $\textcolor{red}{?}$   $\lrcorner$

**Prop. (5.9.1.3) [Bockstein Differential].** Let  $I$  be an invertible ideal of  $A$ , for any  $M^\bullet \in D(A)$ , we use the Breuil-Kisin Twist notation (27.6.5.1) and consider the exact triangle

$$M^\bullet \otimes_A^L A/I\{i+1\} \rightarrow M^\bullet \otimes_A^L I^i/I^{i+2} \rightarrow M^\bullet \otimes_A^L A/I\{i\}$$

obtained from the exact triangle

$$I^{n+1}/I^{n+2} \rightarrow I^n/I^{n+2} \rightarrow I^n/I^{n+1}$$

tensoring  $\mathcal{O}_\Delta$ . Then we get a Bockstein differential

$$\beta^n : H^n(M^\bullet \otimes_A^L A/I\{n\}) \rightarrow H^{n+1}(M^\bullet \otimes_A^L A/I\{n+1\})$$

Then these maps satisfy  $\beta^{n+1} \circ \beta^n = 0$ .  $\lrcorner$

*Proof:* Consider the morphism of distinguished triangles:

$$\begin{array}{ccccc} I^{n+1}/I^{n+3} & \longrightarrow & I^n/I^{n+3} & \longrightarrow & I^{n+1}/I^{n+1} \\ \downarrow & & \downarrow & & \downarrow \\ I^{n+1}/I^{n+2} & \longrightarrow & I^n/I^{n+2} & \longrightarrow & I^{n+1}/I^{n+2} \end{array}$$

then we see for any  $M^\bullet \in D(A)$ ,  $\beta^n$  factors as

$$H^n(M^\bullet \otimes_A^L I^n/I^{n+1}) \rightarrow H^{n+1}(M^\bullet \otimes_A^L I^{n+1}/I^{n+3}) \rightarrow H^{n+1}(M^\bullet \otimes_A^L I^{n+1}/I^{n+2})$$

and also we consider the distinguished triangle

$$I^{n+2}/I^{n+3} \rightarrow I^{n+1}/I^{n+3} \rightarrow I^{n+1}/I^{n+2}$$

to see that the composition

$$H^{n+1}(M^\bullet \otimes_A^L I^{n+1}/I^{n+3}) \rightarrow H^{n+1}(M^\bullet \otimes_A^L I^{n+1}/I^{n+2}) \xrightarrow{\beta^{n+1}} H^{n+2}(M^\bullet \otimes_A^L I^{n+2}/I^{n+3})$$

is 0, and this two observation gives the result.  $\square$

### Injective Amplitude

**Prop. (5.9.1.4) [Injective Amplitude].** For  $K \in D(A)$ , the following are equivalent:

- $K$  has finite amplitude in  $[a, b]$ .
- $\text{Ext}^i(N, K) = 0$  for any  $N \in D^0(A)$  and  $i \notin [a, b]$ .
- $\text{Ext}^i(A/I, K) = 0$  for any ideal  $I$  of  $A$ .

┘

*Proof:*  $1 \rightarrow 2 \rightarrow 3$  is clear. For  $3 \rightarrow 1$ : Notice  $\text{Ext}^n(A, K) = H^n(K)$ ,  $H^i(K) = 0$  for any  $i \notin [a, b]$ . Then  $K$  is represented by a complex

$$0 \rightarrow I^a \rightarrow I^a \rightarrow I^{a+1} \rightarrow \dots \rightarrow I^b \rightarrow \dots$$

Let  $J = \ker(I^b \rightarrow I^{b+1})$ , then  $K$  is also represented by

$$0 \rightarrow I^a \rightarrow I^a \rightarrow I^{a+1} \rightarrow \dots \rightarrow I^b \rightarrow J \rightarrow 0.$$

Let  $K' = (I^a \rightarrow \dots \rightarrow I^b) \in D(A)$ , then there is an distinguished triangle

$$J[-b] \rightarrow K \rightarrow K' \rightarrow J[1-b],$$

which induces an exact sequence  $\text{Ext}^b(R/I, K') \rightarrow \text{Ext}^1(R/I, J) \rightarrow \text{Ext}^{b+1}(R/I, K)$  for any ideal  $I \subset A$ . Then by  $1 \rightarrow 2$ ,  $\text{Ext}^1(R/I, J) = 0$ , implying  $J$  is injective.  $\square$

**Prop. (5.9.1.5) [Dedekind Domain].** Let  $R$  be a Dedekind domain, then every ideal  $I$  is finite torsion-free thus projective over  $R$ , so every  $R$ -module has injective dimension  $\leq 1$ . In particular,  $\text{Ext}^i(M, N) = 0$  for any  $i \geq 2$  and  $M, N \in \text{Mod}_R$ . In particular, by (4.10.3.26), any  $K \in D^+(R)$  is isomorphic to a direct sum of their cohomology groups.  $\square$

**Prop. (5.9.1.6).** Let  $(R, \mathfrak{m}, k)$  be a Noetherian local ring and  $K \in D^+(R)$  have finite cohomology modules, then  $K$  has finite injective dimension iff  $\text{Ext}_R^i(k, K) = 0$  for  $i$  large.  $\square$

*Proof:* Cf. [Sta]0AVJ.  $\square$

## 2 Derived Tensor and Tor

**Prop. (5.9.2.1) [Differential Graded Structure].** If  $K$  is a commutative  $A$ -algebra object in  $D(A)$  in the monoidal structure defined in (7.3.3.8), then  $\oplus_{n \geq 0} H^n(K^\bullet)$  carries a natural graded commutative  $A$ -algebra structure.  $\square$

*Proof:* Compare with (5.8.2.4).

We may replace  $K$  by a  $K$ -flat resolutions  $L^1$  (7.3.3.3) that the algebra structure map for  $K$  is represented by a morphism  $L_1^\bullet \otimes_A L_1^\bullet \rightarrow L^2$  of complexes where  $L^2$  is a complex quasi-isomorphic to  $K$ , hence the graded  $A$ -algebra structure is clear by (4.8.10.2), and it is commutative by (4.8.10.1). (How to check the structure is uniquely determined?).  $\square$

**Tor**

**Def. (5.9.2.2) [Tor].** Let  $M, N$  be  $A$ -module, then the torsion group  $\text{Tor}_n^A(M, N)$  is defined to be  $H^n(M \otimes_{\mathcal{O}}^L N)$ , compatible with the definition in (7.3.3.11).  $\lrcorner$

**Def. (5.9.2.3) [Torsion Group].** Let  $A$  be a commutative ring,  $B$  an  $A$ -algebra and  $I$  be an ideal, then the  $I$ -torsion of  $B$  is defined to be  $\text{Tor}_1^A(A/I, B)$ , denoted by  $B[I]$ . In case  $I = (f)$ , it can be checked that  $B[f]$  is the set of elements of  $B$  that killed by  $f$ .

Also we denote  $B[I^\infty] = \text{colim}_{n \rightarrow \infty} B[I^n]$ . And  $B$  is said to have **bounded  $f$ -torsion** iff  $B[f^\infty] = B[f^n]$  for some  $n$ .  $\lrcorner$

**Prop. (5.9.2.4).** If  $A$  is a commutative ring with bounded  $I$ -torsions and  $B$  is a flat  $A$ -module, then  $B$  also has bounded  $I$ -torsions. (Because tensoring  $B$  is exact).  $\lrcorner$

**Prop. (5.9.2.5) [Balancing Tor].** In  $\mathcal{C}\text{Ring}$ ,  $\text{Tor}_n(A, B) = \text{Tor}_n(B, A)$ . This can be seen using spectral sequence of the double complex of flat resolutions of  $A$  and  $B$ . Similarly, we have two definitions of  $\text{Ext}^i(M, N)$  are compatible.  $\lrcorner$

*Proof:*  $\square$

**Prop. (5.9.2.6) [Base Change].** For a ring extension  $R \rightarrow S$ , using projective resolution and spectral sequence, there is a first quadrant homology spectral sequence:

$$E_{pq}^2 = \text{Tor}_p^S(\text{Tor}_q^R(A, S), B) \Rightarrow \text{Tor}_{p+q}^R(A, B).$$

Similarly, for  $\text{Ext}$ ,

$$E_2^{pq} = \text{Ext}_S^p(A, \text{Ext}_R^q(S, B)) \Rightarrow \text{Ext}_R^{p+q}(A, B).$$

$\lrcorner$

**Prop. (5.9.2.7) [Universal Coefficient Theorem].** Let  $P$  be a free  $R$ -module so  $d(P_n)$  are all flat, then  $Z(P_n)$  are also flat and

$$0 \rightarrow d(P_{n+1}) \rightarrow Z_n \rightarrow H_n \rightarrow 0$$

is a free resolution. we have an exact sequence:

$$0 \rightarrow H_n(P) \otimes_R M \rightarrow H_n(P \otimes_R M) \rightarrow \text{Tor}_1^R(H_{n-1}(P), M).$$

$$0 \rightarrow \text{Ext}_R^1(H_{n-1}(P), M) \rightarrow H^n(\text{Hom}_R(P, M)) \rightarrow \text{Hom}(H_n(P), M) \rightarrow 0$$

and these exact sequences non-canonically split because  $Z_n$  is a direct summand of  $P_n$ , thus  $Z_n \otimes M$  is a direct summand of  $P_n \otimes M$  and a fortiori  $Z_n(P_n \otimes M)$ . so  $H_n(P) \otimes M$  is a direct summand of  $H_n(P \otimes_R M)$ .  $\lrcorner$

**Internal Hom and Derived Tensor**

**Prop. (5.9.2.8).** If  $R$  is a ring and  $K, L, M \in D(R)$ , then

$$R\text{Hom}_R(K, R\text{Hom}(L, M)) = R\text{Hom}_R(K \otimes_R^L L, M).$$

$\lrcorner$

*Proof:* This is a special case of (7.3.3.29).  $\square$

**Cor. (5.9.2.9).**

$$\mathrm{Hom}_{D(R)}(K, R\mathrm{Hom}(L, M)) = \mathrm{Hom}_{D(R)}(K \otimes_R^L L, M),$$

i.e., derived tensor is left adjoint to internal Hom.  $\lrcorner$

*Proof:* This follows from taking  $H^0$ , by (4.10.3.18).  $\square$

**Prop. (5.9.2.10) [Derived Base Change Adjunction].** For a ring map  $R \rightarrow S$  and any  $L \subset D(R)$ ,  $M \subset D(S)$ , there is an isomorphism

$$\mathrm{Hom}_R(L, M) \cong \mathrm{Hom}_S(L \otimes_R^L S, M)$$

$\lrcorner$

*Proof:* This follows from (7.3.3.16).  $\square$

### 3 Rlim

**Def. (5.9.3.1) [Rlim].** Rlim is the derived limit (4.10.6.1) in  $D(\mathcal{A}b)$  restricted to the inverse systems consisting of discrete complexes.  $\lrcorner$

**Lemma (5.9.3.2).** The set of Mittag-Leffler Complexes in  $\mathcal{A}b(\mathbb{N})$  is adapted for  $R\mathrm{lim}$ .  $\lrcorner$

*Proof:* Firstly, for any complex  $(A_n)$ , we can associate to it the complex  $(B_n)$  where  $B_n = A_n \oplus A_{n-1} \oplus \dots \oplus A_1$ , then  $(B_n)$  is a Mittag-Leffler complex and  $(A_n) \hookrightarrow (B_n)$ . So ML complexes are sufficiently large.

Now for any exact sequence of complexes  $0 \rightarrow (A_n) \rightarrow (B_n) \rightarrow (C_n) \rightarrow 0$ , if  $A_n$  is ML, then  $\lim B_i \rightarrow \lim C_i$  is surjective: for an element  $(c_i) \in \lim C_i$ , let  $E_i = \pi_i^{-1}(c_i) \in B_i$ , then  $(E_i)$  is an inverse system of nonempty sets, and it suffices to show  $(E_i)$  is ML, because then (4.1.1.46) will show there is a element  $(e_i) \in \lim E_i \subset \lim B_i$  that maps to  $(c_i)$ .

For this, Cf. [Sta]0598.  $\square$

**Prop. (5.9.3.3) [Rlim].**

- If  $(A_n)$  is Mittag-Leffler, then  $R^1 \mathrm{lim}((A_n)) = 0$ .
- $R\mathrm{lim}((A_n))$  is represented by the complex in degree 0, 1:

$$\prod_n A_n \rightarrow \prod_n A_n : (x_n) \mapsto (x_n - f_{n+1}(x_{n+1}))$$

.

- for any  $(A_n) \in \mathcal{A}b(\mathbb{N})$  we have  $R^p \mathrm{lim}((A_n)) = 0$  for  $p > 1$ .  $\lrcorner$

*Proof:* 1 follows from (5.9.3.2) and (4.10.3.2).

2, 3: We use (4.10.3.2) again. Notice the complex  $(B_n)$  where  $B_n = A_n \oplus A_{n-1} \oplus \dots \oplus A_1$  and the complex  $(C_n)$  where  $C_n = A_{n-1} \oplus A_{n-2} \oplus \dots \oplus A_1$  form an exact sequence of complexes

$$0 \rightarrow (A_n) \rightarrow (B_n) \rightarrow (C_n) \rightarrow 0$$

where  $B_n \rightarrow C_n : (x_i) \mapsto (x_i - f_{i+1}(x_{i+1}))$ , and  $(B_n), (C_n)$  are both ML, so we are done.  $\square$

## 4 Lifting Complexes

**Prop. (5.9.4.1) [Lifting Projective Complex Along Thickening].** Let  $R$  be a ring and  $I$  be a nilpotent ideal, and  $K \in D(R)$ . Now if  $K \otimes_R^L R/I$  is represented by a bounded above complex of projective  $R/I$ -modules, then there is a complex  $P$  of bounded above complex of projective  $R$ -modules that  $P \cong K \in D(R)$ , and  $P \otimes_R R/I \cong E$ .  $\lrcorner$

*Proof:* Cf. [Sta]09AR.  $\square$

## 5 Pseudo-Coherent and Perfect Modules

**Def. (5.9.5.1) [Pseudo-Coherent Modules].** Let  $R$  be a ring,  $m \in \mathbb{Z}$ , then  $K \in D(R)$  is called an  **$m$ -pseudo-coherent module** iff there exists a complex  $E^\bullet \in K^b(R)$  and a morphism  $\alpha : E^\bullet \rightarrow K^\bullet$  where  $K^\bullet$  represents  $K$ , s.t.  $H^i(\alpha)$  is an isomorphism for  $i > m$ , and surjective for  $i = m$ .

$K \in D(R)$  is called a **pseudo-coherent module** if it is represented by a bounded above complex of finite free  $R$ -modules.  $\lrcorner$

**Prop. (5.9.5.2).** If  $A$  is Noetherian and  $C^\bullet$  is a complex of  $A$ -modules bounded above that every cohomology group  $H^i$  is a finite  $A$ -module, then there is a complex  $L^\bullet$  of finite free  $A$ -modules, that  $g : L^\bullet \rightarrow C^\bullet$  is a quasi-isomorphism.

Moreover, if  $C^i$  are all flat  $A$ -modules, then  $L^\bullet \otimes_A M \rightarrow C^\bullet \otimes_A M$  is quasi-isomorphism for every  $M$ .  $\lrcorner$

*Proof:*  $C^\bullet$  is bounded above so we choose  $L^n = 0$ , and use induction to construct  $L^n$  that  $H^i(L) \rightarrow H^i(C)$  is isomorphism for  $i > n+1$  and surjection for  $i = n+1$ . For this, choose a generator  $x_1, \dots, x_r$  of  $H^n(C)$  in  $Z^n(C)$ , and let  $y_{r+1}, \dots, y_s$  be a generator of  $g^{-1}(B^{n+1}(C))$  (Noetherian used), and let  $g(y_i) = dx_i$  for  $x_i \in C^n$ .

Now let  $L^n$  be freely generated by  $e_1, \dots, e_s$  and  $de_i = 0$  for  $i \leq r$  and  $de_i = y_i$  for  $i > r$ , and let  $g : L^n \rightarrow C^n$  be  $ge_i = x_i$ . Then it can be verified to be a quasi-isomorphism.

If  $C^i$  are all flat, we check isomorphism for all f.g. modules  $M$ , because  $\otimes$  and cohomology all commutes with direct limits. Use induction, for  $n$  large, both are 0, and if we write  $0 \rightarrow R \rightarrow F \rightarrow M \rightarrow 0$ , for  $F$  finite free, then there is a commutative diagram of long exact sequences, and for  $F$ ,  $H^i$  are obviously isomorphism, so I can use five lemma.  $\square$

**Def. (5.9.5.3) [Perfect Complexes of Modules].** Let  $R$  be a ring, then  $K \in D(R)$  is called a **perfect module** if  $K$  is quasi-isomorphic to a bounded complex of finite projective  $R$ -modules. An  $R$ -module  $M$  is called perfect iff  $M[0]$  is perfect.  $\lrcorner$

**Prop. (5.9.5.4) [Perfectness and Pseudo-Coherence].** An object  $K \in D(R)$  is perfect iff it is pseudo-coherent and has finite Tor amplitude.  $\lrcorner$

*Proof:* Cf. [Sta]0658.  $\square$

**Prop. (5.9.5.5).** If  $R$  is a regular ring of finite dimension, then an object  $K \in D(R)$  is perfect iff  $K \in D^b(R)$  and each  $H^i(K)$  is a finite  $R$ -module.  $\lrcorner$

*Proof:* Cf. [Sta]066Z.  $\square$

**Prop. (5.9.5.6) [Duality of Perfect Complexes].** Let  $K$  be a perfect complex of  $D(A)$ , then the **dual complex**  $K^\vee = R\mathrm{Hom}(K, A)$  is also a perfect complex and  $(K^\vee)^\vee \cong K$ . Also, there is a functorial isomorphism

$$L \otimes_A^L K^\vee = R\mathrm{Hom}_A(K, L)$$

$\lrcorner$

*Proof:* Cf. [Sta]07VI. □

**Prop. (5.9.5.7).** If  $A$  is a ring and  $K_n$  is a system of perfect objects in  $D(A)$ , then for any  $E \in D(A)$ , there is an isomorphism

$$R\mathrm{Hom}_A(\mathrm{hocolim} K_n, E) \cong R\mathrm{lim} E \otimes_A^L K_n^\vee$$

┘

*Proof:* By (5.9.5.6),  $R\mathrm{lim} E \otimes_A^L K_n^\vee = R\mathrm{lim} R\mathrm{Hom}(K_n, E)$  which fits into a distinguished triangle

$$R\mathrm{lim} R\mathrm{Hom}(K_n, E) \rightarrow \prod \mathrm{Hom}(K_n, E) \rightarrow \prod \mathrm{Hom}(K_n, E)$$

. So it suffices to show that

$$\prod \mathrm{Hom}(K_n, E) \cong R\mathrm{Hom}_A(\oplus K_n, E).$$

This follows from Yoneda lemma and (7.3.3.28)(7.3.3.29). □

**Prop. (5.9.5.8) [Perfectness and Thickening].** If  $R$  is a ring,  $I \subset R$  is a nilpotent ideal, and  $K \in D(R)$ . If  $K \otimes_R^L R/I$  is perfect in  $D(R/I)$ , then  $K$  is perfect in  $R$ . Moreover, if  $K \otimes_R^L R/I = 0$ , then  $K = 0$ . ┘

*Proof:* Let  $\overline{P}^\bullet \cong K \otimes_R^L R/I$  where  $P$  is a complex of finite projective  $R/I$ -modules, then by (5.9.4.1) there is a complex of projective  $R$ -modules  $P$  that  $P/IP \cong \overline{P}$ . Then it follows from Nakayama that  $P$  is bounded. □

### Pseudo-Coherent Modules

**Def. (5.9.5.9) [Pseudo-Coherent Complexes of Modules].** Let  $R \in \mathcal{CAlg}$ ,  $K \in D(R)$  is called an  **$m$ -pseudo-coherent module** if there exists a perfect object  $E \in D(R)$  and a morphism  $E \rightarrow K$  that induces isomorphisms on  $H^i$  for  $i > m$  and surjection on  $H^m$ .

$K \in D(R)$  is called a **pseudo-coherent module** if it is represented by a bounded above complex of finite free  $R$ -modules. ┘

## 6 Derived Completeness

Cf. [Sta]Chap15.90.

**Def. (5.9.6.1).** For a ring  $A$ ,  $f \in A$  and a complex  $K \in D(A)$ , we denote by  $T(K, f)$  a derived limit of the system

$$\dots \rightarrow K \xrightarrow{f} K \xrightarrow{f} K$$

┘

**Prop. (5.9.6.2) [Properties of  $T(K, f)$ ].** For a ring  $A$ ,  $f \in A$  and  $K \in D(A)$ , the following are equivalent:

1.  $T(K, f) = 0$ .
2.  $R\mathrm{Hom}_A(A_f, K) = 0$ .
3.  $\mathrm{Ext}_A^n(A_f, K) = 0$  for all  $n$ .

4.  $\text{Hom}_{D(A)}(E, K) = 0$  for all  $E \in D(A_f)$ .
5. For any  $p \in \mathbb{Z}$ ,  $\text{Hom}_A(A_f, H^p(K)) = 0$  and  $\text{Ext}_A^1(A_f, H^p(K)) = 0$ .
6. For any  $p \in \mathbb{Z}$ ,  $T(H^p(K), f) = 0$ .

┘

*Proof:* 2, 3 is clearly equivalent.

$4 \rightarrow 3$  is clear, and for  $3 \rightarrow 4$ : Let  $I^\bullet$  be a complex representing  $K$ , then 3 says  $\text{Hom}_A(A_f, I^\bullet)$  is acyclic, and  $\text{Hom}_{D(A)}(E, K) = \text{Hom}_{K(A)}(E, I^\bullet) = \text{Hom}_{K(A_f)}(E, \text{Hom}_A(A_f, I^\bullet))$ . As  $\text{Hom}_A(A_f, I^\bullet)$  is both acyclic and  $K$ -injective(4.8.10.6), we get it is homotopic to 0 by(4.10.2.1), thus we get 4.

$1 \iff 3$ : There is a free resolution of  $A_f$  given by

$$0 \rightarrow \bigoplus_n A \rightarrow \bigoplus_n A \rightarrow A_f \rightarrow 0$$

where the first map is  $(a_n) \mapsto (a_n - fa_{n-1})$ , and the second map is  $(a_n) \mapsto \sum a_i/f^i$ . Applying  $\text{Hom}_A(-, I^\bullet)$ , we get a distinguished triangle

$$R\text{Hom}_A(A_f, K) \rightarrow \prod K \rightarrow \prod K.$$

So this shows  $R\text{Hom}_A(A_f, K)$  is just  $T(K, f)$ , so we get  $1 \iff 3$ .

$1 \iff 5 \iff 6$ : There is a spectral sequence convergence(choose a finite free resolution of  $A_f$  then rotate and use(4.10.7.10)):

$$E_2^{p,q} = \text{Ext}_A^q(A_f, H^p(K)) \Rightarrow \text{Ext}^{p+q}(A_f, K)$$

This spectral sequence degenerates at  $E_2$  because  $A_f$  has a length 1 resolution by free  $A$ -modules hence the  $E_2$  page has only 2 rows. So there is an exact sequence

$$0 \rightarrow \text{Ext}_A^1(A_f, H^{p-1}(K)) \rightarrow \text{Ext}_A^1(A_f, K) \rightarrow \text{Hom}_A(A_f, H^p(K)) \rightarrow 0.$$

Then we are done. □

**Lemma (5.9.6.3).** Let  $A$  be a ring,  $K \in D(A)$ , then the set  $I$  of  $f$  that  $T(K, f) = 0$  is a radical ideal of  $A$ . ┘

*Proof:* If  $T(K, f) = 0$  and  $g \in A$ , then  $A_{gf}$  is a  $A_f$ -module, then

$$\text{Ext}_A^n(A_{gf}, K) = \text{Hom}_{D(A)}(A_{gf}[-n], K) \text{ (7.3.3.32)} = 0$$

by(5.9.6.2) item4. Then  $T(K, gf) = 0$  by(5.9.6.2) again. And if  $f, g \in I$ , there is an exact sequence

$$0 \rightarrow A_{f+g} \rightarrow A_{f(f+g)} \oplus A_{g(f+g)} \rightarrow A_{fg(f+g)} \rightarrow 0$$

by(5.4.2.3) and a easy check that the last term is surjective. Then from the long exact sequence of  $\text{Ext}$ , we get  $\text{Ext}^n(A_{f+g}, K) = 0$  for any  $n$ . Finally if  $f^n \in I$ , then  $f \in I$ , because  $A_f = A_{f^n}$ . □

**Def. (5.9.6.4) [Derived Completeness].** Let  $A$  be a ring,  $K \in D(A)$ ,  $I$  is an ideal of  $A$ , then  $K$  is said to be **derived complete** w.r.t  $I$  if  $T(K, f) = 0$  for any  $f \in A$ . Let  $D_{\text{comp}}(A, I)$  denote the subcategory consisting of derived  $I$ -complete objects in  $D(A)$ .

Let  $M$  be an  $A$ -module, then  $M$  is called **derived complete** w.r.t  $I$  if  $M[0] \in D(A)$  is derived complete w.r.t  $I$ . ┘

**Prop. (5.9.6.5).** A  $\aleph_0$ -filtered colimit of derived  $I$ -complete rings is also derived  $I$ -complete.  $\lrcorner$

*Proof:* Cf.[Bhatt, Prism, 5.4.3].  $\square$

**Prop. (5.9.6.6) [Complete and Derived Complete].** Let  $A$  be a ring and  $I$  be an ideal,  $M$  an  $A$ -module, then

- If  $M$  is  $I$ -adically complete, then  $T(M, f) = 0$  for any  $f \in I$ .
- If  $T(M, f) = 0$  for all  $f \in I$  and  $I$  is f.g., then  $M \rightarrow \lim M/I^n M$  is surjective.

In particular, if  $I$  is f.g.,  $M$  is  $I$ -adically complete iff  $M$  is derived  $I$ -adically complete and  $\cap I^n M = 0$ .

In particular, when  $M$  is f.g. over  $A$  Noetherian and  $I \subset \text{rad}(A)$ , derived  $I$ -complete is equivalent to  $I$ -complete(5.2.2.14).  $\lrcorner$

*Proof:* If  $M$  is  $I$ -adically complete, by(5.9.6.2), it suffices to show that  $\text{Hom}(A_f, M) = 0$  and  $\text{Ext}^1(A_f, M) = 0$ . But  $M = \varprojlim_n M/I^n M$ , and  $\text{Hom}(A_f, M/I^n M) = 0$ , because  $f \in I$ . For  $\text{Ext}$ , use(4.10.3.24), for any extension

$$0 \rightarrow M \rightarrow E \rightarrow A_f \rightarrow 0,$$

chose arbitrary  $e_n$  that maps to  $1/f^n$ . Then  $\delta_n = fe_{n+1} - e_n \in M$ . We consider

$$e'_n = e_n + \delta_n + f\delta_{n+1} + f^2\delta_{n+2} + \dots,$$

which exist because  $M$  is  $I$ -adically complete. Then  $fe'_{n+1} = e'_n$ , so this gives a splitting of the extension.

Conversely, if  $I = (f_1, \dots, f_r)$  and  $T(M, f_i) = 0$  for any  $i$ , then by(5.2.3.13), we can assume  $I = (f)$ . Then consider the extension

$$0 \rightarrow M \rightarrow E \rightarrow A_f \rightarrow 0$$

where  $E = (M \oplus \bigoplus Ae_n)/(x_n - fe_{n+1} + e_n) \rightarrow A_f$  that maps  $M$  to 0 and  $e_n$  to  $1/f^n$ . This extension splits by(5.9.6.2) and(4.10.3.24), thus there is an element  $x + e_0$  that generate a copy of  $A_f$  in  $E$ .

But then  $x + e_0 = x - x_0 + fe_1 = x - x_0 - fx_1 + f^2e_2 \dots$ , which implies  $x - x_0 - fx_1 - f^2x_2 - \dots - f^{n-1}x_{n-1} \in f^n E + A_f$  for any  $n$ . Then  $x - x_0 - fx_1 - f^2x_2 - \dots - f^{n-1}x_{n-1} \in f^n M$ , because  $E = M \oplus A_f$ . Then we are done.  $\square$

**Prop. (5.9.6.7).** If  $M \in D(A/I) \subset D(A)$ , then  $M$  is derived- $I$ -complete. (This follows from the definition of  $T(M, f)$ ).  $\lrcorner$

**Prop. (5.9.6.8) [Category of Derived Complete Modules].** Let  $I$  be an ideal of  $A$ , then the derived  $I$ -complete  $A$ -modules form a weak Serre subcategory of  $\text{Mod}_A$ . In particular,  $D_{\text{comp}}(A, I)$  is also a weak Serre subcategory.  $\lrcorner$

*Proof:* If  $f : M \rightarrow N$  is a map of derived  $I$ -complete  $A$ -modules, then we consider the complex  $K = (M \rightarrow N)$ , then there is an exact sequence  $0 \rightarrow M[1] \rightarrow K \rightarrow N \rightarrow 0$ , so we have  $\text{Ext}^n(A_f, K) = 0$  for any  $f \in I, n \in \mathbb{Z}$  because  $M, N$  does(5.9.6.2), so  $K$  is derived  $I$ -complete by(5.9.6.2) again. Then we have  $\ker(f), \text{Coker}(f)$  are derived  $I$ -complete, by(5.9.6.2) again. Extension is also clear.  $\square$

**Lemma (5.9.6.9).** If  $R$  is ring,  $I$  is an ideal, and  $K \in D(R)$  that  $K \otimes_R^L R/I = 0$ , then  $K \otimes_R^L M$  for any  $M \in D^b(R)$  with all the cohomology groups  $I$ -power torsions.  $\lrcorner$

*Proof:* We use the truncation(4.8.7.6), then it suffices to prove for  $M$  discrete. Now  $M = \cup M[I^n]$ , and we have  $K \otimes_R^L M = \text{hocolim} K \otimes_R^L M[I^n]$ , so we may assume  $I^n M = 0$  for some  $n$ . Consider the  $R$ -algebra  $R' = R/I^n \oplus M$ , where  $M^2 = 0$ , then it suffices to show  $K' = K \otimes_R^L R' = 0$ . Now  $0 = K \otimes_R^L R/I = K' \otimes_{R'}^L R/I$ , so by(5.9.5.8)  $K' = 0$ .  $\square$

**Prop. (5.9.6.10) [Derived Nakayama].** the derived tensor product  $-\otimes_A^L A/I$  reflects isomorphism on  $D_{\text{comp}}(A, I)$ , i.e. if  $M \otimes_A^L A/I = 0$ , then  $M = 0$ .  $\lrcorner$

*Proof:* Let  $I = (f_1, \dots, f_r)$ , by (5.9.6.9),  $M \otimes_A^L K_n = 0$  for any  $K_n = \text{Kos}(A, f_1^n, \dots, f_r^n)$ , so  $K = R \lim K \otimes_A^L K_n = 0$ .  $\square$

**Cor. (5.9.6.11).** If  $I$  is f.g. and  $M$  is a derived  $I$ -complete  $A$ -module that  $M/IM = 0$ , then  $M = 0$ .  $\lrcorner$

*Proof:* ? This should be an immediate corollary.

Let  $I = (f_1, \dots, f_r)$ , if  $M \neq 0$ , let  $i$  be the largest integer that  $M/(f_1, \dots, f_i)M \neq 0$ , then  $N$  is also derived  $I$ -complete by (5.9.6.8). But  $f_{i+1} : N \rightarrow N$  is surjective, so  $T(N, f_{i+1}) \neq 0$ , contradiction.  $\square$

**Prop. (5.9.6.12).** If  $A$  is derived  $I$ -complete, then  $(A, I)$  is a Henselian pair.  $\lrcorner$

*Proof:* Cf. [[Sta]0G3H] ?.  $\square$

**Prop. (5.9.6.13) [Derived  $I$ -Completion].** If  $I = (f_1, \dots, f_n)$  is f.g. in  $A$ , the inclusion of categories  $D_{\text{comp}}(A, I) \subset D(A)$  has a left adjoint, which maps  $K$  to

$$\widehat{K} = R \text{Hom}((A \rightarrow \prod_{i_0} A_{f_{i_0}} \rightarrow \prod_{i_0 < i_1} A_{f_{i_0} f_{i_1}} \rightarrow \dots \rightarrow A_{f_1, \dots, f_r}), K).$$

called the **derived  $I$ -completion** of  $K$ .

Moreover, this construction is identical to  $K \mapsto K^\bullet = R \lim(K \otimes_A^L K_n^\bullet)$ , by (5.9.5.7) and (5.4.4.7).  $\lrcorner$

*Proof:* There is a map  $(A \rightarrow \prod_{i_0} A_{f_{i_0}} \rightarrow \prod_{i_0 < i_1} A_{f_{i_0} f_{i_1}} \rightarrow \dots \rightarrow A_{f_1, \dots, f_r}) \rightarrow A$ , which induces a morphism  $K \rightarrow \widehat{K}$ . Now by (7.3.3.28),  $R \text{Hom}(A_f, \widehat{K})$  is isomorphic to

$$R \text{Hom}((A_f \rightarrow \prod_{i_0} A_{f f_{i_0}} \rightarrow \prod_{i_0 < i_1} A_{f f_{i_0} f_{i_1}} \rightarrow \dots \rightarrow A_{f f_1, \dots, f_r}), K)$$

as  $A_f$  is  $A$ -flat. Now this one is 0 for any  $f \in I$ , by (5.4.4.7), so  $\widehat{K}$  is derived  $I$ -complete.

Conversely, if  $\widehat{K}$  is derived  $I$ -complete, then  $R \text{Hom}(A_f, K) = 0$  for any  $f \in I$ , thus  $K \rightarrow \widehat{K}$  is an isomorphism as we inductively use the stupid truncation (4.8.7.6).  $\square$

**Cor. (5.9.6.14).** If  $M$  is an  $A$ -module, then  $H^0(\widehat{M})$  is the derived- $I$ -completion in the category of modules, by (4.10.1.12).  $\lrcorner$

**Cor. (5.9.6.15).** (5.9.6.2) show the notion of derived  $I$ -complete and derived  $I$ -completion only depends on  $\text{rad } I$ .  $\lrcorner$

### Principal Ideal Case

**Prop. (5.9.6.16) [Bounded Torsion and Derived Completion].** Let  $A \in \mathcal{C}\text{Ring}$  and  $f \in A$ . If  $M \in \text{Mod}_A$  has bounded  $f^\infty$ -torsion, then the derived  $f$ -completion of  $M$  as a complex is a module and coincides with the classical  $f$ -adic completion.  $\lrcorner$

*Proof:* The derived  $f$ -completion is defined to be

$$\widehat{M} = R \lim_n (M \otimes_{\mathbb{Z}[X]}^L \mathbb{Z}[X]/(x^n)) = R \lim_n (M \xrightarrow{f^n} M).$$

So by (4.10.6.5), there are exact sequences

$$\begin{aligned} R^1 \lim_n M/f^n M &\cong H^1(\widehat{M}) \\ 0 \rightarrow R^1 \lim_n M[f^n] &\rightarrow H^0(\widehat{M}) \rightarrow \lim_n M/f^n \rightarrow 0 \\ H^{-1}(\widehat{M}) &\cong \lim_n M[f^n] \end{aligned}$$

Now the hypothesis implies that  $(M[f^n])$  is Mittag-Leffler and  $\lim_n M[f^n] = 0$ , so we have the desired result.  $\square$

**Cor. (5.9.6.17).** Let  $R$  be a perfect  $\mathbb{F}_p$ -algebra, then the derived  $p$ -completion and  $p$ -adic completion of  $R$  coincide.  $\lrcorner$

## 7 Derived Completely Properties

**Def. (5.9.7.1) [Derived Completely Properties].** Let  $A$  be a commutative ring and  $I$  is a f.g. ideal, then  $M \subset D(A)$  is called  **$I$ -completely (faithfully) flat/smooth/étale/...** iff  $M \otimes_A^L A/I$  is discrete and is a (faithfully) flat  $A/I$ -module.

$M$  is said to have **finite  $I$ -completely Tor amplitude** if  $M \otimes_A^L A/I$  is a bounded complex in  $D(A/I)$ .

Clearly, any flat/smooth/étale  $A$ -module  $M$  is  $I$ -completely flat/smooth/étale/... for any  $I$ . And  $M$  has finite  $I$ -completely amplitude if  $M$  has a finite resolution of flat  $A$ -modules.  $\lrcorner$

**Prop. (5.9.7.2) [ $I$ -Completely F.F. Descent].** If  $A \rightarrow B \rightarrow B'$  are ring maps and  $I$  is an ideal of  $A$ ,

1. If  $C$  is a  $B$ -algebra and  $B$  is  $I$ -completely f.f. over  $A$ , then  $C$  is  $I$ -completely (f.)f. over  $A$  iff  $C$  is  $I$ -completely (f.)f. over  $B$ .
2. If  $B \rightarrow B'$  is  $I$ -completely flat,  $M$  is a  $B$ -module, then  $M$  is  $I$ -completely flat over  $A$  iff  $M \otimes_B^L B'$  is  $I$ -completely flat over  $A$ .

$\lrcorner$

*Proof:* 1: One direction is easy, for the other, if  $C$  is  $I$ -completely (f.)f. over  $A$ , then

$$C \otimes_A^L A/I = C \otimes_B^L B \otimes_A^L A/I = (C \otimes_B^L B/I) \otimes_{B/I} (B \otimes_A^L A/I)$$

is a discrete and (f.)f.  $C/I$ -module iff  $(C \otimes_B^L B/I)$  does, as  $(B \otimes_A^L A/I)$  is f.f. over  $B/I$ .

2: This is because  $(B' \otimes_B^L M) \otimes_A^L A/I \cong B' \otimes_B^L (M \otimes_A^L A/I)$ .  $\square$

**Prop. (5.9.7.3).** If  $I$  is generated by a Koszul-regular sequence, then any  $A$ -module  $M$  has finite  $I$ -completely Tor amplitude.  $\lrcorner$

*Proof:* This is because  $A/i \cong A \otimes_{\mathbb{Z}[X_1, \dots, X_r]}^L \mathbb{Z}$  in this case, so  $M \otimes_A^L A/I \cong M \otimes_{\mathbb{Z}[X_1, \dots, X_r]}^L \mathbb{Z}$ , which has f.m. homology groups because  $\mathbb{Z}$  has a finite free  $\mathbb{Z}[X_1, \dots, X_n]$ -resolution (5.4.4.1).  $\square$

**Prop. (5.9.7.4) [ $I$ -Completely Flatness and Derived Completion].** Let  $A$  be a commutative ring and  $I$  be f.g., then the derived  $I$ -completion of a  $I$ -completely (faithfully) flat/étale  $M$  is  $I$ -completely (faithfully) flat/étale, both the complex and the module. In fact,  $H^0(\widehat{M}) \otimes_A^L A/I \cong \widehat{M} \otimes_A^L A/I \cong M \otimes_A^L A/I$ .  $\lrcorner$

*Proof:* Because objects in the image of  $D(A/I) \rightarrow D(A)$  are all derived  $I$ -complete, by (5.9.6.7), so there is an isomorphism  $M \otimes_A^L A/I \cong \widehat{M} \otimes_A^L A/I$  for any  $M$ , because they are both left adjoint to  $\text{Mod}_{A/I} \subset D(A)$ , by the definition of derived  $I$ -completion and (5.9.2.10). So  $\widehat{M} \otimes_A^L A/I \cong M \otimes_A^L A/I = M \otimes_A A/I$ , which is a flat  $A/I$ -module.  $\square$

**Prop. (5.9.7.5) [Flatness and Completed Derived Tensor].** The completed derived tensor of a  $I$ -completely flat/étale module is discrete and  $I$ -completely flat/étale.  $\square$

*Proof:* If  $M$  is an  $I$ -completely flat  $A$ -module, then  $M \widehat{\otimes}_A^L B$  is  $I$ -complete and  $I$ -completely flat by (5.9.7.4), and  $(M \widehat{\otimes}_A^L B) \otimes_B^L B/I = H^0(M \widehat{\otimes}_A^L B) \otimes_B^L B/I = M \otimes_A^L B/I$ , because they are both left adjoint of the forgetful functor  $\text{Mod}_{B/I} \subset D(A)$ . Then we have  $M \widehat{\otimes}_A^L B \cong H^0(M \widehat{\otimes}_A^L B)$  is discrete, as they are both  $I$ -complete, by (5.9.6.2) and derived Nakayama.  $\square$

**Prop. (5.9.7.6).**  $A$  is derived  $I$ -completely flat iff  $A$  is  $I^n$ -completely flat for any  $n > 0$ . Moreover, in this case,  $A$  is derived  $J$ -completely flat for any ideal  $J$  that  $I \subset \text{rad } J$ .  $\square$

*Proof:* The exact sequence

$$0 \rightarrow I/I^2 \rightarrow A/I^2 \rightarrow A/I \rightarrow 0$$

induces distinguished triangles

$$(M \otimes_A^L A/I) \otimes_{A/I}^L I/I^2 \rightarrow M \otimes_A^L I/I^2 \rightarrow M \otimes_A^L A/I^2 \rightarrow M \otimes_A^L A/I$$

which shows  $M \otimes_A^L I/I^2$  is discrete,  $= N$ . Then  $N$  is an  $A/I^2$ -module that  $N \otimes_{A/I^2}^L A/I = M/IM$  is  $A/I$ -flat. Then  $N$  is  $A/I^2$  flat: for any  $A/I^2$ -module  $L$ , let  $L' = IL$  and  $L'' = L/IL$  which are both  $A/I$ -modules, then there is a distinguished triangle

$$N \otimes_{A/I^2}^L L' \rightarrow N \otimes_{A/I^2}^L L \rightarrow N \otimes_{A/I^2}^L L''$$

and

$$\begin{aligned} N \otimes_{A/I^2}^L L' &= (N \otimes_{A/I^2}^L A/I) \otimes_{A/I}^L L' = (M/IM) \otimes_{A/I} L' \\ N \otimes_{A/I^2}^L L'' &= (N \otimes_{A/I^2}^L A/I) \otimes_{A/I}^L L'' = (M/IM) \otimes_{A/I} L'' \end{aligned}$$

are both discrete, hence so does  $N \otimes_{A/I^2}^L L$ , implying it is  $A/I^2$ -flat.

In a similar fashion, we can show  $M$  is  $I/I^n$ -flat for any  $n$ . And if  $I \subset \text{rad } J$ , then  $I^n \subset J$ , so  $M \otimes_A^L A/J = (M \otimes_A^L A/I^n) \otimes_{A/I^n}^L A/J$  is discrete and  $A/J$ -flat.  $\square$

**Prop. (5.9.7.7).** Let  $A$  be a ring and  $I$  be an invertible ideal, then any derived  $(p, I)$ -complete and  $(p, I)$ -completely flat  $A$ -complex  $M \in D(A)$  is discrete and  $(p, I)$ -complete. Moreover, for any  $n \geq 0$ , we have  $M[I^n] = 0$  and  $M/I^n M$  has bounded  $p^\infty$ -torsion.  $\square$

*Proof:*  $M$  is  $(I^n, p)$ -completely flat by (5.9.7.6), so we find  $M \otimes_A^L A/I^n$  is  $p$ -completely flat in  $D(A/I^n)$ . Notice that  $A/I^n$  has bounded  $p^\infty$ -torsion by induction ( $I$  invertible used), (5.9.7.11) says  $M \otimes_A^L A/I^n$  is discrete in  $D(A/I^n)$  and has bounded  $p^\infty$ -torsion, and is  $p$ -adically complete. In particular,

$$M \otimes_A^L A/I^n = (M \otimes_A^L A/I^{n+1}) \otimes_{A/I^{n+1}}^L A/I^n$$

So if we denote  $M \otimes_A^L A/I^n = M_n$ , then  $M_n = M_{n+1}/I^n M_{n+1}$ , as  $M$  is derived  $I$ -complete, we have  $M = R\varprojlim (M \otimes_A^L A/I^n)$ , so clearly  $M$  is discrete. And then we have  $M \otimes_A^L AA/I^n = M/I^n M$ , which means  $M[I^n] = 0$ , and  $M/I^n M$  has bounded  $p^\infty$ -torsion. Now because  $M$  is derived  $(p, I)$ -complete,

$$M = R\varprojlim_{m,n} ((M \otimes_A I^n \rightarrow M) \otimes_{A/I^n} (A/I^n \xrightarrow{p^m} A/I^n)) = R\varprojlim_{m,n} (M/I^n \xrightarrow{p^m} M/I^n) = R\varprojlim_{m,n} (M/(I^n, p^n))$$

is  $(p, I)$ -complete.  $\square$

**Lemma (5.9.7.8).** Let  $C$  be a commutative ring with a f.g. ideal  $J$ , and  $D$  a  $C$ -algebra that has finite  $J$ -complete Tor amplitude, then the  $J$ -completed base change operator  $-\hat{\otimes}_C^L D$  commutes with totalization in  $D^{\geq 0}(C)$  and  $D^{\geq 0}(D)$ , i.e. if  $M^\bullet$  is a cosimplicial object with in  $D^{\geq 0}(C)$  with totalization  $M$ , then

$$\mathrm{Tot}(M^\bullet) \hat{\otimes}_C^L D \cong \mathrm{Tot}(M^\bullet \hat{\otimes}_C^L D)$$

via the natural map.  $\lrcorner$

*Proof:* Cf.[Scholze, Prism, 4.22].  $\color{red}?$   $\square$

**Prop. (5.9.7.9)[Elkik's Algebrization Theorem].** Let  $A$  be a commutative ring and  $I$  is a f.g. ideal, then an  $A$ -algebra is derived  $I$ -completely étale/smooth iff it is the derived  $I$ -completion of some étale/smooth  $A$ -algebra.  $\lrcorner$

*Proof:* if it is the derived  $I$ -completion of some étale/smooth algebra, then it is derived  $I$ -completely étale/smooth by (5.9.7.4). Converse, Cf.[A. Arabia, "Relèvements des algèbres lisses et de leurs morphismes", Commentarii Mathematici Helvetici 76 (2001), 607–639.].  $\square$

**Lemma (5.9.7.10).** Let  $A$  be a ring, if  $M$  is an  $A$ -module with bounded  $f^\infty$ -torsion, i.e.  $M[f^\infty] = M[f^c]$  for some  $c > 0$ , then there are maps

$$(M \xrightarrow{f^n} M) \rightarrow M/f^n M, \quad M/f^{n+c} \rightarrow (M \xrightarrow{f^n} M)$$

in  $D(A)$  inducing an equivalence between two pro-objects  $\{M \xrightarrow{f^n} M\}$  and  $\{M/f^n\}$ .  $\lrcorner$

*Proof:* The first map is obvious, for the second map, use the following commutative diagram:

$$\begin{array}{ccc} M/M[f^c] & \xrightarrow{f^{n+c}} & M \\ \downarrow f^c & & \downarrow \\ M & \xrightarrow{f^n} & M \end{array}$$

the upper row is injective thus isomorphic to  $M/f^{n+c}M$ , then this gives the map. It can be checked that this is an equivalence of pro-objects  $\color{red}?$ .  $\square$

**Prop. (5.9.7.11).** Let  $A$  be a commutative ring that has bounded  $f^\infty$ -torsion, then for a  $M \in D(A)$ , the following is equivalent:

- $M$  is derived  $f$ -complete and  $f$ -completely flat.
- $M$  is discrete and is represented by a  $f$ -adically complete module that  $M/f^n M$  is  $A/f^n$ -flat for any  $n > 1$  and  $M$  has bounded  $f^\infty$ -torsion.

Furthermore, in this case,  $M \otimes_A A[f^\infty] = M[f^\infty]$ .  $\lrcorner$

*Proof:* By (5.9.7.10),  $\{A/f^n A\}$  and  $\{Kos(A, f^n)\}$  are two equivalence pro-objects in  $D(A)$ . So if 1 or 2 holds, then  $M$  is derived  $f$ -complete, so

$$M = R\lim(M \otimes_A^L Kos(A, f^n)) = R\lim(M \otimes_A^L A/f^n A).$$

Now if 1 holds, then  $M_n = M \otimes_A^L A/f^n A$  is discrete by (5.9.7.6), and  $M_n = M_{n+1}/f^n M_{n+1}$  is surjective:

$$M \otimes_A^L A/f^n A = (M \otimes_A^L A/f^{n+1} A) \otimes_{A/f^{n+1} A}^L A/f^n.$$

So  $M = R\lim(M \otimes_A^L A/f^n A)$  is discrete. Then  $M \otimes_A A/f^n = M \otimes_A^L A/f^n$  is flat over  $A/f^n$ .

Next we prove  $M \otimes_A A[f^\infty] = M[f^\infty]$ : There is an exact sequence

$$0 \rightarrow (A[f^n])[1] \rightarrow \text{Kos}(A, f^n) \rightarrow A/f^n \rightarrow 0$$

Then tensoring  $M \otimes_A^L$  gives a distinguished triangle

$$(M \otimes_A^L A[f^n])[1] \rightarrow \text{Kos}(M, f^n) \rightarrow M \otimes_A^L A/f^n.$$

Notice that

$$M \otimes_A^L A[f^n] = (M \otimes_A^L A/f^n) \otimes_{A/f^n}^L A[f^n] = (M \otimes_A A/f^n) \otimes_{A/f^n}^L A[f^n] = M \otimes_A A[f^n]$$

by flatness, so the distinguished triangle shows  $M \otimes_A A[f^n] \cong H^{-1}(\text{Kos}(M, f^n)) = M[f^n]$ .

Conversely, if 2 holds, then there are equivalences of pro-objects

$$\{M \otimes_A^L A/f^n\} \cong \{M \otimes_A^L \text{Kos}(A, f^n)\} = \{\text{Kos}(M, f^n)\} \cong \{M/f^n M\}$$

by (5.9.7.10) as  $M$  has bounded  $f^\infty$ -torsion. So

$$\widehat{M} = R\lim\{M \otimes_A^L \text{Kos}(A, f^n)\} = R\lim\{M/f^n M\} = M[0]$$

so  $M$  is derived  $p$ -complete. And the constant system

$$\{M \otimes_A^L A/f\} = \{M \otimes_{A/f^n}^L A/f^n \otimes_{A/f^n}^L A/f\} \cong \{M/f^n M \otimes_{A/f^n}^L A/f\} = \{M/fM\}$$

where we used  $M/f^n M$  is  $A/f^n$ -flat. So  $M \otimes_A^L A/f \cong M/fM$  is flat over  $A/f$ .  $\square$

## 8 Duality

**Def. (5.9.8.1) [Dualizing Complexes].** Let  $A$  be a Noetherian ring, then a **dualizing complex** for  $A$  is a complex  $\omega_A \in D(A)$  s.t.

- $\omega_A$  has finite injective dimension.
- $H^i(\omega_A)$  are all finite  $A$ -modules.
- $A[0] \rightarrow R\text{Hom}(\omega_A, \omega_A)$  is a quasi-isomorphism.

┘

**Prop. (5.9.8.2) [Dualizing Complex is Local].** Let  $A$  be a Noetherian ring,

- If  $B = S^{-1}A$  and  $\omega_A \in D(A)$  is a dualizing complex for  $A$ , then  $\omega_A \otimes_A^L B$  is a dualizing complex for  $B$ .
- If  $(f_1, \dots, f_n) = (1) \in A$ , and  $\omega_A \in D(A)$  satisfies  $(\omega_A)_{f_i}$  are dualizing complexes for  $A_{f_i}$  for any  $i$ , then  $\omega_A$  is a dualizing complex for  $A$ .

┘

*Proof:* Cf. [Sta]0A7G, 0A7H.  $\square$

**Def. (5.9.8.3) [Dualizing Modules].** Let  $(A, \mathfrak{m}, k)$  be a Noetherian local ring and  $\omega_A$  a normalized dualizing complex for  $A$ , then  $[\omega_A] = H^{-\dim A}(\omega_A)$  is called a **dualizing module** for  $A$ .  $\square$

**Def. (5.9.8.4) [Relative Dualizing Complex].** Cf. [Sta]0E9M.  $\square$

### Quasi-Finite Case

Cf. [Sta]Chap49.4.

**Prop. (5.9.8.5).**  $\square$

## 6 | Homotopy Theory

### 6.1 Operads

References are [Operads in algebra, topology and physics, Stasheff].

#### 1 Topological Operads

**Def. (6.1.1.1) [Endomorphism Operads].** For  $X \in \mathbf{Set}$ , then **endomorphism operad**  $\mathrm{End}_X$  is defined to be the collection of sets  $\{\mathrm{Func}(X^n, X)\}_{n \in \mathbb{Z}_+}$  together with maps

$$\circ_i : \mathrm{Func}(X^n, X) \times \mathrm{Func}(X^m, X) \rightarrow \mathrm{Func}(X^{m+n-1}, X)$$

for  $m, n \in \mathbb{Z}_+, i \in [n]_+$  given by

$$(f \circ_i g)(x_1, \dots, x_{m+n-1}) = f(x_1, \dots, x_{i-1}, g(x_i, \dots, x_{i+m-1}), x_{i+m}).$$

┘

**Def. (6.1.1.2) [Operads].** For  $\mathcal{C} \in \mathbf{Cat}$  be a monoidal category, an **operad**  $(\mathcal{O}, \circ_i)$  in  $\mathcal{C}$  is defined to be a collection of objects  $\{\mathcal{O}(n)\}_{n \in \mathbb{Z}} \in \mathcal{C}$  and maps  $\circ_i : \mathcal{O}(n) \times \mathcal{O}(m) \rightarrow \mathcal{O}(m+n-1)$ , s.t. they satisfy relations manifested in the endomorphism operads (6.1.1.1). ? Cf. [Operads in algebra, topology and physics, Stasheff]P

┘

**Example (6.1.1.3) [Operads].**

- The **tree operad** is defined to be the operad  $(\mathcal{T}(n), \circ_i) \in \mathbf{Set}$  where  $\mathcal{T}(n)$  is the set of trees with one root and  $n$  leaves labeled from 1 to  $n$ . And  $f \circ_i g$  is just the tree obtained by grafting the root of  $g$  to the  $i$ -th leaf of  $f$ .
- The  $r$ -dimensional **little cube operad** is defined to be the operad  $(\mathcal{C}_r(n), \circ_i) \in \mathbf{Set}$  where  $\mathcal{C}_r(n)$  is the set of an ordered collection of  $j$   $r$ -cubes linearly embedded in the standard  $r$ -dimensional unit cube  $\mathbb{I}^r$  with disjoint interiors and axes parallel to those of  $\mathbb{I}^r$ . And  $f \circ_i g$  is just the collection obtained by scaling  $g$  into the  $i$ -th cube of  $f$ .

┘

#### 2 Algebras over Operads

**Def. (6.1.2.1) [Algebras over Operads].** Let  $(\mathcal{O}, \circ_i)$  be an operad in  $\mathcal{C}$  (6.1.1.2), then an **algebra over operad**  $\mathcal{O}$  is an object  $A \in \mathcal{C}$  with a map of operads  $(\mathcal{O}, \circ_i) \rightarrow \mathrm{End}_A$ .

┘

### 3 Operads in Topology

**Notation (6.1.3.1).**

- All topological spaces are assumed to be Hausdorff and compactly generated.

┘

**Thm. (6.1.3.2) [Loop Spaces and Operads, Boardman-Vogt/May].** If  $Y \in \mathcal{T}\text{op}$  is connected and has the homotopy type of a CW-complex, then  $Y$  has the homotopy type of a  $n$ -fold loop space  $\Omega^n X$  iff  $Y$  is an algebra over the operad  $\mathcal{C}^r$  (6.1.1.3). ┘

### 7.1 Sites, Sheaves, Topoi and Stacks

*“I can illustrate the second approach with the same image of a nut to be opened. The first analogy that came to my mind is of immersing the nut in some softening liquid, and why not simply water? From time to time you rub so the liquid penetrates better, and otherwise you let time pass. The shell becomes more flexible through weeks and months—when the time is ripe, hand pressure is enough, the shell opens like a perfectly ripened avocado! A different image came to me a few weeks ago. The unknown thing to be known appeared to me as some stretch of earth or hard marl, resisting penetration... the sea advances insensibly in silence, nothing seems to happen, nothing moves, the water is so far off you hardly hear it... yet it finally surrounds the resistant substance.”*  
 –A. Grothendieck

References are [D-M69, Vis08, Ols16, Sta] and [Fibered Category to Algebraic Stacks, Lamb].

#### Notation(7.1.0.1).

- Use notations on categories defined in [Categories II](#).

┘

#### 1 Sites

**Def. (7.1.1.1)[Sites].** A **site** is given by a category  $\mathcal{C} \in \mathbf{Cat}$  and a set  $\mathbf{Cov}(\mathcal{C})$  of families of morphisms with fixed target, called the **coverings** of  $\mathcal{C}$  that:

- An isomorphism is a covering.
- Coverings of coverings are coverings.
- Base change of a covering is a covering.

Sometimes a site is wrongly called a **topology**, the difference is that the morphism of site is looks like a reverse of a morphism of topology(7.1.1.7). We never talk about the category of sites, but we use  $\mathcal{C} \in \mathbf{Site}$  to mean that  $\mathcal{C}$  is a site.

┘

**Def. (7.1.1.2)[Discrete Topology].** A **discrete topology** is a site that the only coverings are identities. In this way, we can regard any category as a site.

┘

**Def. (7.1.1.3)[Topological Basis].** For  $\mathcal{C} \in \mathbf{Site}$ , a **topological basis** for  $\mathcal{C}$  is a subset  $\mathfrak{G} \subset \mathbf{Ob}(\mathcal{C})$  s.t. for any  $U \in \mathcal{C}$ , there is a covering  $\{U_i \rightarrow U\} \in \mathbf{Cov}(\mathcal{C})$  where each  $U_i \in \mathfrak{G}$ .

┘

**Def. (7.1.1.4)[Quasi-Compact Objects].** In a site  $\mathcal{C} \in \mathbf{Site}$ , an object  $U \in \mathcal{C}$  is called **quasi-compact** if each covering of  $U$  has a finite subcovering. The site  $\mathcal{C}$  is called **Noetherian** if each object of  $\mathcal{C}$  is quasi-compact.

Given a site  $\mathcal{C}$ , we can define a new site  $\mathcal{C}^f$  whose coverings are coverings of  $\mathcal{C}$  that are finite. Then this is truly a site and it is Noetherian.  $\lrcorner$

**Def. (7.1.1.5) [Quasi-Separated Objects].** In a site  $\mathcal{C} \in \text{Site}$ , an object  $X \in \mathcal{C}$  is called **quasi-separated** if for any pair of morphisms  $U \rightarrow X \leftarrow V$  where  $U, V$  are quasi-compact object (7.1.1.4), the fiber product  $U \times_X V$  is also quasi-compact.  $\lrcorner$

**Def. (7.1.1.6) [Comma Topology].** For a site  $\mathcal{C}$  and an object  $S$ , we have the comma category  $\mathcal{C}/S$  (4.1.1.17), and we can define a topology on it where the coverings are coverings of  $\mathcal{C}$  that is compatible over  $S$ .  $\lrcorner$

**Def. (7.1.1.7) [Continuous Functor].** A **continuous functor** between sites  $\mathcal{C} \rightarrow \mathcal{D}$  is a functor that preserves coverings and any base change by morphisms in a covering?  $\lrcorner$

A **morphism of sites**  $\mathcal{C} \rightarrow \mathcal{D}$  is given by a continuous functor  $u : \mathcal{D} \rightarrow \mathcal{C}$  that  $u_s$  (7.1.2.11) is exact.  $\lrcorner$

This exact condition is easy to be satisfied, by (7.1.2.14).  $\lrcorner$

**Def. (7.1.1.8) [Cocontinuous functors].** A **cocontinuous functor** between sites  $u : \mathcal{C} \rightarrow \mathcal{D}$  is a functor that for any  $U \in \mathcal{C}$  and any covering  $\{V_i \rightarrow u(U)\}$  in  $\mathcal{D}$ , there is a covering  $\{U_i \rightarrow U\} \in \mathcal{C}$  that refines  $\{V_i \rightarrow u(U)\}$  after the functor  $u$ .  $\lrcorner$

### Topologies and Sieves

**Def. (7.1.1.9) [Sieves].** For a covering  $\mathcal{U} = \{U_i \rightarrow U\}$  in a category  $\mathcal{C}$ , define a subfunctor  $h_{\mathcal{U}} \subset h_U$ , where for each  $X$   $h_{\mathcal{U}}(X)$  consists of elements in  $\text{Hom}(X, U)$  that factor through some  $U_i \rightarrow U$ .  $\lrcorner$

A **sieve**  $S$  on  $U$  is a subfunctor of  $h_U$ . Notice that any sieve must be of the form  $h_{\mathcal{U}}$ , by choosing  $\mathcal{U}$  to consist of all arrows in  $\{S(T)\}_{T \in \mathcal{C}}$ .  $\lrcorner$

**Def. (7.1.1.10).** If  $\mathcal{T}$  is a Grothendieck topology on a category  $\mathcal{C}$ , then a sieve  $S \subset h_U$  over  $U$  is said to **belong to**  $\mathcal{T}$  or just a sieve of the site  $\mathcal{C}$  if there exists a covering  $\mathcal{U}$  of  $U$  that  $h_{\mathcal{U}} \subset S$ .  $\lrcorner$

### G-Spaces

**Def. (7.1.1.11) [G-Spaces].** A **G-space** is a set  $X$  with a family of subsets of  $X$  that they form a site w.r.t inclusions and that covering are all set-theoretic coverings (but not necessarily conversely). These subsets are called **admissible opens** of  $X$  and covers are called **admissible covers**. (In other words, a G-topological space is a "topological space without unions"). Morphisms of G-spaces are maps that are simultaneously a continuous map and a morphism of sites.  $\lrcorner$

**Def. (7.1.1.12) [Completeness].** The completeness of a G-topological space  $X$ :

- G0:  $\emptyset$  and  $X$  are admissible open.
- G1: Let  $\{U_i \rightarrow U\}$  be an admissible cover, then a subset  $V \subset U$  is admissible if  $V \cap U_i$  are all admissible.
- G2: Let  $\{U_i \rightarrow U\}$  be a cover of admissible opens for  $U$  admissible, then the cover is admissible if it has an admissible cover as a refinement.  $\lrcorner$

**Lemma (7.1.1.13) [Admissible is Local].** If G<sub>2</sub> is satisfied for a G-topological space  $X$ , then for an admissible covering  $\{X_i \rightarrow X\}$  and another covering  $\{U_i \rightarrow X\}$  between admissible opens, it is admissible iff  $U_i \cap X_j$  is an admissible covering for  $X_j$  for each  $j$ . (By composition,  $\{U_i \cap X_i \rightarrow X\}$  is admissible, and it refines  $\{U_i \rightarrow X\}$ ).  $\lrcorner$

**Prop.(7.1.1.14) [Glue of Complete G-topological spaces].** For sets  $\cup X_i = X$ , if there are Grothendieck category  $\mathcal{I}_i$  on  $X_i$  making  $X_i$  into a G-topological space, and they all satisfies the completeness conditions  $G_0, G_1, G_2$  of (7.1.1.12). Assume that  $X_i \cap X_j$  is  $\mathcal{I}_i$ -open in  $X_i$  and  $\mathcal{I}_i, \mathcal{I}_j$  restrict to the same topology on  $X_i \cap X_j$ , then there is a unique Grothendieck category  $\mathcal{I}$  on  $X$  making  $X$  a G-topological space that:

- $X_i$  is  $\mathcal{I}$ -open and  $\mathcal{I}$  restricts to  $\mathcal{I}_i$  on  $X_i$ ,
- $\mathcal{I}$  satisfies the completeness conditions  $G_0, G_1, G_2$ .
- $X_i$  is a  $\mathcal{I}$ -covering of  $X$ .

┘

*Proof:* By (7.1.1.12) and (7.1.1.13), the uniqueness is straightforward, for the existence,

- check Grothendieck first: Composition, base change.
- check condition 1: by hypothesis, and (7.1.1.12) applied to  $X_i \cap X_j \rightarrow X_i$  (this is admissible because  $\text{id}_{X_i}$  refined it).
- check condition 2:  $G_0$  obvious,  $G_1$  by if  $V \cap U_i \cap X_i$  admissible, then  $V \cap X_i$  admissible by admissibility of  $U_i \rightarrow U$ , then  $V$  is admissible,  $G_2$ : obvious
- check condition 3: because  $X_i \cap X_j \rightarrow X_i$  is admissible.

□

**Def.(7.1.1.15).** A G-topological space is called **connected** iff there isn't two nonempty admissible open subset  $X_1, X_2$  that  $X_1 \cap X_2 = \emptyset$  and  $\{X_1, X_2 \rightarrow X\}$  is an admissible cover. ┘

### G-torsor

**Def.(7.1.1.16) [Torsors].** Let  $\mathcal{C}$  be a site and  $\mathcal{G} \in \text{Sh}^{\text{grp}}(\mathcal{C})$ , then a **pseudo G-torsor** is a sheaf  $\mathcal{F} \in \text{Sh}^{\text{set}}(\mathcal{C})$  endowed with an action  $\mathcal{G} \times \mathcal{F} \rightarrow \mathcal{F}$  s.t.  $\mathcal{G} \times \mathcal{F} \rightarrow \mathcal{F} \times \mathcal{F} : (g, f) \mapsto (gf, f)$  is an isomorphism.

A pseudo G-torsor is called a **G-torsor** if for any  $U \in \mathcal{C}$ , there is a covering  $\{U_i \rightarrow U\}$  that  $\mathcal{F}(U_i) \neq \emptyset$  for each  $i$ . ┘

**Prop.(7.1.1.17).** Situation as in (7.1.1.16), a G-torsor on  $\mathcal{C}$  is trivial iff  $\Gamma(\mathcal{C}, \mathcal{F}) \neq \emptyset$  (7.3.1.1). ┘

*Proof:* This is because the transitive action of  $\mathcal{G}$  on the global section induces an isomorphism  $\mathcal{G} \rightarrow \mathcal{F}$ . □

**Prop.(7.1.1.18).** If  $\mathcal{C}$  is a subcanonical site, and  $\mathcal{G} \in \text{Sh}^{\text{grp}}(\mathcal{C})$ , then  $\mathcal{F} \in \text{Sh}^{\text{set}}(\mathcal{C})$  together with an action  $\alpha : \mathcal{G} \times \mathcal{F} \rightarrow \mathcal{F}$  is a G-torsor iff for any  $U \in \mathcal{C}$ , there is a covering  $\{U_i \rightarrow U\}$  that the restrictions to  $U_i$  are trivial torsors, i.e.  $\alpha|_{\mathcal{C}/U_i} = \pi_2 : \mathcal{G}|_{U_i} \times \mathcal{F}|_{U_i} \rightarrow \mathcal{F}|_{U_i}$ . ┘

*Proof:* If  $\mathcal{F}$  is a G-torsor, then the restrictions of the torsor on  $U_i$  are trivial because they have global sections in  $\Gamma(\mathcal{C}/U_i, \mathcal{F}) = \mathcal{F}(U_i)$ , by (7.1.1.17). Conversely, if there is a covering  $\{U_i \rightarrow U\}$  that the restrictions to  $U_i$  are trivial torsors, then the map  $\mathcal{G} \times \mathcal{F} \rightarrow \mathcal{F} \times \mathcal{F} : (g, f) \mapsto (gf, f)$  are isomorphisms when restricted to  $U_i$ , which means  $\mathcal{G}(U) \times \mathcal{F}(U) \rightarrow \mathcal{F}(U) \times \mathcal{F}(U)$  is an isomorphism for any  $U$ , because they are sheaves, so it is an isomorphism, and  $\mathcal{F}$  is a G-torsor. □

**Cor.(7.1.1.19) [Representable G-Torsor].** If  $\mathcal{C} \in \text{Site}$  and  $G \in \text{Grp}(\mathcal{C})$ , then

- $X \rightarrow Y$  is a G-torsor (in the category  $\mathcal{C}/Y$ ) (7.1.1.16) iff  $X \rightarrow Y$  is a G-equivariant map (where the action of  $G$  on  $Y$  is trivial),  $G \times X \rightarrow X \times_Y X : (g, x) \mapsto (gx, x)$  is an isomorphism, and  $\{X \rightarrow Y\}$  is refined by a covering of  $Y$ .

- If  $\mathcal{C}$  is a subcanonical site, then  $X \rightarrow Y$  is a  $G$ -torsor in the category  $\mathcal{C}/Y$  iff  $X \rightarrow Y$  is a  $G$ -equivariant map (where the action of  $G$  on  $Y$  is trivial), and there exists a covering  $\{Y_i \rightarrow Y\}$  that each  $Y_i \times_Y X \rightarrow Y_i$  is a trivial torsor, i.e.  $G$ -equivariantly isomorphic to  $G \times Y_i \rightarrow Y_i$ .  $\lrcorner$

**Cor. (7.1.1.20).** If  $\mathcal{C} \in \text{Site}$ ,  $G \in \text{Grp}(\mathcal{C})$  and  $X \rightarrow Y$  is a  $G$ -torsor (7.1.1.16), then the map  $G \times G \times X \rightarrow X \times_Y X \times_Y X : (g, h, x) \mapsto (ghx, hx, x)$  is an isomorphism.  $\lrcorner$

### Presheaves

**Def. (7.1.1.21) [Presheaves].** Let  $\mathcal{C}, \mathcal{D} \in \text{Cat}$ , then a **presheaf** of objects in  $\mathcal{D}$  on  $\mathcal{C}$  is a functor  $\mathcal{C}^{op} \rightarrow \mathcal{D}$ . The category of presheaves of objects in  $\mathcal{D}$  on  $\mathcal{C}$  is denoted by  $\mathcal{PSh}(\mathcal{C}; \mathcal{D})$ . For any  $U \in \mathcal{C}$ ,  $\Gamma(U, -)$  is the functor  $\mathcal{PSh}(\mathcal{C}; \mathcal{D}) \rightarrow \mathcal{D} : F \mapsto F(U)$ .  $\lrcorner$

**Prop. (7.1.1.22).** If  $\mathcal{D}$  is complete or cocomplete, and the same is true for  $\mathcal{PSh}(\mathcal{C}; \mathcal{D})$ .  $\lrcorner$

**Def. (7.1.1.23) [Coherent Sheaves].** For  $\mathcal{C} \in \text{Cat}$ , denote  $\mathcal{PSh}_\infty(\mathcal{C}) = \mathcal{PSh}(\mathcal{C}; \text{Grpd}_\infty)$  (4.7.2.5), called the category of **coherent sheaves** on  $\mathcal{C}$ . It is complete and cocomplete.  $\lrcorner$

**Def. (7.1.1.24) [Points].** A **point of a site** is a Cf. [Sta]00Y3.  $\lrcorner$

## 2 Sheaves and Topoi

**Def. (7.1.2.1) [Sheaves].** Let  $\mathcal{C}$  be a site and  $\mathcal{D} \in \text{Cat}_\infty$ , then  $\mathcal{F} \in \mathcal{PSh}(\mathcal{C}; \mathcal{D})$  is called a **sheaf** of objects in  $\mathcal{D}$  on  $\mathcal{C}$  iff for any sieve  $\mathcal{S}$  on  $U$  belong to  $\mathcal{C}$ , the natural map

$$\text{Map}(\downarrow_U, \mathcal{F}) \rightarrow \text{Map}(\downarrow_{\mathcal{U}}, \mathcal{F})$$

is an equivalence ?.  $\lrcorner$

**Def. (7.1.2.2) [Separate Presheaves].** Let  $\mathcal{C}$  be a site, then  $\mathcal{F} \in \mathcal{PSh}^{\text{Set}}(\mathcal{C})$  is called a **separated presheaf** if  $F(U) \hookrightarrow \prod_i F(U_i)$  is injective for any covering  $\mathcal{U} = \{U_i \rightarrow U\} \in \text{Cov}(\mathcal{C})$ .  $\lrcorner$

**Def. (7.1.2.3) [Effective Epimorphisms].** An epimorphism  $\{U_i \rightarrow V\}$  in a category is called a **family of effective epimorphisms** if

$$\text{Hom}(V, Z) \rightarrow \prod \text{Hom}(U_i, Z) \rightrightarrows \prod \text{Hom}(U_i \times_V U_j, Z)$$

is exact for each  $Z$ . Similarly for a **family of universal effective epimorphisms**.  $\lrcorner$

**Prop. (7.1.2.4) [Subcanonical Site].** The class of all families of universal effective epimorphisms in a category forms a Grothendieck topology, called the **canonical topology**. It is the finest topology that all representable presheaves are sheaves.

Topologies that are coarser than the canonical topology are called **subcanonical topology**. Equivalently, a subcanonical topology is a topology that every representable presheaf is a sheaf.  $\lrcorner$

*Proof:* We only need to verify that family of universal effective epimorphisms is closed under composition. For this, first prove epimorphism, then use epimorphism to prove effectiveness. Universal follows routinely. Cf. [Tamme].  $\square$

**Prop. (7.1.2.5).** For a subcanonical topology on a site  $\mathcal{C}$ , its restriction on a localizing category  $\mathcal{C}/S$  is subcanonical.  $\lrcorner$

*Proof:* The only nontrivial part is that the glued morphism is a morphism over  $S$ . For this, consider its composition that maps to  $S$ , then the uniqueness of the exact sequence (7.1.2.3) will show that it is truly a  $S$ -morphism.  $\square$

**Prop. (7.1.2.6).** Let  $\mathcal{C}$  be a subcanonical site, and  $f : X \rightarrow Y$  is an arrow in  $\mathcal{C}/S$ , suppose there is a covering  $\{S_i \rightarrow S\}$  that the pullback of  $f$  to  $\mathcal{C}/S_i$  are all isomorphisms, then  $f$  is an isomorphism.  $\lrcorner$

*Proof:* This follows from (7.1.3.7) and (7.1.3.9).  $\square$

**Prop. (7.1.2.7) [Sheafification].** Let  $\mathcal{C}$  be a site, consider the functor

$$(\cdot)^+ : \mathcal{PSh}^*(\mathcal{C}) \rightarrow \mathcal{Sh}^*(\mathcal{C}) : F^+(U) = \varinjlim \ker\left(\prod_i F(U_i) \rightrightarrows \prod_{i,j} F(U_i \times_U U_j)\right) = \check{H}^0(U, F).$$

Then

- For  $F \in \mathcal{PSh}^*(\mathcal{C})$ ,  $F^+$  is separated.
- If  $F \in \mathcal{PSh}^*(\mathcal{C})$  is separated,  $F \rightarrow F^+$  is injective and  $F^+ \in \mathcal{Sh}^*(\mathcal{C})$ . (The problem of separated is that the cover may not be identical in  $U_i \times_U U_j$  but only on a cover of it).
- $(\cdot)^+$  is left exact.
- **sheafification functor**  $(\cdot)^\# : \mathcal{PSh}^* \rightarrow \mathcal{Sh}^* : F \mapsto F^\# = F^{++}$  is exact and it is left adjoint to the forgetful functor.

So the forgetful functor is left exact and it preserves injectives. Thus the sheaf cokernel is the sheafification of the presheaf kernel, the sheaf kernel is the presheaf kernel.  $\lrcorner$

*Proof:* The separatedness is simple. For sheaf condition, an element of  $F^+(U_i)$  is represented by a covering  $\{V_{ij} \rightarrow U_i\}$ , and there restriction to  $U_i \times_U U_j$  coincide by separatedness hence the covering  $\{V_{ij} \rightarrow U\}$  is an element of  $F^+(U)$ .

$\mathcal{Sh}$  is left exact because  $(-)^+$  is left exact from  $\mathcal{PSh}^*$  to  $\mathcal{PSh}^*$  by (7.3.2.4) checked on every element  $U$ . It is right exact trivially, hence it is exact.  $\square$

**Def. (7.1.2.8) [Constant Sheaves].** The **constant sheaf**  $\underline{S}$  for a set  $S$  is the sheafification of the constant presheaf  $U \mapsto S$ .  $\lrcorner$

### Transfer of Sheaves under Morphisms of Sites

**Def. (7.1.2.9) [Functoriality of Presheaves].** Given a functor of sites  $u : \mathcal{C} \rightarrow \mathcal{C}'$ , which should be regarded as an inverse map, there are maps

$$u^p F'(U) = F'(u(U)) : \mathcal{PSh}(\mathcal{C}') \rightarrow \mathcal{PSh}(\mathcal{C}), \quad u_p(F)(U') = \varinjlim_{U_i | U' \rightarrow u(U_i)} F(U_i) : \mathcal{PSh}(\mathcal{C}) \rightarrow \mathcal{PSh}(\mathcal{C}')$$

Then  $u_p$  is left adjoint to  $u^p$ .

We can also define a functor

$${}_p u : {}_p u(F)(U') = \varprojlim_{\{U_i | u(U_i) \rightarrow U'\}^{op}} F(U_i) : \mathcal{PSh}(\mathcal{C}) \rightarrow \mathcal{PSh}(\mathcal{C}').$$

Then this functor is right adjoint to  $u^p$ , by duality.  $\lrcorner$

*Proof:* A map  $f \in \text{Mor}(u_p(F), G)$  is represented by compatible maps

$$\varinjlim_{U_i: U' \rightarrow u(U_i)} F(U_i) \rightarrow G(U'),$$

and this is represented by compatible maps  $F(U_i) \rightarrow G(U')$  which is indexed over  $\prod_{U' \in \mathcal{C}'} \mathcal{I}_{U'}$ , where  $\mathcal{I}_{U'} = \{U_i : U' \rightarrow u(U_i)\}$ . Now this is equivalent to compatible maps  $F(U_i) \rightarrow G(u(U_i))$ , which is a map  $g \in \text{Mor}(F, u^p(G))$ .  $\square$

**Cor. (7.1.2.10).**  $u^p$  is exact.  $\lrcorner$

**Def. (7.1.2.11) [Functoriality of Sheaves].**

- Given a continuous functor  $u : \mathcal{C} \rightarrow \mathcal{C}'$  between sites, there are maps

$$u_s = \sharp \circ u_p \circ \iota : \mathcal{S} \rightarrow \mathcal{S}', \quad u^s = u^p \circ \iota : \mathcal{S}' \rightarrow \mathcal{S}.$$

$u_s$  is left adjoint to  $u^s$ , by adjointness of  $u_p, u^p$  and  $\sharp, \iota$ .

- Given a cocontinuous functor  $u : \mathcal{C} \rightarrow \mathcal{C}'$  between sites, there are maps

$$u^s = \sharp \circ u^p \circ \iota : \mathcal{S}' \rightarrow \mathcal{S}, \quad {}_s u = {}_p u \circ \iota : \mathcal{S} \rightarrow \mathcal{S}'.$$

$u^s$  is left adjoint to  ${}_s u$ , by adjointness of  $u^p, {}_p u$  and  $\sharp, \iota$ . Moreover,  $u^s$  is exact.  $\lrcorner$

*Proof:* 1: Notice if  $\mathcal{F}$  is a sheaf, then  $u^s \mathcal{F}$  is also a sheaf, by continuity (7.1.1.7).

2:  ${}_p u \mathcal{F}$  is a sheaf by [Sta]00XK?.  $u^p$  is clearly right exact, and it is left exact because  $\iota, \sharp$  do, and  $u^p$  is exact by (7.1.2.10).  $\square$

**Cor. (7.1.2.12).** When  $u$  is continuous,  $(u_p(G))^\sharp \cong (u_p(G^\sharp))^\sharp$  for any presheaf  $G$  on  $T$ .

When  $u$  is cocontinuous,  $(u^p G)^\sharp \cong (u^p(G^\sharp))^\sharp$  for any presheaf  $G$  on  $T$ .  $\lrcorner$

*Proof:* Use Yoneda lemma.  $\square$

**Prop. (7.1.2.13).** For  $Z \in T$ ,  $u_p h_Z = h_{u(Z)}$ .  $\lrcorner$

*Proof:* Use the adjointness of  $u_p, u^p$  (7.1.2.9), then for any presheaf  $F$ ,

$$\text{Hom}(u_p h_Z, F) = \text{Hom}(h_Z, u^p F) = f^p(F)(Z) = F(f(Z)),$$

thus we are done by Yoneda lemma.  $\square$

**Prop. (7.1.2.14) [When is  $u_s$  Exact].** If  $u : \mathcal{C} \rightarrow \mathcal{C}'$  is a continuous functor between sites that  $\mathcal{I}_{U'}$  is cofiltered for any  $U' \in \mathcal{C}'$ , where  $\mathcal{I}_{U'}$  is the category of all pairs  $(U, \varphi)$  where  $U \in \mathcal{C}$  and  $\varphi : U' \rightarrow u(U)$ , then  $u_s$  is exact.

In particular, this is the case when  $\mathcal{C}, \mathcal{C}'$  both have weakly final objects and finite fiber products and  $u$  preserves them. Notice the condition of weakly final objects can be released if we can show  $\mathcal{I}_{U'}$  is nonempty for any  $U'$ .  $\lrcorner$

*Proof:* It suffices to show the left exactness of  $u_p$ . By definition,  $u_p(U') = \varinjlim_{\mathcal{I}_{U'}^{op}} F_{U'}$  where  $F_{U'}$  is the covariant functor  $(U, \varphi) \rightarrow F(U)$ . Because  $\mathcal{I}_{U'}^{op}$  is filtered, this colimit process is exact form  $\text{Hom}(\mathcal{I}_{U'}^{op}, \mathcal{A}b)$  to  $\mathcal{A}b$  and  $u_p$  is exact. Now shification is also exact (7.1.2.7), so we conclude.

The last assertion is clear. (Notice the weakly-final object are used to assure  $\mathcal{I}_{U'}$  is nonempty.)  $\square$

**Prop. (7.1.2.15) [Localization Site].** For a site  $T$  and  $Z \in T$ , there is a site  $T/Z$  as objects over  $T$ , and  $i : T/Z \rightarrow T$  is continuous. Then  $i^s$  is exact.  $\lrcorner$

*Proof:*  $R^q i^s(F) = (i^p(\mathcal{H}^q(F)))^\sharp$  (7.3.1.7), and  $(\mathcal{H}^q(F))^\sharp = 0$  (7.3.2.14), so it suffices to show  $i^p$  and  $\sharp$  commutes. But  $i^s$  and  $+$  commutes obviously.  $\square$

**Prop. (7.1.2.16) [Sheaf Condition is Local].** To check sheaf condition for presheaf w.r.t. a topology, it suffice to show that for any covering, there is a refinement covering of it that sheaf condition hold, because by the definition of sheafification functor,  $F^+ = F$ , so  $F$  is a sheaf.  $\lrcorner$

**Cor. (7.1.2.17).** For two topology on a same category that  $\mathcal{I}'$  is finer than  $\mathcal{I}$ , then any  $\mathcal{I}'$ -sheaf is a  $\mathcal{I}$ -sheaf. And if any covering in  $\mathcal{I}'$  can be refined by a covering in  $\mathcal{I}$ , then  $\mathcal{S} \rightarrow \mathcal{S}'$  is an equivalence of categories. In particular, if  $T$  is Noetherian,  $\mathcal{S}(T)$  and  $\mathcal{S}(T^f)$  (7.1.1.4) are equivalent.  $\lrcorner$

### Topoi

**Def. (7.1.2.18) [Topoi].** A **topos** is an Abelian category that is equivalent to the category of sheaves  $\text{Sh}^{\text{Set}}(\mathcal{C})$  on a site  $\mathcal{C}$ . A **morphism of topoi**  $f : \text{Sh}^{\text{Set}}(\mathcal{C}) \rightarrow \text{Sh}^{\text{Set}}(\mathcal{D})$  is an adjunction

$$f^{-1} : \text{Sh}^{\text{Set}}(\mathcal{D}) \rightleftarrows \text{Sh}^{\text{Set}}(\mathcal{C}) : f_*$$

s.t.  $f^{-1}$  is exact. Compositions of morphisms of topoi are defined routinely. A **2-morphism of topoi** between two morphisms of topoi  $f, g : \text{Sh}^{\text{Set}}(\mathcal{C}) \rightarrow \text{Sh}^{\text{Set}}(\mathcal{D})$  is a natural transformation  $t : f_* \rightarrow g_*$ .  $\lrcorner$

**Prop. (7.1.2.19) [Presheaves and Topoi].**  $\mathcal{C} \in \text{Cat}$  is a Grothendieck category iff it is a left exact, reflective accessible localization (4.1.2.10) of  $\mathcal{P}\text{Sh}^{\text{Set}}(\mathcal{A})$  for some  $\mathcal{A} \in \text{Cat}$ .  $\lrcorner$

### Sites and Topoi

**Prop. (7.1.2.20) [Continuous Maps and Topoi].** A morphism of sites  $f : \mathcal{D} \rightarrow \mathcal{C}$  consists of a continuous functor  $u : \mathcal{C} \rightarrow \mathcal{D}$  that  $u_s$  is exact, so it induces a functor of topoi  $f : \text{Sh}^{\text{Set}}(\mathcal{C}) \rightarrow \text{Sh}(\mathcal{D})$ , if we define  $f^{-1} = u_s, f_* = u^s$ , by (7.1.2.11).  $\lrcorner$

**Prop. (7.1.2.21) [Cocontinuous Maps and Topoi].** Let  $u : \mathcal{C} \rightarrow \mathcal{D}$  be a cocontinuous functor between sites, then this defines a morphism of topoi  $g : \text{Sh}^{\text{Set}}(\mathcal{C}) \rightarrow \text{Sh}^{\text{Set}}(\mathcal{D})$ , if we define  $g^{-1} = u^s$  and  $g_* = u_s$ , by (7.1.2.11).  $\lrcorner$

**Prop. (7.1.2.22) [Cocontinuous Map with a Right Adjoint].** Let  $u : \mathcal{C} \rightarrow \mathcal{D}$  be a cocontinuous functor between sites with a right adjoint  $v : \mathcal{D} \rightarrow \mathcal{C}$ , then the morphism of topoi  $g : \text{Sh}^{\text{Set}}(\mathcal{C}) \rightarrow \text{Sh}^{\text{Set}}(\mathcal{D})$  is pretty simple,

$$g^{-1}\mathcal{G}(U) = \mathcal{G}(u(U)), \quad g_*\mathcal{F}(V) = \mathcal{F}(v(V)).$$

This holds in particular for localization of sites.  $\lrcorner$

*Proof:* It follows from adjunction that  $u^p h_V = h_{v(V)}$ , so  $g^{-1}(h_V^\sharp) = (u^p h_V^\sharp)^\sharp = (u^p h_V)^\sharp = h_{v(V)}^\sharp$ , and

$$(g_*\mathcal{F})(V) = \text{Hom}(h_V^\sharp, g_*\mathcal{F}) = \text{Hom}(g^{-1}h_V^\sharp, \mathcal{F}) = \text{Hom}(h_{v(V)}^\sharp, \mathcal{F}) = \mathcal{F}(v(V)).$$

The other identity is clear.  $\square$

**Prop. (7.1.2.23) [Continuous and Cocontinuous Maps and Topoi].** Let  $u : \mathcal{C} \rightarrow \mathcal{D}$  be a functor between sites that satisfies

- $u$  is continuous and cocontinuous,
- $u$  is fully faithful,
- $\mathcal{C}$  has final objects and fiber products and  $u$  preserves them.

then there are two maps of topoi:  $f = (u_s, u^s) : \mathrm{Sh}^{\mathrm{Set}}(\mathcal{D}) \rightarrow \mathrm{Sh}^{\mathrm{Set}}(\mathcal{C})$ ,  $g = (u^s, {}_s u) : \mathrm{Sh}^{\mathrm{Set}}(\mathcal{C}) \rightarrow \mathrm{Sh}^{\mathrm{Set}}(\mathcal{D})$  induced by  $u$  (7.1.2.20)(7.1.2.14)(7.1.2.21). They satisfy  $f \circ g = \mathrm{id}_{\mathrm{Sh}^{\mathrm{Set}}(\mathcal{C})}$ , and  $f^{-1} = u_s$  is fully faithful.

In particular, if we define  $g_! = u_s$ , then there are two adjunctions

$$(g_!, g^{-1}) : \mathrm{Sh}(\mathcal{C}) \rightleftarrows \mathrm{Sh}(\mathcal{D}), \quad (g^{-1}, g_*) : \mathrm{Sh}(\mathcal{D}) \rightleftarrows \mathrm{Sh}(\mathcal{C}).$$

□

*Proof:* We need to show that for any  $\mathcal{F} \in \mathrm{Sh}^{\mathrm{Set}}(\mathcal{C})$ ,  $\mathcal{F} \cong g^{-1}g_!\mathcal{F}$  and  $g^{-1}g_*\mathcal{F} \cong \mathcal{F}$ . For this, Cf. [Sta]00XT.?

Then  $f^!$  is fully faithful follows from the equality  $\mathcal{F} \cong g^{-1}g_!\mathcal{F}$ . □

**Prop. (7.1.2.24) [Special Cocontinuous Maps and Topoi].** A functor  $u : \mathcal{C} \rightarrow \mathcal{D}$  between sites is called a **special cocontinuous functor** if:

- $u$  is continuous and cocontinuous,
- Given any  $a, b : U' \rightarrow U \in \mathcal{C}$  s.t.  $u(a) = u(b) : u(U') \rightarrow u(U)$ , there is a covering  $\{f_i : U'_i \rightarrow U'\}$  s.t.  $a \circ f_i = b \circ f_i$ .
- Given any  $U', U \in \mathcal{C}$  and a morphism  $c : u(U') \rightarrow u(U) \in \mathcal{D}$ , there exists a covering  $\{f_i : U'_i \rightarrow U'\} \in \mathcal{C}$  and morphisms  $c_i : U'_i \rightarrow U$  that  $u(c_i) = c \circ u(f_i)$ .
- Given any  $V \in \mathcal{D}$ , there is a covering of the form  $\{u(U_i) \rightarrow V\}$  in  $\mathcal{D}$ .

Then the induced morphism of topoi  $g : \mathrm{Sh}^{\mathrm{Set}}(\mathcal{C}) \cong \mathrm{Sh}^{\mathrm{Set}}(\mathcal{D})$  (7.1.2.21) is an equivalence of topoi. □

*Proof:* Cf. [Sta]03A0.?

□

**Cor. (7.1.2.25) [Comparing Topologies].** Let  $\mathcal{C}'$  be a fully subcategory of  $\mathcal{C}$ , and

- $i : \mathcal{C}' \rightarrow \mathcal{C}$  is continuous, i.e.  $\mathrm{Cov}(\mathcal{C}') \rightarrow \mathrm{Cov}(\mathcal{C})$ .
- $i : \mathcal{C}' \rightarrow \mathcal{C}$  is cocontinuous, i.e. any covering  $\{U_i \rightarrow U'\} \in \mathrm{Cov}(\mathcal{C})$  s.t.  $U' \in \mathcal{C}'$  has a refinement  $\{U'_j \rightarrow U'\} \in \mathrm{Cov}(\mathcal{C}')$ .
- Each  $U \in \mathcal{C}$  has a covering  $\{U_i \rightarrow U\} \in \mathrm{Cov}(\mathcal{C})$  with  $U_i \in \mathcal{C}'$ .

then  $i : \mathrm{Sh}^{\mathrm{Set}}(\mathcal{C}') \rightarrow \mathrm{Sh}^{\mathrm{Set}}(\mathcal{C})$  is an equivalence of topoi.  $i^{-1}$  is just the restriction functor, and  $i_*$  is called the **extension functor of sheaves**.

In particular, this applies to the case  $i : \mathcal{C}' = \mathcal{C}/Z \rightarrow \mathcal{C}$ , the localization category, in which case for  $Z' \in \mathcal{C}/Z$ ,  $i^{-1}F(Z') = F(Z')$  is called the **restriction sheaf**. □

**Prop. (7.1.2.26) [Localizing at Sheaves].** Let  $\mathcal{C}$  be a site and  $\mathcal{F}_i$  be a set of topoi on  $\mathcal{C}$ , then there is an equivalence  $\mathrm{Sh}^{\mathrm{Set}}(\mathcal{C}) \cong \mathrm{Sh}^{\mathrm{Set}}(\mathcal{C}')$  induced by a special cocontinuous functor  $\mathcal{C} \rightarrow \mathcal{C}'$  (7.1.2.24) s.t.

- $\mathcal{C}'$  has the subcanonical topology,
- A family of morphisms  $\{V_i \rightarrow V\}$  are a covering of  $\mathcal{C}'$  iff  $\coprod h_{V_i} \rightarrow h_V$  is surjective.
- $\mathcal{C}'$  has fiber products and a final object.

- Every subsheaf of a representable sheaf is representable,
- Each  $g_*\mathcal{F}_i$  is a representable sheaf.

┘

*Proof:* Cf. [Sta]03CI. □

### 3 Stacks

**Notation (7.1.3.1).**

- Let  $\mathcal{C} \in \text{Site}$ .

┘

**Def. (7.1.3.2) [Stacks].**  $\mathcal{F} \in \text{FibCat}(\mathcal{C})$  (4.2.3.8) is called a **prestack** (resp. **stack**) over  $\mathcal{C}$  if for each covering  $\{U_i \rightarrow U\}$  in  $\mathcal{C}$ , the functor  $\text{Hom}(\textstyle\bigvee_U, \mathcal{F}) \rightarrow \text{Hom}(\textstyle\bigvee_U, \mathcal{F})$  (7.1.1.9) is fully faithful (resp. an equivalence of categories).

Denote the category of prestacks (resp. stacks) over  $\mathcal{C}$  by  $\mathcal{P}\text{Sta}(\mathcal{C})$  (resp.  $\text{Sta}(\mathcal{C})$ ). ┘

**Def. (7.1.3.3) [Category of Descent Datum].** Let  $\mathcal{F} \in \text{FibCat}(\mathcal{C})$ ,  $U \in \mathcal{C}$  and  $\mathcal{U} \in \text{Cov}_{\mathcal{C}}(U)$ . Given a choice of fibered products  $U_{ij}, U_{ijk}$  in  $\mathcal{C}$ , we can define the **category of descent datum**  $\mathcal{F}_{\text{desc}}(\mathcal{U})$  to be the category of tuples  $(\xi_i, \xi_{ij}, \xi_{ijk})$  where  $\xi_\alpha \in \mathcal{F}(U_\alpha)$  with Cartesian morphisms between them that are commutative. A morphism in  $\mathcal{F}_{\text{desc}}(\mathcal{U})$  is a family of morphisms  $(\varphi_i, \varphi_{ij}, \varphi_{ijk})$  commuting with the Cartesian morphisms.

Then there is an equivalence of categories  $\text{Hom}(h_{\mathcal{U}}, \mathcal{F}) \cong \mathcal{F}_{\text{desc}}(\mathcal{U})$ . ┘

*Proof:* For any  $F : h_{\mathcal{U}} \rightarrow \mathcal{F}$ ,  $U_i \rightarrow U \in h_{\mathcal{U}}(U_i)$ , applying  $F$  to the arrows  $\text{id}_{U_i}, U_{ij} \rightarrow U_i, U_{ijk} \rightarrow U_{ij} \in h_{\mathcal{U}}$ , we get an element in  $\mathcal{F}_{\text{desc}}(\mathcal{U})$ . Also a natural transformation  $F \rightarrow G$  maps to a morphism in  $\mathcal{F}_{\text{desc}}(\mathcal{U})$ , so we get a functor  $T : \text{Hom}(h_{\mathcal{U}}, \mathcal{F}) \rightarrow \mathcal{F}_{\text{desc}}(\mathcal{U})$ .

Conversely, choose an arbitrary choice of pullbacks (that coincide with  $\xi_{ij} \rightarrow \xi_i$ ), for any arrow  $f : T \rightarrow U \in h_{\mathcal{U}}(T)$ , we choose a  $U_i$  that  $T \rightarrow U$  factors as  $T \rightarrow U_i \rightarrow U$  (also for  $f = \text{id}_{U_i}$ , choose  $U_i$ ), then define  $F(f)$  as the pullback of  $\xi_i$  along  $T \rightarrow U_i$ . For any morphisms  $T' \rightarrow T \rightarrow U \in h_{\mathcal{U}}$  and their choice of  $U_i, U_j$  that  $T' \rightarrow U$  factors through  $U_j \rightarrow U$  and  $T \rightarrow U$  factors as  $U_i \rightarrow U$ , then  $T' \rightarrow U_j$  factors through  $U_{ij}$ , i.e. we have a commutative diagram

$$\begin{array}{ccccc} T' & \longrightarrow & U_{ij} & \longrightarrow & U_j \\ \downarrow & & \downarrow & & \downarrow \\ T & \longrightarrow & U_i & \longrightarrow & U \end{array}.$$

Then by Cartesian properties, we get a unique map  $F(T') \rightarrow F(T)$ , which is Cartesian by (4.2.3.6). It can be shown these maps make  $F$  a functor, using Cartesian property and the existence of  $\xi_{ijk}$ . And also for any map of descent datum, we get a natural transformation in  $\text{Hom}(h_{\mathcal{U}}, \mathcal{F})$ . Thus we get a functor  $S : \mathcal{F}_{\text{desc}}(\mathcal{U}) \rightarrow \text{Hom}(\textstyle\bigvee_U, \mathcal{F})$ .

The construction of  $S$  shows  $T$  is essentially surjective and full, and also faithful, so  $(S, T)$  is an equivalence of categories. □

**Def. (7.1.3.4) [Everyday Descent Datums].** Let  $\mathcal{F} \in \text{FibCat}(\mathcal{C})$ ,  $U \in \mathcal{C}$  and  $\mathcal{U} \in \text{Cov}_{\mathcal{C}}(U)$ . Given a choice of fibered products  $U_{ij}, U_{ijk}$  in  $\mathcal{C}$  and a cleavage of  $\mathcal{F}/\mathcal{C}$ , let  $\mathcal{F}(\mathcal{U})$  be the category of tuples  $(\xi_i, \varphi_{ij})$  where  $\xi_i \in \mathcal{F}(U_i)$  and  $\varphi_{ij}$  are isomorphisms  $\varphi_{ij} : \text{pr}_1^* \xi_i \cong \text{pr}_2^* \xi_j \in \mathcal{F}(U_{ij})$  s.t.

$$\text{pr}_{13}^* \varphi_{ik} = \text{pr}_{23}^* \varphi_{jk} \circ \text{pr}_{12}^* \varphi_{ij} : \text{pr}_1^* \xi_i \cong \text{pr}_3^* \xi_k.$$

**WARNING:** Notice this doesn't make sense unless we insert three isomorphisms such as  $\mathrm{pr}_{12}^* \mathrm{pr}_1^* \xi_i \cong \mathrm{pr}_{13}^* \mathrm{pr}_1^* \xi_i$ .

Then there is a (non-canonical!) equivalence of categories  $\mathcal{F}_{desc}(\mathcal{U}) \rightarrow \mathcal{F}(\mathcal{U})$ .  $\lrcorner$

*Proof:* For  $(\xi_i, \xi_{ij}, \xi_{ijk}) \in \mathcal{F}_{desc}(\mathcal{U})$ , there are isomorphisms  $\xi_{ij} \cong \mathrm{pr}_1^* \xi_i$  and  $\xi_{ij} \cong \mathrm{pr}_2^* \xi_j$ , which gives an isomorphism  $\varphi_{ij} : \mathrm{pr}_1^* \xi_i \rightarrow \mathrm{pr}_2^* \xi_j$ . This gives an element of  $\mathcal{F}(\mathcal{U})$ , by comparison with  $\xi_{ijk}$ .

Conversely, given  $(\xi_i, \varphi_{ij}) \in \mathcal{F}(\mathcal{U})$ , choose an ordering on  $I$ , for  $i < j$ , let  $\xi_{ij} = \mathrm{pr}_1^* \varphi_i$ , and  $\mathrm{pr}_2^* \varphi_{ij} : \xi_{ij} \rightarrow \xi_j$  is Cartesian. And for  $i < j < k$ , let  $\xi_{ijk} = \mathrm{pr}_1^* \xi_i$ , then there are Cartesian morphisms  $\xi_{ijk} \rightarrow \xi_{ij}, \xi_{ijk} \rightarrow \xi_{ik}, \xi_{ijk} \rightarrow \xi_{jk}$  by Cartesian properties, and it can be verified that the cocycle condition guarantees the diagram can be completed.  $\square$

**Cor. (7.1.3.5) [Cocycle Conditions].** If  $\mathcal{F} \in \mathrm{FibCat}(\mathcal{C})$  is a rigid fibered category, then there is no need to check the cocycle condition, because every automorphism over  $\mathrm{id}_{\mathcal{U}}$  is trivial.  $\lrcorner$

**Cor. (7.1.3.6) [Stacks and Sheaves].** A rigid (pre)stack over  $\mathcal{C}$  is equivalent to a (pre)sheaf on  $\mathcal{C}$ , by (4.2.3.26).  $\lrcorner$

**Cor. (7.1.3.7).** A site is subcanonical iff any representable fibered category  $\mathcal{Y}_{\mathcal{U}} \rightarrow \mathcal{C}$  is a stack.  $\lrcorner$

**Prop. (7.1.3.8) [Equivalence Categories and Stacks].** If  $\mathcal{F} \rightarrow \mathcal{G} \in \mathrm{FibCat}(\mathcal{C})$  is an equivalence of fibered categories over  $\mathcal{C}$ , then  $\mathcal{F}$  is a prestack/stack(in groupoid) iff  $\mathcal{G}$  is.  $\lrcorner$

*Proof:* There is a strict commutative diagram of categories

$$\begin{array}{ccc} \mathrm{Hom}(h_U, \mathcal{F}) & \longrightarrow & \mathrm{Hom}(h_U, \mathcal{F}) \\ \downarrow & & \downarrow \\ \mathrm{Hom}(h_U, \mathcal{G}) & \longrightarrow & \mathrm{Hom}(h_U, \mathcal{G}) \end{array}$$

that the vertical arrows are equivalences of categories, then we are done.  $\square$

**Prop. (7.1.3.9) [Prestack and Hom Functor].** Let  $\mathcal{F}$  be a fibered category over a site  $\mathcal{C}$ , then  $\mathcal{F}$  is a prestack iff for any object  $S$  of  $\mathcal{C}$  and two objects  $\xi, \eta \in \mathcal{F}(S)$ , the presheaf  $\underline{\mathrm{Hom}}_S(\xi, \eta) : (\mathcal{C}/S)^{op} \rightarrow \mathrm{Set}$  (4.2.3.17) is a sheaf in the comma site  $\mathcal{C}/S$  (7.1.1.6).  $\lrcorner$

*Proof:* By (7.1.3.8), it suffices to show  $\mathrm{Hom}_S(\xi, \eta)$  is a stack in the comma topology  $\mathcal{C}/S$ . Then it can be shown that  $\mathrm{Hom}(h_U, \underline{\mathrm{Hom}}_S(\xi, \eta)) \rightarrow \mathrm{Hom}(h_U, \underline{\mathrm{Hom}}_S(\xi, \eta))$  is an equivalence of categories iff  $\mathrm{Hom}(h_U, \mathcal{F}) \rightarrow \mathrm{Hom}(h_U, \mathcal{F})$  is fully faithful.  $\square$

**Lemma (7.1.3.10).** Let  $\mathcal{F} \in \mathcal{P}\mathrm{Sta}(\mathcal{C})$  and  $S, S'$  be sieves belonging to the topology of  $\mathcal{C}$  that  $S' \subset S$ , then the restriction functor

$$\mathrm{Hom}_{\mathcal{C}}(S, \mathcal{F}) \rightarrow \mathrm{Hom}_{\mathcal{C}}(S', \mathcal{F})$$

is faithful.  $\lrcorner$

*Proof:* it suffices to show for  $S' = h_U$  for some covering  $\mathcal{U}$ . Let  $F, G \in \mathrm{Hom}_{\mathcal{C}}(S', \mathcal{F})$  and  $\varphi, \psi$  be two natural transformations from  $F$  to  $G$  that induce the same natural transformation from the restriction of  $F$  to  $h_U$  to the restriction of  $G$  to  $h_U$ , then  $\varphi = \psi$ . For this, just notice there are commutative diagrams

$$\begin{array}{ccc} F(T \times_U U_i/U) & \xrightarrow{\varphi_{T \times_U U_i/U}} & G(T \times_U U_i/U) \\ \downarrow & & \downarrow \\ F(T/U) & \xrightarrow{\varphi_{T/U}} & G(T/U) \end{array},$$

where the vertical arrows are Cartesian, and the hypothesis implies  $\varphi_{T \times_U U_i/U} = \psi_{T \times_U U_i/U}$ . Then we deduce  $\varphi_{T/U} = \psi_{T/U}$  as  $\underline{\text{Hom}}_T(F(T/U), G(T/U))$  is a sheaf, as  $\mathcal{F}$  is a presheaf (7.1.3.9).  $\square$

**Prop. (7.1.3.11)[Stack and Sieves].** A prestack  $\mathcal{F} \in \mathcal{P}\text{Sta}(\mathcal{C})$  is stack iff for any  $U \in \mathcal{C}$  and any sieve  $\mathcal{S}$  on  $U$  belonging to  $\mathcal{T}$ ,

$$\text{Hom}(\mathcal{Y}_U, \mathcal{F}) \rightarrow \text{Hom}(\mathcal{S}, \mathcal{F})$$

is an equivalence of categories.  $\lrcorner$

*Proof:* Let  $\mathcal{S}$  be a sieve on  $U$  belong to  $\mathcal{C}$ , choose a covering  $\mathcal{U}$  of  $U$  that  $h_{\mathcal{U}} \subset \mathcal{S} \subset h_U$ , then there is a factorization

$$\text{Hom}(h_{\mathcal{U}}, \mathcal{F}) \rightarrow \text{Hom}(\mathcal{S}, \mathcal{F}) \rightarrow \text{Hom}(h_U, \mathcal{F}).$$

Then we are done by (7.1.3.10).  $\square$

**Cor. (7.1.3.12).** let  $\mathcal{T}, \mathcal{T}'$  be two topologies on a category  $\mathcal{C}$  that  $T'$  is subordinate to  $\mathcal{T}$  and  $\mathcal{F} \rightarrow \mathcal{C}$  is a fibered category, then if  $\mathcal{F}$  is a prestack/stack relative to  $\mathcal{T}$ , it is also true for  $\mathcal{T}'$ .  $\lrcorner$

**Prop. (7.1.3.13)[2-Fiber Products of Stacks].** There is a natural 2-category of stacks over  $\mathcal{C}$  defined as a sub-2-category of the 2-category of fibered-categories over  $\mathcal{C}$ , and the  $(2, 1)$ -category of stacks over  $\mathcal{C}$  has 2-fibered products, which coincides with that of (4.2.3.13).  $\lrcorner$

*Proof:* For  $\mathcal{X} \rightarrow \mathcal{S}, \mathcal{Y} \rightarrow \mathcal{S} \in \text{Sta}(\mathcal{C})$ , the category  $\mathcal{X} \times_{\mathcal{S}} \mathcal{Y}$  is a fibered category over  $\mathcal{C}$ , by (4.2.3.13). It remains to show that the morphism presheaves sheaves and descent datum are effective.

For this, Cf. [Sta]026G. ?  $\square$

**Prop. (7.1.3.14)[Associated Stack Fibered in Groupoids].** Let  $\mathcal{C} \in \text{Site}$ ,  $\mathcal{F} \in \mathcal{P}\text{Sta}(\mathcal{C})$  and  $\mathcal{F}_{\text{Cart}} \in \text{Sta}^{\text{grpd}}(\mathcal{C})$  is the associated category fibered in groupoids (4.2.3.22), then  $\mathcal{F}_{\text{Cart}}$  is also a prestack. And in this case,  $\mathcal{F}$  is a stack iff  $\mathcal{F}_{\text{Cart}}$  is a stack.  $\lrcorner$

*Proof:* The categories  $\mathcal{F}(\mathcal{U})$  and  $\mathcal{F}_{\text{Cart}}(\mathcal{U})$  have the same isomorphism classes of objects, as isomorphisms are Cartesian, so it suffices to show  $\mathcal{F}$  is a prestack iff  $\mathcal{F}_{\text{Cart}}$  is a prestack. For this, use (7.1.3.9) and consider  $\xi, \eta \in \mathcal{F}(U)$  and a covering  $\{U_i \rightarrow U\}$ , if there are arrows  $\alpha_i : \xi_i \rightarrow \eta_i$  that are compatible, then there is a unique arrow  $\alpha : \xi \rightarrow \eta$  restricting to  $\alpha_i$ , thus it suffices to show  $\alpha$  is Cartesian. But since  $\mathcal{F}_{\text{Cart}}$  is a category fibered in groupoids, each  $\alpha_i$  is invertible, and their inverses glue together to a morphism  $\beta : \eta \rightarrow \xi$  which is the inverse of  $\alpha$ , so  $\alpha$  is also an isomorphism thus Cartesian.  $\square$

**Prop. (7.1.3.15)[2-Fibered Products of Stacks Fibered in Groupoids].** The 2-category of stacks fibered in groupoids over  $\mathcal{C}$  (automatically a  $(2, 1)$ -category because any 2-morphism is an isomorphism) has 2-fiber products, and coincide with that of (7.1.3.13).  $\lrcorner$

*Proof:* This is clear from (7.1.3.13) and (4.2.3.24).  $\square$

**Prop. (7.1.3.16)[Equivalence of Stacks].** Let  $F : \mathcal{S}_1 \rightarrow \mathcal{S}_2 \in \text{Sta}(\mathcal{C})$  be fully faithful, then  $F$  is an equivalence of stacks iff for any  $x \in \mathcal{S}_{2,U}$ , there exists a covering  $\{f_i : U_i \rightarrow U\}$  s.t.  $f_i^* x$  is in the essential image of the functor  $F : \mathcal{S}_{1,U} \rightarrow \mathcal{S}_{2,U}$ .  $\lrcorner$

*Proof:* Easy.  $\square$

**Prop. (7.1.3.17)[Subcanonical Site Prestack].** If  $\mathcal{C}$  is a subcanonical site (7.1.2.4) and  $\mathcal{P}$  is a class of arrows in  $\mathcal{C}$  stable under base change, then the corresponding fibered category  $\mathcal{P} \rightarrow \mathcal{C}$  is a prestack.  $\lrcorner$

*Proof:* By (7.1.3.9), we need to prove for any covering  $\{U_i \rightarrow U\}$  and arrows  $X \rightarrow U, Y \rightarrow U$ ,  $X_i = U_i \times_U X$ , and  $X_{ij} = U_{ij} \times_U X$  and analogous for  $Y$ , if there are arrows  $f_i : X_i \rightarrow Y_i$  over  $U_i$  that the arrows  $X_{ij} \rightarrow Y_{ij}$  induced by  $f_i$  and  $f_j$  coincide, then there is a unique arrow  $f : X \rightarrow Y$  over  $U$  that induces  $f_i$ .

Notice that the composite  $X_i \xrightarrow{f_i} Y_i \rightarrow Y$  give sections  $g_i \in h_Y(X_i)$ , and the pullback of  $g_i, g_j$  to  $X_{ij}$  coincide by hypothesis. Now  $h_Y$  is a sheaf by hypothesis, so there is an arrow  $f : X \rightarrow Y$  that pulls back to  $f_i$  on  $X_i$ . Finally  $f$  is compatible over  $U$  because  $(Y \rightarrow U) \circ f$  and  $(X \rightarrow U)$  coincide when composed with  $X_i \rightarrow X$ , and  $h_U$  is a sheaf.  $\square$

**Prop. (7.1.3.18) [Category of Sheaves is a Stack].** For  $\mathcal{C} \in \text{Site}$ , we denote  $(\text{Sh}/\mathcal{C})(X) = \text{Sh}(\mathcal{C}/X)$ , then  $\text{Sh}/\mathcal{C} \in \text{Sta}/\mathcal{C}$ .  $\lrcorner$

*Proof:* To show  $\text{Sh}/\mathcal{C}$  is a prestack, by (7.1.3.9), it suffices to show for any  $F, G \in \text{Sh}(\mathcal{C}/X)$ ,  $\underline{\text{Hom}}_X(F, G)$  is a sheaf. For this, let  $\{U_i \rightarrow U\}$  be a covering, and  $\varphi_i : F_{U_i} \rightarrow G_{U_i}$  be morphisms of sheaves that their restrictions to  $F_{U_{ij}} \rightarrow G_{U_{ij}}$  are compatible, then for any  $T \rightarrow U$ , there are commutative diagrams

$$\begin{array}{ccccc} F(T) & \longrightarrow & \prod_i F_i(T_i) & \longrightarrow & \prod_{i,j} F_{ij}(T_{ij}) \\ \downarrow & & \downarrow & & \downarrow \\ G(T) & \longrightarrow & \prod_i G_i(T_i) & \longrightarrow & \prod_{i,j} G_{ij}(T_{ij}) \end{array}$$

where  $\varphi_T : F(T) \rightarrow G(T)$  is the unique function of sets that makes the diagram commutative. And it can be shown that these  $\varphi_T$  defines a natural transformation  $F_U \rightarrow G_U$ .

Now for any covering  $\{U_i \rightarrow U\}$  and a descent datum  $(F_i, F_{ij})$ , we need to show it is effective. We define a function  $F$  on  $\mathcal{C}/U$ :  $F(T) = \text{equal}(\prod_i F(T_i) \rightrightarrows \prod_{i,j} F(T_{ij}))$ , then it can be shown that this is a sheaf by spectral sequence.

Then it suffices to check  $F_{U_k} = F_k$ . For any  $T \rightarrow U_k$ ,  $T_i$  maps to  $U_{ik}$ , so  $F_i(T_i) = F_k(T_i)$ , thus for any  $s \in F_k(T)$ , we can produce an element  $(s_{T_i}) \in \prod_i F_i(T_i)$  that satisfies compatibility conditions, which gives us an element of  $F(T)$ . It can be shown this is a natural transformation  $F_k \rightarrow F_{U_k}$ , and it is an isomorphism of sheaves.  $\square$

**Prop. (7.1.3.19) [Descent Along Torsors].** Let  $\mathcal{C} \in \text{Site}$ ,  $G \in \text{Grp}(\mathcal{C})$  and  $X \rightarrow Y \in \text{Tors}_G(Y)$ ,  $\mathcal{F} \in \text{Sta}/\mathcal{C}$ , then there exists a canonical equivalence of categories between  $\mathcal{F}(Y)$  and the category of  $G$ -equivariant objects  $\mathcal{F}^G(X)$  (4.2.3.15).  $\lrcorner$

*Proof:* By (7.1.1.19)  $X \rightarrow Y$  is refined by a covering, thus by (7.1.3.11),  $\mathcal{F}(Y)$  is equivalent to  $\mathcal{F}(X \rightarrow Y)$ . And we check  $\mathcal{F}(X \rightarrow Y) \cong \mathcal{F}^G(X)$ . Then by (7.1.1.20),  $\mathcal{F}(X \rightarrow Y)$  consists of elements  $\xi \in \mathcal{F}(X), \eta \in \mathcal{F}(G \times X)$  and Cartesian arrows  $\varphi_1, \varphi_2$  over  $\alpha, \pi_2$ . Cf. [Vis08]P106. ?  $\square$

### Stackifications

**Prop. (7.1.3.20) [Stackifications].** For  $p : \mathcal{F} \rightarrow \mathcal{C} \in \text{FibCat}()$ , there exists a  $\mathcal{F}' \in \text{Sta}(\mathcal{C})$  and  $G : \mathcal{F} \rightarrow \mathcal{F}' \in \text{FibCat}(\mathcal{C})$  s.t. for any stack  $\mathcal{X} \in \text{Sta}(\mathcal{C})$ , any morphism  $F : \mathcal{F} \rightarrow \mathcal{X} \in \text{FibCat}(\mathcal{C})$  factors through  $G$  2-commutatively and uniquely up to 2-isomorphisms. In other words, there is a canonical equivalence of categories:

$$\text{Mor}_{\text{FibCat}(\mathcal{C})}(\mathcal{F}, \mathcal{X}) \cong \text{Mor}_{\text{Sta}(\mathcal{C})}(\mathcal{F}', \mathcal{X}).$$

In particular, such a stack  $\mathcal{F}'$  is determined up to unique 2-isomorphisms, and is called the **stackification** of  $\mathcal{F}$ .  $\lrcorner$

*Proof:* By (4.2.3.18), we may assume  $\mathcal{F}$  is split, thus  $\mathcal{F}$  corresponds to the functor  $\mathcal{C}^{op} \rightarrow \mathcal{Cat} : U \mapsto \text{Hom}(\mathcal{Y}_U, \mathcal{F})$ . Then we define a functor

$$\mathcal{F}' : \mathcal{C}^{op} \rightarrow \mathcal{Cat} : U \mapsto \varinjlim_{\mathcal{U} \in \text{Cov}_{\mathcal{C}}(U)} \text{Hom}(\mathcal{Y}_{\mathcal{U}}, \mathcal{F}).$$

then there is a natural map of fibered categories  $\mathcal{F} \rightarrow \mathcal{F}'$ . For any  $\mathcal{X} \in \text{Sta}(\mathcal{C})$ , because  $\text{Hom}(\mathcal{Y}_U, \mathcal{X}) \rightarrow \text{Hom}(\mathcal{Y}_{\mathcal{U}}, \mathcal{X})$  is an isomorphism for any  $\mathcal{U} \in \text{Cov}_{\mathcal{C}}(U)$ , the desired equivalence of categories follows.  $\square$

**Prop. (7.1.3.21) [Characterizing Stackifications].** Let  $\mathcal{S} \in \text{FibCat}(\mathcal{C})$  and  $G : \mathcal{S} \rightarrow \mathcal{S}'$  be the stackification (7.1.3.20), then

- For any  $U \in \mathcal{C}$  and  $x, y \in \mathcal{S}_U$ , the map

$$\mathcal{M}or(x, y) \rightarrow \mathcal{M}or(G(x), G(y))$$

identifies the RHS as the shiffication of the LHS.

- For any  $U \in \mathcal{C}$  and  $x \in \mathcal{S}'_U$ , there exists a covering  $\{U_i \rightarrow U\}$  that for any  $i$ ,  $x|_{U_i}$  is in the essential image of  $G_U : \mathcal{S}_U \rightarrow \mathcal{S}'_U$ .

⌋

*Proof:* Cf. [Sta]0435.  $\square$

**Cor. (7.1.3.22).** Let  $\mathcal{S} \in \text{FibCat}(\mathcal{C})$  and  $G : \mathcal{S} \rightarrow \mathcal{S}'$  be the stackification (7.1.3.20), then  $\mathcal{S}'$  is a stackification in groupoids if  $\mathcal{S}$  is a fibered in groupoids.  $\square$

*Proof:* Check that  $\mathcal{S}'_U$  is a groupoid for any  $U \in \mathcal{U}$ , using (7.1.3.21).  $\square$

**Prop. (7.1.3.23) [Stackifications Commute with 2-Fibered Products].** Stackifications commute with 2-fibered products.  $\square$

*Proof:* Cf. [Sta]04Y1.  $\square$

**Prop. (7.1.3.24).** Suppose  $X \in \mathcal{T}op$  and  $\eta : \mathcal{F} \rightarrow \mathcal{G} \in \mathcal{P}Sta(X)$  s.t.

- $\mathcal{F} \in \text{Sta}/X$ .
- $\eta$  induces isomorphisms on stalks.
- $\eta(U) : \mathcal{F}(U) \rightarrow \mathcal{G}(U)$  is fully faithful.

Then  $\eta$  is an equivalence of prestacks. In particular,  $\mathcal{G}$  is also a stack.  $\square$

*Proof:* Let  $\mathcal{H}$  be the stackification of  $\mathcal{G}$ , then  $\mathcal{F} \rightarrow \mathcal{G} \rightarrow \mathcal{H}$  is a morphism of stacks that is isomorphism on the stalk, so it is an isomorphism ?. But  $\mathcal{G}$  is separated, so for any open  $U$ ,  $\mathcal{F}(U) \rightarrow \mathcal{G}(U)$ ,  $\mathcal{G}(U) \rightarrow \mathcal{H}(U)$  is fully faithful, and their composition is an equivalence, thus both of them are equivalences.  $\square$

## Gerbes

**Def. (7.1.3.25) [Gerbes over Sites].** For  $\mathcal{C} \in \text{Site}$ , a **gerbe** over  $\mathcal{C}$  is a  $\mathcal{S} \in \text{Sta}^{\text{Grpd}}(\mathcal{C})$  s.t.

- For any  $U \in \mathcal{C}$ , there is a covering  $\{U_i \rightarrow U\}$  that  $\mathcal{S}_{U_i}$  is nonempty for any  $i$ .
- For any  $U \in \mathcal{C}$  and  $x, y \in \mathcal{S}_U$ , there exists  $\{U_i \rightarrow U\} \in \text{Cov}(\mathcal{C})$  s.t.  $x|_{U_i} = y|_{U_i}$  for any  $i$ .

We use  $\mathcal{S} \in \text{Gerb}(\mathcal{C})$  to denote that  $\mathcal{S}$  is a gerbe over  $\mathcal{C}$ .  $\square$

**Prop. (7.1.3.26).** Let  $\mathcal{C} \in \text{Site}$  and  $\mathcal{S}_1, \mathcal{S}_2 \in \text{Cat}/\mathcal{C}$ . Suppose  $\mathcal{S}_1 \cong \mathcal{S}_2 \in \text{Cat}/\mathcal{C}$ , then  $\mathcal{S}_1$  is a gerbe over  $\mathcal{C}$  iff  $\mathcal{S}_2$  is a gerbe over  $\mathcal{C}$ .  $\lrcorner$

*Proof:* If  $\mathcal{S}_1$  is a gerbe, then  $\mathcal{S}_2 \in \text{Sta}(\mathcal{C})$  by (7.1.3.8). The other properties of gerbes are easy to verify for  $\mathcal{S}_2$ , using (4.2.3.12).  $\square$

**Prop. (7.1.3.27).** If  $\mathcal{C} \in \text{Site}$  and  $\mathcal{S} \in \text{Gerby}(\mathcal{C})$  s.t. for all  $U \in \mathcal{C}$  and  $x \in \mathcal{S}_U$ , the sheaf of groups  $\underline{\text{Aut}}(x)$  on  $\mathcal{C}/U$  is Abelian, then there exists a sheaf of Abelian groups over  $\mathcal{C}$  and for any  $x \in \mathcal{S}_U$  an isomorphism  $\mathcal{G}|_U \rightarrow \underline{\text{Aut}}(x)$  that for any morphism  $\varphi : x \rightarrow y \in \mathcal{S}_U$ , the diagram

$$\begin{array}{ccc} \mathcal{G}|_U & \xlongequal{\quad} & \mathcal{G}|_U \\ \downarrow & & \downarrow \\ \underline{\text{Aut}}(x) & \xrightarrow{\alpha \mapsto \varphi \circ \alpha \circ \varphi^{-1}} & \underline{\text{Aut}}(y) \end{array}$$

is commutative.  $\lrcorner$

*Proof:* It can be checked by using the fact  $\underline{\text{Aut}}(x)$  is Abelian that there are canonical morphisms  $\underline{\text{Aut}}(x) \rightarrow \underline{\text{Aut}}(y)$  induced by any morphism  $\varphi : x \rightarrow y$ .

If there is no morphism from  $x$  to  $y$ , then we can use the condition of gerbe to obtain morphisms  $\underline{\text{Aut}}(x)|_{U_i} \rightarrow \underline{\text{Aut}}(y)|_{U_i}$  locally, and then glue together. Similarly, if  $\mathcal{S}_U$  is empty, then we can restrict to a covering and then glue.

Finally, notice this gives an Abelian sheaf  $\mathcal{G} = \underline{\text{Aut}}$  on  $\mathcal{C}$ .  $\square$

**Def. (7.1.3.28) [Gerbes over Stacks in Groupoids].** For  $F : \mathcal{X} \rightarrow \mathcal{Y} \in \text{Sta}^{\text{grp}}(\mathcal{C})$ , the following are equivalent:

- $F$  factors as  $F = F' \circ a$  where  $a : \mathcal{X} \rightarrow \mathcal{X}' \in \text{Cat}(\mathcal{C})$  is an equivalence, and  $F' : \mathcal{X}' \rightarrow \mathcal{Y} \in \text{Gerby}(\mathcal{Y})$ , where  $\mathcal{Y}$  is equipped with the topology inherited from  $\mathcal{C}$ ?
- If  $F$  factors as  $F = F' \circ a$  where  $a : \mathcal{X} \rightarrow \mathcal{X}' \in \text{Cat}(\mathcal{C})$  is an equivalence, and  $F' : \mathcal{X}' \rightarrow \mathcal{Y} \in \text{FibCat}^{\text{grp}}(\mathcal{Y})$ , then  $\mathcal{X}' \in \text{Gerby}(\mathcal{Y})$ , where  $\mathcal{Y}$  is equipped with the topology inherited from  $\mathcal{C}$ ?
- The following two conditions are satisfied:
  - For any  $U \in \mathcal{C}$  and  $y \in \mathcal{Y}_U$ , there exists  $\{U_i \rightarrow U\} \in \text{Cov}_{\mathcal{C}}(U)$  s.t. each  $y|_{U_i}$  is in the essential image of  $F_{U_i} : \mathcal{X}_{U_i} \rightarrow \mathcal{Y}_{U_i}$ .
  - For any  $U \in \mathcal{C}$  and  $x, y \in \mathcal{X}_U$ ,

$$\underline{\text{Isom}}(x, y) \rightarrow \underline{\text{Isom}}(F(x), F(y))$$

is a surjection of sheaves.

If the above conditions are satisfied, we say that  $\mathcal{X}$  is a **gerbe(over stack)** over  $\mathcal{Y}$ .  $\lrcorner$

*Proof:* Cf. [Sta]06P1.  $\square$

**Prop. (7.1.3.29).** For  $\mathcal{X} \rightarrow \mathcal{Y} \rightarrow \mathcal{Z} \in \text{Sta}^{\text{grp}}(\mathcal{C})$ , if  $\mathcal{X}$  is a gerbe over  $\mathcal{Y}$  and  $\mathcal{Y}$  is a gerbe over  $\mathcal{Z}$ , then  $\mathcal{X}$  is a gerbe over  $\mathcal{Z}$ .  $\lrcorner$

*Proof:* This follows easily from (7.1.3.28).  $\square$

**Prop. (7.1.3.30).** If  $\begin{array}{ccc} \mathcal{X}' & \longrightarrow & \mathcal{Y}' \\ \downarrow & & \downarrow \\ \mathcal{X} & \longrightarrow & \mathcal{Y} \end{array} \in \text{Sta}^{\text{grp}}(\mathcal{C})$  is a 2-fibered product, and  $\mathcal{X}$  is a gerbe over  $\mathcal{Y}$  (7.1.3.28), then  $\mathcal{X}'$  is a gerbe over  $\mathcal{Y}'$ . ┘

*Proof:* Cf. [Sta]06P3. □

**Prop. (7.1.3.31).** Let  $\begin{array}{ccc} \mathcal{X}' & \longrightarrow & \mathcal{Y}' \\ \downarrow & & \downarrow \\ \mathcal{X} & \longrightarrow & \mathcal{Y} \end{array} \in \text{Sta}^{\text{grp}}(\mathcal{C})$  is a 2-fibered product. If

- for each  $U \in \mathcal{C}$  and  $x \in \mathcal{Y}_U$ , there exists  $\{U_i \rightarrow U\} \in \text{Cov}_{\mathcal{C}}(U)$  s.t. each  $x|_{U_i}$  is in the essential image of  $\mathcal{Y}'_{U_i} \rightarrow \mathcal{Y}_{U_i}$ ,
- $\mathcal{X}'$  is a gerbe over  $\mathcal{Y}'$ .

Then  $\mathcal{X}$  is a gerbe over  $\mathcal{Y}$ . ┘

*Proof:* Cf. [Sta]06P4. □

**Prop. (7.1.3.32).** Let  $\mathcal{S} \in \text{Ger}(\mathcal{C})$  s.t. for each  $U \in \mathcal{C}$  and each  $x \in \mathcal{S}_U$  we have  $\underline{\text{Isom}}(x, x) \in \text{Sh}(\mathcal{C}/U)$  (an Abelian sheaf), then

- there exists  $\mathcal{G} \in \text{Sh}(\mathcal{C})$ ,
- For each  $U \in \mathcal{C}$  and  $x \in \mathcal{S}_U$ , there exists an isomorphism  $\mathcal{G}|_U \cong \underline{\text{Isom}}(x, x) \in \text{Sh}(\mathcal{C}/U)$ ,

s.t. for each  $U \in \mathcal{C}$  and each  $\varphi : x \cong y \in \mathcal{S}_U$ , the following commutative diagram holds:

$$\begin{array}{ccc} \mathcal{G}|_U & \xlongequal{\quad} & \mathcal{G}|_U \\ \downarrow & & \downarrow \\ \underline{\text{Isom}}(y, y) & \xrightarrow{\varphi^*} & \underline{\text{Isom}}(x, x). \end{array}$$

┘

*Proof:* Cf. [Sta]0CJY. □

## Bands

### 4 Sites over Schemes

**Notation (7.1.4.1).**

- Let  $S \in \text{Sch}$ .

┘

**Prop. (7.1.4.2).** Fiber products exist in the category of schemes, by (7.2.7.15). ┘

## Zariski Topology

**Def. (7.1.4.3) [Zariski Topology].** The **Zariski topology** has the covering of a scheme  $T$  as classes of open immersions  $\{T_i \rightarrow T\}$  that their images cover  $T$ .

The **Zariski site**  $\text{Sch}_{\text{Zar}}/S$  has the objects as all schemes over  $S$ .

The **small Zariski site**  $S_{\text{Zar}}$  has the objects as all open subschemes over  $S$ .

The **restricted Zariski site**  $S_{\text{Zar pf}}$  has the objects as all schemes that are qcqs open subschemes of  $S$ .

The **big affine Zariski site**  $\mathcal{A}ff_{\text{Zar}}/S$  has the objects as all schemes affine over  $S$ .

These are all topologies because open immersions satisfies base change trick(7.4.5.11).

In particular when the cover has only one element and is affine, the descent datum is equivalent to compatible isomorphisms

$$\varphi_{13} : N \otimes_A B \otimes_A B \xrightarrow{\varphi_{12}} B \otimes_A M \otimes_B \xrightarrow{\varphi_{23}} B \otimes_A B \otimes_A M.$$

┘

**Def. (7.1.4.4) [Zariski Stacks].** The category of sheaves on  $\mathcal{S}ch_{\text{Zar}}/S$  is denoted by  $\mathcal{S}h_{\text{Zar}}/S$ . The category of stacks on  $\mathcal{S}ch_{\text{Zar}}/S$  is denoted by  $\mathcal{S}ta_{\text{Zar}}/S$ . ┘

**Prop. (7.1.4.5) [Affine and Full Sites].** The inclusion functor  $\mathcal{A}ff_{\text{Zar}}/S \rightarrow \mathcal{S}ch_{\text{Zar}}/S$  is a special cocontinuous functor, so by(7.1.2.24), it induces an equivalence of topoi  $\mathcal{S}h(\mathcal{A}ff_{\text{Zar}}/S) \cong \mathcal{S}h_{\text{Zar}}/S$ . ┘

**Def. (7.1.4.6) [Restriction to Small Sites].** The inclusion functor  $S_{\text{Zar}} \rightarrow \mathcal{S}ch_{\text{Zar}}/S$  satisfies the hypothesis of(7.1.2.23), thus induces morphisms of topoi

$$\pi_S : \mathcal{S}h_{\text{Zar}}/S \rightarrow \mathcal{S}h(S_{\text{Zar}}), \quad i_S : \mathcal{S}h(S_{\text{Zar}}) \rightarrow \mathcal{S}h_{\text{Zar}}/S$$

that satisfies  $\pi_S \circ i_S = \text{id}_{S_{\text{Zar}}}$ . In particular,  $i_S^{-1}\mathcal{F}$  is called the **restriction to small sites** of  $\mathcal{F}$ . ┘

**Prop. (7.1.4.7).** A sheaf w.r.t the small Zariski topology is equivalent to a sheaf on  $S$ , trivially, so the sheaf cohomology on  $\mathcal{A}ff_{\text{Zar}}/S$  is equivalent to usual sheaf cohomology on  $S$ . ┘

**Prop. (7.1.4.8) [Transfer of Big Sites].** Let  $f : T \rightarrow S \in \mathcal{S}ch_{\text{Zar}}/S$ , then  $\mathcal{S}ch_{\text{Zar}}/T \rightarrow \mathcal{S}ch_{\text{Zar}}/S$  is a localization, so by(7.1.2.22) it induces a morphism of topoi

$$f : \mathcal{S}h_{\text{Zar}}/T \rightarrow \mathcal{S}h_{\text{Zar}}/S : f^{-1}\mathcal{G}(U/T) = \mathcal{G}(U/S), \quad f_*\mathcal{F}(U/S) = \mathcal{F}(U \times_S T/T).$$

┘

**Prop. (7.1.4.9) [Transfer of Small Sites].** Let  $f : T \rightarrow S \in \mathcal{S}ch_{\text{Zar}}/S$ , then the base change functor  $S_{\text{Zar}} \rightarrow T_{\text{Zar}}$  is continuous, and by(7.1.2.14) induces a morphism of topoi

$$f : \mathcal{S}h_{\text{Zar}}/T \rightarrow \mathcal{S}h_{\text{Zar}}/S.$$

┘

**Prop. (7.1.4.10).** By(7.3.1.15), if  $X$  is qs, then  $\mathcal{S}h(X_{\text{Zar}}) \rightarrow \mathcal{S}h(X_{\text{Zar}fp})$  is an equivalence by  $i_s$  and  $i^s$ . ┘

### Étale Topology

**Def. (7.1.4.11) [Étale Topology].** The **étale topology** has the covering of a scheme  $T$  as classes of étalemorphisms that their images cover  $T$ .

The **étale site**  $\mathcal{S}ch_{\text{ét}}/S$  has the objects as all schemes over  $S$ .

The **small étale site**  $S_{\text{ét}}$  has the objects as all schemes that are étale over  $S$ .

The **restricted étale site**  $S_{\text{ét}fp}$  has the objects as all schemes that are étale and qcqs over  $S$ .

The **big affine étale site**  $\mathcal{A}ff_{\text{ét}}/S$  has the objects as all schemes affine over  $S$ .

These are truly topologies because étale is stable under base change and composition. ┘

**Prop. (7.1.4.12).** Zariski covering is étale, because open immersions are étale.  $\lrcorner$

**Prop. (7.1.4.13).** For a family of maps in  $S_{\text{ét}}$  to be a covering, it suffices to check their image is adjointly surjective, by (7.6.6.4).  $\lrcorner$

**Prop. (7.1.4.14) [Affine and Full Sites].** The inclusion functor  $\mathcal{A}\text{ff}_{\text{ét}}/S \rightarrow \text{Sch}_{\text{ét}}/S$  is a special cocontinuous functor, so by (7.1.2.24), it induces an equivalence of topoi  $\text{Sh}(\mathcal{A}\text{ff}_{\text{ét}}/S) \cong \text{Sh}_{\text{ét}}/S$ .  $\lrcorner$

**Def. (7.1.4.15) [Restriction to Small Sites].** The inclusion functor  $S_{\text{ét}} \rightarrow \text{Sch}_{\text{ét}}/S$  satisfies the hypothesis of (7.1.2.23), thus induces morphisms of topoi

$$\pi_S : \text{Sh}_{\text{ét}}/S \rightarrow \text{Sh}(S_{\text{ét}}), i_S : \text{Sh}(S_{\text{ét}}) \rightarrow \text{Sh}_{\text{ét}}/S$$

that satisfies  $\pi_S \circ i_S = \text{id}_{S_{\text{ét}}}$ . In particular,  $i_S^{-1}\mathcal{F}$  is called the **restriction to small sites** of  $\mathcal{F}$ .  $\lrcorner$

**Prop. (7.1.4.16).** Any étale covering of a qc scheme can be refined a finite covering by affine étale schemes, this is because étale map are open (7.6.6.3).  $\lrcorner$

**Def. (7.1.4.17) [Étale Stacks].** The category of sheaves on  $\text{Sch}_{\text{ét}}/S$  is denoted by  $\text{Sh}_{\text{ét}}/S$ . The category of stacks on  $\text{Sch}_{\text{ét}}/S$  is denoted by  $\text{Sta}_{\text{ét}}/S$ .  $\lrcorner$

**Prop. (7.1.4.18).** For a qc scheme  $X$ ,  $X_{\text{ét}fp}$  is a Noetherian topology, because étale map is open, and any object in  $X_{\text{ét}fp}$  is qc.  $\lrcorner$

**Prop. (7.1.4.19) [Transfer of Big Sites].** Let  $f : T \rightarrow S \in \text{Sch}_{\text{ét}}/S$ , then the functor  $u : \text{Sch}_{\text{ét}}/T \rightarrow \text{Sch}_{\text{ét}}/S$  is cocontinuous, and has base change as a right adjoint, so by (7.1.2.22) it induces a morphism of topoi

$$f : \text{Sh}_{\text{ét}}/T \rightarrow \text{Sh}_{\text{ét}}/S : f^{-1}\mathcal{G}(U/T) = \mathcal{G}(U/S), \quad f_*\mathcal{F}(U/S) = \mathcal{F}(U \times_S T/T).$$

**Prop. (7.1.4.20) [Transfer of Small Sites].** Let  $f : T \rightarrow S \in \text{Sch}_{\text{ét}}/S$ , then the base change functor  $S_{\text{ét}} \rightarrow T_{\text{ét}}$  is continuous, and by (7.1.2.14) induces a morphism of topoi

$$f : \text{Sh}(T_{\text{ét}}) \rightarrow \text{Sh}(S_{\text{ét}})$$

**Prop. (7.1.4.21).** If  $X$  is qs, then  $\text{Sh}(X_{\text{ét}}) \rightarrow \text{Sh}(X_{\text{ét}fp})$  is an equivalence by  $i_s$  and  $i^s$ .  $\lrcorner$

*Proof:* Want to use (7.1.2.25), one condition is satisfied by (7.1.4.16), so it suffice to check any  $X' \in X_{\text{ét}}$  has an étale covering by schemes étale and qcqs over  $X$ . For any point  $p \in X'$ , there is an affine nbhd  $U'$  that maps to an affine nbhd  $U'$  of  $X$ , so  $U' \rightarrow U$  is étale and qcqs, and  $U \rightarrow X$  is open immersion and qs, it is qc because  $X$  is qs and  $U$  is qc (7.4.4.27). So these affine nbhds  $U'$  cover  $X'$ .  $\square$

**Prop. (7.1.4.22) [Cohomology Big and Small Sites].** The inclusion of small sites to the big sites has no infection on the sheaf cohomology, by (7.3.1.4). This is applicable to all topologies  $\tau$  considered here.  $\lrcorner$

**Prop. (7.1.4.23) [Topological Invariance of Étale Sites].** If  $f : S' \rightarrow S$  is universally homeomorphism, then  $f : S'_{\text{ét}} \rightarrow S_{\text{ét}}$  is an equivalence of sites. And it induces an isomorphism of categories

$$f^* : S'_{\text{fét}} \rightarrow S_{\text{fét}}.$$

In particular this applies to  $S' = S_{\text{red}}$ .  $\lrcorner$

*Proof:* Cf. [Sta]04DZ. 0BQZ. ?  $\square$

### Smooth Topology

This topology will be shown to be identical to the étale topology, so it is not so important.

**Def. (7.1.4.24) [Smooth Topology].** The **smooth topology** has the covering of a scheme  $T$  as classes of smooth morphisms that their images cover  $T$ .

The **big smooth site**  $\mathcal{S}ch_{sm}/S$  has the objects as all schemes over  $S$ .

The **small smooth site**  $S_{sm}$  has the objects as all schemes that are smooth over  $S$ .

The **restricted smooth site**  $S_{\acute{e}t,fp}$  has the objects as all schemes that are smooth and qcqs over  $S$ .

The **big affine smooth site**  $Aff_{\acute{e}t}/S$  has the objects as all schemes affine over  $S$ .

These are truly topologies because smoothness is stable under base change and composition.  $\lrcorner$

### Syntomic Topology

**Def. (7.1.4.25) [Syntomic Topology].** The **syntomic topology** has the covering of a scheme  $T$  as classes of syntomic morphisms that their images cover  $T$ .  $\lrcorner$

### fppf Topology

**Def. (7.1.4.26) [Fppf Topology].** The **fppf topology** has the covering of a scheme  $T$  as classes of flat locally of finite presentation morphisms that their images cover  $T$ . (f.f.+locally of f.p.).

The **big Zariski site**  $\mathcal{S}ch_{fppf}/S$  has the objects as all schemes over  $S$ .

The **big affine Zariski site**  $Aff_{fppf}/S$  has the objects as all schemes affine over  $S$ .

They are all topologies because flatness and finite presentedness satisfy base change trick by (7.6.2.1) and (7.6.1.1).  $\lrcorner$

**Prop. (7.1.4.27) [Syntomic Covering is Fppf].** A syntomic covering is fppf by definition (5.4.4.18).  $\lrcorner$

**Prop. (7.1.4.28).** A fppf covering of an affine scheme can be refined a finite affine fppf covering, because fppf map are open (7.6.2.10).  $\lrcorner$

**Def. (7.1.4.29) [Fppf Stacks].** The category of sheaves on  $\mathcal{S}ch_{fppf}/S$  is denoted by  $\mathcal{S}h_{fppf}/S$ . The category of stacks on  $\mathcal{S}ch_{fppf}/S$  is denoted by  $\mathcal{S}ta_{fppf}/S$ .  $\lrcorner$

### fpqc Topology

**Def. (7.1.4.30) [Fpqc Topology].** The **fpqc topology** has the covering of a scheme  $T$  as classes of flat morphisms s.t. their images cover  $T$  and for any affine open  $U \subset T$ , the restriction on  $T$  can be refined by a finite affine cover of open affine subschemes of the covering (f.f.+qc). It is a topology by (7.6.2.1) and (7.4.4.25).

When the covering consists of affine schemes, it is called a **standard fpqc covering**.  $\lrcorner$

**Def. (7.1.4.31) [Fpqc Stacks].** Defining fpqc sites has inescapable set-theoretic difficulties, thus we don't consider fpqc sites and fpqc cohomologies. Cf. [Sta]0BBK.

Nevertheless, we will denote the category of presheaves on  $\mathcal{S}ch/S$  satisfying the sheaf condition w.r.t. the fpqc topology by  $\mathcal{S}h_{fpqc}/S$ , and denote the category of fibered categories over  $\mathcal{S}ch/S$  satisfying the sheaf condition w.r.t. the fpqc topology by  $\mathcal{S}ta_{fpqc}/S$ .  $\lrcorner$

**Prop. (7.1.4.32) [fppf is fpqc].** Fppf coverings are fpqc.  $\lrcorner$

*Proof:* Use (7.6.2.10), we see that fppf covering consists of open morphisms, thus it is qc because affine scheme is quasi-compact.  $\square$

**Prop. (7.1.4.33).** A covering consisting of flat morphisms refined by a fpqc covering is a fpqc covering. Hence being fpqc is local on the target, because a Zariski cover is a fpqc covering.

If  $U$  is a covering consisting of flat morphisms that there is a fpqc covering  $V$  that  $U \times V \rightarrow V$  is a fpqc covering, then  $U$  is fpqc, because  $U \times V$  does and it refines  $U$ .  $\lrcorner$

**Lemma (7.1.4.34) [Checking Sheaf Condition].** Let  $S \in \text{Sch}$ ,  $F \in \mathcal{P}\text{Sh}^{\text{Set}}((\text{Sch}_S)_{\text{fpqc}})$  is a sheaf iff it is a sheaf w.r.t the Zariski topology and satisfies sheaf property w.r.t the single covering  $V \rightarrow U$  f.f. between affine schemes.  $\lrcorner$

*Proof:* This follows from (7.1.3.6)(7.1.3.7) and (7.1.5.7).  $\square$

**Prop. (7.1.4.35) [fpqc Site is Subcanonical].** The coverings in  $(\text{Sch}_S)_{\text{fpqc}}$  are families of universal effective epimorphisms. In other words,  $(\text{Sch}_S)_{\text{fpqc}}$  is subcanonical.

In particular, for any covering  $\mathcal{U} = \{U_i \rightarrow X\} \in \text{Cov}((\text{Sch}_S)_{\text{fpqc}})$  and  $\{V_{ijk} \rightarrow U_i \times_X U_j\} \in \text{Cov}((\text{Sch}_S)_{\text{fpqc}})$ ,

$$X = \text{Coeq}\left(\coprod_{i,j,k} V_{ijk} \rightrightarrows \coprod_i U_i\right) \in \text{Sch}_S.$$

$\lrcorner$

*Proof:* By (7.1.4.34), it suffices to show that any representable presheaf is a sheaf w.r.t Zariski topology and f.f. affine morphisms. The Zariski case follows from (7.1.5.3), for the second,  $\text{Spec } B \rightarrow \text{Spec } Z$ , for any scheme  $X$ , the morphism corresponds to  $0 \rightarrow \text{Hom}(R, A) \rightarrow \text{Hom}(R, B) \rightarrow \text{Hom}(R, B \otimes_A B)$ , but this follows immediately from (5.4.2.2), with  $M = A$ .  $\square$

**Cor. (7.1.4.36).** For  $f : Y \rightarrow X$  a morphism of schemes, if  $Z \in X_\tau$  for the above topologies  $\tau$ , then  $f^*(\text{Hom}_X(-, Z)) \cong \text{Hom}(-, Z \otimes_X Y)$ , in other words, the inverse sheaf of a representable sheaf is representable.  $\lrcorner$

*Proof:* By definition,  $f^*(\text{Hom}_X(-, Z))$  is the sheaf associated to the presheaf  $f_p(\text{Hom}_X(-, Z))$ , which by (7.1.2.13) is just the presheaf represented by  $Z \otimes_X Y$ , but by the proposition, it is already a sheaf.  $\square$

**Prop. (7.1.4.37) [Coherent Sheaves on  $\text{Sch}_{\text{fpqc}}/X$ ].** Let  $\mathcal{F} \in \mathcal{Q}\text{Coh}(X)$ , then the functor  $X' \rightarrow \Gamma(X', \mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{O}_{X'})$  satisfies the axiom for Abelian sheaves on  $\text{Sch}_{\text{fpqc}}/X$ , by (7.1.5.13).  $\lrcorner$

**Prop. (7.1.4.38) [Qco Sheaves on Sites].** For  $X \in \text{Sch}$ ,  $\tau \in \{\text{fppf}, \text{étale}, \text{smooth}, \text{syntomic}, \text{Zariski}\}$ , restriction defines an equivalence of categories

$$\mathcal{Q}\text{Coh}(X) \cong \mathcal{Q}\text{Coh}(\text{Sch}_\tau/X).$$

And if  $\tau \in \{\text{Zariski}, \text{étale}\}$ , restriction defines an equivalence of categories

$$\mathcal{Q}\text{Coh}(X) \cong \mathcal{Q}\text{Coh}(X_\tau).$$

$\lrcorner$

*Proof:* Cf. [Sta]03DX.  $\square$

PH-Covering

**Def. (7.1.4.39)** [Standard PH-Covering]. ┘

**Def. (7.1.4.40)** [PH-Topology]. ┘

**Prop. (7.1.4.41)** [Zariski Covering is PH-Covering]. A Zariski covering is a PH-covering. ┘

*Proof:* Cf. [[Sta]0DBH]. □

**Prop. (7.1.4.42)**. A proper surjective morphism is a ph-covering. ┘

*Proof:* Cf. [[Sta]0DES]. □

V-Topology

**Def. (7.1.4.43)** [Standard V-Covering]. A finite family of morphisms  $T_i \rightarrow X$  of affine schemes is a covering in the **standard v-topology** if for any morphism  $\text{Spec } V \rightarrow X$  where  $V$  is a valuation ring, there is an extension of valuation rings (12.2.2.11)  $V \rightarrow W$  and a morphism  $\text{Spec } W \rightarrow \text{Spec } V \times_X T_i$  for some  $i$ . ┘

**Def. (7.1.4.44)** [V-Topology]. A family of morphisms  $\{T_i \rightarrow T\}$  is called a **v-covering** in the **v-topology** if for any open affine subscheme  $U$  of  $T$ , the base change is refined by a standard v-covering of  $U$ .

The v-coverings form a topology, by [[Sta]0ETJ]. ┘

**Lemma (7.1.4.45)**. A standard fpqc covering is a standard v-covering. ┘

*Proof:* Cf. [[Sta]022E]. □

**Prop. (7.1.4.46)** [fpqc Covering is v-Covering]. A fpqc covering is a v-covering. ┘

*Proof:* This follows immediately from (7.1.4.45). □

**Prop. (7.1.4.47)**. A standard ph-covering is a standard v-covering. ┘

*Proof:* Cf. [[Sta]0ETD]. □

**Prop. (7.1.4.48)** [ph-Covering is V-Covering]. A ph-covering is a v-covering. ┘

*Proof:* This follows immediately from (7.1.4.47). □

**Cor. (7.1.4.49)**. A proper and surjective map is a v-covering, by (7.1.4.48) and (7.1.4.42). ┘

Arc-Topology

**Def. (7.1.4.50)** [Arc-Topology]. A finite family of morphisms  $\{T_i \rightarrow X\}$  of schemes is a covering in the **arc-topology** if for any morphism  $\text{Spec } V \rightarrow X$  where  $V$  is a rank1-valuation ring, there is a rank1-valuation ring  $W$  and a morphism  $\text{Spec } W \rightarrow \text{Spec } V \times_X T_i$  for some  $i$  that  $V \rightarrow W$  is f.f.. ┘

**Prop. (7.1.4.51)**. V-coverings are arc coverings. ┘

*Proof:* This is by the definition and (12.2.2.11). □

## 5 Descent for Schemes

References are [Sta]Chap34 and 10.158.

### General Principal

**Prop. (7.1.5.1).** A property of schemes is called **local** in a topology if for any covering  $\{U_i \rightarrow S\}$ ,  $S$  has  $P$  iff  $U_i$  has  $P$ . A property of morphisms is called **local** in a topology if for any covering  $\{U_i \rightarrow S\}$ ,  $X \rightarrow S$  has  $P$  iff  $X \times_S U_i \rightarrow U_i$  has  $P$ .  $\lrcorner$

**Prop. (7.1.5.2)[Twists and Čech Cohomology].** Let  $\xi$  be an object of a stack  $\mathcal{F}$  over  $\mathcal{C} \in \text{Site}$  lying over an object  $U \in \mathcal{C}$ , we call an object  $\xi' \in \mathcal{F}(U)$  a **twist** of  $\xi$  if there is some covering  $\{U_i \rightarrow U\}$  that the pullback of  $\xi$  and  $\xi'$  to  $U_i \rightarrow U$  are isomorphic.

Then there is a natural bijection between  $\mathcal{F}(U)$ -isomorphism classes of twists of  $\xi$  with  $\check{H}^1(U, \underline{\text{Aut}}(\xi))$ .  $\lrcorner$

*Proof:* Cf.[Appendix of Lamb].  $\square$

### Zariski Descent

**Lemma (7.1.5.3)[Zariski Descent of Qco Sheaves].** The fibered category  $X \mapsto (\mathcal{Q}\text{Coh}/X)$  is a stack over  $\text{Sch}_{\text{Zar}}/S$ .  $\lrcorner$

*Proof:* This is a consequence of (7.1.3.18) and the fact quasi-coherentness is a Zariski local property.  $\square$

**Prop. (7.1.5.4)[Zariski Descent of Schemes].** The fibered category  $X \mapsto \text{Sch}/X$  is in  $\text{Staz}_{\text{Zar}}/S$ .  $\lrcorner$

*Proof:* Firstly it is a prestack by (7.1.3.17) and (7.1.4.35).

To show any descent datum of effective, let  $\{U_i \rightarrow U\}$  be a Zariski covering, and  $X_i \rightarrow U_i$  be schemes with descent datum  $\varphi_{ij} : X_i \times_{U_i} U_{ij} \cong X_j \times_{U_j} U_{ij}$ , then we define  $X = \coprod X_i / \sim$ , where  $x_i \sim x_j$  if  $x_i \in U_{ij}, x_j \in U_{ji}$  and  $\varphi_{ij}(x_i) = \varphi_{ji}(x_j)$ . It can be shown this is an equivalence relation. Denote  $\varphi_i : X_i \rightarrow X$  the natural map, and  $U_i = \varphi_i(X_i)$ . Define the topology on  $X$  as the quotient topology. In particular,  $\varphi_i$  is a homeomorphism onto the image. Then we can use (7.1.3.18) to glue the sheaves of rings  $(\varphi_i)_*(\mathcal{O}_{X_i})$  to a sheaf of rings  $\mathcal{O}_X$  on  $X$  that  $\varphi_i^* \mathcal{O}_X = \mathcal{O}_{X_i}$ . Also we have a map  $f : X \rightarrow U$  by set-theoretical and topological consideration. For the structure map  $f^{-1}(\mathcal{O}_U) \rightarrow \mathcal{O}_X$ , use (7.1.3.18).  $\square$

**Cor. (7.1.5.5).** If  $\mathcal{P}$  is a subclass of arrows of schemes that is stable under base change and local on the target, then  $\mathcal{P}/S$  is a stack over  $(\text{Sch}/S)_{\text{Zar}}$ .  $\lrcorner$

**Cor. (7.1.5.6)[Zariski Descent of Schemes with a Qco Sheaf].** The fibered category over  $\text{Sch}/S$

$$X \mapsto \{\text{Schemes over } X \text{ with a Qco sheaf } \mathcal{F}\}$$

is a stack in  $\text{Staz}_{\text{Zar}}/S$ .  $\lrcorner$

*Proof:* This is a combination of (7.1.5.4) and (7.1.5.3).  $\square$

### Fpqc Descent

**Prop. (7.1.5.7) [Reduction to Affine Case].** Let  $S \in \text{Sch}$ ,  $\mathcal{F} \in \text{FibCat}(\text{Sch}/S)$ . Suppose that

- $\mathcal{F} \in \text{Stazar}/S$ .
- When  $V \rightarrow U$  is a f.f. morphism of affine  $S$ -schemes,  $\mathcal{F}(U) \rightarrow \mathcal{F}(V \rightarrow U)$  is an equivalence of categories.

then  $\mathcal{F} \in \text{Sta}_{\text{fpqc}}/S$ .  $\lrcorner$

*Proof:* Firstly, to show  $\mathcal{F}$  is a prestack, using (7.1.3.9), it suffices to show for an  $S$ -scheme  $T \rightarrow S$  and objects  $\xi, \eta \in \mathcal{F}(T)$ , the functor

$$\underline{\text{Hom}}_T(\xi, \eta) : (\text{Sch}/T)^{op} \rightarrow \text{Set}$$

is a sheaf. But then we can use (7.1.4.34) to achieve this.

Next, according to (4.2.3.18) and (7.1.3.8), we may assume  $\mathcal{F}$  is splitting.

Notice that  $\mathcal{F}(\emptyset)$  is equivalent to the category pt. This is because  $\mathcal{F}(\emptyset)$  is equivalent to  $\mathcal{F}(\mathcal{U})$ , where  $\mathcal{U}$  is the null Zariski covering of  $\emptyset$  (with no mapping or objects at all!). Then for any disjoint union of open subschemes  $U = \coprod U_i$ , there is a natural isomorphism of categories  $\mathcal{F}(U) \cong \prod_i \mathcal{F}(U_i)$ .

Thus for any covering  $\mathcal{U} = \{U_i \rightarrow X\}$ , to show  $\mathcal{F}(X) \rightarrow \mathcal{F}(\mathcal{U})$  is an equivalence of categories, it suffices to show that  $\mathcal{F}(X) \rightarrow \mathcal{F}(\coprod U_i \rightarrow X)$  is an equivalence of categories: this is because  $\coprod U_i \times_X \coprod U_i \cong \coprod U_i \times_X U_j$ , so  $\mathcal{F}(\coprod U_i \rightarrow X) \rightarrow \mathcal{F}(\mathcal{U})$  is an equivalence of categories.

If  $\mathcal{U} = \{V \rightarrow U\}$  is a covering of  $F$  with a single morphism that is qc and  $U$  is affine, then by the proof of (7.1.3.11), we can choose a finite affine cover of  $V$  reduce to the case of covering of f.m. affine maps, then we finish by the case above.

If  $\mathcal{U} = \{V \rightarrow U\}$  is a covering of  $F$  with a single morphism and  $U$  is affine, then we can find a Zariski covering  $\{V_i \rightarrow V\}$  that each  $V_i$  is qc. and surjects onto  $U$ . Then there are maps of categories  $\mathcal{F}(U) \rightarrow \mathcal{F}(\{V \rightarrow U\}) \rightarrow \mathcal{F}(\{V_i \rightarrow V\})$ , where  $\mathcal{F}(U) \rightarrow \mathcal{F}(\{V_i \rightarrow V\})$  is an equivalence and  $\mathcal{F}(U) \rightarrow \mathcal{F}(\{V \rightarrow U\})$  is fully faithful. Thus to show  $\mathcal{F}(U) \rightarrow \mathcal{F}(\{V \rightarrow U\})$  is an equivalence, it suffices to show  $\mathcal{F}(\{V \rightarrow U\}) \rightarrow \mathcal{F}(\{V_i \rightarrow V\})$  is faithful, which is true by (7.1.3.10).

For general case, Cf. [Vis08]P88.  $\square$

**Prop. (7.1.5.8).**  $\text{Mor}/S : X \mapsto \text{Sch}/X$  is a prestack over  $\text{Sch}_{\text{fpqc}}/S$ , by (7.1.4.35) and (7.1.3.17).  $\lrcorner$

**Def. (7.1.5.9) [Affine Fpqc Descent Datum].** For  $A \rightarrow B \in \mathcal{C}\text{Alg}$ , define a category  $\text{Mod}_{A \rightarrow B}$  as follows: its objects are pairs  $(N, \psi)$ , where  $N \in \text{Mod}_B$  and  $\psi : N \otimes_A B \rightarrow B \otimes_A N$  is an isomorphism of  $B \otimes_A B$ -modules s.t. that

$$\psi_{12} \circ \psi_{01} = \psi_{02} : N \otimes_A B \otimes_A B \rightarrow B \otimes_A B \otimes_A N$$

where  $\psi_{ij}$  is permuting the  $i, j$ -parts using  $\psi$ . The morphisms in  $\text{Mod}_{A \rightarrow B}$  are maps in  $\text{Mod}_B$  that is compatible with  $\psi$ .

There is a natural functor  $\text{Mod}_{A \rightarrow B} \rightarrow \text{Mod}_B$ .  $\lrcorner$

**Lemma (7.1.5.10) [Affine Fpqc Descent].** For  $A \rightarrow B \in \mathcal{C}\text{Alg}$ , there is a functor  $F : \text{Mod}_A \rightarrow \text{Mod}_{A \rightarrow B}$ , where  $M$  is mapped to  $(B \otimes_A M, \psi_M)$  with

$$\psi_M : (B \otimes_A M) \otimes_A B \rightarrow B \otimes_A (B \otimes_A M) : b \otimes m \otimes b' \mapsto b \otimes b' \otimes m.$$

Then when  $A \rightarrow B$  is f.f., this is an equivalence of categories.  $\lrcorner$

*Proof:* We construct an inverse  $T$  that maps  $(N, \psi)$  to  $\{n | \psi(n \otimes 1) = 1 \otimes n\}$ . Then  $TF \cong \text{id}$  because of the first exactness of (5.4.2.2).

And for  $FT \cong \text{id}$ , let  $T((N, \psi)) = M$ . Notice if  $\psi(n \otimes 1) = \sum_i b_i \otimes n_i$ , then by cocycle condition,

$$\sum_i b_i \otimes 1 \otimes n_i = \sum_i b_i \otimes \psi(n_i \otimes 1).$$

so  $\psi(N \otimes 1) \subset \ker(\text{id}_B \otimes (n \mapsto \psi(n \otimes 1) - 1 \otimes n)) = B \otimes M$  because  $B/A$  is flat.

So we defined a map  $N \xrightarrow{\Psi} B \otimes_A M \in \text{Mod}_B$ , and the composition  $B \otimes_A M \xrightarrow{\text{mul.}} N \xrightarrow{\Psi} B \otimes_A M$  is identity, because

$$\psi(bm \otimes 1) = (b \otimes 1)\psi(m \otimes 1) = (b \otimes 1)(1 \otimes m) = b \otimes m.$$

This shows  $\Psi$  is surjective. And  $\Psi$  is injective because  $n \mapsto n \otimes 1$  is injective as  $B/A$  is f.f., and  $\psi$  is an isomorphism. So  $\Psi$  is an isomorphism of  $N \cong FT(N)$ .

Finally, to show  $\psi = \psi_M$ , as now  $B \otimes_A M \xrightarrow{\text{mul.}} N$  is an isomorphism, we check

$$\psi((bm) \otimes b') = (b \otimes b')\psi(m \otimes 1) = (b \otimes b')(1 \otimes m) = b \otimes (b'm).$$

□

**Remark (7.1.5.11).** In fact, a descent datum is always effective iff  $A \rightarrow B$  is universally injective.

Cf. [Sta]. And f.f. extension is u.i. (5.4.1.27). ┘

**Prop. (7.1.5.12) [fpqc Descent for Qco Sheaves].** For  $S \in \text{Sch}$ , we have  $\text{QCoh}/S \in \text{Sta}_{\text{fpqc}}/S$ . ┘

*Proof:* We use (7.1.5.7), the first condition is satisfied by (7.1.5.3), and for the second condition, let  $\text{Spec } B \rightarrow \text{Spec } A$  be a f.f. morphism of affine schemes, then  $\text{QCoh}(\text{Spec } B \rightarrow \text{Spec } A)$  is equivalent to  $\text{Mod}_{A \rightarrow B}$ , and  $\text{QCoh}(\text{Spec } A)$  is equivalent to  $\text{Mod}_A$ , so the conclusion follows from (7.1.5.10). □

**Cor. (7.1.5.13).** For any  $\mathcal{F} \in \text{QCoh}(S)$ , the functor  $(\text{Sch}/S)^{\text{op}} \rightarrow \text{Ab} : T \rightarrow \Gamma(T, f^* \mathcal{F}) \in \text{Sta}_{\text{fpqc}}/S$ , hence are also sheaves w.r.t. the fppf, étale, Zariski topologies. ┘

*Proof:* Because this functor is just  $\underline{\text{Hom}}_S(\mathcal{O}_S, \mathcal{F})$ , and it is a sheaf (7.1.3.9). □

**Cor. (7.1.5.14).** If  $\mathcal{P}$  is a property of Qco sheaves that is stable under base change and fpqc local, then  $\text{QCoh}^{\mathcal{P}}/S \in \text{Sta}_{\text{fpqc}}/S$ . ┘

**Prop. (7.1.5.15) [Descending Affine Morphisms].** For  $S \in \text{Sch}$ , let  $\mathcal{P}$  be the class of affine arrows in  $\text{Sch}/S$  that denote by  $\text{Mor}^{\text{aff}}/S$  the resulting fibered category, then  $\text{Mor}^{\text{aff}}/S \in \text{Sta}_{\text{fpqc}}/S$ . ┘

*Proof:* Firstly  $\text{Mor}^{\text{aff}}/S \in \text{Sta}_{\text{Zar}}/S$ , and it satisfies the affine fpqc descent condition of (7.1.5.7) (Notice the  $\{n | \psi(n \otimes 1) = 1 \otimes n\}$  is now a ring, because  $\psi$  is a ring homomorphism), so we are done by (7.1.5.7). □

**Cor. (7.1.5.16).** If  $\mathcal{P}$  is a subclass of affine arrows stable under base change and fpqc local on the target, then  $\text{Mor}^{\mathcal{P}}/S \in \text{Sta}_{\text{fpqc}}/S$ . ┘

**Prop. (7.1.5.17) [Descent via Ample Invertible Sheaves].** Let  $S$  be a scheme and  $\mathcal{P}$  be a class of flat proper morphisms of f.p. in  $\text{Sch}/S$  that is local in the fpqc topology. Assume that for each object  $\xi : X \rightarrow U \in \mathcal{P}$ , we have an invertible sheaf  $\mathcal{L}_\xi$  on  $X$  that is ample relative to  $X \rightarrow U$ , and for an arrow  $f : (X \xrightarrow{\xi} U) \rightarrow (Y \rightarrow \eta V)$ , we have an isomorphism  $\rho_f : f^* \mathcal{L}_\eta \cong \mathcal{L}_\xi$  that satisfies  $\rho_{gf} = \rho_f \circ f^* \rho_g$ , then  $\text{Mor}^{\mathcal{P}}/S \in \text{Sta}_{\text{fpqc}}/S$ . ┘

*Proof:* Cf. [Vistoli, P96]. ?

□

### Étale Descent

**Prop. (7.1.5.18).** ┘

**Prop. (7.1.5.19) [Galois-Descent].** Let  $L/K \in \mathbf{GalField}^{\text{fin}}$ , then  $\text{Spec } L \rightarrow \text{Spec } K$  is a  $\text{Gal}(L/K)$ -torsor in the étale topology. so Galois descent is a special case of étale descent along torsors (7.1.3.19).

Notice this is also true for arbitrary Galois field extensions with continuity condition added, because we can take direct limits of categories over its finite normal subextensions. ┘

*Proof:* Consider the locally constant group scheme  $\underline{G} = \text{Spec}(\prod_{g \in G} K)$ , let  $X = \text{Spec } L, Y = \text{Spec } K$ , then  $\{X \rightarrow Y\}$  is an étale cover, and the action  $\underline{G} \times X \rightarrow X$  is given by

$$L \rightarrow \prod_{g \in G} L : x \mapsto \prod_{g \in G} (g(x)).$$

Thus  $X \rightarrow Y$  is a  $G$ -equivariant map, and there is an isomorphism  $G \times X \cong X \times_Y X : (g, x) \mapsto (gx, x)$  that corresponds to the isomorphism

$$L \otimes_K L \cong \prod_{g \in G} L : (a, b) \mapsto \prod_{g \in G} (g(a)b)$$

□

**Cor. (7.1.5.20) [Galois Descent of Closed Immersions].** Let  $K/k \in \mathbf{GalField}$ ,  $X \in \mathbf{Sch}/k$ . Then the category of closed subschemes of  $X$  is equivalent to the category of closed subschemes of  $X_K$  that is base change from some  $X_{k'}$  where  $k'/k$  is finite, and is stable under the action of  $\text{Gal}(K/k)$ . This weird finiteness condition can be removed when  $X$  is locally algebraic over  $k$ . ┘

*Proof:* This is because the class of closed immersions is a stack (7.1.5.16). □

**Remark (7.1.5.21).** When  $Y \subset X$  is a subvariety and  $K = k^{\text{sep}}$ , to check  $Y$  is stable under action of  $\text{Gal}_k$ , it suffices to check that the geometric points is closed under action of  $\Gamma$ . This is because the geometric points are dense in  $Y'$  (7.12.1.10). ┘

**Cor. (7.1.5.22) [Galois Descent for Ideals of Algebras].** Let  $A \in \mathbf{CRing}_k$ , and  $K/k$  be a Galois field extension with Galois group  $\Gamma$ , then the category of ideals of  $A$  is equivalent to the category of ideals of  $A_K$  that is base change from some  $A_{k'}$  where  $k'/k$  is finite, and is stable under the action of  $\Gamma$ . This weird finiteness condition can be removed when  $A$  is f.g. over  $k$ . ┘

**Cor. (7.1.5.23) [Galois Descent of Morphisms].** Let  $X, Y \in \mathbf{Sch}^{\text{loc.ft}}/k$  and  $K/k \in \mathbf{GalField}$  with Galois group  $\Gamma$ ,  $X' = X \otimes_k K, Y' = Y \otimes_k K$ . If  $Y$  is separated, then a morphism  $\varphi' : X' \rightarrow Y'$  arises from a morphism  $X \rightarrow Y$  iff its graph  $\Gamma_{\varphi'} \subset X' \times_{k'} Y'$  is stable under action of  $\Gamma$ . In this case  $\varphi$  is unique.

And when  $X, Y \in \mathbf{Var}/k$  and  $K = k^{\text{sep}}$ , then it suffices to check the map

$$\varphi'(k^{\text{sep}}) : X'(k^{\text{sep}}) \rightarrow Y'(k^{\text{sep}})$$

commutes with action of  $\text{Gal}_k$ . ┘

**Cor. (7.1.5.24) [Galois Descent for Qco Sheaves].** For  $K/k \in \mathbf{GalField}$  and  $X \in \mathbf{Sch}/k$ , the base change map

$$\mathcal{QCoh}/X \rightarrow \mathcal{QCoh}^{\text{Gal}(K/k)}/X_K$$

is an equivalence of categories, with inverse  $\mathcal{F} \mapsto \mathcal{F}^{\text{Gal}(K/k)}$ .

In particular, the functor  $V \mapsto K \otimes_k V$  induces an equivalence  $\mathbf{Vect}_k \cong \mathbf{Rep}_K(\text{Gal}(K/k))$ . ┘

*Proof:* Because  $\mathcal{Q}\text{Coh}/\mathcal{S}\text{ch}$  is a fpqc stack (7.1.5.12), this follows from (7.1.3.19).  $\square$

**Prop. (7.1.5.25)** [Failure of Étale Descent for proper smooth morphisms]. Cf. [Vis08]P107.  $\lrcorner$

*Proof:*  $\square$

### Descending Properties

**Prop. (7.1.5.26)** [Properties of Morphisms Local in Fpqc Topology]. The following properties of morphisms are local on the target w.r.t. the fpqc topology.

1. quasi-compact.
2. (quasi-)separated.
3. Universally closed.
4. universally open.
5. universally submersive.
6. surjective.
7. universally injective.
8. universally homeomorphism.
9. (locally)of f.t.
10. (locally)of f.p.
11. properness.
12. flatness.
13. (closed/open)immersion.
14. isomorphism/monomorphism.
15. (quasi-)affineness.
16. Being quasi-compact immersions.
17. Being integral morphisms.
18. (locally)(quasi-)finiteness.
19. Being syntomic morphisms.
20. Being smooth/unramified/étale.
21. Being finite locally free.

□

**Prop. (7.1.5.27) [Properties of Schemes Local in the Fppf Topology].** •

┘

*Proof:* Cf. [\[Sta\]](#)Chap34.13.

□

**Prop. (7.1.5.28) [Descending Properties that is not Fpqc Local].**

- If  $X \rightarrow Y$  is a faithfully flat morphism of schemes and  $X$  is (geo.)reduced, then  $Y$  is also (geo.)reduced.
- If  $X \rightarrow Y$  is a faithfully flat morphism of f.p. between schemes and  $X$  is (geo.)regular, then  $Y$  is also (geo.)regular.

┘

*Proof:* Looking stalkwise, these follows from [\(5.4.2.1\)](#).

□

**Prop. (7.1.5.29) [Descending Properties along Torsors].** Let  $G$  be a group object in  $(\text{Sch}_S)_\tau$  and  $X \rightarrow S$  a  $G$ -torsor. Then if  $\tau$  is a subcanonical topology and  $\mathcal{P}$  is a property that is local on  $(\text{Sch}_S)_\tau$  and  $G \rightarrow S$  has  $\mathcal{P}$ , then  $X \rightarrow S$  has  $\mathcal{P}$ .

┘

*Proof:* By [\(7.1.1.19\)](#), there is a covering  $\{Y_i \rightarrow S\}$  s.t. each  $X \times_S Y_i \rightarrow Y_i \cong G \times_S Y_i$  is trivial, thus each  $X \times_S Y_i \rightarrow Y_i$  has  $\mathcal{P}$ , and then  $X \rightarrow S$  has  $\mathcal{P}$ . □

**Weil-Restrictions**

References are [BLR90]Section7.6. and [Conrad-Gabber-Prasad, Pseudo-Reductive Groups]Section A.5.

**Def. (7.1.5.30) [Weil-Restrictions].** For  $S'/S \in \text{Sch}$  and  $X \in \text{Sch}/S$ , then the **Weil restriction** is the scheme  $\text{Res}_{S'/S}(X) \in \text{Sch}/S$  representing the functor

$$\underline{\text{Hom}}_S(S', X) : \text{Sch}/S \rightarrow \text{Set} : T \mapsto X(T \times_S S'),$$

if it exists. ┘

**Thm. (7.1.5.31).** Let  $S' \rightarrow S \in \text{Sch}$  be finite locally-free, and  $X \in \text{Sch}/S'$  satisfying that: for any  $s \in S$  and every finite subset of  $X_{\kappa(s)}$  is contained in some affine open subset of  $X_{\kappa(s)}$ , then  $\text{Res}_{S'/S}(X)$  exists. In particular, this applies to the case that  $X$  is quasi-projective. ┘

*Proof:* Cf.[BLR90, Chap7.6. Thm4]. □

**Thm. (7.1.5.32)[Quasi-Projectiveness].** Let  $S' \rightarrow S \in \text{NSch}$  be finite locally-free, and  $X \in \text{Sch}/S'$  is quasi-projective, then  $\text{Res}_{S'/S}(X)$  is represented by a quasi-projective scheme over  $S$ . ┘

*Proof:* Cf.[Weil Restriction for Schemes]P5. □

**Example (7.1.5.33) [Deligne-Torus].** The **Deligne-torus** is defined to be

$$\mathbb{S} = \text{Res}_{\mathbb{C}/\mathbb{R}} \mathbb{G}_m.$$

Then

1. There are isomorphisms

$$\mathbb{S}(\mathbb{R}) \cong \mathbb{C}^\times, \quad \mathbb{S}_{\mathbb{C}} \cong \mathbb{G}_m \times \mathbb{G}_m,$$

where for any  $T \in \mathcal{C}\text{Ring}/\mathbb{C}$ , the second isomorphism is given by

$$(T \otimes_{\mathbb{R}} \mathbb{C})^\times \mapsto T^\times \times T^\times : t \otimes a \mapsto (t \otimes a, t \otimes \bar{a}).$$

2. Under the isomorphism  $\mathbb{S}_{\mathbb{C}}(\mathbb{C}) \cong \mathbb{C}^\times \times \mathbb{C}^\times$ , the complex conjugation acts by  $\overline{(z_1, z_2)} = (\bar{z}_2, \bar{z}_1)$ .
3. There is a **weight homomorphism**  $w : \mathbb{G}_m \rightarrow \mathbb{S}$  s.t. for any  $T \in \mathcal{C}\text{Ring}/\mathbb{R}$ , the map is given by

$$T^\times \rightarrow (T \otimes \mathbb{C})^\times : t \mapsto t^{-1}.$$

4. There is an exact sequence

$$1 \rightarrow \mathbb{G}_m \xrightarrow{w} \mathbb{S} \xrightarrow{z \mapsto z/\bar{z}} \text{U}(1) \rightarrow 1.$$

(This can be checked on  $\mathbb{C}$ -points by(10.1.5.6), as  $\text{U}(1)$  is a torus). ┘

**6 Étale Torsors**

**Prop. (7.1.6.1).** For  $X \in \text{Sch}$ ,  $\check{H}^1(X, \text{GL}(n)) \cong \text{Coh}_{\text{lf}}^n(X)$  as pointed sets, by(7.1.5.2). ┘

## 7.2 Ringed Topoi, Ringed Sites, Ringed $G$ -Spaces and Schemes

*“L’algèbre n’est qu’une géométrie écrite; la géométrie n’est qu’une algèbre figurée.”*

–S. Germain

### 1 Ringed Topoi, Ringed Sites

**Def. (7.2.1.1) [Ringed Topoi].** A **ringed topos** is a pair  $(\mathrm{Sh}(\mathcal{C}), \mathcal{O})$  where  $\mathcal{C}$  is a site and  $\mathcal{O}$  is a unital object in  $\mathrm{Sh}(\mathcal{C})$ , called the **structure sheaf**. A morphism of ringed topoi  $(f, f^\sharp) : (\mathcal{C}, \mathcal{O}) \rightarrow (\mathcal{C}', \mathcal{O}')$  consists of a morphism of topoi (7.1.2.18)  $f : \mathrm{Sh}(\mathcal{C}) \rightarrow \mathrm{Sh}(\mathcal{C}')$  and a map of sheaves of rings  $f^\sharp : f^{-1}\mathcal{O}' \rightarrow \mathcal{O}$ . A composition of morphism of topoi is defined to be  $(g, g^\sharp) \circ (f, f^\sharp) = (g \circ f, f^\sharp \circ f^{-1}(g^\sharp))$ .  $\lrcorner$

**Def. (7.2.1.2) [Ringed Sites].** A **ringed site** is pair  $(\mathcal{C}, \mathcal{O})$  where  $\mathcal{C}$  is a site and  $\mathcal{O}$  is a sheaf of rings on  $\mathcal{C}$ , called the **structure sheaf**. A ringed site induces a ringed topos. A morphism of ringed sites is a morphism of sites that the induced morphism of topoi (7.1.2.20) is a morphism of ringed topoi (7.2.1.1).  $\lrcorner$

A site is naturally a ringed site where  $\mathcal{O} = \underline{\mathbb{Z}}$  the constant sheaf (7.1.2.8). So we only consider ringed sites afterwards, then a morphism of ringed sites is naturally a morphism of ringed sites. So whenever we say  $\mathcal{C}$  is a site, it is understood as a ringed site  $(\mathcal{C}, \underline{\mathbb{Z}})$ .  $\lrcorner$

**Prop. (7.2.1.3) [Ringed Topoi and Ringed Sites].** Let  $(f, f^\sharp) : (\mathrm{Sh}(\mathcal{C}), \mathcal{O}_{\mathcal{C}}) \rightarrow \mathrm{Sh}(\mathcal{D}, \mathcal{O}_{\mathcal{D}})$  be a morphism of ringed topoi, then we can find ringed sites  $(\mathcal{C}', \mathcal{O}_{\mathcal{C}'})$  and  $(\mathcal{D}', \mathcal{O}_{\mathcal{D}'})$  and a diagram

$$\begin{array}{ccc} (\mathrm{Sh}(\mathcal{C}), \mathcal{O}_{\mathcal{C}}) & \xrightarrow{(f, f^\sharp)} & (\mathrm{Sh}(\mathcal{D}), \mathcal{O}_{\mathcal{D}}) \\ \downarrow (g, g^\sharp) & & \downarrow (e, e^\sharp) \\ (\mathrm{Sh}(\mathcal{C}'), \mathcal{O}_{\mathcal{C}'}) & \xrightarrow{(h, h^\sharp)} & (\mathrm{Sh}(\mathcal{D}'), \mathcal{O}_{\mathcal{D}'}) \end{array}$$

where

- $(g, g^\sharp)$  and  $(e, e^\sharp)$  are equivalence of ringed topoi.
- $\mathcal{C}', \mathcal{D}'$  have final objects and finite products.
- $(h, h^\sharp)$  is induced by a continuous functor  $\mathcal{D}' \rightarrow \mathcal{C}'$  that the preserves the final object and finite products, (thus induces a morphism of sites by (7.1.2.14)).

Moreover, given a set of sheaves  $\mathcal{F}_i$  on  $\mathcal{C}$  and a set of sheaves  $\mathcal{G}_i$  on  $\mathcal{D}$ , we may choose  $\mathcal{C}'$  and  $\mathcal{D}'$  that these sheaves are representable by objects in  $\mathcal{C}'$  or  $\mathcal{D}'$ .  $\lrcorner$

*Proof:* [Sta]03CR.  $\square$

**Prop. (7.2.1.4) [Multiplicative Structure Sheaf].** Given a ringed topoi  $(\mathrm{Sh}(\mathcal{C}), \mathcal{O})$ , the presheaf  $U \mapsto \mathcal{O}^*(U)$  is a sheaf of groups, called the **multiplicative structure sheaf**  $\mathcal{O}^*$ .  $\lrcorner$

*Proof:* This comes from the sheaf property of  $\mathcal{O}$  and the fact the inverse of an element is unique.  $\square$

**Def. (7.2.1.5) [Local Ringed Site].** A ringed site  $(\mathcal{C}, \mathcal{O})$  is called a **local ringed site** if

$$\emptyset^\sharp \rightarrow \mathrm{Equalizer}(0, 1 : \mathrm{pt} \rightarrow \mathcal{O})$$

is an isomorphism of sheaves, and for any  $U \in \mathcal{C}$  and  $f \in \mathcal{O}(U)$ , there exists a covering  $\{U_i \rightarrow U\}$  s.t. for any  $j$ , either  $f|_{U_i}$  is invertible or  $(1 - f)|_{U_i}$  is invertible.  $\lrcorner$

**Prop. (7.2.1.6) [Characterizing Local Ringed Sites].** Let  $(\mathcal{C}, \mathcal{O})$  be a ringed site, the following are equivalent:

- $(\mathcal{C}, \mathcal{O})$  is a local ringed site.
- (Partition of Unity) For any  $U \in \mathcal{C}$ ,  $f_1, \dots, f_n \in \mathcal{O}(U)$  that  $(f_1, \dots, f_n) = (1)$ , there is a covering  $\{U_i \rightarrow U\}$  that for each  $j$ , there exists an  $i$  that  $f_i$  is invertible on  $U_j$ .
- The map of sheaves of sets:

$$(\mathcal{O} \otimes \mathcal{O}) \coprod (\mathcal{O} \times \mathcal{O}) \rightarrow \mathcal{O} \times \mathcal{O}$$

which maps  $(f, a)$  in the first component to  $(f, af)$  and  $(f, b)$  in the second component to  $(f, b(1 - f))$  is surjective.

┘

*Proof:* Cf. [Sta]04ES. □

**Def. (7.2.1.7) [Local Ringed Topoi].** If  $f : \mathrm{Sh}(\mathcal{C}') \rightarrow \mathrm{Sh}(\mathcal{C})$  is a morphism of topoi and  $(\mathcal{C}, \mathcal{O})$  is a local ringed site, then  $(\mathrm{Sh}(\mathcal{C}'), f^{-1}\mathcal{O})$  is also a local ringed site. In particular, being a local ringed site is an intrinsic property, so we can define **local ringed topoi** to be ringed topoi that the underlying ringed sites are local ringed. ┘

*Proof:* Because  $f^{-1}$  is exact (7.1.2.18) and commutes with products and equalizers, it maps the isomorphism

$$\emptyset^\# \rightarrow \mathrm{Equalizer}(0, 1 : \mathrm{pt} \rightarrow \mathcal{O})$$

to the corresponding isomorphism of  $\mathcal{C}'$ , and also the sejection of

$$(\mathcal{O} \otimes \mathcal{O}) \coprod (\mathcal{O} \times \mathcal{O}) \rightarrow \mathcal{O} \times \mathcal{O}$$

in (7.2.1.6) to that of  $\mathcal{C}'$ , thus  $(\mathrm{Sh}(\mathcal{C}'), f^{-1}\mathcal{O})$  is also a local ringed site. □

**Def. (7.2.1.8) [Morphisms of Local Ringed Topoi].** A **morphism of local ringed topoi** is a morphism of ringed topoi  $(f, f^\#) : (\mathrm{Sh}(\mathcal{C}), \mathcal{O}_\mathcal{C}) \rightarrow (\mathrm{Sh}(\mathcal{D}), \mathcal{O}_\mathcal{D})$  that the diagram of sheaves

$$\begin{array}{ccc} f^{-1}(\mathcal{O}_\mathcal{D}^*) & \xrightarrow{f^\#} & \mathcal{O}_\mathcal{C}^* \\ \downarrow & & \downarrow \\ f^{-1}(\mathcal{O}_\mathcal{D}) & \xrightarrow{f^\#} & \mathcal{O}_\mathcal{C} \end{array}$$

is Cartesian, where  $\mathcal{O}_\mathcal{C}^*$  is the multiplicative structure sheaf (7.2.1.4). Morphisms of local ringed topoi are stable under compositions. ┘

## Ringed Spaces

**Def. (7.2.1.9) [Ringed Spaces].** A **ringed space** is a pair  $(X, \mathcal{O}_X)$  consisting of a topological space  $X$  and a sheaf of rings  $\mathcal{O}_X$  on  $X$ . A morphism of ringed spaces  $(X, \mathcal{O}_X) \rightarrow (Y, \mathcal{O}_Y)$  consists of a pair  $(f, f^\#)$  where  $f$  is a continuous map  $X \rightarrow Y$  and  $f^\#$ , which induces a map of sites  $(f^{-1}, f_*) : X_{\mathrm{Zar}} \rightarrow Y_{\mathrm{Zar}}$  (7.2.6.7), and  $f^\#$  is a map  $f^\# : f^{-1}(\mathcal{O}_Y) \rightarrow \mathcal{O}_X$  (7.2.6.2), such that  $(f, f^\#)$  is a map of ringed topoi (7.2.1.1). ┘

**Def. (7.2.1.10) [Local Ringed Space].** A **local ringed space** is a topological space  $X$  with a sheaf of rings  $\mathcal{O}_X$  that  $(X, \mathcal{O}_X)$  forms a local ringed site (7.2.1.5). A morphism of local ringed space is a morphism of ringed spaces that the corresponding morphism of ringed topoi  $(\mathrm{Sh}(\mathcal{C}), \mathcal{O}_{\mathcal{C}}) \rightarrow (\mathrm{Sh}(\mathcal{D}), \mathcal{O}_{\mathcal{D}})$  is a morphism of local ringed topoi (7.2.1.8).  $\lrcorner$

**Prop. (7.2.1.11).** A ringed space  $(X, \mathcal{O}_X)$  is a locally ringed space iff any stalks  $\mathcal{O}_{X,x}$  is either 0 or a local rings.  $\lrcorner$

*Proof:* Cf. [Sta]04ET.  $\square$

## 2 Modules on Ringed Topoi

Main References are [Sta]Chap 18.

**Def. (7.2.2.1) [Modules on Ringed Topoi].** Let  $(\mathrm{Sh}(\mathcal{C}), \mathcal{O})$  be a ringed topos, then a sheaf of  $\mathcal{O}$ -modules is a presheaf of  $\mathcal{O}$ -modules that the underlying presheaf of Abelian groups is a sheaf.  $\lrcorner$

**Def. (7.2.2.2) [Support].** Let  $(X, \mathcal{O}_X)$  be a ringed space,  $\mathcal{F}$  a  $\mathcal{O}_X$ -module, then the **support** of  $\mathcal{F}$  is the set of points  $x$  that  $\mathcal{F}_x \neq 0$ . It is denoted by  $\mathrm{Supp}(\mathcal{F})$ . For a section  $s \in \Gamma(X, \mathcal{F})$ ,  $\mathrm{Supp}(s)$  is defined to be the set of points  $x$  that  $s_x \neq 0 \in \mathcal{F}_x$ .  $\lrcorner$

**Prop. (7.2.2.3).** Glueing sheaves is available for ringed spaces, similar to (7.1.5.3).  $\lrcorner$

*Proof:*  $\square$

**Prop. (7.2.2.4).** Glueing ringed spaces is available.  $\lrcorner$

*Proof:*  $\square$

**Def. (7.2.2.5) [Local Properties of Modules].** On a ringed site  $(\mathcal{C}, \mathcal{O})$ , an  $\mathcal{O}$ -module  $\mathcal{F}$  is called locally has property  $P$  if for any object  $U \in \mathcal{C}$ , there is a covering  $\{U_i \rightarrow U\}$  that  $\mathcal{F}|_{U_i}$  has property  $P$ .  $\lrcorner$

**Def. (7.2.2.6) [Intrinsic Properties of Modules].** An **intrinsic property** of sheaves of modules in a ringed topos  $(\mathrm{Sh}(\mathcal{C}), \mathcal{O})$  that is invariant under equivalence of topoi.  $\lrcorner$

**Def. (7.2.2.7) [Tensor Products Sheaf].** Let  $(\mathcal{C}, \mathcal{O})$  be a ringed site and  $\mathcal{F}, \mathcal{G}$  be  $\mathcal{O}$ -modules, then the **tensor product**  $\mathcal{F} \otimes_{\mathcal{O}} \mathcal{G}$  is defined to be the shification of the presheaf  $U \mapsto \mathcal{F}(U) \otimes_{\mathcal{O}(U)} \mathcal{G}(U)$ .

The tensor product is easily seen to be an intrinsic notion (7.2.2.6), so it can be defined on any ringed topoi.  $\lrcorner$

**Prop. (7.2.2.8) [Base Change].** Let  $(\mathcal{C}, \mathcal{O})$  be a ringed site and  $\mathcal{O}_2$  be a sheaf  $\mathcal{O}_1$ -algebras,  $\mathcal{G}$  be a sheaf of  $\mathcal{O}_1$ -module and  $\mathcal{F}$  a sheaf of  $\mathcal{O}_2$ -module, then

$$\mathrm{Hom}_{\mathcal{O}_1}(\mathcal{G}, \mathcal{F}_{\mathcal{O}_1}) = \mathrm{Hom}_{\mathcal{O}_2}(\mathcal{G} \otimes_{\mathcal{O}_1} \mathcal{O}_2, \mathcal{F}).$$

$\lrcorner$

*Proof:* This can be seen from the definition of tensor product and the fact shification doesn't bother because  $\mathcal{F}$  is a sheaf.  $\square$

**Def. (7.2.2.9) [Transfer of Modules on Ringed Sites].** Let  $(f, f^\#)$  be a morphism of ringed topoi  $(\mathrm{Sh}(\mathcal{C}), \mathcal{O}) \rightarrow (\mathrm{Sh}(\mathcal{C}'), \mathcal{O}')$ , then there are functor:

- the **pushforward**:  $f_* : \text{Mod}(\mathcal{O}) \rightarrow \text{Mod}(\mathcal{O}') : f_*\mathcal{F} = f_*\mathcal{F}$  as a  $\mathcal{O}'$ -module via  $\mathcal{O}' \rightarrow f_*\mathcal{O} \rightarrow f_*\mathcal{F}$ .
- the **pullback**  $f^* : \text{Mod}(\mathcal{O}') \rightarrow \text{Mod}(\mathcal{O}) : f^*\mathcal{G} = \mathcal{O} \otimes_{f^{-1}\mathcal{O}'} f^{-1}\mathcal{G}$  via  $f^\# : f^{-1}\mathcal{O}' \rightarrow \mathcal{O}$ .  $f^*$  is left adjoint to  $f_*$ , by the adjointness of  $f^{-1}$  and  $f_*$  (7.1.2.18).
- (Extension by zero): For the localization map of sites  $j_U : (\mathcal{C}/U, \mathcal{O}_U) \rightarrow (\mathcal{C}, \mathcal{O})$ ,  $j_U^* = j_U^{-1}$  has a left adjoint  $j_{U!}$ , called the **extension by zero** functor, defined by shiffication of the presheaf

$$\mathcal{G} \mapsto j_{U!}(\mathcal{G}) : j_{U!}(\mathcal{G})(V) = \bigoplus_{\varphi: V \rightarrow U} \mathcal{G}(V \xrightarrow{\varphi} U \in \mathcal{C}/U)$$

with obvious restriction mappings and an obvious  $\mathcal{O}$ -module structure. ┘

*Proof:* To show  $j_{U!}$  is left adjoint to  $j_U^*$ , Cf.[Sta]03DI. □

**Remark (7.2.2.10).** The  $f^*$  may not be exact.  $f^{-1}$  is exact, but we tensored with  $\mathcal{O}_X$ , it is exact when  $f$  is flat (7.2.2.15). ┘

**Prop. (7.2.2.11) [Extension by Zero is Exact].** Let  $(\mathcal{C}, \mathcal{O})$  be a ringed site and  $U \in \mathcal{C}$ , then the extension by zero functor  $j_{U!} : \text{Mod}(\mathcal{O}_U) \rightarrow \text{Mod}(\mathcal{O})$  is exact and reflects exactness. ┘

*Proof:* It is right exact because is a left adjoint, and it is left exact by direct inspection and the fact that shiffication is exact.

For refecton of exactness, Cf.[Sta]0E8G. ? □

**Prop. (7.2.2.12) [Tensor Products and Pullbacks].** Tensor products commute with pullbacks, in particular with taking stalks. So tensoring with a locally free sheaf is exact. ┘

*Proof:* By (7.2.3.3) and (7.2.3.5), for any  $\mathcal{O}$ -module  $\mathcal{H}$ ,

$$\text{Hom}(f^*\mathcal{F} \otimes f^*\mathcal{G}, \mathcal{H}) = \text{Hom}(\mathcal{F}, f_*\text{Hom}(f^*\mathcal{G}, \mathcal{H})) = \text{Hom}(\mathcal{F}, \text{Hom}(\mathcal{G}, f_*\mathcal{H})) = \text{Hom}(f^*(\mathcal{F} \otimes \mathcal{G}), \mathcal{H}).$$

□

**Prop. (7.2.2.13) [ $j_{U!}$  Commutes with Restriction].** Let  $(\mathcal{C}, \mathcal{O})$  be a ringed site and  $U \in \mathcal{C}, \mathcal{G} \in \text{Mod}(\mathcal{O}_U), \mathcal{F} \in \text{Mod}(\mathcal{O})$ , then there is a natural isomorphism  $j_{U!}\mathcal{G} \otimes_{\mathcal{O}} \mathcal{F} \cong j_{U!}(\mathcal{G} \otimes_{\mathcal{O}_U} \mathcal{F}|_U)$  ┘

*Proof:* By (7.2.3.3) and (7.2.3.5), for any  $\mathcal{H} \in \text{Mod}(\mathcal{O})$ ,

$$\begin{aligned} \text{Hom}_{\mathcal{O}}(j_{U!}(\mathcal{G} \otimes_{\mathcal{O}_U} \mathcal{F}|_U), \mathcal{H}) &= \text{Hom}_{\mathcal{O}_U}(\mathcal{G} \otimes_{\mathcal{O}_U} \mathcal{F}|_U, \mathcal{H}|_U) = \text{Hom}_{\mathcal{O}_U}(\mathcal{G}, \text{Hom}_{\mathcal{O}}(\mathcal{F}|_U, \mathcal{H}|_U)) \\ &= \text{Hom}_{\mathcal{O}_U}(\mathcal{G}, \text{Hom}_{\mathcal{O}_U}(\mathcal{F}, \mathcal{H})|_U) = \text{Hom}_{\mathcal{O}}(j_{U!}\mathcal{G}, \text{Hom}_{\mathcal{O}}(\mathcal{F}, \mathcal{H})) \\ &= \text{Hom}_{\mathcal{O}}(j_{U!}\mathcal{G} \otimes_{\mathcal{O}} \mathcal{F}, \mathcal{H}) \end{aligned}$$

then use Yoneda lemma. □

**Prop. (7.2.2.14) [Properties of Tensor Products].** Let  $(\mathcal{C}, \mathcal{O})$  be a ringed site and  $\mathcal{F}, \mathcal{G}$  be sheaves of  $\mathcal{O}$ -modules, then

1. If  $\mathcal{F}, \mathcal{G}$  are locally free, then so does  $\mathcal{F} \otimes \mathcal{G}$ .
2. If  $\mathcal{F}, \mathcal{G}$  are locally finite free, then so does  $\mathcal{F} \otimes \mathcal{G}$ .
3. If  $\mathcal{F}, \mathcal{G}$  are locally generated by sections, then so does  $\mathcal{F} \otimes \mathcal{G}$ .

4. If  $\mathcal{F}, \mathcal{G}$  are of f.t., then so does  $\mathcal{F} \otimes \mathcal{G}$ .
5. If  $\mathcal{F}, \mathcal{G}$  are quasi-coherent., then so does  $\mathcal{F} \otimes \mathcal{G}$ .
6. If  $\mathcal{F}, \mathcal{G}$  are of f.p., then so does  $\mathcal{F} \otimes \mathcal{G}$ .
7. If  $\mathcal{F}$  is of f.p. and  $\mathcal{G}$  is coherent, then  $\mathcal{F} \otimes \mathcal{G}$  is coherent. In particular, if  $\mathcal{F}, \mathcal{G}$  are coherent, then so does  $\mathcal{F} \otimes \mathcal{G}$  (7.2.2.27).

┘

*Proof:* Cf. [Sta]03L6.

□

### Flat Modules

**Def. (7.2.2.15) [Flat Modules and Flat Morphisms].** For  $\mathcal{C} \in \text{Site}$  and  $\mathcal{O}$  a presheaf of rings,  $\mathcal{F} \in \mathcal{P}\text{Sh}(\mathcal{O})$  is called **flat** if the functor  $P\text{Mod}(\mathcal{O}) \rightarrow P\text{Mod}(\mathcal{O}) : \mathcal{G} \mapsto \mathcal{G} \otimes_{\mathcal{O}} \mathcal{F}$  is exact.

Let  $\mathcal{C}$  be a ringed site, and  $\mathcal{F}$  is a sheaf of  $\mathcal{O}$ -modules, then it is called **flat** if the functor  $\text{Mod}(\mathcal{O}) \rightarrow \text{Mod}(\mathcal{O}) : \mathcal{G} \mapsto \mathcal{G} \otimes_{\mathcal{O}} \mathcal{F}$  is exact.

A morphism  $(f, f^{\sharp})$  is called a **flat morphism** if the ring map  $f^{\sharp} : f^{-1}\mathcal{O}' \rightarrow \mathcal{O}$  is flat, or equivalently, the pullback functor (7.2.2.9)  $f^*$  is exact.

If  $(f, f^{\sharp})$  is a morphism of ringed topoi  $(\text{Sh}(\mathcal{C}), \mathcal{O}) \rightarrow (\text{Sh}(\mathcal{C}'), \mathcal{O}')$ , and  $\mathcal{F}$  is a sheaf of  $\mathcal{O}$ -modules, then  $\mathcal{F}$  is **flat** over  $(\text{Sh}(\mathcal{C}'), \mathcal{O}')$  if  $\mathcal{F}$  is flat over  $f^{-1}\mathcal{O}'$ .

┘

**Prop. (7.2.2.16).** Let  $\mathcal{C}$  be a site and  $\mathcal{O}$  a presheaf of rings with shification  $\mathcal{O}^{\sharp}$ .

- If  $\mathcal{F}$  is a presheaf of  $\mathcal{O}$ -modules that each  $\mathcal{F}(U)$  is flat  $\mathcal{O}(U)$ -modules, then  $\mathcal{F}$  is flat.
- If  $\mathcal{F}$  is a flat presheaf of  $\mathcal{O}$ -modules, then  $\mathcal{F}^{\sharp}$  is a flat  $\mathcal{O}^{\sharp}$ -modules.
- A filtered colimits of flat presheaves of modules is flat. A direct sum of flat presheaves of modules is flat.
- A filtered colimits of flat sheaves of modules is flat. A direct sum of flat sheaves of modules is flat.

┘

**Prop. (7.2.2.17) [Flatness is Stalkwise].** Let  $(X, \mathcal{O}_X)$  be a ringed space, then an  $\mathcal{O}_X$ -module  $\mathcal{F}$  is flat iff the stalks  $\mathcal{F}_x$  are all flat  $\mathcal{O}_{X,x}$ -modules.

┘

*Proof:* Cf. [Sta]05NE.

□

**Prop. (7.2.2.18) [Flat Morphism and Support].** Let  $f : (X, \mathcal{O}_X) \rightarrow (X', \mathcal{O}_{X'})$  be a flat morphism of local ringed spaces,  $\mathcal{F}$  an  $\mathcal{O}_{X'}$ -module, then  $\text{Supp}(f^*(\mathcal{F})) = f^{-1}(\text{Supp}(\mathcal{F}))$ .

┘

*Proof:* Use the fact flat ring map of local rings is faithfully flat.

□

### Modules of Finite Type & Finite Presentation

**Def. (7.2.2.19) [Finite Type].** An  $\mathcal{O}$ -module is called if **finite type** iff locally a quotient of a finite free sheaf.

┘

**Prop. (7.2.2.20) [Extension of F.T. Sheaves].** if  $0 \rightarrow \mathcal{F}_1 \rightarrow \mathcal{F}_2 \rightarrow \mathcal{F}_3 \rightarrow 0$  is an exact sequence of  $\mathcal{O}$ -modules and  $\mathcal{F}_1, \mathcal{F}_3$  are of f.t., then  $\mathcal{F}_2$  is of f.t..

┘

*Proof:* For any  $U \in \mathcal{C}$ , choose a covering  $\{U_i \rightarrow U\}$  that  $\mathcal{F}_3(U_i)$  is generated by f.m. sections, then by passing to a covering, we may assume these sections come from  $\mathcal{F}_2$ . Pass to another covering that  $\mathcal{F}_1$  is generated by f.m. sections, then on this covering,  $\mathcal{F}_2$  is generated by f.m. sections.  $\square$

**Def. (7.2.2.21)[Finite Presentation].** A sheaf of modules  $\mathcal{F}$  is called **of finite presentation** iff locally it is a cokernel of two finite free modules. The pullback of a f.p. sheaf is f.p, by the left adjointness of  $f^*$ .  $\lrcorner$

**Prop. (7.2.2.22)[FP-FT-FT].** If  $f : \mathcal{G} \rightarrow \mathcal{F}$  is a surjection of  $\mathcal{O}$ -modules,  $\mathcal{F}$  is of f.p. and  $\mathcal{G}$  is of f.t., then the kernel is of finite type.  $\lrcorner$

*Proof:* We first show for  $\mathcal{G} = \mathcal{O}^n$ : By pass to covering, we can construct a diagram

$$\begin{array}{ccccccc} \mathcal{O}_{U_{ij}}^m & \longrightarrow & \mathcal{O}_{U_{ij}}^n & \longrightarrow & \mathcal{F}|_{U_{ij}} & \longrightarrow & 0 \\ \downarrow \alpha & & \downarrow & & \downarrow & & \\ 0 & \longrightarrow & \ker(f)|_{U_{ij}} & \longrightarrow & \mathcal{G}|_{U_{ij}} & \longrightarrow & \mathcal{F}|_{U_{ij}} \longrightarrow 0 \end{array}$$

and then use snake lemma. The image and cokernel of  $\alpha$  are all of f.t., then  $\ker(f)|_{U_{ij}}$  is of f.t. by (7.2.2.20).

For general  $\mathcal{G}$ , locally choose a surjection  $\varphi : \mathcal{O}_{U_i}^n \rightarrow \mathcal{G}|_{U_i}$ , then  $\ker(f|_{U_i}) = \varphi(\ker(\varphi \circ f|_{U_i}))$ , which is of f.t..  $\square$

**Prop. (7.2.2.23).** Pullbacks of a module of finite type is of finite type. Pullback of a module of finite presentation is of finite presentation.

Finite type and finite presentation are local on the target.  $\lrcorner$

*Proof:* This is because pullback is a left adjoint thus right exact. They are local on the target because they are defined locally.  $\square$

**Prop. (7.2.2.24)[Support is Zariski Closed].** If  $(X, \mathcal{O}_X)$  is a ringed space and  $f : \mathcal{G} \rightarrow \mathcal{F}$  is surjective at a point  $x$  and  $\mathcal{F}$  is of f.t., then it is surjective on a Zariski nbhd of  $x$ . Thus the support of a f.t. sheaf is closed (look at  $0 \rightarrow \mathcal{F}$ ).  $\lrcorner$

*Proof:* Choose a nbhd of  $x$  that  $\mathcal{F}(U)$  is generated by  $s_1, \dots, s_n \in \mathcal{F}(U)$ , because  $f$  is surjective at the stalk of  $x$ , after shrinking  $U$ , we may assume  $s_i = f(t_i)$  for  $t_i \in \mathcal{G}(U)$ , so  $f$  is surjective on  $U$ .  $\square$

### (Quasi-)Coherent Sheaves

**Def. (7.2.2.25)[Quasi-Coherent Sheaf].** An  $\mathcal{O}$ -module  $\mathcal{F}$  on a ringed site is called **quasi-coherent** iff locally it is a cokernel of two free modules. A locally f.p. sheaf of modules is Qco.  $\lrcorner$

**Prop. (7.2.2.26)[Associated Qco Sheaves].** And for a ringed space  $(X, \mathcal{O}_X)$  and a  $R = \Gamma(X, \mathcal{O}_X)$ -module  $M$ , we have a coherent sheaf  $\mathcal{F}_M$  on  $X$ , defined as  $\pi^*(M)$ , where  $M$  is seen as a qco sheaf on  $(\text{pt}, R)$ . It is the sheaf associated to the presheaf  $U \mapsto \mathcal{O}_X(U) \otimes M$ .

This construction is a functor from the category of  $R$ -module to the category of Qco  $\mathcal{O}_X$ -modules, and it commutes with colimits because  $\pi^*$  does. And it is left adjoint to  $\Gamma$  by (7.2.2.9):

$$\text{Hom}_A(M, \Gamma(X, \mathcal{G})) \cong \text{Hom}_{\mathcal{O}_X}(\mathcal{F}_M, \mathcal{G})$$

$\lrcorner$

**Def. (7.2.2.27) [Coherent Sheaves].** A **coherent sheaf** is a  $\mathcal{O}$ -module  $\mathcal{F}$  that is of f.t. and for any object  $U$  and for any set of elements of  $\Gamma(U, \mathcal{F})$ , the kernel of  $\oplus \mathcal{O}_U \rightarrow \mathcal{F}|_U$  is of f.t..

A coherent sheaf is of f.p., by base change to a smaller covering, and it is Qco.  $\lrcorner$

**Prop. (7.2.2.28) [Properties of Coherent Sheaves].** Any f.t. subsheaf of a coherent sheaf is coherent, by definition. Any kernel of a morphism from a f.t. sheaf to a coherent sheaf is of f.t..

$\text{Coh}(X)$  is a weak Serre subcategory of  $\text{Mod}_{\mathcal{O}_X}$ . In particular, if  $\mathcal{O}_X$  is coherent, then a sheaf is coherent iff it is f.p.  $\lrcorner$

*Proof:* Let  $\mathcal{G}$  be a sheaf of f.t. and  $\mathcal{F}$  be a coherent sheaf. For any map  $f : \mathcal{G} \rightarrow \mathcal{F}$  and  $U \in \mathcal{C}$ , let  $\{U_i \rightarrow U\}$  be a covering that there are surjections  $\varphi_i : \mathcal{O}_{U_i}^{n_i} \rightarrow \mathcal{G}|_{U_i}$ . Then  $\ker(f \circ \varphi_i)$  is a  $\mathcal{O}_{U_i}$ -module of f.t.. Now  $\varphi_i : \ker(f \circ \varphi_i) \rightarrow \ker(f)|_{U_i}$  is a surjection, so  $\ker(f)|_{U_i}$  is of f.t., and  $\ker(f)$  is of f.t..

The kernel of a map between coherent sheaves is of f.t. by the result above, thus it is coherent.

Let  $\varphi : \mathcal{F}_1 \rightarrow \mathcal{F}$  be a map between coherent sheaves, then  $\text{Im}(\varphi)$  and  $\text{Coker}(\varphi)$  are of f.t.. For any  $U \in \mathcal{C}$  and sections  $\bar{s}_i$  of  $\text{Coker}(\varphi)(U)$  inducing a map  $\bar{\Phi} : \mathcal{O}_U^n \rightarrow \text{Coker}(\varphi)|_U$ , we can choose a covering  $\{U_i \rightarrow U\}$  that  $\bar{s}_i$  comes from  $s_i \in \mathcal{F}(U_i)$  for any  $i$ . Now we can choose coverings  $\{U_{ij} \rightarrow U_i\}$  that there are surjections  $\mathcal{O}_{U_{ij}}^{n_{ij}} \rightarrow \text{Im}(\varphi)(U_{ij})$ . Consider the commutative diagram

$$\begin{array}{ccccccc} 0 & \longrightarrow & \mathcal{O}_{U_{ij}}^{n_{ij}} & \longrightarrow & \mathcal{O}_{U_{ij}}^{n_{ij}} \oplus \mathcal{O}_{U_{ij}}^n & \longrightarrow & \mathcal{O}_{U_{ij}}^n \longrightarrow 0 \\ & & \downarrow & & \downarrow \Phi & & \downarrow \\ 0 & \longrightarrow & \text{Im}(\varphi)|_{U_{ij}} & \longrightarrow & \mathcal{F}|_{U_{ij}} & \longrightarrow & \text{Coker}(\varphi)|_{U_{ij}} \longrightarrow 0 \end{array},$$

then snake lemma gives a surjection  $\ker \Phi \rightarrow \ker(\bar{\Phi}) \rightarrow 0$ . Because  $\ker \Phi$  is of f.t., so does  $\ker(\bar{\Phi})$ , and  $\text{Coker}(\varphi)$  is coherent.

Let  $0 \rightarrow \mathcal{F}_1 \rightarrow \mathcal{F}_2 \rightarrow \mathcal{F}_3 \rightarrow 0$  be an exact sequence that  $\mathcal{F}_1, \mathcal{F}_3$  is coherent, then by (7.2.2.20),  $\mathcal{F}_2$  is of f.t.. For any object  $U \in \mathcal{C}$ , consider the commutative diagram

$$\begin{array}{ccccccc} 0 & \longrightarrow & 0 & \longrightarrow & \mathcal{O}_U^n & \longrightarrow & \mathcal{O}_U^n \longrightarrow 0 \\ & & \downarrow & & \downarrow \varphi_1 & & \downarrow \varphi_2 \\ 0 & \longrightarrow & \mathcal{F}_1|_U & \longrightarrow & \mathcal{F}_2|_U & \longrightarrow & \mathcal{F}_3|_U \longrightarrow 0 \end{array},$$

the snake lemma gives an exact sequence  $0 \rightarrow \ker(\varphi_1) \rightarrow \ker(\varphi_2) \rightarrow \mathcal{F}_1|_U$ . So  $\ker(\varphi_1)$  is of f.t., so  $\mathcal{F}_2$  is coherent.  $\square$

**Prop. (7.2.2.29).** The pullback of a (quasi-)coherent module is a (quasi-)coherent, because  $f^*$  is a left adjoint.  $\lrcorner$

**Prop. (7.2.2.30).** (Quasi-)Coherence is local on the target.  $\lrcorner$

*Proof:* This is because they are defined locally.  $\square$

**Prop. (7.2.2.31).** Let  $(X, \mathcal{O}_X)$  be a ringed space and  $x \in X$ .

- Let  $f : \mathcal{G} \rightarrow \mathcal{F}$  be a map of  $\mathcal{O}_X$ -modules. If  $\mathcal{G}$  is of f.t. and  $\mathcal{F}$  is coherent, and  $f$  is injective at the stalk of  $x$ , then there exists a nbhd  $U$  of  $x$  that  $f|_U$  is injective.
- Let  $f : \mathcal{G} \rightarrow \mathcal{F}$  be a map of coherent  $\mathcal{O}_X$ -modules that is surjective at the stalk of  $x$ , then there exists a nbhd  $U$  of  $x$  that  $f|_U$  is surjective.

- Let  $f : \mathcal{G} \rightarrow \mathcal{F}$  be a map of coherent  $\mathcal{O}_X$ -modules that is isomorphism at the stalk of  $x$ , then there exists a nbhd  $U$  of  $x$  that  $f|_U$  is an isomorphism.  $\lrcorner$

*Proof:* 1: Consider the kernel of  $f$ , then it is of f.t. by definition (7.2.2.27). Then  $\ker(f)_x = 0$ , so there is a nbhd  $U$  of  $x$  that  $\ker(f)|_U = 0$ , by (7.2.2.24), which means  $f|_U$  is injective.

2: this is immediate from (7.2.2.24).

3 follows from 1 and 2.  $\square$

### 3 Construction of Sheaves

#### Internal Hom

**Def. (7.2.3.1) [Internal Hom].** Let  $\mathcal{C}$  is a category and  $\mathcal{O}$  is a presheaf of rings,  $\mathcal{F}, \mathcal{G}$  be presheaves of  $\mathcal{O}$ -modules, then  $U \mapsto \text{Hom}_{\mathcal{O}|_U}(\mathcal{F}|_U, \mathcal{G}|_U)$  defines a presheaf  $\mathcal{H}om(\mathcal{F}, \mathcal{G})$  of  $\mathcal{O}$ -modules, and there is a natural evaluation map

$$\mathcal{F} \otimes_{\mathcal{O}} \mathcal{H}om(\mathcal{F}, \mathcal{G}) \rightarrow \mathcal{G}.$$

Now if  $\mathcal{C}$  is a site and  $\mathcal{O}$  is a sheaf of rings,  $\mathcal{F}, \mathcal{G}$  be sheaves of  $\mathcal{O}$ -modules, then  $\mathcal{H}om_{\mathcal{O}}(\mathcal{F}, \mathcal{G})$  is a sheaf of  $\mathcal{O}$ -modules by (7.1.3.18), called the **internal Hom sheaf**. Denote  $\mathcal{H}om(\mathcal{F}, \mathcal{O})$  by  $\mathcal{F}^\vee$ .  $\lrcorner$

**Prop. (7.2.3.2).** Internal Hom sheaf commutes with localization:  $\mathcal{H}om_{\mathcal{O}_U}(\mathcal{F}|_U, \mathcal{G}|_U) = \mathcal{H}om_{\mathcal{O}}(\mathcal{F}, \mathcal{G})|_U$ . This follows from the definition.  $\lrcorner$

**Prop. (7.2.3.3) [Tensoring and Inner Hom].** If  $\mathcal{C}$  is a site,  $\mathcal{O}$  is a sheaf of rings and  $\mathcal{F}, \mathcal{G}, \mathcal{H}$  are sheaves of  $\mathcal{O}$ -modules, then there is a canonical isomorphism of sheaves:

$$\mathcal{H}om_{\mathcal{O}}(\mathcal{H} \otimes_{\mathcal{O}} \mathcal{F}, \mathcal{G}) \cong \mathcal{H}om_{\mathcal{O}}(\mathcal{F}, \mathcal{H}om_{\mathcal{O}}(\mathcal{H}, \mathcal{G})).$$

In particular, taking limit over  $\mathcal{C}$ , we see  $- \otimes_{\mathcal{O}} \mathcal{H}$  is left adjoint to  $\mathcal{H}om_{\mathcal{O}}(\mathcal{F}, -)$ :

$$\text{Hom}_{\mathcal{O}}(\mathcal{H} \otimes_{\mathcal{O}} \mathcal{F}, \mathcal{G}) \cong \text{Hom}_{\mathcal{O}}(\mathcal{F}, \mathcal{H}om_{\mathcal{O}}(\mathcal{H}, \mathcal{G})).$$

In particular, the monoidal category of  $\mathcal{O}_X$ -modules is closed (7.2.2.15).  $\lrcorner$

*Proof:* Omitted (Recall the definition of tensor product sheaf (7.2.2.7)).  $\square$

**Prop. (7.2.3.4).**

$$\mathcal{H}om(\varinjlim A_i, B) \cong \varprojlim \mathcal{H}om(A_i, B) \quad \mathcal{H}om(A, \varprojlim B_i) \cong \varprojlim \mathcal{H}om(A, B_i)$$

$\lrcorner$

*Proof:* This is immediate from (4.1.5.11).  $\square$

**Prop. (7.2.3.5).**  $f^*$  is left adjoint to  $f_*$  by (7.2.2.9):  $\text{Hom}_{\mathcal{O}_X}(f^*\mathcal{G}, \mathcal{F}) \cong \text{Hom}_{\mathcal{O}_Y}(\mathcal{G}, f_*\mathcal{F})$ . In fact

$$f_*(\mathcal{H}om_{\mathcal{O}}(f^*\mathcal{G}, \mathcal{F})) \cong \mathcal{H}om_{\mathcal{O}'}(\mathcal{G}, f_*\mathcal{F}).$$

by checking on every open subset  $U \subset Y$ .  $\lrcorner$

**Prop. (7.2.3.6).** Let  $\mathcal{C}$  be a site and  $\mathcal{O} \rightarrow \mathcal{O}'$  is a map of sheaves of rings, then for any  $\mathcal{G} \in \text{Mod}(\mathcal{O}')$  and  $\mathcal{F} \in \text{Mod}(\mathcal{O})$ , there is a natural isomorphism

$$\text{Hom}_{\mathcal{O}}(\mathcal{G}, \mathcal{F}) = \text{Hom}_{\mathcal{O}'}(\mathcal{G}, \text{Hom}_{\mathcal{O}}(\mathcal{O}', \mathcal{F})).$$

by checking on every open subset  $U \subset Y$ . ┘

**Prop. (7.2.3.7).** Let  $f_* : (X, \mathcal{O}_X) \rightarrow (Y, \mathcal{O}_Y)$  be a morphism of ringed spaces, and  $\mathcal{F}, \mathcal{G}$  are  $\mathcal{O}_Y$ -modules. If  $\mathcal{F}$  is f.p. and  $f$  is flat, then the canonical map

$$f^* \text{Hom}_{\mathcal{O}_Y}(\mathcal{F}, \mathcal{G}) \rightarrow \text{Hom}_{\mathcal{O}_X}(f^* \mathcal{F}, f^* \mathcal{G})$$

is an isomorphism. ┘

*Proof:* ? □

**Prop. (7.2.3.8).** Let  $(X, \mathcal{O}_X)$  be a ringed space and  $\mathcal{F}, \mathcal{G}$  be  $\mathcal{O}_X$ -modules. If  $\mathcal{F}$  is f.p. or locally free, then the canonical map

$$\text{Hom}(\mathcal{F}, \mathcal{G})_x \rightarrow \text{Hom}_{\mathcal{O}_{X,x}}(\mathcal{F}_x, \mathcal{G}_x)$$

is an isomorphism. ┘

*Proof:* Choose a presentation of  $\mathcal{F}$ . This follows from the exactness of taking stalks and (7.2.3.4). □

**Prop. (7.2.3.9).** Let  $(X, \mathcal{O}_X)$  be a ringed site and  $\mathcal{F}, \mathcal{G}$  be  $\mathcal{O}_X$ -modules. If  $\mathcal{F}$  is f.p. and  $\mathcal{G}$  is coherent, then  $\text{Hom}(\mathcal{F}, \mathcal{G})$  is also coherent. In particular, this applies to  $\mathcal{F}, \mathcal{G}$  both coherent. ┘

*Proof:* This follows from (7.2.3.4) and (7.2.2.28). □

### Tensor Sheaves

**Def. (7.2.3.10) [Tensor Sheaves].** Let  $(\mathcal{C}, \mathcal{O})$  be a ringed site and  $\mathcal{F}$  an  $\mathcal{O}$ -module, then we define

- $T(\mathcal{F})$  to be the sheafification of the presheaf  $U \mapsto T_{\mathcal{O}_X(U)}(\mathcal{F}(U))$  (5.1.1.23).
  - $\wedge \mathcal{F}$  to be the sheafification of the presheaf  $U \mapsto \wedge_{\mathcal{O}_X(U)}(\mathcal{F}(U))$  (5.1.1.23).
  - $\text{Sym}(\mathcal{F})$  to be the sheafification of the presheaf  $U \mapsto \text{Sym}_{\mathcal{O}_X(U)}(\mathcal{F}(U))$  (5.1.1.23).
- ┘

**Cor. (7.2.3.11).** Over a ringed space  $(X, \mathcal{O}_X)$ , the construction of  $T(\mathcal{F})$ ,  $\wedge(\mathcal{F})$  and  $\text{Sym}(\mathcal{F})$  commutes with taking stalks, because the construction of tensor algebras and shiffication are both left adjoints (5.1.1.24). Also they commutes with pullbacks, because they satisfy the same universal properties. ┘

**Prop. (7.2.3.12).** let  $\mathcal{F}$  be an  $(\mathcal{C}, \mathcal{O})$ -module, then the following properties are preserved under the construction of  $T(\mathcal{F})$ ,  $\wedge(\mathcal{F})$  and  $\text{Sym}(\mathcal{F})$ :

- Locally generated by sections.
  - Finite Type.
  - Finite Presented.
  - Coherent.
  - Quasi-coherent.
  - Locally free.
- ┘

*Proof:* Cf. [Sta]01CL. □

#### 4 Sheaf of Differentials

**Prop. (7.2.4.1).** If  $\mathcal{C}$  is a site and  $\mathcal{O}_1 \rightarrow \mathcal{O}_2$  is a homomorphism of sheaves of rings and  $\mathcal{F}$  is a sheaf of  $\mathcal{O}_2$ -modules, then an  $\mathcal{O}_1$ -**derivation** from  $\mathcal{O}_2$  to  $\mathcal{F}$  is a map that for any  $U \in \mathcal{C}$ , the map  $\mathcal{O}_2(U) \rightarrow \mathcal{F}(U)$  is a  $\mathcal{O}_1(U)$ -derivation (5.4.3.1).  $\square$

**Prop. (7.2.4.2) [Sheaf of Differentials].** Let  $\mathcal{C}$  be a site and  $\mathcal{O}_1 \rightarrow \mathcal{O}_2$  is a homomorphism of sheaves of rings and  $\mathcal{F}$  is a sheaf of  $\mathcal{O}_2$ -modules, then the functor  $\text{Mod}(\mathcal{O}_2) \rightarrow \text{Ab} : \mathcal{F} \rightarrow \text{Der}_{\mathcal{O}_1}(\mathcal{O}_2, \mathcal{F})$  is representable by a sheaf of modules  $\Omega_{\mathcal{O}_2/\mathcal{O}_1}$ , called the **sheaf of differentials**. and the map  $d : \mathcal{O}_2 \rightarrow \Omega_{\mathcal{O}_2/\mathcal{O}_1}$  is called the universal derivation.  $\square$

*Proof:* The construction is similar to that of (5.4.3.4): if for any sheaf  $\mathcal{F}$  we denote  $\mathcal{O}_2[\mathcal{F}]$  generated by shification of the presheaf  $U \mapsto \mathcal{O}_2(U)[\mathcal{F}(U)]$ , then  $\Omega_{\mathcal{O}_2/\mathcal{O}_1}$  is the cokernel of

$$\mathcal{O}_2[\mathcal{O}_2 \times \mathcal{O}_2] \oplus \mathcal{O}_2[\mathcal{O}_2 \times \mathcal{O}_2] \oplus \mathcal{O}_2[\mathcal{O}_1] \rightarrow \mathcal{O}_2[\mathcal{O}_2]$$

 $\square$ 

**Prop. (7.2.4.3) [Localness of Sheaf of Differentials].** If  $\mathcal{O}_1 \rightarrow \mathcal{O}_2$  is a homomorphism of presheaves of rings, then  $\Omega_{\mathcal{O}_2^\#/\mathcal{O}_1^\#}$  is the sheafification of the presheaf  $U \mapsto \Omega_{\mathcal{O}_2(U)/\mathcal{O}_1(U)}$ .  $\square$

*Proof:* This is because the construction of  $\Omega_{\mathcal{O}_2^\#/\mathcal{O}_1^\#}$  (5.4.3.4) for all  $U$  gives an exact sequence of presheaves, and the shification of which is just the construction in (7.2.4.2), so we are done because shification is exact (7.1.2.7).  $\square$

**Prop. (7.2.4.4) [Change of Sites].** Let  $f : \text{Sh}(\mathcal{D}) \rightarrow \text{Sh}(\mathcal{C})$  be a morphism of topoi and  $\varphi : \mathcal{O}_1 \rightarrow \mathcal{O}_2$  a homomorphism of rings on  $\mathcal{C}$ , then there is a canonical isomorphism  $f^{-1}\Omega_{\mathcal{O}_2/\mathcal{O}_1} \cong \Omega_{f^{-1}\mathcal{O}_2/f^{-1}\mathcal{O}_1}$  compatible with the universal derivations.  $\square$

*Proof:* This follows from the construction (7.2.4.2) and the fact  $f^{-1}$  is exact (7.2.4.2).  $\square$

**Prop. (7.2.4.5) [Functoriality of  $\Omega$ ].** Let  $\varphi : (\mathcal{O}_1 \rightarrow \mathcal{O}_2) \rightarrow (\mathcal{O}'_1 \rightarrow \mathcal{O}'_2)$  be a commutative diagram of sheaves of rings over a site  $\mathcal{C}$ , then the map  $\mathcal{O}'_1 \rightarrow \mathcal{O}'_2$  composed with the derivative  $\mathcal{O}'_2 \rightarrow \Omega_{\mathcal{O}'_2/\mathcal{O}'_1}$  is a  $\mathcal{O}'_1$ -derivative, thus we obtain a map of  $\mathcal{O}_2$ -modules  $\Omega_{\mathcal{O}_2/\mathcal{O}_1} \rightarrow \Omega_{\mathcal{O}'_2/\mathcal{O}'_1}$ , or equivalently a map of  $\mathcal{O}'_2$ -modules  $\Omega_{\mathcal{O}_2/\mathcal{O}_1} \otimes_{\mathcal{O}_2} \mathcal{O}'_2 \rightarrow \Omega_{\mathcal{O}'_2/\mathcal{O}'_1}$ . Thus  $\Omega_{-/-}$  is a functor of arrows.  $\square$

Moreover, if  $\mathcal{O}'_2 = \mathcal{O}_2 \otimes_{\mathcal{O}_1} \mathcal{O}'_1$ , then this map is an isomorphism, by (7.2.4.3) and (5.4.3.6).  $\square$

**Prop. (7.2.4.6).** Let  $\mathcal{O}_1 \rightarrow \mathcal{O}_2 \rightarrow \mathcal{O}'_2$  be a map of sheaves of rings that  $\mathcal{O}_2 \rightarrow \mathcal{O}'_2$  is surjective with kernel  $\mathcal{I} \subset \mathcal{O}_2$ , then there is a canonical exact sequence of  $\mathcal{O}'_2$ -modules

$$\mathcal{I}/\mathcal{I}^2 \rightarrow \Omega_{\mathcal{O}_2/\mathcal{O}_1} \otimes_{\mathcal{O}_2} \mathcal{O}'_2 \rightarrow \Omega_{\mathcal{O}'_2/\mathcal{O}_1} \rightarrow 0,$$

where the first map is characterized by mapping local sections  $f$  of  $\mathcal{I}$  to  $df \otimes 1$ .  $\square$

*Proof:* The first map is well-defined if  $d(\mathcal{I}^2) = 0$ . To show the exactness, let  $\mathcal{O}''_2 \subset \mathcal{O}'_2$  to be the presheaf of  $\mathcal{O}_1$ -algebras that  $\mathcal{O}''_2(U)$  the image of  $\mathcal{O}_2(U) \rightarrow \mathcal{O}'_2(U)$ . Then there is an exact sequence

$$\mathcal{I}(U)/\mathcal{I}(U)^2 \rightarrow \Omega_{\mathcal{O}_2(U)/\mathcal{O}_1(U)} \otimes_{\mathcal{O}_2(U)} \mathcal{O}''_2(U) \rightarrow \Omega_{\mathcal{O}''_2(U)/\mathcal{O}_1(U)} \rightarrow 0$$

by (5.4.3.8). Now shification of these presheaves gives use the desired result by (7.2.4.3).  $\square$

**Def. (7.2.4.7) [Sheaf of Differentials].** Let  $(X, \mathcal{O}_X) \rightarrow (S, \mathcal{O}_S)$  be a morphism of ringed sites,

- Let  $\mathcal{F}$  be an  $\mathcal{O}_X$ -module, an  $S$ -derivation from  $\mathcal{O}_X$  to  $\mathcal{F}$  is a derivation over  $f^{-1}\mathcal{O}_S$ . The set of  $S$ -derivations is denoted by  $\text{Der}_S(\mathcal{O}_X, \mathcal{F})$ .
- the **sheaf of differentials**  $\Omega_{X/S}$  is defined to be a sheaf of modules  $\Omega_{\mathcal{O}_X/f^{-1}\mathcal{O}_S}$  (7.2.4.2), with a universal derivation  $d_{X/S} : \mathcal{O}_X \rightarrow \Omega_{X/S}$ .

 $\square$

## 5 Locally Free sheaves

**Prop. (7.2.5.1).** Pullbacks of (finite)locally free sheaves are (finite)locally free. Sub- $\mathcal{O}_X$ -modules of a (finite)locally free sheaf is (finite)locally free, by (3.2.4.21).  $\lrcorner$

**Prop. (7.2.5.2) [Finite Locally Free Sheaves and  $\mathcal{H}om$ ].** For any finite locally free sheaf  $\mathcal{E}$  on a ringed site  $(\mathcal{C}, \mathcal{O})$ :

- $\mathcal{E}^{\vee\vee} \cong \mathcal{E}$ .
- $\mathcal{H}om_{\mathcal{O}}(\mathcal{E}, \mathcal{F}) \cong \mathcal{E}^{\vee} \otimes_{\mathcal{O}} \mathcal{F}$ .
- $\mathcal{H}om_{\mathcal{O}}(\mathcal{F}, \mathcal{G}) \otimes \mathcal{H} \cong \mathcal{H}om_{\mathcal{O}}(\mathcal{F}, \mathcal{G} \otimes_{\mathcal{O}} \mathcal{H})$  if  $\mathcal{F}$  or  $\mathcal{H}$  is finite locally free.
- $\mathcal{H}om_{\mathcal{O}}(\mathcal{E} \otimes \mathcal{F}, \mathcal{G}) \cong \mathcal{H}om_{\mathcal{O}}(\mathcal{F}, \mathcal{E}^{\vee} \otimes \mathcal{G})$ , by the first and (7.2.3.3).  $\lrcorner$

*Proof:* We define the map, and verify locally, which is by 1.  $\square$

**Prop. (7.2.5.3).**  $\mathcal{H}om(\mathcal{H}, -)$  is exact for any locally free sheaf  $\mathcal{H}$ .  $\lrcorner$

### Invertible Sheaves

**Def. (7.2.5.4) [Invertible Sheaf].** An **invertible sheaf**  $\mathcal{L}$  on a ringed topoi  $(\mathcal{S}h(\mathcal{C}), \mathcal{O})$  is an invertible object in the symmetric monoidal category  $\mathcal{M}od_{\mathcal{O}}$  (4.1.5.22).  $\lrcorner$

**Prop. (7.2.5.5).** Let  $(\mathcal{C}, \mathcal{O})$  be a ringed site and  $\mathcal{L}$  an  $\mathcal{O}$ -module, the following are equivalent:

- $\mathcal{L}$  is an invertible sheaf.
- there exists some  $\mathcal{O}$ -module  $\mathcal{N}$  that  $\mathcal{L} \otimes_{\mathcal{O}} \mathcal{N} \cong \mathcal{O}$ .

And in this case,  $\mathcal{L}$  is flat and of finite presentation, and  $\mathcal{N} \cong \mathcal{H}om_{\mathcal{O}}(\mathcal{L}, \mathcal{O})$ .  $\lrcorner$

*Proof:*  $\mathcal{L}$  is flat because tensoring  $\mathcal{L}$  is an equivalence thus exact. Let  $\psi : \mathcal{L} \otimes_{\mathcal{O}} \mathcal{N} \cong \mathcal{O}$  the isomorphism,  $U$  an element of  $\mathcal{C}$ , then by construction of  $\otimes$ , after localization, we may assume there exists sections  $x_i \in \mathcal{L}(U), y_i \in \mathcal{N}(U)$  that  $\psi(x_i \otimes y_i) = 1$ . Then there is an automorphism of  $\mathcal{L}|_U : x \mapsto \sum \psi(x \otimes y_i) x_i$ . This automorphism factors through

$$\mathcal{L}|_U \rightarrow \mathcal{O}_U^{\oplus n} \rightarrow \mathcal{L}|_U,$$

thus  $\mathcal{L}|_U$  is a direct summand of a finite free  $\mathcal{O}_U$ -module, thus  $\mathcal{L}$  is of finite presentation.

Assume  $\mathcal{L}$  is invertible, consider the evaluation map

$$\mathcal{L} \otimes_{\mathcal{O}} \mathcal{H}om(\mathcal{L}, \mathcal{O}) \rightarrow \mathcal{O},$$

and by (7.2.3.3),

$$\mathcal{H}om(\mathcal{O}, \mathcal{O}) = \mathcal{H}om_{\mathcal{O}}(\mathcal{L} \otimes \mathcal{N}, \mathcal{O}) \rightarrow \mathcal{H}om_{\mathcal{O}}(\mathcal{N}, \mathcal{H}om_{\mathcal{O}}(\mathcal{L}, \mathcal{O})).$$

The image of 1 gives a morphism  $\mathcal{N} \rightarrow \mathcal{H}om_{\mathcal{O}}(\mathcal{L}, \mathcal{O})$ . Tensoring  $\mathcal{L}$  gives the inverse of the evaluation map.  $\square$

**Cor. (7.2.5.6).** The pullback of an invertible sheaf is an invertible sheaf, because tensoring commutes with pullbacks (7.2.2.12).  $\lrcorner$

**Def. (7.2.5.7) [Picard Groups].** For any ringed site  $(\mathcal{C}, \mathcal{O})$ , there is a set of invertible modules over  $\mathcal{C}$  that any invertible module is isomorphic to exactly one of them. Then this set forms an Abelian group, called the **Picard group**  $\text{Pic}(\mathcal{O})$ .  $\lrcorner$

**Prop. (7.2.5.8) [Invertible Sheaves and Locally Free Sheaves of Rank 1].** If  $(X, \mathcal{O}_X)$  is a ringed space, then any locally free  $\mathcal{O}_X$ -module of rank 1 is invertible. And when  $(X, \mathcal{O}_X)$  is a local ringed space, the converse holds as well.  $\lrcorner$

*Proof:* Assume  $\mathcal{L}$  is locally free of rank 1 and consider the evaluation map (7.2.3.1)

$$\mathcal{L} \otimes_{\mathcal{O}} \text{Hom}(\mathcal{L}, \mathcal{O}) \rightarrow \mathcal{O}.$$

This map is an isomorphism when restricting to any trivializing covering of  $\mathcal{L}$ , so it is an isomorphism. Thus  $\mathcal{L}$  is invertible by (7.2.5.5).

Assume  $(\text{Sh}(\mathcal{C}), \mathcal{O})$  is a local ringed topoi and  $\mathcal{L}$  is invertible, the proof of (7.2.5.5) shows there exists a covering  $\{U_i \rightarrow U\}$  that  $\mathcal{L}|_{U_i}$  is a direct summand of a finite free  $\mathcal{O}_{U_i}$ -module. Replacing  $U_i$  by  $U$ , let  $\pi$  be the projection of  $\mathcal{O}_U^r$  onto  $\mathcal{L}|_U$  which corresponds to a matrix with entries in  $\mathcal{O}(U)$ . The image of  $\pi$  acting on  $\mathcal{O}(U)^r$  is a finite free  $\mathcal{O}(U)$ -module  $M$ , thus there are  $f_1, \dots, f_t$  generating unit ideal of  $\mathcal{O}(U)$  such that  $M_{f_i}$  is finite free. Now by definition of local ringed topoi (7.2.1.6), after replacing  $U$  by a covering, we may assume  $M$  is finite free, which means  $\mathcal{L}|_U$  is free summand of  $\mathcal{O}_U^r$ . But  $\mathcal{L}$  is invertible, thus rank of  $\mathcal{L}$  is 1.  $\square$

**Prop. (7.2.5.9).** Let  $X$  be a locally ringed space and  $\mathcal{L} \in \text{Pic}(X)$  that is generated by global sections  $s_0, \dots, s_n$ . If  $\mathcal{F}$  is the kernel of the map  $\mathcal{O}_X^{\oplus n+1} \rightarrow \mathcal{L}$ , then  $\mathcal{F} \otimes \mathcal{L}$  is globally generated.  $\lrcorner$

*Proof:*  $\mathcal{F}$  is finite locally free of rank  $n$  by (7.2.5.1). The elements

$$s_{ij} = (0, \dots, 0, s_j, 0, \dots, 0, s_i, \dots, 0) \in \Gamma(X, \mathcal{L}^{\oplus n+1})$$

is in  $\Gamma(X, \mathcal{F} \otimes \mathcal{L})$ , and it can be verified locally s.t. they generate  $\mathcal{F} \otimes \mathcal{L}$ .  $\square$

## 6 Sheaves on Spaces

### Sheaves on Topological Spaces

**Remark (7.2.6.1).** A topological space can be regarded as a ringed space by assigning the locally constant sheaf  $\mathbb{Z}$  as the structure sheaf.  $\lrcorner$

**Def. (7.2.6.2) [Grothendieck's Six Operators].** Let  $f : X \rightarrow Y$  be a continuous map of topological spaces, then the inverse image defines a continuous map between sites  $Y_{Zar} \rightarrow X_{Zar}$ , so by (7.1.2.9) and (7.1.2.11) we can define

- the **pushforward**  $f^p F$ ,  $f^p F(U) = F(f^{-1}(U))$  sends presheaf to presheaf.
- the **direct image**  $f_* \mathcal{F}$ ,  $f_* \mathcal{F}(U) = \mathcal{F}(f^{-1}(U))$  sends sheaf to sheaf.
- the **inverse image**  $f_p \mathcal{G}$ ,  $f_p \mathcal{G}(U) = \varinjlim_{f(U) \subset V} \mathcal{G}(V)$  that sends presheaf to presheaf.
- the **inverse image**  $f^{-1} \mathcal{G} = f_s(\mathcal{G})$  that sends sheaf to sheaf.
- For a morphism of locally compact spaces, we can define a **proper direct image**:

$$f_!(\mathcal{F})(U) = \{s \in \Gamma(f^{-1}(U), \mathcal{F}) \mid \text{Supp}(s) \rightarrow U \text{ proper}\}$$

This is a subsheaf of  $f_* \mathcal{F}$  and it is left exact. we denote  $\Gamma_c(X, \mathcal{F})$  as the group  $f_!(\mathcal{F})$  where  $f : X \rightarrow \text{pt}$ . And the stalk  $f_!(\mathcal{F})_y = \Gamma_c(f^{-1}(y), \mathcal{F}|_{f^{-1}(y)})$  Cf. [Gelfand P224 P225].

- the **proper inverse image** (special case)  $i^!$  for a closed immersion  $Z \subset X$  defined by

$$i^!(\mathcal{F})(U = V \cap Z) = \{s \in \Gamma(V, \mathcal{F}) \mid \text{Supp}(s) \in Z\}.$$

sends Abelian sheaves to Abelian sheaves.

- the internal tensor product.
- the internal Hom.

⌋

*Proof:* Check that  $f_!$  is a sheaf: it is separated clearly, it suffices to show that for a covering  $\cup U_i = W$  and  $\xi_i \in F(f^{-1}(U_i))$ , the section  $\xi \in F(f^{-1}(W))$  they generated by sheaf property of  $F$  is in  $f_!F(W)$ . For a compact subset  $K$ , there is a finite cover  $\cup_i U_i$  of it, thus  $K - \cup_{i \neq j} U_j$  is compact in  $U_j$ , thus its inverse image is compact in  $\text{Supp}(\xi)$ . there are f.m.  $U_j$ , thus the inverse image of  $K$  is compact in  $\text{Supp}(\xi)$ .  $\square$

**Def. (7.2.6.3)[Stalks].** The convenience of rings spaces compared to the case of sites is the it has stalk functors: For any presheaf  $\mathcal{F}$  on  $X$  and a point  $i : x \rightarrow X$ , define the **stalk**  $\mathcal{F}_x = i_p(\mathcal{F})$  (7.2.6.2). ⌋

**Prop. (7.2.6.4)[Stalks Commutes with Shiffication].** Taking stalks commutes with shiffication. ⌋

*Proof:* Cf. [Sta]007Z.  $\square$

**Prop. (7.2.6.5).** If a sheaf on a ringed space has only one non-vanishing stalk, then it is a skyscraper sheaf. (Because the restriction map to that point for every open set is an isomorphism). ⌋

**Prop. (7.2.6.6)[Stalks].** Taking stalks is a left adjoint to the skyscraper sheaf from Presheaves to Sets, thus it preserves cokernel. Moreover, for a map of sheaves  $\mathcal{F} \rightarrow \mathcal{G}$  on  $X$ ,

- $\varphi$  is a monomorphism iff  $\varphi_x$  is injective for all  $x \in X$ .
- $\varphi$  is an epimorphism iff  $\varphi_x$  is surjective for all  $x \in X$ .
- $\varphi$  is an isomorphism iff  $\varphi_x$  is surjective for all  $x \in X$ .

⌋

*Proof:* 1: If  $\varphi$  is a monomorphism, then  $\varphi_x$  is clearly. Conversely, if  $\varphi_x$  are all injective, if  $s \in \mathcal{F}(U)$  mapsto  $0 \in (U)$ , then  $s_x$  mapsto  $0 \in \mathcal{G}_x$  for all  $x$ , thus  $s_x = 0$  for all  $x$ , thus  $s = 0$ .

2: If  $\varphi$  is an epimorphism, then  $\varphi_x$  is surjective by definition. The converse is also true.

3: If  $\varphi_x$  is isomorphism for all  $x$ , then  $\varphi$  is monomorphism by 1, and for any  $t \in \mathcal{G}(U)$ ,  $t$  is locally coming from some section of  $s$ , and these sections are compatible on their intersections because of monomorphism, so they glue together to a section  $s \in \mathcal{F}(U)$  that  $\varphi(U)(s) = t$ .  $\square$

**Prop. (7.2.6.7)[Topological Spaces and Sites].** Let  $f : X \rightarrow Y$  be a continuous map of topological spaces, then  $f$  induces a map of sites  $X \rightarrow Y$  because  $f^{-1}$  is exact (7.1.2.14), thus induces a map of topoi  $f : \text{Sh}(X) \rightarrow \text{Sh}(Y)$  (7.1.2.20). ⌋

**Cor. (7.2.6.8).** Let  $f : X \rightarrow Y$  be a continuous map of topological spaces,

- Let  $\mathcal{G}$  be a presheaf on  $Y$ , then there is a canonical bijection of stalks  $(f_p(\mathcal{G}))_x = \mathcal{G}_{f(x)}$ . If  $\mathcal{G}$  is a sheaf on  $Y$ , then there is a canonical bijection of stalks  $(f^{-1}(\mathcal{G}))_x = \mathcal{G}_{f(x)}$ .
- $f^{-1}$  is left adjoint to  $f_*$ .
- $f_!$  is left exact when  $X, Y$  are locally compact. And  $j_!$  is left adjoint to the functor  $j^{-1}$  for an inclusion of open subset  $j : U \subset X$ .

- $i^!$  is right adjoint to  $i_*$  for a closed immersion  $i : Z \rightarrow X$ , in particular  $i_*$  is exact when  $i$  is a closed immersion.  $\lrcorner$

*Proof:* 1: This is because  $(-)_p$  commutes with composition (7.2.6.3), and also shiffication commutes with  $(-)_p$  (7.2.6.4).

2: This is immediate.

3:

4: The adjointness follows from the fact that any section under a homomorphism  $i_*\mathcal{G} \rightarrow \mathcal{F}$  has support contained in  $Z$ .  $\square$

**Prop. (7.2.6.9).** Let  $i : Z \rightarrow X$  be a closed immersion, then the functor  $i_* : \mathcal{A}b(Z) \rightarrow \mathcal{A}b(X)$  is exact, fully faithful, with the essential image those sheaves with support in  $Z$ .  $\lrcorner$

**Prop. (7.2.6.10) [Canonical Exact Sequences].** We have a canonical exact sequences of sheaves of modules:

$$0 \rightarrow j_!(\mathcal{F}|_U) \rightarrow \mathcal{F} \rightarrow i_*(\mathcal{F}|_Z) \rightarrow 0$$

$$0 \rightarrow i_*i_Y^!\mathcal{F} \rightarrow \mathcal{F} \rightarrow j_*(\mathcal{F}|_U) \rightarrow 0$$

(check on stalks), which is important to use reduction to calculate sheaf cohomology. The latter induces long exact sequences:

$$0 \rightarrow H_Y^0(X, \mathcal{F}) \rightarrow H^0(X, \mathcal{F}) \rightarrow H^0(U, \mathcal{F}|_U) \rightarrow H_Y^1(X, \mathcal{F}) \rightarrow \dots$$

$\lrcorner$

*Proof:* Cf. [Sta]02UT.  $\square$

**Prop. (7.2.6.11).** On a topological space  $X$ , for a qc open subset  $U$ ,  $(\oplus \mathcal{F}_i)(U) = \oplus \mathcal{F}_i(U)$ . This uses the compactness of  $U$ .  $\lrcorner$

### Morphisms of Local Ringed Spaces

**Def. (7.2.6.12) [Open Immersion of Ringed Spaces].** A morphism  $f : (X, \mathcal{O}_X) \rightarrow (Y, \mathcal{O}_Y)$  of ringed spaces is called an **open immersion** if  $f$  is a homeomorphism of  $X$  onto an open subset of  $Y$ , and the map  $f^\# : f^{-1}(\mathcal{O}_Y) \rightarrow \mathcal{O}_X$  is an isomorphism.  $\lrcorner$

**Prop. (7.2.6.13).** Let  $(X, \mathcal{O}_X)$  be a ringed space,  $U \subset X$  an open subset, and  $\mathcal{O}_U = \mathcal{O}_X|_U$  is a sheaf of rings on  $U$ , then  $(U, \mathcal{O}_U) \rightarrow (X, \mathcal{O}_X)$  is an open immersion, and  $(U, \mathcal{O}_U)$  is called the **open subspace** associated to  $U$ .  $\lrcorner$

**Prop. (7.2.6.14) [Universal Property of Open Immersions].** Let  $f : (X, \mathcal{O}_X) \rightarrow (Y, \mathcal{O}_Y)$  be an open immersion of ringed spaces, then it has the universal property that any morphism of ringed spaces  $(T, \mathcal{O}_T) \rightarrow (Y, \mathcal{O}_Y)$  that factors set-theoretically through  $f(X)$  factors uniquely through  $(X, \mathcal{O}_X)$ .  $\lrcorner$

**Def. (7.2.6.15) [Closed Immersion].** Let  $i : Z \rightarrow X$  be a morphism of local ringed spaces, then  $i$  is called a **closed immersion of locally ringed spaces** if:

- $i$  is a homeomorphism of  $Z$  onto a closed subspace of  $X$ .
- the map  $\mathcal{O}_X \rightarrow i_*\mathcal{O}_Z$  corresponding to  $f^\#$  is surjective with kernel  $\mathcal{I}$ .
- the  $\mathcal{O}_X$ -module  $\mathcal{I}$  is locally generated by sections.

And for a closed immersion,  $\mathcal{I}$  is called the **ideal sheaf** of  $i$ .  $\square$

**Def. (7.2.6.16) [Closed Immersion Defined by Ideals].** Let  $(X, \mathcal{O}_X)$  be a local ringed space, and  $\mathcal{I} \subset \mathcal{O}_X$  a sheaf of ideals on  $X$  locally generated by sections. Let  $Z$  be the support of the sheaf of rings  $\mathcal{O}_X/\mathcal{I}$ .  $Z$  is closed in  $X$  because it is the support of 1. by (7.2.6.9), there is a unique sheaf of rings  $\mathcal{O}_Z$  on  $Z$  that  $i_*\mathcal{O}_Z = \mathcal{O}_X/\mathcal{I}$ . For any  $z \in Z$ , the stalk  $\mathcal{O}_z = \mathcal{O}_{X,z}/\mathcal{I}_z$  is a quotient of a local ring and is non-zero, thus a local ring. Then  $(Z, \mathcal{O}_Z)$  is a local ringed space and  $i : (Z, \mathcal{O}_Z) \rightarrow (X, \mathcal{O}_X)$  is a closed immersion, called the **closed immersion defined  $\mathcal{I}$** .  $\square$

**Prop. (7.2.6.17) [Closed Immersions are Equivalent to Ideals].** Let  $f : X \rightarrow Y$  be a closed immersion of local ringed spaces with ideal sheaf  $\mathcal{I}$ . Let  $i : Z \rightarrow X$  be the closed immersion defined by  $\mathcal{I}$  (7.2.6.16), then  $f$  is isomorphic to  $i$ .  $\square$

*Proof:* Because  $f_*\mathcal{O}_Z \cong \mathcal{O}_X/\mathcal{I}$  on  $X$ .  $\square$

**Prop. (7.2.6.18).** If  $f : X \rightarrow Y$  is a closed immersion of local ringed spaces with ideal sheaf  $\mathcal{I}$ , then  $f_*$  is fully faithful on  $\text{Mod}_{\mathcal{O}_X}$ , with image those modules annihilated by  $\mathcal{I}$ .  $\square$

*Proof:* Cf. [Sta]08KS.  $\square$

## 7 Spec and Schemes

**Def. (7.2.7.1) [Spectrum].** Given a commutative ring  $A$ , the **spectrum of ring** of  $A$   $\text{Spec } A$  is a locally ringed space whose underlying space is the set of primes of  $A$ , and the topology is generated by the standard open subsets  $D(f) = \{\mathfrak{p} \mid f \notin \mathfrak{p}\}$ .

To define the structure sheaf  $\mathcal{O}_X$ , we first define a sheaf on the site of standard open subsets, which takes value  $R_f$  on  $D(f)$ . This is truly a sheaf by (5.4.2.3), and then we can use (7.1.2.25) to extend this sheaf to a sheaf on  $\text{Spec } A$ , called the structure sheaf  $\mathcal{O}_X$ .

A locally ringed space of the form  $\text{Spec } A$  is called an **affine scheme**. The category of affine schemes is denoted by  $\text{Aff}$ .  $\square$

**Def. (7.2.7.2) [Schemes].** The category  $\text{Sch}$  of **schemes** is the full subcategory of the category of local ringed spaces (7.2.1.10) consisting of local ringed spaces that are locally isomorphic to  $\text{Spec } A$ .  $\square$

**Lemma (7.2.7.3).** If  $X$  is a local ringed space,  $x \in X$ , and  $Y = \text{Spec } A$  an affine scheme,  $f : X \rightarrow Y$  is a morphism, consider the ring map  $\Gamma(X, \mathcal{O}_X) \xrightarrow{f^\#} \Gamma(Y, \mathcal{O}_Y) \rightarrow \mathcal{O}_{Y,x}$ , and consider the inverse image  $\mathfrak{p}$  of  $\mathfrak{m}_x$ , which corresponds to  $y \in Y$ , then  $f(x) = y$ .  $\square$

*Proof:* There are commutative diagrams

$$\begin{array}{ccc} \Gamma(Y, \mathcal{O}_Y) & \longrightarrow & \mathcal{O}_{Y,f(x)} \\ \downarrow & & \downarrow \\ \Gamma(X, \mathcal{O}_X) & \longrightarrow & \mathcal{O}_{X,x} \end{array}$$

and the map of local rings is a local ring map. So the inverse image of  $\mathfrak{m}_x$  is just  $\mathfrak{m}_{f(x)}$ , so  $\mathfrak{m}_{f(x)} = \mathfrak{m}_y$ .  $\square$

**Prop. (7.2.7.4).** Let  $X$  be a local ringed spaces and  $Y = \text{Spec } A$  an affine scheme, then the map  $\text{Hom}(X, \text{Spec } A) \rightarrow \text{Hom}(A, \Gamma(X, \mathcal{O}_X))$  is an isomorphism.  $\square$

*Proof:* The inverse map is constructed as follows: for any  $\varphi : A \rightarrow \Gamma(X, \mathcal{O}_X)$  and  $x \in X$ , define  $\Phi(x)$  to be the point corresponding to the inverse image of  $\mathfrak{m}_x$  in  $A \rightarrow \Gamma(X, \mathcal{O}_X) \rightarrow \mathcal{O}_{X,x}$ . In this way,  $\Phi^{-1}(D(f))$  is just  $D(\varphi(f)) \subset X$  which is open, thus  $\Phi$  is continuous. Now we want to construct a sheaf homomorphism  $f^{-1}(\mathcal{O}_Y) \rightarrow \mathcal{O}_X$ , and it suffices to construct compatible maps on the affine open basis  $D(f)$ , by (7.1.3.18). Now  $\Gamma(D(f), \mathcal{O}_Y) = A_f$ , and because  $f$  is invertible on  $D(\varphi(f))$ , there is by universal property a unique map  $A_f \rightarrow D(\varphi(f))$  extending  $\varphi$ . Then by universal property these maps are compatible. Notice the construction here also shows the homomorphism is determined by the map set-theoretically.

Finally, we need to show this induces a local ring map on the stalks, and this is quite obvious from the definition.

Then we show these two maps are inverse to each other: It suffices to show any ring map  $A \rightarrow \Gamma(X, \mathcal{O}_X)$  comes uniquely from a map  $X \rightarrow Y$ : the uniqueness is proven by (7.2.7.3), and the sheaf homomorphism is determined by the set-theoretical map by the above argument.  $\square$

**Cor. (7.2.7.5) [Adjointness of Spec and  $\Gamma$ ].** The Spec operator  $\text{Spec} : \mathcal{CAlg}^{op} \rightarrow \text{Sch}$  is right adjoint to  $X \rightarrow \Gamma(X, \mathcal{O}_X)$ :

$$\text{Hom}_{\text{Sch}}(X, \text{Spec}(A)) \cong \text{Hom}_{\mathcal{CAlg}}(A, \Gamma(X, \mathcal{O}_X)).$$

Notice the category of schemes is a full subcategory of the category of locally ringed spaces.  $\lrcorner$

**Cor. (7.2.7.6).** Aff is equivalent to  $\mathcal{CAlg}^{op}$ .  $\lrcorner$

**Prop. (7.2.7.7) [Points of Schemes].** Let  $X \in \text{Sch}$  and  $R \in \mathcal{CRing}$  is local, then there is a natural bijection between morphisms  $\text{Spec } R \rightarrow X$  and pairs  $(p, \varphi)$  where  $p \in X$  is a point and  $\varphi : \mathcal{O}_{X,p} \rightarrow R$  is a local ring map.  $\lrcorner$

*Proof:* Consider where the closed point of  $\text{Spec } R$  is mapped to and choose an affine open nbhd of that point, then we reduce to the affine case, which is by (7.2.7.5).  $\square$

**Cor. (7.2.7.8).** if  $f : Y \rightarrow X$  is a morphism of schemes that  $f(y) = x$ , then we have a commutative diagram

$$\begin{array}{ccc} \mathcal{O}_{Y,y} & \longrightarrow & Y \\ \downarrow & & \downarrow \\ \mathcal{O}_{X,x} & \longrightarrow & X \end{array}$$

$\lrcorner$

**Cor. (7.2.7.9).** The points of  $X$  are in bijection with equivalent classes of morphisms from the spectra of fields to  $X$ , and each equivalent class contains a minimal element  $\text{Spec } k(x) \rightarrow X$ .  $\lrcorner$

*Proof:* This is because a local ring map from  $\mathcal{O}_{X,x}$  to a field factors through  $k(x)$ .  $\square$

**Prop. (7.2.7.10).** The closure of a subset  $T$  of  $\text{Spec}(A)$  is  $V(\cap_{\mathfrak{p} \in T} \mathfrak{p})$ .  $\lrcorner$

**Prop. (7.2.7.11) [Scheme is Sober].** The underlying space of a scheme is sober.  $\lrcorner$

*Proof:* Firstly this is true for affine schemes, by (4.12.3.16). Then notice for any affine open subscheme  $U$ , the generic point for  $Z \cap U$  is the generic point for  $Z$ .  $\square$

### Construction of Schemes

**Prop. (7.2.7.12) [Global Spec].** There is an  $S$ -scheme  $f : \mathbf{Spec}_S \mathcal{A} \rightarrow S$  for every Qco sheaf of  $\mathcal{O}_S$ -algebras  $\mathcal{A}$  on  $S$  that for any affine open subscheme  $U \subset X$ ,  $f^{-1}(U) \cong \mathrm{Spec} \mathcal{A}(U)$  over  $U$ . This construction is right adjoint to the direct image map:

$$\mathrm{Hom}_{\mathcal{C}\mathrm{Alg}_{\mathcal{O}_S}}(\mathcal{A}, \pi_* \mathcal{O}_X) \cong \mathrm{Hom}_{\mathrm{Sch}/S}(X, \mathbf{Spec}_S \mathcal{A}).$$

and defines an equivalence of affine morphisms over  $S$  and Qco  $\mathcal{O}_S$ -algebras. Moreover, this defines an equivalence of the category of  $\mathcal{A}$ -modules and the category of  $\mathcal{O}_{\mathbf{Spec}_S \mathcal{A}}$ -modules.  $\lrcorner$

*Proof:* Choose an affine open covering  $\{U_i \rightarrow X\}$  of  $X$ , and consider the schemes  $\mathrm{Spec} \mathcal{A}(U_i) \rightarrow U_i$  over  $U_i$ , then their restrictions to  $U_{ij}$  are compatible, because this is true after further restriction to an affine open covering of  $U_{ij}$ , we can use (7.1.5.4). Then we can use (7.1.5.4) to get an  $S$ -scheme  $f : \mathbf{Spec}_S \mathcal{A} \rightarrow S$  that  $f^{-1}(U_i) \cong \mathrm{Spec} \mathcal{A}(U_i)$ .

Now we check that for any affine open subset  $U \subset X$ ,  $f^{-1}(U) \cong \mathrm{Spec} \mathcal{A}(U)$  over  $U$ . But this is true after base change to  $U_i \cap U$  for any  $i$ , so it is true, by (7.1.5.4).

To show the adjointness condition, by (7.1.5.4), it suffices to show canonical (thus compatible) isomorphism for  $S$  affine. In this case, this reduces to (7.2.7.5).  $\square$

**Cor. (7.2.7.13).** Let  $S$  be a scheme and  $\mathcal{A}$  is a Qco sheaf of  $\mathcal{O}_S$ -algebras, then

- For any morphism  $g : S' \rightarrow S$ ,  $S' \times_S \mathbf{Spec}_S(\mathcal{A}) \cong \mathbf{Spec}_{S'}(g^* \mathcal{A})$ .
- The natural map  $\mathcal{A} \rightarrow \pi_* \mathcal{O}_{\mathbf{Spec}_S(\mathcal{A})}$  is an isomorphism of  $\mathcal{O}_S$ -algebras.

$\lrcorner$

*Proof:* 1: It can be checked that  $S' \times_S \mathbf{Spec}_S(\mathcal{A})$  and  $\mathbf{Spec}_{S'}(g^* \mathcal{A})$  satisfy the same universal property.

2: It suffices to check on affine opens, then it is trivial.  $\square$

**Lemma (7.2.7.14) [Affine Case].** Fiber product of affine schemes is also affine that corresponds to the tensor product of their corresponding rings, by (7.2.7.5).  $\lrcorner$

**Prop. (7.2.7.15) [Finite Limits of Schemes].** Sch admits fiber products, and there is a final object  $\mathrm{Spec} \mathbb{Z}$ , so arbitrary limits exist in the category of schemes (4.1.1.48).

In fact, finite limits exist in the category of ringed spaces, and finite limits of schemes coincide with finite limits as ringed spaces.  $\lrcorner$

*Proof:* Let  $f : X \rightarrow S, g : Y \rightarrow S$ , and  $U_i$  is an affine open covering of  $S$ ,  $V_{ij}$  is an affine open covering of  $f^{-1}(U_i)$  and  $W_{ik}$  is an affine open covering of  $g^{-1}(U_i)$ , then we can check  $h_{V_{ij}} \times_{h_{U_i}} h_{W_{ik}}$  is a covering of  $h_X \times_{h_S} h_Y$  by representable open subfunctors (10.9.1.4), by (7.2.7.14), thus it is representable.  $\square$

**Cor. (7.2.7.16) [Open Subschemes].** Let  $X \rightarrow S, Y \rightarrow S$ , and  $V \subset X, W \subset Y$  be open subschemes mapping into open subscheme  $U \subset S$ , then there is a natural open immersion  $V \times_U W \rightarrow X \times_S Y$  with image  $\pi_1^{-1}V \cap \pi_2^{-1}(W)$ .  $\lrcorner$

*Proof:* There is a natural map  $V \times_U W \rightarrow X \times_S Y$  by Yoneda lemma, and this map has the universal property that any map  $f : (T, \mathcal{O}_T) \rightarrow X \times_S Y$  that  $\pi_1 \circ f$  has image in  $V$  and  $\pi_2 \circ f$  has image in  $W$  factors uniquely through  $V \times_U W$ . But so does the open immersion  $\pi_1^{-1}V \cap \pi_2^{-1}(W) \rightarrow X \times_S Y$  (7.2.6.14), so they are equal.  $\square$

**Cor. (7.2.7.17).** Let  $f : X \rightarrow S, g : Y \rightarrow S$ , and  $U_i$  is an affine open covering of  $S$ ,  $V_{ij}$  is an affine open covering of  $f^{-1}(U_i)$  and  $W_{ik}$  is an affine open covering of  $g^{-1}(U_i)$ , then

$$X \times_S Y = \cup_i \cup_{j,k} V_{ij} \times_{U_i} W_{ik}$$

is an affine open covering of  $X \times_S Y$ .

Also, the structure sheaf of  $X \times_S Y$  is given by  $\mathcal{O}_{X \times_S Y} = \pi_1^{-1} \mathcal{O}_X \otimes_{\pi^{-1} \mathcal{O}_S} \pi_2^{-1} \mathcal{O}_Y$ .  $\lrcorner$

**Cor. (7.2.7.18).** The equalizer of two morphisms from  $X$  to  $Y$  exists, it is a locally closed subscheme of  $X$ , and it is a closed subscheme of  $X$  if  $Y$  is separated.  $\lrcorner$

*Proof:* because it is the base change of  $\Delta : Y \rightarrow Y \times Y$  (4.1.1.48), then use (7.4.5.27).  $\square$

**Remark (7.2.7.19) [Infinite Product of Schemes Doesn't Exist].** WARNING: infinite products of schemes may not exist, Cf. [Sta]0CNH. Intuitively, if you want to glue affine products together, you will notice you can identify only those products that are equal a.e..  $\lrcorner$

**Remark (7.2.7.20).** If  $S \in \text{Sch}$  and  $X, S' \in \text{Sch}/S$ , we sometimes denote  $X \times_S S'$  by  $X_{S'}$ , if no confusion is caused.  $\lrcorner$

**Def. (7.2.7.21) [Generic Fibers and Special Fibers].** If  $X$  is a scheme over an integral ring  $A$ , then the **generic fiber** of  $X/A$  is the stalk  $X_\eta$ , where  $\eta = (0) \in \text{Spec } A$ .

If  $S \in \text{Sch}$  and  $X \in \text{Sch}/S$ , a **special fiber** of  $X/S$  is the stalk of  $X$  over a closed point  $s \in |S|_0$ .  $\lrcorner$

## 8 Rational Maps

**Def. (7.2.8.1) [Rational Maps].** Let  $X, Y \in \text{Sch}/S$  s.t.  $Y/S$  is separated, a **rational map** over  $S$   $f : X \rightarrow Y$  is an equivalence class of maps  $U \rightarrow Y$  over  $S$  where  $U$  is an open dense subset of  $X$ . A **rational function** on  $X$  is a rational map  $X \rightarrow \mathbb{A}^1$ . It has a ring structure. The ring of rational functions is denoted by  $R(X)$ .

Because two rational maps are equivalent iff they are compatible on the intersection of their domain as  $Y/S$  is separated, a rational map  $\varphi : X \rightarrow Y$  has a maximal domain of definition, denoted by  $\text{dom}(\varphi)$ .  $\lrcorner$

**Prop. (7.2.8.2).** If  $X$  is a scheme with f.m. generic points  $\eta_i$ , then

$$R(X) = \prod \mathcal{O}_{X, \eta_i}.$$

$\lrcorner$

*Proof:* Cf. [Sta]01RV.  $\square$

**Def. (7.2.8.3) [Birational Maps].**  $X, Y \in \text{Sch}/S$  are called **birational** over  $S$  if they are isomorphic in the category of  $S$ -schemes with dominant rational maps.  $\lrcorner$

**Prop. (7.2.8.4).** Two schemes  $X, Y$  over  $S$  are birational over  $S$  iff there are nonempty open subschemes  $U \subset X, V \subset Y$  that are isomorphic over  $S$ .  $\lrcorner$

*Proof:*  $\square$

**Def. (7.2.8.5) [ $S$ -Dense Subsets].** Let  $X \in \text{Sch}/S$ , a subscheme  $U \subset X$  is called  **$S$ -dense** if  $U_s$  is dense in  $X_s$  for any  $s \in S$ .  $\lrcorner$

**Prop. (7.2.8.6).** Let  $X \in \text{Sch}^{\text{pf}}/S$  and  $V \subset X$  is a qc open subscheme, then the set of points  $s \in S$  s.t.  $V_s \subset X_s$  is not dense is locally constructible in  $S$ . And if  $V$  is  $S$ -dense in  $X$ , then it is also schematically dense in  $X$ .  $\lrcorner$

*Proof:* Cf.[?BLR]P56.  $\square$

**Prop. (7.2.8.7).** If  $X \in \text{Sch}_{\text{qc}}/S$  and  $U \subset X$  is an  $S$ -dense open subscheme, then  $U$  contains an  $S$ -dense open subscheme of  $S$  that is qc.  $\lrcorner$

*Proof:* Cf.[?BLR]P56.  $\square$

**Def. (7.2.8.8) [ $S$ -Rational Maps].** Let  $X, Y \in \text{Sch}^{\text{sep,loc.pf}}/S$  an  $S$ -**rational map**  $f : X \rightarrow Y$  is an equivalence class of maps  $U \rightarrow Y$  over  $S$  where  $U$  is an open subset of  $X$  that is  $S$ -dense.

Because two rational maps are equivalent iff they are compatible on the intersection of their domain as  $Y/S$  is separated, a rational map  $X \rightarrow Y$  has a maximal domain of definition.  $\lrcorner$

**Def. (7.2.8.9) [ $S$ -Birational Maps].** Let  $X, Y \in \text{Sch}^{\text{sep,loc.pf}}/S$  are called  $S$ -**birational** if they are isomorphic in the category of  $S$ -schemes with dominant  $S$ -rational maps.  $\lrcorner$

**Prop. (7.2.8.10).** The notion of  $S$ -rational and  $S$ -birational maps are stable under base change, because a base change of fields is flat locally of f.p. thus open.  $\lrcorner$

**Prop. (7.2.8.11)[Faithfully Flat Descent].** Let  $X', X, Y \in \text{Sch}^{\text{sep,loc.pf}}/S$  and  $\varphi : Y \rightarrow S$  an  $S$ -rational map,

- If  $f : X' \rightarrow X$  flat, then  $\varphi \circ f$  is an  $S$ -rational map  $X' \rightarrow Y$ , and  $\text{dom}(\varphi \circ f) = f^{-1}(\text{dom}(\varphi))$ . In particular, if  $f$  is f.f. and  $\varphi \circ f$  is a morphism, then  $\varphi$  is also a morphism.
- If  $T \rightarrow S$  is flat, then the base change  $\varphi_T : X_T \rightarrow Y_T$  satisfies  $\text{dom}(\varphi_T) = \text{dom}(\varphi) \times_S T$ .  $\lrcorner$

*Proof:* Cf.[BLR90]P58.  $\square$

## 9 Associated Points

References are [Sta]Chap30.

**Def. (7.2.9.1) [Associated Points].** For  $X \in \text{Sch}$  and  $\mathcal{F} \in \mathcal{QCoh}(X)$ , a point  $x \in X$  is said to be **associated to  $\mathcal{F}$**  iff  $\mathfrak{m}_x$  is associated to  $\mathcal{F}_x$ , which is equivalent to  $\mathfrak{m}_x$  are all zero-divisors in  $M$  by (5.2.5.18). When  $\mathcal{F} = \mathcal{O}_X$ ,  $x$  is called an **associated point of  $X$** .  $\lrcorner$

**Prop. (7.2.9.2).** If  $X \in \text{NSch}$  and  $\mathcal{F} \in \mathcal{QCoh}(X)$ , then for any  $x \in X$ ,  $x$  is associated to  $\mathcal{F}$  iff  $\mathfrak{m}_x$  is an associated prime of  $\Gamma(X, \mathcal{O}_X)$  of  $\Gamma(U, \mathcal{F})$  for an affine nbhd  $U$  of  $x \in X$ .  $\lrcorner$

*Proof:* Cf.[Sta]02OK.  $\square$

**Prop. (7.2.9.3).** Same results of associated points are parallel to the discussion of associated primes:

- relations of  $\text{Asso}(\mathcal{F})$  w.r.t exact sequences (5.2.5.14).
- $\text{Asso}(\mathcal{F}) \subset \text{Supp}(\mathcal{F})$  (5.2.5.16).
- When  $X \in \text{NSch}$  and  $\mathcal{F}$  is coherent, for a quasi-compact open set  $U$  of  $X$ , the number of associated points in  $U$  is finite (5.2.5.16).
- When  $X \in \text{NSch}$ ,  $\mathcal{F} = 0$  iff  $\text{Asso}(\mathcal{F})$  is empty (5.2.5.16).

- When  $X \in \mathbf{NSch}$ , If  $\text{Asso}(\mathcal{F}) \subset$  an open subset  $U$ , then  $\Gamma(X, \mathcal{F}) \rightarrow \Gamma(U, \mathcal{F})$  is injective (5.2.5.22).
- If  $X \in \mathbf{NSch}$ , then the minimal elements (under specialization) of  $\text{Supp}(\mathcal{F})$  are associated points of  $\mathcal{F}$ . in particular, any generic point of an irreducible component of  $X$  is an associated points of  $X$ .
- If  $X \in \mathbf{NSch}$ , then if a map  $\varphi : \mathcal{F} \rightarrow \mathcal{G} \in \mathcal{QCoh}(X)$  that is injective at all the stalks of  $\text{Asso}(\mathcal{F})$ , then  $\varphi$  is injective.

┘

## 10 Frobenius-Morphisms

**Def. (7.2.10.1) [Frobenius-Morphisms].** Let  $k_0 \in \mathbf{Field}^{\text{fin}}$ ,  $k = \overline{k_0}$ ,  $X_0 \in \mathbf{Sch}/k_0$ ,  $X = X_0 \otimes_{k_0} k$ ,

- The **absolute Frobenius-morphism** for  $X$  (resp.  $X_0$ ) is the automorphism  $\varphi_X : X \rightarrow X$  (resp.  $\varphi_{X_0} : X_0 \rightarrow X_0$ ) that is the  $\#k$ -th power on  $\mathcal{O}_X$  (resp.  $\mathcal{O}_{X_0}$ ).
- $F_X = \text{id}_{X_0} \times_{k_0} \varphi_{k_0}^{-1} : X \rightarrow X \in \mathbf{Sch}$ , called the **arithmetic Frobenius-morphism**, which is not  $k$ -linear!
- $\text{Fr}_X = \varphi_{X_0} \times_{k_0} \text{id}_k : X \rightarrow X \in \mathbf{Sch}/k$ , which is  $k$ -linear, called the **geometric Frobenius-morphism**. When  $X_0$  is affine,  $\text{Fr}_X(k) : X(k) \rightarrow X(k)$  is given by  $(a_1, \dots, a_n) \mapsto (a_1^{\#k_0}, \dots, a_n^{\#k_0})$ . Geometric Frobenius-morphisms are usually preferred because it is  $k$ -linear.
- If  $U_0 \in \mathbf{Sch}/X_0$ , then the **relative Frobenius-morphism**  $F_{U/X_0} : U \rightarrow \varphi_{X_0}^*(U) \in \mathbf{Sch}/X_0$  is defined by the universal property of the base change of  $U$  by  $\varphi_{X_0}^r$ .

┘

**Prop. (7.2.10.2).** Situation as in (7.2.10.1),  $\text{Fr}_X = \varphi_{r,X} \circ F_X : X \rightarrow X$ .

┘

*Proof:* Easy.

□

**Prop. (7.2.10.3) [Relative Frobenius are Universal Homeomorphisms].**  $F_{U/X_0}$  is a universal homeomorphism. In particular, if  $U \rightarrow X_0$  is étale, then it is an isomorphism.

This also holds for  $U \rightarrow X_0 \in \mathbf{AlgSp}/k_0$ , Cf. [Zhu17]P465.

┘

*Proof:* Cf. [Sta]0EBS?.

□

**Prop. (7.2.10.4).** If  $k \in p\text{-Field}$  and  $X \in \mathbf{Sch}/k$ , then  $X^{(p)}$  is reduced iff  $X$  is geo.reduced. This follows from (7.4.3.2).

┘

## 7.3 Cohomology on Ringed Sites

*“The question you raise, ‘How can such a formulation lead to computations?’ doesn’t bother me in the least! Throughout my whole life as a mathematician, the possibility of making explicit, elegant computations has always come out by itself, as a byproduct of a thorough conceptual understanding of what was going on. Thus I never bothered about whether what would come out would be suitable for this or that, but just tried to understand - and it always turned out that understanding was all that mattered.”*

–A. Grothendieck

References are [Sta], [Har77] and [Sheaf Cohomology, Anonymous]. Should be refreshed with the language of  $\infty$ -categories?

**Notation (7.3.0.1).**

- We use notations defined in Sites, Sheaves, Topoi and Stacks.

┘

### 1 Derived Cohomology

$D(\text{Mod}(\mathcal{O}))$

**Def. (7.3.1.1) [Setups].** Let  $(\mathcal{C}, \mathcal{O})$  be a ringed site, write  $K(\mathcal{O}) = K(\text{Mod}(\mathcal{O}))$ ,  $D(\mathcal{O}) = D(\text{Mod}(\mathcal{O}))$ . The Abelian category  $\text{Mod}(\mathcal{O})$  contains enough injectives by (4.8.3.29) and (4.8.3.23), so we can consider right derived functor for any left exact functor.

1. (Hom) Let  $K$  be a presheaf of sets on  $\mathcal{C}$ , then  $\mathcal{F} \mapsto \text{Hom}_{\mathcal{P}\text{Sh}(\mathcal{C})}(K, \mathcal{F})$  is a left exact functor  $\text{Mod}(\mathcal{O}) \rightarrow \text{Ab}$ , thus we denote its derived functors as  $H^i(K, \mathcal{F})$ .
2. (Section) The **section functor**  $\Gamma(U, \mathcal{F})$  is the left exact functor  $\text{Mod}(\mathcal{O}) \rightarrow \text{Mod}(\mathcal{O}(U))$  and call the derived functors  $H^i(U, \mathcal{F}) = H^i(R\Gamma(U, \mathcal{F}))$  as the  **$i$ -th cohomology** of  $\mathcal{F}$  at  $U$ . In fact, this functor is just  $\text{Mor}_{\mathcal{P}\text{Sh}(\mathcal{C})}(h_U, \mathcal{F})$  defined in (7.3.1.1).
3. (Global Section) Let  $e$  be the final object in  $\mathcal{P}\text{Sh}(\mathcal{C})$ , then we define the **global section functor**  $\Gamma(\mathcal{C}, -)$  to be the left exact functor  $\text{Mod}(\mathcal{O}) \rightarrow \text{Ab} : \mathcal{F} \mapsto \text{Mor}_{\mathcal{P}\text{Sh}(\mathcal{C})}(e, \mathcal{F}) = \varprojlim_{X \in \mathcal{C}^{\text{op}}} \Gamma(X, \mathcal{F})$ , then we define its derived functor  $R(\mathcal{C}, \mathcal{F})$ , and call the derived functors  $H^i(\mathcal{C}, \mathcal{F}) = H^i(R\Gamma(\mathcal{C}, \mathcal{F}))$  the  **$i$ -th cohomology group** of  $\mathcal{F}$  on  $\mathcal{C}$ .
4. (Pushforward) Let  $(\text{Sh}(\mathcal{C}), \mathcal{O}) \rightarrow (\text{Sh}(\mathcal{D}), \mathcal{O}')$  be a morphism of topoi, then  $f_*$  is a left exact functor from  $\text{Mod}(\mathcal{O})$  to  $\text{Mod}(\mathcal{O}')$  (7.1.2.18), and we call its derived functors  $R^i f_*$  the  **$i$ -th higher direct images**.
5. (Shification) Let shification functor  $\iota : \mathcal{P}\text{Sh}(\mathcal{C}) \rightarrow \text{Sh}(\mathcal{C})$  is left exact, and we call the derived functors  $\mathcal{H}^p(F)$  the **sheaf-cohomology presheaves** of  $F$ .

┘

**Def. (7.3.1.2)  $[\mathbb{G}_a, \mathbb{G}_m]$ .** Let  $(\mathcal{C}, \mathcal{O})$  be a ringed site, denote  $\mathbb{G}_{a,\mathcal{C}} = \mathcal{O}$ ,  $\mathbb{G}_{m,\mathcal{C}} = \mathcal{O}^*$ .

┘

**Prop. (7.3.1.3) [Global Section as Pushforward].** For a ringed site  $(\mathcal{C}, \mathcal{O})$ , if we endow  $\mathcal{C}$  with the discrete topology, then there is a functor  $\mathcal{C} \rightarrow \text{pt}$  which is cocontinuous, thus induce a morphism of ringed topoi  $\pi : (\text{Sh}(\mathcal{C}), \mathcal{O}) \rightarrow (\text{Sh}(\text{pt}) \cong \text{Ab}, \Gamma(\mathcal{C}, \mathcal{O}))$  (7.1.2.21). Then  $\pi_*$  is exactly  $\mathcal{F} \mapsto \Gamma(\mathcal{C}, \mathcal{F})$ , so  $R\pi_* \mathcal{F} = H^i(\mathcal{C}, \mathcal{F})$ .

┘

**Prop. (7.3.1.4) [Change of Topologies].** Let  $\mathcal{C}, \mathcal{C}'$  be sites and  $i : \mathcal{C}' \rightarrow \mathcal{C}$  be a fully subcategory of  $\mathcal{C}$ ,  $i : \mathcal{C}' \rightarrow \mathcal{C}$  is continuous and cocontinuous satisfying the hypothesis of (7.1.2.23), then for  $\mathcal{F} \in \text{Sh}(\mathcal{C}'), \mathcal{G} \in \text{Sh}(\mathcal{C})$ , there are functorial isomorphisms

$$H^p(\mathcal{C}', U, i^{-1}\mathcal{G}) \cong H^p(\mathcal{C}, U, \mathcal{G}).$$

And if  $i$  satisfies the hypothesis of (7.1.2.25), then moreover there are functorial isomorphisms

$$H^p(\mathcal{C}', U, F') \cong H^p(\mathcal{C}; U, i_*F') = H^p(\mathcal{C}; i(U), i_!F')$$

┘

*Proof:* For the first assertion, notice  $g^{-1}$  preserves injectives because it is right adjoint to  $g_! = f^{-1}$  is exact (7.1.2.23).

The second assertion follows immediate from (7.1.2.25). □

### Calculations

**Prop. (7.3.1.5) [Locality of Cohomologies].** Let  $(\mathcal{C}, \mathcal{O})$  be a ring site and  $U \in \mathcal{C}$ , then for  $\mathcal{F} \in \text{Mod}(\mathcal{O}_X)$ ,  $H^n(U, \mathcal{F}) = H^n(\mathcal{C}/U, \mathcal{F}|_U)$ , by (7.3.4.2) and the composition of derived functors applied to the pullback  $j^* : \mathcal{C}/U \rightarrow \mathcal{C}$ . ┘

**Prop. (7.3.1.6) [Sheaf-Cohomological Presheaves].** The forgetful functor is right adjoint to the exact shification functor, the composition of derived functors applied to the functor  $\Gamma(U, -) \circ \iota$  from  $\mathcal{P}\text{Sh}(\mathcal{C})$  to  $\mathcal{A}\text{b}$  shows its right derived functor is

$$\mathcal{H}^p(F) = R^p\iota(F) : U \rightarrow H^p(U, F).$$

┘

**Prop. (7.3.1.7) [Higher Direct Images].** For  $f : (\mathcal{C}', \mathcal{O}') \rightarrow (\mathcal{C}, \mathcal{O})$  a morphism of ringed topoi and  $\mathcal{F} \in \text{Sh}(\mathcal{C})$ , the composition of derived functors applied to the functor  $(\sharp \circ (f_*)^{\mathcal{P}\text{Sh}}) \circ \iota$  (because  $\sharp, (f_*)^{\mathcal{P}\text{Sh}}$  are exact (7.1.2.10)) shows that  $R^p f_* \mathcal{F} = (f_* \mathcal{H}^p(\mathcal{F}))^\sharp$ . So flasque sheaves thus flabby sheaves are right acyclic for  $f_*$ .

In particular,  $R^p f_* \mathcal{F}$  can be calculated locally on the base. ┘

**Prop. (7.3.1.8) [Relative Leray's Spectral Sequence].** Let

$$(f, f^\sharp) : (\text{Sh}(\mathcal{C}), \mathcal{O}) \rightarrow (\text{Sh}(\mathcal{C}'), \mathcal{O}'), \quad (g, g^\sharp) : (\text{Sh}(\mathcal{C}'), \mathcal{O}') \rightarrow (\text{Sh}(\mathcal{D}), \mathcal{O}_{\mathcal{D}})$$

be morphisms of ringed topoi, then the natural transformation  $R(g \circ f) \rightarrow Rg_* \circ Rf_*$  is an isomorphism, and for any  $\mathcal{F}^\bullet \in K^+(\mathcal{O})$ , there is a spectral sequence convergence

$$E_2^{p,q} = R^p g_* R^q f_* (\mathcal{F}^\bullet) \implies E^n = R^n (g \circ f)_* \mathcal{F}^\bullet.$$

┘

*Proof:* This is just the Grothendieck spectral sequence (4.10.7.11), where the condition is satisfied by (7.3.1.7) and (7.3.4.12). □

**Cor. (7.3.1.9) [Leray's Spectral Sequence].** Let  $(f, f^\sharp) : (\mathcal{S}h(\mathcal{C}), \mathcal{O}) \rightarrow (\mathcal{S}h(\mathcal{C}'), \mathcal{O}')$  be a morphism of ringed topoi, then for any  $\mathcal{F}^\bullet \in K^+(\mathcal{O})$ , then  $R\Gamma(\mathcal{C}, -) \rightarrow R\Gamma(\mathcal{C}', -) \circ Rf_*$  is an isomorphism, and there is a spectral sequence convergence

$$E_2^{p,q} = H^p(\mathcal{C}', R^q f_*(\mathcal{F}^\bullet)) \implies E^n = H^n(\mathcal{C}, \mathcal{F}^\bullet).$$

┘

**Prop. (7.3.1.10) [Relative Mayer-Vietoris Sequence].** Let  $(\mathcal{C}, \mathcal{O})$  be a ringed site and  $\mathcal{U} : \{U \rightarrow X, V \rightarrow X\}$  is a covering s.t.  $U \rightarrow X$  is a monomorphism, then for any  $\mathcal{F} \in \mathcal{S}h(\mathcal{O})$  and any morphism of ringed sites  $f : (\mathcal{C}, \mathcal{O}) \rightarrow (\mathcal{C}', \mathcal{O}')$ , there is a long exact sequence of sheaves in  $\mathcal{S}h(\mathcal{O}')$ :

$$0 \rightarrow (f|_X)_*(\mathcal{F}|_X) \rightarrow (f|_U)_*(\mathcal{F}|_U) \oplus (f|_V)_*(\mathcal{F}|_V) \rightarrow (f|_{U \cap V})_*(\mathcal{F}|_{U \cap V}) \rightarrow R^1(f|_X)_*(\mathcal{F}|_X) \rightarrow \dots$$

that is functorial in  $\mathcal{F}$ .

┘

*Proof:* Choose a functorial injection resolution  $\mathcal{F} \rightarrow \mathcal{I}^\bullet$  (4.10.2.9), then there is an exact sequence of complexes

$$0 \rightarrow (f|_X)_*(\mathcal{I}^\bullet|_X) \rightarrow (f|_U)_*(\mathcal{I}^\bullet|_U) \oplus (f|_V)_*(\mathcal{I}^\bullet|_V) \rightarrow (f|_{U \cap V})_*(\mathcal{I}^\bullet|_{U \cap V}) \rightarrow 0$$

because injective sheaves are flabby (7.3.4.9) and  $(U \times_X V) \times_X f^{-1}W \rightarrow V \times_X f^{-1}W$  is a monomorphism for any  $W \in \mathcal{C}'$ . Then we take the long exact sequence of cohomology.  $\square$

**Cor. (7.3.1.11) [Mayer-Vietoris Sequence].** Let  $(\mathcal{C}, \mathcal{O})$  be a ringed site and  $\mathcal{U} : \{U \rightarrow X, V \rightarrow X\}$  is a covering s.t.  $U \rightarrow X$  is a monomorphism, then for any  $\mathcal{F} \in \mathcal{S}h(\mathcal{O})$ , there is a long exact sequence

$$0 \rightarrow H^0(X, \mathcal{F}) \rightarrow H^0(U, \mathcal{F}) \oplus H^0(V, \mathcal{F}) \rightarrow H^0(U \times_X V, \mathcal{F}) \rightarrow H^1(X, \mathcal{F}) \rightarrow \dots$$

that is functorial in  $\mathcal{F}$ .

┘

**Prop. (7.3.1.12) [Compatibility with Algebraic Structures].** Let  $(\mathcal{C}, \mathcal{O})$  be a ringed site and  $\mathcal{F} \in \mathcal{S}h(\mathcal{C})$ ,  $K \in \mathcal{P}Sh(\mathcal{C})$ , then  $H^*(K, \mathcal{F})$  is the same calculated as  $\mathcal{O}$ -modules or Abelian sheaves.  $\square$

*Proof:* Denote  $(C, \mathbb{Z})$  the trivial ringed site and  $ab : (C, \mathcal{O}) \rightarrow (C, \mathbb{Z})$  the forgetful functor, then  $ab$  is exact and  $\text{Hom}(K, \mathcal{F}_{ab}) = \text{Hom}(K, \mathcal{F})$ , thus we can use the Leray spectral sequence (7.3.1.9).  $\square$

**Prop. (7.3.1.13) [Direct Products].** Let  $(\mathcal{C}, \mathcal{O})$  be a ringed site and  $\mathcal{F}_i$  be a family of sites indexed over a set  $I$ , then for any presheaf of sets  $K$  on  $\mathcal{C}$ , there is a Leray spectral sequence convergence (7.3.1.8)

$$H^p(K, R^q(\prod_i \mathcal{F}_i)) \rightarrow R^n(\prod_i \text{Hom}(K, \cdot))(\mathcal{F}_i) \cong \prod_i H^n(K, \mathcal{F}_i).$$

In particular,  $H^1(K, \prod_i \mathcal{F}_i) \rightarrow \prod_i H^1(K, \mathcal{F}_i)$  is injective.

┘

**Prop. (7.3.1.14) [Filtered Colimits].**  $H^n(U, -)$  commutes with filtered colimits if  $T$  is a Noetherian topology.  $\square$

*Proof:*  $n = 0$  case follows from the fact the colimit presheaf is already a sheaf, because for any finite cover, the Čech complex of the limit sheaf is the filtered colimit of Čech complexes, and filtered colimit is exact.

And a filtered colimits of injective sheaves is flask, because flask need only be checked for finite coverings at this case (because of the fact  $T$  and  $T^f$  have equivalent category of sheaves (7.1.1.4) and definition of flask (7.3.4.8)), and a filtered colimit of exact Čech complexes is exact. So we can choose a functorial injective resolution (4.10.2.9) and use the colimit resolution to calculate the cohomology.  $\square$

**Lemma (7.3.1.15).** If  $X$  is a qs ringed space, then  $\mathrm{Sh}(X) \rightarrow \mathrm{Sh}(X_{fp})$  is an equivalence by  $i_s$  and  $i^s$ , where  $fp$  is the subtopology of  $X$  generated by qcqs open subsets.  $\lrcorner$

*Proof:* The proof is the same proof as that of (7.1.4.21).  $\square$

**Prop. (7.3.1.16) [Filtered Colimits].**  $H^i(U, -)$  commutes with direct limits if  $X$  is a qs ringed space and  $U \subset X$  is qc.  $\lrcorner$

*Proof:* This follows from (7.3.1.15) the same way (9.4.1.8) follows from (7.1.4.21).  $\square$

### Low Dimensions

Cf. [Sta]Chap21.5-7.

**Prop. (7.3.1.17) [ $H^1$  and Picard Group].** Let  $(\mathcal{C}, \mathcal{O})$  be a local ringed site, then there is a canonical isomorphism of Abelian groups

$$H^1(\mathcal{C}, \mathcal{O}^*) = \mathrm{Pic}(\mathcal{O}).$$

$\lrcorner$

*Proof:* Let  $\mathcal{L}$  be an invertible sheaf, then there exists a subsheaf

$$\mathcal{L}^* : U \mapsto \{s \in \mathcal{L}(U) \mid s \cdot : \mathcal{O}(U) \rightarrow \mathcal{L}(U) \text{ is an isomorphism}\}.$$

Notice if  $f \in \mathcal{O}^*(U)$  and  $s \in \mathcal{L}^*(U)$ , then  $fs \in \mathcal{L}^*(U)$ , and any two  $s, s' \in \mathcal{L}^*(U)$  differ by an element of  $\mathcal{O}^*(U)$ , so  $\mathcal{L}^*$  is a pseudo- $\mathcal{O}^*$ -torsor. Moreover, as  $\mathcal{L}$  is locally free of rank 1 by (7.2.5.8), so  $\mathcal{L}^*(U)$  has sections locally, so it is an  $\mathcal{O}^*$ -torsor.

In this way, we get a map

$$\mathrm{Pic}(\mathcal{O}) \rightarrow \mathrm{Tor}(\mathcal{O}_X^*) \cong H^1(X, \mathcal{O}_X^*) \text{ (7.3.2.18)}.$$

This map is injective: if  $\mathcal{L}$  corresponds to a trivial torsor, then  $\mathcal{L}^*$  has a global section, and then  $\mathcal{L}$  is also trivial. This map is also surjective, because if  $\mathcal{F}$  is an  $\mathcal{O}_X^*$ -torsor, then we can define

$$\mathcal{L}_1 : U \mapsto [\mathcal{F}(U) \otimes \mathcal{O}(U)] / \mathcal{O}(U)^*,$$

where the action is given by  $f \cdot (s, g) = (fs, f^{-1}g)$ , and  $\mathcal{L}_1$  is an  $\mathcal{O}$ -module given the addition  $(s, g) + (s', g') = (s, g + \frac{s'}{s}g)$ , where  $\frac{s'}{s} \in \mathcal{O}(U)$  satisfies  $\frac{s'}{s} \cdot s = s'$ . Then the sheafification  $\mathcal{L}$  of  $\mathcal{L}_1$  is a locally trivial bundle that maps  $\mathcal{F}$ .  $\square$

**Prop. (7.3.1.18) [ $H^2$  and Objects of Gerbes].** Let  $\mathcal{C}$  be a site and  $\mathcal{S} \rightarrow \mathcal{C}$  be a gerbe whose automorphism sheaves are Abelian. Let  $\mathcal{G}$  be the sheaf defined in (7.1.3.27). If  $U$  is an object of  $\mathcal{C}$  that

- there exists a cofinal system of coverings  $\{U_i \rightarrow U\}$  that for any such covering,  $H^1(U_i, \mathcal{G}) = 0$ ,  $H^1(U_i \times_U U_j, \mathcal{G}) = 0$ ,
- $H^2(U, \mathcal{G}) = 0$ .

Then  $\mathcal{S}_U$  is non-empty.  $\lrcorner$

*Proof:* By hypothesis, there is a covering  $\{U_i \rightarrow U\}$  and  $x_i$  in  $\mathcal{S}$  lying over  $U_i$ . By item1, after refining the covering, we may assume  $H^1(U_i, \mathcal{G}) = 0$  and  $H^1(U_{ij}, \mathcal{G}) = 0$ . Consider the sheaf

$$\mathcal{F}_{ij} = \mathrm{Isom}(x_i|_{U_{ij}}, x_j|_{U_{ij}})$$

on  $\mathcal{C}/U_{ij}$ , then there is an action  $\mathcal{G}_{U_{ij}} \times \mathcal{F}_{ij} \rightarrow \mathcal{F}_{ij}$ . Then  $\mathcal{F}_{ij}$  is a pseudo  $\mathcal{G}|_{U_{ij}}$ -torsor and clearly a torsor because any two objects of a gerbe is locally isomorphic.

By (7.3.2.18), these torsors are trivial, thus having a global section. In other words, there are isomorphisms  $\varphi_{ij} : x_i|_{U_{ij}} \rightarrow x_j|_{U_{ij}}$ . To get an object  $x$  over  $U$ , it suffices to manage the choices of  $\varphi_{ij}$  to get a descent datum. For this, use the fact  $H^2(U, \mathcal{G}) = 0$  and  $\check{H}^2(\mathcal{U}, \mathcal{G}) \rightarrow H^2(U, \mathcal{G})$  is injective by Čech to Derived spectral sequence (7.3.2.13).  $\square$

### Others

**Prop. (7.3.1.19).** Let  $K' \rightarrow K$  be a map of presheaves of sets on  $\mathcal{C}$  whose shification is surjective. Set  $K'_p = K' \times_K \times \dots \times_K K'$ , then for any  $\mathcal{F} \in \text{Sh}(\mathcal{C})$ , there is a spectral sequence convergence

$$E_1^{p,q} = H^q(K'_p, \mathcal{F}) \Rightarrow H^{p+q}(K, \mathcal{F}).$$

┘

*Proof:* Since shification is exact,  $(K'_p)^\sharp = (K')^\sharp_p$ . Then we use (7.1.2.26) to change to a larger site  $\mathcal{C}'$  where the topoi are equivalent and  $K', K$  are objects in  $\mathcal{C}'$  and  $K' \rightarrow K$  is a covering, then we use the  $E_1$  page of the Čech to derived spectral sequence (7.3.2.13). Notice this need modification, the modification goes back to the proof of the Grothendieck spectral sequence, where we choose the natural Čech complex resolution in place of the CE resolution, because we have (7.3.2.3).  $\square$

**Cor. (7.3.1.20)[Čech-Alexander Resolution].** If  $\mathcal{C}$  is a site with the indiscrete topology,  $X$  a weakly final object (4.1.1.8) of  $\mathcal{C}$ , then for any Abelian sheaf  $\mathcal{F}$  on  $\mathcal{C}$ , the total cohomology  $R\Gamma(\mathcal{C}, \mathcal{F})$  is represented by the Čech complex

$$\mathcal{F}(X) \rightarrow \mathcal{F}(X \times X) \rightarrow \mathcal{F}(X \times X \times X) \rightarrow \dots$$

┘

*Proof:* By (7.3.4.10),  $H^q(X^p, \mathcal{F}) = 0$  for  $q > 0$ . The assumption says  $h_X \rightarrow *$  is surjective, thus the conclusion is a special case of (7.3.1.19).  $\square$

## 2 Čech Cohomology

**Def. (7.3.2.1)[Čech Complex and Čech Cohomology].** Let  $(\mathcal{C}, \mathcal{O})$  be a ringed site and  $\mathcal{U} : \{U_i \rightarrow U\}$  be a covering, we have a canonical complex of presheaves  $\mathbb{Z}_{\mathcal{U}, \bullet}$  defined to be

$$\dots \rightarrow \bigoplus_{i_0, i_1, i_2} j_! \mathbb{Z}_{U_{i_0 i_1 i_2}} \rightarrow \bigoplus_{i_0, i_1} j_! \mathbb{Z}_{U_{i_0 i_1}} \rightarrow \bigoplus_{i_0} j_! \mathbb{Z}_{U_{i_0}} \rightarrow 0.$$

And for any presheaf of  $\mathcal{O}_X$ -module  $\mathcal{F}$ , the complex

$$\text{Hom}_{Psh(\mathcal{O})}^\bullet(\mathbb{Z}_{\mathcal{U}, \bullet} \otimes \mathcal{O}, \mathcal{F}) \cong \text{Hom}_{PAb}^\bullet(\mathbb{Z}_{\mathcal{U}, \bullet}, \mathcal{F})$$

is called the **Čech complex**  $\check{\mathcal{C}}^\bullet(\mathcal{U}, \mathcal{F})$  of  $\mathcal{F}$ . The cohomology  $\check{H}^*(\mathcal{U}, \mathcal{F})$  of  $\check{\mathcal{C}}^\bullet(\mathcal{U}, \mathcal{F})$  is called the **Čech cohomology** of  $\mathcal{F}$  w.r.t  $\mathcal{U}$ .

$\mathbb{Z}_{\mathcal{U}, \bullet}$  is exact except in degree 0, where the homology is  $j_! \mathbb{Z}_U$ . This is because we have a homotopy: choose a fixed  $i_0$ , for a  $s \in \Gamma(U_{i_1 \dots i_n}, \mathcal{F})$ , we map it to  $(hs)_{ii_1 \dots i_n} = \delta_{i, i_0} s$  ?. In particular, an injective sheaf is Čech acyclic.  $\square$

**Lemma (7.3.2.2).** The Čech complexes  $\check{C}^\bullet(\mathcal{U}, -)$  induces a functor from  $\mathcal{PSh}(\mathcal{C})$  to  $K^+(\mathcal{A}b)$ , which is an exact functor.  $\lrcorner$

*Proof:* Because in each degree this functor is a sum of functors of the form  $\mathcal{F} \mapsto \mathcal{F}(U)$ , which are exact functors on  $\mathcal{PSh}(\mathcal{C})$ .  $\square$

**Prop. (7.3.2.3) [Čech Complex as Derived Functors].** Let  $\mathcal{C}$  be a site and  $\mathcal{U} : \{U_i \rightarrow U\}$  be a covering, then  $\check{H}^0(\mathcal{U}, -)$  is left exact, and for  $\mathcal{F} \in \mathcal{Sh}(\mathcal{C})$ , there are functorial quasi-isomorphisms

$$\check{C}^\bullet(\mathcal{U}, \mathcal{F}) \rightarrow R\check{H}^0(\mathcal{U}, \mathcal{F})$$

which is functorial in  $\mathcal{F}$ .  $\lrcorner$

*Proof:* Choose a functorial injective resolution of presheaves  $\mathcal{I}^\bullet$  of  $\mathcal{F}$ , and consider the double complex  $\check{C}(\mathcal{U}, \mathcal{I}^\bullet)$ . There are maps of complexes

$$\check{C}(\mathcal{U}, \mathcal{F}) \rightarrow \text{Tot}(\check{C}(\mathcal{U}, \mathcal{I}^\bullet)), \quad \check{H}^0(\mathcal{U}, \mathcal{I}^\bullet) \rightarrow \text{Tot}(\check{C}(\mathcal{U}, \mathcal{I}^\bullet))$$

which are both quasi-isomorphism by an application of spectral sequence and the fact the columns and rows are exact in positive degrees: The columns are exact because of (7.3.2.2) and the rows are exact because  $\mathbb{Z}_{\mathcal{U}, \bullet}$  is exact in positive degrees (7.3.2.1) and  $\mathcal{I}^p$  are injective. Then we have the desired quasi-isomorphism, and it is functorial in  $\mathcal{F}$ .  $\square$

**Cor. (7.3.2.4) [Čech Cohomologies].** If we take filtered colimit for coverings,  $\mathcal{F} \rightarrow \check{H}^0(\mathcal{U}, \mathcal{F}) = H^0(\mathcal{U}, \mathcal{F})$  is a left exact functor from presheaves to sets, the derived complex is just  $\varinjlim_{\mathcal{U}} \check{C}^\bullet(\mathcal{U}, \mathcal{F})$ , and the derived functors are just  $\varinjlim_{\mathcal{U}} \check{H}^q(\mathcal{U}, \mathcal{F})$ .  $\lrcorner$

*Proof:* This is because we can take colimit of the conclusion of (7.3.2.3), because the colimit is filtered by (7.3.2.5) so exact, so the Čech complex also represents the derived complex.  $\square$

**Lemma (7.3.2.5).** The refinement morphism of Čech cohomologies of two coverings doesn't depends on the refinement map chosen.  $\lrcorner$

*Proof:* For two refinement map, there is a commutative diagram

$$\begin{array}{ccc} \prod F(U_i) & \xrightarrow{d^0} & \prod F(U_i \times_U U_j) \\ \downarrow f-g & \swarrow \Delta^1 & \\ \prod F(U'_j) & & \end{array}$$

so it induce the same map on the kernel.  $\square$

**Def. (7.3.2.6) [Alternating Čech Complexes].** Let  $(\mathcal{C}, \mathcal{O})$  be a ringed site and  $\mathcal{U} : \{U_i \rightarrow U\} \in \text{Cov}(\mathcal{C})$ ,  $\mathcal{F} \in \mathcal{Sh}(\mathcal{O})$ , then the **alternating Čech complex** of  $\mathcal{F}$  is defined to be the subcomplex

$$\check{C}_{\text{alt}}^\bullet(\mathcal{U}, \mathcal{F}) = \{s \in \check{C}^\bullet(\mathcal{U}, \mathcal{F}) \mid s_{i_0, \dots, i_p} = 0 \text{ if } i_m = i_n, m \neq n, s_{i_{\sigma(0)}, \dots, i_{\sigma(p)}} = \text{sgn}(\sigma) s_{i_0, \dots, i_p}\} \subset \check{C}^\bullet(\mathcal{U}, \mathcal{F}).$$

It is truly a subcomplex.  $\lrcorner$

**Prop. (7.3.2.7) [Alternating and Usual Complexes].** Let  $(\mathcal{X}, \mathcal{O}_X)$  be a ringed space,  $\mathcal{U} : \{U_i \rightarrow U\} \in \text{Cov}(\mathcal{C})$ ,  $\mathcal{F} \in \mathcal{Sh}(\mathcal{O}_X)$ , then the inclusion

$$\check{C}_{\text{alt}}^\bullet(\mathcal{U}, \mathcal{F}) \rightarrow \check{C}^\bullet(\mathcal{U}, \mathcal{F})$$

is a homotopy equivalence.  $\lrcorner$

*Proof:* Cf. [Sta]01FM. The proof is rather complicated. ?  $\square$

**Remark (7.3.2.8).** WARNING: This is not right for ringed sites, e.g. the étale sites, for example, cf. (9.4.1.25).  $\lrcorner$

### Comparison Theorems

**Prop. (7.3.2.9).** If two coverings are refinements of each other, then their Čech cohomology is isomorphic.  $\perp$

*Proof:* Because the refinement morphism doesn't depend on the refinement map (7.3.2.5).  $\square$

**Prop. (7.3.2.10) [Comparison Theorem for Čech Acyclicity].** If there are two coverings  $\mathfrak{U}, \mathfrak{V}$  and a presheaf  $\mathcal{F}$ , then we can construct a double Čech complex with the  $(p, q)$ -term being  $\mathcal{F}(U_{i_1, \dots, i_p} \cap V_{j_1, \dots, j_q})$ . Then the vertical and horizontal arrays calculate the Čech cohomology  $\prod_j H^*(\mathfrak{U}|_{V_{j_1, \dots, j_q}}, \mathcal{F})$ ,  $\prod_i H^*(\mathfrak{V}|_{U_{i_1, \dots, i_q}}, \mathcal{F})$  respectively.

So by Spectral sequence (4.10.7.8), if both higher Čech cohomology group  $H^k(\mathfrak{U}|_{V_{j_1, \dots, j_q}}, \mathcal{F})$ ,  $H^k(\mathfrak{V}|_{U_{i_1, \dots, i_q}}, \mathcal{F})$  vanish, i.e., they are both  $\mathcal{F}$ -acyclic, then  $H^*(\mathfrak{U}, \mathcal{F}) \cong H^*(\mathfrak{V}, \mathcal{F})$ .  $\perp$

**Cor. (7.3.2.11).** If  $\mathfrak{V}$  is a refinement of  $\mathfrak{U}$ , and  $\mathfrak{V}|_{U_{i_1, \dots, i_p}}$  are all  $\mathcal{F}$ -acyclic, then  $H^*(\mathfrak{U}, \mathcal{F}) \cong H^*(\mathfrak{V}, \mathcal{F})$ .  $\perp$

*Proof:* It suffices to prove  $\mathfrak{U}|_{V_{i_1, \dots, i_q}}$  is  $\mathcal{F}$ -acyclic. But  $\mathfrak{U}|_{V_{i_1, \dots, i_q}}$  and  $\text{id}_{V_{i_1, \dots, i_q}}$  are refinements of each other, so (7.3.2.9) settles the proof.  $\square$

**Cor. (7.3.2.12).** If  $\mathfrak{V}|_{U_{i_1, \dots, i_p}}$  is  $\mathcal{F}$ -acyclic, then the covering  $H^*(\mathfrak{U} \times \mathfrak{V}, \mathcal{F}) = H^*(\{U_i \cap V_j\}, \mathcal{F}) \cong H^*(\mathfrak{U}, \mathcal{F})$ .  $\perp$

*Proof:* Because  $\mathfrak{V}|_{U_{i_1, \dots, i_p}}$  and  $\mathfrak{U} \times \mathfrak{V}|_{U_{i_1, \dots, i_p}}$  are refinement of each other, so  $\mathfrak{U} \times \mathfrak{V}|_{U_{i_1, \dots, i_p}}$  are  $\mathcal{F}$ -acyclic by (7.3.2.9), and  $\mathfrak{U} \times \mathfrak{V}$  refines  $\mathfrak{U}$ , so (7.3.2.11) can be applied.  $\square$

**Prop. (7.3.2.13) [Čech to Derived].** For any  $\mathcal{F} \in \text{Sh}(\mathcal{C})$ , the Grothendieck spectral sequence applied to  $\Gamma(U, -) = H^0(\{U_i \rightarrow U\}, -) \circ \iota = \check{H}^0(U, -) \circ \iota$  gives us:

$$H^p(\{U_i \rightarrow U\}, \mathcal{H}^q(\mathcal{F})) \implies H^{p+q}(U, \mathcal{F}).$$

$$\check{H}^p(U, \mathcal{H}^q(\mathcal{F})) \implies H^{p+q}(U, \mathcal{F}).$$

$\perp$

**Cor. (7.3.2.14) [Higher Cohomologies Vanish Locally].** For any  $\mathcal{F} \in \text{Sh}(\mathcal{C})$ ,  $\mathcal{H}^p(\mathcal{F})^{++} = \mathcal{H}^p(\mathcal{F})^\# = 0$  for  $p > 0$ . In particular

$$\mathcal{H}^p(\mathcal{F})^+(U) = \check{H}^0(U, \mathcal{H}^p(\mathcal{F})) = 0 \quad p > 0.$$

because  $\mathcal{H}^p(\mathcal{F})^+$  is separated by (7.1.2.7). In particular, for any  $s \in H^p(U, \mathcal{F})$ ,  $p > 0$ , there exists a covering  $\mathcal{U}$  of  $U$  s.t.  $s|_{U_i} = 0$  for any  $i$ .

Thus the low degree of Čech-to-sheaf cohomology says (4.10.7.12):

$$0 \rightarrow \check{H}^1(U, \mathcal{F}) \rightarrow H^1(U, \mathcal{F}) \rightarrow 0 \rightarrow \check{H}^2(U, \mathcal{F}) \rightarrow H^2(U, \mathcal{F}) \rightarrow \check{H}^1(U, \mathcal{H}^1(\mathcal{F})) \rightarrow \check{H}^3(U, \mathcal{F}) \rightarrow H^3(U, \mathcal{F}).$$

$\perp$

*Proof:* By Grothendieck spectral sequence applied to forgetful functor and exact  $^\#$  functor, where the condition are satisfied by (7.3.4.3).  $\square$

**Cor. (7.3.2.15) [Acyclic Covering Calculates Derived Cohomologies].** If  $H^q(U_{i_0 i_1 \dots i_r}, \mathcal{F}) = 0$  for  $q \in \mathbb{Z}_+$ , then  $H^p(\{U_i \rightarrow U\}, \mathcal{F}) = H^p(U, \mathcal{F})$  as  $\mathcal{O}_X(U)$ -modules.  $\perp$

*Proof:* Because  $H^p(\{U_i \rightarrow U\}, \mathcal{H}^q(F))$  vanish for  $q > 0$ .  $\square$

**Prop. (7.3.2.16) [Čech Acyclic Čech Comparison].** If  $\mathcal{C}$  be a ringed site,  $\mathfrak{G} \subset \mathcal{C}$ ,  $\text{Cov} \subset \text{Cov}(\mathcal{C})$  and  $\mathcal{F} \in \text{Sh}(\mathcal{C})$  that

- For any  $\{U_i \rightarrow U\} \in \text{Cov}$ ,  $U_i, U \in \mathfrak{G}$ , and  $U_{i_0, \dots, i_p} \in \mathfrak{G}$ .
- $\text{Cov}|_U$  is cofinal in  $\text{Cov}(\mathcal{C}/U)$  for any  $U \in \mathfrak{G}$ .
- $\check{H}^q(U, \mathcal{F}) = 0$  for any  $U \in \mathfrak{G}$  and  $q > 0$ .

Then  $H^p(X, \mathcal{F}) = \check{H}^p(X, \mathcal{F}) = H^p(\{U_i \rightarrow X\}, \mathcal{F})$  for any  $\{U_i \rightarrow X\} \in \text{Cov}$ .  $\lrcorner$

*Proof:* By (7.3.2.15), we only have to show that  $H^q(U, \mathcal{F}) = 0$  for  $U \in \mathfrak{G}$  and  $q > 0$ . Use induction on  $q$ , use Čech to sheaf2:  $\check{H}^p(U, \mathcal{H}^q(\mathcal{F})) \Rightarrow H^{p+q}(U, \mathcal{F})$ . The case  $q \neq 0$  is by condition 2, 3, and induction hypothesis. For  $p = 0$ , use (7.3.2.14).  $\square$

### Non-Abelian Čech Cohomologies

**Def. (7.3.2.17) [Non-Abelian Cohomology].** Let  $\mathcal{C}$  be a site and  $\mathcal{G} \in \text{Sh}^{\text{grp}}(\mathcal{C})$ , for any covering  $\mathcal{U} = \{U_i \rightarrow U\} \in \text{Cov}(\mathcal{C})$ , we can define a **non-Abelian Čech cohomology**  $\check{H}^1(\mathcal{U}, \mathcal{G})$  as follows: Define  $Z^1(\mathcal{U}, \mathcal{G})$  = sets of families

$$\{(c_i) | c_i \in \Gamma(U_{ij}, \mathcal{G}) : c_{jk} c_{ik}^{-1} c_{ij} = 1\}.$$

If  $c \in Z^1(G, M)$ , then for any  $g \in \Gamma(U, \mathcal{G})$ ,

$$c_g = (c'_{ij} = g|_{U_i}^{-1} c_{ij} g|_{U_j})$$

is also in  $Z^1(\mathcal{U}, \mathcal{G})$ . This defines an equivalence relation on  $Z^1(\mathcal{U}, \mathcal{G})$ , the equivalence classes are called  $\check{H}^1(G, M)$ . This is compatible with the commutative case.

Taking filtered colimit over all coverings of  $U$ , we can also define  $\check{H}^1(U, \mathcal{G})$ .  $\lrcorner$

**Prop. (7.3.2.18) [ $H^1$  and Torsors].** Let  $\mathcal{C}$  be a site and  $\mathcal{H} \in \text{Sh}(\mathcal{C})$ , then there is a canonical isomorphism of  $\mathcal{H}$ -torsors (7.1.1.16) and  $H^1(\mathcal{C}, \mathcal{H})$ .  $\lrcorner$

*Proof:* Cf. [Sta]03AJ. Should have a non-commutative version.  $\square$

**Prop. (7.3.2.19) [Long Exact Sequence of Non-Abelian Čech Cohomologies].** Let  $\mathcal{C}$  be a site and  $1 \rightarrow \mathcal{A} \rightarrow \mathcal{B} \rightarrow \mathcal{C} \rightarrow 1$  is an exact sequence in  $\text{Sh}^{\text{grp}}(\mathcal{C})$ , then for any  $U \in \mathcal{C}$ , there is a long exact sequence of pointed sets

$$1 \rightarrow \Gamma(U, \mathcal{A}) \rightarrow \Gamma(U, \mathcal{B}) \rightarrow \Gamma(U, \mathcal{C}) \xrightarrow{\delta} \check{H}^1(U, \mathcal{A}) \rightarrow \check{H}^1(U, \mathcal{B}) \rightarrow \check{H}^1(U, \mathcal{C}) \xrightarrow{\Delta} \check{H}^2(U, \mathcal{A})$$

the last term is defined only when  $\mathcal{A}$  is in the center of  $\mathcal{B}$  and  $U$  satisfies: For any covering  $\mathcal{U}$  and a refinement  $\mathcal{W} \rightarrow \mathcal{U} \times \mathcal{U}$ , there exists a refinement  $\mathcal{U}' \rightarrow \mathcal{U}$  s.t.  $\mathcal{U}' \times \mathcal{U}'$  is a refinement of  $\mathcal{W}$ .

$\delta$  is defined as follows: for  $c \in \Gamma(\mathcal{C}, \mathcal{C})$ , by taking a covering  $\{U_i \rightarrow U\}$ , we may assume that  $c|_{U_i} = b_i \in \Gamma(U_i, \mathcal{B})$ , then  $a_{ij} = b_i^{-1} b_j$  is a cocycle, and a different choice differ by a cocycle, so this is well-defined.

$\Delta$  is defined as: for any covering  $\mathcal{U}$  of  $U$  and  $c = (c_{ij})$  a cocycle in  $\check{H}^1(\mathcal{U}, \mathcal{C})$ , by passing to a refinement, we may assume that  $c_{ij} \in \Gamma(U_{ij}, \mathcal{B})$ , then  $\delta(c)$  is represented by the 2-cocycle  $a_{ijk} = c_{jk} c_{ik}^{-1} c_{ij} \in \Gamma(U, \mathcal{A})$ .  $\lrcorner$

*Proof:* **??** The verification of well-definedness of  $\Delta$  is checked at [Serre Local Fields P124]. **?**

For the exactness at  $C^G$ , the definition of  $\delta$  shows that  $\delta(c) = 1$  iff there is an inverse image  $b$  that  $b^{-1}\sigma(b) = 1$  for all  $\sigma$ .

For the exactness at  $H^1(G, A)$ ,  $a_\sigma = b^{-1}\sigma(b)$  if  $a_\sigma$  is in the image of  $\delta$ . Conversely, the image of  $b$  in  $C$  is in  $C^G$ , so it is in the image of  $\delta$ .

For the exactness at  $H^1(G, B)$ , one way is clear, and for the other, if  $\pi(b_\sigma) = c^{-1}\sigma(c)$ , then if  $t$  is an inverse image of  $c$ , then  $tb_\sigma\sigma(t)^{-1}$  is a cocycle in  $A$  cohomologous to  $b_\sigma$ .

For the exactness at  $H^1(G, C)$ , one way is clear, and if  $b_s$  is an inverse image of  $b_s$  and  $a_{\sigma,\tau} = b_\sigma\sigma(b_\tau)b_{\sigma\tau}^{-1}$  is a coboundary, then it is  $a_\sigma\sigma(a_\tau)a_{\sigma\tau}^{-1}$ , so we change  $b$  to  $a_\sigma^{-1}b_\sigma$ , as  $A$  is in the center of  $B$ , this lifts  $c$  to a cocycle in  $B$ .  $\square$

**Prop. (7.3.2.20) [Hilbert's Theorem 90].** For  $L/K \in \text{GalField}$ ,  $H^1(\text{Gal}(L/K), \text{GL}(n; L)) = 1$ , where  $L$  is equipped with the discrete topology.  $\lrcorner$

*Proof:* We prove any cocycle is a coboundary, for this, notice any cocycle factor through a finite quotient, and the images of it is contained in a finite extension of  $K$ , hence it reduce to the case of  $L/K$  finite.

By definition, this is equivalent to any  $B$ -semi-linear representation of  $G$  free of finite rank is trivial, which is by (24.1.1.15).  $\square$

**Cor. (7.3.2.21) [semi-linear representations].** The proposition implies that any semi-linear  $L$ -representation of  $\text{Gal}(L/K)$  is trivial.  $\lrcorner$

**Cor. (7.3.2.22).**  $H^1(\text{Gal}(L/K), \text{SL}_n(L)) = 1$ . This is seen from the exact sequence  $1 \rightarrow \text{SL}(n, L) \rightarrow \text{GL}(n, L) \rightarrow L^\times \rightarrow 1$ .  $\lrcorner$

### 3 Derived Homology

#### K-Flat Complexes

**Def. (7.3.3.1) [K-flat Complexes].** Let  $(\mathcal{C}, \mathcal{O})$  be a ringed site, a complex  $\mathcal{K}^\bullet$  of  $\mathcal{O}$ -modules is called  $K$ -flat if for any acyclic complex  $\mathcal{F}^\bullet$  of  $\mathcal{O}$ -modules, the total complex  $\text{Tot}^\oplus(\mathcal{F}^\bullet \otimes_{\mathcal{O}} \mathcal{K}^\bullet)$  is acyclic, or equivalently, tensoring with  $\mathcal{K}^\bullet$  maps quasi-iso to quasi-iso, by the long exact sequence and the fact tensoring is an exact functor of triangulated categories (4.8.10.4).  $\lrcorner$

**Prop. (7.3.3.2).** If  $K, K'$  are  $K$ -flat complexes of  $\mathcal{O}$ -modules,

- $\text{Tot}^\oplus(K \otimes_{\mathcal{O}} K')$  is  $K$ -flat.
- If  $(K_1, K_2, K_3)$  is a distinguished triangle in  $K(\mathcal{O})$ , if two of them is  $K$ -flat, then the third is also  $K$ -flat.
- Any bounded above complex of flat  $\mathcal{O}$ -modules is  $K$ -flat.
- Any filtered colimits of  $K$ -flat complexes are  $K$ -flat.

$\lrcorner$

*Proof:* 1: This follows from (4.8.10.2).

3: use (4.8.10.4), and the long exact sequence.

4: Cf. [Sta]06YQ.

5: because we are taking termwise-colimit, and Tot and tensor all commute with filtered colimits.

