# Preface

**What is this?** : At first, this is a note containing subtle or important materials I encountered while studying. I started this project in the fall of my third undergraduate year (October 2019) in Peking University, noticing that I have a poor memory and consistently forget what I thought I have already learned. So it came to me that I can compile all the proofs of theorems I cannot recall that is hard and subtle yet appearing over and over again. But gradually it turns out I want to make it as comprehensive as possible. A more accurate description of this note now is: this is a more self-contained introduction to modern (post-Grothendieck) pure mathematics that I care about.

I constantly add stuff to this note, and I regularly put them online. You can find the newest version released at [https://math.mit.edu/~hao\\_peng/skyscraper.pdf](https://math.mit.edu/~hao_peng/skyscraper.pdf). Don't be surprised to find many sections containing only titles, and the symbol “?” means “further work required here”. If you find errors or have suggestions, please feel free to email me.

**Constitutions:** The following are principles of the structure of this note, but the current version is far from it. They serve as ultimate goals.

- This note should be self-contained.
- Notations should be consistent throughout the whole note.
- Propositions should be put in the (sub)section of the most advanced term appeared in the statement, or as a corollary.
- Logical order is not necessary, but vicious circles are intolerable. Although it should also be properly ordered logically in the sense that if every notion appearing is referred to its definition, the ordering has the least number of reverse cross-references (i.e. referring to definitions after it) under admissible permutation, where admissible permutation means a permutation that preserves the tree structure of this note (i.e. the tree of chapter-section-subsection- $\dots$  ordering).
- Theories should be stated at the most generality. There's no need to give proofs for the special case but clarify the deduction from the general case, unless it is needed in the proof of the general case, then state it as a lemma.
- When facing multiple proofs, only the most elegant and essential proof should be recorded.
- References should be traced to the original author and his specific paper.
- Each part should contain less than 10 chapters. Each chapter should contain less than 20 sections. Each section should contain less than 30 pages.

**Writing Styles:** The following are writing standards of this note. References are [CMOS, Poo] and [How to write mathematics badly, by J. P. Serre]. Notice some rules of [Poo] remain to be discussed.

- Use less words and more math symbols and equations, and use plain English, so that even those who don't speak English can understand without much effort.
- Use proper cases for names of people.

- A proposition is a proven mathematical sentence.
- A theorem is a proposition of notable importance.
- A lemma is a proposition whose importance is derived from the theorem or proposition it aims to prove.
- A corollary is a proposition whose proof readily follows from its corresponding proposition or theorem.
- A conjecture is a mathematical sentence whose proof(or disproof/proof of independence) is unknown yet.
- A conjectural corollary is a mathematical sentence which is implied by the corresponding conjecture.
- A theorem & conjectural corollary is a proven mathematical sentence which can be implied by the corresponding conjecture.
- The naming of lemmas/propositions/theorems/conjectures by multiple authors follows the lexicographical order, except for historical followup works. Authors of the same paper is connected by “-” symbol, and authors of different papers are separated by a “/” symbol.
- A remark is a comment, and the book can be read independent of the remarks.(much like remarks in any programming language).

**Tips:** This is hardly a *readable* note. I use it as a dictionary. It only contains materials that I’m interested in and many proofs are still missing. Hopefully I can complete them later. The main reason why I have to latex all these materials together is that I need tons of cross-references. So I believe it’s the best way to read this book digitally, and it’s good to know how to go forwards and backwards between hyper-references on your computer. For example, on a MacOS system, the default shortcuts are  + ,  +  for Preview and  + ,  +  for Foxit Reader. Foxit Reader is stable when handling a large file.

**Acknowledgement:** Sincere thanks to Yi Tian(田翊) for answering my questions when I was learning algebraic geometry and  $p$ -adic geometry in year 2020 when I was in Peking University. His help is fundamental. Thanks to Zhiyu Zhang(张志宇) for giving me directions on mathematical study and advices on mathematical life in year 2022 when I was in MIT.

There is already a great online book [Sta] maintained by de Jong that covers considerably much of the Algebraic Geometry part of this note. I haven’t finish reading it but I reordered the materials that I learnt and kept track of it in my own way. I sometimes used different paths to optimize the proof. The idea to compile this note was inspired by [Sta]. One different feature of this note compared to [Sta] is that I want to make every proof as optimal and as general as possible(See Constitutions above). Any suggestion to optimize proofs or generalize statements is strongly encouraged.

The writing style of this note is imitating and influenced by various literature, including beautiful writings of J. S. Milne, especially [Mil17, Mil17d, Mil08], monographs of J. Lurie, especially [Lur09, Lur11], and also de Jong’s magnificent [Sta].

In arranging the contents of this note, I consulted the AMS classification (newest version from <https://mathscinet.ams.org/mathscinet/publications-search>).

**Copyright Issue:** It should be made clear that I took proofs from many different places, so only a tiny fraction of this note should be considered originated from me. I am currently too busy being a graduate student, so many references are still missing. Tell me if you think I should cite you or somebody's work. Nevertheless, I hope this note can contribute to my study and help anyone who read it. But it comes with no warranty, please use at your own risk.

**Addendum March 25 2023:** Recently voices are increasing asserting that it is impossible for anyone be sure of every detail of the propositions he used, and everyone has to write assertions he hasn't checked. I don't agree with this. I started to get in touch with V. Voevodsky's idea of machine-assisted proofs and type-theory. And I noticed this book becoming more like programming code inadvertently. Also I'm keeping an eye on Lean-formalized mathematics. With the releasing of ChatGPT4 last week, the future is both exalting and challenging.

**Addendum March 27 2023:** Today I watched Buzzard's ICM2022 talk, and this is the first time I heard of the Lean project. I am astonished to learn that the Lean project and this book share similar goals. Also, what I am writing is in fact similar to type theory based rather than set theory based. And my notes are more like Mizar. But they also differ in several ways: This book put more priority in succinctness, and proofs are only written to the degree that I can check back. I don't need absolute check of rigor. But inspired by those, I made some changes to the note to make it more like a 'pseudocode'.

*“And they said, Go to, let us build us a city and a tower, whose top may reach unto heaven;  
and let us make us a name, lest we be scattered abroad upon the face of the whole earth.”  
—Genesis 11:1-9*

# Table of Contents

## PART I – Foundations

### Chapter 1 – Logics

|                                                                                                |          |
|------------------------------------------------------------------------------------------------|----------|
| <b>1.1 Underlying Logics for this book</b> .....                                               | <b>3</b> |
| (1) Philosophical Issue. (2) Logical Foundations. (3) Other Choice of Foundations. (4) Proofs. |          |

### Chapter 2 – Mathematical Logic and Computer Science

|                                                                                                                                                                                                                                                                                                                                                                                                    |           |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------|
| <b>2.1 Mathematical Logic</b> .....                                                                                                                                                                                                                                                                                                                                                                | <b>9</b>  |
| (1) Peano's Postulates for Natural Numbers. (2) Languages. (3) Class System(ZF). (4) Formal Propositional Calculus. (5) First Order Systems. (6) Models and Examples of Systems.                                                                                                                                                                                                                   |           |
| <b>2.2 Set Theory</b> .....                                                                                                                                                                                                                                                                                                                                                                        | <b>23</b> |
| (1) Von.Neumann-Bernays-Gödel Set Theory(NBG). (2) Relations and Functions. (3) Orderings. (4) Ordinals(Cantor). (5) The Axiom of Choice. (6) Cardinals. (7) Cardinal Arithmetics. (8) Alephs. (9) Natural Numbers and Real Numbers. (10) Filters and Ultrafilters. (11) Models. (12) Large Cardinals. (13) Gödel Model. (14) Silver Machine. (15) Forcing. (16) Determinacy. (17) Stationary Set. |           |
| <b>2.3 Homotopy Type Theory</b> .....                                                                                                                                                                                                                                                                                                                                                              | <b>36</b> |

## Chapter 9 – Weil Cohomologies

### 9.1 Intersection Theory ..... 897

(1) Chow Homologies. (2) Chow-Groups and  $K$ -Groups. (3) Gysin-Maps. (4) Weil Divisors. (5) Bivariant Classes. (6) Chern Classes. (7) Non-Singular Intersection Theory. (8) Numerical Geometry. (9) Riemann-Roch. (10) Numerical Equivalences. (11) Intersection for Line Bundles.

### 9.2 Algebraic deRham Cohomology ..... 923

(1) deRham Complexes. (2) Infinitesimal Sites. (3) Poincaré-Duality.

### 9.3 Étale Fundamental Groups ..... 927

(1) Étale Connected Components. (2) Étale Fundamental Groups.

### 9.4 Étale Cohomology Theory ..... 930

(1) Basics. (2) Constructible Sheaves. (3) Base Changes. (4) Lower Shriek Functor. (5) Torsion Cohomologies. (6)  $\ell$ -adic Étale Cohomologies. (7) Curves and Surfaces.

### 9.5 Pro-Étale Cohomology ..... 953

(1) Ring-Theoretical Stuff.

### 9.6 Cohomologies over Finite Fields ..... 954

(1) Trace Formulae. (2) Weil-Sheaves. (3) Weights and Purity. (4) Geometric Monodromy. (5) Real Weil-Sheaves. (6) Deligne's Purity Theorem. (7) Semisimplicity and Hard Lefschetz Theorem. (8) Deligne-Fourier Transformation. (9) Integrality Problems.

### 9.7 Intersection Homology and Perverse Sheaves ..... 980

### 9.8 Profinite Cohomology ..... 981

(1) Cohomology of Finite Groups. (2) Cohomology of Profinite Groups. (3) Galois-Cohomologies. (4) Non-Abelian Cohomologies. (5) Continuous Cohomologies.

## Chapter 10 – Algebraic Geometry III: Group Theory

### 10.1 Group Schemes I: Structure Theory ..... 997

(1) Group Schemes. (2) Finite Group Schemes. (3) Groupoid Schemes. (4) Algebraic Groups over Fields. (5) Homomorphisms.

### 10.2 Group Schemes II: Solvable Groups ..... 1022

(1) Group Actions. (2) Lie Algebras. (3) Groups of Multiplicative Type. (4) Actions of Tori. (5) Cohomologies and Extensions. (6) Triangularizable Algebraic Groups. (7) Solvable Groups.

### 10.3 Representations of Algebraic Groups I: Elementary Theory ..... 1047

(1) Basics. (2) Tannakian Duality. (3) Semi-Simple Elements. (4) Unipotent Groups. (5) Reductive Groups.

### 10.4 Group Theory III: Reductive Groups ..... 1058

(1) Borel Subgroups and Parabolic Subgroups. (2) Reductive Groups. (3) Geometric Aspects. (4) Root Data. (5) Isogeny and Existence Theorems. (6) Langlands L-Groups.

**10.5 Group Theory IV: More on Reductive Groups .....1082**

(1) Conjugacy Classes. (2) Cohomology of Reductive Groups. (3) Classical Groups. (4) Exceptional Groups. (5) Real Reductive Groups. (6) Reductive Group Schemes.

**10.6 Topics in Group Schemes .....1102**

(1) over Finite Fields.

**10.7 Formal Group Schemes .....1103**

(1) Formal Power Series. (2) Formal Identities. (3) Formal Group Laws. (4) Formal Groups. (5) Cartier-Theory. (6) Isogenies of Formal Groups.

**10.8 Algebraic Stacks .....1123**

(1) Schemes as Functors. (2) Algebraic Spaces. (3) Properties of Algebraic Spaces. (4) Morphisms between Algebraic Spaces. (5) Algebraic Spaces over Fields. (6) Algebraic Stacks. (7) Sheaves on Algebraic Stacks. (8) Representability. (9) Artin's Axioms. (10) Quot and Hilbert Stacks. (11) Properties of Algebraic Stacks. (12) Morphisms of Algebraic Stacks. (13) Limits of Algebraic Stacks. (14) Cohomology of Algebraic Stacks. (15) Derived Categories of Stacks.

**10.9 Moduli Problems .....1129**

(1) Moduli problems. (2) Hilbert & Quot Schemes. (3) Picard Schemes. (4) Picard Spaces. (5) Moduli of Curves.

**10.10 Geometric Invariant Theory .....1142**

**10.11 Group Algebraic Spaces .....1143**

(1) Quotient of Groupoids. (2) Quotients of Schemes.

**10.12 Higher Dimensional Geometry .....1145**

(1) Bend and Break. (2) Cone Theorem. (3) Homological Methods. (4) Minimal Model Program.

**10.13 Toric Varieties .....1146**

**Chapter 11 – Algebraic  $K$ -Theory of Schemes**

**11.1 Algebraic  $K$ -Theory .....1147**

(1) Introduction. (2)  $K$ -Theory of Categories. (3)  $K$ -Theory of Rings. (4)  $K$ -Theory of Schemes.

**11.2 Brauer-Grothendieck Groups .....1153**

(1) Brauer Groups. (2) Field case. (3) Local Field case. (4) Global Field case. (5) Function Field case. (6) Severi-Brauer Varieties. (7) Brauer-Manin Obstruction. (8) Norm Residue Isomorphism Theorem.

**PART III – Analysis and Geometry**

**Chapter 12 – Condensed Mathematics and Analysis**

**12.1 Condensed Mathematics(Scholze) .....1165**

(1) Introduction. (2) Condensed Objects. (3) Cohomologies. (4) LCAs. (5) Solid Abelian Groups. (6) Analytic Geometry. (7) Complex Geometry.

## Chapter 17 – Non-Commutative Geometry(Connes)

### 17.1 Non-Commutative Geometry .....1547

(1) Spectral Triples.

### 17.2 Supersymmetry .....1548

(1) Real Structures. (2) Super Lie Groups.

## Chapter 18 – Theoretical Physics

### 18.1 Hamiltonian Mechanics.....1549

(1) Hamiltonian Mechanics. (2) Symplectic Structure. (3) Unit System.

### 18.2 Gauge Theory .....1556

### 18.3 General Relativity(Gravity Fields) .....1557

(1) Basics.

### 18.4 Quantum Mechanics .....1558

(1) Basics. (2) Relativistic Quantum Mechanics. (3) Quantum Computations. (4) Quantum Algorithms. (5) Quantum Informations.

### 18.5 Statistical Mechanics .....1566

(1) Basics. (2) Evolution of Statistical Systems. (3) Ising Models and Potts Models. (4) Statistical Quantum Mechanics. (5) Thermodynamical Systems.

### 18.6 Field Theory .....1568

(1) Classical Field Theory. (2) Semi-Classical Field Theory. (3) Perturbative Field Theory. (4) Conformal Field Theory. (5) Symmetry Breaking. (6) Statistical Field Theory. (7) Higgs Fields. (8) Dualities.

### 18.7 Quantum Field Theory .....1570

(1) Path Integrals(Feynmann1942). (2) Perturbative QFT. (3) Propagators and perturbations. (4) Relativistic QFT. (5) Fermions. (6) Topological QFT. (7) Vector Operator Algebras and Haag-Kastler Axioms. (8) Wightman QFT. (9) Osterwalder-Schrader Axioms.

### 18.8 Renormalization .....1576

### 18.9 Mirror Symmetry .....1577

### 18.10 Standard Model .....1578

(1) Higgs Fields. (2) Beyond Standard Model.

### 18.11 String Theory .....1579

(1) Basics.

## PART IV – Number Theory and Arithmetic Geometry

### Chapter 19 – Algebraic Number Theory

| (1) Pseudo-Algebraically Closed Fields. (2) Hilbertian Fields. (3) Haar Measures. (4) Problems. (5) Frobenius Fields. (6) Undecidability.              |             |
| <b>20.2 Heights and Diophantine Approximations</b> .....                                                                                               | <b>1694</b> |
| (1) Heights. (2) Canonical Heights. (3) Approximations of Algebraic Numbers. (4) Approximations by Algebraic Numbers. (5) Dynamics on $\mathbb{T}^1$ . |             |

**20.3 Reductions of Schemes.....1712**

(1) Schemes over DVR. (2) Smooth Reductions. (3) Greenberg Functors. (4) Néron Models.  
(5) Semistable Reductions. (6) Reductive of Groups. (7) Reduction of Curves.

**20.4 Arithmetic Subgroups(Fundamental Domains) .....1721**

(1) Reduction Theory. (2) Congruence Subgroups. (3) Adelic  $S$ -Arithmetic Subgroups.  
(4) Arithmetic Subgroup of Lie Groups. (5) Fuchsian Groups of  $\mathrm{PGL}(2; \mathbb{R})$ . (6) Schottky  
Groups of  $\mathrm{PGL}(2; \mathbb{C})$ .

**20.5 Arithmetic of Algebraic Groups .....1730**

(1) over Valued Fields. (2) over Local Fields. (3) over Adeles. (4) Adelic Quotients. (5) over  
Number Fields.

**20.6 Bruhat-Tits Theory .....1751**

(1) Tits-Systems. (2) Buildings. (3) Groups Actioning on Buildings. (4) Bruhat-Tits Buildings.  
(5) Unramified Descent. (6) Metrics and More Properties.

**20.7 More Properties of Bruhat-Tits Buildings .....1773**

(1) Properties of Bruhat-Tits Buildings. (2) Special Points. (3) Buildings for Classical Groups.  
(4) Finite Group Actions and Tamely-Ramified Descent. (5) Moy-Prasad Filtrations. (6) Com-  
pactifications. (7) Classifying Groups over Local Fields.

**20.8 Geometry of Numbers .....1785**

(1) Minkowski Theory.

**20.9 Abelian Varieties .....1787**

(1) Basics. (2) Formal Groups. (3) over Alg.Closed Fields. (4) Dual Abelian Varieties. (5) Co-  
homology on Abelian Varieties. (6) Isogenies and Tate Modules. (7) Polarizations and Weil-  
Pairings. (8) over Archimedean Local Fields. (9)  $\mathrm{char} \, k > 0$  Case. (10) Jacobian Varieties and  
Abanese Varieties.

**Chapter 21 – Rational Points**

**21.1 Arithmetic of Abelian Varieties.....1813**

(1) Néron-Models for Abelian Varieties. (2) Reductions. (3) Néron-Tate Heights. (4) Isoge-  
nies. (5) Heights of Abelian Varieties. (6) Small Points. (7) Finiteness Theorems. (8) Galois-  
Cohomologies of Abelian Varieties.

**21.2 Complex Multiplication Theory .....1833**

(1) CM-Algebras and CM-Types. (2) CM-Abelian Varieties. (3) Fundamental Theorem of  
Complex Multiplication. (4) Main Theorem of Complex Multiplication. (5) over Finite Fields.  
(6) CM-Liftings. (7) Elliptic Curves. (8) Singular Moduli. (9) CM Modular Forms. (10) Real  
Multiplications.

**21.3 Arithmetic of Elliptic Curves .....1850**

(1) Basics. (2) Formal Groups of Elliptic Curves. (3)  $\mathrm{char} \, k > 0$  case. (4) Reduction of Elliptic  
Curves. (5) Tate Curve. (6) Twists of Elliptic Curves. (7) Integral Points.

**21.4 Surfaces and Arithmetic Surfaces.....1875**

(1) over Fields. (2) Fibered Presurfaces. (3) Arithmetic Surfaces. (4) Elliptic Surfaces. (5) Intersection Theory. (6) Minimal Arithmetic Surfaces.

**21.5 Arithmetic of K3 Surfaces.....1881**

(1) over Finite Fields. (2) over Local Fields. (3) over Global Fields.

**21.6 Diophantine Geometry.....1882**

(1) Hilbert's 10-th Problem. (2) Conjectures. (3) Rational Points. (4) Integral Points. (5) Ternary Diophantine Equations. (6) Unlikely Intersections.

**21.7 (Bounding)Rational Points.....1903**

(1) Mordell-Weil Theorem. (2) Lang-Néron Theorem. (3) Elliptic Curves. (4) Modular Curves. (5) Uniformity Conjecture for Torsion Points. (6) Rational Points on Curves(Chabauty). (7) Finite Fields. (8) Hilbert's Theorem. (9) Vojta's Conjecture. (10) Bombieri-Lang Conjecture. (11) Coleman's Conjecture. (12) Hilbert's 10-th Problem.

**21.8 Arithmetic Dynamical Systems .....1917**

(1) over Finite Fields. (2) over Local Fields. (3) over Global Fields. (4) Uniform-Boundedness. (5) Arithmetic Dynamical Mordell-Lang Conjecture. (6) Dynamics Associated to Algebraic Groups. (7) Equidistributions.

**21.9 Arithmetic Topology.....1920**

(1) Knots and Primes.

**Chapter 22 – Motives**

**22.1 Motives .....1921**

(1) Correspondences. (2) Weil Cohomology Theories. (3) Pure Motives. (4) André's Pure Motives. (5) Standard Conjectures. (6) Mixed Motives. (7) Mixed Tate Motives. (8) Motivic Galois Theory. (9) Periods.

**22.2  $\mathbb{P}^1 \setminus \{0, 1, \infty\}$  .....1936**

(1) Dessins d'Enfant. (2) Mixed Motives over  $\mathbb{Z}$ . (3) Multiple Zeta Functions.

**22.3 Tate Conjecture & Hodge Conjecture .....1938**

(1) Hodge-Tate Classes and Monodromy Groups. (2) Tate Conjectures. (3) over Finite Fields. (4) Connection with B-S.D. (5) Hyper-Kähler Varieties. (6) Mumford-Tate Conjectures. (7) for Drinfeld Modules.

**22.4 Motivic Cohomology(Voevodsky-Suslin).....1947**

**22.5 Schemes over  $\mathbb{F}_1$  .....1949**

(1) Geometry of Monoids. (2) Zeta Functions. (3) Absolute Motives via Zeta Functions. (4) K-Theory of  $\mathbb{F}_1$ -Schemes.

## Chapter 23 – Arakelov Geometry

### 23.1 Arithmetic Intersection Theory.....1953

(1) Néron’s Symbol. (2) Arithmetic Intersections. (3) Green Functions. (4)  $S$ -Punctured Arithmetic Chow Groups. (5) Arithmetic Standard Conjectures.

### 23.2 Arakelov Geometry.....1959

(1) Metrized Line Bundles.

## Chapter 24 – Representation Theory

### 24.1 Smooth Representations .....1961

(1) Topological Representations. (2) Smooth Representations. (3) Finite Groups. (4) Symmetric Groups. (5) Character Tables Lists. (6) Locally Profinite Groups.

### 24.2 Positive Characteristic Representations.....1987

(1) Basics. (2) Block Theory. (3) Mixed Characteristic. (4) Equal Characteristic.

### 24.3 Representations of Finite Groups of Lie Type .....1990

(1) Finite Groups of Lie Type. (2) Conjugacy Classes. (3) Deligne-Lustig Varieties. (4) Deligne-Lustig Theory. (5) Howlett-Lehler Theory. (6) Character Sheaves(Lustig). (7) Gelfand-Graev representations. (8) Alvis-Curtis Duality. (9) Deligne-Lustig Varieties. (10)  $GL(n)$ . (11)  $SL(n)$ . (12)  $GL(n)$ . (13)  $Sp(2n)$ .

### 24.4 Representations of Semisimple Lie Algebras.....1998

(1) Semisimple Representations. (2) Verma Modules. (3) Character Formulae. (4) Category  $\mathcal{O}$ (Bernstein-Gelfand-Gelfand). (5) Lie Algebra Cohomology.

### 24.5 Representations of $C^*$ -Algebras.....2014

### 24.6 Smooth Representations of Lie Groups .....2015

(1) Smooth Vectors. (2) Finite-Dimensional Representations. (3)  $(\mathfrak{g}, \mathcal{K})$ -Modules. (4) Reductive Groups.

### 24.7 Unitary Representations of Locally Compact Groups .....2028

(1) Basics. (2) Dual Spectra. (3) Compact Group. (4) Induced Representations. (5) Reductive Groups. (6) Semisimple Lie Groups. (7) Unitary Groups.

### 24.8 Lie Algebras II .....2059

(1) Springer Theory.

### 24.9 Admissible Representations of $p$ -adic Reductive Groups .....2060

(1) Basics. (2) Bernstein Centers. (3) Supercuspidal Representations. (4) Admissible Invariant Distributions(Harish-Chandra). (5) Generic representations. (6) Unramified Representations. (7) Iwahori-Spherical Representations. (8) Unitarizable, Tempered &  $L^2$ -Representations. (9) Langlands Classifications.

### 24.10 Supercuspidal Representations of $p$ -adic Reductive Groups.....2076

(1)  $GL(n)$ . (2)  $SL(n)$ .

**24.11 Admissible Representations of  $GL(n)$  over  $p$ -adic Fields.....2077**

(1) Basics. (2) Supercuspidal Representations. (3) Generic representations. (4) Bernstein-Zelevinsky Classification. (5) Principal Series Representations. (6) Unramified Representations. (7) Iwahori-Spherical Representations. (8) Unitarizable, Tempered &  $L^2$ -Representations.

**24.12 Local Langlands for  $GL(n)$  .....2105**

(1) Local Langlands for  $p$ -adic  $GL(n)$ . (2) Harris-Taylor's Proof. (3) Scholze's Proof. (4)  $p$ -divisible Groups and Vanishing Cycles. (5) Local Cyclic Base Change. (6) Simple Shimura Varieties. (7) Global methods. (8) Lubin-Tate Space. (9) Inertial Local Langlands Correspondence. (10) Local Langlands for Laurent Series.

**Chapter 25 – Galois Representations**

**25.1 Galois Representations(Basics) .....2127**

(1) Basics. (2)  $\ell$ -adic Local Galois Representations. (3) Mod  $\ell$  Local Galois Representations. (4) Global Galois Representations. (5) Deforming Galois Representations(Mazur). (6) Representations from Geometry.

**25.2  $p$ -adic Local Galois Representations .....2137**

(1)  $\mathbb{C}_K$ -Admissibility. (2) Hodge-Tate Representations. (3) Sen-Tate Theory. (4) Fontaine's Rings. (5) deRham Representations. (6) Crystalline Representations. (7) Semi-stable Representations. (8) Barsotti-Tate Representations. (9)  $(\varphi, \Gamma)$ -Modules. (10)  $(\varphi, \Gamma)$ -Modules over the Robba Ring.

**25.3  $p$ -adic Differential Equations .....2158**

**25.4  $p$ -adic Families of Galois Representations .....2159**

(1)  $p$ -adic Simpson Correspondence. (2)  $p$ -adic Riemann-Hilbert Correspondence. (3) Logarithmic Riemann-Hilbert correspondences. (4) Relative Fontaine-Mazur Conjecture.

**Chapter 26 – Automorphic Representations**

**26.1 Archimedean Automorphic Representations .....2163**

(1) Basics. (2)  $GL(n)$ . (3) Maass Forms. (4) Whittaker Models. (5) Spectral Problems.

**26.2 Spectral Theory of Automorphic Forms .....2183**

(1) Quantum Unique Ergodicity.

**26.3 Modular Forms I .....2184**

(1) Modular Forms. (2) Hecke Algebras. (3) Dimension Formulae. (4) Elliptic Eisenstein Series. (5) Arithmetics. (6) Modular Forms Mod  $p$ . (7) Non-Congruent Modular Forms.

**26.4 Modular Forms II .....2207**

(1) Hilbert Modular Forms. (2)  $\Lambda$ -adic Hilbert Modular Forms. (3) Eisenstein Series. (4) Embedding into  $\Lambda$ -adic Modular Forms. (5) Hecke Algebras and Eisenstein Ideals. (6) Ramanujan-Peterson Conjecture for Hilbert Modular Forms. (7) Pseudo-Characters. (8) Galois Representations attached to Hilbert Modular Forms.

|                                                                                                                                                                                                                                                                                             |             |

## **29.6 Converse Theorems .....2600**

(1) Converse Theorem for  $\mathrm{GL}(2)$ . (2) Converse Theorems for  $\mathrm{GL}(n)$ .

## **29.7 Automorphic Representations of $\mathrm{SO}(n)$ .....2603**

(1) Endoscopy for  $\mathrm{SO}(2n + 1)$ .

## **29.8 Endoscopic Classifications .....2604**

(1) Arthur's Multiplicity Conjectures. (2) Comparison of Trace Formulae. (3) Jacquet-Langlands Transfer. (4) Twisted Endoscopy. (5) Applications. (6) Beyond Endoscopy.

## **29.9 Relative Langlands Duality .....2605**

(1) Spherical Varieties. (2) Dual Groups of Spherical Varieties. (3) Spherical Embeddings(Luna-Vust). (4) Examples. (5) Geometry over Local Fields. (6) Discrete Spectra. (7) Bernstein Morphisms. (8) Plancherel Decompositions. (9) Ichino-Ikeda Conjecture.

## **29.10 Gan-Gross-Prasad Conjectures.....2618**

(1) Local Restriction Problems. (2) Local GGP Conjecture. (3) Global Restriction Problems. (4) Global GGP Conjecture. (5) Ichino-Ikeda Formula(Orthogonal case). (6) Waldspurger's Formula(Ichino-Ikeda for  $n = 2$ ). (7) Jacquet-Langlands-Shimizu Correspondence. (8) Triple Product(Ichino-Ikeda for  $n = 3$ ). (9) Unitary case. (10) Orbital Integrals. (11) Fundamental Lemmas. (12) Rallis Inner Product Formula.

# **Chapter 30 – Langlands Reciprocity**

## **30.1 Langlands' Reciprocity Conjectures .....2637**

(1) Compatible Systems. (2) Geometric Galois Representations. (3) Galois Representation attached to Algebraic Automorphic Representations. (4) Potentially Automorphy. (5) Conjectures.

## **30.2 Breuil-Mezard Conjecture.....2653**

## **30.3 Mod $p$ Representations and Modularity Lifting Theorems .....2654**

(1) Global Mod  $p$  Representations. (2) Level-Raising and Level-Lowering. (3) Serre's Modularity Conjecture over  $\mathbb{Q}$ . (4) Dwork's Family. (5) Serre's Modularity Conjecture over Totally Real Fields. (6) Taylor-Wiles-Kisin Methods. (7) Modularity-Lifting. (8) Open Questions.

## **30.4 Shimura-Taniyama-Weil Conjecture(Modular Abelian Variteis).....2663**

(1) Abelian Varieties attached to Modular Forms. (2) Modular Abelian Varieties. (3) Elliptic Curves over  $\mathbb{Q}$ . (4) Weil Parametrizations. (5) Paramodular Conjecture.

## **30.5 Langlands-Kottwitz Method.....2668**

(1) Honda-Tate Theory. (2) Virtual Abelian Varieties with PEL Structures. (3) Kottwitz-Triples. (4) Unstabilized Langlands-Kottwitz Formulas. (5) Stabilization of Langlands-Kottwitz Formulae. (6) Destabilization of Langlands-Kottwitz Formulae. (7) beyond Compact Hyperspecial cases.

**30.6 Cohomology of Unitary Shimura Varieties.....2677**

- (1) Perfectoid Siegel Spaces. (2) Hodge-Tate Period Map. (3) Newton Stratification on the Flag Variety. (4) Geometry of Newton Strata and Igusa Varieties. (5) Cohomology of Igusa Varieties. (6) Torsion in the Cohomology of Unitary Shimura Varieties.

**PART V – Cycles and  $L$ -Values**

**Chapter 31 – Arithmetic Theory of  $L$ -Functions**

**31.1  $L$ -Functions Attached to Motives .....2683**

- (1) Artin  $L$ -Functions. (2) Galois  $L$ -Functions. (3) Hasse-Weil  $L$ -Functions. (4) Motivic  $L$ -Functions. (5) 0-Dimensional Motives. (6) Abelian Motives. (7) Zeta Functions of Shimura Varieties. (8) Tamagawa-Number Conjecture(Bloch-Kato). (9) Others.

**31.2 Euler Systems and Kolyvagin Systems .....2698**

- (1) Local Cohomologies. (2) Selmer Groups. (3) Euler Systems. (4) Kolyvagin Derivatives. (5)  $p$ -adic  $L$ -Functions for Elliptic Curves. (6) Bounding Selmer Groups. (7) Euler System for Elliptic Curves(Kato). (8) Examples.

**31.3 Special Values of  $L$ -Functions.....2715**

- (1) Deligne’s Conjecture. (2) Beilinson-Bloch Conjecture. (3) Bloch-Kato/Fontaine-Perrion.Riou Conjecture. (4) Mahler’s Measure and Special Values. (5)  $\mathbb{A}^1$  Case. (6) Modular Form case. (7) Shimura Curve case.

**31.4 Birch-S.Dyer Conjecture.....2725**

- (1) Statements. (2) Low Rank cases. (3) over Function Fields. (4) Motivic B-S.D Conjectures. (5) Mazur-Tate Conjecture. (6) Nagao’s Conjecture.

**31.5 Artin  $L$ -Functions: Stark Conjectures .....2732**

- (1) Stark Conjecture. (2) Brumer-Stark Conjecture. (3) Rubin-Stark Conjecture. (4) Gross-Stark Conjecture. (5) Serre-Stark Conjecture.

**31.6 Gross-Zagier Formula and AGGP Conjecture.....2735**

- (1) Heegner Points. (2) Gross-Zagier Formula. (3) AGGP Conjecture. (4) Special Divisors on Unitary Shimura Varieties. (5) CM Cycles on Unitary Shimura Varieties. (6) Triple Product. (7) Arithmetic Fundamental Lemma. (8) Arithmetic Transfer Lemma. (9) Archimedean Arithmetic Transfer Lemma. (10) AGGP over Function Fields. (11) Arithmetic Inner Product Formula.

**31.7 Colmez Conjecture .....2747**

- (1) Averaged Colmez Conjecture.

**Chapter 32 – Kudla’s Program**

**32.1 Kudla’s Program .....2749**

- (1) Siegel-Weil Formula for Symplectic Groups. (2) Siegel-Weil Formula for Unitary Groups. (3) Modularity Conjecture.

**32.2 Arithmetic Siegel-Weil Formula .....2754**

(1) Represented by Quadratic Forms.

**32.3 Kudla-Rapoport Conjecture.....2755**

(1) Local Kudla-Rapoport Conjecture. (2) Global Kudla-Rapoport Conjecture.

**Chapter 33 –  $p$ -adic  $L$ -Functions**

**33.1 Classical Iwasawa Theory.....2757**

(1)  $p$ -adic Analysis. (2)  $p$ -adic Eisenstein Series. (3) Coleman Map. (4)  $q$ -Primary Units.

**33.2  $p$ -adic  $L$ -Functions.....2766**

(1)  $p$ -adic Hecke  $L$ -Functions. (2) Leopoldt's Conjecture. (3) Modular Forms. (4) Perrin-Riou's  $p$ -adic  $L$ -Functions. (5) Cyclotomic  $p$ -adic  $L$ -Functions. (6) Anticyclotomic  $p$ -adic  $L$ -Functions for Elliptic Curves. (7) Herbrand-Ribet Theorem.

**33.3 Iwasawa Main Conjecture .....2771**

(1) Iwasawa Main Conjectures. (2) Fields case.

**33.4 Kato's Euler Systems.....2775**

(1) Kato-Siegel Functions. (2) Norm Relations. (3) Dual Exponentials. (4) Rankin-Selberg Convolution. (5) Euler System for Elliptic Curves(Kato).

**33.5 Iwasawa Theory for Elliptic Curves.....2787**

(1) Mazur's Control Theorem. (2) Anticyclotomic Iwasawa Conjecture for Modular Forms. (3) Kolyvagin's Work. (4)  $p$ -adic BSD Conjecture. (5)  $GL(2)$  case.

**33.6 Bloch-Kato Conjecture in the GGP Setting .....2791**

(1)  $SO(2) \times SO(3)$ .

**33.7  $p$ -adic Gross-Zagier Formulae .....2793**

(1) Anticyclotomic  $L$ -Functions for Elliptic Curves. (2) Triple Product  $L$ -Functions. (3)  $p$ -adic Heights.

**33.8  $p$ -adic Beilinson-Bloch-Kato Conjectures .....2794**

(1) Basics. (2) [Darmon-Rotger14]. (3) [Bertolini-Darmon-Rotger14]. (4) [Bertolini-Darmon14]. (5) [Lei-Loeffler-Zerbes14]. (6) [Bertolini-Darmon-Rotger15]. (7) [Darmon-Rotger16]. (8) Kings-Loeffler-Zerbes17. (9) Unitary Groups.

**Chapter 34 – Probability**

**34.1 Probability Theory .....2803**

(1) Basics. (2) Convergence of Laws and Central Limit Theorems. (3) Conditional Expectations. (4) Stochastic Processes. (5) Martingales. (6) Brownian Motions. (7) Statistics.

**34.2 Random Matrices .....2814**

## Chapter 35 – Analytic Theory of $L$ -Functions

## 1.1 Underlying Logics for this book

*“The question for the ultimate foundations and the ultimate meaning of mathematics remains open; we do not know in which direction it will find its final solution nor even whether a final objective answer can be expected at all. “Mathematizing” may well be a creative activity of man, like language or music, of primary originality, whose historical decisions defy complete objective rationalization.”*

–H. Weyl

### 1 Philosophical Issue

References are <https://us.metamath.org/mpeuni/mmset.html>.

**Remark(1.1.1.1).** This section is not mathematics. All other sections are mathematics, and logical issues will not occur(except possibly in comments). ┘

## 2 Logical Foundations

We stick to the formalism point of view that mathematics is a game of symbols with no intrinsic meaning. And this book is a possible way the game is played, and record what we have done with mathematics in a digital form. Our point of view is most similar to that of Metamath:<https://us.metamath.org/mpeuni/mmset.html>.

The game has a rule to label strings of symbols(given below2), and our task is to find more and more strings of symbols labeled “LEGAL”, and for a given string of symbols, determine if we can label it “LEGAL”.

As humans, we observe interesting patterns in these “meaningless” symbol strings as they evolve from the axioms, and we attach meaning to them. One example is the set of natural numbers, whose properties match those we observe when we count everyday objects. “2” is a set, more precisely an abbreviation of a string of symbols. So “2” can never be the two apple sitting in front of you, it just behave like those two apples, because we deliberately designed it to be.

### Primitive Notions:

In essence, this book has no meaning at all, unless you attach meaning to it. And you can never truly understand what is a “set” by studying set theory. This is unavoidable, by the existence of “primitive notions”.

The primitive notion we choose is the notion of “**symbols**”. Alphabets in any human language is a symbol. And “(”, “)”, “ $\implies$ ”, “ $\wedge$ ”, “ $\emptyset$ ”, “ $\neg$ ”, “ $=$ ”, “ $\in$ ” and “ $\forall$ ” are all symbols, called **connectives**.

**Rules(Axioms):**

There are three families of rules to label strings of symbols.

- **Propositional calculus axioms with equality:**

- (Constant variables:) “const:  $\emptyset$ ” can be labeled “LEGAL”.
- (Inference Rules:) If  $\varphi, \psi$  are strings of symbols, and
  - \* “wff:  $\varphi$ ” and “wff:  $\psi$ ” are labeled “LEGAL”.
  - \* “ $\varphi$ ” and “ $\varphi \rightarrow \psi$ ” are labeled “LEGAL”.

Then  $\psi$  can also be labeled “LEGAL”.

- (Axiom for  $\wedge$ :) If  $\varphi, \psi$  are strings of symbols, then

$$\left( (\varphi \wedge \psi) \rightarrow \neg(\varphi \rightarrow \neg\psi) \right)$$

and

$$\left( \neg(\varphi \rightarrow \neg\psi) \rightarrow (\varphi \wedge \psi) \right)$$

can be labeled “LEGAL”.

- (Well-defined formulas:)
  - \* If  $x$  is a string of symbols, then

$$\text{wff: (const: } x \text{)}$$

and

$$\text{wff: (var: } x \text{)}$$

and

$$\text{wff: (wff: } x \text{)}$$

can be labeled “LEGAL”.

- \* If  $x, y$  are strings of symbols, then

$$\left( \left( (\text{var: } x) \wedge (\text{var: } y) \right) \rightarrow \left( (\text{wff: } x = y) \wedge (\text{wff: } x \in y) \right) \right)$$

can be labeled “LEGAL”.

- \* If  $\varphi, \psi$  are strings of symbols, then

$$\left( (\text{wff: } \varphi) \rightarrow (\text{wff: } (\neg\varphi)) \right)$$

and

$$\left( \left( (\text{wff: } \varphi) \wedge (\text{wff: } \psi) \right) \rightarrow (\text{wff: } (\varphi \implies \psi)) \right)$$

can be labeled “LEGAL”.

- (Axioms of simplification:) If  $\varphi, \psi$  are strings of symbols, then

$$\left( \left( (\text{wff: } \varphi) \wedge (\text{wff: } \psi) \right) \rightarrow (\varphi \implies (\psi \implies \varphi)) \right)$$

can be labeled “LEGAL”.

- (Axiom Frege:)If  $\varphi, \psi, \chi$  are strings of symbols, then

$$\left( \left( (\text{wff: } \varphi) \wedge (\text{wff: } \psi) \wedge (\text{wff: } \eta) \right) \rightarrow \left( (\varphi \implies (\psi \implies \eta)) \implies ((\varphi \implies \psi) \implies (\varphi \implies \eta)) \right) \right)$$

can be labeled “LEGAL”.

- (Axiom transpose:)If  $\varphi, \psi$  are strings of symbols, then

$$\left( \left( (\text{wff: } \varphi) \wedge (\text{wff: } \psi) \right) \rightarrow \left( (\neg\varphi \implies \neg\psi) \implies (\psi \implies \varphi) \right) \right)$$

can also be labeled “LEGAL”.

- (Axiom modus ponens:)If  $\varphi, \psi$  are strings of symbols, then

$$\left( \left( (\text{wff: } \varphi) \wedge (\text{wff: } \psi) \wedge \varphi \wedge (\varphi \rightarrow \psi) \right) \rightarrow \psi \right)$$

can be labeled “LEGAL”.

- (Axiom of equality:)If  $x, y, z$  are strings of symbols, then

$$\left( \left( (\text{var: } x) \wedge (\text{var: } y) \wedge (\text{var: } z) \right) \rightarrow \left( (x = y) \implies ((x = z) \implies (y = z)) \right) \right)$$

can be labeled “LEGAL”.

- (Axiom of Substitution:)

- **Predicate calculus axioms with equality:**

- If  $x, \varphi, \psi$  are strings of symbols, then

$$\left( \left( (\text{var: } x) \wedge (\text{wff: } \varphi) \wedge (\text{wff: } \psi) \right) \rightarrow (\text{wff: } ((\forall x)\varphi)) \right)$$

can be labeled “LEGAL”.

- (Axiom of generalization:)If  $x, \varphi$  are strings of symbols, then

$$\left( \left( (\text{var: } x) \wedge (\text{wff: } \varphi) \right) \rightarrow \left( \varphi \implies ((\forall x)\varphi) \right) \right)$$

can be labeled “LEGAL”.

- (Axiom of quantified implication:)If  $x, \varphi, \psi$  are strings of symbols, then

$$\left( \left( (\text{var: } x) \wedge (\text{wff: } \varphi) \wedge (\text{wff: } \psi) \right) \rightarrow \left( ((\forall x)(\varphi \rightarrow \psi)) \rightarrow ((\forall x)\varphi \rightarrow (\forall x)\psi) \right) \right)$$

can be labeled “LEGAL”.

- (Axiom of distinctness:)

- \* If  $x, y$  are strings of symbols, then

$$\left( (\text{var: } x) \rightarrow (\text{wff: } (\text{distin: } (x, y))) \right)$$

can be labeled “LEGAL”.

- \* If  $x, y, z$  are strings of symbols, then

$$\left( \left( (\text{var: } x) \wedge (\text{distin: } (x, y)) \wedge (\text{distin: } (x, z)) \right) \rightarrow (\text{distin: } (x, (y = z))) \right)$$

and

$$\left( \left( (\text{var: } x) \wedge (\text{distin: } (x, y)) \wedge (\text{distin: } (x, z)) \right) \rightarrow (\text{distin: } (x, (y \in z))) \right)$$

can be labeled “LEGAL”.

- \* If  $x, y$  are strings of symbols, then

$$\left( \left( (\text{var: } x) \wedge (\text{distin: } (x, y)) \right) \rightarrow (\text{distin: } (x, (\text{const: } y))) \right)$$

and

$$\left( \left( (\text{var: } x) \wedge (\text{distin: } (x, y)) \right) \rightarrow (\text{distin: } (x, (\text{var: } y))) \right)$$

and

$$\left( \left( (\text{var: } x) \wedge (\text{distin: } (x, y)) \right) \rightarrow (\text{distin: } (x, (\text{wff: } y))) \right)$$

can be labeled “LEGAL”.

- \* If  $x, \varphi$  are strings of symbols, then

$$\left( \left( (\text{var: } x) \wedge (\text{distin: } (x, \varphi)) \right) \rightarrow (\text{distin: } (x, (\neg \varphi))) \right)$$

can be labeled “LEGAL”.

- \* If  $x, \varphi, \psi$  are strings of symbols, then

$$\left( \left( (\text{var: } x) \wedge (\text{distin: } (x, \varphi)) \wedge (\text{distin: } (x, \psi)) \right) \rightarrow (\text{distin: } (x, (\varphi \rightarrow \psi))) \right)$$

can be labeled “LEGAL”.

- \* If  $x, y, \varphi$  are strings of symbols, then

$$\left( \left( (\text{var: } x) \wedge (\text{dist: } (x, y)) \wedge (\text{distin: } (x, \varphi)) \right) \rightarrow (\text{distin: } (x, ((\forall y)\varphi))) \right)$$

can be labeled “LEGAL”.

- \* If  $x, \varphi$  are strings of symbols, then and  $\varphi$  are strings of symbols, then

$$\left( \left( (\text{var: } x) \wedge (\text{wff: } \varphi) \wedge (\text{distin: } (x, \varphi)) \right) \rightarrow (\varphi \rightarrow ((\forall x)\varphi)) \right)$$

can be labeled “LEGAL”.

- **Set theory axioms(TG):**

- (Axiom of Existence:) If  $x, y$  are strings of symbols, then

$$\left( \left( (\text{var: } x) \wedge (\text{var: } y) \right) \rightarrow \left( \neg(\forall x)(\neg(x = y)) \right) \right)$$

can be labeled “LEGAL”.

- (Axiom of left equality:) If  $x, y, z$  are strings of symbols, then

$$\left( \left( (\text{var: } x) \wedge (\text{var: } y) \wedge (\text{var: } z) \right) \rightarrow \left( (x = y) \implies ((x \in z) \implies (y \in z)) \right) \right)$$

can be labeled “LEGAL”.

- (Axiom of right equality:) If  $x, y, z$  are strings of symbols, then

$$\left( \left( (\text{var: } x) \wedge (\text{var: } y) \wedge (\text{var: } z) \right) \rightarrow \left( (x = y) \implies ((z \in x) \implies (z \in y)) \right) \right)$$

can be labeled “LEGAL”.

- (Tarski-Grothendieck Axiom:)

You may noticed the strings of symbols that we have labeled “LEGAL” have something in common, i.e. you can see they are ‘well-formed formulas’, a notion which I didn’t define.

### Abbreviations and definitions:

When doing mathematics, an **abbreviation** is just a new axiom. For example, the sentence

$$“(\varphi \iff \psi)” \text{ is an abbreviation for } “((\varphi \rightarrow \psi) \wedge (\psi \rightarrow \varphi))”$$

is just suggesting adding the axiom

$$\left( \left( (\varphi \iff \psi) \rightarrow ((\varphi \rightarrow \psi) \wedge (\psi \rightarrow \varphi)) \right) \wedge \left( ((\varphi \rightarrow \psi) \wedge (\psi \rightarrow \varphi)) \rightarrow (\varphi \iff \psi) \right) \right).$$

A **definition** is an assertion of a variable followed by an abbreviation, used to save space. All theorems using this definition can be reduced to wffs, where the defined new string disappears.

For example, the sentence “the power set of a set  $X$  is defined to be the set of all subsets of  $X$ ” is just suggesting adding the axioms

$$\text{var: (the power set of } X)$$

and

$$\mathcal{M}(\text{the power set of } X)$$

and

$$(y \in (\text{the power set of } X)) \iff (y \subset X).$$

Notice adding definition may make the axioms inconsistent. Thus whenever we use definitions, we need to make sure that definitions names are different.

Whenever we substitute abbreviates, we will use  $\overset{\text{subst}}{\iff}$ .

### 3 Other Choice of Foundations

Instead of using the foundations given by ZFC+TG, we can also change it to either

- A family of type theory axioms with equality as the only primitive notions, as in HOL Light, or
- A family of calculus of inductive constructions axioms, as in Coq or Lean.

I haven't try these, but may change the setup in the future.

### 4 Proofs

**Def. (1.1.4.1).** A mathematical **proof** of a proposition is a chain of logical deductions leading to the proposition from a base set of axioms. ┘

A Sample Proof:

## 2 | Mathematical Logic and Computer Science

*“It is with logic that one proves; it is with intuition that one invents.”*

–H. Poincaré

### 2.1 Mathematical Logic

References are [Logic for mathematicians, Hamilton], [Axiomatic Set Theory] and [Mathematical Logic, Mendelson]. We mostly follow Mendelson’s approach.

#### Notation(2.1.0.1).

- Beginning this section, we will be talking doing mathematics obeying the rules stated in [Logical Foundations](#). Our task is to write and only write strings of symbols and label them “LEGAL”. Our writing style is most similar to that of Mizar<http://mizar.org>.
- You may see definitions like propositional calculus/predicate calculus which already appeared in the former section, REMEMBER: this has nothing to do with them, and only can be seen as a formal representation of them. The things in the last section belongs to real world, and the things in this section and all the following belongs to this game called “mathematics”(If you are drawing papers on a paper, what you draw are not real papers). Of course you can argue truth can be learned about the real world by doing this “game”, but that depends on you attaching meaning to it.(This point has already been illustrated in the last section.)
- Don’t worry, you can still prove that the axiom of choice is independent with the ZF system by giving a model, essentially the same way proving that the Euclid’s fifth axiom is independent of the other four(in the frame of propositional calculus axioms and predicate calculus axioms, of course, everything is happening in the “game”).

┘

### 1 Peano’s Postulates for Natural Numbers

After settling [Philosophical Issue](#), I can start expressing now. In fact, I already started when I am explaining philosophical issue to you.

#### the Primordial Systems

**Def.(2.1.1.1)[the Primordial Languages].** The primordial language  $\mathcal{L}_0$  consists of

- **free variable symbols**  $a, b, c, d, m, n$ .
- **bound variable symbols**  $x, y, z, w$ .

- **constant variable symbol** 0.
- **function symbols**  $S, +, \cdot$ ,
- **predicate symbols**  $=$ .
- **punctuations symbols** “(”, “...”, “)”.
- **connective symbols**  $\neg$  and  $\implies$ .
- **quantifier symbol**  $\forall$ .

⌋

**Def. (2.1.1.2)[the (Blank)Peano Arithmetic system].** The (blank)Peano arithmetic system PA consists of the following data:

- the primordial language  $\mathcal{L}$ (2.1.1.1).
- A procedure called a **grammar** to specify which things are called **well-formed formulas**(wffs):
  - There is a procedure to specify which things are called **terms**:
    - \* 0 and free variable symbols are terms.
    - \* If  $t, s$  are terms, then  $S(t), (t + s), t \cdot s$  are terms.
  - There is a procedure to specify which things are called **atomic formulas**: If  $t, s$  are terms, then  $t = s$  is an atomic formula.
  - The procedure to determine wffs:
    - \* Atomic formulas are wffs.
    - \* if  $\varphi, \psi$  are wffs and  $x$  is a bound variable not appearing in  $\varphi$ , then  $\neg\varphi, (\varphi \implies \psi), (\forall x)\varphi(x/a)$  are wffs, where  $\varphi(x/a)$  is obtained from  $\varphi$  by replacing each occurrence of some free variable  $a$  by a bound variable  $x$  that doesn't appear in  $\varphi$ .
- A procedure to specify which well-formed formulas are called **axioms**: The following are axioms:
  - Logical Axioms: If  $\varphi, \psi, \eta$  are wffs,
    - \*  $(\varphi \implies (\psi \implies \varphi))$ .
    - \*  $((\varphi \implies (\psi \implies \eta)) \implies ((\varphi \implies \psi) \implies (\varphi \implies \eta)))$ .
    - \*  $((\neg\varphi \implies \neg\psi) \implies (\psi \implies \varphi))$ .
    - \*  $(\varphi \implies (\psi \implies \varphi))$ .
    - \*  $(\varphi \implies (\psi \implies \eta)) \implies ((\varphi \implies \psi) \implies (\varphi \implies \eta))$ .
    - \*  $((\neg\varphi \implies \neg\psi) \implies (\psi \implies \varphi))$ .
    - \*  $((\forall x)\varphi \implies \varphi(a/x))$  where  $\varphi(a/x)$  is obtained from  $\varphi$  by replacing each occurrence of the bound variable  $x$  in  $\varphi(x)$  by the free variable  $a$ .
    - \*  $((\forall x)(\varphi \implies \psi) \implies (\varphi \implies (\forall x)\psi))$ , if the free variable  $a$  in  $\varphi$  which are quantifying with  $x$  doesn't appear.
    - \* (Modus Ponens or MP)  $\varphi \wedge (\varphi \implies \psi) \rightarrow \psi$ .
    - \* (Generalizations)  $\varphi \rightarrow (\forall x)\varphi(x/a)$ , where  $x$  is a bound variable symbol that doesn't appear in  $\varphi$ , and  $\varphi(a/x)$  is obtained from  $\varphi$  by replacing each occurrence of some free variable  $a$  by  $x$ .
  - Non-Logical Axioms: If  $a, b, c$  are any free variables,  $x, y, z$  are any bound variables and  $\varphi$  a wff., then

- \*  $(a = b) \implies ((a = c) \implies (b = c)).$
- \*  $(a = b) \implies (S(a) = S(b)).$
- \*  $\neg(0 = S(a)).$
- \*  $(S(a) = S(b)) \implies (a = b).$
- \*  $(a + 0) = a.$
- \*  $a + S(b) = S(a + b).$
- \*  $a \cdot 0 = 0.$
- \*  $a \cdot S(b) = a \cdot b + b.$
- \* (Principle of mathematical induction)  $\varphi(0/a) \implies ((\forall x)(\varphi(x/a) \implies \varphi(S(x)/a)) \implies (\forall x)\varphi(x)).$

terms in the Peano arithmetic system will be called **natural numbers**.  $\lrcorner$

**Remark (2.1.1.3) [Metaphysical Issue].**

- From now any definition/proposition/rem we make should be regarded as wffs in a formal sufficiently high order system containing the blank PA system(2.1.1.2) and the class system to be defined in(2.1.3.2) and we can quantify over any other systems. In other words, I assume will can comprehend everything in this book. Such a language is called a **metasystem** for it. The symbols in this metalanguage is called a **metavariable**.
- I assume it has an axiom which is a stronger form of the mathematical induction(2.1.1.2)(i.e. Induction can apply to properties of classes).
- If you don't agree with the axioms and assumptions I made so far, you should close this file and leave right now.  $\lrcorner$

**Remark (2.1.1.4) [Logical Issue].** Pedantically, by our construction of our mathematical system, in order for propositions to be defined in a lower order system, we should have defined symbols exclusively each time we enlarge the system, and never say something like “let  $n$  be a natural number,  $n + 1 > 0$ ”, because this is not a wff. In stead, we should write  $(\forall n)(n + 1 > 0)$ , because this is a wff. in Peano's system PA, and  $n$  is born to be representing a natural number, i.e. a symbol in the system PA.

But in practice, it is annoying to do so, so we will be more tolerant on this kind of usage. Just remember always this kind of sentence can be formalized.  $\lrcorner$

## 2 Languages

**Def. (2.1.2.1) [Languages].** A language  $\mathcal{L}$  is a countable set of symbols. There may be subsets of symbols such as free symbols, bound symbols, function symbols, logical symbols, etc..  $\lrcorner$

**Remark (2.1.2.2) [Formal System].** A formal system  $\mathcal{L}$  consists of the following data:

- A language  $L$ (2.1.2.1), or equivalently, a set of symbols.
- A set of **well-formed formulas** or wffs.
- A set of **axioms**.  $\lrcorner$

**Remark(2.1.2.3) [Class System as a Metasystem].** Notice for any language or system, the class system is a metasystem of it. So we can formalize talking about everything about this system in the class system, like consistency, completeness...

Given a formal system  $L$ , we will typically use metavariables  $a, b, c, x, y, z$  whose domain is the collection of symbols in  $L$ , and use metavariables  $\varphi, \psi, \eta$  to describe wffs in  $L$ .  $\perp$

**Meta Thm. (2.1.2.4).** The primordial language  $\mathcal{L}_0$ (2.1.1.1) is a language(2.1.2.1). In fact a first order language to be defined in(2.1.5.1). The class system  $\mathcal{L}_C$  is a formal system(2.1.2.2). (i.e. they are sets).  $\perp$

**Remark (2.1.2.5).** Until now I settled all the logical issues, but remember I made several assumptions that is metaphysical and cannot be settled by logic or math:

- There is a representation of will called the primordial language(2.1.1.1),
  - There is a “talking system” that is a representation of will that can describe all other systems can enables the presence of this book(2.1.1.3).
- $\perp$

### 3 Class System(ZF)

**Def. (2.1.3.1).** In fact this theory is a theory that lies between ZF and NBG. I think it is better to just change everything to NBG?  $\perp$

**Def. (2.1.3.2) [Class System].** The **class system** ZF is a formal system(2.1.2.2) with

- Language: A first order language(2.1.5.1) with
  - Free variable symbols:
    - \*  $0, a_0$  are free variable symbols.
    - \* For any natural number  $n$ , if  $a_n$  is a free variable symbol, then  $a_{n+1}$  is also a free variable symbol.
  - Bound variable symbols:
    - \*  $x(0)$  is a bound variable symbol.
    - \* For any natural number  $n$ , if  $x_n$  is a bound variable symbol, then  $x_{n+1}$  is also a bound variable symbol.
  - Predicate symbol:  $\in, =$ .
  - Punctuation symbols: “(”, “)”, “...”, “,” and “{”, “}”, “|”, “:”.
  - Connective symbols:  $\neg$  and  $\rightarrow$ .
  - Quantifier symbol:  $\forall$ .
- Grammar:
  - A procedure to specify wffs:
    - \* If  $a, b$  are free variable, then  $a \in b$  is a wff..
    - \* If  $\varphi, \psi$  are wffs,  $a, b$  are free variables and  $x$  is a bound variable, then

$$(a \in \{x|\psi(x/a)\}), \quad (\{x|\psi(x/a)\} \in b), \quad (\{x|\varphi(x/a)\} \in \{x|\psi(x/b)\})$$

are wffs, where  $\psi(x/a)$ (resp.  $\varphi(x/b)$ ) is obtained from  $\psi$ (resp.  $\varphi$ ) by replacing a free variable  $a$ (resp.  $b$ ) by a bound variable  $x$  that doesn't appear in  $\psi$ (resp.  $\varphi$ ).

- \* If  $\varphi, \psi$  are wffs, then  $\neg\varphi$  and  $\varphi \rightarrow \psi$  are wffs.
- \* If  $\varphi$  is a wff. and  $x$  is a bound variable, then  $(\forall x)\varphi(x/a)$  is a wff.
- A procedure to specify terms:
  - \* Variables are terms.
  - \* If  $\varphi$  is a wff., then  $\{x|\varphi\}$  is a term, called a **class**.
- Axioms:
  - Logical Axioms: If  $\varphi, \psi, \eta$  are wffs,
    - \*  $(\varphi \implies (\psi \implies \varphi))$ .
    - \*  $((\varphi \implies (\psi \implies \eta)) \implies ((\varphi \implies \psi) \implies (\varphi \implies \eta)))$ .
    - \*  $((\neg\varphi \implies \neg\psi) \implies (\psi \implies \varphi))$ .
    - \*  $((\forall x)\varphi \implies \varphi(a/x))$  where  $\varphi(a/x)$  is obtained from  $\varphi$  by replacing each occurrence of the bound variable  $x$  in  $\varphi(x)$  by the free variable  $a$ .
    - \*  $((\forall x)(\varphi \implies \psi) \implies (\varphi \implies (\forall x)\psi))$ , if the free variable  $a$  in  $\varphi$  which are quantifying with  $x$  doesn't appear.
    - \* (Modus Ponens or MP)  $\varphi \wedge (\varphi \implies \psi) \rightarrow \psi$ .
    - \* (Generalizations)  $\varphi \rightarrow (\forall x)\varphi(x/a)$ , where  $x$  is a bound variable symbol that doesn't appear in  $\varphi$ , and  $\varphi(a/x)$  is obtained from  $\varphi$  by replacing each occurrence of some free variable  $a$  by  $x$ .
  - Non-logical axioms: If  $\varphi, \psi$  are wffs, then
    - C1:  $(a \in \{x|\varphi\}) \iff \varphi(a/x)$ , where  $\varphi(a/x)$  is  $\varphi$  with all occurrence of  $x$  replaced by  $a$ .
    - C2:  $(\{x|\varphi(x)\} \in a) \iff ((\exists y)((y \in a) \wedge (\forall z)((z \in y) \iff \varphi(z/x))))$ , where  $\varphi(z/x)$  is  $\varphi$  with all occurrence of  $x$  replaced by  $z$ .
    - C3:  $(\{x|\varphi(x)\} \in \{x|\psi\}) \iff ((\exists y)(\psi(y/x) \wedge (\forall z)((z \in y) \iff \varphi(z/x))))$ , where  $\varphi(z/x)$  is  $\varphi$  with all occurrence of  $x$  replaced by  $z$  and  $\psi(y/x)$  is  $\psi$  with all occurrence of  $x$  replaced by  $y$ .
    - C4: (Equality)  $(a = b) \iff (\forall x)((x \in a) \iff (x \in b))$ .
    - C5: (Axiom of Extensionality)(2.1.3.3).
    - C6: (Axiom of Pairing)(2.1.3.20).
    - C7: (Axiom of Union)(2.1.3.26).
    - C8: (Axiom of Power Set)(2.1.3.30).
    - C9: (Axiom Schema of Replacement)(2.1.3.31).
    - C10: (Axiom of Regularity/Foundation)(2.1.3.40).
    - C11: (Axiom of Infinity)?.

┘

### Equalities

**Axiom (2.1.3.3)[Axiom of Extensionality].**  $((a = b) \wedge (a \in c)) \rightarrow (b \in c)$ .

┘

**Meta Thm.(2.1.3.4)[Reduce Class to Sets].** For any wff  $\varphi$  in the class system, there exists a wff  $\varphi^*$  in the set system s.t.  $\varphi$  is deducible from  $\varphi^*$  and  $\varphi^*$  is deducible from  $\varphi$ . (2.1.4.1)?  $\lrcorner$

*Proof:* Use induction. ?  $\square$

**Remark(2.1.3.5).** This tells us that the extension from set system to class system is conservative. ?  $\lrcorner$

**Meta Thm.(2.1.3.6).** The set system ? is a subsystem(2.1.4.4) of the class system(2.1.3.2). Moreover, every term in set system is a term in the class system.  $\lrcorner$

**Def.(2.1.3.7).**

- If  $\varphi$  is a wffs, define  $\{x : \varphi\} \triangleq \{x|\varphi\}$ .
- If  $A, B$  are classes, then define  $A \notin B \triangleq \neg(A \in B)$ .
- If  $A$  is a class and  $\varphi$  is a wff., define  $(\forall x \in a)\varphi \triangleq (\forall x)(x \in a)(\wedge \varphi)$

$\lrcorner$

**Def.(2.1.3.8)[Equality between Classes].** If  $A, B$  are classes, then

$$A = B \triangleq (\forall x)((x \in A) \iff (x \in B)), \quad A \neq B \triangleq \neg(A = B)$$

$\lrcorner$

**Meta Thm.(2.1.3.9).** If  $A, B, C$  are classes, then

- $(A = B) \iff (\exists x)((x = A) \wedge (x \in B))$ .
- $(A = A)$ .
- $(A = B) \rightarrow (B = A)$ .
- $(A = B) \wedge (B = C) \rightarrow (A = C)$ .

$\lrcorner$

*Proof:* Cf.[Axiomatic Set Theory]P13.  $\square$

**Meta Thm.(2.1.3.10).**  $(a = b) \rightarrow (\varphi(a/x) \iff \varphi(b/x))$ , where  $\varphi(a/x)$  is constructed from  $\varphi$  by replacing every free occurrence of  $x$  by  $a$ .  $\lrcorner$

*Proof:* Cf.[Axiomatic Set Theory, P8]. The proof used induction on the number of logical symbols in  $\varphi$ . ?  $\square$

**Thm.(2.1.3.11)[Every Set is a Class].**  $a = \{x|x \in a\}$ .  $\lrcorner$

*Proof:* This follows from axiom (C2) and the fact  $(\forall x)((x \in a) \iff (x \in a))$ .  $\square$

**Def.(2.1.3.12)[Set Predicate].** If  $A$  is a class,  $\mathcal{M}(A) \triangleq (\exists x)(x = A)$ . This predicate formally indicate that “ $A$  is a set”.  $\lrcorner$

**Prop.(2.1.3.13).**  $\mathcal{M}(a)$ .  $\lrcorner$

*Proof:*  $a = a$ .  $\square$

**Meta Thm.(2.1.3.14).** If  $A$  is a class, then  $(A \in \{x|\varphi(x)\}) \iff (\mathcal{M}(A) \wedge \varphi(A))$ .  $\lrcorner$

*Proof:* Use induction on  $A$ . ?  $\square$

**Thm. (2.1.3.15) [Russell's Paradox].** Define  $Ru \triangleq \{x | x \notin x\}$ . Then  $\neg \mathcal{M}(Ru)$ . ┘

*Proof:* By considering the wff.  $\varphi : x \notin x$ , it follows from (2.1.3.14) that

$$(\mathcal{M}(Ru) \wedge (Ru \notin Ru)) \rightarrow (Ru \in \{x | x \notin x\}) \xrightarrow{\text{subst}} (Ru \in Ru)$$

so

$$\mathcal{M}(Ru) \rightarrow ((Ru \notin Ru) \rightarrow (Ru \in Ru)).$$

so

$$\mathcal{M}(Ru) \rightarrow (Ru \in Ru).$$

Then by axiom (C3),

$$(Ru \in Ru) \rightarrow ((\exists y)(\psi(y/x) \wedge (\forall z)((z \in y) \iff z \notin z)))$$

which is false. So  $\neg \mathcal{M}(Ru)$ . □

**Def. (2.1.3.16) [Definable Sets].** If  $\varphi$  is a wff., then we say that  $\{x | \varphi(x)\}$  is a **definable set** if  $\mathcal{M}(\{x | \varphi(x)\})$ . ┘

### Properties of Classes

**Def. (2.1.3.17) [Pairs and Ordered Pairs].**

- $\{a, b\} \triangleq \{x | (x = a) \vee (x = b)\}$ .
  - $\{a\} \triangleq \{a, a\}$ .
  - $(a, b) \triangleq \{x | (x = \{a\}) \vee (x = \{a, b\})\}$ .
  - $a_n \triangleq (a, n)$ . (notice  $n$  is a natural number).
- ┘

**Meta Def. (2.1.3.18) [MultiPairs].** For any free variable  $a_0$  and a natural number  $n$ , define a term  $\{a_1, \dots, a_n\}$ . For any bound variable  $x_0$ , define a bound term  $\{x_1, \dots, x_n\}$ . ┘

**Prop. (2.1.3.19).**

- $(c \in \{a, b\}) \iff ((c = a) \vee (c = b))$ .
  - $(c \in \{a\}) \iff (c = a)$ .
  - $(c \in (a, b)) \iff ((c = \{a\}) \vee (c = \{a, b\}))$ .
  - $(\{a\} = \{b\}) \iff (a = b)$ .
  - $(\{a\} = \{b, c\}) \iff ((a = b) \wedge (b = c))$ .
  - $((a, b) = (c, d)) \iff ((a = c) \wedge (b = d))$ .
  - $((\forall x)((a \in x) \rightarrow (b \in x))) \rightarrow (a = b)$ .
- ┘

**Axiom (2.1.3.20) [Axiom of Pairing].**  $\mathcal{M}(\{a, b\})$ . ┘

**Cor. (2.1.3.21).**  $\mathcal{M}((a, b))$ . ┘

**Meta Thm. (2.1.3.22) [Objects of Classes are Sets].** For classes  $A, B$ ,  $(A \in B) \rightarrow \mathcal{M}(A)$ . ┘

**Def. (2.1.3.23) [Unions].** For classes  $A, B$ , define

- $A \cup B \triangleq \{x | (x \in A) \vee (x \in B)\}.$
- $A \cap B \triangleq \{x | (x \in A) \wedge (x \in B)\}.$
- For a class  $A$ , define  $\cup(A) \triangleq \{x | (\exists y)((x \in y) \wedge (y \in A))\}.$

┘

**Prop. (2.1.3.24).**  $(a \cup b) = \cup(\{a, b\}).$

┘

*Proof:* Cf.[Axiomatic Set Theory, P16].

□

**Prop. (2.1.3.25).**

- $(a \in (b \cup \{b\})) \iff (a \in b) \vee (a = b).$
- $A \cup B = B \cup A.$
- $A \cap B = B \cap A.$
- $(A \cup B) \cup C = A \cup (B \cup C).$
- $(A \cap B) \cap C = A \cap (B \cap C).$
- $A \cap (B \cup C) = (A \cap B) \cup (A \cap C).$
- $A \cup (B \cap C) = (A \cup B) \cap (A \cup C).$

┘

*Proof:*

□

**Axiom (2.1.3.26) [Axioms of Union].**  $\mathcal{M}(\cup(a)).$

┘

**Cor. (2.1.3.27).**  $\mathcal{M}(a \cup b).$

┘

*Proof:*

□

**Def. (2.1.3.28) [Subclasses].** For classes  $A, B$ , define

- $A \subset B \triangleq (\forall x)((x \in A) \rightarrow (x \in B)).$
- $A \subsetneq B \triangleq ((A \subset B) \wedge (A \neq B)).$

┘

**Def. (2.1.3.29) [Power Sets].**  $\mathcal{P}(a) \triangleq \{x | x \subset a\}$ , called the **power set** of  $a$ .

┘

**Axiom (2.1.3.30) [Axiom of Power Set].**  $\mathcal{M}(\mathcal{P}(a)).$

┘

**Axiom (2.1.3.31) [Axiom Schema of Replacement].** For each wffs  $\varphi$ , there is an axiom

$$((\forall x)(\forall y)(\forall z)((\varphi(x/a, y/b) \wedge \varphi(x/a, z/b)) \rightarrow (y = z)) \rightarrow \mathcal{M}(\{y | (\exists x \in a)\varphi(x/a, y/b)\})).$$

┘

**Meta Cor. (2.1.3.32).** For any class  $A$ ,  $\mathcal{M}(a \cap A).$

┘

*Proof:* Cf.[Axiomatic Set Theory, P20].

□

**Def. (2.1.3.33) [Setminus].** For classes  $A, B$ , define  $A \setminus B \triangleq \{x | (x \in A) \wedge (x \notin B)\}.$

┘

**Meta Thm. (2.1.3.34).** If  $A$  is a class, then  $\mathcal{M}(a \setminus A).$

┘

*Proof:*  $\mathcal{M}(a \setminus A) \xrightarrow{\text{subst}} \mathcal{M}(\{x \in a \mid x \notin A\})$  is a theorem by (2.1.3.32). □

**Def. (2.1.3.35) [Empty Class].**  $0 \triangleq \{x \mid x \notin x\}$ . ┘

**Prop. (2.1.3.36).**  $a \setminus a = 0$ . ┘

*Proof:*  $a \setminus a \xrightarrow{\text{subst}} \{x \mid (x \in a) \wedge (x \notin a)\} = \{x \mid x \notin x\}$  ? □

**Cor. (2.1.3.37) [Empty Set].**  $\mathcal{M}(0)$ . ┘

**Prop. (2.1.3.38).**

- $(\forall x)(x \notin 0)$ .
  - $(a \neq 0) \iff (\exists x)(x \in a)$ .
- ┘

*Proof:* 1:  $(\forall x)(x = x)$ .  
2: By axiom (Equality),

$$(a \neq 0) \iff (\exists x)((x \in 0) \wedge (x \notin a)) \vee ((x \in a) \wedge (x \notin 0)).$$

Then it follows from item1 that  $(a \neq 0) \iff (\exists x)(x \in a)$ . □

**Meta Def. (2.1.3.39).** We define  $\{a_1 \in a_2 \in \dots \in a_n\}$  as in (2.1.4.3). ? ┘

**Axiom (2.1.3.40) [Axiom of Regularity (Foundation)].**  $(a \neq 0) \rightarrow (\exists x \in a)((x \cap a) = 0)$ . ┘

**Cor. (2.1.3.41).**  $(a \notin a)$ . ┘

*Proof:* If  $(a \in a)$ , then  $\{a\} \neq 0$  by (2.1.3.38), and unwinding the definition ?,

$$(\forall x)((x \in \{a\}) \rightarrow (x \cap \{a\}) \neq 0),$$

contradicting axiom of regularity (2.1.3.40). □

**Meta Cor. (2.1.3.42).** For any natural number  $n > 0$ ,  $\neg(a_1 \in a_2 \in \dots \in a_n \in a_1)$ . ┘

*Proof:* If  $(a_1 \in a_2 \in \dots \in a_n \in a_1)$ , then  $\{a_1, \dots, a_n\} \neq 0$  by (2.1.3.38), and

$$(\forall x)((x \in \{a_1, \dots, a_n\}) \rightarrow (x \cap \{a_1, \dots, a_n\}) \neq 0),$$

contradicting axiom of regularity (2.1.3.40). □

**Prop. (2.1.3.43) [von. Neumann Universe].** Define  $\mathcal{V} \triangleq \{x \mid x = x\}$ , then  $\neg \mathcal{M}(\mathcal{V})$ . And in fact  $\mathcal{V} = \text{Ru}$  (2.1.3.15). ┘

*Proof:* Since  $\mathcal{V} = \mathcal{V}$ , if  $\mathcal{M}(V)$ , then  $V \in V$ , by (2.1.3.14), then this together with  $\mathcal{M}(V)$  contradicts (2.1.3.41) after unwinding definition ?. (Notice that metathm (2.1.3.14) is a wff. when restricted to  $V$ ).

For the last assertion, ? □

**Meta Thm. (2.1.3.44).** For classes  $A, B$ ,

- $0 \subset A$ .

- $A \subset \mathcal{V}$ .
- $(\forall x)(x \notin A) \rightarrow (A = 0)$ .
- $(A \subset a) \rightarrow \mathcal{M}(A)$ .
- $\mathcal{M}(A) \rightarrow \mathcal{M}(A \cap B)$ .
- $A \notin A$ .

┘

**Meta Thm. (2.1.3.45)[Strong Regularity].** The axiom of regularity(2.1.3.40) implies a stronger form of regularity: For any class  $A$ ,

$$(A \neq 0) \rightarrow (\exists x \in A)((x \cap a) = 0).$$

┘

*Proof:* Cf.[Axiomatic Set Theory]P80. □

**Meta Cor. (2.1.3.46).** For any class  $A$ ,

$$(\forall x)((x \subset A) \rightarrow (x \in A)) \rightarrow (A = \mathcal{V})$$

(In words, if every set  $a$  has a property(a wff.  $\varphi$ ) whenever every element of  $a$  has this property, then every set has this property.) ┘

*Proof:* If  $(\forall x)((x \subset A) \rightarrow (x \in A))$ , denote  $B = V \setminus A$ , if  $B \neq 0$ , then by strong regularity(2.1.3.45),

$$(\exists a)((a \in B) \wedge (a \cap B) = 0).$$

So

$$(\forall y)((y \in a) \rightarrow (y \notin B)).$$

But  $y \in V$ , so

$$(\forall y)((y \in a) \rightarrow (y \notin A)).$$

And then  $a \subset A$ , and the hypothesis on  $A$  implies  $a \in A$ , contradicting the fact  $a \in B$ . So  $A = V$ , by(2.1.3.44). □

**Meta Cor. (2.1.3.47)[Inclusion Induction].** There are no infinite descending  $\in$ -chains of sets. ┘

*Proof:* The property  $\mathcal{P}$  of not having infinite descending  $\in$ -chain is a wff., so  $A = \{x | \mathcal{P}(x)\}$  is a class. And it can be shown  $(a \subset A) \rightarrow (a \in A)$ . Thus by(2.1.3.46),  $A = Ru$ , so every set has no infinite descending  $\in$ -chains. □

## 4 Formal Propositional Calculus

**Meta Def. (2.1.4.1)[Deductions].** Let  $L$  be a formal system(2.1.2.2), a **proof** is a finite sequence of wffs s.t. every wffs appearing is either an axiom or a wedge of two wffs before it.

A **theorem** in  $L$  is a wffs that is deducible from an axiom  $\eta$  of  $L$ . A proof(resp. theorem/defi) in the metasystem is called a **metaproof**(resp. **metatheorem**/defi). ┘

**Meta Def. (2.1.4.2)[Multiple Deduction].** Let  $L$  be a formal system and  $\psi$  a wff. in  $L$ , then for any natural number  $n > 0$  and any  $\{\eta_1, \dots, \eta_n\}$  (2.1.3.18), then introduce metaterms

$$\{\eta_1\} \vdash_L \psi, \quad \{\eta_1, \eta_2\} \vdash_L \psi, \quad \{\eta_1, \dots, \eta_n\} \vdash_L \psi$$

and metaaxioms:

$$\{\eta_1\} \vdash_L \psi \triangleq \vdash_L (\eta_1 \rightarrow \psi).$$

$$\{\eta_1, \dots, \eta_{n+1}\} \vdash_L \psi \triangleq \{\eta_1, \dots, \eta_n\} \vdash_L (\eta_{n+1} \rightarrow \psi)$$

It reads:  $\psi$  is **deducible form**  $\eta_1$  **to**  $\eta_n$ . ┘

**Remark (2.1.4.3).** This definition of multiple deduction shows that we have the ability to handle multiple definition involving "...". But due to limit of space, we will not do so again, and leave it to the future to formalize it. ? ┘

**Meta Def. (2.1.4.4)[Subsystem].** A formal system  $L$  is called a **subsystem** of another formal system  $L'$  or  $L'$  is an **extension system** of  $L$  if:

- There is a procedure to assign a wff. in  $L'$  for each wff. in  $L$  such that
    - Every proof in  $L$  is assigned to a proof in  $L'$ .
    - Every axiom in  $L$  is a theorem in  $L'$ .
- ┘

### Propositional Calculus

**Def. (2.1.4.5)[Formal System of Propositional Calculus].** The formal system (2.1.2.2) of **propositional calculus**  $\mathcal{L}$  is defined by the following:

- Symbols:
  - A procedure to specify which things are **variable symbols**.
  - **punctuation symbols** “(”, “)”.
  - **connective symbols**:  $\neg, \implies$ .
- Grammar:
  - Symbols are wffs.
  - If  $\varphi, \psi$  are wffs, then  $\neg\varphi$  and  $(\varphi \implies \psi)$  are wffs.
- Axioms: If  $\varphi, \psi, \eta$  are wffs, then the following are axioms:
  - L1:  $(\varphi \implies (\psi \implies \varphi))$ .
  - L2:  $((\varphi \implies (\psi \implies \eta)) \implies ((\varphi \implies \psi) \implies (\varphi \implies \eta)))$ .
  - L3:  $((\neg\varphi \implies \neg\psi) \implies (\psi \implies \varphi))$ .
  - L4: (Modus Ponens or MP) If  $\varphi, \psi$  are wffs, then  $\varphi \wedge (\varphi \rightarrow \psi) \rightarrow \psi$ .

From now on, this system is the foundation of the book, and every language follows will contain  $\mathcal{L}$ .

┘

**Def. (2.1.4.6)[Logical Abbreviations].** For wffs  $\varphi, \psi$ ,

- $(\varphi \vee \psi) \triangleq (\neg\varphi \implies \psi)$ ,
- $(\varphi \wedge \psi) \triangleq \neg(\varphi \implies \neg\psi)$ ,

- $(\varphi \iff \psi) \triangleq \neg((\varphi \implies \psi) \implies \neg(\psi \implies \varphi))$ ,
- $[ \triangleq \{$ ,
- $] \triangleq \}$ .

┘

**Meta Thm. (2.1.4.7).** let  $L$  be a language and  $\varphi, \psi, \eta$  be wffs in  $L$

- Axioms of  $L$  are theorems in  $L$ .
- $\{(\varphi \implies \psi), (\psi \implies \eta)\} \vdash_L (\varphi \implies \eta)$ .
- $\vdash_L (\neg\psi \implies (\psi \implies \varphi))$ .
- $\vdash_L ((\neg\varphi \implies \varphi) \implies \varphi)$ .

┘

*Proof:* Cf.[Hamilton, Chap2].

□

**Meta Thm. (2.1.4.8)[Deduction Theorem].** Let  $\varphi, \psi$  be wffs in  $L$ ,

- If  $\Gamma \cup \{\varphi\} \vdash_L \psi$ , then  $\Gamma \vdash_L (\varphi \implies \psi)$ .
- If  $\Gamma \vdash_L (\varphi \implies \psi)$ , then  $\Gamma \cup \{\varphi\} \vdash_L \psi$ .

┘

*Proof:* Cf.[Hamilton, P32].?

□

### Adequacy Theorem for $\mathcal{L}$

## 5 First Order Systems

### Formal Predicate Calculus

**Def. (2.1.5.1)[First Order Languages].** A first order language  $\mathcal{L}$  is a language(2.1.2.1) with

- a countable set of **bound variable symbols**.
- a countable set of **free variable symbols**.
- a countable set of **constant symbols**.
- a countable set of **predicate(relation) symbols**.
- a countable set of **functions symbols**.
- the **punctuations symbols** “(”, “)” and “,”.
- the **connective symbols**  $\neg$  and  $\implies$ .
- the **quantifier symbol**  $\forall$ .

┘

**Def. (2.1.5.2)[Formal System of Predicate Calculus].** Given a first order language  $L$ (2.1.5.1), we can define a formal system(2.1.2.2) of **predicate calculus**  $\mathcal{K}_L$  as follows:

- Symbols: symbols in  $L$ .
- Grammar:
  - There is a countable set of **terms**:
    - \* Constant symbols and free variable symbols are terms.

- \* For any natural number  $n$ , If  $f^n$  is a function symbol, and for any  $m < n$ ,  $t_m$  is a term, then  $f(t_1, \dots, t_{n_f})$  is a term.
- There is a set of **atomic formulas**: If  $R^k$  is a predicate symbol and  $t_1, \dots, t_k$  are terms, then  $R^k(t_1, \dots, t_k)$  are atomic formulas.
- There is a countable set of wffs:
  - \* Atomic formulas are wffs.
  - \* if  $\varphi, \psi$  are wffs and  $x$  is a bound variable not appearing in  $\varphi$ , then  $\neg\varphi, (\varphi \implies \psi), (\forall x)\varphi(x/a)$  are wffs, where  $\varphi(x/a)$  is obtained from  $\varphi$  by replacing each occurrence of some free variable  $a$  by a bound variable  $x$  that doesn't appear in  $\varphi$ .
- Axioms: If  $\varphi, \psi, \eta$  are wffs in  $\mathcal{K}_L$  and  $x$  is a variable, then There the following countably many axioms:
  - K1:  $(\varphi \implies (\psi \implies \varphi))$ .
  - K2:  $((\varphi \implies (\psi \implies \eta)) \implies ((\varphi \implies \psi) \implies (\varphi \implies \eta)))$ .
  - K3:  $((\neg\varphi \implies \neg\psi) \implies (\psi \implies \varphi))$ .
  - K4:  $((\forall x)\varphi \implies \varphi(a/x))$  where  $\varphi(a/x)$  is obtained from  $\varphi$  by replacing each occurrence of the bound variable  $x$  in  $\varphi(x)$  by the free variable  $a$ .
  - K5:  $((\forall x)(\varphi \implies \psi) \implies (\varphi \implies (\forall x)\psi))$ , if the free variable  $a$  in  $\varphi$  which are quantifying with  $x$  doesn't appear.
  - K6: (Modus Ponens or MP)  $\varphi \wedge (\varphi \implies \psi) \rightarrow \psi$ .
  - K7: (Generalizations)  $\varphi \rightarrow (\forall x)\varphi(x/a)$ , where  $x$  is a bound variable symbol that doesn't appear in  $\varphi$ , and  $\varphi(a/x)$  is obtained from  $\varphi$  by replacing each occurrence of some free variable  $a$  by  $x$ .

┘

**Meta Def. (2.1.5.3)[Sentences and Theories].** A **sentence** is a formula without free variables.

A **theory** is a set of sentences in a language  $\mathcal{L}$ .

┘

**Meta Thm. (2.1.5.4)[Tautologies are Theorems].** if  $\varphi$  is a wff. in a language  $L$  and it is a tautology<sup>?</sup>, then  $\varphi$  is a theorem(2.1.4.1) of  $\mathcal{K}_L$ (2.1.5.2).

┘

*Proof:* Cf.[Hamilton]P72.

□

**Meta Thm. (2.1.5.5)[Soundness Theorem for  $\mathcal{K}_L$ ].** If  $\varphi$  is a wff. in a language  $L$  and  $\vdash_{\mathcal{K}_L} \varphi$ , then  $\varphi$  is locally valid<sup>?</sup>,

┘

*Proof:* Cf.[Hamilton]P74.

□

**Meta Cor. (2.1.5.6)[Consistence for  $\mathcal{K}_L$ ].**  $\mathcal{K}_L$  is consistent.

┘

*Proof:* Cf.[Hamilton]P74.

□

**Meta Cor. (2.1.5.7).** For any wffs  $\varphi, \psi, \eta$  of  $L$ ,

$$\{(\varphi \implies \psi), (\psi \implies \eta)\} \vdash_{\mathcal{K}_L} (\varphi \implies \eta)$$

┘

*Proof:* Cf.[Hamilton]P76.

□

### Adequacy Theorem for $\mathcal{K}_L$

Def.(2.1.5.8). ┘

### Satisfaction and Truth

See[Hamilton].

## 6 Models and Examples of Systems

Def.(2.1.6.1) [(Mathematical) Languages]. A mathematical language  $\mathcal{L}$  is a first order language(2.1.5.1) given by the following data:

- A set  $\mathcal{F}$  of **function symbols**.
- A set  $\mathcal{R}$  of **relations symbols**.
- A set  $\mathcal{C}$  of **constant symbols**.

Function symbols, relations symbols, constant symbols consists of all symbols in  $\mathcal{L}$ . For simplicity, we call a mathematical language simply a language. ┘

Example(2.1.6.2) [(Mathematical) Languages].

- $\mathcal{L}_0$  is the basic language of logics.
- $\mathcal{L}_r = (+, \cdot)$  is defined to be the language of rings.
- $\mathcal{L}_{or} = (+, \cdot, <)$  is defined to be the language of ordered rings.
- $\mathcal{L}_{\omega_1, \omega}(Q)$  is defined to be the language which is an extension of  $\mathcal{L}_0$  in which we can form countable conjunctions and add a quantifier  $Q$  : there exists uncountably many. ┘

Def.(2.1.6.3) [Theories].

- $ACF$  is defined to be the theory of alg.closed fields, w.r.t  $\mathcal{L}_r$ .
- $ACF_p$  is defined to be the theory of alg.closed fields of char  $p$ .
- $DAG$  is defined to be the theory of non-trivial torsion-free divisible Abelian groups, w.r.t.  $\mathcal{L}_r$ .
- $DLO$  is the theory of dense linear orders without endpoints.
- $ODAG$  is the theory of nontrivial divisible Abelian groups.
- $RCF$  is the theory of real closed fields w.r.t  $\mathcal{L}_{or}$ . ┘

## 2.2 Set Theory

*“No one shall expel us from the paradise which Cantor has created for us.”*

–D. Hilbert

References are [Jec03], [Model Theory Marker], [Axiomatic Set Theory], [Hamilton],

### Notation(2.2.0.1).

- Use notations from [Mathematical Logic](#).
- We build theories based on the class system(2.1.3.2).
- As in(2.1.1.3), all propositions are regarded as theorems in a system that is an extension of all other systems defined in this book, in particular it is an extension of the blank PA system(2.1.1.2) and the class system  $\mathcal{L}_C$ (2.1.3.2).
- We will rebuild PA system and NBG/ZFC set theory inside primordial ZFC.(This new ZFC should be regarded as a representation of the primordial ZFC inside itself), so the logic section will no longer be cited other than this section. ?

┘

### 1 Von.Neumann-Bernays-Gödel Set Theory(NBG)

**Def.(2.2.1.1)[Inductive Sets].** A set  $I$  is called **inductive** if  $0 = \emptyset \in I$  and if  $n \in I$ , then  $n + 1 \in I$ , where  $n + 1 = S(n)$  the successor. ┘

**Axiom(2.2.1.2)[Axiom of infinity].** An inductive set(2.2.1.1) exists. ┘

**Def.(2.2.1.3)[Set of Natural Numbers].** The **set of natural numbers**  $\mathbb{N}$  is defined to be

$$\mathbb{N} = \{x \in I_0 | x \in I \text{ for all inductive set } I\},$$

where  $I_0$  is an inductive set given by(2.2.1.2). Elements of  $\mathbb{N}$  are called **natural numbers**. ┘

**Cor.(2.2.1.4)[Inductive Principle].** If  $P(x)$  is a property that  $P(0)$ , and  $P(n)$  implies  $P(n+1)$ , then  $P(n)$  for each natural number  $n$ . ┘

*Proof:* By definition  $B = \{n \in \mathbb{N} | P(n)\}$  is an inductive set, so  $\mathbb{N} \subset B$ . □

**Prop.(2.2.1.5).**  $\mathbb{N}$ (2.2.1.3) is a linearly ordered set. ┘

*Proof:* Cf.[Set Theory Jech P43]. □

**Cor.(2.2.1.6)[Inductive Principle Second Version].** If  $P(x)$  is a property that  $P(0)$ , and  $P(k)$  holds for all  $k < n$  implies  $P(n)$ , then  $P(n)$  for each natural number  $n$ . ┘

*Proof:* Use induction principle(2.2.1.4) for the property  $Q(n) : P(k)$  for all  $k < n$ . Then  $Q(n)$  implies  $Q(n+1)$ . □

## 2 Relations and Functions

**Def. (2.2.2.1) [Products].** For classes  $A, B$ ,  $A \times B$  is the class

$$\{x | (\exists y \in A)(\exists z \in B)(x = (y, z))\},$$

called the **product of  $A$  and  $B$** . ┘

**Prop. (2.2.2.2).**  $\mathcal{M}(a \times b)$ . ┘

*Proof:* Cf. [Axiomatic Set theory]P23. □

**Def. (2.2.2.3).** Inductively define ? class terms

- $A^1 \triangleq A$ ,
- $A^{n+1} \triangleq A^n \times A$ ,
- $A^{-1} \triangleq \{(x, y) | (y, x) \in A\}$ .

And define ┘

**Def. (2.2.2.4) [Relations and Functions].** Define the following predicates:

- $\text{Rel}(R) \triangleq R \subset A^2$ .
  -
- ┘

**Def. (2.2.2.5) [Bijections].** ┘

**Def. (2.2.2.6) [Finite and Infinite Sets].** For  $n \in \mathbb{N}$  and a set  $X$ , we use the sentence “ $X$  has  $n$  elements” to mean there is a bijection from  $n$  to  $X$ . We use the sentence “ $X$  is a **finite set**” to mean  $X$  has  $n$  elements for some  $n \in \mathbb{N}$ , and say it is an **infinite set** otherwise. ┘

## 3 Orderings

**Def. (2.2.3.1) [Ordering].** A **partial ordering** on a set  $A$  is a relation (2.2.2.4)  $<$  on  $A$ , or equivalently a subset  $C \subset A \times A$  that

- For no  $x \in A$ ,  $x < x$  holds.
- If  $x < y$  and  $y < z$ , then  $x < z$ .

It is called a **total ordering** if moreover it satisfies

- For every  $x, y \in A$  that  $x \neq y$ , either  $x < y$  or  $y < x$ .

A **poset** is defined to be a partially ordered set. ┘

**Def. (2.2.3.2) [Reverse Orderings].** The **reverse ordering**  $A^{\text{op}}$  of an ordered set  $A$  is the same set  $A$  with the ordering reversed. ┘

**Def. (2.2.3.3) [Cofinality].** The **cofinality** of or a poset (2.2.3.1)  $\alpha$  is the smallest cardinality  $\delta$  of a cofinal subset of  $\alpha$ . ┘

**Def. (2.2.3.4) [ $\kappa$ -Filtered Poset].** For a cardinal  $\kappa$ , a poset is called  **$\kappa$ -filtered** if for any subset unbounded from above has cardinality  $\geq \kappa$ . ┘

**Def. (2.2.3.5) [Directed Sets].** A **directed set** is a poset that 3-filtered and non-empty. ┘

**Def. (2.2.3.6).** In a poset  $P$ , two element  $p, q$  are called **compatible** if there is an  $r \in P$  that  $r < p, r < q$ .  $\lrcorner$

**Def. (2.2.3.7) [ $\kappa$ -Chain Condition].** For a cardinal  $\kappa$ , a poset  $P$  is said to satisfy the  **$\kappa$ -chain condition** if for any subset  $A \subset P$  that elements of  $A$  are pairwise incompatible(2.2.3.6), then  $|A| \leq \kappa$ .  $\lrcorner$

### Total Ordering

**Def. (2.2.3.8) [Well-Orderings].** A **linear ordering** is defined to be a total ordering.

A linear ordering is called a **well-ordering** if every nonempty subset has a minimal element.  $\lrcorner$

**Def. (2.2.3.9) [Lexicographical Ordering].** If given a family of linearly ordered set  $A_i$  indexed by a well-ordered set  $I$ , then there is a linear ordering on  $\prod_I A_i$ , where  $(f_i) < (g_i)$  iff  $(f_i) \neq (g_i)$  and for the minimal  $i_0$ (well-ordering used) that  $f_{i_0} \neq g_{i_0}$ ,  $f_{i_0} < g_{i_0}$ . It is called the **lexicographical ordering**.  $\lrcorner$

**Def. (2.2.3.10).** An ordered set  $X$  is called **dense** iff for each  $a < b$ , there is a  $x$  that  $a < x < b$ .  $\lrcorner$

**Def. (2.2.3.11) [Least Upper Bound].** An ordered set  $A$  is said to have the **least upper bound property** if any subset  $A_0 \subset A$  bounded above has a least upper bound. It is said to satisfy the **greatest lower bound property** if  $A^{op}$  satisfies the least upper bound property.  $\lrcorner$

**Prop. (2.2.3.12) [Cantor].** Any two ordered set that is countable, dense and has no endpoints are isomorphic. In particular, any of these is isomorphic to the set of rational numbers  $\mathbb{Q}$ .  $\lrcorner$

*Proof:* We will built the isomorphism by extending partial embeddings. Let  $a_0, \dots, a_n, \dots$  be an ordering of  $A$ ,  $b_0, \dots, b_n, \dots$  be an ordering of  $B$ , and we can alternatively extend mapping on  $a_n$  and  $b_n$ , as  $A, B$  are complete without endpoints. Then we get an isomorphism of  $A$  and  $B$ .  $\square$

**Cor. (2.2.3.13).** Any countable linearly ordered set can be mapped isomorphically into  $\mathbb{Q}$ .  $\lrcorner$

**Def. (2.2.3.14).** A **initial segment** of an ordered set  $W$  is the ordered set  $W[a] = \{x \in W | x < a\}$ .  $\lrcorner$

**Lemma (2.2.3.15).** If  $W$  is a well-ordered set, then any increasing function  $f : W \rightarrow W$  satisfies  $f(x) \geq x$ .  $\lrcorner$

*Proof:* If the set  $\{x | f(x) < x\}$  is not empty, then it has a minimal element  $a$ , then  $f(f(a)) < f(a)$ , contradiction.  $\square$

**Cor. (2.2.3.16).** A well-ordered set cannot be isomorphic to an initial segment of itself, and an automorphism of a well-ordered set must be identity.  $\lrcorner$

*Proof:* Use the above lemma(2.2.3.15), if it is isomorphic to  $W[a]$ , then  $f(a) < a$ , contradiction. For any automorphism,  $f(x) \geq x, f^{-1}(x) \geq x$ , so  $f(x) = x$ .  $\square$

**Prop. (2.2.3.17) [Comparison of Well-Orderings].** A cut of a well-ordered set is well-ordered. And for any two well-ordered sets  $W_1, W_2$ , either they are isomorphic, or one of them is isomorphic to a initial segment of another.  $\lrcorner$

*Proof:* The three cases are mutually exclusive by (2.2.3.16), So it suffices to show one of them holds.