$\square$

**Prop. (7.3.3.3) [K-Flat Resolutions].** Any complex  $P^\bullet$  of  $\mathcal{O}$ -modules has a  $K$ -flat resolution  $K^\bullet \rightarrow P^\bullet$ , moreover, each term of  $K^\bullet$  is a flat  $\mathcal{O}$ -module and  $K^\bullet \rightarrow P^\bullet$  is termwise surjective.  $\lrcorner$

*Proof:* Cf. [Sta]06Y4.  $\square$

**Lemma (7.3.3.4).** Let  $P \rightarrow Q$  be a quasi-iso of  $K$ -flat complexes of  $\mathcal{O}$ -modules, then for any complex  $L$  of  $\mathcal{O}$ -modules,  $\text{Tot}(L \otimes P) \rightarrow \text{Tot}(L \otimes Q)$  is a quasi-isomorphism.  $\lrcorner$

*Proof:* Choose a  $K$ -flat resolution (7.3.3.3)  $K$  of  $L$ , then notice

$$\text{Tot}(L \otimes P) \cong \text{Tot}(K \otimes P) \cong \text{Tot}(K \otimes Q) \cong \text{Tot}(L \otimes Q)$$

by definition of  $K$ -flatness (7.3.3.1).  $\square$

**Prop. (7.3.3.5) [Pullback of K-Flat is K-Flat].** Let  $f : (\mathcal{S}h(\mathcal{C}'), \mathcal{O}_{\mathcal{C}'}) \rightarrow (\mathcal{S}h(\mathcal{C}), \mathcal{O}_{\mathcal{C}})$  be a morphism of ringed topoi, then  $f^*$  maps  $K$ -flat complexes to  $K$ -flat complexes.  $\lrcorner$

*Proof:* Cf. [Sta]0G7E.  $\square$

### Derived Tensor Product and Tor

**Def. (7.3.3.6) [Derived Tensor Product].** Let  $\mathcal{A} \rightarrow \mathcal{B}$  be a homomorphism of sheaves of rings over a site  $\mathcal{C}$ , then the functor  $\text{Tot}^\oplus(- \otimes_{\mathcal{O}} -)$  is a bi-exact bifunctor of triangulated categories  $K(\mathcal{A}) \times K(\mathcal{B}) \rightarrow D(\mathcal{B})$  by (4.8.10.4)(4.8.4.9), and the class of  $K$ -flat complexes in  $K(\mathcal{A})$  and  $K$ -flat complexes in  $K(\mathcal{B})$  satisfies the condition of (the dual of) ?? by (7.3.3.1) and (7.3.3.3), so we get a left derived functor

$$- \otimes_{\mathcal{A}}^L - : D(\mathcal{A}) \times D(\mathcal{B}) \rightarrow D(\mathcal{B}),$$

called the **derived tensor product**. And if any of  $M^\bullet, N^\bullet \in K(\mathcal{A})$  is  $K$ -flat, the natural map  $M^\bullet \otimes_{\mathcal{A}}^L N^\bullet \rightarrow \text{Tot}^\oplus(M^\bullet \otimes_{\mathcal{A}} N^\bullet)$  is an isomorphism in  $D(\mathcal{B})$ .  $\lrcorner$

**Prop. (7.3.3.7).** Let  $\mathcal{A} \rightarrow \mathcal{B}$  be a homomorphism of sheaves of rings over a site  $\mathcal{C}$ . Let  $N^\bullet$  be a  $\mathcal{B}$ -module, then for  $M^\bullet \in D(\mathcal{A})$ , there are functorial isomorphisms

$$M^\bullet \otimes_{\mathcal{A}}^L N^\bullet \cong (M^\bullet \otimes_{\mathcal{A}}^L \mathcal{B}) \otimes_{\mathcal{B}}^L N^\bullet$$

$\lrcorner$

*Proof:* Consider both sides as right derived functors of the multi-exact multifunctor. As this is true for  $\text{Tot}^\oplus$ , these follow from the universal property and (4.10.3.14), the conditions are satisfied by (7.3.3.3)(7.3.3.4)(7.3.3.5).  $\square$

**Cor. (7.3.3.8) [Commutative Monoidal Structure].** If  $\mathcal{A} = \mathcal{B} = \mathcal{C} = \mathcal{O}$  and  $K, L, M \in K(\mathcal{O})$ , there are natural isomorphisms

$$K \otimes^L L \cong L \otimes^L K, \quad (K \otimes^L L) \otimes^L M \cong K \otimes^L (L \otimes^L M).$$

Thus  $D^*(\mathcal{O})$  has a commutative monoidal structure.  $\lrcorner$

**Remark (7.3.3.9) [WARNING].** If  $M, N$  are two  $\mathcal{A}$ -modules, then we can define  $M_R \otimes_R^L N$  and  $M \otimes_R^L N_R$ , but there are no reason for them to be isomorphic.  $\lrcorner$

$$(M \otimes_A^L N) \otimes_B^L K = M \otimes_A^L (N \otimes_B^L K) = (M \otimes_A^L C) \otimes_C^L (N \otimes_B^L K)$$

and

$$(M \otimes_A^L N) \otimes_B^L K \cong (M \otimes_A^L K) \otimes_C^L (N \otimes_B^L C)$$

└

*Proof:* Consider both sides as right derived functors of the multi-exact multifunctor. As these are true for  $\text{Tot}^\oplus$ , these follow from the universal property and (4.10.3.14), the conditions are satisfied by (7.3.3.3)(7.3.3.4)(7.3.3.5).  $\square$

**Def. (7.3.3.11)[Tor Modules].** Let  $\mathcal{F}, \mathcal{G}$  be  $\mathcal{O}$ -modules, then the **Tor modules**  $\mathrm{Tor}_p^{\mathcal{O}}(\mathcal{F}, \mathcal{G})$  is defined to be  $H^{-p}(\mathcal{F} \otimes_{\mathcal{O}}^L \mathcal{G})$ .  $\square$

**Prop. (7.3.3.12)[Flatness and Tor].** Let  $(\mathcal{C}, \mathcal{O})$  be a ringed site, and  $\mathcal{F}$  is an  $\mathcal{O}$ -module. Then  $\mathcal{F}$  is a flat  $\mathcal{O}$ -modules iff  $\mathrm{Tor}_1^{\mathcal{O}}(\mathcal{F}, \mathcal{G}) = 0$  for any  $\mathcal{O}$ -module  $\mathcal{G}$ .  $\square$

*Proof:* If  $\mathcal{F}$  is flat, then clearly  $\mathrm{Tor}_1^{\mathcal{O}}(\mathcal{F}, \mathcal{G}) = 0$  for any  $\mathcal{O}$ -module  $\mathcal{G}$ . Conversely, use the long exact sequence associated to  $\mathcal{F} \otimes_{\mathcal{O}}^{\mathbf{L}} \cdot$  (4.8.10.4).  $\square$

**Def. (7.3.3.13)[Relative Cup Product].** Let  $f : (\mathrm{Sh}(\mathcal{C}), \mathcal{O}_{\mathcal{C}}) \rightarrow (\mathrm{Sh}(\mathcal{D}), \mathcal{O}_{\mathcal{D}})$  be a morphism of ringed topoi, then for any  $K, L \in D(\mathcal{O}_{\mathcal{C}})$ , there is a canonical functorial **relative cup product**

$$Rf_*K \otimes_{\mathcal{O}_{\mathcal{D}}}^L Rf_*L \rightarrow Rf_*(K \otimes_{\mathcal{O}_{\mathcal{C}}}^L L)$$

in  $D(\mathcal{O}_{\mathcal{D}})$  that is the adjunction map of the map

$$Lf^*(Rf_*K \otimes_{\mathcal{O}_{\mathcal{D}}}^L Rf_*L) \rightarrow Lf^*Rf_*K \otimes_{\mathcal{O}_{\mathcal{C}}}^L Lf^*Rf_*L \rightarrow K \otimes_{\mathcal{O}_{\mathcal{C}}}^L L$$

by (7.3.3.15). This map is symmetric and associative.

In particular, if  $(\mathrm{Sh}(\mathcal{D}), \mathcal{O}_{\mathcal{D}}) = (\mathrm{Sh}(\mathrm{pt}), \Gamma(\mathcal{C}, \mathcal{O}_{\mathcal{C}}) = A)$  (7.3.1.3), we get a map

$$R\Gamma(\mathcal{C}, K) \otimes_A^L R\Gamma(\mathcal{C}, L) \rightarrow \Gamma(\mathcal{C}, K \otimes_{\mathcal{O}_{\mathcal{C}}}^L L).$$

L

## Derived Pullback

**Def. (7.3.3.14) [Derived Pullback].** Let  $f : (\mathcal{S}h(\mathcal{C}'), \mathcal{O}') \rightarrow (\mathcal{S}h(\mathcal{C}), \mathcal{O})$  be a morphism of ringed site, define the **derived pullback**

$$Lf^* : D(\mathcal{O}) \rightarrow D(\mathcal{O}') : \mathcal{F}^\bullet \mapsto f^{-1}\mathcal{F}^\bullet \otimes_{f^{-1}\mathcal{O}}^L \mathcal{O}' \quad (7.3.3.6).$$

In particular, if  $\mathcal{F}^\bullet$  is K-flat, then there are natural isomorphisms  $Lf^*\mathcal{F}^\bullet \cong f^*\mathcal{F}^\bullet$ .

Moreover,  $Lf^*$  is also naturally isomorphic to the left derived functor of the pullback morphism  $f^*$ , by composition of derived functors applied to the  $f^* = \text{Tot}(\cdot \otimes_{f^{-1}\mathcal{O}} \mathcal{O}') \circ f^{-1}$  where  $f^{-1}$  is exact. In particular,  $Lf^*$  only depends on the underlying map  $f^*$  of ringed topoi.  $\square$

**Prop. (7.3.3.15).** Let  $f : (\mathrm{Sh}(\mathcal{C}), \mathcal{O}_{\mathcal{C}}) \rightarrow (\mathrm{Sh}(\mathcal{D}), \mathcal{O}_{\mathcal{D}})$ ,  $g : (\mathrm{Sh}(\mathcal{D}), \mathcal{O}_{\mathcal{D}}) \rightarrow (\mathrm{Sh}(\mathcal{E}), \mathcal{O}_{\mathcal{E}})$  be a morphism of ringed topoi, then

- There is a natural isomorphism  $L(g \circ f)^* \cong Lf^* \circ Lg^*$ . In particular, as localizing map  $j^*$  is exact,  $Lf^*$  can be calculated locally on the base.
- For  $\mathcal{F}^\bullet, \mathcal{G}^\bullet \in \text{Mod}_{\mathcal{O}_{\mathcal{D}}}$ , there are natural functorial isomorphisms

$$Lf^*(\mathcal{F}^\bullet \otimes_{\mathcal{O}_{\mathcal{D}}}^L \mathcal{G}^\bullet) \cong Lf^* \mathcal{F}^\bullet \otimes_{\mathcal{O}_{\mathcal{E}}}^L Lf^* \mathcal{G}^\bullet.$$

In particular, as localizing map  $j^*$  is exact, the derived tensor product can be calculated locally on the base.

- For  $\mathcal{F}^\bullet \in \text{Mod}_{\mathcal{O}_{\mathcal{E}}}, \mathcal{G}^\bullet \in \text{Mod}_{\mathcal{O}_{\mathcal{D}}}$ , there are natural functorial isomorphisms

$$\mathcal{F}^\bullet \otimes_{\mathcal{O}_{\mathcal{E}}}^L Lf^* \mathcal{G}^\bullet \cong \mathcal{F}^\bullet \otimes_{f^{-1}\mathcal{O}_{\mathcal{D}}}^L f^{-1} \mathcal{G}^\bullet$$

- For  $\mathcal{F}^\bullet, \mathcal{G}^\bullet \in \text{Mod}_{\mathcal{O}_{\mathcal{D}}}$ , the natural isomorphisms satisfy a commutative diagram

$$\begin{array}{ccc} Lf^*(\mathcal{F}^\bullet \otimes_{\mathcal{O}_{\mathcal{D}}}^L \mathcal{G}^\bullet) & \longrightarrow & Lf^* \text{Tot}^\oplus(\mathcal{F}^\bullet \otimes_{\mathcal{O}_{\mathcal{D}}} \mathcal{G}^\bullet) \\ \downarrow & & \downarrow \\ Lf^* \mathcal{F}^\bullet \otimes_{\mathcal{O}_{\mathcal{E}}}^L Lf^* \mathcal{G}^\bullet & & f^* \text{Tot}^\oplus(\mathcal{F}^\bullet \otimes_{\mathcal{O}_{\mathcal{D}}} \mathcal{G}^\bullet) \\ \downarrow & & \downarrow \\ f^* \mathcal{F}^\bullet \otimes_{\mathcal{O}_{\mathcal{E}}}^L f^* \mathcal{G}^\bullet & \longrightarrow & \text{Tot}^\oplus(f^* \mathcal{F}^\bullet \otimes_{\mathcal{O}_{\mathcal{E}}} f^* \mathcal{G}^\bullet) \end{array}$$

⌋

*Proof:* 1, 2, 3: These follow from (7.3.3.10).

4: By a universal argument,  $(\mathcal{F}^\bullet, \mathcal{G}^\bullet) \mapsto Lf^*(\mathcal{F}^\bullet \otimes_{\mathcal{O}_{\mathcal{D}}}^L \mathcal{G}^\bullet)$  is the derived functor of the bi-exact bifunctor

$$F : K(\mathcal{O}_{\mathcal{D}}) \times K(\mathcal{O}_{\mathcal{D}}) \rightarrow D(\mathcal{O}_{\mathcal{E}}) : (\mathcal{F}^\bullet, \mathcal{G}^\bullet) \mapsto f^* \text{Tot}^\oplus(\mathcal{F}^\bullet \otimes_{\mathcal{O}_{\mathcal{D}}} \mathcal{G}^\bullet).$$

Then by the universal property, both natural transformations corresponds to a natural transformation  $\theta_i : LF \rightarrow LF$ . So it suffices to show that they are isomorphic. But K-flat morphisms are essentially surjective in  $D(\mathcal{O}_{\mathcal{D}})$ , thus it suffices to prove the diagram is commutative for  $\mathcal{F}, \mathcal{G}$  K-flat. But in this case, there are commutative diagrams

$$\begin{array}{ccc} LF(\mathcal{F}^\bullet, \mathcal{G}^\bullet) & \xrightarrow{\eta_{(\mathcal{F}, \mathcal{G})}} & F(\mathcal{F}^\bullet, \mathcal{G}^\bullet) \\ \downarrow \theta_i \star (Q_{\mathcal{O}_{\mathcal{D}}} \times Q_{\mathcal{O}_{\mathcal{D}}}) & & \downarrow \text{id} \\ LF(\mathcal{F}^\bullet, \mathcal{G}^\bullet) & \xrightarrow{\eta_{(\mathcal{F}, \mathcal{G})}} & F(\mathcal{F}^\bullet, \mathcal{G}^\bullet) \end{array}$$

and  $\eta_{(\mathcal{F}, \mathcal{G})}$  is an isomorphism, so  $\theta_1 = \theta_2$ . □

**Prop. (7.3.3.16) [Adjunction].**  $Lf^*$  is left adjoint to  $Rf_*$ , by (4.10.3.15) and (7.2.2.9). ⌋

**Prop. (7.3.3.17) [Base Change Map].** Let

$$\begin{array}{ccc} (\text{Sh}(\mathcal{C}'), \mathcal{O}_{\mathcal{C}'}) & \xrightarrow{g'} & (\text{Sh}(\mathcal{C}), \mathcal{O}_{\mathcal{C}}) \\ \downarrow f' & & \downarrow f \\ (\text{Sh}(\mathcal{D}'), \mathcal{O}_{\mathcal{D}'}) & \xrightarrow{g} & (\text{Sh}(\mathcal{D}), \mathcal{O}_{\mathcal{D}}) \end{array}$$

be a commutative diagram of ringed topoi, then for any  $K \in D(\mathcal{O}_{\mathcal{C}})$ , there is a canonical base change map

$$Lg^*Rf_*K \rightarrow R(f')_*L(g')^*K$$

functorial in  $K$ , and this map is compatible with composition of diagrams.  $\lrcorner$

*Proof:* By adjunction(7.3.3.16), this follows from the canonical map

$$Rf_*K \rightarrow Rg_*R(f')_*L(g')^*K = Rf_*R(g')_*L(g')^*K,$$

which comes from the adjunction map  $K \rightarrow R(g')_*L(g')^*K$ .  $\square$

**Cor. (7.3.3.18) [Flat Base Change Morphism].** Let

$$\begin{array}{ccc} (\mathrm{Sh}(\mathcal{C}'), \mathcal{O}_{\mathcal{C}'}) & \xrightarrow{g'} & (\mathrm{Sh}(\mathcal{C}), \mathcal{O}_{\mathcal{C}}) \\ \downarrow f' & & \downarrow f \\ (\mathrm{Sh}(\mathcal{D}'), \mathcal{O}_{\mathcal{D}'}) & \xrightarrow{g} & (\mathrm{Sh}(\mathcal{D}), \mathcal{O}_{\mathcal{D}}) \end{array}$$

be a commutative diagram of ringed sites. Assume both  $g, g'$  are flat, then for any  $\mathcal{F}^\bullet \in K^+(\mathcal{O}_{\mathcal{C}})$ , there is a canonical base change map

$$g^*Rf_*\mathcal{F}^\bullet \rightarrow Rf'_*(g')^*\mathcal{F}^\bullet.$$

and when  $(\mathrm{Sh}(\mathcal{D}'), \mathcal{O}_{\mathcal{D}'}) = (\mathrm{Sh}(\mathcal{C}/U), \mathcal{O}_U)$  is the localizing site, then this map is an isomorphism

$$(Rf_*\mathcal{F}^\bullet)_U \cong Rf'_*\mathcal{F}_U^\bullet.$$

$\lrcorner$

*Proof:* The last assertion follows from the fact the restriction of a K-injective is also a K-injective(7.3.4.2).  $\square$

**Def. (7.3.3.19) [Projection Map].** Let  $f : (\mathrm{Sh}(\mathcal{C}), \mathcal{O}_{\mathcal{C}}) \rightarrow (\mathrm{Sh}(\mathcal{D}), \mathcal{O}_{\mathcal{D}})$  be a morphism of ringed topoi, then for any  $E \in D(\mathcal{O}_{\mathcal{C}})$  and  $K \in D(\mathcal{O}_{\mathcal{D}})$ , there is a canonical functorial **projection map**

$$Rf_*E \otimes_{\mathcal{O}_{\mathcal{D}}}^L K \rightarrow Rf_*(E \otimes_{\mathcal{O}_{\mathcal{C}}}^L Lf^*K)$$

which is the adjunction of the map

$$Lf^*(Rf_*E \otimes_{\mathcal{O}_{\mathcal{D}}}^L K) \cong Lf^*Rf_*E \otimes_{\mathcal{O}_{\mathcal{C}}}^L Lf^*K \rightarrow E \otimes_{\mathcal{O}_{\mathcal{C}}}^L Lf^*K$$

by(7.3.3.15).  $\lrcorner$

**Prop. (7.3.3.20) [Projection Formula].** In situation(7.3.3.19), if  $K$  is perfect(7.3.4.17), then the projection map is an isomorphism.  $\lrcorner$

*Proof:* To check it is an isomorphism, it suffice to find a covering  $\{U_i \rightarrow V\}$  for each  $V \in \mathcal{C}$  that this map is an isomorphism on  $U_i$ . (To see this, look at  $H^i$ , and notice  $U \mapsto \mathrm{Mod}(\mathcal{O}_U)$  is a stack). Then we may assume  $K$  is a finite complex of  $\mathcal{O}_U$ -modules consisting of finite free  $\mathcal{O}_U$ -modules. And then we use truncation to reduce to the case  $K$  is discrete, in which case it is trivial.  $\square$

**Inner Hom**

**Def. (7.3.3.21) [Sheaf Hom Complexes].** Let  $(\mathcal{C}, \mathcal{O})$  be a ringed site and  $P^\bullet, Q^\bullet \in K(\mathcal{O})$ , we define the **Sheaf Hom complex**  $\mathcal{H}om^\bullet(P^\bullet, Q^\bullet)$  to be

$$\mathcal{H}om^n(P^\bullet, Q^\bullet) = \prod_i \mathcal{H}om_{\mathcal{O}}(P^i, Q^{n+i}) \quad (7.2.3.1),$$

with the differential giving by  $d(\{f_k\})_i = \{df_i - (-1)^i f_{i+1}d\}$  and suitable signatures.

It is clear that

$$\Gamma(U, \mathcal{H}om_{\mathcal{O}}^\bullet(P^\bullet, Q^\bullet)) = \text{Hom}_{\mathcal{O}_U}^\bullet(P^\bullet|_U, Q^\bullet|_U), \quad \Gamma(\mathcal{C}, \mathcal{H}om_{\mathcal{O}}^\bullet(P^\bullet, Q^\bullet)) = \text{Hom}_{\mathcal{O}}^\bullet(P^\bullet|_U, Q^\bullet|_U)$$

and

$$H^n(\Gamma(U, \mathcal{H}om^\bullet(P^\bullet, Q^\bullet))) = \text{Hom}_{K(\mathcal{O}_U)}(P^\bullet|_U, Q^\bullet|_U[n]), \quad H^n(\Gamma(\mathcal{C}, \mathcal{H}om^\bullet(P^\bullet, Q^\bullet))) = \text{Hom}_{K(\mathcal{O})}(P^\bullet, Q^\bullet[n]).$$

┘

**Prop. (7.3.3.22) [Adjunction].** For  $K^\bullet, M^\bullet, L^\bullet \in K(\mathcal{O})$ , there is a canonical functorial isomorphism:

$$\mathcal{H}om^\bullet(K, \mathcal{H}om^\bullet(L, M)) = \mathcal{H}om^\bullet(\text{Tot}(K \otimes_R L), M).$$

┘

*Proof:* Cf. [Sta]0A5Y. □

**Prop. (7.3.3.23).** For  $K^\bullet, M^\bullet, L^\bullet \in K(\mathcal{O})$ , there are canonical functorial morphisms:

- $\text{Tot}(\mathcal{H}om(K^\bullet, L^\bullet) \otimes_{\mathcal{O}} K^\bullet) \rightarrow L^\bullet$ ,
- $\text{Tot}(\mathcal{H}om^\bullet(L, M) \otimes_{\mathcal{O}} \mathcal{H}om^\bullet(K, L)) \rightarrow \mathcal{H}om^\bullet(K, M)$ ,
- $\text{Tot}(\mathcal{H}om^\bullet(L, M) \otimes_{\mathcal{O}} K) \rightarrow \mathcal{H}om^\bullet(\mathcal{H}om^\bullet(K, L), M)$ ,
- $\text{Tot}(K \otimes_{\mathcal{O}} \mathcal{H}om^\bullet(M, L)) \rightarrow \mathcal{H}om^\bullet(M, \text{Tot}(K \otimes_{\mathcal{O}} L))$ ,
- $K \rightarrow \mathcal{H}om^\bullet(L, \text{Tot}(K \otimes_{\mathcal{O}} L))$ .

┘

*Proof:* All these are consequences of (7.3.3.22). □

**Lemma (7.3.3.24).** Let  $(\mathcal{C}, \mathcal{O})$  be a site and  $(\mathcal{I}^\bullet)' \rightarrow \mathcal{I}^\bullet$  be a quasi-isomorphism of K-injective  $\mathcal{O}$ -modules and  $(\mathcal{L}^\bullet)' \rightarrow \mathcal{L}^\bullet$  be a quasi-isomorphism of  $\mathcal{O}$ -modules, then the natural map

$$\mathcal{H}om^\bullet(\mathcal{L}^\bullet, (\mathcal{I}^\bullet)') \rightarrow \mathcal{H}om^\bullet((\mathcal{L}^\bullet)', \mathcal{I}^\bullet)$$

is a quasi-isomorphism. ┘

*Proof:*  $H^n(\mathcal{H}om^\bullet(\mathcal{L}^\bullet, (\mathcal{I}^\bullet)'))$  is the sheaf  $U \mapsto \text{Hom}_{K(\mathcal{O}_U)}(\mathcal{L}_U^\bullet, (\mathcal{I}^\bullet)'_U[n])$ , and  $(\mathcal{I}^\bullet)'_U[n]$  is K-injective by (7.3.4.2). □

**Def. (7.3.3.25) [Internal Hom].** Let  $(\mathcal{C}, \mathcal{O})$  be a ringed site,  $K(\mathcal{O})$  has enough K-injectives, thus by (4.10.3.13), we can define the **internal Hom**

$$R\mathcal{H}om : D(\mathcal{O})^{op} \times D(\mathcal{O}) \rightarrow D(\mathcal{O})$$

as the right derived functor of the bi-exact bifunctor  $\mathcal{H}om^\bullet : K(\mathcal{O})^{op} \times K(\mathcal{O}) \rightarrow D(\mathcal{O})$ , where the conditions are satisfied by (7.3.3.24). ┘

**Prop. (7.3.3.26)[Internal Hom and Localization].** Let  $(\mathcal{C}, \mathcal{O})$  be a ringed site, for any  $\mathcal{G}, \mathcal{F} \in K(\mathcal{O})$  and  $U \in \mathcal{C}$ , the natural transformation

$$R\mathcal{H}om(\mathcal{F}, \mathcal{G})|_U \rightarrow R\mathcal{H}om(\mathcal{F}|_U, \mathcal{G}|_U)$$

is an isomorphism. In particular, we can calculate  $\mathcal{E}xt$  locally.  $\lrcorner$

*Proof:* This follows from (7.3.3.21)(7.3.4.2) and trivial Grothendieck duality applied to restrictions.  $\square$

**Prop. (7.3.3.27) [Derived Hom and Internal Hom].** For a ringed site  $(\mathcal{C}, \mathcal{O})$  and  $\mathcal{F}, \mathcal{G} \in D(\mathcal{O})$ ,  $U \in \mathcal{C}$ ,

$$R\Gamma(\mathcal{C}, R\mathcal{H}om(\mathcal{F}, \mathcal{G})) = R\mathcal{H}om(\mathcal{F}, \mathcal{G}), \quad R\Gamma(U, R\mathcal{H}om(\mathcal{F}, \mathcal{G})) = R\mathcal{H}om_{\mathcal{O}_U}(\mathcal{F}|_U, \mathcal{G}|_U).$$

In particular,

$$\Gamma(U, R\mathcal{H}om(\mathcal{F}, \mathcal{G})) = \mathcal{H}om_{D(\mathcal{O}_U)}(\mathcal{F}|_U, \mathcal{G}|_U),$$

and

$$H^0(\mathcal{C}, R\mathcal{H}om(\mathcal{F}, \mathcal{G})) = \mathcal{H}om_{D(\mathcal{O})}(\mathcal{F}, \mathcal{G}), \quad H^p(\mathcal{C}, R\mathcal{H}om(\mathcal{F}, \mathcal{G})) = \mathcal{E}xt_{\mathcal{O}}^p(\mathcal{F}, \mathcal{G})$$

by (7.3.3.21)(7.3.4.2)(7.3.4.13) and the composition of derived functors.  $\lrcorner$

**Prop. (7.3.3.28).** If  $\mathcal{K}, \mathcal{L}, \mathcal{M} \in D(\mathcal{O})$ , then there is a natural isomorphism

$$R\mathcal{H}om_{\mathcal{O}}(\mathcal{K}, R\mathcal{H}om(\mathcal{L}, \mathcal{M})) \cong R\mathcal{H}om_{\mathcal{O}}(\mathcal{K} \otimes_{\mathcal{O}}^L \mathcal{L}, \mathcal{M}).$$

*Proof:* Consider both sides as the derived functor of the triple-exact triple-functor

$$K(\mathcal{O})^{op} \times K(\mathcal{O})^{op} \times K(\mathcal{O}) \rightarrow D(\mathcal{O}) : (\mathcal{K}^\bullet, \mathcal{L}^\bullet, \mathcal{M}^\bullet) \mapsto \text{Tot}^\oplus(\mathcal{K}^\bullet \otimes_{\mathcal{O}} \text{Tot}^\oplus(\mathcal{L}^\bullet \otimes_{\mathcal{O}} \mathcal{M}^\bullet)),$$

the conditions are satisfied by (7.3.4.13)(7.3.3.3). As this is true for  $\text{Tot}$  by (7.3.3.22), this follows from the universal properties and (4.10.3.14).  $\square$

**Cor. (7.3.3.29)[Adjunction].** By (7.3.3.28), taking  $H^0(R\Gamma(\mathcal{C}, -))$ , we get:

$$\mathcal{H}om_{D(\mathcal{O})}(\mathcal{K}, R\mathcal{H}om(\mathcal{L}, \mathcal{M})) = \mathcal{H}om_{D(\mathcal{O})}(\mathcal{K} \otimes^L \mathcal{L}, \mathcal{M}).$$

that is, derived tensor is left adjoint to internal hom.  $\lrcorner$

**Prop. (7.3.3.30).** Given complexes  $\mathcal{K}, \mathcal{L}, \mathcal{M} \in D(\mathcal{O})$ , there are canonical functorial morphisms:

- $\mathcal{H}om(\mathcal{K}, \mathcal{L}) \otimes_{\mathcal{O}}^L \mathcal{K} \rightarrow \mathcal{L}$ ,
- $R\mathcal{H}om(\mathcal{L}, \mathcal{M}) \otimes_{\mathcal{O}}^L R\mathcal{H}om(\mathcal{K}, \mathcal{L}) \rightarrow R\mathcal{H}om(\mathcal{K}, \mathcal{M})$ ,
- $R\mathcal{H}om(\mathcal{L}, \mathcal{M}) \otimes_{\mathcal{O}}^L \mathcal{K} \rightarrow R\mathcal{H}om(R\mathcal{H}om(\mathcal{K}, \mathcal{L}), \mathcal{M})$ ,
- $\mathcal{K} \otimes_{\mathcal{O}}^L R\mathcal{H}om(\mathcal{M}, \mathcal{L}) \rightarrow R\mathcal{H}om(\mathcal{M}, \mathcal{K} \otimes_{\mathcal{O}}^L \mathcal{L})$ ,
- $\mathcal{K} \rightarrow R\mathcal{H}om(\mathcal{L}, \mathcal{K} \otimes_{\mathcal{O}}^L \mathcal{L})$ .

*Proof:* These are direct consequences of (7.3.3.29).  $\square$

**Prop. (7.3.3.31).** Let  $(\mathrm{Sh}(\mathcal{C}), \mathcal{O}) \rightarrow (\mathrm{Sh}(\mathcal{C}'), \mathcal{O}')$  be a morphism of ringed site and  $\mathcal{K}, \mathcal{L} \in D(\mathcal{O})$ , there is a natural morphism

$$Rf_* R\mathcal{H}om_{\mathcal{O}}(L, K) \rightarrow R\mathcal{H}om_{\mathcal{O}'}(Rf_* L, Rf_* K).$$

┘

*Proof:* This follows from the adjunction (7.3.3.28)(7.3.3.30) and the relative cup product (7.3.3.13).

□

**Def. (7.3.3.32) [Internal Ext Groups].** For any  $\mathcal{G}, \mathcal{F} \in K(\mathcal{O})$ , we define the **internal Ext groups**

$$\mathcal{E}xt_{\mathcal{O}}^n(\mathcal{G}, \mathcal{F}) = H^i(R\mathcal{H}om(\mathcal{G}, \mathcal{F})) \in \mathrm{Mod}(\mathcal{O}).$$

┘

**Prop. (7.3.3.33).** For  $\mathcal{E}, \mathcal{F}, \mathcal{L} \in \mathrm{Mod}(\mathcal{O}_X)$  and  $\mathcal{L}$  finite locally free,

$$\mathcal{E}xt^i(\mathcal{F} \otimes \mathcal{L}, \mathcal{G}) \cong \mathcal{E}xt^i(\mathcal{F}, \mathcal{L}^\vee \otimes \mathcal{G}) \cong \mathcal{E}xt^i(\mathcal{F}, \mathcal{G}) \otimes \mathcal{L}^\vee$$

because there are maps between them (7.2.5.2), and  $\mathcal{E}xt$  is local, so check locally. In particular,

$$\mathrm{Ext}^i(\mathcal{F} \otimes \mathcal{L}, \mathcal{G}) = \mathrm{Ext}^i(\mathcal{F}, \mathcal{L}^\vee \otimes \mathcal{G}).$$

┘

**Prop. (7.3.3.34) [Spectral Sequences for Internal Ext].** Let  $(\mathcal{C}, \mathcal{O})$  be a ringed site and  $\mathcal{K}^\bullet \in K^-(\mathcal{O}), \mathcal{F}^\bullet \in K^+(\mathcal{O})$ , then there are spectral sequence convergence

$$E_2^{i,j} = \mathcal{E}xt_{\mathcal{O}}^i(H^{-j}(\mathcal{K}^\bullet), \mathcal{F}^\bullet) \implies \mathcal{E}xt_{\mathcal{O}}^{i+j}(\mathcal{K}^\bullet, \mathcal{F}^\bullet).$$

$$E_1^{i,j} = \mathcal{E}xt_{\mathcal{O}}^j(\mathcal{K}^{-i}, \mathcal{F}^\bullet) \implies \mathcal{E}xt_{\mathcal{O}}^{i+j}(\mathcal{K}^\bullet, \mathcal{F}^\bullet)$$

$$E_2^{i,j} = H^i(\mathcal{C}, \mathcal{E}xt_{\mathcal{O}}^j(\mathcal{K}^\bullet, \mathcal{F}^\bullet)) \implies \mathrm{Ext}_{\mathcal{O}}^{i+j}(\mathcal{K}^\bullet, \mathcal{F}^\bullet)$$

┘

*Proof:* 1, 2: Choose a (bounded below) injective resolution  $\mathcal{I}^\bullet$  of  $\mathcal{F}^\bullet$ , and these are the two spectral sequences associated to the double complex  $\mathcal{H}om_{\mathcal{O}}(\mathcal{K}^\bullet, \mathcal{I}^\bullet)$ .

3: Use Grothendieck spectral sequence on (7.3.3.27). □

## 4 Acyclic Sheaves

**Prop. (7.3.4.1) [Pushforward of Injectives].** Let  $f : (\mathrm{Sh}(\mathcal{C}), \mathcal{O}_C) \rightarrow (\mathrm{Sh}(\mathcal{D}), \mathcal{O}_D)$  be a flat map of ringed topoi, then  $f$  preserves injectives, as  $f^*$  is exact. ┘

**Prop. (7.3.4.2) [Restriction of (K-)Injectives].** Let  $(\mathcal{C}, \mathcal{O})$  be a ringed site,  $U \in \mathcal{C}$ , then

- If  $\mathcal{K}^\bullet$  be a K-injective complex  $\mathcal{O}$ -modules, then  $(\mathcal{K}^\bullet)|_U$  is a K-injective complex of  $\mathcal{O}_U$ -modules.
- If  $\mathcal{I}$  is an injective  $\mathcal{O}$ -module, then  $\mathcal{I}|_U$  is an injective  $\mathcal{O}$ -module.

┘

*Proof:* Use (4.10.2.6) and the fact  $j_U^*$  is right adjoint to the exact functor  $j_{U!}$  (7.2.2.9)(7.2.2.9). □

**Prop. (7.3.4.3).** If  $\mathcal{I} \in \mathrm{Sh}(\mathcal{C})$  is injective, then  $\mathcal{I}$  is also injective in  $\mathcal{P}\mathrm{Sh}(\mathcal{C})$ . ┘

*Proof:* Because restriction is right adjoint to the exact shification functor. □

**Prop. (7.3.4.4).** For an injective sheaf  $\mathcal{F}$  on a site  $(\mathcal{C}, \mathcal{O})$ ,  $F(U)$  is injective Abelian group for every  $U \in \mathcal{C}$ . ┘

*Proof:* This is because for the morphism  $i : \mathrm{pt} \rightarrow \mathcal{C} : \mathrm{pt} \mapsto U$ ,  $i_p$  is exact ( $i_p A(V) = \oplus_{\mathrm{Hom}(V, U)} A$ ), hence  $i^p$  preserves injectives. □

### Flask Sheaves

**Def. (7.3.4.5) [Totally Acyclic Sheaves].** A **totally acyclic sheaf** on a ringed site  $(\mathcal{C}, \mathcal{O})$  is an object in  $\mathrm{Sh}(\mathcal{C})$  that is acyclic for any functor  $\mathrm{Hom}_{\mathcal{P}\mathrm{Sh}(\mathcal{C})}(K, -)$ .  $\lrcorner$

**Prop. (7.3.4.6) [Characterization of Totally Acyclic Sheaves].** Let  $\mathcal{C}$  be a site and  $\mathcal{F} \in \mathrm{Sh}(\mathcal{C})$ , then  $\mathcal{F}$  is totally acyclic iff

- $\mathcal{F}$  is acyclic for  $\Gamma(U, -)$  for any  $U \in \mathcal{C}$ .
- For every surjection  $K' \rightarrow K$  of sheaves of sets the extended Čech complex

$$0 \rightarrow H^0(K, \mathcal{F}) \rightarrow H^0(K', \mathcal{F}) \rightarrow H^0(K' \times_K K', \mathcal{F}) \rightarrow \dots$$

is exact.  $\lrcorner$

*Proof:* Cf. [Sta]07A1.  $\square$

**Prop. (7.3.4.7).** A totally acyclic sheaf is acyclic for any map of ringed topoi  $f : (\mathrm{Sh}(\mathcal{C}), \mathcal{O}_C) \rightarrow (\mathrm{Sh}(\mathcal{D}), \mathcal{O}_D)$ .  $\lrcorner$

*Proof:* This follows from the description of  $R^i f_*$  in (7.3.1.7).  $\square$

**Def. (7.3.4.8) [Flask Sheaves].** A **flask sheaf** on a ringed site  $(\mathcal{C}, \mathcal{O})$  is an object of  $\mathrm{Sh}(\mathcal{C})$  that satisfies the following equivalent conditions:

- it is acyclic for  $\iota$ .
- It is acyclic for any  $\check{H}^0(\{U_i \rightarrow U\}, -)$
- It is acyclic for all  $\Gamma(U, -)$ .

In particular a totally acyclic sheaf is flask.

A **flabby sheaf** is an object of  $\mathrm{Sh}(\mathcal{C})$  that for any monomorphism  $U \rightarrow V$ ,  $\mathcal{F}(V) \rightarrow \mathcal{F}(U)$  is surjective;  $\lrcorner$

*Proof:* 1  $\iff$  3 is by (7.3.1.6),

3  $\rightarrow$  2: use Čech to sheaf1 (7.3.2.13), notice the  $q > 0$  terms vanish, thus  $\check{H}^p(\{U_i \rightarrow U\}, \mathcal{F}) = H^p(U, \mathcal{F}) = 0$ .

2  $\rightarrow$  3 follows from (7.3.2.16).  $\square$

**Prop. (7.3.4.9).** Injective sheaves are flabby, Flabby sheaves on a ringed space are flask.  $\lrcorner$

*Proof:* For the first assertion, use (7.2.2.9) and the fact  $j_! \mathcal{O}_U \rightarrow j_! \mathcal{O}_V$  is a monomorphism for  $V \rightarrow U$  a monomorphism by definition (7.2.2.9).

For the last assertion, use (4.10.3.29): Injectives are flabby, so it is sufficiently large. For an exact sequence  $0 \rightarrow \mathcal{F} \rightarrow \mathcal{G} \rightarrow \mathcal{H} \rightarrow 0$  of sheaves, if  $\mathcal{F}$  is flabby, then  $\mathcal{H}$  is just the presheaf cokernel. (It reduces to  $\check{H}^1(\{U_i \rightarrow U\}, \mathcal{F}) = 0$ , and this is done by Zorn's lemma). Thus if  $\mathcal{F}$  is flabby,  $\mathcal{G}$  is flabby iff  $\mathcal{H}$  is flabby (by five lemma).  $\square$

**Prop. (7.3.4.10).** On a discrete site, all sheaves are flask, because  $\iota$  is the identity functor.  $\lrcorner$

**Prop. (7.3.4.11).** Filtered colimits of flabby sheaves are flabby. (This is because filtered colimits are exact).  $\lrcorner$

Filtered colimits of injective sheaves over a Noetherian topological space are injective. (Use Baer criterion, then notice every sub-object of  $\mathbb{Z}_U$  is finitely generated because it has only f.m. connected component (4.12.2.4) so it maps to some  $F_\alpha$ ).  $\lrcorner$

**Prop. (7.3.4.12) [Pushforward of Totally Acyclic/Flask Sheaves].** Let  $f : (\mathcal{Sh}(\mathcal{C}), \mathcal{O}_C) \rightarrow (\mathcal{Sh}(\mathcal{D}), \mathcal{O}_D)$  be a map of ringed topoi (resp. ringed site), then  $f_*$  maps totally acyclic (resp. flask) sheaves to totally acyclic (resp. flask) sheaves (7.3.4.5)(7.3.4.8). In particular, it maps injectives to totally acyclic sheaves.  $\lrcorner$

*Proof:* By (7.2.1.3) we may assume  $f$  is a map of ringed sites, and  $K = h_U$  for some  $U \in \mathcal{C}$ . Then we notice  $H^*(\{U_i \rightarrow U\}, f_*\mathcal{F}) = H^*(\{f^{-1}(U_i) \rightarrow f^{-1}(U)\}, \mathcal{F})$ , then we can use (7.3.2.16) to show  $f_*\mathcal{F}$  is totally acyclic.  $\square$

**Prop. (7.3.4.13) [Technical Lemma].** If  $\mathcal{K}^\bullet$  is  $K$ -flat  $\mathcal{O}$ -modules and  $\mathcal{I}^\bullet$  is  $K$ -injective  $\mathcal{O}$ -modules, then  $\mathcal{H}om^\bullet(\mathcal{K}^\bullet, \mathcal{I}^\bullet)$  is  $K$ -injective.  $\lrcorner$

*Proof:* Use definitions (7.3.3.1)(4.10.2.1) and (7.3.3.22).  $\square$

**Prop. (7.3.4.14).** If  $\mathcal{I}$  is an injective  $\mathcal{O}_X$ -module, then for a coherent locally free sheaf  $\mathcal{L}$ ,  $\mathcal{L} \otimes \mathcal{I}$  is also injective, because tensoring with  $\mathcal{L}$  is adjoint to tensoring with  $\mathcal{L}^\vee$  (7.2.5.2), which is exact.  $\lrcorner$

### Pseudo-Coherent Sheaves

**Def. (7.3.4.15) [Strictly Perfect Complexes of Modules].** Let  $(\mathcal{C}, \mathcal{O})$  be a ringed site, a **strictly perfect complex of  $\mathcal{O}$ -modules** of  $\mathcal{O}$ -modules is a finite complex of  $\mathcal{O}$ -modules that each term is a direct summand of a finite free  $\mathcal{O}$ -module.  $\lrcorner$

**Def. (7.3.4.16) [Pseudo-Coherent Complexes of Modules].** Let  $(\mathcal{C}, \mathcal{O})$  be a ringed site, then  $\mathcal{K} \in D(\mathcal{O}_X)$  is called an  **$m$ -pseudo-coherent  $\mathcal{O}_X$ -module** if for any  $U \in \mathcal{C}$ , there exists a covering  $\{U_i \rightarrow U\}$  s.t. for any  $i$ , there are strictly perfect object  $E_i \in D(\mathcal{O}_{U_i})$  and a morphism  $E_i \rightarrow \mathcal{K}|_{U_i}$  that induces isomorphisms on  $H^i$  for  $i > m$  and surjection on  $H^m$ .

$\mathcal{K} \in D(R)$  is called a **pseudo-coherent  $\mathcal{O}_X$ -module** if it is  $m$ -pseudo-coherent for any  $m$ .  $\lrcorner$

### Perfect Sheaves

**Def. (7.3.4.17) [Perfect Complexes of Modules].** Let  $(\mathcal{C}, \mathcal{O})$  be a ringed site, a **perfect complex of  $\mathcal{O}$ -modules** of  $\mathcal{O}$ -modules is an object  $E$  in  $\mathcal{D}(\mathcal{O})$  that for any  $U \in \mathcal{C}$  there is a covering  $\{U_i \rightarrow U\}$  that  $E|_{U_i}$  can be represented by a strictly perfect complexes (7.3.4.15).  $\lrcorner$

**Prop. (7.3.4.18).** Every mapping from a strictly perfect complex to an acyclic complex has a cover of open sets that on each open set the map is nullhomotopic.  $\lrcorner$

*Proof:* This is true for a single direct summand of a finite free sheaf, and we can use induction to prove, Cf. [Sta]08C7.  $\square$

**Cor. (7.3.4.19).** The strictly perfect complexes are fake " $K$ -projective" objects in  $K(\mathcal{O}_X)$ . Note it is not technically  $K$ -projective, but it has all the properties of  $K$ -projective when proven, noticing the fact it is irrelevant when taken shification.  $\lrcorner$

**Def. (7.3.4.20) [Perfect Sheaves].** Let  $(\mathcal{C}, \mathcal{O})$  be a ringed site, an object  $K^\bullet$  in  $K(\mathcal{O})$  **perfect** if there is a covering  $\mathcal{U}$  that on each  $U_i$  there is a quasi-iso  $K_i^\bullet \rightarrow K^\bullet|_{U_i}$  with  $K_i^\bullet$  strictly perfect.

This is equivalent to  $K^\bullet$  is locally represented by perfect objects in  $D(\mathcal{O})$  by the fact that perfect object is fake  $K$ -projective.  $\lrcorner$

**Prop. (7.3.4.21).** When  $X$  is local ringed space, perfectness is equivalent to the fact that it is locally a finite free  $\mathcal{O}_{U_i}$ -module.  $\lrcorner$

*Proof:* This is because direct summand of a finite free module is free, Cf.[Sta]0BCI.  $\square$

**Prop. (7.3.4.22) [Strictly Perfect Modules are “Acyclic” for  $\text{Hom}^\bullet$ ].** If  $(\mathcal{C}, \mathcal{O})$  is a ringed site and  $\mathcal{E}^\bullet, \mathcal{F}^\bullet \in K(\mathcal{O})$ , then  $R\mathcal{H}om(\mathcal{E}^\bullet, \mathcal{F}^\bullet)$  can be calculated directly by  $\mathcal{H}om^\bullet(\mathcal{E}, \mathcal{F})$  in the following cases:

- $\mathcal{E}^\bullet$  is strictly perfect.
- $\mathcal{E}^\bullet \in D^-(\mathcal{O}_X), \mathcal{F}^\bullet \in D^+(\mathcal{O}_X)$ , and each term  $\mathcal{E}^n$  is a direct summand of a finite free  $\mathcal{O}_X$ -module.

┘

*Proof:* Cf.[Sta]08I5, 08DM.  $\square$

**Prop. (7.3.4.23) [Duals].** Let  $K$  be a perfect object in  $D(\mathcal{O})$ , then

- $K^\vee = R\mathcal{H}om(K, \mathcal{O})$  is also a perfect object, and  $(K^\vee)^\vee \cong K$ .
- For any  $M \in D(\mathcal{O})$ , there are functorial isomorphisms

$$M \otimes^{\mathbb{L}} K^\vee \cong R\mathcal{H}om(K, M), \quad H^0(\mathcal{C}, M \otimes^{\mathbb{L}} K^\vee) \cong \text{Hom}_{D(\mathcal{O})}(K, M).$$

┘

*Proof:* Cf.[Sta]08JJ.  $\square$

**Def. (7.3.4.24) [Relative Perfect Modules].** Let  $(X, \mathcal{O}_X) \rightarrow (S, \mathcal{O}_S)$  be a morphism of ringed sites that is flat and locally of f.p., then  $E \in D(\mathcal{O}_X)$  is called a **perfect object relative to  $S$**  if  $E$  is pseudo-coherent and  $E$  locally has finite tor dimension as an object in  $D(f^{-1}\mathcal{O}_S)$ . Cf.[Sta]08CG.  $\perp$

## 5 Topological Sheaves

References are [Sheaf Cohomology, Anonymous].

A topological space can be seen as a ringed site, so the theory of ringed sites applies to topological spaces.

### Acyclic sheaves

**Def. (7.3.5.1).** An Abelian sheaf on a paracompact Hausdorff topological space  $X$  is called

**soft** iff is and  $\forall$  closed  $V, \mathcal{F}(X) \rightarrow \mathcal{F}(V)$  is surjective. A flabby sheaf is soft.

**fine** iff the sheaf of rings  $\text{Hom}(\mathcal{F}, \mathcal{F})$  is soft.

Fine and soft are local properties (Use Zorn’s lemma to construct one-by-one).

┘

**Prop. (7.3.5.2).** For a sheaf of **unital rings** over a paracompact Hausdorff space  $X$ , the following are equivalent,

1. it is a soft sheaf.
2. for any disjoint closed sets  $V, W$ , there is a section of  $X$  that is 0 on  $V$ , and 1 on  $W$ .
3. it possesses a partition of unity.
4. it is a fine sheaf.

Note any soft sheaf possesses a partition of unity.  $\perp$

*Proof:*  $1 \iff 2$  is easy and  $1 \rightarrow 3$  is the to choose a closed locally finite subcover and use Zorn's lemma to construct one-by-one. For  $3 \rightarrow 1$ , notice a closed section can extend to a slightly larger nbhd.

Because for a sheaf of rings  $\mathcal{F}$ , a partition of unity is equivalent to a partition of unity  $\text{Hom}(\mathcal{F}, \mathcal{F})$ , so 34 are equivalent because 13 are equivalent.  $\square$

**Cor. (7.3.5.3).**

- Note that a fine sheaf possesses a decomposition of section because the previous proposition applies to  $\text{Hom}(\mathcal{F}, \mathcal{F})$ , and a partition of unity in  $\text{Hom}(\mathcal{F}, \mathcal{F})$  yields a decomposition of section in  $\mathcal{F}$ . Thus a fine sheaf is soft. (extend to a small nbhd and use partition of unity).
- The sheaf of modules over a soft sheaf of rings is soft, by partition of unity.
- The continuous function sheaf on a paracompact Hausdorff space or the smooth function sheaf on a smooth manifold is fine, thus any smooth module is fine (Use bump function).  $\lrcorner$

**Prop. (7.3.5.4).** Soft sheaf, e.g. fine sheaf is adapted to  $\Gamma(X, -)$ . (Similar as in (7.3.4.9), notice flabby is soft and the others are the same as before).  $\lrcorner$

**Prop. (7.3.5.5).** Let  $X$  be a locally compact space of finite compact dimension, when  $S$  is a soft sheaf, and one of  $S$  and  $\mathcal{F}$  is flat, then  $S \otimes_k \mathcal{F}$  is soft. Cf.[Cohomology of Sheaves Iversen P319].  $\lrcorner$

**Prop. (7.3.5.6).** Over a locally compact space of finite dimension, any flat sheaf  $\mathcal{F}$  on  $X$  has a resolution of soft flat sheaves.  $\lrcorner$

*Proof:* Cf.[Gelfand P232].  $\square$

**Lemma (7.3.5.7).** A constant sheaf on an irreducible topological space is flabby, thus flask.  $\lrcorner$

### Basics

**Prop. (7.3.5.8).** If  $i : Z \rightarrow X \in \mathcal{T}\text{op}$  is a closed immersion, then for any  $\mathcal{F} \in \text{Sh}(Z)$ ,  $H^*(Z, \mathcal{F}) = H^*(Z, i_* \mathcal{F})$ .  $\lrcorner$

*Proof:* This is because  $i_*$  is exact (7.2.6.7), so we can apply the Leray spectral sequence (7.3.1.9).  $\square$

### Comparison Theorems

**Prop. (7.3.5.9) [Singular].** For any locally contractible topological space  $X$  and  $G \in \mathcal{A}\text{b}$ , there are canonical isomorphisms

$$H_{\text{sing}}^*(X, G) \cong H^*(X, \underline{G}).$$

$\lrcorner$

*Proof:* Shiffication of the singular cochain complex is a flabby presheaf resolution of  $\underline{G}$  because it is locally contractible, check on stalks. Then we only have to prove  $C^\bullet(X) \rightarrow (C/V)^\bullet(X)$  is quasi-isomorphism, where  $V$  is the presheaf of locally vanishing cochain. It suffice to prove  $V^\bullet(X)$  is exact.

For any  $i$ -cocycle  $\varphi$ , for any  $i-1$ -complex  $\sigma$ , use barycentric subdivision, we can construct a  $c_\sigma$  whose boundary is  $\sigma$  and other simplexes on which  $\phi$  vanishes, so we have the coboundary of  $\eta : \sigma \rightarrow \varphi(c_\sigma)$  is  $\varphi$ .  $\square$

**Lemma (7.3.5.10) [Poincaré].** For a smooth manifold  $X$  of dimension  $n$ , there is an exact sequence

$$0 \rightarrow \underline{\mathbb{R}}_X \xrightarrow{d} \Omega - X^0 \xrightarrow{d} \Omega - X^1 \xrightarrow{d} \dots \xrightarrow{d} \Omega_X^n \rightarrow 0$$

┘

*Proof:*

□

**Prop. (7.3.5.11) [DeRham].** For any smooth manifold  $X$ ,

$$H_{\text{dR}}^*(X, \underline{\mathbb{R}}_X) \cong H^*(X, \underline{\mathbb{R}})$$

Where the right is constant sheaf cohomology.

┘

*Proof:* Use the fact that smooth sheaf is fine so adapted to sheaf cohomology (7.3.5.4), and Poincaré lemma (7.3.5.10). □

**Prop. (7.3.5.12) [Period Maps].** For a smooth manifold  $X$ , by a similar method as (7.3.5.9), we can define a **differentiable singular cohomology**  $H_{\text{sing},\infty}^*(X)$ , and prove a canonical isomorphism

$$H_{\text{sing},\infty}^*(X, \mathbb{R}) \cong H^*(X, \overline{\mathbb{R}}).$$

Then combining with (7.3.5.11), we get a canonical isomorphism

$$H_{\text{dR}}^*(X, \underline{\mathbb{R}}_X) \cong H_{\text{sing},\infty}^*(X, \mathbb{R})$$

which can be described as follows: there is a map of sheaves

$$\Omega^k \rightarrow C_{\text{sing},\infty}^\bullet(X)$$

that is locally defined to be  $\omega \mapsto \sigma \mapsto \int_\sigma \omega$ , then this map gives a map of complexes

$$\Omega^\bullet \rightarrow C_{\text{sing},\infty}^\bullet(X)$$

that induces the isomorphism.

┘

*Proof:* ? Cf.[Warner, P206].

□

**Prop. (7.3.5.13) [Čech and Sheaf Cohomology].** For a paracompact Hausdorff space  $X$ , there are isomorphisms

$$\check{H}^i(X, \mathbb{Z}) \cong H^i(X, \mathbb{Z}).$$

┘

*Proof:* Cf.[Godement, Prop5.10.1]. ?

□

### Cohomology with Proper Support

References are [Cohomology of Sheaves Iversen].

**Prop. (7.3.5.14).** Soft sheaf is adapted to  $f_!$  when  $X, Y$  are locally compact. Cf.[Gelfand P226]. So we can use soft resolution to define  $R^i f_!$ , in particular, when  $Y = \text{pt}$ , we denote it by  $H_c^i(X, \mathcal{F})$ . Using (7.2.6.2), we get the stalk of  $R^i f_!(\mathcal{F})$  at  $y$  is just  $H_c^i(f^{-1}(y), \mathcal{F}|_{f^{-1}(y)})$ .  $\lrcorner$

**Def. (7.3.5.15).** The **compact dimension** of a locally compact topological space is the smallest  $n$  that  $H_c^i(X, \mathcal{F}) = 0$  for  $i > n$ . It is also the maximal length of minimal soft resolution.

$\dim_c \mathbb{R}^n = n$ , and when  $Y$  is an open or closed subset of  $X$ ,  $\dim_c Y \leq \dim_c X$ .  $\dim_c$  is local in the sense if every point has a nbhd of dimension  $\leq n$ , then  $\dim_c X \leq n$ . Cf.[Iversen].  $\lrcorner$

**Prop. (7.3.5.16)[Proper Pushforward Commutes with Pullback].** For a pullback diagram

$$\begin{array}{ccc} X \times_Y Z & \xrightarrow{\tau'} & X \\ \downarrow \pi' & & \downarrow \pi \\ Z & \xrightarrow{\tau} & Y \end{array}$$

we have  $\tau^{-1}(\pi_! \mathcal{F}) = \pi'_!(\tau')^{-1} \mathcal{F}$ .  $\lrcorner$

*Proof:*  $\square$

### Cohomology on Noetherian Spaces

There are three basic objects, the derived functor for  $f_*$  as an Abelian sheaf,  $f_*$  as a  $\mathcal{O}_X$ -module,  $\Gamma(U, -)$  as an Abelian sheaf. Notice that an Abelian group is just a  $\mathbb{Z}$ -module.

**Prop. (7.3.5.17)[Grothendieck Vanishing].** The sheaf cohomology of an Abelian sheaf over a Noetherian topological space of dimension  $n$  vanish for  $k > n$ .  $\lrcorner$

*Proof:* Use (7.2.6.10) and (7.3.5.8) and long exact sequence, we can reduce to the case of  $X$  irreducible. Then we induct on dimension. Notice first any sheaf is a filtered colimits of sheaf generated by f.m sections, thus we can use (7.3.1.14) to reduce to f.m sections case. And notice  $\mathcal{F}_{\alpha'} \rightarrow \mathcal{F}_{\alpha} \rightarrow \mathcal{G}$ , then  $G$  is generated by at most  $|\alpha| - |\alpha'|$  elements, so reduce to the one section case.

Now it is a quotient sheaf of  $\mathbb{Z}$ , look at the kernel  $R$ . If the kernel is  $d\mathbb{Z}$  at the generic pt, then  $R|_V \cong \mathbb{Z}$  on some nbhd, and  $R|_V/\mathbb{Z}$  supports on a lower dimension set, then we only need to consider the pushout of constant sheaf  $\mathbb{Z}_U$ .

Now there is an exact sequence  $0 \rightarrow \mathbb{Z}_U \rightarrow \mathbb{Z} \rightarrow \mathbb{Z}_Y \rightarrow 0$  (7.2.6.10),  $\mathbb{Z}$  is flabby (7.3.5.7) so flask, and the conclusion follows by induction.

Cf.[Sta]02UU. ?  $\square$

**Prop. (7.3.5.18).** For  $f : X \rightarrow Y$ , if  $\mathcal{I}$  is an injective module on  $X$ , then  $\check{H}^p(\{U_i \rightarrow U\}, f_* \mathcal{I}) = 0$  for every open cover for an open subset  $U$  (7.3.4.8). This is because Čech cohomology is a derived functor. (Notice  $f_* \mathcal{I}$  may not be injective when  $f$  is not flat).  $\lrcorner$

**Cor. (7.3.5.19)[Mayer-Vietoris].** For  $X = U \cup V$ , there is a long exact sequence

$$0 \rightarrow H^0(X, \mathcal{F}) \rightarrow H^0(U, \mathcal{F}) \oplus H^0(V, \mathcal{F}) \rightarrow H^0(U \cap V, \mathcal{F}) \rightarrow H^1(X, \mathcal{F}) \rightarrow \dots$$

derived from the Čech to sheaf because it has only two column, just wrap out the definition.  $\lrcorner$

## 7.4 Properties of Schemes

*“Algebra is the offer made by the devil to the mathematician...All you need to do, is give me your soul: give up geometry.”*

–M. Atiyah

References are [Har77, Tin20, Sta].

**Notation (7.4.0.1).**

- Let  $X, S \in \text{Sch}$ .

┘

### 1 Basic Scheme Properties

#### Affine Local Properties of Schemes

**Lemma (7.4.1.1) [Nike’s Trick].** For  $X \in \text{Sch}$  and two affine open subschemes  $U, V \subset X$ . If  $x \in U \cap V$ , then  $x$  has an open nbhd in  $U \cap V$  that are distinguished in both  $U$  and  $V$ . ┘

*Proof:* Choose a nbhd of  $x$  that is distinguished in  $\text{Spec } A$  that is contained in  $\text{Spec } A \cap \text{Spec } B$ , then because distinguished of distinguished is distinguished, we may assume  $i : \text{Spec } A \subset \text{Spec } B$ . Now let  $f \in B$  be an element that  $D(f) \subset \text{Spec } A$ , then I claim  $D(i^\#(f)) = D(f)$ , this will finish the proof, but this is equivalent to  $i^{-1}(\text{Spec } B_f) = \text{Spec } A_{i^\#(f)}$ , which is true for ideal-theoretical reason. ┐

**Prop. (7.4.1.2) [Affine Communication Theorem].** A property  $P$  of affine open subsets is called **affine local** if:  $\text{Spec}(A)$  has  $P \Rightarrow$  all  $\text{Spec}(A_f)$  has  $P$ , and any cover of  $\text{Spec}(A_{f_i})$  has  $P \Rightarrow \text{Spec}(A)$  has  $P$ . Notice a stalk-wise property is obviously affine-local.

Now if we call  $X$  has  $\tilde{P}$  if  $X = \bigcup_i \text{Spec } A_i$  that  $A_i$  has  $P$ . Then the following is equivalent:

- any open affine subscheme of  $X$  has  $P$ .
- any open subscheme of  $X$  has  $\tilde{P}$ .
- $X$  has a cover of open subschemes that has  $\tilde{P}$ .
- $X$  has  $\tilde{P}$ .

┘

*Proof:*  $1 \rightarrow 2 \rightarrow 3 \rightarrow 4$  is obvious. It suffices to prove  $4 \rightarrow 1$ : if  $X = \bigcup \text{Spec } A_i$ , for any open affine subscheme of  $X$ , by (7.4.1.1), it can be covered by distinguished opens that are also distinguished in some  $\text{Spec } A_i$ , so by hypothesis it has  $P$ . ┐

**Remark (7.4.1.3).** When proving locality of morphism properties using affine communication theorem, one usually resort to [Local Properties](#). ┘

**Prop. (7.4.1.4) [List of Stalkwise Properties].** All properties defined by a stalkwise ring-theoretic property that is stalkwise. (5.1.4.2) ┘

**Prop. (7.4.1.5) [List of properties affine local on the target].** (All the property besides the  $H$ -projectiveness is local on the target).

1. Because affineness is local on the target (7.1.5.26), all properties defined by a ring-theoretic property local on the target is local on the target (5.1.4.4).

2. All properties that is stalkwise.
3. All properties that satisfies faithfully flat descent.(7.1.5.26)
4. Locally projective morphism.

┘

**Prop. (7.4.1.6)** [List of properties affine local on the source]. (not complete)

1. All properties defined to be local ring map property local on the source.(5.1.4.4)
2. Openness.

┘

*Proof:*

1. Trivial.
2. Trivial.

□

### Irreducible

**Def. (7.4.1.7)** [Irreducible Schemes]. A scheme is called **irreducible** iff its underlying topological space is irreducible.

┘

**Prop. (7.4.1.8)** [Nearly Affine Local]. For a scheme, the following are equivalent:

1. It is irreducible.
2. There is an affine cover  $U_i$  of  $X$  that  $U_i$  are all irreducible and  $U_i \cap U_j \neq \emptyset$ .
3. Every affine open subset of  $X$  is irreducible.

┘

*Proof:* As scheme is sober(7.2.7.11), if  $X$  is irreducible, then  $X$  has a unique generic pt  $\eta$  that  $\overline{\{\eta\}} = X$ , then 2, 3 all holds. If 2 holds, then for a decomposition  $X = Z_1 \cup Z_2$ , any  $U_i$  belongs to  $Z_1$  or  $Z_2$ , so it is easy to see  $Z_1 = X$  or  $Z_2 = X$ . If 3 holds, then choose an affine cover  $U_i$  of  $X$ , then  $U_i \cap U_j \neq \emptyset$ , otherwise  $U_i \amalg U_j$  is affine and not irreducible, contradiction, so 2 holds. □

**Cor. (7.4.1.9).** The fiber product of irreducible schemes is irreducible, because .

┘

### Reducedness

**Def. (7.4.1.10)** [Reduced Schemes].  $X$  is called **reduced scheme** if  $\mathcal{O}_X(U)$  is reduced for every open set  $U$ . Reduced is a stalk-wise property(7.4.1.5), it suffices to check reducedness at closed pts.

The full subcategory of reduced schemes is denoted by  $\text{Sch}_{\text{red}}$ .

┘

**Prop. (7.4.1.11).** For  $X \in \text{Sch}_{\text{red}}$ , the map  $\Gamma(X, \mathcal{O}_X) \rightarrow \prod_{x \in X} k(x)$  is injective.

┘

**Prop. (7.4.1.12).** For  $X \in \text{NSch}$ (7.4.1.20), the set of points with reduced stalk is open in  $X$ .

┘

*Proof:* This set is just the set of points  $x$  that  $\mathcal{N}_x = 0$ , where  $\mathcal{N}$  is the sheaf of nilradicals, which is coherent, so it has closed supports(7.5.1.38). □

**Prop. (7.4.1.13)[Reduction].** For any  $X \in \text{Sch}$ , define  $X_{\text{red}} = \text{Spec}(\mathcal{O}_X/\mathcal{N}) \in \text{Sch}/X$  where  $\mathcal{N}$  is the sheaf of nilpotent elements. This construction is right adjoint to the forgetful functor by the adjoint property of **Spec**(7.2.7.12).  $X_{\text{red}} \rightarrow X$  is a closed immersion.

It's useful to change to  $X_{\text{red}}$  when the proposition only involve topology because  $X_{\text{red}}$  has the same topology as  $X$ . A map can induce a map on their reduced structure.  $\lrcorner$

**Prop. (7.4.1.14)[Induced Reduced Scheme Structure].** If  $X \in \text{Sch}$  and  $Z \subset |X|$  is a locally closed subset, then there is a unique reduced subscheme  $Z_{\text{red}}$  of  $X$  with underlying topological space  $Z$ , called the **induced reduced scheme structure** of  $Z$ . It has the universal property that any morphism from a reduced scheme  $Y$  to  $X$  that has image in  $Z$  factors through this subscheme (By virtue of reducedness).

In particular, there is a closed subscheme structure  $X_{\text{red}}$  of  $X$ , called the **underlying reduced subscheme** of  $X$ .  $\lrcorner$

*Proof:* The uniqueness is clear by the universal property. The existence is clear when  $X$  is affine and  $Z$  is closed in  $X$ . Then we can use the uniqueness to glue them to a global subscheme structure.  $\square$

### Integral

**Def. (7.4.1.15)[Integral Schemes].** A scheme  $X$  is called **integral** if  $\mathcal{O}_X(U)$  are all integral. This is equivalent to reduced and irreducible. So a scheme is integral iff there is an integral open affine cover that are pairwise-intersect(7.4.1.7).

The category of integral schemes is denoted by  $\text{Sch}^{\text{int}}$ .  $\lrcorner$

*Proof:* If  $X$  is irreducible and reduced, then so does any affine subscheme  $\text{Spec } R$ , so  $R$  is integral as  $(0)$  is the generic prime, because it has only one minimal prime consisting of nilpotent elements. Conversely, if  $X$  is reduced, then any affine subscheme  $\text{Spec } R$  is integral so reduced, and is irreducible by the presence of prime  $(0)$ .  $\square$

**Cor. (7.4.1.16).** The projective space over an integral scheme is integral. (Check the affine covers are dense). The projective space  $P_{\mathbb{Z}}^n$  is integral.  $\lrcorner$

**Prop. (7.4.1.17)[Integral is Almost Stalkwise].** Let  $X$  be a non-empty and connected scheme, then  $X$  is integral iff all the  $\lrcorner$

**Def. (7.4.1.18)[Function Field].** Let  $X$  be an integral scheme with generic point  $\eta$ , then  $R(X) \cong \mathcal{O}_{X,\eta}$  is a field(7.2.8.2), called the **function field of  $X$** , denoted by  $K(X)$ . Then any rational function on  $X$  is defined on an open dense subset of  $X$ .  $\lrcorner$

**Prop. (7.4.1.19).** If  $X$  is an integral scheme and  $Z_1, Z_2$  are closed subschemes of  $X$  with generic points  $\eta_1, \eta_2$ , then  $\mathcal{O}_{X,\eta_1} \not\subseteq \mathcal{O}_{X,\eta_2}$ . In particular, if  $Z = \{x\}$  consists of a closed point, then there is a rational function defined near  $x$  that is not in  $\mathcal{O}_{X,\eta_2}$ .  $\lrcorner$

*Proof:* [Sta]02NF.  $\square$

### Noetherian

**Def. (7.4.1.20)[Noetherian Scheme].** A scheme is called **locally Noetherian** if it can be covered by open affine spectra of noetherian rings. It is called **Noetherian** if moreover it is quasi-compact.

(Locally)Noetherian is affine local(7.4.1.5).

Denote the full subcategory of locally Noetherian schemes by  $\text{NSch}$ .  $\lrcorner$

**Prop. (7.4.1.21) [Noetherian Scheme is Noetherian].** The underlying space of a Noetherian scheme is a Noetherian space.  $\lrcorner$

*Proof:* By (4.12.2.3), we are reduced to the affine case. Now it is clear from the definition.  $\square$

**Prop. (7.4.1.22).** Any locally closed subscheme of a (locally) Noetherian scheme is (locally) Noetherian. In particular, an subset of a Noetherian scheme is quasi-compact.  $\lrcorner$

*Proof:* This is because any localization and quotients of a Noetherian ring is Noetherian (5.1.1.43), and any subset of a Noetherian space is quasi-compact (4.12.2.2)(7.4.1.21).  $\square$

**Prop. (7.4.1.23) [Finitely Many Irreducible Components].** For a closed subscheme in a locally Noetherian space, the collection of its irreducible components is locally finite in  $X$ , because a Noetherian space has f.m. irreducible components (4.12.2.4).

In particular, a locally Noetherian space is locally connected.  $\lrcorner$

**Prop. (7.4.1.24).** Let  $k'/k$  be a f.g. field extension, then a scheme  $X$  over  $k$  is locally Noetherian iff  $X_{k'}$  is locally Noetherian.  $\lrcorner$

*Proof:* Locally Noetherian is affine local, so the problem is totally ring-theoretic. If  $X_{k'}$  is Noetherian, then so does  $X$  by ff descent (5.4.2.1). If  $X$  is Noetherian, then so does  $X_{k'}$  by (5.1.1.47).  $\square$

### Jacobson

**Def. (7.4.1.25).** An scheme is called **Jacobson** iff its underlying topological space is Jacobson (4.12.2.22). In particular, an affine scheme  $\text{Spec } R$  is Jacobson iff  $R$  is Jacobson (5.2.6.5).

So by (4.12.2.23), being Jacobson is a local property.  $\lrcorner$

**Prop. (7.4.1.26) [Locally Algebraic Scheme is Jacobson].** For a scheme locally algebraic over a field  $k$ , the set of closed points  $X_0$  is dense in every closed subset of  $X$ , Because it is a Jacobson space by (4.12.2.23) and (5.2.6.10). Equivalently, every locally closed subset of  $X$  contains a closed point.

Moreover, the residue field of a closed point is finite over  $k$  by (5.2.6.10), and the converse is also true. In particular, by (7.2.7.9), the closed points of  $X$  are just the geometric points.  $\lrcorner$

*Proof:* For the converse, because  $k \subset A/\mathfrak{p}_x \subset k(x)$  are finite hence integral extensions, by (5.2.1.3)  $A/\mathfrak{p}_x$  is a field, thus  $x$  is a closed point.  $\square$

**Cor. (7.4.1.27) [Algebraic Scheme Preserves Closed Points].** A morphism between algebraic schemes over a field  $k$  maps closed points to closed points.  $\lrcorner$

**Remark (7.4.1.28).** When  $X$  is geo.reduced, a stronger statement shows the set of separable closed points of  $X$  is dense in  $X$ , Cf. (7.4.3.3).  $\lrcorner$

**Cor. (7.4.1.29) [Check Surjectiveness on Closed Points].** If a morphism of locally algebraic schemes over a field  $k$  is surjective on closed points, then it is surjective.  $\lrcorner$

*Proof:* By Chevalley theorem (7.6.1.5), the image is a locally constructible set, thus the supplement set is also locally constructible. Now if it is not surjective, then there is an open closed subset  $U \cap Z$  not in the image. But this set contains a closed point by (7.4.1.26), which is a contradiction.  $\square$

### Cohen-Macaulay

**Def. (7.4.1.30) [Cohen-Macaulay Schemes].** A **Cohen-Macaulay scheme** of a C.M. scheme is a scheme  $X \in \text{Sch}$  s.t. all its stalks is C.M. local. Thus being C.M. is a stalkwise property.  $\lrcorner$

### Dimensions and Catenary Schemes

**Def. (7.4.1.31) [Dimensions of Schemes].** For  $x \in X$ , define

$$\dim(X) \triangleq \dim(|X|), \quad \dim_x(X) \triangleq \dim_x(|X|) \quad (4.12.2.26)$$

$\lrcorner$

**Prop. (7.4.1.32).** We have  $\dim(X) = \sup_{x \in X} \dim(\mathcal{O}_{X,x}) = \sup_{x \in X} \dim_x(X)$  (7.4.1.31).  $\lrcorner$

*Proof:* Cf. [Sta]04MU.  $\square$

**Prop. (7.4.1.33).** If  $Y \subset X$  is an irreducible closed subset with generic point  $\xi$ , then  $\text{codim}(Y, X) = \dim(\mathcal{O}_{X,\xi})$  (4.12.2.30).  $\lrcorner$

*Proof:* By (4.12.2.31), we may assume that  $X$  is affine, then the assertion follows from [Sta]00ET?  $\square$

**Prop. (7.4.1.34) [Separated Schemes of Dimension 0, Gabber2016].** If  $\dim(X) = 0$ , then the following are equivalent:

- $X$  is quasi-separated.
- $X$  is separated.
- $X$  is Hausdorff.
- Every affine open subsets of  $X$  is closed.

And in this case, each connected components of  $X$  is a point.  $\lrcorner$

*Proof:* Cf. [Sta]0CKV.  $\square$

**Prop. (7.4.1.35) [Noetherian Schemes of Dimension 0].** If  $X \in \text{NSch}$  and  $\dim(X) = 0$ , then  $X$  is a disjoint union of spectra of Artinian local rings.  $\lrcorner$

*Proof:* Cf. [Sta]0AAX. ?  $\square$

**Def. (7.4.1.36) [Catenary Schemes].** A **catenary scheme** is a scheme that its underlying space is catenary (4.12.2.32). A **universally catenary scheme** is a scheme  $S \in \text{NSch}$  s.t. any  $X \in \text{Sch}^{\text{loc.ft}}/S$  is catenary.

(Universally)catenary is a stalkwise property, by (5.1.4.2).  $\lrcorner$

**Prop. (7.4.1.37) [Catenary and Dimension Functions].** Let  $X \in \text{Sch}$  be locally Noetherian, then  $X$  is catenary iff locally around every point there is a dimension function, by (4.12.2.41).  $\lrcorner$

**Example (7.4.1.38) [Universally Catenary Schemes].** The following are some examples of universally catenary schemes, by (5.2.4.7).

- A scheme locally of f.t. over a universally catenary scheme.
- A C.M. scheme.
- Spectrum of a 1-dimensional Noetherian domains,
- Spectrum of a fields.

$\lrcorner$

### Japanese & Nagata Schemes

**Def. (7.4.1.39) [Japanese & Nagata Schemes].** A (universally) **Japanese scheme** is a scheme that can be covered by open affine spectrum of (universally) Japanese rings (5.3.8.1). A **Nagata scheme** is a scheme that can be covered by open affine spectrum of Nagata rings (5.3.8.1).  $\lrcorner$

**Prop. (7.4.1.40).** Being (universally) Japanese or Nagata is a local property, and are stable under taking open subschemes, by (5.3.8.1).  $\lrcorner$

**Prop. (7.4.1.41).** Let  $X$  be a locally Noetherian scheme, then  $X$  is Nagata iff every integral closed subscheme  $Z$  of  $X$  is Japanese.  $\lrcorner$

*Proof:* One direction is clear. If every integral closed subscheme  $Z$  of  $X$  is Japanese, let  $U = \text{Spec } A \subset X$  be an affine open subscheme and  $Z = V(\mathfrak{p}) \subset U$ , we need to show  $A/\mathfrak{p}$  is Japanese. Consider  $\bar{Z}$  with the reduced induced structure is an integral closed subscheme of  $X$  and  $Z$  is an open subscheme of  $\bar{Z}$ , thus  $\bar{Z}$  is Japanese and so is  $Z$  by (7.4.1.39).  $\square$

## 2 Normal & Regular

**Def. (7.4.2.1) [Normal & Regular Schemes].** A scheme is called **normal** if all its stalks are normal domains (5.3.5.1), or equivalently all its affine sections are normal rings by (5.3.5.1). In particular, a normal scheme is reduced.

A locally Noetherian scheme is called **regular** iff all its stalks are regular local rings (5.3.5.18), i.e. all affine opens are regular rings. Regular only have to be checked at close pt by (5.3.5.18).  $\lrcorner$

**Def. (7.4.2.2) [Non-normal Loci].** For  $X \in \text{Sch}$ , the set of points  $x \in X$  s.t.  $\mathcal{O}_{X,x}$  is a closed subset by (5.3.5.1). Its induced reduced structure is called the **non-normal locus** of  $X$ .  $\lrcorner$

**Def. (7.4.2.3) [Singular Loci].** For  $X \in \text{NSch}$ , the set of points  $x \in X$  s.t.  $\mathcal{O}_{X,x}$  is a regular local ring is called the **regular locus** of  $X$ , and the complement of the regular locus is called the **singular locus** of  $X$ .  $\lrcorner$

**Prop. (7.4.2.4) [Noetherian and Integral].** For  $X \in \text{NSch}$ ,  $X$  is normal iff it is a disjoint union of integral normal schemes.  $\lrcorner$

*Proof:* It suffices to show that a connected locally Noetherian scheme is integral. Thus it suffices to show it is irreducible. Suppose there are several irreducible components, and let  $p$  be a intersection point, then we may assume  $X$  is affine, then this follows from (5.3.5.4).  $\square$

**Cor. (7.4.2.5).** A normal scheme is integral iff it is connected.  $\lrcorner$

**Prop. (7.4.2.6).** If  $X$  is an integral normal scheme, then  $\Gamma(X, \mathcal{O}_X)$  is a normal ring.  $\lrcorner$

*Proof:* If  $X$  is integral, then  $R = \Gamma(X, \mathcal{O}_X)$  is integral. If  $f = a/b \in K(R)$  that is integral over  $R$ , then for any affine open  $U \subset X$ ,  $b|_U$  is non-zero as  $X$  is integral, thus  $f|_U$  is integral over  $\mathcal{O}_X(U)$  thus  $f|_U \in \mathcal{O}_X(U)$ , thus  $f \in R$ .  $\square$

**Prop. (7.4.2.7) [Normalization].** For an integral scheme  $X$ , there is a  $X_{\text{nom}} \rightarrow X$  which is  $\text{Spec}(\mathcal{O}_{X, \text{nom}})$ , any dominant morphism  $f$  from a normal integral scheme to  $X$  will factor through  $X_{\text{nom}}$ . (Use the adjointness for  $\text{Spec}$  and notice  $f$  maps generic to generic).  $\lrcorner$

*Proof:*

$\square$

**Prop. (7.4.2.8) [Normalizations are Birational].** The normalization of an integral scheme  $X$  is a finite birational map.  $\lrcorner$

*Proof:* ?  $\square$

**Prop. (7.4.2.9) [Normalization is not flat].** Non-trivial normalization is never flat.  $\lrcorner$

*Proof:* Use (7.6.2.6). ?  $\square$

**Prop. (7.4.2.10) [Regular and Normal].** Regular scheme is C.M and locally factorial, hence normal, by (5.3.5.22) and (5.3.5.20). A Normal scheme is regular in codimension 1, by (5.3.5.33).  $\lrcorner$

**Cor. (7.4.2.11).** A regular connected scheme  $X$  is irreducible, by (7.4.2.5).  $\lrcorner$

**Prop. (7.4.2.12).** For a locally Noetherian scheme of dimension  $\leq 1$ , normal is equivalent to regular, by (12.2.3.5).  $\lrcorner$

### Factorial Schemes

**Def. (7.4.2.13) [Factorial Schemes].** A **factorial scheme** is a scheme that all the local rings are UFD.  $\lrcorner$

**Prop. (7.4.2.14).** If  $A$  is a UFD, then  $\text{Spec } A$  is factorial.  $\lrcorner$

### Dedekind Scheme

**Def. (7.4.2.15) [Dedekind Scheme].** A **Dedekind scheme** is an integral Noetherian normal scheme of dimension 1.  $\lrcorner$

## 3 Geometrical properties

**Def. (7.4.3.1) [Geometric Properties over Fields].**

- A scheme  $X$  is called **geometrically integral/reduced/separated/irreducible**... over a field  $k$  iff for any field extension  $k'/k$ ,  $X_{k'}$  is integral/reduced/separated/...
- A locally Noetherian scheme is called **geometrically regular** iff for any f.g. field extension  $K/k$ ,  $X_K$  is regular. It is stalkwise by (7.4.3.18).  $\lrcorner$

### Geo.reducedness

**Prop. (7.4.3.2) [Geo.Reduced].** For a scheme  $X$  over a field  $k$ , the following are equivalent:

1.  $X$  is geometrically reduced.
2. For every reduced  $k$ -scheme  $Y$ , the product  $X \otimes_k Y$  is reduced.
3. All stalks are geometrically reduced ring.
4.  $X$  is reduced and for every maximal point  $\eta$  of  $X$ , the residue field  $k(\eta)$  is separable over  $k$ .
5.  $X_{k^{\text{perf}}}$  is reduced.
6.  $X_K$  is reduced for every finite purely inseparable field extension  $K/k$ .
7.  $X_{k^{1/p}}$  is reduced.

In particular, if  $k$  has characteristic 0, then  $\text{geo.reduced} \iff \text{reduced}$ .  $\lrcorner$

*Proof:* As reduced is local, these all follows from (5.3.6.2).  $\square$

**Prop. (7.4.3.3) [Geo.Reduced and Arithmetic Points].** Let  $X \in \text{Sch}^{\text{loc.ft}}/k$  be geo.reduced, then the set of closed points with finite separable field extensions  $\kappa(x)/k$  is dense in  $X$ .  $\lrcorner$

*Proof:* Combine (7.6.4.18) and (7.6.4.20).  $\square$

**Def. (7.4.3.4) [Density of Points].** Let  $X$  be an algebraic scheme over a field  $k$  and  $k'/k$  be a field extension, then a subset  $S \subset X(k')$  is said to be **schematically dense** in  $X$  if the only closed subscheme  $Z \subset X$  over  $k$  that  $S \subset Z(k')$  is  $X$  itself.

$\color{red}{?}$  Should merge with the definition of scheme-theoretical image.  $\lrcorner$

**Prop. (7.4.3.5) [Schematically Dense Subset].** Let  $X$  be an algebraic scheme over a field  $k$ ,  $S \subset X(k)$  be a subset. Then the following are equivalent:

1.  $S$  is schematically dense in  $X$ .
2.  $X$  is reduced and  $S$  is dense in  $|X|$ .
3. The family of homomorphisms  $\mathcal{O}_X \rightarrow k : f \mapsto f(s)$  is jointly injective.

$\lrcorner$

*Proof:*  $1 \rightarrow 2$ : Let  $\bar{S}$  be the induced reduced structure of the closure  $S$  in  $X$  (7.4.1.14), then  $\bar{S} = X$ , so  $X$  is reduced with  $X = \bar{S}$ .

$2 \rightarrow 3$ :  $\color{red}{?}$  Cf. [Milne Algebraic Groups, P10].  $\square$

**Cor. (7.4.3.6).** A schematically dense subset remains schematically dense after field base changes.  $\lrcorner$

**Cor. (7.4.3.7).** The schematic closure of a subset commutes with base change.  $\lrcorner$

*Proof:* Use the third definition in (7.4.3.5), notice that the valuation maps are also jointly injective because  $k'/k$  is flat.  $\square$

**Cor. (7.4.3.8).** If  $X$  admits a schematically dense subset  $S$ , then  $X$  is geo.reduced.  $\lrcorner$

**Prop. (7.4.3.9).** If  $X(k')$  is dense in  $X$ , then  $X$  is reduced. Conversely, if  $X(k')$  is dense in  $|X_{k'}|$  and  $X$  is geo.reduced, then  $X(k')$  is dense in  $X$ .  $\lrcorner$

*Proof:*  $X$  is reduced because  $X_{\text{red}}(k') = X(k')$ . Conversely if  $Z \subset X$  is a closed subscheme that  $Z(k') = X(k')$ , then  $|Z_{k'}| = |X_{k'}|$  by condition, and then  $Z_{k'} = X_{k'}$  as  $X_{k'}$  is reduced. Thus  $Z = X$  by flatness.  $\square$

**Cor. (7.4.3.10) [Geometric Points Schematically Dense].** If  $X$  is locally algebraic and geo.reduced, then  $X(k')$  is schematically dense in  $X$  for any separably closed field  $k'$  containing  $k$ .  $\lrcorner$

*Proof:*  $X(k')$  is dense in  $|X_{k'}|$  by (7.4.3.3), thus it is schematically dense in  $X$  by (7.4.3.9).  $\square$

**Cor. (7.4.3.11).** If  $Z, Z'$  are closed subvarieties of  $X \in \text{Sch}^{\text{loc.ft}}/k$  s.t.  $Z(k') = Z'(k') \subset X(k')$  for some separably closed field  $k'$  containing  $k$ , then  $Z = Z'$ . In other words, a closed subvariety of  $X$  is determined by the subset  $Z(k^s) \subset X(k^s)$ .  $\lrcorner$

*Proof:* The closed subscheme  $Z \cap Z'$  satisfies  $Z \cap Z'(k') = Z(k')$ , so  $Z \cap Z' = Z$  by (7.4.3.10). Similarly  $Z \cap Z' = Z'$ .  $\square$

Geo.Connected and Geo.Irreducible

**Prop. (7.4.3.12) [Geo.Connectedness].** For a scheme  $X$  over a field  $k$ , the following are equivalent:

- For every connected  $k$ -scheme  $Y$ , the product  $X \otimes_k Y$  is connected.
- $X$  is geometrically connected (7.4.3.1).
- $X_{K^s}$  is connected.
- $X_K$  is connected for any finite separable extension  $K/k$ .

┘

*Proof:* Cf. [Sta]0385, 0389. ?

□

**Prop. (7.4.3.13) [Invariance of Base Change].** Let  $X$  be a scheme over a field  $k$  and  $k'/k$  a field extension, then  $X$  is geo.connected iff  $X_{k'}$  is geo.connected.

┘

*Proof:* Cf. [Sta]054N.

□

**Prop. (7.4.3.14).** Let  $T \rightarrow X$  be a map of schemes over a field  $k$ , if  $T$  is geo.connected and  $X$  is connected, then  $X$  is geo.connected.

┘

*Proof:* Cf. [Sta]056R.

□

**Cor. (7.4.3.15) [Connected with a Rational Point].** Let  $X$  be a scheme over a field  $k$ . Assume  $X$  is connected and has a point  $x$  that  $k$  is alg.closed in  $k(x)$ , then  $X$  is geo.connected. In particular, if  $X$  is connected and has a rational point, then  $X$  is geo.connected.

┘

*Proof:* Cf. [Sta]04KV.

□

**Prop. (7.4.3.16) [Geometrically Irreducible].** For a scheme  $X$  over a field  $k$ , the following are equivalent:

- For every irreducible  $k$ -scheme  $Y$ , the product  $X \otimes_k Y$  is irreducible.
- $X$  is geometrically irreducible.
- $X_{k^s}$  is irreducible.
- $X$  is irreducible and if  $\eta$  is the generic pt of  $X$ , then  $k$  is separably closed in  $k(\eta)$ .
- $X_K$  is irreducible for any finite separable extension  $K/k$ .

┘

*Proof:* Cf. [Gortz P136]. ?

□

Geo.Integral

**Cor. (7.4.3.17) [geometrically Integral].** For a scheme  $X$  over a field  $k$ , the following are equivalent:

- For every integral  $k$ -scheme  $Y$ , the product  $X \otimes_k Y$  is integral.
- $X$  is geometrically integral.
- $X_K$  is irreducible for any finite extension  $K/k$ .
- $X_{\bar{k}}$  is integral.
- $X$  is integral and if  $\eta$  is the generic pt of  $X$ , then  $k$  is alg.closed in  $k(\eta)$  and  $k(\eta)/k$  is separable.

┘

*Proof:*  $1 \rightarrow 2 \rightarrow 3 \rightarrow 4$  is easy, Cf. [Gortz P136]. ?

□

### Geometrically Regular

**Prop. (7.4.3.18).** Let  $X$  be a locally Noetherian scheme over a field  $k$ , then  $X$  is geometrically regular iff the local ring  $\mathcal{O}_{X,x}$  is geometrically regular over  $k$ . Thus it suffice to check for finite purely inseparable field extensions  $k'/k$ , by (5.3.6.7).  $\lrcorner$

*Proof:* For a finite purely inseparable field extension,  $\mathcal{O}_{X,x} \otimes_k k'$  is also a local ring because their spectra are the same (5.1.7.26), so  $\mathcal{O}_{X,x}$  is geometrically regular by (5.3.6.7).

Conversely, if  $\mathcal{O}_{X,x}$  is geo.regular, then for any field extension  $k'/k$ , stalks of  $X_{k'}$  are localization of  $\mathcal{O}_{X,x} \otimes_k k'$ , so it is regular by (5.3.5.18).  $\square$

**Cor. (7.4.3.19).** A geometrically regular ring is geometrically reduced, by (5.3.5.20) and (7.4.3.2).  $\lrcorner$

**Prop. (7.4.3.20) [Partially Invariance Under Base Change].** If  $k'/k$  is a f.g. field extension, then  $X_{k'}$  is geo.regular over  $k'$  iff  $X_k$  is geo.regular over  $k$ .

In fact, this is true for any field extension  $k'/k$  if  $X$  is locally algebraic over  $k$ , because in this case geo.regular is equivalent to smoothness.  $\lrcorner$

*Proof:* One direction is trivial, for the other, Cf. [Sta]038W<sup>?</sup>.  $\square$

## 4 Basic Morphism Properties

Main references are [Sta]02WE.

### Base Change Trick

**Prop. (7.4.4.1) [Base Change Trick].** If a property  $P$  of morphisms satisfy:

- Closed immersion has  $P$ .
- Stable under base change and composition.

Then

- it is stable under product.
- $g \circ f : X \rightarrow Y \rightarrow Z$  has  $P$  and  $g$  separated implies  $f$  has  $P$ .
- it is stable under  $f_{\text{red}}$ . (Notice  $X_{\text{red}} \rightarrow X$  is closed immersion).

$\lrcorner$

*Proof:* For the product, we may assume one of them is identity and use composition, but then the product is just base change, so it has  $P$ .

For the second, factorize  $f : X \rightarrow X \times_Z Y \rightarrow Y$ , the first is base change of  $\Delta : Y \rightarrow Y \times_Z Y$ , so it satisfies  $P$  because  $g$  is separable, and the second map is a base change of  $X \rightarrow Z$ , so it satisfies  $P$ , so  $f$  satisfies  $P$ .

$X_{\text{red}} \rightarrow X \rightarrow Y = X_{\text{red}} \rightarrow Y_{\text{red}} \rightarrow Y$  has  $P$  because  $X_{\text{red}} \rightarrow X$  is closed immersion, and  $Y_{\text{red}} \rightarrow Y$  is separable because closed immersion is separable (checked directly), so by what has been proved,  $X_{\text{red}} \rightarrow Y_{\text{red}}$  has  $P$ .  $\square$

**Prop. (7.4.4.2).** Lists of properties satisfying the base change trick (7.4.4.1) (not complete):

1. Universal closed/universal injective morphisms.
2. Affineness.
3. Morphisms (locally) of finite type.

4. Finite Morphisms.
5. Integral Morphisms.
6. Morphisms (locally) of finite presentation.
7. Quasi-affine morphisms.
8. Closed Immersions.
9. Quasi-compactness.
10. (Quasi-)Separatedness.
11. Proper.
12. Unramified.
13. Monomorphisms.
14. (Locally) Quasi-finiteness.
15. H-projectiveness.

┘

*Proof:*

1. Trivial.
2. Because affineness is local on the target (7.4.1.5), this follows from (7.2.7.17) and (7.2.7.14).
3. Trivial.
4. Trivial.
- 5.
6. By (5.3.7.9).
7. Affine morphism is quasi-compact: because quasi-compactness is local on the target, we can reduce to the affine case, thus it is quasi-compact, by (7.4.4.26). To show a base change of quasi-compact morphism is quasi-compact, because quasi-compactness is local on the target (7.4.1.5), then we can choose a cover by affine opens that the image is contained in an affine open, thus it reduces to show a map between affine schemes is quasi-compact, which is (7.4.4.26).
8. For closed immersions, use (7.2.7.16) and check locally, for open immersions, use (7.2.7.16).
9. It suffices to show an affine map is quasi-compact.
10. Closed immersion is separated is checked directly. Composition: For  $X \rightarrow Y \rightarrow Z$ , the diagonal map decomposes as  $X \rightarrow X \times_Y X \rightarrow X \times_Z X$ , the second one is closed immersion (or quasi-compact) by (7.4.5.29), so this follows from that of closed immersion and qc. Base change: The diagonal commutes with base change (4.1.1.49), so this follows from that of closed immersion and qc.
11. Because universally closed, f.t. and separatedness both do (7.4.4.2).
- 12.
- 13.
- 14.

□

### Injectivity and Monomorphisms

**Def. (7.4.4.3) [Injectivity and Monomorphisms].** A morphism of schemes is called **injective morphism** if it is injective topologically. A morphism of schemes is called a **monomorphism morphism** if it is a monomorphism in the category of schemes.  $\lrcorner$

**Prop. (7.4.4.4) [Universally Injective].** For a morphism of schemes  $X \rightarrow S$ , the following are equivalent:

- It is universally injective.
- It is injective and the residue field extension are all purely inseparable.
- The diagonal map is surjective.
- For any field  $K$ ,  $\text{Hom}(\text{Spec } K, X) \rightarrow \text{Hom}(\text{Spec } K, S)$  is injective.

In particular, any monomorphism is universally injective.  $\lrcorner$

*Proof:* 1  $\rightarrow$  4: For  $s \in \text{Hom}(\text{Spec } K, S)$ , a  $x \in \text{Hom}(\text{Spec } K, X)$  mapping to  $s$  is a section of the injective map  $X \times_S \text{Spec } K \rightarrow \text{Spec } K$ , which is unique if it exists.

4  $\rightarrow$  1: If  $S' \rightarrow S$  is a morphism,  $X' = X \times_S S'$ , and  $x, x' \in X'$  map to the same point  $s' \in S'$ , then we can choose a common field extension  $K/k(s')$  of  $k(x)/k(s)$  and  $k(x')/k(s)$ . Then we get two elements in  $\text{Hom}(\text{Spec } K, X')$ , and the hypothesis says they map to the same element in  $\text{Hom}(\text{Spec } K, X)$ . Thus they are the same, as  $X'$  is the fiber product.

1  $\rightarrow$  2: If the residue field extension is not purely inseparable, then tensoring with this field extension, we get two points mapping to the same, contradiction.

2  $\rightarrow$  4: If the residue field extension is purely inseparable, then  $k(x) \rightarrow K$  is determined by the composition,  $k(s) \rightarrow k(x) \rightarrow K$ , which means 4 is true.

1  $\rightarrow$  3: If  $X \rightarrow S$  is universally injective, then  $X \times_S X \rightarrow X$  is injective, and  $\Delta_{X/S}$  is a section of this map, thus it must be surjective.

3  $\rightarrow$  1: If  $\Delta_{X/S}$  is surjective, then for any base change  $S' \rightarrow S$ ,  $\Delta_{X'/S'}$  is surjective, thus  $X' \rightarrow S'$  is injective, thus 1 holds.  $\square$

**Prop. (7.4.4.5) [Monomorphism and Injectivity].** A morphism of schemes  $j : X \rightarrow Y$  is a monomorphism if  $j$  is an injective map and for any  $x \in X$ ,  $\mathcal{O}_{Y,f(x)} \rightarrow \mathcal{O}_{X,x}$  is surjective.  $\lrcorner$

*Proof:* First check topologically, then check the local ring map.  $\square$

**Cor. (7.4.4.6).** For any scheme  $X$  and a point  $x$ ,  $\text{Spec } \mathcal{O}_{X,x} \rightarrow X$  is a monomorphism.  $\lrcorner$

### Closed Map

**Prop. (7.4.4.7) [Universal Closed].** Universal closedness is local on the basis and satisfies the base change trick(7.4.4.2).  $\lrcorner$

**Prop. (7.4.4.8).** If  $g$  is surjective, then  $f \circ g$  is universally closed iff  $f$  is universally closed (because surjective is S.u.B).  $\lrcorner$

**Prop. (7.4.4.9) [Closed Map and Specialization].** The image of a quasi-compact morphism is closed iff it is stable under specialization. And it is a closed map iff specializations lift along  $f$ .  $\lrcorner$

*Proof:* For the first, the question is local, so reduce to  $Y$  affine, and then  $X$  is qc =  $\cup U_i$ , then we can replace  $X$  by an affine  $\coprod U_i$ , then reduce to the affine case(5.1.7.14).

For the second, for any closed subset of  $X$  with its induced reduced structure, the restriction to it is still qc and specialization lifts, so we prove the image is closed. Now the image is stable under specialization, so the result follows from the first assertion.  $\square$

### Affine Map

**Prop. (7.4.4.10).**  $X$  is affine if there is a finite set of elements  $f_i \in \Gamma(X, \mathcal{O}_X)$  that generate the unit ideal and  $X_{f_i}$  is affine.  $\lrcorner$

*Proof:* First prove that  $X_{f_i} \cap X_{f_j} = X_{f_i f_j}$  is affine because affine intersect  $X_{f_i}$  is affine. Second, prove  $\Gamma(X_f, \mathcal{O}_X) = \Gamma(X, \mathcal{O}_X)_f$ , finally glue them to get a map  $X \rightarrow \text{Spec}(A)$  and use the fact isomorphism is local on the target (7.4.1.5).  $X$  is affine scheme if  $X \rightarrow \text{Spec}(\Gamma(X))$  is affine.  $\square$

**Cor. (7.4.4.11).** Affineness is affine local on the target, and it satisfies the base change trick (7.4.4.2).  $\lrcorner$

**Lemma (7.4.4.12) [Serre Criterion of Affineness].**

- A qc scheme  $X$  is isomorphic to an affine scheme iff  $H^1(X, \mathcal{I}) = 0$  for every Qco sheaf of ideals  $\mathcal{I}$ .
- If  $X$  is qcqs, then it suffices to show  $H^1(X, \mathcal{I}) = 0$  for every Qco sheaf of ideals  $\mathcal{I}$  of f.t..
- If  $f : X \rightarrow Y$  is a quasi-compact morphism between quasi-separated schemes, then  $f$  is affine iff for any Qco sheaf of ideals  $\mathcal{I}$  on  $X$ ,  $R^1 f_* \mathcal{I} = 0$ .

$\lrcorner$

*Proof:* ? Cf. [Sta]01XF.

The case of affine scheme is proven by (7.7.1.1) and (7.7.1.2). The converse: For every point  $p$ , choose an open affine nbhd  $U$ , let  $Y = X - U$ , by the exact sequence

$$0 \rightarrow \mathcal{I}_{Y \cup \{p\}} \rightarrow \mathcal{I}_Y \rightarrow k(P) \rightarrow 0,$$

we have a surjective map  $\Gamma(X, \mathcal{I}_Y) \rightarrow \Gamma(X, k(P))$  thus there is a  $f \in A = \Gamma(X, \mathcal{O}_X)$  that  $P \in X_f \subset U$  is affine. So using (7.4.4.10), we only have to show that for f.m  $f_i$ , they generate  $\Gamma(X, \mathcal{O}_X)$ . This is by considering the kernel  $F$  of  $\mathcal{O}_X^r \rightarrow \mathcal{O}_X : (a_1, \dots, a_r) \rightarrow \sum f_i a_i$ , and there is a filtration on  $F$ , the quotient of which are all coherent sheaves because kernel and cokernel are Qco, and there by induction and hypothesis,  $H^1(X, F) = 0$ , thus the result.

2: In the qcqs case, by (7.7.1.6), we can use filtered colimit to show that  $H^1(X, \mathcal{I}) = 0$  for any Qco sheaf of ideals.

3: For any affine open  $U$  of  $Y$ , the inclusion  $U \rightarrow Y$  is qc, thus  $f^{-1}(U) \rightarrow X$  is also qc. Now any Qco sheaf of ideals  $\mathcal{I}$  on  $U$  extends to a Qco sheaf of ideals on  $X$  by (7.5.1.8), then we can use Leray spectral sequence to conclude that  $H^1(f^{-1}(U), \mathcal{I}) = 0$ , so  $f^{-1}(U)$  is affine.  $\square$

**Cor. (7.4.4.13).** For a Noetherian scheme  $X$ ,  $X$  is affine iff  $X_{\text{red}}$  is affine.  $\lrcorner$

*Proof:* The canonical exact sequence (7.2.6.10) reads:  $0 \rightarrow \mathcal{N}\mathcal{F} \rightarrow \mathcal{F} \rightarrow i_* i^* \mathcal{F} \rightarrow 0$ , so iff  $X_{\text{red}}$  is affine, then we have  $H^i(\mathcal{F}) \cong H^i(\mathcal{N}\mathcal{F})$ , and notice  $\mathcal{N}^k = 0$  for some  $k$ .  $\square$

**Cor. (7.4.4.14).** For a Noetherian reduced scheme  $X$ ,  $X$  is affine iff each irreducible component is affine. (The same as the above, notice that  $\prod p_i = 0$ , for the minimal primes of  $A$ ). (The reducedness can be dropped by the last proposition).  $\lrcorner$

**Lemma (7.4.4.15).** If a morphism  $X \rightarrow Y$  is a homeomorphism onto a closed subset of  $Y$ , then  $f$  is affine.  $\lrcorner$

*Proof:* Cf. [[Sta]04DE].  $\square$

Quasi-affine

**Def. (7.4.4.16) [Quasi-Affine Morphism].** A scheme is called **quasi-affine** iff it is isomorphic to a qc open subscheme of an affine scheme. A morphism is called **quasi-affine** iff the inverse of any affine scheme is quasi-affine.  $\lrcorner$

**Prop. (7.4.4.17).** Quasi-affine is local on the target and satisfies the base change trick.  $\lrcorner$

*Proof:* Cf. [Sta]01SN.  $\square$

**Prop. (7.4.4.18).** Any qc immersion  $i$  of a quasi-affine scheme is quasi-affine.  $\lrcorner$

*Proof:* As  $i$  is qc,  $i$  factors through a map  $Z \rightarrow U \rightarrow X$ , where  $U$  is a quasi-compact open subset of  $X$ . Thus it suffices to consider the closed immersion case, which is clear.  $\square$

**Prop. (7.4.4.19).** A morphism  $f : X \rightarrow S$  is quasi-affine iff  $\mathcal{O}_X$  is  $f$ -ample. In particular, A scheme is quasi-affine iff  $\mathcal{O}_X$  is ample.  $\lrcorner$

*Proof:* Cf. [Sta]01QE.  $\square$

**Cor. (7.4.4.20).** Let  $X$  be a quasi-affine scheme and  $H^p(X, \mathcal{O}_X) = 0$  for  $p > 0$ , then  $X$  is affine.  $\lrcorner$

*Proof:* By (7.4.4.19)  $\mathcal{O}_X$  is ample, then by (7.5.4.20),  $X$  is affine.  $\square$

**Prop. (7.4.4.21) [Descent].** Let  $X$  be a scheme over a field  $k$  and  $K/k$  be a field extension, then  $X$  is quasi-affine iff  $X_K$  is quasi-affine.  $\lrcorner$

*Proof:* Cf. [Sta]0BDD.  $\square$

Dominant

**Prop. (7.4.4.22).** Let  $f : X \rightarrow S$  be a map of schemes.

- If every generic point of irreducible components of  $S$  is in the image of  $f$ , then  $f$  is dominant.
- If  $f$  is quasi-compact, then the converse is also true. More precisely, if a generic point  $\eta$  is not in the image, then it is not in the closure of the image.
- If  $X$  has only f.m. irreducible component, then the converse is also true.

$\lrcorner$

*Proof:* Cf. [Sta]Chap28.8.  $\square$

**Prop. (7.4.4.23) [Dominant Map between Integral Schemes].** If  $f : X \rightarrow S$  is a map between integral schemes, then the following are equivalent:

- $f$  is dominant.
- $f(\eta_X) = \eta_Y$ .
- for some(all) affine open subset  $U \subset X, V \subset Y$  with  $f(U) \subset V$ , the ring map  $\mathcal{O}_Y(V) \rightarrow \mathcal{O}_X(U)$  is injective.
- for some(all)  $x \in X$ , the local ring map  $\mathcal{O}_{Y,f(x)} \rightarrow \mathcal{O}_{X,x}$  is injective.

$\lrcorner$

*Proof:* Cf. [Sta]0CC1.  $\square$

**Def. (7.4.4.24) [Dominant Rational Maps].** A rational map between irreducible schemes is called a **dominant map** if it maps the generic point to the generic point.  $\lrcorner$

### Quasi-Compact

**Prop. (7.4.4.25) [Quasi-Compact Morphism].** A morphism  $f : X \rightarrow S$  of schemes is quasi-compact iff the inverse image of any quasi-compact open subsets is quasi-compact, because affine opens form a basis of  $X$ .

Quasi-compactness is local on the target and satisfies the base change trick(7.4.4.2).  $\lrcorner$

**Prop. (7.4.4.26).** A map between affine schemes is quasi-compact.  $\lrcorner$

*Proof:* Because quasi-compactness is local on the target(7.4.1.5), it suffices to show the inverse image of a distinguished open subset is quasi-compact, and this is true.  $\square$

**Prop. (7.4.4.27).** Let  $f : X \rightarrow Y$ ,  $g : Y \rightarrow Z$ . If  $g \circ f$  is quasi-compact and  $g$  is qs, then  $f$  is qc.  $\lrcorner$

*Proof:* Factor it through  $X \rightarrow X \times_Z Y \rightarrow Y$ . The second map is a base change of  $X \rightarrow Z$  hence qc, the first map is a section of  $X \times_Z Y \rightarrow X$ , which is a base change of  $Y \rightarrow Z$ , hence qs, so by(7.4.5.31), the first map is also qc.  $\square$

**Prop. (7.4.4.28).** Any map between Noetherian schemes is quasi-compact, by(7.4.1.22).  $\lrcorner$

### Finite Type Morphisms

**Def. (7.4.4.29) [Morphisms of Finite Type].** A morphism  $f : X \rightarrow S$  is called of **locally of finite type** if for there exists an affine open cover  $\{\text{Spec}(B_i)\}$  of  $S$  that  $f^{-1}(U_i)$  has an affine open cover of spec of finite generated  $B_i$ -algebras. It is called **finite type** if moreover it is quasi-compact.

Let  $k \in \mathbf{Field}$ , then  $S \in \mathbf{Sch}/k$  is called **(locally)algebraic** iff  $S$  is (locally)of finite type over  $\text{Spec } k$ .

For  $S \in \mathbf{Sch}$ , denote  $\mathbf{Sch}^{\text{loc.ft}}/S$ (resp.  $\mathbf{Sch}^{\text{ft}}/S$ ) the full subcategory of  $\mathbf{Sch}/S$  consisting of (resp. locally) of finite type schemes over  $S$ .

(Locally)Finite type is affine local on the target and on the source, and satisfies the base change trick(7.4.4.2).  $\lrcorner$

**Prop. (7.4.4.30) [Closed Subschemes Descending Chain Stablizes].** The closed subschemes of an algebraic scheme  $X$  over a field  $k$  satisfy the descending chain condition.  $\lrcorner$

*Proof:* As  $X$  is Noetherian, the topological chain  $|Z_1| \supset |Z_2| \supset \dots$  stablizes, so we may assume  $|X| = |Z_1| = |Z_2| = \dots$ . Now choose a finite affine cover  $\text{Spec } A_i$  of  $X$ , then  $Z_i$  corresponds to ideals  $I_i$  of  $A_i$ , so they stablizes, as  $A_i$  are Noetherian.  $\square$

**Cor. (7.4.4.31).** Arbitrary intersection of closed subschemes of an algebraic scheme  $X$  is well-defined.  $\lrcorner$

**Prop. (7.4.4.32) [Algebraic Schemes of Dimension 0 over Fields].** If  $k \in \mathbf{Field}$  and  $X \in \mathbf{Sch}^{\text{loc.ft}}/k$  s.t.  $\dim(X) = 0$ , then  $X$  is a disjoint union of f.d. local Artinian  $k$ -algebras.  $\lrcorner$

*Proof:* This follows from(7.4.1.35).  $\square$

**Prop. (7.4.4.33) [Dimensions for Locally Algebraic  $k$ -Schemes].** For  $k \in \mathbf{Field}$  and  $X \in \mathbf{Sch}^{\text{loc.ft}}/k$ , if  $X$  is irreducible, then  $\dim X = \dim U$  for any nonempty open  $U \subset X$ .  $\lrcorner$

*Proof:* It suffices to show any two affine open subsets  $U, U'$  of  $X$  have the same dimension, then use(4.12.2.27). Now  $U \cap U' \neq \emptyset$  as  $X$  is irreducible, and then it contains a maximal pt  $x$  by Hilbert's Nullstellensatz, and then  $\dim U = \dim(\mathcal{O}_{X,x}) = \dim U'$  because f.g. algebras over a field is catenary.  $\square$

### Integral & Finite Map

**Def. (7.4.4.34) [Finite and Integral Map].** A morphism  $f : X \rightarrow S$  is called **integral** if it is affine and there is a affine open covering  $U_i = \text{Spec } A_i$  of  $S$  that  $f^{-1}(U_i) = \text{Spec } B_i$  and  $A_i \rightarrow B_i$  is integral.

Integral is affine local on the target and satisfies the base change trick(7.4.4.2).

A morphism  $f : X \rightarrow S$  is called **finite** if it is affine and there is a affine open covering  $U_i = \text{Spec } A_i$  of  $S$  that  $f^{-1}(U_i) = \text{Spec } B_i$  and  $B_i$  are finite modules over  $A_i$ .

Finiteness is affine local on the target and satisfies the base change trick(7.4.4.2).

A morphism  $f : X \rightarrow S$  is called **(locally) quasi-finite** if it is (locally) of f.t. and the inverse of a point is a discrete set.  $\lrcorner$

**Prop. (7.4.4.35) [Integral Morphism is Closed].** Specialization lifts along an integral morphism. In particular, an integral morphism is closed, by(7.4.4.9).  $\lrcorner$

*Proof:* If  $f(x) = y, y \rightarrow y'$ , then we can choose an open affine  $U$  containing  $y'$ , which also contains  $y$ . So we can choose an open affine containing  $x$  mapping into  $U$ , then it reduces to the affine case(5.1.7.13).  $\square$

**Prop. (7.4.4.36) [Chevalley].** If  $f : Y \rightarrow X$  is integral surjective,  $Y$  is affine, then  $X$  is affine.  $\lrcorner$

*Proof:* Cf.[Sta]05YU.  $\square$

**Lemma (7.4.4.37).** If  $f : Y \rightarrow X$  is finite surjective,  $Y$  is affine, then  $X$  is affine.  $\lrcorner$

*Proof:*  $\square$

**Prop. (7.4.4.38) [Finite and Integral].** A morphism is finite iff it is integral of f.t..  $\lrcorner$

**Prop. (7.4.4.39) [Integral and Affine u.c.].** Integral map is equivalent to u.c. and affine.  $\lrcorner$

*Proof:* Integral is stable under base change. And if it is integral, then it is closed by(5.2.1.5).

Conversely, we need to prove if  $\text{Spec } B \rightarrow \text{Spec } A$  is u.c., then  $A \rightarrow B$  is integral. For any  $a \in B$ , let  $J$  be the kernel of  $A[X] \rightarrow B[X]/(aX - 1)$ , then if  $f \in J$ , then  $f(X) = (aX - 1)q(X)$ , and  $X^{\deg(f)} f(\frac{1}{X}) = (a - X)X^{\deg(q)} q(\frac{1}{X})$  vanishes at  $a$ , so it suffices to find a  $f \in J$  with constant term 1. It suffices to show that  $\text{Spec}(A[X]/J + (x))$  is empty:

As  $f$  is universally closed,  $\text{Spec } B[X] \rightarrow \text{Spec } A[X]$  is closed, thus the image of  $\text{Spec}(B[X]/(aX - 1))$  is closed in  $\text{Spec } A$ , which is the underlying set of  $\text{Spec } A/J$ , by(7.4.5.15). Now notice  $T = \text{Spec}(A[X]/J + (x)) \times_{\text{Spec}(A[X]/J)} \text{Spec}(B[X]/(aX - 1))$  is empty, because  $(A[X]/J + (x)) \otimes_{A[X]/J} (B[X]/(aX - 1)) = \text{Spec } A \otimes_{\text{Spec } A[X]} \text{Spec}(B[X]/(aX - 1)) = 0$ , as  $X$  is invertible in  $B[X]/(aX - 1)$  but vanish in  $A$ . But  $T \rightarrow \text{Spec}(A[X]/J + (x))$  is surjective, as a base change of  $\text{Spec}(B[X]/(aX - 1)) \rightarrow \text{Spec } A/J$ , thus we are done.  $\square$

**Def. (7.4.4.40) [Degree of Finite Morphisms at a Point].** Suppose  $\pi : X \rightarrow Y$  is a finite morphism, then  $\pi_* \mathcal{O}_X$  is a  $\mathcal{O}_Y$ -module of f.t.. Let  $p \in Y$ , then the **degree of  $\pi$  at  $p$**  is the rank of this sheaf on  $Y$ (7.5.1.11), which is an upper-semicontinuous function(7.5.1.41).  $\lrcorner$

**Prop. (7.4.4.41).** The degree of a finite morphism  $\pi : X \rightarrow Y$  at  $p$  is the dimension over  $k(p)$  of the fiber of  $\pi$  at  $p$ . In particular, the degree is zero iff  $\pi^{-1}(p) = \emptyset$ .  $\lrcorner$

*Proof:* Look affine locally.  $\square$

**Lemma (7.4.4.42).** For  $f : Y \rightarrow X$  finite surjective and  $X$  locally Noetherian, for every integral subscheme  $Z$  of  $X$  with generic point  $\xi$ , there is a coherent sheaf  $\mathcal{F}$  on  $Y$  that the support of  $f_*\mathcal{F}$  is  $Z$  and  $(f_*\mathcal{F})_\xi$  is annihilated by  $\mathfrak{m}_\xi$ .  $\lrcorner$

*Proof:* We consider an inverse image of  $\xi = \xi'$ , and let  $Z' = \overline{\{\xi'\}}$  with the induced reduced structure, then let  $\mathcal{F} = i_*\mathcal{O}_{Z'}$  on  $Y$ ,  $\mathcal{F}$  is coherent, then we need to show that  $(f_*\mathcal{F})_\xi$  is annihilated by  $\mathfrak{m}_\xi$ . This is because it factors through  $Z$ .  $\color{red}{?}$  Cf. [Sta]01YO.  $\square$

### Quasi-Finite Morphisms

**Def. (7.4.4.43) [Quasi-Finite Morphisms].** A morphism  $f : X \rightarrow S \in \text{Sch}$  is called a **locally quasi-finite morphism** if it is locally spec map of quasi-finite ring maps of f.t.  $\color{red}{?}$ .

And  $f$  is called a **quasi-finite morphism** if  $f$  is of f.t. and any  $x \in X$  is isolated in  $f^{-1}(f(x))$ . (Locally) Quasi-finite morphisms are local on the target and satisfies base change trick.  $\lrcorner$

**Prop. (7.4.4.44) [Characterization of Quasi-Finiteness].** For  $f : X \rightarrow S \in \text{Sch}$ , the following are equivalent:

- $f$  is quasi-finite.
- $f$  is locally quasi-finite and quasi-compact.
- $f$  is locally of f.t., qc, and has finite fibers.

 $\lrcorner$ 

*Proof:* Cf. [Sta]01TJ, 02NH.  $\square$

**Prop. (7.4.4.45).** Immersions are locally quasi-finite.  $\lrcorner$

**Prop. (7.4.4.46).** Let  $f : X \rightarrow S$  be a morphism of schemes and  $s \in S$ . Assume that  $f$  is locally of f.t. and  $f^{-1}(s)$  is a finite set, then  $X_s$  is a finite discrete topological space, and  $f$  is quasi-finite at every point of  $f^{-1}(s)$ .  $\lrcorner$

*Proof:* Cf. [Sta]02NG.  $\square$

**Prop. (7.4.4.47) [Zariski's Main Theorem].** Let  $f : Y \rightarrow X$  be an affine morphism of f.t.. Let  $Y \xrightarrow{f'} X' \xrightarrow{\nu} X$  where  $X'$  is the normalization of  $X$  in  $Y$ , then there exists an open subscheme  $U' \subset X'$  that  $(f')^{-1}(U) \rightarrow U$  is an isomorphism and  $(f')^{-1}(U)$  is the set of points at which  $f$  is quasi-finite.  $\lrcorner$

*Proof:* Cf. [Sta]03GT.  $\square$

**Prop. (7.4.4.48) [Quasi-Finite Locus is Open].** For  $f : X \rightarrow S \in \text{Sch}$ , the set of points of  $X$  that  $f$  is quasi-finite is an open subset  $U \subset X$ , and  $U \rightarrow S$  is locally quasi-finite.  $\lrcorner$

*Proof:* Cf. [Sta]01T1.  $\square$

**Prop. (7.4.4.49).** If  $f : Y \rightarrow X$  is a quasi-finite morphism of schemes, and  $T \subset Y$  is nowhere dense, then  $f(T) \subset X$  is also nowhere dense.  $\lrcorner$

*Proof:* Cf. [Sta]03J2.  $\square$

## 5 Zariski's Main Theorem

References are [Sta]Chap36.38.

**Thm. (7.4.5.1) [Zariski's Main Theorem].** For a morphism  $X \rightarrow S$  that is quasi-finite and separated, if  $S$  is qcqs, Then there is a factorization  $X \rightarrow T \rightarrow S$  that  $X \rightarrow T$  is a qc open immersion and  $T \rightarrow S$  is finite.  $\lrcorner$

*Proof:* Cf. [Sta]05K0.  $\square$

### Generically Finiteness

**Def. (7.4.5.2) [Generically Finite Morphisms].** A **generically finite morphism** is a morphism  $f : X \rightarrow Y$  locally of f.t. and there exists a dense open subset  $U \subset X$  s.t.  $U \rightarrow Y$  is locally quasi-finite.  $\lrcorner$

**Lemma (7.4.5.3).** Let  $R \rightarrow S$  be a ring map of f.t., if  $\mathfrak{p} \subset R$  is a minimal prime that there are f.m. primes in  $S$  lying over  $\mathfrak{p}$ , then there is a  $g \in R$ ,  $g \notin \mathfrak{p}$  that  $R_g \rightarrow S_g$  is finite.  $\lrcorner$

*Proof:* The condition means  $S_{\mathfrak{p}}/\mathfrak{p}S_{\mathfrak{p}}$  has only f.m. primes and  $\mathfrak{p}S_{\mathfrak{p}}$  is locally nilpotent. Then  $\kappa(\mathfrak{p}) \rightarrow S_{\mathfrak{p}}/\mathfrak{p}S_{\mathfrak{p}}$  is finite. Let  $x_i$  generate  $S$  over  $R$ , then there are polynomials  $P_i \in R[X]$  that  $P_i(x_i) = 0 \in S_{\mathfrak{p}}/\mathfrak{p}S_{\mathfrak{p}}$ , and thus  $P_i^{e_i}(x_i) = 0 \in S_{\mathfrak{p}}$ . Now choose  $g \notin \mathfrak{p}$  that  $g$  divides the common divisors of the coefficients of  $P_i$  and  $P_i(x_i) = 0 \in S_g$ , then  $R_g \rightarrow S_g$  is finite.  $\square$

**Prop. (7.4.5.4) [Generically Finiteness].** Let  $f : X \rightarrow Y \in \text{Sch}$  be of finite type. If  $\eta_Y \in Y$  is a generic point, then:

- $f^{-1}(\eta_Y)$  is a finite set iff there are affine opens  $U_i \subset X, i = 1, \dots, n$  and  $V \subset Y$  that  $f(U_i) \subset V, \eta \in V$  and  $f^{-1}(\eta) \subset \cup U_i$  and  $U_i \rightarrow V$  are finite.
- If  $f$  is qs, then we can further restrict to  $n = 1$ .
- If  $f$  is qcqs, then we can further restrict to  $U_1 = f^{-1}(V)$ .  $\lrcorner$

*Proof:* These are local on  $Y$ , so we can change  $Y$  to an affine open subscheme containing  $\eta$ .

1: If these affine opens exist, then  $\#f^{-1}(\eta) < \infty$  because finite maps are quasi-finite (7.4.6.5).

If  $f^{-1}(\eta) = \{\xi_1, \dots, \xi_n\}$ , choose affine opens  $U_i$  around each  $\xi_i$ , then we reduce to the affine case (7.4.5.3).

2: Cf. [Sta]02NW.

3:  $\square$

**Prop. (7.4.5.5) [Extension of Fraction Fields].** Let  $f : X \rightarrow Y$  be a dominant morphism locally of f.t. between integral schemes, then the following are equivalent:

1.  $\text{tr.deg } K(X)/K(Y) = 0$ .
2.  $[K(X) : K(Y)] < \infty$ .
3. there exists non-empty affine opens  $U \subset X, V \subset Y$  s.t.  $f(U) \subset V$  and  $f : U \rightarrow V$  is finite.
4.  $\eta_X$  is the only point mapping to  $\eta_Y$ .
5. If  $f$  is qc or qs, in item3 we can assume  $U = f^{-1}(V)$ .  $\lrcorner$

*Proof:* Cf. [Sta]02NX.  $\square$

**Def. (7.4.5.6) [Degree of Generically Finite Dominant Morphisms].** Let  $f : X \rightarrow Y$  be a dominant morphism locally of f.t. between integral schemes, then by (7.4.4.23),  $f$  induces an injective map of function fields  $R(Y) \rightarrow R(X)$ , the degree of field extension  $[R(X) : R(Y)]$  is called the **degree of  $f$** , denoted by  $\deg(f)$ . It is a positive integer or  $\infty$ .

When  $\deg(f)$  is finite (i.e. the conditions of (7.4.5.5) hold), it is called a **separable/purely inseparable morphism** if  $R(X)/R(Y) \in \mathbf{Field}$  is separable/purely inseparable. And also we can define the separable, inseparable degree of  $f$ .  $\lrcorner$

### Immersions

**Def. (7.4.5.7) [Immersion]s.** A **closed immersion** of schemes is a closed immersion of local ringed spaces (7.2.6.15). A **closed subscheme** of a scheme  $X$  is a closed sub-ringed space (7.2.6.15) that is also a scheme.

An **open immersion** of schemes is an open immersion of local ringed spaces (7.2.6.15). An **open subscheme** of a scheme  $X$  is an open subspace (7.2.6.15) that is also a scheme.

Open and closed immersions are affine local on the target (7.4.1.5).

An **immersion** is a morphism that is a closed immersion of an open immersion.  $\lrcorner$

**Lemma (7.4.5.8) [Closed Immersion for Schemes].** Let  $f : Y \rightarrow X$  be a morphism of schemes that induces a homeomorphism of  $Y$  onto a closed subset of  $X$ , and  $f^\# : \mathcal{O}_X \rightarrow f_*\mathcal{O}_Y$  is surjective, then it is a closed immersion (7.2.6.15).  $\lrcorner$

*Proof:* It suffices to show that the kernel of  $f^\#$  is Qco. For this, notice that  $f$  is quasi-compact, and it is a monomorphism by (7.4.4.5), in particular separated by (7.4.5.37). Then (7.5.1.6) shows  $f_*\mathcal{O}_Y$  is Qco. Then the kernel is Qco by (7.5.1.3).  $\square$

**Prop. (7.4.5.9) [Closed Subschemes of Affine Schemes].** The closed sub-ringed spaces of  $X = \text{Spec } A$  are all closed subschemes, and they corresponds to ideals  $I \subset A$ :

- If  $I \subset A$  is an ideal, then the morphism  $Z = \text{Spec } A/I \rightarrow \text{Spec } A$  is a homeomorphism of  $Z$  onto a closed subspace  $V(I)$  of  $X$ , and also the stalk map at a point  $\mathfrak{p} \subset Z$  is  $R_{\mathfrak{p}} \rightarrow (R/I)_{\mathfrak{p}/I} = R_{\mathfrak{p}}/IR_{\mathfrak{p}}$ , which is surjective. So this is a closed immersion by (7.4.5.8).
- By (7.2.6.17), for any closed subscheme  $Z$  of  $X$  with sheaf of ideals  $\mathcal{I}$ ,  $Z$  is isomorphic to the closed subscheme of  $X$  defined by  $\mathcal{I}$ . Now  $\mathcal{I}$  is locally generated by sections, so the quotient sheaf  $\mathcal{O}_X/\mathcal{I}$  is a Qco sheaf, so it is of the form  $\tilde{S}$  for some  $A$ -module  $S$ , by (7.5.1.2). Then  $\mathcal{I}$ , as the kernel of  $\mathcal{O}_X \rightarrow \tilde{S}$ , is also Qco (7.5.1.3), so it equals  $\tilde{I}$  for some ideal  $I \subset A$ . Thus  $S = R/I$ , and we are done.  $\lrcorner$

**Prop. (7.4.5.10) [Closed Subscheme of Schemes].** The closed sub-ringed spaces of a scheme  $X$  are all closed subschemes, and they corresponds to Qco  $\mathcal{O}_X$ -sheaves of ideals via the ideal sheaf (7.2.6.15):  $\lrcorner$

*Proof:* Let  $i : Y \rightarrow X$  be a closed immersion, for any  $x \in X$ , choose an open affine nbhd  $U$  of  $x \in X$ , then  $i : i^{-1}(U) \rightarrow U$  is also a closed immersion, so it corresponds to  $\text{Spec } A/I \rightarrow \text{Spec } A$  for some ideal  $I$  by (7.4.5.9). So  $Z$  is a scheme, and the ideal sheaf  $\mathcal{I}$  is Qco.  $\square$

**Prop. (7.4.5.11).** Closed immersion satisfies the base change trick (7.4.4.2). Open immersions are stable under base change and composition. Immersions are stable under base change and composition.  $\lrcorner$

*Proof:* For immersion, shrink the open subset.  $\square$

**Remark (7.4.5.12).** A open immersion followed by a closed immersion can be written as a closed immersion followed by an open immersion, but not reversely. The reverse happens if the immersion is quasi-compact or the source is reduced (use the reduced induced structure).  $\lrcorner$

**Def. (7.4.5.13) [Schematic Images].** For a morphism  $f : X \rightarrow Y$ , there is a closed scheme called **scheme-theoretic image** or the **schematic image** that is the smallest closed subscheme of  $Y$  that  $f$  factors through  $Z$ .

For an immersion of schemes, the scheme-theoretic image of the immersion is called the **scheme-theoretic closure** or the **schematic closure**.  $\lrcorner$

*Proof:* Consider the kernel of the structural map, and the kernel contains a maximal Qco sheaf of ideals  $\mathcal{I}$  by (7.5.1.12).  $\square$

**Prop. (7.4.5.14).** If  $\begin{array}{ccc} X_1 & \xrightarrow{f_1} & Y_1 \\ \downarrow & & \downarrow \\ X_2 & \xrightarrow{f_2} & Y_2 \end{array}$  be a commutative diagram of schemes and  $Z_i \subset Y_i$  be the scheme-

theoretic image of  $f_i$ , then it induces a commutative diagram  $\begin{array}{ccccc} X_1 & \longrightarrow & Z_1 & \longrightarrow & Y_1 \\ \downarrow & & \downarrow & & \downarrow \\ X_2 & \longrightarrow & Z_2 & \longrightarrow & Y_2 \end{array}$ .  $\lrcorner$

*Proof:* It suffices to show  $Z_1$  factors through the closed subscheme  $Z_2 \times_{Y_2} Y_1$  of  $Y_1$ , which follows from the universal property of  $Z_1$ .  $\square$

**Prop. (7.4.5.15).** Let  $f : X \rightarrow Y$  be a qc morphism of schemes and  $Z$  be the schematic image, then

- the kernel  $\mathcal{I} = \ker(\mathcal{O}_Y \rightarrow f_*\mathcal{O}_X)$  is Qco, thus  $Z$  is the closed subscheme determined by  $\mathcal{I}$ .
- For any open subscheme  $U \subset Y$ , the scheme-theoretical image of  $f|_{f^{-1}(U)}$  is equal to  $Z \cap U$ .
- $f(X)$  is dense in  $Z$ .

$\lrcorner$

*Proof:* 1: As being Qco is local, it suffices to show for  $Y$  affine. Then  $X = \cup U_i$  is a finite union of affine schemes. Now take  $X' = \coprod U_i$ , then there are maps  $X' \xrightarrow{f'} X \rightarrow Y$ . Then  $\mathcal{O}_X$  is a subsheaf of  $f'_*\mathcal{O}_{X'}$ . So  $\mathcal{I} = \ker(\mathcal{O}_Y \rightarrow f_*f'_*\mathcal{O}_{X'})$ . Now  $f \circ f'$  is qcqs, thus by (7.5.1.6),  $f_*f'_*\mathcal{O}_{X'}$  is Qco, thus also  $\mathcal{I}$  is Qco.

2 follows from 1 as the formation of  $\mathcal{I}$  commutes with restriction to open subschemes.

3 follows from 2 as the scheme-theoretical image of empty set is empty.  $\square$

**Prop. (7.4.5.16).** If  $f : X \rightarrow Y$  is a morphism and  $X$  is reduced, then the scheme-theoretical image of  $f$  is the induced-reduced structure (7.4.1.14) of  $\overline{f(X)} \subset Y$ .  $\lrcorner$

*Proof:* This is clear.  $\square$

**Def. (7.4.5.17) [Scheme-Theoretically Dense].** An open subscheme  $U \subset X$  is called **scheme-theoretically dense** if for any open subscheme  $V$  of  $X$ , the scheme-theoretical closure of  $U \cap V$  in  $V$  is equal to  $V$ .  $\lrcorner$

**Prop. (7.4.5.18).** If the inclusion  $U \rightarrow X$  is qc, then  $U$  is scheme-theoretically dense in  $X$  iff the scheme-theoretical closure of  $U$  is  $X$ , by (7.4.5.15).  $\lrcorner$

**Prop. (7.4.5.19).** Let  $j : U \rightarrow X$  be an open immersion of schemes, then  $U$  is scheme-theoretically dense in  $X$  iff  $\mathcal{O}_X \rightarrow j_*\mathcal{O}_U$  is injective.  $\lrcorner$

*Proof:* If it is not injective, then we can find an open subscheme  $V$  of  $X$  that the kernel is non-zero, thus it contains a non-zero  $\mathcal{Q}\text{co}$  ideal sheaf, which means the scheme-theoretical closure of  $U \cap V$  is not  $V$ .  $\square$

**Cor. (7.4.5.20).** If  $U, V$  are open subschemes of  $X$  scheme-theoretically dense in  $X$ , then  $U \cap V$  is also scheme-theoretically dense in  $X$ .  $\lrcorner$

*Proof:*  $\mathcal{O}_X \rightarrow \mathcal{O}_X(U) \rightarrow \mathcal{O}_X(U \cap V)$  is injective.  $\square$

**Prop. (7.4.5.21)[Scheme-Theoretical Image of Immersions].** Let  $f : Z \rightarrow X$  be an immersion and either  $f$  is qc or  $Z$  is reduced. Let  $\overline{Z}$  be the scheme-theoretical image of  $f$ , then the morphism  $Z \rightarrow \overline{Z}$  is an open immersion that identifies  $Z$  with a scheme-theoretical dense open subscheme of  $\overline{Z}$ .  $\lrcorner$

*Proof:* Cf. [Sta]01RG.  $\square$

**Prop. (7.4.5.22)[Immersion to be Closed].** An immersion  $f$  is a closed immersion iff the image is closed.  $\lrcorner$

*Proof:* Let  $i : Y \rightarrow U$  be a closed immersion where  $j : U \subset X$  is an open subscheme, then  $i$  is associated to an ideal sheaf  $\mathcal{I}$  of  $\mathcal{O}_U$ . Now because  $\mathcal{I}|_{U \setminus f(Y)} = \mathcal{O}_{U \setminus f(Y)}$ , we can glue  $\mathcal{I}$  and  $\mathcal{O}|_{X \setminus f(Y)}$  to a sheaf of ideals  $\mathcal{J} \subset \mathcal{O}_X$ . Now  $j^*\mathcal{O}_X/\mathcal{J} = \mathcal{O}_U/\mathcal{I} \cong i_*\mathcal{O}_Y$ , thus  $\mathcal{O}_X \rightarrow f_*\mathcal{O}_Y = j_*(\mathcal{O}_U/\mathcal{I}) = j_*j^*(\mathcal{O}_X/\mathcal{J})$  is surjective, because  $\mathcal{O}_U/\mathcal{I}$  is supported on a closed subset of  $U$ . Thus  $f$  is a closed immersion by (7.4.5.8).  $\square$

**Prop. (7.4.5.23)[Immersion are monomorphisms].** Immersions are monomorphisms.  $\lrcorner$

*Proof:* It is easy to check (7.4.4.5) for both open and closed immersions.  $\square$

**Prop. (7.4.5.24)[Equivalent Definitions of Closed Immersion].** The following are equivalent for a morphism  $f$ :

- $f$  is a closed immersion.
- $f$  is a proper monomorphism.
- $f$  is proper, unramified and u.i..
- $f$  is a u.c., unramified monomorphism.
- $f$  is u.c., unramified and u.i..
- $f$  is u.c., locally of f.t. and a monomorphism.
- $f$  is u.c., u.i., locally of f.t. and formally unramified.

$\lrcorner$

*Proof:* 4 – 7 are equivalent by (7.6.5.13). For the rest, Cf. [Sta], 04XV.  $\square$

### Universal Homeomorphism

**Prop. (7.4.5.25) [Criterion for Universal Homeomorphisms].** A morphism is a universal homeomorphism iff it is integral, surjective and universally injective.  $\square$

*Proof:* A universally homeomorphism is affine by (7.4.4.15). It is clearly u.c, so it is integral by (7.4.4.39). Conversely, it is integral hence u.c, and universally bijective, so it is universally homeomorphism.  $\square$

**Cor. (7.4.5.26).** The reduction  $X_{\text{red}} \rightarrow X$  is a universal homeomorphism, as closed immersion is u.c..  $\square$

### Separatedness

**Def. (7.4.5.27) [Separated Morphisms].**  $f : X \rightarrow Y \in \text{Sch}$  is called **separated morphism** if the diagonal  $\Delta : X \rightarrow X \times_Y X$  is a closed immersion. It is called **quasi-separated** if the diagonal is quasi-compact.

In fact  $\Delta$  is always an immersion because maps between affine scheme is separated so  $\Delta(X)$  is closed in  $\cup U_{ij} \otimes_{V_i} U_{ij}$  where  $U, V$  are affine open, hence it suffice to check the image is closed.  $\square$

**Prop. (7.4.5.28).** (Quasi-)Separatedness is local on the target because closed immersion and quasi-compact is local on the target (7.4.1.5).

(Quasi-)Separatedness satisfies base change trick by (7.4.4.2).  $\square$

**Prop. (7.4.5.29) [Graphs].** By (4.1.1.51), for  $X \rightarrow S$  and  $Y \rightarrow S$ , the map  $X = X \times_Y Y \rightarrow X \times_S Y$  is an immersion. It is closed immersion if  $Y \rightarrow S$  is separated, and it is qc if  $Y \rightarrow S$  is quasi-separated.  $\square$

**Cor. (7.4.5.30).** For  $X \rightarrow Y \in \text{Sch}/S$ , the map  $X = X \times_Y Y \rightarrow X \times_S Y$  is an immersion. It is closed immersion if  $Y \rightarrow S$  is separated, and it is qc if  $Y \rightarrow S$  is quasi-separated.  $\square$

**Cor. (7.4.5.31).** If  $s : S \rightarrow X$  is a section of  $f : X \rightarrow S$ , the above proposition applies to this case, because  $S = S \times_X X \rightarrow S \times_S X = X$ .  $\square$

**Prop. (7.4.5.32) [Characterizing (Quasi-)Separated Morphisms].** A morphism is quasi-separated iff for any two affine open that mapped into an affine open, their intersection is quasi-compact. This is because quasi-compact is local on the target.

A morphism is separated iff for any two affine open that mapped into an affine open, their intersection is affine and  $\mathcal{O}(U) \otimes_{\mathcal{O}(W)} \mathcal{O}(V) \rightarrow \mathcal{O}(U \cap V)$  is surjective. This is because closed immersion is local on the target (7.4.1.5).  $\square$

**Cor. (7.4.5.33).** Any  $X \in \text{NSch}$  is quasi-separated.  $\square$

**Cor. (7.4.5.34).** If  $g \circ f$  is (quasi-)separated, then so is  $f$ .  $\square$

**Cor. (7.4.5.35).** If  $X$  is (quasi-)separated, then  $X \rightarrow Y$  is (quasi-)separated.  $\square$

**Prop. (7.4.5.36) [Injective Maps are Separated].** Injective maps of schemes are separated.  $\square$

*Proof:* Let  $f : X \rightarrow Y$  be an injective map. Firstly  $X \times_Y X$  is a union of affine subschemes of the form  $U \times_V U$  where  $U, V$  are affine and  $f(U) \subset V$ : let  $z \in X \times_Y X$ , then  $\pi_1(z) = \pi_2(z)$ , because they map to the same point in  $Y$ , thus we can choose affine nbhds  $U, V$  of  $\pi_1(z)$  and  $f(\pi_1(z))$ . Now for each of these  $U \times_V U$ ,  $\Delta : U \rightarrow U \times_V U$  is closed immersion, thus  $\Delta_X$  is also closed immersion (7.4.1.5).  $\square$

**Cor. (7.4.5.37).** monomorphisms are separated because they are universal injective (7.4.4.4), and im-  
mersions are separated.  $\lrcorner$

**Prop. (7.4.5.38) [Affine Maps are Separated].** (Quasi-)Affine morphism is separated.  $\lrcorner$

*Proof:* Check the diagonal is a closed immersion directly.  $\square$

**Prop. (7.4.5.39).** if  $f : X \rightarrow S$  is affine,  $h : Y \rightarrow S$  is separated, and  $g : X \rightarrow Y$  is a morphism over  $S$ , then  $g$  is affine.  $\lrcorner$

*Proof:* Decompose  $g$  as  $X \rightarrow X \times_S Y \rightarrow Y$ , where the first map is base change of  $\Delta_Y$  and the second map is base change of  $f$ , so they are both affine.  $\square$

**Prop. (7.4.5.40) [Scheme-Theoretic Equalizer].** If  $X, Y$  are schemes over  $S$  and  $a, b : X \rightarrow S$  are morphisms, then there is a largest locally closed subscheme  $Z$  of  $X$  that  $a|_Z = b|_Z$ . And if  $Y/S$  is separated,  $Z$  is a closed subscheme of  $X$ .  $\lrcorner$

*Proof:* By definition,  $Z$  should be the fibered product:

$$\begin{array}{ccc} Z & \longrightarrow & X \\ \downarrow & & \downarrow (a,b) \\ Y & \xrightarrow{\Delta_Y} & Y \times_S Y \end{array}$$

then the theorem follows from the definition and base change trick of locally closed morphisms.  $\square$

**Prop. (7.4.5.41) [Qsqc Lemma].** If  $X \in \text{Sch}_{\text{qcqs}}$  and  $s \in \Gamma(X, \mathcal{O}_X)$ , then there is a natural isomorphism  $\Gamma(X, \mathcal{O}_X)_s \cong \Gamma(X_s, \mathcal{O}_X)$ .  $\lrcorner$

*Proof:* Firstly this is true for  $X$  affine by definition (7.2.7.1). In general, let  $U_i$  be an affine open cover of  $X$  that  $U_i \cap U_j = \cup_{k=0}^{c_{ij}} U_{ijk}$  be a finite cover by affine opens, then there is an exact sequence

$$\Gamma(X, \mathcal{O}_X) \rightarrow \prod_i \Gamma(U_i, \mathcal{O}_X) \rightarrow \prod_{ijk} \Gamma(U_{ijk}, \mathcal{O}_X).$$

Then we can take localization by  $s$  to get an exact sequence

$$\Gamma(X, \mathcal{O}_X)_s \rightarrow \prod_i \Gamma(D(s, U_i), \mathcal{O}_X)_s \rightarrow \prod_{ijk} \Gamma(D(s, U_{ijk}), \mathcal{O}_X)_s.$$

but  $D(s, U_i)$  is an open cover of  $X_s$  with  $D(s, U_i) \cap D(s, U_j) = \cup_k D(s, U_{ijk})$ , thus we get a natural isomorphism  $\Gamma(X, \mathcal{O}_X)_s \cong \Gamma(X_s, \mathcal{O}_X)$ .  $\square$

**Prop. (7.4.5.42).** If  $S \in \text{Sch}$ ,  $X \in \text{Sch}^{\text{sep}}/S$  and  $\varphi : T \rightarrow T' \in \text{Sch}/S$  is scheme-theoretically dominant, then the map  $\text{Hom}_S(T', X) \rightarrow \text{Hom}_S(T, X)$  is injective.  $\lrcorner$

*Proof:* For  $f, g : T \rightarrow X$ , consider  $(f, g) : T \rightarrow X \times X$ . Let  $Z \subset T$  be the inverse image of the diagonal  $\Delta_X \subset X \times X$ , and similarly consider the composite map  $(f', g') : T' \rightarrow T \rightarrow X \times X$  and let  $Z' \subset T'$  be the inverse image of the diagonal  $\Delta_X \subset X \times X$ . Then  $Z, Z'$  are closed subschemes of  $T, T'$  resp., and  $Z' = \varphi^{-1}(Z)$ . Now if  $f' = g'$ , then  $Z' = T'$ , and then  $Z = T$  because  $T \rightarrow T'$  is dominant.  $\square$

**Cor. (7.4.5.43).** If  $R \hookrightarrow R' \in \mathcal{C}\text{Ring}$  is an inclusion and  $X \in \text{Sch}^{\text{sep}}/R$ , then  $X(R) \rightarrow X(R')$  is injective.  $\lrcorner$

### Constructible Subsets of Schemes

**Prop. (7.4.5.44).** For  $X \in \text{Sch}$ , a subset  $E \subset |X|$  is locally constructible(4.12.2.10) iff  $E \cap |U|$  is constructible in  $|U|$  for any affine open subset  $U \subset X$ .  $\lrcorner$

*Proof:* Cf.[Sta]054C. ?  $\square$

**Cor. (7.4.5.45).** For  $X \in \text{Sch}_{\text{qcqs}}$ , any locally constructible subset  $E \subset |X|$ (4.12.2.10) is constructible.  $\lrcorner$

*Proof:* This follows from(4.12.2.12) and(4.12.2.15).  $\square$

**Prop. (7.4.5.46) [Qcqs Schemes are Spectral].** For any  $X \in \text{Sch}_{\text{qcqs}}$ ,  $|X|$  is a spectral space, by(7.2.7.11) and(27.2.3.20).  $\lrcorner$

**Prop. (7.4.5.47).** Suppose  $X \in \text{Sch}$  and  $E \subset |X|$  is a constructible subset. If  $\xi$  is the generic fiber of an irreducible component of  $X$ , then

- If  $\xi \in E$ , then some open nbhd of  $\xi$  is contained in  $E$ .
- If  $\xi \notin E$ , then some open nbhd of  $\xi$  is disjoint from  $E$ .

$\lrcorner$

*Proof:* Because the complement of a constructible subset is constructible(4.12.2.11), it suffices to show item2. We may assume  $X$  is affine, so  $E$  is constructible by(7.4.5.44). In this case  $X$  is qcqs thus a spectral space by(7.4.5.46), and  $\xi \notin \text{cl}(E)$  by(4.12.3.10).  $\square$

## 6 Proper & Projective

**Prop. (7.4.6.1)[Proper].** A **proper morphism(Schemes)** is a morphism of schemes that is separated, of finite type and universally closed.

Properness is local on the target, because all these three properties do(7.4.1.5). Properness satisfies the base change trick(7.4.4.2).  $\lrcorner$

**Prop. (7.4.6.2).** The class of proper morphisms satisfies the base change trick(7.4.4.1), by valuation criterion(7.4.6.13) and fibered products tricks.  $\lrcorner$

*Proof:* Closed immersion is proper because it is f.t. and is affine so separated(7.4.5.27), and it is universally closed because immersions are stable under base change(7.4.5.11).  $\square$

**Prop. (7.4.6.3) [Image of Proper Map].** If  $f : X \rightarrow Y$  is morphism between separated schemes f.t over  $S$ , then if  $X$  is proper, then  $f$  is proper(by base change trick) thus the image is closed, and is proper over  $S$  in its scheme-theoretic structure.  $\lrcorner$

*Proof:* Notice proper is qc, so by(7.4.5.13), the scheme-theoretic closure has the same underlying space as the image. Then use(7.4.4.8) to show it is u.c..  $\square$

**Cor. (7.4.6.4) [Connected Proper to Affine Constant].** A morphism from a connected proper scheme to an Noetherian affine scheme  $\text{Spec } A$  is constant.  $\lrcorner$

*Proof:* Because the image is proper, by(7.7.4.12), the global section of its image is a finite module over  $k$  thus Artinian(5.1.3.4) so has finitely many points and is discrete. But  $X$  is connected, thus it is constant.  $\square$

**Prop. (7.4.6.5) [Chevalley].** Let  $f : X \rightarrow Y$  be a morphism of schemes, the following are equivalent:

- $f$  is finite.
- $f$  is proper and affine.
- $f$  is proper with finite fibers.
- $f$  is proper and locally quasi-finite.
- $f$  is separated, u.c., locally of f.t. and has finite fibres.

┘

*Proof:* The fiber of  $f : X \rightarrow S$  is  $\text{Spec}(k(y) \otimes_A B)$ , which is Artinian(5.1.3.4), so it has finitely many primes and they are all closed. Finite morphism is proper because it is integral(7.4.4.39).

The converse follows from Zariski's main theorem(7.4.5.1).

Cf.[Sta]02LS.

□

**Cor. (7.4.6.6) [Quasi-Affine+Proper  $\iff$  Affine].** Let  $f : X \rightarrow \text{Spec } A$  be a quasi-affine and proper map, then  $f$  is affine.

┘

*Proof:* This follows from(7.7.2.8)(7.4.4.20) and the fact  $H^p(X, \mathcal{O}_X) = 0$  for  $p > 0$ .

□

**Prop. (7.4.6.7) [Quasi-Finite+Proper  $\iff$  Finite].** Let  $f : X \rightarrow S \in \text{Sch}$  be proper, and  $s \in S$  that  $\#f^{-1}(s) < \infty$ , then there exists a nbhd  $V$  of  $s \in S$  that  $f^{-1}(V) \rightarrow V$  is finite.

┘

*Proof:* By(7.4.4.46),  $f$  is quasi-finite at the points of  $f^{-1}(s)$ . By(7.4.4.48) the set  $U$  of points that  $f$  is quasi-finite is open. Denote  $Z = X \setminus U$ , then  $f(Z)$  is closed in  $S$  and doesn't contain  $s$ . Then  $V = S \setminus f(Z)$  satisfies the requirement by(7.4.6.5).

□

**Prop. (7.4.6.8) [Generically Finite+Proper  $\implies$  Finite].** Let  $f : X \rightarrow S$  be a proper morphism of locally Noetherian schemes and  $y \in Y$  satisfies  $\dim \mathcal{O}_{Y,y} \leq 1$ , and if one of the following holds:

- For every generic point  $\eta$  of  $X$  s.t.  $f(\eta)$  generalizes  $y$ ,  $k(\eta)/k(f(\eta))$  is algebraic.
- $f$  is quasi-finite at every generic point of  $x$ .
- $f$  is quasi-finite on a dense subset of  $X$ .

then there exists an open nbhd  $V$  of  $y \in Y$  s.t.  $f^{-1}(V) \rightarrow V$  is finite.

┘

*Proof:* Cf.[Sta]0AB7.

□

**Example (7.4.6.9) [Non-Proper Schemes].** If  $k \in \text{Field}$  and  $X \in \text{Sch}^{\text{sep}}/k$  with  $\dim X \geq 1$ , and  $x \in |X|_0$ , then  $X \setminus \{x\}$  is not proper over  $k$ .

┘

*Proof:* Cf.[Sta]0A24.

□

**Def. (7.4.6.10) [Modification and Alteration].** A **modification(of schemes)** of  $X \in \text{Sch}$  is a scheme  $X'$  together with a proper birational map  $X' \rightarrow X$ .

A **alteration(of schemes)** of  $X$  is a scheme  $X'$  together with a proper dominant morphism  $f : X' \rightarrow X$  that for some non-empty open  $U$  of  $X$ ,  $f^{-1}(U) \rightarrow U$  is finite.

┘

**Prop. (7.4.6.11) [Modifications and Alterations].** Any modification is an alteration(7.4.6.10). And if  $Y \rightarrow X \in \text{Sch}$  be an alteration, then it can be decomposed into  $Y \rightarrow W \rightarrow X$  where  $Y \rightarrow X$  is a modification and  $W \rightarrow X$  is finite surjective.

┘

*Proof:* ? Use Stein factorization.

□

### Valuation Criteria

**Lemma (7.4.6.12) [Valuation Criteria Lemma].** If  $X$  is a scheme and  $x \rightarrow y$  is a specialization of pts, then for any field extension  $K/k(x)$ , there is a valuation ring  $A \subset K$  and a morphism  $\text{Spec } A \rightarrow X$  that maps the generic pt  $\eta$  to  $x$  and the unique closed pt to  $y$ .

Moreover, if  $X$  is locally Noetherian, then  $A$  can be chosen to be a DVR.  $\lrcorner$

*Proof:* There is a morphism  $\mathcal{O}_{X,y} \rightarrow k(x) \rightarrow K$ , so there is a valuation ring  $A$  with field of fractions  $K$  that dominate the image of  $\mathcal{O}_{X,y}$  by (12.2.2.1), which is also a local ring (5.1.1.11). Then this is what we desire.

For the locally Noetherian case, add (12.2.3.8).  $\square$

**Prop. (7.4.6.13) [Valuation Criteria].** The valuation criterion for  $\text{Spec } K \rightarrow \text{Spec } R$  where  $R$  is a valuation ring with field of fractions  $K$ : Given a morphism  $f : X \rightarrow S$ ,

1. If it is qc, then it is universally closed iff there is at least one lifting.
2. it is separated iff it is quasi-separated and there is at most one lifting.
3. it is proper iff it is finite type, quasi-separated and lifting exists uniquely.

$\lrcorner$

Moreover, if  $S$  is locally Noetherian and  $f$  is locally of f.t., then it suffices to check for discrete valuation rings. *Proof:*

1. Firstly, in this case, by (7.4.4.9), it suffices to prove that: specializations lift along any base change of  $f$  iff it has at least one lifting. If specializations lift along any base change of  $f$ , change  $S$  to  $\text{Spec } A$  and  $X$  to  $X \times_S \text{Spec } A$ . Let  $x'$  be the image of  $\text{Spec } K \rightarrow X$ , then by hypothesis there is a specialization  $x' \rightarrow x$  where  $x$  maps to the closed pt of  $\text{Spec } A$ . Then we get a map  $A \rightarrow \mathcal{O}_{X,x} \rightarrow k(x') \rightarrow K$ , which is exactly the quotient map  $A \rightarrow K$ . So the image of  $\mathcal{O}_{X,x}$  in  $K$  dominates  $A$ , which means it is just  $A$ . Thus we get a map  $\mathcal{O}_{X,x} \rightarrow A$ , which gives a map  $\text{Spec } A \rightarrow X$  that commutes  $\text{Spec } K$ .

Conversely, if  $f$  has at least one lifting, then any base change of  $f$  also has at least one lifting by categorical reason. Thus it suffices to show specializations lift along  $f$ . Let  $s' \rightarrow s$  be a specialization in  $S$  and  $x' \in X$  maps to  $s'$ , we can apply (7.4.6.12) to  $k(s') \subset k(x') = K$ , then we get a lifting diagram, and the image of the closed pt of  $\text{Spec } A$  under the lifting is a point mapping to  $s$ .

2. If it is separated, then if there are two liftings, then consider their equalizer, it is a closed subscheme of  $\text{Spec } A$  by (7.2.7.18), and it contains the generic pt, so it equals  $\text{Spec } A$ , as desired. Conversely, if there are at most one lifting, then we want to prove the diagonal is closed. But by (7.4.5.27) and (7.4.5.22) and the valuation criterion for u.c., it suffices to prove the existence of a lifting for the diagonal map (7.4.6.13). But in fact, a valuation diagram for the diagonal correspond to two liftings of a valuation criterion for  $X \rightarrow S$ , then they are the same, and  $\text{Spec } A \rightarrow X \times_S X$  lifts along the diagonal.

3. follows from the above two.

$\square$

**Prop. (7.4.6.14) [Extension of Rational Maps].** Let  $X, Y$  be schemes over  $S$ ,  $X$  is locally Noetherian and  $Y/S$  is proper. If there is a morphism from an open subset  $U$  of  $X$  to  $Y$ , and there is a point  $x$  in the closure of  $U$  with the stalk being a valuation ring, then the morphism can be extended to an open set containing  $x$ .  $\lrcorner$

*Proof:* We can replace  $X$  by an affine open nbhd of  $X$ . By (7.4.7.1), we assume  $X$  is affine and  $\Gamma(X, \mathcal{O}_X) \subset \mathcal{O}_{X,x}$ . In particular  $X$  is integral with generic pt  $\xi$  with residue field  $K$ . Then  $U$  contains  $\xi$ . By the valuation criterion (7.4.6.13), the morphism  $\text{Spec } K \xrightarrow{\xi} U \rightarrow Y$  can be lifted to a morphism  $\text{Spec } \mathcal{O}_{X,x} \rightarrow Y$ , thus lemma (7.4.7.2) shows there is a morphism on a nbhd  $V$  of  $X$  spreading this morphisms.

Now because  $Y/S$  is separated, the equalizer of this morphism and  $f$  on their intersection is a closed subscheme by (7.4.5.40), but it contains  $\xi$ , so they coincide on the intersection, so we are done.  $\square$

**Prop. (7.4.6.15) [Singularity in Codimension1].** Let  $\varphi : X \rightarrow X'$  be a rational map from a locally Noetherian scheme  $X/K$  regular in codimension1 to a proper scheme  $X'/K$  with maximal domain  $U$ , then

$$\text{codim}(X \setminus U, X) \geq 2.$$

In particular, if  $X$  is non-singular curve, then  $\varphi$  is a morphism.  $\lrcorner$

*Proof:* Use (7.4.6.14), noticing that the stalk at a point of codimension1 is a DVR (5.3.5.21).  $\square$

### Projective Morphism

**Def. (7.4.6.16) [Projective Morphisms].** A **projective morphism**  $X \rightarrow Y$  is a closed immersion  $X \rightarrow \text{Proj}(\mathcal{E})$  for some  $\mathcal{E} \in \mathcal{QCoh}^{\text{ft}}/Y$ .

A **strongly projective morphism**  $X \rightarrow Y$  is a closed immersion  $X \rightarrow \text{Proj}(\mathcal{E})$  for some  $\mathcal{E} \in \mathcal{QCoh}^{\text{lf,ft}}/Y$ .

An **H-projective morphism**  $X \rightarrow Y$  is a closed immersion  $X \rightarrow \mathbb{P}_Y^n$  for some  $n \in \mathbb{Z}_+$ .

An **H-quasi-projective morphism** is an H-projective morphism composed with a quasi-compact open immersion.

A **locally projective morphism** is a morphism  $f : X \rightarrow Y \in \text{Sch}$  s.t. there exists a covering  $U_i$  of  $Y$  that  $f^{-1}(U_i) \rightarrow U_i$  is projective.  $\lrcorner$

**Prop. (7.4.6.17).** For a morphism  $f : X \rightarrow S$ , the following are equivalent:

- $f$  is locally projective.
- There is a covering  $U_i$  of  $S$  that  $f^{-1}(U_i) \rightarrow U_i$  is H-projective.

$\lrcorner$

*Proof:* Clearly 2 implies 1, and for the converse, it suffices to show that projective morphism is locally H-projective. Locally on each affine open nbhd  $U = \text{Spec } R$ ,  $X_U$  is isomorphic to a closed subscheme of  $P(\mathcal{E})$  for some f.t. Qco sheaf of  $\mathcal{O}_U$ -modules  $\mathcal{E}$ . Write  $\mathcal{E} = \widetilde{M}$  for some f.t.  $R$ -module  $M$ , and choose a set of generators  $x_1, \dots, x_n$  for  $M$ , which induces a surjection of graded  $R$ -algebra  $R[X_0, \dots, X_n] \rightarrow \text{Sym}_R(M)$ , then the corresponding morphism  $P(\mathcal{E}) \rightarrow \mathbb{P}^n$  is a closed immersion, so  $f^{-1}(U)$  is a H-projective scheme over  $U$ .  $\square$

**Prop. (7.4.6.18).** H-(quasi-)projectiveness is stable under base change and composition. (because Segre embedding is closed). Disjoint union of f.m. projective morphisms is projective (embed into the Segre embedding).  $\lrcorner$

*Proof:* [Sta]01WE.  $\square$

**Cor. (7.4.6.19) [Projective Maps are Proper].** Projective morphisms are locally projective and locally projective morphisms are proper. Thus a quasi-projective morphism is locally of f.t. and separated (7.4.5.37).  $\lrcorner$

*Proof:* Because locally projective and proper are both local on the base (7.4.4.2), it suffices to show that H-projective morphism is proper by (7.4.6.17).

Because properness satisfies base change trick (7.4.4.2), it suffices to show  $\mathbb{P}_S^n \rightarrow S$  is proper. Also this is base change of  $\mathbb{P}_{\mathbb{Z}}^n \rightarrow \mathbb{Z}$ , it suffices to check this one.  $\mathbb{P}_{\mathbb{Z}}^n$  is clearly separated by (27.2.3.20) (looking at the natural affine covering), and qc. Finally we show it is u.c. using valuation criterion (7.4.6.13):

Let 
$$\begin{array}{ccc} \text{Spec } K & \longrightarrow & X \\ \downarrow & \nearrow & \downarrow \\ \text{Spec } R & \longrightarrow & \text{Spec } \mathbb{Z} \end{array}$$
 be a diagram, by induction on  $n$ , we may assume the image  $\xi_1$  of  $\text{Spec } K$

is not contained in any of the hypersurface  $V(x_i)$ , then  $x_i$  are all invertible in  $\mathcal{O}_{\xi_1}$ , and there is a morphism  $\varphi : k(\xi_1) \rightarrow K$ . Let  $f_{ij}$  be the image of  $x_i/x_j$  under  $\varphi$ , and choose  $k$  which  $f_{k0}$  has the minimal valuation, then  $f_{ik} \in R$  for any  $i$ , which means there is a map

$$\mathbb{Z}[x_0/x_k, \dots, x_n/x_k] \rightarrow R$$

compatible with  $\varphi$ , or equivalently a map  $\text{Spec } R \rightarrow D(x_k) \subset X$  commuting the diagram.  $\square$

**Prop. (7.4.6.20) [Descent for Projectiveness].** Let  $X$  be a scheme over a field  $k$ , and  $K/k$  is a field extension, then  $X_k$  is (quasi-)projective iff  $X_K$  is (quasi-)projective.  $\lrcorner$

*Proof:* This follows from (7.5.4.21) and f.f. descent.  $\square$

**Prop. (7.4.6.21).** H-Projective scheme over  $\text{Spec } A$  is of the form  $\text{Proj } S$  where  $S_0 = A$  and  $S$  is f.g over  $S_0$  by  $S_1$  (7.5.2.11).  $\lrcorner$

*Proof:*  $\square$

**Prop. (7.4.6.22) [Projective Morphisms and Closed Embeddings].** Let  $k$  be an alg.closed field and  $\pi : X \rightarrow Y$  is a projective morphism of algebraic schemes over  $k$  that is injective on closed points and injective on tangent vectors at closed points, then  $\pi$  is a closed embedding.  $\lrcorner$

*Proof:* Cf. [Vak17]P506.  $\square$

**Prop. (7.4.6.23) [Chow's Lemma].** Let  $X \rightarrow S$  be separated of f.t over a qcqs  $S$ , then there is a birational, H-projective map  $\pi : X' \rightarrow X$  over  $S$  that  $X'$  is quasi-projective over  $S$ .

If  $X$  is proper, then  $X'$  is projective over  $S$ . And if  $X$  is integral/irreducible/reduced over  $S$ ,  $X'$  can also be chosen to be so.  $\lrcorner$

*Proof:* We only prove for  $S$  Noetherian, for the general case, Cf. [Sta]0203.

In this case all schemes here are Noetherian. Suppose  $X_i, i \leq r$  are irreducible components of  $X$  with generic points  $\eta_i$ , by (7.4.7.5) and the fact  $X$  is qc we can find a finite affine cover  $X = \cup U_i$  that each  $U_i$  contains all the generic points of  $X$ , thus  $U = U_1 \cap \dots \cap U_n$  is dense in  $X$ . Let  $X^*$  be the schematic-closure of  $U$  in  $X$ , and  $U_i^* = U_i \cap X^*$ , then we may replace  $X$  by  $X^*$  and assume that  $U$  is schematically dense in  $X$  by (7.4.5.18) as  $X$  is qs. By (7.5.4.24) and (7.4.4.19), there are immersions

$U_i \rightarrow \mathbb{P}_S^{n_i}$  together with a closed subscheme  $Z_i \subset \mathbb{P}_S^{n_i}$  that  $U_i \rightarrow Z$  is a scheme-theoretically dense open immersion (7.4.5.21).

Consider the map  $(j_1, \dots, j_m) : U \rightarrow \mathbb{P}_S^{n_1} \times \dots \times \mathbb{P}_S^{n_m}$  with scheme-theoretic image  $Z$ , and the commutative diagrams

$$\begin{array}{ccc} U & \xrightarrow{(j_1, \dots, j_m)} & \mathbb{P}_S^{n_1} \times \dots \times \mathbb{P}_S^{n_m} \\ \downarrow & & \downarrow \pi_i \\ U_i & \xrightarrow{j_i} & \mathbb{P}_S^{n_i} \end{array},$$

which induces a map  $p_i : Z \rightarrow Z_i$  (7.4.5.14) which is proper.

Consider  $p_i^{-1}(j_i(U_i)) = V_i$  and  $X' = \cup_i V_i$  which is an open subscheme of  $Z \subset \mathbb{P}_S^{n_1} \times \dots \times \mathbb{P}_S^{n_m}$  thus quasi-projective over  $S$ .

Finally, we prove that the morphism  $p_i : V_i \rightarrow U_i$  glue together to a proper birational morphism  $\pi : X' \rightarrow X$ : this is because they are compatible on  $U$ , which is scheme-theoretically dense in  $V_i$  for each  $i$  thus also scheme-theoretically dense in  $V_i \cap V_j$ , thus  $p_i$  and  $p_j$  are compatible on  $V_i \cap V_j$  as the target  $X$  is separated over  $S$ .

To show  $\pi$  is proper, firstly notice  $\pi^{-1}(U_i) = V_i$ : there are decompositions  $V_i \rightarrow \pi^{-1}(U_i) \rightarrow U_i$ , where  $V_i \rightarrow U_i$  is proper, thus  $V_i \rightarrow \pi^{-1}(U_i)$  is also proper and  $V_i$  is schematically dense in  $\pi^{-1}(U_i)$  because it contains  $U$ , so it is an isomorphism.

For the same reason  $U \rightarrow \pi^{-1}(U)$  is an isomorphism. Finally  $\pi$  is projective because it factors through some map  $X' \rightarrow X \times_S \mathbb{P}_S^n = \mathbb{P}_X^n$  and it is proper.

If  $X$  is reduced, then  $X'$  is reduced by (7.4.5.16), and if  $X$  is irreducible, then  $X' = Z$  is the closure of  $j(X)$  by (7.4.5.21), which is irreducible.  $\square$

## 7 Technical Lemmas

**Lemma (7.4.7.1).** Let  $X$  be a scheme and  $x$  a point, then there exists an open affine nbhd  $U$  of  $x$  that  $\mathcal{O}_X(U) \rightarrow \mathcal{O}_{X,x}$  is injective, if any of the follows holds:

- $X$  is integral.
- $X$  is locally Noetherian.
- $X$  is reduced with f.m. irreducible components.

$\perp$

*Proof:* This problem is clearly local hence follows from the algebra case (5.1.1.37).  $\square$

**Lemma (7.4.7.2) [Spread Out Stalk Morphism].** Let  $X, Y$  be schemes over  $S$ ,  $s \in S$  and  $x, y$  be pts over  $S$ , then:

- Let  $f, g : X \rightarrow Y$  be morphisms over  $S$  that  $f(x) = g(x) = y$  and  $f_x^\# = g_x^\#$ , then  $f = g$  on a nbhd  $U$  of  $x$  if any of the following holds:
  - (a)  $Y/S$  is locally of f.t..
  - (b)  $X$  is integral.
  - (c)  $X$  is locally Noetherian.
  - (d)  $X$  is reduced with f.m. irreducible components.
- Let  $\varphi : \mathcal{O}_{Y,y} \rightarrow \mathcal{O}_{X,x}$  be a local ring map over  $\mathcal{O}_{S,s}$ , then there is a morphism  $f$  from a nbhd  $U$  of  $x$  mapping to  $Y$  that  $f(x) = y$ , and  $f_x^\# = \varphi$ , if any of the following holds:

- (a)  $Y/S$  is locally of f.p..
- (b)  $Y/S$  is locally of f.t. and  $X$  is integral.
- (c)  $Y/S$  is locally of f.t. and  $X$  is locally Noetherian.
- (d)  $Y/S$  is local of f.t. and  $X$  is reduced with f.m. irreducible components.

┘

*Proof:* Cf. [\[Sta\]0BX6](#).

□

**Prop. (7.4.7.3) [Base Change of Fields is Quotient Map].** For any scheme  $X$  over a field  $k$  and algebraic extensions  $K/k$ ,  $X_K \rightarrow X$  is a quotient map, as it is surjective [\(7.6.2.1\)](#), continuous and closed [\(7.4.4.39\)](#).

┘

**Lemma (7.4.7.4).** Let  $X$  be a qs scheme and  $Z_i$  be a finite set of irreducible components of  $X$ . Let  $\eta_i$  be the generic point of  $Z_i$ , then there are open affine subsets  $U_i \in \mathcal{U}_i$  that  $U_1, \dots, U_n$  are pairwise disjoint.

┘

*Proof:*

□

**Lemma (7.4.7.5).** Let  $X$  be a qs scheme and  $Z_i$  be a finite set of irreducible components of  $X$ . Let  $\eta_i$  be the generic point of  $Z_i$  and  $x \in X$ , then there is an affine open subset of  $X$  containing  $x$  and  $\eta_i$ .

┘

*Proof:* Let  $x \in Z_1, \dots, Z_r$  but  $x \notin Z_{r+1}, \dots, Z_n$ , then we can find an arbitrary affine open nbhd  $W$  of  $x$  that contains  $\eta_1, \dots, \eta_r$  but not  $\eta_{i+1}, \dots, \eta_n$ . By [\(7.4.7.4\)](#), we may choose pairwise disjoint affine open nbhds  $U_{r+1} \in \mathcal{U}_{r+1}, \dots, U_n \in \mathcal{U}_n$ . Now  $U_i \cap W$  is quasi-compact and doesn't contain  $\eta_i$ , so we can shrink  $U_i$  s.t.  $W \cap U_i = \emptyset$  by [\(5.1.7.24\)](#). Then  $U = W \coprod (\coprod U_i)$  satisfies the desired condition. □

## 7.5 Quasi-Coherent Sheaves on Schemes

### 1 (Quasi-)Coherent Sheaves

**Lemma (7.5.1.1) [Associated Qco Sheaves on Affine Scheme].** On an affine scheme  $\text{Spec } A$ , there is a sheaf  $\widetilde{M}$ , that is  $M_f$  on  $\text{Spec } A_f$ . To check it is a sheaf, we only need to check to affine coverings, and this follows from (5.4.2.2).  $\lrcorner$

**Prop. (7.5.1.2) [Qco Sheaves on Affine Schemes].**  $M \mapsto \widetilde{M}$  is an equivalence to the category of quasi-coherent sheaves over  $\text{Spec } A$ . In particular,

$$\text{Hom}_A(M, \Gamma(X, \mathcal{G})) \cong \text{Hom}_{\mathcal{O}_X}(\widetilde{M}, \mathcal{G}),$$

so  $M \mapsto \widetilde{M}$  commutes with colimits and is exact, and commutes with pullbacks.

When  $A$  is Noetherian, this also induces an equivalence between finite  $A$ -modules and coherent sheaves over  $\text{Spec } A$ , because finiteness for modules is local (7.4.1.5).  $\lrcorner$

*Proof:* For any  $A$ -module  $M$ , there is a sheaf of modules  $\mathcal{F}_M$  on  $X = \text{Spec } A$  by (7.2.2.26). This is left adjoint to  $\Gamma$  and defines a functor from the category of  $A$ -modules to the category of  $\mathcal{O}_{\text{Spec } A}$ -modules.

By universal property of  $\mathcal{F}_M$  (7.2.2.26), there is a natural map  $\mathcal{F}_M \rightarrow \widetilde{M}$  corresponding to the ring map  $M \mapsto \Gamma(\text{Spec } A, \widetilde{M}) = M$ . The induced maps on the stalk at a point  $x$  is  $M \otimes_A \mathcal{O}_{X,x} \rightarrow M_{\mathfrak{p}}$ , which is isomorphism, so  $\mathcal{F}_M \cong \widetilde{M}$ .

From the universal property of  $\widetilde{M} = \mathcal{F}_M$ ,  $\text{Hom}(\widetilde{M}, \widetilde{N}) = \text{Hom}(M, N)$ , thus  $\sim$  is fully faithful, to show it is an equivalence, it suffices to show for any Qco sheaf  $\mathcal{F}$  on  $\text{Spec } A$ , the natural map  $\Gamma(\widetilde{X}, \mathcal{F}) \rightarrow \mathcal{F}$  is an isomorphism: ? Cf. [Sta]01IA.

If  $0 \rightarrow M_1 \rightarrow M \rightarrow M_2 \rightarrow 0$  is exact, then  $0 \rightarrow \widetilde{M}_1 \rightarrow \widetilde{M} \rightarrow \widetilde{M}_2 \rightarrow 0$  is exact, because localization is exact.  $\square$

**Prop. (7.5.1.3) [properties of (Quasi-)Coherent Sheaves on Schemes].**

- $\mathcal{QCoh}(X)$  and  $\text{Coh}(X)$  are weak Serre subcategories of  $\text{Mod}_{\mathcal{O}_X}$ , and  $\text{Coh}(X)$  is a Serre subcategory of  $\mathcal{QCoh}(X)$ .
- Colimits in  $\text{Mod}(\mathcal{O}_X)$  preserves  $\mathcal{QCoh}(X)$ , because localization is exact.
- Tensor product of two (Q)co sheaf is (Q)co, and locally free if they are locally free. More explicitly,  $\widetilde{M \otimes_A N} \cong \widetilde{M} \otimes_{\mathcal{O}_X} \widetilde{N}$  as tensor product commutes with  $\pi^*$ .
- If  $\mathcal{F}$  is Qco, then so does  $T(\mathcal{F})$ ,  $\text{Sym}(\mathcal{F})$  and  $\wedge(\mathcal{F})$ , by (7.2.3.12).
- Given  $\mathcal{F}, \mathcal{G} \in \mathcal{QCoh}(\mathcal{F})$  that  $\mathcal{F}$  is f.p.,  $\mathcal{H}om(\mathcal{F}, \mathcal{G}) \in \mathcal{QCoh}(X)$ , by (7.2.3.2) and (7.5.1.2). More explicitly, affine locally  $\mathcal{H}om_X(\widetilde{M}, \widetilde{N}) = \text{Hom}_A(M, N)$ .
- pullback preserves  $\mathcal{QCoh}(X)$  and  $\text{Coh}(X)$ , by (7.2.2.29). More explicitly, if  $\text{Spec } B \subset Y$  is mapped into  $\text{Spec } A \subset X$ , then  $f^*(\mathcal{F})(\text{Spec } B) = \mathcal{F}(\text{Spec } A) \otimes_A B$ , using the fact  $\widetilde{M} = \mathcal{F}_M = \pi^* M$ .

$\lrcorner$

*Proof:* 1:  $\text{Coh}(X)$  follows from (7.2.2.28). For  $\text{QCoh}(X)$ , it follows from (7.5.1.2) that the kernel and cokernel of  $\varphi : \widetilde{M} \rightarrow \widetilde{N}$  is just  $\widetilde{\ker \varphi}$  and  $\widetilde{\text{Coker } \varphi}$  which is Qco, for the extension of Qco, use (7.7.1.3) that the global section is exact, so there is a morphism of exact sequences  $\Gamma(\widetilde{X}, \widetilde{\mathcal{F}}_i)(U) \rightarrow \mathcal{F}_i(U)$ , and five lemma gives the result.  $\square$

**Prop. (7.5.1.4) [Qco Sheaves of F.T./F.P].** Let  $X = \text{Spec } A$  and  $\mathcal{F} = \widetilde{M}$  a Qco sheaf on  $X$ , then  $\mathcal{F}$  is of f.t./f.p. if  $M$  is of f.t./f.p. over  $A$ .  $\square$

*Proof:* These follows from the fact finiteness/f.p. are local properties for modules over a ring (5.1.4.4).  $\square$

**Def. (7.5.1.5) [Locally Projective Qco Sheaves].** Let  $X$  be a scheme, then a **locally projective Qco sheaf** is a Qco sheaf  $\mathcal{F}$  on  $X$  that is affine locally a locally projective module sheaf.

Being locally projective for Qco sheaves satisfies fpqc descent, by (5.4.2.1).  $\square$

**Prop. (7.5.1.6) [Qcqs Pushforward].** If  $f$  is qcqs, then the pushforward of a Qco sheaf is Qco. (Used in??).  $\square$

*Proof:* The question is local so we let  $Y$  be affine, and then  $X$  is qcqs, so we cover it with affine opens  $U_i$  and their intersections are  $U_{ijk}$ . Then we see by sheaf property

$$0 \rightarrow f_* \mathcal{F} \rightarrow \oplus_i f_*(\mathcal{F}|_{U_i}) \rightarrow \oplus_{ijk} f_*(\mathcal{F}|_{U_{ijk}})$$

The last two are Qco because two are maps between affine schemes, so the first is Qco.  $\square$

**Prop. (7.5.1.7) [Qco Sheaves on Qcqs Schemes].** For a qcqs scheme  $X$  and  $s \in \Gamma(X, \mathcal{O}_X)$ , and a Qco module  $\mathcal{F}$ ,  $(\Gamma(X, \mathcal{F}))_s \cong \Gamma(X_s, \mathcal{F})$ .  $\square$

*Proof:* The canonical map  $f : X \rightarrow \text{Spec } \Gamma(X, \mathcal{O}_X)$  (7.2.7.5) is qcqs, so  $f_* \mathcal{F}$  is Qco on  $\text{Spec } \Gamma(X, \mathcal{O}_X)$  by (7.5.1.6). Then the result follows from the fact  $f^{-1}(\text{Spec } (\Gamma(X, \mathcal{O}_X)_s)) = X_s$  and the definition of  $f_*$ .  $\square$

**Lemma (7.5.1.8) [Extending Qco Sheaves].** Let  $i : U \rightarrow X$  be a quasi-compact open immersion of schemes,  $\mathcal{F}$  a Qco  $\mathcal{O}_X$ -module and  $\mathcal{G} \subset \mathcal{F}|_U$  a Qco  $\mathcal{O}_U$ -submodule, then there exists a Qco  $\mathcal{O}_X$ -submodule  $\mathcal{G}' \subset \mathcal{F}$  that  $\mathcal{G}'|_U = \mathcal{G}$ .  $\square$

*Proof:* immersion is separated (7.4.5.37), so  $i_* \mathcal{G}$  is a Qco  $\mathcal{O}_X$ -sheaf by (7.5.1.6), and it is a submodule of  $i_* i^* \mathcal{F}$ , so the kernel

$$\mathcal{H} = \ker(\mathcal{F} \oplus i_* \mathcal{G} \rightarrow i_* i^* \mathcal{F})$$

is also Qco by (7.5.1.3), and  $\mathcal{H} \subset \mathcal{F}$ ,  $\mathcal{H}|_U = \mathcal{G}$ .  $\square$

**Prop. (7.5.1.9) [Extending Qco Sheaves of F.T.].** Let  $X$  be a qcqs scheme, and  $U \subset X$  a qc open subset,  $\mathcal{F}$  a Qco  $\mathcal{O}_X$ -module and  $\mathcal{G} \subset \mathcal{F}|_U$  a Qco  $\mathcal{O}_U$ -submodule of f.t., then there exists a Qco  $\mathcal{O}_X$ -submodule  $\mathcal{G}' \subset \mathcal{F}$  of finite type that  $\mathcal{G}'|_U = \mathcal{G}$ .  $\square$

*Proof:* Let  $n$  be the minimal number of affine open subsets  $U_i$  that  $X = U \cup \bigcup U_i$ , by induction on  $n$ , it suffices to prove for  $n = 1$ . Thus we may assume  $X = U \cup V$  where  $U, V$  are affine opens. Now  $U \cap V$  is qc because  $X$  is qs. Then we can change  $(X, U)$  to  $(V, U \cap V)$ , because we can glue the resulting sheaf. Then we reduce to the case  $X$  is affine.

Let  $X = \text{Spec } R$  and  $\mathcal{F} = \widetilde{M}$ , then by (7.5.1.8), there exists a Qco sheaf  $\widetilde{N}$  that  $\widetilde{N}|_U = \mathcal{G}$ . By hypothesis we can cover  $U$  by f.m. open affine  $D(f_i)$  that  $N_{f_i}$  is f.g., by element  $x_{ij}/f_j^{n_i}$ . Let  $N'$  be the submodule of  $N$  generated by these elements  $x_{ij}$ , then  $\widetilde{N}'$  meets our requirement.  $\square$

**Cor. (7.5.1.10)[Qco Sheaf is a Direct Union of Qco Sheaves of F.T.].** Let  $X$  be a qcqs scheme, then any Qco sheaf  $\mathcal{F}$  on  $X$  is a direct colimit of its Qco subsheaves of f.t..  $\lrcorner$

*Proof:* It is a direct colimit because the sum of two Qco sheaves of f.t. is also Qco of f.t.. Now for any affine open  $U \subset X$  and  $s \in \mathcal{O}_X(U)$ ,  $s$  generates a Qco  $\mathcal{O}_U$ -submodule of f.t. of  $\mathcal{F}|_U$ , and by (7.5.1.9) this extends to a Qco  $\mathcal{O}_X$ -submodule of  $\mathcal{F}$ . Then we see that the direct colimit of Qco subsheaves of f.t. of  $\mathcal{F}$  contains elements of  $\mathcal{F}(U)$  for any affine open subset  $U$ , thus it is just  $\mathcal{F}$ .  $\square$

**Def. (7.5.1.11)[Rank of Sheaves].** Let  $X$  be a scheme and  $\mathcal{F}$  a Qco sheaf on  $X$ ,  $p \in X$ , then the **rank of  $\mathcal{F}$  at  $p$**  is  $\text{rank}_p(\mathcal{F}) = \dim_{k(p)} \mathcal{F}_p / \mathfrak{m}_p \mathcal{F}_p$ .  $\lrcorner$

**Prop. (7.5.1.12)[Maximal Qco Submodule].** For  $X$  a scheme and any  $\mathcal{O}_X$ -module  $\mathcal{F}$ , there is a Qco submodule of  $\mathcal{F}$  maximal among all Qco submodules of  $\mathcal{F}$ . This is because a direct colimit of Qco sheaves is Qco (7.5.1.3).  $\lrcorner$

**Prop. (7.5.1.13)[Integral and Finite Modules].** Let  $X$  be a qcqs scheme and  $\mathcal{A}$  an integral Qco  $\mathcal{O}_X$ -submodule, then

- $\mathcal{A}$  is the directed colimits of its finite Qco  $\mathcal{O}_X$ -modules.
- $\mathcal{A}$  is a direct colimit of finite and finitely presented Qco  $\mathcal{O}_X$ -modules.

$\lrcorner$

*Proof:* Cf. [Sta]0817.  $\square$

**Def. (7.5.1.14). ?**

- for a closed immersion  $Y \rightarrow X$ , there is  $i^! : \mathcal{Q}\text{Coh}(X) \rightarrow \mathcal{Q}\text{co}(Y)$  that is right adjoint to  $i_*$ :  $i^! \mathcal{G} = i^*(\mathcal{H}_Z(\mathcal{G})')$ , where  $\mathcal{H}_Z(\mathcal{G})$  is the sheaf of sections annihilated by  $\mathcal{I}$  and  $\mathcal{F}'$  is the maximal Qco sheaf of  $\mathcal{F}$ .
- For  $f$  proper between locally Noetherian scheme, there is a inverse sheaf  $f^! \mathcal{G} = \mathcal{H}\text{om}_Y(f_* \mathcal{O}_X, \mathcal{G})$ , which maps  $\mathcal{Q}\text{co}(Y)$  to  $\mathcal{Q}\text{Coh}(X)$  by (7.5.1.33) and??. When  $f$  is affine, in particular when it is finite, then  $f^!$  is right adjoint to  $f_*$  on  $\mathcal{Q}\text{co}(7.9.2.12)$ .

$\lrcorner$

### Associated Points

**Def. (7.5.1.15)[Weakly Associated Points].** Let  $X \in \text{Sch}$  and  $\mathcal{F} \in \mathcal{Q}\text{Coh}(X)$ , then a **weakly associated point of  $\mathcal{F}$**  is the set of points  $x \in X$  that  $\mathfrak{m}_x \subset \mathcal{O}_{X,x}$  is weakly associated to the module  $\mathcal{F}_x$ . The set of w.ass points are denoted by  $\text{WeakAsso}(\mathcal{F})$ . The **weakly associated points of  $X$**  is the weakly associated points of  $\mathcal{O}_X$ .

Similarly we can stalkwise define the set of **associated points** of  $X$ .  $\lrcorner$

**Def. (7.5.1.16)[Embedded Points].** Let  $X$  be a scheme and  $\mathcal{F}$  a Qco sheaf on  $X$ , then an **embedded point** of  $\mathcal{F}$  is an associated point that is a specialization of another associated point.  $\lrcorner$

**Prop. (7.5.1.17)[Properties of Associated Points].** Let  $X$  be a scheme and  $\mathcal{F}_i$  be Qco sheaves on  $X$ , then

1.  $\text{Ass}(\mathcal{F}) \subset \text{WeakAsso}(\mathcal{F}) \subset \text{Supp}(\mathcal{F})$ .
2. If  $0 \rightarrow \mathcal{F}_1 \rightarrow \mathcal{F}_2 \rightarrow \mathcal{F}_3 \rightarrow 0$  is an exact sequence, then  $\text{WeakAss}(\mathcal{F}_1) \subset \text{WeakAss}(\mathcal{F}_2)$ , and  $\text{WeakAss}(\mathcal{F}_2) \subset \text{WeakAsso}(\mathcal{F}_1) \cup \text{WeakAsso}(\mathcal{F}_3)$ .
3.  $\text{WeakAss}(\mathcal{F}) = \emptyset$  iff  $\mathcal{F} = 0$ .

4. The generic points of  $\text{Supp}(\mathcal{F})$  are in  $\text{WeakAsso}(\mathcal{F})$ . In particular, generic points of  $X$  are in  $\text{WeakAss}(X)$ .
5. If  $X$  is locally Noetherian, then  $\text{Ass}(\mathcal{F}) = \text{WeakAsso}(\mathcal{F})$ .
6. If  $X$  is reduced, then  $\text{WeakAsso}(X)$  is just the generic points of  $X$ . In particular,  $X$  has no embedded points.
7. If  $X$  is locally Noetherian, then an associated point is an embedded point iff it is not a generic point of  $\text{Supp}(\mathcal{F})$ .
8. If  $X$  is locally Noetherian and  $\mathcal{F}$  is coherent, then  $\mathcal{F}$  has no embedded points iff it satisfies  $(S_1)$ .
9. If  $X$  is locally Noetherian of dimension  $\leq 1$ , then  $X$  is C.M. iff it has no embedded points.

┘

*Proof:* By (5.2.5.21), these reduces to the affine case, so they follows from

- (5.2.5.13)(5.2.5.16).
- (5.2.5.14).
- (5.2.5.16).
- (5.2.5.16).
- (5.2.5.21).
- (5.2.5.24).
- (5.2.5.23).
- [Sta]031Q.
- [Sta]0BXG.

□

**Prop. (7.5.1.18).** Let  $X$  be a scheme and  $\mathcal{F} \in \mathcal{QCoh}(X)$ . If  $U$  is an open subset of  $X$  that contains  $\text{WeakAsso}(\mathcal{F})$ , then  $\Gamma(X, \mathcal{F}) \rightarrow \Gamma(U, \mathcal{F})$  is injective.

┘

*Proof:* If  $s \in \Gamma(X, \mathcal{F})$  be a section that restricts to 0 on  $U$ , let  $\mathcal{F}'$  be the subsheaf generated by  $s$ , then  $\text{WeakAss}(\mathcal{F}') \subset \text{WeakAsso}(\mathcal{F})$ , but  $\text{Supp}(\mathcal{F}') \subset X \setminus U$ , thus  $\text{WeakAss}(\mathcal{F}') = \emptyset$ , so  $\mathcal{F}' = 0$  by (7.5.1.17). □

**Prop. (7.5.1.19) [Schematically Dense and Associated Points].** Let  $X$  be a locally Noetherian scheme and  $U \subset X$  an open subset, then the following are equivalent:

- $U$  is schematically dense in  $X$ .
- $U$  is dense in  $X$  and contains all the embedded points of  $X$ .
- $U$  contains  $\text{Ass}(X)$ .

┘

*Proof:* The problem is local, so we assume  $X = \text{Spec } A$ , then 2, 3 are clearly equivalent.

Let  $U = \cup_i D(f_i)$ , then by (7.4.5.15),  $U$  is schematically dense in  $A$  iff  $A \rightarrow \prod A_{f_i}$  is injective. If  $\mathfrak{p} = \text{Ann}(x)$  for some  $x \in A$ , then  $x$  maps to some non-zero element of  $A_{f_i}$ , then  $f_i \notin \mathfrak{p}$ , so  $\mathfrak{p} \subset D(f_i) \subset U$ . Conversely, if  $\text{Ass}(X) \subset U$ , then every map  $A \rightarrow A_{\mathfrak{p}}$  factors through  $A \rightarrow A_{f_i}$  for some  $i$ , so injectivity of  $A \rightarrow \prod_{\mathfrak{p} \in \text{Ass}(X)} A_{\mathfrak{p}}$  implies injectivity of  $A \rightarrow \prod_i A_{f_i}$ . □

**Prop. (7.5.1.20).** Let  $X$  be a scheme and  $\varphi : \mathcal{F} \rightarrow \mathcal{G} \in \mathcal{QCoh}(X)$  that  $\mathcal{F}_x \rightarrow \mathcal{G}_x$  is injective for any  $x \in \text{WeakAss}(\mathcal{F})$ , then  $\varphi$  is injective.  $\lrcorner$

*Proof:* The hypothesis says  $\text{WeakAss}(\ker(\varphi)) = 0$ , so  $\ker(\varphi) = 0$  by (7.5.1.17).  $\square$

### Fitting Ideals

**Def. (7.5.1.21) [Fitting Ideals].** Let  $X \in \text{Sch}$  and  $\mathcal{F} \in \mathcal{QCoh}^{\text{ft}}(X)$ , the **fitting ideal** of  $\mathcal{F}$  is defined to be  $\mathfrak{f}(\mathcal{F})$ . Cf. [Sta]0C3C.  $\lrcorner$

### Locally Free Sheaves

**Prop. (7.5.1.22) [Locally Free is Stalkwise].**  $\mathcal{F} \in \mathcal{QCoh}^{\text{pf}}(X)$  is locally free iff its stalks are all free, by (5.3.1.7).  $\lrcorner$

**Def. (7.5.1.23) [Locally Free Sheaves].** Let  $X \in \text{Sch}$  and  $\delta : X \rightarrow \mathbb{N}$  a locally constant function, then the category of locally free sheaves of rank  $\delta$  is denoted by  $\text{Coh}_{\text{lf}}^{\delta}(X)$ . The category of locally free coherent sheaves is denoted by  $\text{Coh}_{\text{lf}}(X)$ .  $\lrcorner$

**Prop. (7.5.1.24) [Locally Free Sheaves].** Suppose  $0 \rightarrow \mathcal{F}' \rightarrow \mathcal{F} \rightarrow \mathcal{F}'' \rightarrow 0$  is an exact sequence of sheaves on a scheme  $X$ , then

- If  $\mathcal{F}', \mathcal{F}''$  are both locally free, then so is  $\mathcal{F}$ .
- If  $\mathcal{F}, \mathcal{F}'$  are both locally free of finite rank, then so is  $\mathcal{F}''$ .

$\lrcorner$

*Proof:* Firstly of all in each case all sheaves are Qco by (7.5.1.3).

1: on an affine open  $U = \text{Spec } A \subset X$ , the exact sequence is induced by  $0 \rightarrow A^I \rightarrow \Gamma(U, \mathcal{F}) \rightarrow A^J \rightarrow 0$ , so it splits and  $\Gamma(U, \mathcal{F}) \cong A^{I+J}$  is free.

2: on an affine open  $U = \text{Spec } A \subset X$ , the exact sequence is induced by  $0 \rightarrow \Gamma(U, \mathcal{F}') \rightarrow A^m \rightarrow A^n \rightarrow 0$ , where the map  $A^m \rightarrow A^n$  is represented by a  $n \times m$  matrix  $M$ . Then  $U$  is covered by open subsets  $U_i$  that some  $n \times n$  minor of  $M$  is invertible. Then after a change of coordinates on each subset,  $\mathcal{F}(U_i) \cong A^{m-n}$ .  $\square$

**Prop. (7.5.1.25).** For a exact sequence  $0 \rightarrow \mathcal{F}' \rightarrow \mathcal{F} \rightarrow \mathcal{F}'' \rightarrow 0$  in  $\mathcal{QCoh}^{\text{free}}(X)$ , there is a filtration of  $\text{Sym}^r \mathcal{F}$ :

$$0 = \mathcal{G}^{r+1} \subset \mathcal{G}^r \subset \dots \subset \mathcal{G}^0 = \text{Sym}^r \mathcal{F}$$

that

$$\mathcal{G}^p / \mathcal{G}^{p+1} \cong \text{Sym}^p \mathcal{F}' \otimes \text{Sym}^{r-p} \mathcal{F}''.$$

$\lrcorner$

*Proof:* On any affine open subset, choose a splitting of the exact sequence, then use coordinates.  $\square$

**Prop. (7.5.1.26).** For a exact sequence  $0 \rightarrow \mathcal{F}' \rightarrow \mathcal{F} \rightarrow \mathcal{F}'' \rightarrow 0$  in  $\text{Coh}_{\text{lf}}(X)$ , there is a filtration of  $\wedge^r \mathcal{F}$ :

$$0 = \mathcal{G}^{r+1} \subset \mathcal{G}^r \subset \dots \subset \mathcal{G}^0 = \wedge^r \mathcal{F}$$

that

$$\mathcal{G}^p / \mathcal{G}^{p+1} \cong \wedge^p \mathcal{F}' \otimes \wedge^{r-p} \mathcal{F}''.$$

In particular,

$$\wedge \mathcal{F}' \otimes \wedge \mathcal{F}'' \cong \wedge \mathcal{F}.$$

and when  $\mathcal{F}'' \cong \mathcal{L}$  is a line bundle, there is an exact sequence

$$0 \rightarrow \wedge^r(\mathcal{F}') \rightarrow \wedge^r(\mathcal{F}) \rightarrow \wedge^{r-1}(\mathcal{F}') \otimes \mathcal{L} \rightarrow 0$$

┘

*Proof:* On any affine open subset, choose a splitting of the exact sequence, then use coordinates.

□

**Prop. (7.5.1.27) [Perfect Pairing Wedge Product Sheaf].** Let  $\mathcal{F}$  be a locally free sheaf of rank  $n$ , then there is a perfect pairing  $\wedge^r \mathcal{F} \otimes \wedge^{n-r} \mathcal{F} \rightarrow \wedge \mathcal{F}$  which is a perfect pairing, i.e. it induces an isomorphism  $\wedge^r \mathcal{F} \cong (\wedge^{n-r} \mathcal{F})^\vee \otimes \wedge \mathcal{F}$ .

┘

*Proof:* The map is natural, and the isomorphism can be seen at the level of stalks, by (7.2.3.11). □

**Prop. (7.5.1.28).** Let  $0 \rightarrow \mathcal{F} \rightarrow \mathcal{G} \rightarrow \mathcal{H} \rightarrow 0$  is an exact sequence in  $\mathcal{Q}\text{Coh}(X)$  where  $\mathcal{H}$  is a locally free sheaf, then for any Qco sheaf  $\mathcal{E}$  of  $X$ , then for any Qco sheaf  $\mathcal{E}$  on  $X$ , there is an exact sequence of sheaves

$$0 \rightarrow \mathcal{H}om(\mathcal{H}, \mathcal{E}) \rightarrow \mathcal{H}om(\mathcal{G}, \mathcal{E}) \rightarrow \mathcal{H}om(\mathcal{F}, \mathcal{E}) \rightarrow 0.$$

In particular,  $0 \rightarrow \mathcal{H}^\vee \rightarrow \mathcal{G}^\vee \rightarrow \mathcal{F}^\vee \rightarrow 0$  is exact.

┘

*Proof:* As  $\mathcal{H}om(-, \mathcal{E})$  is left exact, it suffices to show the last one is surjective. This is local, so we may assume  $0 \rightarrow \mathcal{F} \rightarrow \mathcal{G} \rightarrow \mathcal{H} \rightarrow 0$  is  $0 \rightarrow M \rightarrow N \rightarrow A^n \rightarrow 0$ , so this sequence splits, and then  $\mathcal{H}om(\mathcal{G}, \mathcal{E}) \rightarrow \mathcal{H}om(\mathcal{F}, \mathcal{E})$  is surjective, by (7.5.1.3). □

**Prop. (7.5.1.29) [Grothendieck].** Every object in  $\text{Coh}^{\text{free}, r}(\mathbb{P}_k^1)$  is isomorphic to  $\bigoplus_{i=1}^r \mathcal{O}(a_i)$  for a unique non-decreasing sequence of integers  $a_1, \dots, a_r$ .

┘

*Proof:* Use induction on  $r$ . The  $r = 1$  case follows from (7.5.3.16). For a general  $r$ , let  $\mathcal{E} \in \text{Coh}^{\text{free}, r}(\mathbb{P}_k^1)$ , then  $\mathcal{E}(m)$  is generated by global sections for  $m$  large as  $\mathcal{O}_{\mathbb{P}^1}$  is ample, and  $H^0(\mathcal{E}(-m)) = H^1(\mathcal{E}^\vee(m)) = 0$  by Serre duality and (7.7.2.5), so there is a maximal  $m$  s.t. there is a non-zero map  $\mathcal{O}(m) \rightarrow \mathcal{E}$ . The image of this map is also locally free and has degree  $\geq m$  by (7.13.2.8), so it must have degree  $m$  and  $\mathcal{O}_X(m) \rightarrow \mathcal{E}$  is injective by (7.13.2.8). Now the cokernel  $\mathcal{F}$  is also locally free, because otherwise let  $\mathcal{F}_{\text{tor}}$  be the torsion part of  $\mathcal{F}$  (7.13.2.16), and let  $\mathcal{N}$  be the inverse image of  $\mathcal{F}_{\text{tor}}$  in  $\mathcal{E}$ , then it is locally free thus invertible, and  $\mathcal{O}(m) \hookrightarrow \mathcal{N}$ , so  $N = \mathcal{O}(m)$  by (7.13.2.8), and  $\mathcal{F}_{\text{tor}} = 0$ .

There is an exact sequence

$$0 \rightarrow \mathcal{O}(-1) \rightarrow \mathcal{E}(-m-1) \rightarrow \mathcal{F}(-m-1) \rightarrow 0$$

which induces  $H^0(\mathcal{E}(-m-1)) = H^0(\mathcal{F}(-m-1)) = 0$  as  $H^1(\mathbb{P}_k^1, \mathcal{O}(-1)) = 0$ , so by induction hypothesis  $\mathcal{F} = \bigoplus_{i=1}^{r-1} \mathcal{O}(a_i)$  and  $a_i \leq m$ . To show this sequence splits, notice  $\text{Ext}^1(\mathcal{F}(-m-1), \mathcal{O}(-1)) = \bigoplus_{i=1}^{r-1} H^1(\mathcal{O}(m-a_i)) = 0$ . □

**Prop. (7.5.1.30) [Splitting Principal].** Let  $X$  be an integral scheme and  $\mathcal{E} \in \text{Coh}^{\text{free}}(X)$ , then there exists a modification  $X' \rightarrow X$  s.t.  $f^* \mathcal{E}$  has a filtration by invertible sheaves.

┘

*Proof:* Use induction on  $\text{rank}(\mathcal{E})$ . If  $\text{rank}(\mathcal{E}) \leq 1$ , this is trivial, otherwise let  $\text{rank}(\mathcal{E}) = r$ ,  $P = \mathbf{P}(\mathcal{E})$ , then  $\pi : P \rightarrow X$  is proper and there is a canonical surjection  $\pi^* \mathcal{E} \rightarrow \mathcal{O}_P(1)$ , with kernel in  $\text{Coh}^{\text{free}, r-1}(P)$ . Let  $U$  be an open subset of  $X$  s.t.  $\mathcal{E}$  is trivial, then  $\pi^{-1}(U) \cong \mathbb{P}_U^{r-1}$ . Let  $s : U \rightarrow \mathbb{P}^{r-1}(U)$  be a section, and let  $X'$  be the scheme-theoretic closure of  $U$ , which is integral. Then  $X' \rightarrow X$  is proper and thus a modification. Now  $f^* \mathcal{E}$  has an invertible quotient, and we are done by induction hypothesis. □

### Coherent Sheaves

**Prop. (7.5.1.31) [Coh(X)].** The category of coherent sheaves on a scheme  $X$  is denoted by  $\text{Coh}(X)$ . When  $\mathcal{O}_X \in \text{Coh}(X)$ ,  $\text{Coh}(X) = \mathcal{Q}\text{Coh}^{\text{pf}}(X)$  (7.2.2.28).

In particular when  $X$  is locally Noetherian,  $\text{Coh}(X) = \mathcal{Q}\text{Coh}^{\text{ft}}(X)$ . And the notion of coherence are used usually only when  $X$  is locally Noetherian.

(Quasi-)coherence is an affine local property by (7.2.2.30).  $\mathcal{Q}\text{Coh}(X)$  is an Abelian category, by (7.2.2.28).  $\lrcorner$

**Lemma (7.5.1.32).** If  $f$  is finite, then  $f_*$  maps coherent sheaves to coherent sheaves.  $\lrcorner$

*Proof:* This is trivial.  $\square$

**Prop. (7.5.1.33) [Proper Pushforward].** If  $f$  is a proper morphism between locally Noetherian schemes, then  $f_*$  maps coherent sheaves to coherent sheaves.  $\lrcorner$

*Proof:* Immediate from Grothendieck's coherence theorem (7.7.4.11).  $\square$

**Prop. (7.5.1.34) [Artin-Rees].** Let  $X$  be a Noetherian scheme,  $\mathcal{F}$  a coherent  $\mathcal{O}_X$ -module,  $\mathcal{G}$  a Qco subsheaf of  $\mathcal{F}$ ,  $\mathcal{I} \subset \mathcal{O}_X$  a Qco sheaf of ideals, then there exists some  $c > 0$  that for all  $n \geq c$

$$\mathcal{I}^{n-c}(\mathcal{I}^c \mathcal{F} \cap \mathcal{G}) = \mathcal{I}^n \mathcal{F} \cap \mathcal{G}.$$

$\lrcorner$

*Proof:* Cover  $X$  by f.m. affine open subsets, then this follows from the affine case (5.2.2.13).  $\square$

**Cor. (7.5.1.35) [Vanish Analytically].** Let  $X$  be a Noetherian scheme,  $\mathcal{F}$  a coherent  $\mathcal{O}_X$ -module, for any element  $f \in \bigcap_n \mathfrak{m}_x^n \mathcal{F}$ ,  $f$  vanishes at a nbhd of  $x$ .  $\lrcorner$

*Proof:* This follows from the intersection theorem (5.2.2.14).  $\square$

**Prop. (7.5.1.36) [Deligne].** On a Noetherian scheme  $X$ , let  $\mathcal{F}$  be a Qco sheaf,  $\mathcal{G}$  be a coherent sheaf and  $\mathcal{I}$  be a Qco sheaf of ideals corresponding to  $Z$ ,  $U = X - Z$ , then we have

$$\varinjlim \text{Hom}_{\mathcal{O}_X}(\mathcal{I}^n \mathcal{G}, \mathcal{F}) \cong \text{Hom}_{\mathcal{O}_U}(\mathcal{G}|_U, \mathcal{F}|_U).$$

In particular,

$$\varinjlim \text{Hom}_{\mathcal{O}_X}(\mathcal{I}^n, \mathcal{F}) \cong \Gamma(U, \mathcal{F}).$$

$\lrcorner$

*Proof:* Cf. [Sta]01YB.  $\square$

**Prop. (7.5.1.37) [Kleinmann].** If  $X$  is a Noetherian integral separated locally factorial scheme, then every coherent sheaf on  $X$  is a quotient of a finite locally free sheaf.  $\lrcorner$

*Proof:* Cf. [Hartshorne P238].  $\textcolor{red}{?}$   $\square$

**Prop. (7.5.1.38) [Support of Modules].** For  $X \in \text{Sch}$  and  $\mathcal{F} \in \mathcal{Q}\text{Coh}^{\text{ft}}(X)$ , the support (7.2.2.2)  $\text{Supp}(\mathcal{F})$  is closed by (7.2.2.24).

For a flat morphism  $f$ ,  $\text{Supp}(f^*(\mathcal{F})) = f^{-1}(\text{Supp } \mathcal{F})$ , by (7.2.2.18).  $\lrcorner$

*Proof:* because affine locally, for a set of generators  $x_i$  of  $M$ ,  $\text{Ann}(\mathcal{F}) = \cup \text{Ann}(x_i)$ , and  $\text{Ann}(x_i)$  is closed.  $\square$

**Cor. (7.5.1.39).** Any coherent sheaf on an integral scheme is locally free over a dense open subset.  $\lrcorner$

**Cor. (7.5.1.40) [Geometric Nakayama].** If  $\mathcal{F} \in \mathcal{QCoh}^{\text{ft}}(X)$  and for some  $p \in U \subset X$  and  $a_1, \dots, a_n \in \mathcal{F}(U)$  generate  $\mathcal{F}_p \otimes k(p)$ , then there is an affine nbhd  $V \subset U$  that  $a_1, \dots, a_n$  generate  $\mathcal{F}(V)$ .  $\lrcorner$

**Cor. (7.5.1.41) [Upper-Semicontinuity of Ranks].** For a Qco sheaf  $\mathcal{F}$  of f.t. over  $X$ , the rank function  $p \mapsto \text{rank}_p(\mathcal{F})$  is an upper semicontinuous function on  $X$ .  $\lrcorner$

*Proof:* By Nakayama,  $\varphi(y)$  is equal to the minimal number of generators of the  $\mathcal{O}_y$ -module  $\mathcal{F}_y$ . But these generators extends to a nbhd of  $y$ , so  $\varphi \leq n$  on this nbhd.  $\square$

**Def. (7.5.1.42) [Schematic Support].** Let  $X$  be a scheme and  $\mathcal{F}$  a Qco sheaf of f.t. over  $X$ , then the **annihilating ideal** is the ideal  $\mathcal{I} \subset \mathcal{O}_X$  that is affine-locally defined by  $\text{Ann}(\mathcal{F}(U)) \subset \mathcal{O}_X(U)$ , and the **schematic support**  $\text{Supp}(\mathcal{F})$  of  $\mathcal{F}$  is the closed subscheme of  $X$  corresponding to  $\text{Ann}(\mathcal{F})$ .  $\lrcorner$

**Prop. (7.5.1.43).** Let  $\mathcal{F}$  be a Qco sheaf of f.t. over a reduced scheme that the rank function  $\text{rank}_p(\mathcal{F})$  is locally constant, then it is locally free.  $\lrcorner$

*Proof:* Let  $\text{rank}_p(\mathcal{F}) = n$ , by (7.5.1.38), for any  $x \in X$ , there exists an affine nbhd  $U = \text{Spec } A$  of  $x$  and a surjection  $f : \mathcal{O}_U^n \rightarrow \mathcal{F}_U$ . Consider the kernel of  $f$ . If  $(r_1, \dots, r_n)$  is in the kernel and  $r_1 \neq 0$ , then  $r_1 \notin \mathfrak{p}$  for some prime  $\mathfrak{p}$  of  $A$ , as  $A$  is reduced. Then  $\text{rank}_{x_{\mathfrak{p}}}(\mathcal{F}) < n$ , contradiction.  $\square$

### Torsion-Free Sheaves

**Def. (7.5.1.44) [Torsion Sheaves].** Let  $X$  be an integral scheme, then a **torsion sheaf** is a Qco sheaf that its stalk at the generic point of  $X$  vanishes. Equivalently, for any affine open  $U \subset X$ ,  $\mathcal{F}(U)$  is a torsion  $\mathcal{O}_X(U)$ -module.  $\lrcorner$

**Prop. (7.5.1.45).** A torsion  $\mathcal{O}_X$ -module of f.t. on an integral scheme vanish on a dense open subset.  $\lrcorner$

**Prop. (7.5.1.46).** For  $X \in \text{Sch}_{\text{int}}$ , any  $\mathcal{F} \in \mathcal{QCoh}(X)$  factors as  $0 \rightarrow \mathcal{F}_{\text{tor}} \rightarrow \mathcal{F} \rightarrow \mathcal{F}_{\text{tf}} \rightarrow 0$ , where  $\mathcal{F}$  is a torsion sheaf (7.5.1.44) and  $\mathcal{F}_{\text{tf}}$  is Qco and torsion-free.  $\lrcorner$

**Cor. (7.5.1.47).** The subpresheaf  $U \mapsto \{s \in \mathcal{F}(U) | s_{\eta} = 0\}$  is a sheaf, and it is also Qco as on an affine open  $U \subset X$ , it is just  $\mathcal{F}(U)_{\text{tor}}$ . So the quotient is clearly Qco and torsion-free.  $\lrcorner$

**Prop. (7.5.1.48) [Formal Glueing of Vector Bundles].** If  $X$  be a Dedekind scheme and  $x \in |X|_0$ , let  $\hat{X}_x = \text{Spec}(\hat{\mathcal{O}}_{X,x}) \rightarrow X$  be the completion of  $X$  at  $x$ , then there is a pullback of categories:

$$\begin{array}{ccc} \text{Coh}_{\text{lf}}(X) & \longrightarrow & \text{Coh}_{\text{lf}}(X \setminus \{x\}) \\ \downarrow & & \downarrow \\ \text{Coh}_{\text{lf}}(\hat{X}_x) & \longrightarrow & \text{Coh}_{\text{lf}}(\hat{X}_x \setminus \{x\}) \end{array}$$

$\lrcorner$

*Proof:* By glueing, we may study locally near  $x$ , then we can assume that  $X = \text{Spec } A$  is affine. Now shrink  $X$  even more, we can assume that  $x$  is defined by a single  $f \in A$  (localized at the maximal ideal defined by  $x$ ), then we finish by Beauville-Laszlo theorem (5.4.2.15).  $\square$

### Devissage of Coherent Sheaves

**Lemma (7.5.1.49).** Let  $X$  be a Noetherian scheme and  $\mathcal{F} \in \text{Coh}(X)$ , let  $\mathcal{I}$  be a sheaf of ideals that correspond to  $Z$ , then  $\text{Supp}(\mathcal{F}) \subset Z$  iff  $\mathcal{I}^n \mathcal{F} = 0$  for some  $n$ . (This follows easily from Noetherian and (5.2.5.8)).  $\lrcorner$

**Lemma (7.5.1.50).** Let  $X$  be a Noetherian scheme and  $\mathcal{F} \in \text{Coh}(X)$  s.t.  $\text{Supp}(\mathcal{F}) = Z_1 \cup Z_2$  where  $Z_1, Z_2$  are closed, then there is an exact sequence of coherent sheaves  $0 \rightarrow \mathcal{G}_1 \rightarrow \mathcal{F} \rightarrow \mathcal{G}_2 \rightarrow 0$  that  $\text{Supp}(\mathcal{G}_i) \subset Z_i$ .  $\lrcorner$

*Proof:* Let  $\mathcal{I}$  be the ideal defining the induced reduced structure of  $Z_2$ , we use the exact sequence  $0 \rightarrow \mathcal{I}^n \mathcal{F} \rightarrow \mathcal{F} \rightarrow \text{Coker} \rightarrow 0$  and use (7.5.1.49) on  $X \setminus Z_2$  to find  $n$  large that  $\text{Supp}(\mathcal{I}^n \mathcal{F}) \subset Z_1$ , and notice  $\text{Coker}$  has support in  $Z_2$ .  $\square$

**Lemma (7.5.1.51).** Let  $X$  be an integral scheme and  $Z \subset X$  an integral closed subscheme with generic point  $Z$ . If  $\mathcal{F} \in \text{Coh}(X)$  satisfies  $\mathcal{F}_\xi$  is annihilated by  $\mathfrak{m}_\xi$ , then there exists some  $r \geq 0$  and sheaf of ideals  $\mathcal{I}$  on  $Z$  and an injection  $i_*(\mathcal{I}^{\oplus r}) \hookrightarrow \mathcal{F}$  that is an isomorphism at  $\xi$ .  $\lrcorner$

*Proof:* Cf. [Sta]01YE.  $\square$

**Prop. (7.5.1.52).** Let  $X$  be a Noetherian scheme and  $\mathcal{F} \in \text{Coh}(X)$ , then there is a filtration of coherent sheaves that the quotients are pushforward of ideal sheaves on integral subschemes of  $X$ . This is analogous to the filtration in the module case.  $\lrcorner$

*Proof:* We consider the set of these counterexamples and their  $\text{Supp}$ , then use Noetherian induction. The minimal one  $Z$  is irreducible, otherwise from (7.5.1.50) we find a filtration for it. Let the ideal of sheaf of the induced reduced structure of  $Z$  be  $\mathcal{I}$ , then  $\mathcal{I}^n \mathcal{F} = 0$  for some  $n$  by (7.5.1.49), then we may assume  $\mathcal{I} \mathcal{F} = 0$ . Then we use (7.5.1.51) to finish the proof.  $\square$

**Cor. (7.5.1.53) [Basic Dévissage].** Let  $X \in \text{NSch}_{\text{cpct}}$  and  $\mathcal{P}$  be a property of coherent sheaves on  $X$  s.t.

- (1) for an exact sequence of sheaves:  $0 \rightarrow \mathcal{F}_1 \rightarrow \mathcal{F} \rightarrow \mathcal{F}_2 \rightarrow 0$ , if  $\mathcal{F}_i$  has  $\mathcal{P}$ , then  $\mathcal{F}$  has  $\mathcal{P}$ .
- (2) for any integral closed subscheme  $i : Z \subset X$  and any Qco sheaf of ideals  $\mathcal{I}$  on  $Z$ ,  $\mathcal{P}$  holds for  $i_* \mathcal{I}$ .

then  $\mathcal{P}$  holds for any coherent sheaf of  $X$ .  $\lrcorner$

**Lemma (7.5.1.54).** Cf. [Sta]01YH.  $\lrcorner$

**Prop. (7.5.1.55) [Dévissage of Coherent Sheaves I].** Let  $X$  be a Noetherian scheme and  $P$  be a property of coherent sheaves on  $X$  s.t.

- (1) for an exact sequence  $0 \rightarrow \mathcal{F}_1 \rightarrow \mathcal{F} \rightarrow \mathcal{F}_2 \rightarrow 0 \in \text{Coh}(X)$ , if two of them have  $P$ , then the third also has  $P$ .
- (2) For every integral closed subscheme  $Z$  of  $X$  with generic point  $\xi$ , there is a  $\mathcal{G} \in \text{Coh}(X)$  that
  - (a)  $\text{Supp } \mathcal{G} = Z$ .
  - (b)  $\mathcal{G}_\xi \cong \mathcal{O}_X / \mathfrak{m}_x$ .
  - (c)  $P$  holds for  $\mathcal{G}$ .

Then  $P$  holds for every coherent sheaf on  $X$ .  $\lrcorner$

*Proof:* Suppose otherwise, let  $Z$  be the minimal counterexample of item2 of (7.5.1.55). Then it is easily seen that  $P$  holds for any  $\mathcal{F}$  with support strictly contained in  $\mathbb{Z}$ . Then take  $\mathcal{G}$  as in item2, and let  $0 \rightarrow i_*(\mathcal{I}^{\oplus r}) \hookrightarrow \mathcal{G} \rightarrow \text{Coker} \rightarrow 0$ , then  $\text{Supp}(\text{Coker})$  is strictly contained in  $Z$ , and  $r = 1$  by hypothesis, so  $i_*(\mathcal{I})$ . Then for any other sheaf of ideals  $\mathcal{I}'$  on  $Z$ , if  $\mathcal{I}'$  is supported on a smaller subscheme, then it has  $P$ , otherwise there are two exact sequences

$$0 \rightarrow i_*\mathcal{I} \rightarrow i_*(\mathcal{I} + \mathcal{I}') \rightarrow \mathcal{Q} \rightarrow 0,$$

$$0 \rightarrow i_*\mathcal{I}' \rightarrow i_*(\mathcal{I} + \mathcal{I}') \rightarrow \mathcal{Q} \rightarrow 0,$$

where  $\mathcal{I}, \mathcal{Q}$  are supported on smaller subschemes, so  $P$  also holds for  $\mathcal{I}'$ .  $\square$

**Prop. (7.5.1.56) [Dévissage of Coherent Sheaves II].** Let  $X$  be a Noetherian scheme and  $P$  be a property of coherent sheaves on  $X$  s.t.

- (1) for an exact sequence of sheaves:  $0 \rightarrow \mathcal{F}_1 \rightarrow \mathcal{F} \rightarrow \mathcal{F}_2 \rightarrow 0$ , if  $\mathcal{F}_i$  has  $P$ , then  $\mathcal{F}$  has  $P$ .
- (2) If  $\mathcal{F}^{\oplus r}$  has  $P$ , then  $\mathcal{F}$  has  $P$ .
- (3) For every integral closed subscheme  $Z$  of  $X$  with generic point  $\xi$ , there is a  $\mathcal{G} \in \text{Coh}(X)$  that
  - (a)  $\text{Supp } \mathcal{G} = Z$ .
  - (b)  $\mathcal{G}_\xi$  is annihilated by  $\mathfrak{m}_\xi$ .
  - (c) For every sheaf of ideals  $\mathcal{I}$  on  $X$  that  $\mathcal{I}_\xi = \mathcal{O}_{X,\xi}$ , there is a Qco subsheaf  $\mathcal{G}' \subset \mathcal{I}\mathcal{G}$  that  $\mathcal{G}'_\xi = \mathcal{G}_\xi$  and  $P$  holds for  $\mathcal{G}'$ .

Then  $P$  holds for every coherent sheaf on  $X$ .  $\lrcorner$

*Proof:* Cf. [Sta]01YM.  $\square$

## 2 Projective Spaces

**Prop. (7.5.2.1).** For any graded ideal  $I \subset S$ ,  $V_+(I) = \emptyset$  iff  $S_+ \subset \sqrt{I}$ .  $\lrcorner$

*Proof:*  $\square$

**Def. (7.5.2.2) [Projective Schemes].** For a graded ring  $S$ , we have a scheme  $\text{Proj}(S)$  that consists of homogenous primes of  $S$  minus  $S_+$  and the affine cover is  $D(f) = \{p | f \notin p\}$ , and  $\mathcal{O}(D(f)) = \text{Spec } S_{(f)}$ , where  $S_{(f)}$  is the degree zero part of  $T^{-1}S$ . It has  $\mathcal{O}_p = S_{(p)}$ .  $\lrcorner$

*Proof:* Cf. [Sta]01M5?  $\square$

**Cor. (7.5.2.3).** For any graded ring  $S$ ,  $\text{Proj}(S)$  is a separated scheme.  $\lrcorner$

*Proof:* Check that for standard affine opens  $D_+(f)$  and  $D_+(g)$ ,  $D_+(f) \cap D_+(g) = D_+(fg)$  is affine open, and  $S_{(f)} \otimes_{\mathbb{Z}} S_{(g)} \rightarrow S_{(fg)}$  is surjective, which are both clear.  $\square$

**Prop. (7.5.2.4) [Representing Functor of Projective Schemes].** Let  $S$  be a graded ring generated by  $S_1$  over  $S_0$ , then  $\text{Proj}(S)$  represents the functor that maps a scheme  $Y$  to the set of pairs  $(\mathcal{L}, \psi)$ , where  $\mathcal{L}$  is an invertible sheaf on  $Y$ , and  $\psi : S \rightarrow \Gamma_*(Y, \mathcal{L})$  is a graded ring homomorphism that  $\mathcal{L}$  is generated by the global sections  $\psi(S_1)$ , up to strict equivalences.  $\lrcorner$

*Proof:* Cf. [Sta]01NA.  $\square$

**Prop. (7.5.2.5) [Associated Qco Sheaves].** Let  $M$  be a graded  $S$ -module, then

- there is a unique Qco sheaf  $\widetilde{M} \in \mathcal{QCoh}(\text{Proj}(S))$  s.t.  $\Gamma(D_+(f), \widetilde{M}) = M_f$  and the restrictions are compatible with base changes..
- For a point  $x \in \text{Proj}(S)$  corresponding to a homogenous prime not containing  $S_+$ ,  $\widetilde{M}_x = M_{(p)}$ .
- $M \mapsto \widetilde{M}$  is an exact functor from the category of graded  $S$ -modules to  $\mathcal{QCoh}(\text{Proj}(S))$ .
- There is a canonical ring map  $S_0 \rightarrow \Gamma(\text{Proj}(S), \mathcal{O}_{\text{Proj}(S)})$  and canonical  $S_0$ -module map  $M_0 \rightarrow \Gamma(\text{Proj}(S), \widetilde{M})$ .

┘

*Proof:* ?

4: This follows from the fact short exact sequences can be checked on stalks, and item2.  $\square$

**Cor. (7.5.2.6).** There is a canonical morphism of schemes  $\text{Proj}(S) \rightarrow \text{Spec } S_0$ .  $\square$

**Prop. (7.5.2.7).** If  $X \subset \mathbb{P}_k^n$  is a closed subvariety disjoint from a  $d$ -dimensional subspace  $L \subset \mathbb{P}_k^n$ , then the projection  $\pi : X \rightarrow \mathbb{P}^{n-d-1}$  with center  $L$  induces a finite map  $X \rightarrow \pi(X)$ .  $\square$

*Proof:* Cf.[Shafarovich 1, P63].  $\square$

**Cor. (7.5.2.8).** If  $F_0, \dots, F_s$  are forms of degree  $m > 0$  on  $\mathbb{P}_k^n$  having no common zero on a closed subvariety  $X \subset \mathbb{P}^n$ , then  $\varphi(x) = [F_0(x), \dots, F_s(x)]$  defines a finite map  $\varphi : X \rightarrow \varphi(X)$ .  $\square$

*Proof:* Let  $v_m : \mathbb{P}^n \rightarrow \mathbb{P}^N$  be the Veronese embedding of degree  $m$ , then  $X \rightarrow v_m(X)$  is an isomorphism, and  $\varphi$  is a composition of  $v_m$  and a projection  $\mathbb{P}_k^N \rightarrow \mathbb{P}_s^n$ , thus it is a finite map, by(7.5.2.7).  $\square$

**Prop. (7.5.2.9)[Tensor and Proj].** For two graded ring with the same  $S_0 = A$ ,  $\text{Proj}(S \times_A T) \cong X \times_A Y$ , where  $(S \times_A T)_n = S_n \times_A T_n$   $\square$

*Proof:*  $\square$

**Def. (7.5.2.10)[Relative Proj].** The **relative Proj**  $\mathcal{S}$  over locally Noetherian  $Y$  of a Qco graded  $\mathcal{O}_Y$ -algebra  $\mathcal{S}$  f.g. over  $\mathcal{S}_0$  by coherent  $\mathcal{S}_1$  is the glueing of locally  $\text{Proj } \mathcal{S}$ .  $\text{Proj } \mathcal{S} \rightarrow Y$  is locally projective thus proper. It is equipped with invertible sheaf  $\mathcal{O}(1)$  by glueing.  $\square$

**Prop. (7.5.2.11)[Closed Subscheme of Projective Scheme].** The closed scheme of  $X = \mathbb{P}_A^n$  corresponds to the saturated homogenous ideal  $\mathcal{I}_Y$ , (i.e. for any  $s$ , if there is an  $n$  that for any  $i$ ,  $x_i^n s \in \mathcal{I}_Y$ , then  $s \in \mathcal{I}_Y$ ).

So projective scheme over  $\text{Spec } S_0$  corresponds to  $\text{Proj } S$ , where  $S$  are f.g. over  $S_0$  by  $S_1$  saturated in the sense above.  $\square$

*Proof:* A closed immersion is proper, thus the kernel  $\mathcal{I}_Y$  of the structural map is a Qco(7.5.1.3), so it must be an ideal on every affine open, because Qco is affine local. Then we should use(7.5.3.6),  $\Gamma_*(\mathcal{I}_Y)$  will suffice. Cf.[Hartshorne Ex2.5.10].  $\square$

**Prop. (7.5.2.12).** The global section of a projective space  $\text{Proj } S \rightarrow \text{Spec } S_0$  is just  $S_0$ , this is by(7.5.3.6).  $\square$

**Prop. (7.5.2.13).** A quasi-projective scheme  $X$  over a field  $k$  of dimension  $r$  can be covered by  $r + 1$  open affine subsets. This is because there are  $r$  hyperplane that intersect  $X$  non-empty. This can happen by choosing a hyperplane non-intersecting the generic point of  $X$ , otherwise we choose many hyperplane, then their intersection is empty.  $\square$

### Sheaves on Proj

**Def. (7.5.2.14) [Serre Twisting Sheaves].** Let  $S$  be a graded ring and  $X = \text{Proj}(S)$ , then we can define **Serre twisting sheaves**  $\mathcal{O}_X(n) = \widetilde{S(n)} \in \mathcal{Q}\text{Coh}(X)$ . For  $\mathcal{F} \in \mathcal{Q}\text{Coh}(\text{Proj}(S))$ , the **Serre twisting sheaf** of  $\mathcal{F}$  is the sheaf  $\mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{O}_X(n)$ . ┘

**Prop. (7.5.2.15).** Let  $S$  be a graded ring and  $X = \text{Proj}(S)$ ,

1. there are canonical maps

$$\mathcal{O}_X(m) \otimes_{\mathcal{O}_X} \mathcal{O}_X(n) \rightarrow \mathcal{O}_X(m+n),$$

inducing a map of graded rings  $S \rightarrow \Gamma_*(X, \mathcal{O}_X) = \bigoplus_{n \geq 0} \Gamma(X, \mathcal{O}_X(n))$ .

2. For any  $\mathcal{F} \in \text{Sh}(\mathcal{O}_X)$ , there are canonical maps

$$\mathcal{O}_X(n) \otimes_{\mathcal{O}_X} \mathcal{F} \rightarrow \mathcal{F}(n).$$

inducing a map of graded module structure of  $\Gamma_*(X, \mathcal{O}_X)$  on  $\Gamma_*(X, \mathcal{F}) = \bigoplus_{n \geq 0} \Gamma(X, \mathcal{F}(n))$ .

3. There is a canonical map  $\Gamma_*(X, \mathcal{F}) \rightarrow \mathcal{F}$  that is identity on global sections.
4. For any graded  $S$ -module  $M$ , let  $M(n) = M \otimes_S S(n)$ , there are maps  $\widetilde{M}(n) \rightarrow \widetilde{M(n)}$ . (Use property of Qco sheaves).
5. For graded rings  $M, N$  over  $S$ , there are canonical maps  $\widetilde{M} \otimes_{\mathcal{O}_X} \widetilde{N} \rightarrow \widetilde{M \otimes_S N}$ . ┘

*Proof:* □

**Prop. (7.5.2.16).** Let  $S$  be a graded ring generated by  $S_1$  over  $S_0$ , then

1.  $(M \otimes_S N)_{(f)} \cong M_{(f)} \otimes_{S_{(f)}} N_{(f)}$  for  $f \in S_1$ .
2. There canonical maps in item 1, 4, 5 of (7.5.2.15) are isomorphisms.
3. For a graded ring map  $S \rightarrow T$ , we have the corresponding Proj map  $f : U \rightarrow T$  that  $f^*(\widetilde{M}) \cong \widetilde{(M \otimes_S T)|_U}$  and  $f_*(\widetilde{N}|_U) \cong \widetilde{N_S}$ . That's to say,  $f^*(\widetilde{M}(n)) = f^*(\widetilde{M})(n)$  and  $f_*(\widetilde{M}(n)) = f_*(\widetilde{M})(n)$ . ┘

*Proof:* 1:

- 2: By 1 and check locally that tensoring  $f^n$  is an isomorphism on  $D_+(f)$ . □

**Cor. (7.5.2.17).**  $\mathcal{O}_X(n) \otimes_{\mathcal{O}_X} \mathcal{O}_X(m) \cong \mathcal{O}_X(n+m)$  for any scheme  $X$  projective over  $Y$ . ┘

**Prop. (7.5.2.18) [Twisting of Proj].** With notation as in (7.5.2.10), Let  $S' = S * \mathcal{L} : S'_d = S_d \otimes \mathcal{L}^d$ , then  $\varphi : \text{Proj } S' \rightarrow \text{Proj } S$  is an isomorphism that induces

$$\mathcal{O}'(1) \cong \varphi^* \mathcal{O}(1) \otimes \pi'^* \mathcal{L}.$$

**Prop. (7.5.2.19).** If  $Y$  is Noetherian and admits an ample invertible sheaf, then by definition, we have  $S_1 \otimes \mathcal{L}^n$  is base point free for some  $n$ , thus we have a morphism  $\text{Proj}(S * \mathcal{L}^n) \rightarrow \mathbb{P}_Y^N$ , so  $P = \text{Proj } S$  is  $H$ -quasi-projective with  $\mathcal{O}(1) = \mathcal{O}_P(1) \otimes \pi^* \mathcal{L}^n$ . ┘

### Relative Projective Spaces

**Def. (7.5.2.20)** [Relative Projective Spaces]. ┘

**Def. (7.5.2.21)** [Quasi-Coherent Vector Bundles]. For  $X \in \text{Sch}$ , a map  $\pi : V \rightarrow X \in \text{Sch}$  is called an **Quasi-coherent vector bundle** if it is affine, and  $\pi_* \mathcal{O}_V$  endowed with the structure of a graded  $\mathcal{O}_S$ -algebra structure  $\pi_* \mathcal{O}_V = \bigoplus \mathcal{E}_n$ , where  $\mathcal{E}_0 = \mathcal{O}_S$ , and  $\text{Sym}^n \mathcal{E}_1 \rightarrow \mathcal{E}_n$  is an isomorphism for any  $n$ . The category of Qco vector bundles on  $S$  is denoted by  $\text{Vect}^{\text{Qcoh}}(S)$ .

A morphism of affine bundles is a map  $E' \rightarrow E$  over  $X$  s.t. the associated map of  $\mathcal{O}_X$ -modules  $f_* : \pi_* \mathcal{O}_V \rightarrow \pi'_* \mathcal{O}_{V'} \in \text{Alg}(\mathcal{O}_X)$  is compatible with grading.

For  $\mathcal{E} \in \text{QCoh}(X)$ , we can define the **associated vector bundle**  $V(\mathcal{E})$  as  $\text{Spec}_X \text{Sym}(\mathcal{E})$  (7.2.3.10)(7.2.7.12). In this way, the category of Qco vector bundles over  $S$  is anti-equivalent to  $\text{QCoh}(X)$ .

The category of locally free vector bundles over  $X$  is denoted by  $\text{Vect}(X)$ . And the category of finite locally free vector bundles over  $X$  is denoted by  $\text{Vect}^{\text{fin}}(X)$ . ┘

**Def. (7.5.2.22)** [Projective Bundles]. For  $X \in \text{Sch}$  and  $\mathcal{E} \in \text{QCoh}(X)$ , we can define the **associated projective bundle**  $\mathbf{P}(\mathcal{E})$  as  $\text{Proj}_S \text{Sym}(\mathcal{E})$  (7.2.3.10)(7.2.7.12). It is equipped with a Serre twisting sheaf  $\mathcal{O}(1)$ , which is the glue of locally the Serre sheaf in projective space. There is a surjective morphism  $\pi^*(\mathcal{E}) \rightarrow \mathcal{O}(1)$  (local check). ┘

**Prop. (7.5.2.23)**. For  $g : Y \rightarrow X \in \text{Sch}$  and  $E \in \text{QCoh}(X)$ , a morphism  $Y \rightarrow \mathbf{P}(\mathcal{E}) \in \text{Sch}/X$  is equivalent to an invertible sheaf  $\mathcal{L} \in \text{Pic}(Y)$  together with a surjective map  $g^* \mathcal{E} \rightarrow \mathcal{L}$ .

In particular, giving a morphism  $X \rightarrow \mathbf{P}_A^n$  is equivalent to a base point free invertible sheaf with  $n$  generators on  $X$ . ┘

*Proof:* If there is a morphism, it will pullback  $\pi^*(\mathcal{E}) \rightarrow \mathcal{O}(1)$  into  $g^* \mathcal{E} \rightarrow \mathcal{L}$ . For the converse, construct locally and glue, we have the natural morphisms  $A[x_1/x_i, \dots, x_n/x_i] \rightarrow \mathcal{O}_{X_{s_i}} : x_j/x_i \rightarrow s_j/s_i$  in a homogenous sense. It is natural hence glue together. For the module, maps  $x_i \rightarrow s_i$ . □

**Cor. (7.5.2.24)**. All automorphisms of  $\mathbf{P}_k^n$  is linear. ┘

*Proof:* The Picard group of  $\mathbf{P}_k^n$  is  $\mathbb{Z}$  and is generated by  $\mathcal{O}(1)$  (7.5.3.16), so the automorphism will map  $\mathcal{O}(1)$  to  $\mathcal{O}(\pm 1)$  and  $\mathcal{O}(-1)$  has no global section (7.5.3.5). And the global section is  $n$ -dimensional and determines the morphism by the prop. □

**Def. (7.5.2.25)** [Projective Space]. Let  $A$  be a ring, the **projective space**  $\mathbf{P}_A^n$  is defined to be

$$\mathbf{P}_A^n = \text{Proj}(A[T_0, \dots, T_n])$$

with  $\deg(T_i) = 1$ . It represents the functor that maps a scheme  $T$  to the equivalence classes of pairs  $(\mathcal{L}, (s_0, \dots, s_n))$ , where  $\mathcal{L}$  is an invertible sheaf on  $T$ , and  $s_0, \dots, s_n \in \Gamma(T, \mathcal{L})$  that generate  $\mathcal{L}$  by (7.5.2.23). For any scheme  $S$ ,  $\mathbf{P}^n \times_{\mathbb{Z}} S$  is called the projective space over  $S$ . ┘

**Prop. (7.5.2.26)**. Let  $R$  be a ring and  $X = \mathbf{P}_R^n$ ,  $\mathcal{F} \in \text{QCoh}(X)$ , then the canonical map  $\widetilde{\Gamma_*(X, \mathcal{F})} \rightarrow \mathcal{F}$  (7.5.2.15) is an isomorphism. ┘

*Proof:* Cf. [Sta]03GM. ? This is a corollary. □

**Prop. (7.5.2.27)** [Closed Subschemes of  $\mathbf{P}_R^n$ ]. Let  $Z$  be a closed subscheme of  $\mathbf{P}_R^n$ , then it is of the form

$$Z = \text{Proj}(R[X_0, \dots, X_n]/I) \subset \text{Proj}(R[X_0, \dots, X_n])$$

where  $I = \bigoplus I_n$  and  $I_n = \ker(R[X_0, \dots, X_n]_d \rightarrow \Gamma(Z, \mathcal{O}_Z(d)))$ . ┘

*Proof:* Cf.[Sta]03GI.?

□

**Prop. (7.5.2.28) [Segre Embedding].** Let  $S$  be a scheme, there is a natural closed immersion

$$\mathbf{P}_S^m \times_S \mathbf{P}_S^n \rightarrow \mathbf{P}_S^{mn+m+n}$$

called the **Segre embedding**.

┘

*Proof:* It suffices to prove for  $S = \mathbb{Z}$ , and in this case, it suffices to write down an invertible sheaf on  $\mathbf{P}_S^m \times_S \mathbf{P}_S^n$  with  $(n+1)(m+1)$  global sections that generate it. Then we take the invertible sheaf  $\mathcal{L} = \pi_1^* \mathcal{O}_{\mathbf{P}^m}(1) \otimes \pi_2^* \mathcal{O}_{\mathbf{P}^n}(1)$ . and the sections  $X_i Y_j$ , where  $(X_0, \dots, X_m)$  generate  $\mathcal{O}_{\mathbf{P}^m}(1)$  and  $(Y_0, \dots, Y_n)$  generate  $\mathcal{O}_{\mathbf{P}^n}(1)$ .

It is a closed immersion by [Sta]01WD.?

□

**Prop. (7.5.2.29) [Venerose Embedding].**

┘

### 3 Invertible Sheaves

General invertible sheaves on a ringed site is treated in 5.

**Prop. (7.5.3.1) [Faithfully Flat Descent].** To show a quasi-coherent sheaf is a line bundle, it suffices to show fpqc-locally, by (5.4.2.1).

┘

**Def. (7.5.3.2) [Basepoint-Free Line Bundles].** Let  $k \in \mathbf{Field}$ ,  $X \in \mathbf{Sch}/k$  and  $\mathcal{L} \in \mathbf{Pic}(X)$ , then  $\mathcal{L}$  is called **basepoint-free** if the intersection of elements in  $\{\mathrm{div}(s) \mid s \in H^0(V)\}$  is empty.

┘

**Prop. (7.5.3.3).** If  $X$  is qcqs over a field  $k$  and  $K/k$  is a field extension, then  $\mathcal{L}$  is basepoint free iff  $\mathcal{L}_K$  is basepoint free over  $X_K$ .

┘

*Proof:* By flat base change (7.7.5.1),  $H^0(X_K, \mathcal{L}_K) = H^0(X, \mathcal{L}) \otimes_k K$ .

□

**Prop. (7.5.3.4) [Relative Triviality].** Let  $f : X \rightarrow Y$  be a finite morphism of schemes and  $\mathcal{L} \in \mathbf{Pic}(X)$ , then for any  $y \in Y$ , there exists a nbhd  $U$  of  $y \in Y$  s.t.  $\mathcal{L}|_{f^{-1}(U)}$  is trivial.

┘

*Proof:* Cf.[Sta]0BUT.

□

**Prop. (7.5.3.5) [Global Sections].** Let  $\mathcal{L}$  be an invertible sheaf over qcqs scheme  $X$ , for  $\mathcal{F} \in \mathbf{QCoh}(X)$ , let the **global section functor**  $\Gamma_*(\mathcal{F}) = \bigoplus \Gamma(X, \mathcal{F} \otimes \mathcal{L}^n)$ , then

$$\Gamma_*(\mathcal{F})_{(f)} \cong \mathcal{F}(X_f).$$

where  $s \in \Gamma(X, \mathcal{L})$ . In particular that if there is a section  $f$  of  $\mathcal{F}$  on  $X_s$ , then for some  $n$ ,  $f \otimes s^n$  is a global section of  $\mathcal{F} \otimes \mathcal{L}^n$ .

┘

*Proof:* This is nearly the same as the proof that  $(\mathrm{Spec} A)_f = \mathrm{Spec} A_f$ , Cf.[Sta]01PW.?

□

**Cor. (7.5.3.6).** When  $X = \mathrm{Proj} S$  projective over  $\mathrm{Spec} S_0$  and  $\mathcal{F} \in \mathbf{QCoh}(X)$ ,  $\widehat{\Gamma_*(\mathcal{F})} \cong \mathcal{F}$ , where  $\Gamma_*(\mathcal{F}) = \bigoplus_{n \in \mathbb{Z}} \Gamma(X, \mathcal{F}(n))$ , which is a graded  $S$ -module. In particular,  $\Gamma_*$  for projective space  $\mathbb{P}_A^n$  equals  $A[x_1, \dots, x_n]$ .

┘

**Def. (7.5.3.7) [Regular Sections].**

┘

**Prop. (7.5.3.8) [Complete Series].** Let  $H^0(X, \mathcal{L})$  be the sections that corresponds to injective maps  $\mathcal{L}^{-1} \rightarrow \mathcal{O}_X$ , then there is a canonical isomorphism

$$H^0(X, \mathcal{L})_{reg}/H^*(X, \mathcal{O}_X^*) \cong |\mathcal{L}|.$$

Notice when  $X$  is not integral,  $H^0(X, \mathcal{L})_{reg}$  may not equal  $H^0(X, \mathcal{L})$ . ┘

*Proof:* Cf. [Kle05]P22. □

**Prop. (7.5.3.9) [Meromorphic Sections].** Let  $X$  be a locally Noetherian scheme having no embedded points, then every invertible sheaf  $\mathcal{L} \in \text{Pic}(X)$  has a meromorphic section. In particular, this applies for  $X$  integral, by (7.5.1.17). ┘

*Proof:* Cf. [Sta]0EMI. □

### Picard Groups

**Remark (7.5.3.10) [Picard Groups].** The Picard group  $\text{Pic}(X)$  of a local ringed space  $(X, \mathcal{O}_X)$  is defined in (7.2.5.7), and it is isomorphic to  $H^1(X, \mathcal{O}_X^*)$  by (7.3.1.17). ┘

**Prop. (7.5.3.11) [Class Group].** If  $X = \text{Spec } \mathcal{O}$  where  $\mathcal{O}$  is a Dedekind domain, then by (5.2.7.8), the isomorphism class of invertible sheaves on  $X$  is equivalent to the isomorphism class of fractional ideals modulo principle ideals. Thus  $\text{Pic}(\mathcal{O})$  equals the class group of  $\mathcal{O}$  (5.2.7.9). In particular, if  $R$  is a UFD, then  $\text{Pic}(\text{Spec } R) = 0$ . ┘

**Def. (7.5.3.12) [Invertible Sheaf Associated to Cartier Divisors].** For a Cartier divisor on  $X \in \text{Sch}$  (7.8.1.1), define  $\mathcal{O}_X(D)$  (or  $\mathcal{L}(D)$ ) the **Line bundle associated to  $D$**  as the sub  $\mathcal{O}_X$ -module of  $\mathcal{K}$  locally generated by  $(f_i^{-1})$ , where  $D = (f_i)$  locally. Equivalently, it is the line bundle  $\mathcal{I}_D^{-1}$ . ┘

**Def. (7.5.3.13) [Linear Series].** Let  $\mathcal{L} \in \text{Pic}(X)$ , then denote  $|\mathcal{L}|$  the **complete linear series** of effective Cartier divisors  $D$  s.t.  $\mathcal{L}(D) \cong \mathcal{L}$ . ┘

**Def. (7.5.3.14) [Weil divisor of an invertible Sheaf].** For  $X$  a locally Noetherian integral scheme and  $\mathcal{L}$  an invertible sheaf in  $\mathcal{K}$ , if  $s \in \Gamma(X, \mathcal{K} \otimes \mathcal{L})$  is a meromorphic section of  $\mathcal{L}$  (which exists by (7.5.3.9)), for any prime Weil divisor  $Z$  with generic pt  $\eta$ , define  $\text{ord}_Z(s) = \text{ord}_{\mathcal{O}_{X,\eta}}(s/s_\eta)$  (5.1.2.10), for any  $s_\eta$  a generator of  $\mathcal{L}_\eta$  over  $\mathcal{O}_{X,\eta}$ . This is independent of  $s_\eta$  chosen.

The prime Weil divisors that  $\text{ord}_Z(s) \neq 0$  is locally finite, the same as in (9.1.1.18). And any two different sections  $s_i$  defines Weil divisors up to a difference of  $\text{div}(f)$  (9.1.1.18). So we can define the **Weil divisor class associated to  $\mathcal{L}$**  as  $\sum \text{ord}_Z(s)[Z]$  for any meromorphic section  $s$  of  $\mathcal{L}$ .

It is easy to verify that this induces a homomorphism from  $\text{Pic}(X)$  to  $\text{Cl}(X)$ . ┘

**Prop. (7.5.3.15) [Cl-Pic].** For a normal integral locally Noetherian scheme, the above map  $\text{Pic}(X) \rightarrow \text{Cl}(X)$  (7.5.3.14) is an injection. It is an isomorphism iff all local rings of  $X$  are UFD.

Explicitly, the inverse image of a prime Weil divisor  $D$  is the sheaf  $\mathcal{O}_X(D) = \text{Hom}(\mathcal{I}_D, \mathcal{O}_X) = \mathcal{I}_D^{-1}$ , and there is an exact sequence of sheaves on  $X$ :

$$0 \rightarrow \mathcal{O}_X(-D) = \mathcal{I}_D \rightarrow \mathcal{O}_X \rightarrow i_*\mathcal{O}_D \rightarrow 0$$

In particular, this applies to non-singular prevarieties over a field  $k$ , by (7.4.2.10). ┘

*Proof:* If it is not injective, then some meromorphic section on  $\mathcal{L}$  has no associated Weil divisors, then it suffices to show  $\mathcal{L}$  is trivialized by  $s$ . Consider on an affine subscheme  $\text{Spec } A$ , then  $\text{ord}_{A_{\mathfrak{p}}}(s) = 0$  for each minimal prime  $\mathfrak{p}$  of  $A$ , but  $A_{\mathfrak{p}}$  is DVR by (5.3.5.21), so  $s \in A_{\mathfrak{p}}^*$  for each minimal prime  $\mathfrak{p}$ , so  $s \in A^*$  by (5.3.5.12). This shows  $s$  trivialize  $\mathcal{L}$ .

To show it is surjective, it suffices to show any Weil divisor  $D$  is in the image: notice  $D$  is an effective Cartier divisor by (7.8.1.5), and by definition (7.8.1.6) the vanishing of the canonical section  $1_D \in \mathcal{O}_X(D)$  is exactly  $D$ .  $\square$

**Prop. (7.5.3.16) [Examples of Picard Groups].**

- If  $X$  is a locally Noetherian normal integral separated scheme, then so are  $X \times \text{Spec } \mathbb{Z}[T]$  and  $\mathbb{P}_X^n$ , and  $\text{Cl}(X \times \text{Spec } \mathbb{Z}[T]) = \text{Cl}(X)$  and  $\text{Cl}(\mathbb{P}_X^n) = \mathbb{Z} \oplus \text{Cl}(X)$ .
- For a UFD  $R$ ,  $\text{Pic}(\mathbb{A}_R^n) \cong \text{Cl}(\mathbb{A}_R^n) = 0$ .
- For a UFD  $R$ ,  $\text{Pic}(\mathbb{P}_R^n) \cong \text{Cl}(\mathbb{P}_R^n) \stackrel{\text{deg}}{\cong} \mathbb{Z}$ , and it is generated by  $\mathcal{O}_{\mathbb{P}_R^n}(1)$ .
- For any UFD  $R$ ,  $\text{Pic}(\mathbb{P}_R^1 \times \mathbb{P}_R^1) \cong \text{Cl}(\mathbb{P}_R^1 \times \mathbb{P}_R^1) \cong \mathbb{Z} \oplus \mathbb{Z}$ .
- If  $k$  is a field and  $Y \subset \mathbb{P}_k^n$  is a hypersurface of degree  $d$ , then  $\text{Pic}(\mathbb{P}_k^n \setminus Y) \cong \text{Cl}(\mathbb{P}_k^n \setminus Y) \cong \mathbb{Z}/d\mathbb{Z}$ .  $\lrcorner$

*Proof:* By (7.5.3.15) and (9.1.4.7)(9.1.6.10)(9.1.4.8)(9.1.4.9).  $\square$

**Prop. (7.5.3.17).** Let  $X$  be a complete prevariety over a field  $k$  of characteristic  $p > 0$ , then for any  $n$  prime to  $p$  and any purely inseparable field extension  $k'/k$ , the natural map

$$\text{Pic}(X)[n] \rightarrow \text{Pic}(X_{\bar{k}})[n]$$

is an isomorphism.  $\lrcorner$

*Proof:* Cf. [Sta]0CD5.  $\square$

## 4 Ample Invertible Sheaves

**Prop. (7.5.4.1).** Let  $X \in \text{Sch}$ ,  $\mathcal{L} \in \text{Pic}(X)$ ,  $s \in \Gamma(X, \mathcal{L})$ , then for any affine open  $U \subset X$ ,  $X_s \cap U$  is affine.  $\lrcorner$

*Proof:* It suffices to show: If  $R$  is a ring,  $N$  is an invertible  $R$ -module and  $s \in N$ , then  $U = \{\mathfrak{p} | s \notin \mathfrak{p}N\}$  is an affine open subset of  $\text{Spec } R$ . For this, let  $R' = \varinjlim_{-\otimes s} N^{\otimes n}$ , then in fact  $U = \text{Spec } R'$ . Because locally,  $R'$  is just  $R_s$  via an isomorphism  $N_f \cong R_f$ .  $\square$

**Def. (7.5.4.2) [Ample Invertible Sheaves].** On a quasi-compact scheme  $X$ , an **ample invertible sheaf** is a line bundle  $\mathcal{L} \in \text{Pic}(X)$  s.t. there is some  $n \in \mathbb{Z}_+$  and sections  $s_i \in \Gamma(X, \mathcal{L}^n)$  that  $X_{s_i}$  is an affine cover of  $X$ . In particular, an ample invertible sheaf is globally generated.

For a qc morphism  $f : X \rightarrow Y$ , an invertible sheaf on  $X$  is called (relatively)  **$f$ -ample** iff it is ample restricted to every open subscheme  $f^{-1}(V)$ , where  $V$  is an affine open in  $Y$ . In particular, an invertible sheaf  $\mathcal{L}$  on a quasi-compact scheme  $X$  is ample iff it is  $f$ -ample where  $f : X \rightarrow \text{Spec } \mathbb{Z}$ .  $\lrcorner$

**Prop. (7.5.4.3).** For  $m \in \mathbb{Z}_+$ , an invertible sheaf  $\mathcal{L}$  is ( $f$ -)ample iff  $\mathcal{L}^m$  is ( $f$ -)ample.  $\lrcorner$

*Proof:*  $\square$

**Prop. (7.5.4.4) [Ample Implies Separatedness].** When there is a  $f$ -ample invertible sheaf for  $f : X \rightarrow Y$  qc, then  $f$  is separated. In particular, if  $X \in \text{Sch}_{qc}$  has an ample invertible sheaf, then  $X$  is separated.  $\lrcorner$

*Proof:* [Sta]09MP. ?  $\square$

**Prop. (7.5.4.5) [Characterizing Ampleness].** Let  $X \in \text{Sch}_{qc}$ ,  $\mathcal{L} \in \text{Pic}(X)$ ,  $S = \Gamma_*(X, \mathcal{L})$ , then the following are equivalent:

1.  $\mathcal{L}$  is ample.
2. The open subsets  $X_s$ , where  $s \in \Gamma_*(X, \mathcal{L})$  homogeneous, cover  $X$ , and the associated morphism  $X \rightarrow \text{Proj } S$  is an open immersion.
3. The open subsets  $X_s$  where  $s \in \Gamma_*(X, \mathcal{L})$  homogeneous, form a topological basis for  $X$ .
4. The affine open subsets of the form  $X_s$  where  $s \in \Gamma_*(X, \mathcal{L})$  homogeneous, form a topological basis for  $X$ .
5. For any  $\mathcal{F} \in \mathcal{QCoh}(X)$ , the sum of images of the canonical maps  $\Gamma(X, \mathcal{F} \otimes \mathcal{L}^n) \otimes \mathcal{L}^{\otimes -n} \rightarrow \mathcal{F}$  is surjective.
6.  $X$  is quasi-separated, and for any  $\mathcal{F} \in \mathcal{QCoh}^{\text{ft}}(X)$ ,  $\mathcal{F} \otimes \mathcal{L}^{\otimes n}$  is generated by global sections for  $n$  sufficiently large.
7.  $X$  is quasi-separated, and for any  $\mathcal{F} \in \mathcal{QCoh}^{\text{ft}}(X)$ , there exists  $n \in \mathbb{Z}$  s.t.  $\mathcal{F}$  is a quotient of a direct sum of f.m. copies of  $\mathcal{L}^{\otimes -n}$ .  $\lrcorner$

*Proof:* Cf. [Sta]01Q3. ?  $\square$

**Cor. (7.5.4.6).** The pullback of an ample invertible sheaf along a qc immersion is still ample.  $\lrcorner$

**Cor. (7.5.4.7).** Let  $S$  be a quasi-separated scheme and  $X, Y$  be schemes over  $S$ . If  $\mathcal{L}$  is an ample invertible sheaf over  $X$  and  $\mathcal{N}$  an ample invertible sheaf over  $Y$ , then  $\mathcal{M} = \text{pr}_1^* \mathcal{L} \otimes_{\mathcal{O}_{X \times_S Y}} \text{pr}_2^* \mathcal{N}$  is ample over  $X \times_S Y$ .  $\lrcorner$

*Proof:* Because  $X \times_S Y \rightarrow X \times Y$  is a qc immersion, by (7.5.4.6), it suffices to show for  $S = \text{Spec } Z$ . Then if  $X_s$  is an affine nbhd of  $x$  and  $Y_t$  is an affine nbhd of  $Y$ , then  $(X \times Y)_{\pi_1^* s \otimes \pi_2^* t}$  is an affine nbhd of  $x \times y$ .  $\square$

**Cor. (7.5.4.8) [Tensor Product of Ample Invertible Sheaves is Ample].** Let  $X \in \text{Sch}$ ,  $\mathcal{L}, \mathcal{M} \in \text{Pic}(X)$ . If  $\mathcal{M}$  is globally-generated and  $\mathcal{L}$  is ample, then  $\mathcal{L} \otimes \mathcal{M}$  is ample. In particular if  $\mathcal{L}, \mathcal{M}$  are ample invertible sheaves, then  $\mathcal{L} \otimes \mathcal{M}$  is ample.  $\lrcorner$

*Proof:* For any  $x \in X$  and  $U$  a nbhd of  $x$ , choose  $s \in \Gamma(X, \mathcal{L}^n)$  that  $x \in X_s \subset U$ , and choose  $t \in \Gamma(X, \mathcal{M})$  that  $t_x \neq 0$ , then  $x \in X_{s \otimes t^n} \subset U$ , thus  $X_r$  form a basis for  $X$  where  $r \in \Gamma(X, (\mathcal{L} \otimes \mathcal{M})^n)$ , so  $\mathcal{L} \otimes \mathcal{M}$  is ample.  $\square$

**Cor. (7.5.4.9).** Let  $X \in \text{Sch}$ ,  $\mathcal{L}, \mathcal{M} \in \text{Pic}(X)$ . If  $\mathcal{L}$  is ample, then  $\mathcal{M} \otimes \mathcal{L}^{\otimes n}$  is ample for  $n$  sufficiently large.  $\lrcorner$

*Proof:* This is because  $\mathcal{L} \otimes \mathcal{M}^n$  is generated by global sections for  $n$  sufficiently large, thus  $\mathcal{L} \otimes \mathcal{M}^{n+1}$  is ample, by (7.5.4.8).  $\square$

**Prop. (7.5.4.10) [Gluing Ample Invertible Sheaves].** Let  $X \in \text{Sch}_{qc}$  s.t. there is an affine open covering of the form  $X_{s_i}$  where  $s_i$  are sections of  $\mathcal{L}_i$  and  $\mathcal{L}_i$  are globally generated line bundles in  $\text{Pic}(X)$ , then  $X$  has an ample line bundle.  $\lrcorner$

*Proof:* Let  $X_{s_i}$  be an affine open covering of  $X$  where  $s_i$  are sections of globally generated invertible sheaves  $\mathcal{L}_i$ ,  $i = 1, \dots, r$ . As  $\mathcal{L}_i$  are globally generated, let  $X = \cup_j X_{t_{ij}}$  for  $j = 0, 1, \dots, m_i$  where  $t_{i0} = s_i$ . Then for the line bundle  $\otimes_i \mathcal{L}_i$ , the sections  $t_{1,j_1} \otimes \dots \otimes t_{r,j_r}$  where at least one of  $j_i$  equals 0, covers  $X$ , and they are all affine by (7.5.4.1). So  $\otimes_i \mathcal{L}_i$  is ample.  $\square$

**Prop. (7.5.4.11).**  $f : X \rightarrow Y$ , let  $\mathcal{L}$  be  $f$ -ample on  $X$  and  $\mathcal{M}$  ample on  $Y$ , then  $\mathcal{L} \otimes f^* \mathcal{M}^n$  is ample for  $n$  large.  $\lrcorner$

*Proof:* Cf. [Sta]0892.  $\square$

**Cor. (7.5.4.12).** If  $f : X \rightarrow Y$  is quasi-affine, then the pullback of an ample invertible sheaf is ample, by (7.4.4.19) and (7.5.4.3).  $\lrcorner$

**Prop. (7.5.4.13) [Pullback of Ampleness].** If  $f : Y \rightarrow X$  is finite and surjective morphism between schemes proper over a Noetherian affine scheme, then for any invertible sheaf  $\mathcal{L}$  on  $X$ ,  $\mathcal{L}$  is ample iff  $f^* \mathcal{L}$  is ample.  $\lrcorner$

*Proof:* Cf. [Sta]0B5V.  $\square$

One direction follows from (7.5.4.12). For the other we use Serre criterion (7.7.2.8) and devissage (7.5.1.56). We only verify 3: By (7.4.4.42), there exists such coherent sheaf  $f_* \mathcal{F}$  for any integral subscheme, and for a any Qco sheaf of ideals  $\mathcal{I}$ ,  $\mathcal{I} f_* \mathcal{F} = f_*(f^{-1} \mathcal{I} \mathcal{F})$  because  $f$  is affine, thus

$$H^p(X, \mathcal{I} f_* \mathcal{F}) = H^p(X, f_*(f^{-1} \mathcal{I} \mathcal{F} \otimes \mathcal{L}^n)) = H^p(Y, f^{-1} \mathcal{I} \mathcal{F} \otimes \mathcal{L}^n)$$

by projection formula, and  $f$  is affine. This vanish for  $n$  large.  $\square$

**Cor. (7.5.4.14) [Ampleness and Irreducible Components].** Let  $X$  be a scheme proper over a Noetherian affine scheme, then an invertible sheaf  $\mathcal{L}$  on  $X$  is ample iff it is ample on the induced reduced structure of irreducible components of  $X$ .  $\lrcorner$

*Proof:* This is (7.5.4.13) applied to the case  $\coprod_i X_i \rightarrow X$ .  $\square$

**Prop. (7.5.4.15) [Ampleness Restricted to Reduced Case].** If  $i : Z \rightarrow X$  is a closed immersion of schemes that induce homeomorphism on the underlying topology, then  $\mathcal{L}$  is ample iff  $i^* \mathcal{L}$  is ample.

In particular, this applies to  $X_{\text{red}} \rightarrow X$ .  $\lrcorner$

*Proof:* Cf. [Sta]09MW.  $\square$

**Prop. (7.5.4.16).** Let  $f : X \rightarrow Y$  be a proper morphism of schemes and  $\mathcal{L}$  an invertible sheaf on  $X$ . If  $y \in Y$  satisfies  $\mathcal{L}_y$  is ample on  $X_y$ , then there is a nbhd  $U$  of  $y \in Y$  that  $\mathcal{L}|_{f^{-1}(U)}$  is  $f$ -ample.  $\lrcorner$

*Proof:* Cf. [Sta]0D2S.  $\square$

**Prop. (7.5.4.17) [Ampleness is Fiberwise].** For  $f : X \rightarrow T \in \text{Sch}$  proper and  $\mathcal{L} \in \text{Pic}(X)$ ,  $\mathcal{L}$  is  $f$ -ample iff for any  $t \in T$ ,  $\mathcal{L}_t$  is ample over  $X_t$ .  $\lrcorner$

*Proof:* [Positivity in Algebraic Geometry]P97.  $\square$

**Prop. (7.5.4.18) [Finite Map and Ample].** Let  $\mathcal{L}$  be a basepoint-free line bundle on a proper scheme  $X$ , then the associated map  $X \rightarrow P\Gamma(X, \mathcal{L})$  is finite iff  $\mathcal{L}$  is ample.  $\lrcorner$

*Proof:* Cf. [Positivity in Algebraic Geometry, P28].  $\square$

**Prop. (7.5.4.19) [Ampleness is Étale-Local].** Ampleness satisfies étale descent. Cf. [Sta]0D35.  $\lrcorner$

**Prop. (7.5.4.20).** Let  $X$  be a scheme. Let  $\mathcal{L}$  be an ample invertible  $\mathcal{O}_X$ -module. Let  $n_0$  be an integer. If  $H^p(X, \mathcal{L}^{-n}) = 0$  for  $n \geq n_0$  and  $p > 0$ , then  $X$  is affine.  $\lrcorner$

*Proof:* Cf. [Sta]0EBD.  $\square$

**Prop. (7.5.4.21) [Gluing Ample Line Bundles].** Let  $K/k \in \text{Field}$ ,  $X \in \text{Sch}/k$  s.t.  $X_K$  has an ample line bundle, then  $X$  also has an ample line bundle.  $\lrcorner$

*Proof:* Cf. [Sta]0BDC.  $\square$

### Very Ample Invertible Sheaves

**Def. (7.5.4.22) [Very Ampleness].** Let  $f : X \rightarrow S$  be a morphism, a ***f*-very ample** invertible sheaf on  $X$  is the pullback of  $\mathcal{O}(1)$  along some immersion  $X \rightarrow \text{Proj}(\mathcal{E})$  for some  $\mathcal{Q}\text{co}$  module  $\mathcal{E}$  over  $Y$ , Cf. (7.5.2.14). It is called **H-very ample** iff  $\mathcal{E}$  is trivial. Notice when  $X$  is proper, this immersion must be closed by (7.4.6.3).

When  $S$  is affine and  $f : X \rightarrow S$  is of f.t., *f*-very ample is equivalent to H-very ample.  $\lrcorner$

*Proof:* Cf. [Sta]02NP.  $\square$

**Prop. (7.5.4.23) [Tensor Product of Very Ample Line Bundles].** Let  $f : X \rightarrow \text{Spec } A$  be a morphism. If  $\mathcal{L}$  is H-very ample and  $\mathcal{M}$  is generated by global sections, then  $\mathcal{L} \otimes \mathcal{M}$  is H-very ample. In particular, the tensor product of two H-very ample invertible sheaves is H-very ample.  $\lrcorner$

*Proof:* The hypothesis means  $\mathcal{L} = \varphi^* \mathcal{O}(1)$ , where  $\varphi : X \rightarrow \mathbb{P}_A^n$  is an immersion, and  $\mathcal{M} = \psi^* \mathcal{O}(1)$ , where  $\psi : X \rightarrow \mathbb{P}_k^m$  is a morphism. Then the product  $T : X \rightarrow \mathbb{P}_k^n \times \mathbb{P}_k^m$  is also an immersion, by base change trick (7.4.4.2), as  $\mathbb{P}_k^n \times \mathbb{P}_k^m \rightarrow \mathbb{P}_k^n$  is separated. Then  $S \circ T : X \rightarrow \mathbb{P}^{mn+m+n}$ , where  $S : \mathbb{P}_k^n \times \mathbb{P}_k^m \rightarrow \mathbb{P}^{mn+m+n}$  is the Segre embedding, is also an immersion, and  $(ST)^* \mathcal{O}(1) \cong \mathcal{L} \otimes \mathcal{M}$ , thus it is H-very ample.  $\square$

**Prop. (7.5.4.24) [Ample and H-Very Ample].** If  $f : X \rightarrow S$  is locally of f.t. and  $\mathcal{L}$  is an ample invertible sheaf on  $X$ , then  $\mathcal{L}^{\otimes m}$  is H-very ample for  $m$  sufficiently large.  $\lrcorner$

*Proof:* Choose an affine open cover  $\{V_i\}$  of  $S$ . By (7.5.4.5), there are f.m. affine opens  $X_{s_i}$  that cover  $X$  refining a inverse image of  $\{V_i\}$ . Now  $\mathcal{O}_X(X_{s_i})$  is f.g. over  $\mathcal{O}_S(V_i)$ , so we can find f.m.  $f_{ij} \in \mathcal{O}_X(X_{s_i})$  that generates it over  $\mathcal{O}_S(V_i)$ . By (7.5.3.5), we can write each  $f_{ij} = s_{ij}/s_i^{e_{ij}}$  for some  $a_{ij}$  homogenous. We can multiply by a factor to make all the  $s_i^{e_{ij}}$  the same degree  $N$ , and  $f_{ij} = s_{ij} s_i^{N/\deg(s_i) - e_{ij}}$ , then all the elements  $s_i, s_{ij}$  generates the invertible sheaf  $\mathcal{L}$ , thus inducing a map  $j : X \rightarrow \mathbb{P}_k^m$ . This map is an immersion, because  $j^{-1}(D(T_i)) = X_{s_i}$  and the function  $T_{ij}/T_i$  on  $D(T_i)$  pulls back to  $s_{ij}/s_j$ . Thus  $j$  is locally a closed immersion, thus an immersion.

Now  $\mathcal{L}^{\otimes d_1}$  is H-very ample for some  $d_1$ , in particular it is separated, and by (7.5.4.5) there is some  $d_2$  that  $\mathcal{L}^{\otimes d}$  is generated by global sections for all  $d \geq d_2$ , then by (7.5.4.23),  $\mathcal{L}^{\otimes d}$  is H-very ample for  $d \geq d_1 + d_2$ .  $\square$

**Prop. (7.5.4.25) [ $f$ -Very Ample Implies  $f$ -Ample].** If  $f : X \rightarrow S$  is qc, then  $f$ -very ample implies  $f$ -ample.  $\lrcorner$

*Proof:* Cf. [Sta]01VN. ?  $\square$

**Cor. (7.5.4.26) [Serre].** If  $S \in \mathcal{A}ff$ ,  $f : X \rightarrow S$  is of f.t. and  $\mathcal{L} \in \text{Pic}(X)$ , then the following are equivalent:

- $\mathcal{L}$  is ample .
- $\mathcal{L}$  is  $f$ -ample.
- $\mathcal{L}^{\otimes n}$  is (H-)  $f$ -very ample for some (all large)  $n$ .

$\lrcorner$

*Proof:* This follows from (7.5.4.22) (7.5.4.24) and (7.5.4.25).  $\square$

**Cor. (7.5.4.27).** If  $f : X \rightarrow S$  is of f.t. and  $S$  is quasi-compact,  $\mathcal{L}$  is an invertible sheaf on  $X$ , then the following are equivalent:

- $\mathcal{L}$  is  $f$ -ample.
- $\mathcal{L}^{\otimes n}$  is (H-)  $f$ -very ample for some (all large)  $n$ .

$\lrcorner$

*Proof:* Cf. [Sta]01VU.  $\square$

## 5 Sheaf of Differentials

**Prop. (7.5.5.1) [Differentials on Schemes].** Consider a morphism of schemes  $X \rightarrow Y$ , we define the sheaf of differentials  $\Omega_{X/Y}$  together with an  $S$ -derivative  $\mathcal{O}_X \rightarrow \Omega_{X/S}$  as for ringed sites (7.2.4.7). Then  $\Omega_{X/S} \in \mathcal{QCoh}(X)$  by (7.2.4.5). In fact, If  $U = \text{Spec } A$  is mapped into  $\text{Spec } B \subset S$ , then  $\Omega_{X/S}(U) \cong \widetilde{\Omega_{A/B}}$ .

In particular, the stalk of  $\Omega_{X/S}$  at a point  $x \in X$  is  $\Omega_{\mathcal{O}_{X,x}/\mathcal{O}_{S,f(x)}}$ .

Thus when  $X \rightarrow Y$  is locally of f.t. (or locally of f.p.), then  $\Omega_{X/S}$  is an  $\mathcal{O}_X$ -module of f.t. (or of f.p.).  $\lrcorner$

**Prop. (7.5.5.2) [Base change and Differentials].** Let  $\begin{array}{ccc} X' & \xrightarrow{f} & X \\ \downarrow g' & & \downarrow g \\ S' & \longrightarrow & S \end{array}$  be a commutative diagram of

schemes, then there is a canonical map

$$f^* \Omega_{X/S} \rightarrow \Omega_{X'/S'}$$

which is an isomorphism if the diagram is a fiber product square.  $\lrcorner$

*Proof:* Such a diagram gives a diagram  $(f^{-1}g^{-1}\mathcal{O}_S \rightarrow f^{-1}\mathcal{O}_X) \rightarrow ((g')^{-1}(\mathcal{O}_{S'}) \rightarrow \mathcal{O}_{X'})$  of sheaves of rings on  $X'_{Zar}$ , thus the conclusion follows from (7.2.4.5) and (7.2.7.17).  $\square$

**Prop. (7.5.5.3).** Let  $X, Y$  be schemes over another scheme  $S$ , then

$$\pi_1^* \Omega_{X/S} \oplus \pi_2^* \Omega_{Y/S} \cong \Omega_{X \times_S Y/S},$$

where the maps are given by (7.5.5.2).  $\lrcorner$

*Proof:* It suffices to check on affine subschemes, so we may assume  $X, Y, S$  are affine, thus the map is given by

$$\Omega_{A/S} \oplus_S B \oplus_{A \otimes_S B} \Omega_{B/S} \otimes_S A \rightarrow \Omega_{A \otimes_S B/S}$$

which is an isomorphism by (5.4.3.6).  $\square$

**Prop. (7.5.5.4).** Let  $X, Y$  be schemes over another scheme  $S$ , then  $\Omega_{X \times_S Y/S} \cong \pi_1^* \Omega_{X/S} \otimes \pi_2^* \Omega_{Y/S}$ .  $\lrcorner$

**Prop. (7.5.5.5) [Jacobi-Zariski Sequence].** Let  $f : X \rightarrow Y$  and  $g : Y \rightarrow Z$ , then there is an exact sequence of sheaves on  $X$ :

$$f^* \Omega_{Y/Z} \rightarrow \Omega_{X/Z} \rightarrow \Omega_{X/Y} \rightarrow 0.$$

Where the maps come from (7.5.5.2).  $\lrcorner$

*Proof:* Immediate from (5.4.3.8).  $\square$

**Prop. (7.5.5.6).** The stalk of the differential sheaf  $\Omega_{X/k}$  at a rational point  $x$  of a scheme over a field  $k$  is just the Zariski cotangent space  $\mathfrak{m}_x/\mathfrak{m}_x^2$  (7.6.4.21).  $\lrcorner$

*Proof:* Using the Jacobi exact sequence (5.4.3.8) on an affine nbhd  $\text{Spec } A$  of  $x$  for  $A$  and  $\mathfrak{m}_x$ . Then we verified that there is a right inverse of  $A/\mathfrak{m}_x^2 \rightarrow k(x) = x$ , then it follows that  $\mathfrak{m}_x/\mathfrak{m}_x^2 \cong \Omega_{A/k} \otimes_A k(x) = \Omega_{A/\mathfrak{m}_x/k}$  which is the stalk of  $\Omega_{X/k}$  by (7.5.5.1).  $\square$

**Prop. (7.5.5.7) [Euler Exact Sequence].** If  $X = \mathbb{P}_A^n = \text{Proj}(A[x_0, \dots, x_n])$  over  $Y = \text{Spec } A$ , then there is an exact sequence

$$0 \rightarrow \Omega_{X/A} \rightarrow (\mathcal{O}_X(-1))^{n+1} \rightarrow \mathcal{O}_X \rightarrow 0.$$

$\Omega_{X/A}$  is locally free by (7.12.1.16), so by taking dual and exterior powers,

$$0 \rightarrow \mathcal{O}_X \rightarrow \mathcal{O}_X(1)^{n+1} \rightarrow \mathcal{T}_X \rightarrow 0, \quad \mathcal{K}_X \cong \mathcal{O}_X(-n-1).$$

$\lrcorner$

*Proof:* Let  $S = A[x_0, \dots, x_n]$ ,  $E = S(-1)^{\oplus n+1}$  with a basis  $e_0, \dots, e_n$ , then there is a map of  $S$ -graded modules  $E \rightarrow S$  with kernel  $M$ .  $E \rightarrow S$  is surjective in all dimension  $\geq 1$ , so we have an exact sequence

$$0 \rightarrow \widetilde{M} \rightarrow \widetilde{E} \rightarrow \mathcal{O}_X \rightarrow 0.$$

Notice  $E_{(x_i)} \rightarrow S_{(x_i)}$  is given by  $e_j \mapsto x_j/x_i$ , so  $\widetilde{M}|_{D(x_i)}$  is a free sheaf generated by sections  $(1/x_i)e_j - (x_j/x_i^2)e_i, j \neq i$ . So we can define  $\varphi_i : \Omega_{X/A}|_{D(x_i)} \rightarrow \widetilde{M}|_{D(x_i)} : d(x_j/x_i) \mapsto (1/x_i)e_j - (x_j/x_i^2)e_i, j \neq i$  mapping isomorphically onto the kernel. It suffices to show this map glue to a map  $\Omega_{X/A} \rightarrow \widetilde{E}$ : On  $D(x_i x_j)$ ,  $x_k/x_i = (x_k/x_j) \cdot (x_j/x_i)$ , so

$$d\left(\frac{x_k}{x_i}\right) - \frac{x_k}{x_j} d\left(\frac{x_j}{x_i}\right) = \frac{x_j}{x_i} d\left(\frac{x_k}{x_j}\right).$$

Applying  $\varphi_i$  to the LHS and  $\varphi_j$  to the RHS gives the same element  $(1/x_i)e_k - (x_k/x_i x_j)e_j$ , which shows compatibility.  $\square$

### Conormal Sheaves

**Def. (7.5.5.8) [Conormal Sheaf of an Immersion].** Let  $i : Z \rightarrow X$  be a closed immersion with corresponding sheaf of ideals  $\mathcal{I}$ . Consider the Qco sheaf  $\mathcal{I}/\mathcal{I}^2$ , which is annihilated by  $\mathcal{I}$ , thus corresponds to a sheaf on  $Z$  by (7.2.6.18), called the **conormal sheaf**  $\mathcal{C}_{Z/X}$  of  $Z$ .

More generally, if  $i$  is any immersion, we can define the conormal sheaf as the conormal sheaf of the closed immersion  $i : Z \rightarrow X \setminus \partial Z$ . And also the **normal sheaf**  $\mathcal{N}_{Z/X}$  is defined to be  $\mathcal{N}_{Z/X} = \text{Hom}_{\mathcal{O}_Z}(\mathcal{I}/\mathcal{I}^2, \mathcal{O}_Z)$ .  $\lrcorner$

**Prop. (7.5.5.9) [Pullback of Conormal Sheaf].** Let 
$$\begin{array}{ccc} Z' & \xrightarrow{i} & X \\ \downarrow f & & \downarrow g \\ Z' & \xrightarrow{i'} & X' \end{array}$$
 be a fiber product square where  $i, i'$

are immersions, then the canonical map

$$f^* \mathcal{C}_{Z'/X'} \rightarrow \mathcal{C}_{Z/X}$$

is surjective, and if  $g$  is flat, it is an isomorphism.  $\lrcorner$

*Proof:* Change  $X'$  to  $X' \setminus \partial Z'$  and  $X$  to  $X \setminus (g^{-1} \partial Z' \cup \partial Z)$ , we may assume  $i$  is a closed immersion. Then we may localize to the case  $X'$  and  $X$  is affine. Then we notice if  $R' \rightarrow R$  is a ring map and  $I' \subset R'$  is an ideal, with  $I = I'R$ , then  $(I'/(I')^2) \otimes_{R'} R \rightarrow I/I^2$  is surjective, and if  $R/R'$  is flat, then  $I \cong I' \otimes_{R'} R$ , and the map is an isomorphism.  $\square$

**Prop. (7.5.5.10).** Let  $Z \xrightarrow{i} Y \rightarrow X$  be immersions of schemes, then there is a canonical exact sequence

$$i^* \mathcal{C}_{Y/X} \rightarrow \mathcal{C}_{Z/X} \rightarrow \mathcal{C}_{Z/Y} \rightarrow 0$$

*Proof:* By changing  $Y$  to  $Y \setminus \partial Z$  and  $X$  to  $X \setminus (\partial(Y \setminus \partial Z))$ , we can assume the immersions are closed immersion. Now by restricting to affine subsets, it suffices to show that for surjective ring maps  $C \rightarrow B \rightarrow A$ , if  $I = \ker(B \rightarrow A)$ ,  $J = \ker(C \rightarrow A)$ ,  $K = \ker(C \rightarrow B)$ , then there is an exact sequence

$$K/K^2 \otimes_B A \rightarrow J/J^2 \rightarrow I/I^2 \rightarrow 0.$$

But this follows from the observation  $K = \ker(J \rightarrow I)$ .  $\square$

**Prop. (7.5.5.11) [Conormal Sheaf of the Diagonal].** Let  $f : X \rightarrow S$  be a morphism, then there is a canonical isomorphism between  $\Omega_{X/S}$  and the conormal sheaf of the diagonal  $\Delta : X \rightarrow X \otimes_S X$ .  $\lrcorner$

*Proof:* Cf. [Sta]08S2. ?  $\square$

**Cor. (7.5.5.12).** If  $f : X \rightarrow S$  is a monomorphism, e.g. an immersion, then  $\Omega_{X/S} = 0$ .  $\lrcorner$

**Prop. (7.5.5.13).** If  $f : Z \rightarrow X$  is an immersion of schemes over  $S$ , then there is an exact sequence of sheaves on  $Z$ :

$$\mathcal{C}_{Z/X} \rightarrow i^* \Omega_{X/S} \rightarrow \Omega_{Z/S} \rightarrow 0.$$

*Proof:* Replace  $X$  by  $X \setminus \partial Z$ , we can assume  $f$  is a closed immersion. This follows immediate from (7.2.4.6).  $\square$

**Prop. (7.5.5.14).** If  $i : Z \rightarrow X$  is an immersion over  $S$  that locally has a left inverse, then the canonical sequence

$$0 \rightarrow \mathcal{C}_{Z/X} \rightarrow i^* \Omega_{X/S} \rightarrow \Omega_{Z/S} \rightarrow 0.$$

is locally split exact. In particular, if  $s : S \rightarrow X$  is a section of the structure morphism  $X \rightarrow S$ , then the map  $\mathcal{C}_{S/X} \rightarrow s^* \Omega_{X/S}$  is an isomorphism.  $\lrcorner$

*Proof:* Cf. [Sta]0474. ?

□

**Prop. (7.5.5.15).** Let  $\begin{array}{ccc} Z & \xrightarrow{i} & X \\ & \searrow j & \downarrow \\ & & Y \end{array}$  be a commutative diagram where  $i, j$  are immersions, then there is a

canonical exact sequence

$$\mathcal{C}_{Z/Y} \rightarrow \mathcal{C}_{Z/X} \rightarrow i^* \Omega_{X/Y} \rightarrow 0,$$

where the first arrows comes from (7.5.5.9) and the second map comes from (7.5.5.13).  $\lrcorner$

*Proof:* By replacing  $Y$  by  $Y \setminus \partial Z$  and  $X$  by  $X \setminus (\partial i(Z) \cup \partial j(Z))$ , then we may assume  $i, j$  are closed immersion. Then we check locally, the exactness follows from (8.1.1.5).  $\square$

## 7.6 More Properties of Morphisms between Schemes

*“One should never try to prove anything that is not almost obvious.”*

–A. Grothendieck

**Notation(7.6.0.1).**

- Use notations on properties of morphisms between schemes defined in [Properties of Schemes](#).
- Let  $S \in \text{Sch}$

┘

### 1 Finitely Presentedness

**Def.(7.6.1.1) [Locally of Finite Presentation].** A morphism between schemes  $f : Y \rightarrow X$  is called **of locally finite presentation** iff for any point  $x \in X$ , there is an open affine mapped into an open affine that the ring map is of finite presentation. It is called **of finite presentation** iff moreover it is qcqs.

locally of finite presentation is local on the source and target and it is stable under composition and base change but it doesn't satisfy the base change trick by [\(7.4.1.6\)](#) [\(7.4.1.5\)](#) and [\(5.3.7.9\)](#). ┘

**Prop.(7.6.1.2).** Open immersion is locally of finite presentation. ┘

**Prop.(7.6.1.3).** When the target is locally Noetherian, (locally)finite type and (locally)finite presentation is equivalent. ┘

**Prop.(7.6.1.4).** For  $f : X \rightarrow Y$  over  $S$ , if  $X/S$  is locally of f.p. and  $Y/S$  is locally of f.t., then  $f$  is locally of f.p.. If moreover  $X$  is of f.t. and  $Y$  is qc, then  $f$  is of f.t.. ┘

*Proof:* The first follows from [\(5.3.7.11\)](#), the second needs to check qcqs. Qc follows from [\(7.4.4.27\)](#).

□

**Prop.(7.6.1.5) [Chevalley].** A qc morphism locally of f.p. maps locally constructible subset to locally constructible subset. ┘

*Proof:* We prove  $f(E) \cap U_i$  is constructible for every  $U_i$  affine open in  $X$ . The inverse image of  $U_i$  is qc, hence a locally constructible set is constructible [\(4.12.2.10\)](#). So we reduce to the affine case [\(5.1.7.3\)](#). □

**Cor.(7.6.1.6).** As in the proposition, if  $Y$  is qc, and the image is dense in  $Y$ , then it contains an open dense subset of  $Y$ , by [\(4.12.2.18\)](#). ┘

### 2 Flatness

**Def.(7.6.2.1) [Flatness for Schemes].** Flat modules and flat morphisms over schemes are defined in the same way as that of ringed spaces [\(7.2.2.15\)](#). ┘

**Prop.(7.6.2.2).** Flatness is stalkwise by [\(7.2.2.17\)](#), it is stable under base change and compositions.  $\mathcal{F} \in \text{Coh}(X)$  is flat over  $X$  iff it is locally free, by [\(5.4.1.10\)](#)

Thus for  $\mathcal{F} \in \text{QCoh}(X)$ , flatness is equivalent to: For any affine open subsets  $\text{Spec } A \subset X$ ,  $\Gamma(\text{Spec } A, \mathcal{F})$  is flat over  $A$ , because flatness is also stalkwise for modules [\(5.1.4.2\)](#). Similarly, a morphism of schemes  $f : X \rightarrow Y$  is flat iff for any affine opens  $\text{Spec } B \subset X, \text{Spec } A \subset Y$  that  $f(\text{Spec } B) \subset \text{Spec } A$ ,  $B$  is flat over  $A$ . ┘

**Prop. (7.6.2.3).** For a flat morphism of ringed space,  $f^*$  is exact. ┘

*Proof:* Because it is  $f^{-1}$  followed by tensoring with  $\mathcal{O}_X$ , check on stalks. □

**Prop. (7.6.2.4) [Faithfully Flat Descent for Flat Modules].** Let  $f : X \rightarrow Y$  be a morphism of schemes over  $S$  and  $\mathcal{G} \in \mathcal{QCoh}(Y)$ , then  $\mathcal{G}$  is flat over  $S$  iff  $f^*\mathcal{G}$  is flat over  $S$ . In particular,  $Y$  is flat over  $S$  iff  $X$  is flat over  $S$ . ┘

*Proof:* This follows from (5.4.1.6). □

**Prop. (7.6.2.5) [Finite Locally Free Modules].** For  $X \in \mathcal{Sch}$  and  $\mathcal{F} \in \mathcal{QCoh}(X)$ , the following are equivalent, by (5.3.1.7).

1.  $\mathcal{F}$  is finite projective.
  2.  $\mathcal{F}$  is f.p. and flat.
  3.  $\mathcal{F}$  is f.p. and all its localizations at (maximal)primes are free.
  4.  $\mathcal{F}$  is finite locally free.
  5.  $\mathcal{F}$  is finite and locally free.
  6.  $\mathcal{F}$  is finite and all its localizations at primes are free and the function  $p \rightarrow \dim_{k(p)} \mathcal{F} \otimes_R k(p)$  is a locally constant function on  $\text{Spec } R$ .
- ┘

**Cor. (7.6.2.6).** Let  $f : X \rightarrow Y \in \mathcal{NSch}$  be a finite morphism where  $Y$  is reduced, then the following are equivalent:

- $f$  is flat.
  - $f_*\mathcal{O}_X$  is locally free.
  - $\dim_{k(x)}(\pi_*\mathcal{O}_X)_x \otimes k(x)$  is a locally constant function for  $x \in Y$ .
- ┘

*Proof:* 3 follows from (7.5.1.43). □

**Prop. (7.6.2.7) [Going-Down].** Generalizations lift along a flat morphism. ┘

*Proof:* We can find an affine nbhd, then choose a nbhd of the inverse image, then a generalization in an affine open is a true generalization, so it reduce to the affine case. The rest follows from going-down (5.4.1.18). □

**Cor. (7.6.2.8) [Flat Map and Irreducible Components].** A flat morphism maps generic points to generic points. ┘

**Prop. (7.6.2.9) [Flat Map and Associated Points].** Let  $f : X \rightarrow S$  be a morphism of schemes that  $S$  is locally Noetherian, and  $\mathcal{F}$  a Qco sheaf on  $X$ . If  $\mathcal{F}$  is flat over  $S$ , then  $f$  maps  $\text{WeakAss}(\mathcal{F})$  to  $\text{Ass}(S)$ . In particular, if  $X$  is flat over  $S$ , then  $f$  maps  $\text{WeakAss}(X)$  to  $\text{Ass}(S)$ . ┘

*Proof:* Let  $x \in X, f(x) = s$  that  $s \in \text{Ass}(S)$ , then we get a map  $(\mathcal{O}_{S,s}, \mathfrak{m}_s) \rightarrow (\mathcal{O}_{X,x}, \mathfrak{m}_x)$ . If  $\mathfrak{m}_s$  is not associated point, then by prime avoidance (5.1.1.5), there is some  $m \in \mathfrak{m}_s$  that is not a non-zero divisor, by (5.2.5.17), so  $f^\sharp(m)$  is also a non-zero divisor on  $\mathcal{F}_x$ , so  $\mathfrak{m}_x$  is not a weakly associated point of  $\mathcal{F}$ . □

**Prop. (7.6.2.10) [Flat Map is Open].** A flat morphism locally of f.p. is (universally) open, hence it is qc.

And a qc f.f. morphism of schemes is a quotient map.  $\lrcorner$

*Proof:* It suffices to consider the affine case. Then the assertion follows from (5.4.1.30).

For the second, by (7.6.2.7), a subset whose inverse image is closed is stable under specialization (surjectiveness used), then it is closed by (7.4.4.9)  $\square$

**Prop. (7.6.2.11) [Flat Pullback of Closed Subschemes].** Let  $Z \subset X$  be a closed subscheme corresponding to a Qco sheaf of ideals  $\mathcal{I}$ , and  $f : X' \rightarrow X$  be a flat morphism, then the pullback  $Z' \subset X'$  is a closed subscheme that corresponds to the ideal sheaf  $f^*\mathcal{I}$ .  $\lrcorner$

*Proof:* This is because  $f^*$  is exact.  $\square$

**Prop. (7.6.2.12) [Pullback of Flat Closed Subschemes].** Let  $X$  be a scheme over  $S$ ,  $S' \rightarrow S$  be a morphism of schemes, and  $Z \subset X$  be a closed subscheme corresponding to a Qco sheaf of ideals  $\mathcal{I}$  flat over  $S$ , then the pullback  $Z' \subset X'$  is a closed subscheme that corresponds to the ideal sheaf  $f^*\mathcal{I}$ .  $\lrcorner$

**Prop. (7.6.2.13) [Flat Loci is Open].** For a morphism  $f : X \rightarrow S$  locally of f.p., and  $\mathcal{F} \in \mathcal{QCoh}^{\text{pf}}(X)$ , then the set of points of  $X$  that  $\mathcal{F}$  is flat over  $S$  is open. In particular, if  $f$  is a closed map, then the set of points of  $Y$  that  $\mathcal{F}$  is flat is open.  $\lrcorner$

*Proof:* Cf. [Sta]00RC. ?

The last assertion follows from the first one.  $\square$

**Prop. (7.6.2.14) [Generic Flatness].** For a morphism  $f : X \rightarrow S$  of f.t., if  $S$  is reduced and  $\mathcal{F}$  is a Qco f.t.  $\mathcal{O}_X$ -module, then there exists an open dense subset  $U$  of  $S$  that  $X_U \rightarrow U$  is flat, of f.p., and  $\mathcal{F}_{X_U}$  is flat over  $U$  and of f.p. over  $\mathcal{O}_U$ .  $\lrcorner$

*Proof:* As flat and f.p. is local on the base, it suffices to show for  $S$  affine. Then this almost immediately reduces to the affine case by choosing an affine cover of  $X$ , except that we need  $X_U$  to be qs over  $U$ . To achieve this, it suffices to do it second time and let  $X = \cup_{i \leq n} \text{Spec } B_i = \cup X_i$ , and  $X_i \cap X_j = D(I_{ij})$ ,  $M_{ij} = B_i/I_{ij}$ , then choose  $f$  large enough that over  $S_f$ , all  $M_{ij}$  are f.p. over  $B_i$ , then by (5.2.5.9),  $X_{i,f} \cap X_{j,f}$  is qc, thus  $X_f$  is f.p. over  $S_f$ .  $\square$

**Thm. (7.6.2.15) [Fibral Criterion of flatness].** Let  $S \in \text{Sch}$  and  $f : X \rightarrow Y$  in  $\text{Sch}/S$ ,  $\mathcal{F} \in \mathcal{QCoh}^{\text{pf}}(X)$ . Let  $x \in X, y = f(x)$  and  $x$  maps to  $s \in S$ . Suppose  $X, Y$  are both locally Noetherian or  $X$  is locally of f.p. over  $S$  and  $Y$  is locally of f.t. over  $S$ , then the following are equivalent:

- $\mathcal{F}$  is flat over  $S$  at  $x$  and  $\mathcal{F}_s$  is flat over  $Y_s$  at  $x$ .
- $Y$  is flat over  $S$  at  $y$  and  $\mathcal{F}$  is flat over  $Y$  at  $x$ .

$\lrcorner$

*Proof:* Cf. [Sta]039B, 039C.  $\square$

**Prop. (7.6.2.16) [Hilbert Polynomial Constant in Flat Family].** For  $X/T$  projective, where  $T$  is an integral Noetherian scheme and  $X \subset \mathbb{P}_T^n$ . Then for each point  $T$ ,  $X_t$  is a closed subscheme of  $\mathbb{P}_{k(t)}^n$ , so we can consider its Hilbert Polynomial  $P_t$ . Then  $X/T$  is flat iff  $P_t$  is independent of  $T$ .

? Needs huge improvement.  $\lrcorner$

*Proof:*  $P_t(m) = \dim_{k(t)} H^0(X_t, \mathcal{O}_{X_t}(m))$  for  $m$  large by (7.7.3.10). And we may let  $X = \mathbb{P}_T^n$  and prove for any coherent sheaf  $\mathcal{F}$ . Moreover, we may let  $T$  be a affine local Noetherian, because flatness is local and we only need to compare Hilbert polynomial with the generic point. Now we prove a stronger assertion: The following are equivalent:

- $\mathcal{F}$  is flat over  $T$ .
- $H^0(X, \mathcal{F}(m))$  is a free  $A$ -module of finite rank, for  $m$  large.
- The Hilbert polynomial  $P_t$  of  $\mathcal{F}_t$  on  $X_t = \mathbb{P}_{k(t)}^n$  is independent of  $t$ .

1  $\rightarrow$  2: Use the canonical cover and Čech cohomology, then we notice when  $m$  is large,  $H^0(X, \mathcal{F}(m))$  is a kernel of the Čech resolution, so it is flat. And it is also finite by (7.7.4.12). Then it is free because it is flat by (5.4.1.10).

2  $\rightarrow$  1: Let  $M = \bigoplus_{m \geq m_0} H^0(X, \mathcal{F}(m))$ , then  $\widetilde{M} = \mathcal{F}$  (7.5.3.6), notice that the truncation doesn't affect.

2  $\rightarrow$  3: It suffice to prove that for any  $t \in T$ , when  $m$  is large,

$$H^0(X_t, \mathcal{F}_t(m)) \cong H^0(X, \mathcal{F}(m)) \otimes_A k(t).$$

For this, we may use (7.7.5.1) to pass to the localization and assume  $t$  is the closed pt of  $T$ . Then  $A \rightarrow k(t)$  is surjective and we may let  $A^q \rightarrow A \rightarrow k \rightarrow 0$ , then by (7.7.4.8), we have  $H^0(X_t, \mathcal{F}_t(m))$  is the cokernel of  $H^0(X, \mathcal{F}(m))^q \rightarrow H^0(X, \mathcal{F}(m))$ , but this cokernel is  $H^0(X, \mathcal{F}(m)) \otimes_k$  because tensoring is right-adjoint, so we are done.

3  $\rightarrow$  2: We have the rank of  $H^0(X, \mathcal{F}(m))$  at the generic and closed point of  $T$  are the same (still use  $H^0(X_t, \mathcal{F}_t(m)) \cong H^0(X, \mathcal{F}(m)) \otimes_A k(t)$ .) Now (5.4.8.1) gives  $H^0(X, \mathcal{F}(m))$  is free. It is f.g. automatically.  $\square$

**Cor. (7.6.2.17).** For a flat morphism to a connected scheme  $T$ , the dimension, degree, and arithmetic genus of the fibers are independent of  $t$ .  $\lrcorner$

*Proof:* By (7.7.3.6) and (7.7.3.12).  $\square$

**Def. (7.6.2.18).** For a surjective map of varieties  $f : X \rightarrow T$  over an alg.closed field  $k$ , its fibers over closed points with induced reduced structure  $X_{(t)}$  is called a **algebraic family of varieties parametrized by  $T$**  if

1.  $f^{-1}(t)$  is irreducible of dimension  $\dim X - \dim T$  for every closed point  $t$ .
2. If  $\zeta$  is the generic point of  $f^{-1}(t)$ , then  $F^\sharp \mathfrak{m}_t$  generates the maximal ideal  $\mathfrak{m}_\zeta \subset \mathcal{O}_{\zeta, X}$ .

$\lrcorner$

**Prop. (7.6.2.19).** if  $X_{(t)}$  is an algebraic family of normal varieties over an alg.closed field  $k$  parametrized by a nonsingular curve  $T$ , then it is a flat family of schemes.  $\lrcorner$

*Proof:* By (7.13.1.21),  $X \rightarrow T$  is flat. So what we need to do is to prove  $X_t$  is reduced so  $X_t = X_{(t)}$ . Let  $A = \mathcal{O}_{x, X}$ , let  $u_t$  be a uniformizer of  $\mathcal{O}_{t, T}$ , then  $A/tA$  is the local ring of  $x$  on  $X_t$ . By hypothesis  $X_t$  is irreducible so  $tA$  has a unique minimal prime  $p$  in  $A$ , and  $t$  generate the maximal ideal of  $A_p$  by hypothesis. The local ring of  $X_{(t)}$  is  $A/p$ , so  $A/p$  is normal by hypothesis. Then the result follows from (5.3.5.14).  $\square$

**Cor. (7.6.2.20) [Igusa].** Let  $X_{(t)}$  be an algebraic family of normal varieties in  $\mathbb{P}_k^n$  for  $k$  alg.closed parametrized a variety  $T$ , then the Hilbert polynomials of  $X_{(t)}$  are independent of  $t$ .  $\lrcorner$

*Proof:* ? Why is  $X/T$  projective? Cf. [Hartshorne P265].  $\square$

### Degenerating Techniques

#### Finite Locally Free Morphism

**Def. (7.6.2.21) [Finite Locally Free].** A morphism  $f : X \rightarrow Y$  is called **finite locally free of rank  $d$**  iff it is affine, and  $f_*\mathcal{O}_X$  is a finite locally free  $\mathcal{O}_Y$ -module of rank  $d$ . ┘

**Cor. (7.6.2.22).** If  $f$  is finite locally free of rank  $n$ , then for any locally free sheaf  $E$  of rank  $k$  on  $X$ ,  $f_*E$  is locally free of rank  $nk$ . ┘

**Prop. (7.6.2.23).**  $f : X \rightarrow Y \in \text{Sch}$  is finite locally free (7.6.2.21) iff it is finite, flat and of f.p.. In particular, when  $Y$  is locally Noetherian, this is equivalent to  $f$  is finite flat. ┘

*Proof:* Both notions are local on the target, so we reduce to the ring case, which is (5.3.1.7). □

**Cor. (7.6.2.24).** Finite locally freeness is stable under composition and base change, and it is local on the target. ┘

**Prop. (7.6.2.25) [Trace and Norm].** Let  $f : Y \rightarrow X$  be a finite locally free map of constant rank, then there are trace and norm maps  $\text{tr} : f_*\mathcal{O}_Y \rightarrow \mathcal{O}_X$ ,  $\text{Nm} : f_*\mathcal{O}_Y \rightarrow \mathcal{O}_X$  compatible with arbitrary base change. ┘

*Proof:* The proof is the same as that of (5.3.1.11). □

**Prop. (7.6.2.26).** Let  $f : Y \rightarrow X$  be a finite locally free map of constant rank, and  $b \in \Gamma(Y, \mathcal{O}_Y)$ , then  $f(Z(b)) = Z(\text{Nm}(b))$ . ┘

*Proof:* We can assume  $X$  is affine, then we need to show that for a prime  $\mathfrak{p}$  with inverse images  $\mathfrak{p}_i$ ,  $b \in \cup \mathfrak{p}_i$  iff  $\text{Nm}(b) \in \mathfrak{p}$ . We localize at  $\mathfrak{p}$ , then  $\text{Nm}(b) \in \mathfrak{p}$  iff  $\text{Nm}(b)$  is non-invertible iff multiplication by  $b$  is non-invertible iff  $b$  is non-invertible iff  $b \notin \cup \mathfrak{p}_i$ , because  $\mathfrak{p}_i$  are all the maximal ideals of  $B_{\mathfrak{p}}$ . □

### 3 Dimensions

References are [Mat80] and [Vak17]Chap11.

**Prop. (7.6.3.1) [Locally Algebraic Scheme is Catenary].** If  $X$  is a locally algebraic scheme over a field  $k$  purely of dimension  $n$ , and  $Y$  an irreducible subscheme of  $X$ , then  $\dim Y + \text{codim}(Y, X) = \dim X$ . ┘

*Proof:* Choose an affine open of the generic point of  $Y$ , then we are reduced to the affine case (5.2.4.3) (5.2.4.7). □

**Prop. (7.6.3.2).** For any scheme,  $\dim \mathcal{O}_x = \text{codim}(\overline{\{x\}}, X)$ . ┘

**Prop. (7.6.3.3).** For an integral scheme algebraic over a field  $k$ ,

$$\dim X = \dim \mathcal{O}_{p,X} = \dim U = \text{tr.deg } K(X)/k$$

for any closed point  $p$  and any open subscheme  $U$ . ┘

*Proof:* Use closed point are dense (7.4.1.26) and  $k$  is universal catenary to prove it is true for some  $U$  and all the closed point in it, so other  $U$ 's because  $X$  is irreducible. The last equation follows from (5.2.4.23). □

**Prop. (7.6.3.4) [Finite Surjection Preserves Dimension].** Let  $X \rightarrow Y$  be a surjective finite morphism of algebraic integral schemes over a field  $k$ , then  $\dim X = \dim Y$ .  $\lrcorner$

*Proof:* The hypothesis implies that for any affine open  $\text{Spec } A \subset Y$ , the inverse image is  $\text{Spec } B$  that  $A \rightarrow B$  is an injective integral ring extension, so we can use (7.6.3.3) and (5.2.4.14).  $\square$

**Prop. (7.6.3.5).** Let  $X$  be a locally Noetherian scheme, if  $U \subset X$  is an open subscheme that  $U \rightarrow X$  is affine, then every irreducible components of  $X - U$  has codimension  $\leq 1$ . And if  $U$  is dense, then equality must hold.  $\lrcorner$

*Proof:* Cf. [Sta]0BCU.  $\square$

**Prop. (7.6.3.6) [Local Dimensions].** Let  $X$  be a locally algebraic scheme over a field  $k$  and  $x \in X$ , then the local dimension  $\dim_x(X)$  equals the maximal dimension of irreducible components of  $X$  passing through  $x$ , by (5.2.4.27).  $\lrcorner$

**Prop. (7.6.3.7).** If  $f : X \rightarrow Y \in \text{Sch}^{\text{loc.ft}}/S$ ,  $x \in X$  and  $s = f(x)$ , then

$$\dim_x(X_s) = \dim \mathcal{O}_{X_s, x} + \text{tr.deg}_{k(s)} k(x).$$

$\lrcorner$

*Proof:* This reduces to the case  $Y = \text{Spec } k(s)$ , and it follows from (5.2.4.28).  $\square$

**Prop. (7.6.3.8) [Semicontinuity of Dimension].** Let  $f : X \rightarrow S$  be a morphism of schemes locally of f.t., then the function  $x \mapsto \dim_x(X_{f(x)})$  is upper-semicontinuous on  $X$ .

Moreover, if  $f$  is of f.p., then the open subsets  $\{x \mid \dim_x(X_{f(x)}) \leq n\}$  is retrocompact.  $\lrcorner$

*Proof:* This follows directly from (5.2.4.32).  $\square$

**Prop. (7.6.3.9) [Local Dimension and Base Change].** Let

$$\begin{array}{ccc} X' & \xrightarrow{g'} & X \\ \downarrow f' & & \downarrow f \\ S' & \xrightarrow{g} & S \end{array}$$

be a fiber product diagram of schemes, and  $f$  is locally of f.t.. Suppose  $x' \in X'$ ,  $x = g'(x')$ ,  $s = g(s')$ . Then

- $\dim_x(X_s) = \dim_{x'}(X_{s'})$ .

- 

$$\dim \mathcal{O}_{F, x'} = \dim \mathcal{O}_{X'_{s'}, x'} - \dim \mathcal{O}_{X_s, x} = \text{tr.deg}_{k(s)}(k(x)) - \text{tr.deg}_{k(s')} (k(x'))$$

where  $F$  is the fiber of the morphism  $X'_{s'} \rightarrow X_s$  over  $x$ . In particular,  $\dim \mathcal{O}_{X'_{s'}, x'} \geq \dim \mathcal{O}_{X_s, x}$  and  $\text{tr.deg}_{k(s')} (k(x')) \leq \text{tr.deg}_{k(s)}(k(x))$ .

- Given  $s', s, x$  that  $f(x) = g(s')$ , there exists an  $x' \in X'$  that  $\dim \mathcal{O}_{X'_{s'}, x'} = \dim \mathcal{O}_{X_s, x}$  and  $\text{tr.deg}_{k(s')} (k(x')) = \text{tr.deg}_{k(s)}(k(x))$ .

$\lrcorner$

*Proof:* It can be reduced to the case that  $S = \text{Spec } k(s)$ ,  $S' = \text{Spec } k(s')$  and  $X, X'$  affine. Then 1 follows from (5.2.4.31), and 2, 3 follows from (5.2.4.26).  $\square$

**Cor. (7.6.3.10)[Dimension and Field Extension].** Let  $K/k$  be a field extension,  $X$  a locally algebraic scheme over  $k$  purely of dimension  $n$ , then  $X_K$  is a scheme purely of dimension  $n$ .  $\lrcorner$

**Remark (7.6.3.11).** This proposition shows in particular local dimension behaves better than the dimension of the stalk.  $\lrcorner$

**Def. (7.6.3.12)[Relative Dimensions].** A morphism of schemes which locally of f.t. is called of **relative dimension**  $n$  iff all fibers  $X_s$  are equidimensional of dimension  $n$ .  $\lrcorner$

**Prop. (7.6.3.13).** Being a morphism of relative dimension  $n$  is stable under field extension, by (7.6.3.10).  $\lrcorner$

### Dimension and Flatness

**Prop. (7.6.3.14) [Faithfully Flat Morphism].** If  $f : Y \rightarrow X$  is a faithfully flat morphism, then  $\dim Y \geq \dim X$ .  $\lrcorner$

*Proof:* This is easy from (7.6.2.7).  $\square$

**Prop. (7.6.3.15)[Integral Flat Morphisms].** If  $f : X' \rightarrow X$  is an integral flat morphism of schemes, and  $X$  is pure of dimension  $n$ , then so does  $X'$ . The converse holds if  $f$  is faithfully flat.  $\lrcorner$

*Proof:* By (7.6.2.8) and (7.4.4.35),  $f$  maps an irreducible component of  $X'$  onto an irreducible component of  $X$ , Then by (4.12.2.27), the proposition reduces to the affine case (5.2.4.15). If  $f$  is faithfully flat, then every irreducible component of  $X$  is in the image.  $\square$

**Cor. (7.6.3.16)[Dimension and Field Extension].** If  $K/k$  is an algebraic extension,  $X$  a scheme over  $k$  purely of dimension  $n$ , then  $X_K$  is a scheme purely of dimension  $n$ . Compare with (7.6.3.10).  $\lrcorner$

**Prop. (7.6.3.17)[Dimension Extension and Flatness].** Let  $f : X \rightarrow Y, g : Y \rightarrow S$  be locally of f.t.,  $x \in X, y = f(x), s = g(y)$ , then

$$\dim_x(X_s) \leq \dim_x(X_y) + \dim_y(Y_s).$$

Moreover, equality holds if  $\mathcal{O}_{X,x}/\mathcal{O}_{Y,y}$  is flat.

In particular, if  $S = \operatorname{Spec} k$  and  $X, Y$  are irreducible and  $X$  is flat over  $Y$ , then  $\dim X_y = \dim X - \dim Y$  for any  $y \in Y$ .  $\lrcorner$

*Proof:* By (7.6.3.7) and the fact transcendental degree is additive, this reduces to

$$\dim \mathcal{O}_{X_s,x} \leq \dim \mathcal{O}_{X_y,x} + \dim \mathcal{O}_{Y_s,y}.$$

We can assume  $X, Y$  is affine and  $S = \operatorname{Spec} k(s)$ , so the rest follows from (5.2.4.13).  $\square$

**Cor. (7.6.3.18).** If  $f : X \rightarrow Y, g : Y \rightarrow Z$  are of relative dimension  $m$  and  $n$  (7.6.3.12), and  $f$  is flat, then  $g \circ f$  is of relative dimension  $m + n$ .  $\lrcorner$

**Cor. (7.6.3.19)[Generic Dimension Equation].** If  $f : X \rightarrow Y$  is a dominant morphism of irreducible algebraic schemes over  $K$  that  $X$  is reduced, then there is a dense open subset  $U$  of  $Y$  that for any  $y \in U$ ,

$$\dim(X_y) = \dim X - \dim Y.$$

$\lrcorner$

*Proof:* This is a combination of the above proposition and generic flatness(7.6.2.14).  $\square$

**Prop. (7.6.3.20) [Relative Dimension and Base Change].** By(7.6.3.9), the base change of a morphism of locally algebraic schemes over a field  $k$  of relative dimension  $n$  is still of relative dimension  $n$ . In particular, for a variety over  $K$  a field, the dimension is invariant under base change of fields.  $\lrcorner$

**Cor. (7.6.3.21).** Let  $Y, Z$  be irreducible locally algebraic schemes over  $k$ , then  $Y \times_k Z$  is pure of dimensional  $\dim(Y) + \dim(Z)$ .  $\lrcorner$

*Proof:* Combine(7.6.3.20) and(7.6.3.17).  $\square$

**Prop. (7.6.3.22).** For a morphism  $f : X \rightarrow Y$  between locally Noetherian schemes which is flat and locally of f.t and of relative dimension  $n$ , then if  $y = f(x)$ , we have  $\dim_x(X_y) = \dim_x(X) - \dim_y(Y)$ .  $\lrcorner$

*Proof:* Shrinking the nbhd, we may assume  $\dim_x(X) = \dim X$  and  $\dim_y(Y) = \dim Y$  and  $X, Y$  are affine. Now  $f$  is locally of f.p. and flat, so it is open(7.6.2.10). So we may assume  $f$  is surjective. Then  $\dim \mathcal{O}_{X,a} = \dim \mathcal{O}_{Y,b} + \dim \mathcal{O}_{X_b,a} = \dim \mathcal{O}_{Y,b} + n$  by(5.2.4.13), then taking supremum??, the result follows.  $\square$

**Cor. (7.6.3.23).** For a morphism of schemes that is flat and of f.t., if  $Y$  is irreducible, then  $X$  is equidimensional of dimension  $\dim Y + n$  iff  $X_y$  is equidimensional of dimension  $n$  for every  $y \in Y$ .  $\lrcorner$

*Proof:* The proof highly relies on(7.6.3.3).

If  $X$  is equidimensional of dimension  $\dim Y + n$ , for  $Z \subset X_y$  an irreducible component, choose a closed pt  $x$  of  $Z$  not contained in any other irreducible component, then

$$\dim_x Z = \dim_x X - \dim_y Y = \dim X - \dim \overline{\{x\}} - \dim Y + \dim \overline{\{y\}}.$$

The two closures are of the same dimension because by(5.2.6.10), their quotient field extension is finite, and use(5.2.4.14).

Conversely, for an irreducible component of  $X$ , choose a closed pt  $x$  of  $Z$  not contained in any other irreducible component, then the image is also closed, by(7.4.1.27), so the result is immediate.  $\square$

**Prop. (7.6.3.24).** If  $f : X \rightarrow Y$  is a proper flat morphism of schemes of f.p., then the dimension of fibers of  $f$  is a locally constant function.  $\lrcorner$

*Proof:* Cf.[Sta]04DJ. ?  $\square$

## 4 Smoothness

**Def. (7.6.4.1) [Smooth Morphisms].** A **smooth morphism** is a morphism  $f : X \rightarrow Y \in \mathcal{S}ch$  s.t. there is an open affine cover  $\{U_i\}$  of  $S$  and an open affine cover  $\{V_{ij}\}$  of  $f^{-1}(\{U_i\})$  s.t. the ring maps  $\Gamma(U_i) \rightarrow \Gamma(V_{ij})$  are all smooth(5.4.5.12). In particular, it is locally of f.p..

A **standard smooth morphism** is the Spec map of a standard smooth ring map. Smooth morphisms are locally standard smooth by(5.4.5.12).

Smoothness is local on the source and target(5.4.5.13). Smoothness is stable under base change and composition(5.4.5.13).  $\lrcorner$

**Prop. (7.6.4.2).** For a smooth morphism  $X \rightarrow S$ , the morphism of differential  $\Omega_{X/S}$  is locally free and  $\dim_x \Omega_{X/S} = \dim_x(X_{f(x)})(\text{local dimension}(4.12.2.26))$ .  $\lrcorner$

*Proof:* We can assume that  $X \rightarrow S$  is standard smooth, so by the proof in (5.4.5.12),  $\Omega_{X/S}$  is free of dimension  $n - c$ , and also standard smooth is relative global complete intersection (5.4.5.11), so  $U_{f(x)}$  is equidimensional of dimension  $n - c$ , thus the result.  $\square$

**Cor. (7.6.4.3) [Differential Criterion of Smoothness].** If  $X \rightarrow S$  is a flat of relative dimension  $n$ , then  $X$  is smooth over  $S$  iff it is locally of f.p. and  $\Omega_{X/S}$  is locally free of dimension  $n$ , by (5.4.5.23).  $\lrcorner$

**Prop. (7.6.4.4) [Smooth Morphisms are Open].** Smooth morphisms are syntomic hence flat. Smooth morphism is locally of f.p. Hence smooth morphism is universally open (7.6.2.10).  $\lrcorner$

**Prop. (7.6.4.5) [Fiberwise and Stalkwise].** For  $f : X \rightarrow S \in \text{Sch}$  locally of f.p. and  $x \in X$ , the following are equivalent:

- $f$  is smooth at  $x$ .
- $\mathcal{O}_{X,x}/\mathcal{O}_{S,f(x)}$  is flat and  $X_{f(x)}/\kappa(f(x))$  is smooth at  $x$ , by (5.4.5.20).
- $\mathcal{O}_{X,x}/\mathcal{O}_{S,f(x)}$  is flat and  $\Omega_{X/S,x}$  can be generated by  $\dim_x(X_{f(x)})$  elements, by (7.6.4.2) and (5.4.5.23).
- $\mathcal{O}_{X,x}/\mathcal{O}_{S,f(x)}$  is flat and  $\Omega_{X_s/s,x} \otimes_{\mathcal{O}_{X_s,x}} k(x) = \Omega_{X/S,x} \otimes_{\mathcal{O}_{X,x}} \kappa(x)$  can be generated by  $\dim_x(X_{f(x)})$  elements, by Nakayama, because  $\Omega_{X/S,x}$  is of f.p. by (5.4.3.9).

In particular, a smooth morphism can be seen as a family of smooth schemes.  $\lrcorner$

*Proof:*  $\square$

**Prop. (7.6.4.6).** If  $f : X \rightarrow Y \in \text{Sch}/S$  is smooth, then by (7.5.5.5)(5.4.5.5), there is an exact sequence of sheaves on  $X$ :

$$0 \rightarrow f^* \Omega_{Y/S} \xrightarrow{df^*} \Omega_{X/S} \rightarrow \Omega_{X/Y} \rightarrow 0.$$

$\lrcorner$

**Prop. (7.6.4.7).** If  $Z \rightarrow X \rightarrow S$ ,  $Z/S$  is smooth and  $Z \rightarrow X$  is an immersion, then there is an exact sequence of sheaves (7.5.5.13)(5.4.5.6):

$$0 \rightarrow \mathcal{C}_{Z/X} \rightarrow i^* \Omega_{X/S} \rightarrow \Omega_{Z/S} \rightarrow 0$$

$\lrcorner$

**Prop. (7.6.4.8).** If  $X \rightarrow Y \rightarrow S$ , and  $X \rightarrow Y$  are faithfully flat and locally of f.p.,  $X/S$  is smooth, then  $Y/S$  is smooth.  $\lrcorner$

*Proof:* Cf. [Sta]05B5.  $\square$

**Prop. (7.6.4.9).** If  $f : X \rightarrow S$  is faithfully flat and locally of f.p., then the set of points of  $S$  s.t.  $f$  is smooth is table under base change.  $\lrcorner$

*Proof:*  $\square$

**Prop. (7.6.4.10).** By (7.6.4.5)(7.6.4.2), A morphism is smooth of relative dimension  $n$  is equivalent to fppf+fibers equidimensional of dimension  $n$  and  $\Omega_{X/S}$  is locally free of dimension  $n$ .  $\lrcorner$

**Prop. (7.6.4.11) [Jacobian Criterion for Projective Schemes].** Let  $X$  be a closed subscheme of  $\mathbb{P}_R^n$  defined by  $r$  polynomials  $F_1(X_0, \dots, X_n), \dots, F_r(X_1, \dots, X_n)$ , then for  $x \in X$ ,  $X$  is smooth at  $x$  iff the Jacobian has rank  $\geq n - \dim_x X$  at  $x$  iff the Jacobian has rank  $= n - \dim_x X$  at  $x$ .  $\lrcorner$

*Proof:* Assume that  $x$  is in the standard open  $X_0 \neq 0$ , then we can use Euler's identity  $\sum X_i \frac{\partial F}{\partial X_i} = \dim(F)F$  to eliminate the first row, then divide by  $X_0^{\dim F}$  to get the Jacobian on the affine open  $\text{Spec } R[\frac{X_1}{X_0}, \dots, \frac{X_n}{X_0}]$ , so we finish by (5.4.5.24).  $\square$

**Prop. (7.6.4.12) [Generic Smoothness on the Source].** Let  $\pi : X \rightarrow Y$  be a dominant map of integral schemes of f.t. that  $R(Y) \rightarrow R(X)$  is separable, then there is a non-empty open subscheme  $U \subset X$  that  $\pi|_U$  is smooth of relative dimension  $\dim X - \dim Y$ .  $\lrcorner$

*Proof:* This reduces to the affine case, and follows from (5.4.5.29) and (7.6.3.17).  $\square$

**Prop. (7.6.4.13) [Generic Smoothness on the Target].** Let  $\pi : X \rightarrow Y$  be a morphism of  $k$ -varieties where  $\text{char } k = 0$ , and  $X$  is smooth over  $k$ , then there is a dense open subset  $U \subset Y$  that  $\pi^{-1}(U) \rightarrow U$  is smooth.  $\lrcorner$

*Proof:* Cf. [Vak17]P681.  $\square$

### Smooth over Fields

**Prop. (7.6.4.14) [Differential Criterion of Smoothness].** Let  $X$  be a scheme algebraic over a field  $k$ .

- If  $X$  is equidimensional of dimension  $n$ , then  $X$  is smooth over  $k$  iff  $\Omega_{X/S}$  is locally free of dimension  $n$ .
- If  $\Omega_{X/k}$  is locally free, and ( $k$  is of char 0) or ( $k$  is perfect and  $X$  is reduced), then  $X$  is smooth over  $k$ .  $\lrcorner$

*Proof:* 1: This follows from (7.6.4.3).

2: If  $k$  is of characteristic 0, then this follows from (5.4.5.28).

perfect case: [Sta]04QP. ?  $\square$

**Prop. (7.6.4.15) [Smooth over Field and Geo.Regular].** For a scheme locally algebraic over a field  $k$ ,  $X$  is geometrically regular iff it is smooth over  $k$ . In particular, if  $k$  is perfect, then smoothness is equivalent to regularity, by (7.4.3.18).  $\lrcorner$

*Proof:* The question is local around  $x$ , so may assume  $X$  is affine. Then this follows from (5.4.5.27).  $\square$

**Cor. (7.6.4.16) [Hartshorne Definition].** By (7.6.4.5) and (7.6.4.15), a morphism between schemes algebraic over a field  $k$  is smooth of relative dimension  $n$  iff  $f$  is flat and every fiber of  $f$  is geometrically regular of dimension  $n$ .  $\lrcorner$

**Cor. (7.6.4.17).** A smooth scheme over a field  $k$  is regular hence normal.  $\lrcorner$

**Prop. (7.6.4.18) [Smoothness and Arithmetic Points].** For  $X \in \text{Sch}^{\text{sm}}/k$ , the set of closed points of  $X$  with finite separable residue field  $\kappa(x)/k$  is dense in  $X$ .  $\lrcorner$

*Proof:* It suffices to show there exists one such points. By (7.6.6.7), we can assume  $X \xrightarrow{\pi} \mathbb{A}_k^d \rightarrow k$ , where  $\pi$  is étale. Thus  $X$  is open in  $\mathbb{A}_k^d$  by (7.6.6.3). Then we can choose a closed point of  $\pi(X)$  s.t. the residue field is finite separable, as  $k^{\text{sep}}$  is infinite. Then choose an inverse image, then the residue is finite étale over  $k$ , by (7.6.6.8). This point is clearly closed.  $\square$

**Prop. (7.6.4.19) [Smoothness at Rational Points].** Let  $X$  be a locally algebraic scheme over a field  $k$ . Let  $x \in X$  that  $k(x)/k$  is finite separable, then  $X$  is smooth at  $x$  iff it is a regular point, by (5.4.5.26).  $\lrcorner$

**Prop. (7.6.4.20) [Geo.Reduced Scheme Generic Smooth].** Let  $X \in \text{Sch}^{\text{loc.ft}}/k$  be geometrically reduced, then it contains an open dense subset that is smooth over  $k$ .  $\lrcorner$

*Proof:* The problem is local, so we may assume  $X$  is affine, consider its irreducible components, all their intersections can be removed, because they are nowhere dense, so we may assume  $X$  is irreducible. So  $X$  is integral, let  $\eta$  be the generic pt, then  $k(\eta)/k$  is separable, by (7.4.3.2). Then choose an affine subscheme  $\text{Spec } A \subset X$ , then  $A$  is smooth at  $(0)$  over  $k$ , by (5.4.5.29), then by definition, it is smooth on some dense open subscheme of  $X$ .  $\square$

### Tangent Spaces

**Def. (7.6.4.21) [Relative Tangent Spaces].** For  $X \in \text{Sch}/S$  and  $x \in X$ , define  $T_{X/S,x}^* = \Omega_{X/S,x} \otimes_{\mathcal{O}_{X,x}} k(x)$ , and  $T_{X/S,x} = \text{Hom}_{k(x)}(T_{X/S,x}^*, k(x)) = \text{Hom}_{\mathcal{O}_{X,x}}(\Omega_{X/S,x}, k(x))$ , called the **relative tangent space** of  $X$  over  $S$  at  $x$ .