Define a set  $f = \{(x, y) \in W \times W \mid W_1[x] \cong W_2[y]\}$ . (2.2.3.16) shows  $f$  is injective and monotone in both coordinates. Now we want to prove that if the domain of  $f$  is not all  $W_1$ , then it is an initial segment, and the image is all  $W_2$ , this will finish the proof.

It is clearly an initial segment  $W_1[a]$  because it is well-ordered and if  $h : W_1[x] \cong W_2[y]$  and  $x' < x$ , then  $h : W_1[x'] \cong W_2[h(y)]$ . If the image is not all of  $W_2$ , then similarly the image of  $f$  is an initial segment of  $W_2$ ,  $= W_2[b]$ . But this means  $W_1[a] \cong W_2[b]$ , so  $a, b$  is also in the domain(image), which is a contradiction.  $\square$

### Well-Quasi-Orderings

**Def. (2.2.3.18) [Well-quasi-orderings].** A **well-quasi-ordering** on a set  $A$  is a partial ordering  $\leq$  on  $A$  satisfying the following: For any infinite sequence  $(x_i) \in A^{\mathbb{N}}$ , there exists  $i < j \in \mathbb{N}$  s.t.  $x_i \leq x_j$ .  $\perp$

**Prop. (2.2.3.19).** A partial ordering on a set  $A$  is a well-quasi-ordering if  $X$  contains neither an infinite incomparable subset or an infinite decreasing chain  $x_0 > x_1 > \dots$

Moreover, for a well-quasi-ordering, in any infinite sequence, there exists an infinite ascending chain  $x_{i_0} \leq x_{i_1} \leq \dots$  where  $i_0 < i_1 \dots$   $\perp$

*Proof:* This follows from the infinite Ramsey theorem (37.4.0.2).  $\square$

**Prop. (2.2.3.20).** If  $X$  is a quasi-well-ordered set, then we can define a quasi-well-ordering on the set  $[X]^{\leq \aleph_0}$  of finite subsets of  $X$ : for any  $A, B \in [X]^{\leq \aleph_0}$ , define  $A \leq B$  if there is an injection  $f : A \rightarrow B$  s.t.  $a \leq f(a)$  for any  $a \in A$ . Then this is a quasi-well-ordering on  $[X]^{\leq \aleph_0}$ .  $\perp$

*Proof:* Suppose  $[X]^{\leq \aleph_0}$  is not quasi-well-ordered, and call the counterexamples bad sequences. Then we can choose a bad sequence  $(A_n) \in ([X]^{\leq \aleph_0})^{\mathbb{N}}$  s.t. for any  $n \in \mathbb{N}$ ,  $A_n$  is the subset with minimum cardinality s.t.  $(A_0, A_1, \dots, A_n)$  is the start of a bad sequence. Clearly  $A_n \neq \emptyset$  for any  $n \in \mathbb{N}$ .

Choose an element  $a_i$  from each  $A_i$ , and denote  $B_i = A_i \setminus \{a_i\}$ . By hypothesis, the sequence  $(a_0, a_1, \dots)$  contains a infinite ascending sequence  $a_{n_0} \leq a_{n_1} \leq \dots$ . By the choice of  $A_i$ , the sequence

$$A_0, A_1, \dots, A_{n_0-1}, B_{n_0}, B_{n_1}, \dots$$

is not a bad sequence. Clearly such an ascending pair can only be  $B_{n_i} \leq B_{n_j}$  for some  $i < j$ . But extending any injection  $f : B_{n_i} \rightarrow B_{n_j}$  to an injection  $\bar{f} : A_{n_i} \rightarrow A_{n_j}$  by  $\bar{f}(a_{n_i}) = a_{n_j}$ , we get that  $A_{n_i} \leq A_{n_j}$ , contradiction.  $\square$

### Complete Linear Ordering

**Def. (2.2.3.21) [Complete Ordering].** A **cut** of an ordered set  $X$  consists of two disjoint nonempty subsets  $A \cup B = X$  that  $a < b$  for any  $a \in A, b \in B$ .

It is called a **Dedekind cut** if  $A$  doesn't has a maximal element. It is called a **gap** if  $A$  doesn't have a maximal element and  $B$  doesn't have a minimal element.

An ordered set is called **complete** if there are no gaps.  $\perp$

**Prop. (2.2.3.22).** Any complete ordered set  $R$  has the least upper bound property and greatest lower bound property.  $\perp$

*Proof:* Consider the cut  $A = \{x | x < a \text{ for some element in } T\}$ ,  $B = \mathbb{R} - A$ , if  $T$  is bounded above,  $B$  is not empty, so this is truly a cut, and  $A$  doesn't have a maximal element, because if  $x < a \in \mathbb{R}$ , then  $x < \frac{x+a}{2} < a$ . So by completeness of  $\mathbb{R}$ ,  $B$  has a minimal element, that is, the supremum of  $A$  exists. Similarly for the case  $A$  bounded from below.  $\square$

**Prop. (2.2.3.23)[Completion of Ordering].** There is an obvious ordering on the set  $C$  of all Dedekind cuts of  $X$ , and  $X$  embeds into  $C$  by  $b \mapsto \{x | x < b\} \cup \{x | x \geq b\}$ .

$C$  is complete and has no endpoints,  $P$  is dense in  $C$ , which is called a **completion** of  $P$ .  $\lrcorner$

*Proof:* Cf.[Set Theory Jech P88].  $\square$

**Prop. (2.2.3.24) [Real Numbers].**  $\mathbb{Q}$  has a unique completion ordering  $\mathbb{R}$ , called the **set of real numbers**.  $\lrcorner$

*Proof:*  $\mathbb{R}$  is a dense linear ordering without endpoints, so by (2.2.3.12) if it is countable then it is isomorphic to  $\mathbb{Q}$ , but this is not possible because  $\mathbb{Q}$  is not complete.  $\square$

## 4 Ordinals(Cantor)

**Def. (2.2.4.1)[Ordinal Numbers].** A set is called **transitive** iff each element of  $T$  is a subset of  $T$ . A set  $\alpha$  is called a **ordinal number** iff  $\alpha$  is transitive and well-ordered by inclusion.  $\lrcorner$

**Prop. (2.2.4.2).** If  $\alpha$  is an ordinal, then  $S(\alpha) = \alpha \cup \{\alpha\}$  is also an ordinal, obviously. Thus any natural number is an ordinal by definition.

An ordinal is called a **successor ordinal** iff  $\alpha = S(\beta)$  for some  $\beta$ , and a **limit ordinal** otherwise.

$\lrcorner$

**Lemma (2.2.4.3).**

1. If  $\alpha$  is an ordinal, then  $\alpha \notin \alpha$ .
2. Every element of an ordinal is an ordinal.
3. If ordinals  $\alpha \subsetneq \beta$ , then  $\alpha \in \beta$ . That is, for ordinals,  $\subsetneq$  is the same as  $\in$ .

$\lrcorner$

*Proof:*

1. If  $\alpha \in \alpha$ , then contradiction to the fact  $\in$  is a ordering (2.2.4.1).
2. To show  $x \in \alpha$  is transitive, it suffices to show that if  $u \in v \in x$ , then  $u \in x$ , because then  $v$  is a subset of  $x$ . But this follows from the fact  $\in$  is an ordering. And because  $x \subset \alpha$ , the inclusion of  $x$  is the restriction of inclusion in  $\alpha$ , so it is a well-ordering.
3. Consider  $\beta - \alpha$ , it has a minimal element  $\gamma$ . Notice  $\gamma \subset \alpha$ , because otherwise there is an element of  $\beta - \alpha$  smaller than  $\gamma$ , by definition (2.2.4.1).  
Now we show  $\gamma = \alpha$ , then it will follow that  $\alpha \in \beta$ . For this, if  $\delta \in \alpha$  and  $\delta \notin \gamma$ , then  $\gamma \in \delta$  or  $\gamma = \delta$ . But then this implies that  $\delta \in \alpha$  because  $\alpha$  is an ordinal, contradicting the fact  $\gamma \in \beta - \alpha$ .

$\square$

**Prop. (2.2.4.4)[Ordinal is Well-Ordered].** Define the ordering of ordinal by  $\alpha < \beta$  iff  $\alpha \in \beta$ . The ordering of ordinals is a total ordering and is a well-ordering.  $\lrcorner$

*Proof:* If  $\alpha\beta \in \gamma$ , then  $\alpha \in \gamma$  because  $\gamma$  is transitive. If  $\alpha \in \beta \in \alpha$ , then  $\alpha \in \alpha$ , contradicting (2.2.4.3).

Given any two ordinals,  $\alpha \cap \beta$  is also an ordinal by definition. If  $\alpha \cap \beta = \beta$  or  $\alpha$ , then  $\alpha \subset \beta$ , hence  $\alpha \in \beta$  by (2.2.4.3). If  $\alpha \cap \beta \subsetneq \alpha$  and  $\alpha \cap \beta \subsetneq \beta$ , then  $\alpha \cap \beta \in \alpha \cap \beta$ , contradiction.

Well-ordering: Given a set of ordinals, take  $\alpha \in A$  and consider the set  $\alpha \cap A$ . If  $\alpha \cap A = \emptyset$ , then  $\alpha$  is minimal in  $A$ , because otherwise some  $\beta \in \alpha \cap A$ . If  $\alpha \cap A \neq \emptyset$ , then it has a minimal element  $\beta$  in the inclusion because  $\alpha$  is an ordinal. Then  $\beta$  is the minimal element of  $A$ .  $\square$

**Cor. (2.2.4.5)[Supremum Ordinal].** Any set of ordinals has a supremum ordinal, it is just  $\cup_{\alpha \in X} \alpha$ .  $\lrcorner$

*Proof:* Firstly  $\cup_{\alpha \in X} \alpha$  is transitive and it is well-ordered (for each subset  $A \subset X$ , choose an  $\alpha \in X$  that  $\alpha \cap A \neq \emptyset$ , then the minimal element of  $\alpha \cap A$  is just the minimal element of  $A$ .) so it is an ordinal.

Now if  $\alpha \in X$ , then  $\alpha \subset \cup X$ , so  $\alpha \leq \cup X$  by (2.2.4.3). And if  $\alpha \in \gamma$  for some ordinal  $\gamma$ , then  $\cup X \subset \gamma$ . So  $\cup X$  is truly the supremum.  $\square$

**Cor. (2.2.4.6).** For any set  $X$  of ordinals, there is an ordinal  $\alpha$  that is not in  $X$ , just choose  $S(\cup X)$ .  $\lrcorner$

**Prop. (2.2.4.7).** Every well-ordered set is isomorphic to a unique ordinal.

So we can regard an ordinal as an equivalence class of isomorphic well-ordered sets.  $\lrcorner$

*Proof:* Cf.[Set Theory Jech P111].  $\square$

**Cor. (2.2.4.8)[Cardinal as Initial Ordinal].** The axiom of choice together with (2.2.4.4) asserts that every cardinal has a unique smallest ordinal, called the **initial ordinal**. So we can identify cardinal number  $\alpha$  as an ordinal that is the initial ordinal  $\omega_\alpha$  of  $\alpha$ . Anyway, cardinal number is fewer than ordinal numbers.

The first infinite cardinal number (or the first initial ordinal) is denoted by  $\omega$  or  $\aleph_0$ .  $\lrcorner$

**Prop. (2.2.4.9)[Transfinite Induction/Recursion].** If a property defined for the set of ordinals satisfies:

1.  $P(0)$ .
2.  $P(\alpha + 1)$  if  $P(\alpha)$ .
3.  $P(\lambda)$  if  $P(\beta)$  for all  $\beta < \lambda$ .

then  $P$  is true for all ordinals.

Transfinite recursion:  $\lrcorner$

*Proof:*  $\square$

### Ordinal Arithmetic

Cf.[Set Theory Jech Chap5.5].

**Def. (2.2.4.10).** We use infinite recursion to define **addition of ordinals** as

- $\beta + 0 = \beta$
- $\beta + (\alpha + 1) = (\beta + \alpha) + 1$ , where  $\alpha + 1$  is the successor of  $\alpha$ .
- $\beta + \alpha = \sup\{\beta + \gamma \mid \gamma < \alpha\}$  for a limit ordinal  $\alpha$ .

The **multiplication of ordinals** and **exponentiation of ordinals** are defined similarly.  $\lrcorner$

**Remark(2.2.4.11) [Cardinal and Ordinal Arithmetics].** Note that the ordinal arithmetics may be smaller than the ordinal sum of the corresponding initial ordinal(2.2.4.8), because operations of initial ordinals may not be initial, the deeper reason is that the cardinal case, we can rearrange the order to get a smaller ordinal.  $\lrcorner$

**Prop. (2.2.4.12).** The addition and multiplication of ordinals are of the order type of  $\alpha \amalg \beta$  in adjunction order and  $\alpha \times \beta$  in lexicographical order respectively, Cf.[Set Theory Jech P120,122]  $\lrcorner$

### Cantor Normal Form

**Prop. (2.2.4.13) [Cantor Normal Form].** Any ordinal  $\alpha$  can be expressed uniquely as the form  $\alpha = \sum_{i < n} \omega^{\beta_i}$ , where  $\beta_0 \geq \beta_1 \geq \dots \beta_{n-1}$  are ordinals.  $\lrcorner$

*Proof:* Cf.[Jech Set Theory P124].  $\square$

**Prop. (2.2.4.14) [Goodstein Sequence].** A **weak Goodstein sequence** is a sequence that  $m_2$  is any positive integer,  $m_{k+1}$  is  $m_k$  written in  $k$ -basis and replacing the base by  $k + 1$ , and then minus 1.

The **Goodstein sequence** is a sequence that  $m_2$  is any positive integer,  $m_{k+1}$  is  $m_k$  written in  $k$ -basis and even the exponents in  $k$ -basis and replacing the base by  $k + 1$ , and then minus 1.

Then for each Goodstein sequence and weak Goodstein sequence, it reaches 1 in a finite number of times.  $\lrcorner$

*Proof:* Let  $m_k = \sum k^{a_i} b_i$ , then let the ordinal  $\alpha_k = \sum \omega^{a_i} b_i$ . Then it is clear that  $\alpha_2 > \alpha_3 > \dots$ . But if the weak Goodstein sequence doesn't terminate, we constructed a descending sequence of ordinals that doesn't terminate, contradiction(choose a minimal element).

Similarly for Goodstein sequences, just replace every base  $k$  by  $\omega$ .  $\square$

## 5 The Axiom of Choice

**Def. (2.2.5.1) [Choice Functions].** Let  $S$  be a system of sets, a function  $g$  defined on  $S$  is called a **choice function** iff  $g(X) \in X$  for each  $X \in S$ .  $\lrcorner$

**Axiom (2.2.5.2) [the Axiom of Choice, Zermelo1904].** Any system of sets has a choice function.  $\lrcorner$

**Thm. (2.2.5.3) [Zermelo1904].** The following are equivalent:

1. the axiom of choice.
2. (the well-ordering principle) Every set can be well-ordered.
3. (Zorn's lemma) If every chain in a partially ordered sets has an upper bound, then the partially ordered set has a maximal element.

$\lrcorner$

*Proof:*  $2 \rightarrow 1$ : If  $A$  is well-ordered, then  $P(A)$  clearly has a choice function, that is the minimal element of a set.

$1 \rightarrow 2$ : Use transfinite recursion, Cf.[Set Theory Jech P137].

$2 \rightarrow 3, 3 \rightarrow 2$ : Cf.[Set Theory Jech P142].  $\square$

**Prop. (2.2.5.4).** Every infinite set  $X$  has a countable subset, if the axiom of choice holds.  $\lrcorner$

*Proof:* Choose a well-ordering of it(2.2.5.3), then it is an infinite ordinal. Then the initial segment of the first ordinal  $X[\omega]$  is a countable subset.  $\square$

**Prop. (2.2.5.5).** For every infinite set  $S$ , there exists a unique aleph  $\aleph_\alpha$  that  $|S| = \aleph_\alpha$ .  $\lrcorner$

*Proof:* choose a well-ordering of  $S$  (2.2.5.3), then it is an infinite ordinal, and it has the same cardinality as an initial cardinal by (2.2.4.8), thus the result.  $\square$

**Cor. (2.2.5.6).** For any sets  $A$  and  $B$ , either  $\#A \leq \#B$  or  $\#B \leq \#A$ .  $\lrcorner$

*Proof:* Because the ordinal is totally ordered (2.2.4.4).  $\square$

## 6 Cardinals

**Thm. (2.2.6.1) [Cantor-Schröder-Bernstein].** If there is an injection from  $A$  to  $B$  and an injection from  $B$  to  $A$ , then there is a bijection from  $A$  to  $B$ . Thus the ordering of the cardinal is well-defined.

So we can denote  $\#A \leq \#B$  iff there is an injection from  $A$  to  $B$ . Then if  $\#A \leq \#B$  and  $\#B \leq \#A$ , then  $\#A = \#B$ . In particular, this is a well-defined order relation.  $\lrcorner$

*Proof:* It  $f : A \rightarrow B$ ,  $g : B \rightarrow A$  be injection, then use lemma (2.2.6.2) for  $g \circ f(A) \subset g(B) \subset A$ .  $\square$

**Lemma (2.2.6.2).** If  $A_1 \subset B \subset A$  with  $\#A = \#A_1$ , then  $\#A = \#B$ .  $\lrcorner$

*Proof:* Let  $f$  be a bijection from  $A$  to  $A_1$ . Define inductively  $A_{n+1} = f(A_n)$ ,  $B_{n+1} = f(B_n)$ . Then  $A_{n+1} \subset B_n \subset A_n$ . Let  $C_n = A_n - B_n$ ,  $C = \cup C_n$ , then  $f(C_n) = C_{n+1}$ , so  $f(C) = \cup_{i>0} C_i$ .

Now define  $g : A \rightarrow B = f(x)$  on  $C$  and  $x$  on  $A \setminus C$ , then it is a bijection from  $A$  to  $B$ .  $\square$

**Def. (2.2.6.3) [Cardinal Numbers].** A **cardinal number** is an equivalence class of sets, where equivalence is given by bijections. it is used to describe the ‘size’ of a set. We use the sentence  $\kappa \in \mathcal{Card}$  to mean that  $\kappa$  is a cardinal.

It is by the axiom of choice that any two cardinal number can be compared. ?

Denote  $\aleph_0 = \#\mathbb{N}$  (2.2.1.3).  $\lrcorner$

### Peano Arithmetics

#### Countable and Uncountable Sets

**Def. (2.2.6.4) [Countable Sets].** A set is called **countable** iff it has cardinality  $\aleph_0$  (2.2.6.3). It is called a **finite set** if it has the cardinality of  $n$  for some natural number  $n \in \mathbb{N}$ . It is called an **uncountable set** iff it is not countable or finite. It is called an **at most countable set** if it is finite or countable.  $\lrcorner$

**Prop. (2.2.6.5).** The subset or image of an at most countable set is at most countable.  $\lrcorner$

*Proof:*  $\square$

**Prop. (2.2.6.6).** The product of two at most countable sets is at most countable. (Use diagonal enumerating).  $\lrcorner$

*Proof:*  $\square$

**Prop. (2.2.6.7).** A countable union of almost countable subsets is almost countable.  $\lrcorner$

*Proof:* It suffices to prove the countable case, the rest follows from (2.2.6.5). For this, choose an enumerating  $a_n(k)$  for each  $A_n$ , the  $\cup A_n$  is the image of  $\mathbb{N} \times \mathbb{N} : (n, k) \mapsto a_n(k)$ . Then it is countable by (2.2.6.6).  $\square$

**Prop. (2.2.6.8).** The set of finite sequences and hence the set of finite subsets of a countable set is countable.  $\lrcorner$

*Proof:* The desired set equals  $\cup_k A^k$ , which is countable by (2.2.6.6) and (2.2.6.7).  $\square$

## 7 Cardinal Arithmetics

**Def. (2.2.7.1).** The **sum**, **multiplication** and **exponentiation** of two ordinal is the cardinality of the set  $A \coprod B$ ,  $A \times B$  or  $A^B$  respectively.

It is easily verified to be associative and commutative, just as usual operations.  $\lrcorner$

**Prop. (2.2.7.2).**  $\aleph_0 \times \aleph_0 = \aleph_0$  by (2.2.6.6). And  $\kappa \times \kappa = \kappa$  for any infinite cardinal, if one uses the axiom of choice by (2.2.8.3).  $\lrcorner$

**Prop. (2.2.7.3).** The image of a set  $X$  has cardinals no more than  $X$ , if axiom of choice holds.  $\lrcorner$

*Proof:* Use axiom of choice to choose an element from each inverse image  $f^{-1}(\{x\})$ , then it is an injection from  $f(X)$  to  $X$ .  $\square$

**Prop. (2.2.7.4) [Cantor].**  $\#P(X) = 2^{\#X}$ , and  $\#X < \#P(X)$ .  $\lrcorner$

*Proof:* The first is obvious, for the second, the function  $x \rightarrow \{x\}$  is an injection of  $X$  into  $P(X)$ . And there are no mapping from  $X$  onto  $P(X)$ , because if  $f$  is one, then consider  $S = \{x | x \notin f(x)\}$ , then  $S$  is not in the range of  $f$ , because if  $f(z) = S$ , then  $z \in S$  iff  $z \notin S$ , contradiction.  $\square$

**Prop. (2.2.7.5) [Cardinality Arithmetic of  $\aleph_0$ ].** For cardinality arithmetics involving  $\aleph_0$ , Cf.[Set Theory Jech P98].  $\lrcorner$

*Proof:*  $\square$

**Prop. (2.2.7.6) [Cardinality of  $\mathbb{R}$ ].**  $\#\mathbb{R} = \#P(\mathbb{N}) = 2^{\aleph_0}$ . In particular, by (2.2.7.4),  $\mathbb{R}$  is uncountable.  $\lrcorner$

*Proof:* The first equality is by (2.2.7.4). Now by the construction of  $\mathbb{R}$ , it can be embedded into  $P(\mathbb{N})$ , so  $\#\mathbb{R} \leq \#P(\mathbb{Q}) = \#P(\mathbb{N})$ . Conversely,  $|2^{\mathbb{N}}| \leq |\mathbb{R}|$  by decimal representation, so they are equal by bernstein (2.2.6.1).  $\square$

**Prop. (2.2.7.7).** if  $\#B = 2^{\aleph_0}$  and  $\#A \leq \aleph_0$ , then  $|B \setminus A| = 2^{\aleph_0}$ . In fact,  $|B - A| = |B|$  for any  $\#A < \#B$ , if one uses the axiom of choice.  $\lrcorner$

*Proof:* By (2.2.7.5), we can assume  $B = \mathbb{R} \times \mathbb{R}$ , then project  $A$  onto the coordinate axis, then  $\pi(A)$  has cardinality  $\leq \aleph_0$ , so there is a  $x_0 \notin \pi(A)$ , so  $x_0 \times \mathbb{R} \subset B - A$ , so  $|B - A| = 2^{\aleph_0}$ .

For the general case, ?  $\square$

**Conj. (2.2.7.8) [The Continuum Hypothesis, Cantor1878].** There is no cardinal  $\kappa$  that  $\aleph_0 < \kappa < 2^{\aleph_0}$ .

Notice  $2^{\aleph_0} \geq \aleph_1$  by Cantor's theorem (2.2.7.4), and this hypothesis is equivalent to  $2^{\aleph_0} = \aleph_1$ .  $\lrcorner$

*Proof:*  $\square$

For Infinite operation of Cardinal Arithmetics, Cf.[Jec03]Chap9.

## 8 Alephs

**Prop. (2.2.8.1).** For any set  $A$ , there is a least ordinal that is not equipotent to any subset of  $A$ , called the **Hartogs number** of  $A$ . This is clearly an initial ordinal.  $\lrcorner$

*Proof:* By axiom schema of replacement, any well-ordered subsets of  $A$  is equipotent to an ordinal, and also by axiom schema of replacement, there is a set  $H$  that for any well-ordering of subsets of  $A$  in  $P(A \times A)$ , this ordered sets is equipotent to a  $\alpha \in H$ . Then use (2.2.4.6) to find a minimal ordinal that is not equipotent to any subset of  $A$ . In fact, this is just  $h(A) = \{\alpha \in H \mid \alpha \text{ equipotent to some subset of } A\}$ .  $\square$

**Def. (2.2.8.2)[Aleph].** The **alephs** for ordinal numbers are defined recursively:  $\aleph_0 = \omega$ ,  $\aleph_{\alpha+1} = h(\aleph_\alpha)$ , and  $\aleph_\alpha = \sup\{\aleph_\beta \mid \beta < \alpha\}$  for a limit ordinal  $\alpha$ . By definition  $\alpha_\alpha < \aleph_\beta$  when  $\alpha < \beta$ .

Then  $\aleph_\alpha$  are all infinite initial ordinal numbers, and any infinite ordinal number is of the form  $\aleph_\alpha$  for some ordinal  $\alpha$ . So natural numbers together with alephs are just all the cardinal numbers.

Notice: to avoid confusion, when do arithmetic of ordinal numbers,  $\aleph_\alpha$  is written as  $\omega_\alpha$ .  $\lrcorner$

*Proof:* Use transfinite induction on  $\alpha$ . The only nontrivial case is when  $\alpha$  is a limit ordinal, where if  $\gamma < \aleph_\alpha$  and  $|\gamma| = |\aleph_\alpha|$ , then there is a  $\beta < \alpha$  that  $\gamma \leq \aleph_\beta$  by definition, so  $|\aleph_\alpha| < |\gamma| \leq |\aleph_\beta| < |\aleph_\alpha|$  as  $\aleph_\beta$  is an initial ordinal.

To prove that any infinite initial ordinal is an aleph, first notice that  $\alpha < \aleph_\alpha$  by a simple transfinite induction. So we may use transfinite induction on the following assertion for  $\alpha$ : if  $\Omega < \aleph_\alpha$ , then there is a  $\gamma < \alpha$  that  $\Omega = \aleph_\gamma$ . For this,  $\alpha = 0$  is trivially true, if  $\alpha = \beta + 1$ , then  $\Omega < h(\aleph_\alpha)$  implies that  $|\Omega| < |\aleph_\alpha|$  by definition. Because  $\Omega$  is initial,  $\Omega = \aleph_\beta$  or  $\Omega < \aleph_\beta$ , so by induction hypothesis it is true. If  $\alpha$  is a limit ordinal, then  $\Omega < \omega_\beta$  for some  $\beta < \alpha$ , so also by induction hypothesis it is true.  $\square$

### Aleph Arithmetics

**Prop. (2.2.8.3).**  $\aleph_\alpha \cdot \aleph_\alpha = \aleph_\alpha$ .  $\lrcorner$

*Proof:* Cf.[Set Theory Jech P134].  $\square$

**Cor. (2.2.8.4).**  $\aleph_\alpha \cdot \aleph_\beta = \aleph_\beta$  for  $\alpha \leq \beta$ , and  $n \cdot \aleph_\beta = \aleph_\beta$ .  
So  $\aleph_\alpha + \aleph_\beta = \aleph_\beta$  for  $\alpha \leq \beta$ , and  $n + \aleph_\beta = \aleph_\beta$ .  $\lrcorner$

## 9 Natural Numbers and Real Numbers

**Prop. (2.2.9.1).**  $\mathbb{R}$  is the unique ordered field in which every non-empty bounded set has a least upper bound.  $\lrcorner$

*Proof:*  $\square$

**Prop. (2.2.9.2).**  $(\mathbb{N}, <)$  (2.2.1.5) is a well-ordered set.  $\lrcorner$

*Proof:*  $\square$

**Example (2.2.9.3)[Examples of Countable Sets].**

- $\mathbb{Z}$ .
- $\mathbb{Q}$ .

$\lrcorner$

### Arithmetic of Real numbers

**Prop. (2.2.9.4).** The set of real numbers  $\mathbb{R}$ (2.2.3.24) can be endowed with a field structure, making it an ordered field.  $\lrcorner$

*Proof:* Cf.[Set Theory Jech P175].  $\square$

**Prop. (2.2.9.5).**  $\mathbb{R}$  satisfies the least upper bound hypothesis.  $\lrcorner$

*Proof:*  $\square$

## 10 Filters and Ultrafilters

**Def. (2.2.10.1) [Filter].** For a poset  $P$ , a **filter** on  $P$  is a subset  $F$  that

- If  $p < q$  and  $p \in F$ , then  $q \in F$ .
- If  $p, q \in F$ , then there is an  $r \in F$  that  $r < p, r < q$ .

$\lrcorner$

**Def. (2.2.10.2) [Filter on Sets].** Let  $S$  be a non-empty set, a **filter** on  $S$  is a filter  $F$  on  $\mathcal{P}(S)$  that  $\emptyset \notin F$ .

an **ideal** on  $S$  is a collection  $F$  of subsets of  $S$  that:

- $\emptyset \in F$  and  $S \notin F$ .
- If  $X, Y \in F$ , then  $X \cup Y \in F$ .
- If  $X \in F, X \supset Y$ , then  $Y \in F$ .

An ideal is just the dual(complement) of a filter.  $\lrcorner$

**Def. (2.2.10.3) [Finite intersection property].** A family of subsets of a set is said to have the **finite intersection property** if any finite collection of elements of this family is non-empty.  $\lrcorner$

**Lemma (2.2.10.4).** let  $G$  be a collection of subsets of  $S$  that has the finite intersection property(2.2.10.3), then there is a smallest filter  $F$  that  $G \subset F$ . It is just the collection of subsets of  $S$  that contain some finite intersection set of elements of  $G$ .  $\lrcorner$

**Def. (2.2.10.5) [Ultrafilter].** An **ultrafilter** is a filter  $F$  that for every subset  $X$ ,  $X \in F$  iff  $S - X \notin F$ . A **prime ideal** is an ideal that for every subset  $X$ ,  $X \in F$  iff  $S - X \notin F$ .

A ultrafilter is equivalent to a maximal filter. And it is equivalent to a  $\{0,1\}$ -valued finitely additive measure on  $S$ .  $\lrcorner$

*Proof:* If  $F$  is an ultrafilter, then it is maximal, because any larger filter will have some  $X, S - X$ , thus has  $\emptyset$ , contradiction.

Conversely, if  $F$  is maximal filter but not ultra, then there is a  $X$  that  $X \notin F, S - X \notin F$ . Let  $G = F \cup \{X\}$ , then any finite intersection of elements of  $G$  is not empty:  $X_1 \cap \dots \cap X_n \cap X \neq \emptyset$  otherwise  $S - X \in F$ . So there is a filter containing  $G$  by(2.2.10.4), contradiction.  $\square$

**Prop. (2.2.10.6) [Pushforward of Filters].** If  $\mathcal{F}$  is a(n) (ultra)filter on  $X$  and  $f : X \rightarrow Y$  is a function, then  $f_*(\mathcal{F}) = \{A \subset Y | f^{-1}(A) \in \mathcal{F}\}$  is a(n) (ultra)filter on  $Y$ , called the **pushforward filter** of  $\mathcal{F}$ .  $\lrcorner$

**Prop. (2.2.10.7).** For an ultrafilter  $\mathcal{F}$  on  $X$ , if  $U_i \notin \mathcal{F}$ , then  $\sum_{i=1}^n U_i \notin \mathcal{F}$ .  $\lrcorner$

*Proof:* As  $X - U_i \in \mathcal{F}$ , there intersection are in  $\mathcal{F}$ , so its complement is not in  $\mathcal{F}$ .  $\square$

**Prop. (2.2.10.8).** Any filter can be extended to an ultrafilter(maximal filter), if the axiom of choice is used.  $\lrcorner$

*Proof:* Use Zorn's lemma(2.2.5.3). It suffices to prove that a union of a chain of filters is a filter, which is trivial.  $\square$

**Cor. (2.2.10.9).** Non-principal ultrafilter exists on any infinite set. And in fact, any non-principal ultrafilter contains all the cofinite sets.

For any non-principle ultrafilter, it cannot contains a single pt  $\{x\}$ , so it contains every cofinite set.  $\lrcorner$

*Proof:* Consider any ultrafilter containing the filter of cofinite sets of  $S$ , then it is non-principal.  $\square$

**Def. (2.2.10.10) [ $\kappa$ -Completeness].** Let  $\kappa$  be an uncountable cardinal, then a field  $F$  on a set  $S$  is called  $\kappa$ -**complete** if for every cardinal  $\lambda < \kappa$ , if  $X_\alpha \in F$  for every  $\alpha < \lambda$ , then  $\bigcap_{\alpha < \lambda} X_\alpha \in F$ .

An  $\aleph_1$ -complete filter is also called a  $\sigma$ -complete filter.  $\lrcorner$

## Closed unbounded and Stationary Set

#### 12 Large Cardinals

**Def. (2.2.12.1) [Abstract Measures].** Let  $S$  be a non-empty set, then an **abstract measure** on  $S$  is a non-trivial probabilistic measure  $\mu$  on the measurable space  $(S, \mathcal{P}(S))$  that  $\mu(\{a\}) = 0$  for any  $a \in S$ .  $\lrcorner$

**Def. (2.2.12.2) [Regular Cardinal].** A cardinal is called **regular** if it is not a sum of  $\lambda$  cardinals  $\kappa_i$  that  $\lambda < \kappa$  and  $\kappa_i < \kappa$ .  $\lrcorner$

**Def. (2.2.12.3) [Strong Limit].** A cardinal  $\kappa$  is called a **strong limit** if  $2^\lambda < \kappa$  for any  $\lambda < \kappa$ (2.2.12.3).  $\lrcorner$

**Def. (2.2.12.4) [Strongly Inaccessible Cardinal].** A cardinal  $\kappa$  is called **strongly inaccessible(SI)** if it is regular(2.2.12.2) and is a strongly limit.  $\lrcorner$

**Def. (2.2.12.5) [Weakly Inaccessible Cardinal].** A cardinal  $\kappa$  is called **weakly inaccessible** if it is regular and is a limit cardinal.  $\lrcorner$

**Prop. (2.2.12.6) [Measure and CH].** If there exists an abstract measure on  $2^{\aleph_0}$ , then the Continuum Hypothesis(2.2.7.8) fails.  $\lrcorner$

*Proof:* Cf.[Jec03]P242.  $\square$

**Prop. (2.2.12.7).** If there is a measure on a set  $S$ , then some cardinal  $\kappa \leq |S|$  is weakly inaccessible.  $\lrcorner$

*Proof:* Cf.[Jec03]P243. □

**Prop. (2.2.12.8).** Let  $\mu$  be a  $\{0, 1\}$ -valued measure on  $S$ , then  $U = \{X \subset S \mid \mu(X) = 1\}$  is a non-principal  $\sigma$ -complete ultrafilter of  $S$  ┘

**Prop. (2.2.12.9) [Stanislaw-Ulam Dichotomy].** If there exists a measure on some set, then either there exists a  $\{0, 1\}$ -valued measure on some set, or there exists a measure on  $2^{\aleph_0}$ . ┘

*Proof:* Cf.[Jec03]P245. □

**Def. (2.2.12.10) [Measurable Cardinals].** A **measurable cardinal** is an uncountable cardinal  $\kappa$  on which there exists a non-principal  $\kappa$ -complete ultrafilter. ┘

**Prop. (2.2.12.11).** A measurable cardinal is strongly inaccessible. ┘

*Proof:* Cf.[Jec03]P247. □

### 13 Gödel Model

**Thm. (2.2.13.1) [Gödel Incompleteness Theorem].** For any set of axioms for elementary number theory, there will always be statements which can be formulated in an elementary way, and which are decidable, but which can not be deduced using only elementary methods. ┘

*Proof:* □

**Remark (2.2.13.2).** This theorem gives a reason why many theorems, for examples the Fermat's last theorem, must be proven using analytic methods or geometric methods. ┘

### 14 Silver Machine

### 15 Forcing

**Def. (2.2.15.1) [Dense Subset].** In a poset  $P$ , a subset  $D \subset P$  is called **dense** if for any  $p \in P$ , there is a  $q \in D$  that  $q < p$ . If  $\mathcal{D}$  is a collection of dense subsets of  $P$ , a filter  $G \subset P$  is called  **$\mathcal{D}$ -generic** if  $D \cap G \neq \emptyset$  for all  $D \in \mathcal{D}$ . ┘

**Prop. (2.2.15.2).** If  $\mathcal{D}$  is a countable collection of dense subsets of  $P$ , then there is a  $\mathcal{D}$ -generic filter  $G$ . ┘

*Proof:* Let  $\mathcal{D} = \{D_1, \dots, D_n, \dots\}$ . Choose  $p_0 \in P$ , and consecutively choose  $p_n \leq p_{n-1}$  that  $p_n \in D_n$ , and define  $G = \{q \mid q \geq p_n \text{ for some } n\}$ . □

**Axiom (2.2.15.3) [Martin's Axiom].** If  $P$  is a partially ordered set satisfying the countable chain condition (2.2.3.7), and  $\mathcal{D}$  is a collection of dense subsets of  $P$  with  $|\mathcal{D}| < 2^{\aleph_0}$ , then there is a  $\mathcal{D}$ -generic filter on  $P$ . ┘

### 16 Determinacy

### 17 Stationary Set

## 2.3 Homotopy Type Theory

Constructive type theory tries to solve the following question: If any foundation of mathematics (a formal system) are doomed to be inconsistent, can a formal system still give us useful information in spite of being inconsistent? If we are not allowed to prove by contradiction or by negation of negation, then it is possible to have a formal system that may not be consistent but more amenable to computer verifications.

## 2.4 Model Theory

References are [Model Theory Marker]. The exercises of [Model Theory Marker] are important.

**Notation (2.4.0.1).**

- Use notations defined in [Set Theory](#).
- All propositions from now are wffs in class theory (or with choice or large cardinal), so there are no metatheorems.

┘

### 1 Set Models

#### Basics

**Def. (2.4.1.1) [Structures].** Given a mathematical language  $\mathcal{L}$  (2.1.6.1), an  $\mathcal{L}$ -**structure** on a set  $M$  is an assignment for each constant symbol  $c$  an element  $c^M \in M$ , for each function symbol  $f$  of arity  $n$  a function  $f^M : M^n \rightarrow M$ , and for each relation symbol  $R$  of arity  $m$  a subset  $R^M \subset M^m$ . These  $c^M, f^M, R^M$  are called **interpretations** of  $\mathcal{L}$ .

And there is a natural definition of morphisms of  $\mathcal{L}$ -structures, and an injective morphism of  $\mathcal{L}$ -structures is called an **embedding** or a **structure extension**. ┘

**Def. (2.4.1.2) [Satisfaction].** Let  $\varphi$  be a formula with free variables  $\bar{v} = (v_{i_1}, \dots, v_{i_m})$ , then we inductively define  $\mathcal{M} \models \varphi(\bar{a})$  as follows:

- If  $\varphi$  is  $t_1 = t_2$  where  $t_1, t_2$  are terms, then  $\mathcal{M} \models \varphi(\bar{a})$  if  $\sqcup_1^{\mathcal{M}}(\bar{a}) = t_2^{\mathcal{M}}(\bar{a})$ .
- If  $\varphi$  is  $R(t_1, \dots, t_n)$ , then  $\mathcal{M} \models \varphi(\bar{a})$  if  $(t_1^{\mathcal{M}}(\bar{a}), \dots, t_n^{\mathcal{M}}(\bar{a})) \in R^{\mathcal{M}}$ .
- If  $\varphi$  is  $\neg\psi$ , then  $\mathcal{M} \models \varphi(\bar{a})$  if  $\mathcal{M} \not\models \psi(\bar{a})$ .
- If  $\varphi$  is  $\psi \wedge \theta$ , then  $\mathcal{M} \models \varphi(\bar{a})$  if  $\mathcal{M} \models \psi(\bar{a})$  and  $\mathcal{M} \models \theta(\bar{a})$ .
- If  $\varphi$  is  $\exists v_j \psi(\bar{v}, v_j)$ , then  $\mathcal{M} \models \varphi(\bar{a})$  if there is a  $b \in M$  that  $\mathcal{M} \models \psi(\bar{a}, b)$ .

and we say  $M$  **satisfies**  $\varphi(\bar{a})$ , or  $\varphi(\bar{a})$  is true in  $M$ . Notice if there is no free variables,  $\varphi(\bar{a})$  just writes  $\varphi$ . ┘

**Def. (2.4.1.3) [Mathematical  $\mathcal{L}$ -Theory].** Let  $\mathcal{L}$  be a mathematical language, then a (mathematical)  $\mathcal{L}$ -**theory** is a formal system that is a consistent extension of  $\mathcal{K}_{\mathcal{L}}$  (2.1.5.2). ┘

**Def. (2.4.1.4) [Models].** If  $T$  is an  $\mathcal{L}$ -theory and  $\mathcal{M}$  a set with  $\mathcal{L}$ -structure satisfying all theorems  $\varphi \in T$ , then  $\mathcal{M}$  is called a **model** of  $T$ , and writes  $M \models T$ .

A theory  $T$  is called **satisfiable** iff there is a model  $\mathcal{M}$  for  $T$ .

A set of  $\mathcal{L}$ -structures  $\mathcal{K}$  is called an **elementary class** iff there is an  $\mathcal{L}$ -theory  $T$  that  $\mathcal{K} = \{\mathcal{M} \mid \mathcal{M} \models T\}$ .

Given a  $\mathcal{L}$ -structure on  $M$ , the **theory of  $M$**  is the set of all sentences true in  $M$ .

Two  $\mathcal{L}$ -structures  $\mathcal{M}$  and  $\mathcal{N}$  are called **elementary equivalent**, denoted by  $\mathcal{M} \equiv \mathcal{N}$ , if for all  $\mathcal{L}$ -sentences  $\varphi$ ,  $\mathcal{M} \models \varphi \iff \mathcal{N} \models \varphi$ . ┘

**Prop. (2.4.1.5).** If  $T$  is a mathematical  $\mathcal{L}$ -theory given by axioms, and every axiom of  $M$  is a set with  $\mathcal{L}$ -structure satisfying every axiom, then  $\mathcal{M}$  is a model of  $T$ . ┘

*Proof:* This follows from induction on the length of the proof of a theorem. ┘

**Prop. (2.4.1.6).** A mathematical  $\mathcal{L}$ -theory is consistent iff it has a model.  $\lrcorner$

*Proof:* Cf.[Hamilton]P91+98. ?  $\square$

**Prop. (2.4.1.7) [Quantifier-Free Formulae].** Suppose  $\mathcal{M}$  is a substructure of  $\mathcal{N}$  and  $\bar{a}$  is a tuple in  $\mathcal{M}$ . If  $\varphi(\bar{v})$  is a quantifier-free formula, then  $\mathcal{M} \models \varphi(\bar{a})$  iff  $\mathcal{N} \models \varphi(\bar{a})$ .  $\lrcorner$

*Proof:* Cf.[Model Theory P11].  $\square$

**Prop. (2.4.1.8).** If  $\mathcal{L}$ -structures  $\mathcal{M} \cong \mathcal{N}$ , then  $\mathcal{M}$  is elementarily equivalent to  $\mathcal{N}$ .  $\lrcorner$

*Proof:* This seemingly trivial proposition still needs proof, and the proof uses induction, just as that of (2.4.1.7).  $\square$

**Def. (2.4.1.9) [Logical Consequence].** Let  $T$  be an  $\mathcal{L}$ -theory and  $\varphi$  an  $\mathcal{L}$ -sentence, then  $\varphi$  is called a **logical consequence** of  $T$ , writes  $T \models \varphi$ , if for any  $\mathcal{L}$ -structure  $\mathcal{M}$  that  $\mathcal{M} \models T$ ,  $\mathcal{M} \models \varphi$ .  $\lrcorner$

### Definable Sets and Interpretability

**Def. (2.4.1.10) [Definable Sets].** Let  $\mathcal{M}$  be an  $\mathcal{L}$ -structure (2.4.1.1), a subset  $X \subset \mathcal{M}^n$  is called a **definable set** iff there is an  $\mathcal{L}$ -formula  $\varphi(v_1, \dots, v_n, w_1, \dots, w_m)$  and a tuple  $\bar{b} \in \mathcal{M}^m$  that  $X = \{\bar{a} \in \mathcal{M}^n : \mathcal{M} \models \varphi(\bar{a}, \bar{b})\}$ . Moreover if  $A \subset \mathcal{M}$ ,  $X \subset \mathcal{M}^n$  is called an **A-definable set** iff  $y_i \in A$ .  $\lrcorner$

**Prop. (2.4.1.11) [Examples of Definable Sets].** The definability of some sets are often nontrivial, using many number theories. For example, Cf.[Marker P20].  $\lrcorner$

**Prop. (2.4.1.12).** There is an inductive characterization of definable sets, Cf.[Marker P22].  $\lrcorner$

**Prop. (2.4.1.13).** If  $\mathcal{M}$  is an  $\mathcal{L}$ -structure, If  $X \subset \mathcal{M}^n$  is A-definable, then every  $\mathcal{L}$ -automorphism of  $\mathcal{M}$  that fixes A pointwise will fix X setwise.  $\lrcorner$

*Proof:* For an automorphism  $\tau$  of  $\mathcal{M}$ ,  $\mathcal{M} \models \varphi(\bar{b}, \bar{a})$  iff  $\mathcal{M} \models \varphi(\tau(\bar{b}), \tau(\bar{a})) = \varphi(\tau(\bar{b}), \bar{a})$ .  $\square$

**Cor. (2.4.1.14).**  $\mathbb{R}$  is not definable in  $\mathbb{C}$ .  $\lrcorner$

*Proof:* If  $\mathbb{R}$  is definable, it is definable over a finite set  $A \subset \mathbb{C}$ , Let  $r, s$  be algebraically independent over  $\mathbb{A}$  and  $r \in \mathbb{R}, s \notin \mathbb{R}$ . This can be done, otherwise  $\mathbb{C}$  or  $\mathbb{R}$  is finite transcendental over  $\mathbb{Q}$ , then  $|\mathbb{C}| = |\mathbb{Q}|$  (3.2.7.3), which is impossible by (2.2.3.24). Then there is an automorphism  $\sigma$  of  $\mathbb{C}$  fixing A that  $\sigma(r) = s$ , so  $\mathbb{R}$  is not definable by (2.4.1.13).  $\square$

**Def. (2.4.1.15) [Definably Interpretability].** An  $\mathcal{L}_0$ -structure  $\mathcal{N}$  is called **definably interpreted** in an  $\mathcal{L}$ -structure  $\mathcal{M}$  if there is a definable set  $X \subset \mathcal{M}^n$  that we can interpret the symbols of  $\mathcal{L}_0$  as definable subsets and functions of X and the resulting  $\mathcal{L}_0$ -structure is isomorphic to  $\mathcal{N}$ .

The usual example is that the group structure of  $GL_2(K)$  is definably interpreted in the ring structure of a field.  $\lrcorner$

**Def. (2.4.1.16) [Interpretability and Quotient Construction].** An  $\mathcal{L}_0$ -structure  $\mathcal{N}$  is called **interpretable** in an  $\mathcal{L}$ -structure  $\mathcal{M}$  iff there is a definable set  $X \in \mathcal{M}^n$  and a definable equivalence relation  $E$  on X, that we can interpret the symbols of  $\mathcal{L}_0$  as definable subsets and functions of  $X/E$  and the resulting  $\mathcal{L}_0$ -structure is isomorphic to  $\mathcal{N}$ .

The usual example is that the set structure of a projective space is interpretable in the ring structure of a field.  $\lrcorner$

**Prop. (2.4.1.17).** Any structure for a countable language can be interpreted in a graph.  $\lrcorner$

*Proof:*  $\square$

## 2 Basic Techniques

**Def. (2.4.2.1) [Definitions for Theories].** A theory  $T$  is said to have the **witness property** iff whenever  $\varphi(v)$  is an  $\mathcal{L}$ -formula with one free variable  $v$ , there is a constant symbol  $c$  that  $T \models (\exists v \varphi(v) \rightarrow \varphi(c))$ .

A theory  $T$  is called **maximal** iff for any  $\mathcal{L}$ -sentence, either  $\varphi \in T$  or  $\neg\varphi \in T$ .

A theory  $T$  is called **complete** iff for any  $\mathcal{L}$ -sentence, either  $T \models \varphi$  or  $T \models \neg\varphi$ .  $\lrcorner$

**Def. (2.4.2.2) [Consistent Theory].** A theory  $T$  is called **inconsistent** if there is a sentence  $\varphi$  that  $T \vdash \varphi \wedge \neg\varphi$ , otherwise it is called **consistent**.  $\lrcorner$

**Def. (2.4.2.3) [Recursiveness and Decidability].** A language  $\mathcal{L}$  is called **recursive** iff there is an algorithm that decides whether a sequence of symbols is an  $\mathcal{L}$ -formula.

An  $\mathcal{L}$ -theory  $T$  is called **recursive** iff there is an algorithm that decides whether a given  $\mathcal{L}$ -sentence is in  $T$ .

An  $\mathcal{L}$ -theory  $T$  is called **decidable** iff there is an algorithm that decides whether a given  $\varphi$  satisfies  $T \models \varphi$ .  $\lrcorner$

**Prop. (2.4.2.4).** If  $\mathcal{L}$  is a recursive language and  $T$  is a recursive  $\mathcal{L}$ -structure, then  $\{\varphi | T \vdash \varphi\}$  is recursively enumerable.  $\lrcorner$

*Proof:* There is a computable listing  $\sigma_1, \dots, \sigma_n \dots$  of all the finite sequences of  $\mathcal{L}$ -formulas, because  $\mathcal{L}$  is recursive. Then we can check at each stage iff  $\sigma_i$  is a proof of  $\varphi$ . This involves checking if each formula is in  $T$  (checkable because  $T$  is recursive) or it is a simple consequences of formulae before it, and finally check the last formula is  $\varphi$ . If  $\sigma_i$  is a proof of  $\varphi$ , then halt, otherwise go on to check  $\sigma_{i+1}$ .  $\square$

**Prop. (2.4.2.5).** The halting computation set is not computable.  $\lrcorner$

*Proof:* Cf. [Mathematical Logic Shoenfield] ?.  $\square$

**Cor. (2.4.2.6).** The full theory  $Th(\mathbb{N})$  of the ring structure of  $\mathbb{N}$  is undecidable.  $\lrcorner$

*Proof:* If such an algorithm exists, then we can use it to compute whether the sentence

$$\varphi(e, x) = \exists s T(\underbrace{1 + \dots + 1}_{e\text{-times}}, \underbrace{1 + \dots + 1}_{x\text{-times}}, s)$$

is computable. Then this will contradict the fact that halting computation set is not computable (2.4.2.5).  $\square$

**Prop. (2.4.2.7) [Gödel's Completeness Theorem].** Let  $T$  be an  $\mathcal{L}$ -theory and  $\varphi$  is an  $\mathcal{L}$ -sentence, then  $T \models \varphi$  iff  $T \vdash \varphi$ .  $\lrcorner$

*Proof:* ?  $\square$

**Cor. (2.4.2.8) [Consistent and Satisfiable].** A theory  $T$  is consistent iff it is satisfiable.  $\lrcorner$

*Proof:* If  $T$  is satisfiable, then it is clearly consistent, and if  $T$  is not satisfiable, then there are no models for  $T$ , so  $T \models \varphi \wedge \neg\varphi$  by definition, so  $T \vdash \varphi \wedge \neg\varphi$  by Gödel's completeness theorem.  $\square$

**Cor. (2.4.2.9) [Lemma on Constants].** Suppose  $T \vdash \varphi(\bar{c})$  and  $\bar{c}$  is a tuple of constants not appearing in  $T$ , then  $T \vdash \forall x \varphi(x)$ .  $\lrcorner$

*Proof:* We use the Gödel's completeness theorem (2.4.2.7), and notice this theorem is obviously true for  $\vdash$  replaced by  $\models$ . Notice we can add the constants to  $\mathcal{L}$ , thus  $\varphi(\bar{c})$  has no free variables.  $\square$

### Ultraproducts of Theories

**Def. (2.4.2.10) [Ultraproducts of Theories].** If  $M_i, i \in I$  is a collection of  $\mathcal{L}$ -structures and  $\mathcal{F}$  is an ultrafilter on  $I$ , then the **ultraproduct**  $\prod_I M_i / \mathcal{F}$  of  $M_i$  is a  $\mathcal{L}$ -structure defined as:

- The underlying set  $M = \prod M_i / \sim$ , where  $(a_i) \sim (b_i)$  iff  $\{i \in I \mid a_i = b_i\} \in \mathcal{F}$ , which is an equivalent relation.
- If  $c$  is a constant symbol, then  $c^M = (c^{M_i})$ .
- If  $f$  is a function symbol, then  $f^M([a_{i1}], \dots, [a_{in}]) = [f^{M_i}(a_{i1}, \dots, a_{in})]$ .
- If  $R$  is a relation symbol, then  $([a_{i1}], \dots, [a_{in}]) \in R^M$  iff  $\{i \in I \mid (a_{i1}, \dots, a_{in}) \in R^{M_i}\} \in \mathcal{F}$ .

┘

**Prop. (2.4.2.11) [Los Theorem].** Let  $M_i, i \in I$  be  $\mathcal{L}$ -structures and  $\mathcal{F}$  be an ultrafilter on  $I$ . Let  $\varphi(\bar{x})$  be a first-order logic formula in the free variables  $\bar{x}$ , and let  $\overline{[a_i]}$  be a tuple of elements from  $\prod_I M_i / \mathcal{F}$ , then

$$\prod_I M_i / \mathcal{F} \models \varphi(\overline{[a_i]}) \iff \{i \in I \mid M_i \models \varphi(\bar{a}_i)\} \in \mathcal{F}.$$

┘

*Proof:* The proof is by induction, which is routine, Cf.[Model Theory for Algebra and Algebraic Geometry, P22]. □

**Cor. (2.4.2.12).** An ultrapower of models for a theory  $T$  is also a model for  $T$ . ┘

**Cor. (2.4.2.13) [Non-Standard Model for  $\text{Th}(\mathbb{R})$ ].** Consider  $\mathbb{R}$  in the language  $\mathcal{L}_r$ , where  $\mathcal{L}_r$  is the language of rings, (i.e., the ring structure), let  $\mathcal{F}$  be a non-principle ultrafilter on  $\mathbb{N}$  (2.2.10.9), and consider the ultrapower  $\mathcal{R} = \prod_{i \in \mathbb{N}} \mathbb{R} / \mathcal{F}$ , which is called an **ultrapower** of  $\mathbb{R}$ .

Notice each factor satisfies  $\text{Th}(\mathbb{R})$ , so  $\mathcal{R}$  also satisfies  $\text{Th}(\mathbb{R})$ . ┘

**Cor. (2.4.2.14).** Using ultrapower construction, we can find a field of characteristic 0 that has exactly one algebraic extension in each degree. ┘

*Proof:* Just use the field model  $\mathbb{F}_p$  for all  $p$  and construct their ultrapower w.r.t. a non-principal ultrafilter. □

**Prop. (2.4.2.15) [Keisler-Shelah Theorem].** Two  $\mathcal{L}$ -structures  $\mathcal{M}$  and  $\mathcal{N}$  are elementary equivalent iff there is an index set  $I$  and an ultrafilter  $\mathcal{F}$  on  $I$  that  $\prod_I \mathcal{M} / \mathcal{F} \cong \prod_I \mathcal{N} / \mathcal{F}$ . ┘

*Proof:* Cf.[C. C. Chang and H. J. Keisler, Model Theory 6.1.15]. □

### Compactness Theorem and Henkin Construction

**Lemma (2.4.2.16).** Suppose  $T$  is a maximal and finitely satisfiable  $\mathcal{L}$ -theory with the witness property, then  $T$  is satisfiable. In fact,  $T$  has  $\kappa$  constant symbols, then there is a model  $\mathcal{M} \models T$  that  $|\mathcal{M}| \leq \kappa$ . ┘

*Proof:* Cf.[Marker, P35]. □

**Lemma (2.4.2.17).** Let  $\mathcal{L}$  be a finitely satisfiable  $\mathcal{L}$ -theory, then there is a language  $\mathcal{L}^* \subset \mathcal{L}$  and a  $T \subset T^*$  a finitely satisfiable  $\mathcal{L}^*$ -theory that any  $\mathcal{L}^*$ -theory extending  $T^*$  has the witness property. And we can choose  $|\mathcal{L}^*| = |\mathcal{L}| + \aleph_0$ . ┘

*Proof:* We first show there is a language  $\mathcal{L} \subset \mathcal{L}_1$  and a finitely satisfiable  $\mathcal{L}_1$ -theory  $T \subset T_1$  that witnesses all  $\mathcal{L}$ -formulae: We add a constant symbol  $c_\varphi$  for each  $\mathcal{L}$ -formula  $\varphi$ , and add sentences  $(\exists v\varphi(v)) \rightarrow \varphi(c_\varphi)$  to  $T$ , then this  $T_1$  is finitely satisfiable, because for any finite subset  $\Delta$  of  $T_1$ , only f.m. constant symbols appear, and we have a model  $\mathcal{M}$  for  $\Delta \cap T$ , thus we can interpret  $c_\varphi$  as the element  $a$  that  $\mathcal{M} \models \varphi(a)$ , if  $\mathcal{M} \models \exists v\varphi(v)$ . Now we can inductively define  $L_n, T_n$ , and consider their union, then this satisfies the desired conditions. And the cardinality is also clear.  $\square$

**Lemma (2.4.2.18).** If  $T$  is a finitely satisfiable  $\mathcal{L}$ -theory, then there is a maximal (2.4.2.1) finitely satisfiable  $\mathcal{L}$ -theory  $\mathcal{L} \subset \mathcal{L}'$ .  $\lrcorner$

*Proof:* it is easy to construct a maximal satisfiable  $\mathcal{L}$ -theory, and it is truly maximal in sense of (2.4.2.1): for any sentence  $\varphi$ , if  $T \cup \varphi$  is not finitely satisfiable, then there is a finite set  $\Delta \subset T$  that  $\Delta \models \neg\varphi$ . Then we claim  $T \cup \neg$  is finitely satisfiable: for another finite set  $\Sigma$ , because  $\Delta \cup \Sigma$  is finitely satisfiable and  $\Delta \models \neg\varphi$ ,  $\Sigma \cup \neg\varphi$  is satisfiable.  $\square$

**Prop. (2.4.2.19) [Strong Compactness Theorem].** If  $T$  is a finitely satisfiable  $\mathcal{L}$ -theory and  $\kappa$  is an infinite cardinal that  $\kappa > |\mathcal{L}|$ , then there is a model of  $T$  of cardinality at most  $\kappa$ .  $\lrcorner$

*Proof:* By (2.4.2.17), we get a desired language  $\mathcal{L}^*$  of cardinality  $\leq \kappa$ , and a theory  $T^*$ , and by (2.4.2.18), we can assume  $T^*$  is maximal and finitely satisfiable, and it has the witness property. Then (2.4.2.16) says there is a model of cardinality  $\leq \kappa$ .  $\square$

**Cor. (2.4.2.20) [Compactness Theorem].** A theory  $T$  is satisfiable iff every finite subset of  $T$  is satisfiable.  $\lrcorner$

**Remark (2.4.2.21).** Notice the compactness theorem is also a consequence of the completeness theorem (2.4.2.7): if  $T$  is not satisfiable, then it is not consistent by (2.4.2.8). Let  $\sigma$  be a proof of a contradiction in  $T$ , then  $\sigma$  consists of f.m. sentences in  $T$ , which consists of a finite unsatisfiable subset  $T_0$  of  $T$ .

It is clear provable using ultrafilters: If there is a family of structures  $\{M_\Delta\}$  indexed by the collection of all finite subsets of  $T$ , with  $M_\Delta \models \Delta$  for all  $\Delta \in I$  where  $I$  is the set of all finite subsets of  $T$ .

Then we want to find an ultrafilter  $\mathcal{F}$  on  $I$  that for all  $\varphi \in T$ ,  $\{\Delta \mid M_\Delta \models \varphi\} \in \mathcal{F}$ , then we can use Leo's theorem (2.4.2.11) to show that  $\prod_I M_\Delta / \mathcal{F}$  is a model for all  $\varphi \in T$ . Now in fact we make pick a ultrafilter over the filter generated by all the  $A_\varphi = \{\Delta \mid \varphi \in \Delta\}$ , because  $M_\Delta \models \Delta$ . In fact, this is the case because  $A_\varphi$  has the finite intersection property trivially.  $\lrcorner$

**Cor. (2.4.2.22).** If  $T \models \varphi$ , then  $\Delta \models \varphi$  for some finite  $\Delta \subset T$ .  $\lrcorner$

*Proof:* If not, then  $\Delta \cup \{\neg\varphi\}$  is satisfiable for all finite  $\Delta \subset T$ , so  $T \cup \{\neg\varphi\}$  is finitely satisfiable, thus satisfiable by compactness theorem, but this cannot be true because  $T \models \varphi$ .  $\square$

**Cor. (2.4.2.23) [Torsion Elements].** Let  $\mathcal{L}$  be a language containing  $\{\cdot, e\}$ , the language of groups, and  $T$  is a theory extending the theory of groups, let  $\varphi(v)$  be an  $\mathcal{L}$ -formula. If for any  $n$  there is a  $G_n \models T$  and  $G_n$  has an element of finite order greater than  $n$ , then there is an  $\mathcal{L}$ -structure  $G$  that  $G \models T$  and  $G$  has an element of infinite order.

In particular, there is no formula that defines the torsion elements in any models for  $T$ .  $\lrcorner$

*Proof:* Consider a new language  $\mathcal{L}^* = \mathcal{L} \cup \{c\}$ , and  $T^*$  an  $\mathcal{L}^*$ -theory that

$$T^* = T \cup \{\varphi(c)\} \cup \{\neg(\underbrace{c \cdots c}_{n\text{-times}} = e)\},$$

then the theory  $T^*$  is finitely satisfiable by hypothesis, so  $T^*$  is satisfiable by compactness theorem.  $\square$

**Cor. (2.4.2.24) [Element Larger than All Natural Number].** Consider  $\mathcal{L}$  the language of ordered rings, let  $\text{Th}(\mathbb{N})$  be the theory of  $\mathbb{N}$ , then there is an  $\mathcal{L}$ -structure  $\mathcal{M}$  that  $\mathcal{M} \models \text{Th}(\mathbb{N})$  and  $\mathcal{M}$  has an element that is larger than every natural number.  $\lrcorner$

*Proof:* The same proof as that of (2.4.2.23), but use

$$T^* = \text{Th}(\mathbb{N}) \cup \left\{ \underbrace{1 + \dots + 1}_{n\text{-times}} < c \right\}$$

$\square$

**Prop. (2.4.2.25) [Model of a Given Cardinality].** If  $T$  is an  $\mathcal{L}$ -theory with infinite models, then if  $\kappa$  is an infinite cardinal that  $\kappa \geq |\mathcal{L}|$ , then there is a model of  $T$  of cardinality  $\kappa$ .  $\lrcorner$

*Proof:* Let  $\mathcal{L}^* = \mathcal{L} \cup \{c_\alpha : \alpha < \kappa\}$ , where  $c_\alpha$  are pairwise different new constants, and  $T^*$  be the  $\mathcal{L}^*$  theory  $T \cup \{c_\alpha \neq c_\beta, \alpha < \beta < \kappa\}$ , then any model for  $T^*$  must have cardinality  $\geq \kappa$ . But then we use strong compactness theorem (2.4.2.19), it suffices to show  $T^*$  is finitely satisfiable: for any finite  $\Delta \subset T^*$ , there are only f.m. new constant symbols, thus we can use the infinite model  $\mathcal{M}$  to interpret the constant symbols randomly, thus we are done.  $\square$

### Complete Theories

**Def. (2.4.2.26) [Categorical Theories].** Let  $\kappa$  be an infinite cardinal and  $T$  is a theory with models of size  $\kappa$ .  $T$  is called  $\kappa$ -categorical iff any two models of  $T$  of cardinality  $\kappa$  are isomorphic.  $\lrcorner$

**Prop. (2.4.2.27).** The theory of torsion-free divisible Abelian groups is  $\kappa$ -categorical for all  $\kappa > \aleph_0$ .  $\lrcorner$

*Proof:* A torsion-free Abelian group is just a vector space over  $\mathbb{Q}$ . Thus the conclusion is trivial, just notice for a cardinal  $\kappa > \aleph_0$ , a vector space of dimension  $\kappa$  has cardinality  $\kappa$ .  $\square$

**Prop. (2.4.2.28) [Vaught's Test].** Let  $T$  be a satisfiable theory with no finite models, if  $T$  is  $\kappa$ -categorical for some  $\kappa \geq |\mathcal{L}|$ , then  $T$  is complete.  $\lrcorner$

*Proof:* If there is a sentence  $\varphi$  that  $T \not\models \varphi$  and  $T \not\models \neg\varphi$ , so  $T_0 = T \cup \{\varphi\}$  and  $T_1 = T \cup \{\neg\varphi\}$  is satisfiable. They both have infinite models by hypothesis, so by (2.4.2.25) there are models of cardinal  $\kappa$  for  $T_0$  and  $T_1$ , but they cannot be isomorphic, contradiction. So  $T$  is complete.  $\square$

**Prop. (2.4.2.29) [Recursive Complete Satisfiable is Decidable].** If  $T$  is a recursive complete satisfiable theory in a recursive language  $\mathcal{L}$ , then  $T$  is decidable.  $\lrcorner$

*Proof:* Because  $T$  is satisfiable, The set of all  $\varphi$  that  $\mathcal{M} \models \varphi$  and the set of all  $\varphi$  that  $\mathcal{M} \models \neg\varphi$  are disjoint, and their sum is the set of all sentences by completeness. By Gödel's completeness theorem, this is equivalent to  $\mathcal{M} \vdash \varphi$  or  $\mathcal{M} \vdash \neg\varphi$ . Then by (2.4.2.4), they are both enumerable, so it is decidable by definition.  $\square$

**Up and Down(of Cardinality)**

**Def. (2.4.2.30) [Elementary Embedding].** An  $\mathcal{L}$ -structure embedding  $i : \mathcal{M} \rightarrow \mathcal{N}$  is called an **elementary embedding**, denoted by  $\mathcal{M} \prec \mathcal{N}$ , if for any  $\mathcal{L}$ -formula  $\varphi$ ,

$$\mathcal{M} \models \varphi(\bar{a}) \iff \mathcal{N} \models \varphi(i(\bar{a})).$$

Notice that one way implication is sufficient, because we can use negation.

Isomorphisms are elementary embeddings by (2.4.1.8).  $\lrcorner$

**Def. (2.4.2.31) [Diagrams].** Let  $\mathcal{M}$  be an  $\mathcal{L}$ -structure, then we can add to  $\mathcal{L}$  constant symbols for each element of  $M$ , and the class  $Diag(\mathcal{M})$  of **atomic diagrams** of  $\mathcal{M}$  is sentences of the form  $\varphi(m_1, \dots, m_n)$ , where  $\varphi$  is an atomic  $\mathcal{L}$ -formula or the negation of an atomic  $\mathcal{L}$ -formula, and  $\mathcal{M} \models \varphi(m_1, \dots, m_n)$ . And the class  $Diag_{el}(\mathcal{M})$  of **elementary diagrams** of  $\mathcal{M}$  is sentences of the form  $\varphi(m_1, \dots, m_n)$  where  $\varphi$  is an  $\mathcal{L}$ -formula that  $\mathcal{M} \models \varphi(m_1, \dots, m_n)$ .  $\lrcorner$

**Prop. (2.4.2.32) [Diagrams and Embedding].** The diagram and elementary diagram is very important in constructing embeddings of theories: Let  $\mathcal{N}$  be an  $\mathcal{L}_M$ -structure, then:

- If  $\mathcal{N} \models Diag(\mathcal{M})$ , there is an  $\mathcal{L}$ -embedding  $\mathcal{M} \subset \mathcal{N}$ .
- If  $\mathcal{N} \models Diag_{el}(\mathcal{M})$ , there is an elementary  $\mathcal{L}$ -embedding  $\mathcal{M} \prec \mathcal{N}$ .

$\lrcorner$

**Prop. (2.4.2.33) [Upward Löwenheim-Skolem Theorem].** Let  $\mathcal{M}$  be an infinite  $\mathcal{L}$ -structure and  $\kappa$  be an infinite cardinal that  $\kappa \geq |\mathcal{M}| + |\mathcal{L}|$ , then there is an  $\mathcal{L}$ -structure  $\mathcal{N}$  of cardinality  $\kappa$  that  $\mathcal{M}$  embeds into  $\mathcal{N}$ .  $\lrcorner$

*Proof:*  $Diag_{el}(\mathcal{M})$  is clearly satisfiable, so by (2.4.2.25), there is an  $\mathcal{L}^*$ -model  $\mathcal{N}$  of cardinality  $\kappa$  that  $\mathcal{N} \models Diag_{el}(\mathcal{M})$ . Then clearly  $\mathcal{M} \prec \mathcal{N}$ .  $\square$

**Prop. (2.4.2.34) [Tarski-Vaught Test].** A substructure  $\mathcal{M}$  of a structure  $\mathcal{N}$  is an elementary substructure iff for any formula  $\varphi(v, \bar{w})$  and  $\bar{a} \in M$ , if there is  $b \in N$  that  $\mathcal{N} \models \varphi(b, \bar{a})$ , then there is a  $c \in M$  that  $\mathcal{N} \models \varphi(c, \bar{a})$ .  $\lrcorner$

*Proof:* Cf. [Marker P45]. ?  $\square$

**Prop. (2.4.2.35) [(Downward) Löwenheim-Skolem Theorem].** Suppose  $\mathcal{M}$  is an  $\mathcal{L}$ -structure and  $X \subset \mathcal{M}$ , then there is a elementary submodel  $\mathcal{N}$  that  $X \subset \mathcal{N}$  and  $|\mathcal{N}| \leq |X| + |\mathcal{L}| + \aleph_0$ .  $\lrcorner$

*Proof:* Cf. [Marker P46].  $\square$

**Def. (2.4.2.36) [Universal Sentences].** A **universal sentence** is a sentence of the form  $\forall v \varphi(v)$ , where  $\varphi$  is quantifier-free.

For a theory  $T$ , denote by  $T_{\forall}$  the set of all of the universal sentences  $\varphi$  that  $T \models \varphi$ .

A  $\mathcal{L}$ -theory  $T$  is said to have a **universal axiomatization** iff there is a set of universal  $\mathcal{L}$ -sentences  $\Gamma$  that  $\mathcal{M} \models T$  iff  $\mathcal{M} \models \Gamma$ .  $\lrcorner$

**Prop. (2.4.2.37) [Universal Axiomatization].** An  $\mathcal{L}$ -theory  $T$  has a universal axiomatization iff for any  $\mathcal{N} \subset \mathcal{M}$ , if  $\mathcal{M} \models T$ , then  $\mathcal{N} \models T$ .  $\lrcorner$

*Proof:* Cf. [Marker P47].  $\square$

**Prop. (2.4.2.38)[Universal Consequences].** If  $T$  is an  $\mathcal{L}$ -theory, then  $\mathcal{A} \models T_{\forall}$  iff there is an  $\mathcal{M} \models T$  that  $\mathcal{A} \subset \mathcal{M}$ .  $\lrcorner$

*Proof:* If  $\mathcal{A} \subset \mathcal{M}$ , then  $\mathcal{A} \models T_{\forall}$ , by (2.4.2.37). Conversely, if  $\mathcal{A} \models T_{\forall}$ , then consider  $Diag(\mathcal{A})$ , then it suffices to show  $Diag(\mathcal{A})$  is satisfiable. If it is not, then by compactness theorem (2.4.2.20) there is a finite set that is not satisfiable, and the part coming from diagrams of  $\mathcal{M}$  can be expressed by a single formula  $\chi(\bar{a})$ , where  $\chi$  is quantifier-free,  $\bar{a} \in \mathcal{M}$ ,  $\mathcal{M} \models \chi(\bar{a})$ , and we are saying that  $T \cup \{\chi(\bar{a})\}$  is not satisfiable, then  $T \models \neg\chi(\bar{a})$ .

Now  $T \models \forall \bar{x} \neg\varphi(\bar{x})$  as  $\mathcal{L}$ -theory because  $\bar{a}$  can be designated arbitrarily, but this sentence is in  $T_{\forall}$ , thus  $\mathcal{M} \models \forall \bar{x} \neg\varphi(\bar{x})$ , in particular,  $\mathcal{M} \models \neg\varphi(\bar{a})$ , contradiction.  $\square$

**Prop. (2.4.2.39)[Elementary Chain].** If  $\mathcal{M}_i$  is a chain of  $\mathcal{L}$ -structures that  $\mathcal{M}_i \prec \mathcal{M}_j$  for any  $i < j$ , then we can define their union  $\mathcal{M} = \cup \mathcal{M}_i$ . Then  $\mathcal{M}$  is an elementary extension of each  $\mathcal{M}_i$ .  $\lrcorner$

*Proof:* Use induction on formulas to show that

$$\mathcal{M}_i \models \varphi(\bar{a}_i) \iff \mathcal{M} \models \varphi(\bar{a}_i),$$

for all  $\mathcal{L}$ -formulas  $\varphi$ . This is true for quantifier-free formula by (2.4.1.7), and if this is true for  $\varphi, \psi$ , then this is true for  $\neg\varphi$  and  $\varphi \wedge \psi$ . For the sentence  $\varphi = \exists v \psi(v, \bar{w})$ , if  $\mathcal{M}_i \models \varphi(b, \bar{a})$  for some  $b$ , then so does  $\mathcal{M}$ . Conversely, if  $\mathcal{M} \models \varphi(b, \bar{a})$  for some  $b$ , then  $b \in \mathcal{M}_j$  for some  $j$ , then  $\mathcal{M}_j \models \varphi$ , by the condition,  $\mathcal{M}_i \models \varphi$  also.  $\square$

### Back and Forth Argument

Cf.[Marker Chap2.4]. Some deep ideas are involved.

**Prop. (2.4.2.40)[Cantor].** The theory  $DLO(2.1.6.3)$  is  $\aleph_0$ -categorical and complete.  $\lrcorner$

*Proof:* It is  $\aleph_0$ -categorical by (2.2.3.12), and it is complete, by Vaught's test (2.4.2.28), as it has no finite models.  $\square$

## 3 Quantifier Elimination

**Def. (2.4.3.1)[Quantifier Elimination].** A theory is said to have **quantifier elimination** if for each formula  $\varphi(\bar{v})$ , there is a quantifier free  $\psi$  that  $T \models \forall \bar{v}(\varphi(\bar{v}) \leftrightarrow \psi(\bar{v}))$ .  $\lrcorner$

**Lemma (2.4.3.2).** Suppose  $\mathcal{L}$  contains a constant symbol  $c$ ,  $T$  is an  $\mathcal{L}$ -theory, and  $\varphi(\bar{a})$  is an  $\mathcal{L}$ -formula, then the following are equivalent:

- There is a quantifier-free  $\mathcal{L}$ -formula  $\psi(\bar{v})$  that  $T \models \forall \bar{v}(\varphi(\bar{v}) \leftrightarrow \psi(\bar{v}))$ .
- If  $\mathcal{M}, \mathcal{N}$  are models of  $T$ , and  $\mathcal{A}$  is an  $\mathcal{L}$ -structure that  $\mathcal{A} \subset \mathcal{M} \cap \mathcal{N}$ , then for all  $\bar{a} \in \mathcal{A}$ ,  $\mathcal{N} \models \varphi(\bar{a}) \iff \mathcal{M} \models \varphi(\bar{a})$ .  $\lrcorner$

*Proof:*  $1 \rightarrow 2$  is clear, because a quantifier-free formula  $\psi(\bar{a})$  is preserved under substructure by (2.4.1.7).

$2 \rightarrow 1$ , Cf.[Marker, P74]. ?  $\square$

**Lemma (2.4.3.3).** Let  $T$  be an  $\mathcal{L}$ -theory that for any quantifier-free  $\mathcal{L}$ -formula  $\theta(\bar{v}, w)$ , there is a quantifier-free formula  $\psi(\bar{v})$  that  $T \models \forall \bar{v}(\exists w \theta(\bar{v}, w) \leftrightarrow \psi(\bar{v}))$ , then  $T$  has quantifier elimination.  $\lrcorner$

*Proof:* We want to show for each formula  $\varphi(\bar{a})$ , there is a quantifier-free formula  $\psi(\bar{a})$  that  $T \models \forall \bar{v}(\varphi(\bar{a}) \leftrightarrow \psi(\bar{v}))$ , and we use induction on the complexity of  $\varphi$ .

If  $\varphi$  is quantifier-free, this is trivial. If  $\varphi = \neg\theta_0$  or  $\varphi = \theta_0 \wedge \theta_1$ , then we are easily done. If  $\psi(\bar{v}) = \exists w\theta(\bar{v}, w)$ , and  $T \models \forall \bar{v}(\theta(\bar{v}, w) \leftrightarrow \psi_0(\bar{v}, w))$ , then  $T \models \forall \bar{v}(\varphi(\bar{v}) \leftrightarrow \exists w\psi_0(\bar{v}, w))$ . But the assumption shows there is a quantifier-free  $\psi$  that  $T \models \forall \bar{v}(\exists w\psi_0(\bar{v}, w) \leftrightarrow \psi(\bar{v}))$ , and then  $T \models \forall \bar{v}(\varphi(\bar{v}) \leftrightarrow \psi(\bar{v}))$ .  $\square$

**Prop. (2.4.3.4) [Criterion for Quantifier Elimination].** Combining (2.4.3.2) and (2.4.3.3), we get: If  $T$  is an  $\mathcal{L}$ -theory that for all quantifier-free formula  $\varphi(\bar{v}, w)$  and models  $\mathcal{M}, \mathcal{N} \models T$ , and  $\mathcal{A} \subset M \cap N, \bar{a} \in A$ , and if there is  $b \in M$  that  $\mathcal{M} \models \varphi(\bar{a}, b)$  will imply there is  $c \in \mathcal{N}$  that  $\mathcal{N} \models \varphi(\bar{a}, c)$ , then  $T$  is quantifier-free.  $\lrcorner$

**Def. (2.4.3.5) [Algebraically Prime Models].** A theory  $T$  is said to have **algebraically prime models** if for any  $\mathcal{A} \models T_\forall$  (2.4.2.36), there is a  $\mathcal{M} \models T$  and an embedding  $i : \mathcal{A} \subset \mathcal{M}$  that for any other  $\mathcal{N} \models T$ , any embedding  $j : \mathcal{A} \rightarrow \mathcal{N}$  factors through  $i$ .  $\lrcorner$

**Def. (2.4.3.6) [Simply Closed Model].** If  $\mathcal{M}, \mathcal{N}$  are models of  $T$ , and  $\mathcal{M} \subset \mathcal{N}$ , then  $\mathcal{M}$  is called **simply closed** in  $\mathcal{N}$ , denoted by  $\mathcal{M} \prec_s \mathcal{N}$ , iff for any quantifier-free formula  $\varphi(\bar{a}, w)$  and  $\bar{a} \in \mathcal{M}^n$ , if  $\mathcal{N} \models \exists w\varphi(\bar{a}, w)$ , then so does  $\mathcal{M}$ .  $\lrcorner$

**Prop. (2.4.3.7) [Quantifier Elimination Test].** If  $T$  is an  $\mathcal{L}$ -theory that has algebraically prime models, and any inclusion of models for  $T$  is simply closed, then  $T$  has quantifier elimination.  $\lrcorner$

*Proof:* This is an immediate consequence of (2.4.3.4).  $\square$

**Def. (2.4.3.8) [Model-Complete].** An  $\mathcal{L}$ -theory  $T$  is called **model-complete** if for any two models  $\mathcal{M}, \mathcal{N}$  for  $T$ ,  $\mathcal{M} \prec \mathcal{N}$  (2.4.2.30) whenever  $\mathcal{M} \subset \mathcal{N}$ . A complete theory is clearly model complete.  $\lrcorner$

**Prop. (2.4.3.9).** let  $T$  be an  $\mathcal{L}$ -theory. If  $T$  has quantifier elimination, then  $T$  is model-complete.  $\lrcorner$

*Proof:* If  $\mathcal{M} \subset \mathcal{N}$ , let  $\varphi(\bar{a})$  be an  $\mathcal{L}$ -formula, and  $\bar{a} \in \mathcal{M}$ , then there is a quantifier-free formula  $\psi(\bar{v})$  that  $T \models \forall \bar{v}(\varphi(\bar{v}) \leftrightarrow \psi(\bar{v}))$ . By (2.4.1.7), the formula  $\psi(\bar{a})$  passes between  $\mathcal{M}$  and  $\mathcal{N}$ , so

$$\mathcal{M} \models \varphi(\bar{a}) \iff \mathcal{M} \models \psi(\bar{a}) \iff \mathcal{N} \models \psi(\bar{a}) \iff \mathcal{N} \models \varphi(\bar{a}).$$

$\square$

**Prop. (2.4.3.10) [Minimal Model and Completeness].** If  $T$  is model-complete and there is a minimal model  $\mathcal{M}_0$  that  $\mathcal{M}_0$  embeds into every model of  $T$ , then  $T$  is complete.  $\lrcorner$

*Proof:* Clearly any model is elementary equivalent to  $\mathcal{M}_0$ , thus clearly  $T$  is complete.  $\square$

**Prop. (2.4.3.11) [Eliminating Algorithm].** Let  $T$  be a decidable theory with quantifier elimination, then there is an algorithm to find the elimination  $\psi$  of a given formula  $\varphi$ .  $\lrcorner$

*Proof:* We just need to find a quantifier-free  $\psi$  that  $T \models \forall \bar{v}(\varphi(\bar{v}) \leftrightarrow \psi(\bar{v}))$ . This an effective search because  $T$  is decidable, and we can eventually find  $\psi$  because  $T$  has quantifier elimination.  $\square$

### Examples of Quantifier Elimination

**Prop. (2.4.3.12).** The theory  $DLO(2.1.6.3)$  has quantifier elimination. ┘

*Proof:* Cf.[Marker P72]. □

**Lemma (2.4.3.13).**  $DAG(2.1.6.3)$  has algebraically prime models. ┘

*Proof:* This is just the alg.closure of the quotient field of an integral domain. □

**Prop. (2.4.3.14).**  $DAG$  has quantifier elimination. ┘

*Proof:* We use(2.4.3.7) By(2.4.3.13),  $DAG$  has algebraically prime models, thus it suffices to show any inclusion of models for  $DAG(2.1.6.3)$  is simply closed: For any torsion-free divisible Abelian groups  $H \subset G$ ,  $\varphi(\bar{a}, w)$  quantifier-free,  $\bar{a} \in H, b \in G$  that  $G \models \varphi(\bar{a}, w)$ . Then  $\varphi$  is a disjunction of conjunctions of atomic or negated atomic formulas, and we need to prove  $H \models \varphi(\bar{a}, w)$ .

So we may assume  $\varphi$  is conjunction of atomic formulas and negated atomic formulas:

$$\varphi(\bar{a}, w) \leftrightarrow \bigwedge (g_i + m_i w = 0) \wedge \bigwedge (h_i + m'_i w \neq 0).$$

If any  $m_i \neq 0$ , then  $b \in H$ . If all  $m_i = 0$ , then there are only f.m. constraints, and there is  $b' \in H$  that  $H \models \varphi(\bar{a}, b')$  because  $H$  is infinite. □

**Cor. (2.4.3.15).** The theory  $DAG$  is complete, by(2.4.3.10), as  $(\mathbb{Q}, +, 0)$  embeds in every model of  $DAG$ , and(2.4.3.14)(2.4.3.9). ┘

**Prop. (2.4.3.16).** The theory  $ODAG$  is a complete theory with quantifier elimination. In particular, any ordered divisible Abelian group is elementarily equivalent to  $(\mathbb{Q}, +, <)$ , by completeness. ┘

*Proof:* Cf.[Marker, P80]. □

**Prop. (2.4.3.17)[Presburger Arithmetic].** Presburger arithmetic is a complete decidable theory with quantifier elimination in the language  $\mathcal{L}^*$ . ┘

*Proof:* Cf.[Marker, P84] ?. □

### Minimal Structures and Minimal Theories

**Def. (2.4.3.18) [Minimal Structures].** An  $\mathcal{L}$ -structure  $\mathcal{M}$  is called a **minimal structure** if any definable set  $X \subset M$  is either finite or cofinite. ┘

**Def. (2.4.3.19) [Quasi-Minimal Structures].** An  $\mathcal{L}$ -structure  $\mathcal{M}$  is called a **quasi-minimal structure** if  $\mathcal{M}$  is uncountable, and for any definable set  $X \subset \mathcal{M}$  is either countable or uncountable. And it is called a **strongly quasi-minimal structure** if for any finite subset  $A \subset \mathcal{M}$ , each  $\text{Aut}_A(\mathcal{M})$ -invariant subset of  $\mathcal{M}$  is either countable or cocountable. ┘

**Def. (2.4.3.20) [Strongly-(Quasi-)Minimal Theories].** A **strongly-(quasi-)minimal theory** is a theory  $T$  s.t. any model  $\mathcal{M} \models T$  is (quasi-)minimal. ┘

**Prop. (2.4.3.21).**  $DAG(2.1.6.3)$  is a strongly-minimal theory. ┘

*Proof:* Cf.[Marker P78]. □

## 4 Alg.Closed Fields

**Lemma (2.4.4.1).**  $ACF_p$  (2.1.6.3) is  $\kappa$ -categorical for all uncountable cardinal  $\kappa$ . ┘

*Proof:* Because two alg.closed field of the same transcendental degree over the base field is isomorphic (3.2.7.4). The conclusion follows as an alg.closed field of transcendence degree  $\kappa$  has cardinality  $\kappa + \aleph_0$ . □

**Prop. (2.4.4.2).** The theory  $ACF_p$  is complete, by (2.4.4.1) and (2.4.2.28). ┘

**Cor. (2.4.4.3).**  $ACF_p$  is decidable, in particular,  $\text{Th}(\mathbb{C})$ , the first-order theory of the fields of complex numbers, is decidable. ┘

*Proof:*  $ACF_p$  is complete by (2.4.4.1) and (2.4.2.28), it is clearly recursive, and it is clearly satisfiable, so use (2.4.2.29). □

**Prop. (2.4.4.4) [First order Lefschetz Principle].** Let  $\varphi$  be a sentence in the language of rings, the following are equivalent:

1.  $\varphi$  is true in  $\mathbb{C}$ .
  2.  $\varphi$  is true in every(some) alg.closed field of char 0.
  3. For  $p$  large/there exists arbitrary large  $p$ ,  $\varphi$  is true in any alg.closed field of char  $p$ .
- ┘

*Proof:* 1, 2 are equivalent because  $ACF_p$  is complete (2.4.4.2) and use Gödel's completeness theorem. If 2 is true, then  $ACT_0 \models \varphi$ , so by (2.4.2.22), then some  $\Delta \models \varphi$ . So for  $p$  sufficiently large,  $ACF_p \models \Delta$ , so  $ACF_p \models \varphi$  for  $p$  large.

If  $ACF_0 \not\models \varphi$ , then  $ACF_0 \models \neg\varphi$  by completeness (2.4.4.2), so by above argument,  $ACF_p \models \neg\varphi$  for  $p$  large, contradiction. □

**Cor. (2.4.4.5) [Ax].** Any injective polynomial map from  $\mathbb{C}^n$  to  $\mathbb{C}^n$  is surjective. ┘

*Proof:* By Lefschetz principle (2.4.4.4), it suffices to show this for  $(\mathbb{F}_p)^{alg}$  for  $p$  large. If this is not true, then choose the coefficients of the coordinate map of  $f$ , and the coordinates of an element that is not in the image, then the subfield  $k$  they generated is algebraic over  $\mathbb{F}_p$ , so it is finite, and clearly  $f$  is also surjective on  $k^n$ , contradiction. □

**Cor. (2.4.4.6).** Let  $K \subset L$  be alg.closed fields, and  $V, W$  be varieties defined over  $K$ , and  $f$  is a polynomial isomorphism of  $V$  and  $W$  over  $L$ , then there is a polynomial isomorphism of  $V$  and  $W$  over  $K$ . ┘

*Proof:* Let  $f$  have degree  $d$ . Then we can write a formula  $\Psi$  saying that there is an embedding of  $K$  into  $\mathcal{M}$  and there is a polynomial bijection of  $V$  and  $W$  over  $\mathcal{M}$ , then  $L \models \Psi$ , and because  $ACF$  is complete (2.4.4.2),  $K \models \Psi$ , too. Thus there is also an isomorphism over  $K$ . □

**Prop. (2.4.4.7).**  $ACF_{\forall}$  is the theory of integral domains. ┘

*Proof:* Clearly a ring is a subring of an alg.closed field iff it is an integral domain, so the result follows from (2.4.2.38). □

**Prop. (2.4.4.8).**  $ACF$  has qualifier elimination. ┘

*Proof:* Use (2.4.3.5), clearly it has algebraically prime models (2.4.4.7), and we need to check simply closedness.

For this, if  $K \subset L$ , notice that a quantifier-free formula  $\varphi$  is just a conjunction of some polynomial functions and negation of polynomial functions, with their coefficients in  $K$ . If there are some polynomial, then the solution  $b$  of  $\varphi$  in  $L$  is algebraic over  $K$ , thus in  $K$  because  $K$  is alg.closed. Now if it is just negations of polynomials, then clearly  $\varphi$  is true in  $K$  for some  $c \in K$ , because  $K$  is alg.closed thus infinite.  $\square$

**Cor. (2.4.4.9).**  $ACF$  is model-complete, by (2.4.3.9).  $\lrcorner$

**Lemma (2.4.4.10).** Let  $K$  be a field, then the subsets of  $K^n$  defined by atomic formulas are exactly Zariski closed subsets. And a subset of  $K^n$  that is quantifier-definable iff it is a Boolean combination of Zariski closed subsets (constructible). (Clear).  $\lrcorner$

**Prop. (2.4.4.11).**  $ACF$  is strongly minimal.  $\lrcorner$

*Proof:* Because by quantifier elimination (2.4.4.8), every definable set is a finite Boolean combination of sets of the form  $V(p) = 0$ , where  $p \in K[X]$ , but  $V(p)$  is either finite or all of  $K$ .  $\square$

### Elimination of Imaginaries in Alg.Closed Fields

**Def. (2.4.4.12) [Algebraicity].** Let  $\mathcal{M}$  be an  $\mathcal{L}$ -structure and  $A \subset M$ , then for  $b \in M$ ,  $b \in acl(A)$  if there is a formula  $\varphi(x, \bar{y})$  and  $\bar{a} \in A$  that  $\mathcal{M} \models \varphi(b, \bar{a})$ , and  $\{x \in M \mid \mathcal{M} \models \varphi(x, \bar{a})\}$  is finite.  $\lrcorner$

**Def. (2.4.4.13) [Algebraicity over Equivalence Class].** Let  $\mathcal{M}$  be an  $\mathcal{L}$ -structure and  $E$  a definable equivalence relation on  $M^n$ , then we say a element  $c \in M$  is algebraic over  $\bar{a}/E, b_1, \dots, b_m$  if there is a formula  $\varphi(c, \bar{y}, \bar{z})$  that

- $\mathcal{M} \models \varphi(c, \bar{a}, \bar{b})$ .
- If  $\bar{a}E\bar{a}'$ , then  $\mathcal{M} \models \varphi(c, \bar{a}, \bar{b}) \leftrightarrow \varphi(c, \bar{a}', \bar{b})$ .
- $\{x \mid \mathcal{M} \models \varphi(x, \bar{a}, \bar{b})\}$  is finite.

And a sequence  $\bar{c}$  is called algebraic over  $a/E, b_1, \dots, b_m$  iff each coordinate is.  $\lrcorner$

**Lemma (2.4.4.14).** Suppose  $\bar{c}$  is algebraic over  $\bar{a}/E, \bar{d}, \bar{b}$ , and  $\bar{b}$  is algebraic over  $\bar{a}/E, \bar{d}$ , then  $\bar{c}$  is also algebraic over  $\bar{a}/E, \bar{d}$ .  $\lrcorner$

*Proof:* Cf. [Marker, P92].  $\square$

**Lemma (2.4.4.15).** Suppose  $K$  is an alg.closed field and  $E$  is a definable equivalence relation on  $K^n$ , and  $\psi(\bar{x}, \bar{y}, \bar{d})$  defines  $E$ . If  $\bar{a} \in K^n$ , then there is a  $\bar{c} \in K^n$  algebraic over  $\bar{a}/E, \bar{d}$  s.t.  $\bar{c}E\bar{a}$ .  $\lrcorner$

*Proof:* Cf. [Marker, P92]. ?  $\square$

**Prop. (2.4.4.16) [Elimination of Imaginaries].** Let  $K$  be an alg.closed field,  $A \subset K$ , and  $E$  is an  $A$ -definable equivalence relation on  $K^n$ , then for some  $l$  there is an  $A$ -definable function  $f : K^n \rightarrow K^l$  that  $\bar{x}E\bar{y}$  iff  $f(\bar{x}) = f(\bar{y})$ .  $\lrcorner$

*Proof:* Cf. [Marker, P92].  $\square$

## 5 Real-Closed Fields

**Prop. (2.4.5.1).** The class of real-closed fields is an elementary class(2.4.1.4) of  $\mathcal{L}_r$ -structures.  $\lrcorner$

*Proof:* The real-closed fields are axiomatized by:

- Axioms for fields.
- For each  $n \geq 1$ , the sentence  $\forall x_1 \dots \forall x_n (x_1^2 + \dots + x_n^2 + 1 \neq 0)$ .
- $\forall x \exists y (y^2 = x \vee y^2 + x = 0)$ .
- For each  $n \geq 0$ , the sentence  $\forall x_1 \dots \forall x_n \exists y (y^{2n+1} + \sum_{i=0}^{2n} x_i y^i = 0)$ .

These truly axiomatize real-closed fields, by(3.2.10.7).  $\square$

**Prop. (2.4.5.2).** Let  $F$  be a real-closed field, then the definable sets in  $F^n$  w.r.t the  $\mathcal{L}_{or}$  is also definable w.r.t.  $\mathcal{L}_r$ .  $\lrcorner$

*Proof:* Because we can replace all instances  $t_i < t_j$  by  $\exists v (v \neq 0 \wedge t_i + v^2 = t_j)$ .  $\square$

**Prop. (2.4.5.3).**  $RCF_{\forall}$  is the theory of ordered integral domains(easy).  $\lrcorner$

**Cor. (2.4.5.4).**  $RCF$  has algebraically prime models.  $\lrcorner$

*Proof:* Let  $D$  be an ordered domain, and let  $R$  be a real closure of the fraction field of  $D$  compatible with the ordering of  $D$ . Let  $F$  be another real-closed field extension of  $D$ , then let  $K$  be the algebraic closure of the fraction field of  $D$  in  $F$ , then  $K$  is a real-closed field by(3.2.10.7), then by(3.2.10.12) there is an isomorphism of  $R \cong K$  extending  $D \rightarrow K$ , thus embeds  $R$  into  $F$  extending  $D \rightarrow F$ .  $\square$

**Prop. (2.4.5.5).**  $RCF$  has quantifier elimination (w.r.t.  $\mathcal{L}_{or}$ ).  $\lrcorner$

*Proof:* Use(2.4.3.5), it has algebraically prime models by(2.4.5.4), and we need to check simply closedness: Let  $F \subset K$  be RCFs,  $\varphi(v, \bar{w})$  be a quantifier-free formula and let  $\bar{a} \in F, b \in K$  that  $K \models \varphi(b, \bar{a})$ . Then there are polynomials that

$$\varphi(v, \bar{a}) \leftrightarrow (\bigwedge p_i(v) = 0 \wedge \bigwedge q_i(v) > 0).$$

If any  $p_i \neq 0$ , then  $b$  is algebraic over  $F$ , but then  $b \in F$  because  $F$  is real-closed. So we may assume  $\varphi(v, \bar{a}) \leftrightarrow \bigwedge q_i(v) > 0$ . Then because  $q_i(b) > 0$  and  $q_i$  has f.m. zeros, by intermediate property(3.2.10.9), we can find a nbhd of  $b$  that is interval with endpoints in  $F$  that  $q_i > 0$ , and because  $F$  is dense(char0), there is an element  $b'$  that  $F \models \varphi(b', \bar{a})$ .  $\square$

**Cor. (2.4.5.6).**  $RCF$  is complete and decidable. Thus it is just the theory of  $(\mathbb{R}, +, \cdot, <)$ , and it is decidable.  $\lrcorner$

*Proof:* It is model-complete by(2.4.3.9), and it has a minimal model that is the field  $\mathbb{R}_{alg}$  of algebraic numbers in  $\mathbb{R}$ , then it is complete by(2.4.3.10). It is decidable by(2.4.2.29).  $\square$

**Prop. (2.4.5.7)[RCF is o-Minimal].** The theory  $RCF$ (2.1.6.3) is o-minimal.  $\lrcorner$

*Proof:* Because  $RCF$  has quantifier elimination, every definable set of a real-closed field  $R$  is semialgebraic, thus it is clearly a disjoint union of intervals and points.  $\square$

### Semi-algebraic Sets

**Def. (2.4.5.8)[Semi-algebraic Sets].** Let  $F$  be an ordered field, then  $X \subset F^m$  is called **semi-algebraic** if there it is a Boolean combination of sets of the form  $\{\underline{X} \in F^m \mid p(\underline{X}) > 0\}$ , where  $p(\underline{X}) \in F[\underline{X}]$ .  $\lrcorner$

**Thm. (2.4.5.9) [Tarski-Seidenberg].** If  $F \in \mathbf{Field}$  is real-closed, the semi-algebraic sets are closed under projection.  $\lrcorner$

*Proof:* This is because quantifier elimination(2.4.5.5) implies semialgebraic sets are just definable sets, and the projection of a definable set is also definable.  $\square$

**Cor. (2.4.5.10).** The composite of two semialgebraic functions are semialgebraic.  $\lrcorner$

**Prop. (2.4.5.11) [Closure of Semialgebraic Sets].** Let  $F$  be a real-closed field and  $A \subset F^n$  be semialgebraic, then the closure of  $A$  in the Euclidean topology is also semialgebraic.  $\lrcorner$

*Proof:* The closure of  $A$  is defined by

$$\{\bar{x} \mid \forall \varepsilon > 0, \exists \bar{y} \in A, d(\bar{x}, \bar{y}) < \varepsilon\}.$$

Thus it is definable, and thus semialgebraic by quantifier elimination(2.4.5.5).  $\square$

**Prop. (2.4.5.12).** Let  $F$  be a real-closed field and  $X \subset F^n$  be closed and bounded,  $f$  be a continuous semialgebraic function, then  $f(X)$  is closed and bounded.  $\lrcorner$

*Proof:* If  $F$  is  $\mathbb{R}$ , then this follows from(4.4.5.2) that  $X$  is compact hence the image is also compact hence closed and bounded. As we can formulate a sentence asserting the conclusion. Thus the theorem follows as  $RCF$  is complete(2.4.5.6).  $\square$

**Lemma (2.4.5.13).** For  $R$  a real-closed field and  $f : R \rightarrow R$  semialgebraic, then for any interval  $U$  there is an element  $x$  that  $f$  is continuous at  $x$ .  $\lrcorner$

*Proof:* It suffices to prove for  $R = \mathbb{R}$  by completeness of  $RCF$ . If there is an interval that  $f$  has finite range, then the inverse image of some point  $b$  is infinite, but also definable, so by  $o$ -minimality contains an interval that  $f$  is constant, hence continuous.

Otherwise, we inductively choose a chain of intervals:  $V_0 = U$ , and the image of  $V_n$  is definable thus contains an interval of length at most  $1/n$ , by  $o$ -minimality and our assumption. Now for the same reason the inverse image of this interval contains an interval, called  $V_{n+1}$ , s.t.  $\overline{V_{n+1}} \subset V_n$ , then  $\cap V_n = \cap \overline{V_n} \neq \emptyset$  because  $\mathbb{R}$  is locally compact. For any  $x \in V$ , it is easy to see  $f$  is continuous at  $x$ .  $\square$

**Prop. (2.4.5.14).** For  $R$  a real-closed field and  $f : R \rightarrow R$  semialgebraic, then  $f$  is discontinuous only at f.m. points.  $\lrcorner$

*Proof:* The discontinuous points of  $f$  is definable by

$$D = \{x \mid F \models \exists \varepsilon > 0 \forall \delta > 0 \exists y \mid x - y \mid < \delta \wedge \mid f(x) - f(y) \mid > \varepsilon\},$$

thus it is a finite union of intervals and points, by  $o$ -minimality(2.4.5.7), but it must be f.m. points, by(2.4.5.13).  $\square$

**Def. (2.4.5.15).** We can naturally define the notion of **definably connected** and **definably arcwise connected** sets in  $R^n$ .  $\lrcorner$

**Def. (2.4.5.16) [Cells].** For an real-closed field  $F$ , we inductively define  $n$ -cells:

- $X \subset F^n$  is a 0-cell if it is a single point.
- If  $X \subset F^m$  is an  $n$ -cell and  $f : X \rightarrow F$  is a continuous definable function, then  $Y = \{(\bar{x}, f(\bar{x})) | \bar{x} \in X\}$  is an  $n$ -cell.
- If  $X \subset F^m$  is an  $n$ -cell and  $f, g$  are either continuous functions from  $X$  to  $F$  or constants  $\pm\infty$ , then  $Y = \{(\bar{x}, y) | \bar{x} \in X \wedge f(\bar{x}) < y < g(\bar{x})\}$  is an  $n + 1$ -cell.

⌋

**Prop. (2.4.5.17) [Uniform Bounding].** Let  $X \subset F^{m+1}$  be semialgebraic, then there is a natural number  $N$  that if  $\bar{a} \in F^n$  and  $X_{\bar{a}} = \{y | (\bar{a}, y) \in X\}$  is finite, then  $|X_{\bar{a}}| < N$ .

⌋

*Proof:* First notice  $X_{\bar{a}}$  is definable, thus by  $\mathcal{o}$ -minimality,  $\{\bar{a} | |X_{\bar{a}}| < \infty\}$  is definable, thus we may assume these are all of  $X$ .

Now let  $\Gamma$  be the theory

$$RCF + Diag(F) + \{\exists y_1, y_2, \dots, y_m [\bigwedge_{i < j} y_i \neq y_j \wedge \bigwedge y_i \in X_{\bar{c}}]\}$$

where  $m \in \mathbb{N}$ , and  $c_1, \dots, c_n$  are new constants. (Notice  $y_i \in X_{\bar{c}}$  is a sentence).

Then  $\Gamma$  is not satisfiable, because otherwise there is an embedding  $F \subset K$ , and by model completeness  $F \prec K$ , thus there is no  $\bar{a}$  that  $X_{\bar{a}}$  is infinite, because it is definable, contradiction.

Then by compactness theorem, there is some f.m. sentences of  $\Gamma$  that is unsatisfiable, thus the conclusion follows. □

**Prop. (2.4.5.18) [Cell Decomposition].** Let  $F$  be a real-closed field, then any semialgebraic set  $X \subset F^m$  is a finite disjoint union of cells. ⌋

*Proof:* Cf. [Marker, P103]. □

## 2.5 O-Minimal Structures

References are [O-Minimal Structures] and [Tame Topology and O-minimal Structures].

**Notation(2.5.0.1).**

- Use notations defined in [Model Theory](#).
- Fix a real-closed field  $R$ .
- Fix an o-minimal structure on  $R$ (2.5.0.2).

┘

**Def.(2.5.0.2) [O-Minimal Structures on Real Closed Fields].** A structure expanding the real-closed field  $R$  is a collection  $\mathcal{S} = (\mathcal{S}^n)$ , where  $\mathcal{S}^n$  is a family of subsets of  $R^n$ , that

- Algebraic subsets are in  $\mathcal{S}$ .
- Each  $\mathcal{S}^n$  is a Boolean subalgebra of the powerset of  $R^n$ .
- $\mathcal{S}$  is stable under Cartesian product and projection.

And  $\mathcal{S}^n$  are called the **definable subsets** of  $R^n$ . And this structure is called **o-minimal** if moreover each subset in  $\mathcal{S}^1$  is a finite unions of intervals and points.

┘

**Def.(2.5.0.3) [ $r$ -parameterizations].** Let  $X \subset R^n$  be an o-minimally definable set and  $r \in \mathbb{N}$ , then an  **$r$ -parametrization** of  $X$  is a set  $S$  of maps  $(0, 1)^{\dim X} \rightarrow X$  s.t.  $\cup_{\varphi \in S} \text{Im}(\varphi) = X$  and each  $\varphi$  is  $C^r$ -continuous, and  $\varphi^{(\alpha)}$  is strongly-bounded for any  $\alpha \in \mathbb{N}^{\dim X}$  with  $|\alpha| \leq r$ .

Moreover, if  $F : X \rightarrow R^m$  is a definable function and  $S$  is an  $r$ -parametrization of  $X$ , then  $S$  is called an  **$r$ -parametrization** of  $F$  if for  $F \circ S$  is an  $r$ -parametrization of  $F(X)$ .

┘

**Thm.(2.5.0.4) [Gromov Reparameterization theorem].** For any strongly-bounded o-minimally definable subset  $X \subset R^n$  and  $r \in \mathbb{N}$ , there exists an  $r$ -parametrization of  $X$ (2.5.0.3).

And if  $F$  is a strongly-bounded o-minimal definable function on  $X$ , then there exists an  $r$ -parametrization of  $F$ (2.5.0.3).

┘

*Proof:* Cf.[P-W06]P599?.

□

**Cor.(2.5.0.5).** Let  $n, m, r \in \mathbb{Z}_+$  and  $X \subset (0, 1)^n \times R^m$  be a definable family, then there exists  $N \in \mathbb{Z}_+$  and for each  $y \in R^m$  a set  $S_y$  of  $N$  definable functions mapping  $(0, 1)^{\dim X_y}$  to  $X_y$ , s.t.

- $\cup_{\varphi \in S_y} \text{Im}(\varphi) = X_y$ ,
- $|\varphi^{(\alpha)}(x)| \leq 1$  for each  $\varphi \in S_y, \alpha \in \mathbb{N}^{\dim X_y}$  with  $|\alpha| \leq r$  and  $x \in (0, 1)^{\dim X_y}$ .

┘

*Proof:* Cf.[P-W06]P609?.

□

### 1 Theory of Exponential Functions

References are [Zil05] and [Mar06].

**Def.(2.5.1.1) [Exponential Maps].** For  $R \in \mathcal{CRing}$ , an **exponential map** on  $R$  is defined to be a non-trivial group homomorphism  $\exp : R^+ \rightarrow R^\times$ . A ring/field with an exponential map is called an **exponential ring/field**.

┘

**Prop.(2.5.1.2).** An exponential field necessarily has characteristic 0.

┘

**Def. (2.5.1.3) [Exponential Polynomial Rings].** For any exponential ring  $(A, \exp)$  and indeterminants  $X_1, \dots, X_n$ , we can define the **exponential polynomial ring**  $A[X_1, \dots, X_n]_{\exp}$ , and it satisfies an obvious universal property. ? ┘

*Proof:* □

**Thm. (2.5.1.4) [van den Dries/Henson-Rubel].** The natural embedding  $\mathbb{C}[X_1, \dots, X_n]_{\exp} \rightarrow \mathcal{O}(\mathbb{C}^n)$  is injective. ┘

*Proof:* Cf. [Exponential Rings, Exponential Polynomials and Exponential Functions]. □

**Cor. (2.5.1.5).** If  $P \in \mathbb{C}[X, Y] \setminus (\mathbb{C}[X] \cup \mathbb{C}[Y])$  is irreducible, then  $f(z) = P(z, e^z)$  has infinitely many zeros in  $\mathbb{C}$ . ┘

*Proof:* If  $f(z)$  has only f.m. zeros, then by Hadamard's factorization,  $f(z) = e^{az}q(z)$  for some  $q(X) \in \mathbb{C}[X]$ . Then it follows from (2.5.1.4) that

$$P(z, e^z) = e^{az}q(z)$$

is a formal identity. Then  $a \in \mathbb{N}$  and  $P(X, Y) = Y^a q(X)$ , which contradicts the hypothesis. □

**Def. (2.5.1.6) [Exponential Algebraic Closures].** Let  $(L, \exp)$  be an exponential field, and  $A \subset L$ . Suppose  $K \subset L$  is the exponential subfield generated by  $A$ , then the **exponential algebraic closure**  $\text{expcl}(A)$  is defined to be the set of all  $a \in L$  s.t. there exists  $n \in \mathbb{Z}_+$ ,  $f_1, \dots, f_n \in K[X_1, \dots, X_n]_{\exp}$ , and  $(b_1, \dots, b_n) \in L^n$  s.t.

$$f_i(b_1, \dots, b_n) = 0, \forall i, \quad \text{Jac}\left(\frac{f_1, \dots, f_n}{b_1, \dots, b_n}\right) \neq 0, \quad b_1 = a.$$

┘

**Prop. (2.5.1.7).** If  $A \subset \mathbb{C}_{\exp}$  is a finite subset, then  $\text{expcl}(A)$  is countable. ┘

**Prop. (2.5.2.8).** Let  $S \subset \mathbb{R}^m$  be a non-empty definable set, then  $\dim \partial S \leq \dim S$ . In particular,  $\dim \bar{S} = \dim S$ . ┘

*Proof:* Cf.[Dri98]P67. ? □

## 2.6 Elementary Number Theory

### 1 Primes

**Def. (2.6.1.1) [Prime Numbers].**  $p \in \mathbb{Z}_+$  is called a (rational)**prime number** if for any  $d \in \mathbb{Z}_+$ ,  $d|p$  implies  $d = 1$  or  $d = p$ . The set of prime numbers is denoted by  $\mathbf{P}$ .  $\lrcorner$

**Lemma (2.6.1.2) [Infinitely Many Primes].**  $\#\mathbf{Prime} = \infty$ .  $\lrcorner$

*Proof:* Suppose  $\#\mathbf{Prime} < \infty$ , let  $N = \prod_{p \in \mathbf{Prime}} p$ . Then  $N+1$  has no prime factors, contradiction.  $\square$

**Prop. (2.6.1.3) [Multiplicative Groups of Remainders].** For  $p \in \mathbf{Prime}$  and  $n \in \mathbb{Z}_+$ , the  $p$ -adic logarithm map defines an isomorphism

$$(\mathbb{Z}/(p))^* \cong \begin{cases} \mathbb{Z}/(2) \times \mathbb{Z}/(2^{n-2}) & p = 2, n \geq 2 \\ \mathbb{Z}/(p^{n-1}(p-1)) & \text{otherwise} \end{cases}.$$

$\lrcorner$

*Proof:* This follows from (19.1.5.16). For the first case, notice that there is a split exact sequence

$$1 \rightarrow (1 + 4\mathbb{Z})/(1 + 2^n\mathbb{Z}) \rightarrow (\mathbb{Z}/(2^n))^* \rightarrow (\mathbb{Z}/(4))^* \rightarrow 1.$$

$\square$

**Def. (2.6.1.4) [Mersenne-Primes].** If  $p \in \mathbf{Prime}$  and  $M_p = 2^p - 1$  is also a prime, then  $M_p$  is called a **Mersenne prime**.  $\lrcorner$

**Def. (2.6.1.5) [Perfect Numbers].** A **perfect number** is a number  $n \in \mathbb{Z}_+$  s.t.

$$\sigma_1(n) = 2n \text{ (2.6.1.23).}$$

Moreover, an **abundant number** is a number  $n \in \mathbb{Z}_+$  s.t.  $\sigma(n) > 2n$ , and a **deficient number** is a number  $n \in \mathbb{Z}_+$  s.t.  $\sigma(n) < 2n$ .  $\lrcorner$

**Thm. (2.6.1.6) [Even Perfect Numbers, Euclid-Euler].**  $n \in \mathbb{Z}_+$  is an even perfect number iff there exists  $p \in \mathbf{Prime}$  s.t.  $n = 2^{p-1}(2^p - 1)$  and  $2^p - 1 \in \mathbf{Prime}$ .  $\lrcorner$

*Proof:* If  $p \in \mathbf{Prime}$  s.t.  $n = 2^{p-1}(2^p - 1)$  and  $2^p - 1 \in \mathbf{Prime}$ , then it is clear that  $n = 2^{p-1}(2^p - 1)$  is a perfect number. Conversely, suppose  $n = 2^k x$  is even and perfect, where  $2 \nmid x$ . Then

$$2^{k+1}x = \sigma(2^k x) = (2^{k+1} - 1)\sigma(x).$$

Denote  $y = x/(2^{k+1} - 1) \in \mathbb{Z}_+$ , then

$$2^{k+1}y = \sigma(x) \geq x + y = 2^{k+1}y.$$

Thus  $x$  has only two divisors:  $x$  and  $y$ . So  $y = 1$ , and  $x = 2^{k+1} - 1$  is a prime. This forces  $k+1$  to be a prime, and  $x$  being a Mersenne prime.  $\square$

**Conj. (2.6.1.7).** There are no odd perfect numbers.  $\lrcorner$

*Proof:*

□

**Thm& Conj.Cor.(2.6.1.8) [Dickson-Nielsen-Pollack].** For any  $k \in \mathbb{Z}_+$ ,

1. If  $n$  is an odd perfect number, then  $\nu(n) \geq 9$ .
2. If  $n$  is an odd perfect number with  $\nu(n) \leq k$ , then  $n < 2^{4^k}$ .
3. For  $X \in \mathbb{Z}_+$ , the number of odd perfect numbers  $n \leq X$  with  $\nu(n) \leq k$  is bounded by  $(\log x)^k$ .
4. The number of odd perfect numbers  $N$  with  $\nu(n) \leq k$  is bounded by  $4^{k^2}$ .

┘

*Proof:* 1: Cf.[Nielsen, Odd perfect numbers have at least nine distinct prime factors].

2: Cf.[Nielsen, An upper bound for odd perfect numbers].

3: Let  $N$  be an odd perfect number with  $9 \leq \nu(N) \leq k$ , let  $p_0$  be the minimal prime divisor of  $N$ , and  $p_0^{e_0} \parallel N$ . Denote  $B = p_0^{e_0}$  and  $N = BA$ . Then

$$B < \sigma(B) = \frac{2A}{\sigma A} B \leq 2B,$$

with equality on the right iff  $A = 1$ . Suppose  $A \neq 1$ , then  $\sigma(B) \nmid 2B$ . So there is a least  $p_1 \in \mathbf{P}$  s.t.  $p_1 \mid \sigma(B)$ ,  $p_1 \nmid 2B$ . So  $p_1 \mid A$ . Suppose  $p_1^{e_1} \parallel A$ , and let  $A' = A/p_1^{e_1}$ ,  $B' = Bp_1^{e_1}$ , then the same reasoning can apply to  $A'$  and  $B'$ . Finally, we get

$$A = p_1^{e_1} p_2^{e_2} \dots p_l^{e_l},$$

and  $8 \leq l = \nu(N) - 1 \leq k - 1$ . Notice

$$\frac{1}{2} = \frac{N}{\sigma(N)} \geq \prod_{p \mid N} \left(1 - \frac{1}{p}\right) \geq 1 - \sum_{p \mid N} \frac{1}{p} \geq 1 - \frac{k}{p_0},$$

so  $p_0 \leq 2k$ . Thus there are  $\leq k - 1$  possibilities of  $p_0$ . And there are  $\leq \log x / \log 3$  possibilities of  $e_0$ . Notice that if  $B$  is given, then  $A$  is totally determined by the sequence  $e_1, \dots, e_n$ . Thus there are at most

$$\frac{(k-1)(k-4)}{(\log 3)(\log 5)^{k-1}} (\log x)^k$$

possibilities of  $N = AB$ . This coefficient is decreasing for  $k \geq 9$ , and it is smaller than 1.

4 follows from item2 and item3.

□

**Thm& Conj.Cor.(2.6.1.9) [Euler].** If  $N$  is an odd perfect prime, then there exists  $p \in \mathbf{Prime}$  s.t.  $N = p^\gamma m^2$ , where  $p \equiv \gamma \equiv 1 \pmod{4}$ .

┘

*Proof:*

□

**Thm.(2.6.1.10) [Power Lifting].** If  $p \in \mathbf{P}$ ,  $a, b \in \mathbb{Z} \setminus (p)$ , and  $v_p(a - b) = k \geq 1$ , then  $v_p(a^{p^n} - b^{p^n}) = k + n$  for  $n \in \mathbb{Z}_+$ , except for  $p = 2$  and  $k = 1$ , in which case  $v_p(a^{p^n} - b^{p^n}) = k + n + 1$  for  $n \in \mathbb{Z}_+$ .

┘

*Proof:* Use induction on  $n$ : If  $a^{p^n} = b^{p^n} + p^{n+k}c$  for some  $c$  s.t.  $p \nmid c$ , then

$$a^{p^{n+1}} = b^{p^{n+1}} + p^{n+k+1}b^{p^n(p-1)}c \dots + p^{(n+k)p}c^p,$$

and the assertion follows.

□

**Prop. (2.6.1.11).** For  $n \geq 2$ , the multiplicative group of  $(\mathbb{Z}/(2^n))^* \cong \mathbb{Z}/(2) \times \mathbb{Z}/(2^{n-2})$ .  $\lrcorner$

*Proof:* it suffices to show  $3^{2^{n-3}} \not\equiv \pm 1 \pmod{2^n}$ , and  $3^{2^{n-2}} \equiv 1 \pmod{2^n}$ .  $\square$

**Prop. (2.6.1.12) [*b*-adic Decompositions and Irreducibility].** If  $b > 2$  and  $p$  is a prime, consider the  $b$ -adic expansion  $p = \sum a_n b^n$ , then the polynomial

$$\sum a_n X^n$$

is irreducible over  $\mathbb{Z}$ .  $\lrcorner$

*Proof:* If  $p(x) = h(x)r(x)$ , use the lemma?? to show that  $r(b)$  and  $h(b)$  cannot be 1, thus  $h(b)r(b) = p$  cannot happen.  $\square$

**Thm. (2.6.1.13) [Zsigmondy].** If  $a, n \in \mathbb{Z}_{\geq 2}$ , then there exists a prime divisor of  $a^n - 1$  not dividing  $a^j - 1$  for any  $0 < j < n$ , except in the following cases:

- $n = 2, a = 2^s - 1, s \geq 2$ .
- $n = 6, a = 2$ .

$\lrcorner$

*Proof:* By (3.3.2.8), it suffices to find a prime ideal of  $\Psi_n(a)$  not dividing  $n$ . If  $n = 2$ , then any prime divisor of  $a + 1$  not dividing  $a - 1$  suffices, as long as  $a$  is not of the form  $2^s - 1$ .

For  $n \geq 3$ , if all prime divisors of  $\Psi_n(a)$  divides  $n$ , we prove that  $\Psi_n(a) \in \mathbf{P}$ : Take  $p | \Psi_n(a)$ , and let  $k = \text{ord}(a, \mathbb{F}_p^\times) | (p - 1) < n$ , then  $p | \Psi_k(a)$ , and  $n/k = p^t$  for some  $t \in \mathbb{Z}_+$ . Then if  $p \neq 2$ , by power-lifting (2.6.1.10),

$$v_p(a^n - 1) = v_p(a^{n/p} - 1) + 1,$$

so  $v_p(\Psi_n(a)) = 1$ . And if  $p = 2$ , then clearly  $k = 1$ , and  $n \in 2^{\mathbb{Z}_+}$ , and  $\Psi_n(a) = a^{n/2} + 1 \equiv 2 \pmod{4}$  as  $n \neq 2$ , so it is still true that  $v_2(\Psi_n(a)) = 1$ .

And if  $\ell \in \mathbf{P} \setminus \{p\}$  is another prime dividing  $\Psi_n(a)$ , then  $n/p^t = k | (p - 1)$ ,  $n/\ell^{t'} = k' | \ell - 1$ , so  $p \leq \ell - 1 < \ell \leq p - 1$ , contradiction. So  $\Psi_n(a) = p$  is a prime.

Then suppose  $n = p^k r$  where  $(r, p) = 1$ , we prove that  $p > (b^{p-2}(b - 1))^{\varphi(r)}$  where  $b = a^{q^{k-1}}$ : By (3.3.2.5),

$$\Psi_n(a) = \Psi_r(b^p) / \Psi_r(b) \geq \left( \frac{b^p - 1}{b + 1} \right)^{\varphi(r)} \geq \left( \frac{b^{p-2}(b^2 - 1)}{b + 1} \right)^{\varphi(r)} = (b^{p-2}(b - 1))^{\varphi(r)}.$$

If  $p \geq 5$ , then we have  $b^{p-2} > p$ , so only possible cases are  $p = 2$  or  $3$ . The case  $p = 2$  is not possible, because then  $a = 2$ , and  $2 = \Psi_n(2) \equiv 1 \pmod{2}$ . So  $p = 3, a = 2, k = 1$  and  $r = 1$  or  $2$ . But  $\Psi_n(2) \neq 3$ , contradiction.  $\square$

## Integers

**Def. (2.6.1.14) [Numerical Polynomials].** A function  $f : \mathbb{Z} \rightarrow \mathbb{Z}$  is called a **numerical polynomial** if it there exists  $a_1, \dots, a_r \in \mathbb{Z}$  that

$$f(n) = \sum_{i=0}^r a_i \binom{n}{i}.$$

for  $n$  sufficiently large.  $\lrcorner$

**Prop. (2.6.1.15).** Suppose that  $f : \mathbb{Z} \rightarrow \mathbb{Z}$  is defined for  $n$  sufficiently large and  $g(n) = f(n) - f(n - 1)$  is a numerical polynomial, then  $f$  is a numerical polynomial.  $\lrcorner$

*Proof:* Suppose  $f(n) - f(n-1) = \sum_{i=0}^r a_i \binom{n}{i}$  for all  $n > 0$ . If we set  $g(n) = f(n) - \sum_{i=0}^r a_i \binom{n+1}{i+1}$ , then  $g(n) - g(n-1) = 0$  for  $n$  sufficiently large, so it is eventually constant, which is equal to  $a_{-1}$ . Then  $f(n) = \sum_{i=0}^r a_i \binom{n+1}{i+1} + a_{-1}$  is a numerical polynomial.  $\square$

**Cor. (2.6.1.16).** Any polynomial function with coefficients in  $\mathbb{Q}$  maps any integer sufficiently large into  $\mathbb{Z}$  iff it is a numerical function.  $\lrcorner$

**Prop. (2.6.1.17).** Let  $b, k \in \mathbb{Z}_+, n \in \mathbb{Z}$ , then  $v_p(n(n-b) \dots (n-(k-1)b)) \geq v_p(k!)$  for any  $p \nmid b$ .  $\lrcorner$

*Proof:* This is because  $v_p(n(n-b) \dots (n-kb)) \geq [k/p] + [k/p^2] + \dots \geq v_p(k!)$ .  $\square$

**Cor. (2.6.1.18).** Let  $m \in \mathbb{Z}_+$  and  $a \in \mathbb{Q}^*$  with denominator  $b$ , then for  $N$  large,  $b^N \binom{a}{m} \in \mathbb{Z}$ .  $\lrcorner$

### Useful Functions

**Def. (2.6.1.19) [Multiplicative and Additive Functions].** A function  $f : \mathbb{Z}_+ \rightarrow \mathbb{C}$  is called a **multiplicative function** if  $f(mn) = f(m)f(n)$  for any  $m, n \in \mathbb{Z}_+$  s.t.  $(m, n) = 1$ . And it is called an **additive function** if  $f(mn) = f(m) + f(n)$  for any  $m, n \in \mathbb{Z}_+$  s.t.  $(m, n) = 1$ .  $\lrcorner$

**Def. (2.6.1.20) [Greatest Common Divisors].** For  $S \subset \mathbb{Z}$ , the **greatest common divisor**  $\gcd(S) \in \mathbb{Z}_+ \cup \{\infty\}$  denote the supremum of integers  $m \in \mathbb{Z}_+$  s.t.  $m|s$  for each  $s \in S$ .

For  $S \subset \mathbb{Z}^\times$ , the **least common multiple**  $\text{lcm}(S) \in \mathbb{Z}_+ \cup \{\infty\}$  denote the supremum of integers  $m \in \mathbb{Z}_+$  s.t.  $s|m$  for each  $s \in S$ .  $\lrcorner$

**Prop. (2.6.1.21).** For  $n \in \mathbb{Z}_{\geq 7}$ ,

- For any  $1 \leq m \leq n$ ,  $m \binom{n}{m} \mid \text{lcm}(\{1, 2, \dots, n\})$ .
- $\text{lcm}(\{1, 2, \dots, n\}) \geq 2^n$ .

$\lrcorner$

*Proof:* 1: By (2.6.1.33), for any  $p \in \text{Prime}$ , if  $v_p(m) = k$ , then  $k + v_p(\binom{n}{m}) \leq v_p(\text{lcm}(\{1, 2, \dots, n\}))$ . Thus the assertion follows.

2: By item1,  $n \binom{2n}{n} \mid \text{lcm}(\{1, 2, \dots, 2n\})$ , and  $(2n+1) \binom{2n}{n} = (n+1) \binom{2n+1}{n+1} \mid \text{lcm}(\{1, 2, \dots, 2n+1\})$ . So

$$n(2n+1) \binom{2n}{n} \mid \text{lcm}(\{1, 2, \dots, 2n+1\}),$$

and  $\text{lcm}(\{1, 2, \dots, 2n+1\}) \geq n4^n$ . So for  $n \geq 2$ ,  $\text{lcm}(\{1, 2, \dots, 2n+1\})$ , and for  $n \geq 4$ ,  $\text{lcm}(\{1, 2, \dots, 2n+2\}) \geq \text{lcm}(\{1, 2, \dots, 2n+1\}) \geq 2^{2n+2}$ . The case  $n \in \{7, 8\}$  can be verified directly.  $\square$

**Def. (2.6.1.22) [Prime Factors and the Liouville-Function].** Define functions:

$$\Omega : \mathbb{Z}_+ \rightarrow \mathbb{Z}_+ : n \mapsto \sum_{p \in \text{Prime}} v_p(n), \quad \omega : \mathbb{Z}_+ \rightarrow \mathbb{Z}_+ : n \mapsto \#\{p \in \text{Prime} : p|n\}$$

and also  $\nu(n) = (-1)^{\Omega(n)}$ , called the **Liouville-function**.  $\lrcorner$

**Def. (2.6.1.23) [ $\sigma_s$ -Function].** For  $s \in \mathbb{R}$ , the function  $\sigma_s$  is defined to be

$$\sigma_s : \mathbb{Z}_+ \rightarrow \mathbb{R}_+ : n \mapsto \sum_{d \in \mathbb{Z}_+, d|n} d^s.$$

And also denote  $\sigma(n) = \sigma_1(n)$ .

And for  $s = 1$ , denote  $\tau(n) = \sigma_0(n)$ , called the  **$\tau$ -function**.  $\lrcorner$

**Def. (2.6.1.24) [Euler's  $\phi$ -Function].** The **Euler's  $\phi$ -function** is defined to be

$$\phi : \mathbb{Z}_+ \rightarrow \mathbb{Z}_+ : n \mapsto \#(\mathbb{Z}/(n))^* = n \prod_{p \in S(n)} \left(1 - \frac{1}{p}\right).$$

┘

*Proof:* For the explicit formula, use the fact  $\phi = \mu * n$  (2.6.2.10) is multiplicative and

$$\phi(p^k) = \mu(1)p^k + \mu(p)p^{k-1} = p^k(1 - p^{-1}).$$

for any  $p \in \text{Prime}$ ,  $k \in \mathbb{Z}_+$ . □

**Def. (2.6.1.25) [Möbius-Function].** The **Möbius-function** is defined to be the multiplicative function

$$\mu : \mathbb{Z}_+ \rightarrow \{0, 1, -1\} : n \mapsto \begin{cases} (-1)^k & n = \prod_{i=1}^k p_i, p_i \neq p_j \in \text{Prime} \\ 0 & \text{otherwise} \end{cases}.$$

┘

**Prop. (2.6.1.26) [Möbius Identities].** For  $n \in \mathbb{Z}_+$ ,

- If  $m \in \mathbb{Z}_+$  is prime to  $n$ , then  $\mu(mn) = \mu(m)\mu(n)$  (2.6.1.25).

•

$$\sum_{d|n} \mu(d) = \begin{cases} 1 & n = 1 \\ 0 & n > 1 \end{cases}.$$

- For  $p \in \text{Prime}$ ,

$$\sum_{d|n, p \nmid d} \mu(d) = \begin{cases} 1 & n \in p^{\mathbb{Z}_+} \\ 0 & \text{otherwise} \end{cases}.$$

┘

*Proof:* 1: This is clear.

2: By item1, it suffices to prove for  $d = p^k$  for some  $p \in \text{Prime}$ , then this is clear.

3: By item1, it suffices to prove for  $d = p^k$  for some  $p \in \text{Prime}$ , then this is clear. □

**Prop. (2.6.1.27) [Kronecker Symbol].** Define the **Kronecker symbol** as a function

$$\mathbb{Z} \times \mathbb{Z} \rightarrow \{0, -1, 1\} : (a, m) \mapsto \left(\frac{a}{m}\right)$$

satisfying the following:

- $\left(\frac{a}{m}\right)$  is totally multiplicative in  $a$  and in  $m$ .
- $\left(\frac{a}{1}\right) = 1$  for any  $a \in \mathbb{Z}$ .
- $\left(\frac{a}{0}\right) = \begin{cases} 1 & , a \in \{\pm 1\} \\ 0 & , \text{otherwise} \end{cases}.$
- $\left(\frac{a}{-1}\right) = \begin{cases} -1 & a < 0 \\ 1 & a \geq 0 \end{cases}.$

- $\left(\frac{a}{2}\right) = \begin{cases} 0 & a \in 2\mathbb{Z} \\ (-1)^{\frac{a^2-1}{8}} & a \notin 2\mathbb{Z} \end{cases}.$
- For  $p \in \text{Prime}_{\geq 3}$ ,  $\left(\frac{a}{p}\right) = \begin{cases} 0 & , a \in (p) \\ 1 & , a \notin (p), a^{\frac{p-1}{2}} \equiv 1 \pmod{p} \\ -1 & , a \notin (p), a^{\frac{p-1}{2}} \equiv -1 \pmod{p} \end{cases}.$

┘

**Cor. (2.6.1.28).** If  $m \in 2\mathbb{Z}_+ + 1$ , then

- $\left(\frac{-1}{m}\right) = (-1)^{\frac{m-1}{2}}.$
- $\left(\frac{2}{m}\right) = (-1)^{\frac{m^2-1}{8}}.$
- $\left(\frac{n}{m}\right) = (-1)^{(n-1)(m-1)/4} \left(\frac{m}{n}\right)$  for any  $n \in \mathbb{Z}.$
- If  $D \equiv 0, 1 \pmod{4}$  and  $n \in 2\mathbb{Z}_+ + 1$  s.t.  $n \equiv m \pmod{D}$ , then  $\left(\frac{D}{n}\right) = \left(\frac{D}{m}\right).$

┘

**Lemma (2.6.1.29).**  $\sum_{x=0}^{p-1} x^k \equiv \begin{cases} -1 \pmod{p} & , (p-1)|k \\ 0 \pmod{p} & , \text{otherwise} \end{cases}.$

┘

*Proof:* Choose a  $a$  that  $a^k - 1$  is not divisible by  $p$ , this is doable iff  $k$  is not divisible by  $p-1$ , then it is clear.  $\square$

**Def. (2.6.1.30) [Integral Part].** For any  $\alpha \in \mathbb{R}$ , let  $[\alpha]$  be the maximal integer  $n$  that  $n \leq \alpha$ , called the **integral part of  $\alpha$**  and  $\{\alpha\} = \alpha - [\alpha]$ , called the **fractional part of  $\alpha$** .

Also denote  $\llbracket \alpha \rrbracket = [\alpha + \frac{1}{2}]$  to be the integer nearest to  $\alpha$  and  $\{\{\alpha\}\} = |\alpha - \llbracket \alpha \rrbracket|$  to be the distance from  $\alpha$  to the nearest integer.  $\lrcorner$

**Def. (2.6.1.31) [von.Mangoldt Function].** The **von.Mangoldt function** is defined to be

$$\Lambda : \mathbb{Z}_+ \rightarrow \mathbb{R} : \Lambda(n) = \begin{cases} \log p & , p \in \text{Prime}, n \in p^{\mathbb{Z}_+} \\ 0 & , \text{otherwise} \end{cases}.$$

┘

**Def. (2.6.1.32) [Chebyshev Functions].** For  $X \in \mathbb{R}_+$ , define the **Chebyshev function of first kind**

$$\vartheta(X) \triangleq \sum_{p \in \text{Prime}, p \leq X} \log p$$

and the **Chebyshev function of second kind**

$$\psi(X) \triangleq \sum_{n \in \mathbb{Z}_+, n \leq X} \Lambda(n) \text{ (2.6.1.31)}.$$

Notice  $\psi(X) \geq \vartheta(X).$   $\lrcorner$

### Congruences of Binomial Coefficients

References are <http://www.cecm.sfu.ca/organics/papers/granville/paper/binomial/html/binomial.html>.

**Prop. (2.6.1.33) [ $p$ -Power in Factorials].** For  $n \in \mathbb{Z}_+$ ,  $v_p(n!) = \frac{n-c(n)}{p-1}$ , where  $c(n)$  is the sum of the presentation of  $n$  in the  $p$ -adic base. In particular,

$$\frac{n-p+1}{p} \leq v_p(n!) \leq \frac{n-1}{p-1}.$$

┘

**Cor. (2.6.1.34) [Kummer].**  $v_p(\binom{a+b}{a})$  equals the number of carries when adding  $a$  and  $b$  in base  $p$ . ┘

**Prop. (2.6.1.35) [Wilson].** For  $p \in \text{Prime}$ ,  $(p-1)! \equiv -1 \pmod{p}$ . ┘

*Proof:* Consider the two polynomials

$$g(X) = \prod_{k=1}^{p-1} (X-k), \quad h(X) = X^{p-1} - 1,$$

then

$$f(X) = g(X) - h(X)$$

are identically zero on  $\mathbb{F}_q$  but has degree  $\leq p-2$ , so it must be identically 0. Thus the assertion follows.  $\square$

**Cor. (2.6.1.36).** For any  $n \in \mathbb{Z}$ ,

$$\binom{np-1}{p-1} \equiv 1 \pmod{p}.$$

And

$$\binom{2p-1}{p-1} \equiv 1 \pmod{p^r}$$

where  $r = \min(3, p-1)$ . ┘

*Proof:*  $\square$

**Prop. (2.6.1.37) [Lucas].** For  $m, r \in \mathbb{Z}$  s.t.  $n = m + r$ , let  $n_i, m_i, r_i$  be their  $i$ -th term in base- $p$ , then if  $k = v_p(\binom{n}{m})$ , then

$$\frac{(-1)^k}{p^k} \binom{n}{m} \equiv \prod_k \frac{n_k!}{m_k! r_k!} \pmod{p}.$$

┘

*Proof:* Denote  $(n!)_p = \prod_{1 \leq m \leq n, p \nmid m} m$ , then by some argument, it suffices to prove that

$$(-1)^{\lfloor n/p \rfloor} (n!)_p \equiv n_0! \pmod{p}.$$

And this follows easily from Wilson's theorem (2.6.1.35).  $\square$

**Prop. (2.6.1.38) [Glaisher].** If  $p \in \text{Prime}$ ,  $1 \leq j, k \leq p-1$  and  $n \in \mathbb{Z}$  s.t.  $n \equiv k \pmod{p-1}$ , then

$$\sum_{1 \leq m \leq n, m \equiv j \pmod{p-1}} \binom{n}{m} \equiv \binom{k}{j} \pmod{p}.$$

┘

*Proof:* Notice if the  $i$ -th term of  $n, m$  in the base  $p$  are  $n_i, m_i$ , then  $p \nmid \binom{n}{m}$  iff  $m_i < n_i$  for each  $i$ . And then

$$\sum_{1 \leq m \leq n-1, m \equiv j \pmod{p-1}} \binom{n}{m} = \sum_{(m_0, \dots, m_d)} \binom{n_0}{m_0} \cdots \binom{n_d}{m_d}.$$

But the RHS equals the sum of coefficients of  $X^j, X^{j+(p-1)}, X^{j+2(p-1)}, \dots$  in  $(X+1)^{n_0}(X+1)^{n_1} \cdots (X+1)^{n_d} = (X+1)^{\sum n_i}$ , which is also equal to

$$\sum_{1 \leq m \leq \sum n_i, m \equiv j \pmod{p-1}} \binom{\sum n_i}{m}$$

And also  $n \equiv \sum n_i \pmod{p-1}$ , so we can use induction on  $n$ , and notice that the assertion is trivial for  $n \leq p-1$ . □

**Cor. (2.6.1.39) [Hermite].** If  $n \in \mathbb{Z}_+, p \in \text{Prime}$ , then

$$\sum_{1 \leq m \leq n-1, (p-1) \mid m} \binom{n}{m} \equiv 0 \pmod{p}$$

┘

**Prop. (2.6.1.40) [Carlitz].** If  $n \in \mathbb{Z}_+, p \in \text{Prime}, r \in \mathbb{Z}_+$  and  $p^{r-1} \mid n$ , then

$$p + (p-1) \sum_{1 \leq m \leq n-1, (p-1) \mid m} \binom{n}{m} \equiv 0 \pmod{p^r}.$$

┘

*Proof:* □

**Prop. (2.6.1.41) [Morley].** For  $p \in \text{Prime}_{\geq 5}$ ,

$$(-1)^{\frac{p-1}{2}} \binom{p-1}{(p-1)/2} \equiv 4^{p-1} \pmod{p^3}.$$

┘

*Proof:* □

## 2 $L$ -Series

**Def. (2.6.2.1) [ $L$ -Series].** For  $f : \mathbb{Z}_+ \rightarrow \mathbb{C}$ , the  $L$ -**function** of  $f$  is defined to be a formal sum

$$L(f; s) = \sum_{n \in \mathbb{Z}_+} \frac{f(n)}{n^s}.$$

In particular, for  $f, g, h : \mathbb{Z}_+ \rightarrow \mathbb{C}$ , the equation

$$L(h; s) = L(f; s)L(g; s)$$

just means

$$h(n) = \sum_{d|n, d \in \mathbb{Z}_+} f(d)g\left(\frac{n}{d}\right)$$

for any  $n \in \mathbb{Z}_+$ . In this case, we denote  $h = f * g$ , called the **Dirichlet convolution** of  $f$  and  $g$ .  $\lrcorner$

**Def. (2.6.2.2) [Riemann's Zeta Function].** The **Riemann's zeta function** is defined to be the formal sum

$$\zeta(s) = L(\mathbf{1}; s) = \sum_{n \in \mathbb{Z}_+} \frac{1}{n^s} \text{ (2.6.2.1)} = \prod_{p \in \text{Prime}} \left(1 + \frac{1}{p^s} + \frac{1}{p^{2s}} + \dots\right).$$

$\lrcorner$

**Prop. (2.6.2.3).**

$$\zeta^{-1}(s) = \sum_{n \in \mathbb{Z}_+} \frac{\mu(n)}{n^s}.$$

i.e.  $\zeta * \mu = \delta$ .  $\lrcorner$

**Cor. (2.6.2.4) [Möbius-Inversion].** For any  $f, g : \mathbb{Z}_+ \rightarrow \mathbb{C}$ , the following are equivalent:

$$g(n) = \sum_{d|n} f(d), \forall n \in \mathbb{Z}_+.$$

$$f(n) = \sum_{d|n} \mu(d)g\left(\frac{n}{d}\right), \forall n \in \mathbb{Z}_+.$$

$\lrcorner$

*Proof:* The first equation is equivalent to  $L(g; s) = \zeta(s)L(f; s)$ , while the second equation is equivalent to  $L(f; s) = \zeta^{-1}(s)L(g; s)$ .  $\square$

**Cor. (2.6.2.5) [Another Möbius-inversion].** For any finite sequence  $(a_n)_{n \in \mathbb{Z}_+}, (b_m)_{m \in \mathbb{Z}_+}$  supported on square-free numbers, the following two statements are equivalent:

$$b_d = \mu(d) \sum_{d|m} a_m, \forall d \in \mathbb{Z}_+.$$

$$a_d = \mu(d) \sum_{d|m} b_m, \forall d \in \mathbb{Z}_+.$$

$\lrcorner$

*Proof:* Direct calculation.  $\square$

**Prop. (2.6.2.6).** Because  $\log : \mathbb{Z}_+ \rightarrow \mathbb{R}$  is totally additive, we have

$$\log \cdot (f * g) = (\log \cdot f) * g + f * (\log \cdot g)$$

for any  $f, g : \mathbb{Z}_+ \rightarrow \mathbb{C}$ . ┘

**Prop. (2.6.2.7).** Because  $\text{id} : \mathbb{Z}_+ \rightarrow \mathbb{R}$  is totally multiplicative, we have

$$\frac{f(n)}{n} * \frac{g(n)}{n} = \frac{(f * g)(n)}{n}.$$

for any  $f, g : \mathbb{Z}_+ \rightarrow \mathbb{C}$ . ┘

### L-Series of Elementary Functions

**Prop. (2.6.2.8).** For  $r \in \mathbb{R}$ ,

$$\zeta(s)\zeta(s-r) = \sum_{n \in \mathbb{Z}_+} \sigma_r(n)n^{-s}.$$

In particular,  $\zeta^2(s) = \sum_{n \in \mathbb{Z}_+} \sigma_0(n)n^{-s}$ . ┘

**Prop. (2.6.2.9) [Rankin-Selberg  $\zeta$ -Series].** For  $\alpha, \beta \in \mathbb{R}_+$ ,

$$\zeta(s)\zeta(s-\alpha)\zeta(s-\beta)\zeta(s-\alpha-\beta)\zeta^{-1}(2s-\alpha-\beta) = \sum_{n \in \mathbb{Z}_+} \sigma_\alpha(n)\sigma_\beta(n)n^{-s}.$$

In particular,

$$\zeta^4(s)\zeta^{-1}(2s) = \sum_{n \in \mathbb{Z}_+} \sigma_0(n)^2 n^{-s} = \prod_{p \in \text{Prime}} \left(1 + \frac{4}{p^s} + \frac{9}{p^{2s}} + \dots\right).$$

Dividing by  $\zeta(s)$ , we get

$$\zeta^3(s)\zeta^{-1}(2s) = \sum_{n \in \mathbb{Z}_+} \sigma_0(n^2)n^{-s} = \prod_{p \in \text{Prime}} \left(1 + \frac{3}{p^s} + \frac{5}{p^{2s}} + \dots\right).$$

Multiplying by  $\zeta(2s)$ , we get

$$\zeta^3(s) = \sum_{n \in \mathbb{Z}_+} \left( \sum_{n/m \in (\mathbb{Z}_+)^2} \sigma_0(m^2) \right) n^{-s}.$$

Dividing by  $\zeta(s)$  again, we get

$$\zeta^2(s)\zeta^{-2}(2s) = \sum_{n \in \mathbb{Z}_+} 2^{\omega(n)} n^{-s} \text{ (2.6.1.22)} = \prod_{p \in \text{Prime}} \left(1 + \frac{2}{p^s} + \frac{2}{p^{2s}} + \dots\right).$$

Dividing by  $\zeta(s)$  again we get

$$\zeta(s)\zeta^{-1}(2s) = \sum_{n \in \mathbb{Z}_+} |\mu(n)| n^{-s} = \prod_{p \in \text{Prime}} \left(1 + \frac{1}{p^s}\right).$$

Taking inverse, we get

$$\zeta^{-1}(s)\zeta(2s) = \sum_{n \in \mathbb{Z}_+} (-1)^{\Omega(n)} n^{-s}.$$

┘

**Prop. (2.6.2.10)** [Euler's  $\phi$ -Function].

$$\frac{\zeta(s-1)}{\zeta(s)} = \sum_{n \in \mathbb{Z}_+} \phi(n) = \prod_{p \in \text{Prime}} \left( 1 + \frac{p-1}{p^s} + \frac{p(p-1)}{p^{2s}} + \frac{p^2(p-1)}{p^{3s}} + \dots \right).$$

In other words,  $\phi = \mu * \text{id}$ . ┘

*Proof:* This follows from the fact  $n = \mathbf{1} * \phi$  and Möbius inversion (2.6.2.4). □

**Prop. (2.6.2.11).** For  $s \in \mathbb{C}$  s.t.  $\text{Re}(s) > 1$ , we have

$$-\zeta'(s) = \sum_{n \in \mathbb{Z}_+} \frac{\log n}{n^s}.$$

$$-\frac{\zeta'(s)}{\zeta(s)} = \sum_{n \in \mathbb{Z}_+} \Lambda(n) n^{-s} \text{ (2.6.1.31)}.$$

Equivalently,  $\Lambda = \mu * \log$ , and  $\log = \mathbf{1} * \Lambda$ , by (2.6.2.9) and (2.6.2.4). ┘

*Proof:* Both sides are analytic for  $\text{Re}(s)$  large, and when  $s$  is large,

$$-\frac{\zeta'(s)}{\zeta(s)} = -\text{dlog } \zeta(s) = \sum_{p \in \text{Prime}} \text{dlog}(1 - p^{-s}) = \sum_{n \in \mathbb{Z}_+} \Lambda(n) n^{-s}.$$

□

**Cor. (2.6.2.12).**

$$\Lambda - \mathbf{1} = \mu * (L - \sigma_0).$$

┘

**Def. (2.6.2.13)** [Generalized  $\mu$ -Functions and  $\Lambda$ -Functions]. For  $f : \mathbb{Z}_+ \rightarrow \mathbb{C}$ , define  $\mu_f, \Lambda_f : \mathbb{Z}_+ \rightarrow \mathbb{C}$  to be

$$L(f; s)^{-1} = \sum_{n \in \mathbb{Z}_+} \mu_f(n) n^{-s}, \quad -\frac{L'(f; s)}{L(f; s)} = \sum_{n \in \mathbb{Z}_+} \Lambda_f(n) n^{-s}.$$

Notice that when  $f$  is completely multiplicative, then

$$\mu_f = \mu f, \quad \Lambda_f = \Lambda f.$$

┘

### 3 Maximal Orders

**Thm. (2.6.3.1)** [Maximal Order for  $\tau(n)$ ]. For  $n \in \mathbb{Z}_+$ ,

$$\overline{\lim}_n \frac{\log \tau(n)}{\log 2 \cdot \log n / \log_{(2)} n} = 1.$$

In particular, there exists  $c \in \mathbb{R}_+$  s.t.

$$\tau(n) \leq n^{\frac{c}{\log_{(2)} n}}.$$

┘

*Proof:* Cf.[Ten15]P113.?

□

**Cor. (2.6.3.2)**[Maximal Order for  $\omega(n)$ ]. For  $n \in \mathbb{Z}_+$ ,

$$\overline{\lim}_n \frac{\omega(n)}{\log n / \log_{(2)} n} = 1, \quad \overline{\lim}_n \frac{\Omega(n)}{\log n / \log 2} = 1$$

┘

*Proof:* The first equation follows from the inequality  $2^{\omega(n)} \leq \sigma_0(n)$  and (2.6.3.2) (with the same example approaching the suplim).

The second equation follows trivially from the inequality  $2^{\Omega(n)} \leq n$ .

□

**Thm. (2.6.3.3)**[Maximal and Minimum Order for  $\phi(n)$ ]. For  $n \in \mathbb{Z}_+$ ,

$$\overline{\lim}_n \frac{\phi(n)}{n} = 1.$$

$$\lim_n \frac{\phi(n)}{e^{-\gamma_0} n / \log_{(2)} n} = 1.$$

┘

*Proof:* Cf.[Ten15]P115.?

□

## 4 Continued Fractions

**Def. (2.6.4.1)**[Continued Fractions]. A **finite continued fraction**  $[a_1, \dots, a_n]$  is an abbreviation of

$$\frac{1}{a_1 + \frac{1}{a_2 + \dots \frac{1}{a_n}}}, \quad a_i \in \mathbb{Z}_+.$$

A **continued fraction**  $[a_1, a_2, \dots]$  is an abbreviation of

$$\frac{1}{a_1 + \frac{1}{a_2 + \dots}}, \quad a_i \in \mathbb{Z}_+.$$

┘

**Def. (2.6.4.2)**[Gauss Transformation]. The **Gauss transformation** is the function  $\varphi : \mathbb{R} \rightarrow [0, 1]$  :

$$\varphi(x) = \begin{cases} 1/x - [1/x] & x \neq 0 \\ 0 & x = 0 \end{cases}.$$

┘

**Prop. (2.6.4.3)**. For any sequence of positive numbers  $\{a_1, \dots, a_n, \dots\}$ ,  $[a_1, \dots, a_n]$  converges. In particular,  $\lim_{n \rightarrow \infty} [\varphi(x), \varphi^2(x), \dots, \varphi^n(x)] = \{x\}$  for  $x \in \mathbb{R}$ .

┘

*Proof:* We may assume the sequence is infinite. Then we notice for any  $a \in \mathbb{Z}_+$  and  $t$  varying in an interval in  $(0, 1]$  of length  $l$ , the value of  $\frac{1}{a+t}$  is in an interval of length  $l/a(a+l) \leq l/(l+1)$ . So clearly the length of possible values of  $[a_1, \dots, a_n, t]$  for  $t$  in an interval of length  $l$  is in an interval of length  $l_n$  that  $\lim_{n \rightarrow \infty} l_n = 0$ .

Then we conclude  $[a_1, \dots, a_n]$  is a Cauchy sequence for  $n$ , thus it converges.

□

**Prop. (2.6.4.4).**  $x \in \mathbb{R}$  is a rational number iff  $\varphi^m(x) = 0$  for some  $m > 0$ . ┘

*Proof:* If  $x$  is rational then this is Euclid division. If  $\varphi^m(x) = 0$ , then notice  $x = [x] + [\varphi(x), \varphi^2(x), \dots, \varphi^{m-1}(x)]$  is rational. □

**Prop. (2.6.4.5).**  $x \in \mathbb{R}$  has eventually periodic continued fractions  $[\varphi(x), \varphi^2(x), \dots, \varphi^n(x), \dots]$  iff  $[\mathbb{Q}(x) : \mathbb{Q}] \leq 2$ . ┘

*Proof:* If the fraction is finite, then  $\mathbb{Q}(x) = \mathbb{Q}$ , by (2.6.4.4). If the fraction has periodic part  $[a_1, \dots, a_n]$ , let  $t = [a_1, \dots, a_n, a_1, \dots, a_n, \dots]$ , then

$$\frac{at + b}{ct + d} = t$$

for some  $a, b, c, d \in \mathbb{Z}$ , so  $[\mathbb{Q}[t] : \mathbb{Q}] = 2$ , and hence  $[\mathbb{Q}(x) : \mathbb{Q}] = 2$ .

For the converse, ? . □

## 2.7 Complexity Theory

References are [Computational Complexity, Papadimitriou], and [Logics for Mathematicians, Hamilton].

### 1 Problems and Algorithms

**Def. (2.7.1.1) [Decision Problems].** For  $I \in \text{Set}$ , a **decision problem** on  $I$  is a subset  $X \subset I$ . The elements of  $X$  are called its **instances**. The goal is to determine the set  $X$ .  $\perp$

**Def. (2.7.1.2) [Optimization Problems].** For  $I \in \text{Set}$ , a **optimization problem** is a subset  $X \subset I$  and a cost function  $f : I \rightarrow \mathbb{R}$ . The goal is to seek the maximum of  $f$  on  $X$ .  $\perp$

**Remark (2.7.1.3) [Cobham-Edmonds Thesis].** computational problems can be feasibly computed on some computational device only if they can be computed in polynomial time.  $\perp$

### Examples of Problems

**Example (2.7.1.4) [Graph Reachability].** The input is a directed graph  $G = (V, E)$  and two nodes  $s, t \in V$ . The problem is to find if  $s$  is connected to  $t$ , and also find the shortest path from  $s$  to  $t$ .

This problem can be solved by maintaining a set  $S \subset V$ , where  $S = \{s\}$  at first, and at each step, choose a vertex  $i$  in  $S$  that stayed the longest time, delete it, and add all vertices  $j$  s.t.  $(i, j) \in E$ . Proceed until  $t \in S$ , or  $S$  becomes empty. In the first case,  $s$  is connected to  $t$ , and we find a shortest path to  $t$ . While in the second case,  $s$  is disconnected to  $t$ .

Then this problem is in  $\text{TIME}(O(n^2))$ .  $\perp$

**Example (2.7.1.5) [Maximum Flow Problems].** The input is a directed graph  $G = (V, E)$  with a source  $s \in V$  with no incoming edges and a sink  $t \in V$  with no out-coming edges, and each edge is labeled with a positive integer.

A **flow** in  $G$  from  $s$  to  $t$ , which means an assignment of non-negative integers  $f(e)$  to each edge  $e$  s.t. for each vertex  $v$  except  $s$  and  $t$ , the sum of values of edges with source  $v$  equals the sum of values of edges with target  $v$ .

Then the problem is to find a flow with maximum sum of values at  $s$ .

This problem can be solved by at first finding a flow by finding the shortest path from  $s$  to  $t$ , then at each step, we draw the difference graph, and try to find a shortest path from  $s$  to  $t$ . This is called a augmentation flow.

If the edge on a path with the lest capacity is called a **bottleneck**, then it can be proved that there are at most  $\#V^2$  iterations:

**Lemma (2.7.1.6).**

- The distance from  $s$  to any vertex doesn't decrease from one augmentation graph to the next graph.
- If an edge  $e = (i, j)$  is a bottleneck in one augmentation, then the distance of  $i$  from  $s$  must increase by at least 2 before  $-e$  becomes a bottleneck again.

$\perp$

*Proof:* 1: If the distance from  $s$  to some vertex decreases. Let  $v$  be a vertex s.t. the distance after augmentation is the shortest from  $s$ . Let  $s \rightarrow \dots \rightarrow i \rightarrow \dots \rightarrow v$  be a shortest path, then  $(v, i)$  must be in

the shortest flow. Then the distance from  $s$  to  $i$  must also decreased, and that distance is smaller than the distance to  $v$ , contradiction.

2: This follows from 1, because the shortest path from  $s$  to  $j$  cannot decrease, the new path includes  $-e = (j, i)$  instead of going to  $i$  directly, means that the distance from  $s$  to  $i$  must increased by at least 2.  $\square$

Then by (2.7.1.4), the problem is in  $\text{TIME}(O(n^4))$ .  $\lrcorner$

**Example (2.7.1.7) [Bipartite Matching].** The input is a bipartite graph  $G = (U, V, E)$  where  $\#U = \#V = n$  and  $E \subset U \times V$ , the problem is to determine whether there is a matching between  $U$  and  $V$  via  $E$ .

By adding two points  $s, t$  with  $s$  pointing to each vertex in  $U$  and each vertex in  $V$  pointing to  $t$ , we can reduce the problem to finding a flow from  $s$  to  $t$  of capacity  $n$ . Thus this decision problem is in  $\text{TIME}(O(n^4))$ , by (2.7.1.5).  $\lrcorner$

**Example (2.7.1.8) [Salesman Problem].** The salesman problem is clearly in NP.  $\lrcorner$

## 2 Turing Machines

*“It is possible to invent a single machine which can be used to compute any computable sequence.”*  
—A. Turing

**Def. (2.7.2.1) [Turing Machines].** A **Turing machine** is a tuple

$$M = (K, \Sigma, \Delta, s, \Pi, \triangleright, h, y, n, \leftarrow, \rightarrow, -),$$

where

- $h, y, n, \leftarrow, \rightarrow, -$  are disjoint singletons, called the **halting state**, **accepting state**, **rejecting state**, **left curser**, **right curser**, **stay curser** resp.
- $K$  is a finite set disjoint from  $\{h, y, n, \leftarrow, \rightarrow, -\}$ . elements of  $K \cup \{h, y, n\}$  are called **states**.
- $s \in K$  is a state, called the **initial state**.
- $\Sigma$  is a finite set disjoint from  $K \cup \{h, y, n, \leftarrow, \rightarrow, -\}$ , called the **alphabet of  $M$** , and elements of  $\Sigma$  are called **symbols**.
- $\Pi, \triangleright \in \Sigma$  are two symbols, called the **blank symbol** and **first symbol** resp..
- $\Delta \subset K \times \Sigma \times (K \cup \{h, y, n\}) \times \Sigma \times \{\leftarrow, \rightarrow, -\}$ , called the **transition relation of  $M$** .  $\delta$  must satisfy: for any states  $p, q$ , symbol  $\sigma$  and  $m \in \{\leftarrow, \rightarrow, -\}$  s.t.  $(p, \triangleright, q, \sigma, m) \in \Delta$ , we have  $\sigma = \triangleright$  and  $m = \rightarrow$ .

For normalization, we may assume that

$$\Sigma = \{1, 2, \dots, \#\Sigma\}, \quad K = \{\#\Sigma + 1, \dots, \#\Sigma + \#K\},$$

$$s = \#\Sigma + 1, \quad (h, y, n, \leftarrow, \rightarrow, -) = (\#\Sigma + \#K + 1, \dots, \#\Sigma + \#K + 6).$$

where each integer is encoded by a binary string.

$M$  is called a **deterministic Turing machine** if  $\Delta$  is a function  $\Delta : K \times \Sigma \rightarrow (K \cup \{h, y, n\}) \times \Sigma \times \{\leftarrow, \rightarrow, -\}$ , and it is called a **non-deterministic Turing machine** otherwise.

Similarly, we can define **multi-string Turing machines**.  $\lrcorner$

**Prop.(2.7.2.2) [Computing with a non-deterministic Turing Machine].** Given a non-deterministic Turing machine and a finite string  $x \in \text{String}(\Sigma \setminus \Pi)$  called the **input of the Turing machine**, a **computation procedure** is the following:

- Write  $\triangleright$  on the left of  $x$ .
- Put a cursor on  $\triangleright$ .
- set  $\text{STATE} = s$ .
- For  $i \in \mathbb{Z}_+$ , in the  $i$ -th step, if  $\text{STATE} = p \in K$  and the cursor is pointing on  $\rho$ , choose  $(q, \sigma, m) \in (K \cup \{h, y, n\}) \times \Sigma \times \{\leftarrow, \rightarrow, -\}$  s.t.  $(p, \rho, q, \sigma, m) \in \Delta$ , then replace the symbol pointed by the cursor by  $\sigma$ , replace  $\text{STATE} = q$ , and move the cursor according to  $m$ .
- If  $\text{STATE} \in \{h, y, n\}$ , stop.

Notice the cursor will never fall left to the leftmost  $\triangleright$  we wrote. But it may go to the right of  $x$ , in which case we assume it reads  $\Pi$ . So the string may become longer.

The **output of the Turing machine**  $M(x)$  is defined to be

- ‘yes’ if the machine stops with  $\text{STATE} = y$ , in which case we say this machine **accepts the input** in this procedure,
- ‘no’ if the machine stops with  $\text{STATE} = n$ , in which case we say this machine **rejects the input** in this procedure,
- the longest string following the leftmost  $\triangleright$  and ending with a symbol in  $\Sigma \setminus \Pi$ , if the machine stops with  $\text{STATE} = h$ . In which case we say this machine **halted at the input** in this procedure.
- ‘ $\nearrow$ ’ if the machine never stops in this procedure.

┘

**Def.(2.7.2.4) [Las-Vegas Turing Machines].**

┘

### Languages and Computation

**Def.(2.7.2.5) [Languages].** Given a set of symbols  $\Sigma$  (containing  $\Pi$ ), A **language on  $\Sigma$**  is a set of strings of symbols  $\mathcal{L} \subset \text{String}(\Sigma \setminus \Pi)$ .

┘

**Def.(2.7.2.6) [Recursive languages].** Given a set of symbols  $\Sigma$  containing  $\Pi$  and a language on  $\Sigma$ , a deterministic Turing machine  $M$  with alphabet  $\Sigma$  is said to **decide the language  $\mathcal{L}$**  if for any  $x \in \text{String}(\Sigma \setminus \Pi)$ ,  $M(x) = y$  if  $x \in \mathcal{L}$  and  $M(x) = n$  if  $x \notin \mathcal{L}$ .

$\mathcal{L}$  is called a **recursive**(or **computable/decidable**) language if it is decided by some deterministic Turing machine on  $\Sigma$ .

┘

**Def.(2.7.2.7) [Recursively Enumerable languages].** Given a set of symbols  $\Sigma$  containing  $\Pi$  and a language on  $\Sigma$ , a deterministic Turing machine  $M$  with alphabet  $\Sigma$  is said to **accept the language  $\mathcal{L}$**  if for any  $x \in \text{String}(\Sigma \setminus \Pi)$ ,  $M(x) = y$  if  $x \in \mathcal{L}$  and  $M(x) = \nearrow$  if  $x \notin \mathcal{L}$ .

$\mathcal{L}$  is called a **recursively enumerable**(or **computably enumerable/semidecidable/partially decidable/provable/Turing-recognizable**) language if it is accepted by some deterministic Turing machine on  $\Sigma$ .

The class of recursively enumerable languages is denoted by  $RE$ , and the class of complements of enumerable languages is denoted by  $\text{co-}RE$ .

┘

**Cor. (2.7.2.8).** A recursive language is recursively denumerable.  $\lrcorner$

**Def. (2.7.2.9) [Recursive Functions].** Given a set of symbols  $\Sigma$  containing  $\Pi$  and a function  $f : \text{String}(\Sigma \setminus \Pi) \rightarrow \text{String}(\Sigma)$ , a deterministic Turing machine  $M$  with alphabet  $\Sigma$  is said to **compute**  $f$  if for any  $x \in \text{String}(\Sigma \setminus \Pi)$ ,  $M(x) = f(x)$ .

$f$  is called a **recursively function** language if it is decided by some deterministic Turing machine on  $\Sigma$ .  $\lrcorner$

**Def. (2.7.2.10) [Non-deterministic Computations].** Given a set of symbols  $\Sigma$  containing  $\Pi$  and a language on  $\Sigma$ , a non-deterministic Turing machine  $M$  with alphabet  $\Sigma$  is said to **decide the language**  $\mathcal{L}$  if for any  $x \in \text{String}(\Sigma \setminus \Pi)$ ,  $M(x) = y$  iff  $x \in \mathcal{L}$ .  $\lrcorner$

### 3 Computability

**Remark (2.7.3.1) [Church-Turing Thesis].** Church proposed the assertion that every set of  $n$ -tuples of positive integers that is intuitively recursive is in fact Turing recursive.

“intuitively recursive” is not a mathematical statement, so this assertion has no mathematical proof or disproof. It is empirically right, and usually believed to be right.

The guiding role of this thesis played to mathematics should be compared to the role law of conservation of energy played to physics. Namely, once the Turing undecidability of a set has been proved, one need not spend one’s time seeking a universal method for recognizing the elements of that set.  $\lrcorner$

**Def. (2.7.3.2) [Universal Turing Machine].** There is a **universal Turing machine**  $U$  that with the input of a pair  $(M, x)$  where  $M$  is a Turing machine (2.7.2.1) and  $x$  is a input for  $M$ , the output of  $U$  is  $U(M, x) = M(x)$ .  $\lrcorner$

*Proof:* Cf. [Computational Complexity, P57].  $\square$

### 4 P and NP

*“We all know P is different than NP. We just don’t know how to prove it.”*

*–J. Hartmanis*

#### Complexity Classes

**Def. (2.7.4.1) [Complexity Classes].** Given a multi-string Turing machine model, a mode of computation, and a bound  $f : \mathbb{N} \rightarrow \mathbb{N}$  on the resources, a **complexity class** is defined as the set of all languages (2.7.2.5) decided by some multi-string Turing machine  $M$  operating in this mode s.t. for any input  $x$ , each computation procedure of  $M$  expends at most  $f(|x|)$  units of the specified resource. For example,

- $\text{TIME}(f)$ : decided by a deterministic Turing machine in  $f$  times.
- $\text{SPACE}(f)$ : decided by a deterministic Turing machine in  $f$  spaces.
- $\text{P} = \bigcup_{j \in \mathbb{Z}_+} \text{TIME}(n^j)$ : decided by a deterministic Turing machine in polynomial times.
- $\text{PSPACE} = \bigcup_{j \in \mathbb{Z}_+} \text{SPACE}(n^j)$ : decided by a deterministic Turing machine in polynomial spaces.
- $\text{EXP} = \bigcup_{j \in \mathbb{Z}_+} \text{TIME}(2^{n^j})$ : decided by a deterministic Turing machine in exponential times.

- $L = \text{SPACE}(\log n)$ : decided by a deterministic Turing machine in  $\log$  spaces.
- $\text{NTIME}(f)$ : decided by a non-deterministic Turing machine in  $f$  times.
- $\text{NP} = \bigcup_{j \in \mathbb{Z}_+} \text{NTIME}(n^j)$ : decided by a non-deterministic Turing machine in polynomial time.
- $\text{co-NP}$ : The complement is in  $\text{NP}$ .
- $\text{NSPACE}(f)$ : decided by a non-deterministic Turing machine in  $f$  spaces.
- $\text{NPSPACE} = \bigcup_{j \in \mathbb{Z}_+} \text{NSPACE}(n^j)$ : decided by a non-deterministic Turing machine in polynomial spaces.
- $\text{NL} = \text{NSPACE}(\log n)$ : decided by a non-deterministic Turing machine in  $\log$  spaces.
- $\text{BP}(f)$ : decided by a two-sided Monte-Carlo Turing machine in  $f$  times.
- $\text{BPP} = \bigcup_{j \in \mathbb{Z}_+} \text{BP}(n^j)$ : decided by a two-sided Monte-Carlo Turing machine in polynomial times.
- $\text{R}(f)$ : decided by a one-sided Monte-Carlo Turing machine in  $f$  times.
- $\text{RP} = \bigcup_{j \in \mathbb{Z}_+} \text{R}(n^j)$ : decided by a one-sided Monte-Carlo Turing machine in polynomial times.
- $\text{co-RP}$ : The complements is in  $\text{RP}$ .
- $\text{ZPP} = \text{RP} \cap \text{co-RP}$ : decided by a Las-Vegas Turing machine in polynomial expected time.

┘

**Def. (2.7.4.2) [Proper Complexity Functions].** Cf.[Computational Complexity]P140.

┘

**Def. (2.7.4.3) [Hard and Complete Problems].** For a computational complexity class  $\mathcal{C}$ , a decision problem  $X \subset I$  is called  **$\mathcal{C}$ -hard** if every problem in  $\mathcal{C}$  can be reduced to it. And it is called  **$\mathcal{C}$ -complete** if it is  $\mathcal{C}$ -hard and it is in  $\mathcal{C}$ .

┘

**Prop. (2.7.4.4).** Suppose a (deterministic or nondeterministic) Turing machine  $M$  decides a language  $\mathcal{L}$  within time/space  $f(n)$ , where  $f$  is a proper complexity function(2.7.4.2), then there is a precise Turing machine  $M'$ , which decides the same language in time/space  $O(f(n))$ .

┘

*Proof:* Cf.[Computational Complexity]P141.

□

**Prop. (2.7.4.5) [Multi-String and Quadratic Time].** Given a multi-string deterministic Turing machine  $N$  and a language  $\mathcal{L}$  decided by  $N$  in time  $f(n)$ , there is a single-string deterministic Turing machine  $M$  that determines  $\mathcal{L}$  in time  $O(f(n)^2)$ .

┘

*Proof:* Cf.[Computational Complexity]P30.

□

**Prop. (2.7.4.6) [Non-Deterministic Machines and Exponential Time].** Given a non-deterministic Turing machine  $N$ , there exists  $C = C(N) \in \mathbb{R}_{>1}$  s.t. if a language  $\mathcal{L}$  is decided by  $N$  in time  $f(n)$ , then it is decided by a 3-string deterministic Turing machine  $M$  in time  $O(C^{f(n)})$ . In particular,

$$\text{NTIME}(f(n)) \subset \bigcup_{C \in \mathbb{R}_{>1}} \text{TIME}(C^{f(n)}).$$

┘

*Proof:* Cf.[Computational Complexity]P47.

□

**Prop. (2.7.4.7).**  $\text{RP} \subset \text{NP} \subset \text{PSPACE}$ .

┘

*Proof:* □

**Prop. (2.7.4.8).**  $P \subset BPP$ . ┘

*Proof:* □

**Conj. (2.7.4.9).** What is the relation between  $BPP$  and  $NP$ ? ┘

*Proof:* □

**Conj. (2.7.4.10)**[Cook's Hypothesis].  $P \neq NP$ . ┘

*Proof:* □

## 2.11 Linux

### Notation(2.11.0.1).

- Assume we are using the newest version of MacOS.

└

### 1 Terminal

**Def.(2.11.1.1).** • pwd(print work directory): Show current directory.

- ls(list): List names of all files in the current directory.
- cd: Change directory.
  - cd +“folder\_name”: Going to the folder in the current directory.
  - cd .. : Going to the parent folder.

└

### 2 Git

#### Basic Syntaxes

**Def.(2.11.2.1)[Systems].** • Git version: Show current git version.

- Git config: configuration.
  - Git config –global user.name + “user\_name”: change user name of current operations.
  - Git config –global user.email + “user\_email”: change user email of current operations.

└

**Def.(2.11.2.2)[Start a Working Area].**

- Git clone: Clone a repository into a new directory.
- Git init: Create an empty Git repository or reinitialize an existing one.

└

**Def.(2.11.2.3)[Work on the Current Change].**

- Git add + “file\_name”: Add file contents to the index. Git add .: add all file in the current directory to the index.
- Git mv: Move or rename a file, a directory, or a symlink.
- Git restore: Restore working tree files.
- Git rm: Remove files from the working tree and from the index.

└

**Def.(2.11.2.4)[Examine the History and State].**

- Git bisect: Use binary search to find the commit that introduced a bug.
- Git diff +“commit\_id”: Show changes between commits, commit and working tree, etc.
- Git grep: Print lines matching a pattern.
- Git log: Show commit logs.

- Git show: Show various types of objects.
- Git status: Show the working tree status.

└

**Def. (2.11.2.5)[Grow, Mark and Tweak Your Common History].**

- Git branch: List, create, or delete branches.
  - Git branch -a: List all branches.
  - Git branch + “**branch\_name**”: Create a branch with the given name and current changes, while stay on the current branch.
  - Git branch -M + “**branch\_name**”: Create a branch with the given name and current changes, and make it the main branch.
- Git checkout+ “**branch\_name**”: Change to the given branch.
- Git commit: Record changes to the repository. Each commit with have a unique commit id, and marked with date and author’s name and email.
  - Git commit -m “comments”: commit and add a comment to this commit.
- Git merge + “**branch\_name**”: Join this branch to the current branch(when these two branches are the same).
- Git rebase: Reapply commits on top of another base tip.
- Git reset + “**commit\_id**”: Reset current HEAD to the specified state.
- Git switch: Switch branches.
- Git tag: Create, list, delete or verify a tag object signed with GPG.

└

**Def. (2.11.2.6)[Collaborate].**

- Git fetch: Download objects and refs from another repository.
- Git pull: Update remote refs along with associated objects.
- Git push -u + “**branch\_name**”: upload branches.

└

## 2.12 C++

*“There are only two kinds of languages: the ones people complain about and the ones nobody uses.”*  
*–B. Stroustrup*

References are [C++ Primer].

### 1 Data Structures

**Def. (2.12.1.1) [Data].** What is a datum.

A **data structure** is a logical grouping of data and operations on that data. ┘

### 2 Computer System Basics

**Def. (2.12.2.1) [Buffer].** A **buffer** in a computer is a region of storage used to hold data. IO facilities often store input (or output) in a buffer and read or write the buffer independently from actions in the program. Output buffers can be explicitly flushed to force the buffer to be written. By default, reading `tt cin` flushes `tt cout`; `tt cout` is also flushed when the program ends normally. ┘

**Def. (2.12.2.2) [Console Windows].** ┘

**Def. (2.12.2.3) [Operands].** ┘

**Def. (2.12.2.4) [IO Devices].** ┘

### 3 Basic Notions

**Fact (2.12.3.1) [C++ Language].** C++ is a high-level, general-purpose programming language created by Danish computer scientist Bjarne Stroustrup.

Like other programming languages, C++ provides a common set of features, for examples

- Build-in types as integers types, characters, etc. (2.12.4.1),
- Variables (2.12.4.2), which let us give names to the objects we use.
- Expressions and statements (2.12.6.1) to manipulate values of these types.
- Control structures, such as `if` or `while`, that allow us to conditionally or repeatedly execute a set of actions.
- Functions (2.12.7.1) that let us define callable units of computation.

And it distinguishes from other programming languages in the feature of

- Classes (2.12.8.1), which let programmers define their own types that include operations as well as data, which are as easy to use as the built-in types. ┘

**Fact (2.12.3.2) [Philosophy of C++].** Throughout C++’s life, its development and evolution has been guided by a set of principles:

1. It must be driven by actual problems and its features should be immediately useful in real world programs.
2. Every feature should be implementable (with a reasonably obvious way to do so).
3. Programmers should be free to pick their own programming style, and that style should be fully supported by C++.

4. Allowing a useful feature is more important than preventing every possible misuse of C++.
5. It should provide facilities for organising programs into separate, well-defined parts, and provide facilities for combining separately developed parts.
6. No implicit violations of the type system (but allow explicit violations; that is, those explicitly requested by the programmer).
7. User-created types need to have the same support and performance as built-in types.
8. Unused features should not negatively impact created executables (e.g. in lower performance).
9. There should be no language beneath C++ (except assembly language).
10. C++ should work alongside other existing programming languages, rather than fostering its own separate and incompatible programming environment.
11. If the programmer's intent is unknown, allow the programmer to specify it by providing manual control.

┘

**Def. (2.12.3.3) [C++ Programs].** A **C++ program** is a combination of codes that can be used to solve real world problems. It is usually stored in computer files, referred to as the **source files**. ┘

**Fact (2.12.3.4) [How to Compile a C++ Program].** How to compile a program depends on the ongoing operating system and compiler. Many PC-based compilers are run from an integrated development environment (IDE) that bundles the compiler with build and analysis tools. ?

On a command-line interface, a program is usually compiled in a console window (2.12.2.2).

```
| 1 $ CC prog1.cc
```

where tt \$ is the system prompt. ┘

**Def. (2.12.3.5) [Headers].** A **header** in the C++ language is a mechanism whereby the definitions of a class or other names are made available to multiple programs. A program uses a header through a tt `#include` directive, cf. (2.12.9.1)(2.12.8.1). ┘

**Def. (2.12.3.6) [Comments].** A **comment** in a C++ program is a fragment of codes that helps whoever reads this code but ignored by the compiler. There are two kinds of comments: single-lined and multi-lined: comments start with a “//” symbol and ends with a newline:

```
| 1 // any comments you want to write.
```

and everything to the right of the slashes on the current line is ignored by the compiler, so it can contain anything but a newline.

Another kind of comments are multi-lined, which starts with a “/\*” symbol and ends with a “\*/” symbol:

```
| 1 /* any comments
| 2
| 3 that you want to write.
| 4 */
```

and everything that falls between the “/\*” and “\*/” is ignored by the compiler, so it can contain anything but a “\*/” symbol.

In particular, two fragment of comments cannot intersect each other. ┘

## 4 Variables and Types

**Def. (2.12.4.1) [Data Types].** A **type of a datum**(2.12.1.1) is an indication of the contents of this datum and also the operations that can be applied to this datum. Types are fundamental to any program: They tell us what our data mean and what operations we can perform on those data. ┘

**Def. (2.12.4.2) [Variables].** A **variable** in the C++ language is an object with name and types. A variable is defined by the following statement:

```
|1 variable_type variable_name;
```

When defining a variable, we can **initialize** it at the same time, which means giving it a value at the same time that it is created. For example,

```
|1 int v1=0;
```

┘

## 5 Operators

**Def. (2.12.5.1) [Operators].** An **operator** is a C++ language specifies an action and return an object. There are some common operators:

- The **dot operator** “tt .”, which can be used to access a member function(2.12.8.1)(on the right-hand side) of an variable(2.12.4.2) of class type(2.12.8.1)(on the left-hand side), and return this member function. For example:

```
|1 variable_name.member_function
```

- The **call operator** “tt (”, “tt )”, which can be used to call a function(2.12.7.1)(on the left-hand side), and return this function. For example,

```
|1 main()
```

or

```
|1 variable_name.member_function()
```

A pair of parenthesis operator can enclose a (possibly empty) list of arguments(2.12.7.1) used to call this function.

- The scope operator “tt ::” is used to access names(on the right-hand side) in a namespace(on the left-hand side), and returns this name. For example,

```
|1 std::cout
```

┘

## 6 Statements

**Def. (2.12.6.1) [Statements].** A statement in a C++ program(2.12.3.3) that specifies an action to take place when the program is executed. Statements can contain other statements within themselves. ┘

## 7 Functions

**Def. (2.12.7.1) [Functions].** Every C++ program contains some **functions**, which is a unit of computation that can be called by the parenthesis operator(2.12.5.1) to be used, and generate a single output from several inputs. It consists of

- A **return type**, which is the type of the value returned by a function(2.12.4.1).
- A **function name**, which is the name by which a function is known, and the function can be called using the name.
- A **parameter list**, which is a list that specifies what **arguments**(i.e. values passed to this function) can be used to call the function.
- A **function body**, which is a sequence of zero or more statements(2.12.6.1) enclosed in curly braces, that defines the actions performed by a function.

Every function is displayed as follows:

```
1 return_type function_name(parameter_list){
2     function_body
3 }
```

where the function body consists of a block of statements(2.12.6.1), each marked with a symbol “;”. The block is delimited by a pair of curly braces “{” and “}”. And the last statement must be a **return statement**, which determines the function, and also can be used to return a value to the function’s caller. If it returns a value, the value must be compatible with the return type of this function. ┘

**Def. (2.12.7.2)[Main Function].** A **main function** in a C++ program(2.12.3.3) is a function(2.12.7.1) called by the operating system to execute this program. Each program must have one and only one function named main. The main function must have integer return type. The empty main function which return a value 0 to the system:

```
1 int main(){
2     return 0;
3 }
```

The returning value 0 is usually an indication of a successes of running this function, and the returning value -1 is by default treated as a failure indicator. ┘

## 8 Classes

**Def. (2.12.8.1)[Classes].** A **class** in the C++ language is a facility for defining our own data structures together with associated operations, called its **member functions**. How these data are stored or computed is a question?.

A **class type** is a data type(2.12.4.1) defined by a class(2.12.8.1). A class determines all the operations that can be used on objects of this class type.

A class can be called by the directive `tt #include`:

```
1 #include "class_header";
```

Notice that we use the double quote “” symbols when the class is not defined by the standard library, cf.(2.12.9.1). ┘

## Copy Control

## Overloaded Operations and Conversions

## Object-Oriented Programming

## Templates and Generic Programming

## 9 Standard Library

**Def. (2.12.9.1)[Standard Library].** The **standard library** is a collection of types and functions that every C++ compiler must support. It has several sub-libraries, for example,

- The IO library.

Each library has a header(2.12.3.5), and they can be called by the directive `tt #include`:

```
|1 #include <library_header>;
```

Notice this statement must be written in a single line, and outside any functions(2.12.7.1). Usually, these statements are placed at the begging of the program.

Each type defined in the standard library is called a **library type**. ┘

**Def. (2.12.9.2) [Namespaces].** A **namespace** is a mechanism for putting names defined by a library(2.12.9.1) into a single place. Namespaces help avoid inadvertent name clashes. Namespaces allow us to avoid inadvertent collisions between the names we define and uses of those same names inside a library. The names defined by the standard library are in the namespace `tt std`. ┘

## Input and Output

**Def. (2.12.9.3)[Streams].** A **stream** in C++ language is a sequence of characters read from or written to an IO device(2.12.2.4). ┘

**Fact (2.12.9.4)[Iostream Library].** The **iostream** is a header that provides the library types(2.12.9.1) for stream-oriented(2.12.9.3) input and output. It contains two types, the **istream** providing stream-oriented input, and the **ostream** providing stream-oriented output. ┘

**Def. (2.12.9.5) [Standard Input/Output].** A **standard input/output** is an input/output stream(2.12.9.3) usually associated with the window in which the program executes.

A **standard error** is an output stream used for error reporting and warning. Ordinarily, the standard output and the standard error are tied to the window in which the program is executed. ┘

**Fact (2.12.9.6)[Some IO-Type Objects].**

- `tt cin` is an object of type `istream` used to read from the standard input.
- `tt cout` is an object of type `ostream` used to write to the standard output.
- `tt cerr` is an object of type `ostream` tied to the standard error, which often writes to the same device as the standard output. By default, writes to `tt cerr` are not buffered(2.12.2.1). Usually used for error messages or other output that is not part of the normal logic of the program.
- `tt clog` is an object of type `ostream` tied to the standard error. By default, writes to `clog` are buffered(2.12.2.1). `tt clog` is usually used to report information about program execution to a log file.
- A **manipulator** is an object, such as `tt std::endl`, that when read or written “manipulates” the stream itself.

┘

**Def. (2.12.9.7) [Some IO Operators].**

- The **output operator** “<<” writes the right-hand side operand to the output stream indicated by the left-hand operand, and returns the left-hand side. For example, `cout << "hi"` writes `tt hi` to the standard output(2.12.9.5). standard output.
- The **input operator** reads from the input stream specified by the left-hand side operand to the right-hand operand, and returns the left-hand side. For example, `cin >> i` reads the next value on the standard input(2.12.9.5) into `i`.

┘

### Sequential Containers

### Generic Algorithms

### Associative Containers

### Dynamical Memory

### Specialized Library Facilities

## 10 Tools for Large Programs

## 11 Specialized Tools and Techniques

## 2.13 Python

### Notation(2.13.0.1).

- Use basic logics and syntax as in C++.

┘

### 1 Basic Syntax

**Def.(2.13.1.1)[Comments].** Use # to comment out all texts on the right of the same line.

┘

**Remark(2.13.1.2)[Indentation].** In Python, indentation is important, as there are no “;” needed to mark the end of a enviroment.

┘

**Def.(2.13.1.3)[Strings].** Use 'any string' or ''any string'' to define strings.

Use

```
| 1  '''
| 2  any
| 3  string
| 4  '''
```

to define string in multiple lines.

┘

**Def.(2.13.1.4)[Print Function].** The print function prints out strings on the screen. It by default ends with \n to generate a new line. For example

```
| 1  print('Hello World')
```

prints out Hello World on the screen, and generate a new line.

To avoid generating a new line, we can use

```
| 1  print('Hello World', end='')
```

to end with nothing, or

```
| 1  print('Hello World', end=' ')
```

to end with a blank space.

You can also print several strings together, for example,

```
| 1  length = 5
| 2  breadth = 2
| 3  print('Area is', 2 * ( length + breadth ))
```

prints out “Area is 14” in your screen. Notice that you don’t need to manually add a blanket after the string “Area is”.

┘

**Def.(2.13.1.5)[Input Function].** The input function takes user’s input as return, e.g.:

```
| 1  something = input("Enter text: ")
```

will print out “Enter test:” to your screen. And when you enter some string and press “return”, the input function will assign your entered string as value of “something”.

┘

**Def.(2.13.1.6)[Open Functions].** The open function can be used to edit files, e.g.

```
| 1  open('poem.txt', 'w')
```

opens the file “poem.txt” in the writing mode.(if this file doesn’t exist, then it creates a file). And

```
| 1  open('poem.txt', 'r')
```

opens the file “poem.txt” in the reading mode. ┘

**Def.(2.13.1.7)[Control-Flows].** The control-flows of Python is similar to C++. For example,

- If syntax:

```

1 number = 23
2 guess = int(input('Enter an integer : '))\ref{inpvlusidnifenis}
3 if guess == number:
4     print('Congratulations, you guessed it.')
5     print('(but you do not win any prizes!)')
6 elif guess < number:
7     print('No, it is a little higher than that')
8     print('No, it is a little lower than that')
```

(2.13.1.5).

- While syntax:

```

1 number = 23
2 running = True
3 while running:
4     guess = int(input('Enter an integer : '))
5     if guess == number:
6         print('Congratulations, you guessed it.')
7         running = False
8     elif guess < number:
9         print('No, it is a little higher than that.')
10    else:
11        print('No, it is a little lower than that.')
12 else:
13     print('The while loop is over.')
14 print('Done')
```

- For syntax: which is similar to foreach syntax in C++:

```

1 for i in range(1, 5):
2     print(i)
3 else:
4     print('The for loop is over')
```

- Break syntax: get out of the control-flow loop immediately.

```

1 while True:
2     s = input('Enter something : ')
3     if s == 'quit':
4         break
5     print('Length of the string is', len(s))
6     print('Done')
```

- Continue syntax: Jump to the start of the next control-flow loop immediately.

```

1 while True:
2     s = input('Enter something : ')
3     if s == 'quit':
4         break
5     if len(s) < 3:
6         print('Too small')
7     continue
8     print('Input is of sufficient length')
```

But notice there are no “switch” syntax. ┘

## Functions

**Def.(2.13.1.8)[Defining Functions].** Functions can be defined using the syntax “def” following the name of this function and a pair of bracket embracing the parameters of this function, e.g.:

```
1 def say_hello():
2     print('hello world')

1 def print_max(a, b):
2     if a > b:
3         print(a, 'is maximum')
4     elif a == b:
5         print(a, 'is equal to', b)
6     else:
7         print(b, 'is maximum')
```

You can also define default parameter values. But notice parameters with default values must be put after those without default values, e.g.:

```
1 def say(message, times=1):
2     print(message * times)
3 say('Hello')
4 say('World', 5)
```

will print out

```
Hello
WorldWorldWorldWorldWorld
to your screen.
```

└

**Remark(2.13.1.9)[Local Parameters].** When defining a function, your operation to variables will not influence any variable with the same name outside this function definition process. For example:

```
1 x = 50
2 def func(x):
3     print('x is', x)
4     x=2
5     print('Changed local x to', x)
6 func(x)
7     print('x is still', x)
```

will print out

```
x is 50
Changed local x to 2
x is still 50
```

to your screen. If you want to operate on the variable globally, you need to use the syntax `global`,

e.g.:

```
1 x = 50
2 y=10
3 def func():
4     global x, y
5     print('x is', x)
6     x=2
7 func()
8     print(x)
```

will print “2” to your screen.

└

**Def.(2.13.1.10)[Using Functions].** When using functions, we need to provide parameter values, unless it has default setting(2.13.1.8). When providing parameters, we can either provide directly according to their position(called position arguments), or provide by calling their names(called keyword arguments), e.g.:

```

1 def func(a, b=5, c=10):
2     print('a is', a, 'and b is', b, 'and c is', c)
3 func(3, 7)
4 func(25, c=24)
5 func(c=50, a=100)

```

┘

**Def. (2.13.1.11)[Return Syntax].** In defining a function, the `return` syntax stops the function. Every function has an implicit `return None` line in the end, unless you write your own return code. You can also return a value to the function, making this function a string, e.g.

```

1 def maximum(x, y):
2     if x > y:
3         return x
4     elif x == y:
5         return 'The numbers are equal'
6     else:
7         return y
8 print(maximum(2, 3))

```

will print out 3 to your screen.

┘

**Def. (2.13.1.12)[Variable Parameters].** You can define functions with a variable number of parameters, e.g.:

```

1 def total(a=5, *numbers, **phonebook):
2     print('a', a)
3     for single_item in numbers:
4         print('single_item', single_item)
5     for first_part, second_part in phonebook.items():
6         print(first_part, second_part)
7 print(total(10, 1, 2, 3, Jack=1123, John=2231, Inge=1560))

```

will print out

```

a 10
single_item 1
single_item 2
single_item 3
Inge 1560
John 2231
Jack 1123
None

```

to you screen. Where `*param` makes all the position arguments(2.13.1.10) from now on together as a tuple, and `**param` makes all the keyword arguments(2.13.1.10) from now on together as a dictionary?.

┘

**Def. (2.13.1.13)[Documentation Strings].** You can use a function to get a document: e.g.

```

1 def print_max(x, y):
2     x = int(x)
3     y = int(y)
4     if x > y:
5         print(x, 'is maximum')
6     else:
7         print(y, 'is maximum')
8 print_max(3, 5)
9 print(print_max.__doc__)

```

will print out  
 5 is maximum  
 to your screen.

### Modules and Packages

**Def. (2.13.1.14) [Python Modules].** Every Python code file with extension name “.py” is a Python module. e.g. we can create a new file named “mymodule.py” with codes:

```
|1 def say_hi():
|2     print('Hi, this is mymodule speaking.')
|3     __version__ = '0.1'
```

where the “\_\_” makes the function private.

**Def. (2.13.1.15) [Import Modules].** You can import modules using `import` syntax, e.g. with the module defined in (2.13.1.14), we can write in another file:

```
|1 import mymodule
|2
|3 mymodule.say_hi()
|4 print('Version', mymodule.__version__)
```

Or you can import functions directly, e.g.:

```
|1 from math import sqrt
|2 print("Square root of 16 is", sqrt(16))
```

**Def. (2.13.1.16) [dir Functions].** The `dir()` function(directory) can return the name list defined by the parameter object. If the parameter is empty, then it returns the name list of current module. e.g. if you run the file

```
|1 import sys
```

and input “`dir()`”, then it will print out

```
['PS1', 'REPLHooks', '__annotations__', '__builtins__', '__doc__', '__loader__', '__name__',
to your screen.
```

**Def. (2.13.1.17) [Python Packages].** A **Python package** is a folder containing Python modules (2.13.1.14) and a special file named “`__init__.py`”.

### Data Structures

**Def. (2.13.1.18) [Data Structures in Python].** There are 4 default data structures in Python:

- **List:** List is a mutable data structure used to store a set of ordered items. Use brackets to define a list, e.g.

```
|1 shoplist = ['apple', 'mango', 'carrot', 'banana']
```

define a list named “shoplist” with 4 items.

For a list, there are several operations to it, for example, for the shoplist defined above, we can do the following operation:

```
—
|1 a = shoplist[0]
```

which is “apple”,

```

—
|1  shoplist.append('rice')
    which add an item “rice” to the shoplist.

```

```

—
|1  shoplist.sort()
    sorts the items in shoplist in alphabet order.
—

```

- Tuple: A tuple is a immutable data structure used to store items together. Use parenthesis to define a tuple, e.g.:

```

|1  zoo = ('python', 'elephant', 'penguin')
|2  singleton = (2, )

```

define a tuple named “zoo” with 3 items and a tuple named “singleton” with a single item.