When  $x \in X$  mapping to  $s \in S$ ,  $T_{X/S,x} = \text{Hom}_{k(x)}(\mathfrak{m}_x/\mathfrak{m}_x^2, k(x))$ , where  $\mathfrak{m}_x$  is the maximal ideal of the stalk of  $x \in X_s$ .

Then it can be verified that for a  $k$ -scheme and a rational point  $x \in X$ ,  $T_{X,x}$  is in bijection with  $\text{Mor}_k(\text{Spec } k[\varepsilon], X)$  that maps the closed point to  $x$ .  $\lrcorner$

**Prop. (7.6.4.22) [Tangent Map].** Let  $f : X \rightarrow Y$  be a morphism of schemes over  $S$ ,  $x \in X$ ,  $f(x) = y$ . Assume  $k(x) = k(y)$ , then  $f$  defines a natural linear map

$$df : T_{X/S,x} \rightarrow T_{Y/S,y} : \text{Hom}_{\mathcal{O}_{X,x}}((\Omega_{X/S})_x, k(x)) \rightarrow \text{Hom}_{\mathcal{O}_{X,x}}((f^*\Omega_{Y/S})_x, k(x)) \quad (7.5.5.5) = \\ \text{Hom}_{\mathcal{O}_{X,x}}(\Omega_{Y/S,y} \otimes_{\mathcal{O}_{Y,y}} \mathcal{O}_{X,x}, k(y)) = \text{Hom}_{\mathcal{O}_{Y,y}}(\Omega_{Y/S,y}, k(y))$$

$\lrcorner$

**Cor. (7.6.4.23).** Via similar argument, if  $k(x) = k(s) = k(y)$ , there is an isomorphism

$$T_{X/S,x} \oplus T_{Y/S,y} \cong T_{X \times_S Y, (x,y)}.$$

$\lrcorner$

**Prop. (7.6.4.24).** Let  $X$  be a scheme over a field  $k$  and  $x \in X$  with residue field  $k(x)$ , then the tangent space is canonical isomorphic to  $\text{Mor}(k(x)[\varepsilon], X)$  that maps the closed point to  $x$ . And the vector bundle structure is given by the cogroup structure on  $\text{Spec } k[\varepsilon] : \mu : k[\varepsilon] \otimes k[\varepsilon] \rightarrow k[\varepsilon]$ .  $\lrcorner$

**Prop. (7.6.4.25) [Krull's Principal Tangent Theorem].** Let  $Z \subset X$  be a closed subscheme with ideal of definition  $\mathcal{I}$ ,  $x \in Z$ , then  $T_{Z,x}$  is the subspace of  $T_{X,x}$  cut out by  $(\mathcal{I} \bmod \mathfrak{m}_x^2)$ .

In particular,  $\mathcal{T}_{Y \cap Z,p} = T_{Y,p} \cap T_{Z,p} \subset T_{X,p}$ .  $\lrcorner$

**Prop. (7.6.4.26) [Tangent Criterion of Smoothness].** By (7.6.4.15)(7.6.4.19) and the definition of regular local ring, if  $X$  is a locally algebraic scheme over a field  $k$ , then  $X$  is smooth at a point  $x$  with residue field  $k(x)/k$  separable iff  $\dim_{k(x)} T_{X,x}$  equals ( $\leq$ ) the dimension of  $\mathcal{O}_{X,x}$ .  $\lrcorner$

### Bertini's Theorem

**Prop. (7.6.4.27) [Bertini].** For any  $k \in \mathbf{Field}$  and a quasi-projective scheme  $X \subset \mathbb{P}_k^n$  smooth away from f.m. points, there is an open dense subset  $U$  of the dual projective space  $\mathbb{P}_k^{n\vee}$  s.t. for any closed point  $[H] \in U$ ,  $H$  doesn't contain any component of  $X$ , and the scheme  $H \cap X$  is smooth over  $k$ .

Moreover, if  $X$  is a variety and  $\dim X \geq 2$ , the smooth cut is even a smooth variety by (7.9.2.24) and (7.4.2.11).  $\square$

*Proof:* Let  $\mathbb{P}^n = \text{Proj } k[x_0, \dots, x_n]$ ,  $(\mathbb{P}^n)^\vee = \text{Proj } k[a_0, \dots, a_n]$ , Let  $\bar{X}$  be cut out by equations  $f_1, \dots, f_r$ , we define a projective scheme  $Z \subset \mathbb{P}^n \times (\mathbb{P}^n)^\vee$  be cut by the equations

- $f_r$ .
- $f_{r+1} = \sum a_i x_i$ .
- determinants of  $(r+1) \times (r+1)$ -minors of  $(\frac{\partial f_i}{\partial x_j})_{(r+1) \times n}$ .

Now for any  $(x, [H]) \in Z$ ,  $x \in X$ ,  $x \in H$  that  $[H]$  is closed in  $(\mathbb{P}^n)^\vee$ , the last equation means  $X \cap H$  is non-smooth at  $p$  or contains the irreducible component passing  $p$ , by Jacobian criterion (7.6.4.11). Now consider the projection  $Z \rightarrow X$ , for each closed point  $p \in X$  that  $\dim_p X = d$ , the codimension of the fiber of  $Z$  over  $x$  is of dimension  $r-1 = n - \dim_x X - 1$  (To see this, one way is use regularity and tangent space, another way is to use the fact  $(x_i)$  is orthogonal to  $(\frac{\partial f_i}{\partial x_j})_j$  for all  $i$  by Euler identity, so the  $r+1$  restrictions of  $(a_i)$  are linearly independent), then by (7.6.3.17),  $\dim Z = \dim \pi_1^{-1}(Z) \leq n-1$ , Thus the image of  $Z$  in  $\mathbb{P}_k^{n\vee}$  is also a closed subscheme of dimension  $\leq n-1$ .

If  $X$  has f.m. singular points, we also need to cut out the surfaces  $N_{k(x)/k}(\sum x_i^k a_i)$ , where  $(x_i^j)$  are the f.m. closed singular points of  $x$ . They are also of dimension  $n-1$ .  $\square$

**Cor. (7.6.4.28) [Bertini's Theorem for Surfaces].** Similarly, for any  $d \geq 0$ , a generic dimension  $d$  surface intersect  $X$  at a smooth subscheme, by using Veronese embedding.  $\square$

**Cor. (7.6.4.29).** When  $X \subset \mathbb{P}_k^n$  is a projective  $k$ -variety where  $k$  has characteristic 0, the scheme  $Z$  in  $\mathbb{P}_k^{n\vee}$  is called the **dual variety** of  $X$ . When  $X$  is irreducible and smooth, it is of dimension  $n-1$ .  $\square$

*Proof:*  $\square$

**Prop. (7.6.4.30).** The dual variety of the dual variety is  $X$  itself.  $\square$

*Proof:* Cf. [Joe Harris, Algebraic Geometry, 15.24].  $\square$

**Prop. (7.6.4.31) [Kleinman-Bertini].** Let  $X$  be a  $k$ -variety that is homogenous space for a  $k$ -variety  $G$  over a field  $k$ , suppose  $\alpha : Y \rightarrow X, \beta : Z \rightarrow X$  are morphisms of varieties, then

- There is a non-zero open subset  $V \subset G$  that for any closed point  $\sigma \in V$ ,  $\dim \sigma(Y) \times_X Z = \dim Y + \dim Z - \dim X$ .
- If  $Y, Z$  are smooth over  $k$  of characteristic 0, then there is a non-empty open subset  $V \subset G$  that  $(G \times_k Y) \times_X Z \rightarrow G$  is smooth. In particular, for any closed point  $\sigma \in V$ ,  $\sigma(Y) \times_X Z$  is smooth over  $k(\sigma)$  of dimension  $\dim Y + \dim Z - \dim X$ .  $\square$

*Proof:* Let  $\Gamma = (G \times_k Y) \times_X Z$ , then there is a map  $\Gamma \rightarrow Y \times_k Z$ .  $Y \times_k Z$  has dimension  $\dim Y + \dim Z$  by (7.6.3.21), and there is a base change diagram

$$\begin{array}{ccc} (G \times_k Y) \times_X Z & \longrightarrow & Y \times_k Z \\ \downarrow & & \downarrow \\ G \times_k X & \longrightarrow & X \times_k X \end{array},$$

and  $G \times X \rightarrow X \times X$  is flat as it is equivariant under  $G \times G$ -action, by (7.6.2.14), thus  $\Gamma \rightarrow Y \times_k Z$  is flat of relative dimension  $\dim G - \dim X$ , thus it has dimension  $\dim Y + \dim Z + \dim G - \dim X$ .

1: This follows from (7.6.3.19) applied to the map  $G \times_k Y \times_X Z \rightarrow G$ .

2: As  $G \times X \rightarrow X \times X$  is flat, and its fiber are isomorphic to  $G_x$ , which is the fiber of the map  $o_x : G \rightarrow X$ , and this map is smooth by (7.6.4.13), thus  $G \times X \rightarrow X \times X$  is smooth, and then the assertion follows from (7.6.4.13).  $\square$

**Cor. (7.6.4.32).** Let  $Z$  be a smooth  $k$ -variety where  $\text{char } k = 0$ . Let  $V$  be a f.d. basepoint-free line series on  $Z$ , then the section of a general element of  $V$  is smooth.  $\lrcorner$

*Proof:* Apply Kleinman-Bertini to  $\varphi_V : Z \rightarrow \mathbb{P}V^\vee$ ,  $Y = V(\sum a_i x_i) \in PV \times PV^\vee \rightarrow PV^\vee$ ,  $X = PV^\vee$ .  $\square$

## 5 Unramified

**Def. (7.6.5.1) [Unramified Morphisms].** A morphism is called **(G-)unramified** iff there is an open affine cover  $U_i$  and an open affine cover of  $f^{-1}(U_i)$  that the induced ring map is (G-)unramified (5.4.6.4). Equivalently,  $\Omega_{X/S} = 0$  and it is locally of f.t.(f.p.).

(G-)unramifiedness is local on the source and target (7.4.1.5)(7.4.1.6). (G-)unramifiedness is stable under base change and composition (5.4.6.4). Moreover, unramifiedness satisfies the base change trick.  $\lrcorner$

**Prop. (7.6.5.2).** An unramified morphism (7.6.5.1) is locally quasi-finite.  $\lrcorner$

*Proof:* Cf. [Sta]02V5.  $\square$

**Prop. (7.6.5.3) [Fiberwise].** A morphism is (G-)unramified iff it is locally of f.t.(f.p.) and all the fibers  $X_s$  are disjoint unions of spectra of finite separable extensions of  $k(p)$ .  $\lrcorner$

*Proof:* By (5.4.6.7), Notice  $pS_q = qS_q$  is equivalent to every  $q$  is minimal in  $X_p$ , which is equivalent to  $X_p$  is discrete.  $\square$

**Cor. (7.6.5.4) [Unramified over Fields].** A scheme over a field  $k$  is unramified iff it is a disjoint union of spectra of finite separable extensions of  $k$ , because locally of f.p. is trivially satisfied.  $\lrcorner$

**Prop. (7.6.5.5) [Diagonal is Open].** A morphism  $X \rightarrow S$  is (G-)unramified iff it is of f.t.(f.p.) and the diagonal is a clopen immersion of  $X$ , thus all of  $X$ .  $\lrcorner$

*Proof:* If it is unramified, then the diagonal is an open immersion by (5.4.6.10). Conversely,  $\Omega_{X/S}$  is just the conormal sheaf of the diagonal map, so it is zero.  $\square$

**Cor. (7.6.5.6) [Sections of Unramified Morphism].** Any section of an unramified morphism is an open immersion. In particular, a section of a separable unramified morphism is a clopen immersion.  $\lrcorner$

*Proof:* This follows from the proposition and the fact  $S \rightarrow X$  is a base change of  $\Delta_{X/S}$ .  $\square$

**Cor. (7.6.5.7).** For  $f, g : X \rightarrow Y \in \text{Sch}/S$ , if  $Y/S$  is unramified and  $f, g$  are equal on a pt  $x$  of  $X$  (both on image and residue field), then there is a nbhd of  $x$  that  $f, g$  are equal.  $\lrcorner$

*Proof:* This follows as  $\Delta_{Y/S}$  is open immersion, so the set that  $f, g$  are equal is open in  $X$ .  $\square$

**Prop. (7.6.5.8) [Fiberwise].** For a morphism  $f : X \rightarrow S$  locally of f.t.(f.p.),  $x \in X$  and  $s = f(x)$ , the following are equivalent:

- It is  $(G-)$ unramified at  $x$ ,
- The fiber  $X_s$  is unramified over  $k(s)$  at  $x$ , by (7.6.5.3).
- $\Omega_{X_s, x} = 0$ .
- $\Omega_{X_s/s, x} \otimes_{\mathcal{O}_{X_s, x}} k(x) = \Omega_{X/S, x} \otimes_{\mathcal{O}_{X, x}} k(x) = 0$  by (5.4.6.6).
- $\mathfrak{m}_s \mathcal{O}_{X, x} = \mathfrak{m}_x$  and  $k(x)/k(f(x))$  is separable.

┘

*Proof:*  $1 \rightarrow 2 \rightarrow 3 \rightarrow 4$  is clear.  $4 \rightarrow 1$ : Nakayama implies  $\Omega_{X/S, x} = 0$ , thus  $\Omega_{X/S}$  vanishes on a nbhd of  $x$  as it is Qco of f.t..

$4 \iff 5$  follows from (5.4.6.7). □

**Cor. (7.6.5.9) [Generic Unramifiedness].** Let  $f : X \rightarrow Y$  be a finite separable dominant morphism of integral schemes, then there exists an open dense nbhd  $U$  of  $Y$  s.t.  $f : f^{-1}(U) \rightarrow U$  is unramified.

┘

**Prop. (7.6.5.10).** If  $X \rightarrow Y \rightarrow S$  is unramified, then  $X/Y$  is also unramified. And if  $X/S$  is  $G$ -unramified and  $Y/S$  is of f.t., then  $X/Y$  is  $G$ -unramified. ┘

*Proof:* By (7.6.1.4) and (7.5.5.5). □

**Prop. (7.6.5.11) [Base Change of Unramified Points].** If  $f : X \rightarrow S \in \text{Sch}$  is of f.t.(f.p.), then the set of points of  $S$  that  $f$  is unramified is stable under base change. ┘

*Proof:* □

**Prop. (7.6.5.12) [Tangent Criterion of unramifiedness].** Let  $f : X \rightarrow Y$  be a morphism of schemes locally of f.t. over  $S$ ,  $x \in X, y = f(x)$ , then the following are equivalent:

- $df : T_{X/S, x} \rightarrow T_{Y/S, y}$  is an injection (7.6.4.22).
- $f$  is unramified at  $x$ .

┘

*Proof:* It follows from (7.6.4.22) that  $df$  is an isomorphism iff  $(f^* \Omega_{Y/S})_x \otimes_{\mathcal{O}_{X, x}} k(x) \rightarrow \Omega_{X/S, x} \otimes_{\mathcal{O}_{X, x}} k(x)$  is surjective, which by Jacobi-Zariski (7.5.5.5) is equivalent to  $\Omega_{X/Y, x} \otimes_{\mathcal{O}_{X, x}} k(x) = 0$ , and this is equivalent to  $f$  is unramified at  $x$  by (7.6.5.8). □

**Prop. (7.6.5.13) [Unramified Universally Injective Morphisms].** For a morphism  $f$  of schemes, the following are equivalent:

- $f$  is unramified and a monomorphism.
- $f$  is unramified and universal injective.
- $f$  is locally of f.t., formally unramified (7.8.6.12) and universal injective.
- $f$  is locally of f.t. and a monomorphism.
- $f$  is locally of f.t. and  $X_y$  is either empty or  $X_y \rightarrow y$  is an isomorphism for all  $y \in Y$ .

┘

*Proof:* Cf. [Sta], 05VH. □

**Prop. (7.6.5.14) [Unramified and Smoothness].** Let  $f : X \rightarrow Y \in \text{Sch}/S$  s.t.  $X/S$  is smooth (of relative dimension  $n$ ) and  $Y/S$  is unramified, then  $f$  is also smooth (of relative dimension  $n$ ).  $\lrcorner$

*Proof:* This follows from differential criterion (7.6.4.3) and (7.6.1.4). Notice to show it is flat, use the fact  $\Delta_{Y/S}$  and  $X \times Y \rightarrow Y$  are both flat (7.6.5.5).  $\square$

### Noetherian Case

**Prop. (7.6.5.15).** Let  $S$  be a Noetherian scheme,  $X \rightarrow S$  a qc unramified morphism and  $Y \rightarrow S$  a morphism with  $Y$  Noetherian, then  $\text{Mor}_S(Y, X)$  is a finite set.  $\lrcorner$

*Proof:* Cf. [Sta] 0AKI.  $\square$

**Prop. (7.6.5.16) [Unramified Morphisms and DVR].** Let  $R_v$  be a DVR with fraction field  $K$  and  $\varphi : X \rightarrow X'$  be a morphism of schemes of f.t. over  $R_v$ . Let  $Q \in X'(K)$  and  $P \in X(\bar{K})$  with  $\varphi(P) = Q$ . Let  $w|v$  be a valuation of  $K(P)$  extending  $v$ . If  $P$  extends to an  $R_w$ -valued point  $\bar{P}$  of  $X$ , then using the fact  $R_w \cap K = R_v$ , we see  $Q$  also extends to a  $R_v$ -valued point of  $X'$ .

Denote the image of the maximal ideal of  $R_w$  under  $\bar{P}$  by  $P(w)$ , then if  $\varphi$  is unramified at  $P(w)$ , then  $K(P)/K$  is unramified in  $w$ .  $\lrcorner$

*Proof:* Since the unramified point is open,  $\varphi$  is also unramified at  $P$ , thus  $K(P)/K$  is separable (7.6.5.8). For the rest, Cf. [Diophantine Geometry, P598] ?  $\square$

## 6 Étale

**Def. (7.6.6.1) [Étale Morphisms].**  $f : X \rightarrow Y \in \text{Sch}$  is called an **étale morphism** if there is an open affine cover  $\{U_i\}$  of  $S$  and an open affine cover  $V_{ij}$  of  $f^{-1}(U_i)$  for each  $i$  s.t.  $\Gamma(U_i) \rightarrow \Gamma(V_{ij})$  are étale ring maps (5.4.7.4).

A **standard étale morphism** is the Spec map of a standard étale ring map (5.4.7.17). Étale morphisms are locally standard étale on the source, by (5.4.7.18).

Étale is local on the source and target (5.4.7.5).

Étale is stable under base change and composition (5.4.7.5).  $\lrcorner$

**Prop. (7.6.6.2) [Properties of Étale Morphisms].**

- Étale at a point  $x$  is equivalent to smooth and unramified at a  $x$  (5.4.7.4).
- Étale at a point  $x$  is equivalent to flat and  $G$ -unramified at that point, by (5.4.7.11). So étale over field is equivalent to  $G$ -unramified, because over a field it is obviously flat.
- Étale at a point  $x$  is equivalent to locally standard étale at that point (5.4.7.18).
- A morphism is étale iff it is smooth of relative dimension 0, by definition (7.6.4.10).
- Étale is equivalent to flat, locally of f.p. and formally unramified, by (5.4.7.11).  $\lrcorner$

**Cor. (7.6.6.3).** Étale morphisms are smooth, hence syntomic, flat.

Étale morphisms are universally open because it is flat and locally of f.p. (7.6.2.10).  $\lrcorner$

**Prop. (7.6.6.4) [Cancellation Law for Étale Maps].** For  $X, Y \in \text{Sch}_{\text{ét}}/S$ , any map  $X \rightarrow Y \in \text{Sch}/S$  is étale, by (5.4.7.13) and (7.6.6.2).  $\lrcorner$

**Prop. (7.6.6.5) [Fiberwise].** A morphism of schemes is étale iff it is flat, locally of f.p., and every fiber  $X_s$  is a disjoint union of spectra of finite separable field extensions of  $k(s)$ .  $\lrcorner$

*Proof:* Follows from (7.6.6.2)(7.6.5.3) and (5.4.7.10).  $\square$

**Cor. (7.6.6.6) [Étale Schemes over Fields].** For  $k \in \mathbf{Field}$ ,

- $X \in \mathbf{Sch}/k$  is étale iff it is a disjoint union of spectra of finite separable field extensions of  $k$ .
- étale over fields is equivalent to unramified over fields.
- The functor

$$(\mathrm{Spec} k)_{\mathrm{\acute{e}t}} \rightarrow \mathrm{Set}_{\mathrm{Gal}_k} : X \mapsto X(k^{\mathrm{sep}})$$

is an equivalence of categories.  $\lrcorner$

*Proof:* This follows from ?? and (3.2.8.12).  $\square$

**Prop. (7.6.6.7) [Zariski-Local Structure of Smooth Morphisms].** If  $f : X \rightarrow Y \in \mathbf{Sch}$  is smooth at  $x \in X$ , then there exist an affine open nbhd  $U$  of  $x \in X$  and affine open nbhd  $V$  of  $f(x) \in Y$  s.t.  $f|_U$  factors through  $U \xrightarrow{f'} V \times \mathbb{A}^n \xrightarrow{\mathrm{pr}_1} V$ , where  $f'$  is standard étale (7.6.6.1).  $\lrcorner$

*Proof:* Any standard smooth morphism (7.6.4.1) can be factorized as an étale map over a polynomial algebra, as easily seen. And then we can change it to a standard étale map by (5.4.7.18).  $\square$

**Prop. (7.6.6.8) [Stalkwise and Fiberwise].** For  $f : X \rightarrow S \in \mathbf{Sch}^{\mathrm{loc.pf}}/S$ , by (7.6.5.8)(7.6.4.5) and (7.6.6.6), the following are equivalent:

- It is étale at a point  $x \in X$ .
- $\mathcal{O}_{X,x}/\mathcal{O}_{S,f(x)}$  is flat and  $X_{f(x)}/\kappa(f(x))$  is étale at  $x$ .
- $\mathcal{O}_{X,x}/\mathcal{O}_{S,f(x)}$  is flat and  $X_{f(x)}/\kappa(f(x))$  is unramified at  $x$ .
- $\mathcal{O}_{X,x}/\mathcal{O}_{S,f(x)}$  is flat and  $\Omega_{X/S,x} = 0$ .
- $\mathcal{O}_{X,x}/\mathcal{O}_{S,f(x)}$  is flat and  $\Omega_{X_{f(x)}/f(x),x} \otimes_{\mathcal{O}_{X_{f(x)},x}} \kappa(x) = \Omega_{X/S,x} \otimes_{\mathcal{O}_{X,x}} \kappa(x) = 0$ .
- $\mathcal{O}_{X,x}/\mathcal{O}_{S,f(x)}$  is flat,  $\mathfrak{m}_{f(x)}\mathcal{O}_{X,x} = \mathfrak{m}_x$  and  $\kappa(x)/\kappa(f(x))$  is separable.

In particular, an étale morphism can be seen as a covering space.  $\lrcorner$

**Prop. (7.6.6.9).** For  $X \rightarrow Y \rightarrow S \in \mathbf{Sch}$ , if  $X \rightarrow Y$  are faithfully flat and locally of f.p. and  $X \rightarrow S$  is étale, then  $Y \rightarrow S$  is also étale.  $\lrcorner$

*Proof:* Cf. [Sta]05B5.  $\square$

**Cor. (7.6.6.10).** If  $f : X \rightarrow S$  is faithfully flat and locally of f.p., then the set of points of  $S$  s.t.  $f$  is étale is table under base change.  $\lrcorner$

*Proof:* This follows from (7.6.5.11) and (7.6.4.9).  $\square$

**Def. (7.6.6.11) [Étale Neighborhoods].** For  $x \in X$ , an **étale neighborhood** of  $x \in X$  is defined to be an étale morphism  $f : U \rightarrow X \in \mathbf{Sch}$  together with  $u \in U$  s.t.  $f(u) = x$ .  $\lrcorner$

**Prop. (7.6.6.12).** If  $k \in \mathbf{Field}$ ,  $X, Y \in \mathbf{Sch}/k$  are étale and  $f : Y \rightarrow X \in \mathbf{Sch}$ , then  $f$  is surjective iff  $Y(k^{\mathrm{sep}}) \rightarrow X(k^{\mathrm{sep}})$  is surjective.  $\lrcorner$

*Proof:* If  $Y \rightarrow X$  is surjective, then ? □

**Prop. (7.6.6.13) [Fundamental Property of Étale Morphisms, Grothendieck[Gro71]].** For  $f : X \rightarrow Y \in \text{Sch}$ , the following are equivalent:

- $f$  is an open immersion.
- $f$  is universally injective and étale.
- $f$  is a flat monomorphism(7.4.4.3) locally of f.p..

┘

*Proof:* Cf.[Sta]025G. □

### Finite Étale Morphisms

**Prop. (7.6.6.14) [Étale-Local Structure of Finite étale Morphisms].** If  $f : X \rightarrow S \in \text{Sch}$  is finite étale and  $s \in S$ , then there exists an étale nbhd  $(U, u)$  of  $(S, s)$ (7.6.6.11) s.t.

$$X_U \cong \coprod_{j \in [n]_+} U$$

for some  $n \in \mathbb{Z}_+$ . ┘

*Proof:* Cf.[Sta]4HN. ? □

**Prop. (7.6.6.15) [Base Change of Finite Étale Morphisms].** For  $X \in \text{Sch}$ , the category  $X_{\text{fét}}$  has finite limits and colimits, and for any  $X' \rightarrow X \in \text{Sch}/X$ , the base change functor  $X_{\text{fét}} \rightarrow X'_{\text{fét}}$  is exact. ┘

*Proof:* Cf.[Sta]0BN9. □

## 7 Regular Immersions

**Def. (7.6.7.1) [Regular Immersions].** A **regular immersion** of codimension  $r$  is a locally closed embedding  $X \rightarrow Y \in \text{Sch}$  s.t. for any  $p \in X$ , the ideal of  $X$  in the local ring  $\mathcal{O}_{Y,p}$  is generated by a regular sequence of length  $r$ . ┘

## 8 Complete Intersection

Should be refreshed with intrinsic definition of locally complete intersection, Cf.[Sta].

**Def. (7.6.8.1) [Complete Intersection].** A **complete intersection** of codimension  $r$  in  $Y$  is a closed subscheme  $X$  that is the intersection of  $r$  effective Cartier divisors  $D_i$  that at each point  $p \in X$ , the equations defining  $D_i$  form a regular sequence. ┘

**Def. (7.6.8.2) [Locally Complete Intersection].** A closed subscheme  $Y$  of a nonsingular variety  $X$  over a field  $k$  is called **locally complete intersection** iff  $Y$  is locally generated by  $r = \text{codim}(Y, X)$  elements. By(5.3.4.17)  $Y$  is C.M.. In particular, by(7.12.1.16), a regular variety is always a locally complete intersection. ┘

**Def. (7.6.8.3) [Syntomic Morphisms].** A **standard syntomic morphism** is the Spec map of a global complete intersection ring map(5.4.4.11). A **syntomic morphism** is a morphism that is locally a standard syntomic morphism. ┘

**Prop. (7.6.8.4).** Syntomic is local on the source and target, stable under base change and composition, by (5.4.4.12).  $\lrcorner$

**Prop. (7.6.8.5).** Syntomic is equivalent to flat, locally of f.p.+fibers being local complete intersections.  $\lrcorner$

*Proof:* This follows from (5.4.4.18).  $\square$

**Cor. (7.6.8.6).** Syntomic morphisms are universally open.  $\lrcorner$

**Prop. (7.6.8.7).** An open immersion is syntomic, because localizations are global complete intersections (5.4.4.12).  $\lrcorner$

**Prop. (7.6.8.8).** If  $f : X \rightarrow S$  is a syntomic map, then the function  $x \mapsto \dim_x(X_{f(x)})$  is locally constant on  $X$ . If it is standard syntomic, then it is constant.  $\lrcorner$

*Proof:* It suffices to prove for syntomic maps, Cf. [Sta]02K0.  $\square$

**Prop. (7.6.8.9).** A local complete intersection has its ideal sheaf  $\mathcal{I}$ , then  $\mathcal{I}/\mathcal{I}^2$  locally free by (5.3.4.16).  $\lrcorner$

**Prop. (7.6.8.10).** If  $Y$  is a complete intersection in  $\mathbb{P}_k^n$  of hypersurfaces of degree  $d_1, \dots, d_r$ , then  $\omega_Y = \mathcal{O}_Y(\sum d_i - n - 1)$ .  $\lrcorner$

*Proof:* Use the exact sequence  $0 \rightarrow \mathcal{O}_Z(n-d) \rightarrow \mathcal{O}_Z \rightarrow i_*\mathcal{O}_Y \rightarrow 0$  and (7.12.1.17).  $\square$

**Prop. (7.6.8.11).** For a complete intersection of dimension  $q$ ,  $H^i(Y, \mathcal{O}_Y(n)) = 0$  for  $0 < i < q$ . And the natural map  $\Gamma(P, \mathcal{O}_P(n)) \rightarrow H^0(Y, \mathcal{O}_Y(n))$  is a surjection for every  $n$ . In particular,  $Y$  is connected, and the arithmetic genus  $p_a(Y) = \dim H^q(Y, \mathcal{O}_Y)$ .  $\lrcorner$

*Proof:* We use induction, the case  $Y = P$  follows from (7.7.2.1), let  $Y = Z \cap H$ , where  $H$  has degree  $d$ , then

$$0 \rightarrow \mathcal{O}_Z(n-d) \rightarrow \mathcal{O}_Z \rightarrow i_*\mathcal{O}_Y \rightarrow 0$$

thus use long exact sequence. The rest is easy.  $\square$

## 7.7 Cohomology of Schemes

Main references are [Sta]Chap29.

**Notation (7.7.0.1).**

- Use notations defined in [Cohomology on Ringed Sites](#).

┘

### 1 Zariski Cohomology

#### Qco Sheaves

**Lemma (7.7.1.1) [Zariski-Poincare].** A Qco sheaf on an affine scheme  $X$  is Čech-acyclic. ┘

*Proof:* Because the principal affine covers are cofinal in the ordering of covers, we only need to consider principal affine covers. Let  $R \rightarrow A = \prod R_{f_i}$ , then it is f.f., so we can use (5.4.2.2), just notice the higher term is  $\prod_{i_0, \dots, i_n} R_{f_{i_0} \dots f_{i_n}}$ .  $\square$

**Prop. (7.7.1.2) [Čech Cohomology on Separated Schemes].** If  $X$  is separated and  $\mathcal{F} \in \mathcal{QCoh}(X)$ ,  $H^p(X, \mathcal{F}) = \check{H}^p(X, \mathcal{F}) = H_{\text{alt}}^p(\{U_i \rightarrow X\}, \mathcal{F})$  for any open affine covering  $\{U_i \rightarrow X\}$ . ┘

*Proof:* Use (7.3.2.16) and (7.3.2.6), the family of affine open subsets of  $X$  satisfies the requirement because  $X$  is separated and (7.7.1.1), thus the result It can be calculated by alternating complexes by (7.3.2.7).  $\square$

**Cor. (7.7.1.3) [Affine Cohomological Vanishing].** If  $X$  is affine and  $\mathcal{F} \in \mathcal{QCoh}(X)$ ,  $H^i(X, \mathcal{F}) = 0$  for  $i > 0$ .

For a qcqs scheme  $X$ , choose a finite affine cover  $U_1, \dots, U_t$  of  $X$ , then for any  $\mathcal{F} \in \mathcal{QCoh}(X)$ ,  $H^n(X, \mathcal{F}) = 0$  for  $n \geq d$ , where

$$d = \max_{I \subset \{1, \dots, t\}} (\#I + t(U_I))$$

and  $t(Y)$  is the minimal cardinality of an affine open cover of  $Y$ . ┘

*Proof:* The last assertion follows from Čech to sheaf (7.3.2.13) and (7.7.1.2), as  $U_I$  is separated for any  $I \neq \emptyset$ .  $\square$

**Remark (7.7.1.4).** Compare with (8.2.0.4) ?. ┘

**Prop. (7.7.1.5) [ $\mathcal{QCoh}(X)$  vs.  $\text{Mod}(\mathcal{O}_X)$ ].** If  $X$  is a Noetherian scheme, then injective objects in  $\mathcal{QCoh}(X)$  are all flabby (7.3.4.8), thus nearly calculating all cohomologies are legitimate in the category  $\mathcal{QCoh}(X)$ .

However, in general, this is not true, as there are examples of injective  $A$ -module  $\mathcal{I}$  s.t.  $\tilde{\mathcal{I}}$  is not flabby on  $\text{Spec } A$ , by [Sta]0274. ┘

*Proof:* We use the Deligne formula (7.5.1.36) and the definition of injective, by considering the sheaf of ideals of the corresponding induced reduced structure.  $\square$

**Prop. (7.7.1.6) [Filtered Colimits].** By (7.3.1.16), if  $X$  is qcqs, then sheaf cohomology on  $X$  commutes with filtered colimits. ┘

**Prop. (7.7.1.7) [Ext For Coherent Sheaves].** On a locally Noetherian scheme, for  $\mathcal{F} \in \mathcal{QCoh}(X)$  and  $\mathcal{G} \in \mathcal{Coh}(X)$ ,  $\mathcal{E}xt^i(\mathcal{F}, \mathcal{G}) \in \mathcal{QCoh}(X)$ , and affine locally are given by  $\text{Ext}^i(\mathcal{F}(U), \mathcal{G}(U))$ .  
Moreover  $\mathcal{G} \in \mathcal{Coh}(X)$ , then  $\mathcal{E}xt^i(\mathcal{F}, \mathcal{G}) \in \mathcal{Coh}(X)$ . ┘

*Proof:* This follows from (7.9.1.13) and (7.9.1.10). □

**Prop. (7.7.1.8).** When  $X$  is locally Noetherian and  $\mathcal{F} \in \mathcal{Coh}(X)$ ,

$$\mathcal{E}xt^i(\mathcal{F}, \mathcal{G})_x \cong \text{Ext}_{\mathcal{O}_x}^i(\mathcal{F}_x, \mathcal{G}_x).$$

┘

*Proof:* Taking stalk is exact. ? □

**Cor. (7.7.1.9).** If  $X$  is locally Noetherian, suppose that every coherent sheaf is a quotient of a locally free sheaf, we can define the **homological dimension**  $hd(\mathcal{F})$  of a coherent sheaf  $\mathcal{F}$  as the minimal length of a flat resolution of  $\mathcal{F}$ . Then  $hd(\mathcal{F}) \leq n \iff \mathcal{E}xt^i(\mathcal{F}, \mathcal{G}) = 0$  for every  $\mathcal{G}$  and every  $i > n$ . And  $hd(\mathcal{F}) = \sup pd_{\mathcal{O}_{X,x}} \mathcal{F}_x$ , by (7.7.1.8). ┘

**Prop. (7.7.1.10) [Künneth Formula].** If  $X, Y$  are qcqs over a field  $k$  and  $\mathcal{F}, \mathcal{G}$  be Qco  $\mathcal{O}_X, \mathcal{O}_Y$ -modules, then there is a canonical isomorphism:

$$H^n(X \times_{\text{Spec } k} Y, \text{pr}_1^* \mathcal{F} \otimes_{\mathcal{O}_{X \times_{\text{Spec } k} Y}} \text{pr}_2^* \mathcal{G}) \cong \bigoplus_{p+q=n} H^p(X, \mathcal{F}) \otimes_k H^q(Y, \mathcal{G}).$$

┘

*Proof:* Cf. [Sta]0BEF. ? □

**Prop. (7.7.1.11).** On a locally Noetherian scheme  $X$ , any Qco sheaf  $\mathcal{F}$  admits a resolution of Qco sheaves that are flabby. ┘

*Proof:* Because  $\mathcal{QCoh}(X)$  is Serre subcategory, ? □

**Lemma (7.7.1.12) [Gabber].** Let  $X$  be a scheme, then there exists a cardinal  $\kappa$  that every Qco sheaf is a colimit of its  $\kappa$ -generated Qco subsheaves. ┘

*Proof:* Cf. [Sta]077N. □

**Prop. (7.7.1.13) [Qco Cohomology Comparison].** For  $X \in \text{Sch}$ ,  $\mathcal{F} \in \mathcal{QCoh}(X)$ ,  $\tau \in \{\text{fppf}, \text{étale}, \text{smooth}, \text{syntomic}, \text{Zariski}\}$ , there are canonical isomorphisms

$$H^p(X, \mathcal{F}) \cong H^p(\text{Sch}_\tau/X, \mathcal{F}) \cong H^p(X_{\text{Zar}}, \mathcal{F}) \cong H^p(X_{\text{ét}}, \mathcal{F}).$$

┘

*Proof:* Let  $\mathcal{C} = \text{Sch}_\tau/X$  or  $X_{\text{ét}}, X_{\text{Zar}}$ . We use (7.3.2.16) with  $\mathfrak{G}$  the set of affine schemes and  $\text{Cov}$  the subset of  $\text{Cov}(\mathcal{C})$  consisting of morphisms between affine schemes. Then Čech vanishing is clear in the affine case by (5.4.2.2). Thus (7.3.2.16) says  $H^p(\mathcal{C}, \mathcal{F}_{\mathcal{C}}) = 0$  for  $p > 0$ .

Next, if  $U \subset X$  is an affine open s.t.  $U \rightarrow X$  is separated. Let  $\mathcal{U}$  be an affine open covering of  $U$ , then all  $U_{i_0, \dots, i_p}$  are affine, thus

$$H^p(\mathcal{C}, \mathcal{F}_{\mathcal{C}}) = \check{H}(\mathcal{U}, \mathcal{F}_{\mathcal{C}}) = H^p(U, \mathcal{F}|_U)$$

by (7.3.2.15).

Finally, for  $X$ , take an injective resolution  $\mathcal{F} \rightarrow \mathcal{I}^\bullet$ , and an injective resolution  $\mathcal{F}_\mathcal{C} \rightarrow \mathcal{J}^\bullet$ . Then the latter restricts to a chain complex  $\mathcal{F} \rightarrow \mathcal{J}^\bullet|_X$ , which is exact because it is exact on any affine open  $U \subset X$  as  $H^p(\mathcal{C}, \mathcal{F}_\mathcal{C}) = 0$  for  $p > 0$ . Thus by (4.10.2.5), there is a map  $\mathcal{J}^\bullet|_X \rightarrow \mathcal{I}^\bullet$ , inducing a map  $H^p(\mathcal{C}, \mathcal{F}_\mathcal{C}) = H^p(X, \mathcal{J}^\bullet) \rightarrow H^p(X, \mathcal{I}^\bullet) \cong H^p(X, \mathcal{F})$ .

To show these maps are isomorphisms, take an affine open covering  $\mathcal{U}$  of  $X$ , then there are Čech-to-derived spectral sequences

$${}^\tau E_2^{p,q} = \check{H}^p(\mathcal{U}, \mathcal{H}^q(\mathcal{F}^a)) \Rightarrow H^{p+q}(\mathcal{C}, \mathcal{F}_\mathcal{C}), \quad E_2^{p,q} = \check{H}^p(\mathcal{U}, \mathcal{H}^q(\mathcal{F}^a)) \Rightarrow H^{p+q}(\mathcal{C}, \mathcal{F}).$$

The map  $\mathcal{J}^\bullet|_X \rightarrow \mathcal{I}^\bullet$  induces a map  $\check{C}^\bullet(\mathcal{U}, \mathcal{J}) \rightarrow \check{C}^\bullet(\mathcal{U}, \mathcal{I})$  which induces a map of the spectral sequences. But as each affine open of  $X$  is separated over  $X$ , the  $E^2$ -page is an isomorphism by what we have proved. Thus  $\mathcal{H}^q(\mathcal{F}^a) \rightarrow H^{p+q}(\mathcal{C}, \mathcal{F})$  is an isomorphism.  $\square$

**Prop. (7.7.1.14).** For  $X \in \text{Sch}$ ,  $\tau \in \{\text{fppf, étale, smooth, syntomic, Zariski}\}$ ,

$$H_\tau^1(X, \mathbb{G}_m) \cong \text{Pic}(X) \quad (7.5.3.10).$$

⌋

*Proof:* As these  $X_\tau$  are all locally ringed sites, by (7.3.1.17),  $H_\tau^1(X, \mathbb{G}_m) \cong \text{Pic}(X_\tau)$ . Thus it suffices to prove that

$$\text{Pic}(X_{\text{Zar}}) \rightarrow \text{Pic}(X_{\text{ét}}) \rightarrow \dots \rightarrow \text{Pic}(X_{\text{fppf}})$$

are isomorphisms. Then this is because any invertible sheaf is quasi-coherent by (7.2.5.8), so  $\text{Pic}(X_\tau)$  are in fact the group of invertible objects in  $\mathcal{QCoh}(X_\tau)$ . But  $\mathcal{QCoh}(X_\tau)$  are all equivalent categories, by fpqc descent for Qco sheaves (7.1.5.12).  $\square$

## 2 Proper Schemes

**Prop. (7.7.2.1)[Cohomology of Projective Space].** Let  $X = \mathbb{P}_A^r$  we have:

(1)

$$H^q(X, \mathcal{O}_X(d)) = \begin{cases} (A[T_0, \dots, T_r])_d & q = 0 \\ 0 & q \neq 0, r \\ (\frac{1}{T_0 \dots T_r} A[\frac{1}{T_0}, \dots, \frac{1}{T_r}])_d & q = r \end{cases}$$

(2) The cup product defines a perfect pairing

$$H^0(X, \mathcal{O}_X(n)) \times H^r(X, \mathcal{O}_X(-n-r-1)) \rightarrow H^r(X, \mathcal{O}_X(-r-1)) \cong A.$$

⌋

*Proof:*  $X$  is separated, we use Čech cohomology. Let  $\mathcal{F} = \bigoplus_{d \in \mathbb{Z}} \mathcal{O}_X(d)$ , then  $\mathcal{F}$  is a Qco graded ring. Let  $U_{i_0, \dots, i_k}$  be the affine open subset  $U(x_{i_0}) \cap \dots \cap U(x_{i_k})$  of  $X$ , then  $\mathcal{F}(U_{i_0, \dots, i_k}) = A[T_0, \dots, T_r, T_{i_0}^{-1}, \dots, T_{i_k}^{-1}]$  as graded rings, and the cohomology  $H^\bullet(\mathcal{F})$  is calculated by the Čech complex (7.3.2.1)

$$\check{C}^\bullet = \prod_i A[T_0, \dots, T_r, T_i^{-1}] \rightarrow \prod_{i,j} A[T_0, \dots, T_r, T_i^{-1}, T_j^{-1}] \rightarrow \dots \rightarrow A[T_0, \dots, T_r, T_1^{-1}, \dots, T_r^{-1}].$$

This complex has a natural  $\mathbb{Z}^r$ -grading, and the differential is natural inclusion thus preserves the grading, i.e.

$$\check{C}^\bullet = \bigoplus_{v \in \mathbb{Z}^r} \check{C}^\bullet(v)$$

where if we set  $NEG(v) = \{i \in \{0, \dots, r\} | v_i < 0\}$ , then

$$\check{C}^\bullet(v) = \prod_{NEG(v) \subset \{i\}} AT_0^{v_0} \dots T_r^{v_r} \rightarrow \prod_{NEG(v) \subset \{i, j\}} AT_0^{v_0} \dots T_r^{v_r} \rightarrow \dots \rightarrow AT_0^{v_0} \dots T_r^{v_r}$$

is the subcomplex of  $\check{C}^\bullet$ . So it suffices to calculate the cohomology of  $\check{C}^\bullet(v)$  for each  $v$ .

If  $NEG(v) = \{0, 1, \dots, n\}$ , then there is only one term, so

$$H^\bullet(\check{C}^\bullet(v)) = \begin{cases} AT_0^{v_0} \dots T_r^{v_r} & q = r \\ 0 & \text{otherwise} \end{cases}.$$

The sum of all such  $v$  clearly contribute to  $\frac{1}{T_0 \dots T_r} A[\frac{1}{T_0}, \dots, \frac{1}{T_r}]$  in degree  $r$ .

If  $NEG(v) = \emptyset$ , then the complex is isomorphic to the Čech complex calculating cohomology of  $\text{Spec } A$  using the trivial cover  $\{V_i \rightarrow \text{Spec } A\}$ ,  $V_i \cong \text{Spec } A$  times  $T_0^{v_0} \dots T_r^{v_r}$ . As  $\text{Spec}$  is separated, it is just to the sheaf cohomology of  $\text{Spec } A$ , which is  $A$  in degree 0 and 0 otherwise by (7.7.1.1). The sum of all such  $v$  clearly contribute to  $A[T_0, \dots, T_r]$  in degree 0.

Finally, for other  $v$ , choose a  $j \in \{0, 1, \dots, n\} \setminus NEG(v)$ , then the maps

$$h : \check{C}^{p+1}(v) \rightarrow \check{C}^p(v) : h(s)_{i_0 \dots i_p} = s_{ji_0 i_p}$$

(where we are using the alternating Čech complex) induces a homotopy between 0 and id, so  $\check{C}^{p+1}(v)$  have trivial cohomologies.

The pairing given by cup product makes  $T_0^{v_0} \dots T_r^{v_r}$  dual to  $T_0^{-1-v_0} \dots T_r^{-1-v_r}$ , thus it is a perfect pairing.  $\square$

**Cor. (7.7.2.2).** when  $n > 0$ ,  $H^r(X, \mathcal{O}_X(n-r-1)) = 0$ . Notice this an instance of the Kodaira vanishing theorem when  $k$  has characteristic 0 (16.10.7.3).  $\lrcorner$

**Prop. (7.7.2.3).** Let  $X = \mathbb{P}_k^n$  and  $0 \leq p, q \leq n$ , then  $H^q(X, \Omega_X^p) = 0$  for  $p \neq q$  and when  $p = q$ ,  $H^q(X, \Omega_X^p) = k$ .  $\lrcorner$

*Proof:* By (7.5.1.26) and (7.5.5.7), there is an exact sequence  $0 \rightarrow \Omega^q \rightarrow \wedge^q \mathcal{O}(-1) \rightarrow \Omega^{q-1} \rightarrow 0$ , and the middle has vanishing  $q$ -th cohomology by (7.7.2.1), thus we can induct and (7.7.2.1) gives the result.  $\square$

**Prop. (7.7.2.4) [Cohomology of Complete Intersections].** Let  $X$  be a closed subscheme of  $\mathbb{P}_k^n$  defined by a single homogenous equation  $f(x_0, x_1, x_2)$  of degree  $d$ , then  $\dim H^0(X, \mathcal{O}_X) = 1$ , and if  $n \geq 2$ , we have  $\dim H^1(X, \mathcal{O}_X) = (d-1)(d-2)/2$ .  $\lrcorner$

*Proof:* By (7.5.3.15), there is an exact sequence of sheaves on  $\mathbb{P}_k^n$ :

$$0 \rightarrow \mathcal{O}_{\mathbb{P}_k^n}(-d) \cong \mathcal{O}_{\mathbb{P}_k^n}(-X) \rightarrow \mathcal{O}_{\mathbb{P}_k^n} \rightarrow i_* \mathcal{O}_X \rightarrow 0$$

which induces a long exact sequence (7.7.4.2):

$$H^0(\mathbb{P}_k^n, \mathcal{O}_{\mathbb{P}_k^n}(-d)) \rightarrow H^0(\mathbb{P}_k^n, \mathcal{O}_{\mathbb{P}_k^n}) \rightarrow H^0(X, \mathcal{O}_X) \rightarrow H^1(\mathbb{P}_k^n, \mathcal{O}_{\mathbb{P}_k^n}(-d))$$

$$\rightarrow H^1(\mathbb{P}_k^n, \mathcal{O}_{\mathbb{P}_k^n}) \rightarrow H^1(X, \mathcal{O}_X) \rightarrow H^2(\mathbb{P}_k^n, \mathcal{O}_{\mathbb{P}_k^n}(-d)) \rightarrow H^2(\mathbb{P}_k^n, \mathcal{O}_{\mathbb{P}_k^n})$$

By (7.7.2.1), this reads:

$$0 \rightarrow k \rightarrow H^0(X, \mathcal{O}_X) \rightarrow 0 \rightarrow 0 \rightarrow H^1(X, \mathcal{O}_X) \rightarrow H^2(\mathbb{P}_k^n, \mathcal{O}_{\mathbb{P}_k^n}(-d)) \rightarrow 0,$$

and if  $n = 2$ ,  $\dim H^2(\mathbb{P}_k^2, \mathcal{O}_{\mathbb{P}_k^2}(-d)) = (d-1)(d-2)/2$ .

? It is faster using Hilbert Polynomial. □

**Lemma (7.7.2.5) [Cohomology of Projective Space].** Let  $R$  be a Noetherian ring and  $n \geq 0$ , then for any coherent sheaf  $\mathcal{F}$  on  $\mathbb{P}_R^n$ ,

- $H^i(\mathbb{P}_R^n, \mathcal{F}(n)) = 0$  for  $i > 0$  and  $n$  large enough.
- For any  $i$ ,  $H^i(\mathbb{P}_R^n, \mathcal{F})$  is a finite  $R$ -module.
- For any  $k \in \mathbb{Z}$ ,  $\bigoplus_{d \geq k} H^0(\mathbb{P}_R^n, \mathcal{F}(d))$  is a finite  $R[T_0, \dots, T_n]$ -module.

┘

*Proof:* 1: The assertions are true for  $\mathcal{O}_X(n)$  by (7.7.2.1), and for general  $\mathcal{F}$ , we use descending induction on  $i$ . This is true for  $i > n$  by Čech cohomology (7.7.1.2). For general  $i > 0$ , choose a surjection  $\bigoplus \mathcal{O}_X(n_i) \rightarrow \mathcal{F}$  with coherent kernel  $\mathcal{R}$  (7.5.4.5), then there is an exact sequence

$$H^i(X, \bigoplus \mathcal{O}_X(n_i + n)) \rightarrow H^i(X, \mathcal{F}(n)) \rightarrow H^{i+1}(X, \mathcal{R}(n)),$$

and the left term vanish for  $n$  large (7.7.2.1), and the right term vanish by induction hypothesis.

2: Notation as above, we use descending induction on  $i$ . This is true for  $i > n$  by Čech cohomology (7.7.1.2). For general  $i > 0$ ,  $H^i(X, \bigoplus \mathcal{O}_X(n_i))$  is finite by (7.7.2.1), and  $H^{i+1}(X, \mathcal{R})$  is finite by induction hypothesis, thus  $H^i(X, \mathcal{F}(n))$  is also finite.

3: Notation as above, for  $n$  large,  $H^i(X, \bigoplus \mathcal{O}_X(n_i + n)) \rightarrow H^i(X, \mathcal{F}(n))$  is surjective. Thus  $M_k = \bigoplus_{d \geq k} H^0(\mathbb{P}_R^n, \mathcal{F}(d))$  is a quotient of  $N_k = \bigoplus_{d \geq k} H^0(\mathbb{P}_R^n, \mathcal{O}_X(d))$  for  $k$  large. Notice for  $k$  small enough,  $N_k \cong \bigoplus_i R[T_0, \dots, T_n][i]$  is a finite graded  $R[T_0, \dots, T_n]$ -module, thus  $N_k$  is finite for any  $k$  as  $R[T_0, \dots, T_n]$  is Noetherian. Then  $M_k$  is finite for  $k$  large, and each  $H^0(\mathbb{P}_R^n, \mathcal{F}(d))$  is itself finite by item 2, thus  $M_k$  is a finite  $R[T_0, \dots, T_n]$ -module for any  $k$ . □

**Prop. (7.7.2.6) [Cohomology of Proper Schemes].** Let  $X$  be a proper scheme over a Noetherian ring  $A$ ,  $\mathcal{L}$  an ample invertible sheaf on  $X$  and  $\mathcal{F} \in \text{Coh}(X)$ , then

- $H^i(X, \mathcal{F} \otimes \mathcal{L}^{\otimes d}) = 0$  for  $i > 0$  and  $d$  large enough.
- The graded ring  $A = \bigoplus_{n \geq 0} H^0(X, \mathcal{L}^{\otimes n})$  is a f.g.  $R$ -algebra.
- For any  $k \in \mathbb{Z}$ ,  $\bigoplus_{d \geq k} H^0(X, \mathcal{F} \otimes \mathcal{L}^{\otimes d})$  is a finite  $A$ -module.

┘

*Proof:* By (7.5.4.26), there exists a  $d > 0$  and some immersion  $i : X \rightarrow \mathbb{P}_A^n$  that  $i^* \mathcal{O}_{\mathbb{P}_A^n}(1) \cong \mathcal{L}^{\otimes d}$ , and  $i$  is a closed immersion because  $X$  is proper. Let  $S = R[T_0, \dots, T_n]$ .

1: By projection formula (7.7.4.6),

$$i_*(\mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{L}^{\otimes nd+q}) = i_*(\mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{L}^{\otimes q})(n).$$

Then by (7.7.4.2) and (7.7.2.5), for  $n$  large enough,  $H^p(X, \mathcal{F} \otimes \mathcal{L}^{\otimes q}) = 0$  for any  $0 \leq q \leq d-1$ ,  $p > 0$ .

2: By proof of item 1 and (7.7.2.5), we see  $\bigoplus_{n \geq 0} A_{nd+q}$  is a finite graded  $S$ -module for any  $q$ , thus  $A = \bigoplus_{q=0}^{d-1} \bigoplus_{n \geq 0} A_{nd+q}$  is a f.g.  $R$ -module.

3: Similarly, we see  $\bigoplus_{d \geq k} H^0(X, \mathcal{F} \otimes \mathcal{L}^{\otimes d})$  is a finite graded  $S$ -module, and the  $S$ -module structure factors through  $S \rightarrow A$ , thus it is a finite  $A$ -module. □

**Lemma (7.7.2.7).** For an invertible sheaf  $\mathcal{L}$  on a qc scheme  $X$ , if for each Qco sheaf of ideals  $\mathcal{I} \in \mathcal{O}_X$ , there exists an  $n$  that  $H^1(X, \mathcal{I} \otimes \mathcal{L}^n) = 0$ , then  $\mathcal{L}$  is ample.  $\lrcorner$

*Proof:* For any closed pt  $P$ , choose an open affine nbhd  $U$  that  $\mathcal{L}$  is trivial, let  $Y = X - U$ , by the exact sequence  $0 \rightarrow \mathcal{I}_{Y \cup \{P\}} \rightarrow \mathcal{I}_Y \rightarrow k(P) \rightarrow 0$ , for each  $n$ ,

$$0 \rightarrow \mathcal{I}_{Y \cup \{P\}} \otimes \mathcal{L}^n \rightarrow \mathcal{I}_Y \otimes \mathcal{L}^n \rightarrow k(P) \otimes \mathcal{L}^n \rightarrow 0.$$

Thus by assumption for some  $n$  the map  $\Gamma(X, \mathcal{I}_Y \otimes \mathcal{L}^n) \rightarrow \Gamma(X, k(P) \otimes \mathcal{L}^n)$  is surjective. Now  $k(P) \otimes \mathcal{L}^n \cong A/\mathfrak{m}_P$ , so we let  $s \in \Gamma(X, \mathcal{I}_Y \otimes \mathcal{L}^n)$  maps to a section in  $\Gamma(X, k(P) \otimes \mathcal{L}^n)$  that corresponds to  $1 \in A/\mathfrak{m}_P$ , then  $P \in \text{Supp}(s) \subset U$ , and  $\text{Supp}(s)$  is affine. So we find an affine nbhd  $X_s$  for every closed pt of  $X$ .

Finally these  $X_s$  cover  $X$ , because the complement of  $\cup X_s$  is closed in  $X$  thus qc, then it contains a closed point by (4.4.6.1).  $\square$

**Prop. (7.7.2.8)[Serre's Cohomological Criterion of Ampleness].** If  $X$  is proper over a Noetherian affine scheme,  $\mathcal{L}$  is an invertible sheaf, then the following is equivalent.

- $\mathcal{L}$  is ample
  - For any  $\mathcal{F} \in \text{Coh}(X)$ , for  $n$  large enough,  $H^p(X, \mathcal{F} \otimes \mathcal{L}^n) = 0$  for  $p > 0$ .
  - For any Qco sheaf of ideals  $\mathcal{I} \in \mathcal{O}_X$ , there exists an  $n \geq 1$  that  $H^1(X, \mathcal{I} \otimes \mathcal{L}^{\otimes n}) = 0$
- (Notice in this case  $H$ -ample  $\iff$  ample).  $\lrcorner$

*Proof:*  $1 \rightarrow 2$ : This follows from (7.7.2.6).  $2 \rightarrow 3$  is trivial.  $3 \rightarrow 1$ : (7.7.2.7).  $\square$

### Lichtenbaum's theorem

**Lemma (7.7.2.9).** Let  $X$  is a variety and  $\mathcal{F} \in \text{Coh}(\mathcal{O}_X)$ . If  $H^d(X, \mathcal{F}) \neq 0$ , then  $\dim X \geq d$ , and if equality holds,  $X$  is proper.  $\lrcorner$

*Proof:* Cf. [Sta]0G5E.  $\square$

**Prop. (7.7.2.10) [Lichtenbaum].** Let  $X$  be a non-empty separated scheme of f.t. over a field  $k$  of dimension  $d$ , then the following are equivalent:

- $H^d(X, \mathcal{F}) = 0$  for all  $\mathcal{F} \in \text{Coh}(X)$ .
- $H^d(X, \mathcal{F}) = 0$  for all  $\mathcal{F} \in \text{QCoh}(X)$ .
- No irreducible component of  $X$  of dimension  $d$  is proper over  $k$ .

$\lrcorner$

*Proof:* Cf. [Sta]0G5F.  $\square$

## 3 Euler Characteristics

**Def. (7.7.3.1)[Euler Characteristic].** Let  $X$  be proper over a field  $k$  and  $\mathcal{F} \in \text{Coh}(X)$ , then the **Euler characteristic** of  $\mathcal{F}$  is defined to be:

$$\chi(\mathcal{F}) = \sum (-1)^i \dim_k H^i(X, \mathcal{F}).$$

It is definable by Grothendieck vanishing (7.3.5.17) and Grothendieck coherence theorem (7.7.4.12), and It is clearly an additive functor on  $\text{Coh}(X)$ .  $\lrcorner$

**Prop. (7.7.3.2).** For a proper scheme  $X$  over a field  $k$  and  $\mathcal{L}_i$  be invertible sheaves on  $X$ . Then for any  $\mathcal{F} \in \text{Coh}(X)$ ,

$$\chi(X, \mathcal{F} \otimes \mathcal{L}_1^{n_1} \otimes \cdots \otimes \mathcal{L}_r^{n_r})$$

is a polynomial in  $(n_1, \dots, n_r)$  of total degree at most  $\dim \text{Supp } \mathcal{F}$ .  $\lrcorner$

*Proof:* Cf. [Sta]0BEM.  $\square$

**Prop. (7.7.3.3).** Let  $f : Y \rightarrow X$  be morphism between schemes proper over field  $k$  and  $\mathcal{F} \in \text{Coh}(X)$ ,

$$\chi(Y, \mathcal{F}) = \sum (-1)^i \chi(X, R^i f_* \mathcal{F}).$$

In particular, if  $f$  is affine(finite), then  $\chi(Y, \mathcal{F}) = \chi(X, f_* \mathcal{F})$ .  $\lrcorner$

**Prop. (7.7.3.4).** This formula makes sense by (7.7.4.4) and (7.7.4.12), and it is true by Leray spectral sequence (7.3.1.9).  $\lrcorner$

**Prop. (7.7.3.5).** If  $X$  is a proper scheme and  $\mathcal{F} \in \text{Coh}(X)$  with  $\dim \text{Supp}(\mathcal{F}) = 0$ , then  $\mathcal{F}$  is generated by global sections,  $H^i(X, \mathcal{F}) = 0$  for  $i > 0$ , and

$$\chi(X, \mathcal{F} \otimes \mathcal{E}) = n \chi(X, \mathcal{F})$$

for any  $\mathcal{E} \in \text{Vect}^n(X)$ .  $\lrcorner$

*Proof:* The first two are clear as  $\mathcal{F} = i_* \mathcal{G}$  where  $i : \text{Supp}(\mathcal{F}) \rightarrow X$ . The last assertion follows from the projection formula (7.7.4.6)  $i_*(\mathcal{G} \otimes i^* \mathcal{E}) \cong \mathcal{F} \otimes \mathcal{E}$ .  $\square$

**Def. (7.7.3.6) [Arithmetic Genus].** The **arithmetic genus** of a proper scheme of dimension  $r$  over a field is defined to be  $p_a(X) = (-1)^r (\chi(\mathcal{O}_X) - 1)$  (7.7.3.1). In particular, when  $X$  is a complete curve over a field  $k$ , then  $p_a(X) = \dim_k H^1(X, \mathcal{O}_X)$  (7.12.1.12).

The arithmetic genus is stable under base change of fields, by flat base change theorem.  $\lrcorner$

**Prop. (7.7.3.7) [Arithmetic Genus of Product].** By Künneth formula, if  $X, Y$  are proper schemes of dimension  $r, s$  over a field  $k$ , then

$$H^n(X \otimes_k Y, \mathcal{O}_{X \otimes_k Y}) \cong \bigoplus_{0 \leq k \leq n} H^k(X, \mathcal{O}_X) \otimes H^{n-k}(Y, \mathcal{O}_Y).$$

Thus  $\chi(X \times_k Y) = \chi(X) \chi(Y)$ . In particular, we have

$$p_a(X \times Y) = p_a(X) p_a(Y) + (-1)^s p_a(X) + (-1)^r p_a(Y).$$

$\lrcorner$

**Prop. (7.7.3.8) [Arithmetic Genus of Complete Intersections].** Let  $C$  be a smooth complete intersection of a degree  $m$  surface  $S_1$  and a degree  $n$  surface  $S_2$  in  $\mathbb{P}_k^3$ , then  $p_a(C) = \frac{1}{2}(mn(m+n-4)+2)$ .  $\lrcorner$

*Proof:* There are exact sequences  $0 \rightarrow \mathcal{O}_{\mathbb{P}_k^3}(-S_i) \rightarrow \mathcal{O}_{\mathbb{P}_k^3} \rightarrow \mathcal{O}_{S_i} \rightarrow 0$ , which gives

$$0 \rightarrow \mathcal{O}_{\mathbb{P}_k^3}(-S_2)|_{S_1} \rightarrow \mathcal{O}_{S_1} \rightarrow \mathcal{O}_{S_1 \cap S_2} \rightarrow 0.$$

So by adjunction formula,

$$\mathcal{K}_C = \mathcal{K}_{S_1}(S_1 \cap S_2)|_C = \mathcal{K}_{\mathbb{P}_k^3}(S_1)(S_2)|_C = \mathcal{O}_C(m+n-4).$$

So  $2g - 2 = mn(m+n-4)$ .  $\square$

**Prop. (7.7.3.9) [Asymptotic Riemann-Roch].** If  $X$  is a proper scheme over a field  $k$  of dimension  $d$  and  $\mathcal{L}$  is an ample invertible sheaf, then  $\dim \Gamma(X, \mathcal{L}^n) \sim cn^d$ .  $\lrcorner$

*Proof:* Cf. [Sta]0BJ8.  $\square$

### Hilbert Polynomials

References are [Hartshorne I.7] and [Vak17].

**Prop. (7.7.3.10) [Hilbert Polynomial].** For a projective scheme over a field  $k$  and a coherent sheaf  $\mathcal{F}$ , there is a polynomial **Hilbert polynomial**  $P \in \mathbb{Q}[\lambda]$  that  $\chi(\mathcal{F}(n)) = P(n)$ , and  $\deg P \leq \dim \text{Supp}(\mathcal{F})$ .

This Hilbert polynomial is compatible with the definition in (7.7.3.12), because by (7.7.4.7), the higher cohomology group vanishes for  $n$  large, so  $\chi(\mathcal{F}(n)) = \Gamma(\mathcal{F}(n)) = \Gamma_*(\mathcal{F})_n$ .  $\lrcorner$

*Proof:*  $\square$

**Prop. (7.7.3.11).** Let  $X \hookrightarrow Y \hookrightarrow \mathbb{P}_k^n$  be a sequence of closed embeddings, then  $P_X(m) \leq P_Y(m)$  for  $m$  large, and if equality holds for  $m$  large, then  $X = Y$ .  $\lrcorner$

*Proof:* Cf. [Vak17] P490.  $\square$

**Def. (7.7.3.12) [Hilbert Polynomial].** For a scheme projective over a field  $k$  of dimension  $r$ , we define the **Hilbert polynomial**  $P_Y$  as the Hilbert polynomial of its homogenous coordinate ring  $\Gamma_*(Y)$ . It has dimension  $r$  by (5.2.2.17).

The **degree** of  $Y$  is defined as the  $r!$  times the leading coefficients of  $P_Y$ .  $\lrcorner$

**Prop. (7.7.3.13).**

- The degree is a positive integer.
  - If  $Y = Y_1 \cup Y_2$  and  $\dim Y_1 \cap Y_2 < r$ , then  $\deg Y = \deg Y_1 + \deg Y_2$ .
  - If  $H$  is a hypersurface whose ideal is generated by a homogeneous polynomial of degree  $d$ , then  $\deg H = d$ .
- $\lrcorner$

*Proof:* Cf. [Hartshorne P52].  $\square$

**Prop. (7.7.3.14).** For a variety of degree  $k$  and a general linear space, the intersection has  $k$  points.  $\lrcorner$

*Proof:*  $\square$

## 4 Relative Cohomology

**Prop. (7.7.4.1) [Filtered Colimits].** If  $f : X \rightarrow Y$  is qcqs, then  $R^i f_*$  commutes with filtered colimits, by (7.3.1.6) and (7.7.1.6).  $\lrcorner$

**Prop. (7.7.4.2) [Sheaf Cohomology Commutes with Affine Map].** For  $f : X \rightarrow Y$  affine and  $\mathcal{F} \in \mathcal{Q}\text{Coh}(X)$ ,  $H^n(Y, \mathcal{F}) = H^n(X, f_* \mathcal{F})$ .  $\lrcorner$

*Proof:* Because  $R^i f_* \mathcal{F}(U) = 0$  by (7.7.1.3) and (7.3.1.7), we can then use (7.3.1.8) to conclude.  $\square$

**Prop. (7.7.4.3) [Higher Direct Image Preserves Qco Sheaves].** If  $f : X \rightarrow S$  is qcqs then  $R^n f_*$  maps  $\mathcal{Q}\text{Coh}(X)$  to  $\mathcal{Q}\text{Coh}(S)$ , and for  $U \subset S$  affine open,  $\underline{(R^p f_* \mathcal{F})|_U} = \underline{(H^p(f^{-1}(U), \mathcal{F}))^\sim}$ .  $\lrcorner$

*Proof:* Firstly by (7.3.3.18),  $(R^p f_* \mathcal{F})|_U = R^p f_{U*}(\mathcal{F}|_U)$ , so it suffices to prove for  $S$  affine. Then  $R^p f_* \mathcal{F}$  is the sheafification of the presheaf  $G : U \mapsto H^p(f^{-1}(U), \mathcal{F})$  by (7.3.1.7).

If  $f$  is separated, then we can use Čech cohomology (7.7.1.2) to see that  $H^p(f^{-1}(D(f)), \mathcal{F}) = H^p(X, \mathcal{F})_f$  thus  $G$  is itself a sheaf and the conclusion follows.

In general we can choose a finite affine cover  $U_i$  of  $X$ , then every intersection of  $U_i$  is quasi-compact and separated, and there is a spectral sequence convergence  $H^p(\{U_i \rightarrow X\}, \mathcal{H}^q(F)) \implies H^{p+q}(X, F)$ , where the left can be calculated using Čech cohomology. Taking localization w.r.t.  $f$ , we get the desired isomorphism  $H^p(f^{-1}(D(f)), \mathcal{F}) = H^p(X, \mathcal{F})_f$  also by comparison(4.10.7.5).  $\square$

**Prop. (7.7.4.4)[Cohomological Boundedness of  $Rf_*$ ].** For a qcqs morphism  $f : X \rightarrow S$ , if  $S$  is qc, there is an  $N$  that for every base change  $f'$  of  $f$ , we have  $R^n f'_* \mathcal{F} = 0$  for every  $\mathcal{F} \in \mathcal{Q}\text{Coh}(X)$  and  $n \geq N$ .

In particular, if  $f$  is affine, then  $R^n f'_* \mathcal{F} = 0$  for  $n > 0$ . And if  $f$  is projective, then  $R^n f'_* \mathcal{F} = 0$  for  $n$  bigger than the maximal dimension of the fiber of  $f$ .  $\lrcorner$

*Proof:* Check affine locally on  $S$  and use(7.7.4.3), choose a finite affine cover  $\mathcal{U}$  of  $X$ . Then when  $n$  is large,  $(R^n f'_* \mathcal{F})|_{U_i} = 0$  by(7.7.4.3) and(7.7.1.3) for any  $i$ , thus  $R^n f'_* \mathcal{F} = 0$ . For base changes, notice the cardinality of the affine cover are the same.  $\square$

**Cor. (7.7.4.5).** For a qc separated scheme  $X$ , the cohomology vanish for  $n$  large. And when  $X$  is separated and can be covered by  $r$  affine opens, then  $N$  can be chosen to be  $r$ .  $\lrcorner$

**Cor. (7.7.4.6)[Projection Formula].**

- Let  $f : X \rightarrow Y$  be a morphism of schemes, and  $\mathcal{E}$  a locally free  $\mathcal{O}_Y$ -module, then for any  $\mathcal{F} \in \text{Mod}(\mathcal{O}_X)$  and any  $i$ , there are natural isomorphisms.

$$R^i f_*(\mathcal{F} \otimes f^* \mathcal{E}) \cong R^i f_*(\mathcal{F}) \otimes \mathcal{E}.$$

- If  $f : X \rightarrow Y$  is a qcqs morphism of schemes, then for any  $\mathcal{F} \in \text{Coh}(\mathcal{O}_X)$ ,  $\mathcal{E} \in \text{Coh}(\mathcal{O}_Y)$ , there is a natural isomorphism

$$Rf_*(\mathcal{F} \otimes^{\mathbb{L}} Lf^* \mathcal{E}) \cong Rf_*(\mathcal{F}) \otimes^{\mathbb{L}} \mathcal{E}.$$

$\lrcorner$

*Proof:* 1 follows from(7.3.3.20) and 2 follows from(7.9.1.8).  $\square$

### Proper Morphism and $\text{Coh}(X)$

**Prop. (7.7.4.7)[Relative Serre Vanishing].** If  $f : X \rightarrow Y$  is a proper morphism of locally Noetherian schemes,  $\mathcal{I}$  an invertible sheaf on  $X$ , then the following are equivalent:

- $\mathcal{L}$  is  $f$ -ample.
- For any  $\mathcal{F} \in \text{Coh}(X)$ , for  $n$  sufficiently large,  $R^i f_*(\mathcal{F} \otimes \mathcal{I}^{\otimes n}) = 0$  and  $i > 0$ .
- For any Qco sheaf of ideals  $\mathcal{I} \subset \mathcal{O}_X$ , there exists an  $n \geq 1$  that  $R^1 f_*(\mathcal{I} \otimes \mathcal{L}^{\otimes n}) = 0$ .

$\lrcorner$

*Proof:* 1  $\rightarrow$  2: By(7.7.4.3), this follows from(7.7.2.8). 2  $\rightarrow$  3 is trivial as  $X$  is Noetherian. 3  $\rightarrow$  1: Notice for any affine open subset  $U$  of  $Y$ ,  $U \rightarrow Y$  is qc, thus  $f^{-1}(U) \rightarrow X$  is quasi-compact, thus by(7.5.1.8), a Qco sheaf of ideals  $\mathcal{I}$  on  $f^{-1}(U)$  can be extended to a Qco sheaf of ideals on  $X$ . Then we can use(7.7.4.3) and Leray spectral sequence to reduce to(7.7.2.8).  $\square$

**Cor. (7.7.4.8).** Let  $X$  be proper over a Noetherian affine scheme with an ample invertible sheaf  $\mathcal{I}$ , then for any finite exact sequence in  $\text{Coh}(X)$ , if tensoring it with  $\mathcal{I}^{\otimes n}$  for large  $n$ , the resulting global section is exact.  $\lrcorner$

**Cor. (7.7.4.9).** Let  $X$  be proper over a Noetherian affine scheme with an ample invertible sheaf  $\mathcal{I}$ , and  $\mathcal{F}, \mathcal{G} \in \text{Coh}(X)$ ,  $i \geq 0$ , then for  $n$  large (depending on  $\mathcal{F}, \mathcal{G}, i$ ),

$$\text{Ext}^i(\mathcal{F}, \mathcal{G}(n)) \cong \Gamma(X, \mathcal{E}xt^i(\mathcal{F}, \mathcal{G}(n))).$$

┘

*Proof:* By (7.3.3.34)(7.7.1.7), there is a spectral sequence s.t. for  $n$  large, all the small terms vanish.  $\square$

**Lemma (7.7.4.10).** If  $f : X \rightarrow Y$  is projective and  $Y$  locally Noetherian, then for any  $n \in \mathbb{N}$ ,  $R^n f_*$  maps coherent sheaves to coherent sheaves.  $\square$

*Proof:* By (7.7.4.3), this problem is local on the target, so we may assume that  $Y = \text{Spec } R$  and  $X = \mathbb{P}_R^n$ , in which case this follows from (7.7.2.5).  $\square$

**Prop. (7.7.4.11) [Grothendieck's Coherence Theorem].** If  $f : X \rightarrow Y$  is proper and  $Y$  locally Noetherian, then for any  $n \in \mathbb{N}$ ,  $R^n f_*$  maps coherent sheaves to coherent sheaves.  $\square$

*Proof:* By (7.7.4.3), this problem is local on the target, so we may assume  $Y$  is Noetherian, and then  $X$  is also Noetherian. We prove by devissage (7.5.1.55): 1 is trivial, for 2, for any closed subscheme  $i : Z \subset X$ , denote  $g = f|_Z$ , then it suffices to find a coherent sheaf  $\mathcal{G}$  on  $Z$  s.t.

1.  $\mathcal{G}_\xi \cong k(\xi)$ .

2.  $R^p g_* \mathcal{G}$  are coherent for any  $p \geq 0$ .

Because then  $i_* \mathcal{G}$  is a coherent sheaf on  $X$  (7.5.1.32) that  $R^p f_*(i_* \mathcal{G}) = R^p g_* \mathcal{G}$  for any  $p$  by relative Leray spectral sequence (7.3.1.8) and (7.7.4.4), and also  $(i_* \mathcal{G})_\xi = \mathcal{G}_\xi$ .

As  $g : Z \rightarrow Y$  is proper, by Chow's lemma (7.4.6.23), there is a birational, H-projective map  $\pi : Z' \rightarrow Z$  over  $Y$  that  $Z'$  is projective over  $Y$ . Then there is a closed immersion  $j : Z' \rightarrow \mathbb{P}_Y^n$  and an induced closed immersion  $j' : Z' \rightarrow \mathbb{P}_Z^n$ . Then  $\mathcal{L} = j^* \mathcal{O}_{\mathbb{P}_Y^n}(1) = (j')^* \mathcal{O}_{\mathbb{P}_Z^n}(1)$  is both  $g \circ \pi$ -relatively ample and  $\pi$ -relatively ample.

Hence by relative Serre vanishing (7.7.4.7) there exists an  $n$  that  $R^p \pi_* \mathcal{L}^{\otimes n} = 0$  for any  $p > 0$ . Let  $\mathcal{G} = \pi_* \mathcal{L}^{\otimes n}$ , then this  $\mathcal{G}$  satisfies the conditions:  $\mathcal{G}_\xi = \kappa(\xi)$  as  $\pi^{-1}(U) \rightarrow U$  is an isomorphism, and from relative Leray spectral sequence

$$R^p g_* R^q \pi_* \mathcal{L}^{\otimes n} \implies R^n (g \circ \pi)_* \mathcal{L}^{\otimes n},$$

we see  $R^p g_* \mathcal{G} \cong R^p g'_* \mathcal{L}^{\otimes n}$ , which are coherent by (7.7.4.10).  $\square$

**Cor. (7.7.4.12) [Coherent Cohomology Finite].** If  $\pi : X \rightarrow \text{Spec } A$  is proper over a Noetherian affine scheme  $A$  and  $\mathcal{F}$  is a coherent sheaf on  $X$ ,  $H^i(X, \mathcal{F})$  are finite  $A$ -modules.  $\square$

*Proof:* By (7.7.4.3),  $R^p \pi_* \mathcal{F}$  is the Qco sheaf  $\widetilde{H^p(X, \mathcal{F})}$ , which is coherent iff  $H^p(X, \mathcal{F})$  is a finite  $A$ -module.  $\square$

**Prop. (7.7.4.13).** Given a proper morphism between locally Noetherian schemes  $f : X \rightarrow Y$ , a coherent sheaf  $\mathcal{F}$  on  $X$  and a coherent sheaf of ideals  $\mathcal{I}$  of  $\mathcal{O}_Y$ . Then  $\mathcal{M} = \bigoplus_{n \geq 0} R^p f_*(\mathcal{I}^n \mathcal{F})$  is a Qco graded  $\mathcal{A} = \bigoplus_{n \geq 0} \mathcal{I}^n$ -module of f.t..  $\square$

*Proof:* By (7.7.4.3), this is local on  $Y$ , so we may assume  $Y$  is affine, Cf. [Sta]02O8.  $\square$

**Prop. (7.7.4.14).** Let  $f : X \rightarrow Y$  be a proper morphism between locally Noetherian schemes and  $\mathcal{F}$  a coherent sheaf on  $X$ ,  $y \in Y$ . Consider the infinitesimal nbhds  $X_n = \operatorname{Spec}(\mathcal{O}_{Y,y}/\mathfrak{m}_y^n) \times_Y X \xrightarrow{i_n} X$  of the fiber  $X_1 = X_y$ , and set  $\mathcal{F}_n = i_{n*}\mathcal{F}$ , then

$$(R^n f_* \mathcal{F})_y^\wedge \cong \varprojlim_n H^n(X_n, \mathcal{F}_n)$$

as  $\mathcal{O}_{Y,y}^\wedge$ -modules. ┘

*Proof:* Cf. [Sta]02OD. □

**Cor. (7.7.4.15) [Support of Higher Direct Images].** Let  $f : X \rightarrow Y$  be a proper morphism between locally Noetherian schemes and  $y \in Y$  s.t.  $\dim(X_y) = d$ , then for any coherent sheaf  $\mathcal{F}$  on  $X$ ,  $(R^p f_* \mathcal{F})_y = 0$  for  $p > d$ . ┘

*Proof:* Cf. [Sta]02V7. □

## 5 Base Change

**Prop. (7.7.5.1) [Flat Base Change].** For a Cartesian diagram of schemes

$$\begin{array}{ccc} X' & \xrightarrow{g'} & X \\ \downarrow f' & & \downarrow f \\ S' & \xrightarrow{g} & S \end{array}$$

If  $g$  is flat and  $f$  is qcqs, then for every Qco sheaf  $\mathcal{F}$  on  $X$  with base change  $\mathcal{F}'$  on  $X'$ , there is a canonical isomorphism

$$g^* Rf_* \mathcal{F} \cong Rf'_* \mathcal{F}'.$$

By (7.3.3.18), when  $S, S'$  is affine, this reads:

$$H^i(X, \mathcal{F}) \otimes_A B \cong H^i(X \otimes_A B, (g')^* \mathcal{F}).$$

┘

*Proof:* Firstly by (7.3.3.18)(7.7.4.3), it suffices to show for  $S, S'$  affine. If  $X$  is separated, then then we can use Čech cohomology (7.7.1.2), and the Čech complex of  $K'$  is just the cohomology of the Čech complex tensored with  $B$ , so it commutes with taking cohomology because  $B$  is  $A$ -flat.

Now if  $X$  is only qs, then we choose a finite affine open cover  $\{U_i\}$ , then every intersection of  $U_i$  is quasi-compact and separated. and there is a spectral sequence convergence  $H^p(\{U_i \rightarrow X\}, \mathcal{H}^q(F)) \implies H^{p+q}(X, F)$ . Tensoring with  $B$ , we also get the desired isomorphism  $H^i(X, \mathcal{F}) \otimes_A B \cong H^i(X \otimes_A B, (g')^* \mathcal{F})$  by comparison (4.10.7.5). □

**Prop. (7.7.5.2) [Finite Locally Free Base Change].** For a Cartesian diagram of schemes

$$\begin{array}{ccc} X' & \xrightarrow{g'} & X \\ \downarrow f' & & \downarrow f \\ S' & \xrightarrow{g} & S \end{array}$$

If  $S = \operatorname{Spec} A$ ,  $S' = \operatorname{Spec} B$  and  $B$  is finite locally free over  $A$ , for every Qco sheaf  $\mathcal{F}$  on  $X$  with base change  $\mathcal{F}'$  on  $X'$ , there is a canonical isomorphism

$$H^i(X, \mathcal{F}) \otimes_A B \cong H^i(X \otimes_A B, (g')^* \mathcal{F}).$$

┘

*Proof:* If  $X$  is separated, then the then we can use Čech cohomology(7.7.1.2), and the Čech complex of  $K'$  is just the cohomology of the Čech complex tensored with  $B$ , so it commutes with taking cohomology because  $B$  is  $A$ -flat and tensoring a f.p. ring map commutes with colimits of rings.

In general we choose an affine open cover  $\{U_i\}$ , then every intersection of  $U_i$  is separated. and there is a spectral sequence convergence  $H^p(\{U_i \rightarrow X\}, \mathcal{H}^q(F)) \implies H^{p+q}(X, F)$ . Tensoring with  $B$ , we also get the desired isomorphism  $H^i(X, \mathcal{F}) \otimes_A B \cong H^i(X \otimes_A B, (g')^* \mathcal{F})$  by comparison(4.10.7.5).  $\square$

**Prop. (7.7.5.3) [Representing Higher Direct Image].** Let  $f : X \rightarrow S$  be a qcqs morphism of schemes. If  $S$  is qc and separated and  $\mathcal{F}$  is a Qco sheaf on  $X$ , there exists a  $\mathcal{K}^\bullet \in K^+(\mathcal{QCoh}(\mathcal{O}_S))$  s.t. for any morphism  $g : S' \rightarrow S$ , the complex  $g^* \mathcal{K}^\bullet$  is a representative for  $Rf'_* \mathcal{F}'$ , where the notation is as in(7.7.5.1).  $\lrcorner$

*Proof:* We only prove the case  $X$  is separated, the general case in [Sta]01XN.

Choose a finite affine open covering  $\mathcal{U}$  of  $X$ , consider the complex of sheaves  $\mathcal{C}^\bullet(\mathcal{U}, \mathcal{F}) = \text{Hom}^\bullet((\mathbb{Z}_{\mathcal{U}, \bullet}^\sharp, \mathcal{F}))$ (7.3.2.1), then  $\mathcal{C}^p(\mathcal{U}, \mathcal{F}) = \bigoplus_{i_0 \dots i_p} j_{i_0 \dots i_p *} \mathcal{F}_{i_0 \dots i_p}$ . Then let  $\check{\mathcal{C}}^\bullet(\mathcal{U}, f, \mathcal{F}) = f_* \mathcal{C}^\bullet(\mathcal{U}, \mathcal{F})$ . There is a natural map  $\mathcal{F} \rightarrow \mathcal{C}^\bullet(\mathcal{U}, \mathcal{F})$ . Now  $j_{i_0 \dots i_p}$  and  $f_{i_0 \dots i_p}$  are both affine by(7.4.5.39), so are their base changes, thus the higher direct image vanish. So by relative Leray spectral sequence, we see each term  $j_{i_0 \dots i_p *} \mathcal{F}'_{i_0 \dots i_p}$  is  $f'_*$ -acyclic. Then by Leray's acyclicity theorem,

$$Rf'_*(\mathcal{F}') = Rf'_*(\mathcal{C}^\bullet(\mathcal{U}, \mathcal{F})) \cong \mathcal{C}^\bullet(\mathcal{U}', f', \mathcal{F}') = g^* \mathcal{C}^\bullet(\mathcal{U}, f, \mathcal{F}).$$

The last equation follows from the fact  $f_{i_0 \dots i_p}$  are all affine thus the base change are isomorphisms.  $\square$

**Prop. (7.7.5.4) [Proper Flat Base Change].** If  $f : X \rightarrow S$  is a proper morphism of f.p., then

- If  $E$  a perfect object in  $D(\mathcal{O}_X)$ ,  $\mathcal{G} \in D(\mathcal{O}_X)$  is representable by a bounded complex of f.p.  $\mathcal{O}_X$ -modules flat over  $S$ , then

$$Rf_*(E \otimes_{\mathcal{O}_X}^L \mathcal{G}^\bullet), \quad Rf_* R\mathcal{H}om(E, \mathcal{G}^\bullet)$$

are perfect complexes in  $D(\mathcal{O}_S)$ , and its formation commutes with base change.

- If  $E$  a pseudo-coherent object in  $D(\mathcal{O}_X)$ ,  $\mathcal{G} \in D(\mathcal{O}_X)$  is representable by a bounded above complex of f.p.  $\mathcal{O}_X$ -modules flat over  $S$ , then  $Rf_*(E \otimes_{\mathcal{O}_X}^L \mathcal{G}^\bullet)$  is a pseudo-coherent complex in  $D(\mathcal{O}_S)$ , and its formation commutes with base change.  $\lrcorner$

*Proof:* Cf.[Sta]0A1H, 0A1J, 0CSC. ?  $\square$

**Cor. (7.7.5.5).** Let  $f : X \rightarrow S$  be a proper morphism of f.p., then

- If  $E \in D(\mathcal{O}_X)$  is perfect(pseudo-coherent) and  $f$  is flat, then  $Rf_* E$  is a perfect(pseudo-coherent) object in  $D(\mathcal{O}_S)$ , and its formation commutes with base change.
- If  $\mathcal{G} \in \mathcal{QCoh}^{\text{pf}}(\mathcal{O}_X)$  and is flat over  $S$ , then  $Rf_* \mathcal{G}$  is a perfect object of  $D(\mathcal{O}_S)$  and its formation commutes with base change.  $\lrcorner$

**Cor. (7.7.5.6).** If  $A \in \mathcal{CAlg}$ ,  $X$  be a proper scheme of f.p. over  $A$ , then if  $\mathcal{G} \in \mathcal{QCoh}^{\text{pf}}(\mathcal{O}_X)$  and is flat over  $A$ , there exists a finite complex of finite projective  $A$ -modules  $L^\bullet$  that for any  $A' \in \mathcal{CAlg}_A$ ,  $M \in \text{Mod}_A$ , by(7.7.5.5) and projection formula(7.7.4.6),

$$H^i(X_{A'}, \mathcal{F}_{A'}) = H^i(L^\bullet \otimes_A A'), \quad H^i(X, \mathcal{F} \otimes_A M) = H^i(L^\bullet \otimes_A M)$$

$\lrcorner$

## 6 Semicontinuity

**Prop. (7.7.6.1).**  $T^i$  is left exact iff  $\text{Coker } d^{i-1}$  is a projective  $A$ -module, iff it is representable by a finite  $A$ -module.  $\square$

*Proof:* Denote  $W^i = \text{Coker } d^{i-1}$ , then  $\text{Coker } d^{i-1} \otimes_A M = W^i \otimes M$ , because tensoring is right exact. Thus  $T^i(M) = \ker(W^i \otimes M \rightarrow L^{i+1} \otimes M)$ . Then for  $M' \subset M$ , there is a commutative diagram

$$\begin{array}{ccccccc} 0 & \longrightarrow & T^i(M) & \longrightarrow & W^i \otimes M' & \longrightarrow & L^{i+1} \otimes M' \\ & & \downarrow \alpha & & \downarrow \beta & & \downarrow \gamma \\ 0 & \longrightarrow & T^i(M) & \longrightarrow & W^i \otimes M & \longrightarrow & L^{i+1} \otimes M \end{array}$$

$\gamma$  is injective, so using spectral sequence, its clear  $\alpha$  is injective iff  $\beta$  is injective, i.e.  $W^i$  is flat, which is equivalent to finite projective (5.3.1.7).

To prove  $T^i$  is representable, let  $Q = \text{Coker}(L^{i+1,*} \rightarrow W^{i,*})$ , then  $Q$  is finite because  $W^i$  is finite (5.3.1.18), and  $0 \rightarrow \text{Hom}(Q, M) \rightarrow \text{Hom}(W^{i,*}, M) \rightarrow \text{Hom}(L^{i+1,*}, M)$ , but by (5.3.1.19), the last two are just  $W^i \otimes M$  and  $L^{i+1} \otimes M$ ,  $\text{Hom}(Q, M) = T^i(M)$  by what has already be proved.  $\square$

**Prop. (7.7.6.2).**  $T^i$  is right exact iff the cup product  $H^i(X, \mathcal{F}) \otimes_A M \rightarrow H^i(X, \mathcal{F} \otimes_A M)$  is an isomorphism for any  $A$ -module  $M$ .  $\square$

*Proof:* Because  $T^i$  and  $\otimes$  commutes with direct limit, it suffices to prove for  $M$  finite. In this case, choose a finite presentation  $A^r \rightarrow A^s \rightarrow M \rightarrow 0$ , then there is a diagram

$$\begin{array}{ccccccc} T^i(A) \otimes A^r & \longrightarrow & T^i(A) \otimes A^s & \longrightarrow & T^i(A) \otimes M & \longrightarrow & 0 \\ \downarrow & & \downarrow & & \downarrow & & \\ T^i(A^r) & \longrightarrow & T^i(A^s) & \longrightarrow & T^i(M) & & \end{array}$$

The first two vertical arrows are isomorphisms, so if  $T^i$  is right exact, so does the third vertical arrow. Conversely, if  $T^i(A) \otimes_A M \rightarrow T^i(M)$  are all isomorphisms, then by a similar diagram, we can show  $T^i(M) \rightarrow T^i(M')$  are surjective for  $M \rightarrow M'$  surjective.  $\square$

**Cor. (7.7.6.3).**  $T^i$  is exact iff it is right exact and  $T^i(A) = H^i(X, \mathcal{F})$  is a finite projective  $A$ -modules.  $\square$

*Proof:* When  $T^i$  is right exact,  $H^i(X, \mathcal{F} \otimes_A M) \cong H^i(X, \mathcal{F}) \otimes_A M$  by (7.7.6.2), so it is exact iff  $H^i(X, \mathcal{F})$  is flat. Because it is in priori finite, this is equivalent to finite projective (5.3.1.7).  $\square$

**Def. (7.7.6.4).** For a point  $y \in \text{Spec } A$ , define  $T_y^i(N) = H^i(L_y^\bullet \otimes N)$ , then  $T^i$  is (left/right)exact at  $y$  iff  $T_y^i$  are all (left/right)exact(exact sequence is stalkwise (5.1.4.2)).  $\square$

**Prop. (7.7.6.5).** If  $T^i$  is (left/right)exact at a point  $y$ , then the same is true on a nbhd of  $y$ .  $\square$

*Proof:* From (7.7.6.1),  $(\text{Coker } d^{i-1})_y$  is a finite projective  $A_p$  module, so it is free, and it is a coherent sheaf, so it is free at a nbhd of  $y$  by (7.5.1.38), so the same is true on a nbhd of  $y$ . Now right exactness of  $T^i$  is equivalent to left exactness of  $T^{i+1}$ , and exact is left exact+right exact, so we are done.  $\square$

**Prop. (7.7.6.6).**  $T^i$  is right exact at  $y$  iff  $H^i(X, \mathcal{F}) \otimes k(y) \rightarrow H^i(X, \mathcal{F} \otimes_A k(y))$  is surjective.  $\square$

*Proof:* Cf. [Hartshorne P289]. ?  $\square$

**Prop. (7.7.6.7)[Cohomology and Stalks].** Let  $f : X \rightarrow Y$  be a proper morphism of locally Noetherian schemes and  $\mathcal{F}$  is a coherent sheaf on  $X$  flat over  $Y$ ,  $y \in Y$ , then

- If the natural map

$$\varphi^i(y) : R^i f_*(\mathcal{F}) \otimes k(y) \rightarrow H^i(X_y, \mathcal{F}_y)$$

is surjective, then it is an isomorphism, and the same is true for  $y'$  in an open nbhd of  $y$ .

- Assume  $\varphi^i(y)$  is surjective, then  $\varphi^{i-1}(y)$  is also surjective iff  $R^i f_*(\mathcal{F})$  is finite projective in a nbhd of  $y$ .

┘

*Proof:* 1: This follows from (7.7.6.2)(7.7.6.6) and (7.7.6.5).

2:  $\varphi^{i-1}(y), \varphi^i(y)$  are both surjective iff  $T^i$  and  $T^{i-1}$  are both right exact at  $y$  (7.7.6.6), which is equivalent to  $T^i$  exact at  $y$ . Then we finish by (7.7.6.3)  $\square$

**Remark (7.7.6.8).** How's this related to (7.7.5.5)?

┘

**Prop. (7.7.6.9)[Semicontinuity of Cohomology].** Let  $X \rightarrow Y$  be a projective morphism of locally Noetherian schemes and  $\mathcal{F}$  is a coherent sheaf on  $X$ , flat over  $Y$ , then for each  $i$ ,  $h^i(y, \mathcal{F}) = \dim_{k(y)} H^i(X_y, \mathcal{F}_y)$  is an upper semicontinuous function on  $Y$ .  $\square$

*Proof:* The question is local on  $Y$ , so we may assume  $Y$  is affine Noetherian. By (7.7.5.1),  $H^i(y, \mathcal{F}) = \dim_{k(y)} T^i(k(y))$ . And as in the proof of (7.7.6.1),  $T^i(M) = \ker(W^i \otimes M \rightarrow L^{i+1} \otimes M)$ , and  $W^i \rightarrow L^{i+1} \rightarrow W^{i+1} \rightarrow 0$  is exact, so  $0 \rightarrow T^i(k(y)) \rightarrow W^i \otimes k(y) \rightarrow L^{i+1} \otimes k(y) \rightarrow W^{i+1} \otimes k(y) \rightarrow 0$ , and counting dimension,  $h^i(y, \mathcal{F}) = \dim W^i \otimes k(y) + \dim W^{i+1} \otimes k(y) - \dim L^{i+1} \otimes k(y)$ . Notice the last term is constant as  $L^{i+1}$  is free  $A$ -module and the first two terms are upper semi-continuous by (7.5.1.41), thus  $h^i(y, \mathcal{F})$  is upper-semicontinuous.  $\square$

**Cor. (7.7.6.10)[Grauert].** If  $Y$  is integral and  $h^i(y, \mathcal{F})$  is constant on  $Y$ , then  $R^i f_*(\mathcal{F})$  is locally free on  $Y$  and  $R^i f_*(\mathcal{F}) \otimes k(y) \cong H^i(X_y, \mathcal{F}_y)$ .  $\square$

*Proof:* Cf.[Hartshorne P288].  $\square$

References are [Sta].

### 1 Cartier Divisors

**Def. (7.8.1.1) [Cartier Divisor].** A **Cartier divisor** on  $X \in \text{Sch}$  is an element in  $\Gamma(X, \mathcal{K}_X^*/\mathcal{O}_X^*)$ .

An **effective Cartier divisor** is a Cartier divisor that is locally defined as  $\{(U_i, f_i)\}$  where  $f_i \in \Gamma(U_i, \mathcal{O}_{U_i})$  are non-zero-divisors, equivalently, it is a closed subscheme  $D \subset X$  s.t.  $\mathcal{I}(D) \in \text{Pic}(X)$ . (Notice by definition,  $\mathcal{K}$  is the localization w.r.t. non-zero-divisors, and  $f_i$  is invertible in  $\mathcal{K}^*$  so  $f_i$  must be nonzero-divisors.)

The monoid of effective Cartier divisors is denoted by  $\text{Cart}^{\text{eff}}(X)$ .

The **Cartier divisor group**  $\text{CaCl}(X)$  is the quotient of  $\Gamma(X, \mathcal{K}_X^*) \rightarrow \Gamma(X, \mathcal{K}_X^*/\mathcal{O}_X^*)$ .  $\perp$

**Prop. (7.8.1.2) [Cartier Divisor and Flat Base Change].**

- The flat base change of Cartier divisor is also a Cartier divisor.
- The flat base change of a regular immersion (7.6.7.1) is also a regular immersion.

$\perp$

*Proof:* ?

$\square$

**Prop. (7.8.1.3) [Cartier Divisor is Nowhere Dense].** Let  $D \subset X$  be an effective Cartier divisor, then it is nowhere dense in  $X$ , i.e.  $X \setminus D \rightarrow X$  is scheme-theoretically dense.  $\perp$

*Proof:* It suffices to check affine-locally, it is qc so the scheme-theoretic closure of  $\text{Spec } A_f \rightarrow \text{Spec } A$  is  $V(\ker(A \rightarrow A_f)) = V(0)$  as  $f$  is a nonzero-divisor.  $\square$

**Prop. (7.8.1.4) [Closed Subschemes and Effective Cartier Divisors].** Let  $X \in \text{NSch}$  and  $D \subset X$  is a closed subscheme corresponding to a Qco sheaf of ideals  $\mathcal{I} \subset \mathcal{O}_X$ . If for any  $x \in D$ , the ideal  $\mathcal{I}_x \subset \mathcal{O}_{X,x}$  is generated by a single nonzero-divisor, then  $D$  is an effective Cartier divisor.  $\perp$

*Proof:* Cf. [Sta] 0AG8.  $\square$

**Cor. (7.8.1.5) [Prime Divisor and Effective Cartier Divisor].** Let  $X \in \text{NSch}$  and  $D$  is a prime Weil divisor on  $X$  and  $\mathcal{O}_{X,x}$  are UFDs for any  $x \in D$  (e.g.  $X$  is locally factorial), then  $D$  is an effective Cartier divisor.  $\perp$

*Proof:* For any  $x \in D$ , let  $A = \mathcal{O}_{X,x}$ , and  $\mathfrak{p}$  be the prime corresponding to the generic point of  $D$ , then  $\dim A_{\mathfrak{p}} = 1$ , so  $\mathfrak{p}$  is principle as  $A$  is a UFD, so  $D$  is an effective Cartier divisor by (7.8.1.4).  $\square$

**Prop. (7.8.1.6) [Cartier-Pic].** For an integral scheme  $X$ , the homomorphism  $\text{CaCl}(X) \rightarrow \text{Pic}(X)$  (7.8.1.1)(7.5.3.10) induced from long exact sequence of  $0 \rightarrow \mathcal{O}_X^* \rightarrow \mathcal{K}_X^* \rightarrow \mathcal{K}_X^*/\mathcal{O}_X^* \rightarrow 0$  is an isomorphism.

Explicitly, for a Cartier divisor  $D = \{(U_i, f_i)\}$ , the image is the invertible sheaf  $\mathcal{O}_X(D)$  (7.5.3.12).  $\perp$

*Proof:* It is clearly injective by definition, so it suffices to show any invertible sheaf can embed into the constant sheaf: for any invertible sheaf  $\mathcal{L}$ , tensor with  $\mathcal{K}$  and restrict to the stalk of the generic point, i.e. there is a compatible choice of homomorphisms into  $K(X)$ .  $\square$

**Prop. (7.8.1.7).** If  $X \in \text{NSch}$  and the diagonal map is affine, for a dense affine open  $U$ , if all the stalk of  $X \setminus U$  are UFD, then  $U$  is the complement of an effective Cartier divisor.  $\lrcorner$

*Proof:* The irreducible complements of  $X \setminus U$  is finite and has codimension 1 by (7.6.3.5) because  $U \rightarrow X$  is affine, and it is an effective Cartier divisor by (9.1.4.1), so their sum will suffice.  $\square$

**Prop. (7.8.1.8) [Pullback of Effective Cartier Divisors].** Let  $f : X \rightarrow Y \in \text{Sch}$  and  $D \in \text{Cart}^{\text{eff}}(Y)$ , then the pullback of  $D$  via  $f$  is an effective Cartier divisor on  $X$  if one of the following holds:

- $f(x) \notin D$  for any  $x \in \text{WeakAsso}(X)$ .
- $X, Y \in \text{Sch}^{\text{int}}$  and  $f$  is dominant.
- $f$  is flat.

$\lrcorner$

*Proof:* 2 is a special case of 1 as a reduced scheme has no embedded points.

1 follows from (5.2.5.17).

3 is easy.  $\square$

**Prop. (7.8.1.9) [Effective Cartier Divisors].** If  $X \in \text{NSch}_{\text{cpct}}$  with an ample invertible sheaf  $\mathcal{L}$ , then any line bundle in  $\text{Pic}(X)$  is isomorphism to  $\mathcal{O}_X(D - D')$  for some effective Cartier divisors  $D, D'$  on  $X$ .  $\lrcorner$

*Proof:* Cf. [Sta]0AYM.  $\square$

### Relative Effective Cartier Divisors

**Def. (7.8.1.10) [Relative (Effective) Cartier Divisors].** For  $X/S \in \text{Sch}$ , a **relative effective (Cartier) divisor** on  $X/S$  is an effective Cartier divisor  $D$  on  $X$  (7.8.1.1) that is flat over  $S$ .  $\lrcorner$

**Prop. (7.8.1.11).** If  $S \in \text{NSch}$  and  $X \in \text{Var}/S$ , and  $D$  is a relative Cartier divisor on  $X$ , then  $f_*(\mathcal{O}_D)$  is flat and locally free on  $S$ .  $\lrcorner$

*Proof:* Firstly  $f_*(\mathcal{O}_D)$  is f.p. by (7.12.5.2) and the fact  $R^1 f_* \mathcal{O}_X$  is locally free on  $S$ ?, and then it is locally free by (7.6.2.5).  $\square$

**Prop. (7.8.1.12) [Fibral Criterion of Relative Effective Divisor].** Let  $f : X \rightarrow S \in \text{NSch}$  be locally of f.t.,  $D \subset X$  be a closed subscheme and  $x \in D$ ,  $s = f(x)$ , then the following are equivalent:

- $D$  is a relative effective divisor at a nbhd of  $x$ .
- $X$  and  $D$  are flat over  $S$  at  $x$ , and the fiber  $D_s$  is a Cartier divisor on  $X_s$  at  $x$ .
- $X$  is flat over  $S$  at  $x$ , and  $D$  is cut out by an element that is regular on the fiber  $X_s$ .

In particular, a relative Cartier divisor pair can be regarded as a family of Cartier divisors pairs.  $\lrcorner$

*Proof:* 1  $\rightarrow$  2: Let  $\mathcal{O}_{D,x} = b\mathcal{O}_{X,x}$ , then there is an exact sequence  $0 \rightarrow \mathcal{O}_{X,x} \xrightarrow{b} \mathcal{O}_{X,x} \rightarrow \mathcal{O}_{D,x} \rightarrow 0$ , which induces a long exact sequence

$$\text{Tor}_1^{\mathcal{O}_{X,x}}(\mathcal{O}_{X,x}, k(s)) \rightarrow \text{Tor}_1^{\mathcal{O}_{X,x}}(\mathcal{O}_{X,x}, k(s)) \rightarrow \text{Tor}_1^{\mathcal{O}_{D,x}}(\mathcal{O}_{D,x}, k(s)) \rightarrow \mathcal{O}_{X_s,x} \otimes k(s) \xrightarrow{b} \mathcal{O}_{X_s,x} \otimes k(s).$$

Because  $D$  is flat over  $S$ ,  $\text{Tor}_1^{\mathcal{O}_{D,x}}(\mathcal{O}_{D,x}, k(s)) = 0$ , thus  $b$  is regular in  $\mathcal{O}_{X_s,x}$  and  $D_s$  is an effective divisor on  $X_s$  at  $x$ . Also the map  $\text{Tor}_1^{\mathcal{O}_{X,x}}(\mathcal{O}_{X,x}, k(s)) \rightarrow \text{Tor}_1^{\mathcal{O}_{X_s,x}}(\mathcal{O}_{X_s,x}, k(s))$  is surjective, which is

multiplication by  $b$ , and  $b$  is in the maximal ideal, thus by Nakayama lemma,  $\mathrm{Tor}_1^{\mathcal{O}_{S,s}}(\mathcal{O}_{X,x}, k(s)) = 0$ . Then  $\mathcal{O}_{X,x}$  is  $\mathcal{O}_{S,s}$ -flat by local criterion(5.4.1.16).

2  $\rightarrow$  3: Let  $D$  corresponds to an ideal  $I$  in  $\mathcal{O}_{X,x}$ , and because  $D_s$  is effective divisor on  $X_s$ , there exists  $b \in I$  s.t. the image of  $b$  in  $\mathcal{O}_{X,x} \otimes k(s)$  generate the ideal of  $D_s$ . Then it suffices to show that  $b$  generates  $I$ . Notice there is an exact sequence  $0 \rightarrow I \rightarrow \mathcal{O}_{X,x} \rightarrow \mathcal{O}_{D,x} \rightarrow 0$ , and  $\mathcal{O}_{D,x}$  is flat over  $\mathcal{O}_{S,s}$ , thus  $I \otimes k(s) \rightarrow \mathcal{O}_{X,x} \otimes k(s)$  is injective, and the image is just the ideal of  $D_s$ , thus  $b$  generates  $I \otimes k(s)$ . Thus by Nakayama, it also generates  $I$ .

3  $\rightarrow$  1: The exact sequence  $0 \rightarrow I \rightarrow \mathcal{O}_{X,x} \rightarrow \mathcal{O}_{D,x} \rightarrow 0$  induces the long exact sequence

$$\mathrm{Tor}_1^{\mathcal{O}_{S,s}}(\mathcal{O}_{X,x}, k(s)) \rightarrow \mathrm{Tor}_1^{\mathcal{O}_{S,s}}(\mathcal{O}_{D,x}, k(s)) \rightarrow I \otimes k(s) \rightarrow \mathcal{O}_{X_s,x} \otimes k(s).$$

$I \otimes k(s) \rightarrow \mathcal{O}_{X_s,x} \otimes k(s)$  is injective because its composition with  $\mathcal{O}_{X_s,x} \otimes k(s) \rightarrow I \otimes k(s) \rightarrow \mathcal{O}_{X_s,x} \otimes k(s)$  is multiplication by  $b$ , thus injective as  $b$  is regular on the fiber  $X_s$ . Thus  $\mathrm{Tor}_1^{\mathcal{O}_{S,s}}(\mathcal{O}_{D,x}, k(s)) = 0$ , thus  $D$  is flat at  $x$  by local criterion(5.4.1.16). And also  $I$  is flat over  $\mathcal{O}_{S,s}$ . Notice  $b : \mathcal{O}_{X,x} \rightarrow I$  is isomorphism after tensoring  $k(x)$  and  $I$  is flat, so  $\ker(b) = 0$  by Nakayama, and  $b$  is regular.  $\square$

**Cor. (7.8.1.13).** If  $D, E$  are relative effective Cartier divisors on  $X/S$ , then  $D + E$  is also a relative Cartier divisor on  $X/S$ .  $\lrcorner$

*Proof:* This follows from item3 of(7.8.1.12).  $\square$

**Prop. (7.8.1.14) [Pullback of Divisors].** For  $S \in \mathrm{Sch}$ ,  $X \in \mathrm{Sch}/S$  and  $Z$  an relative Cartier divisor on  $X/S$ , then for any  $T \in \mathrm{Sch}/S$ ,  $Z_T$  is a relative Cartier divisor on  $X_T/T$ .

And if  $f : X' \rightarrow X$  is a flat morphism over  $S$ , then  $f^*Z$  is also a relative Cartier divisor on  $X'/S$ .  $\lrcorner$

*Proof:* If  $0 \rightarrow \mathcal{O}_X \xrightarrow{\mathcal{I}} \mathcal{O}_X \rightarrow i_*\mathcal{O}_Z \rightarrow 0$ , then  $0 \rightarrow \mathcal{O}_{X_T} \xrightarrow{\mathcal{I}_T} \mathcal{O}_{X_T} \rightarrow i_*\mathcal{O}_{Z_T} \rightarrow 0$  because  $\mathcal{O}_Z$  is flat over  $\mathcal{O}_S$ , so  $\mathcal{I}_T$  is also an effective divisor on  $X_T/T$ .

The second case is similar.  $\square$

**Def. (7.8.1.15) [Degree of Relative Cartier Divisors].** For  $X/S \in \mathrm{Sch}$  where  $S$  is connected, if  $D$  is a relative Cartier divisor on  $X$ , the **degree of relative Cartier divisor** of  $D$  is defined to be  $\deg(D) = \deg(\mathcal{L}(D)) = \mathrm{rank}_S f_*(\mathcal{O}_D)$ (7.8.1.11).  $\lrcorner$

### Normal-Crossing Divisors

**Def. (7.8.1.16) [Strictly Normal-Crossing Divisors].** For  $X \in \mathrm{NSch}$ , a **strictly normal-crossing divisor** on  $X$  is a effective Cartier divisor  $D \in \mathrm{Cart}^{\mathrm{eff}}(X)$ (7.8.1.1) s.t. for any  $p \in D$ ,  $\mathcal{O}_{X,p}$  is regular, and there exists a regular system of parameters  $x_1, \dots, x_d \in \mathfrak{m}_p$  s.t.  $D$  is cut out by  $x_1, \dots, x_r$  in  $\mathcal{O}_{X,p}$ ?  $\lrcorner$

**Def. (7.8.1.17) [Normal-Crossing Divisors].** For  $X \in \mathrm{NSch}$ , a **normal-crossing divisor** on  $X$  is an effective Cartier divisor  $D \in \mathrm{Cart}^{\mathrm{eff}}(X)$ (7.8.1.1) s.t. for each  $p \in D$ , there exists an étale nbhd  $f : (U, u) \rightarrow (X, p)$ (7.6.6.11) s.t.  $f^*D \in \mathrm{Cart}^{\mathrm{eff}}(U)$ (7.8.1.8) is a strictly normal-crossing divisor on  $U$ (7.8.1.16).  $\lrcorner$

**Prop. (7.8.1.18) [Characterizing Strictly Normal-Crossing Divisors].** For  $X \in \mathrm{NSch}$  and  $D \in \mathrm{Cart}^{\mathrm{eff}}(X)$ , let  $\{D_i\}_{i \in I}$  be the set of irreducible components of  $D$  viewed as reduced closed subschemes of  $X$ , then the following are equivalent:

- $D$  is a strictly normal-crossing divisor.

- $D$  is reduced and  $\cap_{j \in J} D_j$  is a regular scheme whose irreducible components has codimension  $\#J$  in  $X$ , for each  $J \subset I$ .

⌋

*Proof:* Cf. [Sta]0BIA.?

□

**Prop. (7.8.1.19) [Smooth Pullback of Normal-Crossing Divisors].** If  $f : X \rightarrow Y \in \mathbf{NSch}$  is smooth and  $D \in \mathbf{Cart}^{\text{eff}}(Y)$  is a (strictly)normal-crossing divisor (7.8.1.16)(7.8.1.17), then  $f^*D \in \mathbf{Cart}^{\text{eff}}(X)$  (7.8.1.8) is also a (strictly)normal-crossing divisor on  $X$ .

⌋

*Proof:* It suffices to prove for strictly normal-crossing divisors. For this, Cf. [Sta]0CBP? □

**Prop. (7.8.1.20) [Characterizing Normal-Crossing Divisors].** For  $X \in \mathbf{NSch}$  and a closed subscheme  $D \subset X$ , the following are equivalent:

- $D$  is a normal-crossing divisor on  $X$ .
- $D$  is reduced, the normalization  $D^\nu \rightarrow D$  is unramified, and for each  $n \in \mathbb{Z}_+$ , the scheme

$$Z_n = D^\nu \times_D \times \dots \times D^\nu \setminus \{(p_1, \dots, p_n) | \exists (i \neq j) p_i = p_j\}$$

is regular, and the morphism  $Z_n \rightarrow X$  is a local complete intersection morphism whose conormal sheaf is locally free of rank  $n$ ?

⌋

*Proof:* Cf. [Sta]0CBR.

□

**Prop. (7.8.1.21).** If  $X \in \mathbf{NSch}$  is J-2 or Nagata, then for a closed subscheme  $D \subset X$ ,  $D$  is a normal-crossing divisor on  $X$  (7.8.1.17) iff the pullback of  $D$  to  $\text{Spec } \mathcal{O}_{X,p}^{\text{sh}} \rightarrow X$  is a strictly normal-crossing divisor on  $\text{Spec } \mathcal{O}_{X,p}^{\text{sh}}$ , for each  $p \in D$ .

⌋

*Proof:* Cf. [Sta]0CBS.

□

## 2 Blowing-Ups

**Def. (7.8.2.1) [Blowing-Ups].** For  $X \in \mathbf{Sch}$  and a closed subscheme  $Z \subset X$ , the **blowingup** of  $X$  along  $Z$  is defined as the map  $\beta : \mathbf{Proj}_X(\oplus_{d \geq 0} \mathcal{I}(Z)^d) \rightarrow X$ , denoted by  $\mathbf{Bl}_Z(X)$ .

$\mathbf{E}_Z X \triangleq \beta^{-1}(Z)$  is an effective Cartier divisor of  $\mathbf{Bl}_Z(X)$  (7.8.1.1), called the **exceptional divisor**, the line bundle  $\mathcal{O}_{\tilde{X}}(E)$  associated with it is called the **exceptional invertible sheaf**.

Then  $\mathbf{Bl}_Z(X)$  has the universal property that any  $Y \rightarrow X \in \mathbf{Sch}$  that pulls back  $Z$  to an effective Cartier divisor in  $Y$  uniquely factors through  $\mathbf{Bl}_Z X$ .

Blowing-ups commute with flat base change, by universal property and (7.8.1.2)(7.8.1.2). ⌋

*Proof:* Notice first an effective divisor is equivalent to an invertible sheaf of ideal. And any morphism  $Z \rightarrow X$  pulls back  $I$  to the image of  $f^{-1}I \otimes_{\mathcal{O}_X} \mathcal{O}_Z \rightarrow f^{-1}I \cdot \mathcal{O}_Z$ . This is just  $\mathcal{O}(1)$  on  $\mathbf{Bl}_Z X$  so invertible.

For the construction, the local uniqueness will implies the existence. Notice locally  $\tilde{X}_I$  is projective over  $X$ . Now because the  $Z \rightarrow X$  pulls back  $I$  to an invertible sheaf and it is generated by  $f^{-1}(a_i)$ , we use?? to get another  $Z \rightarrow \text{Proj}_X^n$  and it factors through the closed subscheme  $\tilde{X}_I$ . If there is another morphism  $g$ , then  $f^{-1}I \cdot \mathcal{O}_Z = g^{-1}(\pi^{-1}I \cdot \mathcal{O}_{\tilde{X}_I}) \cdot \mathcal{O}_Z = g^{-1}(\mathcal{O}_{\tilde{X}_I}) \cdot \mathcal{O}_Z$  surjective, and a surjective morphism between two invertible sheaf is an isomorphism, and they are both ideal sheaves, thus is the same, so this morphism is unique as it is determined by the map on  $\mathcal{O}_X$ ?? □

**Cor. (7.8.2.2) [Properties of Blowing-Ups].** Situation as in (7.8.2.1),

- If  $Z$  is itself an effective Cartier divisor in  $X$  (7.8.1.1), then the  $\mathbf{Bl}_Z(X) = X$ .
- If  $U \subset X$  is an open subscheme, then  $\mathbf{Bl}_Z(U) = \beta^{-1}(U) \subset \mathbf{Bl}_Z(X)$ . In particular, blowing-up is a local construction.
- If  $Z = X$ , then  $\mathbf{Bl}_X(X) = \emptyset$ .
- $\beta : \beta^{-1}(X \setminus Z) \rightarrow X \setminus Z$  is an isomorphism.
- If  $X$  is reduced, then  $\mathbf{Bl}_Z(X)$  is also reduced.
- If  $X$  is irreducible and  $Z$  doesn't contain the generic point of  $X$ , then  $\mathbf{Bl}_Z(X)$  is irreducible.

┘

*Proof:* 1: By universal property.

2: open immersion are flat.

3: By universal property.

4: By item2 and 3.

5: ?

6: ?

□

**Cor. (7.8.2.3).** Situation as in (7.8.2.1),  $\beta : \mathbf{Bl}_Y(X) \rightarrow X$  is birational, proper thus surjective. If  $X$  is a (complete) variety, then so does  $\mathbf{Bl}_Y(X)$ . ┘

**Def. (7.8.2.4) [Strict Transforms].** Let  $Z \subset X$  is a closed subscheme and  $f : Y \rightarrow X$  be a morphism, then  $Y \times_X \mathbf{Bl}_Z X$  is called the **total transform** of  $Y$ , and the **strict transform** of  $Y$  is the schematic closure of  $Y \times_X \mathbf{Bl}_Z X \setminus Y \times_X E_Z X$  in  $Y \times_X \mathbf{Bl}_Z X$ , or equivalently the closed subscheme of  $Y \times_X \mathbf{Bl}_Z X$  cut out by the  $\mathcal{Q}_{\text{co}}$  ideal of sections supported on  $Y \times_X E_Z Y$ . ┘

**Prop. (7.8.2.5) [Strict Transformation].** Let  $Z \subset X$  is a closed subscheme and  $f : Y \rightarrow X$  be a morphism, then the strict transform of  $Y$  is the blowing-up of  $Y$  at the closed subscheme  $f^{-1}Z$ . ┘

*Proof:* Cf. [Sta]080E. ? (Recall the definition of fiber product, we only need to check for  $Z, X$  affine and glue. For this, check  $B \otimes_A (\oplus I^d) \rightarrow \oplus (IB)^d$  defines the fiber map). □

**Prop. (7.8.2.6).** If  $X$  is  $H$ -(quasi-)projective, then so does  $\tilde{X}_I$  and  $\pi$  is  $H$ -projective (7.5.2.19). And any birational projective morphism from another variety  $Z$  to  $X$  comes from a blowing-up. ┘

*Proof:* Cf. [Hartshorne P166]. □

**Prop. (7.8.2.7) [Exceptional Divisor].** There are canonical coordinates near  $E$ : let  $\tilde{U}_i$  be  $\tilde{U} - \{(l_i = 0)\}$ , then endow  $\tilde{U}_i$  with the coordinate  $z(i) = (l_j/l_i, \dots, z_i, \dots, l_n/l_i)$ , it is holomorphic to  $\mathbb{C}^n$ .  $\pi$  in this coordinate is written as  $(z(1), \dots, z(n)) \mapsto (z(i)z(1), \dots, z(i), \dots, z(n)z(i))$ .

The transition function can be written, it is

$$\varphi_j \circ \varphi_i^{-1}((z(i)_1, \dots, z(i)_n)) = \left( \frac{z(i)_1}{z(i)_j}, \dots, \frac{1}{z(i)_j}, \dots, z(i)_i z(i)_j, \dots, \frac{z(i)_n}{z(i)_j} \right).$$

Notice it is somewhat tricky because it has two different coordinates.

The defining function of  $E$  in this coordinate is  $(z(i)) = (z_i)$ . So the line bundle  $\mathcal{O}_{\tilde{X}}(E)$  has transition function  $g_{ij} = z(i)/z(j)$ , and it can be thought of as the line bundle that has line  $[l]$  at the point  $(z, [l]) \in \tilde{U}$ . So it is kind of tautological, in fact its restriction on  $E \cong \mathbb{CP}^{n-1}$  is just the tautological line bundle. ┘

**Prop. (7.8.2.8).** Situation as in (7.8.2.1), the canonical line bundle  $\mathcal{K}_{\mathbf{Bl}_Y(X)} = \pi^* \mathcal{K}_X + (\dim X - 1) \mathbf{E}_Y(X)$ .  
 $\perp$

*Proof:* Away from  $E$ , the  $\pi$  is a holomorphism, so It suffices to compare the two transition function of the two canonical maps near  $E$  using the coordinates in (7.8.2.7), with the local section given by  $dz_1 \wedge \dots \wedge dz_n$  and  $dz(i)_1 \wedge \dots \wedge dz(i)_n$  respectively. On  $\tilde{U}_i$ , locally  $dz_1 \wedge \dots \wedge dz_n$  is pulled by  $\pi^*$  to the trivial bundle on  $U'$ , and by calculation,  $dz(j)_1 \wedge \dots \wedge dz(j)_n = z(i)_j^{n-1} dz(i)_1 \wedge \dots \wedge dz(i)_n$ , so  $\mathcal{K}_{\tilde{X}} - (n-2)E$  has a global section  $z(i)_i^{n-1} dz(i)_1 \wedge \dots \wedge dz(i)_n$ , so it is also trivial on  $\tilde{U}$ , so  $\mathcal{K}_{\tilde{X}} = \pi^* \mathcal{K}_X + (n-1)E$  is true.  $\square$

### Blowing up along a regular variety

**Prop. (7.8.2.9) [Blowing-ups along Regular Immersions].** If  $X$  is a regular variety over  $k$  and  $Y$  is a regular closed subvariety, then  $\mathbf{Bl}_Y(X)$  is also regular (7.8.2.1), and  $\mathbf{E}_Y(X) \subset \mathbf{Bl}_Y(X)$  is locally principal. In fact,  $\mathbf{E}_Y(X) \rightarrow Y$  is isomorphic to  $\mathbf{Proj}(\mathcal{I}(Y)/\mathcal{I}(Y)^2)$ , and the normal sheaf  $\mathcal{N}_{\mathbf{E}_Y(X)} \mathbf{Bl}_Y(X) \cong \mathcal{O}_{\mathbf{Proj}(\mathcal{I}_Y/\mathcal{I}_Y^2)}(-1)$ .  
 $\perp$

*Proof:* (Imagine the blowing up of  $\mathbb{A}^2$  along  $\{0\}$ ).  $X' \cong \mathbf{Proj} \oplus \mathcal{I}^d$  and  $Y' \cong \mathbf{Proj} \oplus \mathcal{I}^d / \mathcal{I}^{d+1}$ . Then since  $Y$  is regular, (5.3.4.17) tells us  $\mathcal{I}$  is locally generated by a regular sequence and (5.3.4.16) tells  $Y' = \mathbb{P}(\mathcal{I}/\mathcal{I}^2)$ .  $Y'$  is regular by (5.3.5.19), and then (5.3.5.25) shows that  $X'$  is regular also. For the normal sheaf, the defining sheaf  $\mathcal{I}' = \mathcal{O}_{X'}$ , and then  $\mathcal{I}'/\mathcal{I}'^2 = \mathcal{O}_Y(1)$ , thus  $\mathcal{N}_{Y'/X'} \cong \mathcal{O}_{\mathbb{P}(\mathcal{I}/\mathcal{I}^2)}(-1)$ .  $\square$

**Prop. (7.8.2.10) [Picard Group of Blowing-Ups].** In a blowing up along a regular variety of codimension  $r \geq 2$ , There is an isomorphism  $\mathrm{Pic} X' \cong \mathrm{Pic} X \oplus \mathbb{Z}$  induced by the Weil divisor exact sequence of  $Y' \subset X'$ . This is because  $r \geq 2$  and (7.8.2.2).  
 $\perp$

We also have  $\omega_{X'} = f^* \omega_X \otimes \mathcal{L}((r-1)Y')$  because  $\mathcal{L}(Y') = \mathcal{O}(-1)$  and  $\omega_{Y'} \cong \omega_X \otimes \mathcal{L}(D) \otimes \mathcal{O}_Y$  by (7.12.1.17), so it suffice to prove  $\omega_{Y'} \cong f^* \omega_X \otimes \mathcal{O}_{Y'}(-r)$ . For this, notice for a closed pt of  $Y$ , the fiber is a  $\mathbb{P}^{r-1}$  because  $\mathcal{I}/\mathcal{I}^2$  is locally free of rank  $r$  by (7.12.1.16) and the functoriality of  $\mathcal{O}(1)$ .  $\perp$

## 3 Compatifications

**Def. (7.8.3.1) [Compatifications].** Let  $S \in \mathrm{Sch}$ ,  $X \in \mathrm{Sch}/S$ , then the category of **compactifications of schemes** of  $X/S$  is the category of pairs  $(i, \bar{X})$ , where  $i : X \rightarrow \bar{X}$  is a dominant open immersion and  $\bar{X} \rightarrow S$  is proper. If a compactification of  $X/S$  exists, then  $X/S$  is called a **compactifiable morphism**.  
 $\perp$

**Thm. (7.8.3.2) [Nagata-Compactification].** If  $S \in \mathrm{Sch}_{\mathrm{qcqs}}$ ,  $X \in \mathrm{Sch}^{\mathrm{sep}, \mathrm{ft}}/S$ , then  $X/S$  is compactifiable.  
 $\perp$

*Proof:* Cf. [Sta]0F41.  $\square$

## 4 Limits of Schemes

**Prop. (7.8.4.1) [Noetherian Reduction].** For any  $S \in \mathrm{Sch}_{\mathrm{qcqs}}$ , there exists a direct system  $(S_i, f_{ii'})$  indexed over a set  $I$  that

- $f_{ii'}$  are affine.
- $S_i$  are of f.t. over  $\mathbb{Z}$ .
- $S = \varprojlim_i S_i$ .

┘

*Proof:* Cf. [Sta]01ZA. □

**Prop. (7.8.4.2) [Characterizing Morphisms of F.P.].** Let  $f : X \rightarrow S$  be a morphism of schemes, then the following are equivalent:

- $f$  is locally of finite presentation.
- For any directed inverse system  $(T_i, f_{ii'})$  in  $\mathcal{A}ff_S$ , we have

$$\mathrm{Mor}_S(\varprojlim_i T_i, X) = \varinjlim_i \mathrm{Mor}_S(T_i, X)$$

- For any directed inverse system  $(T_i, f_{ii'})$  in  $\mathrm{Sch}_S$  with  $T_i$  qcqs and  $f_{ii'}$  affine, we have

$$\mathrm{Mor}_S(\varprojlim_i T_i, X) = \varinjlim_i \mathrm{Mor}_S(T_i, X)$$

┘

*Proof:* Cf. [Sta]01ZC. □

**Prop. (7.8.4.3) [Reduction to Finite Presented Morphisms].** Let  $f : X \rightarrow S$  be a morphism of schemes, if  $X$  is qcqs and  $S$  is qs, then  $X = \varprojlim_i X_i$  is a limit of a directed system of schemes  $X_i$  of f.p. over  $S$  with affine morphisms over  $S$ . ┘

*Proof:* Cf. [Sta]09MV. □

**Prop. (7.8.4.4) [Integral and Finite].** Let  $f : X \rightarrow S$  be an integral morphism of schemes with  $S$  qcqs, then  $X = \varprojlim_i X_i$  is a limit of a directed system of schemes  $X_i$  finite of f.p. over  $S$  with affine morphisms over  $S$ . ┘

*Proof:* Consider  $\mathcal{A} = f_* \mathcal{O}_X \in \mathcal{Q}\mathrm{Coh}(\mathcal{O}_S)$ , then  $\mathcal{A} = \varinjlim_i \mathcal{A}_i$  is a filtered colimit of finite and f.p.  $\mathcal{O}_S$ -modules by (7.5.1.13). Then  $X_i = \mathbf{Spec}_S(\mathcal{A}_i)$  satisfies the requirement by (7.2.7.12). □

### Descending Properties

**Prop. (7.8.4.5) [Descending l.p. Schemes].** ┘

### Descending Properties of Morphisms

**Prop. (7.8.4.6) [Descending Properness].** Cf. [Sta]0CNV. ┘

**Prop. (7.8.4.7) [Descending Morphisms between l.p. schemes].** ┘

### Sheaves

## 5 Discriminant and Different

### Trace Elements

**Def. (7.8.5.1) [Traces].** For  $f : X \rightarrow Y \in \mathrm{Sch}$  finite locally free, the **trace of  $f$**  is defined to be

$$\mathrm{tr}_f : f_* \mathcal{O}_X \rightarrow \mathcal{O}_Y.$$

Then  $\mathrm{tr}_f \circ f^\# = [\deg(f)] : \mathcal{O}_Y \rightarrow \mathcal{O}_Y$ . Let the **trace pairing** be

$$Q_f : f_*\mathcal{O}_X \otimes f_*\mathcal{O}_X \rightarrow \mathcal{O}_Y : (s, t) \mapsto \mathrm{tr}_f(st),$$

which is equivalent to a map  $Q_f : f_*\mathcal{O}_X \rightarrow f_*\mathcal{O}_X^\vee$ , so the determinant of which is

$$\det(Q_f) : \wedge(f_*\mathcal{O}_X) \rightarrow \wedge(f_*\mathcal{O}_X)^{-1},$$

a section of the line bundle  $\wedge(f_*\mathcal{O}_X)^{-2}$ . Then the **discriminant of  $f$**  is defined to be the closed subscheme  $D_f$  of  $Y$  cut out by this section  $\det(Q_f)$ .  $\lrcorner$

**Def. (7.8.5.2) [Trace Element of Rings].** Let  $A \rightarrow B$  be a flat quasi-finite map of Noetherian rings,  $[\omega_{B/A}]$  the dualizing module (5.9.8.4), then there exists a unique element  $\tau_{A/B} \in \omega_{B/A}$  s.t. for any Noetherian  $A$ -algebra  $A_1$  s.t.  $B \otimes_A A_1 = C \times D$  with  $C$  finite over  $A_1$ , the image of  $\tau_{B/A}$  in  $[\omega_{C/A_1}]$  is  $\mathrm{tr}_{C/A_1}$ , called the **trace element**.  $\lrcorner$

**Def. (7.8.5.3) [Trace Element of Morphisms].** For  $f : X \rightarrow Y \in \mathrm{NSch}$  be flat quasi-finite, denote  $\tau_{X/Y} \in \Gamma(X, [\omega_{X/Y}])$  the **trace element of  $f$**  affine locally given by the trace element  $\tau_{B/A}$  (7.8.5.2).  $\lrcorner$

**Prop. (7.8.5.4) [Discriminant and Étale Loci].** If  $f : X \rightarrow Y \in \mathrm{Sch}$  is finite locally free, then  $f$  is étale iff  $D_f = \emptyset$ .  $\lrcorner$

*Proof:*  $f$  is flat, so it suffices to check fiberwise. Then this follows from (5.4.7.25).  $\square$

### Differents

**Def. (7.8.5.5) [Kähler Different].** Let  $f : X \rightarrow Y$  be a morphism of schemes locally of f.t., the **Kähler different** of  $f$  is the 0-th fitting ideal  $\mathrm{Fit}_0(\Omega_{X/Y}) \in \mathcal{Q}\mathrm{Coh}(X)$  (7.5.1.21).  $\lrcorner$

**Prop. (7.8.5.6).** Let  $f : X \rightarrow Y$  be a morphism of schemes locally of f.t., then the closed subscheme cut out by the Kähler different is stable under base change.  $\lrcorner$

*Proof:* Cf. [Sta]0BVX.  $\square$

**Prop. (7.8.5.7).** If  $X = \mathrm{Spec} A[X_1, \dots, X_n]/(f_1, \dots, f_m)$ , then the Kähler different of  $X \rightarrow \mathrm{Spec} A$  is just the ideal generated by the Jacobians  $\det\left(\frac{\partial f_{i(j)}}{\partial X_j}\right)_{0 \leq j \leq n}$ .  $\lrcorner$

*Proof:* Because  $\Omega_{X/A}$  has a presentation

$$0 \rightarrow \bigoplus_{0 \leq i \leq m} f_i \xrightarrow{d} \bigoplus_{0 \leq j \leq n} dX_j \rightarrow \Omega_{X/A} \rightarrow 0.$$

$\square$

**Prop. (7.8.5.8) [Kähler Different and Unramified Locus].** Let  $f : X \rightarrow Y$  be a morphism of schemes locally of f.t., then the closed subscheme cut out by the Kähler different contains exactly the points that  $f$  is not unramified.  $\lrcorner$

*Proof:* Cf. [Sta]0C3J.  $\square$

**Def. (7.8.5.9) [Differents].** For  $f : X \rightarrow Y \in \mathrm{NSch}$  flat and quasi-finite, define the **different(schemes)** to be the annihilator of  $[\omega_{X/Y}]/\tau_{X/Y}$ , which is a coherent ideal  $\mathfrak{D}_f \subset \mathcal{O}_X$ .  $\lrcorner$

**Prop. (7.8.5.10) [Differents and Étale(Unramified) Locus].** Let  $f : X \rightarrow Y$  be a flat quasi-finite morphism between locally Noetherian schemes, then the closed subscheme of  $X$  cut out by the different  $\mathfrak{D}_f$  contains exactly the set of points that  $f$  is not étale(unramified).  $\lrcorner$

*Proof:* Cf. [Sta]0BW9.  $\square$

**Prop. (7.8.5.11).** If  $f : X \rightarrow Y$  is a quasi-finite syntomic morphism between locally Noetherian schemes, then the different  $\mathfrak{D}_f$  equals the Kähler different of  $f$  (7.8.5.5).  $\lrcorner$

*Proof:* Cf. [Sta]0BWG.  $\square$

**Prop. (7.8.5.12) [Differents for Smooth Schemes].** Let  $S$  be a locally Noetherian scheme and  $X, Y$  be smooth scheme of relative dimension  $n$  over  $S$ , and  $f : X \rightarrow Y$  is a quasi-finite morphism, then  $f$  is syntomic, and the closed subscheme  $R$  cut out by the different  $\mathfrak{D}_f$  of  $f$  is the locally principal vanishing locus of

$$\wedge^n(df^*) \in \text{Hom}(f^*\Omega_{Y/S}^n, \Omega_{X/S}^n) = \Gamma(Y, (f^*\Omega_{Y/S}^n)^{-1} \otimes \Omega_{X/S}^n).$$

And if  $f$  is étale at the associated points of  $X$ , then  $R$  is an effective Cartier divisor, and

$$f^*\Omega_{Y/S}^n \otimes \mathcal{O}(R) \cong \Omega_{X/S}^n.$$

$\lrcorner$

*Proof:* Cf. [Sta]0BWJ.  $\square$

## 6 Deformation Theory

References are [Sta]Chap36.

**Def. (7.8.6.1) [Thickenings].** For  $X, X' \in \text{Sch}$ ,  $X'$  is called a **thickening** of  $X$  iff  $X$  is a closed subscheme of  $X'$  that their underlying topological space are the same. Morphisms of thickenings are defined routinely.

A thickening is said to be **thickening of order  $n$**  iff the ideal sheaf  $\mathcal{I}$  satisfies  $\mathcal{I}^{n+1} = 0$ .

Base change and composition of a (order  $n$ )thickening is also a (order  $n$ )thickening, because closed immersion and surjective do.  $\lrcorner$

**Prop. (7.8.6.2).** Any thickening of an affine scheme is also affine.  $\lrcorner$

*Proof:* This is a special case of (7.4.4.36).  $\square$

**Prop. (7.8.6.3) [Picard Group of Thickenings].** Let  $X \subset X'$  be a first order thickening with ideal sheaf  $\mathcal{I}$ , then there is a canonical long exact sequence of Abelian groups:

$$0 \rightarrow H^0(X, \mathcal{I}) \rightarrow H^0(X', \mathcal{O}_{X'}^*) \rightarrow H^0(X, \mathcal{O}_X^*) \rightarrow H^1(X, \mathcal{I}) \rightarrow \text{Pic}(X') \rightarrow \text{Pic}(X) \rightarrow H^2(X, \mathcal{I}) \rightarrow \dots$$

$\lrcorner$

*Proof:* This follows from taking cohomology of the exact sequence  $0 \rightarrow \mathcal{I} \rightarrow \mathcal{O}_{X'} \rightarrow i_*\mathcal{O}_X \rightarrow 0$ , where  $\mathcal{I} \rightarrow \mathcal{O}_{X'}$  is given by  $a \mapsto 1 + a$ .  $\square$

**Prop. (7.8.6.4).** Let  $X \subset X'$  be a thickening with ideal sheaf  $\mathcal{I}$  and  $n$  is invertible in  $\mathcal{O}_X$ , then  $\text{Pic}(X)[n] \rightarrow \text{Pic}(X')[n]$  is an isomorphism.  $\lrcorner$

*Proof:* By taking cohomology of the exact sequence  $0 \rightarrow (1 + \mathcal{I})^* \rightarrow \mathcal{O}_{X'} \rightarrow i_*\mathcal{O}_X \rightarrow 0$ , it suffices to show that  $n : (1 + \mathcal{I})^* \rightarrow (1 + \mathcal{I})^*$  is an isomorphism, which is true by (5.1.1.19).  $\square$

**Def. (7.8.6.5) [Infinitesimal Neighbourhood].** Let  $Z \subset U \subset X$  be a closed immersion of the open subscheme  $U$  that  $Z$  corresponds to the ideal  $\mathcal{I}$  on  $U$ , then a  **$n$ -th infinitesimal neighbourhood** of  $Z$  in  $X$  is the closed subscheme of  $U$  corresponding to  $\mathcal{I}^n$ .

The infinitesimal neighbourhood of  $Z$  in  $X$  has the universal property s.t. for any infinitesimal thickening  $T \subset T'$  of order  $n$  over  $X$  and a map  $T \rightarrow Z \in \text{Sch}_X$  extension to a morphism of infinitesimal thickenings  $(T \subset T') \rightarrow (Z \rightarrow Z')$  over  $X$ .  $\lrcorner$

**Def. (7.8.6.6) [Infinitesimal Extension].** For  $k \in \text{Field}$ ,  $X \in \text{Sch}^{\text{ft}}/k$  and  $\mathcal{F} \in \text{Coh}(X)$ , a **infinitesimal extension** of  $X$  by the sheaf  $\mathcal{F}$  is a scheme  $X'$  over  $k$  that has a sheaf of ideals  $\mathcal{I}$  that  $\mathcal{I}^2 = 0$  and  $(X', \mathcal{O}_{X'}/\mathcal{I}) \cong (X, \mathcal{O}_X)$ , and moreover,  $\mathcal{I}$  with the  $\mathcal{O}_X$ -structure is isomorphic to  $\mathcal{F}$ .

There is a trivial extension, that is  $(X', \mathcal{O}_{X'}) \cong (X, \mathcal{O}_X \oplus \mathcal{F})$ , where the multiplication is  $(a, f)(a', f') = (aa', af' + a'f)$ .  $\lrcorner$

**Def. (7.8.6.7) [Deformation].** Let  $X$  be a scheme algebraic over a field  $k$ , an **infinitesimal deformation** of  $X$  is a scheme  $X'$  flat over  $D = k[t]/(t^2)$  that  $X' \otimes_D k = X$ . A infinitesimal deformation is a first order thickening, by (7.8.6.1).

If  $Y$  is a closed subscheme of  $X$ , then we define the **infinitesimal deformation of  $Y$  in  $X$**  to be a closed subscheme  $Y' \subset X \otimes_k D$  which is flat over  $D$  and  $Y' \otimes_D k = Y$ .

A scheme algebraic over a field  $k$  is called **rigid** if it has no infinitesimal deformations.  $\lrcorner$

**Prop. (7.8.6.8) [Affine Case].** Any thickening of an affine scheme is affine. (Immediate from (7.4.4.36)).  $\lrcorner$

**Prop. (7.8.6.9).** Let  $X$  be a nonsingular variety over an alg.closed field  $k$ , infinitesimal deformation of  $X$  is the same as an infinitesimal extension of  $X$  by the sheaf  $\mathcal{O}_X$ . Thus we get the set of infinitesimal deformations of  $X$  is parametrized by  $H^1(X, \mathcal{T}_X)$ , by (7.8.6.11) below.  $\lrcorner$

*Proof:* For an infinitesimal deformation, tensoring  $\mathcal{O}_{X'}$  with the exact sequence  $0 \rightarrow k \xrightarrow{t} D \rightarrow k \rightarrow 0$ , we get (by flatness)

$$0 \rightarrow \mathcal{O}_X \xrightarrow{t} \mathcal{O}_{X'} \rightarrow \mathcal{O}_X \rightarrow 0,$$

, and conversely, an extension is locally free (because it is f.g. so flat over  $D$  is equivalent to free).  $\square$

**Prop. (7.8.6.10).** If  $X$  is an affine regular scheme algebraic over an alg.closed field  $k$ , then any extension by coherent sheaf is trivial.  $\lrcorner$

*Proof:* For any infinitesimal extension, the morphism  $X \rightarrow X'$  is a closed immersion and surjection, so  $X'$  is also affine by (7.8.6.8),  $= \text{Spec } A'$ . Now the rest follows from ??  $\square$

**Cor. (7.8.6.11) [Infinitesimal Extension and Cohomology].** Let  $X$  be a nonsingular variety over an alg.closed field  $k$ , then the set of infinitesimal extensions by a coherent sheaf  $\mathcal{F}$  is parametrized by  $H^1(X, \mathcal{F} \otimes \mathcal{T}_X)$ .

If  $Y$  is a closed subscheme of  $X$ , then the set of infinitesimal deformation of  $Y$  in  $X$  is parametrized by  $H^0(Y, \mathcal{N}_{Y/X})$ .  $\lrcorner$

*Proof:* By the proposition, we know that an infinitesimal extension is locally isomorphic to  $(U, \mathcal{O}_X(U) \otimes \mathcal{F}(U))$ , by a section  $\mathcal{F}(U) \rightarrow \mathcal{O}_{X'}(U)$ .

But there is a twist, because there can be different sections. But the different sections are different at a  $\text{Hom}_{\mathcal{O}_X(U)}(\Omega_{\mathcal{O}_X(U)/k}, \mathcal{F}(U)) = (\mathcal{T} \otimes \mathcal{F})(U)$ . These forms a Čech cocycle for  $\mathcal{F} \otimes \mathcal{T}_X$ , and the converse is also true. Finally, use the fact that  $X$  is separated so Čech and sheaf cohomology coincide.

For the subscheme, ?

□

### Formal Properties

**Def. (7.8.6.12) [Formal Properties of Morphisms].** For  $f; X \rightarrow S \in \text{Sch}$ ,  $f$  is called a **formally unramified/smooth/étale** if for any first order thickening of affine schemes  $T \rightarrow T'$  and a morphism  $(T \rightarrow T') \rightarrow (X \rightarrow S)$ , there exists at most one/exists one/exists exactly one lifting  $T' \rightarrow X$ .

Formally unramified/smooth/étale morphisms are stable under base change and compositions.  $\lrcorner$

**Prop. (7.8.6.13).** For  $f : X \rightarrow S \in \mathcal{A}\text{ff}$ ,  $f$  is formally unramified/smooth/étale iff  $\Gamma(S) \rightarrow \Gamma(X)$  is formally unramified/smooth/étale (5.4.6.1)(5.4.5.1)(5.4.7.1).  $\lrcorner$

**Cor. (7.8.6.14).**

- $f : X \rightarrow S \in \text{Sch}$  is formally unramified iff  $\Omega_{X/S} = 0$ , by (5.4.6.1).  $\lrcorner$

**Prop. (7.8.6.15).**

- A morphism is (G-)unramified iff it is formally unramified and locally of f.t.(f.p.).
- A morphism is étale iff it is formally étale and locally of f.p.
- A morphism is smooth iff it is formally smooth and locally of f.p.  $\lrcorner$

*Proof:* 1: This follows from (7.6.5.1).

2:

3:  $\square$

## 7.9 Derived Categories of Coherent Sheaves and Birational Geometry

References are [Har77, B-O02], [Sta]Chap56 and references therein, [Huybrechts, Fourier-Mukai transforms in algebraic geometry].

**Notation (7.9.0.1).**

- Let  $S \in \text{Sch}$ .

┘

### 1 $\mathcal{D}_{\text{Qcoh}}(X)$

**Def. (7.9.1.1) [Notations].** Denote  $\mathcal{D}_{\text{Qcoh}}^*(X) = \mathcal{D}_{\text{Qcoh}(X)}^*(\text{Mod}(\mathcal{O}_X))$  (4.10.1.8). There is a natural functor  $\mathcal{D}^*(\text{Qcoh}(X)) \rightarrow \mathcal{D}_{\text{Qcoh}}^*(X)$ .

Denote  $\mathcal{D}_{\text{coh}}^*(X) = \mathcal{D}_{\text{coh}(X)}^*(\text{Mod}(\mathcal{O}_X))$  (4.10.1.8). There is a natural functor  $D^*(\text{Coh}(X)) \rightarrow D_{\text{coh}}^*(X)$ .

By (7.3.1.5), these notions are affine local.

┘

**Prop. (7.9.1.2) [Qco Direct Sum].** Direct sum exists in  $D_{\text{Qcoh}}(X)$ , and equals that in  $D(X)$ .

┘

*Proof:* By (4.10.1.15), direct sum exists in  $D(X)$  and are given by term-wise direct sums. Notice the direct sum of elements in  $D_{\text{Qcoh}}(X)$  is also in  $D_{\text{Qcoh}}(X)$  as direct sums are exact functor and  $\text{Qcoh}(X)$  is stable under direct sums.  $\square$

**Prop. (7.9.1.3) [Affine Case].** Let  $X = \text{Spec } A$ , there is a natural equivalence  $\sim: D(A) \rightarrow D(\text{Qcoh}(X))$ . Then the functors  $R\Gamma(X, -) : D_{\text{Qcoh}}(X) \rightarrow D(A)$  is quasi-inverse to the inclusion functor  $D^*(\text{Qcoh}(X)) \rightarrow D_{\text{Qcoh}}^*(X)$  (7.9.1.1), and they are both isomorphism of triangulated categories.

┘

*Proof:* Cf. [Sta]06Z0.

$\square$

**Prop. (7.9.1.4) [Qco Derived Pullbacks].** Let  $f : X \rightarrow S \in \text{Sch}$  be qcqs, then  $Lf^*$  maps  $D_{\text{Qcoh}}(X)$  into  $D_{\text{Qcoh}}(S)$ , and affine locally it is just the derived tensor functor  $- \otimes_A^L B : D(A) \rightarrow D(B)$  via identifications in (7.9.1.3), by (7.3.3.14)(7.3.3.15).

┘

**Prop. (7.9.1.5) [Qco Derived Tensor Products].** For  $X \in \text{Sch}$ ,  $D_{\text{Qcoh}}(X)$  is stable under derived tensor products, and affine locally it is just the derived tensor product of rings via identifications in (7.9.1.3), by (7.3.3.6)(7.3.3.15).

┘

**Prop. (7.9.1.6) [Qco Derived Pushforward].** Let  $f : X \rightarrow S$  be a qcqs morphism of schemes, then  $Rf_*$  maps  $D_{\text{Qcoh}}(X)$  into  $D_{\text{Qcoh}}(S)$ . And if  $f$  is affine, affine locally it is just the restriction  $D(B) \rightarrow D(A)$  via identifications in (7.9.1.3), by (7.3.1.9).

Moreover, if  $S$  is qc, then there exists a  $N \in \mathbb{Z}$  s.t.  $Rf_*(D_{\text{Qcoh}}^{\leq m}(X)) \subset D_{\text{Qcoh}}^{\leq m+N}(S)$ , and this  $N$  is invariant under base change.

┘

*Proof:* Cf. [Sta]08D5. ?

$\square$

**Prop. (7.9.1.7).** For  $f : X \rightarrow Y$  qcqs,  $Rf_* : D_{\text{Qcoh}}(X) \rightarrow D_{\text{Qcoh}}(Y)$  preserves direct sums.

┘

*Proof:* Cf. [Sta]08DZ.

$\square$

**Prop. (7.9.1.8) [Projection Formula].** Let  $f : X \rightarrow Y$  be a qcqs morphism of schemes and  $E \in D_{\mathcal{Q}\text{Coh}}(X)$ ,  $K \in D_{\mathcal{Q}\text{Coh}}(Y)$ , then the projection map (7.3.3.19)

$$Rf_*(E) \otimes_{\mathcal{O}_Y}^L K \rightarrow Rf_*(E \otimes_{\mathcal{O}_Y}^L Lf^*K)$$

is an isomorphism. ┘

*Proof:* Cf. [Sta]08EU. □

### Pseudo-Coherent and Perfect Complexes

**Prop. (7.9.1.9) [Affine Case].** If  $X = \text{Spec } A$ ,  $M \in D(A)$  and  $E$  is the corresponding element in  $D(X)$ , then

- $E$  is an  $(m-)$ pseudo-coherent object in  $D(X)$  iff  $M$  is an  $(m-)$ pseudo-coherent object in  $D(A)$  (5.9.5.9).
- $E$  has Tor-amplitude in  $[a, b]$  iff  $M$  has Tor amplitude in  $[a, b]$ .
- $E$  is a perfect object in  $D(X)$  iff  $M$  is a perfect object in  $D(A)$  (5.9.5.3). ┘

*Proof:* Cf. [Sta]08E7, 08EB, 08E9,. □

**Prop. (7.9.1.10) [Noetherian Case].** Let  $X \in \text{NSch}_{\text{qc}}$  and  $\mathcal{E} \in \mathcal{D}_{\mathcal{Q}\text{Coh}}(X)$ , then the following are equivalent:

- $\mathcal{E}$  is  $m$ -pseudo-coherent.
- $\mathcal{E} \in \mathcal{D}_{\mathcal{Q}\text{Coh}}^-(X)$  and  $H^i(\mathcal{E}) \in \mathcal{Coh}(X)$  for  $i \geq m$ .

In particular,  $E$  is pseudo-coherent iff  $E \in \mathcal{D}_{\mathcal{Coh}}^-(X)$ . ┘

*Proof:* Cf. [Sta]08E8. □

**Prop. (7.9.1.11) [Ext].** Let  $X \in \text{Sch}$ .

1. If  $X = \text{Spec } A$  and  $K, L \in D(A)$ , then  $\mathcal{E}xt^n(\widetilde{K}, \widetilde{L})$  is the sheaf extending the sheaf on the basis  $D(f) \mapsto \text{Ext}_{A_f}^n(K_f, L_f)$ .
2. If  $X = \text{Spec } A$  and  $K, L \in D(A)$ , then  $R\mathcal{H}om(\widetilde{K}, \widetilde{L}) = (R\text{Hom}_A(K, L))^\sim$  iff  $K$  is pseudo-coherent and  $L \in D^+(A)$ , or  $K$  is perfect.
3. If  $\mathcal{L} \in D_{\mathcal{Q}\text{Coh}}(X)$  and  $\mathcal{K} \in D(X)$  perfect, then  $R\mathcal{H}om(\mathcal{K}, \mathcal{L}) \in D_{\mathcal{Q}\text{Coh}}(X)$ .
4. If  $\mathcal{L} \in D_{\mathcal{Q}\text{Coh}}^+(X)$  and  $\mathcal{K} \in D(X)$  pseudo-coherent,  $R\mathcal{H}om(\mathcal{K}, \mathcal{L}) \in D_{\mathcal{Q}\text{Coh}}(X)$  and are locally bounded below. ┘

*Proof:* 1: This follows from (7.3.3.27) as

$$H^n(R\mathcal{H}om(X_f, \widetilde{K}, \widetilde{L})) = \text{Hom}_{D(\mathcal{O}_{X_f})}(\widetilde{K}_f, \widetilde{L}_f[n]) = \text{Hom}_{D(A_f)}(K_f, L_f[n]) = \text{Ext}^n(K_f, L_f).$$

2: This follows from (7.3.4.22).

3, 4 follows from item2, (7.3.4.22) and locality of cohomology. □

**Prop. (7.9.1.12) [Criterion for Relative Perfectness over Affine Base].** Let  $A \in \mathcal{CAlg}$  and  $X$  be a separated, flat of f.p. scheme over  $A$ ,  $K \in D_{\mathcal{Q}\text{Coh}}(X)$ . If  $R\Gamma(X, E \otimes^L K)$  is perfect in  $D(A)$  for any perfect object  $E \in D(X)$ , then  $K$  is perfect over  $A$ . ┘

*Proof:* Cf. [Sta]0GET. □

$D_{\text{coh}}(X)$ 

**Prop. (7.9.1.13) [ $R\mathcal{H}om$  Preserves  $D_{\text{coh}}(X)$ ].** If  $X \in \text{NSch}$ ,  $L \in D_{\text{coh}}^+(X)$  and  $K \in D_{\text{coh}}^-(X)$ , then  $R\mathcal{H}om(K, L) \in D_{\text{coh}}^+(X)$ .  $\lrcorner$

*Proof:* Cf. [Sta]0D0C.  $\square$

**Prop. (7.9.1.14).** If  $X \in \text{NSch}_{\text{qc}}$ , then there are natural equivalences

$$D^-(\text{Coh}(X)) \cong D_{\text{coh}(X)}^-(\mathcal{Q}\text{Coh}(X)) \cong D_{\text{coh}}^-(X), \quad D^b(\text{Coh}(X)) \cong D_{\text{coh}}^b(X).$$

 $\lrcorner$ 

*Proof:* Cf. [Sta]0FDA, 0FDB.  $\square$

**Lemma (7.9.1.15).** Let  $k \in \text{Field}$  and  $X \in \text{Sch}^{\text{proper}}/k$ , then  $\sum_{i \in \mathbb{Z}} \dim_k \text{Ext}^i(E, K) < \infty$  for any  $E \in D_{\text{perf}}(X)$  and  $K \in D_{\text{coh}}^b(X)$ .  $\lrcorner$

*Proof:* Cf. [Sta]0FYC.  $\square$

**Prop. (7.9.1.16) [Characterizing Coherent Sheaves].** Let  $k \in \text{Field}$  and  $X \in \text{Sch}^{\text{Proj}}/k$ , then for  $K \in D_{\mathcal{Q}\text{coh}}(X)$ , the following are equivalent:

- $K \in D_{\text{coh}}^b(X)$ .
- $\sum_{i \in \mathbb{Z}} \dim_k \text{Ext}^i(E, K) < \infty$  for any  $E \in D_{\text{perf}}(X)$ .

 $\lrcorner$ 

*Proof:*  $1 \rightarrow 2$  follows from (7.9.1.15). For  $2 \rightarrow 1$ , Cf. [Sta]0FYD.  $\square$

**Prop. (7.9.1.17) [Coherent Derived Proper Pushforwards].** Let  $S \in \text{NSch}_{\text{qc}}$  and  $f : X \rightarrow S$  be a proper morphism, then  $Rf_*$  maps  $D_{\text{coh}}^b(X)$  to  $D_{\text{coh}}^b(S)$ .  $\lrcorner$

*Proof:* Cf. [Sta]08E2.  $\square$

**Prop. (7.9.1.18) [Perfect Complexes for Regular Schemes].** If  $X \in \text{NSch}_{\text{qc}}$  is regular of finite dimension, then  $D_{\text{coh}}^b(X) = D_{\text{perf}}(X)$ , by (5.9.5.5) and (7.9.1.9).  $\lrcorner$

 $K_0$  Groups

**Def. (7.9.1.19) [ $K$ -Groups of Schemes].** The **Grothendieck  $K$ -group (Scheme)** of  $X$  is defined to be  $K_0(X) = K_0(D_{\text{perf}}(X))$ . If  $X \in \text{NSch}$ , we also define the **Grothendieck group of coherent sheaves** on  $X$  to be  $K'_0(X) = K_0(\text{Coh}(X))$ .  $\lrcorner$

**Prop. (7.9.1.20).** If  $X \in \text{NSch}_{\text{qc}}$  then

$$K'_0(X) = K_0(\text{Coh}(X)) = K_0(D^b(\text{Coh}(X))) = K_0(D_{\text{coh}}^b(X)).$$

In particular, there is a map  $K_0(X) \rightarrow K'_0(X)$ .  $\lrcorner$

*Proof:* This follows from (4.10.1.13) and (7.9.1.14).  $\square$

**Prop. (7.9.1.21) [ $K_0 \cong K'_0$ ].** If  $X$  is a Noetherian regular of finite dimension, then the map  $K_0(X) \rightarrow K'_0(X)$  (7.9.1.20) is an isomorphism, by (7.9.1.18).  $\lrcorner$

**Prop. (7.9.1.22).** For  $X \in \text{Sch}$ ,  $-\otimes^{\mathbf{L}}-$  defines a ring structure on  $K_0(X)$ , by (11.1.2.2) and (4.10.3.12).  
 $\perp$

**Prop. (7.9.1.23).** If  $X = \text{Spec } R$ , then  $K_0(X) = K_0(R)$ . And if  $R$  is Noetherian, then  $K'_0(X) = K'_0(R)$ .  
 $\perp$

*Proof:* Cf. [Sta]0FDH. □

**Prop. (7.9.1.24) [Push and Pull].** Let  $f : X \rightarrow Y \in \text{NSch}$  be a proper morphism, then there is a map

$$f_* : K'_0(X) \rightarrow K'_0(Y) : [\mathcal{F}] \mapsto \oplus_{i \geq 0} [R^{2i} f_* \mathcal{F}] - \oplus_{i \geq 0} [R^{2i+1} f_* \mathcal{F}],$$

which is definable by (7.9.1.17). And there is an obvious map  $f^* : K'_0(Y) \rightarrow K'_0(X)$ . They satisfy

$$f_*(\alpha \cdot f^* \beta) = f_* \alpha \cdot \beta, \alpha \in K'_0(X), \beta \in K'_0(Y).$$

$\perp$

*Proof:* The first assertion follows from long exact sequence for  $Rf_*$ . The last assertion follows from projection formula (7.9.1.8). □

**Prop. (7.9.1.25) [Lambda Operators].** Let  $X \in \text{Sch}$ , there are functors  $\lambda^r : K_0(\text{Coh}^{\text{free}}(X)) \rightarrow K_0(\text{Coh}^{\text{free}}(X))$  that sends  $[\mathcal{E}]$  to  $[\wedge^r \mathcal{E}]$ , called the **Lambda operators**.  $\perp$

*Proof:* Consider a map  $c : \text{Coh}^{\text{free}}(X) \rightarrow K_0(\text{QCoh}^{\text{free}}(X))[t] : \mathcal{E} \mapsto \sum_{i=0}^{\infty} [\wedge^i \mathcal{E}] t^i$ . It suffices to prove that for any exact sequence  $0 \rightarrow \mathcal{E}' \rightarrow \mathcal{E} \rightarrow \mathcal{E}'' \rightarrow 0$ ,  $c(\mathcal{E}) = c(\mathcal{E}')c(\mathcal{E}'')$ , and then take  $\lambda^r$  as

$$c(M) = \sum_{r \geq 0} \lambda^r(M) t^r.$$

To show this, notice that there is a filtration of  $\wedge^r \mathcal{E}$  with quotients

$$\wedge^r \mathcal{E}', \wedge^{r-1}(\mathcal{E}') \otimes \mathcal{E}'', \dots, \wedge^r(\mathcal{E}''),$$

by (7.5.1.26). □

**Prop. (7.9.1.26) [Adam Operators].** Let  $X \in \text{Sch}$ , then there are **Adam operators**

$$\psi^{-1}, \psi^1, \psi^2, : K_0(X) \rightarrow K_0(X)$$

s.t. for  $\mathcal{L} \in \text{Pic}(X)$ ,

$$\psi^{-1}[\mathcal{L}] = [\mathcal{L}^{-1}], \quad \psi^1[\mathcal{L}] = [\mathcal{L}], \quad \psi^2[\mathcal{L}] = [\mathcal{L}^{\otimes 2}].$$

$\perp$

*Proof:* For any  $L \in K_0(X)$ , there is an action of  $\{\pm 1\}$  on  $L \otimes^{\mathbf{L}} L$  by switching factors. Denote  $(L \otimes^{\mathbf{L}} L)^+, (L \otimes^{\mathbf{L}} L)^-$  the fixed and anti-fixed parts ? of  $L \otimes^{\mathbf{L}} L$ , and define  $\psi^2[L] = [(L \otimes^{\mathbf{L}} L)^+] - [(L \otimes^{\mathbf{L}} L)^-]$ . ? □

### Coherator

**Prop. (7.9.1.27)**  $[R\mathcal{Q}_X]$ . ┘

**Prop. (7.9.1.28)**  $[D\mathcal{Q}_X]$ . Let  $X \in \text{Sch}^{\text{qcqs}}$ , then the inclusion functor  $D_{\mathcal{Q}\text{Coh}}(X) \rightarrow D(X)$  has a right adjoint, called the **coherator**, denoted by  $D\mathcal{Q}_X$ . ┘

*Proof:* Use (4.8.4.38). The conditions are satisfied as  $D_{\mathcal{Q}\text{Coh}}(X)$  is compactly generated and has direct sums that is preserved by inclusion by (7.9.1.32)(7.9.1.2). □

**Prop. (7.9.1.29)**. Let  $f : X \rightarrow Y \in \text{Sch}^{\text{qcqs}}$ , then

$$Rf_* \circ D\mathcal{Q}_X = D\mathcal{Q}_Y \circ Rf_* : D(X) \rightarrow D_{\mathcal{Q}\text{Coh}}(Y).$$

┘

*Proof:* They are both right adjoint to  $Lf^* : D_{\mathcal{Q}\text{Coh}}(Y) \rightarrow D(X)$ , as  $Lf^*$  maps  $D_{\mathcal{Q}\text{Coh}}(Y)$  into  $D_{\mathcal{Q}\text{Coh}}(X)$  (7.9.1.4). □

**Prop. (7.9.1.30) [Cohomological Boundedness of  $D\mathcal{Q}_X$ ]**. For  $X \in \text{Sch}^{\text{qcqs}}$ , there exists  $N \in \mathbb{Z}$  s.t. if  $K \in D(X)$  satisfies  $K|_U \in D^{[a,b]}(\mathcal{O}_U)$  for any affine open  $U \subset X$ , then  $D\mathcal{Q}_X(K) \in D_{\mathcal{Q}\text{Coh}}^{[a,b+N]}(X)$ . ┘

*Proof:* Cf. [Sta]0CSA. □

### Compact Generators

**Prop. (7.9.1.31) [Perfect and Compact Objects]**. For  $X \in \text{Sch}^{\text{qcqs}}$ ,  $K \in D(X)$  is perfect iff it is a compact object in  $D_{\mathcal{Q}\text{Coh}}(X)$ . ┘

*Proof:* Cf. [Sta]09M1. □

**Prop. (7.9.1.32) [ $D_{\mathcal{Q}\text{Coh}}(X)$  is Compactly Generated]**. There is a perfect object  $P \subset D_{\mathcal{Q}\text{Coh}}(X)$  that is a generator of  $D_{\mathcal{Q}\text{Coh}}(X)$  (4.8.4.34). ┘

*Proof:* Cf. [Sta]09IS. □

### Resolution Property

**Def. (7.9.1.33) [Resolution Properties]**.  $X \in \text{Sch}$  is said to have **resolution property** iff every  $\mathcal{F} \in \mathcal{Q}\text{Coh}^{\text{ft}}(X)$  is a quotient of a locally free sheaf. ┘

**Prop. (7.9.1.34)**. If  $X$  has an ample invertible sheaf, then  $X$  has the resolution property by (7.5.4.5). In fact, every coherent sheaf is a quotient of a finite direct sum of  $\mathcal{O}_X(-n)$ . ┘

**Prop. (7.9.1.35) [Regular Scheme has Resolution property]**. If  $X$  is qc regular scheme with an affine diagonal, then  $X$  has the resolution property, Cf. [Sta]0F8A<sup>?</sup>. Conversely, if  $X$  is qcqs with the resolution property, then  $X$  has affine diagonal. Cf. [Sta]0F8C. ┘

**Prop. (7.9.1.36) [Kleiman]**. If  $X$  is a qc irreducible and locally factorial scheme with affine diagonal map, then  $X$  has the resolution property. ┘

*Proof:* By (7.8.1.7), we have an basis of the form  $X_s$  for  $s \in \Gamma(X, \mathcal{L})$  for various invertible sheaves, then for any coherent sheaf, it is generated by f.m. sections in  $\Gamma(U_i, \mathcal{F})$  and  $U_i = X_s$  for  $s \in \Gamma(X, \mathcal{L})$ , and for each of them, we can use (7.5.3.5), we can extend these to global sections on  $\Gamma(\mathcal{F} \otimes \mathcal{L}_i^{n_i})$  for  $n_i$  large. Then tensoring  $\mathcal{L}_i^{-n_i}$ , we find a  $\oplus L_i^{-n_i} \rightarrow \mathcal{F}$  surjective. □

**Prop. (7.9.1.37).** When  $X$  has the resolution property,  $\mathcal{E}xt^\bullet(-, \mathcal{G})$  is an universal  $\delta$ -functor for every  $\mathcal{G} \in \mathcal{Q}\mathcal{C}oh(X)$ , because locally free sheaf is adapted to  $\mathcal{E}xt^\bullet(-, \mathcal{G})$  by (7.3.3.25), so we can calculate  $\mathcal{E}xt(\mathcal{F}, \mathcal{G})$  using a finite locally free resolution of  $\mathcal{F}$ .  $\lrcorner$

**Prop. (7.9.1.38).** If  $X$  is a qcqs scheme with the resolution property, then the map  $K_0(\mathcal{V}ect(X)) \rightarrow K_0(X)$  is an isomorphism.  $\lrcorner$

*Proof:* Cf. [Sta]0FDJ.  $\square$

## 2 Duality for Schemes

References are [Hartshorne Residues and Duality, Hartshorne], [Sta]Chap48 and [Grothendieck Duality and Base Change, Conrad]

### Right Adjoints of Pushforwards

**Prop. (7.9.2.1) [Right Adjoints of Pushforward].** Let  $f : X \rightarrow Y$  be a morphism between qcqs schemes, then the functor  $Rf_* : D_{\mathcal{Q}\mathcal{C}oh}(X) \rightarrow D_{\mathcal{Q}\mathcal{C}oh}(Y)$  has a right adjoint, denoted by  $f^\times$ .  $\lrcorner$

*Proof:* Use (4.8.4.38). The conditions are satisfied as  $D_{\mathcal{Q}\mathcal{C}oh}(X)$  is compactly generated and has direct sums by (7.9.1.32)(7.9.1.2), and  $Rf_*$  preserves direct limits (7.9.1.7).  $\square$

**Prop. (7.9.2.2).** Let  $f : X \rightarrow Y \in \mathcal{S}ch_{qcqs}$ , then  $f^\times$  maps  $D_{\mathcal{Q}\mathcal{C}oh}^+(Y)$  into  $D_{\mathcal{Q}\mathcal{C}oh}^+(X)$ .  $\lrcorner$

*Proof:* This follows from the fact  $Rf_*$  has finite cohomological dimension  $N$  (7.9.1.6) and (4.10.1.18).  $\square$

**Prop. (7.9.2.3).** Let  $f : X \rightarrow Y$  be a morphism of qcqs schemes, then for  $K \in D_{\mathcal{Q}\mathcal{C}oh}(X), L \in D_{\mathcal{Q}\mathcal{C}oh}(Y)$ , there is a canonical map

$$Rf_* R\mathcal{H}om_{\mathcal{O}_X}(L, f^\times K) \rightarrow R\mathcal{H}om_{\mathcal{O}_Y}(Rf_* L, Rf_* f^\times K) \rightarrow R\mathcal{H}om_{\mathcal{O}_Y}(Rf_* L, K),$$

by (7.3.3.31) and adjunction.

Then this map becomes isomorphism after applying the coherator  $D\mathcal{Q}_X$  (7.9.1.28).  $\lrcorner$

*Proof:* By Yoneda lemma, it suffices to show that for any  $M \in D_{\mathcal{Q}\mathcal{C}oh}(Y)$ ,

$$\mathrm{Hom}_Y(M, Rf_* R\mathcal{H}om_{\mathcal{O}_X}(L, f^\times K)) \cong \mathrm{Hom}_Y(M, R\mathcal{H}om_{\mathcal{O}_Y}(Rf_* L, K)) :$$

$$\begin{aligned} \mathrm{Hom}_Y(M, Rf_* R\mathcal{H}om_{\mathcal{O}_X}(L, f^\times K)) &= \mathrm{Hom}_X(Lf^* M, R\mathcal{H}om_{\mathcal{O}_X}(L, f^\times K)) \\ &= \mathrm{Hom}_X(Lf^* M \otimes^L L, f^\times K) \\ (\text{ as } Lf^* M \otimes^L L &\in D_{\mathcal{Q}\mathcal{C}oh}(X) \text{ by (7.9.1.4)(7.9.1.5)}) = \mathrm{Hom}_Y(Rf_*(Lf^* M \otimes^L L), K) \\ &= \mathrm{Hom}_Y(M \otimes Rf_* L, K) \\ &= \mathrm{Hom}_Y(M, R\mathcal{H}om_{\mathcal{O}_Y}(Rf_* L, K)) \end{aligned}$$

$\square$

**Cor. (7.9.2.4).** By (7.9.1.6), this adjointness is true without coheration if both  $R\mathcal{H}om_{\mathcal{O}_X}(L, f^\times K)$  and  $R\mathcal{H}om_{\mathcal{O}_Y}(Rf_* L, K)$  are in  $D_{\mathcal{Q}\mathcal{C}oh}(Y)$ . This is the case if  $L, Rf_* L$  are perfect or  $K \in D_{\mathcal{Q}\mathcal{C}oh}^+(Y)$  and  $L, Rf_* L$  are pseudo-coherent, by (7.9.1.11).

In particular, this holds if  $f : X \rightarrow Y$  is a proper morphism of Noetherian schemes and  $L \in D_{\mathcal{C}oh}^-(X)$  and  $S \in D_{\mathcal{Q}\mathcal{C}oh}^+(S)$ , by (7.9.1.17) and (7.9.1.10).  $\lrcorner$

**Cor. (7.9.2.5) [Global Sections].** Let  $f : X \rightarrow Y \in \text{Sch}_{\text{qcqs}}$ , then for  $K \in D_{\text{Qcoh}}(X), L \in D_{\text{Qcoh}}(Y)$ , there is a canonical isomorphism

$$R\text{Hom}_{\mathcal{O}_X}(L, f^\times K) \rightarrow R\text{Hom}_{\mathcal{O}_Y}(Rf_*L, Rf_*f^\times K) \rightarrow R\mathcal{H}om_{\mathcal{O}_Y}(Rf_*L, K)$$

┘

*Proof:* This is because for any  $E \in D(X)$ ,  $H^i(X, E) = \text{Ext}_X^i(\mathcal{O}_X, E) = \text{Hom}(\mathcal{O}_X[-i], E) = \text{Hom}(\mathcal{O}_X[-i], DQ(E))$  only depends on  $DQ(E)$ .  $\square$

**Prop. (7.9.2.6) [Proper Flat  $f^\times$ ].** Let  $f : X \rightarrow Y$  be a proper flat morphism of f.p. between qcqs schemes, then  $f^\times$  is compatible with base change between qcqs schemes.  $\square$

*Proof:* Cf. [Sta]0AAB.  $\square$

### Upper Shriek

**Prop. (7.9.2.7) [Lower Shriek].** Let  $f : X \rightarrow Y \in \text{Sch}_S^{\text{ft,sep}}$ , take a compactification  $\bar{f} : \bar{X} \rightarrow Y$  of  $X/Y$ , then we can define the functor

$$f^! : D_{\text{Qcoh}}^+(Y) \rightarrow D_{\text{Qcoh}}^+(X) : f^!K = \bar{f}^\times(K)|_X \text{ (7.9.2.1)}.$$

and this functor is independent of the compactification chosen.  $\square$

*Proof:* Cf. [Sta]0AA0.  $\square$

**Prop. (7.9.2.8).** If  $f : X \rightarrow Y, g : Y \rightarrow Z \in \text{Sch}_S^{\text{ft,sep}}$ , then there is a canonical isomorphism of functors  $(g \circ f)^! \cong f^! \circ g^!$ .  $\square$

*Proof:* Cf. [Sta]0ATX.  $\square$

**Prop. (7.9.2.9) [Properties of  $f^!$ ].** Let  $S \in \text{Sch}$  be Noetherian, then for  $X, Y \in \text{Sch}^{\text{ft,sep}}/S$ ,

- If  $j : X \rightarrow Y$  is an open immersion, then  $j^! = j^*$ .
- If  $i : X \rightarrow Y$  is a closed immersion, then  $i^! = R\mathcal{H}om(\mathcal{O}_X, -)$ .
- $f^!$  maps  $D_{\text{Qcoh}}^+(Y)$  into  $D_{\text{Qcoh}}^+(X)$ .
- If  $f : X \rightarrow Y$  is a local complete intersection morphism, then  $f^!\mathcal{O}_Y$  is an invertible object of  $D(X)$ , and  $f^!$  preserves perfect complexes.
- If  $f : X \rightarrow Y$  is finite, then  $f_*f^!(-) = R\mathcal{H}om_{\mathcal{O}_Y}(f_*\mathcal{O}_X, -)$ .
- If  $f : X \rightarrow Y$  is an effective Cartier divisor, then  $f^!(-) = Lf^*(-) \otimes_{\mathcal{O}_X}^L \mathcal{O}_Y(-X)[-1]$ .
- If  $f : X \rightarrow Y$  is a Koszul regular immersion of codimension  $c$ , then  $f^!(-) = Lf^*(-) \otimes^L \wedge^c \mathcal{N}[-c]$ .
- If  $f : X \rightarrow Y$  is smooth proper of relative dimension  $d$ , then  $f^!(-) = Lf^*(-) \otimes^L \Omega_{X/Y}^d[d]$ .

┘

*Proof:* Cf. [Sta]0AU0, 0AA2, 0AU1, 0B6V, 0AU3. ?  $\square$

### Dualizing Complexes

**Def. (7.9.2.10) [Dualizing Complex].** For  $X \in \mathbf{NSch}$ , a complex  $K \in D_{\mathcal{Q}\mathrm{coh}}(X)$  is called a **dualizing complex** if it satisfies the following equivalent conditions:

- For any affine open  $U = \mathrm{Spec} A \subset X$ ,  $K|_U$  is a dualizing complex in  $D(A)$ .
- There exists an affine open covering  $U_i = \mathrm{Spec} A_i$  of  $X$  s.t.  $K|_{U_i}$  is a dualizing complex in  $D(A_i)$  for any  $i$ .

┘

*Proof:* This follows from (5.9.8.2). □

**Prop. (7.9.2.11) [Dualizing].** Let  $X \in \mathbf{NSch}$  and  $\omega_X$  be a dualizing complex, then  $D = R\mathcal{H}om_{\mathcal{O}_X}(-, \omega_X)$  is an anti-equivalence of  $D_{\mathcal{Q}\mathrm{coh}}(X)$  with itself, and there is a canonical isomorphism  $\mathrm{id} \cong D^{\circ 2}$ .

Moreover, if  $X$  is qc, then  $D$  exchanges  $D_{\mathcal{Q}\mathrm{coh}}^+(X)$  and  $D_{\mathcal{Q}\mathrm{coh}}^-(X)$ , and induces an equivalence  $D : D_{\mathcal{Q}\mathrm{coh}}^b(X) \rightarrow D_{\mathcal{Q}\mathrm{coh}}^b(X)$ . ┘

*Proof:* Cf. [Sta]0A89. □

**Thm. (7.9.2.12) [Grothendieck Duality].** Let  $S \in \mathbf{NSch}_{\mathrm{qc}}$ , then

- $f^!$  makes  $D_{\mathcal{Q}\mathrm{coh}}^+$  a pseudo-functor on  $\mathcal{S}\mathrm{ch}^{\mathrm{ft}, \mathrm{sep}}/S$ .
- If  $f : X \rightarrow Y \in \mathcal{S}\mathrm{ch}_S^{\mathrm{ft}, \mathrm{sep}}$  is proper, then  $f^!$  is the right adjoint of  $Rf_*$ , and there is a canonical isomorphism

$$Rf_* R\mathcal{H}om_{\mathcal{O}_X}(K, f^! M) \cong R\mathcal{H}om_{\mathcal{O}_Y}(Rf_* K, M)$$

for any  $K \in D_{\mathrm{coh}}^-(X)$  and  $M \in D_{\mathcal{Q}\mathrm{coh}}^+(Y)$ , by??

- If  $X \in \mathcal{S}\mathrm{ch}_S^{\mathrm{ft}, \mathrm{sep}}$  has a dualizing complex  $\omega_X$ , then  $D_X = R\mathcal{H}om(-, \omega_X)$  defines an involution of  $D_{\mathrm{coh}}(X)$  switching  $D_{\mathrm{coh}}^+(X)$  and  $D_{\mathrm{coh}}^-(X)$  and fixing  $D_{\mathrm{coh}}^b(X)$ .
- If  $Y$  has a dualizing complex  $\omega_Y$ , then
  - $\omega_X = f^! \omega_Y$  is a dualizing complex for  $X$ ,
  - for  $M \in D_{\mathrm{coh}}^+(Y)$ , there is a canonical isomorphism  $D_X(f^! M) \cong Lf^* D_Y(M)$ .
  - If moreover  $f$  is proper, then  $Rf_* R\mathcal{H}om_{\mathcal{O}_X}(K, \omega_X) = R\mathcal{H}om_{\mathcal{O}_Y}(Rf_* K, \omega_Y)$  for  $K \in D_{\mathrm{coh}}^-(X)$ .

┘

*Proof:* Cf. [Sta]0AU3. □

**Thm. (7.9.2.13) [Over a Dualizing Basis].** ┘

*Proof:* Cf. [Sta]0AUE. □

### Dualizing Modules

**Prop. (7.9.2.14) [Relative Dualizing Modules].** Let  $f : X \rightarrow Y \in \mathbf{NSch}$  be a locally quasi-finite morphism, then there exists a unique coherent  $\mathcal{O}_Y$ -module  $\omega_{X/Y} \in \mathcal{C}\mathrm{oh}(Y)$  that affine locally is given by the dualizing sheaf  $\omega_{B/A}$  (5.9.8.4). ┘

*Proof:* Cf. [Sta]0BVG. □

### Relative Dualizing Complex

**Def. (7.9.2.15) [Relative Dualizing Complexes].** For a separable f.t. morphism of Noetherian schemes  $f : X \rightarrow S$ , the **relative dualizing complex** is defined to be  $\omega_{X/S} = f^! \mathcal{O}_S$ .  $\lrcorner$

**Prop. (7.9.2.16).** Let  $Y$  be a qcqs scheme and  $f : X \rightarrow Y$  be a proper flat morphism of f.p., then

- $\omega_{X/Y}$  is perfect over  $Y$ .
- $R^i f_* \omega_{X/Y} = 0$  for  $i > 0$ .
- $\mathcal{O}_X \rightarrow \mathcal{H}om_{\mathcal{O}_X}(\omega_{X/S}, \omega_{X/S})$  is an isomorphism.

$\lrcorner$

*Proof:* As  $f^\times$  commutes with base change (7.9.2.6), it suffices to assume that  $Y = \text{Spec } A$ .

1: By (7.9.2.4)(7.3.4.23) and (7.7.5.5), for any perfect object  $E \in D(X)$ , there are canonical isomorphisms:

$$Rf_*(E \otimes^L \omega_{X/Y}) = Rf_* R\mathcal{H}om_{\mathcal{O}_X}(E^\vee, \omega_{X/Y}) = R\mathcal{H}om_{\mathcal{O}_Y}(Rf_* E^\vee, \mathcal{O}_Y) = (Rf_* E^\vee)^\vee,$$

which is perfect. So  $\omega_{X/Y}$  is perfect over  $S$  by (7.9.1.12).

2: By (7.9.1.8),

$$\mathcal{H}om_Y(\mathcal{O}_Y[-i], Rf_* \omega_{X/Y}) = \text{Hom}_Y(Rf_* Lf^* \mathcal{O}_Y[-i], \mathcal{O}_Y) = \text{Hom}_Y((Rf_* \mathcal{O}_X)[-i], \mathcal{O}_Y).$$

By proper flat base change (7.7.5.5),  $Rf_* \mathcal{O}_X$  is perfect in  $Y$ , so it can be represented by a finite complex of finite projective  $A$ -modules, so by (7.3.4.22),  $R^i f_* \omega_{X/Y} = 0$  for  $i > 0$ .

3: For any perfect object  $E \in D(X)$ , by (7.9.2.4)(7.3.4.23)(7.7.5.5)(7.3.4.23) and (7.3.1.9), there are canonical isomorphisms

$$\begin{aligned} \text{Hom}_X(E, R\mathcal{H}om_{\mathcal{O}_X}(\omega_{X/Y}, \omega_{X/Y})) &= \text{Hom}_Y(Rf_*(E \otimes^L \omega_{X/Y}), \mathcal{O}_Y) \\ &= \text{Hom}_Y(Rf_* \mathcal{H}om(E^\vee, \omega_{X/Y}), \mathcal{O}_Y) \\ &= \text{Hom}_Y(\mathcal{H}om(Rf_* E^\vee, \mathcal{O}_Y), \mathcal{O}_Y) \\ &= R\Gamma(Y, Rf_* E^\vee) \\ &= \text{Hom}_X(E, \mathcal{O}_X) \end{aligned}$$

So by (7.9.1.32), perfect objects generate  $D_{\text{Qcoh}}(X)$ , so  $R\mathcal{H}om_{\mathcal{O}_X}(\omega_{X/Y}, \omega_{X/Y}) \cong \mathcal{O}_X$ .  $\square$

### Proper over Field case

**Prop. (7.9.2.17) [Serre Duality(Proper over Fields case)].** Let  $k \in \text{Field}$  and  $X \in \text{Sch}^{\text{proper}, \dim=d}/k$ , then there exists a unique dualizing complex  $\omega_X \in D_{\text{Qcoh}}(X)$  with the following properties:

- $H^i(\omega_X) \neq 0$  only for  $i \in [-\dim(X), 0]$ .
- $[\omega_X] = H^{-d}(\omega_X)$  is a coherent  $(S_2)$ -module whose support is the irreducible components of  $X$  of dimension  $d$ .
- $\dim \text{Supp}(H^i(\omega_X)) \leq -i$ .
- For  $x \in |X|_0$ ,  $H^i(\omega_{X,x}) \oplus \dots \oplus H^0(\omega_{X,x}) \neq 0$  iff  $\text{depth}(\mathcal{O}_{X,x}) \leq -i$ .

- For  $K \in D_{\text{Qcoh}}(X)$ , there is a functorial isomorphisms

$$\text{Ext}_X^{-i}(K, \omega_X) \cong \text{Hom}_k(H^i(X, K), k)$$

compatible with shifts and distinguished triangles, which characterizes  $\omega_X$  uniquely.

- There are functorial isomorphisms  $\text{Hom}(\mathcal{F}, [\omega_X]) = \text{Hom}_k(H^d(X, \mathcal{F}), k)$  for  $\mathcal{F} \in \text{Coh}(X)$ .
- If  $X$  is C.M., equidimensional, then  $\omega_X = [\omega_X][d]$ .
- If  $X$  is smooth over  $k$ , then  $\omega_X = \mathcal{K}_{X/k}[d]$ .

┘

*Proof:* Cf. [Sta]0FVV, 0AWT. ?

□

**Cor. (7.9.2.18) [Serre Duality (Smooth over Fields case)].** If  $k \in \text{Field}$  and  $X \in \text{Sch}^{\text{SmPrpr}, \dim=d}/k$ , then for any  $\mathcal{F} \in \text{Vect}(\mathcal{O}_X)$ , there is a functorial isomorphism:

$$H^i(X, \mathcal{F}) \cong (H^{n-i}(X, \mathcal{F}^\vee \otimes \mathcal{K}_{X/k}))^\vee.$$

┘

**Cor. (7.9.2.19).** For a smooth proper variety  $X$  over a field  $k$  of dimension  $n$ ,  $H^n(X, \mathcal{K}_X) = k$ , by (7.12.1.12).

┘

**Cor. (7.9.2.20).** For  $X \in \text{SmPrprVar}^n/k$ ,  $\Omega_{X/k}$  is locally free by (7.6.4.14), thus by (7.5.1.25),  $\Omega_{X/k}^{n-p} \cong (\Omega_{X/k}^p)^\vee \otimes \mathcal{K}_{X/k}$ . So by (7.9.2.18):

$$H^q(X, \Omega_{X/k}^p) \cong (H^{n-q}(X, \Omega_{X/k}^{n-p}))^\vee.$$

┘

**Cor. (7.9.2.21).** If  $X$  is a closed subscheme of  $\mathbb{P}_k^n$  of codimension  $r$ , then  $X$  has a dualizing sheaf  $[\omega_X] = \mathcal{E}xt_P^r(i_* \mathcal{O}_X, \mathcal{K}_{\mathbb{P}_k^n/k})$ , and  $\mathcal{E}xt^i(i_* \mathcal{O}_X, \mathcal{K}_{\mathbb{P}_k^n/k}) = 0$  for  $i < r$

┘

*Proof:* This follows from (7.9.2.17) and (7.9.2.12).

□

**Prop. (7.9.2.22) [Characterizing Cohen-Macaulay Schemes].** Let  $k \in \text{Field}$  and  $X \in \text{Sch}^{\text{Proj}, \dim n}/k$  and  $[\omega_X]$  be the dualizing sheaf, then for  $\mathcal{F} \in \text{Coh}(X)$ , there is a natural map

$$\text{Ext}^i(\mathcal{F}, [\omega_X]) \rightarrow (H^{n-i}(X, \mathcal{F}))^\vee$$

And the following are equivalent:

- For any  $\mathcal{F}$  locally free on  $X$ ,  $H^i(X, \mathcal{F}(-q)) = 0$  for  $i < n$  and  $q$  large.
- $H^i(X, \mathcal{O}_X(-q)) = 0$  for  $i < n$  and  $q$  large.
- This is an isomorphism of  $\delta$ -functors.
- $X$  is C.M. and equidimensional.

┘

*Proof:* Notice the left side is an universal  $\delta$ -functor in  $\mathcal{F}$  by (7.9.1.37), so the map exist, and  
 2  $\rightarrow$  3: This implies that the right is also universal by (7.9.1.34).  
 3  $\rightarrow$  1: For  $\mathcal{F}$  locally free, by (7.3.3.33),

$$H^i(X, \mathcal{F}(-q)) = (\text{Ext}^{n-i}(\mathcal{F}(-q), \omega_X))^\vee = (H^{n-i}(X, \mathcal{F}^\vee \otimes \omega_X(q)))^\vee$$

which is 0 for  $q$  large.

4  $\rightarrow$  1: Embed  $X$  in  $P = \mathbb{P}_k^N$ , for  $\mathcal{F}$  locally free, since  $X$  is catenary, equidimensional is equivalent to  $\dim \mathcal{F}_x = n$  for all closed pt  $x$ , and C.M. says  $\text{depth } \mathcal{F}_x = n$ . Thus by (5.3.5.27),  $pd_{\mathcal{O}_{P,x}} \mathcal{F}_x = N - n$ . Thus  $\mathcal{E}xt_P^k(\mathcal{F}, -)$  vanish for  $k > N - n$  checked on stalks.

Now  $H^i(X, \mathcal{F}(-q))$  is dual to  $\text{Ext}_P^{N-i}(\mathcal{F}, \omega_P(q))$  by the proof of (7.9.2.21), which is isomorphic to  $\Gamma(P, \mathcal{E}xt_P^{N-i}(\mathcal{F}, \omega_P(q)))$  for  $q$  large by (7.7.4.9), so it vanish when  $i < n$  by what we proved.

1  $\rightarrow$  4: The same as the proof of 4  $\rightarrow$  1, then for  $i < n$ ,

$$\Gamma(P, \mathcal{E}xt_P^{N-i}(\mathcal{F}, \omega_P(q))) = 0 = \Gamma(P, \mathcal{E}xt_P^{N-i}(\mathcal{F}, \omega_P)(q))$$

for  $q$  large, so  $\mathcal{E}xt_P^{N-i}(\mathcal{F}, \omega_P) = 0$  as it is coherent. Then the stalk is  $\text{Ext}_{\mathcal{O}_{P,x}}^{N-i}(\mathcal{O}_{X,x}, \mathcal{O}_{P,x})$ , so  $pd_{\mathcal{O}_{P,x}} \mathcal{F}_x \leq N - n$  by (5.3.5.28), so  $\text{depth } \mathcal{O}_{X,x} \geq n$ , we must have equality, thus  $X$  is C.M. and equidimensional, as it suffice to check at closed pts.  $\square$

**Cor. (7.9.2.23)[Enriques-Severi-Zariski].** Let  $X$  be a normal projective scheme that every irreducible component has dimension  $\geq 2$ , then for any  $\mathcal{F} \in \text{Vect}(X)$ ,  $H^1(X, \mathcal{F}(-q)) = 0$  for  $q$  large.  $\lrcorner$

*Proof:* Just notice that  $\dim \mathcal{F}_x \geq 2$ , and Serre criterion shows  $\text{depth } \mathcal{F}_x \geq 2$ , the rest is the same as 4  $\rightarrow$  1 in the proof of (7.9.2.22).  $\square$

**Prop. (7.9.2.24)[Ample Effective Divisor Connected].** Let  $X$  be a proper connected CM. equidimensional scheme over  $k$  of dimension at least 2 and  $D$  is an ample effective Cartier divisor, then  $D$  is connected.

In particular, if  $X$  is a smooth complete variety of dimension  $\geq 2$ ,  $D$  is also a complete variety.  $\lrcorner$

*Proof:* Let  $D = V(s)$ , where  $s$  is a section of an ample invertible sheaf, then there is an exact sequence

$$0 \rightarrow \mathcal{O}_X(-nD) \rightarrow \mathcal{O}_X \rightarrow i_* \mathcal{O}_{V(s^n)} \rightarrow 0,$$

which gives a long exact sequence

$$0 \rightarrow H^0(X, \mathcal{O}_X(-nD)) \rightarrow H^0(X, \mathcal{O}_X) \rightarrow H^0(V(s^n), \mathcal{O}_{V(s^n)}) \rightarrow H^1(X, \mathcal{O}_X(-nD)).$$

But by Serre duality (7.9.2.18) and (7.7.2.6),  $H^0(X, \mathcal{O}_X(-nD)) = H^{\dim X}(X, [\omega_X] \otimes \mathcal{O}_X(nD)) = 0$  for  $n$  sufficiently large, and  $H^1(X, \mathcal{O}_X(-nD)) = H^{\dim X-1}(X, [\omega_X] \otimes \mathcal{O}_X(nD)) = 0$  for  $n$  sufficiently large, so  $H^0(V(s^n), \mathcal{O}_{V(s^n)}) \cong H^0(X, \mathcal{O}_X)$  has no idempotents for  $n$  sufficiently large, so  $V(s^n)$  is connected, and  $D$  is also connected.  $\square$

**Cor. (7.9.2.25).** Any global complete intersection in  $\mathbb{P}^n$  is connected.  $\lrcorner$

### Topological Sheaves

**Prop. (7.9.2.26) [Global Verdier Duality].** If  $f : X \rightarrow Y$  is a map between locally compact spaces with finite dimension, then there exists a functor  $f^! : D^+(SAb_Y) \rightarrow D^+(SAb_X)$  that

$$R\mathrm{Hom}(Rf_! \mathcal{F}^\bullet, \mathcal{G}^\bullet) \cong R\mathrm{Hom}(\mathcal{F}, f^! \mathcal{G}^\bullet).$$

In particular,  $f^!$  is right adjoint to  $Rf_!$ . Cf.[Gelfand P228].

There is also a local form of Verdier duality, which implies the global version by taking global section, Cf.[Cohomology of Sheaves Iversen P330].  $\lrcorner$

**Prop. (7.9.2.27).** When  $X \rightarrow Y$  is an inclusion of open subset,  $f_!$  is just  $j_!$  defined in (7.2.6.2) and  $f^!$  is the restriction. When it is an inclusion of closed subset of locally compact spaces, it is the direct image  $f_*$  and  $f^!$  is the  $j^!$  previously defined in (7.2.6.2). They are not barely defined on  $D^+(SAb)$  but on  $SAb$ .  $\lrcorner$

**Prop. (7.9.2.28).** We consider the case where  $f : X \rightarrow \mathrm{pt}$ , and let  $G = \mathbb{Z}$ , denote  $f^!(\mathbb{Z})$  by  $\mathcal{D}_X^\bullet$ , called the **dualizing complex**, then there is a duality:

$$R\mathrm{Hom}(R\Gamma_c(X, \mathcal{F}^\bullet), \mathbb{Z}) \cong R\mathrm{Hom}(\mathcal{F}^\bullet, \mathcal{D}_X^\bullet).$$

for  $\mathcal{F}^\bullet \in D^+(\mathrm{Sh}(X))$ .  $\lrcorner$

**Prop. (7.9.2.29).** When  $X$  is a  $n$  dimensional topological manifold with boundary, then  $\mathcal{D}_X^\bullet = \omega_X[n]$ , where the sheaf  $\omega_X$  is defined by

$$\Gamma(U, \omega_X) = \mathrm{Hom}_{\mathcal{A}b}(H_c^n(U, \mathbb{Z}), \mathbb{Z}).$$

Cf.[Gelfand P234]. If we replace  $\mathbb{Z}$  by a field  $k$ , then  $\omega_X$  is the sheaf of  $k$ -orientations of  $\mathrm{int}(X)$ , thus the constant sheaf when  $X$  is oriented or  $\mathrm{char} k = 2$  ?.

In particular, place  $k$  in dimension  $i$  then we get an isomorphism

$$\mathrm{Hom}_k(H_c^i(X, \mathcal{F}), k) = \mathrm{Ext}^{n-i}(\mathcal{F}, \omega_X)$$

(because  $k$  is a field thus injective). Gelfand even gives an interpretation of this pair in [Gelfand P236].

And if  $\mathcal{F} = \omega_X$  and  $X$  oriented or  $\mathrm{char} k = 2$ , we have  $\mathrm{Ext}^{n-i}(k_X, k_X[n]) = H^{n-i}(X, k_X)$  using the adjointness of constant sheaf, so we get the Poincare duality:

$$H_c^i(X, k_X)^\vee \cong H^{n-i}(X, k_X).$$

$\lrcorner$

**Prop. (7.9.2.30).** Compact cohomology commute with colimits, Cf.[Cohomology of Sheaves Iversen P173].  $\lrcorner$

### 3 Fourier-Mukai Transforms

**Notation (7.9.3.1).**

- Let  $S \in \mathrm{Sch}$ .

$\lrcorner$

Cf. [Sta]Chap56.

**Def. (7.9.3.2) [Fourier-Mukai Transform].** Let  $X, Y \in \text{Sch}/S$ , then for any  $K \in D(X \times_S Y)$ , the **Fourier-Mukai transform** associated to  $K$  is defined to be the exact functor

$$\Phi_K : D(\mathcal{O}_X) \rightarrow D(\mathcal{O}_Y) : M \rightarrow R\text{pr}_{2*}(L\text{pr}_1^* M \otimes_{X \times_S Y}^L K).$$

And  $K$  is called the **kernel** of  $\Phi_K$ . ┘

**Prop. (7.9.3.3) [Qco Fourier-Mukai Transform].** Situation as in (7.9.3.2), if  $X \in \text{Sch}^{\text{qcs}}/S$ , then  $\Phi_K(D_{\text{Qcoh}}(X)) \subset D_{\text{Qcoh}}(Y)$ . ┘

*Proof:* This follows from (7.9.1.6)(7.9.1.5) and (7.9.1.6). □

**Prop. (7.9.3.4) [Compositions].** Let  $X, Y, Z \in \text{Sch}^{\text{qcs}}/S$  s.t.  $X, Z$  is tor-independent over  $S$  and  $Y/S$  is flat, then for any  $K \in D(X \times_S Y), K' \in D(Y \times_S Z)$ , we have

$$\Phi_{K'} \circ \Phi_K = \Phi_{K''}$$

where  $K'' = R\text{pr}_{13*}(L\text{pr}_{12}^* K \otimes_{X \times_S Y \times_S Z}^L L\text{pr}_{23}^* K') \in D(X \times_S Y \times_S Z)$ . ┘

*Proof:* Cf. [Sta]0FYS. □

**Prop. (7.9.3.5) [Perfect Fourier-Mukai Transform].** Situation as in (7.9.3.2), there are situations that  $\Phi_K(D_{\text{perf}}(X)) \subset D_{\text{perf}}(Y)$ . Cf. [Sta]0FYT. ? ┘

*Proof:* □

**Prop. (7.9.3.6) [Coherent Fourier-Mukai Transform].** Let  $X, Y \in \text{Sch}/S$  s.t.  $X/S$  is proper, then for any  $K \in D_{\text{coh}}(\mathcal{O}_{X \times_S Y})$ ,  $\Phi_K(D_{\text{coh}}(X)) \subset D_{\text{coh}}(Y)$ . when one of the following holds:

- $K$  has finite tor-dimension as an object in  $D(\text{pr}_1^* \mathcal{O}_X)$ .
  - $K$  can be presented by a bounded complex  $\mathcal{K}^\bullet$  of coherent  $\mathcal{O}_{X \times_S Y}$ -modules that are flat over  $X$ .
  - $X$  is regular.
  - $K$  is perfect and  $Y/S$  is flat.
- ┘

*Proof:* Cf. [Sta]0FYU. ? □

**Prop. (7.9.4.2).** If  $X \in \mathcal{S}mPrpr\mathcal{V}ar^n/k$ , then tensoring with  $\omega_X = \mathcal{K}_{X/k}[n]$  is a Serre functor on  $D_{\text{coh}}^b(X)$  (4.8.4.40).  $\lrcorner$

*Proof:* It follows from Serre duality (7.9.2.17) that

$$\text{Ext}^i(F, G) = (\text{Ext}^{-i}(G, F \otimes \omega_X))^*$$

?

□

### Representability

**Thm. (7.9.4.3) [Representability Lemma, Bondal-Bergh [B-B03]].** Let  $X \in \mathcal{S}ch^{\text{Proj}}/k$  and  $F : D_{\text{perf}}(X)^{\text{op}} \rightarrow \mathcal{V}ect_k$  a  $k$ -linear cohomology functor s.t.

$$\sum_{n \in \mathbb{Z}} \dim_k F(E[n]) < \infty$$

for any  $E \in D_{\text{perf}}(X)$ . Then  $F = \mathcal{Y}_K$  for some  $K \in D_{\text{coh}}^b(X)$ .  $\lrcorner$

*Proof:*  $D_{\mathcal{Q}coh}(X)$  has direct sums by (7.9.1.2) and is compactly generated by (7.9.1.32), and  $D_{\text{perf}}(X) = D_{\text{cpct}}(X)$  (7.9.1.31), so we can use (4.8.4.39) to show that  $F = \mathcal{Y}_K$  for some  $K \in D_{\mathcal{Q}coh}(X)$ . But then  $K \in D_{\text{coh}}^b(X)$  by (7.9.1.16). □

**Prop. (7.9.4.4) [Perfect Representability for Regular Schemes].** Let  $X \in \mathcal{S}ch/k$  be regular, then any  $k$ -linear cohomological functor  $F : D_{\text{perf}}(X)^{\text{op}} \rightarrow \mathcal{V}ect_k$  satisfying

$$\sum_{n \in \mathbb{Z}} \dim_k F(E[n]) < \infty$$

for any  $E \in D_{\text{perf}}(X)$  must be of the form  $F = \mathcal{Y}_K$  for some  $K \in D_{\text{perf}}(X)$ .

Dual results holds for homological functors.  $\lrcorner$

*Proof:* Cf. [Sta] 0FYL. □

**Prop. (7.9.4.5) [Existence of Adjoints].** For  $X, Y \in \mathcal{S}ch^{\text{proper}}/k$ , If  $X$  is regular, then any  $k$ -linear exact functor  $F : D_{\text{perf}}(X) \rightarrow D_{\text{perf}}(Y)$  has an exact left adjoint and an exact right adjoint.  $\lrcorner$

*Proof:* This follows formally from (7.9.4.4) and (7.9.1.15) □

### Fully Faithful Functors

**Thm. (7.9.4.6) [Bondal-Orlov [B-O01]].** Let  $X, X' \in \mathcal{V}ar^{\text{sm}}/k$  s.t.  $X$  is projective with  $\mathcal{K}_X$  or  $-\mathcal{K}_X$  ample, and  $D^b(X) \cong D^b(X')$  as graded categories, then  $X \cong X'$ .  $\lrcorner$

*Proof:* Cf. [B-O01]. ?

The idea of the proof is that for varieties with ample canonical or anticanonical sheaf we can recognize the skyscraper sheaves of closed points in  $\text{Db}(X)$  by means of the Serre functor (4.8.4.40). □

**Thm. (7.9.4.7) [Bondal-Orlov [B-O01]].** Let  $X, X' \in \mathcal{V}ar^{\text{sm}}/k$  s.t.  $X$  is projective with  $\omega_X$  or  $-\omega_X$  ample, then

$$\text{Aut}_{\mathcal{T}riCat}(D^b(X)) = \text{Aut}(X) \ltimes (\text{Pic}(X) \oplus \mathbb{Z}).$$

□

*Proof:* Cf.[B-O01].? □

**Prop. (7.9.4.8).** For  $X, Y \in \text{Sch}^{\text{SmPrpr}}/k$ , if  $F, G : D_{\text{coh}}^b(X) \rightarrow D_{\text{coh}}^b(Y)$  are two  $k$ -linear exact functors s.t.

- $F(\mathcal{F}) \cong G(\mathcal{F})$  for any  $\mathcal{F} \in \text{Coh}(\mathcal{O}_X)$  with  $\dim \text{Supp}(f) = 0$ .
- $F$  is fully faithful.
- $G$  is a Fourier-Mukai transform whose kernel is in  $D_{\text{coh}}^b(X \times Y)$ .

then there exists a Fourier-Mukai transform  $F'$  with kernel in  $D_{\text{coh}}^b(X \times Y)$  s.t.  $F, F'$  are siblings. ⌋

**Thm. (7.9.4.9)** [Orlov[Orl97]]. Let  $X, M \in \text{Sch}^{\text{SmPrpr}}/k$  and  $F : D_{\text{coh}}^b(M) \rightarrow D_{\text{coh}}^b(X)$  a fully faithful functor, then there exists a unique element  $E \in D_{\text{coh}}^b(M \otimes X)$  s.t.  $F = \Phi_E$  (7.9.3.2). ⌋

*Proof:* Cf.[Equivalences of derived categories and K3 surfaces, Orlov]. □

**Thm. (7.9.4.10)** [Bondal-Orlov[B-O01]]. Let  $X, M \in \text{SmPrprVar}/k$  and  $E \in D_{\text{coh}}^b(M \otimes X)$ , then

$$\Phi_E \triangleq R\text{pr}_{2*}(E \otimes^L \text{pr}_1^*(-)) : D_{\text{coh}}^b(M) \rightarrow D_{\text{coh}}^b(X)$$

is fully faithful iff the following are satisfied:

- $\text{Hom}_X^i(\Phi_E(\mathcal{O}_M(t)), \Phi_E(\mathcal{O}_M(t'))) = 0$  for any  $i \in \mathbb{Z}$  and any  $t \neq t' \in |M|_0$ .
  - $\text{Hom}_X^0(\Phi_E(\mathcal{O}_M(t)), \Phi_E(\mathcal{O}_M(t))) = k$  for any  $t \in |M|_0$ .
  - $\text{Hom}_X^i(\Phi_E(\mathcal{O}_M(t)), \Phi_E(\mathcal{O}_M(t))) = 0$  for any  $t \in |M|_0$  and  $i \notin [0, \dim M]$ .
- ⌋

### Derived Categories of Complete Intersections of Quadrics

**Thm. (7.9.4.11)** [Derived Categories of Complete Intersections of Quadrics, Kapranov[Kap88]/Bondal-Orlov]. For  $m \in \mathbb{N}, n \in \mathbb{Z}_+$  s.t.  $2m \leq n$ , consider a system of  $m$  quadrics in  $\mathbb{P}^{n-1}$  of the form  $\varphi : U \rightarrow \text{Sym}^2 V^*$  where  $U \cong k^m \in \text{Vect}_k, V \cong k^n \in \text{Vect}_k$ . Suppose the intersection  $X \subset \mathbb{P}^{n-1}$  is smooth of dimension  $n - m - 1$ , then

- There is a sheaf of finite algebras  $\mathcal{B}$  over  $\mathcal{O}_{\mathbb{P}(U)}$  together with a fully faithful embedding  $D^b(\text{Coh}(\mathcal{B})) \rightarrow D_{\text{coh}}^b(X)$ .
- There is an semi-orthogonal decomposition (4.8.4.23)

$$D_{\text{coh}}^b(X) = \langle \mathcal{O}_X(-n + 2m + 1), \mathcal{O}_X(-n + 2m + 2), \dots, \mathcal{O}_X, D^b(\text{Coh}(\mathcal{B})) \rangle$$

In particular, if  $n = 2m$ , then  $D^b(\text{Coh}(\mathcal{B})) \cong D_{\text{coh}}^b(X)$ . ⌋

*Proof:* Cf.[Semiorthogonal decomposition for algebraic varieties, Bondal-Orlov] and [B-O02].? □

**Cor. (7.9.4.12)** [Coherent Sheaves on  $\mathbb{P}^n$ , Beilinson[Bei78]]. There is an semi-orthogonal decomposition

$$D_{\text{coh}}^b(\mathbb{P}^n) = \langle \mathcal{O}_{\mathbb{P}^n}(-n), \mathcal{O}_{\mathbb{P}^n}(-n + 1), \dots, \mathcal{O}_{\mathbb{P}^n} \rangle$$
⌋

*Proof:* Direct proof is given in [Huybrechts, Fourier-Mukai transforms in algebraic geometry]Cor8.29. where Beilinson constructed a resolution of  $\Delta_{\mathbb{P}^n}$  using Koszul complexes. □

**Cor. (7.9.4.13).** If  $n \in 2\mathbb{Z}_+ + 1$  and  $X \in \text{SmPrprVar}/k$  is an intersection of two projective quadrics in  $\mathbb{P}^{n-1}$  and let  $C$  be the hyperelliptic curve which is the double cover of  $\mathbb{P}^1$  that parameterizes the pencil of quadrics, with ramification in the points corresponding to degenerate quadrics, then there is an semi-orthogonal decomposition

$$D_{\text{coh}}^b(X) = \langle \mathcal{O}_X(-n+4), \mathcal{O}_X(-n+4), \dots, \mathcal{O}_X, D_{\text{coh}}^b(C) \rangle$$

┘

*Proof:* Cf. [B-O02]. ?

In this case  $\text{Coh}(\mathcal{B}) \cong \text{Coh}(\mathcal{B}')$  where  $\mathcal{B}'$  is an Azumaya algebra over  $C$ , which is trivial because  $k = \bar{k}$ . so  $D^b(\text{Coh}(\mathcal{B})) \cong D_{\text{coh}}^b(C)$ .  $\square$

### Derived Categories and Blow-Ups

**Prop. (7.9.4.14).** Let  $X \in \text{Var}^{\text{sm}}/k$  and  $i : Y \subset X$  be a smooth variety of codimension  $r$ , denote  $\tilde{X} = \text{Bl}_Y(X) \xrightarrow{\text{pr}} X$  and  $\tilde{Y} = \text{pr}^{-1}(Y) \xrightarrow{j} X$ . As  $\tilde{Y} = \mathbb{P}(N_{Y/X})$ , we can define the relative Serre sheaf  $\mathcal{O}_{\tilde{Y}}(1)$  on  $\tilde{Y}$ .

Then for any  $\mathcal{L} \in \text{Pic}(\tilde{Y})$ , the functors

$$L\pi^* : D_{\text{coh}}^b(X) \rightarrow D_{\text{coh}}^b(\tilde{X}), \quad Rj_*(L \otimes \text{pr}^*(-)) : D_{\text{coh}}^b(Y) \rightarrow D_{\text{coh}}^b(\tilde{X})$$

are fully faithful.  $\square$

*Proof:* Cf. [Projective bundles, monoidal transformations, and derived categories of coherent sheaves, Orlov].  $\square$

**Thm. (7.9.4.15).** Situation as in (7.9.4.14), for  $r \in \mathbb{Z}$ , denote

$$D_X^b(\tilde{X}) = L\pi^*(D_{\text{coh}}^b(X)) \subset D_{\text{coh}}^b(\tilde{X}), \quad D_Y^b(\tilde{X})(r) = Rj_*(\mathcal{O}_{\tilde{Y}}(r) \otimes \text{pr}_Y^*(D_{\text{coh}}^b(Y))),$$

then there is a semi-orthogonal decomposition of triangulated categories (4.8.4.23):

$$D_{\text{coh}}^b(\tilde{X}) = \langle D_Y^b(\tilde{X})(-r+1), \dots, D_Y^b(\tilde{X})(-1), D_X^b(\tilde{X}) \rangle$$

┘

*Proof:* [Projective bundles, monoidal transformations and derived categories of coherent sheaves, Orlov] and [Semiorthogonal decomposition for algebraic varieties, Bondal-Orlov].  $\square$

**Conj. (7.9.4.16) [Flips and Derived Categories, Bondal-Orlov].** For any generalized flip  $X \rightarrow X^+ \in \text{SmProjVar}/k$  (7.9.5.1), there is an exact fully faithful functor  $F : D_{\text{coh}}^b(X^+) \rightarrow D_{\text{coh}}^b(X)$ , and for generalized flop, this is an equivalence.  $\square$

*Proof:*  $\square$

**Thm& Conj. Cor. (7.9.4.17) [Bridgeland [Bri02]].** This conjecture holds true when  $\tilde{X} \rightarrow X$  is a flop of 3-dimensional varieties.  $\square$

*Proof:*  $\square$

**Thm& Conj. Cor. (7.9.4.18) [Simple Flips, Bondal-Orlov].** Situation as in (7.9.5.2), then

$$R\pi_* L\pi^{+*} : D_{\text{coh}}^b(X^+) \rightarrow D_{\text{coh}}^b(X)$$

is fully faithful for  $l \leq m$ , and is an equivalence if  $l = m$ .  $\square$

*Proof:* Cf. [Semiorthogonal decomposition for algebraic varieties, Bondal-Orlov].  $\square$

### Categorical Desingularizations

**Def. (7.9.4.19) [Categorical Desingularizations].** For  $\mathcal{D} \in \text{TriCat}$ , a **categorical desingularization** or a **categorical resolution of singularity** is a pair  $(\mathcal{C}, \mathcal{K})$  where  $\mathcal{C} \in \text{AbVar}$  and  $\mathcal{K} \subset D^b(\mathcal{C})$  a thick triangulated subcategory  $\mathcal{K} \subset D^b(\mathcal{C})$  (4.8.4.21) s.t.  $\mathcal{D} = D^b(\mathcal{C})/\mathcal{K}$  (4.8.4.32).  $\lrcorner$

**Prop. (7.9.4.20).** If  $\text{pr} : \tilde{X} \rightarrow X$  is a desingularization (7.11.1.1) and  $X$  has rational singularities (7.11.1.2), then

$$R\text{pr}_* : D_{\text{coh}}^b(\tilde{X}) \rightarrow D_{\text{coh}}^b(X)$$

makes  $(\text{Coh}(\tilde{X}), \ker(R\text{pr}_*))$  a categorical desingularization of  $D_{\text{coh}}^b(X)$  (7.9.4.19).  $\lrcorner$

*Proof:* ?  $\square$

## 5 Birational Geometry

### Flips and Flops

**Def. (7.9.5.1) [generalized Flips and Flops].**  $\lrcorner$

**Prop. (7.9.5.2) [Simple Flips].** If  $Y \subset X \in \text{Var}^{\text{sm}} \cong \mathbb{P}_k^m$  and  $N_{X/Y} \cong \mathcal{O}_Y(-1)^{\oplus(l+1)}$ , then the blow-up  $\tilde{X} = \text{Bl}_{Y^+}(X^+) \xrightarrow{\text{pr}^+} X$  can be contracted to a smooth variety  $\pi : \tilde{X} \rightarrow X$  s.t. the inverse image  $\tilde{Y} = \text{pr}^{-1}(Y) \cong \mathbb{P}^m \times \mathbb{P}^l$  projects to the second component  $\mathbb{P}^l$ , giving a simple flip  $X \rightarrow X^+$ .  $\lrcorner$

## 7.11 Resolution of Singularities

References are [Sta], [Resolution of Singularities, Hauser-Lipman-Oort-Quiros] and [K-M85].

### 1 Desingularizations and Alterations

**Def. (7.11.1.1)[Desingularizations].** Let  $X \in \text{Sch}$  be reduced and locally Noetherian, then a **desingularization** of  $X$  is a modification (7.4.6.10)  $Z \rightarrow X$  s.t.  $Z$  is regular. A **strong desingularization** is a desingularization  $\text{pr} : Z \rightarrow X$  that  $\text{pr}$  is an isomorphism over any regular point  $x \in X$ .  $\lrcorner$

**Def. (7.11.1.2)[Rational Singularities].** For  $k \in \text{Field}^0$  any  $X \in \text{Sch}/k$ , then  $X$  is said to have **rational singularities** if  $X$  normal, of f.t. over  $k$ , and there exists a desingularization  $Y \rightarrow X$  (7.11.1.1) s.t.

$$R^i f_* \mathcal{O}_Y = 0, \quad \forall i \in \mathbb{Z}_+$$

$\lrcorner$

**Thm. (7.11.1.3) [Hironaka].** Let  $X$  be a reduced scheme locally of f.t. over an excellent, reduced, locally Noetherian scheme  $S$  of characteristic 0 (i.e.  $\text{char } \kappa(x) = 0$  for any  $x \in X$ ), then  $X$  admits a strong desingularization over  $S$ .  $\lrcorner$

*Proof:* [Hironaka, Resolution of singularities of an algebraic variety over a field of characteristic zero. I, II, Ann. Math. 79 (1964), 109–203; 205–326.] or [Resolution of Singularities, Hauser, Lipman, Oort, Quiros].  $\square$

**Thm. (7.11.1.4) [de Jong].** Let  $R$  be a CDVR or a field,  $X \in \text{Sch}_{\text{int}}^{\text{ft,sep}}/R$ , then  $X$  admits an alteration (7.4.6.10)  $Y \rightarrow X$  over  $R$  s.t.  $Y$  is regular.  $\lrcorner$

*Proof:* [de Jong, Smoothness, Semi-stability and Alterations, Publ. Math. IHES 83 (1996), 51–93.] ?

Proof ideas: Replace  $X$  by a fibration  $X \rightarrow B$  where all fibers are curves. By induction on dimensions, we can find an alteration  $B' \rightarrow B$  s.t.  $B'$  is regular. Then  $X' = X \times_B B' \rightarrow X$  is an alteration. Then we use resolution of curves, which can be made effective in a non-singular family.

$\square$

## 7.12 Varieties

*“If there is one thing in mathematics that fascinates me more than anything else (and doubtless always has), it is neither ‘number’ nor ‘size,’ but always form.”*

–A. Grothendieck

References are [Sta] and [Har77].

The materials distinguishes here in the fact that most schemes considered have geo.reduced, geo.connected or geo.integral properties in nature.

### Notation (7.12.0.1).

- Let  $k \in \mathbf{Field}$ .
- Use notations on properties of morphisms between schemes defined in [Properties of Schemes](#) and [More Properties of Morphisms between Schemes](#).
- Use notations on quasi-coherent sheaves on schemes defined in ??.

┘

## 1 Varieties

### Classical varieties

**Prop. (7.12.1.1) [Soberization Functor].** Suppose  $k = k^s$ , the soberization functor  $t$  induce a fully faithful functor from classical varieties over  $k$  to quasi-projective integral schemes over  $k$ . It maps projective varieties to projective integral schemes and preserves fiber products ?.

┘

*Proof:* We assign the irreducible closed subsets space  $t(X)$  and show that this embeds  $X$  in  $t(X)$ , and for an affine variety  $(V, \mathcal{O}_V)$ , the regular function sheaf is isomorphic to the pullback sheaf on  $t(V) = \mathrm{Spec}(A)$ .

By definition  $t(X)$  is quasi-projective, which is separated, the set of geometric pts of any closed variety is dense so  $t(V)$  is homeomorphic to  $X$ . And because they are both reduced, they are isomorphic. So it is essentially surjective.

It is fully faithful by (7.12.1.11).

□

**Prop. (7.12.1.2).** The soberization of a classical variety  $X$  is regular at a closed point iff the local defining functions has rank  $n - \dim X$ .

┘

*Proof:* Consider the space of closed point of  $X$ , they correspond to classical points because  $k$  is alg.closed. Let  $a_p = (x_1 - a_1, \dots, x_n - a_n)$  and  $b$  be the locally defining ideal. Then the differential defines an isomorphism of vector space  $a_p/a_p^2 \cong k^n$ , and the local ring at  $p$  is  $m/m^2 \cong (a_p/b)/(a_p/b)^2 \cong a_p/(b + a_p^2)$ . The rank of the defining functions is  $b + a_p^2/a_p^2$ . Counting dimension gives us the result. (Use (7.6.3.3) also). □

### Varieties

**Def. (7.12.1.3) [Varieties].**

- A **variety** over  $k$  is a geo.integral separated scheme algebraic over  $k$ .
- An **prevariety** over  $k$  is an integral separated scheme algebraic over  $k$ .

- A **complete variety** over  $k$  is a variety over  $k$  that is also proper (i.e. universally closed) over  $k$ .
- A classical variety over  $k$  is an abstract variety over  $k$  because quasi-projective is f.t. and separated (7.4.6.19).
- A **non-singular variety** over  $k$  is a regular variety over  $k$ .
- A (pre)**curve** over  $k$  is a (pre)variety of dimension 1 over  $k$ .

The category of varieties over  $k$  is denoted by  $\text{Var}_k$ .

If  $X/k$  is a (complete)variety and  $K/k$  is a field extension, then  $X_K$  is a (complete)variety over  $K$ , by (7.4.3.17).  $\lrcorner$

**Remark (7.12.1.4).** Notice the prevariety is the same as the variety defined in [Sta].  $\lrcorner$

**Cor. (7.12.1.5).** Any variety is birational to an integral H-quasi-projective scheme. A complete variety is birational to an integral projective scheme by Chow's lemma (7.4.6.23)(7.4.6.3).  $\lrcorner$

**Prop. (7.12.1.6).** By valuation criterion, for a complete variety, every valuation of the function fields of  $K/k$  dominate a unique point of  $X$ . So the points of  $X$  correspond to valuations of  $K$  containing  $k$ .  $\lrcorner$

**Prop. (7.12.1.7) [Generically Smoothness].** A variety is generically smooth, by (7.6.4.20).  $\lrcorner$

**Prop. (7.12.1.8) [Nagata].** By Nagata compactification (7.8.3.2), any variety can be embedded as an open subset of a complete variety.  $\lrcorner$

*Proof:*

$\square$

**Prop. (7.12.1.9) [Product of Varieties].** The product of two (complete)varieties over  $k$  is also a (complete)variety.  $\lrcorner$

*Proof:* It is geometrically integral by (7.4.3.17), it is separated because separatedness is stable under composition and base change (7.4.4.2). So does properness.  $\square$

**Def. (7.12.1.10) [Arithmetic Points].** An **arithmetic point** of a scheme  $X$  is an element of  $X(k^{\text{sep}})$ . For  $X \in \text{Var}/k$ ,  $X(k^{\text{sep}})$  is dense in  $X$ , by (7.4.3.3).

An **geometric point** of a scheme  $X$  is an element of  $X(\bar{k})$ .  $\lrcorner$

**Prop. (7.12.1.11).** To verify two morphisms  $f, g$  between two varieties  $X$  and  $Y$  are equal, it suffices to prove that they are equal on the set of arithmetic points of an open subscheme  $U$  (7.12.1.10).  $\lrcorner$

*Proof:* Because the equalizer is a closed subscheme of  $X$  (7.2.7.18), and it contains all geometric pts of an open subset of  $X$ , so it must be  $X$ , as the geometric-points are dense in  $U$  (7.12.1.10), and  $X$  is reduced and irreducible.  $\square$

**Prop. (7.12.1.12) [Global Sections].** Let  $X \in \text{Sch}^{\text{proper}}/k$ , then

- $A = \Gamma(X, \mathcal{O}_X)$  is a finite  $k$ -algebra hence is a finite product of Artinian local  $k$ -algebras, one for each connected component of  $X$ .
- If  $X$  is reduced, then  $A = \prod k_i$  is a finite product of finite field extensions of  $k$ .
- If  $X$  is geo.reduced, then  $k_i$  are all separable over  $k$ .

- If  $X$  is geo.connected, then  $A$  is geo.irreducible over  $k$ (5.3.6.1).
- If  $X$  is geo.integral(i.e. a complete variety), then  $\Gamma(X, \mathcal{O}_X) = k$ .

┘

*Proof:* 1:  $H^0(X, \mathcal{O}_X)$  is finite  $k$ -algebra by(7.7.4.11), thus it is Artinian(5.1.3.4). The connected components of  $X$  clearly corresponds to idempotents of  $A$ , which corresponds to Artinian local  $k$ -algebras, as a local ring is connected.

2: This follows from(5.1.3.5).

3:  $A \otimes_k \bar{k} = H^0(X_{\bar{k}}, \mathcal{O}_{X_{\bar{k}}})$  is also reduced by flat base change(7.7.5.1), so each  $k'/k$  is geo.reduced(5.3.6.2), thus separable by(5.3.9.4).

4: By hypothesis  $A \otimes_k \bar{k} = H^0(X_{\bar{k}}, \mathcal{O}_{X_{\bar{k}}})$  is an Artinian local ring, thus it has only one point, so irreducible, so it is geo.irreducible(5.3.6.3).

5: By item3, 4,  $A = k'$  is a finite separable field extension of  $k$  that  $\text{Spec}(k' \otimes_k \bar{k})$  is irreducible, but  $k' \otimes_k \bar{k}$  is a finite product of  $\bar{k}$ , thus  $k' = k$ .  $\square$

**Prop. (7.12.1.13)[Check Properties on Geometric/Closed Points].** A nice property of varieties is that identity of two morphisms of products of varieties can be checked at the geometric pts(7.12.1.10), by(7.12.1.11) and(7.12.1.9).

Surjectiveness of a map between varieties can be checked on closed points, by(7.4.1.29).

Also surjective and injective of Qco sheaves need only be checked at closed pts by(7.5.1.38)(7.4.1.26).  $\square$

### Canonical Sheaves

**Prop. (7.12.1.14)[Canonical Sheaves].** For  $X \in \text{SmVar}/k$  and  $Y$  a local complete intersection of  $X$  of codimension  $r$ , by(7.6.4.2) and(7.6.4.15) and(7.6.8.9),  $\mathcal{K}_{X/k}$  and  $\mathcal{I}/\mathcal{I}^2$  is locally free, so we can define the following locally free sheaves:

- The **canonical sheaf**  $\mathcal{K}_{X/k} = \wedge^n \Omega_{X/k}$  on  $X$ .
- The **tangent sheaf**  $\mathcal{T}_X = (\mathcal{K}_{X/k})^{-1}$  on  $X$ .
- The conormal sheaf  $\mathcal{C}_{Y/X} = \mathcal{I}/\mathcal{I}^2$  on  $Y$ .
- The normal sheaf  $\mathcal{N}_{Y/X} = \mathcal{C}_{Y/X}^{-1}$  on  $Y$ .

┘

**Prop. (7.12.1.15)[Kodaira-Spencer map].** There is another characterization of tangent vector fields. (Note: this should be a special case of Prop8.5.9 in [FGA]).

Let  $X$  be a variety over  $k$  and  $S = k[\varepsilon]$  the dual numbers. Then  $H^0(X, \mathcal{T}_X) \cong \text{Aut}^{(1)}(X_S/S)$ , where  $\text{Aut}^{(1)}(X_S/S)$  means that the automorphisms of  $X_S$  over  $S$  that is identity on  $X$ (inclusion to  $X_S$  induced by  $\text{Spec } k \subset \text{Spec } S$ ).  $\square$

*Proof:* First the case  $X = \text{Spec } A$  is affine, then because  $H^0(X, \mathcal{T}_X) = \text{Hom}_k(\mathcal{K}_{A/k}, A) = \text{Der}(A, A)$ , so this is equivalent to  $\text{Der}(A, A) \cong$  automorphisms of  $A[\varepsilon]$  that is identity under pass to quotients to  $A$ . For this, a  $d \in \text{Der}(A, A)$  is mapped to  $a + b\varepsilon \mapsto a + b\varepsilon + d(a)\varepsilon$ . This is checked to be a ring morphism, and any desired morphism are like these.

The above construction is natural and functorial in  $A$ , so it glue together to give the global case.

 $\square$

**Prop. (7.12.1.16)[Smoothness and Conormal Sheaves].** ? Let  $X$  be a smooth variety over a field  $k$ , then an irreducible closed subscheme  $Y$  of codimension  $r$  in  $X$  is smooth iff  $\mathcal{K}_{Y/k}$  is locally free and (7.5.5.13) is exact on the left.

In this case,  $\mathcal{I}$  is locally generated by  $r$  elements and  $\mathcal{C}_{Y/X}$  is a locally free sheaf of rank  $r$  on  $Y$  by (7.6.8.9). ┘

*Proof:* Cf.[Hartshorne P178]. Should has something to do with (7.6.4.2), (7.6.4.15) and (7.6.4.14). □

**Prop. (7.12.1.17)[Adjunction Formulas].** For  $X \in \text{SmVar}/k$  and  $Y$  a smooth subvariety of codimension  $r$ . There is an exact sequence

$$0 \rightarrow \mathcal{I}/\mathcal{I}^2 \rightarrow \mathcal{K}_{X/k} \otimes \mathcal{O}_Y \rightarrow \mathcal{K}_{Y/k} \rightarrow 0$$

by (7.5.5.14). Taking the highest exterior power (7.5.1.25), we get:

$$\mathcal{K}_Y = \mathcal{K}_X \otimes \wedge^r \mathcal{N}_{Y/X} = \mathcal{K}_X \otimes (\wedge \mathcal{I}/\mathcal{I}^2)^{-1}$$

In particular, if  $r = 1$  then  $Y$  is a divisor  $D$  in  $X$ , the canonical sheaf

$$\mathcal{K}_Y \cong (\mathcal{K}_X \otimes \mathcal{L}(D))_Y, \quad \mathcal{K}_{\mathbb{P}_k^n/k} = \mathcal{O}(-n-1) \text{ (7.5.5.7).}$$

because  $\mathcal{I}_Y \cong \mathcal{L}(-Y)$  in this case so  $\mathcal{I}_Y/\mathcal{I}_Y^2 = L(-Y) \otimes \mathcal{O}_Y$ .

Taking dual, we get:

$$0 \rightarrow \mathcal{T}_Y \rightarrow \mathcal{T}_X \otimes \mathcal{O}_Y \rightarrow \mathcal{N}_{Y/X} \rightarrow 0$$

┘

**Prop. (7.12.1.18)[Geometric Genus].** For  $X \in \text{SmVar}/k$ , the **geometric genus**  $p_g$  is defined as the rank of the global section of the invertible canonical sheaf  $\mathcal{K}_X = \wedge^n \mathcal{K}_{X/k}$ . It is a birational invariance. With the same methods, we can prove the rank of global sections of any other functorially defined bundles of  $\mathcal{K}_X$  is birational invariance, e.g. Hodge numbers. ┘

*Proof:* For any rational map  $U \rightarrow Y$ , there is a subset  $V \in U$  and a local isomorphism  $V$  and  $f(V)$ , that will define an isomorphism of global sections. Because a nonzero section of an invertible sheaf cannot vanish on a dense open set  $f(V)$ , the morphism of global sections is injective into  $\Gamma(U, \mathcal{O}_U)$ . Now we find a  $U$  that  $\text{codim}(X - U) > 1$ , then we can use (5.3.5.12) to get  $\Gamma(U) = \Gamma(X)$ , then  $p_g(X) \geq p_g(X')$ , and the converse is also true. For this, we use valuation criterion of properness, then for any codimension 1 point, the stalk is a DVR, thus we find a  $\text{Spec } \mathcal{O}_p \rightarrow X'$ , this extends to a nbhd of  $p$  because  $X'$  is of f.t.. □

**Cor. (7.12.1.19).** By (7.5.5.7),  $\mathcal{K}_{\mathbb{P}_k^n} \cong \mathcal{O}(-n-1)$ , so it has no global section by (7.7.2.1),  $p_g(\mathbb{P}_k^n) = 0$ . Hence every rational variety over a field  $k$ , i.e. one that is birational to  $\mathbb{P}_k^n$ , has geometric genus 0. ┘

### Complete Varieties

**Lemma (7.12.1.20)[Rigidity Lemma].** Let  $X, Y \in \text{Var}/k, Z \in \text{Sch}^{\text{sep}}/k$  and  $f : X \times Y \rightarrow Z \in \text{Sch}/k$ . If  $X$  is complete and  $p \in X(k), y \in Y(k)$  s.t.  $f(\cdot, y) : X \rightarrow Z$  is constant, then  $f$  factors through the projection  $\text{pr}_Y : X \times Y \rightarrow Y$ . ┘

*Proof:* The equalizer is a closed subscheme of  $X \times Y$  as  $Z$  is separated (7.4.5.40), and  $X \times Y$  is a variety (7.12.1.9), thus we can check on closed points. Let  $g(y) = f(p, y) : Y \rightarrow Z$ , then we want to show  $f = g \circ \text{pr}_Y$ .

Let  $U$  be affine open in  $Z$ , then because  $X$  is universally closed,  $\text{pr}_Y$  is closed, so  $V = \text{pr}_Y(f^{-1}(Z \setminus U))$  is closed in  $Y$ . But if  $y \notin V(\bar{k})$ , then  $f(X, y) \subset U$ , and  $X$  is complete and connected, so  $f(\cdot, y)$  is constant (7.4.6.4), and  $f(x, y) = f(p, y)$ . Thus  $f = g \circ \text{pr}_Y$  on a non-empty open subset of  $X \times Y$ , which is a variety, so this is true on all of  $X \times Y$  by (7.12.1.11).  $\square$

**Prop. (7.12.1.21)[See-Saw Principle].** Let  $X$  be a complete variety over a field  $k$  and  $Y$  a  $k$ -scheme, then for any line bundle  $\mathcal{L}$  on  $X \times Y$ , there is a closed subscheme  $Y_1 \subset Y$  s.t. for any morphism  $f : S \rightarrow Y$ ,  $(1 \times f)^*\mathcal{L}$  is trivial on  $X \times S$  iff  $f$  factors through  $Y_1$ .  $\lrcorner$

*Proof:* This  $\mathcal{L}$  corresponds to a morphism  $Y \rightarrow \underline{\text{Pic}}_{X/k}$ , and clearly  $Y_1$  is the fiber of  $Y$  over  $e \in \underline{\text{Pic}}_{X/k}$ .  $\square$

**Cor. (7.12.1.22).** Let  $X$  be a complete variety over a field  $k$  and  $Y$  a reduced locally algebraic  $k$ -scheme, if  $\mathcal{L}, \mathcal{M}$  are two line bundles on  $X \times Y$  s.t.  $\mathcal{L}_y \cong \mathcal{M}_y$  for all closed points  $y \in Y$ , and for some  $x \in X(k)$ ,  $\mathcal{L}_x \cong \mathcal{M}_x$ , then  $\mathcal{L} \cong \mathcal{M}$ .  $\lrcorner$

**Prop. (7.12.1.23)[Theorem of the Cube].** If  $X, Y$  are complete varieties over a field  $k$ , and  $Z$  is a connected, locally Noetherian  $k$ -scheme, if  $x, y$  are rational points of  $X, Y$  resp. and  $z \in Z$ . Supposed  $\mathcal{L} \in \text{Pic}(X \times Y \times Z)$  that is trivial on  $x \times Y \times Z, X \times y \times Z, X \times Y \times z$ , then  $\mathcal{L}$  is trivial.  $\lrcorner$

*Proof:* Let  $Z'$  be the maximal closed subscheme of  $Z$  given by (7.12.1.21). We show that  $Z'$  is open, thus it is all of  $Z$ : If  $\zeta \in Z'$ , let  $I \subset \mathcal{O}_{Z, \zeta}$  be the ideal defining  $Z'$ , we show  $I = (0)$ , which is equivalent to  $Z'$  containing a nbhd of  $\zeta$  (locally Noetherian used). If not, then because  $\cap \mathfrak{m}^n = 0$  by Krull's theorem (locally Noetherian used), there is an  $n \geq 1$  that  $I \subset \mathfrak{m}^n, I \not\subset \mathfrak{m}^{n+1}$ . Let  $\mathfrak{a}_1 = (I, \mathfrak{m}^{n+1})$ , and  $\mathfrak{m}^{n+1} \subset \mathfrak{a}_2 \subset \mathfrak{a}_1$  that  $\dim_{k(\zeta)}(\mathfrak{a}_1/\mathfrak{a}_2) = 1$  (so  $\mathfrak{a}_1 = \mathfrak{a}_2 + k(\xi)a$  for some  $a \in \mathfrak{a}_2$ ), and let  $Z_i \subset \text{Spec } \mathcal{O}_{Z, \xi}$  be the closed subscheme defined by  $\mathfrak{a}_i$ . Let  $\mathcal{L}_i$  be the restriction of  $\mathcal{L}$  on  $X \times Y \times Z_i$ . If we show that  $\mathcal{L}_2$  is trivial, then  $Z_2$  is contained in  $Z'$ , which is contradiction because  $I \not\subset \mathfrak{a}_2$ .

For this, notice that  $\mathcal{L}_1$  is trivial, and to show that  $\mathcal{L}_2$  is trivial, it suffices to lift a non-vanishing global section  $s$  of  $\mathcal{L}_1$  to  $\mathcal{L}_2$ , because  $Z_1, Z_2$  has the same underlying set.

For this, notice there is an exact sequence  $0 \rightarrow k(\xi) \xrightarrow{a} \mathcal{O}_{Z_2} \rightarrow \mathcal{O}_{Z_1} \rightarrow 0$ , where  $k(\xi)$  is the skyscraper sheaf at  $\xi$ . So the obstruction of the lifting is an element  $\xi \in H^1((X \times Y)_{k(\xi)}, \mathcal{O}_{(X \times Y)_{k(\xi)}})$ . But now the conditions show that  $\xi$  is zero under the pullback along  $x \times Y \hookrightarrow X \times Y$  and  $X \times y \hookrightarrow X \times Y$ . So by Kunneth formula (7.7.1.10) and (7.12.1.12),  $\xi$  vanishes.  $\square$

## 2 Projective Varieties

**Example (7.12.2.1)[Non-Projective Smooth Proper Varieties].** There are proper smooth complex 3-folds that are not projective. Examples are given in [Har77]P443<sup>?</sup>.  $\lrcorner$

**Prop. (7.12.2.2)[Affine Dimension Theorem].** Suppose  $X, Y$  are subschemes of  $\mathbb{A}_k^n$  of codimensions  $d$  and  $e$  resp., and  $d + e \leq n$ , then every non-empty irreducible component of  $X \cap Y$  has dimension  $\geq n - d - e$ .  $\lrcorner$

*Proof:* If  $Y$  is an intersection of  $e$  hypersurfaces, then this follows from Krull's height theorem (5.2.4.18). In general, notice the diagonal map  $\Delta : \mathbb{A}_k^n \rightarrow \mathbb{A}_k^n \times \mathbb{A}_k^n$  is an isomorphism onto the diagonal  $T$  defined by  $\{X_i = Y_i\}_{i=1, \dots, n}$ , thus it is a complete intersection in  $\mathbb{A}_k^n \rightarrow \mathbb{A}_k^n \times \mathbb{A}_k^n$ , and  $\Delta$  induces an isomorphism  $X \cap Y \cong X \times Y \cap T$ , so we are done.  $\square$

**Cor. (7.12.2.3) [Projective Dimension Theorem].** Suppose  $X, Y$  are subvarieties of  $\mathbb{P}_k^n$  of codimensions  $d$  and  $e$  resp., and  $d + e \leq n$ , then  $X$  and  $Y$  intersect.  $\lrcorner$

*Proof:* Take the affine cone, then item2 shows any irreducible component of  $\overline{X} \cap \overline{Y}$  containing the origin has dimension  $\geq 1$ , which means  $X \cap Y \neq \emptyset$ .  $\square$

**Prop. (7.12.2.4) [Transversal Intersection].** If  $X \subset \mathbb{P}_k^n$  is a closed subscheme of dimension  $r$ , then there is an intersection of  $r + 1$  non-empty hypersurfaces missing  $X$ . And if  $k$  is infinite, these hypersurfaces can be chosen to be hyperplanes.

If  $\#k = \infty$ , there is an intersection of  $r$  non-empty hypersurfaces intersecting  $X$  at f.m. points.  $\lrcorner$

*Proof:* Let  $\eta_1, \dots, \eta_n$  be the generic points of  $X$ , we want to find a hypersurface  $F$  that doesn't contain any of these generic points. We use induction on  $n$ . If  $n = 1$ , then there is clearly a hyperplane missing  $\eta_1$ . If we find a hypersurface missing  $\eta_1, \dots, \eta_{n-1}$ , if it also misses  $\eta_n$ , we are done, if it contains  $\eta_n$ , we can change  $\eta_n$  to  $\eta_i$  and consider again. If we find polynomials  $F_1, \dots, F_n$  that  $F_i(\eta_i) = 0, F_i(\eta_j) \neq 0$ , we may assume  $\deg(F_i)$  are the same, so  $\sum_i F_1 \dots \widehat{F_i} \dots F_n$  is a polynomial non-zero on each of  $\eta_i$ . If moreover  $k$  is infinite, then we want to find a hyperplane missing every generic point of  $X$ . But each generic point corresponds to a graded ideal  $I_i$  of  $k[T_0, \dots, T_n]$ , and  $(I_i)_1 \neq k\{T_0, \dots, T_n\}$  are proper linear subspaces. As  $k$  is infinite, we can choose a  $a_0T_0 + \dots + a_nT_n$  not in these subspaces, thus non-zero on any generic point of  $X$ .

Now  $X \cap F$  is a closed subscheme of  $\mathbb{P}_k^n$  of dimension  $r - 1$ , thus we can use induction on  $r$  to finish.  $\square$

### 3 Birational Geometry

**Notation (7.12.3.1).**

- Let  $k \in \text{Field}$ .

$\lrcorner$

**Prop. (7.12.3.2).** Any  $X \in \text{Var}/k$  is birational to a hypersurface in  $\mathbb{A}_k^n$  for some  $n$ .  $\lrcorner$

*Proof:* Cf.[Diophantine Geometry, P575].  $\square$

**Prop. (7.12.3.3) [Prevarieties and Function Fields].** The following categories are equivalent.

- The category of prevarieties over  $k$  with dominant rational morphisms.
- The dual category of f.g. field extensions over  $k$ .

$\lrcorner$

*Proof:* Cf.[Sta]0BXN. ?  $\square$

**Prop. (7.12.3.4).** Let  $\varphi : X \rightarrow X'$  be a rational map of  $K$ -varieties with  $X$  smooth. If the base change  $\varphi_{\overline{K}}$  extends to a morphism  $X_{\overline{K}} \rightarrow X'_{\overline{K}}$ , then  $\varphi$  extends to a morphism  $X \rightarrow X'$ .  $\lrcorner$

*Proof:* Let  $U$  be an open dense subset that  $\varphi$  is defined. For a point  $x$ , let  $x' = \varphi_{\overline{K}}(x)$ , then  $x'$  is in the closure of  $\varphi(U)$ . By (7.4.7.2), it suffices to construct a morphism  $\mathcal{O}_{X', x'} \rightarrow \mathcal{O}_{X, x}$ , i.e., to prove for any rational function  $f$  regular at  $x'$ ,  $\varphi \circ f$  is regular at  $x$ . The argument is the same as that of (7.4.6.14).

For any such  $f$ ,  $f_{\overline{K}} \circ \varphi_{\overline{K}}$  is regular at  $x$ , thus no pole of  $\text{div}(f_{\overline{K}} \circ \varphi_{\overline{K}})$  passes through  $x$ . For the rest, Cf.[Diophantine Geometry, P576]. ?  $\square$

**Prop. (7.12.3.5) [Generic Separable Degree].** Let  $\varphi : X \rightarrow X'$  be a dominant morphism of varieties over a field  $k$  of the same dimension, then there exists an open dense subscheme  $U'$  of  $X'$  s.t.  $\varphi^{-1}(U') \rightarrow U'$  is finite and the fibers all have cardinality  $\deg_s(\varphi)$ .  $\lrcorner$

*Proof:* By (7.12.3.3), we can decompose  $\varphi$  and assume it is either separable or purely inseparable, and also primitive. If it is separable, let it be generated by  $t$ . After shrinking (and cutting closure of images), we may assume the coefficients of  $t$  are regular functions, and  $\Gamma(X) = \Gamma(X')[t]/(q(t))$ . As  $q$  is separable, there exists  $a, b \in K(X')$  s.t.  $aq + bq' = 1$ . We may shrink  $X'$  and assume  $a, b \in \Gamma(X')$ , so  $q$  is also separable over any fiber of  $X$ , which means the fibers all have cardinality  $\deg_s(\varphi)$ .

If it is purely inseparable, let  $q(t) = t^{p^k} - h$  be the minimal polynomial of  $t$  over  $K(X')$ ,  $h \in K(X')$ . Then after shrinking, we may assume  $h \in \Gamma(X')$ , thus  $q(t)$  is purely inseparable over any fiber of  $X$ , which means  $\square$

**Def. (7.12.3.6) [Kodaira Dimensions].** For  $X \in \text{SmPrprVar}^n/k$ , the **Kodaira dimension**  $\text{Kod}(X)$  of  $X$  is defined to be  $-\infty$  if  $h^0(X, \mathcal{K}_X^d) = 0$  for  $d$  large, or

$$\text{Kod}(X) = \sup\{k \in \mathbb{R}_+ | h^0(X, \mathcal{K}_X^d)/d^k \text{ is bounded}\}.$$

Then  $\text{Kod}(X) \in \{-\infty\} \cup (\mathbb{Z} \cap [0, n])$ .  $\lrcorner$

## 4 Others

**Prop. (7.12.4.1).** Varieties are triangulable.  $\lrcorner$

*Proof:* Cf. [Triangulation of Algebraic Sets, Hironaka].  $\square$

## Fano Varieties

**Def. (7.12.4.2) [Fano Varieties].** A **Fano variety** is a complete smooth variety  $X$  over a field  $K$  s.t.  $\mathcal{K}_X^*$  is ample.  $\lrcorner$

**Prop. (7.12.4.3).** a smooth complete intersection of hypersurfaces in  $\mathbb{P}_K^n$  is Fano if and only if the sum of their degrees is at most  $n$ .  $\lrcorner$

**Prop. (7.12.4.4) [Kollár-Miyaoka-Mori].** Fano varieties over an alg.closed field are rationally chain connected.  $\lrcorner$

*Proof:* Cf. [Rational connectedness and boundedness of Fano manifolds, Kollar].  $\square$

## Rationally Connected Varieties

**Def. (7.12.4.5) [Rationally Connected Varieties].**  $X \in \text{Var}/K$  is called **rationally connected** if any two points of  $X(\overline{K})$  can be connected by a rational curve (7.13.1.1) over  $\overline{K}$ .  $\lrcorner$

## 5 Relative Varieties

**Def. (7.12.5.1) [Varieties over Schemes].** Let  $S \in \text{Sch}$ , a (proper/smooth) **variety over  $S$**  is a (proper/smooth) flat morphism  $f : X \rightarrow S$  s.t. all the geometric fibers of  $f$  are geo.integral over the resp. residue field  $k(s)$ . It can be regarded as a family of (proper/smooth) varieties parametrized by  $S$ . the category of varieties over  $S$  is denoted by  $\text{Var}/S$ .

Being a (proper/smooth) variety is stable under base change.  $\lrcorner$

**Prop. (7.12.5.2) [Global Sections].** For  $S \in \mathbf{NSch}$  and  $X \in \mathbf{Var}^{\text{proper}}/S$ ,  $\mathcal{O}_S \rightarrow f_*\mathcal{O}_X$  is an isomorphism.  $\lrcorner$

*Proof:* For any closed point  $s \in S$ ,  $k(s) \rightarrow H^0(X_s, \mathcal{O}_{X_s})$  is an isomorphism by (7.12.1.12), and this isomorphism factors through  $k(s) \rightarrow f_*(\mathcal{O}_X) \otimes k(s) \rightarrow H^0(X_s, \mathcal{O}_{X_s})$ . So  $f_*(\mathcal{O}_X) \otimes k(s) \rightarrow H^0(X_s, \mathcal{O}_{X_s})$  is surjective, thus it is an isomorphism by item 4  $\rightarrow$  3 of (10.9.3.17). Thus the first map is also an isomorphism.

Now  $\mathcal{O}_S \rightarrow f_*(\mathcal{O}_X)$  is a surjection at  $s$  by Nakayama. Let  $\mathcal{Q}$  be the coherent sheaf on  $S$  associated to  $\mathcal{F}$ , then by (10.9.3.17), it is free at  $s$ , and  $\mathcal{Q}_s = H^0(X_s, \mathcal{O}_{X_s})$  is of rank 1, but also  $\mathcal{Q}^\vee \cong f_*(\mathcal{O}_X)$ , so  $\mathcal{O}_S \rightarrow f_*(\mathcal{O}_X)$  is in fact a surjection at  $s$ . Now  $s$  is arbitrary, so  $\mathcal{O}_S \rightarrow f_*(\mathcal{O}_X)$  is an isomorphism.  $\square$

**Cor. (7.12.5.3).** If  $S \in \mathbf{NSch}$  and  $f : X \rightarrow S \in \mathbf{SmPrprVar}^d/S$ , then  $f_*\Omega_{X/S} \cong R^1f_*\mathcal{O}_X$  is finite locally free of rank  $d$ , by Grothendieck duality and (7.6.4.2).  $\lrcorner$

**Prop. (7.12.5.4).** Let  $(\mathcal{O}_K, K, k)$  be a DVR and  $X \in \mathbf{Sch}^{\text{sm}}/R$  s.t.  $X_K$  is geo.integral and  $X_k$  is proper, then  $X \in \mathbf{SmPrprVar}/\mathcal{O}_K$ .  $\lrcorner$

*Proof:* Cf. [Good Reduction of Abelian Varieties, P495] ?  $\square$

**Prop. (7.12.5.5) [Generic Geometrically Irreducibility].** For  $f : X \rightarrow Y \in \mathbf{Sch}$  of finite type, if  $Y$  is irreducible with generic point  $\eta$ , and  $X_\eta$  is geometrically irreducible, then there exists a non-empty open subscheme  $V \subset Y$  s.t.  $f : X_V \rightarrow V$  has geometrically irreducible fibers.  $\lrcorner$

*Proof:* Cf. [Sta]0559.  $\square$

## 7.13 Curves

*“Everyone knows what a curve is, until he has studied enough mathematics to become confused through the countless number of possible exceptions.”*

–F. Klein

References are [黎曼曲面, 伍鸿熙], [Vak17]Chap19, [?G–H78], [Har77]Chap4 and [Sta]Chap53. In this section, properties to morphisms of relative dimension  $\leq 1$  are studied.

**Notation (7.13.0.1).**

- Let  $k \in \text{Field}$ .
- Use notations defined in [Cohomology of Schemes](#).
- Use notations defined in [Varieties](#).

┘

### 1 Basics

**Def. (7.13.1.1) [Rational Curve].** A **rational curve** over a field  $k$  is a curve that is birational to  $\mathbb{P}_k^1$ .  
┘

**Lemma (7.13.1.2).** If  $X$  is an integral separated scheme and  $U \subset X$  is an non-empty affine open that  $X \setminus U$  is a finite set of points with  $\mathcal{O}_{X, x_i}$  Noetherian of dimension 1, then there exists a base-point free invertible sheaf  $\mathcal{L} \in \text{Pic}(X)$  and a section  $s$  s.t.  $U = X_s$ .  
┘

*Proof:* Cf. [Sta]09NB. □

**Prop. (7.13.1.3).** A Noetherian separated scheme of dimension  $\leq 1$  has an ample invertible sheaf. ┘

*Proof:* First reduce to the case when  $X_{\text{red}}$ , because (7.13.2.19) shows any invertible sheaf on  $X_{\text{red}}$  is a pullback of a sheaf of  $X$  and (7.5.4.15) shows this sheaf is ample.

Second we reduce to the case  $X$  is integral. Let  $X_i$  are the integral irreducible components of  $Z$ , Cf. [Sta]09NX? □

Finally, for  $X$  integral, the assertion follows from (7.13.1.2) and (7.5.4.10). □

**Cor. (7.13.1.4) [Complete Precurves are Projective].** A separated algebraic scheme  $X$  of dimension 1 over  $k$  is  $H$ -(quasi)projective, by (7.13.1.3) and (7.5.4.24). If  $X$  is proper, then it is projective. ┘

**Prop. (7.13.1.5) [Completion of Curves].** For a separated algebraic  $k$ -scheme  $X$  of dimension  $\leq 1$ , there is an open immersion  $j : X \rightarrow \overline{X}$  that

- $\overline{X}$  is projective over  $k$ .
- $j(X) \subset \overline{X}$  is dense and schematically dense open subscheme.
- $\overline{X} \setminus X$  consists of f.m. closed points  $\{x_i\}$  of  $\overline{X}$ .

This  $\overline{X}$  is called a **completion curve** of  $X$ . And when  $X$  is reduced, the stalk at  $x_i$  are DVRs. In particular, it is non-singular if  $X$  is non-singular. ┘

*Proof:* By (7.13.1.3), we can assume  $X$  is a locally closed subscheme of  $\mathbb{P}_k^n$ . Let  $\overline{X}$  be the scheme theoretic image (7.4.5.13) of the inclusion, then 1, 2 holds by (7.4.5.21). 3 holds because  $\overline{X} \setminus X$  is Noetherian of dimension 0.

For the last assertion, Cf. [Sta]0BXW. □

**Cor. (7.13.1.6).** A morphism of prevarieties  $X \rightarrow Y$  with  $X$  a precurve (thus reduced) and  $Y$  proper over a field  $k$  factors through the completion  $\overline{X}$  of  $X$  by (7.4.6.14). In particular, the completion curves of  $X$  are unique.  $\lrcorner$

**Prop. (7.13.1.7) [Affine or Projective].** A precurve over a field  $k$  is either affine (not proper) or H-projective (proper).  $\lrcorner$

*Proof:* Cf. [Sta]0A27?, (Hard).  $\square$

**Cor. (7.13.1.8).** Let  $X$  be a separated scheme algebraic over a field  $k$ . If  $\dim X \leq 1$  and no irreducible component of  $X$  is proper of dimension 1, then  $X$  is affine.  $\lrcorner$

*Proof:* Let  $X_i$  be f.m. irreducible components of  $X$ , then they are precurves in the induced reduced structure, so they are affine by (7.13.1.7). Now  $\coprod X_i \rightarrow X$  is a finite surjective morphism, so  $X$  is affine by (7.4.4.36).  $\square$

**Prop. (7.13.1.9).** A map from a proper connected scheme to a precurve is either constant or surjective.  $\lrcorner$

*Proof:* Because the closed subset of a precurve is either itself or f.m. closed points.  $\square$

**Prop. (7.13.1.10) [Constant or Finite].** Let  $f : X \rightarrow Y$  be a morphism of schemes over a field  $k$  that  $Y$  is separated and  $X$  is proper of dimension  $\leq 1$ . If the image of every irreducible component of  $X$  is not a pt, then  $f$  is finite. If  $Y$  is a precurve, then it is moreover surjective.  $\lrcorner$

*Proof:* Cf. [Sta]0CCL. ?  $\square$

**Def. (7.13.1.11) [Separable Morphisms].** Let  $f : X \rightarrow Y$  be a non-constant morphism of precurves, then  $f$  is finite surjective by (7.13.1.10). so  $\deg(f)$  is finite (7.4.5.6), and we can define separable/purely separable morphisms as in (7.4.5.6).  $\lrcorner$

### Non-Singular Curves

**Example (7.13.1.12) [Non-Singular and Smooth Curves].** A non-singular curve  $C/k$  may not be smooth, for example, the curve  $tx^p + z^{p-1}y + y^p = 0$  is regular and geo.reduced, but not smooth.  $\lrcorner$

*Proof:* To show it is regular, check directly that at the closed point  $[1, t^{1/p}, 0]$ , the maximal ideal is just  $(y^p - t, z)$  and it just generated by  $z$ .  $\square$

**Def. (7.13.1.13) [Uniformizer].** Let  $C/k$  be a precurve, then the local rings of  $C$  at a non-singular closed point  $p$  is a DVR by (12.2.3.5). Then an element  $t \in K(C)$  with valuation 1 is called a **uniformizer at  $p$** .  $\lrcorner$

**Prop. (7.13.1.14).** Let  $C$  be a precurve over  $k$ , and  $t \in K(C)$  is a uniformizer at some non-singular point, then  $K(C)$  is a finite separable extension of the subfield generated by  $t$ .  $\lrcorner$

*Proof:*  $K(C)$  is a finite extension of  $K(t)$ , because  $\text{tr. deg}(K(C)/k) = 1$  and  $t$  is not algebraic over  $K$  by valuation reasons. Then it suffices to show for any  $x \in K(C)$ ,  $x$  is separable over  $K(t)$ . Let  $\Phi(X, T) = \sum a_{ij} T^i X^j$  be a minimal polynomial of  $x$  over  $K(T)$ . It is separable iff for some  $(j, p) = 1$  and some  $i$ ,  $a_{ij} \neq 0$ . If it is not separable then we can write  $\Phi(X, T) = \sum_{k=0}^{p-1} \varphi_k(X, T)^p T^k$ . But each  $\varphi_k(x, t)^p t^k$  has distinct valuations, unless they are all zero, contradicting the fact  $\Phi$  is a minimal polynomial.  $\square$

**Prop. (7.13.1.15) [Non-singular Complete Precurves and DVRs].** Let  $C$  be a non-singular complete precurve over  $k$ , then all valuation rings of  $K(C)$  containing  $k$  are DVRs, and the set of closed points of  $C$  correspond to the set of DVRs in  $K(C)$  containing  $k$ , which is denoted by  $\Sigma_{K(C)}^0$ .  $\lrcorner$

*Proof:* This is a consequence of the valuation criterion (7.4.6.13). Notice that the local rings of  $C$  at closed points are all DVRs (12.2.3.5), thus they must equal to the valuation ring given.  $\square$

**Prop. (7.13.1.16) [Extension of Rational Maps].** Rational map from a non-singular precurve to a complete prevariety is the same as a morphism, by (7.4.6.15).  $\lrcorner$

**Cor. (7.13.1.17).** Two birationally equivalent normal proper precurves over a field is isomorphic.

Thus if a normal precurve is birationally equivalent to another normal complete curve, then it is an open immersion, by (7.13.1.5).  $\lrcorner$

**Prop. (7.13.1.18) [Category of Non-singular Projective Precurves].** Let  $k$  be a field, the following categories are equivalent:

1. The opposite category of f.g. field extensions of  $k$  of trans.deg 1 with injective  $k$ -homomorphisms.
2. The category of precurves and dominant rational maps.
3. The category of normal complete precurves over  $k$  with non-constant morphisms.
4. The category of non-singular projective precurves over  $k$  with non-constant morphisms.

$\lrcorner$

*Proof:* 1 and 2 are equivalent by (7.12.3.3).

3 and 4 are equivalent by (7.13.1.7) and the fact normal and regular are the same (7.4.2.12).

For the rest, Cf. [Sta]0BY1. ?

$\square$

**Cor. (7.13.1.19) [Non-singular Projective Model].** Comparing this and (7.12.3.3), we see that every precurve over  $k$  is birational to a unique non-singular proper precurve over  $k$  with the same function field, which is called the **non-singular projective model**.  $\lrcorner$

**Prop. (7.13.1.20) [Flatness and Associated Points].**  $f : X \rightarrow Y$  with  $Y$  integral and regular of dimension 1. Then  $f$  is flat iff every associated prime of  $X$  is mapped to the generic point of  $Y$ .

In particular when  $X$  is reduced, this is equivalent to every irreducible component of  $X$  dominants  $Y$ , by (5.2.5.25).  $\lrcorner$

*Proof:* If  $x$  is mapped to a closed pt of  $Y$ , then  $\mathcal{O}_{y,Y}$  is a DVR, let  $t$  be a uniformizer, then  $t$  is not a zero-divisor, and  $f^\sharp(t) \in \mathfrak{m}_x$  is also not a zero-divisor. So  $x$  is not an associated point.

Conversely, to show  $f$  is flat, if  $y$  is the generic point, then  $\mathcal{O}_{y,Y}$  is a field, so it is flat. When  $y$  is a closed pt,  $\mathcal{O}_{y,Y}$  is a DVR, so by (5.4.1.11), we need to show that it is torsion free. If it is not, then  $f^\sharp(t)$  must be a zero-divisor for a uniformizer  $t$  of  $\mathcal{O}_{y,Y}$ . But then it is contained in some associated prime  $p$  of  $\mathcal{O}_{x,X}$  (5.2.5.17). Now  $p$  is mapped to  $y$ , which is a contradiction.  $\square$

**Cor. (7.13.1.21) [Morphism to a Non-singular Curve is Flat].** If  $f : X \rightarrow Y$  is a dominant morphism from a prevariety to a non-singular curve over  $k$ , then  $f$  is flat.  $\lrcorner$

**Cor. (7.13.1.22) [Flat Specializations along Curves].** Let  $Y$  be integral and regular of dimension 1 and  $P$  a closed pt.  $X$  is a closed subscheme in  $\mathbb{P}_{Y-P}^n$  that is flat over  $Y - P$ , then there is a unique closed subscheme  $\overline{X}$  closed in  $\mathbb{P}_Y^n$  that is flat over  $Y$  and restrict to  $X$  on  $\mathbb{P}_{Y-P}^n$ .  $\lrcorner$

*Proof:* Choose the scheme-theoretic closure of  $X$  in  $\mathbb{P}_Y^n$ . Cf.[Hartshorne P258].  $\square$

**Cor.(7.13.1.23) [Finite Flatness].** Any non-constant morphism from a precurve to a nonsingular precurve is finite locally free, by (7.13.1.20) and (7.13.1.10).  $\lrcorner$

**Prop.(7.13.1.24).** A projective non-degenerate non-singular curve of degree  $d$  in  $\mathbb{P}_k^n$  is isomorphic to the  $n$ -tuple embedding, and  $d = n$ .

This has easy generalizations to surfaces and higher dimensions.  $\lrcorner$

*Proof:* (7.5.3.16) shows  $\mathcal{O}_X(1) \cong \mathcal{O}(d)$  over  $\mathbb{P}_k^1$ , and the restriction of global sections is injective. So the global section is an isomorphism, and it defines the embedding up to a linear automorphism.  $\square$

**Prop.(7.13.1.25) [Genera Equal].** For a complete smooth curve  $X$  over a field  $k$ ,

$$p_a(X) = p_g(X) = \dim_k H^1(X, \mathcal{O}_X)$$

by Serre duality (7.9.2.18) and (7.12.1.18) (7.7.3.6).

So from now on we use genus to denote the arithmetic genus.  $\lrcorner$

**Cor.(7.13.1.26) [Topological Genus].** By GAGA, for a complex complete smooth curve, the genus also equals the topological genus.  $\lrcorner$

### Morphisms Between Non-singular Curves

**Prop.(7.13.1.27) [Degree and Analytic Degree].** Let  $f : C \rightarrow C'$  be a non-constant morphism between non-singular complete curves over  $\mathbb{C}$ , then the degree defined in (7.4.5.6) is the same as the degree as map of Riemann surfaces.  $\lrcorner$

*Proof:* This is because the map is finite locally free (7.13.1.23), thus for an affine open subset  $U = \text{Spec } A$  of  $C'$ , the  $f^{-1}(U) = \text{Spec } B$  where  $B \cong A^{\otimes n}$  as  $A$ -modules, where  $n$  is the degree. Then clearly for most  $x \in U$ ,  $\#f^{-1}(x) = n$  (look at the minimal polynomial of a family of generators for  $B$  over  $A$ ).  $\square$

**Def.(7.13.1.28) [Ramification Degrees].** Let  $f : X \rightarrow Y$  be a morphism of non-singular precurves over a  $k$ , let  $P \in X$  be a closed point and  $f(P) = Q$ . Because the local rings are DVRs, we define the **ramification degree**  $e_P(f)$  where  $f^\#(\mathfrak{m}_Q)\mathcal{O}_{X,P} = \mathfrak{m}_P^{e_P(f)}$ .

$f$  is called **weakly unramified at  $P$**  if  $e_P(f) = 1$ , and it is called **unramified at  $P$**  if moreover  $\kappa(P)/\kappa(f(P))$  is separable.  $f$  is called **tamely ramified at  $P$**  if  $\text{?}$

Notice that unramifiedness just means the morphism is unramified, by (7.6.5.8) and (7.13.1.23).  $\lrcorner$

**Prop.(7.13.1.29).** Let  $f : X \rightarrow Y$  be a non-constant morphism of non-singular precurves over  $k$ , then

- If  $g : Y \rightarrow X$  be another morphism of non-singular precurves, then for any  $P_1 \in X$ ,  $e_P(g \circ f) = e_P(f)e_{f(P)}(g)$ .
- for any closed point  $Q \in C_2$ ,  $\sum_{P \in f^{-1}(Q)} e_P(f)[k(P) : k(Q)] = \deg(f)$ .
- If  $k$  is alg.closed, then for a.e. closed point  $Q \in C_2$ ,  $\#f^{-1}(Q) = \deg_s(f)$ .

$\lrcorner$

*Proof:* 1: Trivial.

2: This follows from (7.13.1.46).

3: This follows from (7.12.3.5).  $\square$

**Prop. (7.13.1.30).** If  $f : X \rightarrow Y$  is a non-constant morphism of percurves over  $k$  s.t.  $X$  is smooth and  $Y$  is non-singular, then  $Y$  is also smooth, by (7.1.5.28).  $\lrcorner$

**Prop. (7.13.1.31).** Let  $X$  be a smooth curve over  $k$ ,  $x \in X$  and  $\bar{x} \in X_{\bar{k}}$  is a point mapping to  $x$ , then the ramification degree of  $\mathcal{O}_{X,x} \subset \mathcal{O}_{X_{\bar{k}},\bar{x}}$  equals the inseparable degree of  $k(x)/k$ .  $\lrcorner$

*Proof:* By (7.6.6.7), we can find a étale map  $X \rightarrow \mathbb{A}_k^1$ , which has ramification degree 1 and separable, so we may assume  $X = \mathbb{A}_k^1$ . Then the assertion is clear.  $\square$

**Prop. (7.13.1.32) [Separable Morphisms].** Let  $f : X \rightarrow Y$  be a morphism of smooth curves over  $k$ , then the following are equivalent:

1.  $f$  is finite separable.
2.  $df^* : f^*\Omega_{Y/k} \rightarrow \Omega_{X/k}$  is non-zero.
3.  $\Omega_{X/Y}$  is supported on a proper closed subscheme of  $X$ .
4. There exists a non-empty open subset  $U \subset X$  s.t.  $f$  is unramified.
5. There exists a non-empty open subset  $U \subset X$  s.t.  $f$  is étale.

$\lrcorner$

*Proof:* As  $X, Y$  are smooth,  $\Omega_{X/k}, \Omega_{Y/k}$  are invertible sheaves, and the exact sequence

$$f^*\Omega_{Y/k} \rightarrow \Omega_{X/k} \rightarrow \Omega_{X/Y} \rightarrow 0$$

shows 2, 3 are both equivalent to  $\Omega_{X/Y, \xi} = 0$ .

3, 4, 5 are equivalent as  $f$  is automatically flat (7.13.1.21).

1, 5 are equivalent by (7.6.5.9).  $\square$

**Prop. (7.13.1.33) [Riemann-Hurewitz for Separable Maps].** If  $f : X \rightarrow Y$  is a non-constant separable map between two complete non-singular curves over a field  $k$ , then

$$2g_X - 2 = \deg(f)(2g_Y - 2) + \sum_{x \in X} d_x [\kappa(x) : k],$$

where  $d_x = \text{length}_{\mathcal{O}_{X,x}}(\Omega_{X/Y,x}) \geq 0$  satisfies  $d_x \geq e_x(f) - 1$ , and equality holds iff  $f$  is tamely unramified at  $P$ .  $\lrcorner$

*Proof:* By (7.8.5.12), in this case the vanishing locus  $R$  of  $df^*$  is an effective Cartier divisor, and  $f^*\mathcal{K}_{Y/k} \otimes \mathcal{O}(R) \cong \mathcal{K}_{X/k}$ , so by (7.13.2.10)(7.13.2.3)(7.13.2.7),

$$2g_X - 2 = \deg(\mathcal{K}_{X/k}) = \deg(f^*\mathcal{K}_{Y/k} \otimes \mathcal{O}(R)) = \deg(f) \deg(\mathcal{K}_{Y/k}) + \deg(R) = \deg(f)(2g_Y - 2) + \deg(R).$$

For analysis of  $d_x$ , Cf. [Sta]0C1F. ?  $\square$

**Cor. (7.13.1.34).** The only geo.integral unramified finite covering of  $\mathbb{P}_k^1$  is itself.  $\lrcorner$

**Thm. (7.13.1.35) [De Franchis].** Let  $k \in \mathbf{Field}$  and  $C, C'$  are two complete smooth curves over  $k$ . Then if  $g(C) \geq 2$ , there are only f.m. non-constant maps  $C' \rightarrow C$ .

In particular,  $\# \text{Aut}(C) < \infty$ .  $\lrcorner$

*Proof:* We prove for  $k = \mathbb{C}$ ? Cf.[Mil08]P146.

Any automorphism of  $C$  fixes its set of Weierstrass sets, which is finite, so we only need to consider the case that it fixes all Weierstrass points.

If  $C$  is hyperelliptic, consider a hyperelliptic map, this covering has an involution of  $C$ , and this is just  $C \mapsto C/\tau$ . So modulo  $\tau$ , it suffices to show  $\mathbb{P}^1$  has f.m. automorphisms fixing the branch points. But this is true, as  $2g + 2 > 3$ .

If  $C$  is non-hyperelliptic, then there are more than  $2g + 2$  Weierstrass points. But we can find a function  $f$  on  $C$  with  $g + 1$  zeros and poles, by Riemann-Roch, then for an automorphism  $\varphi$  of  $C$ ,  $f - \varphi^*f$  has no more than  $2g + 2$  poles, so also has no more than  $2g + 2$  zeros. But  $\varphi$  fixes all Weierstrass points, so it has more than  $2g + 2$  zeros, contradiction.  $\square$

**Prop. (7.13.1.36) [Hurewitz's Automorphism Theorem].** If  $C$  is a complete smooth curve of genus  $g \geq 2$  over a field of characteristic 0, then  $\# \text{Aut}(C) \leq 84(g - 1)$ .  $\lrcorner$

*Proof:* We may pass to the alg.closure. By(7.13.1.35),  $\# \text{Aut}(C) < \infty$ . In fact, let  $G$  be a finite group acting on  $C$ , let  $C'$  be the non-singular precurve corresponding to  $C'$ , then by(3.2.8.7),  $C \rightarrow C'$  is a Galois cover with Galois group  $G$ . Now by Dedekind extension theory,  $G$  acts transitively on the preimage of a given point. Suppose there are  $n$  branched points with ramification degrees  $r_i$ , then by Riemann-Hurewitz(7.13.1.33)(notice in this case it is tamely unramified):

$$(2g - 2) = |G|(2g(C') - 2 + \sum_{i=1}^n \frac{r_i - 1}{r_i}).$$

Then a combinatorial argument shows the maximal possible  $|G|$  is obtained when  $g(C') = 0, n = 3$  and  $(r_1, r_2, r_3) = (2, 3, 7)$ .  $\square$

**Remark (7.13.1.37).** In the case  $\text{char } k \neq 0$ , there may be more automorphisms. For example, if  $p \in \mathbb{P} \setminus \{2\}$ , the completion of the affine curve  $y^{p^n} = x + x^{p^n+1}$  has genus  $g = p^n(p^n - 1)/12$  and  $\# \text{Aut}(C) = p^{3n}(p^{3n} + 1)(p^{2n} - 1)$ , Cf.[H.Stichtenoth,Über die Automorphismengruppe eines algebraischen Funktionenkörpers von Primzahlcharakteristik. I. Eine Abschätzung der Ordnung der Automorphismengruppe, Arch. Math. (Basel) 24 (1973), 527–544.].  $\lrcorner$

**Prop. (7.13.1.38) [Frobenius Map].** Let  $k \in \text{Field}^p, C \in \text{Cur}^{\text{SmPrpr}}/k$  and  $C \xrightarrow{F_{X/k,r}} C^{(r)}$  be the Frobenius, where  $C^{(r)} = C \otimes_{k, \text{Frob}^r} k$ , then  $F_{X/k,r}$  is purely inseparable, and  $\deg(F_{X/k,r}) = p^r$ . And it is a topological homeomorphism by(5.1.7.26).  $\lrcorner$

*Proof:* To show inseparability, we can base change to  $\bar{k}$ , then the field map is  $f/g \mapsto f(\underline{X}^{p^r})/g(\underline{X}^{p^r})$ , which is just  $K(C_{\bar{k}})^{p^r}$ , so purely inseparable of degree  $p^r$ .  $\square$

**Prop. (7.13.1.39) [Inseparable Decomposition].** Let  $k \in \text{Field}^p$ . If  $C_1$  is a smooth complete precurve, then any map of non-singular complete precurves  $f : C_1 \rightarrow C_2$  over  $k$  factors as

$$C_1 \xrightarrow{F_{X/k,r}} C_1^{(r)} \xrightarrow{\lambda} C_2$$

where  $C_1^{(r)} = C_1 \otimes_{k, \text{Frob}^r} k$ , and  $\lambda$  is separable.  $\lrcorner$

*Proof:* By(7.13.1.18), it suffices to show any inseparable morphism is a Frobenius. It suffices to show that any subfield of  $K(X)$  of index  $p$  equals  $K(X^{(1)}) = kK(X)^p$ . For this, Cf.[Sta]0CCY?.  $\square$

**Cor. (7.13.1.40).** If  $C \rightarrow C'$  is a non-constant separable map between complete smooth curves, then  $g(C) \geq g(C')$ .  $\lrcorner$

*Proof:* This follows from (7.13.1.39)(7.13.1.33) and the fact  $C_1^{(r)}$  is smooth and have the same genus as  $C_1$  by flat base change.  $\square$

**Prop. (7.13.1.41) [Finiteness of Ramified Covers].** Let  $C \in \mathcal{C}ur^{\text{sm}, \text{Prpr}}/\mathbb{C}$  and  $B \subset C(\mathbb{C})$  a finite set, then for any  $n \in \mathbb{Z}_+$ , there exists only f.m. isomorphism classes of  $n$ -fold ramified coverings of  $C$  that are unramified outside  $B$ .  $\lrcorner$

*Proof:* The ramified coverings correspond to  $n$ -fold covering spaces of  $C(\mathbb{C}) \setminus B$ , which corresponds to index- $n$  subgroups of  $\pi_1(C(\mathbb{C}) \setminus B)$  by (4.15.1.28).  $\pi_1(C(\mathbb{C}) \setminus B)$  is f.g., and a subgroup corresponds to an action of  $\pi_1(C(\mathbb{C}) \setminus B)$  on  $[n]_+$ . So there are only f.m..  $\square$

### Divisors on Curves

**Def. (7.13.1.42) [Weil Divisors on Curves].** If  $k = \bar{k}$  and  $X \in \mathcal{S}ch_{\text{int}}^{\text{loc.ft, dim}=1}/k$ , then a **Weil divisor** on  $X$  is defined to be a locally finite formal sum of closed pts.

If  $X$  is integral algebraic of dimension 1 over  $k$ , then the sum is in fact finite, we we can define the **degree** of a Weil divisor  $D = \sum n_P P$  as  $\deg(D) = \sum n_P [k(P) : k]$ .

Similarly, for a Cartier divisor  $D$  on  $X$ , the **degree of  $D$**  is defined to be  $\dim_k \Gamma(D, \mathcal{O}_D)$ . By (9.1.4.1), a Cartier divisor on  $X$  is equivalent to an effective Weil divisor, and the definition of degrees are compatible.  $\lrcorner$

**Cor. (7.13.1.43) [Non-singular Case].** As a non-singular precurve  $C$  is locally factorial, (7.5.3.15) shows in this case a line bundles on  $C$  is equivalent to a Weil divisor on  $C$ .  $\lrcorner$

**Prop. (7.13.1.44) [Pullback of Divisor].** If  $k = \bar{k}$  and  $f : X \rightarrow Y \in \mathcal{C}ur^{\text{sm}}/k$  is a non-constant map, then for any Weil divisor  $D$  on  $X$  (7.13.1.42), we have  $\deg f^* D = \deg f \cdot \deg D$ .  $\lrcorner$

*Proof:* This is because  $f$  is finite locally free (7.13.1.23), thus this follows from [Sta]02RH<sup>?</sup>.  $\square$

**Prop. (7.13.1.45).** An element  $\notin k$  in the function fields of a projective non-singular curve over an alg.closed  $k$  defines a inclusion  $k(f) \subset K(X)$  thus a morphism from  $X$  to  $\mathbb{P}_k^1$  (7.12.3.3), and  $(f) = \varphi^*(\{0\} - \{\infty\})$ .  $\lrcorner$

**Prop. (7.13.1.46).** Let  $\pi : C \rightarrow C'$  be a non-constant separable morphism of precurves over a field  $k$  that  $C'$  is nonsingular,  $p \in C'$  is a closed point, then  $\pi$  is finite locally free by (7.13.1.23), and

- $\pi^{-1}(p) \subset C$  is a dimension 0 scheme.
- $\dim_k(\Gamma(\pi^{-1}(p))) = (\deg \pi)(\deg p)$ .
- Let  $\varpi$  be a uniformizer of the DVR  $\mathcal{O}_{C', p}$ , then

$$\deg \pi = \sum_{x \in \pi^{-1}(p)} [k(x) : k(p)] \text{ord}_{\mathcal{O}_{C, x}}(f^* \varpi).$$

$\lrcorner$

*Proof:* Look affine locally, then these follow from the fundamental identity (5.2.7.21).  $\square$

**Prop. (7.13.1.47).** For a 1-dimensional integral scheme  $c : X \rightarrow k$  proper over  $k$  and a function  $f \in R(X)^*$ ,

$$\sum_{x \text{ closed}} [k(x) : k] \text{ord}_{\mathcal{O}_{X,x}}(f) = 0.$$

In other words, the number of zeros of  $f$  equals the number of poles of  $f$ .  $\lrcorner$

*Proof:* It suffices to show that the pushforward  $c_* \text{div}(f) = 0 \in \text{CH}_0(\text{Spec } k)$ . consider  $Y$  the closure of the graph of  $f$  in  $X \times \mathbb{P}_k^1$ , then there is a commutative diagram

$$\begin{array}{ccc} Y & \xrightarrow{\text{pr}_1} & X \\ \downarrow \text{pr}_2 & & \downarrow c \\ \mathbb{P}_k^1 & \xrightarrow{c'} & \text{Spec } k \end{array},$$

and  $\text{div}_X(f) = \text{pr}_{1*} \text{div}_Y(f)$  by (9.1.1.22). We may assume  $f$  is not constant, then  $\text{pr}_2$  is finite locally free of degree  $d$ , and  $\text{div}_Y(f) = \text{pr}_2^*([(\infty)] - [(\infty)])$ , so  $\text{pr}_{2*} \text{div}_Y(f) = d([(\infty)] - [(\infty)])$  is mapped to  $0 \in \text{CH}_0(\text{Spec } k)$ .  $\square$

## 2 Vector Bundles

### Degrees and Riemann-Roch

**Def. (7.13.2.1) [Degrees].** The **degree of a locally free sheaf**  $\mathcal{E}$  of rank  $n$  on a proper scheme  $X$  of dimension  $\leq 1$  over  $k$  is defined to be  $\deg(\mathcal{E}) = \chi(X, \mathcal{E}) - n\chi(\mathcal{O}_X)$  (7.7.3.1).

If  $X$  is integral (e.g. a complete precurve), this definition can extend to any coherent sheaves  $\mathcal{F}$ , if we define  $\text{rank}(\mathcal{F}) = \dim_{k(\eta)} \mathcal{F}_\eta$ .  $\lrcorner$

**Prop. (7.13.2.2).** The degree function is additive, stable under base change of fields, and stable under birational equivalence of proper scheme  $X$  of dimension 1 over  $k$ .  $\lrcorner$

*Proof:* The base change follows from flat base change (7.7.5.1), the additivity follows from the additivity of rank and Euler characteristic (7.7.3.1).

For the birational equivalence, If  $f : X \rightarrow Y$  is a birational map between proper schemes of dimension  $\leq 1$  over  $k$ , then  $f$  is proper with finite fibres, so  $f$  is finite (7.4.6.5), thus for any  $\mathcal{E} \in \text{QCoh}^{\text{free}, n}(Y)$ ,  $f_* f^* \mathcal{E} = \mathcal{E} \otimes_{\mathcal{O}_Y} f_* \mathcal{O}_X$ , and there is an exact sequence

$$0 \rightarrow \mathcal{K} \rightarrow \mathcal{O}_Y \rightarrow f_* \mathcal{O}_X \rightarrow \mathcal{Q} \rightarrow 0$$

where  $\mathcal{K}, \mathcal{Q}$  are coherent sheaves on  $Y$  with supported dimension 0. Then by (7.7.3.5) and (7.7.3.3),

$$\begin{aligned} \chi(Y, \mathcal{E}) - \chi(X, f^* \mathcal{E}) &= \chi(Y, \mathcal{E}) - \chi(Y, f_* f^* \mathcal{E}) \\ &= \chi(Y, \mathcal{K} \otimes \mathcal{E}) - \chi(Y, \mathcal{Q} \otimes \mathcal{E}) \\ &= n\chi(Y, \mathcal{K}) - n\chi(Y, \mathcal{Q}) \\ &= n\chi(Y, \mathcal{O}_Y) - n\chi(X, \mathcal{O}_X) \end{aligned}$$

$\square$

**Prop. (7.13.2.3) [Non-reduced Riemann-Roch].** If  $X$  is a proper scheme over  $k$  of dimension  $\leq 1$  with integral components  $C_i$  of  $X$  of dimension 1 with generic points  $\eta_1, \dots, \eta_r$  and multiplicities  $m_i$ , and  $\mathcal{E} \in \text{Vect}^n(C)$ ,  $\mathcal{F} \in \text{Coh}(C)$ , then

$$\chi(\mathcal{E} \otimes \mathcal{F}) = \sum_i (\text{length}_{\mathcal{O}_{X, \eta_i}} \mathcal{F}_{\eta_i}) \deg(\mathcal{E}|_{C_i}) + n\chi(\mathcal{F}).$$

┘

*Proof:* We use dévissage (7.5.1.55), the condition 1 are true by additivity of  $\chi$ , and for condition 2, take  $\mathcal{G} = i_* \mathcal{O}_Z$ , the equation holds by (7.7.3.5) and projection formula.  $\square$

**Cor. (7.13.2.4).** Let  $X$  be a proper scheme of dimension  $\leq 1$  over  $k$ , and  $C_i$  are the irreducible components of  $X$  of dimension 1 with the induced reduced structure and multiplicity  $m_i$ , then for  $\mathcal{E} \in \text{Coh}^{\text{free}}(X)$ ,

$$\deg(\mathcal{E}) = \sum m_i \deg(\mathcal{E}|_{C_i}).$$

┘

**Cor. (7.13.2.5).** Let  $X$  be a proper scheme of dimension  $\leq 1$  over  $k$ , then

- If  $\mathcal{E} \in \text{Coh}^{\text{free}, m}(X)$ ,  $\mathcal{F} \in \text{Coh}^{\text{free}, n}(X)$ , then  $\deg(\mathcal{E} \otimes \mathcal{F}) = m \deg(\mathcal{F}) + n \deg(\mathcal{E})$ .
- If  $\mathcal{L}, \mathcal{M} \in \text{Pic}(X)$ , then  $\deg(\mathcal{L} \otimes \mathcal{M}) = \deg(\mathcal{L}) + \deg(\mathcal{M})$ .
- If  $\mathcal{L} \in \text{Pic}(X)$ ,  $\deg(\mathcal{L}) = -\deg(\mathcal{L}^{-1})$ .
- If  $\mathcal{E} \in \text{Coh}^{\text{free}}(X)$ ,  $\deg(\mathcal{E}) = \deg(\wedge \mathcal{E})$ .

┘

*Proof:* By (7.13.2.4), we can assume  $X$  is integral. Then 1, 2 follow from (7.13.2.3), and 3 follows from the fact there is a modification  $X' \rightarrow X$  s.t.  $f^* \mathcal{E}$  has a filtration with invertible sheaves  $\mathcal{L}_i$  as quotients (7.5.1.30). Then by (7.13.2.2), we can work on  $X'$ . Then  $\deg(\mathcal{E}) = \sum_i \deg(\mathcal{L}_i)$ , and the assertion follows from additivity and (7.13.2.3).  $\square$

**Prop. (7.13.2.6).** If  $D$  is an effective Cartier divisor on a proper scheme  $X$  of dimension  $\leq 1$  over  $k$ , then for  $\mathcal{E} \in \text{Coh}^{\text{free}, n}(X)$ ,

$$\deg(\mathcal{E}(D)) = n \deg(D) + \deg(\mathcal{E})$$

where  $\deg(D) = \dim_k \Gamma(X, \mathcal{O}_D)$ . In particular,  $\deg(\mathcal{L}(D)) = \deg(D)$ .  $\square$

*Proof:* By (7.8.1.3),  $D$  is nowhere dense in  $X$ , thus  $D$  is finite over  $k$ , and there is an exact sequence

$$0 \rightarrow \mathcal{E} \rightarrow \mathcal{E}(D) \rightarrow \mathcal{E}(D)|_D \rightarrow 0.$$

So the assertion follows from the additivity of Euler characteristics and (7.7.3.5).  $\square$

**Prop. (7.13.2.7).** Let  $f : X \rightarrow Y$  be a non-constant map of complete precurves over  $k$  and  $\mathcal{E} \in \text{Coh}^{\text{free}}(Y)$ , then  $\deg(f^* \mathcal{E}) = \deg(f) \deg(\mathcal{E})$ .  $\square$

*Proof:* By (7.13.1.10) and (7.13.2.3),

$$\chi(X, f^* \mathcal{E}) = \chi(Y, \mathcal{E} \otimes f_* \mathcal{O}_X) = \deg(f) \deg(\mathcal{E}) + \text{rank}(\mathcal{E}) \chi(X, \mathcal{O}_X).$$

┘

**Prop. (7.13.2.8) [Degree and Sections].** Let  $C$  be a complete precurve over  $k$  and  $\mathcal{L} \in \text{Pic}(C)$ , then

- If  $\mathcal{L}$  has a non-zero section, then  $\deg(\mathcal{L}) \geq 0$ .
- If  $\mathcal{L}$  has a non-zero section that vanishes at some point, then  $\deg(\mathcal{L}) \geq 1$ .
- If both  $\mathcal{L}, \mathcal{L}^{-1}$  have non-zero sections, then  $\mathcal{L} \cong \mathcal{O}_X$ .
- If  $\deg(\mathcal{L}) \leq 0$  and  $\mathcal{L}$  has a non-zero section, then  $\mathcal{L} \cong \mathcal{O}_X$ .
- If  $\mathcal{N} \rightarrow \mathcal{L}$  is a non-zero map of invertible sheaves, then  $\deg(\mathcal{L}) \geq \deg(\mathcal{N})$ , with equality iff this is an isomorphism.

┘

*Proof:* If  $s$  is a section of  $\mathcal{L}$  with vanishing locus  $D$ , then  $D$  is an effective Cartier divisor and  $\mathcal{L} \cong \mathcal{L}(D)$ , so  $\deg(\mathcal{L}) = \deg(D)$  by (7.13.2.6), so these are all simple now.  $\square$

**Prop. (7.13.2.9) [Riemann-Roch].** Let  $D$  be a Weil divisor on a complete non-singular precurve  $X$  of genus  $g$  over  $k$ , then

- If  $l(D) = \dim_k H^0(X, \mathcal{L}(D))$ ,  $l(D)$  is finite by (7.7.4.11).
- $[\omega_X]$  is an invertible sheaf by [Sta]0BFQ?.
- $l(D) - l([\omega_X] - D) = \deg D + 1 - g$ .
- $\deg(D) = \deg(\mathcal{L}(D))$

Notice when  $X$  is smooth,  $[\omega_X]$  is just  $\mathcal{K}_X$  (7.9.2.17).  $\square$

*Proof:* 4 is equivalent to 3 by Serre duality (7.9.2.17), and 3 follows from (7.13.2.6).  $\square$

**Cor. (7.13.2.10).**  $\deg([\omega_C]) = 2g - 2$ .  $\square$

*Proof:* By (7.13.2.9) and Serre-duality (7.9.2.17),

$$\deg([\omega_C]) = h^0(X, [\omega_X]) - h^0(X, \mathcal{O}_X) + g - 1 = h^1(X, \mathcal{O}_X) - h^0(X, \mathcal{O}_X) + g - 1 = 2g - 2.$$

$\square$

**Prop. (7.13.2.11) [Twisting Sheaves].** Let  $\mathcal{L}$  be a line bundle on a complete nonsingular precurve  $C$ , and  $p \in C$  is a closed point of degree  $d$ , then  $0 \leq h^0(\mathcal{L}) - h^0(\mathcal{L}(-p)) \leq d$  for any  $\mathcal{L} \in \text{Pic}(C)$ .

In particular, by (7.13.2.8), if  $C$  is a complete non-singular curve, then  $h^0(\mathcal{L}) \leq \deg L + 1$  for any  $\mathcal{L} \in \text{Pic}(C)$ .  $\square$

*Proof:* There is an exact sequence  $0 \rightarrow \mathcal{O}_C(-p) \rightarrow \mathcal{O}_C \rightarrow \mathcal{O}_C|_p \rightarrow 0$ , tensoring with  $\mathcal{L}$  and take the cohomology, we get an exact sequence  $0 \rightarrow h^0(\mathcal{L}, \mathcal{L}(-p)) \rightarrow h^0(\mathcal{L}, \mathcal{L}) \rightarrow H^0(C, \mathcal{L}|_p)$ , and notice that  $h^0(C, \mathcal{L}|_p) = d$ .  $\square$

**Prop. (7.13.2.12) [Riemann-Roch for High Degree  $D$ ].** If  $\deg(D) \geq 2g - 1$ , then  $\deg([\omega_X] - D) < 0$ , so by (7.13.2.8),  $l([\omega_X] - D) = 0$ , thus  $l(D) = d - g + 1$ .  $\square$

**Cor. (7.13.2.13) [Characterizing  $[\omega_C]$ ].** Any degree  $2g - 2$  divisor  $D$  satisfies  $l(D) = g - 1$  or  $g$ , and the latter case happens iff  $D = [\omega_C]$ .  $\square$

*Proof:*  $l([\omega_C] - D) = 1$  iff  $[\omega_C] = D$  by (7.13.2.8).  $\square$

**Def. (7.13.2.14) [Special Divisors].** A **special divisor** on a complete non-singular curve is a divisor  $D$  that  $h^0([\omega_C] - D) > 0$ .  $\square$

**Prop. (7.13.2.15).** For any complete smooth curve  $C$  of genus  $g > 1$  over a field  $k$ , there is a closed point on  $C$  of degree  $\leq 2g - 2$ . And if  $g \geq 2$ , we can assume this point is a geometric point.  $\lrcorner$

*Proof:* The canonical sheaf  $\mathcal{K}_C$  is a line bundle of degree  $2g - 2$  and  $h^0(\mathcal{K}_C) = g \geq 1$ , so we can assume  $\mathcal{K}_C$  is an effective divisor, then one of its support point has degree  $\leq 2g - 2$ .

For the last assertion, Cf. [Sta]0CD4.  $\square$

### Vector Bundles

**Prop. (7.13.2.16) [Torsion-Free Sheaves].** Let  $C$  be a non-singular precurves over  $k$ , then

- Any torsion-free coherent sheaf  $\mathcal{F}$  on  $C$  is locally free.
- Any  $\mathcal{F} \in \text{Coh}(X)$  factors as  $0 \rightarrow \mathcal{F}_{\text{tor}} \rightarrow \mathcal{F} \rightarrow \mathcal{F}_{\text{lf}} \rightarrow 0$ , where  $\mathcal{F}$  is a torsion sheaf (7.5.1.44) and  $\mathcal{F}_{\text{lf}}$  is Qco and locally free, by (7.5.1.46)  $\lrcorner$

*Proof:*  $\square$

**Prop. (7.13.2.17) [Pic<sup>0</sup>(C)].** For a smooth complete curve  $C$  over  $k$  with a rational point,  $\text{Pic}^0(C)$  are exactly the set of line bundles of degree 0, by (20.9.10.2). In particular, there is an exact sequence

$$0 \rightarrow \text{Pic}^0(C) \rightarrow \text{Pic}(C) \rightarrow \mathbb{Z} \rightarrow 0.$$

$\lrcorner$

**Prop. (7.13.2.18) [Torsion Elements].** If  $k = \bar{k}$  and  $C$  is a smooth complete curve of genus  $g$  over  $k$ , then for  $m \in \mathbb{Z} \cap k^\times$ ,  $\text{Pic}(C)[m] = \text{Pic}^0(C) \cong (\mathbb{Z}/(m))^{2g}$ .  $\lrcorner$

*Proof:* This follows from (20.9.10.2)(7.13.2.17) and (20.9.6.18).  $\square$

**Prop. (7.13.2.19).** If  $Z \rightarrow X$  is a closed immersion and  $\dim X \leq 1$ , then  $\text{Pic } X \rightarrow \text{Pic } Z$  is a surjection.  $\lrcorner$

*Proof:* Use the exact sequence  $0 \rightarrow (1 + \mathcal{I}) \cap \mathcal{O}_X^* \rightarrow \mathcal{O}_X^* \rightarrow i_* \mathcal{O}_Z^* \rightarrow 0$ ,  $\dim X \leq 1$  and the Grothendieck vanishing theorem gives the desired result, also notice  $i$  is affine.  $\square$

### Ample Line Bundles

**Prop. (7.13.2.20).** A line bundle  $\mathcal{L}$  over a complete precurve  $C$  over  $k$  is ample iff  $\deg(\mathcal{L}) > 0$ .  $\lrcorner$

*Proof:* If  $C$  is non-singular, the proof is easy:  $\mathcal{L}$  is ample iff  $\mathcal{L}^{\otimes n}$  is very ample for  $n$  large (7.5.4.24). If  $\deg(\mathcal{L}) < 0$ , this cannot happen, by (7.13.2.8). For  $\deg L \geq 0$ ,  $\mathcal{L}^{\otimes n}$  is very ample for  $n$  large by (7.13.2.26).

In general, Cf. [Sta]0B5X?  $\square$

**Cor. (7.13.2.21) [Ample and Nef Line Bundles].** Let  $\mathcal{L}$  be an invertible  $\mathcal{O}_X$ -module over a proper scheme of dimension  $\leq 1$  over  $k$ , let  $C_i$  be the integral components of  $X$  of dimension 1, then  $\mathcal{L}$  is a ample iff  $\deg(\mathcal{L}|_{C_i}) > 0$  for all  $i$ .  $\lrcorner$

*Proof:* This follows from (7.5.4.14) applied to the reduced structure of the irreducible components of  $X$ , together with the fact a line bundle on an irreducible component  $\text{Spec } k(x)$  of dimension 0 is obviously ample.  $\square$

**Prop. (7.13.2.22).** Let  $\mathcal{L}$  be a line bundle on a complete non-singular precurve  $C$  of degree  $d$  that is basepoint-free, then it determines a morphism  $\pi : C \rightarrow \mathbb{P}_k^1$  of degree  $d$ .  $\lrcorner$

*Proof:* This follows from (7.13.1.46).  $\square$

**Prop. (7.13.2.23).** Let  $C$  be a complete precurve over  $k$  with genus  $g > 0$ , and  $p, q$  are rational points on  $C$ , then  $\mathcal{O}_C(p) \cong \mathcal{O}_C(q)$  iff  $p = q$ , and  $h^0(C, \mathcal{O}_C(p)) = 1$ .  $\lrcorner$

*Proof:* The hypothesis shows  $\mathcal{L} = \mathcal{O}_C(p)$  has degree 1 and is basepoint-free, thus defines a degree 1 map  $C \rightarrow \mathbb{P}_k^1$ , which is an isomorphism, by (7.13.1.16) and (7.13.1.18), contradiction.

If  $h^0(C, \mathcal{O}_C(p)) \geq 2$ , then for any section  $s$ ,  $\text{div}(s) = q$  for some rational point  $q$ , so by the above argument,  $q = p$ , so any two such  $f$  is proportional.  $\square$

**Prop. (7.13.2.24).** Let  $C$  be a complete curve over  $k$  with genus  $g > 0$ , and  $\mathcal{L}$  is a line bundle of degree 2, then  $h^0(C, \mathcal{L}) \leq 2$ , and if the equality holds, then it is basepoint-free.  $\lrcorner$

*Proof:* We can base change to  $\bar{k}$ .  $h^0(C, \mathcal{L}) \leq 3$  by (7.13.2.11). If equality holds, then then  $h^0(C, \mathcal{L}(-p)) = 2$  for some  $p$ , contradiction by (7.13.2.23). If  $h^0(C, \mathcal{L}) = 2$ , then  $h^0(C, \mathcal{L}(-p)) < 2$  for any  $p$ , so it is basepoint-free. Conversely, if it is basepoint free, then  $\mathcal{L} \cong \mathcal{O}(p)$  for some rational point  $p$ , and  $h^0(C, \mathcal{L}) = h^0(C, \mathcal{O}_C) + 1 = 2$ .  $\square$

**Prop. (7.13.2.25)[Criterion of Very Ampleness].** Let  $k = \bar{k}$  and  $\mathcal{L}$  be a line bundle on a curve over  $k$ , then

- $\mathcal{L}$  is basepoint-free iff  $h^0(\mathcal{L}) - h^0(\mathcal{L} - p) = 1$  for any closed point  $p \in \mathcal{L}$ .
- $\mathcal{L}$  is very ample iff  $h^0(\mathcal{L}) - h^0(\mathcal{L} - p - q) = 2$  for any closed points  $p, q \in \mathcal{L}$ .

$\lrcorner$

*Proof:* Cf. [Vakil, P509]. ?  $\square$

**Cor. (7.13.2.26).** Any line bundle  $\mathcal{L}$  on a complete non-singular curve of genus  $g$  that  $\deg(\mathcal{L}) \geq 2g$  is basepoint-free, and if  $\deg(\mathcal{L}) \geq 2g + 1$ , then it is very ample.  $\lrcorner$

*Proof:* When  $k = \bar{k}$ , this follows from (7.13.2.25) and Riemann-Roch (7.13.2.9). For general  $k$ , use the fact being basepoint-free, closed embedding and degree are all stable and reflective under base change of fields (7.13.2.2)(7.5.3.3)(7.1.5.26).  $\square$

**Prop. (7.13.2.27)[Very Ample Line Bundles].** Let  $X$  be a complete curve over a field  $k$ , then

- If  $\mathcal{L}$  is effective and  $H^1(X, \mathcal{L}) = 0$ , then  $\mathcal{L}^{\oplus 6}$  is very ample.
- If  $\mathcal{L}$  is globally generated and  $H^1(X, \mathcal{L}) = 0$ , then  $\mathcal{L}^{\oplus 2}$  is very ample.

$\lrcorner$

*Proof:* Cf. [Sta]0E8V, 0E8W. ?  $\square$

### Curves in Low Dimension

**Prop. (7.13.2.28)[Projection Along a Point].** Let  $C \subset \mathbb{P}_k^n$  be a non-singular precurve, then for any rational point  $p \in C$ , there is a **projection along**  $p$  map  $v_p : C \rightarrow \mathbb{P}_k^{n-1}$  that is the projection along  $p$  for  $q \in C \setminus \{p\}$ , and extend to whole  $C$  by (7.13.1.16), which corresponds to the line bundle  $\mathcal{O}_C(1)(-p)$ .  $\lrcorner$

**Prop. (7.13.2.29).** Let  $C$  be a smooth plane precurve of degree  $e > 2$  and  $D_1, D_2$  are two polynomials of degree  $d$  not vanishing on  $C$ . Suppose there is a divisor  $E$  on  $C$  of degree  $de - 1$  and rational points  $p_i$  on  $C$  that  $D_i|_C = E + p_i$ , then  $\mathcal{O}_C(-E)$  is not base-free.  $\lrcorner$

*Proof:* Notice by genus formula  $g > 0$ , and  $\mathcal{O}_C(-E) \cong \mathcal{O}_C(p_i)$  has degree 1, then  $p_1 = p_2$  by (7.13.2.23).  $\square$

**Prop. (7.13.2.30).** Let  $C$  be a smooth conic plane curve over a field of characteristic  $\neq 2$ , show the dual variety of  $C$  is also a smooth conic. In particular, for a general point in the plane, there are two tangents to  $C$ . (This can be also proved using Riemann-Hurewitz by projection through this point).  $\lrcorner$

*Proof:*  $\square$

**Prop. (7.13.2.31).** The number of plane conics containing  $i$  generally chosen points and  $5 - i$  generally chosen lines is 1, 2, 4, 4, 2, 1 resp. for  $i = 0, 1, \dots, 4, 5$ . (The duality comes from the duality between the conic and the dual conic (7.13.2.30)).  $\lrcorner$

*Proof:*  $\square$

**Prop. (7.13.2.32) [Curves in  $\mathbb{P}^1 \times \mathbb{P}^1$ ].** Let  $C$  be a curve in  $\mathbb{P}^1 \times \mathbb{P}^1$  given by a bi-homogenous polynomial of type  $(a, b)$ . Then  $g(C) = (a - 1)(b - 1)$ .  $\lrcorner$

*Proof:* We have  $\mathcal{K}_C = (\mathcal{K}_{\mathbb{P}^1 \times \mathbb{P}^1} + C)|_C$  (7.12.1.17). We have  $\text{Pic}(\mathbb{P}^1 \times \mathbb{P}^1) \cong \mathbb{Z}H_1 \oplus \mathbb{Z}H_2$ , thus

$$\begin{aligned} \deg(\mathcal{K}_C) &= \deg((\mathcal{K}_{\mathbb{P}^1 \times \mathbb{P}^1} + C)_C) \\ &= \deg((-2H_1 - 2H_2 + aH_1 + bH_2)|_C) \\ &= \deg(((a - 2)H_1 + (b - 2)H_2)|_C) \\ &= (a - 2)b + (b - 2)a = 2ab - 2a - 2b \\ &= 2g - 2. \end{aligned}$$

Thus  $g = (a - 1)(b - 1)$ .

? For non-smooth case, see AG psets.  $\square$

**Prop. (7.13.2.33) [Genus Formula].** Let  $C$  be a closed subscheme of  $\mathbb{P}_k^2$  defined by a homogenous polynomial  $f(x_0, x_1, x_2)$  of degree  $d$ , then it has arithmetic genus  $p_a(C) = (d - 1)(d - 2)/2$ .  $\lrcorner$

*Proof:* This follows from (7.7.2.4).  $\square$

**Cor. (7.13.2.34).** Let  $C$  be a complete smooth plane curve of degree  $d$ , then it has genus  $g = (d - 1)(d - 2)/2$ .  $\lrcorner$

*Proof:* Alternative proof: By adjunction formula,  $\mathcal{K}_C = \mathcal{K}_{\mathbb{P}^2}(C)|_C = \mathcal{O}_C(d - 3)$  which has degree  $d(d - 3)$ . But this also equals  $2g - 2$  (7.13.2.10), thus  $g = (d - 1)(d - 2)/2$ .  $\square$

**Prop. (7.13.2.35) [Cubic Curves in  $\mathbb{P}^3$ ].** A twisted cubic (rational)  $C$  in  $\mathbb{P}^3$  is contained in a quadric.  $\lrcorner$

*Proof:* Calculate that  $h^0(\mathcal{O}_{\mathbb{P}^3}(2)) = C_5^2 = 10$  and  $\deg(\mathcal{O}_C(2)) = 6$ , thus  $h^0(\mathcal{O}_C(2)) = 6 + 1 = 7$  by Riemann-Roch. Then  $C$  is contained in 3 quadrics.  $\square$

### 3 Singularities and $\delta$ -Invariants

**Def. (7.13.3.1) [Different Kinds of Singularities].** Let  $X$  be a curve over an alg.closed field  $k$ , a point  $p \in X$  is called a

- **node** if the completion of  $\mathcal{O}_{X,p}$  at  $\mathfrak{m}_{X,p}$  is isomorphic to  $k[[x, y]]/(xy)$  as topological local rings.
- **cusp** if the completion of  $\mathcal{O}_{X,p}$  at  $\mathfrak{m}_{X,p}$  is isomorphic to the completion of  $k[x, y]/(x^2 - y^3)$  at  $(x, y)$ .
- **tacnode** if the completion of  $\mathcal{O}_{X,p}$  at  $\mathfrak{m}_{X,p}$  is isomorphic to the completion of  $k[x, y]/(x^2 - y^4)$  at  $(x, y)$ .
- **triple point** if the completion of  $\mathcal{O}_{X,p}$  at  $\mathfrak{m}_{X,p}$  is isomorphic to the completion of  $k[x, y]/(x^3 - y^3)$  at  $(x, y)$ .

┘

**Def. (7.13.3.2) [ $\delta$ -Invariants].**

┘

### 4 Linear Series

**Def. (7.13.4.1) [Moduli Spaces].** Define the **Hilbert scheme**  $\mathcal{H}_{d,g,r} = \{\text{Curves } C \text{ of degree } d \text{ and genus } g\}$ .

Define the **moduli space of curves**  $\mathcal{M}_g = \{\text{isomorphism classes of smooth projective curves of genus } g\}$ .

Define  $W_d^r(C) = \{L \in \text{Pic}^d(C), h^0(L) \geq r + 1\}$ .

┘

**Def. (7.13.4.2) [Linear Series].** A **linear series** is a line bundle  $L$  together with a vector space  $V \subset H^0(L)$ .

A  $\mathfrak{g}_d^r$  is a line bundle  $L$  together with a vector space  $V \subset H^0(L)$  of dimension  $r + 1$ .

For a line bundle  $\mathcal{L}$ , denote by  $|L|$  the linear series  $(L, H^0(L))$ .

┘

**Cor. (7.13.4.3) [ $r \leq d$ ].** If  $\mathfrak{g}_d^r$  exists on a complete curve  $C$ , then  $r \leq d$ . And if  $r = d$ , then  $g(C) = 0$ .

┘

*Proof:* Let  $s$  be a section of  $\mathcal{L}$ , then the vanishing locus of  $s$  is an effective Cartier divisor  $D$ ,  $\mathcal{L} \cong \mathcal{L}(D)$ , and there is an exact sequence

$$0 \rightarrow \mathcal{O}_X \rightarrow \mathcal{L} \rightarrow \mathcal{L}|_D \rightarrow 0.$$

As  $D$  is an Artinian scheme,  $\mathcal{L}|_D$  is trivial as  $D$  is discrete, so by (7.13.2.6),  $h^0(\mathcal{L}|_D) = \deg(D)$ , and  $h^0(X, \mathcal{O}_X) = 1$ , so  $r = h^0(X, \mathcal{L}) \leq d$ .

If the equality holds, then  $H^0(X, \mathcal{L}) \rightarrow H^0(X, \mathcal{L}|_D)$  is surjective, so to show  $g(C) = 0$ , it suffices to show that  $h^0(X, \mathcal{L}) = 0$ . As  $\mathcal{L}|_D$  is trivial, there is a section  $t$  of  $\mathcal{L}$  that generate  $\mathcal{L}|_D$ . Consider the exact sequence

$$0 \rightarrow \mathcal{L} \rightarrow \mathcal{L}^2 \rightarrow \mathcal{L}^2|_D \rightarrow 0,$$

$H^0(X, \mathcal{L}^2) \rightarrow H^0(X, \mathcal{L}|_D)$  is surjective because  $\sigma \otimes t$  is mapped to  $\sigma$ . Then by (7.13.2.5),

$$h^0(X, \mathcal{L}^2) = 2r + 1 = \deg(\mathcal{L}^2) + 1.$$

So we may replace  $\mathcal{L}$  by arbitrarily large powers of  $\mathcal{L}$ . Now  $\mathcal{L}$  is ample by (7.13.2.20), so for  $r$  large,  $H^1(X, \mathcal{L}^r) = 0$ . □

**Prop. (7.13.4.4) [Linear Series and Maps].** For any  $\mathfrak{g}_d^r(L, V)$  on a non-singular precurve  $C$ , there is a map  $\varphi : C \rightarrow \mathbb{P}^r$  and a map  $\varphi^* \mathcal{O}_{\mathbb{P}^r}(1) \rightarrow \mathcal{L}$  s.t. the coordinates  $T_0, \dots, T_r$  are mapped to a basis of  $V$ .

This map is injective iff for any  $p \neq q$ ,  $V_{p+q}$  has codimension 2. This map is an immersion iff for all  $p$ ,  $V_{2p}$  has codimension 2. So in particular, this map is an embedding iff for any effective divisor  $D$  of degree 2,  $V_D$  has codimension 2.  $\lrcorner$

*Proof:* Take a basis  $s_0, s_1, \dots, s_r \in V$ , as  $C$  is non-singular, the image of the map  $(s_0, \dots, s_r) : \mathcal{O}_X^{r+1} \rightarrow \mathcal{L}$  is an invertible sheaf as it is torsion-free. Then take the corresponding embedding induced by (7.5.2.4).  $\square$

**Cor. (7.13.4.5).** If  $\mathcal{L}$  is a very ample line bundle of degree  $d$  on a curve  $C$ , then  $\varphi_{|\mathcal{L}|}$  embeds  $C$  as a closed subscheme of degree  $d$ .  $\lrcorner$

*Proof:* Use (7.13.4.4), The pullback of  $\mathcal{O}_{\mathbb{P}^r}(1)$  under  $\varphi$  is just  $\mathcal{L}$ , so the assertion follows from (7.13.2.7).  $\square$

**Lemma (7.13.4.6).** Let  $\mathcal{L} \in \text{Pic}^d(C)$  be general, then  $h^0(\mathcal{L}) = \max\{1, d - g + 1\}$ .  $\lrcorner$

*Proof:* If  $D = \sum p_i$  is a general effective divisor, notice  $h^0(K) = g$ ,  $h^0(K - p_1) = g - 1$ ,  $h^0(K - p_1 - p_2) = g - 2$ , and repeating this, we get  $h^0(K - D) = \max\{0, g - d\}$ , when we choose  $p_i$  that are as independent as possible (any section has f.m. zeros). Then by Riemann-Roch,  $l(D) = d - g + 1 + \max\{0, g - d\} = \max\{1, d - g + 1\}$ . As every divisor of degree  $d \geq g$  is effective, this settles the  $d \geq g$  case.

If  $D$  is non-effective and  $d \leq g - 1$ , we need to show  $W_d^0$  is not dominant in  $\text{Pic}^d$ . But  $J$  has dimension  $g$  by ?? and  $W_d^0$  has dimension at most  $d$ , so this is true.  $\square$

**Prop. (7.13.4.7).** Suppose  $D$  is a divisor of degree  $g + 3$ , then for  $D$  general,  $\varphi_D = \varphi_{|\mathcal{L}(D)|}$  is an embedding.  $\lrcorner$

*Proof:* By (7.13.4.6), for a general  $D$ ,  $l(D) = 4$ . Thus  $\varphi_D$  being not an embedding is equivalent to the existence of a divisor  $D_0 = p + q$  that  $l(D - D_0) \geq 3$ . This means  $D - D_0 \in W_{g+1}^2 = K - W_{g-3}^0$ . So the divisor  $D = D_0 + (D - D_0) \in W_2^0 + (K - W_{g-3}^0)$  which has dimension at most  $2 + (g - 3) = g - 1$ . But a general divisor  $D$  doesn't lie on this  $g - 1$ -dimensional subvariety by (20.9.10.11), so a general  $D$  defines an embedding  $\varphi_D$ .  $\square$

**Def. (7.13.4.8) [Canonical Map].** For a smooth curve  $C$  of degree  $g$  over a field  $k$  of genus  $g \geq 1$ , the canonical divisor  $\mathcal{K}_C$  is basepoint-free, and defines a **canonical map** to  $\mathbb{P}_k^{g-1}$ .  $\lrcorner$

*Proof:* By (7.13.2.2)(7.5.3.3)(7.1.5.26), it suffices to prove for  $\bar{k}$ , thus for any closed point  $p$ ,  $h^0(\mathcal{K}_C - p) = 2g - 3 - g + 1 + h^0(\mathcal{O}_C(p)) \leq g - 1 < h^0(\mathcal{K}_C) = g$  by (7.13.2.23), so it is basepoint-free.  $\square$

**Prop. (7.13.4.9) [Base-Free Pencil Trick].** Let  $\mathcal{L}, \mathcal{M}$  be line bundles on  $C$ . Let  $s_1, s_2$  be sections of  $H^0(\mathcal{L})$  without common zero, then the kernel of the map

$$s_1 H^0(\mathcal{M}) \oplus s_2 H^0(\mathcal{M}) \rightarrow H^0(\mathcal{L} \otimes \mathcal{M})$$

is  $H^0(\mathcal{M} \otimes \mathcal{L}^{-1})$ .  $\lrcorner$

*Proof:* Indeed, there is an exact sequence of sheaves:

$$\mathcal{M} \otimes \mathcal{L}^{-1} \rightarrow \mathcal{M} \oplus \mathcal{M} \xrightarrow{(s_1, s_2)} \mathcal{M} \otimes \mathcal{L} \rightarrow 0.$$

Where the first map maps a section  $t$  to the pair  $(ts_2, -ts_1)$ . This is a Koszul regular sequence (on a common trivialization  $U$  of  $\mathcal{M}, \mathcal{L}$ ,  $s_1, s_2 \in C(U)$ , thus this is just  $0 \rightarrow A \rightarrow A \oplus A \xrightarrow{s_1, s_2} A \rightarrow 0$ ). Taking the global section functor gives the desired result.  $\square$

**Prop. (7.13.4.10) [Geometric Riemann-Roch].** Let  $C$  be a non-hyperelliptic curve of genus  $g \geq 2$ . Then the canonical map  $\varphi_K$  is an embedding, so we can assume  $C \subset \mathbb{P}^{g-1}$ . Then for a divisor  $D = \sum p_i$ ,

$$r(D) = d - 1 - \dim \overline{D},$$

where  $\overline{D}$  is the linear subspace generated by  $p_i$ . Thus  $r(D)$  can be interpreted as the number of linear relations between  $p_i$ .  $\lrcorner$

*Proof:* By the definition of the canonical embedding,  $l(K - D)$  is just the dimension of hypersurfaces containing  $p_i$ , thus it is equal to  $g - 1 - \dim \overline{D}$ . Now by Riemann-Roch,  $r(D) = d - g + l(K - D) = d - g + g - 1 - \dim \overline{D} = d - 1 - \dim \overline{D}$ .  $\square$

**Prop. (7.13.4.11).**  $\lrcorner$

**Cor. (7.13.4.12) [Special Divisors].** Let  $U^{(g)}$  be the open subscheme of  $C^{(g)}$  corresponding to the set of non-special divisors of degree  $g$ .  $\lrcorner$

*Proof:*  $\square$

**Prop. (7.13.4.13) [Clifford Theorem].** For a divisor  $D$  of degree  $0 \leq d \leq 2g - 2$  on a curve of genus  $g$ ,

$$r(D) \leq \frac{d}{2}.$$

with equality iff one of the following holds:

- $r = d = 0, D = 0$ .
- $d = 2g - 2, r = g - 1, D = \mathcal{K}_C$ .
- $C$  is hyperelliptic and  $D = mg_2^1$ .

$\lrcorner$

*Proof:* Cf. [Algebraic Curves, Harris, P32].  $\lrcorner$

## 5 Hyperelliptic Curves

**Def. (7.13.5.1) [Hyperelliptic Curves].** A **hyperelliptic curve** over  $k$  is a complete non-singular curve  $C$  together with a finite degree 2 map  $C \rightarrow \mathbb{P}_k^1$ . Such a map is called a **hyperelliptic map**. For  $g > 0$ , this is equivalent to the existence of a  $g_2^1$  on  $C$  (such a linear series must be basepoint-free, by (7.13.2.24)).  $\lrcorner$

**Cor. (7.13.5.2) [Genus 2 Curves are Hyperelliptic].** Any complete nonsingular curve of genus 2 is hyperelliptic, because  $\mathcal{K}_C$  has degree 2 and  $h^0(\mathcal{K}_C) = 2$  (7.13.2.10).  $\lrcorner$

**Prop. (7.13.5.3) [Equation of Hyperelliptic Curves].** Any image of a hyperelliptic map from a hyperelliptic curve of genus  $g$  over an alg.closed field  $k$  of characteristic  $k \neq 2$  is isomorphic to the projective curve that is the completion(7.13.1.19) of the affine curve in  $\mathbb{A}^2$  defined in an affine chart by  $y^2 = \prod_{i=0}^{2g+2} (x - \alpha_i)$  or  $y^2 = \prod_{i=0}^{2g+1} (x - \alpha_i)$ , depending on whether the  $\infty$  is branched or not. And given  $2g + 2$  points in  $\mathbb{P}_k^1$ , there is exactly one degree 2 covering of  $\mathbb{P}^1$  branched over these points.  $\perp$

*Proof:* Given any  $r$  points of  $\mathbb{P}_k^1$ , we can use a transformation of  $\mathbb{P}^1$  to assume that all branch points are finite, denoted by  $\alpha_1, \dots, \alpha_r$ . Consider the curve  $C'$  defined by  $y^2 = \prod_{i=0}^{2g+2} (x - \alpha_i)$ , then it is a smooth curve by Jacobian criterion. Now let  $C$  be the smooth model of  $C'$ , and consider  $\pi : C \rightarrow \mathbb{P}^1$  by projecting to the  $x$ -coordinates and extend to the whole  $C$  by(7.13.1.16). This is finite separable of degree 2, and  $\pi$  is simply branched at the points  $\alpha_i$ , and simply branched over  $\infty$  if  $r$  is odd, thus it has genus  $\lfloor \frac{r-1}{2} \rfloor$  by Riemann-Hurwitz(7.13.1.33).

Conversely, by Riemann-Hurwitz(7.13.1.33), any degree 2 covering of  $\mathbb{P}^1$  has  $2g + 2$  branch points, because the branch points must be simply branched. The map  $k(x) \rightarrow k(C)$  is Galois of degree 2, take a  $y \in k(C)$  that  $\sigma(y) = -y$ , then  $y^2 = g \in k(x)$ . We can modify  $y$  s.t.  $g$  is a monic polynomial with no repeated factors. Then it is of the form  $g(x) = \prod_{i=1}^r (x - x_i)$ . Then it is isomorphic to the curve constructed above, and branched over  $x_1, \dots, x_r$  and possibly  $\infty$ . In particular, it is determined by the set of branched points, so we get the desired assertion.  $\square$

**Remark (7.13.5.4).** The completion of  $C$  can be explicitly constructed, by gluing another affine chart defined by  $(\frac{y}{x^{g+1}})^2 = \prod_{i=0}^{2g+2} (1 - \alpha_i \frac{1}{x})$  or  $(\frac{y}{x^{g+1}})^2 = \frac{1}{x} \prod_{i=0}^{2g+1} (1 - \alpha_i \frac{1}{x})$ .  $\perp$

**Prop. (7.13.5.5).** If  $C$  is a nonsingular complete curve of genus  $g \geq 2$  over  $k$  and  $\mathcal{L}$  is a line bundle that corresponds to a hyperelliptic map  $C \rightarrow \mathbb{P}_k^1$ , then  $\mathcal{L}^{\otimes(g-1)} \cong \mathcal{K}_C$ .

In particular, the image of  $C$  under the canonical map is the rational curve in  $\mathbb{P}_k^{g-1}$ .  $\perp$

*Proof:* Consider the composition of the hyperelliptic map and the Veronese map

$$C \xrightarrow{|\mathcal{L}|} \mathbb{P}_k^1 \xrightarrow{v_{g-1}} \mathbb{P}_k^{g-1},$$

which corresponds to the line bundle  $|\mathcal{L}^{\otimes(g-1)}|$ . This line bundle has degree  $2g - 2$ , and the map  $H^0(\mathbb{P}^{g-1}, \mathcal{O}(1)) \rightarrow H^0(C, \mathcal{L}^{\otimes(g-1)})$  is injective, because the Veronese map is non-degenerate. Thus  $h^0(\mathcal{L}^{\otimes(g-1)}) \geq g$ , thus isomorphic to  $\mathcal{K}_C$ , by(7.13.2.13). Hence this map is just the canonical map.  $\square$

**Cor. (7.13.5.6).** For a hyperelliptic curve, the smallest degree of an embedding  $C \rightarrow \mathbb{P}^r$  is  $g + r$ . Note that hyperelliptic curves cannot be embedded into  $\mathbb{P}^2$ , i.e. smooth plane curves are non-hyperelliptic.  $\perp$

*Proof:* Firstly we show a special divisor cannot induce an embedding: A special divisor is a divisor that is contained in a hypersurface intersection of  $C$  under the canonical map, thus by geometric Riemann-Roch(7.13.4.10),  $r(D)$  is just the number of points of  $D$  mapped to the same point under the canonical map, because intersection with the rational normal curve are all linearly independent. Now this means  $D$  contains  $g_2^1$ , so  $\varphi_D$  factors through  $\pi$ , thus not an embedding. ? Cf.[Algebraic Curves, Harris, P21].  $\square$

**Prop. (7.13.5.7) [Hyperelliptic and Canonical Map].** A complete smooth curve of genus  $g \geq 1$  is hyperelliptic iff the canonical map(7.13.4.8) is not a closed embedding.  $\perp$

*Proof:* The canonical map is not an embedding iff there exists an effective divisor  $D$  of degree 2 that  $l(K - D) > l(K) - 2$ . Now  $l(K - D) = 2g - 4 - g + 1 + l(D)$ , so this is equivalent to  $l(D) > 1$ , which is equivalent to a  $g_2^1$ , which is equivalent to hyperelliptic(7.13.5.1).  $\square$

**Prop. (7.13.5.8)[Uniqueness of Hyperelliptic Maps].** For a hyperelliptic curve of genus  $g \geq 2$ , up to automorphism of  $\mathbb{P}^1$ , there are at most one hyperelliptic map, or equivalently there is exactly one  $g_2^1$  on  $C$ .

But for (hyperelliptic)curve of genus 1, thus is not unique: any divisor of degree 2 is effective, but they are not unique, because  $\text{Pic}^2(C) \cong J(C)$  (20.9.10.11).  $\lrcorner$

*Proof:* If  $\mathcal{L} \neq \mathcal{M}$  are two line bundles on  $C$  with  $h^0 = 2$ , then  $h^0(\mathcal{L} \otimes \mathcal{M}) \geq 4$  by base-free pencil trick (7.13.4.9), and in fact  $h^0(\mathcal{L} \otimes \mathcal{M}) = 4$  by (7.13.4.3). Now we can run the same argument again to  $\mathcal{L}$  and  $\mathcal{L} \otimes \mathcal{M}$ , to show that  $h^0(\mathcal{L}^2 \otimes \mathcal{M}) = 6$ . And inductively  $h^0(\mathcal{L}^n \otimes \mathcal{M}) = 2n + 2$ . But then for  $n$  large, Riemann-Roch shows  $2n + 2 = 2n + 2 - g + 1$ , thus  $g = 1$ , contradiction.  $\square$

### Gonal Curves

**Def. (7.13.5.9)[Gonal Curves].** A **trigonal curve** is a complete non-singular curve  $C$  with a degree 3 map  $C \rightarrow \mathbb{P}^1$ . Generally, a  **$k$ -gonal curve** is a complete non-singular curve  $C$  with a degree  $k$  map  $C \rightarrow \mathbb{P}^1_k$ . Being  $k$ -gonal is equivalent to having a basepoint-free  $g_k^1$ .

Notice also for non-hyperelliptic curves, any  $g_3^1$  must be basepoint-free.  $\lrcorner$

**Def. (7.13.5.10)[Hurewitz Spaces].** Let the **Hurewitz space** be

$$\mathcal{H}_{d,g} = \{(C, f) | C \in \mathcal{M}_g, f : C \rightarrow \mathbb{P}^1 \text{ of degree } d \text{ with simple branching}\}.$$

In particular,  $\mathcal{H}_{2,g}$  is just the space of hyperelliptic curves together with a hyperelliptic map.  $\lrcorner$

**Prop. (7.13.5.11)[Dimension of Hurewitz Spaces].**  $\dim \mathcal{H}_{d,g} = 2d + 2g - 2$ .  $\lrcorner$

*Proof:* Let  $b = 2d + 2g - 2$ , then the branch divisor will consist of an unordered  $b$ -tuple of distinct points. Then we obtain a map  $\mathcal{H}_{d,g} \rightarrow \mathbb{P}^b \setminus \Delta$ , where we regard  $\mathbb{P}^b$  as the set of polynomials of degree  $b$  and  $\Delta$  the determinant, and the fiber is finite by cut-paste technique.  $\square$

**Cor. (7.13.5.12)[Dimension of Moduli Space of Curves].**  $\dim \mathcal{M}_g = 3g - 3$ .  $\lrcorner$

*Proof:* There is a map  $\mathcal{H}_{d,g} \rightarrow \mathcal{M}_g$ . When  $d$  is large, we can analyze the fiber of this map, that is, given a curve of genus  $g$ , how many simply branched maps  $C \rightarrow \mathbb{P}^1$  of degree  $d$  are there? Such a map is equivalent to a line bundle of degree  $d$  and a pair of base free sections  $\sigma_0, \sigma_1 \in H^0(L)$ . The base-free condition is an open condition, thus the dimension of the fiber is  $g + 2(d - g - 1) - 1 = 2d + g - 1$ . Thus the dimension of  $\mathcal{M}_g = 2d + 2g - 2 - (2d + g - 1) = 3g - 3$ .  $\square$

**Cor. (7.13.5.13).** The space of hyperelliptic curves has dimension  $2g - 1$ .  $\lrcorner$

*Proof:*  $\mathcal{H}_{2,g}$  has dimension  $2g + 2$ , and for any hyperelliptic curve, there is exactly one hyperelliptic map up to automorphism of  $\mathbb{P}^1$ , by (7.13.5.8), thus the space of hyperelliptic curves has dimension  $2g + 2 - 3 = 2g - 1$ .  $\square$

**Cor. (7.13.5.14).** If  $g \geq 3$ , then not all curves of genus  $g$  is hyperelliptic.  $\lrcorner$

*Proof:* Because when  $g \geq 3$ ,  $2g - 1 < 3g - 3$ .  $\square$

**Lemma (7.13.5.15).** For a line bundle of degree 3 on a curve of genus  $g \geq 3$ ,  $h^0(L) \leq 2$ , by Clifford's theorem (7.13.4.13). Thus a trigonal map must be associated to a complete linear series  $g_3^1$ .  $\lrcorner$

**Prop. (7.13.5.16)[Hyperelliptic are not Trigonal].** A curve of genus  $g \geq 3$  cannot be both hyperelliptic and trigonal.  $\lrcorner$

*Proof:* Suppose there are two basepoint-free line bundles  $\mathcal{L}, \mathcal{M}$  of degree 2 and 3 on  $C$  that  $h^0(\mathcal{L}) = h^0(\mathcal{M}) = 2$  (7.13.5.15), then the base-free pencil trick (7.13.4.9) implies that  $h^0(\mathcal{M} \otimes \mathcal{L}) \geq 4$ . If  $g = 3$ , then this contradicts Riemann-Roch. If  $g \geq 4$ , then this contradicts Clifford's theorem (7.13.4.13).  $\square$

**Prop. (7.13.5.17) [Genus 3 Curves are Hyperelliptic or Trigonal].** Any genus 3 non-hyperelliptic complete smooth curve  $C$  with a rational point is trigonal.  $\lrcorner$

*Proof:* If  $C$  is non-hyperelliptic, then the canonical map realizes  $C$  as a plane curve of degree 4 (7.13.8.6), thus the projection of  $C$  along a point on  $C$  induces a map  $C \rightarrow \mathbb{P}^1$ . This map is finite of degree 3 because it is non-constant as  $C$  is non-degenerate, and has degree 3, by (7.13.2.28).  $\square$

**Prop. (7.13.5.18) [Uniqueness of Trigonal Divisors].** There exists at most one  $g_3^1$  on a curve of genus  $g \geq 5$ .  $\lrcorner$

*Proof:* If  $\mathcal{L} \neq \mathcal{M}$  are two base free line bundles of degree 3 that  $h^0 = 2$ , then we can use base-free trick to show that  $h^0(\mathcal{L} \otimes \mathcal{M}) = 4$ . But this contradicts Clifford's theorem (7.13.4.13). Notice the equality cannot hold, because the degree is too low to be the canonical bundle, and also  $C$  cannot be both hyperelliptic and trigonal (7.13.5.16).  $\square$

## 6 Castelnuovo's Theory

**Lemma (7.13.6.1) [Castelnuovo's Lemma].** Let  $\Gamma \in \mathbb{P}^n$  be a configuration of  $d \geq 2n + 3$  points in linear general position, and if  $h_\Gamma(2) = 2n + 1$ , then  $\Gamma$  lies in a rational normal curve.  $\lrcorner$

## 7 Plucker Formulas

**Def. (7.13.7.1) [Weierstrass Group].** Let  $C$  be a smooth of genus  $g \geq 2$ ,  $p \in C$ , then  $S_p = \{-\text{ord}_p(f) \mid f \in H^0(\mathcal{O}_C(-p))\}$  is a semigroup, called the **Weierstrass semigroup** of  $p \in C$ . And the **gap sequence** is  $\mathbb{N} \setminus S_p$ , which is the set of orders of pole of  $p$  that doesn't occur.  $\lrcorner$

**Lemma (7.13.7.2).** We have  $|G_p| = g$ .  $\lrcorner$

*Proof:* Notice that

$$G_p = \{m : h^0(mp) = h^0((m-1)p)\}, \quad S_p = \{m : h^0(mp) = h^0((m-1)p) + 1\}$$

and we know by (7.13.2.12) that  $h^p(mp) = m - g + 1$  for  $m$  large, thus there are exactly  $g$  jumps, which shows  $|G_p| = g$ .  $\square$

**Def. (7.13.7.3) [Weierstrass Points].** A point  $p \in C$  is called **Weierstrass point** if the gap sequence is not  $\{1, 2, \dots, g\}$ . It is called a **hyperelliptic Weierstrass point** if  $G_p = \{1, 3, \dots, 2g-1\}$ , and is called a **normal Weierstrass point** if  $G_p = \{1, 2, 3, \dots, g-1, g+1\}$ .

Define the **weight** of the  $p \in C$  to be the sum  $w(p) = \sum_{i \leq g} (a_i - i)$ , where the gap sequence is numbered  $\{a_1, \dots, a_g\}$ .  $\lrcorner$

**Prop. (7.13.7.4).** For any compact Riemann surface  $C$ ,  $\sum_{p \in C} w(p) = g(g-1)(g+1)$ .  $\lrcorner$

*Proof:* Cf. [G-H78], P274.  $\square$

**Cor. (7.13.7.5).** For general  $p \in C$ ,  $G_p = \{1, 2, \dots, g\}$ .  $\lrcorner$

**Prop. (7.13.7.6)[Hyperelliptic Weierstrass Points].** If  $C$  is hyperelliptic defined by  $y^2 = \prod_{i=0}^{2g+1} (x - \alpha_i)$ , then there are  $2g + 2$  branching point of  $x$ , where  $S_p = \{0, 2, 4, \dots, 2g, 2g + 1, \dots\}$ . In this way,  $w(p) = g(g - 1)/2$ . Thus there are  $2g + 2$  Weierstrass points, and these are all of them.

If  $C$  is non-hyperelliptic, then by Clifford's theorem(7.13.4.13),

$$h^0(kp) < \frac{k}{2} + 1, k = 1, \dots, g$$

Thus  $h^0((a_i - 1)p) < \frac{a_i - 1}{2} + 1$ , and  $h^0((a_i - 1)p) = 1 + (a_i - 1) - (i - 1)$ . Thus we get

$$a_i \leq 2i - 2, i = 2, \dots, g.$$

Then  $w(p) \leq \sum_{i=2}^g (i - 2) = \frac{(g-1)(g-2)}{2}$ . Thus there are at least

$$\frac{2g(g-1)(g+1)}{(g-1)(g-2)} \geq 2g + 6$$

Weierstrass points.

To sum up, there are no less than  $2g+2$  Weierstrass points, and there are exactly  $2g+2$  Weierstrass points iff  $C$  is hyperelliptic.  $\lrcorner$

**Prop. (7.13.7.7)[No Automorphisms].** A generic Riemann surface of genus  $g \geq 3$  has no non-trivial automorphisms.  $\lrcorner$

*Proof:*  $\square$

## 8 Curves of Low Genus

In this subsection complete smooth curves of low genus are considered.

**Prop. (7.13.8.1)[Genus 0 Curve].** All smooth complete curve  $C$  of genus 0 is isomorphic to a plane conic.  $\lrcorner$

*Proof:* The curve has a degree 2 line bundle  $\mathcal{K}_C^\vee$ , thus by Riemann-Roch  $h^0(\mathcal{O}(p)) = 3$  and by(7.13.2.26) it induces a closed embedding of  $C$  into  $\mathbb{P}^2$  of degree 2, thus it is a plane conic.  $\square$

**Prop. (7.13.8.2).** A nonsingular curve  $C$  of genus 0 with a  $k$ -rational point  $p$  is isomorphic to  $\mathbb{P}_k^1$ :  $\lrcorner$

*Proof:* By Riemann-Roch,  $h^0(\mathcal{O}(p)) = 2$  and  $\deg \mathcal{O}(p) = 1$ , thus by(7.13.2.26),  $\mathcal{O}(p)$  defines a closed embedding of  $C$  into  $\mathbb{P}^1$ , which must be an isomorphism.  $\square$

**Prop. (7.13.8.3)[Genus 1 Curve].** By(7.13.2.26), an effective divisor of degree 3 induces an embedding of  $C$  into  $\mathbb{P}^2$ , So it is a smooth plane cubic by genus formula(7.13.2.33). Conversely, any smooth plane cubic has genus 1.

Similarly, if we take an effective divisor of degree 4, then it gives an embedding  $C \rightarrow \mathbb{P}^3$ . We know that  $h^0(\mathcal{O}_{\mathbb{P}^3}(2)) = 10$  and  $h^0(\mathcal{O}_C(2)) = 8$ , thus  $C$  is contained in 2 quadrics. Then  $C$  is the intersection of these two quadrics, by Bezout's theorem.  $\lrcorner$

**Prop. (7.13.8.4)[Genus 2 Curves and Degree 4 Divisors].** Let  $C$  be a curve of genus 2, and  $D$  a divisor of degree 4. Then  $l(D - K_C) = 1 + l(2K_C - D) \geq 1$ , thus  $D - K_C$  is effective. Let  $D - K_C = p + q$ . Then  $\varphi_D$  maps  $p, q$  to the same point.

There are two situations, firstly if  $D \neq 2K_C$ , then  $D - K_C$  can be written uniquely as  $p + q$ . Then the image of  $\varphi_D$  is a degree 4 curve with a node (if  $p = q$ ) or a cusp (if  $p \neq q$ ). Counting genus, this has exactly arithmetic genus 2.

If  $D = 2K_C$ . Then notice  $\varphi_{2K_C}$  is equal to  $\varphi_K$  followed by the normal curve map  $\mathbb{P}^1 \rightarrow \mathbb{P}^2$ . This is because if  $\omega_1, \omega_2$  are a basis of  $H^0(K_C)$ , then  $\omega_1^2, \omega_1\omega_2, \omega_2^2$  is a basis of  $H^0(K_C^2)$ . So  $\varphi_D$  is a 2 to 1 map to a rational normal curve in  $\mathbb{P}^2$ .  $\lrcorner$

**Prop. (7.13.8.5) [Genus 2 Curve and degree 5 Divisors].** Let  $C$  be a curve of genus 2 and  $D$  a divisor of degree 5, then  $\varphi_D : C \rightarrow \mathbb{P}^3$  embeds  $C$  as a degree 5 curve, by (7.13.2.26).

Notice  $h^0(\mathcal{O}_{\mathbb{P}^3}(2)) = 10$  and  $h^0(\mathcal{O}_C(2)) = 10 - 2 + 1 = 9$ , thus  $C$  lies on at least one quadric  $Q$ . And it can in fact lie on only one quadric, because if it lies on two quadrics, then  $C$  is the intersection, and can have degree at most 4.

Next, notice  $h^0(\mathcal{O}_{\mathbb{P}^3}(3)) = 20$  and  $h^0(\mathcal{O}_C(3)) = 15 - 2 + 1 = 14$ , so  $C$  lies on at least 6 cubics. Without the 4 cubics containing the quadric, there are still at least 2 new cubics. Let  $S$  be such a cubic, then  $S \cap Q$  is a curve of degree 6, so  $S \cap Q = C \cup L$ , where  $L \cong \mathbb{P}^1$ .  $\lrcorner$

**Prop. (7.13.8.6) [Genus 3 Non-Hyperelliptic Curve].** For any non-hyperelliptic smooth curve  $C$  of genus 3 over a field  $k$ , the canonical map (7.13.4.8) embeds  $C$  as a smooth quartic curve in  $\mathbb{P}^2$ . This induces an isomorphism of smooth quartic plane curves up to automorphism of  $\mathbb{P}^2$ .  $\lrcorner$

*Proof:* The canonical embedding is a closed embedding by (7.13.5.7). For the last assertion, any plane curve of degree 4 has genus 3 by (7.13.2.33), and the sheaf  $\mathcal{O}_C(1)$  has degree 4 and 3 sections, thus by (7.13.2.13), so this comes from a canonical embedding. In particular, any such curve can be embedded in  $\mathbb{P}^2$  in a unique way.  $\square$

**Prop. (7.13.8.7).** Any hyperelliptic smooth curve of genus 3 is a flat limit of non-hyperelliptic smooth curves of genus 3.  $\lrcorner$

*Proof:* Cf. [Vak17]P520.  $\square$

**Prop. (7.13.8.8) [Genus 4 Non-Hyperelliptic Curves].** Any non-hyperelliptic smooth complete canonical curve  $C$  of genus 4 is a complete intersection of a quadric surface and a cubic surface. Conversely, any regular complete intersection of a quadric surface and a cubic surface is a canonically embedded non-hyperelliptic curve of genus 4.  $\lrcorner$

*Proof:* Looking at the map  $H^0(\mathcal{O}_{\mathbb{P}^3}(2)) \rightarrow H^0(\mathcal{O}_C(2))$ , we see  $C$  lies on a unique quadric  $Q$  (uniqueness follows from Bezout's theorem and (7.7.3.11), by the same reason as (7.13.8.5)).

Next looking at the map  $H^0(\mathcal{O}_{\mathbb{P}^3}(3)) \rightarrow H^0(\mathcal{O}_C(3))$ , then the kernel has dimension at least 5, thus there is a cubic containing  $C$  but not  $Q$ . Then  $S \cap Q$  is a complete intersection of degree 6 containing  $C$ , also it has the same arithmetic genus as  $C$  (7.7.3.8), thus the same Hilbert polynomial (linear function), so  $C = S \cap Q$  by (7.7.3.11)s. Conversely, any smooth curve of the form  $S \cap Q$  is a canonical curve of genus 4, by adjunction formula ( $\mathcal{K}_C = \mathcal{O}_C(1)$  has degree 6).

Conversely, for any smooth complete intersection of a quadric surface and a cubic surface has arithmetic genus 4 by (7.7.3.8),  $\mathcal{O}_C(1)$  has degree 6 and  $h^0(\mathcal{O}_C(1)) \geq 4$  because  $C$  is non-degenerate: there are no smooth plane curve of genus 4.

Now if  $Q$  is non-singular, then  $C$  is of type (3, 3) in  $Q$ , thus the two projections are two trigonal map from  $C$  to  $\mathbb{P}^1$ , and if  $Q$  is a cone, the projection from the vertex is a trigonal map from  $C$  to  $\mathbb{P}^1$ .  $\square$

**Prop. (7.13.8.9) [Non-Hyperelliptic Curve of Genus  $\geq 5$ ].** For a non-hyperelliptic curve  $C$  of genus 5, we have a canonical map  $\varphi : C \rightarrow \mathbb{P}^4$ . Firstly we consider what quadrics  $C$  lies on:  $h^0(\mathcal{O}_{\mathbb{P}^4}(2)) = 15$  and  $h^0(\mathcal{O}_C(2)) = 12$ , so  $C$  lies on at least 3 quadrics. There are two cases:

1.  $C = \cap Q_i$  where  $Q_i$  are the quadrics containing  $C$ .
2.  $C$  is a strict subset of  $\cap Q_i$ .

which corresponds to non-trigonal and trigonal curves.  $\lrcorner$

*Proof:* The case 1 does occur, because by Bertini's theorem (7.6.4.28), for general three quadrics  $Q_i$ ,  $\cap Q_i$  is a smooth curve, and thus  $\mathcal{K}_C = (\mathcal{K}_{\mathbb{P}^4}(-5 + 2 + 2 + 2))|_C = \mathcal{O}_C(1)$ . So  $d = 8, g(C) = 5$ .

In this case,  $C$  is not trigonal, because if  $C$  is trigonal, then  $C$  has a  $g_3^1$ , which means  $C$  has three colinear point. Then all the quadrics  $Q_i$  must contain this line, contradiction.

The case 2: Cf. [Algebraic Curves, Harris, P24]. ? This case corresponds to trigonal curves.  $\square$

**Prop. (7.13.8.10) [Non-Hyperelliptic Curve of Genus 5 is Tetragonal].** Let  $C$  be a canonical embedded curve which is not trigonal admits a map of degree 4 to  $\mathbb{P}^1$ .  $\lrcorner$

*Proof:* Let  $\mathbb{P}^2 = \{Q | C \subset Q\}$ . We can ask there are singular quadrics in this set. Inside  $\mathbb{P}^{14}$  which is the space of all quadrics in  $\mathbb{P}^4$ , there is a quintic hypersurface of singular quadrics. ? For the rest, Cf. [Algebraic Curves, Harris, P25].  $\square$

**Prop. (7.13.8.11).** If  $C \subset \mathbb{P}_k^{g-1}$  is a canonical smooth curve of genus  $g \geq 6$ , then  $C$  is not a complete intersection.  $\lrcorner$

*Proof:*

$\square$

### 9 Brill-Noether Theory

### 10 Relative Curves

**Def. (7.13.10.1) [Relative Curves].** Let  $S \in \text{Sch}$ , a **smooth curve** over  $S$  is a smooth morphism  $C \rightarrow S$  of relative dimension 1 that is separated and of f.p..  $\lrcorner$

**Prop. (7.13.10.2).** Let  $S \in \text{Sch}$  and  $C$  a smooth curve over  $S$ , then  $\lrcorner$

## 7.14 K3 Surfaces

References are [Lectures on K3 Surfaces Huybrechts] and [General Introduction to K3 Surfaces].

### 1 Surfaces

**Prop. (7.14.1.1).** Any complete non-singular surface over an algebraically closed field is projective.  $\lrcorner$

*Proof:* Cf.[Badescu, L. Algebraic surfaces]Thm2.8.  $\square$

### 2 K3 Surfaces

**Def. (7.14.2.1) [K3 Surfaces].** For  $k \in \mathbf{Field}$ , a(n) (algebraic)**K3 surface** over  $k$  is a complete non-singular surface  $X$  over  $k$  s.t.  $\omega_X \cong \mathcal{O}_X$ , and  $H^1(X, \mathcal{O}_X) = 0$ .  $\lrcorner$

**Prop. (7.14.2.2).** For  $k \in \mathbf{Field}$ , the intersection of three quadrics in  $\mathbb{P}_k^5$  is a K3 surface of genus 5 and degree 8.  $\lrcorner$

*Proof:*  $\square$

**Prop. (7.14.2.3).** For  $k \in \mathbf{Field}$  and  $X/k$  a K3 surface, we have

- $\Omega_X \cong \mathcal{T}_X$ ,
- $H^2(X, \mathcal{O}_X) \cong H^0(X, \mathcal{O}_X)$ ,
- $\chi(\mathcal{O}_X) = 2 \dim H^0(X, \mathcal{O}_X) = 2$ .

$\lrcorner$

*Proof:* Easy by Poincaré duality.  $\square$

**Prop. (7.14.2.4) [Chow Ring of K3 Surfaces].** Let  $k \in \mathbf{Field}$  and  $X/k$  a K3 surface, then

- All points of  $X$  that lies in some rational(possibly singular)curve have the same class  $c_X \in \mathrm{CH}_0(X)$ .
- The image of the intersection  $\mathrm{Pic}(X) \times \mathrm{Pic}(X) \rightarrow \mathrm{CH}_0(X)$  is contained in  $\mathbb{Z}c_X$ .
- $c_2(X) = 24c_X$ .
- If  $c_X$  is represented by some  $c \in X$ , then for any  $x \in X$ ,

$$(x, x) - (x, c) - (c, x) + (c, c) = 0 \in \mathrm{CH}_0(X \times X).$$

$\lrcorner$

*Proof:* Cf.[Chow Ring of a K3 Surface, Beauville-Voisin].  $\square$

### K3 Surfaces over Finite Fields

**Prop. (7.14.2.5).** If  $k \in \mathbf{Field}^{\mathrm{fin}}$  and  $X \in \mathbf{K3}/k$ , then  $H_{\mathrm{ét}}^1(X_{\bar{k}}, \mathbb{Q}_\ell) = H_{\mathrm{ét}}^3(X_{\bar{k}}, \mathbb{Q}_\ell) = 0$ .  $\lrcorner$

*Proof:*  $\square$

### 3 Enriques Surfaces

**Def. (7.14.3.1) [Enriques Surfaces].** Enriques surfaces are algebraic surfaces  $X$  such that the irregularity  $q = 0$  and the canonical line bundle  $\omega_X$  is non-trivial but has trivial square.  $\lrcorner$

**Prop. (7.14.3.2) [Enriques Surfaces are Quotients of K3 Surfaces].** If  $\text{char } k \neq 2$ , then any Enriques surface over  $k$  is a quotient of a K3 surface by an involution.  $\lrcorner$

*Proof:* ?  $\square$

### 4 Complex K3 Surfaces

**Def. (7.14.4.1) [Complex K3 Surfaces].** a **complex K3 surface** is a compact connected Kähler complex surface  $X/\mathbb{C}$  such that  $\omega_X \cong \mathcal{O}_X$  and  $H^1(X, \mathcal{O}_X) = 0$ .

Notice that by [Lectures on K3 surfaces]Section7.3.2, the condition that  $X$  being Kähler is redundant ? .  $\lrcorner$

**Prop. (7.14.4.2) [Complex and Algebraic K3 Surfaces].** By GAGA and (7.14.1.1), an algebraic K3 surface over  $\mathbb{C}$  is equivalent to a projective complex K3 surface.  $\lrcorner$

**Prop. (7.14.4.3) [K3 Surfaces are Spin].** ?  $\lrcorner$

**Prop. (7.14.4.4) [K3 Lattice].** For  $X \in \text{K3}/\mathbb{C}$ , the cohomology group  $H^2(X, \mathbb{Z})$  endowed with the intersection form is isomorphic to  $E_8(-1)^{\oplus 2} \oplus U^{\oplus 3}$ . In particular,  $H^2(X, \mathbb{Z})$  is even of signature  $(3, 19)$ .

Such a lattice is called a **K3 lattice**, denoted by  $\Lambda^{\text{K3}}$ .  $\lrcorner$

*Proof:* Cf.[Lectures on K3 surfaces]Prop1.3.5. ?  $\square$

**Prop. (7.14.4.5).** If  $X$  is a complex K3 surface, then  $\text{Pic}(X)$  is torsion-free.  $\lrcorner$

*Proof:*  $\square$

**Prop. (7.14.4.6) [Complex K3 Surfaces are Deformation Equivalent].** All complex K3 surfaces are deformation equivalent.  $\lrcorner$

*Proof:* ?

Proof sketch:  $\square$

### 5 Period Maps

References are [Huybrechts]Section6.3

**Def. (7.14.5.1) [Polarized K3 Surfaces].** A **polarized K3 surface** is a tuple  $(X, \mathcal{L})$  where  $X/k$  is a K3 surface and  $\mathcal{L}$  is an ample line bundle on  $X$ . A **primitive polarized K3 surface** is a polarized K3 surface  $(X, \mathcal{L})$  s.t.  $\mathcal{L}$  is not a multiple of other ample line bundles.  $\lrcorner$

**Prop. (7.14.5.2) [Period Map].** For a smooth proper family of K3 surfaces  $X/S$  where  $S$  is connected, simply-connected and has distinguished point  $s_0$  with an isomorphism  $H_{\text{Betti}}^2(X_{s_0}, \mathbb{Z}) \cong \Lambda^{\text{K3}}$ , then we can assume that all  $H_{\text{Betti}}^2(X_s, \mathbb{Z})$  for  $s \in S$  are canonically isomorphic to  $\Lambda^{\text{K3}}$ . Then the **period map** is defined to be

$$\mathcal{P} : S \mapsto \mathbb{P}(\Lambda_{\mathbb{C}}^{\text{K3}}) : t \mapsto [H_{\text{Betti}}^{2,0}(X, \mathbb{C})] \in \mathbb{P}^1(\Lambda_{\mathbb{C}}^{\text{K3}}).$$

$$\mathbb{D} = \{ \langle z \rangle \in \mathbb{P}(\Lambda_{\mathbb{C}}^{\text{K3}}) \mid \langle z, z \rangle = 0, \langle z, \bar{z} \rangle < 0, z \perp v \in \text{Hom}(C^*, \text{SO}(v^\perp)) \}.$$

$\lrcorner$

## 6 Moduli Space of K3 Surfaces

**Thm. (7.14.6.1) [Moduli Space of K3 Surfaces].** Let  $\Lambda^{\text{K3}} \cong E_8^{\oplus 2} \oplus U^{\oplus 3}$ , and fix a vector  $v \in \Lambda$  of length  $d > 0$ . Then for any  $N \in \mathbb{Z}_+$ , there is a variety  $M_{N,d}^{\text{K3}}/\mathbb{Q}$  representing the functor that maps  $S \in \text{Sch}/\mathbb{Q}$  to the set of datum  $(X/S, E, \xi)$ , where

- $\pi : X \rightarrow S$  is a family of K3 surfaces.
- $E \in \text{NS}(X/S)$  is a polarization of degree  $d$ .
- $\xi : R^2\pi_{*,\text{ét}}(\mathbb{Z}/(N)) \cong (\Lambda^{\text{K3}}/(N))_S$  is an isomorphism.

┘

*Proof:*

□

**Thm. (7.14.6.2) [Global Tonelli Theorem].** If  $(S, \mathcal{L}), (S', \mathcal{L}') \in \text{K3}^{\text{polar}}/\mathbb{C}$  and there exists an isometry

$$\varphi : H_{\text{Betti}}^2(S', \mathbb{Z}) \cong H_{\text{Betti}}^2(S, \mathbb{Z})$$

s.t.  $\varphi(\mathcal{L}') = \varphi(\mathcal{L})$  and  $\varphi_{\mathbb{C}}(H_{\text{Betti}}^{2,0}(S')) = H_{\text{Betti}}^{2,0}(S)$ , then there exists an isomorphism  $\sigma : S \cong S'$  s.t.  $\sigma^* = \varphi$ .

┘

*Proof:* ?

□

**Prop. (7.14.6.3).** For  $g \in \mathbb{Z}_{\geq 2}$ , the period map  $\wp_g : M_g^{\text{K3}} \rightarrow \mathcal{P}_g(7.14.5.2)$  is an open immersion.

┘

*Proof:*

□

**Thm. (7.14.6.4) [K3 Surfaces and Shimura Varieties].** For suitable compact open subset  $\mathcal{K} \subset \text{SO}(2, 19)(\mathbf{A}^f)$ , let  $M_{g,\mathcal{K}}$  be the moduli space of K3 surfaces of genus  $g$  with level structure  $\mathcal{K}$ , then the period map is a morphism

$$\wp_{g,\mathcal{K}} : M_{g,\mathcal{K}}^{\text{K3}} \otimes \mathbb{C} \rightarrow \text{Sh}_{\mathcal{K}}(\text{SO}(2, 19), \mathbb{D})_{\mathbb{C}}.$$

┘

*Proof:*

□

**Thm. (7.14.6.5) [Rizov].** The period map in (7.14.6.4) is defined over  $\mathbb{Q}$ .

┘

*Proof:* Cf. [Rizov, Complex multiplication for K3 surfaces] ?

□

## 7.15 Tropical Geometry

References are [Tropical Geometry, Introduction] and [Mik06].

From a geometric point of view tropical geometry describes worst possible degenerations of the complex structure on an  $n$ -fold  $X$ .

### 1 Tropical Arithmetic

**Def. (7.15.1.1) [Tropical Semifield].** The **tropical semifield** or the **tropical line**  $\mathbb{T}$  is defined to be the topological space  $\{-\infty\} \cup \mathbb{R}$  with the operation of addition and multiplication given by

$$a \oplus b = \max a, b, \quad a \otimes b = a + b.$$

┘

**Def. (7.15.1.2) [Tropical Polynomials].** A **tropical polynomial** is a finite tropical sum of tropical monomials.

A  **$\mathbb{Z}$ -affine function** is a tropical quotient of two tropical monomials. Equivalently, it is a linear function with integer slopes.

A **tropical rational function** is a tropical quotient of two tropical polynomials. ┘

**Prop. (7.15.1.3) [Tropical Fundamental Theorem of Algebra].** Every tropical polynomial function can be written uniquely as a tropical product of tropical linear functions. ┘

*Proof:*

□

**Def. (7.15.1.4) [Regular Tropical Functions].** A **regular tropical function** on a Euclidean open subset  $U \subset \mathbb{T}^n$  is a function of the form  $p(y) \oplus \varphi(y)$  where  $p$  is a tropical polynomial and  $\varphi(y)$  is a  $\mathbb{Z}$ -affine function. ┘

**Prop. (7.15.1.5) [Tropical Sheaf].** For any Euclidean open subset  $U \subset \mathbb{T}^n$ , the set of regular tropical functions on  $U$  forms a semi-algebra, i.e. a tropical algebra. And in this way we get a structure sheaf  $\mathcal{O}$  on  $\mathbb{T}^n$ . ┘

*Proof:* ?

□

### 2 Tropical Varieties

**Def. (7.15.2.1) [Tropical Hypersurfaces].** For a tropical polynomial  $f$ , the tropical hypersurface  $V(f) \subset \mathbb{T}^n$  is just the set of points that  $f$  is not linear, i.e.  $\frac{1}{f}$  is not regular (7.15.1.4). ┘

**Def. (7.15.2.2) [Tropical Graphs].** For a tropical polynomial  $f : \mathbb{T}^n \rightarrow \mathbb{T}$ , we can define its **tropical graph** as

$$\Gamma_f \in \mathbb{T}^n \times \mathbb{T} = V(y + f(x)).$$

┘

**Def. (7.15.2.3) [Contractions].** For any tropical polynomial  $f$ , the projection  $\Gamma_f \rightarrow \mathbb{T}^n$  is called a **tropical principal contraction**. A **tropical contraction** is a composition of tropical principal contractions (a restriction of a tropical principal contraction to a tropical tropical subset in  $\mathbb{T}^n$ ). ┘

### Tropical Varieties

**Def. (7.15.2.4) [Tropical Varieties].** For  $n \in \mathbb{Z}_+$ , a **tropical variety** of dimension  $n$  is a topological space  $X \in \mathcal{Top}$  with atlas  $\varphi_\alpha : U_\alpha \rightarrow \mathbb{T}^n$  s.t.  $\cup_\alpha U_\alpha = X$ , and

- Each  $\varphi_\alpha$  is a contraction to an open subset of  $\mathbb{T}^n$ .
- The translation maps  $\Phi_{\alpha,\beta} = \varphi_\beta \circ \varphi_\alpha^{-1}$  are induced by the integer affine-linear maps.
- There exists a finite covering  $\{W_j\}$  of  $X$  s.t. for any  $j$ , there exists  $\alpha$  s.t.  $W_j \subset U_\alpha$  and the closure of  $\varphi_\alpha(W_j)$  is contained in  $\varphi_\alpha(U_\alpha)$ .

┘

**Def. (7.15.2.5) [Tropical Varieties are Balanced].** If  $\delta : V \subset \mathbb{T}^N \rightarrow \mathbb{T}^n$  is contraction map, then  $V$  is balanced (7.15.3.2), where the weight on each facet is given by the gcd of the two monomials equating at this facet.

Then by the definition (7.15.2.4), the image of  $X$  under any tropical chart is balanced.

┘

*Proof:* ?

□

**Def. (7.15.2.6) [Finite Points].** For a tropical variety  $X$ , a point  $x \in X$  is called a **finite tropical point** if  $x$  is mapped to  $\mathbb{R}^n \subset \mathbb{T}^n$  under some (thus all) tropical atlas on  $X$ .

At a finite point, we have the notion of **integer tangent vector** to  $X$ .

┘

**Def. (7.15.2.7) [Tropical Morphisms].** A map  $f : X \rightarrow Y$  of tropical varieties is called a **linear tropical map** is that is linear on the tropical coordinates. It is called a **regular tropical map** if it is given by regular functions on tropical coordinates.

┘

**Prop. (7.15.2.8).** The image of a map  $f : X \rightarrow Y$  of tropical varieties is a  $(\dim X)$ -dimensional tropical variety.

┘

**Def. (7.15.2.9) [Equivalent Tropical Varieties].** A **tropical contraction of varieties** is a tropical map  $f : X \rightarrow Y$  of tropical varieties of the same dimension that is locally a contraction map. Two tropical varieties are called **equivalent tropical varieties** if they are in the same equivalence class under the equivalence relation generated by contraction maps.

┘

**Prop. (7.15.2.10) [Regular Tropical Maps are Contractions of Linear Tropical Maps].** If  $f : X \rightarrow Y$  is a regular tropical morphism (7.15.2.7), then there exists a contraction  $\delta : \tilde{X} \rightarrow X$  s.t.  $f \circ \delta : \tilde{X} \rightarrow Y$  is a linear tropical morphism.

┘

*Proof:* ?

□

### Projective Tropical Varieties

**Def. (7.15.2.11) [Tropical Projective Spaces].** For  $n \in \mathbb{Z}_+$ , the **tropical projective space**  $\mathbb{TP}^n$  is defined by the quotient of  $\mathbb{T}^{n+1} \setminus (-\infty, \dots, -\infty)$  under the equivalence relation  $(x_0, \dots, x_n) \sim (\lambda \otimes x_0, \dots, \lambda \otimes x_n)$  for any  $\lambda \in \mathbb{T}^\times$ .

It has  $n + 1$  tropical charts (7.15.2.4).

┘

**Def. (7.15.2.12) [Tropical Varieties].** Let  $K = \overline{\mathbb{C}((t))} = \mathbb{C}\{\{t\}\}$ , then any  $p \in K^\times$  can be written as a Puiseux series

$$p = c_1 t^{q_1} + c_2 t^{q_2} + \dots,$$

where  $c_i \in \mathbb{C}^\times$  and  $q_1 < q_2 < \dots \in \mathbb{Q}$  with bounded denominators. Then we call  $q_1$  the order of  $p$ .

Thus there is a map

$$\text{ord} : (K^\times)^n \rightarrow \mathbb{Q}^n \subset \mathbb{R}^n,$$

Then a **tropical variety** in  $\mathbb{R}^n$  is defined to be a subset of the form

$$T(I) = \overline{\text{ord}(V(I))}$$

where  $I$  is an ideal of  $K[X_1^\pm, \dots, X_n^\pm]$  and  $V(I) \subset (K^\times)^n$  its vanishing points.  $\lrcorner$

**Def. (7.15.2.13) [Projective Tropical Varieties].** And a **projective tropical variety** in  $\mathbb{TP}^{n-1}$  is defined to be a subset of the form

$$T(I) = \overline{\text{ord}(V(I))} / \mathbb{R}(1, \dots, 1).$$

$\lrcorner$

**Def. (7.15.2.14).** And a **tropical linear subspace** in  $\mathbb{TP}^{n-1}$  is defined to be a projective tropical variety  $T(I)$  s.t.  $I$  is generated by linear forms.  $\lrcorner$

**Prop. (7.15.2.15) [Tropical Variety and Tropical Numbers].** Tropical varieties can be regarded as sets where at least two of the terms in the tropical polynomial attains minimum. ?  $\lrcorner$

**Def. (7.15.2.16) [Tropical Basis].** For any  $w \in \mathbb{Q}^n$  called a **weight**, we can define the weight of a tropical monomial, and thus define the initial terms of a tropical polynomial  $f$ , denoted by  $In_w(f)$ . For any ideal  $I \subset \mathbb{C}\{\{t\}\}[X_1^\pm, \dots, X_n^\pm]$ , let  $In_w(I)$  be the ideal generated by initial forms of its elements. Then for any ideal  $I$ , there exists a finite set  $G \subset I$  s.t.

- If  $w \in T(I)$ , then  $\{In_w(g)\}_{g \in G}$  generate  $In_w(I)$ .
- If  $w \notin T(I)$ , then  $\{In_w(g)\}_{g \in G}$  contains a monomial.

Such a set  $G$  is called a **tropical basis** of  $I$ .  $\lrcorner$

*Proof:* Cf. [Solving Systems of Polynomial Equations] Section 9 or [tropical Grassmannian].  $\square$

**Cor. (7.15.2.17).** It can be verified that if  $G$  is a tropical basis for an ideal  $I$ , then  $T(I) = \bigcap_{g \in G} T(g)$ .  $\lrcorner$

**Def. (7.15.2.18) [Tropical Prevarieties].** A **tropical prevariety** in  $\mathbb{R}^n$  or  $\mathbb{TR}^n$  is an intersection of f.m. tropical hypersurfaces.

Any tropical variety is a tropical prevariety, but not conversely.  $\lrcorner$

*Proof:* Every tropical variety is a tropical prevariety by (7.15.2.17). For the converse ?.

$$I = 0x + 0y + 0z, \quad I' = 0x + 0y + 1z.$$

Then  $\square$

## Differential Forms

**Def. (7.15.2.19) [Tropical Differential Forms].** For  $k \in \mathbb{N}$ , a **tropical  $k$ -form** on a tropical variety  $X$  is an exterior real-valued  $k$ -form of the integer tangent vectors at every finite point  $x \in X$  (7.15.2.6) s.t. on each chart  $U_\alpha$ , the form is induced from a constant linear  $k$ -form on  $\varphi_\alpha(U_\alpha)$ .  $\lrcorner$

**Def. (7.15.2.20)[Globally-Defined Differential Forms].** A globally-defined differential form on a tropical variety  $X$  is a differential form (7.15.2.19) s.t. for any non-finite point  $x \in X$ , if  $x \in U_\alpha$  and  $\varphi_\alpha(x) \in \mathbb{T}^{N_\alpha}$  has the  $j$ -th coordinate  $-\infty$ , then the constant differential form  $\omega$  on  $\mathbb{R}^{N_\alpha}$  doesn't depend on the  $j$ -th coordinate.  $\lrcorner$

**Example (7.15.2.21).** There are globally-defined differential forms on any tropical torus  $\mathbb{R}^n/\Lambda$ , but there are no globally-defined differential forms on  $\mathbb{TP}^n$ .  $\lrcorner$

**Prop. (7.15.2.22).** For any tropical contraction  $\tilde{X} \rightarrow X$ , any globally-defined differential forms vanishes on the direction of the local contraction maps, so there is a bijection between globally-defined differential forms on  $\tilde{X}$  and that on  $X$ .  $\lrcorner$

### 3 Polyhedra Structures

**Def. (7.15.3.1)[Integer Convex Polyhedron].** An integer convex polyhedron in  $\mathbb{T}^n$  is the closure of a convex polyhedron in  $\mathbb{R}^n$  (may be unbounded) s.t. the slopes of all its faces are integers.  $\lrcorner$

**Def. (7.15.3.2)[Balanced Complexes].** A balanced simplicial complex of integer convex polyhedra  $X$  in  $\mathbb{T}^n$  of dimension  $k$  is a simplicial complex of integer convex polyhedra with each facets assigned a weight that satisfy the following: For any  $(k-1)$ -dimensional face  $Q$  of  $X$  and facets  $P_1, \dots, P_l$  adjacent to  $Q$ , if we consider the map  $\lambda : \mathbb{R}^n \rightarrow \mathbb{R}^{n-k+1}$  mapping the affine  $(k-1)$ -subspace containing  $Q$  to a point and each  $P_i$  to an interval, and let  $v_j$  be the primitive integer vector parallel to  $\lambda(P_j)$  multiplied by the weight of  $P_j$ , then

$$\sum_{i=1}^l v_j = 0.$$

$\lrcorner$

**Thm. (7.15.3.3)[Characterizing Tropical Curves].** Tropical curves in  $\mathbb{TP}^2$  are exactly the balanced rational graphs.  $\lrcorner$

*Proof:* Cf.[Tropical geometry, first steps]P300. ?  $\square$

**Prop. (7.15.3.4)[Planer Quadratic Tropical Curves].** There are classifications of planer quadratic tropical curves in [Tropical geometry, first steps]P297.  $\lrcorner$

*Proof:*  $\square$

**Thm. (7.15.3.5)[Speyer].** Any tropical variety is an integral, weighted, balanced polyhedral complex.  $\lrcorner$

*Proof:*  $\square$

**Prop. (7.15.3.6)[Tropical Lines].** Here is a description of tropical lines in  $\mathbb{TP}^{n-1}$ : A tropical line in  $\mathbb{TP}^{n-1}$  is an embedded tree whose edges are either bounded line segments or unbounded half rays, subject to the following three rules:

- The directions of all edges in the tree are spanned by integer vectors.
- There are precisely  $n$  unbounded half rays. Their directions are the  $n$  standard coordinate directions  $e_1, \dots, e_n$  in  $\mathbb{TP}^{n-1}$ .
- If  $u_1, u_2, \dots, u_r$  are the primitive integer vectors in the directions of all outgoing edges at any fixed vertex of the tree then  $u_1 + u_2 + \dots + u_r = 0$ .

$\lrcorner$

*Proof:* Cf.[Tropical Grassmannian]  $\square$

### Tropical Incidences

**Thm. (7.15.3.7) [Tropical Pappus Hexagon Theorem, Tabera].** Let 1, 2, 3, 4, 5 be five points in  $\mathbb{TP}^2$ , and define the cross products:

$$a = 1 \otimes 4, b = 2 \otimes 4, c = 3 \otimes 4, a' = 1 \otimes 5, b' = 2 \otimes 5, c' = 3 \otimes 5,$$

$$6 = b \otimes c', 7 = a' \otimes c, 8 = a \otimes b', a'' = 1 \otimes 6, b'' = 2 \otimes 7, c'' = 3 \otimes 8.$$

Then the three tropical lines  $a'', b'', c''$  are concurrent.  $\lrcorner$

*Proof:* Cf. [Tropical Constructive Pappus' Theorem].  $\square$

## 4 Intersection Theory

**Def. (7.15.4.1) [Tropical Cycles].** For a tropical variety  $X$  and  $k \in \mathbb{N}$ , a  **$k$ -tropical cycle** is a  $k$ -dimensional integer piece-wise linear polyhedral complex weighted by integers that satisfy the balancing property (7.15.3.2).  $\lrcorner$

**Prop. (7.15.4.2) [Linear Pushforward of Cycles].** For a linear map of tropical varieties  $f : X \rightarrow Y$  and a tropical  $k$ -cycle  $B \subset X$ ,  $f_*(B) \subset Y$  is also a tropical  $k$ -cycle.  $\lrcorner$

**Def. (7.15.4.3) [Cartier Divisors].** For a tropical variety  $X$ , a **tropical Cartier divisor** on  $X$  is a formal linear sum of  $(\dim X - 1)$ -cycles on  $X$  s.t. there exists an open covering  $\{U_\alpha\}$  of  $X$  and regular functions  $f_\alpha : U_\alpha \rightarrow \mathbb{T}$  that defines  $D \cap U_\alpha \subset U_\alpha$  as a hypersurface.  $\lrcorner$

**Prop. (7.15.4.4) [Tropical Intersections]. ?**

The intersection is well-defined and gives a commutative associative ring structure on  $\text{Ch}^*(X)$ .  $\lrcorner$

**Def. (7.15.4.5) [Linear Pullback of Cycles].** For a linear map  $f : X \rightarrow Y$  of tropical varieties and  $B \subset Y$  a  $k$ -cycle, the pullback cycle is the  $(k + \dim X - \dim Y)$ -dimensional cycle

$$f^*(B) = \pi_*^X((X \times B) \cdot \Gamma_f) \subset X \text{ (7.15.4.4).}$$

$\lrcorner$

**Def. (7.15.4.6) [Linear Equivalence of Cycles].** Two cycles in a tropical variety  $X$  are called **tropical linearly equivalent** if they appear in a family of cycles in  $X$  parametrized by  $\mathbb{TP}^1$ .  $\lrcorner$

**Prop. (7.15.4.7).** The degree of a 0-cycle in a compact tropical variety is a deformation invariant.  $\lrcorner$

*Proof:* ?  $\square$

## 5 Tropical Curves

References are [M-Z08].

### Metric Graphs

**Def. (7.15.5.1)[Metric Graphs].** In a graph, a **leaf** is an edge adjacent to a 1-valent vertex. A **finite** is an edge that is not a leaf.

A **metric graph** is a finite graph  $\Gamma$  s.t. each of its finite edge is assigned a positive real length.

┘

**Prop. (7.15.5.2)[Tropical Curves and Metric Graphs].** There is a bijection between compact tropical curves and metric graphs, and a map  $f : \Gamma \rightarrow \Gamma'$  between tropical graphs is a regular morphism iff there exists a presentation of  $\Gamma$  as a metric graph s.t. for each  $e \in E(\Gamma)$ , there exists  $n(e) \in \mathbb{N}$  s.t.

$$d_{\Gamma'}(f(x), f(y)) = n(e)d_{\Gamma}(x, y).$$

┘

*Proof:* ?

□

**Prop. (7.15.5.3).** The 1-forms on a compact tropical curve  $\Gamma$  form a real vector space  $\Omega(\gamma)$  of dimension  $b_1(\Gamma)$ .

┘

## 6 Enumerative Tropical Geometry

References are [Mikhalkin, Enumerative tropical algebraic geometry in  $\mathbb{R}^2$ ].

**Prop. (7.15.6.1).** For  $g \in \mathbb{N}$  and  $d \in \mathbb{Z}_+$ , let  $\mathcal{Z}$  be a set of  $3d - 1 + g$  points in  $\mathbb{CP}^2$  in general position, and denote  $N_{g,d}^{\mathbb{C}}$  the number of curves of degree  $d$  and genus  $g$  through them. On the other hand, let  $\mathcal{X}$  be a set of  $3d - 1 + g$  points in  $\mathbb{TP}^2$  in general position, and denote  $N_{g,d}^{\mathbb{T}}$  the number of curves of degree  $d$  and genus  $g$  through them. Then  $N_{g,d}^{\mathbb{T}} = N_{g,d}^{\mathbb{C}}$ .

┘

*Proof:* ?

## 8 | Algebraic Geometry II: Spectral Algebraic Geometry

### 8.1 Andre-Quillen-Cohomology

Basic references are [Andre-Quillen Cohomology of Commutative Algebras Iyenger]. See also [Quillen Cohomology of Commutative Rings] and [Quillen On the (Co-)homology of Commutative Rings]. [Smoothness, Regularity and Complete Intersections] is a must read.

#### 1 Naive Cotangent Complex

This subsection is obsolete.

**Prop. (8.1.1.1) [Polynomial Replacement].** For a morphism of ring morphisms  $(R \rightarrow S) \rightarrow (R' \rightarrow S')$ , let  $\alpha, \alpha'$  be two presentations, then there exists morphism of presentations, and different morphisms induce homotopic maps  $NL_{S/R} \rightarrow NL_{S'/R'}$ .  $\lrcorner$

*Proof:* Cf. [[Sta]00S1]. In fact, any surjective formally smooth representation will give the naive cotangent complex, up to quasi-isomorphism (8.1.1.4).  $\square$

**Cor. (8.1.1.2).** If  $A = R[X_i]$  be a polynomial algebras, then  $NL_{A/R}$  is homotopic to  $(0 \rightarrow \Omega_{B/A})$  because  $A \rightarrow A$  is a presentation with zero kernel.

If  $R \rightarrow A$  is surjective with kernel  $I$ , then  $NL_{A/R}$  is homotopic to  $(I/I^2 \rightarrow 0)$ .  $\lrcorner$

**Lemma (8.1.1.3) [Formally Smooth Replacement 1].** If  $A \rightarrow B$  is a ring map that has two surjective presentations  $C \rightarrow B, D \rightarrow B$  with kernels  $I, J$ . If there is a map  $C \rightarrow D$  commuting these two presentation,  $D$  formally smooth, and  $C \rightarrow D$  is surjective or  $C$  is formally smooth, then their corresponding naive cotangent complexes are quasi isomorphic.  $\lrcorner$

*Proof:* Cf. [Foundations of Perfectoid Geometry P123].  $\square$

**Prop. (8.1.1.4) [Formally Smooth Replacement 2].** If  $B$  is an  $A$ -algebra that has two formally smooth presentation  $C \rightarrow B, D \rightarrow B$  with kernels  $I, J$ . then their corresponding naive cotangent complexes are quasi isomorphic.  $\lrcorner$

*Proof:* It suffices to prove they are both quasi isomorphic to the canonical cotangent complex. For

this, we first consider the diagram 
$$\begin{array}{ccc} D & \longrightarrow & C \\ \downarrow & & \downarrow \\ A[B] & \longrightarrow & B \end{array}$$
, where  $D = A[S]$  and  $S = C \amalg A[B]$  as sets. The

two map  $D \rightarrow A[B]$  and  $D \rightarrow A[B]$  can be chosen because  $C \rightarrow B$  is surjective. So the results follows from (8.1.1.3).  $\square$

**Prop. (8.1.1.5) [Jacobi-Zariski Sequence].** Let  $A \rightarrow B \rightarrow C$  be a ring map. Choose a presentation  $\alpha : P \rightarrow B$  for  $B/A$  with kernel  $I$ , a presentation  $\beta : Q \rightarrow C$  for  $C/B$  with kernel  $J$ , a presentation  $\gamma : R \rightarrow C$  for the induced representation  $C/A$  with kernel  $K$ , then there is an exact sequence of complexes:

$$\begin{array}{ccccccc} I/I^2 \otimes_B C & \longrightarrow & K/K^2 & \longrightarrow & J/J^2 & \longrightarrow & 0 \\ \downarrow & & \downarrow & & \downarrow & & \\ 0 \longrightarrow \Omega_{P/A} \otimes_B C & \longrightarrow & \Omega_{R/A} \otimes C & \longrightarrow & \Omega_{Q/B} \otimes C & \longrightarrow & 0 \end{array}$$

Applying snake lemma, we get

$$H_1(NL_{B/A} \otimes_B C) \rightarrow H_1(L_{C/A}) \rightarrow H_1(L_{C/B}) \rightarrow C \otimes_B \Omega_{B/A} \rightarrow \Omega_{C/A} \rightarrow \Omega_{C/B} \rightarrow 0.$$

┘

*Proof:* Cf. [[Sta]00S2].

□

**Prop. (8.1.1.6) [Localization].** Let  $A \rightarrow B$  be a ring map, for a multiplicative set  $S$  of  $B$ , we have  $NL_{B/A} \otimes_B S^{-1}B$  is quasi-isomorphic to  $NL_{S^{-1}B/A}$ .

┘

*Proof:* Because it commutes with colimit, it suffice to prove for  $S = f$ , and this is the content of lemma (8.1.1.7) below.

□

**Lemma (8.1.1.7).** If  $A \rightarrow B$  is a ring map and  $\alpha : P \rightarrow B$  is a presentation of  $B$  with kernel  $I$ , then  $\beta : P[X] \rightarrow B_g : X \rightarrow 1/g$  is a presentation of  $B_g$  with kernel  $J = I + (gX - 1)$ . Then we have

- $J/J^2 = (I/I^2)_g \oplus B_g(fX - 1)$ .
- $\Omega_{P[X]/A} \otimes_{P[X]} B_g = \Omega_{P/A} \otimes_P B_g \oplus B_g dX$ .
- $NL(\beta) \cong NL(\alpha) \otimes_B B_g \oplus (B_g \xrightarrow{g} B_g)$ .

Hence  $NL_{B/A} \otimes_B B_g \rightarrow NL_{B_g/A}$  is a homotopy equivalence.

┘

*Proof:* Cf. [[Sta]08JZ].

□

## 2 Cotangent Complex

**Def. (8.1.2.1) [Cotangent Complex].** The adjunction of  $A \ltimes -$  and  $A \otimes_- \Omega_{-/R}$  (5.4.3.5) extends to an adjunction between  $(sCAlg_R)_{/A}$  and  $sMod_A$ . These categories are model categories by (5.8.2.11)(5.8.2.14) and (4.5.4.1), and  $A \ltimes -$  preserves all weak equivalences and fibrations, so it is a Quillen adjunction (4.5.2.1). Then the **cotangent complex**  $L_{A/R}$  as a simplicial  $A$ -module is defined to be the total left derived functor applied to the trivial simplicial algebra  $A$ . Equivalently, it is

$$L_{A/R} = A \otimes_X \Omega_{X/R}$$

where  $X$  is a cofibrant replacement (4.5.1.12) of  $A$ .

Because of the Dold-Kan equivalence, we sometimes also call  $NL_{A/R}$  the cotangent complex. ┘

**Def. (8.1.2.2) [André-Quillen Homology and Cohomology].** The **André-Quillen homology** is defined to be

$$D_q(A/R) = \pi_q(L_{A/R}) = H_q N(L_{A/R}) \quad (5.8.2.2).$$

More generally, if  $M$  is an  $A$ -module, then let

$$D_q(A/R, M) = \pi_q(L_{A/R} \otimes_A M).$$

The **André-Quillen cohomology** is defined to be

$$D^q(A/R, M) = \text{Ext}^n(NL_{A/R}, M).$$

┘

**Prop. (8.1.2.3) [Functoriality].** The cotangent complex is functorial in arrows  $R \rightarrow A$ : If there is a commutative diagram

$$\begin{array}{ccc} R & \longrightarrow & S \\ \downarrow & & \downarrow \\ A & \longrightarrow & B \end{array}$$

then there is a natural morphism  $L_{A/S} \otimes_A B \rightarrow L_{B/R}$ . This is because if  $X$  is a cofibrant replacement for  $A$ , then  $X \otimes_R S$  is also cofibrant object, because  $B \otimes_A -$  is a Quillen adjunction, by (5.8.2.15), then it factors through  $X \otimes_R S \rightarrow Y \rightarrow B$  where  $Y$  is a cofibrant replacement of  $B$ , thus  $Y$  is also cofibrant. Then the functor  $L_{A/S} \otimes_A B \rightarrow L_{B/R}$  is induced by

$$B \otimes_A (A \otimes_X \Omega_{X/R}) \rightarrow B \otimes_Y \Omega_{Y/S}.$$

The formation of Kähler differential commutes with arbitrary colimit as it is a left adjoint, so the formation of cotangent complex commutes with filtered colimits, both in  $A$  and  $B$ . Especially, it commutes with taking stalks, hence the sheaf of cotangent complexes of a map between schemes can be constructed as in the case of Kähler differentials, and it is a Qco sheaf. ┘

**Def. (8.1.2.4) [Canonical Resolution].** By the Dold-Kan correspondence, we will say that two simplicial  $A$ -modules are quasi-isomorphic iff their normalized nerves are quasi-isomorphic. Then  $P_A(B) \rightarrow B$  is a quasi-isomorphic resolution of  $B$ , where  $B$  is the trivial complex. ┘

*Proof:* There is a homotopy  $d$  between  $\text{id}$  and  $0$  for  $n \leq 0$ , where

$$d_n : F(GF)^n G(B) \rightarrow F(FG)^n \circ GFG(B)$$

using counit map, and on degree  $0, -1$ , it is  $A[A[B]] \xrightarrow{\partial_1 - \partial_2} A[B] \rightarrow B \rightarrow 0$ , which is clearly  $0$ , so this is a zero map.

Thus  $\text{Tot}(P_A(B)) \cong B$ , and  $N_*(A) \cong \text{Tot}(A)$  by Dold-Kan correspondence, so we are done. ┘

**Cor. (8.1.2.5).**

$$D_0(L_{B/A}, M) = \Omega_{B/A} \otimes M, \quad D^0(A/R, M) = \text{Der}_R(A, M)$$

by the generator-relation definition of Kähler differential. ┘

**Prop. (8.1.2.6) [The fundamental Distinguished Triangle].** If  $\mathcal{T}$  is a site and  $A \rightarrow B \rightarrow C$  are morphisms of sheaves of rings over  $\mathcal{T}$ , then there is a morphism of simplicial  $A$ -modules that corresponds to distinguished triangles in  $D^{\leq 0}(C)$  via Dold-Kan correspondence:

$$L_{B/A} \otimes_B^L C \rightarrow L_{C/A} \rightarrow L_{C/B}.$$

In particular, if  $M$  is a  $B$ -module, then there are long exact sequences

$$\begin{aligned} \dots &\rightarrow D_1(A/R, M) \rightarrow D_1(B/R, M) \rightarrow D_1(B/A, M) \rightarrow M \otimes_A \Omega_{A/R} \rightarrow M \otimes_A \Omega_{B/A} \rightarrow M \otimes_B \Omega_{B/A} \rightarrow 0 \\ \dots &\rightarrow D^1(A/R, M) \rightarrow D^1(B/R, M) \rightarrow D^1(B/A, M) \rightarrow \text{Der}_R(A, M) \rightarrow \text{Der}_A(B, M) \rightarrow \text{Der}_A(B, M) \rightarrow 0 \end{aligned}$$

┘

*Proof:* Choose a simplicial resolution  $X \rightarrow A$  where  $X$  is free, then we factor the morphism  $X \rightarrow A \rightarrow B$  to get a commutative diagram

$$\begin{array}{ccc} X & \xrightarrow{i} & Y \\ \downarrow & & \downarrow \\ A & \longrightarrow & B \end{array}$$

where  $i$  is free, then we have an exact sequence (in  $Ch_{\geq 0}(R)$  via Dold-Kan) of simplicial modules

$$0 \rightarrow B \otimes_X \Omega_{X/R} \rightarrow B \otimes_Y \Omega_{Y/R} \rightarrow B \otimes_Y \Omega_{Y/X} \rightarrow 0$$

because each  $X_n \rightarrow Y_n = X_n \otimes \bigoplus_{\varphi: [n] \rightarrow [k]} \varphi^* P_k$  has a retraction, and use (5.4.3.7).

Notice we have a simplicial map  $A \otimes_X Y \rightarrow B$  which is a weak equivalence and  $A \otimes_X Y$  is a free simplicial  $A$ -algebra. Then it suffices to note that  $X_n \rightarrow Y_n = X_n \otimes \bigoplus_{\varphi: [n] \rightarrow [k]} \varphi^* P_k$  is projective implies

$$B \otimes_Y \Omega_{Y/X} \cong B \otimes_{A \otimes_X Y} \Omega_{A \otimes_X Y/A}$$

, and  $\Omega_{X/R}$  is termwise projective. □

**Prop. (8.1.2.7) [Properties of Cotangent Complexes].**

- If  $B = s(P)$  where  $P$  is a projective  $A$ -module, then  $L_{B/A}$  is weakly equivalent to  $\Omega_{P/A}^1[0]$ .
- (Kunneth Formula) If  $B, C$  are Tor independent over  $A$ , then

$$L_{B \otimes C/A} \cong (L_{B/A} \otimes_A C) \oplus (L_{C/A} \otimes_A B).$$

- (Flat Base Change) If  $B, C$  are Tor independent over  $A$ ,  $L_{B/A} \otimes_A C \cong L_{B \otimes_A C/C}$ . ┘

*Proof:*

- $S_R(P)$  is already cofibrant in  $(sCAlg_R)_A$ .
- Let  $X \rightarrow B, Y \rightarrow C$  be cofibrant replacement of  $A, B$  respectively, then  $X \otimes_R Y \rightarrow B \otimes_A C$  is a cofibrant replacement, as  $X \otimes_A Y$  is cofibrant, and Tor independence shows

$$\pi_*(X \otimes_A Y) = \pi_*(X) \otimes_A \pi_*(Y) = B \otimes_A C.$$

thus the result follows from (5.4.3.6).

- The same as Künneth formula, noticing that  $X \otimes_A C \rightarrow B \otimes_A C$  is a weak equivalence by Tor independence, and  $X \otimes_A C$  is cofibrant. □

### 3 Relations with Algebraic Properties

Cf. [Andre-Quillen Homology].

**Prop. (8.1.3.1) [Acyclicity for Smooth Algebras].** If  $A \rightarrow B$  is smooth, then  $L_{B/A} \cong \Omega_{B/A}^1[0]$ . In particular, if  $A \rightarrow B$  is étale, then  $L_{B/A} = 0$ , and  $L_{C/A} \cong L_{B/A} \otimes_B C$ , by distinguished triangle (8.1.2.6). ┘

*Proof:* The cotangent complex is local, so we may assume it is standard smooth, so it factors as  $A \rightarrow A[X_1, \dots, X_k] \xrightarrow{g} B$ , where  $g$  is étale, so using the distinguished triangle and polynomial case, the result follows.  $\square$

**Prop. (8.1.3.2) [Compatibility with  $p$ -adic Completion].** If  $A$  is a  $p$ -adically complete commutative ring with bounded  $p$ -torsion and  $B$  is a flat  $A$ -module, then  $B$  also has bounded  $p^\infty$ -torsion by (5.9.2.4), let  $\hat{B}$  be the  $p$ -adic completion of  $B$ , then the cotangent complex  $L_{\hat{B}/B}$  vanishes after derived  $p$ -completion.

In particular, by the distinguished triangle (8.1.2.6), if  $B$  is a smooth algebra, then  $L_{\hat{B}/A} \cong \Omega_{\hat{B}/A}^1$  is a finite projective  $\hat{B}$ -module.  $\lrcorner$

*Proof:* This is true after base change  $-\otimes_A^L A/p$  by flat base change (8.1.2.7), (5.9.7.4) and derived Nakayama (5.9.6.10).  $\square$

## 4 Deformations

**Prop. (8.1.4.1) [Topological Invariance of Étale Site].** Let  $A$  be a ring, consider the following category:  $\mathcal{C}_A$  of flat  $A$ -algebras  $B$  that  $L_{B/A} = 0$ , then if  $\tilde{A} \rightarrow A$  is surjective with locally nilpotent kernel, then the base change defines an isomorphism of categories  $\mathcal{C}_{\tilde{A}} \cong \mathcal{C}_A$ .

By (8.1.2.7),  $L_{B/A}$  vanish is equivalent to being étale, thus the properties characterize the invariance of étale site under infinitesimal thickening.  $\lrcorner$

*Proof:* ?  $\square$

**Prop. (8.1.4.2) [Relative Perfect Case].** If  $A$  is a ring of char  $p$  and  $B$  is an  $A$ -algebra which is relatively perfect, i.e.  $B^{(1)} = B \otimes_{A, \text{Frob}} A \rightarrow B$  is an isomorphism, then  $L_{B/A} = 0$ .  $\lrcorner$

*Proof:* Notice for any  $A$ -algebra  $C$ , the relative Frobenius induces zero map  $L_{C^{(1)}/A} \rightarrow L_{C/A}$ , because by using the canonical polynomial resolution,  $d(x^p) = px^{p-1}xs = 0$ . Now the relative Frobenius is an isomorphism  $B^{(1)} \rightarrow B$ , thus induces an isomorphism  $L_{B^{(1)}/A} \rightarrow L_{B/A}$  by Functoriality, thus  $L_{B/A} = 0$ .  $\square$

**Cor. (8.1.4.3) [Witt Vector Construction].** There is an equivalence of categories of  $\mathcal{C}_n = \text{flat } \mathbb{Z}/p^n$ -algebras that  $A/p$  is perfect and  $\mathcal{C}_1 = \text{perfect rings over } \mathbb{Z}/p$ .

moreover, taking limit, this is even equivalent to the category of flat  $p$ -adically complete  $\mathbb{Z}_p$ -algebras that  $A/p$  is perfect. Which is just the construction of Witt vectors.  $\lrcorner$

*Proof:* It suffices to show that  $\mathcal{C}_n \subset \mathcal{C}_{\mathbb{Z}/p^n}$ : By (8.1.4.2) and flat base change (8.1.2.7),  $L_{A/(\mathbb{Z}/p^n)} \otimes_{\mathbb{Z}/p^n} \mathbb{Z}/p \cong L_{(A/p)/(\mathbb{Z}/p)} = 0$ , so  $L_{A/(\mathbb{Z}/p^n)} \otimes_{\mathbb{Z}/p^n} \mathbb{Z}/p^k \cong 0$  by induction, and so  $L_{A/(\mathbb{Z}/p^n)} \cong 0$ .

For the last assertion, it is flat because it is torsion-free, which is because if  $p(x_n) = 0$ , then by  $0 \rightarrow p^n \mathbb{Z}/p^{n+1} \rightarrow \mathbb{Z}/p^{n+1} \xrightarrow{p} \mathbb{Z}/p^n \rightarrow 0$  and the flatness of  $A_{n+1}$ ,  $x_{n+1} \in p^n A_{n+1}$ , thus  $x_n = 0$ , and  $x = 0$ .  $\square$

**Prop. (8.1.4.4) [Adjointness of Witt Vectors].** Using a more careful analysis of cotangent complex (embedded deformation), we can show that if  $A \rightarrow B \in \mathcal{C}_A$  and there is a infinitesimal deformation  $C \rightarrow C'$  of  $A$ -algebra, then a map  $B \rightarrow C'$  can be lifted to an  $A$ -algebra map  $A \rightarrow C$ .

In particular, taking inverse image, we get that

$$\text{Hom}_{\mathbb{F}_p}(A, B/p) \cong \text{Hom}_{\mathbb{C}\text{Ring}_{\mathbb{Z}_p}}(W(A), B).$$

which is the usual adjointness of the Witt vector construction.  $\lrcorner$

## 5 Algebra Extension

Cf.[Perfectoid Geometry Appendix B].

**Def. (8.1.5.1) [Algebra Extensions].** Let  $A \rightarrow B$  be a ring map and  $M$  be a  $B$ -module, then an  **$A$ -algebra extension** of  $B$  by  $M$  is a short exact sequence of  $A$ -modules  $0 \rightarrow M \rightarrow B' \rightarrow B \rightarrow 0$  that  $B'$  is an  $A$ -algebra with  $M$  being an ideal of it.

The set of such extensions are denoted by  $\text{Exal}_A(B, M)$ . ┘

**Prop. (8.1.5.2).**  $\text{Exal}_A(B, M)$  is a group under Baer sum, where the sum of two extension is the extension given by pushout, i.e.  $(B_1 \oplus B_2)/\{(m, -m) | m \in M\}$ . Moreover, it is a  $B$ -module, where the multiplication is the pushout along multiplication of  $b$  on  $M$ . ┘

**Prop. (8.1.5.3).** There is a trivial extension given by  $D_B(M) = B \oplus M$  (5.4.3.5), and the automorphism of  $D_B(M)$  is isomorphic to  $\text{Der}_A(B, M)$  via  $d \mapsto \text{id} \oplus d$ . ┘

*Proof:* Cf.[Foundations of Perfectoid Spaces Masullo P118]. □

**Prop. (8.1.5.4).** Let  $A \rightarrow B \rightarrow C$  be ring maps, then for any  $C$ -module  $M$ , there is an exact sequence

$$0 \rightarrow \text{Der}_B(C, M) \rightarrow \text{Der}_A(C, M) \rightarrow \text{Der}_A(B, M) \xrightarrow{\partial} \text{Exal}_B(C, M) \rightarrow \text{Exal}_A(C, M) \rightarrow \text{Exal}_A(B, M)$$

functorial in  $M$ . Where  $\partial$  is given by (8.1.5.3). ┘

*Proof:* Cf.[Foundations of Perfectoid Spaces Masullo P119]. □

**Prop. (8.1.5.5).** Let  $A \rightarrow B$  be a ring map or a map of sheaves of rings, and let  $M$  be a  $B$ -module, then there is an isomorphism of  $B$ -modules that is natural in  $M$ :

$$\text{Exal}_A(B, M) = \text{Ext}_B^1(NL_{B/A}, M).$$

┘

*Proof:* Cf.[Foundations of Perfectoid Spaces, P127]. □

### Infinitesimal Deformation

**Def. (8.1.5.6).** An **infinitesimal deformation** of a f.g.  $k$ -algebra is defined as a algebra  $A'$  flat over  $D = k[t]/(t^2)$  that  $A' \otimes_D k = A$ .

A f.g.  $k$ -algebra is called **rigid** if it has no infinitesimal deformations. ┘

**Prop. (8.1.5.7).** Let  $A$  be a f.g.  $k$ -algebra, write  $A$  as a quotient of a polynomial ring over  $k$  with kernel  $J$ , then there is an exact sequence  $J/J^2 \rightarrow \Omega_{P/k} \otimes_P A \rightarrow \Omega_{A/k} \rightarrow 0$  by (5.4.3.7), then we apply  $\text{Hom}_A(-, A)$  and let  $T^1(A) = \text{Coker}(\text{Hom}_A(\Omega_{P/k} \otimes_P A, A) \rightarrow \text{Hom}_A(J/J^2, A))$ . Then  $T^1(A)$  parametrize infinitesimal deformations of  $A$ . ┘

## 8.2 Spectral Algebraic Geometry(Lurie)

Main references are Lurie's work, [Derived Algebraic Geometry, Thesis, Lurie].

**Notation(8.2.0.1).**

- Use notations from [Derived Commutative Algebras](#).

┘

**Prop.(8.2.0.2)** [ $\mathcal{D}_{\mathcal{QCoh}}(\mathrm{Spec} R)$ ]. For  $R \in \mathcal{CRing}$ , there exists a unique sheaf of  $\infty$ -categories  $\mathcal{D}_{\mathcal{QCoh}}$  on  $\mathrm{Spec} R$  s.t. for any affine open subset  $U$ ,

$$\mathcal{D}_{\mathcal{QCoh}}(U) = \mathcal{D}(\mathcal{O}(U)).$$

┘

*Proof:* Cf.[Clausen, deRham Cohomology]L8P3. □

**Cor.(8.2.0.3).** For  $R \in \mathcal{CRing}$  and any  $M \in \mathrm{Mod}(R)$ , there exists an associated sheaf of derived modules  $M^\sharp$  on  $\mathrm{Spec} R$  s.t. for any affine open  $U \subset \mathrm{Spec} R$ ,  $M^\sharp(U) = M \otimes_R \mathcal{O}_{\mathrm{Spec} R}(U)$ . (I think this sheaf is just the derived shification of the associated sheaf  $\widetilde{M}$  on  $\mathrm{Spec} R$  defined in(7.5.1.1).) ┘

*Proof:* Cf.[Clausen, deRham Cohomology]L8P3. □

**Cor.(8.2.0.4).** Let  $X \in \mathcal{Aff}$  and  $\mathcal{F} \in \mathcal{QCoh}(X)$ , then  $H^q(X; \mathcal{F}) = 0$  for  $q > 0$ . ┘

*Proof:* This is because the sheaf cohomology is the global section of the derived shification, and the derived shification of  $\mathcal{F}(X)^\sharp$  equals  $\widetilde{\mathcal{F}(X)}$  on any affine opens by(8.2.0.3). Thus  $H^*(X; \mathcal{F}) = \mathcal{F}(X) \in D(\mathcal{O}_X(X))$ . □

**Cor.(8.2.0.5).** For  $R \in \mathcal{CRing}$ , there is a sheaf of Abelian categories on  $X = \mathrm{Spec} R$  with assigns  $\mathrm{Mod}_{\mathcal{O}_X(U)}$  for any affine open subset  $U \subset X$ . ┘

*Proof:* It suffices to show the discrete elements in  $\mathcal{D}_{\mathcal{QCoh}}(\mathrm{Spec} R)$  form a sheaf, i.e. if  $M \in \mathcal{D}_{\mathcal{O}_X(U)}$  is locally discrete, then it is discrete. And this is because the ring extensions are flat. □

**Def.(8.2.0.6)** [ $\mathcal{D}(X)$ ]. Let  $X \in \mathcal{Sch}$ , then  $\mathcal{D}(X) = \mathrm{Mod}_{\mathcal{O}_X}(\mathrm{Sh}(X; \mathcal{D}(Z)))$  is an  $\infty$ -category, and the assignment  $\mathcal{D}_X : U \mapsto \mathcal{D}(U)$  is a sheaf of  $\infty$ -categories on  $X$ . ┘

*Proof:* ? □

**Def.(8.2.0.7)** [ $\mathcal{D}_{\mathcal{QCoh}}(\mathrm{Spec} R)$ ]. Let  $X \in \mathcal{Sch}$ , then there is a sub- $\infty$ -category

$$\mathcal{D}_{\mathcal{QCoh}}(X) \subset \mathcal{D}(X)$$

consisting of elements  $\mathcal{M}$  s.t. for any inclusion of affine opens  $U \subset V$ , there is a natural isomorphism

$$\mathcal{M}(V) \otimes_{\mathcal{O}_X(V)} \mathcal{O}_X(U) \cong \mathcal{M}(U).$$

And the assignment  $\mathcal{D}_{\mathcal{QCoh}, X} : U \mapsto \mathcal{D}_{\mathcal{QCoh}}(X)$  is a sheaf of  $\infty$ -categories on  $X$ .

Moreover, when  $X$  is affine, the global section functor defines an equivalence  $\mathcal{D}(X) \cong D(\mathcal{O}_X(X))$ .

┘

*Proof:* ?

This follows from (8.2.0.6) and the fact that the  $\mathcal{Q}_{\text{co}}$  requirement is local.

The last assertion is trivial.  $\square$

**Prop. (8.2.0.8) [Compact Objects in  $\mathcal{D}(R)$ ].** For  $R \in \mathcal{C}\text{Ring}$  and  $M \in \mathcal{D}(R)$ , the following are equivalent:

- $M$  is a compact object.
- $M$  lies in the thick (stable- $\infty$ )subcategory generated by  $R$ .
- $M$  is dualizable w.r.t. the tensor product.
- $M$  can be represented by a bounded chain of finite projective  $R$ -modules.

In particular, there is a full sub- $\infty$ -category of  $\mathcal{D}_{\mathcal{Q}\text{coh}}(R)$  consisting of perfect objects, denoted by  $\text{Perf}(R)$ .  $\lrcorner$

*Proof:* Cf. [Clausen, deRham Cohomology]L8P8.  $\square$

**Cor. (8.2.0.9).** For  $R \in \mathcal{C}\text{Ring}$ ,  $X = \text{Spec } R$ , the assignment  $\text{Perf} : U \mapsto \text{Perf}(\mathcal{O}_X(U))$  on affine opens is a subsheaf of  $\mathcal{D}_{\mathcal{Q}\text{coh}, X}$  on affine opens.  $\lrcorner$

*Proof:* Cf. [Clausen, deRham Cohomology]L8P9.  $\square$

**Def. (8.2.0.10) [Perfect Objects].** For  $X \in \text{Sch}$ , a **perfect quasi-coherent sheaf** on  $X$  is an object  $\mathcal{F} \in \mathcal{D}_{\mathcal{Q}\text{coh}}(X)$  s.t. for any affine open  $U \subset X$ ,  $\mathcal{F}|_U \in \mathcal{D}(U)$  is a compact object (i.e.  $\text{Hom}(\mathcal{M}, -) : \mathcal{D}_{\mathcal{Q}\text{coh}}(X) \rightarrow \text{sSet}$  commutes with filtered colimits).  $\lrcorner$

**Prop. (8.2.0.11) [Pull and Push].** For  $f : X \rightarrow Y \in \text{Sch}$ , there is a pushforward functor  $f_* : \mathcal{D}(X) \rightarrow \mathcal{D}(Y)$  s.t.

- $f_* \mathcal{D}_{\mathcal{Q}\text{coh}}(X) \subset \mathcal{D}_{\mathcal{Q}\text{coh}}(Y)$ .
- $f_* : \mathcal{D}_{\mathcal{Q}\text{coh}}(X) \rightarrow \mathcal{D}_{\mathcal{Q}\text{coh}}(Y)$  preserves colimits and limits.

And it has a left adjoint  $f^* : \mathcal{D}(Y) \rightarrow \mathcal{D}(X)$  s.t.

- $f^* \mathcal{D}_{\mathcal{Q}\text{coh}}(Y) \subset \mathcal{D}_{\mathcal{Q}\text{coh}}(X)$ .
- If  $X, Y \in \text{Aff}$ , then  $f^*$  is just the derived base change functor.
- $f_*$  commutes with base change ?.
- $f_*$  satisfies projection formula ?.

$\lrcorner$

*Proof:* Cf. [Clausen, deRham Cohomology]L8P7.  $\square$

**Prop. (8.2.0.12).** If  $f$  is smooth and proper,  $f_* : \mathcal{D}_{\mathcal{Q}\text{coh}}(X) \rightarrow \mathcal{D}_{\mathcal{Q}\text{coh}}(Y)$  preserves perfect objects.  $\lrcorner$

*Proof:* Cf. [Clausen, deRham Cohomology]L8P8.  $\square$

**Prop. (8.2.0.13) [Grothendieck Duality].** If  $f : X \rightarrow Y \in \text{Sch}$  is proper and smooth, then there is a right adjoint  $f^!$  to  $f_* : \mathcal{D}(X) \rightarrow \mathcal{D}(Y)$ , and it satisfies

- There is a natural isomorphism of functors:  $f^* \otimes f^!(\mathcal{O}_Y) \cong f^!$ .
- If  $f$  has relative dimension  $d$ , then there is a natural isomorphism  $f^!(\mathcal{O}_Y) \cong \Omega_{X/Y}^d[d]$ .

$\lrcorner$

*Proof:* ?  $\square$

### 8.3 Elliptic Cohomology Theory(Lurie)

Main references are [Elliptic Cohomology,1, 2, Lurie].

## 9 | Weil Cohomologies

### 9.1 Intersection Theory

References are [Sta]Chap43, 44 and [Ful98].

**Notation(9.1.0.1).**

- Let  $k \in \mathbf{Field}$ .
- Let  $S$  be a universally catenary(hence locally Noetherian) scheme(7.4.1.36) endowed with a dimension function  $\delta$ (4.12.2.34). There are some examples of  $(S, \delta)$  in(9.1.0.1):
  - $S = \mathrm{Spec} k$  and  $\delta(|S|) = 0$ .
  - $A$  is a Noetherian domain of dimension 1,  $\delta(\mathfrak{p}) = 0$  if  $\mathfrak{p}$  is a maximal ideal and  $\delta(\eta) = 1$  for the generic point  $\eta$ .
  - $S$  is a C.M. scheme and let  $\delta(s) = -\dim(\mathcal{O}_{S,s})$ .

These follow from(7.4.1.38).

┘

**Prop.(9.1.0.2).**  $S$  is Jacobian and  $\delta(s) = 0$  for any closed point  $s \in S$ . If  $Z \subset S$  is an integral closed subscheme with generic point  $\xi$ , then

$$\delta(\xi) = \dim(Z) = \dim(\mathcal{O}_{Z,z})$$

where  $z \in Z$  is a closed point.

┘

*Proof:* Cf.[Sta]02QO.

□

**Prop.(9.1.0.3)[ $\delta$ -Dimension].** For  $f : X \rightarrow S$  locally of f.t., the function

$$\delta(x) = \delta(f(x)) + \mathrm{tr.deg}_{k(f(x))} k(x)$$

is a dimension function on  $X$ . In particular, this equation is satisfied for any morphisms between schemes of f.t. over  $S$ .

For a closed subscheme  $Z$  of  $X$ , define  $\dim_\delta(Z) = \sup \dim_\delta(\eta)$  where  $\eta$  are generic pts of irreducible components of  $Z$ .

┘

*Proof:* Cf.[Sta]02JW.?

□

## 1 Chow Homologies

### Cycles

**Def. (9.1.1.1) [Cycles].** An **algebraic cycle** on a scheme  $X \in \text{Sch}^{\text{loc.ft}}/S$  is a formal sum of integral closed subschemes of  $X$  with integer coefficients that is locally finite. For  $k \in \mathbb{N}$ , a  **$k$ -cycle** is a cycle that is a sum of integral closed subschemes of dimension  $k$  that is locally finite. The group of  $k$ -cycles over  $X$  is denoted by  $Z_k(X)$ .

If  $\dim_\delta(X) = d$ , then we also denote  $Z^k(X) = Z_{d-k}(X)$ .  $\lrcorner$

**Prop. (9.1.1.2).** Let  $X$  be a scheme locally of f.t. over  $S$ , and  $X = X_1 \cup X_2$  is a decomposition as closed subschemes, then there are exact sequences

$$Z_k(X_1 \cap X_2) \rightarrow Z_k(X_1) \oplus Z_k(X_2) \rightarrow Z_k(X) \rightarrow 0$$

$\lrcorner$

**Prop. (9.1.1.3) [Cycle associated to a Closed Subscheme].** For a closed subscheme  $Z$  of a scheme  $X \in \text{Sch}^{\text{loc.ft}}/S$ , if  $\dim_\delta(Z) \leq k$  and  $\eta \in Z$  has dimension  $k$ , then  $\eta$  is a generic pt of an irreducible component  $Z'$  of  $Z$ , and  $m_{Z,Z'} = \text{length}_{\mathcal{O}_{X,\eta}} \mathcal{O}_{Z,\eta}$  is finite.

So we may define the  **$k$ -cycle associated to  $Z$**  as:  $[Z]_k = \sum_{Z' \subset Z} m_{Z,Z'} [Z']$ , where the sum is over all integral components of  $Z$  of  $\delta$ -dimension  $k$ .  $\lrcorner$

*Proof:*  $m_{Z,Z'}$  is finite because  $\text{length}_{\mathcal{O}_{Z,\eta}} \mathcal{O}_{Z,\eta} = \text{length}_{\mathcal{O}_{X,\eta}} \mathcal{O}_{Z,\eta} < \infty$  because it is Noetherian and have 0 dimension (5.1.3.4). The sum is locally finite by (7.4.1.23).  $\square$

**Prop. (9.1.1.4) [Cycle associated to a Coherent Sheaf].** For  $X \in \text{Sch}^{\text{loc.ft}}/S$  and  $\mathcal{F} \in \text{Coh}(X)$ , if  $\dim_\delta \text{Supp}(\mathcal{F}) \leq k$  and  $\eta \in \text{Supp}(\mathcal{F})$  has dimension  $k$ , then  $\eta$  is a generic pt of an irreducible component  $Z'$  of  $Z$ , and  $m_{Z,\mathcal{F}} = \text{length}_{\mathcal{O}_{X,\eta}} \mathcal{F}_\eta < \infty$ .

So we may define the  **$k$ -cycle associated to  $\mathcal{F}$**  as:  $[\mathcal{F}]_k = \sum_{Z \subset X} m_{Z,\mathcal{F}} [Z]$ , where the sum is over all integral components of  $\text{Supp } \mathcal{F}$  of  $\delta$ -dimension  $k$ .  $\lrcorner$

*Proof:*  $\text{length}_{\mathcal{O}_{X,\eta}} \mathcal{F}_\eta < \infty$  by (5.2.5.7).  $\square$

**Prop. (9.1.1.5).** Let  $X \in \text{Sch}^{\text{loc.ft}}/S$  and  $Z \subset X$  a closed subscheme with  $\dim_\delta(Z) \leq k$ , then  $[Z]_k = [\mathcal{O}_Z]_k$ .  $\lrcorner$

**Prop. (9.1.1.6).** Let  $X \in \text{Sch}^{\text{loc.ft}}/S$ , the cycle map from  $\text{Coh}^{\leq k}(X)$  to  $Z_k(X)$  is additive.  $\lrcorner$

### Pushforward and Pullback

**Lemma (9.1.1.7) [Degree of Maps].** Let  $f : X \rightarrow Y$  be a map between schemes integral and locally of f.t. over  $S$ , if  $\dim_\delta X = \dim_\delta Y$ , then either  $f(X)$  not dominant or the function field extension is finite. If  $f$  is dominant, the the degree of  $f$  (7.4.5.6) is a finite number.  $\lrcorner$

*Proof:* Because  $X$  is irreducible, so does  $f(X)$  and  $\overline{f(X)}$ . If  $f(X)$  is dominant, then  $f$  maps the generic point of  $X$  to that of  $Y$ . Now  $\deg_{K(Y)}(K(X)) = 0$  and  $K(X)/K(Y)$  is f.g., thus it is a finite extension.  $\square$

**Lemma (9.1.1.8).** Let  $f : X \rightarrow Y$  be a qc map between schemes integral and locally of f.t. over  $S$ , and  $\{Z_i\}$  is a locally finite collection of closed subschemes of  $X$ , then  $\{\overline{f(Z_i)}\}$  is also a locally finite collection of closed subschemes of  $Y$ .  $\lrcorner$

*Proof:* This is a simple topological proof and omitted.  $\square$

**Def. (9.1.1.9) [Proper Pushforward].** Let  $f : X \rightarrow Y$  be a proper morphism in  $\text{Sch}^{\text{loc.ft}}/S$ , we define a map

$$p_* : Z_k(X) \rightarrow \text{CH}_k(X)$$

as follows: If  $Z \subset X$  is an integral closed subscheme of  $X$  that  $\dim_\delta(Z) = k$ , then we define

$$f_*[Z] = \begin{cases} 0 & \dim_\delta(f(Z)) \leq k \\ \deg(Z/f(Z))[f(Z)] & \dim_\delta(f(Z)) = k \end{cases} \quad (9.1.1.7)$$

where we regard  $f(Z)$  as an integral closed subscheme of  $Y$  using its scheme-theoretical image. In general

$$f_*(\sum n_Z[Z]) = \sum n_Z f_*([Z]).$$

The sum is locally finite by (9.1.1.8).

It can be easily verified that  $f_* \circ g_* = (f \circ g)_*$ .  $\square$

**Prop. (9.1.1.10) [Pushforward of Coherent Sheaves].** Let  $f : X \rightarrow Y \in \text{Sch}^{\text{loc.ft}}/S$ , then

- If  $Z \subset X$  is an integral closed subscheme of  $X$  that  $\dim_\delta(Z) \leq k$ , then

$$f_*[Z]_k = [\mathcal{O}_Z]_k.$$

- If  $\mathcal{F} \in \text{Coh}^{\leq k}(X)$ , then

$$f_*[\mathcal{F}]_k = [f_*\mathcal{F}]_k.$$

$\square$

*Proof:* 1 follows from 2 and (9.1.1.5). To show 2, by restricting to  $\text{Supp}(\mathcal{F})$  and taking the scheme-theoretic image, it suffices to show for both closed immersions and proper dominant maps. The closed immersions case are easy. For the proper dominant case, it suffices to show  $f_*[\mathcal{F}]_k$  and  $[f_*\mathcal{F}]_k$  have the same coefficients in each integral subscheme  $Z \subset X$  of dimension  $k$ . By looking at the inverse image of the generic point of  $Z$ , we may assume that  $f$  is finite by (7.4.5.4). Thus we can assume  $f$  is finite. Then it reduces to the affine case, which follows from (5.1.2.7).  $\square$

**Lemma (9.1.1.11).** Let  $f : X \rightarrow Y$  be a flat morphism of relative dimension  $r$  in  $\text{Sch}^{\text{loc.ft}}/S$ , then for any closed subscheme  $Z \subset Y$ ,  $\dim_\delta(f^{-1}(Z)) = \dim_\delta(Z) + r$  if  $f^{-1}(Z) \neq \emptyset$ . If  $Z$  is irreducible and  $Z' \subset f^{-1}(Z)$  is an irreducible component, then  $Z'$  dominates  $Z$  and  $\dim_\delta(Z') = \dim_\delta(Z) + r$ .  $\square$

*Proof:* By passing to the integral components, we may assume  $Z = Y$  is integral and  $X \rightarrow Y$  is surjective, then notice  $f$  is open, and use (9.1.0.3) and (7.6.3.7).  $\square$

**Def. (9.1.1.12) [Flat Pullbacks].** Let  $f : X \rightarrow Y$  be a flat morphism of relative dimension  $r$  in  $\text{Sch}^{\text{loc.ft}}/S$ , for  $Z \subset X$  an integral closed subscheme that  $\dim_\delta(Z) \leq k$ , define

$$f^* : Z_k(Y) \rightarrow Z_{k+r}(X) : f^*([Z]) = [f^{-1}(Z)]_{k+r}$$

which is definable by (9.1.1.11). In general, define  $f^*(\sum n_Z[Z]) = \sum n_Z f^*([Z])$ , which is locally finite.  $\square$

**Prop. (9.1.1.13).** If  $f : X \rightarrow Y, g : Y \rightarrow Z \in \text{Sch}^{\text{loc.ft}}/S$  is flat of relative dimensions  $r$  and  $s$ , then  $f^* \circ g^* = (g \circ f)^*$ .  $\square$

*Proof:* Firstly  $g \circ f$  is flat of relative dimension  $r + s$  by (7.6.3.18). And the assertion follows from (5.1.2.9).  $\square$

**Prop. (9.1.1.14).** Let  $X \in \text{Sch}^{\text{loc.ft}}/S$  and  $i : Y \rightarrow X$  a reduced closed subscheme of  $X$ ,  $j : U = X \setminus Z \rightarrow X$ , then for any  $k \in \mathbb{Z}$ , there is an exact sequence

$$Z_k(Y) \xrightarrow{i_*} Z_k(X) \xrightarrow{j^*} Z_k(U) \rightarrow 0.$$

$\lrcorner$

**Prop. (9.1.1.15) [Pullback of Coherent Sheaves].** If  $f : X \rightarrow Y \in \text{Sch}^{\text{loc.ft}}/S$  is flat of relative dimensions  $r$ ,  $\mathcal{F} \in \text{Coh}^{\leq k}(\mathcal{O}_Y)$ , then  $f^*\mathcal{F} \in \text{Coh}^{\leq k+r}(\mathcal{O}_X)$ , and

$$f^*[\mathcal{F}] = [f^*\mathcal{F}]_{k+r}.$$

In particular, for a closed subscheme  $Z \subset X$  with  $\dim_\delta(Z) \leq k$ ,  $f^*[Z]_k = [f^{-1}Z]_{k+r}$ , by (5.1.2.8).

$\lrcorner$

*Proof:* This follows from (5.1.2.9).  $\square$

**Prop. (9.1.1.16) [Push and Pull].**

- Let

$$\begin{array}{ccc} X' & \xrightarrow{g'} & X \\ \downarrow f' & & \downarrow f \\ Y' & \xrightarrow{g} & Y \end{array}$$

be a diagram in  $\text{Sch}^{\text{loc.ft}}/S$  where  $f$  is proper and  $g$  is flat of relative dimension  $r$ , then

$$g^*f_* = (g')^*f'_* : Z_k(X) \rightarrow Z_{k+r}(Y').$$

- Let  $f : X \rightarrow Y \in \text{Sch}^{\text{loc.ft}}/S$  be a finite locally free morphism of degree  $d$ , then it is both proper and flat of relative dimension 0, and  $f_*f^* = [d] : Z_k(Y) \rightarrow Z_k(Y)$ .

$\lrcorner$

*Proof:* 1: It suffices to prove for a closed subscheme  $W \subset X$  of  $\delta$ -dimension  $k$ . Then  $[W] = [\mathcal{O}_W]$  (9.1.1.5). Then by (9.1.1.10) and (9.1.1.15), the assertion follows from flat base change.

2: Similarly this follows from the fact  $f_*f^*\mathcal{O}_Z$  is a finite locally free  $\mathcal{O}_Z$ -sheaf of rank  $d$ .  $\square$

### Rational Equivalences and Chow-Groups

**Def. (9.1.1.17) [Prime Weil Divisors].** Let  $X \in \text{Sch}^{\text{loc.ft,int}}/S$ , then an integral closed scheme  $W \subset X$  of  $\delta$ -codimension 1 is called a **prime Weil divisor**.  $\lrcorner$

**Prop. (9.1.1.18) [Principal Weil Divisor].** Let  $X \in \text{Sch}^{\text{loc.ft,int}}/S$ ,  $f \in \mathcal{K}_X$ , for any prime Weil divisor  $Z$  with generic pt  $\eta$ , we can define  $\text{ord}_Z(f) = \text{ord}_{\mathcal{O}_{X,\eta}}(f)$  (5.1.2.10). It is multiplicative, and the closed integral subschemes  $Z$  that  $\text{ord}_Z(f) \neq 0$  is locally finite.

So, we can define the **principle Weil divisor**  $\text{div}(f) = \sum_Z \text{ord}_Z(f)[Z]$ .  $\lrcorner$

*Proof:* There is an open subset  $U$  that  $f \in \Gamma(U, \mathcal{O}_X^*)$ , so all  $Z$  are irreducible components of  $X - U$ , which is locally finite because  $X$  is locally Noetherian and (7.4.1.23).  $\square$

**Def. (9.1.1.19) [Principal Divisors].** Let  $X \in \text{Sch}^{\text{loc.ft}}/S$ ,  $W \subset X$  a  $(k+1)$ -dimensional integral closed subscheme and  $f \in K(W)^\times$ , then the **principle divisor associated to  $f$**  is defined to be

$$\text{div}(f) = \sum \text{ord}_Z(f)[Z] \in Z^1(X),$$

where  $Z$  runs through codimension-1 integral closed subschemes of  $W$ , as defined in (9.1.1.18). This is truly a  $k$ -cycle.  $\lrcorner$

**Def. (9.1.1.20) [Rational Equivalence].** Let  $X \in \text{Sch}^{\text{loc.ft}}/S$  has  $\delta$ -dimension  $k+1$ . Given any locally finite collection of integrally closed subschemes  $j_i : W_i \subset X$  of  $\delta$ -dimension  $k+1$  and  $f_i \in K(W_i)^\times$ , we can consider the  $k$ -cycle  $\sum (j_i)_*(\text{div}(f_i)) \in Z_k(X)$  (9.1.1.19). This is a  $k$ -cycle because  $\coprod W_i \rightarrow X$  is proper. Two  $k$ -cycles are called **rational equivalent** if they differ by a  $k$ -cycle of the this form.

Define the **Chow-group of  $k$ -cycles**  $\text{CH}_k(X)$  to be  $Z_k(X)$  modulo the rational equivalence relation.  $\text{CH}_1(X)$  is also denoted by  $\text{Cl}(X)$ .  $\lrcorner$

**Lemma (9.1.1.21) [Push and Pull of Principle Divisors].**

- If  $f : X \rightarrow Y \in \text{Sch}^{\text{loc.ft,int}}/S$  is flat of relative dimension  $r$ , and  $g \in K(Y)^*$ , then  $f^* \text{div}(f) = \text{div}(f)$ .
- If  $\varphi : X \rightarrow Y \in \text{Sch}^{\text{loc.ft,int},\delta=d}/S$  is a dominant proper morphism,  $f \in K(X)^*$ , and  $g = \text{Nm}_{K(X)/K(Y)}(f) \in K(Y)^*$ , then  $f_* \text{div}(f) = \text{div}(g)$ .

$\lrcorner$

*Proof:* 1: Cf. [Sta]0EPH?.

2: Cf. [Sta]02RT?.

$\square$

**Lemma (9.1.1.22).** If  $X \in \text{Sch}^{\text{loc.ft,int},\delta=n}/S$   $U \subset X$  be an open subscheme and  $f \in \Gamma(U, \mathcal{O}_X)^* \subset K(X)^*$ , let  $Y$  be the graph of  $f$  in  $X \times_S \mathbb{P}_S^1$ , then

- the projection  $\text{pr}_1 : Y \rightarrow X$  is an isomorphism  $\text{pr}_1^{-1}(U) \rightarrow U$ , thus  $\dim_\delta(Y) = n$ .
- the closed subschemes  $Y_0 = \text{pr}_2^{-1}(\{0\})$  and  $Y_\infty = \text{pr}_2^{-1}(\{\infty\})$  of  $Y$  are effective Cartier divisors. In particular, they have  $\delta$ -dimension  $n-1$  by (9.1.4.2).
- $\text{div}_Y(f) = [Y_0] - [Y_\infty]$ .
- $\text{div}_X(f) = \text{pr}_{1*} \text{div}_Y(f) = [Y_0] - [Y_\infty]$ .

$\lrcorner$

*Proof:* 1 is clear.

2 follows from (7.8.1.8) as  $\text{pr}_2 : Y \rightarrow \mathbb{P}^1$  is dominant.

3 is clear.

4 follows from item1 and (9.1.1.21).  $\square$

**Prop. (9.1.1.23) [Rational Equivalence via Rational Functions].** Let  $X \in \text{Sch}^{\text{loc.ft}}/S$ , then  $\alpha \in Z_k(X)$  is rationally trivial iff

$$\alpha = \sum ([ (W_i)_0 ]_k - [ (W_i)_1 ]_k) = j_0^*(\sum [W_i]) - j_\infty^*(\sum [W_i])$$

where  $\{W_i\}$  is a locally finite family of integral closed subschemes of  $X \times_S \mathbb{P}_S^1$  of  $\delta$ -dimension  $k$ . ( $j_0^*, j_\infty^*$  are the Gysin maps, which will be defined in (9.1.3.2))  $\lrcorner$

*Proof:* Firstly such a  $\sum([(W_i)_0]_k - [(W_i)_\infty]_k)$  is locally finite, and each  $[(W_i)_0]_k - [(W_i)_\infty]_k$  is rationally trivial: Similar as in (9.1.1.22),  $[(W_i)_0] - [(W_i)_\infty]$  is rationally trivial on  $W_i$ , and then it pushforward via  $\text{pr}_1$  is also rationally trivial, by (9.1.1.21).

Conversely, if  $\alpha = \sum (V_i \rightarrow X)_* \text{div}(f_i)$ , where  $\{V_i\}$  is a locally finite family of integral closed subschemes of  $X$  of  $\delta$ -dimension  $k+1$  and  $f_i \in K(V_i)^*$ . Let  $W_i \subset V_i \times \mathbb{P}_k^1 \subset X_i \times \mathbb{P}_k^1$  be the the graph of  $f$ , then  $(V_i \rightarrow X)_* \text{div}(f_i)$  equals  $[(W_i)_0]_k - [(W_i)_1]_k$  by (9.1.1.22) again. (We are secretly using the fact Gysin map commutes with pushforwards (9.1.5.9), but in this case it is trivial trough).  $\square$

**Prop. (9.1.1.24) [Push and Pull for Chow-Groups].**

- If  $f : X \rightarrow Y \in \text{Sch}^{\text{loc.ft}}/S$  is flat of relative dimension  $r$ , then  $f^*$  induces a map  $\text{CH}_k(Y) \rightarrow \text{CH}_{k+r}(X)$  for each  $k \in \mathbb{N}$ .
- If  $f : X \rightarrow Y \in \text{Sch}^{\text{loc.ft}}/S$  is proper, then  $f_*$  induces a map  $\text{CH}_k(X) \rightarrow \text{CH}_k(Y)$  for each  $k \in \mathbb{N}$ .

┘

*Proof:* Cf. [Sta]02S2, 02S1.  $\square$

**Prop. (9.1.1.25) [Restriction of Divisors].** Let  $X \in \text{Sch}^{\text{loc.ft}}/S$  and  $i : Y \rightarrow X$  a reduced closed subscheme of  $X$ ,  $j : U = X \setminus Z \rightarrow X$ , then for any  $k \in \mathbb{Z}$ , there is an exact sequence

$$\text{CH}_k(Y) \xrightarrow{i_*} \text{CH}_k(X) \xrightarrow{j^*} \text{CH}_k(U) \rightarrow 0.$$

┘

*Proof:* Cf. [Sta]02RX?  $\square$

**Prop. (9.1.1.26) [Excision].** Let  $X \in \text{Sch}^{\text{loc.ft}}/S$  and  $X_1, X_2$  be closed subschemes of  $X$  s.t.  $X_1 \cup X_2 = X$  as sets, then for any  $k \in \mathbb{Z}$ , there is an exact sequence

$$\text{CH}_k(X_1 \cap X_2) \rightarrow \text{CH}_k(X_1) \oplus \text{CH}_k(X_2) \rightarrow \text{CH}_k(X) \rightarrow 0.$$

┘

*Proof:* Cf. [Sta]0F94.  $\square$

**Def. (9.1.1.27) [Degree of 0-Cycles].** Let  $X$  be a proper scheme over a field  $k$ , the **degree of a zero cycle** is given by the proper pushforward

$$p_* : \text{CH}_0(X) \rightarrow \text{CH}_0(\text{Spec } k) \cong \mathbb{Z}.$$

Equivalently, if  $\alpha = \sum n_i [Z_i] \in \text{CH}_0(X)$ ,  $\deg(\alpha) = \sum n_i \deg(Z_i)$ .  $\deg$  is also denoted by  $\int_X$ .  $\square$

**Def. (9.1.1.28) [Stratification by Dimension].** Let  $X \in \text{Sch}^{\text{loc.ft}}/S$ , then the following are equivalent:

- There exists a decomposition  $X = \coprod_n X_n$  where  $X_n$  is pure of  $\delta$ -dimension  $n$ .
- For any  $x \in X$ , there exist s nbhd  $x \in U$  s.t.  $U$  is pure of  $\delta$ -dimension  $n$ .
- For an  $x \in X$ , the irreducible components of  $X$  containing  $x$  are all of the same  $\delta$ -dimension  $n_x$ .

These conditions are satisfied if  $X$  is normal or Cohen-Macaulay.  $\square$

*Proof:*  $1 \rightarrow 2 \rightarrow 3$  is trivial.  $3 \rightarrow 1$  follows from the fact  $x \mapsto n_x$  is continuous.

If  $X$  is normal, it is a disjoint union of integral schemes by (7.4.2.4). For  $X$  Cohen-Macaulay, Cf. [Sta]0FE3. ? □

**Def. (9.1.1.29) [Cohomological Chow Groups].** If  $X$  satisfies (9.1.1.28), we define

$$Z^p(X) = \prod_n Z_{n-p}(X_n), \quad Z^*(X) = \bigoplus_p Z^p(X)$$

and the **Chow group of codimension  $p$  cycle**

$$\mathrm{CH}^p(X) = \prod_n \mathrm{CH}_{n-p}(X_n), \quad \mathrm{CH}^*(X) = \bigoplus_p \mathrm{CH}^p(X).$$

┘

**Def. (9.1.1.30) [Fundamental Class].** If  $X$  satisfies (9.1.1.28), define

$$[X] = \prod [X_n]_n \in \mathrm{CH}^0(X)$$

to be the **fundamental class of  $X$** . ┘

**Prop. (9.1.1.31) [Exterior Products of Cycle Classes].** For  $X, Y \in \mathrm{Sch}^{\mathrm{ft}}/k$  and  $k, l \in \mathbb{N}$ , we can define the exterior product

$$Z_k(X) \times Z_l(Y) \rightarrow Z_{k+l}(X \times Y) : [Z] \times [W] \rightarrow [Z \times W].$$

Then we have

- If  $\alpha \sim_{\mathrm{rat}} 0$  or  $\beta \sim_{\mathrm{rat}} 0$ , then  $\alpha \times \beta \sim_{\mathrm{rat}} 0$ . In particular, we get a map  $\mathrm{CH}_k(X) \times \mathrm{CH}_l(Y) \rightarrow \mathrm{CH}_{k+l}(X \times Y)$ , which is called the **exterior product of cycle classes**.
- If  $f : X' \rightarrow X \in \mathrm{Sch}^{\mathrm{ft}}/k, g : Y' \rightarrow Y \in \mathrm{Sch}^{\mathrm{ft}}/k$  are proper, then

$$(f \times g)_*(\alpha \times \beta) = f_*(\alpha) \times g_*(\beta).$$

- If  $f : X' \rightarrow X \in \mathrm{Sch}^{\mathrm{ft}}/k, g : Y' \rightarrow Y \in \mathrm{Sch}^{\mathrm{ft}}/k$  are flat, then

$$(f \times g)^*(\alpha \times \beta) = f^*(\alpha) \times g^*(\beta).$$

┘

*Proof:* Cf. [Ful98]P25. □

## 2 Chow-Groups and $K$ -Groups

Cf. [Sta]42.22, 42.56 and 42.68.

### 3 Gysin-Maps

**Def. (9.1.3.1) [Gysin-Maps for Virtual Divisors].** Let  $X \in \text{Sch}^{\text{loc.ft}}/S$ ,  $\mathcal{L} \in \text{Pic}(X)$ ,  $s \in H^0(X, \mathcal{L})$ , denote  $D = Z(s)$ , and  $i : D \rightarrow X$  the closed immersion. Then for any  $k \in \mathbb{Z}$ , there is a **Gysin homomorphism**

$$i^* : Z_{k+1}(X) \rightarrow \text{CH}_k(D)$$

that for an integral closed subscheme  $Z \subset X$  with  $\dim_\delta(Z) = k + 1$ ,

$$i^*([Z]) = \begin{cases} [D \cap Z]_k & , Z \not\subset D \\ i'_*(c_1(\mathcal{L}|_Z) \cap [Z]) & , Z \subset D \text{ via } i' : Z \rightarrow D \end{cases}$$

and extends linearly to  $Z_{k+1}(X)$ , which is also locally finite.

We will see this is map  $i^*$  in fact factor through rational equivalence relations in (9.1.5.9).  $\lrcorner$

*Proof:* To show this is well defined, Cf. [Sta]02TO. ?  $\square$

**Remark (9.1.3.2).** If  $\mathcal{L}|_D \cong \mathcal{O}_D$ , the  $c_1(\mathcal{L}|_Z)$  term is trivial, so the Gysin homomorphism factors through  $Z_k(D) \rightarrow \text{CH}_k(D)$ .  $\lrcorner$

**Cor. (9.1.3.3).** Let  $X \in \text{Sch}^{\text{loc.ft}}/S$ ,  $(\mathcal{L}, s, i : D \rightarrow X)$  as in (9.1.3.1), then for any  $\alpha \in \text{CH}_*(X)$ ,

$$i_* i^* \alpha = c_1(\mathcal{L}) \cap \alpha$$

$\lrcorner$

**Def. (9.1.3.4) [Intersection with Cartier Divisors].** If  $X \in \text{Sch}^{\text{loc.ft}}/S$ ,  $D \in \text{Cart}^{\text{eff}}(X)$ , denote  $D \cap \alpha = c_1(\mathcal{O}_X(D)) \cap \alpha$  for  $\alpha \in Z_*(X)$ . ?  $\lrcorner$

**Def. (9.1.3.5) [Gysin Map for Local Complete Intersection Maps].** Let  $f : X \rightarrow Y \in \text{Sch}^{\text{loc.ft}}/S$  be a local complete intersection map s.t.  $f = g \circ i$  where  $g$  is smooth and  $i$  is a regular immersion, then we define the **Gysin map** for  $f$  to be  $f^! = i^! \circ g^* \in A^*(X \rightarrow Y)$ . This is independent of the decomposition  $f = g \circ i$  chosen. In this case, we say the Gysin map for  $f$  exists.  $\lrcorner$

*Proof:* Cf. [Sta]0FF2. ?  $\square$

**Prop. (9.1.3.6) [ $f^!$  and  $f^*$ ].** Let  $f : X \rightarrow Y \in \text{Sch}^{\text{loc.ft}}/S$  be a local complete intersection map, then if the Gysin map  $f^!$  exists and  $f$  is flat, then  $f^*$  can be defined and  $f^! = f^* \in A^*(X \rightarrow Y)$ .  $\lrcorner$

*Proof:* Cf. [Sta]0FF4. ?  $\square$

### 4 Weil Divisors

**Prop. (9.1.4.1) [Weil-Cartier].** For  $X \in \text{Sch}^{\text{loc.ft}}/S$ , there is a map from Cartier divisors on  $X$  to Weil divisors mapping  $(D, s_D)$  to  $[Z(s_D)]_k$ . Notice this is defined because a Cartier divisor is locally defined by a regular element and Krull's principal ideal theorem.

Moreover, if  $X$  is locally factorial, this map is an isomorphism  $\text{CaCl}(X) \rightarrow \text{Cl}(X)$  by (7.8.1.5), and (effective)Cartier divisors correspond (effective)Weil divisors.

This in particular applies to non-singular varieties over a field, by (5.3.5.20).  $\lrcorner$

**Prop. (9.1.4.2).** Let  $X \in \text{Sch}^{\text{loc.ft}}/S$  and  $Z \subset X$  be an integral closed subscheme, then  $Z$  is a Weil divisor iff  $\dim_\delta(Z) = \dim_\delta(X) - 1$ . In particular, this holds for any irreducible component of a Cartier divisor by (9.1.4.1).  $\lrcorner$

**Def. (9.1.4.3) [Q-Cartier Divisors].** A **Q-Cartier divisor** on a locally Noetherian integral scheme is a Weil divisor that some multiply of it is the image of a Cartier divisor.  $\lrcorner$

**Example (9.1.4.4) [Non-Q-Cartier Divisors].** It is easy to show some Weil divisor is not an Q-Cartier divisor (on a singular variety), by showing its complement is not affine (7.8.1.1). For example, on  $X = \text{Spec } k[x, y, z, w]/(xy - zw)$ , the Weil divisor cut out by  $(z, w)$  is not Q-Cartier, as the closed subscheme  $y = w = 0$  of its complement is isomorphic to  $\mathbb{A}_k^2 \setminus \{(0, 0)\}$ , which is not affine by calculating Čech cohomology.

In particular,  $k[x, y, z, w]/(xy - zw)$  is normal but not a UFD.  $\lrcorner$

**Prop. (9.1.4.5) [Rational Functions and Poles].** If  $X$  is an integral locally Noetherian normal scheme and  $f \in K(X)$  has no poles, then  $f \in \Gamma(X)$ , by (5.3.5.12).  $\lrcorner$

**Prop. (9.1.4.6) [UFD and Class Groups].** For  $A$  a Noetherian normal domain, it is a UFD iff  $\text{Cl}(\text{Spec } A) = 0$ .  $\lrcorner$

*Proof:* It suffices to show minimal primes of  $A$  is principal iff minimal primes of  $A$  are principal divisors. This is done by (5.3.5.12) and (3.2.3.9).  $\square$

**Prop. (9.1.4.7) [Picard Group of Projective Spaces].** Let  $R$  be a UFD, then  $\text{Cl}(\mathbb{P}_R^n) = \mathbb{Z}$ , and it is generated by  $[H]$  where  $H$  is any hyperplane of  $\mathbb{P}_R^n$ . And a hypersurface  $Y$  of degree  $d$  is mapped to  $d$ .  $\lrcorner$

*Proof:* These follow from (9.1.6.10) and (9.1.4.6). The last assertion follows from the fact  $[Y] \sim d[H]$  by direct verification.  $\square$

**Cor. (9.1.4.8).** If  $Y \subset \mathbb{P}_k^n$  is a hypersurface of degree  $d$ , then  $\text{Cl}(\mathbb{P}^2 \setminus Y) = \mathbb{Z}/d\mathbb{Z}$ .  $\lrcorner$

*Proof:* This follows from (9.1.1.25) and (9.1.4.7).  $\square$

**Cor. (9.1.4.9).** If  $k \in \text{Field}$ ,  $\text{Cl}(\mathbb{P}_k^1 \times \mathbb{P}_k^1) = \mathbb{Z} \oplus \mathbb{Z}$ , by (9.1.6.10).  $\lrcorner$

**Prop. (9.1.4.10).** If  $X$  is a non-singular cubic surface in  $\mathbb{P}_k^3$ , then  $\text{Cl}(X) \cong \mathbb{Z}^7$ .  $\lrcorner$

*Proof:* Cf. [Har77] Chap 5.4.8.  $\square$

## 5 Bivariant Classes

**Def. (9.1.5.1) [Bivariant Classes].** Let  $f : X \rightarrow Y \in \text{Sch}^{\text{loc.ft}}/S$  and  $p \in \mathbb{Z}$ , a **bivariant class**  $c$  of degree  $p$  for  $f$  is a class of maps

$$c \cap - : \text{CH}_k(Y') \rightarrow \text{CH}_{k-p}(Y' \times_Y X)$$

for any  $Y' \in \text{Sch}^{\text{loc.ft}}/Y$  and  $k \in \mathbb{Z}_+$  that satisfies

- If  $Y'' \rightarrow Y' \in \text{Sch}^{\text{loc.ft}}/Y$  is proper,  $c \cap -$  commutes with proper pushforwards.
- If  $Y'' \rightarrow Y' \in \text{Sch}^{\text{loc.ft}}/Y$  is flat of relative dimension  $r \in \mathbb{Z}$ ,  $c \cap -$  commutes with flat pullbacks.
- Let  $(\mathcal{L}, s, i : D \rightarrow Y')$  be a triple on  $Y'$  as in (9.1.3.1), then  $c \cap -$  commutes with Gysin homomorphisms  $i^*$ .

The set of bivariant classes of degree  $p$  for  $f$  is denoted by  $A^p(X \rightarrow Y)$ . And denote  $A^*(X \rightarrow Y) = \bigoplus_{p \in \mathbb{Z}} A^p(X \rightarrow Y)$ .  $\perp$

**Prop. (9.1.5.2).** For any  $f : X \rightarrow Y, g : Y \rightarrow X \in \text{Sch}^{\text{loc.ft}}/S$ ,  $p, q \in \mathbb{Z}$ ,  $A^p(X \rightarrow Y)$  is an Abelian group, and the composition defines a bilinear map

$$A^q(Y \rightarrow Z) \times A^p(X \rightarrow Y) \rightarrow A^{p+q}(X \rightarrow Z)$$

that is associative w.r.t. compositions in  $\text{Sch}^{\text{loc.ft}}/S$ .  $\perp$

**Def. (9.1.5.3) [Chow Cohomologies].** Let  $X \in \text{Sch}^{\text{loc.ft}}/S$ , denote  $A^p(X) = A^p(\text{id}_X)$ , and  $A^*(X) = \bigoplus_{p \in \mathbb{Z}} A^p(X)$  the graded ring, called the **Chow cohomology group** of  $X$ .  $\perp$

**Prop. (9.1.5.4) [Restriction of Classes].** Let  $X \rightarrow Y, f : Y' \rightarrow Y \in \text{Sch}^{\text{loc.ft}}/S$  and  $X' = X \times_Y Y'$ , then obviously there is a map  $f^* : A^p(X \rightarrow Y) \rightarrow A^p(X' \rightarrow Y')$ . In particular, if  $Z \subset X$  is a closed subscheme, then  $f^*(c) \cap \alpha = c \cap f_*(\alpha)$  for  $c \in A^p(Z \rightarrow X), \alpha \in A^p(Z)$  by proper pushforward (9.1.5.1).  $\perp$

**Cor. (9.1.5.5) [Product of Classes].** Let  $X \rightarrow Y, X' \rightarrow Y' \in \text{Sch}^{\text{loc.ft}}/S$ ,  $c \in A^p(X \rightarrow Y), c' \in A^q(X' \rightarrow Y')$ , then the product  $c \circ c'$  is defined to be the element in  $A^{p+q}(X \times_S X' \rightarrow Y \times_S Y')$  defined by the map

$$\text{CH}_*(Y \times_S Y') \xrightarrow{c' \cap -} \text{CH}_{*+q}(Y \times_S X') \xrightarrow{c \cap -} \text{CH}_{*+p+q}(X \times_S X')$$

and all base change variants of this.

Notice  $c' \circ c$  is also in  $A^{p+q}(X \times_S X' \rightarrow Y \times_S Y')$ , so it makes sense to talk about when two classes commute. Maybe  $c' \circ c$  can be defined on smaller base changes, but to say  $c, c'$  commute always means  $c \circ c' = c' \circ c \in A^{p+q}(X \times_S X' \rightarrow Y \times_S Y')$ .  $\perp$

**Lemma (9.1.5.6) [Gysin Factors Through Rational Equivalences].** Let  $X \in \text{Sch}^{\text{loc.ft}}/S$ , Gysin homomorphism for a triple  $(\mathcal{L}, s, j : D \rightarrow X)$  on  $X$  that are base change of  $(\mathcal{O}(1), x, j : S \times (0) \rightarrow \mathbb{P}_S^1)$  factors through rational equivalences.  $\perp$

*Proof:* This follows from the characterization of rational equivalences in (9.1.1.23) and the fact in this case Gysin maps are easy to describe: They are just  $k$ -parts of the inverse images.  $\square$

**Prop. (9.1.5.7) [Weakening Bivariant Conditions].** Let  $f : X \rightarrow Y \in \text{Sch}^{\text{loc.ft}}/S$  and  $c$  is a class of maps

$$c \cap - : Z_k(Y') \rightarrow \text{CH}_{k-p}(Y' \times_Y X)$$

for any  $Y' \in \text{Sch}^{\text{loc.ft}}/Y$  that is compatible with Gysin homomorphism for triples  $(\mathcal{L}, s, j : D \rightarrow Y')$  that are base change of  $(\mathcal{O}(1), x, j : S \times (0) \rightarrow \mathbb{P}_S^1)$ , then  $c$  factors through rational equivalences

And if moreover  $c$  commutes with proper pushforwards and flat pullbacks (up to rational homotopy), then it induces a bivariant class  $c \in A^p(X \rightarrow Y)$ .  $\perp$

*Proof:* For the first assertion: As  $\mathcal{L}|_D = \mathcal{O}_D$ , the Gysin homomorphism is defined on the level of cycles by (9.1.3.2) and pass to  $\text{CH}_*$  (9.1.5.6), so compositions with Gysin homomorphisms are well-defined. Then  $c$  factors through rational equivalence by the characterization of rational equivalences in (9.1.1.23).

For the last assertion, Cf. [Ful98]P321 or [Sta]0F9A. ?  $\square$

**Prop. (9.1.5.8).** Let  $f : X \rightarrow Y \in \text{Sch}^{\text{loc.ft}}/S$  and  $X = \coprod_I X_i, Y = \coprod_J Y_j$  be clopen subschemes and  $\alpha : I \rightarrow J$  is a map of sets s.t.  $f(X_i) \subset Y_{\alpha(i)}$ , then for any  $p \in \mathbb{Z}_+$ ,

$$A^p(X \rightarrow Y) = \prod_I A^p(X_i \rightarrow Y_{\alpha(i)}).$$

┘

*Proof:* Cf. [Sta]0FDZ?.

□

**Prop. (9.1.5.9) [Gysin Homomorphisms are Bivariant].** Let  $X \in \text{Sch}^{\text{loc.ft}}/S$  and  $(\mathcal{L}, s, i : D \rightarrow X)$  be a triple on  $X$  as in (9.1.3.1), then the Gysin homomorphism  $(i')^*$  associated to the base changes of  $i$  form a bivariant class in  $A^1(D \rightarrow X)$ .

┘

*Proof:* Cf. [Sta]02TA, 0B71, 0B73. ? and (9.1.5.7).

Let  $f : X' \rightarrow X \in \text{Sch}^{\text{loc.ft}}/S$  and  $(\mathcal{L}, s, i : D \rightarrow X)$  be a triple on  $X$  as in (9.1.3.1), we can define the pullback triple  $f^*(\mathcal{L}, s, i) = (\mathcal{L}', s', i' : D' \rightarrow X')$ , and then

- If  $f$  is proper, then Gysin maps commute with proper pushforwards.
- If  $f$  is flat of relative dimension  $r$ , then the Gysin maps commute with flat pullbacks.
- If  $(\mathcal{M}, t, f : X' \rightarrow X)$  is a triple on  $X$  as in (9.1.3.1), then the different Gysin maps are compatible.

□

**Prop. (9.1.5.10) [Flat Pullbacks are Bivariant].** Let  $f : X \rightarrow Y \in \text{Sch}^{\text{loc.ft}}/S$  be flat of relative dimension  $r$ , then the flat pullbacks along base changes of  $f$  form a bivariant class of degree  $-r$ .

┘

*Proof:* This follows from (9.1.1.13)(9.1.1.16)(9.1.5.9) and (9.1.5.7).

□

**Prop. (9.1.5.11) [Proper Pushforwards are Bivariant].** Let  $f : X \rightarrow Y, g : Y \rightarrow Z \in \text{Sch}^{\text{loc.ft}}/S$ ,  $f$  is proper, and  $c \in A^p(X \rightarrow Z)$ , then the base change of  $f_* \circ c$  form a bivariant class in  $A^p(Y \rightarrow Z)$ .

┘

*Proof:* This reduces to the fact proper pushforwards commutes with flat pullbacks, proper pushforwards and Gysin maps, by (9.1.5.10)(9.1.5.9)(9.1.1.9) and (9.1.5.7).

□

## 6 Chern Classes

### Invertible Sheaves

**Prop. (9.1.6.1) [First Chern Classes].** Let  $X \in \text{Sch}^{\text{loc.ft}}/S$  and  $\mathcal{L} \in \text{Pic}(X)$ , then for any  $k \in \mathbb{Z}$ , there is a map

$$c_1(\mathcal{L}) \cap - : Z_{k+1}(X) \rightarrow \text{CH}_k(X)$$

called intersection with the **first Chern class** of  $\mathcal{L}$  (the name will be made clear in (9.1.6.5)), defined as follows: If  $i : Z \rightarrow X$  is an integral subscheme of  $X$  with  $\dim_\delta(Z) = k + 1$ , then  $c_1(\mathcal{L}) \cap [Z]$  is the the pushforward of the image of  $i^*\mathcal{L}$  under the map  $\text{Pic}(Z) \rightarrow \text{Cl}(Z) \cong \text{CH}_k(Z)$  (7.5.3.14), i.e.

$$c_1(\mathcal{L}) \cap [Z] = i_*(c_1(i^*\mathcal{L}) \cap [W]).$$

In general, define  $c_1(\mathcal{L}) \cap (\sum n_Z [Z]) = \sum n_Z c_1(\mathcal{L}) \cap [Z]$ . We will see the first Chern class factors through rational equivalence relations in (9.1.6.5).

┘

**Lemma (9.1.6.2)**[The first Chern Class is Multiplicative]. Let  $X \in \text{Sch}^{\text{loc.ft}}/S$  and  $\mathcal{L}, \mathcal{N} \in \text{Pic}(X)$ , then

$$c_1(\mathcal{L}) + c_1(\mathcal{N}) = c_1(\mathcal{L} \otimes \mathcal{N}) : Z_{*+1}(X) \rightarrow \text{CH}_*(X).$$

In particular,  $c_1(\mathcal{L}) = -c_1(\mathcal{L}^{-1})$ , and  $c_1(\mathcal{O}_X) = 0$ .  $\lrcorner$

**Prop. (9.1.6.3)**[Chern Classes and Zero Cycles]. Let  $X \in \text{Sch}^{\text{loc.ft}}/S$  and  $\mathcal{L} \in \text{Pic}(X)$ ,  $Y \subset X$  a closed subscheme. If  $s \in \Gamma(Y, \mathcal{L}|_Y)$  satisfies

- $\dim_\delta(Y) \leq k + 1$ .
- $\dim_\delta(Z(s)) \leq k$ .
- For any generic point  $\xi$  of irreducible components of  $Z(s)$  of  $\delta$ -dimension  $k$ , multiplying by  $s$  induces an injection  $\mathcal{O}_{Y,\xi} \rightarrow (\mathcal{L}|_Y)_\xi$ .

Then  $c_1(\mathcal{L}) \cap [Y]_{k+1} = [Z(s)]_k$ .  $\lrcorner$

*Proof:* Cf. [Sta]02SQ. ?  $\square$

**Prop. (9.1.6.4)**[First Chern Classes Factor Through  $\text{CH}_*(X)$ ]. Situation in (9.1.6.1), then the first Chern class map  $c_1(\mathcal{L}) \cap - : Z_{k+1}(X) \rightarrow \text{CH}_k(X)$  factors through  $Z_{k+1}(X) \rightarrow \text{CH}_{k+1}(X)$ .  $\lrcorner$

*Proof:* Cf. [Sta]02TI.  $\square$

**Prop. (9.1.6.5)**[First Chern Classes Form Bivariant Classes]. Let  $X \in \text{Sch}^{\text{loc.ft}}/X$  and  $\mathcal{L} \in \text{Pic}(X)$ , then the first Chern class maps  $c_1(f^*\mathcal{L}) \cap - : Z_*(X') \rightarrow \text{CH}_{*-1}(X')$  factor through rational equivalences for each  $f : X' \rightarrow X \in \text{Sch}^{\text{loc.ft}}/X$ , and form a bivariant class in  $A^1(X)$ , called the **first Chern class**  $c_1(\mathcal{L})$ .  $\lrcorner$

*Proof:* Cf. [Sta]02SU, 02SS, 0B72. and (9.1.5.7).  $\square$

To show it commutes with pullbacks,  $\square$

**Prop. (9.1.6.6)**[First Chern Classes Commute with Bivariant Classes]. Let  $f : X' \rightarrow X \in \text{Sch}^{\text{loc.ft}}/S$  and  $\mathcal{L} \in \text{Pic}(X)$ , then  $c_1(\mathcal{L})$  commutes with every element of  $A^*(X' \rightarrow X)$ .  $\lrcorner$

In particular,  $c_1(\mathcal{L})$  is in the center of  $A^*(X)$ .  $\lrcorner$

*Proof:* Cf. [Sta]0B7B. ?  $\square$

**Prop. (9.1.6.7)**. Let  $X \in \text{Sch}^{\text{loc.ft}}/S$  and  $\mathcal{L} \in \text{Pic}(X)$  be an ample invertible sheaf. Assume  $d = \dim(X) < \infty$ , then for any  $\mathcal{L}_1, \dots, \mathcal{L}_{d+1} \in \text{Pic}(X)$ ,  $c_1(\mathcal{L}_1) \circ \dots \circ c_1(\mathcal{L}_{d+1}) = 0 \in A^{d+1}(X)$ .  $\lrcorner$

*Proof:* Use induction on  $d$ :  $d = 0$  case is trivial as  $X$  is discrete thus any invertible sheaf is trivial. In general, by (7.8.1.9) and (9.1.6.2), it suffices to prove for  $\mathcal{L}_i = \mathcal{O}_X(D_i)$  being Cartier divisors. If  $i : D_{d+1} \rightarrow X$ , then  $c_1(\mathcal{L}_{d+1}) = i_* \circ i^*$  by (9.1.3.3), and  $c_1(\mathcal{L}_i)$  commutes with both  $i_*$  and  $i^*$ , so we can replace  $X$  by  $D$  and then use induction hypothesis.  $\square$

**Lemma (9.1.6.8)**. If  $X \in \text{Sch}^{\text{loc.ft}}/S$  and  $0 \rightarrow \mathcal{L}_1 \rightarrow \mathcal{E} \rightarrow \mathcal{L}_2 \rightarrow 0$  is an exact sequence with  $\mathcal{L}_1, \mathcal{L}_2 \in \text{Pic}(X)$ , and there is a non-vanishing section  $s$  of  $\mathcal{E}$ , then  $c_1(\mathcal{L}_1) \cap c_1(\mathcal{L}_2) = 0 \in A^2(X)$ .  $\lrcorner$

*Proof:* Consider the image  $\bar{s}$  of  $s$  in  $\Gamma(X, \mathcal{L}_2)$ , then we can consider the Gysin map associated to  $(\mathcal{L}_2, \bar{s}, j)$ . Then

$$c_1(\mathcal{L}_1) \cap c_1(\mathcal{L}_2) \cap \alpha = j_*(c_1(j^*\mathcal{L}_1) \cap j^*\alpha).$$

$j^*\mathcal{L}_1$  is trivialized by  $s$  now, so this one is vanishes.  $\square$

**Lemma (9.1.6.9).** If  $X \in \text{Sch}^{\text{loc.ft}}/S$ ,  $r \in \mathbb{Z}_+$ ,  $\mathcal{L} \in \text{Vect}^r(X)$ , let  $\pi : \mathbf{P}(\mathcal{E}) \rightarrow X$  be the projective space of  $\mathcal{E}$ , then for any  $k \in \mathbb{Z}$  and  $\alpha \in \text{CH}_k(X)$ ,

$$\pi_*(c_1(\mathcal{O}_{\mathbf{P}(\mathcal{E})}(1))^s \cap \pi^* \alpha) = \begin{cases} 0 & , s < r-1 \\ \alpha & , s = r-1 \end{cases} \in \text{CH}_{k+r-1-s}(X).$$

┘

*Proof:* Cf. [Sta]02TW. □

**Prop. (9.1.6.10) [Projective Bundles Formula].** If  $X \in \text{Sch}^{\text{loc.ft}}/S$ ,  $r \in \mathbb{Z}_+$ ,  $\mathcal{L} \in \text{Vect}^r(X)$ , let  $\pi : \mathbf{P}(\mathcal{E}) \rightarrow X$  be the projective space of  $\mathcal{E}$ , then for any  $k \in \mathbb{Z}$ , the map

$$\text{CH}_{k+r-1}(\mathbf{P}(\mathcal{E})) = \bigoplus_{i=0}^r c_i(\mathcal{O}_{\mathbf{P}(\mathcal{E})}(1))^i \cap \pi^* \text{CH}_{k+i}(X).$$

is an isomorphism.

In particular, if  $X$  is integral, then

$$\text{Cl}(\mathbf{P}(\mathcal{E})) = \pi^*(\text{Cl}(X)) \oplus [c_1(\mathcal{O}_{\mathbf{P}(\mathcal{E})}(1))].$$

┘

*Proof:* Cf. [Sta]02TX. ? □

**Prop. (9.1.6.11) [Vector Bundles].** If  $X \in \text{Sch}^{\text{loc.ft}}/S$ ,  $r \in \mathbb{Z}_+$ ,  $\mathcal{L} \in \text{Vect}^r(X)$ , let  $\pi : \mathbf{E} = \text{Spec}(\text{Sym}(\mathcal{E})) \rightarrow X$  be the vector bundle of  $\mathcal{E}$ , then for any  $k \in \mathbb{Z}$ ,  $p^* : \text{CH}_k(X) \rightarrow \text{CH}_{k+r}(X)$  is an isomorphism. ┘

*Proof:* Cf. [Sta]02TY. □

**Prop. (9.1.6.12) [Diagonal Intersections].** For  $X \in \text{SmProj}^n/k$ ,

$$\Delta \cdot \Delta = \deg(c_n(\mathcal{T}_X)).$$

┘

*Proof:* Cf. [Mustata, P14]. □

### Vector Bundles

**Prop. (9.1.6.13) [Splitting Principle].** Let  $X \in \text{Sch}^{\text{loc.ft}}/S$ ,  $\mathcal{E}_i \subset \text{Vect}(X)$  be a finite set of finite locally free sheaves, there exists a projective flat morphism  $\pi : P \rightarrow X$  of relative dimension  $d$  s.t.

- For any  $Y \in \text{Sch}^{\text{loc.ft}}/X$ , the map  $\pi_Y^* : \text{CH}^*(Y) \rightarrow \text{CH}^*(Y \times_X P)$  is injective.
- Each  $\pi^* \mathcal{E}_i$  has a filtration with invertible quotient sheaves.

This is useful in the way that when proving functorial properties of Chern classes of vector bundles, we can reduce to invertible sheaves. ┘

*Proof:* Cf. [Sta]02UL. □

**Def. (9.1.6.14)[Chern Classes of Vector Bundles].** Let  $X \in \text{Sch}^{\text{loc.ft}}/S$ ,  $r \in \mathbb{Z}_+$ ,  $\mathcal{E} \subset \text{Vect}^r(X)$  with projective bundle  $\pi : \mathbf{P}(\mathcal{E}) \rightarrow X$ , then for any  $k, p \in \mathbb{N}$ , there is a map

$$c_p(\mathcal{E}) \cap - : \text{CH}_k(X) \rightarrow \text{CH}_{k-p}(X)$$

called **intersection with Chern classes** as follows (the name will be made clear in (9.1.6.15)): Let  $\alpha \in \text{CH}_k(X)$ , by (9.1.6.10) there are unique elements  $c_p \in \text{CH}_{k-p}(X)$  s.t.  $c_0 = \alpha$  and

$$\sum_{p=0}^r (-1)^p c_1(\mathcal{O}_{\mathbf{P}(\mathcal{E})})^p \cap \pi^* c_{r-p} = 0 \in \text{CH}_{k-1}(\mathbf{P}(i^*\mathcal{E})).$$

Then define  $c_p(\mathcal{E}) \cap \alpha = c_p$ .

In particular, if  $\mathcal{E}$  is an invertible sheaf,  $c_1(\mathcal{E}) \cap$  is just the intersection with the first Chern class  $c_1(\mathcal{E}) \cap \alpha$  (9.1.6.1)(9.1.6.6).  $\lrcorner$

**Prop. (9.1.6.15) [Chern Classes Form Bivariant Classes].** Let  $X \in \text{Sch}^{\text{loc.ft}}/X$ ,  $r \in \mathbb{Z}_+$ ,  $\mathcal{E} \in \text{Vect}^r(X)$ , then the maps  $c_p(f^*\mathcal{E}) \cap - : \text{CH}_k(X') \rightarrow \text{CH}_{k-p}(X')$  for each  $f : X' \rightarrow X \in \text{Sch}^{\text{loc.ft}}/X$ ,  $k \in \mathbb{Z}_+$  form a bivariant class in  $A^p(X)$ , called the **Chern classes**  $c_p(\mathcal{E})$ . By convention, set  $c_p(\mathcal{E}) = 0$  for  $p > r$ .

And  $c(\mathcal{E}) = \sum_{i=0}^r c_i(\mathcal{E}) \in A^*(X)$  are called the **total Chern class** of  $\mathcal{E}$ .  $\lrcorner$

*Proof:* For commuting with proper pushforward, use the definition (9.1.6.14) and (9.1.1.24)(9.1.6.5), and push and pull (9.1.1.16).

For commuting with flat pullback, use the definition (9.1.6.14) and (9.1.1.24)(9.1.6.5) and properties of flat pullbacks (9.1.1.13).

For commuting with Gysin map, use the definition (9.1.6.14) and (9.1.1.24)(9.1.6.5) and properties of Gysin maps (9.1.5.9).  $\square$

**Prop. (9.1.6.16)[Chern Classes Commute with Bivariant Classes].** Let  $f : X' \rightarrow X \in \text{Sch}^{\text{loc.ft}}/S$  and  $\mathcal{E} \in \text{Vect}^r(X)$ , then for any  $p \in \mathbb{Z}_+$ ,  $c_p(\mathcal{E})$  commutes with every element of  $A^*(X' \rightarrow X)$ .

In particular,  $c_p(\mathcal{E})$  are in the center of  $A^*(X)$ , and for  $\mathcal{E} \in \text{Vect}^r(X)$ ,  $\mathcal{F} \in \text{Vect}^s(X)$ ,  $p, q \in \mathbb{Z}_+$ ,  $c_p(\mathcal{E}), c_q(\mathcal{F})$  commute.  $\lrcorner$

*Proof:* Reduce to  $c_1$  and (9.1.6.6) as we did in (9.1.6.15).  $\square$

**Prop. (9.1.6.17) [Chern Classes for Arbitrary Vector Bundles].** Let  $X \in \text{Sch}^{\text{loc.ft}}/X$ ,  $\mathcal{E} \in \text{Vect}^\delta(X)$ , then constancy of  $r$  induces a clopen partition of  $X = \coprod_{i=0}^\infty X_i$ , where  $X_i$  are the clopen subscheme s.t.  $\delta = i$ . Then by (9.1.5.8),  $A^p(X) = \prod_{i=0}^\infty A^p(X_i)$ , so we can define the Chern class  $c_p(\mathcal{E})$  to be the product of  $c_p(\mathcal{E}|_{X_i})$ . Also we can define a **rank class**  $r(\mathcal{E}) \in A^0(X) = \prod_{i=0}^\infty A^0(X_i)$  that is product of  $[i] \in A^0(X_i)$ .  $\lrcorner$

**Prop. (9.1.6.18)[Additivity].** Let  $X \in \text{Sch}^{\text{loc.ft}}/S$  and  $0 \rightarrow \mathcal{E}_1 \rightarrow \mathcal{E} \rightarrow \mathcal{E}_2 \rightarrow 0 \in \text{Vect}(X)$ , then

$$c(\mathcal{E}) = c(\mathcal{E}_1)c(\mathcal{E}_2).$$

$\lrcorner$

*Proof:* It suffices to check this by their action on  $[X]$  where  $X \in \text{Sch}^{\text{loc.ft,int}}/S$ . Using splitting principle (9.1.6.13), we can easily reduce to the case  $\mathcal{E}_1, \mathcal{E}_2 \in \text{Pic}(X)$  by induction on  $\text{rank}(\mathcal{E}_1)$  and

$\text{rank}(\mathcal{E}_2)$ . In this case, let  $\mathbf{P}$  be the projective bundle of  $\mathcal{E}$  with  $\mathcal{O}(1) = \mathcal{O}_{\mathbf{P}}(1)$ . By tag02U6, it suffices to show that

$$c_1(\mathcal{O}(1))^2 \cap \pi^* \alpha - c_1(\mathcal{O}(1)) \cap \pi^*(c_1(\mathcal{E}_1) \cap \alpha + c_1(\mathcal{E}_2) \cap \alpha) + \pi^*(c_1(\mathcal{E}_1) \cap c_1(\mathcal{E}_2) \cap \alpha).$$

for which it suffices to show that

$$(c_1(\mathcal{O}(1)) - c_1(\pi^* \mathcal{E}_1)) \cap (c_1(\mathcal{O}(1)) - c_1(\pi^* \mathcal{E}_2)) = c_1(\pi^* \mathcal{E}_1^\vee(1)) \cap c_1(\pi^* \mathcal{E}_2^\vee(1)) = 0$$

There is a surjection  $\mathcal{E} \rightarrow \mathcal{O}(1)$ , which corresponds to a non-zero section of  $\mathcal{E}^\vee(1)$ . Notice there is an exact sequence

$$0 \rightarrow \mathcal{E}_2^\vee \rightarrow \mathcal{E}^\vee(1) \rightarrow \mathcal{E}_1^\vee \rightarrow 0,$$

so the assertion follows from (9.1.6.8).  $\square$

**Prop. (9.1.6.19).** Let  $X \in \text{Sch}^{\text{loc.ft}}/S$  and  $\mathcal{E} \in \text{Vect}^r(X)$ , then  $c_1(\wedge \mathcal{E}) = c_1(\mathcal{E})$ , and

$$\prod_{p=0}^r c(\wedge^p \mathcal{E})^{(-1)^n} = 1 - (r-1)!c_r(\mathcal{E}) + \dots$$

┘

*Proof:* Use splitting principle and Cf. [Sta]0FEE.  $\square$

**Prop. (9.1.6.20)[Degrees and First Chern Classes].** Let  $X$  be a proper scheme over a field  $k$ , then

- Let  $\mathcal{L}_1, \dots, \mathcal{L}_d$  be invertible sheaves on  $X$  and  $Z \subset X$  a closed subscheme of dimension  $d$ , then

$$(\mathcal{L}_1 \cdot \dots \cdot \mathcal{L}_d; Z) = \deg(c_1(\mathcal{L}_1) \cap \dots \cap c_1(\mathcal{L}_d) \cap [Z]_d).$$

In particular, if  $\mathcal{L}$  is an ample invertible sheaf,

$$\deg_{\mathcal{L}}(Z) = \deg(c_1(\mathcal{L})^d \cdot [Z]_d).$$

- If  $\dim X \leq 1$ , for  $\mathcal{E} \in \text{Coh}^{\text{free}}(X)$ ,

$$\deg(\mathcal{E}) = \deg(c_1(\mathcal{E}) \cdot [X]_1).$$

┘

*Proof:* Cf. [Sta]0AZ3, 0BFI. ?  $\square$

**Prop. (9.1.6.21)[Chern Characters].** Let  $X \in \text{Sch}^{\text{loc.ft}}/S$ ,  $r$  a locally constant  $\mathbb{Z}$ -valued functions on  $X$  and  $\mathcal{E} \in \text{Vect}^r(X)$ , define the **Chern character** of  $\mathcal{E}$  to be

$$\begin{aligned} \text{ch}(\mathcal{E}) &= \text{rank}(\mathcal{E}) + \sum_{p \geq 0} \frac{P_p(c_1(\mathcal{E}), \dots, c_n(\mathcal{E}))}{p!} \in \prod_{i \geq 0} A^i(X)_{\mathbb{Q}} \\ &= \text{rank}(\mathcal{E}) + c_1(\mathcal{E}) + \frac{1}{2}(c_1(\mathcal{E})^2 - 2c_2(\mathcal{E})) + \frac{1}{6}(c_1(\mathcal{E})^3 - 3c_1(\mathcal{E})c_2(\mathcal{E}) + 3c_3(\mathcal{E})) \\ &\quad + \frac{1}{24}(c_1(\mathcal{E})^4 - 4c_1(\mathcal{E})^2c_2(\mathcal{E}) + 4c_1(\mathcal{E})c_3(\mathcal{E}) + 2c_2(\mathcal{E})^2 - 4c_4(\mathcal{E})) + \dots \end{aligned}$$

where  $P_p$  are Chern polynomials (3.3.4.3).  $\square$

**Prop. (9.1.6.22) [Tensor Products].** If  $X \in \text{Sch}^{\text{loc.ft}}/S$ ,  $r, s, t$  are locally constant  $\mathbb{Z}$ -valued functions on  $X$  and  $\mathcal{E} \in \text{Vect}(X)$ ,  $\mathcal{F} \in \text{Vect}(X)$ ,  $\mathcal{G} \in \text{Vect}(X)$ , then

- If there is an exact sequence  $0 \rightarrow \mathcal{E} \rightarrow \mathcal{G} \rightarrow \mathcal{F} \rightarrow 0$ , then  $\text{ch}(\mathcal{E}) + \text{ch}(\mathcal{F}) = \text{ch}(\mathcal{G})$ .
- $\text{ch}(\mathcal{E} \otimes_{\mathcal{O}_X} \mathcal{F}) = \text{ch}(\mathcal{E}) \text{ch}(\mathcal{F})$ .
- $\text{ch}_i(\mathcal{E}^\vee) = (-1)^i \text{ch}_i(\mathcal{E})$ .

In particular,  $\text{ch}$  defines a ring homomorphism  $\text{ch} : K_0(\text{Vect}(X)) \rightarrow \prod_{i \geq 0} A^i(X)_{\mathbb{Q}}$ .  $\lrcorner$

*Proof:* It suffices to prove for  $X$  connected, and then by (9.1.6.13), we can assume  $\mathcal{E}, \mathcal{F}$  have filtrations with invertible quotient sheaves  $\mathcal{E}_1, \dots, \mathcal{E}_r$  and  $\mathcal{F}_1, \dots, \mathcal{F}_s$  with first Chern characters  $a_1, \dots, a_r$  and  $b_1, \dots, b_s$ , then by additivity (9.1.6.18) and the definition of Chern polynomials (3.3.4.3), we see

$$\text{ch}(\mathcal{E}) = \sum_{i=1}^r \exp(a_i), \quad \text{ch}(\mathcal{F}) = \sum_{j=1}^s \exp(b_j),$$

and  $\mathcal{E} \otimes \mathcal{F}$  has a filtration with quotient sheaves  $\mathcal{E}_i \otimes \mathcal{F}_j$  with first Chern characters  $a_i + b_j$  by (9.1.6.2), so the assertions are now clear.  $\square$

**Cor. (9.1.6.23) [Chern Classes of Tensor Products].** If  $X \in \text{Sch}^{\text{loc.ft}}/S$ ,  $r, s$  are locally constant  $\mathbb{Z}$ -valued functions on  $X$  and  $\mathcal{E} \in \text{Vect}^r(X)$ ,  $\mathcal{F} \in \text{Vect}^s(X)$ , then

$$\begin{aligned} c_i(\mathcal{E}^\vee) &= (-1)^i c_i(\mathcal{E}) \in A^i(X), \\ c_1(\mathcal{E} \otimes \mathcal{F}) &= r c_1(\mathcal{E}) + s c_1(\mathcal{F}) \in A^1(X), \\ c_2(\mathcal{E} \otimes \mathcal{F}) &= r c_2(\mathcal{F}) + s c_2(\mathcal{E}) + \binom{r}{2} c_1(\mathcal{F})^2 + (rs - 1) c_1(\mathcal{E}) c_1(\mathcal{F}) + \binom{s}{2} c_1(\mathcal{E})^2 \in A^2(X), \\ c_2(\text{Hom}(\mathcal{E}, \mathcal{E})) &= 2r c_2(\mathcal{E}) - (r - 1) c_1(\mathcal{E})^2 \in A^2(X). \end{aligned}$$

$\lrcorner$

**Prop. (9.1.6.24) [Todd Classes].** Let  $X \in \text{Sch}^{\text{loc.ft}}/S$  and  $\mathcal{E} \in \text{Vect}(X)$ , define the **Todd class**  $\text{Todd}(\mathcal{E})$  of  $\mathcal{E}$  to be

$$\begin{aligned} \text{Todd}(\mathcal{E}) &= \text{Todd}(c_1(\mathcal{E}), c_2(\mathcal{E}), \dots) \text{ (3.3.4.4)} = 1 + \frac{1}{2} c_1(\mathcal{E}) + \frac{1}{12} (c_1(\mathcal{E})^2 + c_2(\mathcal{E})) \\ &\quad + \frac{1}{24} c_1(\mathcal{E}) c_2(\mathcal{E}) + \frac{1}{720} (-c_1^4(\mathcal{E}) + 4c_1^2(\mathcal{E}) c_2(\mathcal{E}) + 3c_2^2(\mathcal{E}) + c_1(\mathcal{E}) c_3(\mathcal{E}) - c_4(\mathcal{E})) + \dots \end{aligned}$$

Then if  $0 \rightarrow \mathcal{E}' \rightarrow \mathcal{E} \rightarrow \mathcal{E}'' \rightarrow 0 \in \text{Vect}(X)$  be an exact sequence, then  $\text{Todd}(\mathcal{E}) \text{Todd}(\mathcal{E}'') = \text{Todd}(\mathcal{E}')$ .  $\lrcorner$

*Proof:* The proof is the same as that of (9.1.6.22).  $\square$

**Prop. (9.1.6.25) [Borel-Serre].** Let  $X \in \text{Sch}^{\text{loc.ft}}/S$  and  $\mathcal{E} \in \text{Coh}^{\text{free}, r}(X)$ , then

$$\sum_{p=0}^r (-1)^p \text{ch}(\wedge^p \mathcal{E}^\vee) = c_r(\mathcal{E}) \text{Todd}(\mathcal{E})^{-1}.$$

$\lrcorner$

*Proof:* ?  $\square$

**Prop. (9.1.6.26) [Chern Classes of K-Groups].**  $X \in \text{Sch}^{\text{loc.ft}}/S$ , by additivity and multiplicativity (9.1.6.18)(9.1.6.22), we can extend Chern classes and Chern characters to the K-group  $K_0(\text{Vect}(X))$ :

$$c : K_0(\text{Vect}(X)) \rightarrow \prod_{p \geq 0} A^p(X), \quad \text{ch} : K_0(\text{Vect}(X)) \rightarrow \prod_{p \geq 0} A^p(X)_{\mathbb{Q}}$$

where  $c$  is a group homomorphism and  $\text{ch}$  is a ring homomorphism.  $\lrcorner$

**Prop. (9.1.6.27) [Adam Operators and Chern Characters].**  $X \in \text{Sch}^{\text{loc.ft}}/S$  and  $\alpha \in K_0(\text{Vect}(X))$ , then  $c_i(\psi^k(\alpha)) = 2^{ki} c_i(\alpha)$  and  $\text{ch}_i(\psi^k(\alpha)) = 2^{ki} \text{ch}_i(\alpha)$ .  $\lrcorner$

*Proof:* It suffices to prove for  $\alpha = [\mathcal{E}]$  where  $\mathcal{E} \in \text{Vect}(X)$ , then by splitting principle it suffices to prove for line bundles, and this is clear from (9.1.6.23) and the definition (9.1.6.21)t.  $\square$

### Perfect Complexes

**Lemma (9.1.6.28).** Let  $X \in \text{Sch}^{\text{loc.ft}}/S$ , then for each perfect complex  $\mathcal{E}$  in  $D(\mathcal{O}_X)$ , we can define the Chern classes, Chern characters and ranks of  $\mathcal{E}$ . But we only define for a subset of  $E$  here? Cf. [Sta]0F9E: If  $\mathcal{E}$  is represented by a finite complex  $\mathcal{E}^\bullet$  of vector bundles on  $X$ , define

$$c(\mathcal{E}) = \prod_i c(\mathcal{E}^i)^{(-1)^i} \in \prod_{i \geq 0} A^i(X), \quad \text{ch}(\mathcal{E}) = \sum_i (-1)^i \text{ch}(\mathcal{E}^i) \in \prod_{i \geq 0} A^i(X)_{\mathbb{Q}}, \quad r(\mathcal{E}) = \sum_i (-1)^i r(\mathcal{E}^i).$$

$\lrcorner$

*Proof:* To show this is well defined,  $\square$

**Prop. (9.1.6.29) [Chern Classes via Envelopes].** Let  $Y \rightarrow X \in \text{Sch}^{\text{loc.ft}}/S$  be an envelope?,  $\mathcal{E}$  perfect in  $D(\mathcal{O}_X)$  s.t.  $Lf^*\mathcal{E}$  is representable by a finite complex of vector bundles on  $Y$ , then there are unique bivariant classes  $c(\mathcal{E}) \in \prod_{i \geq 0} A^i(X)$ ,  $\text{ch}(\mathcal{E}) \in \prod_{i \geq 0} A^i(X)_{\mathbb{Q}}$ ,  $r(\mathcal{E})$  s.t. their restrictions to  $Y$  are of the form defined in (9.1.6.28).

Moreover, these bivariant classes are invariant of the envelope chosen. In this case, we say the Chern classes of  $\mathcal{E}$  are defined.  $\lrcorner$

*Proof:* Cf. [Sta]0GUD.  $\square$

**Prop. (9.1.6.30).** If  $X \in \text{Sch}^{\text{loc.ft}}/S$  and each irreducible components of  $X$  are qc, then  $X$  has an envelope. In particular, this applies to  $X$  qc.  $\lrcorner$

*Proof:* Cf. [Sta]0GUE?.  $\square$

**Prop. (9.1.6.31) [Additivity].** If  $X \in \text{Sch}^{\text{loc.ft}}/S$  and  $\mathcal{E}_1 \rightarrow \mathcal{E}_2 \rightarrow \mathcal{E}_3 \rightarrow \mathcal{E}_1[1]$  is a distinguished triangle of perfect complexes in  $D(\mathcal{O}_X)$ , and one of the following holds:

- There exists an envelope  $f : Y \rightarrow X$  s.t.  $Lf^*\mathcal{E}_1 \rightarrow Lf^*\mathcal{E}_2$  is representable by a map of finite complexes of vector bundles on  $Y$ .
- Each irreducible components of  $X$  is irreducible.

Then Chern classes of  $\mathcal{E}_i$  are defined, and

$$c(\mathcal{E}_2) = c(\mathcal{E}_1)c(\mathcal{E}_3), \quad \text{ch}(\mathcal{E}_2) = \text{ch}(\mathcal{E}_1) + \text{ch}(\mathcal{E}_3).$$

$\lrcorner$

*Proof:* Cf. [Sta]0F9F? .  
Se

□

**Prop. (9.1.6.32).** If  $X \in \text{Sch}^{\text{loc.ft}}/S$  and  $\mathcal{E}$  be a perfect object in  $D(\mathcal{O}_X)$  whose Chern classes are defined, then

- Let  $f : X' \rightarrow X \in \text{Sch}^{\text{loc.ft}}/S$ ,  $p \in \mathbb{Z}_+$ , then  $c_p(\mathcal{E})$  commutes with every element of  $A^*(X' \rightarrow X)$ , i.e.  $c \cdot c_p(\mathcal{E}) = c_p(Lf^*\mathcal{E}) \cdot c$ .  
In particular,  $c_p(\mathcal{E})$  are in the center of  $A^*(X)$ , and for  $\mathcal{E}, \mathcal{F}$  perfect in  $D(\mathcal{O}_X)$  whose Chern classes are defined,  $p, q \in \mathbb{Z}_+$ ,  $c_p(\mathcal{E}), c_q(\mathcal{F})$  commute.
- $\log(c(\mathcal{E})) = \sum_{p \geq 0} \frac{P_p(c_1(\mathcal{E}), \dots, c_n(\mathcal{E}))}{p}$  also holds, where  $P_p$  are Chern polynomials (3.3.4.3). Similarly for Chern character  $\text{ch}(\mathcal{E})$ .
- $c_i(\mathcal{E}^\vee) = (-1)^i c_i(\mathcal{E})$ ,  $\text{ch}_i(\mathcal{E}^\vee) = (-1)^i \text{ch}_i(\mathcal{E})$ .

┘

*Proof:* These follow from the splitting principle and the definition (9.1.6.29).

□

**Prop. (9.1.6.33) [Tensor Products].** If  $X \in \text{Sch}^{\text{loc.ft}}/S$  and  $E, F$  perfect in  $D(\mathcal{O}_X)$  whose Chern classes are defined, then

$$\text{ch}(\mathcal{E} \otimes_{\mathcal{O}_X}^L \mathcal{F}) = \text{ch}(\mathcal{E}) \text{ch}(\mathcal{F}),$$

in particular, formulas in (9.1.6.23) hold.

┘

*Proof:* This follows from the splitting principle and the definition (9.1.6.29).

□

## 7 Non-Singular Intersection Theory

**Lemma (9.1.7.1).** If  $X \in \text{Sch}_{\text{reg}, qc}^{\text{ft, sep}}/S$  with bounded  $\delta$ -dimension, then the composition

$$K_0(\text{Vect}(X)) \otimes \mathbb{Q} \xrightarrow{\text{ch}} \prod_{p \geq 0} A^p(X) \xrightarrow{-\cap[X]} \text{CH}^*(X) \otimes \mathbb{Q}$$

is an isomorphism.

┘

*Proof:* Firstly  $K_0(X) = K'_0(X) = K_0(\text{Vect}(X))$  by (7.9.1.35) and (7.9.1.38).

The rest follows from [Sta]0FEY? .

□

**Prop. (9.1.7.2) [Q-Intersection Products on Regular Schemes].** If  $X \in \text{Sch}_{\text{reg}, qc}^{\text{ft, sep}}/S$  with bounded  $\delta$ -dimension, then the isomorphism  $K_0(\text{Vect}(X)) \otimes \mathbb{Q} \cong \text{CH}^*(X) \otimes \mathbb{Q}$  endows  $\text{CH}^*(X)_{\mathbb{Q}}$  with a commutative associative ring structure: If  $\alpha = \text{ch}(\alpha') \cap [X], \beta = \text{ch}(\beta') \cap [X]$ , then

$$\alpha \cdot \beta = \text{ch}(\alpha) \cap \text{ch}(\beta) \cap [X] = \text{ch}(\alpha') \cap \beta = \text{ch}(\beta') \cap \alpha.$$

And this ring structure preserves the gradation on  $\text{CH}^*(X)_{\mathbb{Q}}$ . Also it is preserved under morphism in  $\text{Sch}_{\text{reg}, qc}^{\text{ft, sep}}$  flat of relative dimension  $r$ .

┘

*Proof:* To prove it preserves gradation, suppose  $\alpha \in \text{CH}^i(X), \beta \in \text{CH}^j(X)$ , then  $\alpha'$  and  $2^{-i}\psi^2(\alpha')$  (9.1.6.27) are both inverse images of  $\alpha$ , so they are equal. Then  $\text{ch}(\alpha') = \text{ch}(2^{-i}\psi^2(\alpha'))$ , which means  $\text{ch}(\alpha') \in A^i(X)_{\mathbb{Q}}$ , and then  $\text{ch}(\alpha') \cap \beta \in \text{CH}^{i+j}(X)_{\mathbb{Q}}$ .

□

Smooth over Dedekind Schemes CaseSmooth over Fields Case

**Prop. (9.1.7.3) [Exterior Products].** If  $k \in \mathbf{Field}$ ,  $S = \operatorname{Spec} k$ ,  $X, Y \in \operatorname{Sch}^{\operatorname{loc.ft}}/k$ , there is a **exterior product map**

$$\operatorname{CH}_n(X) \otimes \operatorname{CH}_m(Y) \rightarrow \operatorname{CH}_{n+m}(X \times_S Y)$$

defined by sending  $[X'] \otimes [Y']$  to  $[X' \times_S Y']_{n+m}$ , where  $X' \subset X, Y' \subset Y$  are integral closed subschemes of dimension  $n$  and  $m$  resp.  $\lrcorner$

*Proof:* To show this is well defined, consider  $i : X' \rightarrow X, c : X \rightarrow \operatorname{Spec} k$ , then by (9.1.5.11),  $c_* \circ (c \circ i)^* \in A^{-n}(X \rightarrow \operatorname{Spec} k)$ , which sends  $[Y']$  to  $[X' \times_k Y']_{n+m}$ , so this map factors through rational equivalences on  $Y$ , and similarly it factors through rational equivalences on  $X$ .  $\square$

**Prop. (9.1.7.4).** If  $k \in \mathbf{Field}$ ,  $S = \operatorname{Spec} k$  and  $X \in \operatorname{Sch}^{\operatorname{loc.ft}}/k$ , there is a natural isomorphism  $A^p(X \rightarrow \operatorname{Spec} k) \cong \operatorname{CH}_{-p}(X)$  for any  $p \in \mathbb{Z}$ .  $\lrcorner$

*Proof:* The map  $A^p(X \rightarrow \operatorname{Spec} k) \rightarrow \operatorname{CH}_{-p}(X)$  is given by  $c \mapsto c \cap [\operatorname{Spec} k]$ . Conversely, for any  $\alpha \in \operatorname{CH}_{-p}(X)$ , we can define for any  $X' \in \operatorname{Sch}^{\operatorname{loc.ft}}/k$  a map

$$\operatorname{CH}_n(X') \rightarrow \operatorname{CH}_{n-p}(X \times_k X') : \beta \mapsto \alpha \times \beta \text{ (9.1.7.3)}.$$

Then this is a bivariant class in  $A^p(X \rightarrow \operatorname{Spec} k)$ : Let  $\alpha = \sum n_i [X_i]$ , and let  $g : \coprod_i X_i \rightarrow X$ ,  $f : \coprod_i X_i \rightarrow \operatorname{Spec} k$ . Denote  $\nu^* \in A^0(\coprod_i X_i)$  the bivariant class that multiplies by  $n_i$  at each component  $X_i$ , then  $g_* \circ \nu \circ f^* \in A^p(X \rightarrow \operatorname{Spec} k)$  by (9.1.5.10)(9.1.5.11), and this is just the map we defined above.

To show these two maps are inverse to each other, one direction is clear. To show  $c(\beta) = (c \cap [\operatorname{Spec} k]) \times \beta$ , it suffices to show for  $\beta = [X']$  is integral, then  $\beta = (X' \rightarrow \operatorname{Spec} k)^* [\operatorname{Spec} k]$ , then it is easy to see they are equal because  $c$  commutes with flat pullbacks  $(X' \rightarrow \operatorname{Spec} k)^*$ .  $\square$

**Cor. (9.1.7.5) [Commutativity and Associativity].** If  $k \in \mathbf{Field}$ ,  $S = \operatorname{Spec} k$  and  $X \in \operatorname{Sch}^{\operatorname{loc.ft}}/k$ , then  $c \in A^p(X \rightarrow \operatorname{Spec}(k))$  commutes with any  $c' \in A^q(Y \rightarrow Z)$  for any  $f : Y \rightarrow Z \in \operatorname{Sch}^{\operatorname{loc.ft}}/k$ . In other words, for any  $\alpha \in \operatorname{CH}_*(X), \beta \in \operatorname{CH}_*(Z)$  and  $c \in A^*(Y \rightarrow Z)$ ,

$$\alpha \times (c \cap \beta) = c \cap (\alpha \times \beta) \in \operatorname{CH}_*(X \times_k Y).$$

In particular, if  $\gamma \in \operatorname{CH}_*(Y)$ , then

$$(\alpha \times \beta) \times \gamma = \alpha \times (\beta \times \gamma) \in \operatorname{CH}_*(X \times_k Y \times_k Z).$$

$\lrcorner$

*Proof:* This is because  $c = g_* \circ \nu \circ f^*$  as in the proof of (9.1.7.4).  $\square$

**Prop. (9.1.7.6) [Perturbation and Chow Rings].** Any two algebraic cycles  $\gamma_1, \gamma_2 \in Z_*(X)$  are rationally equivalent to cycles  $\gamma'_1, \gamma'_2$  s.t.  $\gamma'_1, \gamma'_2$  intersect properly. And the rational class of resulting intersection cycle is well-defined. So there is an intersection on  $\operatorname{CH}^*(X)$  making it a commutative ring, called the **Chow ring of  $X$** .  $\lrcorner$

*Proof:*

$\square$

**Prop. (9.1.7.7) [Bezout].** The Chow ring of  $\mathbb{P}_k^n$  is isomorphic to  $\mathbb{Z}[x]/(x^{n+1})$ . The degree of an irreducible closed variety corresponds to the coefficient of it.  $\lrcorner$

*Proof:*

$\square$

**Def. (9.1.7.8) [Euler Characteristic].** If  $X$  is a smooth scheme over a field  $k$  of dimension  $d$  with tangent bundle  $\mathcal{T}_{X/k} \in \text{Vect}(X)$ , the **Euler characteristic of  $X$**  is defined to  $\deg(c_d(\mathcal{T}_{X/k}) \cap [X])$ , and the **Todd characteristic of  $X$**  is defined to  $\deg(\text{Todd}_d(\mathcal{T}_{X/k}) \cap [X])$  (9.1.6.24).  $\lrcorner$

**Prop. (9.1.7.9).** If  $X$  is a smooth scheme over a field  $k$  and  $i : Y \rightarrow X$  is a regular closed immersion and  $Y$  is equidimensional of dimension  $e$ , then

$$[Y]_e \cdot \alpha = i_*(i^!(\alpha)).$$

$\lrcorner$

*Proof:* Cf. [Sta]0FFE?.

$\square$

### Serre's Approach

**Prop. (9.1.7.10).** If  $X$  is a integral scheme smooth over a field  $k$ , and  $W, V$  be two integral closed subschemes of  $X$ , then  $\text{codim}(W \cap V) \leq \text{codim}(W) + \text{codim}(V)$ .  $\lrcorner$

*Proof:* Cf. [Sta]0AZP.

$\square$

**Def. (9.1.7.11) [Proper Intersections].** Let  $X$  be a integral scheme smooth over a field  $k$ , then two cycles  $\alpha = \sum n_i [W_i]$  and  $\beta = \sum m_j [V_j]$  are said to intersect properly iff

$$\text{codim}(W_i \cap V_j) \geq \text{codim}(W_i) + \text{codim}(V_j).$$

And in fact equality holds, by (9.1.7.10).  $\lrcorner$

**Lemma (9.1.7.12) [Tor Sheaves].** Let  $X$  be a integral scheme smooth over a field  $k$  and  $\mathcal{F}, \mathcal{G} \in \text{Coh}(X)$ , then  $\text{Tor}_p^{\mathcal{O}_X}(\mathcal{F}, \mathcal{G}) \in \text{Coh}(X)$ , with stalk at  $x \in X$  being  $\text{Tor}_p^{\mathcal{O}_{X,x}}(\mathcal{F}_x, \mathcal{G}_x)$ , and is supported on  $\text{Supp}(\mathcal{F}) \cap \text{Supp}(\mathcal{G})$ , and nonzero only for  $0 \leq p \leq \dim X$ .  $\lrcorner$

*Proof:* Cf. [Sta]0AZT.

$\square$

**Def. (9.1.7.13) [Intersection via Tor].** Let  $X$  be a regular scheme and  $W, V \subset X$  be integral closed subschemes intersecting properly, by (9.1.7.12) we can define the **intersection product**

$$W \cdot V = \sum_i [\text{Tor}_i^{\mathcal{O}_X}(\mathcal{O}_W, \mathcal{O}_V)]_{r+s-\dim X},$$

and for any irreducible component  $Z$  of  $W \cap V$  the **intersection multiplicities**

$$e(X, W \cdot V, Z) = \sum_i (-1)^i \text{length}_{\mathcal{O}_{X,Z}} \text{Tor}_i^{\mathcal{O}_{X,Z}}(\mathcal{O}_{W,Z}, \mathcal{O}_{V,Z}).$$

$\lrcorner$

*Proof:* Why is this compatible with the definition given before? Why the multiplicity is given by this form?  $\square$

**Remark (9.1.7.14) [Serre Conjecture].** Serre conjectured that in (9.1.7.13), even if  $W, V$  doesn't intersect properly, for an irreducible component  $Z \subset W \cap V$  of dimension  $\geq \dim W + \dim V - \dim X$ , we have  $e(X, W \cdot V, P) = 0$ .  $\lrcorner$

**Prop. (9.1.7.15) [Discrete Case].** Let  $X$  be a integral scheme smooth over  $k$  and  $W, V \subset X$  be closed subvarieties that intersect properly. Let  $Z$  be an irreducible component of  $V \cap W$  with generic point  $\xi$  and  $\mathcal{O}_{W,\xi}, \mathcal{O}_{V,\xi}$  are both C.M., then

$$e(X, W \cdot V, Z) = \text{length}_{\mathcal{O}_{X,\xi}}(\mathcal{O}_{V \cap W, \xi}).$$

 $\lrcorner$ 

*Proof:* Cf. [Sta]0B02?.

□

**Prop. (9.1.7.16) [Exterior Product of Subvarieties].** Let  $X, Y$  be integral schemes smooth over  $k$  and  $W \subset X, V \subset Y$  be subvarieties, then  $[W] \times [V] = ([W] \times [Y]) \cdot ([X] \times [V]) \in Z_*(X \times Y)$ .  $\lrcorner$

*Proof:* As  $W \times V$  is a variety with generic point  $\xi$ , and  $X$  is smooth over  $k$ ,  $X \times V$  is smooth over  $V$ , thus  $\mathcal{O}_{X \times V, \xi}$  is regular, hence C.M., and similarly is  $\mathcal{O}_{W \times Y, \xi}$ , thus (9.1.7.15) applies to show that  $([W] \times [Y]) \cdot ([X] \times [V]) = [W] \times [V]$ .  $\square$

**Prop. (9.1.7.17) [Serre].** If  $X$  is a integral scheme smooth over a field  $k$ ,  $\mathcal{F} \in \text{Coh}_{\leq r}(X), \mathcal{G} \in \text{Coh}_{\leq s}(X)$ , and  $\dim(\text{Supp}(\mathcal{F}) \cap \text{Supp}(\mathcal{G})) \leq r + s - \dim X$ . Then  $[\mathcal{F}]_r$  and  $[\mathcal{G}]_s$  intersect properly, and

$$[\mathcal{F}]_r \cdot [\mathcal{G}]_s = \sum_p (-1)^p [\text{Tor}_p^{\mathcal{O}_X}(\mathcal{F}, \mathcal{G})]_{r+s-\dim X}$$

 $\lrcorner$ 

*Proof:* Cf. [Sta]0B0W.

□

**Cor. (9.1.7.18).** If  $X$  is a smooth integral scheme over a field  $k$ , the intersection product on  $\text{CH}^*(X)$  makes it a commutative graded (associative, unital) ring.  $\lrcorner$

*Proof:* To show the intersection is associative, let  $U, V, W$  be closed subvarieties of  $X$  s.t.  $\text{codim}(U \cap V \cap W, X) = \text{codim}(U, X) + \text{codim}(V, X) + \text{codim}(W, X) = p$ , then it suffices to show that

$$\sum_i (-1)^{i+j} [\text{Tor}_j(\mathcal{O}_U, \text{Tor}_i(\mathcal{O}_V, \mathcal{O}_W))]_{\dim X - p} = \sum_i (-1)^{i+j} [\text{Tor}_j(\text{Tor}_i(\mathcal{O}_U, \mathcal{O}_V), \mathcal{O}_W)]_{\dim X - p}.$$

This is true because they are both equal to

$$\sum_k (-1)^k [H^k(\mathcal{O}_U \otimes^{\mathbb{L}} \mathcal{O}_V \otimes^{\mathbb{L}} \mathcal{O}_W)]_{\dim X - p}$$

which is because there is an spectral sequence convergence

$$E_2^{p,q} = \text{Tor}_{-p}(\mathcal{O}_U, \text{Tor}_{-q}(\mathcal{O}_V, \mathcal{O}_W)) \Rightarrow H^{p+q}(\mathcal{O}_U \otimes^{\mathbb{L}} \mathcal{O}_V \otimes^{\mathbb{L}} \mathcal{O}_W)$$

and use the fact length functions are additive.  $\square$

## 9 Riemann-Roch

Main references are [Ful98] Chap15, 18.

**Prop. (9.1.9.1)**[Grothendieck-Riemann-Roch]. Let  $f : X \rightarrow Y \in \mathbf{Sch}^{\text{loc.ft}}/S$  be proper smooth, and  $\mathcal{E} \in \mathbf{Coh}^{\text{free}}(X)$ ,  $\mathcal{T}_{X/Y} \in \mathbf{Coh}^{\text{free}}(X)$  is the relative tangent bundle, then

$$f_*(\text{Todd}(\mathcal{T}_{X/Y}) \text{ch}(\mathcal{E})) = \sum_i (-1)^i \text{ch}(R^i f_* \mathcal{E}).$$

┘

**Remark (9.1.9.2).** This theorem also has an Arithmetic version. ┘

*Proof:* □

**Cor. (9.1.9.3)**[Hirzebruch-Riemann-Roch]. If  $k \in \mathbf{Field}$  and  $X \in \mathbf{SmPrpr}/k$ ,  $\mathcal{E} \in \mathbf{Coh}^{\text{free}}(X)$ , then

$$\chi(X, \mathcal{E}) = \int_X \text{Todd}(\mathcal{T}_{X/k}) \text{ch}(\mathcal{E}).$$

In particular,

$$\chi(X, \mathcal{O}_X) = \int_X \text{Todd}(\mathcal{T}_{X/k}).$$

┘

## Singular Case

### 10 Numerical Equivalences

**Def. (9.1.10.1)[Numerical Equivalences].** Two cycles  $\gamma, \gamma' \in \text{CH}^k(X)$  are called **numerically equivalent** if for any  $\delta \in Z_k(X)$ ,  $\gamma \cdot \delta = \gamma' \cdot \delta$ . And we can define  $\text{CH}_{\text{num}}^k(X)$  the **Grothendieck group of codimension- $k$ -cycles** to be  $Z^k(X)$  modulo the numerical equivalence relation.  $\lrcorner$

**Prop. (9.1.10.2)[Grothendieck Rings].** There is a group homomorphism  $\text{CH}^*(X) \rightarrow \text{CH}_{\text{num}}^*(X)$  and the ring structure on  $\text{CH}^*(X)$  descends to  $\text{CH}_{\text{num}}^*(X)$ , making it a ring, called the **Grothendieck ring of  $X$** .  $\lrcorner$

**Prop. (9.1.10.3).** Each  $\text{CH}_{\text{num}}^k(X)$  is a finite free Abelian group.  $\lrcorner$

*Proof:* Use the Poincaré pairing on the étale cohomology, and the fact  $\gamma_X(\text{CH}^{2r-2k}(X)) \subset H_{\text{ét}}^{2r-2k}(X, \overline{\mathbb{Q}}_\ell)$  is a finite  $\overline{\mathbb{Q}}_\ell$ -vector space.  $\square$

### 11 Intersection for Line Bundles

References are [FGA, Appendix B].

## Algebraic Equivalence

**Def. (9.1.11.1)[Algebraically Equivalent Line Bundles].** Let  $X$  be a scheme over a field  $k$ , then  $\mathcal{L}_1, \mathcal{L}_2 \in \text{Pic}(X)$  are called **algebraically equivalent** if they are equivalent in the equivalence relation  $\mathcal{M} \sim \mathcal{N}$  iff there is a connected scheme  $T$  and a line bundle  $\mathcal{L} \in \underline{\text{Pic}}_{X/k}(T)$  s.t.  $\mathcal{N}_{k(t_1)} = \mathcal{L}_{t_1}$  and  $\mathcal{M}_{k(t_2)} = \mathcal{L}_{t_2}$  where  $t_1, t_2 \in T$ .  $\lrcorner$

**Cor. (9.1.11.2)[ $\text{Pic}^0(X)$ ].** The elements in  $\text{Pic}(X)$  algebraically equivalent to 0 is a subgroup of  $\text{Pic}(X)$ , denoted by  $\underline{\text{Pic}}^0(X)$ . In (9.1.11.4), we will see when  $X$  has a rational point and  $\underline{\text{Pic}}_{X/k}$  is representable, this is just  $\underline{\text{Pic}}_{X/k}^0(k)$ , by (10.9.3.8).  $\lrcorner$

**Prop. (9.1.11.3)[Algebraically Equivalent Divisors].** If  $X$  be a regular  $K$ -prevariety, then  $\text{Pic}(X) \cong \text{CH}^1(X)$  (7.5.3.15). We call two divisors  $D_1, D_2$  on  $X$  **algebraically equivalent** if  $\mathcal{O}(D_1)$  and  $\mathcal{O}(D_2)$  are algebraically equivalent.  $\lrcorner$

*Proof:* Cf.[Diophantine Geometry, P563].  $\square$

**Prop. (9.1.11.4)[Moduli Characterization].** If  $X$  is a scheme over a field  $k$  s.t.  $\underline{\text{Pic}}_{X/k}$  is representable, then two line bundles are algebraically equivalent iff they corresponds to points of  $\underline{\text{Pic}}_{X/k}$  in the same connected component.  $\lrcorner$

*Proof:* By (10.9.3.21),  $\underline{\text{Pic}}_{X/k}$  is a locally algebraic group scheme over  $k$ , so by (10.1.4.15), every connected components of it is irreducible. Clearly two algebraically equivalent line bundles are in the same connected component of  $\underline{\text{Pic}}_{X/k}$ . Conversely, the inclusion of their common connected component  $P$  corresponds to a line bundle on some fppf covering  $T \rightarrow P$ . Then use the fact fppf covering is open map, and the fact  $P$  is irreducible to get an algebraic equivalence chain.  $\square$

**Prop. (9.1.11.5)[Algebraic Equivalence for Curves].** If  $C$  is a smooth complete curve over a field  $k$ , then two line bundles  $\mathcal{L}_1, \mathcal{L}_2 \in \text{Pic}(C)$  are algebraically equivalent iff they have the same degree.  $\lrcorner$

*Proof:* It suffices to show after base change to  $\bar{k}$ . Then it suffices to show for any two closed points  $x_1, x_2 \in C$ ,  $\mathcal{L}(x_1) \sim \mathcal{L}(x_2)$ . Consider the diagonal of  $C \times C$  is a Cartier divisor, and its restriction to  $C \times \{x_i\}$  is  $\mathcal{L}(x_i)$ .  $\square$

### Numerical Intersections

**Def. (9.1.11.6).** Let  $X$  be a proper scheme and  $\mathcal{F}$  be a coherent sheaf with  $\dim \text{Supp } \mathcal{F} \leq n$ , and  $\mathcal{L}_1, \dots, \mathcal{L}_n$  are invertible sheaves on  $X$ , then we define  $(\mathcal{L}_1 \cdot \dots \cdot \mathcal{L}_n; \mathcal{F})$  to be

$$\sum_{\{i_1, \dots, i_m\} \subset \{1, \dots, n\}} (-1)^m \chi(X, \mathcal{L}_{i_1}^\vee \otimes \dots \otimes \mathcal{L}_{i_m}^\vee \otimes \mathcal{F}).$$

When  $\mathcal{F}$  is the structure sheaf of a closed subscheme  $Y$ , then denote  $(\mathcal{L}_1 \cdot \dots \cdot \mathcal{L}_n; \mathcal{F})$  by  $(\mathcal{L}_1 \cdot \dots \cdot \mathcal{L}_n; \mathcal{Y})$ . This intersection is stable under base change of fields.  $\lrcorner$

**Prop. (9.1.11.7).** If  $X$  is a complete curve and  $\mathcal{L}$  an invertible sheaf on  $X$ , then  $(\mathcal{L}; X) = \deg(\mathcal{L})$ .  $\lrcorner$

*Proof:*  $\square$

**Prop. (9.1.11.8).** If  $k$  is an infinite field and  $X = \mathbb{P}_k^n$ , and  $Y$  is a dimension  $n$  subvariety of  $X$ . If  $H_1, \dots, H_n$  are generic chosen hypersurfaces of degree  $d_1, \dots, d_n$  resp., then

$$(\mathcal{O}_X(H_1) \cdot \dots \cdot \mathcal{O}_X(H_n); Y) = d_1 \dots d_n \deg(Y).$$

$\lrcorner$

*Proof:*  $\square$

**Prop. (9.1.11.9).** If  $D$  is an effective Cartier divisor on  $X$  that doesn't contain any associated point of  $\mathcal{F}$ , then

$$(\mathcal{L}_1 \cdot \dots \cdot \mathcal{L}_n \cdot \mathcal{O}(D); \mathcal{F}) = (\mathcal{L}_1|_Y \cdot \dots \cdot \mathcal{L}_n|_Y; \mathcal{F}|_D)$$

$\lrcorner$

*Proof:*  $\square$

**Prop. (9.1.11.10).** For a fixed  $\mathcal{F}$ ,  $(\mathcal{L}_1 \cdot \dots \cdot \mathcal{L}_n; \mathcal{F})$  is a symmetric multilinear function of  $\mathcal{L}_1, \dots, \mathcal{L}_n$ , where the addition is tensor production. Moreover, if  $\mathcal{F}$  is a coherent sheaf with support dimension  $n$ , then  $(\mathcal{L}_1 \cdot \dots \cdot \mathcal{L}_{n+1}; \mathcal{F}) = 0$ .  $\lrcorner$

*Proof:* Cf. [Rising Sea, P544].  $\square$

**Prop. (9.1.11.11).** The numerical intersection  $(\mathcal{L}_1 \cdot \dots \cdot \mathcal{L}_n; \mathcal{F})$  only depends on the numerical classes of  $\mathcal{L}_i$ .  $\lrcorner$

**Prop. (9.1.11.12) [Projection Formula].** Let  $\pi : X_1 \rightarrow X_2$  be a proper morphism of proper schemes, then

$$(\pi^* \mathcal{L}_1 \cdot \dots \cdot \pi^* \mathcal{L}_n; \mathcal{F}) = (\mathcal{L}_1 \cdot \dots \cdot \mathcal{L}_n; \pi_* \mathcal{F}).$$

In particular, when  $X_1, X_2$  are integral with the same dimensions and  $\pi$  is a finite map,

$$(\pi^* \mathcal{L}_1 \cdot \dots \cdot \pi^* \mathcal{L}_n) = \deg(\pi) (\mathcal{L}_1 \cdot \dots \cdot \mathcal{L}_n).$$

$\lrcorner$

*Proof:*

For the last assertion, notice  $\pi_* \mathcal{O}_{X_1} = \deg(\pi) \mathcal{O}_{X_2} +$  coherent sheaves with smaller support dimensions.  $\square$

**Prop. (9.1.11.13).** Let  $k$  be a field and  $X$  a proper scheme over  $k$ , and  $Z \subset X$  a closed subscheme of dimension  $d$ . If  $\mathcal{L}_1, \dots, \mathcal{L}_d$  are ample invertible sheaves on  $X$ , then  $(\mathcal{L}_1 \cdot \dots \cdot \mathcal{L}_d; Z)$  is positive.  $\lrcorner$

*Proof:*  $\square$

**Prop. (9.1.11.14).** Let  $X$  be a complex projective scheme, then  $(\mathcal{L}_1 \cdot \dots \cdot \mathcal{L}_n; Z)$  equals

$$(c_1((\mathcal{L}_1)_{an}) \cup \dots \cup c_1((\mathcal{L}_n)_{an}), Z)$$

where  $c_1$  is the complex Chern class.  $\lrcorner$

*Proof:* Cf. [Rising Sea, P547].  $\square$

**Def. (9.1.11.15) [First Chern Class].** Let  $X$  be a proper scheme and  $K$  be the Grothendieck group of  $\text{Coh}(X)$ . For  $\mathcal{L} \in \text{Pic}(X)$ , define  $c_1(\mathcal{L})$  to be the endomorphism of  $K$  defined by

$$c_1(\mathcal{L})\mathcal{F} = \mathcal{F} - \mathcal{L}^{-1} \otimes \mathcal{F}.$$

**Prop. (9.1.11.16).** If  $\mathcal{L}, \mathcal{M} \in \text{Pic}(X)$ , then

- $c_1(\mathcal{L})c_1(\mathcal{M}) = c_1(\mathcal{L}) + c_1(\mathcal{M}) - c_1(\mathcal{L} \otimes \mathcal{M})$ .
- $c_1(\mathcal{O}_X) = 0$ .
- $c_1(\mathcal{L})c_1(\mathcal{L}^{-1}) = c_1(\mathcal{L}) + c_1(\mathcal{L}^{-1})$ .

In particular,  $c_1(\mathcal{L})$  and  $c_2(\mathcal{M})$  commutes.  $\lrcorner$

**Prop. (9.1.11.17).** If  $X$  is a proper scheme over a field  $k$  and let  $K^d$  be the subgroup generated by coherent sheaves over  $X$  with support dimension  $\leq d$ , then if  $\mathcal{F} \in K^d$ , then  $c_1(\mathcal{L})\mathcal{F} \in K^{d-1}$ .  $\lrcorner$

*Proof:*  $\square$

**Prop. (9.1.11.18).** If  $Y \subset X$  is a closed subscheme, and  $\mathcal{L} \in \text{Pic}(X)$  satisfy  $\mathcal{L}_Y$  is an effective Cartier divisor  $D$ , then  $c_1(\mathcal{L})[Y] = [D]$ .  $\lrcorner$

*Proof:* There is an exact sequence  $0 \rightarrow \mathcal{O}_Y(-D) \rightarrow \mathcal{O}_Y \rightarrow \mathcal{O}_D$ , and  $\mathcal{O}_Y(-D) \cong \mathcal{L}^{-1} \otimes \mathcal{O}_Y$ .  $\square$

### $\tau$ -Equivalences

**Def. (9.1.11.19) [ $\tau$ -Equivalence].** Let  $X \in \text{Sch}/k$ , then two line bundles  $\mathcal{L}_1, \mathcal{L}_2$  are called  **$\tau$ -equivalent** if there are some  $m \in \mathbb{Z}_+$  s.t.  $\mathcal{L}_1^{\otimes m} \sim \mathcal{L}_2^{\otimes m}$ .  $\lrcorner$

**Prop. (9.1.11.20) [Moduli Characterization].** Let  $X \in \text{Sch}/k$  and  $\underline{\text{Pic}}_{X/k}$  is representable, then  $\mathcal{L} \in \text{Pic}(X)$  is  $\tau$ -equivalent to  $\mathcal{O}_X$  iff its corresponding point  $\lambda \in \underline{\text{Pic}}_{X/k}$  is in  $\underline{\text{Pic}}_{X/k}^\tau$ .  $\lrcorner$

*Proof:* Clear from the definition of  $\underline{\text{Pic}}_{X/k}^\tau$ .  $\square$

**Def. (9.1.11.21) [Numerically Equivalence].** Two line bundles  $L_1, L_2$  on a complete prevariety over a field  $K$  is called **numerically equivalent** if  $c_1(L_1) \cdot \alpha = c_1(L_2) \cdot \alpha$  for any complete precurve  $C \subset X$ . Two divisors on  $X$  is called **numerically equivalent** if their corresponding line bundle do.

Numerically trivial line bundles form a group, and are stable under proper pullbacks, by (7.13.2.7)(7.13.2.5).

**?** How is this definition equivalent to that of (9.1.10.1)?  $\lrcorner$

**Prop. (9.1.11.22)[Algebraic and Numerical Equivalences].** Let  $\mathcal{L}_1, \mathcal{L}_2$  be algebraically equivalent line bundles on a proper scheme  $X/k$ , then  $\deg_{\mathcal{L}_1}(X) = \deg_{\mathcal{L}_2}(X)$ . In particular, algebraically equivalent divisors are numerically equivalent.  $\lrcorner$

*Proof:* This is because in this case  $\mathcal{L}_1, \mathcal{L}_2$  are in the same connected component of  $\text{Pic}_{X/k}$ .  $\square$

**Cor. (9.1.11.23).** Let  $X$  be a complete prevariety over  $K$  and  $L_i$  be line bundles and  $Z \in Z_r(X)$ , then  $\deg(c_1(L_1).c_1(L_2).\dots.c_r(L_r).Z)$  only depends on algebraic equivalence classes of  $L_i$ .  $\lrcorner$

*Proof:* Cf.[Diophantine Geometry, P562].  $\square$

**Def. (9.1.11.24)[Bounded Set of Line Bundles].** Let  $X$  be a scheme over  $S$ , then a set  $\Lambda \subset \text{Pic}(X_k)$  where  $\text{Spec } k \rightarrow S$  are points are called **bounded** if there is a  $T \in \text{Sch}^{\text{ft}}/S$  and a line bundle  $\mathcal{M}$  on  $X_T$  s.t. for any  $\mathcal{L} \in \Lambda$ , there is some schematic point  $\text{Spec } k \rightarrow T$  s.t.  $\mathcal{L} \cong \mathcal{M}_k$ .  $\lrcorner$

**Prop. (9.1.11.25) [Numerical and  $\tau$ -Equivalence].** If  $X$  is proper over an alg.closed field  $k$  and  $\mathcal{L} \in \text{Pic}(X)$ , then the following are equivalent:

- $\mathcal{L}$  is  $\tau$ -equivalent to  $\mathcal{O}_X$ .
- $\mathcal{L}$  is numerically equivalent to  $\mathcal{O}_X$ .
- The family  $\{\mathcal{L}^{\oplus p} | p \in \mathbb{Z}\}$  is bounded.
- For any  $\mathcal{F} \in \text{Coh}(X)$ ,  $\chi(\mathcal{F} \otimes \mathcal{L}) = \chi(\mathcal{F})$ .
- For any  $p \in \mathbb{Z}$ ,  $\mathcal{L}^{\oplus p}(1)$  is ample.
- 

$\lrcorner$

*Proof:* Cf.[Kle05]P52, 57. is this true for  $k$  separably closed?  $\square$

**Prop. (9.1.11.26).** If  $X$  is projective over an alg.closed field  $k$ , then the set of line bundles numerically equivalent to  $\mathcal{O}_X$  is bounded.  $\lrcorner$

*Proof:* See the proof of [Kle05]P52.  $\square$

**Prop. (9.1.11.27).** If  $X$  is projective over an alg.closed field  $k$ , then there exists an  $m \in \mathbb{Z}$  s.t. for any  $\mathcal{L} \in \text{Pic}(X)$  numerically equivalent to  $\mathcal{O}_X$ ,  $\mathcal{L}$  is  $m$ -regular and  $\chi(\mathcal{L}(n)) = \chi(\mathcal{O}_X(n))$  for any  $n \in \mathbb{Z}$ .  $\lrcorner$

*Proof:* Cf.[Kle05]P55.  $\square$

### Nef Line Bundles

**Def. (9.1.11.28)[Nef Line Bundles].** A **nef line bundle** or **numerically effective line bundle** on a complete prevariety over a field  $k$  is a line bundle  $\mathcal{L}$  s.t.  $c_1(\mathcal{L}).C \geq 0$  for any complete precurve  $C \subset X$ .

Nef line bundles form a semigroup, and are stable under proper pullbacks, by (7.13.2.7)(7.13.2.5).  $\lrcorner$

**Prop. (9.1.11.29).** Ample line bundles are nef, by (7.13.2.20).  $\lrcorner$

Surface Case

**Def. (9.1.11.30) [(-1)-Curves].** Let  $X$  be a complete curve over a field  $k$ , then a **(-1)-curve** on  $X$  is a curve  $C$  consisting of smooth points,  $C \cong \mathbb{P}_k^1$  and  $C \cdot C = -1$ . ┘

**Prop. (9.1.11.31) [Hodge Index Theorem].** Let  $X$  is a smooth surface over a field  $k$  and  $\mathcal{L}, \mathcal{H} \in \text{Pic}(X)$  with  $\mathcal{H} \cdot \mathcal{H} > 0$  and  $\mathcal{L} \cdot \mathcal{H} = 0$ , then  $\mathcal{L} \cdot \mathcal{L} = 0$ , and the equality holds iff  $\mathcal{L}$  is numerically trivial. ┘

*Proof:* Cf. [Rising Sea, P552]. □

**Prop. (9.1.11.32) [ $\mathbb{P}^1 \times \mathbb{P}^1$ ].** Let  $X = \mathbb{P}^1 \times \mathbb{P}^1$ ,  $l = \mathbb{P}^1 \times \{0\}$  and  $m = \{0\} \times \mathbb{P}^1$ , then  $l \cdot l = m \cdot m = 0$ , and  $l \cdot m = 1$ . ┘

## 9.2 Algebraic deRham Cohomology

References are [algebraic de Rham Cohomology, Clausen] and [Gro66a, Gro15, Sta].

**Notation (9.2.0.1).**

- Use notations from [Spectral Algebraic Geometry \(Lurie\)](#).

┘

### 1 deRham Complexes

**Def. (9.2.1.1) [Absolute deRham Complex].** For  $B \in \mathcal{CRing}$ , let  $\Omega_B = \Omega_{B/\mathbb{Z}}$ , and  $\Omega_B^i = \wedge^i \Omega_B$ , then there is a **total de Rham complex** of  $B$ :

$$B \rightarrow \Omega_B^1 \rightarrow \Omega_B^2 \rightarrow \dots$$

as  $B$ -modules, which is a complex, where  $d(b_0 db_1 \wedge \dots \wedge db_p) = db_0 \wedge db_1 \wedge \dots \wedge db_p$ .

┘

*Proof:*  $d$  is well-defined on  $\Omega_B^1$  because it vanishes on the element  $d(a+b) - da - db$  and  $d(ab) - ad(b) - bd(a)$  by Leibniz rule, and then we get a map

$$\bigotimes_1^p \Omega_B \rightarrow \Omega_B^{p+1} : \omega_1 \otimes \dots \otimes \omega_p \mapsto \sum (-1)^{i+1} \omega_1 \wedge \dots \wedge d(\omega_i) \wedge \dots \wedge \omega_p.$$

We want to descend this to a map on  $\Omega_B^p$  using (5.1.1.23): it is clearly alternating, and it suffices to show it is  $f$ -linear, and this is clear by direct calculation.

Finally  $d^2 = 0$ .

□

**Prop. (9.2.1.2) [Quotient of de Rham Complexes].** Let  $B$  be a ring and  $\pi : \Omega_B \rightarrow \Omega$  be a surjective map of  $B$ -modules. Denote  $d : B \rightarrow \Omega_B \rightarrow \Omega$ , and  $\Omega^i = \wedge^i \Omega$ . Assume that the kernel of  $\pi$  is generated as a  $B$ -module by elements  $\omega$  that  $\wedge^2(\pi)(d_B(\omega)) = 0$  in  $\Omega^2$ , then there is a de Rham complex

$$B \rightarrow \Omega^1 \rightarrow \Omega^2 \rightarrow \dots$$

whose differential is defined by the rules similar to that of (9.2.1.1).

┘

*Proof:* Because  $\pi$  is surjective, so do  $\wedge^i \pi$ , and it suffices to show  $\wedge \pi$  gives a connecting morphism between  $\Omega_B^\bullet$  and  $\Omega^\bullet$ , then the well-definedness of  $d$  is automatic. Cf. [[Sta]07HY].

□

**Cor. (9.2.1.3) [Relative de Rham Complex].** If  $B$  is an  $A$ -algebra, the surjection  $\Omega_B \rightarrow \Omega_{B/A}$  satisfies the condition of (9.2.1.2) thus we can define the **relative deRham complex**  $\Omega_{B/A}^\bullet$ .

┘

*Proof:* The verification of the condition is routine.

□

**Prop. (9.2.1.4) [Universality of deRham Complexes].** Let  $C$  be a  $B$ -algebra and  $(E^\bullet, d)$  a non-negatively graded commutative  $B$ -dga and we are given a  $B$ -algebra map  $\eta : C \rightarrow E^0$  that for every  $x \in C$ , the element  $d(\eta(x)) \in E^1$  satisfies  $d^2 = 0$ , then the map  $C \rightarrow E^0$  extends uniquely to a map  $\Omega_{C/B}^\bullet \rightarrow E^\bullet$  of  $B$ -dga.

┘

*Proof:* One direction is trivial as  $\Omega_{C/B}^\bullet$  is strict by construction. Conversely, the composite map  $C \rightarrow E^0 \rightarrow E^1$  is a  $B$ -derivation thus extends to a map  $\eta^1 : \Omega_{C/B}^1 \rightarrow E^1$ , then the universal property of the exterior product (5.1.1.23) gives maps  $\eta^i : \Omega_{C/B}^i \rightarrow E^i$ , and this gives the desired extension. □

**Def. (9.2.1.5) [Connection].** Let  $B$  be a ring and  $\Omega_B \rightarrow \Omega$  be a quotient satisfying the condition of (9.2.1.2), then a **connection** on  $M$  is an additive map

$$\nabla : M \mapsto M \otimes_B \Omega : \quad \nabla(b \otimes m) = b\nabla(m) + m \otimes db$$

Given a connection on  $M$ , we can define maps

$$\nabla : M \otimes_B \Omega^i \rightarrow M \otimes_B \Omega^{i+1}, \quad \nabla(b \otimes \omega) = \nabla(b) \wedge \omega + m \wedge d\omega$$

This is well defined because it commutes it commutes with  $B$ -action. The connection is called **integrable** if  $\nabla^2 = 0$ .  $\lrcorner$

**Def. (9.2.1.6) [deRham Complexes for Schemes].**  $\lrcorner$

### Cohomologies

**Def. (9.2.1.7) [Algebraic de Rham Cohomology].** Let  $X \rightarrow S$  be a morphism of rings, then we define the **algebraic de Rham cohomology**  $H_{\text{dR}}^\bullet(X/S)$  of  $X$  over  $S$  as the image of the de Rham complex  $\Omega_{X/S}^\bullet$  in  $D(\text{Mod}(\mathcal{O}_X))$ .

Notice that if  $X$  is affine, then by (7.5.5.1) and (7.7.1.3),  $H_{\text{dR}}^n(\Omega_X^\bullet) = H^n(\Gamma(X, \Omega_{X/S}^\bullet))$ .  $\lrcorner$

**Prop. (9.2.1.8).** There is a similar construction of connections on a f.g. projective  $R$ -module  $M$  and Weil-Chern theory parallel to that of 5 and 4.

But in this case, the trace map is defined only when  $M$  is f.g. projective, which is called the **Hattoris-Stallings trace**: If  $A$  is f.g. projective, the natural map  $\text{Hom}_R(A, R) \otimes_R A \rightarrow \text{End}_A(P)$  is an isomorphism (Because locally it is an isomorphism??), and the inverse composed with  $\text{Hom}_R(A, R) \otimes_R A \rightarrow A$ , we get the desired map.

Also, when  $M$  is f.g. projective, there is a **Levi-Cevita connection** induced by the  $A \rightarrow \Omega_{A/R}^1$  because  $M$  is a direct summand of some  $A^n$ . This is verified to be independent of  $n$ , or one can more algeoly use the fact that projective module is locally free.

The Chern character is important, it defines a ring map from  $K_0(R)$  to  $H_{\text{dR}}^{ev}(A)$ . In fact, this can be lifted to a morphism  $K_0(A) \rightarrow HC_0^{\text{perf}}(A) \rightarrow H_{\text{dR}}^{ev}(A)$ , Cf.[阳恩林 循环同调 Dennis trace].  $\lrcorner$

**Def. (9.2.1.9) [Cup Products].**  $\lrcorner$

**Prop. (9.2.1.10) [Grothendieck].** For  $X \in \text{Sch}^{\text{sm}}/\mathbb{C}$ , there is a functorial equivalence

$$R\Gamma(X; \Omega_{X/\mathbb{C}}^\bullet) \cong R\Gamma(X^{\text{an}}; \Omega_{X^{\text{an}}/\mathbb{C}}^{\text{an}, \bullet}).$$

*Proof:*  $\square$

**Remark (9.2.1.11).** Notice if  $X$  is smooth and proper, then this follows from GAGA.  $\lrcorner$

**Def. (9.2.1.12) [Hodge Cohomologies].** For a morphism  $X \rightarrow S \in \text{Sch}$ , define the **Hodge cohomology** to be the graded  $\Gamma(X, \mathcal{O}_X)$ -algebra

$$H_{\text{Hdg}}^*(X/S) = \bigoplus_{n \geq 0} H_{\text{Hdg}}^n(X/S) = \bigoplus_{n \geq 0} \bigoplus_{p+q=n} H^p(X, \Omega_{X/S}^q) \quad (9.2.1.6)$$

with the  $\Gamma(X, \mathcal{O}_X)$ -linear cup product

$$\cup : H^p(X, \Omega_{X/S}^q) \otimes H^{p'}(X, \Omega_{X/S}^{q'}) \rightarrow H^{p+p'}(X, \Omega_{X/S}^{q+q'})$$

given by [Sta]068G<sup>?</sup>. It is associative and graded commutative.  $\lrcorner$

**Cor. (9.2.1.13).** For each map of morphisms  $f : (X' \rightarrow S') \rightarrow (X \rightarrow S)$ , there are pullback maps

$$f^* : H_{\text{Hdg}}^*(X/S) \rightarrow H_{\text{Hdg}}^*(X'/S')$$

compatible with gradings and cup products and the homomorphism  $\Gamma(X, \mathcal{O}_X) \rightarrow \Gamma(X', \mathcal{O}_{X'})$ , which is induced by  $f^* : f^{-1}\Omega_{X/S} \rightarrow \Omega_{X'/S'}$ .  $\lrcorner$

*Proof:* ?  $\square$

**Prop. (9.2.1.14) [Hodge-to-deRham Spectral Sequence and Conjugate Spectral Sequences].** For  $X \rightarrow S \in \text{Sch}$ , using the Cartan-Eilenberg resolution of  $\Omega_{X/S}^\bullet$ , we get a **Hodge-to-deRham spectral sequence** (Cf. [Sta]015J ?)

$$E_1^{p,q} = H^q(X; \Omega_{X/S}^q) \implies H_{\text{dR}}^n(X/S).$$

(with arrows direction from  $p$  to  $q$ ), and a **conjugate spectral sequence**

$$E_2^{p,q} = H^p(X, \mathcal{H}^q(\Omega_{X/S}^\bullet)) \implies H_{\text{dR}}^n(X/S),$$

(with arrows direction from  $p$  to  $q$ ).  $\lrcorner$

**Cor. (9.2.1.15).** Situation as in (9.2.1.14), the Hodge-to deRham spectral sequence gives:

$$H_{\text{dR}}^0(X/S) = \ker(d : H^0(X, \mathcal{O}_X) \rightarrow H^0(X, \Omega_{X/S}^1)),$$

and the conjugate spectral sequence gives  $H_{\text{dR}}^0(X/S) = H^0(X, \mathcal{H}^0(\Omega_{X/S}^\bullet))$  and a long exact sequence

$$0 \rightarrow H^1(X, \mathcal{H}^0(\Omega_{X/S}^\bullet)) \rightarrow H_{\text{dR}}^1(X/S) \rightarrow H^0(X, \mathcal{H}^1(\Omega_{X/S}^\bullet)) \rightarrow H^2(X, \mathcal{H}^0(\Omega_{X/S}^\bullet)) \rightarrow H_{\text{dR}}^2(X/S).$$

$\lrcorner$

**Def. (9.2.1.16) [Hodge-Filtration].** For  $X \rightarrow S \in \text{Sch}$ , the Hodge-to-deRham spectral sequence (9.2.1.14) induces a **Hodge-filtration** on each  $H_{\text{dR}}^*(X/S)$ , i.e.

$$\text{Fil}^p H_{\text{dR}}^n(X/S) = \text{Im} \left( H^n(X, \sigma_{\geq p} \Omega_{X/S}^\bullet) \rightarrow H_{\text{dR}}^n(X/S) \right).$$

which satisfies

$$\text{Fil}^i H_{\text{dR}}^n(X/S) \cup \text{Fil}^j H_{\text{dR}}^m(X/S) \subset \text{Fil}^{i+j} H_{\text{dR}}^{n+m}(X/S)??$$

$\lrcorner$

### Curve case

**Prop. (9.2.1.17).** Let  $X$  be a smooth curve over  $\mathbb{C}$  with a smooth completion  $\overline{X}$ , and denote  $S = \overline{X} \setminus X$ . Then there is an exact sequence of sheaves

$$0 \rightarrow \Omega_{\overline{X}}^\bullet \rightarrow \Omega_{\overline{X}}^\bullet(\log S) \xrightarrow{\text{res}} i_* \Omega_S^{\bullet-1} \rightarrow 0, ?$$

inducing a  $\lrcorner$

**Thm. (9.2.1.18) [Deligne].** Situation as in (9.2.1.17), there is a canonical isomorphism

$$\mathbb{H}^n(\Omega_X^\bullet(\log S)) \cong \mathbb{H}^n(\Omega_Y^\bullet).$$

$\lrcorner$

## 2 Infinitesimal Sites

## 3 Poincaré-Duality

**Def. (9.2.3.1) [Situation].** Let  $S$  be a qcqs scheme and  $f : X \rightarrow S$  is a proper smooth morphism of schemes whose fiber are all equidimensional of dimension  $d$ .  $\lrcorner$

**Prop. (9.2.3.2) [Relative Poincaré duality].** In situation (9.2.3.1) there is a canonical  $\mathcal{O}_S$ -module map

$$t : Rf_*\Omega_{X/S}^d[d] \rightarrow \mathcal{O}_S$$

s.t. for any  $p$ , the pairing

$$Rf_*\Omega_{X/S}^p \otimes_{\mathcal{O}_S}^L Rf_*\Omega_{X/S}^{n-p} \rightarrow \mathcal{O}_S$$

induced from relative cup product and  $t$  is a perfect pairing of perfect complexes in  $D(\mathcal{O}_S)$  that is compatible perfect under base change. And it also induces a perfect  $\mathcal{O}_S$ -bilinear pairing

$$f_*\mathcal{O}_X \otimes R^df_*\Omega_{X/S}^d \rightarrow \mathcal{O}_S$$

compatible with base change.  $\lrcorner$

*Proof:* Cf. [Sta]0G8I.  $\square$

**Cor. (9.2.3.3).** If  $S$  is Noetherian and  $X$  is a proper smooth variety over  $S$ , then there is an isomorphism  $R^df_*\Omega_{X/S}^d \cong \mathcal{O}_S$  that is compatible with base change.  $\lrcorner$

## 9.3 Étale Fundamental Groups

References are [Gro71, K-M85].

### 1 Étale Connected Components

**Def. (9.3.1.1) [Étale Connected Components].** Let  $k \in \mathbf{Field}$  and  $X \in \mathbf{Sch}/k$ , define  $\pi_0(X)$  to be the spectrum of the largest étale subalgebra  $\pi(X)$  of  $\Gamma(X, \mathcal{O}_X)$  (5.4.7.27), called the **étale connected component** of  $X$ .

Then  $\pi_0 : \mathbf{Sch}/k \rightarrow (\mathbf{Spec} k)_{\text{ét}}$  is a functor.  $\lrcorner$

**Prop. (9.3.1.2).** Let  $X$  be a locally algebraic scheme over a field  $k$ , then

- for any field extension  $k'/k$ ,  $\pi_0(X_{k'}) = \pi_0(X)_{k'}$ .
- Let  $Y$  be a schemes over a field  $k$ , then  $\pi_0(X \times Y) = \pi_0(X) \times \pi_0(Y)$  and  $\pi_0(X \amalg Y) = \pi_0(X) \amalg \pi_0(Y)$ .  $\lrcorner$

*Proof:* 1: Cf. [Mil17b] P15.

2: There is a map  $\pi(X) \times_k \pi(Y) \rightarrow \pi(X \times Y)$ . Because  $\pi$  commutes with base change, we can base change to separable closure. In this case, it suffices to show if  $X, Y$  is connected then  $X \times Y$  is connected, but this follows from (7.4.3.12).  $\square$

**Prop. (9.3.1.3).** For  $X \in \mathbf{Sch}^{\text{loc.ft}}/k$ ,

- The mapping  $\text{pr} : X \rightarrow \pi_0(X)$  induces a bijection between  $|\pi_0(X)|_0$  and connected components of  $X$ .
- For all  $x \in |\pi_0(X)|$ , the fiber  $\text{pr}^{-1}(x)$  is geo.connected over  $\kappa(x)$ .
- $X \rightarrow \pi_0(X)$  is faithfully flat.  $\lrcorner$

*Proof:*  $|\pi_0(X)|$  is discrete, so the inverse image of each point  $x \in |\pi(X)|_0$  is a sum of connected components of  $X$ . But  $\pi_0(X_x) = \kappa(x)$ , so  $X_x$  must be connected by (9.3.1.2). Also, this implies that  $\pi_0(X_{\bar{\kappa}(x)}) = \pi_0(X_x) \times_{\kappa(x)} \bar{\kappa}(x) = \bar{\kappa}(x)$ , thus  $X_x$  is geo.connected.  $\square$

### 2 Étale Fundamental Groups

References are [Sta]Chap53.

**Prop. (9.3.2.1) [Connected Finite Étale Schemes].** For  $X \in \mathbf{Sch}_{\text{cntd}}$ ,  $Y \in X_{\text{fét}}$  is a connected object (4.1.1.21) iff  $Y$  is a connected scheme.  $\lrcorner$

*Proof:* Cf. [Sta]0BNB. ?  $\square$

**Prop. (9.3.2.2) [Étale Fundamental Groups].** For  $X \in \mathbf{Sch}_{\text{cntd}}$  and  $\bar{x}$  a geometric point of  $X$ , then the fibre functor

$$F_{\bar{x}} : X_{\text{fét}} \rightarrow \mathbf{finSet} : Y \mapsto |Y_{\bar{x}}|$$

makes  $X_{\text{fét}}$  a Galois-category (4.3.4.4). And we denote

$$\pi_1(X, \bar{x}) \triangleq \text{Aut}(F_{\bar{x}}),$$

called the **étale fundamental group** of  $X$ .  $\lrcorner$

*Proof:* Identifying  $(\bar{x})_{\text{fét}}$  with  $\text{finSet}$  (7.6.6.6), we see that  $F_{\bar{x}}$  is just the base change functor for the morphism  $\bar{x} \rightarrow X$ , thus  $X_{\text{fét}}$  has finite limits and colimits and  $F_{\bar{x}}$  is exact by (7.6.6.15).

$Y \in X_{\text{fét}}$  is a connected object (4.1.1.21) iff  $Y$  is a connected scheme by (9.3.2.1), then we show that each  $Y \in X_{\text{fét}}$  is a finite co-product of connected schemes?.

To show  $F_{\bar{x}}$  reflects isomorphisms, suppose  $Y \rightarrow Z \in X_{\text{fét}}$  s.t.  $F_{\bar{x}}(Y) \rightarrow F_{\bar{x}}(Z)$  is an isomorphism, to show  $Y \rightarrow Z$  is an isomorphism, by the above we may assume that  $Z$  is connected. Because  $\mathcal{O}_Y$  is finite locally free over  $\mathcal{O}_Z$ , it suffices to show that it is locally free of rank 1. But the rank is constant, and when base changed to  $\bar{x}$ , it is of rank 1.  $\square$

**Prop. (9.3.2.3) [Properties of Étale Fundamental Groups].** For  $X \in \text{Sch}_{\text{cntd}}$  with a geometric point  $\bar{x}$ ,

- The fiber functor  $F_{\bar{x}}$  (9.3.2.2) defines an equivalence of categories

$$X_{\text{fét}} \cong \pi_1(X, \bar{x})\text{-finSet} \text{ (9.3.2.2)}.$$

- If  $\bar{x}'$  is another geometric point of  $X$ , then there exists an isomorphism  $t : F_{\bar{x}} \cong F_{\bar{x}'}$  which induces an isomorphism  $\pi_1(X, \bar{x}) \cong \pi_1(X, \bar{x}')$  compatible with the equivalences in item 1. This isomorphism is independent of  $t$  up to inner automorphisms.
- For  $f : X \rightarrow Y \in \text{Sch}_{\text{cntd}}$ , denote  $\bar{y} = f \circ \bar{x}$ , then there is a canonical continuous homomorphism  $f_* : \pi_1(X, \bar{x}) \rightarrow \pi_1(Y, \bar{y})$  s.t. the following commutative diagram holds:

$$\begin{array}{ccc} Y_{\text{fét}} & \xrightarrow{f^*} & X_{\text{fét}} \\ \downarrow F_{\bar{y}} & & \downarrow F_{\bar{x}} \\ \pi_1(X, \bar{x})\text{-finSet} & \xrightarrow{f_*} & \pi_1(Y, \bar{y})\text{-finSet} \end{array}$$

And if  $f$  is a universal homeomorphism, then  $f_* : \pi_1(X, \bar{x}) \rightarrow \pi_1(Y, f(\bar{x}))$  is an isomorphism by (7.1.4.23).  $\square$

*Proof:* 1: This follows from (9.3.2.2) and (4.3.4.9).

2: This follows from (4.3.4.10) and (7.6.6.15).

3: This follows from (4.3.4.10) and (7.6.6.15) applied to the commutative diagram of categories:

$$\begin{array}{ccc} Y_{\text{fét}} & \xrightarrow{f^*} & X_{\text{fét}} \\ \downarrow F_{\bar{y}} & & \downarrow F_{\bar{x}} \\ \text{finSet} & \xlongequal{\quad} & \text{finSet} \end{array}.$$

$\square$

**Cor. (9.3.2.4) [Étale Fundamental Groups of Fields].** For  $k \in \text{Field}$ ,  $X = \text{Spec } k$ , let  $\bar{x} = \text{Spec}(\bar{k}) \rightarrow X$  be a geometric point, then the functor in (7.6.6.6) induces an equivalence of categories

$$X_{\text{fét}} \cong \text{Gal}_k\text{-finSet}.$$

And there is a canonical isomorphism  $\text{Gal}_k \rightarrow \pi_1(X, \bar{x})$  constructed as follows: For each  $Y \in X_{\text{fét}}$ , there is a functorial continuous action

$$\text{Aut}(\bar{k}/k) \times F_{\bar{x}}(Y) \rightarrow F_{\bar{x}}(Y),$$

which induces the desired isomorphism  $\text{Gal}_k \rightarrow \pi_1(X, \bar{x})$ .  $\square$

*Proof:* This follows from (7.6.6.6).  $\square$

**Cor. (9.3.2.5) [Locally Constant Sheaves and Fundamental Group].** By (9.4.2.19), if  $X \in \text{Sch}_{\text{cntd}}$  and  $\bar{x}$  be a geometric point of  $X$ , then there is an equivalence of categories between finite locally constant Abelian sheaves on  $X$  and finite  $\pi_1(X, \bar{x})$ -modules.  $\lrcorner$

**Prop. (9.3.2.6) [Categories and Fundamental Groups].** If  $f : X \rightarrow Y \in \text{Sch}_{\text{qcqs}}$  s.t.  $f^* : Y_{\text{fét}} \rightarrow X_{\text{fét}}$  is an equivalence of categories, then  $f_* : \pi_0(X) \rightarrow \pi_0(Y)$  is a homeomorphism.

And if  $Y$  is connected, then for any geometric point  $\bar{x}$  of  $X$  with  $\bar{y} = f \circ \bar{x}$ ,  $f_* : \pi_1(X, \bar{x}) \rightarrow \pi_1(Y, \bar{y})$  is an isomorphism.  $\lrcorner$

*Proof:* Firstly  $f(X)$  meets every clopen subset  $U \subset Y$ , otherwise  $U \times_Y X \rightarrow X$  is an isomorphism but  $U \rightarrow Y$  is not.

Conversely, for any clopen subset  $X_1 \subset X$ ,  $X_1 = X \times_Y V$  for some  $V \in Y_{\text{fét}}$ . Then  $V$  must be a clopen subset of  $Y$ .

Thus  $f_* : \pi_0(X) \rightarrow \pi_0(Y)$  is a bijection. And because  $\pi_0(X)$  and  $\pi_0(Y)$  are profinite spaces by (7.4.5.46) and (4.12.3.5), we see that  $f_*$  is a homeomorphism.  $\square$

**Lemma (9.3.2.7) [Rigidity Lemma].** If  $f, g : S' \rightarrow S''$  are two  $S$ -morphisms where  $S''$  is a separated étale  $S$ -scheme and  $(S', \bar{s}')$  is a pointed scheme that  $f(\bar{s}') = g(\bar{s}')$ , then  $f = g$ .  $\lrcorner$

*Proof:* The diagonal  $S'' \rightarrow S'' \otimes_S S''$  is a closed immersion and also étale hence open (7.6.6.3), so the diagonal is an clopen subset. And now  $f \times g : S' \rightarrow S'' \otimes_S S''$  intersects the diagonal, and  $S'$  is connected, so  $f, g$  are identical on the diagonal.  $\square$

**Def. (9.3.2.8) [Galois-Covers].**  $Y \rightarrow X \in X_{\text{fét}}$  is called a **Galois-covering map (of schemes)** if  $Y$  defines a Galois-object in  $X_{\text{fét}}$  (4.3.4.6).

For any  $Y \in X_{\text{fét}}$  connected, there exists a finite étale Galois cover  $Y' \rightarrow X$  that factors through  $Y$ , by (9.3.2.1) and (4.3.4.7).  $\lrcorner$

**Prop. (9.3.2.9).** For  $k \in \text{Field}$  s.t.  $k = \bar{k}$ , we have  $\pi_1(\mathbb{P}_k^1) = 0$ .  $\lrcorner$

*Proof:*  $\square$

**Prop. (9.3.2.10) [Arithmetic and Geometric Fundamental Groups].** Suppose  $k \in \text{Field}$  and  $X \in \text{Sch}_{\text{qcqs}}/k$  is geometrically connected (7.4.3.1), then for any  $\bar{x} \in X(\bar{k})$ , there is an exact sequence

$$1 \rightarrow \pi_1(X_{\bar{k}}, \bar{x}) \rightarrow \pi_1(X, \bar{x}) \rightarrow \text{Gal}_k \rightarrow 1.$$

$\lrcorner$

*Proof:* Cf. [Sta]0BTX?  $\square$

**Prop. (9.3.2.11) [Proper Scheme over Henselian Local Rings].** If  $(A, \mathfrak{m}, \kappa)$  is a Henselian local ring and  $X \in \text{Sch}^{\text{proper}}/A$ , then the base change functor

$$X_{\text{fét}} \rightarrow (X_{\kappa})_{\text{fét}}$$

is an equivalence of categories.  $\lrcorner$

*Proof:* Cf. [Sta]0A48.  $\square$

**Prop. (9.3.2.12) [Change of Alg. Closed Fields].** If  $k \subset k'$  and  $k = \bar{k}, k' = \bar{k}'$ , and  $X \in \text{Sch}^{\text{proper}}/k$ , then the base change functor

$$X_{\text{fét}} \rightarrow (X_{k'})_{\text{fét}}$$

is an equivalence of categories.  $\lrcorner$

*Proof:* Cf. [Sta]0A49.?  $\square$

## 9.4 Étale Cohomology Theory

*“It is less than four years since cohomological methods (i.e. methods of Homological Algebra) were introduced into Algebraic Geometry in Serre’s fundamental paper, and it seems certain that they are to overflow the part of mathematics in the coming years, from the foundations up to the most advanced parts.”*

–A. Grothendieck

References are [Fu11, Mil13b, Con15], [Sta], [Étale Cohomology, Tamme], and [Notes on étale cohomology of number fields, Mazur].

### Notation(9.4.0.1).

- Let  $X, S \in \text{Sch}_{\text{qcqs}}$ .
- Use notations on Properties of Schemes defined in [More Properties of Morphisms between Schemes](#).
- Use notations on Cohomology of Schemes defined in [Cohomology of Schemes](#).

┘

### 1 Basics

**Prop.(9.4.1.1).** The étale site  $X_{\text{ét}}$  is a ringed site,  $\text{Sh}(X_{\text{ét}})$  is a Grothendieck Abelian category, and we can define right derived functors of any left exact functor, by(7.3.1.1). ┘

### Étale Topoi

**Prop.(9.4.1.2) [Zariski-Étale Comparison].** For  $X \in \text{Sch}$ , the inclusion  $X_{\text{Zar}} \rightarrow X_{\text{ét}}$  of topologies which is a morphism of sites  $\varepsilon : X_{\text{ét}} \rightarrow X_{\text{Zar}}$ , for any  $\mathcal{F} \in \text{Sh}(X_{\text{ét}})$ , there is a Leray spectral sequence(7.3.1.8)

$$E_2^{pq} = H_{\text{Zar}}^p(X, R^q \varepsilon_*(\mathcal{F})) \Rightarrow H_{\text{ét}}^{p+q}(X, \mathcal{F}).$$

┘

**Def.(9.4.1.3) [Pushforward & Pullback].** For  $f : X \rightarrow Y \in \text{Sch}$ , there is a continuous functor between sites  $f_{\text{ét}} : Y_{\text{ét}} \rightarrow X_{\text{ét}}$ , which preserves final objects and finite fiber products, so by(7.1.2.14), it induces a morphism of sites(7.1.1.7)  $f_{\text{ét}} : X_{\text{ét}} \rightarrow Y_{\text{ét}}$ , which induces a morphism of topoi

$$f_{\text{ét}} : \text{Sh}(X_{\text{ét}}) \rightarrow \text{Sh}(Y_{\text{ét}}).$$

$f_{\text{ét}}^*$  is called the inverse image, it is exact. By definition(7.1.2.11), for  $\mathcal{F} \in \text{Sh}(Y_{\text{ét}})$  and  $X \in X_{\text{ét}}$ ,  $f^* \mathcal{F}(X')$  equals the colimit over all pairs  $(Y', \varphi)$  where  $Y' \in Y_{\text{ét}}$  and  $\varphi : X' \rightarrow Y' \times_Y X$ , equivalently, all  $X' \rightarrow Y'$  over  $Y$ . ┘

**Cor.(9.4.1.4) [Localizations].** By(7.1.2.25), an object  $i : X' \rightarrow X \in X_{\text{ét}}$  induce a morphism  $({}_s i, i^s)$  of topoi  $X'_{\text{ét}} \rightarrow X_{\text{ét}}$ .

Denote  $i^s \mathcal{F} = F/X'$ , then for  $Z' \in X'_{\text{ét}}$ , by(7.3.1.4) and(7.1.2.25)

$$F/X'(Z') = F(Z'), \quad H^q(X_{\text{ét}}; Z', F) \cong H^q(X'_{\text{ét}}; Z', F/X').$$

In particular,

$$H^q(X_{\text{ét}}; X', \mathcal{F}) = H^q(X'_{\text{ét}}; X', \mathcal{F}|_{X'}),$$

thus we will omit the ambient sites and the restriction of sheaves, which should cause no confusion.  
 $\perp$

**Prop. (9.4.1.5).** If  $Z$  is étale over  $X$ , then the canonical morphism

$$f^* \operatorname{Hom}_X(-, Z) \rightarrow \operatorname{Hom}_Y(-, Z \times_X Y)$$

is an isomorphism.  $\perp$

*Proof:* By definition,  $f^* \operatorname{Hom}_X(-, Z)$  is the sheaf associated to the presheaf  $f_p \operatorname{Hom}_X(-, Z)$  (7.1.2.11), which is identical to the presheaf  $\operatorname{Hom}_Y(-, Z)$  on  $Y_{\text{ét}}$ , but it is already a sheaf (7.1.4.35).  $\square$

**Prop. (9.4.1.6) [Relative Leray Spectral Sequence].** If  $f : X \rightarrow Y, g : Y \rightarrow Z \in \operatorname{Sch}$ , then for any  $\mathcal{F} \in \operatorname{Sh}(X_{\text{ét}})$ , there is a relative Leray spectral sequence (7.3.1.8)

$$E_2^{pq} = R^p g_*(R^q f_*(\mathcal{F})) \Rightarrow R^{p+q}(gf)_*(\mathcal{F}).$$

$\perp$

**Cor. (9.4.1.7) [Leray Spectral Sequence].** For a morphism of schemes  $f : X \rightarrow Y$  and  $\mathcal{F} \in \operatorname{Sh}(X_{\text{ét}})$ ,  $Y' \in Y_{\text{ét}}$ , there is a Leray spectral sequence??:

$$E_2^p = H^p(Y', R^q f_*(\mathcal{F})) \Rightarrow H^{p+q}(Y' \times_Y X, \mathcal{F})$$

$\perp$

**Prop. (9.4.1.8) [Commutates with Colimits].** For  $X \in \operatorname{Sch}^{\text{qcqs}}$ , by (7.1.4.18)(7.1.4.21) and (7.3.1.14),  $H_{\text{ét}}^q(X, -)$  commutes with filtered colimits.  $\perp$

**Prop. (9.4.1.9).** Let  $X, Y \in \operatorname{Aff}$ , then for any morphism of ringed sites  $(g, g^\sharp) : (X_{\text{ét}}, \mathcal{O}_X) \rightarrow (Y_{\text{ét}}, \mathcal{O}_Y)$ , there exists a unique morphism of schemes  $f : X \rightarrow Y \in \operatorname{Sch}$  s.t.  $(g, g^\sharp)$  is 2-isomorphic to  $(f, f^\sharp)$ .  $\perp$

*Proof:* Cf. [Sta]04I6.  $\square$

### Field case

**Thm. (9.4.1.10) [Étale Sites over Fields].** The functor  $f : X' \rightarrow X'(k_s)$  is an equivalence of topologies from the small étale site  $(\operatorname{Spec}(k))_{\text{ét}}$  to the canonical topology  $T_G$  on the category of  $G$ -sets, where  $G = G(k_s/k)$ .

In particular, any Abelian sheaf on  $\operatorname{Spec}(k)_{\text{ét}}$  is representable by  $?$ .  $\perp$

*Proof:* First  $f$  maps a family of morphisms of schemes to a covering iff this family is a covering itself. This is because both are defined by set-theoretical surjectivity, and this is by (7.6.6.12).

Next we need to show this is an equivalence of categories.  $f$  has a left adjoint  $g$  because  $X' \rightarrow \operatorname{Hom}_G(U, X'(k_s))$  is representable for any  $G$ -set  $U$ , because any  $G$ -set is equivalent to disjoint sums of  $G/H$ , and both category has arbitrary sums, so it suffice to prove for  $G/H$ , but this is represented by  $\operatorname{Spec} k'$ , where  $k'$  is the fixed field of  $H$ .

To prove  $fg \cong \operatorname{id}$  and  $gf \cong \operatorname{id}$ , they commutes with direct sums, so the first one is true because  $G/H \rightarrow fg(G/H) = \operatorname{Spec}(k_s)(k)$  is an isomorphism, and the second follows from (7.6.6.6) as all étale schemes over field  $k$  is a disjoint union of spectra of finite separable field extensions of  $k$ .  $\square$

**Cor. (9.4.1.11)** [Étale and Galois Cohomologies]. By (9.8.2.2),

$$\mathrm{Sh}((\mathrm{Spec} k)_{\mathrm{\acute{e}t}}) \rightarrow \mathrm{Mod}_G : \mathcal{F} \rightarrow \varinjlim_{k \subset k' \subset k^s} \mathcal{F}(\mathrm{Spec} k')$$

is an equivalence of categories, so

$$H_{\mathrm{\acute{e}t}}^q(\mathrm{Spec} k, \mathcal{F}) \cong H^q(G, \varinjlim_{k \subset k' \subset k^s} \mathcal{F}(\mathrm{Spec} k_s)).$$

In particular, if  $k = k^s$ , then  $(\mathrm{Spec} k)_{\mathrm{\acute{e}t}}$  is equivalent to  $\mathcal{A}b$ , and  $H_{\mathrm{\acute{e}t}}^p(\mathrm{Spec}(k), \mathcal{F}) = 0$  for  $p > 0$ .  $\lrcorner$

### Stalks

**Def. (9.4.1.12)** [Stalk]. By (9.4.1.10), for any scheme  $X$  and an arithmetic point  $x : \mathrm{Spec} k \rightarrow X$ , the section functor  $F \rightarrow F(x)$  is an equivalence of categories from  $(\mathrm{Spec} k)_{\mathrm{\acute{e}t}}$  to  $\mathcal{A}b$ . Thus for any  $\mathcal{F} \in \mathrm{Sh}(X_{\mathrm{\acute{e}t}})$ , we can define the **stalk map**

$$\mathrm{Sh}(X_{\mathrm{\acute{e}t}}) \rightarrow \mathcal{A}b : \mathcal{F} \mapsto (x^* \mathcal{F})(x).$$

$\lrcorner$

**Prop. (9.4.1.13)**. For any geometric point  $P$  of  $X$ ,

- the stalk map is exact and commutes with colimits.
- For any morphism  $u : P' \rightarrow P$  of geometric points over  $X$ ,  $\mathcal{F}_P \cong \mathcal{F}_{P'}$ .
- If  $X \rightarrow Y$  is a morphism, then  $(f^* F)_P \cong F_P$ .

$\lrcorner$

*Proof:* 1: taking stalk is a composition of  $f^*$  and taking section over  $P$  (which is an equivalence), so it is exact and commutes with colimits (9.4.1.3).

2, 3: Trivial.  $\square$

**Prop. (9.4.1.14)** [Stalk is Defined Naturally]. By the definition of  $f^*$  (7.1.2.11), if  $X'$  be an étale nbhd of  $P$  in  $X$ , i.e.  $P \rightarrow X' \rightarrow X$ , then

$$(f_{\mathrm{\acute{e}t}})_P(\mathcal{F}(P)) = \varinjlim_{X'} \mathcal{F}(X')$$

and  $F_P = f^* F(P)$ , thus there is a natural map  $\varinjlim_{X'} F(X') \rightarrow F_P$ .

Then we have:

$$\varinjlim_{X'} G(X') \rightarrow (G^\sharp)_P$$

for any presheaf  $G$  on  $X_{\mathrm{\acute{e}t}}$ .  $\lrcorner$

*Proof:* Firstly  $(f^\sharp)^\sharp(G) \cong (f^* G)^\sharp$  by (7.1.2.12). Then it suffices to prove that  $G(P) \rightarrow G^\sharp(P)$  is an isomorphism for any presheaf  $G$  on  $P_{\mathrm{\acute{e}t}}$ . But this is because  $P_{\mathrm{\acute{e}t}}$  is just  $\mathcal{A}b$  (9.4.1.10), and  $P \xrightarrow{\mathrm{id}} P$  is cofinal in the category of coverings of  $P$ .  $\square$

**Cor. (9.4.1.15)**. For  $X \rightarrow Y \in \mathrm{Sch}$  and  $P$  is a geometric point of  $Y$ , we have

$$R^p f_*(F)_P \cong \varinjlim_{P \in Y'} H^p(X \times_Y Y', F).$$

$\lrcorner$

**Cor. (9.4.1.16).** For  $X = \operatorname{Spec} k$ , the equivalence (9.4.1.10) of  $X_{\text{ét}}$  with continuous  $G$ -modules are just induced by taking the stalk at  $\operatorname{Spec} k_s$ .  $\lrcorner$

**Prop. (9.4.1.17) [Exactness and Stalks].** The exactness, injectivity and surjectivity of maps of sheaves  $F' \rightarrow F$  on  $X_{\text{ét}}$  can be checked on stalks (9.4.1.12).  $\lrcorner$

*Proof:* It suffices to prove the isomorphism case, because taking stalks are exact (9.4.1.13) and other maps can be characterized by isomorphisms.

Monomorphism: suppose not, if  $s \in F'(X')$  is mapped to 0, by taking base change, we can assume  $X' = X$ , and then  $0 = v(s)_{\bar{x}} = v_{\bar{x}}(s_{\bar{x}})$ , thus  $s_{\bar{x}} = 0$  by assumption. Now by (9.4.1.14), for any  $x$  there is an étale nbhd of  $x$  that  $s$  vanishes on it. So we find an étale covering of  $X$  that  $s$  vanishes, thus  $s = 0$  because  $F'$  is a sheaf.

Epimorphism: Similarly, for any  $v \in F(X')$ , we can pass to the base change and assume  $X' = X$ , then find for each  $x$  a nbhd that comes from some  $v(s_x)$ , and they glue together to be a global section of  $F'(X)$ .  $\square$

**Prop. (9.4.1.18) [Finite Morphism is Exact].** For a finite morphism  $f$ ,  $f_*$  are exact on étale topos.  $\lrcorner$

*Proof:* Check on stalks,  $\square$

### Strict Henselization

**Def. (9.4.1.19) [Strict Henselization].**  $\lrcorner$

**Prop. (9.4.1.20) [Hensel's Lemma].** Let  $(\mathcal{O}, \kappa)$  be a Henselian local ring and  $Y \in \operatorname{Sch}^{\text{sm}}/\mathcal{O}$ , then the map  $Y(\mathcal{O}) \rightarrow Y(\kappa)$  is surjective.  $\lrcorner$

*Proof:* Cf. [BLR90] Section 2.3. Prop 5.  $\square$

### Properties of Étale Cohomologies

**Prop. (9.4.1.21) [Restriction to Small Sites].** If  $\mathcal{F} \in \operatorname{Sh}_{\text{ét}}/S$ , then the cohomology groups of  $\mathcal{F}$  on  $S$  agrees with the cohomology of its restriction on  $\operatorname{Sh}(S_{\text{ét}})$ , by (7.3.1.4).  $\lrcorner$

**Prop. (9.4.1.22) [Čech Comparison, Arin].** If  $X \in \operatorname{Sch}$  is compact and any finite subset of  $X$  is contained in an open affine (e.g.  $X$  is quasi-projective), then for any covering  $\mathcal{U} \in \operatorname{Cov}(\operatorname{Sch}_{\text{ét}}/X)$  of  $X$ ,  $\check{H}(\mathcal{U}, -)$  is exact.

In particular, by (7.3.2.16), in this case, we can use Čech cohomology to calculate the étale cohomologies.  $\lrcorner$

*Proof:* Cf. [Milne, Étale Cohomologies, Prop 3.2.17].  $\square$

**Prop. (9.4.1.23) [Inverse Limits].** Let  $(X_i)_I$  be a projective system in  $\operatorname{Sch}_{qc}$  with affine morphisms,  $X_{\infty} = \varprojlim_{i \in I} X_i$ . For any projective system of sheaves  $(\mathcal{F}_i)_I$ ,  $\mathcal{F}_i \in \operatorname{Sh}((X_i)_{\text{ét}})$ , let  $\mathcal{F}_{\infty} = \varprojlim_{i \in I} \mathcal{F}_i$ , then there are isomorphisms

$$\varprojlim_{i \in I} H_{\text{ét}}^p(X_i, \mathcal{F}_i) \cong H_{\text{ét}}^p(X_{\infty}, \mathcal{F}_{\infty}).$$

$\lrcorner$

*Proof:* Cf. SGA4, Prop 7.5.8, or Artin 1962, Chap 3.3. ?  $\square$

**Prop. (9.4.1.24) [Étale-Zariski Comparison for Qco Sheaves].** Recall by (7.1.4.37) if  $M \in \mathcal{QCoh}(X)$  then  $\widetilde{M}$  is a fpqc sheaf on  $X$ , in particular an étale sheaf on  $X$ . Now the edge map of the Zariski-étale comparison for  $\widetilde{M}$  is an isomorphism:

$$H_{\text{Zar}}^p(X, M) \cong H_{\text{ét}}^p(X, \widetilde{M})$$

In particular,  $H_{\text{ét}}^p(X, \mathbb{G}_a) \cong H^p(X, \mathcal{O}_X)$ , and the étale cohomology for Qco sheaves vanishes on affine schemes.  $\lrcorner$

*Proof:* Cf. [Sta].

We show that  $R^p \varepsilon^s(\widetilde{M}) = 0$  for  $p > 0$ , Cf. [Tamme P109]. Not hard.  $\square$

**Prop. (9.4.1.25) [Galois Covering and Group Cohomology].** If  $\mathcal{U} = \{Y \rightarrow X\}$  is a single Galois covering with Galois group  $G$ ,  $\mathcal{P}$  is a presheaf on  $\text{Sch}/X$  s.t.  $\text{?}$  then  $\check{H}^r(\mathcal{U}, \mathcal{P}) = H^r(G, \mathcal{P}(Y))$ .

In particular, we may not use alternating complex to calculate the étale cohomologies.  $\lrcorner$

*Proof:*  $\square$

**Prop. (9.4.1.26) [Hochschild-Serre Spectral Sequences].** Let  $X \in \text{Sch}$  and  $Y \in X_{\text{ét}}$  be a Galois covering with Galois group  $\Gamma$ , then for any  $\mathcal{F} \in \text{Sh}(X_{\text{ét}})$ , there is a spectral sequence  $\lrcorner$

**Prop. (9.4.1.27) [Mayer-Vietoris Sequences].** Let  $X \in \text{Sch}$  and  $f : Y \rightarrow X \in X_{\text{ét}}$ ,  $U \subset X$  s.t.  $f(Y) \cup U = X$ , then for any  $\mathcal{F} \in \text{Sh}(X_{\text{ét}})$ , there is a long exact sequence

$$0 \rightarrow H_{\text{ét}}^0(X, \mathcal{F}) \rightarrow H_{\text{ét}}^0(U, \mathcal{F}) \oplus H_{\text{ét}}^0(Y, \mathcal{F}) \rightarrow H_{\text{ét}}^0(f^{-1}(U), \mathcal{F}) \rightarrow H_{\text{ét}}^1(X, \mathcal{F}) \rightarrow \dots$$

that is functorial in  $\mathcal{F}$ , by (7.3.1.11).  $\lrcorner$

### Restricted Cohomologies

**Def. (9.4.1.28) [Restricted Cohomologies].** Let  $X \in \text{Sch}$  and  $\mathcal{F} \in \text{Sh}(X_{\text{ét}})$ , if  $\varphi : U' \rightarrow U \in X_{\text{ét}}$  and  $Z' \subset U'$  is a closed subschemes s.t.  $Z' \rightarrow U' \rightarrow U$  is a closed embedding with image  $Z \subset U$ , then there is a canonical bijection

$$\{s \in \mathcal{F}(U) \mid \text{Supp}(s) \in Z\} = \{s' \in \mathcal{F}(U') \mid \text{Supp}(s') \in Z'\}.$$

which is given by restriction when  $\varphi^{-1}(Z) = Z'$ .

In particular, if  $Z \subset X$  be a locally closed subscheme, then there is a functor

$$\Gamma_Z(X, -) : \text{Sh}(X_{\text{ét}}) \rightarrow \mathcal{A}b : \mathcal{F} \mapsto \{s \in \mathcal{F}(U) \mid \text{Supp}(s) \in Z\} = \ker(\mathcal{F}(U) \rightarrow \mathcal{F}(U \setminus Z))$$

where  $U \subset X$  is any open subscheme containing  $Z$  as a closed subscheme.

$\Gamma_Z(X, -)$  is left exact as both  $\Gamma(U, -)$  and  $\Gamma(U \setminus Z, -)$  are.

The right derived cohomology of  $H_Z^r(X, -)$ , called the **restricted étale cohomology** of  $\mathcal{F}$  with supports in  $Z$ .  $\lrcorner$

*Proof:* Denote  $Z'' = \varphi^{-1}(Z) \subset U'$ , then  $Z' \subset Z''$  is closed and also étale because  $Z', Z''$  are both étale over  $Z$  (7.6.6.4). Thus  $Z'' = Z' \amalg T$  for some closed subset  $T$  by (7.6.2.10).

The open covering  $U' = (U' \setminus T) \cup (U' \setminus Z')$  shows that

$$\{s' \in \mathcal{F}(U') \mid \text{Supp}(s') \in Z'\} = \{s' \in \mathcal{F}(U' \setminus T) \mid \text{Supp}(s') \in Z'\},$$

and the étale covering  $\{U' \setminus T \rightarrow U, U \setminus Z \rightarrow U\}$  shows that

$$\{s \in \mathcal{F}(U) \mid \text{Supp}(s) \in Z\} = \{s' \in \mathcal{F}(U' \setminus T) \mid \text{Supp}(s') \in Z'\}.$$

$\square$

**Prop. (9.4.1.29) [Excision Sequences].** Situation as in (9.4.1.28), if  $Z \subset X$  is a closed subschemes, then for any  $\mathcal{F} \in \mathcal{S}h(X_{\text{ét}})$ , there is a functorial long exact sequence

$$\cdots \rightarrow H_Z^r(X, \mathcal{F}) \rightarrow H_{\text{ét}}^r(X, \mathcal{F}) \rightarrow H_{\text{ét}}^r(U, \mathcal{F}) \rightarrow H_Z^{r+1}(X, \mathcal{F}) \rightarrow \cdots$$

┘

*Proof:* Choose a functorial injective resolution (4.10.2.9), and this follows from the fact an injective sheaf is flabby (7.3.4.9).  $\square$

**Prop. (9.4.1.30) [Restricted Cohomology at a point].** For  $x \in |X|_0$  and any  $\mathcal{F} \in \mathcal{S}h(X_{\text{ét}})$ , there is an isomorphism

$$H_x^p(X, \mathcal{F}) \cong H_{\text{ét}}^r(\text{Spec } \mathcal{O}_{X,x}^{\text{sh}}, i_x^* \mathcal{F}) \text{ (9.4.1.28)(9.4.1.19).}$$

┘

*Proof:* Take limits over the affine étale nbhds of  $x \in X$  and use (9.4.1.23).  $\square$

### Kummer Theory

**Prop. (9.4.1.31) [Kummer Sequence].** For  $X \in \text{Sch}/\mathbb{Z}[\frac{1}{n}]$ , there is an exact sequence in  $\mathcal{S}h(X_{\text{ét}})$ :

$$0 \rightarrow \mu_{n,X} \rightarrow \mathbb{G}_{m,X} \xrightarrow{n} \mathbb{G}_{m,X} \rightarrow 0$$

┘

*Proof:* The proof is similar to that of Artin-Schreier sequence (9.4.1.37), noticing that  $A \rightarrow A[T]/(T^n - s)$  is an étale map.  $\square$

**Cor. (9.4.1.32).** For  $X \in \text{Sch}/\mathbb{Z}[\frac{1}{n}]$ , by (7.7.1.14), there is an exact sequence

$$0 \rightarrow H^0(X, \mathcal{O}_X^*)/nH^0(X, \mathcal{O}_X^*) \rightarrow H^1(X, \mu_n) \rightarrow \text{Pic}(X)[n] \rightarrow 0$$

┘

**Cor. (9.4.1.33).** If  $X = \text{Spec } A$  where  $A$  is a local ring and  $n$  is invertible in  $A$ , then  $H^1(X, \mu_n) \cong A^*/(A^*)^n$ . ?

┘

*Proof:* Cf. [Tamme, P110].  $\square$

**Cor. (9.4.1.34).** If  $k \in \text{Field}$ ,  $k = k^{\text{sep}}$ ,  $X \in \text{Sch}_{\text{red}}^{\text{proper}}/k$ , and  $n \in \mathbb{Z} \cap k^\times$ , then  $H_{\text{ét}}^1(X, \mu_n) \cong \text{Pic}(X)[n]$ , by (7.12.1.12).  $\square$

### Artin-Schreier Theory

**Prop. (9.4.1.35) [Characters of Finite Fields].** Any character  $\psi : \mathbb{F}_q \rightarrow \overline{\mathbb{Q}}_\ell^\times$  can be extended to  $\mathbb{F}_{q^n}$  by

$$\mathbb{F}_{q^n} \xrightarrow{\text{tr}} \mathbb{F}_q \xrightarrow{\psi} \overline{\mathbb{Q}}_\ell^\times,$$

also denoted by  $\psi$ .  $\square$

**Def. (9.4.1.36) [Artin-Schreier Covering].** The **Artin-Schreier cover** of  $\mathbb{A}^1$  is defined to be the finite Galois cover

$$\varphi : \mathbb{A}_{\mathbb{F}_q}^1 \rightarrow \mathbb{A}_{\mathbb{F}_q}^1 : x \mapsto x^q - x,$$

with the Galois group isomorphic to  $\mathbb{F}_q$  via  $a \mapsto (x \mapsto x + a)$ .  $\lrcorner$

**Prop. (9.4.1.37) [Artin-Schreier Sequence].** For  $X \in \text{Sch}/\mathbb{F}_p$ , let  $P = \text{id} - \text{Frob}$ , then there is an **Artin-Schreier exact sequence** of étale sheaves

$$0 \rightarrow (\underline{\mathbb{Z}/(p)})_X \rightarrow (\mathbb{G}_a)_X \xrightarrow{P} (\mathbb{G}_a)_X \rightarrow 0$$

$\lrcorner$

*Proof:* If  $s \in \mathcal{O}_{X'}$  is in the kernel, then  $s = s^p$ , so it is locally constant and comes from the map  $\mathbb{Z}/p\mathbb{Z} \rightarrow \mathcal{O}_{X'}$ . Conversely, for any  $s \in \mathcal{O}_{X'}$ , it suffices to find an étale cover that  $s$  is a  $p$ -th power in  $\mathcal{O}_{X'_i}$ . For this, it suffices to notice that for any  $p$ -ring  $A$ ,  $A[t]/(t^p - t - s)$  is free of rank  $p$  and étale over  $A$ .  $\square$

**Cor. (9.4.1.38).** If  $X$  has char  $p$ , then by the long exact sequence and (9.4.1.24), there is an exact sequence

$$0 \rightarrow H^0(X, \mathcal{O}_X)/P(H^0(X, \mathcal{O}_X)) \rightarrow H^1(X, (\mathbb{Z}/p\mathbb{Z})) \rightarrow H^1(X, \mathcal{O}_X)^F \rightarrow 0$$

where the last one is the fixed elements.  $\lrcorner$

**Cor. (9.4.1.39).** If  $X = \text{Spec } A$  and  $pA = 0$ , then  $H_{\text{ét}}^q(X, \mathbb{Z}/p\mathbb{Z}) = \begin{cases} A/\text{Im}((\text{Frob} - 1)|_A) & , q = 0 \\ 0 & , q \geq 1 \end{cases}$ .  $\lrcorner$

**Cor. (9.4.1.40).** if  $k \in p\text{-Field}$ ,  $k = k^{\text{sep}}$  and  $X$  is a reduced proper  $k$ -scheme, then  $H^1(X, \mathbb{Z}/p\mathbb{Z}) = (H^1(X, \mathcal{O}_X))^F$ .  $\lrcorner$

## 2 Constructible Sheaves

### Torsion Sheaves

**Def. (9.4.2.1) [Torsion Sheaves].** For  $\mathcal{C} \in \text{Site}$ ,  $\mathcal{F} \in \text{Sh}(\mathcal{C}; \text{Set})$  is called a **torsion sheaf** iff it is associated to a presheaf of torsion Abelian groups. Equivalently, the canonical morphism  $\varinjlim_n \mathcal{F}[n] \rightarrow \mathcal{F}$  is an isomorphism. The category of torsion sheaves on  $\mathcal{C}$  is denoted by  $\text{Sh}_{\text{tor}}(\mathcal{C})$ .  $\lrcorner$

*Proof:* It  $\mathcal{F} = P^\sharp$ , then consider  $0 \rightarrow P[n] \rightarrow P \xrightarrow{n} P \rightarrow 0$ . Because  $\sharp$  is exact,  $\mathcal{F}[n] = (P[n])^\sharp$ . Then because  $\sharp$  commutes with inductive limits and  $P = \varinjlim_n P[n]$ , it follows  $\mathcal{F} = \varinjlim_n \mathcal{F}[n]$ .

Conversely, if  $\mathcal{F} = \varinjlim_n \mathcal{F}[n]$ , then  $\mathcal{F} = \varinjlim_n (\mathcal{F}^{\text{PSh}}[n])^\sharp = (\varinjlim_n \mathcal{F}[n])^\sharp$ , and  $\varinjlim_n \mathcal{F}^{\text{PSh}}[n]$  is presheaf of torsion Abelian groups.  $\square$

**Remark (9.4.2.2).** WARNING: For a torsion sheaf,  $\mathcal{F}(U)$  need not be torsion Abelian, but this is the case if  $U$  is quasi-compact, Cf.[Tamme P146].  $\lrcorner$

**Prop. (9.4.2.3) [Being Torsion is Local].** For  $X \in \text{Sch}$ ,  $\mathcal{F} \in \text{Sh}(X_{\text{ét}})$  is a torsion sheaf (9.4.2.1) iff all stalks  $\mathcal{F}_x$  are torsion.  $\lrcorner$

*Proof:* By definition  $\mathcal{F}$  is torsion iff  $\varinjlim_n \mathcal{F}[n] \rightarrow \mathcal{F}$  is an isomorphism. Then use the fact isomorphisms are checked on stalks (9.4.1.17) and stalk maps are exact (9.4.1.13).  $\square$

**Prop. (9.4.2.4).** For  $f : X \rightarrow Y \in \text{Sch}$ .

- If  $\mathcal{F} \in \text{Sh}(Y_{\text{ét}})$  is a torsion sheaf on  $Y$  (9.4.2.1), then  $f^*\mathcal{F}$  is torsion sheaf on  $X$ .
- If  $f$  is qcqs and  $\mathcal{F} \in \text{Sh}(X_{\text{ét}})$  is a torsion sheaf on  $X$ , then  $R^n f_* \mathcal{F}$  are torsion sheaves on  $Y$  for any  $n \in \mathbb{N}$ . In particular, if  $X$  is qcqs and  $\mathcal{F}$  is a torsion sheaf on  $X$ , then  $H_{\text{ét}}^n(X, \mathcal{F})$  are torsion for all  $n \in \mathbb{N}$ .

┘

*Proof:* 1: This follows immediately from (9.4.2.3) and (9.4.1.13).

2: For any  $y \in Y$ ,  $(R^q f_* \mathcal{F})_{\bar{y}} \cong H^q(\bar{X}, \bar{F})$ , where  $\bar{X} = X \otimes_Y \bar{Y}$  and  $\bar{Y}$  is the strict localization of  $Y$  in  $\bar{y}$  by ? . Now  $\bar{F}$  is torsion sheaf by item1, and  $\bar{X} \rightarrow \bar{Y}$  is also qcqs with  $\bar{Y}$  being affine, so  $H^q(\bar{X}, \bar{F})$  is torsion by item3, so  $R^q f_* \mathcal{F}$  is torsion by (9.4.2.3).  $\square$

**Prop. (9.4.2.5).** Let  $X \in \text{NSch}_{\text{qc}}$  and  $x \in X$ , then

- for any torsion sheaf  $\mathcal{F} \in \text{Sh}(\text{Spec}(\kappa(x))_{\text{ét}})$ , the sheaves  $R^p i_* \mathcal{F}$  are torsion sheaf for  $p > 0$ .
- $H_{\text{ét}}^p(X, i_* \mathcal{F})$  are torsion for all  $p > 0$ .

┘

*Proof:* 1: Cf. [Tamme P148]. Uses strict Henselization.

2: Consider the Leray spectral sequence  $H_{\text{ét}}^p(X, R^q i_* \mathcal{F}) \implies H_{\text{ét}}^{p+q}(\text{Spec}(\kappa(x)), \mathcal{F})$ , the left term vanishes for  $p \geq 0, q > 0$  by item1 and (9.4.2.4), and the right hand side vanish for  $p + q > 0$  by (9.4.2.4), then it can be checked that  $H_{\text{ét}}^p(X, i_* \mathcal{F})$  are torsion for  $p > 0$ .  $\square$

**Prop. (9.4.2.6).** For a closed subscheme  $i : Y \subset X$ ,  $R^p i^!$  preserves torsion sheaves.

┘

*Proof:* Cf. [Tamme P148].

$\square$

**Prop. (9.4.2.7).** For a regular Noetherian scheme  $X$ ,  $H_{\text{ét}}^n(X, \mathbb{G}_m)$  are torsion for any  $n \in \mathbb{Z}_{\geq 2}$ .

┘

*Proof:* Cf. [Tamme P149].

$\square$

**Prop. (9.4.2.8).** For a torsion sheaf  $F$ , define  $F(\ell) = \varinjlim_n F[\ell^n]$ , so it is an  $\ell$ -torsion sheaf, and in fact

$$\bigoplus_{\ell \in \text{Prime}} F(\ell) = F,$$

this is because this is true at the stalks, because stalks is exact and commutes with colimits (9.4.1.13).

So if  $X$  is qcqs, then  $H^p(X, F) \cong H^p(X, F(\ell))$ , which is the primary decomposition of  $H^p(X, F)$ .

┘

*Proof:*

$\square$

### Cohomological Dimensions

**Def. (9.4.2.9) [Cohomological Dimension].** For  $X \in \text{Sch}_{\text{qcqs}}/k$  and  $\ell \in \text{Prime}$ , define the  $\ell$ -**adic cohomological dimension** of  $X$  as the smallest number  $\text{cd}_{\ell}(X) = n$  that  $H^p(X, \mathcal{F})_{[\ell]} = 0$  for all  $p > n$  and  $\mathcal{F} \in \text{Sh}^{\text{tor}}(X_{\text{ét}})$ , and define the **cohomological dimension**  $\text{cd}(X)$  of  $X$  as the smallest number  $n$  that  $H^p(X, F) = 0$  for all  $p > n$  and  $\mathcal{F} \in \text{Sh}_{\text{tor}}(X_{\text{ét}})$ . Equivalently,  $\text{cd}(X) = \sup_{\ell \in \mathbf{P}} \{\text{cd}_{\ell}(X)\}$ .

┘

**Prop. (9.4.2.10).** If  $k \in \mathbf{Field}$  and  $X \in \mathbf{Sch}^{\text{ft}}/k$ , then

$$\text{cd}_{\ell}(X) \leq \begin{cases} 2 \dim X + \text{cd}_{\ell}(k) & \ell \neq \text{char } k \\ \dim X + 1 & \ell = \text{char } k \end{cases}.$$

┘

*Proof:*

□

**Cor. (9.4.2.11).** If  $k \in \mathbf{Field}$ ,  $k = k^s$ , then  $\text{cd}(X) \leq 2 \dim X$ .

┘

*Proof:*

□

**Thm. (9.4.2.12) [Artin Vanishing Theorem].** If  $k \in \mathbf{Field}$ ,  $k = k^{\text{sep}}$  and  $X \in \mathbf{Aff}^{\text{ft}}/k$ , then  $\text{cd}(X) \leq \dim X$ .

┘

*Proof:* Cf. [Mil13b] P105. ?

□

**Prop. (9.4.2.13) [Arc Descent for Étale Cohomology].** Let  $R$  be a ring and  $\mathcal{G} \in \mathbf{Sh}_{\text{ét}}^{\text{tor}}(\text{Spec } R)$ , and  $\mathcal{F} : (\mathbf{Sch}_{\text{qcqs}}/R)^{\text{op}} \rightarrow D^{\geq 0}(\Lambda)$  be the functor  $(f : X \rightarrow \text{Spec } R) \mapsto R\Gamma(X_{\text{ét}}, f^*\mathcal{G})$ , then  $\mathcal{F}$  satisfies arc-descent.

┘

*Proof:* Cf. [Arc Topology, Bhatt, 5.4.]

□

### Constructible Sheaves

References are [Conrad notes, L3].

**Prop. (9.4.2.14).** If  $G \in \mathbf{GrpSch}/X$  is commutative, finite and étale, the sheaf  $G_X$  represented by  $G$  is locally finite on  $X_{\text{ét}}$ .

Conversely, any locally constant sheaf  $\mathcal{F} \in \mathbf{Sh}(X_{\text{ét}})$  is represented by a unique commutative étale group scheme over  $X$ , and it is finite if  $\mathcal{F}$  has finite stalks.

┘

*Proof:* Cf. [Tamme P152].

□

**Def. (9.4.2.15) [Finite étale Sheaves].** For  $X \in \mathbf{Sch}$ , a **finite étale sheaf** is a sheaf  $\mathcal{F} \in \mathbf{Sh}(X_{\text{ét}}; \mathbf{Set})$  s.t. all its stalks are finite.

┘

**Def. (9.4.2.16) [Lcc and Constructible étale Sheaves].** For  $X \in \mathbf{NSch}$ , a **lcc étale sheaf** on  $X$  is an étale sheaf  $\mathcal{F} \in \mathbf{Sh}(X_{\text{ét}}; \mathbf{Set})$  that is locally constant and finite (9.4.2.15). The category of lcc étale sheaves on  $X$  is denoted by  $\mathbf{Sh}_{\text{lcc}}(X_{\text{ét}}; \mathbf{Set})$ .

And a **constructible étale sheaf** on  $X$  is an étale sheaf  $\mathcal{F} \in \mathbf{Sh}(X_{\text{ét}}; \mathbf{Set})$  s.t. there is a stratification  $\{X_i\}$  of  $X$  s.t.  $\mathcal{F}_{X_i} \in \mathbf{Sh}_{\text{lcc}}((X_i)_{\text{ét}}; \mathbf{Set})$ . The category of constructible sheaves on  $X$  is denoted by  $\mathbf{Sh}_{\text{const}}(X_{\text{ét}}; \mathbf{Set})$ .

┘

**Prop. (9.4.2.17).**  $\mu_{n,X}$  is étale over  $X$  iff  $n$  is prime to the characteristic of all local residue fields of  $X$ . (Only unramifiedness is concerned, and it is fiberwise (5.4.6.6)). And we can compute the Kahler differential of  $k[T]/(T^n - 1)$  vanish iff  $n \neq 0$  in  $k$ .

In this case,  $\mu_n$  is locally isomorphic to  $(\mathbb{Z}/(n))_X$ , because for any affine open  $U = \text{Spec } A$ ,  $U' = \text{Spec } A[t]/(t^n - 1) \rightarrow U$  is étale and surjective (5.4.1.21) and  $U'$  has all  $n$ -th roots of unity, so  $(\mu_n)_{\text{Spec } U'} \cong (\mathbb{Z}/n\mathbb{Z})_{\text{Spec } U'}$ .

┘

**Example (9.4.2.18).** For  $n \in \mathbb{Z}_+$ ,  $\mu_n \in \mathrm{Sh}_{\mathrm{const}}(\mathbb{Z}[\frac{1}{n}])$  but  $\mu_n \notin \mathrm{Sh}_{\mathrm{lcc}}(\mathbb{Z}[\frac{1}{n}])$ .  $\lrcorner$

*Proof:* It is locally constant after the étale base change  $\mathbb{Z}[\frac{1}{n}] \rightarrow \mathbb{Z}[\frac{1}{n}][\zeta_n]$ .  $\square$

**Prop. (9.4.2.19) [Properties of Constructible Sheaves].**

- If  $F \in \mathrm{Sh}(X_{\mathrm{\acute{e}t}})$  and  $X$  has a finite decomposition into constructible reduced subschemes  $X_i$  that  $F/X_i$  are locally constant, then  $F$  is constructible. The converse is also true if  $X$  is qcqs.
- Constructibility is a local property.
- Constructibility is stable under pullback, pushout and finite direct limits.
- Constructibility is stable  $j_!$  for  $j$  qc étale.
- Subsheaves of a constructible sheaf are constructible.

$\lrcorner$

*Proof:* Cf. [Tamme P155]. [Conrad L3 P2], [Étale Cohomology and Weil Conjecture P42] ?  $\square$

**Prop. (9.4.2.20) [Lcc Sheaves and Finite Étale Schemes].** The functor  $X \mapsto \mathrm{Hom}_S(-, X)$  defines an equivalence of categories

$$\mathrm{Sch}^{\mathrm{f\acute{e}t}}/S \cong \mathrm{Sh}_{\mathrm{lcc}}(S_{\mathrm{\acute{e}t}}; \mathrm{Set}).$$

$\lrcorner$

*Proof:* The Yoneda functor is fully faithful, thus we need to show the essentially surjectivity. Notice first  $\mathrm{Hom}_S(-, X)$  is locally constant finite: we can restrict to an open subset of  $S$  that the fiber are of fixed order  $n$ , and  $X \rightarrow X \times_S X$  is étale and a closed immersion, thus  $X \times_S X = X \amalg Y$ , and  $Y$  is finite étale over  $X$  through  $\pi_1$ . Now by induction on the order of the fiber,  $Y = X \otimes \Sigma'$  locally. So  $X = S \times \Sigma$  locally, which means  $X$  represents the constant sheaf  $\underline{\Sigma}$  locally.

To show that every locally constant finite étale sheaf is represented by a finite étale scheme, Cf. [Conrad Etale coh, P19] ?.  $\square$

**Prop. (9.4.2.21).** If  $G$  is a commutative étale group scheme over  $X$ , then the sheaf  $G_X$  represented by  $G$  is constructible iff  $G$  is f.p. over  $X$ .  $\lrcorner$

*Proof:*  $\square$

**Prop. (9.4.2.22) [Locally Constancy and Specializations].** For  $S \in \mathrm{NSch}$  and  $\mathcal{F} \in \mathrm{Sh}_{\mathrm{const}}(S_{\mathrm{\acute{e}t}})$ ,  $\mathcal{F}$  is locally constant iff all the specialization maps for geometric points  $\mathcal{F}_{\bar{s}} \rightarrow \mathcal{F}_{\bar{\eta}}$  are bijective.  $\lrcorner$

*Proof:* If  $\mathcal{F}$  is locally constant, because the conclusion is local, we may assume  $\mathcal{F}$  is constant, then  $\mathcal{F}_{\bar{s}} \rightarrow \mathcal{F}_{\bar{\eta}}$  are all identities.

Conversely, for any geometric point  $s$ ,  $\Sigma = \mathcal{F}_s$  is finite by definition, thus there is an étale nbhd  $U$  of  $s$  that the map  $\underline{\Sigma} \rightarrow \mathcal{F}$  induces an isomorphism on  $s$ -stalks, so this is an isomorphism for any geometric point linked to  $s$  by specialization, in particular the generic point of the irreducible component containing  $s$  and all the points in this irreducible component, thus  $\mathcal{F}$  is constant on an open nbhd of  $s$  (because  $X$  is Noetherian thus has f.m. irreducible components), so  $\mathcal{F}$  is locally constant because  $X$  is Noetherian.  $\square$

**Prop. (9.4.2.23) [Constructible Sheaves are Noetherian].**  $\mathrm{Sh}_{\mathrm{const}}(X_{\mathrm{\acute{e}t}})$  are exactly the Noetherian objects in  $\mathrm{Sh}_{\mathrm{tor}}(X_{\mathrm{\acute{e}t}})$ .  $\lrcorner$

*Proof:*  $\square$

### Derived Categories of Constructible Sheaves

References are [Lei Fu, Étale Cohomology Theory].

**Def. (9.4.2.24) [Derived Category of Constructible Sheaves].** For  $\Lambda \in \mathcal{A}b^{\text{fin}}$ , define  $D_{\text{const}}^b(X_{\text{ét}}; \Lambda)$  to be the category of **derived category of bounded complexes with constructible cohomology sheaves**.

And define  $D_{\text{csttf}}^b(X_{\text{ét}}; \Lambda)$  to be the category of **derived category of bounded complexes with constructible cohomology sheaves of finite Tor dimensions**.  $\lrcorner$

*Proof:* ?  $\square$

### 3 Base Changes

**Prop. (9.4.3.1) [Proper Base Change].** If there is a Cartesian diagram

$$\begin{array}{ccc} X' & \xrightarrow{g'} & Y' \\ \downarrow f' & & \downarrow f \\ X & \xrightarrow{g} & Y \end{array}$$

that  $f$  is proper, then for any torsion sheaf  $\mathcal{F}$  on  $Y'$ , the base change maps (7.3.3.18)

$$g^* R^q f_* \mathcal{F} \rightarrow R^q f'_*(g'^* \mathcal{F})$$

are isomorphisms.  $\lrcorner$

*Proof:* Cf. [Conrad L6].  $\square$

**Prop. (9.4.3.2) [Smooth Base Change].** If there is a Cartesian diagram

$$\begin{array}{ccc} X' & \xrightarrow{g'} & Y' \\ \downarrow f' & & \downarrow f \\ X & \xrightarrow{g} & Y \end{array}$$

that  $f$  is smooth, then for any  $\mathcal{K}^\bullet \in D^+(X, \mathbb{Z}/(n))$ , the base change map (7.3.3.18)

$$f^* Rg_* \mathcal{K}^\bullet \rightarrow Rg'_* f'^* \mathcal{K}^\bullet$$

is an isomorphism.  $\lrcorner$

*Proof:* Cf. [Lei Fu, P391].  $\square$

### 4 Lower Shriek Functor

References are [Sta]Chap61.

**Def. (9.4.4.1) [Lower Shriek Functors].** For  $f : X' \rightarrow X \in \text{Sch étale}$ , the **lower shriek functor**  $f_! : \text{Sh}(X'_{\text{ét}}) \rightarrow \text{Sh}(X_{\text{ét}})$  is defined to be ? Cf. [Lei Fu, P205].  $\lrcorner$

**Prop. (9.4.4.2) [Derived Upper Shriek Functors].** For  $\Lambda \in \mathcal{C}\text{Ring}_{\text{tor}}$  and  $f : X \rightarrow Y \in \text{Sch}_{\text{qcqs}}$  that is separated of f.t., the functor  $Rf_! : D(X_{\text{ét}}, \Lambda) \rightarrow D(Y_{\text{ét}}, \Lambda)$  commutes with direct sums. In particular, it has an exact right adjoint  $Rf^! : D(Y_{\text{ét}}, \Lambda) \rightarrow D(X_{\text{ét}}, \Lambda)$  by adjointness theorem (4.8.4.38), called the **derived upper shriek functor**.  $\lrcorner$

*Proof:* Cf. [Sta]0G29.  $\square$

### Cohomology with Compact Support

Cf.[Weil1, P18].

**Lemma (9.4.4.3).** Extension by 0 commutes with pullback Cf.[KF Lemma4.9].  $\square$

**Def. (9.4.4.4) [Higher Direct Images with Compact Support].** Let  $Y \in \mathcal{S}ch_{qcqs}$ ,  $f : X \rightarrow Y \in \mathcal{S}ch^{sep,ft}/Y$ ,  $\mathcal{F} \in \mathcal{S}h(X_{\acute{e}t})$ , then  $f$  factors as  $f : X \xrightarrow{j} \overline{X} \xrightarrow{\overline{f}} Y$  where  $j : X \rightarrow \overline{X}$  is an open dense subscheme and  $\overline{f}$  is proper, by Nagata-compactification (7.8.3.2). So we can define the **higher direct image with compact support** as

$$Rf_! \triangleq R\overline{f}_* \circ j_! : D^+(X, \text{tor}) \rightarrow D^+(Y, \text{tor}).$$

Then this notion is well-defined.

And if  $Y = \text{Spec } k$ , define  $H_{\acute{e}t,c}^i(X, \mathcal{F}) = H_{\acute{e}t}^i(\text{Spec } k, Rf_! \mathcal{F})$ , called the **étale cohomology with compact support**.  $\square$

*Proof:* To show it is well-defined, notice for any two compactification, we can find a common compactification that dominates them both  $?$ , so using lemma (9.4.4.5), we easily show they are isomorphic.  $\square$

**Lemma (9.4.4.5) [ $j_!$  and Higher Pushforward].** If there is a commutative diagram

$$\begin{array}{ccc} X & \xrightarrow{i} & \overline{X} \\ \downarrow f & & \downarrow \overline{f} \\ Y & \xrightarrow{j} & \overline{Y} \end{array}$$

where  $i, j$  are open immersion and  $f, \overline{f}$  are proper, then there is a natural transformation  $j_! f_* \rightarrow \overline{f}_* i_!$  that induces a natural transformation

$$j_! Rf_* \rightarrow R\overline{f}_* i_!,$$

which is an isomorphism iff  $\overline{f}$  is proper.  $\square$

*Proof:* If this is a Cartesian diagram, then the natural transformation is give by

$$j_! f_* \rightarrow \overline{f}_* \overline{f}^* j_! f_* \cong \overline{f}_* i_! f^* f_* \rightarrow \overline{f}_* i_!.$$

(the second isomorphism is by (9.4.4.3)). The rest is by proper base change Cf.[KF P88].

The general case is also easily reduced to the Cartesian case.  $?$   $\square$

**Prop. (9.4.4.6) [Proper Maps Induce Maps on Proper Pushforward].** If  $f : X \rightarrow S \in \mathcal{N}Sch$  is separated of f.t. and  $g : Y \rightarrow X \in \mathcal{S}ch/S$  is proper, then for any étale Abelian sheaf  $\mathcal{F}$  on  $X$ , there is a canonical map

$$g : Rf_!(\mathcal{F}) \rightarrow R(f \circ g)_!(g^* \mathcal{F}).$$

$\square$

*Proof:* Choose a compactification  $X_2 \xrightarrow{j} \overline{X}_2$ , then choose a compactification  $X_1 \xrightarrow{i} \overline{X}_1$  of  $i \circ g$ , now

Cf. <https://math.stackexchange.com/questions/3120833/proper-morphism-induces-a-map-between-cohomology-groups>  $?$ .  $\square$

**Prop. (9.4.4.7)[Properties of Compact Pushforwards].** Suppose  $S \in \text{Sch}_{\text{qcqs}}$  and  $f : X \rightarrow S \in \text{Sch}$  is separated of f.t., then:

- (Base Change) If there is a Cartesian diagram

$$\begin{array}{ccc} X' & \xrightarrow{h} & X \\ \downarrow f' & & \downarrow f \\ S' & \xrightarrow{g} & S \end{array}$$

then there is a natural isomorphism

$$g^* Rf_! \cong Rf'_! h^*.$$

- (Composition) For two morphisms  $f_1, f_2$  separated of f.t,  $R(f_1 \circ f_2)_! = R(f_1)_! \circ R(f_2)_!$ , which induces a Leray spectral sequence.
- (Excision) If  $\mathcal{F} \in D_{\text{tor}}^+(X)$  and  $Z \subset X$  be a closed subscheme and  $U = X \setminus Z$ , then there is a long exact sequence

$$\cdots \rightarrow R^p(f_U)_!(\mathcal{F}|_U) \rightarrow R^p f_! \mathcal{F} \rightarrow R^p(f_Z)_!(\mathcal{F}|_Z) \rightarrow R^{p+1}(f_U)_!(\mathcal{F}|_U) \rightarrow \cdots$$

┘

*Proof:* 1: Choose a compactification of  $f$ , then it suffices to show  $Rf_*^c$  and  $j_!$  both commutes with base change, which is by proper base change(9.4.3.1) and(9.4.4.3).

2: Two compactification can be splinted, and use(9.4.4.5).

3: Use the long exact sequence applied to the exact sequence(checked on stalks(9.4.1.17))

$$0 \rightarrow j_! j^* \mathcal{F} \rightarrow \mathcal{F} \rightarrow i_* i^* \mathcal{F} \rightarrow 0.$$

□

**Prop. (9.4.4.8)[Proper Pushforward to Direct Image].** There is a natural map from  $R^i f_! \rightarrow R^i f_*$ , which is induced by

$$R^i f_! = R^i \bar{f}_* j_! \rightarrow R^i \bar{f}_* j_* \rightarrow R^i f_*$$

where the second one is edge map of Leray spectral sequence.

In particular, there is a canonical map  $H_{\text{ét},c}^i(X, \mathcal{F}) \rightarrow H_{\text{ét}}^i(X, \mathcal{F})$ .

┘

**Prop. (9.4.4.9)[Vanishing Result].** If  $f : X \rightarrow S \in \text{Sch}^{\text{sep,ft}}/S$  and let  $d = \sup_{s \in S} \dim X_s$ , then if  $\mathcal{F} \in D(X, \text{tor})$  satisfies  $H^p(\mathcal{F})[p] = 0$  for  $p \geq r$ , then

$$R^p f_! \mathcal{F} = 0, \quad p \geq r + 2d.$$

┘

*Proof:* Cf.[Conrad L10 P4].

□

**Thm. (9.4.4.10)[Projection Formula].** If  $f : X \rightarrow S$  is a quasi-projective morphism,  $\mathcal{F} \in D^-(S)$  and  $\mathcal{G} \in D(X)$ , then we have a natural isomorphism

$$\mathcal{F} \otimes_S^L Rf_! \mathcal{G} \cong Rf_! (f^* \mathcal{F} \otimes_X^L \mathcal{G})$$

┘

*Proof:* We may pass to the compactification, as  $j_!$  commutes with  $f^*$ ?

□

### Frobenius Actions

References are [Étale Cohomology Theory, Lei Fu]Chap10.3.

#### Notation(9.4.4.11).

- Use notations as in [Frobenius-Morphisms](#).

┘

**Prop.(9.4.4.12) [Frobenius action on Étale Sheaves].** Let  $k \in \mathbf{Field}^p, k \cong \mathbb{F}_{p^r}$  and  $X \in \mathbf{Sch}^{\text{sep,ft}}/k, \mathcal{F} \in \mathbf{Sch}(X_{\text{ét}})$ , we have an isomorphism  $\mathcal{F} \cong (\varphi_{r,X})_* \mathcal{F}$  which is the inverse of the isomorphisms

$$(\varphi_{r,X})_*(\mathcal{F})(U) = \mathcal{F}(\varphi_{r,X}^{-1}(U)) \xrightarrow{F_{U/X}^*} \mathcal{F}(U),$$

and its adjoint  $\varphi_{r,X}^* \mathcal{F} \rightarrow \mathcal{F}$  is denoted by  $\varphi_{\mathcal{F}}$ .

Then  $\varphi_{\mathcal{F}}$  commutes with tensor product and it is an isomorphism.

┘

*Proof:* The adjoint is an isomorphism because  $\varphi^*$  induces equivalence of categories of étale site of  $X_{\text{ét}}$  with itself, by [\(7.1.4.23\)](#). □

**Prop.(9.4.4.13) [Compatibility of  $\varphi_{\mathcal{F}}$  wit Pullbacks].** Let  $k \in \mathbf{Field}^p, k \cong \mathbb{F}_{p^r}$  and  $f : Y \rightarrow X \in \mathbf{Sch}^{\text{sep,ft}}/k$  be separated,  $\mathcal{F} \in \mathbf{Sch}(X_{\text{ét}})$ , then the morphism  $\varphi_Y^* f^* \mathcal{F} \cong f^* \varphi_{r,X}^* \mathcal{F} \xrightarrow{f^* \varphi_{\mathcal{F}}} f^* \mathcal{F}$  is just  $\varphi_{f^* \mathcal{F}}$ .

┘

*Proof:* Cf. [\[Fu11\]P586](#). □

**Prop.(9.4.4.14) [Compatibility of  $\varphi_{\mathcal{F}}$  with Higher Direct Image].** Let  $k \in \mathbf{Field}^{\text{fin}}$  and  $f : X \rightarrow Y \in \mathbf{Sch}^{\text{sep,ft}}/k$  be separated,  $\mathcal{F} \in \mathbf{Sch}(X_{\text{ét}})$ , so we have a Cartesian diagram about  $\varphi_{r,X}$  and  $\varphi_Y$ . Then the composition

$$\varphi_S^* R^i f_* \mathcal{F} \rightarrow R^i f_* \varphi_{r,X}^* \mathcal{F} \xrightarrow{R^i f_*(\varphi_{\mathcal{F}})} R^i f_* \mathcal{F}$$

is just  $\varphi_{R^i f_* \mathcal{F}}$ .

┘

*Proof:* Cf. [\[Conrad L18 P4\]](#). ? □

**Cor.(9.4.4.15) [Compatibility of  $\varphi_{\mathcal{F}}$  with Proper Pushforward].** If  $X \rightarrow S$  is a separated morphism of f.t. between  $k$ -schemes and  $\mathcal{F}$  is a torsion Abelian sheaf on  $X_{\text{ét}}$ , then the morphism

$$\varphi_{r,S}^* R^i f_! \mathcal{F} \rightarrow R^i f_! \varphi_{r,X}^* \mathcal{F} \xrightarrow{R^i f_!(\varphi_{\mathcal{F}})} R^i f_! \mathcal{F}$$

is just  $\varphi_{R^i f_! \mathcal{F}}$ .

┘

*Proof:* Choose a compactification, the  $j_!$  doesn't matter, so we finish by [\(9.4.4.14\)](#). □

**Def.(9.4.4.16) [Frobenius Action on Compact Cohomology].** Let  $k \cong \mathbb{F}_{p^r} \in p\text{-Field}, X_0 \in \mathbf{Sch}^{\text{sep,ft}}/k, \mathcal{F}_0 \in \mathbf{Sh}((X_0)_{\text{ét}}), X = X_0 \times_k \bar{k}, \mathcal{F} = \mathcal{F}_0 \times_k \bar{k}$ ,

- As  $\text{Fr}_X$  is finite, by [\(9.4.4.6\)](#) it induces a pullback map  $\text{H}_{\text{ét},c}^i(X, \mathcal{F}) \rightarrow \text{H}_{\text{ét},c}^i(X, \text{Fr}_X^* \mathcal{F})$ , which by composing with the natural isomorphism

$$\text{Fr}_{\mathcal{F}} : \text{Fr}_X^* \mathcal{F} = \text{Fr}_X^*(X \rightarrow X_0)^* \mathcal{F}_0 = (X \rightarrow X_0)^*(\varphi_{r,X})^* \mathcal{F}_0 \xrightarrow{\varphi_{\mathcal{F}_0} \text{ (9.4.4.12)}} (X \rightarrow X_0)^* \mathcal{F}_0 = \mathcal{F}$$

gives an endomorphism  $\text{Fr}_{\mathcal{F}}^* : \text{H}_{\text{ét},c}^i(X, \mathcal{F}) \rightarrow \text{H}_{\text{ét},c}^i(X, \mathcal{F})$ , called the **geometric Frobenius action on the étale cohomology**.

- For  $F_X$ , there is a natural map  $\mathcal{F} \rightarrow F_X^* \mathcal{F}$ , and a natural isomorphism

$$F_{\mathcal{F}} : F_X^* \mathcal{F} = F_X^*(X \rightarrow X_0)^* \mathcal{F}_0 \cong ((X \rightarrow X_0) \circ F_X)^* \mathcal{F}_0 = \mathcal{F},$$

so we can define the action of  $F_X$  on  $H_{\text{ét},c}^i(X, \mathcal{F})$  by

$$F_X^* : H_{\text{ét},c}^i(X, \mathcal{F}) \rightarrow H_{\text{ét},c}^i(X, F_X^* \mathcal{F}) \xrightarrow{F_{\mathcal{F}}} H_{\text{ét},c}^i(X, F_X^* \mathcal{F}),$$

called the **arithmetic Frobenius action on the étale cohomology**.

- Similarly, the natural isomorphisms  $\varphi_{r,\mathcal{F}} : \varphi_{r,X}^* \mathcal{F} \cong \mathcal{F}$  (9.4.4.12) defines an action of  $\varphi_{r,X}$  on  $H_{\text{ét},c}^i(X, \mathcal{F})$  by

$$\varphi_{r,X}^* : H_{\text{ét},c}^i(X, \mathcal{F}) \rightarrow H_{\text{ét},c}^i(X, \varphi_{r,X}^* \mathcal{F}) \xrightarrow{\varphi_{r,\mathcal{F}}} H_{\text{ét},c}^i(X, F_X^* \mathcal{F}),$$

called the **absolute Frobenius action on the étale cohomology**. ┘

**Lemma (9.4.4.17).** Situation as in (9.4.4.16),  $\text{Fr}_X^* \mathcal{F} = \varphi_{r,X}^* F_X^* \mathcal{F} \xrightarrow{\varphi_{r,X}^* F_{\mathcal{F}}} \varphi_{r,X}^* \mathcal{F} \xrightarrow{\varphi_{r,\mathcal{F}}} \mathcal{F}$  is just  $\text{Fr}_{\mathcal{F}}$ , by (7.2.10.2). ┘

**Prop. (9.4.4.18) [Frobenius Actions are Compatible].** Situation as in (9.4.4.16),  $\varphi_{r,X}^* = \text{id}$  on  $H_{\text{ét},c}^i(X, \mathcal{F})$ .

In particular, so  $F_X^*$  agrees with  $\text{Fr}_X^*$  on  $H_{\text{ét},c}^i(X, \mathcal{F})$ , because (9.4.4.17) shows  $\text{Fr}_X^* = \varphi_{r,X}^* \circ F_X^*$  on  $H_{\text{ét},c}^i(X, \mathcal{G})$ . We can calculate with either one of them, and denote it by  $F_X^*$ , called the **Frobenius action on étale cohomologies**. ┘

*Proof:* Choose an injective resolution  $\mathcal{F} \rightarrow \mathcal{I}^\bullet$ , it suffices to show that

$$\Gamma(X, \mathcal{I}^\bullet) \rightarrow \Gamma(X, \varphi_* \varphi^* \mathcal{I}^\bullet) \xrightarrow{\varphi_{\mathcal{F}}} \Gamma(X, \varphi_* \mathcal{I}^\bullet)$$

is the identity. But notice by definition  $\mathcal{I}^\bullet \rightarrow \varphi_* \varphi^* \mathcal{I}^\bullet \xrightarrow{\varphi_{\mathcal{F}}} \varphi_* \mathcal{I}^\bullet$  is the inverse of the isomorphism in (9.4.4.12). □

## 5 Torsion Cohomologies

### Finiteness Theorems

**Prop. (9.4.5.1).** If  $S \in \text{NSch}_{\text{cpct}}$ ,  $f : X \rightarrow S \in \text{Sch}^{\text{sep,ft}}/S$ , and  $\mathcal{F} \in \text{Sh}_{\text{const}}(X_{\text{ét}})$  whose torsion order is invertible in  $S$ , then  $R^p f_* \mathcal{F}$  are all constructible on  $Y$ . ┘

*Proof:* Cf. [Conrad L10 P5]. □

**Cor. (9.4.5.2).** If  $k \in \text{Field}$ ,  $k^{\text{sep}} = k$ ,  $X \in \text{Sch}^{\text{proper}}/k$  and  $\mathcal{F} \in \text{Sh}_{\text{const}}(X_{\text{ét}})$ , then  $\#H_{\text{ét}}^n(X, \mathcal{F}) < \infty$  for all  $n \in \mathbb{N}$ . ┘

*Proof:* □

**Lemma (9.4.5.3).** If  $f : X \rightarrow S$  is smooth and proper, and  $\mathcal{F}$  is a locally constant finite Abelian sheaf with torsion order invertible on  $S$ , suppose  $S$  is Noetherian, then all specialization maps for  $R^p f_* \mathcal{F}$  are isomorphisms. ┘

*Proof:* Cf.[Conrad L10 P5]. □

**Prop. (9.4.5.4) [Proper Smooth Higher Direct Image of Lcc Sheaves].** If  $f : X \rightarrow S$  is smooth and proper, and  $F$  is a lcc Abelian sheaf (9.4.2.15) with torsion order invertible on  $S$ , then  $R^n f_* \mathcal{F}$  are locally constant finite sheaves for any  $n \in \mathbb{N}$ . ┘

*Proof:* By (9.4.2.20), we may assume  $\mathcal{F} = \underline{X}'$  for some finite étale scheme  $X' \rightarrow X$ . By Noetherian descent? together with proper base change, we may reduce to the case  $S$  is Noetherian. Thus by (9.4.5.1),  $R^p f_* \mathcal{F} = R^p f_! \mathcal{F}$  are constructible, and (9.4.5.3) shows that the stalk maps are isomorphisms. So (9.4.2.22) shows that  $R^p f_* \mathcal{F}$  are locally constant finite. □

## 6 $\ell$ -adic Étale Cohomologies

References are [Ekedahl, on the Adic Formalism] and [Lei Fu, Étale Cohomology Theory].

**Notation (9.4.6.1).**

- Let  $\ell \in \text{Prime}$ .
  - Let  $(\Lambda_E, \mathfrak{m}, E, \kappa_E) \in \text{CDVR}$  be of mixed characteristic  $(0, \ell)$  and suppose  $\#\kappa < \infty$ .
  - Let  $S, X \in \text{Sch}/\mathbb{Z}[\frac{1}{\ell}]$ .
  - Let  $\Lambda_n = \Lambda_E / \mathfrak{m}^n$ .
- ┘

### Artin-Rees Formalism

**Def. (9.4.6.2) [pre Artin-Rees Categories].** The **pre Artin-Rees category** of  $A$ -modules is a category s.t.

- Its objects consists of projective systems of  $A$ -modules  $M_\bullet = (M_n)_{n \in \mathbb{Z}}$  s.t.  $M_n = 0$  for  $n \ll 0$ ,
- Its morphisms are the elements of the set

$$\text{Hom}_{A\text{-R}}(M_\bullet, N_\bullet) = \varinjlim \text{Hom}(M_\bullet[d], N_\bullet).$$

An object  $M_\bullet$  in the Artin-Rees category is called a **null system** if for some  $\geq 0$  the map  $M_{n+} \rightarrow M_n$  vanishes for all  $n$ . ┘

**Prop. (9.4.6.3) [Artin-Rees Category].** The pre Artin-Rees category (9.4.6.2) is an Abelian category, and the null systems form a weak Serre-subcategory. Then we define the **Arin-Rees category** as the quotient category, denoted by  $\text{Sh}(S_{\text{ét}}; \Lambda_E)$ . ┘

*Proof:* □

**Prop. (9.4.6.4).** If the kernel and cokernel of two systems are all null systems, then they induce isomorphism on inverse limit. ┘

*Proof:* Cf.[Conrad L15, P5]. □

**Def. (9.4.6.5) [Artin-Rees  $\ell$ -adic Modules].** An object  $M_\bullet$  in the A-R category (9.4.6.3) is called an **Artin-Rees  $I$ -adic module** if it is represented by a system  $M_n$  s.t.  $M_n = 0$  for  $n < 0$  and  $M_n$  is finite over  $A_n$ ,  $M_{n+1} \otimes_{A_{n+1}} A_n \rightarrow M_n$  is an isomorphism for  $n \in \mathbb{N}$ . ┘

**Prop. (9.4.6.6).** The full subcategory of Artin-Rees  $I$ -adic modules is an Abelian category, and it is equivalent to the category of finite  $A$ -modules by the stalk functor.  $\lrcorner$

**Prop. (9.4.6.7).** The category  $\mathrm{Sh}_{\Lambda\text{-lcc}}(S_{\text{ét}})$  is equivalent to the full subcategory of  $\mathrm{Sh}_{\mathbf{m}}(S_{\text{ét}})$  consisting of objects with Artin-Rees property and that the terminal stable image is constructible.  $\lrcorner$

*Proof:*  $\square$

**Def. (9.4.6.8) [Strict  $\mathbf{m}$ -adic Sheaves].** The category  $\mathrm{Sh}_{\mathbf{m}\text{-strict}}(S_{\text{ét}})$  of **strict  $\mathbf{m}$ -adic sheaves** are defined as before.  $\lrcorner$

**Prop. (9.4.6.9).** We can strictify any  $\mathbf{m}$ -adic sheaf, Cf.[Conrad, Etale Coh].  $\lrcorner$

### Constructible and Lisse $\mathbf{m}$ -adic Sheaves

**Def. (9.4.6.10) [Constructible and Lisse Adic Sheaves].** For  $S \in \mathrm{Sch}$ ,  $\mathcal{F} \in \mathrm{Sh}(S_{\text{ét}}; \Lambda)$  is called **constructible  $\mathbf{m}$ -adic sheaf** if it is isomorphic to a strict system  $\{\mathcal{F}_n\}$  that  $\mathcal{F}_n \in \mathrm{Sh}_{\text{const}}(S_{\text{ét}}; \Lambda_n)$  (9.4.2.16). The subcategory of  $\mathrm{Sh}_{\mathbf{m}}(S)$  consisting of constructible  $\mathbf{m}$ -adic sheaves is denoted by  $\mathrm{Sh}_{\mathbf{m}\text{-const}}(S)$ .

$\mathcal{F} \in \mathrm{Sh}(S; \Lambda)$  (9.4.6.3) is called a **lisse  $\mathbf{m}$ -adic sheaf** on  $X$  if it is isomorphic to a strict system  $\{\mathcal{F}_n\}$  (9.4.6.8) s.t.  $\mathcal{F}_n \in \mathrm{Sh}_{\text{lcc}}(S_{\text{ét}}; \Lambda_n)$  (9.4.2.16). The category of lisse  $\mathbf{m}$ -adic Sheaves is denoted by  $\mathrm{Sh}_{\text{lisse}}(S_{\text{ét}}; \Lambda)$ .  $\lrcorner$

**Def. (9.4.6.11) [Tate-Twist Sheaves].** The **Tate-twist sheaf**  $\Lambda(1)$  is defined to be  $?$ . It is invertible, thus we denote its dual by  $\Lambda(-1)$ . Then  $\Lambda(r) \in \mathrm{Sh}_{\Lambda\text{-lcc}}(X_{\text{ét}})$  if  $p$  is invertible on  $X$ .

For any  $\mathbf{m}$ -adic sheaf  $\mathcal{F}$ , denote  $\mathcal{F}(1)$  to be the sheaf  $\mathcal{F} \otimes \Lambda(1)$ . Also denote  $\Lambda(r) = \Lambda(1)^{\otimes r}$ .  $\lrcorner$

**Def. (9.4.6.12) [Stalk Maps].** For any  $k \in \mathbf{Field}$ ,  $k = k^{\text{sep}}$  and  $s \in S(k^{\text{sep}})$ , there is a **stalk map**

$$\mathrm{Sh}_{\mathbf{m}\text{-const}}(S) \rightarrow \mathrm{Mod}_{\Lambda}^{\text{fin}} : \mathcal{F}_{\bullet} \mapsto \varprojlim_n (\mathcal{F}_n)_s.$$

It is well-defined by [Conrad, Etale Coh]P72.  $\lrcorner$

**Prop. (9.4.6.13).** Constructibility/lisse (9.4.6.10) are étale-local and stratification-local properties for  $\mathcal{F} \in \mathrm{Sh}_{\mathbf{m}}(S_{\text{ét}})$ .  $\lrcorner$

*Proof:* Cf.[Conrad, Etale Coh]P71.  $\square$

**Prop. (9.4.6.14).** The full subcategory  $\mathrm{Sh}_{\text{lisse}}(S_{\text{ét}}; \Lambda_E) \subset \mathrm{Sh}(S_{\text{ét}}; \Lambda_E)$  (9.4.6.10) is stable under taking kernels and cokernels.  $\lrcorner$

**Prop. (9.4.6.15) [Constructible and Lisse  $\mathbf{m}$ -adic Sheaves].** Let  $S \in \mathbf{NSch}$  and  $\mathcal{F} \in \mathrm{Sh}_{\text{const}}(S_{\text{ét}}; \Lambda_E)$ , then there is a stratification of  $X$  that  $\mathcal{F}$  is locally constant and finite on each stratum.  $\lrcorner$

*Proof:* Cf.[Conrad, Etale Coh]P73  $?$ .

By the stalk criterion of locally constant finite (9.4.2.22), a constructible extension of locally constant finite sheaves is also locally constant finite. So by the exact sequence  $1 \rightarrow \ell^{n-1}\mathcal{F}_n \rightarrow \mathcal{F}_n \rightarrow \mathcal{F}_{n-1} \rightarrow 1$ , iff we show there is a stratification that all  $\ell^{n-1}\mathcal{F}_n$  are locally constant finite, then by induction all  $\mathcal{F}_n$  are locally constant finite. But then  $\ell^{n-1}\mathcal{F}_n$  is a descending chain of quotients of  $\mathcal{F}_1$ , thus the kernel is ascending thus stabilizes because  $\mathcal{F}_1$  is constructible (9.4.2.23), so there are only f.m. such  $\ell^n\mathcal{F}_n$ , so there is a common stratification.  $\square$

**Cor. (9.4.6.16).** Exactness/Isomorphism between constructible sheaves can be checked at stalks.  $\lrcorner$

**Def. (9.4.6.17) [Lisse and Constructible  $E$ -Sheaves].** Define the category of **lisse  $E$ -sheaves** on  $X$  is defined to be the subcategory

$$\mathrm{Sh}_{\mathrm{lisse}}(X_{\mathrm{\acute{e}t}}; E) \triangleq \mathrm{Sh}_{\mathrm{lisse}}(X_{\mathrm{\acute{e}t}}; \Lambda_E) \otimes_{\Lambda_E} E \quad (9.4.6.10).$$

And define the category of **constructible  $E$ -sheaves** on  $X$  as the category

$$\mathrm{Sh}_{\mathrm{const}}(X_{\mathrm{\acute{e}t}}; E) \triangleq \mathrm{Sh}_{\mathrm{const}}(X_{\mathrm{\acute{e}t}}; \Lambda_E) \otimes_{\Lambda_E} E \quad (9.4.6.10).$$

**Def. (9.4.6.18) [Étale Tate-Twist Sheaves].** Denote  $E(r) = \Lambda_E(r) \otimes_{\Lambda_E} E \in \mathrm{Sh}_{\mathrm{lisse}}(X_{\mathrm{\acute{e}t}}; E)$  (9.4.6.17), called the **Étale Tate-twist sheaf**.  $\lrcorner$

**Prop. (9.4.6.19) [Lisse  $K$ -Sheaves and  $\pi_1(S, \bar{s})$ -Representations].** Assume  $S$  is connected, then for any  $\bar{s} \in S$  with  $\kappa(\bar{s})$  separable, the stalk map  $\mathcal{F} \rightarrow \mathcal{F}_{\bar{s}}$  induces equivalences:

$$\mathrm{Sh}_{\mathrm{const}}(S_{\mathrm{\acute{e}t}}; \Lambda_E) \cong \mathrm{Rep}_{\Lambda_E}(\pi_1(S, \bar{s})), \quad \mathrm{Sh}_{\mathrm{const}}(S_{\mathrm{\acute{e}t}}; E) \cong \mathrm{Rep}_K^{\mathrm{fd}}(\pi_1(S, \bar{s})).$$

*Proof:* The point is that by (24.2.3.2), any representation of  $\pi_1(S, \bar{s})$  stabilizes some  $\Lambda$ -lattice. So by the equivalence (9.3.2.2)(9.4.2.20) and taking limit using (9.4.6.6), we get the result about  $\mathcal{O}_E$ -sheaves and representations of  $\pi_1(S, \bar{s})$  over  $\mathcal{O}_E$ .  $\square$

**Prop. (9.4.6.20) [Lisse and Specializations].** If  $S \in \mathrm{NSch}$  and  $\mathcal{F} \in \mathrm{Sh}_{\mathrm{const}}(S_{\mathrm{\acute{e}t}}; \Lambda_E)$ , then  $\mathcal{F}$  is lisse (9.4.6.10) iff all the specialization maps for geometric points  $\mathcal{F}_{\bar{s}} \rightarrow \mathcal{F}_{\bar{\eta}}$  are bijective.

And if  $S$  is moreover normal, then the same holds for  $\mathcal{F} \in \mathrm{Sh}_{K\text{-const}}(S_{\mathrm{\acute{e}t}})$ .  $\lrcorner$

*Proof:* We can assume  $\mathcal{F}$  is strictly  $\mathfrak{m}$ -adic (9.4.6.10) and then use (9.4.2.22) on each  $\mathcal{F}_n$ .

For the second assertion, Cf. [Conrad, Etale Coh]P77.  $\square$

**Cor. (9.4.6.21) [Étale Descent for Lisse  $K$ -Sheaves].** If  $S$  is Noetherian and normal, then étale-descent holds for lisse  $K$ -sheaves.  $\lrcorner$

*Proof:* ?  $\square$

**Prop. (9.4.6.22) [Constructible Sheaves are Noetherian].** Constructible  $\mathfrak{m}$ -adic sheaves are Noetherian, i.e. scending chain of subsheaves stabilizes.  $\lrcorner$

*Proof:* Cf. [Conrad L16 P3].  $\square$

**Prop. (9.4.6.23).** For any  $\mathcal{F} \in \mathrm{Sh}_{\mathfrak{m}\text{-const}}(S_{\mathrm{\acute{e}t}})$ , there exists some  $\mathcal{G} \in \mathrm{Sh}_{\Lambda\text{-const}}(S_{\mathrm{\acute{e}t}})$  s.t.  $\mathcal{G} \subset \mathcal{F}$  and  $\mathcal{F}/\mathcal{G}$  has  $\Lambda$ -flat stalks.

In particular, any  $\mathcal{F} \in \mathrm{Sh}_{K\text{-const}}(S_{\mathrm{\acute{e}t}})$  is  $K$ -isomorphic to some  $K \otimes \mathcal{F}'$  where  $\mathcal{F}'$  has  $\Lambda$ -flat stalks.  $\lrcorner$

*Proof:* Cf. [Conrad Etale Coh]P75. ?  $\square$

**Def. (9.4.6.24) [Extensions].** Let  $\Lambda'/\Lambda$  be an extension, then we can define extension functors

$$\Lambda' \otimes_{\Lambda} - : \mathrm{Sh}_{\Lambda\text{-const}}(X_{\mathrm{\acute{e}t}}) \rightarrow \mathrm{Sh}_{\Lambda'\text{-const}}(X_{\mathrm{\acute{e}t}}), \quad K' \otimes_K - : \mathrm{Sh}_{K\text{-const}}(X_{\mathrm{\acute{e}t}}) \rightarrow \mathrm{Sh}_{K'\text{-const}}(X_{\mathrm{\acute{e}t}}).$$

?  $\lrcorner$

**Constructible and Lisse  $\overline{\mathbb{Q}_\ell}$ -Sheaves**

**Def. (9.4.6.25) [ $\overline{\mathbb{Q}_\ell}$ -Sheaves].** The category  $\mathrm{Sh}_{\mathrm{const}}(X_{\acute{\mathrm{e}}\mathrm{t}}; \overline{\mathbb{Q}_\ell})$  of **constructible  $\overline{\mathbb{Q}_\ell}$ -sheaves** on  $X$  is defined to be the direct limit of categories

$$\mathrm{Sh}_{\mathrm{const}}(X_{\acute{\mathrm{e}}\mathrm{t}}; \overline{\mathbb{Q}_\ell}) \triangleq \varinjlim_{E \in \ell\text{-}\mathbf{NField}} \mathrm{Sh}_{\mathrm{const}}(X_{\acute{\mathrm{e}}\mathrm{t}}; E).$$

And the category of **lisse  $\overline{\mathbb{Q}_\ell}$ -sheaves** on  $X$  is defined to be

$$\mathrm{Sh}_{\mathrm{lisse}}(X_{\acute{\mathrm{e}}\mathrm{t}}; \overline{\mathbb{Q}_\ell}) \triangleq \varinjlim_{E \in \ell\text{-}\mathbf{NField}} \mathrm{Sh}_{\mathrm{lisse}}(X_{\acute{\mathrm{e}}\mathrm{t}}; E) \quad (9.4.6.17).$$

┘

**Prop. (9.4.6.26) [Lisse  $\overline{\mathbb{Q}_\ell}$ -Sheaves and  $\pi_1(X, \bar{x})$ -Representations].** Assume  $S$  is connected, then for any  $\bar{s} \in S$  with  $\kappa(\bar{s})$  separable, the stalk map  $\mathcal{F} \rightarrow \mathcal{F}_{\bar{s}}$  induces equivalences:

$$\mathrm{Sh}_{\mathrm{const}}(X_{\acute{\mathrm{e}}\mathrm{t}}; \overline{\mathbb{Q}_\ell}) \cong \mathrm{Rep}_{\overline{\mathbb{Q}_\ell}}^{\mathrm{fd}}(\pi_1(X, \bar{x})), \quad \mathrm{Sh}_{\mathrm{const}}(X_{\acute{\mathrm{e}}\mathrm{t}}; \Lambda) \cong \mathrm{Rep}_\Lambda(\pi_1(X, \bar{s})).$$

┘

*Proof:* This follows from (9.4.6.19) and (24.2.3.2) by taking direct limit.  $\square$

**Cor. (9.4.6.27) [Irreducible and Semisimple Lisse Sheaves].**  $\mathcal{F} \in \mathrm{Sh}_{\mathrm{lisse}}(S_{\acute{\mathrm{e}}\mathrm{t}}; \overline{\mathbb{Q}_\ell})$  is called an **irreducible lisse sheaf** (resp. **semi-simple lisse sheaf**) if its corresponding representation (9.4.6.26) is.

And  $\mathcal{F}$  is called a **geometrically irreducible lisse sheaf** (resp. **geometrically semi-simple lisse sheaf**) if  $\mathcal{F}_{k^{\mathrm{sep}}} \in \mathrm{Sh}_{\mathrm{lisse}}((S_{k^{\mathrm{sep}}})_{\acute{\mathrm{e}}\mathrm{t}}; \overline{\mathbb{Q}_\ell})$  is irreducible (resp. semi-simple), or equivalently, its corresponding representation is irreducible/semisimple as a  $\pi_1(S_{k^{\mathrm{sep}}}, \bar{s})$ -representation.  $\square$

 **$\ell$ -adic Cohomologies**

**Def. (9.4.6.28) [Derived Category of Constructible Sheaves].** Define the **derived category of bounded complexes with constructible cohomology sheaves**  $D_{\mathrm{const}}^b(X_{\acute{\mathrm{e}}\mathrm{t}}; \Lambda_E)$  and the **derived category of bounded complexes with constructible cohomology groups with finite Tor dimensions**  $D_{\mathrm{csttf}}^b(X_{\acute{\mathrm{e}}\mathrm{t}}; \Lambda_E)$ .

And denote

$$\begin{aligned} D_{\mathrm{const}}^b(X_{\acute{\mathrm{e}}\mathrm{t}}; E) &\triangleq D_{\mathrm{const}}^b(X_{\acute{\mathrm{e}}\mathrm{t}}; \Lambda_E) \otimes_{\Lambda_E} E, & D_{\mathrm{csttf}}^b(X_{\acute{\mathrm{e}}\mathrm{t}}; E) &\triangleq D_{\mathrm{csttf}}^b(X_{\acute{\mathrm{e}}\mathrm{t}}; \Lambda_E) \otimes_{\Lambda_E} E. \\ D_{\mathrm{const}}^b(X_{\acute{\mathrm{e}}\mathrm{t}}; \overline{\mathbb{Q}_\ell}) &\triangleq \varinjlim_{E \in \ell\text{-}\mathbf{NField}} D_{\mathrm{const}}^b(X_{\acute{\mathrm{e}}\mathrm{t}}; E), & D_{\mathrm{csttf}}^b(X_{\acute{\mathrm{e}}\mathrm{t}}; \overline{\mathbb{Q}_\ell}) &\triangleq \varinjlim_{E \in \ell\text{-}\mathbf{NField}} D_{\mathrm{csttf}}^b(X_{\acute{\mathrm{e}}\mathrm{t}}; E). \end{aligned}$$

┘

*Proof:* ? Cf. [Ekedahl, on the Adic Formalism].  $\square$

**Prop. (9.4.6.29) [Direct Pushforward of  $m$ -adic Sheaves].** For a compactifiable morphism  $f : X \rightarrow S \in \mathrm{Sch}$  and  $\mathcal{F} \in \mathrm{Sh}_{\mathrm{const}}(X_{\acute{\mathrm{e}}\mathrm{t}}; \Lambda_E)$ , we can define  $R^i f_*$  and  $R^i f_!$  termwisely, and we have  $R^i f_* \mathcal{F}$  is a constructible sheaf, hence so is  $R^i f_!$ .  $\square$

*Proof:* Cf. [Weil Conjecture and Étale sheaves, P128].  $\square$

**Def. (9.4.6.30) [ $p$ -adic étale Cohomologies].** For  $X \in \mathrm{Sch}$ ,  $p \in \mathrm{Prime}$  and any  $i \in \mathbb{N}$ , define

$$H_{\acute{\mathrm{e}}\mathrm{t}}^i(X; \mathbb{Q}_p) = \left( \varprojlim_n H_{\acute{\mathrm{e}}\mathrm{t}}^i(X; \mathbb{Z}/(p^n)) \right) \left[ \frac{1}{p} \right],$$

called the  $i$ -th  $p$ -adic étale cohomology of  $X$ .  $\square$

## 6-operator Formalism

### Artin-Schreier Sheaves

**Def. (9.4.6.31) [Artin-Schreier Sheaves].** The Artin-Schreier cover (9.4.1.36) gives a map  $\pi_1(\mathbb{A}_{\mathbb{F}_q}^1, \bar{s}) \rightarrow \mathbb{F}_q$ , when composed with any character  $\psi : \mathbb{F}_q \rightarrow \overline{\mathbb{Q}_\ell}^\times$ , we get a rank 1  $\ell$ -adic étale sheaf  $\mathcal{L}(\psi)$  via (9.4.6.19), called an **Artin-Schreier sheaf** on  $\mathbb{A}_{\mathbb{F}_q}^1$ .

Moreover, if we extend  $\psi$  to  $\mathbb{F}_{q^n}$  by  $\psi_n = \psi \circ \text{tr}_{\mathbb{F}_{q^n}/\mathbb{F}_q}$ , then the definition of  $\mathcal{L}(\psi)$  or even  $\mathcal{L}(\psi_x)$  is compatible with base change. (where  $\psi_x(y) = \psi(xy)$ .)  $\lrcorner$

*Proof:* This is because over a base change field  $\mathbb{F}_{q^n}$ , there is a map of Galois coverings:

$$\wp^{(n)} = \wp \circ \text{tr}_{\mathbb{F}_{q^n}/\mathbb{F}_q} : \mathbb{A}_{\mathbb{F}_{q^n}}^1 \rightarrow \mathbb{A}_{\mathbb{F}_q}^1,$$

so by a minute's thought, their corresponding maps  $\pi_1(\mathbb{A}_{\mathbb{F}_{q^n}}^1, \bar{s}) \rightarrow \overline{\mathbb{Q}_\ell}^\times$  are the same. Thus  $\mathcal{L}(\psi_n) \cong \mathcal{L}(\psi)$  over  $\mathbb{F}_{q^n}$ .

For  $\psi_x$ , just notice if  $x \in \mathbb{F}_q$ ,  $\psi_x \circ \text{tr}_{\mathbb{F}_{q^n}/\mathbb{F}_q} = (\psi_n)_x$ .  $\square$

**Prop. (9.4.6.32).** Situation as in (9.4.6.31), for  $1 \neq \psi \in \chi(\mathbb{F}_q)$  and  $x \in \mathbb{F}_q$ , denote  $\psi_x \in \chi(\mathbb{F}_q) : y \mapsto \psi(xy)$ , then

$$\wp_*(\overline{\mathbb{Q}_\ell}) = \bigoplus_{x \in \mathbb{F}_q} \mathcal{L}(\psi_x).$$

$\lrcorner$

*Proof:* Cf. [K-W01]P39.  $\square$

**Prop. (9.4.6.33) [Frobenius Action on Artin-Schreier Sheaves].** Situation as in (9.4.6.31), for any  $x \in \mathbb{A}^1(\mathbb{F}_{q^n})$ ,  $\text{Frob}_x^{-1}$  acts on the stalk  $\mathcal{L}(\psi^{-1})_{\bar{x}}$  via multiplication by  $\psi(\text{tr}_{\mathbb{F}_{q^n}/\mathbb{F}_q}(x))$ .  $\lrcorner$

*Proof:* By (9.4.6.31), we may base change to  $\mathbb{F}_{q^n}$ . Let  $\alpha \in \mathbb{A}^1(\overline{\mathbb{F}_q})$  s.t.  $\alpha^{q^n} - \alpha = x$ , then the arithmetic Frobenius at  $x$  maps  $\alpha$  to  $\alpha^{q^n} = \alpha + x$ . So by the definition of fundamental group (9.3.2.2), (9.6.2.4) and the definition of the Artin-Schreier sheaf (9.4.6.31),  $\text{Frob}_x^{-1}$  acts via multiplication by  $\psi(\text{tr}_{\mathbb{F}_{q^n}/\mathbb{F}_q}(x))$ .  $\square$

## Analytification

### Comparison Theorems

**Thm. (9.4.6.34) [Topological Comparison, Artin].** For  $f : X \rightarrow S \in \text{Sch}^{\text{sep, ft}}/\mathbb{C}$ ,

- If  $\mathcal{F} \in \text{Sch}_{\text{tor}}(S_{\text{ét}})$ , then the comparison morphism for  $R^\bullet f_!$  is an isomorphism.
- If  $\mathcal{F} \in \text{Sch}_{\text{const}}(S_{\text{ét}})$ , then the comparison morphism for  $R^\bullet f_*$  is an isomorphism.

$\lrcorner$

*Proof:* [Conrad, Etale Coh] ?  $\square$

**Cor. (9.4.6.35) [Comparison with Betti Cohomology].** For  $X \in \text{Sch}^{\text{ft, sep}}/\mathbb{C}$ ,  $A \in \text{Ab}^{\text{fin}}$ , there is a canonical isomorphism

$$H_{\text{ét}}^q(X, \underline{A}_X) \cong H_{\text{Betti}}^q(X; A).$$

$\lrcorner$

**Cor. (9.4.6.36) [Good Reduction cases].** For  $(K, \mathcal{O}_K, \kappa) \in p\text{-NField}$  and  $\mathcal{X} \in \text{SmPrpr}/\mathcal{O}_K$ , let  $X = \mathcal{X}_\kappa$ , then for  $\ell \neq p$ , we have

$$H_{\text{ét}}^i(X_{\bar{\kappa}}; \mathbb{Q}_\ell) \cong H^i(\mathcal{X}_{\bar{\eta}}; \mathbb{Q}_\ell) \cong H_{\text{Betti}}^i(\mathcal{X}_{\mathbb{C}})_{\mathbb{Q}_\ell}.$$

In particular,  $H_{\text{ét}}^i(X, \mathbb{Q}_\ell)$  is an unramified representation of  $\text{Gal}_K$ .  $\lrcorner$

*Proof:* Let  $\text{Spec } \mathcal{O}_{F_v} = \{s, \eta\}$ , where  $s$  is the special point and  $\eta$  the generic point. Let  $\bar{\eta}, \bar{s}$  be arithmetic points mapping to  $\eta, s$  resp. By proper base change (9.4.3.1), The stalk of higher direct image of  $X \rightarrow \mathcal{O}_{F_v}$  along  $\bar{s}, \bar{\eta}$  are  $H_{\text{ét}}^i(\bar{X}, \mathbb{Q}_\ell)$  and  $H^i(\mathcal{X}_{\bar{\eta}}, \mathbb{Q}_\ell)$  resp., and they are the same by (9.4.5.4). And  $H_{\text{ét}}^i(\mathcal{X}_{\bar{\eta}}, \mathbb{Q}_\ell) \cong H_{\text{Betti}}^i(X, \mathbb{Q}_\ell)$  by (9.4.6.35) and the fact  $\bar{\mathbb{Q}}_\ell$  is isomorphic to  $\mathbb{C}$ .  $\square$

**Prop. (9.4.6.37) [Étale and Fppf Comparison].** Let  $X \in \text{Sch}$  and  $G$  a smooth commutative group scheme over  $X$ , then there are natural isomorphisms

$$H_{\text{ét}}^*(X; G) \cong H_{\text{fppf}}^*(X; G).$$

$\lrcorner$

*Proof:* Cf. [Mil80Etale Cohomologies, Prop. III.3].  $\square$

### **A<sub>f</sub>-Cohomologies**

**Def. (9.4.6.38) [A<sub>f</sub>-Cohomologies].** Define

$$H_{\text{ét}}^n(X; \mathbf{A}_f) \triangleq \left( \varprojlim_m H_{\text{ét}}^n(X, \mathbb{Z}/(m)) \right) \otimes \mathbb{Q}.$$

Then if  $X$  is a smooth complete variety over  $\mathbb{C}$ , then by (9.4.6.35), there is a canonical isomorphism

$$H_{\text{Betti}}^n(X) \otimes \mathbf{A}_f \cong H_{\mathbf{A}_f}^n(X).$$

Thus  $H_{\text{Betti}}^n(X) \otimes \mathbf{A}_f$  is intrinsic in  $X$  and  $H_{\mathbf{A}_f}^n(X)$  free over  $\mathbf{A}_f$ .  $\lrcorner$

### **Conjectures**

**Conj. (9.4.6.39) [Semisimplicity Conjecture, Grothendieck-Serre].** For  $F \in \text{NField}$  and  $X \in \text{SmPrpr}/F$ , the action of  $\text{Gal}_F$  on  $H_{\text{ét}}^i(X_{\bar{F}}, \mathbb{Q}_p)$  is semisimple.  $\lrcorner$

*Proof:*

$\square$

**Thm& Conj. Cor. (9.4.6.40).** This is known for  $X \in \text{AbVar}/F$  and some Shimura varieties  $X/F$ .  $\lrcorner$

*Proof:* By work of Faltings?  $\square$

**Conj. (9.4.6.41) [F-Semisimplicity Conjecture].** For  $F \in \text{NField}$  and  $X \in \text{SmPrpr}/F$ , if  $v \nmid p$ , then the action of  $\sigma_v$  on  $H_{\text{ét}}^i(X_{\bar{F}}, \mathbb{Q}_p)$  is semisimple.

There is also a version with  $v|p$ , which says that the action of  $\varphi_{\text{crys}, v}^{\deg v}$  on  $D_{\text{crys}}(H_{\text{ét}}^i(X_{\bar{F}}, \mathbb{Q}_p)|_{\text{Gal}_{F_v}})$  is semisimple.  $\lrcorner$

*Proof:*

$\square$

**Thm& Conj. Cor. (9.4.6.42).**  $F$ -semi-simplicity conjecture (9.4.6.41) is true for  $X \in \text{AbVar}/F$ .  $\lrcorner$

*Proof:* by work of Tate?  $\square$

**Weil-Axioms**

**Prop. (9.4.6.43) [Compact  $\ell$ -adic Étale Cohomologies].** Let  $k \in \mathbf{Field}$ ,  $k = k^{\text{sep}}$ ,  $X \in \mathbf{Sch}^{\text{sep,ft}}/k$ , and  $\Lambda \in \mathcal{A}\mathbf{b}^{\text{tor}}$  with  $(\text{char } k, \#\Lambda) = 1$ , then

1.  $H_{\text{ét},c}^i(X, \underline{\Lambda})$  are finite  $\Lambda$ -modules.
2. For  $n \in \mathbb{Z}$ ,  $H_{\text{ét},c}^n(X, \underline{\Lambda}) = 0$  unless  $n \in [2 \dim X]$ . And if  $X$  is affine, then  $H_{\text{ét},c}^n(X, \underline{\Lambda}) = 0$  unless  $n \in [\dim X]$ .
3. There is a natural isomorphism  $H_{\text{ét},c}^{2d}(X, \underline{\Lambda}) \cong \Lambda[S]$ , where  $S$  is the set of irreducible components of  $X$  of dimension  $d$ .
4. there is a long exact sequence

$$\cdots \rightarrow H_{\text{ét},c}^p(U, \underline{\Lambda}) \rightarrow H_{\text{ét},c}^p(X, \underline{\Lambda}) \rightarrow H_{\text{ét},c}^p(Z, \underline{\Lambda}) \rightarrow H_{\text{ét},c}^{p+1}(U, \underline{\Lambda}) \rightarrow \cdots$$

$$5. \text{ For } d \in \mathbb{Z}_+, H_{\text{ét},c}^i(\mathbb{A}_k^d, \underline{\Lambda}) = \begin{cases} \Lambda & , i = 2d \\ 0 & , \text{otherwise} \end{cases}.$$

6. If  $G \in \mathcal{A}\mathbf{lgGrp}_{\text{cnd}}/k$  acting regularly on  $X$ , then  $G(k)$  acts trivially on  $H_{\text{ét},c}^i(X, \underline{\Lambda})$ .

┘

*Proof:* 1 follows from (9.4.5.1). 4 follows from excision (9.4.4.7).

2 follows from (9.4.2.11) and (9.4.2.12).

3: By item2 and item4, it suffices to show for  $X$  irreducible. ?

5: This follows from Künneth formula (9.4.6.46) and (9.4.7.5).

6: Cf. [Deligne-Lustig] Prop 6.4 ?.

□

**Def. (9.4.6.44) [Cup Product].**

┘

**Cor. (9.4.6.45) [Homotopy Axiom].** Two maps  $\varphi, \varphi' : X \rightarrow Y \in \mathbf{Sch}$  induce the same map on the  $\ell$ -adic cohomology if their graphs are rationally equivalent.

┘

*Proof:* This is because the maps on cohomology depends only on the rational equivalence classes of the graph. ?

□

**Prop. (9.4.6.46) [Künneth Formula].** Let  $X, Y$  be complete varieties over  $k$ , then there is a natural isomorphism

$$H_{\text{ét}}^*(X, \mathbb{Q}_\ell) \otimes H_{\text{ét}}^*(Y, \mathbb{Q}_\ell) \cong H_{\text{ét}}^*(X \times Y, \mathbb{Q}_\ell).$$

┘

*Proof:* ?

□

**Lemma (9.4.6.47) [Torsion Poincaré-Duality].**

┘

**Prop. (9.4.6.48) [Poincaré-Duality].** If  $X \in \mathbf{Sch}^{\text{sm}\mathcal{P}\text{rpr}}/k$ ,  $d = \dim X$  and  $\mathcal{F} \in \mathbf{Sh}_{\text{lisse}}(X_{\text{ét}})$ , then there is a natural isomorphism  $H_{\text{ét},c}^{2d}(X_{k^{\text{sep}}}, \mathbb{Q}_\ell(d)) \xrightarrow{\text{tr}_X} \mathbb{Q}_\ell$  and a perfect pairing

$$H_{\text{ét},c}^n(X_{k^{\text{sep}}}, \mathcal{F}) \times H_{\text{ét},c}^{2d-n}(X_{k^{\text{sep}}}, \mathcal{F}^\vee(d)) \xrightarrow{\cup} H_{\text{ét},c}^{2d}(X_{k^{\text{sep}}}, \mathbb{Q}_\ell(d)) \xrightarrow{\text{tr}_X} \mathbb{Q}_\ell,$$

That is  $\text{Gal}_k$ -equivariant.

┘

*Proof:* Cf.[Conrad L12-13], [Weil 2Bhatt P5].?