- Dictionary: A dictionary is a way to assign values to keywords, e.g.

```

|1  ab = {
|2      'Swaroop': 'swaroop@swaroopch.com',
|3      'Larry': 'larry@wall.org',
|4      'Matsumoto': 'matz@ruby-lang.org',
|5      'Spammer': 'spammer@hotmail.com'
|6  }
|7  for name, address in ab.items():
|8  print('Contact {} at {}'.format(name, address))

```

will print out

Contact Swaroop at swaroop@swaroopch.com

Contact Matsumoto at matz@ruby-lang.org

Contact Larry at larry@wall.org

to your screen. And

```

|1  ab['Guido'] = 'guido@python.org'

```

will add a pair

'Guido': 'guido@python.org'

to the dictionary.

- Set:

└

**Def. (2.13.1.19) [Format Function].** The format function can construct character strings from other informations, e.g.:

```

|1  age = 20
|2  name = 'Swaroop'
|3
|4  print('{0} was {1} years old when he wrote this book'.format(name, age))
|5  print('Why is {0} playing with that python?'.format(name))

```

will print out

Swaroop was 20 years old when he wrote this book

Why is Swaroop playing with that python?

to your screen.

└

## 2 Python Standard Library

References are <https://docs.python.org/3/library/>.

**Def. (2.13.2.1) [Python Packages].** Python has many open-sourced libraries and packages, you can find them in <https://pypi.org> and download them via the package installer `pip`! (Cf. <https://pip.pypa.io/en/latest/>) in the terminal. ┘

**Def. (2.13.2.2) [How to Ask Questions].** Cf. <http://catb.org/~esr/faqs/smart-questions.html>. ┘

### 3.1 Group Theory

*“La théorie des groupes est, pour ainsi dire, la mathématique entière, dépouillée de sa matière et réduite à une forme pure.”*

–H. Poincaré

Main References are [Finite Groups, Issac], [Lan02] and [代数学引论, 丁石孙].

**Notation(3.1.0.1).**

- Let  $G \in \mathcal{G}rp$ .
- Use notations on sets defined in [Set Theory](#).

┘

#### 1 Magmas

*“Il est peu de notions en mathématiques qui soient plus primitives que celle de loi de composition.”*

–N. Bourbaki

**Def.(3.1.1.1)[Binary Operators].** A **binary operator** on a set  $X$  is a map  $\circ : X \times X \rightarrow X$ . ┘

**Def.(3.1.1.2)[Unital Operator].** A **unital binary operator** on a set  $X$  is a map  $\circ : X \times X \rightarrow X$  that has a left and right identity element  $1_\circ$ . ┘

**Prop.(3.1.1.3)[Associative Operators].** An **associative operator** on a set  $X$  is an operator  $\circ : X \times X \rightarrow X$  s.t.  $(x \circ y) \circ z = x \circ (y \circ z)$  for any  $x, y, z \in X$ . ┘

**Def.(3.1.1.4)[Magma].** A **magma** is a set  $X \in \mathcal{S}et$  with a binary operator  $\circ : X \times X \rightarrow X$ . A **unital magma** is a magma that the operator is unital. It is called **Abelian** if  $x \circ y = y \circ x$  for any  $x, y \in X$ . ┘

**Prop.(3.1.1.5)[Eckmann-Hilton argument].** If  $\circ$  and  $\otimes$  are two unital binary operators on a set that commute with each other:  $(a \otimes b) \circ (c \otimes d) = (a \circ c) \otimes (b \circ d)$ , then they are equal and in fact commutative and associative. ┘

*Proof:* Firstly the units coincide, because

$$1_\circ = 1_\circ \circ 1_\circ = (1_\otimes \otimes 1_\circ) \circ (1_\circ \otimes 1_\otimes) = (1_\otimes \circ 1_\circ) \otimes (1_\circ \circ 1_\otimes) = 1_\otimes \otimes 1_\otimes = 1_\otimes.$$

Next

$$a \circ b = (1 \otimes a) \circ (b \otimes 1) = (1 \circ b) \otimes (a \circ 1) = b \otimes a = (b \circ 1) \otimes (1 \circ a) = (b \otimes 1) \circ (1 \otimes a) = b \circ a.$$

Thus  $\circ$  and  $\otimes$  coincide and are commutative. Finally for associativity:

$$(a \otimes b) \otimes c = (a \otimes b) \otimes (1 \otimes c) = (a \otimes 1) \otimes (b \otimes c) = a \otimes (b \otimes c).$$

□

**Def. (3.1.1.6) [Monoid].** A **monoid** is an associative unital magma  $(X, \circ)$  (3.1.1.3)(3.1.1.2)(3.1.1.4). The category of monoids are denoted by  $\mathcal{Mon}$ . ┘

## 2 Groups

**Def. (3.1.2.1) [Groups, Cayley1854].** ?, The category of Groups is denoted by  $\mathsf{Grp}$ . ┘

**Def. (3.1.2.2) [Generators].** Let  $G \in \mathsf{Grp}$  and  $S \subset G$ , then  $S$  is said to be a **set of generator** for  $G$  if the only subgroup of  $G$  containing  $S$  is  $G$ . ┘

**Def. (3.1.2.3) [Normal Subgroups].** A **normal subgroup** of a group  $G$  is a subgroup  $N$  that if  $x \in G$ , then  $x^{-1}Nx = N$ . ┘

**Def. (3.1.2.4) [Simple Groups].** A **simple group** is a group that has no normal subgroups. ┘

**Def. (3.1.2.5) [Finitely Generated Group].** A group  $G$  is called finitely generated if there is a finite subset  $S$  that the only subgroup containing  $S$  is  $G$  itself. ┘

**Def. (3.1.2.6) [Product Subgroups].** Let  $G$  be a group and  $N, H$  be subgroups such that  $N$  is normal in  $G$ , then  $NH = \{x \in G | x = nh, n \in N, h \in H\}$  is a subgroup of  $G$ , called the **product subgroup**. ┘

**Def. (3.1.2.7) [Coset].** Let  $G$  be a group and  $H$  a subgroup. Consider the equivalence relation on  $G$  s.t.  $x \sim y$  iff  $x = yh$  for some  $h \in H$ , then the equivalence classes is denoted by  $G/H$ , called the **right coset** of  $H$  in  $G$ . And  $G$  acts on this set by left translation.

Similarly we can define **left coset**  $H \backslash G$  of  $H$  in  $G$ .

Moreover, if  $H$  is normal in  $G$ , then this set is a group with structure given by  $\tau H \cdot \sigma H = \tau \sigma H$ , called the **quotient group** structure. It satisfies the universal property that any group homomorphism  $\varphi : G \rightarrow G'$  s.t.  $\varphi(H) = e$  factors through  $G/H$  uniquely. ┘

**Prop. (3.1.2.8) [Fundamental Isomorphisms].** Let  $G$  be a group and  $N, H$  be subgroups such that  $N$  is normal in  $G$ , then

- there is a natural isomorphism  $G/NH \cong (G/N)/(H/H \cap N)$  as sets, and if  $H$  is also normal, this is an isomorphism of groups.
  - there is a natural isomorphism of groups:  $H/N \cap H \cong NH/N$ .
- ┘

*Proof:* 1:

2: Consider the natural isomorphism  $N \mapsto NH/H : n \mapsto nH$ , then it is a group homomorphism, and the kernel is  $N \cap H$ , thus we are done. ┘

**Cor. (3.1.2.9).** if  $H_1, H_2$  are subgroups of a group  $G$  that has finite indexes, then  $H_1 \cap H_2$  also has finite index in  $G$ . ┘

*Proof:* By fundamental isomorphism (3.1.2.8),  $H_1/H_1 \cap H_2 \cong H_1 H_2 / H_2 \subset G/H_2$ , so  $H_1 \cap H_2$  has finite index in  $H_1$ , so by transitivity of indexes,  $H_1 \cap H_2$  has finite index in  $G$ . ┘

**Def. (3.1.2.10)[Index of Subgroup].** The **index of a subgroup**  $H$  in a group  $G$  is defined to be the number of the left coset  $G/H$ , if it is finite. Now if  $H$  has finite index in  $G$ , then  $|G/H| = |H \backslash G|$ .  $\lrcorner$

*Proof:* Because for any system of representative  $a_i$  for the left coset  $G/H$ ,  $a_i^{-1}$  is a representative for the right coset  $H \backslash G$ , and vice versa.  $\square$

**Prop. (3.1.2.11).** If a finite group  $G$  has an automorphism  $\alpha$  that  $\alpha^2 = \text{id}$  and  $\alpha$  has no fixed point other than  $e$ , then  $G$  is an Abelian group of odd order.  $\lrcorner$

*Proof:*  $G$  is clearly of odd order. Consider the map  $g \mapsto \alpha(g)g^{-1}$ , then it is injective, hence it is also surjective, and consider  $\alpha(\alpha(g)g^{-1}) = g\alpha(g)^{-1} = (\alpha(g)g^{-1})^{-1}$ , thus  $\alpha(h) = h^{-1}$  for all  $h \in G$ , thus clearly  $G$  is Abelian.  $\square$

**Prop. (3.1.2.12).** If  $H \leq G \in \mathcal{A}b^{\text{fin}}$  and  $H \neq G$ , then  $G \neq \cup g^{-1}Hg$ .  $\lrcorner$

*Proof:* There are at most  $|G/H|$  different summands in the right hand side, so it doesn't have enough elements.  $\square$

**Prop. (3.1.2.13).** If  $G$  is a f.g. group (3.1.2.5) and  $H$  is a group of finite index in  $G$ , then  $H$  is f.g.  $\lrcorner$

*Proof:* Suppose  $G$  has generators  $g_i$ , we may add their inverses to it, and let  $Ht_1, \dots, Ht_m$  are all the right cosets with  $t_1 = 1$ , then there are  $h_{ij}$  that  $t_i g_j = h_{ij} t_{k_{ij}}$ , then we claim  $H$  is generated by  $h_{ij}$ .

For this, consider any  $h = \prod g_{i_r}$ , then  $g_1 = h_{1i_r} t_{k_{1i_r}}$ , and we can do this from left to right. Now  $h = \prod h_{i_s j_s} t_{o_s}$ , then  $t_o$  must be 1, and we are done.  $\square$

**Prop. (3.1.2.14).** Let  $\varphi : G \rightarrow H$  be a map of sets between groups s.t.  $\# \text{Im}(\varphi) = \infty$ , and for each  $g \in G$ , there is a set  $S(g) \in H$  that  $\varphi(h)\varphi(g) = \varphi(hg)$  for any  $h$  s.t.  $\varphi(h) \notin S(g)$ , then  $\varphi$  is a homomorphism.  $\lrcorner$

*Proof:* For  $g, h \in G$ , take  $f$  s.t.  $\varphi(f) \notin S(g) \cup \varphi(g)^{-1}S(h) \cup \{\varphi(gh)\}$ . Then

$$\varphi(f)\varphi(g)\varphi(h) = \varphi(fg)\varphi(h) = \varphi(fgh) = \varphi(f)\varphi(gh),$$

thus  $\varphi(g)\varphi(h) = \varphi(gh)$ .  $\square$

### General Linear Groups

**Notation (3.1.2.15)[Group-Theoretic Notations for  $\text{GL}(n)$ ].** When  $G = \text{GL}(n)$ ,

- Let  $B$  be the Borel subgroup of upper triangular matrices.
- Let  $\text{Unip}(n)$  is the subgroup of upper triangle unipotent matrices.
- Let  $M_n$  is the **mirabolic subgroup** of  $B$  with  $a_{n,n} = 1$ , which is isomorphic to  $\text{GL}(n-1) \ltimes \mathbb{A}^n$ .
- Let  $T$  the group of diagonal matrices.  $T_1$  is the subgroup of  $T$  that  $a_{nn} = 1$ .
- Denote  $w^0$  the matrix  $= \sum_{i=1}^n e_{i,n-i}$ .
- If  $n = 2$ , denote  $w_0 = \begin{bmatrix} & -1 \\ 1 & \end{bmatrix}$ ,  $w_1 = \begin{bmatrix} & 1 \\ -1 & \end{bmatrix}$ ,

$$t(y) = \begin{bmatrix} y & \\ & y^{-1} \end{bmatrix}, \quad n(z) = \begin{bmatrix} 1 & z \\ & 1 \end{bmatrix} \quad \forall y \in F^*, z \in F.$$

following (3.1.5.9).

$\lrcorner$

### 3 Abelian Groups

**Remark (3.1.3.1).** An Abelian group is the same as a module over  $\mathbb{Z}$ . Thus the theory of commutative algebra applies in this case. The category of Abelian groups is denoted by  $\mathcal{Ab}$ . The category of finite Abelian groups are denoted by  $\mathcal{Ab}^{\text{fin}}$ .  $\lrcorner$

**Prop. (3.1.3.2) [Abelianization].** There is a functor from the category of Abelian semi-groups to the category of Abelian groups that is left adjoint to the forgetful functor, called the **Abelianization**.  $\lrcorner$

*Proof:* Define  $A'$  to be the quotient

$$\bigoplus_{(a,b) \in A^2} \mathbb{Z} \rightarrow \bigoplus_{x \in A} \mathbb{Z} \rightarrow A' \rightarrow 0,$$

where  $1_{(a,b)}$  is mapped to  $1_a + 1_b - 1_{a+b}$ . Then it can be seen this satisfies the universal property and it is functorial in  $A$ .  $\square$

**Prop. (3.1.3.3) [Classifying F.g. Abelian Groups].** Any finitely generated Abelian group is of the form

$$\mathbb{Z}^r \bigoplus_{p_i \text{ primes}} \bigoplus_{j \leq n_i} \mathbb{Z}/(p_i^{a_{i,j}})$$

*Proof:* As  $\mathbb{Z}$  is PID, the classifying theorem follows immediately from (3.2.4.21):  $\square$

**Prop. (3.1.3.4) [Baer-Specker Group].** The group  $\prod^{\mathbb{N}} \mathbb{Z}$  is called the **Baer-Specker group**. Then the natural homomorphism

$$\text{Hom}(\prod^{\mathbb{N}} \mathbb{Z}, \mathbb{Z}) \rightarrow \prod^{\mathbb{N}} \mathbb{Z}$$

is injective with image  $\bigoplus^{\mathbb{N}} \mathbb{Z}$ . In particular, by countability argument,  $\prod^{\mathbb{N}} \mathbb{Z}$  is not a free group (5.3.1.5). Moreover, any infinite direct product of  $\mathbb{Z}$  is not free, because otherwise the subgroup  $\prod^{\mathbb{N}} \mathbb{Z}$  would be free.  $\lrcorner$

*Proof:* The natural homomorphism is the composite  $?$

$$\text{Hom}(\prod^{\mathbb{N}} \mathbb{Z}, \mathbb{Z}) \xrightarrow{\varepsilon^*} \text{Hom}(\#^{\mathbb{N}} \mathbb{Z}, \mathbb{Z}) \xrightarrow{\eta} \prod^{\mathbb{N}} \mathbb{Z}.$$

Thus the assertion follows from (3.1.5.6) and (3.1.5.5).  $\square$

**Remark (3.1.3.5).** This can be proven in other ways, like using condensed mathematics.  $?$   $\lrcorner$

#### Finite Abelian Groups

**Prop. (3.1.3.6) [Characterizing Finite Cyclic Groups].** Let  $G \in \mathcal{Ab}^{\text{fin}}$  that  $\#\{x \in G \mid x^d = 1\} \leq d$  for any  $d \geq 1$ , then  $G$  is cyclic.  $\lrcorner$

*Proof:* Consider the subset  $G_d$  of elements of order  $d$ , if it is non-empty, choose  $y \in G_d$ , then  $\#\langle y \rangle = d$ , thus  $\langle y \rangle = \{x \in G \mid x^d = 1\}$ , which means  $\#G_d \leq \varphi(d)$ . Then  $|G| = \sum_{d \mid n} \#G_d \leq \sum_{d \mid n} \varphi(d) = n$ . Thus  $G_n \neq \emptyset$ , which means  $G$  is cyclic.  $\square$

**Cor. (3.1.3.7).** For  $k \in \text{Field}$ , any finite subgroup of  $k^\times$  is cyclic.  $\lrcorner$

**Cor. (3.1.3.8) [Primitive roots modulo  $q$ ].** For  $p \in \mathbf{P}$  and  $q \in p^{\mathbb{Z}_+}$ ,  $\mathbb{F}_q^\times$  is cyclic, i.e.  $\mathbb{F}_q^\times \cong \langle \sigma \rangle$ . Any such generator  $\sigma$  is called a **primitive root modulo  $p$** .  $\lrcorner$

## 4 Automorphism Groups

**Def. (3.1.4.1) [Automorphisms Groups].** Let  $G \in \mathcal{G}rp$ , the set of automorphism of  $G$  is a group, denoted by  $\text{Aut}(G)$ .

Then for any  $g \in G$ , there is an automorphism  $C_g \in \text{Aut}(G) = \text{Hom}(G, G) : x \mapsto gxg^{-1}$ . And the mapping  $G \rightarrow \text{Aut}(G) : g \mapsto C_g$  is a group homomorphism. All automorphisms of  $G$  of the form are called **inner automorphisms** of  $G$ . The group of inner automorphisms of  $G$  is denoted by  $\text{Inn}(G)$ . Automorphisms that are not inner are called **outer automorphisms**.  $\lrcorner$

**Prop. (3.1.4.2).** Any group of order  $> 2$  have at least 2 automorphisms.  $\lrcorner$

*Proof:* Assume the contrary, consider its inner automorphism, then it is Abelian, and then multiplying by  $p$  for  $p$  large prime is not identity, Then  $\#G|(p-1)$  for such  $G$ . Now it is clear  $|G| = 2$ , because otherwise we can choose  $p \equiv 2 \pmod{\#G}$ .  $\square$

**Def. (3.1.4.3) [Automorphic Complete Groups].** An **automorphic-complete group** is a group whose automorphisms are all inner.  $\lrcorner$

**Prop. (3.1.4.4).**  $S_n$  is the automorphism group of  $A_n$  for  $n = 5$  or  $n \geq 7$ .  $\lrcorner$

*Proof:*  $\square$

**Prop. (3.1.4.5).** If  $G$  is a non-Abelian simple group, then  $\text{Aut}(G)$  is a complete group.  $\lrcorner$

**Prop. (3.1.4.6).**  $S_n$  are complete groups except for  $S_6$ .  $\lrcorner$

*Proof:*  $S_n$  is the automorphism group of  $A_n$  for  $n = 5$  or  $n \geq 7$  by (3.1.4.4), thus it is complete by (3.1.4.5).  $\square$

**Prop. (3.1.4.7) [Wielandt].** If  $G$  is a finite group with trivial center, then the sequence

$$G < \text{Aut}(G) < \text{Aut}(\text{Aut}(G)) < \dots$$

must terminate in finite steps.  $\lrcorner$

*Proof:*  $\square$

## 5 Free Groups and Presentations

**Def. (3.1.5.1) [Free Groups].** There is a **free group** functor  $F : \text{Set} \rightarrow \mathcal{G}rp$  that is left adjoint to the forgetful functor.

The image of the set  $[n-1]$  is denoted by  $F_n$ .  $\lrcorner$

*Proof:* For the existence of  $F$ , Cf. [Lan02]P66.  $\square$

**Prop. (3.1.5.2) [Nielsen-Schreier].** A subgroup  $H$  of a free group  $G$  is a free group. Moreover, a subgroup  $H$  of finite index  $m$  in  $F_n$  is isomorphic to  $F_{1+m(n-1)}$ .  $\lrcorner$

*Proof:* A free group is the fundamental group of a graph  $X$  which is a wedge sum of circles, and there is a covering  $X_H \rightarrow X$  the  $\pi_1(X_H) = H$  by (4.15.1.28). And if  $H$  is of index  $m$  in a free group  $G$ ,  $X_H \rightarrow X$  has degree  $m$  by (37.2.1.26). Now (37.2.1.26) shows  $H = \pi_1(X_H)$  is a free group, and the final assertion follows by comparing two ways of counting Euler number  $\chi$ .  $\square$

**Prop. (3.1.5.3).** Use the same method as in (3.1.5.2), we can determine all the subgroups of index 2 in  $F_2$ . ┘

*Proof:* ? □

**Def. (3.1.5.4) [Earring Group].** For any  $n \in \mathbb{Z}_+$ , there are group homomorphisms  $F_n \rightarrow F_{n-1}$  corresponding to the map of sets

$$[n-1] \rightarrow F_{n-1} : i \mapsto \begin{cases} [i] & , i \leq n-2 \\ 1 & , i = n-1 \end{cases}.$$

The **Earring group**  $\#^{\mathbb{N}}\mathbb{Z}$  is defined to be the subgroup of

$$\varprojlim_{n \in \mathbb{N}} F_n$$

consisting of elements  $(w_0, w_1, \dots, w_n, \dots)$  s.t. if each  $w_n$  is a reduced word, then for any  $k \in \mathbb{Z}_+$ , the number of  $[k]^{\pm}$  appearing in  $w_n$  stabilizes. ┘

**Prop. (3.1.5.5).** The natural homomorphism

$$\eta : \text{Hom}(\#^{\mathbb{N}}\mathbb{Z}, \mathbb{Z}) \rightarrow \prod^{\mathbb{N}} \mathbb{Z}$$

is injective with image  $\oplus^{\mathbb{N}}\mathbb{Z}$ . ┘

*Proof:* Cf. <https://wildtopology.com/2014/05/09/the-hawaiian-earring-group-is-not-free-part-i/>. □

**Prop. (3.1.5.6).** There is a natural group homomorphism  $\varepsilon : \#^{\mathbb{N}}\mathbb{Z} \rightarrow \prod^{\mathbb{N}} \mathbb{Z}$  that is surjective. ┘

*Proof:* The  $k$ -th coordinate of this map is given by omitting all the elements that is not  $[k]$ . It is clearly surjective. □

**Prop. (3.1.5.7) [Smith].**  $\#^{\mathbb{N}}\mathbb{Z}$  is not a free group. ┘

*Proof:* Cf. <https://wildtopology.com/2014/05/09/the-hawaiian-earring-group-is-not-free-part-i/>. □

### Presentations

**Def. (3.1.5.8) [Defining Sets].** For  $G \in \text{Grp}$ , a **defining set** of  $G$  is a subset  $S \subset G$  s.t.  $G$  is generated by  $S$  subject to the relations of the form  $ab = c$  where  $a, b, c \in S$ . ┘

### List of Presentations of Important Groups

**Prop. (3.1.5.9).** For  $K \in \text{Field}$ ,  $\text{SL}(2; K)$  has a representation as:

$$\langle t(y), n(z), w_1 \rangle, \quad y \in K^{\times}, z \in F$$

quotient the relations:

$$t(y_1)t(y_2) = t(y_1y_2), \quad n(z_1)n(z_2) = n(z_1 + z_2), \quad t(y)n(z)t(y)^{-1} = n(y^2z), \quad w_1t(y)w_1 = t(-y^{-1}).$$

$$w_1 n(z) w_1 = t(-z^{-1}) n(-z) w_1 n(-z^{-1}), z \in F^*,$$

And the isomorphism is given by  $\Phi$ :

$$t(y) \mapsto \begin{bmatrix} y & \\ & y^{-1} \end{bmatrix}, \quad n(z) \mapsto \begin{bmatrix} 1 & z \\ & 1 \end{bmatrix}, \quad w_1 \mapsto \begin{bmatrix} & 1 \\ -1 & \end{bmatrix}.$$

┘

*Proof:* The map vanishes on the relations is direct calculation. An inverse of  $\Phi$  is constructed by

$$\Psi \begin{pmatrix} a & b \\ c & d \end{pmatrix} = \begin{cases} n(a/c) t(-c^{-1}) w_1 n(d/c) & c \neq 0 \\ t(a) n(b/a) & c = 0 \end{cases}$$

The verification of the inverse is verified by direct calculation. □

**Prop. (3.1.5.10) [Metaplectic Modular Group].** In the metaplectic modular group  $\text{Mp}(2, \mathbb{Z})$  (26.5.1.1), define

$$\tilde{S} = \left( \begin{bmatrix} & 1 \\ -1 & \end{bmatrix}, -i\sqrt{\tau} \right), \quad \tilde{T} = \left( \begin{bmatrix} 1 & \\ & 1 \end{bmatrix}, \mathbb{1} \right), \quad \tilde{R} = \tilde{S}^2 = (-I, -i).$$

Then  $\text{Mp}(2, \mathbb{Z})$  is generated by  $\tilde{S}, \tilde{T}$  with relations

$$\tilde{S}^8 = (\tilde{S}\tilde{T})^3 = 1.$$

And the center  $C(\text{Mp}(2, \mathbb{Z})) = \langle \tilde{S}^2 \rangle \cong \mathbb{Z}/(4)$ , with  $\text{Mp}(2, \mathbb{Z})/\{1, \tilde{S}^4\} = \text{SL}(2, \mathbb{Z})$ . ┘

*Proof:* ? □

**Cor. (3.1.5.11).**  $\text{SL}(2, \mathbb{Z})$  is generated by  $S = \begin{bmatrix} & -1 \\ 1 & \end{bmatrix}, T = \begin{bmatrix} 1 & \\ & 1 \end{bmatrix}$  with relations

$$S^4 = 1, \quad (ST)^3 = S^2$$

.

┘

*Proof:* [Serre, Trees, P81]. □

**Cor. (3.1.5.12) [Modular Group].**  $\text{PSL}_2(\mathbb{Z}) = \text{SL}(2, \mathbb{Z})/\{\pm 1\}$  is generated by  $S = \begin{bmatrix} & -1 \\ 1 & \end{bmatrix}, T =$

$\begin{bmatrix} 1 & \\ & 1 \end{bmatrix}$  with relations

$$S^2 = 1, \quad (ST)^3 = 1.$$

┘

## 6 Sylow Theory

**Prop. (3.1.6.1) [Class Equation].** For a finite group  $G$ , if  $G_x = C((x))$ , then

$$|G| = |C(G)| + \sum |G|/|G_x|$$

where the summation is over non-trivial conjugate classes of  $G$ .  $\lrcorner$

*Proof:* Consider the left action of  $G$  on itself, and calculate elements.  $\square$

**Cor. (3.1.6.2) [ $p$ -Groups has non-trivial center].** if  $G$  is a  $p$ -group, then  $G$  has a non-trivial center.  $\lrcorner$

*Proof:* Consider the conjugation action of  $G$  on itself.  $\square$

**Cor. (3.1.6.3).** If  $p \nmid \#G$ , then  $G$  has an element of order  $p$ .  $\lrcorner$

*Proof:* Follows from Sylow theory and any  $p$ -group has a non-trivial center.  $\square$

**Lemma (3.1.6.4).** For any  $p$ -group  $G$  acting on a finite set  $X$ ,  $|X| \equiv |X^G| \pmod{p}$ . (trivial).  $\lrcorner$

**Prop. (3.1.6.5) [Sylow Theorem, Sylow1872].** For a finite group of order  $|G| = p^k m$ .

- There is a Sylow  $p$ -group.
  - For a Sylow  $p$ -subgroup, any  $p$ -subgroup is contained in a conjugate of  $P$ . In particular, any two Sylow  $p$ -subgroups are conjugate.
  - the number of Sylow  $p$ -groups  $n_p$  satisfies:  $n_p | m, n_p \equiv 1 \pmod{p}$ .
- $\lrcorner$

*Proof:* 1: Use induction, let  $Z = C(G)$ , if  $p \nmid |Z|$ , then  $Z$  contains a cyclic group of order  $p$ . Choose a  $p$ -Sylow subgroup of  $G/C$ , then its inverse image in  $G$  is a  $p$ -Sylow subgroup. If  $Z$  is prime to  $p$ , consider the conjugate action of  $G$  on  $G - Z$ , then some conjugacy class has order prime to  $p$ , by (3.1.6.4), then the stablizer  $H$  of this class satisfies  $[G : H]$  is prime to  $p$ . Thus  $H$  contains a  $p$ -Sylow subgroup by induction.

2: If  $Q$  is a  $p$ -subgroup, then  $Q$  acts on  $G/P$  by left translation, so it has a fixed element by (3.1.6.4),  $QxP = xP$  for some  $x$ , thus  $Q \subset xPx^{-1}$ .

3:  $n_p | m$  by considering the conjugate action of  $P$  on the set of conjugates of  $P$ , then as in the proof of item2,  $P$  is the only fixed element, so  $n_p \equiv 1 \pmod{p}$  by (3.1.6.4).  $\square$

**Lemma (3.1.6.6).** If  $G$  has a sylow subgroup  $H$  that  $|G/H|!$  is not divisible by  $|G|$ , then  $G$  is not simple.  $\lrcorner$

*Proof:* Consider the conjugate action of  $G$  on the conjugacy classes of  $H$ , then it is a group homomorphism of  $G$  into a subgroup of  $S_{|G/H|}$ , but the hypothesis shows that it is not injective, thus the kernel is non-trivial normal.  $\square$

**Prop. (3.1.6.7) [Frattini Argument].** If  $G$  is a finite group,  $N$  is normal in  $G$  and  $P$  is a Sylow subgroup of  $N$ , then  $N.N_G(P) = G$ .  $\lrcorner$

*Proof:* For any element  $g \in G$ , consider  $g^{-1}Pg \subset N$  is a Sylow subgroup of  $N$ , thus by Sylow theorem (3.1.6.5), there is a  $n \in N$  that  $g^{-1}Pg = n^{-1}Pn$ , thus  $gn^{-1} \in N_G(P)$ , thus  $g \in NN_G(P)$ .  $\square$

## 7 Split Extension

**Prop. (3.1.7.1) [Cyclic Central Extension Split].** If there is an exact sequence  $0 \rightarrow Z \rightarrow G \rightarrow C \rightarrow 0$  where  $Z \subset C(G)$  and  $C$  is cyclic, then  $G$  is Abelian.  $\lrcorner$

*Proof:* This is because we can choose an inverse image of a generator of  $C$ .  $\square$

**Prop. (3.1.7.2) [Schur-Zassenhaus].** An exact sequence of finite groups  $0 \rightarrow A \rightarrow E \rightarrow G \rightarrow 0$  must split when  $|A|$  and  $|G|$  are relatively prime.  $\lrcorner$

*Proof:*  $\square$

**Prop. (3.1.7.3).** Let  $\alpha, \beta : G \rightarrow \text{Aut}(H)$  be two actions of  $G$  on  $H$ , then their semiproduct sequences

$$1 \rightarrow H \rightarrow G \ltimes H \rightarrow G \rightarrow 1$$

are isomorphic iff  $\alpha, \beta$  are equivalent modulo  $\text{Inn}(H)$ .  $\lrcorner$

## 8 Subnormality

**Def. (3.1.8.1) [Subnormal Series].** A **subnormal series** of  $G$  is a descending chain of groups:

$$G = G_0 \triangleright G_1 \triangleright \dots \triangleright G_r = \{e\}$$

that  $G_{k+1}$  is normal in  $G_k$ . It is called a **composite series** iff each  $G_k/G_{k+1}$  is simple.

A subnormal series is called a **normal series** if each  $G_i$  is normal in  $G$ .  $\lrcorner$

**Lemma (3.1.8.2) [Butterfly Lemma].** Let  $H_1, H_2 \leq G, N_1 \trianglelefteq H_1, N_2 \trianglelefteq H_2$ , then there is a canonical isomorphism of groups:

$$N_1(H_1 \cap H_2)/N_1(H_1 \cap N_2) \cong N_2(H_2 \cap H_1)/N_2(H_2 \cap N_1).$$

$\lrcorner$

*Proof:* Cf. [Lan02] P20.  $\square$

**Prop. (3.1.8.3) [Schreier].** Any two subnormal series of a group  $G$  have a common refinement.  $\lrcorner$

*Proof:*  $\square$

**Cor. (3.1.8.4) [Jordan-Hölder].** For any two composition series  $G = G_0 \triangleright G_1 \triangleright \dots \triangleright G_r = \{e\}$ ,  $G = G'_0 \triangleright G'_1 \triangleright \dots \triangleright G'_{r'} = \{e\}$ , there  $r = r'$ , and there exists a permutation  $\sigma \in S_{r-1}$  s.t.  $G_i/G_{i+1} \cong G'_{\sigma(i)}/G'_{\sigma(i)+1}$ .  $\lrcorner$

**Def. (3.1.8.5) [Central Series].** A **central series** of  $G$  is an ascending chain of subgroups:

$$1 = Z_0 < Z_1 < \dots < Z_r = G$$

s.t. each  $Z_{k+1}/Z_k$  is in the center of  $G/Z_k$ .  $\lrcorner$

**Def. (3.1.8.6) [Solvable and Nilpotent Groups].**  $G$  is called a **A solvable group** if it has a finite subnormal series (3.1.8.1)  $\{G_i\}$  s.t. each  $G_i/G_{i+1}$  is Abelian.

$G$  is called a **nilpotent group** if it has a finite central series (3.1.8.5).  $\lrcorner$

**Def. (3.1.8.7) [Solvable Index].** If  $G \in \text{Grp}^{\text{fin}}$  is solvable, then the **solvable index** of  $G$  is the integer  $m \in \mathbb{N}$  s.t. there is a subnormal sequence

$$\{e\} = G_0 \trianglelefteq G_1 \trianglelefteq G_2 \trianglelefteq \dots \trianglelefteq G$$

that each quotient  $G_{k+1}/G_k$  is a cyclic group of prime order.  $\lrcorner$

**Def. (3.1.8.8) [Supersolvable Groups].**  $G$  is called a **supersolvable group** iff it has a finite normal series (3.1.8.1)  $\{G_i\}$  s.t.  $G_i/G_{i+1}$  is cyclic. Any supersolvable group is solvable.  $\lrcorner$

**Prop. (3.1.8.9).**

- Subgroups and quotients of a supersolvable group is supersolvable.
- Any finite nilpotent group is supersolvable.  $\lrcorner$

**Prop. (3.1.8.10).** If  $G$  is a non-Abelian supersolvable group, then there is a normal Abelian subgroup of  $G$  not contained in the center of  $G$ .  $\lrcorner$

*Proof:* Let  $G = G_1 \triangleright G_2 \triangleright \dots \triangleright G_r = 1$  be a normal series of  $G$ , then there is a maximal  $i$  s.t.  $G_{i+1}$  is contained in the center of  $G$  but  $G_i$  is not. Then  $G_i$  is Abelian and normal in  $G$ .  $\square$

**Lemma (3.1.8.11) [ $p$ -Groups are Nilpotent].** Any finite  $p$ -group is nilpotent, thus supersolvable (3.1.8.9).  $\lrcorner$

*Proof:* Using induction by (3.1.6.2), we see it has a central series, thus nilpotent (3.1.8.6).  $\square$

**Prop. (3.1.8.12) [Characterizing Nilpotent Finite Groups].** If  $\#G < \infty$ , then the following are equivalent:

- $G$  is nilpotent.
- $N_G(H) > H$  for every proper subgroup  $H < G$ .
- Every maximal subgroup of  $G$  is normal.
- Every Sylow subgroup of  $G$  is normal.
- $G$  is a direct product of its non-trivial Sylow subgroups.  $\lrcorner$

*Proof:*  $1 \rightarrow 2$ : Choose a central series  $Z_n$ , let  $Z_n \subset H$  and  $Z_{n+1} \not\subset H$ , then  $[Z_{n+1}, H] \subset [Z_{n+1}, G] \subset Z_n \subset H$ , thus  $Z_{n+1} \subset N_G(H)$ .

$2 \rightarrow 3, 4 \rightarrow 5$ : trivial.

$3 \rightarrow 4$  For any  $p$ -Sylow subgroup  $G$ , if  $N_G(P)$  is proper subgroup, then it is contained in some maximal subgroup  $M$ , and  $M$  is normal, thus by Frattini argument (3.1.6.7),  $G = N_G(P)M = M$ , contradiction.

$5 \rightarrow 1$ : By lemma (3.1.8.11).  $\square$

### Minimal Normal Subgroups

**Prop. (3.1.8.13) [Minimal Normal Subgroup].** The minimal normal subgroup  $N$  of a finite group  $G$  is a direct product of simple groups  $L^n$ .  $\lrcorner$

*Proof:* Let  $N_1$  be a maximal normal subgroup of  $N$ , then  $N/N_1$  is simple, and let  $N_i$  be the conjugates of  $N_1$  in  $G$ , then they are all maximal normal subgroup of  $N$ . the simple groups  $N/N_i$  are mutually isomorphic, and  $\cap N_i = 1$  by the minimality of  $N$ .

Now we use induction to prove  $N/N_1 \cap \dots \cap N_i$  is isomorphic to a product of  $N/N_1$ , which will finish the proof.

Now assume  $N_1 \cap \dots \cap N_{i-1} \not\subseteq N_i$ , then  $(N_1 \cap \dots \cap N_{i-1})N_i = N$ , and notice

$$N/N_1 \cap \dots \cap N_i \cong N_1 \cap \dots \cap N_{i-1}/N_1 \cap \dots \cap N_i \times N_i/N_1 \cap \dots \cap N_i \cong N/N_i \times N/N_1 \cap \dots \cap N_{i-1}.$$

□

**Prop. (3.1.8.14).** If a finite group  $|G| = \prod p_i$ , where  $p_i$  are distinct primes that  $\prod p_i$  and  $\prod (p_i - 1)$  are coprime, then  $G$  is cyclic. ┘

*Proof:* We prove all the Sylow groups are normal. Choose the maximal Sylow group  $A_n$ , then it is normal by Sylow theorem, and other Sylow groups act by conjugation is trivial (consider the center (3.1.6.2), then the center of the quotient, and so on), hence  $A_n$  is in the center. Now consider the quotient, by induction it is cyclic, hence this is a central extension of a cyclic group, hence  $G$  is Abelian (3.1.7.1), hence cyclic. □

**Prop. (3.1.8.15).** If  $\#G < \infty$  and  $p$  is the minimal prime factor of  $\#G$ , then all subgroups  $N$  of  $G$  of index  $p$  are normal. ┘

*Proof:* Consider the left action of  $G$  on  $G/H$ , then the kernel is  $\cap a^{-1}Ha$ , which is the maximal normal subgroup contained in  $H$ . Now this is group homomorphism of  $G$  into  $S_p$ , thus it has kernel at least  $|G|/p$ , so the kernel equals  $H$ , showing  $H$  is normal. □

**Prop. (3.1.8.16) [Burnside's Theorem].** If  $p, q$  are primes, then any finite groups of order  $p^a q^b$  is solvable. ┘

*Proof:* Cf. [Serre Linear representations of finite groups, P65]. □

**Prop. (3.1.8.17) [Thompson].** A finite group is not solvable iff there exist non-trivial elements  $x, y, z$  of coprime orders  $a, b, c$  that  $xy = z$ . ┘

**Prop. (3.1.8.18) [Feit-Thompson].** All finite groups that has odd order is solvable. ┘

*Proof:* □

## 9 Commutators

**Def. (3.1.9.1) [Notation].**

- $[a, b] = a^{-1}b^{-1}ab$ .
- $x^y = y^{-1}xy$ .

┘

**Prop. (3.1.9.2) [Commutator relations].** ┘

**Def. (3.1.9.3) [Metabelian Groups].** A metabelian group is a group  $G$  that  $G'$  is Abelian. ┘

**Prop. (3.1.9.4).** If  $G = AB$  where  $A, B$  are Abelian, then  $[G, G] = [A, B]$  and  $G$  is metabelian. ┘

*Proof:* The first one is easy to verify, the second because if we let  $b^{a_1} = a_2 b_2$ ,  $a^{b_1} = b_3 a_3$ , then

$$[a, b]^{a_1 b_1} = [a, b^{a_1}]^{b_1} = [a, b_2]^{b_1} = [a^{b_1}, b_2] = [a_3, b_2]$$

and similarly,  $[a, b]^{b_1 a_1} = [a_3, b_2]$ , so we have  $[a, b]$  commutes with  $[b_1^{-1}, a_1^{-1}]$ , which shows  $[A, B]$  is Abelian.  $\square$

**Prop. (3.1.9.5).** If  $f : G_1 \rightarrow G_2 \in \mathcal{G}rp$  s.t.  $G_2$  is nilpotent. Then  $f$  is surjective iff  $f^{ab} : G_1^{ab} \rightarrow G_2^{ab}$  is surjective.  $\lrcorner$

*Proof:* Define inductively  $\gamma_1(G_i) = G_i$ ,  $\gamma_{n+1}(G_i) = [\gamma_n(G_i), G_i]$ , we prove by induction that  $G_1/\gamma_j(G_1) \rightarrow G_2/\gamma_j(G_2)$  is surjective for any  $j \in \mathbb{Z}$ : The case  $j \leq 2$  follows from the hypothesis. Then it suffices to show that

$$\gamma_i(G_1)/\gamma_{i+1}(G_1) \rightarrow \gamma_i(G_2)/\gamma_{i+1}(G_2)$$

is surjective. It suffices to show that any element  $[a, b]$  where  $a \in \gamma_{i-1}(G_2)$ ,  $b \in G_2$  is contained in the image. But by induction hypothesis, there exists  $a' \in \gamma_{i-1}(G_1)$  and  $b' \in G_1$  s.t.  $f(a') = am$ ,  $f(b') = bn$  for some  $m, n \in \gamma_i(G_2)$ . Then

$$f([a', b']) = [am, bn] = [m, b]^a [a, b][am, n]^b \equiv [a, b] \pmod{\gamma_{i+1}(G_2)}.$$

$\square$

### Transfer

**Def. (3.1.9.6) [Transfer Maps].** For  $H \leq G \in \mathcal{G}rp$  s.t.  $[G : H] < \infty$ , choose a set of left coset representatives  $\{x_1, \dots, x_n\}$  of  $H$ , then for any  $g \in G$  and  $i \in [n]_+$ , there exists  $h_i \in H$  s.t.  $gx_i = x_j h_i(g)$ . Then the map

$$G \mapsto H^{ab} : g \mapsto \prod_{i \in [n]_+} h_i(g)$$

is a group homomorphism, and induces a map  $\text{Ver} : G^{ab} \rightarrow H^{ab}$ , called the **transfer map**.  $\lrcorner$

**Prop. (3.1.9.7).** If  $G$  is a met-Abelian finite group, then the transfer of  $\text{Ver} : G \rightarrow G'$  is trivial map.  $\lrcorner$

## 10 Permutation Groups

**Def. (3.1.10.1) [Permutation Groups].** For  $n \in \mathbb{Z}_+$ , denote  $\text{Sym}_n = \text{Aut}([n]_+)$ . In particular,  $\#\text{Sym}_n = n!$ .

For  $\pi \in \text{Sym}_n$ , construct a graph on  $[n]_+$  s.t.  $i$  is connected to  $\pi(i)$ , then this graph is 2-regular (may have loops) thus consists of cycles

$$(x_1, \pi(x_1), \pi^{\circ 2}(x_1), \dots, \pi^{(k_i-1)}(x_1)), \dots, (x_r, \pi(x_r), \pi^{\circ 2}(x_r), \dots, \pi^{(k_r-1)}(x_r)),$$

then we denote

$$\pi = (x_1 \pi(x_1) \pi^{\circ 2}(x_1) \dots \pi^{(k_i-1)}(x_1)) \dots (x_r \pi(x_r) \pi^{\circ 2}(x_r) \dots \pi^{(k_r-1)}(x_r)).$$

For example, if  $\pi \in \text{Sym}_5$  and  $\pi(1) = 2, \pi(2) = 3, \pi(3) = 1, \pi(4) = 5, \pi(5) = 4$ , then  $\pi$  is denoted by

$$\pi = (123)(45).$$

Sometimes the cycle of length 1 (i.e. fixed points of  $\pi$ ) can be omitted.  $\lrcorner$

**Prop. (3.1.10.2).** For  $n \in \mathbb{Z}_+$  and  $\sigma, \pi \in \text{Sym}_n$ , if

$$\pi = (i_1 i_2 \dots i_l) \dots (i_m i_{m+1} \dots i_n),$$

then

$$\sigma \pi \sigma^{-1} = (\sigma(i_1) \sigma(i_2) \dots \sigma(i_l)) \dots (\sigma(i_m) \sigma(i_{m+1}) \dots \sigma(i_n)).$$

┘

**Lemma (3.1.10.3).** If  $n \geq 3$ , then any proper normal subgroup of  $A_n$  has index divisible by 3. ┘

*Proof:* Otherwise consider  $n = [G : H]$ , then every  $p$ -power is in  $H$ . But then an element  $c$  of order 3 is in  $H$ , because  $c = c^{3k+1} = (c^{-1})^{3k+2}$  for any  $k$ . But  $A_n$  is generated by 3-Cycles.  $\square$

**Lemma (3.1.10.4).**  $A_5$  is simple. ┘

*Proof:* By (3.1.10.3), any proper normal subgroup  $H$  has order dividing 20.  $H$  cannot contain a 5-cycle, because a 5-cycle has  $\square$

**Prop. (3.1.10.5).**  $\text{Alt}_n$  is simple for  $n \geq 5$ . ┘

*Proof:* Cf. [代数学引论 P66].  $\square$

## 11 Classification of Finite Groups

**Thm. (3.1.11.1) [Classification of Finite Simple Groups].** Every finite simple group is one of the following:

- $\mathbb{Z}/(p)$ .
- $\text{Alt}_n$ .
- 16 infinite family of finite groups of Lie type.
- 26 exceptional groups, called **sporadic simple groups**.

┘

*Proof:* A full list is in <https://brauer.maths.qmul.ac.uk/Atlas/v3/> ?  $\square$

**Prop. (3.1.11.2) [Monster Group].** The largest sporadic simple group is called the **Monster group**  $\mathbb{M}$ .

$$\#\mathbb{M} = 2^{46} \cdot 3^{20} \cdot 5^9 \cdot 7^6 \cdot 11^2 \cdot 13^3 \cdot 17 \cdot 19 \cdot 23 \cdot 29 \cdot 31 \cdot 41 \cdot 47 \cdot 59 \cdot 71.$$

┘

*Proof:*  $\square$

**Prop. (3.1.11.3) [Happy Family].** There are 20 sporadic groups appearing as a subquotient of  $\mathbb{M}$ , and they form a set called the **happy family**. The remaining 6 groups are known as the **pariah groups**, including the **Lyons group**, **Janko groups**  $J_1, J_3, J_4$ , **Rudvalis group** and the **O’Nan group**  $\text{ON}$ . ┘

**Prop. (3.1.11.4) [Baby Monster Group].** The second largest sporadic simple group is called the **baby Monster group**  $\mathbb{B}$ . ┘

**Def. (3.1.11.5)[O’Nan Group].** ┘

**Prop. (3.1.11.6).** The O’Nan group has size

$$\#\text{ON} = 2^9 \cdot 3^4 \cdot 5 \cdot 7^3 \cdot 11 \cdot 19 \cdot 31.$$

┘

**Prop. (3.1.11.7)[Classification of Small Groups].**

1. A group  $G$  of prime order  $p$  or order  $p^2$  is Abelian.
2. A group  $G$  of order  $p^a q^b$  that it has  $q^b$   $p$ -Sylow subgroups, then its  $q$ -Sylow subgroup is normal thus it is not simple.
3. A non-Abelian group  $G$  of order 6 is isomorphic to  $\text{Sym}_3$ .
4. Any non-Abelian group of order 8 is isomorphic to  $D_4$  or quadratic numbers  $Q$ .
5. A group of order smaller than 60 is solvable.
6. Any simple group  $G$  of order 60 is isomorphic to  $\text{Alt}_5$ .
7. A group of order 148 is not simple, by (3.1.6.6) applied to the 37-Sylow subgroup.
8. A group of order 150 is not simple, by (3.1.6.6) applied to the 5-Sylow subgroup.

┘

*Proof:*

1. Because  $G$  has non-trivial center  $Z$  by (3.1.6.2), if  $Z = G$ , then it is Abelian, otherwise the  $\#Z = p$ , and the quotient  $G/Z$  is cyclic, thus  $G$  is Abelian by (3.1.7.1).
2. Calculating elements.
3. Consider its normal 3-Sylow group, then the quotient is cyclic thus  $G$  is semi-product which must by  $S_3$  when non-Abelian.
- 4.
- 5.
6. Consider  $G$  has 6 5-Sylow groups, thus there are 24 elements of order 5.  
 $G$  has 4 or 10 3-Sylow subgroups, if it have 4 3-Sylow subgroups, then the normalizer contains a 5-Sylow subgroup, so we have a subgroup of order 15, which must by  $\mathbb{Z}/15$ , so it contains a normal 5-Sylow subgroup, which shows there are at most  $60/15 = 4$  5-Sylow subgroups, contradiction.  
 So we have 10 3-Sylow subgroups, which shows there are at most 15 elements of order 2 or 4.  
 So we have 3 or 5 2-Sylow subgroups. If it is 3, then we can do the same as that for 3-Sylow to construct a 20-order group and reach contradiction.  
 So now it have 5 2-Sylow subgroups, and then we consider the conjugate action on Sylow subgroups, which is transitive, so it has trivial kernel, and  $G \hookrightarrow S_5$ . Now  $G = [G, G] \subset [S_5, S_5] = A_5$ .

□

**Prop. (3.1.11.8).** There is a group that is group that  $a^3 = 1$  for any  $a \in G$ , but is not Abelian. It is the uni-upper-triangular matrices in  $\text{Mat}(3; \mathbb{F}_3)$ . ┘

## 12 Profinite Groups

References are [Neukirch Cohomology of Number Fields], [Serre Galois Cohomology] [Profinite Groups Zaleskii] and [Shatz, Profinite Groups, Arithmetic and Geometry].

**Def. (3.1.12.1)[Profinite Groups].** A **profinite group** is a topological group that is an inverse limit of finite discrete groups. The category of profinite groups is denoted by  $\mathcal{ProfGrp}$ . And the subcategory of profinite Abelian groups is denoted by  $\mathcal{ProfAb}$ .  $\lrcorner$

**Lemma (3.1.12.2).** For a compact totally disconnected group  $G$ , any nbhd  $U$  of  $e$  contains a normal open subgroup.  $\lrcorner$

*Proof:*  $U$  contains a precompact nbhd of  $e$ , then by (4.12.1.24),  $U$  contains an open subgroup  $V$ , so by (4.12.1.6), there is a nbhd  $V'$  of  $e$  that  $xV'x^{-1} \subset V$  for all  $x \in G$ , this says  $\cap x^{-1}Vx$  is open, so it is an open normal subgroup.  $\square$

**Prop. (3.1.12.3)[Profinite Compact and Totally Disconnected].** A profinite group  $G$  is the same thing as a totally disconnected, compact Hausdorff topological group. In particular,  $G \cong \varprojlim G/U$  where  $U$  runs over all open normal subgroups of  $G$ .  $\lrcorner$

*Proof:* One way is because  $\lim G_i$  is a closed subgroup of  $\prod G_i$  which by Tychonoff's theorem is compact.

Conversely, by (3.1.12.2),  $G$  has a basis of  $e$  consisting of normal open subgroups, and by (4.12.1.23), the intersection of open normal subgroups is  $\{e\}$ . For any open normal subgroup  $N$  of  $G$ ,  $G/N$  is compact discrete hence finite, the map  $G \rightarrow \varprojlim G/N$  is continuous and has dense image, but  $G$  is compact and the right is Hausdorff, so the image is closed, hence it is surjective. It is injective because  $\cap N = \{e\}$ . Hence  $G \cong \varprojlim G/N$ .  $\square$

**Cor. (3.1.12.4).** A closed subgroup of a profinite group is profinite, and a quotient group is profinite.

A direct product of profinite groups are profinite, and so the inverse limit profinite groups are profinite, as it is a closed subgroup of a direct product.  $\lrcorner$

*Proof:* The closed subgroup is totally disconnected by (4.4.1.27).

To show the quotient group is totally disconnected, by (4.12.1.23), it suffice to prove  $H$  is intersection of compact open nbhds in  $G/H$ . If  $x \notin H$ , then there is an open subgroup  $U$  disjoint from  $xH$  by (4.12.1.7), so it is closed hence compact. So  $UH$  is a compact nbhd of  $H$  in  $G/H$  that doesn't contains  $xH$ , hence the result.  $\square$

**Cor. (3.1.12.5).** A closed subgroup of a profinite group is a intersection of open normal subgroups of  $G$  containing it, as  $G/H$  is profinite and as in the proof of (3.1.12.3),  $H$  is the intersection of open normal subgroups of  $G/H$ .  $\lrcorner$

**Prop. (3.1.12.6).** For  $G \in \mathcal{ProfGrp}$ , if  $U_\alpha$  is the system of open normal subgroups of  $G$ , and  $H$  is a closed subgroup of  $G$ , then there is a natural isomorphism of topological groups

$$H \cong \varprojlim H/H \cap U_\alpha,$$

and if  $H$  is normal, then there is a natural isomorphism of topological groups

$$G/H \cong \varprojlim G/HU_\alpha.$$

$\lrcorner$

*Proof:* Cf.[Central Simple Algebras]P113.?

□

**Prop. (3.1.12.7).** Any infinite profinite groups is uncountable.

┘

*Proof:* [Profinite Groups Zalesskii]Prop2.3.1.

□

**Prop. (3.1.12.8).**  $\text{ProfAb}$  is Pontryagin dual to the category of torsion abelian group. (not that hard to verify).

┘

*Proof:*

□

### Pro- $p$ -Groups

**Def. (3.1.12.9) [Surnatural Number].** To consider indexes of closed subgroups of a profinite group, the notion of surnatural numbers are needed. A **surnatural number** is a formal product  $\prod_p p^{n_p}$ ,  $n_p \in \mathbb{N} \cup \{0, \infty\}$ .

For a closed subgroup  $H$  of a profinite group  $G$ ,  $[G : H]$  is defined to be the least common multiple of  $[G/U : H/H \cap U]$  where  $U$  goes over all open normal subgroups of  $G$ . This also equals the least common multiple of  $[G : V]$  for  $V$  open containing  $H$  (because for any such  $V$ , there is an open normal subgroup  $U$  that  $HU \subset V$  (4.12.1.6)).

┘

**Prop. (3.1.12.10).** The index is compatible with composition and quotient:  $[G : K] = [G : H][H : K]$  and  $[G : H] = [G/K : H/K]$  for  $K$  closed normal in  $G$ .

$[G : H]$  is finite iff  $H$  is open. For a decreasing family of closed subgroups  $H_i$  of  $G$ ,  $[G : \cap H_i]$  equals the least common multiple of  $[G : H_i]$ .

┘

*Proof:*  $[G/U : K/K \cap U] = [G/U : H/H \cap U][H/H \cap U : K/K \cap U][G : H][H : K]$ , giving one way of inequality. For the converse, Cf.[Etale Cohomology Fulei P150]. The quotient case is trivial.

If  $[G : H]$  is finite, then For the final assertion, notice for a open subgroup  $V$ ,  $G - V$  is compact, so  $\cap H_i \subset V$  iff  $\cap H_i \subset V$  for some  $i$ .

□

**Def. (3.1.12.11) [Pro- $p$ -Group].** A profinite group  $G$  is called a **pro- $p$ -group** iff  $[G : 1]$  is a power of  $p$ .

Given a profinite group, a closed subgroup  $H$  is called **Sylow pro- $p$ -subgroup** of  $G$  if  $H$  is pro- $p$  and  $[G : H]$  is prime to  $p$ .

┘

*Proof:*

□

**Prop. (3.1.12.12).** A profinite group  $G$  is a pro- $p$ -group iff it is an inverse limit of finite  $p$ -groups. In particular, any finite quotient of a pro- $p$ -group is a  $p$ -group.

┘

*Proof:*

□

**Prop. (3.1.12.13) [Sylow Pro- $p$ -Group Exists].**

┘

*Proof:*

□

**Prop. (3.1.12.14).** Any pro- $p$  subgroup  $H$  of  $G$  is contained in a Sylow  $p$ -subgroup of  $G$ , and any two Sylow  $p$ -subgroups are conjugate. And a surjective morphism of profinite groups maps a pro- $p$  group to a pro- $p$  group.

┘

*Proof:* For any open normal subgroup  $U$  of  $G$ , let  $I_U$  be the sets of all Sylow groups of  $G/U$  containing  $H/H \cap U$ , then the map  $G/V \rightarrow G/U$  maps  $I_V$  to  $I_U$ , and  $I_U$  is finite nonempty by Sylow theory. So the inverse limit of  $I_U$  is nonempty, and let  $(P_U)$  be such an element, and  $P = \varprojlim_U P_U$ , then  $P$  is a pro- $p$  subgroup of  $G$ , and  $[G : P]$  equals the least common multiple of  $[G/U : P_U]$ , which is prime to  $p$ , so it is a Sylow  $p$ -group. Similarly, for two Sylow- $p$  subgroup, we consider  $A_U$  the set of all  $x \in G/U$  that  $x^{-1}(PU/U)x = P'U/U$ , then there is a inverse element  $x$ , and  $x^{-1}Px = P'$ .

If  $G' = G/N$ , then  $[G/N : PN/N] = [G : PN][G : P]$  is prime to  $p$ , and  $[PN/N : 1] = [P : P \cap N][P : 1]$  is a power of  $p$ , so  $PN/N$  is Sylow- $p$  in  $G'$ .  $\square$

**Prop. (3.1.12.15).** For a pro- $p$  group  $G$ , any nonzero simple  $p$ -torsion  $G$ -module is isomorphic to  $\mathbb{Z}/p\mathbb{Z}$  with trivial  $G$ -action.  $\lrcorner$

*Proof:* The action of  $G$  on  $A$  factors through a finite quotient group which is a  $p$ -group, by (24.1.3.7),  $A^G \neq 0$ , so  $A = A^G$ , then  $A$  must be  $\mathbb{Z}/(p)$ .  $\square$

## 3.2 Algebras

*“En un mot les calculs sont impraticables.”*

–E. Galois

References are [Lan02, Rom07] and [Finite Groups, Issac].

This section differs from sections on Commutative Algebras because it contains more basic, but maybe non-commutative properties. This section differs from [Group Theory](#) because it concerns objects with more structure than a group.

**Notation(3.2.0.1).**

- Use notations on groups defined in [Group Theory](#).

┘

### 1 Rings

#### Basics

**Def.(3.2.1.1)[Rings].** A **ring** is an Abelian group  $(R, +) \in \mathcal{Ab}$  together with a multiplication map

$$\times : R \times R \rightarrow R$$

s.t.

- $(R, \times)$  is a monoid.
- For any  $x, y, z \in R$ ,

$$x(y + z) = xy + xz, \quad z(x + y) = zx + zy$$

A **commutative ring** is a ring that the multiplication is commutative.

- The category of non-associative rings is denoted by  $\mathbf{naAlg}$ .
- The category of associative rings is denoted by  $\mathbf{Alg}$ .
- The category of unital associative rings is denoted by  $\mathbf{Ring}$ .
- The category of commutative rings is denoted by  $\mathbf{CAlg}$ .
- The category of commutative unital rings is denoted by  $\mathbf{CRing}$ .

┘

**Def.(3.2.1.2).**  $R \in \mathbf{Ring}$  is called

- a **simple ring** iff it has no non-trivial 2-sided ideals.
- a **prime ring** iff for any two ideals  $A, B \in \mathbf{Ring}$ ,  $AB = 0$  implies  $A = 0$  or  $B = 0$ .
- a **domain** or **integral ring** if for any  $a, b \in R$ ,  $ab = 0$  implies  $a = 0$  or  $b = 0$ .
- a **reduced ring** iff it has no non-zero nilpotent element.
- a **Dedekind-finite ring** iff for any  $a, b \in R$ ,  $ab = 1 \Rightarrow ba = 1$ .

┘

**Def.(3.2.1.3)[Fields].** A **field** is a commutative ring that every non-zero element has an inverse. The category of fields is denoted by  $\mathbf{Field}$ .

┘

**Prop. (3.2.1.4) [Characteristic].** For  $R \neq 0 \in \text{Ring}$ , there exists at most one  $p \in \mathbf{P}$  s.t.  $p \cdot 1 = 0 \in k$ .  
If such a  $p$  exists, denote  $\text{char } k = p$ , otherwise denote  $\text{char } k = 0$ .  $\lrcorner$

**Prop. (3.2.1.5).** If  $1 - ab$  is left(resp. right) invertible in a unital ring  $R$ , then so is  $1 - ba$ , and

$$(1 - ba)^{-1} = 1 + b(1 - ab)^{-1}a.$$

 $\lrcorner$ 

*Proof:* Direct Calculation.  $\square$

**Prop. (3.2.1.6) [Kaplansky].** If  $a$  has a right inverse by no left inverse in a ring, then  $a$  has infinitely many right inverses.  $\lrcorner$

*Proof:* If  $ab = 1$ , then in fact  $b + (1 - ba)a^n$  are right inverses for  $a$  for any  $n \geq 0$ , and they are distinct, because if  $b + (1 - ba)a^n = b + (1 - ba)a^m$ , then  $(1 - ba)a^n = (1 - ba)a^m$ . And by multiplying  $b$  on the right, we get  $(1 - ba)a^{n-m} = 1 - ba$ , so  $((1 - ba)a^{n-m-1} + b)a = 1$ .  $\square$

### Others

**Prop. (3.2.1.7).** If  $R \in \text{Ring}$ ,  $\#R = p^2$ , then  $R$  is commutative.  $\lrcorner$

*Proof:* Consider the center of  $R$ , it is non-trivial because  $\textcolor{red}{?}$ .  $\square$

**Prop. (3.2.1.8).** Let  $A, A'$  be  $k$ -algebras and  $B, B'$  subalgebras of  $A, A'$  with centralizers  $C, C'$ , then the centralizer of  $B \otimes_k B' \subset A \otimes_k A'$  is  $C \otimes_k C'$ .  $\lrcorner$

*Proof:* It suffices to show that  $C \otimes_k A' \cap A \otimes_k C' = C \otimes_k C'$ , which is clear because they are flat over  $k$ .  $\square$

**Def. (3.2.1.9) [Division Algebras].** A **skew field**(or **division algebra**) is an algebra that every non-zero element is invertible (but may not be unital or associative). A unital division algebra is called a **division ring**.  $\lrcorner$

**Def. (3.2.1.10) [Involutions].** For  $R \in \text{Ring}$ , an **involution** on  $R$  is a bijection  $*$  :  $R \rightarrow R$  s.t.  $(ab)^* = b^*a^*$  and  $*^{\circ 2} = \text{id}$ . It is called an **involution of first kind** if it fixes elements in the center of  $B$ . It is called an **involution of second kind** otherwise.  $\lrcorner$

## 2 Gröbner Basis

Cf.[Algebraic Aspects of Cryptography]P70.

## 3 Commutative Rings

### Bézout Domain

**Def. (3.2.3.1) [Bézout Domains].** A **Bézout domain** is an integral domain that any sum of two principal domains is also principal.  $\lrcorner$

**Prop. (3.2.3.2).** The localization of a Bézout domain is Bézout. A local ring is Bézout iff it is a valuation ring by (12.2.2.8).  $\lrcorner$

### UFDs

**Def. (3.2.3.3) [Unique Factorization Domains].** A non-zero element  $x$  in a domain  $R$  is called **irreducible element** iff for any  $y, z \in R$  that  $x = yz$ , either  $y$  or  $z$  is a unit.

A non-zero element  $x$  in a domain  $R$  is called a **prime element** iff  $(x)$  is a prime ideal. Every prime is irreducible.

A domain  $R$  is called a **UFD** or **unique factorization domain** iff every non-zero element  $x \in R$  has a factorization into irreducibles, unique up to units.  $\lrcorner$

**Def. (3.2.3.4) [Relatively Prime Elements].** A set of elements  $(x_1, \dots, x_n)$  in a domain  $R$  is called **relatively prime** if there are no irreducible elements that divides each one of them.  $\lrcorner$

**Prop. (3.2.3.5).** if  $R$  is Noetherian domain, then each element has a decomposition into irreducible.  $\lrcorner$

*Proof:* Trace the decomposition inductively, if it doesn't stop, then it contradicts with Noetherian hypothesis.  $\square$

**Prop. (3.2.3.6).** An integral domain  $R$  is a UFD(3.2.3.3) iff each element  $x$  factors into irreducible elements(3.2.3.3), and every irreducible element is a prime element(3.2.3.3). Also this is equivalent to every non-zero element factors into product of prime elements.  $\lrcorner$

*Proof:* If  $R$  is a UFD, then if  $x$  is irreducible, if  $ab \in (x)$ ,  $ab = xc$ , then  $x$  is one irreducible in the decomposition of  $a$  and  $b$ , by UFD, so  $a \in (x)$  or  $b \in (x)$ , and  $(x)$  is a prime ideal.

Conversely, if there are two decompositions  $\prod a_i = \prod b_j$ , then some  $b_j \in (a_i)$  by primeness of  $(a_i)$ , so  $b_j = a_i u$ , so  $u$  must be units, so by induction, this two decompositions are the same.

If every element factors into prime elements, then an irreducible element is a prime because it factors as a product of primes, and notice every prime is irreducible(3.2.3.3).  $\square$

**Prop. (3.2.3.7) [Gauss Lemma].** If  $R \in \mathcal{CRing}$  is a UFD, then

- The product of two primitive elements in  $R[X]$  is primitive.
- $p(X) \in R[X]$  is irreducible iff it is primitive and irreducible in  $\text{Frac}(R)[X]$ .

$\lrcorner$

*Proof:* ?  $\square$

**Cor. (3.2.3.8).** If  $R \in \mathcal{CRing}$  is a UFD, then  $R[X]$  is a UFD.  $\lrcorner$

*Proof:*  $\text{Frac}(R)[X]$  is a Euclidean domain thus a PID, so any  $p(X) \in R[X]$ ,  $p(X)$  factors into a product of irreducible polynomials in  $\text{Frac}(R)[X]$  up to units:  $p(X) = \prod_i p_i(X)$ . By multiplying elements in  $R^\times$ , we may assume that  $c_i p_i(X)$  are primitive elements contained in  $R[X]$ . Thus  $\prod_i (c_i p_i(X))$  is also a primitive element in  $R[X]$ , thus it must equal  $p(X)$  up to a unit in  $R$ . So we proved that  $p(X)$  factors into a product of irreducible elements in  $R[X]$ . And clearly the factorization is unique up to units.  $\square$

**Prop. (3.2.3.9) [Kaplansky].** An integral domain  $R$  is UFD iff every non-zero prime ideal contains a non-zero principle prime ideal. In particular, any prime of height 1 is principal.  $\lrcorner$

*Proof:* If  $R$  is a UFD, let  $\mathfrak{p}$  be a non-zero prime ideal, choose  $a \neq 0 \in \mathfrak{p}$ , and write  $a = \pi_1 \dots \pi_n$  as a product of irreducibles. Then  $\pi_i \in \mathfrak{p}$  for some  $i$ , so  $\mathfrak{p}$  contains the prime ideal  $(\pi_i)$ (3.2.3.6).

Conversely, let  $S$  be the set of all finite products of prime ideals of  $R$ , then  $S$  is a multiplicative set of  $R$ . For any non-zero element  $a \in R$ , if  $(a) \cap S = \emptyset$ , then there is a prime ideal  $P$  containing  $(a)$  and

is maximal among those avoiding elements of  $S$ . Then  $P$  contains a non-zero prime  $\pi$ , contradiction. So  $(a) \cap S \neq \emptyset$ . Let  $b \in R$  that  $ab = \pi_1 \dots \pi_n$ , then we show  $a \in S$  by induction on  $n$ .

If  $n = 1$ , then  $a$  is a unit or a prime, so we are done. For general  $n$ , if  $\pi_k | b$  for some  $k$ , then  $b = \pi_k c$ , and  $ac = \pi_1 \dots \pi_{k-1} \pi_{k+1} \dots \pi_n$ , then  $a \in S$  by induction hypothesis. Otherwise  $\pi_k | a$  for all  $k$ , thus  $a = \pi_1 \dots \pi_n c$  and  $1 = bc$ , thus  $c$  is a unit and  $a \in S$ .

Thus we proved that every non-zero element is a product of prime elements, so  $R$  is a UFD by (3.2.3.6).  $\square$

**Prop. (3.2.3.10).** If  $k \in \mathbf{Field}$ , then the ring of power series  $k[[X]]$  is a UFD.  $\lrcorner$

*Proof:* Cf.[Algebra, Lang P209].  $\square$

**Remark (3.2.3.11).** WARNING: if  $A$  is a UFD,  $A[[X]]$  may not be a UFD. Cf.[Matsumura, Commutative Ring Theory, P165].  $\lrcorner$

**Prop. (3.2.3.12) [Nagata].** If  $A$  is a Noetherian domain and  $x \in A$  is a prime element s.t.  $A[\frac{1}{x}]$  is a UFD, then  $A$  is a UFD.  $\lrcorner$

*Proof:*  $A[\frac{1}{x}]$  is normal by (5.3.5.2), and  $A$  is also normal: If  $a \in \text{Frac}(A)$  is integral over  $A$ , then  $a = r/x^m$  for some  $m \in \mathbb{Z}, r \in A \setminus (x)$ . If  $a \notin A$ , then  $r \in x$ , contradiction.

Then we can use (9.1.1.25) to show that  $\text{Cl}(\text{Spec } A) = 0$ , and then  $A$  is a UFD by (9.1.4.6).  $\square$

**Prop. (3.2.3.13).** For a field  $k$  of characteristic  $\neq 2$  and  $n \geq m \geq 5$ ,  $A = k[x_1, \dots, x_n]/(-x_1^2 + x_2^2 + \dots + x_m^2)$  is a UFD.  $\lrcorner$

*Proof:*  $A \cong k[x_1, \dots, x_n]/(x_1 x_2 + x_3^2 + \dots + x_m^2)$ , and  $(x_2)$  is a prime ideal of  $A$  s.t.  $A[\frac{1}{x}]$  is a UFD by (3.2.3.8), so  $A$  is a UFD by Nagata's lemma (3.2.3.12).  $\square$

**Prop. (3.2.3.14) [Quadratic Extension of UFDs].** If  $A \in \mathcal{CA}lg$  is an integral domain and  $Z^2 - gZ + f$  doesn't have a root in  $\text{Frac}(A)$ , then  $A[Z]/(Z^2 - gZ - f)$  is integral and normal.  $\lrcorner$

*Proof:* If  $(a + bZ)(c + dZ) = 0$ , then by hypothesis  $ad + bc + bdg = 0, ac + fbd = 0$ . Then  $b(fd^2 - c^2 - cdg) = 0$ , so  $b = 0$  or  $c = d$  by hypothesis. If  $(c, d) \neq (0, 0)$ , then  $ac = ad = 0$ , so  $a = b = 0$ .  $\square$

### PIDs

**Def. (3.2.3.15) [Euclidean Domain].**  $\lrcorner$

**Prop. (3.2.3.16) [Euclidean Domains are PID].** Euclidean domains (3.2.3.15) are PIDs.  $\lrcorner$

*Proof:*  $\square$

**Example (3.2.3.17).**

- $\mathbb{Z}$  is a PID.
- For  $k \in \mathbf{Field}$ ,  $k[X]$  is a PID.

$\lrcorner$

**Prop. (3.2.3.18) [PID Structures].** In a PID,

- An element  $t$  is irreducible iff  $(t)$  is maximal.
- A PID is UFD hence Noetherian.

- An element  $t$  is irreducible iff it is a prime.
- 

┘

*Proof:* 1:  
 2: By (3.2.3.9).  
 3: By item2 and (3.2.3.5).

□

## 4 Modules

**Def. (3.2.4.1) [Modules].** For  $R \in \mathcal{M}\text{on}$  (3.1.1.6), a (left)  $R$ -modules is defined to be ?. The category of  $R$ -modules is denoted by  $\text{Mod}_R$ .

Left modules are preferred. There are several proposition that is written in favor of right modules, they should be rectified. ┘

**Def. (3.2.4.2) [Finite Modules].** For  $R \in \mathcal{M}\text{on}$ , a **finite  $R$ -module** is an  $R$ -module  $M$  that there is a surjection  $R^n \rightarrow M$  for some  $n \geq 0$ . ┘

**Prop. (3.2.4.3).** Let  $R \in \mathcal{C}\text{Ring}$  and  $M$  be an  $R$ -module generated by  $n-1$  elements, then any  $R$ -module map  $R^n \rightarrow M$  has a nonzero kernel. ┘

*Proof:* Choose a surjection  $R^{n-1} \rightarrow M$ , then the map  $R^n \rightarrow M$  can be extended to a map  $R^n \rightarrow R^{n-1}$ . It suffices to assume  $M = R^{n-1}$ . This map is represented by a matrix. If some entry  $a_{ij} = a$  is not nilpotent, then we can localize  $R$  to  $R_a$  that  $a$  is a unit. We can assume  $a_{11} = a$ , and apply elementary row and column transformation to make  $A = \text{diag}(1, B)$ , then we finish by induction. Now if all  $a_{ij}$  are nilpotent, then  $I = (a_{ij})$  is nilpotent, and if  $m$  is the maximal integer that  $I^m \neq 0$ , then  $(I^m)^{\oplus n}$  is contained in the kernel of this morphism. □

**Cor. (3.2.4.4) [Rank of Free Modules].** If  $M$  is a free module over a nonzero commutative ring  $R$ , then any basis of  $M$  is of the same cardinality, called the **rank** of  $M$ , and any spanning subset of  $M$  has greater cardinalities. In particular,  $R^m \neq R^n$  as  $R$ -modules. ┘

**Prop. (3.2.4.5) [Fitting Lemma].** For  $R \in \mathcal{C}\text{Ring}$ ,  $M \in \text{Mod}_R$  and  $T \in \text{End}_R(M)$ , if we denote  $p$  the minimal integer that  $R(T^p) = R(T^{p+1})$  and  $q$  the minimal integer that  $N(T^q) = N(T^{q+1})$ . Then

- The morphisms are stable afterward.
- If there is a  $m, n$  that  $R(T^m) \oplus N(T^n) = X$  for a  $R$ -module endomorphism  $T \in \text{End}(M)$ , then  $p, q < \infty$  and they are equal. Moreover, if we know  $p, q < \infty$ , then we have  $R(T^p) \oplus N(T^q) = M$ . ┘

*Proof:* We notice that

$$T^i : N(T^{i+j})/N(T^i) \rightarrow R(T^i) \cap N(T^j), \quad T^i : M/(R(T^j) + N(T^i)) \rightarrow R(T^i)/R(T^{i+j})$$

are isomorphisms. Thus  $R(T^m) \oplus N(T^n) = X$  shows  $q \leq m$  and  $p \leq n$ , thus we have  $R(T^p) \oplus N(T^q) = M$ , which implies  $p \geq q$  and  $q \geq p$ . thus the result. The rest also follows easily from these isomorphisms. □

**Prop. (3.2.4.6) [Nakayama].** If  $M$  is a finite  $A$ -module, and  $I \subset A$  is an ideal that  $IM = M$ , then there is a  $a \in 1 + I$  that  $aM = 0$ .

In particular, if  $I \subset \text{rad}(A)$ , then  $a$  is a unit (5.2.6.2), so  $M = 0$ . ┘

*Proof:* Because  $M = IM$ , choose a set of generators  $\{x_i\}$  of  $M$ , then  $x_i = \sum a_{ij}x_j$ , where  $a_{ij} \in I$ . Then if the matrix  $M = (\delta_{ij} - a_{ij})$ , then  $Mx_i = 0$ . So taking the adjoint matrix, then  $\det(M)x_i = 0$ . Notice  $\det(M)$  is a morphism. But the determinant must be element like  $1 + k, k \in I$ , so we are done.  $\square$

**Cor. (3.2.4.7).** If  $M$  is a finite  $A$ -module,  $N$  a submodule and  $M = \text{rad}(A)M + N$ , then  $M = N$ .  $\lrcorner$

**Cor. (3.2.4.8).** If a finite  $R$ -module  $M$  satisfies  $M \otimes_R k(p) = 0$ , then there is a  $f \notin p$  that  $M_f = 0$ .  $\lrcorner$

*Proof:* Because  $M_p = 0$ , and the support of  $M$  is closed(finiteness used).  $\square$

**Cor. (3.2.4.9).** If an endomorphism  $\varphi$  of a finite module  $M$  over  $R$  is surjective, then it is injective.  $\lrcorner$

*Proof:* This endomorphism makes  $M$  a finite module over  $R[X]$  by letting  $X$  acts by  $\varphi$ . So the hypothesis shows  $IM = M$  where  $I = (x) \subset R[x]$ . Then Nakayama(3.2.4.6) shows there are some  $(1 + f(X)X)M = 0$ . Thus for any  $m \in M$  that  $X(m) = 0$ ,  $m = 0$ , so  $\varphi$  is injective.  $\square$

**Prop. (3.2.4.10).** If  $A \in \text{Ring}/\mathbb{C}$  and  $\alpha \in A$  is not nilpotent, then there exists a simple  $A$ -module  $M$  that  $\alpha|_M \neq 0$ .  $\lrcorner$

*Proof:* First we claim that there is some  $\lambda \neq 0 \in \mathbb{C}$  that  $a - \lambda$  is not invertible in  $A$ , this is nearly the same as the proof of(3.6.1.2), noticing that  $a$  is not nilpotent. Now we can take  $M = A/(a - \lambda)A$ , then  $a1 = \lambda \neq 0$ .  $\square$

**Prop. (3.2.4.11)[Jordan-Horder].** Cf.(3.1.8.4).  $\lrcorner$

### Tensor Module and Hom Module

**Def. (3.2.4.12)[Hom Module].** If  $B$  is an  $R$ - $S$ -bimodule and  $C$  is a  $T$ - $S$ -bimodule, then  $\text{Hom}_S(B, C)$  is naturally a  $T - R$ -module given by the action  $(tfr)(b) = tf(rb)$ .

Dually, if  $B$  is an  $S - R$ -bimodule and  $C$  is a  $S - T$ -bimodule, then  $\text{Hom}_S(B, C)$  is naturally an  $R - T$ -bimodule given by the action  $(rft)(b) = f(br)t$ .  $\lrcorner$

**Def. (3.2.4.13)[Tensor Product].** Given a ring  $R$ , a  $T$ - $R$ -bimodule  $A$  and an  $R$ - $S$ -bimodule  $B$ , their **tensor product** is a  $T$ - $S$ -bimodule defined by universal properties:  $A \times B \rightarrow A \otimes_R B$  is a  $T$ - $S$ -bimodule map, and any  $T$ - $S$ -bimodule map  $A \times B \rightarrow C$  to a  $T$ - $S$ -bimodule  $C$  factors uniquely through  $A \otimes_R B \rightarrow C$ .

The tensor product can be constructed as:

There is an adjoint:

$$- \otimes_R B : {}_T \text{Mod}_R \xleftrightarrow{\quad} {}_T \text{Mod}_S : \text{Hom}_S(B, -) .$$

In particular, tensoring commutes with colimits.

Similarly, there is an adjoint:

$$A \otimes_R - : {}_R \text{Mod}_S \xleftrightarrow{\quad} {}_T \text{Mod}_R : \text{Hom}_T(A, -) .$$

$\lrcorner$

*Proof:* We need to give an isomorphism

$$\tau : \text{Hom}_S(A \otimes_R B, C) \cong \text{Hom}_R(A, \text{Hom}_S(B, C)).$$

Given  $f \in \text{Hom}_S(A \otimes_R B, C)$ , we define

$$\tau(f) : A \rightarrow \text{Hom}_S(B, C) : (\tau(f)a)(b) = f(a \otimes b).$$

and conversely, for  $g \in \text{Hom}_R(A, \text{Hom}_S(B, C))$ ,

$$\tau^{-1}(g)(a \otimes b) = (g(a))(b).$$

The verifications is routine and the isomorphism for left modules is dual.  $\square$

**Prop. (3.2.4.14) [(Co)Induced Modules].** Given a ring homomorphism  $S \rightarrow R$ , then  $R$  is a  $S - R$ -bimodule as well as a  $R - S$ -bimodule, then we define:

- $f^* : {}_R\text{Mod} \rightarrow {}_S\text{Mod} : f^*M = {}_S M = \text{Hom}_R(R, M) = R \otimes_R M$  (3.2.4.12)(3.2.4.13), the **restriction**.
- $f_! : {}_S\text{Mod} \rightarrow {}_R\text{Mod} : f_!M = R \otimes_S M$  is the **induced module**, it is left adjoint to restriction, by (3.2.4.13).
- $f_* : {}_S\text{Mod} \rightarrow {}_R\text{Mod} : f_*M = \text{Hom}_S(R, M)$  is the **coinduced module**, it is right adjoint to restriction, by (3.2.4.13).

Dually for left modules, we define:

- $f^* : \text{Mod}_R \rightarrow \text{Mod}_S : f^*M = M_S = \text{Hom}_R(R, M) = M \otimes_R R$  (3.2.4.12)(3.2.4.13), the **restriction**.
- $f_! : \text{Mod}_S \rightarrow \text{Mod}_R : f_!M = M \otimes_S R$  is the **induced module**, it is left adjoint to restriction, by (3.2.4.13).
- $f_* : \text{Mod}_S \rightarrow \text{Mod}_R : f_*M = \text{Hom}_S(R, M)$  is the **coinduced module**, it is right adjoint to restriction, by (3.2.4.13).  $\lrcorner$

**Def. (3.2.4.15) [Algebras].** For  $R \in \mathcal{C}\text{Ring}$ , a(n) (commutative/unital/associative)**algebra** over  $R$  is a (commutative/unital/associative)magma object in the monoidal category  $(\text{Mod}_R, \otimes)$ .

- The category of  $R$ -algebras is denoted by  $\mathcal{A}lg_R$ .
- The category of commutative  $R$ -algebras is denoted by  $\mathcal{C}Alg_R$ .
- The category of commutative unital associative algebra over  $R$  is denoted by  $\mathcal{C}\text{Ring}_R$ .

Notice  $\mathcal{C}\text{Ring}_R \cong \mathcal{C}\text{Ring}/R$ .  $\lrcorner$

### Torsion-Free Modules

**Def. (3.2.4.16) [Torsion-Free Modules].** Let  $R$  be a ring, an  $R$ -module  $M$  is called **torsion-free** iff there are no non-zero divisor  $x \in R, 0 \neq f \in M$  that  $xf = 0$ .  $\lrcorner$

**Prop. (3.2.4.17).** If  $0 \rightarrow M_1 \rightarrow M_2 \rightarrow M_3$  and  $M_1, M_3$  are torsion-free, then  $M_2$  is torsion-free. Torsion-free is a stalk-wise property (5.1.4.2).  $\lrcorner$

*Proof:* Trivial.  $\square$

**Prop. (3.2.4.18).** Let  $M$  be a finite  $R$ -module, then  $M$  is torsion-free if it is a submodule of a finite free module.  $\lrcorner$

*Proof:* One direction is trivial, for the other, if  $M$  is torsion-free, then  $M \subset M \otimes_R K$ , and  $M \otimes_R K$  is a finite  $K$ -vector space, with basis  $e_i$ . Now let  $x_i$  be a basis of  $M$ , let  $x_i = \sum a_{ij}/b_{ij}e_j$ , then let  $e = \prod_{ij} b_{ij}$ , then  $M \subset Re_1/b \oplus \dots \oplus Re_n/b$ .  $\square$

**Prop. (3.2.4.19).** If  $M, N$  are  $R$ -modules that  $M$  is torsion-free, then  $\text{Hom}(N, M)$  is torsion free.  $\lrcorner$

*Proof:* Choose a surjection  $\bigoplus_I R \rightarrow N \rightarrow 0$ , then  $\text{Hom}(N, M) \hookrightarrow \prod_I M$  is torsion free.  $\square$

### Modules over PIDs or Bézout Domains

**Prop. (3.2.4.20)[Modules over a Bézout domain].** Let  $R$  be a Bézout domain, then

- any finite submodule of a free module over  $R$  is finite free.
- any f.p.  $R$ -module  $M$  is a summand of a free  $R$ -module and  $M_{\text{tor}}$ , where  $M_{\text{tor}} = \bigoplus R/(f_i)$  where  $f_i \in R^*$ .

$\lrcorner$

*Proof:* Cf. [Sta]0ASU. ?  $\square$

**Prop. (3.2.4.21)[Classification of Modules over PID].** Let  $R \in \mathcal{CRing}$  be a PID, then:

1. Every submodule of a free module over  $R$  is free of smaller rank. In particular, a projective module over  $R$  is free.
2. Every finite torsion-free module over  $R$  is free.
3. Every finite module over  $R$  has a primary decomposition  $M = \bigoplus_i R/(q_i)$ , where  $(q_i)$  is primary ideals.

So projective  $\iff$  free  $\iff$  torsion-free (when f.g.).  $\lrcorner$

*Proof:* 1: Choose a well ordering on the basis of  $F$ , let  $F_i$  is the submodule generated by  $e_j, j \leq i$ . Then  $\text{pr}_i(P \cap F_i) \subset R$  is an ideal of the form  $(a_i)$ , thus choose  $u_i \in P$  that  $\text{pr}_i(u_i) = a_i$ . Then  $u_i$  is a basis for  $P$ : they are linearly independent, because for any finite linear combination that are 0, the maximal coordinate are 0. It also spans  $P$ , because we can choose an element in  $P - \{u_i\}$  whose maximal nonzero coordinate  $\alpha$  is minimal among them, by well-orderedness. But we can subtract a multiple of  $u_\alpha$ , thus producing a smaller element, contradiction.

2: If it is finite torsion-free, then it is a submodule of a finite free module (3.2.4.18), so it is free by item 1.

3: Follows immediately from (5.2.5.34) and (3.2.3.18).  $\square$

**Prop. (3.2.4.22)[Primary Cyclic Decomposition].** There is a primary cyclic decomposition theorem for a torsion module  $M$  over a PID  $R$ . Thus the multisets of elementary divisors of  $M$  is a complete set of invariants for  $M$ .  $\lrcorner$

*Proof:* Cf. [Advanced Linear Algebra P153].  $\square$

**Cor. (3.2.4.23)[Invariant Factor Decomposition].** By reordering the cyclic decomposition, we can get the **invariant factor decomposition** of  $M$ , there are scalars  $d_m | d_{m-1} | \dots | d_1$  that are called the **invariant factors** of  $M$ .  $\lrcorner$

*Proof:* Cf. [Advanced Linear Algebra P157].  $\square$

**Cor. (3.2.4.24) [Elementary Factor Theorem].** Let  $F$  be a free module over a PID  $R$ , and let  $M$  be a f.g. submodule  $\neq 0$ , then there exists a basis  $\mathcal{B}$  of  $F$ , elements  $e_1, \dots, e_m$  in this basis, and non-zero elements  $a_1, \dots, a_m \in R$  that

- the elements  $a_1 e_1, \dots, a_m e_m$  forms a basis of  $M$ .
- $a_i | a_{i+1}$ .

And these  $a_i$  are uniquely determined up to units.  $\lrcorner$

### Transfinite Direct Sum Dévissage of Modules

**Def. (3.2.4.25) [Direct Sum Dévissage of Modules].** Let  $M$  be a module over a ring  $R$ , then a **direct sum dévissage** is a family of submodules  $M_\alpha$  indexed by an ordinal  $S$  such that

- $M_0 = 0$ .
- if  $\alpha + 1 \in S$ , then  $M_\alpha$  is a direct sum of  $M_{\alpha+1}$ .
- if  $\alpha$  is a limit ordinal, then  $M_\alpha = \bigcup_{\beta < \alpha} M_\beta$ .
- $\bigcup_{\alpha \in S} M_\alpha = M$ .

If moreover, for any  $\alpha \in S, \alpha + 1 \in S$ ,  $M_{\alpha+1}/M_\alpha$  is countably generated, then  $M_\alpha$  is called a **Kaplansky dévissage** of  $M$ .  $\lrcorner$

**Prop. (3.2.4.26).** Let  $M_\alpha$  be a direct sum dévissage of  $M$ , then  $M \cong \bigoplus_{\alpha \in S, \alpha+1 \in S} M_{\alpha+1}/M_\alpha$ .  $\lrcorner$

*Proof:* Cf. [Sta]058V.  $\square$

**Cor. (3.2.4.27).**  $M$  is a direct sum of countably generated modules iff  $M$  admits a Kaplansky dévissage.  $\lrcorner$

**Prop. (3.2.4.28).** Suppose  $M$  is a direct sum of countably generated modules and  $P$  is a direct sum of  $M$ , then  $P$  is also a direct sum of countably generated modules.  $\lrcorner$

*Proof:* Cf. [Sta]058X.  $\square$

**Prop. (3.2.4.29) [Direct Summand Criterion of Free Modules].** Let  $M$  be a countably generated  $R$ -module that for any direct summand  $N$  of  $M$  and an element  $x \in N$ ,  $x$  is contained in a free direct summand of  $N$ , then  $M$  is free.  $\lrcorner$

*Proof:* Let  $x_1, x_2, \dots$  be a countable set of generators for  $M$ , then we can use inductions to find free submodules  $F_1, F_2, \dots$  of  $M$  s.t.  $\bigoplus_{i=1}^n F_i$  are direct summands of  $M$  and contains  $x_1, \dots, x_n$  for any  $n$ , thus  $M = \bigoplus F_i$  is free.  $\square$

### Quadratic Forms on Modules

**Def. (3.2.4.30) [Quadratic Forms].** For  $A \in \mathcal{C}\text{Ring}$  and  $M, N \in \text{Mod}_A$ , a function  $Q : M \rightarrow N$  is called a **quadratic form** if

- $Q(am) = a^2 d(m)$  for any  $a \in A$  and  $m \in M$ .
- The function  $B_Q : M \otimes_A M \rightarrow N : (\alpha, \beta) \mapsto Q(\alpha + \beta) - Q(\alpha) - Q(\beta)$  is bilinear.

It is called **positive semi-definite form** if moreover  $N = \mathbb{R}$  as a module over  $A$  and  $Q(m) \geq 0$  for any  $m \in M$ , and it is called a **positive-definite form** if moreover  $Q(m) = 0 \iff m = 0$ .  $\lrcorner$

**Prop. (3.2.4.31) [Cauchy-Schwartz].** Let  $A \in \mathcal{A}b$  and  $d$  a positive semi-definite quadratic form over  $A$ , then

$$|d(\alpha - \beta) - d(\alpha) - d(\beta)| \leq 2\sqrt{d(\alpha)d(\beta)}.$$

┘

*Proof:* Consider the bilinear form  $B_d$ , then

$$0 \leq d(m\alpha - n\beta) = m^2d(\alpha) + n^2d(\beta) - 2mnB_d(\alpha, \beta).$$

This is true for any  $m, n \in \mathbb{Z}$ , thus the discriminant  $B_d(\alpha, \beta)^2 \leq d(\alpha)d(\beta)$ . □

**Prop. (3.2.4.32).** If  $M, N \in \mathcal{A}b$  and  $d$  is a quadratic form on  $M \times N$  s.t.  $d(0 \times N) = d(M \times 0) = 0$ , then  $d$  is bilinear in both  $M$  and  $N$ . ┘

*Proof:* The bilinear form associated to  $d$  satisfies  $B_d((a, 0), (0, b)) = d(a, b)$ , thus it is clear  $d$  is bilinear in  $M$  and  $N$ . □

**Def. (3.2.4.33) [Polarization].** Let  $\Gamma \in \mathcal{A}b$  and  $h : \Gamma \rightarrow \mathbb{R}$  is a function, then the  $r$ -th **polarization function**  $P_r(h) : \Gamma^r \rightarrow \mathbb{R}$  is defined to be

$$P_r(h)(x_1, \dots, x_r) = \frac{1}{r!} \sum_{I \subset \{1, \dots, r\}} (-1)^{r-\#I} \left( \sum_{i \in I} x_i \right).$$

┘

**Lemma (3.2.4.34).**

- Let  $\tau_a(h)(x) = h(a + x) - h(x)$ , then  $\tau_a\tau_b = \tau_{a+b} - \tau_a - \tau_b$ .
- $P_r(h)(x_1, \dots, x_r) = \tau_{x_1}\tau_{x_2} \dots \tau_{x_r}(h)(0) = \tau_{x_2} \dots \tau_{x_r}(h)(x_1)$ .
- If  $A_r \in \text{Sym}^r \Gamma^\vee$ , let  $\Delta A_r : \Gamma : \mathbb{R} : \Delta A_r(x) = \frac{1}{r!} A_r(x, \dots, x)$ , then  $\tau_a \Delta A_r(x) = \sum_{1 \leq s < r} \Delta A_s$ , where  $A_s \in \text{Sym}^s \Gamma^\vee$ , and  $A_{r-1}(x_1, \dots, x_{r-1}) = A_r(x_1, \dots, x_{r-1}, a)$ .
- If  $A_r \in \text{Sym}^r \Gamma^\vee$ ,  $P_r(\Delta A_r)(x_1, \dots, x_n) = A_r(x_1, \dots, x_r)$  and  $P_s(\Delta A_r) = 0$  for  $s > r$ .

┘

**Prop. (3.2.4.35).** There is a natural isomorphism of additive groups

$$\bigoplus_{j=0}^{r-1} \text{Sym}^j \Gamma^\vee \cong \{h : \Gamma \rightarrow \mathbb{R} | P_r(h) = 0\} : (A_0, \dots, A_{r-1}) \mapsto \sum_{i=0}^{r-1} \Delta A_i.$$

┘

*Proof:* This is an injective map by (3.2.4.34), and for any  $h$  that  $P_r(h) = 0$ , By (3.2.4.34) item1, this means  $A_{r-1} = P_{r-1}(h) \in \text{Sym}^{r-1} \Gamma^\vee$ . Let  $h' = h - \Delta A_{r-1}$ , then (3.2.4.34) item4 shows  $P_{r-1}(h') = 0$ , thus we can use induction to show  $h' = \sum_{i=1}^{r-2} \Delta A_i$ , thus  $h = \sum_{i=1}^{r-1} \Delta A_i$ . □

**Prop. (3.2.4.36).** Let  $\Gamma \in \mathcal{A}b$ , for functions  $h_1, h_2 : \Gamma \rightarrow \mathbb{R}$ , let  $h_1 = h_2 + O(1)$  denote the fact that  $|h_1 - h_2|$  is bounded on  $\Gamma$ . Then there is a natural isomorphism of additive groups:

$$\bigoplus_{j=0}^{r-1} \text{Sym}^j \Gamma^\vee \cong \{h : \Gamma \rightarrow \mathbb{R} | P_r(h) = O(1)\} / O(1) : (A_0, \dots, A_{r-1}) \mapsto h(x) = A_0 + A_1(x) + \dots + A_{r-1}(x, \dots, x).$$

┘

*Proof:* The map is injective by (3.2.4.35). To show surjectivity:

By hypothesis and (3.2.4.34), there exists  $C > 0$  s.t.

$$|P_{r-1}h(x_0 + x_1, x_2, \dots, x_{r-1}) - P_{r-1}h(x_0, x_2, \dots, x_{r-1}) - P_{r-1}h(x_1, x_2, \dots, x_{r-1})| \leq C.$$

So

$$|P_{r-1}h(2^N x_1, x_2, \dots, x_{r-1}) - 2P_{r-1}h(2^{N-1} x_1, x_2, \dots, x_{r-1})| \leq C$$

for any  $N$ , and by iterating,

$$|P_{r-1}h(2^N x_1, 2^N x_2, \dots, x_{r-1}) - 2^{r-1} P_{r-1}h(2^{N-1} x_1, 2^{N-1} x_2, \dots, 2^{N-1} x_{r-1})| \leq (2^{r-1} - 1)C.$$

$$\left| \frac{P_{r-1}h(2^N x_1, 2^N x_2, \dots, x_{r-1})}{2^{N(r-1)}} - \frac{P_{r-1}h(2^{N-1} x_1, 2^{N-1} x_2, \dots, 2^{N-1} x_{r-1})}{2^{(N-1)(r-1)}} \right| \leq \frac{2^{r-1} - 1}{2^{N(r-1)}} C.$$

Thus

$$A_{r-1}(x_1, \dots, x_{r-1}) = \lim_{N \rightarrow \infty} \frac{P_{r-1}h(2^N x_1, 2^N x_2, \dots, x_{r-1})}{2^{N(r-1)}}$$

exists, and it is clear that  $A_{r-1} \in \text{Sym}^{r-1} \Gamma^\vee$  and  $A_{r-1}(x_1, \dots, x_{r-1}) - P_{r-1}h(x_1, \dots, x_{r-1}) \leq 2^{r-1}C$ .