□

**Def. (9.4.6.49) [Cycle Maps].** For  $X \in \text{Sch}^{\text{SmPrpr}}/k$ , there exists an **étale cycle map**

$$\text{cyl}_\ell : \text{CH}^j(X) \rightarrow H_{\text{ét}}^{2j}(X_{k^s}, \mathbb{Q}_\ell)(j)$$

s.t.

$$x \cdot y = \text{tr}_X(\text{cyl}_\ell(x) \cup \text{cyl}_\ell(y)).$$

┘

*Proof:*

□

## 7 Curves and Surfaces

**Prop. (9.4.7.1).** Let  $k \in \text{Field}$  s.t.  $k = k^{\text{sep}}$  and  $X \in \text{Sch}^{\text{sep,ft,dim}=1}/k$ . If  $\mathcal{F} \in \text{Sh}_{\text{tor}}(X_{\text{ét}})$ , then  $H_{\text{ét}}^i(X, \mathcal{F}) = 0$  for  $i \in \mathbb{Z}_{\geq 3}$ . If  $\mathcal{F} \in \text{Sh}_{\text{const}}(X_{\text{ét}})$ , then  $H_{\text{ét}}^i(X, \mathcal{F})$  are finite.

Moreover if  $X$  is affine and  $\mathcal{F}$  is locally killed by  $n$  not divisible by  $\text{char } k$  or  $X$  is proper and sections of  $\mathcal{F}$  are locally  $p$ -torsions with  $p = \text{char } k > 0$ , then  $H_{\text{ét}}^2(X, \mathcal{F}) = 0$ . ┘

*Proof:* Cf.[Conrad L4 P4] and [Tamme].

□

**Lemma (9.4.7.2) [Smooth Complete Curves].** If  $k \in \text{Field}$ ,  $k = k^{\text{sep}}$ ,  $g \in \mathbb{N}$  and  $X \in \text{SmPrprCur}^g/k$  and  $n \in \mathbb{Z} \cap k^\times$ , then there are canonical identifications

$$H_{\text{ét}}^q(X, \mu_n) = \begin{cases} \mu_n(k) & , q = 0 \\ \text{Pic}^0(X)[n] & , q = 1 \\ \mathbb{Z}/n\mathbb{Z} & , q = 2 \\ 0 & , q \geq 3 \end{cases}, \quad \#H_{\text{ét}}^q(X, \mu_n) = \begin{cases} n & , q = 0 \\ n^{2g} & , q = 1 \\ n & , q = 2 \\ 0 & , q \geq 3 \end{cases}.$$

In particular, because  $\mathbb{Z}/(n) \cong \mu_n$ , we can get the corresponding cohomologies. ┘

*Proof:* Cf.[Sta]03RQ.

□

**Prop. (9.4.7.3) [Torsion-Freeness].** Let  $k \in \text{Field}$ ,  $L \in \ell\text{-NField}$ ,  $X \in \text{SmCur}/k$ , then  $H_{\text{ét},c}^i(X, \mathcal{O}_L)$  are  $\mathcal{O}_L$ -torsion-free. ┘

*Proof:* Cf. [SGA4 $\frac{1}{2}$ , Chap3.3].?

□

**Prop. (9.4.7.4) [Curve and Jacobians].** For  $k \in \text{Field}$  and  $C \in \text{SmPrprCur}/k$ , we have

$$H_{\text{ét}}^1(C, \mathbb{Q}_\ell) \cong H_{\text{ét}}^1(\text{Jac}(C), \mathbb{Q}_\ell).$$

┘

*Proof:*

□

**Prop. (9.4.7.5) [Non-Complete Curves].** If  $k \in \text{Field}$ ,  $k = k^{\text{sep}}$ ,  $\ell \in \text{Prime} \setminus \{\text{char } k\}$ , then

$$H_{\text{ét},c}^i(\mathbb{A}_k^1, \mathbb{Q}_\ell) = \begin{cases} \mathbb{Q}_\ell & , i = 2 \\ 0 & , \text{otherwise} \end{cases}, \quad H_{\text{ét},c}^i(\mathbb{A}_k^1 \setminus \{0\}, \mathbb{Q}_\ell) = \begin{cases} \mathbb{Q}_\ell & , i = 1, 2 \\ 0 & , \text{otherwise} \end{cases}$$

┘

*Proof:* These follow from (9.4.7.2) by excision and (9.4.2.12).

□

## 9.5 Pro-Étale Cohomology

References are [?B-S14] and [Sta]Chap56.

Deligne introduced a derived category of  $\ell$ -adic sheaves as a certain 2-limit of categories of complexes of sheaves of  $\mathbb{Z}/\ell^n\mathbb{Z}$ -modules on the étale site of a scheme  $X$ . This approach is used in the paper by Beilinson, Bernstein, and Deligne ([BBD82]) as the basis for the theory of perverse sheaves. In a paper entitled “Continuous Étale Cohomology” ([Jan88]) Jannsen discusses an important variant of the cohomology of a  $\ell$ -adic sheaf on a variety over a field. His paper is followed up by a paper of Torsten Ekedahl ([Eke90]) who discusses the adic formalism needed to work comfortably with derived categories defined as limits.

### 1 Ring-Theoretical Stuff

**Def. (9.5.1.1) [étale Local Isomorphism].** A ring map  $A \rightarrow B$  is called a **local isomorphism** if for every prime  $\mathfrak{q} \in \text{Spec } B$ , there is a nbhd  $\text{Spec } B_{\mathfrak{q}}$  that  $\text{Spec } B_{\mathfrak{q}} \rightarrow \text{Spec } A$  is an open immersion.  $\lrcorner$

**Prop. (9.5.1.2).** The class of local isomorphisms is stable under base change and compositions. (This follows from (7.4.5.11)).

Moreover, if  $A \rightarrow B \rightarrow C$  are ring maps that  $A \rightarrow B, A \rightarrow C$  are both local isomorphisms, then  $B \rightarrow C$  is also a local isomorphism.  $\lrcorner$

**Def. (9.5.1.3) [w-Local Rings].** A ring  $A$  is called **w-local** if  $\text{Spec } A$  is w-local (4.12.3.20). it is called **strictly w-local** if it is w-local and every f.f. étale map  $A \rightarrow B$  has a section. A map of rings is called **w-local** if it induces a w-local map (4.12.3.20) on the  $\text{Spec}$ .  $\lrcorner$

**Prop. (9.5.1.4).** A w-local ring  $A$  is strictly w-local iff all local rings of  $A$  at closed pts are strictly-Henselian (5.3.10.1).  $\lrcorner$

*Proof:* Cf. [Pro-Etale Cohomology, Scholze, P10].  $\square$

### Ind-Zariski Algebra

**Def. (9.5.1.5) [Ind-Zariski Algebra].** A ring map  $A \rightarrow B$  is called **ind-Zariski/smooth/étale** if  $B$  is a filtered colimit of local isomorphisms/smooth ring maps/étale ring maps  $A \rightarrow B_i$ .  $\lrcorner$

**Prop. (9.5.1.6) [Properties of Ind-Zariski Algebras].** Ind-Zariski ring maps are stable under base change and composition, by (9.5.1.2). ?

If  $A \rightarrow B \rightarrow C$  are ring maps that  $A \rightarrow B, A \rightarrow C$  are both ind-Zariski, then  $B \rightarrow C$  is also ind-Zariski.

$A \rightarrow B$  be ind-Zariski, then it identifies local rings.  $\lrcorner$

*Proof:*  $\square$

**Def. (9.5.1.7) [Ind-(Zariski Localization)].** A ring map  $A \rightarrow B$  is called a **Zariski localization** if  $B = \prod_i^n A_{f_i}$ . An **ind-(Zariski localization)** of  $A$  is a colimit of Zariski localizations of  $A$ .  $\lrcorner$

## 9.6 Cohomologies over Finite Fields

Basic References are [Conrad Seminar note in Stanford], [Seminar on Gross-Zagier over Function Fields, Lei Fu], [Seminar notes on Weil 2 Bhatt], [K-W01], [Étale Cohomology and Weil Conjecture], [A course on Weil Conjectures, Szamuely], [Deligne's proof of the Weil Conjecture, Jannsen].

**Notation(9.6.0.1).**

- Let  $k_0 \in \mathbf{Field}^{\text{fin}}$  and  $k = \overline{k_0}$ .
- Denote  $k_n$  the unique extension of  $k_0$  of degree  $n$  in  $k$ .
- Let  $\ell \in \mathbf{Prime} \setminus \{\text{char } k\}$ .
- Let  $X_0 \in \mathbf{Sch}^{\text{ft}}/k$  and denote  $X = X_0 \otimes_{k_0} k$ .
- Use notations on Étale Cohomology Theory defined in [Étale Cohomology Theory](#).
- Use notations on Frobenius Morphisms defined in ??.
- If  $\mathcal{F}_0 \in \mathbf{Sh}(X_{\text{ét}})$ , then denote  $\mathcal{F} = \mathcal{F}_0 \otimes_k \overline{k}$ .
- If  $x_0 \in |X_0|_0$ , denote  $x = x_0 \otimes_k \overline{k}$ , and choose a arbitrary  $\overline{x} \in x$ .
- Fix a CDVR  $(\Lambda, K, \mathfrak{m}, \kappa_\Lambda)$  of mixed characteristic  $(0, \ell)$ .
- For a Noetherian ring  $A \in \mathbf{CRing}$  with a distinguished ideal  $I \in \mathbf{Ideal}(A)$ , denote  $A_n = A/I^n$ .

┘

### 1 Trace Formulae

References are [Pin92], [Lefschetz-Verdier Rigid geometry, Lefschetz-Verdier trace formula and Deligne's conjecture, Fujiwara]. [Lefschetz-Verdier Trace Formula and a Generalization of a Theorem of Fujiwara].

**Notation(9.6.1.1).**

- Let  $k \in \mathbf{Field}$  s.t.  $k = k^{\text{sep}}$ .
- Let  $X, X_1, X_2 \in \mathbf{Sch}^{\text{sep,ft}}/k$ .
- Let  $E_\lambda \in \ell\text{-NField}$ .
- Let  $\Lambda \in \{\mathcal{O}_\lambda\} \cup \{\mathcal{O}_\lambda/\mathfrak{m}_\lambda^n\}_{n \in \mathbb{Z}_+}$ .

┘

### Cohomological Correspondences

**Def.(9.6.1.2)[Correspondences].** A **correspondence of schemes** between  $X_1, X_2 \in \mathbf{Sch}^{\text{sep,ft}}/k$  is a map  $c : C \rightarrow X_1 \times X_2$ . For such a correspondence, we denote  $c_1 \triangleq \text{pr}_1 \circ c, c_2 \triangleq \text{pr}_2 \circ c$ .

┘

**Def.(9.6.1.3)[Morphisms and Correspondences].** Any  $f : X \rightarrow X \in \mathbf{Sch}/S$  induces a correspondence

$$\Gamma_f : X \xrightarrow{f \times \text{id}_X} X \times_S X \in \mathbf{Sch}/S.$$

┘

**Def. (9.6.1.4) [Fixed Points of Correspondences].** For a correspondence  $a : Y \rightarrow X \times X \in \text{Sch}/k$  (9.6.1.2), the **fixed point scheme of the correspondence** is defined to be  $\text{Fix}(a) \stackrel{\Delta}{=} Y \times_{X \times X} \Delta_X$ .

And we denote the natural maps  $\Delta'_c : \text{Fix}(c) \rightarrow C, c' : \text{Fix}(c) \rightarrow X$ .  $\lrcorner$

**Def. (9.6.1.5) [Proper Correspondences].** A morphism of correspondences  $[f] = (f^\natural, f_1, f_2)$  between two correspondences  $c : C \rightarrow X_1 \times X_2, b : B \rightarrow Y_1 \times Y_2 \in \text{Sch}/k$  is called a **proper morphism** if  $f^\natural, f_1, f_2$  are all proper. And  $c : C \rightarrow X_1 \times X_2$  is called a **proper correspondence** if  $C/k, X_1/k, X_2/k$  are all proper.  $\lrcorner$

**Def. (9.6.1.6) [Compactifications of Correspondences].** For a correspondence  $c : C \rightarrow X_1 \times X_2 \in \text{Sch}^{\text{sep,ft}}/k$ , a **compactification of correspondence** of  $c$  is a pair  $([j], \bar{c})$  where  $\bar{c} : \bar{C} \rightarrow \bar{X}_1 \times \bar{X}_2 \in \text{Sch}^{\text{proper}}/k$  is a proper correspondence and  $[j] = (j_c, j_1, j_2)$  where  $j_c : C \rightarrow \bar{C}, j_1 : X_1 \rightarrow \bar{X}_1, j_2 : X_2 \rightarrow \bar{X}_2$  are all compactifications (7.8.3.1).

If  $c : C \rightarrow X_1 \times X_2 \in \text{Sch}^{\text{sep,ft}}/k$ , then any compactifications of schemes  $j_1 : X_1 \hookrightarrow \bar{X}_1, j_2 : X_2 \hookrightarrow \bar{X}_2$  extends to a compactification of correspondences  $([j], \bar{c})$ .  $\lrcorner$

*Proof:* To show that the compactification of correspondences exists, take an arbitrary compactification  $j_c : C \rightarrow C'$ , and take  $\bar{C}$  to be the schematic image (7.4.5.13) of the immersion

$$C \rightarrow C' \times \bar{X}_1 \times \bar{X}_2.$$

Then  $\bar{c} \stackrel{\Delta}{=} \text{pr}_{2,3} : \bar{C} \rightarrow \bar{X}_1 \times \bar{X}_2$  is a proper correspondence extending  $c$ , by (7.4.5.21).  $\square$

**Def. (9.6.1.7) [Cohomological Correspondences].** For a correspondence  $c : C \rightarrow X_1 \times_S X_2 \in \text{Sch}/S$  (9.6.1.5) a  **$c$ -morphism** is a morphism  $u : R(c_2)_! c_1^* K_1 \rightarrow K_2 \in D_{\text{csttf}}^b((X_2)_{\text{ét}}; \overline{\mathbb{Q}}_\ell)$  for some  $K_1 \in D_{\text{csttf}}^b((X_1)_{\text{ét}}; \overline{\mathbb{Q}}_\ell)$  and  $K_2 \in D_{\text{csttf}}^b((X_2)_{\text{ét}}; \overline{\mathbb{Q}}_\ell)$ .  $\lrcorner$

**Prop. (9.6.1.8) [Base Change Cohomological Correspondences].** If

$$\begin{array}{ccccc} X_1 & \xleftarrow{c_1} & C & \xrightarrow{c_2} & X_2 \\ \downarrow f_1 & & \downarrow f^\natural & & \downarrow f_2 \\ Y_1 & \xleftarrow{b_1} & B & \xrightarrow{b_2} & Y_2 \end{array} \in \text{Sch}^{\text{sep,ft}}/k$$

is a map of correspondences (9.6.1.2), and either  $(C_2)_{\text{red}} \cong (B \times_{Y_2} X_2)_{\text{red}}$  or  $f^\natural, f_2$  are étale, then we have a base change map  $\text{BC} : R(c_2)_!(f^\natural)^* \rightarrow (f_2)^* R(b_2)_!$  ?. Thus any  $b$ -morphism  $u : R(b_2)_!(b_1)^* K_1 \rightarrow K_2$  (9.6.1.7) pulls back to a  $c$ -morphism

$$[f]^*(u) : R(c_2)_!(c_1)^*(f_1^* K_1) = R(c_2)_!(f^\natural)^*(b_1)^* \mathcal{F}_1 \xrightarrow{\text{BC}} (f_2)^* R(b_2)_! b_1^* K_1 \xrightarrow{f_2^* u} f_2^* K_2.$$

In particular, we can restricts cohomological correspondences to open subschemes.  $\lrcorner$

**Prop. (9.6.1.9) [Extension of Cohomological Correspondences].** For a proper correspondence  $a : Y \rightarrow X \times_k X \in \text{Sch}/\kappa$  (9.6.1.5), suppose

- $Y \hookrightarrow \bar{Y} \in \text{Sch}/\kappa, X \hookrightarrow \bar{X} \in \text{Sch}/\kappa$  are compactifications (7.8.3.1).
- $\bar{a} : \bar{Y} \rightarrow \bar{X} \times_k \bar{X} \in \text{Sch}/\kappa$  is a proper correspondence extending  $a$ ,
- $K \in D_{\text{csttf}}^b(X_{\text{ét}}; \Lambda)$  lifting to a cohomological correspondence  $c_K \in \text{Corr}^{\text{coh}}(a; K)$  (9.6.1.7).

Then  $c_K$  extends canonically to a cohomological correspondence for  $j_!K$  (resp.  $j_*K$ ) if  $a_1$  (resp.  $a_2$ ) is proper. And if  $Y \subset \bar{Y}$  is proper, then this extension is unique.  $\lrcorner$

*Proof:* Cf. [Fuj97]P496.  $\square$

**Prop. (9.6.1.10) [Pushforward Cohomological Correspondences].** If

$$\begin{array}{ccccc} X_1 & \xleftarrow{c_1} & C & \xrightarrow{c_2} & X_2 \\ \downarrow f_1 & & \downarrow f^\natural & & \downarrow f_2 \\ Y_1 & \xleftarrow{b_1} & B & \xrightarrow{b_2} & Y_2 \end{array} \in \text{Sch}^{\text{sep,ft}}/k$$

is a map of correspondences (9.6.1.2), and one of the following holds:

- $\begin{array}{ccc} X_1 & \xleftarrow{c_1} & C \\ \downarrow f_1 & & \downarrow f^\natural \\ Y_1 & \xleftarrow{b_1} & B \end{array}$  is Cartesian.
- $f_1, f^\natural$  are proper.
- $c_1, b_1$  are proper.

Then  $\text{?}$   $\lrcorner$

**Def. (9.6.1.11) [Action of Cohomological Correspondence on Cohomology].** If  $c : C \rightarrow X_1 \times X_2 \in \text{Sch}^{\text{sep,ft}}/k$  is a correspondence s.t.  $c_1$  is proper, and  $u : R(c_2)_!(c_1)^*K_1 \rightarrow K_2 \in D_{\text{csttf}}^b((X_2)_{\text{ét}}, \Lambda)$  is a  $c$ -morphism, then the structural map  $[\pi_c] : c \rightarrow 1_k$  satisfies the conditions in (9.6.1.10), and we get a map

$$R\Gamma_c(u) \triangleq [\pi_c]_!(u) : R\Gamma_c(X_1, K_1) \rightarrow R\Gamma_c(X_2, K_2).$$

More explicitly,  $R\Gamma_c(u)$  is the composition

$$R\Gamma_c(X_1, K_1) \xrightarrow{c_1^*} R\Gamma_c(C, c_1^*K_1) = R\Gamma_c(C, R(c_2)_!(c_1)^*K_1) \xrightarrow{R\Gamma_c(u)} R\Gamma_c(X_2, K_2) \text{ (9.4.4.6)}.$$

More generally, if  $c : C \rightarrow X_1 \times X_2 \in \text{Sch}^{\text{sep,ft}}/k$  is a correspondence and  $U \subset X_1$  is an open subscheme s.t.  $c_1|_{c_1^{-1}(U)}$  is proper, and  $u : R(c_2)_!(c_1)^*K_1 \rightarrow K_2 \in D_{\text{csttf}}^b((X_2)_{\text{ét}}, \Lambda)$  is a  $c$ -morphism s.t.  $K_1|_{X \setminus U} = 0$ . Denote  $c^0 : c_1^{-1}(U_1) \rightarrow U_1 \times X_2$  the restriction of  $c$  and  $u^0$  the restriction of  $u$  to  $c^0$ , then

$$R(j_1)_! : R\Gamma_c(U_1, K_1|_{U_1}) \rightarrow R\Gamma_c(X_1, K_1|_{U_1})$$

is an isomorphism by excision (9.4.4.7), and we define

$$R\Gamma_c(u)R\Gamma_c(u^0) \circ (R(j_1))^{-1} : R\Gamma_c(X_1, K_1) \rightarrow R\Gamma_c(X_2, K_2).$$

$\lrcorner$

**Def. (9.6.1.12) [Local Traces].**  $\text{?}$  For any open subset  $\beta \subset \text{Fix}(a)$ , define  $\text{Tr}_\beta$  to be the composition

$$\text{Tr}_\beta : \text{Hom}(R(c_2)_!c_1^*K, K) \rightarrow H^0(\text{Fix}(c), K_{\text{Fix}(c)}) \rightarrow H^0(\beta, K_\beta).$$

And when  $\beta/k$  is proper, define  $\text{locTr}_\beta(u) : \text{Hom}(R(c_2)_!c_1^*K, K) \rightarrow \Lambda$  to be the trace of  $\text{Tr}_\beta$ .

And when  $\beta$  is a connected component of  $\text{Fix}(a)$  that is proper over  $k$  and  $u \in \text{Hom}(R(c_2)_!c_1^*K, K)$ ,  $\text{locTr}_\beta(u) = (\text{pr}_\beta)_! \circ \text{Tr}_\beta(u) \in \Lambda$   $\text{?}$  is called the **local trace** of  $u$  on  $\beta$ .  $\lrcorner$

*Proof:* Cf.[Fuj97]P495.?

□

**Thm. (9.6.1.13) [Trace Maps and Proper Push-forwards].** Let  $[f] = (f^\natural, f_1, f_2)$  be a proper morphism between correspondences  $c : C \rightarrow X \times X, b : B \rightarrow Y \times Y \in \mathcal{S}ch/k$  (9.6.1.5), then the induced morphism  $f' : \text{Fix}(c) \rightarrow \text{Fix}(b) \in \mathcal{S}ch/k$  (9.6.1.4) is also proper, and for any  $K \in D_{\text{csttf}}^b(X_{\text{ét}}, \Lambda)$ , there is a commutative diagram

$$\begin{array}{ccc} \text{Hom}((c_2)_!(c_1)^* K, K) & \xrightarrow{\text{Tr}_c} & H^0(\text{Fix}(c), K_{\text{Fix}(c)}) \\ \downarrow [f]_! & & \downarrow f'_! \\ \text{Hom}((b_2)_!(b_1)^*(f_! K), f_! K) & \xrightarrow{\text{Tr}_b} & H^0(\text{Fix}(b), K_{\text{Fix}(b)}) \end{array} \quad (9.6.1.4)$$

┘

*Proof:* Cf.[Var07]Chap4.?

□

**Cor. (9.6.1.14) [Lefschetz-Verdier Trace Formulae for Proper Correspondences, Illusie[III94]/Varshavsky[Var07]].** If  $c : C \rightarrow X \times X \in \mathcal{S}ch^{\text{proper}}/k$  is a proper correspondence (9.6.1.5) and  $u : \text{R}(c_2)_! c_1^* K \rightarrow K \in D_{\text{csttf}}^b(X_{\text{ét}}, \Lambda)$  is a  $c$ -morphism corresponding  $c_K \in \text{Corr}^{\text{coh}}(a; K)$  (9.6.1.7), we have

$$\text{Lef}(u) \stackrel{\Delta}{=} \text{Tr}(\text{R}\Gamma_c(u)) = \sum_{\beta \in \pi_0(\text{Fix}(c))} \text{locTr}_\beta(u) \quad (9.6.1.11)(9.6.1.4)(9.6.1.12),$$

where the sum on the RHS is finite. The LHS is called the **Lefschetz-trace** of  $u$ .

┘

### Locally Invariant Subsets

**Def. (9.6.1.15) [Locally Invariant Subsets].** Let  $c : C \rightarrow X \times X \in \mathcal{S}ch^{\text{sep,ft}}/k$  be a correspondence and  $Z \subset |X|$  is a closed subset, then

- $Z$  is called a  **$c$ -invariant subset** if  $|c_1|(|c_2|^{-1}(Z)) \subset Z$ .
- $Z$  is called  **$c$ -invariant in a nbhd of fixed points** if there exists  $W \subset C$  of  $\text{Fix}(c)$  s.t.  $Z$  is  $c|_W$ -invariant.
- $Z$  is called **locally  $c$ -invariant** if for any  $x \in Z$ , there exists an open nbhd  $U$  of  $x \in X$  s.t.  $Z \cap |U|$  is  $c|_U$ -invariant.

┘

**Cor. (9.6.1.16).** Situation as in (9.6.1.15), if  $x \in |X|_0$  and  $\#c_2^{-1}(x) < \infty$ , then  $\{x\}$  is locally  $c$ -invariant. In fact, we can take the nbhd  $U = \left(X \setminus c_1\left(c_2^{-1}(x)\right)\right) \cup \{x\}$  of  $x \in X$ .

┘

**Prop. (9.6.1.17) [Compactification of Locally Invariant Subsets].** Let  $c : C \rightarrow X \times X \in \mathcal{S}ch^{\text{sep,ft}}/k$  be a correspondence and  $U \subset X$  is an open subscheme s.t.  $c_1^{-1}(U)$  is dense in  $C$ ,  $c_1|_{c_1^{-1}(U)}$  is proper, and  $X \setminus U$  is locally  $c$ -invariant (9.6.1.15), then there exists a compactification  $\bar{c} : \bar{C} \rightarrow \bar{X} \times \bar{X}$  of  $c$  (9.6.1.6) s.t.  $\bar{X} \setminus U$  is locally  $\bar{c}$ -invariant.

┘

*Proof:* ? Cf.[Var07]P285.

□

**Prop. (9.6.1.18) [Restriction of Correspondences to Closed Subsets].** Let  $c : C \rightarrow X \times X \in \mathcal{S}ch^{\text{sep,ft}}/k$  be a correspondence,  $u : (c_2)_! c_1^* K \rightarrow K \in D_{\text{csttf}}^b(X_{\text{ét}}, \Lambda)$  a  $c$ -morphism, and  $Z \subset X$  a reduced closed subscheme.

- If  $Z$  is  $c$ -invariant (9.6.1.15), denote by  $c|_Z : c_2^{-1}(Z)_{\text{red}} \rightarrow Z \times Z$  the restriction of  $c$  to  $Z$ , and the closed immersion of correspondences  $[i_Z] : c|_Z \rightarrow c$ . Then by (9.6.1.8),  $u$  restricts to a  $c|_Z$ -morphism  $u|_Z \stackrel{\Delta}{=} [i_Z]^*(u)$ .
- For general  $Z$ , we can also restrict, Cf. [Var07]P286 ?.

┘

**Cor. (9.6.1.19) [Naive Local Traces].** Situation as in (9.6.1.18), suppose  $c_2$  is quasi-finite. Then for any  $x \in |X|_0$ ,  $c|_x$  is just  $c_1^{-1}(x) \cap c_2^{-1}(x) \rightarrow \{x\} \times \{x\}$ , and  $c_1^{-1}(x) \cap c_2^{-1}(x) = \text{Fix}(c|_x)$  is Artinian.

For any  $y \in \text{Fix}(c|_x)$ , the restriction of  $u|_x$  to  $\{y\}$  gives an endomorphism  $u_y : K_x \rightarrow K_x$ , which is the restriction of

$$u_x : (R(c_2)!c_1^*K)_x = \bigoplus_{y' \in c_2^{-1}(x)} (c_1^*K)_{y'} \rightarrow K_x$$

to  $(c_1^*K)_y \cong K_x$ . In particular,  $\text{locTr}_y(u|_x) = \text{tr}(u_y)$  (9.6.1.12) ?, called the **naive local trace** at  $y$ .  
┘

### Contracting Correspondences

**Def. (9.6.1.20) [Contracting Correspondences].** Let  $c : C \rightarrow X \times X \in \text{Sch}^{\text{sep,ft}}/k$  be a correspondence and  $Z \subset X$  a closed subscheme, then

- $Z$  is said to be **stabilized by**  $c$  if  $c_1|_{c_1^{-1}(Z)}$  factors through  $Z$  (i.e.  $c_1^*(\mathcal{I}_Z) \subset c_2^*(\mathcal{I}_Z)\mathcal{O}_C$ ).
- $c$  is said to be **contracting near**  $Z$  if  $c$  stabilizes  $Z$  and there exists  $n \in \mathbb{Z}_+$  s.t.  $c_1^*(\mathcal{I}_Z)^n \subset c_2^*(\mathcal{I}_Z)^{n+1}\mathcal{O}_C$ .
- $c$  is said to be **contracting near**  $Z$  **in a nbhd of fixed points** if there exists an open subscheme  $W \subset C$  containing  $\text{Fix}(c)$  s.t.  $c|_W$  is contracting near  $Z$ .

┘

**Thm. (9.6.1.21) [Local Traces for Contracting Correspondences].** Let  $c : C \rightarrow X \times X \in \text{Sch}^{\text{sep,ft}}/k$  be a correspondence contracting near a closed subscheme  $Z \subset X$  (9.6.1.20) and let  $\beta$  be an open connected subset of  $\text{Fix}(c)$  s.t.  $c'(\beta) \cap Z \neq \emptyset$  (9.6.1.4), then

- $|c'|(\beta) \subset Z$ . Hence  $\beta$  is an open connected subset of  $\text{Fix}(c|_Z)$ .
- For any  $c$ -morphism  $(c_2)!c_1^*K \rightarrow K$ , we have  $\text{Tr}_\beta(u) = \text{Tr}_\beta(u|_Z)$  (9.6.1.18). In particular, if  $\beta/k$  is proper, then  $\text{locTr}_\beta(u) = \text{locTr}_\beta(u|_Z)$  (9.6.1.12).

┘

*Proof:* Cf. [Fuj97]P515. □

### Lefschetz-Verdier Trace Formulae over Finite Fields

**Def. (9.6.1.22) [Ramifications].** Suppose  $k_0 \in \text{Field}^{\text{fin}}$  s.t.  $k = k_0^{\text{sep}}$ , and  $f : Y \rightarrow X \in \text{NSch}_{\text{cpct}}/k$ .

- If  $Z \subset X$  is a closed subscheme, denote  $\text{Ram}(f, Z)$  the smallest  $m \in \mathbb{Z}_+$  s.t.  $(\mathcal{I}_{f^{-1}(Z)})^m \subset \mathcal{I}_{f^{-1}(Z)}$ .
- If  $f$  is quasi-finite, then  $\text{Ram}(f, x) \leq \dim_k \Gamma(f^{-1}(x))$  for any  $x \in |X|_0$ , which is bounded ?. So we can define  $\text{Ram}(f) = \max_{x \in |X|_0} \text{Ram}(f, x) \in \mathbb{Z}_+$ .

┘

**Prop. (9.6.1.23) [High-Power Twisting Correspondences are Contracting].** Suppose

- $k_0 \in \mathbf{Field}^{\text{fin}}$  s.t.  $k = k_0^{\text{sep}}$ ,
- $c_0 : C_0 \rightarrow X_0 \times X_0 \in \text{Sch}^{\text{sep,ft}}/k_0$  is a correspondence (9.6.1.2),
- $Z \subset X$  is a reduced closed subscheme and  $n \in \mathbb{N}$  s.t.  $\#k_0^n > \text{Ram}(c_2, Z)$  (9.6.1.22) and  $|Z|$  is  $\text{Fr}_X^n \circ c$ -invariant (9.6.1.15),

then  $\text{Fr}_X^n \circ c$  is contracting near  $Z$  (9.6.1.20).  $\lrcorner$

*Proof:* Cf. [Var07]P289.  $\square$

**Cor. (9.6.1.24).** Suppose  $k_0 \in \mathbf{Field}^{\text{fin}}, k = k_0^{\text{sep}}$  and  $c_0 : C_0 \rightarrow X_0 \times X_0 \in \text{Sch}^{\text{sep,ft}}/k_0$  is a correspondence (9.6.1.2).

- If  $Z_0 \subset X_0$  is a reduced closed subscheme s.t.  $|Z|$  is  $c$ -invariant (9.6.1.15), then  $\text{Fr}_X^n \circ c$  is contracting near  $Z$  in a nbhd of fixed points (9.6.1.20) for any  $n \in \mathbb{Z}$  s.t.  $\#k_0^n > \text{Ram}(c_2, Z)$  (9.6.1.22).
- If  $c_2$  is quasi-finite, then for any  $x \in |X|_0$ ,  $\text{Fr}_X^n \circ c$  is contracting near  $x$  in a nbhd of fixed points (9.6.1.20) for any  $n \in \mathbb{Z}$  s.t.  $\#k_0^n > \text{Ram}(c_2)$  (9.6.1.22).  $\lrcorner$

*Proof:* Cf. [Var07]P289.  $\square$

**Thm. (9.6.1.25) [Simple Lefschetz-Verdier Trace Formulae, Delignes' Conjecture, Illusie [Ill94]/Zink [Zin90]/ Pink/Shipz/Fujiwara [Fuji97]/Varshavsky [Var07]].** Suppose  $k_0 \in \mathbf{Field}^{\text{fin}}$  s.t.  $k = k_0^{\text{sep}}$  and  $c_0 : C_0 \rightarrow X_0 \times X_0 \in \text{Sch}^{\text{sep,ft}}/k_0$  is a correspondence, then

- If  $c_2$  is quasi-finite, then  $\text{Fix}(\text{Fr}^n \circ c)$  is Artinian for any  $n \in \mathbb{N}$  s.t.  $q^n > \text{Ram}(c_2)$  (9.6.1.22),
- If  $U_0 \subset X_0$  is an open subscheme s.t.  $c_1|_{c_1^{-1}(U)}$  is proper and  $c_2|_{c^{-1}(U \times U)}$  is quasi-finite, and  $X \setminus U$  is locally  $c$ -invariant, then there exists  $N \in \mathbb{Z}_+$  satisfying the following: For any  $K \in D_{\text{csttf}}^b(X, \Lambda)$  s.t.  $K|_{X \setminus U} = 0$ ,  $n \in \mathbb{Z}_{\geq \log_{\#k_0} N}$  and a  $\text{Fr}_X^n \circ c$ -morphism  $u : (c_2)_!(\text{Fr}_X^n \circ c_1)^* K \rightarrow K$ , we have

$$\text{Lef}(u) = \sum_{y \in |\text{Fix}(\text{Fr}_X^n \circ c) \cap c^{-1}(U \times U)|} \text{tr}(u_y) \quad (9.6.1.14)(9.6.1.19),$$

where the RHS is a finite sum.

- In item2, if  $X_0/k_0, C_0/k_0$  are proper, then we can take

$$N = \max \left( \text{Ram}(c_2|_{c^{-1}(U \times U)}), \text{Ram}(c_2, X \setminus U) \right) \quad (9.6.1.22).$$

$\lrcorner$

*Proof:* 1: Choose a closed point  $x \in (\text{Fr}^n \circ c)'(\text{Fix}(\text{Fr}^n \circ c)) \subset X$  (9.6.1.4), then  $\text{Fr}^n \circ c$  is contracting near  $x$  in a nbhd of fixed points by (9.6.1.24). Then  $|\text{Fix}(\text{Fr}^n \circ c)| \subset \text{Fix}(c|_x)$  by (9.6.1.21), which is Artinian by (9.6.1.19).

3: By Lefschetz-Verdier trace formula (9.6.1.14), we have

$$\text{Lef}(u) = \sum_{\beta \in \pi_0(\text{Fix}(\text{Fr}^n \circ c))} \text{locTr}_{\beta}(u).$$

For any  $\beta \in \pi_0(\text{Fix}(\text{Fr}^n \circ c))$ , if  $c_2(\beta) \in X \setminus U$ , then  $\text{Fr}^n \circ c$  is contracting near  $X \setminus U$  in a nbhd of fixed points by (9.6.1.24). Thus  $\beta$  is a connected component of  $\text{Fix}(\text{Fr}^n \circ c|_{X \setminus U})$  and  $\text{locTr}_{\beta}(u) = \text{locTr}_{\beta}(u|_{X \setminus U})$  by (9.6.1.21), But  $K|_{X \setminus U} = 0$ , thus  $\text{locTr}_{\beta}(u) = 0$ .

And if  $c_2(\beta) \cap U \neq \emptyset$ , then it follows from item1 that  $\beta$  is a single point  $y \in \text{Fix}(\text{Fr}_X^n \circ c) \cap c^{-1}(U \times U)$ , and  $\text{Fr}_X^n \circ c$  is contracting near  $c_2(y)$  in a nbhd of fixed points by (9.6.1.24), so  $\text{locTr}_\beta(y) = \text{locTr}_y(u|_{c_2(y)}) = \text{tr}(u_y)$  by (9.6.1.21) and (9.6.1.19).

2: Cf. [Var07]P292. □

**Cor. (9.6.1.26) [Grothendieck-Lefschetz Trace Formula for Frobenius Morphisms].** Let  $X_0 \in \text{Sch}^{\text{sep}, \text{ft}}/k_0$ ,  $K_0 \in D_{\text{const}}^b(X_0, \overline{\mathbb{Q}}_\ell)$ , then

$$\sum_{x_0 \in |X_0|_0} \text{tr}(F_{x_0}^* | K_{\overline{x}}) = \text{tr}(F_X^* | [H_{\text{ét}, c}^\bullet(X, K)]) \quad (9.4.4.16).$$

┘

*Proof:* Because  $F_X^* = \text{Fr}_X^*$  on  $H_{\text{ét}, c}^*(X, \mathcal{F})$  by (9.4.4.18), this follow from (9.6.1.25).

[Fu11]P596 has a direct proof of this using induction on  $\dim X$ . □

### Lefschetz-Numbers

**Def. (9.6.1.27) [Lefschetz-Numbers of Sheaves].** Let  $X \in \text{Sch}^{\text{sep}, \text{ft}}/k$ ,  $\mathcal{F} \in \text{Sh}_{\text{const}}(X_{\text{ét}}, \overline{\mathbb{Q}}_\ell)$ , then for any  $g \in \text{Aut}(X/k)$ , define the **alternating cohomology group**

$$[H_{\text{ét}, c}^\bullet(X; \mathcal{F})] = \sum_{i \geq 0} (-1)^i H_{\text{ét}, c}^i(X, \mathcal{F}).$$

and the **Lefschetz-number** for  $\mathcal{F}$  to be

$$\text{Lef}(g, X; \mathcal{F}) \triangleq \text{tr} \left( g | [H_{\text{ét}, c}^\bullet(X, \mathcal{F})] \right) = \sum_{i \geq 0} (-1)^i \text{tr}(g | H_{\text{ét}, c}^i(X, \mathcal{F})).$$

┘

**Prop. (9.6.1.28).** Let  $k \in \text{Field}$ ,  $k = k^{\text{sep}}$ ,  $X, C' \in \text{Sch}^{\text{sep}, \text{ft}}/k$ ,  $g, h \in \text{Aut}(X)$ ,  $g' \in \text{Aut}(X')$ , then

1.  $\text{tr}(g, X, -)$  is additive.
2. If  $Z \subset X$  is a closed subscheme and  $U = X \setminus Z$ , then  $\text{tr}(g, X, \mathcal{F}) = \text{tr}(g, U, \mathcal{F}) + \text{tr}(g, Z, \mathcal{F})$ .
3.  $\text{tr}(g \times g, X \times X'; \mathcal{F} \times \mathcal{F}') = \text{tr}(g, X, \mathcal{F}) \text{tr}(g', X'; \mathcal{F}')$ .
4. If  $g, h$  commute, then  $\text{tr}(gh, X, \mathcal{F}) = \text{tr}(g, X^h, \mathcal{F})$ .
5. If  $T$  is a tori acting on  $X$ , then  $\text{tr}(g, X, \mathcal{F}) = \text{tr}(g, X^S, \mathcal{F})$ .

┘

*Proof:* 1, 2, 3 follow from (9.4.6.43).

4, 5: [Deligne-Lustig, Thm3.2] and [Digne and Michel, Prop10.15]. ? □

**Prop. (9.6.1.29).** Cf. [Representations of Finite Groups of Lie type, Digne and Michel]. ┘

**Cor. (9.6.1.30) [Lefschetz-Numbers of Schemes].** For  $X \in \text{Sch}^{\text{sep}, \text{ft}}/k$ , the Lefschetz-numbers  $\text{Lef}(\text{id}_X, X, \mathbb{Q}_\ell)$  for  $\ell \in \text{Prime}$  (9.6.1.27) are independent of  $\ell$  chosen, and it is called the **Lefschetz-number** for  $X$ . ┘

**Prop. (9.6.1.31) [Grothendieck-Lefschetz Trace Formulae].** Suppose  $p \in \text{Prime}$ ,  $q \in p^{\mathbb{Z}}$  and  $k = \overline{\mathbb{F}}_p$ . If  $X \in \text{Sch}^{\text{sep}, \text{ft}}/\mathbb{F}_q$ , then

$$\text{Lef}(\sigma_{q, X}, X_k; \mathbb{Q}_\ell) = \#X(\mathbb{F}_p).$$

┘

## 2 Weil-Sheaves

### Weil-Sheaves

**Def. (9.6.2.1) [Weil-Groups].** Cf. [Conrad, L19]. ? ┘

**Def. (9.6.2.2) [Weil Sheaves].** By Galois-descent, the pullback  $(X \rightarrow X_0)^*$  induces an equivalence of categories between  $\mathrm{Sh}_{\mathrm{const}}(X_{\mathrm{\acute{e}t}}, \overline{\mathbb{Q}}_\ell)$  to the category of constructible  $\overline{\mathbb{Q}}_\ell$ -sheaves on  $X$  with an specified  $\mathrm{Gal}(X/X_0) = \mathrm{Gal}_{k_0} \cong \widehat{\mathbb{Z}}$ -actions. In practice, sometimes it is hard to verify the action of  $\mathbb{Z} \subset \widehat{\mathbb{Z}}$  is continuous, which leads to the following definition:

The category  $\mathrm{WSh}_\ell(X_0)$  of  $(\overline{\mathbb{Q}}_\ell)$ -**Weil-sheaves** on  $X_0$  consists of pairs  $\mathcal{G}_0 = (\mathcal{G}, F_{\mathcal{G}})$  where  $\mathcal{G} \in \mathrm{Sh}_{\mathrm{const}}(X_{\mathrm{\acute{e}t}}, \overline{\mathbb{Q}}_\ell)$  and an isomorphism  $F_{\mathcal{G}} : F_X^* \mathcal{G} \rightarrow \mathcal{G} \in \mathrm{Sh}_{\mathrm{const}}(X_{\mathrm{\acute{e}t}}, \overline{\mathbb{Q}}_\ell)$  (7.2.10.1). Notice  $F_X^*$  is not  $\bar{k}$ -linear! There are natural definition of morphisms of Weil-sheaves.

A **lisse Weil-sheaf** is a Weil-sheaf  $\mathcal{G}_0 = (\mathcal{G}, F_{\mathcal{G}}) \in \mathrm{WSh}(X_0, \overline{\mathbb{Q}}_\ell)$  s.t.  $\mathcal{G}$  is lisse (9.4.6.25). The category of lisse Weil-sheaves are denoted by  $\mathrm{WSh}_{\ell, \mathrm{lisse}}(X_0)$ . ┘

**Prop. (9.6.2.3) [Constructible  $\overline{\mathbb{Q}}_\ell$ -Sheaves as Weil Sheaves].** For any  $\mathcal{F}_0 \in \mathrm{Sh}_{\mathrm{const}}((X_0)_{\mathrm{\acute{e}t}}; \overline{\mathbb{Q}}_\ell)$  (9.4.6.10), the canonical map

$$F_X^* \mathrm{pr}^* \mathcal{F}_0 \cong (\mathrm{pr} \circ F_X)^* \mathcal{F}_0 = \mathrm{pr}^* \mathcal{F}_0$$

makes  $\mathcal{F} = (X \rightarrow X_0)^* \mathcal{F}_0$  a Weil-sheaf. ┘

**Prop. (9.6.2.4).**

- $\mathrm{WSh}_\ell(X_0) \in \mathrm{AbCat}$ , the subcategory of lisse  $\overline{\mathbb{Q}}_\ell$ -sheaves is an Abelian subcategory.
- The constructions like  $R^i f_*$ ,  $R^i f_!$ ,  $f^*$  is functorial thus is definable on  $\mathrm{WSh}_\ell(X_0)$  by (9.4.2.19).
- (Frobenius-Actions on Cohomologies) The specified isomorphism  $F_{\mathcal{G}} : F_X^* \mathcal{G} \rightarrow \mathcal{G}$  gives a map  $\mathcal{G} \rightarrow F_X^* \mathcal{G} \xrightarrow{F_{\mathcal{G}}} \mathcal{G}$ , thus gives an action  $F_X^*$  of  $F_X$  on  $H_{\mathrm{\acute{e}t}, c}^*(X, \mathcal{G})$  and  $H_{\mathrm{\acute{e}t}}^*(X, \mathcal{G})$ .
- (Frobenius-Actions on Stalks) Let  $x_0 \in X_0(\bar{k})$ ,  $x = x_0 \otimes_{\kappa(x)} \bar{k}$ ,  $\bar{x} \in x$ , there is an Frobenius action  $F_{x_0}^*$  of  $x_0$  on  $\mathcal{G}_{\bar{x}}$  given as follows: Pulling back  $\mathcal{G}_0$  to a Weil-sheaf on  $x_0$ , then  $F_x^* \mathcal{G}_x \cong \mathcal{G}_x$  gives an isomorphism  $\mathcal{G}_{F^{i+1}(\bar{x})} \cong \mathcal{G}_{F^i(\bar{x})}$ , whose  $\deg(x_0)$ -th iterate gives the action  $\mathcal{G}_{\bar{x}} \cong \mathcal{G}_{F^{\deg(x_0)-1}(\bar{x})} \cong \dots \cong \mathcal{G}_{F(\bar{x})} \cong \mathcal{G}_{\bar{x}}$ . For different choice of  $\bar{x}$ , the actions are conjugate.

And if  $\mathcal{G}_0 \in \mathrm{Sh}_{\mathrm{const}}((X_0)_{\mathrm{\acute{e}t}}, \overline{\mathbb{Q}}_\ell)$ , then  $F_{x_0}^*$  acts via  $\varphi_{x_0}^{-1}$  ?. ┘

**Prop. (9.6.2.5) [Weil Sheaves and Representation].** If  $X_0$  is geo.connected, then there is an equivalence of categories

$$\mathrm{WSh}_\ell(X_0) \cong \mathrm{Rep}_\ell(W(X_0, \bar{x})) : \mathcal{G}_0 \mapsto (\mathcal{G}_0)_{\bar{x}},$$

and the correspondence defined in (9.4.6.26) is a sub-correspondence of this.

Thus the notion of **geometric irreducible Weil-sheaves** and **semi-simple Weil-sheaves** are definables. ┘

*Proof:* Because by the correspondence (9.4.6.26),  $\mathcal{G}$  corresponds to a representation of  $\pi_1(X, \bar{x})$ , and  $\pi_1(X, \bar{x})$  acts trivially on the Galois cover  $X/X_0$ . Now a representation of  $W(X_0, \bar{x})$  is equivalent to an automorphism  $\rho(\sigma)$  (where  $\sigma \in W(X_0, \bar{x})$  satisfies  $\deg(\sigma)$  corresponds to the geometric Frobenius) that  $\rho(\sigma)\rho(\pi_1(X, \bar{x}))\rho(\sigma^{-1}) = \rho(\sigma\pi_1(X, \bar{x})\sigma^{-1})$ , which is equivalent to an isomorphism  $F_X^* \mathcal{G} \rightarrow \mathcal{G}$ .  $\square$

**Cor.(9.6.2.6) [Constant Weil-Sheaves].** For any  $b \in \overline{\mathbb{Q}_\ell}^\times$ , there is a **constant Weil-sheaf**  $\mathcal{L}_b \in \text{WSh}_\ell(\text{Spec } k_0)$  corresponding to the character  $W(X_0, \bar{x}) \rightarrow \overline{\mathbb{Q}_\ell}^\times : x \mapsto b^{\deg(x)}$ .  $\lrcorner$

**Prop.(9.6.2.7) [Lisse Weil Sheaves and  $\overline{\mathbb{Q}_\ell}$ -Sheaves].** If  $X_0$  is geo.connected,  $\mathcal{G}_0 \in \text{WSh}_{\ell, \text{lisse}}(X_0)$  comes from a  $\overline{\mathbb{Q}_\ell}$ -sheaf iff some  $\deg 1$  element  $\sigma$  in  $W(X, \bar{x})$  acts on  $\mathcal{G}_{0\bar{x}}$  with eigenvalues which are  $\ell$ -adic units.  $\lrcorner$

*Proof:* This is purely a Galois representation problem, concerning whether the representation of  $W(X_0, \bar{x})$  can be extended to a representation of  $\pi_1(X_0, \bar{x})$ , and it is a continuity problem.

Firstly the representation of  $\pi_1(X, \bar{x})$  stabilizes a lattice  $\mathcal{O}_E^n$  for some  $E/\mathbb{Q}_\ell$  finite, and then extends  $E$  to contain coefficients of  $\rho(\sigma)$  and even its rational form. Then notice  $\pi_1(X_0, \bar{x})$  is the profinite completion of  $W(X_0, \bar{x})$ , thus it suffices to see if the image  $\rho(W(X_0, \bar{x}))$  is compact, and this is equivalent to eigenvalues of  $\rho(\sigma)$  are units.  $\square$

**Prop.(9.6.2.8) [Determinential Criterion for Genuine Sheaves].** If  $X_0$  is normal and geo.connected, then a irreducible lisse Weil-sheaf on  $X_0$  comes from a constructible  $\overline{\mathbb{Q}_\ell}$ -sheaf(9.6.2.3) iff its determinant bundle does.  $\lrcorner$

*Proof:* Use geometric monodromy group. Cf.[Conrad L19 P7].

First assume that  $\mathcal{G}_0$  is geometrically irreducible, then(9.6.4.4) shows that there is a nonzero power  $\sigma^m = gz$  where  $g \in G_{\text{geo}}(\overline{\mathbb{Q}_\ell})$  and  $z \in Z(G(\overline{\mathbb{Q}_\ell}))$ . Now  $G_{\text{geo}}$  is a semisimple algebraic group(9.6.4.4), so the determinential character maps  $G_{\text{geo}}(G(\overline{\mathbb{Q}_\ell}))$  to a finite group, because connected semisimple algebraic group has no nontrivial character as  $[G, G] = G$ ?. So the determinant of  $g$  is an  $\ell$ -unit, and  $\det(\sigma^m) = \det(z)$  is a unit. But  $z$  is a scalar by Schur's lemma, thus  $z$  is an  $\ell$ -adic unit. Now it suffices to show the eigenvalue of  $g$  are all  $\ell$ -units.

Now consider  $\rho(\pi_1(X, \bar{x}))$  is a compact group in  $\text{End}(V)$ , thus it generates a finite  $\mathcal{O}_E$ -submodule  $A$ , which is full-rank lattice in  $\text{End}(V)$  by Jacobson density theorem? and the fact  $\rho$  is absolutely irreducible.  $g$  normalized  $A$ , because  $\sigma$  and  $z$  both normalizes  $\rho(\pi_1(X, \bar{x}))$ , so the eigenvalue of the conjugate action of  $g$  are all  $\ell$ -units, but its eigenvalue are of the form  $\lambda_i \lambda_j^{-1}$  where  $\lambda_i$  are eigenvalues of  $g$ , so this together with the fact  $\det(g)$  is  $\ell$ -units shows that all  $\lambda_i$  are  $\ell$ -units.

For the general case, Cf.[Conrad L19 P7].?  $\square$

**Cor.(9.6.2.9) [Filtration of Lisse Weil-Sheaves].** If  $X_0$  is a normal and geo.connected and  $\mathcal{G}_0 \in \text{WSh}_{\ell, \text{lisse}}(X_0)$ , then there is a filtration

$$0 = \mathcal{G}_0^{(0)} \subset \mathcal{G}_0^{(1)} \subset \dots \subset \mathcal{G}_0^{(r)} = \mathcal{G}_0$$

s.t. each sub-quotients are irreducible and of the form  $\mathcal{F}_0^{(i)} \otimes \mathcal{L}_{b_i}$  for some  $b_i \in \overline{\mathbb{Q}_\ell}^\times$  (9.6.2.6) and  $\mathcal{F}_0^{(i)} \in \text{Sh}_{\text{lisse}}^{\text{irr}}((X_0)_{\text{ét}}; \overline{\mathbb{Q}_\ell})$ .  $\lrcorner$

*Proof:* It suffices to prove for  $\mathcal{G}_0$  irreducible. Then we choose  $b = \chi_{\det}(\sigma)^{1/n}$ , where  $\deg(\sigma) = 1$ , then

$$\wedge(\mathcal{G}_0 \otimes \mathcal{L}_{b^{-1}}) \cong \wedge(\mathcal{G}_0) \otimes \mathcal{L}_{\chi_{\det}(\sigma)}^{-1}$$

which has unit eigenvalues thus  $\mathcal{F}_0 = \mathcal{G}_0 \otimes \mathcal{L}_{b^{-1}}$  is a lisse  $\overline{\mathbb{Q}_\ell}$ -sheaf by(9.6.2.8).  $\square$

### Zeta-Functions and Trace Formulae for Weil-Sheaves

**Def. (9.6.2.10) [Zeta-Functions].** For  $\mathcal{F}_0 \in \text{WSh}_\ell(X_0)$  (9.6.2.2), the **zeta-function** associated to  $\mathcal{F}_0$  is defined to be

$$Z(X_0, \mathcal{F}_0; T) = \prod_{x_0 \in |X_0|_0} \det\left(1 - F_{x_0}^* T^{\deg(x_0)} | \mathcal{F}_{\bar{x}}\right)^{-1} \in 1 + T\Lambda[[T]],$$

where  $F_{x_0}^*$  is defined in (9.6.2.4). Notice if  $\mathcal{F}_0 \in \text{Sh}((X_0)_{\text{ét}})$ , then  $F_{x_0}^* = \varphi_{\kappa(x_0)}^{-1}$  by (9.6.2.4).  $\lrcorner$

**Prop. (9.6.2.11).** Situation as in (9.6.2.10), we have

$$Z(X_0, \mathcal{F}_0; T) = \exp\left(\sum_{n \geq 1} \sum_{x_0 \in X_0(k_n)} \text{tr}(F_{x_0}^* | \mathcal{F}_{\bar{x}}) \frac{T^n}{n}\right).$$

$\lrcorner$

*Proof:* By (3.5.9.26),

$$\begin{aligned} Z(X_0, \mathcal{F}_0; T) &= \prod_{x_0 \in |X_0|_0} \exp\left(\sum_{n \geq 1} \text{tr}((F_{x_0}^*)^n | \mathcal{F}_{\bar{x}}) \frac{T^n \deg(x_0)}{n}\right) \\ &= \exp\left(\sum_{n \geq 1} \sum_{x_0 \in |X_0|_0} \deg(x_0) \text{tr}((F_{x_0}^*)^n | \mathcal{F}_{\bar{x}}) \frac{T^n}{n}\right) \\ &= \exp\left(\sum_{n \geq 1} \sum_{x_0 \in X_0(k_n)} \text{tr}(F_{x_0}^* | \mathcal{F}_{\bar{x}}) \frac{T^n}{n}\right) \end{aligned}$$

where in the last equality, notice there are exactly  $\deg(x_0)$ -many points in  $X_0(k)$  over  $x_0 \in |X_0|_0$ .  $\square$

**Cor. (9.6.2.12).** If  $\mathcal{F} = \mathbb{Q}_\ell$ , then

$$Z(X_0, \mathbb{Q}_\ell; T) = \prod_{x_0 \in |X_0|_0} \frac{1}{1 - T^{\deg(x_0)}}$$

is just the zeta-function defined in (31.1.3.1).  $\lrcorner$

**Thm. (9.6.2.13) [Grothendieck-Lefschetz Trace Formula for Weil-Sheaves].** Let  $S_0 \in \text{Sch}^{\text{ft}}/k_0$ ,  $f_0 : X_0 \rightarrow S_0 \in \text{Sch}$  be separated of f.t. and  $\mathcal{F}_0 = (\mathcal{F}, F_{\mathcal{F}}) \in \text{WSh}_\ell(X_0)$  (9.6.2.2). We have:

$$Z(X_0, \mathcal{F}_0; T) = \prod_{n=0}^{2 \dim X_0} Z(S_0, R^n f_{0!} \mathcal{F}_0; T)^{(-1)^n} \in \overline{\mathbb{Q}_\ell}[[T]] \text{ (9.6.2.10)}.$$

In particular, for  $S_0 = \text{Spec } k_0$ ,  $X_0 \in \text{Sch}^{\text{sep, ft}}/k_0$ , we have

$$Z(X_0, \mathcal{F}_0; T) = \prod_{n=0}^{2 \dim X_0} \det\left(1 - F_X^* T | H_{\text{ét}, c}^n(X, \mathcal{F})\right)^{(-1)^{n+1}} \in \overline{\mathbb{Q}_\ell}[[T]].$$

Notice by (9.4.4.9), the higher proper pushforward of  $\mathcal{F}_0$  vanish for  $n > 2 \dim X_0$ .  $\lrcorner$

*Proof:* Because  $Z(X_0, \mathcal{F}_0; T)$  is defined by Euler-product, base change isomorphism for  $Rf_!$  holds (9.4.4.7), and description of the fiber (9.6.2.4), it suffices to prove for  $S_0 = \text{Spec } k_0$ .

Use the filtration in (9.6.2.9), notice that the trace is additive, so we can reduce to the case  $\mathcal{G}_0 = \mathcal{F}_0 \otimes \mathcal{L}_b$  and  $\mathcal{G}_{\bar{x}} = \mathcal{F}_{\bar{x}} \otimes \mathcal{L}_{b, \bar{x}}$ , then the Euler-factors are

$$\det \left( 1 - b^{\deg(x_0)} \varphi_{\kappa(x_0)}^{-1} T^{\deg(x_0)} | \mathcal{F}_{\bar{x}} \right)$$

and the cohomology factor is

$$\det \left( 1 - F_X^* T | H_{\text{ét}, c}^i(X, \mathcal{F} \otimes \mathcal{L}_b) \right) = \det \left( 1 - b F_X^* T | H_{\text{ét}, c}^i(X, \mathcal{F}) \right),$$

where the projection formula (9.4.4.10) is used, noticing the  $\mathcal{L}_b$  is pulled back from  $\text{Spec } k_0$ . Then the assertion is clear from (9.6.1.26) and (9.6.2.11)(9.6.2.4).  $\square$

**Cor. (9.6.2.14).** Situation as in (9.6.2.13), we have  $Z(X_0, \mathcal{F}_0; T) \in \overline{\mathbb{Q}}_\ell(T)$ .  $\square$

### 3 Weights and Purity

#### Determinantal Weights

**Prop. (9.6.3.1) [Structure of Weil Group of Curves].** If  $X_0 \in \text{SmCur}/k$ , then the image of  $\pi_1(X, \bar{x})$  in  $W(X_0, \bar{x})_{\text{ab}}$  is a product of a finite group and a pro- $p$  group.  $\square$

*Proof:* Denote  $K = R(X_0)$ , and let  $\overline{X_0}$  be the regular completion of  $X_0$ , with  $S_0 = \overline{X_0} \setminus X_0$ . Then we have an isomorphism  $\pi_1(\overline{X_0}, \bar{x}) \cong \text{Gal}_K$ , Cf. [Étale Cohomology Lei Fu P136] ?. Recall the global class field theory:

$$\begin{array}{ccccccc} \pi_1(\overline{X}, \bar{x})^{ab} & \longrightarrow & \pi_1(\overline{X_0}, \bar{x})^{ab} & \longrightarrow & \text{Gal}_K \cong \widehat{\mathbb{Z}} & \longrightarrow & 0 \\ & \searrow & \uparrow & & \uparrow & & \\ 0 & \longrightarrow & I_K & \longrightarrow & W(\overline{X_0}, \bar{x})^{ab} \cong W(K, k) & \longrightarrow & W(k) \cong \mathbb{Z} \longrightarrow 0 \quad \text{?} \\ & \downarrow \cong & & & \downarrow \cong & & \downarrow \cong \\ 0 & \longrightarrow & K^* \backslash (A_K^*)^1 / \prod_v \mathcal{O}_v^* & \longrightarrow & K^* \backslash A_K^* / \prod_v \mathcal{O}_v^* & \longrightarrow & q^{\mathbb{Z}} \longrightarrow 0 \end{array}$$

So the image of  $\pi_1(\overline{X}, \bar{x})$  factors through  $\pi_1(\overline{X}, \bar{x}) \rightarrow \pi_1(\overline{X}, \bar{x})_{\text{ab}} \rightarrow K^* \backslash A_K^* / \prod_v \mathcal{O}_v^*$  which is the class number of  $K$ , is finite.

In this diagram,  $W(X_0, \bar{x})$  corresponds to  $K^* \backslash A_K^* / \prod_{v \notin S_0} \mathcal{O}_v^*$ , so

$$0 \rightarrow \ker(W(X_0, \bar{x}) \rightarrow W(\overline{X_0}, \bar{x})) \rightarrow \text{Im}(\pi_1(X_0, \bar{x})) \rightarrow \text{Im}(\pi_1(\overline{X_0}, \bar{x})) \rightarrow 0$$

But the kernel is a quotient of  $\prod_{v \in S_0} \mathcal{O}_v^*$ , which is a pro- $p$  group times a finite group, so finally  $\text{Im}(\pi_1(X_0, \bar{x}))$  is a product of a pro- $p$ -group times a finite group.  $\square$

**Lemma (9.6.3.2) [Curve Rank 1 case].** If  $X_0 \in \text{SmCur}/k_0$  and  $\chi : W(X_0, \bar{x}) \rightarrow \overline{\mathbb{Q}}_\ell^\times$  be a continuous character, then there exists a  $c \in \overline{\mathbb{Q}}_\ell^\times$  that  $\chi$  is a product of a character of finite order and the character  $\sigma \mapsto c^{\deg(\sigma)}$ .

In particular, the Weil-sheaf corresponding to  $\chi$  is punctually  $\iota$ -pure of weight  $2 \log_q |\iota(c)|$ .  $\square$

*Proof:* By (24.2.3.2), the image of  $\chi$  is in  $\mathcal{O}_E^*$  for some  $E \in \ell\text{-LField}$ , so by (9.6.3.1), it has an open subgroup which is pro- $p$  and pro- $\ell$  so trivial, thus  $\pi_1(X_0, \bar{x})$  is mapped to a finite group.

In particular there is an  $n$  that  $\chi^n = \text{id}$  on  $\pi_1(X_0, \bar{x})$ , so there is some  $b$  that  $\chi^n = b^{\deg(\sigma)}$ , hence if  $c$  is an  $n$ -th roots of  $b$  and we let  $\chi' = \chi/c^{\deg(\sigma)}$ , then  $(\chi')^n = 1$ .  $\square$

**Cor. (9.6.3.3) [Rank 1 Lisse Sheaf is Pure].** If  $X_0 \in \text{SmCur}/k_0$ , then any  $\mathcal{F} \in \text{WSh}_{\ell, \text{lisse}}^1(X_0)$  is pure.  $\lrcorner$

**Def. (9.6.3.4) [Determinantal Weight].** Suppose  $X_0$  is geo.connected and smooth, and  $\mathcal{F}_0 \in \text{WSh}_{\text{lisse}}(X_0; \overline{\mathbb{Q}}_\ell)$  with a filtration of lisse sheaves

$$0 = \mathcal{F}_n \subset \mathcal{F}_{n-1} \subset \dots \subset \mathcal{F}_0 \in \text{WSh}_{\text{lisse}}(X_0, \overline{\mathbb{Q}}_\ell)$$

with irreducible quotients, then for any  $\iota : \overline{\mathbb{Q}}_\ell \rightarrow \mathbb{C}$ , we define the **determinantal  $\iota$ -weights** of  $\mathcal{F}_0$  to be that of the  $\iota$ -weights of the top wedge products of the successive quotients divided by their ranks, which exists by (9.6.3.3).

Notice that the determinantal  $\iota$ -weights are unchanged when  $\mathcal{F}_0$  is replaced by its semi-simplification  $\mathcal{F}_0^{\text{ss}} = \bigoplus_{i \in \mathbb{N}} (\mathcal{F}_i / \mathcal{F}_{i-1})$ .  $\lrcorner$

### Pure Weil-Sheaves

**Def. (9.6.3.5) [Pure Weil-Sheaves].** For an embedding  $\iota : \overline{\mathbb{Q}}_\ell \rightarrow \mathbb{C}$ ,  $\mathcal{F}_0 \in \text{WSh}_\ell(X_0)$  is called  **$\iota$ -pure** of weight  $w \in \mathbb{Z}$  if for any closed point  $x \in X$ , the  $\overline{\mathbb{Q}}_\ell$ -eigenvalues of  $F_{x_0}^*$  on the stalks  $\mathcal{F}_x$  (9.6.2.4) are algebraic and satisfy  $|\iota(\alpha_i)| = (q^{\deg(x)})^{w/2}$ .

It is called **pure of weight  $w$**  iff for any closed point  $x \in X$ , the  $\overline{\mathbb{Q}}_\ell$ -eigenvalues are  $q^{\deg(x)}$ -Weil numbers of weight  $w$  (19.3.1.16), i.e.  $\iota$ -pure for any embedding  $\iota : \overline{\mathbb{Q}}_\ell \rightarrow \mathbb{C}$ .

It is said to be **( $\iota$ )-mixed** with weights  $w_1, \dots, w_n$  if it has a filtration of constructible  $\overline{\mathbb{Q}}_\ell$ -sheaves that each quotient is pure of weight  $w_i$  respectively.  $\lrcorner$

**Example (9.6.3.6).**  $\mathbb{Q}_\ell(r)$  is pure of weight  $-2r$ .  $\lrcorner$

*Proof:* This is because the geometric Frobenius  $\varphi_{\kappa(x)}^{-1}$  acts by  $1/q^{d_x}$ -th power, which is additively multiplying by  $(q^{d_x})^{-2/2}$ .  $\square$

**Prop. (9.6.3.7) [Permanence Properties of Purity].** For an embedding  $\iota : \overline{\mathbb{Q}}_\ell \rightarrow \mathbb{C}$ ,

- If  $f_0 : X_0 \rightarrow Y_0 \in \text{Sch}^{\text{ft}}/k_0$  and  $\mathcal{G}_0 \in \text{WSh}_\ell(Y_0)$  is  $\iota$ -pure, then  $f_0^* \mathcal{G}_0$  is also  $\iota$ -pure, and the converse is also true if  $f$  is surjective.
- If  $f_0 : X_0 \rightarrow Y_0 \in \text{Sch}^{\text{ft}}/k_0$  is finite and  $\mathcal{G}_0 \in \text{WSh}_\ell(X_0)$  s.t.  $j_0^*(\mathcal{G}_0)$  is  $\iota$ -pure, then  $\mathcal{G}_0$  is  $\iota$ -pure.
- Let  $k'_0/k_0 \in \text{Field}$  be a finite extension, then  $\mathcal{G}_0 \in \text{WSh}_\ell(X_0)$  is pure of weight  $\beta$  iff  $(\mathcal{G}_0)_{k'_0} \in \text{WSh}_\ell((X_0)_{k'_0})$  is.

$\lrcorner$

*Proof:* 1 is because the stalk corresponds.

2: This is because the stalks can be calculated, by ?.

3: ?

$\square$

### Semicontinuity of Weights

**Def. (9.6.3.8) [Maximal Weight].** For  $\mathcal{G}_0 \in \text{WSh}_\ell(X_0)$ , we can also define the **maximal  $\iota$ -weight** of  $\mathcal{G}_0$  as

$$\text{wt}(\mathcal{G}_0) = \sup_{x \in |X_0|} \sup_{\alpha_i} 2 \log_{N(x)}(|\iota(\alpha_i)|).$$

┘

**Lemma (9.6.3.9).** There exists  $c \in \mathbb{R}_+$  s.t. for any  $n \in \mathbb{Z}_+$  we have  $\#X_0(k_n) \leq cq^{n \dim X_0}$

┘

*Proof:* We can pass to the reduced structure of  $X_0$ , then we can use excision to pass to the integral case. Then choose an open affine dense subset  $U_0$  of  $X_0$ , then by Noetherian normalization, it factors through a finite map  $f : U_0 \rightarrow \mathbb{A}_{k_n}^{\dim X_0}$ , so

$$|U(k_n)| \leq (\deg f) q^{n \dim X_0}$$

Then we can use induction on dimension, because  $\dim(X_0 \setminus U_0) < \dim X_0$ .

□

**Lemma (9.6.3.10).** Let  $\mathcal{G}_0 \in \text{WSh}(X_0, \overline{\mathbb{Q}_\ell})$  and  $\beta \in \mathbb{R}_{>\text{wt}(\mathcal{G}_0)}$ , then

$$\iota(Z(X_0, \mathcal{G}_0, T)) = \prod_{x \in |X_0|_0} \iota(\det(1 - T^{d_x} F_x, \mathcal{G}_{0,\bar{x}})^{-1}) \quad (9.6.2.10)$$

converges for  $|T| < q^{-\beta/2 - \dim X_0}$  and has no zero or pole there.

┘

*Proof:* We can show that it has no zero or pole using the fact that the logarithmic derivative has no poles (when it is convergent). We suppress the isomorphism  $\iota : \overline{\mathbb{Q}_\ell} \rightarrow \mathbb{C}$  and calculate:

$$\frac{d \log}{dt} L(X_0, \mathcal{G}_0, t) = \sum_{x \in |X_0|_0} \sum_{n \geq 1} \deg(x) (\text{tr}(F_x^n)) t^{d_x n - 1} = \sum_{n \geq 1} \sum_{x \in |X_0|_0, \deg(x)|n} \deg(x) (\text{tr}(F_x^{n/d_x})) t^{n-1}$$

Notice by assumption on  $\beta$ ,  $|\text{tr}(F_x^{n/\deg(x)})| \leq r q^{n\beta/2}$ , where  $r = \sup_{x \in |X_0|_0} \dim_{\overline{\mathbb{Q}_\ell}} \mathcal{G}_{0,x}$  is finite because it has a stratification by (9.4.6.15), so

$$\left| \frac{d \log}{dt} L(X_0, \mathcal{G}_0, t) \right| \leq \sum_{n \geq 1} \sum_{\substack{x \in |X_0|_0 \\ \deg(x)|n}} d_x r q^{n\beta/2} t^{n-1} = \sum_{n \geq 1} |X_0(k_n)| r q^{n\beta/2} t^{n-1}$$

converges for  $|t| < q^{-\beta/2 - \dim X_0}$  by (9.6.3.9).

□

**Lemma (9.6.3.11) [Semi-continuity of Weights for Curves].** If  $X_0 \in \text{SmCur}/k_0$  and  $j_0 : U_0 \hookrightarrow X_0$  be a non-empty open immersion with  $S_0 = X_0 \setminus U_0$ . Let  $\mathcal{G}_0$  be a Weil-sheaf on  $X_0$  s.t. the restriction  $j_0^* \mathcal{G}_0$  is lisse and  $H_S^0(X, \mathcal{G}) = 0$ , then  $\text{wt}(j_0^*(\mathcal{G}_0)) \leq \beta$  implies  $\text{wt}(\mathcal{G}_0) \leq \beta$ .

┘

*Proof:* For any point  $x$ , consider an affine open subset of  $X_0$ , then reduce to the affine case, and because  $H_S^0(X, \mathcal{G}) = 0$  and the excision sequence (9.4.4.7), we have  $\mathcal{G} \hookrightarrow j_* j^* \mathcal{G}$ , so the weights of  $\mathcal{G}_0$  are no more than that of  $j_* j^* \mathcal{G}$ , and replacing  $\mathcal{G}_0$  with  $j_{0*} j_0^* \mathcal{G}_0$ , we can assume  $\mathcal{G}_0 = j_{0*} j_0^* \mathcal{G}_0$ . Then

$$H_c^0(X, \mathcal{G}) = H_c^0(X, j_* j^* \mathcal{G}) = H_c^0(U, j^* \mathcal{G}) = 0$$

by Poincare duality and the fact  $j_*$  is exact because it is finite.

Now by Grothendieck-Lefschetz trace formula(9.6.2.13),

$$Z(X_0, \mathcal{G}_0, T) = L(U_0, j_0^*(\mathcal{G}_0), T) \cdot \prod_{s \in |X_0|_0} \det \left( 1 - T^{d_s} F_s, \mathcal{G}_{\bar{s}} \right)^{-1} = \frac{\det \left( 1 - F_X T \middle| H_{\text{ét},c}^1(X, \mathcal{G}) \right)}{\det \left( 1 - F_X T \middle| H_{\text{ét},c}^2(X, \mathcal{G}) \right)}$$

Denote  $\mathcal{F}_0 = j_0^* \mathcal{G}_0$ , then

$$H_{\text{ét},c}^2(X, \mathcal{G}) = H_{\text{ét},c}^2(U, \mathcal{F}) = (\mathcal{F}_{\bar{x}})_{\pi_1(U, \bar{x})}(-1)$$

So the weights of eigenvalues of  $F_X$  on  $H_{\text{ét},c}^2(X, \mathcal{G}) \leq$  weights of  $\mathcal{F} + 2$ , hence the  $L$ -function converges for  $|t| < q^{-\beta/2-1}$ . Now the LHS has  $L(U_0, j_0^*(\mathcal{G}_0), t)$  converges for  $|t| < q^{-\beta/2-1}$  because  $w(\mathcal{F}_0) \leq \beta$ , and so for the points in  $S_0$ , we also have  $\det \left( 1 - t^{d_s} F_s, \mathcal{G}_{\bar{s}} \right)$  has no zero there, which means they have weights  $\leq \beta + 1$ . Now consider replacing  $\mathcal{G}_0$  with  $\mathcal{G}_0^{\otimes k}$  and let  $k \rightarrow \infty$ , then their weights  $\leq \beta$ .  $\square$

**Prop. (9.6.3.12) [Semi-continuity of Weights].** Let  $X_0$  be geo.normal,  $\mathcal{G}_0 \in \text{WSh}_{\ell, \text{lis}}(X_0)$  and  $j_0 : U_0 \hookrightarrow X_0$  be an open dense subscheme, then

- $w(\mathcal{G}_0) = w(j_0^* \mathcal{G}_0)$ .
- If  $j_0^*(\mathcal{G}_0)$  is  $\iota$ -pure of weights  $\beta$ , then  $\mathcal{G}_0$  is also  $\iota$ -pure of weights  $\beta$ .
- Let  $X_0$  be irreducible and normal, and  $\mathcal{G}_0$  is irreducible, then if  $j_0^* \mathcal{G}_0$  is  $\iota$ -mixed, then  $\mathcal{G}_0$  is  $\iota$ -pure.

┘

*Proof:* 1: The weights is local so we may assume  $X_0$  is irreducible, and then for any closed point  $x$ , we can connect it with  $U_0$  with a curve (choose an affine open and use Noetherian Normalization to choose an irreducible component of an arbitrary curve in  $\mathbb{A}^n$ ). Notice  $H_S^0(X, \mathcal{G}) = 0$  because it is lisse thus  $H^0(X, \mathcal{G})$  is determined by stalk thus  $H^0(X, \mathcal{G}) \rightarrow H^0(U, \mathcal{G}|_U)$  is injective. So we finish by the curve case(9.6.3.11).

2: Apply item1 to  $\mathcal{G}_0$  and  $\mathcal{G}_0^\vee$ .

3: It is  $\iota$ -mixed so it has  $\iota$ -pure Weil-sheaf constituents. Now by(9.4.6.15) we can find an open dense  $U_0$  that restriction to  $U_0$  has constituents  $\iota$ -pure lisse sheaves. But it is also irreducible because  $\pi_1(U_0, \bar{a}) \rightarrow \pi_1(X_0, \bar{a})$  is surjective<sup>?</sup>, so it is  $\iota$ -pure and item2 shows  $\mathcal{G}_0$  is  $\iota$ -pure.  $\square$

### $L^2$ -Norms and Maximal Weights

**Def. (9.6.3.13) [ $L^2$ -Norm of Sheaves].** As in(9.6.8.1), for any  $\mathcal{G}_0 \in D_{\text{const}}^b(X_0, \bar{\mathbb{Q}}_\ell)$ , we have a function

$$f^{\mathcal{G}_0} : X_0(\mathbb{F}_{q^n}) \rightarrow \bar{\mathbb{Q}}_\ell : x \mapsto \sum_i (-1)^i \text{tr}(F_x^{n/d_x} | (H^i(\mathcal{G}_0))_{\bar{x}}),$$

Fix an arbitrary isomorphism  $\bar{\mathbb{Q}}_\ell \cong \mathbb{C}$ , we can consider the usual  $L^2$ -norm for functions on  $X_0(k_n)$ , denoted by  $(f, g)_n$ .  $\square$

**Def. (9.6.3.14) [Maximal Weights].** Notice the equation form(9.6.3.10) can be rewritten as

$$\frac{d \log}{dT} L(X_0, \mathcal{G}_0, T) = \sum_{n \geq 1} \sum_{\substack{x_0 \in |X_0|_0 \\ \deg(x_0) | n}} d_x(\text{tr}(F_x^{n/d_x})) T^{n-1} = \sum_n (f^{\mathcal{G}_0}, 1)_n T^{n-1}.$$

Now we define another closed related function

$$\varphi^{\mathcal{G}_0}(t) = \sum_n \left\| f^{\mathcal{G}_0} \right\|_n^2 t^{n-1} \quad (9.6.3.13),$$

which works better with Fourier-transform we are about to define later.  $\lrcorner$

**Lemma (9.6.3.15).** There is a constant  $C$  that  $\left\| f^{\mathcal{G}_0}(x) \right\|^2 \leq C q^{n(w(\mathcal{G}_0) + \dim X_0)}$ , so  $\varphi^{\mathcal{G}_0}(T)$  converges for  $|T| \leq q^{-w(\mathcal{G}_0) - \dim X_0}$ .  $\lrcorner$

*Proof:* The proof is similar to that of (9.6.3.10) thus omitted.  $\square$

**Def. (9.6.3.16) [Norm of Weil Sheaves].** Define the **norm of a Weil-sheaf** to be

$$\|\mathcal{G}_0\| = \sup \left\{ \rho \left| \lim_n \frac{\left\| f^{\mathcal{G}_0} \right\|_n^2}{q^{n(\rho + \dim X_0)}} > 0 \right. \right\} \quad (9.6.3.13)$$

Then  $q^{-\|\mathcal{G}_0\| - \dim X_0}$  is just the radius of convergence of the function  $\varphi^{\mathcal{G}_0}(t)$  (9.6.3.14), and  $\|\mathcal{G}_0\| \leq w(\mathcal{G}_0)$  by lemma (9.6.3.15) above.  $\lrcorner$

**Prop. (9.6.3.17) [Radius of Convergence].** Let  $\mathcal{G}_0$  be a  $\iota$ -mixed sheaf on a smooth curve  $X_0$  over  $k$ , and  $H_{\text{ét},c}^0(X, \mathcal{G}) = 0$ , then  $\|\mathcal{G}_0\| = w(\mathcal{G}_0) = \beta$ .  $\lrcorner$

*Proof:* It suffices to show  $w(\mathcal{G}_0) \leq \|\mathcal{G}_0\|$ . First notice we can assume  $X_0$  is reduced because the nilpotents corresponds to zero Frobenius eigenvalues, and also it is connected, because the function  $f^{\mathcal{G}_0}$  is additive in  $X$ . Now we study by cases:

1: If  $\mathcal{G}_0$  is a lisse  $\iota$ -pure sheaf on a smooth affine curve  $X_0$ , we may assume  $\mathcal{G}_0 \neq 0$ , then  $\mathcal{G}_0 \otimes \overline{\mathcal{G}_0}$  (9.6.5.2) is  $\iota$ -real of weight  $2\beta$  and  $(f^{\mathcal{G}_0 \otimes \overline{\mathcal{G}_0}}, 1)_n = \left\| f^{\mathcal{G}_0} \right\|_n^2$ , so  $\varphi^{\mathcal{G}_0}(t)$  is just the logarithmic derivative of the  $L$ -function  $L(X_0, \mathcal{G}_0 \otimes \overline{\mathcal{G}_0}, t)$ , thus (9.6.3.10) shows its convergence radius  $\geq q^{-\beta-1}$ . And notice the  $H_c^0$  terms vanish so the poles can only appear as the zeros of  $H_c^2$  term, so (9.6.5.3) shows the poles of the  $L(X_0, \mathcal{G}_0 \otimes \overline{\mathcal{G}_0}, t)$  has weight  $2\beta + 2$ , thus the poles can only appear on  $|t| = q^{-\beta-1}$ .

Now consider each local Euler factor  $\det \left( 1 - F_x t^{d_x} |(\mathcal{G}_0 \otimes \overline{\mathcal{G}_0})_x \right)^{-1}$  has non-negative coefficients, they have poles because  $\mathcal{G}_0 \neq 0$ , and their poles have weight  $\beta$  because of purity, thus their product also has (real) poles, by previous argument, the pole has weight  $\beta + 1$ , thus it has convergence radius at most  $q^{-\beta-1}$ , so we are done.

2: If  $\mathcal{G}_0$  is a  $\iota$ -mixed, consider its semisimplification  $\mathcal{G}_0^{ss} = \mathcal{F}_0 \oplus \mathcal{H}_0$ , where  $\mathcal{F}_0$  is  $\iota$ -pure of weight  $w(\mathcal{G}_0)$ , and  $w(\mathcal{H}_0) \leq w(\mathcal{F}_0)$ .

Then  $f^{\mathcal{G}_0} = f^{\mathcal{F}_0} + f^{\mathcal{H}_0}$ , and

$$\varphi^{\mathcal{G}_0}(T) = \varphi^{\mathcal{F}_0}(T) + \sum_{n \geq 1} 2 \operatorname{Re}(f^{\mathcal{F}_0}, f^{\mathcal{H}_0})_n T^{n-1} + \varphi^{\mathcal{H}_0}(T).$$

Then by item 1,  $\varphi^{\mathcal{F}_0}(t)$  has convergence radius  $q^{-w(\mathcal{G}_0)-1}$ , and by (9.6.3.15)  $\varphi^{\mathcal{H}_0}(t)$  has radius at least  $q^{-w(\mathcal{H}_0)-1} > q^{-w(\mathcal{G}_0)-1}$ , and by Cauchy's inequality the middle term satisfies

$$\left| 2 \operatorname{Re}(f^{\mathcal{F}_0}, f^{\mathcal{H}_0})_n \right| \leq 2 \left\| f^{\mathcal{F}_0} \right\|_n \left\| f^{\mathcal{H}_0} \right\|_n \leq C q^{n(w(\mathcal{F}_0) + w(\mathcal{H}_0)/2 + 1)}$$

So the middle term has convergence radius  $> q^{-w(\mathcal{G}_0)-1}$ , so their sum has convergence radius  $q^{-w(\mathcal{G}_0)-1}$ .  $\square$

#### 4 Geometric Monodromy

**Notation (9.6.4.1).**

- Let  $X_0/k$  be geometrically connected and normal.

┘

**Def. (9.6.4.2)[Geometric Monodromy Group].** Let  $\mathcal{G}_0$  be a Weil-sheaf associated to a representation  $(V, \rho) = \text{GL}(\mathcal{G}_{\bar{x}})$  of  $W(X_0, \bar{x})$ , the **geometric monodromy group**  $G_{geo}$  associated to  $\mathcal{G}_0$  is the Zariski Closure of  $\rho(\pi_1(X, \bar{x})) \subset \text{GL}(V)$ .

Every element in  $\rho(W(X_0, \bar{x}))$  normalizes  $G_{geo}$  by continuity, so choosing an arbitrary generator  $\sigma \in W(\bar{k}/k)$ , we have an action of  $W(\bar{k}/k)$  on  $G_{geo}$ . Define  $G = W(\bar{k}/k) \ltimes G_{geo}$  the **arithmetic monodromy group** of  $\mathcal{G}_0$ .

┘

**Lemma (9.6.4.3).** If  $G_{geo}$  is connected, then there is a positive integer  $N$  that the semidirect sequence

$$1 \rightarrow G_{geo} \rightarrow \text{deg}^{-1}(N\mathbb{Z}) \xrightarrow{\text{deg}} N\mathbb{Z} \rightarrow 1$$

is direct, i.e.  $\text{deg}^{-1}(N\mathbb{Z}) \cong G_{geo} \times \mathbb{Z}$ .

┘

*Proof:* Choose a  $\text{deg}(g) = 1$ . The representation  $G_{geo}$  splits as a characters of  $Z(G)$ , and then some  $g^n$  stablizes these characters, hence stablizes  $Z(G)$ , which then it descends to an action on  $G_{adj}$ , whose automorphism is the automorphism of the Dynkin diagram ?, so finite, so some  $g^m$  fixes  $G_{adj}$  after changing a semidirect product, thus induces a map  $\text{Hom}(G_{adj}, Z(G))$ , but  $G_{adj}$  is semisimple(10.4.2.23), so the connected component is mapped to 1 in  $Z(G)$ (10.4.2.18), so there are only f.m. such homomorphism, showing  $g^k$  is 1, so the product is exact for  $N = k$ .  $\square$

**Prop. (9.6.4.4)[Geometric Monodromy Group is Semisimple].** Let  $\mathcal{G}_0 \in \text{WSh}_{\text{lisse}}^{geo, ss}(X_0)$ (9.6.2.5), then

- $G_{geo}$  and  $G_{geo}^0$  are semisimple algebraic group.
- Let  $Z = Z(G(\bar{\mathbb{Q}}_\ell))$ , then the map  $\psi : Z \rightarrow W(\bar{k}/k)$  has finite kernel and cokernel. In particular,  $Z$  contains an element of finite degree, and it is surjective after a finite base change of fields.

And notice in fact if  $\mathcal{G}_0$  is semisimple, then it is automatically geometrically semisimple by(24.1.2.15).  $\square$

*Proof:* 1:  $L G_{geo}$  is semisimple iff  $G_{geo}^0$  is semisimple. Pass to a finite étale covering, we may assume  $G_{geo} = G_{geo}^0$ . Let  $R(G_{geo}^0)$  be the radical and  $R_u(G_{geo}^0)$  be the unipotent radical, then  $R$  is normal in  $G^0$  and  $G^0$  is normal in  $G$ , so by(24.1.2.15)  $V = \text{GL}(\mathcal{G}_{\bar{x}})$  is irreducible  $R(G_{geo}^0)$  representation, but it is solvable, so  $V$  is a direct sum of 1-dimensional representations, and  $R_u(G_{geo}^0)$  is trivial, in particular  $G_{geo}^0$  is reductive. So it is semisimple if the maximal Abelian quotient  $G_{geo}^{ab}$  is finite(10.4.2.18).

let  $T_1$  be the maximal central torus of  $G_{geo}^0$ , then lemma(9.6.4.3) shows after a finite base change of fields, we may assume  $G = G_{geo} \times \mathbb{Z}$ , consider the composite  $W(X_0, \bar{x}) \rightarrow G_{geo} \times \mathbb{Z} \rightarrow G_{geo} \rightarrow G_{geo}^{ab}$ , then  $\pi_1(X, \bar{x})$  is Zariski dense in  $G_{geo}^{ab}$ , and (9.6.3.3) shows clearly  $G_{geo}^{ab}$  has no maximal torus thus finite.

2:  $\ker \psi \subset Z(G_{geo}(\bar{\mathbb{Q}}_\ell))$  is finite since  $G_{geo}$  is semisimple. To find an element in  $Z(G)$  of positive degree, we may use the same method as before to find an element  $\zeta$  that commutes with  $G_{geo}^0$ , and pass to a power, we may assume it acts trivially on  $G_{geo}/G_{geo}^0$ .

For any  $g \in G_{geo}$ , consider  $vp_g(n) = g\zeta^n g^{-1}\zeta^{-n} \in G_{geo}^0$ , so  $\varphi_g(m+n) = \varphi_g(n)\zeta^n \varphi_g(m)\zeta^{-n} = \varphi_g(n)\varphi_g(m)$ , thus it is a homomorphism, and if  $g' \in G_{geo}^0$ , then

$$\varphi_g = \varphi_{g(g^{-1}g'g)} = \varphi_{g'g} = g'\varphi_g(g')^{-1}$$

so  $\varphi_g$  has image in  $Z(G_{geo}^0)$ , which is finite, so  $\varphi_g(n) = 1$  for some  $n$ , then  $\zeta^n$  commutes with  $G_{geo}$  so  $\zeta^n \in Z(G)$ .  $\square$

**Cor.(9.6.4.5) [Weights and Center Element Actions].** Let  $\mathcal{G}_0 \in \text{WSh}_{\text{isse}}^{\text{ss}}(X_0)$  (9.6.2.5), if  $z \in Z(G(\overline{\mathbb{Q}}_\ell))$  satisfies  $\deg(z) = n \neq 0$ , which exists by (9.6.4.4), then if  $z$  acts on  $V$  with eigenvalues  $\alpha_i$ , then  $\frac{2}{n} \log_q(|\iota(\alpha_i)|)$  is just the determinential  $\iota$ -weights of  $\mathcal{G}_0$ .  $\lrcorner$

*Proof:*  $z$  is in the center, thus by Shur's lemma, it acts on each irreducible part of  $\mathcal{G}_0$  by a constant. Thus the determinential weights are clear, by definition.  $\square$

**Cor.(9.6.4.6) [Properties of Determinential Weights].** Suppose  $X_0 \in \text{SmCur}/k$  and  $\mathcal{F}_0, \mathcal{G}_0 \in \text{WSh}_{\text{isse}}(X_0)$ , then

- If  $\alpha_i$  are the determinential  $\iota$ -weights of  $\mathcal{F}_0$  and  $\beta_j$  be that of  $\mathcal{G}_0$ , then  $\alpha_i + \beta_j$  are those of  $\mathcal{F}_0 \otimes \mathcal{G}_0$  with multiplicity.
- For  $\gamma \in \mathbb{R}$ , let  $r(\gamma)$  be the sum of ranks of all irreducible constituents of  $\mathcal{F}_0$  which have determinential weight  $\gamma$  w.r.t  $\iota$ , then the determinential weights of  $\wedge^r \mathcal{F}_0$  are the numbers  $\sum_\gamma n(\gamma)\gamma$  with  $\sum n(\gamma) = r$  and  $0 \leq n(\gamma) \leq r(\gamma)$ ,  $n(\gamma) \in \mathbb{Z}$  with multiplicity.

$\lrcorner$

*Proof:* Firstly notice the determinential weight is unchanged when we change  $\mathcal{F}_0, \mathcal{G}_0$  to their semisimplification  $\mathcal{F}_0^{ss}, \mathcal{G}_0^{ss}$  (9.6.3.4). And notice  $(\mathcal{F}_0 \otimes \mathcal{G}_0)^{ss} = ((\mathcal{F}_0)^{ss} \otimes (\mathcal{G}_0)^{ss})^{ss}$ , thus the determinential weights of  $\mathcal{F}_0 \otimes \mathcal{G}_0$  are also unchanged. Similarly for the wedge product.

2: We may assume  $\mathcal{F}_0, \mathcal{G}_0$  are irreducible, and let  $\mathcal{H}_0 = (\mathcal{F}_0 \otimes \mathcal{G}_0)^{ss}$ ,  $G_{geo}^\oplus, G_{geo}^{ss}$  be the geometric monodromy group of  $\pi_1(X, \bar{x})$  in  $GL(\mathcal{F}_{\bar{x}} \oplus \mathcal{G}_{\bar{x}})$  and  $GL(\mathcal{H}_{\bar{x}})$  correspondingly, then  $G_{geo}^\oplus \rightarrow G_{geo}^{ss}$  is surjective because they are both the geometric monodromy group of  $\mathcal{H}_{\bar{x}}$ . So also  $G^\oplus \rightarrow G^{ss}$  is surjective. So if  $g$  be an element in the center of  $G^\oplus$  that has nonzero degree, then it maps to the center of  $G^{ss}$  of nonzero degree. And the action of  $g$  on each factor  $\mathcal{F}_x, \mathcal{G}_x$  is a constant, so action on  $H_x$  is also a constant, so we are done.

3: Easy from 2.  $\square$

## 5 Real Weil-Sheaves

**Def.(9.6.5.1) [ $\iota$ -Real Weil-Sheaf].**  $\mathcal{F}_0 \in \text{WSh}(X_0; \overline{\mathbb{Q}}_\ell)$  is called a  $\iota$ -real Weil-Sheaf if for any  $x \in |X_0|$ , the characteristic polynomial  $\iota(\det(1 - F_x t; \mathcal{F}_{\bar{x}}))$  of  $F_x$  real coefficients.  $\lrcorner$

**Prop.(9.6.5.2).** Any  $\iota$ -pure Weil-sheaf of weight  $w$  is a direct sum of a  $\iota$ -real  $\iota$ -pure Weil-sheaf. In fact,  $\mathcal{F}_0 \oplus \mathcal{F}_0^\vee(-w) = \mathcal{F}_0 \oplus \overline{\mathcal{F}_0}$  is  $\iota$ -real.  $\lrcorner$

**Lemma(9.6.5.3) [Eigenvalue of Cohomology and Stalk in Curve case].** Let  $X_0/k$  be a smooth curve,  $\mathcal{F}_0 \in \text{WSh}(X_0)$  is lisse, then the eigenvalues of  $F_X$  on  $H^0(X, \mathcal{F})$  or  $H_{\text{ét},c}^2(X, \mathcal{F})$  is related to the determinential weights of  $\mathcal{F}_0$  and the eigenvalue of  $F_x$  on  $\mathcal{F}_{\bar{x}}$ .  $\lrcorner$

*Proof:* Let  $V = \mathcal{F}_{\bar{x}}$ , then

$$H^0(X, \mathcal{F}) = V^{\pi_1(X, \bar{x})}, \quad H_c^2(X, \mathcal{F}) = V_{\pi_1(X, \bar{x})}(-1).$$

Then the base change sheaf of the sheaf  $V^{\pi_1(X, \bar{x})}$  or  $V_{\pi_1(X, \bar{x})}(-1)$  on  $\text{Spec } k$  is the maximal subsheaf/quotient lisse sheaf of  $\mathcal{F}_0$  that is constant on  $X$ . Then it has determinential weights just the action of  $F_X$  on the stalk by (9.6.4.5), which are also determinential weights of  $\mathcal{F}_0$  by (9.6.4.6).  $\square$

**Lemma (9.6.5.4) [Rankin-Selberg Method].** If  $X_0 \in \text{SmCur}/k$  and  $\mathcal{F}_0 \in \text{WSh}_{\text{lisse}}(X_0)$ , and  $w$  be the largest determinential weight of  $\mathcal{F}_0$ , then for any  $x \in |X_0|$ ,  $w_{N(x)}(\alpha) \leq w$ .  $\lrcorner$

*Proof:* By the arbitrariness of  $x$ , we can replace  $X_0$  by an affine open nbhd of  $x$ . Then  $H_c^0(X, \mathcal{G}) = 0$  by Artin vanishing (9.4.2.12). By Grothendieck trace formula,

$$\prod_{x \in |X_0|} \iota \det \left( 1 - t^{d_x} F_x | \otimes^{2k} \mathcal{F}_{\bar{x}} \right)^{-1} = \frac{\iota \det \left( 1 - t F_X^* | H_c^1(X, \otimes^{2k} \mathcal{F}) \right)}{\iota \det \left( 1 - t F_X^* | H_c^2(X, \otimes^{2k} \mathcal{F}) \right)}$$

Now the weight of root  $t_0$  of  $\det \left( 1 - t F_X^* | H_c^2(X, \otimes^{2k} \mathcal{F}) \right)$  has weight  $\leq$  (determinential weight of  $\mathcal{G}_0^{\otimes 2k}$ ) + 2(9.6.5.3)  $\leq 2kw + 1$  (9.6.4.6), so  $|t_0| \geq q^{-k\beta-1}$ .

Now by the formula?? and noticing  $\text{tr}(F_x^n, \otimes^{2k} \mathcal{F}_{\bar{x}}) = (\text{tr}(F_x, \mathcal{F}_{\bar{x}}))^{2k}$ , so  $(1 - t^{d_x} F_x | \otimes^{2k} \mathcal{F}_{\bar{x}})^{-1}$  has non-negative coefficients, which means their convergence radius are no less than  $q^{-k\beta-1}$ , equivalently,  $(1 - t^{d_x} F_x | \otimes^{2k} \mathcal{F}_{\bar{x}})$  has no zeros with eigenvalue  $< q^{-k\beta-1}$ .

So for any eigenvalue  $\alpha$  of  $F_x$  acting on  $\mathcal{F}_{\bar{x}}$ ,  $|\iota(\alpha^{-2k/d_x})| \leq q^{-k\beta-1}$ , or equivalently,

$$|\iota(\alpha)|^2 \leq N(x)^{\beta+1/k}.$$

Now let  $k \rightarrow \infty$ , we are done.  $\square$

**Lemma (9.6.5.5) [Real Sheaf Mixed Curve case].** Let  $X_0/k$  be smooth curve and  $\mathcal{F}_0 \in \text{WSh}(X_0)$  is  $\iota$ -lisse, then all irreducible constituents of  $\mathcal{F}_0$  is  $\iota$ -pure, and their  $\iota$ -weights coincides with their determinential weights.  $\lrcorner$

*Proof:* For  $\beta \in \mathbb{R}$ , let  $\mathcal{F}_0(\beta)$  be the sum of constituents of  $\mathcal{F}_0$  of determinential weight  $\beta$ , and let  $n(\beta) = \text{rank}(\mathcal{F}_0(\beta))$ , then we need to show that  $w_{N(x)}(\alpha_i(\beta)) = \beta$  for any eigenvalue of  $F_x$  on  $\mathcal{F}(\beta)_{\bar{x}}$ .

By definition of determinential weight, for each  $\gamma$ , we have  $\sum w_{N(x)}(\alpha_j(\gamma)) = n(\gamma)\gamma$ . Now let  $N = \sum_{\gamma > \beta} n(\gamma)$ , then any determinential weight of  $\wedge^{N+1} \mathcal{F}_0$  has weight  $\leq \beta + \sum_{\gamma > \beta} n(\gamma)\gamma$ : This is clear by (9.6.4.6) as the determinential weights of  $\wedge^{N+1} \mathcal{F}_0$  is of the form  $\sum_{\gamma} a(\gamma)\gamma$  that  $0 \leq a(\gamma) \leq \gamma$  and  $\sum_{\gamma} a(\gamma) = N + 1$ .

But now  $\alpha_i(\beta) \prod_{\gamma > \beta} \prod_{i=1}^{n(\gamma)} \alpha_j(\gamma)$  is an eigenvalue of  $(\wedge^{N+1} \mathcal{F}_0)_{\bar{x}}$ , but by lemma (9.6.5.4),  $w_{N(x)}(\alpha_i(t)) \leq t$ . Thus we must have equality  $w_{N(x)}(\alpha_i(\beta)) = \beta$ .  $\square$

**Prop. (9.6.5.6) [Real Sheaf is Mixed].** For  $X_0 \in \text{Sch}^{\text{ft}}/\mathbb{F}_q$ ,

- Any  $\iota$ -real Weil-sheaf on  $X_0$  is  $\iota$ -mixed.
- If  $X_0$  is irreducible and normal, any irreducible constituent of a lisse of an  $\iota$ -real sheaf is  $\iota$ -pure.  $\lrcorner$

*Proof:* Cf. [Bhatt P28], [KW, P36].

We have the following devissages:

- Choose an open subset  $j_0 : U_0 \hookrightarrow X_0$ ,  $S_0 = X_0 - U_0$  and consider the fundamental excision sequence (9.4.4.6), we can reduce to an open affine subscheme  $U_0 \subset X_0$ .
- We may base change to a finite field extension. ?
- So we may reduce to the case  $X_0$  is smooth, irreducible affine, and  $\mathcal{G}_0$  is lisse, with all the irreducible constituents geometrically irreducible (by base change, because they are geometrically semisimple (9.6.4.4)). And we may assume  $\dim X_0 > 1$  because the curve case is proven.

- Change  $k$  to the alg.closure of  $k$  in the function field of  $X_0$ , we can assume  $X_0$  is geometrically irreducible by (7.4.3.16).

Embed  $X_0$  in some projective space  $\mathbb{P}_0^N$ , then by a suitable Bertini theorem, the linear subspaces of codimension  $\dim X - 1$  that intersects  $X$  with a non-empty smooth irreducible curve  $C_L$  is dense in the Grassmannian. Now the closed points in any  $C_L$  is a pure-point for the any irreducible component  $\mathcal{F}_0$  of  $\mathcal{G}_0$  of the same weights. Now let  $L$  vary, then there is a dense subset of a finite extension of  $X_0$  that  $\mathcal{F}_0$  is pure. So we are done.  $\square$

## 6 Deligne's Purity Theorem

**Thm. (9.6.6.1) [Deligne's Purity Theorem].** If  $f : X_0 \rightarrow Y_0 \in \text{Sch}^{\text{ft}}/k_0$  is separated, and  $\mathcal{F}_0 \in \text{WSh}_{\text{lis}}(X_0, \overline{\mathbb{Q}_\ell})$  that is mixed weights  $\leq n$ , then for any integer  $i \geq 0$ , the sheaf  $R^i f_{0!} \mathcal{F}_0$  is also  $\iota$ -mixed of weights  $\leq n + i$ .

Moreover, each  $\iota$ -weight of  $R^i f_! \mathcal{F}$  is equivalent modulo  $\mathbb{Z}$  to an  $\iota$ -weight of  $\mathcal{F}$ . In particular, if all  $\iota$ -weights of  $\mathcal{F}$  is integral, then so is  $R^i f_! \mathcal{F}$ .  $\lrcorner$

*Proof:* This follows from (9.6.6.6).  $\square$

**Cor. (9.6.6.2).** If  $X_0 \in \text{Sch}^{\text{sm,sep,ft}}/k_0$  and  $\mathcal{F}_0$  is mixed of weight  $\geq n$ , then  $H_{\text{ét}}^i(X, \mathcal{F})$  is mixed of weights  $\geq n + i$ .  $\lrcorner$

*Proof:* By Poincaré duality (9.4.6.48),  $H_{\text{ét},c}^{2d-n}(X, \mathcal{F}^\vee(d)) = (H_{\text{ét}}^n(X, \mathcal{F}))^\vee$  as Galois representation, and  $\mathcal{F}^\vee(d)$  is still a lisse sheaf pure of weight  $-w - 2d$ , thus Deligne's purity theorem (9.6.6.1) shows that  $H_{\text{ét},c}^{2d-n}(X_{\bar{k}}, \mathcal{F}^\vee(d))$  has weight  $\leq (-w - 2d) + (2d - n) = -w - n$ , thus we are done.  $\square$

**Cor. (9.6.6.3) [Weil-Deligne Conjecture].** Suppose  $X_0 \in \text{Sch}^{\text{sm,sep,ft}}/k$ , and  $\mathcal{F}_0 \in \text{WSh}_{\text{lis}}(X_0, \overline{\mathbb{Q}_\ell})$  is pure of weight  $w$ , then  $\text{Im} \left( H_{\text{ét},c}^n(X, \mathcal{F}) \rightarrow H_{\text{ét}}^n(X, \mathcal{F}) \right)$  (9.4.4.8) is pure of weight  $w + n$ .  $\lrcorner$

*Proof:* The morphism  $H_{\text{ét},c}^n(X, \mathcal{F}) \rightarrow H_{\text{ét}}^n(X, \mathcal{F})$  is compatible with Frobenius  $\text{?}$ , so from (9.6.6.2) we know the image has weights  $\geq w + n$ , so combined with Deligne's purity theorem (9.6.6.1), we know it is pure of weight  $w + n$ .  $\square$

**Cor. (9.6.6.4).** If  $f_0 : X_0 \rightarrow Y_0$  is a smooth proper map of algebraic schemes and  $\mathcal{F}_0$  is  $\iota$ -pure of weight  $\beta$ , then  $R^i f_{0,*} \mathcal{F}_0$  is  $\iota$ -pure of weight  $\beta + i$ .  $\lrcorner$

*Proof:* Use proper base change of (9.4.4.7) to reduce to the case of (9.6.6.3). Notice in the proper case,  $Rf_* = Rf_!$ .  $\square$

**Cor. (9.6.6.5) [Riemann Hypothesis].** If  $X_0 \in \text{SmPrpr}/k$ , then  $H_{\text{ét}}^n(X; \mathbb{Q}_\ell)$  as a Weil-sheaf over  $\text{Spec } k$ , is pure of weight  $n$ .  $\lrcorner$

### Reduction to Curve case

**Prop. (9.6.6.6).** Deligne's purity theorem (9.6.6.1) can be reduced to case that  $X_0$  is a smooth geo.connected affine curve in  $\mathbb{A}_{k_0}^1$  and  $\mathcal{F}_0 \in \text{WSh}_{\text{lis}}(X_0, \overline{\mathbb{Q}_\ell})$ .  $\lrcorner$

*Proof:* We have the following dévissages about the Deligne's :

1. It is trivial in case  $f_0$  is quasi-finite. This is because of (9.4.4.9), as the fiber has dimension 0.
2. We can replace  $X_0$  by an affine open  $U_0 \subset X_0$  by Noetherian induction and excision sequence (9.4.4.7), which commutes with Frobenius action.

3. If the conclusion is true for  $g_0, h_0$ , then it is true for  $f_0 = g_0 \circ h_0$ , this follows from the Leray spectral sequence(9.4.4.7), which is Frobenius equivariant by(9.4.4.15).
4. We can replace  $Y_0$  with an affine open  $U_0 \subset Y_0$ : If the image  $f_0$  is not dense, then trivial, if it is dense, then choose any affine open  $U_0$ , then it suffices to prove for  $f_0 : f_0^{-1}(U_0) \rightarrow Y_0$  by item2, then then by item3 it suffice to prove for  $f_0 : f_0^{-1}(U_0) \rightarrow U_0$ , because  $U_0 \hookrightarrow Y_0$  is quasi-finite and use item1.

Now we claim we can reduce to the case of  $f_0 : X_0 \rightarrow Y_0$  surjective affine smooth with the fibers being geometrically irreducible curves: By devissage2 and 4, we may assume  $X_0, Y_0$  is affine, thus  $f_0$  is affine. Take a generic point  $\eta$  of  $Y_0$ (How to pass to the reduced case?), then  $(X_0)_\eta \rightarrow \text{Spec } k(\eta)$  is affine hence by Noetherian normalization(5.2.4.22) there is a finite map  $X_\eta \rightarrow \mathbb{A}_{k(\eta)}^n$ , and this spread out to a finite morphism  $f_0^{-1}(U_0) \rightarrow U_0$  for some affine open  $U_0 \subset Y_0$  because  $f_0$  is of f.t.. Then by Devissage1 and 3 we are reduced to the case  $A_{Y_0}^1 \rightarrow Y_0$ . Now by(9.4.6.15), there is an affine open  $U_0 \subset A_{Y_0}^1$  that  $\mathcal{F}_0|_{U_0}$  is lisse, so by Devissage2 we may change  $X_0$  to  $U_0$ .

That is we reduced to the case that  $\mathcal{F}_0$  is lisse and  $X_0$  is open in  $\mathbb{A}_{Y_0}^1$  so  $f_0$  is smooth affine, in particular open(7.6.4.4), so we can replace  $Y_0$  by  $f(X_0)$  and assume  $f_0$  is surjective. Then the fiber are all geometrically irreducible curves.

Then the assertion about weights are clear from proper base change(9.4.4.7) and the curve case.

For the  $\iota$ -mixedness, we may use(9.6.5.2) and(9.6.5.6) to reduce to showing that  $R^i f_!$  maps  $\iota$ -real sheaves to  $\iota$ -real sheaves.

for a geometric point  $\bar{x} \rightarrow x \rightarrow X_0$ , let  $C \rightarrow C_0$  be the fiber, which is affine irreducible, so  $H_c^0(X, \mathcal{F}) = 0$  by Poincaré duality(9.4.6.48) and Artin vanishing theorem(9.4.2.12), so

$$\iota L(C_0, \mathcal{G}_0, t) = \frac{\iota \det(1 - tF_X^* | H_c^1(C, \mathcal{G}|_C))}{\iota \det(1 - tF_X^* | H_c^2(C, \mathcal{G}|_C))}$$

by Grothendieck-Lefschetz formula(9.6.2.13). Now we can use Poincare duality and the definition that  $\mathcal{G}_0$  is pure of weight  $\beta$ , we know  $H_c^2(C, \mathcal{G}|_C)$  is pure of weight  $\beta + 2$ , by(9.6.5.3). And  $H_c^2(C, \mathcal{G}|_C)$  has weights smaller than  $\beta + 1$  by the curve case, so the two polynomial is coprime, and both has constant coefficient 1, which shows they are both real. And then by proper base change(9.4.4.7), this just says  $R^i f_0! \mathcal{G}_0$  is  $\iota$ -real.  $\square$

### Third Reduction

**Prop. (9.6.6.7).** If  $X_0 \subset \mathbb{A}_{k_0}^1$  is a smooth curve and  $\mathcal{F}_0 \in \text{WSh}_{\text{lisse}}(X_0; \overline{\mathbb{Q}_\ell})$ , the Deligne's purity theorem(9.6.6.1) is true.  $\lrcorner$

*Proof:* We have the following devissages:

- We only need to check for  $H_{\text{ét},c}^1(X, \mathcal{F})$ , because  $H_c^0$  vanish by Poincaré duality(9.4.6.48) and Artin vanishing theorem(9.4.2.12) and ,  $H_{\text{ét},c}^2(X, \mathcal{F})$  is dealt with in(9.6.5.3).
- We are free to pass to finite base change.
- We may assume  $\mathcal{F}_0$  is geometrically irreducible: By(9.6.4.4), all the irreducible constituents of  $\mathcal{F}_0$  are geometrically semisimple, so pass to a finite base change, we may assume that its irreducible filtration is just the geometric irreducible filtration, then because  $H_{\text{ét},c}^0 = 0$ ,  $H_{\text{ét},c}^1$  is left exact.
- We can assume that  $\mathcal{F}_0$  can be extended to a lisse sheaf on  $\infty$ . This is because we can choose a closed point and move it to  $\infty$  by using Möbius transform, after a finite base change.

- We can assume  $\mathcal{F}_0$  is not geometrically constant: if  $\mathcal{F}_0 \cong \overline{\mathbb{Q}_\ell}$ , then let  $i : U_0 \rightarrow P_{k_0}^1$  and  $Z_0 = P_{k_0}^1 - U_0$ , then there is a short exact sequence

$$0 \rightarrow j_{0!}(\overline{\mathbb{Q}_\ell}) \rightarrow j_*(\overline{\mathbb{Q}_\ell}) \rightarrow \mathcal{Q} \rightarrow 0$$

where  $\mathcal{Q}$  is supported on  $S$ , so its higher compact cohomology vanish, and weights of  $H^0(\mathcal{Q}) = \prod_{s \in S} (j_{0*}(\mathcal{F}_0))_{\overline{s}}$  is no more than the maximal weight of  $\overline{\mathbb{Q}_\ell}$  on  $X_0$ , which is 0, by semicontinuity of weights for curves (9.6.3.11). And  $j_*(\overline{\mathbb{Q}_\ell})$  is also geometrically constant, thus its cohomology is  $\text{Pic}(\mathbb{P}^1)[n] = 0$  by (9.4.7.2), so  $H^1(P^1, j_{0!}(\overline{\mathbb{Q}_\ell}))$  has weights zero.

The actual proof will use the following lemma (9.6.6.8). After that, notice by (9.6.8.6)

$$(T_\psi(G_0))|_{\{0\}} = R\Gamma_c(\mathbb{A}^1, \mathcal{G})[1] = R\Gamma_c(U, \mathcal{F})[1] = H_{\text{ét},c}^1(U, \mathcal{F})$$

Then to understand the Frobenius eigenvalues of  $H_c^1(U, \mathcal{F})$ , it suffices to understand the weights of  $T_\psi(\mathcal{G}_0)$ , i.e.

$$\text{wt}(T_\psi(\mathcal{G}_0)) \leq w + 1$$

Then we use (9.6.3.17), notice the condition is satisfied by lemma (9.6.6.8), so  $w(T_\psi(\mathcal{G}_0)) = \|T_\psi(\mathcal{G}_0)\|$ , and also  $w(G_0) = \|G_0\|$  for the same reason as  $H_c^0(\mathbb{A}^1, \mathcal{G}) = H_{\text{ét},c}^0(U, \mathcal{F}) = 0$  by Poincaré duality. Now (9.6.8.9) gives the result.  $\square$

**Lemma (9.6.6.8) [key assertions of Weil Proof].** If  $\mathcal{G}_0 = j_{0!}(\mathcal{F}_0)$  where  $j_0 : U_0 \hookrightarrow A_{k_0}^1$ ,  $\psi : k_0 \rightarrow \overline{\mathbb{Q}_\ell}$  is a fixed non-trivial additive character, then

- $T_\psi(\mathcal{G}_0)$  is a sheaf placed at degree 0.
- $H_{\text{ét},c}^0(\mathbb{A}^1, T_\psi(\mathcal{G}_0)) = 0$ .
- $T_\psi(\mathcal{G}_0)$  is  $\iota$ -mixed.

┘

*Proof:* 1: By (9.6.8.6), we need to show  $H_{\text{ét},c}^i(\mathbb{A}^1, \mathcal{G}_0 \otimes \mathcal{L}(\psi_a)) = 0$  for  $i \neq 1$ , and this is equivalent to

$$H_{\text{ét},c}^i(\mathbb{A}^1, j_! \mathcal{F} \otimes \mathcal{L}(\psi_a)) = H_c^i(U, F \otimes \mathcal{L}(\psi_a)) = 0.$$

Notice by vanishing result (9.4.4.8), only need to show  $i = 0, i = 2$ ,  $i = 0$  case is done by Poincaré duality (9.4.6.48) and Artin vanishing (9.4.2.12) because it is smooth and  $\mathcal{F}$  is lisse.

$H_c^2(\mathcal{G}_0 \otimes \mathcal{L}(\psi_a)) = V_{\rho \otimes \chi_a}|_{\pi_1(U, \overline{x})}(-1)$  by (9.6.5.3), and  $\rho \otimes \chi_a$  irreducible as  $\rho$  does, so if  $V_{\rho \otimes \chi_a}|_{\pi_1(U, \overline{x})} \neq 0$ , then  $\rho \otimes \psi_a$  is trivial representation. Then  $\mathcal{G} \cong \mathcal{L}_{\psi_a}$  on  $\mathbb{P}_{\overline{k}}^1$  as an étale sheaf on  $\mathbb{A}^1 \cup \{\infty\} = \mathbb{P}^1$  by our reduction, so we have the character  $\psi_{-a}$  factors through  $\pi_1(\mathbb{P}^1, \overline{x})$ , i.e.

$$\begin{array}{ccc} \pi_1(\mathbb{A}^1, \overline{x}) & \longrightarrow & \pi_1(\mathbb{P}^1, \overline{x}) = 0 \\ \downarrow & & \downarrow \\ \pi_1(\mathbb{A}_0^1, \overline{x}) & \longrightarrow & \pi_1(\mathbb{P}_0^1, \overline{x}) \xrightarrow{\psi_{-a}} \overline{\mathbb{Q}_\ell} \end{array}.$$

But this is in contradiction with the fact the Artin-Schreier cover is geometrically irreducible ?.

2: Denote  $T_\psi(\mathcal{G}_0) = \mathcal{K}_0$ , then by (9.6.8.5) and Fourier inversion (9.6.8.8):

$$H_c^0(\mathbb{A}^1, \mathcal{K}) = \mathcal{H}^{-1}((T_{\psi^{-1}}(\mathcal{K}_0))_0) = \mathcal{H}^{-1}(T_{\psi^{-1}} \circ T_\psi(j_{0!}(\mathcal{F}_0))_0) = \mathcal{H}^{-1}(j_{0!}(\mathcal{F}_0)(-1))_0 = 0$$

because  $\mathcal{F}_0$  is placed at degree 0.

3: To show  $\iota$ -mixed, the only thing we can do is show it is embedded in a  $\iota$ -real sheaf: Consider the  $\iota$ -real sheaf

$$\mathcal{H}_0 = \mathrm{pr}_2^*(j_{0!}\mathcal{F}_0) \otimes \mathrm{mul}^*(\mathcal{L}(\psi)) \oplus \mathrm{pr}_2^*(j_{0!}\mathcal{F}_0^\vee) \otimes \mathrm{mul}^*(\mathcal{L}(\psi^{-1}))(-w)$$

Then

$$(R^i\pi_1^1(\mathcal{H}_0))_{\bar{x}} = H^i(\{\bar{x}\} \times \mathbb{A}^1, \mathcal{H}_0) = H^i(j_{0!}\mathcal{F}_0 \otimes \mathcal{L}(\psi_x)) \oplus H^i(j_{0!}\mathcal{F}_0^\vee \otimes \mathcal{L}(\psi_{x^{-1}}))(-w)$$

which we proved to vanish for  $i \neq 1$ . So using Poincaré duality on  $\{\bar{x}\} \times \mathbb{A}^1$ ,

$$\det\left(1 - tF_x^{d_x}|(R^1\pi_1^1(\mathcal{H}_0))_{\bar{x}}\right) = \det\left(1 - tF_X|H_c^1(\{\bar{x}\} \times \mathbb{A}^1, H_0|_{\{\bar{x}\} \times \mathbb{A}^1})\right) = \prod_{y \in \mathbb{F}_{q^n}} \det\left(1 - tF_y^{d_y}|(\mathcal{H}_0)_{\overline{(x,y)}}\right)^{-1}$$

which is real, so by (9.6.5.5), the direct summand  $T_\psi(\mathcal{G}_0)$  is  $\iota$ -mixed.  $\square$

**Remark (9.6.6.9).** If we use the machinery of perverse sheaf and show that Fourier transform preserves perversity, then item 1, 2 will be a direct consequence, Cf. [Bhatt notes, P39]. In fact, this is just the bigger picture, given in [Weil conjectures Perverse Sheaves and  $l$ -adic Fourier Transform Kiehl/Weissauer].  $\lrcorner$

## 7 Semisimplicity and Hard Lefschetz Theorem

**Prop. (9.6.7.1) [Semisimplicity Theorem].** If  $X_0/k_0$  is smooth and  $\mathcal{F}_0 \in \mathrm{WSh}_{\mathrm{lis}}(X_0; \overline{\mathbb{Q}_\ell})$  is  $\iota$ -pure, then  $\mathcal{F}_0$  is semi-simple (9.6.2.5), thus geometrically semisimple by (9.6.4.4).  $\lrcorner$

*Proof:* Let  $\mathcal{F}'$  be the sum of irreducible lisse subsheaves of  $\mathcal{F}$ , then it is the largest semisimple subsheaf of  $\mathcal{F}$ . It is stable under  $G(\overline{\mathbb{F}_q}/\mathbb{F}_q)$ , thus can be descended to a lisse subsheaf  $\mathcal{F}'_0$  of  $\mathcal{F}_0$ , and let  $\mathcal{F}'' = \mathcal{F}_0/\mathcal{F}'_0$ , we want to show the exact sequence

$$0 \rightarrow \mathcal{F}'_0 \rightarrow \mathcal{F}_0 \rightarrow \mathcal{F}'' \rightarrow 0$$

splits geometrically. Notice this exact sequence defines an element in  $\mathrm{Ext}_X^1(\mathcal{F}'', \mathcal{F}') = H^1(X, (\mathcal{F}'')^\vee \otimes \mathcal{F}')$ .  $\mathcal{F}_0$  is pure, hence so does  $(\mathcal{F}''_0)^\vee \otimes \mathcal{F}'_0$ , thus  $H^1(X, (\mathcal{F}'')^\vee \otimes \mathcal{F}')$  is  $\iota$ -mixed of weights  $\geq 1$ . But the exact sequence is compatible with Frobenius action, it defines a Frobenius fixed element, which then must vanish.  $\square$

**Cor. (9.6.7.2).** If  $f : X \rightarrow Y$  is proper between smooth algebraic schemes, then the sheaves  $R^i f_* \mathbb{Q}_\ell$  are semisimple.  $\lrcorner$

### Hard Lefschetz

**Situation (9.6.7.3).** Suppose  $F \in \mathrm{Field}^0$  and  $\mathcal{H}$  is a cohomology theory  $\mathrm{SmProj}/k \rightarrow \mathcal{C}\mathrm{Ring}^{\mathrm{gr}}/F$  which satisfies

- (Poincaré duality)  $\mathcal{H}^i(X) \otimes_F \mathcal{H}^{2n-i}(X) \rightarrow \mathcal{H}^{2n}(X)$  is a perfect pairing, and the Frobenius  $F_X^* = q^n$  on  $\mathcal{H}^{2n}(X)$ .
- (Weak Lefschetz) If  $\mathcal{L}$  is an ample line bundle on  $X$  and  $H \subset X$  is a smooth divisor in  $|\mathcal{L}|$ , then

$$f^* : \mathcal{H}^i(X) \rightarrow \mathcal{H}^i(Y)$$

is an isomorphism for  $i = n - 2$  and injective for  $i = n - 1$ .

- (Zeta Function) Let  $\mathcal{P}^i(X; T) = \det(1 - F_X^* T | \mathcal{H}^i(X))$ , then the Hasse-Weil zeta function

$$Z(X; T) = \prod_{i=0}^{2n} \mathcal{P}^i(X; T)^{(-1)^{i+1}}.$$

┘

**Prop. (9.6.7.4).** Crystalline and  $\ell$ -adic étale cohomologies satisfy the hypothesis (9.6.7.3). ┘

*Proof:* □

**Prop. (9.6.7.5).** Situation as in (9.6.7.3), then  $\mathcal{P}^i(X; T) = P_{\text{ét}}^i(X; T)$ . ┘

*Proof:* ? □

**Cor. (9.6.7.6).**

- The characteristic polynomial  $P_{\text{ét}}(X; T)$  is independent of  $\ell \in \mathbf{Prime}$  chosen.
- $\dim_F \mathcal{H}^i(X) = \dim_{\mathbb{Q}_\ell} H_{\text{ét}}^i(X)$ .
- (Hard Lefschetz) If  $\mathcal{L}$  is an ample line bundle on  $X$ , then

$$\mathcal{H}^{n-i}(X) \xrightarrow{c_1(\mathcal{L})^i} \mathcal{H}^{n+i}(X)$$

is an isomorphism. ┘

**Cor. (9.6.7.7).**

$$b_d \geq b_{d-2} \geq \dots, \quad b_{d-1} \geq b_{d-3} \geq \dots$$

┘

**Prop. (9.6.7.8)** [Hard-Lefschetz]. Cf. [Bhatt P42]. ┘

## 8 Deligne-Fourier Transformation

### Sheaf-Function Correspondence

**Def. (9.6.8.1)** [Sheaf-Function Correspondence]. For a complex  $K_0 \in D_{\text{const}}^b(X_0, \overline{\mathbb{Q}}_\ell)$ , we can associate a function

$$f^{K_0} : X_0(\mathbb{F}_{q^n}) \rightarrow \overline{\mathbb{Q}}_\ell : x_0 \mapsto \text{tr}((F_{x_0}^*)^{n/d_x} | (K_0)_{\overline{x}}) = \text{tr}((\varphi_{x_0}^{-1})^{n/\deg(x_0)} | (K_0)_{\overline{x}}) \quad (9.6.2.4).$$

┘

**Prop. (9.6.8.2)** [Sheaf-Function Dictionary]. We can use Grothendieck formula for a constructible sheaf (9.6.2.13) to relate the function  $f^{K_0}$  to the compact cohomologies of  $\mathcal{H}^i K_0$ , and we can translate many known theorems:

- $f^{f^* K_0} = f^{K_0} \circ f$ .
- 

$$f^{K_0} \cdot f^{T_0} = f^{K_0 \otimes^L T_0} ?$$

- (Base Change)(9.4.4.7) asserts that given a Cartesian diagram

$$\begin{array}{ccc} X' & \xrightarrow{g'} & X \\ \downarrow f' & & \downarrow f \\ Y' & \xrightarrow{g} & Y \end{array}$$

then it says in case  $Y'$  is a closed point of  $Y$ ,

$$f^{Rf!K_0}(y) = \sum_{x \in X_y(\mathbb{F}_{q^n})} f^{K_0}(x)$$

where  $y \in Y(\mathbb{F}_{q^n})$ , and more generally

$$\sum_{x' \in X'_{y'}} f^{K_0}(g'(x')) = \sum_{x \in X_{g(y')}} f^{K_0}(x)$$

- The projection formula(9.4.4.10) turns out to say something trivial:

$$\sum_{x \in X_y} (f^{K_0}(f(x)) \cdot f^{T_0}(x)) = f^{K_0}(y) \cdot \left( \sum_{x \in X_y} f^{T_0}(x) \right)$$

┘

**Prop. (9.6.8.3).**  $f^{\mathcal{L}_0(\psi)}(x) = \psi(-x)$ , by(9.4.6.33).

┘

### Fourier-Deligne Transforms on $\mathbb{A}^1$

Use notations as in [Artin-Schreier Theory](#).

**Def. (9.6.8.4) [Fourier-Deligne Transform].** Consider the multiplication map  $\text{mul.} : \mathbb{A}_0 \times \mathbb{A}'_0 \rightarrow \mathbb{A}_0$ , let the sheaf  $\mathcal{L}(\psi)$  be placed at  $A_0$ , and  $K_0 \in D_{\text{const}}^b(\mathbb{A}'_0, \overline{\mathbb{Q}}_\ell)$  be placed at  $\mathbb{A}'_0$ , then define the **Deligne-Fourier transform**

$$T_\psi : D_{\text{const}}^b(\mathbb{A}'_0, \overline{\mathbb{Q}}_\ell) \rightarrow D_{\text{const}}^b(\mathbb{A}_0, \overline{\mathbb{Q}}_\ell) : K_0 \mapsto R\pi_1^1(\text{pr}_2^* K_0 \otimes^L \text{mul.}^* \mathcal{L}_0(\psi))[1]$$

┘

**Lemma (9.6.8.5).**  $f^{T_\psi K_0}(x) = -\sum_{y \in \mathbb{F}_{q^n}} f^{K_0}(y) \psi^{-1}(xy)$  for any  $x \in \mathbb{F}_{q^n}$ .

┘

*Proof:* By(9.6.8.2),

$$\begin{aligned} f^{T_\psi K_0}(x) &= \sum_{y \in \mathbb{F}_{q^n}} f^{(\text{pr}_2^* K_0 \otimes^L \text{mul.}^* \mathcal{L}_0(\psi))[1]}((x, y)) \\ &= - \sum_{y \in \mathbb{F}_{q^n}} f^{\text{pr}_2^* K_0}((x, y)) \cdot f^{\text{mul.}^* \mathcal{L}_0(\psi)}((x, y)) \\ (9.6.8.3) &= - \sum_{y \in \mathbb{F}_{q^n}} f^{K_0}(y) \psi(-xy). \end{aligned}$$

□

**Prop. (9.6.8.6).** For  $a \in \mathbb{A}^1(\mathbb{F}_{q^n})$ ,

$$(T_\psi(K_0))_a = R\Gamma_c(K \otimes^L \mathcal{L}(\psi_a))[1]$$

where  $\psi_a : \mathbb{F}_{q^n} \rightarrow \overline{\mathbb{Q}}_\ell^\times$  maps  $x \mapsto \psi(ax)$ . In particular,  $\mathcal{H}^i((T_\psi(K_0))_0) = H_{\text{ét},c}^i(\mathbb{A}^1, K)$ , so we placed the complex into a family of deformations.  $\lrcorner$

*Proof:* By base change(9.4.4.7),

$$(T_\psi(K_0))_a = R\Gamma_c((\text{pr}_2^* K_0 \otimes^L m^* \mathcal{L}_0(\psi))|_{\{a\} \times \mathbb{A}^1})[1] = R\Gamma_c(K \otimes^L \mathcal{L}(\psi_a))[1].$$

□

**Lemma (9.6.8.7).** If  $\delta_0 = i_{0*} \overline{\mathbb{Q}}_\ell$  is the skyscraper sheaf where  $i_0 : \{0\} \hookrightarrow \mathbb{A}_0^1$ , then

$$T_\psi(\overline{\mathbb{Q}}_\ell[1]) = \delta_0(-1).$$

□

*Proof:* For the Artin-Schreier cover  $\wp : x \mapsto x^q - x$ , by(9.4.6.32),

$$\wp_* \overline{\mathbb{Q}}_\ell \cong \bigoplus_{x \in \mathbb{F}_q} \mathcal{L}(\psi_x).$$

As  $\wp$  is finite,  $\wp_*$  is exact(9.4.1.18), so using the Leray spectral sequence(9.4.4.7), we can calculate

$$H_{\text{ét},c}^1(\mathbb{A}^1, \mathcal{L}(\psi_x)) = 0 = H_{\text{ét},c}^1(\mathbb{A}^1, \overline{\mathbb{Q}}_\ell), \quad H_{\text{ét},c}^2(\mathbb{A}^1, \mathcal{L}(\psi_x)) = 0 \text{ (9.4.4.9)}, \quad H_c^2(\mathbb{A}^1, \mathcal{L}(\psi_x)) = \delta_0(x) \overline{\mathbb{Q}}_\ell(-1) \text{ (9.6.5.3)}.$$

So

$$\left( R\pi_1^1(m^* \mathcal{L}_0(\psi)[1])[1] \right)_x = R\Gamma_c(\mathcal{L}(\psi_x))[2] = \delta_0(-1).$$

□

**Prop. (9.6.8.8) [Fourier Inversion].** For  $K_0 \in D_c^b(\mathbb{A}_0, \overline{\mathbb{Q}}_\ell)$ ,  $T_{\psi^{-1}} T_\psi(K_0) = K_0(-1)$ .  $\lrcorner$

*Proof:* Consider

$$\begin{array}{ccc} \mathbb{A}_0^1 \times \mathbb{A}_0^1 \times \mathbb{A}_0^1 & \xrightarrow{\text{pr}_{23}} & \mathbb{A}_0^1 \times \mathbb{A}_0^1 \xrightarrow{\text{pr}_2} \mathbb{A}_0^1 \\ \downarrow \text{pr}_{12} & & \downarrow \text{pr}_1 \\ \mathbb{A}_0^1 \times \mathbb{A}_0^1 & \xrightarrow{\text{pr}_2} & \mathbb{A}_0^1 \\ \downarrow \text{pr}_1 & & \\ \mathbb{A}_0^1 & & \end{array}$$

And we will use the following Cartesian diagrams:

$$\begin{array}{ccc} \mathbb{A}_0^3 & \xrightarrow{\alpha: (x,y,z) \mapsto (y,z-x)} & \mathbb{A}_0^2 \\ \downarrow \pi^{13} & & \downarrow \text{pr}_2 \\ \mathbb{A}_0^2 & \xrightarrow{\beta: (x,z) \mapsto z-x} & \mathbb{A}_0^1 \end{array} \quad , \quad \begin{array}{ccc} \mathbb{A}_0^1 & \longrightarrow & * \\ \downarrow \Delta & & \downarrow i_0 \\ \mathbb{A}_0^2 & \xrightarrow{\beta} & \mathbb{A}_0^1 \end{array}$$

Then

$$T_{\psi^{-1}} T_\psi K_0$$

$$(T_{\psi^{-1}} T_\psi f)(x)$$

$$= R\pi_!^1(\mathrm{pr}_2^* R\pi_!^1(\mathrm{pr}_2^* K_0 \otimes m^* \mathcal{L}_0(\psi)) \otimes m^* \mathcal{L}_0(\psi^{-1}))[2] = \sum_y \left( \sum_z f(z) \psi(-yz) \right) \psi(xy)$$

By base change(9.4.4.7) :

$$= R\pi_!^1 \left( R\pi_!^{12} \mathrm{pr}_{23}^* (\mathrm{pr}_2^* K_0 \otimes m^* \mathcal{L}_0(\psi)) \otimes m^* \mathcal{L}_0(\psi^{-1}) \right) [2]$$

By projection formula(9.4.4.7) :

$$= R\pi_!^1 R\pi_!^{12} (\mathrm{pr}_{23}^* (\mathrm{pr}_2^* K_0 \otimes m^* \mathcal{L}_0(\psi)) \otimes \mathrm{pr}_{12}^* m^* \mathcal{L}_0(\psi^{-1}))[2] = \sum_y \sum_z f(z) \psi(-yz) \psi(xy)$$

Combine the character:

$$= R\pi_!^1 R\pi_!^{12} (\mathrm{pr}_{23}^* \mathrm{pr}_2^* K_0 \otimes \alpha^* m^* \mathcal{L}_0(\psi))[2] = \sum_y \sum_z f(z) \psi(-y(z-x))$$

Change order of summation:

$$= R\pi_!^1 R\pi_!^{13} (\pi^{13*} \mathrm{pr}_2^* K_0 \otimes \alpha^* m^* \mathcal{L}_0(\psi))[2] = \sum_z \sum_y f(z) \psi(-y(z-x))$$

By projection formula:

$$= R\pi_!^1 (\mathrm{pr}_2^* K_0 \otimes R\pi_!^{13} \alpha^* m^* \mathcal{L}_0(\psi))[2] = \sum_z f(z) \sum_y \psi(-y(z-x))$$

By base change:

$$= R\pi_!^1 \left( \mathrm{pr}_2^* K_0 \otimes \beta^* R\pi_!^2 (\mathrm{mul}^* \mathcal{L}_0(\psi)) \right) [2] = R\pi_!^1 \left( \mathrm{pr}_2^* K_0 \otimes \beta^* T_\psi \overline{\mathbb{Q}}_\ell[-1] \right) [2]$$

By(9.6.8.7) :

$$= R\pi_!^1 (\mathrm{pr}_2^* K_0 \otimes \beta^* \delta_0[-2])[2] = R\pi_!^1 (\mathrm{pr}_2^* K_0 \otimes \beta^* \delta_0(-1)) = \sum_z f(z) \#k_0^n \delta_0(z-x)$$

Use base change and noticing  $i_0$  is finite thus proper and exact:

$$= R\pi_!^1 (\mathrm{pr}_2^* K_0 \otimes R\Delta_! \overline{\mathbb{Q}}_\ell(-1)) = \sum_z \sum_{x=z} q^n$$

By projection formula:

$$\begin{aligned} &= R\pi_!^1 R\Delta_! (\Delta^* \mathrm{pr}_2^* K_0 \otimes \overline{\mathbb{Q}}_\ell)(-1) \\ &= K_0(-1) \end{aligned} \quad \begin{aligned} &= \#k_0^n \sum_{\{z|z=x\}} f(z) \\ &= \#k_0^n f(x) \end{aligned}$$

□

**Prop. (9.6.8.9) [Plancherel Formula].**

$$\left\| f^{T_\psi(K_0)} \right\|_n = \#k_0^{n/2} \left\| f^{K_0} \right\|_n \quad (9.6.3.13).$$

In particular,

$$\|T_\psi(K_0)\| \leq \|K_0\| + 1 \quad (9.6.3.16)$$

┘

*Proof:* By definition and using(9.6.8.5),

$$\left\| f^{T_\psi(K_0)} \right\|_n^2 = \sum_{x \in k_n} f^{T_\psi(K_0)}(x) \overline{f^{T_\psi(K_0)}(x)}$$

$$\begin{aligned}
&= \sum_{x,y,z} f^{K_0}(y) \overline{f^{K_0}(z)} \psi(-xy) \psi(xz) \\
&= \#k_0^n \sum_{z=y} f^{K_0}(y) \overline{f^{K_0}(z)} \\
&= \#k_0^n (f, f)_n
\end{aligned}$$

□

## 9 Integrality Problems

**Def. (9.6.9.1) [Integral Sheaves].** Let  $X_0 \in \text{Sch}^{\text{sep,ft}}/k_0$  and  $\mathcal{F}_0 \in \text{WSh}_{\text{lis}}(X_0; \overline{\mathbb{Q}_\ell})$ , then  $\mathcal{F}_0$  is called an **integral lisse sheaf** if for all  $x_0 \in |X_0|_0$ , all the eigenvalues of  $F_x^*$  acting on  $\mathcal{F}_{\overline{x}}$  are algebraic integers. ┘

**Prop. (9.6.9.2) [Deligne].** If  $\mathcal{F}_0$  is an integral lisse sheaf (9.6.9.1) on  $X_0$ , then all coefficients of  $H_{\text{ét},c}^n(X, \mathcal{F})$  are integral for any  $n \in \mathbb{N}$ . ┘

*Proof:* Cf. [Weil 1 Proof, P21]. □

**Cor. (9.6.9.3).** All Frobenius-eigenvalues of  $H_{\text{ét},c}^i(X, \mathcal{F})$  are algebraic integers. ┘

## 9.7 Intersection Homology and Perverse Sheaves

References are [Perverse Sheaves, Beilinson-Bernsterin-Deligne], [D-modules, perverse sheaves, and representation theory], [K-W01].

**Notation (9.7.0.1).**

- Let  $k \in \mathbf{Field}$  s.t.  $\#k < \infty$  or  $k = \bar{k}$ .
- Let  $\ell \in \mathbf{P} \setminus \{\text{char } k\}$ .

⌋

## 9.8 Profinite Cohomology

Reference are [B-S64, Lan96, Ser97a, Neu15], [Brown, Cohomology of Groups]Chap6 and the giant book [Neukirch Cohomology of Number Fields].

### 1 Cohomology of Finite Groups

**Notation(9.8.1.1).**

- Let  $G \in \mathcal{G}rp^{\text{fin}}$ .

┘

**Def.(9.8.1.2)[Group Cohomologies].** The **group cohomology**  $H^n(G, A)$  is the derived functor of the left exact functor

$$\text{Mod}_G \rightarrow \text{Ab} : H^0(G, A) = A^G = \text{Hom}_{\mathbb{Z}[G]}(\mathbb{Z}, A),$$

so  $H^n(G, A) = \text{Ext}_{\mathbb{Z}[G]}^n(\mathbb{Z}, A)$ .

The **group homology**  $H_n(G, A)$  is the left derived functor of the right exact functor

$$\text{Mod}_G \rightarrow \text{Ab} : H_0(G, A) = A_G = \mathbb{Z} \otimes_{\mathbb{Z}[G]} A,$$

so  $H_n(G, A) = \text{Tor}_n^{\mathbb{Z}[G]}(\mathbb{Z}, A)$ .

┘

**Prop.(9.8.1.3).** For a normal subgroup  $H$  of  $G$ ,  $A \mapsto A^H$  is left exact from  $G\text{-mod}$  to  $G/H\text{-mod}$  and preserves injectives ?? because it is right adjoint to the exact inclusion functor as  $\text{Hom}_G(B, A) = \text{Hom}_{G/H}(B, A^H)$ . Dually for  $A_H$ .

┘

**Prop.(9.8.1.4).** For  $G = \mathbb{Z}$ , we have a free resolution  $0 \rightarrow \mathbb{Z}[t, t^{-1}] \xrightarrow{1-t} \mathbb{Z}[t, t^{-1}] \rightarrow \mathbb{Z} \rightarrow 0$ . In particular, thus  $H_n(\mathbb{Z}, \mathbb{Z}) = \mathbb{Z}$  iff  $n = 0, 1$  and vanish otherwise.

┘

**Prop.(9.8.1.5)[Tate-Cohomologies].** There is a standard resolution of the  $\mathbb{Z}[G]$ -module  $\mathbb{Z}$ :

$$\cdots \longleftarrow X_{-2} \longleftarrow X_{-1} \xleftarrow{\mu \circ \varepsilon} X_0 \longleftarrow X_1 \longleftarrow \cdots$$

that  $X_q = X_{-q-1}$  are  $\mathbb{Z}[G]$ -module generated by  $q$ -cells  $(\sigma_1, \dots, \sigma_q)$ ,  $X_0 = X_{-1} = \mathbb{Z}[G]$ .

It then can be verified that for  $G \in \text{Ab}^{\text{fin}}$ ,  $\text{Hom}$  from this resolution gives out the Tate cohomology

$$H_{\text{Tate}}^n(G, A) = \begin{cases} H^n(G, A) & n \geq 1 \\ A^G / \text{tr}_G(A) & n = 0 \\ \ker(\text{tr}_G|A) / I_G A & n = -1 \\ H_{-1-n}(G, A) & n \leq -2 \end{cases}$$

and  $H_T^n$  is a long exact sequence.

In particular, the  $\text{Hom}$  complex looks like:

$$\cdots \rightarrow A_{-2} \xrightarrow{\partial_{-1}} A_{-1} \xrightarrow{\partial_0} A_0 \xrightarrow{\partial_1} A_1 \xrightarrow{\partial_2} A_2 \rightarrow \cdots$$

where  $A_{-1} = A_0 = A$  and  $\partial_0 x = \text{tr}_G x$ ,  $(\partial_1 x)(\sigma) = \sigma x - x$ ,

$$\partial_2(x)(\sigma_1, \sigma_2) = \sigma_1 x(\sigma_2) - x(\sigma_1 \sigma_2) + x(\sigma_1).$$

┘

*Proof:* Cf.[Neukirch CFT P13]?

□

**Remark (9.8.1.6).** From now on, consider only Tate cohomology. ┘

**Prop. (9.8.1.7).**

$$H^{-2}(G, \mathbb{Z}) = G_{\text{ab}}, \quad H^{-1}(G, \mathbb{Z}) = 0, \quad H^0(G, \mathbb{Z}) = \mathbb{Z}/|G|\mathbb{Z}, \quad H^1(G, \mathbb{Z}) = 0, \quad H^2(G, \mathbb{Z}) = \chi(G).$$

┘

*Proof:*  $H^0$  is trivial and  $H^1(G, \mathbb{Z}) = H^0(G, \mathbb{Q}/\mathbb{Z}) = 0$ ,  $H^2(G, \mathbb{Z}) = H^1(G, \mathbb{Q}/\mathbb{Z}) = \text{Hom}(G, \mathbb{Q}/\mathbb{Z})$ .  
 $H^{-1}(G, \mathbb{Z}) = {}_{N_G}\mathbb{Z}/I_G A = 0$ .

For  $H^{-2}(G, \mathbb{Z})$ , use the dimension shifting  $0 \rightarrow I_G \rightarrow \mathbb{Z}[G] \rightarrow \mathbb{Z} \rightarrow 0$ ,  $= H^{-1}(G, I_G) = I_G/I_G^2$ .  
 And  $G^{ab} \cong I_G/I_G^2$  by  $\sigma \mapsto \sigma - 1$ . □

**Prop. (9.8.1.8) [Group Cohomologies are Torsion].** For  $G \in \text{Ab}^{\text{fin}}$ ,  $\#G \cdot H^n(G, A) = 0$  for any  $A \in \text{Mod}_G$ . (True for  $H^0$  and use dimension shifting). In particular, a divisible  $G$ -module  $A$  has trivial cohomology. ┘

### Operations

**Prop. (9.8.1.9) [Dimension Shifting].** There are fundamental split exact sequence  $0 \rightarrow I_G \rightarrow \mathbb{Z}[G] \rightarrow \mathbb{Z} \rightarrow 0$  and  $0 \rightarrow \mathbb{Z} \rightarrow \mathbb{Z}[G] \rightarrow J_G \rightarrow 0$ , thus  $A_G = A/I_G A$ . This can be used to tensor with  $A$  and define natural dimension shifting of cohomology  $\delta$ . ┘

**Lemma (9.8.1.10).** If  $H \leq G$ , by Grothendieck spectral sequence applied to  $\text{Mod}_G \xrightarrow{\text{res}} \text{Mod}_H \xrightarrow{(\cdot)^H} \text{Ab}$  shows that for  $A \in \text{Mod}_G$ ,  $H^*(H, A)$  is the same as the right derived functor of the functor  $(\cdot)^H$  on  $\text{Mod}_G$ . ┘

**Def. (9.8.1.11) [Restrictions, Corestrictions and Inflation].** Let  $H$  be a subgroup of  $G$ ,

- The **inflation** is the  $\delta$ -morphism  $H^*(G/H, A) \rightarrow H^*(G, A)$  on  $\text{Mod}_{G/H}$  induced by the natural transformation ? How to define it ?
- The **restriction** are the  $\delta$ -morphisms  $H^*(G, A) \rightarrow H^*(H, A)$  on  $\text{Mod}_G$  induced by the natural transformation  $A^G \rightarrow A^H$ .
- The **corestricton** are the  $\delta$ -morphisms  $H^*(H, A) \rightarrow H^*(G, A)$  on  $\text{Mod}_G$  induced by the natural transformation  $A^H \rightarrow A^G : a \mapsto N_{G/H}a$ .

┘

*Proof:* These exist by (4.10.3.5) and (9.8.1.10). □

**Cor. (9.8.1.12).** Let  $H$  be a subgroup of  $G$ , then  $\text{cor} \circ \text{res} = [G : H]\text{id}$ . ┘

**Prop. (9.8.1.13) [Kernel of Restriction].** If  $G \in \text{Grp}^{\text{fin}}$ ,  $H_1, H_2 \leq G$  are conjugate subgroups, and  $M \in \text{Mod}_G$ , then the kernel of the restriction maps  $H^1(G, M) \rightarrow H^1(H_i, M)$  are identical. ┘

*Proof:* If a 1-cycle  $\sigma \mapsto f(\sigma)$  is a cocycle, then it is a boundary when restricted to  $H_1$  iff  $f(\sigma) = \sigma(a) - a$  for some  $a \in M$  for any  $\sigma \in H_1$ . Thus

$$f(x^{-1}\sigma x) = f(x^{-1}) + x^{-1}f(\sigma x) = -x^{-1}f(x) + x^{-1}f(\sigma) + x^{-1}\sigma f(x) = x^{-1}(\sigma(f(x) + a) - (f(x) + a))$$

is also boundary when restricted to  $x^{-1}H_1x$ . □

**Thm. (9.8.1.14) [Serre-Hochschild Spectral Sequence].** If  $G \in \text{Grp}^{\text{fin}}$  and  $H \trianglelefteq G$ , by Grothendieck spectral sequence, the relation  $A^G = (A^H)^{G/H}$  gives us a spectral sequence  $E$  that

$$E_2^{p,q} = H^p(G/H, H^q(H, A)) \implies E^n = H^n(G, A).$$

The edge morphisms are:

- inflation maps  $H^k(G/H, A^H) \xrightarrow{\text{inf}} H^k(G, A)$ .
- restriction maps  $H^k(G, A) \xrightarrow{\text{res}} H^k(H, A)^{G/H}$ .

And the lower parts give us:

$$0 \rightarrow H^1(G/H, A^H) \xrightarrow{\text{inf}} H^1(G, A) \xrightarrow{\text{res}} H^1(H, A)^{G/H} \xrightarrow{\text{trans}} H^2(G/H, A^H) \xrightarrow{\text{inf}} H^2(G, A).$$

And dually for homology group.

Moreover if  $H^k(H, A) = 0$  for  $k = 1, \dots, n-1$ , then the rows are blank, thus the above lower part can change to dimension  $n$ .  $\lrcorner$

*Proof:* Prove the compatibility of inflation, restriction with the definition given in (9.8.1.11). ??  $\square$

**Cor. (9.8.1.15) [Hopf].** If  $G = F/R$ ,  $F$  is free, then use the homology spectral sequence,  $H_2(G, \mathbb{Z}) \cong \frac{R \cap [F, F]}{[F, R]}$ . Cf. [Weibel P198].  $\lrcorner$

**Prop. (9.8.1.16).** For an isomorphism  $(\sigma^*, \sigma)$  of a group and its cochain map in the sense that  $\sigma^*(g)(\sigma(a)) = g(a)$ , we have an isomorphism of Conjugation acts trivially on the group cohomology, because it does on  $H^0$  because  $H^0 = A^G$  fixed by  $G$ , and it commutes with dimension shifting. (Warning, if you count directly  $a(\sigma\tau\sigma^{-1}) - \sigma a(\tau)$ , you won't get 0, but a 1-coboundary).  $\lrcorner$

**Prop. (9.8.1.17) [Cup Products].** The cup product is defined by  $C^p(X, A) \times C^q(X, B) \rightarrow C^{p+q}(X, A \otimes B)$ :

$$(a \smile b)(\sigma_1, \dots, \sigma_{p+q}) = a(\sigma_1, \dots, \sigma_p) \otimes \sigma_1 \dots \sigma_p b(\sigma_{p+1}, \dots, \sigma_{p+q}).$$

It satisfies  $\partial(a \smile b) = \partial(a) \smile b + (-1)^p a \smile \partial(b)$ , thus defines a:

$$\smile: H^p(G, A) \times H^q(G, B) \rightarrow H^{p+q}(G, A \otimes B)$$

for  $p, q \geq 0$ . And in negative dimension this is also definable but not computable, Cf. [Neukirch Cohomology of Number Fields P42] or [Neukirch Class Field Theory 2015 P45].

- $a \smile b = a \otimes b$  for  $a \in H^0(G, A), b \in H^0(G, B)$ .
- $\delta(a \smile b) = \delta a \smile b, \delta(a \smile b) = (-1)^p (a \smile \delta b)$  for  $a \in H^p(G, A)$ .
- $\smile$  is associative and skew-symmetric (follows from dimension shifting and the last one.)

$\lrcorner$

*Proof:*  $\square$

**Prop. (9.8.1.18) [Duality and Cup Product].** Let  $0 \rightarrow A' \xrightarrow{i} A \xrightarrow{j} A'' \rightarrow 0$  and  $0 \rightarrow B' \xrightarrow{u} B \xrightarrow{v} B'' \rightarrow 0$  be exact and there is a pairing  $\varphi: A \times B \rightarrow C$  that  $\varphi(A' \times A') = 0$  hence induce a compatible pairing on  $A' \times B''$  and  $A'' \times B'$ , then we have

$$\delta(\alpha) \smile \beta + (-1)^p \alpha \smile \delta(\beta) = 0$$

for  $\alpha \in H^p(G, A'')$  and  $\beta \in H^q(G, B'')$ .  $\lrcorner$

*Proof:* Use the definition of  $\delta$ , let  $a, b$  be the preimage of  $\alpha, \beta$  in  $A$  and  $B$ , and  $ia' = \partial a, ub' = \partial b$ , then  $\delta(\alpha) \smile \beta + (-1)^p \alpha \smile \delta(\beta) = a' \smile vb + (-1)^p ja \smile b' = \partial a \smile b + (-1)^p a \smile \partial b = \partial(a \smile b)$  is a boundary.  $\square$

**Prop. (9.8.1.19) [Naturality of Cup Products].**

$$\text{res}(a \smile b) = \text{res}(a) \smile \text{res}(b), \quad \inf(a \cup b) = \inf(a) \cup \inf(b), \quad \text{cor}(\text{res } a \smile b) = a \smile \text{cor } b.$$

┘

*Proof:* Cf.[Neukirch CFT P48] or [Central Simple Algebras]P100. ?

$\square$

**Prop. (9.8.1.20).** Let  $\sigma \in G^{ab} = H^{-2}(G, \mathbb{Z})$  and  $a_1 \in H^1(G, A), a_2 \in H^2(G, A)$ , then

$$a_1 \smile \sigma = a_1(\sigma), \quad a_2(\sigma) = \sum_{\tau} a_2(\tau, \sigma).$$

Cf.[Neukirch CFT P50,P51].

┘

**Prop. (9.8.1.21) [Cyclic Group Cohomologies].** For cyclic group, the Tate cohomology is 2-cyclic.

In particular, if  $\sigma$  be a generator for  $\mathbb{Z}/(n)$ , then

$$H_{\text{Tate}}^p(\mathbb{Z}/(n), A) = \begin{cases} A^G / \text{tr}(A) & , p \in 2\mathbb{Z} \\ \text{tr } A / (\sigma - 1)A & , p \in 2\mathbb{Z} + 1 \end{cases}.$$

┘

*Proof:* There is an exact sequence  $0 \rightarrow \mathbb{Z} \rightarrow \mathbb{Z}[G] \xrightarrow{\sigma-1} \mathbb{Z}[G] \rightarrow \mathbb{Z} \rightarrow 0$ , and this defines an isomorphism  $\delta^2 : H^0(G, \mathbb{Z}) \cong H^2(G, \mathbb{Z})$ . And this is also true for any  $A$  when tensored with it. The isomorphism is  $a \mapsto \delta^2 a = \delta^2(1) \smile a$ .  $\square$

**Prop. (9.8.1.22) [Duality].** The cup product induces an isomorphism  $H^i(G, A^\vee) \cong (H^{-i-1}(G, A))^\vee$ , i.e.,  $H^n(G, A^\vee)$  and  $H_n(G, A)$  are dual to each other when  $n > 0$ , where  $A^\vee = \text{Hom}(A, \mathbb{Q}/\mathbb{Z})$ .  $\square$

*Proof:* We only need to verify  $A^{*G}/N_G A^* \cong (N_G A/I_G A)^*$  and use dimension shifting. Should use the injectivity of  $\mathbb{Q}/\mathbb{Z}$  and the compatibility of cup product with dual.  $\square$

**Cor. (9.8.1.23).** When  $A$  is  $\mathbb{Z}$ -free, the cup product also induce an isomorphism  $H^i(G, \text{Hom}(A, \mathbb{Z})) \cong H^{-i}(G, A)^\vee$ .  $\square$

**Prop. (9.8.1.24) [Theorem of Cohomological Triviality].** For a  $G$ -module  $A$ , if there is a  $q$  s.t.  $H^q(g, A) = H^{q+1}(g, A) = 0$  for all subgroups of  $G$ , then  $H^p(g, A) = 0$  for any  $p$  and subgroup  $g$ . Cf.[Neukirch CFT P57].  $\square$

**Prop. (9.8.1.25) [Tate's Theorem].** Assume  $A$  is a  $G$ -module that  $H^1(G, A) = 0$  and  $H^2(g, A)$  is cyclic of order  $|g|$  for any subgroup  $g$  of  $G$ , then for a generator  $a$  of  $H^2(G, A)$ , there is an isomorphism

$$a \smile : H^q(G, \mathbb{Z}) \cong H^{q+2}(G, A).$$

Cf.[Neukirch CFT P79].

┘

**Cor. (9.8.1.26).** In particular, by dimension shifting, if  $A$  is a  $G$ -module that  $H^1(G, A) = 0$  and  $H^2(g, A)$  is cyclic of order  $|g|$  for any subgroup  $g$  of  $G$  this gives an isomorphism:

$$a \smile : H^q(G, \mathbb{Z}) \cong H^{q+2}(G, A).$$

for a generator  $a$  of  $H^2(G, A)$ , because cup product commutes with dimension shifting.  $\square$

### Miscellaneous

**Prop. (9.8.1.27) [ $H^2$  and Extensions, Schreier].** For a  $G$ -module  $A$ , there is a correspondence of equivalence classes of extension of  $G$  over  $A$  that are compatible with the  $G$  action and  $H^2(G, A)$ .  $\lrcorner$

*Proof:* Cf.[Weibel P183]. In fact there are also interpretations of  $H^3(G, A)$  as  $0 \rightarrow A \rightarrow N \rightarrow E \rightarrow G$  under some equivalences.  $\square$

**Prop. (9.8.1.28) [Herbrand Quotients for Cyclic Groups].** When  $G$  is a cyclic group and  $A$  is a  $G$ -module, let  $f = \sigma - 1$ ,  $g = 1 + \sigma + \dots + \sigma^{n-1}$ , then we can form a cyclic complex of order 2 and compute the Herbrand quotient(4.8.8.7). In this case,  $g_{f,g}$  is just  $|H^0(G, A)|/|H^{-1}(G, A)|$ . And by(4.8.8.9), if a  $G$ -morphism  $A \rightarrow B$  has finite kernel and cokernel, then they have the same Herbrand quotient.  $\lrcorner$

## 2 Cohomology of Profinite Groups

**Notation (9.8.2.1).**

- Let  $G \in \text{ProfGrp}$ .
- Let  $p \in \text{Prime}$ .
- Elements in  $\text{Mod}_G$  are assumed to be discrete.

$\lrcorner$

**Prop. (9.8.2.2) [Abelian Sheaves on  $T_G$ ].** The category of Abelian sheaves on the canonical topology(7.1.2.4)  $T_G$  of  $G$ -sets is equivalent to the the category  $\text{Mod}_G^{\text{alg}}$ , by  $Z \mapsto \text{Hom}(-, Z)$ . The inverse map is given by  $F \mapsto \varinjlim F(G/H)$ .  $\lrcorner$

*Proof:* The task is to prove  $F \cong h_{\varinjlim} F(G/H)$ . Cf.[Tamme P29].

The inverse of the Yoneda functor is the functor  $F \mapsto F(G)$  as a left  $G$ -set where  $gs = F(\cdot g)s$ . The task is to show that  $F \cong h_{F(G)}$ . For this, for any  $U$  we consider the covering  $\{G \xrightarrow{\varphi_u} U \text{ where } \varphi_U(g) = gu. \text{ Sheaf condition says}$

$$F(U) \rightarrow \prod_{u \in U} F(G) \rightrightarrows F(G \times_U G)$$

is exact, in other words,  $F(U) \cong \text{Hom}_G(U, F(G))$ .  $\square$

**Prop. (9.8.2.3) [Profinite Cohomologies].** The **profinite cohomology** is the derived functor of  $A \rightarrow A^G$  on the Abelian category  $\text{Mod}_G^{\text{alg}}$ (9.8.2.2)(It has enough injectives by(24.1.2.2)). It satisfies

$$H^*(G, A) \cong H^*(C^\bullet(G, A)) \cong \varinjlim H^*(G/U, A^U)$$

where  $C^\bullet(G, A)$  is the set of continuous cochain complex of morphisms from  $G$  to  $A$  and the colimit is taken over the transition maps defined by inflations. Moreover, for the same reason, when  $G = \varprojlim G_i$ , and  $A = \varinjlim A_i$ , then

$$H^*(G, A) \cong \varinjlim H^*(G_i, A_i).$$

$\lrcorner$

*Proof:* The second is an isomorphism because  $C^n(G, A) = \varinjlim C^n(G/U, A^U)$  and direct limit is exact.

For the first, the  $H^0$  obviously coincide, so it suffice to prove  $H^*(C(G, A))$  form a universal  $\delta$ -functor. It is effaceable because  $(-)^U$  preserves injective modules(9.8.1.3).

For the last one, we need to check  $C^n(G, A) = \varinjlim C^n(G_i, A_i)$ . Notice  $G$  has the profinite topology, thus must factor through some  $G_i$ , and the right through some  $A_i$  because the image of a morphism from  $G^n$  to  $A$  has finite image. Thus the result follows.  $\square$

**Prop.(9.8.2.4)[Cohomology Groups are Torsion].** For  $M \in \text{Mod}_G^{\text{alg}}, i \in \mathbb{N}$ ,  $H^i(G, M)$  are torsion Abelian groups. And if  $G$  is a pro- $p$ -group, then  $H^i(G, M)$  are  $p$ -primary torsion subgroups.  $\lrcorner$

*Proof:* Notice if  $M \in \text{Mod}_G^{\text{alg}}$ , this follows from(9.8.2.3) and(9.8.1.8). The last assertion is similar.  $\square$

**Def.(9.8.2.5)[Restrictions, Co-restrictions and Inflation].** Let  $H \leq G$  be a closed subgroup, for any  $A \in \text{Mod}_G^{\text{alg}}$ , taking colimits over all open subgroup  $U_\alpha$  of  $G$  of the restriction maps

$$\text{res} : H^i(G/U_\alpha, A^{U_\alpha}) \rightarrow H^i(H/(H \cap U_\alpha), A^{U_\alpha}) \rightarrow H^i(H/H \cap U_\alpha, A^{H \cap U_\alpha}),$$

by(3.1.12.6), we get a restriction map

$$\text{res} : H^i(G, A) \rightarrow H^i(H, A).$$

Similarly, if  $H$  is open in  $G$ , we can define a corestriction map

$$H^i(H, A) \rightarrow H^i(G, A).$$

And if  $H \triangleleft G$  is normal, we can define an inflation map

$$H^i(G/H, A^H) \rightarrow H^i(G, A).$$

as the colimit of the inflation maps

$$H^i(G/HU_\alpha, A^{HU_\alpha}) \rightarrow H^i(G/H, A^{U_\alpha}).$$

$\lrcorner$

**Prop.(9.8.2.6).** Situation as in(9.8.2.5), if  $H \leq G$  is open, then  $\text{cor} \circ \text{res} = [G : H]$  for a subgroup  $H$  is also true for profinite cohomology(9.8.1.12)  $\lrcorner$

*Proof:* This is because of(9.8.2.3).  $\square$

**Prop.(9.8.2.7).** If  $H$  is a closed subgroup of a profinite group  $G$ ,  $p \in \text{Prime}$  s.t.  $p \nmid [G : H]$ , then for any  $A \in \text{Mod}_G^{\text{alg}}, i \in \mathbb{N}$ ,  $\text{res} : H^i(G, A) \rightarrow H^i(H, A)$  is injective on the  $p$ -primary part of  $H^i(G, A)$ .  $\lrcorner$

*Proof:* This follows from(9.8.2.6) and(9.8.2.5) by taking filtered colimits.  $\square$

**Lemma(9.8.2.8)[Shapiro].**

$$H_*(G, \text{Ind}_H^G(A)) \cong H_*(H, A), \quad H^*(G, \text{ind}_H^G(A)) \cong H^*(H, A)$$

because (co)induction is adjoint to exact functors, so it preserves injectives(projectives) and it is exact because  $\mathbb{Z}[G]$  is free  $\mathbb{Z}[H]$ -module.

And in the finite case, this is also true for Tate cohomology using dimension shifting.  $\lrcorner$

**Prop. (9.8.2.9) [Serre-Hochschild Spectral sequence].** The same spectral sequence as in the finite case (9.8.1.14) also applies to profinite cohomology with  $H$  closed normal in  $G$ .  $\lrcorner$

**Def. (9.8.2.10) [Cup Products].** For any  $U \leq G$  open and  $A, B \in \text{Mod}_G^{\text{alg}}$ , there are natural cup product maps

$$H^*(G/U, A^U) \times H^*(G/U, B^U) \rightarrow H^*(G/U, A^U \otimes B^U) \rightarrow H^*(G/U, (A \otimes B)^U).$$

Then by the naturality of inflation and the fact inflation commutes with cup product (9.8.1.19), we get a natural cup product map

$$H^*(G, A) \times H^*(G, B) \rightarrow H^*(G, A \otimes B).$$

$\lrcorner$

**Prop. (9.8.2.11).** The cup products for profinite groups (9.8.2.10) is associative, graded-commutative, and commutes with inflations, restrictions and corestrictions as in (9.8.1.19).  $\lrcorner$

*Proof:*

$\square$

### Pro- $p$ -Groups

**Thm. (9.8.2.12) [Golod-Shafarevich Inequality].** If  $G$  is a non-trivial pro- $p$ -group, then

$$\dim H^2(G, \mathbb{Z}/(p)) > \frac{(\dim H^1(G, \mathbb{Z}/(p)))^2}{4}.$$

$\lrcorner$

*Proof:* Cf. [Ser97a]P66?.

$\square$

### Serre-Tate Duality

### Cohomological Dimensions

**Def. (9.8.2.13) [Cohomological Dimensions].** For  $p \in \text{Prime}$ , the  $p$ -cohomological dimension  $\text{cd}_p(G)$  is defined as the infimum of integers  $n \in \mathbb{Z}_+$  s.t.  $H^n(G, A)[p^\infty] = 0$  for any  $A \in \text{Mod}_G^{\text{tor}}$ . The **strict  $p$ -cohomological dimension**  $\text{scd}_p(G)$  is defined as the infimum of integers  $n \in \mathbb{Z}_+$  s.t.  $H^n(G, A)[p^\infty] = 0$  for any  $A \in \text{Mod}_G$ .

The **cohomological dimension**  $\text{cd}(G)$  is defined to be  $\text{cd}(G) \triangleq \sup_p(\text{cd}_p(G))$ . The **strict cohomological dimension**  $\text{scd}(G)$  is defined to be  $\text{scd}(G) \triangleq \sup_p(\text{scd}_p(G))$ .  $\lrcorner$

**Prop. (9.8.2.14) [Characterizing Cohomological Dimensions].** For  $p \in \text{Prime}$  and  $n \in \mathbb{N}$ , the following are equivalent:

- $\text{cd}_p(G) \leq n$ .
- $H^i(G, A) = 0$  for any  $i > n$  and any  $p$ -torsion  $G$ -module  $A$ .
- $H^{n+1}(G, A) = 0$  for any simple  $p$ -torsion  $G$ -module  $A$ .

And if  $G$  is pro- $p$ , then it suffice to check  $H^{n+1}(G, \mathbb{Z}/(p)) = 0$

$\lrcorner$

*Proof:*  $1 \iff 2$ : For any torsion  $G$ -module  $A$ , we have  $A = \bigoplus_{p \in \text{Prime}} A[p^\infty]$ , so  $H^i(G, A[p^\infty])$  is the  $p$ -primary part of  $H^i(G, A)$ .

$2 \rightarrow 3$  is trivial.

$3 \rightarrow 1$ : Use the fact cohomology commutes with colimits (9.8.2.3), reduce to the case of  $A$  finite, and then use the quotient tower ?.

The last assertion is by (3.1.12.15).  $\square$

**Cor. (9.8.2.15).** For  $A \in \text{Mod}_G$  s.t.  $p : A \rightarrow A$  is surjective, then  $H^n(G, A)[p^\infty] = 0$  for all  $n > \text{cd}_p(G)$ .

In particular, if  $A \in \text{Mod}_G$  is divisible, then  $H^n(G, A) = 0$  for all  $n > \text{cd}(G)$ .  $\lrcorner$

*Proof:* This follows from the exact sequence  $0 \rightarrow A[p] \rightarrow A \rightarrow A \rightarrow 0$ .  $\square$

**Prop. (9.8.2.16).**  $\text{cd}_p(G) \leq \text{scd}_p(G) \leq \text{cd}_p(G) + 1$ .  $\lrcorner$

*Proof:* There are exact sequences  $0 \rightarrow A[p] \rightarrow A \xrightarrow{p} pA \rightarrow 0$  and  $0 \rightarrow pA \rightarrow A \rightarrow A/(p) \rightarrow 0$ .  $A[p]$  and  $A/(p)$  are  $p$ -torsion  $G$ -modules, so if  $i > \text{cd}_p(G) + 1$ , then  $H^i(G, A[p]) = H^{i-1}(G, A/(p)) = 0$ . so  $H^i(G, A) \xrightarrow{p} H^i(G, pA)$  and  $H^i(G, pA) \rightarrow H^i(G, A)$  are injections, so their composition  $H^i(G, A) \xrightarrow{p} H^i(G, A)$  is injective, showing  $(H^i(G, A))_p = 0$ , so  $\text{scd}_p(G) \leq \text{cd}_p(G) + 1$ .  $\square$

**Cor. (9.8.2.17).** For any  $p \in \text{Prime}$ , we have  $\text{scd}_p(G) \geq 2$ .  $\lrcorner$

*Proof:* If  $\text{scd}_p(G) = 1$ , then  $\text{cd}_p(G) = 1$ , and ?  $\square$

**Prop. (9.8.2.18).** If  $H \leq G$  is closed, then  $\text{cd}_p(H) \leq \text{cd}_p(G)$  and  $\text{scd}_p(H) \leq \text{scd}_p(G)$ . And the equality holds if  $[G : H]$  is relatively prime to  $p$ .  $\lrcorner$

*Proof:* The first is because of Shapiro's lemma (9.8.2.8). For the equality, use (9.8.2.7).  $\square$

**Cor. (9.8.2.19).** For  $p \in \text{Prime}$ ,  $\text{cd}_p(G) = \text{cd}_p(G_p) = \text{cd}(G_p)$ ,  $\text{scd}_p(G) = \text{scd}_p(G_p) = \text{scd}(G_p)$ , where  $G_p$  is the Sylow- $p$ -subgroup of  $G$ .  $\lrcorner$

**Prop. (9.8.2.20) [Maximal Pro- $p$ -Quotients].** If  $G(p) = G/N$  is the maximal pro- $p$ -quotient of  $G$  and  $\text{cd}_p(N) \leq 1$ , then the canonical maps

$$H^n(G(p), \mathbb{Z}/(p)) \rightarrow H^n(G, \mathbb{Z}/(p))$$

are isomorphisms. In particular,  $\text{cd}(G(p)) \leq \text{cd}_p(G)$ , by (9.8.2.19)(9.8.2.14).  $\lrcorner$

*Proof:* Cf. [Ser97a]P74.  $\square$

**Cor. (9.8.2.21).** If  $\text{cd}_p(G) \leq 1$ , then  $\text{cd}_p(G(p)) \leq 1$ , where  $G(p) = G/N$  is the maximal pro- $p$ -quotient of  $G$ .  $\lrcorner$

*Proof:* It follows from (9.8.2.18) that  $\text{cd}_p(N) \leq 1$ .  $\square$

**Prop. (9.8.2.22).** If  $p \in \text{Prime}$  and  $H \trianglelefteq G$  is closed, then  $\text{cd}_p(G) \leq \text{cd}_p(H) + \text{cd}_p(G/H)$ , by Hochschild-Serre spectral sequence.  $\lrcorner$

**Example (9.8.2.23) [Cohomological Dimensions].**

- For any  $p \in \text{Prime}$ ,  $\text{cd}_p(\widehat{\mathbb{Z}}) = 1$ . But  $H^2(\widehat{\mathbb{Z}}, \mathbb{Z}) \cong H^1(\widehat{\mathbb{Z}}, \mathbb{Q}/\mathbb{Z}) = \mathbb{Q}/\mathbb{Z}$ , so  $\text{scd}_p(\widehat{\mathbb{Z}}) = 2$ . ?
- If  $k \in \text{Field}^{\text{fin}}$ , then  $\text{cd}(k) = 1$ ,  $\text{scd}(k) = 2$ . ?

$\lrcorner$

### 3 Galois-Cohomologies

References are [Ser97a] and [Neukirch, Cohomology of Number Fields]Chap6.

**Prop. (9.8.3.1) [Hilbert's Additive Satz 90].** For  $K \in \mathbf{Field}$ , if  $L/K$  is a Galois-extension, then  $H^n(\mathrm{Gal}(L/K), L) = 0$  for any  $n \in \mathbb{Z}_+$ , where  $L$  is equipped with the discrete topology.  $\lrcorner$

*Proof:* From the normal basis theorem??, for finite Galois extension  $L/K$ ,  $L$  is an induced module over  $K$ , thus  $H^*(G, L) = H_*(G, L) = 0$  for  $* \neq 0$  and  $H_T^*(G, L) = 0$  by (9.8.2.8).

Hence the same is true, for arbitrary Galois-extension, when  $L$  is equipped with the discrete topology, the same as in the proof of (10.2.5.12).  $\square$

**Prop. (9.8.3.2) [Hilbert's Multiplicative Satz 90].**  $H^1(\mathrm{Gal}(L/K), L^\times) = 0$  for any  $L/K \in \mathbf{GalField}$ , where  $L$  is equipped with the discrete topology.  $\lrcorner$

*Proof:* This follows from (10.2.5.12).  $\square$

**Prop. (9.8.3.3) [Generalized Hilbert's Additive Satz 90].** If  $L/K \in \mathbf{GalField}$  and  $k \in \mathbb{Z}_+$ , then  $H^1(\mathrm{Gal}(L/K), W_{p,k}^+(L)) = 0$ .  $\lrcorner$

*Proof:* By linear independence of characters, if  $L/K$  is finite, then there is some  $x_0 \in L$  s.t.  $\mathrm{tr}_{L/K}(x_0) \neq 0$ . Then by (5.5.2.24),  $x = (x_0, 0, \dots, 0)$  is a unit in  $W_{p,k}^+(L)$ . Given any cocycle  $\mu : \sigma \mapsto \mu_\sigma$ , let

$$\theta = \mathrm{tr}_{L/K}(x)^{-1} \sum_{\sigma \in \mathrm{Gal}(L/K)} \mu_\sigma \sigma(x),$$

then for  $\tau \in \mathrm{Gal}(L/K)$ ,

$$\theta - \tau(\theta) = \mathrm{tr}_{L/K}(x)^{-1} \sum_{\sigma \in \mathrm{Gal}(L/K)} [\mu_{\tau\sigma}(\tau\sigma)(x) - \tau(\mu_\sigma)(\tau\sigma)(x)] = \mathrm{tr}_{L/K}(x)^{-1} \mu_\tau \sum_{\sigma \in \mathrm{Gal}(L/K)} (\tau\sigma)(x) = \mu_\tau.$$

Thus  $\mu$  is a coboundary.

Hence the same is true, for arbitrary Galois extension, when  $L$  is equipped with the discrete topology, the same as in the proof of (10.2.5.12).  $\square$

**Def. (9.8.3.4) [Galois Cohomologies].** For  $k \in \mathbf{Field}$ , for any  $M \in \mathbf{Mod}^{\mathrm{alg}}(\mathrm{Gal}_k)$ , denote  $H^i(k, M) = H^i(\mathrm{Gal}_k, M)$ .  $\lrcorner$

**Prop. (9.8.3.5).**  $\mathrm{Br}(\mathbb{R}) = \mathbb{Z}/(2)$ .  $\lrcorner$

*Proof:* By (9.8.1.21) and (9.8.1.5),  $H^2(\mathrm{Gal}(\mathbb{C}/\mathbb{R}), \mathbb{C}^\times) \cong \{u \in \mathbb{C}^\times | \bar{u} = u\} / \{|u|^2, u \in \mathbb{C}^\times\} \cong \mathbb{Z}/(2)$ .  $\square$

**Prop. (9.8.3.6) [Kummer-Cohomologies].** For  $L/K \in \mathbf{GalField}$  and  $m \in \mathbb{Z} \cap k^\times$ , there exists an isomorphism

$$K^\times / (K^\times)^m \xrightarrow{\partial, \cong} H^1(K, \mathbb{Z}/(p^r)).$$

$\lrcorner$

*Proof:* This follows from the Kummer exact sequence  $1 \rightarrow \mu_m \rightarrow \mathbb{G}_m \xrightarrow{\times m} \mathbb{G}_m \rightarrow 1$  and Hilbert's theorem90 (9.8.3.2).  $\square$

**Prop. (9.8.3.7) [Restrictions and Co-restrictions on  $H^0$ ].** If  $K/k \in \mathbf{Field}$  is separable, then

$$\mathrm{res}_k^K = i : k \rightarrow K, \quad \mathrm{cor}_k^K = \mathrm{Nm}_{K/k} : K \rightarrow k$$

┘

*Proof:* This follows from the definition (9.8.1.11). □

**Cor. (9.8.3.8) [Change of Fields and Kummer Cohomology].** For  $K/k \in \mathbf{GalField}$  and  $m \in \mathbb{Z} \cap k^\times$ , there are commutative diagrams

$$\begin{array}{ccc} k^\times & \xrightarrow{\partial} & H^1(k, \mu_m) \\ \downarrow & & \downarrow \mathrm{res} \\ K^\times & \xrightarrow{\partial} & H^1(K, \mu_m) \end{array} \quad \begin{array}{ccc} K^\times & \xrightarrow{\partial} & H^1(K, \mu_m) \\ \downarrow \mathrm{Nm}_{K/k} & & \downarrow \mathrm{cor} \\ k^\times & \xrightarrow{\partial} & H^1(k, \mu_m) \end{array}$$

┘

*Proof:* Cf. [Central Simple Algebras] P131. ? □

**Prop. (9.8.3.9) [Artin-Schreier Cohomology].** If  $k \in \mathbf{Field}$ ,  $p = \mathrm{char} K \in \mathbf{Prime}$  and  $r \in \mathbb{Z}_+$ , then there exists an isomorphism

$$W_{p,r}(k)^+ / (\mathrm{Frob} - \mathrm{id}) W_{p,r}(k)^+ \cong H^1(k, \mu_{p^r}).$$

┘

*Proof:* This follows from the Artin-Schreier exact sequence (3.2.8.16) and Hilbert's theorem90 (9.8.3.3). □

**Prop. (9.8.3.10) [Unramified Classes].** For  $F \in \mathbf{GField}$ , a  $M \in \mathbf{Mod}_{\mathrm{Gal}_F}$  is called a **unramified class** at a place  $v \in \Sigma_F$  if it is trivial when restricted to  $H^k(I_{F_v}, M)$ .

Notice  $I_{F_v}$  is defined only up to conjugacy, but this notion is well-defined by (9.8.1.13). ┘

**Prop. (9.8.3.11) [Unramified Classes are Rare].** Let  $C$  be a proper Dedekind domain or a complete non-singular curve over a field  $k$  with fraction field  $F$  and  $G = \mathrm{Gal}_F$ , then for any finite  $G_F$ -module  $M$ , if  $S$  is a finite set of places in  $F$  and  $H^1(\mathrm{Gal}_F, M, S)$  the set of elements of  $H^1(F, M, S)$  that is unramified outside  $S$ , then  $\#H^1(G_F, M, S) < \infty$ . ┘

*Proof:* By the inflation restriction exact sequence (9.8.1.14), we can reduce  $G$  to a subgroup of finite index. And because  $M$  is a finite  $G$ -module, there is a finite index subgroup of  $G$  that acts trivially on  $M$ . Thus we can assume  $M$  is  $G$ -trivial. But then if  $m > 0$  s.t.  $mM = 0$ , then the assertion follows from the fact the maximal Abelian extension of exponent  $m$  unramified outside  $S$  is finite over  $K$  (19.7.4.5). □

### Cohomological Dimensions

**Def. (9.8.3.12) [Cohomological Dimensions].** For  $k \in \mathbf{Field}$ , define the **cohomological dimension** of  $F$  to be  $\mathrm{cd}(F) \triangleq \mathrm{cd}(\mathrm{Gal}_F)$ ,  $\mathrm{cd}_p(k) \triangleq \mathrm{cd}_p(\mathrm{Gal}_k)$  (9.8.2.13), and similarly the strictly cohomological dimensions to be

$$\mathrm{scd}_p(k) = \mathrm{scd}_p(\mathrm{Gal}_k), \quad \mathrm{scd}(k) = \mathrm{scd}(\mathrm{Gal}_k).$$

┘

**Prop. (9.8.3.13).** If  $p \in \mathbf{Prime}$  and  $k \in \mathbf{Field}^p$ ,

- $\mathrm{cd}_p(k) \leq 1$  and also  $\mathrm{cd}_p(\mathrm{Gal}_{K,p}) \leq 1$ , where  $\mathrm{Gal}_{K,p}$  is the maximal pro- $p$ -quotient of  $\mathrm{Gal}_k$ .
- If  $H^2(L, (k^{\mathrm{sep}})^\times) = 0$  for all  $L/k \subset k^{\mathrm{sep}}$ , then  $\mathrm{cd}(k) \leq 1$ . In particular  $H^i(k, (k^{\mathrm{sep}})^\times) = 0$  for  $i \geq 2$ .

┘

*Proof:* 1: Let  $G_p$  be the Sylow- $p$ -subgroup of  $\mathrm{Gal}_K$  and  $K_p = (K^{\mathrm{sep}})^{G_p}$ . There is an exact sequence

$$0 \rightarrow \mu_p(K) \rightarrow K^{\mathrm{sep}} \xrightarrow{x^p - x} K^{\mathrm{sep}} \rightarrow 0,$$

and combined with the fact that  $H^i(G_p, K_s) = H^i(\mathrm{Gal}(K^{\mathrm{sep}}/K_p), K^{\mathrm{sep}}) = 0$  for  $i \geq 1$  (9.8.3.1), so  $H^i(G_p, \mathbb{Z}/(p)) = 0$  for  $i \geq 2$ . Thus by (9.8.2.14) and (9.8.2.19),  $\mathrm{cd}_p(K) \leq 1$ .

2: similarly, for  $\ell \neq p$ ,  $H^2(G_\ell, \mu_\ell) = \varinjlim_L H^2(\mathrm{Gal}(K_s/L), \mu_\ell(k^{\mathrm{sep}})) = 0$ , so  $\mathrm{cd}_\ell(K) \leq 1$ . Then  $\mathrm{cd}(k) \leq 1$ , and  $\mathrm{scd}(k) \leq 2$ , so  $H^i(k, (k^{\mathrm{sep}})^\times) = 0$  for  $i \geq 1$ .  $\square$

**Cor. (9.8.3.14).** If  $K'/K \in \mathbf{Field}$  is purely-inseparable, then the canonical map  $\mathrm{Br}(K) \rightarrow \mathrm{Br}(K')$  is surjective.  $\square$

*Proof:* Cf. [Ser97a]P75?  $\square$

**Prop. (9.8.3.15) [Algebraic Extensions].** If  $K'/K$  is an algebraic extension and  $p \in \mathbf{Prime}$ , then  $\mathrm{cd}_p(K') \leq \mathrm{cd}_p(K)$ , which is an equality if one of the following holds:

- $p \nmid [K' : K]_{\mathrm{sep}}$ .
- $[K' : K]_{\mathrm{sep}} < \infty$ ,  $\mathrm{cd}_p(K) < \infty$ .

In fact, if  $[K' : K] < \infty$ , then  $\mathrm{cd}_p(K') = \mathrm{cd}(K)$  unless  $p = 2$ ,  $K$  is an ordered field, and  $\mathrm{cd}_2(K') < \infty$ .  $\square$

*Proof:* Cf. [Ser79a]P83?  $\square$

**Prop. (9.8.3.16) [Transcendental Extensions].** For  $K \subset_{\mathrm{fin}} L \in \mathbf{Field}$  and  $p \in \mathbf{Prime}$ , we have  $\mathrm{cd}_p(\mathrm{Gal}_L) \leq \mathrm{cd}_p(\mathrm{Gal}_K) + \mathrm{tr.deg}(L/K)$ .  $\square$

*Proof:* Cf. [Etale Cohomology Fulei P169].  $\square$

**Cor. (9.8.3.17).** If  $k = k^{\mathrm{sep}}$  and  $K$  be a function field over  $k$ , then  $\mathrm{cd}(K) \leq 1$ .

And if  $p = \mathrm{char} K \in \mathbf{Prime}$ , then  $H^2(K, (K^{\mathrm{sep}})^\times)$  is a  $p$ -torsion group.  $\square$

*Proof:* Th first one is clear, for the second, for any  $l \neq p$ , use the exact sequence  $\mu_l(K_s) \rightarrow K_s^* \xrightarrow{x \rightarrow x^l} K_s^* \rightarrow 0$ , then  $H^2(G(K_s/K), \mu_l(K_s)) = 0$ , and  $H^2(G(K_s/K), K_s^*) \xrightarrow{l} H^2(G(K_s/K), K_s^*)$  is injective.  $l$  is arbitrary, so  $H^2(G(K_s/K), K_s^*)$  must be a  $p$ -torsion group.  $\square$

### cd-1 Fields

**Def. (9.8.3.18) [cd-1 Fields].** For  $k \in \mathbf{Field}$ , the following are equivalent:

- $\mathrm{cd}(k) = 1$ , and when  $\mathrm{char} k > 0$ , we have moreover that  $\mathrm{Br}(K)[p^\infty] = 0$  for any algebraic extension  $K/k \in \mathbf{Field}$ .
- $\mathrm{Br}(K/k) = 0$  for all algebraic extension  $K/k \in \mathbf{Field}$ .
- If  $K/k \in \mathbf{Field}$  is an algebraic extension and  $L/K \in \mathbf{GalField}^{\mathrm{fin}}$ , then  $L^\times$  is  $\mathrm{Gal}(L/K)$ -cohomological trivial?  $\square$

- If  $K/k \in \mathbf{Field}$  is an algebraic extension and  $L/K \in \mathbf{GalField}^{\text{fin}}$ , then  $\text{Nm}_{L/K} : L^\times \rightarrow K^\times$  is surjective.

And moreover, It suffices to check any of these conditions for all finite separable extensions  $K/k \in \mathbf{Field}$ . If these hold, then  $k$  is said to be a **cd-1 field**.  $\lrcorner$

*Proof:* ? Cf. [Ser97a]P78.

By (9.8.3.14) it suffices to check item1 or item2 on separable extensions.  $\square$

**Prop. (9.8.3.19).** For  $K \in \mathbf{Field}$ ,

- If  $K$  is a cd-1 field (9.8.3.18), then every algebraic extension of  $K$  is a cd-1 field.
- If  $K = K^{\text{perf}}$ , then  $K$  is a cd-1 field iff  $\text{cd}(K) \leq 1$ .

$\lrcorner$

*Proof:* 1 is trivial.

2: If  $K = K^{\text{perf}}$ , then  $x \mapsto x^p$  is a bijection of  $\mathbb{G}_m$ , thus  $\text{Br}(K)[p^\infty] = 0$ . This can be applied to any algebraic extension of  $k$  by (3.2.6.20), so  $k$  is a cd-1 field.  $\square$

**Prop. (9.8.3.20) [ $C_1$  Fields are cd-1 Fields].** If  $K \in \mathbf{Field}$  is  $C_1$  (21.6.2.5),  $L/K \in \mathbf{GalField}^{\text{fin}}$ , then  $\text{Nm}_{L/K}(L^\times) = K^\times$ .

In particular,  $C_1$ -fields are cd-1 fields, by (21.6.2.6) and (9.8.3.18). And if  $p = \text{char } K \in \mathbf{Prime}$ , then  $[K : K^p] | p$ .  $\lrcorner$

*Proof:* For any  $a \in K^\times$ , consider the equation

$$\text{Nm}_{L/K}(x) = ax_0, \text{ where } x \in L, x_0 \in K.$$

Then it is homogenous of degree  $[L : K]$  with  $[L : K] + 1$  variables, so it has a non-trivial solution. Then  $x_0 \neq 0$  otherwise  $x = 0$ . So  $a = \text{Nm}_{L/K}(x/x_0)$  and the assertion follows.

For the last assertion, notice that if  $K'/K$  is purely-inseparable of degree  $p$ , then  $\text{Nm}_{K'/K}(K') = (K')^p = K$ , so  $[K : K^p] = [K' : K] = p$ .  $\square$

**Example (9.8.3.21) [cd-1 Fields].**

- Finite fields are cd-1 fields, by (21.6.2.7) and (9.8.3.20).
- Algebraic function fields over  $K = \overline{K} \in \mathbf{Field}$  are cd-1 fields, by (21.6.2.9) and (9.8.3.20).

$\lrcorner$

**Prop. (9.8.3.22) [Henselian DVR with Alg. Closed Residue Fields are cd-1 Fields].** If  $(\mathcal{O}_K, K) \in \mathbf{DVR}$  is Henselian and  $\kappa = \overline{\kappa}$ , then  $K$  is a cd-1 field (9.8.3.18).  $\lrcorner$

*Proof:* For any finite separable extension  $L/K \in \mathbf{Field}$  and  $E/L \in \mathbf{GalField}^{\text{fin}}$ , let  $T$  be the kernel of the map  $\text{Res}_{E/L} \mathbb{G}_m \rightarrow \mathbb{G}_m \in \mathbf{GrpSch}/L$ , then  $T$  is a torus, and  $H^1(E, L) = 0$  by (10.5.2.4). Then we see  $\text{Nm}_{E/L} E^\times = L^\times$ , and thus  $K$  is a cd-1 field.  $\square$

### Local Fields

**Prop. (9.8.3.23).** If  $K \in p\text{-LField}$ , then  $\text{cd}(K) = \text{scd}(K) = 2$ .  $\lrcorner$

*Proof:* ?  $\square$

**Prop. (9.8.3.24).**  $\text{cd}(\mathbb{R}) = \text{scd}(\mathbb{R}) = \infty$ .  $\lrcorner$

*Proof:* ? □

**Thm. (9.8.3.25).** If  $(\mathcal{O}_K, K, \kappa) \in \text{DVR}$  is Henselian with  $\kappa = \bar{\kappa}$ , then  $K$  is a cd-1 field (9.8.3.18). In particular,  $\text{cd}(K) = 1$ . ┘

*Proof:* Cf. [K-P23]P79. ? □

**Thm. (9.8.3.26) [Tate].** For any  $p, \ell \in \text{Prime}$ ,  $\text{cd}_p(\text{Gal}_{\overline{\mathbb{Q}_\ell}}) = \text{scd}_p(\text{Gal}_{\overline{\mathbb{Q}_\ell}}) = 2$ . ┘

*Proof:* Cf. [Ser97a]Chap2.5.3.. □

### Global Fields

References are [Tat63].

**Notation (9.8.3.27).**

- Let  $F \in \text{GField}$ .

┘

**Def. (9.8.3.28) [Šafarevič-Tate Groups and Hasse-Principle].** For any  $A \in \text{Mod}_{\text{Gal}_F}$ , denote

$$\text{III}(A) = \ker \left( H^1(F, A) \xrightarrow{\text{res}} \prod_{v \in \Sigma_F} H^1(F_v, A) \right),$$

called the **Šafarevič-Tate group** of  $A$ . Notice the kernel is independent of the extension of  $v$  to  $F^{\text{sep}}$ , because any two such extensions induces conjugate groups  $\text{Gal}_{F_v}$  in  $\text{Gal}_F$  and use (9.8.1.13).

$A \mapsto \text{III}(A)$  induces a functor  $\text{III} : \text{Mod}_{\text{Gal}_F} \rightarrow \text{Ab}$ .

For any  $G \in \text{GrpSch}/F$ , denote  $\text{III}(G/F) \triangleq \text{III}(G(F^{\text{sep}}))$ , called the **Šafarevič-Tate group** of  $G$ . And if  $\text{III}(G/F) = 1$ , then we say **Hasse-principle** holds for  $G$ . ┘

## 4 Non-Abelian Cohomologies

**Def. (9.8.4.1) [Non-Abelian Cohomologies].** Let  $G, M \in \text{TopGrp}$  with a continuous action of  $G$  on  $M$  by group homomorphisms, then we define  $H^0(G, M) = M^G$ .

We define the set of **cocycles**  $Z^1(G, M)$  to be the set of continuous maps  $x : G \rightarrow M$  that

$$\sigma_1(x(\sigma_2))x(\sigma_1\sigma_2)^{-1}x(\sigma_1) = 1, \quad \text{i.e.} \quad x(gh) = x(g)g(x(h))$$

If  $x \in Z^1(G, M)$  and  $m \in M$ , then  $x_m : \sigma \rightarrow m^{-1}x(\sigma)\sigma(m) \in Z^1(G, M)$  too. This defines an equivalence relation on  $Z^1(G, M)$ , the equivalence classes are called  $H^1(G, M)$ . This is compatible with the commutative case. ┘

**Prop. (9.8.4.2).** Restriction map and inflation map is definable for  $H^0$  and  $H^1$ , and  $H^1(H, M)$  is a  $G/H$ -set where  $G$  acts on  $H^1(H, M)$  by  $g(c)(h) = g(c(g^{-1}hg))$ . ┘

**Prop. (9.8.4.3).** There is an exact sequence of pointed sets:

$$0 \rightarrow H^1(G/H, M^H) \xrightarrow{\text{inf}} H^1(G, M) \xrightarrow{\text{res}} H^1(H, M)^{G/H} \text{ (9.8.4.2)}.$$

┘

*Proof:* First  $\text{res}(H^1(G, M)) \subset H^1(H, M)^{G/H}$  because  $g(c)(h) = c(g)^{-1}c(h)h(c(g))$  is checked so  $g(c)$  is cohomologous to  $c$ .

$\text{res} \circ \text{inf} = 0$  is easy, if  $\text{res}(c) = 0$ , then  $c$  is trivial on  $H$ , hence  $c(gh) = c(g)$  and  $h(c(g)) = c(hg) = c(g \cdot g^{-1}hg) = c(g)$ , so  $c$  is inflated from  $H^1(G/H, M^H)$ .

For the injectivity of  $\text{inf}$ . If  $c(\bar{g}) = g^{-1}g(a)$ , then  $a \in M^H$ , so it is a coboundary in  $H^1(G/H, M^H)$ .

□

**Prop. (9.8.4.4).** Let  $1 \rightarrow A \rightarrow B \rightarrow C \rightarrow 1$  be an exact sequence of  $\mathcal{T}\text{opGrp}_G$ , then there is a long exact sequence of pointed sets

$$1 \rightarrow A^G \rightarrow B^G \rightarrow C^G \xrightarrow{\delta} H^1(G, A) \rightarrow H^1(G, B) \rightarrow H^1(G, C) \xrightarrow{\Delta} H^2(G, A)$$

the last term is defined only when  $A \leq Z(B)$ .

Where  $\delta$  is defined as follows: for  $c \in C^G$ , let  $b$  be an inverse image of  $c$  in  $B$ , then  $a_\sigma = b^{-1}\sigma(b) \in A$ , and it defines a cocycle in  $H^1(G, A)$ , different choice differ by a coboundary, so it is well-defined.

$\Delta$  is defined as follows: for  $c_\sigma$  a cocycle in  $H^1(G, C)$ , choose  $b_s$  inverse images of  $c_s$ , then  $a_{\sigma, \tau} = b_\sigma \sigma(b_\tau) b_{\sigma\tau}^{-1}$  is a cocycle in  $H^2(G, A)$ . ┘

*Proof:* Similar to (7.3.2.19), but need to show continuity? □

**Prop. (9.8.4.5) [Shapiro's Lemma].** If  $K/k \in \mathbf{Field}^{\text{fin}}$  and  $G \in \mathcal{A}\text{lgGrp}^{\text{sm}}/K$ , then

$$H^1(k, \text{Res}_{K/k} G) \cong H^1(K, G).$$

┘

*Proof:* Cf. [Kneser1969, Lectures on Galois cohomology of classical groups]1.3.? □

### Interpretation of $H^1$ and Torsors

**Def. (9.8.4.6) [A-Torsors].** Let  $A$  be a discrete  $G$ -group, an **A-torsor** is a discrete  $G$ -set with a right  $A$ -action that is simply transitive and semi-linear in  $G$ . ┘

**Prop. (9.8.4.7) [ $H^1$  and Torsors].** We have a canonical bijection of pointed sets:  $H^1(G, A) \cong \text{Tors}_G(A)$ . ┘

*Proof:* If  $X$  is an  $A$ -torsor, choose  $x \in X$ , then  $\sigma(x) = xa_\sigma$  for  $a_\sigma \in A$ . Now that  $\sigma \mapsto a(\sigma)$  is checked to be a cocycle, and change of  $x$  changes to  $\sigma \mapsto b^{-1}a_\sigma\sigma(b)$ .

Conversely, for an  $a \in H^1(G, A)$ , we let  $X = A$  be a right  $A$ -module, and let  $\sigma'(x) = a_\sigma\sigma(x)$ , i.e. regarding coming from  $x = 1$ , then this is an inverse map. □

**Prop. (9.8.4.8) [Extension of Rings].** ┘

**Prop. (9.8.4.9).** There is an isomorphism of pointed sets  $H^1(G, O(\varphi_L)) \cong E_\varphi(L/K)$ . ┘

*Proof:* Cf. [Neukirch Cohomology of Number Fields P346]. □

## 5 Continuous Cohomologies

In this subsubsection cohomology of  $G$ -modules with topology is studied. References are [Cohomology of Number Fields, Neukirch]Chap 2.7.

**Prop. (9.8.5.1).**  $H_{\text{cont}}^*(G, -)$  forms a long exact sequence for any  $0 \rightarrow A \rightarrow B \rightarrow C \rightarrow 0$  of continuous  $G$ -modules.  $\lrcorner$

*Proof:* ?  $\square$

**Prop. (9.8.5.2).** If  $A$  is a compact  $G$ -module which is an inverse limit of finite discrete  $G$ -modules  $A_n$  and  $H^i(G, A_n)$  is finite for all  $n$ , then

$$H_{\text{cont}}^{i+1}(G, A) = \varprojlim_n H^{i+1}(G, A_n).$$

$\lrcorner$

*Proof:* Cf.[Cohomology of Number Fields Neukirch P142].  $\square$

**Lemma (9.8.5.3).** Let  $\pi$  be a topologically nilpotent element of  $A$  which is complete in the  $\varpi$ -adic topology and  $\varpi$  is not a zero-divisor, let  $R = A/(\varpi)$  equipped with discrete topology. Let  $G$  be a group which acts continuously on  $A$  and fix  $\pi$ , then if  $H^1(G, R)$  is trivial, then  $H^1(G, A)$  is trivial, and if moreover  $H^1(G, GL(n; R))$  is trivial, then  $H^1(G, GL(n; A))$  is trivial.  $\lrcorner$

*Proof:* Cf.[Galois Representations Berger P15].  $\square$

**Prop. (9.8.5.4) [Cyclic Case].** if  $G$  is a topological cyclic group  $\overline{\langle g \rangle}$ , then the map  $H^1(G, M) \rightarrow M/(1 - g)$  is well-defined and injective. And when  $M$  is profinite,  $p$ -adically complete, then the map is also surjective.  $\lrcorner$

*Proof:* The surjection: there is only one choice:  $c(g^i) = (1 + g + \dots + g^{i-1})(m)$ . And we need to verify that it is continuous. The case of  $p$ -adic can be deduced from profinite case, because  $c(\gamma) \in p^{-k}M$  for some  $k$ , and  $p^{-k}M$  is then profinite. For any finite quotient  $N$  of  $M$ , there is a  $k$  that  $kM = 0$ , and a  $n$  that  $g^n = \text{id}$  on  $N$ , so  $c(g^{rkn}) = 0$  on  $N$ , which shows  $c$  is continuous.  $\square$

**Prop. (9.8.5.5) [Inf-Res Exact Sequence].**  $\lrcorner$

**Prop. (9.8.5.6) [Cohomology as Extensions].** Let  $G$  be a topological group acting on a field  $K$  and  $W \in \text{Rep}_K(G)$ , there exists a bijection continuous extensions

$$0 \rightarrow W \rightarrow W' \rightarrow K \rightarrow 0$$

and  $H_{\text{cont}}^1(G, W)$  that is  $K$ -linear.  $\lrcorner$

*Proof:* For any such extension, choose a  $K$ -linear splitting  $W' \cong W \oplus K$ , then

$$g(w, c) = (g(w) + g(c)\tau(g), g(c)),$$

where  $\tau : G \rightarrow W$  is a continuous 1-coboundary in  $H^1(G, W)$ , and clearly changing a splitting changes this coboundary by a 1-cocycle, and it is clearly a bijection.  $\square$

# 10 | Algebraic Geometry III: Group Theory

## 10.1 Group Schemes I: Structure Theory

*“Whenever you have to do with a structure-endowed entity  $S$  try to determine its group of automorphisms, the group of those element-wise transformations which leave all structural relations undisturbed. You can expect to gain a deep insight into the constitution of  $S$  in this way.”*

–H. Weyl

References are [Sta]Chap38 and [Mil17].

**Notation(10.1.0.1).**

- Let  $k \in \mathbf{Field}$ .
- Let  $R \in \mathbf{CRing}$ .
- Let  $S \in \mathbf{Sch}$ .

┘

### 1 Group Schemes

**Def.(10.1.1.1) [Group Scheme].** A **monoid scheme** over  $S$  is a monoid object in the Cartesian monoidal category  $\mathbf{Sch}/S$ . The category  $\mathbf{Grp}_S$  of **group schemes** over  $S$  consists of group objects in the Cartesian category  $\mathbf{Sch}/S$ (4.1.1.67). Let  $\mathbf{AlgGrp}/S$  denote the category of groups schemes over  $S$  that is also algebraic over  $S$ .

An **open/closed subgroup scheme** of a group scheme  $G/S$  is an open/closed subscheme of  $G/S$  that represents a subgroup functor of  $G/S$ .

A **smooth/flat/separated/... group scheme** is a group scheme  $G/S$  that  $G$  is smooth/flat/separated/... over  $S$ .

We have the left(right)translation for an elements in  $G(R)$ , equivalently, a natural transformation on  $G$ , and base change  $(G \otimes_S S')(T'/S') = G(T'/S)$ . ┘

**Remark(10.1.1.2)[Yoneda Interpretation].** We do not need to verify all the relations, whenever we have a functorial commutative group structure on all the set  $\mathbf{Hom}(T, G)$ , we immediately recover the map  $m : G \times G \rightarrow G$  as  $\mathrm{pr}_1 \cdot \mathrm{pr}_2 \subset G(G \times G)$ ,  $\mathrm{inv} : G \rightarrow G$  as  $\mathrm{inv}$  in  $G(G)$ ,  $u : S \rightarrow G$  as  $e$  in  $G(S)$ , by Yoneda lemma. ┘

**Cor.(10.1.1.3)[Group Schemes as Functors].** From the Yoneda-interpretation and strong Yoneda-lemma(10.8.1.1), a group scheme over  $S$  is equivalent to a contravariant functor

$$\mathbf{Aff}_S \rightarrow \mathbf{Grp} : R \mapsto \mathbf{Hom}(\mathbf{Spec} R, G)$$

(or equivalently a functor  $\text{Sch}_S \rightarrow \text{Grp}$ ) that is represented by a scheme over  $S$ .

In particular, the category of affine group scheme over  $\text{Spec } R$  is equivalent to the category of commutative Hopf algebras over  $R$ (3.11.4.1).  $\lrcorner$

**Def. (10.1.1.4) [Categorical Group Definitions].** Because we can regard group schemes as functors by (10.1.1.3), we can define categorical constructions of group schemes:

- (Trivial Group Scheme)  $S$  is a trivial group scheme over  $S$ . It is the zero object in  $\text{Grp}_S$ , denoted by  $e$ .
- (Commutative Group Schemes) A group scheme  $G$  is called a **commutative group scheme** if each  $G(R)$  is commutative.
- ( $[n]_G$ ) For any  $n \geq 1$ , the natural transformation of commutative groups functors  $x \mapsto x^n$  induces a morphism of commutative group schemes  $[n] : G \mapsto G$  for any group scheme  $G$ .
- (Semi-Direct Product) Let  $G$  be a group scheme acting on a group scheme  $H$ , then we can form a **semi-direct product group scheme**  $G \ltimes H$  representing the functor  $T \mapsto G(T) \ltimes H(T)$ . and  $G \ltimes H$  is isomorphic to  $G \times H$  as schemes.
- (Kernel) For a homomorphisms of group schemes  $\varphi : G \rightarrow H$  over  $R$ , we define the **kernel group scheme**  $\ker \varphi$  representing the functor  $R \mapsto \ker(\varphi(R))$ . it is represented by the fibered product

$$\begin{array}{ccc} \ker \varphi & \longrightarrow & \text{Spec } R \\ \downarrow & & \downarrow \varepsilon_H \\ G & \xrightarrow{\varphi} & H \end{array}$$

then it is a group scheme over  $R$ .

When  $G, H$  are affine group schemes, it corresponds to the cokernel Hopf algebra defined in (3.11.4.15).

- (Short Exact Sequences) A sequence of homomorphisms of algebraic groups  $e \rightarrow N \xrightarrow{i} G \xrightarrow{q} Q$  is called an **exact** if they are exact as sheaves in  $\text{Sh}(\text{Aff}_S)$  (or  $\text{Sh}(\text{Sch}_S)$ ). Exact sequences are stable under base change of fields
- (Quotient Scheme) Let  $H \subset G$  be subgroup schemes. If  $\tilde{G}/\tilde{H}$  is representable, then it is called the **quotient scheme**, denoted by  $G/H$ .
- (Monomorphism) A homomorphism  $H \rightarrow G$  of group schemes is called a **monomorphism** if  $\tilde{H} \rightarrow \tilde{G}$  is injective.
- (Quotient Map) A homomorphism  $H \rightarrow G$  of group schemes is called a **quotient map** if  $\tilde{G} \rightarrow \tilde{H}$  is surjective in  $\text{Sh}(\text{Aff}_{\text{fppf}}/k)$ .
- (Normal/Characteristic/Central Subgroups) A subgroup scheme  $H$  of  $G$  is called normal/characteristic/central if  $H(R)$  is normal/characteristic/central in  $G(R)$  for any  $k$ -algebra  $R$ .
- (Normalizing) Let  $H, N$  be subgroup schemes of  $G$ , then we say  $H$  normalizes  $N$  if  $H$  is contained in the normalizer of  $N$  in  $G$ .
- (Product Subgroup) Let  $H, N$  be algebraic subgroups of an algebraic group  $G$  such that  $H$  normalizes  $N$ , then we define  $NH \subset G$  be the algebraic subgroup that is the image of the homomorphism  $N \rtimes H \rightarrow G$ , if it is representable.
- (Generated Subgroup Scheme) Let  $\{\varphi_i : X_i \rightarrow G\}$  be a family of maps to a group scheme  $G$ , then the smallest subgroup sheaf functor  $H$  of  $G$  generated by images of  $\varphi_i$  is called the

**generated subgroup scheme** if it is representable, denoted by  $\langle X_i, \varphi_i \rangle$ . It is clear such generated subgroup scheme commutes with base change of fields.

- (Commutator Subgroup) If  $H_1, H_2$  are subgroups of  $G$ , let  $[H_1, H_2]$  be the subgroup generated by the commutator map of  $H_1, H_2$  if it is representable. Or equivalently, it is the subgroup generated by the map  $H_1 \times H_2 \rightarrow G : [h_1, h_2] \mapsto h_1 h_2 h_1^{-1} h_2^{-1}$ .
- (Derived Series) For a group scheme  $G$ , define  $G^{(1)} = [G, G]$  and define inductively  $G^{(n+1)} = [G^{(n)}, G^{(n)}]$  if they are representable.
- (Derived Central Series) For a group scheme  $G$ , define  $G^1 = [G, G]$  and define inductively  $G^{n+1} = [G^n, G^n]$  if they are representable.
- (Subnormal Series) For a group scheme  $G$ , a **subnormal series** is a finite sequence of algebraic subgroups  $G = G_0 \triangleright G_1 \triangleright \dots \triangleright G_r = e$  s.t.  $G_{i+1}$  is normal in  $G_i$ .
- (Solvable Group Schemes) A **solvable group scheme** is a group scheme  $G$  that has a subnormal series  $G = G_0 \triangleright G_1 \triangleright \dots \triangleright G_s = \{e\}$  that each quotient  $G_i/G_{i+1}$  is commutative.
- (Nilpotent Group Schemes) A **nilpotent group scheme** is a group scheme  $G$  that has a subnormal series  $G = G_0 \triangleright G_1 \triangleright \dots \triangleright G_s = \{e\}$  that each quotient  $G_i/G_{i+1}$  is central in  $G/G_{i+1}$ . Such a sequence is called a **central normal series**.
- (Split Solvable(resp. Nilpotent) Group Schemes) A **split solvable**(resp. **split nilpotent group**) is a group scheme  $G$  that has a subnormal(resp. central) series  $G = G_0 \triangleright G_1 \triangleright \dots \triangleright G_s = \{e\}$  that each quotient  $G_i/G_{i+1}$  is isomorphic to either  $\mathbb{G}_a$  or  $\mathbb{G}_m$ .
- (Perfect Group Schemes) A group scheme  $G$  is called **perfect group** if  $G = [G, G]$ .

┘

**Lemma (10.1.1.5) [Butterfly Lemma].** Let  $H_1, H_2$  be algebraic subgroups of an algebraic group  $G$ ,  $N_1, N_2$  are normal subgroups of  $H_1$  and  $H_2$ , then there is a canonical isomorphism of algebraic groups:

$$N_1(H_1 \cap H_2)/N_1(H_1 \cap N_2) \cong N_2(H_2 \cap H_1)/N_2(H_2 \cap N_1).$$

┘

*Proof:* Use the Butterfly lemma for groups (3.1.8.2) and shiffy. □

**Def. (10.1.1.6) [Translation Map].** For  $G \in \mathcal{Gp}/S$  and any  $a \in G(S)$ , there is a (left) translation map

$$l_a : G \cong S \times_S G \xrightarrow{(a, \text{id})} G \times_S G \xrightarrow{m} G.$$

and it satisfies  $l_a, l_b$  by associativity. ┘

**Prop. (10.1.1.7) [Common Group Schemes].**

- $\mathbf{D}(\Gamma) = \text{Spec } \mathbb{Z}[\Gamma]$  for a group  $\Gamma$ , representing  $\underline{\text{Hom}}(\Gamma, \mathbb{G}_m)$  (3.11.4.3).
- $\mu_n = \mathbb{Z}[T]/(T^n - 1)$  (3.11.4.5)
- $\mathbb{G}_a = \mathbb{Z}[T]$  (3.11.4.6)
- $\underline{\Gamma} = \text{Spec } \prod_{\gamma \in \Gamma} \mathbb{Z}$  (3.11.4.9).
- $\alpha_{p^r} = \text{Spec } \mathbb{F}_p[X]/X^{p^r}$  (3.11.4.13).
- $V_a = \text{Spec } \text{Sym}(V^\vee)$  (3.11.4.8).

⌋

**Prop. (10.1.1.8).**

- $\text{Hom}(\mathbb{G}_{m,R}, \mathbb{G}_{a,R}) = 0$ .
- $\text{Hom}(\mathbb{G}_{a,R}, \mathbb{G}_{m,R}) = 0$ .
- If  $R$  is reduced, then  $\text{Aut}(\mathbb{G}_{a,R}) \cong R$ .
- If  $k \in \mathbf{Field}^p$ , then  $\text{End}_k(\alpha_p) = \mathbb{G}_a$ .

⌋

*Proof:* 1: Such a homomorphism corresponds to an element  $f(T) = \sum a_i T^i \in R[T]$  s.t.  $\sum a_i T^i \otimes T^i = \sum a_i (T^i \otimes 1 + 1 \otimes T^i)$ , which implies  $a_i = 0$  for all  $i$ . A homomorphism  $\mathbb{G}_{m,R} \rightarrow \mathbb{G}_{a,R}$  corresponds to an element  $f(T) = \sum a_i T^i$  s.t.  $\sum a_i T^i \otimes T^i = \sum a_i (T^i \otimes 1 + 1 \otimes T^i)$ , which implies  $a_i = 0$  for all  $i$ .

2: The proof is the same as that of (10.1.1.8).

3: Any endomorphism of  $\mathbb{G}_{a,R}$  is of the form  $X \mapsto a_0 + a_1 X + \dots + a_n T^n$ . If it is an automorphism, then for any prime ideal  $\mathfrak{p} \in \text{Spec } R$ ,  $a_0 \notin \mathfrak{p}$  and  $a_i \in \mathfrak{p}, i > 0$ , thus  $a_0$  is a unit and  $a_i$  are nilpotent for  $i > 1$ , so  $a_i = 0$  for  $i > 1$ .

4: Any homomorphism  $(\alpha_p)_R \rightarrow (\alpha_p)_R$  corresponds to an element  $f(T) = \sum a_i T^i \in R[T]$  s.t.  $\sum a_i (T \otimes 1 + 1 \otimes T)^i = \sum a_i (T^i \otimes 1 + 1 \otimes T^i)$ . So  $a_i = 0$  unless  $i \in p^{\mathbb{N}}$ , and in which case  $f \equiv a_1 T \pmod{T^p}$ , so the assertion follows.  $\square$

**Prop. (10.1.1.9).** For  $G \in \mathcal{G}rp/S$ , there is a Cartesian diagram:

$$\begin{array}{ccc} G & \xrightarrow{\Delta_{X/S}} & G \times_S G \\ \downarrow & & \downarrow (g, g') \mapsto m(i(g), g') \\ S & \xrightarrow{e} & G \end{array}$$

This can be seen by a testing scheme  $T$ .  $\square$

**Cor. (10.1.1.10) [Separatedness].**  $G \in \mathcal{G}rp/S$  is (quasi-)separated iff  $e$  is qc(closed immersion). In particular, if  $S$  is a field, then  $G$  is separated.  $\square$

**Def. (10.1.1.11) [Character Groups].** A **character** of a group scheme  $G$  is a homomorphism  $G \rightarrow \mathbb{G}_m$ .

It is easy to see that a character of  $G$  is equivalent to a group-like element (3.11.4.17) in  $\Gamma(G)$ . The characters of  $G$  form a **character group**, denoted by  $X^*(G)$ . Also denote  $X^\bullet(G) = X^*(G_{k^{\text{sep}}})$ .

Similarly we define  $X_*(G)$  (resp.  $X_\bullet(G)$ ) as the set of cocharacters of  $G$  (resp.  $G_{k^{\text{sep}}}$ ).

In particular, if  $G \in \mathcal{A}lg\mathcal{G}rp/k$ , then the set of characters of  $G$  are linearly independent, by (3.11.4.18).  $\square$

**Prop. (10.1.1.12) [Sheaf of Differentials is Parallel].** For  $f : G \rightarrow S \in \mathcal{G}rp/S$ , there are canonical isomorphisms

$$\Omega_{G/S} \cong f^* \mathcal{C}_{G/S} \cong f^* e^* \Omega_{G/S}.$$

In particular, if  $S$  is the spectrum of a local ring, then  $\Omega_{G/S}$  is a free  $\mathcal{O}_G$ -module.  $\square$

*Proof:* By base change,  $\Omega_{G \otimes_S G/S} = \pi_0^* \Omega_{G/S}$ , and the transition map

$$\tau : G \otimes_S G \rightarrow G \otimes_S G : (g, h) \mapsto (m(g, h), h)$$

is an automorphism of  $G \otimes_S G$  over  $G$ , so there is an isomorphism

$$\tau^* \pi_0^* \Omega_{G/S} \cong \pi_0^* \Omega_{G/S}$$

but  $\pi_0 \circ \tau = m$ , showing this isomorphism is  $m^* \Omega_{G/S} \cong \pi_0^* \Omega_{G/S}$ . Now pulling this isomorphism along the isomorphism by  $(e \circ f, \text{id}) : G \rightarrow G \otimes_S G$  we obtain the isomorphism

$$\Omega_{G/S} \cong f^* e^* \Omega_{G/S}.$$

Finally  $e^* \Omega_{G/S} \cong \mathcal{C}_{S/G}$  by (7.5.5.14). □

**Prop. (10.1.1.13).** Any  $G \in \text{GrpSch}/k$  is geo.reduced. ┘

*Proof:* Cf. [Sta]047O. ? □

**Prop. (10.1.1.14) [Galois Descent].** Let  $k \in \text{Field}$ ,  $G \in \text{Grp}/k$  and  $K/k$  is a Galois extension with Galois group  $\Gamma$ . If  $H'$  is a subgroup of  $G \otimes_k K$ , then  $H'$  is stable under the action of  $\Gamma$  iff there exists a subgroup  $H$  of  $G$  that  $H \otimes_k K = H'$ . In this case,  $H$  is unique. ┘

*Proof:* Use (7.1.5.20) and (7.1.5.23). □

**Prop. (10.1.1.15).** Let  $X, Y$  be varieties over a field  $k$  that both have at least one  $K$ -point, and  $X$  is complete. Then any morphism  $X \times Y \rightarrow G$  to a group scheme  $G$  over  $k$  factorizes as  $f(x, y) = g(x)h(y)$ , where  $f : X \rightarrow G$  and  $h : Y \rightarrow G$ . ┘

*Proof:* Fix a  $y_0 \in Y(K)$  and define a morphism  $g : X \rightarrow G : x \mapsto f(x, y_0)$ , then the morphism  $F : X \times Y \rightarrow G : (x, y) \mapsto g(x)^{-1} f(x, y)$  is constant on  $X \times \{y_0\}$ . Then the rigidity lemma (7.12.1.20) and (10.1.1.10) shows  $F(x, y) = h(y)$  where  $h : Y \rightarrow G$  is a morphism. Then we are done. □

**Cor. (10.1.1.16).** Any morphism from a  $\mathbb{P}_K^1$  to a group scheme  $G$  is constant. ┘

*Proof:* Let  $(x_0, x_1)$  be a homogenous coordinate of  $\mathbb{P}^1$ , consider the morphism  $s : \mathbb{P}^1 \times \mathbb{A}^1 \rightarrow \mathbb{P}^1 : (x_0, x_1) \times y \mapsto (x_0, x_0 + x_1 y)$ . Let  $f : \mathbb{P}^1 \rightarrow G$  be a morphism, consider the composition

$$\mathbb{P}^1 \times \mathbb{A}^1 \xrightarrow{s} \mathbb{P}^1 \xrightarrow{f} G$$

then by (10.1.4.21),  $f \circ s$  factors as  $f(s(x, y)) = g(x)h(y)$ .

We take  $y = 0$ , then  $s(x, 0) = x$ , and  $g(x) = f(x)h(0)^{-1}$ . Thus  $f(s(x, y)) = f(x)h(0)^{-1}h(y)$ . Next we take  $x = (0, 1)$ , then  $s((0, 1), y) = (0, 1)$ , and  $f((0, 1)) = f((0, 1))h(0)^{-1}h(y)$ . This shows  $h(y) = h(0)$  is constant, thus  $f(s(x, y)) = f(x)$ . Finally, let  $x = (0, 1)$ , then  $s((0, 1), y) = y$ , and  $f(y) = h(0)$  is constant. □

**Cor. (10.1.1.17).** Let  $U$  be an open subset of  $\mathbb{P}^1$ , then any morphism from  $U$  to a group variety  $G$  is constant. In particular,  $G$  contains no rational curve, and any morphism from a rationally connected variety to  $G$  is constant, in particular  $\mathbb{P}_K^n$ . ┘

*Proof:* Any rational map from  $\mathbb{P}^1$  to  $G$  can be extended to a morphism, by (7.13.1.16), thus it is constant, by the proposition above. □

**Prop. (10.1.1.18) [Weil's Extension Theorem].** Let  $S \in \text{NSch}_{\text{nom, qc}}$ ,  $Z \in \text{Sch}^{\text{sm}}/S$ ,  $G \in \text{Grp}^{\text{sm, sep}}/S$ . If  $\varphi : Z \rightarrow G$  is an  $S$ -rational map, then every irreducible component of  $Z \setminus \text{dom}(\varphi)$  is of codimension 1. ┘

*Proof:* Cf. [BLR90]P109. ? □

## Classification of groups schemes of height 1 over a field

### Quotients of Group Schemes

**Thm. (10.1.1.19) [Grothendieck].** Suppose  $G \in \mathcal{G}rpSch^{\text{ft}}/S$  and  $H \leq G \in \mathcal{G}rpSch/S$  is a closed subgroup scheme. If  $H$  is proper flat over  $S$  and if  $G$  is quasi-projective over  $S$ , then the quotient sheaf  $\mathcal{G}/_{\text{fppf}}(G)/\mathcal{Y}o_{\text{fppf}}(H)$  is representable by a scheme over  $S$ , denoted by  $G/H$ .  $\lrcorner$

*Proof:* Cf. [Grothendieck, A. Technique de descente et theoremes d'existence en geometrie algebrique, III].  $\square$

**Cor. (10.1.1.20) [Existence of Quotient Schemes].** Let  $H \rightarrow G \in \mathcal{A}lg\mathcal{G}rp/k$  be a monomorphism (10.1.5.7), then the quotient sheaf  $\tilde{G}_{\text{fppf}}/\tilde{H}_{\text{fppf}}$  is representable by an algebraic scheme, and the natural map  $G \rightarrow G/H$  is faithfully flat.  $\lrcorner$

*Proof:* Cf. [Mil17b]P605.  $\square$

**Cor. (10.1.1.21) [Quotient by Normal Subgroups].** For  $G \in \mathcal{A}lg\mathcal{G}rp/k$ , every normal algebraic subgroup  $N \trianglelefteq G \in \mathcal{A}lg\mathcal{G}rp/k$  arises as the kernel of a quotient map  $G \rightarrow G/N$ . And if  $G$  is affine,  $G/N$  is also affine.  $\lrcorner$

*Proof:* This is a corollary of (10.1.1.20) and (10.1.1.24) and (10.8.1.12).

The second assertion follows from [Mil17]P103.  $\square$

**Cor. (10.1.1.22) [Quotient Map is a Cokernel].** Let  $q : G \rightarrow Q \in \mathcal{A}lg\mathcal{G}rp/k$  be a quotient map with kernel  $N$ , then every homomorphism  $G \rightarrow H$  whose kernel contains  $N$  factors uniquely through  $q$ .  $\lrcorner$

**Prop. (10.1.1.23) [Quotient as Torsors].** Let  $G \in \mathcal{G}rpSch/S$  and  $H \leq H' \leq G \in \mathcal{A}lg\mathcal{G}rp/S$  be subgroups schemes, then there is a Cartesian diagram

$$\begin{array}{ccc} G \times (H'/H) & \longrightarrow & G/H \\ \downarrow & & \downarrow \\ G & \longrightarrow & G/H' \end{array}.$$

In particular,  $G$  is a  $(\text{fppf})H$ -torsor over  $G/H$ .  $\lrcorner$

*Proof:* For any  $T \in \mathcal{S}ch/S$ ,  $G(T) \times H(T) \rightarrow G(T) \times_{G(T)/H(T)} G(T)$  is an isomorphism, and then use the fact shification commutes with limits.  $\square$

**Cor. (10.1.1.24).** Situation as in (10.1.1.23), for any  $T \in \mathcal{S}ch/S$ , the nonempty fibers of  $G(T) \rightarrow (G/H)(T)$  are cosets of  $H(T)$ . In particular, the fiber over  $\mathbf{1} \in G/H$  is just  $H$ .  $\lrcorner$

**Cor. (10.1.1.25) [Smoothness of the Quotients].** Situation as in (10.1.1.23), suppose  $S = k \in \mathbf{Field}$ . If  $H'/H$  is smooth (resp. finite/étale) over  $k$ , then the map  $G/H \rightarrow G/H'$  is smooth (resp. finite flat/étale).  $\lrcorner$

*Proof:* Because  $G \rightarrow G/H$  is faithfully flat (10.1.1.20), we can use faithfully flat descent (7.1.5.26) and (10.1.1.23).  $\square$

**Cor. (10.1.1.26) [Points of Smooth Quotients].** If  $H \leq G \in \mathcal{A}lg\mathcal{G}rp/k$  is a closed subgroup, then  $G(\bar{k}) \rightarrow (G/H)(\bar{k})$  is surjective. Moreover, if  $H$  is smooth, then  $G(k^{\text{sep}}) \rightarrow (G/H)(k^{\text{sep}})$  is surjective, and

$$(G/H)(k) = \{gH(k^{\text{sep}}) \in G(k^{\text{sep}})/H(k^{\text{sep}}), \sigma(g)g^{-1} \in H(k^{\text{sep}}) \forall \sigma \in \text{Gal}_k\}.$$

$\lrcorner$

*Proof:* For any  $x \in H(\bar{k})$  (resp.  $x \in H(k^{\text{sep}})$ ),  $G_x$  is non-empty and locally algebraic (resp. smooth) over  $\kappa(x)$  by (10.1.1.25), thus has a  $\bar{k}$  (resp.  $k^{\text{sep}}$ -point) by (7.6.4.18).  $\square$

**Prop. (10.1.1.27) [Additivity of Dimensions].** If  $G \in \text{AlgGrp}/k$  and  $H \leq G \in \text{AlgGrp}/k$ , then

$$\dim G = \dim H + \dim G/H.$$

┘

*Proof:* This follows from (7.6.3.17) and (10.1.1.24). (Notice  $G(\bar{k}) \rightarrow H(\bar{k})$  is surjective (10.1.5.6)).  $\square$

**Thm. (10.1.1.28) [Homomorphism Theorem].** Every homomorphism  $f : G \rightarrow H \in \text{AlgGrp}/k$  factors uniquely as

$$G \xrightarrow{q} I \xrightarrow{i} H,$$

where  $q$  is a quotient map and  $i$  is a monomorphism.  $I$  is called the **image of  $f$** .  $\lrcorner$

*Proof:* Let  $N = \ker(f)$ , and  $q : G \rightarrow I = G/N$  (10.1.1.21), then by (10.1.1.22),  $f$  factors through  $I$  via a monomorphism  $i$  by (10.1.1.19).  $\square$

**Cor. (10.1.1.29).** A homomorphism of algebraic groups is a quotient map iff it is an epimorphism in the category of algebraic schemes.  $\lrcorner$

*Proof:* For any homomorphism of group schemes  $\varphi : G \rightarrow H$ , factor it as in (10.1.1.28), then we can form the quotient space  $H/I$ , so if it is an epimorphism,  $I = H$ , and  $\varphi$  is a quotient map. Conversely, if it is a quotient map, then  $\mathcal{O}_H \rightarrow \varphi_* \mathcal{O}_G$  is injective by (10.1.5.4), thus it is an epimorphism.  $\square$

**Cor. (10.1.1.30).** If  $f : G \rightarrow H \in \text{AlgGrp}/k$  is surjective and  $H$  is reduced, then  $f$  is a quotient map.  $\lrcorner$

**Prop. (10.1.1.31).** Let  $H, N$  be subgroup schemes of  $G$  with  $N$  normal, then the canonical map

$$N \rtimes H \rightarrow G$$

is an isomorphism iff  $N \cap H = e$  and  $NH = G$ .  $\lrcorner$

*Proof:* This follows from the exact sequence  $e \rightarrow N \cap H \rightarrow N \rtimes H \rightarrow NH \rightarrow e$ .  $\square$

**Prop. (10.1.1.32) [Isomorphism Theorem].** Let  $H, N$  be algebraic subgroups of an algebraic group  $G$  such that  $H$  normalizes  $N$ , then  $H \cap N$  is a normal algebraic subgroup of  $H$ , and the natural map

$$H/H \cap N \rightarrow HN/N$$

is an isomorphism.  $\lrcorner$

*Proof:* The isomorphism is induced by shification of the natural isomorphism

$$T_R : H(R)/H(R) \cap N(R) \cong H(R)N(R)/N(R) \text{ (3.1.2.8)}.$$

$\square$

**Thm. (10.1.1.33) [Correspondence Theorem].** Let  $G \in \text{AlgGrp}/k$  and  $N \trianglelefteq G \in \text{AlgGrp}/k$  is a normal algebraic subgroup, then

- For any algebraic subgroup  $H \leq G \in \mathcal{AlgGrp}/k$ , the inverse image of the image of  $H$  in  $G/N$  is  $HN$ .
- The map  $H \mapsto H/N$  is a bijection between the set of algebraic subgroups of  $G$  containing  $N$  to the set of algebraic subgroups of  $G/N$ .
- An algebraic subgroup  $H$  of  $G$  containing  $N$  is normal in  $G$  iff  $H/N$  is normal in  $G/N$ , in which case the natural map  $G/H \rightarrow (G/N)/(H/N)$  is an isomorphism.

⌋

*Proof:* Cf. [Mil17]P113. ?

□

**Prop. (10.1.1.34) [Group Formation].** WARNING: the category  $\mathcal{AlgGrp}_k$  of algebraic groups is not Abelian, not even an exact category, but it is a group formation (4.3.2.1), and its subcategory  $\mathcal{CAlgGrp}_k$  of commutative algebraic groups is an Abelian category, by (10.1.1.21)(10.1.5.3)(10.1.1.4). Also the subcategory of affine algebraic groups is a Serre subcategory, by (10.1.1.21) and (10.1.5.33).

⌋

**Cor. (10.1.1.35).** By taking shiffication, it can be shown that the same categorical properties of  $\mathcal{Grp}$  holds for  $\mathcal{AlgGrp}_k$ , such as the nine lemma, five lemma, and the restrictive snake lemma.

⌋

**Prop. (10.1.1.36) [Extensions of Group Schemes].** If  $G', G'' \in \mathcal{GrpSch}^{\text{pf}}/S$  with  $G'$  affine flat over  $S$ , and

$$1 \rightarrow G' \rightarrow G \rightarrow G'' \rightarrow 1 \in \text{Sh}(\mathcal{Sch}_{\text{fppf}}/S)$$

is an exact sequence, then  $G$  is representable by a f.p.  $S$ -scheme flat and affine over  $G''$ . Moreover,  $G', G''$  are finite group schemes over  $S$  (10.1.2.1) iff  $G$  is.

⌋

*Proof:* Cf. [CCO14]P35. ?

□

## 2 Finite Group Schemes

References are [Finite Flat Group Schemes and  $p$ -Divisible Groups, Jakob], [Finite Group Schemes, Pink], [Introduction to Finite Group Schemes], [Finite Flat Group Schemes, Tate].

**Def. (10.1.2.1) [Finite Locally Free Group Schemes].** For  $S \in \mathcal{Sch}$ , a **finite locally free group scheme** or a **finite group scheme** over  $S$  is a group scheme  $G \in \mathcal{GrpSch}/S$  that is finite locally free (7.6.2.21) over  $S$ . It is said to have **order/rank**  $d$  if  $G$  is finite locally free of rank  $d$  over  $S$ , where  $d$  is a locally constant  $\mathbb{N}$ -valued function on  $S$ .

The category of finite locally free group scheme over  $S$  of rank  $d$  is denoted by  $\text{finGrpSch}^d/S$ .

The category of commutative finite group schemes over  $S$  of rank  $d$  is denoted by  $\text{finAbSch}^d/S$ .

⌋

**Prop. (10.1.2.2) [Connected-étale Exact Sequences Split over Perfect Fields].** If  $k \in \text{Field}$  s.t.  $k = k^{\text{sep}}$  and  $G \in \text{finGrpSch}/k$ , then  $(G^0)_{\text{red}} = \mathbf{1}$ , and the connected-étale exact sequence (10.1.4.13)

$$1 \rightarrow G^0 \rightarrow G \rightarrow \pi_0(G) \rightarrow 1$$

splits.

⌋

*Proof:*  $(G^0)_{\text{red}} = \mathbf{1}$  because it is connected and étale (7.6.6.6). Then (10.1.5.6) implies that  $G(k^{\text{sep}}) = \pi_0(k^{\text{sep}})$ . Then we have  $G_{\text{red}} \cong \pi_0(G)$  by (10.1.4.4) because they are both étale over  $k$  (7.6.6.6). Thus  $G \cong G^0 \rtimes \pi_0(G)$ .

□

**Prop. (10.1.2.3) [Infinitesimal Finite Group Schemes].** For  $G \in \text{finGrpSch}/S$ ,  $G$  is called a **infinitesimal finite group** over  $S$  if it satisfies the following equivalent conditions:

- The augmentation ideal  $\mathcal{I}$  of  $G$  is locally nilpotent.
- For each  $s \in S$ ,  $G_s$  is connected.
- For each  $s \in S$ ,  $G_s$  doesn't contain isolated points.
- For each geometric point  $\bar{s}$  of  $S$ ,  $G_{\bar{s}}$  doesn't contain isolated points.

┘

*Proof:* ?

□

**Prop. (10.1.2.4) [Cartier].** For  $k \in \text{Field}^0$ ,

- Every affine finite commutative group scheme over  $k$  is finite étale.
- If  $k = \bar{k}$ , then there is an equivalence of categories between finite commutative group schemes over  $k$  and  $\mathcal{A}b$ , by  $G \mapsto G(k)$  and  $\Gamma \mapsto \underline{\Gamma}_k$ .

┘

*Proof:* 1: by (3.11.4.20) and (5.4.7.24).

2:  $\underline{\Gamma}_k$  is clearly affine commutative group schemes over  $k$ . If  $A$  is finite locally free Hopf algebra over  $k$ , then it is finite étale by item1 and isomorphic to a finite product of copies of  $k$ . Now the equivalence is clear.

□

**Prop. (10.1.2.5) [Finite Group Schemes of Order Invertible in  $S$  is Finite Étale].** A finite locally free group scheme  $G$  over  $S$  of order invertible in  $S$  is finite étale.

┘

*Proof:* Cf. [Jakob, P45]. ?

□

**Prop. (10.1.2.6) [Finite Étale Group Schemes].** Let  $X$  be a connected smooth scheme with a geometric point  $\bar{x}$ , then there is a equivalence of categories:

$$\text{Grp}(X_{\text{fét}}) \cong \text{Grp}^{\text{fin}} / \pi_1(X, \bar{x})$$

by (9.3.2.2). In particular, constant group schemes correspond to finite groups with trivial  $\pi_1(X, x)$  actions.

┘

**Cor. (10.1.2.7).** The category of finite étale commutative group schemes over  $X$  is Abelian.

The category of commutative group schemes over  $X$  of order invertible in  $X$  is Abelian, by (10.1.2.5).

┘

**Prop. (10.1.2.8) [Quotients Maps and Faithfully Flat Maps].** For  $f : X \rightarrow Y \in \text{finGrpSch}/S$ ,  $f$  is a quotient map iff it is faithfully flat.

┘

*Proof:* ? By fibral criterion of flatness (7.6.2.15), it suffices to check on geometric fibers, which follows from (10.1.5.4).

□

### Commutative Finite Group Schemes

**Thm. (10.1.2.9) [Cartier-Duality].** If  $G \in \text{finAbSch}/S$ , then  $\mathcal{O}_G$  is a finite locally free  $\mathcal{O}_S$ -Hopf algebra, and  $\text{Hom}_{\mathcal{O}_S}(\mathcal{O}_G, \mathcal{O}_S) = \mathcal{O}_G^\vee$  is again a finite locally free  $\mathcal{O}_S$ -Hopf algebra (7.2.5.2), and thus  $\text{Spec } \mathcal{O}_G$  is a finite locally free group scheme over  $S$ , called the **Cartier-dual**  $G^D$  of  $G$ .

Then  $G^D$  represents the Hom sheaf  $\underline{\mathrm{Hom}}_{\mathrm{Sch}/S}(G, \mathbb{G}_m)$ . In particular, there is a natural bi-commutative morphism  $G \times G^D \rightarrow \mathbb{G}_m \in \mathrm{GrpSch}/S$  inducing isomorphism  $G \cong \underline{\mathrm{Hom}}_{\mathrm{Sch}/S}(G^D, \mathbb{G}_m)$  and  $G^D \cong \underline{\mathrm{Hom}}_{\mathrm{Sch}/S}(G, \mathbb{G}_m)$ .

Cartier-duality commutes with base changes. And there is a natural isomorphism  $(G^D)^D = G$ , so the Cartier-duality is a contravariant auto-equivalence of  $\mathrm{finAbSch}/S$ .  $\square$

*Proof:* Cf.[Abelian Varieties, Geer]P42<sup>?</sup>.

It suffices to show that

$$G^D(T) \cong \mathrm{Hom}_T(G \otimes_S T, \mathbb{G}_{m,T})$$

for any  $T \in \mathrm{Sch}/S$ . Notice a  $g \in G^D(T)$  corresponds to an  $R$ -algebra morphism  $g \in \mathrm{Hom}_{\mathrm{Alg}/\mathcal{O}_S}(\mathcal{O}_G^\vee \rightarrow \mathcal{O}_T) = \mathcal{O}_G \otimes_{\mathcal{O}_S} \mathcal{O}_T$  (7.2.5.2) that satisfies

$$(\Delta \otimes \mathrm{id}_T)(g) = g \otimes_T g \in (\mathcal{O}_G \otimes_{\mathcal{O}_S} \mathcal{O}_G) \otimes_{\mathcal{O}_S} \mathcal{O}_T, \quad (\varepsilon \otimes \mathrm{id}_T)(g) = 1$$

Also,  $g$  is a unit, as

$$g \cdot (\iota \times \mathrm{id}_T)(g) = \mu \circ ((\mathrm{id}_{\mathcal{O}_G} \otimes \iota) \otimes \mathrm{id}_{\mathcal{O}_T})(g \otimes g) = \mu \circ ((\mathrm{id}_{\mathcal{O}_G} \otimes \iota) \otimes \mathrm{id}_T) \circ (\Delta \otimes \mathrm{id}_T)(g) = (\eta_{\mathcal{O}_G} \otimes \mathrm{id}_T)(\varepsilon \otimes \mathrm{id}_T)(g) = 1$$

so  $g$  corresponds to a  $\mathcal{O}_T$ -Hopf algebra map

$$\mathcal{O}_T[X, X^{-1}] \rightarrow \mathcal{O}_G \otimes_{\mathcal{O}_S} \mathcal{O}_T$$

which maps  $X$  to  $g$ , thus inducing a homomorphism in  $\mathrm{Hom}_T(G \otimes_S T, \mathbb{G}_{m,T})$ . This process is invertible.  $\square$

**Prop. (10.1.2.10)** [ $\underline{\Gamma}$  is Cartier Dual to  $D(\Gamma)$ ]. Let  $\Gamma \in \mathrm{Ab}^{\mathrm{fin}}$  and  $S$  be a scheme, then  $\underline{\Gamma}_S$  is Cartier dual to  $D(\Gamma)_S$ .  $\square$

*Proof:* By (10.1.2.9), it suffices to show for  $S = \mathrm{Spec} \mathbb{Z}$ . Now  $\underline{\Gamma} = \prod_{\gamma \in \Gamma} \mathbb{Z}$ , and  $\Delta(e_\gamma) = \sum_{gg'=\gamma} e_g \otimes e_{g'}$ . Let  $f_\gamma \in \underline{\Gamma}^\vee$  be dual to  $e_\gamma$ , then

$$f_\gamma \cdot f_{\gamma'} = \sum_{g \in \Gamma} \Delta^\vee(f_\gamma \otimes f_{\gamma'})(e_g) f_g = \sum_{g \in \Gamma} f_\gamma \otimes f_{\gamma'} \left( \sum_{st=g} e_s \otimes e_t \right) f_g = f_{\gamma\gamma'}$$

so  $\underline{\Gamma}^\vee \cong \mathbb{Z}[\Gamma]$ , and

$$\Delta(f_\gamma) = \sum_{g, g' \in \Gamma} \mu^\vee(f_\gamma)(e_g \otimes e_{g'}) f_g \otimes f_{g'} = f_\gamma \otimes f_\gamma.$$

$\square$

**Cor. (10.1.2.11).**  $\underline{\mathbb{Z}/n\mathbb{Z}}$  is Cartier-dual to  $\mu_n$ .  $\square$

**Prop. (10.1.2.12)** [ $\alpha_p$  is Self Cartier-Dual]. For any  $S \in \mathrm{Sch}^p$ ,  $\alpha_{p,S}$  is Cartier-dual to itself.  $\square$

*Proof:* By (10.1.2.9), it suffices to show for  $S = \mathrm{Spec} \mathbb{F}_p$ . Then  $\alpha_p = \mathbb{F}_p[X]/X^p$  with

$$\Delta(X) = X \otimes 1 + 1 \otimes X, \quad \varepsilon(X) = 0, \quad S(X) = -X.$$

Let  $Y_i \in \alpha_p^\vee$  dual to  $X^i$  then

$$Y_i \cdot Y_j = \sum_{k=0}^{p-1} \Delta^\vee(Y_i \otimes Y_j)(X^k) Y_k = \sum Y_i \otimes Y_j (\Delta(X^k)) Y_k = \sum Y_i \otimes Y_j \left( \sum_{a+b=k} \binom{k}{a} X^a \otimes X^b \right) Y_k = \binom{i+j}{i} Y_k$$

Now  $\binom{i+j}{i}$  is unit, so  $\alpha_p^\vee = \mathbb{F}_p[Y]/Y^p$  where  $Y = Y_1$ . and

$$\Delta(Y) = \sum_{a,b} \mu^\vee(Y)(X^a \otimes X^b)Y_a \otimes Y_b = \sum Y(X^{a+b}) = Y \otimes 1 + 1 \otimes Y,$$

so  $\alpha_p^\vee = \alpha_p$ . □

**Prop. (10.1.2.13).** For  $k \in \mathbf{Field}^p$  and  $G \in \mathbf{finGrpSch}/k$  is connected, then  $\mathrm{rank}(G) \in p^{\mathbb{N}}$ . ┘

*Proof:* Cf.[Van de Geer, P68]. □

**Cor. (10.1.2.14).** If  $k \in \mathbf{Field}^p$  and  $G \in \mathbf{finAbSch}/k$ , then  $p \nmid \mathrm{rank}(G)$  iff  $G$  and  $G^D$  are both étale over  $k$ . ┘

*Proof:* This follows from the connected-étale exact sequence (10.1.4.13) and (10.1.2.13). Conversely, if  $G$  and  $G^D$  are both étale, then we may base change to  $\bar{k}$ , and  $G$  is a constant group scheme. But if  $p \mid \mathrm{rank}(G)$ , then  $G$  has a factor  $\mathbb{Z}/(p^r)$ , thus  $G^D$  has a factor  $\mu_{p^r}$ , which is not étale. □

**Prop. (10.1.2.15).** For  $k \in \mathbf{Field}$  s.t.  $k = k^{\mathrm{perf}}$  and  $G \in \mathbf{finGrpSch}/k$ , there is a canonical decomposition

$$G = G_{cc} \times G_{ce} \times G_{ec} \times G_{ee},$$

where  $G_{cc}, G_{ce}, G_{cc}^D, G_{ec}^D$  are connected and  $G_{ec}, G_{ee}, G_{ce}^D, G_{ee}^D$  are étale over  $k$ .

And if  $\mathrm{rank}(G) \in p^{\mathbb{N}}$ , then  $G_{ee} = 1$ , by (10.1.2.14). ┘

*Proof:* This follows from Cartier-duality (10.1.2.9) and (10.1.2.2). □

**Prop. (10.1.2.16) [No Maps between étale and Connected Finite Schemes].** If  $G_1, G_2 \in \mathbf{finAbSch}/k$  s.t.  $G_1$  is étale and  $G_2$  is connected, then  $\mathrm{Hom}_k(G_1, G_2) = 1, \mathrm{Hom}_k(G_2, G_1) = 1$ . ┘

*Proof:*  $(G_2)_{\mathrm{red}} = 1$  because it is connected and étale. Any map from  $G_1$  to  $G_2$  factors through  $(G_2)_{\mathrm{red}}$ , which is trivial. Similarly, and map from  $G_2$  to  $G_1$  factors through  $G_1^0$ , which is trivial. □

**Prop. (10.1.2.17) [Multiplicativity of Ranks].** If  $e \rightarrow G_1 \rightarrow G \rightarrow G_2 \rightarrow e \in \mathbf{finGrpSch}/S$  is an exact sequence, then  $\mathrm{rank}(G) = \mathrm{rank}(G_1) \cdot \mathrm{rank}(G_2)$ . ┘

*Proof:* This follows from the fact that  $G$  is a  $G_1$ -torsor over  $G_2$  (10.1.1.23). □

**Prop. (10.1.2.18).** If  $S \in \mathbf{Sch}^p$ , the three group schemes  $\underline{\mathbb{Z}/p\mathbb{Z}}_S, \mu_{p,S}, \alpha_{p,S}$  are mutually non-isomorphic. ┘

*Proof:* We may take a fiber and assume  $S = \mathrm{Spec} K$ , then  $\underline{\mathbb{Z}/p\mathbb{Z}}_S$  is reduced,  $\mu_{p,S}$  is non-reduced and  $\alpha_{p,S}$  is non-reduced. Then we can look at the reducedness of the group scheme and its Cartier dual. □

**Prop. (10.1.2.19) [The Order Kills the Finite Group, Deligne].** For  $n \in \mathbb{Z}_+$  and  $G \in \mathbf{finAbSch}/S$  with constant rank  $n$ , we have  $[n]_G = 0 : G \rightarrow G$ . ┘

*Proof:* Cf.[Jakob P12] or [Tate-Oort, Group schemes of prime order]. ? □

**Prop. (10.1.2.20) [Properties of Commutative Finite Group Schemes].** For  $G \in \mathbf{finAbSch}/S$ ,

- The following are equivalent:

- $G$  is étale over  $S$ .
- For each  $s \in S$ ,  $G_s$  is étale over  $\kappa(s)$ .
- For each geometric point  $\bar{s}$  of  $S$ ,  $G_{\bar{s}}$  is reduced.
- $G$  is étale-locally constant.
- $G$  is unipotent iff  $G^D$  is infinitesimal(10.1.2.9)(10.1.2.3).
- The following are equivalent:
  - $G$  is of multiplicative-type over  $S$ .
  - $G^D$  is étale over  $S$ .
  - For each  $s \in S$ ,  $G_s$  is of multiplicative-type over  $\kappa(s)$ .
  - Étale-locally  $G$  embeds into  $G_m^r$  for some  $r \in \mathbb{Z}_+$ .
- $G$  is called a **bi-infinitesimal group scheme** if it is infinitesimal and unipotent.

┘

**Prop. (10.1.2.21).** If  $1 \rightarrow G_1 \rightarrow G \rightarrow G_2 \rightarrow 1 \in \text{finAbSch}/S$  is an exact sequence, then

- $G$  is étale over  $S$  iff  $G_1, G_2$  are both étale over  $S$ .
- $G$  is multiplicative-type over  $S$ (10.1.2.20) iff  $G_1, G_2$  are both multiplicative-type over  $S$ .

┘

*Proof:* 1: This follows from(7.6.6.2), the fibral criterion of étaleness(7.6.6.8) and the connected-étale exact sequence(10.1.4.13).

2: This follows from item1 and Cartier-duality. □

**Def. (10.1.2.22) [Verschiebung-Maps].** If  $\text{char } k = p \in \text{Prime}$ , then for any  $G \in \text{finAbSch}/k$ , we can define a **Verschiebung-map**

$$\text{Ver}_{G/k} : G^{(p)} \rightarrow G$$

which is the Cartier-dual of the relative Frobenius of the Cartier-dual of  $G$ (10.1.2.9).

Then we have

$$F_{G/k} \circ \text{Ver}_{G/k} = [p] = \text{Ver}_{G/k} \circ F_{G/k}.$$

┘

*Proof:* ? □

### Commutative $p$ -Group Schemes

**Notation (10.1.2.23).**

- Let  $p \in \text{Prime}$ .

┘

Cf.[Finite Flat Group Schemes, Tate]Section4.

**Def. (10.1.2.24) [ $p$ -Group Schemes].** The category of commutative group schemes over  $S$  annihilated by a power of  $p$  is denoted by  $p\text{-finAbSch}/S$ . ┘

**Prop. (10.1.2.25).** If  $\kappa \in \mathbf{Field}^p$  s.t.  $\kappa = \bar{\kappa}$ , then for each  $G \in p\text{-finAbSch}/\kappa$ , there is a composition series

$$G_n = 0 \leq G_{n-1} \leq \dots \leq G_1 \leq G_0 = G$$

s.t. each subquotient  $G_i/G_{i+1}$  is isomorphic to one of the groups  $\alpha_p, \mu_p, \mathbb{Z}/(p)$ . And

- $G$  is infinitesimal iff each subquotient is isomorphic to  $\alpha_p$  or  $\mu_p$ .
- $G$  is étale iff each subquotient is isomorphic to  $\mathbb{Z}/(p)$ .
- $G$  is unipotent iff each subquotient is isomorphic to  $\mathbb{Z}/(p)$  or  $\alpha_p$ .
- $G$  is of multiplicative-type iff each subquotient is isomorphic to  $\mu_p$ .
- $G$  is of bi-infinitesimal iff each subquotient is isomorphic to  $\alpha_p$ .

⌋

*Proof:* SGA4, XVII.1.7 and 4.2.1. ?

□

- Let  $\kappa \in \mathbf{Field}^p$  s.t.  $\kappa = \kappa^{\text{perf}}$ .

⌋

**Thm. (10.1.2.27) [Dieudonné-Theory for Finite Commutative  $p$ -Group Schemes].** There is an additive anti-equivalence between Abelian categories:

$$M^* : p\text{-finAbSch}/\kappa \rightarrow \text{Mod}_{D(\kappa)}^{W(\kappa)\text{-fin}} : G \mapsto M^*(G) \triangleq \text{Hom}_{\kappa}(G, \mathbf{CW}_k)$$

(?, [CCO14]P347) called the **contravariant Dieudonné functor**, with inverse functor given by

$$M \mapsto G(M) \triangleq \left( R \in \mathcal{CRing}/\kappa \mapsto \text{Hom}_{D(\kappa)}(M, \mathbf{CW}(R)) \right).$$

Moreover,

- $\text{length}_{W(k)} M^*(G) = \log_p \#|G|$ .
- If  $\kappa' \in \mathbf{Perf}^p/\kappa$ , then there are natural isomorphisms

$$M^*(G_{\kappa'}) = M^*(G) \otimes_{W(\kappa)} W(\kappa').$$

- The relative Frobenius-morphism  $F_{G/\kappa} : G \rightarrow G^{(p)}$  corresponds to

$$M^*(G^{(p)}) \cong \varphi_*(M^*(G)) \xrightarrow{F} M^*(G),$$

and the Verschiebung-morphism  $\text{Ver}_{G/\kappa} : G^{(p)} \rightarrow G$  corresponds to

$$M^*(G) \xrightarrow{V} \varphi_*(M^*(G)) = M^*(G^{(p)}).$$

**Prop. (10.1.2.31) [Comparison of Classical and Crystalline Dieudonné Theories].** There are functorial isomorphisms

$$E^*(G) \cong M^*(G)_{(p)}, \quad E_*(G) \cong M_*(G)^{(p)} \text{ (10.1.2.29)(10.1.2.27).}$$

for each finite commutative  $G \in \mathcal{G}\text{rpSch}/\kappa$  with  $p$ -power order. Taking projective limits, we get functorial isomorphism

$$E^*(X) \cong M^*(X)_{(p)}, \quad E_*(X) \cong M_*(X)^{(p)} \text{ (10.1.2.29)(10.1.2.27).}$$

for each  $X \in p\text{Div}/\kappa$ . ┘

*Proof:* Cf. [Berthelot-Breen-Messing, Theorie de Dieudonné cristalline 2]4.2.14. □

More differential invariants of  $G$  expressed via Dieudonné modules can be found in [CCO14]B.3.10?.

### Finite Group Schemes over Henselian Local Rings

**Notation (10.1.2.32).**

- Let  $(\mathcal{O}_K, \mathfrak{m}_K, \kappa)$  be a Henselian local ring. ┘

**Prop. (10.1.2.33).** ┘

*Proof:* □

**Cor. (10.1.2.34).** Let  $R$  be a equal characteristic Henselian local ring of characteristic  $p > 0$ , then every finite locally free group scheme over  $R$  of prime order is automatically commutative. ┘

*Proof:* Cf. [Shatz, P50]. □

**Cor. (10.1.2.35).** Let  $R$  be a strict Henselian local ring with residue field of characteristic  $p > 0$ , then any connected finite locally free group scheme over  $R$  has order  $p^t$  for some  $t > 0$ . ┘

*Proof:* Cf. [Shatz, P50]. □

**Prop. (10.1.2.36) [Raynaud].** Let  $(K, \mathcal{O}_K, \kappa) \in p\text{-NField}$  and  $G \in \mathcal{G}\text{rpSch}/\mathcal{O}_K$  be quasi-finite flat of finite type, then there is a canonical exact sequence

$$0 \rightarrow G' \rightarrow G \rightarrow G'' \rightarrow 0 \in \mathcal{G}\text{rpSch}/\mathcal{O}_K$$

s.t.  $G'$  is finite flat over  $\mathcal{O}_K$  and  $G''$  is étale quasi-finite over  $\mathcal{O}_K$  with trivial special fiber. ┘

*Proof:* Cf. [Maz78]P134. □

**Prop. (10.1.2.37) [Specialization Lemma, Raynaud].** Let  $p \in \text{Prime}$ ,  $(K, \mathcal{O}_K, \kappa) \in p\text{-NField}$  s.t.  $e(K/\mathbb{Q}_p) < p - 1$ . If  $f : \mathcal{H} \rightarrow \mathcal{G} \in \mathcal{G}\text{rpSch}/\mathcal{O}_K$  is finite flat and  $f_K : \mathcal{H}_K \rightarrow \mathcal{G}_K$  is a monomorphism, then  $f$  is a closed embedding. And if  $f_K$  is an isomorphism, then  $f$  is also an isomorphism. ┘

*Proof:* ? Cf. [Ray74]. □

**Cor. (10.1.2.38).** Let  $p \in \text{Prime}$ ,  $(K, \mathcal{O}_K, \kappa) \in p\text{-NField}$  s.t.  $e(K/\mathbb{Q}_p) < p - 1$ . if  $\mathcal{G} \in \mathcal{G}\text{rpSch}/\mathcal{O}_K$  is finite flat and  $x \in \mathcal{G}(\mathcal{O}_K)$  is a section, then the order of  $x$  equals the order of the specialization of  $x$  in  $G(\kappa)$ . ┘

### 3 Groupoid Schemes

Cf. [Sta]Cha38, 39.

### 4 Algebraic Groups over Fields

**Notation (10.1.4.1).**

- Let  $G \in \text{locAlgGrp}/k$ .

┘

**Prop. (10.1.4.2) [Smoothness and Geo.Reducedness].** For  $x \in |G|_0$ ,  $G$  is smooth at  $x$  iff it is geo.reduced at  $x$ . ┘

*Proof:* If  $G$  is smooth, then it is geo.regular thus geo.reduced. The converse follows from (10.2.1.9).  
□

**Cor. (10.1.4.3) [Cartier].** If  $\text{char } k = 0$ , then  $G/k$  is smooth. ┘

*Proof:* This is a consequence of (10.1.1.13) and (10.1.4.2). Alternative proof:  $\Omega_{G/k}$  is free, by (10.1.1.12), so it is smooth by (7.6.4.14). □

**Prop. (10.1.4.4) [Reduced Structure].** If  $G_{\text{red}}$  is geo.reduced, then it is a subgroup of  $G$ . This is the case if  $k = k^{\text{perf}}$ . ┘

*Proof:* This is because  $G_{\text{red}} \times G_{\text{red}}$  is reduced so the multiplication factors through  $G_{\text{red}} \times G_{\text{red}}$ . □

**Prop. (10.1.4.5) [Smoothness in Characteristic  $p$ ].** Let  $\text{char } k = p \neq 0$ ,  $k = k^{\text{perf}}$  and let  $G$  be affine, and  $r \geq 0$ . Then the image of the relative Frobenius  $F_{G/k} : G \rightarrow G^{(p^r)}$  is geo.reduced group scheme when  $r$  is sufficiently large. ┘

*Proof:* To show it is a group scheme, notice  $F^r$  is a homomorphism and use homomorphism theorem (10.1.1.28). And It corresponds to

$$\Gamma(G) \otimes_{k, \varphi^r} k \rightarrow \Gamma(G) : a \otimes c \mapsto ca^{p^r}.$$

The image of which is just  $\Gamma(G)^{p^r}$  as  $k$  is perfect. To show it is geo.reduced, we can assume  $k$  is alg.closed, then the nilradical  $N$  of  $\Gamma(G)$  is nilpotent, so some  $N^m = 0$ , and then the image is reduced for any  $p^r > m$ . □

**Prop. (10.1.4.6) [Smoothness and Tangent Space].**  $G/k$  is smooth iff it is regular iff  $\dim_k T_e \leq \dim_e G$ , where  $e$  is the identity element. ┘

*Proof:* By homogeneity and the fact smooth locus is open,  $G$  is smooth iff it is smooth at  $e$ . Now  $e$  is a rational point, by (5.4.5.26),  $G$  is smooth at  $e$  iff it is regular at  $e$ . □

**Prop. (10.1.4.7) [Closed Subgroups and Points].** Let  $S \leq G(k)$  a closed subgroup, then there is a unique reduced closed subgroup  $H$  of  $X$  that  $H(k) = S$ . Moreover,  $H$  is geo.reduced. The algebraic subgroups of  $G$  arising in this way are exactly those that  $H(k)$  is schematically dense in  $H$ .

In particular, if  $k = k^{\text{sep}}$ , then  $H \mapsto H(k)$  is a bijection between closed subgroups of  $G$  and closed subgroups of  $G(k)$ , by (7.4.3.10). ┘

*Proof:* Let  $H$  be a reduced closed subscheme of  $G$  that  $H(k) = S$ , then  $S$  is dense in  $|H|$  and  $H$  is reduced, so by (7.4.3.5) and (7.4.3.8) shows  $S$  is schematically dense in  $H$  and  $H$  is geo.reduced. Therefore  $H \times H$  is reduced and thus multiplication map  $H \times H \rightarrow G$  factors through  $H$ , also does inversion and unit, so  $H$  is a subgroup of  $G$ .

The converse is also true.  $\square$

**Cor. (10.1.4.8) [Zariski Closure].** Let  $S \subset G(k)$  a subgroup, then there is a unique geo.reduced closed subscheme  $H$  of  $G$ , called the Zariski closure of  $S$  in  $G$ , such that  $H(k)$  is the Zariski closure of  $S \leq G(k)$ .  $\lrcorner$

**Prop. (10.1.4.9) [Algebraic Group Scheme is Quasi-Projective].** If  $G \in \mathcal{AlgGrp}/k$ , then  $G$  is quasi-projective.  $\lrcorner$

*Proof:* Cf. [Sta]0BF7?  $\square$

**Prop. (10.1.4.10) [Center Subgroup].** The center  $Z(G)$  of  $G$  is a closed subgroup scheme of  $G$ .  $\lrcorner$

*Proof:* Cf. [Sta]0BF8.  $\square$

**Prop. (10.1.4.11).** Every étale normal subgroup of a connected algebraic group is central.  $\lrcorner$

*Proof:* This is because the automorphism group scheme of an étale group scheme is étale?  $\square$

**Prop. (10.1.4.12) [Identity Components].** Consider the identity component  $G^0$  of  $G$ , then

- It commutes with the formation of identity component commutes with base change of fields. In particular,  $G^0$  is geo.connected.
- $G$  is locally connected (7.4.1.23), thus  $G^0$  is clopen in  $G$ .
- $G^0$  is a characteristic algebraic subgroup of  $G$

$\lrcorner$

*Proof:* 1, 2 follows from (7.4.3.15).

3: By (7.4.3.12),  $G^0 \times G^0$  is connected, thus  $G^0 \times G^0$  is mapped into  $G^0$ , and it is an open subscheme, thus it is an algebraic subgroup of  $G$ .  $\square$

**Cor. (10.1.4.13) [Connected-étale Exact Sequence].** Group structure induces a group structure on the maximal étale subalgebra of  $\Gamma(G)$ , thus  $G \rightarrow \pi_0(G)$  is a group homomorphism (9.3.1.1), which is faithfully flat by (9.3.1.3), and the stabilizer of the identity in  $\pi_0(G)$  is just  $G^0$  by (9.3.1.3) again. Thus  $\pi_0(G) = G/G^0$  by (10.2.1.10).

In fact,

$$1 \rightarrow G^0 \rightarrow G \rightarrow \pi_0(G) \rightarrow 1$$

is the unique exact sequence with  $G^0$  connected and  $\pi_0(G)$  étale.  $\lrcorner$

**Cor. (10.1.4.14).** If  $G \in \mathcal{AlgGrp}/k$  and  $H \leq G$  is a closed subgroup, then  $G/H \rightarrow G/H^0$  is finite smooth, by (10.1.4.13) and (10.1.1.25).  $\lrcorner$

**Prop. (10.1.4.15).** Every connected component of  $G$  is irreducible.  $\lrcorner$

*Proof:* By (10.1.4.12),  $G_k^0$  is connected. To show it is irreducible, it suffices to consider its reduced structure, and in this case it is smooth (Notice in this case  $G_{\text{red}}^0$  is an algebraic group because  $G_{\text{red}}^0 \times G_{\text{red}}^0$  is reduced). Thus no closed point is connected in two irreducible component, thus it is irreducible. Then  $G^0$ , as a quotient space of  $G_k^0$ , is also irreducible.

For another connected component  $H$ , choose a closed point  $h$ , let  $L$  be a finite normal extension of  $k$  containing  $k(h)$ , then each connected component of  $H_L$  maps surjectively onto  $H$ , thus contains one of the finitely many inverse images of  $h$  in  $H_L$ . And they are all rational points, thus isomorphic to  $G_L^0$ , which is irreducible, thus  $H$  is also irreducible.  $\square$

**Cor. (10.1.4.16) [Connected Algebraic Group is Geo.Irreducible].** If  $G$  is connected and qc, then it is geo.irreducible by (10.1.4.12) and (10.1.4.15).  $\lrcorner$

**Cor. (10.1.4.17).** If  $G \in \text{AlgGrp}/k$  is connected, then for any non-empty open subschemes  $U, V$  of  $G$ ,  $U \times V \rightarrow G$  is surjective.  $\lrcorner$

*Proof:* By (7.4.1.29), it suffices to check on closed points. Let  $p$  be a closed point, by base change, we may assume  $x \in G(k)$ , then  $xV^{-1} \cap U \neq \emptyset$  as  $G$  is geo.irreducible (10.1.4.16), thus  $x \in UV$ .  $\square$

**Cor. (10.1.4.18).** Every connected component of  $G$  is algebraic over  $k$ .  $\lrcorner$

*Proof:* For the identity component, take a non-empty affine open subset  $U$ , then  $U^2 = G^0$  by (10.1.4.17), thus  $G^0$  is qc. For the other components, the same proof as that of (10.1.4.15) shows they are also quasi-compact.  $\square$

**Def. (10.1.4.19) [Torsion Component].** Let  $G$  is commutative, then  $G^\tau = \cup_{n>0} [n]^{-1}G^0 \subset G$  is an open group subscheme, called the **torsion component** of  $G$ . Forming  $G^\tau$  commutes with change of fields, and if  $G^\tau$  is quasi-compact, it is a clopen subgroup.  $\lrcorner$

**Prop. (10.1.4.20).** Let  $G$  is commutative, then any algebraic subgroup of  $G$  is contained in  $G^\tau$ . In particular, if  $G^\tau$  is algebraic over  $k$ , then it is the maximal algebraic subgroup of  $G$ .  $\lrcorner$

*Proof:* As  $H$  is qc, it is covered by f.m. translates of  $G^0$ , thus  $G^0$  has finite index in  $G^0H$ , which means  $[n](H) \subset G^0$  for some  $n \in \mathbb{Z}_+$ .  $\square$

**Prop. (10.1.4.21).** Let  $X, Y$  be varieties over a field  $k$  that both have at least one  $K$ -point, and  $X$  is complete. Then any morphism  $X \times Y \rightarrow G$  to a group scheme  $G$  over  $k$  factorizes as  $f(x, y) = g(x)h(y)$ , where  $f : X \rightarrow G$  and  $h : Y \rightarrow G$ .  $\lrcorner$

*Proof:* Fix a  $y_0 \in Y(K)$  and define a morphism  $g : X \rightarrow G : x \mapsto f(x, y_0)$ , then the morphism  $F : X \times Y \rightarrow G : (x, y) \mapsto g(x)^{-1}f(x, y)$  is constant on  $X \times \{y_0\}$ . Then the rigidity lemma (7.12.1.20) and (10.1.1.10) shows  $F(x, y) = h(y)$  where  $h : Y \rightarrow G$  is a morphism. Then we are done.  $\square$

**Cor. (10.1.4.22).** If  $G$  is qc, then any morphism from a  $\mathbb{P}_K^1$  to  $G$  is constant.  $\lrcorner$

*Proof:* Let  $(x_0, x_1)$  be a homogenous coordinate of  $\mathbb{P}^1$ , consider the morphism  $s : \mathbb{P}^1 \times \mathbb{A}^1 \rightarrow \mathbb{P}^1 : (x_0, x_1) \times y \mapsto (x_0, x_0 + x_1y)$ . Let  $f : \mathbb{P}^1 \rightarrow G$  be a morphism, consider the composition

$$\mathbb{P}^1 \times \mathbb{A}^1 \xrightarrow{s} \mathbb{P}^1 \xrightarrow{f} G$$

then by (10.1.4.21),  $f \circ s$  factors as  $f(s(x, y)) = g(x)h(y)$ .

We take  $y = 0$ , then  $s(x, 0) = x$ , and  $g(x) = f(x)h(0)^{-1}$ . Thus  $f(s(x, y)) = f(x)h(0)^{-1}h(y)$ . Next we take  $x = (0, 1)$ , then  $s((0, 1), y) = (0, 1)$ , and  $f((0, 1)) = f((0, 1))h(0)^{-1}h(y)$ . This shows  $h(y) = h(0)$  is constant, thus  $f(s(x, y)) = f(x)$ . Finally, let  $x = (0, 1)$ , then  $s((0, 1), y) = y$ , and  $f(y) = h(0)$  is constant.  $\square$

**Cor. (10.1.4.23).** Let  $U$  be an open subset of  $\mathbb{P}^1$ , then any morphism from  $U$  to a group variety  $G$  is constant. In particular,  $G$  contains no rational curve, and any morphism from a rationally connected variety to  $G$  is constant, in particular  $\mathbb{P}_K^n$ .  $\lrcorner$

*Proof:* Any rational map from  $\mathbb{P}^1$  to  $G$  can be extended to a morphism, by (7.13.1.16), thus it is constant, by the proposition above.  $\square$

**Def. (10.1.4.24) [Anti-Affine Group Schemes].** An **anti-affine algebraic group** over  $k$  is an algebraic group  $G$  over  $k$  s.t.  $\Gamma(G) = k$ . For example, Abelian varieties are anti-affine by (7.12.1.12).  $\lrcorner$

**Prop. (10.1.4.25).** Let  $\varphi : G \rightarrow H$  be a homomorphism of algebraic groups over  $k$  that  $G$  is anti-affine and  $H$  is connected, then  $\varphi$  factors through the center of  $H$  (10.1.4.10).  $\lrcorner$

*Proof:* Cf. [Mil17]P151.  $\square$

**Cor. (10.1.4.26).** If  $G$  is a connected and qc, then every anti-affine algebraic subgroup is contained in the center of  $G$ .  $\lrcorner$

**Cor. (10.1.4.27).** If  $G$  is anti-affine and qc, then it is commutative and connected.  $\lrcorner$

*Proof:*  $G \rightarrow \pi_0(G)$  is surjective but  $\pi_0(G)$  is affine thus this map is trivial, so  $G$  is connected. Then it is also commutative by (10.1.4.26).  $\square$

### Constructing Algebraic Groups

**Prop. (10.1.4.28) [Generated Closed Subgroup].** Let  $\varphi_i : X_i \rightarrow G$  be a family of maps from algebraic schemes  $X$  to an algebraic group over a field  $k$ .

- If  $X_i$  and  $G$  are all affine, then the generated group scheme is representable by an algebraic subgroup  $H$ .
- If  $X_i$  are all geo.reduced. Then the generated group scheme is representable by a smooth subgroup  $H$ .

Moreover, in both cases, if there is only a single map  $\varphi : X \rightarrow G$  and  $X$  is geo.connected, and  $e \in \varphi(X)$ , then  $\langle X, \varphi \rangle$  is geo.connected.  $\lrcorner$

*Proof:* Cf. [Mil17]P54, 55, 56.  $\square$

**Def. (10.1.4.29) [Commutator Subgroups].** If  $G \in \text{AlgGrp}/k$  is affine or smooth, then  $[G, G]$  exists by (10.1.4.28), and:

- $[G, G]$  is the intersection of all normal subgroups  $H$  of  $G$  s.t.  $G/H$  is commutative.
- For a field extension  $k'/k$ ,  $[G_{k'}, G_{k'}] = [G, G]_{k'}$ .
- If  $G$  is connected/smooth, then  $[G, G]$  is also connected/smooth.
- If  $G$  is an affine smooth connected group scheme, then  $[G, G]$  is the unique smooth connected subgroup scheme that satisfies  $[G, G](\bar{k}) = [G(\bar{k}), G(\bar{k})]$ .  $\lrcorner$

*Proof:* 1: Cf. [Mil17]P129.

2: This is formal.

3: This follows from (10.1.4.28).

4: Cf. [Mil17]P130.  $\square$

**Cor. (10.1.4.30).** If  $G \in \mathcal{AlgGrp}/k$ , the derived series and central derived series of  $G$  (10.1.1.4) exist. And  $G$  is solvable (resp. nilpotent) iff  $G^{(n)} = e$  (resp.  $G^n = e$ ) for some  $n \in \mathbb{N}$ .  $\lrcorner$

**Def. (10.1.4.31) [Transporter].** Let  $G \times X \rightarrow X$  be an action of an algebraic group on a scheme, and  $Y, Z$  be subschemes of  $X$ ,  $Z$  is a closed subscheme and  $Y$  is an algebraic scheme, then the functor

$$R \mapsto \{g \in G(R) \mid gY_R \subset Z_R\}$$

is represented by a closed subscheme of  $G$ , called the **transporter**  $T_G(Y, Z)$ .  $\lrcorner$

*Proof:*  $T_G(Y, Z)$  is in fact the sheaf  $\mathcal{H}om(Y, Z) \times_{\mathcal{H}om(Y, X)} G$ , and notice  $\mathcal{H}om(Y, Z) \rightarrow \mathcal{H}om(Y, X)$  is a closed subfunctor (10.8.1.3), thus  $T_G(Y, Z)$  is a closed subfunctor of  $G$ , thus represented by a closed subscheme of  $G$ .  $\square$

**Cor. (10.1.4.32).** Let  $G \times X \rightarrow X$  be an action of an algebraic group on a scheme, and  $Y, Z$  be closed subschemes of  $X$ , then the functor

$$R \mapsto \{g \in G(R) \mid gY_R = Z_R\}$$

is represented by a closed subscheme of  $G$ .  $\lrcorner$

*Proof:* In this case, the functor is represented by the closed subscheme  $T_G(Y, Z) \cap \text{inv}(T_G(Z, Y))$ .  $\square$

**Cor. (10.1.4.33) [Stablizer].** Let  $G \times X \rightarrow X$  be an action of an algebraic group on a scheme, and  $Y$  be closed subschemes of  $X$ , then the functor

$$\text{Stab}_G(Y) : R \mapsto \{g \in G(R) \mid gY_R = Y_R\}$$

is represented by a closed subscheme of  $G$ , called the **stablizer subgroup of  $Y$** .  $\lrcorner$

**Def. (10.1.4.34) [Normalizer].**  $\lrcorner$

**Def. (10.1.4.35) [Centralizer].**  $\lrcorner$

### Group Varieties

**Def. (10.1.4.36) [Group Varieties].** A **group variety** over  $k$  is a  $k$ -variety (7.12.1.3) that is also a group scheme.

The category of group varieties over  $k$  is denoted by  $\text{GrpVar}/k$ .  $\lrcorner$

**Prop. (10.1.4.37) [Group Varieties are Smooth].** Any  $X \in \text{GrpVar}/k$  is smooth by (10.1.4.2). Conversely, any smooth connected algebraic group over  $k$  is a group variety, by (10.1.4.2)(10.1.4.16) and (10.1.1.10).  $\lrcorner$

**Prop. (10.1.4.38) [Tangent Bundle Trivial].** For  $G \in \text{GrpVar}/k$ ,  $T_{X,e}$  is the tangent space at  $e$ , then there is a natural isomorphism  $\Omega_{X/k} \cong T_{X,e}^* \otimes \mathcal{O}_X$ . Also true for  $\mathcal{T}_X$  (because  $\Omega_{X/k}$  is locally free as  $X$  is smooth (10.1.4.37)(7.12.1.14)).  $\lrcorner$

*Proof:* There should be another proof using relation in (7.5.5.14)?.

Use a dual number characterization of tangent spaces and tangent vector fields (7.6.4.21)(7.12.1.15), then notice a tangent vector  $\tau \in T_{X,e}$  is a  $S = k[\varepsilon]$ -point of  $X$ , then right translation gives a translation  $X_S \rightarrow X_S$  that is invariant on  $X$ , which gives a tangent vector on  $X$ .

So there is a map  $T_{X,e} \otimes \mathcal{O}_X \rightarrow \Omega_{X/k}$ . To check isomorphism, both are locally free of the same rank, so it suffices to show it is surjective. But on closed pts, pass to Nakayama, this is clearly true, so it is surjective by (7.12.1.13).  $\square$

**Prop. (10.1.4.39) [Dimension Theorem].** Let  $\varphi : G \rightarrow H$  be a surjective homomorphism of group varieties, then

$$\dim(G) = \dim(H) + \dim(\ker(\varphi)).$$

┘

*Proof:* This is a consequence of (7.6.3.19), as the fiber over any closed pt is isomorphic to a field base change of  $\ker(\varphi)$ .  $\square$

**Prop. (10.1.4.40).** Every binational homomorphism of a connected affine group varieties is an isomorphism.  $\square$

*Proof:* Such an isomorphism induces a homomorphism  $A \rightarrow B$  of integral Hopf algebras that is an isomorphism on the fraction field, then it is an isomorphism by (3.11.4.22).  $\square$

**Def. (10.1.4.41) [Quasi-Central Homomorphisms].** A **quasi-central homomorphism**  $\varphi : G' \rightarrow G$  of group varieties over  $k$  is a homomorphism the kernel of  $\varphi(\bar{k})$  is central in  $G'(\bar{k})$ .  $\square$

**Prop. (10.1.4.42).** If a homomorphism of group varieties  $\varphi : G' \rightarrow G$  is quasi-central and the kernel of  $\text{Lie}(\varphi)$  is central, then  $\ker(\varphi) \subset Z(G')$ .  $\square$

*Proof:* Cf. [Bruhat-Tits, 2.1].  $\square$

**Prop. (10.1.4.43) [1-Dimensional Group Varieties].** Suppose  $k = \bar{k}$  and  $G$  is a group variety of dimension 1, then either  $G \cong \mathbb{G}_a$ ,  $\mathbb{G}_m$  or an elliptic curve.  $\square$

*Proof:* Cf. [Sil99].  $\square$

## 5 Homomorphisms

**Notation (10.1.5.1).**

- Let  $G \in \text{AlgGrp}/k$ .

┘

**Prop. (10.1.5.2) [Connected-Étale Sequence].** Cf. [Mil17]P114, [Finite Flat Group Schemes, Tate]Section3.7 and [?Mil17b]P117.  $\square$

**Prop. (10.1.5.3) [Algebraic Subgroups are Closed].** Any algebraic subgroup  $H \leq G$  is a closed subgroup. In particular, an algebraic subgroup of an affine algebraic group is affine.

WARNING:  $H$  must first be an algebraic group, so we can use Chevalley theorem to show it is locally closed.  $\square$

*Proof:* As  $H_{k'} \rightarrow H$  is a quotient map (7.4.7.3), we can assume  $k$  is alg.closed, and also assume  $H, G$  are reduced. Now Chevalley shows that the image is a constructible set of  $G$ . Then we can consider all on the level of  $\bar{k}$  points, because  $G$  is Jacobson. Then  $H$  contains an open subset of  $\bar{H}$  by (4.12.2.18), which implies  $H(\bar{k})$  is open in  $\bar{H} \cap G(\bar{k})$ . Now  $\bar{H} \cap G(\bar{k})$  is the closure of  $H(\bar{k})$  in  $G(\bar{k})$ , thus it is also a subgroup of  $G(\bar{k})$ , and we can consider the coset of  $H(\bar{k})$  in  $\bar{H} \cap G(\bar{k})$ .  $H$  is open in  $\bar{H}$ , and  $\bar{H}$  is compact, and also  $\bar{H} \cap G(\bar{k})$  is compact because  $G$  is Jacobson, so there are only f.m. coset, thus  $H(\bar{k})$  is also closed in  $\bar{H} \cap G(\bar{k})$ , thus  $H$  is also closed in  $\bar{H}$ , so  $H = \bar{H}$ . ? Cf. [Mil17]P19.  $\square$

**Prop. (10.1.5.4) [Characterizing Quotient Maps].** The following conditions on a homomorphism  $\varphi : G \rightarrow Q \in \text{AlgGrp}/k$  are equivalent:

- $\varphi$  is faithful flat.
- $\varphi$  is a quotient map (10.1.1.4).
- The homomorphism  $\mathcal{O}_Q \rightarrow \varphi_* \mathcal{O}_G$  is injective.

┘

*Proof:*  $1 \rightarrow 2$  follows from the very definition of fat subfunctors, as f.f. map is a fppf cover. Cf. [Mil17]P109. ?  $\square$

**Cor. (10.1.5.5) [Surjective Map between Group Varieties].** Let  $\varphi : G \rightarrow H \in \text{AlgGrp}/k$  is surjective and  $H$  is reduced, then  $\varphi$  is a quotient map. In particular, a surjective map between group varieties are quotient maps.  $\square$

*Proof:* The hypothesis implies  $G(\bar{k})$  acts transitively on  $H(\bar{k})$ , thus  $\varphi$  is faithfully flat by (10.2.1.4).  $\square$

**Prop. (10.1.5.6) [Check Quotient Map on Closed Points].** Let  $\varphi : G \rightarrow H \in \text{AlgGrp}/k$ . If  $\varphi$  is a quotient map, then  $\varphi : G(\bar{k}) \rightarrow H(\bar{k})$  is surjective. The converse is also true if  $H$  is reduced.

In particular, if  $\mathbf{1} \rightarrow N \rightarrow G \rightarrow H \rightarrow \mathbf{1} \in \text{AlgGrp}/k$  is an exact sequence, then  $\mathbf{1} \rightarrow N(\bar{k}) \rightarrow G(\bar{k}) \rightarrow H(\bar{k}) \rightarrow \mathbf{1}$  is exact. Moreover, if  $N$  is smooth, then  $\varphi : G(k^{\text{sep}}) \rightarrow H(k^{\text{sep}})$  is also surjective, and

$$H(k) = \{gN(k^{\text{sep}}) \in G(k^{\text{sep}})/N(k^{\text{sep}}), \sigma(g)g^{-1} \in N(k^{\text{sep}}) \forall \sigma \in \text{Gal}_k\}.$$

┘

*Proof:* This follows from (10.1.1.26). For the converse, notice the image of  $\varphi$  has the same  $\bar{k}$ -points as  $H$ , thus it equals  $H$  as  $H$  is reduced and locally algebraic.  $\square$

**Prop. (10.1.5.7) [Characterizing Monomorphisms].** For a homomorphism  $\varphi : G \rightarrow H$  of algebraic groups over  $k$ , the following are equivalent:

- $\varphi$  is a monomorphism.
- $\ker(\varphi) = e$  (10.1.1.4).
- $\varphi$  is a monomorphism in the category of algebraic groups over  $k$ .
- $\varphi$  is a monomorphism in the category of algebraic schemes over  $k$ .

Moreover, a monomorphism is just a closed embedding.  $\square$

*Proof:*  $1 \rightarrow 4 \rightarrow 3$  is obvious.

$3 \rightarrow 2$ : the composition of  $\ker(\varphi) \rightarrow G$  with  $\varphi$  is trivial, thus  $\ker(\varphi)$  is trivial.

2  $\iff$  1: This follows from the definition of  $\ker(\varphi)$ (10.1.1.4).

For the last assertion, if  $\varphi$  is a closed embedding, then it is a monomorphism in the category of algebraic schemes over  $k$ (7.4.5.23). Conversely, if  $\varphi$  is a monomorphism, consider the quotient space  $G \rightarrow G/H$ (10.1.1.19), then by(10.1.1.24),  $H$  is the fiber over  $o \in G/H$ , thus a closed subscheme.  $\square$

**Def. (10.1.5.8) [Embeddings].** Following(10.1.5.7), define an **embedding of algebraic groups** to be a closed immersion of algebraic groups.  $\lrcorner$

**Def. (10.1.5.9) [Almost-Direct Products].**  $G$  is called an **almost-direct product** of f.m.  $G_1, \dots, G_n \in \text{AlgGrp}/k$  if there is a quotient map(10.1.5.4)

$$G_1 \times \dots \times G_n \rightarrow G \rightarrow 1$$

with finite kernel.  $\lrcorner$

### Isogenies

**Def. (10.1.5.10) [Finite-Index Subgroups].** An algebraic subgroup  $H \leq G$  is said to have **finite index** if the quotient  $G/H \in \text{AlgGrp}/k$  is a finite scheme.  $\lrcorner$

**Prop. (10.1.5.11).** The identity component  $G^0$  is of finite index in  $G$ (10.1.5.10).  $\lrcorner$

*Proof:* Notice an algebraic group  $H$  is finite iff  $\#H(\bar{k}) < \infty$ . And  $(G/G^0)(\bar{k}) = G(\bar{k})/G^0(\bar{k})$ (10.1.4.12) is finite as  $G$  is compact.  $\square$

**Def. (10.1.5.12) [Isogeny].** An **isogeny of algebraic groups** is a homomorphism  $f : G \rightarrow H \in \text{AlgGrp}/k$  s.t.  $\ker(f)$  is finite and  $\text{Im}(f) \leq H$  is of finite index(10.1.5.10).

When  $\text{char } k > 0$ , a **Frobenius-isogeny** is an isogeny s.t. the kernel equals the kernel of some power of the Frobenius map.

Any isogeny is a finite morphism by(10.1.1.25).  $\lrcorner$

**Def. (10.1.5.13) [Strongly Connected Groups].**  $G$  is called a **strongly connected group** if it has no non-trivial subgroup of finite index.  $\lrcorner$

**Def. (10.1.5.14) [Strongly Identity Components].** The **strongly identity component**  $G^{s0}$  of an algebraic group  $G$  is defined to be the intersection of the algebraic subgroups of finite index. Thus it is a characteristic subgroup of  $G$ .  $\lrcorner$

**Prop. (10.1.5.15).**  $G/G^{s0}$  is a finite scheme. In particular,  $G^{s0}$  is the smallest algebraic subgroup having the same dimension as  $G$ .  $\lrcorner$

*Proof:* As  $G$  is Noetherian,  $G^{s0} = H_1 \cap \dots \cap H_r$  for  $G/H_i$  finite schemes. Thus  $G/G^{s0} \hookrightarrow H_1 \cap \dots \cap H_r$  is a finite scheme.  $\square$

**Prop. (10.1.5.16) [Strongly Identity Components and Identity Components].**  $G^{s0}$  is connected, and the converse is true if  $G$  is smooth. In fact, if  $G$  is smooth,  $G^{s0} = G^0$ .

In particular, a group variety has no non-trivial algebraic subgroup of finite index. Thus an isogeny to a group varieties is surjective(thus a quotient map by(10.1.1.30)).  $\lrcorner$

*Proof:*  $G^{s0}$  is connected because the identity component is of finite index(10.1.5.11). Conversely,  $G^0/G^{s0}$  is smooth and connected and finite(10.1.5.33), thus it is a group variety of dimension 0, which is trivial.  $\square$

**Prop. (10.1.5.17).** If  $k = k^{\text{perf}}$  and  $G \in \mathcal{A}lgGrp/k$ , then  $G_{\text{red}}^0 = G^{s0}$ . ┘

*Proof:* Cf. [Mil17]P122. □

**Def. (10.1.5.18) [Isogenies].** A **central isogeny**(resp. **multiplicative Isogeny**) is an isogeny(10.1.5.12) that the kernel is central(resp. of multiplicative type). ┘

**Prop. (10.1.5.19).** Any isogeny with kernel order prime to the characteristic has étale kernel by(10.1.2.5), thus it is central, by(10.1.4.11). ┘

**Prop. (10.1.5.20) [Multiplicative Isogenies are Central].** Every multiplicative isogeny from a connected algebraic group is central, by(10.2.3.27). ┘

**Def. (10.1.5.21).** A composition of multiplicative isogenies is a multiplicative isogeny. ┘

*Proof:* This is because there is an exact sequence  $e \rightarrow \ker(\varphi_1) \rightarrow \ker(\varphi_2 \circ \varphi_1) \rightarrow \ker(\varphi_2) \rightarrow e$ , thus  $\ker(\varphi_2 \circ \varphi_1)$  is central by(10.2.3.30), hence of multiplicative type by(10.2.3.19). □

**Prop. (10.1.5.22) [Isogenies between Group Varieties].** Let  $\varphi : G \rightarrow H$  be a surjective homomorphism of group varieties, then  $\varphi$  is flat. And if  $\dim G = \dim H$ , then  $\varphi$  is finite, and the rank of  $\ker(\varphi)$  equals the separable degree of  $K(G)/K(H)$ . ┘

*Proof:*  $\varphi$  is flat by(10.2.1.4). By(7.12.3.5), there exists a dense open subscheme  $U'$  s.t.  $\varphi^{-1}(U') \rightarrow U'$  is finite, thus by homogeneity,  $\varphi$  is finite, and rank of  $\ker(\varphi)$  is  $[K(G) : K(H)]_s$ . □

### Subnormal Series

**Prop. (10.1.5.23) [Solvability].** If  $G$  is either affine or smooth, then  $G$  is solvable iff  $G^{(n)} = e$  for some  $n \in \mathbb{Z}_+$ (10.1.1.4). In particular, for  $k'/k \in \mathbf{Field}$ ,  $G$  is solvable iff  $G_{k'}$  is solvable. ┘

**Prop. (10.1.5.24) [Nilpotency].** If  $G$  is either affine or smooth, then  $G$  is nilpotent iff  $G^n = e$  for some  $n \in \mathbb{Z}_+$ (10.1.1.4). In particular, for  $k'/k \in \mathbf{Field}$ ,  $G$  is nilpotent iff  $G_{k'}$  is nilpotent.

In particular, if  $G$  is a nilpotent and geo.connected, then it contains a non-trivial geo.connected subgroup scheme in its center, by(10.1.4.29). ┘

**Prop. (10.1.5.25).** A split solvable algebraic group  $G$  is an affine group variety, by(10.1.5.33). ┘

**Lemma (10.1.5.26).** If  $G = G_0 \triangleright G_1 \triangleright \dots \triangleright G_s = e$  is a subnormal series and  $\dim G = \dim G_i/G_{i+1}$  for some  $i$ , then  $G \sim G_i/G_{i+1}$ . ┘

*Proof:* The maps  $G_i \rightarrow G_i/G_{i+1}$  and  $G_i \rightarrow G_{i-1} \rightarrow \dots \rightarrow G_0 = G$  are isogenies(10.1.5.12). □

**Def. (10.1.5.27) [Composition Series].** A **composition series** of  $G$  is defined to be a maximal object among the subnormal series

$$G = G_0 \triangleright G_1 \triangleright \dots \triangleright G_s = e$$

that satisfies  $\dim G_0 > \dim G_1 > \dots > \dim G_s$ . ┘

**Prop. (10.1.5.28).** Any two composition series of an algebraic group  $G$  has refinements that the quotients are isogenous. ┘

**Cor. (10.1.5.29) [Jordan-Holder].** ┘

**Example (10.1.5.30) [Unip( $n$ ) is Nilpotent].**  $\text{Unip}(n)$  has a central normal series of length  $\frac{n(n-1)}{2}$  s.t. each subquotient is isomorphic to  $\mathbb{G}_a$ , Cf. [Mil17]P136. ┘

**Maximal Subgroups with Properties****Notation(10.1.5.31).**

- Let  $G \in \text{AlgGrp}/k$ .

┘

**Def.(10.1.5.32)[Good Properties].** A property of algebraic groups over fields is called a **good property(algebraic groups)** s.t.

- $e_k$  has  $\mathcal{P}$ .
- Every extension of algebraic groups over  $k$  with property  $\mathcal{P}$  has  $\mathcal{P}$ .
- Every quotient of a algebraic group over  $k$  with property  $\mathcal{P}$  has  $\mathcal{P}$ .

┘

**Prop.(10.1.5.33)[List of Good Properties].** The following are group properties for algebraic groups over fields(10.1.5.32):

1. Strongly connectedness.
2. Solvability. Moreover, subgroups of solvable groups are solvable.
3. Smoothness.
4. Affineness. Moreover, subgroups of affine groups are affine.
5. Connectedness.
6. Finiteness. Moreover, subgroups of finite groups are finite.
7. Unipotency. Moreover, subgroups of unipotent groups are unipotent.
8. Being a group variety.

┘

*Proof:*

1. This follows from the isomorphism and correspondence theorems(10.1.1.32)(10.1.1.33).
2. This follows from standard argument and correspondence theorems(10.1.1.32)(10.1.1.33).
3. Let  $e \rightarrow N \rightarrow G \rightarrow H \rightarrow e$  be an exact sequence of algebraic groups, then if  $G$  is smooth, then so is  $H$  by(10.2.1.9) and the fact  $G/H$  is geo.reduced by(7.1.5.28) and(10.1.5.4). If  $N, H$  are smooth, then so is  $G$  by the fact smoothness is stalkwise.
4. Notice by(10.1.1.23) and(7.1.5.29).  $G \rightarrow Q$  is affine.
5. Let  $e \rightarrow N \rightarrow G \rightarrow H \rightarrow e$  be an exact sequence of algebraic groups. If  $N$  is connected, then  $G \rightarrow \pi_0(G)$  is trivial on  $N$  thus factors through  $H$ , and hence through  $\pi_0(H)$ , which is trivial if  $H$  is connected, so in this case  $G$  is connected. And if  $G$  is connected, the surjective homomorphism  $G \rightarrow H \rightarrow \pi_0(H)$  factors through  $\pi_0(G)$ , so  $\pi_0(H) = 1$ .
6. This follows from(10.1.1.27).
7. This follows from(10.3.4.5).
8. This follows from(10.1.4.37).

□

**Prop.(10.1.5.34) [Maximal Group Varieties Exist].** If  $\mathcal{P}$  is a good property of algebraic groups(10.1.5.32), then  $G$  contains a largest normal subgroup variety  $H \leq G$  with property  $\mathcal{P}$ . And also  $G/H$  has contains no non-trivial such subgroups.

┘

*Proof:*  $G$  contains at least one normal subgroup variety, namely  $e$ . There exists a maximal such one, by taking the one with maximal dimension (because smooth varieties are reduced), then it is the largest, because if  $H'$  is another, then  $HH'$  is a larger one, by (10.1.5.33) and the fact  $NH$  is a quotient of  $N \rtimes H$ .

And if  $G/H$  contains a normal subgroup variety  $H'$  that has  $P$ , then the inverse image of  $H'$  in  $G$  is also a normal subgroup variety that has  $P$ , contradiction.  $\square$

## 10.2 Group Schemes II: Solvable Groups

References are [Mil17].

**Notation(10.2.0.1).**

- Let  $k \in \mathbf{Field}$ .
- Let  $R \in \mathbf{CRing}$ .
- Use notations on group schemes defined in [Group Schemes I: Structure Theory](#).

┘

### 1 Group Actions

**Remark(10.2.1.1).** Group action of an group functor on an object is defined in [\(4.1.1.68\)](#).

┘

**Prop.(10.2.1.2)[Group Action].** An action of a group scheme  $G \in \mathbf{GrpSch}$  on a scheme  $X \in \mathbf{Sch}$  is equivalent to a right  $\Gamma(G)$ -comodule structure on  $\Gamma(X)$  as  $\Gamma(G)$ -modules. This action will induce a right comodule structure on  $\Gamma(X)$ .

The action of  $G$  on itself is called the **regular action** of  $G$ .

┘

**Prop.(10.2.1.3).** Let  $\mu : G \times X \rightarrow X$  be an action of an group scheme  $G$  on a scheme  $X$ , then it is faithfully flat, and it is called a smooth/finite/...action if  $\mu$  is smooth/finite/..

┘

*Proof:* We can see this from the commutative diagram [\(4.1.1.69\)](#).

□

**Prop.(10.2.1.4)[Images of Equivariant Maps].** Let  $G$  be a group functor and  $X, Y$  be non-empty algebraic schemes on which  $G$  acts, and  $f : X \rightarrow Y$  is an equivariant map.

- If  $Y$  is reduced and  $G(\bar{k})$  acts transitively on  $Y(\bar{k})$ , then  $f$  is faithfully flat.
- If  $G(\bar{k})$  acts transitively on  $X(\bar{k})$ , then the set  $f(|X|)$  is locally closed in  $|Y|$ , so we can let  $f(X)_{\text{red}}$  denote its reduced subscheme structure [\(7.4.1.14\)](#).
- If  $X$  is reduced and  $G(\bar{k})$  acts transitively on  $X(\bar{k})$ , then  $f$  factors into

$$X \xrightarrow{\text{faithfully flat}} f(X)_{\text{red}} \xrightarrow{\text{immersion}} Y.$$

Moreover,  $f(X)_{\text{red}}$  is stable under the action of  $G$ .

┘

*Proof:* Cf. [\[Mil17\]P26](#). ?

1:

2:

3:  $f$  factors through  $f(X)_{\text{red}}$  because  $X$  is reduced [\(7.4.1.14\)](#). Then the first assertion follows from 1 and 2. The last assertion follows from universal property again. □

**Def.(10.2.1.5)[Orbit Maps].** Let  $\mu : G \times X \rightarrow X$  be an action of  $G \in \mathbf{AlgGrp}/k$  on  $X \in \mathbf{Sch}^{\text{ft}}/k$ . For any  $x \in X(k)$ , the **orbit map**

$$\mu_x : G \rightarrow X : g \mapsto gx$$

is defined to be the restriction to  $\mu$  to  $G \times \{x\} \cong G$ . The image of the orbit map is locally closed in  $X$  by [\(10.2.1.4\)](#), and then its reduced structure subscheme is called the **orbit scheme**  $O(x)$  of  $x$ . ┘

**Prop. (10.2.1.6) [Fixed Subscheme].** Let  $\mu : G \times X \rightarrow X$  be an action of a group functor  $G$  on a separated algebraic scheme over  $k$ , then the functor

$$\tilde{X}^G : R \mapsto \{x \in X(R) \mid \mu(g, x_{R'}) = x_{R'}, \forall R - \text{algebra } R', g \in G(R')\}$$

is representable by a closed subscheme  $X^G$  of  $X$ , called the **fixed subscheme** of this action. Then it can be seen directly that the formation of fixed subscheme commutes with extension of base fields.  $\perp$

*Proof:* An element  $x \in X(R)$  defines two functors

$$G(R') \rightarrow X(R') : g \mapsto gx_{R'}$$

$$G(R') \rightarrow X(R') : g \mapsto x_{R'}$$

which are both natural in  $R'$ . Thus we get a map  $X(R) \rightarrow \text{Hom}(G_R, X_R \times X_R)$  which is also natural in  $R$ , thus induce a map  $X \mapsto \text{Hom}(G, X \times X)$ .

Then there is a Cartesian diagram

$$\begin{array}{ccc} \tilde{X}^G & \longrightarrow & \text{Hom}(G, \Delta_X) \\ \downarrow & & \downarrow \text{closed} \\ \tilde{X} & \longrightarrow & \text{Hom}(G, X \times X) \end{array} \quad .$$

The right vertical map is a closed subfunctor by (10.8.1.10), as  $\Delta_X$  is closed in  $X \times X$  because  $X$  is separated. Hence  $\tilde{X}^G$  is a closed subfunctor of  $\tilde{X}$ , thus represented by a closed subscheme of  $X$ , by (10.8.1.3).  $\square$

**Prop. (10.2.1.7) [Orbit Map is Faithfully Flat and Smooth].** Let  $\mu : G \times X \rightarrow X$  be an action of an algebraic group  $G$  on an algebraic scheme  $X$  and  $x \in X(k)$ .

- If  $X$  is reduced and  $G(\bar{k})$  acts transitively on  $X(\bar{k})$ , then the orbit map  $\mu_x : G \rightarrow X$  is faithfully flat.
- If  $G$  is reduced, then  $O_x$  is stable under  $G$ , and the map  $\mu_x : G \rightarrow O_x$  is faithfully flat. If  $G$  is smooth, then  $O_x$  is also smooth.

$\perp$

*Proof:* 1: this follows from (10.2.1.4).

2: The first statement follows from (10.2.1.4)3, and then  $\mathcal{O}_{O_x} \rightarrow \mu_{x*}(\mathcal{O}_G)$  is universally injective. Therefore if  $G$  is smooth, then  $\mathcal{O}_{O_x}$  is geometrically reduced. Then  $O_x$  is smooth by (10.2.1.9).  $\square$

**Def. (10.2.1.8) [Homogenous Space].** A non-empty algebraic scheme  $X$  with an action of a group scheme  $G$  is called a **homogeneous space** for  $G$  if  $G(\bar{k})$  acts transitively on  $X(\bar{k})$ , and for any (some)  $x \in X(\bar{k})$ ,  $\mu_x$  is faithfully flat (thus surjective).  $\perp$

**Prop. (10.2.1.9) [Smoothness for Homogenous Spaces].** If  $G$  is a group scheme and  $X$  is a generically geo.reduced  $G$ -homogeneous space, then  $X$  is smooth.  $\perp$

*Proof:* By (7.6.4.20), it has an open dense smooth locus. Now smoothness can be checked after base change to alg.closed field (5.4.2.1), but then because  $G(\bar{k})$  acts transitively on itself, thus all the geometric points are smooth. But geometric points are dense in  $G$  (7.4.1.26), thus  $G$  is smooth.  $\square$

### Orbits

**Prop. (10.2.1.10) [Homogenous Space as Quotient Spaces].** Let  $G \in \mathcal{AlgGrp}/k$  acts on  $X \in \mathcal{Sch}^{\text{ft,sep}}/k$  with a rational point  $x \in X(k)$ , then  $X \cong G/G_x$  iff the orbit map  $\mu_x : G \rightarrow X$  is faithfully flat.  $\square$

*Proof:* If  $(X, x)$  is a quotient space, then by (10.1.1.20),  $\mu_x$  is faithfully flat. Conversely, if it is faithfully flat, then clearly  $\mu_x(\tilde{G})$  is a fat subfunctor of  $\tilde{X}$ , thus  $X$  represents the quotient functor  $\tilde{G}/\tilde{G}_x$ .  $\square$

**Cor. (10.2.1.11).** If  $G \in \mathcal{AlgGrp}_{\text{red}}/k$  and  $\mu : G \times X \rightarrow X$  is an action of  $G$  on a  $X \in \mathcal{Sch}^{\text{ft,sep}}/k$  with a rational point  $x \in X(k)$ , then  $O(x) \cong G/G_x$ .  $\square$

*Proof:* Because  $G$  is reduced,  $\mu_x : G \rightarrow O(x)$  is faithfully flat by (10.2.1.7), and  $O(x)$  is stable under the action of  $G$  by (10.2.1.4), thus (10.2.1.10) applies to this case.  $\square$

**Prop. (10.2.1.12) [Orbit Map are Immersions].** If  $G \in \mathcal{AlgGrp}^{\text{sm}}/k$  acts on  $X \in \mathcal{Sch}^{\text{ft,sep}}/k$ , then for any  $x \in X(k)$ ,  $G/G_x \rightarrow X$  is an immersion.  $\square$

*Proof:* Cf. [Mil17]P143.  $\square$

**Prop. (10.2.1.13).** Let  $G \in \mathcal{AlgGrp}^{\text{sm}}/k$  acts on  $X \in \mathcal{Sch}^{\text{ft,sep}}/k$ , then:

- A reduced closed subscheme  $Y \subset X$  is stable under  $G$  iff  $\bar{Y}$  is stable under  $G(\bar{k})$ .
- Let  $Y$  be a locally closed subscheme of  $X$ , then if  $Y$  is stable under  $G$ , then  $(\bar{Y})_{\text{red}}$  and  $(\bar{Y}_{\bar{k}} \setminus Y)_{\text{red}}$  is also stable under  $G$ .

$\square$

*Proof:* 1: Because  $G$  is geo.reduced and  $Y$  is reduced,  $G \times Y$  is reduced (7.4.3.2), thus  $\mu : G \times Y \rightarrow X$  factors through  $Y$  iff  $\mu(\bar{k})$  factors through  $Y(\bar{k})$ .

2:  $|\bar{Y}|_{\text{red}}(\bar{k})$  is the closure of  $Y(\bar{k})$  in  $X(\bar{k})$ . So as  $G(\bar{k})$  acts continuously on  $X(\bar{k})$ , if it fixes  $Y(\bar{k})$ , then it also fixes  $(\bar{Y})(\bar{k})$  and  $(\bar{Y} \setminus Y)(\bar{k})$ , thus we finish by item1.  $\square$

**Cor. (10.2.1.14) [Orbits of Smallest Dimension are Closed].** Let  $G \in \mathcal{AlgGrp}^{\text{sm}}/k$  acts on  $X \in \mathcal{Sch}^{\text{ft,sep}}/k$ , and let  $Y \subset X$  be a non-empty locally closed subscheme stable under the action of  $G$  of the smallest dimension, then it is closed.  $\square$

*Proof:* This is because  $\dim Y > \dim(\bar{Y} \setminus Y)_{\text{red}}$  (Because irreducible components of  $\bar{Y}$  is not contained in  $\bar{Y} \setminus Y$ ).  $\square$

**Cor. (10.2.1.15) [Orbit Lemma, Borel].** Let  $k = \bar{k}$  and  $G \in \mathcal{AlgGrp}^{\text{sm}}/k$  acts on  $X \in \mathcal{Sch}^{\text{ft,sep}}/k$ , then every orbit of minimal dimension is closed.  $\square$

*Proof:* If  $Y$  is an orbit of minimal dimension, then  $(\bar{Y} \setminus Y)_{\text{red}}$  is stable under  $G$  and has smaller dimensions. If it is non-zero, then it contains an orbit.  $\square$

**Def. (10.2.1.16) [G-Orbits].** Let  $G \in \mathcal{AlgGrp}^{\text{sm}}/k$  acts on  $X \in \mathcal{Sch}^{\text{ft,sep}}/k$ , then a reduced subscheme  $O \leq X$  is called an  $G$ -orbit of  $X$  if  $(O_{\bar{k}})_{\text{red}} = O_{\gamma}$  for some  $\gamma \in X(\bar{k})$ .  $\square$

**Prop. (10.2.1.17) [Galois Theory of Orbits].** Situation as in (10.2.1.16), there is a bijection between the set of  $G$ -orbits in  $X$  and the set of  $\text{Aut}_k(\bar{k})$ -stable  $G(\bar{k})$ -orbits in  $X(\bar{k})$ .  $\square$

*Proof:* Cf. [Getz]P437.  $\square$

**Def. (10.2.1.18) [Relatively Semisimple and Relatively Regular Elements].** Situation as in (10.2.1.16),  $\gamma \in X(k)$  is called a **relatively semisimple element** if  $O(\gamma) \subset X$  is closed. And  $\gamma \in X(k)$  is called a **relatively regular element** if the dimension of  $O(\gamma) \subset X$  is maximal among all  $\gamma \in X(\bar{k})$ .  $\lrcorner$

**Prop. (10.2.1.19) [Semisimple Elements in Conjugation Actions].** If  $k = k^{\text{perf}}$  and  $G \in \text{RedGrp}/k$ , then under the conjugate action of  $G$  on itself,  $\gamma \in G(k)$  is relatively semisimple (resp. relatively regular) iff  $x$  is semisimple (resp. regular in the sense of [Steinberg. Regular elements of semisimple algebraic groups]).  $\lrcorner$

*Proof:* ? [Steinberg, Regular elements of semisimple algebraic groups] Prop 6.13.  $\square$

**Prop. (10.2.1.20) [Stabilizers are Reductive].** Situation as in (10.2.1.16), if  $G^0 \in \text{RedGrp}/k$  and  $\gamma \in X(k)$ , then  $O(\gamma)$  is affine iff  $(G_\gamma)^0 \in \text{RedGrp}/k$ . In particular, if  $X$  is affine, then for any relatively semisimple element  $\gamma \in X(k)$  (10.2.1.18),  $(G_\gamma)^0 \in \text{RedGrp}/k$ .  $\lrcorner$

*Proof:* Cf. [Getz] P438. ?  $\square$

### Linear Actions

**Prop. (10.2.1.21).** For  $G \in \text{linAlgGrp}/k$ , any  $(V, \rho) \in \text{Rep}(G)$  induces an action of  $G$  on  $\underline{V}$ , and also an action of  $G$  on the projective algebraic scheme  $\mathbb{P}(V)$ .  $\lrcorner$

**Prop. (10.2.1.22).** Let  $G \times X \rightarrow X$  be an action of  $G \in \text{linAlgGrp}/k$  on an  $X \in \text{Aff}^{\text{ft}}/k$  over  $k$ , then there exists  $V \in \text{Rep}^{\text{fd}}(G)$  and an equivariant closed embedding  $X \hookrightarrow \underline{V}$ .  $\lrcorner$

*Proof:* Cf. [Mil17b] P145.  $\square$

**Def. (10.2.1.23) [Linear Action].** An action of  $G \in \text{AlgGrp}/k$  on  $X \in \text{Sch}^{\text{ft}}/k$  is called a **linear action** if there exists  $(V, \rho) \in \text{Rep}^{\text{fd}}(G)$  and an equivariant non-degenerate immersion  $X \hookrightarrow \mathbb{P}(V)$ .  $\lrcorner$

**Prop. (10.2.1.24).** If  $G \times X \rightarrow X$  is a transitive action of  $G \in \text{linAlgGrp}/k$  on  $X \in \text{Sch}^{\text{ft, sep}}/k$  s.t.  $X(k)$  is non-empty, then this action is linear.  $\lrcorner$

*Proof:* Cf. [Mil17b] P145.  $\square$

**Def. (10.2.1.25) [Grassmannian Variety].** The **Grassmannian variety**  $\text{Gr}(n, k)$  is a scheme over  $\mathbb{Z}$  defined to be the quotient of  $\text{GL}(n)$  by the algebraic subgroup  $B$  fixing a subspace of dimension  $k$  (10.1.1.19).  $\lrcorner$

The Grassmannian varieties are projective by (10.9.2.16).  $\lrcorner$

**Remark (10.2.1.26).** For an explicit construction of  $\text{Gr}(n, k)$ , Cf. [Sta] 089T or [Nit05] P6.  $\lrcorner$

**Def. (10.2.1.27) [Flag Varieties].** The **flag variety** is a scheme over  $\mathbb{Z}$  defined to be the quotient of  $\text{GL}(n)$  by the algebraic subgroup  $B_F$  fixing a flag  $F$  (10.1.1.19).  $\lrcorner$

The flag varieties are projective by (10.9.2.19).  $\lrcorner$

## 2 Lie Algebras

**Notation(10.2.2.1).**

- Let  $G \in \text{locAlgGrp}^{\text{aff}}/k$ .

⌋

**Def.(10.2.2.2)[Lie Algebra of an Algebraic Group].** By(7.6.4.24), the tangent space of  $G$  at  $e$  is isomorphic to

$$\text{Lie}(G) = \ker(G(k[\varepsilon]/(\varepsilon^2)) \rightarrow G(k))$$

as a vector space. For any homomorphism  $f : G \rightarrow H$ , there is a Lie algebra map

$$\text{Lie}(f) : \text{Lie}(G) \rightarrow \text{Lie}(H)$$

induced by  $f$ .

In particular, if  $G$  is affine, it is the set of homomorphisms  $\Gamma(G) \rightarrow k[\varepsilon]$  that the composition with  $k[\varepsilon] \rightarrow k$  is the counit map  $\varepsilon : \Gamma(G) \rightarrow k$ (10.1.1.2).

If  $G$  is affine,  $\varphi$  maps the augmentation ideal  $I_G = \ker(\varepsilon)$  into  $(\varepsilon)$ , and thus is trivial on  $I_G^2$ . So  $\varphi$  factors through  $\Gamma(G)/I_G^2$ . Now  $\Gamma(G)/I_G^2 \cong k \oplus I_G/I_G^2$  by(3.11.4.11), so

$$\text{Lie}(G) \cong \text{Hom}_k(I_G/I_G^2, k).$$

And we define  $\text{Lie}(G)$  to be  $L(G)$ .

In general, for  $R \in \mathcal{CRing}/k$ , define  $\mathfrak{g}(R) = \ker(G(R[\varepsilon]) \rightarrow G(R))$ , then similarly

$$(G) \cong \text{Hom}_k(I_G/I_G^2, k).$$

$G(R[\varepsilon])$  acts on  $\mathfrak{g}(R)$  by inner automorphism, so also does  $G(R)$ , and we get a homomorphism of algebraic groups

$$\text{Ad} : G \rightarrow \mathbf{GL}(\mathfrak{g})$$

This homomorphism commutes with Lie algebra homomorphism: If  $f : G \rightarrow H$  is a homomorphism of algebraic groups, then there is a commutative diagram

$$\begin{array}{ccc} G \times \mathfrak{g} & \xrightarrow{(x,X) \mapsto \text{Ad}(x)X} & \mathfrak{g} \\ \downarrow f & & \downarrow \text{Lie}(f) \\ H \times \mathfrak{h} & \xrightarrow{(y,Y) \mapsto \text{Ad}(y)Y} & \mathfrak{h} \end{array}$$

Define a Lie bracket on  $\mathfrak{g}$  as follows:  $[X, Y] = \text{ad}(X)(Y) = \text{Lie}(\text{Ad})(X)(Y)$ . Then this is a Lie algebra structure on  $\mathfrak{g}$ , and it commutes with arbitrary base change.

For example,  $\mathfrak{gl}(n) = \text{Lie}(\text{GL}(n))$  is given the Lie algebra structure  $[X, Y] = XY - YX$ . ⌋

*Proof:* To verify this is truly a Lie algebra, we take a faithful embedding of  $G$  into some  $\mathbf{GL}(V)$ (10.3.1.22). Thus it suffices to prove the Lie algebra of  $\mathbf{GL}(V)$  is a Lie algebra. Now for  $A, B \in \text{Mat}(n; R)$ , pondering the definition shows

$$(1 + \delta A)(1 + \varepsilon B)(1 + \delta A)^{-1} = 1 + \varepsilon B + \varepsilon \delta [A, B] \in k[\varepsilon, \delta]/(\varepsilon^2, \delta^2).$$

So by calculation  $[A, B] = XY - YX$ , so it is truly a Lie algebra.

To show the group structure on  $\text{Lie}(G)$  equals the structure on the tangent space, use the Eckmann-Hilton argument(3.1.1.5), notice the hypothesis is satisfied because both composition is the morphism  $\text{Spec } k[\varepsilon] \rightarrow \text{Spec}(k[\varepsilon] \otimes k[\varepsilon]) \xrightarrow{\varphi} G \times G \xrightarrow{\mu} G$ , where  $\varphi = (a, b, c, d) : k[\varepsilon] \otimes k[\varepsilon] \xrightarrow{\varphi} G \times G$ . □

**Cor. (10.2.2.3) [Exponential Map].** As there are natural isomorphisms  $\mathfrak{g}(R) \cong \mathfrak{g} \otimes R$ , we can write  $e^{\varepsilon X}$  the element of  $G(R) \leq G(R[\varepsilon])$  corresponding to  $X \in \mathfrak{g} \otimes R$ . Then  $e^{\varepsilon X + \varepsilon Y} = e^{\varepsilon X} e^{\varepsilon Y}$ , and by functoriality, for any homomorphism  $f : G \rightarrow H$ ,

$$f(e^{\varepsilon X}) = e^{\varepsilon \operatorname{Lie}(f)(X)}.$$

Also

$$x \cdot e^{\varepsilon Y} x^{-1} = e^{\varepsilon \operatorname{Ad}(x)Y}$$

and also the commutative diagram in (10.2.2.2) means

$$f(e^{\varepsilon X}) = e^{\varepsilon \operatorname{Lie}(f)(X)}.$$

┘

**Cor. (10.2.2.4) [Lie algebra commutes with Limits].** It can be seen from the definition (10.2.2.2) that the Lie algebra construction commutes with limits of algebraic groups, because kernel commutes with limits. In particular it commutes with kernel map. ┘

**Prop. (10.2.2.5) [Lie Algebra of Smooth Subgroups].** Let  $H \leq G$  be an algebraic subgroup s.t.  $\operatorname{Lie}(H) = \operatorname{Lie}(G)$ . If  $H$  is smooth and  $G$  is connected, then  $H = G$ . ┘

*Proof:* Recall that  $\dim \mathfrak{g} \geq \dim G$ , with equality iff  $G$  is smooth (10.1.4.6), so the condition forces  $G$  to be smooth. Now  $G$  is smooth and connected thus irreducible (10.1.4.16) and  $\dim G = \dim H$ , so  $H = G$ .  $\square$

**Cor. (10.2.2.6).** Let  $H_1, H_2$  be connected algebraic subgroups of  $G$  and  $H_1 \cap H_2$  is smooth. If  $\operatorname{Lie}(H_1) = \operatorname{Lie}(H_2)$ , then  $H_1 = H_2$ . ┘

**Cor. (10.2.2.7).** If  $\operatorname{char} k = 0$  and  $G \in \operatorname{AlgGrp}/k$ , then there is a bijection between connected algebraic subgroups of  $G$  and Lie subalgebras of  $\operatorname{Lie}(G)$ , because every subgroup is smooth, by (10.1.4.3). ┘

**Cor. (10.2.2.8).** Let  $G \in \operatorname{AlgGrp}/k$  and  $\{H_i\}_{i \in I}$  are smooth algebraic subgroups of  $G$ . If  $\operatorname{Lie}(H_i)$  generate  $\operatorname{Lie}(G)$  as a Lie algebra, then  $H_i$  generates  $G$  (10.1.4.28). ┘

*Proof:* Let  $H$  be the subgroup they generate, then  $H$  is smooth (10.1.4.28) and  $\operatorname{Lie}(H) = \operatorname{Lie}(G)$ , thus  $H = G$  by (10.2.2.5).  $\square$

**Prop. (10.2.2.9) [Lie Algebra of Quotients].** For an exact sequence  $1 \rightarrow K \rightarrow G \rightarrow H \rightarrow 1 \in \operatorname{AlgGrp}/k$ ,  $\operatorname{Lie}(G) \rightarrow \operatorname{Lie}(H)$  is surjective iff  $K$  is smooth. ┘

*Proof:* ?  $\square$

### Stabilizers, Centers and Centralizers

**Prop. (10.2.2.10) [Lie Algebra of Stabilizer].**  $G \in \operatorname{AlgGrp}/k$  and  $V \in \operatorname{Rep}^{\operatorname{fd}}(G)$ , then it induces an action of  $\mathfrak{g}$  on  $V$  (10.2.2.2). Let  $W \subset V$  be a subspace, then the stabilizer  $\operatorname{Stab}_G(W)$  is a subgroup of  $G$  (10.3.1.3)

$$\operatorname{Lie}(\operatorname{Stab}_G(W)) = \operatorname{Stab}_{\mathfrak{g}}(W).$$

In particular,  $\dim(\operatorname{Stab}_G(W)) \leq \dim \operatorname{Stab}_{\mathfrak{g}}(W)$ , with equation iff  $\operatorname{Stab}_G(W)$  is smooth. ┘

*Proof:* By (10.2.2.3),

$$\begin{aligned}
 X \in \operatorname{Lie}(\operatorname{Stab}_G(W)) &\iff r(e^{\varepsilon X})W[\varepsilon] \subset W[\varepsilon] \\
 &\iff e^{\varepsilon \operatorname{Lie}(r)(X)}W_R[\varepsilon] \subset W_R[\varepsilon] \\
 &\iff (1 + \varepsilon \operatorname{Lie}(r)(X))(W_R + \varepsilon W_R) \subset (W_R + \varepsilon W_R) \\
 &\iff \operatorname{Lie}(r)(X)(W_R) \subset W_R \\
 &\iff X \in \operatorname{Stab}_{\mathfrak{g}}(W)
 \end{aligned}$$

□

**Prop. (10.2.2.11) [Lie Algebra of Center].** If  $G \in \operatorname{GrpVar}/k$ , then

$$\dim z(\mathfrak{g}) \geq \dim Z(G),$$

and if equality holds, then  $Z(G)$  is smooth and  $\operatorname{Lie}(Z(G)) = z(\mathfrak{g})$ . ┘

*Proof:* There are maps

$$\begin{aligned}
 \operatorname{Ad} : G &\mapsto \operatorname{GL}(\mathfrak{g}), Z(G) \subset \ker(\operatorname{Ad}), \\
 \operatorname{ad} : \mathfrak{g} &\rightarrow \mathfrak{gl}(\mathfrak{g}), \ker(\operatorname{ad}) = z(\mathfrak{g}).
 \end{aligned}$$

Because Lie algebra commutes with kernel (10.2.2.4),  $\operatorname{Lie}(Z(G)) \subset \operatorname{Lie}(\ker(\operatorname{Ad})) = \ker(\operatorname{ad})$ . So

$$\dim z(\mathfrak{g}) = \dim \ker(\operatorname{ad}) = \dim \operatorname{Lie}(\ker(\operatorname{Ad})) \geq \dim \ker(\operatorname{Ad}) \geq \dim Z(G)$$

with equality iff  $\ker(\operatorname{Ad})$  is smooth and  $\dim \ker(\operatorname{Ad}) = \dim Z(G)$  and thus  $\ker(\operatorname{Ad})^0 = Z(G)^0$ , so  $Z(G)$  is also smooth. Finally,  $\operatorname{Lie}(Z(G)) \subset z(\mathfrak{g})$ , so they are equal if they have the same dimensions. □

**Prop. (10.2.2.12) [Lie Algebra of Centralizer].** Let  $G \in \operatorname{AlgGrp}/k$  and  $H \leq G$  is an algebraic subgroup, then  $H$  acts on  $\mathfrak{g}$  by  $\operatorname{Ad}$ , and

$$\operatorname{Lie}(C_G(H)) = \mathfrak{g}^H, \quad \operatorname{Lie}(N_G(H))/\operatorname{Lie}(H) = (\operatorname{Lie}(G)/\operatorname{Lie}(H))^H.$$

┘

*Proof:*

$$\begin{aligned}
 X \in \operatorname{Lie}(C_G(H)) &\iff x(e^{\varepsilon X})_S x^{-1} = e^{\varepsilon X}_S, \quad \forall k[\varepsilon] \rightarrow S, x \in H(S), \\
 X \in \mathfrak{g}^H &\iff y e^{\varepsilon X_R} y^{-1} = e^{\varepsilon X_R}, \quad \forall k \rightarrow R, x \in H(R).
 \end{aligned}$$

And it can be shown these two are equal. Similarly, there is a natural map  $\operatorname{Lie}(N_G(H)) \rightarrow \operatorname{Lie}(G)/\operatorname{Lie}(H)$ , and the image lies in the fixed subgroup of  $H$ , because

$$X \in \operatorname{Lie}(N_G(H)) \iff (e^{\varepsilon X})_S x (e^{\varepsilon X})_S^{-1} \in H(S) \iff e^{\varepsilon \operatorname{ad}(x)X_S} \in H(S) e^{\varepsilon X_S}, \quad \forall k[\varepsilon] \rightarrow S, x \in H(S)$$

$$X \in (\operatorname{Lie}(G)/\operatorname{Lie}(H))^H \iff e^{\varepsilon \operatorname{ad}(x)X_R} \in e^{\varepsilon (X_R + \operatorname{Lie}(H)(R))}, \quad \forall k \rightarrow R, x \in H(R)$$

Then it can be shown that  $X$  satisfies condition in 1 iff  $\overline{X}$  satisfies condition in 2, thus we are done. □

**Cor. (10.2.2.13) [Kernel of Ad].** If  $\operatorname{char} k = 0$  and  $G \in \operatorname{AlgGrp}/k$  is connected, then  $\ker(\operatorname{Ad}) = Z(G)$ . ┘

*Proof:* Let  $H = \ker(\operatorname{Ad})$ , then  $\operatorname{Lie}(C_G(H)) = \mathfrak{g}^H = \mathfrak{g}$ , which implies  $H = G$  by (10.2.2.7). □

### 3 Groups of Multiplicative Type

**Notation(10.2.3.1).**

- Let  $G \in \text{linAlgGrp}/k$ .