Let  $h' = h - \Delta A_{r-1}$ , then  $P_{r-1}h' = P_{r-1}h - A_{r-1} = O(1)$ , thus we can use induction to show  $h' = \sum_{i=1}^{r-2} \Delta A_i + O(1)$ , thus  $h = \sum_{i=1}^{r-1} \Delta A_i + O(1)$ .  $\square$

**Cor. (3.2.4.37).** Let  $\Gamma \in \mathcal{A}b$  and  $h : \Gamma \rightarrow \mathbb{R}$  be a function on an Abelian group  $\Gamma$  that

$$h\left(\sum_{i=1}^3 x_i\right) - \sum_{1 \leq i < j \leq 3} h(x_i + x_j) + \sum_{i=1}^3 h(x_i) = O(1),$$

then there exists a unique symmetric bilinear pairing  $b$  on  $\Gamma$  and  $l$  a homomorphism  $\Gamma \rightarrow \mathbb{R}$ , that

$$h(x) = \frac{1}{2}b(x, x) + l(x) + O(1).$$

┘

**Prop. (3.2.4.38).** Let  $M \in \mathcal{A}b$  and  $b : M \times M \rightarrow \mathbb{R}$  is a bilinear form on  $M$  that  $\text{rad}(B) = 0$ , so  $b$  defines a bilinear form on  $B_{\overline{R}} : M \otimes_{\mathbb{Z}} \mathbb{R} \rightarrow \mathbb{R}$ . Then  $b_{\mathbb{R}}$  is positive-definite iff for any f.g. subgroup  $M'$  of  $M$  and  $C > 0$ ,  $\{x \in M' | b(x, x) \leq C\}$  is finite.  $\square$

*Proof:* We may assume  $M$  is f.g.. As  $M/M_{\text{tor}}$  is torsion-free, it is a lattice in  $M_{\mathbb{R}}$  (19.1.5.39). Assume  $b_{\mathbb{R}}$  is positive-definite, then it defines a topology on  $M_{\mathbb{R}}$ , then  $\{x \in M' | b_{\mathbb{R}}(x, x) \leq C\}$  is finite because it is a compact discrete set.

Conversely, if  $\{x \in M' | b(x, x) \leq C\}$  is finite and  $b_{\mathbb{R}}$  is not positive-definite, then it is at least semi-positive definite. If  $b_{\mathbb{R}}(y, y) = 0$ , then by Cauchy-Schwartz inequality (3.2.4.31),  $y$  is in the radical of  $b_{\mathbb{R}}$ . By hypothesis  $y \notin M_{\mathbb{Q}}$ .

Now choose a basis  $e_1, \dots, e_n$  of  $M$ , for any  $n > 1$ , there is a  $y_n \in M$  s.t.  $y_n - ny \in S = \{\sum \alpha_i e_i | 0 \leq \alpha \leq 1\}$ , and

$$b_{\mathbb{R}}(y_n, y_n) = b_{\mathbb{R}}(y_n - ny, y_n - ny)$$

is bounded by the maximal value of  $b_{\mathbb{R}}$  on  $S$ . These  $y_n$  are all different because  $y \notin M_{\mathbb{Q}}$ , thus contradicting the hypothesis.  $\square$

**Prop. (3.2.4.39) [Descent].** Let  $M \in \mathcal{Ab}$  s.t.  $\#M/(n) < \infty$  for some  $n \geq 2$  and there is a positive semi-definite symmetric bilinear form  $B$  on  $M$  s.t.  $\{x \in M \mid B(x, x) \leq C\}$  is finite for any  $C > 0$ , then  $M$  is f.g..  $\lrcorner$

*Proof:* Choose a set of generators  $\{x_i\}$  for  $M/(n)$ . Now there is a constant  $C$  that whenever  $(x, x) \geq C$ ,

$$(x - x_i, x - x_i) < 2(x, x), \forall i,$$

because by Cauchy-Schwartz inequality (3.2.4.31),  $(x - x_i, x - x_i)$  is similar to  $(x, x)$  when  $(x, x)$  is large.

Now let  $\Gamma = \{x_1, \dots, x_s\} \cup \{x \in \Gamma \mid (x, x) < C\}$ . Then  $\Gamma$  is finite by hypothesis. We prove  $\Gamma$  generates  $M$ : Consider the infimum  $C_0$  of  $(x, x)$  that  $x$  is not generated by  $M$ , then there is a  $x$  that  $C_0 \leq (x, x) < 2C_0$ . Obviously  $C_0 \geq C$ . Let  $x = x_i + ny$  for some  $x_i \in \Gamma, y \in M$ , then

$$(y, y) = \frac{1}{n^2}(x - x_i, x - x_i) < \frac{2}{n^2}(x, x) \leq \frac{1}{2}(x, x) < C_0.$$

Thus by minimality of  $C_0$ ,  $y \in \Gamma$ , thus  $x \in \Gamma$ .  $\square$

**Prop. (3.2.4.40) [Lagrangian Decomposition].** Let  $A \in \mathcal{Ab}$  be f.g. and  $\Gamma : A \times A \rightarrow \mathbb{Q}/\mathbb{Z}$  is a bilinear alternating non-degenerate pairing, then a **Lagrangian decomposition** of  $A$  is an Abelian subgroup  $B \subset A$  s.t.  $\Gamma|_B = 0$ , called an **isotropic subgroup** of  $A$ , such that  $A \cong B \oplus B^\vee$ , and  $\Gamma$  is given by

$$\Gamma((x, \chi), (y, \psi)) = \chi(y)\psi(x)^{-1}.$$

Then  $A$  admits a Lagrangian decomposition. In particular, if  $\#A < \infty$ , then  $\#A \in (\mathbb{Z}_+)^2$ .  $\lrcorner$

*Proof:* Because  $A$  is f.g., take  $x, y$  in  $A$  s.t.  $\Gamma(x, y)$  has the maximal denominator, then it is easy to see that for any  $z \in A$ ,  $z - ax - by \in \text{span}(x, y)^\perp$  for some  $a, b \in \mathbb{Z}$ , so  $A = \text{span}(a, b) \oplus \text{span}(a, b)^\perp$ , and we can use induction.  $\square$

## 5 Fields

### Finite Fields

## 6 Field Extensions

**Def. (3.2.6.1) [Composition of Fields Extensions].**  $\lrcorner$

**Def. (3.2.6.2) [Distinguished Class of Extensions].** A family  $\mathcal{L}$  of field extensions are called a **distinguished class** iff

- It is closed under base change.
- $E/F/K \in \mathcal{L}$  iff  $F/K \in \mathcal{L}$  and  $E/F \in \mathcal{L}$ .

$\lrcorner$

### Algebraic Extensions

**Def. (3.2.6.3) [Algebraic Extensions].** An **algebraic extension** is a field extension  $L/K$  s.t. for any element  $\alpha \in L$ , there exists a nonzero polynomial  $f(X) \in K[X]$  s.t.  $f(\alpha) = 0$ .  $\lrcorner$

**Prop. (3.2.6.4).** The family of finite extensions form a distinguished class.

The family of algebraic extensions form a distinguished class.

The family of f.g. extensions form a distinguished class.  $\lrcorner$

*Proof:* Finite case is trivial. For the alg. extensions, for  $k \subset F \subset E$ , for any  $\alpha \in E$ ,  $\alpha$  satisfies a polynomial function with f.m coefficients in  $F$ , the coefficients form a subfield  $F_0$  of  $F$  which is finite over  $k$ , so  $k \subset F_0 \subset F_0(\alpha)$  is a finite tower, so it is finite, hence algebraic. The base change is easy to check.

For f.g. extensions, it suffice to check composition: ? □

**Prop. (3.2.6.5).** For an alg. extension  $k \subset E$ , any injective field map  $E \rightarrow E$  over  $k$  is an automorphism. (This is because it induce a permutation of any  $\alpha$  with its conjugates in  $E$ , so it is surjective). ⌋

**Lemma (3.2.6.6).** Let  $f \in k[X]$  be a polynomial of degree  $\geq 1$ , then there is a field  $K$  that  $f$  has a root in  $K$ . Hence for any finite set of polynomials, there is a field  $K$  that all of them have roots in  $K$ . ⌋

*Proof:* Cf. [Algebra Lang P231]. □

**Lemma (3.2.6.7).** For any  $k \in \mathbf{Field}$ , there exists  $K \in \mathbf{Field}$  s.t.  $k \subset K, \overline{K} = K$ . ⌋

*Proof:* Firstly, we construct a field that every polynomial in  $k[X]$  of degree  $\geq 1$  has a root. Consider the polynomial ring  $k[X_f]$ , where there is a indeterminant  $X_f$  for each  $f \in k[X]$  of deg  $\geq 1$ . Then the ideal generated by  $f(X_f)$  is not a unit ideal, which can be seen by constructing a finite field extension that  $f_i$  all have a root in it (3.2.6.6).

So if  $\mathfrak{m}$  is a maximal ideal containing all  $f(X_f)$ , then the quotient field is a field that all  $f$  have a root ( $X_f$ ).

So now if we construct inductively like this, and consider their union, then it is clearly a field and any polynomial of degree  $\geq 1$  have a root in it. □

**Prop. (3.2.6.8) [Algebraic Closure].** Assume the axiom of choice, for any  $K \in \mathbf{Field}$ , there exists uniquely an algebraic field extension  $K/k$  s.t.  $K$  is alg. closed, up to isomorphism over  $k$ . Any such field  $K$  is called an **algebraic closure** of  $k$ , denoted by  $\overline{k}$ . ⌋

*Proof:* Let  $E$  be a field that is alg. closed and contains  $k$  by (3.2.6.7). Let  $k^a$  be the union of subextensions that are algebraic over  $k$ .  $k^a$  is a field, by (3.2.6.4), and  $k^a$  is alg. closed, because if  $f(X)$  is a polynomial of degree  $\geq 1$  in  $k^a[X]$ , then it has a root  $\alpha \in E$ , and  $\alpha$  is algebraic over  $k^a$ , so  $\alpha \in k^a$ .

Why unique? □

**Prop. (3.2.6.9) [Finite Algebraic Extensions].** Let  $F/L/K \in \mathbf{Field}$ , there is a finite extension  $F'/K$  s.t.  $F = LF'$ . ⌋

*Proof:* Take a generator  $x_i$  of  $F/L$ , then  $x_i$  are algebraic over  $L$ , thus there are polynomials  $f_i \in L[X]$  s.t.  $f_i(x_i) = 0$ . Let  $F'$  be the fields over  $K$  generated by all the coefficients of  $f_i$ s, then  $F = LF'$ . □

**Prop. (3.2.6.10).** If  $E/F$  is an algebraic field extension, then for any  $R$  that  $E \subset R \subset F$ ,  $R$  is a field. ⌋

*Proof:* If  $\alpha \in R$ , then  $\alpha$  is algebraic over  $E$ , so there is a relation  $\alpha^n + \dots + a_0 = 0$ , so  $\alpha^{-1} = -a_0^{-1}(a_1 + \dots + \alpha^{n-1}) \in R$ . □

### Normal & Separable Extensions

**Def. (3.2.6.11) [Normal Extensions].** A field extension  $K/k$  in  $\bar{k}$  is called **normal extension** iff it satisfied the following equivalent conditions:

1. Any embedding of  $K$  into  $\bar{k}$  induce an automorphism on  $K$ .
2.  $K$  is the splitting field of a family of polynomials in  $k[X]$ .
3. Every irreducible polynomial in  $k[X]$  that has a root in  $K$  splits in  $K$ .

┘

*Proof:* Cf.[Algebra Lang P237].

□

**Prop. (3.2.6.12).** Normal extensions are stable under base change and composition, by the first definition of (3.2.6.11). ┘

**Def. (3.2.6.13) [Normal Closure].** For any field extension  $F/K$ , there is a field extension  $E/F$  that  $E/K$  is normal, called the **normal closure** of  $F/K$ , denoted by  $\tilde{F}/K$ . It is the composite of conjugates of  $F/K$ . ┘

**Def. (3.2.6.14) [Separable Degree].** Define the **separable degree**  $[E : k]_s$  of an extension  $E/k$  as the cardinality of embedding of  $E$  into  $\bar{k}$ . Separable degree commutes with composition, and when  $E/k$  is finite,  $[E : k]_s \leq [E : k]$ . ┘

**Def. (3.2.6.15) [Separable Polynomials].** A finite extension is called a **separable extension** iff  $[E : k]_s = [E : k]$ , an algebraic number  $\alpha$  over  $k$  is called **separable over  $K$**  iff  $k(\alpha)/k$  is separable. A polynomial  $f \in k[X]$  is called a **separable polynomial** iff it has no multiple roots in  $\bar{k}$ . ┘

**Def. (3.2.6.16) [Separable Extensions].** An algebraic extension  $E/k$  is called a **separable extension** iff it satisfies the following equivalent conditions:

- Every f.g. subfield is separable over  $k$ , (this is compatible because subfield of a finite separable extension is separable, by the compatibility of separable degree).
- Every element of  $E$  is separable.
- It is generated by a family of separable elements.

┘

*Proof:* If  $E/k$  is separable and  $k \subset k(\alpha) \subset E$ , then by (3.2.6.15),  $k(\alpha)$  is separable. And if it is generated by a family of separable elements  $\{\alpha_i\}$ , then any f.g. subfield can be f.g. by elements  $\{\alpha_i\}$ . Now it is a tower of separable extensions, hence separable by the compatibility of separable degree. □

**Prop. (3.2.6.17).** Separable extensions form a distinguished class. ┘

*Proof:* Cf.[Algebra Lang P241].

□

**Prop. (3.2.6.18) [Primitive Element Theorem].** A finite extension  $E/k \in \mathbf{Field}$  is primitive iff there are only f.m. middle fields. And if  $E/k$  is separable, this is satisfied. ┘

*Proof:* If  $k$  is finite, this is simple. Assume  $k$  infinite, for any two elements  $\alpha, \beta$ , consider  $k(\alpha + c_i\beta)$ , if there is only finitely many middle fields, there exists two that are equal, so  $k(\alpha, \beta) = k(\gamma)$ . Proceeding inductively,  $E$  is primitive.

Conversely, if  $k(\alpha) = E$ , every middle field corresponds to a divisor of the irreducible polynomial of  $\alpha$ . This map is injective, because for any  $g_F$ , degree of  $\alpha$  over  $F$  is the same over the degree over the coefficient field of  $g_F$ , so it must be equal to  $F$ .

If  $E/k$  is separable, Let

$$P(X) = \prod_{i \neq j} (\sigma_i \alpha + X \sigma_i \beta - \sigma_j \alpha - X \sigma_j \beta)$$

for different embedding  $\sigma_i, \sigma_j$  of  $E(\alpha, \beta)$  into  $\bar{k}$ . Then it is not identically zero, thus there exists  $c$  that  $\sigma_i(\alpha + c\beta)$  is all distinct, thus generate  $K(\alpha, \beta)$ .  $\square$

### Inseparable Extensions

**Def. (3.2.6.19) [Perfect Fields].**  $K \in \mathbf{Field}$  is called a **perfect field** if  $\text{char } k = 0$  or  $k^{\text{char } k} = k$ .  $\lrcorner$

**Prop. (3.2.6.20) [Algebraic Extensions of Perfect Fields are Perfect].** Algebraic extensions of perfect fields (3.2.6.19) are perfect fields.  $\lrcorner$

**Prop. (3.2.6.21).** Let  $k \in \mathbf{Field}$  and  $f(X) \in k[X]$  irreducible. If  $\text{char } k = 0$ , then  $f$  is separable, and if  $\text{char } k = p \in \mathbf{Prime}$ , then all the roots of  $f$  in  $\bar{k}$  have the same multiplicity and  $[k(\alpha) : k] = p^n [k(\alpha) : k]$  for some  $n \in \mathbb{Z}_+$ .  $\lrcorner$

*Proof:* All roots have the same multiplicity because there are Galois actions. If the multiplicity is not 1, the derivative  $f'$  is zero, otherwise  $f$  is not irreducible. Then  $f(X) = g(X^p)$ . We can choose  $f(X) = h(X^{p^n})$  with  $h$  separable, then  $[k(\alpha) : k(\alpha^{p^n})] = p^n$ , thus the result.  $\square$

**Def. (3.2.6.22) [Inseparable Degrees].** The **inseparable degree**  $[E : k]_i$  is defined as the quotient  $[E : k] / [E : k]_s$ . An algebraic element  $\alpha$  is called **purely inseparable** over  $k$  iff there is a  $n$  that  $\alpha^{p^n} \in k$ .  $\lrcorner$

**Def. (3.2.6.23) [Purely Inseparable Extensions].** An extension is called **purely inseparable** if it satisfies the following equivalent conditions:

- $[E : k]_s = 1$ .
- Every element  $\alpha$  of  $E$  is purely inseparable over  $k$ .
- For every  $\alpha \in E$ , the irreducible equation of  $\alpha$  over  $k$  is of type  $X^{p^n} - a$ .
- It is generated by a family of purely inseparable elements.

$\lrcorner$

*Proof:* Cf. [Algebra Lang P249].  $\square$

**Cor. (3.2.6.24).**  $K \in \mathbf{Field}^p$  is perfect (3.2.6.19) iff there are no purely inseparable extensions of it.  $\lrcorner$

**Cor. (3.2.6.25) [Perfect Closure].** For any  $k \in \mathbf{Field}^p$ , there is a unique purely inseparable field extension  $k^{\text{perf}}/k$  that  $k^{\text{perf}}$  is perfect, called the **perfect closure** of  $k$ . It is generated by adding all the  $p^n$ -th roots to  $k$ .  $\lrcorner$

**Prop. (3.2.6.26).** Purely inseparable extensions form a distinguished class.  $\lrcorner$

*Proof:* Cf. [Algebra Lang P250].  $\square$

**Prop. (3.2.6.27).** If  $E/k \in \mathbf{Field}$  is algebraic and  $E_0$  be the maximal separable extension contained in  $E$ , then  $E/E_0$  is purely inseparable. And if  $E/k$  is normal, then  $E_0/k$  is normal, too.  $\lrcorner$

*Proof:* By the proof of (3.2.6.21), any  $\alpha$  has a  $p^n$  that  $\alpha^{p^n}$  that  $\alpha^{p^n}$  is separable, hence it is purely inseparable over  $E_0$  by (3.2.6.23).  $E_0/k$  is normal because any  $\sigma$  maps  $E$  to itself, and  $E_0$  to  $\sigma(E_0) \in E$  separable, hence  $\sigma(E_0) \subset E_0$ .  $\square$

### Trace and Norm

**Prop. (3.2.6.28) [Trace and Norm].** Let  $K \subset_{\text{fin}} L \in \mathbf{Field}$  and  $\Sigma = \text{Hom}(L, \overline{K})$ , then define the **trace map**  $\text{tr}_{L/K} : L \rightarrow K : x \mapsto [L : K]_i \sum_{\sigma \in \Sigma} \sigma(x)$  and the **norm map**  $\text{Nm}_{L/K} : L \rightarrow K : x \mapsto (\prod_{\sigma \in \Sigma} \sigma(x))^{[L:K]_i}$ .  $\lrcorner$

**Prop. (3.2.6.29).** For  $L/K \in \mathbf{Field}$ ,

- the norm induces a multiplicative homomorphism  $L^\times \rightarrow K^\times$ , and the trace induces an additive homomorphism  $L \rightarrow K$ .
- if  $E/F/K$  are field extensions, then  $\text{Nm}_{E/K} = \text{Nm}_{F/K} \circ \text{Nm}_{E/F}$ , and  $\text{tr}_{E/K} = \text{tr}_{F/K} \circ \text{tr}_{E/F}$ .
- if  $L = K(\alpha)$  and  $F = \text{Irr}(\alpha, k; X) = X^n - a_{n-1}X^{n-1} + \dots + (-1)^n a_0$ , then

$$\text{Nm}_{L/K}(\alpha) = a_0, \quad \text{tr}_{L/K}(\alpha) = a_{n-1}.$$

$\lrcorner$

*Proof:* Cf. [Lan02]P285.  $\square$

**Prop. (3.2.6.30) [Calculating Dual Basis].** Let  $L = K(\alpha)$  be a finite separable extension, let  $f(X) = \text{Irr}(\alpha, K; X)$ , and

$$\frac{f(X)}{(X - \alpha)} = \beta_0 + \beta_1 X + \dots + \beta_{n-1} X^{n-1},$$

then the dual basis of  $(1, \alpha, \dots, \alpha^{n-1})$  w.r.t. the trace form (3.2.6.32) is

$$\frac{\beta_0}{f'(\alpha)}, \dots, \frac{\beta_{n-1}}{f'(\alpha)}.$$

$\lrcorner$

*Proof:* Denote the roots of  $f$  be  $\alpha_i$ , then they are pairwise different, and

$$\sum_i \frac{f(X)}{X - \alpha_i} \frac{\alpha_i^r}{f'(\alpha_i)} = X^r$$

for all  $r$  by Lagrange interpolation (3.3.1.2). But this is equivalent to

$$\text{tr}\left(\frac{\alpha^r \beta_j}{f'(\alpha)}\right) = \delta_{ij}$$

$\square$

**Prop. (3.2.6.31).** For  $K \subset L \in \mathbf{Field}$  and  $x \in L$ ,  $x \in L$  acts on  $L$  via multiplication  $T_x$ . Then

$$\det(T_x) = N_{L/K}(x), \quad \text{tr}(T_x) = \text{tr}_{L/K}(x).$$

$\lrcorner$

*Proof:* Let  $F = K(x) \subset L$ , and  $p(X)$  be the minimal monic polynomial of  $x$ , then  $\text{char}(T_x|_X) = \text{char}(T_x|_K; X)^{[L:K(x)]}$ , thus we are done by (3.2.6.29).  $\square$

**Prop. (3.2.6.32) [Trace Form].** For  $L \subset_{\text{fin}} K \in \text{Field}$ , consider the pairing

$$\text{Tr}_{L/K} : L \times L \rightarrow K : (x, y) \mapsto \text{tr}(xy),$$

called the **trace form**. Then the following are equivalent:

1.  $L/K$  is separable.
2.  $\text{tr}_{L/K} \neq 0$ .
3.  $\text{Tr}_{L/K}$  is non-degenerate.

┘

*Proof:* 2, 3 are equivalent by a minute's thought. For  $1 \iff 2$ :

If  $L/K$  is inseparable, then by (3.2.6.29), if we consider  $L/K'/K$  that  $L/K'$  is purely inseparable of degree  $p$ , then it is generated by some equation  $x^p - a$ , and the root is  $\alpha$ . Then  $L = K'(\alpha)$  and the minimal polynomial of  $\alpha^i$ ,  $0 \leq i \leq p-1$  is  $x^p - a^i$ , so  $\text{tr}(\alpha^i) = 0$ , and  $\text{tr}_{L/K} = 0$ .

If  $L/K$  is separable,  $\text{tr}_{L/K} \neq 0$  by the linear independence of characters (3.2.8.4). □

**Def. (3.2.6.33) [Discriminant of a Basis].** Let  $\alpha_i$  be a basis of a separable extension  $L/K$ , then the **discriminant of the basis**  $d(\alpha_1, \dots, \alpha_n)$  is defined to be  $(\det(\sigma_i(\alpha_j))_{i,j})^2$ . Clearly,  $d(\alpha_1, \dots, \alpha_n)$  is invariant under the Galois action of  $L/K$ , thus it is an element of  $K$ . ┘

**Prop. (3.2.6.34).** Notice  $\text{tr}_{L/K}(\alpha_i \alpha_j) = \sum_k \sigma_k(\alpha_i) \sigma_k(\alpha_j)$ , thus  $(\text{tr}_{L/K}(\alpha_i \alpha_j))$  is the product of the matrices  $(\sigma_k \alpha_i)^t$  and  $(\sigma_k \alpha_j)$ , thus

$$d(\alpha_1, \dots, \alpha_n) = \det(\text{tr}_{L/K}(\alpha_i \alpha_j)).$$

So the discriminant of  $\{\alpha_1, \dots, \alpha_n\}$  is the Gram matrix of the trace norm w.r.t. this basis (3.5.11.3).

In particular, by (3.2.6.32),

$$d(\alpha_1, \dots, \alpha_n) \neq 0.$$

┘

**Prop. (3.2.6.35).** If  $L = K(\theta)$  is a separable field extension of degree  $d$ , and  $\theta_1 = \theta, \dots, \theta_n$  are the conjugates of  $\theta$ , then

$$d(1, \theta, \dots, \theta^{d-1}) = (\det \text{Van}(\theta_1, \dots, \theta_d))^2 = \prod_{i < j} (\theta_i - \theta_j)^2.$$

┘

## 7 Transcendental Extensions

**Def. (3.2.7.1) [Transcendental Basis].** Let  $k \subset K \in \text{Field}$ , a **transcendental base** of  $K/k$  is an algebraically independent subset of  $K$  that any element of  $K$  is algebraic over it.

Given any algebraically independent set  $S \subset T$  a set over which  $K$  is algebraic,  $S$  can be extended to a transcendental base contained in  $T$ , by Zorn's lemma. In particular, transcendental basis exist.

┘

**Prop. (3.2.7.2).** Any two transcendental basis have the same cardinality, called the **transcendental degree** of  $K/k$ , denoted by  $\text{tr.deg}(K/k)$ . ┘

*Proof:* If  $K/k$  has a finite transcendental basis, then let  $X = \{x_1, \dots, x_m\}$  transcendental base of minimal number,  $S = \{w_1, \dots, w_n\}$  an algebraically independent set. If  $n > m$ , we proceed by changing one element in  $X$  a time using induction and prove that  $K$  is algebraic over  $\{w_1, \dots, w_r, x_{r+1}, \dots, x_m\}$ , contradiction.

Because  $w_{r+1}$  is algebraic over  $\{w_1, \dots, w_r, x_{r+1}, \dots, x_m\}$ , we have a minimal polynomial

$$f = \sum g_j(w_{r+1}, w_1, \dots, w_r, x_{r+2}, \dots, x_m)x_{r+1}^j$$

s.t.  $f(w_{r+1}, w_1, \dots, x_m) = 0$  (after possibly renumbering  $x_i$ , this  $x$  must exist because  $S$  is itself algebraically independent). So  $x_r$  is algebraic over  $\{w_1, \dots, w_{r+1}, x_{r+2}, \dots, x_m\}$ , hence  $K$  is independent over it, too.

If  $K/k$  has an infinite basis  $B$ , let  $B'$  be another basis, then for any  $\alpha \in B^*$ , there is a finite set  $B_\alpha \subset B$  that  $\alpha$  is algebraic over  $k(B_\alpha)$ , because algebraic equation involves f.m. generators. Then we define  $B^* = \cup_{\alpha \in B'} B_\alpha$ , then it has cardinality smaller than  $B'$ . But  $B^* = B$ , because for any  $\beta \in B$ ,  $\beta$  is algebraic over  $B'$  which is algebraic over  $k(B^*)$ , thus  $\beta$  is algebraic over  $k(B^*)$ , thus  $\beta \in B^*$ .  $\square$

**Prop. (3.2.7.3).** If  $K$  is of finite transcendental degree over  $k$ , then  $\#K = \#k$ .  $\lrcorner$

*Proof:* We find a purely transcendental  $L/k$  that  $K/L$  is algebraic, then the element of  $L$  are all polynomials of finite indeterminants of elements of  $k$ , so  $|L| = |k|$  by (2.2.8.4), and similarly  $|K| = |L|$ .  $\square$

**Prop. (3.2.7.4).** For  $k \in \mathbf{Field}$ , any two alg.closed field extension  $K_1/k, K_2/k$  of the same transcendental degree over  $k$  are isomorphic over  $k$ .  $\lrcorner$

*Proof:* We define a bijection of the transcendental basis, and then extend it to an isomorphism of fields, by (3.2.6.8).  $\square$

**Cor. (3.2.7.5).** Any two alg.closed field of the same characteristic and cardinality are isomorphic.  $\lrcorner$

*Proof:* It suffices to show that their transcendental basis over the base field are of the same cardinality?  $\square$

**Cor. (3.2.7.6) [Extending Automorphisms].**

- Let  $K/k \in \mathbf{Field}$  and  $K = \overline{K}$ , then any automorphism of  $k$  extends to an automorphism of  $K$ .
- Let  $K/k \in \mathbf{Field}$  and  $\#K \leq \aleph_0, \#K > \aleph_0$ , then any homomorphism  $\alpha : k \rightarrow K$  extends to an automorphism of  $K$ .

$\lrcorner$

*Proof:* 1 follows from (3.2.7.5).

2 follows from the fact that  $\text{tr.deg}(K/k) = \text{tr.deg}(K/\alpha(k))$ .  $\square$

**Prop. (3.2.7.7) [Transitivity of Transcendence Degrees].** Let  $k \subset E \subset K \in \mathbf{Field}$ , then  $\text{tr.deg}(K/k) = \text{tr.deg}(K/E) + \text{tr.deg}(E/k)$ .  $\lrcorner$

*Proof:* ?  $\square$

**Prop. (3.2.7.8) [Lüroth].** The automorphism group of  $K(T)$  is  $\text{PGL}(2; K)$ .  $\lrcorner$

*Proof:* Consider  $\theta = \sigma(x) = \frac{f(x)}{g(x)}$ , then  $x$  is algebraic over  $K(\theta) : \theta g(x) - f(x) = 0$ . Now  $x$  is transcendental over  $K$ , thus  $\theta$  is transcendental over  $K$  as well. Now the minimal polynomial of  $x$  over  $K(\theta)$  is just  $\theta g(x) - f(x)$ , because it is irreducible, as it is linear over  $\theta$ . But  $K(x) = K(\theta)$ , thus the polynomial must have degree 1, so  $f(x), g(x)$  is of degree 1. Now the rest is clear.  $\square$

**Prop. (3.2.7.9) [Lüroth].** Any subfield  $K \not\subset L \subset K(T)$  is of the form  $K(u)$  where  $u \in K(X)$  is transcendental over  $K$ .  $\lrcorner$

*Proof:* It is clearly transcendental over  $K$ , so this follows from (7.13.1.18) and Riemann-Hurewitz (7.13.1.33), notice that the field extension is separable by (5.3.9.4): The non-singular complete curve corresponding to  $L$  has genus 0, and it has a rational point, so isomorphic to  $\mathbb{P}_k^1$  (7.13.8.2).  $\square$

### Linearly Disjoint Extensions

**Def. (3.2.7.10) [Linearly Disjoint Extensions].** Let  $k \subset K \in \mathbf{Field}$ ,  $L \subset \Omega = \overline{\Omega} \in \mathbf{Field}$ . Then  $K$  is said to be **linearly disjoint** from  $L$  over  $k$  if any finite subset of  $K$  that is linearly independent over  $k$  remains linearly independent over  $L$ .

When  $[K : k], [L : k] < \infty$ , this is equivalent to the fact that  $[KL : k] = [K : k] \cdot [L : k]$ .  $\lrcorner$

**Prop. (3.2.7.11).** Situation as in (3.2.7.10), if  $K$  is linearly disjoint from  $L$ , then  $L$  is linearly disjoint from  $K$ .  $\lrcorner$

*Proof:* Let  $y_1, \dots, y_n$  be elements of  $L$  that is linearly independent over  $k$ . Suppose  $x_1, \dots, x_n \in K$  are not all zero s.t.  $\sum x_i y_i = 0$ , then we may assume  $x_1, \dots, x_r$  are linearly independent and  $x_{r+1}, \dots, x_n$  are linear combinations of  $\{x_1, \dots, x_r\}$ . Suppose  $x_k = \sum_{i=1}^r a_{ki} x_i$ , then

$$\sum_{i=1}^r \left( y_i + \sum_{k=r+1}^n a_{ki} y_k \right) x_i = 0.$$

But then by the hypothesis,  $y_i + \sum_{k=r+1}^n a_{ki} y_k = 0$ , contradiction.  $\square$

**Prop. (3.2.7.12).** Let  $k \subset \Omega \in \mathbf{Field}$  and  $K, E \subset L \in \mathbf{Field}$  be subfields of  $\Omega$  containing  $k$ , then  $K, L$  are linearly disjoint over  $k$  iff  $K, E$  are linearly disjoint over  $k$  and  $KE, L$  are linearly disjoint over  $E$ .  $\lrcorner$

*Proof:* Cf. [Lan02] P361. ?  $\square$

**Def. (3.2.7.13) [Algebraically Disjoint Extensions].** Situation as in (3.2.7.10),  $K$  is said to be **algebraically disjoint** from  $L$  over  $k$  if any finite subset of  $K$  that is algebraically independent over  $k$  remains algebraically independent over  $L$ .

When  $\text{tr.deg}(K/k), \text{tr.deg}(L/k) < \infty$ , this is equivalent to the fact that  $\text{tr.deg}(KL/k) = \text{tr.deg}(K/k) + \text{tr.deg}(L/k)$ .  $\lrcorner$

**Prop. (3.2.7.14).** Situation as in (3.2.7.10), if  $K$  is algebraically disjoint from  $L$ , then  $L$  is algebraically disjoint from  $K$ .  $\lrcorner$

*Proof:* This follows from transitivity property of transcendence degrees (3.2.7.7).  $\square$

**Prop. (3.2.7.15).** Situation as in (3.2.7.10), if  $K, L$  are linearly disjoint over  $k$ , then they are algebraically disjoint over  $k$ .  $\lrcorner$

*Proof:* Let  $x_1, \dots, x_n$  be elements of  $K$  that are algebraically independent over  $k$ , suppose there are f.m.  $y_\alpha \in L$  s.t.  $\sum_\alpha y_\alpha \underline{x}^\alpha = 0$ , then  $\{\underline{x}^\alpha\}_\alpha$  are linearly dependent over  $L$ . But they are linearly independent over  $k$ , contradicting the hypothesis that  $K, L$  are linearly disjoint over  $k$ .  $\square$

## 8 Galois Theory

**Prop. (3.2.8.1) [Fixed Fields].** If  $K \subset L \in \mathbf{Field}$  and  $L = \overline{L}$ , then  $L^{\mathrm{Aut}(L/K)} = K^{\mathrm{perf}}$ .  $\lrcorner$

*Proof:*  $K^{\mathrm{perf}} \subset L^{\mathrm{Aut}(L/K)}$  is trivial, to show the other inclusion, it suffices to show that for any  $x \in L \setminus K^{\mathrm{perf}}$ , there exists  $\sigma \in \mathrm{Aut}(L/K)$  s.t.  $\sigma(x) \neq x$ . If such an  $x$  is transcendental over  $K$ , then there is an automorphism of  $K(x)$  that maps  $x$  to  $-x$ , and it extends to an automorphism of  $L$  by (3.2.7.6). And if  $x$  is integral over  $K$  but not purely inseparable over  $K$ , then there exists a conjugate  $x'$  of  $x$  s.t.  $x' \neq x$ . Then there is an automorphism of  $K(x)$  that maps  $x$  to  $x'$ , and it extends to an automorphism of  $L$ .  $\square$

**Def. (3.2.8.2) [Galois Extensions].** A **Galois field extension** is a field extension that is both normal (3.2.6.11) and (algebraic)separable (3.2.6.14). We use  $L/K \in \mathbf{GalField}$  to denote that:  $L/K \in \mathbf{Field}$  and  $L/K$  is a Galois field extension. And we use  $L/K \in \mathbf{GalField}^{\mathrm{fin}}$  to denote that:  $L \subset K \in \mathbf{Field}$  and  $L/K$  is a finite Galois field extension.  $\lrcorner$

**Def. (3.2.8.3) [Galois Closures].** Let  $F/K \in \mathbf{Field}$  be separable, then the normal closure  $E/K$  is also separable, called the **Galois closure** of  $F/K$ .

In particular, the maximal separable extension  $k^{\mathrm{sep}}/k$ , called the **separable closure** of  $k$ , is Galois over  $k$ , and  $\mathrm{Gal}(k^{\mathrm{sep}}/k)$  is denoted by  $\mathrm{Gal}_k$ .  $\lrcorner$

**Prop. (3.2.8.4) [Linear Independence of characters, Dedekind/Artin].** Let  $L \in \mathbf{Field}$ ,  $G \in \mathcal{M}\mathrm{on}$  and  $\chi_i : G \rightarrow L$  be distinct multiplicative maps, then  $\chi_i$  are linearly independent over  $L$ .  $\lrcorner$

*Proof:* Let  $\sum_{i=1}^n a_i \chi_i = 0$  and  $a_i \neq 0$  for any  $i$ , we use induction to derive contradictions: for all  $i$ .  $n = 1$  is trivial, and for general  $n$ , assume  $a_1, a_2 \neq 0$ , then the two equations  $\chi_1(h) \neq \chi_2(h)$ , then  $\sum_{i=1}^n a_i \chi_i(hg) = 0$  and  $\sum_{i=1}^n a_i \chi_i(g) = 0$  gives us a equation with smaller  $n$ , thus we are done.  $\square$

**Cor. (3.2.8.5).** If  $\alpha_i$  are different elements in  $K$  and there are element  $a_i$  that  $\sum a_i \alpha_i^v = 0$  for every  $v \geq 0$ , then  $a_i = 0$  for all  $n$ . (Seen as characters from  $\mathbb{Z}_{\geq 0} \rightarrow K$ ).  $\lrcorner$

**Thm. (3.2.8.6) [Algebraic Independence of Automorphisms, Artin].** Let  $K \in \mathbf{Field}$ , and  $G = \{\sigma_1, \dots, \sigma_n\}$  be a finite subgroup of  $\mathrm{Aut}(K)$ , then  $\{\sigma_i\}$  are algebraically independent over  $K$ .  $\lrcorner$

*Proof:* Cf. [Lang, P311]. ?  $\square$

**Thm. (3.2.8.7) [Galois Main Theorem, Artin].** Let  $K \in \mathbf{Field}$  and  $G \leq \mathrm{Aut}(K)$  be a finite subgroup. Then  $K/K^G \in \mathbf{GalField}$  and  $\mathrm{Gal}(K/K^G) \cong G$ .  $\lrcorner$

*Proof:* For every element  $x$ , set  $\{\sigma_1 x, \dots, \sigma_r x\}$  be distinct conjugates, then  $f(X) = \prod_i^r (X - \sigma_i x)$  shows that  $K$  is separable and normal over  $K^G$ . And primitive element theorem shows that  $[K : K^G] \leq |G|$ , so it must equals  $G$ .  $\square$

**Prop. (3.2.8.8).** If  $L/K \in \mathbf{GalField}^{\mathrm{fin}}$ , then there is an isomorphism of  $L$ -vector spaces:

$$L \otimes_K L \cong L \times L \times \dots \times L : (a, b) \mapsto (ab, a\sigma_1(b), \dots, a\sigma_{n-1}(b))$$

where  $\sigma_i$  are Galois elements, and  $L$  acts on the left on  $L \otimes_K L$ .  $\lrcorner$

*Proof:* Choose a primitive element  $x$  and its minimal polynomial  $f(x)$ , then  $L \cong K[X]/(f)$ , and  $L \otimes_K L \cong L[X]/(f)$ , but  $f$  decomposes completely in  $L[X]$ , thus by Chinese remainder theorem (5.1.1.8), the given map is an isomorphism of rings.  $\square$

**Prop. (3.2.8.9)[Normal Basis Theorem].** For  $L/K \in \mathbf{GalField}^{\text{fin}}$ , normal basis exists.  $\lrcorner$

*Proof:* Finite case: The Galois group is cyclic, and the linear independent of characters shows that the minimal polynomial of  $\sigma$  is  $n$ -dimensional thus equals  $X^n - 1$ . Regard  $L$  as a  $K[X]$  module thus by (3.2.4.21) is a direct sum of modules of the form  $K[X]/(f(x))$ ,  $f(x)|X^n - 1$  and the minimal polynomial for the action of  $X$  is  $X^n - 1$ . So it must be isomorphic to  $K(X)/(X^n - 1)$ .

Infinite Case: Let

$$f(\{X_\sigma\}) = \det(t_{\sigma_i, \sigma_j}) \in \mathbb{Z}[\{X_\sigma\}], \quad t_{\sigma, \tau} = X_{\sigma^{-1}\tau}$$

then  $f \neq 0$  by substituting 1 for  $X_{\text{id}}$  and 0 otherwise. So it won't vanish for all  $x \in L$  if we substitute  $X_\sigma = \sigma(x)$  because  $\{(\sigma(x))_\sigma\}$  are algebraically independent (3.2.8.6). Thus there exists  $w \in L$  s.t.

$$\det(\sigma^{-1}\tau(w)) \neq 0.$$

Now if

$$\sum a_\tau \tau(w) = 0, \quad a_\sigma \in K,$$

act by  $\sigma$  for all  $\sigma$ , we get  $[\sigma^{-1}\tau(w)]_{\tau, \sigma} [a_\sigma]_\sigma = 0$ , thus  $a_\sigma = 0$  for each  $\sigma \in \text{Gal}(L/K)$ . So  $\{\tau(w)\}$  is a  $K$ -basis of  $L$ .  $\square$

**Prop. (3.2.8.10)[Finite Fields].**  $\text{Gal}(\mathbb{F}_{p^n}/\mathbb{F}_p) = \mathbb{Z}/(n)$ . and is generated by the **Frobenius automorphism**  $\varphi : x \mapsto x^p$ .  $\lrcorner$

*Proof:*  $\square$

### Infinite Galois theory

References are [Hid04]P31 and [Sta].

**Def. (3.2.8.11)[Krull Topology].** For  $L/K \in \mathbf{Field}$ , we can define a topology on  $\text{Aut}(L/K)$  as follows: A fundamental system of nbhd of  $\text{id} \in \text{Aut}(L/K)$  is given by  $\text{Aut}(L/M)$ , where  $M/K$  is f.g. This is called the **Krull topology**.  $\lrcorner$

**Thm. (3.2.8.12)[Infinite Galois Theorem, Jacobson].** For  $L/K \in \mathbf{Field}$ , the set of intermediate fields  $M$  s.t.  $L/M \in \mathbf{GalField}$  is in bijection with the set of compact subsets of  $\text{Aut}(L/M)$ .

Moreover, this bijection induces a bijection between the set of intermediate fields  $M$  f.g. over  $K$  s.t.  $L/M \in \mathbf{GalField}$  with the set of compact open subsets of  $\text{Aut}(L/M)$ . If there is a compact open subset of  $\text{Aut}(L/M)$ , then  $\text{Aut}(L/M)$  is locally compact.  $\lrcorner$

*Proof:* ? Cf. [Hid04]P35 or [Sta]0BML.

The highlight is that  $G(L/L^H) = H$  for a closed subgp  $H$  of  $\text{Gal}(L/K)$ . If  $\sigma$  fixes  $L^H$  but is not in  $H$ , because for every finite field  $M$ ,  $H \cdot G(L/M)$  corresponds to  $M/(M \cap L^H)$ , so  $\sigma G(L/M) \cap H \neq \emptyset$ . So  $\sigma$  is in the closure of  $H$  thus in  $H$ .  $\square$

**Prop. (3.2.8.13)[Infinite Fixed Fields].** Suppose  $C \in \mathbf{Field}$  s.t.  $C = \overline{C}$ , and  $U \leq \text{Aut}(C)$  with  $V \leq U$  a subgroup of finite index, then  $[C^V : C^U] < \infty$ . Moreover, if  $V \trianglelefteq U$ , then  $[C^V : C^U] \leq [U : V]$ .  $\lrcorner$

*Proof:* Define  $W = \bigcap_{g \in U} gVg^{-1} \subset V$ , then  $W$  is a subgroup of  $V$  that is normal in  $U$ . There is a natural map  $U/V \rightarrow \text{Aut}(C^U/C^V)$ , and the fixed field of the image is just  $C^V$ . By (3.2.8.7), this implies that  $C^U/C^V \in \mathbf{GalField}^{\text{fin}}$  and  $U/V \rightarrow \text{Aut}(C^U/C^V)$  is surjective. Thus

$$[C^V : C^U] \leq [C^W : C^U] \leq [U : W].$$

$\square$

**Prop. (3.2.8.14)[Linearly Disjoint Galois Extensions].** Situation as in (3.2.7.10), if  $K, L$  are linearly independent over  $k$ , then  $K \cap L = k$ , and the converse is true if  $K/k, L/k \in \mathbf{GalField}$ .  $\square$

*Proof:* For the converse, it suffices to prove for  $K/k, L/k \in \mathbf{GalField}^{\text{fin}}$ . Let  $H_L = \text{Gal}(KL/K)$  and  $H_K = \text{Gal}(KL/K)$ , we have  $H_L \cap H_K = e$  and  $H_L H_K = H$ , so we must have  $[KL : k] = [K : k] \cdot [L : k]$ .  $\square$

**Prop. (3.2.8.15)[Kummer Theory].** Let  $n \in \mathbb{Z}_+, K \in \mathbf{Field}$  s.t.  $n \in K^\times$  and  $\mu_n \subset K$ . A **Kummer extension**  $L/K$  of exponent  $n$  is a Galois extension that the Galois group is Abelian of exponent  $n$ .

Then there is an inclusion preserving isomorphism between the lattice of Kummer extensions  $L$  over  $K$  and the lattice of subgroups of  $K^\times$  containing  $(K^\times)^n$ :

$$L \mapsto \Delta = (L^\times)^n \cap K^\times, \quad \Delta \mapsto K(\sqrt[n]{\Delta}).$$

And  $\Delta/(K^\times)^n$  is isomorphic to  $\text{Gal}(L/K)^\vee = \text{Hom}(\text{Gal}(L/K), \mathbb{Q}/\mathbb{Z})$ .  $\square$

*Proof:* The Galois cohomology of the Kummer sequence  $1 \rightarrow \mu_n \rightarrow L^\times \xrightarrow{n} (L^\times)^n \rightarrow 0$  says

$$1 \rightarrow K^\times \xrightarrow{n} (L^\times)^n \cap K^\times \xrightarrow{\delta} H^1(\text{Gal}(L/K), \mu_n) \rightarrow H^1(\text{Gal}(L/K), L^\times) = 1 \text{ (9.8.3.2)}.$$

And  $\text{Gal}(L/K)$  acts trivially on  $\mu_n \subset K^*$ , so

$$H^1(\text{Gal}(L/K), \mu_n) = \text{Hom}(\text{Gal}(L/K), \mathbb{Q}/\mathbb{Z}),$$

and

$$\delta : a \mapsto \chi_a(\sigma) = \sigma(\sqrt[n]{a})/\sqrt[n]{a} \in \mu_n.$$

Now let  $L/K \in \mathbf{GalField}$  be the maximal Kummer extension of exponent  $n$ , then  $(L^\times)^n = K^\times$ . So the assertion follows from Galois theory on applied to  $L/K$ .  $\square$

**Thm. (3.2.8.16)[Artin-Schreier Theory].** Let  $K \in p\text{-Field}$  containing  $\mathbb{F}_q$ , where  $q = p^k$ , an **Artin-Schreier extension**  $L/K$  of exponent  $q$  is a Galois extension that the Galois group is Abelian of exponent  $q$ .

Then there is an inclusion preserving isomorphism between the lattice of Artin-Schreier extensions  $L$  over  $K$  of exponent  $q$  and the lattice of subgroups of  $W_{p,k}^+(K)$  containing  $(W_{p,k}^+(\text{Frob}_p^k) - \text{id})(W_{p,k}^+(K))$ :

$$L \mapsto \Delta = (W_{p,k}^+(\text{Frob}_p^k) - \text{id})(W_{p,k}^+(L)) \cap W_{p,k}^+(K),$$

$$\Delta \mapsto K(\{b_{i1}, \dots, b_{ik} | b_i = (b_{i1}, \dots, b_{ik}), W_{p,k}^+(\text{Frob}_p^k)(b) - b \in \Delta\}).$$

And  $\Delta/(W_{p,k}^+(\text{Frob}_p^k) - \text{id})(W_{p,k}^+(K))$  is isomorphic to  $\text{Gal}(L/K)^\vee = \text{Hom}(\text{Gal}(L/K), \mathbb{Q}/\mathbb{Z})$ .  $\square$

*Proof:* The Galois cohomology of this exact sequence

$$0 \rightarrow W_{p,k}^+(\mathbb{F}_q) \rightarrow W_{p,k}^+(L) \xrightarrow{W_{p,k}^+(\text{Frob}_p^k) - \text{id}} (W_{p,k}^+(\text{Frob}_p^k) - \text{id})(W_{p,k}^+(L)) \rightarrow 0,$$

says

$$1 \rightarrow W_{p,k}^+(K) \xrightarrow{W_{p,k}^+(\text{Frob}_p^k) - \text{id}} (W_{p,k}^+(\text{Frob}_p^k) - \text{id})(W_{p,k}^+(L)) \cap W_{p,k}^+(K)$$

$$\xrightarrow{\delta} H^1(\text{Gal}(L/K), W_{p,k}^+(\mathbb{F}_q)) \rightarrow H^1(\text{Gal}(L/K), W_{p,k}^+(L)) = 0 \text{ (9.8.3.3)}$$

And  $\text{Gal}(L/K)$  acts trivially on  $W_{p,k}^+(\mathbb{F}_q)$ , so by (5.5.3.14),

$$H^1(\text{Gal}(L/K), W_{p,k}^+(\mathbb{F}_q)) = \text{Hom}(\text{Gal}(L/K), \mathbb{Q}/\mathbb{Z})$$

and

$$\delta : a \mapsto \chi_a(\sigma) = \sigma(b) - b \in W_{p,k}^+(\mathbb{F}_q), \quad W_{p,k}^+(\text{Frob}_p^k)(b) - b = a.$$

Next we prove for any  $b = (b_1, \dots, b_k)$ ,  $W_{p,k}^+(\text{Frob}_p^k)(b) - b \in W_{p,k}^+(K)$ ,  $K(\{b_1, \dots, b_k\})/K$  is Abelian of exponent  $q$ : Let  $K_i = K(\{b_1, \dots, b_i\})$ . By (5.5.2.7),

$$(b_1^q, \dots, b_k^q) - (b_1, \dots, b_k) \in W_{p,k}^+(K)$$

implies  $b_i^q - b_i \in K_{i-1}$ . Thus  $K_i/K_{i-1}$  is an Artin-Schreier extension of exponent  $p$ . As the Galois action is always of the form  $\sigma(s) - s \in \mathbb{F}_q$  for any  $\sigma \in \text{Gal}(K_i/K)$  and  $s \in K_k$ , we see  $K_k/K$  is also Artin-Schreier of exponent  $q = p^k$ .

Now let  $L/K$  be the maximal Artin-Schreier extension of exponent  $q$ , then  $(W_{p,k}^+(\text{Frob}_p^k) - \text{id})(W_{p,k}^+(L)) = W_{p,k}^+(K)$ . So the assertion follows from Galois theory on applied to  $L/K$ .  $\square$

**Cor. (3.2.8.17) [Artin-Schreier of Exponent  $p$ ].** Let  $p \in \text{Prime}$ ,  $K \in \text{Field}^p$ , then there is an inclusion preserving isomorphism between the lattice of Artin-Schreier extensions  $L$  over  $K$  of exponent  $p$  and the lattice of subgroups of  $K^+$  containing  $\{x^p - x | x \in K\}$ :

$$L \mapsto \Delta = \{x^p - x | x \in L\} \cap K,$$

$$\Delta \mapsto K(\{b | b^p - b \in \Delta\}).$$

And  $\Delta / \{x^p - x | x \in K\}$  is isomorphic to  $\text{Gal}(L/K)^\vee = \text{Hom}(\text{Gal}(L/K), \mathbb{Q}/\mathbb{Z})$ .  $\lrcorner$

**Thm. (3.2.8.18) [Unsolvability of the Quintic by Radicals, Abel1826-Galois1832].**  $\lrcorner$

*Proof:*  $\square$

## 9 Ordered Rings

**Def. (3.2.9.1) [Ordered Abelian Groups].** An **ordered Abelian group** is an Abelian group  $\Gamma \in \mathcal{Ab}$  together with a subset  $P \subset \Gamma$  s.t.

- $R = P \coprod \{0\} \coprod (-P)$  is a disjoint union.
- If  $x, y \in P$ , then  $x + y \in P$ .

Elements in  $P$  are called **positive elements**.  $\lrcorner$

**Def. (3.2.9.2) [Ordered Rings].** An **ordered ring** is a commutative ring  $R \in \mathcal{CRing}$  together with a subset  $P \subset R$  s.t.

- $R = P \coprod \{0\} \coprod (-P)$  is a disjoint union.
- If  $x, y \in P$ , then  $x + y, xy \in P$ .

Elements in  $P$  are called **positive elements**.

An **ordered field** is an ordered ring that is also a field. An **orderable ring** (resp. orderable field) is a ring (resp. field) that can be given an ordered structure.  $\lrcorner$

**Prop. (3.2.9.3).** An orderable field  $K$  (3.2.9.2) satisfies  $\text{char } K = 0$ , because  $0 \notin P \cup (-P)$ .

For any orderable field  $K$  and  $x \in K$ , we have  $x^2 \in P$ .  $\lrcorner$

**Def. (3.2.9.4) [Convex Subgroups].** Let  $\Gamma$  be an ordered Abelian group (3.2.9.1), then a **convex subgroup** of  $A$  is a subgroup  $\Delta$  that if  $a < b < c$  and  $a, c \in \Delta$ , then  $b \in \Delta$ . Notice this is in fact equivalent to if  $0 < c \in \Delta$ , then  $0 < b < c$  are also in  $\Delta$ .  $\lrcorner$

**Prop. (3.2.9.5) [Height].** Let  $\Gamma$  be an ordered Abelian group (3.2.9.1), then the set of all convex subgroups of  $\Gamma$  is well-ordered, and its ordinal is called the **height** of  $\Gamma$ .  $\lrcorner$

*Proof:* If  $\Delta_1, \Delta_2$  don't contain each other, let  $a \in \Delta_1 - \Delta_2$  and  $b \in \Delta_2 - \Delta_1$ , then changing  $\pm a, \pm b$ , we may assume  $0 < a < b$ , so  $a \in \Delta_2$ , contradiction.  $\square$

**Prop. (3.2.9.6) [Height 1 Case].** Let  $\Gamma$  be an ordered Abelian group (3.2.9.1), then the following are equivalent:

1.  $\text{ht}(\Gamma) = 1$ .
2. for all  $a, b \in \Gamma$  that  $a > 0$  and  $b \geq 0$ , there is an integer  $n$  that  $b \leq na$ .
3. there exists an ordered injection  $\Gamma \hookrightarrow (\mathbb{R}, <)$ .

$\lrcorner$

*Proof:*  $3 \rightarrow 1$  is easy.

$1 \rightarrow 2$ : Consider the convex subgroup generated by  $a$ , then it is  $\Delta$  by height condition, so  $b$  must be in it, i.e.  $b \leq na$  for some  $n$ .

$2 \rightarrow 3$ : Choose an  $a > 0$ , let the injection  $\varphi$  given by  $\varphi(b) = \sup\{\frac{n}{k} | na \leq kb\}$  for  $b > 0$  and extends to negative elements.

It is easily verified that  $\varphi(c) + \varphi(b) \leq \varphi(c + b)$ , and if  $\varphi(c) + \varphi(b) < \varphi(c + b)$ , choose a rational approximation of them, and multiply to get integers, then if  $k(c + b) \leq \varphi(c + b)ka > \varphi(b)a + \varphi(c)a + a$ , then either  $kc \geq \varphi(c)ka + a$  or  $kb \geq \varphi(b)ka + a$ , contradiction.

So this map is truly a morphism of ordered Abelian groups, and it is injective because if  $b > 0$ , then by 2, there must be an  $n$  that  $a \leq nb$ , so  $\varphi(b) \geq 1/n$ .  $\square$

## 10 Real Fields

**Def. (3.2.10.1) [Real Fields].** A field  $K$  is called **real** if  $-1$  is not a sum of squares in  $K$ . A field  $K$  is called **real closed** iff it is real, and any alg. extension that is real must be itself. An ordered field is clearly a real field by (3.2.9.3), the converse is in fact true, by (3.2.10.11). In particular, a real field is of characteristic 0.  $\lrcorner$

**Prop. (3.2.10.2).** If  $K$  is real,  $a \in K$ ,  $a$  and  $-a$  cannot both be sum of squares. If  $-a$  is not a sum of squares in  $K$ , then  $K(\sqrt{a})$  is real. Hence either  $K(\sqrt{a})$  or  $K(\sqrt{-a})$  is real.  $\lrcorner$

*Proof:* Suppose  $K(\sqrt{a})$  is not real. If  $a$  is a square, then  $K(\sqrt{a}) = K$  is real. So  $a$  is not a square,

$$-1 = \sum (b_i + c_i \sqrt{a})^2 = \sum (b_i^2 + ac_i^2 + 2b_i c_i \sqrt{a})$$

Since  $\sqrt{a} \notin K$ ,  $-1 = \sum (b_i^2 + ac_i^2)$ , so

$$-a = \frac{1 + \sum b_i^2}{\sum c_i^2}$$

This implies that  $-a$  is a sum of squares.  $\square$

**Prop. (3.2.10.3).** If the minimal polynomial  $f$  of an  $\alpha$  algebraic over a real field  $K$  is of odd degree, then  $K(\alpha)$  is real.  $\lrcorner$

*Proof:* If  $K(a)$  is not real, then  $-1 = \sum g_i(X)^2 + h(X)f(X)$ , where  $g_i$  has degree smaller than  $n$ . This can happen if  $h(X)$  has degree odd and  $\leq n-2$ . Then if  $\beta$  is a root of  $h$ , then  $K(\beta)$  is also not real. So the proof is finished if we use induction.  $\square$

**Def. (3.2.10.4) [Real Closure Exists].** For any real field  $K$ , there exists a **real closure**  $K^a$  of  $K$ . That is, it is real closed and algebraic over  $K$ .  $\lrcorner$

*Proof:* This is an easy consequence of Zorn's lemma.  $\square$

**Cor. (3.2.10.5) [Real Closed Fields Unique Ordering].** There exists a unique ordering on a real closed field  $R$ . The elements  $> 0$  are just the squares in  $R$ . Now every real closed field is assumed to have this ordering tacitly. In particular, any real closed field has  $\text{char} 0$ , so does any real field.  $\lrcorner$

*Proof:* The set of finite sum of squares in  $R$  is closed under addition and multiplication, and all of them are squares, by (3.2.10.2) and maximality of  $R$ . Also by (3.2.10.2) either  $a$  is a square or  $-a$  is a square, but not simultaneously. So it is truly an order on  $R$ .  $\square$

**Prop. (3.2.10.6) [Fundamental Theorem of Algebra].** For  $R \in \mathbf{Field}$ ,  $R$  is real closed iff  $R \neq R[\sqrt{-1}]$  and  $\overline{R} = R(\sqrt{-1})$ .  $\lrcorner$

*Proof:* One direction is trivial, the other follows from the lemma below (3.2.10.7), it satisfies the condition by (3.2.10.2) and maximality.  $\square$

**Lemma (3.2.10.7) [Equivalent Definition of Real Closed Fields].** If  $R$  is a real field that: for all  $a \in R$ ,  $\sqrt{a} \in R$  or  $\sqrt{-a} \in R$ , and any polynomial of odd degree has a root in  $R$ , then  $K = R(\sqrt{-1})$  is alg.closed.  $\lrcorner$

*Proof:* For any order of  $R$ , the first condition in fact says that any  $a > 0$  in  $R$  is a square. Now  $\frac{a+\sqrt{a^2+b^2}}{2}$  is non-negative, so there is a  $c^2 = \frac{a+\sqrt{a^2+b^2}}{2}$ , that is  $(c + \frac{b}{2c}i)^2 = a + bi$ , so  $K$  has all squares.

As  $R$  is of  $\text{char} 0$  (3.2.10.5) (3.2.9.3), so it suffices to show any Galois extension  $L/K$  is trivial. Let  $G = G(L/R)$ , and  $H$  be its 2-Sylow subgroup, then  $G = H$  by condition. Now if  $G_1 = G(L/K)$ , then  $G_1$  is nontrivial, because otherwise there is a subgroup of index 2, then its fixed field is a square extension of  $K$ , which is impossible by what we have proved. So  $G = G_1$ , that is  $L = K$ .  $\square$

**Cor. (3.2.10.8) [Complex Numbers is Alg.Closed, Gauss1799].**  $\mathbb{C} = \mathbb{R}[i]$  is alg.closed.  $\lrcorner$

**Prop. (3.2.10.9) [Intermediate Property].** An ordered field is real closed iff it has the intermediate property.  $\lrcorner$

*Proof:* If  $R$  is real closed, as  $R[i]$  is alg.closed (3.2.10.6),  $f$  can be decomposed into factors of degree 1 or 2. For a factor  $X^2 + \alpha X + \beta$ ,  $4\beta > \alpha^2$ , otherwise it has a root hence not irreducible. So the change of sign is because of a linear factor, the rest is easy.

Conversely, if it has the intermediate property, then for  $a > 0$ , consider  $p(X) = X^2 - a$ , then  $p(0) < 0, p(a+1) > 0$ , so  $p$  has a root, that is,  $a$  is a square. For a polynomial of odd degree, for  $M$  large enough,  $f(M) > 0, f(-M) < 0$ , so  $f$  has a root. So by (3.2.10.7)  $R$  is real closed.  $\square$

**Prop. (3.2.10.10) [Artin-Schreier].** If  $K \in \mathbf{Field}$ ,  $K = K^{\text{sep}}$ , and  $F \subset_{\text{fin}} K$ , then  $F = K$  or  $F$  is real closed and  $K = F(\sqrt{-1})$ .  $\lrcorner$

*Proof:* Cf. [Lan02] P299.  $\square$

### Real Fields and Order

**Prop. (3.2.10.11) [Real Field and Order].** If  $R$  is a real field, then it is orderable, in fact, if  $-a$  is not a sum of squares in  $F$ , then there is an ordering that  $a > 0$ . So a real field is equivalent to an orderable field.  $\lrcorner$

*Proof:* By (3.2.10.2),  $F(\sqrt{a})$  is real, so it has a real closure (3.2.10.4) and has the induced order (3.2.10.5), and  $a > 0$  because it is a square (3.2.9.3).  $\square$

**Prop. (3.2.10.12) [Existence and Uniqueness of Real Closure].** For any ordered field  $F$ , there is a unique real closure  $R$  of  $F$  that every positive element of  $F$  is a square in  $R$ , thus the ordering is compatible.  $\lrcorner$

*Proof:* The existence is by adding all the square roots of elements  $> 0$  to  $F$ , the resulting field is real closed because of (3.2.10.2) and the fact a union of real fields (3.2.10.2) is real.

The uniqueness: because an ordered field is of char 0 (3.2.9.3), so the primitive element theorem (3.2.6.18) applies that each finite subextension of  $R_0$  is of the form  $F(\alpha)$ , where  $\alpha$  is a root of an irreducible separable polynomial  $f$ . Then the roots of  $f$  are different so can be ordered  $\alpha_1 < \dots < \alpha_n$ . Similarly,  $f$  has the same number of different roots in  $R_1$   $\beta_1 < \dots < \beta_n$  by (3.2.10.14), so there is a map  $h : \alpha_i \rightarrow \beta_i$ , and it is the unique map that a ordered map from  $F(\alpha)$  to  $R_1$  extending id on  $F$  can be. it is this uniqueness that makes us able to use Zorn's lemma to show that there is a maximal ordered map, must be a map from  $R_0$  to  $R_1$ , which is an isomorphism, by primitive element theorem again.  $\square$

**Prop. (3.2.10.13) [Sturm's Algorithm].** Cf. [Model Theory Marker P327].  $\lrcorner$

**Cor. (3.2.10.14).** If  $F$  is an ordered field and  $R_0, R_1$  be two real closure of  $F$  that is compatible with the ordering, then any irreducible polynomial has the same number of roots in  $R_0$  and  $R_1$ .  $\lrcorner$

*Proof:* Cf. [Model Theory Marker P328].  $\square$

**Prop. (3.2.10.15) [Hilbert's 17th Problem].** If  $f$  is a positive semidefinite rational function over a real closed field  $F$ , then  $f$  is a sum of squares of rational functions.  $\lrcorner$

*Proof:* Let  $f(X_1, \dots, X_n)$  be a positive semidefinite rational function, if  $f$  is not a sum of squares of rational functions, then by (3.2.10.11), there is an ordering on  $F(\overline{X})$  that  $f < 0$ . Let  $R$  be a real closure of  $F(\overline{X})$ , then  $R \models \exists \bar{v} F(\bar{v}) < 0$ , as  $F(\overline{X}) < 0$ . But  $RCR$  is complete, by (2.4.5.6), thus  $F \models \exists \bar{v} F(\bar{v}) < 0$  also, contradiction.  $\square$

### 3.3 Polynomials

*“You probably think that one knows everything about polynomials.”*

–S. Lang

#### 1 Basics

**Prop. (3.3.1.1)[Descartes’s Rule of Sign].** Let  $p(x) = a_0x^{b_0} + a_1x^{b_1} + \dots + a_nx^{b_n}$  be a real polynomial with nonzero  $a_i$ , where  $A_0 < B_1 < \dots < b_n$ , then the number of positive roots of  $p(x)$  has the same parity with the number of consecutive changes of signs of  $(a_k)_{k=0,\dots,n}$ .  $\square$

*Proof:* Lemma: when  $a_0a_n > 0$ , the number of positive roots are even and when  $a_0a_n < 0$ , it is odd. This is seen by consider  $p(0)$  and  $p(\infty)$ .

Then we consider the derivative  $p'$  and use induction. Denote the number of changing sign by  $v(p)$  and the number of positive roots by  $z(p)$ , then if  $z_0a_1 > 0$ , then  $v(p) = v(p')$  and  $z(p) \equiv z(p') \pmod{2}$ . Then we have  $z(p) \equiv v(p) \pmod{2}$  and middle value theorem shows that  $z(p') \leq z(p) - 1$ , hence by induction and parity argument, we have  $v(p) \geq z(p)$ .

If  $a_0a_1 < 0$ , then the same method shows that  $v(p) = v(p') + 1 \geq z(p') + 1 \geq z(p)$  and the have the same parity by the lemma.  $\square$

**Prop. (3.3.1.2)[Lagrange Interpolation].** If  $K \in \mathbf{Field}$  and  $a_i$  are  $n + 1$  elements of  $K$ ,  $b_i$  are  $n + 1$  elements of  $K$ , then there is a unique polynomial  $f$  of degree no greater than  $n$  that  $f(a_i) = b_i$ .  $\square$

*Proof:* The polynomial in search is

$$f(X) = \sum \prod_{j \neq i} b_i \frac{X - a_j}{a_i - a_j}.$$

It is a polynomial of degree smaller than  $n + 1$ , and it satisfies the hypothesis. And clearly there is at most one such polynomial, otherwise their difference has  $n + 1$  zeros.  $\square$

**Cor. (3.3.1.3).** If  $f(X) = a_nX^n + \dots + a_0$ , then for any  $n + 1$  different integers  $a_0, \dots, a_n$ , there exists some  $|f(a_i)| \geq \frac{n!}{2^n} |a_n|$ .  $\square$

*Proof:* Use Lagrange interpolation and consider the leading coefficient.  $\square$

**Prop. (3.3.1.4).** If a degree  $n$  polynomial  $p$  satisfies  $p(n) = 2^n$  for  $n = 0, 1, \dots, n$ , then  $p(n + 1) = 2^{n+1} - 1$ .  $\square$

*Proof:* The polynomial in search is  $p(x) = \sum_{k=0}^n \binom{x}{k}$ .  $\square$

#### Irreducibility

**Prop. (3.3.1.5).** If  $p \in \mathbf{Prime}$  and  $f(x) = a_nx^n + \dots + a_1x + p \in \mathbb{Z}[X]$  satisfies  $\sum |a_i| < p$ , then  $f$  is irreducible in  $\mathbb{Z}[X]$ .  $\square$

*Proof:* Firstly, all of its roots has norm bigger than 1, because otherwise  $p = |\sum a_k x^k| \leq \sum |a_k| < p$ , contradiction. So if now  $f = gh$ , then  $g, h$  all have roots with norm greater than 1, in particular their constant coefficients have norm greater than 1, which is a contradiction because  $p$  is a prime.  $\square$

**Prop. (3.3.1.6) [Irreducible Reciprocal Polynomials].** Let  $K \subset \mathbb{R} \in \mathbf{Field}$  and  $f(X) \in K[X]^\times$  be an irreducible polynomial with a root  $\alpha \in \mathbb{C}$  s.t.  $|\alpha| = 1$  but  $\alpha \neq 1$ , then  $f(X)$  is reciprocal, i.e.  $f(X) = X^{\deg f} f(1/X)$ .  $\lrcorner$

*Proof:* If  $\alpha = -1$ , then  $f(X) = X + 1$  is reciprocal. If  $\alpha \neq -1$ , then  $\alpha^{-1} = \bar{\alpha} \neq \alpha$  is also a root of  $f(X)$ . But  $\alpha^{-1}$  is also a root of  $X^{\deg f} f(1/X)$  which has the same degree as  $f(X)$ , thus  $f(X) = X^{\deg f} f(1/X)$  because  $f(X)$  is irreducible.  $\square$

### Resultants

**Def. (3.3.1.7) [Resultants].** Let  $R \in \mathcal{CRing}$ , the **resultant**  $\text{res}(A, B)$  of two polynomials  $A, B \in R[X]$  of degree  $d, e$  respectively is the determinant of the linear map

$$W_e \times W_d \rightarrow W_{d+e} : (X, Y) \mapsto AX + BY,$$

where  $W_t$  is the free module of polynomials of degree  $< t$ .  $\lrcorner$

**Prop. (3.3.1.8).** The resultant can be seen as the determinant of the matrix with values the coefficient of  $A$  or  $B$  in different places, multiplying  $X$ 's with different degree and add to the last row, we can get  $A \cdot X$ 's and  $B \cdot X$ 's, so:  $\text{res}(A, B) = AC + BD$  for some  $C, D$ .

Now if  $R \subset S$  and  $A, B$  has common roots in  $S$ , then  $\text{res}(A, B) = 0$ .  $\lrcorner$

**Cor. (3.3.1.9).** Resultant is stable under Euclidean division, so it can be seen as a suitable division remainder of the two polynomial.  $\lrcorner$

**Prop. (3.3.1.10) [Resultants Detects Coprime Polynomials].** Let  $R \subset L \in \mathcal{CRing}$  and  $L \in \mathbf{Field}$ . If  $A, B \in R[X]$  decompose into linear factors in  $L$ , let  $t_i$  be roots of  $A$  and  $u_j$  be roots of  $B$ , then

$$\text{res}(A, B) = v_0^d w_0^e \prod_{i=1}^d \prod_{j=0}^e (t_i - u_j)$$

In particular,  $\text{res}(A, B) \neq 0$  iff  $A, B \in L[X]$  are coprime.  $\lrcorner$

*Proof:* See the resultant as polynomials of the roots of  $A$  and  $B$ , then we proved that if they has the same root, then  $\text{res} = 0$ , so it is divisible by  $(t_i - u_j)$  for all  $i, j$ . Then notice the RHS is homogenous of degree  $d$  in  $u_j$  and homogenous of degree  $e$  in  $t_i$ , so does  $\text{res}$ . So they are equal.  $\square$

**Prop. (3.3.1.11).** Let  $k \in \mathbf{Field}$  and  $P \in k[X]$ , then  $x \in k$  is a double root of  $P$  iff  $\gcd(P, P')(x) = 0$ .  $\lrcorner$

*Proof:*  $\square$

## 2 Cyclotomic Polynomials

Cf. [Cyclotomic Polynomials in Olympiad Number Theory].

**Def. (3.3.2.1) [Cyclotomic Polynomials].** For  $n \in \mathbb{Z}_+$ , define the **cyclotomic polynomial**

$$\Psi_n(X) = \prod_{a \in (\mathbb{Z}/(n))^*} (X - e^{2\pi i \frac{a}{n}}) \in \mathbb{C}[X].$$

Then in fact  $\Psi_n(X) \in \mathbb{Z}[X]$ .

Sometimes we also consider the homogenized version  $\Phi_n(X, Y)$  of  $\Psi_n(X)$ .  $\lrcorner$

*Proof:* Its coefficients are algebraic integers, and it is invariant under action of  $\text{Gal}_{\mathbb{Q}}$ , so its coefficients are in  $\mathbb{Q} \cap \mathcal{O}_{\overline{\mathbb{Q}}} = \mathbb{Z}$ .  $\square$

**Prop. (3.3.2.2) [Cyclotomic Polynomials are Irreducible].** For any  $n \in \mathbb{Z}_+$ , the cyclotomic polynomial  $\Psi_n(x)$  is irreducible over  $\mathbb{Z}$ .  $\lrcorner$

*Proof:* It suffices to show that for any irreducible factor  $f|\Psi_n(x)$ , if  $\xi$  is a root of  $f$  and  $(p, n) = 1$ , then  $\xi^p$  is also a root of  $f$ . Cf. [Lan02].  $\textcolor{red}{?}$   $\square$

**Prop. (3.3.2.3).** For  $a, n \in \mathbf{P}$  and  $(a, n) = 1$ ,  $\Psi_n(X^p) = \prod_{d|a} \Psi_{dn}(X)$ .  $\lrcorner$

*Proof:* This follows from counting.  $\square$

**Cor. (3.3.2.4).** For  $n \in \mathbb{Z}_+$ ,  $X^n - 1 = \prod_{d|n} \Psi_d(X)$ . Thus by Möbius inversion,  $\Psi_n(x) = \prod_{d|n} (X^d - 1)^{\mu(n/d)}$ .  $\lrcorner$

**Prop. (3.3.2.5).** For  $n \in \mathbb{Z}_+$  and  $p \in \mathbf{P}$ ,

$$\Psi_{np}(X) = \begin{cases} \Psi_n(X^p) & , p|n \\ \frac{\Psi_n(X^p)}{\Psi_n(X)} & , p \nmid n \end{cases}.$$

$\lrcorner$

*Proof:* These follows from counting.  $\square$

**Cor. (3.3.2.6).** If  $n \in \mathbb{Z}_{\geq 3}$  is odd, then  $\Psi_{2n}(X) = \Psi_n(-X)$ .  $\lrcorner$

*Proof:* It suffices to show that  $\Psi_{2n}(X^2) = \Psi_n(X)\Psi_n(-X)$ . And this is because  $\zeta \mapsto \zeta^2$  is an automorphism between primitive  $n$ -th roots, and  $\varphi(n)$  is even.  $\square$

**Prop. (3.3.2.7).** For  $m \neq n \in \mathbb{Z}_+$ ,  $\Psi_m(X)$  and  $\Psi_n(X)$  are coprime in  $\mathbb{Q}(X)$ . And if  $m, n \in \mathbb{Z}_+ \setminus (p)$ , then  $\Psi_m(X)$  and  $\Psi_n(X)$  are also coprime in  $\mathbb{F}_p[X]$ .  $\lrcorner$

*Proof:* It suffices to show that  $X^{mn} - 1$  doesn't have multiple roots. By (3.3.1.11), it suffices to notice that

$$\gcd(X^{mn} - 1, mnX^{mn-1}) = 1,$$

which is also true in  $\mathbb{F}_p[X]$  if  $m, n \in \mathbb{Z}_+ \setminus (p)$ .  $\square$

**Cor. (3.3.2.8).** For  $p \in \mathbf{P}$  and  $n \in \mathbb{Z}_+ \setminus (p)$ ,  $a \in \mathbb{Z}$ ,

$$p|\Psi_n(a) \iff p \nmid a \quad \& \quad \text{ord}(a, \mathbb{F}_p^\times) = n.$$

$\lrcorner$

**Cor. (3.3.2.9).** For  $p \in \mathbf{P}$  and  $n \in \mathbb{Z}_+ \setminus (p)$ ,  $p|\Psi_n(a)$  for some  $a \in \mathbb{Z}$  iff  $p \equiv 1 \pmod{n}$ .  $\lrcorner$

**Prop. (3.3.2.10).** If  $m \geq n \in \mathbb{Z}_+$ ,  $h \in \mathbb{Z}$ , and  $A = \gcd(\Psi_n(h), \Psi_m(h)) \neq 1$ , then there exists  $p \in \mathbf{P}$  s.t.  $A \in p^{\mathbb{Z}_+}$ , and also  $\frac{m}{n} \in p^{\mathbb{Z}_+}$ .  $\lrcorner$

*Proof:* Suppose  $p|A$ , and suppose  $m = p^a c, n = p^b d, p \nmid cd$ , then by (3.3.2.5),

$$\Psi_m(h) \equiv (\Psi_c(h))^{p^a} \pmod{p}, \quad \Psi_n(h) \equiv (\Psi_d(h))^{p^b} \pmod{p}.$$

Then it follows from (3.3.2.7) that  $c = d$ . Thus  $\frac{m}{n} \in p^{\mathbb{Z}_+}$ . The assertions follow easily from this.  $\square$

**Prop. (3.3.2.11).** For  $n \in \mathbb{Z}_+$ ,

$$\Psi_n(1) = \begin{cases} p & , n \in p^{\mathbb{Z}_+}, p \in \mathbf{P} \\ 1 & , \text{otherwise} \end{cases}$$

┘

*Proof:* This follows easily from induction and the fact

$$X^{n-1} + \dots + X + 1 = \prod_{d|n, d \neq 1} \Psi_d(X).$$

□

**Prop. (3.3.2.12) [Lower Bounds on Cyclotomic Polynomials].** there exists  $c \in \mathbb{R}_+$  s.t. for any  $n \in \mathbb{Z}_+$ , and  $a > b \in \mathbb{Z}_+$ ,

$$|\Phi_n(a, b)| \geq e^{cn}.$$

┘

*Proof:*  $\Phi_n(a, b) = \prod (a - \zeta b)$ , and  $|a - \zeta b| > 1$ . moreover, notice that for  $n$  large, nearly half of the primitive roots of unity  $\zeta$  will have negative real parts (Cf. [The Distribution of Totatives, Lehmer]), and for such  $\zeta$ ,  $|a - \zeta b| \geq \sqrt{5}$ . □

### 3 Stable Polynomials

**Def. (3.3.3.1) [Stable Polynomials].** For  $n \in \mathbb{Z}_+$ , a **real-stable polynomial**  $f \in \mathbb{C}[z_1, \dots, z_n]$  is either a zero polynomial or it satisfies that

$$f(z_1, \dots, z_n) \neq 0$$

for any  $z_1, \dots, z_n \in \mathcal{H}$ . ┘

**Cor. (3.3.3.2).** A real stable univariate polynomial is real-rooted. ┘

**Prop. (3.3.3.3) [Wagner].** If  $n \in \mathbb{Z}_+$  and  $f \in \mathbb{R}[z_1, \dots, z_n]$  is real stable, then for any  $c \in \mathbb{R}$ ,  $f(z_1, \dots, z_{n-1}, c)$  is also real stable. ┘

*Proof:* Cf. [Multivariate stable polynomials: theory and applications] Lemma 2.4. ? □

**Prop. (3.3.3.4) [Borcea-Brändén].** Let  $m, n \in \mathbb{Z}_+$  and  $A_1, \dots, A_m \in \text{Pos}_{\geq 0}(n; \mathbb{C})$ , then

$$f(z_1, \dots, z_n) = \det\left(\sum z_i A_i\right)$$

is a real stable polynomial (3.3.3.1). ┘

*Proof:* ? Cf. [Applications of stable polynomials to mixed determinants: Johnson's conjectures, unimodality, and symmetrized Fischer products] Prop 2.4.. □

**Prop. (3.3.3.5) [Borcea-Brändén].** Let  $n \in \mathbb{Z}_+$  and  $T : \mathbb{R}[z_1, \dots, z_n] \rightarrow \mathbb{R}[z_1, \dots, z_n]$  be a differential operator of the form

$$T = \sum_{\alpha, \beta \in \mathbb{N}^n} c_{\alpha, \beta} z^\alpha \partial^\beta,$$

and define

$$f_T(\mathbf{z}, \mathbf{w}) = \sum_{\alpha, \beta \in \mathbb{N}^n} c_{\alpha, \beta} z^\alpha w^\beta.$$

Then  $T$  preserves real-stable polynomials (3.3.3.1) iff  $F_T(\mathbf{z}, -\mathbf{w})$  is real-stable. ┘

*Proof:* ? Cf.[Multivariate Polya-Schur classification problems in the Weyl algebra]Thm1.3.  $\square$

**Cor. (3.3.3.6).** For any  $a, b \in \mathbb{R}_{\geq 0}$ , the operators  $T = 1 + a\partial_x$  or  $T = 1 + a\partial_x + b\partial_y$  preserves real-stable polynomials.  $\lrcorner$

### Mixed Characteristic Polynomials

**Def. (3.3.3.7) [Mixed Characteristic Polynomials].** For  $m, d \in \mathbb{Z}_+$  and  $A_1, \dots, A_m \in \text{Mat}(n; \mathbb{C})$ , the **mixed characteristic polynomial** of  $A_1, \dots, A_m$  is defined to be

$$\mu[A_1, \dots, A_m](X) = \left[ \prod_i (1 - \partial_{z_i}) \det \left( X\mathbf{1} + \sum_i z_i A_i \right) \right] \Big|_{z_1=\dots=z_m=0}.$$

It is a monic polynomial.  $\lrcorner$

**Thm. (3.3.3.8) [Mixed Characteristic Polynomials are Real-Rooted].** For  $m, d \in \mathbb{Z}_+$  and  $A_1, \dots, A_m \in \text{Pos}_{\geq 0}(n; \mathbb{C})$ , the mixed characteristic polynomial  $\mu[A_1, \dots, A_m]$  is monic and real-rooted.  $\lrcorner$

*Proof:* It follows from (3.3.3.4)(3.3.3.6) and (3.3.3.3) that  $\mu[A_1, \dots, A_m]$  is real stable. Then it is real-rooted by (3.3.3.2).  $\square$

**Thm. (3.3.3.9) [Marcus-Spielman-Srivastava].** Let  $m, d \in \mathbb{Z}_+$  and  $v_1, \dots, v_m$  be independent random column vectors in  $\mathbb{C}^d$  with finite support, and let  $A_i = \mathbf{E} v_i v_i^*$ , then

$$\mathbf{E} \det \left( X\mathbf{1} - \sum_i v_i v_i^* \right) = \mu[A_1, \dots, A_m](X) \quad (3.3.3.7).$$

$\lrcorner$

*Proof:* Using induction on  $m$ , it suffices to show that for any  $A \in \text{Mat}(d; \mathbb{C})$ ,

$$\mathbf{E} \det(A - vv^*) = \left[ (1 - \partial_t) \det(A + t \mathbf{E} vv^*) \right] \Big|_{t=0}.$$

If  $A$  is invertible, then by (3.5.9.12), the LHS equals

$$\mathbf{E} \det(A) (1 - v^* A^{-1} v) = \det(A) \mathbf{E} (1 - \text{tr}(A v^* v)) = \det(A) - \det(A) \text{tr}(A^{-1} \mathbf{E} vv^*).$$

And this equals the RHS by (3.5.9.25).

The case that  $A$  being non-invertible follows from continuity.  $\square$

**Cor. (3.3.3.10).** Let  $m, n \in \mathbb{Z}_+$  and  $u_1, \dots, u_m, v_1, \dots, v_m \in \mathbb{C}^n$ ,  $D \in \text{Pos}(n; \mathbb{C})$ , and  $p_1, \dots, p_m \in [0, 1]$ , then the univariate polynomial

$$P(X) = \sum_{S \subset [m]_+} \prod_{i \in S} p_i \prod_{i \notin S} (1 - p_i) \det \left( X\mathbf{1} + D + \sum_{i \in S} u_i u_i^* + \sum_{i \notin S} v_i v_i^* \right)$$

is real-rooted.  $\lrcorner$

*Proof:* This follows from (3.3.3.9) with binomial distributions, and also the fact that  $D$  is a sum of rank-1 matrices.  $\square$

### Interlacing Polynomials

**Def. (3.3.3.11) [Interlacing Sequences].** For  $n \in \mathbb{Z}_+$  and  $A = \{\alpha_1 \leq \alpha_2 \leq \dots \alpha_n\} \in \mathbb{R}$  and  $B = \{\beta_1 \leq \beta_2 \leq \dots \leq \beta_{n+1}\} \in \mathbb{R}$ ,  $A$  is said to interlace  $B$  iff

$$\beta_1 \leq \alpha_1 \leq \beta_2 \leq \alpha_2 \leq \dots \leq \alpha_n \leq \beta_{n+1}.$$

┘

**Def. (3.3.3.12) [Interlacing Polynomials].** For two real-rooted monic polynomials  $f(X), g(X) \in \mathbb{R}[X]$  s.t.  $\deg(f) = \deg(g) + 1$ ,  $g$  is said to **interlace the polynomial**  $f$  iff the roots of  $g$  interlaces the roots of  $f$  (3.3.3.11). ┘

**Prop. (3.3.3.13).** Let  $k \in \mathbb{Z}_+$  and  $f_1, \dots, f_k$  be real-rooted polynomials of the same degree, then they have a common interlacing polynomial (3.3.3.12) iff for any  $t \in \mathbb{R}$ ,  $|\# \text{Zero}(f) \cap [t, \infty) - \# \text{Zero}(g) \cap [t, \infty)| \leq 1$ . ┘

**Thm. (3.3.3.14) [Chudnovsky-Seymour].** Let  $k \in \mathbb{Z}_+$  and  $f_1, \dots, f_k \in \mathbb{R}[X]$  be monic real-rooted polynomials of the same degree, then the following are equivalent:

- $\sum_i \lambda_i f_i$  is real-rooted for any  $\lambda_1, \dots, \lambda_k \in \mathbb{R}_{\geq 0}$ .
- $f_1, \dots, f_k$  have a common interlacing polynomial.
- Any two  $f_i, f_j$  have a common interlacing polynomial.
- $f_i + c f_j$  is real-rooted for any  $c \in \mathbb{R}_+$ .

┘

*Proof:*  $1 \rightarrow 4$  is trivial.

$4 \rightarrow 3$ : By (3.3.3.13), it suffices to show that for any  $t \in \mathbb{R}$ ,  $|\# \text{Zero}(f_i) \cap [t, \infty) - \# \text{Zero}(f_j) \cap [t, \infty)| \leq 1$  for any  $i, j$ . We may assume that  $f_i, f_j$  have no common zeros. Suppose for the contrary that there exists a maximal  $t \in \mathbb{R}$  s.t.  $\# \text{Zero}(f_i) \cap [t, \infty) - \# \text{Zero}(f_j) \cap [t, \infty) \geq 2$ . then  $f_i(t) = 0, f_j(t) \neq 0$ . Take  $\varepsilon \in \mathbb{R}_+$  small s.t.  $f_j, f_i \neq 0$  on  $[t - \varepsilon, t)$ . Now for any  $\lambda \in [0, 1]$ , consider the number of zeros of  $F_\lambda = \lambda f_1 + (1 - \lambda) f_2$  on the region  $\{x + iy \in \mathbb{C} | x > t - \varepsilon\}$ , then it is a constant function of  $\lambda$ . But  $F_0 = f_1, F_1 = f_2$ , contradicting the assumption. So we proved that  $|\# \text{Zero}(f_i) \cap [t, \infty) - \# \text{Zero}(f_j) \cap [t, \infty)| \leq 1$  for any  $i, j$ .

$3 \rightarrow 2$ : This follows easily from (3.3.3.13).

$2 \rightarrow 1$ : This follows easily from the intermediate property. ┘

**Cor. (3.3.3.15) [Derivatives of Interlacing Polynomials].** Let  $k \in \mathbb{Z}_+$  and  $f_1, \dots, f_k \in \mathbb{R}[X]$  be monic real-rooted polynomials of the same degree with a common interlacing polynomial, then so does  $\{f_1^\lambda, \dots, f_k^\lambda\}$ . ┘

*Proof:* This follows from the fact that the derivative of a real-rooted polynomial is also real-rooted. ┘

**Def. (3.3.3.16) [Interlacing Families].** Let  $m, n \in \mathbb{Z}_+, S_1, \dots, S_m \in \text{finSet}$ , and  $\{f_{s_1, \dots, s_m}\}$  be real-rooted degree  $n$ -polynomials with positive leading coefficients indexed over  $S_1 \times \dots \times S_m$ . For any  $k \in [m - 1]_+$  and  $s_1 \in S_1, \dots, s_k \in S_k$ , define

$$f_{s_1, \dots, s_k} = \sum_{s_{k+1} \in S_{k+1}, \dots, s_m \in S_m} f_{s_1, \dots, s_k, s_{k+1}, \dots, s_m},$$

and

$$f_{\emptyset} = \sum_{s_1 \in S_1, \dots, s_m \in S_m} f_{s_1, \dots, s_m}.$$

Then  $\{f_{s_1, \dots, s_m}\}$  is called an **interlacing family of polynomials** if for any  $k \in [m-1]_+$  and  $s_1 \in S_1, \dots, s_k \in S_k$ , the family of polynomials

$$\{f_{s_1, \dots, s_k, t}\}_{t \in S_{k+1}}$$

has a common interlacing.  $\lrcorner$

**Prop. (3.3.3.17).** Let  $k \in \mathbb{Z}_+$ ,  $f_1, \dots, f_k \in \mathbb{R}[X]$  be real-rooted polynomials with positive leading coefficients such that  $\deg(f_1) = \dots = \deg(f_k)$ , and having a common interlacing polynomial (3.3.3.12), then the polynomial

$$f_{\emptyset} = \sum_i f_i.$$

is also real-rooted, and there exists  $i \in [k]_+$  s.t. the roots of  $f_i$  is bounded by the largest root of  $f_{\emptyset}$ .  $\lrcorner$

*Proof:*  $f_{\emptyset}$  is real-rooted by (3.3.3.14).

Let  $g$  interlaces each  $f_i$ , and  $\alpha_{n-1}$  the largest root of  $g$ , then  $f_i(\alpha_{n-1}) \leq 0$  for any  $i$ . So  $f_{\emptyset}(\alpha_{n-1}) \leq 0$ . But  $f_{\emptyset}$  has positive leading coefficients, so the largest root  $\beta_n$  of  $f_{\emptyset}$  satisfies  $\beta_n \geq \alpha_{n-1}$ .

But now  $f_i(\beta_n) \geq 0$  for some  $i$ . Then this  $f_i$  has a root in  $[\alpha_{n-1}, \beta_n]$ , which is its largest root. So the roots of  $f_i$  is bounded by the largest root of  $f_{\emptyset}$ .  $\square$

**Cor. (3.3.3.18).** Let  $m, n \in \mathbb{Z}_+$ ,  $S_1, \dots, S_m \in \text{finSet}$ , and  $\{f_{s_1, \dots, s_m}\}$  be an interlacing family of real polynomials, then there exists  $s_i \in S_i$  s.t. the roots of  $f_{s_1, \dots, s_m}$  is bounded by the largest root of  $f_{\emptyset}$ .  $\lrcorner$

*Proof:* This follows easily by inductively using (3.3.3.17).  $\square$

**Thm. (3.3.3.19) [Interlacing Families from Independent Random Vectors].** Let  $m, d \in \mathbb{Z}_+$  and  $v_1, \dots, v_m$  be independent random column vectors in  $\mathbb{C}^d$  with finite support, and let  $v_i$  take values  $w_{i1}, \dots, w_{il_i}$  with probabilities  $p_{i1}, \dots, p_{il_i}$  resp.. For  $j_i \in [l_i]_+$ , define

$$q_{j_1, \dots, j_m}(X) = \prod_i p_{ij_i} \det \left( X \mathbf{1} - \sum_i w_{ij_i} w_{ij_i}^* \right) \in \mathbb{C}[X],$$

then these polynomials form an interlacing family (3.3.3.16).  $\lrcorner$

*Proof:* Notations as in (3.3.3.16), it suffices to show that for any  $k \in [m]_+$  and  $j_i \in [l_i]_+$ , the family

$$\{q_{j_1, \dots, j_k, t}\}_{t \in [l_{k+1}]_+}$$

has a common interlacing. By (3.3.3.14), it suffices to show that for any  $\lambda_1, \dots, \lambda_{l_{k+1}} \in [0, 1]$  s.t.  $\sum_j \lambda_j = 1$ ,

$$\sum_{j=1}^{l_{k+1}} \lambda_j q_{j_1, \dots, j_k, t}$$

is real-rooted. But then this follows from (3.3.3.8) with a suitable choice of the probability distribution.  $\square$

## 4 Invariant Theory

**Prop. (3.3.4.1) [Elementary Symmetric Polynomial].** For  $n$  indeterminants  $x_i$ , define the **elementary polynomials**

$$\sigma_k = \sum_{1 \leq i_1 < \dots < i_k \leq n} x_{i_1} x_{i_2} \dots x_{i_k} \in \mathbb{Z}[x_1, \dots, x_n]$$

where for  $k > n$  this expression means 0. Then any symmetric polynomial is a polynomial of the fundamental symmetric polynomials.  $\lrcorner$

*Proof:* Set the first coordinate to 0, then the rest is a polynomial of the fundamental symmetric polynomials by induction,  $f(0, x) = h(\sigma_1, \dots, \sigma_n)$ , then consider  $f - h$ , with  $h$  the same expression but  $x_n$  is included, we get it is a symmetric polynomial, and it is divisible by  $x_1$ , thus also divisible by  $\prod x_i$ , thus divide it by  $\prod x_i$  and use induction, we get  $f$  is a polynomial of elementary symmetric polynomials.  $\square$

**Prop. (3.3.4.2) [Newton Identities].** For  $n$  indeterminants  $x_i$ , define

$$s_k = \begin{cases} \sum x_i^k & , k \geq 0 \\ 0 & , k < 0 \end{cases} \in \mathbb{Z}[x_1, \dots, x_n],$$

then there are **Newton Identities**:

$$s_k - \sigma_1 s_{k-1} + \dots + (-1)^n \sigma_n s_{k-n} = 0.$$

$\lrcorner$

*Proof:* The case of  $k \geq n$  is simple. Now if  $k < n$ , then we prove by induction on  $n$ : If  $n$  is already proven, then the term is 0 if one of them is 0, but this implies that this equation is divisible by  $\prod_{i=1}^{n+1} x_i$ , but it has degree  $k \leq n$ , so it must be 0.  $\square$

**Prop. (3.3.4.3) [Chern Polynomials].** By (3.3.4.2) and induction there are polynomials  $P_k \in \mathbb{Z}[x_1, \dots, x_k]$  s.t.  $P_k(\sigma_1, \dots, \sigma_k) = s_k, k \geq 0$ , called the **Chern polynomials**. Then they satisfy:

$$\log(1 + c_1 + c_2 + \dots + c_n + \dots) = \sum_{p \geq 1} (-1)^{p-1} \frac{P_p}{p} \in \mathbb{Q}[[c_1, \dots, c_n, \dots]].$$

In particular, we can easily calculate via homogeneity that

$$P_1 = c_1, \quad P_2 = c_1^2 - 2c_2, \quad P_3 = c_1^3 - 3c_1c_2 + 3c_3, \quad P_4 = c_1^4 - 4c_1^2c_2 + 4c_1c_3 + 2c_2^2 - 4c_4.$$

$\lrcorner$

*Proof:* We can define elementary power series

$$\sigma_k = \sum_{1 \leq i_1 < \dots < i_k} x_{i_1} x_{i_2} \dots x_{i_k} \in \mathbb{Z}[[x_1, \dots, x_n, \dots]],$$

and also

$$s_k = \begin{cases} \sum x_i^k & , k \geq 0 \\ 0 & , k < 0 \end{cases} \in \mathbb{Z}[[x_1, \dots, x_n, \dots]].$$

Then the Newton identities also holds by taking limits. There is an injection

$$\mathbb{Q}[[c_1, \dots, c_n, \dots]] \rightarrow \mathbb{Q}[[x_1, \dots, x_n, \dots]] : c_i \mapsto \sigma_i,$$

and the LHS is mapped to

$$\log\left(\prod_i (1 + x_i)\right) = \prod_i \log(1 + x_i) = \sum_{p \geq 1} (-1)^p \frac{s_p}{p}$$

is the image of the RHS.  $\square$

**Prop. (3.3.4.4) [Todd Polynomials].** There are **Todd polynomials**  $Q_p \in \mathbb{Q}[\sigma_1, \dots, \sigma_p], p \geq 1$  homogenous of degree  $p$  s.t.

$$\text{Todd}(x_1, \dots, x_n, \dots) = \prod_{i=1}^n \frac{x_i}{1 - e^{-x_i}} = 1 + \sum_{p \geq 1} Q_p \in \mathbb{Q}[[x_1, x_2, \dots]]$$

for any  $n \in \mathbb{Z}_+$ , and

$$Q_1 = \frac{1}{2}c_1, \quad Q_2 = \frac{1}{12}(c_1^2 + c_2), \quad Q_3 = \frac{1}{24}c_1c_2, \quad Q_4 = \frac{1}{720}(-c_1^4 + 4c_1^2c_2 + 3c_2^2 + c_1c_3 - c_4).$$

┘

*Proof:* ?  $\square$

**Prop. (3.3.4.5) [Conjugate Invariant Polynomials].** Any polynomial on the entries of matrixes  $M_n(k)$  that is invariant under conjugation is generated by coefficients of  $\det(\lambda I + X)$  and can also be generated by  $\text{tr}(X^k)$ .  $\square$

*Proof:* We notice that the matrixes having disjoint eigenvalues is dense in  $M_n(k)$ , thus the restriction of the polynomial on these matrixes is a symmetric polynomial(3.3.4.1) thus identical to a polynomial described above. Hence they are equal.  $\square$

**Prop. (3.3.4.6).** For any polynomial on the entries of matrixes  $M_n(k)$  that  $f(BA) = f(A)$  for  $B \in O(n)$ , there is a polynomial  $F$  that  $f(A) = F(A^*A)$ . Cf.[Heat Equation and the Index Theorem Atiyah P323].  $\square$

**Prop. (3.3.4.7) [Weyl].** Any linear map  $f$  from  $(\mathbb{R}^m)^{\otimes n}$  to  $R$  that is  $O(m, \mathbb{R})$ -equivariant is a linear combinations of maps of the form:

$$v_1 \otimes v_2 \otimes \dots \otimes v_n \mapsto \langle v_{i_1}, v_{i_2} \rangle \langle v_{i_3}, v_{i_4} \rangle \dots \langle v_{n-1}, v_n \rangle.$$

Where  $i_1, \dots, i_n$  is a permutation of  $1, 2, \dots, n$  when  $n$  is even and when  $n$  is odd,  $f$  must be 0.  $\square$

*Proof:* Cf.[Heat Equation and the Index Theorem].  $\square$

## 3.4 Orthogonal Polynomials

References are [Special Functions].

### 1 Chebyshev Polynomials

**Def. (3.4.1.1) [Chebyshev Polynomials].** For any  $n \in \mathbb{N}$ , the **Chebyshev polynomial**  $S_n(T)$  is defined to be the expression of

$$\alpha^n + \alpha^{n-2} + \dots + \alpha^{2-n} + \alpha^{-n}$$

as a polynomial of  $T = \alpha + \alpha^{-1}$ . For example,

$$S_0(T) = 1, \quad S_1(T) = T, \quad S_2(T) = T^2 - 1.$$

$$S_3(T) = T^3 - 2T, \quad S_4(T) = T^4 - 3T^2 + 1, \quad S_5(T) = T^5 - 4T^3 + 3T.$$

┘

**Prop. (3.4.1.2).** For any  $n \in \mathbb{N}$ ,  $S_n(T)$  is monic of degree  $n$ . In particular,  $\{S_n(T)\}$  form a basis for  $\mathbb{Z}[T]$  over  $\mathbb{Z}$ . ┘

**Prop. (3.4.1.3).** If  $m, n \in \mathbb{N}$  with  $m \neq n$ , then

$$\int_{-1}^1 S_m(T) S_n(T) \left( \frac{2}{\pi} \sqrt{1-T^2} \right) dt = 0.$$

┘

*Proof:*

□

### 3.5 Linear Algebra

*“It is my experience that proofs involving matrices can be shortened by 50% if one throws the matrices out.”*

–E. Artin

References are [H-K71, Mey00, Rom07], [线性代数 谢启鸿], [Matrix Analysis, Horn-Johnson] and [Determinant, 高等代数 notes, 安金鹏].

**Def. (3.5.0.1) [Notations].**

- Let  $k \in \text{Field}$ .
- Let  $R \in \mathbb{C}\text{Ring}$ .

┘

In this section,  $\text{Vect}_k$  is studied, without considering any topology on  $k$  or  $V$ . More generally, the category of f.g. modules over a commutative unital ring  $R$  is studied.

#### 1 Basics

**Def. (3.5.1.1) [Vector Spaces].** A **vector space** over  $k$  is a module over  $k$  (3.2.4.1). ┘

**Def. (3.5.1.2) [Linear Operators].** A **linear operator** on a  $R$ -module  $V$  is an element of the endomorphism ring  $\text{End}_R(V)$  ┘

**Def. (3.5.1.3) [Basis].** Let  $R$  be a field, then the sets  $S$  that are linearly independent over  $R$  has maximal objects by Zorn’s lemma, and such a maximal object must span  $M$ , called a **basis** of  $M$ . ┘

**Prop. (3.5.1.4) [Dimension].** All basis of a linear  $k$ -vector space  $V$  have the same cardinality, this cardinality is called the **dimension(vector space)** or **rank(vector space)**  $\dim_k(V)$  or  $\text{rank}_k(V)$  of  $V$ . This follows immediately from (3.2.4.4). ┘

**Prop. (3.5.1.5) [Canonical way of Writing a Basis].** After so many years, I still find it confusing to write a basis and observing change of basis, so I will write it here:

A vector should always be written vertically, and so a basis should be  $\vec{e} = (e_1, \dots, e_n)$  (horizontal), and a vector with basis  $\vec{a}$  (vertical) is in fact  $\vec{e} \vec{a}$ .

A change of basis should be written  $\vec{e}' = ea$ , with  $a \in GL_n$ , and then if an operator has matrix  $A$  w.r.t. the basis  $\vec{e}$ , it then map in the basis  $\vec{e}'$   $v = \vec{e}' x = \vec{e} ax \mapsto \vec{e} Aax = \vec{e}' a^{-1} Aax$ , so it has matrix  $a^{-1} Aa$  w.r.t the basis  $\vec{e}'$ . ┘

**Prop. (3.5.1.6) [Extension of Basis].** ┘

*Proof:* ┘

**Prop. (3.5.1.7).** Let  $F$  be a subfield of  $k$  and  $U \in \text{Vect}/k$  with a  $F$ -subspace  $U'$ . Then if every finite  $F$ -linearly independent subset of  $U'$  is independent over  $k$ , then  $\dim_F(U') \leq \dim_K(U)$ . ┘

*Proof:* If the converse is true, there is a  $F$ -basis  $u'_j$  of  $U'$ , then some of  $u'_j$  is  $K$ -linearly dependent, contradiction. ┘

**Def. (3.5.1.8) [Flags].** For  $V \in \text{Vect}/k$ , a **flag** in  $V$  is a nested sequence

$$V_1 \subsetneq \dots \subsetneq V_n$$

of subspaces of  $V$ . ┘

### Matrices

**Def. (3.5.1.9) [Matrices].** Let  $R$  be a commutative ring, the set of **matrices** of size  $m \times n$  over  $R$  is an (non-commutative) algebra  $\text{Mat}(m \times n; R)$  over  $R$  whose underlying module is  $R^{\oplus n^2} = \bigoplus_{1 \leq i \leq m, 1 \leq j \leq n} e_{ij}R$ , and the algebra structure is given by

$$e_{ij}e_{ik} = e_{ik}.$$

An element  $A = \sum_{1 \leq i \leq m, 1 \leq j \leq n} a_{ij}e_{ij} \in M_{m \times n}(R)$  is denoted by  $A = (a_{ij})$ . ┘

**Def. (3.5.1.10) [Common Matrices].** For  $n \in \mathbb{Z}_+$ , let

$$\mathbf{1} = \mathbf{1}_n \stackrel{\Delta}{=} \text{diag}(1, 1, \dots, 1) \in \text{Mat}(n; \mathbb{Z}),$$

and

$$\mathbf{J} = \mathbf{J}_n \stackrel{\Delta}{=} \sum_{1 \leq i, j \leq n} e_{ij}.$$

**Prop. (3.5.1.11).**  $A, B$  are two  $n \times n$ -matrices, if  $1 - AB$  is invertible, then so does  $1 - BA$ , and ┘

$$(1 - BA)^{-1} = 1 + B(1 - AB)^{-1}A.$$

*Proof:* Immediate from (3.2.1.5) or (3.5.9.9). □

**Cor. (3.5.1.12).**  $AB$  and  $BA$  has the same characteristic polynomials. ┘

**Prop. (3.5.1.13).** For a ring  $R$ , there is an isomorphism of rings

$$\text{Mat}(n; R)^{\text{op}} \cong \text{Mat}(n; R^{\text{op}}).$$

The isomorphism is given by  $A \mapsto A^t$ . ┘

**Def. (3.5.1.14) [Notation for Matrix Groups].** Let  $R$  be a ring, denote

- $\text{GL}(n; R)$  be the subgroup of  $\text{End}_R(\bigoplus R^{\oplus n})$  consisting of invertible matrices.
- $\text{SL}(n; R)$  be the subgroup of  $\text{GL}(n, R)$  consisting of matrices of determinant 1 (3.5.9.1).
- $\text{Unip}(n; R)$  be the subgroup of  $\text{GL}(n, R)$  consisting of upper-triangular matrices.
- $P_n(R)$  be the subgroup of  $\text{GL}(n, R)$  consisting of matrices  $A = (a_{ij})$  that  $a_{ni} = 0$  for  $i < n$ .
- $Q_n(R)$  be the subgroup of  $\text{GL}(n, R)$  consisting of matrices  $A = (a_{ij})$  that  $a_{ni} = 0$  for  $i < n$  and  $a_{nn} = 1$ . ┘

**Prop. (3.5.1.15).** Let  $K$  be a topological field, there is a decomposition of spaces

$$U_n(K) \setminus \text{GL}(n; K) \cong GL(1; K) \times U_2(K) \setminus \text{GL}(2; K) \times \dots \times Q_n(K) \setminus GL(n, K)$$

where  $\text{GL}(n-1; K)$  embeds  $\text{GL}(n, K)$  obviously. ┘

**Remark (3.5.1.16).** ? This is wrong. ┘

*Proof:* By induction, it suffices to show

$$U_n(K) \setminus \text{GL}(n, K) \times U_{n-1}(K) \setminus \text{GL}(n-1, K) \times Q_n(K) \times GL(n, K).$$

Consider the map  $\text{GL}(n-1, K) \times \text{GL}(n, K) \rightarrow U_n(K) \setminus \text{GL}(n, K) : (x, y) \mapsto xy$ , then  $x_1y_1 = x_2y_2$  iff  $x_1y_1 = ux_2y_2$  for some  $u \in U_n(K)$ , iff  $y_1y_2^{-1} = x_1^{-1}ux_2$ . This is possible iff  $y_1y_2^{-1} \in Q_n$ , and for all  $(y_1, y_2)$  that  $y_1y_2^{-1} \in Q_n$ ,  $x_1y_1 = ux_2y_2$  iff  $x_1 = ux_2y_2y_1^{-1}$ . □

## 2 Rank

**Prop. (3.5.2.1) [Rank Nullity Theorem].** For  $T : V \rightarrow W \in \mathcal{V}ect_k$ , then  $\text{rank}(T) + \dim \text{Nul}(T) = \dim V$ .

┘

*Proof:* This follows from the exact sequence  $0 \rightarrow \ker(T) \rightarrow V \rightarrow \text{Im}(T) \rightarrow 0$ . □

**Prop. (3.5.2.2) [Row Rank equals Column Rank].** The row rank of a  $m \times n$  matrix  $A$  is the same as the column rank. ┘

*Proof:* Let  $A$  be the matrix of a linear map  $T : V \rightarrow W$ , then column rank equals the range of  $T$ , and the row rank equals the range of  $T^t$ , so they are equal by (3.5.3.7). □

**Prop. (3.5.2.3) [Sylvester's Inequality].** For  $U$  a  $m \times n$  matrix and  $V$  a  $n \times k$  matrix,

$$\text{Rank}(UV) \geq \text{Rank}(U) + \text{Rank}(V) - n$$

┘

*Proof:* This comes from  $\dim \ker fg \leq \dim \ker f + \dim \ker g$ , which is because  $\ker fg = g^{-1}(\ker f)$ . □

**Prop. (3.5.2.4) [Finite Field General Linear Group].** Over finite field  $\mathbb{F}_{p^k}$ ,  $\# \text{GL}(n; \mathbb{F}_{p^k}) = (p^n - 1)(p^n - p) \dots (p^n - p^{n-1})$ . ┘

*Proof:* This is because choose the rows are equivalent to choosing a basis for  $V = \bigoplus_{i=1}^n \mathbb{F}_{p^k}$ , and when choosing  $n$ -th row, it suffices to avoid an element in the span of the first  $n - 1$  rows. □

**Prop. (3.5.2.5) [Wedge and Rank].** Let  $T : V \rightarrow V'$  be a linear map, then  $\wedge^m(T) = 0$  iff  $\text{rank}(T) < m$ . ┘

*Proof:* If  $\text{rank}(T) < m$ , then  $\text{Im}(\wedge^m(T)) \subset \wedge^m \text{Im}(T) = 0$ . Conversely, if  $\text{rank}(T) \geq m$ , choose  $\{Te_1, \dots, Te_m\}$  linearly independent, then  $T(e_1 \wedge \dots \wedge e_m) = Te_1 \wedge \dots \wedge Te_m \neq 0$ . □

## 3 Dual spaces

**Def. (3.5.3.1) [Dual Spaces].** For  $V \in \mathcal{V}ect_k$ , the set of linear functionals on  $V$  with value in  $k$  form another vector space, which is denoted by  $V^*$ , called the **dual space** of  $V$ . ┘

**Def. (3.5.3.2) [Annihilator].** Let  $V$  be a vector space and  $W \subset V$  a subspace, then the **annihilator**  $W^\perp$  is the subspace of  $V^*$  consisting of linear functionals  $l$  on  $V$  s.t.  $l(W) = 0$ . ┘

**Def. (3.5.3.3) [Dual Basis].** Let  $V \in \mathcal{V}ect_k$  and  $(e_1, \dots, e_n)$  is a basis of  $V$ , then there exists unique elements  $\alpha_1, \dots, \alpha_n$  of  $V^*$  s.t.  $(e_i, \alpha_j) = \delta_{ij}$ . Any such elements  $\alpha_1, \dots, \alpha_n$  constitute a basis for  $V^*$ , and is called the **dual basis** of  $(e_1, \dots, e_n)$ . ┘

**Prop. (3.5.3.4) [Dimension of the Annihilator].** Let  $W \subset V$  be f.d. vector spaces, then  $\dim W + \dim W^\perp = \dim V$ . ┘

*Proof:* Let  $\{e_1, \dots, e_k\}$  be a basis of  $W$  and extend it to a basis  $\{e_1, \dots, e_k, e_{k+1}, \dots, e_n\}$  of  $V$  by (3.5.1.6). Consider the dual space  $e_1^*, \dots, e_n^*$ , then the annihilator of  $W$  is just  $\text{span}\{e_{k+1}^*, \dots, e_n^*\}$ . Thus  $k + (n - k) = n = \dim V$ . □

**Def. (3.5.3.5) [Transpose].** Let  $T : V \rightarrow W$  be a linear map of f.d. vector spaces, then  $T$  induces a map  $T^t : W^* \rightarrow V^*$  given by  $T^t(l) = l \circ T$ . This is a linear map, called the **transpose** of  $T$ .  $\lrcorner$

**Prop. (3.5.3.6) [Adjoint Map and Transpose].** Let  $T : V \rightarrow W$  be a linear map of f.d. vector spaces, such that w.r.t. a basis  $\{e_1, \dots, e_n\}$  of  $V$  and  $\{f_1, \dots, f_m\}$  of  $W$ ,  $T$  is given by matrix  $A = (a_{ij})$ . Then w.r.t. the dual basis  $\{f_1^*, \dots, f_m^*\}$  of  $W^*$ ,  $\{e_1^*, \dots, e_n^*\}$  of  $V^*$ , the transpose map (3.5.3.5)  $T^t : W^* \rightarrow V^*$  is given by the a matrix  $A^t = (b_{ij})$ , where  $b_{ij} = a_{ji}$ .  $A^t$  is called the **transpose matrix** of  $A$ .  $\lrcorner$

*Proof:*  $\langle e_j, T^t(f_i^*) \rangle = \langle Te_j, f_i^* \rangle = a_{ji}$ , thus  $b_{ij} = a_{ji}$ .  $\square$

**Prop. (3.5.3.7) [Transpose Range Nullity Duality].** Let  $f : V \rightarrow V'$  be a linear map between f.d. vector spaces over a field  $k$ , then

- $\text{rank}(T^t) = \text{rank}(T)$ .
- The range of  $T^t$  is the annihilator of the null space of  $T$ .

$\lrcorner$

*Proof:* 1: Notice that  $T^t(g) = 0$  iff  $\langle g, T(v) \rangle = 0$  for any  $v \in V$ , thus the null space of  $T^t$  is just the annihilator of the range of  $T$ , which equals  $\dim V' - \text{rank}(T)$  by (3.5.3.4). But this space has dimension  $\dim \ker(T^t) = \dim V' - \text{rank}(T^t)$ , so  $\text{rank}(T) = \text{rank}(T^t)$ .

2: This follows from the fact that  $(T^t)^t = T$  and the argument above.  $\square$

**Cor. (3.5.3.8).** A linear map between f.d. vector spaces is surjective iff its transpose is injective.  $\lrcorner$

**Prop. (3.5.3.9) [Infinite Dual space].** If  $\dim_K V = \infty$ , then  $\dim_K V < \dim_K V^*$ .  $\lrcorner$

*Proof:* Notice  $\text{Hom}(\oplus_{i \in I} K e_i, K) = \prod K e_i^*$ .

We prove first that if  $|K|$  is at most countable, then  $|V| = |I|$ . Notice the set  $S_n(I)$  of all  $n$ -element subsets of  $I$  is of the same cardinality of  $I$  (2.2.8.3). And the finite sums of  $K$  and  $e_i$  can be seen as a subset of  $S_n(I) \times K^n$ , so it has the same cardinality of  $I$ .

Now we can prove if  $\#K < \aleph_0$ , then  $\dim V < \dim V^*$ . This is because  $V^*$  equals the functions from  $V$  to  $K$ , which is bigger than the functions from  $V$  to  $\{0, 1\}$ , which is the power set of  $V$ , so having cardinality  $2^{|V|}$  which is bigger than  $|V|$ , by Cantor theorem (2.2.7.4).

Now generally,  $K$  is not countable, but it has a base field  $F$ , which is countable, so we consider the  $F$ -vector space  $W = \oplus_{i \in I} F e_i$ , then  $\dim_F W = \dim_K V$ , and  $\dim_F W < \dim_F W^*$ . If we can show  $\dim_F W^* \leq \dim_K V^*$ , then we are done.

For this, first consider the natural  $F$ -linear mapping  $W^* \rightarrow V^*$ , which is clearly an imbedding. Now we want to use (3.5.1.7), so we check the conditions, for  $F$ -linearly independent  $\varphi_1, \dots, \varphi_n$ , if  $\sum c_i \varphi_i = 0$ ,  $c_i \in K$ , then if we can find  $w_k \in W$  that  $\varphi_i(w_j) = \delta_{ij}$ , then this is a contradiction. But this is true, by a simple argument, using the  $F$ -linearity of  $F$ .  $\square$

## 4 Rational Forms and Jordan Forms

**Prop. (3.5.4.1) [Elementary and Invariant Factors].** A linear operator in  $L(V)$  is equivalent to a  $k[X]$ -module structure on  $V$ , and two operators are similar iff the module structure are isomorphic.

As  $k[X]$  is a PID, the elementary factors, invariant factors, cyclic and elementary decomposition theorems (3.2.4.22) can be applied to the case.  $\lrcorner$

*Proof:* Cf. [Advanced Linear Algebra P168].  $\square$

**Cor. (3.5.4.2) [Jordan Forms].**

- For any  $g \in \text{Mat}(n; k)$ , if all the eigenvalues of  $g$  are in  $k$  (e.g.  $k = \bar{k}$ ), then  $g$  is similar to a matrix of blocks  $\lambda_i \mathbf{1} + N$ ,  $Nx_i = x_{i-1}$ , called the **Jordan form** of the matrix.
- Any  $g \in \text{Mat}(n; \mathbb{R})$  is similar to a matrix of blocks of the above form together with  $\begin{bmatrix} a & -b \\ b & a \end{bmatrix}$  on the diagonal and  $I_{2 \times 2}$  on the lower side.

┘

*Proof:* 1: Because  $k = \bar{k}$ , the elementary factors are all of the form  $(x - c_i)^{m_{ij}}$ . Now in the basis

$$\{(T - c_i)^{m_i-1}v, (T - c_i)^{m_i-2}v, \dots, v\},$$

the matrix is just the Jordan form.

1: Over  $\mathbb{R}$ , the elementary factors are all of the form  $(x - c_i)^{m_{ij}}$  and  $((x - a)^2 + b^2)^{m_{ij}}$ . Then complexify it and consider a cyclic vector  $v$ , for  $(T - (a + bi)I)$ , let  $v_{n+1} = (T - (a + bi)I)v_n$ , and let  $v_n = X_n + iY_n$ , then it can be verified that  $T$  is of the Jordan form given in the basis  $X_i, Y_i$ .  $\square$

**Def. (3.5.4.3) [Companion matrix].** The **companion matrix** for a monic polynomial  $p(x) = x^n + a_{n-1}x^{n-1} + \dots + a_0 \in k[X]$  is the matrix

$$T_{p(x)} = \begin{bmatrix} 0 & 0 & \cdots & 0 & -a_0 \\ 1 & 0 & \cdots & 0 & -a_1 \\ 0 & 1 & \ddots & & \vdots \\ \vdots & \vdots & \ddots & 0 & \\ 0 & 0 & \cdots & 1 & -a_{n-1} \end{bmatrix}$$

┘

**Prop. (3.5.4.4) [Companion Matrix is Nonderogatory].** An operator is cyclic iff it is similar to a companion matrix.

A companion matrix is nonderogatory (3.5.9.28). In fact, the minimal polynomial and the maximal polynomial of the companion matrix of  $p(X)$  are both  $p(X)$ .  $\square$

*Proof:* The operator of the companion matrix is an operator  $A$  with a basis  $\{v, Av, A^2v, \dots, A^{n-1}v\}$  and  $A^n v = -\sum_{i < n} a_i A^i v$ , which is just equivalent to the fact the action of  $A$  is cyclic.

The determinant of  $T_{p(X)}$  equals  $p(X)$  by (3.5.4.14), and for the minimal polynomial, in the basis of  $\{v, Av, A^2v, \dots, A^{n-1}v\}$ , clearly for a polynomial  $f(X)$  of degree  $m < n$ ,  $f(A)v \neq 0$ , and  $p(A)v = \sum_{i < n} a_i A^i v + A^n v = 0$ . So the minimal polynomial of  $A$  is  $p(X)$ .  $\square$

**Prop. (3.5.4.5) [Rational Canonical Form].** Every matrix is similar to a sum of companion matrices (3.5.4.3) corresponding to its elementary divisors.  $\square$

**Prop. (3.5.4.6) [Invariant Factor Form].** Every matrix is similar to a sum of companion matrices, corresponding to its invariant factors.  $\square$

**Def. (3.5.4.7) [Nilpotent and Unipotent Matrices].** A **nilpotent matrix** is a matrix  $A \in \text{Mat}(n; k)$  s.t.  $A^n = \mathbf{1}$ . And it is called **maximally nilpotent** if the minimal polynomial of  $A$  is  $T^n = 1$ .

A **unipotent matrix** is a matrix  $A \in \text{Mat}(n; k)$  s.t.  $A - \mathbf{1}$  is nilpotent. And a **maximally unipotent matrix** is a matrix  $A \in \text{Mat}(n; k)$  s.t.  $A - \mathbf{1}$  is maximally nilpotent.  $\square$

### Computing the Invariant Factors

**Def. (3.5.4.8) [Elementary Row Operation].** An **elementary row operation** for a matrix  $M$  over an algebra  $A$  is one of the following:

- Multiplying one row of  $M$  by a non-zero scalar in  $A$ .
- plus the  $r$ -th row by  $c$ -times the  $s$ -th row, where  $c$  is invariant  $A$ .

And an **elementary matrix** is a matrix obtained by the identity matrix by an elementary row operation.

Two matrix is called **row equivalent** iff they can be connected by f.m. elementary row operations, and this is equivalent to  $M = PN$ , where  $P$  is a product of f.m. elementary matrices, because left multiplication by an elementary matrix is equivalent to an elementary row operation.

Similarly we can define elementary column operations. ┘

**Lemma (3.5.4.9).** The elementary row operation change the determinant only by an invariant element in  $A$ . (Clear). ┘

**Prop. (3.5.4.10).** Let  $P$  be a matrix with entries in  $F[X]$ , then the following are equivalent:

- $P$  is invertible.
  - The determinant is a nonzero scalar.
  - $P$  is row equivalent to identity matrix.
  - $P$  is a product of elementary matrices.
- ┘

*Proof:* The only hard part is  $2 \rightarrow 3$ : this is because it has determinant in  $F^*$ , thus the greatest common divisor of the first column is a scalar, thus we can use row operation to make it  $(1, 0, \dots, 0)^t$ , and then we can continue to make it a upper triangular matrix with 1 in the diagonal, and also kill the upper half part. So it is row equivalent to the identity matrix. □

**Cor. (3.5.4.11).** Let  $M, N$  be two matrices with entries in  $F[X]$ , then they are equivalent iff  $N = PM$  for some  $P$  that has determinant in  $F$ . ┘

**Def. (3.5.4.12).** We call  $M, N$  **equivalent** iff  $M, N$  are connected by a sequence of elementary row operations and column operations. This is equivalent to  $M = PNQ$  for  $P, Q$  invertible matrices in  $M_n(F[X])$ . ┘

**Prop. (3.5.4.13) [Normal Form of Companion Matrix].** For a monic polynomial  $p(X)$ , consider its companion matrix  $T_p$ , then the matrix  $xI - T_p \in M_n(F[X])$  is equivalent to  $\text{diag}(p(X), 1, \dots, 1)$ . ┘

*Proof:* Clear, if one reduces the  $x$  in the diagonal from the bottom row to the top row one by one. □

**Cor. (3.5.4.14).** For a companion matrix  $A$  of  $p$ ,  $\det(xI - A) = p$ . ┘

*Proof:* This is from (3.5.4.9), and the fact both the side are monic polynomials. □

**Def. (3.5.4.15) [Smith Normal Form].**  $A \in \text{Mat}(n; k[X])$  is called a **Smith normal form** if it is diagonal and diagonal entries  $f_i \in F[X]$  is monic and satisfies  $f_k$  divides  $f_{k+1}$ . ┘

**Prop. (3.5.4.16).** Any matrix  $M$  with entries in  $F[X]$  is equivalent to a unique Smith normal form. ┘

*Proof:* This is immediate from (16.5.5.5) applied to the PID  $F[X]$  (3.2.3.17).  $\square$

**Cor. (3.5.4.17)[Computing Invariant Factors].** The diagonal entries of the Smith form of the matrix  $xI - M \in M_n(F[X])$  are just the invariant factors of  $M$ .  $\lrcorner$

*Proof:* This is because of the uniqueness of Smith form (3.5.4.16) and the invariant factor (3.5.4.6) and (3.5.4.13).  $\square$

### Applications

**Prop. (3.5.4.18).** For any two matrices  $A, B \in M_{n \times n}(K)$ ,  $(AB)^n$  and  $(BA)^n$  are similar.  $\lrcorner$

*Proof:* It suffices to show that they have the same elementary factors. Notice that for any irreducible polynomial  $p$ , if  $p \neq x$ , then if  $p^k(AB)v = 0$ , then  $p^k(BA)Bv = 0$ , if  $p^k(BA)v = 0$ , then  $p^k(AB)Av = 0$ . Thus there are maps  $B : N(p^k(AB)) \rightarrow N(p^k(BA))$  and  $A : N(p^k(BA)) \rightarrow N(p^k(AB))$ . Now their composition are both injective, thus they have the same dimension.

And for  $p = x$ , these two both have nullity as the multiplicity of 0 in the charpoly of  $AB, BA$  (3.5.9.10), thus the same. So they have the same elementary factors, thus similar.  $\square$

**Prop. (3.5.4.19)[Matrix Similar to Transpose].** Any matrix is similar to its transpose.  $\lrcorner$

*Proof:* This is because the invariant factors can be computed using the greatest common divisors of minors by (3.5.4.16) and (3.5.4.17), and they are clearly invariant under conjugation.  $\square$

## 5 Tensor Algebras

**Def. (3.5.5.1) [Tensor Algebras].** The tensor product and tensor algebras of modules are defined in (3.2.4.13) and (5.1.1.23). In this subsection, we focus on tensor algebras of vector spaces.  $\lrcorner$

**Def. (3.5.5.2) [Symmetrized Tensors].** If  $k \in \text{Field}^0$  and  $V \in \text{Vect}_k$ , for any  $n \in \mathbb{Z}_+$ , we can define a multilinear map

$$V^n \rightarrow T^n(V) : (v_1, \dots, v_n) \mapsto \frac{1}{n!} \sum_{\sigma \in S_n} v_{\sigma(1)} \otimes \dots \otimes v_{\sigma(n)}.$$

and descends to a linear map  $\sigma : S^n(V) \rightarrow T^n(V)$ , called the **symmetrizer map**. Elements in  $\text{Im}(\sigma) = \tilde{S}^n(V)$  is called **symmetrized tensors**.

Then  $\sigma^2 = \sigma$ , and  $\ker(\sigma) = I \cap T^n$ , where  $I = \ker(T(V) \rightarrow \text{Sym}(V))$ . In particular,

$$T^n(V) = \tilde{S}^n(V) \oplus (T^n(V) \cap I).$$

$\lrcorner$

*Proof:*  $\sigma^2 = \sigma$  is easy. So  $V = \text{Im}(\sigma) \oplus \ker(\sigma)$ . Now  $T^n(V) \cap I \subset \ker(\sigma)$ , and because  $\text{Im}(\sigma) \rightarrow S^n(V)$  is surjective,  $T^n(V) \cap I = \ker(\sigma)$ .  $\square$

**Def. (3.5.5.3)[Anti-Symmetrized Tensors].** Let  $k \in \text{Field}^0$  and  $V \in \text{Vect}_k$ , for any  $n \in \mathbb{N}$ , we define a multilinear map

$$V^n \rightarrow T^n(V) : (v_1, \dots, v_n) \mapsto \frac{1}{n!} \sum_{\sigma \in S_n} \text{sgn}(\sigma) v_{\sigma(1)} \otimes \dots \otimes v_{\sigma(n)}.$$

and descends to a linear map  $\sigma : \wedge^n(V) \rightarrow T^n(V)$ , called the **anti-symmetrizer map**. Elements in  $\text{Im}(\tau) = \tilde{\wedge}^n(V)$  is called **anti-symmetrized tensors**.

Then  $\tau^2 = \tau$ , and  $\ker(\tau) = I \cap T^n$ , where  $I = \ker(T(V) \rightarrow \wedge(V))$ . In particular,

$$T^n(V) = \tilde{\wedge}^n(V) \oplus (T^n(V) \cap I).$$

┘

*Proof:*  $\sigma^2 = \sigma$  is easy. So  $V = \text{Im}(\sigma) \oplus \ker(\sigma)$ . Now  $T^n(V) \cap I \subset \ker(\sigma)$ , and because  $\text{Im}(\sigma) \rightarrow S^n(V)$  is surjective,  $T^n(V) \cap I = \ker(\sigma)$ .  $\square$

**Prop. (3.5.5.4).** Let  $k \in \text{Field}$ ,  $A \in \text{Mat}(k)$ , then the eigenvalues of  $\text{Sym}^n A$  and  $\wedge^n A$  are all known.  $\lrcorner$

*Proof:* Because we can pass to  $\bar{k}$ , and over there  $A$  is upper-triangularizable.  $\square$

## 6 Supervector Spaces(Berezin)

**Def. (3.5.6.1)[Supervector Spaces].** For  $k \in \text{Field}^0$ , a **supervector space** over  $k$  is a  $\mathbb{Z}/(2)$ -graded vector spaces over  $k$ , i.e.  $V = V_0 \oplus V_1$ . If  $\dim V_0 = n$  and  $\dim V_1 = m$ , then  $V$  is denoted by  $k^{n|m}$ .  $\lrcorner$

**Prop. (3.5.6.2)[Tensors of Supervector Spaces].** There is a natural notion of tensors of supervector spaces, and  $S_2$  acts on  $V \otimes V$  by

$$\sigma(v \otimes w) = (-1)^{ij} w \otimes v, \quad v \in V_i, w \in V_j.$$

And then we can define the **symmetric algebra**  $S(V) = \bigoplus_{i \in \mathbb{N}} S^i(V)$  and the **exterior algebra**  $\wedge(V) = \bigoplus_{i \in \mathbb{N}} \wedge^i(V)$  s.t.

$$S(V) = S(V_0) \otimes \wedge(V_1), \quad \wedge(V) = \wedge(V_0) \otimes S(V_1).$$

┘

## 7 Spectral Theory

References are [\[Mey00\]](#)Chap7.

**Def. (3.5.7.1)[Eigenvalues and Eigenvectors].** For  $A \in \text{Mat}(n; k)$ , an **eigenvalue** of  $A$  is a number  $\lambda \in \bar{k}$  s.t there exists  $v \in (\bar{k})^n$  s.t.

$$Av = \lambda v.$$

And such a vector is called a **eigenvector** for  $A$  of eigenvalue  $\lambda$ . More generally, a **generalized eigenvalue** is a vector  $v \in (\bar{k})^n$  s.t.

$$(A - \lambda \mathbf{1})^k v = 0$$

for some  $k \in \mathbb{Z}_+$ .  $\lrcorner$

### Indices

**Def. (3.5.7.2) [Indices].** For a singular matrix  $A \in \text{Mat}(n; k)$ , there exists  $m \in \mathbb{Z}_+$  s.t.

$$k^m = \text{Im}(A^m) \oplus \ker(A^m).$$

The smallest such  $m$  is called the **index of nilpotency** of  $A$ , denoted by  $\text{ind}(A)$ . For  $A \in \text{GL}(n; k)$ , define  $\text{ind}(A) = 0$ . ┘

**Prop. (3.5.7.3) [Indices of Nilpotent Matrices].** If  $A \in \text{Mat}(n; k)$  is nilpotent, then  $\text{ind}(A)$  is the smallest number  $m$  s.t.  $A^m = 0$ . ┘

*Proof:* Cf.[Matrix Analysis and Applied Linear Algebra]P396. □

**Def. (3.5.7.4) [Indices].** For  $A \in \text{Mat}(n; k)$  and an eigenvalue  $\lambda$ , the **index of eigenvalue** of  $\lambda$  is defined to be  $\text{ind}(\lambda) = \text{ind}(A - \lambda \mathbf{1})$  (3.5.7.2). ┘

### Difference Equations, Limits, and Summability

**Prop. (3.5.7.5) [Cesáro Summability].** For  $A \in \text{Mat}(n; \mathbb{C})$ , then  $A$  is Cesáro summable, i.e.

$$G = \lim_{k \rightarrow \infty} \frac{\mathbf{1} + P + \dots + P^{k-1}}{k}$$

exists, iff  $\rho(A) < 1$ , or  $\rho(A) = 1$  with the unit eigenvalues all being semisimple.

And in this case,  $G$  is the projection onto  $\ker(\mathbf{1} - A)$  along  $\text{Im}(\mathbf{1} - A)$ .

And if  $A$  is convergent to  $G$ , then  $A$  is summable to  $G$ . ┘

*Proof:* Cf.[Matrix Analysis and Applied Linear Algebra]P633. ? □

## 8 Location and Perturbation of Eigenvalues

References are [Matrix Analysis, Horn-Johnson]Chap6.

## 9 Homogenous Invariants

### Determinants

References are [advanced determinant calculus].

**Def. (3.5.9.1) [Determinant].** For  $T \in \text{End}(V)$ , as  $\dim \wedge^n V^* = 1$ , the **determinant**  $\det(T) \in R$  is an identity  $\det(T) \in R$  determined by the identity  $\wedge^n(T^t) = \det T \cdot \text{id}_{\wedge^n V^*}$ . That is:  $L(T\alpha_1, \dots, T\alpha_n) = \det T \cdot L(\alpha_1, \dots, \alpha_n)$ . And the determinant of a matrix is defined by the linear operator it associates in a canonical basis. ┘

**Prop. (3.5.9.2) [Properties of Determinants].**

1.  $\det(\text{id}_V) = 1$ .
2.  $\det(UV) = \det U \cdot \det V$ .
3.  $T$  is invertible iff  $\det T$  is invertible, in which case  $\det(T^{-1}) = (\det T)^{-1}$ .
4. If  $\{\alpha_1, \dots, \alpha_n\}$  is a basis for  $V$ , and  $f_i$  is its dual basis, then  $\det T = f_1 \wedge \dots \wedge f_n(T\alpha_1, \dots, T\alpha_n)$ . ┘

*Proof:* All these are not hard. □

**Cor. (3.5.9.3).**  $\det(P^{-1}AP) = \det(A)$ . ┘

**Prop. (3.5.9.4).**  $\det T = \det T^t$ . ┘

*Proof:* Use (3.5.9.2), if  $\{\alpha_1, \dots, \alpha_n\}$  is a basis for  $V$ , and  $f_i$  is its dual basis, then

$$\det T^t = \alpha_1 \wedge \dots \wedge \alpha_n(T^t f_1, \dots, T^t f_n) = f_1 \wedge \dots \wedge f_n(T\alpha_1, \dots, T\alpha_n) = \det T$$

□

**Prop. (3.5.9.5) [Expansion of Determinants].** If  $A_i$  be the  $i$ -th column of  $A$ , then

$$\det A = f_1 \wedge \dots \wedge f_n(A\varepsilon_1, \dots, A\varepsilon_n) = f_1 \wedge \dots \wedge f_n(A_1, \dots, A_n) = \sum_{\sigma \in S_n} \text{sgn}(\sigma) \prod_{1 \leq i \leq n} A_{\sigma(i)i}.$$

┘

**Prop. (3.5.9.6).** For a matrix, the determinant satisfies the following properties:

1. adding a multiple of a column/row to another column/row, the determinant doesn't change.
2. Multiplying a row or a column with a scalar, then the determinant multiplies with this scalar.
3. Changing two rows or two columns makes the determinant multiply by  $-1$ .

┘

*Proof:* All this follows from 4 of (3.5.9.2). Notice the last one follows from the first two. □

**Prop. (3.5.9.7) [Laplacian Expansion Formula].** Cf. [Determinant 安金鹏 P15]. ┘

**Prop. (3.5.9.8) [Binet's Formula].** Let  $F/E$  be a Hermitian pair (3.5.11.6),  $A \in \text{Mat}(n \times m; F)$ , then

$$\det(A^*A) = \sum_{I \in \{0, \dots, n\}, \#I=m} |\det(A_I)|^2.$$

┘

*Proof:* Let  $L : F^m \rightarrow F^n$  be the corresponding map, then  $\wedge^n(L^*) \circ \wedge^n(L) = \wedge^n(L^* \circ L)$ . In the canonical basis, the matrices for  $\wedge^n(L^*)$  (resp.  $\wedge^n(L)$ ) have only one column (resp. one row) with entries  $\det(A_I)$  by definition (3.5.9.1), thus the assertion follows by (3.5.9.1) again. □

**Prop. (3.5.9.9) [Sylvester's Determinant Identity].** If  $A$  and  $B$  are matrices of sizes  $m \times n$  and  $n \times m$ , then

$$\det(\mathbf{1}_m + AB) = \det(\mathbf{1}_n + BA)$$

┘

*Proof:* Notice

$$\begin{aligned} \begin{bmatrix} 1 & A \\ B & 1 \end{bmatrix} &= \begin{bmatrix} 1 & 0 \\ B & 1 \end{bmatrix} \begin{bmatrix} 1 & 0 \\ 0 & 1 - BA \end{bmatrix} \begin{bmatrix} 1 & A \\ 0 & 1 \end{bmatrix} \\ &= \begin{bmatrix} 1 & A \\ 0 & 1 \end{bmatrix} \begin{bmatrix} 1 - BA & 0 \\ 0 & 1 \end{bmatrix} \begin{bmatrix} 1 & 0 \\ B & 1 \end{bmatrix} \end{aligned}$$

and use (3.5.9.2). □

**Cor. (3.5.9.10).** Multiplying by  $T$ , we see that the characteristic polynomial of  $AB$  and  $BA$  are the same.  $\lrcorner$

**Remark (3.5.9.11).** There is another proof in case  $m = n$ : It suffices to show

$$\det(\mathbf{1} + (A + X\mathbf{1})(B + X\mathbf{1})) = \det(\mathbf{1} + (B + X\mathbf{1})(A + X\mathbf{1})).$$

But notice  $A + X\mathbf{1}$  and  $B + X\mathbf{1}$  are invertible in  $\text{Mat}(n; K(X))$ , thus

$$\det(\mathbf{1} + (A + x\mathbf{1})(B + x\mathbf{1})) = \det((A + x\mathbf{1})((A + x\mathbf{1})^{-1} + (B + x\mathbf{1}))) = \det(\mathbf{1} + (B + x\mathbf{1})(A + x\mathbf{1})).$$

$\lrcorner$

**Cor. (3.5.9.12).** Let  $n \in \mathbb{Z}_+$ ,  $A \in \text{GL}(n; \mathbb{C})$  and  $u, v \in \mathbb{C}^n$ , then

$$\det(A + uv^t) = \det(A) \cdot (1 + v^t A^{-1} u).$$

$\lrcorner$

**Prop. (3.5.9.13) [Schur Complements].** If  $A$  is invertible,

$$\det \begin{bmatrix} A & B \\ C & D \end{bmatrix} = \det(A) \det(D - CA^{-1}B).$$

The matrix  $D - CA^{-1}B$  is called the **Schur complement** of  $A$  in  $\begin{bmatrix} A & B \\ C & D \end{bmatrix}$ .

Similarly, if  $D$  is invertible,

$$\det \begin{bmatrix} A & B \\ C & D \end{bmatrix} = \det(D) \det(A - BD^{-1}C).$$

The matrix  $A - BD^{-1}C$  is called the **Schur complement** of  $D$  in  $\begin{bmatrix} A & B \\ C & D \end{bmatrix}$ .  $\lrcorner$

*Proof:*

$$\det \begin{bmatrix} A & B \\ C & D - CA^{-1}B \end{bmatrix} = \det(A) \det(D - CA^{-1}B).$$

$\square$

### Applications

**Prop. (3.5.9.14).** Adjunction matrix, Cf. [Determinant 安金鹏 P16].  $\lrcorner$

*Proof:*  $\square$

**Cor. (3.5.9.15).** If  $AB = 1$ , then  $BA = 1$ .  $\lrcorner$

**Prop. (3.5.9.16) [Cramer's Rule].** Cf. [Determinant 安金鹏 P16].  $\lrcorner$

**Prop. (3.5.9.17) [Hadamard's Inequality].** For any  $A \in \text{Mat}(n; \mathbb{R})$ ,

$$|\det(A)| \leq \prod_j \left( \sum_i |a_{ij}|^2 \right)^{1/2},$$

with equality iff  $A \in O(n)$ . ┘

*Proof:* If  $\det A = 0$ , this is trivially true. And if  $A$  is non-singular, then we have a  $QR$ -decomposition  $A = QR$  (16.5.5.4), where  $Q$  is orthogonal and  $R$  is upper-triangular. Then  $|\det(A)| = |\det(R)|$ , and left multiplication by  $Q$  doesn't change the norm of column vectors of  $A$ , so it suffices to prove for  $A = R$ . And this is trivial. □

**Prop. (3.5.9.18) [Vandermonde Matrix].** For  $R \in \mathcal{CRing}$  and  $x_1, \dots, x_n \in R$ , the  $n \times n$  **Vandermonde matrix** is defined to be  $\text{Van}(x_1, \dots, x_n) \triangleq (x_i^{j-1})_{i,j}$ . Then it has determinant  $\prod_{i < j} (x_i - x_j)$ , which is invertible when  $x_i$  are pairwise different. ┘

*Proof:* Eliminate the first row by adding columns. □

**Prop. (3.5.9.19) [Pfaffian].** There is a **Pfaffian polynomial**  $\text{Pf}(M)$  s.t.  $\det M = \text{Pf}(M)^2$  for a skew-symmetric matrix. This is because a skew symmetric is equal to  $A^t \begin{bmatrix} 0 & 1 \\ -1 & 0 \end{bmatrix}^k A$  for  $A$  an orthogonal matrix (3.5.11.9), so it has determinant  $(\det A)^2$  and  $A$  and depends polynomially on the entries of  $M$ . ┘

**Cor. (3.5.9.20).**

$$\text{Pf}(A^t M A) = \det A \cdot \text{Pf}(M).$$

Because we only need to consider the sign and it is determined by letting  $A = \mathbf{1}$ . ┘

**Prop. (3.5.9.21) [Determinants of Hermitian Pairs].** ┘

### Characteristic Polynomials

**Def. (3.5.9.22) [Characteristic Polynomials].** For  $k \in \text{Field}$ ,  $V \in \text{Vect}_k$  and  $T \in \text{End}(V)$ , the **characteristic polynomial** of  $T$  is defined to be

$$P(X; T) = \det(X\mathbf{1} - T|V) \in \mathbb{Z}[X] \text{ (3.5.9.1)},$$

where  $X\mathbf{1} - T$  is regarded as an element in  $\text{End}(V \otimes k(X))$ . ┘

### Traces

**Def. (3.5.9.23) [Trace].** For a  $n \times n$ -matrix  $A$ , define its **trace**  $\text{tr}(A)$  to be the minus of the coefficient of  $x^{n-1}$  in  $\det(x\mathbf{1} - A)$ . It is clear that  $\text{tr}(A) = \sum_{i=1}^n a_{ii}$ , and by (3.5.9.3) that traces are invariant under conjugacy. ┘

**Prop. (3.5.9.24).**  $\text{tr}(AB) = \text{tr}(BA)$ . ┘

*Proof:* This is because  $\det(x - AB) = \det(x - BA)$  by Sylvester determinant identity (3.5.9.9). □

**Prop. (3.5.9.25).** If  $A, B \in \text{Mat}(n; \mathbb{C})$  and  $A$  is invertible, then

$$\frac{\partial}{\partial t} \det(A + tB) = \det A \text{tr}(A^{-1}B).$$

┘

**Prop. (3.5.9.26) [Trace Formula].** For  $V \in \mathcal{V}ect/k, F \in \text{End}(V), d \in \mathbb{Z}_+$ ,

$$t \frac{\partial}{\partial t} \log \det(1 - FT^d)^{-1} = \sum_{i \geq 1} d \text{tr}(F^i|V) T^i \in 1 + Tk[[T]].$$

In particular, if  $\text{char } k = 0$ ,

$$\det(1 - FT^d|V)^{-1} = \exp \left( \sum_{i \geq 1} \text{tr}(F^i|V) \frac{T^{di}}{i} \right) \in 1 + Tk[[T]].$$

┘

*Proof:* Pass to  $\bar{k}$  and let  $k_1, \dots, k_r$  be the eigenvalues of  $F$ . □

### Minimal Polynomials

**Def. (3.5.9.27) [Minimal Polynomials].** The **minimal polynomial** of a matrix  $A$  is the polynomial  $p$  of minimal degree that  $p(A) = 0$ . It is equivalent to the maximal invariant factor of  $A$ , by (3.5.4.1).

┘

**Def. (3.5.9.28) [Non-derogatory Operator].** An operator is called **nonderogatory** iff it has only one invariant factor. ┘

**Prop. (3.5.9.29) [Generalized Cayley-Hamilton].** The characteristic polynomial of  $A$  is the product of the elementary divisors of  $A$ , thus the characteristic polynomial and minimal polynomial (3.5.9.27) of  $A$  have the same set of irreducible factors, but may not with the same multiplicity.

In particular, the characteristic polynomial is divisible the minimal polynomial. ┘

*Proof:* Because charpoly and minipoly are both invariant under similarity, assume  $A$  is in rational form (3.5.4.5), so the result follows from (3.5.4.4). □

**Prop. (3.5.9.30).** For  $k \in \text{Field}$  and  $A, C \in \text{Mat}(n; k)$ , the linear map  $\text{Mat}(n; k) \rightarrow \text{Mat}(n; k) : X \rightarrow AX - XC$  is an isomorphism iff the minimal polynomials of  $A$  and  $C$  has no common factor. ┘

*Proof:* Notice if  $AX = XC$ , then we have  $P(A)X = XP(C)$  for every polynomial  $P$ , in particular for the minimal polynomials of  $A$  and  $C$ , thus  $P(C)$  is non-invertible and  $A, C$  has a characteristic value in common. Conversely, if they have a characteristic value, then we upper triangularize  $A$  to see clearly that there is a  $X$  that  $AX = XC$  ( $X$  has only the first row). □

### Characteristic Polynomial Images

In this subsubsection, we consider the set of characteristic polynomials of elements in a subgroup of  $\text{GL}(n; k)$  as a whole.

## 10 Diagonalization and Triangulation

**Prop. (3.5.10.1).** If a linear map has matrix form  $T$  in a basis  $(X_i)$  and there is another basis  $(Y_i)$  that  $(Y_i) = (X_i)P$ , then it has matrix form  $PTP^{-1}$  in the basis  $(Y_i)$ . In particular, if  $T$  can be diagonalized, with eigenvectors  $(X_i)$ , then  $T = (X_i)D(X_i)^{-1}$ .  $\lrcorner$

**Prop. (3.5.10.2) [Relation with Minimal Polynomial].** For  $n \in \mathbb{Z}_+$ ,

- $A \in \text{GL}(n; k)$  is upper-triangulable iff its minimal polynomial is a product of linear factors.
- $A \in \text{GL}(n; k)$  is diagonalizable iff its minimal polynomial is a product of linear factors with no multiple roots.

$\lrcorner$

*Proof:* 1: If it is upper-triangulable, its minimal polynomial is a product of factors because its characteristic polynomial does (3.5.9.29). Conversely, we can find an eigenvector for  $A$ , then we quotient this vector and use induction.

2: If it is diagonalizable, then the minimal polynomial is clearly polynomials. Conversely, its elementary factors are all linear factors, thus its Jordan form is just diagonal (3.5.4.2).  $\square$

**Cor. (3.5.10.3) [Upper Triangulation over Alg. Closed Field].** If  $k \in \text{Field}, k = \bar{k}$ , then any  $A \in \text{Mat}(n; k)$  is upper-triangulable over  $k$ . Dually, it is lower-triangulable.  $\lrcorner$

*Proof:* It suffices to find an eigenvector of  $A$  and then use induction. This is clear, as the characteristic polynomial of  $A$  has a root in  $k$ .  $\square$

**Prop. (3.5.10.4) [Simultaneously Triangulation].** If  $A_i \subset \text{Mat}(n; k)$  is a commuting family of upper-triangulable matrices, then they are simultaneously triangulable.  $\lrcorner$

*Proof:* As in the proof of (3.5.10.3), by induction, it suffices to show there is a common eigenvector. Now assume there are f.m. matrices in  $\mathcal{F}$ , we induct on the number of matrices to show there is an eigenvector. Let  $\lambda$  be an eigenvalue of  $A_1$  because it is upper-triangulable, then  $N(A_1 - \lambda I)$  is invariant under  $\mathcal{F}$ , and all the matrices are upper-triangulable on  $N(A_1 - \lambda I)$ , which is seen by intersecting the flag with  $N(A_1 - \lambda I)$ . So by induction, there is a common eigenvector for  $\mathcal{F}$ .  $\square$

**Prop. (3.5.10.5) [Simultaneously Diagonalizable].** If  $A_i$  is a commuting family of diagonalizable  $n \times n$ -matrices, then they are simultaneously diagonalizable.

If  $A_i$  is a commuting family of real symmetric matrixes, then they are simultaneously orthogonally diagonalizable.  $\lrcorner$

*Proof:* We may assume there are f.m. matrices and use induction. Consider the diagonal decomposition  $V_i$  of  $V$  for  $A_1$ , then each  $V_i$  is invariant under  $\mathcal{F}$ . Notice then each  $A_i$  is diagonalizable on  $V_i$ , thus by induction,  $\mathcal{F}$  is simultaneously diagonalizable on each  $V_i$ , then  $\mathcal{F}$  is simultaneously diagonalizable.

For the second, induction on the numbers of matrices. If some matrix is  $cI$ , then clear, if some are not  $cI$ , then choose its eigenvalue decomposition, we conclude by induction hypothesis.  $\square$

**Prop. (3.5.10.6) [Invariance of Field Extension].** Let  $A \in \text{Mat}(n; k)$ , and  $E$  be the subfield generated by the entries of  $A$ , then the invariant factors of  $A$  are polynomials over  $E$ . In particular, two matrix are similar over the smallest field that they are defined.  $\lrcorner$

*Proof:* Clear, because we know how an irreducible polynomial over  $E$  factors through  $\bar{E}$ .  $\square$

### Jordan-Decompositions

**Prop. (3.5.10.7) [Jordan-Decompositions].** If  $k^{\text{sep}} = k$  and  $A \in \text{Mat}(n; k)$ , then there exists unique matrices  $A_s, A_n$  that  $A_s$  is semisimple,  $A_n$  is nilpotent,  $A = A_s + A_n$ , and  $A_s, A_n$  are polynomials of  $A$ , in particular,  $A_s$  commutes with  $A_n$ . This is called the **Jordan-decomposition** of  $A$  in  $\text{Mat}(n; k)$ .

Moreover, if  $A$  is invertible, then there exists a unique pair of matrices  $(A_s, A_u)$  in  $\text{Mat}(n; k)$  s.t.  $A_s$  is semisimple,  $A_u$  is unipotent,  $A = A_s \cdot A_u$ , and  $A_s, A_u$  are polynomials of  $A$ , in particular,  $A_s$  commutes with  $A_u$ . This is called the **Jordan-decomposition** of  $A$  in  $\text{GL}(n; k)$ .  $\square$

*Proof:* If  $k$  is alg.closed, then use (3.5.10.3). And Lagrange interpolation shows  $A_s, A_n$  are polynomials in  $A$ . For the uniqueness, notice that because they are polynomials in  $A$ , if there are two sets of Jordan decompositions  $A = A_s + A_n = A'_s + A'_n$ , then  $(A_s - A'_s) = (A'_n - A_n)$ , but the sum of commuting semisimple/nilpotent matrices is semisimple/nilpotent, so it is semisimple and nilpotent, so it can only be 0, so  $A_s = A'_s$ .

In general, because  $k$  is perfect, we can take a Galois field extension  $k'/k$  containing all eigenvalues of  $A$ . Then  $A = A_s + A_n$  where  $A_s, A_n$  has entries in  $k'$ . But then taking Galois action and using the uniqueness,  $A_s, A_n$  has entries in  $k$ .

Finally, by the Galois action again,  $A_s, A_n$  are polynomials in  $A$ .

If  $A$  is invertible, then  $A_s$  is also invertible, seen by base change to alg.closure. Then  $A = A_s(1 + A_s^{-1}A_n)$ , where  $1 + A_s^{-1}A_n$  is unipotent.  $\square$

**Prop. (3.5.10.8).** If  $T$  is a diagonalizable operator on a subspace  $V$ , then for any invariant subspace  $V'$ ,  $T|_{V'}$  is also diagonalizable.  $\square$

*Proof:* Use the eigenvalue decomposition  $V = \oplus_i V_{\lambda_i}$ , then  $V' = \oplus_i (V_{\lambda_i} \cap V')$ , which is because if  $\sum v_i \in V'$ , where  $v_i$  are in different eigenspaces, then each  $v_i \in V'$ .  $\square$

**Prop. (3.5.10.9) [Jordan-Decomposition over Finite Fields].** Let  $k \in \text{Field}^{\text{fin}}$  and  $p = \text{char } k, q = \#k, n \in \mathbb{Z}_+$ , then  $x \in \text{GL}(n; k)$  has  $p$ -power order iff  $x$  is unipotent, and  $x$  is order prime to  $p$  iff  $x$  is semisimple.  $\square$

*Proof:* If  $x$  is unipotent, then  $(x - 1)^{q^m} = x^{q^m} - 1 = 0$  for  $m$  large. Conversely, if  $x^{q^m} = 1$  for some  $m$ , then  $x$  is unipotent.

if  $x$  has order prime to  $p$ , then  $x$  is semisimple by (3.5.10.2). Conversely, if  $x$  is semisimple, then over a finite base change  $x$  is diagonal, thus  $x^{q^m-1} = 1$ , and the order of  $x$  is prime to  $p$ .  $\square$

## 11 Sesqui-linear Forms

**Def. (3.5.11.1) [Sesqui-linear Forms].** For an involutive algebra  $(R, *) \in \text{Alg}^{\text{asso}}$  and a free left  $R$ -module  $V$ , a **sesquilinear form** on  $V$  is a map  $\varphi : V \times V \rightarrow R$  s.t.

$$\varphi(ax, by) = a^* \varphi(x, y) b, \text{ where } a, b \in R, x, y \in V.$$

A sesquilinear form  $\varphi$  on  $V$  is called a **Hermitian form** (resp. **skew-Hermitian form**) if  $\varphi(x, y) = \varphi(y, x)^*$  (resp.  $\varphi(x, y) = -\varphi(y, x)^*$ ).

When  $*$  = id, it is also called a **bilinear form**/symmetric form/alternating form resp.  $\square$

**Def. (3.5.11.2) [Hermitian Matrices].** Situation as in (3.5.11.6), then a **Hermitian matrix** w.r.t.  $E/F$  is a matrix  $A \in \text{Mat}(n; E)$  s.t.  $A^t = cA$ , which corresponds to an  $E$ -linear map  $L : E^n \rightarrow E^n$  s.t.  $L^* = L$  (3.5.11.7).  $\square$

**Prop. (3.5.11.3) [Gram-Matrices].** Let  $n \in \mathbb{Z}_+$  and  $V \in \text{Vect}_k$  with a basis  $\{e_1, \dots, e_n\}$ , then a  $n \times n$  symmetric(Hermitian) matrix (3.5.11.2)  $M$  defines a bilinear(sesqui-linear) form  $B$  on  $V$  by  $(y, x) \mapsto x^t M y (x^t M \bar{y})$ . Conversely, for any bilinear(sesqui-linear) form  $B$  on  $V$ , let  $M = (a_{ij})$  where  $a_{ij} = (e_i, e_j)$ , then  $M$  is symmetric(Hermitian) matrix, called the **Gram matrix** of  $B$ .

so we will interchange freely between a symmetric(Hermitian) matrix and a bilinear(sesqui-linear) form on  $V$ .  $\lrcorner$

**Prop. (3.5.11.4) [Casimir Elements].** Let  $(R, *) \in \text{Alg}^{\text{asso}}$  and  $B$  is a non-degenerate sesquilinear form on  $R$ . Choose a basis  $\{x_i\}$  of  $V$  and a dual basis  $y_i$ , then  $\sum x_i \otimes y_i \in T(V)$  is independent of  $x_i$  chosen.  $\lrcorner$

*Proof:* Let  $V^\vee$  be the dual of the vector space  $V$ . There is an isomorphism  $V \otimes V^\vee \cong \text{End}(V)$  given by mapping  $(v, f)$  to the operator  $v' \mapsto f(v')v$ . The non-degenerate bilinear form induces naturally an isomorphism  $\beta : V \cong V^\vee : v \mapsto (\cdot, v)$ . Then under the isomorphisms

$$\text{End}(V) \cong V \otimes V' \cong V \otimes V,$$

where the second isomorphism is  $(\text{id}_V, \beta^{-1})$ . The identity map  $\text{id}_V \in \text{End}(V)$  is sent to  $\sum x_i \otimes y_i \in T(V)$ , so  $\sum x_i \otimes y_i$  is independent of the basis chosen.  $\square$

### Quadratic Spaces and Orthogonal Matrices

For symmetric bilinear forms and more about quadratic forms, see [Quadratic Forms](#).

### Hermitian Spaces

**Notation (3.5.11.5).**

- Let  $D \in \text{Az}_k$  with an involution  $*$ .

$\lrcorner$

**Def. (3.5.11.6) [Hermitian Space].** A **Hermitian space**(resp. **skew-Hermitian space**) over  $D$  is a finite free  $D$ -module  $V$  with a Hermitian form(resp. skew-Hermitian form)  $(-, -) : V \times V \rightarrow E(3.5.11.1)$  that is non-degenerate.

When  $*$  = id, these are also called **symmetric spaces** and **symplectic spaces**.  $\lrcorner$

**Def. (3.5.11.7) [Hermitian Transpose].** Let  $L : V \rightarrow W$  be a map between Hermitian spaces over  $D$ , then there exists a unique **Hermitian transpose**  $L^* : W^* \rightarrow V^*$  which is a  $F$ -anti-linear map that satisfies

$$\langle w', Lu \rangle = \langle L^* w', u \rangle, \text{ where } u \in V, w' \in W^*.$$

As the pairing on  $V$  is non-degenerate(3.5.11.6), this map is uniquely determined.

If  $V = W$ , then in coordinate forms, it can be verified that  $[L^*] = \overline{[L]}^t$ .  $\lrcorner$

### Complex Hermitian Matrices and Real Symmetric Matrices

**Prop. (3.5.11.8) [Hermitian Eigenvalues are Real].** Any eigenvalue of a Hermitian(e.g., real symmetric) matrix  $M$  is real.  $\lrcorner$

*Proof:* Consider the bilinear form defined by the matrix  $M$ , then if  $x$  is an eigenvector with eigenvalue  $\lambda$ , then  $\lambda(x, x) = (Hx, x) = (x, Hx) = \bar{\lambda}(x, x)$ , so if  $\lambda$  is not real,  $x = 0$ .  $\square$

**Thm. (3.5.11.9) [Principal Axis Theorem].** A symmetric matrix  $A$  is orthogonally diagonalizable. Similarly, a Hermitian matrix is unitarily diagonalizable.  $\lrcorner$

*Proof:* Firstly, we can find an eigenvector of  $A$ : Only the real case needs proof, and this is because any eigenvalue of  $A$  is real (3.5.11.8).

Let  $v$  be an eigenvector of  $A$  of length 1, then the orthogonal complement of  $v$  is preserved by  $A$ , so we can use induction to find an orthonormal basis consisting of eigenvectors of  $A$ , then these together with  $v$  forms an orthonormal basis consisting of eigenvectors of  $A$ .  $\square$

**Prop. (3.5.11.10) [Complex Normal operators].** More generally, a normal operator over  $\mathbb{C}$  is unitarily diagonalizable using resolution of identity (12.9.3.3) because the spectrum are discrete thus the point projection is orthogonal.  $\lrcorner$

**Prop. (3.5.11.11) [Gram-Schmidt].** Suppose  $\text{char } k \neq 2$ , then any symmetric matrix over  $k$  is congruent to a diagonal matrix.  $\lrcorner$

*Proof:* Any symmetric matrix defines a bilinear form on  $V$ . If  $B$  is not identically 0, then there is a  $x$  that  $x^t B x \neq 0$ , by polarization identity. Then  $W = \{Kx\}$  is non-degenerate, so we have  $W \oplus W^\perp = V$  by (19.5.1.8). And by induction, we are done.  $\square$

**Prop. (3.5.11.12) [Antonne-Takagi].** For any complex symmetric matrix  $A$ , there is unitary matrix  $U$  that  $UAU^t$  is a real diagonal matrix with non-negative entries.  $\lrcorner$

*Proof:* Consider  $B = A^*A$  is Hermitian and positive-semi-definite, thus there is a unitary matrix  $V$  that  $V^*BV$  is diagonal with non-negative real entries by (3.5.11.9). Now  $C = V^tAV$  is complex symmetric with  $C^*C$  real diagonal. If we let  $C = X + iY$ , then  $XY = YX$ . So by (3.5.10.5), there is a real orthogonal matrix  $W$  that  $WXW^t$  and  $WYW^t$  are diagonal. Now set  $U = WV^t$ , which is unitary,  $UAU^t$  is complex diagonal. And easily we can modify the diagonal entries to be non-negative.  $\square$

### Real Spectral Theory

**Notation (3.5.11.13).**

- Use notations on spectral theory defined in [Spectral Theory on Hilbert Spaces](#).  $\lrcorner$

**Prop. (3.5.11.14).** For a normal operator  $N$  on a real inner product space,  $N\alpha = 0$  iff  $N^t\alpha = 0$ . In particular,  $N$  and  $N^t$  has the same number of eigenvalues and dimension of eigenspaces.  $\lrcorner$

*Proof:* This is because

$$(N\alpha, N\alpha) = (N^t N\alpha, \alpha) = (NN^t\alpha, \alpha) = (N^t\alpha, N^t\alpha).$$

$\square$

**Cor. (3.5.11.15).** For a normal operator  $N$  on a real inner product space,  $\text{Im}(N) = \ker(N)^\perp$ .  $\lrcorner$

*Proof:*  $\text{Im}(N) = \ker(N^*) = \ker(N)$ .  $\square$

**Cor. (3.5.11.16).** For a normal operator  $N$  on a real inner product space, if  $N^2\alpha = 0$ , then  $N\alpha = 0$ .  $\lrcorner$

*Proof:* This is because  $N\alpha \in \ker(N) \cap \text{Im}(N) = \emptyset$ .  $\square$

**Lemma (3.5.11.17).** If  $f, g$  are relatively prime polynomials and  $T$  is a normal operator,  $f(T)\alpha = 0$  and  $g(T)\beta = 0$ , then  $\alpha$  is orthogonal to  $\beta$ .  $\lrcorner$

*Proof:* Choose polynomials  $a, b$  that  $af + bg = 1$ , then  $\alpha = b(T)g(T)\alpha$ , and

$$(\alpha, \beta) = (b(T)g(T)\alpha, \beta) = (b(T)\alpha, g(T)^*\beta)$$

Notice  $g(T)$  is also normal, and  $g(T)\beta = 0$ , thus by (3.5.11.14)  $g(T)^*\beta = 0$ . Thus  $\alpha, \beta$  are orthogonal.  $\square$

**Lemma (3.5.11.18).** Let  $V$  be a real inner product space and  $S$  an operator that  $S^2 = -1$ . Suppose  $\alpha \in V$  and  $S\alpha = -\beta$ , then

$$S^*\alpha = \beta, \quad S^*\beta = -\alpha,$$

$\alpha, \beta$  are orthogonal, and  $\|\alpha\| = \|\beta\|$ .  $\lrcorner$

*Proof:* Because

$$0 = \|S\alpha + \beta\|^2 + \|S\beta - \alpha\|^2 = \|S\alpha\|^2 + \|\beta\|^2 + 2(S\alpha, \beta) + \|S\beta\|^2 + \|\alpha\|^2 - 2(S\beta, \alpha),$$

and  $S$  is normal, we get

$$0 = \|S^*\alpha\|^2 + \|\beta\|^2 - 2(S^*\alpha, \beta) + \|S^*\beta\|^2 + \|\alpha\|^2 + 2(S^*\beta, \alpha) = \|S^*\alpha - \beta\|^2 + \|S^*\beta + \alpha\|^2,$$

which gives the desired equation. And also

$$(\alpha, \beta) = (-S^*\beta, \beta) = -(\beta, S\beta) = -(\beta, \alpha)$$

which implies  $(\alpha, \beta) = 0$ .  $\square$

**Prop. (3.5.11.19) [Real Normal Operators].** Let  $A$  be a normal matrix, then  $A$  is orthogonally congruent to matrixes of the form  $\text{diag}(B_1, \dots, B_n)$ , where  $B_i$  are  $1 \times 1$  or  $2 \times 2$  matrixes of the form

$$\begin{bmatrix} a & b \\ -b & a \end{bmatrix}. \quad \lrcorner$$

*Proof:* Firstly the minimal polynomial of  $A$  is a product of different irreducible polynomials  $p = p_1 \dots p_k$ , by (3.5.11.16). Let  $f_i = p/p_i$ , then  $f_1, \dots, f_k$  are relatively prime, so there are polynomials  $g_i$  that  $1 = \sum f_i g_i$ . Then for any  $v \in V$ ,  $v = \sum f_i(T)g_i(T)v$ , and  $f_i(T)g_i(T)v$  is annihilated by  $p_i(T)$ . Let  $W_i = \ker(p_i(T))$ , then  $V = \sum W_i$ , and  $W_i$  is orthogonal to  $W_j$  by (3.5.11.17).

The restriction of  $T$  on  $W_i$  has minimal polynomial  $p_i$ . If  $p_i$  has degree 1, then  $T$  is a scalar on  $W_i$ . If  $p_i$  has degree 2, then  $p_i = (x - a_i)^2 + b_i^2$  for some  $a_i, b_i \in \mathbb{R}, b_i \neq 0$ . Then we choose a maximal  $k$  that there exists subspaces  $V_j \in W_i, j \leq k$  that

- $\dim V_j = 2$ .
- $V_j$  are pairwise orthogonal.
- $V_j$  is invariant under  $T, T^*$ , and  $T|_{V_i}$  is orthogonal congruent to  $\begin{bmatrix} a_i & b_i \\ -b_i & a_i \end{bmatrix}$ .

Then denote  $W = \bigoplus_{j=1}^k V_j$ , we prove that  $W = V$ : Suppose not, then  $W^\perp \neq 0$  is invariant under  $T$  and  $T^*$ . Denote  $S = b^{-1}(T - a)$ , then  $S^2 + 1 = 0$ . Let  $\alpha \neq 0 \in W^\perp$ ,  $\beta = -S\alpha$ , then  $S\beta = \alpha$ ,  $\alpha, \beta \in W^\perp$ . Since  $T = aI + bS$ , we have

$$T\alpha = a\alpha - b\beta, \quad T\beta = b\alpha + a\beta.$$

Now lemma (3.5.11.18) implies  $\{\alpha, \beta\}$  is invariant under  $S, S^*$  thus also  $T, T^*$ , so this gives another  $V_{k+1}$ , contradiction.  $\square$

**Cor. (3.5.11.20) [Unitary Equivalence of Normal Operators].** Let  $T, T'$  be real(complex) normal matrices, then  $T$  is orthogonally(unitarily) congruent to  $T'$  iff  $T$  and  $T'$  have the same characteristic polynomial.  $\lrcorner$

*Proof:* This follows from (3.5.11.19)(or (3.5.11.10)).  $\square$

**Cor. (3.5.11.21) [Complex Structure Form].** A real normal matrix  $J$  s.t.  $J^2 + 1 = 0$  is orthogonal congruent to  $\langle \begin{bmatrix} 0 & -1 \\ 1 & 0 \end{bmatrix} \rangle_n$ .

In particular, as such  $J$  is equivalent to a complex structure on  $\mathbb{R}^n$ , so the set of complex structures is bijective to  $O(n)/U(\frac{n}{2})$  thus can be endowed with a structure of a homogenous space.  $\lrcorner$

*Proof:* This is because  $J$  and  $\langle \begin{bmatrix} 0 & -1 \\ 1 & 0 \end{bmatrix} \rangle_n$  are both normal and they have the same characteristic polynomial, by (3.5.9.29).  $\square$

**Def. (3.5.11.22) [Cayley-transformation].** If  $\text{char } k \neq 2$  and  $P \in \text{Mat}(n; k)$  that has no eigenvalue  $-1$ , there is a **Cayley transformation**  $A = \frac{1-P}{1+P}$ ,  $1+A$  is invertible, and  $P = \frac{1-A}{1+A}$ .  
Then  $A$  is skew-symmetric iff  $P$  is orthogonal.  $\lrcorner$

*Proof:* If  $Av = -v$ , then  $v - Pv = -v - Pv$ , so  $2v = 0$ , so  $v = 0$ . So  $A + 1$  is invertible.

If  $P$  is orthogonal, then  $A^t = \frac{1-P^t}{1+P^t} = \frac{1-P^{-1}}{1+P^{-1}} = -A$ . Conversely, if  $A^t = -A$ , then  $P^t = \frac{1+A}{1-A} = P^{-1}$ .  $\square$

**Prop. (3.5.11.23).** If  $\text{char } k \neq 2$  and  $P$  is an orthogonal matrix of odd dimension, then  $\det P$  is an eigenvalue of  $P$ .  $\lrcorner$

*Proof:* multiplying by  $-1$ , we can assume  $\det P = 1$ . Then the action of  $P$  on  $S^{n-1}$  has a fixed point by Lefschetz trace formula. Thus  $1$  is an eigenvalue of  $P$ . Contradiction.  $\square$

### Symplectic Spaces and Symplectic Matrices

**Def. (3.5.11.24) [Lagrangian Subspaces].** For a f.d. symplectic space  $V$  over  $k$ , a **Lagrangian subspace** of  $V$  is defined to be a subspace  $W \subset V$  s.t.  $W^\perp = W$ . In particular,  $\dim W = \frac{1}{2} \dim V$ .  $\lrcorner$

**Prop. (3.5.11.25).** For  $V \in \text{Vect}^{\text{fin}}_k$ , there is a natural symplectic space structure on  $V \otimes V^*$ , defined by

$$\langle (x, \xi), (x', \xi') \rangle = \langle x', \xi \rangle - \langle x, \xi' \rangle.$$

$\lrcorner$

**Prop. (3.5.11.26) [Basis for Symplectic Spaces].** Suppose  $\text{char } k \neq 2$ , then for any f.d. symplectic vector space  $V$  over  $k$ , there exists a basis  $\{x_1, \dots, x_r, y_1, \dots, y_r, z_1, \dots, z_k\}$  s.t.  $(x_i, y_i) = -(y_i, x_i) = 1$ , and the inner product of other pairs in this basis vanish.

In particular, if  $V$  is non-degenerate, then  $\dim V \in 2\mathbb{Z}_+$ .  $\lrcorner$

*Proof:* Use induction on  $\dim V$ . If  $\dim V = 0$ , this is clear. For  $\dim V > 0$ , if there exists a pair  $(x, y) \neq 0$ , then we can take  $(x, y) = 1$ , and we can look at the complement  $\{x, y\}^\perp \subset V$  and use induction.  $\square$

**Prop. (3.5.11.27).** Given a bilinear form over  $k$ , the relation of orthogonality is symmetric iff the space is symmetric or symplectic.  $\lrcorner$

*Proof:* Let  $w = B(x, z)y - B(x, y)z$ , then  $B(x, w) = 0$ , hence we have  $B(w, x) = 0$ , that is

$$B(x, z)B(y, x) - B(x, y)B(z, x) = 0.$$

Let  $z = x$ , then  $B(x, x)[B(x, y) - B(y, x)] = 0$ .

If some  $B(u, v) \neq B(v, u)$  and  $B(w, w) \neq 0$ , then  $B(u, u) = B(v, v) = 0, B(w, v) = B(v, w), B(w, u) = B(u, w)$ , Let  $x = u$  or  $v$  we get  $B(w, v) = B(v, w) = 0 = B(w, u) = B(u, w)$ . Now  $B(u, w + v) \neq B(w + v, u)$ , hence  $B(w + v, w + v) = 0 = B(w, w)$ , contradiction.  $\square$

**Prop. (3.5.11.28) [Symplectic Group Determinant 1].**  $\text{Sp}(2n) \subset \text{SL}(2n)$ .  $\lrcorner$

*Proof:* A symplectic matrix preserves the symplectic structure thus the symplectic form  $\omega$ , hence preserves  $\omega^n$  which is a volume form, so it has determinant 1 by definition (3.5.9.1).  $\square$

### Complex Structures

**Def. (3.5.11.29) [Complex Pairs].** Let  $F \in \text{Field}$  and  $E$  an étale  $F$ -algebra of degree 2. Thus  $E/F$  is a Galois extension of degree 2 with involution  $c \in \text{Gal}(E/F)$  or  $E = F \oplus F$  with involution  $c(x, y) = (\overline{x}, \overline{y}) = (y, x)$ . Such a pair  $E/F$  is called a **complex pair**. We sometimes write  $c(x)$  as  $\overline{x}$ .  $\lrcorner$

**Prop. (3.5.11.30) [Complex Structures].** Let  $g \in \mathbb{Z}_+$  and  $V \in \text{Vect}^{2g}/\mathbb{R}$ , then the following are equivalent:

- A complex structure on  $V$ .
- An endomorphism  $J \in \text{End}_{\mathbb{R}}(V)$  s.t.  $J^2 = -\text{id}$ .
- A representation  $\rho : U^1 \rightarrow \text{End}_{\mathbb{R}}(V)$  s.t.  $V \otimes_{\mathbb{R}} \mathbb{C}$  has weights  $\pm 1$ , each with multiplicity  $g$ .

$\lrcorner$

*Proof:* 1  $\rightarrow$  2: Take  $J$  to be multiplication by  $i$ .

2  $\rightarrow$  1: The complex structure is given by  $(a + bi)x = ax + bJx$ .

2  $\rightarrow$  3: The representation is given by  $\rho(\theta) \mapsto \cos \theta + \sin \theta J$ . Then  $V_{\mathbb{C}} = \ker(J - i) \oplus \ker(J + i)$ , and conjugation interchanges these two spaces.

3  $\rightarrow$  2: Given such a representation,  $J = \rho(i)$  satisfies  $J^2 = -1$ .  $\square$

**Prop. (3.5.11.31) [Hermitian Forms on Complex Vector Spaces].** Given a complex vector space  $(V, J)/\mathbb{C}$  (3.5.11.30) and a Hermitian form  $V \times V \rightarrow \mathbb{C}$ , if we write  $(u, v) = \varphi(u, v) - i\psi(u, v)$ , then

- $\varphi$  is symmetric and  $\varphi(Ju, Jv) = \varphi(u, v)$ .
- $\psi$  is alternating and  $\psi(Ju, Jv) = \psi(u, v)$ .
- $\psi(u, v) = -\varphi(u, Jv), \varphi(u, v) = \psi(u, Jv)$ .

Conversely, if  $\varphi$  satisfies these conditions, then

$$(u, v) = \varphi(u, v) + i\varphi(u, Jv).$$

is a Hermitian form. Also  $(-, -)$  is positive or non-singular iff  $\varphi$  is.  $\lrcorner$

over  $\mathbb{H}$

**Def. (3.5.11.32) [Real Quaternion Algebra].** The **real quaternion algebra**  $\mathbb{H}$  is the space  $\mathbb{R}\{1, i, j, k\}$  subjects to the relations

$$ij = -ji = k, jk = -kj = i, ki = -ik = j, i^2 = j^2 = k^2 = -1.$$

In fact, by (19.5.5.3), any quaternion algebra over  $\mathbb{R}$  is isomorphic to  $\mathbb{H}$ .  $\lrcorner$

**Prop. (3.5.11.33) [Module of Quaternion Algebras].** There is an involution on  $\mathbb{H}$  s.t. if  $x = a + bi + cj + dk$ , then  $\bar{x} = a - bi - cj - dk$ . Then we define a the modulus of  $x \in \mathbb{H}$  as

$$|x|^2 = x\bar{x} = \bar{x}x = a^2 + b^2 + c^2 + d^2.$$

Then every non-zero element of  $\mathbb{H}$  is invertible. In particular, it is a skew field.  $\lrcorner$

**Prop. (3.5.11.34).**  $\mathbb{H}$  is isomorphic to subalgebra of matrices in  $\text{Mat}(2; \mathbb{C})$  consisting of elements of the form

$$\left\{ \begin{bmatrix} \alpha & -\bar{\beta} \\ \beta & \bar{\alpha} \end{bmatrix} \mid \alpha, \beta \in \mathbb{C} \right\}$$

**Prop. (3.5.11.35).** The center of  $\mathbb{H}$  is  $\mathbb{R}$ , by (19.6.1.8).  $\lrcorner$

**Prop. (3.5.11.36) [Invertible Quaternion Matrices].** Denote  $\text{GL}(n; \mathbb{H})$  the set of invertible matrices in  $\text{Mat}(n; \mathbb{H})$ . If  $A \in \text{Mat}(n; \mathbb{H})$ ,  $A$  acts on  $\mathbb{H}^n$ , and determines a complex matrix  $A'$  in  $\text{Mat}(2n; \mathbb{C})$ .

- If  $A, B \in \text{Mat}(n; \mathbb{H})$  satisfies  $AB = 1$ , then  $BA = 1$ .
- $A \in M = \text{GL}(n; \mathbb{H})$  iff  $A' \in \text{GL}(2n; \mathbb{C})$ . In particular if we define the determinant of  $A \in \text{Mat}(n; \mathbb{H})$  as the determinant of  $A'$ , then  $\det(A) \neq 0$  iff  $A$  is invertible.  $\lrcorner$

*Proof:* 1:  $(AB)' = A'B'$ , thus  $\text{Mat}(n; \mathbb{H})$  is a subalgebra of  $\text{Mat}(2n; \mathbb{C})$ . Thus  $B'A' = 1$  by (3.5.9.15).

2: If  $A'$  is invertible, then  $A$  is a bijection, thus there are vectors  $v_1, \dots, v_n$  that  $Av_i = e_i$ . This means

$$(v_1, \dots, v_n)A = 1.$$

Thus by item1  $A$  is invertible.  $\square$

**Prop. (3.5.11.37) [Quaternion Hermitian Forms].**

- Every non-degenerate Hermitian quaternion form is of the form

$$(x, y) = \bar{x}_1 y_1 + \dots + \bar{x}_p y_p - \overline{x_{p+1}} y_{p+1} - \dots - \bar{x}_n y_n$$

in some basis, where  $p$  is uniquely determined by the form.

- Every non-degenerate skew-Hermitian quaternion form is of the form

$$(x, y) = \bar{x}_1 j y_1 + \dots + \bar{x}_n j y_n$$

in some basis.  $\lrcorner$

*Proof:* Firstly, there are some  $v$  that  $(v, v) \neq 0$ : If  $(v, v) = 0$  for all  $v$ , then  $(x, y) + (y, x) = 0$  for all  $x, y$ . If it is skew-Hermitian, this means  $(x, y)$  is real, which is impossible, unless  $(x, y) = 0$ . If it is Hermitian, this means  $(x, y)$  is imaginary, but  $(x, yi), (x, yj), (x, yk)$  are all imaginary, thus  $(x, y) = 0$ .

Then choose this  $v$ , and take the orthogonal complement of  $v$ , then by induction we can find  $v_1, \dots, v_n$  that is mutually orthogonal.

If it is Hermitian, then  $(v_i, v_i) \in \mathbb{R}$ , thus we can find some  $t_i \in \mathbb{R}$  that  $(tv_i, tv_i) = \pm 1$ .  $2p$  is the multiplicity of the eigenvalue 1 of the eigenspace of the matrix corresponding to the form, so  $p$  is uniquely defined.

If it is skew-Hermitian, then  $(v_i, v_i)$  is imaginary, thus by (16.6.1.7), there are  $u_i \in \mathbb{H}$  that  $(u_i v_i, u_i v_i) = \bar{u}_i (v_i, v_i) u_i = j$ .  $\square$

**Cor. (3.5.11.38).**

- Every non-degenerate Hermitian quaternion form is of the form

$$(x, y) = B_1(x, y) + jB_2(x, y)$$

in some basis, where  $B_1(x, y)$  is the usual canonical Hermitian form of signature  $(2p, 2q)$ , and  $B_2$  is the usual canonical skew-symmetric bilinear form. Also  $B_2(x, y) = B_1(xj, y)$ .

- Every non-degenerate skew-Hermitian quaternion form is of the form

$$(x, y) = B_1(x, y) + jB_2(x, y)$$

in some basis, where  $B_1(x, y)$  is the usual canonical skew-Hermitian form that  $iB_1$  is Hermitian of signature  $(n, -n)$ , and  $B_2$  is the usual canonical symmetric bilinear form. Also  $B_2(x, y) = B_1(xj, y)$ . in some basis.  $\lrcorner$

## 12 Positivity (Inner Spaces)

**Def. (3.5.12.1) [Inner Spaces].** A **real inner space** is a f.d. real quadratic space that  $B(v, v) \in \mathbb{R}_+$  for  $v \neq 0$ . It is necessarily non-degenerate.

A **complex inner space** is a f.d. Hermitian space  $V$  w.r.t.  $\mathbb{C}/R(3.5.11.6)$  s.t.  $B(v, v) \in \mathbb{R}_+$  for  $v \neq 0$ .  $\lrcorner$

**Prop. (3.5.12.2).** An inner metric on a vector space will induce an inner metric on the dual space, that is, asserting the dual basis of an orthonormal basis to be orthonormal. On an arbitrary basis, the matrix on the dual basis is written as  $A^{-1}$ . because we can write  $A = P^t P$ , and the dual basis transformation is like  $(P^t)^{-1}$ , so the metric matrix is  $A^{-1}$ .  $\lrcorner$

**Prop. (3.5.12.3) [Positivity and Principal Minors].** A matrix is positive symmetric (Hermitian) iff it is symmetric, and all its upper principle minors has positive determinants.

A positive symmetric (Hermitian) matrix is equivalent to a real (complex) inner space.  $\lrcorner$

*Proof:* Cf. [Hoffman P328].  $\square$

**Prop. (3.5.12.4) [Positive Eigenvalues are Positive Real].** The spectrum of a Hermitian matrix (e.g. positive symmetric matrix)  $A$  is positive and real.  $\lrcorner$

*Proof:* Let  $x$  be an eigenvector of  $A$  with eigenvalue  $\lambda$ , then  $\lambda$  is real by (3.5.11.8), and  $0 < (x, x) = x^* A x = \lambda x^* x$ , so  $\lambda > 0$ .  $\square$

**Prop. (3.5.12.5) [Positivity of Traces].** Let  $A, B \in \text{Pos}_{\geq 0}(n; \mathbb{R})$ ,  $\text{tr}(A) \geq 0$ , and  $\text{tr}(AB) \geq 0$ .  $\lrcorner$

*Proof:*  $\text{tr}(A) \geq 0$  because we can write  $A = P^{-1}DP$  where  $D$  is diagonal and  $P$  is orthogonal. Then the entries of  $D$  are non-negative, and  $\text{tr}(A) = \text{tr}(D) \geq 0$ .

Also, write  $A = P^t P$ , then  $\text{tr}(AB) = \text{tr}(PBP^t) \geq 0$ , because  $PBP^t$  is also a semi-positive matrix.

□

### 13 Matrix Analysis

**Thm. (3.5.13.1).** Let  $K \in \text{Pos}_{\geq 0}(n; \mathbb{C})$ , and the eigenvalues of  $K$  be  $\kappa_1 \geq \kappa_2 \geq \dots \geq \kappa_n \geq 0$  (3.5.12.4), then for any  $x \in \mathbb{C}^n$ ,

$$\kappa_n \|x\|^2 \leq x^t K x \leq \kappa_1 \|x\|^2.$$

$\lrcorner$

*Proof:* By [Principal Axis Theorem\(3.5.11.9\)](#), we can assume that  $K = U^{-1} \text{diag}(\kappa_1, \dots, \kappa_n) U$ , where  $U \in U(n)$ . Then

$$\kappa_n \|x\|^2 \leq \kappa_n \|Ux\|^2 \leq x^t K x = x^t U^t \text{diag}(\kappa_1, \dots, \kappa_n) U x \leq \kappa_1 \|Ux\|^2 = \kappa_1 \|x\|^2$$

□

**Thm. (3.5.13.2) [Weyl].** Let  $\varphi : [0, \infty) \rightarrow \mathbb{R}$  be a non-decreasing function s.t.  $\varphi(0) = 0$ , and  $\varphi(e^\xi)$  is a convex function of  $\xi$ . Suppose  $A \in \text{Mat}(n; \mathbb{C})$ , and  $K = A^* A$ , and let the eigenvalues of  $A$  be  $\alpha_1, \dots, \alpha_n$  with  $\lambda_i = |\alpha_i|^2$  satisfying  $\lambda_1 \geq \lambda_2 \geq \dots \geq \lambda_n$ , and the eigenvalues of  $K$  be  $\kappa_1 \geq \kappa_2 \geq \dots \geq \kappa_n \in \mathbb{R}_+$  (3.5.12.4).

Then for any  $1 \leq m \leq n$ ,

$$\varphi(\lambda_1) + \dots + \varphi(\lambda_m) \leq \varphi(\kappa_1) + \dots + \varphi(\kappa_m).$$

In particular, for  $s \in \mathbb{R}_+$ ,

$$\lambda_1^s + \dots + \lambda_m^s \leq \kappa_1^s + \dots + \kappa_m^s.$$

$\lrcorner$

*Proof:* Notice first that by (12.3.12.4), it suffices to show that

$$\prod_{i=1}^m \lambda_i \leq \prod_{i=1}^m \kappa_i, \forall 1 \leq m \leq n.$$

Then notice  $\prod_{i=1}^m \lambda_i$  is the largest module of eigenvalues of  $\wedge^m A$ , and  $\prod_{i=1}^m \kappa_i$  is the largest eigenvalue of  $(\text{Sym}^m A)^* \text{Sym} A$  by (3.5.5.4), so it reduces to show that  $\lambda_1 \leq \kappa_1$ . For this, notice that if  $Ax = \alpha_1 x$ , then  $x^t K x = \lambda_1 \|x\|^2$ . But  $x^t K x \leq \kappa_1 \|x\|^2$  (3.5.13.1), so we are done.  $\square$

**Cor. (3.5.13.3).** If  $A \in \text{GL}(n, \mathbb{C})$  is invertible, then we can apply the theorem to  $A^{-1}$  to show that: For any non-increasing function  $\varphi : [0, \text{infy}) \rightarrow \mathbb{R}$  s.t.  $\lim_{x \rightarrow \infty} \varphi(x) = 0$ , and  $\varphi(e^\xi)$  is a convex function of  $\xi$ , and any  $1 \leq m \leq n$ ,

$$\varphi(\lambda_1) + \dots + \varphi(\lambda_m) \leq \varphi(\kappa_1) + \dots + \varphi(\kappa_m).$$

In particular, for  $s \in \mathbb{R}_+$ ,

$$\frac{1}{\lambda_1^s} + \dots + \frac{1}{\lambda_m^s} \leq \frac{1}{\kappa_1^s} + \dots + \frac{1}{\kappa_m^s}.$$

$\lrcorner$

### Positive Solutions

**Prop. (3.5.13.4) [Farkas' Lemma].** For  $A \in \text{Mat}(n; \mathbb{R})$  and  $b \in \mathbb{R}^n$ , exactly one of the following equation has a solution:

- $AX = b, X \geq 0$ .
- $Y^t A \leq 0, Y^t b > 0$ .

┘

*Proof:* First notice if both have a solution, then  $0 \geq Y^t AX > 0$ , contradiction. The rest follows from the Hahn-Banach separation theorem.  $\square$

**Cor. (3.5.13.5) [Gordan's Theorem].** exactly one of the following has a solution:

$$\begin{cases} AX > 0 \\ Y^t A = 0, Y \geq 0, Y \neq 0 \end{cases}$$

┘

*Proof:* If both have a solution, then  $0 = Y^t AX > 0$ , contradiction. If the first has no solution, then  $A'x = e, z \geq 0$ , where  $A' = [A, -A, -I]$  has no solution, by Farkas' lemma, there is a solution of  $Y^t A' \leq 0$  and  $Y^t b = 0$ . Which shows that  $Y^t A = 0$  and  $Y \neq 0$ .  $\square$

**Cor. (3.5.13.6).** For any subspace in  $\mathbb{R}^m$ , either it has an intersection with the open first quadrant, or its orthogonal complement has an intersection with the closed first quadrant minus 0. (Regard it has the image of a  $AX$ ).  $\square$

## 14 Perron-Frobenius Theory

References are [Mey00]Chap8 and [Matrix Analysis, Horn-Johnson]Chap8.

**Prop. (3.5.14.1) [Positive Eigenvalue].** For  $A \in \text{Mat}(n; \mathbb{R}_+)$ , then

1.  $\rho(A) \neq 0$ .
2.  $\rho(A) \in \sigma(A)$ ,
3. If  $x \in \mathbb{R}^n$  s.t.  $Ax = \rho(A)x$ , then  $A \text{abs}(x) = \rho(A) \text{abs}(x)$  and  $x \in (\mathbb{R}_{\geq 0})^n$ . In particular,  $A$  has a  $\rho(A)$ -eigenvector with positive entries.
4.  $\rho(A)$  is the only eigenvalue of  $A$  on the radius circle.

┘

*Proof:* Cf. [Matrix Analysis and Applied Linear algebra]P663. ?

- 1: If  $\rho(A) = 0$ , then  $A$  is nilpotent, so  $A^n = 0$ , which is impossible.
- 2:
- 3:
- 4:

 $\square$ 

**Prop. (3.5.14.2) [Multiplicity One and the Perron Vector].** For  $A \in \text{Mat}(n; \mathbb{R}_+)$ ,

- $\rho(A)$  has multiplicity 1.
- $A$  has a unique eigenvector  $p \in (\mathbb{R}_+)^n$  with  $\|p\| = 1$ , called the **Perron vector** of  $A$ .
- There are no other eigenvector of  $A$  with non-negative entries that is not a positive multiple of  $p$ .

$\rho(A)$  is also called the **Perron root** of  $A$ . ┘

*Proof:* We may assume that  $\rho(A) = 1$ .

1: We first show that  $\text{ind}(1) = 1$ . Cf.[Matrix Analysis and Applied Linear algebra]P664. ?

Then if  $\text{mul}(\rho(A)) = m > 1$ , then there are  $m$   $\rho(A)$ -eigenvectors for  $A$ . But for two different eigenvalues, we can use linear combination to get an eigenvector of  $A$  that has some entry 0, which contradicts(3.5.14.1).

2: This follows from(3.5.14.1).

3: Suppose  $(\lambda, v)$  is an eigenpair for  $A$  with  $v \in (\mathbb{R}_{\geq 0})^n$ , and  $u$  be the Perron vector of  $A^t$ . Then  $u^t v > 0$ , and

$$\rho(A)u^t v = u^t A v = \lambda u^t v.$$

So  $\lambda = \rho(A)$ , and the rest follows. □

**Prop. (3.5.14.3) [Collatz-Wielandt Formula].** For  $A \in \text{Mat}(n; \mathbb{R}_+)$ , the Perron root  $\rho(A)$  is given by

$$\rho(A) = \max_{\mathbf{x} \in (\mathbb{R}_{\geq 0})^n \setminus 0} \left( \min_{1 \leq i \leq n, x_i \neq 0} \frac{(A\mathbf{x})_i}{x_i} \right).$$

┘

*Proof:* For  $\mathbf{x} \in (\mathbb{R}_{\geq 0})^n \setminus 0$ , let  $\xi = \min_{1 \leq i \leq n, x_i \neq 0} \frac{(A\mathbf{x})_i}{x_i}$ , then  $0 \leq \xi \mathbf{x} \leq A\mathbf{x}$ . Let  $\mathbf{q}$  be the Perron vector for  $A^t$ , then  $\mathbf{q}^t \mathbf{x} > 0$ , and

$$\xi \mathbf{q}^t \mathbf{x} \leq \mathbf{q}^t A \mathbf{x} = \rho(A) \mathbf{q}^t \mathbf{x},$$

which implies that  $\xi \leq \rho(A)$ . □

### Non-negative Entried Irreducible Matrices

**Def. (3.5.14.4) [Irreducible Matrices].** ┘

**Def. (3.5.14.5) [Primitive Matrices].** An irreducible matrix  $A \in \text{Mat}(n; \mathbb{R}_{\geq 0})$  is called a **primitive matrix** if there are only one eigenvalue on the radius circle of  $A$ .