┘

#### Diagonalizable Groups

**Def.(10.2.3.2)[Diagonalizable Groups].** A group scheme over  $R$  isomorphic to  $\mathbf{D}(M)$  for some f.g. commutative group  $M$  is called a **diagonalizable group**.

┘

**Prop.(10.2.3.3).**  $G \in \text{GrpSch}^{\text{fg,aff}}/R$  is diagonalizable(10.2.3.2) iff  $\Gamma(G)$  is a finite projective  $R$ -module generate by the group-like elements(3.11.2.4) in  $\Gamma(G)$ .

┘

*Proof:* For the group algebra  $k(M)$ , its group-like elements are just  $\{m|m \in M\}$  by(3.11.4.19), and they clearly span  $R(M)$  as a  $R$ -space. Conversely, if the set  $M$  of group-like elements in  $\Gamma(G)$  spans  $\Gamma(G)$ , then by(3.11.4.18) they form a basis of  $\Gamma(G)$ , so there is an isomorphism of vector spaces  $\mathbf{D}(M) \rightarrow \Gamma(G)$ . But this is also a homomorphism, because they are on a basis.  $\square$

**Cor.(10.2.3.4)[Classifying Diagonalizable Groups].** If  $\text{Spec}(R)$  is connected, then

- $M \mapsto \mathbf{D}(M)$  is a contravariant equivalence from  $\mathcal{CAlg}_R^{\text{fg}}$  to the category of diagonalizable algebraic groups, with inverse give by  $G \mapsto X^*(G)$ .
- This functor preserves exact sequences.
- Algebraic subgroups and quotient groups of diagonalizable groups are diagonalizable.

┘

*Proof:* 1: By(10.2.3.3), it suffices to show that  $\text{Hom}(M, M') \rightarrow \text{Hom}(\mathbf{D}(M'), \mathbf{D}(M))$  is an isomorphism. Because  $\mathbf{D}$  sends direct sums to direct products, it suffices to check the case that  $M, M'$  are cyclic. This is easy to check, just notice that a group homomorphism maps group-like elements to group-like elements.

2: If  $M' \rightarrow M$  is injective, then  $k[M'] \rightarrow k[M]$  is injective, thus faithfully flat by(3.11.4.21), and  $\mathbf{D}(M) \rightarrow \mathbf{D}(M')$  is a quotient map. Conversely,  $\mathbf{D}(M) \rightarrow \mathbf{D}(M')$  is a quotient map iff  $k[M'] \rightarrow k[M]$  is faithfully flat thus injective thus  $M' \rightarrow M$  is injective. Now the kernel of  $\mathbf{D}(M) \rightarrow \mathbf{D}(M')$  is represented by  $k[M]/I_{k[M']}$ , where  $I_{k[M']}$  is the augmentation ideal. Then it is isomorphic to  $k[M/M']$ .

3: Let  $H$  be an algebraic subgroup of  $G$ , then the map  $\Gamma(G) \rightarrow \Gamma(H)$  is surjective, and sends group-like elements to group-like elements, thus  $\Gamma(H)$  is also spanned by group-like elements, and  $H$  is diagonalizable.

if  $\mathbf{D}(M) \rightarrow Q$  is a quotient map, then its kernel is an algebraic subgroup thus equals  $\mathbf{D}(M'')$  for some quotient  $M''$  of  $M$ . Let  $M$  be the kernel of  $M \rightarrow M''$ , then  $\mathbf{D}(M) \rightarrow \mathbf{D}(M')$  and  $\mathbf{D}(M) \rightarrow Q$  are quotient maps with the same kernel, so they are isomorphic, by(10.1.1.22).  $\square$

**Prop.(10.2.3.5)[Representation of Diagonalizable Groups].** For  $R \in \mathcal{CRing}$  and  $G \in \text{GrpSch}^{\text{aff}}/R$ , the following conditions are equivalent:

1.  $G$  is diagonalizable.
2. Every representation of  $G$  is diagonalizable.
3. Every f.d. representation of  $G$  is diagonalizable.

┘

*Proof:* Cf.[Pseudo-Reductive Groups]P545.

1  $\rightarrow$  2: We need to show for any co-module  $\rho : V \rightarrow V \otimes \Gamma(G)$  (3.11.2.22),  $V$  is a sum of 1-dimensional representations, or equivalently, it is spanned by vectors  $u$  that  $\rho(u) \in Ru \otimes \Gamma(G)$ . Let  $v \in V$ , we can write  $\rho(v) = \sum u_i \otimes e_i$  where  $e_i$  are group-like elements in  $G$ .

Applying comodule relations (3.11.2.22), we get

$$\sum u_i \otimes e_i \otimes e_i = \sum \rho(u_i) \otimes e_i, \quad v = \sum u_i \text{ (3.11.4.17)}.$$

so  $\rho(u_i) = u_i \otimes e_i$  and they span  $V$ .

2  $\rightarrow$  1: The regular representation of  $G$  is diagonalizable, so  $\Gamma(G)$  is spanned by its eigenvectors, for any eigenvector  $f \in \Gamma(G)$ , so  $\mu(f) = f \otimes e$  where  $e$  is a group-like element. Applying  $\varepsilon \otimes \text{id}$  shows  $f = \varepsilon(f)e$ , so  $G$  is diagonalizable.

2  $\rightarrow$  3: trivial.

3  $\rightarrow$  2: Every representation of  $G$  is a sum of f.d. representation, so it is a sum of 1-dimensional representations, so it is diagonalizable by (10.3.1.17).  $\square$

### Tori

**Def. (10.2.3.6) [Linear Tori].** A **split torus** over  $k$  is a linear group scheme of the form  $T = \mathbb{G}_{m,k}^n$  for some  $n \in \mathbb{Z}_+$ , and a **linear torus** over  $k$  is defined to be  $T \in \text{linAlgGrp}/k$  s.t.  $T_{k^{\text{sep}}}$  is a split torus. If  $k = k^{\text{sep}}$ , then any torus is a split torus. In particular, any torus split over a finite separable extension.  $\square$

**Prop. (10.2.3.7).** By (10.2.3.4), a split torus is just a group scheme  $\mathbf{D}(\mathbb{Z}^n)$  for some  $n \in \mathbb{Z}_+$ , and quotient of a split torus is a split torus.

Thus a quotient of a torus is a torus, and an algebraic subgroup of a torus is a torus iff it is a group variety.  $\square$

**Prop. (10.2.3.8) [Classifying Tori].** For a torus  $T/k$  of dimension  $n$ ,  $X^\bullet(T) \cong \mathbb{Z}^n \cong X_\bullet(T)$  (10.1.1.11), and there is a natural perfect pairing  $X^\bullet(X) \times X_\bullet(X) \rightarrow \mathbb{Z}$ . In particular,

$$X^\bullet(-) : \{\text{tori over } k\} \rightarrow \{\text{finite free Abelian groups with a continuous action of } \text{Gal}_k\}$$

is an equivalence of categories, by Galois descent.  $\square$

*Proof:* This follows from (10.2.3.7) and (10.2.3.4).  $\square$

**Def. (10.2.3.9) [Monoidal Transformation].** For  $A \in \text{GL}(n; \mathbb{Z})$  with  $\det A = \pm 1$ , we define an isomorphism of  $\mathbb{G}_{n,k}$ :

$$\varphi_A(x) = (x_1^{a_{11}} x_2^{a_{12}} \dots x_n^{a_{1n}}, \dots, x_1^{a_{n1}} \dots x_n^{a_{nn}}).$$

these isomorphisms  $\varphi_A$  is called the **monoidal transformations**.  $\square$

**Prop. (10.2.3.10).** Let  $G \in \text{GrpVar}/k$  and  $T \leq G$  be a central torus, then

- $T \cap [G, G]$  is finite.
- If  $G/T$  is a perfect group, then the sequence

$$e \rightarrow T \cap [G, G] \rightarrow T \times [G, G] \rightarrow G \rightarrow e$$

is exact.

In particular,  $G/[G, G]$  is a torus.  $\lrcorner$

*Proof:* Cf. [Mil17]P246.  $\square$

**Def. (10.2.3.11) [Induced Tori].** An **induced torus** is a torus  $T$  over  $k$  s.t.  $X^\bullet(T)$  has a  $\mathbb{Z}$ -basis that is stable under the action of  $\text{Gal}_k$ . It is easy to see from (10.2.3.8) that this is equivalent to  $T$  being a finite product of torus of the form  $\text{Res}_{k'/k} \mathbb{G}_m$  where  $k'/k$  is a finite separable extension.  $\lrcorner$

**Cor. (10.2.3.12).** If  $T \in \text{Tori}/k$  is induced (10.2.3.11) and  $k \subset k' \subset k^{\text{sep}} \in \text{Field}$ , then  $T_{k'}$  is induced.  $\lrcorner$

**Prop. (10.2.3.13).** For any torus  $T/k$ , there exists an exact sequence

$$1 \rightarrow R_1 \rightarrow R_0 \rightarrow T \rightarrow 1$$

where  $R_1 \in \text{AlgGrp}/k$  is a tori and  $R_0 \in \text{AlgGrp}/k$  is an induced tori.  $\lrcorner$

*Proof:* Let  $k' \leq k^{\text{sep}}$  be a splitting field for  $T$ . Define  $R_0 = \text{Res}_{k'/k}(T_{k'})$  with a norm map  $\text{Nm}_{k'/k} : R_0 \rightarrow T$ , then  $\text{Nm}_{k'/k}$  is surjective with a connected kernel (by looking at based changed to  $k'$ ).  $\square$

### Groups of Multiplicative Type

**Def. (10.2.3.14) [Groups of Multiplicative Type].**  $G$  is called an **algebraic group of multiplicative type** over  $k$  if  $G_{k'}$  is diagonalizable (10.2.3.2) for some field extension  $k'/k$ . In this case, we say that  $G$  is split over  $k'$ .

Subgroups and quotient groups of groups of multiplicative type are also of multiplicative type, because this is true for diagonalizable groups (10.2.3.4).  $\lrcorner$

**Prop. (10.2.3.15) [Characterizing Groups of Multiplicative Type].** The following are equivalent:

- $G$  is of multiplicative type.
- $G$  is commutative and  $\text{Hom}(G, \mathbb{G}_a) = 0$ .
- $G$  is commutative and  $\Gamma(G)$  is coétale.
- $G_{k^{\text{sep}}}$  is diagonalizable.

$\lrcorner$

*Proof:* Cf. [Mil17]237.  $\square$

**Cor. (10.2.3.16).** An algebraic group over  $k$  becomes diagonalizable over some field extension of  $k$  iff it becomes diagonalizable over some finite separable extension of  $k$ .  $\lrcorner$

**Cor. (10.2.3.17).** If a group of multiplicative type splits over a purely inseparable extension of  $k$ , then it splits over  $k$ .  $\lrcorner$

*Proof:* Cf. [Mil17]P238.  $\square$

**Cor. (10.2.3.18).** If  $G$  is smooth and commutative, then  $G$  is of multiplicative type iff  $G(\bar{k})$  consists of semisimple elements.  $\lrcorner$

*Proof:* We can assume that  $k = \bar{k}$ , and embed  $G$  into  $\text{GL}(n)$  for some  $n \in \mathbb{Z}_+$  (10.3.1.22). If  $G$  is of multiplicative type, then by (10.2.3.5), there is a basis that  $G \subset \mathbb{D}_n$ , so all the elements in  $G(k)$  is diagonalizable hence semisimple. Conversely, if  $G(k)$  are all semisimple, then they form a commutative family of semisimple elements, so  $G(k) \subset \mathbb{D}_n(k)$  in some basis. Because  $G$  is smooth thus reduced,  $G \subset \mathbb{D}_n$ .  $\square$

**Cor. (10.2.3.19).** An extension of algebraic groups of multiplicative type is of multiplicative type iff it is commutative.  $\lrcorner$

*Proof:* A exact sequence  $e \rightarrow G' \rightarrow G \rightarrow G'' \rightarrow e$  of commutative group schemes gives rise to an exact sequence

$$0 \rightarrow \operatorname{Hom}(G'', \mathbb{G}_a) \rightarrow \operatorname{Hom}(G, \mathbb{G}_a) \rightarrow \operatorname{Hom}(G', \mathbb{G}_a)$$

of Abelian groups by (10.1.1.22), thus we can use characterization (10.2.3.15).  $\square$

**Thm. (10.2.3.20) [Classifying Groups of Multiplicative Type].** The functor  $X^*$  is an equivalence from the category of algebraic groups of multiplicative type over  $k$  to the category of f.g.  $\mathbb{Z}$ -modules equipped with a continuous action of  $\operatorname{Gal}_k$ , and the inverse is given by  $M \mapsto$  the Galois decent of  $\mathbf{D}(M)$ .  $\lrcorner$

*Proof:* This follows from (10.2.3.4) and Galois descent.  $\square$

**Cor. (10.2.3.21) [Largest Subtori].** If  $G$  is of multiplicative type, then there is a unique exact sequence

$$1 \rightarrow G_t \rightarrow G \rightarrow G'' \rightarrow 1$$

where  $G_t$  is a torus over  $k$  and  $G''$  is a finite group over  $k$ .  $G_t$  is the largest subtorus of  $G$ , and is also the unique subtorus of  $G$  with finite quotient, denoted by  $G_t$ . In particular, this exact sequence is compatible with base change of fields.

Then  $G_t = G_{\text{red}}^0$ .  $\lrcorner$

*Proof:* Cf. [Mil17]P241.  $\square$

**Cor. (10.2.3.22).** A group variety of multiplicative type is a torus. And if  $H \leq G$  is a normal subgroup scheme, then  $H_t \leq G$  is a normal torus.  $\lrcorner$

**Prop. (10.2.3.23) [Representation of Groups of Multiplicative Type].** If  $G$  is of multiplicative type (e.g. a torus), then  $\operatorname{Rep}_k^{\text{fd}}(G)$  is a semisimple Abelian category, and the isomorphism classes of simple objects in  $\operatorname{Rep}_k^{\text{fd}}(G)$  are classified by the orbits of  $\operatorname{Gal}_k$  acting on  $X^\bullet(G)$ .

If  $(V, r) \in \operatorname{Rep}_k^{\text{fd}}(G)$  corresponds to an orbit  $\Sigma$ , and let  $\chi \in \Sigma$ , then  $\operatorname{End}(V) \cong k_\chi$ , where  $k_\chi$  is the subfield of  $k^s$  fixed by the stabilizer of  $\chi$  in  $\operatorname{Gal}_k$ . In particular,  $\dim_k k_\chi = \dim V_\chi$ .  $\lrcorner$

*Proof:* The group  $G$  is split by a finite Galois extension  $K/k$  by (10.2.3.16). Then  $\operatorname{Gal}(K/k)$  acts on  $\Gamma(G_K)$  through its action on  $K$ . Let  $(V, r)$  be a representation of  $G_K$  and let  $\rho$  be the corresponding co-action, then by (7.1.5.24), the functor  $V \mapsto V \otimes_k K$  induces an equivalence between  $\operatorname{Rep}(G)$  and  $\operatorname{Rep}_k^{\text{fd}}(G_K)$  with a semi-linear action of  $\operatorname{Gal}(K/k)$  fixing  $\rho$ .

Let  $V \in \operatorname{Rep}_k^{\text{fd}}(G)$ , then  $V_K$  decomposes as a representation of  $G_K$  into

$$K \otimes V = \bigoplus_{\chi \in X^*(G_K)} V_\chi.$$

and an element  $\gamma \in \operatorname{Gal}(K/k)$  maps  $V_\chi$  isomorphically onto  $V_{\sigma\chi}$ . Thus the set of  $\chi$  occurring in  $K \otimes V$  is stable under the action of  $\bar{\Gamma}$ .

Conversely, if  $\Sigma$  is an orbit of  $\operatorname{Gal}(K/k)$  in  $X^*(G_K)$  and  $V$  is a 1-dimensional  $K$  vector space, then  $\bigoplus_{\chi \in \Sigma} V_\chi$  has a natural semi-linear action of  $\operatorname{Gal}(K/k)$ , so it arises from a simple representation of  $G$  over  $k$ .  $\square$

**Prop. (10.2.3.24) [Density Theorem for Groups of Multiplicative Type].** Let  $G$  be a smooth of multiplicative type, then  $G$  is commutative.

- The only closed subscheme containing every  $G[n]$  is  $G$  itself.
- If  $G$  is smooth, then the only closed subscheme containing  $G[n]$  for  $n$  prime to characteristic of  $k$ , is  $G$  itself.

┘

*Proof:* 1: 2: Cf. [Mil17]P242. ?

□

**Cor. (10.2.3.25).** Suppose  $G$  is of multiplicative type, then any two homomorphisms from  $G$  to another algebraic group  $H$  that coincide on  $G[n]$  for all  $n \geq 1$  are equal.

┘

*Proof:* This is because the equalizer is a closed subscheme of  $G$ , as  $H$  is separated (10.1.1.10). □

**Prop. (10.2.3.26) [Rigidity Theorem for Groups of Multiplicative Type].** Let  $G, H$  be diagonalizable groups over  $k$ , and let  $X$  be a connected group scheme over  $k$ . Let  $\varphi : X \times G \rightarrow H$  be a morphism that for all  $k$ -algebra  $R$  and  $x \in X(R)$ , the map  $g \mapsto \varphi(x, g) : G(R) \rightarrow H(R)$  is a homomorphism. Then for any  $x_0 \in X(k)$ , we have  $\varphi(x, g) = \varphi(x_0, g)$  for any  $k$ -algebra  $R$  and  $(x, g) \in X(R) \times G(R)$ .

┘

*Proof:* Cf. [Mil17]P243. ?

□

**Cor. (10.2.3.27).** If  $G$  is connected, then any action of  $G$  on an algebraic group  $H$  of multiplicative type by group homomorphisms is trivial.

┘

**Cor. (10.2.3.28).** If  $G$  is connected, then every normal algebraic subgroup of multiplicative type of  $G$  is contained in the center of  $G$ .

┘

*Proof:* The action of  $G$  on  $N$  by inner automorphism is trivial.

□

**Cor. (10.2.3.29).** Let  $H$  be a subgroup of multiplicative type of an algebraic group  $G$ , then  $N_G(H)^0 = Z_G(H)^0$ , i.e.  $C_G(H)$  is an open subgroup of  $N_G(H)$ .

┘

*Proof:* The inner action of  $N_G(H)^0$  on  $H$  by inner automorphism is trivial.

□

**Cor. (10.2.3.30).** If  $N$  is a normal subgroup of an algebraic group  $H$  that  $N$  and  $H/N$  are of multiplicative type, then every action of a connected algebraic group  $G$  on  $H$  by group homomorphisms preserving  $N$  is trivial.

┘

*Proof:* The action of  $G$  on  $N$  is trivial, thus the action factors through  $G \times H/N \rightarrow H$ , thus also factors through  $G \times H/N \rightarrow N$ . Now the action is trivial, by (10.2.3.26). □

**Cor. (10.2.3.31) [Extension of Groups of Multiplicative Types].** An extension  $G$  of algebraic groups of multiplicative type is of multiplicative type if it is connected.

┘

*Proof:* The conjugation action of  $G$  on itself is trivial, by (10.2.3.30), thus  $G$  is commutative. Thus it is of multiplicative type by (10.2.3.19). □

**Cor. (10.2.3.32).** If  $G$  is connected and  $H' \leq H \leq G$  are normal subgroups of  $G$  s.t.  $H', H/H'$  are both of multiplicative type, then  $H$  is central and of multiplicative type.

┘

*Proof:* Consider the conjugate action of  $G$  on  $H$ , then  $H$  is central by (10.2.3.30). In particular  $H$  is commutative and thus of multiplicative type by (10.2.3.19). □

### Linearly Reductive Groups

**Def. (10.2.3.33) [Linearly Reductive Groups].**  $G$  is called **linearly reductive** if any  $\rho \in \mathcal{R}\text{ep}_k^{\text{fd}}(G)$  is totally decomposable.  $\lrcorner$

**Prop. (10.2.3.34).** Let  $k'/k \in \mathbf{Field}$ . If  $G_{k'}$  is linearly reductive, then so is  $G$ . Conversely, if  $G$  is linearly reductive and  $k'$  is separable over  $k$ , then  $G_{k'}$  is linearly reductive.  $\lrcorner$

*Proof:* Cf. [Mil17]P248.  $\square$

**Prop. (10.2.3.35).** If  $G$  is commutative, then it is linearly reductive iff it is of multiplicative type. In particular, a linear torus is linearly reductive, by (10.2.3.16).  $\lrcorner$

*Proof:* Cf. [Mil17]P248. ?  $\square$

**Prop. (10.2.3.36) [Hilbert].** Let  $G \subset \text{GL}(n)$  be linearly reductive and let  $A = k[T_1, \dots, T_n]$ , then  $A^G$  is f.g. as a  $k$ -algebra.  $\lrcorner$

*Proof:* Cf. [Mil17]P249. ?  $\square$

### 4 Actions of Tori

References are [CGP15].

**Notation (10.2.4.1).**

- Let  $G \in \text{linAlgGrp}/k$ .

$\lrcorner$

**Thm. (10.2.4.2) [Smoothness of Fixed Points].** If  $G \in \text{GrpVar}/k$  is linearly reductive (10.2.3.33) (e.g. a torus, by (10.2.3.35)) and acts on  $X \in \text{SmVar}/k$ , and  $S \subset G(k)$  is dense in  $|G|$ , then the fixed scheme  $X^S$  is smooth and equals  $X^G$ .  $\lrcorner$

*Proof:* Cf. [Mil17]P254.  $\square$

**Cor. (10.2.4.3) [Fixed Points of Semisimple Elements].** If  $G \in \text{GrpVar}/k$  acts on  $X \in \text{SmVar}/k$  and  $s \in G(k)$  is semisimple, and let  $G' \leq G$  be the closed subgroup generated by  $s$ , then  $X^{G'} = X^s$  is smooth.  $\lrcorner$

*Proof:*  $G'$  is linearly reductive (10.2.3.33) because  $s$  is semisimple.  $\square$

### Dynamical Methods

**Notation (10.2.4.4).**

- Let  $G \in \text{GrpSch}^{\text{fg,aff}}/R$ .

$\lrcorner$

**Prop. (10.2.4.5).** For  $V \in \mathcal{R}\text{ep}^{\text{fd}}(\mathbb{G}_m)$  and  $v \in V$ , the orbit map

$$\mu_{[v]} : \mathbb{G}_m \rightarrow \mathbb{P}^1(V) : t \mapsto t[v]$$

extends uniquely to a map  $\mathbb{P}^1 \rightarrow \mathbb{P}^1(V)$ . And either  $[v]$  is a fixed point or the closure of its orbit has exactly two fixed points:  $\{\mu_{[v]}(0), \mu_{[v]}(\infty)\}$ .  $\lrcorner$

*Proof:* The case that  $[v]$  is fixed is easy, so we assume that  $[v]$  is not fixed. Write  $V = \oplus_{n \in \mathbb{Z}} V_n$  where  $\mathbb{G}_m$  acts on  $V_n$  via  $t \mapsto t^n$ , and write  $v = v_r + \dots + v_s$  where  $v_r \neq 0, v_s \neq 0$ . By looking at the affine charts, it is clear that  $\mu_{[v]}$  extends uniquely to a map  $\mathbb{P}^1 \rightarrow \mathbb{P}^1(V)$  s.t.  $\mu_{[v]}(0) = [v_r]$  and  $\mu_{[v]}(\infty) = [v_s]$ , and these are the only two fixed points.  $\square$

**Def. (10.2.4.6) [Concentrator Schemes].** For  $X \in \text{Aff}/R$  with an action of  $\mathbb{G}_m$  and  $Z \subset X$  a closed subscheme stable under the action, there is a  $\mathbb{Z}$ -gradation  $\Gamma(X) = \oplus_{n \in \mathbb{Z}} \Gamma(X)_n$  where  $\mathbb{G}_m$  acts on  $\Gamma(X)_n$  by  $t \mapsto t^n$  and similarly for  $\Gamma(Z)$ .  $\Gamma(X) \rightarrow \Gamma(Z)$  is a graded subjective homomorphism with kernel  $I(Z) = \oplus_{n \in \mathbb{Z}} I(Z)_n$ .

The **concentrator subscheme** of  $Z \subset X$  is the closed subscheme of  $X$  defined by the ideal generated by  $I(Z)_0 + \sum_{n \in \mathbb{Z}_-} \Gamma(X)_n$ , denoted by  $X_Z$ .  $\lrcorner$

**Prop. (10.2.4.7) [Dynamical Meaning of Concentrator Subschemes].** Situation as in (10.2.4.6), for  $R' \in \mathcal{C}\text{Ring}/R$ ,

$$X_Z(R') = \left\{ x \in X(R') : \lim_{t \rightarrow 0} tx \text{ exists and lies in } Z(R') \right\}.$$

And  $X_Z$  is unchanged if we replace  $\lambda$  by  $\lambda^n$  for some  $n \in \mathbb{Z}_+$ .  $\lrcorner$

*Proof:* For  $x \in X(R')$ , the orbit map  $\mu_x : (\mathbb{G}_m)_{R'} \rightarrow X_{R'}$  corresponds to the map  $\sum_n f_n \rightarrow \sum_n x(f_n)T^n$ . Thus the limit exists iff  $x(f_n) = 0$  for any  $n \in \mathbb{Z}_{<0}$ , in which case the limit is the point in  $X(R)$  corresponding to the homomorphism  $\Gamma(X) \rightarrow R' : \sum f_n \mapsto x(f_0)$ . Thus the limits lies in  $Z(R')$  iff  $x \in X_Z(R')$ .

For the last assertion, Cf. [CGP] 2.1.7.  $\square$

**Prop. (10.2.4.8) [Smoothness of Concentrator Subschemes].** Situation as in (10.2.4.6), if  $X, Z$  are smooth, then  $X_Z$  is smooth.  $\lrcorner$

*Proof:* Cf. [Mil17] P261.  $\square$

**Prop. (10.2.4.9) [Concentrator Subgroups of Torus Actions].** If  $\lambda : \mathbb{G}_m \times G \rightarrow G \in \text{GrpSch}/R$  is an action of  $\mathbb{G}_m$  by group homomorphisms, then the concentrator subschemes (10.2.4.6)

$$P_G(\lambda) \triangleq G_G, \quad U_G(\lambda) \triangleq G_e$$

are subgroup schemes by (10.2.4.6). Then

1.  $P_G(\lambda) \leq G$  is a subgroup scheme,  $U_G(\lambda) \trianglelefteq P_G(\lambda)$  is a normal subgroup scheme.
- 2.

$$P(\lambda) \cap P(-\lambda) = Z(\lambda)$$

is the fixed point of  $\lambda$  on  $G$ , and  $P_G(\lambda) \cap U_G(-\lambda) = e$ .

3.  $P_G(\lambda), U_G(\lambda), Z_G(\lambda)$  are stable under base change, and if  $H \leq G$  is a subgroup scheme that is stable under action of  $T$ , then  $P_H(\lambda) = H \cap P_G(\lambda), U_H(\lambda) = H \cap U_G(\lambda), Z_H(\lambda) = H \cap Z_G(\lambda)$ .
4. If  $G/R$  is of f.t., then the fibers of  $U_G(\lambda)$  are unipotent.

$\lrcorner$

*Proof:* 1: This follows from (10.2.4.7).

2: If  $t.g = g$  for all  $t \in \mathbb{G}_m$ , then  $g \in P(\lambda) \cap P(-\lambda)$ . Conversely, if  $g \in P(\lambda) \cap P(-\lambda)$ , then  $\text{Orb}_g : \mathbb{G}_m \rightarrow G$  extends to a map  $\mathbb{P}^1 \rightarrow G$ , which can only be the constant map, thus  $t.g = g$  for all  $t \in \mathbb{G}_m$ . The last assertion is clear.

3: This follows from (10.2.4.7).

4: To show the fibers of  $U_G(\lambda)$  are unipotent, it suffices to show for  $R \in \mathbf{Field}$ . And then we can embed  $G$  into  $\text{GL}(n)$  for some  $n$  by (10.3.1.22). Then this follows from [CGP15]P2.1.1?  $\square$

**Cor. (10.2.4.10).** Situation as in (10.2.4.9), if  $G/R$  is of f.p., then

1.  $P_G(\lambda), U_G(\lambda), Z_G(\lambda)$  are also of f.p.
2. The fibers of  $U_G(\lambda)$  are connected, and if the fibers of  $G$  are connected, then the same hold for  $P_G(\lambda)$  and  $Z_G(\lambda)$ .
3.  $\text{Lie}(Z_G(\lambda)) = \text{Lie}(G)_0, \text{Lie}(U_G(\lambda)) = \text{Lie}(G)_+, \text{Lie}(P_G(\lambda)) = \text{Lie}(G)_{\geq 0}$ .
4. The multiplication map induces an group isomorphism  $Z_G(\lambda) \rtimes U_G(\lambda) \cong P_G(\lambda)$ .
5. If  $R \in \mathbf{Field}$ ,  $G$  is connected, and  $f : G \rightarrow H$  is an  $S$ -equivariant quotient map, then so are the maps  $P_G(\lambda) \rightarrow P_H(\lambda), U_G(\lambda) \rightarrow U_H(\lambda), Z_G(\lambda) \rightarrow Z_H(\lambda)$ .
6. If  $R = k \in \mathbf{Field}$ , the multiplication map  $U(-\lambda) \times P(\lambda) \rightarrow G$  is an open immersion. And if  $H \leq G$  is an algebraic subgroup stable under action of  $\mathbb{G}_m$ , then

$$H \cap (U_G(-\lambda') \times P_G(\lambda')) = U_H(-\lambda) \times P_H(\lambda).$$

And if moreover  $G/R$  is smooth, then

1.  $P_G(\lambda), U_G(\lambda), Z_G(\lambda)$  are smooth.
2. The multiplicative map  $U_G(\lambda) \times P_G(\lambda) \rightarrow G$  is an open immersion. This open immersion is an isomorphism if  $R \in \mathbf{Field}$  and  $G$  is connected and solvable.
3. If  $R \in \mathbf{Field}$ , then  $U_G(\lambda)$  is split unipotent.

┘

*Proof:* Cf. [CGP15]2.1.12, 2.2.9, 2.2.5.?

1: When  $G$  is of f.p.,  $G$  and the action  $\lambda$  descends to a Noetherian subring of  $R$ , then it is clear that  $P_G(\lambda), U_G(\lambda), Z_G(\lambda)$  are of f.p..

2: Cf. [CGP15]Prop2.1.8.?

3:  $\text{Lie}(P_G(\lambda)) = P_G(\lambda)(R[\varepsilon]) \cap \text{Lie}(G)$ , so? Cf. [CGP15]2.1.8.

And  $\text{Lie}(Z_G(\lambda)) = \text{Lie}(P_G(\lambda)) \cap \text{Lie}(P_G(-\lambda)) = \text{Lie}(G)_0$ .

4: Notice that the group homomorphism  $P_G(\lambda) \rightarrow Z_G(\lambda) : g \mapsto \lim_{t \rightarrow 0} t.g$  is a projection.

5: As  $f$  is flat, the induced map of open subschemes

$$U_G(-\lambda) \times Z_G(\lambda) \times U_G(\lambda) = U_G(-\lambda) \times P_G(\lambda) \rightarrow U_H(-\lambda) \times P_H(\lambda) = U_H(-\lambda) \times Z_H(\lambda) \times U_H(\lambda)$$

is flat. Thus the map on each factor is flat, thus open (5.4.1.30), but the image is also closed by (10.1.5.3). Now by item2, the maps are surjective, in particular they are quotient maps by (10.1.5.4).

6: Cf. [CGP15]Prop2.1.8.

For the smooth case:

1: Cf. [CGP15]Prop2.1.8.

2: Cf. [CGP15]Prop2.1.12.

3: Cf. [CGP15]Prop2.1.10.  $\square$

**Cor. (10.2.4.11).** If  $G \in \text{GrpVar}/k$  is non-solvable, then there exists a sub-torus  $T \leq G$  s.t.  $Z_G(T)$  is a subgroup variety of smaller dimension as  $G$ .  $\lrcorner$

*Proof:* If every maximal tori of  $G$  is central, take a maximal torus  $T \leq G$ , then  $G/T$  is unipotent by (10.3.4.18). Thus  $G$  is solvable, contradiction.  $\square$

**Prop. (10.2.4.12) [Weil Restrictions of Concentrator Subgroups].** Let  $R'/R \in \mathcal{CRing}$  is finite locally free,  $G' \in \text{GrpSch}^{\text{aff}, \text{pf}}/R$  with  $G = \text{Res}_{R'/R}(G')$ , and  $\lambda' \in X_*(G')$  with  $\lambda = \mathbb{G}_m \rightarrow \text{Res}_{R'/R} \mathbb{G}_m \rightarrow G \in X_*(G)$ , then we have

$$P_G(\lambda) = \text{Res}_{R'/R}(P_{G'}(\lambda')), \quad U_G(\lambda) = \text{Res}_{R'/R}(U_{G'}(\lambda')), \quad Z_G(\lambda) = \text{Res}_{R'/R}(Z_{G'}(\lambda')) \quad (10.2.4.9).$$

$\lrcorner$

*Proof:* Cf. [CGP15]P61.  $\square$

**Def. (10.2.4.13) [Roots].** Suppose  $R$  is local and  $S/R$  is a non-trivial split torus  $?$  and  $G/R$  is smooth with an action of  $T$ , then by (10.2.3.5),  $\mathfrak{g} = \text{Lie}(G)$  decomposes as

$$\mathfrak{g} = \mathfrak{g}_0 \otimes \bigotimes_{\alpha \in X^\bullet(T)} \mathfrak{g}_\alpha,$$

where  $\mathfrak{g}^0 = \mathfrak{g}^S = \text{Lie}(G^S) = \text{Lie}(Z_G(S)) = \text{Lie}(S) = \mathfrak{t}$  (10.2.2.12)(10.4.2.15) and  $S$  acts on  $\mathfrak{g}_\alpha$  by the character  $\alpha$  for  $\alpha \in X^\bullet(S)$ . The set of  $\alpha \in X^\bullet(S)$  s.t.  $\mathfrak{g}_\alpha \neq 0$  is denoted by  $\widehat{\Phi}(G, S)$ , and  $\Phi(G, S) = \widehat{\Phi}(G, S) \setminus \{0\}$  is called the set of **roots of**  $(G, S)$ , denoted by  $\Phi(G, S)$ .

Also denote  $\text{wt}(G, S)$  the sub-semigroup of  $X^\bullet(S)$  generated by  $\Phi(G, S)$ .  $\lrcorner$

**Prop. (10.2.4.14).** Let  $R = k$ , and  $G/k$  smooth with an action of a split torus  $S/k$ . If  $H \leq G$  is a subgroup variety that is stable under action of  $T$ , then  $\Phi(S, H) = \Phi(S, G) \cap \text{wt}(G, S)$  (10.2.4.13).  $\lrcorner$

*Proof:* Cf. [Pseudo-Reductive Groups]Chap3.3.  $\square$

**Prop. (10.2.4.15).** Let  $R = k$ , and  $G/k$  smooth with an action of a split torus  $S/k$ . If  $H_1, H_2 \leq G$  are subgroup varieties that are stable under action of  $T$ , and  $H = \langle H_1, H_2 \rangle$ ,  $\widehat{\Phi}(S, H) = \widehat{\Phi}(S, G) \cap \text{wt}(G, S)$  (10.2.4.13). then

- $\text{wt}(S, H)$  is the semigroup generated by  $\text{wt}(S, H_1)$  and  $\text{wt}(S, H_2)$ .
- $\text{wt}(S, [H_1, H_2]) \subset \text{wt}(S, H_1) + \text{wt}(S, H_2)$ .

$\lrcorner$

*Proof:* Cf. [Pseudo-Reductive Groups]Prop3.3.5.  $\square$

**Thm. (10.2.4.16) [Subgroup varieties and Weight Groups].** Let  $R = k$ , and  $G/k$  smooth with an action of a split torus  $S/k$ . For any sub-semigroup  $A \leq X^\bullet(S)$ , there exists a unique  $S$ -invariant subgroup variety  $H_A \leq G$  s.t.

$$\text{Lie}(H_A) = \bigoplus_{\alpha \in A \cap \widehat{\Phi}(G, S)} \text{Lie}(G)_\alpha.$$

And any  $S$ -invariant subgroup variety  $H' \leq G$  s.t.  $\widehat{\Phi}(H', S) \subset A$  is contained in  $H_A$ .

When  $0 \notin A$ ,  $H_A$  is unipotent, so also denoted by  $U_A$ .  $\lrcorner$

*Proof:* Cf. [Pseudo-Reductive Groups]Prop3.3.6.  $\square$

**Prop. (10.2.4.17) [Filtrations on Unipotent Subgroups].** Let  $R = k$ , and  $G/k$  smooth with an action of a split torus  $S/k$ . For any  $a \in X^\bullet(S) \setminus \{0\}$ , let  $A = \mathbb{Z}_+ \cdot a$ ,  $A^j = \mathbb{Z}_{\geq j} a$  where  $j \in \mathbb{Z}_+$ , and  $U_{ja} = U_{A^j}$  (10.2.4.16), then

- Each  $U_{(j+1)a}$  is normal in  $U_{ja}$ , and the quotients  $U_{ja}/U_{(j+1)a}$  are vector groups. If  $U_{ja}/U_{(j+1)a} \neq 1$ , then  $\widehat{\Phi}(U_{ja}/U_{(j+1)a}, S) = \{ja\}$ .

┘

*Proof:* Cf. [Pseudo-Reductive Groups] Prop 3.3.8. □

**Prop. (10.2.4.18).** Let  $R = k$ ,  $G \in \text{GrpVar}/k$  be solvable with an action of a split torus  $S/k$ . Suppose there is a decomposition  $\widehat{\Phi}(G, S) = \coprod_{i \in [n]_+} \Psi_i$  s.t. the sub-semigroups  $A_i$  generated by  $\Psi_i$  are pairwise-disjoint, then the natural multiplication map

$$H_{A_1} \times \dots \times H_{A_n} \rightarrow G$$

is a group isomorphism. ┘

**Prop. (10.2.4.19) [Integral Root Groups].** Let  $(\mathcal{O}_K, K, \kappa) \in p\text{-Field}$ ,  $R = \mathcal{O}_K$  and  $\mathcal{S} \in \text{GrpVar}/\mathcal{O}_K$  be a split torus, and  $\mathcal{G}/\mathcal{O}_K$  is smooth. For any  $\alpha \in X^\bullet(\mathcal{S})$ ,  $\mathcal{S}_\alpha = \ker(\alpha) \subset \mathcal{S}$  is isomorphic to  $\mathbf{D}(X^\bullet(\mathcal{S})/\mathbb{Z} \cdot \alpha)$ , thus flat over  $\mathcal{O}_K$ , and  $\mathcal{S}/\mathcal{S}_\alpha \cong \mathbb{G}_m$ . Denote  $S = \mathcal{S}_K$ ,  $G = \mathcal{G}_K$ , then  $X^\bullet(\mathcal{S}) \cong X^\bullet(S) \cong X^\bullet(\mathcal{S}_\kappa)$ .

Given any root  $\alpha \in \Phi(\mathcal{G}, \mathcal{S})$  (10.2.4.13), there is a unique closed  $\mathcal{O}_K$ -smooth subgroup scheme  $\mathcal{U}_\alpha \leq \mathcal{G}^0$  s.t.

- $\mathcal{U}_\alpha$  is stable under the action of  $\mathcal{S}$  and  $\mathcal{S}_\alpha$  acts trivially on it.
- $(\mathcal{U}_\alpha)_\kappa$  is connected and unipotent.
- 

$$\text{Lie}(\mathcal{U}_\alpha) = \bigoplus_{\beta \in \mathbb{Q}_+ \cdot \alpha \cap \Phi} \mathfrak{g}_\beta.$$

And this  $\mathcal{U}_\alpha$  also satisfies

- $\mathcal{U}_\alpha$  is the schematic closure of  $U_\alpha$  in  $\mathcal{G}$  (7.4.5.13).
- $\mathcal{U}_\alpha(\mathcal{O}_K) = U_\alpha(K) \cap \mathcal{G}(\mathcal{O}_K)$ .
- $(\mathcal{U}_\alpha)_\kappa$  is the  $\alpha$ -root group for the action of  $\mathcal{S}_\kappa$  on  $\mathcal{G}_\kappa$ .

This  $\mathcal{U}_\alpha$  is called the **integral  $\alpha$ -root group** of  $\mathcal{G}$  w.r.t.  $\mathcal{S}$ . ┘

*Proof:* Cf. [K-P23] P134. □

**Prop. (10.2.4.20) [Root Groups].** Suppose  $G \in \text{GrpVar}^{\text{aff}}/k$  and  $S \leq G$  is a split torus. For  $\alpha \in \Phi(G, T)$  (10.2.4.13), denote

- $S_\alpha = \ker(\alpha)_t$ .
- $G_\alpha = C_G(S_\alpha)$ , which is a subgroup variety of  $G$  with Lie algebra

$$\text{Lie}(G_\alpha) = \mathfrak{g}^{S_\alpha} = \mathfrak{g}^S \oplus \bigoplus_{\beta \in \mathbb{Q}_+ \cdot \alpha \cap \Phi(G, S)} \mathfrak{g}_\beta.$$

- $U_\alpha = U_{G_\alpha}(\lambda)$ , where  $\lambda \in X_\bullet(S)$  is any cocharacter s.t.  $\langle \alpha, \lambda \rangle > 0$ .
- $G^\alpha = [G_\alpha, G_\alpha]$ .

Then

- These are all group varieties, and  $U_\alpha$  is normalized under  $S$ .
- 

$$\mathrm{Lie}(U_\alpha) = \bigoplus_{\beta \in \mathbb{Z}_+, \alpha \cap \Phi(G, S)} \mathfrak{g}_\beta.$$

- For any  $T$ -normalized subgroup variety  $H \leq G$ ,  $H$  contains  $U_\alpha$  (resp. is contained in  $U_\alpha$ ) iff  $\mathrm{Lie}(U) \subset \mathrm{Lie}(U_\alpha)$  (resp.  $\mathrm{Lie}(U_\alpha) \subset \mathrm{Lie}(U)$ ). In particular  $U_\alpha$  is independent of  $\lambda$  chosen, and is called the **root group** of  $\alpha$ .

┘

*Proof:* Cf. [Mil17]P348? and [K-P23]P135.

□

**Cor. (10.2.4.21).**  $\dim G = \dim T + \#\Phi$ .

┘

*Proof:* Because both  $G, T$  are smooth, this follows from (10.1.4.6).

□

**Cor. (10.2.4.22).** Notation as in (10.2.4.20),  $G_\alpha$  is generated by  $U_\alpha, U_{-\alpha}$  and  $T$ , and  $G^\alpha$  is generated by  $U_\alpha$  and  $U_{-\alpha}$ .

┘

*Proof:* Because both  $G, T$  are smooth, we can check on the level of Lie algebras.? And use the fact  $\mathrm{SL}(2)$  is generated by  $U^+$  and  $U^-$ .

□

**Lemma (10.2.4.23).** If  $k = \bar{k}, G \in \mathrm{GrpVar}/k$  and  $T \leq G$  is a torus, then  $C_G(T) \leq \cup_{B \in \mathcal{B}^T} B$ , where  $\mathcal{B}^T$  is the set of Borel subgroups of  $G$  containing  $T$ .

┘

*Proof:* Cf. [Mil17]P363.

□

**Prop. (10.2.4.24).** If  $G \in \mathrm{GrpVar}$  is solvable and  $T \leq G$  is a torus, then  $Z_G(T)$  is connected and  $G = UZ_G(T)$  for some unipotent subgroup  $U \leq G$ .

┘

*Proof:* Cf. [Mil17]P399.?

□

### Białynicki-Birula Decomposition

**Prop. (10.2.4.25)** [Białynicki-Birula Decomposition]. Cf. [Mil17]P272.

┘

## 5 Cohomologies and Extensions

**Notation (10.2.5.1).**

- Let  $G \in \mathrm{AlgGrp}/k$ .
- Use notations on non-Abelian cohomologies defined in [Profinite Cohomology](#).

┘

**Def. (10.2.5.2)** [Galois Cohomology of Algebraic Groups]. For  $G \in \mathrm{AlgGrp}/k$  and  $L/k \in \mathrm{GalField}$ , denote

$$H^1(\mathrm{Gal}(K/k), G) \triangleq H^1(\mathrm{Gal}(K/k), G(K)), \quad H^1(k, G) \triangleq H^1(\mathrm{Gal}_k, G(k^{\mathrm{sep}})) \quad (9.8.4.1),$$

where  $G(K)$  or  $G(k^{\mathrm{sep}})$  is equipped with the discrete topology.

┘

**Prop. (10.2.5.3) [Long Exact Sequence].** Let  $e \rightarrow N \rightarrow G \rightarrow Q \rightarrow e$  be an exact sequence in  $\mathcal{AlgGrp}/k$  s.t.  $N/k$  is smooth (e.g.  $\text{char } k = 0$  (10.1.4.3)), then there is an exact sequence

$$1 \rightarrow N(k) \rightarrow G(k) \rightarrow Q(k) \rightarrow H^1(k, N) \rightarrow H^1(k, Q) \rightarrow H^1(k, Q).$$

┘

*Proof:* This follows from (10.1.5.6) and (9.8.4.4). □

**Def. (10.2.5.4) [Inner Automorphisms].** An **inner automorphism** of  $G$  is an automorphism that its restriction on  $G_{\bar{k}}$  is conjugation by some  $g \in G(\bar{k})$ . ┘

**Prop. (10.2.5.5).** The group of inner automorphisms of  $G$  are isomorphic to  $G_{\text{ad}}(k)$ . ┘

*Proof:* There is an embedding of groups  $G^{\text{ad}} \hookrightarrow \text{Aut}(G)$ , and  $x \in \text{Aut}(G)(k)$  is an inner automorphism iff it is contained in  $G_{\text{ad}}(\bar{k})$ , which means it is contained in  $G_{\text{ad}}(k)$ . □

### Forms of Algebraic Groups

**Thm. (10.2.5.6) [Forms of Vector Spaces and Galois Cohomologies].** Let  $V \in \mathcal{Vect}^{\text{fin}}/k$  and  $t_i \in V^{\otimes r_i} \otimes (V^{\vee})^{\otimes s_i}$ , and let  $G \leq \mathbf{GL}(V)$  is the algebraic subgroup fixing each  $t_i$ , then for any  $K/k \in \mathcal{GalField}$ ,  $H^1(\text{Gal}(K/k), G)$  classifies  $K/k$ -forms of  $(V, \{t_i\})$ . (This is a special case of (7.1.5.2)). ┘

*Proof:* Let  $(V', t')$  be a  $K/k$ -form of  $(V, t)$  with an isomorphism  $f : (V, \{t_i\})_K \cong (V', \{t'_i\})_K$ , then the map

$$\sigma \mapsto a_{\sigma}(f) = f^{-1} \circ \sigma(f), \text{ where } \sigma \in \text{Gal}(K/k)$$

defines a 1-cocycle in  $H^1(\text{Gal}(K/k), G)$ , and the cohomology class doesn't depend on  $f$  (9.8.4.1). And if another  $K/k$ -form  $(V_1, \{t_{1,i}\})$  with an isomorphism  $f_1 : (V, \{t_i\})_K \cong (V_1, \{t_{1,i}\})_K$  satisfies  $[a_{\sigma}(f)] = [a_{\sigma}(f_1)]$ , then there exists  $g \in G(K)$  s.t.

$$f_1^{-1} \circ \sigma(f_1) = g^{-1} f^{-1} \circ \sigma(f) \sigma(g), \text{ where } \sigma \in \text{Gal}(K/k).$$

Thus  $f \circ g \circ f_1^{-1} = \sigma(f \circ g \circ f_1^{-1})$  for any  $\sigma \in \text{Gal}(K/k)$ . Thus  $f \circ g \circ f_1^{-1}$  is an isomorphism from  $(V_1, \{t_{1,i}\})$  to  $(V, \{t_i\})$ .

Conversely, for any cohomology class  $(a_{\sigma})_{\sigma \in \text{Gal}(K/k)} \in H^1(\text{Gal}(K/k), G)$ , define a new semi-linear action of  $\text{Gal}(K/k)$  on  $V_K$  by

$$\sigma'(x) = a_{\sigma} \cdot \sigma(x),$$

and define

$$V' = \{x \in V_K \mid \sigma'(x) = x\}.$$

Then  $V'_K = V_K$  by (7.1.5.24), and  $\sigma'(t_i) = t_i$  for any  $\sigma \in \text{Gal}(K/k)$ , so  $t_i \in (V')^{\otimes r_i} \otimes (V'^{\vee})^{\otimes s_i}$ . Thus  $(V', \{t_i\})$  is a  $K/k$ -form of  $(V, t)$  with  $a_{\sigma}(\text{id}) = a_{\sigma}$ . □

**Def. (10.2.5.7) [Forms of Algebraic Groups].** For  $K/k \in \mathcal{Field}$ , two algebraic groups  $G, G' \in \mathcal{AlgGrp}/k$  are called  $K/k$ -forms of each other if  $G_K \cong G'_K$ . ┘

**Thm. (10.2.5.8) [Forms and Galois Cohomologies].** For  $G \in \mathcal{AlgGrp}/k$  and  $K/k \in \mathcal{GalField}$ , the cohomology group  $H^1(\text{Gal}(K/k), \underline{\text{Aut}}(G))$  classifies  $K/k$ -forms of  $G$  (10.2.5.7). The form  $G'$  corresponding to  $(a_{\sigma})_{\sigma \in \text{Gal}(K/k)}$  satisfies

$$G'(k) = \{x \in G(k^{\text{sep}}) \mid a_{\sigma}(\sigma(x)) = x, \forall \sigma \in \text{Gal}(K/k)\}.$$

┘

*Proof:* This is a special case of (7.1.5.2). Alternatively it can be proved the same way as the proof of (10.2.5.6). □

### Inner Forms

**Def.(10.2.5.9) [Inner Forms of Algebraic Groups].** For  $G \in \text{AlgGrp}/k$  and  $K/k \in \text{GalField}$ , a  $K/k$ -form  $G'$  of  $G$  (10.2.5.7) is called an  $K/k$ -**inner form** of  $G$  if its corresponding cohomology class in  $H^1(\text{Gal}(K/k), \underline{\text{Aut}}(G))$  (10.2.5.8) is contained in the image of the map

$$H^1(\text{Gal}(K/k), G/Z(G)) \rightarrow H^1(\text{Gal}(K/k), \underline{\text{Aut}}(G)).$$

And it is called a **pure inner form** if it is contained in the image of the map

$$H^1(\text{Gal}(K/k), G) \rightarrow H^1(\text{Gal}(K/k), \underline{\text{Aut}}(G)).$$

┘

**Cor.(10.2.5.10).** If  $G, G'$  are inner forms, then  $Z(G) \cong Z(G')$ . ┘

**Def.(10.2.5.11) [Inner Twistings, Vogan[Vog93]].** For  $G \in \text{AlgGrp}/k$  and  $K/k \in \text{GalField}$ , a  $K/k$ -**inner twisting** of  $G$  is a pair  $(G', \xi)$  where  $G' \in \text{AlgGrp}/k$  and  $\xi : G_K \rightarrow (G_1)_K \in \text{AlgGrp}/K$  an isomorphism s.t.  $\xi^{-1}\xi^\sigma \in G_{\text{ad}}(K)$  for all  $\sigma \in \text{Gal}(K/k)$ .

Two  $K/k$ -inner twistings  $(G_1, \xi_1), (G_2, \xi_2)$  are called **isomorphic inner twisting** if there exists an isomorphism  $f : G_1 \rightarrow G_2$  s.t.  $\xi_2^{-1} \circ f \circ \xi_1$  is an inner form of  $G$ . In this way, the set of isomorphism classes of  $K/k$ -inner twists of  $G$  are in bijection with  $H^1(\text{Gal}(K/k), G/Z(G))$ .

Similarly, a  $K/k$ -**pure inner twisting** of  $G$  is a pair  $(G', \xi, z)$  where  $G' \in \text{AlgGrp}/k$  and  $\xi : G_K \rightarrow (G_1)_K \in \text{AlgGrp}/K$  an isomorphism,  $z \in Z^1(\text{Gal}(K/k), G(K))$  s.t.  $\xi^{-1}\xi^\sigma = \text{Ad}(z_\sigma)$  for all  $\sigma \in \text{Gal}(K/k)$ .

Two pure  $K/k$ -inner twistings  $(G_1, \xi_1, z_1), (G_2, \xi_2, z_2)$  are called **isomorphic pure inner twisting** if there exists an isomorphism  $f : G_1 \rightarrow G_2$  and  $g \in G(K)$  s.t.  $\xi_2^{-1} \circ f \circ \xi_1 = \text{Ad}(g)$  and  $(z_2)_\sigma = g(z_1)_\sigma \sigma(g^{-1})$  for all  $\sigma \in \text{Gal}(K/k)$ . In this way, the set of isomorphism classes of pure  $K/k$ -inner twists of  $G$  are in bijection with  $H^1(\text{Gal}(K/k), G(K))$ . ┘

**Prop.(10.2.5.12) [Hilbert's Theorem 90].** For  $K/k \in \text{GalField}$ ,  $H^1(\text{Gal}(K/k), \text{GL}(n)) = 1$  (10.2.5.2). In particular,  $H^1(k, \text{GL}(n)) = 1$ .

More generally, if  $A \in \text{Ring}^{\text{fin}}/k$ , then  $H^1(\text{Gal}(K/k), A^\times) = 1$ . ┘

*Proof:* We prove any cocycle is a coboundary, for this, notice any cocycle factor through a finite quotient (because it maps  $e$  to  $1$ ), and the images of it is contained in a finite extension of  $K$ , hence it reduces to the case when  $[K : k] < \infty$ . Then the assertion follows from (10.2.5.6).

For the second assertion, notice that if  $W, W'$  are  $A$ -modules s.t.  $W_K \cong W'_K$  as  $A_K$ -modules, then  $W^{\oplus [K:k]} \cong (W')^{[K:k]}$ , thus  $W \cong W'$  as  $A$ -modules, by Krull-Schmidt theorem (Cf. [Krull-Schmidt categories and projective covers]?). ┘

**Cor.(10.2.5.13).** For  $K/k \in \text{GalField}$ , we have  $H^1(\text{Gal}(K/k), \text{SL}(n)) = 1$  (10.2.5.2). In particular,  $H^1(k, \text{SL}(n)) = 1$ . ┘

*Proof:* This is seen from the exact sequence  $1 \rightarrow \text{SL}(n; K) \rightarrow \text{GL}(n; K) \rightarrow K^\times \rightarrow 1$ . ┘

**Prop.(10.2.5.14) [No Pure Inner forms for  $\text{Sp}(n)$ ].** If  $\text{char } k \neq 2$  and  $K/k \in \text{GalField}$ , then  $H^1(\text{Gal}(K/k), \text{Sp}(n)) = 1$  (10.2.5.2). In particular,  $H^1(k, \text{Sp}(n)) = 1$ . ┘

*Proof:* Similar to the proof of (10.2.5.12), we may assume that  $[K : k] < \infty$ . Then this follows from (10.2.5.6) and the fact that any two non-degenerate alternating forms on  $k^n$  are congruent, by (3.5.11.26). ┘

**Prop. (10.2.5.15) [Non-degenerate Quadratic Spaces].** If  $\text{char } k \neq 2$  and  $V/k$  is a non-degenerate quadratic space, then  $H^1(k, \text{O}(V))$  classifies the isomorphism classes of non-degenerate quadratic spaces over  $k$  of dimension  $\dim V$ .  $\lrcorner$

*Proof:* This follows from (10.2.5.6) and the fact that any two non-degenerate quadratic forms on  $(k^{\text{sep}})^{\oplus n}$  are congruent.  $\square$

**Prop. (10.2.5.16) [No Inner Forms over Finite Fields].** If  $k \in \text{Field}^{\text{fin}}$  and  $G \in \text{GrpVar}/k$ , then  $H^1(k, G) = 1$ .  $\lrcorner$

*Proof:* For any 1-cocycle  $f : \text{Gal}_k \rightarrow G(\bar{k})$ , by Lang's theorem (10.6.0.2), there exists  $g \in G(\bar{k})$  s.t.  $f(\varphi_k) = g^{-1} \text{Frob}(g)$ . Thus  $f$  agrees with the principle cocycle defined by  $g$  on  $\varphi_k$ , thus they agree for any power of  $\varphi_k$ , and thus  $f$  is a coboundary by continuity.  $\square$

## 6 Triangularizable Algebraic Groups

**Notation (10.2.6.1).**

- Let  $k \in \text{Field}$ .
- Let  $G \in \text{linAlgGrp}/k$ .

$\lrcorner$

**Def. (10.2.6.2) [Triangularizable Algebraic Groups].** A **triangularizable algebraic group** is an algebraic group s.t. every simple representation has dimension 1. Equivalently, for any  $V \in \text{Rep}^{\text{fd}}(G)$  (or for some faithful representation  $V \in \text{Rep}^{\text{fd}}(G)$ ), there exists a basis of  $V$  s.t.  $G$  is mapped into  $\text{B}(n)$ .  $\lrcorner$

**Prop. (10.2.6.3).** Unipotent algebraic groups and diagonalizable algebraic groups are triangularizable by definitions (10.3.4.3) (10.2.3.5).  $\lrcorner$

**Prop. (10.2.6.4) [Characterizing Triangularizable Groups].** The following are equivalent:

- $G$  is triangularizable.
- Every  $V \in \text{Rep}^{\text{fd}}(G)$  is triangularizable.
- $G$  is isomorphic to an algebraic subgroup of  $\text{B}(n)$  for some  $n \in \mathbb{Z}_+$ .
- There exists a normal unipotent algebraic subgroup  $U \leq G$  s.t.  $G/U$  is diagonalizable.

$\lrcorner$

*Proof:* Cf. [Mil17] P325. ?  $\square$

**Cor. (10.2.6.5).** Subgroups, quotients and base change of triangularizable subgroups are triangularizable.  $\lrcorner$

**Prop. (10.2.6.6) [Largest Unipotent Subgroups].** The following are equivalent:

- $G_{k'}$  is triangularizable for some separable field extension  $k'/k$ .
- $G$  contains a normal unipotent algebraic subgroup  $G_u \trianglelefteq G$  s.t.  $G/G_u$  is of multiplicative type. And in these cases,  $G_u$  is unique and contains every unipotent algebraic subgroup of  $G$ , called the **largest unipotent subgroup** of  $G$ , and we have:

- $G_u$  is the unique normal unipotent subgroup of  $G$  with quotient of multiplicative type. In particular,  $G_u$  is compatible with base change of fields.

- $G_u$  is the smallest normal subgroup of  $G$  with quotient of multiplicative type. In particular, the formation of  $G_u$  commutes with base change of fields.
- $G_u(\bar{k}) = G(\bar{k})_u$ .

⌋

*Proof:* Cf. [Mil17]P325, 326. ?

□

**Prop. (10.2.6.7) [Structure of Triangularizable Groups].** If  $G$  is a triangularizable group, then there exists a normal series

$$G \triangleright G_0 \triangleright G_1 \triangleright \dots \triangleright G_r = e$$

s.t.

- $G_0 = G_u$  (10.2.6.6).
- For  $i \in \mathbb{N}$ , the action of  $G$  on  $G_i/G_{i+1}$  factors through  $G/G_u$ , and there exists an embedding  $G_i/G_{i+1} \hookrightarrow G_a$  that is equivariant w.r.t. some linear action of  $G/G_u$  on  $G_a$ .

⌋

*Proof:* Cf. [Mil17]P330.

□

**Cor. (10.2.6.8).** If  $k = k^{\text{perf}}$ ,  $G$  is smooth and  $G_u \in \text{GrpVar}/k$ , then the above normal series can be chosen s.t. each  $G_i$  is a group variety, and the embedding  $G_i/G_{i+1} \hookrightarrow G_a$  is an isomorphism.

⌋

*Proof:* Cf. [Mil17]P331.

□

**Cor. (10.2.6.9) [Unipotent Groups split over  $k^{\text{perf}}$ ].** If  $k = k^{\text{perf}}$  and  $U \in \text{GrpVar}/k$  is unipotent, then  $U$  has a central normal series with components isomorphic to  $G_a$ . Moreover, if  $T \cong G_m^r$  is a torus acting on  $U$ , then it is possible to choose the normal series s.t. the action of  $T$  on the components are linear.

⌋

*Proof:*  $G = U \rtimes T$  is a triangularizable group variety by (10.2.6.4), and the assertion follows from (10.2.6.8) for  $G$ .

□

**Prop. (10.2.6.10) [Splitting of Triangularizable Groups].** Let  $e \rightarrow G_u \rightarrow G \xrightarrow{q} D \rightarrow e$  be an exact sequence of algebraic groups over  $k$  s.t.  $G_u$  is unipotent and  $D$  is smooth of multiplicative type, then the sequence splits if either of the following holds:

- $G_u$  is commutative and  $q$  admits a section as a map of schemes.
- $k = \bar{k}$ .
- $k = k^{\text{perf}}$  and  $G_u$  is connected (e.g.  $G$  is connected, by (10.2.6.11)).
- $G_u$  is a split unipotent group.

And in each case, any two right inverse  $s, s' : D \rightarrow G \in \text{AlgGrp}/k$  of  $q$  are conjugate by an element of  $G_u(k)$ , and subgroups of multiplicative type in  $G$  that are maximal are of the form  $s(D)$  for some right inverse  $s : D \rightarrow G \in \text{AlgGrp}/k$  of  $q$ . In particular, they are conjugate under  $G_u(k)$ .

⌋

*Proof:* Cf. [Mil17]P334.

□

**Cor. (10.2.6.11) [Smoothness and Connectedness of  $G_u$ ].** Situation as in (10.2.6.10), if  $G$  is smooth (resp. connected), then so are  $G_u$  and  $G/G_u$ , by (10.1.4.17) and (10.1.4.2), because after base change to  $\bar{k}$ ,  $G \cong G_u \times (G/G_u)$  as schemes.

⌋

## 7 Solvable Groups

**Notation(10.2.7.1).**

- Let  $k \in \mathbf{Field}$ .
- Let  $G \in \mathbf{linAlgGrp}/k$ .

┘

**Thm.(10.2.7.2) [Solvable Group Varieties over Perfect Fields].** Suppose  $k = k^{\text{perf}}$  and  $G$  is a solvable group variety, then

- $G$  is triangularizable after a separable base change by(10.2.6.6), and the largest unipotent subgroup  $G_u \trianglelefteq G$  is a group variety, and the formation of  $G_u$  is compatible with base change of fields.
- The canonical exact sequence  $e \rightarrow G_u \rightarrow G \xrightarrow{q} D \rightarrow e$  splits, and  $D$  is a torus.
- Any two splittings  $s_1, s_2 : D \rightarrow G \in \mathbf{AlgGrp}/k$  are conjugate by action of  $G_u(k)$ .
- Diagonalizable subgroups of  $G$  that are maximal are maximal tori of  $G$  of the form  $s(D)$  for some splitting  $s : D \rightarrow G \in \mathbf{AlgGrp}/k$  of  $q$ . In particular, they are conjugate under  $G_u(k)$ .
- Let  $T \leq G$  be a maximal torus, then  $G = G_u \rtimes T$ .

┘

*Proof:* These follow from(10.2.6.6)(10.2.6.10) and(10.2.6.11). Notice  $D$  is a torus by(10.1.5.33) and(10.2.3.21). □

### Borel Fixed Point Theorem

**Prop.(10.2.7.3).** If  $G \in \mathbf{GrpVar}/k$  is solvable and  $H \leq G \in \mathbf{AlgGrp}$ , then  $G/H$  doesn't contain a proper subscheme of dimension  $> 0$ . In particular,  $G = H$  if  $G/H$  is proper. ┘

*Proof:* Cf.[Mil17]P353. □

**Cor.(10.2.7.4).** If  $G$  is a solvable group variety acting on a separated algebraic scheme  $X$  over  $k$ , then no orbits of  $X$  contains a proper subscheme of dimension  $> 0$ . ┘

*Proof:* By(10.2.1.11), the orbits are quotients of  $G$ . □

**Cor.(10.2.7.5) [Borel Fixed Point Theorem].** Let  $G$  is a split solvable group acting on a  $X \in \mathbf{Sch}^{\text{proper}}/k$  and  $X(k) \neq \emptyset$ , then  $X^G(k) \neq \emptyset$ . ┘

*Proof:* Cf.[Mil17]P343.

It suffices to change to  $\bar{k}$  and assume that  $X$  is reduced. Then by(10.2.1.15)  $X$  has a closed orbit, which is then proper, thus must be a point. □

**Cor.(10.2.7.6) [Borel Fixed Point Theorem].** If  $G$  is solvable and acts on a  $X \in \mathbf{Sch}^{\text{proper}}/k$  and  $X \neq \emptyset$ , then  $X^G \neq \emptyset$ . In particular,  $X^G(\bar{k}) \neq \emptyset$ . ┘

*Proof:* It suffices to base change to  $\bar{k}$ , and then the assertion follows from(10.2.7.5). □

**Thm.(10.2.7.7)[Lie-Kolchin].** Suppose  $k = \bar{k}$ , then  $G$  is solvable iff it is triangularizable. In particular, any solvable group variety over  $k$  is a triangularizable after a finite field extension. ┘

*Proof:* For any  $V \in \mathbf{Rep}^{\text{fd}}(G)$ ,  $G$  acts on the full flag variety of  $V$ . Thus by Borel's fixed point theorem(10.2.7.6), there is a flag in  $V$  that is fixed by  $G$ , which means  $G$  is mapped into  $\text{Unip}(n)$  in this basis.

The converse is true by(10.2.6.4), as  $B(n)$  is solvable. □

### Nilpotent Groups

**Thm. (10.2.7.8).** Let  $G$  be unipotent and connected. Then

- $Z(G)_s$  is the largest algebraic subgroup of  $G$  of multiplicative type, and  $G/Z(G)_s$  is unipotent.
- If  $G$  becomes trigonalizable over a separable extension of  $k$ , then it has a unique decomposition  $G = G_u \times Z(G)_s$  where  $G_u$  is unipotent and  $Z(G)_s$  is of multiplicative type.
- If  $G$  is smooth, then  $Z(G)_s \in \text{Tori}/k$ .

┘

### Split Solvable Groups

**Prop. (10.2.7.9) [Split Solvable Groups].** Split solvable groups (10.1.1.4) are group varieties by (10.1.5.33). Extensions and quotients of split solvable groups are split solvable. ┘

*Proof:* ?

□

**Prop. (10.2.7.10) [Split Solvable Groups are Triangularizable].** Suppose  $G \in \text{GrpVar}/k$ . If  $G$  is a split solvable group, then  $G$  is triangularizable (10.2.6.2), and the converse is true if  $k = k^{\text{perf}}$ . ┘

*Proof:* Take a faithful representation  $V \in \text{Rep}^{\text{fd}}(G)$ , then  $G$  acts on the full flag variety  $\text{Flag}(V)$ . Then  $G$  fixes a flag by Borel fixed point theorem (10.2.7.5), which implies that  $G$  is triangularizable (10.2.6.2). Conversely, if  $k = k^{\text{perf}}$  and  $G$  is triangularizable, then  $G_u$  (10.2.6.6) is a group variety by (10.2.6.11) and  $G/G_u$  is a split torus by (10.2.6.11).  $G_u$  is split unipotent by (10.2.6.9), and thus  $G$  is split solvable. □

**Cor. (10.2.7.11).** If  $k = k^{\text{perf}}$ , then unipotent group varieties over  $k$  are split solvable groups, by (10.2.6.3). ┘

**Prop. (10.2.7.12) [Characterizing Split Solvable Groups over  $\bar{k}$ ].** If  $k = \bar{k}$ , the following are equivalent:

- $G$  is a triangularizable group variety.
- $G$  is split solvable.
- $G$  is a group variety, and  $G(k)$  is a solvable group.
- $G$  is a solvable group variety.

┘

*Proof:* 1  $\iff$  2 follows from (10.2.7.10).

2  $\rightarrow$  3 follows from (10.2.7.9).

3  $\rightarrow$  4: By considering the derived series of  $G$  (10.1.4.30), this follows from (10.1.4.29).

4  $\rightarrow$  1 follows from Lie-Kolchin theorem (10.2.7.7). □

**Prop. (10.2.7.13) [Structure of Split Solvable Groups].** If  $G$  is split solvable, then

- $G$  is triangularizable by (10.2.7.10), and the largest unipotent subgroup  $G_u \trianglelefteq G$  (10.2.6.6) is split unipotent.
- The canonical exact sequence  $e \rightarrow G_u \rightarrow G \xrightarrow{q} D \rightarrow e$  splits, and  $D$  is a split torus.
- Any two splittings  $s_1, s_2 : D \rightarrow G \in \text{AlgGrp}/k$  are conjugate by action of  $G_u(k)$ .

- Subgroups of multiplicative type in  $G$  that are maximal are split maximal torus of the form  $s(D)$  for some right inverse  $s : D \rightarrow G \in \text{AlgGrp}/k$  of  $q$ . In particular, they are conjugate under  $G_u(k)$ .
- Let  $T \leq G$  be a split maximal torus, then  $G = G_u \rtimes T$ .

┘

*Proof:* We can prove  $G_u$  is split unipotent by induction on  $\dim G$ , and  $D$  is a torus by (10.1.5.33) and (10.2.3.21). Also we can prove  $D$  is a split torus by induction on  $\dim G$  using (10.2.3.20). So the assertions follow from (10.2.6.6) and (10.2.6.10).  $\square$

**Prop. (10.2.7.14) [Torsors for Split Solvable Groups].** Suppose  $G$  is split solvable.

- If  $X \in \text{Aff}^{\text{ft}}/k$  and  $\text{Pic}(X) = 0$ , then every  $G$ -torsor on  $X$  is trivial.
- If  $X \in \text{Aff}^{\text{ft}}/k$  and  $G$  is unipotent, then every  $G$ -torsor on  $X$  is trivial.
- Every  $G$ -torsor is Zariski-locally trivial.

┘

*Proof:* Cf. [Mil17]P344.  $\square$

**Cor. (10.2.7.15).** If  $G$  is a split solvable, then  $G \cong \mathbb{A}^r \times (\mathbb{A}^1 \setminus 0)^{\dim G - r}$ , where  $r = \dim G_u$  (10.2.7.13).

┘

*Proof:* Cf. [Mil17]P344.  $\square$

**Thm. (10.2.7.16) [Rosenlicht].** If  $G$  is a solvable group variety, then  $G$  is split solvable iff there exists a dominant map of  $k$ -schemes  $\varphi : (\mathbb{A}^1 \setminus 0)^n \rightarrow G$  for some  $n \in \mathbb{Z}_+$ , or equivalently, a homomorphism of  $k$ -algebras:  $\varphi_* : \Gamma(G) \rightarrow k[T_1, \dots, T_n, T_1^{-1}, \dots, T_n^{-1}]$  for some  $n \in \mathbb{Z}_+$ .  $\square$

*Proof:* Cf. [Mil17]P345.  $\square$

**Thm. (10.2.7.17) [Lazard].** The following are equivalent:

- There exists an isomorphism of  $k$ -schemes  $G \cong \mathbb{A}^{\dim G}$ .
- $G$  is split unipotent.
- $G$  is reduced and solvable, and there exists a dominant map of  $k$ -schemes  $\varphi : \mathbb{A}^n \rightarrow G$  for some  $n \in \mathbb{Z}_+$ .

┘

*Proof:* Cf. [Mil17]P345.

1  $\iff$  2 follows from (10.2.7.11) and (10.2.7.15).

1  $\rightarrow$  3 is trivial.

3  $\rightarrow$  1: ? We only prove for  $G$  geo.reduced:  $G$  is geo.reduced and connected, thus a group variety, and then  $G$  is split solvable by (10.2.7.16). Thus  $G \cong \mathbb{A}^r \times (\mathbb{A}^1 \setminus 0)^{\dim G - r}$ , where  $r = \dim G_u$  by (10.2.7.15). There are no dominant maps  $\mathbb{A}^n \rightarrow \mathbb{A}^1 \setminus 0$ , so  $G = G_u$ , which is split unipotent (10.2.7.13).  $\square$

### 10.3 Representations of Algebraic Groups I: Elementary Theory

References are [Mil17] and [Representations of Algebraic Groups, Jantzen].

**Notation (10.3.0.1).**

- Let  $k \in \mathbf{Field}$ .
- Let  $R \in \mathbf{CRing}$ .
- Let  $G \in \mathbf{linAlgGrp}^{\text{aff}}/k$ .

┘

#### 1 Basics

**Def. (10.3.1.1) [Linear Representations of Algebraic Groups].** Let  $V$  be a free  $R$ -module and let  $\text{GL}(V)$  be the group functor

$$\mathcal{C}\text{Alg}_R \rightarrow \mathbf{Grp} : R' \mapsto \text{Aut}(V \otimes_R R').$$

Then a **linear representation**  $(r, V)$  of an arbitrary group scheme  $G/R$  is a homomorphism of group functors  $r : G \rightarrow \text{GL}_R(V)$ . It is called **faithful representation** if  $r$  is a monomorphism as natural transformation of functors.

If  $V/R$  is finite free, this is equivalent to a homomorphism  $G \rightarrow \text{GL}(V)$ . And by (10.1.5.7), it is faithful iff  $G \rightarrow \text{GL}(V)$  is a closed embedding.

For a linear representation  $(r, V)$ , let  $\text{End}(V) = \text{Aut}(r)$ .

┘

**Prop. (10.3.1.2) [Representations and Co-modules].** A representation of an arbitrary group scheme  $G/R$  on a free  $R$ -module  $V/R$  is equivalent to a right  $\Gamma(G)$ -comodule structure on  $V$  (3.11.2.22). ┘

*Proof:* Let  $A = \Gamma(G)$ . For any representation  $r : G \rightarrow \text{GL}(V)$ , it induces a map  $G(A) \rightarrow \text{GL}_A(V \otimes A)$ , which maps  $\text{id}_A$  to a map  $\rho : V \rightarrow V \otimes A$ . Now if  $\rho(e_j) = \sum e_i \otimes a_{ij}$ , then by functoriality, the map  $G(R') \rightarrow \text{GL}_{R'}(V \otimes R')$  is given by  $g \mapsto (e_j \mapsto e_i \otimes a_{ij}(g))$ .

And it can be verified that this is a group homomorphism iff the comodule condition is satisfied.

□

**Def. (10.3.1.3) [Stabilizers].** Let  $(r, V)$  be a representation of  $G$ ,  $W$  a subspace of  $V$ , consider the functor

$$\text{Stab}_G(W) : R' \mapsto \{g \in G(R') \mid g(W_{R'}) = W_{R'}\},$$

then if  $V$  is of f.d.,  $\text{Stab}_G(W)$  is representable by a closed subgroup of  $G$ , called the **stabilizer group scheme** of  $W$  in  $V$ . ┘

*Proof:* Let  $\rho : \Gamma(G) \rightarrow V \otimes \Gamma(G)$  be the comodule action corresponding to  $r$ , let  $\{e_i\}_{i \in I}$  be a basis for  $W$ , and extends it to a basis  $\{e_i\}_J \coprod_I$  of  $V$ , and

$$\rho(e_j) = \sum e_i \otimes a_{ij}, \quad a_{ij} \in \Gamma(G).$$

Let  $g \in \text{Hom}(\Gamma(G), R')$ , then  $ge_j = \sum e_i \otimes g(a_{ij})$ , and then clearly  $G_W$  is represented by the quotient of  $\Gamma(G)$  by the ideal generated by  $\{a_{ij} \mid i \in I, j \in J\}$ . ┘

**Cor. (10.3.1.4).** If  $S \in \mathbf{Sch}$  and  $G$  is an affine group scheme over  $S$ ,  $\mathcal{V}$  a locally free sheaf on  $S$  and  $\mathcal{W}$  a locally free subsheaf of  $\mathcal{V}$ , then similarly  $\text{Stab}_G(\mathcal{W})$  is representable by a closed subgroup of  $G$  over  $S$ . ┘

*Proof:* By considering affine-locally, and modify the proof of (10.3.1.3) to replace  $k$  by an arbitrary  $R \in \mathcal{CRing}$ .  $\square$

**Cor. (10.3.1.5).** Let  $(\rho, V)$  be a f.d. representation of  $G$  and  $S \subset G(k)$  be a subset schematically dense in  $G$ , then a subspace  $W \subset V$  is stable under  $G$  iff it is stable under  $S$ .  $\lrcorner$

**Prop. (10.3.1.6) [Fixed Subspace].** Let  $(r, V) \in \text{Rep}_k^{\text{fd}}(G)$ , define the **fixed subspace** by  $G$ :

$$V^G = \{v \in V \mid gv_R = v_R, \forall R \in \mathcal{CRing}_k, g \in G(R)\}.$$

Then for any  $R \in \mathcal{CAlg}_k$ ,  $V^G \otimes R$  is the submodule of  $V \otimes R$  that is fixed by elements of  $G(R')$  for any  $R' \in \mathcal{CAlg}_R$ .  $\lrcorner$

*Proof:* Cf. [Mil17]P96.  $\square$

**Cor. (10.3.1.7).** The fixed subspace is compatible with base change of fields.  $\lrcorner$

**Def. (10.3.1.8) [Subrepresentations].** For  $V \in \text{Rep}_k(G)$ , a subspace  $W \subset V$  is called a **subrepresentation** of  $V$  if  $G = \text{Stab}_G(W)$ .

A linear representation is called **simple** if has no non-trivial subrepresentations.  $\lrcorner$

**Prop. (10.3.1.9).** Let  $U$  be a normal subgroup of  $G$ , then for any representation  $V \in \text{Rep}_k^{\text{fd}}(G)$ ;  $V^U$  is a subrepresentation of  $V$ .  $\lrcorner$

**Prop. (10.3.1.10) [Union of F.D. Subrepresentations].** Any  $(\rho, V) \in \text{Rep}_k(G)$  is a filtered union of its f.d. subrepresentations.  $\lrcorner$

*Proof:* It suffices to consider comodules and prove any vector  $v \in V$  is contained in a f.d. submodule. Let  $\{e_i\}$  be a basis of  $\Gamma(G)$ , let

$$\Delta(e_i) = \sum_{j,k} r_{ijk} e_j \otimes e_k, \quad \rho(v) = \sum_i v_i \otimes e_i, \quad v_i \in V.$$

Because  $(\text{id}_V \otimes \Delta) \circ \rho = (\rho \otimes \text{id}_{\Gamma(G)}) \circ \rho$  (3.11.2.22), thus

$$\sum_{i,j,k} r_{ijk} v_i \otimes e_j \otimes e_k = \sum_k \rho(v_k) e_k$$

which means

$$\rho(v_k) = \sum_{j,k} r_{ijk} v_i \otimes e_j.$$

Thus  $\text{span}\{v_i\}$  is a f.d. comodule of  $V$  containing  $v$ .  $\square$

**Cor. (10.3.1.11).** Any simple representations of  $G$  is of f.d.  $\lrcorner$

**Cor. (10.3.1.12) [Schur's Lemma].**  $(V, r)$  is a simple representation of  $G$ , then  $\text{End}(V)$  is a f.d. division algebra  $D$  over  $k$ . In particular, if  $k = \bar{k}$ , then  $\text{End}(V) = k$ .  $\lrcorner$

**Prop. (10.3.1.13) [Simple Representations of Product Groups].** Let  $G_1, G_2 \in \text{AlgGrp}/k$  and  $V_1, V_2$  are simple representations of  $G_1, G_2$  resp., then  $V_1 \otimes V_2$  is a simple representation of  $G_1 \times G_2$ .

Conversely, if  $\text{End}(V) = k$  for any simple representation  $(V, r)$  of  $G_1$ , then any simple representation of  $G_1 \times G_2$  is of this form.  $\lrcorner$

*Proof:* Cf.[Mil17]P91. □

**Def. (10.3.1.14) [Semisimple Representations].** A linear representation  $(r, V)$  of an algebraic group is called **semisimple** if it is a direct sum of simple representations. Equivalently, it is a sum of simple subrepresentation. (The proof is the same).

Or equivalently, every submodule has a complement. ┘

**Prop. (10.3.1.15) [Base Change of Fields].** Let  $(V, r) \in \text{Rep}^{\text{fd}}(G)$ ,  $k'/k$  a field extension, then  $(V', r') = (V, r) \otimes_k k'$  is a representation of  $G_{k'}$ , and

- If  $(V', r')$  is simple(resp. semisimple), and  $(V, r)$  is simple(resp. semisimple).
  - If  $(V, r)$  is simple and  $\text{End}(V) = k$ , then  $(V', r')$  is simple.
  - If  $(V, r)$  is semisimple and  $(k'/k)$  is separable or  $\text{End}(V)$  is a separable algebra over  $k$ , then  $(V', r')$  is semisimple.
- ┘

*Proof:* Cf.[Mil17]P90.

1: This is trivial.

2:

3: □

**Prop. (10.3.1.16) [Constructing All F.D. Representations].** Let  $V \in \text{Rep}^{\text{fd}}(G)$  is faithful, then every  $W \in \text{Rep}^{\text{fd}}(G)$  is a subquotient of  $V^m \otimes (V^\vee)^n$ . ┘

*Proof:* Cf.[Mil17]P88. □

**Def. (10.3.1.17) [Diagonalizable Representation].** A representation of  $G$  is called a **diagonalizable representation** if it is a direct sum of 1-dimensional representations.

Let  $(\rho, V) \in \text{Rep}(G)$ . If  $V$  is a sum of 1-dimensional representations, then  $\rho$  is diagonalizable(10.3.1.17). ┘

*Proof:* Let  $V = \sum_{\chi \in X(G)} V_\chi$ . If the sum is not direct, then there is some relation  $v_1 + v_2 + \dots + v_m = 0$  for  $v_i \in V_{\chi_i}$ . Applying  $\rho$  shows

$$0 = v_1 \otimes a(\chi_1) + \dots + v_m \otimes a(\chi_m)$$

so any coordinate of  $v_i$  is 0 by(10.1.1.11). □

**Prop. (10.3.1.18) [Chevalley].** Any algebraic subgroup  $H \leq G$  arises as the stabilizer of a 1-dimensional subspace in a f.d. representation of  $G$ . ┘

*Proof:* Cf.[Mil17]P94. □

**Cor. (10.3.1.19).** If  $\text{char } k = 0$ , then an algebraic subgroup  $H$  of  $G$  is normal in  $G$  iff for any linear representation  $V$  of  $G$  and a character  $\chi \in X(H)$ , the eigenspace  $V_\chi$  is stable under  $G$ . ┘

*Proof:* □

**Prop. (10.3.1.20).** If  $\#\pi_0(G)$  is prime to  $\text{char } k$ , then any representation  $V$  of  $G$  is semisimple iff it's semisimple when restricted to  $G^0$ . ┘

### Linear Algebraic Group

**Def. (10.3.1.21) [Linear Algebraic Groups].** A **linear algebraic group** over  $R$  is a closed subgroup scheme of  $\mathrm{GL}(n)_R$  for some  $n \in \mathbb{Z}_+$ . The category of linear algebraic groups over  $R$  is denoted by  $\mathrm{linAlgGrp}/R$ .

If  $R = k \in \mathrm{Field}^0$ , then a linear algebraic group over  $k$  is automatically smooth, by Cartier theorem (10.1.4.3).  $\lrcorner$

**Prop. (10.3.1.22) [Affine Algebraic Group is Linear].** The regular representation of  $G$  (10.2.1.2) contains a faithful f.d. sub-representation. In particular, the regular representation is itself faithful, and  $G$  is a linear algebraic group (10.3.1.21).  $\lrcorner$

*Proof:* Let  $\{e_i\}$  be a set of generators of  $\Gamma(G)$  as an  $R$ -algebra. Let  $V$  be a f.d. subrepresentation of the regular representation containing  $\{e_i\}$  which exists by (10.3.1.10), let  $\{v_i\}$  be a basis for  $V$ , and suppose  $\Delta(e_j) = \sum e_i \otimes a_{ij}$ , then the image of  $\Gamma(\mathrm{GL}(V)) \rightarrow \Gamma(G)$  contains  $a_{ij}$ . Now because  $\varepsilon : A \rightarrow R$  is the counit,

$$e_j = (\varepsilon \otimes \mathrm{id})\Delta(e_j) = \sum \varepsilon(e_i)a_{ij},$$

so the image contains  $V$ , so it contains  $\Gamma(G)$  by (10.3.1.10). So  $\Gamma(\mathrm{GL}(V)) \rightarrow \Gamma(G)$  is a closed immersion, thus a faithful representation, by (10.3.1.1).  $\square$

## 2 Tannakian Duality

**Lemma (10.3.2.1).** Let  $G$  be an arbitrary affine group scheme over  $R$  corresponding to a Hopf algebra  $A$ . If  $u$  is an  $R$ -endomorphism of  $A$  s.t. the following diagram commutes:

$$\begin{array}{ccc} A & \xrightarrow{\Delta} & A \otimes A \\ \downarrow u & & \downarrow 1 \otimes u \\ A & \xrightarrow{\Delta} & A \otimes A \end{array}$$

then there exists a  $g \in G(R)$  that  $u = r_A(g)$ , where  $r_A$  is the regular action of  $G$  on  $A$ .  $\lrcorner$

*Proof:* Let  $\varphi : G \rightarrow G$  be the morphism corresponding to  $u$ , then the commutative diagram shows  $\varphi_S(xy) = x\varphi_S(y)$  for  $x, y \in G(S)$ . Then  $\varphi_S(x) = xg_S$  where  $g_S = \varphi_S(e)$ .

Then for  $f \in A, x \in G(R)$ ,  $x(uf) = \varphi_R(x)(f) = (xg)(f) = x(r_A(f))$ , thus  $u = r_A(g)$ .  $\square$

**Prop. (10.3.2.2).** Let  $R \in \mathcal{C}\mathrm{Ring}_k$ . Suppose that for any  $(V, r_V) \in \mathrm{Rep}_k^{\mathrm{fd}}(G)$ , we are given an  $R$ -linear map  $\lambda_R : V_R \rightarrow V_R$  that satisfies:

- $\lambda_{V \otimes W} = \lambda_V \otimes \lambda_W$ .
- $\lambda_1 = \mathrm{id}$ .
- For  $G$ -invariant maps  $u : V \rightarrow W$ ,  $\lambda_W \circ u_R = u_R \circ \lambda_V$ .

then there exists a unique  $g \in G(R)$  that  $\lambda_V = r_V(g)$  for any  $V$ .  $\lrcorner$

*Proof:* Cf. [Milne, P164]. ?  $\square$

**Cor. (10.3.2.3) [Reconstruction Theorem].** Let  $\omega : \mathrm{Rep}_k(G) \rightarrow \mathrm{Vect}_k$  be the forgetful functor, and for any  $k$ -algebra  $R$ , let  $\omega_R = R \otimes \omega$ , then this proposition says the canonical morphism  $G(R) \rightarrow \mathrm{End}^{\otimes}(\omega_R)$  is an isomorphism. Now if  $\underline{\mathrm{Aut}}^{\otimes}(\omega)$  is the functor  $R \mapsto \mathrm{End}^{\otimes}(\omega_R)$ , then  $G \cong \underline{\mathrm{Aut}}^{\otimes}(\omega)$ .  $\lrcorner$

**Cor. (10.3.2.4).** Let  $G, G'$  be affine algebraic groups over  $k$  and let  $F : \mathcal{R}\text{ep}_k(G') \rightarrow \mathcal{R}\text{ep}_k(G)$  be a tensor functor that  $\omega^G \circ F = \omega^{G'}$ , then there exists a unique homomorphism  $f : G \rightarrow G'$  that  $F = \omega^f$ .  $\lrcorner$

*Proof:* Such a tensor functor defines a homomorphism

$$F^* : \underline{\text{Aut}}^\otimes(\omega^G)(R) \rightarrow \underline{\text{Aut}}^\otimes(\omega^{G'})(R)$$

functorial in  $R$ , thus defines a homomorphism  $f : G \rightarrow G'$  by Yoneda lemma and (10.3.2.4).  $\square$

**Lemma (10.3.2.5).** Let  $\mu$  be a cocharacter  $\mathbb{G}_m \rightarrow G$  over  $\overline{\mathbb{Q}_p}$ , then the conjugacy class  $\{\mu\}$  of  $\mu$  is defined over a finite extension  $E/\mathbb{Q}_p$ .  $\lrcorner$

*Proof:* By Tannakian duality, two cocharacters are conjugate over a field  $K$  iff the filtrations they defined on  $V \otimes \overline{\mathbb{Q}_p}$  for some faithful  $V \in \mathcal{R}\text{ep}_{\overline{\mathbb{Q}_p}}(G)$  are isomorphic by an action of  $G(K)$ . Now this action of  $G(\overline{\mathbb{Q}_p})$  on  $V_{\overline{\mathbb{Q}_p}}$  is defined over a f.d. field extension  $E/\mathbb{Q}_p$ , so the filtrations are isomorphic by an action of  $G(E)$ .  $\square$

### Tannakian Reconstruction

**Prop. (10.3.2.6) [Tannakian Reconstruction].** Let  $(\mathcal{C}, \otimes)$  be a rigid Abelian tensor category that  $k = \text{End}(\mathbf{1})$  and  $\omega : \mathcal{C} \rightarrow \mathcal{V}\text{ect}_k^{\text{fin}}$  an exact faithful  $k$ -linear tensor functor, then the functor  $\underline{\text{Aut}}^\otimes(\omega)$  is representable by an affine groups scheme  $G$ , and  $\mathcal{C} \cong \mathcal{R}\text{ep}_k^{\text{fd}}(G)$ .  $\lrcorner$

*Proof:* Cf. [Milne, Tannakian category, P21]. ?  $\square$

**Cor. (10.3.2.7) [Tannakian Reconstruction].** Let  $\mathcal{C} \in \text{AbCat}_k$  and  $\otimes : \mathcal{C} \times \mathcal{C} \rightarrow \mathcal{C}$  a  $k$ -bilinear functor. Suppose there are given a faithful exact  $k$ -linear functor  $F : \mathcal{C} \rightarrow \mathcal{V}\text{ect}_k$  and functorial isomorphisms

$$\varphi_{X,Y,Z} : X \otimes (Y \otimes Z) \rightarrow (X \otimes Y) \otimes Z, \quad \psi_{X,Y} : X \otimes Y \rightarrow Y \otimes X$$

s.t.

- $F$  commutes with  $\otimes$ , and maps  $\varphi$  and  $\psi$  to the natural associativity and commutativity isomorphism in  $\mathcal{V}\text{ect}_k$ .
- There exists an identity object  $\mathbf{1} \in \mathcal{C}$  that  $k \rightarrow \text{End}(\mathbf{1})$  is an isomorphism and  $\dim_k F(\mathbf{1}) = 1$ .
- Any object  $L \in \mathcal{C}$  s.t.  $\dim_k F(L) = 1$  is an invertible object.

Then  $\mathcal{C}$  is equivalent to  $\mathcal{R}\text{ep}_k^{\text{fd}}(G)$  for some affine group scheme  $G$  over  $k$ . In fact,  $G \cong \underline{\text{Aut}}^\otimes(\omega)$  as in (10.3.2.3)  $\lrcorner$

*Proof:* The proof of (10.3.2.6) shows  $F$  defines an equivalence of categories  $\mathcal{C} \rightarrow \mathcal{R}\text{ep}_k^{\text{fd}}(G)$  where  $G$  is an affine monoid scheme representing  $\text{End}_k^\otimes(\omega)$ . Thus we may assume  $\mathcal{C} = \mathcal{R}\text{ep}_k(G)$ . For the rest, Cf. [Tannakian Categories, Milne, P24].  $\square$

**Cor. (10.3.2.8) [Real Algebraic Envelopes].** For  $K \in \text{TopGrp}$ ,  $\mathcal{R}\text{ep}_{\mathbb{R}}^{\text{fd}}(K)$  together with the forgetful functor satisfies the hypothesis of (10.3.2.7), thus there is an affine group  $\widetilde{K} \in \text{GrpSch}^{\text{aff}}/\mathbb{R}$ , called the **real algebraic envelope** of  $K$ , and an equivalence of categories

$$\mathcal{R}\text{ep}_{\mathbb{R}}^{\text{fd}}(\widetilde{K}) \rightarrow \mathcal{R}\text{ep}_{\mathbb{R}}^{\text{fd}}(K)$$

induced by a homomorphism  $K \rightarrow \widetilde{K}(\mathbb{R})$ , which is an isomorphism when  $K$  is compact (? Cf. [Serre, Gerbes], 5.2)  $\lrcorner$

**Cor. (10.3.2.9) [Hochschild-Mostow Group].** Similar as (10.3.2.8), if  $G$  is a complex Lie group or a f.g. abstract group, then  $\text{Rep}^{\text{fd}}(G)$  satisfies the hypothesis of (10.3.2.7), thus there exists a unique  $A(G) \in \text{GrpSch}^{\text{aff}}/\mathbb{C}$  with a homomorphism  $P : G \rightarrow A(G)$  that induces an equivalence of categories

$$\text{Rep}^{\text{fd}}(A(G)) \cong \text{Rep}^{\text{fd}}(G).$$

This  $A(G)$  is called the **Hochschild-Mostow group** of  $G$ . ┘

**Cor. (10.3.2.10) [Lie Algebra Representations].** For  $\mathfrak{g} \in \text{LieAlg}_k$ ,  $\text{Rep}_k^{\text{fd}}(\mathfrak{g})$  together with the forgetful functor to  $\text{Vect}_k^{\text{fin}}$  satisfies the hypothesis of (10.3.2.7), thus there exists a unique  $G(\mathfrak{g}) \in \text{GrpSch}^{\text{aff}}/k$  with a homomorphism  $P : U(\mathfrak{g}) \rightarrow G(\mathfrak{g})$  that induces an equivalence of categories

$$\text{Rep}^{\text{fd}}(G(\mathfrak{g})) \cong \text{Rep}^{\text{fd}}(\mathfrak{g}).$$

┘

**Prop. (10.3.2.11).** Let  $\mathcal{C} \in \text{AbCat}_k$ , and let  $\omega : \mathcal{C} \rightarrow \text{Vect}_k^{\text{fin}}$  be an exact faithful  $k$ -linear functor, then there exists a coalgebra  $C$  s.t.  $\mathcal{C}$  is equivalent to the category of  $C$ -comodules of f.d. ┘

*Proof:* Cf. [Mil17] P175. □

### Properties of $G$ and $\text{Rep}_k^{\text{fd}}(G)$

**Prop. (10.3.2.12).** Let  $G/k$  be an arbitrary affine group scheme, then:

- $G$  is finite iff there exists an object  $X \in \text{Rep}_k^{\text{fd}}(G)$  that every object of  $\text{Rep}_k^{\text{fd}}(G)$  is isomorphic to a subquotient of  $X^n$  for some  $n > 0$ .
- $G$  is algebraic iff there exists an object  $X \in \text{Rep}_k^{\text{fd}}(G)$  that every object of  $\text{Rep}_k^{\text{fd}}(G)$  is isomorphic to a subquotient of  $X^n \otimes (X^\vee)^m$  for some  $m, n \geq 0$ .

┘

*Proof:* Cf. [Milne, Tannakian categories, P25]. □

**Prop. (10.3.2.13).** Let  $f : G \rightarrow G' \in \text{linAlgGrp}/k$ , and let  $\omega^f$  be the corresponding functor  $\text{Rep}_k(G') \rightarrow \text{Rep}_k(G)$ . Then

- $f$  is faithfully flat iff  $\omega^f$  is fully faithful and each  $\omega^f$  induces an equivalence of subobjects of  $X'$  and  $\omega^f(X')$ .
- $f$  is a closed immersion iff every object of  $\text{Rep}_k^{\text{fd}}(G)$  is isomorphic to a subquotient of an object  $\omega^f(X')$ .

┘

*Proof:* Cf. [Milne, Tannakian categories, P25]. □

**Cor. (10.3.2.14).** Suppose  $\text{char } k = 0$ , then  $G$  is connected iff for any  $1 \neq V \in \text{Rep}_k(G)$ ;  $\langle V \rangle$  is not stable under  $\otimes$ . ┘

*Proof:* Cf. [Milne, Tannakian categories, P25]. □

### 3 Semi-Simple Elements

References are [Conjugacy Classes in Semisimple Groups, Hymphreys], [Conjugacy Classes, Springer-Steinberg].

**Prop. (10.3.3.1) [Abstract Jordan-Decompositions].** Suppose  $k = k^{\text{perf}}$  and  $g \in G(k)$ , then there exists a unique pair of elements  $(g_s, g_u)$  in  $G(k)$  s.t. for any  $(\rho, V) \in \text{Rep}_k^{\text{fd}}(G)$ , we have  $\rho(g_s) = \rho(g)_s$  and  $\rho(g_u) = \rho(g)_u$  (3.5.10.7). Furthermore,

$$g = g_s g_u = g_u g_s.$$

The elements  $g_s, g_u$  are called the semisimple and unipotent parts of  $g$ , and this decomposition is called the abstract Jordan decomposition of  $g$ .  $g \in G(k)$  is called a **semisimple element** (resp. **unipotent element**) if  $g = g_s$  (resp.  $g = g_u$ ).  $\perp$

*Proof:* This follows from the functoriality of Jordan-decompositions (3.5.10.7) and the reconstruction theorem (10.3.2.2).  $\square$

**Cor. (10.3.3.2).** To check a decomposition is the Jordan-decomposition, it suffices to check for a single faithful representation of  $G$ .  $\perp$

**Remark (10.3.3.3).** If  $k = \bar{k}$  and  $G \in \text{GrpVar}/k$ . In general, the set  $G(k)_s$  of semisimple elements in  $G(k)$  is not closed for the Zariski topology, but the set  $G(k)_u$  of unipotent elements are closed for the Zariski topology. To see this, embed  $G$  into  $\text{GL}(n)$  for some  $n \in \mathbb{Z}_+$ , then the set of unipotent elements are the matrices with characteristic polynomial  $(T-1)^n$ , and this is a polynomial condition.  $\perp$

**Prop. (10.3.3.4) [Semi-Simple Elements and Tori].** Semi-simple elements of  $G$  are exactly elements contained in some maximal torus of  $G$ .  $\perp$

*Proof:* If  $x$  is contained in a torus  $T$ , then for any  $(\rho, V) \in \text{Rep}_k^{\text{fd}}(G)$ , we have  $\rho|_T$  is diagonalizable (10.2.3.23), thus  $\rho(x)$  is diagonalizable, thus semisimple. Conversely, if  $x$  is semisimple, for a faithful representation  $(\rho, V) \in \text{Rep}_k^{\text{fd}}(G)$  (10.3.1.22), then there is a basis of  $V$  s.t.  $\rho(x)$  is diagonal, thus it is contained in the maximal torus of  $G$ , by [Linear Algebraic Groups, Springer] P109?  $\square$

**Thm. (10.3.3.5) [Steinberg].** If  $G \in \text{RedGrp}/k$  and  $x \in G(k)$  is a semi-simple element (10.3.3.1), then  $Z_G(x)^0 \in \text{RedGrp}/k$ . Moreover, if  $[G, G]$  is simply-connected, then  $Z_G(x)$  is connected.  $\perp$

*Proof:* Now take a maximal torus  $T \leq G$  containing  $x$  (10.3.3.4), then  $Z_G(x) = Z_{[G, G]}(x).T$ . By (10.4.2.13), it suffices to prove for  $G$  semisimple. Cf. [Conjugacy Classes, Springer-Steinberg] 2.3.9.?. Use z-extension?  $\square$

### 4 Unipotent Groups

**Def. (10.3.4.1) [Unipotent Groups].**  $G$  is called a **unipotent algebraic group** if  $V^G \neq 0$  for any  $V \in \text{Rep}_k^{\text{fd}}(G)$ . Equivalently, every finite representation sends  $G$  into  $\text{Unip}(n)$  in some coordinates, by (10.3.1.10).  $\perp$

**Prop. (10.3.4.2).** For  $k'/k \in \text{Field}$ ,  $G$  is unipotent iff  $G_{k'}$  is unipotent.  $\perp$

*Proof:* This follows from the fact that for  $V \in \text{Rep}_k^{\text{fd}}(G)$ ;  $(V \otimes k')^{G_{k'}} = V^G \otimes k'$  (10.3.1.7).  $\square$

**Prop. (10.3.4.3) [Characterizing Unipotent Subgroups].** The following are equivalent:

- $G$  is unipotent.
- $G$  is isomorphic to a subgroup of  $\text{Unip}(n)$  for some  $n \geq 2$ .
- The Hopf algebra  $\Gamma(G)$  is coconnected ?.

┘

*Proof:* Cf. [Mil17]P281.

□

**Example (10.3.4.4) [ $\mathbb{G}_a$  is Unipotent].**  $\mathbb{G}_a$  and any subgroups of  $\mathbb{G}_a$  are unipotent, because  $\mathbb{G}_a \cong \text{Unip}(2)$ .

┘

**Prop. (10.3.4.5).** Subgroups, quotient groups, and extensions of unipotent groups are unipotent.

┘

*Proof:* quotient groups and extensions of unipotent groups are unipotent by easy manipulation of the definition (10.3.4.1). Subgroups of unipotent groups are unipotent by (10.3.4.3).

□

**Cor. (10.3.4.6).** If  $\text{char } k = 0$ , then any unipotent algebraic group  $U$  over  $k$  is a group variety.

┘

*Proof:*  $G$  is smooth by (10.1.4.3). Consider  $\pi_0(G) = G/G^0$ , then it is a finite unipotent group by (10.3.4.5), and contained in  $\text{Unip}(n)$  for some  $n \in \mathbb{Z}_+$ . But  $\text{Unip}(n; \bar{k})$  has no elements of finite order, thus  $\pi_0(G) = \mathbf{1}$ .

□

**Prop. (10.3.4.7).** Representations of  $\mathbb{G}_a$  over a field of characteristic 0 corresponds to locally nilpotent endomorphisms.

┘

*Proof:* <https://qchu.wordpress.com/2017/11/26/the-representation-theory-of-the-additive-group-s>

□

**Prop. (10.3.4.8).** If  $U$  is a normal unipotent subgroup of  $G$ , then for any  $V \in \text{Rep}^{\text{fd}}(G)$  semisimple,  $U$  acts trivially on  $V$ .

┘

*Proof:* Consider a simple subrepresentation  $W$  of  $V$ , then  $W^U \neq 0$  is a subrepresentation of  $G$  by (10.3.1.9), thus  $W^U = W$  and  $U$  acts trivially on  $W$ . As  $V$  is a sum of simple representations (10.3.1.14),  $U$  acts trivially on  $V$ .

□

**Cor. (10.3.4.9).** If  $G$  is both unipotent and of multiplicative type, then  $G = e$ .

┘

*Proof:* Let  $(\rho, V)$  be a faithful representation of  $G$  (10.3.1.22), then it is semisimple by (10.2.3.23), but then by definition of unipotency (10.3.4.1),  $G$  acts trivially on  $V$ , so  $G = e$ .

□

**Cor. (10.3.4.10).** The intersection of a unipotent subgroup and a subgroup of multiplicative type in  $G$  is trivial.

┘

*Proof:* This is because unipotency and multiplicative type are both properties that are stable under subgroups, by (10.2.3.14) and (10.3.4.5).

□

**Prop. (10.3.4.11).** If  $G \leq \text{GL}(n)$ , then  $G$  is unipotent iff there is a subgroup of  $G(k)$  that is dense in  $G$  and consists of unipotent elements (10.3.3.1).

┘

*Proof:* One direction is clear. For the other direction, if  $S \subset G(k)$  is such a dense subgroup, then by Kolchin's theorem (24.1.1.13), there is a basis s.t.  $S \subset \text{Unip}(n; k)$ . So  $\text{Unip}(n) \cap G = G$ , and  $G \subset \text{Unip}(n)$ , hence unipotent by (10.3.4.3).

□

**Cor. (10.3.4.12).** If  $G$  is smooth, then  $G$  is unipotent iff elements in  $G(\bar{k})$  are all unipotent (10.3.3.1).  
 $\lrcorner$

*Proof:* Cf. [Mil17]P283. ? □

**Prop. (10.3.4.13) [Unipotent Groups are Nilpotent].** Any unipotent algebraic group admits a central normal series whose subquotients are isomorphic to algebraic subgroups of  $\mathbb{G}_a$ . In particular, any unipotent group is nilpotent, and hence solvable. □

*Proof:* This is because  $\text{Unip}(n)$  has a central normal series of length  $\frac{n(n-1)}{2}$  and subquotients isomorphic to  $\mathbb{G}_a$  (10.1.5.30), and  $G$  is a subgroup of some  $\text{Unip}(n)$  by (10.3.4.3). □

**Def. (10.3.4.14) [Split Unipotent Groups].** A **split unipotent group** is a unipotent algebraic group with a central normal series whose subquotients are all isomorphic to  $\mathbb{G}_a$ . This agrees with the definition in (10.1.1.4). □

**Prop. (10.3.4.15).**  $G$  is unipotent iff any non-trivial subgroup  $U \leq G$  admits a non-trivial homomorphism to  $\mathbb{G}_a$ . □

*Proof:* Cf. [Mil17]P285. ? □

**Prop. (10.3.4.16).** If  $G$  is connected and  $N = \ker(\text{Ad} : G \rightarrow \mathbf{GL}(\mathfrak{g}))$ , then  $N/Z(G)$  is unipotent. □

*Proof:* Cf. [Mil17]P285. ? □

**Prop. (10.3.4.17) [Unipotent Group Varieties over Perfect Fields are Split].** If  $k = k^{\text{perf}}$  and  $G \in \text{GrpVar}/k$  is unipotent (10.3.4.1), then  $G$  is split. □

*Proof:* Cf. [Mil17]Prop14.53 ? or [Bor91]Cor15.5(2). □

**Prop. (10.3.4.18) [Tori and Unipotency].** If  $G \in \text{GrpVar}/k$ , then  $G$  is unipotent iff it contains no non-trivial tori. □

*Proof:* Cf. [Mil17]378. □

**Prop. (10.3.4.19) [Group Acting on Unipotent Groups].** If  $G \in \text{GrpVar}/k$  is unipotent and  $\Gamma \in \text{Grp}^{\text{fin}}$  acts by group homomorphisms on  $G$ . If  $\#\Gamma \neq 0 \in k$ , then  $U^\Gamma \in \text{GrpVar}/k$ . □

*Proof:* Cf. [K-P23]P285. □

**Prop. (10.3.4.20) [Galois Cohomology].** If  $k = k^{\text{sep}}$  and  $U \in \text{GrpVar}/k$  is unipotent, then  $E/F \in \text{GalField}$ , then  $H^1(\text{Gal}(E/F), U(E)) = 0$ . □

*Proof:* This follows from (10.3.4.17) and (9.8.3.1) by induction. □

## 5 Reductive Groups

**Prop. (10.3.5.1).** For  $G \in \text{GrpVar}/k$ , if  $G$  has a faithful semisimple representation, then  $R_u(G) = 1$ , by (10.3.4.8). In particular,  $G$  is reductive if it has a geometrically semisimple faithful representation. □

**Thm. (10.3.5.2) [Representations of Reductive Groups are Semisimple].** Suppose  $k \in \text{Field}^0$  and  $G$  is connected, then the following are equivalent:

- $G \in \text{RedGrp}/k$ .
- Every f.d. representation of  $G$  is semisimple(10.3.1.14).
- Some faithful representation of  $G$  is semisimple(10.3.1.14).

┘

*Proof:* Cf.[Mil17]P477.

□

**Thm. (10.3.5.3) [Semisimple Lie Algebras].** If  $\text{char } k = 0$  and  $\mathfrak{g} \in \text{LieAlg}_k$  is semisimple, there is a Tannakian reconstructed group  $G(\mathfrak{g})$ (10.3.2.10). Then:

- $\eta : \mathfrak{g} \rightarrow \text{Lie}(G(\mathfrak{g}))$  is an isomorphism.
- $G(\mathfrak{g}) \in \text{RedGrp}^{\text{ss}}/k$ .
- For any  $H \in \text{AlgGrp}/k$ , there is an isomorphism

$$\text{Hom}(G(\mathfrak{g}), H) \cong \text{Hom}(\mathfrak{g}, \text{Lie}(H)) : b \mapsto \text{Lie}(b) \circ \eta.$$

- If  $\mathfrak{g}$  is split with root system  $(V, \Phi)$ , then  $G(\mathfrak{g})$  is split semisimple and simply-connected.

┘

*Proof:* Cf.[Mil17]P507.?

□

**Thm. (10.3.5.4) [Representations of Semisimple Groups].** If  $\text{char } k = 0$  and  $G \in \text{RedGrp}^{\text{ss}}/k$ , then  $\mathfrak{g}$  is a semisimple Lie algebra, and the natural functor  $\text{Rep}^{\text{fd}}(G) \rightarrow \text{Rep}^{\text{fd}}(\mathfrak{g})$  is fully faithful. It is essentially surjective if  $G$  is simply-connected.

┘

*Proof:* To show  $\mathfrak{g}$  is semisimple, See [Mil17]P476?

And then  $G(\mathfrak{g})$ (10.3.5.3) is the universal covering of  $G$  by(10.4.5.11). Thus  $\text{Rep}^{\text{fd}}(G) \rightarrow \text{Rep}^{\text{fd}}(G(\mathfrak{g})) \cong \text{Rep}^{\text{fd}}(\mathfrak{g})$  is clearly fully faithful.

□

### Split Reductive Groups

**Notation (10.3.5.5).**

- Let  $(G, B, T) \in \text{RedGrp}/k$  be split with root datum  $(X^\bullet, \Phi, \Phi^\vee)$ .

┘

**Def. (10.3.5.6) [Dominant Weights].** A **dominant weight** is an element  $\lambda \in X^\bullet$  s.t.  $\langle \lambda, \alpha^\vee \rangle \geq 0$  for all  $\alpha \in \Phi^+$ . The set of dominant weights is denoted by  $X^+$ .

┘

**Prop. (10.3.5.7).** For  $\lambda \in X^+$ , the set of dominant weights  $\mu \in X^+$  s.t.  $\mu < \lambda$  is finite.

┘

*Proof:* Choose a scalar product on  $X_{\mathbb{R}}$  that is invariant under  $W$ (3.9.5.5), then for  $\mu \in X^+$  s.t.  $\mu < \lambda$ , we have

$$(\mu, \mu) < (\mu, \lambda) < (\lambda, \lambda)$$

by(3.9.2.4). As  $X$  is discrete in  $X_{\mathbb{R}}$ , the assertion follows.

□

**Thm. (10.3.5.8) [Classifying Simple Representations].** For each dominant weight  $\lambda \in X^\bullet$ (10.3.5.6), there exists a  $V_\lambda \in \text{Irr}(G)$  unique up to isomorphism, s.t.

$$V_\lambda = V_\lambda[\lambda] \oplus \bigoplus_{\mu < \lambda} V_\lambda[\mu],$$

where  $T$  acts on  $V_\lambda[\mu]$  by the character  $\mu$ , and  $\dim_k V_\lambda[\lambda] = 1$ . This is called the **simple representation with highest weight**  $\lambda$ .

Conversely, any irreducible representation of  $G$  is of this form for a unique dominant  $\lambda \in X^\bullet$ . ┘

*Proof:* ? □

**Cor. (10.3.5.9).**  $\text{End}_k(V_\lambda) = k$  because it is generated by  $V_\lambda[\lambda]$ . In particular,  $V_\lambda$  is absolutely simple(10.3.1.15). ┘

**Prop. (10.3.5.10) [Representations and Isogenies].** For  $\lambda \in X^+$ ,  $Z(\tilde{G}) \cong D(\mathbb{P}(\Phi)/Q(\Phi))$  acts on  $V_\lambda$  via the character  $\lambda + Q(\Phi) \in P(\Phi)/Q(\Phi)$ . And if  $(G, B, T) \rightarrow (G', B', T') \in \text{RedGrp}/k$  is a central isogeny of split reductive groups(10.4.5.8), then  $V_\lambda$  factors through  $G'$  iff  $\lambda \in X^\bullet(T')$ . ┘

**Prop. (10.3.5.11) [Dual Representations].** It is easy to see that for  $\lambda \in P^+(\Phi)$ ,  $V_\lambda^* \cong V_{-w_0(\lambda)}$ . ┘

**Def. (10.3.5.12) [Characters of Representations].** For  $V = \bigoplus_{\chi \in X^\bullet} V_\chi \in \text{Rep}^{\text{fd}}(G)$ , the **character** of  $V$  is define to be the element

$$\text{ch}(V) = \sum_{\chi \in X^\bullet} \dim_k(V[\chi])e^\chi \in \mathbb{Z}[X^\bullet].$$

This extends to a homomorphism  $\text{ch} : K_0(\text{Rep}^{\text{fd}}(G)) \rightarrow \mathbb{Z}[X^\bullet]$ . ┘

**Thm. (10.3.5.13).**  $\text{ch} : K_0(\text{Rep}^{\text{fd}}(G)) \rightarrow \mathbb{Z}[X^\bullet]$  is injective with image  $\mathbb{Z}[X^\bullet]^W$ . ┘

*Proof:* By(10.3.5.8), it suffices to show that  $\{\text{ch}(V_\lambda)\}_{\lambda \in X^+}$ (10.3.5.6) form a basis of  $\mathbb{Z}[X^\bullet]^W$ .

As  $W$  acts simply transitively on Weyl chambers, every orbit of  $W$  in  $X^\bullet$  contains exactly one dominant weight. For  $\lambda \in X^+$ ,  $\text{ch}(V_\lambda)$  is fixed by  $W$  because  $W$  acts by inner automorphisms. So  $\text{ch}(V_\lambda) = We^\lambda + \sum_i We^{\lambda_i}$  where  $\lambda_i \in X^+$  and  $\lambda_i < \lambda$ .

From this we see that the map is injective. And because the set of dominant weights smaller than  $\lambda$  are finite(10.3.5.7), it is easy to show by induction or Zorn's lemma that every element in  $\mathbb{Z}[X^\bullet]^W$  is in the image of  $\text{ch}$ . □

**Def. (10.3.5.14) [Infinitesimally Irreducible Representations].**  $(V, r) \in \text{Rep}^{\text{fd}}(G)$  is called **infinitesimally irreducible** if  $(V, \text{Lie}(r)) \in \text{Rep}^{\text{fd}}(\mathfrak{g})$  is irreducible.

By(10.3.5.3), if  $\text{char } k = 0$  and  $G \in \text{RedGrp}^{\text{ss}}/k$ , then  $V \in \text{Rep}^{\text{fd}}(G)$  is irreducible iff it is infinitesimally irreducible. ┘

### Partial-Orderings

**Prop. (10.3.5.15) [Partial-Orderings].** For  $G \in \text{RedGrp}$ ,  $T \leq G$  a maximal torus and  $\Phi^+ \subset \Phi(G, T)$  a system of positive roots, let the partial-ordering on  $X_\bullet(T)_\mathbb{R}$  be as defined in(3.9.5.34), then for  $x, x' \in X_\bullet(T)_\mathbb{R}$ ,  $x \prec x'$  iff for any  $\rho : G \rightarrow \text{GL}(n) \in \text{Rep}_k^{\text{fd}}(G)$ , if  $T' \leq \text{GL}(n)$  is a maximal torus containing  $\rho(T)$ , then

$$\rho(x) \prec \rho(x').$$

┘

*Proof:* Cf.[R-R96]P165. ? □

## 10.4 Group Theory III: Reductive Groups

diagram borrowed from [Mil17]

### Notation(10.4.0.1).

- Let  $k \in \mathbf{Field}$ .
- Let  $R \in \mathbf{CRing}$ .
- Let  $\emptyset \neq S \in \mathbf{Sch}$ .
- Use notations on solvable groups defined in [Group Schemes II: Solvable Groups](#).
- Let  $G, G' \in \mathbf{GrpVar}^{\text{aff}}/k$ .

┘

### 1 Borel Subgroups and Parabolic Subgroups

**Def.(10.4.1.1)[Borel Subgroups].** A **Borel subgroup** of  $G$  is a solvable subgroup variety of  $G$  s.t.  $G/B$  is proper. The set of Borel subgroups of  $G$  is denoted by  $\mathcal{B}_G$ .

A **Borel pair** is a pair  $(B, T)$  where  $B$  is a Borel subgroup of  $G$  and  $T$  is a maximal torus of  $G$ (10.4.1.16) contained in  $B$ .

If  $k'/k \in \mathbf{Field}$ , then  $B \leq G$  is Borel iff  $B_{k'} \leq G_{k'}$  is Borel, by(10.1.5.23) and **?**.

$G$  is called a **quasi-split group** if it contains a Borel subgroup. And  $G$  is called a **split group** if it contains a Borel subgroup that is split(10.1.1.4)(If  $G$  is reductive, This is equivalent to  $G$  containing a split maximal torus by(10.4.4.2)).

┘

**Def. (10.4.1.2) [Parabolic Subgroups].** A **parabolic subgroup**  $P \leq G$  is a smooth closed subgroup s.t.  $G/P$  is proper. In particular, a Borel subgroup is parabolic.  $\lrcorner$

**Prop. (10.4.1.3) [Parabolic and Borel Subgroups].** If  $k = \bar{k}$ , then parabolic subgroups of  $G$  are exactly closed subgroups containing a solvable subgroup of maximal dimension.  $\lrcorner$

*Proof:* If  $P$  contains a solvable subgroup of maximal dimension, then  $G/P$  is proper by 1  $\rightarrow$  2 part of (10.4.1.4). Conversely, if  $G/P$  is proper, then by Borel fixed point theorem (10.2.7.6), if  $B$  is a solvable subgroup of  $G$  of maximal dimension, then  $B$  has a fixed point  $xP \in G/P$  for some  $x \in G(k)$ , which means  $x^{-1}Bx \leq P$ .  $\square$

**Cor. (10.4.1.4) [Characterizing Borel Subgroups over  $\bar{k}$ ].** If  $k = \bar{k}$  and  $H \leq G$  is a closed subgroup, then the following are equivalent:

- $H$  is a solvable subgroup variety of  $G$  of maximal dimension.
- $H$  is Borel (10.4.1.1).
- $H$  is minimally parabolic.

In particular,  $G$  has a Borel subgroup.  $\lrcorner$

*Proof:* 1  $\rightarrow$  2: If  $H$  is maximal solvable, there exists  $V \in \text{Rep}^{\text{fd}}(G)$  s.t.  $H$  is the stabilizer of a 1-dimensional subspace  $L \subset V$ . Now  $B$  acts on  $V/L$ , and by Lie-Kolchin theorem (10.2.7.7),  $B$  fixes a full flag of  $V$ , starting from  $L$ . Thus  $B$  is the stabilizer of this flag. Then because  $B$  is maximal,

2  $\rightarrow$  3: If  $H$  is solvable and  $G/H$  is proper, then it is parabolic by definition (10.4.1.2). And if  $P \leq H$  is a parabolic subgroup of  $G$ , then  $P$  contains a Borel subgroup  $B$  by (10.4.1.3). But because  $H$  is solvable, by definition of Borel subgroup, we have  $B = H$ , so  $H$  is a minimal parabolic subgroup.

3  $\rightarrow$  1: If  $H$  is minimally parabolic, then  $H$  contains a solvable subgroup  $B$  of maximal dimension which is parabolic by (10.4.1.3), and then  $H = B$  by minimality.  $\square$

**Cor. (10.4.1.5).**  $G$  is solvable iff  $G_{\bar{k}}$  contains no properly-contained parabolic subgroups, by (10.1.5.23) and (10.4.1.4).  $\lrcorner$

**Prop. (10.4.1.6) [Minimally Parabolic Subgroups].** Any two minimally parabolic subgroups of  $G$  are conjugate by an element of  $G(k)$ .

In particular, if  $G$  is quasi-split (10.4.1.1), then the minimally parabolic subgroups of  $G$  coincide with Borel subgroups of  $G$ , and any two Borel subgroups of  $G$  are conjugate by an element of  $G(k)$ .  $\lrcorner$

*Proof:* Cf. [Mil17] P546.

The last assertion follows from (10.4.1.4).  $\square$

**Prop. (10.4.1.7) [Split Borel Pairs are Conjugate].**

1. If  $H \leq G$  is a split solvable subgroup and  $B \leq G$  is a split Borel subgroup, then  $gHg^{-1} \leq B$  for some  $g \in G(k)$ .
2. Any two split Borel subgroups of  $G$  (10.4.1.1) are conjugate by an element of  $G(k)$ .
3. (Borel-Tits) Any two maximal split tori of  $G$  are conjugate by an element of  $G(k)$ .
4. If  $G$  is a split group (10.4.1.1), any two split Borel pairs (10.4.1.1) are conjugate by an element of  $G(k)$ .
5. Any split maximal torus is contained in a split Borel pair, and any split Borel subgroup is contained in a split Borel pair.

┘

*Proof:* 1: Let  $H$  acts on  $G/B$  by left multiplication, then by Borel fixed-point theorem(10.2.7.5), there exists a fixed point  $P \in G/B(k)$ . the inverse image of  $P$  in  $G$  is a  $B$ -torsor over  $k$ , which is trivial by(10.2.7.14). Thus  $HgB \subset gB$  for some  $g \in G(k)$ , and then  $H \leq gBg^{-1}$ .

2: This follows from item1.

3: ? Cf.[pesudo-reductive groups]Theorem C.2.3 or [Bor91]Theorem 15.14.

4: For any two split Borel pairs  $(B, T)$  and  $(B', T')$ ,  $B$  and  $B'$  are conjugate by item2, and then use item2 applied to  $B$ .

5: Let  $T$  be a split maximal torus, then  $G$  has a split Borel subgroup by(10.4.4.2), thus  $T$  is contained in a split Borel subgroup by item1. And any split Borel subgroup  $B \leq G$  is conjugate to this Borel subgroup by item2, so  $B$  contains a split maximal torus.  $\square$

**Cor.(10.4.1.8).** Suppose  $k = \bar{k}$  and  $T \leq G$  is a maximal torus. Then for any subgroup variety  $H \leq G$  containing  $T$ ,  $N_G(T)(k)$  acts transitively on the set of  $G(k)$ -conjugates of  $H$  containing  $T$ . In particular,  $N_G(T)(k)$  acts transitively on the set of Borel-subgroups containing  $T$  by(10.4.1.7).  $\square$

*Proof:* Cf.[Mil17]P355. ?  $\square$

**Prop.(10.4.1.9) [Homomorphisms and Borel Subgroups].** Let  $R \in \mathcal{C}\text{Ring}/k$  and  $\varphi_1, \varphi_2 : G_R \rightarrow G'_R$  be homomorphisms that agree on  $B_R$  for some Borel subgroup  $B \leq G$ , then  $\varphi_1 = \varphi_2$ .  $\square$

*Proof:* Cf.[Mil17]P358.  $\square$

**Cor.(10.4.1.10) [Centralizer of Borel Subgroups].** Let  $B \leq G$  be a Borel subgroup, then  $Z(B) = Z_G(B) = Z(G)$ .  $\square$

*Proof:*  $Z_G(B) = Z(G)$  follows from(10.4.1.9).

To show that  $Z(G) \leq B$ , by(10.1.4.10), we may pass to  $\bar{k}$ , and let  $T$  be a maximal torus contained in  $B$ (10.4.1.7). Then  $Z(G) \subset Z_G(T) \leq B$  by(10.4.1.20).  $\square$

**Thm.(10.4.1.11) [Normalizer Theorem, Chevalley].** If  $P \leq G$  is a parabolic subgroup(10.4.1.2), then  $P$  is connected and  $N_G(P) = P$ .  $\square$

*Proof:* Cf.[Mil17]P367. ?  $\square$

**Prop.(10.4.1.12) [Borel Subgroups and Quotient Maps].** Suppose  $k = \bar{k}$ ,  $q : G \rightarrow G'/k$  is a quotient map and  $H \leq G$  is a subgroup variety. If  $H$  is a parabolic subgroup/Borel subgroup/maximally unipotent subgroup/maximal torus, then so is  $q(H)$ , and any such subgroup of  $G'$  arises in this way.  $\square$

*Proof:* Cf.[Mil17]P357. ?  $\square$

**Cor.(10.4.1.13).** Quotients of split groups are split groups(10.4.1.1), by(10.4.1.12) and(10.2.7.9).  $\square$

### Density Theorem

**Thm.(10.4.1.14) [Density Theorem].** Suppose  $k = \bar{k}$ .

- If  $T \leq G$  is a maximal torus, and let  $C = C_G(T)^0$ , then  $\cup_{g \in G(k)} g|C|g^{-1}$  contains a dense open subset of  $|G|$ .
- If  $B \leq G$  is a Borel subgroup, then  $|G| = \cup_{g \in G(k)} g|B|g^{-1}$ .

- Every element of  $G(k)$  is contained in a Borel subgroup of  $G$ . Every normal Borel subgroup equals  $G$ .
- Every semisimple element  $s \in G(k)$  is contained in a maximal torus.

┘

*Proof:* 1, 2: Cf. [Mil17]P362. ?

3 follows from item 1, 2.

4: Let  $B$  be a Borel subgroup containing  $s$ , and let  $T \leq G$  be a maximal torus of  $G$  contained in  $B$  (10.4.1.7). Then the Zariski closure  $S = \overline{\{s\}}$  is diagonalizable by (10.2.3.5). Thus  $S$  is contained in a conjugate of  $T$  by (10.2.7.2).  $\square$

### Maximal Tori and Cartan Subgroups

**Def. (10.4.1.15) [Maximally-Split Tori].** A **maximally-split torus** of  $G$  is a torus  $T \leq G$  s.t.  $T$  contains a maximal split torus of  $G$ .  $\perp$

**Def. (10.4.1.16) [Maximal Tori].** For  $G \in \text{GrpSch}^{\text{aff}}/S$ , a **maximal torus** of  $G$  is an  $S$ -torus  $T \leq G$  s.t.  $T_{\bar{s}} \leq G_{\bar{s}}$  is torus not contained in any other torus of  $G_{\bar{s}}$ , for any geometric point  $\bar{s} \in S$ .  $\perp$

**Prop. (10.4.1.17) [Maximal Tori Exist, Grothendieck [D-G70b]].** Let  $k'/k \in \text{Field}$ , then  $T \leq G$  is a torus that is maximal iff  $T_{k'} \leq G_{k'}$  is a torus that is maximal. In particular, maximal tori exist.  $\perp$

*Proof:*  $T$  is maximal iff it is maximal in  $Z_G(T)$ , which is also a group variety by (10.2.4.10). If  $T' \leq C_G(T)/T$  is a torus, let  $G'$  be the inverse image of  $Z_{Z_G(T)/T}(T')$  in  $C_G(T)$  and let  $T''$  be the inverse image of  $T'$  in  $C_G(T)$ , which are both group varieties, and  $T''$  is normal in  $G'$ . Thus (10.2.3.32) implies that  $T''$  is also a torus.

Thus  $T$  is maximal iff  $Z_G(T)/T$  contains no tori, which is equivalent to  $Z_G(T)/T$  being unipotent by (10.3.4.18). This property and centralizer, quotients are both invariant under base change by (10.3.4.2)(10.2.1.6), thus the assertion follows.  $\square$

**Def. (10.4.1.18) [Ranks and Semisimple Ranks].** The (reductive)**rank of a group variety** of  $G$  is the dimension of a maximal torus in  $G$ . The **semisimple rank** of  $G$  is rank of  $G/R(G)$ .

These are well-defined because maximal tori exist and are conjugate over  $G(k^{\text{sep}})$  by (10.4.1.7).  $\perp$

**Prop. (10.4.1.19) [Nilpotent Groups and Maximal Tori].** Let  $k = \bar{k}$  and  $G \in \text{GrpVar}/k$ , then the following are equivalent:

- $G$  has only one maximal torus.
- Some Borel-subgroup of  $G$  is unipotent.
- $G$  is unipotent.
- Every maximal torus of  $G$  is central.

┘

*Proof:* Cf. [Mil17]P359.  $\square$

**Prop. (10.4.1.20) [Centralizer of Maximal Tori].** If  $T \leq G$  is a maximal torus, then

- $Z_G(T) = N_G(T)^0$ . In particular,  $Z_G(T) \in \text{GrpVar}/k$  by (10.2.4.2).
- $Z_G(T)$  is nilpotent.
- $Z_G(T)$  is contained in any Borel subgroup containing  $T$ .

- $Z_G(T) = Z_G(T)_u \times T$  if  $k = k^{\text{perf}}$ . ┘

*Proof:* 1:  $Z_G(T)$  is connected by (10.2.4.10), so this follows from the rigidity theorem (10.2.3.29). ┘

2: We may pass to  $\bar{k}$  and this follows from (10.4.1.19). ┘

3: We may pass to  $\bar{k}$ . As  $Z_G(T)$  is connected and nilpotent, it is contained in a Borel-subgroup by (10.4.1.4), thus it is contained in any Borel-subgroup by (10.4.1.8). ┘

4: This follows from (10.2.7.8). □

**Cor. (10.4.1.21).** ┘

**Prop. (10.4.1.22).** If  $B \leq G$  is a Borel subgroup and  $T \leq B$  is a torus, then  $Z_G(T) \cap B$  is a Borel subgroup of  $Z_G(T) \in \text{GrpVar}/k$  (10.4.1.20). And if  $k = \bar{k}$ , then any Borel subgroup of  $Z_G(T)$  is of this form. ┘

*Proof:* Cf. [Mil17]P365. ? □

**Def. (10.4.1.23) [Weyl-Groups].** For a maximal split torus  $S \leq G$ , the **Weyl-group**  $W(G, S)$  is defined to be the finite group ┘

$$W(G, S) \triangleq N_G(S)/Z_G(S) \cong \pi_0(N_G(S)) \text{ (10.1.4.13) (10.4.1.20).}$$

$W(G, S)$  acts faithfully on  $S$ . For more about Weyl-groups, Cf. [Bor91]Section21. ? ┘

**Def. (10.4.1.24) [Cartan-Subgroups].** A **Cartan-subgroup** of  $G$  is the centralizer of a maximal torus (10.4.1.16). ┘

Every Cartan-subgroup of  $G$  is a nilpotent group subvariety, by (10.2.4.10)(10.4.1.19)(10.2.4.2). And if  $k = \bar{k}$ , they are all conjugate by action of  $G(k)$  (10.4.1.7), and their union contains a dense open subset of  $|G|$  by (10.4.1.14). ┘

**Prop. (10.4.1.25).**  $G$  is generated by its Cartan subgroups (10.4.1.24). ┘

*Proof:* Cf. [Mil17]P381. □

### The Variety of Minimal Parabolic Subgroups

**Prop. (10.4.1.26).** If  $G$  is a quasi-split group, then any Borel subgroup  $B \leq G$  defines a  $k$ -structure of the variety of Borel subgroups:  $(G/B)_{\bar{k}} \cong \mathcal{B}_G$ , and this is independent of  $B$  chosen, by (10.4.1.6). ┘

### Radical Subgroups and Unipotent Radical Subgroups

**Def. (10.4.1.27) [Radical Subgroups].** The **radical subgroup scheme**  $R(G)$  of  $G$  is the largest solvable normal subgroup variety of  $G$ , which exists by (10.1.5.33) and (10.1.5.34). ┘

**Def. (10.4.1.28) [Unipotent Radical Subgroups].** The **unipotent radical subgroup** of  $G$  is the largest normal unipotent subgroup variety  $R_u(G)$ , which exists by (10.3.4.5) and (10.1.5.34). ┘

**Prop. (10.4.1.29).** For arbitrary  $G \in \text{GrpVar}/k$  and  $k'/k \in \text{Field}$  is separable, then  $R(G_{k'}) = R(G)_{k'}$ . ┘

*Proof:*  $R(G)_{k'} \subset R(G_{k'})$  by definition, and it suffices to prove they are the same when  $k'/k$  is Galois. But then this follows from Galois descent (7.1.5.20) and the fact connectedness, smoothness, normality and solvability is reflexive (10.1.5.23). □

**Thm. (10.4.1.30) [Kostant-Rosenlicht].** If  $U \in \text{GrpVar}/k$  is unipotent and  $U$  acts on  $X \in \text{Aff}^{\text{ft}}/k$ , then every  $U$ -orbit in  $X$  (10.2.1.16) is closed. In particular, any  $\gamma \in X(k)$  is relatively semisimple (10.2.1.18).  $\lrcorner$

*Proof:* Cf. [Mil17]P373.  $\square$

**Thm. (10.4.1.31) [Chevalley].** If  $k = \bar{k}$  and  $T$  is a maximal torus of  $G$ , then

$$R_u(G)T = \left( \bigcap_{B \in \mathcal{B}^T} B \right)_{\text{red}}^0, \quad R_u(G) = \left( \bigcap_{B \in \mathcal{B}^T} B_u \right)_{\text{red}}^0 \quad (10.2.7.13),$$

where  $\mathcal{B}^T$  is the finite set of Borel subgroups of  $G$  containing  $T$ .  $\lrcorner$

*Proof:* Cf. [Mil17]P371.  $\square$

**Cor. (10.4.1.32).** If  $k = \bar{k}$  and  $S/k$  is a torus acting on  $G$ , then  $R_u(G^S) = R_u(G)^S$ .  $\lrcorner$

*Proof:* Cf. [Mil17]P371. ?  $\square$

## 2 Reductive Groups

### Semisimple Groups

**Def. (10.4.2.1) [Semisimple Algebraic Groups].**  $G$  is called a **semisimple algebraic group** iff it is an affine group variety and  $R(G_{\bar{k}}) = e$  (10.4.1.27). The category of semisimple algebraic groups over  $k$  is denoted by  $\text{RedGrp}^{\text{ss}}/k$ .

$G$  is called an **adjoint reductive group** if  $G$  is semisimple and  $Z(G) = 1$ .  $\lrcorner$

**Prop. (10.4.2.2).** For arbitrary  $G \in \text{AlgGrp}/k$  and  $k'/k \in \text{Field}$ ,  $G$  is semisimple iff  $G_{k'}$  is semisimple.  $\lrcorner$

*Proof:* Affineness, smoothness and geo.connectedness satisfies field descent by (7.1.5.26), so it suffices to prove for  $k', k$  alg.closed. But if  $N$  is non-trivial normal solvable subgroup variety of  $G_{k'}$ , it is defined on a f.g. field extension  $K = k(x_1, \dots, x_n)$  of  $k$ , thus  $N_K$  is a normal solvable subgroup variety of  $G_K$ , and they extends to smooth group varieties  $\mathcal{G}$  and  $\mathcal{N}$  on some open subscheme  $\text{Spec } A \subset \text{Spec } k[x_1, \dots, x_n]$ . But on some maximal ideal  $\mathfrak{m}$ ,  $\mathcal{N}_{k(\mathfrak{m})}$  is non-zero (5.2.6.11) normal open subgroup of  $\mathcal{G}_{k(\mathfrak{m})}$ , and  $k(\mathfrak{m}) \cong k$  as  $k = \bar{k}$ , contradiction.  $\square$

**Prop. (10.4.2.3) [Semisimple Quotients].** If  $k = k^{\text{perf}}$ , then  $G$  is semisimple iff  $R(G) = e$  (10.4.1.27). In particular,  $G/R(G)$  is semisimple, by (10.1.5.34).  $\lrcorner$

**Cor. (10.4.2.4).** If  $G$  is semisimple, then it contains no non-trivial commutative normal subgroup varieties. The converse is also true if  $k = k^{\text{perf}}$ .  $\lrcorner$

**Prop. (10.4.2.5) [Radical Subgroup and Borel Subgroups].** If  $k = \bar{k}$ , then

$$R(G) = \left( \bigcap_{B \leq G \text{ Borel}} B \right)_{\text{red}}^0.$$

$\lrcorner$

*Proof:* The RHS is a solvable normal subgroup variety of  $G$ , thus contained in  $R(G)$ . Conversely,  $R(G)$  is contained in a Borel subgroup by (10.4.1.4), and because it is normal, it is contained in every Borel subgroup by (10.4.1.7).  $\square$

**Def. (10.4.2.6)[Simple Groups].** A **simple algebraic group** is a semisimple non-commutative group with no non-trivial normal algebraic subgroups.

An **almost-simple algebraic group** is a semisimple non-commutative group s.t. every properly-contained normal algebraic subgroup is finite.

A **geometrically (almost-)simple algebraic group** is an algebraic group  $G$  s.t.  $G_{\bar{k}}$  is (almost-)simple.

A(n) **(almost-)pseudo-simple algebraic group** is a non-commutative group variety  $G$  s.t. every properly-contained normal algebraic subgroup is trivial (resp. finite). (May not be semisimple).  $\perp$

### Reductive Groups

**Def. (10.4.2.7) [Unipotent Radical Subgroups].**  $G$  is called a (connected) **reductive group** iff  $R_u(G_{\bar{k}}) = e$  (10.4.1.28). The category of reductive group schemes over  $k$  is denoted by  $\text{RedGrp}/k$ .  $G$  is called a **pseudo-reductive group** if  $R_u(G) = e$ .  $\perp$

**Prop. (10.4.2.8).** Suppose  $G \in \text{AlgGrp}/k$  and  $k'/k \in \text{Field}$ , then  $G$  is reductive iff  $G_{k'}$  is reductive.  $\perp$

*Proof:* The proof is verbatim as that of (10.4.2.2).  $\square$

**Prop. (10.4.2.9)[Pseudo-Reductive Quotients].**  $R/R_u(G)$  is pseudo-reductive, by (10.1.5.34), called the **largest pseudo-reductive quotient** of  $G$ .  $\perp$

**Prop. (10.4.2.10).** If  $k'/k \in \text{Field}$  is separable, then  $R_u(G_{k'}) = R_u(G)_{k'}$ . In particular,  $R_u(G_k) = R_u(G_{\bar{k}})$  if  $k = k^{\text{perf}}$ .  $\perp$

*Proof:*  $R(G)_{k'} \subset R(G_{k'})$  by definition, and it suffices to prove they are the same when  $k'/k$  is Galois. But then this follows from Galois descent (7.1.5.20) and the fact connectedness, smoothness, normality and unipotency is reflexive (10.3.4.2).  $\square$

**Cor. (10.4.2.11)[Reductive Quotients].** If  $k = k^{\text{perf}}$ , then  $G$  is reductive iff  $R_u(G) = e$ . In particular,  $G/R_u(G)$  is reductive, by (10.1.5.34), called the **largest reductive quotient** of  $G$ .  $\perp$

**Prop. (10.4.2.12).** If  $k = k^{\text{perf}}$ , then  $G(k) \rightarrow (G/R_u(G))(k)$  is surjective.  $\perp$

*Proof:* This follows from (10.3.4.20) and (10.4.1.28).  $\square$

**Prop. (10.4.2.13)[Extensions of Reductive Groups].** If  $1 \rightarrow G_1 \rightarrow G \rightarrow G_2 \rightarrow 1 \in \text{AlgGrp}/k$  is an exact sequence and  $G_1, G_2 \in \text{RedGrp}/k$ , then  $G \in \text{RedGrp}/k$ .  $\perp$

*Proof:* It suffices to prove for  $k = \bar{k}$ . Then  $R_u(G) \cap G_1$  is finite and  $R_u(G)/(R_u(G) \cap G_1) \subset H$  is a unipotent group variety (10.3.4.5), thus trivial, and then  $R_u(G) = 1$ .  $\square$

**Prop. (10.4.2.14)[Centralizers of Tori are Reductive].** If  $G \in \text{RedGrp}/k$  and  $S$  is a torus acting on  $G$ , then  $G^S \in \text{RedGrp}/k$ . In particular, the centralizer of a torus in  $G$  is a reductive group.  $\perp$

*Proof:*  $G^S$  is a group variety by (10.4.1.20), and  $R_u(G_{\bar{k}}^S) = R_u(G_{\bar{k}})^S = e$  by (10.4.1.32).  $\square$

**Prop. (10.4.2.15) [Maximal Tori of Reductive Groups].** If  $G \in \mathcal{R}\text{edGrp}/k$ , then

- For any maximal torus  $T \leq G$  (10.4.1.16),  $Z_G(T) = T$ . In particular,  $W(G, T) = N_G(T)/T$ . Thus Cartan subgroups of  $G$  are just maximal tori of  $G$ .
- $Z(G) \leq T$  for any maximal torus  $T \leq G$ , and  $Z(G) = \cap_{T \text{ maximal tori}} T$ .
- If  $T \leq G$  is a maximal torus, then  $Z(G) = \ker(\text{Ad} : T \rightarrow \mathbf{GL}(\mathfrak{g}))$ .

┘

*Proof:* 1: We may assume  $k = \bar{k}$ . Because  $C_G(T)$  is a group variety (10.2.4.10),  $C_G(T) \leq (\cap_{B \in \mathcal{B}^T} B)_{\text{red}}^0 = R_u(G)T = T$  (10.2.4.23)(10.4.1.31).

2:  $Z(G) \leq T$  by item1. And any  $g \in \cap_{T \text{ maximal tori}} T(\bar{k})$  commutes with all Cartan subgroups, which generate  $G$  by (10.4.1.25), so  $g \in Z(G)(\bar{k})$ .

3:  $Z(G) \leq \ker(\text{Ad} : T \rightarrow \mathbf{GL}(\mathfrak{g}))$  by (10.4.2.15). The quotient  $\ker(\text{Ad})/Z(G)$  is unipotent by (10.3.4.16), thus the image of  $\ker(\text{Ad} : T \rightarrow \mathbf{GL}(\mathfrak{g}))$  in  $\ker(\text{Ad})/Z(G)$  is trivial by (10.2.3.14)(10.3.4.9). □

**Prop. (10.4.2.16) [Radicals of Reductive Groups].** If  $G \in \mathcal{R}\text{edGrp}/k$ , then

1.  $Z(G)$  is of multiplicative type.
2.  $R(G) = Z(G)_t = Z(G)_{\text{red}}^0$  (10.2.3.21).
3.  $R(G_{k'}) = R(G)_{k'}$  for any  $k'/k \in \mathbf{Field}$ .
4.  $G/R(G) \in \mathcal{R}\text{edGrp}^{\text{ss}}/k$ .
5.  $G_{\text{ad}} \triangleq G/Z(G)$  is an adjoint group (10.4.1.27).
6.  $Z(G) \cap [G, G]$  is finite.

┘

*Proof:* 1: Let  $T$  be a maximal torus in  $G$  (10.4.1.17), then  $Z(G) \leq C_G(T) = T$  (10.4.2.15), thus  $Z(G)$  is of multiplicative type.

2: Cf. [Mil17]P373?

3: This follows from 3 because taking center and taking largest torus commute with base change of fields (10.2.3.21).

4: By item3 we can base change to  $\bar{k}$ , and then the assertion follows from (10.4.2.3).

5:  $G_{\text{ad}}$  is semisimple by item4, and if  $Z'$  be the inverse image of  $Z(G/Z(G))$  in  $G$ , then  $Z'$  is an extension of  $Z(G/Z(G))$  by  $Z(G)$ , which are both of multiplicative type by item1, thus the conjugate action of  $G$  on  $Z'$  is trivial by (10.2.3.30), thus  $Z' = Z(G)$  and  $Z(G/Z(G)) = 1$ .

6:  $R(G) \cap [G, G]$  is finite by (10.2.3.10), and  $R(G)$  has finite index in  $Z(G)$  by item2, so  $Z(G) \cap [G, G]$  is finite. □

**Cor. (10.4.2.17) [Central and Multiplicative Isogenies].** Central and multiplicative isogenies from a reductive group are the same thing, by (10.1.5.20) and (10.4.2.16). ┘

**Prop. (10.4.2.18) [Reductive Groups and Semisimple Groups].** A semisimple group is reductive, because  $R_u(G) \subset R(G)$ , because a unipotent group is solvable. Conversely, if  $G \in \mathcal{R}\text{edGrp}/k$ , then the following are equivalent:

- $G$  is semisimple.
- $R(G) = e$ .
- $Z(G)$  is finite.

- $G/[G, G]$  is finite.

┘

*Proof:* 1  $\iff$  2 follows from (10.4.2.16).

2  $\iff$  3: As  $R(G)$  is the maximal subtorus of the group  $Z(G)$  of multiplicative type, the assertion follows from (10.2.3.21).

4: ?

□

**Prop. (10.4.2.19).** If  $G \in \text{RedGrp}/k$ , then every commutative normal subgroup variety of  $G$  is a torus, and the converse is also true if  $k = k^{\text{perf}}$ .

┘

*Proof:* If  $N$  is a commutative normal subgroup variety of  $G$ , then  $N \subset R(G)$ , which is a torus by (10.4.2.16) and (10.2.3.7). The converse follows from the fact  $R_u(G) = e$  because  $\text{Unip}(n)$  has no non-zero subtorus by (10.5.3.8).

□

**Prop. (10.4.2.20).** Any commutative affine group variety  $G$  is of the form  $U \times T$  where  $U$  is unipotent and  $T$  is a torus.

┘

*Proof:* ?

□

**Prop. (10.4.2.21) [Semisimple and Reductive under Isogenies].** Let  $\varphi : G' \rightarrow G \in \text{GrpVar}/k$  be an isogeny. If  $G$  is reductive or semisimple, then so is  $G'$ .

┘

*Proof:* By (10.4.2.8), it suffices to prove for  $k = \bar{k}$ . Let  $U$  be a normal unipotent/solvable subgroup variety of  $G$ , then  $\varphi(U)$  is also a unipotent/solvable group variety by (10.1.5.33), and it is normal because  $\varphi$  is a quotient map (10.1.5.33). Thus  $\varphi(U) = e$ , which implies  $U$  is a finite group variety, thus trivial.

□

**Prop. (10.4.2.22) [Matsushima's Criterion].** If  $G \in \text{RedGrp}/k$  and  $H \leq G$  is a smooth algebraic subgroup, then  $G/H$  is affine iff  $H^0$  is reductive.

┘

*Proof:* Cf. [Borel, On affine algebraic homogeneous spaces].

□

**Prop. (10.4.2.23) [Derived Groups are Semisimple].** For  $G \in \text{RedGrp}/k$ ,

- The semisimple rank of  $G$  equals  $\text{rank}(G/R(G)) = \text{rank } G - \dim Z(G) = \text{rank}(G^{\text{ad}})$ .
- $[G, G] \rightarrow G/R(G) \rightarrow G^{\text{ad}}$  are central isogenies.
- $[G, G]$  is semisimple with rank equal to the semisimple rank of  $G$ .

┘

*Proof:* 1: The kernel is finite by (10.4.2.16), and the image is of finite index by (10.4.2.16)(10.4.5.17) and (10.2.3.10).

2: The semisimple rank of  $G$  equals  $\text{rank}(G_{\bar{k}}/R(G_{\bar{k}})) = \text{rank}(G_{\bar{k}}/R(G)_{\bar{k}}) = \text{rank}(G/R(G))$  (10.4.2.16). Let  $T$  be a maximal torus of  $G$ , then  $Z(G) \leq T$  by (10.4.2.15), and  $T/R(G)$  is a maximal torus of  $G/R(G)$ , so  $\text{rank}(G/R(G)) = \dim(T/R(G)) = \dim T - \dim Z(G) = \text{rank } G - \dim Z(G)$  (10.4.2.16). The same argument shows that  $\text{rank } G - \dim Z(G) = \text{rank}(G^{\text{ad}})$ .

3:  $[G, G]$  is semisimple by (10.4.2.21), and the same argument as in item 2 shows that  $\text{rank}([G, G]) = \text{rank}(G^{\text{ad}})$ .

□

**Def. (10.4.2.24) [Anisotropic Reductive Groups].**  $G \in \text{RedGrp}$  is called an **isotropic reductive group** if it contains a non-trivial split torus; otherwise, it is called an **anisotropic reductive group**.

┘

**Def. (10.4.2.25) [Elliptic Maximal Tori].** For  $G \in \mathcal{R}\text{edGrp}/k$ , an **elliptic maximal torus** of  $G$  is a maximal torus that is anisotropic modulo  $Z(G)$  (10.4.2.15)(10.4.2.24). ┘

**Prop. (10.4.2.26) [Elliptic Elements].** For  $G \in \mathcal{R}\text{edGrp}/k$ ,  $x \in G(k)$  is called an **elliptic element** if  $x$  is not contained in any elliptic torus of  $G$  (10.4.2.25). ┘

If  $G$  admits an elliptic maximal torus (e.g.  $k \in p\text{-LField}$  (20.7.7.4) or  $k \in \mathbf{NField}$  ? or  $k = \mathbb{R}$  and  $G$  has Shimura variety ?), then  $x \in G(k)$  is elliptic iff  $Z_G(x)^0/Z_G^0$  is anisotropic. ┘

*Proof:* ? □

**Prop. (10.4.2.27) [Maximal Tori and Isogenies].** If  $G \in \mathcal{R}\text{edGrp}/k$  and  $T \leq G$  is a maximal torus, then ┘

- The intersection  $T_{\text{der}} = T \cap [G, G]$  is a maximal torus of  $[G, G]$ , and  $T = T_{\text{der}}R(G)$ . This induces a bijection between the set of maximal tori of  $[G, G]$  and the set of maximal tori of  $G$ .
- The preimage  $T_{\text{sim.cntd}} \leq G_{\text{sim.cntd}}$  is a maximal torus.

• The image  $T_{\text{ad}} \leq G_{\text{ad}}$  is a maximal torus.

If  $S \leq G$  is a maximal split torus, then

- The intersection  $S \cap [G, G]$  contains a unique maximal split torus  $S_{\text{der}}$  of  $G_{\text{der}}$ , and  $S = S_{\text{der}}A_G$  where  $A_G \leq G$  is the maximal split central torus. This induces a bijection between the set of maximal split tori of  $[G, G]$  and the set of maximal split tori of  $G$ .
- The preimage  $S_{\text{der}}$  in  $G_{\text{sim.cntd}}$  contains a unique maximal split torus  $S_{\text{sim.cntd}}$  of  $G_{\text{sim.cntd}}$ .
- The image  $S_{\text{ad}} \leq G_{\text{ad}}$  is a maximal split torus. ┘

*Proof:* ? 1: □

For 2, 3, notice that any maximal torus contains the center (10.4.2.15).

1:

2:

3: □

### Parabolic Subgroups of Reductive Groups

**Prop. (10.4.2.28) [Levi-Decompositions].** For  $P \in \mathcal{G}\text{rpVar}/k$ , a **Levi-factor** of  $P$  is a subgroup variety  $L \leq P$  s.t.  $L_{\bar{k}} \rightarrow P_{\bar{k}}/R_u(P_{\bar{k}})$  is an isomorphism. In other words,  $L$  is a reductive subgroup of  $P$  (10.4.2.11) s.t.  $P_{\bar{k}} = R_u(P_{\bar{k}}) \rtimes L_{\bar{k}}$ . If  $U \leq G$  is a subgroup s.t.  $U_{\bar{k}} = R_u(P_{\bar{k}})$  (e.g. when  $k = k^{\text{perf}}$  take  $U = R_u(P)$ ), then  $P = U \rtimes L$ , which is called a **Levi-decomposition** of  $P$ . ┘

**Def. (10.4.2.29) [Levi-Subgroups].** For  $G \in \mathcal{R}\text{edGrp}/k$ , a **levi-subgroup** is a Levi-factor (10.4.2.28) of a parabolic subgroup of  $G$ . ┘

**Thm. (10.4.2.30) [Mostov, [Mos56]].** If  $\text{char } k = 0$  and  $G \in \text{linAlgGrp}/k$  is arbitrary, then there exists  $M \leq G$  s.t.  $M^0$  is reductive and  $G = M.R_u(G)$ . Any such  $M$  is conjugate under conjugation by  $R_u(G)(k)$ . ┘

*Proof:* □

**Prop. (10.4.2.31) [Parabolic Subgroups are Rationally Conjugate].** If  $G \in \mathcal{RedGrp}/k$  and  $P, P' \leq G$  are two parabolic subgroups that are conjugate over  $\bar{k}$ , then they are conjugate.  $\lrcorner$

*Proof:* ?  $\square$

**Thm. (10.4.2.32) [Parabolic Subgroups are Concentrator Subgroups].** For  $G \in \mathcal{RedGrp}/k$ , any parabolic subgroup  $P \leq G$  is of the form  $P_G(\lambda)$  (10.4.4.3) for some cocharacter  $\lambda \in X_*(G)$ . In particular, its unipotent radical is split (10.2.4.10).  $\lrcorner$

*Proof:* Cf. [CGP15]P67.  $\square$

**Cor. (10.4.2.33) [Parabolic Subgroups have Levi-Decompositions].** Let  $G \in \mathcal{RedGrp}/k$  and  $P \leq G$  be a parabolic subgroup, then  $P$  has Levi-decompositions (10.4.2.28), and any two Levi subgroups of  $P$  are conjugate by a unique element of  $R_u(P)(k)$ .  $\lrcorner$

*Proof:* Cf. [Mil17]P559.  $\square$

**Cor. (10.4.2.34).** For  $G \in \mathcal{RedGrp}/k$ ,  $G$  has a properly-contained parabolic subgroup iff it has a non-central split torus.  $\lrcorner$

**Prop. (10.4.2.35) [Parabolic Subgroups and Reductive Quotients].** For  $\text{pr} : G \rightarrow G/R_u(G)$ , the maps

$$P \mapsto \text{pr}(P), \bar{P} \rightarrow f^{-1}(\bar{P})$$

are mutually-inverse  $\text{Gal}_k$ -equivariant  $G(k)$ -equivariant inclusion-preserving bijections between sets of parabolic subgroups of  $G$  and  $G/R_u(G)$ . In particular,  $G$  is quasi-split iff  $G/R_u(G)$  is quasi-split.  $\lrcorner$

*Proof:* Cf. [K-P23]P84.  $\square$

**Cor. (10.4.2.36).** If  $k = k^{\text{perf}}$ , then  $G$  has a properly-contained parabolic subgroup iff  $G/R_u(G)$  has a non-central split torus, by (10.4.2.34) and (10.4.2.11).  $\lrcorner$

### 3 Geometric Aspects

**Def. (10.4.3.1) [Simply-Connected Groups].**  $G$  is called a **simply-connected group variety** if every multiplicative isogeny (10.1.5.18) from another group variety  $G' \rightarrow G \in \mathcal{GrpVar}/k$  is an isomorphism.  $\lrcorner$

**Def. (10.4.3.2) [Isogenies of Reductive Pairs].** An **isogeny of reductive pairs**  $\varphi : (G, T) \rightarrow (G', T')$  is an isogeny  $\varphi : G \rightarrow G' \in \mathcal{RedGrp}/k$  s.t.  $\varphi(T) \subset T'$ .  $\lrcorner$

**Prop. (10.4.3.3) [Liftings].** If  $G$  is simply-connected (10.4.3.1) and  $\varphi : G' \rightarrow G$  is a multiplicative isogeny, then  $\varphi$  admits a section if  $k = k^{\text{perf}}$  or  $G$  is a perfect group.  $\lrcorner$

*Proof:* Cf. [Mil17]P388.  $\square$

**Def. (10.4.3.4) [Universal Covering].** A **universal covering** of  $G$  is a multiplicative isogeny  $\pi : G' \rightarrow G$  where  $G' \in \mathcal{GrpVar}/k$  is simply-connected.  $\lrcorner$

**Prop. (10.4.3.5) [Galois Theory].** Let  $\text{pr} : \tilde{G} \rightarrow G \in \mathcal{GrpVar}$  be a universal covering (10.4.3.4). If  $k = k^{\text{perf}}$  or  $G$  is perfect, then  $\text{pr}$  factors uniquely through any other multiplicative isogeny  $G' \rightarrow G \in \mathcal{GrpVar}/k$ .  $\lrcorner$

*Proof:* As  $\tilde{G}$  is a group variety, it admits no finite quotient(10.1.5.16), thus if  $[G, G] = G$ , then  $[\overline{G}, \overline{G}] \ker \pi = \overline{G}$ , thus  $G/[G, G]$  is finite, thus trivial, so  $\tilde{G}$  is also perfect.

The map  $G' \times_G \tilde{G}$  is surjective with finite kernel of multiplicative type, thus it has a section by(10.4.3.3), and the composite of this section with projection to  $G'$  is the desired lifting. If  $\alpha, \beta$  are two liftings, then  $\alpha/\beta$  is a map from  $\tilde{G}$  to  $\ker(\varphi)$ , which is finite, thus  $\alpha = \beta$ .  $\square$

**Prop.(10.4.3.6)[Simply-Connected Coverings].** Every  $G \in \mathcal{R}\text{edGrp}^{\text{ss}}/k$  admits an essentially unique universal covering(10.4.2.23).

In particular, for any  $G \in \mathcal{R}\text{edGrp}/k$ , there exists a universal covering  $G_{\text{sim.cntd}}$  of  $[G, G]$ , called the **simply-connected covering** of  $G$ .  $\lrcorner$

*Proof:* ?  $\square$

**Prop.(10.4.3.7).** If  $G$  is semisimple, then  $G$  is simply-connected(10.4.3.1) iff every central isogeny  $G' \rightarrow G$  with  $G'$  semisimple is an isomorphism.  $\lrcorner$

*Proof:* If  $G' \rightarrow G$  is a multiplicative isogeny then  $G'$  is semisimple by(10.4.2.20). If  $G' \rightarrow G$  is a central isogeny with  $G'$  semisimple, then it is a multiplicative isogeny by(10.4.2.17).  $\square$

## 4 Root Data

**Notation(10.4.4.1).**

- Let  $G \in \mathcal{R}\text{edGrp}/k$ .
- Let  $S \leq G$  be a maximal split torus.
- Let  $T \leq G$  be a maximal torus containing  $S$ .
- Let  $\Phi(T, G)$ (resp.  $\Phi(S, G)$ ) be the set of roots of the conjugation action of  $T$ (resp.  $S$ ) on  $G$ (10.2.4.13).
- Let  $\mathfrak{g}$  be the Lie algebra of  $G$ (10.2.2.2).
- Let  $\mathfrak{t}$  be the Lie algebra of  $T$ .

$\lrcorner$

**Def.(10.4.4.2)[Split Reductive Groups].** A **split reductive pair** is a pair  $(G, T)$  where  $G \in \mathcal{R}\text{edGrp}/k$  and  $T$  is a split maximal torus(10.1.1.4) of  $G$ . A reductive group is called a **split reductive group** if it is contained in some reductive pair. By(10.2.3.6), any reductive group is split reductive after a finite separable field extension.

This definition is compatible with that of(10.4.1.1).  $\lrcorner$

*Proof:* If  $G$  has a split maximal torus, then it has a split Borel subgroup by(10.4.4.12). Conversely, if  $G$  has a split Borel subgroup, then  $B$  contains a split maximal torus by(10.2.7.13), which is also maximal in  $G$  by base change to  $\bar{k}$  and use(10.4.1.7).  $\square$

**Thm.(10.4.4.3)[Parabolic Subgroups].** If  $G \in \mathcal{R}\text{edGrp}/R$ , then for any  $\lambda \in X_*(G)$ ,  $P_G(\lambda)$  is a parabolic subgroup scheme with unipotent radical  $U_G(\lambda)$ , and any ?  $\lrcorner$

*Proof:* ? Cf.[CGP15]  $\square$

**Prop.(10.4.4.4)[Action of Weyl Groups].** If  $\alpha \in \Phi(G, S)$ (10.4.4.1) and  $s \in W(G, S)(k)$ (10.4.1.23), then  $s\alpha \in \Phi(G, S)$ , and  $\mathfrak{g}_{s\alpha} = s\mathfrak{g}_\alpha$ , where  $s\mathfrak{g}_\alpha$  means  $n\mathfrak{g}_\alpha$  for any  $n \in N_G(S)(k)$  representing  $s$ , which is well-defined.  $\lrcorner$

*Proof:* Let  $n \in N_G(T)(k)$  represent  $s$ , and let  $t \in T(R)$  for some  $R \in \mathcal{C}\text{Ring}/k$ , then  $(s\alpha)(t) = \alpha(n^{-1}tn)$ . For any  $x \in \mathfrak{g}_\alpha$ , we have  $t(nx) = t(nx) = n(n^{-1}tn)x = \alpha(n^{-1}tn)n(x) = ((s\alpha)(t))(nx)$ . So  $\mathfrak{g}_{s\alpha} = s\mathfrak{g}_\alpha$ .  $\square$

**Prop. (10.4.4.5).** The natural map  $\text{Hom}(X^\bullet(G), \mathbb{Q})^{\text{Gal}_k} \rightarrow \text{Hom}(X^*(G), \mathbb{Q})$  is an isomorphism.  $\lrcorner$

*Proof:* The exact sequence  $0 \rightarrow X^\bullet(G) \rightarrow X^\bullet(G) \rightarrow X^\bullet(G)/X^*(G) \rightarrow 0$  remains exact after applying  $\text{Hom}(-, \mathbb{Q})^{\text{Gal}_k}$ , but

$$\text{Hom}(X^\bullet(G)/X^*(G), \mathbb{Q})^{\text{Gal}_k} = \text{Hom}((X^\bullet(G)/X^*(G))_{\text{Gal}_k}, \mathbb{Q})$$

vanishes because  $(X^\bullet(G)/X^*(G))_{\text{Gal}_k}$  is finite, because  $(X^\bullet(G)/X^*(G))^{\text{Gal}_k} = 0$ ?  $\square$

**Prop. (10.4.4.6) [Characters of the Center].** Let  $Z\Phi$  be the  $\mathbb{Z}$ -submodule of  $X^\bullet(T)$  generated by  $\Phi = \Phi(G, T)$ , then  $Z(G)$  and  $T/Z(G)$  are diagonalizable groups with

$$X^\bullet(Z(G)) = X^\bullet(T)/Z\Phi, \quad X^\bullet(T/Z(G)) = Z\Phi.$$

$\lrcorner$

*Proof:* By (10.4.2.15), there is an exact sequence

$$0 \rightarrow Z(G) \rightarrow T \xrightarrow{t \mapsto (\alpha(t))_\alpha} \prod_{\alpha \in \Phi(G, T)} \mathbb{G}_m,$$

so the assertions follow from (10.2.3.4).  $\square$

**Prop. (10.4.4.7).** If  $A_G$  is the maximal central split torus of  $G$ , then the natural map  $X^*(G) \rightarrow X^*(A_G)$  is injective with finite cokernel.  $\lrcorner$

*Proof:* It follows from (10.4.2.16) that  $X^*(G) = X^*(G/[G, G])$  and  $G/[G, G]$  is a connected quotient of  $Z(G)$  with finite kernel. Then the assertion follows from the fact that

$$X^\bullet(Z(G)_{\text{lf}})^{\text{Gal}_K} \rightarrow (X^\bullet(Z(G))_{\text{Gal}_K})_{\text{lf}}$$

is injective with finite cokernel.  $\square$

**Thm. (10.4.4.8) [Root Datum of  $G$ ].** Notation as in (10.2.4.20), if  $S$  is split, then

- $(G_\alpha, S)$  is a split reductive group of semisimple rank 1.
- $\text{Lie}(G_\alpha) = \mathfrak{t} \oplus \mathfrak{g}_{-\alpha} \oplus \mathfrak{g}_\alpha$ , and  $\dim \mathfrak{g}_\alpha = \dim \mathfrak{g}_{-\alpha} = 1$ . In particular,  $\mathbb{Q} \cdot \alpha \cap \Phi(G, S) = \{-\alpha, 0, \alpha\}$ .
- $U_\alpha$  is normalized by  $S$  and is isomorphic to  $\mathbb{G}_a$ , with Lie algebra  $\mathfrak{g}_\alpha$ . Any other  $T$ -normalized subgroup variety of  $G$  contains  $S_\alpha$  iff its Lie algebra contains  $\mathfrak{g}_\alpha$ .
- $W(G_\alpha, S) = \{1, s_\alpha\}$ , where  $s_\alpha$  can be represented by some  $n_\alpha \in N_{G_\alpha}(T)(k)$ .
- There exists a unique  $\alpha^\vee \in X_\bullet(S)$  s.t.  $s_\alpha(x) = x - \langle x, \alpha^\vee \rangle \alpha$  for any  $x \in X^\bullet(T)$ . Moreover,  $\langle \alpha, \alpha^\vee \rangle = 2$ .

And  $G$  is generated by  $T$  and the root groups  $\{U_\alpha\}_{\alpha \in \Phi(G, S)}$ .

The same hold in the non-split case, except that  $U_\alpha$  is not isomorphic to  $\mathbb{G}_a$  but split unipotent. In fact, if  $2\alpha \notin \Phi(G, T)$ , it is a vector group, and when  $2\alpha \in \Phi(G, T)$ ,  $U_\alpha/U_{2\alpha}$  is a vector space.  $\lrcorner$

*Proof:* Cf.[Mil17]P428.?

□

**Cor.(10.4.4.9).** Situation as in(10.4.4.8),  $U_\alpha$  is the unique subgroup of  $G$  that is normalized by  $T$ , isomorphic to  $\mathbb{G}_a$ , and  $T$  acts on it through  $\alpha$ .  $\lrcorner$

*Proof:* Cf.[Mil17]P431?.

□

**Cor.(10.4.4.10) [The Cocharacter  $\alpha^\vee$ ].** Situation as in(10.4.4.8), for  $\alpha \in \Phi(G, S) \in X^\bullet(S)$ , let  $C_\alpha = \ker(\alpha) \subset S$ , then  $S/C_\alpha \cong \mathbb{G}_m$ , and the homomorphism

$$S \rightarrow S : s \mapsto s/s_\alpha(s)$$

factors through  $C_\alpha$  and induces a map  $\mathbb{G}_m \rightarrow S/C_\alpha \rightarrow S$ . Then this map is exactly  $\alpha^\vee \in X_\bullet(S)$ (10.4.4.8).  $\lrcorner$

*Proof:* Cf.[K-P23]P94.

□

**Def.(10.4.4.11) [Regular Cocharacters].** Situation as in(10.4.4.8),  $\lambda \in X_\bullet(S)$  is called a **regular cocharacter** if it is contained in the interior of some Weyl chamber(3.9.5.8), i.e.  $\langle \alpha, \lambda \rangle \neq 0$  for any  $\alpha \in \Phi(G, S)$ .  $\lrcorner$

**Prop.(10.4.4.12) [Borel Subgroups Containing  $T$  are Split].** Let  $\lambda \in X_\bullet(T)$  be a regular cocharacter(10.4.4.11), then  $P(\lambda)$ ?? is the unique Borel subgroup of  $G$  containing  $T$  with Lie algebra

$$\mathfrak{t} \oplus \bigoplus_{\alpha \in \Phi(G, T), \langle \alpha, \lambda \rangle > 0} \mathfrak{g}_\alpha.$$

In this way, we get a bijection between the set of Weyl chambers to the set of Borel subgroups containing  $T$ . In particular, all the Borel subgroups of  $G_{\bar{k}}$  containing  $T_{\bar{k}}$  are defined over  $k$ , and they are split solvable.  $\lrcorner$

*Proof:* Cf.[Mil17]P433, 434, 435?.

□

**Cor.(10.4.4.13) [Root Data for  $G$ ].** If  $T$  is split,  $(X^\bullet(T), \Phi(G, T), X_\bullet(T), \Phi(G, T)^\vee, W(G, T)) \in \text{RootDat}_{\text{red}}$  is a reduced root datum(3.9.5.40). Moreover, its isomorphism type doesn't depend on  $T$ , and is functorial under isomorphisms of  $G$ . And its Weyl group is exactly  $W(G, T)$ (10.4.1.23).  $\lrcorner$

*Proof:* To check  $(X^\bullet(T), \Phi(G, T), W(G, T)(k)) \in \text{RootSys}_{\text{red}}$ ,  $s_\alpha$  exists by(10.4.4.8), and  $s_\alpha(\Phi) = \Phi$  by(10.4.4.4). These  $s_\alpha$  generate the Weyl group  $W(G, T)$  because  $G$  is generated by  $T$  and the root groups  $\{U_\alpha\}_{\alpha \in \Phi}$ .

Choose a Borel subgroup  $B \leq G$  containing  $T$ (10.4.4.12). Suppose  $(B', T')$  is another split Borel pair, then there exists  $g \in G(k)$  s.t.  $(B', T') = g(B, T)g^{-1}$  by(10.4.1.7). This  $g$  defines an isomorphism between  $\Phi(G, T')$  and  $\Phi(G, T)$ . If  $(B', T') = g'(B, T)(g')^{-1}$  for some other  $g' \in G(k)$ , then  $g' = gh$  for some  $h \in N_G(T)(k)$ , but then  $h \in T$  by(10.4.4.12) and(3.9.5.16). Thus this inner isomorphism is unique.  $\lrcorner$

□

**Thm.(10.4.4.14) [Relative Root Datum for  $G$ ].**  $(X^\bullet(S), \Phi(G, S), X_\bullet(S), \Phi(G, S)^\vee, W(G, S)) \in \text{RootDat}$  is a root datum(3.9.5.40), and its Weyl group is exactly  $W(G, S)$ (10.4.1.23). This root system is called the **relative root datum** of  $G$  w.r.t.  $S$ .  $\lrcorner$

*Proof:* ? Cf.[Borel91]Thm21.6.

□

**Cor.(10.4.4.15)[Absolute Root Datum for  $G$ ].** By(10.4.4.14),

$$(X^\bullet(T), \Phi(G_{k^{\text{sep}}}, T_{k^{\text{sep}}}), X_\bullet(T), \Phi(G_{k^{\text{sep}}}, T_{k^{\text{sep}}})^\vee, W(G_{k^{\text{sep}}}, T_{k^{\text{sep}}}))$$

is a another root datum, called the **absolute root datum** of  $G$  w.r.t.  $T$ . We denote  $\Phi(G, T) \triangleq \Phi(G_{k^{\text{sep}}}, T_{k^{\text{sep}}})$ .

Then  $\Phi(G, S)$  is contained in the image of  $\Phi(G, T)$  under the map  $X^\bullet(T) \rightarrow X^\bullet(S)$  ┘

*Proof:* ? Cf.[Borel91]Thm21.8. □

**Prop.(10.4.4.16)[Root Systems and Isogenies].** For a maximal torus  $S \leq G$ , the natural maps

$$\Phi(G_{\text{sim.cntd}}, S_{\text{sim.cntd}}) \rightarrow \Phi(G_{\text{der}}, S_{\text{der}}) \rightarrow \Phi(G, S) \rightarrow \Phi(G_{\text{ad}}, S_{\text{ad}}) \quad (10.4.2.27)$$

are bijective. And for  $\alpha \in \Phi(G, S)$ , these maps induce isomorphism on the corresponding root groups  $U_\alpha$ . ┘

*Proof:* ? □

**Def.(10.4.4.17)[Positive System of Roots].** Let  $B \leq G$  be a minimal parabolic subgroup containing  $T$  with Lie algebra  $\mathfrak{b}$ , define the system of **positive roots attached to  $B$** :

$$\Phi^+(B) = \{\alpha \in \Phi | \mathfrak{g}_\alpha \subset \mathfrak{b}\},$$

and the **dominant Weyl-chamber**

$$C_+(B) = \{\lambda \in X_\bullet(T)_\mathbb{R} | \langle \alpha, \lambda \rangle > 0, \quad \forall \alpha \in \Phi^+(B)\}.$$

┘

**Prop.(10.4.4.18)[Positive System of Roots and Minimal Parabolics].** Construction(10.4.4.17) gives a bijection between set of positive system of roots of  $\Phi$  and the set of minimal parabolic subgroups containing  $T$ . ┘

*Proof:* ? □

**Cor.(10.4.4.19)[Quasi-Splitness and Centralizers of Maximal Split Tori].**  $G$  is quasi-split iff the centralizer of a maximal split torus is a maximal torus(i.e. solvable). ┘

*Proof:* The centralizer of a maximal split torus is the Levi of a minimal parabolic subgroup, thus it is a maximal torus iff the minimal parabolic subgroup is solvable. □

**Prop.(10.4.4.20).**  $G$  is semisimple iff its root datum(10.4.4.13) is semisimple(3.9.5.1). ┘

*Proof:*  $G$  is semisimple iff it has finite center(10.4.2.18), which is equivalent to  $\mathbb{Z}\Phi$  having finite index in  $X^\bullet(T)$  by(10.4.4.6). □

**Prop.(10.4.4.21).**

- If  $G$  is semisimple, then  $G$  is generated by the root groups  $U_\alpha$ (10.2.4.20) for each  $\alpha \in \Phi(G, T)$ . Thus it is also generated by the subgroups  $G^\alpha$  for each  $\alpha \in \Phi(G, T)$  by(10.2.4.22).
- If  $\Delta \subset \Phi(G, T)$  is a base, then  $[G, G]$  is generated by the subgroups  $G^\alpha$ (10.2.4.20) for each  $\alpha \in \Delta$ , and  $G$  is generated by the subgroups  $G_\alpha$  for each  $\alpha \in \Delta$ , thus also by  $T$  and  $U_\alpha$  for each  $\alpha \in \Delta$  by(10.2.4.22).

┘

*Proof:* Cf.[Mil17]P439, P443. □

**Prop. (10.4.4.22).** For any  $\alpha \in \Phi(G, S)$  and any  $u \in U_\alpha(k) \setminus \{1\}$ , there exists unique  $u', u'' \in U_{-\alpha}(k)$  s.t.  $m(u) = u'uu'' \in N_G(S)(k)$ . Moreover we have

- $u' \neq 1, u'' \neq 1$ .
- $m(u)$  acts on  $S$  as  $s_\alpha$ (10.4.4.8).
- $m(u) = m(u') = m(u'')$ .
- $m(u)^{-1} = m(u^{-1})$ .

┘

*Proof:* Cf.[K-P23]Prop C.2.24.

3 follows from the identities

$$m(u) = (m(u)u''m(u)^{-1})u'u = uu''(m(u)^{-1}u'm(u))$$

and the fact that  $m(u)u''m(u)^{-1}, m(u)^{-1}u'm(u) \in U_{-\alpha}(k)$  by item2.

4 is easy. □

**Def. (10.4.4.23) [Generic Unipotent Characters].** Let  $B = LU \leq G$  be a Borel-subgroup with associated base  $\Delta \subset \Phi(G, T)$ , then a character  $\psi : U(k) \rightarrow \mathbb{C}^\times$  is called a **generic unipotent character** on if  $\psi|_{U_\alpha(k)}$ (10.2.4.20) is non-trivial for each  $\alpha \in \Delta$ . Equivalently, the stabilizer of  $\psi$  in the  $k$ -points  $T = B/U$  is  $Z(k)$ .

A **Whittaker-datum** is a  $G(F)$ -conjugacy class of pairs  $(B, \psi)$  where  $B$  is a Borel subgroup of  $G$  and  $\psi$  is a generic unipotent character on  $B$ . ┘

**Prop. (10.4.4.24).** There are only f.m. Whittaker-data for  $G$ . And if  $G$  is an adjoint group, there exists a unique Whittaker-datum(10.4.4.23). ┘

*Proof:* ? □

### Reductive Groups of Semisimple Rank $\leq 1$

**Prop. (10.4.4.25) [Classifying Reductive Groups of Semisimple Rank  $\leq 1$ ].** Any  $G \in \mathcal{RedGrp}/k$  of semisimple rank 1(10.4.1.18) is isomorphic to exactly one of the groups

$$\mathbb{G}_m^r \times \mathrm{SL}(2), \quad \mathbb{G}_m^r \times \mathrm{PGL}(2), \quad \mathbb{G}_m^r \times \mathrm{PGL}(2), \quad r \in \mathbb{N}.$$

┘

*Proof:* Cf.[Mil17]P419. □

**Prop. (10.4.4.26).** Any  $G \in \mathcal{GrpVar}^1/k$  is commutative. ┘

*Proof:* Cf.[Mil17]P286. □

### Bruhat Decompositions

**Thm. (10.4.4.27)[Bruhat-Decompositions].** Let  $(G, B, T, S)$  be a split reductive group, denote  $N = N_G(T)$  and  $R = \{s_\alpha | \alpha \in S\}$ , then  $(B, N)$  is a Tits system (20.6.1.1).

In particular, we have a Bruhat decomposition

$$G(K) = B(K)WB(K).$$

┘

*Proof:* ? Cf. [Mil17]P448.

□

**Cor. (10.4.4.28)[Bruhat Decompositions for  $\mathrm{GL}(n)$ ].** For  $K \in \mathbf{Field}$ ,

$$\mathrm{GL}(n; K) = B(K)WB(K) = B(K)W \cdot \mathrm{Unip}(n; K)$$

where  $W$  is the set of permutation matrices,  $B$  is the invertible upper triangular matrices, and the decomposition is a disjoint union w.r.t.  $W$ .

Moreover, if  $K$  is a topological field, there is a lexicographical stratification  $0 = W_0 \subset W_1 \subset \dots \subset W_n$  of  $\mathrm{GL}(n; K)$  that  $W_k$  is closed in  $W_{k+1}$  and each  $W_{k+1} \setminus W_k$  is a double coset  $BwB$ .

For  $g \in \mathrm{GL}(n; K)$ , in order to find  $w \in W$  s.t.  $g \in BwB$ , it suffices to manipulate  $g$  by the following two operations:

- Add a row to rows before it.
- Add a column to columns after it.
- Multiply a row by non-zero scalars.

┘

*Proof:* For any matrix  $M \in \mathrm{GL}(n; K)$ , consider the first column, then there is a lowest term  $a_{i_1 1}$  that are not zero, then we can left multiply an upper triangular matrix  $b_1$  s.t. the first column of  $b_1 M$  has only one nonzero entry  $a_{i_1 1} = 1$ , then consider the second column but ignore the  $k$ -th row, we can find a lowest term  $a_{i_2 2}$  that is non-zero, then left multiply an upper triangular matrix  $b_2$  that the second column of  $b_2 b_1 M$  has only one non-zero entry  $a_{i_2 2} = 1$ . Now continuing this way, we find a permutation  $\sigma$  that only the entries  $a_{ij}$  that  $j \geq \sigma^{-1}(i)$  are non-zero. Then we can find an upper triangular matrix  $c$  that  $b_n b_{n-1} \dots b_1 M c$  is a permutation matrix  $M_{\sigma^{-1}}$ .

So we proved  $BWB = \mathrm{GL}(n; K)$ . Now it suffices to show if  $M_{\sigma_1}^{-1} b M_{\sigma_2} \in B$  for some  $b \in B$ , then  $\sigma_1 = \sigma_2$ : Because  $M_\sigma = \sum_i e_{\sigma(i)i} = \sum_i e_{i\sigma^{-1}(i)}$ ,

$$M_{\sigma_1}^{-1} b M_{\sigma_2} = \sum_{ij} b_{\sigma_1(i)\sigma_2(j)} e_{ij}.$$

This is an element in  $B$ , both its  $(\sigma_1^{-1}(k), \sigma_2^{-1}(k))$ -entry is  $b_{kk} \neq 0$ , thus  $\sigma_1^{-1}(k) \leq \sigma_2^{-1}(k)$ , which implies  $\sigma_1 = \sigma_2$ . □

**Cor. (10.4.4.29).** For  $K \in \mathbf{Field}$ ,  $\mathrm{SL}(2; K)$  is generated by  $\mathrm{Unip}(K)$  and any element in  $\mathrm{SL}(2; K) \setminus B(K)$ . ┘

## 5 Isogeny and Existence Theorems

**Prop. (10.4.5.1) [Isogenies of Root Data].** If  $\varphi : (G', T') \rightarrow (G, T)$  is an isogeny of split reductive groups (10.4.3.2), then  $X^\bullet(\varphi) : X^\bullet(T) \rightarrow X^\bullet(T')$  is an isogeny of root data (3.9.5.50), where  $\alpha \in \Phi$  and  $\alpha' \in \Phi'$  correspond iff  $\varphi(U_\alpha) = U_{\alpha'}(10.2.4.20)$ , in which case

$$\varphi(u_\alpha(a)) = u_{\alpha'}(c_\alpha a^{q(\alpha)}),$$

where  $a \in k^\times$  and  $q(\alpha) \in \max(\text{char } k, 1)^\mathbb{N}$  s.t.  $f(\alpha') = q(\alpha)\alpha$ .

$\varphi$  is central/isomorphism/Frobenius iff  $X^\bullet(\varphi)$  is (3.9.5.51). ┘

*Proof:* Cf. [Mil17]P485. □

**Prop. (10.4.5.2).** If two isogenies of split reductive groups (10.4.3.2)  $\varphi_1, \varphi_2 : (G', T') \rightarrow (G, T)$  induce the same map on root data (10.4.5.1), then they differ by an inner automorphism by a unique element  $t \in (T/Z(G))(k)$ . ┘

*Proof:* Cf. [Mil17]P486. □

**Thm. (10.4.5.3) [Isogeny Theorem, Chevalley-Demazure].** Let  $\varphi : (G, T) \rightarrow (G', T')$  be an isogeny of split reductive pairs over  $k$  (10.4.3.2), then  $X^\bullet(\varphi) : X^\bullet(T') \rightarrow X^\bullet(T)$  induces an isogeny of root data  $\Phi(G', T') \rightarrow \Phi(G, T)$  (3.9.5.50), and every isogeny of root data  $\Phi(G', T') \rightarrow \Phi(G, T)$  arises in this way. Moreover,  $\varphi$  is uniquely determined by  $X^\bullet(T)$  up to an inner automorphism defined by an element of  $T'/Z(G')(k)$ .

The statement also holds for “isogeny” replaced by “central isogeny”, “Frobenius-isogeny” or “isomorphism”. ┘

*Proof:* This follows from (10.4.5.1)(10.4.5.2) and [Mil17]P487. ? □

**Cor. (10.4.5.4).** If  $(G, T)$  and  $(G', T')$  are split reductive groups over  $k$  s.t.  $(G, T)_{\bar{k}} \cong (G', T')_{\bar{k}}$ , then  $(G, T) \cong (G', T')$ . ┘

**Cor. (10.4.5.5).** If  $(G, T)$  and  $(G', T')$  are reductive groups over  $k$  s.t.  $(G, T)_{\bar{k}} \cong (G', T')_{\bar{k}}$ , then  $(G, T)_{k'} \cong (G', T')_{k'}$  for some  $k'/k$  separable. ┘

**Def. (10.4.5.6) [Pinnings].** A **pinning on split reductive group** on  $G$  is a pair  $(\Delta, (e_\alpha)_{\alpha \in \Delta})$ , where  $\Delta$  is a base of  $\Phi(G)$ , and  $e_\alpha$  is a non-zero element of  $\mathfrak{g}_\alpha$  for each  $\alpha \in \Delta$ . A **pinned split reductive group** is a split reductive group with a pinning. ┘

**Def. (10.4.5.7) [Isogenies of Pinned Groups].** An **isogeny of pinned groups**  $\varphi : (G, T, \Delta, (e_\alpha)_{\alpha \in \Delta}) \rightarrow (G', T', \Delta', (e'_\alpha)_{\alpha \in \Delta'})$  s.t.

- Under the correspondence  $\Phi \rightarrow \Phi' : \alpha \mapsto \alpha'$  (10.4.5.1),  $\Delta$  corresponds to  $\Delta'$ .
  - $\text{Lie}(\varphi)(e_\alpha) = e_{\alpha'}$ .
- ┘

**Thm. (10.4.5.8) [Isogeny of Pinned Split Reductive Groups].** Let  $(G, T, \Delta, (e_\alpha)_{\alpha \in \Delta}), (G', T', \Delta', (e'_\alpha)_{\alpha \in \Delta'}) \in \text{RedGrp}$  be pinned split reductive groups over  $k$  and let  $f : (\Phi(G'), \Delta') \rightarrow (\Phi(G), \Delta)$  be an isogeny of based root data (i.e. an isogeny of root data (3.9.5.50) mapping  $\Delta'$  to  $\Delta$ ), then there exists a unique isogeny of pinned groups  $\varphi : (G, T, \Delta, (e_\alpha)_{\alpha \in \Delta}) \rightarrow (G', T', \Delta', (e'_\alpha)_{\alpha \in \Delta'})$  s.t.  $X^\bullet(\varphi) = f$ .

In particular, we have

$$\text{Aut}(\Phi(G), \Delta) \cong \text{Aut}((G, T, \Delta, (e_\alpha)_{\alpha \in \Delta})) \cong \text{OAut}(G).$$
┘

*Proof:* This follows from isogeny theorem(10.4.5.3) and? Cf.[Mil17]P496.  $\square$

**Thm.(10.4.5.9)[Existence Theorem, Chevalley-Demazure].** Every root datum arises from a split reductive group over  $k$  as in(10.4.4.8).  $\lrcorner$

*Proof:* Cf.[Mil17]P501.  $\square$

**Cor.(10.4.5.10) [Split  $k$ -Forms].** For arbitrary  $G \in \mathcal{R}\text{edGrp}/k$ , there exists a unique split reductive group  $G_0 \in \mathcal{R}\text{edGrp}/k$  s.t.  $(G_0)_{k^{\text{sep}}} \cong G_{k^{\text{sep}}}$ , called the **split  $k$ -form** of  $G$ , and  $G$  is called an **inner reductive group** if  $G_0$  is an inner form of  $G$ ??, and an **outer reductive group** otherwise.  $\lrcorner$

*Proof:* Take a maximal torus  $T \leq G$ (10.4.1.17), then  $T_{k^{\text{sep}}}$  is split, then we can take  $(G_0, T_0) \in \mathcal{R}\text{edGrp}/k$  split with root system equal to that of  $(G, T)_{k^{\text{sep}}}$  by(10.4.5.9). Then  $(G_0)_{k^{\text{sep}}} \cong G_{k^{\text{sep}}}$  by(10.4.5.3).  $G_0$  is unique by isomorphism theorem(10.4.5.3).  $\square$

**Thm.(10.4.5.11) [Classifying Split Semisimple Groups].** Associating root diagrams to split semisimple groups(10.4.4.20) is bijection between  $\mathcal{R}\text{edGrp}^{\text{ss}}/k$  to the set of isomorphism classes of rational root diagrams(3.9.5.31).

A split semisimple group  $G \in \mathcal{R}\text{edGrp}^{\text{ss}}/k$  is simply-connected iff its root diagram is simply-connected??(i.e.  $X = P(\Phi(G))$ ).  $\lrcorner$

*Proof:* The first assertion follows from(3.9.5.44) and the isomorphism and existence theorem(10.4.5.3)(10.4.5.9).

For the last assertion, for any central isogeny  $\varphi : G' \rightarrow G$ ,  $f = X^\bullet(\varphi)$  is central(10.4.5.1), so

$$f(X) \subset X' \subset P(\Phi') = f_{\mathbb{Q}}(P(\Phi)).$$

If  $X = P(\Phi)$ , then  $f(X) = X'$  is an isomorphism, thus  $\varphi$  is an isomorphism by isogeny theorem(10.4.5.3) and(10.4.3.7).

Conversely, if  $X \neq P(\Phi)$ , then  $(X, \Phi, \Phi^\vee) \hookrightarrow (P(\Phi), \Phi, \Phi^\vee)$  is a central isogeny, which corresponds to a non-isomorphic central isogeny by existence and isogeny theorem(10.4.5.9)(10.4.5.3)  $\square$

**Def.(10.4.5.12) [Strictly Isogenous Semisimple Groups].** Two  $G, G' \in \mathcal{R}\text{edGrp}^{\text{ss}}/k$  are called **strictly isogenous semisimple groups** if there exist central isogenies  $H \rightarrow G, H \rightarrow G' \in \mathcal{R}\text{edGrp}/k$ .  $\lrcorner$

**Prop.(10.4.5.13) [Classifying Strictly Isogenous Split Semisimple Groups].** Strict-isogeny classes(10.4.5.12) of split semisimple groups over  $k$  are in bijection with the set of Dynkin-diagrams(3.9.5.29). Such a group is (geometrically)almost-simple iff its Dynkin-diagram is connected.  $\lrcorner$

*Proof:* Simply-connected semisimple groups over  $k$  are classified by their root systems(10.4.5.11), which are classified by Dynkin diagrams by(3.9.5.29). The last assertion follows from(10.4.5.18).  $\square$

### Inner Forms

**Notation(10.4.5.14).**

- Use notations defined in Cohomologies and Extensions.

$\lrcorner$

**Prop. (10.4.5.15) [Quasi-Split Forms].** Every element of  $H^1(k, \text{OAut}(G_{k^{\text{sep}}}))$  is the class of a quasi-split  $k$ -form of  $G$ , and two quasi-split  $k$ -forms of  $G$  are isomorphic iff they have the same class.  
 $\lrcorner$

*Proof:* Cf. [Mil17]P499.  $\square$

**Cor. (10.4.5.16) [Quasi-Split Inner Forms].** Any  $G \in \text{RedGrp}/k$  is an inner form of a quasi-split reductive group  $H \in \text{RedGrp}/k$ , and  $H$  is uniquely determined up to isomorphism.  $\lrcorner$

*Proof:* Cf. [Mil17]P500.  $\square$

### More on Reductive Groups

**Prop. (10.4.5.17) [Semisimple Groups are Perfect].** If  $G \in \text{RedGrp}^{\text{ss}}/k$ , then  $G$  is a perfect group, i.e.  $G = [G, G]$ .  $\lrcorner$

*Proof:* It suffices to prove for  $k = \bar{k}$ . Choose a maximal torus  $T \leq G$ , Then notice that each  $G^\alpha$  for  $\alpha \in \Phi(G, T)$  is split by [Mil17]Prop20.24  $\color{red}{?}$ , and they generate  $G$  by (10.4.4.21).  $\square$

**Prop. (10.4.5.18) [Almost-Simple Factors].** Any  $G \in \text{RedGrp}^{\text{ss}}/k$  has only f.m. almost-simple normal subgroup varieties  $G_1, \dots, G_r$  (10.4.2.6), and is an almost-direct product of them (10.1.5.9). These are called the **almost-simple factors** of  $G$ .

Every normal subgroup variety of  $G$  is an almost-direct product of the almost-simple factors it contains, and is centralized by the remaining ones.  $\lrcorner$

*Proof:* Cf. [Mil17]P440.  $\square$

**Prop. (10.4.5.19).** An isogeny of geometrically almost-simple split algebraic groups over  $k$  is an isomorphism if it restricts to an isomorphism  $T \rightarrow T'$ , except for the isogenies  $\text{SO}(2n+1) \rightarrow \text{Sp}(2n)$  when  $\text{char } k = 2$ .  $\lrcorner$

*Proof:* Cf. [Mil17]P494.  $\square$

**Prop. (10.4.5.20) [Deconstructing Semisimple Groups].** If  $G$  is simply-connected and semisimple, then

$$G \cong \text{Res}_{k_1/k}(G_1) \times \dots \times \text{Res}_{k_m/k}(G_s),$$

where  $k \leq k_i \leq k^{\text{sep}}$ ,  $G_i \in \text{RedGrp}^{\text{ss}}/k$  is geometrically almost-simple for each  $i$ . And each  $\text{Res}_{k_i/k}(G_i)$  is almost-simple.

If  $G$  is an adjoint group (10.4.2.1), then

$$G \cong \text{Res}_{k_1/k}(G_1) \times \dots \times \text{Res}_{k_m/k}(G_s),$$

where  $k \leq k_i \leq k^{\text{sep}}$ ,  $G_i \in \text{RedGrp}^{\text{ss}}/k$  is geometrically simple. And each  $\text{Res}_{k_i/k}(G_i)$  is simple.  $\lrcorner$

*Proof:* Consider  $G_{k^{\text{sep}}}$  and the Galois action on the decomposition (10.4.5.18).  $\square$

**Prop. (10.4.5.21) [Reductive Groups and Semisimple Groups].** The following are equivalent:

- $G$  is reductive.
- $R(G_{\bar{k}})$  is a torus.
- $G$  is an almost-product of a torus and a semisimple group, (in fact,  $G = R(G) \cdot [G, G]$ ) (10.4.2.23).

And in this case,  $G$  has a semisimple representation with finite kernel. The converse holds if  $k = k^{\text{perf}}$ .  
 $\perp$

*Proof:* Cf. [Mil17]P442<sup>?</sup>.  $\square$

**Prop. (10.4.5.22) [Quasi-Split Twists of Reductive Groups].** Given a connected reductive group  $G/F$  and its dual group  $\widehat{G}$  (10.4.6.2), there exists a split reductive group that is isomorphic to  $G$  over  $\overline{F}$ <sup>?</sup>. Choose an isomorphism  $\psi$  over  $\overline{F}$  from  $G$  to such a group, then the map

$$\sigma \mapsto \sigma(\psi^{-1})\psi, \quad \sigma \in \text{Gal}_F$$

induces a map  $\text{Gal}_F \rightarrow \text{OAut}(G)$ .

Then to any such homomorphism, there corresponds to a unique quasi-split reductive group over  $F$ <sup>?</sup>.  $\perp$

*Proof:*  $\square$

**Prop. (10.4.5.23).**  $\perp$

### Algebraic Fundamental Groups

**Prop. (10.4.5.24) [Algebraic Fundamental Groups, Borovoi].** For  $G \in \text{RedGrp}/k$  and  $T \leq G$  a maximal torus,  $\text{Gal}_k$  acts on the quotient  $X_{\bullet}(T)/Q(\Phi^{\vee}(G, T))$  (3.9.5.30). If  $T' \leq G$  is another maximal torus, then there exists some  $g \in G(k)$  s.t.  $T' = gTg^{-1}$ , and we get an isomorphism  $\text{Ad}(g) : X_{\bullet}(T)/Q^{\vee}(\Phi(G)) \cong X_{\bullet}(T')/Q^{\vee}(\Phi(G, T'))$ . Because  $W(G, T)$  acts on  $X_{\bullet}(T)$  by adding co-roots, it acts trivially on  $P(\Phi(G, T))$ , and the isomorphism  $X_{\bullet}(T)/Q^{\vee}(\Phi(G, T)) \cong X_{\bullet}(T')/Q^{\vee}(\Phi(G, T'))$  doesn't depend on  $g$  and is canonical. In particular, it is  $\text{Gal}_k$ -equivariant. Then we define

$$\pi_1(G) = \lim_{T \leq G \text{ maximal tori}} X_{\bullet}(T)/Q(\Phi^{\vee}(G, T)),$$

called the **algebraic fundamental group** of  $G$ .

This assignment  $G \mapsto \pi_1(G)$  induces a functor  $\pi_1 : \text{RedGrp}/k \rightarrow \text{Mod}_{\text{Gal}_k}^{\text{fg}}$ .  $\perp$

*Proof:* Any  $f : H \rightarrow G \in \text{RedGrp}/k$  lifts to a map  $f_{\text{sim.cntd}} : H_{\text{sim.cntd}} \rightarrow G_{\text{sim.cntd}}$ <sup>?</sup>, and for any maximal torus  $T \leq H$ , we can take a maximal torus  $T' \leq G$  containing  $f(T)$ .  $\square$

**Cor. (10.4.5.25).** For  $G \in \text{RedGrp}/k$ ,

- If  $G = T$  is a torus, then  $\pi_1(G) = X_{\bullet}(T)$ .
  - $G$  is semisimple and simply-connected iff  $\pi_1(G) = \mathbf{1}$ .
  - If  $k = \mathbb{C}$ , then  $\pi_1(G) \cong \pi_1(G^{\text{an}})$ .
  - If  $\widehat{G} \in \text{RedGrp}/\overline{\mathbb{Q}}$  is the Langlands dual group of  $G$  (10.4.6.2), then there is an canonical isomorphism  $\pi_1(G) \cong X^{\bullet}(Z(\widehat{G}))$ .
- $\perp$

*Proof:* 1 is trivial.

2: This follows from (10.4.5.11).

3: This follows from item2 and the fact that  $G$  is simply-connected iff  $G^{\text{an}}$  is simply-connected<sup>?</sup>.

4: <sup>?</sup>  $\square$

**Prop. (10.4.5.26)** [ $\pi_1$  is Exact].  $\pi_1 : \text{RedGrp}/k \rightarrow \text{Ab}_{\text{Gal}_K}^{\text{fg}}$  is an exact functor.  $\lrcorner$

*Proof:* ? Cf. [Borovoi]Prop1.5.  $\square$

**Prop. (10.4.5.27)** [Inner Forms]. If  $G' \in \text{RedGrp}/k$  is an inner form of  $G \in \text{RedGrp}/k$ , then there is a canonical isomorphism

$$\pi_1(G) \cong \pi_1(G').$$

$\lrcorner$

*Proof:* ?  $\square$

### Z-Extensions

**Def. (10.4.5.28)** [Z-Extensions, Ono[Ono65]/Langlands[Lan79b]]. For  $G \in \text{RedGrp}/k$ , an **z-extension** of  $G$  is a central extension  $1 \rightarrow Z \rightarrow \tilde{G} \rightarrow G \rightarrow 1$  s.t.

- $Z$  is an induced torus (10.2.3.11).
- $[\tilde{G}, \tilde{G}]$  is simply-connected.

$\lrcorner$

**Prop. (10.4.5.29)** [Properties of Z-Extensions, Langlands[Lan79b]/Kottwitz[Kot84]]. For  $G \in \text{RedGrp}/k$ ,

- If  $L/F \in \text{GalField}^{\text{fin}}$  s.t.  $G_L$  is split, there is a z-extension  $1 \rightarrow Z \rightarrow \tilde{G} \rightarrow G \rightarrow 1$  s.t.  $Z$  is a product of the form  $\text{Res}_{L/F} \mathbb{G}_m$ .
- If  $\tilde{G}_1 \rightarrow G, \tilde{G}_2 \rightarrow G$  are two z-extensions, so is their fiber product.
- If  $f : G \rightarrow H \in \text{RedGrp}/k$  and  $\tilde{G} \rightarrow G, \tilde{H} \rightarrow H$  are z-extensions (10.4.5.28), then there exists a z-extension  $\tilde{G}_1 \rightarrow G$  factoring through  $\tilde{G}$  and a commutative diagram

$$\begin{array}{ccc} \tilde{G}_1 & \longrightarrow & \tilde{H} \\ \downarrow & & \downarrow \\ G & \longrightarrow & H \end{array}$$

$\lrcorner$

*Proof:* 1:  $Z(G)^0 \times G_{\text{sim.cntd}} \rightarrow G$  is surjective because  $[G, G] \rightarrow G_{\text{ad}}$  does, and it has finite kernel by (10.4.2.16). Denote the kernel by  $\mu$ , then  $\mu$  splits over  $L$  and the  $\text{Gal}(L/F)$ -module  $X^\bullet(\mu)$  is a quotient of a free  $\text{Gal}(L/K)$ -module  $M$ . Let  $Z = \mathbf{D}(M)$ , then  $Z$  is an induced torus defined over  $F$  with an injection  $\mu \hookrightarrow Z$ . Define  $\tilde{G} = ((Z(G)^0 \times G_{\text{sim.cntd}}) \times Z) / \mu$ , then  $\tilde{G}$  is a central extension of  $G$  by  $Z$  (10.4.2.13). Thus  $\tilde{G}$  is reductive.  $G_{\text{sim.cntd}}$  embeds into  $G$  as a normal subgroup with Abelian quotient, so  $[G, G] = G_{\text{sim.cntd}}$  is simply-connected.

2: The kernel  $Z$  of  $\tilde{G}_3 = \tilde{G}_1 \times_G \tilde{G}_2 \rightarrow G$  is the product of kernels of  $\tilde{G}_1 \rightarrow G$  and  $\tilde{G}_2 \rightarrow G$ , thus induced.  $\tilde{G}_3$  is reductive because  $\tilde{G}_3$  is a central extension of  $G$  by  $Z$  (10.4.2.13). And  $[\tilde{G}, \tilde{G}]$  is simply-connected because  $\tilde{G} \rightarrow \tilde{G}_1$  is a (surjective) central extension.

3: Take  $\tilde{G}_1 = \tilde{G} \times_H \tilde{H}$ , then  $\tilde{G}_1 \rightarrow G$  is surjective with kernel the product of kernels of  $\tilde{G} \rightarrow G$  and  $\tilde{H} \rightarrow H$ , so  $\tilde{G}_1$  is reductive and  $[\tilde{G}_1, \tilde{G}_1]$  is simply-connected for the same reason as in item2.  $\square$

**Prop. (10.4.5.30) [Z-Extensions and Inner Twists].** For  $G \in \mathcal{R}\text{edGrp}/k$  and an inner twisting  $\psi : G_{k^{\text{sep}}} \cong H_{k^{\text{sep}}}$  s.t.  $H \in \mathcal{R}\text{edGrp}/k$  is quasi-split. If  $1 \rightarrow Z \rightarrow \tilde{G} \rightarrow G \rightarrow 1$  is a z-extension, then there exists a unique z-extension  $1 \rightarrow \tilde{Z} \rightarrow \tilde{H} \rightarrow H \rightarrow 1$  and a unique inner twisting  $\tilde{G}_{k^{\text{sep}}} \cong \tilde{H}_{k^{\text{sep}}}$  s.t.  $\tilde{H}$  is quasi-split, and the following diagram is commutative:

$$\begin{array}{ccc} \tilde{G} & \xrightarrow{\psi'} & \tilde{H} \\ \downarrow & & \downarrow \\ G & \xrightarrow{\psi} & H \end{array}$$

Moreover,  $\tilde{\psi} : Z \cong Z'$  is defined over  $k$ . ┘

*Proof:* Cf. [Kot82]P799. ? □

### Relative Dynkin-Diagrams

Cf. [K-P23]P98.

**Def. (10.4.5.31) [Tits-indices].** For  $G \in \mathcal{R}\text{edGrp}^{\text{ss}}/k$ , a **Tits-index** is a tuple  $(\Delta, \Delta_0, \rho)$  where  $\Delta \subset \Phi(G, T)$  is a set of absolute simple roots,  $\Delta_0 \subset \Delta$  is a subset consisting of the simple roots of the anisotropic kernel  $G^1$  ?, and  $\rho$  is a continuous action of  $\text{Gal}_k$  on  $\Delta$  preserving  $\Delta_0$ . ┘

## 6 Langlands L-Groups

References are [Bor79].

**Notation (10.4.6.1).**

- Let  $G \in \mathcal{R}\text{edGrp}/k$ . ┘

**Def. (10.4.6.2) [Langlands Dual Groups].** For  $G \in \mathcal{R}\text{edGrp}/k$ , there is a **Langlands dual group**  $\hat{G} \in \mathcal{R}\text{edGrp}/\overline{\mathbb{Q}}$  s.t.

- Any maximal torus  $\hat{T}$  of  $\hat{G}$  is isomorphic to the complex dual torus  $T^*(T)_{\mathbb{C}^\times} = \text{Hom}(X_*(T), \mathbb{C}^\times)$ .

- The Coxeter-Dynkin diagram of  $\hat{G}$  is dual to that of  $G$ . ?  
Then there is a canonical isomorphism  $\text{OAut}(\hat{G}) \cong \text{OAut}(G)$ .

Such a  $\hat{G}$  is only determined up to inner homomorphisms. ┘

*Proof:* Cf. [Bor79], [Kot84]Section1 and [B-G14] ?. □

**Def. (10.4.6.3) [Langland L-Groups].** The **Langlands L-group**  ${}^L G$  is a (possibly non-connected) reductive group over  $\overline{\mathbb{Q}}$  defined as a semi-direct product

$${}^L G = \hat{G} \rtimes \text{Gal}_k,$$

where  $\text{Gal}_k$  acts on  $\hat{G}$  via a homomorphism to  $\text{OAut}(\hat{G})$  (10.4.5.22) and a section of  $\text{Aut}(\hat{G}) \rightarrow \text{OAut}(\hat{G})$  via pinning ?.

The action factors through a finite quotient group  $\text{Gal}(K/k)$  for some  $K/k \in \text{GalField}^{\text{fin}}$ , so we can consider the **reduced Langlands L-group**  ${}^L G = \hat{G} \rtimes \text{Gal}(K/k)$ .

$$\mu_G : \text{Gal}_k \rightarrow \text{Aut}(\Phi(G_{\bar{k}}, B, T)) \cong \text{Aut}(\Phi(\widehat{G}, \widehat{B}, \widehat{T})) \rightarrow \text{Aut}(\widehat{G}).$$

And for each  $v \in \Sigma_F$ , a complex analytic group  ${}^L G_{F_v}$ , and complex analytic homomorphisms  ${}^L G_{F_v} \rightarrow {}^L G_F$  defined up to conjugacy.  $\lrcorner$

**Prop. (10.4.6.4) [Langlands L-Groups of Inner Forms].** An inner twisting  $G_{k^{\text{sep}}} \xrightarrow{\xi} G'_{k^{\text{sep}}}$  induces a  $\text{Gal}_K$ -equivariant isomorphism of Langlands dual groups  $\widehat{G} \cong \widehat{G}'$ , thus an isomorphism of Langlands L-groups  ${}^L G \cong {}^L G'$ .  $\lrcorner$

*Proof:* ?  $\square$

**Example (10.4.6.5) [Langlands Dual Groups].**

- $\widehat{\text{GL}(n)} = \text{GL}(n)$ .
- $\widehat{\text{SL}(n)} = \text{PGL}(n)$  and  $\widehat{\text{PGL}(n)} = \text{SL}(n)$ .
- $\widehat{\text{SO}(2n+1)} = \text{Sp}(2n)$  and  $\widehat{\text{Sp}(2n)} = \text{SO}(2n+1)$ .
- $\widehat{\text{SO}(2n)} = \text{SO}(2n)$ .
- $\widehat{\text{GSp}(2n)} = \text{GSpin}_{2n+1}(\mathbb{C})$ .
- $\widehat{\text{G2}} = \text{G2}$ ,  $\widehat{\text{F4}} = \text{F4}$ ,  $\widehat{\text{E6}} = \text{E6}$ ,  $\widehat{\text{E7}} = \text{E7}$ ,  $\widehat{\text{E8}} = \text{E8}$ .
- If  $G$  is semi-simple and simply-connected, then  $\widehat{G}$  is an adjoint group (10.4.2.1).
- If  $G$  is an adjoint group, then  $\widehat{G}$  is semi-simple and simply-connected.  $\lrcorner$

*Proof:* ? Cf. [Bor79]P30.  $\square$

**Example (10.4.6.6) [Langlands L-Groups for  $\text{U}(m)$ ].** If  $G = \text{U}(m)$  is the standard unitary group attached to a CM extension  $E/F$  (10.5.3.19), then the reduced Langlands L-group of  $\text{U}(m)$  is  ${}^L \text{U}(m) = \text{GL}(m; \mathbb{C}) \rtimes \text{Gal}(E/F)$  where  $c \in \text{Gal}(E/F)$  acts on  $\text{GL}(m; \mathbb{C})$  via

$$cMc = \varphi_m M^{-t} \varphi_m^{-1}, \quad \varphi_m = \begin{bmatrix} & & & (-1)^m \\ & & \cdots & \\ & -1 & & \\ 1 & & & \end{bmatrix}$$

$\lrcorner$

### Parabolic Subgroups of Langlands L-Groups

References are [Bor79].

**Notation (10.4.6.7).**

- Let  $G \in \text{RedGrp}/k$ .  $\lrcorner$

**Def. (10.4.6.8) [Parabolic Subgroups of  ${}^L G$ ].** A parabolic subgroup of  ${}^L G_{\mathbb{C}}$  (10.4.6.3) is a closed subgroup  $P \leq {}^L G_{\mathbb{C}}$  that surjects onto  $\text{Gal}_k$  and is a normalizer of a parabolic subgroup of  $\widehat{G}_{\mathbb{C}}$ .

${}^L B = \widehat{B} \rtimes \text{Gal}_k$  is a parabolic subgroup of  ${}^L G_{\mathbb{C}}$ . A parabolic subgroup  $P \leq {}^L G_{\mathbb{C}}$  is called a **standard parabolic subgroup** if it contains  ${}^L B$ .

Any parabolic subgroup of  ${}^L G_{\mathbb{C}}$  is conjugate to a unique standard parabolic subgroup ?.

Let  $\text{Par}({}^L G_{\mathbb{C}})$  be the conjugacy classes of parabolic subgroups of  ${}^L G(\mathbb{C})$ . ┘

**Def. (10.4.6.9) [Relevant Parabolic Subgroups of  ${}^L G$ ].** There is a bijection  $\text{Par}(G)_F \cong \text{Par}({}^L G_{\mathbb{C}})$  (10.4.6.8), and  $P \in \text{Par}({}^L G_{\mathbb{C}})$  is called a **relevant parabolic subgroup** if it corresponds to a class in  $p(G/F)$  under this bijection.

If  $G$  is quasi-split, then any parabolic subgroup of  ${}^L G(\mathbb{C})$  is relevant.

Let  ${}^L \text{Par}({}^L G(\mathbb{C}))$  denote the set of relevant parabolic subgroups of  ${}^L G(\mathbb{C})$ . ┘

*Proof:* ? Cf. [Bor79]P32. □

**Prop. (10.4.6.10).** If  $G' \in \text{RedGrp}/F$  is a quasi-split inner form of  $G$ , then

$${}^L p({}^L G_{\mathbb{C}}) \subset {}^L p({}^L G'_{\mathbb{C}}) = p({}^L G_{\mathbb{C}}).$$

┘

*Proof:* ? Cf. [Bor79]P32. □

## 10.5 Group Theory IV: More on Reductive Groups

*“Before Genesis, God gave the devil free reign to construct much of creation, but dealt with certain matters himself, including semisimple groups.”*

– C. Chevalley.

References are [B-T65, D-G70, D-G70a, D-G70b, Hum75, Bor91, P-R94, Spr98, Mil17, Con14].

### Notation(10.5.0.1).

- Let  $k \in \mathbf{Field}$ .
- Let  $R \in \mathbf{CRing}$ .
- Let  $\emptyset \neq S \in \mathbf{Sch}$ .
- Use notations on reductive groups defined in [Group Theory III: Reductive Groups](#).
- Let  $G, G' \in \mathbf{RedGrp}/k$ .

┘

### 1 Conjugacy Classes

References are [Kot82] and [Conjugacy classes, Springer-Steinberg].

### Notation(10.5.1.1).

- Suppose  $k = k^{\text{perf}}$ .

┘

### Stable Conjugacy Classes

References are [Kot82].

**Thm.(10.5.1.2)**[Steinberg]. Suppose  $T \leq G$  be a maximal torus and let

$$T/W(G, T) \triangleq \text{Spec} \left( \Gamma(T)^{W(G, T)} \right),$$

then there exists a  $G$ -invariant morphism  $G \rightarrow T/W(G, T)$ . If  $k = k^{\text{sep}}$ , then this map induces a bijection between the set of semi-simple conjugacy classes of  $G(k)$  and  $(T/W(G, T))(k)$ . ┘

*Proof:* ?

□

**Def.(10.5.1.3)**[Stable Conjugacy Classes, Kottwitz[Kot82]].  $x, y \in G(k)$  are called **stably conjugate** if there exists  $g \in G(k^{\text{sep}})$  s.t.  $gxg^{-1} = y$  and  $g^{-1}\sigma(g) \in Z_G(x_s)^0$ , where  $x_s$  is the semisimple part of  $x$  in the abstract Jordan-decomposition(10.3.3.1).

In this case, applying  $\sigma \in \text{Gal}_k$  to the equation  $gxg^{-1} = y$  implies that  $g^{-1}\sigma(g) \in Z_G(x)$ . Thus  $g^{-1}\sigma(g) \in Z_G(x) \cap Z_G(x_s)^0$ . Denote  $G_x^* \triangleq Z_G(x) \cap Z_G(x_s)^0$ . Notice that when  $Z_G(x_s)$  is connected(e.g.  $\pi_1([G, G]) = 1$  or  $x_s$  is strongly regular semi-simple(10.5.1.17)), we have  $G_x^* = Z_G(x)$  by(10.3.3.5), and the notion of stable conjugacy is the same as the notion of conjugacy under  $G(k^{\text{sep}})$ . ┘

**Cor.(10.5.1.4)**[ $G_{\text{ad}}$ -Conjugacy Implies Stable Conjugacy]. By(10.1.1.26), if  $x, y \in G(k)$  are conjugate under  $G_{\text{ad}}(k)$ , then  $x, y$  are stably conjugate(10.5.1.3), by(10.1.5.6). ┘

**Cor. (10.5.1.5).** If  $x, y \in G(k)$  and  $g \in G(k^{\text{sep}})$  s.t.  $\text{Ad}(g)$  is a stable conjugacy from  $x$  to  $y$ , then  $\text{Ad}(g)$  induces an inner twisting  $(G_x^*)_{k^{\text{sep}}} \cong (G_y^*)_{k^{\text{sep}}}$ .  $\lrcorner$

**Prop. (10.5.1.6) [Conjugacy Classes in Stable-Conjugacy Classes].** Suppose  $x, y \in G(k)$ . If  $g \in G(k^{\text{sep}})$  s.t.  $\text{Ad}(g)$  is a stable conjugacy from  $x$  to  $y$  (10.5.1.3), then  $(g^{-1}g^\sigma)_{\sigma \in \text{Gal}_k}$  is a 1-cycle of  $\text{Gal}_k$  in  $G_x^*$  whose cohomology class  $\text{inv}(x, y)$  lies in the kernel of

$$H^1(k, G_x^*) \rightarrow H^1(k, G).$$

Similarly, if  $g x g^{-1} = y$ , then  $(g^{-1}g^\sigma)_{\sigma \in \text{Gal}_k}$  defines a 1-cycle of  $\text{Gal}_k$  in  $G_x$  whose cohomology class lies in the kernel of

$$H^1(k, G_x) \rightarrow H^1(k, G).$$

In this way, we get

- An isomorphism between the set of conjugacy classes of  $x$  within the set of  $k^{\text{sep}}$ -conjugacy classes of  $x$  and  $\ker(H^1(k, G_x) \rightarrow H^1(k, G))$ .
- An isomorphism between the set of conjugacy classes of  $x$  within the set of stable-conjugacy classes of  $x$  and

$$\text{Im}\left(\ker\left(H^1(k, G_x^*) \rightarrow H^1(F, G)\right) \rightarrow \ker\left(H^1(k, G_x) \rightarrow H^1(F, G)\right)\right).$$

In particular, if  $G_x$  is connected (e.g.  $\pi_1([G, G]) = 1$  or  $x_s$  is strongly-regular semi-simple), then this set is just  $\ker(H^1(k, G_x) \rightarrow H^1(F, G))$ .  $\lrcorner$

*Proof:* This is easy from the definition (9.8.4.1).  $\square$

**Prop. (10.5.1.7) [Stable Conjugacy Classes and Z-Extensions].** Let  $1 \rightarrow Z \rightarrow G \xrightarrow{\alpha} H \rightarrow 1 \in \text{RedGrp}/k$  be a z-extension (10.4.5.28), then

- If  $y \in G(k)$  and  $x = \alpha(y) \in H(k)$ , then  $1 \rightarrow Z \rightarrow Z_H(y) \xrightarrow{\alpha} G_x^* \rightarrow 1$  (10.5.1.3) is an exact sequence. In particular,  $G_x^* \in \text{RedGrp}/k$ .
- $x, x' \in H(k)$  are stably conjugate iff there exists stably conjugate elements  $y, y' \in G(k)$  s.t.  $\alpha(y) = x, \alpha(y') = x'$ .  $\lrcorner$

*Proof:* Cf. [Kot82]P789.  $\square$

**Prop. (10.5.1.8).** If  $x, y \in G(k)$  are stably conjugate (10.5.1.3), then  $G_x^*$  and  $G_y^*$  are inner forms of each other. And if  $G_x = G_x^*$ , then there is a choice of inner twisting  $(G_x)_{k^{\text{sep}}} \cong (G_y)_{k^{\text{sep}}}$  that is canonical up to inner automorphisms of  $G_x$ .  $\lrcorner$

*Proof:* Cf. [Kot82]P789.  $\square$

**Prop. (10.5.1.9).** If  $G$  is quasi-split and  $x \in G(k)$  is semi-simple, then there exists  $y \in G(k)$  stably-conjugate to  $x$  (10.5.1.3) s.t.  $Z_G(y)^0$  is quasi-split.  $\lrcorner$

*Proof:* Cf. [Kot82]P790.  $\square$

### Rational Conjugacy Classes

**Def. (10.5.1.10) [c-complete Reductive Groups].**  $G$  is called a **c-complete reductive group** if every semi-simple conjugacy class  $C$  in  $G(k^{\text{sep}})$  that is defined over  $k$  (i.e.  $\sigma(C) = C$  for all  $\sigma \in \text{Gal}_k$ ) contains an element of  $G(k)$ .  $\lrcorner$

**Thm. (10.5.1.11) [Kottwitz[Kot82]].** If  $G$  is quasi-split and  $\pi_1([G, G]) = 1$ , then  $G$  is c-complete(10.5.1.10).  $\lrcorner$

*Proof:* Cf.[Kot82]P791.  $\square$

**Thm. (10.5.1.12) [Rational Unipotent Conjugacy Classes, Kottwitz[Kot82]].** If  $\text{char } k = 0$  and  $G$  is quasi-split, then every unipotent conjugacy class in  $G(k^{\text{sep}})$  that is defined over  $k$  contains an element of  $G(k)$ .  $\lrcorner$

In fact the same holds for  $\text{char } k$  large enough relative to the Dynkin-diagram of  $G$ .?  $\lrcorner$

*Proof:* Cf.[Kot82]P793.  $\square$

**Cor. (10.5.1.13).** if  $\text{char } k = 0$ ,  $G$  is quasi-split and  $\pi_1([G, G]) = 1$ , then every conjugacy class in  $G(k^{\text{sep}})$  that is defined over  $k$  contains an element of  $G(k)$ .  $\lrcorner$

In fact the same holds for  $\text{char } k$  large enough relative to the Dynkin-diagram of  $G$ .  $\lrcorner$

*Proof:* Let  $x \in G$  s.t. the conjugacy class of  $x$  is defined over  $k$ . Let  $x = us = su$  be the abstract Jordan-decomposition of  $x$  in  $G$ (10.3.3.1). For any  $\sigma \in \text{Gal}_k$ , there exists  $g \in G(k)$  s.t.  $gxg^{-1} = \sigma(x)$ , and it follows from the uniqueness of Jordan-decomposition that  $gs\sigma(s)^{-1} = \sigma(s)$ . Thus the conjugacy class of  $s$  is also defined over  $k$ . Thus it follows from(10.5.1.11) that if we replace  $x$  by a conjugate, then we may assume that  $s \in G(k)$ . And it follows from(10.5.1.9) that by replacing  $x$  by a stable conjugate, we may assume that  $Z_G(s)$  is quasi-split (and still  $s \in G(k)$ ).

Similarly,  $gu\sigma(u)^{-1} = \sigma(u)$ , and the conjugacy class of  $u$  is also defined over  $k$ , and it follows from(10.5.1.12) that there exists  $h \in Z_G(s)$  s.t.  $huh^{-1} \in Z_G(s)(k)$ . And then  $huh^{-1} = s(huh^{-1}) \in G(k)$ .  $\square$

### Cyclic Norm Maps

**Def. (10.5.1.14) [Cyclic Norm Maps, Kottwitz[Kot82]].** Suppose  $\text{char } k = 0$  and  $L/k \in \text{GalField}^{\text{fin}}$  is a cyclic extension of degree  $l$  with  $\text{Gal}(L/k) = \langle \sigma \rangle$ . Choose an inner twisting  $\psi : G_{\bar{k}} \rightarrow H_{\bar{k}}$  where  $H \in \text{RedGrp}/k$  is quasi-split(10.4.5.16). Then we can define a map  $\mathfrak{N}$  from  $G(L)$  to the set of stable-conjugacy classes of  $H(k)$  as follows:

- If  $[G, G]$  is simply-connected and  $x \in G(L)$ , define  $\text{Nm}_{L/k}(x) = \sigma^{l-1}(x)\sigma^{l-2}(x)\dots\sigma(x)x$ , then the conjugacy class of  $\psi(\text{Nm}_{L/k}(x))$  is defined over  $k$ , thus by(10.5.1.13) defines a  $k^{\text{sep}}$ -conjugacy class in  $H(k)$  (which is the same as stable-conjugacy class by(10.5.1.3)).
- In general, take a  $z$ -extension  $1 \rightarrow Z \rightarrow \tilde{G} \rightarrow G \rightarrow 1$  and a  $z$ -extension  $1 \rightarrow Z' \rightarrow \tilde{H} \rightarrow H \rightarrow 1$  where  $H'$  is quasi-split and inner twisting  $\tilde{\psi} : (\tilde{G})_{k^{\text{sep}}} \cong (\tilde{H})_{k^{\text{sep}}}$  as in(10.4.5.30). Then there exists a unique map  $\mathfrak{N}$  from  $G(L)$  to the set of stable conjugacy classes of  $H(k)$  making the following commutative diagram commutative:

$$\begin{array}{ccc} \tilde{G}(L) & \xrightarrow{\mathfrak{N}_{\sigma, \tilde{\psi}}} & \{\text{stable-conjugacy classes of } \tilde{H}(k)\} \\ \downarrow & & \downarrow \\ G(L) & \xrightarrow{\mathfrak{N}_{\sigma, \psi}} & \{\text{stable-conjugacy classes of } H(k)\} \end{array} .$$

This  $\mathfrak{N}_{\sigma,\psi}$  doesn't depends on  $\tilde{G}$  chosen. And if  $H = G, \psi = \text{id}_G$ , then denote  $\mathfrak{N}_\sigma$ . ┘

*Proof:* 1:  $\sigma(\text{Nm}(x)) = x \text{Nm}(x) x^{-1}$ , so the conjugacy class of  $\text{Nm}(x) \in G(k^{\text{sep}})$  is defined over  $k$ . And the same holds for  $\psi(\text{Nm}_{L/k}(x))$  because  $\psi$  is an inner twisting.

2: Uniqueness of  $\mathfrak{N}_{\sigma,\psi}$  follows from the fact that  $\tilde{G}(L) \rightarrow G(L)$  is surjective by (10.2.3.12). To show existence, notice that if  $x, y \in \tilde{G}(L)$  s.t.  $y = xz$  for some  $z \in Z(k)$ , then we have  $\text{Nm}_{L/k}(y) = \text{Nm}_{L/k}(x) \text{Nm}_{L/k}(z)$ , thus  $\mathfrak{N}_{\sigma,\psi}(x) = \mathfrak{N}_{\sigma,\psi}(y)$  modulo  $Z'$ . The independence of  $\psi$  follows from (10.4.5.29) and the definition in item1. □

**Prop. (10.5.1.15)[Conjugacy and Cyclic Extensions].** Situation as in (10.5.1.14), let  $I = \text{Res}_{L/k} G_L$ , then ?

In particular, for  $x, y \in G(L)$ ,  $\text{Nm}_{L/k}(x), \text{Nm}_{L/k}(y) \in G(k^{\text{sep}})$  are conjugate iff  $x, y \in I(k^{\text{sep}})$  are  $\sigma$ -conjugate. ┘

*Proof:* Cf. [Kot82]P801 ? □

**Prop. (10.5.1.16)[Stable Conjugacy and Cyclic Extensions].** Situation as in (10.5.1.14), for  $x, y \in G(L)$ ,  $x, y$  are stably conjugate iff  $\mathfrak{N}(x) = \mathfrak{N}(y)$ . ┘

*Proof:* Cf. [Kot82]P804. □

### Strongly Regular Semi-Simple Elements

**Def. (10.5.1.17) [Regular Semi-Simple Elements].** A semi-simple element  $\gamma \in G(k)$  is called a **regular semi-simple element** if  $Z_G(\gamma)^0 \in \mathcal{T}_{\text{ori}}/k$ , and it is called a **strongly regular semi-simple element** if  $Z_G(\gamma) \in \mathcal{T}_{\text{ori}}/k$ . ┘

**Prop. (10.5.1.18).** If  $\text{char } k = 0, \gamma, \gamma' \in G(k)$  are strongly regular semi-simple elements and  $g \in G(k^{\text{sep}})$  s.t.  $g\gamma g^{-1} = \gamma', \text{Ad}(g) : Z_G(\gamma) \rightarrow Z_G(\gamma')$  doesn't depends on  $g$  chosen because  $Z_G(\gamma)$  is a torus, and we denote it by  $\varphi_{\delta, \delta'}$ . ┘

## 2 Cohomology of Reductive Groups

References are [Mil17]Chap25.g and [Ser97a] and [Number theory and Algebraic groups].

**Prop. (10.5.2.1)[Cohomology of Parabolic Subgroups].** Let  $G \in \text{RedGrp}/k$  and  $P \leq G$  a parabolic subgroup with Levi-subgroup  $L$  (10.4.2.33), then the natural map  $H^1(k, L) \rightarrow H^1(k, P)$  is bijective and  $H^1(k, P) \rightarrow H^1(k, G)$  is injective. ┘

*Proof:* □

### Cohomology over Local Fields

References are [Kne65].

**Thm. (10.5.2.2) [Tate-Nakayama Theorem].** For  $K \in \text{LField}$  and  $T \in \mathcal{T}_{\text{ori}}/K$  with splitting field  $L/K$ , then for any  $n \in \mathbb{Z}_+$ , we have

$$H_{\text{Tate}}^n(L/K, T) \cong H_{\text{Tate}}^{2-i}(L/K, X^\bullet(T)) \cong H_{\text{Tate}}^{i-2}(L/K, X_\bullet(T)) \quad (9.8.1.5).$$

In particular,  $H^1(L/K, T) \cong H^1(L/K, X^\bullet(T)) = (X^\bullet(T)_{\text{Gal}_K})_{\text{tor}} = \pi_0(\hat{T}^{\text{Gal}_K})^\vee$ . ┘

**Thm. (10.5.2.3)**[Steinberg's Theorem, Lang[Lan56]/Serre[Ser62]/Springer[Spr62]/Steinberg[Ste65]].

If  $k$  is a cd-1 field(9.8.3.18)(e.g. a finite field?? or a Henselian field with alg.closed residue field??) and  $G \in \mathcal{R}edGrp/k$ , then  $H^1(k, G) = \mathbf{1}$  and  $G$  is quasi-split.

Moreover, if  $k = k^{\text{perf}}$ , then the above assertion holds for any  $G \in \mathcal{A}lgGrp_{\text{c}ntd}/K$ .  $\lrcorner$

*Proof:* Cf.[Ser97a]Section2.2, 2.3. This statement is right!! [P-R94] has a proof of Lang's theorem.  $\square$

**Prop. (10.5.2.4).** Suppose  $(\mathcal{O}_K, K, \kappa) \in \text{DVR}$  is Henselian and  $\kappa = \bar{\kappa}$ . If  $G \in \mathcal{G}rpVar/K$ , then  $H^1(K, G) \rightarrow H^1(\bar{K}, G)$  is a bijection. In particular, if  $G$  is reductive, then  $H^1(K, G) = \mathbf{1}$ .  $\lrcorner$

*Proof:* Cf.[Fibres principaux sur les corps values henseliens]Prop3.5.3.(2). or [K-P23]P81?  $\square$

The last assertion follows from(10.5.2.3).  $\square$

**Prop. (10.5.2.5).** If  $k$  is a cd-1 field(9.8.3.18) and  $T/k$  is a torus, then  $H^i(k, T) = 0$  for any  $i \in \mathbb{Z}_+$ .  $\lrcorner$

*Proof:* Take an exact sequence  $1 \rightarrow R_1 \rightarrow R_0 \rightarrow T \rightarrow 1$  where  $R_1$  is a torus and  $R_0$  is an induced torus(10.2.3.13), then  $H^i(k, R_0)$  is a finite product of  $H^i(k', \mathbb{G}_m)$  for  $k'/k$  finite separable.  $H^1(k', \mathbb{G}_m)$  by Hilbert's multiplicative Satz90(9.8.3.2), and  $H^2(k', \mathbb{G}_m) = \text{Br}(k') = 0$  by(9.8.3.18). And also  $H^i(k', \mathbb{G}_m) = 0$  for  $i \geq 3$  by??. Now  $H^{i+2}(k, R_1) = 0$  for any  $i \in \mathbb{Z}_+$  by(9.8.3.18), so  $H^{i+1}(k, T) = 0$ , and then also  $H^{i+1}(k, R_1) = 0$  for all  $i \in \mathbb{Z}_+$ , so  $H^i(k, T) = 0$  for any  $i \in \mathbb{Z}_+$ .  $\square$

**Thm. (10.5.2.6).** Suppose  $(\mathcal{O}_K, K) \in \text{DVR}$  is Henselian s.t.  $\kappa$  is a perfect cd-1 field(9.8.3.18). If  $C \subset \mathcal{B}(G_{K^{\text{sh}}})$  is a  $\text{Gal}_\kappa$ -stable chamber(20.5.2.31) with corresponding Iwahori-subgroup  $\mathcal{I} \subset G(K^{\text{sh}})$ , and  $\mathcal{N} = N_{G(K^{\text{sh}})}(\mathcal{I}) = G(K^{\text{sh}})_C$  the normalizer, then the natural maps

$$H^1(\text{Gal}_\kappa, \mathcal{N}/\mathcal{I}) \leftarrow H^1(\text{Gal}_\kappa, \mathcal{N}) \rightarrow H^1(\text{Gal}_\kappa, G(K^{\text{sh}})) \rightarrow H^1(K, G)$$

are bijective.  $\lrcorner$

*Proof:* ? Cf.[K-P23].  $\square$

**Cor. (10.5.2.7)** [Cohomology of Simply-Connected Semisimple Groups, Kneser/Bruhat-Tits[B-T87]]. Suppose  $(\mathcal{O}_K, K) \in \text{DVR}$  is Henselian s.t.  $\kappa$  is a perfect cd-1 field(9.8.3.18). If  $G$  is semisimple and simply-connected, then  $H^1(K, G) = \mathbf{1}$ .  $\lrcorner$

*Proof:* In this case  $G(K)^0 = G(K)$ (20.5.2.18), thus  $\mathcal{N} = \mathcal{I}$  by(20.6.4.14) and(20.6.1.5), so the assertion follows from(10.5.2.6).  $\square$

**Prop. (10.5.2.8)**[Anisotropic Tori]. If  $K \in p\text{-LField}$  and  $T \in \mathcal{T}ori/K$  is anisotropic, then  $H^2(K, T) = 0$ .  $\lrcorner$

*Proof:* Cf.[K-P23]P400.  $\square$

**Thm. (10.5.2.9)**[Finiteness Theorems]. If  $K \in \text{LField}$  and  $G \in \text{linAlgGrp}/K$ , then  $\#H^1(K, G) < \infty$ .  $\lrcorner$

*Proof:* Cf.[P-R94]P316.  $\square$

### Cohomology over Global Fields

**Notation (10.5.2.10).**

- Let  $F \in \mathbf{GField}$ .
- Let  $G \in \mathbf{RedGrp}/F$ .

┘

**Thm. (10.5.2.11) [Finiteness Theorems].** If  $F \in \mathbf{NField}$  and  $G \in \mathbf{linAlgGrp}/F$ , then

$$\# \ker \text{III}(G/F) < \infty \text{ (9.8.3.28)}.$$

┘

*Proof:* Cf. [P-R94]P316. □

**Thm. (10.5.2.12) [Hasse-Principle for Simply-Connected Semisimple Groups, Kneser/Harder/Chernousov].** If  $F \in \mathbf{NField}$  and  $G$  is semi-simple and simply-connected, then

$$H^1(F, G) \rightarrow \prod_{v \in \Sigma_\infty(F)} H^1(F_v, G)$$

is a bijection. In particular,  $\text{III}(G/F) = 1$ . ┘

*Proof:* Cf. [P-R94]P286. ? □

**Cor. (10.5.2.13) [Hasse-Principle for Adjoint Groups].** If  $F \in \mathbf{NField}$  and  $G$  is an adjoint group, then

$$\text{III}(G/F) = 1.$$

┘

*Proof:* Cf. [P-R94]P336. ? □

**Prop. (10.5.2.14) [Cohomology of Semi-Simple Groups].** If  $K \in p\text{-LField} \cup \mathbf{NField}$  and  $G \in \mathbf{RedGrp}^{\text{ss}}/K$ , then the connecting map  $H^1(K, G) \xrightarrow{\delta} H^2(K, \pi_1(G))$  associated to the exact sequence  $1 \rightarrow \pi_1(G) \rightarrow G_{\text{sim.cntd}} \rightarrow G \rightarrow 1$  is surjective. And if  $K \in p\text{-LField}$ , it is moreover bijective. ┘

*Proof:* Cf. [R-P94]P326. ? □

**Thm. (10.5.2.15) [Kneser [Kne65]].** If  $F \in \mathbf{NField}$ ,  $T \in \mathbf{Tori}/F$  and  $T_{F_v}$  is anisotropic for some  $v \in \Sigma_F$ , then

$$H^2(F, T) \rightarrow \prod_{v \in \Sigma_F} H^2(F_v, T)$$

is injective. ┘

*Proof:* Cf. [P-R94]P315. ? □

### 3 Classical Groups

**Def. (10.5.3.1) [Classical Groups and Exceptional Groups].**  $G \in \mathcal{R}ed\mathcal{G}rp/K$  is called a **classical group** if it is semisimple and the simply-connected covering group  $\tilde{G}_{\bar{k}}$  of  $G_{\bar{k}}$  has associated Dynkin diagrams with connected components of type  $A_n, B_n, C_n, D_n$  excluding the type  ${}^3D_4$  or  ${}^6D_4$  (Galois action).

$G$  is called an **exceptional group** if it is semisimple and the simply-connected covering group  $\tilde{G}_{\bar{k}}$  of  $G_{\bar{k}}$  with associated Dynkin diagrams has connected components of type  $E_6, E_7, E_8, F_4, G_2$ .

$G$  is called a **trialitarian group** if it is semisimple and the simply-connected covering group  $\tilde{G}_{\bar{k}}$  of  $G_{\bar{k}}$  has associated Dynkin diagrams with connected components of type  $D_4$  and the action of  $\text{Gal}_k$  on them permutes with three outer vertices.  $\lrcorner$

#### Split Classical Groups

**Def. (10.5.3.2) [Examples of Classical Groups over  $\mathbb{Z}$ ].** For  $n \in \mathbb{Z}_+$ ,

- the **general linear group**  $\text{GL}(n) = \mathbb{Z}[T_{ij}][1/\det]$  representing the group functor  $\mathcal{C}Alg_{\mathbb{Z}} \rightarrow \mathcal{G}rp : R \mapsto \text{GL}(n; R)$ .
- the **multiplicative group**  $\mathbb{G}_m = \text{Spec } \mathbb{Z}[T, T^{-1}]$ , which is just  $\text{GL}(1)$ .
- the **special linear group**  $\text{SL}(n)$  is the algebraic subgroup scheme of  $\text{GL}(n)$  defined by the ideal  $(\det - 1)$ , representing the group functor  $\mathcal{C}Alg_{\mathbb{Z}} \rightarrow \mathcal{G}rp : R \mapsto \text{SL}(n, R)$ .
- the (standard)**orthogonal group**  $\text{O}(n)$  is the algebraic subgroup of  $\text{GL}(n)$  generated by the entries of the equation  $(T_{ij})^t C_n (T_{ij}) = C_n$ , where  $C_n = \begin{bmatrix} 1 & \mathbf{0} & \mathbf{0} \\ \mathbf{0} & \mathbf{0} & \mathbf{1}_k \\ \mathbf{0} & \mathbf{1}_k & \mathbf{0} \end{bmatrix}$  if  $n = 2k+1$  and  $\begin{bmatrix} \mathbf{0} & \mathbf{1}_k \\ \mathbf{1}_k & \mathbf{0} \end{bmatrix}$  if  $n = 2k$ , representing the functor  $\mathcal{C}Alg_{\mathbb{Z}} \rightarrow \mathcal{G}rp : R \mapsto \{g \in \text{GL}(n, R) \mid g^t C_n g = C_n\}$ .
- the (standard)**general orthogonal group**  $\text{GO}(n)$  is the algebraic subgroup of  $\text{GL}(n) \times \mathbb{G}_m \subset \text{GL}(n+1)$  generated by the entries of the equation  $(T_{ij})^t C_n (T_{ij}) = T C_n$ , representing the functor

$$\mathcal{C}Ring_{\mathbb{Z}} \rightarrow \mathcal{G}rp : R \mapsto \{g \in \text{GL}(n, R) \times \mathbb{R}^\times \mid g^t C_n g = r C_n\}.$$

There is an exact sequence

$$1 \rightarrow \text{O}(n) \rightarrow \text{GO}(n) \xrightarrow{\nu} \mathbb{G}_m \rightarrow 1,$$

where  $\nu : (g, r) \mapsto r$  is called the **amplitude character**.

- the **special orthogonal groups**  $\text{SO}(n) = \text{O}(n) \cap \text{SL}(n)$  (when  $\text{char } k \neq 2$ ).
- the (standard)**symplectic group**  $\text{Sp}(n)$  is the algebraic subgroup of  $\text{GL}(2n)$  defined by the ideal generated by the entries of the equation  $(T_{ij})^t J_n (T_{ij}) = J_n$ , where  $J_n = \begin{bmatrix} \mathbf{0} & \mathbf{1}_n \\ -\mathbf{1}_n & \mathbf{0} \end{bmatrix}$ , representing the functor

$$\mathcal{C}Ring_{\mathbb{Z}} \rightarrow \mathcal{G}rp : R \mapsto \{g \in \text{GL}(2n; R) \mid g^t J_n g = J_n\} = \left\{ \begin{bmatrix} A & B \\ C & D \end{bmatrix} \mid A^t C = C^t A, A^t D - C^t B = I, B^t D = D^t B \right\}.$$

- the (standard)**general symplectic group**  $\text{GSp}(n)$  is the algebraic subgroup of  $\text{GL}(2n) \times \mathbb{G}_m \subset \text{GL}(2n+1)$  generated by the entries of the equation  $(T_{ij})^t J_n (T_{ij}) = T J_n$ , representing the functor

$$\mathcal{C}Ring_{\mathbb{Z}} \rightarrow \mathcal{G}rp : R \mapsto \{(g, r) \in \text{GL}(2n; R) \times R^* \mid g^t J_n g = r J_n\}.$$

There is an exact sequence

$$1 \rightarrow \mathrm{Sp}(2n) \rightarrow \mathrm{GSp}(2n) \xrightarrow{\nu} \mathbb{G}_m \rightarrow 1,$$

where  $\nu : (g, r) \mapsto r$  is called the **amplitude character**.

- $\mathrm{PGL}(n)$  is the quotient group of  $\mathrm{GL}(n)$  by its center.
- $\mathrm{PSL}(n)$  is the quotient group of  $\mathrm{SL}(n)$  by its center.
- $\mathrm{PSO}(n)$  is the quotient group of  $\mathrm{SO}(n)$  by its center.
- the **standard Borel subgroup**  $B(n)$  is the algebraic subgroup of  $\mathrm{GL}(n)$  representing the upper-triangular matrices.
- the **standard unipotent subgroup**  $\mathrm{Unip}(n)$  is the algebraic subgroup of  $B(n)$  representing the unipotent matrices.
- the **diagonal group**  $T(n)$  is the unipotent subgroup of  $B(n)$  representing diagonal matrices.

┘

*Proof:* By (10.1.1.3), it suffices to show  $\mathrm{Hom}(-, G)$  is a group functor when restricted to affine schemes.  $\square$

**Prop. (10.5.3.3) [Linear Groups].** For any  $n \in \mathbb{Z}_+$ ,  $\mathrm{PGL}(n; k) = \mathrm{GL}(n; k)/k^\times$  because  $H^1(k, \mathbb{G}_m) = 1$ ?

There is an exact sequence  $1 \rightarrow \mu_n \rightarrow \mathrm{SL}(n) \rightarrow \mathrm{PGL}(n) \rightarrow 1$  because  $\mathrm{SL}(n, \bar{k}) \rightarrow \mathrm{PGL}(n, \bar{k})$  is surjective (10.1.5.6).  $\square$

**Def. (10.5.3.4) [Spin Algebraic Groups].** There are algebraic subgroups of  $\mathrm{Cl}^+(L)_{\mathbb{Q}}$  generating the spin group construction (3.11.5.6):

$$\mathrm{Spin}(L)(R) = \{g \in \mathrm{Cl}^+(L)_R : gg' = 1, gLg^{-1} = L\}$$

$$\mathrm{GSpin}(L)(R) = \{g \in \mathrm{Cl}^+(L)_R : gg' = \lambda(g) \in R^*, gLg^{-1} = L\}.$$

Called the **spin algebraic group** and the **GSpin algebraic group**.  $\mathrm{Spin}(L)$  and  $\mathrm{GSpin}$  acts on  $L$  via conjugation.  $\square$

**Prop. (10.5.3.5).** There is a diagram with exact rows and columns:

$$\begin{array}{ccccccc} 1 & \longrightarrow & \mu_2 & \longrightarrow & \mathrm{Spin}(L) & \longrightarrow & \mathrm{SO}(L) \longrightarrow 1 \\ & & \downarrow & & \downarrow & & \parallel \\ 1 & \longrightarrow & \mathbb{G}_m & \longrightarrow & \mathrm{GSpin}(L) & \longrightarrow & \mathrm{SO}(L) \longrightarrow 1 \\ & & \downarrow 2 & & \downarrow \lambda & & \\ & & \mathbb{G}_m & \xlongequal{\quad} & \mathbb{G}_m & & \end{array}$$

┘

*Proof:*

$\square$

**Prop. (10.5.3.6) [Simply-Connectedness].**  $\mathrm{Spin}(n)$  are simply-connected.  $\square$

### Parabolic Subgroups

**Prop. (10.5.3.7)[Borel Subgroups of  $\mathrm{GL}(n)$ ].** If  $k = \bar{k}$  and  $G = \mathrm{GL}(n)$ , then by Lie-Kolchin(10.2.7.7), the Borel subgroups of  $G$  are exactly the conjugates by  $G(k)$  of  $B(n)$ .  $\lrcorner$

*Proof:* Cf.[Mil17]P354.  $\square$

**Prop. (10.5.3.8).**  $B(n)$  is split solvable and  $\mathrm{Unip}(n)$  is split nilpotent.

Moreover,  $\mathrm{Unip}(n)$  has no non-zero subtorus, by successively using(10.1.1.8).  $\lrcorner$

*Proof:* Cf.[Mil17]P137.  $\square$

**Prop. (10.5.3.9) [Maximal Borel Subgroups].** Let  $G = \mathrm{SO}(2n), \mathrm{SO}(2n+1)$  or  $\mathrm{Sp}(2n)$ , then the maximal Borel subgroup of  $G$  are the stabilizers of the maximal totally anisotropic flags in  $G$ (of length  $n$ ).  $\lrcorner$

*Proof:* Cf.[Mil17]P354.  $\square$

**Prop. (10.5.3.10)[ $\mathrm{Sp}(2n)$  and  $\mathrm{SL}(2n)$ ].**  $\mathrm{Sp}(2n) \subset \mathrm{SL}(2n)$ , and  $\mathrm{Sp}(2) = \mathrm{SL}(2)$ .  $\lrcorner$

*Proof:* The first inclusion follows from(3.5.11.28), and the second follows from the fact that the volume form the definition(10.5.3.2).  $\square$

### Almost-Simple Semisimple Groups

#### Semisimplicity

**Prop. (10.5.3.11)[Reductive and Semisimple Groups].**  $\mathrm{GL}(n), \mathrm{SL}(n+1), \mathrm{SO}(n), \mathrm{Sp}(2n)$  are reductive by(10.3.5.1), as they are connected, and their standard representation is geo.simple.

$\mathrm{SL}(n), \mathrm{SO}(n), \mathrm{Sp}(2n)$  are semisimple, as they have finite centers(10.4.2.18).  $\lrcorner$

#### Root Systems

**Prop. (10.5.3.12) [Maximal Tori of  $\mathrm{GL}(n)$ ].**  $T(n)$  is a maximal torus in  $\mathrm{GL}(n)$  because  $C_{\mathrm{GL}(n)}(T(n)) = T(n)$ . And for  $n \in \mathbb{Z}_+$ , the conjugacy classes of maximal tori in  $\mathrm{GL}(n)$  is in bijection with the isomorphism classes of étale  $k$ -algebras of rank  $n$ . In particular,  $\lrcorner$

*Proof:* If  $T \leq \mathrm{GL}(n)$  is a maximal torus, then  $V = k^n$  decomposes as a direct sum of simple  $T$ -modules(10.2.3.23)  $V = \bigotimes_i V_i$ , and each  $k_i = \mathrm{End}_{T_i}(V_i)$  is a separable field extension of  $k$  s.t.  $\dim_{k_1} V_i = 1$  by(10.2.3.23), and  $T \leq \prod_i \mathrm{Res}_{k_i/k} \mathbb{G}_m$ . By comparing ranks, we see  $T = \prod_i \mathrm{Res}_{k_i/k} \mathbb{G}_m$ , and  $\prod_i k_i$  is an étale  $k$ -algebra of rank  $n$ . Conversely, for any étale  $k$ -algebra  $\prod_i k_i$  of rank  $n$ ,  $T = \prod_i \mathrm{Res}_{k_i/k} \mathbb{G}_m$  is a maximal torus contained in  $\mathrm{GL}(\prod_i k_i) \cong \mathrm{GL}(n)$ (maximal because it has rank  $n$ , which equals the diagonal torus). Clearly this establishes a bijection.  $\square$

**Prop. (10.5.3.13)[Classical Semisimple Groups].**

- For the split reductive pair  $(\mathrm{GL}(n), T(n))$  where  $n \in \mathbb{Z}_{\geq 2}$  and  $T$  is the diagonal torus,  $\Phi(\mathrm{GL}(n), T(n)) = \{e_i - e_j\}_{i \neq j \in [n]_+}$ , where  $e_i \in X^\bullet(T(n))$  where

$$e_i(\mathrm{diag}(t_1, \dots, t_n)) = t_i, \quad s_{i,j}(t_1, \dots, t_n) = (t_1, \dots, t_{i-1}, t_j, t_{i+1}, \dots, t_{j-1}, t_i, t_{j+1}, \dots, t_n),$$

$$(e_i - e_j)^\vee = e_i^\vee - e_j^\vee : t \mapsto (1, \dots, [t]_i, \dots, [t^{-1}]_j, \dots, 1).$$

$A_n$  : For the split reductive pair  $(\mathrm{SL}(n+1), T)$ , where  $n \in \mathbb{Z}_{\geq 2}$  and  $T$  is the diagonal torus,  $\Phi(\mathrm{SL}(n+1), T) = \{\pm\alpha_{ij}\}$ , where  $\alpha \in X^\bullet(T)$  s.t.

$$\alpha_{ij}(\mathrm{diag}(t_1, \dots, t_{n+1})) = t_i/t_j, \quad s_{i,j}(t_1, \dots, t_{n+1}) = (t_1, \dots, t_{i-1}, t_j, t_{i+1}, \dots, t_{j-1}, t_i, t_{j+1}, \dots, t_{n+1}),$$

$$\alpha_{ij}^\vee(t) = (1, \dots, [t]_i, \dots, [t^{-1}]_j, \dots, 1).$$

and the base corresponding to the standard Borel is  $\Delta = \{\alpha_{12}, \alpha_{23}, \dots, \alpha_{n,n+1}\}$ . Thus it is of type  $A_n$  (3.9.6.3). It is simply-connected and geometrically almost-simple because  $X = P(\Phi)$  (10.4.5.11) (10.4.5.13), and has center  $D(P(\Phi)/Q(\Phi)) \cong \mu_{n+1}$  (10.4.4.6). The unique outer automorphism reversing the Dynkin diagram is given by  $X \mapsto X^{-t}$ .

- For the split reductive pair  $(\mathrm{PGL}(n), \overline{T}(n))$ ,  $\Phi(\mathrm{PGL}(n), \overline{T}(n)) = \{\alpha_{ij}\}_{i \neq j \in [n]_+}$ , where  $\alpha_{ij} \in X^\bullet(T(n))$  s.t.  $\alpha_{ij}(\mathrm{diag}(t_1, \dots, t_n)) = t_i/t_j$ .

$B_n$  : The split reductive pair  $(\mathrm{SO}(2n+1), T)$  where  $T = \{\mathrm{diag}(1, t_1, \dots, t_n, t_1^{-1}, \dots, t_n^{-1})\}$ ,

$$\Phi(\mathrm{SO}(2n+1), T) = \{\pm(e_i + e_j), \pm(e_i - e_j), \pm e_i\}_{i \neq j \in [n]_+},$$

where

$$e_i(\mathrm{diag}(1, t_1, \dots, t_n, t_1^{-1}, \dots, t_n^{-1})) = t_i, \quad (e_i - e_j)^\vee = e_i^\vee - e_j^\vee : t \mapsto (1, \dots, [t]_i, \dots, [t^{-1}]_j, \dots, 1),$$

$$s_{i,j}(\mathrm{diag}(1, t_1, \dots, t_n, t_1^{-1}, \dots, t_n^{-1})) = \mathrm{diag}(1, t_1, \dots, t_{i-1}, t_j, t_{i+1}, \dots, t_{j-1}, t_i, t_{j+1}, \dots, t_n, \\ t_1^{-1}, \dots, t_{i-1}^{-1}, t_j^{-1}, t_{i+1}^{-1}, \dots, t_{j-1}^{-1}, t_i^{-1}, t_{j+1}^{-1}, \dots, t_n^{-1}).$$

The eigenvectors in  $\mathfrak{so}(2n+1)$  is given in [Mil17]P458. And the base corresponding to the standard Borel is  $\Delta = \{e_1 - e_2, e_2 - e_3, \dots, e_{n-1} - e_n, e_n\}$ .

Thus it is of type  $B_n$  (3.9.6.3). It is geometrically almost-simple of adjoint-type because  $X = Q(\Phi)$  (10.4.4.6) (10.4.5.13). Its simply-connected covering group is  $\mathrm{Spin}(2n+1) \rightarrow \mathrm{SO}(2n+1)$  with kernel  $D(P(\Phi)/Q(\Phi)) \cong \mu_2$  (10.4.5.3), which is the center of  $\mathrm{Spin}(n)$ .

$C_n$  : For the split reductive pair  $(\mathrm{Sp}(n), T)$  where  $n \in \mathbb{Z}_{\geq 2}$  and  $T$  is the diagonal torus,

$$\Phi(\mathrm{Sp}(n), T) = \{\pm 2e_i, \pm e_i \pm e_j\}_{i \neq j \in [n]_+},$$

where

$$e_i(\mathrm{diag}(t_1, \dots, t_n, t_1^{-1}, \dots, t_n^{-1})) = t_i, \quad (e_i - e_j)^\vee = e_i^\vee - e_j^\vee : t \mapsto (1, \dots, [t]_i, \dots, [t^{-1}]_j, \dots, 1),$$

$$s_{i,j}(\mathrm{diag}(t_1, \dots, t_n, t_1^{-1}, \dots, t_n^{-1})) = \mathrm{diag}(t_1, \dots, t_{i-1}, t_j, t_{i+1}, \dots, t_{j-1}, t_i, t_{j+1}, \dots, t_n, \\ t_1^{-1}, \dots, t_{i-1}^{-1}, t_j^{-1}, t_{i+1}^{-1}, \dots, t_{j-1}^{-1}, t_i^{-1}, t_{j+1}^{-1}, \dots, t_n^{-1}).$$

The eigenvectors in  $\mathfrak{sp}(n)$  is given in [Mil17]P459. And the base corresponding to the standard Borel is  $\Delta = \{e_1 - e_2, e_2 - e_3, \dots, e_{n-1} - e_n, 2e_n\}$ .

Thus it is of type  $D_n$  (3.9.6.3). It is geometrically almost-simple and simply-connected because  $X = P(\Phi)$  (10.4.5.11) (10.4.5.13), and has center  $D(P(\Phi)/Q(\Phi)) \cong \mu_2$ .

$D_n$  : For the split reductive pair  $(\mathrm{SO}(2n), T)$  where  $n \in \mathbb{Z}_{\geq 2}$  and  $T = \{\mathrm{diag}(t_1, \dots, t_n, t_1^{-1}, \dots, t_n^{-1})\}$ ,

- $\Phi(\mathrm{SO}(2n), T) = \{\pm e_i \pm e_j\}_{i \neq j \in [n]_+}$ , where
 
$$e_i(\mathrm{diag}(t_1, \dots, t_n, t_1^{-1}, \dots, t_n^{-1})) = t_i, \quad (e_i - e_j)^\vee = e_i^\vee - e_j^\vee : t \mapsto (1, \dots, [t]_i, \dots, [t^{-1}]_j, \dots, 1),$$
- $s_{i,j}(\mathrm{diag}(1, t_1, \dots, t_n, t_1^{-1}, \dots, t_n^{-1})) = \mathrm{diag}(1, t_1, \dots, t_{i-1}, t_j, t_{i+1}, \dots, t_{j-1}, t_i, t_{j+1}, \dots, t_n, t_1^{-1}, \dots, t_{i-1}^{-1}, t_j^{-1}, t_{i+1}^{-1}, \dots, t_{j-1}^{-1}, t_i^{-1}, t_{j+1}^{-1}, \dots, t_n^{-1})$ .
- The eigenvectors in  $\mathfrak{so}(2n)$  is given in [Mil17]P460.
- The base corresponding to the standard Borel is  $\Delta = \{e_1 - e_2, e_2 - e_3, \dots, e_{n-1} - e_n, e_{n-1} + e_n\}$ .
- Thus it is of type  $D_n$  (3.9.6.3). It is geometrically almost-simple by (10.4.5.13). Its non-simply-connected and non-adjoint-type with center  $D(X/Q(\Phi)) \cong \mu_2$ . It simply-connected covering group is  $\mathrm{Spin}(2n) \rightarrow \mathrm{SO}(2n)$  with kernel  $D(P(\Phi)/Q(\Phi)) \cong \begin{cases} \mu_2 \times \mu_2 & , 2|n \\ \mu_4 & , 2 \nmid n \end{cases}$  (10.4.5.3).

⌋

**Prop. (10.5.3.14)**[Root Systems of Semisimple Rank 1]. There are only three reduced root systems of semisimple rank 1, given by  $(\mathbb{Z}^r, \{\pm\alpha\}, \{\pm\alpha^\vee\})$  with

$$\begin{cases} \alpha = 2e_1 \\ \alpha^\vee = e_1^\vee \end{cases}, \quad \begin{cases} \alpha = e_1 \\ \alpha^\vee = 2e_1^\vee \end{cases}, \quad \begin{cases} \alpha = e_1 - e_2 \\ \alpha^\vee = e_1^\vee - e_2^\vee \end{cases},$$

corresponding resp. to the reductive groups

$$\mathrm{SL}(2) \times \mathbb{G}_m^{r-1}, \quad \mathrm{PGL}(2) \times \mathbb{G}_m^{r-1}, \quad \mathrm{GL}(2) \times \mathbb{G}_m^{r-2}.$$

### Forms of Classical Groups

**Prop. (10.5.3.15)**[Pure Inner Forms]. Suppose  $\mathrm{char} k = 2$ .

- For  $K/k \in \mathrm{Field}$  of degree 2 and  $V \in \mathrm{Herm}_n(K/k)$ , the inner forms of  $\mathrm{U}(V)$  are exactly the groups  $\mathrm{U}(V')$  where  $V' \in \mathrm{Herm}_n(K/k)$ .
- For  $V \in \mathrm{SymSpa}_n(k)$ , the inner forms of  $\mathrm{SO}(V)$  are exactly the groups  $\mathrm{SO}(V')$  where  $V' \in \mathrm{SymSpa}_n(k)$  and  $\mathrm{disc}(V') = \mathrm{disc}(V)$ .

⌋

*Proof:* This follows from (10.2.5.6).

□

**Thm. (10.5.3.16)**. If  $\mathrm{char} k \neq 2$ , then the geometrically almost-simple simply-connected classical groups over  $k$  are the following:

$A_n$  : The groups  $\mathrm{SL}(m; D)$  for  $D \in \mathrm{Az}_k$ , which are inner forms of  $\mathrm{SL}(n)$ . The special unitary groups attached to a Hermitian form for a division ring of simple unitary type (3.6.4.33), which are outer forms for  $\mathrm{SL}(n)$ . There are no pure inner forms, by (10.2.5.13).

$C_n(n \geq 3)$  : The unitary groups attached to a  $\epsilon$ -skew Hermitian form for a central division ring with an involution of  $\epsilon$ -symplectic type (3.6.4.31) over  $k$ , which are inner forms for  $\mathrm{Sp}(2n)$ .

$B_{n \geq 2}, D_{n \geq 4}$  : The unitary groups attached to a  $\epsilon$ -skew Hermitian form for a central division ring with an involution of  $\epsilon$ -orthogonal type(3.6.4.31) over  $k$ , which are  $k$ -forms for  $\text{Spin}(n)$ .  $\lrcorner$

*Proof:* 1: ? Cf.[Mil17]P524, 525.

2: ? Cf.[Mil17]P526.

3: ? Cf.[Mil17]P534.  $\square$

**Cor.(10.5.3.17).** If  $k$  is a special field(11.2.2.10) and  $\text{char } k \neq 2$ , then the geometrically almost-simple simply-connected classical groups over  $k$  are the following:

$A_n$  : The groups  $\text{SL}(m; D)$  for  $D \in \text{Az}_k$ , which are inner forms of  $\text{SL}(n)$ . The special unitary groups attached to a Hermitian form for a division ring of simple unitary type(3.6.4.33), which are outer forms for  $\text{SL}(n)$ .

$C_n(n \geq 3)$  : The unitary groups attached to a  $\epsilon$ -skew Hermitian form for a quaternion field with an involution of  $\epsilon$ -symplectic type(3.6.4.31) over  $k$ , which are inner forms for  $\text{Sp}(2n)$ .

$B_{n \geq 2}, D_{n \geq 4}$  : The unitary groups attached to a  $\epsilon$ -skew Hermitian form for a central division ring with an involution of  $\epsilon$ -orthogonal type(3.6.4.31) over  $k$ , which are  $k$ -forms for  $\text{Spin}(n)$ .  $\lrcorner$

### Symplectic Groups

**Def.(10.5.3.18) [Siegel Parabolic Subgroups].** Situation as in(10.5.3.19), the **Siegel parabolic subgroup** of  $\text{Sp}(2n)$  is defined to be the parabolic subgroup  $P_{\text{Sie}} = LU$  where

$$L = \{\text{diag}(A, A^{-t}) : A \in \text{GL}(n)\} \cong \text{GL}(n).$$

$$U = \left\{ \begin{bmatrix} \mathbf{1}_n & B \\ \mathbf{0} & \mathbf{1}_n \end{bmatrix} : B \in \text{Sym}_n(F) \right\} \cong \text{Sym}_n.$$

By(12.10.1.21), the modular quasi-character of  $P_{\text{Sie}}$  is

$$\delta_L(g) = \det(\text{Ad}(g)|\mathfrak{U}) = |\det(A(g))|^{n+1}.$$

$\lrcorner$

### Unitary Groups

**Def.(10.5.3.19) [Standard Unitary Groups].** Let  $k \in \mathbf{Field}$  and  $E/k$  an étale  $k$ -algebra of degree 2 with a non-trivial involution  $\mathfrak{c}$ , then  $\text{U}(n; n)_F$  be defined to be algebraic subgroup of  $\text{Res}_{E/F} \text{GL}(2n)$  representing the functor

$$\mathfrak{c}\text{Ring}_k \rightarrow \mathfrak{Grp} : R \mapsto \left\{ g \in \text{GL}(2n; R \otimes_k E) : g^t \begin{bmatrix} & & 1 \\ & \ddots & \\ 1 & & \end{bmatrix} g^{\mathfrak{c}} = \begin{bmatrix} & & 1 \\ & \ddots & \\ 1 & & \end{bmatrix} \right\}.$$

$\lrcorner$

**Def. (10.5.3.20) [Siegel Parabolic Subgroups].** Situation as in (10.5.3.19), the **Siegel parabolic subgroup** of  $U(n, n)_F$  is defined to be the parabolic subgroup  $P_{\text{Sie}} = LU$  where

$$L = \{\text{diag}(A, c(A)^{-t}) : A \in \text{Res}_{E/F} \text{GL}(n)\} \cong \text{Res}_{E/F} \text{GL}(n).$$

$$U = \left\{ \begin{bmatrix} \mathbf{1}_n & b \\ \mathbf{0}_n & \mathbf{1}_n \end{bmatrix} : b \in \text{Herm}_n(E/F) \right\} \cong \text{Herm}_n(E/F).$$

The modular character of  $L$  is

$$\det(\text{Ad}_{\mathfrak{u}}(g)) = |\det(A(g))|^n.$$

┘

**Def. (10.5.3.21) [Unitary Groups associated to \*-Algebras].** Let  $k \in \text{Field}$  and  $E/k$  an étale  $k$ -algebra of degree 2 with a non-trivial involution  $c$ . Let  $D$  be a  $k$ -algebra of rank  $2m^2$  with center  $E$  that is simple over  $E$ , equipped with an involution  $*$  of second kind (3.2.1.10). Let  $G \in \text{AlgGrp}/k$  be defined as follows:

$$G(R) = \{x \in (D \otimes_k R)^\times \mid xx^* = 1\}.$$

There are two cases:

- If  $E \cong k \times k$ , then  $D \cong D_1 \times D_2$  where  $D_i$  are central simple  $k$ -algebras with  $*$  :  $D_1 \cong D_2^{\text{op}}$ . Then  $G \cong \Delta_i^*$ .
- If  $E \in \text{Field}$ , then  $G$  is called a **unitary group** attached to  $E/k$ . Moreover, if  $D \cong \text{Mat}(m; k)$ , then  $*$  must be an adjunction w.r.t. a non-degenerate  $c$ -Hermitian form  $f$  on  $E^m$ . Moreover, if  $f$  is the **standard anti-diagonal form**

$$f(xe_i, ye_j) = c(x)y\delta_{i, m+1-i},$$

then  $G$  is called the **quasi-split unitary group** attached to  $E/k$ .

┘

### Langlands Dual Groups

**Prop. (10.5.3.22).** The Langlands dual group of  $\text{GL}(n)$  is  $\text{GL}(n)$ . The Langlands dual group of  $\text{SL}(n)$  is  $\text{PGL}(n)$ .

┘

## 4 Exceptional Groups

See [Springer, Linear Algebraic Groups] and [Book of Involutions].

## 5 Real Reductive Groups

References are [Gaitsgory, Real Reductive Groups] and [Mil17].

**Def. (10.5.5.1) [Real Forms].** Let  $G$  be a connected complex Lie group, then a **real form** of  $G$  is a connected real Lie subgroup  $K \subset G$  that  $\mathfrak{k} \otimes_{\mathbb{R}} \mathbb{C} \cong \mathfrak{g}$ .

┘

**Prop. (10.5.5.2) [Real Lie Groups and Algebraic Groups].** Let  $(H, \mathfrak{h})$  be a connected Lie group in  $\text{LieGrp}/\mathbb{C}$ , then there needs not be an algebraic group  $G$  over  $\mathbb{R}$  that  $G(\mathbb{R})^0 = H$ . For example, the topological fundamental group of  $\text{SL}(2; \mathbb{R})$  is  $\mathbb{Z}$ , so it has many coverings of finite degree, none of which is algebraic, because  $\text{SL}(2)$  as an algebraic group is simply connected **?**.

However, if  $H$  admits a f.d. representation  $H \hookrightarrow \text{GL}(V)$ , then there exists an algebraic group  $G \subset \text{GL}(V)$  that  $\text{Lie}(G) = [\mathfrak{h}, \mathfrak{h}]$ . So if  $H$  is semisimple, then there exists an algebraic group  $G \subset \text{GL}(V)$  s.t.  $\text{Lie}(G) = [\mathfrak{h}, \mathfrak{h}]$ . When  $H$  is semisimple, this means  $G^0 = H$ .

┘

### Compact Real Algebraic Groups

**Def. (10.5.5.3) [Compact Real Algebraic Groups].** A **compact real algebraic group** is an algebraic group  $G \in \text{AlgGrp}/\mathbb{R}$  s.t.  $G(\mathbb{R})$  is a compact Lie group.  $\lrcorner$

**Prop. (10.5.5.4) [Compactness and Representations].** Let  $G \in \text{AlgGrp}_{\text{cnd}}/\mathbb{R}$ . If  $G$  is compact, then every f.d. real representation  $\rho : G \rightarrow \text{GL}(V)$  carries a  $G(\mathbb{R})$ -invariant inner form. Conversely, if a faithful f.d. real representation carries such a form, then  $G$  is compact.  $\lrcorner$

*Proof:* If  $G$  is compact, then  $H = \rho_{\mathbb{R}}(G(\mathbb{R}))$  is compact, so we can take an arbitrary inner form on  $V$  and take average on  $H$ . The converse is easy.  $\square$

**Def. (10.5.5.5) [Relevant Groups].** A compact real algebraic group is called **relevant group** iff the map  $\pi_0(G(\mathbb{R})) \rightarrow \pi_0(G)(\mathbb{R})$  is surjective.  $\lrcorner$

**Lemma (10.5.5.6).** Let  $Z$  be an affine variety over  $\mathbb{R}$ , let  $X$  be a subset of  $Z(\mathbb{R})$ , and let  $I_X$  be the ideal of regular functions on  $Z$  that vanishes at  $X$ , then  $X' = V(I_X)$  satisfies  $X \subset X'(\mathbb{R})$ . Also by construction,  $X'$  is relevant and  $X$  intersects real points of every connected components of  $X'$ .

Now if  $Z$  is acted on by a compact Lie group  $K$  and  $X$  is a single  $K$ -orbit, then  $X \cong X'(\mathbb{R})$ .  $\lrcorner$

*Proof:* Cf. [Gaitsgory P17].  $\square$

**Prop. (10.5.5.7) [Compact Relevant Groups and Compact Real Lie Groups].** The functor  $G \mapsto G(\mathbb{R})$  is an equivalence of categories from the category of relevant real compact algebraic groups to the category of compact real Lie groups.  $\lrcorner$

*Proof:* For the fully faithfulness: given a map  $\varphi : G_1(\mathbb{R}) \rightarrow G_2(\mathbb{R})$ , we need to show it comes from a unique algebraic group homomorphism. Let  $K \subset G_1(\mathbb{R}) \times G_2(\mathbb{R})$  be the graph of  $\varphi$ , then let  $\Gamma$  be the subgroup of  $G_1 \times G_2$  corresponding to  $K$  in (10.5.5.6), then it suffices to prove that the map  $\Gamma \rightarrow G_1$  is an isomorphism. It is an isomorphism after passing to real points, so isomorphism on the level of Lie algebras. And then it is an isomorphism, because both groups are relevant?  $\square$

**Cor. (10.5.5.8).** The proof actually works if only  $G_1$  is relevant compact real group. So if we choose  $G_2 = \text{Res}_{\mathbb{C}/\mathbb{R}} \text{GL}(n)$ , then by adjointness there is a bijection

$$\text{Hom}_{\text{AlgGrp}}(G_{\mathbb{C}}, \text{GL}(n)) \cong \text{Hom}_{\text{LieGrp}}(G(\mathbb{R}), \text{GL}(n; \mathbb{C})).$$

That is, their complex representations correspond.  $\lrcorner$

### Complex Reductive Algebraic Groups

**Prop. (10.5.5.9).** If  $G$  is a real reductive group, then its complexification  $G_{\mathbb{C}}$  is complex reductive.  $\lrcorner$

*Proof:* It suffices to show that  $\text{Rep}(G(\mathbb{C}))$  is semisimple. For this, notice  $\text{Rep}(G)$  is semisimple by definition, so it suffices to show for any representation  $V$  of  $G_{\mathbb{C}}$ , if  $W$  is a  $G$ -invariant subspace, then  $W$  is also  $W$  is  $G_{\mathbb{C}}$ -invariant. But the invariance condition is a vanishing of some matrix coefficients, they vanish on  $G$  so also vanish on  $G_{\mathbb{C}}$ .  $\square$

**Def. (10.5.5.10) [Real Form].** A **real form** on a complex reductive algebraic group is an anti-linear group isomorphism  $\sigma : G \rightarrow G$  that  $\sigma^2 = 1$ . It is called **compact** iff  $G^{\sigma}$  is compact real, and it is called **relevant** iff  $G^{\sigma}$  is relevant compact (10.5.5.5).  $\lrcorner$

**Prop. (10.5.5.11)[Polar Decomposition].** If  $G \in \text{AlgGrp}/\mathbb{C}$  and  $K \in G(\mathbb{C})$  is a compact Lie subgroup s.t.

- $\mathfrak{g} \cong \mathfrak{k} \otimes_{\mathbb{R}} \mathbb{C}$ .

- $K$  intersects non-trivially every connected components of  $G(\mathbb{C})$ .

then the group  $G$  contains a unique real structure  $\sigma$  that  $K = G(\mathbb{C})^\sigma$ . And if  $\mathfrak{p} \subset \mathfrak{g}$  be the subspace  $\{\xi \in \mathfrak{g} | \sigma(\xi) = -\xi\}$ , then the map

$$k \times \mathfrak{p} \rightarrow G(\mathbb{C}) : (k, p) \mapsto k \cdot \exp(p)$$

is a diffeomorphism. ┘

*Proof:* Cf.[Gaitsgory P18]. □

**Cor. (10.5.5.12).** If we denote  $P = \exp(\mathfrak{p})$ , then  $P \subset \tilde{P} = \{g \in G(\mathbb{C}) | \sigma(g) = g^{-1}\}$ , and there is a diffeomorphism:

$$\coprod_{k \in K, k^2=1} \{k\} \times P \cong \tilde{P}.$$

┘

**Cor. (10.5.5.13).** In the situation of(10.5.5.11),  $G$  is reductive, by(10.5.5.9). ┘

**Cor. (10.5.5.14).**  $K \rightarrow G(\mathbb{C})$  is a homotopy equivalence. ┘

### Cartan Involutions

**Def. (10.5.5.15)[Cartan Involutions].** Let  $G \in \text{AlgGrp}_{\text{cntd}}/\mathbb{R}$ , an **involution on  $G$**  is an isomorphism  $\theta : G \cong G \in \text{AlgGrp}/\mathbb{R}$  s.t.  $\theta^2 = \text{id}$ .

A **Cartan involution** is an involution s.t.  $G^{(\theta)}(\mathbb{R}) = \{g \in G(\mathbb{C}) | g = \theta(\bar{g})\}$  is compact. ┘

**Prop. (10.5.5.16).** Cartan involution and compactness. ┘

**Example (10.5.5.17).** Let  $G = \text{SL}(2)_{\mathbb{R}}$  and  $\theta = \text{ad}\left(\begin{bmatrix} 0 & 1 \\ -1 & 0 \end{bmatrix}\right)$ , then  $\text{SL}(2)^{(\theta)}(\mathbb{R}) = \text{SU}(2)$  is compact, so this is a Cartan involution on  $G$ . ┘

**Thm. (10.5.5.18) [Satake].** Let  $G \in \text{AlgGrp}_{\text{cntd}}/\mathbb{R}$ , then  $G$  admits a Cartan involution(10.5.5.15) iff  $G$  is reductive. And in this case, any two Cartan involutions differ by a conjugation by elements in  $G(\mathbb{R})$ , i.e.  $(\tau = \text{ad}(g_0)^{-1} \circ \theta \circ \text{ad}(g_0))$ . ┘

*Proof:* Cf.[Satake, Algebraic structures of symmetric domains, volume 4 of Kano Memorial Lectures, 1980]I.4.3. □

**Cor. (10.5.5.19) [Satake].**

- $G$  is a connected algebraic group, then  $G$  is compact iff  $\text{id}$  is a Cartan involution on  $G$ . And in this case, this is the only Cartan involution of  $G$ . In particular, a compact connected algebraic group is reductive.
- If  $V$  is a f.d. real vector space and  $G = \text{GL}(V)$ , then the choice of a basis for  $V$  determines a Cartan involution  $M \mapsto M^t$ , and by(10.5.5.18), any Cartan involution is of this form.
- If  $G \subset \text{GL}(V)$ , then  $G$  is reductive iff  $G$  is stable under a Cartan involution of  $\text{GL}(V)$ . And any Cartan involutions of  $G$  is of this form.

┘

*Proof:* Cf.[Satake, Algebraic structures of symmetric domains, volume 4 of Kano Memorial Lectures, 1980]I.4.4. □

**Prop. (10.5.5.20)[*c*-Polarizations].** Let  $G \in \text{AlgGrp}/\mathbb{R}$  and  $c \in G(\mathbb{R})$  (equivalently  $c^2 \in Z(G(\mathbb{R}))$ ), and  $\text{ad}(c)^{-1} = \text{ad}(c^{-1})$ . Then for a real representation  $V$  of  $G$ , a ***c*-polarization** is a  $G(\mathbb{R})$ -invariant bilinear form  $\varphi$  s.t. the form  $(u, v) \mapsto \varphi(u, cv)$  is symmetric and positive-definite.

Then for such  $c$ , if  $\text{ad}(c)$  is a Cartan involution, then any f.d. real representation of  $G$  admits a  $c$ -polarization. Conversely, if a faithful real representation of  $G$  admits a  $c$ -involution, then  $\text{ad}(c)$  is a Cartan involution. ┘

*Proof:* Cf.[?Mil17b]P16. □

### Maximal Compact Subgroup

**Thm. (10.5.5.21) [Existence and Uniqueness of Maximal Compact Subgroups].** For  $G \in \text{linAlgGrp}/\mathbb{R}$ ,  $G(\mathbb{K})$  has a maximal compact subgroup  $\mathcal{K}$  that is unique up to conjugation.

For any compact subgroup  $K' \subset G(\mathbb{R})$ , there exists an element  $g \in P^\tau$  s.t.  $\text{Ad}_g(K') \in K^\tau$ . ┘

*Proof:* Cf.[Getz]P114 ? and [Gaitsgory P25]. □

**Example (10.5.5.22)[ $\text{GL}(n)$ ].** Fix the following maximal compact subgroup of  $\text{GL}(n; F \otimes \mathbb{R})$ :

$$\mathcal{K}_\infty = \prod \mathcal{K}_v, \quad \mathcal{K}_v = \begin{cases} \text{O}(n) & v \text{ real} \\ \text{U}(n) & v \text{ complex} \end{cases}.$$

Define  $\mathfrak{gl}_{n,\infty} = \prod_{v \in S_\infty} \mathfrak{gl}(n, F_v)$ , then we can define  $(\mathfrak{gl}_{n,\infty}, \mathcal{K}_\infty)$ -modules. ┘

### Complex Reductive Lie Groups

**Def. (10.5.5.23)[Compact Part].** If  $G = ((\mathbb{C}^\times)^r \times G_{ss})/Z$  is a connected complex reductive Lie group, then  $Z \subset (S^1)^r \times G_{ss}^c$  (the compact part), then we denote  $G^c = (S^1)^r \times G_{ss}^c/Z$  the compact subgroup of  $G$ . Then the restriction of f.d. representations of  $G$  to  $G^c$  is an equivalence by (16.5.6.3). ┘

**Example (10.5.5.24).**  $\text{GL}(n; \mathbb{C}) = (\mathbb{C}^* \times \text{SL}(n; \mathbb{C}))/\mu_n$  is a complex reductive Lie group. ┘

## 6 Reductive Group Schemes

**Def. (10.5.6.1)[Transporter Functors].** For  $G \in \text{GrpSch}/S$  and  $Y, Y' \rightarrow G \in \text{Sch}/S$ , the **transporter functor**  $\text{bxTransp}_G(Y, Y')$  is the functor on  $S$ -schemes:

$$\text{Transp}_G(Y, Y') : S' \in \text{Sch}/S \mapsto \{g \in G(S') \mid gY_{S'}g^{-1} \subset Y'_{S'}\}.$$

And when  $Y = Y'$  is f.p. over  $S$ , this is denoted by  $N_G(Y)$ . (Cf. [Con14]P56). ┘

**Prop. (10.5.6.2) [Smoothness of Transporter Subgroups].** For  $G \in \text{GrpSch}^{\text{pf}}/S$  and f.p. closed subschemes  $Y, Y' \subset G \in \text{Sch}^{\text{pf}}/S$ . If  $Y$  is either a multiplicative type subgroup or finite flat over  $S$ , then  $\text{Transp}_G(Y, Y')$  (10.5.6.1) is represented by a f.p. closed subscheme of  $G$ .

And if  $G/S$  is smooth and  $Y, Y'$  are both of multiplicative type over  $S$ , then  $\text{Transp}_G(Y, Y')$  is smooth over  $S$ . ┘

*Proof:* Cf.[Con14]P56. □

**Prop. (10.5.6.3) [Smoothness of Centralizers].** For  $G \in \mathcal{G}rpSch^{pf}/S$  and f.p. closed subschemes  $Y, Y' \subset G \in \mathcal{S}ch^{pf}/S$ . If  $Y$  satisfies one of the following:

- $Y$  is a multiplicative type subgroup.
- $Y$  is smooth over  $S$  with connected non-empty fibers.
- $Y$  is finite flat over  $S$ .

Then  $C_G(Y)$  is representable by a f.p. closed subgroup of  $G$ .

And  $C_G(Y)$  is smooth when  $G$  is smooth and  $Y$  is a multiplicative type subgroup, in which case  $\mathrm{Lie}(C_G(Y)) = \mathrm{Lie}(G)^Y$ . ┘

**Def. (10.5.6.4) [ $S$ -Tori].**  $T \in \mathcal{G}rpSch^{aff}/S$  is called an  **$S$ -torus** if it is of multiplicative type with smooth connected fibers. ┘

**Def. (10.5.6.5) [Semisimple and Reductive Schemes].**  $G \in \mathcal{G}rpSch^{aff}/S$  is called a **reductive scheme** if it has reductive geometric fibers. It is called a **semisimple scheme** if it has semisimple geometric fibers. ┘

**Prop. (10.5.6.6) [Non-Connected Reductive Groups].** If  $G \in \mathcal{G}rpSch^{sm,sep,pf}/S$  has reductive geometric fibers, then  $G^0$  is a clopen reductive  $S$ -scheme, and  $G/G^0$  is a separated étale  $S$ -group of finite presentation. ┘

*Proof:* Cf.[Con14]P82. □

**Prop. (10.5.6.7) [Spreading Out Subgroups].** For  $G \in \mathcal{G}rpSch^{aff,sm}/S$ ,  $s \in S$  and  $H_0 \leq G_s$  a subgroup of multiplicative type, then there exists an étale nbhf  $(S', s')$  of  $(S, s)$  with  $\kappa(s') = \kappa(s)$  and a multiplicative type group  $H' \leq G_{S'}$  s.t.  $H'_{s'} = H_0$  inside  $(G_{S'})_{s'} = G_s$ . ┘

*Proof:* Cf.[Con14]P83. □

**Prop. (10.5.6.8) [Locality of Reductive Group Schemes and Maximal Tori].** Let  $G \in \mathcal{G}rpSch^{aff,sm}/S$  and  $s \in S$  s.t.  $G_s^0$  is reductive, then

- There exists an open subscheme  $s \in U \subset S$  s.t.  $G_u^0$  is reductive for any  $u \in U$ .
  - If  $T \leq G$  is an  $S$ -torus (10.5.6.4) s.t.  $T_s \leq G_s^0$  is maximal, then there exists an open subscheme  $s \in V \subset S$  s.t.  $C_G(T)_V^0 = T_V$ , and  $T_v$  is a maximal torus in  $G_v^0$  for any  $v \in V$ .
- ┘

*Proof:* Cf.[Con14]P85. □

**Def. (10.5.6.9) [Maximal Tori].** For  $G \in \mathcal{G}rpSch^{aff,sm}/S$ , an  $S$ -torus (10.5.6.4)  $T \leq G$  is called a **maximal  $S$ -torus** if  $T_s \leq G_s$  is a maximal torus for any  $s \in S$ . ┘

**Prop. (10.5.6.10).** Let  $G \in \mathcal{G}rpSch^{aff,sm}/S$  and  $S' \in \mathcal{S}ch/S$ . If  $T \leq G$  is a maximal  $S$ -torus (10.5.6.9), then  $T_{S'} \leq G_{S'}$  is a maximal  $S'$ -torus, by (10.4.1.17).

And if  $T \leq G$  is an  $S$ -torus s.t.  $T_s \leq G_s$  is a maximal torus for each  $s \in S$ , then  $T$  is a maximal torus of  $G$ , by (10.5.6.8). ┘

**Prop. (10.5.6.11).** Let  $G \in \mathcal{G}rpSch^{aff,sm}/S$  s.t.  $G_s^0$  is reductive for any  $s \in S$ , then the locus of  $s \in S$  s.t.  $G_s$  is connected is closed in  $G$ . ┘

*Proof:* Cf.[Con14]P89. □

**Thm. (10.5.6.12) [Moduli of Maximal Tori].** Let  $G \in \text{GrpSch}^{\text{aff}, \text{sm}}/S$  s.t.  $G_s^0$  is reductive for any  $s \in S$ . Then the functor on  $S$ -schemes:

$$\underline{\text{Tor}}_{G/S} : S' \in \text{Sch}/S \mapsto \{\text{maximal tori in } G_{S'}\}$$

is represented by a smooth quasi-affine  $S$ -scheme  $\text{Tor}_{G/S}$ , and  $\text{Tor}_{G/S} \rightarrow S$  is surjective.

If  $T \leq G$  is a maximal  $S$ -torus, then the map  $G/N_G(T) \rightarrow \text{Tor}_{G/S}$  defined by  $G$ -conjugation on  $T$  is an isomorphism. In particular, any two maximal tori of  $G$  are conjugate étale-locally on  $S$ .  $\lrcorner$

*Proof:* Cf.[Con14]P94.  $\square$

**Cor. (10.5.6.13) [Maximal Tori Exist].** Any  $G \in \text{RedGrp}/S$  admits a maximal torus étale-locally on  $S$ .  $\lrcorner$

*Proof:* This is because a smooth surjective admits a section étale-locally. ?  $\square$

**Prop. (10.5.6.14) [Finite Weyl Groups].** For  $G \in \text{RedGrp}/S$  and a maximal  $S$ -torus  $T \leq G$ , the Weyl group  $W_G(T) = N_G(T)/C_G(T)$  is finite étale over  $S$ .  $\lrcorner$

*Proof:* Cf.[Con14]P96.  $\square$

**Prop. (10.5.6.15).** For  $G \in \text{RedGrp}/S$ ,  $Z(G) = \ker(\text{Ad} : G \rightarrow \text{GL}(\mathfrak{g}))$ .  $\lrcorner$

*Proof:* Cf.[Con14]P102.  $\square$

**Def. (10.5.6.16) [Isogenies of Reductive Schemes].**  $f : G \rightarrow G' \in \text{GrpSch}^{\text{sm}, \text{aff}}/S$  is called an **isogeny** if it is a finite flat surjective. And it is called a **central isogeny** if its kernel is central in  $G$ .  $\lrcorner$

**Prop. (10.5.6.17) [Fibral Criterion of Central Isogenies].** If  $f : G \rightarrow G' \in \text{RedGrp}/S$  is surjective, then  $f$  is a central isogeny iff  $f_{\bar{s}}$  has finite central kernel for all  $s \in S$ .  $\lrcorner$

*Proof:* Cf.[Con14]P103.  $\square$

### Split Reductive Schemes

**Def. (10.5.6.18) [Split Reductive Schemes].**  $G \in \text{RedGrp}/S$  is called a **split reductive scheme** if it has a maximal torus  $T \leq G$  with an isomorphism  $T \cong D_S(M)$  for some finite free  $\mathbb{Z}$ -module  $M$  s.t.

- Every root  $\alpha : T \rightarrow \mathbb{G}_m$  (characters of  $T$  appearing in  $\mathfrak{g}$ ) arises from elements of  $M$ .
- Every root space  $\mathfrak{g}_\alpha$  is free of rank 1 over  $\mathcal{O}_S$ .
- Every coroot  $\alpha^\vee : \mathbb{G}_m \rightarrow T$  arises from elements of  $M^\vee$ .

$\lrcorner$

**Prop. (10.5.6.19).** Every  $G \in \text{RedGrp}/S$  is split(10.5.6.18) étale-locally on  $S$ .  $\lrcorner$

*Proof:* Cf.[Con14]P136.  $\square$

**Thm. (10.5.6.20) [Split Reductive Schemes of Semisimple Rank 1].** Let  $(G, T, M) \in \text{RedGrp}/S$  be split reductive with geometric fibers of semisimple rank 1, then Zariski-locally on  $S$ ,  $(G, T)$  is isomorphic to product of a split central torus with one of the following:

- $(\text{SL}(2), D)$  with  $D$  the diagonal torus.

- $(\mathrm{PGL}(2), \overline{D})$  with  $\overline{D}$  the diagonal torus.
- $(\mathrm{GL}(2), T)$  with  $T$  the diagonal torus.

⌋

*Proof:* Cf.[Con14]P139.

□

**Def. (10.5.6.21) [Parabolic Subgroup Schemes].** For  $G \in \mathrm{RedGrp}/S$ , a **parabolic subgroup scheme**  $P \leq G$  is a smooth  $S$ -affine subgroup scheme  $P \in \mathrm{GrpSch}^{\mathrm{aff}, \mathrm{sm}}/S$  equipped with a monic homomorphism  $P \leq G$  that embeds  $P_{\overline{s}}$  as a parabolic subgroup of  $G_{\overline{s}}$  for any  $s \in S$ .

⌋

**Prop. (10.5.6.22).** Suppose  $G \in \mathrm{RedGrp}/S$ . Any parabolic subgroup scheme  $P \leq G$  (10.5.6.21) is a closed subscheme of  $G$ , and étale-locally there exists a maximal torus  $T \leq G$  s.t.  $T \leq P$ .

Conversely, if  $G$  admits a maximal torus  $T$  s.t.  $T \leq P$  and  $(G, T)$  is split, then Zariski-locally on  $S$ , there exists  $\lambda : \mathbb{G}_m \rightarrow T$  s.t.  $P = P_G(\lambda)$ ?

⌋

*Proof:* Cf.[Con14]P152.?

□

**Prop. (10.5.6.23) [Moduli of Parabolic Subgroups].** Let  $G \in \mathrm{RedGrp}/S$ , then the functor on  $S$ -schemes:

$$\underline{\mathrm{Par}}_{G/S} : S' \in \mathrm{Sch}/S \mapsto \{\text{parabolic subgroups of } G_{S'}\}$$

is represented by a smooth proper  $S$ -scheme  $\mathrm{Par}_{G/S}$  represented by the canonical  $S$ -ample line bundle  $\det(\mathrm{Lie}(\mathcal{P}))^*$ , where  $\mathcal{P} \subset G \times \mathrm{Par}_{G/S}$  is the universal parabolic subgroup of  $G$ .

⌋

*Proof:* Cf.[Con14]P156.

□

**Def. (10.5.6.24) [Borel Subgroup Schemes].** For  $G \in \mathrm{RedGrp}/S$ , a **Borel subgroup scheme**  $P \leq G$  is a parabolic subgroup scheme  $P \leq G$  (10.5.6.21) s.t.  $P_{\overline{s}}$  is a Borel subgroup of  $G_{\overline{s}}$  for any  $s \in S$ .

$G$  is called a **quasi-split reductive group scheme** over  $S$  if it admits a Borel subgroup scheme.

⌋

**Prop. (10.5.6.25) [Moduli of Borel Subgroups].** For  $G \in \mathrm{RedGrp}/S$ ,

- If  $P \leq G$  is a parabolic subgroup scheme, then the locus of  $s \in S$  s.t.  $P_{\overline{s}}$  is Borel in  $G_{\overline{s}}$  is a clopen subset of  $S$ .
- Any two Borel subgroups of  $G$  are conjugate étale-locally on  $S$ .
- the functor on  $S$ -schemes:

$$\underline{\mathrm{Bor}}_{G/S} : S' \in \mathrm{Sch}/S \mapsto \{\text{Bor subgroups of } G_{S'}\}$$

is represented by a smooth proper  $S$ -scheme  $\mathrm{Bor}_{G/S}$  represented by the canonical  $S$ -ample line bundle  $\det(\mathrm{Lie}(\mathcal{B}))^*$ , where  $\mathcal{B} \subset G \times \mathrm{Bor}_{G/S}$  is the universal Borel subgroup of  $G$ .

⌋

*Proof:* Cf.[Con14]P158.

□

**Cor. (10.5.6.26) [Reductive Groups over henselian Local Rings are Quasi-Split].** If  $R \in \mathcal{CRing}$  is a Henselian local ring with finite residue field and  $G \in \mathrm{RedGrp}/R$ , then  $G$  is quasi-split, and becomes split over a finite étale extension of  $R$ .

⌋

*Proof:* Cf.[Con14]P159.

□

### Isogeny and Existence Theorems

**Def. (10.5.6.27) [Compatibility with Splittings].** Let  $(G, T, M), (G', T', M') \in \mathcal{R}\text{edGrp}/S$  be split, then a quasi-finite surjection  $f : (G', T') \rightarrow (G, T)$  is said to be **compatible with splittings** if there is a homomorphism  $h : M \rightarrow M'$ , a bijection  $d : \Phi' \cong \Phi$  and a function  $q : \Phi' \rightarrow \mathbb{Z}_+$  valued in prime powers s.t.

The induced map  $X^\bullet(f) : M_S \rightarrow M'_S$  arises from  $h$ .

- For all  $\alpha' \in \Phi'$ ,  $h(d(\alpha')) = q(\alpha')\alpha'$  and  $h^\vee(\alpha'^\vee) = q(\alpha')d(\alpha')^\vee$ .
- If  $q(\alpha') \in p(\alpha')^{\mathbb{Z}}$  for some  $p(\alpha') \in \text{Prime}$ , then  $S \in \text{Sch}/\mathbb{F}_{p(\alpha')}$ .

┘

**Prop. (10.5.6.28).** Let  $(G, T, M), (G', T', M') \in \mathcal{R}\text{edGrp}/S$  be split, then any quasi-finite surjection  $f : (G', T') \rightarrow (G, T)$  is Zariski-locally compatible with splitting. In particular, if  $S$  is connected, then  $f$  is compatible with the splittings.

┘

*Proof:* Cf. [Con14]P190.

□

**Thm. (10.5.6.29) [Isogeny Theorem].** For split reductive groups  $(G', T', M'), (G, T, M) \in \mathcal{R}\text{edGrp}/S$ , any  $p(S)$ -morphism  $\Phi(G', T', M') \rightarrow \Phi(G, T, M)$  is induced by an isogeny  $f : (G', T', M') \rightarrow (G, T, M)$  compatible with the splittings, and such  $f$  is unique up to an action of  $(T/Z(G))(S)$  on  $G$ .

┘

*Proof:* Cf. [Con14]P196.

□

**Thm. (10.5.6.30) [Existence Theorem].** Every root datum arises from a split reductive scheme over  $S$ .

┘

*Proof:* Cf. [Con14]P196.

□

### Dynamical Methods

#### Chevalley Groups

References are [Groups over  $\mathbb{Z}$ , Gross].

**Def. (10.5.6.31) [Chevalley Group Schemes].** A **Chevalley group scheme** is a split reductive group scheme over  $\mathbb{Z}$  that admits maximal tori (10.4.1.16).

┘

**Prop. (10.5.6.32) [Classifying Chevalley Groups].** Chevalley group schemes are determined up to isomorphisms by its reduced root datum, and each reduced root data arises in this way. In particular, two Chevalley groups are isomorphic iff they are isomorphic over  $\mathbb{C}$ .

┘

*Proof:* Cf. [Con14]P230.

□

## 10.6 Topics in Group Schemes

**Notation(10.6.0.1).**

- Use notations on group schemes defined in [Group Schemes I: Structure Theory](#). ┘

**Thm.(10.6.0.2) [Lang-Steinberg].** Let  $k \in \mathbf{Field}$ ,  $G \in \mathbf{AlgGrp}_{\text{cntd}}/k$  and  $F : G_{\bar{k}} \rightarrow G_{\bar{k}} \in \mathbf{AlgGrp}/\bar{k}$  s.t. the fixed point of  $F$  is finite, then the **Lang map**

$$\mathcal{L} : G(\bar{k}) \rightarrow G(\bar{k}) : g \mapsto g^{-1}F(g)$$

is surjective. ┘

*Proof:* Cf.[Steinberg, Endomorphisms of Linear Algebraic Groups, P67]. ?

We only prove this when  $\#k < \infty$  and  $F$  is a Steinberg endomorphism(10.6.1.2).

By(10.1.4.4) and(10.1.4.2), we can assume  $G$  is smooth.  $G$  acts on itself by  $g(x) = gxF(g)^{-1}$ . By(10.2.1.15), it has a closed orbit  $\Omega$ . Thus it suffices to show that  $\dim \Omega = \dim G$ . Take  $x \in \Omega(k)$ , by(10.2.1.11) and(10.1.1.27), it suffices to show there exists only f.m.  $g \in G(k)$  s.t.  $gxF(g)^{-1} = x$ . Let  $F^m(x) = x$ ,  $f : G \rightarrow G : f(g) = xF(g)x^{-1}$ . Notice  $xF(x) \cdot F^2(x) \cdot \dots \cdot F^{m-1}(x)$  is contained in  $\ker(F^m)$ , so it is of finite order, let's say  $r$ . Then  $f^{mr} = F^{mr}$ , which has only f.m. solutions, thus there are only f.m.  $g$  s.t.  $gxF(g)^{-1} = x$ . □

### 1 over Finite Fields

Main references are [Representations of Finite Groups of Lie Type, Digne and Michel].

**Notation(10.6.1.1).**

- Let  $p \in \mathbf{Prime}$ ,  $r \in \mathbb{Z}_+$ ,  $q = p^r$ .
- Let  $k \in \mathbf{Field}^p$ ,  $\#k = q$ . ┘

**Def.(10.6.1.2) [Steinberg-Endomorphisms].** Let  $k \in \mathbf{Field}^p$  and  $G \in \mathbf{GrpVar}/k$ , a **Steinberg-endomorphism** of  $G$  is an endomorphism  $F : G_{\bar{k}} \rightarrow G_{\bar{k}} \in \mathbf{AlgGrp}/\bar{k}$  s.t. some power of  $F$  equals some power of the geometric Frobenius  $\text{Fr}_X$ (7.2.10.1). ┘

**Prop.(10.6.1.3) [Orbits Contains a Rational Point].** Let  $V \in \mathbf{Sch}^{\text{ft}}/k$ ,  $G \in \mathbf{AlgGrp}_{\text{cntd}}/k$ ,  $G$  acts on  $V$ , then any  $G$ -orbits  $O$  contains a rational point. ┘

*Proof:* Let  $v \in O(\bar{k})$ , then  $F(v) = gv$  for some  $g \in G(\bar{k})$ . Then by Lang's theorem(10.6.0.2),  $g = F(h)^{-1}h$  for some  $h \in G(\bar{k})$ . Then  $F(h(v)) = h(v)$ , so  $h(v) \in O$  is a rational point. □

**Cor.(10.6.1.4).** If  $G \in \mathbf{AlgGrp}/k$ ,  $H \leq G$  is a connected subgroup, then  $G(k)/H(k) = G/H(k)$ . ┘

**Prop.(10.6.1.5) [Any Group Variety over Finite Fields is Quasi-Split].** Any group variety  $G/k$  is quasi-split(10.4.1.1). ┘

*Proof:* Let  $B \leq G_{\bar{k}}$  be a Borel subgroup(10.4.1.4), then  $\text{Frob}^{-1}(B(\bar{k})) = hB(\bar{k})h^{-1}$  for some  $h \in G(\bar{k})$  by(10.4.1.7). By(10.6.0.2),  $h = g^{-1}\text{Frob}(g)$  for some  $g \in G(\bar{k})$ . Then  $g\text{Frob}^{-1}(B(\bar{k}))g^{-1}$  is the  $\bar{k}$ -points of a Borel subgroup of  $G$  and is fixed by  $\text{Frob}$ , so it descends to a Borel subgroup of  $G$ . □

## 10.7 Formal Group Schemes

References are [Zin84].

**Notation (10.7.0.1).**

- Let  $p \in \text{Prime}$ .
- Let  $R \in \mathbb{C}\text{Ring}$ .
- Let  $S \in \text{Sch}$ .

┘

### 1 Formal Power Series

**Def. (10.7.1.1) [Notations].** Let  $\mathbf{X} = \{X_1, \dots, X_n\}$ ,  $\mathbf{Y} = \{Y_1, \dots, Y_n\}$ .

Let  $R$  be a commutative unital ring,  $R[[\mathbf{X}]]$  be the power series ring. It is a local ring with the maximal ideal  $(\mathbf{X})$ .

Let  $i_1 : R[[\mathbf{X}]] \rightarrow R[[\mathbf{X}, \mathbf{Y}]]$  and  $i_2 : R[[\mathbf{Y}]] \rightarrow R[[\mathbf{X}, \mathbf{Y}]]$  be the natural embeddings.

Let  $\Omega_{R[[\mathbf{X}]]/R}^1$  be the free  $R[[X]]$ -module with basis given by  $dX_1, \dots, dX_n$ . And there is a universal derivative  $D : R[[\mathbf{X}]] \rightarrow \Omega_{R[[\mathbf{X}]]/R}^1$  given by  $D(f) = \sum_i \frac{\partial f}{\partial X_i} dX_i$ . It satisfies the usual universal property of Kähler differentials, but with morphisms changed to continuous morphisms. ┘

**Prop. (10.7.1.2) [Formal Sums and Products].**

- Let  $f_n \in R[[\mathbf{X}]]$  for any  $n \in \mathbb{N}$  s.t. for any  $m \in \mathbb{N}$ , there exists a  $N(m) \in \mathbb{N}$  s.t.  $f_n \in (\mathbf{X})^m$  for any  $n \geq N(m)$ , then define the **formal sum**

$$\sum_n f_n = \varinjlim_{n \rightarrow \infty} \sum_{k=0}^n f_k.$$

In this case, we say  $\sum_n f_n$  is well-defined.

- Let  $g_n \in R[[\mathbf{X}]]$  for any  $n \in \mathbb{N}$  s.t. for any  $m \in \mathbb{N}$ , there exists a  $N(m) \in \mathbb{N}$  s.t.  $g_n \in 1 + (\mathbf{X})^m$  for any  $n \geq N(m)$ , then define the **formal product**

$$\prod_n g_n = \varinjlim_{n \rightarrow \infty} \prod_{k=0}^n g_k.$$

In this case, we say  $\prod_n g_n$  is well-defined. ┘

**Prop. (10.7.1.3) [Automorphisms].** If  $F_i$  are power series without constant terms that the matrix degree 1 terms of  $(F_i)$  (the Jacobi matrix) is invertible in  $R$ , then there are unique power series  $G_i$  without constant terms that  $G \circ F = \text{id}$  and  $F \circ G = \text{id}$ . ┘

*Proof:* It  $F_i$  induces a map  $F : R[[X_1, \dots, X_n]] \rightarrow R[[X_1, \dots, X_n]]$  which in turn induces a graded map  $K[X_1, \dots, X_n] \rightarrow K[X_1, \dots, X_n]$ . It is clear that  $(\frac{\partial F_i}{\partial X_j})_{ij}$  is invertible iff the induced graded ring map is an isomorphism, and because  $K[[X_1, \dots, X_n]]$ , a map is an isomorphism iff its induced graded map is an isomorphism.  $\square$

**Prop. (10.7.1.4).** If  $R$  be a torsion-free algebra, and let

$$f(T) = \sum_{n \geq 1} \frac{a_n}{n!} T^n \in (R \otimes \mathbb{Q})[[T]], \quad a_1 \in R^*.$$

Then the unique  $g(T)$  s.t.  $f(g(T)) = T$  is of the form

$$g(T) = \sum_{n \geq 1} \frac{b_n}{n!} T^n \in (R \otimes \mathbb{Q})[[T]], \quad b_1 \in R^*.$$

⌋

*Proof:* Repeatedly differentiating the equation  $f(g(T)) = T$ , we get that  $f'(g(T))g^{(n)}(T)$  can be expressed as integral polynomials in the variables

$$f^{(i)}(g(T)), 1 \leq i \leq n, \quad g^{(j)}(T), 1 \leq j \leq n-1.$$

Then evaluating at  $T = 0$ , we get that  $b_n \in R$  and  $b_1 \in R^*$ , as  $a_1 \in R^*$ . □

### 1-Dimensional Formal Power Series

**Def. (10.7.1.5) [Formal Exponential and Logarithm].** The **formal exponential** and **formal logarithm** is defined to be

$$\exp(X) = \sum_{n \geq 0} \frac{X^n}{n!}, \quad \log(1 + X) = - \sum_{n > 0} \frac{(-X)^n}{n} \in \mathbb{Q}[[X]].$$

They satisfies  $\exp(\log(1 + X)) = 1 + X$ ,  $\log(\exp(X)) = X$ . ⌋

**Remark (10.7.1.6).** WARNING: It should be made clear that  $\log(1 + f)$  is defined only for  $f \in xK[[x]]$ , and  $\log(1 + x)$  is a symbol for the function  $\text{Log}(x) = \log(1 + x)$ .  $\log(x)$  is not defined. ⌋

*Proof:* It suffices to prove  $\text{Exp}(x) = \exp(x) - 1$  and  $\text{Log}(x) = \log(1 + x)$  are inverse to each other. It suffices to show  $\log(\exp(x)) = x$ , because then by (10.7.1.3) the inverse of  $\text{Log}$  must be just  $\text{Exp}$  by (10.7.1.3).

We notice  $\text{Exp}$  are the unique formal power series without constant term that satisfied  $d(\text{Exp}) = \text{Exp} + 1$ , and  $\text{Log}$  is the unique formal power series that satisfies  $d(\text{Log}(x)) = \frac{1}{1+x}$ . Thus

$$d(\log(\exp(x))) = \frac{\exp(x)}{\exp(x)} = 1,$$

so  $\log(\exp(x)) = x$ , because it has no constant term. □

**Prop. (10.7.1.7) [Multiplicative Properties].** Suppose  $\mathbb{Q} \subset R$ , then

- for any  $f, g \in R[[\mathbf{X}]]$ ,  $\exp(f + g) = \exp(f) \exp(g)$ .
- If  $\sum_n f_n$  is well-defined (10.7.1.2), then  $\prod_n \exp(f_n)$  is well-defined and

$$\exp\left(\sum_n f_n\right) = \prod_n \exp(f_n).$$

- for any  $f, g \in 1 + (\mathbf{X})$ ,  $\log(f) + \log(g) = \log(fg)$ .

- If  $g_n \in 1 + (\mathbf{X})$  and  $\prod_n g_n$  is well-defined (10.7.1.2), then  $\sum_n \log(f_n)$  is well-defined and

$$\log\left(\sum_n f_n\right) = \prod_n \log(f_n).$$

┘

*Proof:* Brutal force calculation. ?

□

**Def. (10.7.1.8) [Formal Powers].** Let  $f \in 1 + xR[[x]]$ ,  $g \in R[[x]]$ ,  $f^g$  is defined to be

$$\exp(g \log(f)).$$

In particular,  $\log(f^g) = g \log(f)$  by (10.7.1.5).

┘

**Prop. (10.7.1.9).** If  $p \in \text{Prime}$ ,  $m, n \in \mathbb{Z}_+$ ,  $(n, p) = 1$ , and  $f(x) \in 1 + T\mathbb{Z}_{(p)}[[T]]$ , then  $f(T)^{m/n} \in 1 + T\mathbb{Z}_{(p)}[[T]]$ .

┘

*Proof:* If  $g(T) = f(T)^{m/n}$ , it is easy to see  $g(T)^n = f(T)^m$  and  $g(T) \in 1 + T\mathbb{Q}[[T]]$ . Let

$$f(T)^m = 1 + \sum_{m \geq 1} a_m T^m, \quad g(T) = 1 + \sum_{m \geq 1} b_m T^m,$$

Then it is easy to use induction to show  $b_m \in \mathbb{Z}_{(p)}$  for any  $m \in \mathbb{Z}_+$ .

□

**Prop. (10.7.1.10).** In  $\mathbb{Q}[[x]]$ ,

$$\exp(x) = \prod_{d>0} \left(\frac{1}{1-x^d}\right)^{\frac{\mu(d)}{d}} = \prod_{d>0} B_{-\mu(d)/d}(-X^d).$$

┘

*Proof:* Taking log, we prove its convergence and equality at once:

$$\sum_{d>0} \log\left(\left(\frac{1}{1-x^d}\right)^{\frac{\mu(d)}{d}}\right) = \sum_{d>0} \frac{\mu(d)}{d} \log\left(\frac{1}{1-x^d}\right) = \sum_{d>0} \frac{\mu(d)}{d} \sum_{d'|d} \frac{x^{dd'}}{d'} = \sum_{n>0} \frac{x^n}{n} \sum_{d|n} \mu(d) = x \text{ (2.6.1.26)}.$$

□

**Prop. (10.7.1.11) [Artin-Hasse Exponential].** For  $p \in \text{Prime}$ , the **Artin-Hasse exponential** is the power series  $\text{hexp}(x)$  defined to be

$$\text{hexp}(x) = \exp\left(x + \frac{x^p}{p} + \frac{x^{p^2}}{p^2} + \dots\right) \in \mathbb{Q}[[x]].$$

Then it satisfies

$$\text{hexp}(x) = \prod_{d \in \mathbb{Z}_+ \setminus (p)} \left(\frac{1}{1-x^d}\right)^{\frac{\mu(d)}{d}} = \prod_{d \in \mathbb{Z}_+ \setminus (p)} B_{-\mu(d)/d}(-X^d).$$

and in fact  $\text{hexp}(x) \in \mathbb{Z}_{(p)}[[x]]$ . (Compare (10.7.1.10)).

┘

*Proof:* Taking log, we see

$$\begin{aligned}
 \sum_{d \in \mathbb{Z}_+ \setminus (p)} \log \left( \left( \frac{1}{1-x^d} \right)^{\frac{\mu(d)}{d}} \right) &= \sum_{d \in \mathbb{Z}_+ \setminus (p)} \frac{\mu(d)}{d} \log \left( \frac{1}{1-x^d} \right) \\
 &= \sum_{d \in \mathbb{Z}_+ \setminus (p)} \frac{\mu(d)}{d} \sum_{d' > 0} \frac{x^{dd'}}{d'} \\
 &= \sum_{n \in \mathbb{Z}_+} \frac{x^n}{n} \sum_{d|n, p \nmid d} \mu(d) \\
 &= \sum_{k \in \mathbb{N}} \frac{x^{p^k}}{p^k} \text{ (2.6.1.26)}.
 \end{aligned}$$

Then the last assertion follows from (10.7.1.9).  $\square$

**Def. (10.7.1.12) [Bernoulli-Numbers].** For  $k \in \mathbb{N}$ , the **Bernoulli-numbers**  $B_k$  are defined by the following generating function:

$$\frac{T}{e^T - 1} = \sum_{k \in \mathbb{N}} B_k \frac{T^k}{k!} \in \mathbb{Q}[[T]].$$

Then  $B_k \in \mathbb{Q}$  for all  $k$ , and

$$B_0 = 1, B_1 = -\frac{1}{2}, B_{2k+1} = 0 (k \geq 1), \quad B_2 = \frac{1}{6}, B_4 = -\frac{1}{30}, B_6 = \frac{1}{42}, B_8 = -\frac{1}{30}.$$

More numbers can be found at [https://oeis.org/wiki/Bernoulli\\_numbers](https://oeis.org/wiki/Bernoulli_numbers).

For simplicity, for  $k \in \mathbb{Z}_{<0}$ , denote  $B_k = 0$ .  $\lrcorner$

*Proof:* To show that  $B_{2k+1} = 0$  for  $k \geq 1$ , notice

$$\frac{T}{e^T - 1} - \frac{-T}{e^{-T} - 1} = -T.$$

$\square$

**Def. (10.7.1.13) [Bernoulli-Polynomials].** For  $k \in \mathbb{N}$ , the **Bernoulli-polynomials**  $B_k(X) \in \mathbb{Q}[X]$  are defined by the following generating function:

$$\frac{T e^{TX}}{e^T - 1} = \left( \sum_{k \in \mathbb{N}} B_k \frac{T^k}{k!} \right) \left( \sum_{k \in \mathbb{N}} \frac{(XT)^k}{k!} \right) = \sum_{k \in \mathbb{N}} B_k(X) \frac{T^k}{k!} \text{ (10.7.1.12)}.$$

In particular,

$$B_k(X) = \sum_{i=0}^k \binom{k}{i} B_i X^{k-i},$$

and

$$B_0(X) = 1, \quad B_1(X) = X - \frac{1}{2}, \quad B_2(X) = X^2 - X + \frac{1}{6}, \quad B_3(X) = X^3 - \frac{3}{2}X^2 + \frac{1}{2}X.$$

$\lrcorner$

**Prop. (10.7.1.14) [Properties of Bernoulli-Polynomials].** For any  $k \in \mathbb{N}$ , we have

- $\frac{\partial}{\partial X} B_{k+1}(X) = (k+1)B_k(X)$ .
- $B_k(1-X) = (-1)^k B_k(X)$ .
- $B_k(X+1) - B_k(X) = kX^{k-1}$ .
- For any  $N \in \mathbb{Z}_+$ , we have

$$\sum_{a \in [N-1]} B_k(X + \frac{a}{N}) = N^{1-k} B_k(NX).$$

┘

*Proof:* These all follow from the functional equation, for example,

$$\frac{\partial}{\partial T} \left( \frac{T e^{TX}}{e^T - 1} \right) = T \cdot \frac{T e^{TX}}{e^T - 1}.$$

□

**Cor. (10.7.1.15).**

┘

**Prop. (10.7.1.16) [Generalized Bernoulli-Polynomials].** For  $N \in \mathbb{Z}_+$  and  $\chi \in \text{Diri}(N)$ , define the **generalized Bernoulli-polynomials**  $B_{k,\chi}(X) \in \mathbb{C}[X]$  by the following generating function:

$$\sum_{a \in [N]_+} \chi(a) \frac{T e^{aT} e^{TX}}{e^{NT} - 1} = \sum_{n \in \mathbb{N}} B_{k,\chi}(X) \frac{T^n}{n!}.$$

And denote

$$B_{k,\chi} = B_{k,\chi}(0).$$

Then for each  $M \in \mathbb{Z}_+$  s.t.  $N|M$  and each  $k \in \mathbb{Z}_+$ , we have

$$B_{k,\chi} = M^{k-1} \sum_{a \in [M]_+} \chi(a) B_k\left(\frac{a}{M}\right).$$

┘

**Def. (10.7.1.17) [Hankel-Determinants].** Let  $K$  be a field and  $f = \sum a_i T^i \in K[[T]]$ , then for  $k, M > 0$ , define the **Hankel-determinants** to be

$$H_k = \det(a_{i+j+k}), 1 \leq i, j \leq M$$

┘

**Prop. (10.7.1.18) [Characterizing Rational Functions].** Let  $f(T) = \sum_{i \in \mathbb{N}} a_i T^i \in K[[T]]$ , then  $f \in K[T]$  iff for some  $m \in \mathbb{Z}_+$ , the **Hankel determinants**  $H_{k,m} = \det(a_{k-2+i+j})_{1 \leq i \leq j \leq m} = 0$  for all  $k$  large.

┘

*Proof:* Suppose  $f(T) = P(T)/Q(T)$  where  $P(T) = \sum_{i=0}^m b_i T^i, Q(T) = \sum_{i=0}^n c_i T^i$ , then  $P(T) = F(T)Q(T)$ . So for  $i$  large,

$$\sum_{j=0}^n a_{i-n+j} c_{n-j} = 0.$$

And these will imply that  $H_{k,m} = 0$  for  $k \geq \max(m - n + 1, 1)$ .

Conversely, if  $H_{k,m} = 0$  for a minimal  $m$ , denote  $S \in \mathbb{Z}_+$  s.t.  $H_{k,m} = 0$  for  $k \geq S$ . Then we claim that  $H_{k,m-1} \neq 0$  for any  $k \geq S$ : If  $H_{s,m-1} = 0$  for some  $s \geq S$ , then in  $(a_{k-2+i+j})_{1 \leq i \leq j \leq m}$ , the upper-left  $(m-1) \times (m-1)$ -matrix has determinant 0. So we can use row linear combination to make some row zero except possibly the last entry. Then we can argue in each case, the lower-left  $(m-1) \times (m-1)$  matrix has determinant 0, which is just  $H_{s+1,m-1}$ . So by induction,  $H_{k,m-1} = 0$  for any  $k \geq s$ , contradicting the minimality of  $m$ .

Thus for any  $s \geq S$ ,  $H_{s,m} = 0$  and  $H_{s,m-1} \neq 0$ . Thus the last row of  $(a_{k-2+i+j})_{1 \leq i \leq j \leq m}$  is a linear combination of the first  $m-1$  rows. This implies that if we take any  $u_1, \dots, u_m \in K$  s.t.

$$a_S u_{m-1} + a_{S+1} u_{m-1} + \dots + a_{S+m-1} u_0 = 0,$$

$$a_{S+1} u_{m-1} + a_{S+2} u_{m-1} + \dots + a_{S+m} u_0 = 0,$$

.....

$$a_{S+m-2} u_{m-1} + a_{S+m-1} u_{m-1} + \dots + a_{S+2m-3} u_0 = 0,$$

also satisfies

$$a_{S+m-1} u_{m-1} + a_{S+m} u_{m-1} + \dots + a_{S+2m-2} u_0 = 0.$$

Thus by induction, for any  $s \geq S$ ,

$$a_s u_{m-1} + a_{s+1} u_{m-1} + \dots + a_{s+m-1} u_0 = 0.$$

This implies that

$$\left( \sum_{i=0}^{m-1} u_i T^i \right) \left( \sum_{i \in \mathbb{N}} a_i T^i \right) \in K[T].$$

□

**Cor. (10.7.1.19).** If  $K \subset L \in \mathbf{Field}$ , then  $K[[T]] \cap L[T] = K[T]$ . ┘

**Prop. (10.7.1.20).** Let  $P, Q \in \mathbb{Q}[T]$  be prime to each other with constant coefficient 1. if  $P/Q = Z \in \mathbb{Z}[[T]]$ , then we have  $P, Q \in \mathbb{Z}[T]$ . ┘

*Proof:* Let  $\lambda$  be a root of  $Q(T)$ , we prove that  $|\lambda^{-1}|_p \leq 1$  for any  $p \in \mathbf{P}$ : If  $|\lambda|_p < 1$ , then  $Z(\lambda)$  converges in  $\mathbb{Q}_p$  because it has integral coefficients, and then

$$P(\lambda) = Q(\lambda)Z(\lambda) = 0.$$

This contradicts the fact that  $P, Q$  are coprime. So  $\lambda^{-1} \in \mathbb{Z}$ , and  $Q \in \mathbb{Z}[T]$ . Consequently,  $P(T) = Q(T)Z(T) \in \mathbb{Z}[[T]] \cap \mathbb{Q}[T] = \mathbb{Z}[T]$ . □

## 2-Dimensional Formal Power Series

**Def. (10.7.1.21)[Binomial Power Series].** The **binomial power series**  $B_X(Y) = (1+Y)^X$  is defined to be

$$B_X(Y) = \sum_{n \in \mathbb{N}} \frac{X(X-1) \dots (X-n+1)}{n!} Y^n \in \mathbb{Q}[[X, Y]].$$

And for any  $a \in \mathbb{Q}$ , define

$$B_a(X) = B(a, X) \in \mathbb{Q}[[X]].$$

┘

### Geometric Objects

**Def. (10.7.1.22) [Differential Operators].** A continuous  $R$ -linear mapping  $D : R[[\mathbf{X}]] \rightarrow R[[\mathbf{X}]]$  is called a **formal differential operator** of order  $N \geq -1$  iff

$$L_D : R[[\mathbf{X}, \underline{Z}]] \rightarrow R[[\mathbf{X}]] : \sum p_\alpha(\mathbf{X})Z^\alpha \rightarrow \sum p_\alpha(\mathbf{X})D(X^\alpha)$$

vanish on  $J^{N+1}$ , where  $J = (X_i - Z_i)$ .

Then  $D$  is an operator of order  $N$  if  $[f, D] = fD - Df$  has order  $N - 1$  for any  $f \in R[[X]]$ .  $\lrcorner$

*Proof:* Let  $D$  be a differential operator of order  $N$ , since  $f(\mathbf{X}) - f(\underline{Z}) \in J$ , for all  $g(\mathbf{X}, \underline{Z}) \in J^N$ , we have  $L_D((f(\mathbf{X}) - f(\underline{Z}))g(\mathbf{X}, \underline{Z})) = 0$ , which is equivalent to  $L_{D \circ f - f \circ D}(g) = 0$ , so  $D \circ f - f \circ D$  is an operator of order  $N - 1$ . Conversely, if  $D \circ f - f \circ D$  is an operator of degree  $N - 1$ , then  $L_D((f(\mathbf{X}) - f(\underline{Z}))g) = 0$  for all  $g \in J^N$ , then  $D$  is an operator of order  $N$ .  $\square$

**Cor. (10.7.1.23).** A differential operator  $D : R[[\mathbf{X}]] \rightarrow R[[\mathbf{X}]]$  of order 1 is a linear map that satisfies  $D(fg) = D(f)g + fD(g)$ , which is just a derivative on  $R[[\mathbf{X}]]$ . Equivalently,  $D = \sum_i u_i(\underline{Z}) \frac{\partial}{\partial Z_i}$ .  $\lrcorner$

**Prop. (10.7.1.24) [Graded Module of Differential Operators].** Let  $D_1, D_2$  be differential forms of order  $N_1, N_2$ , then  $D_1 \circ D_2$  is a differential form of order  $N_1 + N_2$ , and  $[D_1, D_2]$  is a differential form of order  $N_1 + N_2 - 1$ . The  $R$ -algebra of differential operators on  $R[[\mathbf{X}]]$  is denoted by  $\mathcal{DO}$ .

In particular, the graded module of differential operators

$$\text{gr } \mathcal{DO} = \oplus \mathcal{DO}_N / \mathcal{DO}_{N-1}$$

is a commutative graded ring.  $\lrcorner$

*Proof:*

$\square$

**Prop. (10.7.1.25) [Basis of Differential Operators].** There is a representation  $g(X + Y) = \sum_\alpha D_\alpha g(X)Y^\alpha$  for any  $g \in R[[\mathbf{X}, \mathbf{Y}]]$ , where  $D_\alpha$  is a differential operator of degree  $|\alpha|$ . And  $\{D_\alpha\}$  form a free  $K[[\mathbf{X}]]$ -basis for the module of differential operators (10.7.1.24).

In fact,  $D_\alpha$  is just mimicking  $\frac{\partial^\alpha}{\alpha!}$  in all fields.  $\lrcorner$

*Proof:*  $g(\underline{Z}) = \sum_\alpha D_\alpha g(\mathbf{X})(\underline{Z} - \mathbf{X})^\alpha$ , thus if  $D$  is a differential operator of order  $N$ , then

$$D(g)(\mathbf{X}) = L_D(g(\underline{Z})) = \sum_{|\alpha| \leq N} L((\underline{Z} - \mathbf{X})^\alpha) D_\alpha g(\mathbf{X}),$$

which means  $D = \sum_{|\alpha| \leq N} a_\alpha(\mathbf{X}) D_\alpha$ , where  $a_\alpha = L((\underline{Z} - \mathbf{X})^\alpha)$ .  $\square$

**Def. (10.7.1.26) [Tangent Space].** The tangent space of  $K[[\mathbf{X}]]$  is the  $K$ -module  $\text{Hom}_K((\mathbf{X})/(\mathbf{X})^2, K)$ .  $\lrcorner$

**Def. (10.7.1.27) [Formal Curves].** A **formal curve** in  $K[[\mathbf{X}]]$  is an  $n$ -tuple  $(\gamma_1(T), \dots, \gamma_n(T))$  of elements in  $K[[T]]$ . The **tangent space of formal curve** is the map  $\text{Hom}_K((\mathbf{X})/(\mathbf{X})^2, K)$  given by  $X_i \mapsto \gamma_i(T) \in (T)/(T^2) \cong K$ .  $\lrcorner$

**Prop. (10.7.1.28) [Integral Curves].** For any  $\lrcorner$

## 2 Formal Identities

**Prop. (10.7.2.1).** In  $\mathbb{Z}[[T]]$ ,

$$\frac{1}{(1-T)^2} = \sum_{n \geq 0} (n+1)z^n$$

┘

*Proof:*

$$(1-T)^2 \sum_{n \geq 0} (n+1)z^n = (1-T) \sum_{n \geq 0} z^n = 1.$$

□

**Prop. (10.7.2.2).** In  $\mathbb{Z}[[T]]$ ,

$$\sum_{n \geq 1} \frac{nT^n}{1-T^n} = \sum_{n \geq 1} \frac{T^n}{(1-T^n)^2}$$

┘

*Proof:*

□

**Prop. (10.7.2.3).** In  $R[[z]]$ , if

$$\sum_{r=0}^{\infty} A(r)z^r = \frac{1}{(1-\alpha_1 z)(1-\alpha_2 z)}, \quad \sum_{r=0}^{\infty} B(r)z^r = \frac{1}{(1-\beta_1 z)(1-\beta_2 z)},$$

then

$$\sum_{r=0}^{\infty} A(r)B(r)z^r = (1-\alpha_1\alpha_2\beta_1\beta_2 z^2) \prod_{i=1}^2 \prod_{j=1}^2 \frac{1}{(1-\alpha_i\beta_j z)}.$$

┘

*Proof:*  $A(n)B(n) = \sum_{0 \leq k, j \leq n} \alpha_i^k \alpha_2^{n-k} \beta_1^j \beta_2^{n-j}$ , and the coefficients in the  $z^n$  term of  $\prod_{i=1}^2 \prod_{j=1}^2 \frac{1}{(1-\alpha_i\beta_j z)}$  is

$$\sum_{0 \leq k, j \leq n} \#\{(r_1, r_2, r_3, r_4) | 0 \leq r_i \leq n, r_1 + r_2 = a, r_1 + r_3 = b, r_1 + r_2 + r_3 + r_4 = n\} \alpha_i^k \alpha_2^{n-k} \beta_1^j \beta_2^{n-j}.$$

Notice

$$\#\{(r_1, r_2, r_3, r_4) | 0 \leq r_i \leq n, r_1 + r_2 = a, r_1 + r_3 = b, r_1 + r_2 + r_3 + r_4 = n\} = \min(a, b) - (a + b - n).$$

Thus the effect of multiplying  $(1-\alpha_1\alpha_2\beta_1\beta_2 z^2)$  reduces the coefficients of  $\alpha_i^k \alpha_2^{n-k} \beta_1^j \beta_2^{n-j} z^n$  to 1. So the assertion follows. □

**Prop. (10.7.2.4) [Euler Identities].**

- In  $\mathbb{Z}[x][[q]]$ ,

$$\prod_{n \geq 0} (1 + xq^n) = \sum_{n=0}^{\infty} \frac{q^{n(n-1)/2} x^n}{(1-q) \dots (1-q^n)}.$$

- In  $\mathbb{Z}[[x, q]]$ ,

$$\prod_{n \geq 0} (1 - xq^n)^{-1} = \sum_{n=0}^{\infty} \frac{x^n}{(1-q) \dots (1-q^n)}.$$

┘

*Proof:* These follow from interesting combinatorial identities:

1: The coefficient of  $q^m x^n$  on both sides are the number of ways to add  $n$  different non-negative integers to  $m$ .

2: The coefficient of  $q^m x^n$  on both sides are the number of ways to add  $n$  non-negative integers to  $m$ .  $\square$

**Prop.(10.7.2.5) [Jacobi's Triple Product Formula, Andrew[And65]].** in  $\mathbb{Z}[x][[x^{-1}q]]$  (notice  $\mathbb{Z}[x][[x^{-1}q]] \subset \mathbb{Z}[x, x^{-1}][[q]]$ ),

$$\sum_{n=-\infty}^{\infty} x^n q^{n^2} = \prod_{n=1}^{\infty} (1 - q^{2n})(1 + xq^{2n-1})(1 + x^{-1}q^{2n+1}).$$

┘

*Proof:* By substituting  $q = q^2, x = xq$  in Euler identities (10.7.2.4), in  $\mathbb{Z}[x][[x^{-1}q]]$ ,

$$\begin{aligned} \prod_{n \geq 0} (1 + xq^{2n+1}) &= \sum_{n=0}^{\infty} \frac{q^{n^2} x^n}{(1 - q^2)(1 - q^4) \dots (1 - q^{2n})} \\ &= \left( \prod_{j \geq 0} (1 - q^{2j+2}) \right)^{-1} \sum_{n=0}^{\infty} q^{n^2} x^n \prod_{j=0}^{\infty} (1 - q^{2n+2+2j}) \\ &= \left( \prod_{j \geq 0} (1 - q^{2j+2}) \right)^{-1} \sum_{n=-\infty}^{\infty} q^{n^2} x^n \prod_{j=0}^{\infty} (1 - q^{2n+2+2j}) \\ (q = q^2, x = q^{2n+2} \text{ in (10.7.2.4)}) &= \left( \prod_{j \geq 0} (1 - q^{2j+2}) \right)^{-1} \sum_{n=-\infty}^{\infty} q^{n^2} x^n \sum_{m=0}^{\infty} \frac{(-1)^m q^{m^2+m+2nm}}{(1 - q^2)(1 - q^4) \dots (1 - q^{2n})} \\ &= \left( \prod_{j \geq 0} (1 - q^{2j+2}) \right)^{-1} \sum_{m=0}^{\infty} \frac{(-x^{-1}q)^m}{(1 - q^2) \dots (1 - q^{2n})} \sum_{n=-\infty}^{\infty} q^{(m+n)^2} x^{m+n} \\ (q = q^2, x = -x^{-1}q \text{ in (10.7.2.4)}) &= \left( \prod_{j \geq 0} (1 - q^{2j+2}) \right)^{-1} \prod_{j=0}^{\infty} (1 + x^{-1}q^{2j+1})^{-1} \sum_{n=-\infty}^{\infty} q^{n^2} x^n. \end{aligned}$$

 $\square$ 

**Cor.(10.7.2.6) [Dedekind Eta Function].** Substitute  $q = q^{3/2}$  and  $x = q^{-1/2}$ , we get:

$$\sum_{n=-\infty}^{\infty} (-1)^n q^{(3n^2+n)/2} = \prod_{n=1}^{\infty} (1 - q^{3n})(1 - q^{3n-1})(1 - q^{3n-2}) = \prod_{n=1}^{\infty} (1 - q^n) \in \mathbb{Z}[[q]].$$

By completing the square,

$$\sum_{n=-\infty}^{\infty} (-1)^n q^{(6n+1)^2/24} = q^{1/24} \prod_{n=1}^{\infty} (1 - q^n) \in \mathbb{Z}[[q^{1/24}]].$$

the last term is known as the **Dedekind eta function**  $\eta(q) = q^{1/24} \prod_{n=1}^{\infty} (1 - q^n) \in \mathbb{Z}[[q^{1/24}]]$ .  $\square$

### 3 Formal Group Laws

In this subsection, the local structure of an algebraic group scheme at the origin is studied.

**Def. (10.7.3.1) [Formal Group Laws].** A **formal group law**  $\mathcal{G}$  of dimension  $n$  over  $R$  is a continuous local map  $\mu_{\mathcal{G}} : R[[\mathbf{X}]] \rightarrow R[[\mathbf{X}, \mathbf{Y}]]$  given by an  $n$ -tuple of power series  $G = (G_1, \dots, G_n)$  in  $R[[\mathbf{X}, \mathbf{Y}]]$  that

$$G(X, Y) \equiv X + Y \pmod{(\mathbf{X}, \mathbf{Y})^2}, \quad G(G(\mathbf{X}, \mathbf{Y}), Z) = G(X, G(\mathbf{Y}, Z)).$$

A **formal  $R$ -module** is a formal group law  $\mathcal{G}$  over  $R$  together with a ring homomorphism  $R \rightarrow \text{End}_R(G)$  that  $[a](X) = aX + \dots$

A morphism of formal groups laws  $\mathcal{G} \rightarrow \mathcal{H}$  is a continuous local map  $\varphi^* : R[[\mathbf{X}']] \rightarrow R[[\mathbf{X}]]$  given by an  $n'$ -tuple of power series  $\varphi = (\varphi_1, \dots, \varphi_{n'})$  in  $R[[\mathbf{X}]]$  that satisfies

$$\mu_{\mathcal{G}} \circ \varphi^* = (\varphi^* \otimes \varphi^*) \circ \mu_{\mathcal{H}}.$$

Or equivalently,  $\varphi(G(\mathbf{X}, \mathbf{Y})) = H(\varphi(\mathbf{X}), \varphi(\mathbf{Y}))$ . ┘

**Prop. (10.7.3.2).** For a formal group law  $G$  over  $R$  (10.7.3.1),

- $G(0, \mathbf{Y}) = \mathbf{Y}, G(\mathbf{X}, 0) = \mathbf{X}$ .
  - There exists a unique inverse  $\text{inv}(\mathbf{X})$  that  $G(\mathbf{X}, \text{inv}(\mathbf{X})) = 0$ . And this  $\text{inv}(\mathbf{X})$  satisfies  $G(\text{inv}(\mathbf{X}), \mathbf{X}) = 0$ , and  $\text{inv}^2 = \text{id}$ .
- ┘

*Proof:* ? □

**Remark (10.7.3.3).** WARNING: A formal group law of dimension  $n$  is not equivalent to a group scheme structure on  $\text{Spec } \mathbb{Z}[[X_1, \dots, X_n]]$  (10.1.1.1), as here we are taking a completion. But see (10.7.4.4). ┘

**Def. (10.7.3.4) [Multiplication Map].** Let  $G$  be a commutative formal group law over  $R$  and  $m \in \mathbb{Z}$ , then we can define a group homomorphism  $[m] : G \rightarrow G$  inductively as follows:

$$[0](\mathbf{X}) = 0, \quad [m+1](\mathbf{X}) = G([m](\mathbf{X}), \mathbf{X}), \quad [m-1](\mathbf{X}) = G([m](\mathbf{X}), i(\mathbf{X})).$$

Then it can be verified that this is well-defined and  $[m]$  is a group homomorphism. ┘

**Prop. (10.7.3.5) [Multiplications as Automorphisms].** Let  $\mathcal{G}$  be a commutative formal group law over  $R$  and  $m \in \mathbb{Z}$ , then  $[m](\mathbf{X}) = m\mathbf{X} + o(\mathbf{X})$ . In particular, if  $m$  is invertible in  $R$ , then  $[m]$  is an automorphism of  $G$ , by (10.7.1.3). ┘

**Example (10.7.3.6) [Additive and Multiplicative Groups].**  $\mathbb{G}_a$  is the one-dimensional formal group with  $\mathbb{G}_a(\mathbf{X}, \mathbf{Y}) = X + Y$ ,  $\mathbb{G}_m$  is the one-dimensional formal group with  $\mathbb{G}_m(\mathbf{X}, \mathbf{Y}) = X + Y + XY$ .

Over a  $\mathbb{Q}$ , there is an isomorphism between  $\mathbb{G}_a$  and  $\mathbb{G}_m$  giving by  $X \rightarrow \exp(X) - 1$ . ┘

**Def. (10.7.3.7) [Representing Functors of Formal Modules].** For  $\mathcal{O} \in \mathcal{CRing}$ , the functor

$$\mathcal{CRing}_{\mathcal{O}} \rightarrow \text{Set} : B \mapsto \{\text{Formal Groups over } B\}$$

is representable by an  $\mathcal{O}$ -algebra  $\Lambda_{\mathcal{O}}$ . ┘

**Def. (10.7.3.8) [Invariant Differential Forms].** An **invariant differential form** on a formal group law  $G$  over  $R$  is an element  $\omega = \sum a_i(\mathbf{X})dX_i \in \Omega_{R[[X]]/R}^1$  that satisfies  $(\mathbf{Y} \mapsto G(\mathbf{X}, \mathbf{Y}))_*\omega = \omega$ , i.e.

$$\sum_j a_j(\mathbf{Y})dY_j = \sum_i a_i(G(\mathbf{X}, \mathbf{Y})) \frac{\partial G_i}{\partial Y_j}(\mathbf{X}, \mathbf{Y})dY_j.$$

If  $G$  is commutative, then this is equivalent to  $\mu_*\omega = i_{1*}\omega + i_{2*}\omega$ . ┘

**Prop. (10.7.3.9).** The mapping  $\omega \mapsto (u_1(0), \dots, u_n(0))$  is an isomorphism of the  $R$ -module of invariant differential forms and  $R^n$ . ┘

*Proof:* Cf. [Zin84]P14. □

**Prop. (10.7.3.10) [Pullback of Invariant Differential Forms].** Let  $\varphi : G \rightarrow H$  be a homomorphism of formal group laws, then for any invariant differential form  $\omega = \sum a_i(\mathbf{X})dX_i$  on  $H$ ,  $\varphi^*\omega$  is a differential form on  $G$ , given by expanding  $\sum a_i(\varphi(\mathbf{X}))d(\varphi_i(\mathbf{X}))$ . ┘

*Proof:*

$$\begin{aligned} (\mathbf{Y} \mapsto G(\mathbf{X}, \mathbf{Y}))^*\varphi^*\omega &= \sum a_i(\varphi(G(\mathbf{X}, \mathbf{Y})))d(\varphi(G(\mathbf{X}, \mathbf{Y}))) \\ &= \sum a_i(H(\varphi(\mathbf{X}), \varphi(\mathbf{Y})))d(H(\varphi(\mathbf{X}), \varphi(\mathbf{Y}))) \\ &= \sum_i a_i(\varphi(\mathbf{Y}))d(\varphi(\mathbf{Y})) \\ &= \varphi^*\omega \end{aligned}$$

□

**Def. (10.7.3.11) [Invariant Differential Operators].** An **invariant differential operator** on a formal group  $G$  of dimension  $n$  is a differential operator  $D$  s.t.

$$\mu \circ D = (1 \otimes D) \circ \mu.$$

Equivalently, if  $D = \sum_i u_i(\underline{Z}) \frac{\partial}{\partial Z_i}$ , it satisfies

$$\sum_j u_j(\mathbf{Y}) \frac{\partial G_i}{\partial Y_j} = u_i(G(\mathbf{X}, \mathbf{Y})).$$

The space of invariant operators is stable under composition. The  $R$ -algebra of invariant differential operators on  $G$  is denoted by  $\mathcal{DO}_G$ . ┘

**Prop. (10.7.3.12).** The space of invariant differential operators on  $G$  of order  $\leq N$  are in bijection with the space of  $K$ -linear maps  $l : K[[\mathbf{X}]] \rightarrow K$  s.t.  $l((\mathbf{X})^{N+1}) = 0$  via

$$Df(\mathbf{X}) = (1 \otimes l)f(G(\mathbf{X}, \mathbf{Y})).$$

┘

*Proof:* Cf. [Zin84]P22. □

**Cor.(10.7.3.13) [Basis of Invariant Differential Operators].** For any  $f \in K[[\mathbf{X}]]$ , write  $f(G(\mathbf{X}, \mathbf{Y})) = \sum_{\alpha} (H_{\alpha}f)(\mathbf{X})Y^{\alpha}$ .

Then  $H_{\alpha}$  are differential operators of order  $|\alpha|$ , and the space of invariant differential operators of order  $N$  form a free  $R$ -module with basis  $H_{\alpha}$ . In particular, the space of invariant derivatives is isomorphic to  $R^n$ .  $\lrcorner$

*Proof:* By (10.7.3.12),

$$Df(\mathbf{X}) = (1 \otimes l)f(G(\mathbf{X}, \mathbf{Y})) = (1 \otimes l)\left(\sum_{\alpha} (H_{\alpha}f)(\mathbf{X})Y^{\alpha}\right) = \sum_{\alpha} l(\mathbf{Y}^{\alpha})(H_{\alpha}f)(\mathbf{X}).$$

□

**Cor.(10.7.3.14) [Composition of Invariant Differential Operators].** Let  $D_1, D_2 \in \mathcal{DO}_G$ , then

$$(D_1 \circ D_2)f(\underline{Z}) = (1 \otimes l_1 \otimes l_2)f(G(\underline{Z}, G(\mathbf{X}, \mathbf{Y}))),$$

in particular,

$$l_{D_1 \circ D_2}(f) = (l_1 \otimes l_2)f(G(\mathbf{X}, \mathbf{Y})).$$

□

*Proof:*

$$(D_1 \circ D_2)f(\underline{Z}) = D_1(1 \otimes l_1)f(G(\underline{Z}, \mathbf{Y})) = (1 \otimes l_2 \otimes 1)(1 \otimes 1 \otimes l_1)f(G(G(\underline{Z}, \mathbf{X}), \mathbf{Y})) = (1 \otimes l_1 \otimes l_2)f(G(\underline{Z}, G(\mathbf{X}, \mathbf{Y}))).$$

□

**Prop.(10.7.3.15) [Pushforward of Invariant Differential Operators].** A homomorphism  $\varphi$  of formal groups  $G \rightarrow H$  induces a map from the linear maps  $l : K[[\mathbf{X}]] \rightarrow K$  to linear maps  $l \circ \varphi^* : K[[\mathbf{X}']] \rightarrow K$ , which induces a  $K$ -homomorphism of algebras  $\varphi_* : \mathcal{DO}_G \rightarrow \mathcal{DO}_H$ .  $\lrcorner$

*Proof:* To show preserves algebra structure, notice for any  $f \in R[[\mathbf{X}']]$ , by (10.7.3.14),

$$\begin{aligned} \varphi_*(D) \circ \varphi_*(D')f(0) &= (l \circ \varphi^*) \otimes (l' \circ \varphi^*)f(H(\mathbf{X}', \mathbf{Y}')) \\ &= (l \otimes l')f(H(\varphi(\mathbf{X}), \varphi(\mathbf{Y}))) \\ &= (l \otimes l')f(\varphi(G(\mathbf{X}, \mathbf{Y}))) \\ &= [(l \otimes l') \circ \varphi^*]f(G(\mathbf{X}, \mathbf{Y})) \\ &= \varphi_*(D \circ D')f(0). \end{aligned}$$

Thus  $\varphi_*(D) \circ \varphi_*(D') = \varphi_*(D \circ D')$ , by (10.7.3.12).  $\lrcorner$

□

**Prop.(10.7.3.16) [Q-Theorem].** Any commutative connected formal group over a  $\mathbb{Q}$ -algebra  $R$  is a direct sum of  $\widehat{\mathbf{G}}_a$ .  $\lrcorner$

□

*Proof:* Cf. [Zin84] P19.  $\lrcorner$

□

**Thm.(10.7.3.17) [Lazard 1955].** If  $S \rightarrow R \in \mathcal{CRing}$  is surjective, then any formal group law over  $R$  comes from a formal group law over  $S$ .  $\lrcorner$

□

*Proof:* Cf. [Zin84] ?  $\lrcorner$

□

### 1-dimensional Formal Group Laws

**Def. (10.7.3.18) [Normalized Invariant Differential Form].** For a 1-dimensional formal group  $G$  over  $R[[X]]$ , the module of invariant differentials is isomorphic to  $R$  (10.7.3.11). An invariant differential form  $\omega = P(T)dT$  is called **normalized** if  $P(0) = 1$ .

Then the unique normalized invariant differential form on  $G$  is given by  $\omega_G = G_X(0, T)^{-1}dT$ .  $\lrcorner$

*Proof:* We need to check  $G_X(0, G(T, S))^{-1}G_X(T, S) = G_X(0, T)^{-1}$ , and this is just  $G(U, G(T, S)) = G(G(U, T), S)$  differentiated at  $U$  and let  $U = 0$ .  $\square$

**Prop. (10.7.3.19).** For a morphism  $\varphi : \mathcal{F} \rightarrow \mathcal{G}$  of 1-dimensional formal groups laws over  $R$ ,  $\varphi^*\omega_{\mathcal{G}} = \varphi'(0)\omega_{\mathcal{F}}$ .  $\lrcorner$

*Proof:* By (10.7.3.10),  $\varphi^*\omega_{\mathcal{G}}$  is an invariant differential form, and compare their constant coefficients.  $\square$

**Cor. (10.7.3.20).** Let  $p$  be a prime, then for any formal group law of dimension 1,

$$[p](T) = pf(T) + g(T^p)$$

for some  $f(0) = g(0) = 0$ .  $\lrcorner$

*Proof:* It suffices to show that  $[p]'(T) \in pR[[T]]$ . But by (10.7.3.19) and (10.7.3.5),

$$p\omega(T) = [p]^*\omega(T) = G_X(0, [p](T))^{-1}[p]'(T)dT$$

so this is true.  $\square$

**Def. (10.7.3.21) [Formal Logarithm].** When  $R$  is torsion-free, the **formal logarithm**  $\log_{\mathcal{F}}$  for a 1-dimensional formal group is the integration of invariant differential

$$\int_0^T \omega_{\mathcal{F}} = T + \frac{c_1}{2}T^2 + \cdots \in (R \otimes \mathbb{Q})[[T]].$$

Then the **formal power exponential** is the unique power series  $\exp_{\mathcal{F}}$  that is the inverse of  $\log_{\mathcal{F}}$ . It exists uniquely by (10.7.1.3), and by (10.7.1.4), it is of the form

$$\exp_{\mathcal{F}} = \sum_{n \geq 1} \frac{b_n}{n!} T^n \in (R \otimes \mathbb{Q})[[T]], b_n \in R.$$

$\lrcorner$

**Prop. (10.7.3.22).** For  $R$  is torsion-free and an 1 dimensional formal group  $\mathcal{F}$  over  $R$ ,

$$\log_{\mathcal{F}} : \mathcal{F} \rightarrow \mathbb{G}_a$$

is an isomorphism of formal groups laws over  $R \otimes_{\mathbb{Z}} \mathbb{Q}$ .

And if  $\mathcal{F}$  is a formal  $R$ -module, then it is an isomorphism of  $R$ -modules, because from (10.7.3.19) that  $\omega_{\mathcal{F}} \circ [a] = a\omega_{\mathcal{F}}$ , thus  $\log_{\mathcal{F}} \circ [a] = a \cdot \log_{\mathcal{F}}$ .  $\lrcorner$

*Proof:* From  $\omega_{\mathcal{F}}(F(T, S)) = \omega_{\mathcal{F}}(T)$ , we get that  $\log_{\mathcal{F}}(F(T, S)) = \log_{\mathcal{F}}(S) + \log_{\mathcal{F}}(T)$ . So it is a homomorphism. Now the inverse  $\exp_{\mathcal{F}}$  is already given, so it is an isomorphism.  $\square$

**Cor. (10.7.3.23) [1-Dimensional Formal Group Law is Commutative].** Any 1-dimensional formal group over a ring  $R$  that has no torsion nilpotents is commutative.  $\lrcorner$

*Proof:* We only prove for  $R$  torsion free  $\color{red}{?}$ .  $F(T, S) = \exp_{\mathcal{F}}(\log_{\mathcal{F}}(T) + \log_{\mathcal{F}}(S))$ .  $\square$

### Lubin-Tate Formal Group Law

**Notation(10.7.3.24).**

- Let  $(K, \mathcal{O}_K, \mathfrak{m}_K, \varpi_K, k) \in p\text{-LField}$ .

┘

**Def.(10.7.3.25)[Lubin-Tate Formal Group Law].** A **Lubin-Tate power series** for  $\varpi$  is a power series  $\varphi(X) \in \mathcal{O}_K[[X]]$  s.t.

$$\varphi(X) \equiv \varpi X \pmod{X^2}, \quad \varphi(X) \equiv X^q \pmod{\mathfrak{p}_v}.$$

A **Lubin-Tate module**  $G$  over  $\mathcal{O}_K$  is a formal  $\mathcal{O}_K$ -module(10.7.3.1) s.t.  $[\varpi_K](X)$  is a Lubin-Tate power series.

┘

**Prop.(10.7.3.26).** Given a  $p$ -adic number field  $K$  with residue field  $\mathbb{F}_q$ , we consider the set  $\xi_\pi$  of all Lubin-Tate power series for  $\pi$ .

If  $f, g \in \xi_\pi$  and  $L(\mathbf{X}) = \sum a_i X_i$  be a linear form, then there exists a unique power series  $F(\mathbf{X})$  that  $F(X) \equiv L(X) \pmod{(\mathbf{X})^2}$  and  $f(F(\mathbf{X})) = F(g(\mathbf{X}))$ .

┘

*Proof:* Choose  $F$  consecutively, if  $F_{r+1} = F_r + \Delta_r$ , then must

$$\Delta \equiv \frac{f(F_r(X)) - F_r(g(X))}{\pi^{r+1} - \pi} \pmod{\text{degree}(r+2)}.$$

This has coefficient in  $\mathcal{O}$  because  $f \equiv g \equiv Z^q \pmod{\pi}$ .

□

**Cor.(10.7.3.27).** If we let  $f = g, L = X + Y$  to get  $F_f$  and  $f, g, L = aX$  to get  $a_{f,g}$ , then

- $F_f(X, Y) = F_f(Y, X)$ .
- $F_f(F_f(X, Y), Z) = F_f(X, F_f(Y, Z))$ .
- $a_{f,g}(F_g(X, Y)) = F_f(a_{f,g}(X), a_{f,g}(Y))$ .
- $a_f b_f(Z) = (ab)_f(Z)$ .
- $(a + b)_f(Z) = F_f(a_f(Z), b_f(Z))$ .
- $\pi_f(Z) = f(Z)$ .

all follow from the unicity of the last proposition.

┘

**Cor.(10.7.3.28)[Existence of Lubin-Tate Modules].** We get a commutative formal  $\mathcal{O}$ -module  $F_f$  for every  $f$ . And this group can act on  $\mathfrak{p}_L$  for an alg.ext  $L/K$ . The set of zeros  $\Lambda_{f,n}$  of  $f^n$  in  $L$ , as the elements annihilated by  $\pi^n$ , is a submodule of  $\mathfrak{p}_L^{(f)}$ .

And  $u_{g,f}$  for any unit  $u \in \mathcal{O}$  defines an isomorphism between  $F_f$  and  $F_g$ , thus this formal group only depends on  $\pi$ , called  $F_\pi$ . Hence  $L_{f,n} = K(\Lambda_{f,n})$  only depends on  $\pi$ , with Galois group  $G_{\pi,n}$ .

┘

**Prop.(10.7.3.29)[Different Uniformizers].** For two uniformizers  $\varpi, \varpi'$ , it is proven that  $F_\varpi$  and  $F_{\varpi'}$  are isomorphic, but isomorphic over  $\mathcal{O}_{\check{K}}$ .

Thus  $L_{\varpi,n}$  and  $L_{\varpi',n}$  may not be isomorphic, but  $K^{\text{ur}}.L_{\pi,n} = K^{\text{ur}}.L_{\pi',n}$  since  $\check{K}.L_{\pi,n} = \check{K}.L_{\varpi',n}$  and both of them is the algebraic closure of  $K$  in it.

┘

*Proof:* Cf.[Neukirch CFT P105].?

□

**Lemma (10.7.3.30).** The Newton polygon of  $[\varpi_K^n]/\varpi_K^n$  has vertices

$$(1, 0), (q, -1/e_K), (q^2, -2/e_K), \dots$$

┘

*Proof:* Notice  $[\varpi_K^n]$  has no infinite edge of negative slope because all its coefficient are in  $\mathcal{O}_K$ . Now look at its roots, it has a root 0, and  $q - 1$  roots of valuation  $v_p(\varpi_K)/(q - 1)$ ,  $q(q - 1)$  roots of valuation  $v_p(\varpi_K)/q(q - 1)$ , and so on. So by factor out these roots,  $[\varpi_K^n]/\varpi_K^n$  is left with a power series whose Newton polygon is a single line, which shows the desired result.  $\square$

**Prop. (10.7.3.31).** The formal logarithm (10.7.3.21) of the Lubin-Tate formal group  $F_\pi$  satisfies:

$$\log_{\mathcal{F}_\varpi}(T) = \lim_{n \rightarrow \infty} [\varpi_{\mathcal{F}}^n]/\varpi_{\mathcal{F}}^n.$$

┘

*Proof:* By (10.7.3.22) we have

$$\log_{\mathcal{F}}(T) = \log_{\mathcal{F}}([\varpi_{\mathcal{F}}^n]/\varpi_{\mathcal{F}}^n) = ([\varpi_K^n] + a_2/2[\varpi_K^n]^2 + \dots)/\varpi_K^n$$

and for any degree  $n$ , the coefficient of  $[\varpi_K^{2n}]/\varpi_K^{2n}$  is bounded below by a  $c(n)$ , so  $[\varpi_K^{2n}]/\varpi_K^{2n}$  converges to 0, thus the result.  $\square$

**Cor. (10.7.3.32).** The Newton polygon of  $\log_{\mathcal{F}}(T)$  has vertices  $(1, 0), (q, -1/e_K), (q^2, -2/e_K), \dots$  ┘

The discussion is continued at 2.

### Canonical and Quasi-Canonical Liftings

**Def. (10.7.3.33).** Let  $(K, \mathcal{O}_K, \varpi, \kappa) \in p\text{-Field}$ . ┘

**Prop. (10.7.3.34) [Canonical Liftings].** Let  $L/K$  be a quadratic extension with a uniformizer  $t$  and residue field  $k_L$ , and  $\check{L}$  the maximal unramified extension of  $L$  with residue field  $k$ . Let  $G$  be the unique formal  $\mathcal{O}_K$ -module of height 2 over  $k$  (10.7.4.19), and  $R = \text{End}_k(G)$  is isomorphic to the maximal order in the quaternion division algebra  $B$  over  $F$ .

Then there exist inclusions  $\alpha : \mathcal{O}_L \hookrightarrow B$  whose action on  $k = \text{Lie}_k(G)$  is compatible with the reduction map ?. Then this makes  $G$  an  $\mathcal{O}_L$ -module of height 1.

Then  $G$  can be lifted uniquely to a formal  $\mathcal{O}_L$ -module  $\underline{G}$  over  $\mathcal{O}_{\check{L}}$ , called the **canonical lifting** of the pair  $(G, \alpha)$ . ┘

*Proof:* The Lubin-Tate formal group gives a formal  $\mathcal{O}_L$ -module over  $\mathcal{O}_L$  with  $[t](X) \equiv tX + X^{\#k_L}$ , so its of height 1 modulo  $t$ , so isomorphic to  $G$ . This together with the fact that height 1 formal groups has trivial deformations spaces (Cf. [Lubin-Tate, Formal moduli for one-parameter formal Lie groups]1. Prop4.2 ?) implies that there are canonical lifting to  $\mathcal{O}_{\check{L}}$ .  $\square$

**Prop. (10.7.3.35) [Gross].** Situation as in (10.7.3.34), for  $n \in \mathbb{Z}_+$ , denote  $R_n = \text{End}_{\mathcal{O}_{\check{L}}/(t^n)}(\underline{G})$ , then there are inclusions

$$\dots \subset R_n \subset \dots \subset R_1 \subset R_0 = R.$$

And by completeness, we have  $\cap_n R_n = \mathcal{O}_L$ .

Then in fact  $R_n = \mathcal{O}_L + t^n R$ . ┘

*Proof:* Cf. [Gross, Canonical and QuasiCanonical Liftings]P322. ┘

## 4 Formal Groups

**Notation(10.7.4.1).**

- Let  $\text{Nil}_R$  be the exact category of nilpotent commutative (possibly non-unital)  $R$ -algebras.  $\lrcorner$

**Def.(10.7.4.2) [Formal Groups].** A (commutative) **formal group** is an exact functors  $\text{Nil}_R \rightarrow \mathcal{A}b$  that commutes with infinite direct sums.  $\lrcorner$

**Remark(10.7.4.3).** Don't confuse formal groups with formal schemes, they are totally different notions.  $\lrcorner$

**Prop.(10.7.4.4) [Formal Group Law as Formal Groups].** For  $n \in \mathbb{Z}_+$ , a commutative formal group law of dimension  $n$  (10.7.3.1) is equivalent to an Abelian functor on  $\text{Nil}_R$  whose underlying set-theoretic functor if  $N \mapsto N^{\oplus n}$ , in particular, it is a formal group over  $R$  (10.7.4.2).  $\lrcorner$

*Proof:* Each commutative formal group law  $G$  of dimension  $n$  defines a functor

$$\text{Nil}_R \rightarrow \mathcal{A}b : N \mapsto (N^n, G)$$

Conversely, if  $\tilde{G} : \text{Nil}_R \rightarrow \mathcal{A}b$  is a functor s.t. the underlying set-theoretic map is  $N \mapsto N^n$ , then  $\tilde{G}((\mathbf{X}, \mathbf{Y})/(\mathbf{X}, \mathbf{Y})^k) \cong [(\mathbf{X}, \mathbf{Y})/(\mathbf{X}, \mathbf{Y})^k]^n$  as sets. Suppose

$$(X_1, \dots, X_n) + (Y_1, \dots, Y_n) = (G_1^k(\mathbf{X}, \mathbf{Y}), \dots, G_n^k(\mathbf{X}, \mathbf{Y}))$$

in  $\tilde{G}((\mathbf{X}, \mathbf{Y})/(\mathbf{X}, \mathbf{Y})^k)$ , then  $G_i^{k+1} \equiv G_i^k \pmod{(\mathbf{X}, \mathbf{Y})^k}$ , and their limit defines a commutative formal group law of dimension  $n$ . Because for any nilpotent algebra  $N$  and  $(a_1, \dots, a_n), (b_1, \dots, b_n) \in N^n$ , there is a surjective map  $(\mathbf{X}, \mathbf{Y})/(\mathbf{X}, \mathbf{Y})^k \rightarrow N$  for some  $k$  that maps  $X_i$  to  $a_i$ ,  $Y_i$  to  $b_i$ , thus by functoriality,  $\tilde{G}(N) \cong G(N)$ .  $\square$

**Prop.(10.7.4.5) [Formal Groups are Left Exact].** If  $G$  is a formal group over  $R$ , then  $G(0) = 0$ , and  $G$  commutes with fiber products.  $\lrcorner$

*Proof:* ?  $\square$

**Prop.(10.7.4.6) [Formal Completion of Group Schemes].** Let  $G \in \text{GrpSch}/R$  be commutative and smooth, then

$$\hat{G} : \text{Nil}_R \rightarrow \mathcal{A}b : N \mapsto \ker(G(R \oplus N) \rightarrow G(R))$$

is a formal group over  $R$ , where  $R \oplus N$  is endowed with the commutative  $R$ -ring structure  $(r_1, n_1)(r_2, n_2) = (r_1 r_2, r_1 n_2 + r_2 n_1 + n_1 n_2)$  and  $R \oplus N \rightarrow R$  is the map  $\text{id} \oplus 0$ .  $\lrcorner$

*Proof:* Cf.  $[p]$ -divisible groups, lecture, Zink]Prop1.5. ?  $\square$

**Example(10.7.4.7).** For  $S \in \text{Nil}_R$ , the functor  $\text{Res}_{S/R}(G_m)$  is a commutative formal group.  $\lrcorner$

**Prop.(10.7.4.8) [Formal Group Laws over Complete Local Rings].** Let  $G$  be a commutative formal group law defined over a complete local ring  $(R, \mathfrak{m})$ , then

- For each  $n$ ,  $G(\mathfrak{m}^n)/G(\mathfrak{m}^{n+1}) \cong \mathfrak{m}^n/\mathfrak{m}^{n+1}$  as groups.
- Let  $p$  be the characteristic of the residue field  $k$  ( $p$  may be 0), then  $\mathcal{F}(\mathfrak{m})_{\text{tor}} = \mathcal{F}(\mathfrak{m})[p^\infty]$ .  $\lrcorner$

*Proof:* 1: This is because  $F(x, y) \equiv x + y \pmod{\mathfrak{m}^n}$ .

2: This is because  $[m]$  is an automorphism by (10.7.3.5) as  $m$  is invertible in  $R$ .  $\square$

**Prop. (10.7.4.9) [Tangent Functors].** For a formal group  $G$  over  $R$  and  $M \in \text{Mod}_R$ , we can regard  $M$  as an element of  $\text{Nil}_R$  by requiring that  $M^2 = 0$ . Then there is a natural  $R$ -module structure on  $G(M)$ , and we get a functor

$$t_G : \text{Mod}_R \rightarrow \text{Mod}_R.$$

┘

*Proof:* Cf. [ $p$ -Divisible Groups, lecture, Zink]Prop1.9.  $\square$

**Prop. (10.7.4.10).** Suppose  $G$  is a formal group over  $R$ . For  $M \in \text{Mod}_R$  and  $m \in M$ , define  $c_m : R \rightarrow M : a \mapsto am$ , then the map

$$t_G(R) \otimes_R M \rightarrow t_H(M) : \xi \otimes m \mapsto t_H(c_m)(\xi)$$

is a map of  $R$ -modules, and it is an isomorphism. In particular,  $t_H(R)$  is flat over  $R$ .  $\square$

*Proof:* Cf. [ $p$ -Divisible Groups, lecture, Zink]Prop1.11.  $\square$

**Prop. (10.7.4.11) [Characterizing Formal Group Laws].** If  $G$  is a formal group over  $R$  s.t.  $t_G(R) \cong R^{\oplus n}$  for some  $n \in \mathbb{Z}_+$ , then  $G$  comes from a formal group law of dimension  $n$  over  $R$  as in (10.7.4.4).  $\square$

*Proof:* Cf. [ $p$ -divisible groups, lecture, Zink]Prop1.14.  $\square$

**Prop. (10.7.4.12) [Base Change of Formal Groups].** If  $f : R \rightarrow S \in \mathcal{C}\text{Ring}$  and  $G$  is a formal group over  $R$ , then the forgetful functor  $\text{Nil}_R \rightarrow \text{Nil}_S$  makes  $G$  a formal group over  $S$ , denoted by  $f_*G$ .  $\square$

**Thm. (10.7.4.13) [Lazard].**  $\square$

### Grothendieck-Messing Exponentials

**Def. (10.7.4.14) [Lie Algebras of Formal Groups].** For a formal group  $G$  over  $R$ , define

$$\text{Lie}(G) : \text{Nil}_R \rightarrow \text{Set} : N \mapsto G(N'),$$

where  $N' \in \text{Nil}_R$  is the module  $N$  with a different algebra structure  $N^2 = 0$ . Then  $\text{Lie}(G)$  naturally prolongs to a map  $\text{Lie}(G) : \text{Nil}_R \rightarrow \mathcal{A}\text{b}$  because  $G(N' \times_R N') = G(N') \times G(N')$  by (10.7.4.5).  $\square$

**Prop. (10.7.4.15) [Grothendieck-Messing Exponentials].** If  $N \in \text{Nil}_R$  has a pd-structure  $\{\gamma_n : N \rightarrow N\}$ , and  $G$  is a strictly pro-representable commutative formal group over  $R$  (10.7.4.2), then there is an isomorphism

$$\exp_N : \text{Lie}(G)(N) \cong G(N) \in \mathcal{A}\text{b} \text{ (10.7.4.14)}$$

functorial in  $(N, \{\gamma_n\}_{n \in \mathbb{Z}_+})$  and in  $G$ , called the **Grothendieck-Messing exponential map**.

In particular, if  $\mathbb{Q} \subset R$ , then for any strictly pro-representable commutative formal group  $G$  over  $R$ , there is an isomorphism

$$\exp_G : \text{Lie}(G) \cong G$$

functorial in  $G$ .  $\square$

*Proof:* Cf. [ $p$ -divisible Groups, lecture, Zink]Prop1.38, 1.47.  $\square$

### 1-Dimensional Formal $\mathcal{O}$ -Modules over Fields of Finite Characteristic

**Def. (10.7.4.16).** Let  $(K, \mathcal{O}_K, \varpi, \kappa) \in p\text{-Field}$ ,  $A \in \mathcal{CRing}/\mathcal{O}_K$  and  $G$  a formal  $\mathcal{O}_K$ -module over  $A$ , then  $\quad \lrcorner$

**Prop. (10.7.4.17) [Heights of Homomorphisms].** Let  $E$  be a field over  $\kappa$ , then any homomorphism  $\varphi$  between formal  $\mathcal{O}$ -modules over  $E$  is of the form  $\varphi(x) = \psi(x^{p^k})$  where  $\psi^\lambda \neq 0$ .

Then from the fact  $\varphi$  commutes with  $\mathcal{O}$ -actions, we can deduce that  $\log_p \# \kappa | k$  ?. The number  $k / \log_p \# \kappa$  is called the **height of  $\varphi$** . The height of a formal  $\mathcal{O}$ -module is the height of the multiplication by  $\varpi$ .  $\quad \lrcorner$

**Prop. (10.7.4.18).**

- There exists  $\mathcal{O}$ -modules of arbitrary heights.
- Non-zero homomorphisms exists only between  $\mathcal{O}$ -modules of the same height.
- Any formal module of height  $h$  is isomorphic to  $G_a$  modulo  $q^h$ .  $\quad \lrcorner$

*Proof:* Cf. [Elliptic Modules, Drinfeld] P566. ?

2. This is because  $\text{ht}(g \circ f) = \text{ht}(g) + \text{ht}(f)$ .  $\quad \square$

**Prop. (10.7.4.19) [ $\mathcal{O}$ -Modules over Separably Closed Fields].** If  $E/\kappa$  is a field extension and  $E^s = E$ , then

- For  $h \in \mathbb{Z}_+$ , all  $\mathcal{O}$ -modules over  $E$  of height  $h$  are isomorphic.
- The ring of endomorphisms of such an  $\mathcal{O}$ -module is isomorphic to the maximal order of a central division algebra with invariant  $1/h$  over  $K$ .  $\quad \lrcorner$

*Proof:* Cf. [Elliptic Modules, Drinfeld] P566. ?  $\quad \square$

### 1-Dimensional Commutative Formal Groups over DVR

**Prop. (10.7.4.20).** Let  $(K, \mathfrak{m}_K, \kappa)$  be a CDVR with mixed characteristic  $(0, p)$ ,  $\mathcal{F}$  a formal group law over  $R$ . Then  $\mathcal{F}(\mathfrak{m})_{\text{tor}} = \mathcal{F}[p^\infty]$ , and if  $x \in \mathcal{F}(\mathfrak{m})$  has exact order  $p^n$ , then  $v(x) \leq \frac{v(p)}{p^n - p^{n-1}}$ .  $\quad \lrcorner$

*Proof:* If  $(m, p) = 1$ , then  $\mathcal{F}(\mathfrak{m})[m] = 0$  by (10.7.3.5).

By (10.7.3.20),  $[p](x) = pf(x) + g(x^p)$ , where  $f(0) = 1$ . Thus it is possible only if  $pv(x) \geq v(p^x)$ , which means  $v(x) \leq v(p)/(p-1)$ .

Now if this is true for  $n \geq 1$ , let  $x \in \mathcal{F}(\mathfrak{m})$  with order  $p^{n+1}$ , then  $v([p](x)) = v(pf(x) + g(x^p)) \geq \min(v(px), pv(x))$ . But  $[p](x)$  has order  $p^n$ , thus  $\frac{v(p)}{p^n - p^{n-1}} \geq \min(v(px), pv(x))$ . But  $n \geq 1$  and  $v(x) > 0$ , it is impossible that  $\frac{v(p)}{p^n - p^{n-1}} \geq v(px)$ , thus we have  $\frac{v(p)}{p^n - p^{n-1}} \geq pv(x)$ .  $\quad \square$

**Prop. (10.7.4.21).** Let  $(K, \mathcal{O}_K, \mathfrak{m}_K, \kappa)$  be a CDVR of mixed characteristic  $(0, p)$ ,  $\mathcal{F}$  a formal group law over  $K$ , then

- the formal logarithm (10.7.3.21) induces an homomorphism  $\log_{\mathcal{F}} : \mathcal{F}(\mathfrak{m}) \rightarrow K$ .
- For  $r > \frac{v(p)}{p-1}$ ,  $\log_{\mathcal{F}}$  is an isomorphism  $\log_{\mathcal{F}} : \mathcal{F}(\mathfrak{m}^r) \cong \mathfrak{m}^r$ .  $\quad \lrcorner$

*Proof:* This follows from determining the convergence of  $\log_{\mathcal{F}}$  and  $\exp_{\mathcal{F}}$  by (19.1.7.3), after which it is a homomorphism by (10.7.3.22).  $\quad \square$

**Cor. (10.7.4.22) [Group Structure of CDVRs].** Take  $F(X, Y) = (1 + X)(1 + Y) - 1$ , then  $\log_{\mathcal{F}}$  is given by  $\log(1 + x) = x - \frac{x^2}{2} + \frac{x^3}{3} - \dots$ , and it induces an isomorphism  $(1 + \mathfrak{m}^r)^{\times} \cong \mathfrak{m}^r$  for  $r > \frac{v(p)}{p-1}$ .  
 $\perp$

**Prop. (10.7.4.23) [ $\mathbb{Z}_p$ -Multiplication].** Let  $(R, \mathfrak{m})$  be a CDVR with residue field  $k$  of characteristic  $p$ ,  $F$  a formal group law over  $R$ , then for any  $x \in \mathcal{F}(\mathfrak{m})$ ,  $\lim_{n \rightarrow \infty} [p^n](x) \rightarrow 0$ .  
 In particular, we can define  $[\alpha](x)$  for any  $\alpha \in \mathbb{Z}_p$ .  $\perp$

*Proof:* By (10.7.3.20),  $v([p](x)) = v(pf(x) + g(x^p)) \geq \min(v(x) + v(p), pv(x))$ .  $\square$

## 5 Cartier-Theory

References are [Zin84].

## 6 Isogenies of Formal Groups

References are [Zin84].

**Def. (10.7.6.1) [Isogenies of Formal Groups].** A homomorphism  $\varphi : G_1 \rightarrow G_2$  of formal groups of the same dimension is called an **isogeny of formal groups** if the kernel of  $\varphi$  is representable.

If  $G_i = \mathrm{Spf} R_i$  and  $\mathfrak{a}_i$  is the augmentation ideal of  $G_i$ , then  $\varphi$  is an isogeny iff  $\mathfrak{a}_i$  is nilpotent in  $R_1/\varphi^*(\mathfrak{a}_2)R_1$ .  $\perp$

*Proof:* Cf. [Zin84]P87.  $\square$

**Def. (10.7.6.2) [Heights in Positive Characteristic].** For  $R = k \in \mathbf{Field}^p$  and  $\varphi : F \rightarrow G$  an isogeny of formal groups over  $k$ , then  $\# \ker(\varphi) = p^h$  for some  $h \in \mathbb{N}$  by [Zin84]P86, then  $\varphi$  is said to be of height  $h$ . In general, if  $R \in \mathbf{Field}^p$  and  $\varphi : F \rightarrow G$  is an isogeny of formal groups over  $R$ , then  $\varphi$  is said to have **height of isogeny**  $h$  if  $\varphi_{\kappa(\mathfrak{p})}$  is of height  $h$  for each  $\mathfrak{p} \in \mathrm{Spec}(R)$ .  $\perp$

**Prop. (10.7.6.3) [Composition of Isogenies].** If  $\varphi_1 : G_1 \rightarrow G_2, \varphi_2 : G_2 \rightarrow G_3$  are morphisms of formal groups of the same dimension, then  $\varphi_2 \circ \varphi_1$  is an isogeny iff  $\varphi_1, \varphi_2$  are both isogenies. And in this case we have

$$\mathrm{ht}(\varphi_1) + \mathrm{ht}(\varphi_2) = \mathrm{ht}(\varphi_2 \circ \varphi_1)$$

if two of the heights are defined (10.7.6.2).  $\perp$

*Proof:* Cf. [Zin84]P90.  $\square$

**Def. (10.7.6.4) [Heights of Isogenies between 1-Dimensional Formal Groups].** For  $R \in \mathbf{CRing}^p$  and  $\varphi : F \rightarrow G$  be a homomorphism of formal group laws over  $R$  of dimension 1, the **height of homomorphism**  $\mathrm{ht}(\varphi)$  is the largest integer  $h$  s.t.  $\varphi(T) = g(T^{p^h})$  for some  $h$ .

For a formal group law  $F$  over  $R$ , the **height of formal group law**  $\mathrm{ht}(F)$  is  $\mathrm{ht}([p]_F)$ . By (10.7.3.20), the height is always positive.  $\perp$

**Prop. (10.7.6.5).** Let  $R \in \mathbf{CRing}^p$  and  $f : F \rightarrow G$  be a homomorphism of formal group laws over  $R$  of dimension 1, then

- If  $f^\wedge(0) \neq 0$ , then  $\mathrm{ht}(f) > 0$ .
- If  $f = g(T^{p^h})$  with  $h = \mathrm{ht}(f)$ , then  $g'(0) \neq 0$ .

In particular, the first non-zero term of  $f(T)$  is  $T^{p^h}$ , where  $h$  is the height of  $f$ .  $\perp$

*Proof:* 1: Let  $\omega_F, \omega_G$  be the normalized invariant differential forms of  $F$  and  $G$ , then

$$0 = f'(0)\omega_F(T) = \omega_G(f(T)) = G_X(0, T)^{-1}f'(T)dT,$$

thus  $f'(T) = 0$ , which means  $\text{ht}(f) > 0$ .

2: Let  $q = p^h$  and  $F^{(q)}(T) = F(X^{1/q}, Y^{1/q})^q$ . Then it is easy to see  $F^{(q)}$  is another formal group law, and  $g$  is a homomorphism from  $F^{(q)}$  to  $F$ :

$$g(F^{(q)}(X^q, Y^q)) = g(F(X, Y)^q) = f(F(X, Y)) = F(f(X), f(Y)) = F(g(X^q), g(Y^q)).$$

Which means  $g(F^{(q)}(X, Y)) = F(g(X), g(Y))$ . Thus if  $g'(T) = 0$ , by item1,  $g(T) = g_1(T^p)$ , contradicting  $h = \text{ht}(f)$ .  $\square$

**Thm.(10.7.6.6) [Fiber Criterion of Isogenies].** Suppose  $R \in \mathcal{CRing}/\mathbb{Z}_{(p)}$  and  $\varphi : G_1 \rightarrow G_2$  is a morphism of formal groups of the same dimension over  $R$ . If  $\varphi_{\kappa(\mathfrak{p})}$  is an isogeny for each  $\mathfrak{p} \in \text{Spec}(R/(p))$ , then  $\text{ht}(\mathfrak{p}) \geq \text{ht}(\mathfrak{q})$  for each  $\mathfrak{q} \subset \mathfrak{p}$ . And if  $\text{ht}(\mathfrak{p})$  is independent of  $p$  and  $R$  has only f.m. minimal non-trivial prime ideals, then  $\varphi$  is an isogeny.  $\lrcorner$

*Proof:* Cf. [Zin84](#)P91 ?  $\square$

## 10.8 Algebraic Stacks

Basic references are [Knu71, L-MB00, Vis08, Ols16, Sta] and [Fibered Category to Algebraic Stacks, Lamb].

**Notation (10.8.0.1).**

- Let  $S \in \mathbf{Sch}$ .
- Use notations on sites, sheaves and stacks defined as in [Sites, Sheaves, Topoi and Stacks](#).
- A fibered category/stack over  $S$  means a fibered category/stack over  $\mathbf{Sch}_{\text{fppf}}/S$  (obsolete).

┘

### 1 Schemes as Functors

**Prop. (10.8.1.1) [Strong Yoneda Lemma].** For any  $S \in \mathbf{Sch}$ , the functor

$$\mathbf{Sch}/S \rightarrow \mathbf{Sh}_{\text{fppf}}/S \rightarrow \mathbf{Sh}^{\text{set}}(\mathbf{Aff}_{\text{fppf}}/S) \rightarrow \mathbf{PSh}^{\text{set}}(\mathbf{Aff}/S) : X \mapsto (\downarrow_X : \text{Spec } R \mapsto \text{Mor}_S(\text{Spec } R, X))$$

is a fully faithful embedding of the categories.

┘

*Proof:* (7.1.2.25) applied to  $\mathbf{Aff}_{\text{fppf}}/S \rightarrow \mathbf{Sch}_{\text{fppf}}/S$  implies the restriction map  $\mathbf{Sh}_{\text{fppf}}/S \rightarrow \mathbf{Sh}(\mathbf{Aff}_{\text{fppf}}/S)$  is an equivalence, thus the assertion follows from Yoneda's lemma and the fact  $\mathbf{Sh}^{\text{set}}(\mathbf{Aff}_{\text{fppf}}/S) \rightarrow \mathbf{PSh}^{\text{set}}(\mathbf{Aff}/S)$  is fully faithful.  $\square$

**Def. (10.8.1.2) [Closed Subfunctors].** For  $X \in \mathbf{PSh}^{\text{set}}(\mathbf{Aff}_S)$ , a subfunctor  $Z$  of  $\downarrow_X \in \mathbf{PSh}^{\text{set}}(\mathbf{Aff}_S)$  is called a **closed subfunctor** of  $X$  if for any  $T \in \mathbf{Aff}/S$  and  $f \in \text{Mor}(\downarrow_T, X)$ , the functor  $Z \otimes_{X, f} \downarrow_T$  is represented by a closed subscheme of  $T$ .

┘

**Prop. (10.8.1.3) [Closed Subfunctor of Schemes].** For  $X \in \mathbf{Sch}/S$ , a closed subfunctors of  $\downarrow_X$  (10.8.1.2) are exactly of the form  $\downarrow_Z$  for a closed subscheme  $Z \subset X$ .

┘

*Proof:* If  $Z$  is a closed subscheme of  $X$ , then for any  $f : h^A \rightarrow X$ ,  $f^{-1}(Z)$  is the pullback of  $Z$  along  $\text{Spec } A \rightarrow X$ , so it is a closed subscheme of  $\text{Spec } A$ . Conversely, if  $Z$  is a closed subfunctor of  $X$ , then for each affine open subset  $U$  of  $X$ ,  $Z \cap h_U$  is represented by a quotient of  $\mathcal{O}(U)$  by some ideal  $\mathcal{I}(U)$ . Because of the uniqueness,  $\mathcal{I}(U)$  and  $\mathcal{I}(U')$  coincides on the intersection  $U \cap U'$ , thus  $U \mapsto \mathcal{I}(U)$  defines a sheaf of ideals  $\mathcal{I}$  on  $X$ .

Now  $Z = h_{Z'}$ , where  $Z'$  is the closed subscheme of  $X$  defined by  $\mathcal{I}$ , because for any  $\text{Spec } R \rightarrow X$ , the pullback of  $Z$  and  $Z'$  to  $R$  are the same, because they are all closed subschemes of  $\text{Spec } R$  and they are equal on an open covering of  $\text{Spec } R$  (The pullback of the open coverings of  $X$ ). Now if  $\text{Spec } R \rightarrow X$  is represented by an element  $\alpha \in X(R)$ ,  $Z \times_X h^R(R)$  is the set  $\{\varphi \in \text{Hom}(R, R) \mid X(\varphi)(\alpha) \in Z(R)\}$ . So  $\text{id}_R \in Z \times_X h^R(R) \iff \alpha \in Z(R)$ . From this we see that  $Z(R) = Z'(R)$  for any  $R$ .  $\square$

**Def. (10.8.1.4) [Open Subfunctors].** Let  $Z$  be a subfunctor of  $X \in \mathbf{PSh}^{\text{set}}(\mathbf{Aff}/S)$ .  $Z$  is called an **open subfunctor** of  $X$  if for any  $T \in \mathbf{Aff}_S$ ,  $f \in \text{Mor}(\downarrow(T), X)$ , the functor  $U \otimes_X h_T$  is represented by an open subscheme of  $T$ .

┘

**Prop. (10.8.1.5) [Open Subfunctors of Schemes].** For  $X \in \mathbf{Sch}_S$ , the open subfunctors of  $\downarrow_X$  (10.8.1.4) are exactly of the form  $\downarrow_U$  for an open subscheme  $U \subset X$ .

┘

*Proof:* The proof is exactly the same as that of (10.8.1.3).  $\square$

**Def. (10.8.1.6) [Open Coverings by Functors].** An **open covering of a functor**  $X \in \mathcal{PSh}^{\text{Set}}(\text{Sch}_S)$  is a family of open subfunctors  $\{U_i\}$  that for any  $T \in \text{Aff}/S$ ,  $h_T \times_X U_i$  is an open covering of  $T$ .  $\lrcorner$

**Prop. (10.8.1.7) [Open Coverings of Schemes].** For  $X \in \text{Sch}_S$ , the open coverings of the functor  $\lrcorner_X$  are exactly open coverings of  $X$ .  $\lrcorner$

*Proof:* The proof is exactly the same as that of (10.8.1.3).  $\square$

**Prop. (10.8.1.8).** The pullback of a closed subfunctor is also a closed subfunctor. The intersection of closed subfunctors is a closed subfunctor.  $\lrcorner$

**Lemma (10.8.1.9).** Let  $k$  be a field and  $B \in \mathcal{CAlg}_k$ ,  $X \in \mathcal{PSh}^{\text{Set}}(\mathcal{CAlg}_B)$ , define

$$X_* \in \mathcal{PSh}^{\text{Set}}(\mathcal{CAlg}_k) : X_*(R) = X(R \otimes_k B).$$

Then if  $Z$  is a closed subfunctor of  $X$ ,  $Z_*$  is also a closed subfunctor of  $X_*$ .  $\lrcorner$

*Proof:* Let  $A$  be a  $k$ -algebra, and  $\alpha \in X_*(A)$ . To prove  $Z_*$  is closed in  $X_*$ , we need to show there exists an ideal  $\mathfrak{a} \subset A$  that for any homomorphism  $\varphi : A \rightarrow R$ ,

$$X_*(\varphi)(\alpha) \in Z_*(R) \iff \varphi(\mathfrak{a}) = 0.$$

Because  $Z$  is closed in  $X$ , there exists an ideal  $\mathfrak{b}$  of  $A \otimes_k B$  that for any  $\varphi : A \rightarrow R$ ,

$$X(\varphi \otimes B)(\alpha) \in Z_*(R) \iff (\varphi \otimes B)(\mathfrak{b}) = 0.$$

Now by (5.1.1.29), there is an ideal  $\mathfrak{a} \subset A$  that an ideal  $I$  of  $A$  satisfies  $\mathfrak{b} \subset I \otimes B \iff \mathfrak{a} \subset I$ , thus we are done.  $\square$

**Prop. (10.8.1.10).** Let  $S \in \text{Sch}$ ,  $X \in \mathcal{PSh}^{\text{Set}}(\text{Aff}/S)$  and  $Z$  a closed subfunctor of  $X$ . If  $Y \in \text{Sch}_R$ , then  $\text{Mor}(\lrcorner_Y, Z)$  is a closed subfunctor of  $\text{Mor}(\lrcorner_Y, X)$ .  $\lrcorner$

*Proof:* If  $Y = h^B$ , then  $\text{Mor}(Y, X)(R) = X(B \otimes R)$ , thus the conclusion follows from (10.8.1.9). For a general  $Y$ , let  $Y_i$  be an affine open covering of  $Y$ , then there are maps  $\rho_i : \text{Hom}(Y, X) \rightarrow \text{Hom}(Y_i, X)$ . Now  $\text{Hom}(Y_i, Z)$  is closed subfunctor of  $\text{Hom}(Y_i, X)$ , thus we are done if we can show that  $\text{Hom}(Y, Z) = \cap_i \rho_i^{-1}(\text{Hom}(Y_i, Z))$ . But this is equivalent to any map  $Y_R \rightarrow X_R$  that maps  $(Y_i)_R$  into  $Z_R$  maps  $Y_R$  into  $Z_R$ , which is clear.  $\square$

**Def. (10.8.1.11) [Fat Subfunctors].** Let  $S \in \text{Sch}$  and  $\mathcal{F} \in \text{Sh}^{\text{Set}}(\text{Aff}_{\text{fppf}}/S)$ , then a subfunctor  $D$  of  $\mathcal{F}$  is called a **fat subfunctor** if the shification of  $D$  w.r.t. the fppf topology is just  $\mathcal{F}$ .  $\lrcorner$

**Prop. (10.8.1.12) [Extending Group Structures].** Let  $S \in \text{Sch}$ ,  $\mathcal{F} \in \text{Sh}^{\text{grp}}(\text{Aff}_{\text{fppf}}/S)$  and  $D$  a fat subfunctor of  $\mathcal{F}$ , then every group structure on  $D$  extends uniquely to a group structure on  $\mathcal{F}$  by shification.  $\lrcorner$

## 2 Algebraic Spaces

**Def. (10.8.2.1) [Schematic Morphism].** A **schematic morphism** of fibered categories  $\mathcal{X} \rightarrow \mathcal{Y} \in \text{FibCat}^{\text{grp}}(\text{Sch}_{\text{fppf}}/S)$  over  $S$  is a representable morphism of fibered categories over  $\text{Sch}_{\text{fppf}}/S$  (4.2.3.34).  $\lrcorner$

**Prop. (10.8.2.2).** Suppose  $\mathcal{F} \rightarrow \mathcal{G} \in \mathcal{PSh}_{\text{fppf}}^{\text{Set}}/S$  be schematic (10.8.2.1) and  $\mathcal{G} \in \text{Sh}_{\text{fppf}}^{\text{Set}}/S$ , then  $\mathcal{F} \in \text{Sh}_{\text{fppf}}^{\text{Set}}/S$ .  $\lrcorner$

*Proof:* Cf.[Sta]02WD.  $\square$

**Prop. (10.8.2.3).** Suppose  $\mathcal{F} \rightarrow \mathcal{G} \in \mathcal{PSh}_{\text{fppf}}^{\text{Set}}/S$  is schematic(10.8.2.1), then  $\Delta_{\mathcal{F}/\mathcal{G}} : \mathcal{F} \rightarrow \mathcal{F} \times_{\mathcal{G}} \mathcal{F}$  is also schematic.  $\lrcorner$

*Proof:* Cf.[Sta]05L9.  $\square$

**Def. (10.8.2.4) [Properties of Schematic Morphisms].** For a property  $\mathcal{P}$  of maps of schemes that is fppf-local on the target and stable under base change, we say that  $\mathcal{P}$  holds for a schematic map(10.8.2.1)  $\mathcal{X} \rightarrow \mathcal{Y} \in \text{FibCat}(\text{Sch}_{\text{fppf}}/S)$  if  $\mathcal{P}$  holds for the map  $T \times_{\mathcal{Y}} \mathcal{X} \rightarrow T$  for any  $T \in \text{Sch}/S$ .

It is easy to show that this definition is compatible with that of schemes when  $\mathcal{X}, \mathcal{Y} \in \text{Sch}_{\text{fppf}}/S$ .  $\lrcorner$

**Prop. (10.8.2.5) [Descent for Properties].** Let  $f : \mathcal{X} \rightarrow \mathcal{Y} \in \mathcal{PSh}^{\text{Set}}(\text{Sch}_{\text{fppf}}/S)$  be a schematic morphism and  $g : \mathcal{Z} \rightarrow \mathcal{Y} \in \mathcal{PSh}^{\text{Set}}(\text{Sch}_{\text{fppf}}/S)$ . If  $g^{\#}$  is an epimorphism, then  $f$  has  $\mathcal{P}$  iff  $\mathcal{X} \times_{\mathcal{Y}} \mathcal{Z} \rightarrow \mathcal{Z}$  has  $\mathcal{P}$ .  $\lrcorner$

*Proof:* Cf.[Sta]03KD.  $\square$

**Prop. (10.8.2.6) [Properties of Diagonals].** For  $\mathcal{F} \in \mathcal{PSh}^{\text{Set}}(\text{Sch}_{\text{fppf}}/S)$ , the following are equivalent:

- $\Delta_{\mathcal{F}}$  is schematic(10.8.2.1).
- For any  $U \in \text{Sch}_{\text{fppf}}/S$  and  $a \in \mathcal{F}(U)$ , the map  $a : \mathcal{Y}_U \rightarrow \mathcal{F}$  is representable.
- For any  $U, V \in \text{Sch}_{\text{fppf}}/S$  and  $a \in \mathcal{F}(U), b \in \mathcal{F}(V)$ , the fiber product  $\mathcal{Y}_U \times_{a, \mathcal{F}, b} \mathcal{Y}_V$  is representable.

Moreover,  $\Delta_{\mathcal{F}}$  has a property  $\mathcal{P}$  iff for any  $U, V \in \text{Sch}_{\text{fppf}}/S$  and  $a \in \mathcal{F}(U), b \in \mathcal{F}(V)$ , the map  $\mathcal{Y}_U \times_{a, \mathcal{F}, b} \mathcal{Y}_V \rightarrow U \times V$  has property  $\mathcal{P}$ .  $\lrcorner$

*Proof:* Cf.[Sta]025W, 0CBT.  $\square$

**Prop. (10.8.2.7).** If a schematic morphism  $f : \mathcal{X} \rightarrow \mathcal{Y} \in \mathcal{PSh}^{\text{Set}}(\text{Sch}_{\text{fppf}}/S)$  is flat, loc.p. and surjective, then  $f$  is an epimorphism.  $\lrcorner$

*Proof:* Cf.[Sta]05VM.  $\square$

### Algebraic Spaces

**Def. (10.8.2.8) [Algebraic Space].** An **algebraic space** is a sheaf  $\mathcal{X} \in \text{Sh}_{\text{fppf}}^{\text{Set}}/S$  s.t.

- The diagonal map  $\Delta_{\mathcal{X}}$  is schematic(10.8.2.1),
- There exists some scheme  $U \in \text{Sch}/S$  with an étale surjective map  $\mathcal{Y}_U \rightarrow \mathcal{X}$  in  $\text{Sch}_{\text{fppf}}/S$ , called an **étale atlas for the algebraic space  $\mathcal{X}$** . (Notice  $\mathcal{Y}_U \rightarrow \mathcal{X}$  is schematic by(10.8.2.6)).

and

The category of algebraic spaces is the full subcategory of  $\text{Sh}_{\text{fppf}}^{\text{Set}}/S$ , denoted by  $\text{AlgSp}/S$ .  $\lrcorner$

**Prop. (10.8.2.9) [Schemes as Algebraic Spaces].**  $\mathcal{Y} : \text{Sch}/S \rightarrow \text{AlgSp}/S$ (10.8.2.8) is a fully faithful embedding.  $\lrcorner$

*Proof:* For  $X \in \text{Sch}/S$ ,  $h_X$  is a sheaf because fppf site is subcanonical by(7.1.4.35), its diagonal is representable, and the identity  $\text{id}_X : X \rightarrow X$  is surjective and étale.  $\square$

**Remark (10.8.2.10)[Kollar].** In general, the quotient of a scheme by a finite group action is an algebraic space that is not a scheme. Naively one can think of algebraic spaces as quotients of schemes by finite groups.  $\lrcorner$

**Def. (10.8.2.11) [Sites over Algebraic Spaces].** The Zariski/étale/smooth/fppf/... sites over an algebraic space is defined verbatim as that of over algebraic schemes.  $\lrcorner$

**Prop. (10.8.2.12) [Algebraic Spaces and Étale Equivalence Relations].** Cf. [Sta]02WW.  $\lrcorner$

*Proof:*  $\square$

**Prop. (10.8.2.13).** For  $\mathcal{X} \in \mathcal{A}lgSp/S$  (10.8.2.8), the diagonal map  $\Delta_{\mathcal{X}/S}$  is locally of finite type, locally quasi-finite, separated and is a monomorphism.  $\lrcorner$

*Proof:* Cf. [Sta]02X4.  $\square$

**Def. (10.8.2.14) [Underlying Space of Algebraic Spaces].** For  $\mathcal{X} \in \mathcal{A}lgSp/S$ , the underlying space  $|\mathcal{X}|$  is a topological space whose points are

$$\lim_{K \in \mathbf{Field}} \text{Mor}_{\mathbf{Sh}_{fppf}^{\text{set}}/S}(\text{Spec } K, \mathcal{X}),$$

and the topology is defined in [Sta]03BX<sup>?</sup>.

Then  $X \mapsto |X|$  induces a functor  $|-| : \mathcal{A}lgSp/S \rightarrow \mathcal{T}op/|S|$ .  $\lrcorner$

**Prop. (10.8.2.15).** Let  $\mathcal{X} \in \mathcal{A}lgSp/S$ ,  $T \in \mathcal{S}ch/S$ ,  $f : T \rightarrow \mathcal{X} \in \mathcal{A}lgSp/S$ , then  $f$  is surjective iff  $|f| : |T| \rightarrow |X|$  (10.8.2.14) is surjective.  $\lrcorner$

*Proof:*  $\square$

### 3 Properties of Algebraic Spaces

**Def. (10.8.3.1) [Properties of Algebraic Spaces].** Let  $X \in \mathcal{A}lgSp/S$ . For a property  $\mathcal{P}$  of schemes that is étale-local, the following are equivalent:

- There exists some  $U \in \mathcal{S}ch$  with a surjective étale morphism  $U \rightarrow \mathcal{X} \in \mathcal{A}lgSp/S$  (10.8.2.4) s.t.  $U$  has property  $\mathcal{P}$ .
- For any  $U \in \mathcal{S}ch$  with an étale morphism  $U \rightarrow \mathcal{X} \in \mathcal{A}lgSp/S$ ,  $U$  has property  $\mathcal{P}$ .

In which case, we say  $X$  has property  $\mathcal{P}$ . This is compatible with the definition in the scheme case when  $X \in \mathcal{S}ch/S$ .  $\lrcorner$

*Proof:*  $2 \rightarrow 1$  is clear. For  $1 \rightarrow 2$ : If  $U \in \mathcal{S}ch$  with a surjective étale morphism  $U \rightarrow \mathcal{X} \in \mathcal{A}lgSp/S$  s.t.  $U$  has property  $\mathcal{P}$ , and  $V \in \mathcal{S}ch$  with an étale morphism  $V \rightarrow \mathcal{X} \in \mathcal{A}lgSp/S$ , then  $U \times_X V \rightarrow U$  is étale, and  $U \times_X V \rightarrow V$  is an étale covering. Thus  $U \times_X V \rightarrow U$  has property  $\mathcal{P}$  because  $U$  does, and  $V$  has property  $\mathcal{P}$  because  $U \times_X V$  does.  $\square$

**Def. (10.8.3.2) [Dimensions of Algebraic Stacks].** For  $X \in \mathcal{A}lgSp/S$  and  $x \in |X|$ , define the local dimension

$$\dim_x(X) \triangleq \dim_u(U)$$

for any étale morphism  $f : U \rightarrow X$  with  $u \in U$  s.t.  $f(u) = x$ . Notice this is well-defined by (10.8.2.8) and (5.4.7.28). And we define

$$\dim(X) = \sup_{x \in |X|} \dim_x(X),$$

which is compatible with the definition in the scheme case when  $X \in \mathcal{S}ch/S$ , by (7.4.1.31).  $\lrcorner$

**Remark (10.8.3.3).** WARNING: unlike the case of schemes (7.4.1.31), for  $X \in \mathcal{A}lgSp/S$ , it may not be true that  $\dim(X) = \dim(|X|)$ , Cf. [Sta]02Z8.  $\lrcorner$

**Thm. (10.8.3.4) [Algebraic Spaces are Fpqc Shaves, Gabber].**  $\mathcal{A}lgSp/S \subset \mathcal{S}h^{\text{Set}}(\mathcal{A}ff_{\text{fpqc}}/S)$ .  $\lrcorner$

*Proof:* Cf. [Sta]0APL.  $\square$

## 4 Morphisms between Algebraic Spaces

**Remark (10.8.4.1).** We need to define properties for not necessarily schematic morphisms, and the definition should be compatible with (10.8.2.4).  $\lrcorner$

### Open Morphisms

**Def. (10.8.4.2) [Open Morphisms].** For a representable morphism  $f : X \rightarrow Y \in \mathcal{A}lgSp/S$  (4.2.3.34), the following are equivalent:

- $f$  is universally open (10.8.2.4).
- For any  $Z \rightarrow Y \in \mathcal{A}lgSp/S$ ,  $|Z \times_Y X| \rightarrow |Z|$  is open.

Thus we can define an **open morphism of algebraic spaces** to be a morphism  $f : X \rightarrow Y \in \mathcal{A}lgSp/S$  s.t.  $|f| : |X| \rightarrow |Y|$  is open. This is compatible with the definition in (10.8.2.4).  $\lrcorner$

*Proof:* Cf. [Sta]03Z1.  $\square$

## 5 Algebraic Spaces over Fields

## 6 Algebraic Stacks

References are [Sta].

**Def. (10.8.6.1) [Representable by Algebraic Spaces].** A morphism  $f : \mathcal{X} \rightarrow \mathcal{Y} \in \mathcal{F}ibCat^{\text{grpd}}_{\text{fppf}}/S$  is called **representable by algebraic spaces** if for any  $T \in \mathcal{S}ch_{\text{fppf}}/S$  and a morphism  $(\mathcal{S}ch_{\text{fppf}}/U) \rightarrow \mathcal{Y}$ , the fibered category  $(\mathcal{S}ch_{\text{fppf}}/T) \times_{\mathcal{Y}} \mathcal{X}$  is equivalent to an algebraic space over  $T$  (10.8.2.8). (Notice it is a fibered category by (4.2.3.13) and (4.2.3.14))  $\lrcorner$

**Def. (10.8.6.2) [Properties of Morphisms Representable by Algebraic Spaces].** For a property  $\mathcal{P}$  of maps of schemes that is fppf-local and stable under base change, we say that  $\mathcal{P}$  holds for a morphism  $f : \mathcal{X} \rightarrow \mathcal{Y} \in \mathcal{F}ibCat^{\text{grpd}}(\mathcal{S}ch_{\text{fppf}}/S)$  representable by algebraic spaces (10.8.6.1) iff for any  $U \in \mathcal{S}ch_{\text{fppf}}/S$ ,  $\mathcal{P}$  holds for the map of algebraic spaces  $U \times_{\mathcal{Y}} \mathcal{X} \rightarrow U \in \mathcal{A}lgSp/S$  (in the sense of Morphisms between Algebraic Spaces).  $\lrcorner$

**Prop. (10.8.6.3) [Properties Under Equivalences].** Having properties are stable under equivalences. Cf. [Sta]0459.  $\textcolor{red}{?}$   $\lrcorner$

**Def. (10.8.6.4) [2-Category of Algebraic Stacks].** An **algebraic stack** over  $S$  is a stack fibered in groupoids  $\mathcal{X} \in \mathcal{S}ta^{\text{grpd}}_{\text{fppf}}/S$  s.t. the diagonal is representable by an algebraic space (10.8.6.1), and there exists some scheme  $U \in \mathcal{S}ch/S$  with a smooth surjective map  $\mathcal{S}ch_{\text{fppf}}/U \rightarrow \mathcal{X}$  in  $\mathcal{S}ta_{\text{fppf}}/S$ , called an **atlas for the algebraic stack**  $\mathcal{X}$ .

It is called a **Deligne-Mumford stack** if moreover there exists some  $U \in \mathcal{S}ch_{\text{fppf}}/S$  with a smooth étale map  $\mathcal{S}ch_{\text{fppf}}/U \rightarrow \mathcal{X}$  in  $\mathcal{S}ta_{\text{fppf}}/S$ .

The 2-category of algebraic (resp. Deligne-Mumford) stacks is the full sub-2-category of  $\mathcal{S}ta_{\text{fppf}}/S$ , denoted by  $\mathcal{A}lgSta/S$  (resp.  $\mathcal{A}lgSta^{\text{DM}}/S$ ).  $\lrcorner$

**Prop. (10.8.6.5).** If  $X, Y \in \mathcal{C}at(\mathcal{S}ch/S)$  are equivalent, then  $\mathcal{X} \in \mathcal{A}lg\mathcal{S}p/S$  (resp.  $\mathcal{A}lg\mathcal{S}ta^{DM}/S$ ) iff so is  $\mathcal{Y}$ . ┘

*Proof:* By (7.1.3.8),  $\mathcal{Y}$  is also a stack in groupoid. And  $\Delta_Y$  is equivalent to  $\Delta_X$ , and notice that having property  $\mathcal{P}$  is stable under equivalences (10.8.6.3). □

**Prop. (10.8.6.6) [2-Fibered Products of Algebraic Stacks].** The 2-category  $\mathcal{A}lg\mathcal{S}p/S$  has 2-fibered products. ┘

*Proof:* Cf. [Sta]04TF. □

**Prop. (10.8.6.7) [Algebraic Stacks and Étale Groupoid Object].** There is a bijection of étale groupoid objects on a scheme with the category of algebraic stacks. ┘

*Proof:* Cf. [Lamb, P39]. □

**Prop. (10.8.6.8) [Algebraic Spaces and Étale Equivalence Relations].** There is a bijection of étale equivalence relations on a scheme with the category of algebraic spaces. ┘

*Proof:* This is a corollary of (10.8.6.7). □

## 10.9 Moduli Problems

### 1 Moduli problems

*“...the theory of moduli spaces has the wonderful feature of having many doors, many techniques by which this theory can be developed. ...This is another part of its charm. ...one fact stands out: the story is not finished.”*

– D. Mumford

. . . the theory of moduli spaces has the wonderful feature of having many doors, many techniques by which this theory can be developed. ...This is another part of its charm. . . . one fact stands out: the story is not finished. —David Mumford

References are [Sta] and [Stacks and Moduli, Alper].

### Moduli Fields

**Def. (10.9.1.1) [Fields of Moduli].** For  $k \in \mathbf{Field}$ ,  $k = \bar{k}$  and  $X \in \mathbf{Var}/\bar{k}$ , the **moduli field** of  $X$  is the fixed field of  $\{\sigma \in \mathrm{Gal}(\bar{k}/k) \mid X^\sigma \cong X\}$ .  $\lrcorner$

**Prop. (10.9.1.2) [Hammer-Herrlich [H-H03]].** If  $k \in \mathbf{Field}$ ,  $k = \bar{k}$  and  $C \in \mathbf{SmProjVar}^1/k$ , then  $C$  is defined on a finite extension of the moduli field  $M$ . Sometimes,  $X$  cannot be defined on the moduli field.

In fact, this works nearly for any kind of smooth projective varieties with a coarse moduli space.

$\lrcorner$

*Proof:* Cf. [H-H03].

There exists a f.g.  $M$ -algebra  $A \subset k$  s.t.  $C$  has model  $\mathcal{C}$  over  $A$ . By localizing  $A$ , we may assume that  $\mathcal{C}/A$  is smooth and projective. Let  $G$  be the subgroup of  $\mathrm{Aut}(C)$  consisting of  $\sigma$  s.t.  $C^\sigma \cong C$ . Consider  $\mathrm{Spec}(A \otimes_M k)$ , then there is a natural  $k$ -point  $p$ , and for any  $\sigma \in G$ , the fiber of  $\mathcal{C}$  over  $\sigma(p)$  is  $C^\sigma$  which is isomorphic to  $C$ .

Then we prove that  $\{\sigma(p)\}_{\sigma \in G}$  is dense in  $\mathrm{Spec}(A \otimes_M k)$ ? After this, we see that the family  $\mathcal{C}$  corresponds to a map from  $\mathrm{Spec}(A \otimes_M k)$  to the moduli space of smooth genus  $g$  curves that is constant on a dense subset, thus constant. But  $\mathrm{Spec}(A \otimes_M k)$  contains  $\bar{M}$  points, so  $C$  is defined over  $\bar{M}$ .  $\square$

**Prop. (10.9.1.3).** For  $k \in \mathbf{Field}^0$ ,  $k = \bar{k}$  and  $C \in \mathbf{SmProjVar}^1/k$ ,

- If  $C$  has genus  $\leq 1$ , then  $C$  is defined over the moduli field of  $C$ .
- $C/\mathrm{Aut}(C)$  is defined over the moduli field of  $C$ .

$\lrcorner$

*Proof:* 1: If  $g(C) = 0$ , then  $C \cong \mathbb{P}^1$ , which is defined over  $\mathbb{Q}$ . If  $g(C) = 1$ , then the moduli field and the field of definition are both  $\mathbb{Q}(j(C))$ .

2: Cf. [Koc04].?  $\square$

### Representability

**Prop. (10.9.1.4) [A Representability Criterion].** Let  $\mathcal{F} \in \mathbf{Sh}^{\mathrm{Set}}(\mathbf{Sch}_{\mathrm{Zar}})$  and there is a covering  $F = \cup F_i$  by open subfunctors (10.8.1.4)(10.8.1.6) that are representable by schemes, then  $F$  is representable by a scheme.  $\lrcorner$

*Proof:* Let  $(X_i, \xi_i)$  represents  $F_i$ , where  $\xi \in F_i(X_i)$ . Because  $F_j \subset F$  is representable by open immersion, there are open subsets  $U_{ij} \subset X_i$  that  $T \rightarrow X_i$  factors through  $U_{ij}$  iff  $\xi|_T \in F_j(T)$ . In particular,  $\xi_i|_{U_{ij}} \in F_j(U_{ij})$ , and therefore there is a canonical map  $\varphi_{ij} : U_{ij} \rightarrow X_j$  that  $\varphi_{ij}^* \xi_j = \xi_i|_{U_{ij}}$ . By definition of  $U_{ji}$  this map factors through  $U_{ji}$ .

For the rest, Cf. [Sta]01JJ. ?

□

**Cor. (10.9.1.5) [Representing Group Functors].** Let  $S \in \text{Sch}$  and  $\mathcal{G} \in \text{Sh}^{\text{grp}}(\text{Aff}_{\text{Zar}}/S)$  and there is an open subfunctor  $\mathcal{F} \subset \mathcal{G}$  s.t. for any  $\text{Spec } K \in \text{Aff}_S$  where  $K$  is a field and  $g \in \mathcal{G}(K)$ , there exists a  $g' \in \mathcal{F}(K)$  s.t.  $gg' \in \mathcal{F}(K)$ , then  $\mathcal{G}$  is representable.  $\lrcorner$

*Proof:* For any  $g \in \mathcal{G}(S)$ , let  $F_g = \tau_g^* F$ , then  $F_g \cong F$  and are also open subfunctors of  $\mathcal{G}$ . then  $\{F_g \rightarrow G\}$  is an open covering because for any  $T \in \text{Sch}$  and  $\xi \in \text{Mor}(h_T, \mathcal{G})$ ,  $F_g \times_{\mathcal{G}} h_T$  is represented by open subschemes of  $T$ , and it must covers  $T$  because otherwise there are some map  $\text{Spec } k(x) \rightarrow T$  s.t.  $F_g \times_{\mathcal{G}} h_{k(x)}$  are all empty, contradicting the hypothesis. Thus the assertion follows from (10.9.1.4).  $\square$

**Prop. (10.9.1.6) [Hom( $\mathcal{E}, \mathcal{F}$ ) for Coherent Sheaves].** Let  $S$  be a locally Noetherian scheme and  $X$  a projective scheme over  $S$ . Let  $\mathcal{E}, \mathcal{F}$  be coherent sheaves on  $X$  and  $\mathcal{F}$  is flat, then the functor

$$\underline{\text{Hom}}(\mathcal{E}, \mathcal{F}) : \text{Sch}_S \rightarrow \text{Set} : T \mapsto \text{Hom}_T(\mathcal{E}_T, \mathcal{F}_T)$$

is representable by a vector bundle  $\mathbf{V}$  over  $S$  (7.5.2.21).  $\lrcorner$

*Proof:* Cf. [Kle05]P16.  $\square$

**Cor. (10.9.1.7).** For any  $f \in \text{Hom}(\mathcal{E}, \mathcal{F})$ ,  $f$  corresponds to a morphism  $X \rightarrow \mathbf{V}$ , then the inverse image of  $\mathbf{V}_0 \subset \mathbf{V}$  in  $X$  is the closed subscheme  $X'$  with the universal property that for any  $\varphi : T \rightarrow X$ ,  $\varphi^* f = 0$  iff  $\varphi$  factors through  $X'$ .  $\lrcorner$

### Coarse Moduli Schemes

**Def. (10.9.1.8) [Coarse Moduli Schemes].** For  $k \in \text{Field}$  and  $\mathcal{F} : \text{Sch}/k \rightarrow \text{Set}$ , a **coarse moduli scheme** for  $\mathcal{F}$  is a scheme  $Z \in \text{Sch}/k$  with a morphism  $\varphi : \mathcal{F} \rightarrow \mathcal{Y}_Z$  satisfying the following universal property: for any  $T \in \text{Sch}/k$ ,

$$\text{Hom}(\mathcal{F}, \mathcal{Y}_T) = \text{Hom}(Z, T).$$

And  $Z$  is called a **fine moduli scheme** for  $\mathcal{F}$  if  $\varphi$  is an isomorphism.  $\lrcorner$

## 2 Hilbert & Quot Schemes

References are [Nit05].

For simplicity, we restrict to the category of locally Noetherian schemes over  $S$ , and assume  $X/S$  is separated.

**Def. (10.9.2.1) [Hilbert Functors].** For  $X \in \text{NSch}/S$ , the **Hilbert functor** is the functor

$$\underline{\text{Hilb}}_{X/S} : \text{Sch}_S \rightarrow \text{Set} : T \mapsto \{\text{closed subschemes of } X_T \text{ that is flat over } T\}.$$

□

**Def. (10.9.2.2) [Quot Functors].** Let  $S \in \text{NSch}$ ,  $f : X \rightarrow S \in \text{Sch}^{\text{ft}}/S$  and  $\mathcal{E} \in \text{Coh}(X)$ , then for any  $T \in \text{Sch}_S$ , define a **family of quotients of  $\mathcal{E}$  parametrized by  $T$**  to be a pair  $(\mathcal{F}, q)$  where

- $\mathcal{F} \in \text{Coh}(X_T)$  s.t.  $\text{Supp}(\mathcal{F})$  is proper over  $T$ .
- $q : \mathcal{E}_T \rightarrow \mathcal{F}$  is a surjective homomorphism of sheaves.

Then the **Quot functor** is the functor

$$\underline{\text{Quot}}_{\mathcal{E}/X/S} : \text{Sch}_S \rightarrow \text{Set} : T \mapsto \{\text{isomorphism classes of family of quotients of } \mathcal{E} \text{ parametrized by } T\}.$$

┘

**Cor. (10.9.2.3) [Hilbert Functors as Quot Functors].**  $\underline{\text{Hilb}}_{X/S} = \underline{\text{Quot}}_{\mathcal{O}_X/X/S}$ .

┘

**Prop. (10.9.2.4) [ $\underline{\text{Quot}}_{\mathcal{F}/X/S}$  are Fpqc Sheaves].**  $\underline{\text{Quot}}_{\mathcal{F}/X/S}$  is a fpqc sheaf over  $\text{Sch}$ .

┘

*Proof:* This follows from the fact  $\mathcal{QCoh}/\text{Sch}$  is a fpqc sheaf (7.1.5.12). □

**Prop. (10.9.2.5) [Stratification by Hilbert Polynomials].** Let  $\mathcal{L} \in \text{Pic}(X_T)$ , then for any  $t \in T$ , the Hilbert polynomial of  $\mathcal{F}_t$  w.r.t. the line bundle  $\mathcal{L}_t$  on  $X_t$  is locally constant on  $T$ ?, and is stable under extension of residue fields, thus we can define  $\underline{\text{Quot}}_{\mathcal{E}/X/S}^{\Phi, \mathcal{L}}$  to represent the subfunctor of  $\underline{\text{Quot}}_{\mathcal{E}/X/S}$  consisting of pairs  $(\mathcal{F}, q)$  s.t.  $\mathcal{F}_t$  has Hilbert polynomial  $\Phi$  w.r.t.  $\mathcal{L}_t$  for all  $t \in T$ .

Thus if each  $\underline{\text{Quot}}_{\mathcal{E}/X/S}^{\Phi, \mathcal{L}}$  is representable,  $\underline{\text{Quot}}_{\mathcal{E}/X/S}$  is also representable, and there is a decomposition

$$\underline{\text{Quot}}_{\mathcal{E}/X/S} = \coprod_{\Phi \in \mathbb{Q}[\lambda]} \underline{\text{Quot}}_{\mathcal{E}/X/S}^{\Phi, \mathcal{L}}.$$

┘

**Prop. (10.9.2.6) [Valuation Criterion].** Let  $X \rightarrow S$  be proper, then the morphism of functors  $\underline{\text{Quot}}_{\mathcal{E}/X/S}^{\Phi, \mathcal{L}} \rightarrow h_S$  satisfies the discrete valuation criterion for properness.

┘

*Proof:* The valuation criterion says if  $R$  is a valuation ring with fraction field  $K$  with a morphism  $\text{Spec } R \rightarrow S$ , then any pairs  $(\mathcal{F}_K, q_K)$  where  $\mathcal{F}_K \in \text{Coh}(X_K)$  and  $q_K : \mathcal{E}_K \rightarrow \mathcal{F}_K$  a surjection can extend uniquely to a surjective map  $q_R : \mathcal{E}_R \rightarrow \mathcal{F}_R \in \text{Coh}(X_R)$  s.t.  $\mathcal{F}_R$  is flat over  $R$ .

For this, let  $j : X_K \rightarrow X_R$  be the open immersion, take  $\mathcal{F}_R$  to be the image of the map  $\mathcal{E}_R \rightarrow i_* \mathcal{E}_K \xrightarrow{i_* q_K} i_* \mathcal{F}_K$ , then  $i^* \mathcal{F}_R = \mathcal{F}_K$ , and  $\mathcal{F}_R$  is flat over  $R$  because it is torsion-free (5.4.1.12). Notice the properness of  $X/S$  is used to show that  $\text{Supp}(\mathcal{F}) \subset X_R$  is proper over  $R$ . □

**Lemma (10.9.2.7) [Preliminary Reductions].** Situation as in (10.9.2.2), then

- Let  $\nu \in \mathbb{Z}$ , then tensoring  $\mathcal{L}^\nu$  gives an isomorphism of functors  $\underline{\text{Quot}}_{\mathcal{E}/X/S}^{\Phi, \mathcal{L}} \cong \underline{\text{Quot}}_{\mathcal{E}(\nu)/X/S}^{\Psi, \mathcal{L}}$ , where  $\Psi(\lambda) = \Phi(\lambda + \nu)$ .
- Let  $\varphi : \mathcal{E} \rightarrow \mathcal{G}$  be a surjective homomorphism in  $\text{Coh}(X)$ , then the corresponding natural transformation  $\underline{\text{Quot}}_{\mathcal{G}/X/S}^{\Phi, \mathcal{L}} \rightarrow \underline{\text{Quot}}_{\mathcal{E}/X/S}^{\Phi, \mathcal{L}}$  is a closed subfunctor.
- If  $X/S$  is proper, let  $i : U \rightarrow X$  be an open subscheme, then  $\underline{\text{Quot}}_{i_* \mathcal{E}/U/S}^{\Phi, \mathcal{L}}$  is an open subfunctor of  $\underline{\text{Quot}}_{\mathcal{E}/X/S}^{\Phi, \mathcal{L}}$ .

┘

*Proof:* 1 is obvious.

2: It suffices to show for any locally Noetherian scheme  $T \in \text{Sch}_S$  and a pair  $(\mathcal{F}, q) \in \underline{\text{Quot}}_{\mathcal{E}/X/S}^{\Phi, \mathcal{L}}(T)$ , there exists a closed subscheme  $T'$  of  $T$  s.t. for any locally Noetherian scheme  $U$  and  $f : U \rightarrow T$ ,  $q_U : \mathcal{E}_U \rightarrow \mathcal{F}_U$  factors through  $\mathcal{G}_U$  iff  $f$  factors through  $T'$ . For this, just take  $T'$  to be the vanishing scheme of  $\ker(\varphi_T) \rightarrow \mathcal{E}_T \rightarrow \mathcal{F}_T$  (10.9.1.7) (or by direct verification).

3: Firstly the natural transformation  $\underline{\text{Quot}}_{i^*\mathcal{E}/U/S}^{\Phi, \mathcal{L}} \rightarrow \underline{\text{Quot}}_{\mathcal{E}/X/S}^{\Phi, \mathcal{L}}$  is given by

$$\eta_T : (\mathcal{F}, i^*\mathcal{E}_T \rightarrow \mathcal{F}) \mapsto (\text{Im}(\mathcal{E}_T \rightarrow i_*\mathcal{F}), \text{adjunction}).$$

Notice restriction is a left inverse to this transformation. Then by inspection, this is an open subfunctor iff for any locally Noetherian scheme  $T \in \text{Sch}_S$  and a pair  $(\mathcal{F}, q) \in \underline{\text{Quot}}_{\mathcal{E}/X/S}^{\Phi, \mathcal{L}}(T)$ , for any locally Noetherian scheme  $Q$  and  $f : Q \rightarrow T$ , the restriction of  $(\mathcal{F}, q)$  to  $Q$  is in  $\underline{\text{Quot}}_{i^*\mathcal{E}/U/S}^{\Phi, \mathcal{L}}(Q)$  iff  $\mathcal{F}_Q \rightarrow i_{Q*}i_Q^*\mathcal{F}_Q$  is injective. ?  $\square$

**Thm. (10.9.2.8) [Grothendieck].** Let  $S \in \text{NSch}_{\text{qc}}$  and  $f : X \rightarrow S$  a (quasi-/strongly)projective morphism,  $\mathcal{L}$  an  $f$ -ample line bundle on  $X$ , then for any  $\mathcal{E} \in \text{Coh}(X)$  and  $\Phi \in \mathbb{Q}[\lambda]$ , the functor  $\underline{\text{Quot}}_{\mathcal{E}/X/S}^{\Phi, \mathcal{L}}$  (10.9.2.5) is representable by a (quasi-/strongly)projective  $S$ -scheme.  $\square$

*Proof:* Cf. [Nit05]P24.

For the quasi-projective case, use (10.9.2.7) and the fact any coherent sheaf can be extended.  $\square$

**Remark (10.9.2.9).** Cf. [Hartshorne Appendix B, 3.4.1] has an example of a  $X \in \text{SmPrpr}^3/\mathbb{C}$  with a free  $G = \mathbb{Z}/(2)$ -action for which the quotient  $X/G$  is not a scheme. Which means that  $\underline{\text{Hilb}}_{X/\mathbb{C}}$  is not representable by a scheme.  $\square$

**Cor. (10.9.2.10).** Let  $S$  be a locally Noetherian scheme and  $f : X \rightarrow S$  be  $H$ -projective,  $\mathcal{L} = \mathcal{O}_{\mathbb{P}_S(V)}(1)|_X$ ,  $\mathcal{E}$  a coherent quotient sheaf of  $\mathcal{O}_X^{\oplus p}(\nu)$  where  $p > 0, \nu \in \mathbb{Z}$ , and  $\Phi \in \mathbb{Q}[\lambda]$ , then the functor  $\underline{\text{Quot}}_{\mathcal{E}/X/S}^{\Phi, \mathcal{L}}$  is representable by an  $H$ -projective  $S$ -scheme.  $\square$

**Lemma (10.9.2.11) [Altman-Kleinman].** Let  $S \in \text{NSch}$  and  $f : X \rightarrow S$  be a closed subscheme of some  $\mathbb{P}_S(V)$  where  $V$  is a finite locally free sheaf on  $S$ ,  $\mathcal{L} = \mathcal{O}_{\mathbb{P}_S(V)}(1)|_X$ ,  $\mathcal{E}$  a coherent quotient sheaf of  $f^*(W)(\nu)$  where  $W$  is a finite locally free sheaf on  $S$  and  $\nu \in \mathbb{Z}$ , and  $\Phi \in \mathbb{Q}[\lambda]$ , then the functor  $\underline{\text{Quot}}_{\mathcal{E}/X/S}^{\Phi, \mathcal{L}}$  is representable by a projective  $S$ -scheme that can be embedded in  $\mathbb{P}_S(F)$  for some finite locally free sheaf  $F$  on  $S$  that is an exterior power of  $W$  with a symmetric power of  $V$ .  $\square$

*Proof:* Cf. [Nit05]P24.  $\square$

**Lemma (10.9.2.12).** Let  $S \in \text{NSch}$  and  $f : X = \mathbb{P}_S(V) \rightarrow S$  where  $V$  is a finite locally free sheaf on  $S$ ,  $\mathcal{L} = \mathcal{O}_{\mathbb{P}_S(V)}(1)$ ,  $\mathcal{E} = f^*(W)(\nu)$  where  $W$  is a finite locally free sheaf on  $S$  and  $\nu \in \mathbb{Z}$ , and  $\Phi \in \mathbb{Q}[\lambda]$ , then the functor  $\underline{\text{Quot}}_{\mathcal{E}/X/S}^{\Phi, \mathcal{L}}$  is representable by a projective  $S$ -scheme that can be embedded in  $\mathbb{P}_S(F)$  for some finite locally free sheaf  $F$  on  $S$  that is an exterior power of  $W$  with a symmetric power of  $V$ .  $\square$

*Proof:* Cf. [Nit05]P24.  $\square$

### Examples of Quot Schemes

**Prop. (10.9.2.13) [Projective Spaces].**  $\underline{\text{Quot}}_{\mathcal{O}_{\mathbb{P}^n}^{\oplus(n+1)}/\mathbb{Z}/\mathbb{Z}}^{1, \mathcal{O}_{\mathbb{P}^n}} \cong \mathbb{P}_{\mathbb{Z}}^n$ , with the universal element the tautological quotient  $\mathcal{O}_{\mathbb{P}^n}^{\oplus(n+1)} \rightarrow \mathcal{O}_{\mathbb{P}^n}(1)$ .

Moreover, if  $\mathcal{E} \in \text{Coh}^{\text{free}}(S)$ , then  $\underline{\text{Quot}}_{\mathcal{E}/S/S}^{1, \mathcal{O}_S} \cong \mathbb{P}(\mathcal{E})$ , with the universal element the tautological quotient  $\pi^*(\mathcal{E}) \rightarrow \mathcal{O}_{\mathbb{P}(\mathcal{E})}(1)$ .  $\square$

*Proof:* For any surjective map  $\mathcal{E}_T \rightarrow \mathcal{L}$  where  $\mathcal{L}$  is a line bundle, locally  $H^0(\mathcal{L}) \cong H^0(\mathcal{E}_T)$  is of dimension  $n$  and thus  $\mathcal{L}$  is basepoint-free. Now the associated map  $\varphi_{\mathcal{L}} : T \rightarrow \mathbb{P}(\mathcal{E})$  ? pulls  $\mathcal{O}_{\mathbb{P}(\mathcal{E})}(1)$  to  $\mathcal{L}$ .  $\square$

**Def. (10.9.2.14) [Relative Grassmannians].** Let  $\mathcal{E} \in \text{Coh}(S)$ , define the **relative Grassmannian of**  $\mathcal{E}$  to be  $\text{Gr}_S(\mathcal{E}, k) = \underline{\text{Quot}}_{\mathcal{E}/S/S}^{k, \mathcal{O}_S}$ .

Then if  $\mathcal{E}$  is finite locally free, it is a quotient of the group scheme  $\text{GL}(n)_S$ , and when  $\mathcal{E} \cong \mathcal{O}_S^n$  and  $S = \mathbb{Z}$ , this is just the Grassmannian variety  $\text{Gr}(n, k)$  defined in (10.2.1.25).

In particular,  $\text{Gr}(n+1, 1) \cong \mathbb{P}_{\mathbb{Z}}^n$  by (10.9.2.13).  $\lrcorner$

*Proof:* First we prove for  $\mathcal{E}$  finite locally free: There is a natural action of  $\text{GL}(n)$  on  $\underline{\text{Quot}}_{\mathcal{E}/S/S}^{k, \mathcal{O}_S}$ , it is clearly a quotient map, and the kernel is a closed subgroup of  $\text{GL}(n)_S$  by (10.3.1.4). Thus  $\text{Gr}(\mathcal{E}, k)$  is a quotient of  $\text{GL}(n)$  by definition (10.1.1.19).

In general,  $\mathcal{E}$  is a locally a quotient of a finite locally free sheaf, thus  $\text{Gr}(\mathcal{E}, k)$  is locally projective by (10.9.2.7).  $\square$

**Prop. (10.9.2.15) [Quotient by Flat Projective Equivalence Relations].**  $\lrcorner$

*Proof:* Cf. [Nit05]P31.  $\square$

**Prop. (10.9.2.16) [Grassmannian Varieties are projective].** The Grassmannian variety  $\text{Gr}(\mathcal{E}, k)$  is locally projective, and when  $\mathcal{E}$  is locally free, it is projective, and if  $\mathcal{E}$  is trivial, it is  $H$ -projective.  $\lrcorner$

*Proof:* It injects into  $\mathbb{P}(\wedge^k \mathcal{E})$  by the natural transformation

$$T_S : (\mathcal{O}_T^n \rightarrow \mathcal{Q}) \mapsto (\wedge^k (\mathcal{O}_T^n) \rightarrow \wedge^k \mathcal{Q}).$$

In particular, the corresponding very ample line bundle is just  $\wedge^k \mathcal{F}$ , where  $f^* \mathcal{E} \rightarrow \mathcal{F}$  is the universal element and  $f : \text{Gr}(\mathcal{E}, k) \rightarrow S$ , by (10.9.2.13).  $\square$

**Cor. (10.9.2.17) [Grassmannian Varieties and Projective Space].** There is a canonical isomorphism  $G(n, n-1) \cong \mathbb{P}^{n-1}$  identifying sections with surjections from  $\mathcal{O}_X^n$ .  $\lrcorner$

**Prop. (10.9.2.18) [Flag Varieties].** The flag variety (10.2.1.27) represents the functor  $T \mapsto \{ \text{ the isomorphism classes of flags in } \mathcal{O}_T^n \text{ of the given dimensions} \}$ .  $\lrcorner$

**Cor. (10.9.2.19) [Flag Varieties are Projective].** The flag varieties are projective as they are closed subsets of a product of Grassmannian varieties.  $\lrcorner$

### 3 Picard Schemes

References are [Kle05].

**Notation (10.9.3.1).**

- For simplicity, we assume  $S \in \text{NSch}$  and restrict to  $\text{NSch}^{\text{sep}}/S$ .
- Recall a morphism  $X \in \text{NSch}/S$  is said to have integral geometric fibers if for any alg.closed field  $k$  and a morphism  $\text{Spec } k \rightarrow S$ ,  $X_k$  is integral.

$\lrcorner$

#### Picard Functors

**Def. (10.9.3.2) [Picard Functors].** Let  $X \in \text{Sch}/S$ , the **Picard-functor** is the functor

$$\underline{\text{Pic}}_X : \text{Sch}_S \rightarrow \text{Grp} : T \mapsto \text{Pic}(X_T) = H^1(X_T, \mathcal{O}_{X_T}^*).$$

The problem of this functor is that it is not a Zariski presheaf.

Define the **relative Picard functor**  $\widetilde{\text{Pic}}_{X/S} : \text{Sch}_S \rightarrow \text{Grp} : T \mapsto \text{Pic}(X_T)/\text{pr}_T^*(\text{Pic}(T))$ . Let the shification of this ring in the Zariski/étale/fppf topology denoted by  $\underline{\text{Pic}}_{X/S, \text{Zar}}$ ,  $\underline{\text{Pic}}_{X/S, \text{ét}}$ ,  $\underline{\text{Pic}}_{X/S}$ . Then there are maps of presheaves:

$$\underline{\text{Pic}}_X \rightarrow \widetilde{\text{Pic}}_{X/S} \rightarrow \underline{\text{Pic}}_{X/S, \text{Zar}} \rightarrow \underline{\text{Pic}}_{X/S, \text{ét}} \rightarrow \underline{\text{Pic}}_{X/S}.$$

┘

**Remark (10.9.3.3).** In the following we will frequently use a technical condition s.t.  $\mathcal{O}_S \rightarrow f_*(\mathcal{O}_X)$  is an isomorphism. This is true when  $X$  is a proper variety over  $S$ , by (7.12.5.2). ┘

**Prop. (10.9.3.4).** Assume  $\mathcal{O}_S \cong f_*\mathcal{O}_X$ , then the functor  $\mathcal{N} \rightarrow f^*\mathcal{N}$  is fully faithful from the category of finite locally free sheaves on  $S$  to the category of finite locally free sheaves on  $S$  s.t.  $f_*$  is a left partial inverse. ┘

*Proof:* For any finite locally free sheaf  $\mathcal{N}$ , there is an isomorphism  $\mathcal{N} \cong f_*f^*\mathcal{N}$  by checking locally, and for any other finite locally free sheaf  $\mathcal{N}'$ ,  $\text{Hom}(\mathcal{N}, \mathcal{N}')$  is also finite locally free, thus the natural map  $f^*\text{Hom}(\mathcal{N}, \mathcal{N}') \rightarrow \text{Hom}(f^*\mathcal{N}, f^*\mathcal{N}')$  is an isomorphism by checking locally. Thus  $\text{Hom}(\mathcal{N}, \mathcal{N}') \cong \text{Hom}(f^*\mathcal{N}, f^*\mathcal{N}')$ .  $\square$

**Def. (10.9.3.5) [Rigidification].** Assume  $f : X \rightarrow S \in \text{NSch}$  has a section  $g : S \rightarrow X$ , then for any  $T \in \text{Sch}/S$  and  $\mathcal{L} \in \text{Pic}(X_T)$ , a  **$g$ -rigidification of  $\mathcal{L}$**  is an isomorphism  $u : \mathcal{O}_T \cong g_T^*\mathcal{L}$ . ┘

**Prop. (10.9.3.6).** Let  $f : X \rightarrow S$  be a morphism of schemes with a section  $g$ , then for any  $T \in \text{Sch}/S$ , the group of isomorphism classes of pairs  $(\mathcal{L}, u)$  where  $\mathcal{L} \in \text{Pic}(X_T)$  and  $u$  is a  $g$ -rigidification of  $\mathcal{L}$ , is isomorphism to  $\underline{\text{Pic}}_{X/S}(T)$ . ┘

*Proof:* For any  $\mathcal{M} \in \text{Pic}(X_T)$ , let  $\mathcal{L} = \mathcal{M} \otimes (f_T^*g_T^*\mathcal{M})^{-1}$ , then  $\mathcal{L} = \mathcal{M} \in \text{Pic}(X_T)/\text{pr}_T^*\text{Pic}(T)$ , and there is a canonical isomorphism  $g_T^*\mathcal{L} \cong \mathcal{O}_T$ .

Conversely, if  $u : \mathcal{O}_T \cong g_T^*\mathcal{L}$  and there exists some  $\mathcal{N} \in \text{Pic}(T)$  s.t.  $v : \mathcal{L} \cong f_T^*\mathcal{N}$ , let  $w = g_T^* \circ u : \mathcal{O}_T \cong g_T^*\mathcal{L} \cong \mathcal{N}$ , then there are isomorphism of pairs:  $v : (\mathcal{L}, u) \cong (f_T^*\mathcal{N}, w)$ ,  $f_T^*w : (\mathcal{O}_{X_T}, \text{can}) \cong (f_T^*\mathcal{N}, w \circ \text{can})$ , thus  $(\mathcal{L}, u) = e$ .  $\square$

**Prop. (10.9.3.7) [No Automorphisms after Rigidification].** Let  $f : X \rightarrow S \in \text{NSch}$ . If for any  $T \in \text{Sch}/S$ ,  $f_T : X_T \rightarrow T$  satisfies  $\mathcal{O}_T \cong (f_T)_*\mathcal{O}_{X_T}$ , and  $f$  has a section  $g$ , then for any  $(\mathcal{L}, u)$  where  $u$  is a  $g$ -rigidification of  $\mathcal{L}$ ,  $\text{Aut}(\mathcal{L}, u)$  is trivial. ┘

*Proof:* For such an automorphism  $v : \mathcal{L} \rightarrow \mathcal{L}$ ,  $g_T^*(v) = \text{id}$ . Also notice  $\text{Hom}(\mathcal{L}, \mathcal{L}) = H^0(\text{Hom}(\mathcal{L}, \mathcal{L})) = H^0(\mathcal{O}_{X_T}) \cong H^0(\mathcal{O}_T)$ , thus  $v$  is tensoring a line bundle  $\mathcal{L}$  from  $\mathcal{O}_T$ . Thus  $g^*v$  is multiplying  $\mathcal{L}$ . So  $\mathcal{L} \cong \mathcal{O}_T$  and  $v$  is trivial.  $\square$

**Prop. (10.9.3.8) [Comparison Theorems].** Let  $f : X \rightarrow S \in \text{NSch}$ . If for any  $T \in \text{Sch}_S$ ,  $f_T : X_T \rightarrow T$  satisfies  $\mathcal{O}_T \cong (f_T)_*\mathcal{O}_{X_T}$ , then

- The morphisms  $\underline{\text{Pic}}_{X/S} \hookrightarrow \underline{\text{Pic}}_{X/S, \text{Zar}} \hookrightarrow \underline{\text{Pic}}_{X/S, \text{ét}} \hookrightarrow \underline{\text{Pic}}_{X/S}$  are injections. In particular,  $\underline{\text{Pic}}_{X/S}$  is separated in the fppf topology.
- If  $f$  has a section, then  $\widetilde{\text{Pic}}_{X/S} \cong \underline{\text{Pic}}_{X/S, \text{Zar}} \cong \underline{\text{Pic}}_{X/S, \text{ét}} \cong \underline{\text{Pic}}_{X/S}$ .
- If  $f$  has a section Zariski locally, then  $\underline{\text{Pic}}_{X/S, \text{Zar}} \cong \underline{\text{Pic}}_{X/S, \text{ét}} \cong \underline{\text{Pic}}_{X/S}$ .
- if  $f$  has a section étale locally, then  $\underline{\text{Pic}}_{X/S, \text{ét}} \cong \underline{\text{Pic}}_{X/S}$ .

┘

*Proof:* 1: It suffices to show that  $\widetilde{\text{Pic}}_{X/S} \rightarrow \text{Pic}_{X/S}$  are injective. For this, notice first  $\text{Pic}_{X/S}$  is also the fppf-sheaf associated to  $\text{Pic}_X$ , as any line bundle on  $T$  is Zariski-locally trivial. Then if  $\mathcal{L} \in \text{Pic}(X_T)$  is fppf-locally trivial, then for some fppf covering  $\pi : T' \rightarrow T$ ,  $(f_{T'})_* \pi_X^* \mathcal{L} \cong \mathcal{O}_{T'}$  by hypothesis. And this equals  $\pi^*(f_T)_* \mathcal{L}$  by flat base change. So  $(f_T)_* \mathcal{L}$  is an invertible sheaf (by hypothesis used on  $f_T$ ) and  $(f_T)_*(f_T)^* \mathcal{L} \cong \mathcal{L}$  because it is true after f.f. base change to  $T'$  (flat base change used).

2: By item 1, it suffices to show  $\widetilde{\text{Pic}}_{X/S}$  satisfies the fppf-descent, but this follows from the facts that  $\text{Pic}_{X/S}$  is a rigid fibered category (7.1.3.6),  $\mathcal{QCoh}/\text{Sch}$  is a stack (7.1.5.12) and  $\text{Pic}$  satisfy the fpqc descent (7.5.3.1).

3, 4 follow from 2 by base change. □

**Prop. (10.9.3.9) [Comparison of Points].** Let  $\text{Spec } A \in \text{Sch}/S$  where  $A$  is a local ring, then

- the natural maps  $\text{Pic}_X(A) \rightarrow \text{Pic}_{X/S}(A) \rightarrow \text{Pic}_{X/S, \text{Zar}}(A)$  are isomorphisms.
- If  $A$  is Artin local with alg. closed residue field, then  $\text{Pic}_X(A) \cong \text{Pic}_{X/S, \text{ét}}(A)$ .
- If  $A = k \in \mathbf{Field}$  and  $k = \bar{k}$ , then  $\text{Pic}_X(k) \cong \text{Pic}_{X/S}(k)$

┘

*Proof:* 1: Since  $A$  is local,  $\text{Pic}(\text{Spec } A) = 0$ , and it has a unique minimal point, thus 1 is clear.

2: Every étale  $A$ -algebra of f.t. is a direct product of copies of  $A^?$ , thus it is clear any fppf local scheme is a scheme.

3: In this case, any fppf covering of  $\text{Spec } k$  has a section, thus this follows from (10.9.3.8). □

**Prop. (10.9.3.10).** If  $X/S$  is proper of f.p., then an element in  $\text{Pic}_{X/S}(S)$  is trivial iff it is trivial Zariski-locally on  $S$ . ┘

*Proof:* Cf. [Neron Model, P202]. □

### Relative Effective Divisors

**Prop. (10.9.3.11) [Divisor Functor].** The divisor functor  $\text{Div}_{X/S} : \text{Sch}/S \rightarrow \text{Grp}$  is given by  $T \mapsto \{\text{relative effective divisors on } X_T/T\}$ . This is truly a functor by (7.8.1.14). ┘

**Thm. (10.9.3.12) [ $\text{Div}_{X/S}$  is Representable].** If  $S$  is a locally Noetherian scheme and  $X \rightarrow S$  is projective and flat, then  $\text{Div}_{X/S}$  (10.9.3.11) is representable by an open subscheme of the Hilbert scheme  $\text{Hilb}_{X/S}$ . ┘

*Proof:* Let  $H = \text{Hilb}_{X/S}$  and  $W \subset X \times H$  the universal closed subscheme. Then  $\text{pr}_H$  is projective and flat. Let  $V$  be the open loci of points of  $W$  s.t.  $W$  is an effective divisor,  $U = H \setminus q(W \setminus V)$ , then  $U$  is open in  $H$  and  $q^{-1}U$  is an effective divisor on  $X \times U/U$ . By definition of Hilbert scheme, for any effective divisor  $D$  on some  $X_T/T$  is the pullback of  $W$  via  $g$ . Now we show for any  $t \in D$ ,  $g(t) \in U$ . This follows from (7.8.1.12) and f.f. descent of regularness (7.1.5.28). Thus  $g$  factors through  $U$ , as  $U$  is open. □

**Def. (10.9.3.13) [Relative Abel Map].** The relative Abel map is the functor

$$A_{X/S}(T) : \mapsto \text{Div}_{X/S}(T) \rightarrow \widetilde{\text{Pic}}_{X/S}(T) : D \mapsto \mathcal{L}_{X_T}(D).$$

┘

**Def. (10.9.3.14) [Linear System Functor].** Let  $X \in \text{Sch}_S$  and  $\mathcal{L} \in \text{Pic}(X)$ , the **linear system functor**  $\underline{\text{LinSys}}_{\mathcal{L}/X/S} : \text{Sch}_S \rightarrow \text{Set}$  is defined to be the inverse image of  $\mathcal{L} \in \widetilde{\text{Pic}}_{X/S}$  in  $\underline{\text{Div}}_{X/S}$  via the Abel map(10.9.3.13).  $\lrcorner$

**Thm. (10.9.3.15) [ $\underline{\text{LinSys}}_{\mathcal{L}/X/S}$  is Representable].** Let  $X$  be a proper variety over  $S$  and  $\mathcal{L} \in \text{Pic}(X)$ , then  $\underline{\text{LinSys}}_{\mathcal{L}/X/S}$  is represented by some projective space  $\mathbb{P}(\mathcal{Q})$  over  $S$ .  $\lrcorner$

*Proof:* Cf. [Kle05]P25. ?  $\square$

**Prop. (10.9.3.16).** Assume  $X/S$  is proper and  $\mathcal{F} \in \text{Coh}(X)$ , then there exists a unique  $\mathcal{Q} \in \text{Coh}(S)$  with functorial isomorphism

$$q : \text{Hom}(\mathcal{Q}, \mathcal{N}) \cong f_*(\mathcal{F} \otimes f^*\mathcal{N})$$

for any  $\mathcal{N} \in \mathcal{QCoh}(S)$ .

And the formation of  $\mathcal{Q}$  commutes with base change.  $\lrcorner$

*Proof:* Cf. [Kle05]P24. ?  $\square$

**Prop. (10.9.3.17).** Situation as in(10.9.3.16), if  $S$  is a local ring with closed point  $s$ , the following are equivalent:

- The  $\mathcal{O}_S$ -module  $\mathcal{Q}$  is locally free.
- For all  $\mathcal{N} \in \mathcal{QCoh}(\mathcal{O}_S)$ , the functor  $\mathcal{N} \mapsto f_*(\mathcal{F} \otimes f^*\mathcal{N})$  is right exact.
- For all  $\mathcal{N} \in \mathcal{QCoh}(\mathcal{O}_S)$ , the natural map  $f_*(\mathcal{F}) \otimes \mathcal{N} \rightarrow f_*(\mathcal{F} \otimes f^*\mathcal{N})$  is an isomorphism.
- The natural map  $H^0(X, \mathcal{F}) \otimes k(s) \rightarrow H^0(X_s, \mathcal{F}_s)$  is a surjection.

$\lrcorner$

*Proof:* Cf. [Kle05]P24. ?  $\square$

**Prop. (10.9.3.18) [ $\underline{\text{Div}}_{X/S}$  and  $\underline{\text{LinSys}}_{\mathcal{P}/X_{\underline{\text{Pic}}_{X/S}/\underline{\text{Pic}}_{X/S}}$ ].** If  $X$  is a proper variety over  $S$  and  $\widetilde{\text{Pic}}_{X/S}$  is representable with the universal sheaf  $\mathcal{P}$ , then  $\underline{\text{Div}}_{X/S}$  with the relative Abel map(10.9.3.13) is isomorphic to  $\underline{\text{LinSys}}_{\mathcal{P}/X_{\underline{\text{Pic}}_{X/S}/\underline{\text{Pic}}_{X/S}}$  and also  $\mathbb{P}(\mathcal{Q})$  over  $\underline{\text{Pic}}_{X/S}$ , where  $\mathcal{Q}$  is the coherent sheaf associated to  $\mathcal{P}$ (10.9.3.16).  $\lrcorner$

*Proof:* It follows from definitions(10.9.3.14)(10.9.3.11) and(10.9.3.13) and the definition of a universal sheaf. The last assertion follows from(10.9.3.15).  $\square$

**Prop. (10.9.3.19) [ $\underline{\text{Div}}_{X/S}$  is Proper over  $\underline{\text{Pic}}_{X/S}$ ].** Let  $X/S$  be locally projective flat with integral geometric fibers, then

- $A_{X/S} : \underline{\text{Div}}_{X/S} \rightarrow \underline{\text{Pic}}_{X/S}(T)$  is proper.
- If  $\widetilde{\text{Pic}}_{X/T} \cong \text{Pic}_{X/T}$ , then  $A_{X/S} : \underline{\text{Div}}_{X/S} \rightarrow \underline{\text{Pic}}_{X/S}(T)$  is projective.

$\lrcorner$

*Proof:* If  $\widetilde{\text{Pic}}_{X/T} \cong \text{Pic}_{X/T}$ , then by(10.9.3.18), it is projective. For general case, notice proper satisfies fpqc descent, so we can base change to  $X \times_S X \rightarrow X$ , then it has a section, i.e. the diagonal section. Thus by(10.9.3.8),  $\widetilde{\text{Pic}}_{X/T} \cong \text{Pic}_{X/T}$  and  $A_{X \times_S X/X}$  is projective, thus  $A_{X/S}$  is proper.  $\square$

### Picard Schemes

**Def. (10.9.3.20) [Picard Scheme].** For the 5 different presheaves on  $\text{Sch}_S$  in (10.9.3.2), if one of them is representable, then all the sheaves after it are all isomorphic to it and representable, because fpqc sites are subcanonical. So it will make no confusion to call the representing scheme the **Picard scheme**.  $\lrcorner$

**Prop. (10.9.3.21).** If  $\underline{\text{Pic}}_{X/S}$  is representable, then it is locally of f.t. over  $S$ .  $\lrcorner$

*Proof:* Because  $S$  is locally Noetherian, by (7.8.4.2), it suffices to show that for any directed inverse system  $(T_i, f_{ii'}) \in \text{Aff}_S$ ,

$$\varinjlim_I \underline{\text{Pic}}_{X/S}(T_i) \cong \underline{\text{Pic}}_{X/S}(\varinjlim_I T_i).$$

For the rest, Cf. [Kle05]P33.  $\color{red}?$   $\square$

**Prop. (10.9.3.22) [Points of  $\underline{\text{Pic}}_{X/S}$ ].** If  $\underline{\text{Pic}}_{X/S}$  exists, then schematic points of  $\underline{\text{Pic}}_{X/S}$  corresponds to line bundles on the geometric fibers of  $X/S$ .  $\lrcorner$

*Proof:* This follows from the definition of schematic points and (10.9.3.9) item 3.  $\square$

**Thm. (10.9.3.23) [Grothendieck].** Let  $f : X \rightarrow S$  be locally projective, flat with integral geometric fibers, then

- $\underline{\text{Pic}}_{X/S, \text{ét}}$  is representable by a scheme separated and locally of f.p. over  $S$ .
- If moreover  $S$  is Noetherian and  $X/S$  is projective, then  $\underline{\text{Pic}}_{X/S, \text{ét}}$  is a disjoint union of open subschemes, each an increasing union of open quasi-projective  $S$ -schemes.

Moreover, by (10.9.3.8), if  $f$  has a section  $e$ , then there is a **Poincaré-class**  $p_{X/S} \in \text{Pic}(X \times \underline{\text{Pic}}_{X/S, \text{ét}})$  with a rigidification along  $e$ .  $\lrcorner$

*Proof:* Cf. [Kle05]P27.  $\color{red}?$   $\square$

**Cor. (10.9.3.24).** If  $S$  is Noetherian and  $X/S$  is projective flat with integral geometric fibers, then any qc locally closed subscheme of  $\underline{\text{Pic}}_{X/S}$  is quasi-projective.  $\lrcorner$

**Prop. (10.9.3.25) [Tangent Space of  $\underline{\text{Pic}}_{X/k}$ ].** Let  $k \in \text{Field}$  and  $X \in \text{Sch}/k$ . Assume  $\underline{\text{Pic}}_{X/k}$  is representable by a scheme and equals  $\underline{\text{Pic}}_{X/k, \text{ét}}$ , then  $T_e(\underline{\text{Pic}}_{X/k}) \cong H^1(X, \mathcal{O}_X)$ .  $\lrcorner$

*Proof:* By (10.2.2.2), the tangent space equals  $\ker(\underline{\text{Pic}}_{X/k}(k[\varepsilon]) \rightarrow \underline{\text{Pic}}_{X/k}(k))$ .

Take the first order thickening  $X_k \subset X_{k[\varepsilon]} = X_\varepsilon$ , there is an exact sequence  $0 \rightarrow \mathcal{O}_X \rightarrow \mathcal{O}_{X_\varepsilon}^* \rightarrow \mathcal{O}_X^* \rightarrow 1$ , where  $\mathcal{O}_X \rightarrow \mathcal{O}_{X_\varepsilon}^* : a \mapsto 1 + a\varepsilon$ . And it is split. Thus we have a split exact sequence

$$0 \rightarrow H^1(\mathcal{O}_X) \rightarrow H^1(\mathcal{O}_{X_\varepsilon}^*) \rightarrow H^1(\mathcal{O}_X^*) \rightarrow 0.$$

Now  $\underline{\text{Pic}}_{X/S, \text{ét}}$  is also the shification of  $\widetilde{\underline{\text{Pic}}}_{X/k} : T \mapsto H^1(X_T, \mathcal{O}_{X_T}^*)$ , thus there is a natural map

$$H^1(\mathcal{O}_X) \rightarrow \ker(\underline{\text{Pic}}_{X/k}(k[\varepsilon]) \rightarrow \underline{\text{Pic}}_{X/k}(k)) = T_e(\underline{\text{Pic}}_{X/k}).$$

And it can be shown that this is a  $k$ -homomorphism.

To show this map is an isomorphism, by flat base change we can assume  $k$  is alg.closed. Then by (10.9.3.9), the maps  $H^1(\mathcal{O}_X^*) \rightarrow \underline{\text{Pic}}_{X/k}(k)$  and  $H^1(\mathcal{O}_{X_\varepsilon}^*) \rightarrow \underline{\text{Pic}}_{X/k}(k[\varepsilon])$  are isomorphisms, thus  $H^1(\mathcal{O}_X) \rightarrow T_e(\underline{\text{Pic}}_{X/k})$  is also an isomorphism by five lemma.  $\square$

**Thm. (10.9.3.26)[Grothendieck].** Assume  $X$  is proper over  $S$  integral, then there exists a non-empty open subscheme  $V \subset S$  s.t.  $\underline{\text{Pic}}_{X_V/V}$  is representable, and is a disjoint union of quasi-projective subschemes.  $\lrcorner$

*Proof:* Cf.[Kle05]P34.  $\square$

**Cor. (10.9.3.27)[Murre-Oort/Artin].** Let  $X$  be a proper scheme over a field  $k$ , then  $\underline{\text{Pic}}_{X/k}$  is representable by a disjoint union of quasi-projective subschemes.  $\lrcorner$

**Prop. (10.9.3.28).** Let  $X \rightarrow Y$  be a surjective morphism of proper schemes over a field  $k$ , then the dual map  $\underline{\text{Pic}}_{Y/k} \rightarrow \underline{\text{Pic}}_{X/k}$  is affine.  $\lrcorner$

*Proof:*  $\square$

**Prop. (10.9.3.29).** If  $X/S$  is projective and flat with integral geometric fibers, then any connected component of  $\underline{\text{Pic}}_{X/S}$  is clopen of f.t..  $\lrcorner$

*Proof:* By(10.9.3.23),  $\underline{\text{Pic}}_{X/S}$  is locally Noetherian, so each connected components are clopen(7.4.1.23), and they are of f.t. as  $\underline{\text{Pic}}_{X/S}^\Phi$  are(10.9.3.41).  $\square$

**Prop. (10.9.3.30) [Projectiveness of Subschemes].** Let  $S$  be Noetherian and  $X \rightarrow S$  be smooth projective with irreducible geometric fibers, then every quasi-compact closed subscheme of  $\underline{\text{Pic}}_{X/S}$  over  $S$  is projective.  $\lrcorner$

*Proof:* By(10.9.3.24), it suffices to show it is universally closed. As  $X \rightarrow S$  is both proper and flat, it suffices to show for  $X \rightarrow S$  f.f.. Then we can base change via the f.f. covering  $X \rightarrow S$ , thus we can assume it has a section, so  $\widetilde{\underline{\text{Pic}}}_{X/S} \cong \underline{\text{Pic}}_{X/S}$ . Then we use valuation criterion: for any valuation ring  $A$  with fraction field  $K$ , it suffices to extend a line bundle on  $X_K$  to a line bundle on  $X_A$ , because  $Z$  is closed and  $A$  is reduced. By replacing  $\mathcal{L}$  with  $\mathcal{L}(n)$ , we can assume  $\mathcal{L}$  has a global section, which implies  $\mathcal{L}$  is an effective Cartier divisor  $D$ , as  $X_K$  is integral. Notice  $A$  is regular and  $X_T/T$  is smooth, so  $X_T$  is regular?? and thus locally factorial. Then the closure of  $D$  in  $X_T$  is also a divisor?.  $\square$

**Cor. (10.9.3.31).** If  $k \in \text{Field}$  and  $X \in \text{SmProj}/k$ , then all connected components of  $\underline{\text{Pic}}_{X/k}$  are proper.  $\lrcorner$

*Proof:* This follows from(10.9.3.30) and(10.1.4.18).  $\square$

**Prop. (10.9.3.32)[Product Varieties].** If  $k \in \text{Field}$  and  $X, Y$  are two complete varieties over  $k$  with rational points, then  $\underline{\text{Pic}}_{X \times Y/k} \cong \underline{\text{Pic}}_{X/k} \times \underline{\text{Pic}}_{Y/k}$ , with  $p_{X \times Y} = \text{pr}_1^* p_X \otimes \text{pr}_2^* p_Y$ .  $\lrcorner$

*Proof:* This follows from see-saw principal(7.12.1.22), the theorem of the cube(7.12.1.23) and(10.9.3.6).  $\square$

$\underline{\text{Pic}}_{X/S}^0$

**Def. (10.9.3.33)[ $\underline{\text{Pic}}_{X/S}^0$ ].** If  $\underline{\text{Pic}}_{X/S}$  exists, then its identity component is a subgroup scheme(10.1.4.12), denoted by  $\underline{\text{Pic}}_{X/S}^0$ .  $\lrcorner$

**Prop. (10.9.3.34)[Projectiveness of  $\underline{\text{Pic}}_{X/k}^0$ ].** Let  $X$  be a projective variety over a field  $k$ , then  $\underline{\text{Pic}}_{X/k}^0$  is representable(10.9.3.23) and is quasi-projective. And it is projective if  $X/k$  is geo.normal.  $\lrcorner$

*Proof:* Cf. [Kle05]P37. ?

□

**Cor. (10.9.3.35) [Subfamily and Morphisms Relations].** The Poincaré class  $p_X$  in  $\text{Pic}(X \times \underline{\text{Pic}}^0(X))$  is the unique line bundle that satisfies  $p_b = b$  for a point  $b \in \underline{\text{Pic}}^0(X)$ , and  $p_0$  is trivial.

For a subfamily  $c$  of  $\text{Pic}^0(X)$  parametrized by an scheme  $T$  over  $k$ , there is a morphism

$$T \rightarrow \underline{\text{Pic}}^0(X) : t \mapsto c_t \in \underline{\text{Pic}}^0(X)(\kappa(t))$$

over  $k$ .

┘

*Proof:* A point  $b \in \underline{\text{Pic}}^0(X)$  is a morphism  $k(b) \rightarrow \underline{\text{Pic}}^0(X)$ , and the restriction of  $p$  to  $b$  is just  $b$ , by (10.9.3.23).

The second assertion follows from the first, because this subfamily corresponds to a morphism  $T \rightarrow \underline{\text{Pic}}^0(X)$ , and the restriction of  $p$  at the image of  $t$  in  $\underline{\text{Pic}}^0(X)$  is just the subfamily restricted at  $t$ , which is  $c_t$ . □

**Prop. (10.9.3.36) [ $\underline{\text{Pic}}_{X/k, \text{red}}^0$  is an Abelian Variety].** If  $k \in \text{Field}$  and  $X \in \text{SmProjVar}/k$ , then  $\underline{\text{Pic}}_{X/k, \text{red}}^0$  is an Abelian variety. ┘

*Proof:*  $\underline{\text{Pic}}_{X/S, \text{red}}^0$  is also a smooth proper connected algebraic group by (10.9.3.31)(10.9.3.29), thus it is an Abelian variety. □

**Prop. (10.9.3.37) [Dual Picard-Maps].** By functoriality, if  $X/S, X'/S$  are connected schemes with sections s.t.  $\underline{\text{Pic}}_{X/S}$  and  $\underline{\text{Pic}}_{X'/S}$  are representable, then the pullback along  $\varphi$  induces a dual homomorphism of group schemes:

$$\varphi^\vee : \underline{\text{Pic}}_{X'/S, \text{red}}^0 \rightarrow \underline{\text{Pic}}_{X/S, \text{red}}^0.$$

In other words, it is the unique morphism  $\underline{\text{Pic}}_{X'/S, \text{red}}^0 \rightarrow \underline{\text{Pic}}_{X/S, \text{red}}^0$  s.t.

$$(\varphi \times \text{id}_{\underline{\text{Pic}}_{X'/S, \text{red}}^0})^* p_{X'/S} = (\text{id}_X \times \varphi^\vee)^* p_{X/S}.$$

┘

**Prop. (10.9.3.38) [Double Picard-Map].** Let  $X/S$  be a connected scheme s.t.  $\widetilde{\underline{\text{Pic}}}_{X/S, \text{red}}$  is representable with a Poincaré class  $p_X \in \text{Pic}(X \times \underline{\text{Pic}}_{X/S, \text{red}}^0)$ , and  $(\underline{\text{Pic}}_{X/S, \text{red}}^0)^\vee$  is representable, then  $p_X$  satisfies  $(p_X)_0 = 0$ , thus inducing a **double Picard-map**  $\kappa_X : X \rightarrow (\underline{\text{Pic}}_{X/S, \text{red}}^0)^\vee$ . ┘

**Def. (10.9.3.39) [Néron-Severi Group Scheme].** Let  $X$  be a complete  $k$ -variety, the **Néron-Severi group**  $\text{NS}(X_{\bar{k}})$  of  $X_{\bar{k}}$  is defined to be

$$\text{NS}(X_{\bar{k}}) = \text{Pic}(X_{\bar{k}}) / \underline{\text{Pic}}^0(X_{\bar{k}}) = \pi_0(\underline{\text{Pic}}_{\bar{X}/\bar{k}})(\bar{k}) \text{ (9.1.11.4) (9.3.1.2),}$$

which in fact equals  $\pi_0(\underline{\text{Pic}}_{X_{k^s}/k^s})(k^s) = \text{Pic}(X_{k^s}) / \underline{\text{Pic}}^0(X_{k^s}) = \text{NS}(X_{k^s})$ .

Also denote

$$N^1(X_{\bar{k}}) = \text{Pic}(X_{\bar{k}}) / \text{Pic}^\tau(X_{\bar{k}}) = \text{NS}(X_{\bar{k}}) / \text{NS}(X_{\bar{k}})_{\text{tor}} \text{ (9.1.11.25) } = N^1(X_{k^s}).$$

┘

**Prop. (10.9.3.40) [Theorem of the Base].**  $\text{NS}(X_{\bar{k}})$  is f.g. In particular,  $N^1(X_{\bar{k}})$  is a finite free  $\mathbb{Z}$ -module, and its rank  $\rho(X)$  is called the **Picard number** of  $X$ . ┘

*Proof:* Cf. [Kleiman, Toward a numerical theory of ampleness, P334].  $\square$

**Prop. (10.9.3.41)** [ $\underline{\text{Pic}}_{X/S}^\Phi$ ]. If  $X/S$  is locally projective, flat with integral geometric fibers,  $\Phi \in \mathbb{Q}[\lambda]$ , let  $\underline{\text{Pic}}_{X/S}^\Phi$  denote the subfunctor of  $\underline{\text{Pic}}_{X/S}$  representing invertible sheaves  $\mathcal{L}$  with  $\chi(\mathcal{L}(n)) = \Phi(n)$ , then  $\underline{\text{Pic}}_{X/S}^\Phi$  are clopen subschemes of  $\underline{\text{Pic}}_{X/S}$  of f.t. and form a disjoint cover of it, and forming it commutes with base change. Moreover, if  $X/S$  is projective and  $S$  is Noetherian, then each  $\underline{\text{Pic}}_{X/S}^\Phi$  is quasi-projective over  $S$ .  $\sqsubset$

*Proof:* Cf. [Kle05]P60. ?

The first assertion follows from the fact Euler character is locally constant so  $\underline{\text{Pic}}_{X/S}^\Phi$  form a clopen disjoint covering of  $\underline{\text{Pic}}_{X/S}$  and use (10.8.1.5) and (10.8.1.7).  $\square$

**Prop. (10.9.3.42)** [Quasi-Coherence and Boundedness]. If  $\underline{\text{Pic}}_{X/S}$  is representable and  $\Lambda \subset \underline{\text{Pic}}_{X/S}$  be a subset with corresponding set of line bundles  $L$ , then  $\Lambda$  is qc iff  $L$  is bounded (9.1.11.24).  $\sqsubset$

*Proof:* If  $L$  is bounded by  $T \in \text{Sch}^{\text{ft}}/S$ , then there is a map  $\theta : T \rightarrow \underline{\text{Pic}}_{X/S}$  that  $\Lambda \subset \theta(T)$ . Notice  $T$  is a Noetherian space, thus so is  $\theta(T)$ , and  $\Lambda$  is qc.

Conversely, if  $\Lambda$  is qc, then it is contained in an open subscheme  $U \subset \underline{\text{Pic}}_{X/S}$  of f.t. over  $S$ , then  $U$  gives out a line bundle on  $X_T$  for some fppf covering  $T$  of  $U$ . Such  $T$  can be chosen to be f.t. over  $S$  as  $U$  is f.t., so  $L$  is bounded by  $T$ .  $\square$

**Cor. (10.9.3.43)** [Quasi-Coherence and Hilbert-Polynomials]. If  $S$  is Noetherian and  $X/S$  is projective and flat, and  $\underline{\text{Pic}}_{X/S}$  is representable, let  $\Lambda \subset \underline{\text{Pic}}_{X/S}$  be any subset and  $\Pi$  the corresponding set of Hilbert polynomials, then  $\#\Pi < \infty$  if  $\Lambda$  is qc, and  $\#\Pi = 1$  if  $\Lambda$  is connected.  $\sqsubset$

*Proof:* If  $\Lambda$  is qc, then  $L$  is bounded by some  $T \in \text{Sch}^{\text{ft}}/S$ , and then by locally constancy of Hilbert polynomials,  $\#\Pi < \infty$ .

If  $\Lambda$  is connected, then so is the induced reduced structure on its closure  $\overline{\Lambda}$ .  $\overline{\Lambda}$  gives out a line bundle on  $X_T$  for some fppf covering  $T$  of  $\overline{\Lambda}$ . Notice  $T \rightarrow \overline{\Lambda}$  is open and Hilbert polynomial is locally constant on  $T$ , so there is only one Hilbert polynomial type.  $\square$

### Torsion Components

**Prop. (10.9.3.44)**. If  $X/S$  is projective, flat with integral geometric fibers, then for  $n \in \mathbb{Z}_+$ ,  $[n] : \underline{\text{Pic}}_{X/S} \rightarrow \underline{\text{Pic}}_{X/S}$  is of f.t.  $\sqsubset$

*Proof:* Cf. [Kle61].  $\square$

**Prop. (10.9.3.45)**. If  $X/S$  is proper and  $\underline{\text{Pic}}_{X/S}$  exists, then  $\underline{\text{Pic}}_{X/S}^\tau$  is an open subgroup of f.t..  $\sqsubset$

*Proof:* Cf. [Kle61]P59.  $\square$

**Prop. (10.9.3.46)**. If  $X$  is a  $k$ -scheme s.t.  $\underline{\text{Pic}}_{X/k}$  is representable, then  $\underline{\text{Pic}}_{X/S}^\tau$  is an open subgroup, and forming it commutes with change of fields. Moreover, if  $X/S$  is projective, then  $\underline{\text{Pic}}_{X/S}^\tau$  is clopen of f.t..  $\sqsubset$

*Proof:* Using (10.1.4.19) and (10.9.3.21), it suffices to prove  $\underline{\text{Pic}}_{X/S}^\tau$  is of f.t. when  $X$  is projective over  $S$ . For this, it suffices to prove for  $k = \overline{k}$ . In this case, by (9.1.11.25) and (9.1.11.26), there is an algebraic  $k$ -scheme  $T$  and  $\mathcal{M} \in \mathcal{T}$  s.t. the corresponding map  $\theta : T \rightarrow \underline{\text{Pic}}_{X/k}$  satisfies  $\underline{\text{Pic}}_{X/S}^\tau \subset \theta(T)$ . Notice  $T$  is a Noetherian space, thus so is  $\theta(T)$ , and  $\Lambda$  is qc.  $\square$

**Cor. (10.9.3.47).** Let  $X$  is a projective variety over a field  $k$ , then  $\underline{\text{Pic}}_{X/k}^\tau$  is quasi-projective. And if  $X$  is geo.normal, then it is projective.  $\lrcorner$

*Proof:* By (10.9.3.46)(10.9.3.24),  $\underline{\text{Pic}}_{X/S}$  is quasi-projective. To show it is proper, it suffices to show for  $k = \bar{k}$ . In this case,  $\underline{\text{Pic}}_{X/k}^\tau$  is covered by f.m. translates of  $\text{Pic}_{X/k}^0$  as it is qc, and  $\underline{\text{Pic}}_{X/k}^0$  is projective by (10.9.3.34), so  $\underline{\text{Pic}}_{X/k}^\tau$  is also proper, as it is closed so is the scheme-theoretic image of these copies  $\underline{\text{Pic}}_{X/k}^0$ .  $\square$

**Prop. (10.9.3.48).** Let  $X/S$  be locally projective flat with integral geometric fibers, then  $\underline{\text{Pic}}_{X/S}^\tau$  is a clopen subgroup of  $\underline{\text{Pic}}_{X/S}$  of f.t., and forming it is compatible with base change. Moreover, if  $X/S$  is projective with  $S$  Noetherian, then  $\underline{\text{Pic}}_{X/S}^\tau$  is quasi-projective.  $\lrcorner$

*Proof:* Cf. [Kle05]P58.  $\square$

**Cor. (10.9.3.49) [Torsion Components are Projective].** If  $X/S$  is smooth projective with integral geometric fibers and  $S$  is Noetherian, then  $\underline{\text{Pic}}_{X/S}^\tau$  is projective.  $\lrcorner$

*Proof:* This follows from (10.9.3.48) and (10.9.3.30).  $\square$

**Prop. (10.9.3.50).** If  $S$  is Noetherian and  $X/S$  is locally projective flat with integral geometric fibers, then for any  $s \in S$  with residue field  $k(s)$  and an alg.closure  $\bar{k}(s)$ , the group

$$\underline{\text{Pic}}_{X_{\bar{k}(s)}/\bar{k}(s)}^\tau(\bar{k}(s)) / \underline{\text{Pic}}_{X_{\bar{k}(s)}/\bar{k}(s)}(\bar{k}(s))$$

is a finite group, and its order is uniformly bounded.  $\lrcorner$

*Proof:* It is finite by (10.9.3.48), and the number of connected components of  $\underline{\text{Pic}}_{X_{\bar{k}(s)}/\bar{k}(s)}^\tau$  is constant for a non-empty open subset of  $S$  by [EGA 4.3, 9.7.9], so it is bounded by Noetherian induction.  $\square$

## 4 Picard Spaces

**Thm. (10.9.4.1) [Representability by Algebraic Spaces, Artin].** If  $X \rightarrow S$  is proper flat and f.p. morphism of algebraic spaces s.t. forming  $f_*\mathcal{O}_X$  commutes with base change, then  $\underline{\text{Pic}}_{X/S}$  is representable by an algebraic space, and is locally of f.p. over  $S$ .  $\lrcorner$

*Proof:* Cf. [Artin, Algebraization of formal moduli: 1]Thm7.3.  $\square$

## 5 Moduli of Curves

**Def. (10.9.5.1) [Smooth Curves of Genus  $g$ ].** Given a scheme  $S$ , there is a category  $\mathcal{M}_g$  fibered in sets over  $\text{Sch}/S$  where  $\mathcal{M}_g(T)$  is the set of smooth and proper morphisms of schemes  $C \rightarrow T$  that the fibered are all geometrically connected curves of genus  $g$ .

Similarly there is a category  $Z_g$  fibered in sets over  $\text{Sch}/S$  of smooth pointed curves of genus  $g$   $\lrcorner$

### 1 Quotient of Groupoids

Main references are [Quotient Spaces Modulo Algebraic Groups, Kollar, 1997].

**Def. (10.11.1.1) [Quotients of Groupoids].** Let  $U \in \text{AlgSp}/B$ ,  $j : R \rightarrow U \times_B U$  be a pre-relation on  $U$  over  $B$ ,  $\varphi : U \rightarrow X \in \text{AlgSp}/B$ , then

- For  $u \in |U|$ , the  **$R$ -orbit** of  $u$  is the equivalent class of  $u \in |U|$  generated by  $|R| \subset |U| \times |U|$ .
- For  $T \subset |U|$ ,  $T$  is called  **$R$ -invariant** if  $s^{-1}(T) = t^{-1}(T) \subset |R|$ .
- $\varphi$  is said to be  **$R$ -invariant** if for it equalizes the two maps  $s, t : R \rightarrow U$ .
- $\varphi$  is said to be **set-theoretically  $R$ -invariant** if for any  $\text{Spec } k \in \text{Sch}/B, k = \bar{k}$ ,  $\varphi(k)$  equalizes the two maps  $s, t : R(k) \rightarrow U(k)$ .
- $\varphi$  is said to **separate  $R$ -orbits** if it is set-theoretically  $R$ -invariant and for any  $\text{Spec } k \in \text{Sch}/B, k = \bar{k}$  and  $u, u' \in U(k)$ ,  $\varphi(u) = \varphi(u') \in X(k)$  implies  $u, u'$  are in the same  $R$ -orbits.
- $\varphi$  is said to be an **orbit space for  $R$**  if it is  $R$ -invariant and surjective, and separates  $R$ -orbits.
- $\varphi$  is said to be a **course quotient for  $R$**  if it is a categorical quotient and it is an orbit space for  $R$ .
- If  $S = B, U, R, X \in \text{Sch}$ , then  $\varphi$  is said to be a **course quotient in schemes for  $R$**  if it is a categorical quotient in schemes and it is an orbit space for  $R$ .
- If  $\varphi$  is  $R$ -invariant, The **sheaf of  $R$ -invariant functions**  $(\varphi_* \mathcal{O}_U)^R$  as the étale  $\mathcal{O}_X$ -subalgebra of  $\varphi_* \mathcal{O}_U$  which is the equalizer of two maps induced from  $s, t : R \rightarrow U$ .

┘

**Prop. (10.11.1.2).** Situation as in (10.11.1.1), if  $R, U$  are locally of f.t. over  $B$ ,  $\varphi$  is an orbit space for  $R$  iff it is  $R$ -invariant and for any  $\text{Spec } k \in \text{Sch}/B, k = \bar{k}$ ,

$$U(k)/(\text{equivalent relations generated by } j(R(k))) \rightarrow X(k)$$

is bijective.

┘

*Proof:* Cf. [Sta]04A0.

□

**Def. (10.11.1.3) [Good Quotients].** Situation as in (10.11.1.1),  $\varphi$  is said to be a **good quotient** if

- $\varphi$  is affine, surjective,  $R$ -invariant.
- For any base change  $\varphi'$  of  $\varphi$ ,  $|\varphi'|$  is a closed map, and  $|\varphi|(Z_1 \cap Z_2) = |\varphi|(Z_1) \cap |\varphi|(Z_2) \subset |X|$  for any closed subsets  $Z_1, Z_2 \subset |U|$ .
- $\mathcal{O}_X \rightarrow (\varphi_* \mathcal{O}_U)^R$  is an isomorphism.

┘

**Def.(10.11.1.4) [Geometric Quotients].** Situation as in (10.11.1.1),  $\varphi$  is said to be a **geometric quotient** if

- $\varphi$  is an orbit space for  $R$ ,
- $\varphi$  is universally submersive,
- $\mathcal{O}_X \rightarrow (\varphi_* \mathcal{O}_U)^R$  is an isomorphism.

┘

**Thm.(10.11.1.5) [Kollar].** Let  $S \in \text{Sch}$  be excellent,  $G \in \text{AlgGrp}_{\text{Aff}}/S$ ,  $X \in \text{AlgSp}^{\text{sep,ft}}/S$ . Let  $m : G \times X \rightarrow X$  be a proper  $G$ -action on  $X$ , and one of the following holds:

- $G$  is a reductive group scheme over  $S$ ,
- $S = \text{Spec } k$  where  $k \in \text{Field}$ ,  $\text{char } k > 0$ .

┘

*Proof:* then a geometric quotient  $\varphi : X \rightarrow X/G$  exist (10.11.1.4), and  $X/G \in \text{AlgSp}^{\text{sep,ft}}/S$ . Cf.[Quotient Schemes modulo Algebraic Groups, Kollar]P35.  $\square$

## 2 Quotients of Schemes

**Prop.(10.11.2.1).** Let  $u_0, u_1 : X_1 \rightarrow X_0$  be an equivalence relation on the algebraic scheme  $X_0$  over  $R_0$ . Assume that

- $u_0 : X_1 \rightarrow X_0$  is locally free of rank  $r$ .
- For all  $x_0 \in X$ ,  $u_0(u_1^{-1}(x))$  is contained in an open affine subscheme of  $X_0$ .

Then a quotient  $u : X_0 \rightarrow X$  exists. Moreover,  $u$  is locally free of rank  $r$ .

┘

*Proof:* Cf[?Mil17b]P597.  $\square$

# 11 | Algebraic $K$ -Theory of Schemes

## 11.1 Algebraic $K$ -Theory

### 1 Introduction

Algebraic  $K$ -theory is about natural constructions of cohomology theories/spectra from algebraic data such as commutative rings, symmetric monoidal categories and various homotopy theoretic refinements of these.

When applied to the stack of vector bundles then algebraic  $K$ -theory subsumes topological  $K$ -theory and also differential  $K$ -theory.

### 2 $K$ -Theory of Categories

#### $K$ -Groups of Triangulated Categories

**Def. (11.1.2.1) [ $K$ -Groups of Triangulated Categories].** Let  $\mathcal{D}$  be a triangulated categories, then the  $K$ -group of  $\mathcal{D}$  is defined to be the quotient

$$\bigoplus_{X \rightarrow Y \rightarrow Z \text{ distinguished}} 1 \rightarrow \bigoplus_{X \in \mathcal{D}} \rightarrow K_0(\mathcal{D}) \rightarrow 0$$

where  $e_{X \rightarrow Y \rightarrow Z}$  is mapped to  $e_Y - e_X - e_Z$ . ┘

**Prop. (11.1.2.2) [Naturality].**

- An exact functor between triangulated categories induce a map of their corresponding  $K$ -groups,
- A bi-exact bifunctor  $F : \mathcal{D} \times \mathcal{D}' \rightarrow \mathcal{E}$  (4.8.4.9) induces a bilinear map  $K_0(\mathcal{D}) \times K_0(\mathcal{D}') \rightarrow K_0(\mathcal{E})$  sending  $([X], [X'])$  to  $F(X, X')$ .
- A  $\delta$ -functor from an Abelian category to a triangulated category induces a map of their corresponding  $K$ -groups (Notice these two  $K$ -groups are defined differently).
- A functor from an exact category to a triangulated category that sends exact sequences to distinguished triangles induces a map of their corresponding  $K$ -groups. ┘

#### $K$ -Theory of quasi-exact categories

**Def. (11.1.2.3) [Quasi-Exact Categories].** A **quasi-exact category** is a pair  $(\mathcal{C}, \mathcal{E})$  where  $\mathcal{C}$  is a pointed balanced small additive category and  $\mathcal{E}$  is a set of short sequences

$$0 \rightarrow X \xrightarrow{\varphi} Y \xrightarrow{\psi} Z \rightarrow 0$$

(where we call  $\varphi$  an **admissible monomorphism** and  $\psi$  an **admissible epimorphism**) satisfying the following:

- **Ex1:** For any complex  $0 \rightarrow X \xrightarrow{\varphi} Y \xrightarrow{\psi} Z \rightarrow 0$  in  $\mathcal{E}$ ,  $\varphi$  is the kernel of  $\psi$  and  $\psi$  is the cokernel of  $\varphi$ .
- For any  $X, Y \in \mathcal{C}$ ,  $0 \rightarrow X \rightarrow X \oplus Y \rightarrow Y \rightarrow 0$  is in  $\mathcal{E}$ .
- $\mathcal{E}$  is closed under isomorphisms.
- Admissible monomorphisms are stable under compositions and base change by admissible epimorphisms.
- Admissible epimorphisms are stable under compositions and base change by admissible monomorphisms.

┘

**Def. (11.1.2.4).** For any quasi-exact category  $(\mathcal{C}, \mathcal{E})$ , we can define the category  $Q(\mathcal{C})$  as the category s.t.

- $\text{Ob}(Q(\mathcal{C})) = \text{Ob}(\mathcal{C})$ ,
- For  $X, Y \in \text{Ob}(Q(\mathcal{C}))$ ,  $\text{Map}_{Q(\mathcal{C})}(X, Y)$  consists of isomorphism classes of roofs  $(X \xleftarrow{\varphi} S, S \xrightarrow{f} Y)$  s.t.  $\varphi$  is an admissible epimorphism and  $f$  is an admissible monomorphism.
- The compositions are given by base change.

The conditions in (11.1.2.3) ensures that  $Q(\mathcal{C})$  is truly a category.

┘

**Def. (11.1.2.5) [ $K$ -Groups of Quasi-Exact Categories].** For any quasi-exact category  $(\mathcal{C}, \mathcal{E})$ ,  $Q(\mathcal{C})$  is path-connected as  $\mathcal{C}$  is pointed, so we can define the  **$K$ -group of quasi-separated categories** as

$$K_i(\mathcal{C}, \mathcal{E}) = \pi_{i+1}(\mathbb{B}(Q(\mathcal{C}))).$$

┘

**Prop. (11.1.2.6) [ $K_0$ -Groups].** For any quasi-exact category  $(\mathcal{C}, \mathcal{E})$ ,  $K_0(\mathcal{C}, \mathcal{E})$  can be described as the kernel:

$$\bigoplus_{[0 \rightarrow A \rightarrow B \rightarrow C \rightarrow 0] \in \mathcal{E}} \mathbb{Z} \rightarrow \bigoplus_{A \in \mathcal{C}} \mathbb{Z} \rightarrow K_0(\mathcal{A}) \rightarrow 0,$$

where  $e_{0 \rightarrow A \rightarrow B \rightarrow C \rightarrow 0}$  is mapped to  $e_B - e_A - e_C$ .

┘

*Proof:*

□

### 3 $K$ -Theory of Rings

**Def. (11.1.3.1) [ $K$ -Theories of Rings].** For  $R \in \mathcal{C}\text{Ring}$ , Let  $\text{Proj}_R^{\text{fg}}$  be the 1-category of f.g. projective  $R$ -modules, and let  $\iota \text{Proj}_R^{\text{fg}}$  be the maximal subgroupoid, then it is a  $E_\infty$ -space. Let

$$K(R) = (\iota \text{Proj}_R^{\text{fg}})^{\infty\text{-ab}} \text{ (4.9.2.7)}.$$

And let

$$K_0(R) = \pi_0(K(R)), \quad K_j(R) = \pi_j(K(R), 0).$$

┘

**Prop. (11.1.3.2) [Ring Structure].** There is an  $\mathbb{E}_\infty$ -Ring structure on  $K_{\geq 0}(R)$ , so

$$K_*(R) = \bigoplus_{j \geq 0} K_j(R)$$

has a graded ring structure. ┘

**Prop. (11.1.3.3) [Matsumoto].** For  $k \in \mathbf{Field}$ , there are natural isomorphisms

$$K_i^{\text{Mil}}(k) \cong K_i(k)$$

for  $i = 0, 1, 2$ , thus inducing a map

$$K_*^{\text{Mil}}(k) \rightarrow K_*(k)$$

that is not necessarily an isomorphism. ┘

*Proof:* ? □

#### 4 K-Theory of Schemes

**Thm. (11.1.4.1) [Thomason, Quillen].** Let  $X$  be an affine regular and separated scheme, and  $X = U \cup V$  is an affine open cover, then there is a Cartesian square of spectra

$$\begin{array}{ccc} K(X) & \longrightarrow & K(U) \\ \downarrow & & \downarrow \\ K(V) & \longrightarrow & K(U \cap V) \end{array}$$

*Proof:* ┘

**Cor. (11.1.4.2) [Descent Spectral Sequence].** There is a spectral sequence

$$H^p(X; \pi_q(K)) \Rightarrow K_{p-q}(X).$$

*Proof:* ? ┘

**Def. (11.1.4.3) [Graded Determinant Map].** For  $X \in \mathbf{Sch}$  affine or regular, let  $\mathbf{Pic}^{\mathbb{Z}}(X) = \mathbf{Pic}(X) \rtimes H^0(X; \mathbb{Z})$ , where  $H^0(X; \mathbb{Z})$  acts on  $\mathbf{Pic}(X)$  locally by  $n \cdot \mathcal{L} = \mathcal{L}^{(-1)^n}$ . Then there is a graded determinant map

$$(\det, \text{rank}) : \iota \text{Proj}^{\text{fg}}(X) \rightarrow \mathbf{Pic}^{\mathbb{Z}}$$

that is a morphism of  $\mathbb{E}_\infty$ -rings:

$$\begin{array}{ccc} \det(M \oplus N) & \xrightarrow{\cong} & \det(M) \otimes \det(N) \\ \downarrow \cong, (-1)^{\text{rank}(M) \text{rank}(N)} & & \downarrow \cong \\ \det(N \oplus M) & \xrightarrow{\cong} & \det(N) \otimes \det(M) \end{array}$$

is commutative. Thus by universal property of group completion, we get a map

$$K(X) \rightarrow \mathbf{Pic}^{\mathbb{Z}}(X).$$

Thus we have maps

$$K_j(X) \xrightarrow{(\det, \text{rank})} \pi_j(\mathbf{Pic}^{\mathbb{Z}}(X)),$$

and the kernel is denoted by  $SK_j(X)$ . ┘

**Prop. (11.1.4.4).** The graded determinant map (11.1.4.3) induces a surjective ring homomorphism

$$K_0(X) \rightarrow \mathbf{Pic}^{\mathbb{Z}}(X).$$

┘

*Proof:*  $\mathcal{L} \otimes \mathcal{O}_X^{n-1}$  is mapped to  $(\mathcal{L}, n)$ , and these generate  $\mathbf{Pic}^{\mathbb{Z}}(X)$ . □

**Prop. (11.1.4.5).** If  $R$  is a local ring, then there is an isomorphism

$$K_1(R) \xrightarrow{(\det, \text{rank})} \pi_1(\mathbf{Pic}^{\mathbb{Z}}(R)) \cong R^*.$$

┘

**Prop. (11.1.4.6).** Let  $X$  be a an irreducible regular Noetherian scheme of dimension 1, then there is an isomorphism

$$K_0(X) \xrightarrow[\cong]{(\det, \text{rank})} \mathbf{Pic}^{\mathbb{Z}}(X).$$

┘

*Proof:* [Motives at p]L7P4. ? □

**Prop. (11.1.4.7) [Properties of K-Groups].** For  $j \in \mathbb{Z}$ ,  $K_j : \text{Sch}^{\text{op}} \rightarrow \mathcal{A}b$  are functors satisfying the following properties:

- there is a rank map  $\text{rank} : K_0(X) \rightarrow H^0(X, \mathbb{Z})$ , which is an isomorphism if  $X$  is a local scheme.
- If  $X$  is qcqs and  $X = U \cup V$  is an open cover, there is a long exact sequence

$$\cdots \rightarrow K_j(X) \rightarrow K_j(U) \oplus K_j(V) \rightarrow K_j(U \cap V) \rightarrow K_{j-1}(X) \rightarrow \cdots.$$

- If  $X$  is qcqs and  $Y \rightarrow X$  is a closed immersion s.t.  $Y$  is regular, then there are natural maps

$$i_* : K_j(Y) \rightarrow K_j(X)$$

that fits into a long exact sequence

$$\cdots \rightarrow K_j(Y) \xrightarrow{i_*} K_j(X) \rightarrow K_j(X \setminus Y) \rightarrow K_{j-1}(Y) \rightarrow \cdots.$$

- If  $X$  is regular, then the projection  $X \times \mathbb{A}^1 \rightarrow X$  induces isomorphisms

$$K_j(X) \cong K_j(X \times \mathbb{A}^1).$$

- If  $X$  is qcqs, there is a natural isomorphism

$$K_j(X)\{0\} \oplus K_j(X)\{0(1) - 0\} \cong K_j(\mathbb{P}_X^1). ?$$

┘

*Proof:* ? □

**Def. (11.1.4.8) [K-Groups of Schemes].** For  $X \in \text{Sch}_{\text{qcqs}}$ , its algebraic K-theory is defined to be the spectrum

$$K(X) = \varprojlim_{\text{Spec } R \rightarrow X} K(R).$$

It follows from (11.1.4.1) that this defines a ┘

**Prop. (11.1.4.9)[Cup Products, Push and Pull].** For any regular separated Noetherian scheme  $X$ , there is a cup product map

$$\cup : K_i(X) \times K_j(X) \rightarrow K_{i+j}(X).$$

And if  $f : X' \rightarrow X$  is a morphism of regular separated Noetherian schemes, there is a graded ring homomorphism  $f^* : K_*X \rightarrow K_*X'$ . And if  $f$  is proper, there are pushforward maps  $f_* : K_i(X') \rightarrow K_i(X)$ . And in this case, they satisfy the projection formula

$$f_*(f^*a \cup b) = a \cup f_*b.$$

There is a canonical inclusion  $\mathcal{O}^*(X) \subset K_1(X)$ , and the restriction of  $f^*(\mathcal{O}^*(X)) \subset \mathcal{O}^*(X')$ , which is just the pullback map. And if  $f$  is finite flat, then the image of  $f_*(\mathcal{O}^*(X')) \subset \mathcal{O}^*(X)$ , which is just the norm map.

The cup product map restricted to  $\mathcal{O}^*(X) \times \mathcal{O}^*(X) \rightarrow K_2(X)$  is called the **universal norm map**, denoted by  $\{u, v\}$ . ┘

*Proof:* ? □

**Conj. (11.1.4.10)[Beilinson-Parshin].** For  $k \in \mathbf{Field}$ ,  $\#k < \infty$ ,  $X \in \mathbf{SmProj}/k$ ,  $i > 0$ ,  $K_i(X) \otimes \mathbb{Q} = 0$ . ┘

*Proof:* □

**Remark (11.1.4.11).** In fact, when  $\dim X = 0$  this is done by Quillen's computation of K-groups of fields, Cf.[On the Cohomology and K-theory of the General Linear Groups over a Finite Field, Quillen, 1972].

when  $\dim X = 1$ ,  $K_i(X)$  are in fact finite, by [Finite Generation of K-Groups of a Curve over a Finite Field, Don 1982]. ┘

### Comparison Maps

**Prop. (11.1.4.12)[Logarithm Differential Maps].** For  $S \in \mathcal{C}\mathbf{Ring}$ ,  $R \in \mathcal{C}\mathbf{Ring}/S$ ,  $X = \mathbf{Spec} R$  and  $q \in \mathbb{N}$ , there are homomorphisms

$$\mathrm{dlog} : K_q(R) \rightarrow \Omega_{R/S}^q,$$

satisfying

- $\mathrm{dlog}(a \cup b) = \mathrm{dlog} a \cup \mathrm{dlog} b$ .
- If  $a \in R^* \subset K_1(R)$ , then  $\mathrm{dlog} a = a^{-1}da \in \Omega_{R/S}^1$ .
- On  $K_0(R)$ ,  $\mathrm{dlog}$  is the degree map.
- If  $R'/R$  is a finite flat extension of regular rings, then

$$\mathrm{tr}_{R'/R}^\Omega \circ \mathrm{dlog}_{R'} = \mathrm{dlog}_R \mathrm{tr}_{R'/R}^K.$$

*Proof:* □

**Prop. (11.1.4.13).** If  $S \in \mathcal{C}\mathbf{Ring}$ , and  $Y = \mathbf{Spec} R$  is an smooth affine precurve over  $S$ , with a smooth completion  $X$  over  $S$ , and  $Z = X \setminus Y$ , then in fact the image of  $\mathrm{dlog}$  is contained in

$$H^0(X, \Omega_{X/S}^q(\log Z)).$$

*Proof:* Cf.[Scholl, P411] ?. □

$K_2$  of Curves

**Prop. (11.1.4.14) [Faddeev's Exact Sequence].** Let  $X$  be a non-singular complete curve over a field  $k$ . Then for any point  $P \in X$ , consider the tame symbol  $\{-, -\}_P$  at  $P$  (3.10.1.5), then there is an exact sequence

$$0 \rightarrow K_2(X) \rightarrow K_2(R(X)) \xrightarrow{\prod_{P \in X} \{-, -\}_P} \kappa(P)^\times.$$

┘

*Proof:* ?

□

**Prop. (11.1.4.15) [Étale Abel-Jacobi Maps].** If  $Y$  is a smooth variety over a number field  $F$ ,  $p \in \mathbf{P}$ ,  $n, j \in \mathbb{Z}_+$ , and  $H^{j+1}(Y_{\mathbb{Q}}, \mathbb{Q}_p(n))^{\text{Gal}_F} = 0$ , then there is an **Abel-Jacobi map**

$$\text{AJ}_{n,j} : K_{2n-j-1}(Y) \rightarrow H^1(\text{Gal}_F, H^j(Y_{\mathbb{Q}}, \mathbb{Q}_p)(n)).$$

In case  $Y$  is a curve,  $j = 1$  and  $n = 2$ , then the Abel-Jacobi map is defined integrally:

$$\text{AJ}_2 : K_2(Y) \rightarrow H^1(\text{Gal}_F, H^1(Y_{\mathbb{Q}}, \mathbb{Z}_p)(2)).$$

It is defined as follows: There is a Chern class map  $c_2 : K_2(Y) \rightarrow H^2(Y, \mathbb{Z}_p(2))$ , and by torsion-freeness (9.4.7.3) and weight reason ?, the first column in the Hochschild-Serre spectral sequence

$$E_2^{i,j} = H^i(\text{Gal}_F, H^j(Y_{\overline{\mathbb{Q}}}, \mathbb{Z}_p(n))) \Rightarrow H^{i+j}(Y, \mathbb{Z}_p(n))$$

vanishes. So there is a low degree exact sequence

$$0 \rightarrow H^2(\text{Gal}_F, H^0(Y_{\mathbb{Q}}, \mathbb{Z}_p(2))) \rightarrow H^2(Y, \mathbb{Z}_p(2)) \xrightarrow{\text{H-S}_2} H^1(\text{Gal}_F, H^1(Y_{\mathbb{Q}}, \mathbb{Z}_p(2))) \rightarrow H^3(\text{Gal}_F, H^0(Y_{\mathbb{Q}}, \mathbb{Z}_p(2))).$$

Then define  $\text{AJ}_2 = -\text{H-S}_2 \circ c_2$ .

┘

*Proof:*

□

## 11.2 Brauer-Grothendieck Groups

References are [Central Simple Algebras and Galois Cohomology, Gille and Szamuely] and [The Brauer-Grothendieck Group].

### 1 Brauer Groups

**Def. (11.2.1.1) [Brauer Groups].** For  $X \in \text{Sch}$ , the **Brauer group**  $\text{Br}(X)$  is defined to be  $\text{Br}(X) = H_{\text{et}}^2(X, \mathbb{G}_m) = H_{\text{fppf}}^2(X, \mathbb{G}_m)$  (9.4.6.37). And for  $R \in \mathbb{C}\text{Ring}$ ,  $\text{Br}(R)$  is defined to be  $\text{Br}(R) = \text{Br}(\text{Spec } R)$ .  $\lrcorner$

**Prop. (11.2.1.2).** If  $X$  is a regular Noetherian scheme that is qc or integral,  $\text{Br}(X) \rightarrow \text{Br}(R(X))$  is injective, and  $\text{Br}(X)$  is a torsion Abelian group.  $\lrcorner$

*Proof:* The qc case reduces to the integral case, and this follows from [Brauer-Grothendieck Groups]Chap3.5.

The second assertion follows from the first and the fact  $\text{Br}(R(X))$  is torsion (11.2.2.4).  $\square$

**Cor. (11.2.1.3).** If  $X \rightarrow Y$  is a birational morphism of integral regular schemes, then  $\text{Br}(Y) \rightarrow \text{Br}(X)$  is injective.  $\lrcorner$

*Proof:* This follows from the fact  $\text{Br}(Y) \rightarrow \text{Br}(X) \rightarrow \text{Br}(R(X)) = \text{Br}(R(Y))$  is injective.  $\square$

### Azumaya Brauer Groups

**Prop. (11.2.1.4) [Azumaya Algebras of Schemes].** For  $X \in \text{Sch}$ , an **Azumaya algebra** over  $X$  is a coherent  $\mathcal{O}_X$ -algebra  $\mathcal{A}$  s.t.  $\mathcal{A}_x \neq 0$  for any  $x \in X$ , and satisfies the following equivalent definitions:

- There exists an étale covering  $\{U_i \rightarrow X\}$  s.t. for each  $i$ , there exists  $r_i \in \mathbb{Z}_+$  s.t.  $\mathcal{A} \otimes_{\mathcal{O}_X} \mathcal{O}_{U_i} \cong \text{End}(\mathcal{O}_{U_i}^{\otimes r_i})$ .
- There exists an fppf covering  $\{U_i \rightarrow X\}$  s.t. for each  $i$ , there exists  $r_i \in \mathbb{Z}_+$  s.t.  $\mathcal{A} \otimes_{\mathcal{O}_X} \mathcal{O}_{U_i} \cong \text{End}(\mathcal{O}_{U_i}^{\otimes r_i})$ .
- $\mathcal{A} \in \text{Vect}_X$ , and for any arithmetic point  $x \in X$ ,  $\mathcal{A}_x$  is isomorphic to  $\text{Mat}(r_x, \kappa(x))$  for some  $r_x \in \mathbb{Z}_+$ . And this  $r_x$  is called the **degree of  $\mathcal{A}$  at  $x$** .
- $\mathcal{A} \in \text{Vect}_X$ , and the canonical homomorphism  $\mathcal{A} \otimes \mathcal{A}^{\text{op}} \rightarrow \text{End}_{\mathcal{O}_X}(\mathcal{A})$  is an isomorphism.

In particular, this definition is compatible with the definition of Azumaya algebras over fields in (3.6.4.5), by (3.6.4.26).

The category of Azumaya algebras over  $X$  is denoted by  $\text{Az}_X$ . For  $n \in \mathbb{Z}_+$ , the subset of Azumaya algebras over  $X$  of constant degree  $n$  is denoted by  $\text{Az}^n(X)$ .  $\lrcorner$

*Proof:*  $1 \rightarrow 2 \rightarrow 3 \rightarrow 4$  is trivial by (3.6.4.26).  $4 \rightarrow 1$ : Cf. [Milne80 Etale Cohomologies]P141.  $\square$

**Def. (11.2.1.5) [Azumaya Brauer Groups].** Let  $X \in \text{Sch}$ , the **Azumaya Brauer group**  $\text{Br}_{\text{Az}}(X)$  is defined to be the set of equivalence class of Azumaya algebras over  $X$  under the equivalence relation that  $\mathcal{A} \sim \mathcal{A}'$  iff there exists  $\mathcal{E}, \mathcal{E}' \in \text{Vect}(X)$  with positive ranks at each point s.t.

$$\mathcal{A} \otimes_{\mathcal{O}_X} \text{End}(\mathcal{E}) \cong \mathcal{A}' \otimes_{\mathcal{O}_X} \text{End}(\mathcal{E}').$$

Moreover,  $\text{Br}_{\text{Az}}(X)$  is a group under tensor product and the inverse is given by  $\mathcal{A} \rightarrow \mathcal{A}^{\text{op}}$ .  $\lrcorner$

*Proof:* To show this is an equivalence and the group operation is well-defined, use the fact that for  $\mathcal{E}, \mathcal{E}' \in \text{Vect}(X)$ ,

$$\mathbf{End}(\mathcal{E}) \otimes_{\mathcal{O}_X} \mathbf{End}(\mathcal{E}') \cong \mathbf{End}(\mathcal{E} \otimes \mathcal{E}').$$

And the inverse is of the form given, by (11.2.1.4).  $\square$

**Lemma (11.2.1.6).** Let  $(\mathcal{C}, \mathcal{O})$  be a ringed site and  $\mathcal{F}, \mathcal{G} \in \text{Vect}(\mathcal{O})$  s.t.  $\mathbf{End}(\mathcal{F}) \cong \mathbf{End}(\mathcal{G})$ , then there exists an invertible sheaf  $\mathcal{L}$  s.t.  $\mathcal{F} \otimes \mathcal{L} \cong \mathcal{G}$ .  $\lrcorner$

*Proof:* Let  $\mathcal{L} \subset \text{Hom}(\mathcal{F}, \mathcal{G})$  be generated as an  $\mathcal{O}_X$ -module by local isomorphisms  $\varphi : \mathcal{F} \cong \mathcal{G}$  s.t. the conjugation by  $\varphi$  coincides with the given isomorphism, then local computation and the fact all automorphisms of  $\text{Mat}(n)$  is inner shows that  $\mathcal{L}$  is invertible, and the evaluation map

$$\mathcal{F} \otimes \mathcal{L} \rightarrow \mathcal{G}$$

is an isomorphism.  $\square$

**Prop. (11.2.1.7).** If  $\mathcal{A} \in \text{Az}_X$  has constant degree  $d$ , then  $[\mathcal{A}] \in \text{Br}_{\text{Az}}(X)$  is annihilated by  $d$ .  $\lrcorner$

*Proof:* Choose an étale covering  $\{U_i \rightarrow X\}$  and isomorphisms  $\mathcal{A}|_{U_i} \cong \text{Hom}(\mathcal{F}_i, \mathcal{F}_i)$ , where  $\mathcal{F}_i \in \text{Vect}^d(X)$ , then

$$\mathcal{A}^{\otimes d}|_{U_i} \cong \mathbf{End}(\mathcal{F}_i^{\oplus d}).$$

Consider the maps

$$p_i : \mathcal{F}_i^{\oplus d} \rightarrow \wedge^d \mathcal{F}_i \subset \mathcal{F}_i^{\oplus d},$$

then  $p_i^2 = d!p_i$  and  $\text{rank}(p_i) = 1$ . We show now that these  $p_i$  glue together to get a global section  $p$  of  $\mathcal{A}^{\otimes d}$ : by (11.2.1.6), there exist compatible invertible sheaves  $\mathcal{L}_{ij}$  on  $U_i \cap U_j$  s.t.

$$\mathcal{F}_i|_{U_{ij}} \otimes \mathcal{L}_{ij} \cong \mathcal{F}_j|_{U_{ij}}.$$

These isomorphisms can clearly generate isomorphisms to glue  $\{p_i\}$  together.

Then consider  $\mathcal{H} = \mathcal{A}^{\otimes d} \circ p \subset \mathcal{A}^{\otimes d}$ , we claim that

- $\dim \mathcal{H} = d^d$ ,
- left multiplication by  $\mathcal{A}^{\otimes d}$  induces an isomorphism  $\mathcal{A}^{\otimes d} \cong \mathbf{End}(\mathcal{H})$ .

Which will imply that  $d[\mathcal{A}] = 0 \in \text{Br}_{\text{Az}}(X)$ . To show these claims, it suffices to do local calculations:

If  $\mathcal{F} \cong \mathcal{O}_X e_1 \oplus \dots \oplus \mathcal{O}_X e_d$ , then  $\mathcal{A} \cong \mathbf{End}(\mathcal{O}_X^d)$ , and

$$p : e_{\sigma(1)} \otimes \dots \otimes e_{\sigma(d)} \mapsto \text{sgn}(\sigma) e_1 \otimes \dots \otimes e_d, \sigma \in \mathcal{S}_d, \quad 0 \text{ on other basis vectors}$$

So

$$\mathcal{H} = \{f : \mathcal{F}^{\otimes d} \rightarrow \mathcal{F}^{\otimes d} : e_{\sigma(1)} \otimes \dots \otimes e_{\sigma(d)} \mapsto \text{sgn}(\sigma) v_1 \otimes \dots \otimes v_d, \quad 0 \text{ on other basis vectors}\}$$

Then  $\mathcal{A} \cong \mathbf{End}(\mathcal{O}_X^d)$  is clear.  $\square$

**Cor. (11.2.1.8)[Azumaya Brauer Groups are Torsion].** If  $X \in \text{Sch}$  is qc or connected, then  $\text{Br}_{\text{Az}}(X)$  is a torsion Abelian group.  $\lrcorner$

### Comparison of Two Brauer Groups

**Prop. (11.2.1.9) [Azumaya Brauer Groups via Cohomology].** Let  $X \in \text{Sch}$ , there exists an isomorphism of pointed sets

$$\text{Az}_X^n \cong \check{H}_{\text{ét}}^1(X, \text{PGL}(n)).$$

┘

*Proof:* As  $\text{PGL}(n) = \text{Aut}(\text{Mat}(n))$  and any Azumaya algebra is a twist-form for  $\text{Mat}(n)_X$ , any  $\mathcal{A} \in \text{Az}_X^n$  defines a 1-cocycle for  $\text{PGL}(n)$ . It is clear that if this cocycle is a coboundary, then  $\mathcal{A} \cong \text{Mat}(n)_X$ . Its left to show that any 1-cocycle comes from these: As  $\text{PGL}(n) \subset \text{GL}(n^2)$ , and 1-cocycle is a 1-cocycle for  $\text{GL}(n^2)$ , thus by (7.1.6.1) corresponds to a vector bundle  $\mathcal{E}$  of rank  $n^2$ . By taking a refinement, this means there is a covering  $\{U_i \rightarrow X\}$  and isomorphisms  $\varphi_i : \text{Mat}(n, \mathcal{O}_{U_i}) \cong \mathcal{E}|_{U_i}$  as modules such that the transformation maps  $\varphi_i^{-1} \circ \varphi_j \in \text{PGL}(n, \mathcal{O}_{U_{ij}}) \subset \text{GL}(n^2, \mathcal{O}_{U_{ij}})$ , which means exactly  $\mathcal{E} \in \text{Az}_X^n$ .  $\square$

**Prop. (11.2.1.10) [Br(X) and  $\text{Br}_{\text{Az}}(X)$ ].** Assume  $X \in \text{Sch}$  is qc and every finite subset of  $X$  is contained in an affine scheme, by (7.3.2.19), the exact sequence

$$1 \rightarrow \mathbb{G}_m \rightarrow \text{GL}(n) \rightarrow \text{PGL}(n) \rightarrow 1$$

of algebraic groups gives a map

$$\check{H}_{\text{ét}}^1(X, \text{GL}(n)) \rightarrow \text{Az}^n(X) = \check{H}_{\text{ét}}^1(X, \text{PGL}(n)) \xrightarrow{\delta_n} \check{H}_{\text{ét}}^2(X, \mathbb{G}_m) \hookrightarrow H_{\text{ét}}^2(X, \mathbb{G}_m) = \text{Br}(X).$$

by (11.2.1.9) and (7.3.2.14). So the kernel of  $\delta : \text{Az}_X^n \rightarrow \text{Br}(X)$  is given by Azumaya algebras of the form  $\mathbf{End}(\mathcal{E})$  for  $\mathcal{E} \in \text{Vect}^n(X)$ . These maps for various  $n$  give a map

$$\text{Az}(X) \rightarrow \text{Br}(X).$$

Then

- This map is an injective homomorphism, so  $\text{Br}_{\text{Az}}(X) \subset \text{Br}(X)$ .
- If  $X$  has an ample invertible sheaf, then the map induces an isomorphism

$$\text{Br}_{\text{Az}}(X) \cong \text{Br}(X)_{\text{tor}}.$$

In particular, if  $X$  is a regular quasi-projective scheme over some  $A \in \mathbb{C}\text{Ring}$ , then by (11.2.1.2),

$$\text{Br}_{\text{Az}}(X) \cong \text{Br}(X)_{\text{tor}} = \text{Br}(X).$$

For general  $X$ , this is also doable, by Gabber and de Jong? ?

┘

*Proof:* 1: By taking disjoint union, it suffices to show that for  $\mathcal{A} \in \text{Az}_X^n, \mathcal{B} \in \text{Az}_X^m$ ,

$$\delta_{mn}(\mathcal{A} \otimes \mathcal{B}) = \delta_n(\mathcal{A}) \cdot \delta_m(\mathcal{B}).$$

But this is clear from the description of  $\delta_n$ : by the hypothesis and [Milne80 Etale Cohomology, Prop4.2.19] ? and (7.3.2.19), we may take an étale refinement  $\{U_i\}$  and assume the cocycle corresponding to  $\mathcal{A}$  is given by a cocycle  $c_{ij}$  s.t.  $c_{ij} \in \Gamma(U_{ij}, \text{GL}(n))$ . Then  $\delta(\mathcal{A})$  is represented by the 2-cocycle with  $a_{ijk} = c_{jk}c_{ik}^{-1}c_{ij} \in \Gamma(U_{ijk}, \mathbb{G}_m)$ .

The injectivity follows from the presentation

$$\mathrm{Br}_{\mathrm{Az}}(X) \cong \varinjlim \mathrm{Az}_X^n / \sim = \varinjlim \check{H}_{\mathrm{et}}^1(X, \mathrm{PGL}(n)) / \check{H}_{\mathrm{et}}^1(X, \mathrm{GL}(n)).$$

and the fact the image of  $\check{H}_{\mathrm{et}}^1(X, \mathrm{GL}(n))$  in  $\check{H}_{\mathrm{et}}^1(X, \mathrm{PGL}(n))$  is the class of **End**( $n, E$ ): a  $\mathbf{a} \in \check{H}_{\mathrm{et}}^1(X, \mathrm{GL}(n))$  corresponds to a vector bundle  $\mathcal{E}$  of rank  $n$  with trivializations  $\varphi_i : \mathcal{O}_{U_i}^n \cong E|_{U_i}$  s.t.  $\mathbf{a}$  is represented by  $(\varphi_i^{-1}\varphi_j)$ . Then  $\mathcal{A} = \mathbf{End}(n, \mathcal{E}) \in \mathrm{Az}_X^n$  has trivializations  $\psi_i : \mathrm{Mat}(n, \mathcal{O}_{U_i}) \cong \mathbf{End}(n, \mathcal{E})|_{U_i}$ , and  $\mathcal{A}$  corresponds to the 1-cocycle

$$(\psi_i^{-1}\psi_j) = (\alpha_{ij}), \quad \alpha_{ij}(a) = \varphi_j^{-1}\varphi_i a \varphi_i^{-1}\varphi_j, a \in \mathrm{Mat}(n, \mathcal{O}_{U_{ij}})$$

which is exactly the image of the class  $\mathbf{a}$  under the map  $\mathrm{GL}(n) \rightarrow \mathrm{PGL}(n) : u \mapsto \mathrm{conj}(u)$ .

2: Cf.[Brauer-Grothendieck Group]Chap4.?

□

**Prop.(11.2.1.11)[Kummer Exact Sequences].** For  $X \in \mathrm{Sch}$ ,  $n \in \mathbb{Z}_+$ , the Kummer exact sequence of algebraic groups

$$1 \rightarrow \mu_n \rightarrow \mathbb{G}_m \xrightarrow{n} \mathbb{G}_m \rightarrow 1$$

gives exact sequences

$$0 \rightarrow \mathrm{Pic}(X)/n \mathrm{Pic}(X) \rightarrow H_{\mathrm{fppf}}^2(X, \mu_n) \rightarrow \mathrm{Br}(X)[n] \rightarrow 0,$$

$$0 \rightarrow \mathrm{Br}(X)/n \mathrm{Br}(X) \rightarrow H_{\mathrm{fppf}}^3(X, \mu_n) \rightarrow H_{\mathrm{et}}^3(X, \mathbb{G}_m)[n] \rightarrow 0.$$

by(9.4.6.37).

┘

**Prop.(11.2.1.12)[Mayer-Vietoris Exact Sequence].** Let  $X \in \mathrm{Sch}$  and  $X = U \cup V$  be a Zariski covering with  $U \cap V = W$ , then by(11.2.1.2) there is an exact sequence

$$\begin{aligned} 0 \rightarrow \Gamma(X, \mathcal{O}_X^\times) &\rightarrow \Gamma(V, \mathcal{O}_X^\times) \oplus \Gamma(V, \mathcal{O}_X^\times) \rightarrow \Gamma(W, \mathcal{O}_X^\times) \\ &\rightarrow \mathrm{Pic}(X) \rightarrow \mathrm{Pic}(U) \oplus \mathrm{Pic}(V) \rightarrow \mathrm{Pic}(W) \\ &\rightarrow \mathrm{Br}(X) \rightarrow \mathrm{Br}(U) \oplus \mathrm{Br}(V) \rightarrow \mathrm{Br}(W) \rightarrow H_{\mathrm{et}}^3(X, \mathbb{G}_m) \rightarrow \dots \end{aligned}$$

And when  $U$  is locally factorial, then  $\mathrm{Pic}(U) \rightarrow \mathrm{Pic}(W)$  is surjective?, so there is an exact sequence

$$0 \rightarrow \mathrm{Br}(X) \rightarrow \mathrm{Br}(U) \oplus \mathrm{Br}(V) \rightarrow \mathrm{Br}(W) \rightarrow H_{\mathrm{et}}^3(X, \mathbb{G}_m).$$

┘

**Prop.(11.2.1.13)[Hochschild Spectral Sequence].**

┘

### Residue Homomorphism

**Prop.(11.2.1.14)[Faddeev].** For  $k \in \mathrm{Field}$ , there is an exact sequence

$$0 \rightarrow \mathrm{Br}(k) \rightarrow \mathrm{Br}(\mathbb{P}_k^1) \xrightarrow{\mathrm{res}} \bigoplus_{x \in |\mathbb{P}_k^1|_0} H^2(\kappa(x), \mathbb{Q}/\mathbb{Z}) \rightarrow H^1(k, \mathbb{Q}/\mathbb{Z}) \rightarrow 0.$$

┘

*Proof:* Cf. [GS06, 6.4.5]?

□

**Artin Conjecture**

**Conj. (11.2.1.15)**[Artin]. For  $X \in \text{Sch}/\mathbb{Z}$  proper,  $\# \text{Br}(X) < \infty$ . ┘

*Proof:* Cf.[Central Simple Algebras and Galois Cohomology, 6.4.5.]. □

**Prop. (11.2.1.16)**[Artin & Tate Conjecture]. For a proper surface  $X/\mathbb{Z}$ , the Artin conjecture for  $X$  (11.2.1.15) is equivalent to Tate conjecture for divisors of  $X$ . ┘

*Proof:* □

**Prop. (11.2.1.17)**[Artin vs. Tate-Šafarevič Conjecture]. For  $F \in \mathbf{NField}$ , for a regular integral scheme  $X$  of dimension 2 that is flat proper over  $\mathcal{O}_F$  that has a section, the Artin conjecture for  $X$  is equivalent to the finiteness of  $\text{III}(\text{Jac}(X_F))$ . ┘

*Proof:* □

**2 Field case**

**Notation (11.2.2.1).**

- Let  $k \in \mathbf{Field}$ .
- ┘

**Prop. (11.2.2.2)**[Indices of Brauer Classes]. Any Brauer class in  $\text{Br}_{\text{Az}}(k)$  is represented by a unique central division ring.

So we can define the **index of the Brauer class**  $D$  as the  $\text{ind}([D]) = \sqrt{[D : k]} \in \mathbb{Z}_+$  (3.6.4.16). And the **period of the Brauer class**  $D$  to be the exponent of  $[D] \in \text{Br}_{\text{Az}}(k)$ . ┘

*Proof:* The existence of this division ring follows from Wedderburn theorem (3.6.2.22), and to show uniqueness, notice if

$$\text{Mat}(n; D) \cong \text{Mat}(m; D') = A$$

when we can recover  $D$  as  $D = D' = \text{End}_A(V)$ , where  $V$  is the unique simple module, by (3.6.2.21). □

**Prop. (11.2.2.3)**[Brauer Groups and Galois Cohomology]. The **Brauer group**  $\text{Br}(k)$  is defined as the profinite cohomology  $H^2(\text{Gal}(k^{\text{sep}}/K), (k^{\text{sep}})^{\times})$ . For a Galois extension  $L/k$ ,  $\text{Br}(L/k)$  is defined as  $H^2(\text{Gal}(L/k), L^{\times})$ . Then by (9.8.2.3) we have

$$\varinjlim \text{Br}(L/k) = \text{Br}(k).$$

And by Hochschild-Serre spectral sequence and by Hilbert's multiplicative theorem90:  $H^1(H, k_s^*) = 0$ , we have the low term:

$$0 \rightarrow \text{Br}(L/k) \xrightarrow{\text{inf}} \text{Br}(k) \xrightarrow{\text{res}} \text{Br}(L)^{\text{Gal}(L/k)} \rightarrow H^3(\text{Gal}(L/k), L^{\times}) \rightarrow H^3(k, (k^{\text{sep}})^{\times}).$$

So  $\text{Br}(L/k)$  is the kernel of  $\text{Br}(k) \rightarrow \text{Br}(L)$ . ┘

*Proof:* Cf.[Neukirch Cohomology of Number Fields Chap6.3]. ? □

**Cor. (11.2.2.4)**[Brauer Groups are Torsion].  $\text{Br}(k) \in \mathcal{A}b_{\text{tor}}$ , by (9.8.2.4). In particular,  $\text{Br}_{\text{Az}}(k) \cong \text{Br}(k)$  by (11.2.1.10). ┘

**Cor. (11.2.2.5).** If  $k \in \mathbf{Field}^{\text{fin}}$ , we have  $\text{Br}(k) = 0$ , ┘

**Prop. (11.2.2.6)[Involutions].** If  $D \in \text{Az}_k$  admits an involution of the first kind, then period of  $[D]$  is 1 or 2. In particular, periods of a quaternion ring over  $k$  is 1 or 2. ┘

*Proof:* An involution of first kind defines an isomorphism  $A \cong A^{\text{op}}$ , which implies that  $A \otimes A \cong \text{End}(A)$ . Thus  $2[A] = 0 \in \text{Br}_{\text{Az}}(k)$ . □

**Prop. (11.2.2.7)[Finite Fields, Wedderburn].** If  $k \in \mathbf{Field}^{\text{fin}}$ , then for any  $n \in \mathbb{N}$ ,  $\check{H}^1(k, \text{PGL}(n)) = 0$ , and  $\text{Br}(k) = 0$ . ┘

*Proof:* This follows from (11.2.2.2) and the fact any finite division ring is commutative (3.6.1.1). Alternatively, because the finite Galois extensions are cyclic and unramified. □

**Prop. (11.2.2.8)[Valued Fields].** For  $(R, K, k) \in \text{CDVR}$ , there exists a split exact sequence

$$0 \rightarrow \text{Br}(k) \rightarrow \text{Br}_{\text{tame}}(K) \rightarrow H^1(k, \mathbb{Q}/\mathbb{Z}) \rightarrow 0.$$

┘

*Proof:* Cf. [Brauer-Grothendieck Group, P32]. □

**Prop. (11.2.2.9).** For any  $D \in \text{Az}_k$  with index  $n$ , there is a map from the conjugacy classes of  $D^\times$  to the conjugacy classes of  $\text{GL}(n; k)$ . Cf. [Wed08]P293? ┘

**Def. (11.2.2.10)[Special Fields].**  $k$  is called a **special field** if every element of order 2 is represented by a quaternion ring over  $k$  (11.2.2.6). ┘

**Prop. (11.2.2.11).** Separably-closed fields, finite fields, local fields and global fields are special. ┘

*Proof:* ? Their Brauer group has descriptions. □

### 3 Local Field case

**Notation (11.2.3.1).**

- Let  $K \in \mathbf{LField}$ .

┘

**Thm. (11.2.3.2)[Brauer Groups of Local Fields].**

- the invariant map (19.7.2.6) is a canonical injection

$$\text{inv}_K : \text{Br}(K) \hookrightarrow \mathbb{Q}/\mathbb{Z}$$

whose image is

$$\begin{cases} \mathbb{Q}/\mathbb{Z} & , K \in p\text{-LField} \\ \frac{1}{2}\mathbb{Z}/\mathbb{Z} & , K = \mathbb{R} \\ 0 & , K = \mathbb{C} \end{cases}$$

- Every Azumaya algebra over  $K$  is cyclic?.
- Every element of  $\text{Br}(K)$  has period equal to index (11.2.2.2).

┘

*Proof:* 1: This follows from the definition of a class formation (19.7.1.1).

The rest follows from [Poonen, P25]. ?

□

**Cor. (11.2.3.3).** For  $K \neq \mathbb{C} \in \mathbf{LField}$ , there exists a unique nontrivial quaternion algebra over  $K$ , and its the only division ring with exponent 2. ┘

**Prop. (11.2.3.4).** For any  $D \in \mathbf{Az}_K$  of dimension  $\dim_K D = r^2$ , we can define an additive norm on  $D$  by

$$v_D(\delta) = \frac{1}{r} v_K(\text{Nmrd}(\delta)).$$

Then  $D$  is complete w.r.t. this norm. Define

$$\mathcal{O}_D = \{\delta \in D : v_D(\delta) \geq 0\}, \quad \mathfrak{m}_D = \{\delta \in D : v_D(\delta) > 0\}.$$

Then  $\mathfrak{m}_D$  is a two-sided ideal of  $\mathcal{O}_D$  and  $\kappa_D = \mathcal{O}_D/\mathfrak{m}_D$  is division ring that is finite over  $k$  thus a field.

Then  $L = W(\kappa_D)[\frac{1}{p}] \subset D$ , and  $f(D) \triangleq [\kappa_D : \kappa] = [L : K] \leq r$ . But also  $e(D) \leq r$ , and  $ef = r^2$ , so  $e = f = r$ .

By the Skolem-Noether theorem, there exists  $\delta_D \in D^\times$  s.t.  $\delta_K(x) = \delta x \delta^{-1}$  for any  $x \in L$ . Then we have  $\text{inv}_K(D) = v_D(\delta) \in \mathbb{Q}/\mathbb{Z}$ . ? ┘

**Prop. (11.2.3.5) [Description of Azumaya Algebras].** For  $(K, \mathcal{O}_K, \varpi_K, \kappa) \in p\text{-}\mathbf{LField}$  and  $r \in \mathbb{Z}_+, s \in [0, r]$  s.t.  $(r, s) = 1$ , denote  $\lambda = r/s$ , then the unique  $D_{K, \lambda} \in \mathbf{Az}_k$  with  $\text{inv}_K(D) = \lambda$  is defined as follows:

$$D_{K, \lambda} = K_r[\Pi]$$

where  $K_r$  is the unramified extension of  $K$  of degree  $r$ , and  $\Pi$  is an indeterminate satisfying the relations

$$\Pi^r = \varpi_K^r, \quad \Pi.a = \sigma_K(a).\Pi.$$

Then  $\dim D_\lambda = r^2$ , and  $\text{ind}(D_\lambda) = r$ . ┘

*Proof:* ?

□

## 4 Global Field case

**Thm. (11.2.4.1) [Brauer-Hasse-Noether].** For  $F \in \mathbf{NField}$ ,

- there is a canonical exact sequence

$$1 \rightarrow \text{Br}(F) \rightarrow \bigoplus_{\mathfrak{p} \in \Sigma_F} \text{Br}(F_{\mathfrak{p}}) \xrightarrow{\text{inv}_F} \mathbb{Q}/\mathbb{Z} \rightarrow 0,$$

and in the characterization via Azumaya algebras (11.2.1.5)(11.2.1.10), the first map sends  $[D]$  to the family  $([D \otimes_F F_v])_v$ .

- Every Azumaya algebra over  $F$  is cyclic ?.
- Every element of  $\text{Br}(F)$  has exponent equal to index.

┘

*Proof:* 1: Choose for each  $v \in \Sigma_F$  a fixed valuation of  $K^{\text{sep}}$  extending  $v$ , and for each  $L/K \in \text{GalField}^{\text{fin}}$ , consider the homomorphisms

$$1 \rightarrow H^2(\text{Gal}(L/F), L^\times) \rightarrow H^2(\text{Gal}(L/F), \mathbf{I}_F) \cong \otimes_{v \in \Sigma_F} H^2(\text{Gal}(L_v/K_v), L_v^\times) \xrightarrow{\text{inv}_{L/K}} \frac{1}{[L:F]} \mathbb{Z}/\mathbb{Z} \rightarrow 1 \quad (19.7.3.3),$$

by taking direct limit, we get the homomorphism

$$\text{Br}(F) \rightarrow \bigoplus_{\mathfrak{p} \in \Sigma_F} \text{Br}(F_{\mathfrak{p}}) \xrightarrow{\text{inv}_F} \mathbb{Q}/\mathbb{Z}.$$

But by (19.7.3.15), these groups are unions over only the cyclic extensions  $L/F$ . But for cyclic extensions the above sequence is exact (19.7.3.13), so the limit is also exact.

2: [Poonen, Rational Points, P26]. ?

3: It follows from item1 that for any division ring  $D/F$ ,  $[D] \in \text{Br}(F)$  has exponent  $n = \text{lcm}(\text{ord}(\text{inv}_v([D])))$ . So it follows from (11.2.3.2) that there  $n_v | \text{ind}([D])$  for any  $v$ , so  $n | \text{ind}([D])$ .

And it follows from Grünwald-Wang (19.7.4.32) and the local-global compatibility of  $\text{inv}_v$  that there exists a cyclic extension  $L/K$  of degree  $n$  that splits  $D$ . Then it follows from (3.6.4.18) (11.2.2.2) that there exists  $B = \text{Mat}(r; D)$  s.t.  $L \subset B$  and  $[B:F] = [L:K]^2$ . Thus  $[D:F] | [L:K]^2$ , so  $\text{ind}(D) = n$ .  $\square$

**Prop. (11.2.4.2) [Norm Groups of Division Rings, Eichler].** If  $F \in \text{NField}$  and  $D/F$  is a division ring of index  $n$ , then  $\text{Nm}_{D/K}(D^\times) \subset F^\times$  is the set of elements that is positive under all  $v \in \Sigma_F^{\mathbb{R}}$  s.t.  $D_v \not\cong \text{Mat}(n; F_v)$ .  $\lrcorner$

*Proof:* Cf. [P-R94] P38.  $\square$

**Prop. (11.2.4.3) [Wang].** If  $F \in \text{NField}$  and  $D/F$  is a division ring of index  $n$ , then  $\text{SL}(1; D) = [D^\times, D^\times]$ .  $\lrcorner$

**Prop. (11.2.4.4).**  $\lrcorner$

## 5 Function Field case

**Conj. (11.2.5.1) [Period-Index Conjecture, Colliot-Thelene(01)].** If  $k = \bar{k}$  and  $X \in \text{SmProj}/k$ , if  $\alpha \in \text{Br}(R(X))$ , then  $\text{ind}(\alpha) | \text{per}(\alpha)^{\dim X - 1}$  (11.2.2.2).  $\lrcorner$

*Proof:*  $\square$

**Thm& Conj. Cor. (11.2.5.2).** If  $k = \bar{k}$  and  $X \in \text{SmProj}^1/k$ , then  $\text{Br}(R(X)) = 1$ . In particular, the period-index conjecture is true in this case.

If  $k = \bar{k}$  and  $X \in \text{SmProj}^1/k$ , then the period-index conjecture is true by deJong-Lieblich.  $\lrcorner$

## 6 Severi-Brauer Varieties

References are [Severi – Brauer varieties: a geometric treatment, Kollar] and [Central Simple Algebras and Galois Cohomology].

**Def. (11.2.6.1) [Severi-Brauer Varieties].** For  $k \in \text{Field}$ , a **Severi-Brauer variety** over  $k$  is a  $k$ -variety  $X$  that is a  $k$ -form for  $\mathbb{P}_k^n$  for some  $n \in \mathbb{N}$ .

If  $K/k$  is a field extension and  $X_K \cong \mathbb{P}_K^n$ , then  $K$  is called a **splitting field** for  $X$ .  $\lrcorner$

**Prop. (11.2.6.2).** Let  $k \in \mathbf{Field}$  and  $X$  a Severi-Brauer variety over  $k$ , then a **twisted-linear subvariety** of  $X$  is a closed subvariety of  $X$  s.t. the inclusion  $Y_{\bar{k}} \subset X_{\bar{k}} \cong \mathbb{P}_{\bar{k}}^n$  embeds  $Y_{\bar{k}}$  as a linear subvariety of  $\mathbb{P}_{\bar{k}}^n$ .  $\lrcorner$

**Prop. (11.2.6.3) [Châtelet].** For  $k \in \mathbf{Field}$  and an  $n$ -dimensional Severi-Brauer variety  $X$  over  $k$ , the following are equivalent:

- $X \cong \mathbb{P}_k^n$ .
- $X \sim \mathbb{P}_k^n$ .
- $X(k) \neq \emptyset$ .
- $X$  contains a twisted-linear subvariety of codimension 1.

 $\lrcorner$ 

*Proof:*  $1 \rightarrow 2$  is trivial. If 2 holds, then to show item 3, if  $\#k = \infty$ , then any Zariski open subset of  $\mathbb{P}_k^n$  contains a  $k$ -point, and if  $\#k < \infty$ , clearly any Severi-Brauer variety over  $k$  splits over a finite Galois field extension of  $k$ , so by the proof of (11.2.6.6)  $\color{red}?$  shows that  $SB_n(K) \cong H^1(k, \mathrm{PGL}(n)) = 1$  (11.2.2.7). Thus  $X \cong \mathbb{P}_k^n$  has a rational point.

$4 \rightarrow 1$ : The twisted-linear subvariety is a divisor of  $X$   $\color{red}?$ , so it defines a rational map  $\varphi_D$  into some projective variety, and when base changed to  $\bar{k}$ , it is the isomorphism of  $X$  with  $\mathbb{P}_{\bar{k}}^n$ . Thus it must be an isomorphism.

$3 \rightarrow 4$ : Cf. [Central Simple Algebras] P341.  $\color{red}?$

 $\square$ 

**Cor. (11.2.6.4) [Galois Splitting Fields].** Let  $k \in \mathbf{Field}$  and  $X$  a Severi-Brauer variety over  $k$ , then  $X$  has a finite Galois splitting field.  $\lrcorner$

*Proof:* It suffices to show that  $k^s$  is a splitting field for  $X$ . But for this, by the theorem, it suffices to notice  $X_{k^s}$  always has a rational point (7.12.1.10).  $\square$

**Cor. (11.2.6.5).** Severi-Brauer groups satisfy the local-global property.  $\lrcorner$

*Proof:* Cf. [Poonen] P108.  $\square$

**Prop. (11.2.6.6) [Severi-Brauer Varieties and Galois Cohomologies].** For  $k \in \mathbf{Field}$ , there is an isomorphism of pointed sets  $H^1(k, \mathrm{PGL}(n)) \cong SB_n(L/K)$ , where  $SB_n(L/K)$  is the isomorphism classes of Severi-Brauer varieties of dimension  $n - 1$  that splits in  $L$ .  $\lrcorner$

*Proof:* Cf. [Neukirch Cohomology of Number Fields P348].  $\square$

## 7 Brauer-Manin Obstruction

**Prop. (11.2.7.1).** For  $F \in \mathbf{GField}$  and  $X \in \mathbf{Sch}^{\mathrm{sm}}/F$ , there is a natural continuous right-linear pairing

$$\gamma : X(\mathbf{A}_F) \times \mathrm{Br}(X) \rightarrow \mathbb{Q}/\mathbb{Z}$$

s.t. the restriction to  $X(F) \times \mathrm{Br}(X)$  is trivial.

Let  $X(\mathbf{A}_F)^{\mathrm{Br}}$  denote the left kernel of  $\gamma$ , then we say the **Brauer-Manin obstruction** is sufficient for  $X$  if  $X(F) \subset X(\mathbf{A}_F)^{\mathrm{Br}}$  is dense.  $\lrcorner$

*Proof:*  $\color{red}?$

 $\square$ 

**Prop. (11.2.7.2).** If  $F \in \mathbf{GField}$  and  $X \in \mathbf{SmProj}/F$ , then if  $X$  satisfies the weak approximation, then Brauer-Manin obstruction is sufficient.  $\lrcorner$

*Proof:*

 $\square$

## 12.1 Condensed Mathematics(Scholze)

Main references are [Condensed Mathematics, Scholze]. [Lectures on Condensed Mathematics, Clausen-Scholze], [Lectures on Analytic Geometry, Clausen-Scholze].

**Notation(12.1.0.1).**

- Use notations defined in [Profinite Cohomology](#).

┘

### 1 Introduction

**Remark(12.1.1.1).** Delete this subsection. ?

┘

Condensed mathematics is invented to overcome the subtleties when dealing with algebra together with topology. For example, the category of topological Abelian groups doesn't form an Abelian category.

### 2 Condensed Objects

**Def.(12.1.2.1) [ $\kappa$ -Condensed Objects].** The pro-étale site  $*_{pro\acute{e}t}$  of a point is isomorphic to  $\mathcal{P}rof$  in the standard topology. For any uncountable strong limit cardinal  $\kappa$ , the site  $\mathcal{P}rof_\kappa$  is the category of  $\kappa$ -small profinite sets  $S$  in the standard topology.

Then for any  $\mathcal{C} \in \mathcal{C}at$ , we can define the category  $\mathcal{C}ond_\kappa(\mathcal{C})$  of  $\kappa$ -**condensed objects** in  $\mathcal{C}$  to be the category  $\mathcal{F}unc(\mathcal{P}rof_\kappa, \mathcal{C})$ .

┘

**Prop.(12.1.2.2)[Adjointness].** Given an uncountable strong limit cardinal  $\kappa$ , the functors

$$X \mapsto \underline{X} : \mathcal{P}rof / \mathcal{G}rp / \mathcal{C}Alg \rightarrow \mathcal{C}ond(\mathcal{S}et) / \mathcal{C}ond(\mathcal{G}rp) / \mathcal{C}ond(\mathcal{C}Alg)$$

are faithful, and fully faithful when restricted to the category of  $\kappa$ -small objects.

And there is an adjunction

$$X \mapsto \underline{X} : \mathcal{P}rof \rightleftarrows \mathcal{C}ond(\mathcal{S}et) : T \mapsto T(*)_{\text{top}} = \varinjlim_{S \in \mathcal{P}rof_\kappa / T} S.$$

In particular,  $\underline{X}(*)_{\text{top}} \cong X_{\kappa\text{-cg}}$ .

┘

*Proof:* Firstly,  $\underline{X}$  is truly a condensed set: for the sheaf condition, let  $S' \rightarrow S$  be surjective morphism of profinite spaces, then the sheaf condition is true set-theoretically, and for any map  $S \rightarrow T$ , if  $S' \rightarrow S \rightarrow T$  is continuous, then  $S \rightarrow T$  is continuous, because  $S' \rightarrow S$  is a closed map.

It suffices to check the set case, and the faithfulness and fully faithfulness follows from the adjointness

$$\mathrm{Hom}_{\kappa\text{-Cond}(\mathrm{Set})}(T, \underline{X}) = \mathrm{Hom}(T(*)_{\mathrm{top}}, X).$$

Notice that any  $s \in T(S)$  induces a map of sets  $\bar{s} : S \rightarrow T(*) : x \mapsto T(* \xrightarrow{x} S)(s)$ , inducing the topology of  $T(*)$ . And by definition, a morphism  $T \rightarrow \underline{X}$  is just a morphism  $T(*) \rightarrow X$  that for any  $S \rightarrow T$ , the composition  $S \rightarrow T(*) \rightarrow X$  is continuous. And by definition, this is just a morphism from  $T(*)_{\mathrm{top}} \rightarrow X$ .

The last assertion follows from the fact any compact Hausdorff space  $S$  is a quotient space of its Stone-Ćech compactification.  $\square$

**Prop. (12.1.2.3) [Free Condensed Abelian Groups].** By the adjoint functor theorem (4.1.1.35), the forgetful functor from  $\mathrm{Cond}(\mathcal{A}b)$  to  $\mathrm{Cond}(\mathrm{Set})$  has a left adjoint  $T \mapsto \mathbb{Z}[T]$ . Concretely,  $\mathbb{Z}[T]$  is the sheafification of the functor that sends a compact Hausdorff space  $S$  to the free Abelian group  $\mathbb{Z}[T(S)]$ . In particular, by Yoneda lemma, for any compact Hausdorff space  $S$ , there is a condensed Abelian group  $\mathbb{Z}[S]$  that for any condensed Abelian group  $M$ ,  $\mathrm{Hom}(\mathbb{Z}[S], M) = M(S)$ .  $\lrcorner$

**Lemma (12.1.2.4).** Consider the site of all  $\kappa$ -small compact Hausdorff topological spaces, then the category of sheaves on this site is equivalent to that of  $\mathrm{Prof}_{\kappa}$  (via restriction).  $\lrcorner$

*Proof:* Use (7.1.2.25), because any  $\kappa$ -small compact Hausdorff space is a quotient space of a  $\kappa$ -small profinite space  $(\beta S_0)$  (4.4.2.15), noticing that  $|\beta S| \leq 2^{2^{|S|}} < \kappa$ .  $\square$

**Lemma (12.1.2.5).** Consider the site of all  $\kappa$ -small extremally disconnected spaces, then the category of sheaves on this site is equivalent to that of  $\kappa$ -small condensed sets, via restriction.  $\lrcorner$

*Proof:* Because any  $\kappa$ -small compactly generated space is a quotient space of a  $\kappa$ -small extremally disconnected space  $(\beta S)$  (4.4.2.17), noticing that  $|\beta S| \leq 2^{2^{|S|}} < \kappa$ .  $\square$

**Cor. (12.1.2.6) [Cond( $\mathcal{A}b$ ) and Extremally Disconnected Spaces].** The category of  $\kappa$ -condensed Abelian groups is equivalent to the category of presheaves  $\mathcal{F}$  on the category of  $\kappa$ -extremally disconnected spaces that  $\mathcal{F}(\emptyset) = 0$  and  $\mathcal{F}(S_1 \coprod S_2) = \mathcal{F}(S_1) \times \mathcal{F}(S_2)$ .  $\lrcorner$

*Proof:* It suffices to show that the second sheaf condition is automatic: For a surjective map of extremally disconnected spaces  $f : \tilde{S} \rightarrow S$ , there is an isomorphism

$$\mathcal{F}(S) \xrightarrow{\mathcal{F}(f)} \{g \in \mathcal{F}(\tilde{S}) \mid \mathcal{F}(p_1)(g) = \mathcal{F}(p_2)(g)\}.$$

By (4.4.1.32), there is a section  $\sigma : S \rightarrow \tilde{S}$  that  $f \circ \sigma = \mathrm{id}_S$ , thus  $\mathcal{F}(\sigma) \circ \mathcal{F}(f) = \mathrm{id}$ , thus  $\mathcal{F}(f)$  is injective. For the surjectivity, suppose  $\mathcal{F}(p_1)(g) = \mathcal{F}(p_2)(g)$ , then

$$\mathcal{F}(p_2)(\mathcal{F}(f)\mathcal{F}(\sigma)(g)) = \mathcal{F}((\sigma \circ f) \times_S \mathrm{id}_{\tilde{S}})\mathcal{F}(p_1)(g) = \mathcal{F}((\sigma \circ f) \times_S \mathrm{id}_{\tilde{S}})\mathcal{F}(p_2)(g) = \mathcal{F}(p_2)(g)$$

And similarly  $\mathcal{F}(p_2)$  is injective, thus  $g = \mathcal{F}(f)\mathcal{F}(\sigma)(g)$  is in the image.  $\square$

**Prop. (12.1.2.7) [Category of Condensed Abelian Groups].** The category of  $\kappa$ -condensed Abelian groups satisfies Grothendieck's Axiom  $AB3, AB4, AB5, AB6, AB3^*, AB4^*$ . And also it is generated by compact projective objects.  $\lrcorner$

*Proof:* We use (12.1.2.6). Because all limits and colimits of Abelian groups commutes with finite products, the limits and colimits in the category of condensed Abelian groups are just the pointwise limits and colimits, thus the axioms follow from that of the category  $\mathcal{A}b$ .

By (12.1.2.3), the condensed Abelian group  $\mathbb{Z}[S]$  for  $S$   $\kappa$ -extremally disconnected satisfies  $\text{Hom}(\mathbb{Z}[S], M) = M(S)$ , and by arguments above,  $M \rightarrow M(S)$  commutes with all limits and colimits, thus  $\mathbb{Z}[S]$  is compact and projective. And we show every  $M$  admits a surjection from some direct sum of  $\mathbb{Z}[S]$ : use Zorn's lemma, choose the maximal object  $M'$  that admits a surjection, if  $M/M' \neq 0$ , then find a nonzero map  $\mathbb{Z}[S] \rightarrow M/M'$  (because  $M(S) = 0$  for any  $S$  implies  $M = 0$ ), then it lifts to a nonzero map  $\mathbb{Z}[S] \rightarrow M$  by projectivity, contradiction.  $\square$

**Cor. (12.1.2.8).**

- We can define the tensor of two condensed Abelian groups  $M, N$  as the shiffication of the presheaf  $S \mapsto M(S) \otimes N(S)$ .
- We can define an internal Hom, which is right adjoint to tensor operator. In particular, for any compact Hausdorff space  $S$ ,  $\underline{\text{Hom}}(M, N)(S) = \text{Hom}(\mathbb{Z}[S] \otimes M, N)$ .
- The derived category  $D(\text{Cond}(\mathcal{A}b))$  is also compactly generated, and we can define Rtensor and RHom as in 2.

*Proof:* Cf.[Condensed Mathematics, P13].?  $\square$

**Prop. (12.1.2.9).** Let  $\kappa' > \kappa$  be uncountable strongly limit cardinals, then there is a natural functor from the set of  $\kappa$ -condensed sets to the category of  $\kappa'$ -condensed sets by pulling back along the morphism of sites  $\text{Prof}_{\kappa'} \rightarrow \text{Prof}_{\kappa}$ . Then this functor is fully faithful and commutes with all colimits and  $\lambda$ -small limits, where  $\lambda$  is the cofinality of  $\kappa$ .  $\lrcorner$

*Proof:* This should have something to do with (7.1.2.25), thus it is left adjoint to the restriction functor and  $i^s i_s \cong \text{id}$ , thus it is fully faithful and commutes with all colimits. For the limits, cf.[Condensed Mathematics, P14].?  $\square$

**Def. (12.1.2.10) [Condensed Objects].** For any  $\mathcal{C} \in \text{Cat}$ , define the category  $\text{Cond}(\mathcal{C})$  of **condensed objects** in  $\mathcal{C}$  is defined to be the filtered colimits of the category of  $\kappa$ -condensed sets along the filtered poset of all uncountable limit cardinals  $\kappa$ .  $\lrcorner$

**Prop. (12.1.2.11).** If  $X$  is a  $T_1$  topological space, then  $\underline{X}$  is a condensed set that all maps from points are quasicompact. Conversely, if  $T$  is a condensed set that all maps from points are quasicompact, then  $T(*)_{\text{top}}$  is a compactly generated  $T_1$  space.  $\lrcorner$

*Proof:* Cf.[Condensed Mathematics, P16].?  $\square$

**Prop. (12.1.2.12) [ $\mathcal{T}_{\text{op}}$  and  $\text{Cond}(\text{Set})$ ].**

- The functor  $X \mapsto \underline{X}$  induces an equivalence between compact Hausdorff space and qcqs condensed sets.
- A compactly generated space  $X$  is weak Hausdorff iff  $\underline{X}$  is quasi-separated. For any quasi-separated condensed set  $T$ , the space  $T(*)_{\text{top}}$  is compactly generated weak Hausdorff.  $\lrcorner$

*Proof:* Cf.[Condensed Mathematics, P16].?  $\square$

**Prop. (12.1.2.13).** The example  $(R, \text{disc}) \rightarrow (R, \text{Nat})$ .?

In particular, enlarging topological abelian groups into an abelian category precisely forces us to include non-quasi-separated objects.  $\lrcorner$

### 3 Cohomologies

**Prop. (12.1.3.1).** For any set  $I$ , there is an isomorphism

$$\check{H}^i(\prod_I S^1, \mathbb{Z}) \cong \bigwedge^i (\oplus_I \mathbb{Z}).$$

preserving the natural cup product.  $\lrcorner$

*Proof:* If  $I$  is finite, this follows from the classical calculation of the cohomology of the tori. If  $I$  is infinite, then we should use lemma (12.1.3.2) below.  $\square$

**Lemma (12.1.3.2).** If  $S_j, j \in J$  is a filtered system of compact Hausdorff spaces and  $S = \varprojlim_{j \in J} S_j$ , then there are natural maps

$$\varprojlim_j \check{H}^i(S_j, \mathbb{Z}) \rightarrow \check{H}^i(S, \mathbb{Z})$$

are isomorphisms.  $\lrcorner$

*Proof:*  $\square$

**Prop. (12.1.3.3) [Z-Cohomology].** Let  $S$  be a compact Hausdorff space, then there are natural functorial isomorphisms

$$H^i(S, \mathbb{Z}) \cong H_{\text{Cond}}^i(S, \mathbb{Z}).$$

*Proof:* Because the Čech and sheaf cohomology of  $S$  are equal by (7.3.5.13), it suffices to calculate for Čech cohomology.  $\lrcorner$

Firstly, if  $S$  is a profinite set, let  $S = \varprojlim_j S_j$  where  $S_j$  are finite, then  $\square$

**Prop. (12.1.3.4) [R-Cohomologies Vanish].** For any compact Hausdorff space  $S$ ,

$$H_{\text{Cond}}^i(S, \mathbb{R}) = 0$$

for  $i > 0$ , and  $H^0(S, \mathbb{R}) = C(S, \mathbb{R})$ .  $\lrcorner$

*Proof:* Cf. [Condensed Mathematics, P21].  $\square$

### 4 LCAs

### 5 Solid Abelian Groups

**Def. (12.1.5.1) [Solid Abelian Group].** For a profinite set  $S = \varprojlim S_i$ , define the condensed Abelian group

$$\mathbb{Z}[S]^{\blacksquare} = \varprojlim \mathbb{Z}[S_i].$$

There is a natural map  $S \rightarrow \mathbb{Z}[S]^{\blacksquare}$ , inducing a map  $\mathbb{Z}[S] \rightarrow \mathbb{Z}[S]^{\blacksquare}$ .

Then a **solid Abelian group** is a condensed Abelian group  $A$  that for any profinite set  $S$  and a morphism of Abelian groups  $\mathbb{Z}[S] \rightarrow A$  extends to a morphism  $\mathbb{Z}[S]^{\blacksquare} \rightarrow A$ .

A complex  $C \subset D(\text{Cond}(\mathcal{A}b))$  is called a **solid complex** if for all profinite set  $S$ , the natural map

$$R\text{Hom}(\mathbb{Z}[S]^{\blacksquare}, C) \rightarrow R\text{Hom}(\mathbb{Z}[S], C)$$

is an isomorphism.  $\lrcorner$

**Prop. (12.1.5.2)[Free Solid Abelian Group].** For a profinite set  $S$ ,

- Consider ?

$$\mathbb{Z}[S]^{\blacksquare} = \varprojlim \mathbb{Z}[S_i] = \varprojlim \underline{\mathrm{Hom}}(C(S_i, \mathbb{Z}), \mathbb{Z}) = \underline{\mathrm{Hom}}(C(S, \mathbb{Z}), \mathbb{Z}).$$

This means that the underlying Abelian group of  $\mathbb{Z}[S]^{\blacksquare}$  is the  $\mathbb{Z}$ -valued measures on  $S$ .

- There is some set  $|I| \leq 2^{|S|}$ , that there is an isomorphism  $\mathbb{Z}[S]^{\blacksquare} \cong \prod_I \mathbb{Z}$ .
- $\mathbb{Z}[S]^{\blacksquare}$  is solid both as a module and a complex.

┘

*Proof:* 2: Take an isomorphism  $C(S, \mathbb{Z}) \cong \oplus_I \mathbb{Z}$ ?, then

$$\mathbb{Z}[S]^{\blacksquare} = \underline{\mathrm{Hom}}(C(S, \mathbb{Z}), \mathbb{Z}) \cong \underline{\mathrm{Hom}}(\bigoplus_I \mathbb{Z}, \mathbb{Z}) \cong \prod_I \mathbb{Z}.$$

3: We need to show the extension property, but by 2, it suffices to show for  $\mathbb{Z}[S]^{\blacksquare} = \mathbb{Z}$ ?. □

**Prop. (12.1.5.3)[Category of Solid Abelian Groups].** The category  $\mathrm{Solid} \subset \mathrm{Cond}(\mathcal{A}\mathrm{b})$  is an Abelian subcategory that is stable under all limits, colimits and extensions. The objects  $\prod_I \mathbb{Z}$ , where  $I$  is any set, form a family of compact projective generators. The inclusion  $\mathrm{Solid} \subset \mathrm{Cond}(\mathcal{A}\mathrm{b})$  admits a left adjoint  $M \mapsto M^{\blacksquare}$  which is the unique colimit-preserving extension of  $\mathbb{Z}[S] \mapsto \mathbb{Z}[S]^{\blacksquare}$ .

The functor  $D(\mathrm{Solid}) \rightarrow D(\mathrm{Cond}(\mathcal{A}\mathrm{b}))$  is fully faithful and its essential image is precisely the solid Abelian groups, and the inclusion admits a left adjoint  $C \rightarrow C^L$  which is left derived functor of  $M \rightarrow M^{\blacksquare}$ . ┘

## 12.2 Topological Commutative Algebra(Adic Rings)

References are [Hub93, Sch12, Bos15, B-S19, Mor19].

**Notation(12.2.0.1).**

- Use notations on topological groups defined in [Topology II](#).
- Use notations on  $p$ -adic commutative algebra defined in [p-adic Commutative Algebras](#).

┘

### 1 Topological Abelian Groups and Rings

**Def.(12.2.1.1) [Topological Rings].** A **topological Abelian group** is an Abelian group with a topology structure that the addition and inversion are all continuous.

A **topological (commutative)ring** is a commutative ring  $R \in \mathcal{CRing}$  endowed with a topology structure that the addition, multiplication and inversion are all continuous. The category of topological rings is denoted by  $\mathcal{TopCRing}$ .

Similarly we can define a **topological module** over a topological ring. ┘

**Def.(12.2.1.2) [Topologically Nilpotent Element].** For  $A \in \mathcal{TopCRing}$ ,  $x \in A$  is called **topologically nilpotent element** iff  $x^n \rightarrow 0$  when  $n \rightarrow \infty$ . The set of topologically nilpotent elements is denoted by  $A^{00} \subset A$ . ┘

**Def.(12.2.1.3) [Bounded Sets].** For  $A \in \mathcal{TopCRing}$ , a subset  $S \subset A$  is called a **bounded subset** iff for all open nbhd  $U$  of 0, there exists an open nbhd  $V$  of 0 that  $VS \subset U$  ┘

**Def.(12.2.1.4) [Power-Bounded Elements].** For  $A \in \mathcal{TopCRing}$ ,  $x \in A$  is called a **power-bounded element** if  $\{x^n | n \in \mathbb{Z}_+\}$  is a bounded subset of  $A$  (12.2.1.3). The set of power-bounded elements are denoted by  $A^0$ . ┘

**Def.(12.2.1.5) [Uniform Rings].**  $A \in \mathcal{TopCRing}$  is called a **uniform ring** if  $A^{00}$  is bounded in  $A$  (12.2.1.2)(12.2.1.3). ┘

**Def.(12.2.1.6) [Strict Morphism].** A **strict morphism** of topological rings is a continuous morphism that the quotient topology and the subspace topology coincides on the image. ┘

### Completion of Topological Abelian Groups

**Prop.(12.2.1.7) [Completion].** There exists a completion functor left adjoint to the forgetful functor from the category of complete topological Abelian groups to the category of topological Abelian groups, given by Cauchy filters. ┘

*Proof:* ┘

**Prop.(12.2.1.8) [Subgroups and Completion].** Let  $A \in \mathcal{TopAb}$ , then the completion  $i : A \rightarrow \hat{A}$  induces a bijection between the set of open subgroups of  $A$  and the open subgroups of  $\hat{A}$ , given by  $G \mapsto \overline{i(G)} = \hat{G}$ . ┘

*Proof:* Cf.[Mor19]P74. ┘

**Def.(12.2.1.9) [Restricted Power Series].** For  $R \in \mathcal{TopCRing}$ , the **restricted power series** over  $R$  is defined to be

$$R\langle X_1, \dots, X_n \rangle \triangleq \left\{ \sum a_v X^v \in R[[X_1, \dots, X_n]] : \lim_{v \rightarrow \infty} a_v \rightarrow 0 \right\}.$$

┘

### Adic Rings

**Def. (12.2.1.10) [Adic Rings].** An **adic ring** is a topological ring  $R \in \text{TopCRing}$  s.t. the topology coincides with the  $\mathfrak{a}$ -adic topology for some ideal  $\mathfrak{a} \in \text{Ideal}(R)$ , and any such  $\mathfrak{a}$  is called a **ideal of definition**.

Write  $(R, \mathfrak{a}) \in \text{AdicCRing}$  to denote that  $R$  is an adic ring with an ideal of definition  $\mathfrak{a}$ .  $\lrcorner$

**Prop. (12.2.1.11).** If  $(R, \mathfrak{a}) \in \text{AdicCRing}$  (12.2.1.10) and  $R$  is Noetherian, then  $R$  has a maximal ideal of definition.  $\lrcorner$

*Proof:* ?  $\square$

**Prop. (12.2.1.12) [Topologically Nilpotent Elements].** For  $A \in \text{AdicCRing}$  and  $x \in A$ , the following are equivalent:

- $x$  is topologically nilpotent.
- There exists an ideal of definition  $I$  that the image of  $x$  in  $A/I$  is nilpotent.
- There exists an ideal of definition  $I$  that  $x \in I$ .

In particular, the  $A^{00}$  is an open radical ideal of  $A$  (12.2.1.2), and it is the union of all ideals of definitions in  $A$  (12.2.1.10).  $\lrcorner$

*Proof:*  $3 \rightarrow 1 \rightarrow 2$  is trivial.  $2 \rightarrow 3$ : if  $x$  is nilpotent in  $A/I$ , let  $J = I + xA$ , then  $J$  is an open ideal, and  $J^n \in I$ , so  $I$ -adic and  $J$ -adic topologies on  $A$  coincide, so  $J$  is an ideal of definition.

The rest is easy.  $\square$

**Prop. (12.2.1.13) [Adic Localization].** For  $(R, \mathfrak{a}) \in \text{AdicCRing}$ , the restricted power series  $R\langle \xi \rangle$  is complete w.r.t. the  $\mathfrak{a}$ -adic topology, and in fact

$$R\langle \xi \rangle \cong \varprojlim_n R/\mathfrak{a}^n[\xi].$$

For  $f \in R$ , we can define the **adic completion** of  $R$  at  $f$  to be the

$$R\langle f^{-1} \rangle = \varprojlim_n (R/\mathfrak{a}^n[\frac{1}{f}]).$$

The natural map  $R\langle \xi \rangle \rightarrow R\langle f^{-1} \rangle$  induces an isomorphism

$$R\langle \xi \rangle / (1 - f\xi) \cong R\langle f^{-1} \rangle.$$

$\lrcorner$

*Proof:* There is an isomorphism  $R[f^{-1}]/(\mathfrak{a}^n) \cong (R/\mathfrak{a}^n)[f^{-1}]$  because localization is flat, so we are done.  $\square$

**Remark (12.2.1.14).** There is another canonical morphism  $R[f^{-1}] \rightarrow R\langle f^{-1} \rangle$  which exhibits  $R\langle f^{-1} \rangle$  as the completion of  $R[f^{-1}]$  w.r.t. the ideal  $\mathfrak{a}R[f^{-1}]$ .

Then  $R\langle f^{-1} \rangle$  is endowed with an  $\mathfrak{a}$ -adic topology, and if  $\mathfrak{a}$  is f.g., then  $R\langle f^{-1} \rangle$  is complete w.r.t. to the  $\mathfrak{a}R\langle f^{-1} \rangle$ -adic topology. Also we see  $R\langle f^{-1} \rangle$  doesn't depend on the choice of ideal of definition of  $\mathfrak{a}$ .  $\lrcorner$

*Proof:* Consider the projective system of exact sequences:

$$0 \rightarrow (1 - f\xi)R/\mathfrak{a}^n[\xi] \rightarrow R/\mathfrak{a}^n[\xi] \rightarrow R/\mathfrak{a}^n[f^{-1}] \rightarrow 0.$$

which is a surjective system so by Mittag-Leffler(4.1.1.45),  $\varprojlim$  is exact(5.9.3.2), and there is an exact sequence

$$0 \rightarrow \varprojlim_n (1 - f\xi)R[\xi] \rightarrow \varprojlim_n R[\xi] \rightarrow \varprojlim_n R[f^{-1}] \rightarrow 0.$$

Now  $\varprojlim_n (1 - f\xi)R[\xi] \cong (1 - f\xi) \cong (1 - f\xi)R\langle\xi\rangle$ , because  $(1 - f\xi)$  is not a zero-divisor in  $R/\mathfrak{a}^n$ , and we get the desired isomorphism.  $\square$

**Def. (12.2.1.15) [Completed Tensor Product].** Let  $(A, \mathfrak{a}), (B, \mathfrak{b}) \in \text{AdicCRing}$  be complete, then we can define a **complete tensor product** ring  $(A \widehat{\otimes} B, (\mathfrak{a} \otimes B + A \otimes \mathfrak{b})) \in \text{AdicCRing}$  as

$$A \widehat{\otimes} B = \varprojlim_n (A/\mathfrak{a}^n \otimes B/\mathfrak{b}^n)$$

this is just the  $(\mathfrak{a} \otimes B + A \otimes \mathfrak{b})$ -adic completion of the tensor product  $A \otimes B$ , because  $(\mathfrak{a} \otimes B + A \otimes \mathfrak{b})^n$  and  $(\mathfrak{a}^n \otimes B + A \otimes \mathfrak{b}^n)$  are cofinal.  $\lrcorner$

### Properties of $R$ -Algebras

**Def. (12.2.1.16) [Topologically of Finite Presentation].** For  $(R, I) \in \text{AdicCRing}$ ,  $(A, I_A) \in \text{AdicCRing}/R$  is called

- **of topologically finite type** if  $A \cong R\langle\zeta_1, \dots, \zeta_n\rangle/\mathfrak{a}$  and  $I_A = IA$ , where  $\mathfrak{a} \in \text{Ideal}(R\langle\zeta_1, \dots, \zeta_n\rangle)$ .
- **of topologically finite presentation** if moreover the ideal  $\mathfrak{a}$  is f.g..
- **admissible** if it is of topologically finite presentation and  $A[I] = 0$ .

$\lrcorner$

**Prop. (12.2.1.17) [Raynaud-Gruson].** For  $(R, I) \in \text{AdicCRing}$ , if  $A \in \text{AdicCRing}$  is an  $R$ -algebra of topologically finite type(12.2.1.16) and  $M \in \text{Mod}_A$  is flat over  $R$ . Then  $M$  is an  $A$ -module of f.p..  $\lrcorner$

*Proof:* Cf.[Bos15]P165.  $\square$

**Cor. (12.2.1.18).** For  $(R, I) \in \text{AdicCRing}$ , if  $A \in \text{AdicCRing}$  is an  $R$ -algebra of topologically finite type(12.2.1.16) s.t.  $A[I] = 0$ , then  $A$  is of topologically finite presentation, in particular admissible(12.2.1.16).  $\lrcorner$

*Proof:* Cf.[Bos15]P166.  $\square$

**Prop. (12.2.1.19) [Topologically of Finite Presentation is Local].** Let  $A$  be an  $R$ -algebra that is  $I$ -adically complete and separated,  $f_1, \dots, f_r$  be a set of elements generating the unit ideal, then  $A$  is of topologically finite type/topologically finite presentation/admissible iff each  $A\langle f_i^{-1} \rangle$  does.  $\lrcorner$

*Proof:* Cf.[Bos15]P169.  $\square$

## 2 Valuation Rings

**Def.(12.2.2.1) [Valuation Ring].** A **valuation ring** is the maximum elements in the dominating ordering of local rings in a field  $K$ , where  $B$  **dominates**  $A$  iff  $A \subset B$  and  $\mathfrak{m}_B \cap A = \mathfrak{m}_A$ .

A valuation ring in  $K$  is called **absolutely algebraically closed** if  $K$  is alg.closed. ┘

**Prop.(12.2.2.2) [Valuation is Maximal].** Any local ring  $A$  in a field  $K$  is dominated by a valuation ring with fractional field  $K$ . ┘

*Proof:* Note that the dominating relation satisfies the condition of the Zorn's lemma, so it suffices to prove that  $A$  is not maximal if its fractional field is not  $K$ . Let  $t \notin K_0 = \text{frac}A$ . If  $t$  is transcendental over  $K_0$ , then  $A[t]$  with the maximal ideal  $(\mathfrak{m}, t)$  dominate  $A$ . If  $t$  is algebraic over  $K_0$ , then there is a  $a$  that  $at$  is integral over  $A$ , hence by (5.2.1.5) there is a maximal ideal of  $A[at]$  above  $A$ , which proves the lemma. □

**Prop.(12.2.2.3) [Valuation Ring Criterion].**  $A$  is a valuation ring with field of fraction  $K$  iff for any  $x \in K$ ,  $x$  or  $x^{-1}$  is in  $A$ . ┘

*Proof:* If  $A$  is a valuation ring, then for  $x \notin A$ , we know that  $A[x]$  is a local ring, hence there is no prime over  $\mathfrak{m}$  otherwise  $A[x]_{\mathfrak{p}}$  is a bigger local ring, so we see  $\mathfrak{m}A[x] = A[x]$ , i.e.  $1 = \sum t_i x^i$ , so  $x^{-1}$  is integral over  $A$ . Now  $A[x^{-1}]$  has a  $\mathfrak{m}'$  over  $\mathfrak{m}$ , so  $A = A[x^{-1}]_{\mathfrak{m}'}$ , which shows  $x^{-1} \in A$ .

Conversely, if for any  $x \in K$ ,  $x$  or  $x^{-1}$  is in  $A$ , we assume  $A$  is not  $K$ , so  $A$  is not field by the condition. Then it has a non-zero maximal ideal, but only one, otherwise we can choose  $x, y$  that  $x/y, y/x \notin A$ . And  $A$  is maximal because if there is a  $A \subset A'$ , and a  $x \in A'$ , then if  $x \notin A$ , then  $x^{-1} \in A$ , hence also in  $\mathfrak{m}_A$ , so it is in  $\mathfrak{m}_{A'}$ , but now  $x^{-1}$  cannot be in  $A'$ , contradiction. □

**Cor.(12.2.2.4).** For  $K \subset L$  subfield, if  $A$  is a valuation ring of  $L$ , then  $A \cap K$  is a valuation ring of  $K$ . And if  $L/K$  is algebraic and  $A$  is not a field, then  $A \cap K$  is not a field. (This is because the primes of  $A$  are all over 0 so cannot contain each other (5.2.1.5) so  $A$  is a field). ┘

**Cor.(12.2.2.5).** The quotient  $A/p$  at a prime is a valuation ring, and any localization of valuation ring is a valuation ring, by this criterion. ┘

**Prop.(12.2.2.6) [Valuation Rings are Normal].** Valuation rings are normal rings. ┘

*Proof:* If  $A$  is a valuation ring and  $x \in \text{Frac}(A)$  is algebraic over  $A$ , then either  $x \in A$ , or  $x$  is a combination of  $x^{-1}$  thus in  $A$ , by (12.2.2.3). □

**Cor.(12.2.2.7) [Integral Closure and Valuation Ring].** The integral closure of a subring in a field  $K$  is the intersection of valuation rings containing  $A$ . ┘

*Proof:* Valuation ring is integrally closed, so it suffices to prove if  $x$  is not algebraic over  $A$ , then there is a valuation ring of  $A$  not containing  $x$ . This is because  $x \notin B = A[x^{-1}]$  otherwise  $x$  is integral over  $A$ . Now  $x^{-1}$  is not a unit in  $B$ , hence  $x \in p \in B$ , hence  $B_p$  is dominated by some valuation ring  $V$ , and  $x \notin V$  because  $x^{-1} \in \mathfrak{m}_V$ . □

**Prop.(12.2.2.8) [Bezout Domain and Valuation Ring].** A valuation ring is equivalent to a Bezout local domain. ┘

*Proof:* One way is because the element of minimum valuation generate the ideal. Conversely, for  $f, g \in A$ ,  $(f, g) = (h)$ , so  $f = ah, g = bh$ , and  $h = cf + dg$ , then  $ab + cd = 1$ , hence  $a$  or  $b$  is a unit, so  $f/g \in A$  or  $g/f \in A$ . By (12.2.2.3),  $A$  is a valuation ring. □

**Prop. (12.2.2.9).** A valuation ring is Noetherian iff it is discrete valuation iff it is PID.  $\lrcorner$

*Proof:* Only need to prove Noetherian then  $\Gamma = \mathbb{Z}$ . we know ideals of  $\Gamma$  of the form  $\{x | x \geq \gamma\}$ , where  $\gamma > 0$  has a maximal element, so there is a minimal element bigger than 0, so  $\Gamma \cong \mathbb{Z}$ .  $\square$

**Prop. (12.2.2.10).** In a fixed field, any inclusion relation of two valuation ring is given by localization.  $\lrcorner$

*Proof:* Just localize at the image of the maximal ideal  $\mathfrak{m}_B \cap A$ , then they are valuation rings (12.2.2.5) that dominate each other, thus they are the same by definition (12.2.2.1).  $\square$

**Def. (12.2.2.11) [Extension of Valuation Rings].** An injective local homomorphism of valuation rings is called an **extension of valuation rings**. By (5.4.1.28), it is equivalent to a f.f. morphism of valuation rings.  $\lrcorner$

### 3 Valuations on Fields

**Notation (12.2.3.1).**

- Let  $K \in \text{Field}$ .

**Def. (12.2.3.2) [Valuations on Fields].** For  $K \in \text{Field}$ , a **field valuation** on  $K$  is a surjective homomorphism  $v : K^\times \rightarrow \Gamma \in \text{Ab}$  s.t.  $v(x + y) \geq \min\{v(x), v(y)\}$  for any  $x \neq -y \in K^\times$ , where  $\Gamma$  is an ordered Abelian group (3.2.9.2). This  $\Gamma$  is called the **value group** of  $v$ .

The **rank of a valuation on field** is defined as the height of its value group (3.2.9.5).

$v$  is called **discrete valuation on field** if  $\Gamma \cong (\mathbb{Z}, < 0)$ .  $\lrcorner$

**Prop. (12.2.3.3) [Valuation Ring and Valuation].** For  $K \in \text{Field}$ , given a valuation ring  $A \leq K$  (12.2.2.1), let  $K^\times \rightarrow \Gamma = K^\times / A^*$  be the natural valuation (12.2.3.2). Conversely, given a valuation  $v$  on  $K$ ,  $A = v^{-1}(\{x \geq 0\}) \cup \{0\}$  is a valuation ring.

Thus valuation rings of  $K$  is equivalent to valuations on  $K$ .  $\lrcorner$

*Proof:* These are definitely valuation rings, and if  $A$  is a valuation ring by (12.2.2.3), then we set  $\Gamma = K^*/A^*$ , where  $A^*$  is the invertible elements of  $A$  and  $x \leq y$  iff  $y/x \in (A - \{0\})/A^*$ . This is totally ordered by (12.2.2.3).  $\square$

**Cor. (12.2.3.4) [Rank and Dimension].** A valuation ring of rank  $n$  (12.2.3.2) has Krull dimension  $n$ , because the set of convex subgroups of  $K^\times / A^*$  (3.2.9.4) is in bijection with the set of ideals of  $A$ .  $\lrcorner$

**Prop. (12.2.3.5) [DVRs].** For a Noetherian local domain  $(A, \mathfrak{m}, \kappa)$  of dimension 1 that is not a field, the following are equivalent:

1.  $A$  is a valuation ring corresponding to a discrete valuation in (12.2.3.3).
2.  $A$  is normal.
3.  $\mathfrak{m}$  is a principal ideal.
4.  $A$  is regular.
5. Every nonzero ideal is a power of  $\mathfrak{m}$ .
6. There exists a  $x \in A$  that every nonzero ideal is of the form  $(x^k)$ .

Such a ring is called a **discrete valuation ring** or a DVR. The category of discrete valued rings are denoted by DVR.  $\lrcorner$

*Proof:*  $1 \rightarrow 2$  : Valuation ring is integrally closed, by(12.2.2.6).

$2 \rightarrow 3$  : As the radical of any non-trivial ideal  $(a)$  is  $\mathfrak{m}$ , and  $A$  is Noetherian, so there is an  $n$  that  $\mathfrak{m}^n \subset a$  and  $\mathfrak{m}^{n-1} \not\subset a$ . Then choose  $b \in a - \mathfrak{m}^{n-1}$ ,  $x = a/b \in K$ , then  $x^{-1} \notin A$ , then it is not integral over  $A$ . So  $x^{-1}\mathfrak{m} \not\subset \mathfrak{m}$ , but  $x^{-1}\mathfrak{m} \subset A$ , so it equals  $A$ , which means  $\mathfrak{m} = (x)$ .

$3 \rightarrow 4$  : Clear.

$4 \rightarrow 5$  : For any ideal  $a$ , its radical is  $\mathfrak{m}$  and  $A$  is Noetherian, so  $\mathfrak{m}^n \subset a$ . Now  $A/\mathfrak{m}^n$  is Artinian by(5.1.3.4), so by(5.1.3.6)  $a$  is a power of  $\mathfrak{m}$ .

$5 \rightarrow 6$  : And  $x \in \mathfrak{m} - \mathfrak{m}^2$  will do.

$6 \rightarrow 1$  : Define  $v(a) = k$  if  $(a) = (x^k)$ . □

**Cor.(12.2.3.6) [Noetherian Valuation Rings are DVRs].** A Noetherian valuation rings are automatically DVRs. ┘

*Proof:* This is implicit in the proof above. □

**Prop.(12.2.3.7).** Let  $R$  be a Noetherian local domain with fraction field  $K$  and  $R \neq K$ , then there exists a Noetherian local ring  $R'$  of dimension 1 that dominates  $R$  s.t.  $R \rightarrow R'$  is essentially of f.t.. ┘

*Proof:* Cf.[Sta]00P8. □

**Cor.(12.2.3.8) [Dominance by DVRs].** Let  $R$  be a Noetherian local domain with fraction field  $K$  and  $R \neq K$ ,  $L/K$  a f.g. filed extension, then there exists a a DVR  $A$  with fraction field  $L$  which dominants  $R$ . ┘

*Proof:* First we can reduce to the case  $L/K$  is finite: If it is not finite, choose a transcendence basis  $x_1, \dots, x_r$ , and replace  $R$  by  $R[x_1, \dots, x_r]_{\mathfrak{m}_{R,x_1,\dots,x_r}}$ .

In the finite case, first we can reduce to the case  $\dim R = 1$  by(12.2.3.7), and let  $A$  be the integral closure of  $R$  in  $L$ , then by(5.1.1.53),  $A$  is Noetherian, and  $R \rightarrow A$  is integral so there exists a maximal prime  $\mathfrak{n} \subset A$  that  $\mathfrak{n} \cap R = \mathfrak{m}_R$ . Thus  $A_{\mathfrak{n}}$  is a DVR by(12.2.3.6). □

### Valuations of Rank 1

In this subsubsection, all valuations are of rank 1(12.2.3.2).

**Remark(12.2.3.9) [Multiplicative Valuations].** As any ordered Abelian group of height 1 can be embedded into  $\mathbb{R}$ (3.2.9.6), a field valuation  $v$  on a field  $K$  of rank 1 is equivalent to a real-valued ultrametric valuation.

In this case, define  $|\cdot| : K \rightarrow \mathbb{R}_+ : |a| = \begin{cases} \exp(-v(a)) & , a \neq 0 \\ 0 & , a = 0 \end{cases}$ . ┘

**Def.(12.2.3.10) [Valuations].** For  $R \in \mathcal{CRing}$ , a **valuation** on  $R$  is a function  $|\cdot| : R \rightarrow \mathbb{R}_{\geq 0}$  s.t.

- $|1| = 1$ .
- $|x + y| \leq |x| + |y|$  for all  $x, y \in R$ .
- $|ab| = |a| \cdot |b|$  for any  $a, b \in R$ .

And a commutative ring with a valuation is called a **valued ring**.

A valuation is called a **non-Archimedean valuation** iff  $|x + y| \leq \max\{|x|, |y|\}$  for any  $x, y$ , i.e.  $|\cdot|$  is a ultrametric valuation(19.1.1.3). It is called an **Archimedean valuation** iff it is not non-Archimedean.

A **non-Archimedean field**(resp. Archimedean field) is a field with a non-Archimedean(resp. Archimedean) valuation. ┘

**Prop. (12.2.3.11).** A valuation on  $K$  is non-Archimedean(12.2.3.10) iff  $\{|n| : n \in \mathbb{N}\} \subset \mathbb{R}_{\geq 0}$  is bounded.  
 $\lrcorner$

*Proof:* If it is non-archimedean, then clearly by induction and  $n = 1 + (n - 1)$   $|n| \leq 1$ . Conversely, if  $|n| \leq M$ , then consider  $|x + y|^n = |(x + y)^n| \leq \sum |C_n^k| x^k y^{n-k} \leq M \max\{|x|, |y|\}$ , so letting  $n$  be large, clearly  $|x + y| \leq \max\{|x|, |y|\}$ .  $\square$

**Cor. (12.2.3.12).** If  $p \in \text{Prime}$  and  $R \in \mathcal{CRing}/\mathbb{F}_p$ , then any valuation on  $R$  is non-Archimedean(12.2.3.10).  
 $\lrcorner$

**Def. (12.2.3.13) [Equivalent Valuations].** For  $R \in \mathcal{CRing}$ , two valuations on  $R$ (12.2.3.10) are called **equivalent** if they induce the same topology on  $K$ .  
 $\lrcorner$

**Prop. (12.2.3.14) [Equivalent Valuations].** Two valuations on a field is equivalent(12.2.3.13) iff  $|x|_1 < 1 \implies |x|_2 < 1$ . And in this case,  $|x|_1 = |x|_2^s$  for some  $s \in \mathbb{R}_+$ .  
 $\lrcorner$

*Proof:* if two valuation are equivalent, then  $x^n \rightarrow 0$  in  $\tau_1$  iff  $x^n \rightarrow 0$  in  $\tau_2$ , so  $|x|_1 < 1 \implies |x|_2 < 1$ .  
 If  $|x|_1 < 1 \implies |x|_2 < 1$ , then let  $y$  be an element that  $|y|_1 > 1$ , then any element  $|x| = |y|^\alpha$  for some  $\alpha \in \mathbb{R}$ . Let  $\frac{n_i}{m_i}$  converges to  $\alpha$  from above, then  $|\frac{x^{n_i}}{y^{m_i}}|_1 < 1$ , so  $|\frac{x^{n_i}}{y^{m_i}}|_2 < 1$ , so  $|x|_2 \leq |y|_2^\alpha$ . Similarly,  $|x|_2 \geq |y|_2^\alpha$ , so  $|x|_2 = |y|_2^\alpha$ . So  $|x|_1 = |x|_2^s$  for some  $s > 0$ .  
 If  $|x|_1 = |x|_2^s$  for some  $s > 0$ , then these two valuations are clearly equivalent.  $\square$

**Cor. (12.2.3.15) [Weak Approximation].** If  $|\cdot|_1, \dots, |\cdot|_n$  be pairwise inequivalent valuations on  $K$ , then for any  $a_1, \dots, a_n \in K$  and  $\varepsilon > 0$ , there is an  $x \in K$  that  $|x - a_i|_i < \varepsilon$ .  
 $\lrcorner$

*Proof:* As  $|\cdot|_1, |\cdot|_n$  are inequivalent, there are  $\alpha, \beta$  that  $|\alpha|_1 < 1, |\alpha|_n \geq 1, |\beta|_n < 1, |\beta|_1 \geq 1$  by(12.2.3.14), so let  $y = \beta/\alpha$ , then  $|y|_1 > 1, |y|_n < 1$ .  
 Now we prove by induction that there is an  $\alpha$  that  $|\alpha|_1 > 1, |\alpha|_i < 1$  for  $i = 2, \dots, n$ . the case  $n = 2$  is done, for general  $n$ , if the  $z$  for  $n - 1$  satisfies  $|z|_n \leq 1$ , then  $z^m y$  will do, for  $m$  large. if  $|z| > 1$ , then the sequence  $|t_m|_i = |\frac{z^m}{1+z^m}|_i$  converges to 1 for  $i = 1, n$  and converges to 0 for  $i = 2, \dots, n - 1$ , so  $t^m y$  will do, for  $m$  large.  $\square$

**Prop. (12.2.3.16) [Gelfand].** Any field  $K$  with an Archimedean place is a subfield of  $\mathbb{C}$ .  
 $\lrcorner$

*Proof:* We consider its completion. when it contains  $\mathbb{C}$ , this is a corollary of??, otherwise, we consider  $K \otimes \mathbb{C}$ , then it is a finite dimensional module over  $K$  thus also complete.  $\square$

**Remark (12.2.3.17).** Because of this, we usually don't consider only non-Archimedean valuations, and refer to all valuations as **places**, cf.(19.3.1.5).  
 $\lrcorner$

**Thm. (12.2.3.18) [Ostrowski].**

1.  $\Sigma_{\mathbb{Q}} = \text{Prime} \cup \{\infty\}$ . Thus any complete Archimedean field is isomorphic to  $\mathbb{R}$  or  $\mathbb{C}$  by(12.2.3.16).
2. Any non-trivial valuation on  $\mathbb{F}_q(t)$  is of the form  $|\cdot|_p$  or  $|\cdot|_\infty$ , where  $p$  is an irreducible polynomial in  $\mathbb{F}_q[t]$ .

$\lrcorner$

*Proof:* 1: if it is non-Archimedean, then  $|n| \leq 1$ , and it is not trivial, so there is a minimal  $p$  that  $|p| < 1$ . Then  $p$  is easily seen to be a prime. Then for any  $(a, p) = 1$ ,  $a = dp + r$ , so  $|r| = 1$ , so  $|a| = 1$ .

And if it is Archimedean, then we prove that in  $\mathbb{N}$ ,  $|m| = m^\lambda$  for some  $\lambda$ : Let  $F(n) = |n|$  and  $f = \log_2 F$ , then  $f(m+n) \leq \max\{f(m), f(n)\} + 1$ , and if  $m = \sum_{i=1}^r d_i n^i$ , then  $f(m) \leq r(1+f(n)) + a_n$ , where  $a_n = \sup\{f(k) | k < n\}$ . And  $r \leq \log m / \log n$ , so

$$\frac{f(m)}{\log m} \leq \frac{a + f(n)}{\log n} + \frac{b}{\log n}$$

then letting  $m \rightarrow m^k, k \rightarrow \infty$ , and then let  $n \rightarrow n^k, k \rightarrow \infty$ , we get  $\frac{f(m)}{\log m} \leq \frac{f(n)}{\log n}$ , for any  $m, n$ .

2: Any valuation on  $\mathbb{F}_q(t)$  is non-Archimedean(12.2.3.12), and  $|n| = 1$  if  $(n, p) = 1$ , because  $n^{p-1} = 1$ . Similarly, if there is a minimal hence irreducible  $P$  that  $|P| < 1$ , then use induction and  $Q = sP + r$  for some  $s, r$  of degree  $< \deg Q$ , so  $|Q| = 1$  for all  $(Q, P) = 1$ . Otherwise,  $|P| \leq 1$  for all  $P$ , then  $|t| > 1$ , otherwise  $|\cdot|$  is trivial, so it is easy by induction that  $|F(t)| = |t|^{\deg F}$ .  $\square$

**Lemma(12.2.3.19) [Continuity of Roots].** If  $(K, |\cdot|)$  is a valued field and  $K = \overline{K}$ , then for a separable polynomial  $f$  over a valued alg.closed field  $\overline{K}$ , there is a  $\varepsilon$  that every polynomial  $g$  that are closed enough to  $f$ , the roots of  $g$  is closed to roots of  $f$  respectively.  $\lrcorner$

*Proof:* This is easy to see by decomposition as each root of  $f$  is close to a root of  $g$ .  $f, g$  have the same degree so the roots correspond to each other.  $\square$

**Prop.(12.2.3.20) [Fundamental Inequality].** if  $(K, v)$  is a valued field and  $L/K$  be a field extension of degree  $n$ , if  $w_i$  are the valuations of  $L$  above  $v$ , then

$$\sum_{w_i|v} e(w_i/v) f(w_i/v) \leq [L : K].$$

The equality holds when  $v$  is discrete and  $L/K$  is separable.  $\lrcorner$

*Proof:* Cf.[Clark note Theorem4].?  $\square$

**Def.(12.2.3.21) [Spherically Complete Valued Field].** A valued field  $K$  is called **spherically complete** iff each descending chain of metric balls has a nonempty intersection.  $\lrcorner$

### Microbial Valuations

**Prop.(12.2.3.22) [Microbial Valuation].** For a valuation ring  $(R, K)$  with the corresponding valuation on  $K$ . The following are equivalent:

- The topology on  $K$  coincides with a rank 1 topology.
- $K^{00} \neq 0$ .
- $R$  has a prime ideal of height 1.

If this is the case, then the valuation defined by  $A$  is called **microbial valuations**.

And in this case, for any topologically nilpotent element  $\varpi$ ,  $K = R[\varpi^{-1}]$ , and  $\varpi^r \in R$  for some  $r$ , and the topology on  $R$  is  $\varpi^r$ -adic. And if  $\mathfrak{p}$  is a prime ideal of rank 1, then the valuation ring  $R_{\mathfrak{p}}$  is of rank 1, and defines the same topology on  $R$ .  $\lrcorner$

*Proof:* 1  $\rightarrow$  2: if there is a rank 1 valuation  $|\cdot|'$  that defines the same topology as  $R$ , then any  $|x|' < 1$  will be a topological nilpotent element by(12.2.3.23).

2  $\rightarrow$  3: if  $\varpi$  is a topological nilpotent element, then  $\mathfrak{p} = \sqrt{(\varpi)}$  is a prime ideal, and it is minimal, because if there is another  $\mathfrak{q} \subsetneq \mathfrak{p}$ , then  $\varpi \notin \mathfrak{q}$ , but  $\mathfrak{p} \subset (\varpi^n)$  by induction: because  $(\varpi) \not\subseteq \mathfrak{q}$ ,  $\mathfrak{q} \subset (\varpi)$ ,

and if  $x \in \mathfrak{q}$ , then  $x = \varpi^n y$ , and  $\varpi \notin \mathfrak{q}$ , so  $y \in \mathfrak{q} \subset (\varpi^n)$ , so  $x \in (\varpi^{n+1})$ . Now  $\mathfrak{q} = 0$  because  $\varpi$  is topological nilpotent.

$3 \rightarrow 1$ : It suffices to prove that the valuation defined by  $R_{\mathfrak{p}}$  is the same as the topology of  $R$ . But this is true in general, just notice that the valuation topology of a nontrivial valuation is also defined by  $B(a, \gamma]$ .

The final remark is clear as  $x\varpi^n \in R \iff |\varpi^n| \leq |x^{-1}|$ .  $\square$

**Lemma (12.2.3.23).** Let  $R$  be a valuation ring, if  $x \in R^*$  is topologically nilpotent, then  $|x| < 1$ , and the converse is also true if  $R$  has rank 1.  $\lrcorner$

*Proof:* if  $|x| \geq 1$ , then  $x^{\mathbb{N}} \not\subset B(0, 1)$ , so it is not topologically nilpotent. And if  $R$  has rank 1,  $|x| < 1$ , then for any  $\delta \neq 0$ , there is some  $n$  that  $|\delta^{-1}| < |x^{-n}|$  (3.2.9.6), so  $|x^m| < |\delta|$  for  $m$  large, thus  $x$  is topologically nilpotent.  $\square$

**Prop. (12.2.3.24) [Constructing Microbial Valuations].** If  $A$  is a valuation ring and  $f \in A$  is a non-zero non-unit, then the  $f$ -adic Hausdorffization  $\overline{A} = A / \cap_n (f^n)$  and the completion  $\hat{A}$  are all microbial.  $\lrcorner$

*Proof:* Easy, Cf. [Perfectoid Spaces, Bhatt]P63.  $\square$

## 4 Affinoid Algebras

References are [BGR84]Part B.

**Notation (12.2.4.1).**

- Let  $(K, |\cdot|_K, \mathcal{O}_K, \kappa)$  be a complete non-Archimedean field.

$\lrcorner$

### Tate-Algebras

**Def. (12.2.4.2) [Tate-Algebras].** The **Tate- $K$ -algebra**  $T_n = K \langle x_1, \dots, x_n \rangle$  is defined to be the restricted power series (12.2.1.9) consists of elements  $\sum_{\alpha} a_{\alpha} x^{\alpha}$  s.t.  $a_{\alpha} \in K$  and  $\lim_{|\alpha| \rightarrow \infty} |a_{\alpha}| = 0$ . It is endowed with the norm  $|f| = \max |a_v|$ .

The norm satisfies  $|fg| = |f||g|$  and  $|f + g| \leq |f| + |g|$ .

There is a **reduction map** from  $T_n$  to  $\kappa[x_1, \dots, x_n]$ , which is surjective.  $\lrcorner$

*Proof:*  $T_n$  is an algebra because the values of coefficients of  $f$  is bounded.  $|fg| \leq |f| \cdot |g|$  is easy, to show  $|fg| \geq |f||g|$ , we assume  $|f| = |g| = 1$ , then their reduction in  $K[x_1, \dots, x_n]$  is non-zero, thus  $\overline{fg}$  is non-zero, which shows  $|fg| \geq 1$ .  $\square$

**Prop. (12.2.4.3) [Maximum Principle].** A formal power series  $f \in K[[\mathbf{X}]]$  converges in  $B^n(\overline{K})$  iff it is in  $T_n$ .

And when it is in  $T_n$ ,  $|f(x)|$  attains its maximum value  $|f|$  in  $B^n(\overline{K})$ .  $\lrcorner$

*Proof:* If it converges at  $(1, \dots, 1)$ , then  $\lim_{|v| \rightarrow \infty} |a_v| = 0$  by (19.1.2.10). Conversely, for any point in  $B^n(\overline{K})$ , it can be considered in a finite extension field of  $K$ , thus complete, hence we can apply (19.1.2.10) again.

For the second assertion, we assume  $|f| = 1$ , then consider its reduction to  $k[x_1, \dots, x_n]$ , then there is a  $\bar{x}$  in the alg. closure of  $k$  that  $\bar{f}(\bar{x}) \neq 0$ . Now  $\bar{k}$  can be seen as the residue field of  $\overline{K}$ . Then the lifting of  $\bar{x}$  to a  $x \in \overline{K}$  has valuation 1 and  $|f(x)| = 1$ .  $\square$

**Prop. (12.2.4.4).**  $T_n$  is a Banach-algebra(12.7.4.1). ┘

**Cor. (12.2.4.5).** An element  $f$  of norm 1 of  $T_n$  is invertible in  $T_n$  iff its reduction in  $k[x_1, \dots, x_n]$  is a unit. Elements of other norms can be reduced to the case of norm 1. ┘

*Proof:* One direction is trivial, the other is because  $|f - f(0)| < 1$ , hence  $f = f(0)(1 + g)$ , this is invertible by power expansion as  $T_n$  is complete. □

**Def. (12.2.4.6) [Distinguished Power Series].** A restricted power series  $g = \sum g_v X_n^v \in T_n \in T_{n-1} \langle X_n \rangle$  is called  $X_n$ -**distinguished of order  $s$**  iff  $g_s$  is a unit in  $T_{n-1}$ ,  $|g_s| = |g|$  and  $|g_s| > |g_v|$  for all  $v > s$ . ┘

**Lemma (12.2.4.7).** For any f.m. elements  $f_i \in T_n$ , there is a continuous automorphism of  $T_n$  that maps  $T_n \rightarrow T_n, T_i \rightarrow T_i + T_n^{\alpha_i}$  that maps  $f_i$  to  $X_n$ -distinguished elements. ┘

*Proof:* Cf.[Rigid and Formal Geometry P16]. □

**Prop. (12.2.4.8) [Weierstrass Division].** If  $g \in T_n$  is  $X_n$ -distinguished of order  $s$ , for any  $f \in T_n$ , there is a unique form  $f = qg + r$ , where  $q \in T_n$  and  $r \in T_{n-1}[X_n]$  of degree  $r < s$ . Moreover,  $|f| = \max\{|q||g|, |r|\}$ . ┘

*Proof:* Cf.[Rigid and Formal Geometry P17]. □

**Cor. (12.2.4.9) [Weierstrass Preparation].** If  $g \in T_n$  is  $X_n$ -distinguished of order  $s$ (12.2.4.6), then there exists uniquely a  $r \in T_{n-1}[X_n]$  of degree  $s$  and  $g = re$ , where  $e$  is a unit in  $T_n$ . ┘

*Proof:* By(12.2.4.8) applied to  $X_n^s = qg + r$  with  $|r| \leq 1$ . Then  $\omega = X_n^s - r$  is  $X_n$  is the desired polynomial, it suffice to show  $q$  is a unit. Let  $g$  be normalized that  $|g| = 1$ , then  $|q| = 1$ , by reduction to polynomials, we see  $\tilde{\omega} = \tilde{q}\tilde{g}$ , and  $\tilde{\omega}, \tilde{g}$  are both polynomials of degree  $s$ , so  $\tilde{q} \in k^*$ , so  $q$  is a unit by(12.2.4.5).

Uniqueness: if  $g = e\omega$ , then  $X_n^s = e^{-1}g + (X_n^s - \omega)$ , so uniqueness follows from that of Weierstrass division. □

**Prop. (12.2.4.10) [Noether Normalization].** For any proper ideal  $\mathfrak{a} \in \text{Ideal}(T_n)$ , there exists some  $d \in \mathbb{N}$  with a finite injection  $T_d \hookrightarrow T_n/\mathfrak{a}$ . ┘

*Proof:* We may assume  $\alpha \neq 0$ , thus choose a  $g \in \alpha \neq 0$ , then using(12.2.4.7), we may assume  $g$  is  $X_n$ -distinguished. Now the Weierstrass division theorem(12.2.4.8) says that  $T_{n-1} \rightarrow T_n/(g)$  is finite. Hence  $T_{n-1} \rightarrow T_n/(g) \rightarrow T_n/\mathfrak{a}$  is finite. Now we can use induction to find a  $T_d \rightarrow T_{n-1}/T_{n-1} \cap \mathfrak{a}$  finite, thus also  $T_d \rightarrow T_n/\mathfrak{a}$  is finite. □

**Cor. (12.2.4.11) [Finite Residue Fields].** The residue field of a maximal ideal  $\mathfrak{m} \in |\text{Spec } T_n|_0$  is a finite extension field of  $K$  ┘

*Proof:* Because finite injection  $T_d \rightarrow T_n/\mathfrak{m}$  shows  $T_n$  is a field(5.2.1.3), thus we must have  $d = 0$ . because  $T_n/\mathfrak{m}$  has dimension 0, thus  $K \rightarrow T_n/\mathfrak{m}$  is a finite injection. □

**Cor. (12.2.4.12).** The map from  $B^n(\overline{K})$  to the set of maximal ideals of  $T_n$  are surjective. ┘

*Proof:* Evaluation map defines a map  $T_n \rightarrow K(x_1, \dots, x_n)$  that is surjective, thus the kernel is a maximal ideal. Conversely, for any maximal ideal  $\mathfrak{m} \subset T_n$ ,  $K' = T_n/\mathfrak{m}$  is finite over  $K$ , so we may assume  $K' \subset \overline{K}$ .

We show that this map  $\varphi : T_n \rightarrow \overline{K}$  is contractive, otherwise there is a  $|a| = 1, |\alpha = \varphi(a)| > 1$ . Consider the minimal polynomial  $p$  of  $|\alpha|$ , all the conjugates of  $\alpha$  has the same valuation as  $K$ , as  $K$  is Henselian, thus  $p$  has ascending Newton polygon, thus by (12.2.4.5) it is invertible in  $T_n$ . But  $\varphi(p(a)) = 0$ , contradiction.

So  $|\varphi(x)| \leq |x|$ , then it is continuous, and  $(\varphi(T_1), \dots, \varphi(T_n)) \subset B^n(K^n)$ , so we are done.  $\square$

**Cor. (12.2.4.13) [Ring Properties of  $T_n$ ].**  $T_n$  is Noetherian, UFD, Jacobson of Krull dimension  $n$ .  $\lrcorner$

*Proof:* Noetherian: Use induction, as in the proof of (12.2.4.10),  $T_{n-1} \rightarrow T_n/(g)$  is finite for some  $g \in \mathfrak{a}$ , then also  $T_n/\mathfrak{a}$  is finite over  $T_{n-1}$ , thus Noetherian as a  $T_{n-1}$  module, thus Noetherian as a ring.

UFD: Cf. [Rigid and Formal Geometry P20].

Jacobson: We need to show that any prime ideal  $\mathfrak{p}$  is an intersection of maximal ideals. The case of  $\mathfrak{p}$  is by (12.2.4.3). For  $\mathfrak{p} \neq 0$ , by Noetherian normalization (12.2.4.10), there is a  $T_d \subset T_n/\mathfrak{p}$  finite. Then use induction and generalized Nullstellensatz (5.2.6.10),  $T_n/\mathfrak{p}$  is Jacobson, thus  $\mathfrak{p} = \text{rad}(T_n/\mathfrak{p})$ .

Dimension  $n$ : Cf. [Formal and Rigid Geometry P22].  $\square$

**Prop. (12.2.4.14).** For an ideal  $\mathfrak{a} \in T_n$ , there are  $a_1, \dots, a_r$  which generate  $\mathfrak{a}$  that  $|a_i| = 1$ , and any elements in  $f$  has a representation of the form  $\sum f_i a_i$  with  $|f_i| \leq |f|$ .

The same assertion holds for submodules of  $T_n^k$ .  $\lrcorner$

*Proof:* Cf. [Formal and Rigid Geometry P27,29].  $\square$

**Cor. (12.2.4.15) [Affinoid Ideals are Closed].** Each ideal of  $T_n$  is closed hence complete in  $T_n$ . This follows immediately from (12.2.4.13) and (19.1.6.13).  $\lrcorner$

**Cor. (12.2.4.16).** For any ideal  $\mathfrak{a}$  of  $T_n$ , the distance from an element to  $\mathfrak{a}$  attains minimum.  $\lrcorner$

*Proof:* Cf. [Bos15] P28.  $\square$

### Affinoid Algebras

**Def. (12.2.4.17) [Affinoid Tate  $K$ -Algebras].** A normed algebras of the form  $A = T_n/\mathfrak{a}$  are called **affinoid  $K$ -algebras**, so it is Noetherian and Jacobson by (12.2.4.13). An affinoid algebra has a natural semi-norm by  $|f|_{\text{sup}} = \sup |f|_{\mathfrak{m}}$  in  $A/\mathfrak{m}$  for a maximal ideal  $\mathfrak{m}$  of  $A$  by (12.2.4.11).  $\lrcorner$

*Proof:* We need to show the sup is finite, for this, notice  $|f| = |g|$  for some  $g$  in the residue norm (12.2.4.18), so for any maximal ideal  $\mathfrak{m}$  of  $A$ , the inverse is a maximal ideal  $\mathfrak{n}$  in  $T_n$  by finiteness, thus  $|f|_{\mathfrak{m}} = |g|_{\mathfrak{n}} \leq |g|_{\text{sup}} = |g| = |f|$ , so  $|f|_{\text{sup}} \leq |f|$ .

For the second-last equality, notice on  $T_n$ ,  $|\cdot|_{\text{sup}}$  and  $|\cdot|$  equal, by (12.2.4.3) and (12.2.4.12).  $\square$

**Def. (12.2.4.18) [Residue Norm].** For an affinoid  $K$ -algebra  $A = T_n/\mathfrak{a}$ , there is a natural residue norm on it. This is a complete  $K$ -algebra norm on  $A$  s.t.  $T_n \rightarrow A$  is continuous and open. For any  $f \in A$ , the residue norm is obtained at an element of  $T_n$ .

Any residue norm is bigger than the sup-norm, by the proof of (12.2.4.17).  $\lrcorner$

*Proof:* It is a  $K$ -algebra norm is easily verified, should notice  $|f| = 0$  iff  $f = 0$ , because  $\mathfrak{a}$  is closed (12.2.4.15). The last assertion follows from (12.2.4.16).  $\square$

**Remark (12.2.4.19).** The sup norm may not even be a norm, if  $\mathfrak{a}$  is not radical, but the fact that sup norm is smaller than any residue norm, together with (12.2.4.23), is enough for use.  $\lrcorner$

**Prop. (12.2.4.20).** For  $T_d \rightarrow A$  a finite injection, assume  $A$  is a torsion-free  $T_d$ -module, then for any  $f \in A$ , there is a unique minimal monic polynomial  $P$  of  $f$  over  $T_d$ .

In this case,  $|f|_{\sup} = \sup |a_i|_{\sup}^{1/i}$  where  $a_i$  are coefficients of  $P$ .  $\lrcorner$

*Proof:* Because  $A$  is torsion-free, we reduce to the quotient field of  $T_n$ , then  $f$  has a minimal monic polynomial, and  $T_n$  is UFD, hence Gauss lemma shows that this polynomial has coefficients in  $T_d$ . Hence  $T_n[f] = T_n[X]/(p)$ .

For the second, notice first for finite extension the Spec map is surjective, thus we may assume  $A = T_n[f] = T_n[X]/(p)$ , and for a maximal ideal  $\mathfrak{m}$  of  $T_n$ , let  $T_n/\mathfrak{m} = k$ , then  $A/(\mathfrak{m}) = k[X]/(\bar{p})$ , then maximal ideals of  $A/(\mathfrak{m})$  corresponds to roots  $\alpha_i$  of  $\bar{p}$  in  $\bar{k}$ , so

$$\sup_{\varphi^{-1}(\mathfrak{n})=\mathfrak{m}} |f|_{\mathfrak{n}} = \sup |\alpha_i| = \max |a_i|_{\mathfrak{m}}^{1/i},$$

so the result follows.  $\square$

**Cor. (12.2.4.21).**  $|f|_{\sup} \in \sqrt[N]{|K|}$  for some  $N$  and all  $f \in A$ , because the minimal polynomial has coefficients in  $T_n$ , and sup norm and Gauss norm coincide on  $T_n$  by the proof of (12.2.4.17).  $\lrcorner$

**Cor. (12.2.4.22) [Maximum Principle].** For any  $f \in A$ ,  $\|f\|_{\sup} = \|f\|_{\mathfrak{m}}$  for some maximal ideal  $\mathfrak{m}$ .  $\lrcorner$

*Proof:* Since  $A$  is Noetherian (12.2.4.13), it has f.m. minimal primes, hence  $|f|_{\sup} = |f|_{\sup}$  in  $A/p_i$  for some minimal prime of  $A$ . Hence we reduce to the case of (12.2.4.20), hence the conclusion follows from (12.2.4.3) and the proof of (12.2.4.20).  $\square$

**Prop. (12.2.4.23) [Residue Norms Equivalent].** Any morphism from a Noetherian  $k$ -algebra to an affinoid algebras  $A$  is continuous w.r.t any residue norms. In particular, any  $k$ -Banach algebra topology on  $A$  coincides with the  $k$ -affinoid topology on  $A$ , and all residue norms on an affinoid algebra are equivalent.

Moreover, for any morphism of  $k$ -affinoid algebras  $B \rightarrow A$ , the norm on  $A$  can be replaced by an equivalent one that makes  $A$  into a normed  $B$ -algebra.  $\lrcorner$

*Proof:* Use (19.1.6.10), it suffices to show the condition holds, for  $\mathfrak{B} = \{\mathfrak{m}^v\}$  where  $\mathfrak{m}$  are maximal ideals of  $A$ : The residue field is finite by (12.2.4.11), their intersections is  $(0)$  because if  $f \in \cap_{\mathfrak{m}} \cap_n \mathfrak{m}^n$ , Krull's theorem (5.2.2.15) (use localization) says for each maximal ideal  $\mathfrak{m}$  there is a  $m \in \mathfrak{m}$  that  $(1 - m)f = 0$ , so  $\text{Ann}(f) = (1)$ , so  $f = 0$ .

For the second assertion, see [non-Archimedean Analysis P229].  $\square$

**Cor. (12.2.4.24).** The notion of power-boundedness and topological nilpotence is independent of residue norm chosen.  $\lrcorner$

**Cor. (12.2.4.25) [Restricted Power Series].** For an affinoid algebra  $A$ , the restricted power series in  $A$ :

$$A\langle X_i \rangle = \left\{ \sum a_v X^v \mid \lim_{|v| \rightarrow \infty} a_v = 0 \right\}$$

is an affinoid algebra, and is independent of the residue norm chosen.  $\lrcorner$

**Def. (12.2.4.26) [Strongly Noetherian].**  $A$  is called **strongly Noetherian** if  $A\langle T_1, \dots, T_n \rangle$  are Noetherian for any  $n \geq 0$ .  $\lrcorner$

**Lemma (12.2.4.27).** The image  $A$  is dense in  $A\langle X \rangle / (X - f)$  (in the residue norm, and thus in all other norms, by (12.2.4.23)(12.2.4.18)), this is because a restricted power series can be truncated by a finite part and a part with small norm, and the finite part is in the image of  $A$ .  $\lrcorner$

**Def. (12.2.4.28) [Affinoid Generators].** For a morphism of affinoid algebras  $A \rightarrow A'$ , a set of elements  $h_i$  in  $A'$  is called a set of **affinoid generator** iff there is a surjection

$$A\langle X_1, \dots, X_n \rangle \rightarrow A', \quad X_i \mapsto h_i$$

Of course  $h_i$  is power-bounded, by the residue norm given.  $\lrcorner$

**Lemma (12.2.4.29).** If  $\pi' : A\langle X_1, \dots, X_n \rangle \rightarrow A' : X_i \mapsto h'_i$  is a surjective morphism of affinoid algebras that  $A\langle X_1, \dots, X_n \rangle$  is endowed with the Gauss norm and  $A'$  is endowed with the residue norm, then any set of elements  $h = (h_1, \dots, h_n)$  that  $|h_i - h'_i| < 1$  is a set of affinoid generators.  $\lrcorner$

*Proof:* By non-Archimedean property,  $|h_i| \leq 1$  thus also  $|h'_i| \leq 1$ , and Let  $\varepsilon = \max\{|h_i - h'_i|\} < 1$ . The strategy is simple, if for each  $g$  in  $A'$ , we can find a  $f$  that  $|f| = |g|, |\pi(f) - g| \leq \varepsilon|g|$ , then by iteration, there is a  $f$  that  $\pi(f) = g$ . But by (12.2.4.18) and (12.2.4.16), if we choose a  $f$  that  $\pi'(f) = g$  and  $|f| = |g|$ , then

$$|\pi(f) - g| = \left| \sum a_v h^v - \sum a_v h'^v \right| = \left| \sum a_v (h^v - h'^v) \right| \leq \varepsilon |f| = \varepsilon |g|.$$

□

**Def. (12.2.4.30) [Distinguished Element].** For an affinoid algebra  $A$  and an element  $x \in \text{Sp } A$  (27.2.1.1), a element  $f \in A\langle X_1, \dots, X_n \rangle$  is called  **$X_n$ -distinguished of order  $s$  at  $x$**  iff it is distinguished in  $A/\mathfrak{m}_x\langle X_1, \dots, X_n \rangle$  is distinguished of order  $s$  in the sense of (12.2.4.6) (notice  $A/\mathfrak{m}_x$  is a complete valued field by (12.2.4.11)).  $\lrcorner$

**Prop. (12.2.4.31) [Fibered Pushouts].** When  $R, A_1, A_2$  are all affinoid algebras, the amalgamated sum is also an affinoid algebra. In other words, the category of affinoid algebras admits amalgamated sums (fibered pushouts by (19.1.2.6)).  $\lrcorner$

*Proof:* Cf. [Formal and Rigid Geometry P245].  $\lrcorner$

**Prop. (12.2.4.32).**  $T_n \hat{\otimes} T_m \cong T_{m+n}$ .  $K' \hat{\otimes} T_{n,K} = T_{n,K'}$ .  $\lrcorner$

**Prop. (12.2.4.33).** For affinoid algebras  $R, A_1, A_2$  and ideals  $\mathfrak{a}_1 \subset A_1, \mathfrak{a}_2 \subset A_2$ , there is an isomorphism:

$$(A_1 \hat{\otimes}_R A_2) / (\mathfrak{a}_1, \mathfrak{a}_2) \cong (A_1 / \mathfrak{a}_1) \hat{\otimes}_R (A_2 / \mathfrak{a}_2)$$

□

*Proof:* Cf. [Rigid and Formal Geometry P248].  $\lrcorner$

**Prop. (12.2.4.34) [Finite Extension of Affinoid Algebras].** If  $B$  is an affinoid  $K$ -algebra and  $\varphi : B \rightarrow A$  is a finite ring map, then  $A$  can be provided a topology to make it an affinoid  $K$ -algebra, and  $\varphi$  is continuous.  $\lrcorner$

*Proof:* We can associate to  $A$  a Banach algebra topology induced from  $B^n \rightarrow A \rightarrow 0$  that is continuous. Now it is an affinoid  $K$ -algebra: we may assume  $B = T_n$ , then  $A = \sum T_n a_i$ , and we may assume  $|a_i| < 1$  then clearly there is a continuous extension  $T_n\langle X_i \rangle \rightarrow A$  extending this map, so  $A$  is affinoid.  $\lrcorner$

### Construction of Affinoid Tate Algebras

**Def. (12.2.4.35) [Affinoid Localizations].** Let  $A$  be an affinoid Tate algebra (12.2.4.17), then for a finite set of elements  $\{f_i, g_j\} \subset A$ , we can define the localization

$$A\langle f_i, g_j^{-1} \rangle = A\langle \zeta_1, \dots, \zeta_i, \xi_1, \dots, \xi_j \rangle / (\zeta_i - f_i, 1 - \xi_j g_j),$$

which is also an affinoid Tate algebra.  $\lrcorner$

## 5 Huber-Rings

**Def. (12.2.5.1) [Huber-Rings].** A **Huber-ring** is a topological ring  $A \in \text{TopCRing}$  s.t. there is an open subring  $A_0 \subset A \in \text{CRing}$  s.t. the induced topology on  $A_0$  is  $I$ -adic for some f.g. ideal  $I \in \text{Ideal}(A_0)$ . Such an  $A_0$  is called a **ring of definition** of  $A$ , and  $I$  is called the **ideal of definition** of  $A$ .

The category  $\text{HubCRing}$  is defined to be the subcategory of topological rings consisting of Huber rings. We write  $(A, A_0, I) \in \text{HubCRing}$  to denote that  $A$  is a Huber-ring with a ring of definition  $A_0$  and an ideal of definition  $I \in \text{Ideal}(A_0)$ .  $\lrcorner$

**Prop. (12.2.5.2) [Boundedness and Rings of Definition].** For  $A \in \text{HubCRing}$ ,  $A_0 \subset A \in \text{CRing}$  is a ring of definition (12.2.5.1) iff  $A_0$  is open and bounded in  $A$ .  $\lrcorner$

*Proof:* Clearly a ring of definition is open and bounded, for the converse, let  $(A'_0, I)$  be a couple of definition, and  $A_0$  is an open and bounded subset of  $A$ , then  $I^k \subset A_0$  for some  $n$ , and set  $J = I^k A_0$ . As  $A_0$  is bounded, for any open nbhd  $U$  of 0, there exists  $m > 0$  that  $I^{km} A_0 \subset U$ , thus  $J^m \subset U$ . This shows  $J$  is a fundamental system of nbhd of 0, thus  $A_0$  is  $J$ -adic and is a ring of definition.  $\square$

**Cor. (12.2.5.3).** For  $A \in \text{HubCRing}$ .

- If  $A_0, A_1$  are two rings of definition of  $A$ , then so does  $A_0 \cap A_1$  and  $A_0 A_1$ .
- Every open subring  $B$  of  $A$  is a Huber ring.
- If  $B \leq C$  are subrings of  $A$  and  $B$  is bounded,  $C$  is open, then there is a ring of definition  $A_0$  of  $A$  s.t.  $B \leq A_0 \leq C$ .  $\lrcorner$

*Proof:* 1: By (12.2.5.2).

2: Let  $I^n \subset B$ , then  $(B \cap A_0, I^n)$  is a couple of definition of  $B$ .

3: By 2,  $C$  is Huber, take a ring of definition  $A_0$  of  $C$ , then  $A_0 B$  is open and bounded in  $C$ , thus a ring of definition.  $\square$

**Lemma (12.2.5.4).** If  $A$  is a Huber ring and  $T \subset A$  is a subset that generates an open ideal of  $A$ , then for any open nbhd  $U$  of  $A$ , the subgroup  $T^n U$  is open.  $\lrcorner$

*Proof:* Let  $(A_0, I)$  be a couple of definition. By assumption the ideal  $J$  generated by  $T$  is open, thus  $J^n$  is also open, and contains some  $I^m$ . Now we can change  $I^m$  to  $I$ . Now  $I$  is f.g., so there is a finite subset  $M \subset A$  that  $I \subset T^n M$ . Notice  $M$  is bounded because it is finite, so there is an integer  $r$  that  $I^r M \subset U$ , thus  $I^{r+1} \subset T^n U$ , and  $T^n U$  is open.  $\square$

**Def. (12.2.5.5) [Tate-Huber Rings].** A **Tate-Huber ring** is a Huber-ring  $A \in \text{HubCRing}$  s.t. there exists an open subring  $A_0$  that the induced topology on  $A_0$  is  $t$ -adic for some  $t \in A_0 \cap A^*$ . Such a  $t$  is called a **pseudo-uniformizer** of  $A$ .  $\lrcorner$

**Prop. (12.2.5.6) [Examples of Tate-Huber-Rings].**

- If  $K$  is a complete non-Archimedean field and  $R$  is a  $K$ -Banach algebra, then  $R$  is Tate with a ring of definition by  $(R_{\leq 1}, t)$ , where  $t$  is a pseudo-uniformizer of  $K$ .
- If  $A_0 \in \mathcal{CRing}$  and  $g \in A_0$  is a nonzero-divisor, then  $(A_0[g^{-1}], (g))$  is an Tate-Huber ring.

⌋

**Prop. (12.2.5.7) [Properties of Tate-Huber-Rings].** If  $(A, A_0) \in \text{HubCRing}$  is Tate with a pseudo-uniformizer  $g$  (12.2.5.5), then there exists  $n \in \mathbb{Z}_+$  s.t.  $g^n \subset A_0$ . And in this case,  $A_0$  is  $g^n$ -adic and  $A = A_0[(g^n)^{-1}]$ .

In this case, a subset  $S \subset A$  is bounded iff  $S \subset g^{-n}A_0$  for some  $n$ .

⌋

*Proof:* Because  $A_0$  is open in  $g$ , there is some  $n$  that  $g^n \subset A_0$ , and then with  $n$  even larger we can assume  $g \in I$ , because  $g$  is topologically nilpotent, and  $gA_0$  is also open in  $A_0$ , thus it contains  $I^m$  for some  $m$ . So now  $g^{mn}A_0 \subset I^m \subset g^nA_0$ , which means  $A_0$  is  $g^n$ -adic.

To show  $A = A_0[(g^n)^{-1}]$ , it suffices to notice  $g^{kn}x \rightarrow 0$  as  $k \rightarrow \infty$  for any  $x \in A$ , so for  $k$  large,  $g^{kn}x \in A_0$ .

The last assertion is easy, as open subsets of  $A$  and  $g^{kn}A_0$  are cofinal.

□

**Prop. (12.2.5.8) [Power-Bounded Elements and Topologically Nilpotent Elements].** The subset  $A^0$  of power-bounded elements in  $A$  is a subring, and it is the filtered colimit of all the ring of definition in  $A$ , thus open. It is also integrally closed in  $A$ .

$A^{00}$  (12.2.1.2) is a radical ideal of  $A^0$ . But it is in general not an ideal of  $A$ .

Recall  $A$  is called uniform if  $A^0$  is bounded (12.2.1.5), or equivalently  $A^0$  is a ring of definition, by (12.2.5.2).

⌋

*Proof:* By (12.2.5.3), every power-bounded element is contained in a ring of definition, and any ring of definition is bounded, so  $A^0$  is the union of all rings of definitions of  $A$ , and this is filtered by (12.2.5.3).

To show  $A^0$  is integrally closed, notice by what we already proved, if  $a$  is integral over  $A^0$ , then it is integral over a ring of definition  $A_0$ , but then  $\{a^n\} \subset A_0[a]$  is bounded, so  $a \in A^0$ .

Showing  $A^{00}$  is a radical ideal of  $A^0$  is easy and omitted.

□

**Cor. (12.2.5.9).** If  $A \in \text{HubCRing}$  is separated, Tate (12.2.5.5) and uniform (12.2.1.5), then  $A$  is reduced.

⌋

*Proof:* Assume that  $A_0$  the set of power-bounded elements is a ring of ideal and  $g \in A_0$  is a pseudo-uniformizer. If  $x$  is nilpotent, then  $g^{-n}$  is nilpotent for any  $x$ , so power-bounded and  $g^{-n}x \in A_0$ , which means  $x \in g^nA_0$  for any  $n$ . But  $A_0$  is separated, so  $x = 0$ .

□

**Cor. (12.2.5.10).** For  $A \in \text{HubCRing}$ , an ideal  $J \in \text{Ideal}(A)$  is open iff  $A^{00} \in \sqrt{J}$ .

⌋

*Proof:* If  $J$  is open, then clearly  $A^{00} \subset \sqrt{J}$ . Conversely, if  $A^{00} \subset \sqrt{J}$  and  $(A_0, I)$  is a couple of definition, then  $I \subset A^{00}$  by (12.2.1.12), so  $I \subset \sqrt{J}$ . And  $I$  is f.g., so  $I^N \subset J$  for some  $J$ , thus  $J$  is open.

□

**Prop. (12.2.5.11).** If  $K$  is a complete non-Archimedean field, then any Banach  $K$ -algebra  $R$  is a complete Tate ring, and if  $K, R$  are perfectoids, then  $R^{00} = K^{00}R^0$ .

⌋

*Proof:* In the perfectoid case, first  $K^{00}R^0 \subset R^{00}$ , and for any topological nilpotent  $\alpha$ ,  $\alpha^n \subset tR^{00}$  for a pseudo-uniformizer  $t$ . Thus  $R^{00}$  and  $K^{00}R^0$  has the same radical, it suffices to show  $K^{00}R^0$  is radical, but the quotient  $R^0/K^{00}R^0$  is a perfect  $K^0/K^{00}$ -algebra by perfectoidness, thus it must be radical.

□

**Prop.(12.2.5.12) [Complete Perfect Tate ring are Uniform, André].** If  $A \in \text{HubCRing}$  is a complete Tate ring s.t.  $\text{char } A = p \in \text{Prime}$  and  $A = A^{\text{perf}}$ , then  $A$  is uniform(12.2.1.5).  $\lrcorner$

*Proof:* Let  $(A_0, t)$  be a ring of definition, let  $A_n = A_0^{\frac{1}{p^n}}$ , then  $A_\infty = \text{colim } A_n = (A_0)_{\text{perf}}$ . We check  $t^{\frac{1}{p^n}} A^0 \subset A_\infty \subset t^{-1} A_0$ , which shows  $A^0$  is bounded.

If  $f \in A^0$ , then  $t^a f^{\mathbb{N}} \subset A \subset A_\infty$ , and  $A_\infty$  is perfect, so  $t^{\frac{a}{p^n}} f \in A_\infty$  for all  $n$ . Notice the Frobenius is a continuous bijection of Banach spaces, so it is open by Banach theorem(12.7.2.5), so  $A_0^p \supset t^{mp} A_0$ , thus  $t^m A_1 \subset A_0$ , and then  $t^{\frac{m}{p^n}} A_{n+1} \subset A_n$ . So  $t^{\sum_n m/p^n} A_n \subset A_1$ . So  $t^c A_\infty \subset A_0$ , for  $c$  large.  $\square$

### Huber-Pairs

**Def.(12.2.5.13) [Huber-Pairs].** For  $A \in \text{HubCRing}$ , a **ring of integral elements** is an open and integrally closed subring of  $A$  contained in  $A^0$ (12.2.5.8)(e.g.  $A^0$  itself, by(12.2.5.8)).

A **Huber-pair** is a pair  $(A, A^+)$  where  $A \in \text{HubCRing}$  and  $A^+ \leq A$  is a ring of integral elements. A morphism of Huber pairs should preserve the ring of integers.  $\lrcorner$

**Prop.(12.2.5.14).** For  $(A, A^+) \in \text{HubPair}$ , we have  $A^{00} \in \text{Ideal}(A^+)$ . In particular,  $A^+$  contains any pseudo-uniformizer, and the set of rings of integral elements is in bijection with integrally closed subrings of  $A/A^{00}$ .

Also,  $A^+$  is a filtered colimits of rings of definitions.  $\lrcorner$

*Proof:*  $t \in A^{00}$  is topologically nilpotent hence  $t^n \subset A^+$  for some  $n$  as it is open, and then  $t \in A^+$  as it is integrally closed. It is an ideal because it is an ideal of  $A^0$ (12.2.5.8).

For the last assertion, notice that  $A^0$  is the filtered colimits of rings of definitions(12.2.5.8), and the intersection of a ring of definition with  $A^+$  is also a ring of definition, because it is open and bounded(12.2.5.2), the result follows.  $\square$

**Def.(12.2.5.15) [Zariski, Henselian, Complete Huber Pairs].**  $(A, A^+) \in \text{HubPair}$  is called

- **complete Huber-pair** iff  $A$  is complete.
- **Henselian Huber-pair** iff  $(A^+, A^{00})$  is a Henselian pair.
- **Zariski Huber-pair** iff  $(A^+, A^{00})$  is a Zariski pair.

$\lrcorner$

**Prop.(12.2.5.16).** An affinoid Tate ring  $(A, A^+) \in \text{HubCRing}$  with a ring of definition  $(A_0, I)$  that  $A_0 \subset A^+$  is

- Zariski iff  $I$  is in the Jacobson radical of  $A_0$ .
- Henselian iff the pair  $(A_0, I)$  is Henselian.
- Complete then it is Henselian.
- Henselian then it is Zariski.

$\lrcorner$

*Proof:* 1: We prove that if  $t \in \text{rad}(A_0)$ , then for any other  $B_0 \supset A_0$ ,  $t \in \text{rad}(B_0)$ . If this is true, then as  $A^+$  is a filtered colimits of rings of definitions(because  $A^0$  does), it is clear that  $t$  lies in the maximal ideal (check  $1 + at$  is unit). For this, if  $\mathfrak{m} \subset B_0$  is maximal and  $t \notin \mathfrak{m}$ , choose  $n$  that  $t^n B_0 \subset A_0$ , and an element  $b \in B_0$  that maps to  $t^{-n-1}$  modulo  $\mathfrak{m}$ , then  $a = t^n b \in A_0$  is mapped to  $t^{-1}$ . Thus the composition  $A_0 \rightarrow B_0 \rightarrow B_0/\mathfrak{m}$  is surjective:  $\bar{b}$  is the image of  $a^n(t^n b) \in A$ . So  $t$  is not in a maximal ideal of  $A_0$ , contradiction.

Conversely, Cf.[Bhatt Perfectoid Space P57].

2: Cf.[Bhatt Perfectoid Spaces P57].

3:  $A$  is complete then  $A_0$  is complete, hence  $(A_0, I)$  is Henselian by (5.3.10.6), so it is Henselian by item2. 4: Trivial.  $\square$

### Adic Morphisms

**Def. (12.2.5.17) [Adic Morphisms].**  $f : A \rightarrow B \in \text{HubCRing}$  is called an **adic morphism** if there are rings of definitions  $A_0, B_0$  and an ideal of definition  $I$  of  $A$  that  $f(A_0) \subset B_0$ , and  $f(I)B_0$  is an ideal of definition of  $B_0$ .

A morphism  $(A, A^+) \rightarrow (B, B^+)$  of Huber pairs is called an **adic morphism** if  $A \rightarrow B$  is.  $\lrcorner$

**Prop. (12.2.5.18).** Let  $f : A \rightarrow B \in \text{HubCRing}$  be an adic morphism (12.2.5.17), then:

1.  $f$  is continuous and open.
2. If  $A_0, B_0$  are rings of definition s.t.  $f(A_0) \leq B_0$ , then for any ideal of definition  $I \subset A_0$ ,  $f(I)B_0$  is an ideal of definition in  $B_0$ .
3.  $f$  maps bounded sets to bounded sets.

$\lrcorner$

*Proof:* Let  $f(A_0) \subset B_0$  and  $J = f(I)B_0$ . Then  $I^n \subset f^{-1}(J^n)$ , so  $f$  is continuous.

If  $E$  is bounded in  $A$ , for any  $n$ , let  $m$  be that  $I^m E \subset I^n$ , then  $f(E)f(I)^m = f(EI^m) \subset f(I^n) \subset J^n$ , thus  $f(E)J^m \subset J^n$ , so  $f(E)$  is bounded.  $\square$

### Construction of Huber Rings

References are [Mor19].

**Prop. (12.2.5.19) [Quotient].** Let  $(A, A^+) \in \text{HubPair}$  and  $\mathfrak{a} \in \text{Ideal}(A)$ , then the quotient pair  $(A/\mathfrak{a}, (A/\mathfrak{a})^+)$  where  $A/\mathfrak{a}$  is the integral closure of  $A^+/\mathfrak{a}$  in  $A/\mathfrak{a}$ .  $\lrcorner$

**Prop. (12.2.5.20) [Completion of Huber Rings].** For  $(A, A_0, I) \in \text{HubCRing}$ , define  $\widehat{A} = \varprojlim_n A/I^n$  (as an Abelian group), then:

1. The canonical map  $\widehat{A_0} \rightarrow \widehat{A}$  is injective and  $\widehat{A_0} \cap A = A_0$ .
2. If we put the unique topology on  $\widehat{A}$  that  $\widehat{A_0}$  is an open subgroup, then  $\widehat{A}$  is complete.
3. There is a unique topological ring structure on  $\widehat{A}$  that  $A \rightarrow \widehat{A}$  is continuous.
4.  $\widehat{A}$  is Huber with a couple of definition  $(\widehat{A_0}, I\widehat{A_0})$ , and the canonical map  $A \rightarrow \widehat{A}$  is adic.
5.  $\widehat{A_0} \otimes_{A_0} A \rightarrow \widehat{A}$  is an isomorphism.

$\lrcorner$

*Proof:* Cf.[Mor19]P72.  $\square$

**Prop. (12.2.5.21).** Let  $A$  be a Huber ring and  $i : A \rightarrow \widehat{A}$  be the completion, then under the bijection of (12.2.1.8),

- $\widehat{A^0} = \widehat{A^0}$ ,  $\widehat{A^{00}} = \widehat{A^{00}}$ .
- $G \subset A$  is a ring of definition iff  $\widehat{G} \subset \widehat{A}$  is a ring of definition.
- the map  $\text{Cont}(\widehat{A}) \rightarrow \text{Cont}(A)$  is a bijection.

┘

*Proof:* Cf[[Mor19](#)] P75. □

**Prop. (12.2.5.22).** For  $A \in \text{HubCRing}$ , under the bijection of [\(12.2.1.8\)](#), an open ring  $A_0$  is a ring of integral elements of  $A$  iff  $A_0^\wedge$  is a ring of integral elements of  $A^\wedge$ . ┘

*Proof:* It is easy to show  $A_0$  is a ring iff  $A_0^\wedge$  is a ring, and by [\(12.2.5.21\)](#),  $A_0 \subset A^0$  iff  $A_0^\wedge \subset (A^\wedge)^0$ .

It suffices to prove that if  $A_0$  is open and integrally closed, then  $A_0^\wedge$  is integrally closed in  $A^\wedge$ . Let  $x \in A^\wedge$  satisfy  $x^d + a_{d-1}x^{d-1} + \dots + a_0 = 0$ , where  $a_i \in A_0^\wedge$ , because  $A_0^\wedge$  is open, we can find  $x' \in A$  and  $a'_i \in A_0$  that  $(x')^d + a'_{d-1}(x')^{d-1} + \dots + a'_0 \in A'_0$ , but then  $x' \in A_0$  because  $A_0$  is integrally closed, and thus  $x = (x - x') + x' \in A'_0$ . □

**Cor. (12.2.5.23) [Completion of Huber Pairs].** The forgetful functor from the category of complete Huber-pairs to  $\text{HubPair}$  has a left adjoint called completion, where  $(A, A^+)^\wedge = (A^\wedge, (A^\wedge)^+)$ , where  $A^\wedge$  is defined in [\(12.2.5.30\)](#), and  $(A^\wedge)^+$  is the closure of the image of  $A^+$  in  $A^\wedge$ . ┘

**Prop. (12.2.5.24) [Completion, Henselization, Zariski Localization].** There are left adjoint to the forgetful functors from the category of complete/Henselian/Zariski pairs to the category of pairs, called the **completion/Henselization/Zariski localization** of pairs. And there are natural maps

$$(A, A^+) \rightarrow (A, A^+)_{\text{Zar}} \rightarrow (A, A^+)_{\text{Hens}} \rightarrow (A, A^+)^\wedge.$$

┘

*Proof:* □

**Prop. (12.2.5.25) [Tensor Products of Adic Maps of Huber Rings].**

- If  $(A, A^+) \rightarrow (B, B^+) \in \text{HubPair}$  is adic [\(12.2.5.17\)](#), then pullback along the associated map of topological spaces  $\text{Spa}(B, B^+) \rightarrow \text{Spa}(A, A^+)$  preserves rational subsets.
- Let  $(B, B^+) \leftarrow (A, A^+) \rightarrow (C, C^+) \in \text{HubPair}$  be adic morphisms. Let  $A_0, B_0, C_0$  be rings of definition compatible with the morphisms, and  $I \subset A_0$  be an ideal of definition. Let  $D = B \otimes_A C$  and let  $D_0$  be the image of  $B_0 \times_{A_0} C_0$  in  $D$ . Make  $D$  into a Huber ring by declaring  $D_0$  to be a ring of definition with  $ID_0$  as its ideal of definition and  $D^+$  be the integral closure of the image of  $B^+ \otimes_{A^+} C^+$  in  $D$ . Then  $(D, D^+)$  is a Huber pair, and it is the pushout of the diagram in the category of Huber pairs. ┘

*Proof:* For 1, it suffices to show that if  $T$  is a finite set of  $A$  that  $TA$  is open, then  $TB$  is open in  $B$ :  $I \subset TA$  for some ideal of definition  $I \subset A_0$ , in which case  $IB_0 \subset B_0$  is also an ideal of definition by [\(12.2.5.18\)](#), thus open, and so  $TB$  is also open as  $IB \subset TB$ . □

2 just follows from the definition. □

**Remark (12.2.5.26) [Non-Adic Morphisms].** Pushouts may not exist for non-adic morphisms of Huber rings. For example,  $\mathbb{Z}_p \rightarrow \mathbb{Z}_p[[T]]$  is not adic [\(12.2.5.18\)](#), and the diagram

$$(\mathbb{Z}_p[[T]], \mathbb{Z}_p[[T]]) \leftarrow (\mathbb{Z}_p, \mathbb{Z}_p) \rightarrow (\mathbb{Q}_p, \mathbb{Z}_p)$$

has no pushout in the category of Huber pairs: If there is a pushout  $(D, D^+)$ , then we will have a morphism

$$(D, D^+) \rightarrow (\mathbb{Q}_p \langle T, \frac{T^n}{p} \rangle, \mathbb{Z}_p \langle T, \frac{T^n}{p} \rangle)$$

for each  $n \geq 1$ . But notice that  $T$  is nilpotent in  $D$ , and  $1/p \in D <$  so  $T^n/p \rightarrow 0 \in D$  as  $n \rightarrow \infty$ . So  $T^n/p \in D^+$  for some  $n$ , but then  $T^n/p \in \mathbb{Z}_p\langle T, \frac{T^{n+1}}{p} \rangle$ , which is impossible.  $\perp$

**Def. (12.2.5.27)[Topological Polynomial Functions].** Let  $A$  be a non-Archimedean topological ring, and  $\{X_i\}_{i \in I}$  be a family of indeterminates,  $\{T_i\}_{i \in I}$  be a family of subsets of  $A$  that satisfies  $T_i^n U$  is open for any  $n > 0, i$  and open nbhd  $U$  of  $A$ .

Let  $\mathbb{N}^{(I)}$  be the set of functions  $I \rightarrow \mathbb{N}$  with finite support, then for any  $\nu \in \mathbb{N}^{(I)}$ , let  $T^\nu = \prod T_i^{\nu(i)}$ . For any nbhd  $U$  of  $A$ , we set

$$U_{[X,T]} = \left\{ \sum_{\nu \in \mathbb{N}^{(I)}} a_\nu X^\nu \mid a_\nu \in T^\nu U \right\}.$$

Then there exists a unique topological structure on  $A[X]$  that  $U_{[X,T]}$  form a fundamental system of nbhds of 0, and denote it by  $A[X]_T$ . It satisfies:

- the canonical inclusion  $\iota : A \rightarrow A[X]_T$  is continuous and the set  $\{T_i X_i\}_{i \in I}$  is power-bounded.
- $\iota$  satisfies the universal property that any continuous map  $f : A \rightarrow B$  to another non-Archimedean topological ring  $B$  that  $\{f(T_i)X_i\}_{i \in I}$  is power-bounded factors through  $A[X]_T$ .  $\perp$

*Proof:* Just notice that  $(U \cap V)_{[X,T]} \subset U_{[X,T]} \cap V_{[X,T]}$  and  $U_{[X,T]} \cdot V_{[X,T]} = (UV)_{[X,T]}$ , so they form a topological basis because  $A$  is topological.

The first properties are easily verified. For the second, the extension  $f' : A[X] \rightarrow B$  exists abstractly, and it suffices to show it is continuous. If we let  $E \subset B$  be the subring generated by  $\{f(T_i)X_i\}_{i \in I}$ , then  $E$  is bounded, so for any open subgroup  $H \subset B$ , there is some open subgroup  $G \subset B$  that  $EG \subset H$ , and thus  $f^{-1}(G)$  is open and contains some nbhd  $U$ , then  $U_{[X,T]} \subset (f')^{-1}(G)$ , so  $f'$  is continuous.  $\square$

**Def. (12.2.5.28)[Topological Power Series].** Let  $A, X, T$  as in (12.2.5.27), then the set

$$A\langle X \rangle_T = \left\{ \sum_{\nu \in \mathbb{N}^{(I)}} a_\nu X^\nu \in A[[X]] \mid a_\nu \in T^\nu U \text{ a.e.} \right\},$$

is a subring of  $A[[X]]$ , and there is a unique topological structure on  $A[[X]]$  that

$$U_{\langle X, T \rangle} = \left\{ \sum_{\nu \in \mathbb{N}^{(I)}} a_\nu X^\nu \in A\langle X \rangle_T \mid a_\nu \in T^\nu U \right\},$$

form a fundamental system of nbhds of  $A\langle X \rangle_T$ .  $\perp$

*Proof:* The proof is not hard and similar to that of (12.2.5.27) so omitted.  $\square$

**Prop. (12.2.5.29).** Let  $A, X, T$  as in (12.2.5.27), then

- $A[X]_T$  is dense in  $A\langle X \rangle_T$  and the topology coincide.
- If  $A$  is Hausdorff and  $T_i$  is bounded for any  $i \in I$ , then  $A[X]_T$  and  $A\langle X \rangle_T$  are all Hausdorff.
- If  $A$  is complete and  $T_i$  is bounded for any  $i \in I$ , then  $A\langle X \rangle_T$  is complete, so it is the completion of  $A[X]_T$ .  $\perp$

*Proof:* Only the completeness needs proof, Cf.[Mor19]P80.  $\square$

**Prop. (12.2.5.30)[Power Series is Huber].** Let  $A$  be a Huber ring with a couple of definition  $(A_0, I)$ , and  $X = \{X_\lambda\}$  be a finite set of indeterminates,  $T_\lambda$  is a family of subsets of  $A$  that  $T_\lambda A$  is open in  $A$ , then

- $A[X]_T$  is a Huber ring with a couple of definition  $((A_0)_{[X,T]}, I_{[X,T]})$ , and there is a canonical map  $A \rightarrow A[X]_T$  which is adic.
- $A\langle X \rangle_T$  is Huber with a couple of definition  $((A_0)_{\langle X,T \rangle}, I_{\langle X,T \rangle})$ , and there is a canonical map  $A \rightarrow A\langle X \rangle_T$  which is adic.

┘

*Proof:* It suffices to prove for any ideal of definition  $J$ ,  $J_{[X,T]} = J \cdot (A_0)_{[X,T]}$  and  $J_{\langle X,T \rangle} = J \cdot (A_0)_{\langle X,T \rangle}$ . The first is clear. For the second, use the fact  $J$  is f.g. and  $\{J^n\}$  is a fundamental basis of nbhds of 0.  $\square$

**Prop. (12.2.5.31)[Example].** Let  $A = \mathbb{Z}_p$  and  $T = p$ , then there is a Huber ring

$$\mathbb{Z}_p\langle X \rangle_T = \left\{ \sum_{n \geq 0} a_n X^n \in \mathbb{Z}_p[[X]] \mid l^{-n} a_n \rightarrow 0 \right\}$$

with a ring of definition

$$(Z_p)_{\langle X,T \rangle} = \left\{ \sum_{n \geq 0} a_n X^n \in \mathbb{Z}_p\langle X \rangle_T \mid a_n \in p^n \mathbb{Z}_p \right\}.$$

Notice that  $\mathbb{Z}_p\langle X \rangle_T$  is not adic although  $\mathbb{Z}_p$  is (because  $p$  is nilpotent but  $pX$  is not).  $\square$

**Def. (12.2.5.32)[Localizations].** Let  $A$  be a non-Archimedean topological ring and  $\{T_i\}$  is a family of subsets of  $A$  satisfying  $T_i^n U$  is open for any  $n > 0, i$  and open nbhd  $U$  of  $A$ , and  $\{s_i\}$  is a family of elements of  $A$ , which generates a multiplicative subset  $R \subset A$ .

Then there is a unique non-Archimedean ring structure on  $R^{-1}A$ , denoted by  $A(\frac{T}{S})$ , that the canonical map  $\varphi : A \rightarrow A(\frac{T}{S})$  is continuous and the set  $\{\frac{\varphi(t)}{\varphi(s_i)}\}$  is power-bounded, and it is the initial map for all maps  $A \rightarrow B$  satisfying this property.  $\square$

*Proof:* Cf.[Mor19]P83.  $\square$

**Cor. (12.2.5.33).** Let  $J$  be the ideal of  $A[X]_T$  generated by  $\{1 - s_i X_i\}$ , then  $A[X]_T/J$  with the quotient topology satisfies the same universal property as  $A(\frac{T}{S})$ , so there is a canonical isomorphism

$$A[X]_T/J \cong A(\frac{T}{S}).$$

In particular,  $A(\frac{T}{S})$  is a Huber ring, and the canonical map  $A \rightarrow A(\frac{T}{S})$  is adic. Explicitly,  $B_0$  is the  $(A_0)_{[X,T]}$ -subalgebra of  $B$  generated by the elements  $\frac{T_i}{s_i}$ .  $\square$

**Def. (12.2.5.34).** If  $A$  is Huber ring, then we denote the completion of  $A(\frac{T}{S})$  by  $A\langle \frac{T}{S} \rangle$ , which is also a Huber ring, and the canonical map  $A \rightarrow A\langle \frac{T}{S} \rangle$  is adic, by (12.2.5.30) and (12.2.5.33). It satisfies the natural universal property.  $\square$

**Cor. (12.2.5.35).** If  $A$  is complete, then we can also regard  $A\langle \frac{T}{S} \rangle$  as the quotient of  $A\langle X \rangle_T$  by the closure of the ideal generated by  $\{1 - s_i X_i\}$ .  $\square$

**Prop. (12.2.5.36)[Example].** Let  $A = \mathbb{Z}_p[[T]]$  with the  $(p, T)$ -adic topology, then

$$A\left(\frac{p, T}{T}\right) = \mathbb{Z}_p[[T]][T^{-1}]$$

with a ring of definition  $A[\frac{p}{T}]$ , and

$$A\left(\frac{p, T}{p}\right) = \mathbb{Z}_p[[T]][p^{-1}]$$

with a ring of definition  $A[\frac{T}{p}]$ .

In  $A\langle\frac{p, T}{T}\rangle$ , a ring of definition is  $A_{\langle X, T \rangle}/(1 - pX)$ , which is isomorphic to

$$A\left\langle\frac{T}{p}\right\rangle = \left\{ \sum_{n \geq 0} a_n \left(\frac{T}{p}\right)^n \mid a_n \in A, a_n \rightarrow 0 \right\}$$

by (12.2.5.33). ┘

## 6 Analytic Points and Analytic Huber Pairs

**Def. (12.2.6.1)[Analytic Huber Rings].** A Huber ring  $A \in \text{HubCRing}$  is called an **analytic Huber-ring** if  $AA^{00} = A$  (12.2.1.2). Any Tate-Huber ring (12.2.5.5) is analytic. ┘

**Prop. (12.2.6.2)[Equivalent Definitions of Analytic Rings].** For  $A \in \text{HubCRing}$ , the following are equivalent:

1.  $A$  is analytic (12.2.6.1).
2. Any ideal of definition in any ring of definition of  $A$  generates the unit ideal of  $A$ .
3. Any open ideal of  $A$  is trivial.
4. For any non-trivial ideal  $I$  of  $A$ , the quotient topology on  $A/I$  is not discrete.
5. The only discrete  $A$ -module is the 0-module.
6. The set  $\text{Spa}(A, A^+)$  contains no point with induced topology on the residue field trivial. ┘

*Proof:* Cf. [Ked19] P4. ? □

**Prop. (12.2.6.3)[Analytic Open Mapping Theorem].** If  $A$  is an analytic Huber ring, and  $M, N$  are complete Banach  $A$ -modules, then any continuous surjective map  $M \rightarrow N$  is open. ┘

*Proof:* [Hub94] L2.4(i). ? □

### Analytic Points

**Def. (12.2.6.4)[Analytic Points].** For  $A \in \text{HubCRing}$ , a point  $x \in \text{Cont}(A)$  is called an **analytic point** if  $\mathfrak{p}_x$  is not open in  $A$ . The set of analytic points of  $\text{Cont}(A)$  is denoted by  $\text{Cont}(A)_{\text{an}}$ .

If  $A$  is Tate, then  $\text{Cont}(A)_{\text{an}} = \text{Cont}(A)$ , because the only open ideal of  $A$  is  $A$  itself. ┘

**Prop. (12.2.6.5)[Characterizations of Analytic Points].** Let  $A$  be a Huber ring, then for a point  $x \in \text{Cont}(A)$ , the following is equivalent:

1.  $x$  is analytic.
2.  $|A^{00}|_x \neq 0$ .
3. For any ring of definition and ideal of definition  $(A_0, I)$  of  $A$ ,  $|I|_x \neq 0$ .

┘

*Proof:* 1  $\rightarrow$  2:  $\mathfrak{p}_x$  is non-open, so it cannot contain the open subset  $A^{00}$  of  $A$ ??.

2  $\rightarrow$  3: trivial because any ring of definition contains  $A^{00}$ (12.2.5.8). □

**Cor.(12.2.6.6).** Let  $A$  be a Huber ring and  $I$  an ideal of definition with a set of generators  $(f_1, \dots, f_n)$ , then

$$\text{Cont}(A)_{an} = \cup_{i=1}^n U\left(\frac{f_1, \dots, f_n}{f_i}\right).$$

┘

**Prop.(12.2.6.7)[Analytic Valuation Microbial].** Let  $A$  be a Huber ring and  $x \in \text{Cont}(A)_{an}$ , then  $x$  has  $\text{rank} \geq 1$ , and the valuation  $|\cdot|_x$  on  $k(x)$  is microbial(12.2.3.22). ┘

*Proof:* If  $x$  has rank 1, then  $\Gamma_x = 1$ , and  $\mathfrak{p}_x = \{a \in A \mid |a|_x < 1\}$  is open.

If  $x$  is analytic, then there are some  $a \in A^{00}$  that  $|a|_x \neq 0$ (12.2.3.22), thus the image of  $a$  in  $k(x)$  is non-zero and topologically nilpotent, thus  $k(x)$  is microbial by(12.2.3.22). □

**Prop.(12.2.6.8)[Adic Morphism and Analytic Points].** Let  $\varphi : (A, A^+) \rightarrow (B, B^+)$  be a morphism of Huber pairs, then:

- If  $x \in \text{Spa}(B, B^+)$  is not analytic, then  $\text{Spa}(\varphi)(x)$  is not analytic.
- If  $\varphi$  is adic, then  $\text{Spa}(\varphi) : \text{Spa}(B, B^+) \rightarrow \text{Spa}(A, A^+)$  carries analytic points to analytic points.
- If  $B$  is complete and  $\text{Spa}(\varphi) : \text{Spa}(B, B^+) \rightarrow \text{Spa}(A, A^+)$  carries analytic points to analytic points, then  $\varphi$  is adic.
- If  $\varphi$  is adic, then the  $\text{Spa}(\varphi)$  maps rational subsets to rational subsets. In particular,  $\text{Spa}(\varphi)$  is spectral.

┘

*Proof:* 1: Trivial.

2: If  $f(x)$  is not analytic, then  $I \subset \varphi^{-1}(\mathfrak{p}_x)$ , so  $f(I) \subset \mathfrak{p}_x$ , which means  $\mathfrak{p}_x$  is not analytic because  $f(I)A_0$  is open.

3: Cf. Morel P96?.

4: Only notice that  $(f(T))$  is open if  $(T)$  is open. □

**Cor.(12.2.6.9).** If  $A$  is an analytic Huber ring, then any continuous morphism  $f : A \rightarrow B$  is adic, by(27.3.4.27). ┘

## 7 Huber and Banach Rings

Cf.[Ked19]1.5.

**Prop.(12.2.7.1).** Let  $A$  be a uniform Huber ring, then for  $x = \sum_{n=0}^{\infty} x_n T^n \in A\langle T \rangle$  such that the coefficients  $x_n$  generate the unit ideal of  $A$ , then multiplication by  $x$  defines a strict inclusion  $A\langle T \rangle \rightarrow A\langle T \rangle$ , i.e.  $|xg| \geq |g|$ . ┘

*Proof:* Cf.[Ked19]P25. □

## 8 Perfectoid Fields

**Notation(12.2.8.1).** Let  $(K, \mathcal{O}_K, \mathfrak{m}_K, k)$  be a non-Archimedean complete valued field.  $\lrcorner$

**Prop.(12.2.8.2).** The valuation can in fact be constructed from  $K^0$  as  $|x| = \sup\{\frac{n}{k} | x^k \in t^n K^0\}$  by(3.2.9.6), as it is a rank 1 valuation.  $\lrcorner$

**Def.(12.2.8.3)[Perfectoid Field].** If  $\text{char } K = p \in \text{Prime}$ , then  $K$  is called a **perfectoid field** iff:

- The value group  $|K^\times| \subset \mathbb{R}_+^\times$  is not discrete.
- $\mathcal{O}_K/(p)$  is semi-perfect.

$\lrcorner$

**Prop.(12.2.8.4)[Examples of Perfectoid Fields].**

- $K = \mathbb{Q}_p(p^{\frac{1}{p^\infty}})^\wedge$ .  $\mathcal{O}_K = \mathbb{Z}_p(p^{\frac{1}{p^\infty}})^\wedge$ , and  $\mathcal{O}_K/(p) \cong [\mathbb{F}_p(t^{\frac{1}{p^\infty}})/(t)]^\wedge$ , which is clearly semi-perfect. And its value group is  $\mathbb{Z}[p^{-1}]$ .
- $K = \mathbb{C}_p$ , its value group is  $\mathbb{Q}$ , and  $K = \overline{K}$ , so  $\mathcal{O}_K/(p)$  is clearly perfect.
- if  $\text{char } K = p$ , then  $K$  is a perfectoid field iff  $K$  is perfect: if  $K$  is perfect, then it is clearly perfectoid, and the semi-perfectness of  $\mathcal{O}_K$  implies its perfectness, so also  $K$  is perfect(multiply by a  $p$ -power of an element in  $\mathfrak{m}_K$ ).
- If  $K \in \text{PerfdField}$  and  $|p| \leq |\varpi| < 1$  is a pseudo-uniformizer, then  $K/(\varpi)$  is perfect hence perfectoid.