The number of eigenvalues on the radius circle is called the **index of primitivity** of  $A$ . ┘

**Prop. (3.5.14.6) [Characterizing Primitive Matrices].** An irreducible matrix  $A \in \text{Mat}(n; \mathbb{R}_{\geq 0})$  is primitive iff  $\lim_k (\frac{A}{\rho(A)})^k$  exists. In which case,

$$\lim_k \left( \frac{A}{\rho(A)} \right)^k = G = \frac{\mathbf{p} \mathbf{q}^t}{\mathbf{q}^t \mathbf{p}}$$

where  $\mathbf{p}, \mathbf{q}$  are Perron vectors for  $A$  and  $A^t$  resp. and  $G$  is the projection onto  $\ker(A - \rho(A)\mathbf{1})$  along  $\text{Im}(A - \rho(A)\mathbf{1})$ . ┘

*Proof:* Cf.[Matrix Analysis and Applied Linear algebra]P674. ? □

**Prop. (3.5.14.7).** If irreducible  $A \in \text{Mat}(n; \mathbb{R}_{\geq 0})$  has imprimitive index  $h$  with eigenvalues  $\{\lambda_1, \dots, \lambda_h\}$  on the radius circle, then  $\{\lambda_i\} = \mu_n$  and  $\text{mul}(\lambda_i) = 1$  for any  $i$ . ┘

*Proof:* Cf.[Matrix Analysis and Applied Linear algebra]P676. ? □

**Prop. (3.5.14.8) [Frobenius Test for Primitivity].** An irreducible matrix  $A \in \text{Mat}(n; \mathbb{R}_{\geq 0})$  is primitive, then  $A$  is primitive iff  $A^m \in \text{Mat}(n; \mathbb{R}_+)$  for some  $m \in \mathbb{Z}_+$ . ┘

*Proof:* Cf.[Matrix Analysis and Applied Linear algebra]P678. ? □

### Stochastic Matrices and Markov Chains

**Def. (3.5.14.9) [Stochastic Matrices].** A **stochastic matrix** is a matrix  $P \in \text{Mat}(n; \mathbb{R}_{\geq 0})$  s.t. each column sum of  $P$  is 1.  $\lrcorner$

**Def. (3.5.14.10) [Unit Eigenvalues].** A **unit eigenvalue** of a stochastic matrix (3.5.14.9) is a complex eigenvalue of unit length.  $\lrcorner$

**Prop. (3.5.14.11).** If  $P$  is a stochastic matrix, then  $1 \leq \rho(P) \leq \|P\|_{\infty} = 1$ , so  $\rho(P) = 1$ .  $\lrcorner$

**Prop. (3.5.14.12) [Canonical Forms for Stochastic Matrices].** If  $P \in \text{Mat}(n; \mathbb{R}_{\geq 0})$  is a stochastic matrix, then there is a permutation matrix  $Q$  s.t.

$$Q^{-1}PQ = \begin{bmatrix} P_{11} & P_{12} & \dots & P_{1r} & P_{1,r+1} & P_{1,r+2} & \dots & P_{1m} \\ 0 & P_{22} & \dots & P_{2r} & P_{2,r+1} & P_{2,r+2} & \dots & P_{2m} \\ \vdots & 0 & \ddots & \vdots & \vdots & \vdots & \dots & \vdots \\ 0 & 0 & \dots & P_{rr} & P_{r,r+1} & P_{r,r+2} & \dots & P_{rm} \\ 0 & 0 & \dots & 0 & P_{r+1,r+1} & 0 & \dots & 0 \\ 0 & 0 & \dots & 0 & 0 & P_{r+2,r+2} & \dots & 0 \\ \vdots & \vdots & \dots & \vdots & \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & \dots & 0 & 0 & 0 & \dots & P_{m,m} \end{bmatrix}$$

where

- $P_{11}, \dots, P_{rr}$  are either irreducible or  $[0]_{1 \times 1}$ ,
- $P_{r+1,r+1}, \dots, P_{m,m}$  are irreducible,
- For  $1 \leq i \leq r$ , not all  $P_{i,i+j}$  are 0 for  $1 \leq j \leq m-i$ .

$\lrcorner$

*Proof:*

$\square$

**Prop. (3.5.14.13).** If  $P$  is a stochastic matrix, then every unit eigenvalue of  $P$  is semisimple, and is a root of unity.  $\lrcorner$

*Proof:* By using the canonical form (3.5.14.12), it suffices to show that  $\rho(P_{ii}) < 1$  for any  $1 \leq i \leq r$ : This is true if  $P_{ii} = 0$ , and if  $P_{ii}$  is irreducible, by the hypothesis we have  $P_{ii}\mathbf{e} < \mathbf{e}$ . So  $\rho(P_{ii}) < 1$ , otherwise we will get a contradiction by left multiplying a left Perron vector (3.5.14.2).  $\square$

**Cor. (3.5.14.14) [Stochastic Matrices are Cesàro Summable].** If  $P$  is a stochastic matrix, then  $P$  is Cesàro summable, i.e.

$$G = \lim_{k \rightarrow \infty} \frac{\mathbf{1} + P + \dots + P^{k-1}}{k}$$

exists, and  $G$  is the projection onto  $\ker(\mathbf{1} - P)$  along  $\text{Im}(\mathbf{1} - P)$ .  $\lrcorner$

*Proof:* This follows from (3.5.7.5).  $\square$

## 15 Others

**Prop. (3.5.15.1).** Let  $H^* = \bigoplus_{i=0}^{2d} H^i$  be a graded algebra over  $k$  s.t.  $\dim H^i < \infty$  for each  $i$ . Assume that for each  $0 \leq i \leq 2d$ , there is a perfect pairing

$$H^i \times H^{2d-i} \rightarrow K$$

induced from an isomorphism  $\text{tr} : H^{2d} \cong K$ , Let  $\varphi$  be a ring endomorphism of  $H^*$  that satisfies

- $\varphi(H^i) \subset H^i$ ,
- $\varphi_{2d} = \text{id}$

Then each  $\varphi_i$  is invertible, and  $\varphi_i^{-1} = \varphi_{2d-i}^t$ , where  $\varphi_{2d-i}^t$  is the transpose of  $\varphi_{2d-i}$  w.r.t. the perfect pairing  $H^i \times H^{2d-i} \rightarrow K$ . ┘

*Proof:* Let  $a \in H^i$  be any element, if  $a \neq 0$ , then because the pairing  $H^i \times H^{2d-i} \rightarrow K$  is perfect, there exists some  $b \in H^{2d-i}$  s.t.  $ab \neq 0$ . Thus  $\varphi_i(a)\varphi_{2d-i}(b) \neq 0$ , thus  $\varphi_i$  is injective. Now  $\text{tr}(\varphi_i^{-1}(a)b) = \text{tr}(\varphi_{2d}(\varphi_i^{-1}(a)b)) = \text{tr}(a\varphi_{2d-i}(b))$ , thus  $\varphi_i^{-1} = \varphi_{2d-i}^t$ . □

**Notation(3.6.0.1).**

- Use notations on algebras defined in [Algebras](#).
- Use notations on linear algebras defined in [Linear Algebra](#).
- Let  $R \in \text{Ring}$ .

┘

#### 1 Division Rings

**Prop.(3.6.1.1)[Wedderburn].** Any finite division ring  $D$  is a field. ┘

*Proof:* Use the class equation for the invertible elements of  $D$ , if it is not isomorphic, consider the center  $Z(D)$  of  $D$ , let  $|Z(D)| = z$ , then it is a field, and any other centralizer can be seen as a vector space over  $Z(D)$ , let it of dimension  $k$ , then  $z^n - 1 = z - 1 + \sum \frac{z^n - 1}{z^{k_i} - 1}$ . But then let  $\Psi_n$  be the cyclotomic polynomial of degree  $n$ , then  $\Psi_n(z)$  divides  $z - 1$ . But this is not true, as it is bigger.  $\square$

**Prop.(3.6.1.2).** Let  $k \in \text{Field}$ ,  $k = \bar{k}$ , then any division ring  $A$  over  $k$  with dimension  $< \#k$  is isomorphic to  $k$ .

In particular, a division ring  $A$  of at most countable dimension over  $\mathbb{C}$  is isomorphic to  $\mathbb{C}$ . ┘

*Proof:* Notice it suffices to find an eigenvalue of  $L_\varphi : A \rightarrow A$  for each  $\varphi \in A$ . But  $\{(\varphi - a)^{-1}\}$  is a uncountable set of elements of  $A$ , so some  $\sum a_i(\varphi - c_i)^{-1} = 0$ , spanning the expression, we see  $\prod_k(\varphi - \mu_k) = 0$ , so some  $\varphi - \mu_k = 0$ , contradiction.  $\square$

**Prop.(3.6.1.3)[Hua Equation].** In a division ring  $D$ , if  $a, b \neq 0$  and  $ab \neq 1$ , then

$$a - (a^{-1} + (b^{-1} - a)^{-1})^{-1} = aba$$

┘

*Proof:* suffices to show

$$1 = (1 - ab)a(a^{-1} + (b^{-1} - a)^{-1}) = (1 - ab)(1 + a(b^{-1} - a)^{-1}).$$

But this is equal to

$$(1 - ab)(1 - (b^{-1} - a)(b^{-1} - a)^{-1} + b^{-1}(b^{-1} - a)^{-1}) = (1 - ab)(1 - ab)^{-1} = 1.$$

$\square$

**Prop.(3.6.1.4)[Cartan-Brauer-Hua].** Let  $K \subset D$  be division rings s.t.  $x^{-1}Kx \in K$  for any  $x \in D^\times$ , then either  $K \subset Z(D)$  or  $K = D$ . ┘

*Proof:* Cf.[Lam, P211].  $\square$

**Remark(3.6.1.5).** For more about division rings, see [Finite Semi-simple Algebras](#) and [Brauer-Grothendieck Groups](#). ┘

## 2 Semisimplicity

**Def. (3.6.2.1).** For  $R \in \text{Ring}$ , a **simple  $R$ -module** is a  $E \in \text{Mod}_R$  that no submodules other than 0 and  $E$ . It is called **faithful** iff there is no nonzero element  $a \in R$  that  $ax = 0$  for any  $x \in E$ .

It is called **non-degenerate  $R$ -module** if  $RE = E$ .  $\lrcorner$

**Prop. (3.6.2.2) [Shur's lemma].** For  $R \in \text{Ring}$  and  $E$  a simple  $R$ -module,  $\text{End}_R(E)$  is a division ring, this is because the kernel and image are all 0 or  $E$ .  $\lrcorner$

**Cor. (3.6.2.3) [Uniqueness of Decomposition of Modules].** If an  $R$ -module  $E$  can be written as a finite direct sum of simple  $R$ -modules in multiple ways, then the multiplicity of the irreducible modules appearing in it is uniquely determined.  $\lrcorner$

*Proof:* Cf. [Lang, Algebra, P643]  $\square$

**Def. (3.6.2.4) [Semisimple Modules].** For  $R \in \text{Ring}$ , a **semisimple  $R$ -module** is a  $E \in \text{Mod}_R$  iff it satisfies the following equivalent conditions:

- It is a sum of simple modules.
- It is a direct sum of simple modules.
- Any submodule  $F$  of  $E$  has a complement in  $E$ .

$\lrcorner$

*Proof:*  $3 \rightarrow 2$ : By Zorn's lemma, it suffices to show any non-zero semisimple module contains a simple submodule: Take a  $m \neq 0 \in M$ , then we may assume  $M = Rm$ , and by Zorn's lemma there is a maximal submodule  $N$  that  $m \notin N$ , and let  $N \oplus N' = M$ , then we show  $N'$  is simple. because any submodule  $N''$  satisfies  $m \in N \oplus N''$  thus  $N'' = N'$ .

$2 \rightarrow 1$  is immediate, it suffices to show  $1 \rightarrow 3$ : for any submodule  $N \subset M$ , consider all the simple modules that intersect  $N$  trivially, denote their sum by  $V$ , I claim  $N \oplus V = M$ , otherwise, let  $S$  be a simple submodule that contained in  $N + V$ , then  $S \cap (N + V) = 0$ , so  $N \cap (S + V) = 0$ , contradicting the maximality.  $\square$

**Cor. (3.6.2.5).** For  $R \in \text{Ring}$ , any submodule and quotient module of a semisimple  $R$ -module is semisimple.  $\lrcorner$

*Proof:* The quotient is clearly a sum of simple modules, and for a submodule, its submodule has a complement.  $\square$

### Density Theorems

**Def. (3.6.2.6).** If  $E$  be a semisimple  $R$ -module, let  $R' = \text{End}_R(E)$ , then  $E$  is also a  $R'$ -module, where the action is given by  $(\varphi, x) \mapsto \varphi(x)$ . Then any element of  $R$  defines an element of  $\text{End}_{R'}(E)$  by left multiplication. If we called  $\text{End}_{R'}(E)$  the **bicommutant** of  $E$  over  $R$ , then  $\lrcorner$

**Lemma (3.6.2.7).** For a module  $E$  over  $R$ , let  $\text{End}_{R'}(E)$  be the bicommutant. If  $f \in \text{End}_{R'}(E)$  and  $x \in E$ , then there is an element  $\alpha \in R$  that  $\alpha x = f(x)$ .  $\lrcorner$

*Proof:* Since  $E$  is semisimple, write  $E = Rx \oplus F$ , and let  $\pi$  be the projection unto  $Rx$ , then  $\pi \in \text{End}_R(E)$ , and  $f(x) = f(\pi(x)) = \pi f(x) \in Rx$ .  $\square$

**Prop. (3.6.2.8) [Jacobson Density Theorem].** Let  $E$  be semisimple over  $R$  and let  $R' = \text{End}_R(E)$ . If  $f \in \text{End}_{R'}(E)$  and  $x_1, \dots, x_n \in E$ , then there is an element  $\alpha \in R$  that  $\alpha x_i = f(x_i)$  for all  $i$ .

In particular, if  $E$  is f.g. over  $R'$ , the natural map  $R \rightarrow \text{End}_{R'}(E)$  is surjective.  $\lrcorner$

*Proof:* Consider  $f^n \in \text{End}_R(E^n)$ , then it is just a  $n \times n$  matrix with entries in  $R' = \text{End}_R(E)$ . Consider the lemma(3.6.2.7) shows there is an  $\alpha \in R$  that

$$(\alpha x_1, \dots, \alpha x_n) = (f(x_1), \dots, f(x_n))$$

which is the result.  $\square$

**Cor.(3.6.2.9) [Wedderburn Theorem].** Let  $R \in \mathcal{R}$ ing and  $E$  is a faithful simple  $R$ -module. Let  $D = \text{End}_R(E)$ . If  $E$  is of f.g. over  $D$ , then  $R = \text{End}_D(E)$ .  $\lrcorner$

*Proof:* The density theorem(3.6.2.8) and the fact  $E$  is f.g. over  $D$  shows that  $R \rightarrow \text{End}_k(E)$  is surjective, and also injective because it is faithful, thus  $R = \text{End}_k(E)$ .  $\square$

**Cor.(3.6.2.10)[Burnside's Theorem].** Let  $E$  is an  $R$ -module that is f.d over an alg.closed field  $k$  and  $R$  is a subalgebra of  $\text{End}_k(E)$ . If  $E$  is simple as an  $R$ -module, then  $R = \text{End}_k(E)$ .  $\lrcorner$

*Proof:* It follows from Shur's lemma(3.6.2.2) and(3.6.1.2)  $R' = \text{End}_R(E)$  is just  $k$ , so we can use Wedderburn's theorem(3.6.2.9).  $\square$

**Cor.(3.6.2.11)[F.d. Simple Module over Commutative Algebra].** If  $R$  is commutative and  $E$  is a simple  $R$ -module of f.d. over an alg.closed field  $k$ , then  $E$  is of 1-dimensional.  $\lrcorner$

*Proof:* The theorem shows the image of  $R$  in  $\text{End}_k(E)$  is all of  $\text{End}_k(E)$ , but Shur's lemma(3.6.2.2) and(3.6.1.2) that the image of  $R$  consists of scalars, thus  $\dim_k E = 1$ .  $\square$

**Prop.(3.6.2.12) [Projection Operators].** Let  $k$  be a field and  $R$  is a  $k$ -algebra. If  $V_1, \dots, V_n$  are pairwise non-isomorphic simple  $R$ -modules of f.d. over  $k$ , then there exists elements  $e_i$  in  $R$  that acts as identity on  $V_i$  and 0 on other  $V_j$ .  $\lrcorner$

*Proof:* This is an immediate consequence of Jacobson density theorem(3.6.2.8) applied to the projection operator on  $\oplus_i V_i$ .  $\square$

**Prop.(3.6.2.13)[Characters Determine F.D. Representations(Bourbaki)].** Let  $R$  be an algebra over a field  $k \in \mathbf{Field}^0$ , and  $E_1, E_2$  be two semisimple  $R$ -module of f.d. over  $k$  s.t. they have the same character  $\chi_1 = \chi_2$ , then the  $R$ -modules  $E_1, E_2$  are isomorphic.  $\lrcorner$

*Proof:*  $E, F$  are isomorphic to direct sums of simple  $R$ -modules, so it suffices to show the multiplicities  $m, n$  of any simple module  $V$  is the same. We can find an element  $e$  that is identity on  $E$  and 0 on other simple modules  $V_i$  by(3.6.2.12), thus the trace of  $e$  on  $E, F$  are  $m \dim_k(V), n \dim_k(V)$  respectively, thus  $m = n$  because  $k$  is of char0.  $\square$

**Def.(3.6.2.14)[Matrix Coefficients].** Let  $R$  be an algebra over a field  $k \in \mathbf{Field}^0$  and  $M \in \text{Mod}_R$  is of f.d. over  $k$ , then a **matrix coefficient** of  $M$  is a function  $c : R \rightarrow k$  of the form  $c(r) = L(rx)$ , where  $L$  is a linear functional on  $M$  and  $x \in M$ .  $\lrcorner$

**Cor.(3.6.2.15).** If  $R$  is an algebra over a field  $k$  and two simple  $R$ -modules that is f.d. over  $k$  have a nonzero matrix coefficient in common, then they are isomorphic.  $\lrcorner$

*Proof:* Let  $c(r) = L_1(rx_1) = L_2(rx_2)$ . If they are non-isomorphic, then we can find a  $e \in R$  that is identity on  $M_1$  and 0 on  $M_2$  by(3.6.2.12). Let  $c(u) \neq 0$ , then

$$c(ue) = L_1(ue x_1) = L_1(ux_1) = c(u) \neq 0, \quad c(ue) = L_2(ue x_2) = L_2(0) = 0$$

contradiction.  $\square$

**Prop. (3.6.2.16) [Simple Modules of Tensor Product].** Let  $A, B$  be algebras over a field  $\Omega$ ,  $R = A \otimes B$ , then:

- If  $P$  be a simple  $R$ -module of f.d. over  $\Omega$ , then there is a simple  $A$ -module  $M$  and a simple  $B$ -module  $N$  that  $P$  is isomorphic to a quotient of  $M \otimes N$ . Also the isomorphism classes of  $M, N$  are uniquely determined.
- If  $\Omega$  is alg.closed and  $M, N$  are simple modules of  $A, B$  of f.d. over  $\Omega$ , then  $M \otimes N$  is a simple module over  $A \otimes B$ .

┘

*Proof:* 1: because  $P$  is f.d., it contains a simple  $A$ -module  $M$ . Let  $N_1 = \text{Hom}_A(M, P)$ , then it is a  $B$ -module as  $A, B$  commutes in  $A \otimes B$ . Then we can define a map  $\lambda : M \otimes N_1 \rightarrow P$ , which is a  $A \otimes B$ -module morphism. Now  $N_1$  is also of f.d., so it contains a simple  $B$ -module  $N$ , and  $\lambda$  is clearly non-zero on  $M \otimes N$ , thus its image is all of  $P$ , as  $P$  is simple.

For the uniqueness, let  $d = \dim N$ , then  $P$  is isomorphic to  $k \leq d$  copies of  $M$  as an  $A$ -module, so the isomorphism class of  $M$  is determined, so does that of  $N$ .

2: Consider the map of  $A, B$  to  $\text{End}_\Omega(M), \text{End}_\Omega(N)$  are surjective by (3.6.2.10). Then it suffices to show that  $M \otimes N$  are simple over  $\text{End}_\Omega(M) \otimes \text{End}_\Omega(N)$ , but this is just  $\text{End}_\Omega(M \otimes N)$ , over which  $M \otimes N$  is clearly simple.  $\square$

### Semisimple Rings and Simple Rings

**Def. (3.6.2.17) [Semisimple Ring].** A (left) **semisimple ring** is a ring  $R$  s.t. it is a (left) semisimple module over itself (3.6.2.4). In (3.6.2.23), we will see left-semisimple is equivalent to right-semisimple.

┘

**Prop. (3.6.2.18).** Any semisimple ring is left Artinian and Noetherian.  $\square$

*Proof:* Consider the decomposition  $R = \oplus_\alpha \mathfrak{A}_\alpha$ , where  $\mathfrak{A}_\alpha$  are simple left  $R$ -ideals. Then by considering the decomposition of  $1 \in R$ , clearly this is a finite sum. The rest is easy.  $\square$

**Prop. (3.6.2.19).** If  $R$  is a semisimple ring, then any  $R$ -module is semisimple.  $\square$

*Proof:* Any  $R$ -module is a quotient of a free  $R$ -module, thus semisimple, by (3.6.2.5).  $\square$

**Prop. (3.6.2.20).**  $R$  is semisimple iff all  $R$ -modules are projective.  $\square$

*Proof:* If  $R$  is left-semisimple, for any  $R$ -module  $P$  and an exact sequence

$$0 \rightarrow N \rightarrow M \rightarrow P \rightarrow 0$$

by (3.6.2.19), there is a complement of  $N$  in  $M$ , thus this sequence splits and  $P$  is projective. The converse is also clear that any submodule of any  $R$ -module has a complement.  $\square$

**Lemma (3.6.2.21).** Let  $D$  be a division ring and  $R = \text{Mat}(n; D)$ , then

- $R$  is simple, left semisimple and left Noetherian.
- $R$  has a unique left simple module  $V$ , and  $R$  acts faithfully on  $V$ , with  $R \cong nV$ .
- $\text{End}_R(V) \cong D$ .

┘

*Proof:* Cf. [Lam, P31].  $\square$

**Prop. (3.6.2.22) [Wedderburn-Artin].** Any left semisimple ring is of the form  $R \cong \text{Mat}(n_1; D_1) \times \dots \times \text{Mat}(n_r; D_r)$ , and  $D_k$  are uniquely determined division rings. There are exactly  $r$  different left simple  $R$ -modules and  $D_i$  are uniquely determined.  $\lrcorner$

*Proof:* Consider the decomposition

$$R \cong n_1 V_1 \oplus \dots \oplus n_r V_r$$

where  $V_i$  are non-isomorphic simple left  $R$ -modules. Then we can use Schur's lemma (3.6.2.2) and (3.6.2.21) to calculate the endomorphism ring, so

$$R \cong \text{End}(n_1 V) \times \dots \times \text{End}(n_r V_r) \cong \text{Mat}(n_1, D_1) \times \dots \times \text{Mat}(n_r, D_r).$$

For the uniqueness, we use (3.6.2.21), which shows  $D_i$  and  $V_i$  both can be recovered.  $\square$

**Cor. (3.6.2.23).**  $R \in \text{Ring}$  is left semisimple iff it is right semisimple. ((3.5.1.13) is used).  $\lrcorner$

**Cor. (3.6.2.24).** A semisimple commutative ring is a finite direct product of fields.  $\lrcorner$

**Def. (3.6.2.25) [Semisimple Categories].** Let  $k \in \text{Field}$  and  $\mathcal{A} \in \text{AbCat}/k$  that  $\text{End}(X)$  are all finite  $k$ -modules for  $X \in \mathcal{A}$ , then  $\mathcal{A}$  is semisimple iff  $\text{End}(X)$  is a semisimple  $k$ -algebra for any  $X$ .  $\lrcorner$

*Proof:* If  $\mathcal{A}$  is semisimple, then any  $X \in \mathcal{A}$  is a direct sum of simple objects, so  $\text{End}(X)$  is semisimple.

Conversely, if  $\text{End}(X)$  is semisimple thus a product of matrix algebras over division algebras, so  $X$  can be indecomposable only if  $\text{End}(X)$  is a division algebra. Now if  $f : M \rightarrow N$  is a morphism of indecomposable objects, if there is a map  $g : N \rightarrow M$  that  $g \circ f \neq 0$ , then  $g \circ f$  is an automorphism of  $M$ , and  $(g \circ f)^{-1} \circ g$  is a right inverse to  $f$ , so  $N$  is a direct sum of  $M$ , and thus  $f$  is an isomorphism because  $M$  is indecomposable.

Now it suffices to show any indecomposable object is simple. If  $M$  is an indecomposable object properly contained in another indecomposable object, then

$$\begin{bmatrix} 0 & 0 \\ \text{Hom}(M, N) & 0 \end{bmatrix} \subset \begin{bmatrix} \text{End}(M) & \text{Hom}(N, N) \\ \text{Hom}(M, N) & \text{End}(N) \end{bmatrix} = \text{End}(M \oplus N)$$

is a two sided nilpotent nonzero ideal, contradicting the fact  $\text{End}(M \oplus N)$  is semisimple.  $\square$

**Prop. (3.6.2.26) [Semisimplicity and Base Change].** If  $A \in \text{Alg}_k$  and  $A \otimes_k K$  is semisimple for some field extension  $K/k$ , then  $A$  is semisimple. Conversely, if  $A \in \text{Alg}_k$  is semisimple, then  $A \otimes_k K$  is semisimple for every separable field extension  $K/k$ .  $\lrcorner$

*Proof:* Cf. [Milne, Lie Algebras, Lie Groups and Algebraic Groups] P48.  $\square$

**Prop. (3.6.2.27) [Characters Determine F.D. Representations].** If  $R$  is a semisimple ring over a field  $k \in \text{Field}^0$ , then its f.d. representations are determined by their characters, by (3.6.2.13).  $\lrcorner$

**Prop. (3.6.2.28) [Simple Artinian Algebras].** For a simple ring  $R$  (3.2.1.2), the following are equivalent:

- $R$  is left semisimple.
- $R$  is left Artinian.
- $R$  has a minimal left ideal.

- $R \cong \text{Mat}(n; D)$  for some division ring  $D$ .

┘

*Proof:* The equivalence of 1, 4 is by Wedderburn theorem (3.6.2.22) and (3.6.2.21).  $2 \rightarrow 3$  is easy, and for  $1 \rightarrow 2$ ,  $R$  is a finite direct sum of minimal ideals by Wedderburn theorem (3.6.2.22), so it is Artinian.

For  $3 \rightarrow 1$ , consider all the ideals in  $R$  that is isomorphic to the minimal ideal  $\mathfrak{A}$ , then it is also a right ideal of  $R$ , so equals  $R$ , hence  $R$  is semisimple.  $\square$

**Cor. (3.6.2.29).** And finite simple  $k$ -algebra  $A$  is of the form  $\text{Mat}(n; D)$  where  $D$  is a finite division ring over  $k$ . This is because  $A$  is clearly left Artinian.  $\square$

**Prop. (3.6.2.30) [Double Centralizer Property].** Let  $R$  be a simple ring and  $\mathfrak{A}$  a nonzero left ideal. Let  $D = \text{End}_R(\mathfrak{A})$ , then the natural map  $f : R \rightarrow \text{End}_D(\mathfrak{A})$  is an isomorphism.  $\square$

*Proof:* since  $R$  is simple,  $f$  is injective. To show it is surjective, let  $E = \text{End}_D(\mathfrak{A})$ , then for any  $a, r \in \mathfrak{A}$  and  $h \in E$ , we have  $h(ra) = h(r)a$ , thus

$$(h \cdot f(r))a = h(ra) = h(r)a = f(h(r))a$$

which shows  $f(R)$  is a left ideal in  $E$ . And because  $\mathfrak{A}R = R$ , we have  $f(R) = f(\mathfrak{A})f(R)$ , then

$$Ef(R) = Ef(\mathfrak{A})f(R) \subset f(\mathfrak{A})f(R) = f(R).$$

which shows  $f(R)$  is a left ideal in  $E$ , and it contains 1, so  $f(R) = E$ .  $\square$

### 3 Jacobson Radicals

**Def. (3.6.3.1) [Jacobson Radical].** For  $R \in \text{Ring}$ , the **Jacobson radical** is defined to be the intersection of all maximal left ideals in  $R$ .

$R$  is called **Jacobson-semisimple** if  $\text{rad } R = 0$ .

$R$  is called **semi-local** if  $\overline{R} = R/\text{rad } R$  is semisimple (3.6.2.17).

$R$  is called **semi-primary** if  $R$  is semi-local and  $\text{rad } R$  is nilpotent.  $\square$

**Prop. (3.6.3.2) [Characterizing Jacobson Radicals].** For  $R \in \text{Ring}$  and  $y \in R$ , the following are equivalent:

- $y \in \text{rad } R$ .
- $1 - xy$  is left-invertible for any  $x \in R$ .
- $yM = 0$  for any simple left  $R$ -module  $M$ .
- $1 - xyz$  is invertible for any  $x, z \in R$ .

┘

*Proof:*  $1 \rightarrow 2$ : If  $1 - xy$  is not left invertible, then it is contained in a maximal left ideal  $\mathfrak{m}$ , but  $y \in \mathfrak{m}$ , then  $1 \in \mathfrak{m}$ , contradiction.

$2 \rightarrow 3$ : If  $ym \neq 0$ , then we must have  $Rym = M$ , so  $xym = m$  for some  $x \in R$ , which shows  $(1 - xy)m = 0$ , but then  $m = 0$ .

$3 \rightarrow 1$ : Consider the simple left  $R$ -module  $R/\mathfrak{m}$  for any maximal left ideal  $\mathfrak{m}$ .

$4 \rightarrow 2$  is trivial, for  $1 + 2 + 3 \rightarrow 4$ : By item 3 we know  $\text{rad } R$  is an ideal, so  $yz \in \text{rad } R$  and there is a  $u$  that  $u(1 - xyz) = 1$ . But then  $u = 1 + u(xyz)$  is also left-invertible, so  $u$  is invertible and  $1 - xyz$  is invertible.  $\square$

**Cor. (3.6.3.3)[rad( $R$ ) is 2-Sided].**  $\text{rad } R$  is the largest ideal  $\mathfrak{A}$  of  $R$  that  $1+\mathfrak{A}$  are all units. In particular,  $\text{rad}(R)$  is a 2-sided ideal of  $R$ , and it is also the intersection of maximal right ideals of  $R$ .  $\lrcorner$

**Def. (3.6.3.4) [Locally Nilpotent Subsets].** A subset of  $R \in \mathcal{C}\text{Ring}$  is called **locally nilpotent** iff every element of it is nilpotent.  $\lrcorner$

**Lemma (3.6.3.5).** if a left or right ideal  $\mathfrak{A} \subset R$  is locally nilpotent, then  $\mathfrak{A} \subset \text{rad } R$ .  $\lrcorner$

*Proof:* Suppose  $y \in \mathfrak{A}$ , then  $xy \in \mathfrak{A}$  is nilpotent. So  $1 - xy$  has an inverse, for any  $x$ . Then  $y \in \text{rad } R$ , by (3.6.3.2).  $\square$

**Prop. (3.6.3.6) [Artinian Radical Nilpotent].** In a left Artinian ring,  $\text{rad } R$  is the largest nilpotent left ideal, and it is also the largest nilpotent right ideal.  $\lrcorner$

*Proof:* By the above lemma, it suffices to show  $J = \text{rad } R$  is nilpotent. By Artinian property, the descending chain  $J \supset J^2 \supset J^3 \supset \dots$  is stabilizing, so there exists  $k$  s.t.  $J^k = J^{k+1} = I$ . Then  $I = 0$ , because otherwise we can choose a minimal non-zero left ideal  $\mathfrak{A}$  s.t.  $I\mathfrak{A} = 0$ . Then if  $a \neq 0 \in \mathfrak{A}$ ,

$$I(Ia) = I^2a = Ia = 0,$$

so  $\mathfrak{A} = Ia$ , and  $a = ya$  for some  $y \in J$ , so  $(1 - y)a = 0$ . But  $1 - y$  is a unit by (3.6.3.2), contradiction.  $\square$

**Cor. (3.6.3.7).** In a left Artinian ring, any 1-sided locally nilpotent ideal is nilpotent. By left Artinian, there is a  $k$  that  $(\text{rad } R)^k = (\text{rad } R)^{k+1} = I$ . Now if  $I \neq 0$ , then we can choose a minimal left ideal  $\mathfrak{A}$  that  $I\mathfrak{A} \neq 0$  by Artinian property. Now there is an  $a \in \mathfrak{A}$  that  $Ia \neq 0$ , so  $I(Ia) = Ia \neq 0$ , so  $Ia = \mathfrak{A}$  and  $a = ya$  for some  $y \in I$ . But  $1 - y$  is invertible, so  $a = 0$ , contradiction.  $\lrcorner$

**Prop. (3.6.3.8) [Semisimplicity and Jacobson Semisimplicity].** For  $R \in \text{Ring}$ , the following are equivalent:

- $R$  is semisimple.
- $R$  is Jacobson-semisimple and left Artinian.
- $R$  is Jacobson semisimple and satisfies DCC on principal left ideals.

$\lrcorner$

*Proof:*  $1 \rightarrow 2$ :  $R$  is left Artinian by (3.6.2.18), and consider  $R = \text{rad } R \oplus \mathfrak{B}$ , then  $\mathfrak{B}$  is contained in a maximal left ideal  $\mathfrak{m}$ , which cannot contain  $\text{rad } R$ , unless  $\text{rad } R = 0$ .

$3 \rightarrow 1$ : 3 implies that any left ideal  $\mathfrak{A}$  contains a minimal left ideal  $I$  (the minimal principal one), and every minimal left ideal  $I$  is a direct summand of  ${}_R R$  (by choosing the maximal left ideal  $\mathfrak{m}$  not containing  $I$ , because  $I \oplus \mathfrak{m} = R$ ).

Then we can deduce 1: If  $R$  is not semisimple, then take a minimal left ideal  $\mathfrak{B}_1$ , then  $R = \mathfrak{B}_1 \oplus \mathfrak{A}_1$ , and  $\mathfrak{A}_1 \neq 0$  otherwise  $R$  is semisimple, and we can choose a minimal left ideal  $\mathfrak{B}_2 \subset \mathfrak{A}_1$ , then  $\mathfrak{A}_1 = \mathfrak{B}_2 \oplus \mathfrak{A}_2$ . Continuing this way, we get a chain of left ideals  $\mathfrak{A}_1 \supset \mathfrak{A}_2 \supset \dots$ , and they are both principal because they are direct summands of  ${}_R R$ , contradicting item 3.  $\square$

**Prop. (3.6.3.9) [Hokins-Levitzki Theorem].** Let  $R$  be a semi-primary ring (3.6.3.1), then for any  $R$ -module  $M$ , the following are equivalent:

- $M$  is Noetherian.
- $M$  is Artinian.

- $M$  has a composition series.

In particular, a ring is left Artinian iff it is left Noetherian and semi-primary.  $\lrcorner$

*Proof:* It suffices to prove if  $M$  is Noetherian or Artinian,  $M$  has a composition series. Denote  $J = \text{rad } R$ , then  $J^n$  for some  $n > 0$ . We consider

$$0 \subset J^{n-1}M \subset \dots \subset JM \subset M,$$

and the quotient  $J^{k-1}M/J^kM$  is Artinian or Noetherian over  $\overline{R} = R/\text{rad } R$  which is semisimple, so it is a direct sum of simple modules, and the sum is finite, so there is a composition series.

The last assertion: A left Artinian ring is semi-primary, by (3.6.3.6) and (3.6.3.8). So the assertion follows from the equivalence of item 1 and 2.  $\square$

**Lemma (3.6.3.10).** Let  $x \in \text{rad}(R)$  where  $R$  is a  $k$ -algebra, then  $x$  is algebraic over  $k$  iff  $x$  is nilpotent.  $\lrcorner$

*Proof:* One direction is trivial. For the other, if  $x^r + a_1x^{r+1} + \dots + a_nx^{r+n} = 0$ , then because

$$1 + a_1x^1 + \dots + a_nx^n$$

is invertible, we have  $x^r = 0$ .  $\square$

**Prop. (3.6.3.11) [Amitsur].** Suppose  $k \in \mathbf{Field}$  and  $R \in \mathbf{Ring}/k$  s.t.  $\dim_k R < \#k$ , then  $\text{rad } R$  is the largest locally nilpotent ideal of  $R$ .  $\lrcorner$

*Proof:* If  $|k| < \infty$ , then  $R$  is Artinian, so  $\text{rad } R$  is nilpotent by (3.6.3.6), and it is the largest by (3.6.3.6) again. Suppose now  $k$  is infinite. By the lemma above, it suffices to show every  $r \in \text{rad } R$  is algebraic over  $k$ . Notice that  $a - r$  is invertible for  $a \in k^*$ , and  $\{(a - r)^{-1}\}$  cannot be  $k$ -linearly independent because  $\dim_k R < |k|$ , so there is a dependence relation

$$\sum_{i=1}^n b_i(a_i - r)^{-1} = 0.$$

Hence  $r$  is algebraic over  $k$ .  $\square$

**Prop. (3.6.3.12) [Amitsur].** Let  $R \in \mathbf{Ring}$  and  $S = R[T]$ . Let  $J = \text{rad } S$  and  $N = R \cap J$ , then  $N$  is a locally nilpotent ideal in  $R$ , and  $J = N[T]$ . In particular, if  $R$  is Jacobson semisimple, then  $S$  is also Jacobson semisimple (3.6.3.5).  $\lrcorner$

*Proof:* Cf. [Lam, P71].  $\square$

**Lemma (3.6.3.13).** Let  $R \in \mathbf{Ring}/k$  and  $K/k$  is a separable algebraic field extension, then if  $R$  is Jacobson semisimple, so is  $R \otimes_k K$ .  $\lrcorner$

*Proof:* Cf. [Lam, P76].  $\square$

**Prop. (3.6.3.14) [Jacobson Radical Under Base Change of Fields].** Let  $R \in \mathbf{Ring}/k$  and  $K/k$  a separable algebraic extension, then  $\text{rad}(R \otimes_k K) = (\text{rad } R) \otimes_k K$ .  $\lrcorner$

*Proof:* Cf. [Lam, P76].  $\square$

## 4 Finite Semi-simple Algebras

References are [Sta]Chap 11.

**Notation(3.6.4.1).**

- Let  $k \in \mathbf{Field}$ .

┘

**Def.(3.6.4.2) [Separable Semi-simple Algebras].** A **separable semisimple  $k$ -algebra** is a  $k$ -algebra  $A \in \mathbf{Ring}/k$  s.t.  $Z(A)$  is étale over  $k$ . Every separable semisimple  $k$ -algebra is a product of separable simple  $k$ -algebras, which are of the form  $\mathbf{Mat}(n, K)$  for some  $K/k \in \mathbf{Field}$  separable. ┘

**Prop.(3.6.4.3).** If  $A$  is a separable semisimple  $k$ -algebra, then  $A \otimes_k k'$  is a separable semisimple  $k'$ -algebra for any  $k'/k \in \mathbf{Field}$ . ┘

**Def.(3.6.4.4) [Azumaya Algebras].** A **central  $k$ -algebra** is a  $k$ -algebra  $A \in \mathbf{Ring}_k$  s.t.  $Z(A) = k$ . ┘

**Def.(3.6.4.5) [Azumaya Algebras].** An **Azumaya algebra** over  $k$  is defined to be a finite central simple  $k$ -algebra(3.2.1.2). The category of Azumaya algebras over  $k$  is denoted by  $\mathbf{Az}_k$ . ┘

**Lemma(3.6.4.6).** Let  $D/k$  be a central division ring and  $A \in \mathbf{Ring}/k$ , then any two-sided ideal  $I$  of  $A \otimes_k D$  is of the form  $J \otimes_k D$  for some two-sided ideal  $J$  of  $A$ . In particular, if  $A$  is simple, then  $A \otimes_k D$  is also simple. ┘

*Proof:* Cf.[Sta]074C or [Frobenius Algebras, 1]P371.?

□

**Prop.(3.6.4.7) [Tensor Product of Simple Algebras].** if  $A, A'$  are two simple  $k$ -algebras that  $A$  is finite central over  $k$ , then  $A \otimes_k A'$  is also simple. ┘

*Proof:* Let  $A'$  be finite central over  $k$ , then by(3.6.2.28),  $A' \cong \mathbf{Mat}(n; D)$  for some finite central division algebra over  $k$ . Then

$$A \otimes_k A' \cong \mathbf{Mat}(n; A \otimes_k D),$$

which is simple by(3.6.4.6) and(3.6.4.10). ┘

□

**Cor.(3.6.4.8).** The tensor product of two Azumaya  $k$ -algebras is an Azumaya  $k$ -algebra. ┘

*Proof:* Combine the proposition with(3.2.1.8). ┘

□

**Cor.(3.6.4.9) [Base Change].** If  $A \in \mathbf{Ring}/k$ , then for any field extension  $k'/k$ ,  $A \otimes_k k' \in \mathbf{Az}_{k'}$  iff  $A \in \mathbf{Az}_k$ . ┘

*Proof:* Combine(3.2.1.8) with(3.6.4.7). ┘

□

**Prop.(3.6.4.10) [Matrix Algebras].** Let  $R \in \mathbf{Ring}$  and  $n \in \mathbb{Z}_+$ , then

- The functors  $M \mapsto M^{\oplus n}, N \mapsto e_{11}n$  defines an equivalence of categories between  $\mathbf{Mod}_R$  and  $\mathbf{Mod}_{\mathbf{Mat}(n; R)}$ .
- Any two-sided ideal of  $\mathbf{Mat}(n; R)$  is of the form  $\mathbf{Mat}(n; I)$  for some two-sided ideal  $I$  of  $R$ .
- Then center of  $\mathbf{Mat}(n, R)$  is the equal to the center of  $R$ .

┘

*Proof:* 3 is easy. ┘

□

**Thm. (3.6.4.11) [Skolem-Noether].** Let  $A \in \text{Az}_k$  and  $B$  be a simple  $k$ -algebra, and  $f, g : B \rightarrow A \in \text{Ring}_k$ . Then there exists  $x \in A^*$  s.t.  $f(a) = x^{-1}g(a)x$  for any  $a \in A$ .  $\lrcorner$

*Proof:* Choose a simple  $A$ -module  $M$ , then  $L = \text{End}_A(M)$  is a division ring, and  $M$  has two  $B \otimes_k L^{\text{op}}$  structures induced by  $f$  and  $g$ . The  $k$ -algebra  $B \otimes_k L$  is simple by (3.6.4.7), and also  $B$  is finite simple because there is a  $k$ -homomorphism  $B \rightarrow A$ , so  $B \otimes_k L$  is finite simple. Thus the two  $B \otimes_k L$ -structures on  $M$  are isomorphic, which means there is a  $\varphi : M \rightarrow M$  intertwining these two structures. But  $\varphi$  commutes with  $L$ , meaning that  $\varphi$  is just multiplying by some  $x \in A$  by Jacobson density theorem (3.6.2.8), so  $x$  is what we want.  $\square$

**Cor. (3.6.4.12).** If  $A \in \text{Az}_k$ , then any automorphism of  $A$  is inner.  $\lrcorner$

### Splitting Fields

**Prop. (3.6.4.13) [Centralizer Theorem].** Let  $A \in \text{Az}_k$ , and  $B$  a simple sub- $k$ -algebra of  $A$ , then

- $C = C_A(B)$  is also simple.
- $\dim_k A = \dim_k B \cdot \dim_k C$ .
- $C_A(C) = B$ .

$\lrcorner$

*Proof:* Cf. [Sta]074T. ?  $\square$

**Cor. (3.6.4.14).** Let  $B \subset A \in \text{Az}_k$ , then  $C = C_A(B)$  is also in  $\text{Az}_k$ , and  $A \cong B \otimes_k C$ .

In particular, if a division ring  $D$  is of f.d. over its center  $k$ , then  $D \in \text{Az}_k$ , and  $\dim_k D$  is a square.  $\lrcorner$

*Proof:*  $\dim_k A = \dim_k(B \otimes_k C)$  by (3.6.4.13), and  $B \otimes_k C$  is simple by (3.6.4.7), so the natural map  $B \otimes_k C \rightarrow A$  is an isomorphism, and the center of  $C$  is  $k$  by (3.6.4.7).  $\square$

**Prop. (3.6.4.15).** For  $A \in \text{Az}_k$ , If  $K \subset A$  is a sub- $k$ -field, then the following are equivalent:

- $\dim_k A = [K : k]^2$ .
- $C_A(K) = K$ .
- $K$  is a maximal commutative subring of  $A$ .

$\lrcorner$

*Proof:* 1, 2 are equivalent by (3.6.4.13),  $2 \rightarrow 3$  is trivial, and  $3 \rightarrow 2$  because if  $C_A(K) \neq K$ , take any  $a \in C_A(K)$ , we get a larger commutative subring  $K(a)$  of  $A$ .  $\square$

**Cor. (3.6.4.16) [Central Simple Algebras has Square Dimensions].** If  $D \in \text{Az}_k$  is a central division algebra, then  $\dim_k D$  is a square, and every maximal subfield  $K$  of  $D$  satisfies  $\dim_k D = [K : k] = \sqrt{\dim_k D}$ .  $\lrcorner$

*Proof:* This is because any commutative subring of  $D$  is a field.  $\square$

**Def. (3.6.4.17) [Splitting Fields].** For  $k \in \text{Field}$  and  $B$  a finite semisimple  $k$ -algebra, then  $B$  is said to **split** if  $B$  is isomorphic to a product of matrix algebras over  $k$ . A field extension  $K/k$  is called a **splitting field** of  $B$  if  $B \otimes_k K$  is split.  $\lrcorner$

**Prop. (3.6.4.18) [Maximal Subfields are Splitting].** Let  $k \subset_{\text{fin}} k' \in \mathbf{Field}$ ,  $A \in \mathbf{Az}_k$ , then  $k'$  is a splitting field of  $A$  iff there exists a  $B \in \mathbf{Az}_k$  similar to  $A$  (11.2.1.5) s.t.  $k' \subset B$  and  $\dim_k B = [k' : k]^2$ .

In particular, if  $D \in \mathbf{Az}_k$  is a central division ring, any maximal subfield of  $D$  is a splitting field of  $D$ , by (3.6.4.15),  $\lrcorner$

*Proof:* Cf. [Sta]074Z. ?  $\square$

**Cor. (3.6.4.19).** If  $D \in \mathbf{Az}_k$  is a central division algebra with  $\dim_k D = d^2$ ,  $d \in \mathbb{Z}_+$  by (3.6.4.16), then for any splitting field  $k'$  for  $D$ , we have  $d \mid [k' : k]$ .  $\lrcorner$

*Proof:* By (3.6.4.18), there exists  $B \in \mathbf{Az}_k$  similar to  $D$  s.t.  $\dim_k B = [k' : k]^2$ . Then it follows from (11.2.2.2) that  $B \cong \text{Mat}(n, D)$  for some  $n \in \mathbb{Z}_+$ . Then  $n^2 d^2 = [k' : k]^2$ , so  $d \mid [k' : k]$ .  $\square$

**Prop. (3.6.4.20) [Galois Splitting Fields, Noether-Köthe].** If  $D \in \mathbf{Az}_k$ , then there exists a maximal subfield  $K \subset D$  s.t.  $K/k$  is finite separable. In particular, by (11.2.2.2) (3.6.4.18), any central simple algebra has a finite Galois splitting field.  $\lrcorner$

*Proof:* Notice it suffices to prove that: if  $D \neq k$ , there exists  $\alpha \in D \setminus k$  s.t.  $k(\alpha)/k$  is separable. This is because if we find such  $\alpha$ , then  $D' = C_D(k(\alpha)) \in \mathbf{Az}_{k(\alpha)}$ , by (3.6.4.13), so we can use induction on  $D'/k(\alpha)$ .

We may assume  $k$  is non-perfect of characteristic  $p \in \mathbf{Prime}$ , thus an infinite field. Suppose we cannot find such an element, then every element satisfies an equation of the form  $T^{p^r} - a = 0$ , where  $a \in k$ . And because  $\dim_k D < \infty$ , there exists an  $r$  s.t.  $x^{p^r} \in k$  for any  $x \in D$ . Then we can use the fact  $\#k = \infty$  to show that  $x^{p^r} \in \bar{k}$  for any  $x \in D \otimes_k \bar{k}$ . But then every  $p^r$ -th power of  $D \otimes_k \bar{k} \cong \text{Mat}(n, \bar{k})$  is central, which is not true, as  $n > 1$  and we can take  $e_{11}$ .  $\square$

**Cor. (3.6.4.21).** For  $A \in \mathbf{Ring}/k$ ,  $A \in \mathbf{Az}_k$  iff  $A \otimes_k k^{\text{sep}} \cong \text{Mat}(n, k^{\text{sep}})$  for some  $n \in \mathbb{Z}_+$ , by (3.6.4.9). In particular, if  $A \in \mathbf{Az}_k$ , then  $\dim_k A \in (\mathbb{Z}_+)^2$ .  $\lrcorner$

**Def. (3.6.4.22) [Reduced Degrees].** If  $B \in \mathbf{Ring}_{\text{fin,ss}}/k$  and  $B = \prod_i B_i$  where  $B_i$  are simple  $k$ -algebras with center  $k_i$ , define the **reduced degree** of  $B$  over  $k$  to be

$$[B : k]_{\text{red}} = \sum_i [B_i : k_i]^{1/2} [k_i : k],$$

which is an integer by (3.6.4.16). And for any field extension  $k'/k$ ,

$$[B_{k'} : k']_{\text{red}} = [B : k]_{\text{red}}.$$

$\lrcorner$

*Proof:* To show it is invariant, pass to the algebraic closure, then  $B = \prod_j \text{Mat}(n_j, \bar{k})$ , and  $[B : k]_{\text{red}} = \sum n_j$ .  $\square$

**Def. (3.6.4.23) [Reduced Norms].** Let  $B \in \mathbf{Az}_k$ . If  $x \in B$ , let  $P(T)$  be the characteristic polynomial of  $R_x : B \rightarrow B$ . Then by passing to finite Galois splitting fields (3.6.4.20), we get  $P(T) = Q(T)^n$  where  $\dim_k B = n^2$ . Then because there are Galois actions, we see  $Q(T) \in k[T]$ . This  $Q(T)$  is called the **reduced characteristic** of  $x$ . We can also routinely define **reduced norms** and **reduced trace**, denoted by  $\text{Nmrd}_{B/k}$  and  $\text{trrd}_{B/k}$ .

Then this reduced characteristic is just the usual one when  $B \cong \text{Mat}(n; k)$ . And when  $K$  is a splitting field of  $B$  containing  $x$ , then this equals the characteristic polynomial of  $x$  in  $K/k$ .

More generally, if  $k \subset_{\text{fin}} K \in \mathbf{Field}$  and  $B \in \mathbf{Az}_K$ , then we can define  $\text{Nmrd}_{B/k} = \text{Nm}_{K/k} \circ \text{Nmrd}_{B/K}$  and  $\text{trrd}_{B/k} = \text{tr}_{K/k} \circ \text{trrd}_{B/K}$ .  $\lrcorner$

*Proof:* For the last assertion, notice  $B = K \oplus Kx_1 \oplus \dots \oplus Kx_n$  as modules over  $K$ .  $\square$

**Prop. (3.6.4.24).** If  $B$  is a finite semisimple  $k$ -algebra, any maximal étale  $k$ -subalgebra of  $B$  has rank  $[B : k]_{\text{red}}$  over  $k$ .  $\lrcorner$

*Proof:* This follows from (3.6.4.16).  $\square$

**Prop. (3.6.4.25).** If  $B$  is a finite semisimple  $k$ -algebra, then for any faithful  $B$ -module  $M$ ,

$$\dim_k M \geq [B : k]_{\text{red}}.$$

And the equality holds iff  $B$  is split.  $\lrcorner$

*Proof:* This is clear from (3.6.2.21).  $\square$

**Prop. (3.6.4.26).** For  $A \in \text{Az}_k$ ,  $A \otimes_k A^{\text{op}} \cong \text{Mat}(n; k)$ , where  $n = \dim_k A$ .  $\lrcorner$

*Proof:* There is a map  $A \otimes_k A^{\text{op}} \rightarrow \text{End}_k(A) : (a \otimes a') \mapsto (x \mapsto axa')$ . By (3.6.4.8),  $A \otimes_k A^{\text{op}}$  is simple, thus this is an injective map, but both sides have the same dimension, thus this is an isomorphism.  $\square$

### Finite Semisimple $k$ -Algebras with Involutions

See [Book on Involutions].

**Prop. (3.6.4.27) [Decomposition of Semisimple Algebras with an involution].** Let  $(B, *)$  be a finite semisimple  $k$ -algebra with an involution, if  $k = \bar{k}$  and  $\text{char } k = 0$ , then it decomposes as products of pairs of the following types:

- (A) :  $\text{Mat}(n; k) \times \text{Mat}(n; k)$ ,  $(a, b)^* = (b^t, a^t)$ .
- (C) :  $\text{Mat}(n; k)$ ,  $b^* = b^t$ .
- (BD) :  $\text{Mat}(2n; k)$ ,  $b^* = Jb^tJ^{-1}$ , where  $J = \begin{bmatrix} 0 & -1 \\ 1 & 0 \end{bmatrix}$ .

$\lrcorner$

*Proof:* Let  $B = B_1 \times \dots \times B_r$  be the decomposition into products of simple  $k$ -algebras, where  $B_i^*$  are the minimal two-sided ideals of  $B$ . Applying  $*$ ,  $B = B_1^* \times \dots \times B_r^*$  so  $B_i^*$  is a permutation of  $B_i$ , so  $B$  is a product of algebras either simple or product of two simple algebras that  $*$  interchanges them.

If  $B$  is simple, then  $B \cong M_n(k)$  as  $k$  is alg.closed, so  $b^* = ub^tu^{-1}$  for some  $u \in M_n(k)$  by Skolem-Noether (3.6.4.11). Then  $b = b^{**} = (u^tu^{-1})^{-1}bu^tu^{-1}$ , so  $u^tu^{-1}$  is in the center, denote it by  $c$ , then  $u^t = cu$ ,  $u = c^2u$ , so  $c = \pm 1$ , and  $u$  is symmetric or skew-symmetric. Up to a congruence, we see the situation is (C) or (BD).

The other case is also easy.  $\square$

**Prop. (3.6.4.28).** Let  $A$  be a finite simple algebra over  $k$  with center  $K$ , and let  $\dagger$  be an involution on  $A$ .

- If  $\dagger$  is of the first kind, then every involution on  $A$  of the first kind are of the form  $x \rightarrow ax^\dagger a^{-1}$  for some  $a \in A^*$  with  $a^\dagger = \pm a$ .
- If  $\dagger$  is of the second kind, then every involution on  $A$  of the second kind agreeing with  $\dagger$  on  $K$  are of the form  $x \rightarrow ax^\dagger a^{-1}$  for some  $a \in A^*$  with  $a^\dagger = a$ .

┘

*Proof:* If  $*$  is an involution satisfying the conditions as above,  $* \circ \dagger$  is an automorphism of  $A$  preserving  $K$ . So by Skolem-Noether, we see  $x^* = ax^\dagger a^{-1}$  for some  $a \in A^\times$ . And because  $*$  is an involution, we have  $a^\dagger a^{-1} \in K$ . Assume  $a^\dagger = ca$  where  $c \in k^\times$ , then  $c^\dagger c = 1$ . If  $\dagger$  is of the first kind, this means that  $c = \pm 1$ . And if  $\dagger$  is of the second kind, this implies that  $c = d^\dagger d^{-1}$  for some  $d \in K^\times$  by [Mil17]P78<sup>?</sup>. Thus we can replace  $a$  by  $a/d$  to achieve  $a^\dagger = a$ .  $\square$

**Prop. (3.6.4.29) [Adjoint Involutions].** Let  $D \in \text{Az}_k$  with an involution  $*$  and  $V \in \text{Vect}^{\text{fin}}/D$ . If  $\varphi$  is a (skew-)Hermitian form over  $D$ , then there is an involution  $*_V$  on  $\text{End}_D(V)$  extending  $*$  s.t. for each  $\alpha \in \text{End}_D(V)$ ,

$$(\alpha^{*_\varphi} x, y) = (x, \alpha y), \text{ where } x, y \in V,$$

called the **adjoint involution** associated to  $\varphi$ . And if  $\varphi, \varphi'$  are two such sesquilinear forms, then  $*_\varphi \cong *_{\varphi'}$  iff  $\varphi' = c\varphi$  for some  $c \in k^\times$ .

Every involution on  $\text{End}_D(V)$  extending  $*$  appears in this way.  $\square$

*Proof:* To show that every involution on  $\text{End}_D(V)$  extending  $*$  is of this form, take the standard Hermitian sesquilinear form on  $V$  and consider its adjoint involution, then the assertion follows from (3.6.4.28).  $\square$

**Cor. (3.6.4.30) [Types of Involutions of First Kind].** If  $\text{char } k \neq 2$ ,  $D \in \text{Az}_k$  and  $*$  is an involution of first kind on  $D$ , then  $(D, *) \otimes_k k^{\text{sep}} \cong (\text{End}(V), *_\varphi)$  for some  $V \in \text{Vect}^{\text{fin}}/k^{\text{sep}}$  and a non-degenerate symmetric or alternating form  $\varphi$  on  $V$ . In the symmetric case,  $*$  is called an **involution of orthogonal type**, and in the skew-symmetric case it is called an **involution of symplectic type**. Notice the symplectic type happens only when  $\dim_k D$  is even.  $\square$

**Prop. (3.6.4.31) [(Skew)Hermitian Spaces and Involutions of the First Kind].** If  $\text{char } k \neq 2$ ,  $D \in \text{Az}_k$  and  $*$  is an involution on  $D$  of the first kind (3.2.1.10), taking adjoint form (3.6.4.29) induces bijections between

- $k^\times$ -homogeneity classes of Hermitian spaces of rank  $n$  over  $D$ , and involutions on  $\text{Mat}(n; D)$  extending  $*$  of the same type as  $*$  (3.6.4.30).
- $k^\times$ -homogeneity classes of skew-Hermitian spaces of rank  $n$  over  $D$ , and involutions on  $\text{Mat}(n; D)$  extending  $*$  of the opposite type as  $*$  (3.6.4.30).

┘

*Proof:* Extends  $*$  to an involution of first type on  $\text{Mat}(n; D)$  in the natural way  $((a_{ij})^* = (a_{ij}^*)^t)$ , which is the adjoint involution of the standard Hermitian form, and it is of the same type as  $*$ . If  $\varphi'$  be another sesquilinear form and let  $*_{\varphi'}$  be the adjoint involution, then  $*' = *_{\varphi'} = \text{Inn}(a) \circ *$  for some  $a \in \text{GL}(n; D)$  with  $a^* = \pm a$  by (3.6.4.28). Notice the sesquilinear form

$$\varphi''(x, y) = \varphi(a^{-1}x, y)$$

satisfies  $*'' = *_{\varphi''} = \text{Inn}(a) \circ *$ , we have  $\varphi''$  is a scalar multiple of  $\varphi'$  by (3.6.4.29). It is clear that this  $\varphi'$  is Hermitian iff  $a^* = a$  and skew-Hermitian iff  $a^* = -a$ . And it is clear that  $\text{Inn}(a) \circ *$  is of the same type as  $*$  iff  $a^* = a$  and is of the opposite type as  $*$  iff  $a^* = -a$ .  $\square$

**Prop. (3.6.4.32) [Transpose Involutions].** For any  $A \in \text{Alg}/k$ , the map

$$*_{\text{trans}} : A \times_k A^{\text{op}} \rightarrow A \times_k A^{\text{op}} : (a, b) \mapsto (b, a)$$

is an involution of second kind in  $A \otimes_k A^{\text{op}}$ .  $\square$

**Prop. (3.6.4.33) [Involutions Simple of Unitary Type].** For any separable semisimple algebra  $A/k$  with an involution  $*$  of second kind s.t.  $k = \{a \in A \mid a^* = a\}$ .

- The center  $K$  of  $A$  is an étale  $k$ -algebra of degree 2.
- Let  $L/k \in \mathbf{Field}$  s.t.  $K \otimes_k L \cong K_1 \times K_2 \cong L \times L$  and let  $A_1 = A \otimes_K K_1$ , then  $A_1$  is a central simple algebra over  $K_1$ , and there is an isomorphism of involutive algebras

$$(D \otimes_k L, *) = (D_1 \times D_1^{\text{op}}, *) \cong (D_1 \times D_1^{\text{op}}, *_{\text{trans}}) : a \otimes c \mapsto (a \otimes c, a^* \otimes c) \quad (3.6.4.32).$$

- $(D, *) \otimes_k k^{\text{sep}} \cong (\text{End}(V) \times \text{End}(V)^{\text{op}}, *_{\text{trans}}) \cong (\text{End}(V) \times \text{End}(V), *'_{\text{trans}})$ , where  $(a, b)^{*'_{\text{trans}}} = (b^t, a^t)$ .

Such  $A$  is said to be **simple of unitary type**. In this case,  $A$  is either a simple algebra or a product of two central simple algebras over  $k$ .  $\lrcorner$

*Proof:* Why is it an isomorphism?

Only need to check the isomorphism to the transpose involutions, but this follows from the fact that  $A_1$  is simple.  $\square$

**Prop. (3.6.4.34) [Hermitian Spaces and Involutions of Second Kind].** If  $K/k$  is a separable quadratic extension with  $\text{Gal}(K/k) = \{1, \mathbf{c}\}$ , taking adjoint form (3.6.4.29) induces bijections between  $K^\times$ -homogeneity classes of Hermitian spaces of rank  $n$  over  $K$ , and involutions on  $\text{Mat}(n; K)$  extending  $\mathbf{c}$  (3.6.4.30).  $\lrcorner$

*Proof:* The proof is the same as that of (3.6.4.31).  $\square$

## 5 Idempotent Algebras

**Lemma (3.6.5.1).** Let  $R \in \mathbf{Ring}$  and  $e, f$  be idempotents of  $R$  that  $ef = fe = e$ , then  $f = e + e'$ , where  $e'$  is an idempotent and  $M[f] = M[e] \oplus M[e']$ .

Moreover, if  $R$  is an algebra over an alg.closed field  $k$  and  $M[e]$  is a simple  $R[e]$ -module of f.d. over  $k$ , then  $\dim \text{Hom}_{R[e]}(M[e], M[f]) = 1$ .  $\lrcorner$

*Proof:* Let  $e' = f - e$ , then it is easily verified to be an idempotent, and  $ee' = e'e = 0$ , thus  $M[f] = M[e] \oplus M[e']$  is clear.

For the second, because  $R[e]$  acts by 0 in  $R[e']$ ,  $\text{Hom}_{R[e]}(M[e], M[f]) = \text{Hom}_{R[e]}(M[e], M[e])$  has dimension 1, by Shur's lemma (3.6.2.2) and (3.6.1.2).  $\square$

**Def. (3.6.5.2) [Idempotent Algebra].** For  $k \in \mathbf{Field}$ , **idempotent algebra** over  $k$  is an algebra  $\mathcal{H} \in \mathbf{Alg}_k^{\text{asso}}$  together with a set  $\mathcal{E}$  of idempotents that if  $e_1, e_2 \in \mathcal{E}$ , then there exists  $e_0 \in \mathcal{E}$  that

$$e_0 e_1 = e_1 e_0 = e_1, e_0 e_2 = e_2 e_0 = e_2,$$

and also for any  $\varphi \in \mathcal{H}$ , there exists  $e \in \mathcal{E}$  that  $e\varphi = \varphi e = \varphi$ .

We can define a partial order on  $\mathcal{E}$ :  $e < f$  iff  $ef = fe = f$ , then this order is cofinal.

If  $e$  is an idempotent, denote  $\mathcal{H}[e] = e\mathcal{H}e$ , which is a subring of  $\mathcal{H}$  with unit  $e$ . Also if  $M$  is an  $\mathcal{H}$ -module, we denote  $M[e]$  the  $R[e]$ -module  $eM$ .  $\lrcorner$

**Prop. (3.6.5.3).** If  $0 \rightarrow M_1 \rightarrow M_2 \rightarrow M_3 \rightarrow 0$  is an exact sequence of  $\mathcal{H}$ -modules,  $e \in \mathcal{E}$ , then  $0 \rightarrow M_1[e] \rightarrow M_2[e] \rightarrow M_3[e] \rightarrow 0$  is also exact.  $\lrcorner$

*Proof:* Because tensoring an idempotent is exact.  $\square$

**Def. (3.6.5.4) [Smooth Representations of Idempotent Algebras].** Let  $(\mathcal{H}, \mathcal{E})$  be an idempotent algebra, a **smooth  $\mathcal{H}$ -module**  $M$  is an  $\mathcal{H}$ -module  $M = \cup_{e \in \mathcal{E}} M[e]$ , and an **admissible  $\mathcal{H}$ -module** is a smooth  $\mathcal{H}$ -module that each  $M[e]$  is of f.d. over  $k$ .

A smooth  $\mathcal{H}$ -module is clearly non-degenerate.  $\lrcorner$

**Def. (3.6.5.5) [Contragradient Module].** If  $M$  be a smooth  $\mathcal{H}$ -module, then we can define a **contragradient  $\bar{M}$**  of  $M$ , which is the smooth  $\mathcal{H}$ -module consisting of smooth vectors in  $M^*$ , where the action is defined as  $((\varphi)\lambda)(m) = \lambda(\iota(\varphi)m)$ . Notice if  $M$  is admissible, then so does  $\bar{M}$ , because an element in  $\bar{M}[e]$  is determined by its restriction on  $M[\iota(e)]$ , so  $\bar{M}[e]$  is of f.d. if  $M[\iota(e)]$  does.  $\lrcorner$

**Prop. (3.6.5.6) [Simpleness Checked on Idempotents].** Let  $M$  be a non-zero module over an idempotent algebra  $(\mathcal{H}, \mathcal{E})$  over  $\mathbb{C}$ ,  $\mathcal{E}^0$  be a cofinal subset of  $\mathcal{E}$ , then  $M$  is a simple  $\mathcal{H}$ -module iff  $M[e]$  is simple  $\mathcal{H}[e]$ -modules for any  $e \in \mathcal{E}^0$ .  $\lrcorner$

*Proof:* If there exists a proper  $\mathcal{H}$ -submodule  $M_1$  of  $M$ , let  $M/M_1 = M_2$ , then  $M[e]/M_1[e] = M_2[e]$  for all  $e$  by (3.6.5.3), Thus we can choose  $e$  s.t.  $M_1[e] \neq 0, M_2[e] \neq 0$ , thus  $M[e]$  is reducible. Conversely, If  $W_0 \subset M[e_K]$  is a proper non-zero  $\mathcal{H}[e_K]$ -submodule, then  $[\pi(\mathcal{H})W_0][e] = W_0$ , thus  $\pi(\mathcal{H})W_0$  is a proper submodule of  $M$ .  $\square$

**Prop. (3.6.5.7) [Isomorphism Checked on Idempotents].** Let  $V_1, V_2$  be two simple admissible modules over an idempotent algebra  $(\mathcal{H}, \mathcal{E})$ , if  $e \in E$  that  $V_1[e] \cong V_2[e] \neq 0$ , then  $V_1 \cong V_2$ .  $\lrcorner$

*Proof:* Choose an isomorphism  $j : V_1[e] \rightarrow V_2[e]$ , then the subspace  $V' = \{(x, jx)\} \subset V_1[e] \oplus V_2[e] \subset V_1 \oplus V_2$  is a  $\mathcal{H}[e]$ -submodule. Let  $V = \pi(\mathcal{H})V'$ , then  $V[e] = V'$ , so  $V$  is not contained or contains any of  $V_1$  or  $V_2$ , thus  $V \cap V_1 = V \cap V_2 = 0$  as  $V_i$  are irreducible. Thus the projections  $V \rightarrow V_1, V \rightarrow V_2$  are isomorphisms as  $V_i$  are irreducible, and  $V_1 \cong V_2$ .  $\square$

**Prop. (3.6.5.8) [Extension Theorem].** Let  $(\mathcal{H}, \mathcal{E})$  be an idempotent algebra and  $e \in E$ . If  $V_e$  is a simple  $\mathcal{H}[e]$ -module, then there is a simple  $\mathcal{H}$ -module  $V$  that  $V[e] = V_e$ .  $\lrcorner$

*Proof:* Let  $V_e \cong \mathcal{H}[e]/I$ , where  $I$  is a left ideal of  $V_e$ . Let  $E_1, E_2$  be the module generated by  $I$  and  $\mathcal{H}[e]$  in  $\mathcal{H}$  by left action of  $\mathcal{H}$ , then  $E_1[e] = I$  and  $E_2[e] = \mathcal{H}[e]$ , thus  $(E_3 = E_1/E_2)[e] \cong V_e$  by (3.6.5.3). Now if  $E'$  is a submodule of  $E_3$ , then either  $E'[e] = 0$  thus  $(E_3/E')[e] \cong L$ , or  $E'[e] = L$ , thus  $E' = E_3$  by (3.6.5.7). Thus if we choose the proper submodule  $E'$  that  $E_3/E'$  is irreducible by (24.1.2.10), then  $E_3/E'[e] = L$ .  $\square$

**Prop. (3.6.5.9).** If  $\mathcal{H}$  is an idempotent algebra, then  $\mathcal{M}(\mathcal{H})$  has enough projectives.  $\lrcorner$

*Proof:* For any idempotent  $e \in \mathcal{H}$ , consider the module  $\mathcal{H}e$ , then it is projective, because  $\text{Hom}_{\mathcal{H}}(\mathcal{H}e, X) = eX$ , thus it is clearly exact. Now any  $m \in V$  has an idempotent  $e \in \mathcal{H}$  that  $ev = v$  (use definition). Thus by taking the direct sum, we are done.  $\square$

### Spherical Idempotents

**Def. (3.6.5.10) [Spherical Idempotents].** Let  $(\mathcal{H}, \mathcal{E})$  be an idempotent algebra over a field  $\Omega$ . Then an idempotent  $e^0 \in \mathcal{E}$  is called **spherical idempotent** if there exists an anti-involution  $\iota : \mathcal{H} \rightarrow \mathcal{H}$  that  $\iota(x) = x$  for any  $x \in \mathcal{H}[e^0]$ . Notice this implies  $\mathcal{H}[e^0]$  is commutative, as  $xy = \iota(xy) = yx$ .  $\lrcorner$

**Def. (3.6.5.11) [Spherical Vectors].** Let  $e^0$  be a spherical idempotent of the idempotent algebra  $(\mathcal{H}, \mathcal{E})$  and  $\iota$  is the corresponding involution. If  $M$  is an admissible  $\mathcal{H}$ -module, then a **spherical(unramified) module** is a  $\mathcal{H}$ -module  $M$  that  $M[e^0] \neq 0$ , and elements in  $M[e^0]$  are called **spherical vectors**.

Then if  $M$  is simple and spherical, then  $M$  has at most one spherical vector up to scalar, and  $\widehat{M}$  is also spherical. Thus the space of spherical vectors is fixed by  $\mathcal{H}[e^0]$ , and the action of  $\mathcal{H}[e^0]$  on that defines a **spherical character**.  $\lrcorner$

*Proof:* In fact,  $M[e^0]$  is a simple  $\mathcal{H}[e^0]$ -module (3.6.5.6), and is of f.d., and  $\mathcal{H}[e^0]$  is commutative (3.6.5.10), so (3.6.2.11) shows it is of dimension 1. so if  $m^0 \neq 0 \in M[e^0]$ , then we can define a  $\widehat{m}^0 \neq 0 \in \widehat{M}[e^0]$  as:

$$e^0 m = \widehat{m}^0(m) \cdot m^0.$$

□

**Prop. (3.6.5.12) [Isomorphism Checked on Spherical Idempotents].** Let  $(\mathcal{H}, \mathcal{E})$  be an idempotent algebra over a field  $\Omega$  with a spherical idempotent  $e^0$  (3.6.5.11). If  $M, N$  are simple admissible spherical  $\mathcal{H}$ -modules that  $M[e^0] \cong N[e^0]$  over  $\mathcal{H}[e^0]$ , then  $M \cong N$  as  $\mathcal{H}$ -modules.  $\lrcorner$

*Proof:* This follows from (3.6.5.7).  $\square$

### Restricted Tensor Product

**Def. (3.6.5.13) [Restricted Tensor Product].** Give Vector spaces  $V_v$  indexed by a set  $\Sigma$  and elements  $x_v^0 \in V_v$  be given for a.e.  $v$ , we can define the **restricted tensor product**  $\bigotimes' V_v$  as the direct limit

$$\lim_{S \subset \Sigma \text{ finite}} \bigotimes_{v \in S} V_v.$$

It can be thought of as the vector spaces spanned by all symbols  $\bigotimes_v x_v$  where  $x_v = x_v^0$  for a.e.  $v$ .

Notice if  $V_v$  are idempotent algebras and  $x_v^0 \in V_v$  are idempotents for a.e.  $v$ , then  $\prod' V_v$  also has a natural idempotent algebra structure.  $\lrcorner$

**Def. (3.6.5.14) [Tensor Product Module of Idempotent Algebras].** Given a set of idempotent algebras  $(\mathcal{H}_v, \mathcal{E}_v)$  and specify an idempotent  $e_v^0$  for a.e.  $v$ . Let  $M_v$  be  $\mathcal{H}_v$ -modules over  $k$  for all  $v$ , and assume  $M_v[e_v^0]$  be of dimension 1 a.e.  $v$ , and specify a.e. a non-zero element  $m_v^0 \in M_v[e_v^0]$

Then we can define tensor product (3.6.5.13)  $\prod' \mathcal{H}_v$  which is an idempotent algebra and  $\prod' M_v$ . Then we can define an **restricted tensor module** structure of  $M_v$  over  $\prod' \mathcal{H}_v$  by the action

$$(\bigotimes_v \varphi_v) x_v = \bigotimes_v (\varphi_v) x_v.$$

□

**Lemma (3.6.5.15) [Simple Module of Tensor Product].** Let  $(\mathcal{H}_1, \mathcal{E}_1), (\mathcal{H}_2, \mathcal{E}_2)$  be idempotent algebras over an alg.closed field  $\Omega$ , and let  $(\mathcal{H}, \mathcal{E})$  be their tensor product. If  $M_1, M_2$  are simple admissible modules over  $\mathcal{H}_1, \mathcal{H}_2$ , respectively, then  $M_1 \otimes M_2$  are simple admissible modules over  $\mathcal{H}_1 \otimes \mathcal{H}_2$ , and any simple admissible module over  $\mathcal{H}$  comes uniquely from a pair  $(M_1, M_2)$  like this.  $\lrcorner$

*Proof:* If  $M_1, M_2$  are simple admissible over  $\mathcal{H}_1, \mathcal{H}_2$  respectively, then if  $e_1 \in \mathcal{E}_1, e_2 \in \mathcal{E}_2$ , then  $(M_1 \otimes M_2)[e_1 \otimes e_2] = M_1[e_1] \otimes M_2[e_2]$  is simple and of f.d. by (3.6.5.6) and (3.6.2.16), so  $M_1 \otimes M_2$  is simple by (3.6.5.6).

Now if  $M$  is simple admissible over  $\mathcal{H}_1 \otimes \mathcal{H}_2$ , then we find an  $e_1^0 \otimes e_2^0 \in \mathcal{E}$  that  $M[e_1^0 \otimes e_2^0] \neq 0$ . Let  $\mathcal{E}_i^0 = \{e_i \in \mathcal{E}_i | e_i < e_i^0\}$ , then  $\mathcal{E}_i^0$  is cofinal in  $\mathcal{E}_i$ . Then for any  $e_i \in \mathcal{E}_i^0$ ,  $M[e_1 \otimes e_2]$  is non-zero thus simple, thus it is of the form

$$M[e_1 \otimes e_2] = M_1(e_1, e_2) \otimes M_2(e_1, e_2)$$

where  $M_i(e_1, e_2)$  are simple  $\mathcal{H}[e_i]$ -modules by (3.6.2.16).

Now we show that  $M_2(e_1, e_2)$  depends only on  $e_1$ : it suffices to show  $M_2(e_1, e_2) = M_2(f_1, e_2)$  for  $f_1 < e_1$ . For this, notice that for any idempotents  $g_1, g_2$ ,

$$M[g_1 \otimes g_2] = M_1(g_1, g_2) \otimes M_2(g_1, g_2)$$

is a finite direct sum of simple modules  $M_2(g_1, g_2)$  as an  $\mathcal{H}_2[g_2]$ -module. Notice that by (3.6.5.1),  $M[e_1 \otimes e_2] = M[f_1 \otimes e_2] \oplus M[e' \otimes e_2]$  for  $e' = f_1 - e_1$ , so by (3.6.2.3),  $M_2(f_1, e_2) = M_2(e_1, e_2)$ . Similarly we know  $M_1(e_1, e_2)$  only depends on  $e_1$ .

Next we have:

$$\dim_k \operatorname{Hom}_{H_1[e_1]}(M_1[e_1], M_1[f_1]) \geq 1, \quad f_1 \leq e_1.$$

and similar for  $\mathcal{H}_2$ . For this, it suffices to prove that  $\dim_k \operatorname{Hom}_{H_1[e_1]}(M[e_1 \otimes e_2], M[f_1 \otimes e_2]) \geq 1$ , by what we just said, but this is by the decomposition

$$M[e_1 \otimes e_2] = M[f_1 \otimes e_2] \oplus M[e' \otimes e_2]$$

above. But

$$\dim_k \operatorname{Hom}_{H_1[e_1] \otimes H_2[e_2]}(M_1(e_1) \otimes M_2(e_2), M_1(f_1) \otimes M_2(f_2)) = 1, \quad f_1 \leq e_1, f_2 \leq e_2$$

by (3.6.5.1), so the  $\geq$  above should change to  $=$ .

Now we know the homomorphism is of dimension 1, we want to choose a family of maps that is compatible for  $g_1 \leq f_1 \leq e_1 \leq e_1^0$ . For this, we can choose the maps  $\lambda(e_1, e_1^0)$  arbitrarily, then choose  $\lambda(e_1, f_1)$  to be compatible with  $\lambda(e_1, e_1^0)$  and  $\lambda(f_1, e_1^0)$ , then these are compatible choices. Hence we can define a direct limit

$$M_1 = \varinjlim_{(\mathcal{E}^0)^{op}} M(e_1).$$

It is easy to see  $M_1(e_1) \rightarrow M_1$  are all injective, and  $M_1(e_1) = M[e_1]$ . Similarly, we can define an  $M_2$  that  $M_2[e_2] = M_2(e_2)$ .

Finally, we have

$$M[e_1 \otimes e_2] = M_1[e_1] \otimes M_2[e_2] = (M_1 \otimes M_2)[e_1 \otimes e_2]$$

for all  $e_1 \in \mathcal{E}_1^0, e_2 \in \mathcal{E}_2^0$ , thus  $M \cong M_1 \otimes M_2$  by (3.6.5.7).

As for the uniqueness of  $M_1, M_2$ , notice the decomposition of  $M[e_1 \otimes e_2]$  is unique by (3.6.2.16), so  $M_i[e_i]$  is uniquely determined, thus by (3.6.5.7)  $M_i$  are determined.  $\square$

**Prop. (3.6.5.16)[Flath Theorem].** let  $(\mathcal{H}_v, \mathcal{E}_v)$  be an indexed family of idempotent  $k$ -algebras, and for a.e.  $v$  let  $e_v^0 \in \mathcal{E}_v$  be a spherical idempotent. Let  $(\mathcal{H}, \mathcal{E})$  be the restricted tensor product of  $\mathcal{H}_c$  w.r.t.  $e_v^0$ , which is an idempotent algebra. For each  $v \in \Omega$ , there is a simple  $\mathcal{H}_v$ -module  $M_v$  and for a.e.  $v$  we specify a non-zero spherical vector. Let  $\otimes_v M_v$  be the tensor product module, then it is a simple admissible  $\mathcal{H}$ -module, and every simple admissible module is of this type, with  $M_v$  uniquely determined.  $\square$

*Proof:* Firstly the tensor product is simple and admissible: For any idempotent  $e = \otimes e_v \in \mathcal{E}$ , there is a finite set  $S$  that if  $v \notin S$ , then  $e_v = e_v^0$ , hence for these  $v$   $\dim M_v[e_v] = 1$ . Then

$$M[e] = \bigotimes_{v \in S} M_v[e_v].$$

which is simple of f.d. by (3.6.5.15), so  $M$  is simple admissible by (3.6.5.6).

Conversely, for any simple  $\mathcal{H}$ -module  $M$ , we need to show it is a tensor product. If there are only f.m. indices, then this follows from (3.6.5.15).

Suppose first that  $e_v^0$  is defined and spherical for all  $v$ , and  $e = \otimes_v e_v^0$ , and  $M[e] \neq 0$ . Then  $\dim M[e] = 1$  (3.6.5.11). Let  $m$  be a spherical vector, then there is a ring homomorphism  $\gamma : \mathcal{H}[e] \rightarrow k$  defined by  $hm = \gamma(h)m$ . Because  $\mathcal{H}[e] = \otimes'_v \mathcal{H}_v[e_v^0]$ , we have

$$\gamma(\otimes_v h_v) = \prod_v \gamma_v(h_v).$$

Now if we decompose  $\mathcal{H} = \mathcal{H}_v \otimes \mathcal{H}'_v$ , then by (3.6.5.15), there exists simple admissible module  $M_v$  over  $\mathcal{H}_v$ ,  $M'_v$  over  $\mathcal{H}'_v$  respectively, that  $M = M_v \otimes M'_v$ , thus  $M[e] = M_v[e_v^0] \otimes M'_v[e'_v]$ . Now consider  $M_v$  for all  $v$ , and  $N = \otimes'_v M_v$  w.r.t.  $m_v$ , then it is simple admissible  $\mathcal{H}$ -module, and we have  $N[e] = \otimes'_v M_v[e_v^0] \cong M[e]$  as  $\mathcal{H}[e]$ -modules of dimension 1, which is because they are both simple and have the same character

$$\gamma(\otimes_v h_v) = \prod_v \gamma_v(h_v).$$

Hence  $M \cong N$ , by (3.6.5.12).

Now the general case follows from the two situations above: choose  $e \in \mathcal{E}$  that  $M[e] \neq 0$ , then let  $S$  be large that for  $v \notin S$ ,  $e_v = e_v^0$ . Then we decompose  $\mathcal{H}$  as  $\mathcal{H} = \bigotimes_{v \in S} \mathcal{H}_v \otimes (\bigotimes_{v \notin S} \mathcal{H}_v)$ , then

$$M = \bigotimes_{v \in S} M_v \otimes M' = \bigotimes_{v \in S} M_v \otimes \left( \bigotimes_{v \notin S} M_v \right) = \otimes_v M_v.$$

## 6 Rings and Categories

References are <https://stacks.math.columbia.edu/tag/0GNG>.

**Prop. (3.6.6.1).** Let  $A, B \in \mathbf{Ring}$  and  $F : \mathbf{Mod}_A \rightarrow \mathbf{Mod}_B$  a functor, then the following are equivalent:

- $F$  is isomorphic to the functor  $K \otimes_A M$  for some  $K \in \mathbf{Mod}_{(B,A)}$ .
- $F$  is right exact and commutes with all direct sums.
- $F$  commutes with all colimits.
- $F$  has a right adjoint  $G$ .

┘

*Proof:* Cf. [Sta]0GNR.

□

**Prop. (3.6.6.2).** Let  $R \in \mathbf{Ring}$  and  $A, B \in \mathbf{Ring}_R$ , then there is an equivalence of categories:

$$\mathbf{Func}(\mathbf{Mod}_A, \mathbf{Mod}_B) \cong \mathbf{Mod}_{A \otimes_R B}.$$

┘

*Proof:* Cf. [Sta]0GNR.

□

### Quotient by Equivalence Relations

**Prop. (3.6.6.3) [Quotients by Equivalence Relations].** Let  $u_0, u_1 : A_0 \rightarrow A_1$  be an equivalence in the dual category of  $\mathcal{CRing}_{R_0}$  (4.1.1.24). If  $u_0$  is locally free of constant rank  $r$ , then a quotient  $u : A \rightarrow A_0$  exists, and  $u$  is locally free of constant rank  $r$ .  $\lrcorner$

*Proof:* Cf. [Mil17b]P592.  $\square$

### Morita Theory

References are [Morita Equivalence], [Frobenius Algebras, 1]Chap2 and [Fuller Rings and Categories of Modules].

**Def. (3.6.6.4).** Two ring  $R, S$  are called **Morita equivalent** if the category of  $\text{mod-}R$  is equivalent to the category of  $\text{mod-}S$ .  $\lrcorner$

**Prop. (3.6.6.5).** For an Abelian category  $\mathcal{A}$  satisfying AB3 (i.e arbitrary sum exists), An object  $P$  of  $\mathcal{A}$  is a **progenerator** if the functor  $h' : X \mapsto \text{Hom}_{\mathcal{A}}(P, X)$  is exact and and strict:  $h'(X) = 0$  implies  $X = 0$ . Then  $h'$  determines an equivalence from  $\mathcal{A}$  to  $\text{mod-}R$ , where  $R = \text{Hom}_{\mathcal{A}}(P, P)$ .

Similarly, if  $\mathcal{A}$  is an Abelian Noetherian category and  $P$  is a progenerator, then  $R$  is Noetherian and  $\mathcal{A}$  is equivalent to the category of finitely generated  $R$ -categories.  $\lrcorner$

*Proof:* Essentially surjective: construct using direct limit and cokernel.

Notice that  $h'(X) \cong h'(X') \rightarrow X \cong X'$  by strictness and A4 axiom. So let  $X = \text{Coker}(P^{\oplus I}, P^{\oplus J})$ ,

$$\begin{aligned} \text{Hom}(h'(X), h'(Y)) &= \text{Hom}(\text{Coker}(h'(P^{\oplus J}), h'(P^{\oplus I})), h'(Y)) \\ &= \ker(\text{Hom}(h'(P^{\oplus J}), h'(Y)) \rightarrow \text{Hom}(h'(P^{\oplus I}), h'(Y))) \\ &= \ker(h'(Y^{\coprod I}) \rightarrow h'(Y^{\coprod J})) \\ &= \text{Hom}(X, Y) \end{aligned}$$

$\square$

**Prop. (3.6.6.6).** In the case when  $\mathcal{A}$  is the category  $\text{mod-}R$ ,  $P$  is a generator  $\iff h' : X \mapsto \text{Hom}_R(P, X)$  is faithful  $\iff$  every  $M$  is a quotient of direct sums of  $P$ . And a **progenerator** is a f.g. projective generator.  $\lrcorner$

**Prop. (3.6.6.7).** Let  $P$  be a  $(A, B)$ -bimodule, iff  $P$  is a progenerator as a right  $B$  module, then it is a progenerator as a left  $A$  module.  $\lrcorner$

**Prop. (3.6.6.8).** Let  $P$  be a progenerator as a  $\lrcorner$

**Prop. (3.6.6.9) [Morita].** The following are equivalent:

- categories  $A\text{-mod}$  and  $B\text{-mod}$  are equivalent.
- categories  $\text{mod-}A$  and  $\text{mod-}B$  are equivalent.
- There exist a finitely generated progenerator  $P$  of  $\text{mod-}A$  that  $B \cong \text{End}_A P$ .

$\lrcorner$

*Proof:*  $2 \rightarrow 3$ :  $A$  is a progenerator in  $\text{mod-}A$ , thus when  $A \sim B$ ,  $F : \text{mod-}A \rightarrow \text{mod-}B$ ,  $A \cong \text{End}_A A = \text{End}_B F(A)$ , and  $F(A)$  is a left  $A$  module as well as a progenerator of  $B$ . Thus there is a  $(A, B)$ -bimodule  $P$  that  $A \cong \text{End}_B P$ , and a  $(B, A)$ -bimodule  $Q$  that  $B \cong \text{End}_A Q$ .  $\square$

**Prop. (3.6.6.10).** There can be defined another Morita invariance that  $R \sim S$  iff there are  $(R, S)$ -bimodule  $P$  and  $(S, R)$ -bimodule  $Q$  that  $P \otimes_S Q \cong R$  as a  $(R, R)$ -bimodule and  $Q \otimes_R P \cong S$  as a  $(S, S)$ -bimodule. This will immediately generate equivalence between  $R\text{-mod}$  and  $S\text{-mod}$  as well as equivalence between  $\text{mod-}R$  and  $\text{mod-}S$  by tensoring. And  $P$  and  $Q$  are projective modules respectively, because equivalence is a kind of adjoint.  $\lrcorner$

**Prop. (3.6.6.11).** Let  $D$  be a division ring over  $k$  of finite degree and  $A = M_r(D)$ . Let  $S = D^r$  with  $A$  acting by left multiplication and  $D$  acting by right multiplication, then there  $S$  is a simple  $A$ -module, and every  $A$ -module is a direct sum of copies of  $S$ . This means that  $S \otimes_D -$  induces an equivalence from  $\text{Mod}_D$  to  $\text{Mod}_A$ .  $\lrcorner$

**Prop. (3.6.6.12) [Properties Preserved under Morita Invariance].** Cf. [Rings and Categories of Modules P54].  $\lrcorner$

## 7 Auslander-Reiten Theory

References are [Frobenius Algebras, 1].

## 8 Frobenius-Algebras

**Notation (3.6.8.1).**

- Let  $k \in \text{Field}$ .

$\lrcorner$

**Def. (3.6.8.2) [Frobenius-Algebras].** A **Frobenius algebra** over  $k$  is a finite  $k$ -algebra s.t. the left regular representation of  $A$  and the right regular representation of  $A$  are equivalent. A Frobenius algebra  $A$  is called a **symmetric algebra** if the left regular representation of  $A$  and the right regular representation of  $A$  are conjugate by a symmetric invertible matrix.  $\lrcorner$

**Thm. (3.6.8.3) [Frobenius].** A finite  $k$ -algebra  $A$  is a Frobenius algebra (resp. symmetric algebra) iff there exists an invertible (resp. symmetric invertible) parastrophic matrix  $P(\xi)$ .  $\lrcorner$

*Proof:* Cf. [Frobenius Algebras, 1]P334.  $\square$

**Def. (3.6.8.4) [Associative Bilinear form].** For a finite  $k$ -algebra  $A$ , an **associative bilinear form** on  $A$  is a  $k$ -bilinear map  $(-, -) : A \times A \rightarrow k$  s.t.  $(a, bc) = (ab, c)$  for any  $a, b, c \in A$ .  $\lrcorner$

**Thm. (3.6.8.5) [First Brauer–Nesbitt–Nakayama Theorem].** For a finite  $k$ -algebra  $A$ , the followings are equivalent:

1.  $A$  is a Frobenius algebra (3.6.8.2).
2. There exists a non-degenerate associative bilinear form on  $A$ .
3. There exists a  $k$ -linear map  $\varphi : A \rightarrow k$  s.t.  $\ker(\varphi)$  contains no non-zero right ideals of  $A$ .
4. There exists a  $k$ -linear map  $\varphi' : A \rightarrow k$  s.t.  $\ker(\varphi')$  contains no non-zero left ideals of  $A$ .

In particular,  $A$  is a Frobenius algebra iff  $A^{\text{op}}$  is a Frobenius algebra.  $\lrcorner$

*Proof:* Cf. [Frobenius Algebras, 1]P336.

The equivalence between item2, 3, 4 are clear, by defining  $\varphi(ab) = (a, b)$ .  $\square$

**Thm. (3.6.8.6) [Second Brauer–Nesbitt–Nakayama Theorem].** For a finite  $k$ -algebra  $A$ , the followings are equivalent:

1.  $A$  is a symmetric algebra(3.6.8.2).
2. There exists a non-degenerate associative symmetric bilinear form on  $A$ .
3. There exists a  $k$ -linear map  $\varphi : A \rightarrow k$  s.t.  $\varphi(ab) = \varphi(ba)$  for all  $a, b \in A$  and  $\ker(\varphi)$  contains no two-sided ideals of  $A$ .
4. There exists an isomorphism  $A \cong D(A)$  of  $A$ -bimodules. ?