$\lrcorner$

**Prop.(12.2.8.5)[Perfectoid Field and Integral Perfectoid Rings].** The ring of integers  $\mathcal{O}_K$  for a perfectoid field  $K$  is an integral perfectoid ring(27.6.3.1).  $\lrcorner$

*Proof:* We assume that  $K$  is of char0, then we check conditions in(27.6.3.6). It is clear that  $\mathcal{O}_K$  is  $p$ -adically complete,  $p$ -normal. To find  $\varpi^p = pu$ , as  $|K^*|$  is not discrete, we find  $x$  that  $x^p$  divides  $p$ , and then there exists some  $y$  that  $y^p \equiv x^p/p \pmod{p}$ , thus  $(xy)^p \equiv 1 \pmod{p}$ , thus  $\varpi = xy$  satisfies the condition.  $\square$

**Prop.(12.2.8.6).** If  $K \in \text{Perfd}$ , then

- $|K^\times|$  is a  $p$ -divisible Abelian group.
- $\mathfrak{m}_K^2 = \mathfrak{m}_K$ , and  $\mathfrak{m}_K$  is flat ?.
- $\mathcal{O}_K$  is not Noetherian.

$\lrcorner$

*Proof:* 1 : First if  $|p| < |x| \leq 1$ , we show  $|x|$  is  $p$ -divisible: there is a  $y, z \in K^0$  that  $y^p = x + pz$ , so  $|y|^p = |x|$ . Now because  $|K^*|$  is not discrete, so there is a  $|x| \notin |p|^\mathbb{Z}$ , by rescaling, we may assume  $|p| < |x| \leq 1$ , thus  $p = xy$  for some  $y$ , and  $|p| < |y| \leq 1$ , too. So  $|p|$  is also divisible by  $p$ , so it is clear now  $|K^*|$  is divisible by  $p$ .

2 follows from(27.6.3.5)(12.2.8.5).

2  $\rightarrow$  3 by Nakayama's lemma, because otherwise  $K^{00} = 0$ .  $\square$

**Cor.(12.2.8.7).** The proof of 1 also shows that  $|K^\times|$  is generated by  $|x|$  that  $|p| < |x| < 1$ .  $\lrcorner$

**Lemma(12.2.8.8).** If  $C^\flat$  is a perfectoid space of residue characteristic  $p$ , then  $1 + \mathfrak{m}_{C^\flat}$  is a  $\mathbb{Q}_p$ -algebra.  $\lrcorner$

*Proof:* Both  $\varphi$  and exponentiation of  $\mathbb{Z}_p^*$  is definable, so  $p^n t \cdot (1 + x) = (\varphi^n(1 + x))^k$ .  $\square$

### Tilting

**Prop. (12.2.8.9) [Pseudo-Uniformizers].** Fix a **pseudo-uniformizer**  $|p| \leq |\varpi| < 1$ , consider the tilting(5.5.1.9)  $\mathcal{O}_K^\flat$ , then by(5.5.1.12), this topological group doesn't depends on  $\pi$  chosen.  $\lrcorner$

**Remark (12.2.8.10).** There are diagrams:

$$\begin{array}{ccc} \lim_{x \rightarrow x^p} \mathcal{O}_K & \xrightarrow{\quad} & \mathcal{O}_K \\ \downarrow \cong & \nearrow \# & \downarrow \\ \mathcal{O}_K^\flat = \lim_{\varphi} K^0/(\varpi) & \longrightarrow & \mathcal{O}_K/(\varpi) \end{array} . \quad \lrcorner$$

**Prop. (12.2.8.11) [Tilting of  $\mathcal{O}_K$ ].** There is an element  $t \in \mathcal{O}_K^\flat$  that  $|t^\sharp| = |\varpi|$ ,  $t$  maps into  $(\pi)$  and gives an isomorphism  $\mathcal{O}_K^\flat/(t) \cong \mathcal{O}_K/(\varpi)$ .

Moreover, the  $t$ -adic topology on  $\mathcal{O}_K^\flat$  is complete, and coincides with the topology of  $\mathcal{O}_K^\flat$  given as in(5.5.1.9).  $\lrcorner$

*Proof:* There are canonical surjective map  $K^{0b} \rightarrow K^0/p \rightarrow K^0/\pi$ , and by  $p$ -divisibility of the value group(12.2.8.6), there is a  $f \in K^0$  that  $|f|^p = |\pi|$ , so in particular  $|f| > |\pi|$ , thus  $f \neq 0 \in K^0/\pi$ . and choose a  $g \in K^{0b}$  lifting  $f \bmod \pi$ , then  $g^\sharp \equiv f \bmod \pi$ , see diagram(12.2.8.10). so  $|g^\sharp| = |f|$  as  $|f| > |\pi|$ . Now let  $t = g^p$ , then  $|t^\sharp| = |f|^p = |\pi|$ .

Now clearly  $t$  maps into  $(\pi)$ , and if  $g$  maps to 0 in  $K^0/\pi$ , then by the diagram again,  $g^\sharp \in (\pi)$ , and  $(t^\sharp) = (\pi)$ , so  $g^\sharp = at^\sharp$  for some  $a \in K^0$ . so  $t|g$  in  $K^{0b}$ , as by(5.5.1.17),  $R^{0b}$  is a valuation ring in the valuation  $|\cdot| \circ \sharp$ .

For the last assertion, just use the commutative diagrams:

$$\begin{array}{ccc} K^{0b}/(t^{p^n}) & \longrightarrow & K^{0b}/(t^{p^{n-1}}) \\ \downarrow & & \downarrow \\ K^0/(\pi) & \xrightarrow{\varphi} & K^0/(\pi) \end{array} , \text{ where}$$

the vertical are isomorphisms, and compute their inverse limits.  $\square$

**Cor. (12.2.8.12) [Tilting of Perfectoid Fields].**

- $\mathcal{O}_K^\flat$  is a valuation ring of rank 1, with the field of fraction  $K^\flat = \mathcal{O}_K^\flat[t^{-1}] \in \text{Perfd}$ .
- Its maximal ideal is  $(t^{\frac{1}{p^\infty}})$ , with Krull dimension 1.
- The value group and residue field of  $K$  and  $K^\flat$  is canonical isomorphic.

$\lrcorner$

*Proof:*  $K^{0b}$  has rank no more than  $K^0$  which is 1(12.2.8.3), and it is non-trivial because  $|t| = |\pi|$ , so the rank is 1, and it is perfect by definition, so  $K$  is perfectoid by(12.2.8.4).

For the maximal ideal, the maximal ideal of  $K^{0b}/t$  is its nilradical, as it is a valuation ring of rank 1(3.2.9.6), which is clearly  $(t^{\frac{1}{p^\infty}})$ . For the dimension, by(12.2.3.4), the Krull dimension equal the rank, which is 1.

For the residue field, use the isomorphism(12.2.8.11),  $K^{0b}/t = K^0/\pi$  and the second item just proved, and for the value group, the same lemma(12.2.8.11) gives any  $|p| \leq |\pi| < 1$  are in the value group of  $K^\flat$ , and  $|K^\times|$  is generated by these values by(12.2.8.7).  $\square$

**Prop. (12.2.8.13) [Tilting Continuous Valuations].** If  $K \in \text{Perfd}$ , for any continuous valuation on  $K$  of any rank, the function  $|\cdot|^\flat = |\cdot| \circ \sharp$  is a continuous valuation on  $\mathcal{O}_K^\flat$ , and every continuous valuation of  $\mathcal{O}_K^\flat$  comes from this way.  $\lrcorner$

**Remark(12.2.8.18).** Notice that  $K = \mathbb{Q}_p(\mu_{p^\infty})^\wedge$  and  $K = \mathbb{Q}_p(p^{\frac{1}{p^\infty}})^\wedge$  have the same tiltings, so the tilting functor is not faithful. this is due to the fact that  $\mathbb{Q}_p$  is not perfectoid. This will not happen over a perfectoid base field, see(12.2.9.13).  $\square$

## 9 Perfectoid Algebras

**Def. (12.2.9.1) [Perfectoid Algebra].** For  $K$  a perfectoid field with tilt  $K^\flat$ , let  $t \in K^\flat$  be a pseudo-uniformizer (12.2.5.5) with  $\varpi = t^\sharp$ , so it has a compatible collection of  $p^n$ -th roots  $(t^{\frac{1}{p^n}})^\sharp$ . Now:

- A **perfectoid algebra** over  $K$  is a uniform Banach  $K$ -algebra  $R$  that  $R^0/\pi$  is semi-perfect.
- A **perfectoid algebra** over  $K^{0a}$  is a  $K^{0a}$ -algebra  $A$  that is  $t$ -adically complete and flat over  $K^{0a}$  (or  $A_*$  over  $K^0$ , by (5.7.3.3)), and  $K^{0a}/\pi \rightarrow A/\pi$  is relative perfect, i.e. the Frobenius induces an isomorphism  $A/\pi^{\frac{1}{p}} \cong A/\pi$ .
- A **perfectoid algebra** over  $K^{0a}/\pi$  is a  $K^{0a}/\pi$ -algebra  $A$  that is flat over  $K^{0a}/\pi$  (or  $A_*$  over  $K^0/\pi$ , by (5.7.3.3)), and the map  $K^{0a}/\pi \rightarrow A$  is relatively perfect, i.e. the Frobenius induces an isomorphism  $A/\pi^{\frac{1}{p}} \cong A$ .

┘

**Remark (12.2.9.2).** notice the definition regarding the relative perfectness doesn't depends on  $\pi$  chosen, by the power lifting theorem (2.6.1.10). ┘

**Prop. (12.2.9.3) [Faithfully flatness of Perfectoids].** Nonzero flat  $\mathcal{O}_K^a/(\varpi)$ -algebras are faithfully flat, so does  $t$ -adically complete flat  $K^{0a}$ -algebras. In particular,  $\text{Perfd}_{\mathcal{O}_K^a/(\varpi)}$  and  $\text{Perfd}_{\mathcal{O}_K^a}$  are all faithfully flat modules. ┘

*Proof:* If  $K^{0a}/\pi \rightarrow A$  is not faithfully flat, then there is an ideal  $J \subset K^{0a}/\pi$  that  $K^0/J \neq 0$  but  $A/J = 0$ . Now this implies  $J \subsetneq I$ , so there is a  $\varpi \in I - J$  hence  $J \subset (\varpi)$ . Hence  $A/\varpi = 0$  as well. Now there are exact sequences  $0 \rightarrow K^{0a}/\varpi^n \xrightarrow{\varpi} K^{0a}/\varpi^{n+1} \rightarrow K^{0a}/\varpi \rightarrow 0$ , so tensoring with  $A$  and induct, we get  $K^{0a}/\varpi^n \otimes A = 0$ , but  $|\varpi^n| < |\pi|$  for some  $n$ , so  $A = 0$ .

The other case is similar, now  $A/\varpi = 0$ , so use (5.7.3.3),  $A_*/\varpi \subset (A/\varpi)_* = 0$ , but  $A_*$  is also  $t$ -adically complete, so  $A_* = 0$ , and  $A = (A_*)^a = 0$ . ┘

**Prop. (12.2.9.4) [Examples of Perfectoid Algebras].**

- If  $\text{char } K = p$ , then a  $K$ -Banach algebra is perfectoid iff it is uniform and perfect. Likewise, a  $\pi$ -adically complete and  $\pi$ -torsion free  $K^{0a}$ -algebra is perfectoid iff it is perfect.
- Let  $A = \mathcal{O}_K[x_1^{\frac{1}{p^\infty}}, \dots, x_n^{\frac{1}{p^\infty}}]^\wedge$ , then  $A^a \in \text{Perfd}_{\mathcal{O}_K^a}$ , and  $R = A[\pi^{-1}] \in \text{Perfd}_K$  in the Banach metric as in (19.1.6.8).

┘

*Proof:* 1: a perfectoid algebra of char  $p$  is perfect, because by semi-perfectness,  $x = x_1^p + \pi z_1 = x_1^p + \pi x_2^p + \pi^2 z_2 = \dots$ , so  $x = (x_1 + \pi^{\frac{1}{p}} x_2 + \pi^{\frac{2}{p}} x_3 + \dots)^p$ . In fact, uniformity is automatically implied by perfectness, by (12.2.5.12). The case of  $\mathcal{O}_K^a$ -algebra is similar.

2:  $A^a$  is  $K^{0a}$ -flat because  $A_*$  does, because it is a colimit of completions of polynomial algebras over  $I$  and  $I$  is flat over  $K^0$  (12.2.8.6). and  $R$  is perfectoid by (19.1.6.8) because  $A$  is totally integrally closed in  $R$ , because  $K^0[x_1^{\frac{1}{p^\infty}}, \dots, x_n^{\frac{1}{p^\infty}}]$  does (trivially), and use (5.7.2.10). ┘

### Tilting Equivalence

**Prop. (12.2.9.5) [Tilting Equivalence].** There are canonical isomorphisms of categories:

$$\text{Perfd}_K \cong \text{Perfd}_{K^{0a}} \cong \text{Perfd}_{K^{0a}/\pi},$$

where the first map is by  $R \mapsto R^{0a}$  and  $A \rightarrow A_*[t^{-1}]$  just as in (19.1.6.8). The second map is reduction by  $\pi$ .

In particular, using tilting (12.2.8.11), there are canonical isomorphisms of categories:

$$\mathrm{Perfd}_K \cong \mathrm{Perfd}_{K^{0a}} \cong \mathrm{Perfd}_{K^{0a}/\pi} = \mathrm{Perfd}_{K^{b0a}/t} \cong \mathrm{Perfd}_{K^{b0a}} \cong \mathrm{Perfd}_{K^b}.$$

If  $R \in \mathrm{Perfd}_K$  corresponds to  $S \in \mathrm{Perfd}_{K^b}$ , then we call  $S = R^b$  the **tilting** of  $R$  and  $R = S^\sharp$  the **untilting** of  $S$ .  $\square$

*Proof:*  $[\mathrm{Perfd}_K \cong \mathrm{Perfd}_{K^{0a}}]$

Firstly, if  $R \in \mathrm{Perfd}_K$ , then  $A = R^{0a} \in \mathrm{Perfd}_{K^{0a}}$ :  $R^0/\pi^{\frac{1}{p}} \rightarrow R^0/\pi$  is surjective by definition, for injectivity, if  $x^p/\pi \in R^0$ , then  $x/\pi^{\frac{1}{p}}$  is also power bounded, thus in  $R^0$ . And by (19.1.6.8),  $A$  is  $\pi$ -adically complete and  $\pi$ -torsion-free, hence  $R$ -flat by (5.4.1.12).

Next we show if  $A \in \mathrm{Perfd}_{K^{0a}}$ , then  $A_*$  is  $\pi$ -adically complete,  $t$ -torsion free and  $p$ -root closed in  $A[\pi^{-1}]$ , hence is a left inverse to the mapping  $R \rightarrow R^{0a}$ , by (5.7.3.5). It is complete by (5.7.3.3)2,3.

For  $p$ -root closedness, by (5.7.3.3),  $A_*/\pi^{\frac{1}{p}} \subset (A/\pi^{\frac{1}{p}})_* \hookrightarrow (A/\pi)_*$  by Frobenius, and then so does  $A_*/\pi^{\frac{1}{p}} \rightarrow A_*/\pi$ . Now if  $x \in A_*[\pi^{-1}]$  satisfies  $x^p \in A_*$ , then  $y = \pi^{\frac{k}{p}}x \in A_*$  for some  $k$ , and we want to lower  $k$  by 1 inductively, thus showing  $x \in A_*$ : As  $y^p \in \pi A_*$ ,  $y \in \pi^{\frac{1}{p}}A_*$  by what we have proved, thus  $\pi^{\frac{k-1}{p}}x \in A_*$ .

For surjectivity of Frob:  $A_*/\pi \rightarrow A_*/\pi$ , notice first it is almost surjective, because  $(A_* \rightarrow A_*/\pi)^a = A \rightarrow (A_*/\pi)^a \subset (A/\pi)_*^a = A/\pi$  is surjective by hypothesis, then by (5.7.2.3), it suffices to show that Frob is surjective on  $A/IA$ . For some  $x \in A^*$ , choose  $0 < 1 < c$ , almost surjectivity shows that  $\pi^c x \equiv y^p \pmod{\pi A_*}$ , so  $(y/p^{\frac{c}{p}})^p \in A_*$ , thus  $y \in p^{\frac{c}{p}}A_*$ , thus  $x \equiv (y/p^{\frac{c}{p}})^p \pmod{\pi^{1-c}A_*} \subset IA$ , so we are done.

Finally, this is also a right inverse, because we know that  $A_* \cong R^0$  by (5.7.3.5), thus  $A \cong R^{0a}$  in  $\mathrm{Mod}_R^a$ .  $\square$

*Proof:*  $[\mathrm{Perfd}_{K^{0a}} \cong \mathrm{Perfd}_{K^{0a}/\pi}]$

Firstly the reduction is a perfectoid  $K^{0a}/\pi$ -algebra: it is flat because flatness is stable under base change, and the rest are trivial. To construct a converse is a problem of deformation theory, we need to lift from  $K^{0a}/\pi$ -algebra via  $K^{0a}/\pi^n$ -algebras to a  $K^{0a}$ -algebra, suppose each lifting is unique up to isomorphism and the lift  $A_n$  is flat over  $K^{0a}/\pi^n$ , then we can form their inverse limit, which is flat, because it is  $\pi$ -torsion-free: if  $\pi(x_n) = 0$ , then by  $0 \rightarrow \pi^n K^{0a}/\pi^{n+1} \rightarrow K^{0a}/\pi^{n+1} \xrightarrow{\pi} K^{0a}/\pi^n \rightarrow 0$  and the flatness of  $A_{n+1}$ ,  $x_{n+1} \in \pi^n A_{n+1}$ , thus  $x_n = 0$ , and  $x = 0$ .

Now  $0 \neq A \in \mathrm{Perfd}_{K^{0a}/\pi}$ , then  $A$  is faithfully flat by (12.2.9.3), then by (5.7.1.8),  $A_{!!}$  is faithfully flat, and  $(-)_!!$  preserves all colimits and also Frobenius, so  $A_{!!}$  is relatively perfect. Then we use the above argument, and (8.1.4.1) to show that there is a  $\tilde{A} \in \mathcal{C}$  which is  $\pi$ -adically complete and  $K^0$ -flat, then  $\tilde{A} = (\tilde{A}_{!!})^a$  is also  $p$ -adically complete and  $K^{0a}$ -flat, by (5.7.3.3).

And we check  $\tilde{A}/\pi = (\tilde{A}_{!!}/\pi)^a = (A_{!!}/\pi)^a = A$  as  $(-)_!!$  commutes with colimits, and conversely, if  $A \in \mathrm{Perfd}_{K^{0a}}$ , we need to show  $A = \tilde{A}/\pi$ , notice by hypothesis,  $A_{!!}$  is faithfully flat  $K^0$ -algebra that is relatively flat over  $K^0/\pi$ , now it is also complete, because  $A_{!!} \rightarrow A_*$  is an injection (because  $(-)^a$  is exact) and almost isomorphism, so the cokernel is  $\pi$ -torsion, and  $A_*$  is complete, so does  $A_{!!}$ , by (5.2.3.9). Now  $A_{!!}/\pi = (A_{!!}/\pi)$  as  $(-)_!!$  commutes with colimits, so  $A_{!!}$  is just the lift, and  $(\tilde{A}_{!!}/\pi)^a = A_{!!}^a = A$ .  $\square$

**Cor. (12.2.9.6) [Tilting via Foutain's Functors].** The tilt  $R^b$  is just the Foutain's tilting, i.e.  $R^b = R^{0b}[t^{-1}]$ , and  $R^b = \lim_{x \mapsto x^p} R$ ,  $R^{0b} = (R^b)^0$ .  $\square$

*Proof:* Consider the diagram

$$\begin{array}{ccccc}
 K^{b0}/t^{p^n} & \xrightarrow{\varphi^{-n}} & K^{b0}/t \cong K^0/\pi & \longrightarrow & R^0/t \\
 & \searrow & \downarrow \varphi^n & & \downarrow \varphi^n \\
 & & K^{b0}/t \cong K^0/\pi & \longrightarrow & R^0/t
 \end{array}$$

Then the upper row is just the unique flat and relative perfect lifting along  $K^{b0}/t^{p^n} \rightarrow K^{b0}/t$ . Taking inverse limit, we get the structure map  $K^{b0} \rightarrow R^{b0}$ , so after almostification, this is just the lifting we are looking for, because it is unique. So  $(R^{0b})^a = (R^{b0})^a$ , and  $R^b = R^{0b}[t^{-1}]$  unwinding the tilting equivalence.

For  $R^b$ , notice there is a map

$$R^b \cong (\lim_{x \mapsto x^p} R^0)[t^{-1}] \rightarrow \lim_{x \mapsto x^p} (R^0[\pi^{-1}]) \cong \lim_{x \mapsto x^p} R$$

Now injectivity is clear as  $t$  is non-zero-divisor, and if  $(f_n) \in \lim_{x \mapsto x^p} R$ , then  $\pi^c f_n \in R^0$  for some  $c$ , then  $\pi^{\frac{c}{p^n}} f_n \in R^0$  because  $R^0$  is  $p$ -root closed(5.7.3.5), so  $t^c(f_n) \subset R^{0b}$ .

For the last assertion, it is true if  $R^{0b}$  is totally integrally closed in  $R^b$ , by(5.7.3.5). For this, if  $t^c f^{\mathbb{N}} \subset R^{0b}$ , then  $\pi^c(f^{\sharp})^{\mathbb{N}} \subset R^0$ , thus  $f^{\sharp} \in R^0$ . And by  $p$ -root closedness,  $p^n$ -th roots of  $f^{\sharp}$  are all in  $R^0$ , so  $f = (f_n) \in \lim_{x \mapsto x^p} R$  is in  $R^{0b}$ .  $\square$

**Prop. (12.2.9.7)[Fountain's Functor  $\theta$ ].** Given a perfectoid field  $K$ , the kernel of the Fontaine's map  $\theta : A_{\text{inf}}(K) \rightarrow K^0$ (5.5.1.15) is generated by a non-zero-divisor, in fact, if  $\text{char} K = 0$ , the generator can be chosen to be any element that maps to a generator of  $\ker \bar{\theta}$  and if  $\text{char} K = p$  this diagram is trivial. In particular, the diagram is a pushout.  $\lrcorner$

*Proof:* See the proof of(27.6.3.6) in the  $p$ -torsionfree case.  $\square$

**Prop. (12.2.9.8)[Untilting via  $A_{\text{inf}}$ ].** For any perfect  $\mathcal{O}_K^b$ -algebra  $A$ , by deformation theory(or in fact Witt theory) there is a unique lifting  $W(A)$  lifting it to  $A_{\text{inf}}(K^{0b})$ . And then pushout  $W(A) \otimes_{A_{\text{inf}}(K^0)} K^0$  is just the lifting of  $A/\pi$ , because the diagram above is pushout. This is in fact the method of [Kedlaya-Liu] used to prove the tilting-equivalence without the use of almost mathematics and deformation theory.  $\lrcorner$

**Cor. (12.2.9.9) [Limits and Colimits].** Any of the categories in(12.2.9.5) has arbitrary limits and colimits.  $\lrcorner$

*Proof:* We construct for  $\text{Perfd}_{K^{0ba}}$ : The limits is just the limits of topological rings, as the properties of  $t$ -adically complete,  $t$ -torsion free and perfect is preserved by limits(5.2.3.18). For the colimit, just use the  $t$ -adic completion of the left perfection of the colimits in the category of  $K^{0ba}$ -algebras, its  $t$ -torsion is almost zero because of perfectness, thus it is almost flat(5.7.3.3).  $\square$

**Remark (12.2.9.10).** Note also for further reference that in the category  $\text{Perfd}_{K^{0a}}$ , a filtered colimits is just the  $\pi$ -adically completion of the filtered limits as rings, because perfectness and flatness is preserved(5.4.1.6).  $\lrcorner$

**Prop. (12.2.9.11)[Tilting Equivalence Identifies Fields].**  $R \in \text{Perfd}_K$  is a perfectoid field iff its tilt  $R^b$  is a perfectoid field.  $\lrcorner$

*Proof:* It is proven that if  $R$  is a perfectoid field, then  $R^b$  is a perfectoid field. Conversely,  $R$  is a perfectoid field if the spectral norm given by  $\|x\| = \inf\{|t|^{-1} | t \in R^*, tx \in R^0\}$  is the Banach valuation of  $R$  and  $R$  is a field.

For the multiplicativeness of  $\|\cdot\|_R$ , notice that  $R^b$  is a perfectoid field, so its non-Archimedean valuation coincides with the spectral norm of  $\|\cdot\|_{R^b}$ , and this equals  $\|\cdot\|_R \circ \sharp$ , because  $R^{0b} = R^{b0}$ , an element  $f \in R^{b0}$  iff  $f^\sharp \in R^0$ . Now the norm extends that of  $K$  and commutes with scalar multiplication, so for any  $f, g$ , we may assume  $f, g \in R^0 - 0\pi^{\frac{1}{p}}R^0$ , now choose  $a, b \in R^b$  that  $a^\sharp - f, b^\sharp - g \in \pi R^0$ , this can be done because  $R^{b0} = R^{0b} \rightarrow R^0/\pi$  is surjective, then  $a, b, ab \notin \pi R^{b0}$  because  $R^{0b} = R^{b0}$ . Then clearly  $\|f\|_R = \|a\|_{R^b}, \|g\|_R = \|b\|_{R^b}, \|fg\|_R = \|ab\|_{R^b}$ , so it is multiplicative by the multiplicativeness of  $R^b$ .

To show  $R$  is a field, consider and  $f \in R - \pi^{\frac{1}{p}}R$ , choose  $a \in R^b$  that  $f = a^\sharp + \pi g$ , then as  $R^b$  is a field, there is a  $b$  that  $ab = 1$ . Now  $\|\pi\|_R < \|\pi^{\frac{1}{p}}\|_R \subset \|f\|_R = \|a\|_{R^b} \leq 1$ , so we get  $\|\pi b^\sharp g\| < 1$ , then

$$f^{-1} = \frac{1}{a^\sharp + \pi g} = \frac{b^\sharp}{1 + \pi b^\sharp g} = b^\sharp \left( \sum (-\pi b^\sharp g)^k \right)$$

can be constructed in  $R$ . □

### Perfectoid Affinoid Algebra

**Def. (12.2.9.12) [Perfectoid Affinoid  $K$ -algebras].** An **affinoid  $K$ -algebra**  $(R, R^+)$  is just an affinoid Tate ring over  $(K, K^0)$ . It is called a **perfectoid affinoid  $K$ -algebra** iff  $R$  is a perfectoid algebra. ┘

**Prop. (12.2.9.13) [Affinoid Tilting Equivalence].** The categories of perfectoid affinoid algebras (12.2.9.12) over  $K$  and  $K^b$  are equivalent, where  $(R, R^+)$  is identified with  $(R^b, R^{b+})$  iff  $R^b$  is the tilting of  $R$  and

$$\begin{array}{ccc} R^+/\mathfrak{m}R^0 & \xrightarrow{\cong} & R^{b+}/\mathfrak{m}^b R^{b0} \\ \downarrow & & \downarrow \\ R^0/\mathfrak{m}R^0 & \xrightarrow{\cong} & R^{b0}/\mathfrak{m}^b R^{b0} \end{array}.$$

Moreover, in this case,  $R^+/\pi$  is semi-perfect, and  $R^{+b} \cong R^{b+}$  as a subring of  $R^{0b} \cong R^{b0}$ . ┘

*Proof:* The case  $R^+ = R^0$  is already known by tilting equivalence (12.2.9.5) and (12.2.9.6).

By (12.2.5.11) and (12.2.5.14),  $\mathfrak{m}R^0 = R^{00} \subset R^+ \subset R^0$ , thus  $R^+ \rightarrow R^0$  is an almost isomorphism and  $R^+$  is determined by its image  $\overline{R^+} \subset R^0/\mathfrak{m}R^0$ , which is integrally closed if  $R^+$  does, so the identification is clear.

For the semi-perfectness: as  $R^+/\mathfrak{m}R^0$  is integrally closed, it is perfect. Now  $R^+ \rightarrow R^0$  is an almost isomorphism, so Frob on  $R^+/\pi$  is almost surjective because it does on  $R^0/\pi$  by definition, and now we know Frob is surjective on  $R^+/\pi$  by (5.7.2.3).

To show  $R^{+b} \cong R^{b+}$ , we show there is a Cartesian diagram

$$\begin{array}{ccc} R^{+b} & \longrightarrow & R^{b+}/\mathfrak{m}^b R^{b0} \\ \downarrow & & \downarrow \\ R^b & \longrightarrow & R^b/\mathfrak{m}^b R^{b0} \end{array}, \text{ but this is the}$$

Cartesian diagram

$$\begin{array}{ccc} R^+/\pi & \longrightarrow & R^+/\mathfrak{m}R^0 \cong R^{b+}/\mathfrak{m}^b R^{b0} \\ \downarrow & & \downarrow \\ R^0/\pi & \longrightarrow & R^0/\mathfrak{m}R^0 \end{array}$$

applied the functor  $(-)^{\text{perf}}$ , which preserves

limits(5.5.1.9). (Notice that  $R^+/\mathfrak{m}R^0 \cong R^{b+}/\mathfrak{m}^b R^{b0}$  is already perfect).  $\square$

**Cor.(12.2.9.14).** Notice that the proof also shows that  $R^+ \rightarrow R^0$  is an almost isomorphism, thus if  $R$  is a perfectoid  $K$ -algebra, then  $R^+$  is automatically a perfectoid  $K^{0a}$ -algebra by(12.2.9.1).  $\lrcorner$

**Cor.(12.2.9.15) [Perfectoid Affinoid Field].** A perfectoid affinoid  $K$ -algebra  $(R, R^+)$  is called a **perfectoid affinoid field** iff  $R$  is a perfectoid field and  $R^+$  is an open valuation ring.

Notice this is equivalent to  $R^+/\mathfrak{m}R^0$  is a valuation ring in  $R^0/\mathfrak{m}R^0$ . In particular, combining with(12.2.9.11), affinoid perfectoid fields are preserved under tilting and untilting.  $\lrcorner$

**Cor.(12.2.9.16).** The tilting equivalence also shows that for any perfectoid affinoid  $K$ -algebra  $(R, R^+)$ , the tilting induces an equivalence of categories  $\mathcal{P}\text{erf}_R \cong$   $\lrcorner$

**Prop.(12.2.9.17) [Filtered Colimits of Perfectoid Affinoid  $K$ -Algebras].** The category of perfectoid affinoid  $K$ -algebras has filtered colimits, and it is just the colimits in the category of complete uniform affinoid Tate rings(27.3.2.21). In particular, the filtered colimits of  $(A_i, A_i^+)$  is  $(\text{colim}_i A_i, \text{colim}_i A_i^+)$ .  $\lrcorner$

*Proof:* The colimit is perfectoid because the filtered colimits is exact.  $\square$

## 10 Almost Purity Theorem

**Thm.(12.2.10.1) [Almost Purity Theorem, Fontaine-Wintemberger[F-W79]/Faltings[Fal02]/Scholze[Sch12]].** For  $R \in \mathcal{P}\text{erf}_K$  with tilt  $S$ (12.2.9.5),

- Almost purity in characteristic  $p$ : (take  $(-)_*$  and) Inverting  $t$  gives an equivalence  $S_{\text{afét}}^0 \cong S_{\text{fét}}$ .
- Almost purity in characteristic 0: Inverting  $\pi$  gives an equivalence  $R_{\text{afét}}^0 \cong R_{\text{fét}}$ .
- Tilting and untilting functors induce equivalences  $R_{\text{afét}}^0 \cong S_{\text{afét}}^0$ .

In particular, there are equivalences

$$S_{\text{fét}} \xleftarrow{a} S_{\text{afét}}^{0a} \xrightarrow{b} (S^{0a}/t)_{\text{afét}} \cong (R^{0a}/\pi)_{\text{afét}} \xleftarrow{c} R_{\text{afét}}^{0a} \xrightarrow{d} R_{\text{fét}},$$

$\lrcorner$

*Proof:* The map  $a$  is already given in(5.7.2.14) by passing the power bounded-elements(equivalently,  $S_*$ ) and inverting  $t$ . And it is an isomorphism.

The equivalence of  $b$  and  $c$  follows from[Almost Ring theory, Thm5.3.27] **?**.

The functor  $d$  is given by  $A \rightarrow A_*[t^{-1}]$ . Firstly,  $A$  is a perfectoid  $K^{0a}$ -algebra. This is because it is almost finite projective thus almost flat, and  $R^{0a}/\pi \rightarrow A/\pi$  is weakly relative perfect by(5.7.2.15), so does  $K^{0a}/\pi \rightarrow A/\pi$  because relative perfect is stable under composition. And it is finite projective thus almost direct summand of a finite free module.

So now the tilting equivalence(12.2.9.5) shows that  $A_*[t^{-1}] \in R_{\text{fét}}$ : it is finite etale because the  $A_*$  is finite projective by the right adjointness of  $(-)_*$ , and unramified is defined in terms of  $A_*$ . The converse of  $d$  is supposed to be the functor that extract from  $A_*$  from  $A_*[t^{-1}]$  the total integral closure  $A_{\text{tic}}$  of  $R^0$ , which is functorial. We already know that  $A_*$  is totally integrally closed in  $A_*[t^{-1}]$  by(12.2.9.5), so  $A_{\text{tic}} \subset A_*$ . Conversely, as  $A$  is almost finitely generated over  $R^0$ , for  $f \in A_*$ ,  $\pi f^{\mathbb{N}}$  lies in a f.g.  $R^0$ -submodule of  $A_*$ , so  $f^{\mathbb{N}}$  is totally integral over  $R^0$ , so  $A_* = A_{\text{tic}}$ .

It's left to show that  $d$  is essentially surjective, but this uses perfectoid spaces. For now, we only check that this is true for  $R$  being a perfectoid field(of char 0).For this, we show directly that the untilting functor  $\sharp : K_{\text{fét}}^b \rightarrow K_{\text{fét}}$  is essentially surjective. Now  $\sharp$  is an equivalence of categories

$\text{Perfd}_{K^\flat} \rightarrow \text{Perfd}_K$ , and it preserves degree, at least for field extensions, so it preserves Galois extensions. Now that finite étale algebra over fields are just disjoint of finite separable extensions(5.4.7.23), so it suffices to show that any finite extension of  $K$  is contained in some  $L^\sharp$ .

Consider  $M = \widehat{K^\flat}$ , it is alg.closed of char  $p$  so clearly a perfectoid field, and by(12.2.8.16)  $M^\sharp$  is alg.closed.  $M^\sharp$  is just the colimit in the category of uniform Banach  $K$ -algebras, so its valuation ring is just the completion of the valuation ring of  $L^\sharp$  for  $L/K^\sharp$  finite Galois. Then if  $N = \cup L^\sharp$ , then  $N$  is dense in  $M^\sharp$ , and  $N/K$  is clearly algebraic and in particular Hensel. So  $N \subset \overline{N} \subset M^\sharp$  is dense, so by Krasner's lemma(19.1.2.29),  $N = \overline{N}$ . Now  $N = \cup L^\sharp$  is an alg.closure of  $K$ , so every finite extension of  $K$  is contained in some  $L^\sharp$ .

The proof of the general case of the essentially surjectivity of  $d$  is continued at(27.4.3.10). □

## 1 Measures

**Def. (12.3.1.1) [ $\sigma$ -Algebras]**. For  $X \in \text{Set}$ , an **algebra of subsets** of  $X$  is a subset of  $\mathcal{P}(X)$  that is closed under taking complements and finite unions. A  **$\sigma$ -algebra** on  $X$  is an algebra of subsets of  $X$  that is closed under countable unions. ┘

**Def. (12.3.1.2) [Measurable Space]**. A **measurable space** is a tuple  $(X, \mathcal{M})$  where  $X \in \text{Set}$  and  $\mathcal{M}$  is a  $\sigma$ -algebra on  $X$  (12.3.1.1). ┘

**Prop. (12.3.1.3) [Constructing  $\sigma$ -Algebras]**.

- Suppose  $X \in \text{Set}$  and  $X_\alpha \subset X$  are subsets s.t.  $X = \bigcup_{\alpha \in I} X_\alpha$ , and  $\mathcal{M}_\alpha$  are  $\sigma$ -algebras of  $X_\alpha$ , then we can construct a  $\sigma$ -algebra  $\mathcal{M}$  on  $X$  consisting of  $A \in \mathcal{P}(X)$  s.t.  $A \cap X_i \in \mathcal{M}_i$ , called the **colimit  $\sigma$ -algebra** on  $X$ .
- Suppose  $\text{pr} : Y \rightarrow X \in \text{Set}$  is a surjection and  $\mathcal{M}$  is a  $\sigma$ -algebra on  $Y$ , then we can construct a  $\sigma$ -algebra on  $X$  consisting of elements  $A \in \mathcal{P}(X)$  s.t.  $\text{pr}^{-1}(A) \in \mathcal{M}$ , called the **quotient  $\sigma$ -algebra** on  $X$ .

┘

**Example (12.3.1.4) [Borel  $\sigma$ -Algebras]**. For any  $X \in \text{Top}$ , the  $\sigma$ -algebra generated by the open subsets of  $X$  is called the **Borel  $\sigma$ -Algebra** on  $X$ . The elements in this  $\sigma$ -algebra are called **Borel subsets** of  $X$ . ┘

**Def. (12.3.1.5) [Separated Measurable Spaces]**. A measurable space  $(X, \mathcal{M})$  is called a **separable measurable space** if  $\{x\} \in \mathcal{M}$  for each  $x \in X$ .

And  $(X, \mathcal{M})$  is called a **countably-separated measurable space** if there is a countable family  $\{E_j\}_{j \in \mathbb{Z}_+} \in \mathcal{M}$  s.t. for any  $x \in X$ ,  $\{x\} = \bigcap_{j \in \mathbb{Z}_+} E_j$ .

$(X, \mathcal{M})$  is called a **Polish space** if  $X$  is a separable completely-metrizable topological space, and  $\mathcal{M}$  is the Borel  $\sigma$ -algebra on  $X$  (12.3.1.4).

$(X, \mathcal{M})$  is called a **standard measurable space** if it is isomorphic to a Borel subset (12.3.1.4) of a Polish space. It is clear that a standard measurable space is countably-separated. ┘

**Lemma (12.3.1.6) [Measurable Schröder-Bernstein Theorem]**. If  $(X, \mathcal{A}), (Y, \mathcal{B})$  are measurable spaces and there exists an injective bimeasurable map  $f : (X, \mathcal{A}) \rightarrow (Y, \mathcal{B})$  and also an injective bimeasurable map  $g : (Y, \mathcal{B}) \rightarrow (X, \mathcal{A})$ , then there exists an isomorphism of measurable spaces  $h : (X, \mathcal{A}) \cong (Y, \mathcal{B})$ . ┘

**Thm. (12.3.1.7) [Borel Isomorphism Theorem]**. Any two standard measurable spaces (12.3.1.5) are isomorphic iff they have the same cardinality.

In particular, any uncountable standard Borel set is isomorphic to  $\mathbb{C}$ , or equivalently  $[0, 1]$ . ┘

*Proof:* Cf. [ELEMENTARY PROOF OF THE BOREL ISOMORPHISM THEOREM]. □

### Measures

**Def. (12.3.1.8) [Measures and Measure Spaces].** Let  $(X, \mathcal{M})$  be a measurable space (12.3.1.2), then a **measure** on  $(X, \mathcal{M})$  is a function  $\mu : \mathcal{M} \rightarrow [0, \infty]$  that

- $\mu(\emptyset) = 0$ .
- (Countable additivity) If  $E_i$  is a countable family of disjoint sets in  $\mathcal{M}$ , then  $\mu(\cup_{i=1}^{\infty} E_i) = \sum_{i=1}^{\infty} \mu(E_i) \in [0, \infty]$ .

A **measure space** is a measurable space together with a measure  $\mu$ . And  $\mu$  is called a

- **finite measure** if  $\mu(X) < \infty$ .
- **probabilistic measure** if  $\mu(X) = 1$ .
- **$\sigma$ -finite measure** if there exists  $(E_i)_{i \in \mathbb{Z}_+} \in \mathcal{M}$  s.t.  $X = \cup_i E_i$  and  $\mu(E_i) < \infty$  for each  $i$ .

┘

**Prop. (12.3.1.9).** Let  $(X, \mathcal{M}, \mu)$  be a measure space (12.3.1.8), then

- For any  $E, F \in \mathcal{M}$  s.t.  $E \subset F$ , we have  $\mu(E) \leq \mu(F)$ .
- For any  $(E_i)_{i \in \mathbb{Z}} \in \mathcal{M}$ , we have  $\mu(\cup_i E_i) \leq \sum_{i \in \mathbb{Z}_+} \mu(E_i)$ .
- For any  $(E_i)_{i \in \mathbb{Z}} \in \mathcal{M}$  s.t.  $E_1 \subset E_2 \subset \dots$ , we have  $\mu(\cup_i E_i) = \lim_{n \rightarrow \infty} \mu(E_n)$ .
- For any  $(E_i)_{i \in \mathbb{Z}} \in \mathcal{M}$  s.t.  $\mu(E_1) < \infty$ , we have  $\mu(\cap_i E_i) = \lim_{i \rightarrow \infty} \mu(E_i)$ .

┘

*Proof:* Cf. [Fol99]P25. ?

□

**Def. (12.3.1.10) [Complete Measures].** A measure space  $(X, \mathcal{M}, \mu)$  is called a **complete measure space** if the following is satisfied: For any  $E \in \mathcal{M}$  s.t.  $\mu(E) = 0$  and  $F \subset E$ , we have  $F \in \mathcal{M}$ .

Denote  $\mathcal{N} = \{N \in \mathcal{M} | \mu(N) = 0\}$  and denote

$$\overline{\mathcal{M}} = \{X \in \mathcal{P}(X) | X = E \cup F, E \in \mathcal{M}, F \in \mathcal{N} \text{ for some } E, F\}.$$

Then  $\overline{\mathcal{M}}$  is a  $\sigma$ -algebra on  $X$  (12.3.1.1), and there is a unique extension of  $\mu$  to a measure  $\bar{\mu}$  on  $\overline{\mathcal{M}}$ . This  $\bar{\mu}$  is called the **completion measure** of  $\mu$ .

┘

*Proof:* Cf. [Fol99]P27. ?

□

**Def. (12.3.1.11) [Signed Measures].** Let  $(X, \mathcal{M})$  be a measurable space (12.3.1.2), then a **signed measure** on  $X$  is a function  $\mu : \mathcal{M} \rightarrow [-\infty, \infty]$  that

- $\mu(\emptyset) = 0$ .
- $\mu$  assumes at most one of the values  $\pm\infty$ .
- If  $E_i$  is a countable family of disjoint sets in  $\mathcal{M}$ , then  $\mu(\cup_{i=1}^{\infty} E_i) = \sum_{i=1}^{\infty} \mu(E_i)$ , where the sum converges absolutely if  $\mu(\cup_{i=1}^{\infty} E_i) \in (-\infty, \infty)$ .

$\mu$  is called a **finite signed measure** if  $\text{Im}(\mu) \subset (-\infty, \infty)$ .

┘

**Prop. (12.3.1.12).** Let  $X \in \text{Set}$  and  $\mathcal{M}$  be an algebra on  $X$ , then a finitely-additive real-valued function  $\mu$  on  $\mathcal{M}$  is countably-additive iff  $\lim_n \mu(A_n) = 0$  for any sequence  $(A_n)_{n \in \mathbb{N}} \subset \mathcal{M}$  s.t.  $A_0 \supset A_1 \supset \dots \supset A_n$  and  $\cap_n A_n = \emptyset$ .

┘

*Proof:* [Dudley, P86].

□

**Def. (12.3.1.13) [Outer Measures].** Let  $X \in \text{Set}$ , an **outer measure** on  $X$  is a map

$$\mu^* : \mathcal{P}(X) \rightarrow [0, \infty]$$

s.t.

- $\mu^*(\emptyset) = 0$ .
- (Countable sub-additivity)  $\mu^*(A) \leq \sum_{i \in \mathbb{Z}_+} \mu^*(A_i)$  if  $A \subset \bigcup_{i \in \mathbb{Z}_+} A_i$ .
- $\mu^*(\bigcup_{i \in \mathbb{Z}_+} A_i) \leq \sum_{i \in \mathbb{Z}_+} \mu^*(A_i)$  for any  $(A_i)_{i \in \mathbb{Z}_+} \subset X$ .

┘

**Prop. (12.3.1.14) [Constructing Outer Measures].** Suppose  $X \in \text{Set}$  and  $\mathcal{E} \subset \mathcal{P}(X)$  be a family of subsets of  $X$  s.t.  $\emptyset \in \mathcal{E}$ ,  $X \in \mathcal{E}$ , and  $\rho : \mathcal{E} \rightarrow [0, \infty]$  is a map. For any  $A \subset X$ , define

$$\mu_\rho^*(A) = \inf \left\{ \sum_{i \in \mathbb{Z}_+} \rho(E_i) \mid E_i \in \mathcal{E}, A \subset \bigcup_{i \in \mathbb{Z}_+} E_i \right\},$$

then  $\mu^*$  is an outer measure on  $X$  (12.3.1.13). ┘

*Proof:* Only the countable sub-additivity property needs a proof: For any  $(A_i)_{i \in \mathbb{Z}_+} \subset X$  and  $\varepsilon \in \mathbb{R}_+$ , choose  $(E_i^k)_{i \in \mathbb{Z}_+} \subset X$  s.t.  $\sum_{k \in \mathbb{Z}_+} \rho(E_i^k) \leq \mu_\rho^*(A) + \varepsilon 2^{-i}$ . Then  $\{E_i^k\}_{i,k \in \mathbb{Z}_+}$  covers  $\bigcup_{i \in \mathbb{Z}_+} A_i$ , and thus

$$\mu_\rho^*\left(\bigcup_{i \in \mathbb{Z}_+} A_i\right) \leq \sum_{i,k \in \mathbb{Z}_+} \rho(E_i^k) \leq \sum_{i \in \mathbb{Z}_+} \mu_\rho^*(A_i) + \varepsilon.$$

Since  $\varepsilon$  is arbitrary, the assertion follows.  $\square$

**Thm. (12.3.1.15) [Carathéodory's Theorem].** Let  $X \in \text{Set}$  and  $\mu^*$  be an outer measure on  $X$ . A subset  $A \subset X$  is called a  $\mu^*$ -**measurable set** if

$$\mu^*(E) = \mu^*(E \cap A) + \mu^*(E \cap A^c)$$

for any  $E \subset X$ . Let  $\mathcal{M} \subset \mathcal{P}(X)$  be the set of  $\mu^*$ -measurable sets, then  $\mathcal{M}$  is a  $\sigma$ -algebra, and the restriction of  $\mu^*$  to  $\mathcal{M}$  is a complete measure (12.3.1.10). ┘

*Proof:* Cf. [Fol99] P29. ?  $\square$

**Prop. (12.3.1.16) [Hahn Decomposition Theorem].** Let  $(X, \mathcal{M})$  be a measurable space and  $\mu$  a signed measure on  $X$ , a set  $E \in \mathcal{M}$  is called **positive (resp. negative/null) for  $\mu$**  if  $\mu(F) \geq 0$  (resp.  $\mu(F) \leq 0 / \mu(F) = 0$ ) for any  $F \in \mathcal{M} \cap \mathcal{P}(E)$ .

Then there exists a disjoint decomposition  $X = P \sqcup N$ ,  $P, N \in \mathcal{M}$ , s.t.  $P$  is positive for  $\mu$  and  $N$  is negative for  $\mu$ . Such a decomposition is unique up to a null subset of  $\mu$ . ┘

*Proof:* Cf. [Follan, P86]. ?  $\square$

**Def. (12.3.1.17) [Orthogonal Measures].** Let  $(X, \mathcal{M})$  be a measurable space, then two signed measures  $\mu, \nu$  on  $X$  is called **orthogonal measures** if there is a decomposition  $X = E \sqcup F$ ,  $E, F \in \mathcal{M}$  s.t.  $E$  is null for  $\mu$  and  $F$  is null for  $\nu$ . Orthogonal measures are denoted by  $\mu \perp \nu$ . ┘

**Prop. (12.3.1.18) [Jordan-Decompositions].** Let  $(X, \mathcal{M})$  be a measurable space and  $\mu$  a signed measure on  $X$ , then there exist unique positive measures  $\mu^+$  and  $\mu^-$  on  $X$  s.t.  $\mu = \mu^+ - \mu^-$  and  $\mu^+ \perp \mu^-$  (12.3.1.17). Such a decomposition is called the **Jordan-decomposition of measures**.

$|\mu| = \mu^+ + \mu^-$  is called the **total variation** of  $\mu$ . And  $\mu$  is called a **finite signed measure** /  **$\sigma$ -finite signed measure** iff  $|\mu|$  is finite /  $\sigma$ -finite. ┘

*Proof:* This follows immediately from (12.3.1.16).  $\square$

**Def. (12.3.1.19) [Complex Measures].** A **complex measure** on a measurable space  $(X, \mathcal{M})$  is a function  $\nu : \mathcal{M} \rightarrow \mathbb{C}$  s.t.

- $\nu(\emptyset) = 0$ .
- If  $E_i$  is a countable family of disjoint sets in  $\mathcal{M}$ , then  $\mu(\cup_{i=1}^{\infty} E_i) = \sum_{i=1}^{\infty} \mu(E_i)$ , where the series converges absolutely.

┘

**Def. (12.3.1.20) [Lebesgue Space].** A one-point subset with positive measure is called an **atomic measure space**. A **Lebesgue space** is a finite measure space that is isomorphic to a finite union of intervals and countably many atomic measure spaces.

┘

### Borel Measures

**Notation (12.3.1.21).**

- Let  $X \in \text{LCH}$ .

┘

**Def. (12.3.1.22) [Radon Measure].** A **Borel measure** on  $X$  is a measure defined on the Borel  $\sigma$ -algebra of  $X$  (12.3.1.4)

A Borel measure  $\mu$  is called **inner regular** on a Borel set  $E$  iff  $\mu(E) = \inf\{\mu(K) \mid K \subset E \text{ compact}\}$  for every Borel set  $E$ . It is called **outer regular** on a Borel set  $E$  iff  $\mu(E) = \sup\{\mu(U) \mid E \subset U \text{ open}\}$ .

$\mu$  is called a **regular measure** if it is finite on compact sets and outer regular on Borel sets.

A **Radon measure** is a Borel measure that is finite on compact set, outer regular on Borel sets, inner regular on open sets.

┘

**Def. (12.3.1.23) [Discrete Measures and Continuous Measures].** A complex or signed Borel measure  $\mu$  on Hausdorff space  $X$  is called a **discrete measure** if there exists a countable set  $\{x_i\} \subset X$  and  $c_j \in \mathbb{C}$  s.t.  $\sum |c_j| < \infty$ , and  $\mu = \sum c_j \delta_{x_i}$ . And  $\mu$  is called a **continuous measure** if  $\mu(\{x\}) = 0$  for any  $x \in X$ .

Any complex or  $\sigma$ -finite signed measure  $\mu$  on  $X$  can be written uniquely as  $\mu = \mu_d + \mu_c$ , where  $\mu_d$  is a discrete measure and  $\mu_c$  is a continuous measure.

┘

*Proof:* It is easy to see that  $E = \{x \in X : \mu(\{x\}) > 0\}$  is countable. Thus we can define  $\mu_d(A) = \mu(A \cap E)$  and  $\mu_c(A) = \mu(A \setminus E)$ .  $\square$

**Prop. (12.3.1.24).** Every Radon measure is inner regular on all of its  $\sigma$ -finite sets.

┘

*Proof:* Cf. [Folland, Real Analysis, P216].  $\square$

**Cor. (12.3.1.25).** Every  $\sigma$ -finite Radon measure is regular. In particular, if  $X$  is  $\sigma$ -compact, then every Radon measure is regular.

┘

### Measurable Maps

**Def. (12.3.1.26) [Measurable Map].** A **measurable map** or a measurable function  $f : (X, \mathcal{M}) \rightarrow (Y, \mathcal{N})$  between two measurable spaces is a map  $f : X \rightarrow Y$  that  $f^{-1}(E) \in \mathcal{M}$  for any  $E \in \mathcal{N}$ .

┘

**Def. (12.3.1.27) [Non-Singular Maps].** A **non-singular measurable map** is a measurable map of measure spaces that the preimage of every set of measure 0 has measure 0.

┘

**Prop. (12.3.1.28)[convergences].** There are three different kinds of convergences:

- **almost everywhere convergence** iff  $f_n(x) \rightarrow f(x)$  a.e.
- **almost uniform convergence** iff for any  $\delta > 0$ , there is a measurable subset  $E_\delta$  that  $f_n$  convergent to  $f$  uniformly on  $E - E_\delta$ .
- **convergence in measure** iff  $\lim_{k \rightarrow \infty} m(\{x \in E \mid |f_n(x) - f(x)| > \varepsilon\}) = 0$ .

┘

**Prop. (12.3.1.29)[Relations between Convergences].**

- (Egoroff) If  $m(E) < \infty$  and  $f_k$  converges to  $f$  a.e. then  $f_k$  converges to  $f$  almost uniformly.
- If  $f_k$  converges to  $f$  almost uniformly, then  $f_k$  converges to  $f$  in measure.
- (Riesz) If  $f_k$  converges to  $f$  in measure, then there is a subsequence  $f_{n_k}$  that converges to  $f$  a.e..

┘

*Proof:* 1: Cf.[实变函数周明强 P113].

2: Trivial.

3: Cf.[实变函数周明强 P118].

□

## 2 Integrations

**Def. (12.3.2.1)[Simple Functions].**

┘

**Def. (12.3.2.2)[Integrable Functions].** Let  $(X, \mathcal{M})$  be a measurable space. If  $\mu$  is a measure, ?

If  $\mu$  is a signed measure, then define  $L^1(\mu) = L^1(|\mu|) = L^1(\mu^+) \cap L^1(\mu^-)$  (12.3.1.18). And  $f$  is called an **extended integrable function** if either  $f^+$  or  $f^-$  is integrable.

┘

**Def. (12.3.2.3)[Locally Integrable Functions].** A measurable function  $f : \mathbb{R}^n \rightarrow \mathbb{C}$  is called **locally integrable** if  $\int_K |f(x)| dx < \infty$  for every bounded measurable set  $K$  of  $\mathbb{R}$ . The set of locally integrable function is denoted by  $L^1_{\text{loc}}(\mathbb{R}^n)$ .

┘

**Prop. (12.3.2.4).** A function  $f$  is real analytic on an open set of  $\mathbb{R}$  iff there is a extension to a complex analytic function to an open set of  $\mathbb{C}$ . And this is equivalent to: For every compact subset, there is a constant  $C$  that for every positive integer  $k$ ,  $|\frac{d^k f}{dx^k}(x)| \leq C^{k+1} k!$ .

┘

*Proof:* Use Lagrange residue(中值定理) to show that it will converge to  $f$ .

□

**Prop. (12.3.2.5)[Monotone-convergence-theorem].**

┘

**Prop. (12.3.2.6)[Dominant Convergence Theorem].**

┘

**Prop. (12.3.2.7)[Fatou's Lemma].**

┘

*Proof:* ?

□

**Prop. (12.3.2.8).** The set  $E$  of nowhere differentiable functions are of second category in  $C[0, 1]$ , and its complement set is of first category.

┘

*Proof:* let  $A_n$  be the sets of functions  $f$  that there exists a  $s$  that for any  $|h| \leq 1/n$ ,  $|\frac{f(s+h)-f(s)}{h}| \leq n$ . It is easy to see that  $C[0, 1] - E \subset \cup_n A_n$ , so it suffices to show each  $A_n$  is of first category.

Firstly  $A_n$  is closed, because if  $s \notin A_n$ , then for any  $s$ , there is a  $|h_s| \leq 1/n$  that  $|f(s+h_s)-f(s)| > n|h_s|$ . So by continuity, there is a  $\varepsilon_s > 0$  and some nbhd  $J_s$  of  $s$  that  $|f(\sigma-h_s)-f(\sigma)| > n|h_s| + 2\varepsilon_s$  for all  $\sigma \in J_s$ . Then there are f.m.  $J_{s_i}$  that covers  $[0, 1]$ , so let  $\varepsilon = \min\{\varepsilon_i\}$ , then if  $\|g-f\| < \varepsilon$ , then  $g \notin A_n$ .

And  $A_n$  has no interior point, because for any  $f \in A_n$ ,  $f$  can be approximated by a polynomial  $g$ , by Stone-Weierstrass theorem(12.3.8.2), and by Mean-value theorem, there is a  $M$  that  $|g(s+h)-g(s)| \leq M|h|$  for all  $s$  and  $|h| < 1/n$ . So if  $p$  is a pairwise-linear function that  $\|p\|$  is small and the slopes of  $p$  are bigger than  $M+n$ , then  $g+p$  is near  $f$  but  $g+p \notin A_n$ .

Finally,  $E$  is of second category by Baire theorem(4.4.9.2).  $\square$

**Prop. (12.3.2.9) [Fubini-Tonelli].** For two  $\sigma$ -finite measure spaces  $X, Y$ ,

- If  $f \in L^+(X \times Y)$ , then  $f_x \in L^+(Y)$  and  $f^y \in L^+(X)$ , and

$$\int_{X \times Y} f dx dy = \int_Y \int_X f dx dy = \int_X \int_Y f dy dx.$$

- If  $f \in L^1(X \times Y)$ , then  $f_x \in L^1(Y)$  and  $f^y \in L^1(X)$ , a.e. and the product formula is definable and holds.  $\lrcorner$

*Proof:* Cf.[Folland P67].  $\square$

**Prop. (12.3.2.10).** Let  $(X, \mathcal{M})$  be a measurable space with a positive measure  $\mu$ , and  $f$  is an extended  $\mu$ -integrable function(12.3.2.2), then we can define a singed measure  $\nu$  on  $X$  by

$$\nu(E) = \int_E f d\mu, \quad E \in \mathcal{M}.$$

This relation is denoted by  $d\nu = f d\mu$ . It is clear that  $\nu \ll \mu$ .  $\lrcorner$

**Cor. (12.3.2.11).** Let  $(X, \mathcal{M})$  be a measurable space with a positive measure  $\mu$ , and  $f \in L^1(\mu)$ , then it follows from(12.3.3.2) that: For any  $\varepsilon \in \mathbb{R}_+$ , there exists  $\delta \in \mathbb{R}_+$  s.t.  $|\int_E f d\mu| < \varepsilon$  whenever  $\mu(E) < \delta$ .  $\lrcorner$

### Miscellaneous

**Lemma (12.3.2.12) [Smooth Test Functions].** If  $[t_0, t_1] \subset \mathbb{R}$  is an interval and  $f \in C([t_0, t_1])$  s.t.  $\int_{t_0}^{t_1} f(t)h(t)dt = 0$  for any  $h(t) \in C^\infty([t_0, t_1])$  that  $h(t_0) = h(t_1) = 0$ , then  $f = 0$ .  $\lrcorner$

*Proof:* Use bump functions as a test function.  $\square$

### Henstock-Kurzweil integrations

**Prop. (12.3.2.13).** For  $f : \mathbb{R} \rightarrow \mathbb{C}$ ,  $f \in L^1(m)$  iff both  $f^+$  and  $f^-$  are Henstock-Kurzweil integrable.  $\lrcorner$

*Proof:*  $\square$

**Thm. (12.3.2.14).** If  $a < b \in \mathbb{R}$  and  $f : [a, b] \rightarrow \mathbb{R}$  is Henstock-Kurzweil integrable and  $F(x) = {}^{HK}\int_a^x f(x)dx$ , then

$$F^\Delta(x) = f(x).$$

$\lrcorner$

*Proof:*

□

**Thm. (12.3.2.15).** If  $a < b \in \mathbb{R}$  and  $F : [a, b] \rightarrow \mathbb{R}$  is differentiable, then

$$F(b) - F(a) = {}^{HK} \int_a^b F'(x) dx.$$

┘

### 3 Differentiations

#### Absolute Continuity

**Def. (12.3.3.1) [Absolutely Continuous].** Let  $(X, \mathcal{M})$  be a measurable space with a positive measure  $\mu$ . A signed measure  $\nu$  on  $X$  is called **absolutely continuous** w.r.t.  $\mu$  (denoted by  $\nu \ll \mu$ ) if for any  $E \in \mathcal{M}$ ,  $\mu(E) = 0 \implies \nu(E) = 0$ . ┘

**Prop. (12.3.3.2).** Let  $(X, \mathcal{M})$  be a measurable space with a positive measure  $\mu$ , and  $\nu$  a finite signed measure on  $X$ , then  $\nu \ll \mu$  iff for any  $\varepsilon \in \mathbb{R}_+$ , there exists  $\delta \in \mathbb{R}_+$  s.t.  $|\nu(E)| < \varepsilon$  whenever  $\mu(E) < \delta$ . ┘

*Proof:* Cf.[Folland]P89.

□

**Lemma (12.3.3.3).** Let  $(X, \mathcal{M})$  be a measurable space and  $\mu, \nu$  are positive measures on  $X$ , then either  $\nu \perp \mu$ , or there exists  $\varepsilon \in \mathbb{R}_+$  and  $E \in \mathcal{M}$  s.t.  $\mu(E) > 0$ , and  $E$  is a positive set for  $\nu - \varepsilon\mu$ . ┘

*Proof:* Cf.[Folland]P90.

□

**Thm. (12.3.3.4) [Lebesgue-Radon-Nikodym].** Let  $(X, \mathcal{M})$  be a measurable space and  $\mu$  is positive  $\sigma$ -finite measures on  $X$ . Then for any  $\sigma$ -finite signed measures  $\nu$  on  $X$ , there exists unique  $\sigma$ -finite signed measures  $\lambda, \rho$  on  $X$  s.t.

$$\lambda \perp \mu, \quad \rho \ll \mu \text{ (12.3.3.1)}, \quad \nu = \lambda + \rho.$$

Moreover, there exists an extended  $\mu$ -integrable function  $f : X \rightarrow \mathbb{R}$  s.t.  $d\rho = f d\mu$ , and  $f$  is determined a.e. w.r.t.  $\mu$ . Such  $f$  is called the **Radon-Nikodym derivative** of  $\rho$  w.r.t.  $\mu$ , denoted by  $d\rho/d\mu$ .

The same holds true for a complex measure  $\nu$  (12.3.1.19), by applying to the real and complex parts. ┘

*Proof:* This is a special case of the **Freudenthal Spectral Theorem** (12.9.3.18). Cf.[Folland]P90. □

**Cor. (12.3.3.5) [Lebesgue Decomposition Theorem].** By (12.3.1.23), any (complex or  $\sigma$ -finite signed) Borel measure  $\nu$  on  $X$  can be written uniquely as a sum of Borel measures

$$\nu = \nu_d + \nu_{ac} + \nu_{sc},$$

where  $\nu_d$  is discrete,  $\mu_{ac} \ll dm$ , and  $\nu_{sc} \perp dm$  but continuous. ┘

**Def. (12.3.3.6) [Total Variation for Complex Measures].** For a complex measure  $\nu$  on a measurable space  $(X, \mathcal{M})$ , we can define its total variation to be the positive measure on  $\mathcal{M}$  defined as follows: Write  $d\mu = f d(|\mu_r| + |\mu_i|)$ , where  $\mu_r$  and  $\mu_i$  are the real and complex parts of  $\mu$ . Then define  $d|\mu| = |f| d(|\mu_r| + |\mu_i|)$ . This is compatible with the definition for signed measures (12.3.1.18). ┘

**Prop. (12.3.3.7).** For a complex measure  $\nu$  on a measurable space  $(X, \mathcal{M})$ ,

- $|\nu(E)| \leq |\nu|(|E|)$  for any  $E \in \mathcal{M}$ .
- $\nu \ll |\nu|$ , and  $d\nu/d|\nu|$  has absolute value 1  $|\nu|$ -a.e.
- $L^1(\nu) = L^1(|\nu|)$ , and if  $f \in L^1(\nu)$ , then  $|\int f d\nu| \leq \int |f| d|\nu|$ .

┘

*Proof:* Cf. [Fol99]P94.

□

### Differentiation on Euclidean Spaces

**Lemma (12.3.3.8) [Vitali Covering Theorem].** Let  $\mathcal{C}$  be a collection of balls in  $\mathbb{R}^n$ , and let  $U = \cup_{B \in \mathcal{C}} B$ . Then if  $c > m(U)$ , then there exists disjoint  $B_1, \dots, B_k \in \mathcal{C}$  that  $\sum_{i=1}^k m(B_k) > 3^{-n}c$ .

┘

*Proof:*

□

**Lemma (12.3.3.9).** If  $f \in L^1_{\text{loc}}$  and  $A_r f(x) = \frac{1}{\text{Vol}(B(r,x))} \int_{B(r,x)} f(y) dy$ , then  $A_r f$  is continuous in both  $r$  and  $x$ .

┘

*Proof:* Cf. [Folland P96].

□

**Prop. (12.3.3.10).** If  $f \in L^1_{\text{loc}}$ , then  $\lim_{r \rightarrow 0} A_r f(x) = f(x)$  for a.e.  $x \in \mathbb{R}^n$ .

┘

*Proof:* Cf. [Folland P97].

□

**Prop. (12.3.3.11) [Fermat].** Let  $x_0 \in \mathbb{R}$ ,  $\delta \in \mathbb{R}_+$ ,  $f$  is a function on  $U(x_0, \delta)$ . If  $x_0$  is an extreme point of  $f$ , and  $f'(x_0)$  exists, then  $f'(x_0) = 0$ .

┘

*Proof:* By changing  $f$  to  $-f$  if necessary, we can assume  $x_0$  is a supremum point. Then for  $0 < h < \delta$ ,  $\frac{f(x_0+h)-f(x_0)}{h} \leq 0$ , and for  $-\delta < h < 0$ ,  $\frac{f(x_0+h)-f(x_0)}{h} \geq 0$ , so  $f'(x_0) = 0$ .

□

**Lemma (12.3.3.12) [Rolle's Mean Value Theorem].** If  $a < b \in \mathbb{R}$ ,  $f \in C([a, b])$  is differentiable on  $[a, b]$ , and  $f(a) = f(b)$ , then there exists some  $\xi \in (a, b)$  s.t.  $f'(\xi) = 0$ .

┘

*Proof:* As  $f$  is continuous on  $[a, b]$ , which is compact,  $f$  has minimum  $m$  and maximum  $M$  on  $[a, b]$ . If  $m = M$ , then  $f$  is constant, and any  $\xi \in (a, b)$  will do. If  $M > m$ , then  $M \neq f(a)$  or  $m \neq f(a)$ . Suppose WLOG the first case happens, then if  $f(\xi) = M$ ,  $\xi \in (a, b)$ , then  $f'(\xi) = 0$  by Fermat's theorem (12.3.3.11).

□

**Thm. (12.3.3.13) [Lagrange's Mean Value Theorem].** If  $a < b \in \mathbb{R}$ ,  $f \in C([a, b])$  is differentiable on  $[a, b]$ , then there exists some  $\xi \in (a, b)$  s.t.  $f'(\xi) = \frac{f(b)-f(a)}{b-a}$ .

┘

*Proof:* This follows from Rolle's mean value theorem by considering the function

$$F(x) = f(x) - \left[ f(a) + \frac{f(b) - f(a)}{b - a}(x - a) \right].$$

□

**Cor. (12.3.3.14) [Cauchy's Mean Value Theorem].** If  $a < b \in \mathbb{R}$ ,  $f, g \in C([a, b])$  is differentiable on  $[a, b]$ , and  $g' \neq 0$ . then there exists some  $\xi \in (a, b)$  s.t.  $\frac{f(b)-f(a)}{g(b)-g(a)} = \frac{f'(\xi)}{g'(\xi)}$ .

┘

*Proof:* This follows from Rolle's mean value theorem by considering the function

$$G(x) = f(x) - \left[ f(a) + \frac{f(b) - f(a)}{g(b) - g(a)} (g(x) - g(a)) \right].$$

□

**Cor.(12.3.3.15) [Integral Mean Value Theorem].** For  $a < b \in \mathbb{R}$ ,  $f, g \in C([a, b])$ , there exists  $\xi \in (a, b)$  s.t.

$$\int_a^b f(t)g(t)dt = f(\xi) \int_a^b g(t)dt.$$

┘

*Proof:* Consider

$$H(x) = \int_a^x f(t)g(t)dt, \quad G(x) = \int_a^x g(t)dt,$$

then it follows from Cauchy's mean value theorem(12.3.3.14) that there exists  $\xi \in (a, b)$  s.t.

$$\frac{H(b) - H(a)}{G(b) - G(a)} = \frac{\int_a^b f(t)g(t)dt}{\int_a^b g(t)dt} = \frac{H'(\xi)}{G'(\xi)} = f(\xi).$$

□

**Prop.(12.3.3.16) [Commutativity of Integration].** Let  $n \in \mathbb{Z}_{\geq 2}$ ,  $\Omega \subset \mathbb{R}^n$  be open and  $f \in C(\Omega)$ . If  $1 \leq j < k \leq n$  and  $\frac{\partial}{\partial x_j} \frac{\partial}{\partial x_k} f, \frac{\partial}{\partial x_k} \frac{\partial}{\partial x_j} f$  exist and continuous on  $\Omega$ , then

$$\frac{\partial}{\partial x_j} \frac{\partial}{\partial x_k} f = \frac{\partial}{\partial x_k} \frac{\partial}{\partial x_j} f.$$

In particular, this holds for  $f \in C^2(\Omega)$ .

┘

*Proof:* For simplicity we prove for  $n = 2, i = 1, j = 2$ , and the general case is verbatim. For  $\mathbf{x} = (x, y) \in \Omega$ , if  $\Delta x, \Delta y$  is sufficiently small, define

$$I(\Delta x, \Delta y) = \frac{f(x_0 + \Delta x, y_0 + \Delta y) - f(x_0 + \Delta x, y_0)}{\Delta x \Delta y} - \frac{f(x_0, y_0 + \Delta y) - f(x_0, y_0)}{\Delta x \Delta y}$$

and

$$g(x) = f(x, y_0 + \Delta y) - f(x, y_0), \quad h(y) = f(x_0 + \Delta x, y) - f(x_0, y).$$

Then by mean value theorem(12.3.3.13),

$$\begin{aligned} I(\Delta x, \Delta y) &= \frac{g(x_0 + \Delta x) - g(x_0)}{\Delta x \Delta y} \\ &= \frac{g'(x_0 + \theta_1 \Delta x)}{\Delta y} \\ &= \frac{\frac{\partial}{\partial x} f(x_0 + \theta_1 \Delta x, y_0 + \Delta y) - \frac{\partial}{\partial x} f(x_0 + \theta_1 \Delta x, y_0)}{\Delta y} \\ &= \frac{\partial}{\partial y} \frac{\partial}{\partial x} f(x_0 + \theta_1 \Delta x, y_0 + \theta_2 \Delta y) \end{aligned}$$

where  $\theta_1, \theta_2 \in [0, 1]$ , and

$$\begin{aligned} I(\Delta x, \Delta y) &= \frac{h(y_0 + \Delta y) - h(y_0)}{\Delta x \Delta y} \\ &= \frac{h(y_0 + \theta_3 \Delta y)}{\Delta x} \\ &= \frac{\frac{\partial}{\partial y} f(x_0 + \Delta x, y_0 + \theta_3 \Delta y) - \frac{\partial}{\partial x} f(x_0, y_0 + \theta_3 \Delta y)}{\Delta x} \\ &= \frac{\partial}{\partial x} \frac{\partial}{\partial y} f(x_0 + \theta_4 \Delta x, y_0 + \theta_3 \Delta y) \end{aligned}$$

where  $\theta_3, \theta_4 \in [0, 1]$ . Then we get

$$\frac{\partial}{\partial y} \frac{\partial}{\partial x} f(x_0 + \theta_1 \Delta x, y_0 + \theta_2 \Delta y) = \frac{\partial}{\partial x} \frac{\partial}{\partial y} f(x_0 + \theta_4 \Delta x, y_0 + \theta_3 \Delta y).$$

Now let  $\Delta x, \Delta y \rightarrow 0$  and use the fact  $\frac{\partial}{\partial x_j} \frac{\partial}{\partial x_k} f, \frac{\partial}{\partial x_k} \frac{\partial}{\partial x_j} f$  are continuous to finish the proof.  $\square$

**Thm. (12.3.3.17) [Taylor's Expansion with Integral Remainder].** Let  $n \in \mathbb{Z}_+, k \in \mathbb{N}, f \in C^{k+1}(\mathbb{R}^n)$ , then for  $\underline{x} \in \mathbb{R}^n$ ,

$$f(\underline{x}) = \sum_{j=0}^k \frac{1}{j!} \left( \left( \sum_i x_i D^i \right)^j f \right)(0) + \int_0^1 \frac{(1-t)^k}{k!} \left( \left( \sum_i x_i D^i \right)^{k+1} f \right)(t\underline{x}) d\underline{x}$$

Equivalently,

$$f(\underline{x}) = \sum_{|\alpha| \leq k} D^\alpha f(0) \frac{x^\alpha}{\alpha!} + (k+1) \sum_{|\alpha|=k+1} \left( \int_0^1 (1-t)^k D^\alpha f(t\underline{x}) dt \right) \frac{x^\alpha}{\alpha!}.$$

This is called the a **Taylor's expansion with integral remainder**.  $\lrcorner$

*Proof:* Consider the function  $\varphi(u) = f(u\underline{x}), u \in \mathbb{R}$ , it is reduced to the  $n = 1$  case. Thus it suffices to prove that

$$f(x) - \sum_{j=0}^k f^{(j)}(0) \frac{x^j}{j!} = \int_0^1 (1-t)^k \frac{x^{k+1}}{k!} f^{(k+1)}(tx) dt = \int_0^x \frac{(x-t)^k}{k!} f^{(k+1)}(t) dt.$$

Use induction on  $k$ : For  $k = 0$ , this is just the fundamental theorem of calculus. In general, it suffices to notice that if  $f \in C^{k+2}(\mathbb{R}^n)$ ,

$$\begin{aligned} \int_0^x \frac{(x-t)^k}{k!} f^{(k+1)}(t) dt &= \left( -\frac{(x-t)^{k+1}}{(k+1)!} f^{(k+1)}(t) \right) \Big|_0^x + \int_0^x \frac{(x-t)^{k+1}}{(k+1)!} f^{(k+2)}(t) dt \\ &= f^{(k+1)}(0) \frac{x^{k+1}}{(k+1)!} + \int_0^x \frac{(x-t)^{k+1}}{(k+1)!} f^{(k+2)}(t) dt. \end{aligned}$$

$\square$

**Cor. (12.3.3.18) [Taylor's Expansion with Lagrangian Remainder].** Let  $n \in \mathbb{Z}_+, k \in \mathbb{N}, f \in C^{k+1}(\mathbb{R}^n)$ , then for  $\underline{x} \in \mathbb{R}^n$ ,

$$f(\underline{x}) = \sum_{j=0}^k \left( \left( \sum_i x_i D^i \right)^j f \right)(0) \frac{x^j}{j!} + \frac{1}{(k+1)!} \left( \left( \sum_i x_i D^i \right)^{k+1} f \right)(\theta \underline{x})$$

for some  $\theta \in (0, 1)$ . This is called a **Taylor's expansion with Lagrangian remainder**.  $\lrcorner$

*Proof:* It follows from (12.3.3.17) and the integral mean value theorem (12.3.3.15) that there exists some  $\theta \in (0, 1)$  s.t.

$$\begin{aligned} f(\underline{x}) - \sum_{|\alpha| \leq k} D^\alpha f(0) \frac{\underline{x}^\alpha}{\alpha!} &= \int_0^1 \frac{(1-t)^k}{k!} \left( \left( \sum_i x_i D^i \right)^{k+1} f \right) (t\underline{x}) dt \\ &= \left( \left( \sum_i x_i D^i \right)^{k+1} f \right) (\theta \underline{x}) \int_0^1 \frac{(1-t)^k}{k!} dt \\ &= \frac{1}{(k+1)!} \left( \left( \sum_i x_i D^i \right)^{k+1} f \right) (\theta \underline{x}) \end{aligned}$$

□

**Cor. (12.3.3.19) [Taylor's Expansion with Peano Remainder].** Let  $n \in \mathbb{Z}_+$ ,  $k \in \mathbb{N}$ ,  $f \in C^{k+1}(\mathbb{R}^n)$ , then for  $\underline{x} \in \mathbb{R}^n$ ,

$$f(\underline{x}) = \sum_{j=0}^k \left( \left( \sum_i x_i D^i \right)^j f \right) (0) \frac{\underline{x}^j}{j!} + o(|\underline{x}|^k)$$

for some  $\theta \in (0, 1)$ . This is called a **Taylor's expansion with Peano remainder**. ┘

*Proof:* This follows from (12.3.3.18) and the continuity (thus local boundedness) of the derivatives of  $f$ . □

**Prop. (12.3.3.20) [Derivatives of Reciprocals].** For any  $k \in \mathbb{N}$ ,

$$\left( \frac{1}{f} \right)^{(k)} = \frac{1}{f} \sum_{a_1, a_2, \dots \in \mathbb{N}, a_1 + 2a_2 + \dots = k} \binom{a_1 + a_2 + \dots}{a_1, a_2, \dots} \left( \frac{-f'}{1!f} \right)^{a_1} \cdot \left( \frac{-f^{(2)}}{2!f} \right)^{a_2} \cdots$$

┘

*Proof:* ? □

**Prop. (12.3.3.21) [Derivatives of Composite Functions, Faà di Bruno].** For  $m \in \mathbb{Z}_+$  and  $g, f \in C^m(\mathbb{R})$ ,

$$\begin{aligned} (g \circ f)^{(m)}(t) &= \sum_{b_1 + 2b_2 + \dots + mb_m = m} \frac{m!}{b_1! \dots b_m!} g^{(b_1 + \dots + b_m)}(f(t)) \left( \frac{f'(t)}{1!} \right)^{b_1} \left( \frac{f^{(2)}(t)}{2!} \right)^{b_2} \cdots \left( \frac{f^{(m)}(t)}{m!} \right)^{b_m} \\ &= \sum g^{(k)}(f(t)) \left( \frac{f'(t)}{1!} \right)^{b_1} \left( \frac{f^{(2)}(t)}{2!} \right)^{b_2} \cdots \left( \frac{f^{(m)}(t)}{m!} \right)^{b_m} \end{aligned}$$

where in the last expression, the summation is over all partitions of  $[m]_+$ , and for each partition,  $k$  is the number of blocks, and  $b_i$  is the number of blocks with exactly  $i$  elements. ┘

*Proof:* Firstly it is easy to prove by induction that the expression of  $(g \circ f)^{(m)}$  is of the form

$$(g \circ f)^{(m)}(t) = \sum_{k \in \mathbb{Z}_+} g^{(k)}(f(t)) B_k(f'(t), \dots, f^{(m)}(t))$$

where  $B_k$  are polynomials. If we take  $g(t) = e^{pt}$  and  $f$  analytic, then we can express

$$(g \circ f)(x+h) = e^{pf(x+h)} = e^{pf(x)} e^{pf'(x)h} e^{pf^{(2)}(x)\frac{h^2}{2!}} \cdots$$

$$= \sum_{m \in \mathbb{N}} h^m \sum_{k \in \mathbb{N}} p^k e^{pf(x)} \sum \frac{1}{(b_1)! \dots (b_m)!} \left( \frac{f^{(1)}(t)}{1!} \right)^{b_1} \left( \frac{f^{(2)}(t)}{2!} \right)^{b_2} \dots \left( \frac{f^{(m)}(t)}{m!} \right)^{b_m}$$

for any  $h$ , where the summation is over all  $b_1, \dots, b_m \in \mathbb{N}$  s.t.

$$b_1 + \dots + b_m = k, \quad b_1 + 2b_2 + \dots + mb_m = m.$$

Now by Taylor's formula, we get

$$(g \circ f)^{(m)}(x) = \sum_{k \in \mathbb{N}} p^k e^{pf(x)} \sum \frac{m!}{(b_1)! \dots (b_m)!} \left( \frac{f^{(1)}(t)}{1!} \right)^{b_1} \left( \frac{f^{(2)}(t)}{2!} \right)^{b_2} \dots \left( \frac{f^{(m)}(t)}{m!} \right)^{b_m}.$$

And because  $p$  is arbitrary and the Taylor expansion of  $f$  at  $x$  is arbitrary, the desired formula follows.  $\square$

### Functions of Bounded Variation

**Prop. (12.3.3.22) [Bounded Variations].** For a function  $F : \mathbb{R} \rightarrow \mathbb{C}$ , define the **total variation function** of  $F$ :

$$T_F : \mathbb{R} \rightarrow \mathbb{R}_{\geq 0} : T_F(x) = \sup \left\{ \sum_{j=1}^n |F(x_j) - F(x_{j-1})| : n \in \mathbb{N}, -\infty < x_0 < x_1 < \dots < x_n = x \right\}.$$

Then  $T_F$  is a non-decreasing function, and for  $a < b \in \mathbb{R}$ ,

$$T_F(b) - T_F(a) = \sup \left\{ \sum_{j=1}^n |F(x_j) - F(x_{j-1})| : n \in \mathbb{N}, a = x_0 < x_1 < \dots < x_n = b \right\}.$$

Then  $F$  is called a **function of bounded variation** if  $T_F(\infty) = \lim_{x \rightarrow \infty} T_F(x) < \infty$ . The space of functions of bounded variation is denoted by  $BV(\mathbb{R})$ .

Similarly we can define the totally variation function for a function  $F : [a, b] \rightarrow \mathbb{C}$ , where  $a < b \in \mathbb{R}$ , by regarding it as a function on  $\mathbb{R}$  s.t.  $F(x) = F(a)$  if  $x < a$  and  $F(x) = F(b)$  if  $x > b$ . So we can define  $BV([a, b])$ .  $\lrcorner$

**Prop. (12.3.3.23) [Properties of Bounded Variations].**

- $F \in BV(\mathbb{R})$  iff  $\operatorname{Re} F, \operatorname{Im} F \in BV(\mathbb{R})$ .
- For  $F : \mathbb{R} \rightarrow \mathbb{R}$ ,  $F \in BV$  iff  $F$  is the difference of two bounded non-decreasing functions. And if this is the case, then these functions can be chosen to be  $\frac{1}{2}(T_F + F)$  and  $\frac{1}{2}(T_F - F)$ , which is called the **Jordan decomposition** of  $F$ .
- If  $F \in BV(\mathbb{R})$ , then  $F(x-), F(x+)$  exists for any  $x \in \mathbb{R}$ . And also  $F(\pm\infty)$  exist.
- If  $F \in BV(\mathbb{R})$ , then  $F$  has at most countably many discontinuous points.
- If  $F \in BV(\mathbb{R})$  and  $G(x) = F(x+)$ , then  $F^\wedge$  and  $G^\wedge$  exist, and they are equal.

$\lrcorner$

*Proof:* Cf. [Folland]P103.  $\square$

**Def. (12.3.3.24) [Normalized Bounded Variations].** The space NBV of **normalized bounded variation functions** consists of functions  $F \in BV(\mathbb{R})$  (12.3.3.22) s.t.  $F(-\infty) = 0$  and  $F$  is right-continuous.  $\lrcorner$

**Prop. (12.3.3.25)[Bounded Variations and Measures].** If  $\mu$  is a complex Borel measure on  $\mathbb{R}$ , and  $F(x) = \mu((-\infty, x])$  for any  $x \in \mathbb{R}$ , then  $F \in \text{NBV}$ . Conversely, if  $F \in \text{NBV}$ , then there exists a unique complex Borel measure  $\mu_F$  on  $\mathbb{R}$  s.t.  $F(x) = \mu_F((-\infty, x])$ . Moreover,  $|\mu_F| = \mu_{T_F}$ .  $\lrcorner$

*Proof:* Cf.[Folland]P104.  $\square$

**Def. (12.3.3.26) [Lebesgue-Stieltjes Integration].** For  $F \in \text{NBV}$  and any function  $G : X \rightarrow \mathbb{C}$ , denote

$$\int g dF \triangleq \int g d\mu_F \text{ (12.3.3.25)}$$

when it is integrable, which is called the **Lebesgue-Stieltjes integral**.  $\lrcorner$

**Thm. (12.3.3.27)[Integration by Parts].** If  $F, G \in \text{NBV}$  and at least one of them is continuous, then for  $a < b \in \mathbb{R}$ ,

$$\int_{(a,b]} F dG + \int_{(a,b]} G dF = F(b)G(b) - F(a)G(a).$$

*Proof:* Cf.[Fol99]P107.  $\square$

**Def. (12.3.3.28) [Absolute Continuity].** For  $a < b \in [-\infty, \infty]$ ,  $f \in C([a, b])$  is called **absolutely continuous** on  $[a, b]$  if for any  $\varepsilon > 0$ , there exists  $\delta < 0$  s.t. for any f.m. disjoint intervals  $(a_i, b_i), i \leq N$ ,

$$\sum_{i=1}^N (b_i - a_i) < \delta \implies \sum_{i=1}^N |F(b_i) - F(a_i)| < \varepsilon.$$

**Prop. (12.3.3.29).** For  $F \in \text{NBV}$ ,  $F$  is absolutely continuous iff  $\mu_F \ll m$  (12.3.3.25).  $\lrcorner$

*Proof:* Cf.[Folland]P105.  $\square$

**Prop. (12.3.3.30).** For  $a < b \in [-\infty, \infty]$ ,  $f \in C([a, b])$  is differentiable and  $F^\Delta$  is bounded, then  $F$  is absolutely continuous.  $\lrcorner$

*Proof:* This follows from the fact  $|F(b_i) - F(a_i)| \leq (\sup |F^\Delta|)|b_i - a_i|$  by mean value theorem (12.3.3.13).  $\square$

**Thm. (12.3.3.31)[Fundamental Theorem of Calculus for Lebesgue Measure].** If  $a < b \in \mathbb{R}$  and  $F \in C([a, b])$ , then the following are equivalent:

- $F$  is absolutely continuous on  $[a, b]$ .
- $F(x) - F(a) = \int_a^x f(t) dt$  for some  $f \in L^1([a, b], m)$ .
- $F$  is differentiable a.e. on  $[a, b]$ ,  $F^\Delta \in L^1([a, b], m)$ , and  $F(x) - F(a) = \int_a^x F^\Delta(t) dt$ .

In particular, this is the case for  $F$  everywhere differentiable and  $F^\Delta$  bounded, by (12.3.3.30).  $\lrcorner$

*Proof:* Cf.[Fol99]P106.  $\square$

## 4 Smooth Functions

**Prop. (12.3.4.1).** For  $n \in \mathbb{Z}_+$  and  $f \in C^\infty(\mathbb{R}^n)$ , if  $f(0) = 0$ , then there exists  $g_1, \dots, g_n \in C^\infty(\mathbb{R}^n)$  s.t.

$$f(\mathbf{x}) = x_1 g_1(\mathbf{x}) + \dots + x_n g_n(\mathbf{x}).$$

┘

*Proof:*

$$f(\mathbf{x}) = \int_0^1 f(t\mathbf{x}) dt = \int_0^1 \frac{\partial}{\partial x_i} f(t\mathbf{x}) x_i dt.$$

So we can take  $g_i(\mathbf{x}) = \int_0^1 \frac{\partial}{\partial x_i} f(t\mathbf{x}) dt$ . □

**Thm. (12.3.4.2) [Implicit Function Theorem].** ┘

## 5 Series

**Lemma (12.3.5.1).** For a sequence  $(a_n)_{n \in \mathbb{N}}$  in  $\mathbb{R}_+$ ,

$$\lim_{n \rightarrow \infty} \frac{a_{n+1}}{a_n} \leq \lim_{n \rightarrow \infty} a_n^{1/n} \leq \overline{\lim}_{n \rightarrow \infty} a_n^{1/n} \leq \overline{\lim}_{n \rightarrow \infty} \frac{a_{n+1}}{a_n}$$

┘

*Proof:* Let  $\lim_{n \rightarrow \infty} a_n^{1/n} = R$ . If  $R > 0$ , then by definition, for any  $\varepsilon > 0$  and  $M \in \mathbb{Z}_+$ , there exists some  $m \geq M$  s.t.  $a_m^{1/m} < R + \varepsilon$ . Then for such  $M$ ,  $a_m/a_1 \leq (R + \varepsilon)^m/a_1$ . So for some  $k \leq m$ ,  $a_k/a_{k-1} \leq ((R + \varepsilon)^m/a_1)^{m-1}$ . Then if  $M$  is very large,  $a_k/a_{k-1} < R + 2\varepsilon$ . Thus  $\lim_{n \rightarrow \infty} \frac{a_{n+1}}{a_n} \leq R$ .

Then  $\overline{\lim}_{n \rightarrow \infty} a_n^{1/n} \leq \overline{\lim}_{n \rightarrow \infty} \frac{a_{n+1}}{a_n}$  follows from this by considering the sequence  $b_n = a_n^{-1}$ . The other inequality is trivial. □

**Prop. (12.3.5.2).** If  $(a_n)_{n \geq n_0, n \in \mathbb{N}}$  is a series of real numbers and  $C \in \mathbb{R}$  s.t.  $a_{m+n} \geq a_m + a_n + C$  for any  $m, n \geq n_0 \in \mathbb{N}$ , then  $a_m/m$  converges to  $\overline{\lim} a_n/n \in (-\infty, \infty]$ .

Notice by taking  $b_n = -a_n$ , the  $\leq$  case is also true. In particular, if  $|a_{m+n} - a_m - a_n| \leq C$  for any  $m, n \geq n_0 \in \mathbb{N}$ , then  $a_m/m$  converges in  $\mathbb{R}$ . ┘

*Proof:* Let  $\lambda = \overline{\lim} a_n/n$ . By induction, for any  $N \geq n_0 \in \mathbb{N}$ ,  $a_{2^k N} \geq 2^k a_N + (2^k - 1)C$  for any  $k \in \mathbb{N}$ , so  $a_{2^k N}/2^k N \geq a_N/N + \min\{C, 0\}$ , so  $\lambda > -\infty$ .

If  $\lambda = +\infty$ , then for any  $M \in \mathbb{R}$ , there exists  $n > |C|/\varepsilon$  s.t.  $a_n/n \geq M$ . For any  $N$  large,  $N = kn + m$  for some  $k, m$  and  $n_0 \leq m < n_0 + n$ , so  $a_N \geq ka_n + a_m + (k+1)C$ , so  $\underline{\lim} a_N/N \geq a_n/n - \varepsilon \geq M - \varepsilon$  for  $N$  large, so  $\underline{\lim} a_n/n = \overline{\lim} a_n/n$ .

If  $\lambda < \infty$ , for any  $\varepsilon > 0$ , there exists  $n > |C|/\varepsilon$  s.t.  $\lambda - a_n/n < \varepsilon$ . For any  $N$  large,  $N = kn + m$  for some  $k, m$  and  $n_0 \leq m < n_0 + n$ , so  $a_N \geq ka_n + a_m + (k+1)C$ , so  $\underline{\lim} a_N/N \geq a_n/n \geq \lambda - 2\varepsilon$  for  $N$  large, so  $\underline{\lim} a_n/n = \overline{\lim} a_n/n$ . □

## Power Series

**Prop. (12.3.5.3) [Cauchy-Hadamard].** For any power series  $a_0 + a_1 X + \dots + a_n X^n + \dots \in \mathbb{R}[[X]]$ , take  $1/R = \overline{\lim} |a_n|^{1/n}$ , where we assume  $1/0 = \infty$  and  $1/\infty = 0$ , then

- The series converges absolutely for every  $|x| < R$ , and if  $\rho < R$ , then the convergence is uniform for  $|x| \leq \rho$ . In particular, the series converges to a continuous function in  $\mathbb{D}(0, R)$  by (4.4.8.21).

- If  $|x| > R$ , the terms are unbounded, and the series diverges.

And  $R$  is called the **radius of convergence** of the sequence.  $\lrcorner$

*Proof:* 1: For  $0 < \rho < R$ , take  $\rho_1 \in (\rho, R)$ , then the definition of  $R$  implies that for some  $N \in \mathbb{Z}_+$  and any  $n \geq N$ ,  $|a_n| \leq R^{-n} < \rho_1^{-n}$ , so  $|a_n x^n| \leq (\rho/\rho_1)^n$ , so  $\sum_{n \in \mathbb{N}} a_n x^n$  converges absolutely and uniformly for  $|x| \leq \rho$ .

2: For  $R < |x|$ , the definition of  $R$  implies that for any  $N \in \mathbb{Z}_+$ , there exists  $n \geq N$  s.t.  $|a_n| \geq R^{-n}$ , so  $|a_n x^n| \geq |x/R|^n > 1$ , so this sequence cannot be convergent.  $\square$

**Prop. (12.3.5.4).** For any power series  $a_0 + a_1 x + \dots + a_n x^n + \dots$  in  $\mathbb{R}$ , by (12.3.5.1), if  $\lim_{n \rightarrow \infty} \left| \frac{a_{n+1}}{a_n} \right| = \rho \in [0, \infty]$ , then the radius of convergence (12.4.3.1)  $R = 1/\rho$ , where we assume  $1/0 = \infty$  and  $1/\infty = 0$ .  $\lrcorner$

### Abel Summation

**Prop. (12.3.5.5) [Abel Summation].** For  $(a_n)_{n \in \mathbb{Z}_+}, (b_n)_{n \in \mathbb{Z}_+} \in \mathbb{C}^{\mathbb{Z}_+}$  and  $N \in \mathbb{N}, k \in \mathbb{Z}_+$ , if we denote  $A(n) = \sum_{N < m \leq n} a_m$ , then

$$\sum_{N < n \leq N+k} a_n b_n = A_{N+k} b_{N+k+1} + \sum_{N < n \leq N+k} A_n (b_n - b_{n+1}).$$

$\lrcorner$

**Cor. (12.3.5.6) [Abel's Criterion of Convergence].** If  $(a_n)_{n \in \mathbb{N}} \in \mathbb{C}^{\mathbb{N}}$  is a sequence and  $(b_n) \in \mathbb{R}_{\geq 0}^{\mathbb{N}}$  is a non-increasing sequence, and there exists  $A \in \mathbb{R}_+$  s.t.

$$\lim_{n \rightarrow \infty} b_n = 0, \quad \sup_{N \in \mathbb{N}} \left| \sum_{n \in [N]} a_n \right| \leq A,$$

then the series  $\sum_{n \in \mathbb{N}} a_n b_n$  converges, and for each  $N \in \mathbb{N}$ , we have

$$\left| \sum_{n > N} a_n b_n \right| \leq 2A b_{N+1}.$$

$\lrcorner$

**Cor. (12.3.5.7) [Abel Integrations].** If  $(a_n)_{n \in \mathbb{Z}_+} \in \mathbb{C}^{\mathbb{Z}_+}$  and we denote  $A(X) = \sum_{n \in [X]_+} a_n$ , then for any  $X \in \mathbb{R}_{\geq 1}$  and  $b(X) \in C^1([1, X])$ , we have

$$\sum_{n \in [X]_+} a_n b(n) = A(X) b(X) - \int_1^X A(t) b'(t) dt.$$

$\lrcorner$

### Double Series

**Def. (12.3.5.8) [Pringsheim Convergence, Pringsheim [Pri00]].** A double sequence  $x = (x_{ij})_{i,j \in \mathbb{Z}_+} \in \mathbb{C}^{\mathbb{Z}_+ \times \mathbb{Z}_+}$  is said to be **convergent in Pringsheim's sense** if there exists  $L \in \mathbb{C}$  s.t. for any  $\varepsilon \in \mathbb{R}_+$ , there exists  $\mathbb{N} \in \mathbb{Z}_+$  s.t.  $|x_{jk} - L| \leq \varepsilon$  for any  $j, k \in \mathbb{Z}_{\geq \mathbb{N}}$ .

And it is said to be a **Cauchy sequence in Pringsheim's sense** if for any  $\varepsilon \in \mathbb{R}_+$ , there exists  $\mathbb{N} \in \mathbb{Z}_+$  s.t.  $|x_{jk} - x_{pq}| \leq \varepsilon$  for any  $p, q, j, k \in \mathbb{Z}_{\geq \mathbb{N}}$ .  $\lrcorner$

### Statistical Convergence

References are [Fri85].

**Def. (12.3.5.9) [Statistical Convergent Sequences].** A sequence  $x = (x_i)_{i \in \mathbb{Z}_+} \in \mathbb{C}^{\mathbb{Z}_+}$  is called a **statistically convergent** if there exists  $L \in \mathbb{C}$  s.t. for any  $\varepsilon \in \mathbb{R}_+$ , we have

$$\lim_{n \rightarrow \infty} \frac{1}{n} \# \{k \in [n]_+ : |x_k - L| \leq \varepsilon\} = 0.$$

And it is said to be a **statistically Cauchy sequence** if for any  $\varepsilon \in \mathbb{R}_+$ , there exists  $N \in \mathbb{Z}_+$  sut

$$\lim_{n \rightarrow \infty} \frac{1}{n} \# \{k \in [n]_+ : |x_k - x_N| \leq \varepsilon\} = 0.$$

┘

**Def. (12.3.5.10) [Statistical Convergent Double Sequences].** A double sequence  $x = (x_{i,j})_{i,j \in \mathbb{Z}_+} \in \mathbb{C}^{\mathbb{Z}_+ \times \mathbb{Z}_+}$  is called a **statistical convergent double sequence** if there exists  $L \in \mathbb{C}$  s.t. for any  $\varepsilon \in \mathbb{R}_+$ , the set

$$\{(j, k) \in \mathbb{Z}_+ \times \mathbb{Z}_+ : |x_{jk} - L| \geq \varepsilon\}$$

has natural double density 0.

A double sequence  $x = (x_{i,j})_{i,j \in \mathbb{Z}_+} \in \mathbb{C}^{\mathbb{Z}_+ \times \mathbb{Z}_+}$  is called a **statistical Cauchy double sequence** if for any  $\varepsilon \in \mathbb{R}_+$ , there exists  $M, N \in \mathbb{Z}_+$  s.t.

$$\{(j, k) : |x_{jk} - x_{MN}| \geq \varepsilon\}$$

has natural double density 0.

Then a complex double sequence  $x = (x_{i,j})_{i,j \in \mathbb{Z}_+}$  is statistical Cauchy iff it is statistically convergent. ┘

*Proof:* ?

□

**Prop. (12.3.5.11).** Convergent double sequences are statistically convergent, but not conversely. ┘

*Proof:* Cf. [M-O03].

□

**Prop. (12.3.5.12).** The set of bounded statistically convergent double sequences is a closed subspace of the space of bounded sequences, but it is nowhere dense. ┘

### Cesáro-Summable(convergent) Sequences

**Def. (12.3.5.13) [Cesáro-Summable Sequences].** A sequence  $x = (x_i)_{i \in \mathbb{Z}_+}$  is called **Cesáro-summable** if the limit

$$\lim_{n \rightarrow \infty} \frac{1}{n} \sum_{i=1}^n x_i$$

exists.

A double sequence  $x = (x_{i,j})_{i,j \in \mathbb{Z}_+}$  is called **Cesáro-summable** if the limit

$$\lim_{n,m \rightarrow \infty} \frac{1}{mn} \sum_{i=1}^m \sum_{j=1}^n x_{i,j}$$

exists. ┘

**Prop. (12.3.5.14).** Let  $x$  be a double sequence and  $p \in \mathbb{R}_+$ , then

- If  $x$  is bounded, then  $x$  is strongly Ceáro- $p$ -summable iff it is strongly Ceáro-summable.
- If  $x$  is bounded and convergent in Pringsheim's sense (12.3.5.8), then it is strongly Ceáro- $p$ -summable.
- If  $x$  is strongly Ceáro- $p$ -summable, then it is statistically convergent. And the converse is true if  $x$  is bounded.

┘

**Cor. (12.3.5.15).** If  $x$  is a sequence or a double sequence that is bounded and statistically convergent (12.3.5.10), then it is also Cesáro-summable (12.3.5.13).

┘

### Borel-Summable Series

**Prop. (12.3.5.16) [Borel Summation].** Suppose  $\sum_{n \in \mathbb{N}} a_n x^n$  is a power series with zero radius of convergent, and suppose that the **exponential generating function**

$$g(x) = \sum_{n \in \mathbb{N}} a_n \frac{x^n}{n!}$$

is convergent on some nbhd of 0, and analytically extends to a smooth function on  $[0, \infty)$ , and satisfies that  $g(x) = O(x^N)$ .

Then we can define a **Borel summation** of this power series as

$$I(x) = \int_0^\infty g(xu) e^{-u} du = x^{-1} \int_0^\infty g(u) e^{-\frac{u}{x}} du = x^{-1} (\mathcal{L}g)(x^{-1}) \quad (12.5.4.4).$$

Then  $I(x)$  is convergent on  $[0, \frac{1}{N})$ , and has the Taylor expansion  $\sum_{n \in \mathbb{N}} a_n x^n$  at the origin.

┘

*Proof:* Take derivatives, and notice that for  $n \in \mathbb{N}$ ,  $\int_0^\infty x^n e^{-x} dx = n!$ .

□

**Example (12.3.5.17).** Consider the power series

$$\sum_{n \in \mathbb{N}} (-1)^n n! x^n,$$

then  $g(x) = \sum_{n \in \mathbb{N}} (-1)^n x^n = \frac{1}{1+x}$ , so

$$I(x) = \int_0^\infty \frac{e^{-u}}{1+xu} du = x^{-1} e^{1/x} E_1\left(\frac{1}{x}\right),$$

where  $E_1(x) = \int_x^\infty \frac{e^{-u}}{u} du$  is the integral exponential.

┘

## 6 $L^p$ -spaces

**Lemma (12.3.6.1) [Hölder].** if  $\sum x_i = 1, x_i \geq 0$ , then for any  $a_i \geq 0$

$$\prod a_i^{x_i} \leq \sum a_i x_i.$$

┘

*Proof:* ?

□

**Thm. (12.3.6.2) [Hölder-Cauchy-Bunyakovsky-Schwarz Inequality].** Let  $X$  be a measure space, and  $1 \leq p, q \leq \infty$  satisfies  $1/p + 1/q = 1$ , then

$$\|fg\|_1 \leq \|f\|_p \|g\|_q.$$

More generally, if  $\sum_{i=1}^n 1/p_i = 1$ , then

$$\left\| \prod f_i \right\|_1 \leq \prod \|f_i\|_{p_i}.$$

┘

*Proof:* The both sides are homogenous for  $f_i$ , so we may assume  $\|f_i\|_{p_i} = 1$ , then use Hölder's Lemma(12.3.6.1) for  $x_i = q/p_i$ .  $\square$

**Cor. (12.3.6.3) [Generalized Cauchy-Schwartz Inequality].** Let  $f : I \rightarrow J \in \text{finSet}$  and  $\{a_j\}_{j \in J} \subset \mathbb{C}$ , then

$$\sum_{i \in I} |a_{f(i)}| \leq \left( \sum_{j \in J} |a_j|^2 \right)^{1/2} \left( \sum_{i \in I} \#f^{-1}(f(i)) \right)^{1/2}.$$

┘

**Prop. (12.3.6.4) [Dual of  $L^p(\mu)$ ].** For a  $\sigma$ -finite measurable space  $(X, \mathcal{M}, \mu)$ , for  $1 \leq p < \infty$

$$L^p(X, \Omega, \mu)^* = L^q(X, \Omega, \mu).$$

┘

*Proof:* Firstly, Hölder inequality(12.3.6.2) shows that a  $g \in L^q(X, \Omega, \mu)$  defines a functional by  $f \mapsto \int f g d\mu$ . Conversely, if given a functional  $F$ , define a measure  $v(E) = F(\chi_E)$  for all measurable set  $E \in \Omega$ . It is countably additive: first it is finitely additive, and if  $E_n$  is a descending sequence of measurable sets that  $\cap E_n = \emptyset$ , then

$$v(E_n) \leq \|F\| \|\chi_{E_n}\|_{L^p} = \|F\| \mu(E_n)^{1/p} \rightarrow 0.$$

(where we used the fact  $p < \infty$ ). And it is clearly absolutely continuous w.r.t.  $\mu$ .

So by Radon-Nikodym(12.3.3.4), there is a measurable function  $g$  that  $v(E) = \int_E g d\mu$ . So for all simple function  $f$ ,  $F(f) = \int f g d\mu$ . Next we want to prove  $\|g\|_q \leq \|F\|$ , because any measurable function  $f$  can be approximated by simple functions  $f_i$  in  $L^p$  norm(12.3.8.6), so

$$\left| \int (f(x) - f_i(x)) g(x) d\mu \right| \leq \|f - f_i\|_p \cdot \|g\|_q \leq \|f - f_i\|_p \|g\|_q.$$

So  $F(f) = \lim F(f_i) = \lim \int f_i g d\mu = \int f g d\mu$ .

To prove this, if  $1 < p$ , then let  $E_t = \{x : |g(x)| \leq t\}$ , and  $f = \chi_{E_t} |g|^{q-2} g$ , then

$$\int_{E_t} |g|^q d\mu = \int f g d\mu = F(f) \leq \|F\| \|f\|_{L^p} = \|F\| \left( \int_{E_t} |g|^q d\mu \right)^{1/p}$$

which is equivalent to  $\|g \chi_{E_t}\|_{L^q} \leq \|F\|$ . Let  $t \rightarrow \infty$ , then the monotone convergence theorem(12.3.2.5) gives us the result.

If  $p = 1$ , then  $q = \infty$ . For any  $\varepsilon > 0$ , let  $A = \{x : |g(x)| > \|F\| + \varepsilon\}$ ,  $E_t = \{x : |g(x)| \leq t\}$ , and let  $f = \chi_{E_t \cap A} \text{sgn}(g)$ , then  $\|f\|_{L^1} = \mu(E_t \cap A)$ , and

$$\mu(E_t \cap A) (\|F\| + \varepsilon) \leq \int_{A \cap E_t} |g| d\mu = \int f g d\mu \leq \|F\| \mu(E_t \cap A)$$

If  $\mu(A) \neq 0$ , then let  $t \rightarrow \infty$ , this is a contradiction. So  $\|g\|_\infty \leq \|F\|$ .  $\square$

**Prop. (12.3.6.5) [Hilbert Basis for Products].** For two  $\sigma$ -finite measure spaces  $M, N$  and Hilbert basis (12.7.4.8)  $\{e_i\}$  of  $L^2(M)$  and  $\{f_j\}$  of  $L^2(N)$ ,  $\{e_i \otimes f_j\}$  gives a Hilbert basis for  $L^2(M \times N)$ . (Use Fubini).  $\lrcorner$

*Proof:* It is easily verified that  $e_i \otimes f_j$  are mutually orthogonal, and if some  $f \in L^2(M \times N)$  satisfies  $(f, e_i \otimes f_j) = 0$  for all  $i, j$ , then

$$\int_M e_i(x) \int_N f(x, y) f_j(y) dy = 0$$

for all  $i$ . But  $\int_N f(x, y) f_j(y) dy \in L^2(M)$  for a.e.  $x$  ( $f(x, y) \in L^2(N)$  a.e.  $x$  by Fubini-Tonelli), thus it vanishes. So  $\int_N f(x, y) f_j(y) dy = 0 \in L^2(M)$  for a.e.  $x$ , so by Fubini-Tonelli again,  $\|f\|_{L^2(M \times N)} = 0$ , thus  $f = 0$ .  $\square$

**Prop. (12.3.6.6) [Minkowski's Inequality].** Let  $(X, \mathcal{M}, \mu), (Y, \mathcal{N}, \nu)$  be  $\sigma$ -finite measure spaces, and  $f$  a  $(\mathcal{M} \otimes \mathcal{N})$ -measurable function on  $X \times Y$ .

- If  $f \geq 0$  and  $1 \leq p < \infty$ , then

$$\left[ \int \left( \int f(x, y) d\nu(y) \right)^p d\mu(x) \right]^{1/p} \leq \int \left[ \int f(x, y)^p d\mu(x) \right]^{1/p} d\nu(y).$$

- If  $1 \leq p \leq \infty$ ,  $f(\cdot, y) \in L^p(\mu)$  for a.e.  $y$ , and the function  $y \mapsto \|f(\cdot, y)\|_p$  is in  $L^1(\nu)$ , then  $f(x, \cdot) \in L^1(\nu)$  for a.e.  $x$ , and the function  $x \mapsto \int f(x, y) d\nu(y)$  is in  $L^p(\mu)$ , and

$$\left\| \int f(\cdot, y) d\nu(y) \right\|_p \leq \int \|f(\cdot, y)\|_p d\nu(y).$$

$\lrcorner$

*Proof:* 1: If  $p = 1$ , then this is just Tonelli's theorem (12.3.2.9), and when  $1 < p < \infty$ , let  $q^{-1} + p^{-1} = 1$ , and  $g \in L^q(\mu)$ , then by Tonelli's theorem and Holder's inequality (12.3.6.2),

$$\int \left[ \int f(x, y) d\nu(y) \right] |g(x)| d\mu(x) = \int \int f(x, y) |g(x)| d\mu(x) d\nu(y) \leq \|g\|_q \int [f(x, y)^p d\nu(y)]^{1/p} d\mu(x).$$

So we finish by (12.3.6.4).

2 follows from item 1 and Fubini's theorem. And when  $p = \infty$ , this is trivial.  $\square$

### $L^2$ -Space

**Def. (12.3.6.7).** Let  $X$  be a measure space, then there is a map

$$\star : L^2(X \times X) \times L^2(X \times X) \rightarrow L^2(X \times X) : (K_1 \star K_2)(u, v) = \int_X K_1(u, x) K_2(x, v) dx.$$

By Schwarz inequality,  $\|K_1 \star K_2\|_2 \leq \|K_1\|_2 \star \|K_2\|_2$ , thus  $\star$  makes  $L^2(G \times G)$  into a Banach algebra (without a unit).

This Banach algebra can left and right act on  $L^2(X)$ , also denoted by  $\star$ , then for  $K \in L^2(X \times X)$ ,  $P, Q \in L^2(X)$ ,

$$(P \otimes Q) \star K = P \otimes (Q \star K), \quad K \star (P \otimes Q) = (K \star P) \otimes Q.$$

And also for  $S, T \in L^2(X)$ ,

$$(P \otimes Q) \star (\bar{S} \otimes T) = (Q, S)_{L^2} P \otimes T.$$

$\lrcorner$

**Prop. (12.3.6.8).**

- An element  $K \in L^2(X \times X)$  has the form  $P \otimes Q$  iff  $K \star K' \star K$  is proportional to  $K$  for all  $K' \in L^2(X \times X)$ .
- Let  $K_1 = P_1 \otimes Q_1$  and  $K_2 = P_2 \otimes Q_2$ , then  $P_1$  and  $P_2$  are proportional iff  $K_1 \star K$  and  $K_2 \star K$  are proportional for all pure tensors  $K \in L^2(X \times X)$ . Similarly,  $Q_1$  and  $Q_2$  are proportional iff  $K \star K_1$  and  $K \star K_2$  are proportional for all pure tensor  $K$ .
- For any uniform transformation  $s : L^2(X \times X) \rightarrow L^2(X \times X)$  respecting  $\star$ , there exists a unitary transformation  $s_0 : L^2(X) \rightarrow L^2(X)$  s.t.  $s(P \otimes \overline{Q}) = s_0(P) \otimes \overline{s_0(Q)}$ . And it can be chosen to be invertible iff  $s$  is.

┘

*Proof:* Cf.[Bump, P527].?

□

 **$L^\infty$ -Spaces**

**Def. (12.3.6.9) [Slowly Oscillating Functions].** A **slowly oscillating function** on  $\mathbb{R}^n$  is a function  $f \in L^\infty(\mathbb{R}^n)$  s.t. for any  $\varepsilon \in \mathbb{R}_+$ , there exists  $A, \delta \in \mathbb{R}_+$  s.t.  $|f(x) - f(y)| < \varepsilon$  whenever  $|x| > A, |y| > A, |x - y| < \delta$ .

┘

**7 Estimations**

**Prop. (12.3.7.1).**  $\lim_{n \rightarrow \infty} n^{1/n} = 1$ .

┘

*Proof:* Let  $n^{1/n} = 1 + \delta_n, \delta_n > 0$ , then  $n = (1 + \delta_n)^n \geq 1 + \frac{n(n-1)}{2} \delta_n^2$ , so  $\delta_n \leq \sqrt{2/n}$ , and  $\lim_{n \rightarrow \infty} \delta_n = 0$ .

□

**Prop. (12.3.7.2).** For any  $x \in (0, \frac{\pi}{2})$ ,  $\frac{2}{\pi}x < \sin x < x$ .

┘

*Proof:* it suffices to show that  $\frac{\sin x}{x}$  is decreasing on  $x \in (0, \frac{\pi}{2})$ :

$$\left(\frac{\sin x}{x}\right)' = \frac{x \cos x - \sin x}{x^2},$$

and  $x \cos x - \sin x < 0$  because

$$(x \cos x - \sin x)' = -x \sin x < 0.$$

□

**8 Approximations**

**Notation (12.3.8.1).**

**Prop. (12.3.8.2) [Stone-Weierstrass Approximation].** If  $X$  is compact and  $A$  is a unital  $*$ -subalgebra of  $C(X)$  that separates points, then  $A$  is dense in  $C(X)$ .

┘

*Proof:* This is a consequence of Bishop theorem (12.8.3.18) because in this case the real functions in  $A$  separate points, so all  $A$ -antisymmetric sets consists of one point.

□

**Cor. (12.3.8.3).** The set of Polynomial functions are dense in  $C([0, 1]^n)$  for any  $n \in \mathbb{Z}_+$ . ┘

**Cor. (12.3.8.4).** The set of trigonometric polynomials are dense in  $\mathbb{C}([0, 1]^n)$  for any  $n \in \mathbb{Z}_+$ . ┘

**Prop. (12.3.8.5) [Simple Function Approximation].** Let  $E$  be a measure space,

- If  $f(x)$  is a non-negative measurable function on  $E$ , then there is an ascending sequence of simple functions  $(\varphi_n(x))$  that converges to  $f$  point-wise.
- If  $f(x)$  is a measurable function on  $E$ , then there is a sequence of simple functions  $\varphi_n$  that  $|\varphi_k(x)| \leq |f(x)|$ , and converges to  $f$  pointwise.
- If  $f(x)$  is bounded, then the convergence can be chosen to be uniform.

┘

*Proof:* Cf. [实变函数周明强 P110]. □

### $L^p$ -Approximation

**Prop. (12.3.8.6) [Simple Function Approximation].** Any function in  $L^p$  can be approximated by compactly supported simple functions in  $L^p$  norm. ┘

*Proof:* □

**Prop. (12.3.8.7) [Approximation by Compactly Supported Functions].** for  $1 \leq p < +\infty$ ,  $C_c(X)$  are dense in  $L^p(X, \mu)$ , but not for  $p = \infty$ . ┘

*Proof:* Use compactly supported simple function approximation (12.3.8.6) and then use outer regular approximation (12.3.1.22) and then Tietz extension. □

**Prop. (12.3.8.8) [Lusin].** If  $f$  is almost everywhere finite on  $E$ , then for any  $\delta > 0$ , there is a closed subset  $F \subset E$  that  $f$  is continuous function on  $F$ . ┘

*Proof:* First if  $f$  is a simple function  $f = \sum_{i=1}^n c_i \chi_{E_i}$ , then for each  $E_i$ , choose a closed subset  $F_i \subset E_i$  that  $m(E_i - F_i) < \frac{\delta}{n}$ , and then  $\cup F_i$  satisfies the required condition.

Now if  $f$  is arbitrary, let  $g(x) = \frac{f(x)}{1+|f(x)|}$  to make it bounded, then by (12.3.8.5), there is a sequence of simple functions  $\varphi_k$  converging to  $f$ , and for each  $k$ , we choose a closed subset  $F_k$  that  $m(E - F_k) < \frac{\delta}{2^k}$ , so if we let  $F = \cap F_k$ , then  $\varphi_k$  are all continuous on  $F$ , so by the uniform convergence,  $f$  is also continuous on  $F$ . □

**Cor. (12.3.8.9).** If  $f$  is measurable function on  $E$  that is a.e. finite, then for any  $\delta$ , there is a continuous function  $g$  that  $m(\{x \in E | f(x) \neq g(x)\}) < \delta$ . And if  $E$  is bounded,  $g$  can be chosen to be compactly supported. ┘

*Proof:* Now that there is a closed subset  $F$  that  $m(E - F) < \delta$  and  $f$  is continuous on  $F$ , we can use Tietze extension (4.4.6.4), there is a function  $g$  that equals  $f$  on  $F$ .

If  $E \subset B(0, R)$ , then we can choose a bump function to multiply with  $g$ . □

**Prop. (12.3.8.10).** for  $1 \leq p < +\infty$ , trigonometric polynomials are dense in  $L^p(\mathbb{T})$  and  $C(\mathbb{T})$ , but not for  $p = \infty$ . So  $e^{2\pi i n x}$  forms an orthogonal basis in  $L^2(\mathbb{T})$ . ┘

Thus, the Parseval's identity holds. ┘

*Proof:* Just use the fact that Fejer kernels are an approximate identity. □

**Prop. (12.3.8.11).** For a integrable function  $u$  that has compact support,  $u_\delta = j_\delta * u$  is a smooth function of compact support that  $\|u_\delta - u\|_{C^k} \rightarrow 0$  when  $u \in C^k$ . Where  $j_\delta$  is the scaling of a smooth function of compact support. So Smooth function of compact support are dense in  $C_0^k$ .  $\lrcorner$

**Prop. (12.3.8.12).**  $D(\mathbb{R}^n)$  is dense in  $W^{m,p}(\mathbb{R}^n)$ .  $\lrcorner$

*Proof:* Use the fact that  $C_0$  are dense in  $L^p$  by (12.3.8.11). And  $f_\delta \rightarrow f$  in  $L^p$  norm for  $f \in C_0$ . So we can use the three-part argument applied to  $D_\alpha u$  to get  $D_\alpha(u_\delta) \rightarrow D_\alpha u$  in  $L^p$  norm for  $|\alpha| \leq m$ . Thus the result.  $\square$

## 9 Example of Calculations

**Prop. (12.3.9.1).** For  $s \in \mathbb{C}, \operatorname{Re}(s) > 1/2$ , then

$$\int_{-\infty}^{\infty} (1+x^2)^{-s} e^{ik \arctan(-\frac{1}{x})} dx = (-i)^k \sqrt{\pi} \frac{\Gamma(s)\Gamma(s-\frac{1}{2})}{\Gamma(s+\frac{k}{2})\Gamma(s-\frac{k}{2})}.$$

$\lrcorner$

*Proof:* Cf.[Bump, Automorphic Forms and Representations, P230].  $\square$

## 10 Hausdorff Measures and Hausdorff Dimensions

References are [Fol99].

**Def. (12.3.10.1) [Metric Outer Measure].** For a metric space  $(X, d)$ , an outer measure  $\mu^*$  on  $X$  is called a **metric outer measure** if

$$\mu^*(A \cup B) = \mu^*(A) + \mu^*(B)$$

for any  $A, B \subset X$  s.t.  $\operatorname{Dist}(A, B) > 0$ .  $\lrcorner$

**Prop. (12.3.10.2) [Metric Outer Measure is a Borel Measure].** If  $(X, d)$  is a metric space and  $\mu^*$  is an outer measure, then every Borel subset of  $X$  is  $\mu^*$ -measurable (12.3.1.15).  $\lrcorner$

*Proof:* Because closed subsets of  $X$  generates the  $\sigma$ -algebra of Borel subsets of  $X$ , by (12.3.1.15), it suffices to show that any closed subset  $A$  of  $X$  is  $\mu^*$ -measurable, i.e.  $\mu^*(A) = \mu^*(A \cap F) + \mu^*(A \setminus F)$  for any  $F \subset X$ . We may assume  $\mu^*(A) < \infty$ , and for each  $n \in \mathbb{Z}_+$ , denote  $B_n = \{x \in A \setminus F \mid \operatorname{Dist}(x, F) \geq n^{-1}\}$ , then  $B_n$  is an increasing sequence of sets with union  $A \setminus F$ , and  $\operatorname{Dist}(B_n, F) \geq n^{-1}$ . Thus

$$\mu^*(A) \geq \mu^*((A \cap F) \cup B_n) = \mu^*(A \cap F) + \mu^*(B_n).$$

Thus it suffices to show that  $\lim_n \mu^*(B_n) = \mu^*(A \setminus F)$ .

Denote  $C_j = B_{j+1} \setminus B_j$ , then  $\operatorname{Dist}(C_{j+1}, B_j) > \frac{1}{j(j+1)}$ , thus

$$\mu^*(B_{2k}) \geq \sum_{j=1}^k \mu^*(C_{2j-1}), \quad \mu^*(B_{2k+1}) \geq \sum_{j=1}^k \mu^*(C_{2j}).$$

In particular,  $\sum_{j \in \mathbb{Z}_+} \mu^*(C_j)$  converges. Then it follows from the inequality

$$\mu^*(A \setminus F) \leq \mu^*(B_n) + \sum_{i=n+1}^{\infty} \mu^*(C_i)$$

that  $\limsup \mu^*(B_n) \leq \mu^*(A \setminus F)$ .  $\square$

**Def. (12.3.10.3) [Hausdorff Measures].** Suppose  $(X, d)$  is a metric space, then for  $p \in \mathbb{R}_{\geq 0}, \delta \in \mathbb{R}_+$  and  $A \subset X$ , define

$$H_{p,\delta}(A) = \inf \left\{ \sum_{j=1}^{\infty} \text{diam}(B_j)^p \mid B_j \subset X, A \subset \cup_j B_j, \text{diam } B_j \leq \delta \right\}.$$

with the convention  $\inf \emptyset = \infty$ , and the  $p$ -dimensional **Hausdorff outer measure**

$$H_p(A) = \lim_{\delta \rightarrow 0} H_{p,\delta}(A).$$

Then  $H_p$  is a metric outer measure (12.3.10.1). In particular, it restricts to a Borel measure on  $X$  by (12.3.10.1).  $\lrcorner$

*Proof:*  $H_{p,\delta}$  is an outer measure by (12.3.1.14), and it is easy to show that the limit  $H_p$  is also an outer measure. It is a metric outer measure because for any  $A, B \subset X$ , when  $\delta < \text{Dist}(A, B)$ , any subset  $B_i$  of  $X$  with  $\text{diam}(B_i) < \delta$  can only intersect either  $A$  or  $B$ .  $\square$

**Prop. (12.3.10.4).** For  $p \in \mathbb{R}_{\geq 0}$ , the  $p$ -dimensional Hausdorff measure is invariant under isometries, and if  $f : (X, d) \rightarrow (Y, d')$  is a map and there exists  $C \in \mathbb{R}_+$  s.t.  $d'(f(x), f(y)) \leq Cd(x, y)$  for any  $x, y \in X$ , then  $H_p(f(A)) \leq CH_p(A)$  for any  $A \subset X$ .  $\lrcorner$

**Def. (12.3.10.5) [Hausdorff Dimensions].** Suppose  $(X, d)$  is a metric space and  $p \in \mathbb{R}_{\geq 0}, A \subset X$ . If  $H_p(A) < \infty$ , then  $H_q(A) = \infty$  for any  $q \in \mathbb{R}_{>p}$ . And if  $H_p(A) > 0$ , then  $H_q(A) = \infty$  for any  $q \in \mathbb{R}_{<p}$ . In particular,  $\inf\{p \in \mathbb{R}_{\geq 0} : H_p(A) = 0\} = \sup\{p \in \mathbb{R}_{\geq 0} : H_p(A) = \infty\}$ , which is called the **Hausdorff dimension** of  $A$ , denoted by  $\dim^H(A)$ .  $\lrcorner$

*Proof:* If  $H_p(A) < \infty$ , then for any  $\delta \in \mathbb{R}_+$ , there exists  $(B_i)_{i \in \mathbb{Z}_+} \subset X$  s.t.  $A \subset \cup_{i \in \mathbb{Z}_+} B_i$ ,  $\text{diam}(B_i) < \delta$  and  $\sum_i \text{diam}(B_i)^p < H_p(A) + 1$ . Then for any  $q \in \mathbb{R}_{>p}$ , we have

$$H_{q,\delta}(A) \leq \sum_i \text{diam}(B_i)^q \leq \delta^{q-p} \sum_i \text{diam}(B_i)^p \leq \delta^{q-p}(H_p(A) + 1).$$

Taking limit  $\delta \rightarrow 0$ , we see  $H_q(A) = 0$ .

The second assertion follows by contraposition.  $\square$

**Prop. (12.3.10.6).** Suppose  $(X, d)$  is a metric space and  $(A_i)_{i \in \mathbb{Z}_+} \subset X$ , then  $\dim^H(\cup_i A_i) = \sup_i \dim^H(A_i)$ .  $\lrcorner$

**Prop. (12.3.10.7).** For  $n \in \mathbb{Z}_+$ , there exists  $\gamma_n \in \mathbb{R}_+$  s.t.  $\gamma_n H_n$  is the Lebesgue measure on  $\mathbb{R}^n$ .  $\lrcorner$

*Proof:* Cf. [Fol99]P351.  $\color{red}{?}$   $\square$

**Prop. (12.3.10.8) [Hausdorff Measure of  $C^1$ -Manifolds].** Let  $M$  be a  $k$ -dimensional  $C^1$ -submanifold of  $\mathbb{R}^n$  parametrized by  $f : V \rightarrow \mathbb{R}^n$  for some open subset  $U \subset \mathbb{R}^k$ . If  $A \subset U$  is a Borel subset, then  $f(A)$  is also a Borel subset, and

$$H_k(f(A)) = \int_A J(df_x) dH_k(x).$$

Moreover, if  $\varphi$  is any Borel-measurable function on  $M$  that is either non-negative or in  $L^1(M, H_k)$ , then

$$\int_M \varphi(y) dH_k(y) = \int_U \varphi(f(x)) J(df_x) dH_k(x).$$

*Proof:*  $\color{red}{?}$   $\square$

### Self-Similarity and Hausdorff Dimensions

**Prop. (12.3.10.9)[Semilitudes and Invariant Measures].** Let  $r \in (0, 1)$  and  $\mathcal{S} = (S_1, \dots, S_m)$  is a family of semilitudes of  $\mathbb{R}^n$  with scaling factor  $r$ , and  $X \subset \mathbb{R}^n$  is a non-empty compact set that is invariant under  $\mathcal{S}$ . For  $x \in \mathbb{R}^n, E \subset \mathbb{R}^n, \mu \in \text{Meas}(\mathbb{R}^n)$  and  $i_1, \dots, i_k \in [m]_+$ , denote

$$x_{i_1, \dots, i_k} = S_{i_1} \circ \dots \circ S_{i_k}(x), \quad E_{i_1, \dots, i_k} = S_{i_1} \circ \dots \circ S_{i_k}(E), \quad \mu_{i_1, \dots, i_k}(E) = \mu((S_{i_1} \circ \dots \circ S_{i_k})^{-1}(E)).$$

Then there is a Borel probability measure on  $X$  s.t. for any  $k \in \mathbb{Z}_+$ ,

$$\mu = \frac{1}{m^k} \sum_{i_1, \dots, i_k \in [m]_+} \mu_{i_1, \dots, i_k}.$$

┘

*Proof:* Choose  $x \in X$  and for each  $k \in \mathbb{Z}_+$ , denote

$$\mu^k = \frac{1}{m^k} \sum_{i_1, \dots, i_k \in [m]_+} [\delta_x]_{i_1, \dots, i_k}.$$

Then it is easy to prove by uniform continuity that  $\{\mu^k(f)\}$  is a Cauchy sequence for each  $f \in C(X)$  and the limits define a linear functional on  $C(X)$ . Let  $\mu$  be the associated Radon measure on  $X$ .

Then  $\mu$  is clearly a probability measure. And  $\text{Supp}(\mu) = X$  because the points  $x_{i_1, \dots, i_k}$  are dense in  $X$ . And the invariance properties of  $\mu$  follows because convergence of measures commutes with similitudes.  $\square$

**Def. (12.3.10.10)[Separating Sets].** Let  $r \in (0, 1)$  and  $\mathcal{S} = (S_1, \dots, S_m)$  is a family of semilitudes of  $\mathbb{R}^n$  with scaling factor  $r$ , then a **separating set** for  $\mathcal{S}$  is a non-empty bounded open set  $U \subset \mathbb{R}^n$  s.t.

$$S_i(U) \subset U, \quad S_i(U) \cap S_j(U) = \emptyset, \forall i \neq j \in [m]_+.$$

┘

**Prop. (12.3.10.11).** Suppose  $r \in (0, 1)$  and  $\mathcal{S} = (S_1, \dots, S_m)$  is a family of semilitudes of  $\mathbb{R}^n$  with scaling factor  $r$  with a separating set  $U \subset \mathbb{R}^n$  (12.3.10.10), then

$$X = \bigcap_{n \in \mathbb{Z}_+} \left( \bigcup_{i=1}^m S_i \right)^{\circ n} (\bar{U})$$

is the unique non-empty compact subset of  $\mathbb{R}^n$  that is invariant under  $S = \bigcup_{i=1}^m S_i$ .  $\square$

*Proof:* Clearly  $X$  is a non-empty compact invariant subset for  $S$ . And if  $Y$  is another non-empty compact subset of  $\mathbb{R}^n$  that is invariant under  $S$ , because  $S(Y) = Y, S(X) = X$ , we have

$$d_X^{\text{sup}}(Y) = \max_i d_X^{\text{sup}}(S_i(Y)) \leq r d_X^{\text{sup}}(Y).$$

thus  $d_X^{\text{max}}(Y) = 0$ , and thus  $Y \subset X$ . The same argument shows that  $X \subset Y$ , thus  $X = Y$ .  $\square$

**Prop. (12.3.10.12)[Hausdorff Dimension of Invariant Subsets with Similitudes].** Suppose  $r \in (0, 1)$  and  $\mathcal{S} = (S_1, \dots, S_m)$  is a family of semilitudes of  $\mathbb{R}^n$  with scaling factor  $r$  with a separating set  $U \subset \mathbb{R}^n$  (12.3.10.10), and  $X \subset \mathbb{R}^n$  is the unique non-empty invariant compact subset. Denote  $p = \log_{1/r}(m)$ , then

- $0 < \dim_p^H(X) < \infty$ . In particular,  $X$  has Hausdorff dimension  $p$ .
- $\dim_p^H(S_i(X) \cap S_j(X)) = 0$  for  $i \neq j$ .

┘

*Proof:* •  $\square$

## 11 Area and Coarea Formulas

## 12 Inequalities

References are [HLP88].

### Limits

**Prop. (12.3.12.1)**[e]. For  $x \in \mathbb{R}_+$ ,

$$\lim_{x \rightarrow \infty} \left(1 + \frac{1}{x}\right)^x = e.$$

┘

*Proof:*

□

### Convex Functions

**Def. (12.3.12.2)**[Convex Functions]. Let  $X \subset \mathbb{R}^n$  be a convex set, then a **convex function** on  $X$  is a function  $f : X \rightarrow \mathbb{R}$  s.t. for any  $x, y \in X$  and  $t \in [0, 1]$ ,

$$f((1-t)x + ty) \leq (1-t)f(x) + tf(y).$$

┘

**Prop. (12.3.12.3)**. A convex function on  $\mathbb{R}$  is absolutely continuous.

┘

*Proof:* This is because it is absolutely continuous.

□

**Prop. (12.3.12.4)**. Let  $\varphi : \mathbb{R}_+ \rightarrow \mathbb{R}$  be a non-decreasing function s.t.  $\varphi(0) = 0$ , and  $\varphi(e^\xi)$  is a convex function of  $\xi$ . Suppose  $\lambda_1 \geq \lambda_2 \geq \dots \geq \lambda_m \in \mathbb{R}_+$ ,  $\kappa_i \in \mathbb{R}$  satisfy

$$\lambda_1 \leq \kappa_1, \quad \lambda_1 \lambda_2 \leq \kappa_1 \kappa_2, \quad \dots \quad \lambda_1 \dots \lambda_m \leq \kappa_1 \dots \kappa_m,$$

then

$$\sum_i \varphi(\lambda_i) \leq \sum_i \varphi(\kappa_i).$$

┘

*Proof:* For  $z \in \mathbb{R}_{\geq 0}$ , define

$$f(z) = \prod_i \max(1, \kappa_i z), \quad g(z) = \prod_i \max(1, \lambda_i z),$$

then by argue case by case,  $g(z) \leq f(z)$ .

Notice if there exists an increasing function  $\psi : [0, \infty) \rightarrow \mathbb{R}$  s.t. for any  $\lambda \in \mathbb{R}_+$ ,

$$\varphi(\lambda) = \int_{\lambda^{-1}}^{\infty} \log(\lambda z) d\psi(z),$$

where the RHS is the Lebesgue-Stieltjes integral(12.3.3.26), then

$$\sum_i \varphi(\lambda_i) = \int_0^\infty \log g(z) d\psi(z) \leq \int_0^\infty \log f(z) d\psi(z) = \sum_i \varphi(\kappa_i).$$

Denote  $G(\xi) = \varphi(e^\xi)$ , then we show that  $\psi(z) = -G^\lambda(-\log z)$  suffices: If  $\xi = \log \lambda$ , then

$$\int_{\lambda^{-1}}^{\infty} \log(\lambda z) d\psi(z) = \int_{-\xi}^{\infty} (\xi + t) d(-G^\lambda(-t)) = G(\xi) = \varphi(\lambda).$$

Where we used integration by parts?? and the fact  $\lim_{t \rightarrow -\infty} tG^\lambda(t) = 0$ , which is because  $\lim_{t \rightarrow -\infty} G(t) = 0$  and

$$tG^\lambda(t) \leq 2 \int_t^{t/2} G^\lambda(t) dt = 2[G(\frac{t}{2}) - G(t)].$$

□

### Hardy Inequality

**Thm. (12.3.12.5) [Hardy Inequality].** For  $p \in \mathbb{R}_{>1}$  and a measurable function  $f(x)$  on  $(0, \infty)$  s.t.  $f(x) \geq 0$ ,

$$\int_0^\infty \left( \frac{1}{x} \int_0^x f(t) dt \right)^p dx \leq \left( \frac{p}{p-1} \right)^p \int_0^\infty f(x)^p dx.$$

┘

*Proof:* Let  $F(x) = \int_0^x f(t) dt$ , then  $\frac{\partial}{\partial x} F(x)^p = pF(x)^{p-1} f(x)$ . So by integration by part, for any  $\alpha < A \in \mathbb{R}_+$ ,

$$\begin{aligned} \int_\alpha^A \left( \frac{F(x) - F(\alpha)}{x} \right)^p dx &= -\frac{A^{1-p}}{p-1} (F(A) - F(\alpha))^p + \frac{p}{p-1} \int_\alpha^A \left( \frac{F(x) - F(\alpha)}{x} \right)^{p-1} f(x) dx \\ (12.3.6.2) \leq \frac{p}{p-1} \left( \int_\alpha^A \left( \frac{F(x) - F(\alpha)}{x} \right)^p dx \right)^{(p-1)/p} \left( \int_\alpha^A f(x)^p dx \right)^{1/p}, \end{aligned}$$

which implies that

$$\int_\alpha^A \left( \frac{F(x) - F(\alpha)}{x} \right)^p dx \leq \left( \frac{p}{p-1} \right)^p \int_\alpha^A f(x)^p dx.$$

Then the result follows by taking limit  $A \rightarrow \infty$  and then take limit  $\alpha \rightarrow 0$ . □

**Cor. (12.3.12.6) [Hardy-Landau Inequality].** If  $p \in \mathbb{R}_{>1}$  and  $(a_k)_{k \in \mathbb{Z}_+} \subset \mathbb{R}_+$  is a sequence of positive real numbers, then

$$\sum_{n=1}^{\infty} \left( \frac{1}{n} \sum_{k=1}^n a_k \right)^p \leq \left( \frac{p}{p-1} \right)^p \sum_{n=1}^{\infty} a_n^p.$$

┘

*Proof:* We may assume that  $a_1 > a_2 > \dots$ , and  $\sum_{n=1}^{\infty} a_n^p < \infty$ . Define  $f : (0, \infty) \rightarrow \mathbb{R}_+ : x \mapsto a_{[x]}$ , then  $f \in L^p(0, \infty)$ , and

$$\frac{1}{x} \int_0^x f(t) dt = \frac{\sum_{k \leq x} a_k + a_{[x]}(x - [x])}{x},$$

which is decreasing in  $x$ .

Then

$$\sum_{n=1}^{\infty} \left( \frac{1}{n} \sum_{k=1}^n a_k \right)^p \leq \sum_{n=1}^{\infty} \left( \int_{n-1}^n \frac{1}{x} \int_0^x f(t) dt \right)^p dx \leq \left( \frac{p}{p-1} \right)^p \int_0^\infty f(x)^p dx = \left( \frac{p}{p-1} \right)^p \sum_{n=1}^{\infty} a_n^p$$

□

**Cor. (12.3.12.7) [Carleman Inequality].** If  $(a_k)_{k \in \mathbb{Z}_+} \subset \mathbb{R}_+$  is a sequence of positive real numbers, then

$$\sum_{n=1}^{\infty} (a_1 \dots a_n)^{1/n} \leq e \sum_{n=1}^{\infty} a_n.$$

┘

*Proof:* By [Hardy-Landau Inequality](#), for any  $p \in \mathbb{R}_{>1}$ ,

$$\left(\frac{p}{p-1}\right)^p \sum_{n=1}^{\infty} a_n \geq \sum_{n=1}^{\infty} \left(\frac{1}{n} \sum_{k=1}^n a_k^{1/p}\right)^p \geq \sum_{n=1}^{\infty} (a_1 \dots a_n)^{1/n}.$$

Then we use the fact  $\lim_{p \rightarrow \infty} \left(\frac{p}{p-1}\right)^p = e$  [\(12.3.12.1\)](#). □

**Cor. (12.3.12.8) [Pólya-Knopp Inequality].** For any measurable function  $f(x)$  on  $(0, \infty)$  s.t.  $f(x) > 0$ ,

$$\int_0^{\infty} \exp\left(\frac{1}{x} \int_0^x \log f(t) dt\right) dx \leq e \int_0^{\infty} f(x) dx.$$

┘

*Proof:* The proof is similar in essence to that of [Carleman Inequality](#). □

**Thm. (12.3.12.9) [Copson Inequality].** If  $p \in \mathbb{R}_{>1}$  and  $(a_k)_{k \in \mathbb{Z}_+} \subset \mathbb{R}_+$  is a sequence of positive real numbers, then

$$\sum_{n=1}^{\infty} \left(\sum_{k=n}^{\infty} \frac{a_k}{k}\right)^p \leq p^p \sum_{n=1}^{\infty} a_n^p.$$

┘

*Proof:* □

**Def. (12.4.1.1) [Regions].** A **region** is a nonempty connected open subset of  $\mathbb{C}$ .

┘

**Def. (12.4.1.2) [Conjugations].** The non-zero element in  $\text{Gal}(\mathbb{C}/\mathbb{R})$  is denoted by  $c$ . And for  $z \in \mathbb{C}$ ,  $c(z)$  is also denoted by  $\bar{z}$ .

For  $z \in \mathbb{C}$ , denote  $\text{Re}(z) = \frac{z+\bar{z}}{2}$ ,  $\text{Im}(z) = \frac{z-\bar{z}}{2i}$ , called the **real part** and **complex part** of  $z$  resp..  
So

$$z = \text{Re}(z) + i \text{Im}(z), \quad \bar{z} = \text{Re}(z) - i \text{Im}(z).$$

┘

**Prop. (12.4.1.3) [C is Complete].** The natural extended value from  $\mathbb{R}$  to  $\mathbb{C}$  is of the form  $|x + iy| = \sqrt{x^2 + y^2}$ . In particular, it is easy to prove that  $\mathbb{C}$  is a complete valued field.

┘

**Def. (12.4.1.4) [Derivatives].** We introduce the following notations:

$$\frac{\partial}{\partial z} = \frac{1}{2} \left( \frac{\partial}{\partial x} - i \frac{\partial}{\partial y} \right), \quad \frac{\partial}{\partial \bar{z}} = \frac{1}{2} \left( \frac{\partial}{\partial x} + i \frac{\partial}{\partial y} \right), \quad dz = dx + i dy \quad d\bar{z} = dx - i dy.$$

Then  $dz$  is dual to  $\frac{\partial}{\partial \bar{z}}$  and  $d\bar{z}$  is dual to  $\frac{\partial}{\partial z}$ . And for any function  $f \in C^1(\mathbb{C})$ ,

$$df = \frac{\partial}{\partial x} f dx + \frac{\partial}{\partial y} f dy = \frac{\partial}{\partial z} f dz + \frac{\partial}{\partial \bar{z}} f d\bar{z}.$$

And also,

$$dz d\bar{z} = 2 dx dy = 2 r dr d\theta$$

┘

**Prop. (12.4.1.5) [Orientations].** For  $f \in C^1(\mathbb{C})$ ,

$$\text{Jac}_f(z) = \frac{\partial}{\partial x} f \frac{\partial}{\partial y} f = \left| \frac{\partial}{\partial z} f \right|^2 - \left| \frac{\partial}{\partial \bar{z}} f \right|^2.$$

Thus  $f$  preserves orientations at  $z$  iff  $\left| \frac{\partial}{\partial z} f \right| > \left| \frac{\partial}{\partial \bar{z}} f \right|$ .

┘

**Def. (12.4.1.6) [Cross Ratios].** For any three pts  $z_2, z_3, z_4 \in \overline{\mathbb{C}}$ , there is a unique linear transformation that maps them to  $1, 0, \infty$ . In fact, the linear transformation is just  $Sz = \frac{z-z_3}{z-z_4} / \frac{z_2-z_3}{z_2-z_4}$ .

Then for any point  $z_1$ , the **cross ratio**  $(z_1, z_2, z_3, z_4)$  is the image of  $z_1$  under the linear transformation that carries  $z_2, z_3, z_4$  to  $1, 0, \infty$ .

┘

**Prop. (12.4.1.7).** The cross ratio is invariant under linear transformation, and it is real iff  $z_1, z_2, z_3, z_4$  are colinear or cocycle.

┘

*Proof:* The first is because there is only one linear transformation that maps  $z_2, z_3, z_4$  to  $1, 0, \infty$ .

For the second, notice by (12.4.1.6),  $\arg(z_1, z_2, z_3, z_4) = \arg \frac{z_1 - z_3}{z_1 - z_4} - \arg \frac{z_2 - z_3}{z_2 - z_4}$ , and this is real iff  $\angle z_4 z_2 z_3 = \angle z_4 z_1 z_3$  or  $\pi - \angle z_4 z_1 z_3$ , which is equivalent to cocycle. For other degenerate cases, we need some other argument.  $\square$

**Cor. (12.4.1.8).** A linear transformation maps colinear/cocycle points to colinear/cocycle points.  $\lrcorner$

**Lemma (12.4.1.9) [Invariant Factor].** If  $a, b, c, d \in \mathbb{R}$ , then

$$\operatorname{Im}\left(\frac{az + b}{cz + d}\right) = \frac{ad - bc}{|cz + d|^2} \operatorname{Im}(z).$$

$\lrcorner$

### Analytic Functions

**Def. (12.4.1.10) [Analytic Functions].** For an open subset  $\Omega \subset \mathbb{C}$ , a complex-valued function  $f$  on  $\Omega$  is called **analytic** or **holomorphic** if  $\frac{\partial}{\partial \bar{z}} f(z) = 0$  for any  $z \in \Omega$  (12.4.1.4). Equivalently,

$$\frac{\partial}{\partial x} f = -i \frac{\partial}{\partial y} f, \quad \text{i.e.} \quad \begin{cases} \frac{\partial}{\partial x} \operatorname{Re}(f) = \frac{\partial}{\partial y} \operatorname{Im}(f) \\ \frac{\partial}{\partial x} \operatorname{Im}(f) = -\frac{\partial}{\partial y} \operatorname{Re}(f) \end{cases}$$

i.e.  $f$  has the same derivative vertically and horizontally, hence in every direction.

The space of analytic functions on  $\Omega$  is denoted by  $\mathcal{O}(\Omega)$ . More generally, if  $\Omega \subset \mathbb{C}$  is any subspace,  $\mathcal{O}(\Omega) = C(\Omega) \cap \mathcal{O}(\Omega^\circ)$ .

For  $f \in \mathcal{O}(\Omega)$ , denote

$$f^\wedge(z) = \frac{\partial}{\partial z} f(z) = \frac{\partial}{\partial x} f(z) = -i \frac{\partial}{\partial y} f(z).$$

and for  $n \in \mathbb{N}$ , denote inductively

$$f^{(0)} = f, \quad f^{(1)} = f^\wedge, \quad f^{(n+1)} = (f^{(n)})^\wedge.$$

$\lrcorner$

**Lemma (12.4.1.11).** Let  $\Omega \subset \mathbb{C}$  be a region and  $f \in \mathcal{O}(\Omega)$  s.t.  $f^\wedge = 0$ , then  $f$  is a constant function.  $\lrcorner$

*Proof:* This follows from the fact any two points in  $\Omega$  can be connected by a path consisting of vertical or horizontal segments, and use the fundamental theorem of calculus (12.3.3.31).  $\square$

**Prop. (12.4.1.12) [ $\bar{\partial}$ -Equation].** Let  $\Omega \subset \mathbb{C}$  be a region and  $f \in C^k(\Omega)$ ,  $k \geq 1$ , then locally near every point, there exists a  $C^k$ -function  $g$  s.t.

$$\frac{\partial}{\partial \bar{z}} g = f.$$

And such a function is defined up to an analytic function.  $\lrcorner$

*Proof:* Taking a bump function, we may assume  $f \in C_c^k(\Omega)$ . Then define

$$g(z) = \frac{1}{2\pi i} \int_{\mathbb{C}} \frac{f(\zeta)}{\zeta - z} d\zeta \wedge d\bar{\zeta} = \frac{1}{2\pi i} \int_{\mathbb{C}} \frac{f(\zeta + z)}{\zeta} d\zeta \wedge d\bar{\zeta}.$$

This singular integration is convergent because  $h(\zeta) = \frac{1}{\zeta - z}$  is locally  $L^1$  (this follows from (12.4.1.4)). And the integration is uniformly convergent in  $z$ . Then the differentiation commutes with integration and shows  $g$  is  $C^k$ . Moreover,

$$\frac{\partial}{\partial \bar{z}} g(z) = \lim_{\varepsilon \rightarrow 0} \frac{1}{2\pi i} \int_{\mathbb{C} \setminus \mathbb{D}(0, \varepsilon)} \frac{\partial}{\partial \bar{\zeta}} f(\zeta) \frac{d\zeta \wedge d\bar{\zeta}}{\zeta - z} = \lim_{\varepsilon \rightarrow 0} \frac{1}{2\pi i} \int_{\partial \mathbb{D}(0, \varepsilon)} f(\zeta) \frac{d\zeta}{\zeta - z} = f(z)$$

by Stoke's formula and continuity.  $\square$

## 2 Complex Integration

**Lemma (12.4.2.1).** If  $f$  is analytic on a rectangle  $R$  minus f.m. points  $\zeta_i$  and if  $\lim_{z \rightarrow \zeta_i} (z - \zeta_i)f(z) = 0$ , then  $\int_{\partial R} f(z)dz = 0$ .  $\square$

*Proof:* We consider first the case that no points are omitted. Cut the rectangle  $R$  into 4 rectangles  $R^1, R^2, R^3, R^4$  that is similar to  $R$ , then

$$\int_{\partial R} f(z)dz = \sum_{i=1}^4 \int_{\partial R^i} f(z)dz.$$

Let  $|\int_{\partial R} f(z)dz| = T$ , then there exists some  $R^i$  that  $|\int_{\partial R^i} f(z)dz| \geq \frac{1}{4}T$ . Denote this  $R^i$  by  $R_1$ . Then we can do the same for  $R_1$  to find an  $R_2$  s.t.  $|\int_{\partial R_2} f(z)dz| \geq \frac{1}{4^2}T$ . Continuing this process, we find a sequence  $R_1 \supset R_2 \supset \dots \supset R_n \supset$ , and their intersection is a single point  $z_0$  as  $R$  is compact. Now as  $f$  is analytic, for any  $\varepsilon > 0$ , for  $n$  sufficiently large, for any  $z \in \partial R_n$ ,

$$\left| \frac{f(z) - f(z_0)}{z - z_0} - f'(z_0) \right| \leq \varepsilon.$$

Notice also by direct calculating that

$$\int_{\partial R_n} dz = 0, \quad \int_{\partial R_n} z dz = 0,$$

we have

$$\frac{T}{4^n} \leq \left| \int_{\partial R_n} f(z)dz \right| = \left| \int_{\partial R_n} [f(z) - f(z_0) - f'(z_0)(z - z_0)]dz \right| \leq \varepsilon \int_{\partial R_n} |z - z_0| |dz| \leq \varepsilon \frac{dL}{4^n}$$

where  $d, L$  are the length of the diagonal and the perimeter of  $R$ . So  $T \leq \varepsilon$ . As  $\varepsilon$  is arbitrary, this means  $T = 0$ .

In general, by cutting into several rectangles, it suffices to prove for the case that only one point is omitted, and in this case, we can use what we have proved and the hypothesis to reduce the rectangle to any small enough rectangle  $R_0$  around  $\zeta_1$  s.t. for any  $z \in \partial R_0$ ,

$$f(z) \leq \frac{\varepsilon}{|z - \zeta_1|}.$$

And then

$$\left| \int_{\partial R_0} f(z)dz \right| \leq \varepsilon \int_{\partial R_0} \frac{|dz|}{|z - \zeta_1|} \leq 8\varepsilon$$

by elementary estimation. As  $\varepsilon$  is arbitrary, this means  $\int_{\partial R_0} f(z)dz = 0$ .  $\square$

**Thm. (12.4.2.2) [Cauchy].** If  $\Omega \subset C$  is a simply-connected region and  $\Omega'$  is the region obtained from  $\Omega$  by omitting f.m. points  $\zeta_i$ . Suppose  $f \in \mathcal{O}(\Omega')$ , and  $\lim_{z \rightarrow \zeta_i} (z - \zeta_i)f(z) = 0$ , then  $\int_{\gamma} f(z)dz = 0$  for any closed piecewise  $C^1$  curve  $\gamma \subset \Omega'$ .

Moreover, if  $f \in \mathcal{O}(\overline{\Omega'})$ , then  $\int_{\gamma} f(z)dz = 0$  for any closed piecewise  $C^1$  curve  $\gamma \subset \overline{\Omega'} \setminus \{\zeta_1, \dots, \zeta_i\}$ .  $\square$

*Proof:* Fix a  $z_0 \in \Omega$ , then for any  $z \in \Omega$ , choose a path  $\gamma$  from  $z_0$  to  $z$  consisting of vertical or horizontal segments, and let  $F(z) = \int_{\gamma} f(z)dz$ . Then this  $F$  is well-defined: if there are two paths  $\gamma, \gamma'$ ,  $\gamma - \gamma'$  is a sum oriented boundary of rectangles, and these rectangles must be contained in  $\Omega$

because  $\Omega$  is simply-connected. Thus the above lemme(12.4.2.1) shows that  $F(z)$  is independent of the path chosen, and it is clear that  $F(z)$  has the same derivative in both directions so analytic by definition(12.4.1.10). So clearly  $\int_{\gamma} f(z)dz = F(z)\Big|_{\gamma(0)}^{\gamma(1)} = 0$ .

For the last assertion, any such a closed piecewise  $C^1$  curve  $\gamma \subset \overline{\Omega'} \setminus \{\zeta_1, \dots, \zeta_i\}$  can be uniformly approximated by a path in  $\Omega'$ .  $\square$

**Cor. (12.4.2.3) [Existence of Primitive].** If  $\Omega \subset \mathbb{C}$  is a simply connected region and  $f \in \mathcal{O}(\Omega)$ , then there exists a function  $F \in \mathcal{O}(\Omega)$  s.t.  $F' = f$ .  $\lrcorner$

*Proof:* Take  $z_0 \in \Omega$  and take  $F(z) = \int_{\gamma} f(z)dz$  for any path  $\gamma$  from  $z_0$  to  $z$ .  $F$  is well-defined by the Cauchy theorem(12.4.2.2).  $\square$

**Prop. (12.4.2.4) [Generating Analytic Functions].** If  $\varphi(\zeta)$  is continuous on an arc  $\gamma$ , then the function

$$F_n(\zeta) = \int_{\gamma} \frac{\varphi(\zeta)}{(\zeta - z)^n} d\zeta$$

is analytic on each connected component of  $\mathbb{C} \setminus \gamma$ , and its derivative is  $F'_n(z) = nF_{n+1}(z)$ .  $\lrcorner$

*Proof:* Use induction on  $n$ : for  $n = 1$ , firstly we prove  $F_1$  is continuous: for  $z_0 \notin \gamma$ , choose  $\delta > 0$  s.t.  $U(z_0, \delta) \cap \gamma = \emptyset$ , then for  $z \in U(z_0, \delta)$ ,  $d(z, \gamma) > \delta/2$ , and

$$|F_1(z) - F_1(z_0)| = |z - z_0| \left| \int_{\gamma} \frac{\varphi(\zeta)}{(\zeta - z)(\zeta - z_0)} d\zeta \right| \leq |z - z_0| \frac{2}{\delta^2} \int_{\gamma} |\varphi| |d\zeta|,$$

thus  $F_1$  is continuous. Moreover, the above argument applied to the function  $\Phi(\zeta) = \varphi(\zeta)/(\zeta - z_0)$  implies that

$$\lim_{z \rightarrow z_0} \frac{F_1(z) - F_1(z_0)}{z - z_0} = \lim_{z \rightarrow z_0} \int_{\gamma} \frac{\varphi(\zeta)}{(\zeta - z)(\zeta - z_0)} d\zeta = \lim_{z \rightarrow z_0} \int_{\gamma} \frac{\Phi(\zeta)}{(\zeta - z)} d\zeta = \int_{\gamma} \frac{\Phi(\zeta)}{(\zeta - z_0)} d\zeta = F_2(z_0),$$

hence  $F_1' = F_2$ .

For  $n > 1$ , suppose we have shown  $F_{n-1}' = (n-1)F_n$ , then with notations as above, we have

$$\begin{aligned} F_n(z) - F_n(z_0) &= \left[ \int_{\gamma} \frac{\varphi(\zeta)}{(\zeta - z)^{n-1}(\zeta - z_0)} d\zeta - \int_{\gamma} \frac{\varphi(\zeta)}{(\zeta - z_0)^n} d\zeta \right] + (z - z_0) \int_{\gamma} \frac{\varphi(\zeta)}{(\zeta - z)^n(\zeta - z_0)} d\zeta \\ &= \left[ \int_{\gamma} \frac{\Phi(\zeta)}{(\zeta - z)^{n-1}} d\zeta - \int_{\gamma} \frac{\Phi(\zeta)}{(\zeta - z_0)^{n-1}} d\zeta \right] + (z - z_0) \int_{\gamma} \frac{\Phi(\zeta)}{(\zeta - z)^n} d\zeta \end{aligned}$$

Then we see by induction hypothesis that  $\lim_{z \rightarrow z_0} F_n(z) - F_n(z_0) = 0$  and  $F_n$  is continuous for any  $\varphi$ . Moreover,

$$\begin{aligned} \lim_{z \rightarrow z_0} \frac{F_n(z) - F_n(z_0)}{(z - z_0)} &= \lim_{z \rightarrow z_0} \frac{1}{(z - z_0)} \left[ \int_{\gamma} \frac{\Phi(\zeta)}{(\zeta - z)^{n-1}} d\zeta - \int_{\gamma} \frac{\Phi(\zeta)}{(\zeta - z_0)^{n-1}} d\zeta \right] + \int_{\gamma} \frac{\Phi(\zeta)}{(\zeta - z)^n} d\zeta \\ &= n \int_{\gamma} \frac{\Phi(\zeta)}{(\zeta - z_0)^n} d\zeta + \int_{\gamma} \frac{\Phi(\zeta)}{(\zeta - z_0)^n} d\zeta \\ &= (n+1)F_{n+1}(z_0) \end{aligned}$$

$\square$

**Prop. (12.4.2.5) [Index of a Point w.r.t a Curve].** If  $\gamma$  is a piecewise  $C^1$  curve that doesn't pass a point  $a$ , then  $\frac{1}{2\pi i} \int_{\gamma} \frac{dz}{z-a}$  is an integer  $n(\gamma, a)$ , called the **index of  $a$  w.r.t  $\gamma$** , or the **winding number**.

And this index function is constant on each connected component of  $\mathbb{C} \setminus \gamma$ , and 0 on the unbounded component. In particular, if  $\gamma$  is a circle and  $a$  is contained in the interior of this circle, then  $n(\gamma, a) = 1$ .  $\lrcorner$

*Proof:* Cf. [Ahl78]P115. ?

this index function is constant on each connected component of  $\mathbb{C} \setminus \gamma$ , and 0 on the unbounded component by the continuity of the integral by (12.4.2.4).

For the last assertion, it suffices to show for  $\gamma = \partial \mathbb{D}(0, R)$  and  $a = 0$ , by what we just said. And in this case,

$$\frac{1}{2\pi i} \int_{\gamma} \frac{dz}{z-a} = \frac{1}{2\pi i} \int_0^{2\pi} \frac{iRe^{i\theta}}{Re^{i\theta}} d\theta = 1$$

$\square$

**Cor. (12.4.2.6) [Cauchy Integral Formula, Cauchy1825].** if  $\Omega \subset \mathbb{C}$  is a simply-connected region,  $f \in \mathcal{O}(\Omega)$ , then for any piecewise  $C^1$  closed curve  $\gamma \subset \Omega$  and  $a \notin \gamma$ ,

$$\frac{1}{2\pi i} \int_{\gamma} \frac{f(\xi)}{\xi-a} d\xi = n(\gamma, a)f(a) \text{ (12.4.2.5).}$$

In particular, if  $\gamma$  is the boundary of a disk  $D$  contained in  $\mathbb{C}$ , then for any  $a \in D$ ,

$$\frac{1}{2\pi i} \int_{\gamma} \frac{f(\xi)}{\xi-a} d\xi = f(a).$$

Moreover, if  $f \in \mathcal{O}(\overline{\Omega})$ , then this is true for any piecewise  $C^1$  closed curve  $\gamma \subset \Omega$  and  $a \notin \gamma$ .  $\lrcorner$

*Proof:* Consider the function  $F(z) = \frac{f(z)-f(a)}{z-a}$ , then it is analytic for  $z \neq a$ , and at  $a$  it satisfies the condition of Cauchy theorem (12.4.2.2), so  $\int_{\gamma} F(z)dz = 0$  which is  $\int_{\gamma} \frac{f(z)dz}{z-a} = f(a) \int_{\gamma} \frac{dz}{z-a}$ , and use (12.4.2.5).  $\square$

**Cor. (12.4.2.7) [Higher Derivations].** For any region  $\Omega$   $f \in \mathcal{O}(\Omega)$ , if  $a \in \Omega$  and  $\gamma$  is a small piecewise-smooth curve  $\gamma$  in  $\Omega$  centered at  $a$ ,

$$f(a) = \frac{1}{2\pi i} \int_{\gamma} \frac{f(\zeta)}{\zeta-a} d\zeta$$

by Cauchy integral theorem (12.4.2.6). So derivatives of  $f$  are all analytic, and satisfy:

$$f^{(n)}(z) = \frac{n!}{2\pi i} \int_{\gamma} \frac{f(\zeta)}{(\zeta-z)^{n+1}} d\zeta.$$

In particular,  $\mathcal{O}(\Omega) \subset C^\infty(\Omega)$ .  $\lrcorner$

**Cor. (12.4.2.8) [Morera].** If  $f$  is continuous on a region  $\Omega$  and if  $\int_{\gamma} f dz = 0$  for any piecewise closed curve  $\gamma \subset \Omega$  consisting of vertical or horizontal segments, then  $f(z) \in \mathcal{O}(\Omega)$ .  $\lrcorner$

*Proof:* There is an analytic function  $F$  that  $F' = f$ , by the same method of the proof of (12.4.2.2), so  $f$  is analytic, by (12.4.2.7).  $\square$

**Cor. (12.4.2.9) [Cauchy Estimate].** If  $f \in \mathcal{O}(\overline{\mathbb{D}(a, r)})$ , and  $|f| \leq M$  on the boundary, then  $|f^{(n)}(a)| \leq Mn!r^{-n}$  for any  $a \in \mathbb{D}$ .  $\lrcorner$

**Cor. (12.4.2.10) [Liouville].** Any bounded holomorphic function on  $\mathbb{C}$  is constant.  $\lrcorner$

*Proof:* If  $|f(z)| \leq M$ , then the Cauchy estimate (12.4.2.9) shows that  $|f'(a)| \leq Mr^{-1}$ , letting  $r$  tends to  $\infty$ , then  $f'(a) = 0$  for all  $a$ , thus  $f$  is constant.  $\square$

**Cor. (12.4.2.11) [Mean Value Property].** If  $f \in \mathcal{O}(\mathbb{D})$ , then  $|f(0)| \leq \int_{\mathbb{D}} |f(z)| dx dy$ .  $\lrcorner$

*Proof:*  $|f(0)| \leq \frac{1}{2\pi} \int f(re^{i\theta}) d\theta$ , so if multiplied by  $rdr$  and integrate, then

$$|f(0)| \leq \int \int f(re^{i\theta}) r dr d\theta = \int \int f(z) dx dy.$$

$\square$

**Prop. (12.4.2.12).** For any  $f \in \mathcal{O}(\overline{\mathbb{D}(0, R)})$ , for  $z \in \mathbb{D}(0, R)$ :

$$f(z) = \frac{1}{2\pi i} \int_{|\zeta|=R} \operatorname{Re}\left(\frac{\zeta+z}{\zeta-z}\right) f(\zeta) \frac{d\zeta}{\zeta}.$$

$\lrcorner$

*Proof:* Let  $F(\zeta) = \frac{f(\zeta)}{\zeta - R^2/\bar{z}}$ , then  $F \in \mathcal{O}(\overline{\mathbb{D}(0, R)})$ , and by Cauchy's theorem (12.4.2.2),

$$\int_{|\zeta|=R} \frac{f(\zeta)}{\zeta - R^2/\bar{z}} d\zeta = 0.$$

And by Cauchy's integral formula,

$$\frac{1}{2\pi i} \int_{|\zeta|=R} \frac{f(\zeta)}{\zeta - z} d\zeta = f(z).$$

so

$$f(z) = \frac{1}{2\pi i} \int_{|\zeta|=R} \left[ \frac{f(\zeta)}{\zeta - z} - \frac{f(\zeta)}{\zeta - R^2/\bar{z}} \right] d\zeta = \frac{1}{2\pi i} \int_{|\zeta|=R} \left[ \frac{\zeta}{\zeta - z} + \frac{\bar{z}}{\zeta - \bar{z}} \right] f(\zeta) \frac{d\zeta}{\zeta} = \frac{1}{2\pi i} \int_{|\zeta|=R} \operatorname{Re}\left(\frac{\zeta+z}{\zeta-z}\right) f(\zeta) \frac{d\zeta}{\zeta}$$

$\square$

**Prop. (12.4.2.13) [Invariance of Winding Numbers].** Let  $S$  be a smooth Jordan curve in  $\mathbb{C}$ , and let  $(C_s)_{s \in S}$  be a smoothly varying family of smooth Jordan curves (i.e. there exists a diffeomorphism  $J : S \times \partial\mathbb{D}(0, 1) \cong \{(s, z) : s \in S, z \in C_s\}$ ), with  $D_s = \operatorname{int} C_s$ . Let  $a, b, f : S \rightarrow \mathbb{C}$  be smooth functions s.t.  $a(s), b(s) \in D_s$ , and  $f(s) \in C_s$ , then

$$\int_S \frac{1}{f(s) - a(s)} ds = \int_S \frac{1}{f(s) - b(s)} ds$$

$\lrcorner$

*Proof:* The use of the smoothly varying property is that: by isotopy extension theorem (16.1.7.3), we can extend  $J$  to a diffeomorphism

$$J : S \times \overline{\mathbb{D}(0, 1)} \cong \{(s, z) : s \in S, z \in \overline{D_s}\},$$

so we can define a homotopy from  $a(s)$  to  $b(s)$  via

$$e_t(s) = J_s((1-t)J_s^{-1}(a(s)) + tJ_s^{-1}(b(s))).$$

$\square$

### Constructing Analytic Functions

**Prop. (12.4.2.14) [Holomorphic Function Defined by Integrations].** Let  $(X, \mathcal{M}, \mu)$  be a  $\sigma$ -finite measure space and  $\Omega \subset \mathbb{C}$  be a region. For any  $F \in L^1(\Omega \times X)$ , if

- $F(z, x)$  is analytic in  $z$  for any  $x \in X$ .
- $z \mapsto \int_X |F(z, x)| dx$  is uniformly convergent on compact subsets.

then  $f(z) = \int_X F(z, x) dx$  is an analytic function on  $\Omega$ .

In particular, item2 holds if  $F \in C(\Omega \times X)$  and  $X$  is compact.  $\lrcorner$

*Proof:* This follows from Morera's theorem(12.4.2.8) and Fubini-Tonelli theorem(12.3.2.9).  $\square$

**Cor. (12.4.2.15) [Weierstrass].** If  $(f_n)_{n \in \mathbb{Z}_+}$  is a sequence of holomorphic functions on  $\Omega$  that converges uniformly to  $f^\wedge$  on every compact subset, then  $f$  is holomorphic on  $\Omega$ . And for any  $k \in \mathbb{N}$ ,  $(f_n^{(k)})_{n \in \mathbb{Z}_+}$  converges uniformly on  $f^\wedge$  on every compact subset.  $\lrcorner$

*Proof:* For the last assertion, use Cauchy's integral formula(12.4.2.6).  $\square$

### Local Properties of Analytic Functions

**Prop. (12.4.2.16) [Taylor Expansions].** Let  $\Omega \subset \mathbb{C}$  be a region and  $f \in \mathcal{O}(\Omega)$ , then if  $D \subset \Omega$  be a closed disk with center  $z_0$ , then for any  $z \in D$ ,

$$f(z) = \sum_{n \in \mathbb{N}} \frac{f^{(n)}(z_0)}{n!} (z - z_0)^n.$$

$\lrcorner$

*Proof:* By Cauchy's integral formula(12.4.2.6), if  $C$  is the boundary of  $D$ , then

$$f(z) = \frac{1}{2\pi i} \int_C \frac{f(\xi)}{\xi - z} d\xi$$

But

$$\frac{1}{\xi - z} = \frac{1}{\xi - z_0} \frac{1}{1 - \left(\frac{\xi - z}{\xi - z_0}\right)} = \sum_{n \in \mathbb{N}} \frac{(\xi - z)^n}{(\xi - z_0)^{n+1}}$$

and the convergence is uniform on  $C$ , so by(12.4.2.7),

$$f(z) = \int_C \left( \frac{1}{2\pi i} \int_C \frac{f(\xi)}{(\xi - z_0)^{n+1}} \right) (\xi - z)^n = \sum_{n \in \mathbb{N}} \frac{f^{(n)}(z_0)}{n!} (z - z_0)^n.$$

$\square$

**Cor. (12.4.2.17).** For any region  $\Omega \subset \mathbb{C}$  and  $f \in \mathcal{O}(\Omega)$ . If  $z_0 \in \Omega$  and  $f^{(n)}(z_0) = 0$  for any  $n \in \mathbb{N}$ , then  $f = 0 \in \mathcal{O}(\Omega)$ .  $\lrcorner$

*Proof:* The subset  $E = \{z_0 \in \Omega | f^{(n)}(z_0) = 0, \forall n \in \mathbb{N}\}$  is an open subset by the Taylor expansion(12.4.2.16), and the complement is also an open subset as all the derivatives are continuous. So  $E = \Omega$ , and  $\Omega$  is connected.  $\square$

**Prop. (12.4.2.18) [Removable Singularities].** Let  $\Omega \subset \mathbb{C}$  and  $\Omega'$  is the region obtained from  $\Omega$  by omitting f.m. points  $\zeta_i$ ,  $f \in \mathcal{O}(\Omega')$ , then  $f$  can be extended to an analytic function  $f \in \mathcal{O}(\Omega)$  iff  $\lim_{z \rightarrow \zeta_i} (z - \zeta_i) f(z) = 0$  for each  $i$ .  $\lrcorner$

*Proof:* The necessary is clear. For the other direction, choose for each  $\zeta_i$  a disk  $D(\zeta_i, \delta)$  contained in  $\Omega$  with boundary  $\gamma$ , then for any  $z_0 \in D(\zeta_i, \delta)$ , by Cauchy theorem(12.4.2.2) applied to the analytic function  $F(z) = \frac{f(z)-f(z_0)}{z-z_0}$  on  $D(z_0, \delta) \setminus \{z_0, \zeta_i\}$ , we see

$$\int_{\gamma} \frac{f(\xi)}{\xi - z_0} d\xi = \int_{\gamma} \frac{f(z_0)}{\xi - z_0} = f(z_0) \quad (12.4.2.5).$$

But by(12.4.2.4),  $z \mapsto \int_{\gamma} \frac{f(\xi)}{\xi - z} d\xi$  is a holomorphic function on  $D(\zeta_i, \delta)$ , and it extends  $f(z_0)$ . So  $f$  can be extended to an analytic function  $f \in \mathcal{O}(\Omega)$ .  $\square$

**Def. (12.4.2.19)[Orders of Vanishing].** For any region  $\Omega \subset \mathbb{C}$  and  $f \neq 0 \in \mathcal{O}(\Omega)$ , then for any  $z_0 \in \Omega$ , there exists a smallest  $n \in \mathbb{N}$  s.t.  $f^{(n)}(z_0) \neq 0$  by(12.4.2.17). So by repeatedly using(12.4.2.18) on  $\frac{f(z)}{z-z_0}$ , we get

$$f(z) = (z - z_0)^n f_n(z)$$

on a nbhd of  $z_0$ , where  $f_n \in \mathcal{O}(\Omega')$  and  $f_n(z_0) \neq 0$  for some nbhd  $\Omega'$  of  $z_0 \in \Omega$ . Such an  $n$  is called the **order of vanishing** of  $f$  at  $z_0$ .

In particular, if  $n > 0$ ,  $f_n(z) \neq 0$  on a nbhd of  $z_0$ , so  $f(z) \neq 0$  on nbhd of  $z_0$ , thus the vanishing point of  $f$  is isolated in  $\Omega$ .  $\lrcorner$

**Cor. (12.4.2.20)[Uniqueness].** If the zeros of a holomorphic function  $f$  has a convergent point in the domain of definition, then  $f = 0$ . In particular, if  $f, g \in \mathcal{O}(\Omega)$  satisfies  $f(z) = g(z)$  for any  $z \in E$ , where  $E \subset \Omega$  is a subset with convergence points in  $\Omega$ , then  $f = g \in \mathcal{O}(\Omega)$ .  $\lrcorner$

**Prop. (12.4.2.21)[Singularities].** If  $\Omega \subset \mathbb{C}$  is region and  $\Omega'$  is the region obtained from  $\Omega \setminus E$  where  $E = \{\zeta_1, \dots, \zeta_n, \dots\} \subset \Omega$  is a discrete subset. Suppose  $f \in \mathcal{O}(\Omega')$ , then  $f$  is said to have a **singularity** at  $\zeta_i$ . For each  $i$ , let  $\zeta = \zeta_i$ , the following are all the cases:

- $\lim_{z \rightarrow \zeta} |z - \zeta|^\alpha |f(z)| = 0$  for any  $\alpha \in \mathbb{R}$ . In this case,  $f = 0 \in \mathcal{O}(\Omega)$ .
- there exists  $h \in \mathbb{R}$  s.t.  $\lim_{z \rightarrow \zeta} |z - \zeta|^\alpha |f(z)| = \begin{cases} 0 & , \alpha < h \\ \infty & , \alpha > h \end{cases}$ . In this case,  $h \in \mathbb{Z}$ , and  $z_0$  is called a **zero** of  $f$  if  $h > 0$  and **pole** of  $f$  if  $h < 0$ . And if  $h = 0$ , it is called a **removable singularity**, which is discussed in(12.4.2.18).
- Neither of the above holds. In this case,  $z_0$  is called a **essential singularity** of  $f$ .  $\lrcorner$

*Proof:* In case 1,  $f$  can be extended to a function on  $\Omega' \cup \{\zeta\}$  with  $f(\zeta) = 0$  by(12.4.2.18), and at this point, all the derivatives of  $f$  vanish by(12.4.2.19), so  $f = 0 \in \mathcal{O}(\Omega)$  by(12.4.2.20).

In case 2,  $|z - \zeta|^m |f(z)| = 0$  for some  $m \in \mathbb{Z}$  larger than  $h$ , so  $(z - \zeta)^m f(z)$  can be extended to a function on  $\Omega' \cup \{\zeta\}$ . As  $f$  is not identically zero,  $(z - \zeta)^m f(z)$  has a finite order of vanishing at  $\zeta$ , so  $(z - \zeta)^m f(z) = (z - \zeta)^k f_k(z)$  for some  $k \in \mathbb{Z}$ , and  $f_k$  is analytic on a nbhd of  $\zeta$ , by(12.4.2.19). Thus  $f(z) = (z - \zeta)^{k-m} f_k(z)$ , and clearly  $h$  is an integer.  $\square$

**Def. (12.4.2.22)[Meromorphic Functions].** Situation as in(12.4.2.21), if all the singularities of  $f$  on  $\Omega$  are zeros or poles,  $f$  is called a **meromorphic function** on  $\Omega$ . Notice the poles and zeros of  $f$  are discrete. The space of meromorphic functions on  $\Omega$  is denoted by  $\mathcal{M}(\Omega)$ .  $\lrcorner$

**Prop. (12.4.2.23).**  $\mathcal{M}(\Omega) \in \text{Field}$ , and for any  $f \in \mathcal{M}(\Omega)^\times$  and  $z_0 \in \Omega$ , either  $f(z_0) \neq 0$ , or  $f(z) = (z - z_0)^{n_{z_0}} g(z)$  for some  $n_{z_0} \in \mathbb{Z}$  and  $g(z) \in \mathcal{M}(\Omega)$  s.t.  $g(z_0) \neq 0$ .  $\lrcorner$

*Proof:* This follows from (12.4.2.21) and (12.4.2.18).  $\square$

**Prop. (12.4.2.24) [Maximum Principle].** Let  $f(z)$  be analytic and non-constant on a region  $\Omega$ , then its absolute value attains no minimum or maximum on  $\Omega$ .  $\lrcorner$

*Proof:* This follows easily from Cauchy's integral formula (12.4.2.6). Notice if it attains an extremal at  $z_0 \in \Omega$ , then the Cauchy integral implies that  $f$  is constant on a small circle surrounding  $z_0$ , so it is constant by uniqueness theorem (12.4.2.20).  $\square$

**Prop. (12.4.2.25) [Analytic Functions on Annulus].** If  $0 \leq r < R \leq \infty$  and  $f$  is holomorphic on  $\{z \in \mathbb{C} | r \leq |z| \leq R\}$ , show that  $f$  has a series expansion

$$f = \sum_{n \in \mathbb{Z}} a_n z^n$$

$\lrcorner$

*Proof:* For  $\zeta \in C_R$ ,

$$\frac{1}{\zeta - z} = \frac{1}{\zeta} \cdot \frac{1}{1 - \frac{z}{\zeta}} = \sum_{n \in \mathbb{N}} \frac{z^n}{\zeta^{n+1}},$$

and the convergence is uniform on  $C_R$ , so

$$\frac{1}{2\pi i} \int_{C_R} \frac{f(\zeta)}{\zeta - z} d\zeta = \sum_{n \in \mathbb{N}} \underbrace{\left( \frac{1}{2\pi i} \int_{C_R} \frac{f(\zeta)}{\zeta^{n+1}} d\zeta \right)}_{a_n} z^n.$$

Similarly, for  $\zeta \in C_r$ ,

$$\frac{1}{\zeta - z} = \frac{1}{z} \cdot \frac{1}{1 - \frac{\zeta}{z}} = \sum_{n \in \mathbb{N}} \frac{\zeta^n}{z^{n+1}},$$

and the convergence is uniform on  $C_r$ , so

$$\frac{1}{2\pi i} \int_{C_r} \frac{f(\zeta)}{\zeta - z} d\zeta = \sum_{n \in \mathbb{Z}^+} \underbrace{\left( \frac{1}{2\pi i} \int_{C_r} f(\zeta) \zeta^{n-1} d\zeta \right)}_{a_{-n}} z^{-n}.$$

Thus it follows from the Cauchy integral formula (12.4.2.6) that

$$f(z) = \frac{1}{2\pi i} \int_{C_R} \frac{f(\zeta)}{\zeta - z} d\zeta - \frac{1}{2\pi i} \int_{C_r} \frac{f(\zeta)}{\zeta - z} d\zeta = \sum_{n \in \mathbb{Z}} a_n z^n,$$

and the convergence is uniform on the annulus.  $\square$

## Residues

**Def. (12.4.2.26) [Residues].** If  $\Omega \subset \mathbb{C}$  is a simply-connected region and  $f$  is a function on  $\Omega$  analytic except for isolated singularities  $\{a_j\}$ , then for each  $i$ , if  $\mathbb{D}(a_i, \delta)$  is a nbhd of  $a_i$  contained in  $\Omega$  and contains no other singularities of  $f$ , then define

$$\text{res}_{z=a_i} f = \frac{1}{2\pi i} \int_{\gamma} f(z) dz,$$

where  $\gamma = \partial \mathbb{D}(a_i, \delta)$ . This quantity is invariant of the nbhd chosen by Cauchy's theorem (12.4.2.2), and is called the **residue** of  $f$  at  $a_i$ .  $\lrcorner$

**Thm. (12.4.2.27) [Residue theorem].** If  $\Omega \subset \mathbb{C}$  is a simply-connected region and  $f$  is a function on  $\Omega$  analytic except for isolated singularities  $\{a_j\}$ , then for any piecewise  $C^1$  closed curve  $\gamma \subset \Omega$  not passing through the singularities,

$$\frac{1}{2\pi i} \int_{\gamma} f(z) dz = \sum_i n(\gamma, a_i) \operatorname{res}_{z=a_i} f,$$

where the RHS is a finite sum. ┘

*Proof:* This is because the interior of  $\gamma$  contains only f.m. singularity points, and  $\gamma$  is homologous to a linear combination of cycles around each singularity with multiplicity  $n(\gamma, a_i)$ . □

**Prop. (12.4.2.28).** For  $n \in \mathbb{Z}$ ,

$$\operatorname{res}_{z=0} z^n = \begin{cases} 1 & , n = -1 \\ 0 & , n \neq -1 \end{cases}.$$

In particular, if locally near  $z = 0$ ,  $f(z) = \sum_{n \in \mathbb{Z}} a_n z^n$ , then

$$\operatorname{res}_{z=0} f(z) = a_{-1}.$$

┘

*Proof:*

$$\begin{aligned} \int_{|z|=r} z^n dz &= \int_0^{2\pi} z^n(t) z'(t) dt = \int_0^{2\pi} i r^{n+1} e^{i(n+1)t} dt \\ &= \begin{cases} \frac{r^{n+1}}{n+1} e^{i(n+1)t} \Big|_{t=0}^{2\pi} = 0 & , n \neq -1 \\ 2\pi i & , n = -1 \end{cases} \end{aligned}$$

□

**Prop. (12.4.2.29).** If  $\Omega \subset \mathbb{C}$  is a region and  $f$  is a function on  $\Omega$  analytic with singularities. If  $f$  is analytic around  $z_0 \in \Omega$ , then for  $n \in \mathbb{Z}_+$ , by (12.4.2.7),

$$\operatorname{res}_{z=z_0} \frac{f(z)}{(z-z_0)^n} = \frac{f^{(n-1)}(z_0)}{(n-1)!}.$$

┘

**Prop. (12.4.2.30) [Generalized Argument Principle].** If  $\Omega \subset \mathbb{C}$  is a simply-connected region and  $f \in \mathcal{M}(\Omega)$  with zeros  $\{a_i\}$  and poles  $\{b_i\}$ , and  $g(z) \in \mathcal{O}(\Omega)$ , then for any piecewise  $C^1$  closed curve  $\gamma \subset \Omega$  not passing through zeros or poles of  $f$ ,

$$\frac{1}{2\pi i} \int_{\gamma} g(z) \frac{f'(z)}{f(z)} dz = \sum_i n(\gamma, a_i) g(a_i) - \sum_j n(\gamma, b_j) g(b_j)$$

where the RHS is a finite sum, and counted with multiplicity by the order.

Moreover, notice if  $\Gamma$  is the closed curve  $f \circ \gamma$ , then

$$\frac{1}{2\pi i} \int_{\gamma} \frac{f'(z)}{f(z)} dz = \frac{1}{2\pi i} \int_{\Gamma} \frac{1}{z} dz = n(\Gamma, 0).$$

┘

*Proof:* Notice if  $z_0 \in \Omega$  and  $f(z) = (z - z_0)^h f_h(z)$  near  $z_0$  where  $h \in \mathbb{Z}$ ,  $f_h(z)$  is analytic on a nbhd of  $z_0$  and  $f_h(z_0) = 0$ , then

$$g(z) \frac{f'(z)}{f(z)} = \frac{hg(z)}{z - z_0} + f'_h(z)g(z),$$

so  $\text{res}_{z=z_0} [g(z) \frac{f'(z)}{f(z)}] = hg(z_0)$  by (12.4.2.29) and (12.4.2.5). Thus the assertion follows from the residue formula (12.4.2.27) applied to the meromorphic function  $F = gf'/f \in \mathcal{M}(\Omega)$ .  $\square$

**Cor. (12.4.2.31) [Rouché].** If  $\Omega \subset \mathbb{C}$  is a region and  $\gamma \subset \Omega$  is a piecewise  $C^1$  closed curve that is a boundary of a subset of  $\Omega$  homeomorphic to a  $\mathbb{D}$ . Suppose  $f, g \in \mathcal{O}(\Omega)$  satisfies  $|f(z) - g(z)| < |f(z)|$  for  $z \in \gamma$ , then  $f(z)$  and  $g(z)$  have the same number of zeros or poles on the interior of  $\gamma$ .  $\lrcorner$

*Proof:* This follows from the argument principle (12.4.2.30) applied to the meromorphic function  $F = f/g \in \mathcal{M}(\Omega)$ . Notice that  $n(\gamma, a) = 1$  for any  $a$  in the interior of  $\gamma$ , and  $n(F \circ \gamma, 0) = 0$  because

$$|F(z) - 1| < 1$$

For  $z \in \gamma$  by hypothesis.  $\square$

### Logarithm

**Def. (12.4.2.32) [Branch of Logarithm].** Let  $\Omega \subset \mathbb{C}^\times$  be a region, a branch of **logarithm** is an analytic function  $\ell(z) \in \mathcal{O}(\Omega)$  s.t.  $e^{\ell(z)} = z$  (12.4.3.6).

By connectedness, If no confusion is made, we will denote any branch of logarithm by  $\log(z)$ .  $\lrcorner$

**Prop. (12.4.2.33).** If  $\Omega \subset \mathbb{C}$  is a simply-connected region, and  $f \in \mathcal{O}(\Omega)$  is non-vanishing, then there exists some  $g \in \mathcal{O}(\Omega)$  s.t.  $f(z) = e^{g(z)}$ .  $\lrcorner$

*Proof:* By (12.4.2.3), there exists  $\ell \in \mathcal{O}(\Omega)$  s.t.  $g' = \frac{f'}{f}$  and we can assume  $e^{g(z_0)} = f(z_0)$  for some  $z_0 \in \Omega$  because  $\exp : \mathbb{C} \rightarrow \mathbb{C}^\times$  is clearly surjective. Then notice  $[f(z) \exp(-g(z))]' = \exp(-g(z))(f'(z) - f(z)g'(z)) = 0$ , so  $f(z) \exp(-g(z)) = 0$ .  $\square$

**Cor. (12.4.2.34) [Existence of Logarithm].** If  $\Omega \subset \mathbb{C}^\times$  be simply-connected region, then there exists a branch of logarithm on  $\Omega$ , and also a branch of  $\sqrt[n]{f}$  on  $\Omega$ .  $\lrcorner$

## 3 Series and Product Developments

*“The letter e may now no longer be used to denote anything other than this positive universal constant.”*

—E. Landau

**Prop. (12.4.3.1) [Abel-Hadamard].** For any power series  $a_0 + a_1z + \dots + a_nz^n + \dots \in \mathbb{C}[[z]]$ , take  $1/R = \overline{\lim} |a_n|^{1/n}$ , where we assume  $1/0 = \infty$  and  $1/\infty = 0$ , then

- The series converges absolutely for every  $|z| < R$ , and if  $\rho < R$ , then the convergence is uniform for  $|z| \leq \rho$ .
- If  $|z| > R$ , the terms are unbounded, and the series diverges.

And  $R$  is called the **radius of convergence** of the sequence. Notice the radius of convergence is the same as that of  $|a_0| + |a_1|z + \dots + |a_n|z^n + \dots$  in  $\mathbb{R}$  (12.3.5.3).  $\lrcorner$

*Proof:* 1: For  $0 < \rho < R$ , take  $\rho_1 \in (\rho, R)$ , then the definition of  $R$  implies that for some  $N \in \mathbb{Z}_+$  and any  $n \geq N$ ,  $|a_n| \leq R^{-n} < \rho_1^{-n}$ , so  $|a_n z^n| \leq (\rho/\rho_1)^n$ , so  $\sum_{n \in \mathbb{N}} a_n z^n$  converges absolutely and uniformly for  $|z| \leq \rho$ .

2: For  $R < |z|$ , the definition of  $R$  implies that for any  $N \in \mathbb{Z}_+$ , there exists  $n \geq N$  s.t.  $|a_n| \geq R^{-n}$ , so  $|a_n z^n| \geq |z/R|^n > 1$ , so this sequence cannot be convergent.  $\square$

**Cor. (12.4.3.2).** By (12.3.5.4) and (12.4.3.1), for any power series  $a_0 + a_1 x + \dots + a_n x^n + \dots$  in  $\mathbb{R}$ , if  $\lim_{n \rightarrow \infty} \frac{|a_{n+1}|}{|a_n|} = \rho \in [0, \infty]$ , then the radius of convergence (12.4.3.1)  $R = 1/\rho$ , where we assume  $1/0 = \infty$  and  $1/\infty = 0$ .  $\lrcorner$

**Prop. (12.4.3.3).** The power series  $a_0 + a_1 z + \dots + a_n z^n + \dots$  defines an analytic function  $f(z)$  on its disk of convergence. And also

$$f'(z) = \sum_{n \in \mathbb{N}} n a_n z^{n-1}.$$

In particular,  $f(z)$  is infinite differentiable in its disk of convergence.  $\lrcorner$

*Proof:* The partial sum converges to  $f$  uniformly on compact subset of the disk of convergence (12.4.3.1), so this follows from (12.4.2.15).  $\square$

**Prop. (12.4.3.4).** Any holomorphic function  $f$  defined on the punctured disk  $0 < |z| < 1$  is of the form

$$f(z) = \sum_{n \in \mathbb{Z}} a_n z^n$$

where  $\overline{\lim}_{n \rightarrow \infty} |a_n|^{1/n} \leq 1$ , and  $\lim_{n \rightarrow \infty} |a_{-n}|^{1/n} = 0$ .  $\lrcorner$

*Proof:*

$\square$

**Prop. (12.4.3.5).** If  $f \in C((0, 1])$  has an expansion

$$f(x) = \sum_{\nu \in \Sigma} a(\nu) x^\nu$$

near  $x = 0$ , where  $\Sigma \subset \mathbb{R}$  is a discrete subset bounded from below, then

$$\int_0^1 f(x) x^s \frac{dx}{x}$$

has meromorphic continuation to all  $s \in \mathbb{C}$ , and has only simple poles at  $s \in -\Sigma$ , and the residue at  $s = -\nu$  is  $a(\nu)$ . Moreover, for any  $N \in \mathbb{R}$ ,  $f$  is essentially bounded on  $\text{Re}(s) > -N$ .  $\lrcorner$

*Proof:* For any  $N \in \mathbb{R}$ , let

$$f(x) = \sum_{\nu \in \Sigma, \nu < N} a(\nu) x^\nu + R(x), \quad R(x) = O(x^N),$$

then

$$\int_0^1 f(x) x^s \frac{dx}{x} = \sum_{\nu \in \Sigma, \nu < N} \frac{a(\nu)}{s + \nu} + \int_0^1 R(x) x^s \frac{dx}{x}.$$

$\square$

**Prop. (12.4.3.6) [Trigonometric Functions].** The exponential function

$$\exp(z) = \sum_{n \in \mathbb{N}} \frac{z^n}{n!} \quad (10.7.1.5)$$

is convergent and analytic on  $\mathbb{C}$ , by (12.4.3.1), and it is also denoted by  $e^z$ . We can also define the **trigonometric functions**

$$\cos(z) = \frac{e^{iz} + e^{-iz}}{2} = \sum_{n \in \mathbb{N}} (-1)^n \frac{z^{2n}}{(2n)!}, \quad \sin(z) = \frac{e^{iz} - e^{-iz}}{2i} = \sum_{n \in \mathbb{N}} (-1)^n \frac{z^{2n+1}}{(2n+1)!},$$

which are analytic on  $\mathbb{C}$ . ┘

**Prop. (12.4.3.7) [Eulerian Identity].** The smallest positive real number  $\rho$  that  $e^{i\rho} + 1 = 0$  is  $\pi$ . In particular, the Eulerian identity  $e^{i\pi} + 1 = 0$  holds. ┘

*Proof:* □

**Prop. (12.4.3.8) [Infinite Products].** For a sequence  $(b_n) \in \mathbb{C} \setminus \{-1\}$ , the infinite product  $\prod_{n \in \mathbb{Z}_+} (1 + b_n)$  is said to **converge** if the sequence

$$\Pi_m = \prod_{n=1}^m (1 + b_n)$$

converges. It is said to **converge absolutely** if  $\prod_{n \in \mathbb{Z}_+} \log(1 + b_n)$  converges absolutely. Then:

- If  $\prod_{n \in \mathbb{Z}_+} (1 + b_n)$  converges absolutely, then  $\prod_{n \in \mathbb{Z}_+} (1 + b_n)$  converges to a non-zero limit.
- $\prod_{n \in \mathbb{Z}_+} (1 + b_n)$  converges absolutely iff  $\sum_{n \in \mathbb{Z}_+} b_n$  converges absolutely.
- If  $(a_n) \in \mathbb{C}$  and  $\sum_{n \in \mathbb{Z}_+} a_n$  converges absolutely, then  $\prod_{n \in \mathbb{Z}_+} (1 + a_n) = 0$  iff  $a_k = -1$  for some  $k$ . ┘

*Proof:* 1:  $\prod_{n \in \mathbb{Z}_+} (1 + b_n) = \exp(\sum_n \log(1 + b_n))$ .

2: It follows from the fact  $\lim_{z \rightarrow 0} \frac{\log(1+z)}{z} = 1$  that there exists a  $0 < \varepsilon < 1/2$  that

$$(1 - \varepsilon)|a_n| < |\log(1 + a_n)| \leq (1 + \varepsilon)|a_n|$$

for  $n$  sufficiently large.

3: By omitting f.m. terms, this follows from item2. □

**Prop. (12.4.3.9).** If  $(F_n)$  is a sequence of holomorphic functions on a region  $\Omega$ , and there exists constants  $c_n > 0$  s.t.

$$\sum c_n < \infty, |F_n(z) - 1| \leq c_n, \forall z \in \Omega,$$

then

- The product  $\prod_n F_n(z)$  converges uniformly on  $\Omega$  to a holomorphic function  $F(z)$ .
- If  $F_n \neq 0$  for any  $n$ , then

$$\frac{F'(z)}{F(z)} = \sum_n \frac{F'_n(z)}{F_n(z)}.$$

- If  $F_n \neq 0$  for any  $n$ , then the zeros of  $F(z)$  are exactly zeros of  $F_n(z)$  (counting multiplicity).

┘

*Proof:* 1: The proof is the same as that of(12.4.3.8), and notice that the convergence is uniform so the resulting function is holomorphic.

2: we can omit f.m. terms, so we may assume that each  $F_n$  is non-vanishing. Let  $G_N(z) = \prod_{k=1}^N F_n(z)$ , then  $G_N(z) \rightarrow F(z)$  uniformly on compact subsets. So by(12.4.2.15),  $G_N^\lambda$  converges to  $F^\lambda(N)$  uniformly on compact subset, and

$$\frac{F^\lambda(z)}{F(z)} = \lim_{N \rightarrow \infty} \frac{G_N^\lambda(z)}{G_N(z)} = \sum_n \frac{F_n^\lambda(z)}{F_n(z)}.$$

3: This is because we can omit f.m. terms and assume that each  $F_n$  is non-vanishing. Then the resulting □

### Partial Fractions

**Def. (12.4.3.10).** ┘

**Prop. (12.4.3.11).**

$$\pi \cot(\pi z) = \frac{1}{z} + \sum_{n \neq 0 \in \mathbb{Z}} \left( \frac{1}{z-n} + \frac{1}{n} \right) = \frac{1}{z} + \sum_{n \in \mathbb{Z}_+} \frac{2z}{z^2 - n^2} = \frac{1}{z} - 2 \sum_{k \in \mathbb{Z}_+} \zeta(2k) z^{2k-1}.$$

┘

*Proof:* This follows from taking logarithmic derivative of the Hadamard product of  $\sin(\pi z)$ (12.4.3.24). □

**Cor. (12.4.3.12).**

$$\frac{\pi}{\sin(\pi z)} = \frac{1}{z} + \sum_{n \in \mathbb{Z}_+} (-1)^n \left( \frac{1}{z-n} + \frac{1}{z+n} \right).$$

┘

*Proof:* Use the formula  $\frac{1}{\sin(2z)} = \cot(z) - \cot(2z)$ . □

**Cor. (12.4.3.13).**

$$\frac{\pi^2}{\sin^2(\pi z)} = \sum_{n \in \mathbb{Z}} \frac{1}{(z-n)^2}.$$

┘

*Proof:* This follows from taking derivative of(12.4.3.11). □

### Entire Functions

**Thm. (12.4.3.14) [Product Development, Weierstrass].**

- If  $f$  is an entire function, then the zeros of  $f$  is at most countable(counting multiplicity), and if they can be ordered by their modules,  $|a_1| \leq |a_2| \leq \dots \leq |a_n| \leq \dots$  with  $\lim_{n \rightarrow \infty} |a_n| = \infty$ .

- If  $S \subset \mathbb{Z}_+$ , and  $(a_n)_{n \in S} \subset \mathbb{C}$  be a sequence of complex numbers, which satisfies  $\lim_{n \rightarrow \infty} a_n = \infty$  when  $\#S = \infty$ , then every entire function with  $(a_n)$  as zeros(counting multiplicity) can be written in the form

$$f(z) = z^m e^{g(z)} \prod_{n \in S} \left[ \left(1 - \frac{z}{a_n}\right) \exp\left(\frac{z}{a_n} + \frac{1}{2}\left(\frac{z}{a_n}\right)^2 + \dots + \frac{1}{m_n}\left(\frac{z}{a_n}\right)^{m_n}\right) \right]$$

for some sequence  $(m_n)_{n \in S}$  of positive integers. ┘

*Proof:* Firstly, for any such sequence, the RHS converges to an entire function: for any  $z \in \mathbb{C}$ , we can discard f.m. terms s.t.  $|a_n| \leq |z|$ , and for  $|a_n| > |z|$ ,

$$\left(1 - \frac{z}{a_n}\right) \exp\left(\frac{z}{a_n} + \frac{1}{2}\left(\frac{z}{a_n}\right)^2 + \dots + \frac{1}{m_n}\left(\frac{z}{a_n}\right)^{m_n}\right) = \exp\left(-\frac{1}{m_n+1}\left(\frac{z}{a_n}\right)^{m_n+1} - \frac{1}{m_n+2}\left(\frac{z}{a_n}\right)^{m_n+2} - \dots\right)$$

and the module of the exponent is bounded by

$$\frac{1}{m_n+1} \left(\frac{|z|}{|a_n|}\right)^{m_n+1} \left(1 - \frac{|z|}{|a_n|}\right)^{-1}$$

So if we choose  $m_n = n$ , the RHS converges in a nbhd of  $z$ , and it is entire.

Then any such function with the desired zeros differ by the RHS by an entire non-vanishing function, which must be of the form  $\exp(g(z))$  by (12.4.2.34). □

**Cor. (12.4.3.15).** Any entire function on  $\mathbb{C}$  is a quotient of two meromorphic functions. ┘

**Cor. (12.4.3.16).** If  $S \subset \mathbb{Z}_+$ , and  $(a_n)_{n \in S}, (A_n)_{n \in S} \subset \mathbb{C}$  be two sequence of complex numbers s.t.  $a_m \neq a_n$  for  $m \neq n$ , which satisfies  $\lim_{n \rightarrow \infty} a_n = \infty$  when  $\#S = \infty$ , then there exists an entire function  $f(z)$  which satisfies  $f(a_n) = A_n$ . ┘

*Proof:* Let  $g(z)$  be an entire function satisfying  $g(z)$  has simple zeros at  $a_n$ , then consider

$$f(z) = \sum_{n \in S} g(z) \frac{e^{\gamma_n(z-a_n)} A_n}{z - a_n g'(a_n)}.$$

□

**Def. (12.4.3.17) [Genus of Entire Functions and Canonical Products].** The **genus of an entire function**  $f$  is the smallest  $h \in \mathbb{N}$  s.t.  $f$  can be written in the form

$$f(z) = z^m e^{g(z)} \prod_{n \in S} \left[ \left(1 - \frac{z}{a_n}\right) \exp\left(\frac{z}{a_n} + \frac{1}{2}\left(\frac{z}{a_n}\right)^2 + \dots + \frac{1}{h}\left(\frac{z}{a_n}\right)^h\right) \right]$$

where  $S \subset \mathbb{N}, m \in \mathbb{N}, g(z)$  is a polynomial of degree  $\leq h$ . if no such  $h$  exists,  $f$  is said to have genus  $\infty$ .

In view of the Weierstrass theorem (12.4.3.14), this  $h$  is equal to the minimal non-negative integer s.t.

$$\sum_{n \in \mathbb{Z}_+} |a_n|^{-h-1} < \infty.$$

If  $f$  has finite genus, then the canonical form of  $f$  is unique. ┘

**Def. (12.4.3.18) [Order of Growth].** The **order of growth** of an entire function  $f$  is defined to be

$$\lambda = \overline{\lim}_{r \rightarrow \infty} \frac{\log \log \max_{|z|=r} |f(z)|}{\log r},$$

or equivalently the smallest number  $\lambda \in \mathbb{R} \cup \{\infty\}$  s.t.

$$\max_{|z|=r} |f(z)| \leq e^{r^{\lambda+\varepsilon}}$$

for any  $\varepsilon > 0$ .

More generally,  $f \in \mathcal{M}(\mathbb{C})$  is said to have order of growth  $\leq \lambda$  iff it can be written as a quotient  $f = g/h$  where  $g, h \in \mathcal{O}(\mathbb{C})$  both have order of growth  $\leq \lambda$ .  $\lrcorner$

**Lemma (12.4.3.19) [Order of Growth and Roots].** Let  $f$  be an entire function with order of growth  $\rho$ .

- For  $r \in \mathbb{R}_+$ , let  $N(r)$  be the number of zeros of  $f$  in  $\mathbb{D}(0, r)$ , then for any  $\varepsilon > 0$ , there exists  $C > 0$  s.t.  $N(r) \leq Cr^{\rho+\varepsilon}$  for  $r$  sufficiently large.
- Let  $\{a_n\}_{n \in \mathbb{Z}_+}$  be the zeros of  $f$ , then for any  $\varepsilon > 0$ ,  $\sum_{k \in \mathbb{N}} |a_k|^{-\rho-\varepsilon} < \infty$ .

$\lrcorner$

*Proof:* 1: dividing  $f(z)$  by a power of  $z$ , we may assume  $f(0) \neq 0$ . Then it follows from the Jensen formula (12.5.2.11) on the disk  $\mathbb{D}(0, 2\rho)$  that

$$N(r) \log 2 \leq \frac{1}{2\pi} \int_0^{2\pi} \log |f(2re^{i\theta})| d\theta - \log |f(0)| \leq (2r)^{\rho+\varepsilon} - \log |f(0)|.$$

2: By item 1, for  $n$  large,  $n \leq N(|a_n|) \leq |a_n|^{\rho+\varepsilon/2}$ , so

$$\sum |a_n|^{-\rho-\varepsilon} \leq \sum_{n \in \mathbb{Z}_+} |n|^{-\frac{\rho+\varepsilon}{\rho+\varepsilon/2}} < \infty.$$

$\square$

**Lemma (12.4.3.20).** If  $g$  is an entire function on  $\mathbb{C}$ ,  $\rho \in \mathbb{R}_+$  and there is a sequence of positive real numbers  $(r_n)$  that extends to infinity, and  $u = \operatorname{Re}(g)$  satisfies

$$\max_{|z|=r_n} u(z) \leq Cr_n^\rho$$

for each  $n$ , then  $g$  is a polynomial of degree  $\leq \rho$ .  $\lrcorner$

*Proof:* Let  $g(z) = \sum_{n \in \mathbb{N}} a_n z^n$ , then for any  $k \in \mathbb{Z}_+$ , let  $r = r_k$ , by Cauchy's formula

$$\frac{1}{2\pi} \int_0^{2\pi} g(re^{i\theta}) e^{-im\theta} d\theta = \begin{cases} a_m r^m & , m \in \mathbb{N} \\ 0 & , n \in \mathbb{Z}_- \end{cases},$$

so by taking conjugation and adding,

$$\frac{1}{\pi} \int_0^{2\pi} \operatorname{Re}(g)(re^{i\theta}) e^{-in\theta} d\theta = \begin{cases} a_n r^n & , n \in \mathbb{Z}_+ \\ \operatorname{Re}(a_0) & , n = 0 \end{cases}.$$

Then for  $n \in \mathbb{Z}_+$ ,

$$|a_n| = \frac{1}{\pi r^n} \left| \int_0^{2\pi} [u(re^{i\theta}) - Cr^\rho] e^{-in\theta} d\theta \right| \leq \frac{1}{\pi r^n} \int_0^{2\pi} [Cr^\rho - u(re^{i\theta})] d\theta = 2Cr^{\rho-n} - 2\operatorname{Re}(a_0)r^{-n}.$$

Then letting  $r = r_k \rightarrow \infty$  finishes the proof.  $\square$

**Thm. (12.4.3.21)[Hadamard].** The genus  $h$  and the order of growth  $\lambda$  (12.4.3.18) of an entire function  $f$  satisfies

$$0 \leq h \leq \lambda \leq h + 1 \leq \infty.$$

(Notice if  $\lambda \in \mathbb{Z}$ , it might not be able to determine  $h$  from  $\lambda$ ). ┘

*Proof:* It follows from the proof of Weierstrass theorem (12.4.3.14) that  $f$  is of genus  $h < \infty$ , then  $\lambda \leq h + 1$  (taking  $m_n = h$  for each  $n$ ). Conversely, if  $f$  has order of growth  $\lambda < \infty$ , then we need to show that  $h \leq \lambda$ . Take  $h = \lfloor \lambda \rfloor$ , and let  $(a_n)$  are zeros of  $f$  (counting multiplicity and ordered by modulus), then firstly, we show that the product

$$\prod_{n \in S} \left[ \left(1 - \frac{z}{a_n}\right) \exp\left(\frac{z}{a_n} + \frac{1}{2}\left(\frac{z}{a_n}\right)^2 + \dots + \frac{1}{h}\left(\frac{z}{a_n}\right)^h\right) \right]$$

converges: For this, by the proof of Weierstrass theorem (12.4.3.14), it suffices to show that  $\sum_{n \in S} |a_n|^{-h-1}$  converges, and this follows from (12.4.3.19).

Then it's left to show that the entire function  $g(z)$  as in (12.4.3.14) is a polynomial of degree  $\leq h$ . For this, firstly we prove that if  $\varepsilon > 0$  is small that  $\rho + \varepsilon < h + 1$ , and  $|z - a_n| \geq |a_n|^{h+1}$  for any  $n \in S$ , then there exists  $C \in \mathbb{R}_+$  s.t.

$$\left| \prod_{n \in S} \left[ \left(1 - \frac{z}{a_n}\right) \exp\left(\frac{z}{a_n} + \frac{1}{2}\left(\frac{z}{a_n}\right)^2 + \dots + \frac{1}{h}\left(\frac{z}{a_n}\right)^h\right) \right] \right| \geq e^{-C|z|^{\rho+\varepsilon}}.$$

Deonte  $E_h(s) = (1 - s) \exp\left(s + \frac{1}{2}s^2 + \dots + \frac{1}{h}s^h\right)$ , we use a lemma:

**Lemma (12.4.3.22).** there exists constant  $C$  s.t.

- If  $|s| \leq 1/2$ ,  $|E_h(s)| \geq e^{-C|z|^{h+1}}$ .
- If  $|s| \geq 1/2$ ,  $|E_h(s)| \geq |1 - s|e^{-C|z|^h}$ .

┘

*Proof:* For  $|s| \geq 1/2$ ,

$$|E_h(s)| \geq |(1 - s)|e^{-|s| - \frac{|s|^2}{2} - \dots - \frac{|s|^h}{h}} \geq |1 - s|e^{-C|z|^h}.$$

And for  $|s| \leq 1/2$ ,

$$|E_h(s)| \geq |(1 - s)|e^{-\frac{|s|^{h+1}}{h+1} - \frac{|s|^{h+2}}{h+2} - \dots} \geq e^{-C|z|^{h+1}}.$$

□

Then if  $|a_n| \geq 2|z|$ ,

$$\left| E_h\left(\frac{z}{a_n}\right) \right| \geq e^{-C|z/a_n|^{h+1}} \geq e^{-C|z/a_n|^{\rho+\varepsilon}},$$

and if  $|a_n| \leq 2|z|$ , by the hypothesis,

$$\left| E_h\left(\frac{z}{a_n}\right) \right| \geq \left| \left(1 - \frac{z}{a_n}\right) \right| e^{-C|z/a_n|^h} \geq |a_n|^{-h-2} e^{-C|z/a_n|^{\rho+\varepsilon}}.$$

Thus by (12.4.3.19),

$$\prod_{n \in S} \left| E_h\left(\frac{z}{a_n}\right) \right| \geq e^{-C'z} \prod_{|a_n| \leq 2|z|} |a_n|^{-h-2} \geq e^{-C'z} |2z|^{-(h+2)N(2|z|)} \geq e^{-C''|z|^{\rho+\varepsilon}'}$$

for any  $\varepsilon' > \varepsilon$ .

Finally, we get

$$e^{\operatorname{Re}(g(z))} = |e^{g(z)}| = \left| \frac{f(z)}{\prod_{n \in S} |E_h(\frac{z}{a_n})|} \right| \leq C e^{\rho + \varepsilon}$$

whenever  $|z - a_n| \geq |a_n|^{h+1}$  for any  $n \in S$ . Then as  $\sum_n |a_n|^{h+1} < \infty$ , we can apply (12.4.3.20) to show that  $g$  is a polynomial of degree  $\leq \rho + \varepsilon < h + 1$ , thus we are done.  $\square$

**Cor. (12.4.3.23).** For an entire function  $f$  with order  $\lambda \in \mathbb{R}_+ \setminus \mathbb{Z}_+$ , then  $\#f^{-1}(a) = \infty$  for any  $a \in \mathbb{C}$ .  $\perp$

*Proof:* As  $f$  and  $f - a$  has the same order, it suffices to show that such an  $f$  has i.m. zeros. Suppose it has only f.m. zeros, then we can divide a polynomial  $P(z)$  and see that  $F(z) = f(z)/P(z)$  also has the same order but no zero. Thus  $F(z) = e^{g(z)}$  for some entire  $g$ . But then  $g$  is a polynomial of degree  $\lambda$ , which is impossible.  $\square$

**Example (12.4.3.24) [Canonical Forms].**

$$\sin(\pi z) = \pi z \prod_{n \in \mathbb{Z}^\times} \left[ \left(1 - \frac{z}{n}\right) e^{z/n} \right] = \pi z \prod_{n=1}^{\infty} \left(1 - \frac{z^2}{n^2}\right).$$

is of genus 1 and order of growth 1.  $\perp$

*Proof:*  $|\sin(\pi z)| \leq e^{\pi|z|}$ , so it has order of growth  $\leq 1$ , and it has a simple zero at  $z = 0$ , so by Hadamard's theorem (12.4.3.21),

$$\sin(\pi z) = \pi z e^{Az+B} \prod_{n \neq 0 \in \mathbb{Z}} \left[ \left(1 - \frac{z}{n}\right) e^{z/n} \right] = \pi z e^{Az+B} \prod_{n=1}^{\infty} \left(1 - \frac{z^2}{n^2}\right)$$

for some  $A, B \in \mathbb{C}$ . Letting  $z \rightarrow 0$  implies that  $B = 0$ . And letting  $z \rightarrow 1$  implies that

$$e^A = 2 \prod_{n=1}^{\infty} \left(1 - \frac{1}{n^2}\right) = 1,$$

so  $A = 0$ .  $\square$

## 4 Analytic Continuations

**Lemma (12.4.4.1) [Symmetry Principle].** If  $\Omega \subset \mathbb{C}$  is a region s.t.  $c(\Omega) = \Omega$ , denote  $\Omega^+ = \Omega \cap \mathcal{H}$ ,  $\Omega^- = c(\Omega^+)$ ,  $I = \Omega \cap \mathbb{R}$ . Suppose  $f^+ \in \mathcal{O}(\overline{\Omega^+})$ ,  $f^- \in \mathcal{O}(\overline{\Omega^-})$ , and  $f^+(z) = f^-(z)$  for  $z \in \mathbb{R}$ , then the function

$$f : \Omega \rightarrow \mathbb{C} : z \mapsto \begin{cases} f^+(z) & , z \in \overline{\Omega^+} \\ f^-(z) & , z \in \Omega^- \end{cases}$$

is analytic on  $\Omega$ .  $\perp$

*Proof:*  $f$  is clearly continuous. Thus it is easily seen to be analytic by Morera's theorem (12.4.2.8).  $\square$

**Prop. (12.4.4.2) [Schwarz Reflection Principle].** If  $\Omega \subset \mathbb{C}$  is a region s.t.  $c(\Omega) = \Omega$ , denote  $\Omega^+ = \Omega \cap \mathcal{H}$ ,  $\Omega^- = c(\Omega^+)$ ,  $I = \Omega \cap \mathbb{R}$ . Suppose  $f^+ \in \mathcal{O}(\overline{\Omega^+})$  satisfies  $f(I) \subset \mathbb{R}$ , then  $f^+$  can be analytically extended to an analytic function on  $\Omega$ .  $\perp$

*Proof:* For  $z \in \Omega^-$ , define  $f(z) = \overline{f(\bar{z})}$ , then  $f$  is a continuous function on  $\Omega$ , because for  $z \in I$ ,  $f(z) = \overline{f(\bar{z})}$ . To show that  $f$  is analytic, by (12.4.4.1), it suffices to show that  $f$  is analytic on  $\Omega^-$ : For any  $z_0 \in \Omega^-$ , if  $z$  is close to  $z_0$ , then  $\bar{z}, \bar{z}_0 \in \Omega^+$ . By Taylor expansion of  $f$  around  $\bar{z}_0$  (12.4.2.16)

$$f(z) = \overline{f(\bar{z})} = \overline{\sum_{n \in \mathbb{N}} a_n(\bar{z} - \bar{z}_0)^n} = \sum_{n \in \mathbb{N}} \bar{a}_n(z - z_0)^n.$$

And this is a power series around  $z_0$  with the same radius of convergence as that of  $\bar{z}_0$ , thus  $f$  is analytic around  $z_0$ . Because  $z_0$  is arbitrary,  $f$  is analytic on  $\Omega^-$ .  $\square$

**Cor. (12.4.4.3).** If  $\Omega \subset \mathbb{C}^\times$  is a region that is stable under the involution  $\iota : z \mapsto \bar{z}^{-1}$ , denote  $\Omega^+ = \Omega \cap \mathcal{H}$ ,  $\Omega^- = \iota(\Omega^+)$ ,  $I = \Omega \cap \partial\mathbb{D}$ . Suppose  $f^+ \in \mathcal{O}(\Omega^+)$  satisfies  $f(I) \subset \mathbb{R}$ , then  $f^+$  can be analytically extended to an analytic function on  $\Omega$ .  $\lrcorner$

*Proof:* For  $z \in \Omega^-$ , define  $f(z) = \overline{f(\iota(z))}$ , then  $f$  is a continuous function on  $\Omega$ , because for  $z \in I$ ,  $f(z) = \overline{f(\iota(z))}$ . To show that  $f$  is analytic, by a similar lemma as (12.4.4.1), it suffices to show that  $f$  is analytic on  $\Omega^-$ : For any  $z_0 \in \Omega^-$ , if  $z$  is close to  $z_0$ , then  $\iota(z), \iota(z_0) \in \Omega^+$ . By Taylor expansion of  $f$  around  $\iota(z_0)$  (12.4.2.16)

$$f(z) = \overline{f(\iota(z))} = \overline{\sum_{n \in \mathbb{N}} a_n(\iota(z) - \iota(z_0))^n} = \sum_{n \in \mathbb{N}} \frac{\bar{a}_n}{z_0} \frac{(z - z_0)^n}{z^n} = g\left(\frac{1}{z}\right),$$

where  $g(z) = \sum_{n \in \mathbb{N}} (-1)^n \bar{a}_n (z - \frac{1}{z_0})^n$  is a power series around  $z_0$  with the same radius of convergence as that of  $\bar{z}_0$ , so analytic around  $z_0^{-1}$ . Thus  $f$  is analytic around  $z_0$ . Because  $z_0$  is arbitrary,  $f$  is analytic on  $\Omega^-$ .  $\square$

## 5 Theorems

**Prop. (12.4.5.1) [Runge's Theorem].** Let  $K$  be a compact subset of  $\bar{\mathbb{C}}$  and let  $f$  be a function which is holomorphic on an open set containing  $K$ . If  $A$  is a set containing at least one complex number from every bounded connected component of  $\bar{\mathbb{C}} \setminus K$ , then there exists a sequence of rational functions which converges uniformly to  $f$  on  $K$  and all the poles of the functions are in  $A$ .  $\lrcorner$

*Proof:*  $\square$

**Prop. (12.4.5.2) [Mergelyan].** If  $K$  is compact in  $\mathbb{C}$  and  $f$  is a continuous function on  $K$  that is holomorphic in  $\text{int}(K)$ , then  $f$  can be uniformly approximated by polynomials.  $\lrcorner$

**Prop. (12.4.5.3) [Weierstrass].** For a ascending sequence of regions  $\Omega_1 \subset \Omega_2 \subset \dots$ ,  $\cup_n \Omega_n = \Omega$ , and  $f_n$  is analytic on  $\Omega_n$ , and  $f_n(z)$  converges to a function  $f(z)$  in the compact-open topology, then  $f(z)$  is also analytic, and moreover,  $f'_n(z)$  converges to  $f'(z)$  in the compact-open topology.  $\lrcorner$

*Proof:* The analyticity follows from Morera's theorem (12.4.2.8) as the integration on a closed curve commutes with uniform convergence, the same argument applied to the limit of equations

$$f'_n(z) = \frac{1}{2\pi i} \int_{\partial\mathbb{D}(0,r)} \frac{f_n(\zeta) d\zeta}{(\zeta - z)^2}$$

shows that the derivative also converges, and uniformly on  $\overline{\mathbb{D}(0, \rho)}$  for  $\rho < r$ .  $\square$

**Cor. (12.4.5.4) [Hurwitz].** Cf. [Ahlfors P178].  $\lrcorner$

**Thm. (12.4.5.5) [Montel].** If  $\Omega \subset \mathbb{C}$  is region and  $\mathcal{S} = \{f_\alpha\}$  is a set of holomorphic functions on  $\Omega$  bounded in the topology of  $H(\Omega)$ , i.e. inter convex uniform convergence, then  $\mathcal{S}$  is sequentially compact in  $H(\Omega)$ . Equivalently,  $\mathcal{O}(\Omega)$  has the Heine-Borel property.  $\lrcorner$

*Proof:* By Arzela-Ascoli(4.4.8.28) that it suffices to show that  $\mathcal{S}$  is uniformly bounded on any compact subset  $K \subset \Omega$ . Choose  $\delta$  small s.t.

$$K_0 = \{z \in \mathbb{C} | d(z, K) \leq 2\delta\} \subset \Omega,$$

then  $|f_\alpha(z)| \leq M$  for any  $f_\alpha \in \mathcal{S}$  and  $z \in K_0$  for some  $M$ . So by Cauchy's formula,  $|f'_\alpha(z)| \leq \frac{M}{\delta}$  for any  $z \in K$ ,  $f_\alpha \in \mathcal{S}$ . Thus it is clear  $\mathcal{S}$  are equicontinuous on  $K$ .  $\square$

**Thm. (12.4.5.6) [Little Picard Theorem].** The image of a non-constant entire function  $f : \mathbb{C} \rightarrow \mathbb{C}$  is either  $\mathbb{C}$  or  $\mathbb{C}$  with one point omitted.  $\lrcorner$

*Proof:* The modular curve  $Y(2)$  is the sphere minus three points(28.3.3.4)(26.3.3.14)(26.3.3.16), and the linear transformations of  $S^1$  is triply transitive, thus we can assume  $f$  is a analytic map  $\mathbb{C} \rightarrow Y(2)$ . As  $\mathbb{C}$  is simply connected, we can lift this map to the covering of  $Y(2)$ , which is  $\mathcal{H}$ . But  $\mathcal{H}$  is biholomorphic to the open disk, but a bounded entire function is constant(12.4.2.10), so  $f$  is constant.  $\square$

**Thm. (12.4.5.7) [Phragmén-Lindelöf].** Let  $f$  be a function that is holomorphic on  $\{\sigma + it \in \mathbb{C} : \sigma_1 \leq \sigma \leq \sigma_2, t \geq c\}$ , and  $f(\sigma + it) = O(e^{t^\alpha})$  for some  $\alpha > 0$  uniformly for any  $\sigma_1 \leq \sigma \leq \sigma_2$ .

Suppose further that there exist  $M_a, M_b \in \mathbb{R}_+$  s.t.

$$f(a + it) \leq M_a(1 + |t|)^\alpha, \quad f(b + it) \leq M_b(1 + |t|)^\beta,$$

then

$$f(\sigma + it) \leq M_a^{\ell(\sigma)} M_b^{1-\ell(\sigma)} (1 + |t|)^{\alpha\ell(\sigma) + \beta(1-\ell(\sigma))},$$

where  $\ell$  is the linear function on  $\mathbb{R}$  s.t.  $\ell(a) = 1$  and  $\ell(b) = 0$ .  $\lrcorner$

*Proof:* First assume that  $M_a = M_b = M$  and  $\alpha = \beta = 0$ , then there exists  $M$  that  $|\varphi(s)| \leq M$  for  $\text{Re}(s) = \sigma_i$ . Now let  $m \equiv 2 \pmod{4}$  and  $m > \alpha$ , then  $\text{Re}((\sigma + i\tau)^m)$  is a polynomial of  $\sigma$  and  $\tau$  with highest term of  $\tau$  being  $-\tau^m$ , so we have

$$\text{Re}(s^m) = -\tau^m + O(|\tau|^{m-1}), \quad |\tau| \rightarrow \infty$$

uniformly on the strip. So  $\text{Re}(s^m)$  has an upper bound  $N$  on the strip. Thus for any  $\varepsilon > 0$ ,

$$|f(s)e^{\varepsilon s^m}| \leq M e^{\varepsilon N}$$

on the boundary of the strip and

$$|f(s)e^{\varepsilon s^m}| = O(e^{|t|^\alpha - \varepsilon|t|^m})$$

uniformly on the strip, thus converges uniformly to 0 as  $|\text{Im}(s)| \rightarrow \infty$ .

Then we can use maximum principle to see that

$$|f(s)e^{\varepsilon s^m}| \leq M e^{\varepsilon N}$$

on the strip. Let  $\varepsilon \rightarrow 0$ , we get  $|\varepsilon(s)| \leq M$ , thus the theorem.

In general, define  $\psi(s) = (s - \sigma_1 + 1)^b$ ?, then  $|\psi(s)| = |s - \sigma_1 + 1|^b \sim |\tau|^b$  when  $|\tau| \rightarrow \infty$ . Thus  $f_1(s) = f(s)/\psi(s)$  satisfies the same condition as  $\varphi$  with  $b = 0$ , so  $f(s)/\psi(s)$  is bounded on the strip, and thus  $|f(s)| = O(|t|^b)$ .  $\square$

**Remark (12.4.5.8).** Some condition on the growth rate of  $|f(\sigma + it)|$  is necessary, otherwise we can consider  $e^{iz}$  on the strip  $-\frac{\pi}{2} \leq \text{Re}(z) \leq \frac{\pi}{2}$ , then it is bounded for  $\text{Re}(z) = \pm \frac{\pi}{2}$ , but not bounded for  $-\frac{\pi}{2} < \text{Re}(z) < \frac{\pi}{2}$ .  $\lrcorner$

## 6 Calculating Definite Integrals

### 1

**Prop. (12.4.6.1).** If  $f$  has a primitive  $F$ , then for any arc  $\gamma$ ,

$$\int_{\gamma} f(z) dz = F(\gamma(1)) - F(\gamma(0)).$$

┘

**Example (12.4.6.2).** For  $a > 0$ , evaluate the integrals

$$\int_0^{\infty} e^{-ax} \cos(bx) dx, \quad \int_0^{\infty} e^{-ax} \sin(bx) dx.$$

┘

*Proof:*

$$\int_0^{\infty} e^{-(a+bi)z} dz = \lim_{R \rightarrow \infty} \left. \frac{-1}{a+bi} e^{-(a+bi)z} \right|_0^R = \frac{1}{a+bi} - \lim_{R \rightarrow \infty} \frac{1}{a+bi} e^{-(a+bi)R}.$$

As  $|\frac{1}{a+bi} e^{-(a+bi)R}| = \frac{1}{\sqrt{a^2+b^2}} e^{-aR} \rightarrow 0$  as  $R \rightarrow \infty$ ,

$$\int_0^{\infty} e^{-(a+bi)z} dz = \frac{1}{a+bi}.$$

Then taking the real and imaginary part, we see that

$$\int_0^{\infty} e^{-ax} \cos(bx) dx = \frac{a}{a^2 + b^2}, \quad \int_0^{\infty} e^{-ax} \sin(bx) dx = \frac{b}{a^2 + b^2}.$$

□

### From Real to Complex

**Prop. (12.4.6.3).** For any  $\xi \in \mathbb{C}$ ,

$$e^{-\pi\xi^2} = \int_{-\infty}^{\infty} e^{-\pi x^2} e^{2\pi i x \xi} dx.$$

┘

*Proof:* Firstly we show that both sides are holomorphic functions in  $\xi$ : The LHS is clear. For the RHS, by (12.4.2.14), it suffices to show that

$$\xi \mapsto \int_{-\infty}^{\infty} e^{-\pi x^2} e^{-2\pi x \operatorname{Im}(\xi)} dx$$

is a uniformly convergent on compact subsets. But because  $\operatorname{Im}(z)$  is bounded on compact subsets, it suffices to show that  $\int_{-\infty}^{\infty} e^{-\pi x^2} e^{Ax} dx$  is convergent for any  $A \in \mathbb{R}$ . And by a change of variable, it suffices to notice that  $\int_{-\infty}^{\infty} e^{-\pi x^2} dx = 1$ , by [Stein]P42.

It has been proven in Stein's book Page42? that the assertion is true for  $\xi \in \mathbb{R}$ . Then as both sides are holomorphic functions in  $\xi$ , this is true for all  $\xi \in \mathbb{C}$ , by the uniqueness theorem. □

**Cor. (12.4.6.4).** For any  $a \in \mathbb{C}$ ,  $\operatorname{Re} a > 0$  and  $\xi \in \mathbb{C}$ ,

$$\frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} e^{-i\xi x - \frac{1}{2}ax^2} dx = \frac{1}{\sqrt{a}} e^{-\frac{1}{2a}\xi^2}.$$

┘

*Proof:* Firstly we show that both sides are holomorphic functions in  $a$ : The RHS is clear. For the LHS, by (12.4.2.14), it suffices to show that

$$a \mapsto \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} e^{-i\xi x - \frac{1}{2}ax^2} dx$$

is a uniformly convergent on compact subsets. But because  $\operatorname{Re}(a) > 0$  is bounded below on compact subsets, it suffices to show that  $\int_{-\infty}^{\infty} e^{-Ax^2 - Bx} dx$  is convergent for any  $A \in \mathbb{R}_+$ . And by a change of variable, it suffices to notice that  $\int_{-\infty}^{\infty} e^{-\pi x^2} dx = 1$ , by [Stein]P42.

It follows from (12.4.6.3) and a change of variable that the assertion is true for  $a \in \mathbb{R}_+$ . Then as both sides are holomorphic functions in  $\xi$ , this is true for all  $a$ , by the uniqueness theorem.  $\square$

**Prop. (12.4.6.5).** For  $\alpha \in \mathbb{C}$  s.t.  $\operatorname{Re}(\alpha^2) \geq 0$ ,

$$\int_0^{\infty} e^{-\alpha^2 x^2} dx = \frac{\sqrt{\pi}}{2\alpha}.$$

┘

*Proof:* By a change of variable, it suffices to show for  $\alpha = e^{i\theta}$ . But in this case,

$$\alpha \int_0^R e^{-\alpha^2 x^2} dx - \int_0^R e^{-x^2} dx = \int_{\gamma} e^{-z^2} dz$$

where  $\gamma : t \in [0, \theta] \mapsto Re^{it}$ . But the RHS is bounded by

$$R \int_0^{\pi/4} e^{-R^2 \sin(2\theta)} d\theta \leq R(\delta + \frac{\pi}{4} e^{-R^2 \sin(2\delta)})$$

for any  $\delta \in (0, \pi/4)$ . If we take  $\delta = R^{-3/2}$ , then for  $R$  large, the RHS is bounded by

$$\frac{1}{\sqrt{R}} + \frac{\pi R}{2} e^{-\sqrt{R}}$$

which tends to 0. Thus the integral

$$\lim_{R \rightarrow \infty} \alpha \int_0^R e^{-\alpha^2 x^2} dx = \lim_{R \rightarrow \infty} \alpha \int_0^R e^{-x^2} dx = \frac{\sqrt{\pi}}{2} \text{ (12.4.6.3)}.$$

$\square$

### Rational Functions

**Prop. (12.4.6.6).** Let  $f, g$  be real polynomials, and  $\deg(g) \geq \deg(f) + 2$ , and  $g(z)$  has no zeros on the real line. Then

$$\int_{-\infty}^{\infty} \frac{f(x)}{g(x)} dx$$

can be calculated. ┘

*Proof:* As the integral is absolutely convergent, we can take  $R \in \mathbb{R}$ , and  $\gamma$  to be the loop which consists of the line from  $-R$  to  $R$  and the hemisphere with origin 0 and radius  $R$  from  $R$  to  $-R$ , then when  $R$  is large, we can assume all the zeros of  $g(z)$  in  $\mathcal{H}$  is enclosed by  $\gamma$ . Then the integral equals  $2\pi i$  times the sum of residues of  $\frac{f(z)}{g(z)}$  at the zeros of  $g(z)$  in  $\mathcal{H}$ . □

**Example (12.4.6.7).** Evaluate the integrals

$$\int_{-\infty}^{\infty} \frac{1}{1+x^4} dx.$$

What are the poles of  $1/(1+z^4)$ ? ┘

*Proof:*  $g(z) = 1 + z^4$  has two zeros  $e^{\frac{\pi}{4}i}$  and  $e^{-\frac{3\pi}{4}i}$  on the upper half plane, so the integral equals

$$\int_{\gamma_1} \frac{(x - e^{\frac{\pi}{4}i})^{-1}(x - e^{\frac{5\pi}{4}i})^{-1}(x - e^{\frac{7\pi}{4}i})^{-1}}{x - e^{\frac{3\pi}{4}i}} + \int_{\gamma_2} \frac{(x - e^{\frac{3\pi}{4}i})^{-1}(x + e^{\frac{5\pi}{4}i})^{-1}(x - e^{\frac{7\pi}{4}i})^{-1}}{x - e^{\frac{\pi}{4}i}}$$

which equals  $2\pi i$  times

$$\left( \frac{x^4 + 1}{x - e^{\frac{\pi}{4}i}} \right)^{-1} \Big|_{x=e^{\frac{\pi}{4}i}} + \left( \frac{x^4 + 1}{x - e^{\frac{3\pi}{4}i}} \right)^{-1} \Big|_{x=e^{\frac{3\pi}{4}i}}$$

so it equals

$$(2\pi i) \left[ \frac{1}{4e^{\frac{3\pi}{4}i}} + \frac{1}{4e^{\frac{9\pi}{4}i}} \right] = \frac{\pi}{\sqrt{2}}$$

□

**Prop. (12.4.6.8)[Fractional Powers].** Let  $f, g$  be real polynomials, and  $\deg(g) \geq \deg(f) + 2$ , and  $g(z)$  has at most one simple zero at the origin and no other zeros, then the integral

$$\int_0^{\infty} x^{\alpha} \frac{f(x)}{g(x)} dx, 0 < \alpha < 1$$

can be evaluated. ┘

*Proof:* The integral equals  $2 \int_0^{\infty} t^{2\alpha+1} \frac{f(t^2)}{g(t^2)} dt$ , and we can choose a branch of  $z^{\alpha}$  that is defined on  $\mathbb{C} \setminus \mathbb{R}_{\leq 0}$ . Then we can integrate along the loop in  $\mathcal{H}$  that consists of two hemisphere of radius  $\varepsilon, R$  centered at the origin,  $[\varepsilon, R] \cup [-R, -\varepsilon]$ . Then when  $R \rightarrow \infty$  and  $\varepsilon \rightarrow 0$ , the integration on the hemisphere tends to 0, and the integration on  $[\varepsilon, R] \cup [-R, -\varepsilon]$  tends to

$$\int_{-\infty}^{\infty} z^{2\alpha+1} \frac{f(z^2)}{g(z^2)} dz = (1 - e^{2\pi i \alpha}) \int_0^{\infty} t^{2\alpha+1} \frac{f(t^2)}{g(t^2)} dt.$$

□

4

**Prop. (12.4.6.9).** Let  $f, g$  be real polynomials, and  $\deg(g) \geq \deg(f) + 1$ , and  $g(z)$  has no zeros on the real line, then

$$\int_{-\infty}^{\infty} \frac{f(x)}{g(x)} e^{ix} dx, \quad \int_{-\infty}^{\infty} \frac{f(x)}{g(x)} \cos(x) dx, \quad \int_{-\infty}^{\infty} \frac{f(x)}{g(x)} \sin(x) dx$$

can be calculated. ┘

*Proof:* If  $\deg(g) \geq \deg(f) + 2$ , then as before we can use the same hemisphere methods to evaluate, because on the hemisphere, we can bound

$$\left| \int_{\gamma} \frac{f(Re^{i\theta})}{g(Re^{i\theta})} iRe^{iz} d\theta \right| \leq C \int_{\gamma} \frac{e^{-y}}{R} d\theta \leq C \int_{\gamma} \frac{1}{R} d\theta \leq \frac{2\pi C}{R}$$

which converges 0 as  $R \rightarrow \infty$ .

But if  $\deg(g) = \deg(f) + 1$ , this hemisphere integral is no longer converging to 0, so we try another method: Integrate around the square with vertices

$$\{(X_1, 0), (X_1, X_1 + X_2), (-X_2, X_1 + X_2), (-X_2, 0)\}.$$

The integral on the vertical lines are bounded by

$$C \int_0^{X_1+X_2} e^{-y} \frac{dy}{|z|} \leq C \frac{1}{X_2} \int_0^{X_1+X_2} e^{-y} dy \leq \frac{C}{X_2}$$

And the same is true for the left vertical lines. And the horizontal line is bounded by

$$C \int_{-X_1}^{X_2} \frac{e^{-(X_1+X_2)}}{X_1 + X_2} dt = Ce^{-(X_1+X_2)}$$

and all these converge to 0 as  $X_1, X_2 \rightarrow \infty$ . □

**Prop. (12.4.6.10).** Show that

$$\int_0^{\infty} \frac{\sin x}{x} dx = \frac{\pi}{2}.$$

┘

*Proof:* To do this one, we need a variation of the technique from above. Choose the semi-contour, then it equals the half of the integral

$$\int_{\gamma} \frac{e^{iz}}{z} dz = 2\pi i$$

minus the integral

$$\int_{\gamma} \frac{e^{iz}}{z} dz$$

where  $\gamma : [0, \pi] \rightarrow \mathbb{C} : t \mapsto \varepsilon e^{it}$ . So the integral equals

$$\int_0^{\pi} e^{iz} i dz$$

which converges to  $\pi i$ . □

## 7 Biholomorphisms

**Def. (12.4.7.1) [Biholomorphisms].** For regions  $U, V \subset \mathbb{C}$ , a **biholomorphism** from  $U$  to  $V$  is a holomorphic map  $f : U \rightarrow V$  s.t. there is an inverse  $g : V \rightarrow U$  which is also holomorphic, and  $f \circ g = \text{id}_V, g \circ f = \text{id}_U$ .  $\lrcorner$

**Prop. (12.4.7.2) [Analytic Functions are Open].** Let  $\Omega \subset \mathbb{C}$  be a region, then any non-constant  $f \in \mathcal{O}(\Omega)$  defines an open map  $\Omega \rightarrow f(\Omega)$ .  $\lrcorner$

*Proof:* Let  $z_0 \in \Omega, w_0 = f(z_0)$ . by (12.4.2.20), we can find  $\varepsilon > 0$  s.t.  $\mathbb{D}(z_0, 2\varepsilon) \subset U$ , and  $z_0$  is the only zero of  $f - w_0$  in  $\mathbb{D}(z_0, 2\varepsilon)$ . Let  $\gamma$  be the circle  $|z - z_0| = \varepsilon$ , and  $\Gamma = f(\gamma)$ . Then because  $w_0 \notin \Gamma$ , there exists  $\delta$  s.t.  $\mathbb{D}(w_0, \delta) \cap \Gamma = \emptyset$ . Then by Rouché's theorem (12.4.2.31), for any  $w \in \mathbb{D}(w_0, \delta)$ ,  $f - w$  has a zero  $z \in \mathbb{D}(z_0, \varepsilon)$ . Thus  $f(\mathbb{D}(z_0, \varepsilon)) \supset \mathbb{D}(w_0, \delta)$ , and this implies  $f$  is open.  $\square$

**Prop. (12.4.7.3) [Local Biholomorphisms].** A holomorphic map  $f : U \rightarrow V \subset \mathbb{C}$  is a local bijection iff  $f'(z) \neq 0$  for any  $z \in U$ .  $\lrcorner$

*Proof:* For  $z_0 \in U$ , let  $F(z) = f(z) - f(z_0)$ , then by discreteness of the zeros, there exists  $\delta > 0$  s.t.  $\mathbb{D}(z_0, \delta) \subset U$  and  $F(z) \neq 0$  for  $0 < |z - z_0| < \delta$ . Because  $\{F(z) : |z - z_0| = \delta\}$  is compact, there exists some  $\varepsilon > 0$  s.t.  $\mathbb{D}(f(z_0), \varepsilon) \subset V$  and  $|F(z)| \geq \varepsilon$  for any  $|z - z_0| = \delta$ .

If  $F(z)$  has zero of order exactly 1 at  $z_0$ , then for  $\xi \in \mathbb{D}(0, \varepsilon)$ , by Rouché's theorem (12.4.2.31),  $F(z) - \xi$  has exactly 1 zeros in  $\mathbb{D}(z_0, \delta)$ , which implies  $F^{-1}(\mathbb{D}(0, \varepsilon)) \xrightarrow{F} \mathbb{D}(0, \varepsilon)$  is a bijection, and  $z_0 \in F^{-1}(\mathbb{D}(0, \varepsilon))$ . Thus  $F$  and also  $f$  is a local bijection at  $z_0$ .

If  $F(z)$  has zero of order  $d \geq 1$  at  $z_0$ , then for  $\xi \in \mathbb{D}(0, \varepsilon)$ , by Rouché's theorem (12.4.2.31),  $F(z) - \xi$  has exactly  $d$  zeros in  $\mathbb{D}(z_0, \delta)$ , which implies  $F^{-1}(\mathbb{D}(0, \varepsilon')) \xrightarrow{F} \mathbb{D}(0, \varepsilon')$  is a  $d$ -fold covering for any  $\varepsilon' < \varepsilon$ , so  $F$  thus also  $f$  can never be a local bijection at  $z_0$ .

Thus  $f$  is a local bijection at  $z_0$  iff  $f'(z_0) \neq 0$  has zero of order exactly 1 at  $z_0$ , which is also clearly equivalent to  $f'(z_0) \neq 0$ . So the assertion is true.  $\square$

**Cor. (12.4.7.4).** If  $U, V$  are regions of  $\mathbb{C}$  and  $f : U \rightarrow V$  is holomorphic and bijective, then  $f'(z) \neq 0$  for any  $z \in U$ , and the inverse of  $f$  is also holomorphic.  $\lrcorner$

*Proof:* To show the inverse is holomorphic, notice that for  $w_0 = f(z_0) \in V$ , if  $w = f(z)$  is close to  $w_0$ , then

$$\frac{g(w) - g(w_0)}{w - w_0} = \frac{1}{\frac{w - w_0}{g(w) - g(w_0)}} = \frac{1}{\frac{f(z) - f(z_0)}{z - z_0}}.$$

Because when  $z \rightarrow z_0, w \rightarrow w_0$ , so we conclude that  $g$  is holomorphic at  $w_0$ , and its derivative is the reciprocal of the derivative of  $f$ .  $\square$

**Cor. (12.4.7.5).** For regions  $U, V \subset \mathbb{C}$ , any holomorphic bijection from  $U$  to  $V$  is a biholomorphism.  $\lrcorner$

**Def. (12.4.7.6) [Univalent Functions].** A **univalent function** is a holomorphic function that is injective.  $\lrcorner$

**Prop. (12.4.7.7).** Any  $C^1$  conformal map in  $\mathbb{C}$  is holomorphic or anti-holomorphic. In higher dimension, conformal is equivalent to  $\langle df_p(v_1), df_p(v_2) \rangle = \lambda^2(p) \langle v_1, v_2 \rangle$ .  $\lrcorner$

*Proof:* Cf. [Ahlfors P74].  $\square$

**Prop. (12.4.7.8) [Automorphism Groups].**

- The only holomorphic automorphisms of  $\mathbb{D}$  fixing the origin are the rotations.
- $\text{Aut}(\mathbb{D}) = \{e^{i\theta} \frac{\alpha - z}{1 - \bar{\alpha}z}, \alpha \in \mathbb{D}\}$ . Moreover, we denote by  $\psi_\alpha$  the automorphism  $\psi_\alpha(z) = \frac{\alpha - z}{1 - \bar{\alpha}z}$ , then  $\psi_\alpha^2 = \text{id}$ .
- $\text{Aut}(\mathcal{H}) = \text{PSL}(2, \mathbb{R})$ .
- $\text{Aut}(\bar{\mathbb{C}}) = \text{PSL}(2, \mathbb{C})$ .
- $\text{Aut}(\mathbb{C}) = \mathbb{C} \ltimes \mathbb{C}^\times$ .

□

*Proof:* 1:  $g, g^{-1}$  are both automorphisms of  $\mathbb{D}$  that fixes the origin, so by Schwartz's lemma(12.5.1.3),  $|g(z)| \leq |z|, |g^{-1}(z)| \leq |z|$ . Thus  $|g(z)| = |z|$  for any  $z \in \mathbb{D}$ , and by Schwartz's lemma(12.5.1.3),  $g$  is a rotation.

2: For any  $f \in \text{Aut}(\mathbb{D})$ , there exists some  $\alpha \in \mathbb{D}$  s.t.  $f(\alpha) = 0$ . Then  $g = f \circ \psi_\alpha$  maps 0 to 0. Then by item1,  $g(z) = e^{i\theta}z$ , and  $f(z) = e^{-i\theta}\psi_\alpha(z)$ .

3: Firstly  $SL(2, \mathbb{R})$  acts transitively on  $\mathcal{H}$  it suffices to show that any  $z \in \mathcal{H}$  can be mapped to  $i$ :  $\begin{bmatrix} & -c^{-1} \\ c & \end{bmatrix} (z) = \frac{1}{c^2 z}$ , so we may take  $c \in \mathbb{R}$  s.t.  $M_1 = \begin{bmatrix} & -c^{-1} \\ c & \end{bmatrix}$  maps  $z$  to  $z_1$  with  $\text{Im}(z_1) = 1$ , and then we can take some  $b \in \mathbb{R}$  s.t.  $M_2 = \begin{bmatrix} 1 & b \\ & 1 \end{bmatrix}$  maps  $z_1$  to  $i$ .

Then for any  $f \in \text{Aut}(\mathcal{H})$ , there exists some  $\beta \in \mathcal{H}$  s.t.  $f(\beta) = i$ . take some matrix  $\gamma$  s.t.  $\gamma(\beta) = i$ , then  $g = f \circ \gamma^{-1}$  preserves  $i$ . Let  $F : \mathcal{H} \cong \mathbb{D} : z \mapsto \frac{z-i}{z+i}$  be a biholomorphism, then it can be checked that

$$F \circ \begin{bmatrix} \cos \theta & \sin \theta \\ -\sin \theta & \cos \theta \end{bmatrix} \circ F^{-1} = e^{i\theta} : \mathbb{D} \rightarrow \mathbb{D}.$$

Thus by Schwartz lemma(12.5.1.3), there exists some  $\theta \in \mathbb{R}$  s.t.  $g = \begin{bmatrix} \cos \theta & \sin \theta \\ -\sin \theta & \cos \theta \end{bmatrix} = \kappa_\theta$ , and then  $f = \kappa_\theta \circ \gamma \in \text{SL}(2; \mathbb{R})$ .

4: For any distinct points  $z_1, z_2, z_3 \in \mathbb{C} \cup \{\infty\}$ ,

$$F_{z_1, z_2, z_3} : \mathbb{C} \cup \{\infty\} \rightarrow \mathbb{C} \cup \{\infty\} : z \mapsto \frac{z - z_2}{z - z_3} / \frac{z_1 - z_2}{z_1 - z_3}$$

satisfies  $F_{z_1, z_2, z_3}(z_1) = 1, F_{z_1, z_2, z_3}(z_2) = 0, F_{z_1, z_2, z_3}(z_3) = \infty$ , and

$$G_{z_1, z_2, z_3} : \mathbb{C} \cup \{\infty\} \rightarrow \mathbb{C} \cup \{\infty\} : w \mapsto \frac{w z_3 \frac{z_1 - z_2}{z_1 - z_3} - z_2}{w \frac{z_1 - z_2}{z_1 - z_3} - 1}$$

is an inverse of  $f_{z_1, z_2, z_3}$ , so  $f_{z_1, z_2, z_3}$  is a bijection.

Now consider  $h = F_{f(1), f(0), f(\infty)} \circ f$ , then  $h$  is also a bijection and  $h(1) = 1, h(0) = 0, h(\infty) = \infty$ . Thus  $h$  is entire, and by(12.4.2.23)  $h(z) = zL(z)$  for some  $L(z) \in \mathcal{M}(\mathbb{C})$  entire and  $L(1) = 1, L(\infty) = 0$ , so by Liouville's theorem(12.4.2.10),  $L = 1$ , and  $h(z) = z$ .

Thus  $f(z) = G_{f(1), f(0), f(\infty)}$  is of the form  $\frac{az+b}{cz+d}$ . To show that  $ad - bc \neq 0$ , notice if  $ad - bc = 0$ , then  $f(z)$  is constant, contradiction.

5: Notice  $g(z) = (f(z) - f(0))/(f(1) - f(0))$  is also injective and entire, and  $g(0) = 0, g(1) = 1$ . But by Picard's great theorem,  $g(z)$  is meromorphic at  $\infty$ . So  $g(\infty) = \infty$ , otherwise  $g$  is entire and bounded, contradicting Liouville's theorem(12.4.2.10). So  $g(z) = z$ , by item4. Thus  $f(z) = (f(1) - f(0))z + f(0)$  is linear. □

### Riemann Mapping Theorem

**Lemma (12.4.7.9) [Limits of Univalent Functions are Univalent].** A limit of a sequence of univalent holomorphic functions in the compact-open topology is univalent or constant.  $\lrcorner$

*Proof:* If  $f = \lim_{n \rightarrow \infty} f_n$  is non-constant and  $f(z_1) = f(z_2)$ , we can take a Jordan curve  $\gamma$  surrounding  $z_1$  and  $z_2$  s.t.  $0 \notin f(\gamma)$ . Then  $f_n$  converges uniformly to  $f$  on  $\gamma$ , and then it follows from Rouché's theorem (12.4.2.31) that when  $n$  is large,  $f_n - f(z_1)$  has two zeros inside  $\gamma$ , contradiction.  $\square$

**Thm. (12.4.7.10) [Riemann Mapping Theorem, Koebe].** Let  $\Omega \subset \mathbb{C}$  be a simply-connected region and  $\Omega \neq \mathbb{C}$ , then for any  $z_0 \in \Omega$ , there exists a unique biholomorphism  $F : \Omega \rightarrow \mathbb{D}$  s.t.  $F(z_0) = 0$  and  $F'(z_0) \in \mathbb{R}_+$ .  $\lrcorner$

**Remark (12.4.7.11).** This theorem can be generalized to other simply-connected Riemann surfaces, see (16.9.9.2).  $\lrcorner$

*Proof:* For the uniqueness, if there are two such maps  $\varphi$  and  $\varphi'$ , then  $h = \varphi' \circ \varphi^{-1}$  is an automorphism of  $\mathbb{D}$  s.t.  $h(0) = 0$  and  $h'(0) \in \mathbb{R}_+$ . Then it follows from (12.4.7.8) that  $h = \text{id}$ .

For the existence, let  $\mathcal{F}$  be the space of univalent holomorphic functions on  $\Omega$  with values in  $\mathbb{D}$ . Then  $\mathcal{F} \neq \emptyset$ : Let  $a \neq b \in \partial\Omega$ , then by the map  $g(z) = \frac{z-a}{z-b}$ , we may assume that  $\{0, \infty\} \subset \partial\Omega$ . Then  $\sqrt{\cdot}$  has two branches on  $\Omega$ , denoted by  $h_+$  and  $h_-$ . Suppose  $w_0 \in h_-(\Omega)$  with  $\mathbb{D}(w_0, \delta) \subset h_-(\Omega)$ , then the function

$$f_0 : z \mapsto \frac{\delta}{h_+(z) - w_0} \in \mathcal{F}.$$

Let

$$\alpha = \sup_{f \in \mathcal{F}} |f'(z_0)|.$$

If  $\mathbb{D}(z_0, \delta_1) \subset \Omega$ , then by Cauchy's formula,  $0 < |f'(z_0)| \leq \delta_1^{-1}$ , so  $\alpha \in (0, \infty)$ , and there exists  $f_n \in \mathcal{F}$  s.t.  $|f'_n(z_0)| \geq \alpha - \frac{1}{n}$ . Then it follows from Montel's theorem (12.4.5.5) that there is a subsequence of  $\{f_n\}$  that converges to a holomorphic function  $f$  in compact-open topology, and  $|f'(z_0)| = \alpha > 0$  by Weierstrass theorem (12.4.5.3). Notice  $f$  is also univalent by (12.4.7.9), so  $f \in \mathcal{F}$ .

It remains to show that  $f(z_0) = 0$  and  $f_0(\Omega) = \Delta$ , as a rotation of  $f$  will satisfy the requirement. If  $f(z_0) = \beta \neq 0$ , then take

$$f'(z) = \psi_\beta \circ f$$

then  $f' \in \mathcal{F}$ , and

$$|(f')'(z_0)| = \left| \frac{f'(z_0)}{1 - |\beta|^2} \right| > |f'(z_0)|,$$

contradicting the maximality of  $|f'(0)|$ .

If  $w \in \mathbb{D} \setminus f(\Omega)$ , then  $\psi(z) = \psi_\beta \circ f$  is non-vanishing on  $\Omega$ , thus  $\sqrt{\cdot}$  has a branch  $h$  on  $\psi(\Omega)$ . Now suppose

$$f'(z) = \psi_{h(z_0)} \circ h,$$

then

$$f = \psi_w^{-1} \circ (z \mapsto z^2) \circ \psi_{h(w)}^{-1} \circ f',$$

where  $\Phi = \psi_w^{-1} \circ (z \mapsto z^2) \circ \psi_{h(w)}^{-1}$  is an automorphism of  $\mathbb{D}$  that fixes 0, so  $|\Phi'(0)| < 1$  by Schwartz's lemma (12.5.1.3), and

$$|f'(0)| = |\Phi'(0)| |(f')'| \leq |(f')'|,$$

contradicting the maximality of  $|f'(0)|$ .  $\square$

**Cor. (12.4.7.12).** Let  $\Omega \subset \overline{\mathbb{C}}$  be a simply-connected region, then  $D$  is biholomorphic to exactly one of the following:

- $\mathbb{D} \cong \mathcal{H}$ , in which case  $\#\partial\Omega > 1$ , and  $\Omega$  is said to be of **hyperbolic type**.
- $\mathbb{C}$ , in which case  $\#\partial\Omega = 1$ .
- $\overline{\mathbb{C}}$ , in which case  $\#\partial\Omega = 0$ .

┘

*Proof:* If  $\#\partial\Omega > 1$ , by a fractional transformation, we can assume  $\Omega \subset \mathbb{C}$ , and  $\Omega \neq \mathbb{C}$ , so  $\Omega \cong \mathbb{D}$  by (12.4.7.10). If  $\#\partial\Omega = 1$ , then clearly  $\Omega = \overline{\mathbb{C}} \setminus \{z_0\} \cong \mathbb{C}$ . □

**Cor. (12.4.7.13).** Any two simply-connected regions  $\Omega, \Omega' \subset \mathbb{C}$  are homeomorphic. ┘

### Injective Holomorphic Maps

**Thm. (12.4.7.14)**[Bieberbach Conjecture1916, de Branges1984]. Let  $f(z) = z + a_2 z^2 + \dots \in \mathcal{O}(\mathbb{D})$  is an injective map, then  $|a_n| \leq n$ . And the equation holds iff  $f$  is a rotation composed with the Koebe function. ┘

*Proof:* Cf.[李忠]. □

### Notation(12.5.0.1).

- Use notations defined in [Measure Theory and Functions on  \$\mathbb{R}^n\$](#) .
- Let  $\Omega$  be a region(12.4.1.1).

┘

### 1 Poincaré Metric

**Def.(12.5.1.1) [Hyperbolic Metric].** For any region  $\Omega \subset \mathbb{C}$  of hyperbolic type??, there exists a covering  $\mathbb{D} \rightarrow \Omega$ , and different coverings differ by an automorphism of  $\mathbb{D}$ . Thus we can define a **Poincaré metric** on  $\Omega$  by pushforward of the Poincaré metric  $d^P s = \rho_\Omega(s)|dz|$  on  $\mathbb{D}$ . Then this is well-defined and independent of the covering map. ┘

*Proof:* It is well-defined because for any two local inverse map  $\Omega \rightarrow \mathbb{D}$  differ by a Deck transformation which is an automorphism of  $\mathbb{D}$  thus preserves the Poincaré metric?. And any two covering  $\mathbb{D} \rightarrow \Omega$  differ by a covering map which is also an automorphism of  $\mathbb{D}$ , thus preserves the Poincaré metric. □

**Prop.(12.5.1.2) [Hyperbolic Metrics].**

- $\rho_{\mathcal{H}}(z) = 1/\text{Im}(z)$ .
- $\rho_{\mathbb{D}(0,(0,r))}(z) = 1/(|z| \log \frac{r}{|z|})$ .

┘

*Proof:* 1: ?.

2: There is a covering map  $\mathcal{H} \rightarrow \mathbb{D}(0,(0,r)) : z \mapsto re^{iz}$ , so we can plug in the inverse map  $w = i \log z$  into  $|dw|/\text{Im } w$  to get the desired formula. □

**Thm.(12.5.1.3) [Schwartz Lemma].** If  $f \in \mathcal{O}(\mathbb{D})$  and satisfies  $|f(z)| \leq 1$ ,  $f(0) = 0$ , then  $|f(z)| \leq |z|$ , and  $|f'(0)| \leq 1$ . Moreover, if  $|f(z)| = |z|$  for some  $z$  or  $|f'(0)| = 1$ , then  $f(z) = cz$  for some  $|c| = 1$ .

┘

*Proof:* The function  $g(z) = f(z)/z$  is analytic on  $0 < |z| < 1$  with a removable singularity at 0(12.4.2.18) and extends to an analytic function on  $|z| < 1$  with  $g(0) = f'(0)$ , and  $\lim_{|z| \rightarrow 1} |g(z)| \leq 1$ , thus by maximal principle(12.4.2.24),  $|g(z)| \leq 1$  for any  $|z| < 1$ , thus we are done. The last assertion also follows from(12.4.2.24). □

**Cor.(12.5.1.4).** If  $g \in \mathcal{O}(\mathbb{D}(0,r))$  satisfies  $|g(z)| \leq B$  for any  $z \in \mathbb{D}(0,r)$ , then for any  $z, \zeta \in \mathbb{D}(0,r)$ , we have

$$|g(z) - g(\zeta)| \leq 2B \left| \frac{r(z - \zeta)}{r^2 - \bar{\zeta}z} \right|.$$

┘

**Lemma(12.5.1.5) [Schwartz-Pick].** Let  $f \in \mathcal{O}(\mathbb{D})$ , and  $f(\mathbb{D}) \subset \mathbb{D}$ ,  $f(0) = 0$ , then in the Poincaré metric, for any  $z_1, z_2 \in \mathbb{D}$ ,

$$d^P(f(z_1), f(z_2)) \leq d^P(z_1, z_2).$$

And if the equality holds for some  $z_1 \neq z_2$ , then  $f \in \text{Aut}(\mathbb{D})$ . ┘

*Proof:* Cf.[李忠]P29. □

**Prop. (12.5.1.6) [Generalized Schwartz Lemma].** Let  $\Omega_1, \Omega_2$  be regions of hyperbolic type with Poincaré metrics  $ds_1 = \sigma_1(z)|dz|$  and  $ds_2 = \sigma_2(z)|dz|$ , then for any holomorphic map  $f : \Omega_1 \rightarrow \Omega_2$ ,

$$\sigma_2(f(z))|f'(z)| \leq \sigma_1(z).$$

In particular, if  $\Omega_1 \subset \Omega_2$ , then  $\sigma_2(z) \leq \sigma_1(z)$ . ┘

*Proof:* Let  $h_1 : \mathbb{D} \rightarrow \Omega_1, h_2 : \mathbb{D} \rightarrow \Omega_2$  be covering maps, then  $f : \Omega_1 \rightarrow \Omega_2$  lifts to a holomorphic map  $F : \mathbb{D} \rightarrow \mathbb{D}$ . Thus Schwartz-Pick lemma implies that  $\sigma_{\mathbb{D}}(F(z))|F'(z)| \leq \sigma_{\mathbb{D}}(z)$ . And this implies that

$$\sigma_1(z) \geq \sigma_{\mathbb{D}}(F \circ \psi_1(z))|(F \circ \psi_1)'(z)| = \sigma_{\mathbb{D}}(\psi_2 \circ f(z))|(\psi_2 \circ f)'(z)| = \sigma_2(f(z))|f'(z)|.$$

□

### Montel-Normal Family

**Def. (12.5.1.7) [Montel-Normal Family].** If  $\Omega \subset \mathbb{C}$  is a region, then a set  $\mathcal{S} = \{f_\alpha\}$  of holomorphic functions on  $\Omega$  is called a **Montel-normal family** if for any sequence of functions in  $\mathcal{S}$ , there exists a subsequence that converges uniformly in  $\Omega$  to  $\infty$  or to a holomorphic function. Or equivalently, for any compact subset  $D \subset \Omega$ , there exists a subsequence that converges uniformly in the compact-open topology of  $C(D, \mathbb{P}^1(\mathbb{C}))$ .

$\mathcal{S}$  is called normal at a point  $z \in \mathbb{C}$  if there exists a region  $z \in \Omega$  s.t.  $\mathcal{S}|_\Omega$  is a Montel-normal family. ┘

**Prop. (12.5.1.8).** If  $\Omega, \Omega' \subset \mathbb{C}$  is a region, and  $\{f_\alpha\}$  is a Montel-normal family of holomorphic maps from  $\Omega$  to  $\Omega'$ . Suppose  $g \in \mathcal{O}(\Omega')$ , then  $\{g \circ f_\alpha\}$  is also Montel-normal on  $\Omega$ . ┘

**Prop. (12.5.1.9) [Montel].** If  $\Omega \subset \mathbb{C}$  is a region, and  $\mathcal{S} = \{f_\alpha\}$  is a set of holomorphic functions on  $\Omega$  s.t.

$$\mathcal{S}' = \left\{ \frac{|f'_\alpha(z)|}{1 + |f_\alpha(z)|^2} \right\}$$

is a set of functions on  $\Omega$  bounded in the compact-open topology, then  $\mathcal{S}$  is a Montel-normal family. ┘

*Proof:* □

**Thm. (12.5.1.10) [Montel].** If  $\Omega \subset \mathbb{C}$  is a region, and  $\mathcal{S} = \{f_\alpha\}$  is a set of holomorphic functions on  $\Omega$  s.t. there exists  $a, b \in \mathbb{C}$  s.t.  $f(z) \neq a, b$  for any  $f \in \mathcal{S}, z \in \Omega$ , then  $\mathcal{S}$  is a Montel-normal family (12.5.1.7). ┘

*Proof:* By Riemann-mapping theorem, there is a covering map  $\rho : \mathbb{D} \rightarrow \mathbb{C} \setminus \{0, 1\}$ . Then each map  $f_\alpha$  lifts via  $\rho$  to a map  $\tilde{f}_\alpha : \Omega \rightarrow \mathbb{D}$ . Then  $\tilde{f}$  is bounded, and it follows from the formula  $f'(z) = \frac{1}{2\pi} \int_\gamma \frac{f(\zeta)}{(\zeta-z)^2} d\zeta$  that the derivatives of  $\tilde{f}_\alpha$  are also uniformly bounded. Thus  $\tilde{f}_\alpha$  is equicontinuous and uniformly bounded, so Montel-normal by Arzela-Ascoli. Finally, by (12.5.1.8),  $\{f_\alpha\}$  is also Montel-normal. □

**Prop. (12.5.1.11).** If  $\Omega \subset \mathbb{C}$  is a region and  $f \in \mathcal{M}(\Omega)$ , then for  $k \in \mathbb{Z}_+$ , the family  $\{f^{(n)}\}_{n \in \mathbb{Z}_+}$  is Montel-normal on  $\Omega$  iff the family  $\{f^{(kn)}\}_{n \in \mathbb{Z}_+}$  is Montel-normal on  $\Omega$ . ┘

$$\rho_{0,1}(z)$$

**Prop. (12.5.1.12)**  $[\rho_{0,1}]$ . Suppose the Poincaré metric on  $\mathbb{D} \setminus \{0, 1\}$  is  $\rho_{0,1}(z)|dz|$ , then

- $\rho_{0,1}(z) = \rho_{0,1}(1 - z)$ .
- $\rho_{0,1}(1/z) = \rho_{0,1}(z)/z^2$ .
- $\rho_{0,1}(z) = \rho_{0,1}(1 - z) > \frac{1}{4|z|}$  when  $|z|$  is small.
- $\rho_{0,1}(z) \leq \frac{1}{|z| \log |\frac{1}{z}|}$ .

┘

*Proof:* 1, 2 follows from the uniqueness of the Poincaré metric.

3 follows from [李忠]P46. ?

4: This follows from (12.5.1.2) and generalized Schwartz lemma (12.5.1.6).

□

**Prop. (12.5.1.13)**. Let  $\eta = \min\{\rho_{0,1}(z) : |z| = 1\}$ , then  $\eta = \rho_{0,1}(-1) = 4\pi^2/\Gamma^4(\frac{1}{4}) = 0.2284733$ .

┘

*Proof:*

□

**Prop. (12.5.1.14)**. For  $0 < |z| \leq 1$ ,

$$\rho_{0,1}(z) \geq \frac{1}{|z|(\eta^{-1} - \log |z|)},$$

where  $\eta = \min\{\rho_{0,1}(z), |z| = 1\} > 0$  by (12.5.1.12).

┘

*Proof:*

□

**Cor. (12.5.1.15)**. When  $z \rightarrow 0$ ,  $\rho_{0,1}(z) \sim \frac{1}{|z| \log |\frac{1}{z}|}$ .

┘

**Thm. (12.5.1.16)** [Landau]. If  $f \in \mathcal{O}(\mathbb{D})$  doesn't take the values 0, 1, then

$$|f'(0)| \leq 2|f(0)|(\eta^{-1} + |\log |f(0)||) \quad (12.5.1.13).$$

And the equality can be achieved.

┘

*Proof:* Cf. [李忠]P41.

□

**Thm. (12.5.1.17)** [Great Picard Theorem]. If an analytic function  $f$  has an essential singularity at a point  $w$ , then on any punctured nbhd of  $w$ ,  $f$  takes any value infinitely often, except for at most one single exception.

┘

*Proof:* We may assume  $f : \mathbb{D} \setminus \{0\} \rightarrow \mathbb{C} \setminus \{0, 1\}$ , then by generalized Schwartz lemma (12.5.1.6) and (12.5.1.2),

$$\rho_{0,1}(f(z))|f'(z)| \leq \frac{1}{|z| \log \frac{1}{|z|}}.$$

We want to prove that for  $z \in \mathbb{D}(0, e)$ , there exists some  $C$  s.t.

$$-\log |f(z)| < C \log \frac{1}{|z|}.$$

When  $f(z) \geq 1$ , this is clearly true, so we may assume  $f(z) < 1$ . Let  $m = \max\{|f(z)| : |z| = \rho\}$ , and let  $z = re^{i\theta}$ . Consider two cases:

If  $f(te^{i\theta}) \in \mathbb{D}$  for any  $r \leq t \leq e$ , then by (12.5.1.14),

$$\frac{|f'(z)|}{|f(z)|} [\eta^{-1} - \log |f(te^{i\theta})|]^{-1} \leq \frac{1}{|z| \log \frac{1}{|z|}}.$$

Integration on  $t \in [r, \rho]$  implies that

$$\log[\eta^{-1} - \log |f(z)|] \leq \log \log \frac{1}{|z|} - \log \log \frac{1}{\rho} + \log[\eta^{-1} - \log |f(\rho e^{i\theta})|] \leq \log \log \frac{1}{|z|} + \log \log \frac{e^{\eta^{-1}}}{m},$$

which implies that

$$-\log |f(z)| < C \log \frac{1}{|z|}.$$

If  $r_0 \in (r, e]$  is the smallest number s.t.  $|f(r_0 e^{i\theta})| = 1$ , then integration on  $t$  from  $r$  to  $r_0$  implies that

$$\log[\eta^{-1} - \log |f(z)|] \leq \log \log \frac{1}{|z|} - \log \log \frac{1}{r_0} + \log(\eta^{-1}) \leq \log \log \frac{1}{|z|},$$

which also implies that

$$-\log |f(z)| < \eta^{-1} \log \frac{1}{|z|}.$$

Now notice we can do all above for  $f$  replaced by  $1/f$ , so it implies that

$$\log |f(z)| < C' \log \frac{1}{|z|},$$

and then  $f$  is meromorphic at  $z = 0$ . □

**Thm. (12.5.1.18) [Schottky].** If  $f \in \mathcal{O}(\mathbb{D})$  doesn't take the values 0, 1, then

$$\log |f(z)| \leq [\eta^{-1} + \max\{\log |f(0)|, 0\}] \frac{1 + |z|}{1 - |z|} - \eta^{-1},$$

and the equality can be achieved. ┘

*Proof:* It follows from generalized Schwartz lemma (12.5.1.6) that

$$\rho_{0,1}(f(z)) |f'(z)| \leq \frac{2}{1 - |z|^2}.$$

For  $z = re^{i\theta} \in \mathbb{D}$ , if  $f(te^{i\theta}) \in \mathbb{D}$  for any  $t \in [0, r]$ , then it follows from (12.5.1.14) that

$$\frac{|f'(z)|}{|f(z)|} [\eta^{-1} - \log |f(te^{i\theta})|]^{-1} \leq \frac{2}{1 - |z|^2}.$$

Integration on  $t \in [0, r]$  implies that

$$\frac{\eta^{-1} - \log |f(z)|}{\eta^{-1} - \log |f(0)|} \leq \frac{1 + |z|}{1 - |z|}.$$

If  $r_0 \in (0, r]$  is the largest number s.t.  $|f(r_0 e^{i\theta})| = 1$ , then integration on  $t$  from  $r_0$  to  $r$  implies that

$$\eta(\eta^{-1} - \log |f(z)|) \leq \frac{1 + |z|}{1 - |z|} \frac{1 - r_0}{1 + r_0} < \frac{1 + |z|}{1 - |z|}.$$

So in any case we get

$$\eta^{-1} - \log |f(z)| \leq [\eta^{-1} + \max\{\log |f(0)|, 0\}] \frac{1 + |z|}{1 - |z|}.$$

And all the above applies to  $f$  replaced by  $1/f$ , so we get the desired formula.

To show the equality can be achieved, Cf.[李忠]P45. □

## 2 Harmonic Functions

**Def. (12.5.2.1) [Harmonic Functions].** A real-valued function on a region  $\Omega \subset \mathbb{C}$  is called **harmonic** iff it is  $C^1$  and has second order derivatives and

$$\Delta u = \left( \frac{\partial^2}{\partial x^2} + \frac{\partial^2}{\partial y^2} \right) u = 4 \frac{\partial}{\partial \bar{z}} \frac{\partial}{\partial z} f = 0.$$

This is an elliptic differential operator, so  $u$  is automatically smooth, by (13.1.8.4).

The vector space of Harmonic functions on  $\Omega$  is denoted by  $\mathcal{H}(\Omega) \subset C^\infty(\Omega)$ . ┘

**Prop. (12.5.2.2) [Schwarz's Theorem].** Cf.[Ahlfors P169]. ┘

**Def. (12.5.2.3) [Mean-Value Property].** A real valued function  $u$  on a region  $\Omega$  is said to have the **mean-value property** iff

$$u(z_0) = \frac{1}{2\pi} \int_0^{1\pi} u(z_0 + r e^{i\theta}) d\theta$$

whenever  $\mathbb{D}(z_0, r) \subset \Omega$ . ┘

**Lemma (12.5.2.4) [Harmonic Mean Value].** If  $u$  is a Harmonic function between two concentric circles, then the arithmetic mean of it over circles  $|z| = r$  is a linear function of  $\log r$ :

$$\frac{1}{2\pi} \int_{|z|=r} u d\theta = \alpha \log r + \beta.$$

In particular, if  $u$  is harmonic in the disk, then by continuity,  $\alpha = 0$ , and the mean value is a constant. ┘

*Proof:* Cf.[Ahlfors P165]. □

**Prop. (12.5.2.5) [Harmonicity and Mean-Value Property].** A harmonic function satisfies the mean-value property, and conversely, and continuous function satisfying the mean-value property is harmonic. ┘

*Proof:* Harmonic function satisfies the mean-value property by (12.5.2.4). Conversely, for any  $z_0$ , by Schwarz's theorem (12.5.2.2), there is a harmonic function  $v(z)$  that is harmonic in  $\mathbb{D}(z_0, \rho)$  and equals  $u(z)$  on  $\partial B(z_0, \rho)$ . Now the maximal and minimal principles apply to  $u - v$ , thus  $u = v$  is harmonic. □

**Cor. (12.5.2.6) [Maximum Principle].** If  $u$  is a harmonic function, then it attains neither maximum nor minimum at its region of definition.  $\lrcorner$

**Prop. (12.5.2.7) [Real Part of an Analytic Function is Harmonic].** On  $\mathbb{C}$ , formally,

$$4 \frac{\partial}{\partial z} \frac{\partial}{\partial \bar{z}} = 4 \frac{\partial}{\partial \bar{z}} \frac{\partial}{\partial z} = \Delta.$$

Thus for any open subset  $\Omega \subset \mathbb{C}$ , if  $f \in \mathcal{O}(\Omega)$ , then  $\operatorname{Im} f, \operatorname{Re} f \in \mathcal{H}(\Omega)$ .  $\lrcorner$

*Proof:* By (12.4.1.4),

$$4 \frac{\partial}{\partial z} \frac{\partial}{\partial \bar{z}} = \left( \frac{\partial}{\partial x} - i \frac{\partial}{\partial y} \right) \left( \frac{\partial}{\partial x} + i \frac{\partial}{\partial y} \right) = \frac{\partial^2}{\partial x^2} + \frac{\partial^2}{\partial y^2}.$$

$$4 \frac{\partial}{\partial \bar{z}} \frac{\partial}{\partial z} = \left( \frac{\partial}{\partial x} + i \frac{\partial}{\partial y} \right) \left( \frac{\partial}{\partial x} - i \frac{\partial}{\partial y} \right) = \frac{\partial^2}{\partial x^2} + \frac{\partial^2}{\partial y^2}.$$

If  $f \in \mathcal{O}(\Omega)$ , then  $f \in C^\infty(\Omega)$  by (12.4.2.7), then by (12.3.3.16) the formal calculation above applies to  $f$ , and by (12.4.1.10)

$$\Delta \operatorname{Re} f + i \Delta \operatorname{Im} f = \Delta f = \frac{\partial}{\partial z} \frac{\partial}{\partial \bar{z}} f = 0,$$

so  $\Delta \operatorname{Re} f = \Delta \operatorname{Im} f = 0$ , and  $\operatorname{Im} f, \operatorname{Re} f \in \mathcal{H}(\Omega)$ .  $\square$

**Cor. (12.5.2.8).** If  $\Omega \subset \mathbb{C}$  is a region and  $z \in \Omega$ ,  $f \in \mathcal{O}(\Omega)$  is non-vanishing, then  $\log |f| \in \mathcal{H}(\Omega)$ .  $\lrcorner$

*Proof:* Being harmonic is local, so we may look locally and assume  $\Omega$  is a disk. Then by (12.4.2.33), there exists a  $g \in \mathcal{O}(\Omega)$  s.t.

$$f(z) = \exp(g(z)).$$

Then it follows  $\operatorname{Re}(g(z)) = \log |f(z)|$ , which is harmonic by (12.5.2.7).  $\square$

**Prop. (12.5.2.9) [Harmonic Functions as the Real Parts of Analytic Functions].** Let  $\Omega \subset \mathbb{C}$  be a simply-connected region,  $u \in \mathcal{H}(\Omega)$ , then there exists  $f \in \mathcal{O}(\Omega)$  s.t.  $\operatorname{Re} f = u$ . And any two such  $f$  differ by a purely imaginary constant.  $\lrcorner$

*Proof:* Let  $g(z) = 2 \frac{\partial}{\partial \bar{z}} u$ , then  $\frac{\partial}{\partial \bar{z}} g = 2 \frac{\partial}{\partial \bar{z}} \frac{\partial}{\partial \bar{z}} u = \frac{1}{2} \Delta u = 0$ , so  $g \in \mathcal{O}(\Omega)$ . Then by (12.4.2.3), there exists  $f \in \mathcal{O}(\Omega)$  s.t.  $\frac{\partial}{\partial \bar{z}} f = g = 2 \frac{\partial}{\partial \bar{z}} u$ . So

$$2 \frac{\partial}{\partial x} u = \frac{\partial}{\partial x} \operatorname{Re} f + \frac{\partial}{\partial y} \operatorname{Im} f = 2 \frac{\partial}{\partial x} \operatorname{Re} f, \quad 2 \frac{\partial}{\partial y} u = \frac{\partial}{\partial y} \operatorname{Re} f - \frac{\partial}{\partial x} \operatorname{Im} f = 2 \frac{\partial}{\partial y} \operatorname{Re} f.$$

So  $u - \operatorname{Re} f$  is a constant function. And we may modify  $f$  to make  $\operatorname{Re} f = u$ . For the last assertion, use the Cauchy-Riemann equations to show that  $\frac{\partial}{\partial x} (\operatorname{Im} f - \operatorname{Im} f') = \frac{\partial}{\partial y} (\operatorname{Im} f - \operatorname{Im} f') = 0$ , so  $\operatorname{Im} f - \operatorname{Im} f'$  is a constant function.  $\square$

## Properties

**Prop. (12.5.2.10) [Poisson Formula].** For  $u \in \mathcal{H}(\overline{\mathbb{D}(0, R)})$ ,

$$u(z) = \frac{1}{2\pi} \int_0^{2\pi} \frac{R^2 - |z|^2}{|Re^{i\theta} - z|^2} u(Re^{i\theta}) d\theta = \operatorname{Re} \left[ \frac{1}{2\pi i} \int_{|\zeta|=R} \frac{\zeta + z}{\zeta - z} u(\zeta) \frac{d\zeta}{\zeta} \right].$$

for  $z \in \mathbb{D}(0, R)$ .

In particular, for any  $f \in \mathcal{O}(\overline{\mathbb{D}(0, R)})$ , there is a constant  $C \in \mathbb{R}$  s.t. for any  $z \in \mathbb{D}(0, R)$ :

$$f(z) = \frac{1}{2\pi i} \int_{|\zeta|=\rho} \frac{\zeta + z}{\zeta - z} \operatorname{Re}(f(\zeta)) \frac{d\zeta}{\zeta} + iC.$$

┘

*Proof:* This follows from (12.5.2.9) and (12.4.2.12). □

**Cor. (12.5.2.11) [Poisson-Jensen Formula].** For  $f \in \mathcal{O}(\overline{\mathbb{D}(0, R)})$  with no zeros on the boundary and zeros  $a_1, \dots, a_n$  inside (counting multiplicity), then for  $z \in \mathbb{D}(0, R)$  s.t.  $f(z) \neq 0$ ,

$$\log |f(z)| = - \sum_i \log \left| \frac{R^2 - \bar{a}_i z}{R(z - a_i)} \right| + \frac{1}{2\pi} \int_0^{2\pi} \frac{R^2 - |z|^2}{|Re^{i\theta} - z|^2} \log |f(Re^{i\theta})| d\theta.$$

In particular, if  $f(0) \neq 0$ , then

$$\log |f(0)| = - \sum_i \log \left| \frac{R}{a_i} \right| + \frac{1}{2\pi} \int_0^{2\pi} \log |f(Re^{i\theta})| d\theta.$$

┘

*Proof:* Firstly, this is true when  $f$  is non-vanishing on  $\mathbb{D}(0, \rho)$ , because in this case  $\log |f|$  is harmonic by (12.5.2.8) and we can use mean value theorem (12.5.2.5). In general, consider the function

$$F(z) = f(z) \prod_{i=1}^n \frac{R^2 - \bar{a}_i z}{R(z - a_i)},$$

then it satisfies  $F(z) = f(z)$  for  $|z| = R$ , and has no zeros on  $\mathbb{D}(0, R)$ , so

$$\frac{1}{2\pi} \int_0^{2\pi} \log |f(\rho e^{i\theta})| d\theta = \log |F(0)| = \log |f(0)| + \sum_i \log \left| \frac{R^2 - \bar{a}_i z}{R(z - a_i)} \right|.$$

□

**Prop. (12.5.2.12) [Hadamard's Three Circle Theorem].** Let  $f(z)$  be analytic in the annulus  $r_1 < |z| < r_2$ , and continuous on the boundary, if  $M(r)$  denotes the maximum of  $|f(z)|$  for  $|z| = r$ , then:

$$M(r) \leq M(r_1)^\alpha M(r_2)^{1-\alpha}$$

where  $\alpha = \log(r_2/r) : \log(r_2/r_1)$ . ┘

*Proof:* Apply the maximum principle (12.5.2.6) for

$$g(z) = \log |f(z)| - \log(M(r_1))(\log(r_2/|z|) : \log(r_2/r_1)) - \log(M(r_2))(1 - \log(r_2/|z|) : \log(r_2/r_1)),$$

it is harmonic by (12.5.2.8), then  $g(z) \leq 0$  on  $|z| = r_1$  and  $|z| = r_2$ , so  $g(z) \leq 0$  on all the annulus. □

**Cor. (12.5.2.13).** Let  $f(z)$  be analytic in the annulus  $r_1 < |z| < r_2$ , then the function

$$s \mapsto \max_{z=e^s} |f(z)|$$

is convex on the interval  $[\log(r_1), \log(r_2)]$ . ┘

**Prop. (12.5.2.14) [Reflection Principle].** ┘

*Proof:* □

**Prop. (12.5.2.15) [Harnack's Inequality].** For a positive harmonic function  $u$  on  $B(0, \rho)$ ,

$$\frac{\rho - |z|}{\rho + |z|} u(0) \leq u(z) \leq \frac{\rho + |z|}{\rho - |z|} u(0).$$

┘

*Proof:* By Poisson formula,

$$u(z) = \frac{1}{2\pi} \int \frac{\rho^2 - |z|^2}{|\rho e^{i\theta} - z|^2} u(\rho e^{i\theta}) d\theta$$

for  $|z| < \rho$ , so the conclusion follows from the obvious inequality

$$\frac{\rho - |z|}{\rho + |z|} \leq \frac{\rho^2 - |z|^2}{|\rho e^{i\theta} - z|^2} \leq \frac{\rho + |z|}{\rho - |z|}$$

and Mean-value property (12.5.2.5). □

**Cor. (12.5.2.16).** If  $E$  is a compact subset of a region  $\Omega$ , there is a constant  $M$ , depending on  $E, \Omega$  that for any positive harmonic function  $u(z)$  on  $\Omega$ ,  $u(z_2) \leq Mu(z_1)$  for any  $z_1, z_2 \in E$ . ┘

*Proof:* This is an easy consequence of Harnack inequality and the compactness of  $E$ . □

**Cor. (12.5.2.17) [Harnack's Principle].** Consider a sequence of functions  $u_n(z)$ , each harmonic in a region  $\Omega_n$ , and there is a region  $\Omega$  that every point has a nbhd that is contained in all but f.m.  $\Omega_n$ , and in this nbhd  $u_n(z) \leq u_{n+1}(z)$  for  $n$  large, then either  $u_n(z)$  tends to  $+\infty$  in the compact open topology, or they tends to a harmonic function in compact open topology. ┘

*Proof:* The uniform continuity follows easily from Harnack's inequality, and for the harmonicity of the limit function  $u(z)$  is a consequence of the Poisson formula. □

### Bounds on Locations of Zeros

**Prop. (12.5.2.18).** For  $f \in \mathcal{O}(\mathbb{D})$  and  $r \in (0, 1)$ , denote

$$A(r) = \frac{1}{2r} \int_0^{2\pi} \log |f(re^{i\theta})| d\theta.$$

Then if  $f$  has no zeros on  $\partial\mathbb{D}(0, r)$ ,

$$\frac{\partial}{\partial r} A(r) = \frac{1}{r} \#\{\text{zeros of } f \text{ in } \mathbb{D}(0, r)\}.$$

┘

*Proof:* We may divide  $f$  by  $z^k$  to make  $f(0) \neq 0$ , then the assertion follows from (12.5.2.11). □

**Prop. (12.5.2.19).** Let  $f \in \mathcal{O}(\overline{\mathbb{D}})$  s.t.  $\max_{z \in \overline{\mathbb{D}}} |f| = K|f(0)|$ . Then for any  $\delta \in (0, 1)$ ,

- $\#\text{Zero}(f) \cap \mathbb{D}(0, 1 - \delta) \leq \frac{\log K}{\delta}$ .

- There exists  $C(\delta) \in \mathbb{R}_+$  s.t. for any  $s \in \mathbb{D}(0, 1 - \delta)$ ,

$$\left| \frac{f^n}{f}(s) + \sum_{\text{Zero}(f) \cap \mathbb{D}(0, 1 - \delta)} \frac{1}{s - \rho} \right| \leq C(\delta) \log K.$$

┘

*Proof:* 1: By (12.5.2.18) and fundamental theorem of calculus,

$$\#\text{Zero}(f) \cap \mathbb{D}(0, 1 - \delta) \leq \frac{A(1) - A(1 - \delta)}{\delta} \leq \frac{\max_{\partial \mathbb{D}} \log |f| - \log |f(0)|}{\delta} = \frac{\log K}{\delta}.$$

2: Cf. [Larry Guth]P83.

□

### Dirichlet Problem

### 3 Subharmonic Functions

**Def. (12.5.3.1) [Subharmonic Functions].**

┘

**Prop. (12.5.3.2) [Hartog's Lemma].** If  $(u_i)_{i \in \mathbb{Z}_+}$  is a sequence of real-valued subharmonic functions (12.5.3.1) on an open subset  $U \subset \mathbb{C}$  that is uniformly bounded from above, and there exists  $C \in \mathbb{R}$  s.t.

$$\overline{\lim}_i u_i(z) \leq C$$

for each  $z \in U$ . Then for any  $\varepsilon \in \mathbb{R}_+$  and any compact subset  $K \subset U$ , there exists  $N \in \mathbb{Z}_+$  s.t. for any  $k \in \mathbb{Z}_{\geq N}$ , we have

$$u_k(z) \leq C + \varepsilon.$$

┘

*Proof:* By shrinking  $U$  (but still contains  $K$ ), we may assume that  $(u_i)$  are uniformly bounded on  $U$ . We may assume that  $u_i \leq 0$ . Let  $r = d(K, U^c)/4$ , then for any  $z \in K$ ,

$$\overline{\lim}_k \int_{\mathbb{D}(z, r)} u_k(\zeta) d\zeta \leq 2\pi r^2 C$$

by Fatou's lemma (12.3.2.7). Thus for  $k$  sufficiently large,

$$\int_{\mathbb{D}(z, r)} u_k(\zeta) d\zeta \leq 2\pi r^2 (C + \varepsilon/2).$$

Now for any  $0 < \delta < r$  and  $w \in D(z, \delta)$ , we have

$$\pi(r + \delta)^2 u_k(w) \leq \int_{D(w, r + \delta)} u_k(\zeta) d\zeta \leq \int_{\mathbb{D}(z, r)} u_k(\zeta) d\zeta \leq 2\pi r^2 (C + \varepsilon)$$

Thus for suitable  $\delta$ , we have  $u_k(w) \leq C + \varepsilon$ . Since  $K$  is compact, the assertion follows.

□

#### 4 Mellin-Transform

**Def. (12.5.4.1) [Mellin-Types].** For  $-\infty \leq \alpha < \beta \leq \infty$ , a function  $f : \mathbb{R}_+ \rightarrow \mathbb{C}$  is called of **Mellin-type**  $(\alpha, \beta)$  if

$$f(y)y^{s-1} \in L^1(\mathbb{R})$$

for each  $s \in \mathbb{C}$  s.t.  $\operatorname{Re}(s) \in (\alpha, \beta)$ . ┘

**Prop. (12.5.4.2) [Mellin Transform and Inversion].** Given a function  $f : \mathbb{R}_+ \rightarrow \mathbb{C}$  of Mellin-type  $(\alpha, \beta)$ , its **Mellin-transformation** is defined to be

$$(\mathcal{M}f)(s) = \int_0^\infty f(t)t^s \frac{dt}{t}.$$

where  $s \in \mathbb{C}$  is in the domain s.t. this integral is absolutely convergent (this is the case when  $\operatorname{Re}(s) \in (\alpha, \beta)$ ).

Notice if  $\int_0^1 f(t)t^s \frac{dt}{t}$  is convergent for some  $s_0 \in \mathbb{C}$ , then it converges for any  $s \in \mathbb{C}$  with  $\operatorname{Re}(s) > \operatorname{Re}(s_0)$ , and if  $\int_1^\infty f(t)t^s \frac{dt}{t}$  converges for some  $s$ , then it converges for any smaller  $s$ . So the domain of  $\mathcal{M}(f)$  is a vertical strip  $\sigma_1 < \operatorname{Re}(s) < \sigma_2$  for  $\sigma_1, \sigma_2 \in [-\infty, \infty]$ , if nonempty. And in this case,  $\mathcal{M}(f)$  is an analytic function on it, by (12.4.2.14).

Then  $f$  can be recovered from  $\mathcal{M}f$ : for any  $\sigma_1 < \sigma < \sigma_2$ , we have

$$f(x) = \frac{1}{2\pi i} \int_{\sigma-i\infty}^{\sigma+i\infty} (\mathcal{M}f)(s)x^{-s} ds.$$

┘

*Proof:* Using the isomorphism of groups  $t = e^x : \mathbb{R}^+ \rightarrow \mathbb{R}$ , this is just the usual Fourier-transformation on  $\mathbb{R}$  (12.11.3.34). □

**Prop. (12.5.4.3) [L-Functions].** Let  $f : \mathbb{R}_{\geq 0} \rightarrow \mathbb{C}$  be a smooth function that decays exponentially at infinity, then the **L-function**

$$L(f; s) = \frac{1}{\Gamma(s)} \int_0^\infty f(t)t^s \frac{dt}{t} \quad (12.5.4.2)$$

converges absolutely to a holomorphic function for  $\operatorname{Re}(s) > 0$ . Moreover,

$$L(f; s) = -L(f^\vee, s+1).$$

In particular,  $L(f; s)$  extends to a holomorphic function on  $\mathbb{C}$ . And for  $n \in \mathbb{N}$ ,

$$L(f; -n) = (-1)^n f^{(n)}(0).$$

┘

*Proof:*  $\mathcal{M}h(s)$  is analytic for  $\operatorname{Re}(s) > 0$  by (12.5.4.2). The equation  $L(f; s) = -L(f^\vee, s+1)$  follows by integration by part and the fact  $\Gamma(s) = (s-1)\Gamma(s-1)$  (12.6.1.2). Thus

$$L(f; -n) = (-1)^{n+1} L(f^{(n+1)}; 0) = (-1)^{n+1} \int_0^\infty f(t) dt = (-1)^n f^{(n)}(0).$$

□

**Def. (12.5.4.4) [Laplace-Transformation].** Let  $h : \mathbb{R}_+ \rightarrow \mathbb{R}$  be a piecewise-continuous function, the **Laplace-transformation** of  $h$  is the function

$$(\mathcal{L}h)(s) = \int_0^\infty e^{-st} h(t) dt, s \in \mathbb{C}$$

whenever it is convergent. It is a holomorphic function for  $\operatorname{Re}(s) > c$  if  $h(t) \leq \kappa e^{ct}$  for some  $\kappa \in \mathbb{R}_+$ .  
 $\lrcorner$

*Proof:* The last assertion follows from (12.4.2.14).  $\square$

**Thm. (12.5.4.5).** Let  $f : \mathbb{R}_{\geq 0} \rightarrow \mathbb{R}$  be a bounded piecewise-continuous function that its Laplace-transform  $(\mathcal{L}f)(s)$  (12.5.4.4) extends to a holomorphic function on  $\operatorname{Re}(s) \geq 0$ , then the integral  $\int_0^\infty f(t) dt$  converges and equals  $\mathcal{L}f(0)$ .  $\lrcorner$

*Proof:* Cf. [Suthurland, Number Theory1, L16]. ?  $\square$

### Calculations

References are [Table of integrals, series, and products].

**Example (12.5.4.6).** For  $s = \sigma + i\tau \in \mathbb{C}$ ,

- $\mathcal{M}(e^{-y})(s) = \Gamma(s)$  if  $\sigma > 0$ .
- $\mathcal{M}(\cos y)(s) = \Gamma(s) \cos\left(\frac{\pi s}{2}\right)$  if  $0 < \sigma < 1$ .
- $\mathcal{M}(\sin y)(s) = \Gamma(s) \sin\left(\frac{\pi s}{2}\right)$  if  $-1 < \sigma < 1$ .
- $\mathcal{M}\left(\frac{1}{1+y}\right)(s) = \frac{\pi}{\sin(\pi s)}$  if  $0 < \sigma < 1$ .
- $\mathcal{M}(\log(1+y))(s) = \frac{\pi}{s \sin(\pi s)}$  if  $-1 < \sigma < 0$ .

$\lrcorner$

*Proof:* Cf. [Table of integrals, series, and products] Chap3.  $\square$

**Example (12.5.4.7) [Integral Representation of  $\log^+ x$ ].** Because

$$\mathcal{M}(\log^+ x)(s) = s^{-2}, \quad \operatorname{Re}(s) < 0,$$

we have

$$\log^+ x = \frac{1}{2\pi i} \int_{\sigma-i\infty}^{\sigma+i\infty} x^s s^{-2} ds, \quad \sigma \in \mathbb{R}_+.$$

$\lrcorner$

## 5 Miscellaneous

**Def. (12.5.5.1) [ $L^2(\mathbb{D}, \nu_k)$  Unit Disc].** Define a density  $\nu_k = \frac{4(1-|w|^2)^{k-2} du dv}{|1-w|^{2k}} (k \geq 2)$  on  $\mathbb{D}$  and define  $L^2(\mathbb{D}, \nu_k)$  to be the space of holomorphic functions on  $\mathbb{D}$  that is  $L^2(\nu_k)$  bounded. Then the space  $L^2(\mathbb{D}, \nu_k)$  is complete.  $\lrcorner$

*Proof:* By (12.4.2.11), the uniform norm is bounded by the local  $L^1$ -norm hence also the local  $L^2$ -norm. Hence for a compact subset  $K$ , the uniform norm is also bounded by  $L^2(\nu_k)$ -norm. Thus any Cauchy sequence in  $L^2(\mathbb{D}, \nu_k)$  converges to a holomorphic function by Weierstrass theorem (12.4.5.3).  $\square$

**Prop. (12.5.5.2).** The space  $L^2(\mathbb{D}, \nu_k)$  has an orthogonal basis consisting of holomorphic functions

$$\{\psi_n = w^n(1-w)^k\}_{n \geq 0}.$$

┘

*Proof:* Firstly,  $\psi_n$  is convergent: In the polar coordinate,  $\nu_k = \frac{4(1-r^2)^{k-2}rdrd\theta}{|1-w|^{2k}}$ , so

$$\|\psi_n\|^2 = 4 \int_0^{2\pi} \int_0^1 r^{2n}(1-r^2)^{k-2} dr d\theta < \infty.$$

And if  $m \neq n$ ,

$$\int_{\mathbb{D}} \psi_m(w) \overline{\psi_n(w)} dw = 4 \int_{\mathbb{D}} w^m (\overline{w})^n (1-r^2)^{k-2} dr d\theta = 4 \int_0^1 r^{m+n} (1-r^2)^{k-2} \int_0^{2\pi} e^{i(m-n)\theta} d\theta = 0.$$

□

**Def. (12.5.5.3) [Upper Half Plane  $\mathcal{H}_k$ ].** On the upper half plane  $\mathcal{H}$ , we can define a density  $\mu_k = y^k \frac{dx dy}{y^2}$  ( $k \geq 2$ ), and define  $L^2(\mathcal{H}, \mu_k)$  to be the space of holomorphic functions on  $\mathcal{H}$  that is  $L^2(\mu_k)$  bounded. Then under the Cayley map  $z \mapsto w = \frac{z-i}{z+i}$ , this density is mapped to the density  $\nu_k$  of  $\mathbb{D}$  and induces an isomorphism of spaces

$$L^2(\mathcal{H}, \mu_k) \cong L^2(\mathbb{D}, \nu_k).$$

In particular,  $L^2(\mathcal{H}, \mu_k)$  is complete, and it has an orthogonal basis

$$\{\varphi_n = \left(\frac{z-i}{z+i}\right)^n \frac{(2i)^k}{(z+i)^k}\}.$$

by (12.5.5.1) and (12.5.5.2).

┘

## 6 Elliptic Functions

References are [Ahl78]Chap7, [Sil99], [Sil16]. [Elliptic Functions according to Eisenstein and Kronecker, Weil].

### Trigonometric Functions

#### Elliptic Functions(Eisenstein)

**Def. (12.5.6.1) [Doubly Periodic Function].** Let  $\Lambda$  be a lattice of  $\mathbb{C}$ , then a meromorphic function  $f$  on  $\mathbb{C}$  is called **doubly periodic w.r.t.**  $\Lambda$  if it is invariant under  $\Lambda$ .

┘

**Prop. (12.5.6.2).** Let  $f$  be a periodic function for  $\Lambda$ , not identically zero, and let  $D$  be a fundamental parallelogram for  $\Lambda$  that  $f$  has no zeros or poles on the boundary of  $D$ . Then

- $\sum_{P \in D} \text{ord}_P(f) = 0$ .
- $\sum_{P \in D} \text{res}_P(f) = 0$ .
- $\sum_{P \in D} \text{ord}_P(f) \cdot P = 0$ .

┘

*Proof:*  $f$  can be realized as meromorphic functions on the Riemann surface  $\mathbb{C}/\Lambda$ , so 1, 2 are direct consequences of (16.9.9.9) 1, 2. 3 is 2 applied to the meromorphic function  $zf'(z)/f(z)$ .  $\square$

**Def. (12.5.6.3)[Order].** The order of an elliptic function  $f$  is defined to be the number of poles of  $f$  in  $D$ . Equivalently, it is the number of zeros of  $f$  in  $D$  (12.5.6.2).  $\lrcorner$

**Prop. (12.5.6.4).** The total number of orders of a non-constant elliptic function  $\geq 2$ .  $\lrcorner$

*Proof:* If its order is 0, then it is bounded on  $D$  and also on  $\mathbb{C}$  thus constant by Liouville's theorem. If its order is 1, then it has a simple pole  $z_0$ , but then  $\text{Res}_{z_0}(f) \neq 0$ , contradicting (12.5.6.2).  $\square$

**Def. (12.5.6.5)[Weierstrass  $\wp$ -Function].** For a lattice  $\Lambda \subset \mathbb{C}$ , consider the function

$$\wp(z) = \frac{1}{z^2} + \sum_{\omega \in \Lambda \setminus \{0\}} \left( \frac{1}{(z - \omega)^2} - \frac{1}{\omega^2} \right)$$

Then it is a doubly periodic meromorphic function that has a double pole at 0, and so does its derivative  $\wp'$ , having a triple pole at 0. Hence they descend to a rational function on  $\mathbb{C}/\Lambda$ .

If  $\Lambda = \Lambda_\tau$ , then the function  $\wp(z; \tau) = \wp(z)$  is called the **Weierstrass  $\wp$ -function**.  $\lrcorner$

**Prop. (12.5.6.6).** Let  $G_k(\Lambda)$  be given by (26.3.4.5),

$$\wp(z) = \frac{1}{z^2} + \sum_{k \geq 1} (2k + 1) G_{2k+2}(\Lambda) z^{2k}.$$

$\lrcorner$

*Proof:* This follows from (10.7.2.1).  $\square$

**Prop. (12.5.6.7)[Fields of Elliptic Functions].** The field of doubly periodic functions for  $\Lambda$  is just  $\mathbb{C}(\wp, \wp')$ . And  $\wp, \wp'$  also satisfies the following equation:

$$\wp'(z)^2 = 4\wp(z)^3 - g_2\wp(z) - g_3$$

where  $g_2 = 60G_4(\Lambda)$ ,  $g_3 = 140G_6(\Lambda)$  (26.3.4.5).  $\lrcorner$

*Proof:* For the equational function, just notice we can calculate directly that the difference of the two sides is a holomorphic function in  $z$  without constant terms, and they are both doubly periodic, thus is zero.

For the first statement, notice that any function is a sum of an odd function and an even function.  $\wp'$  is odd, thus an odd function is  $\wp'$  times an even function. Thus it reduces to show that any even doubly periodic function is a rational function of  $\wp$ .

For any even periodic function  $f$ ,  $f$  has the same order at  $z_0$  and  $-z_0$ , also if  $z_0 \equiv -z_0 \pmod{\Lambda}$ , the order of  $f$  at  $z_0$  must be odd. Now consider  $\wp(z) - \wp(z_0)$ , then it is a function with two poles at 0, so it has two zeros. If  $z_0 \equiv -z_0$ , then  $\wp(z) - \wp(z_0)$  has a zero of order 2 at  $z_0$ , and otherwise it has simple zeros at  $z_0$  and  $-z_0$ .

So for any even doubly periodic function  $f$ , we can use the product  $\prod (\wp(z) - \wp(z_0))^{m_i}$  to get a function with the same order of poles and zeros as  $f$ , which implies it equals  $f$ .  $\square$

**Prop. (12.5.6.8)[Uniformization Theorem].** For any complex numbers  $A, B \in \mathbb{C}$  that  $A^3 - 27B^2 \neq 0$ , there exists a unique lattice  $\Lambda \in \mathbb{C}$  that  $g_2(\Lambda) = A$ ,  $g_3(\Lambda) = B$  (12.5.6.7).  $\lrcorner$

*Proof:* The  $j$ -function (26.3.4.22) is surjective, thus there is a  $z \in \mathbb{C}$  s.t.

$$1728 \frac{1}{1 - \frac{E_6^2}{E_4^3}} = j(z) = 1728 \frac{A^3}{A^3 - 27B^2}$$

And if we assume  $A, B \neq 0$ , then by (26.3.4.5) (31.3.5.3) and (10.7.1.12), assume this implies

$$\left(\frac{B}{g_3(\tau)}\right)^2 \left(\frac{g_2(\tau)}{A}\right)^3 = 1.$$

Then we can scale  $\Lambda$  by  $\Lambda' = \alpha\Lambda$  s.t.  $g_3(\Lambda') = B$ ,  $g_2(\Lambda) = A$ .

The case that  $A = 0$  or  $B = 0$  is similar.

The uniqueness follows from (20.9.8.10). □

## 7 Quasi-Conformal Mappings

### Modulus

**Def. (12.5.7.1) [Conformal Annulus].** A **conformal annulus** is an open subset  $A$  of  $\mathbb{P}^1(\mathbb{C})$  that can be mapped conformally to an annulus  $\mathbb{D}(0, (r, s))$  for  $r < s \in \mathbb{R}_{\geq 0}$ . And in this case, the **module of**  $A$  is defined to be  $\frac{1}{2\pi} \log(\frac{s}{r})$ . And this is an invariance of  $A$ . ┘

*Proof:* □

**Def. (12.5.7.2) [Uniformly Perfect Subsets].** A compact subset  $E \subset \mathbb{P}^1(\mathbb{C})$  is called **uniformly perfect** if  $\#E \geq 2$ , and the modules of the conformal annuli in  $\mathbb{P}^1(\mathbb{C}) \setminus E$  that separate  $E$  are bounded. ┘

### Beltrami Equations

**Def. (12.5.7.3) [Beltrami Coefficients].** For  $f \in C^1(\mathbb{C})$  and  $z \in \mathbb{C}$  s.t.  $df$  is non-singular at  $z$ , then the **Beltrami coefficient** of  $f$  at  $z$  is defined to be the number

$$\mu = \frac{\frac{\partial}{\partial \bar{z}} f}{\frac{\partial}{\partial z} f}.$$

By (12.4.1.5),  $f$  preserves orientation iff  $|\mu| < 1$  at any point.

If  $f^{(-1)}$  is the inverse of  $f$  near  $f(z)$ , then

$$|\mu_{f^{-1}}(f(z))| = |\mu_f(z)|,$$

because

$$\frac{\partial}{\partial z} f^{-1} \frac{\partial}{\partial z} f + \frac{\partial}{\partial \bar{z}} f^{-1} \overline{\frac{\partial}{\partial \bar{z}} f} = 0$$

┘

**Def. (12.5.7.4) [Beltrami Equations].** For  $\mu \in C(\mathbb{C})$ , the equation  $\frac{\partial}{\partial z} f = \mu \frac{\partial}{\partial \bar{z}} f$  is called a **Beltrami equation**. ┘

**Prop. (12.5.7.5).** If  $f \in \mathbb{C}^1(\mathbb{C})$  is non-singular and  $\varphi$  is conformal, then

$$\begin{aligned}\mu_{\varphi \circ f}(z) &= \mu_f(z), \\ \mu_{f \circ \varphi}(z) &= \mu_f(\varphi(z)) \frac{\overline{\varphi'(z)}}{\varphi'(z)}.\end{aligned}$$

┘

*Proof:* These follow from the fact that  $\frac{\partial}{\partial \bar{z}}\varphi = 0$ . □

**Def. (12.5.7.6) [Quasiconformal Maps].** For a region  $\Omega \subset \mathbb{C}$  and  $k \in [0, 1)$ , a  **$k$ -quasiconformal map**  $f$  on  $\Omega$  is a function  $f^\infty(\Omega)$  s.t.  $|\mu| \leq k < 1$  at each point  $z \in \Omega$ . ┘

**Def. (12.5.7.7) [Quasi-Circles].** A **quasi-circle** is a subset of  $\mathbb{P}^1(\mathbb{C})$  that can be mapped via a quasiconformal homeomorphism of the sphere to  $\partial\mathbb{D}(0, 1) \in \mathbb{P}^1(\mathbb{C})$ . ┘

## 8 Multi-Variable case

### Basics

Should cover the part from [Complex Analytic and Differential Geometry Demailly], [Principle of Algebraic Geometry Griffith/Harris] and [Huy05].

**Def. (12.5.8.1) [Polydiscs].** For  $z \in \mathbb{C}^n$  and  $\varepsilon \in (\mathbb{R}_+)^n$ , the **polydisc**  $B(z, \varepsilon) \subset \mathbb{C}^n$  is defined to be the set  $\{z : |z_i - a_i| < \varepsilon_i\}$ . ┘

**Def. (12.5.8.2) [Holomorphic Functions in Several Variables].** Let  $\Omega \subset \mathbb{C}^n$  be an open subset, then  $f : \Omega \rightarrow \mathbb{C}$  is called a **holomorphic function in several variables** iff it is holomorphic for each coordinate separately. ┘

**Thm. (12.5.8.3) [Hartog's Theroem].** Let  $\Omega \subset \mathbb{C}^n$  be an open subset and  $f : \Omega \rightarrow \mathbb{C}$  be a holomorphic function (12.5.8.2), then for any  $z \in \Omega$ ,  $f$  is a convergent power series in some nbhd of  $z$ . ┘

*Proof:* Firstly, if  $f$  is continuous on some closed polydisc  $\overline{\mathbb{D}}(z, \varepsilon)$  around  $z$  (12.5.8.1), then

$$\begin{aligned}f(z) &= \frac{1}{2\pi i} \int_{|\zeta_1 - z_1| = \varepsilon_1} \cdots \int_{|\zeta_n - z_n| = \varepsilon_n} \frac{f(\zeta)}{(\zeta_1 - z_1) \cdots (\zeta_n - z_n)} d\zeta_1 \cdots d\zeta_n \\ &= \sum_{a_i \in \mathbb{N}} z_1^{a_1} \cdots z_n^{a_n} \cdot \int_{|\zeta_1 - z_1| = \varepsilon_1} \cdots \int_{|\zeta_n - z_n| = \varepsilon_n} \frac{f(\zeta)}{\zeta_1^{a_1+1} \cdots \zeta_n^{a_n+1}} d\zeta_1 \cdots d\zeta_n.\end{aligned}$$

is a power series around  $z$ .

$f$  is continuous on some closed polydisc around  $z$  if it is bounded on this closed polydisc, by Schwarz lemma (12.5.1.4) applied to each coordinate.

Now we prove the assertion by induction on  $n$ .  $n = 1$  if trivial, for  $n \geq 2$ , let  $\overline{\mathbb{D}} = \prod_{i=1}^n \overline{\mathbb{D}}(z_i, 2r)$  be a polydisc around  $z$ . For  $B \in \mathbb{Z}_+$ , let

$$\Omega_B = \{z' \in \prod_{1 \leq j \leq n-1} \overline{\mathbb{D}}(z_j, r) : |f(z', z_n)| \leq B, \forall z_n \in \overline{\mathbb{D}}(z_n, r)\},$$

then  $\Omega_B$  is closed because for each  $z_n \in \overline{\mathbb{D}}(z_n, r)$ ,  $f(z', z_n)$  is analytic in  $z'$  by induction hypothesis. But for fixed  $z' \in \prod_{1 \leq j \leq n-1} \overline{\mathbb{D}}(z_j, r)$ ,  $f(z', z_n)$  is continuous in  $z_n$ , thus bounded on  $\overline{\mathbb{D}}(z_n, r)$ . So we have

$$\bigcup_{B \in \mathbb{Z}_+} \Omega_B = \prod_{1 \leq j \leq n-1} \overline{\mathbb{D}}(z_j, r).$$

But then by Baire category theorem, some  $\Omega_B$  must have a non-empty interior, thus contains a closed polydisc  $\prod_{1 \leq j \leq n-1} \overline{\mathbb{D}}(w_j, \varepsilon) \times \overline{\mathbb{D}}(z_n, r)$ . Thus  $f$  is analytic on the interior of this polydisc by the argument above.

Now take the Taylor expansion

$$f(\zeta', \zeta_n) = \sum_{\alpha} c_{\alpha}(\zeta_n)(\zeta' - w')^{\alpha},$$

where each  $c_{\alpha}(\zeta_n)$  is holomorphic in  $\zeta_n$  and satisfies  $|c_{\alpha}(\zeta_n)| \leq M/\varepsilon^{|\alpha|}$  for some  $M \in \mathbb{R}_+$  uniformly in  $\zeta_n$  and  $\alpha$  by Cauchy's integral formula.

For any  $0 < r_1 < r_2 < r$  and  $\zeta_n \in \mathbb{D}(z_n, r)$ , we have  $\lim_{|\alpha| \rightarrow \infty} |c_{\alpha}(\zeta_n)| r_2^{|\alpha|} = 0$  because of the convergence of power series for  $\zeta' \in \prod_{1 \leq j \leq n-1} \mathbb{D}(w_j, r)$ . Thus the functions

$$\{u_{\alpha}(\zeta_n) = \frac{1}{|\alpha|} \log |c_{\alpha}(\zeta_n)|\}_{|\alpha| \geq 1}$$

are uniformly bounded on  $\mathbb{D}(z_n, r)$ , and for any fixed  $\zeta_n$ ,

$$\overline{\lim}_{|\alpha| \rightarrow \infty} u_{\alpha}(\zeta_n) \leq \log(1/r_2).$$

Thus by Hartog's lemma (12.5.3.2), for all  $\alpha$  sufficiently large, we have  $u_{\alpha}(\zeta_n) \leq \log(1/r_1)$  uniformly in  $\zeta_n \in \mathbb{D}(z_n, r_1)$ . Thus

$$f(\zeta', \zeta_n) = \sum_{\alpha} c_{\alpha}(\zeta_n)(\zeta' - w')^{\alpha}$$

converges uniformly to an analytic function on the polydisc  $\prod_{1 \leq j \leq n-1} \mathbb{D}(w_j, r_1) \times \mathbb{D}(z_n, r)$ . Since  $r_1 < r_2$  are arbitrary, we see  $f$  is analytic on the polydisc  $\prod_{1 \leq j \leq n-1} \mathbb{D}(w_j, r) \times \mathbb{D}(z_n, r)$ , which contains  $z$ , so  $f$  is analytic at  $z$ .  $\square$

**Thm. (12.5.8.4) [Hartog's Extension Theorem].** If  $n \in \mathbb{Z}_{\geq 2}$  and  $K$  is a compact subset in an open domain  $\Omega \subset \mathbb{C}^n$  s.t.  $\Omega \setminus K$  is connected, then any holomorphic function on  $\Omega \setminus K$  extends to a holomorphic function on  $\Omega$ .  $\lrcorner$

*Proof:* ?  $\square$

**Prop. (12.5.8.5).** Let  $\varepsilon = (\delta, \dots, \delta)$  and  $f$  be a holomorphic function on the polydisc  $\overline{B_{\varepsilon}(0)}$ . Then if  $f$  vanishes of order  $k$  at the origin and  $|f(z)| \leq C$ , then

$$f(z) \leq C \left( \frac{|z|}{\delta} \right)^k$$

for all  $z \in \overline{B_{\varepsilon}(0)}$ .  $\lrcorner$

*Proof:* Fix  $z \in \overline{B_{\varepsilon}(0)} \neq 0$ , consider the one-variable function  $g_z(w) = w^{-k} f(w \cdot \frac{z}{|z|})$ , then  $g_z$  is holomorphic and  $|g_z(w)| \leq \delta^{-k} C$  for  $|w| = \delta$ . So maximal principle implies that  $g_z(w) \leq \delta^{-k} C$  for all  $|w| \leq \delta$ . Hence  $|z|^{-k} |f(z)| = |g_z(z)| \leq \delta^{-k} C$ .  $\square$

## 12.6 Special Functions

References are [Special Functions].

### 1 Gamma Function

**Def. (12.6.1.1) [Gamma Function, Euler(1729)].** For  $s \in \mathbb{C}$  s.t.  $\operatorname{Re}(s) > 0$ , the **Gamma function** is defined to be

$$\Gamma(s) = \int_0^\infty e^{-t} t^s \frac{dt}{t} = \mathcal{M}(e^{-t})(s) \text{ (12.5.4.2).}$$

which is convergent for any  $\operatorname{Re}(s) > 0$  thus an analytic function for  $\operatorname{Re}(s) > 0$  by (12.4.2.14).  $\lrcorner$

**Prop. (12.6.1.2).** For  $s \in \mathbb{C}$  that  $\operatorname{Re}(s) > 0$ ,  $\Gamma(s+1) = s\Gamma(s)$ .  $\lrcorner$

*Proof:* For any  $\varepsilon \in \mathbb{R}_+$ ,

$$\int_\varepsilon^{1/\varepsilon} \frac{\partial}{\partial t} (e^{-t} t^s) dt = - \int_\varepsilon^{1/\varepsilon} e^{-t} t^s dt + s \int_\varepsilon^{1/\varepsilon} e^{-t} t^{s-1} dt.$$

Then letting  $\varepsilon \rightarrow 0$  gives the desired formula.  $\square$

**Cor. (12.6.1.3).**  $\Gamma(s)$  extends to a meromorphic function for all  $s \in \mathbb{C}$ , with simple poles at  $s \in \mathbb{Z}_{\leq 0}$ . And for  $n \in \mathbb{N}$ , the Laurent series of  $\Gamma(s)$  at  $s = -n$  is given by

$$\Gamma(s) = \frac{(-1)^n}{n!} \left( \frac{1}{s+n} + \left(1 + \frac{1}{2} + \dots + \frac{1}{n} - \gamma_0\right) + \dots \right),$$

where  $\gamma_0$  is the Euler's constant (35.1.2.8).  $\lrcorner$

*Proof:* ? We only prove that  $\operatorname{res}_{s=-n} \Gamma(s) = \frac{(-1)^n}{n!}$ .

In fact, for  $m \in \mathbb{Z}_+$ ,

$$F_m(s) = \frac{\Gamma(s+m)}{s(s+1)\dots(s+m-1)}$$

extends  $\Gamma(s)$  meromorphically to  $\operatorname{Re}(s) > -m$  with simple poles at  $s = 0, -1, \dots, -m+1$ , and

$$\operatorname{res}_{s=-m+1} F_m(s) = \frac{\Gamma(1)}{(-1)(-2)\dots(-m+1)} = \frac{(-1)^{m-1}}{(m-1)!}.$$

$\square$

**Lemma (12.6.1.4) [Gamma Function is Logarithmically Convex].**  $\log \Gamma(x)$  is convex on  $\mathbb{R}_+$ .  $\lrcorner$

*Proof:* It suffices to show that  $\Gamma''(x)\Gamma(x) \geq \Gamma'(x)^2$ . But notice

$$\Gamma'(x)^2 = \left( \int_0^\infty e^{-t} t^{x-1} \log t dt \right)^2 \leq \Gamma(x) \Gamma''(x)$$

by the Cauchy-Schwarz inequality.  $\square$

**Prop. (12.6.1.5) [Characterizing Gamma Function, Artin].** Let  $\Phi : \mathbb{R}_+ \rightarrow \mathbb{R}_+$  be differential s.t.  $\log \Phi$  is convex and  $x\Phi(x) = \Phi(x+1)$  for all  $x \in \mathbb{R}_+$ , then we have  $\Phi(x) = \Gamma(1)\Gamma(x)$  for all  $x \in \mathbb{R}_+$ .  $\lrcorner$

*Proof:* Let  $H = \Phi/\Gamma$ , then  $H$  is 1-periodic, and  $H(1) = \Phi(1)$ . Since  $\Phi'/\Phi$  and  $\Gamma'/\Gamma$  are non-decreasing(12.6.1.4), we have

$$\frac{\Phi'(n)}{\Phi(n)} - \frac{\Gamma'(n+1)}{\Gamma(n+1)} \leq \frac{H'(n+x)}{H(n+x)} = \frac{\Phi'(n+x)}{\Phi(n+x)} - \frac{\Gamma'(n+x)}{\Gamma(n+x)} \leq \frac{\Phi'(n+1)}{\Phi(n+1)} - \frac{\Gamma'(n)}{\Gamma(n)}$$

for each  $n \in \mathbb{Z}_+$  and  $x \in \mathbb{R}_{\geq 0}$ . However, both  $\Gamma$  and  $\Phi$  satisfy the functional equation

$$\frac{f'(x+1)}{f(x+1)} - \frac{f'(x)}{f(x)} = \frac{1}{x},$$

so for each  $x \in \mathbb{R}_+$ , we get

$$\frac{H'(1)}{H(1)} - \frac{1}{n} \leq \frac{H'(x)}{H(x)} \leq \frac{H'(1)}{H(1)} + \frac{1}{n}.$$

Notice  $n \in \mathbb{Z}_+$  is arbitrary, so we see  $H'(x) = \kappa H(x)$  for some  $\kappa \in \mathbb{R}$ . Thus  $H(x) = H(1)e^{\kappa x}$ . Because  $H$  is 1-periodic, we see  $\kappa = 0$ .  $\square$

**Prop. (12.6.1.6).** For  $t \in \mathbb{R}_+$ ,  $\Gamma(t)$  is decreasing for  $t \leq 1$ , and increasing for  $t \geq 1$ .  $\lrcorner$

*Proof:*

$$\frac{\partial}{\partial t} \Gamma(t) = \int_0^\infty \log t e^{-t} t^s \frac{dt}{t}.$$

$\square$

**Prop. (12.6.1.7) [Euler's Reflection Formula].**

$$\Gamma(s)\Gamma(1-s) = \frac{\pi}{\sin(\pi s)}.$$

$\lrcorner$

*Proof:* By uniqueness theorem, it suffices to prove for  $0 < s < 1$ . Then

$$\begin{aligned} \Gamma(1-s)\Gamma(s) &= \int_0^\infty e^{-t} t^{s-1} \Gamma(1-s) dt = \int_0^\infty e^{-t} t^{s-1} \left( t \int_0^\infty e^{-vt} (vt)^{-s} dv \right) dt \\ &= \int_0^\infty \int_0^\infty e^{-t(v+1)} v^{-s} dv dt = \int_0^\infty \frac{v^{1-s}}{v(v+1)} dv \\ (12.4.6.8) &= \frac{\pi}{\sin(\pi s)} \end{aligned}$$

$\square$

**Prop. (12.6.1.8) [Special Values].**

$$\Gamma(n+1) = n!, \quad \forall n \in \mathbb{N}, \quad \Gamma\left(\frac{1}{2}\right) = \sqrt{\pi}.$$

$\lrcorner$

*Proof:* For the first assertion, use induction:  $\Gamma(1) = \int_0^\infty e^{-t} dt = 1$ , and the induction process follows from(12.6.1.2). The second assertion follows from(12.6.1.7).  $\square$

**Cor. (12.6.1.9).** For  $k \in \mathbb{N}$ ,

$$\Gamma\left(\frac{1-2k}{2}\right) = \frac{\sqrt{\pi}(-1)^k k! 2^{2k}}{(2k)!}.$$

┘

**Thm. (12.6.1.10) [Hadamard Product for  $\Gamma^{-1}(s)$ ].** For  $s \in \mathbb{C}$ ,

$$\frac{1}{\Gamma(s)} = e^{\gamma_0 s} \prod_{n \in \mathbb{Z}_+} \left[ \left(1 + \frac{s}{n}\right) e^{-s/n} \right].$$

where the product is absolutely convergent.

┘

*Proof:* By (12.6.1.21)(12.6.1.3) and (12.4.3.21),

$$\frac{1}{\Gamma(s)} = e^{As+B} s \prod_{n \in \mathbb{Z}_+} \left[ \left(1 + \frac{s}{n}\right) e^{-s/n} \right]$$