In particular,  $A$  is a symmetric algebra iff  $A^{\text{op}}$  is a symmetric algebra.  $\lrcorner$

*Proof:* Cf.[Frobenius Algebras, 1]P340.  $\square$

**Cor.(3.6.8.7) [Product of Frobenius Algebras].** Let  $A_1, \dots, A_r$  be finite  $k$ -algebras, then  $A$  is a Frobenius algebra(resp. symmetric algebra) iff each  $A_i$  is.  $\lrcorner$

*Proof:* This follows from non-degenerate associative bilinear form criterions in(3.6.8.5) and(3.6.8.6).  $\square$

**Example(3.6.8.8) [Frobenius Algebras].**

- For  $n \in \mathbb{Z}_+$ ,  $\text{Mat}(n; k)$  is a symmetric algebra with the non-degenerate associative symmetric  $k$ -bilinear form  $\text{Mat}(n; k) \times \text{Mat}(n; k) \rightarrow k : (A, B) \mapsto \text{tr}(AB)$ .
- For  $G \in \text{Grp}^{\text{fin}}$ ,  $k[G]$  is a symmetric algebra with the non-degenerate associative symmetric  $k$ -bilinear form  $k[G] \times k[G] \rightarrow k : (\sum \lambda_g g, \sum \mu_g g) = \sum_{g \in G} \lambda_g \mu_{g^{-1}}$ .
- For  $\lambda \in k^\times$ , define  $A_\lambda = k\{X, Y\}/(X^2, Y^2, XY - \lambda YX)$ , where  $k\{X, Y\}$  is the non-commutative polynomial ring of 2 variables. Then  $A$  is a 4-dimensional local  $k$ -algebra. Let  $\varphi : A_\lambda \rightarrow k$  be the  $k$ -linear map s.t.  $\varphi(1) = \varphi(x) = \varphi(y) = 0, \varphi(xy) = 1$ . Then it is easy to verify that the kernel of  $\varphi$  contains no non-zero right ideals of  $A_\lambda$ , thus  $A_\lambda$  is a Frobenius algebra by(3.6.8.5). If  $\lambda = 1$ ,  $A_\lambda$  is a symmetric algebra. And if  $\lambda \neq 1$ , then  $A$  is not a symmetric algebra, because for any  $k$ -linear map  $\varphi' : A \rightarrow k$  s.t.  $\varphi'(ab) = \varphi'(ba)$ , we have  $\varphi'(xy) = \lambda \varphi'(yx) = \lambda \varphi'(xy)$ , which implies  $\varphi'(xy) = 0$ , so  $k.xy$  is a non-zero right ideal in the kernel of  $\varphi'$ .  $\lrcorner$

**Prop.(3.6.8.9) [Semisimple Algebras are Symmetric Algebras].** Any finite semisimple algebra  $A \in \text{Ring}/k$  is a symmetric algebra(3.6.8.2).  $\lrcorner$

*Proof:* It follows from Wedderburn-Artin(3.6.2.22) and(3.6.8.7) that it suffices to prove that  $\text{Mat}(n; D)$  is a symmetric algebra for any  $n \in \mathbb{Z}_+$  and any finite division ring  $D$  over  $k$ . Cf.[Frobenius Algebras, 1]P374 ?  $\square$

**Def.(3.6.8.10) [Nakayama Automorphisms].** If  $A$  is a Frobenius algebra over  $k$ (3.6.8.2) and let  $(-, -) : A \times A \rightarrow k$  be a non-degenerate associative  $k$ -bilinear form, then there exists a unique automorphism  $\nu$  of  $A$  s.t.

$$(\nu(a), b) = (b, a), \text{ where } a, b \in A,$$

called the **Nakayama automorphism** associated to  $(-, -)$ . And for any invertible element  $c \in A^*$ ,  $\nu'(a) = \nu(cac^{-1})$  is the Nakayama automorphism associated to the non-degenerate associative  $k$ -bilinear form  $(a, b)' = (a, bc)$ .  $\lrcorner$

*Proof:* Cf.[Frobenius Algebras, 1]P345.  $\square$

**Prop.(3.6.8.11).** If  $A$  is a Frobenius algebra over  $k$ (3.6.8.2) and  $(-, -), (-, -)' : A \times A \rightarrow k$  are two non-degenerate associative  $k$ -bilinear forms, then there exists  $c \in A^*$  s.t.  $(a, b)' = (a, bc)$  for any  $a, b \in A$ . In particular, any two Nakayama automorphisms of  $A$  are conjugate(3.6.8.10).  $\lrcorner$

*Proof:* Cf.[Frobenius Algebras, 1]P346.  $\square$

## 9 Non-Associative Algebras

**Def.(3.6.9.1)[Alternative Algebras].** An **alternative algebra** is an algebra  $A \in \text{naAlg}$  s.t. for any  $x, y \in A$ ,

$$x(xy) = x^2y, \quad (yx)x = yx^2.$$

┘

**Prop.(3.6.9.2)[Properties of Alternative Algebras].** For any alternative algebra  $A$  and  $x, y, z \in A$ ,

- (Associator) Define the associator  $\text{Asso}(x, y, z) = x(yz) - (xy)z$ . Then the associator is anti-symmetric:

$$\text{Asso}(x, y, z) = -\text{Asso}(x, z, y) = -\text{Asso}(z, y, x) = -\text{Asso}(y, x, z).$$

- (Flexible Law)  $(xy)x = x(yz)$ .
- If  $xy = -yx$ , then  $x(yz) = -y(xz)$ ,  $(zx)y = -(zy)x$ .
- (Moufang Identity)  $(zx)(yz) = z(xy)z$ .
- (Powers) If we define inductively  $x^0 = 1$ ,  $x^{n+1} = x^n x$  for  $n \in \mathbb{Z}_+$ , then we have  $x^n x^m = x^{n+m}$  for any  $m, n \in \mathbb{N}$ .

┘

*Proof:* 1: The alternativity says  $\text{Asso}(x, x, y) = \text{Asso}(x, y, y) = 0$ . So

$$0 = \text{Asso}(x+y, x+y, z) = \text{Asso}(x, x, z) + \text{Asso}(x, y, z) + \text{Asso}(y, x, z) + \text{Asso}(y, y, z) = \text{Asso}(x, y, z) + \text{Asso}(y, x, z).$$

2: This is because  $\text{Asso}(x, y, x) = -\text{Asso}(y, x, x) = 0$ .

3:  $0 = \text{Asso}(x, y, z) + \text{Asso}(y, x, z) + (xy + yx)z = x(yz) + y(xz)$ .

4:

$$\begin{aligned} (zx)(yz) - ((zx)y)z &= \text{Asso}(zx, y, z) = \text{Asso}(y, z, zx) = y(z^2x) - (yz)(zx) \\ &= y(z^2x) - \text{Asso}(yz, z, x) - (yz^2)x = \text{Asso}(y, z^2, x) - \text{Asso}(yz, z, x) \\ &= \text{Asso}(y, z^2, x) - \text{Asso}(x, yz, z) = \text{Asso}(y, z^2, x) - x(y^2z) + (x(yz))z \\ &= \text{Asso}(y, z^2, x) + \text{Asso}(x, y, z)z = \text{Asso}(x, y, z^2) = \text{Asso}(x, y, z)z \end{aligned}$$

So  $(zx)(yz) = \text{Asso}(x, y, z)z + ((zx)y)z = z(xy)z$ .

5: It can be shown by flexibility and induction that  $x.x^m = x^{m+1}$  for any  $m \in \mathbb{N}$ . Then we can assume  $m \in \mathbb{Z}_+$  and use induction on  $n$  and the Moufang identity to show that

$$x^{n+1}.x^m = (x.x^n)(x^{m-1}x) = x(x^n.x^{m-1})x = x.x^{n+m-1}.x = x^{m+n+1}.$$

□

## 10 Miscellaneous

**Lemma(3.6.10.1).** Let  $R$  be a (possibly non-commutative) unital ring of characteristic 0 with the following properties:

- $R$  has no zero-divisors,
- $\text{rank}_{\mathbb{Z}} R \leq 4$ ,

- $R$  has an involution  $*$  :  $R \rightarrow R^{\text{op}}$ ,
- For any  $\alpha \in R$ ,  $\alpha\alpha^* \in \mathbb{N}$ , and  $\alpha\alpha^* = 0$  iff  $\alpha = 0$ .

Then  $R$  is isomorphic to exactly one of the following:

- $\mathbb{Z}$ .
- a  $\mathbb{Z}$ -order in an imaginary quadratic extension over  $\mathbb{Q}$ .
- a  $\mathbb{Z}$ -order in a definite quaternion algebra over  $\mathbb{Q}$ .

And the third case won't happen in characteristic 0, by (21.3.1.26).  $\lrcorner$

*Proof:* It suffices to show  $K = R \otimes \mathbb{Q}$  is either  $\mathbb{Q}$ , an imaginary quadratic field or a definite quaternion algebra. For  $\alpha \in K$ , denote  $\text{Nm}(\alpha) = \alpha\alpha^*$ ,  $\text{tr}(\alpha) = \alpha + \alpha^*$ , then  $\text{tr}\alpha = 1 + \text{Nm}(\alpha) - \text{Nm}(1 - \alpha) \in \mathbb{Q}$ .

Assume  $K \neq \mathbb{Q}$ , let  $\alpha \in K \setminus \mathbb{Q}$ . We may replace  $\alpha$  by  $\alpha - \frac{1}{2}\text{tr}(\alpha)$  to assume  $\text{tr}(\alpha) = 0$ , then  $\alpha^2 = -\text{Nm}(\alpha) < 0 \in \mathbb{Z}$ . So  $\mathbb{Q}(\alpha)$  is an imaginary quadratic field.

Assume  $K \neq \mathbb{Q}(\alpha)$ , let  $\beta \in K \setminus \mathbb{Q}(\alpha)$ . We may replace  $\beta$  by  $\beta - \frac{1}{2}\text{tr}\beta - \frac{\text{tr}(\alpha\beta)}{\alpha^2}\alpha$  to assume  $\text{tr}(\beta) = \text{tr}(\alpha\beta) = 0$ . Hence  $\beta^2 = -N\beta < 0 \in \mathbb{Z}$ , and  $\alpha\beta = -\beta\alpha$ . So  $\mathbb{Q}(\alpha, \beta)$  is a definite quadratic extension of  $\mathbb{Q}$ . Then  $K = \mathbb{Q}(\alpha, \beta)$  because they are has rank 4 over  $\mathbb{Z}$ .  $\square$

### 3.7 Lie Algebras, I

Basic references are [Ser87, ?Kna96, Car05, Mil13, ?Et121], [Lie Algebras and Lie Groups Serre].

**Notation (3.7.0.1).**

- Let  $k \in \text{Field}^0$ .
- Let  $\mathfrak{g} \in \text{LieAlg}_k$  (3.7.1.1).

┘

#### 1 Basics

**Def. (3.7.1.1) [Lie Algebras].** A **Lie algebra**  $L$  over  $k$  is an non-associative algebra over  $k$  with a bilinear **Lie-bracket** operation that satisfies:

$$[x, x] = 0, \quad [x[yz]] = [[xy]z] + [y[xz]] \text{ (Jacobi Identities)}.$$

The category of Lie-algebras over  $k$  is denoted by  $\text{LieAlg}_k$ .

It is easily deduced that  $[xy] = -[yx]$ .

Denote  $\text{adx}(y) = [xy]$ , then  $\text{ad}(x)$  are all derivatives of  $L$ .

An element  $x \in \mathfrak{g}$  is called a **nilpotent element** (resp. **semisimple element**) if  $\text{ad}(x)$  is nilpotent (resp. semisimple). ┘

**Prop. (3.7.1.2) [Associative Algebra].** Any  $A \in \text{Alg}_k^{\text{asso}}$  can be given naturally a Lie algebra structure by defining  $[xy] = xy - yx$ . In this way, we get a natural functor  $\text{Alg}_k^{\text{asso}} \rightarrow \text{LieAlg}_k : A \mapsto [A]$ . ┘

**Prop. (3.7.1.3) [Derivatives form a Lie Algebra].** For  $A \in \text{Alg}_k^{\text{asso}}$ , the set of derivatives  $\text{Der}_k(A) = \text{Der}_k(A, A)$  is a Lie algebra under the associative bracket. ┘

*Proof:*

$$\begin{aligned} [D_1, D_2](ab) &= D_1(D_2(a)b + aD_2(b)) - D_2(D_1(a)b + aD_1(b)) \\ &= D_1D_2(a)b + D_2(a)D_1(b) + D_1(a)D_2(b) + aD_1D_2(b) \\ &\quad - (D_2D_1(a)b + D_1(a)D_2(b) + D_2(a)D_1(b) + aD_2D_1(b)) \\ &= [D_1, D_2](a)b + a[D_1, D_2](b) \end{aligned}$$

□

**Prop. (3.7.1.4) [Base Change of Fields].** Let  $\mathfrak{a}$  be a subalgebra of a Lie algebra  $\mathfrak{g}$  over  $k$ , and  $k'/k$  a field extension, then  $\mathfrak{a}_{k'}$  is a subalgebra of  $\mathfrak{g}_{k'}$ , and

$$N_{\mathfrak{g}_{k'}}(\mathfrak{a}_{k'}) = N_{\mathfrak{g}}(\mathfrak{a})_{k'}.$$

$$c_{\mathfrak{g}_{k'}}(\mathfrak{a}_{k'}) = c_{\mathfrak{g}}(\mathfrak{a})_{k'}.$$

┘

*Proof:* This is because the normalizer and centralizer is defined by linear equations with coefficients in  $k$ , thus the vector space is defined over  $k$ . □

**Prop. (3.7.1.5).** Let  $D$  be a derivative of a  $k$ -algebra  $A$  that is nilpotent, then  $e^D$  is an automorphism of  $A$  (as an algebra). ┘

*Proof:* Routine calculation.  $\square$

**Def. (3.7.1.6) [Semidirect Product of Lie Algebras].** Let  $\mathfrak{g}, \mathfrak{h} \in \text{LieAlg}_k$  and  $\tau : \mathfrak{g} \rightarrow \text{Der}(\mathfrak{h})$ , then we can define a **semi-direct product Lie algebra**  $\mathfrak{g} \ltimes \mathfrak{h}$  that is isomorphic to  $\mathfrak{g} \oplus \mathfrak{h}$  as vector spaces, and  $\mathfrak{g}, \mathfrak{h}$  are subalgebras of  $\mathfrak{g} \ltimes \mathfrak{h}$ , with  $[g, h] = \tau(g)(h)$ . It can be shown that this is truly a Lie algebra.  $\lrcorner$

**Def. (3.7.1.7) [Elementary Automorphisms].** Let  $\mathfrak{g}$  be a Lie algebra, a **special automorphism** is an automorphism of  $\mathfrak{g}$  of the form  $e^{\text{ad}_{\mathfrak{g}} x}$ , where  $x$  is in the nilpotent radical (3.7.1.34).

The group of **elementary automorphisms** is the subgroup of the automorphism group of  $\mathfrak{g}$  generated by the automorphisms of the form  $e^{\text{ad}_{\mathfrak{g}}(x)}$  where  $\text{ad}(x)$  is nilpotent.  $\lrcorner$

**Def. (3.7.1.8) [Ideals].** A subspace  $\mathfrak{a} \subset \mathfrak{g}$  is called an **ideal** of  $\mathfrak{g}$  iff  $[\mathfrak{g}, \mathfrak{a}] \subset \mathfrak{a}$ . If  $I$  is an ideal of  $L$ , then  $L/I$  can be made into a Lie algebra by defining  $[I + x, I + y] = I + [xy]$ .  $\lrcorner$

**Def. (3.7.1.9) [Center].** The **center** of a Lie algebra  $\mathfrak{g}$  is the elements  $a$  that  $\text{ada} = 0$ . It is an ideal.  $\lrcorner$

**Def. (3.7.1.10) [Simple Lie Algebras].** A Lie algebra  $\mathfrak{g}$  is called **simple** if it is not 1-dimensional and it has no nontrivial ideal.  $\lrcorner$

**Def. (3.7.1.11) [Lie Algebra of Affine Maps].** For  $V \in \text{Vect}^{\text{fin}}/k$ , if we regard  $V$  as a commutative algebra, then  $\text{Der}_k(V) = \mathfrak{gl}_V$ . Then  $V \rtimes \mathfrak{gl}_V$  is a Lie algebra, denoted by  $\mathfrak{af}(V)$ .

Let  $V' = V \oplus k$ , and let  $\mathfrak{h} = \{w \in \mathfrak{gl}_{V'} \mid w(V') \subset V\}$ , which is a Lie subalgebra of  $\mathfrak{gl}_{V'}$ . If we define

$$\eta : \mathfrak{h} \rightarrow \mathfrak{gl}_V : \eta(w) = w|_V, \quad \zeta : \mathfrak{h} \rightarrow V : \zeta(w) = w(0, 1),$$

then  $(\eta, \zeta)$  defines a Lie algebra homomorphism from  $\mathfrak{h}$  to  $\mathfrak{af}(V)$ . This map is bijective, with the inverse given by sending  $(v, f) \in \mathfrak{af}(V)$  to the morphism

$$(v', c) \mapsto (f(v') + cv, 0).$$

$\lrcorner$

**Lemma (3.7.1.12).** Let  $\lambda, \mu \in k$  and  $x, y, z \in \mathfrak{g}$ , then we have

$$(\text{ad}(x) - \lambda - \mu)^m [y, z] = \sum_{i=1}^m \binom{m}{i} [(\text{ad}(x) - \lambda)^i y, (\text{ad}(x) - \mu)^{m-i} z].$$

$\lrcorner$

*Proof:*

$$\begin{aligned} (\text{ad}(x) - \lambda - \mu)^m [y, z] &= \sum_{p+q+r+s=m} (-1)^{r+s} \frac{m!}{p!q!r!s!} \lambda^r \mu^s [(\text{ad} x)^p(y), (\text{ad} x)^q(z)] \\ &= \sum_{k+l=m} \frac{m!}{k!l!} [(\text{ad}(x) - \lambda)^k y, (\text{ad}(x) - \mu)^l z]. \end{aligned}$$

$\square$

**Def. (3.7.1.13) [Killing Form].** A bilinear form  $B$  on  $\mathfrak{g}$  is called **invariant** if  $B([x, y], z) + B(x, [y, z]) = 0$ .

The **Killing form** on a Lie algebra  $\mathfrak{g}$  of f.d. is the invariant symmetric bilinear form defined by  $B(x, y) = \text{tr}(\text{adx} \circ \text{ady})$ .

if  $\mathfrak{a}$  is an ideal of a Lie algebra  $\mathfrak{g}$ , then the Killing form on  $\mathfrak{a}$  is that of the Killing form on  $\mathfrak{a}$  as a Lie algebra. This is linear algebra.  $\lrcorner$

**Prop. (3.7.1.14).** Any invariant symmetric bilinear form on a simple Lie algebra  $\mathfrak{g}$  is a multiple of the Killing form.  $\lrcorner$

**Prop. (3.7.1.15).** A subalgebra  $\mathfrak{h}$  of a Lie algebra  $\mathfrak{g}$  is commutative if it consists of semisimple elements.  $\lrcorner$

*Proof:* For an element  $x \in \mathfrak{h}$ , we need to show that  $\text{ad}_{\mathfrak{h}}(x) = 0$ . If it is not, because  $\text{ad}_{\mathfrak{h}}(x)$  is semisimple by (3.5.10.8), there is a nonzero eigenvector  $y$  at least after a base change, so  $[x, y] = cy, y \neq 0 \in \mathfrak{h}$ . So  $\text{ad}(y)(x) = -cy$ , and  $\text{ad}(y)^2(x) = 0$ , so  $\text{ad}(y)$  is non-semisimple on the subspace  $\{x, y\}$ , which means  $\text{ad}(y)$  is non-semisimple on  $\mathfrak{g}$ , by (3.5.10.8) again.  $\square$

**Lemma (3.7.1.16).** If  $\mathfrak{g} \subset \mathfrak{gl}_n$  is a Lie subalgebra, and  $a \in \mathfrak{g}$  is a nilpotent matrix, then  $\text{ad}(a)$  is also nilpotent.  $\lrcorner$

*Proof:* This is because  $\text{ad}(a) = l(a) - r(a)$ , where  $l(a)$  is left multiplication and  $r(a)$  is right multiplication. The left and right multiplication commutes, so it is clear  $\text{ad}(a)^{2n} = 0$  if  $\text{ad}(a)^n = 0$ .  $\square$

### Nilpotent and Solvable Lie Algebras

**Def. (3.7.1.17)[Nilpotent and Solvable Lie Algebras].** For  $\mathfrak{g} \in \text{LieAlg}_k$ , the **lower central series** of  $\mathfrak{g}$  is the descending sequence of ideals of  $\mathfrak{g}$  defined inductively by  $C^1\mathfrak{g} = \mathfrak{g}$  and  $C^m\mathfrak{g} = [\mathfrak{g}, C^{m-1}\mathfrak{g}]$ .

Let  $\mathfrak{g}$  be a Lie algebra, the **derived series** of  $\mathfrak{g}$  is the descending sequence of ideals of  $\mathfrak{g}$  defined inductively by  $D^1\mathfrak{g} = \mathfrak{g}$  and  $D^n\mathfrak{g} = [D^{n-1}\mathfrak{g}, D^{n-1}\mathfrak{g}]$ .

A Lie algebra is called **nilpotent Lie algebra** if there is an  $n$  that  $C^n\mathfrak{g} = 0$ . This is equivalent to  $\text{adx}_1\text{adx}_2 \dots \text{adx}_n = 0$  for any  $n$  element  $x - 1, \dots, x_n$ . It is called **solvable** if  $D^n = 0$  for some  $n$ . It is clear that  $D^n \subset C^n$ , so nilpotent Lie algebra is solvable.  $\lrcorner$

**Prop. (3.7.1.18).** The lower central series satisfies:  $[C^n\mathfrak{g}, C^m\mathfrak{g}] \subset C^{m+n}\mathfrak{g}$ .

The operation of taking derived series or lower central series commutes with base change of fields.  $\lrcorner$

*Proof:* Prove by induction on  $n$ :  $n = 0, 1$  is trivial, and if the assertion is true for  $n \geq k$ , then for  $n = k + 1$ ,  $[C^n\mathfrak{g}, C^m\mathfrak{g}] \subset [\mathfrak{g}, [C^{n-1}\mathfrak{g}, C^m\mathfrak{g}]] + [C^{n-1}\mathfrak{g}, C^{m+1}\mathfrak{g}] \subset C^{m+n}\mathfrak{g}$ .  $\square$

**Cor. (3.7.1.19).** Let  $\mathfrak{g}$  be a Lie algebra over a field  $k$ , and  $k'/k$  is a field extension, then  $\mathfrak{g}$  is solvable/nilpotent iff  $\mathfrak{g} \otimes_k k'$  is solvable/nilpotent.  $\lrcorner$

**Prop. (3.7.1.20).** If  $\mathfrak{g}$  is a nilpotent Lie algebra, then for any subalgebra  $\mathfrak{h} \subsetneq \mathfrak{g}$ ,  $N_{\mathfrak{g}}(\mathfrak{h}) \neq \mathfrak{h}$ .  $\lrcorner$

*Proof:* Because  $\mathfrak{g}^n = 0$  for some  $n$ , take  $n$  to be the maximal one that  $\mathfrak{h} \not\subset \mathfrak{g}^n$ , the  $[\mathfrak{g}^n, \mathfrak{h}] \subset \mathfrak{g}^{n+1} \subset \mathfrak{h}$ , so  $\mathfrak{g}^n \subset N_{\mathfrak{g}}(\mathfrak{h})$ , so  $N_{\mathfrak{g}}(\mathfrak{h}) \neq \mathfrak{h}$ .  $\square$

**Prop. (3.7.1.21).** Sub-Lie-algebras, quotient Lie-algebras and extension Lie-algebras of solvable Lie-algebras are solvable.  $\lrcorner$

*Proof:* Let  $\mathfrak{h} \subset \mathfrak{g}$ , then  $D^n(\mathfrak{h}) \subset D^n(\mathfrak{g})$ , so if  $\mathfrak{g}$  is solvable, then so is  $\mathfrak{h}$ . Also the quotient is clearly solvable. For an extension of Lie algebras

$$0 \rightarrow \mathfrak{h} \rightarrow \mathfrak{g} \rightarrow \mathfrak{r} \rightarrow 0,$$

if  $\mathfrak{h}, \mathfrak{r}$  are both solvable, let  $D^m(\mathfrak{h}) = 0, D^n(\mathfrak{r}) = 0$ , then the image of  $D^n(\mathfrak{g})$  is 0 in  $\mathfrak{r}$ , so  $D^n(\mathfrak{g}) \subset \mathfrak{h}$ , so  $D^{m+n}(\mathfrak{g}) = 0$ .  $\square$

**Cor. (3.7.1.22) [Radicals].** If  $\mathfrak{a}, \mathfrak{b}$  are solvable ideals of a Lie algebra  $\mathfrak{g}$ , then the ideal  $\mathfrak{a} + \mathfrak{b}$  is also solvable, because  $0 \rightarrow \mathfrak{a} \rightarrow \mathfrak{a} + \mathfrak{b} \rightarrow \mathfrak{b}/\mathfrak{a} \cap \mathfrak{b}$ .

Let  $\mathfrak{r} \subset \mathfrak{g}$  be the sum of all solvable ideals of  $\mathfrak{g}$ , called the **radical(Lie-algebra)**, denoted by  $\text{rad}(\mathfrak{g})$ . When  $\mathfrak{g}$  is of f.d., this is the maximal solvable ideal.  $\lrcorner$

**Def. (3.7.1.23) [Semisimple Lie-Algebras].**  $\mathfrak{g} \in \text{LieAlg}_k$  is called a **semisimple Lie-algebra** if  $\text{rad}(\mathfrak{g}) = 0$  (3.7.1.22), or equivalently  $\mathfrak{g}$  has no solvable ideals or no commutative ideals. Notice  $\mathfrak{g}/\text{rad}(\mathfrak{g})$  is semisimple, by (3.7.1.22).  $\lrcorner$

**Prop. (3.7.1.24) [Lie].** Let  $\mathfrak{g} \subseteq \mathfrak{gl}(V)$  be a solvable lie algebra over an alg.closed field  $k$  of char 0, then  $\mathfrak{g}$  is upper triangulable. Equivalently, there exists a vector  $v \in V$  which is a common eigenvector for all  $X \in \mathfrak{g}$ , and moreover equivalently, any irreducible representation of  $\mathfrak{g}$  is 1-dimensional.  $\lrcorner$

*Proof:* Idea is to prove by induction on dimension of  $\mathfrak{g}$ .

Produce a codimension 1 ideal  $\mathfrak{h}$  of  $\mathfrak{g}$ . Let  $\mathfrak{g}$  be generated (as a vector space) by  $\mathfrak{h}$  and  $Y$ . Being a subalgebra of solvable algebra  $\mathfrak{g}$ ,  $\mathfrak{h}$  is itself a solvable lie algebra. Apply induction step on  $\mathfrak{h}$  and choose  $v \in V$  such that  $v$  is an eigenvector for all  $X \in \mathfrak{h}$ .

The idea is to consider set  $W$  all common eigenvectors of elements of  $\mathfrak{h}$  and produce an eigenvector of  $Y$  from this  $W$ . Let

$$W = \{v \in V | X(v) = \lambda(X)v \ \forall X \in \mathfrak{h} \text{ for a fixed } \lambda(X) \in \mathbb{C}\}.$$

Suppose  $W$  is an invariant subspace of  $Y$ , we then have restriction map  $Y : W \rightarrow W$ . As we are in complex vector space (algebraically closed) there exists an eigenvector for  $Y$  in  $W$  say  $w_0$ . Thus,  $w_0$  is common eigenvector for all elements of  $\mathfrak{g}$ .

It remains to show that  $W$  is an invariant subspace of  $Y$  i.e.,  $Y(w) \in W$  for all  $w \in W$  i.e., given  $X \in \mathfrak{h}$ , we need to have  $X(Y(w)) = \lambda(X)Y(w)$ .

Let  $w \in W$ , we have

$$\begin{aligned} X(Y(w)) &= Y(X(w)) + [X, Y](w) \\ &= Y(\lambda(X)w) + \lambda([X, Y])w \\ &= \lambda(X)Y(w) + \lambda([X, Y])w \end{aligned}$$

This is almost the same as what we want but with an extra term  $\lambda([X, Y])w$ . Suppose we prove  $\lambda([X, Y]) = 0$  for all  $X \in \mathfrak{h}$  then we are done.

Then considers subspace  $U$  spanned by elements  $\{w, Y(w), Y^2(w), \dots\}$  and then says that  $U$  is invariant subspace of each element of  $\mathfrak{h}$  and (assuming  $n$  is the smallest integer such that  $Y^{n+1}w$  is in the subspace generated by  $\{w, Y(w), \dots, Y^n(w)\}$ ) representation of an element  $Z$  of  $\mathfrak{h}$  with the basis  $\{w, Y(w), \dots, Y^n(w)\}$  is an upper triangular matrix with  $\lambda(Z)$  in the diagonal. So,  $\text{tr}(Z) = n\lambda(Z)$ .

So,  $\text{tr}([X, Y]) = n\lambda([X, Y])$ . As  $[X, Y] = XY - YX$ , we have  $\text{tr}([X, Y]) = \text{tr}(XY) - \text{tr}(YX) = 0$ . Thus,  $\lambda([X, Y]) = 0$  and we are done.  $\square$

**Cor. (3.7.1.25).** If  $\mathfrak{g}$  is a solvable algebra over an alg.closed field  $k$  of char 0, then all irreducible representations of  $\mathfrak{g}$  is of dimension 1.  $\lrcorner$

**Cor. (3.7.1.26).**  $\mathfrak{g}$  is a solvable algebra iff  $[\mathfrak{g}, \mathfrak{g}]$  is nilpotent.  $\lrcorner$

*Proof:* If  $[\mathfrak{g}, \mathfrak{g}]$  is nilpotent, then clearly  $\mathfrak{g}$  is solvable. Conversely, if  $\mathfrak{g}$  is solvable, we need to prove  $[\mathfrak{g}, \mathfrak{g}]$  is nilpotent. For this, we can assume  $k$  is alg.closed, and then  $\text{ad}(\mathfrak{g}) \subset \mathfrak{b}_{\mathfrak{g}}$  for some basis, thus  $\text{ad}([\mathfrak{g}, \mathfrak{g}]) \subset \mathfrak{n}_{\mathfrak{g}}$  is nilpotent, and the kernel of  $\text{ad}$  is an Abelian subalgebra, so  $[\mathfrak{g}, \mathfrak{g}]$  is nilpotent.  $\square$

**Cor. (3.7.1.27).** If  $\mathfrak{g}$  is a Lie subalgebra of  $\mathfrak{gl}_n(k)$  where  $k$  is an alg.closed field of char 0, then

$$\mathfrak{g} \text{ is solvable} \iff \operatorname{tr}(xy) = 0, \forall x \in \mathfrak{g}, y \in [\mathfrak{g}, \mathfrak{g}].$$

┘

*Proof:* Firstly if  $\mathfrak{g}$  is solvable, then by Lie's theorem, we can assume  $\mathfrak{g} \in \mathfrak{b}_V$  the upper-triangular matrices, so  $[\mathfrak{g}, \mathfrak{g}] \in \mathfrak{n}_V$  is nilpotent, and so  $xy \in \mathfrak{n}_V$  is also nilpotent, and  $\operatorname{tr}(xy) = 0$ .

Conversely, if  $\operatorname{tr}(xy) = 0$  for all  $x \in \mathfrak{g}, y \in [\mathfrak{g}, \mathfrak{g}]$ , we only need to prove  $[\mathfrak{g}, \mathfrak{g}]$  is solvable, so we may change  $\mathfrak{g}$  to  $[\mathfrak{g}, \mathfrak{g}]$  and assume  $\operatorname{tr}(xy) = 0$  for all  $x, y \in \mathfrak{g}$ .

Now to show  $\mathfrak{g}$  is solvable, it suffices to show  $[\mathfrak{g}, \mathfrak{g}]$  is nilpotent, or by Engel's theorem(3.7.1.29) all  $x \in [\mathfrak{g}, \mathfrak{g}]$  defines a nilpotent endomorphism on  $V$ . Choose a basis that  $x$  is upper-triangular by(3.5.10.3), and let  $x_s$  be the semisimple part of  $x$ , then it suffices to show  $x_s = 0$ , or equivalently  $\operatorname{tr}(\overline{x_s}x) = 0$ . To show this, notice  $x \in [\mathfrak{g}, \mathfrak{g}]$ , so it suffices to show  $\operatorname{tr}(\overline{x_s}[y, z]) = 0$  for any  $y, z$ . But this equals  $\operatorname{tr}([\overline{x_s}, y], z)$ . Finally, this is 0 because of the hypothesis and the fact  $\overline{x_s}$  is a polynomial in  $x$ (3.5.10.7) so  $[\overline{x_s}, y] \in \mathfrak{g}$ .  $\square$

**Cor. (3.7.1.28) [Cartan's Criteria for Solvability].**  $\mathfrak{g} \in \operatorname{LieAlg}_k$  is solvable if  $\kappa_{\mathfrak{g}}(x, y)$  for any  $x \in \mathfrak{g}, y \in [\mathfrak{g}, \mathfrak{g}]$ , where  $\kappa$  is the Killing form.  $\square$

*Proof:* By(3.7.1.19), it suffices to show for  $k$  alg.closed. Because the kernel of the adjoint map is the center of  $\mathfrak{g}$ , so  $\mathfrak{g}$  is solvable iff  $\operatorname{ad}(\mathfrak{g})$  is solvable.  $\square$

**Prop. (3.7.1.29) [Engel].** If  $(V, \rho)$  is a representation of a Lie algebra  $\mathfrak{g}$  s.t.  $\rho(x)$  is nilpotent for all  $x \in \mathfrak{g}$ , then there is a basis that  $\rho(\mathfrak{g})$  is contained in  $\mathfrak{n}_V$ , in particular  $\mathfrak{g}$  is nilpotent.  $\square$

*Proof:* It suffices to show if a sub-Lie algebra of  $\mathfrak{gl}_V$  consists of nilpotent elements, then there is a common 0-eigenvector. Use Induction, choose a maximal subalgebra  $K$  of  $L$ , then notice the normalizer of  $K$  in  $L$  is strictly containing  $K$ , because we can let  $K$  acts by adjoint on  $L/K$ , and notice  $\operatorname{ad}x = \lambda_x - \rho_x$  is nilpotent for  $x$  a nilpotent matrix, so by induction hypothesis there is an  $x \in L$  that  $[x, K] \subset K$ . But  $K$  is maximal, so it must be of codimension 1, and  $L = K + Fz$ . The 0-eigenvectors for  $K$  is a nonzero subspace by induction hypothesis. Now this space is invariant under  $z$ : for any  $h \in K$ ,

$$h(z(v)) = [h, z](v) + zh(v) = 0.$$

So now a 0-eigenvector for  $z$  in this space will suffice.  $\square$

**Cor. (3.7.1.30).** If all elements of  $L$  are ad-nilpotent(i.e.  $\operatorname{ad}x = 0$ ), then  $L$  is nilpotent. Equivalently, elements of  $L$  has a common 0-eigenvector.  $\square$

*Proof:* Consider  $\operatorname{ad} : \mathfrak{g} \rightarrow \mathfrak{gl}_{\mathfrak{g}}$ , then the image is nilpotent by Engel's theorem(3.7.1.29), and the kernel of  $\operatorname{ad}$  is the center of  $\mathfrak{g}$ , so  $\mathfrak{g}$  is also nilpotent.  $\square$

**Cor. (3.7.1.31).** Let  $\mathfrak{a}$  be an ideal of a Lie algebra  $\mathfrak{g}$ . Then  $\mathfrak{a}$  is nilpotent if  $\operatorname{ad}_{\mathfrak{g}}(a)$  is nilpotent for any  $a \in \mathfrak{a}$ .  $\square$

*Proof:* If  $\operatorname{ad}_{\mathfrak{g}}(a)$  is nilpotent for any  $a \in \mathfrak{a}$ , then also  $\operatorname{ad}_{\mathfrak{a}}(a)$  is nilpotent, so  $\mathfrak{a}$  is nilpotent by Engel's theorem. Conversely, if  $\mathfrak{a}$  is nilpotent, then  $\operatorname{ad}_{\mathfrak{a}}(a)$  is nilpotent for any  $a \in \mathfrak{a}$ . And  $\operatorname{ad}(a)(\mathfrak{g}) \subset \mathfrak{a}$ , so  $\operatorname{ad}_{\mathfrak{g}}(a)$  is nilpotent.  $\square$

**Cor. (3.7.1.32).** The sum of two nilpotent ideals of  $\mathfrak{g}$  is nilpotent.  $\square$

*Proof:* We need to show for any  $a \in \mathfrak{a}, b \in \mathfrak{b}$ ,  $\text{ad}_{\mathfrak{g}}(a + b)$  is nilpotent. For this, we need to factor  $\mathfrak{g}$  as Jordan sequence  $0 \subset \mathfrak{g}_1 \subset \mathfrak{g}_2 \subset \dots \subset \mathfrak{g}_n = \mathfrak{g}$  over itself via the adjoint representation, then I claim that  $\text{ad}(a)(\mathfrak{g}_k) \subset \mathfrak{g}_{k-1}$ : Because  $V = \mathfrak{g}_k/\mathfrak{g}_{k-1}$  is simple, let  $V' \subset V$  consists of vectors  $v$  that  $a(v) = 0$  for any  $a \in \mathfrak{a}$ , then it is non-empty by Engel's theorem, and also it is invariant under action of  $\mathfrak{g}$ :  $a(gv) = [a, g](v) + g(av) = 0$ . So it is all of  $V$ .

Then, we have  $\text{ad}(a + b)(\mathfrak{g}_k) \subset \mathfrak{g}_{k-1}$ , thus  $\text{ad}(a + b)$  is nilpotent.  $\square$

**Cor. (3.7.1.33) [Maximal Nilpotent Ideal].** For any Lie algebra  $\mathfrak{g}$ , there exists a maximal nilpotent ideal, denoted by  $\mathfrak{n}$ .  $\lrcorner$

**Def. (3.7.1.34) [Nilpotent Radical].** The **nilpotent radical**  $\mathfrak{s} = \mathfrak{s}(\mathfrak{g})$  of a Lie algebra is the intersection of the kernels of simple representations of  $\mathfrak{g}$ .

$\mathfrak{s}$  is nilpotent for any f.d. representation of  $\mathfrak{g}$ , in particular the adjoint representation of  $\mathfrak{g}$ . Thus it is nilpotent, by (3.7.1.31).  $\lrcorner$

**Lemma (3.7.1.35).** Let  $\mathfrak{g} \subset \mathfrak{gl}_V$  be a subalgebra, and let  $\mathfrak{a}$  a commutative ideal of  $\mathfrak{g}$ . If  $V$  is simple as a  $\mathfrak{g}$ -module, then  $[\mathfrak{g}, \mathfrak{g}] \cap \mathfrak{a} = 0$ .  $\lrcorner$

*Proof:* Cf. [Mil13]P58.  $\square$

**Prop. (3.7.1.36).** Let  $\mathfrak{g}$  be a Lie algebra, and  $\mathfrak{r}$  its radical,  $\mathfrak{s}$  its nilpotent radical, then

$$\mathfrak{s} = D(\mathfrak{g}) \cap \mathfrak{r} = [\mathfrak{g}, \mathfrak{r}].$$

In particular,  $[\mathfrak{g}, \mathfrak{r}]$  is nilpotent (3.7.1.34).  $\lrcorner$

*Proof:* To show  $D(\mathfrak{g}) \cap \mathfrak{r} \subset \mathfrak{s}$ , we need to show that  $\rho(D(\mathfrak{g}) \cap \mathfrak{r}) = 0$  for any simple representation  $\rho$ . Because  $\mathfrak{r}$  is solvable, let  $r$  be the smallest integer that  $\rho(D^{r+1}(\mathfrak{r})) = 0$ , then  $\mathfrak{a} = \rho(D^r(\mathfrak{r}))$  is a commutative ideal of  $\rho(\mathfrak{g})$ . Hence by (3.7.1.35)  $D(\rho(\mathfrak{g})) \cap \mathfrak{a} = 0$ , so  $\rho(D(\mathfrak{g}) \cap D^r(\mathfrak{r})) = 0$ . Now if  $r > 0$ , then  $\rho(D^r(\mathfrak{r})) = 0$ , contradicting the minimality of  $r$ , so  $\rho(D(\mathfrak{g}) \cap \mathfrak{r}) = 0$ .

To show  $\mathfrak{s} \subset [\mathfrak{g}, \mathfrak{r}]$ , let  $\mathfrak{q} = \mathfrak{g}/[\mathfrak{g}, \mathfrak{r}]$ , and  $f$  the quotient map. Then because the kernel is solvable,  $f(\mathfrak{r})$  is the radical of  $\mathfrak{q}$  (3.7.1.22), but it is also contained in the center of  $\mathfrak{q}$ , so  $\mathfrak{q}$  is reductive, and thus has a faithful semisimple representation (3.7.4.4), then the kernel of this representation is just  $[\mathfrak{g}, \mathfrak{r}]$ , showing that  $\mathfrak{s} \subset [\mathfrak{g}, \mathfrak{r}]$ .  $\square$

**Def. (3.7.1.37) [Levi Subalgebras].** Let  $\mathfrak{g}$  be a Lie algebra and  $\mathfrak{r}$  its radical, then a Lie subalgebra  $\mathfrak{s}$  is called a **Levi subalgebra** if  $\mathfrak{g} = \mathfrak{r} \oplus \mathfrak{s}$ .  $\lrcorner$

**Prop. (3.7.1.38) [Levi-Malcev].** Every Lie algebra over a field  $k$  of char 0 has a Levi subalgebra, and any two Levi subalgebras of  $\mathfrak{g}$  are conjugate by a special automorphism of  $\mathfrak{g}$  (3.7.1.7).  $\lrcorner$

*Proof:* If  $\mathfrak{g}$  is reductive, then Levi subalgebra exists uniquely, by (3.7.4.2) and (3.7.4.3).

if  $\mathfrak{r}$  is a minimal ideal of  $\mathfrak{g}$ , then  $[\mathfrak{g}, \mathfrak{r}] = \mathfrak{r}$ , and  $[\mathfrak{r}, \mathfrak{r}] = 0 = Z(\mathfrak{g})$ . Consider the adjoint action of  $\mathfrak{g}$  on  $\text{End}_k(\mathfrak{g})$ . Also consider the subspaces  $V, W$  of  $\text{End}_k(\mathfrak{g})$ , where  $V$  is the subspace of maps from  $\mathfrak{g}$  to  $\mathfrak{r}$  that restriction to  $\mathfrak{r}$  is a constant multiple of identity, and  $W$  is the subspaces of  $W$  consisting of maps vanishing on  $\mathfrak{r}$ . Both of  $V, W$  are invariant under action of  $\mathfrak{g}$ .

Let  $\varphi : \mathfrak{r} \rightarrow \mathfrak{g}$  be the adjoint action, which is injective and has image  $P \subset W$ . Also  $\mathfrak{P}$  is invariant under action of  $\mathfrak{g}$  (because  $\mathfrak{r}$  is an ideal).

For  $x \in \mathfrak{r}, y \in \mathfrak{g}, \alpha \in V$ ,  $(x\alpha)(y) = [x, \alpha(y)] - \alpha([x, y]) = -\lambda(\alpha)[x, y]$ , so  $x\alpha = \text{ad}(\lambda(\alpha)x)$ , which means elements of  $\mathfrak{r}$  map  $V$  into  $P$ . Thus now  $\mathfrak{r}$  acts trivially on  $V/P$ , and  $W/P$  is invariant under

the action of  $\mathfrak{g}/\mathfrak{r}$ , which is a semisimple Lie algebra. Thus by Weyl's theorem(24.4.1.2), there exists a  $\mathfrak{g}$ -stable line  $L$  that  $V/P = W/P \oplus L$ . But  $\mathfrak{g}$  acts trivially on  $L$  by(24.4.1.1).

Let  $\alpha_0$  generates  $L$  and normalized that  $\lambda(\alpha) = 1$ , then  $\mathfrak{g}\alpha_0 \in P$ , We consider the map  $\mathfrak{g} \xrightarrow{g \mapsto g\alpha_0} P \xrightarrow{\varphi^{-1}} \mathfrak{r}$ , whose restriction to  $\mathfrak{r}$  is the identity map, so its kernel is a Levi subgroup for  $\mathfrak{r}$ .

Still in this case, let  $\mathfrak{s}'$  be a second Levi subgroup for  $\mathfrak{r}$ . For each  $x \in \mathfrak{s}'$ , there is a unique  $h(x) \in \mathfrak{r}$  that  $x + h(x) \in \mathfrak{s}$ . Hence this  $h$  satisfies  $h([x, y]) = [h(x), y] + [x, h(y)]$ . But then by(24.4.1.3),  $h(x) = [a, x]$  for some  $a \in \mathfrak{r}$ . Then  $1 + \text{ad}(a)$  maps  $\mathfrak{s}$  to  $\mathfrak{s}'$ , and  $\text{ad}(a)^2 = 0$  because  $\mathfrak{r}$  is commutative. And  $\mathfrak{r} = [\mathfrak{r}, \mathfrak{g}]$ , so  $a$  is in the nilpotent radical of  $\mathfrak{g}$ , thus  $\mathfrak{s}, \mathfrak{s}'$  are conjugate by a special automorphism.

For the general case, we can use induction on the dimension of  $\mathfrak{g}$ . After the first two cases, we can assume that  $[\mathfrak{g}, \mathfrak{r}] \neq 0$  and  $\mathfrak{r}$  contains a proper non-trivial ideal. As  $[\mathfrak{g}, \mathfrak{r}]$  is nilpotent(3.7.1.36), its center is non-zero. So we can choose a maximal ideal  $\mathfrak{m}$  contained in the center of  $[\mathfrak{g}, \mathfrak{r}]$ , and  $\mathfrak{m} \neq \mathfrak{r}$ . Now  $\mathfrak{g}/\mathfrak{m}$  has radical  $\mathfrak{r}/\mathfrak{m}$  because  $\mathfrak{m}$  is solvable, so we can apply induction to find a Levi subgroup  $\mathfrak{h}'$  for  $\mathfrak{g}/\mathfrak{m}$  in  $\mathfrak{g}/\mathfrak{m}$ , and let  $\mathfrak{h}''$  be its preimage in  $\mathfrak{g}$ . Then  $\mathfrak{h}''$  has radical  $\mathfrak{m}$ , and thus by induction there is a Levi subgroup  $\mathfrak{h}$  for  $\mathfrak{m}$  in  $\mathfrak{h}''$ , and this  $\mathfrak{h}$  is a Levi subgroup for  $\mathfrak{r}$  in  $\mathfrak{g}$ . Similarly any two such Levi subgroups are conjugate by a special automorphism.

This has another cohomological proof in [Etingof, Section48].?

□

## 2 Semisimple Lie-Algebras

**Prop. (3.7.2.1)[Cartan-Killing Criteria for Semisimplicity].** A f.d. Lie algebra  $\mathfrak{g}$  is semisimple iff its Killing form(3.7.1.13) is non-degenerate. ┘

*Proof:* If  $\mathfrak{g}$  is semisimple, then the adjoint representation is faithful, thus by(3.7.9.6) the Killing form is non-degenerate. Conversely, if the Killing form is non-degenerate and  $\mathfrak{a}$  is a commutative ideal of  $\mathfrak{g}$  and  $a \in \mathfrak{a}, g \in \mathfrak{g}$ , then  $(\text{ada} \circ \text{ad}g)^2 = 0$ , so  $\text{ada} \circ \text{ad}g$  is nilpotent and has trace 0. so  $a \in \mathfrak{g}^\perp$ , which is 0 because the Killing form is non-degenerate. □

**Cor. (3.7.2.2).** Let  $\mathfrak{a}$  be a semisimple ideal of a Lie algebra  $\mathfrak{g}$ , then the orthogonal space  $\mathfrak{a}'$  w.r.t the Killing form is an ideal and is a complement for  $\mathfrak{a}$  in  $\mathfrak{g}$ , and  $\mathfrak{g} \cong \mathfrak{a} \times \mathfrak{a}'$ . ┘

*Proof:*  $\mathfrak{a}^\perp$  is an ideal because the Killing form is invariant. The Killing form of  $\mathfrak{a}$  is the restriction of the Killing form of  $\mathfrak{g}$ (3.7.1.13), so  $\mathfrak{a} \cap \mathfrak{a}' = 0$  because  $\kappa_{\mathfrak{a}}$  is non-degenerate. □

**Cor. (3.7.2.3).** A Lie algebra is semisimple iff it is isomorphic to a product of simple algebras  $\mathfrak{g} = \mathfrak{a}_1 \times \cdots \times \mathfrak{a}_r$ , and these  $\mathfrak{a}_i$  are all its minimal ideals, (Not only up to isomorphism). ┘

*Proof:* The Killing form of  $\mathfrak{a} \cap \mathfrak{a}^\perp$  is 0, thus it is solvable, by(3.7.1.28), and then 0, so we can continue the decomposition.

For any minimal nonzero ideal  $\mathfrak{a} \subset \mathfrak{g}$ , then  $[\mathfrak{g}, \mathfrak{a}]$  is an ideal contained in  $\mathfrak{a}$ . which is nonzero because  $\mathfrak{g}$  has trivial center. Then

$$\mathfrak{a} = [\mathfrak{g}, \mathfrak{a}] = \oplus_i [\mathfrak{a}, \mathfrak{a}_i]$$

so  $\mathfrak{a} \subset [\mathfrak{a}, \mathfrak{a}_i] \subset \mathfrak{a}_i$ , and then  $\mathfrak{a} = \mathfrak{a}_i$  by simplicity. □

**Cor. (3.7.2.4).** If  $\mathfrak{g}$  is semisimple, then  $[\mathfrak{g}, \mathfrak{g}] = \mathfrak{g}$ . ┘

**Cor. (3.7.2.5).** Let  $\mathfrak{g}$  be a Lie algebra over a field  $k$  and  $k'/k$  is a field extension, then  $\mathfrak{g}$  is semisimple iff  $\mathfrak{g} \otimes_k k'$  is semisimple. ┘

**Prop. (3.7.2.6)[Examples of Semisimple Lie Algebras].**

- The subalgebra  $\mathfrak{sl}(V)$  of all elements of  $\text{End}(V)$  of trace 0 is semisimple. ┘

**Prop. (3.7.2.7).** If  $L$  is semisimple, then every derivative of  $L$  is inner. ┘

*Proof:* This is a special case of (24.4.1.3) applied to the adjoint representation. □

**Prop. (3.7.2.8).** If  $\mathfrak{g} \in \text{LieAlg}_k$  is a semisimple sub-Lie-algebra of  $\mathfrak{gl}_n(k)$ , then it contains the semisimple and nilpotent parts of each of its elements under the Jordan decomposition (3.5.10.7). ┘

*Proof:* We may assume  $k$  is alg.closed, because the Jordan decomposition is invariant of the field that contains  $\mathfrak{g}$ , and an element is contained in a vector space can be checked after base change to a larger field. For any subspace  $W \subset V$ , let  $\mathfrak{g}_W = \{\alpha \in \mathfrak{gl}_V \mid \alpha(W) \subset W, \text{tr}(\alpha|_W) = 0\}$ , then if  $\mathfrak{g}W \subset W$ , then  $\mathfrak{g} \subset \mathfrak{g}_W$ , because every element of  $\mathfrak{g}$  is a sum of brackets by (3.7.2.4), thus have zero trace. Now consider

$$\mathfrak{g}' = \mathfrak{n}_{\mathfrak{gl}_V}(\mathfrak{g}) \bigcap_{\mathfrak{g}W \subset W} \mathfrak{g}_W.$$

If  $x \in \mathfrak{g}'$ , then so does  $x_s$  and  $x_n$ , because they are polynomials in  $x$  without constant terms, and  $\text{ad}(x)_s = \text{ad}(x_s)$ ,  $\text{ad}(x)_n = \text{ad}(x_n)$ .

So it suffices to show that  $\mathfrak{g} = \mathfrak{g}'$ . We claim that  $\mathfrak{g}' = \mathfrak{g}$ : As  $\mathfrak{g}$  is a semisimple ideal of  $\mathfrak{g}'$ , by (3.7.2.2), we have a decomposition

$$\mathfrak{g}' = \mathfrak{g} \oplus \mathfrak{g}^\perp.$$

Let  $\alpha \in \mathfrak{g}^\perp$  and  $W$  a simple  $\mathfrak{g}$ -module of  $V$ , then  $\alpha$  acts on  $W$  as a scalar, which must be 0 because  $\alpha \in \mathfrak{gl}_W$  and  $k$  has char 0. As  $W$  is a sum of simple  $\mathfrak{g}$ -modules by Weyl's theorem (24.4.1.2), we get the desired conclusion. □

**Prop. (3.7.2.9) [Abstract Jordan-Decomposition].** A **semisimple/nilpotent element**  $x$  in a Lie algebra  $\mathfrak{g}$  is an element that  $\rho(x)$  is semisimple/nilpotent for any representation  $(V, \rho)$  of  $\mathfrak{g}$ . And  $x = x_s + x_n$  is called a **Jordan decomposition** iff  $\rho(x) = \rho(x_s) + \rho(x_n)$  is a Jordan-decomposition (3.5.10.7) for any representation  $\rho$  of  $\mathfrak{g}$ .

Every element of a semisimple Lie algebra  $\mathfrak{g}$  over a field of characteristic 0 has a unique Jordan decomposition, and  $x = x_s + x_n$  is a Jordan decomposition if  $\rho(x) = \rho(x_s) + \rho(x_n)$  is a Jordan decomposition for one faithful representation  $\rho$  of  $\mathfrak{g}$ . In particular, this holds for the adjoint representation  $\text{ad}$ . ┘

*Proof:* Let  $x \in \mathfrak{g}$  and  $(V, \rho)$  a faithful representation of  $\mathfrak{g}$  (for example the adjoint representation), then there is at most one  $x = x_s + x_n$  that  $\rho(x) = \rho(x_s) + \rho(x_n)$  is the Jordan decomposition, which proves the uniqueness.

Now for any  $x \in \mathfrak{g}$ , as (3.7.2.8) shows, there do exist these two elements that  $\rho(x) = \rho(x_s) + \rho(x_n)$ . But then it can be checked directly  $\text{ad}(x) = \text{ad}(x_s) + \text{ad}(x_n)$  is the Jordan decomposition of  $\text{ad}(x)$  as an endomorphism of  $\mathfrak{g}$ , by (3.7.1.16). As the adjoint representation is faithful, this shows the Jordan decomposition is independent of the faithful representation chosen.

Now every representation is a subrepresentation of a faithful representation, so we can prove the existence. □

### Simple Lie Algebras

References are [Car05]Chap8 and [Kna96], more data about simple Lie algebras can be found in [Kna96]P508.

**Def. (3.7.2.10) [Lie Algebras of Type  $A_n$ :  $\mathfrak{sl}(n+1, \mathbb{C})$ ].** ┘

**Def. (3.7.2.11) [Lie Algebras of Type  $A_1$ ].**  $A_1$  is also called  $\mathfrak{sl}_2(\mathbb{C})$ . It has a basis  $f, h, e$  with

$$[he] = 2e, \quad [hf] = -2f, \quad [ef] = h.$$

In matrix form,

$$h = \begin{bmatrix} 1 & 0 \\ 0 & -1 \end{bmatrix}, \quad e = \begin{bmatrix} 0 & 1 \\ 0 & 0 \end{bmatrix}, \quad f = \begin{bmatrix} 0 & 0 \\ 1 & 0 \end{bmatrix}.$$

It can also be realized by

$$H = \begin{bmatrix} 0 & -i \\ i & 0 \end{bmatrix}, \quad R = \frac{1}{2} \begin{bmatrix} 1 & i \\ i & -1 \end{bmatrix}, \quad L = \frac{1}{2} \begin{bmatrix} 1 & -i \\ -i & -1 \end{bmatrix}.$$

These two representation differ by a conjugation by the Cayley transformation  $C = -\frac{1+i}{2} \begin{bmatrix} i & 1 \\ i & -1 \end{bmatrix}$ .

It is simple by ?. The subalgebra  $\mathfrak{b}$  generated by  $X$  and  $H$  is solvable, called the canonical Borel subalgebra of  $\mathfrak{sl}_2$ . ┘

*Proof:* □

**Prop. (3.7.2.12) [Lie Algebras of Type  $B_n$ :  $\mathfrak{so}(2n+1, \mathbb{C})$ ].** ┘

**Prop. (3.7.2.13) [Lie Algebras of Type  $C_n$ :  $\mathfrak{sp}(n, \mathbb{C})$ ].** ┘

**Prop. (3.7.2.14) [Lie Algebras of Type  $D_n$ :  $\mathfrak{so}(2n, \mathbb{C})$ ].** ┘

**Prop. (3.7.2.15) [Lie Algebras of Type  $G_2$ ].** ┘

**Prop. (3.7.2.16) [Lie Algebras of Type  $F_4$ ].** ┘

**Prop. (3.7.2.17) [Lie Algebras of Type  $E_8$ ].** ┘

**Prop. (3.7.2.18) [Classification of F.D. Complex Simple Lie Algebras].** ┘

**Prop. (3.7.2.19) [Group Automorphisms of Simple Lie Algebras].** Cf.[Carter, P184]. ┘

**Prop. (3.7.2.20).**  $\mathfrak{sl}_2(k)$  is simple if  $k$  has characteristic  $\neq 2$ . ┘

**Def. (3.7.2.21) [Exponent].** Let  $\mathfrak{g}$  be simple,

$$e = \sum e_i, \quad h = 2\rho^\vee = \sum_i (2\rho^\vee, \omega_i) h_i, \quad f = \sum_i (2\rho^\vee, \omega_i) f_i,$$

then by definition,  $[h, e] = 2e$ ,  $[e, f] = h$ , and

$$[h, f] = \sum_i \sum_j (2\rho^\vee, \omega_i) \alpha_i^\vee(\alpha_j) (2\rho^\vee, \omega_j) f_j$$

$$\begin{aligned}
&= \sum_j [(\sum_i (2\rho^\vee, \omega_i) \alpha_i^\vee, \alpha_j)] (2\rho^\vee, \omega_j) f_j \\
&= \sum_j (2\rho^\vee, \alpha_j) (2\rho^\vee, \omega_j) f_j \\
&= -2f
\end{aligned}$$

So  $\{h, e, f\}$  is a  $\mathfrak{sl}_2$ -tuple, called the **principal  $\mathfrak{sl}_2$ -subalgebra** of  $\mathfrak{g}$ . The highest weights of subrepresentation of the adjoint action of this subalgebra on  $\mathfrak{g}$  is called the **exponents of  $\mathfrak{g}$** , counted with multiplicity.

Equivalently, as  $h|_{\mathfrak{g}^\alpha} = \text{ht}(\alpha)\text{id}$ , if  $r_m$  is the number of roots of  $\mathfrak{g}$  of height  $m$ , the exponents of  $\mathfrak{g}$  is the numbers  $m$  that  $r_m > r_{m+1}$ .  $\lrcorner$

**Cor. (3.7.2.22).** While  $r_m = 0$  for  $m$  large and  $r_1 = r(\mathfrak{g})$ , there are  $r$  exponents of  $\mathfrak{g}$ . Since the roots of height 2 are all  $\alpha_i + \alpha_j$  where  $i, j$  are connected by an edge in the Dynkin diagram, thus  $r_2 = r - 1$ , thus  $1 = m_1 \leq \dots \leq m_r$ ,  $\sum_{i=1}^r = |R^+|$ . And  $\mathfrak{g} \cong \oplus_{r=1}^r L_{2m_i+1}$  as a representation of the principal  $\mathfrak{sl}_2$ -subalgebra.  $\lrcorner$

**Prop. (3.7.2.23)[Exponents of Simple Lie Algebras].** The data of exponents of simple Lie algebras:

- $A_n : 1, 2, \dots, n$ .
- $B_n : 1, 3, \dots, 2n - 1$ .
- $C_n : 1, 3, \dots, 2n - 1$ .
- $D_n : 1, 3, \dots, 2n - 3$  and  $n$ .
- $G_2 : 1, 5$ .
- $F_4 : 1, 5, 7, 11$ .
- $E_8 : 1, 7, 11, 13, 17, 19, 23, 29$ .
- $E_7 : 1, 5, 7, 9, 11, 13, 17$ .
- $E_6 : 1, 4, 5, 7, 8, 11$ .

$\lrcorner$

*Proof:*

$\square$

### 3 Cartan Subalgebras

Lie algebras in this subsection are assumed to be of f.d..

**Def. (3.7.3.1)[Cartan Subalgebras].** A **Cartan subalgebra** of a Lie algebra  $\mathfrak{g}$  is a nilpotent subalgebra  $\mathfrak{h}$  that equals to its own normalizer in  $\mathfrak{g}$ .  $\lrcorner$

**Remark (3.7.3.2).** As a proper subalgebra of a nilpotent algebra is never its own normalizer (3.7.1.20), a Cartan subalgebra is a maximal nilpotent subalgebra, but a maximal nilpotent subalgebra may not be a Cartan subalgebra.

If  $k'/k$  is a field extension, then  $\mathfrak{h}$  is a Cartan subalgebra of  $\mathfrak{g}$  iff  $\mathfrak{h}_{k'}$  is a Cartan subalgebra of  $\mathfrak{g}_{k'}$ . This is because being nilpotent and the normalizer is also compatible with base change (3.7.1.4).  $\lrcorner$

**Prop. (3.7.3.3)[Diagonal Cartan Algebra].** Let  $\mathfrak{g} \subset \mathfrak{gl}_V$  be a subalgebra containing a diagonal matrix  $a = \text{diag}(a_1, \dots, a_n)$  with distinct  $a_i$ , and let  $\mathfrak{h}$  be the subspace of all diagonal matrices in  $\mathfrak{g}$ , then  $\mathfrak{h}$  is a Cartan subalgebra of  $\mathfrak{g}$ .  $\lrcorner$

*Proof:* Firstly  $\mathfrak{h}$  is Abelian, and if  $b = \sum b_{ij}e_{ij} \in N_{\mathfrak{g}}(\mathfrak{h})$ , then  $[a, b] \in \mathfrak{h}$ . But

$$[a, b] = \sum_{ij} (a_{ii} - a_{jj})b_{ij}e_{ij}$$

is in  $\mathfrak{h}$  iff  $\mathfrak{b}$  is diagonal, or  $b \in \mathfrak{h}$ , so  $\mathfrak{h} = N_{\mathfrak{g}}(\mathfrak{h})$  and  $\mathfrak{h}$  is a Cartan subalgebra.  $\square$

**Def. (3.7.3.4) [Regular Elements].** Let  $\mathfrak{g}$  be a f.d. Lie algebra, for any  $x \in \mathfrak{g}$ , let  $P_x(T)$  be the characteristic polynomial of  $\text{ad}(x)$ :

$$P_x(T) = \det(T - \text{ad}(x)) = T^m + a_{m-1}(x)T^{m-1} + \dots + a_0(x).$$

Then the **rank of  $\mathfrak{g}$**  is the minimal  $n$  that  $n(x) \neq 0$  for some  $x \in \mathfrak{g}$ . A **regular element** is an element  $x \in \mathfrak{g}$  that  $a_n(x) \neq 0$ .  $\lrcorner$

**Prop. (3.7.3.5) [Regular Elements and Cartan Subalgebras].** For any regular element  $x \in \mathfrak{g}$ , the nilspace  $\mathfrak{g}_x^0$  is a Cartan subalgebra of  $\mathfrak{g}$ .  $\lrcorner$

*Proof:* Let

$$U_1 = \{y \in \mathfrak{g}_x^0 \mid \text{ad}_{\mathfrak{g}}(y)|_{\mathfrak{g}_x^0} \text{ is not nilpotent}\},$$

$$U_2 = \{y \in \mathfrak{g}_x^0 \mid \text{ad}_{\mathfrak{g}}(y)|_{(\mathfrak{g}/\mathfrak{g}_x^0)} \text{ is invertible}\}.$$

They are both Zariski open subsets of  $\mathfrak{g}_x^0$ . According to Engel's theorem (3.7.1.29), to show  $\mathfrak{g}$  is nilpotent, it suffices to show that  $U_1$  is empty.  $U_2$  is non-empty because it contains  $x$ , so if  $U_1$  is non-empty,  $U_1 \cap U_2$  is non-empty and there is a  $y \in U_1 \cap U_2$ . For this  $y$ ,  $n(y) < \dim \mathfrak{g}_x^0 = n(x)$ , contradicting the regularity of  $x$ .

It remains to show that  $\mathfrak{g}_x^0$  is its own normalizer. If  $z$  normalizes  $\mathfrak{g}_x^0$ , then  $[z, x] \in \mathfrak{g}_x^0$ , which means  $(\text{ad}(x))^n[z, x] = 0$ , so  $\text{ad}(x)^{n+1}(z) = 0$ , thus  $z \in \mathfrak{g}_x^0$ .  $\square$

**Cor. (3.7.3.6) [Cartan Subalgebras Exist].** Let  $\mathfrak{g}$  be a Lie algebra over an infinity field  $k$  contains some Cartan subalgebra, and when  $k$  is alg.closed, all Cartan subalgebras come from some regular element, by (3.7.3.13).  $\lrcorner$

*Proof:* Regular elements exist because  $k$  is infinite.  $\square$

**Cor. (3.7.3.7).** Every Lie algebra over an infinite field is a sum of Cartan subalgebras.  $\lrcorner$

*Proof:* This is because the sum of Cartan subalgebras is a vector space thus Zariski closed but it contains all regular elements, which is a Zariski open subset.  $\square$

**Cor. (3.7.3.8).** Let  $\mathfrak{a}$  be a subalgebra of a Lie algebra  $\mathfrak{g}$  that  $\text{ad}_{\mathfrak{g}}(a)$  is semisimple for any  $a \in \mathfrak{a}$ , then  $\mathfrak{a}$  is contained in a Cartan subalgebra of  $\mathfrak{g}$ .  $\lrcorner$

*Proof:* Cf. [Mil13]P81. ?  $\square$

**Prop. (3.7.3.9).** Let  $\mathfrak{h}$  be a Cartan subalgebra of  $\mathfrak{g}$  over an alg.closed field  $k$ . Consider the generalized eigenvalue decomposition (3.7.3.12), if  $x \in \mathfrak{g}^\alpha$ , then  $\text{ad}(x)(\mathfrak{g}^\beta) \in \mathfrak{g}^{\alpha+\beta}$  (3.7.1.12), and thus  $\text{ad}(x)$  is nilpotent. Let  $E(\mathfrak{h})$  be the subgroup of the group of elementary automorphisms (3.7.1.7) of  $\mathfrak{g}$  generated by the set of all the automorphisms  $e^{\text{ad}_{\mathfrak{g}}(x)}$ , where  $x \in \mathfrak{g}^\alpha$  for some  $\alpha \in \mathfrak{h}^* \setminus 0$ .

Now let  $\mathfrak{h}, \mathfrak{h}'$  be two Cartan subalgebras of  $\mathfrak{g}$ , then there exists  $u \in E(\mathfrak{h}), u' \in E(\mathfrak{h}')$  that  $u(\mathfrak{h}) = u'(\mathfrak{h}')$ .  $\lrcorner$

*Proof:* Number the elements of  $\mathfrak{h}^* \setminus 0$  as  $\alpha_1, \dots, \alpha_n$ , and consider the map

$$f : \mathfrak{g}^{\alpha_1} \times \dots \times \mathfrak{g}^{\alpha_n} \times \mathfrak{h} \rightarrow \mathfrak{g} : (x_1, \dots, x_n, h) \mapsto e^{\text{ad}(x_1)} \dots e^{\text{ad}(x_n)} h.$$

Given a  $h_0 \in \mathfrak{h}$ , it can be shown that

$$(df)|_{(0, \dots, 0, h_0)} : (x_1, \dots, x_n, h) \mapsto h + \sum_i [x_i, h_0].$$

Thus if we choose a regular  $h_0 \in \mathfrak{h}$ , then  $(df)|_{(0, \dots, 0, h_0)}$  is surjective from  $\mathfrak{g}$  to  $\mathfrak{g}$ . Thus  $E(\mathfrak{h})\mathfrak{h}_r$  contains a dense open subset of  $\mathfrak{g}$ . Similarly,  $E(\mathfrak{h}')\mathfrak{h}'_r$  contains a dense open subset of  $\mathfrak{g}$ . So their intersection is not empty, i.e.  $u(h) = u'(h')$  for some  $u, u', h, h'$ . Now

$$u(\mathfrak{h}) = u(\mathfrak{g}_h^0) = \mathfrak{g}_{u(h)}^0 = \mathfrak{g}_{u'(h')}^0 = u'(\mathfrak{g}_{h'}^0) = u'(\mathfrak{h}')$$

□

**Cor. (3.7.3.10).** All Cartan subalgebras in a Lie algebra have the same dimension, which is the rank of  $\mathfrak{g}$ .

*Proof:* Because we can take a base change to an alg.closed field, under which a Cartan subalgebra is also a Cartan subalgebra by (3.7.3.2), then they have the same rank. □

**Cor. (3.7.3.11) [Cartan Subalgebras are Conjugate].** Any two Cartan subalgebras of a f.d. Lie algebra over an alg.closed field  $k$  are conjugate by an elementary automorphism.

### Cartan Subalgebra of Semisimple Lie Algebras

**Lemma (3.7.3.12) [Decomposition w.r.t. a Cartan Subalgebra].** Let  $\mathfrak{h}$  be a Cartan subalgebra of a semisimple Lie algebra  $\mathfrak{g}$ , and assume that

$$\mathfrak{g} = \mathfrak{h} \oplus \bigoplus_{\alpha \in \mathfrak{h}^\vee \setminus 0} \mathfrak{g}^\alpha.$$

where  $R = R(\mathfrak{g}, \mathfrak{h})$  is called the **root system associated to  $(\mathfrak{g}, \mathfrak{h})$** . This is true, for example, when  $k = \bar{k}$ , by (3.7.9.10). (See (3.7.3.21) for when this decomposition is possible). □

**Cor. (3.7.3.13).** If  $k = \bar{k}$ , the set  $\mathfrak{h}_r$  of regular elements  $h$  in  $\mathfrak{h}$  that  $\mathfrak{g}_h^0 = \mathfrak{h}$  is open and dense in  $\mathfrak{h}$  in the Zariski topology. □

*Proof:* The condition is equivalent to  $\prod_{\alpha \in \mathfrak{h}^\vee \setminus 0} \alpha(h) \neq 0$ , which is an open condition. □

**Lemma (3.7.3.14).** In the decomposition above, if  $\alpha + \beta \neq 0$ , then  $\mathfrak{g}^\alpha$  and  $\mathfrak{g}^\beta$  is orthogonal w.r.t. the Killing form. □

*Proof:*  $\text{ad}(x)\text{ad}(y)\mathfrak{g}^\gamma \subset \mathfrak{g}^{\alpha+\beta+\gamma}$ , so if  $\alpha + \beta \neq 0$ , then  $\text{ad}(x)\text{ad}(y)$  is nilpotent, thus  $\kappa(x, y) = 0$ . □

**Prop. (3.7.3.15) [Cartan Subalgebras of Semisimple Lie Algebras].** Let  $\mathfrak{h}$  be a Cartan subalgebra of a semisimple Lie algebra  $\mathfrak{g}$ , then

- Every element of  $\mathfrak{h}$  is semisimple. In particular,  $\mathfrak{h}$  is commutative.
- The centralizer of  $\mathfrak{h}$  in  $\mathfrak{g}$  is  $\mathfrak{h}$ .
- The restriction of the Killing form to  $\mathfrak{h}$  is non-degenerate.

┘

*Proof:* By (3.7.3.2), it suffices to prove this after  $k$  is replaced by its alg.closure, so the generalized eigenvalue decomposition (3.7.3.12) holds. We prove 3 first: by (3.7.3.14),  $\mathfrak{h}$  is orthogonal to all  $[\mathfrak{h}, x]$  for any  $x$ . But if  $x \in \mathfrak{g}^\alpha$ , we can see that  $[\mathfrak{h}, x] = \mathfrak{g}^\alpha$ , so  $\mathfrak{h}$  is orthogonal to all  $\bigoplus \mathfrak{g}^\alpha$ , so  $\kappa$  must be non-degenerate on  $\mathfrak{h}$ .

Because  $\mathfrak{g}$  has trivial center, the adjoint representation realizes  $\mathfrak{h}$  as a subalgebra of  $\mathfrak{gl}_{\mathfrak{g}}$ , and Lie's theorem (3.7.1.24) shows there is a basis that  $\mathfrak{h} \subset \mathfrak{b}_{\mathfrak{g}}$ , hence  $\text{ad}([\mathfrak{h}, \mathfrak{h}]) \subset \mathfrak{n}_{\mathfrak{g}}$ , and so  $\text{tr}(\mathfrak{h}, [\mathfrak{h}, \mathfrak{h}]) = 0$ . As  $\kappa$  is non-degenerate on  $\mathfrak{h}$ ,  $[\mathfrak{h}, \mathfrak{h}] = 0$ , thus  $\mathfrak{h}$  is commutative. Now  $\mathfrak{h} \subset c_{\mathfrak{g}}(\mathfrak{h}) \subset N_{\mathfrak{g}}(\mathfrak{h})$ , thus  $\mathfrak{h} = c_{\mathfrak{g}}(\mathfrak{h})$ .

If  $x \in \mathfrak{h}$ , and  $x = x_s + x_n$  is the Jordan decomposition (3.7.2.9), then  $\text{ad}(x_n)$  are polynomials of  $\text{ad}(x)$  thus lies in  $\mathfrak{h}$ . Now  $\text{ad}(x_n)$  commutes with all  $\text{ad}(y)$  for  $y \in \mathfrak{h}$ , thus  $\text{ad}(y)\text{ad}(x_n)$  is nilpotent, thus  $\kappa(y, x_n) = 0$ . Thus  $x_n = 0$  as  $\kappa$  is non-degenerate on  $\mathfrak{h}$ .  $\square$

**Cor. (3.7.3.16) [Cartan Subalgebra Maximal Abelian].** The Cartan subalgebras of a semisimple Lie algebra are the maximal subalgebras consisting of semisimple elements (3.7.2.9), and they are maximal Abelian subalgebras.

WARNING: maximal Abelian subalgebra may not be Cartan subalgebras, as they may contain non-semisimple elements.  $\perp$

*Proof:* A subalgebra consisting of semisimple elements is contained in a Cartan subalgebra, by (3.7.3.8).

Conversely, if  $\mathfrak{h} \subset \mathfrak{h}'$  and  $\mathfrak{h}$  is a Cartan subalgebra and  $\mathfrak{h}'$  consists of semisimple elements, then by (3.7.1.15),  $\mathfrak{h}'$  is commutative, and thus  $\mathfrak{h}' \subset c_{\mathfrak{g}}(\mathfrak{h})$ , so  $\mathfrak{h} = \mathfrak{h}'$ .

Cartan subalgebras are Abelian by (3.7.3.15), and they are maximal Abelian because they are self-centralizing.  $\square$

**Cor. (3.7.3.17).** Every regular element is semisimple, because it is contained in a Cartan subalgebra by (3.7.3.5).  $\perp$

### Split Semisimple Lie Algebras

**Def. (3.7.3.18) [Split Semisimple Lie Algebras].** A **split Cartan subalgebra** of a semisimple Lie algebra  $\mathfrak{g}$  over a field  $k$  is a Cartan subalgebra that all the eigenvalues of the linear maps  $\text{ad}(h)$  lies in  $k$  for all  $h \in \mathfrak{h}$ . A **split semisimple Lie algebra** is a pair  $(\mathfrak{g}, \mathfrak{h})$  where  $\mathfrak{g}$  is semisimple and  $\mathfrak{h}$  is a split Cartan subalgebra.  $\perp$

**Remark (3.7.3.19).** For example, the diagonal matrices in  $\mathfrak{sl}(n)$  is a splitting Cartan subalgebra over any field.

$\mathfrak{sl}(2; \mathbb{R})$  has a non-split Cartan subalgebra  $\left\{ \begin{bmatrix} 0 & -a \\ a & 0 \end{bmatrix} \mid a \in \mathbb{R} \right\}$ .  $\perp$

**Prop. (3.7.3.20).** Let  $\alpha$  be a root of the split semisimple Lie algebra  $(\mathfrak{g}, \mathfrak{h})$ , then

- The subspaces  $\mathfrak{g}^\alpha$  and  $\mathfrak{h}_\alpha = [\mathfrak{g}^\alpha, \mathfrak{g}^{-\alpha}]$  are both 1-dimensional.
- There is a unique element  $h_\alpha \in \mathfrak{h}_\alpha$  such that  $\alpha(h_\alpha) = 2$ , and  $(h_\alpha, h_\alpha) \neq 0$ .
- For each nonzero  $x_\alpha \in \mathfrak{g}^\alpha$ , there is a  $y_\alpha \in \mathfrak{g}^{-\alpha}$  such that

$$[x_\alpha, y_\alpha] = h_\alpha, \quad [h_\alpha, x_\alpha] = 2x_\alpha, \quad [h_\alpha, y_\alpha] = -2y_\alpha.$$

i.e.  $\mathfrak{s}_\alpha = \{x_\alpha, y_\alpha, h_\alpha\} \cong \mathfrak{sl}_2$ .

- $k\alpha$  is a root iff  $k = 0, \pm 1$ .

┘

*Proof:* Define  $\mathfrak{h}_\alpha = [\mathfrak{g}^\alpha, \mathfrak{g}^{-\alpha}] \subset \mathfrak{h}$ . Because the Killing form is non-degenerate on  $\mathfrak{h}$ , we can define for each  $\alpha \in R$  a unique element  $h^\alpha \in \mathfrak{h}$  that  $\alpha(h) = \kappa(h, h^\alpha)$  for all  $h \in \mathfrak{h}$ . Then  $\mathfrak{h}_\alpha$  is the subspace spanned by  $h^\alpha$ : This is because for  $x \in \mathfrak{g}^\alpha, y \in \mathfrak{g}^{-\alpha}$ ,

$$\kappa(h, [x, y]) = \kappa([h, x], y) = \alpha(x)\kappa(x, y)$$

so  $[x, y] = \kappa(x, y)h^\alpha$ . Combine this with the fact  $\kappa(\mathfrak{g}^\alpha, \mathfrak{g}^{-\alpha}) \neq 0$ , we get the fact  $\mathfrak{h}_\alpha = kh^\alpha$  is 1-dimensional.

Next, there is a unique element  $h_\alpha \in \mathfrak{h}_\alpha$  that  $\alpha(h_\alpha) = 2$ . For this, it suffices to show that  $\alpha$  doesn't vanish on  $\mathfrak{h}_\alpha$ : Otherwise let  $x \in \mathfrak{g}^\alpha$  and  $y \in \mathfrak{g}^{-\alpha}$  that  $[x, y] = h \neq 0$ , then  $[h, x] = \alpha(h)x = 0 = [h, y]$ . So  $\{x, y, h\}$  spans a solvable subalgebra  $\mathfrak{a}$  of  $\mathfrak{g}$ . As  $h \in [\mathfrak{a}, \mathfrak{a}]$ . By Lie's theorem,  $\rho(h)$  is nilpotent for any representation  $\rho$  of  $\mathfrak{a}$ . But  $h$  is in the Cartan subalgebra so  $\text{ad}_{\mathfrak{g}}(h)$  is semisimple(3.7.3.15), so  $h = 0$ , contradiction.

If  $(h_\alpha, h_\alpha) = 0$ , let  $h_\alpha = [x_\alpha, y_\alpha]$  for  $x_\alpha \in \mathfrak{g}^\alpha, y_\alpha \in \mathfrak{g}^{-\alpha}$ , then  $\{x_\alpha, y_\alpha, h_\alpha\}$  is solvable, so by Lie's theorem, there is a basis of  $\mathfrak{g}$  that the adjoint action is upper-triangular(when pass to the alg.closure). But then  $\text{ad}(h_\alpha)$  is nilpotent, but it is also semisimple, so  $h_\alpha = 0$ , contradiction.

Because  $x_\alpha \neq 0$ , there exists a unique  $y_\alpha \in \mathfrak{g}^{-\alpha}$  that  $[x_\alpha, y_\alpha] = h_\alpha$ . Now  $[h_\alpha, x_\alpha] = \alpha(h_\alpha)x_\alpha = 2x_\alpha, [h_\alpha, y_\alpha] = -\alpha(h_\alpha)y_\alpha = -2y_\alpha$ .

Finally,  $\mathfrak{h}_\alpha \oplus \bigoplus_{k \neq 0 \in \mathbb{Z}} \mathfrak{g}^{k\alpha}$  is a subrepresentation of  $x_\alpha, y_\alpha, h_\alpha \cong \mathfrak{sl}_2$ , so if  $\mathfrak{g}^{2\alpha} \neq 0$ , then  $\text{ad}(x_\alpha)$  induces an isomorphism  $\mathfrak{g}^\alpha \cong \mathfrak{g}^{2\alpha}$  by the representation theory of  $\mathfrak{sl}_2$ (24.4.1.11). But  $\mathfrak{g}^\alpha$  is generated by  $x_\alpha$ , contradiction. So  $\mathfrak{g}^{k\alpha} \neq 0$  only for  $k = 0, \pm 1$ .  $\square$

**Prop. (3.7.3.21) [Root Decompositions].** If  $(\mathfrak{g}, \mathfrak{h})$  is a split semisimple Lie algebra, then  $\text{ad}(\mathfrak{h})$  is a commuting family of semisimple endomorphisms with eigenvalues in  $k$ (3.7.3.15). Thus the decomposition

$$\mathfrak{g} = \mathfrak{h} \oplus \bigoplus_{\alpha \in \Phi} \mathfrak{g}^\alpha$$

holds as in(3.7.3.12). And it is in fact an eigenvalue decomposition, not only generalized eigenvalue decomposition, by(3.7.3.20).

Then  $\Phi$  is a reduced root system(3.9.5.2) in  $\mathfrak{h}^\vee$ , with  $s_\alpha(\beta) = \beta - \beta(h_\alpha)\alpha$ . In particular,  $\alpha^\vee = h_\alpha$ .

┘

*Proof:* Firstly  $R$  spans  $\mathfrak{h}^\vee$ : if  $h \in \mathfrak{h}$  lies in the center of all  $\alpha \in \Phi$ , then  $[h, \mathfrak{g}^\alpha] = 0$  for all  $\alpha \in R$ , and as  $[h, \mathfrak{h}] = 0$ , this means  $h$  is in the center of  $\mathfrak{g}$ , which is trivial, so  $h = 0$ . So  $R$  spans  $\mathfrak{h}^\vee$ .

We need to prove that if  $\alpha, \beta \in \Phi$ , then  $\beta(h_\alpha) \in \mathbb{Z}$  and  $\beta - \beta(h_\alpha)\alpha \in \Phi$ . For this, regard  $\mathfrak{g}$  as a  $\mathfrak{s}_\alpha$ -module(3.7.3.20) under the adjoint action, then the assertion follows from the representation theory of  $\mathfrak{sl}(2)$ (24.4.1.11):  $h_\alpha$  acts on  $\mathfrak{g}^\beta$  by  $\beta(h_\alpha)$ , and  $y_\alpha^n$  induces an isomorphism  $\mathfrak{g}^\beta \cong \mathfrak{g}^{\beta - n\alpha}$ .

Finally,  $R$  is reduced by(3.7.3.20).  $\square$

**Prop. (3.7.3.22) [Splitting Cartan Subalgebras are Conjugate].** The group of elementary automorphisms of  $\mathfrak{g}$ (3.7.1.7) acts transitively on the set of pairs  $(\mathfrak{b}, \mathfrak{h})$  consisting of a Borel subalgebra(3.7.4.7) and a splitting Cartan subalgebra of  $\mathfrak{g}$ .  $\square$

*Proof:* Cf.[Mil13]P98.  $\square$

**Prop. (3.7.3.23) [Jacobson-Morozov].** Let  $\mathfrak{g}$  be a semisimple Lie algebra and  $e \in \mathfrak{g}$  is nilpotent, then there exists a homomorphism  $\mathfrak{sl}_2 \rightarrow \mathfrak{g}$  mapping  $X$  to  $e$ .  $\square$

*Proof:* Cf.<https://people.math.harvard.edu/~ana/part1.pdf>.  $\square$

### Recovering Split Semisimple Lie Algebras from Dynkin Diagrams

References are [Car05]Chap7.

**Def. (3.7.3.24) [Cartan Matrix].** Let  $(\mathfrak{g}, \mathfrak{h})$  be a split semisimple Lie algebra with root system  $\Phi$ , with notations in (3.7.3.20), define the Cartan matrix of  $\mathfrak{g}$  to be the Cartan matrix  $A$  of  $\Phi$ ,  $A = (a_{ij})$ , where  $a_{ij} = \alpha_j(h_{\alpha_i})$ , where  $\{\alpha_1, \dots, \alpha_n\}$  is a base  $S$  of  $\Phi$ .  $\lrcorner$

**Prop. (3.7.3.25) [Serre Relations].** Let  $(\mathfrak{g}, \mathfrak{h})$  be a split semisimple Lie algebra with root system  $R$  and a base  $S$ , and Cartan matrix  $A = (a_{ij})$ . Denote  $\mathfrak{n}_{\pm} = \bigoplus_{\alpha \in R^{\pm}} \mathfrak{g}^{\alpha}$ , then  $\mathfrak{g} = \mathfrak{n}_{-} \oplus \mathfrak{h} \oplus \mathfrak{n}_{+}$ . Take  $e_i \in \mathfrak{g}^{\alpha_i}$ ,  $f_i \in \mathfrak{g}^{-\alpha_i}$  s.t.  $\{e_i, f_i, h_i = [e_i, f_i]\} = \mathfrak{s}_i$  is a  $\mathfrak{sl}_2$ -triple (3.7.3.20). Then

- $e_i, f_i, h_i$  generate  $\mathfrak{g}$ .
- (Serre Relations):

$$[h_i, h_j] = 0, \quad [h_i, e_j] = a_{ij}, \quad [h_i, f_j] = -a_{ij}f_j, \quad [e_i, f_j] = \delta_{ij}h_i,$$

$$(\text{ad}(e_i))^{1-a_{ij}}e_j = 0, \quad (\text{ad}(f_i))^{1-a_{ij}}f_j = 0, \quad i \neq j$$

$\lrcorner$

*Proof:* 1: Because  $h_i$  generate  $\mathfrak{h}$ , it suffices to show  $e_i$  generate  $\mathfrak{n}_{+}$ , then dually  $f_i$  generate  $\mathfrak{n}_{-}$ . We prove any  $\mathfrak{g}^{\alpha}$  is in the span by induction on the height of  $\alpha$ . If  $\alpha = \sum n_i \alpha_i$ , where  $n_i > 0$ , then  $0 < (\alpha, \alpha) = \sum n_i (\alpha, \alpha_i)$ , thus  $(\alpha, \alpha_i) > 0$  for some  $i$ , thus by (3.9.5.23)  $\alpha - \alpha_i$  is a root, and the representation theory of  $\mathfrak{s}_i$  shows  $e_i$  induces an isomorphism  $\mathfrak{g}^{\alpha - \alpha_i} \cong \mathfrak{g}^{\alpha}$ . So we are done.

2: Only the last two assertions need a proof. The irreducible  $\mathfrak{s}_i$  representation generated by  $e_j$  satisfies  $[f_i, e_j] = 0$ ,  $[h_i, e_j] = a_{ij}$ , thus this submodule is isomorphic to  $W_{a_{ij}}$ , and  $(\text{ad}(e_i))^{1-a_{ij}}e_j = 0$ . The  $f_i$  case is similar.  $\square$

**Prop. (3.7.3.26) [Criterion of Semisimplicity].** Let  $\mathfrak{g} \in \text{LieAlg}_k$  and  $\mathfrak{h}$  a commutative Lie subalgebra. If

- there is a decomposition

$$\mathfrak{g} = \mathfrak{h} \oplus \bigoplus_{\alpha \in \Phi} \mathfrak{g}^{\alpha},$$

where  $\Phi \in \mathfrak{h}^{\vee}$  is the finite set of  $\alpha \in \mathfrak{h}^{\vee} \setminus \{0\}$  that  $\mathfrak{g}^{\alpha} \neq 0$ , and  $\dim \mathfrak{g}^{\alpha} = 1$  for all  $\alpha \in \Phi$ .

- $\Phi$  generates  $\mathfrak{h}^{\vee}$ .
- If  $\alpha \in \Phi$ , then  $-\alpha \in \Phi$ , and  $[[\mathfrak{g}^{\alpha}, \mathfrak{g}^{-\alpha}], \mathfrak{g}^{\alpha}] \neq 0$ .

Then  $\mathfrak{g}$  is semisimple and  $\mathfrak{h}$  is a split Cartan subalgebra of  $\mathfrak{g}$  with root system  $\Phi$ .  $\lrcorner$

*Proof:* If  $I$  is a commutative ideal of  $\mathfrak{g}$ , by action of  $\mathfrak{h}$ , we can assume that  $\mathfrak{g}^{\alpha} \subset I$  for some  $\alpha$ . If  $\alpha \neq 0$ , then  $\mathfrak{g}^{\alpha}$  and  $[\mathfrak{g}^{-\alpha}, \mathfrak{g}^{\alpha}] \subset I$ , so  $[[\mathfrak{g}^{\alpha}, \mathfrak{g}^{-\alpha}], \mathfrak{g}^{\alpha}] = 0$ , contradiction. If  $I \subset \mathfrak{h}$ , then by the hypothesis some  $\alpha(I) \neq 0$ , so  $\mathfrak{g}^{\alpha} = [I, \mathfrak{g}^{\alpha}] \subset \mathfrak{g}^{\alpha}$ , contradiction. So  $I = 0$ .

$\mathfrak{h}$  consists of semisimple elements and it is its own centralizer, so it is a Cartan subalgebra by (3.7.3.16). It is clearly split.  $\square$

**Cor. (3.7.3.27) [Criterion of Simplicity].** Let  $(\mathfrak{g}, \mathfrak{h})$  be a split semisimple Lie algebra. A decomposition  $\mathfrak{g} = \mathfrak{g}_1 \oplus \mathfrak{g}_2$  of Lie algebras defines a decomposition  $(\mathfrak{g}, \mathfrak{h}) = (\mathfrak{g}_1, \mathfrak{h}_1) \oplus (\mathfrak{g}_2, \mathfrak{h}_2)$ , and hence a decomposition of the root system  $\Phi(\mathfrak{g}, \mathfrak{h})$ .

In particular, if the root system  $\Phi(\mathfrak{g}, \mathfrak{h})$  is indecomposable, then  $\mathfrak{g}$  is simple.  $\lrcorner$

*Proof:* Let

$$\mathfrak{g} = \mathfrak{h} \oplus \bigoplus_{\alpha \in \Phi} \mathfrak{g}^\alpha, \quad \mathfrak{g}_1 = \mathfrak{h}_1 \oplus \bigoplus_{\alpha \in \Phi_1} \mathfrak{g}_1^\alpha, \quad \mathfrak{g}_2 = \mathfrak{h}_2 \oplus \bigoplus_{\alpha \in \Phi_2} \mathfrak{g}_2^\alpha$$

be the eigenvalue decomposition of  $\mathfrak{g}, \mathfrak{g}_1, \mathfrak{g}_2$  w.r.t. the adjoint action of  $\mathfrak{h}$ , then  $\mathfrak{h} = \mathfrak{h}_1 \oplus \mathfrak{h}_2$ , and  $\Phi = \Phi_1 \amalg \Phi_2$ .  $\square$

**Prop. (3.7.3.28)[Serre Presentations].** Let  $\mathfrak{g}(R)$  be the Lie algebra generated by  $e_i, f_i, h_i$  with defining relations as in (3.7.3.25), then

- The Lie subalgebra  $\mathfrak{n}_+$  generated by  $e_i$  has  $(\text{ad}(e_i))^{1-a_{ij}}(e_j) = 0$  as defining relations. The Lie subalgebra  $\mathfrak{n}_-$  generated by  $f_i$  has  $(\text{ad}(f_i))^{1-a_{ij}}(f_j) = 0$  as defining relations. And  $h_i$  are linearly independent.
- $\mathfrak{g}(R)$  is a sum of f.d. modules over every  $\mathfrak{sl}_2$ -triple  $\mathfrak{s}_i$ .
- $\mathfrak{g}(R)$  is of f.d..
- $\mathfrak{g}(R)$  is semisimple and has root system  $R$ .
- $\mathfrak{g}(R_1 \oplus R_2) \cong \mathfrak{g}(R_1) \oplus \mathfrak{g}(R_2)$ . In particular, by (3.7.3.27),  $\mathfrak{g}(R)$  is simple iff  $R$  is indecomposable.  $\dashv$

*Proof:* It suffices to prove for indecomposable root systems. Consider  $\widetilde{\mathfrak{g}(R)}$  the Lie algebra generated by elements  $e_i, f_i, h_i$  with the defining relations in (3.7.3.25) without the final two Serre relations, then it is  $\mathbb{Z}$ -graded, with  $\deg(e_i) = 1, \deg(f_i) = -1, \deg(h_i) = 0$ . Thus we have a decomposition

$$\widetilde{\mathfrak{g}(R)} = \widetilde{\mathfrak{n}_+} \oplus \widetilde{\mathfrak{h}} \oplus \widetilde{\mathfrak{n}_-}$$

by degree, and clearly  $\widetilde{\mathfrak{n}_+}$  is generated by  $e_i$ ,  $\widetilde{\mathfrak{h}}$  is generated by  $h_i$  and  $\widetilde{\mathfrak{n}_-}$  is generated by  $f_i$ .

Now I claim that  $\widetilde{\mathfrak{n}_+}$  is a free Lie algebra on generators  $e_i$ ,  $\widetilde{\mathfrak{n}_-}$  is a free Lie algebra on generators  $f_i$  and  $h_i$  are linearly independent. It suffices to prove for  $e_i$ , and  $f_i$  is true with the dual polarization. For this, let  $\mathfrak{h}'$  be a vector space with basis  $h'_i$ , and consider the Lie algebra  $\mathfrak{a} = FL_r \rtimes \mathfrak{h}'$ , where  $FL_r$  is the free Lie algebra generated by  $f'_i$ , and  $\mathfrak{h}'$  acts on  $FL_r$  by  $[h'_i, f'_j] = -a_{ij}f'_j$ , then  $U = U(\mathfrak{a}) = k\langle f'_1, \dots, f'_n \rangle \rtimes k[h'_1, \dots, h'_n]$ , and there is an action of  $\widetilde{\mathfrak{g}(R)}$  on  $U$  that is defined on the generators as follows: if  $w = f'_{j_1} \dots f'_{j_s}$  is a word in  $f'_i$  of weight  $\alpha$  and  $P \in k[h'_1, \dots, h'_n]$ , then

$$h_i(w \otimes P) = w \otimes (h'_i - \alpha(h_i))P$$

$$f_i(w \otimes P) = fw \otimes P$$

$$e_i(f'_{j_1} \dots f'_{j_s} \otimes P) = \sum_{k|j_k=i} f'_{j_1} \dots \widehat{f'_{j_k}} \dots f'_{j_s} (h'_i - (\alpha_{j_{k+1}} + \dots + \alpha_{j_s})(h'_i))P.$$

It can be shown that this is truly a representation, and then it induces a map  $\widetilde{\mathfrak{g}(R)} \rightarrow U : x \mapsto x(1)$ , and this maps Lie polynomials of  $f_i$  in  $\widetilde{\mathfrak{n}_+}$  to Lie polynomials of  $f'_i$ , and  $h_i$  to  $h'_i$ , so the assertions are true.

1: Now consider the elements  $S_{ij}^+ = (\text{ade}_i)^{1-a_{ij}}e_j \in \widetilde{\mathfrak{n}_+}$  and  $S_{ij}^- = (\text{ad}f_i)^{1-a_{ij}}f_j \in \widetilde{\mathfrak{n}_-}$ . Then  $[f_k, S_{ij}^+] = 0$ : If  $k \neq i, j$ , then this is true, and if  $k = j$ , then  $[f_j[e_ie_j]] = [e_i[f_je_j]] = [h_je_i] = a_{ji}e_i$ , thus  $[f_j(\text{ade}_i)^r(e_j)] = 0$  for  $r \geq 2$ . If  $a_{ij} \geq -1$ , then this is true, and if  $a_{ij} = 0$ , then  $a_{ji} = 0$  too, so the assertion is also true. If  $k = i$ , then we can prove by induction that  $[f_i(\text{ade}_i)^r(e_j)] = -r(a_{ij} + r - 1)(\text{ade}_i)^{r-1}(e_j)$ . Thus  $[f_i(\text{ade}_i)^{1-a_{ij}}(e_j)] = 0$ , too.

So by induction we see that the ideals  $I^\pm \in \widetilde{\mathfrak{n}}_\pm$  generated by such  $S_{ij}^\pm$  is ideals  $I_\pm$  of  $\widetilde{g(R)}$ . Then the ideal generated by the the Serre relations is the graded ideal  $I = I_+ \oplus I_-$ , which implies the assertion.

2: The Serre relations shows that  $e_j$  generates the representation  $W_{-a_{ij}}$  of  $\mathfrak{s}_i$  for  $j \geq i$ , and so does  $f_j$ . Also  $e_i, f_i, h_i$  generate  $W_2$ , and  $h_j$  generates  $W_0$  or  $W_0 \oplus W_2$ , so  $\mathfrak{g}(R)$  is a sum of f.d. modules over  $\mathfrak{s}_i$ , as the module generated by  $[a, b]$  is a subquotient of  $V \otimes W$  the modules generated by  $\{a\}$  and  $\{b\}$ .

3:  $\mathfrak{g}(R) = \bigoplus_{\alpha \in Q} \mathfrak{g}_\alpha$ , where  $\mathfrak{g}_\alpha$  is the subspace of  $\mathfrak{g}(R)$  of weight  $\alpha$ . Then  $\mathfrak{g}_\alpha \neq 0$  only if  $\alpha \in Q_+$  or  $Q_-$ , and each  $\mathfrak{g}_\alpha$  is of f.d.. Now we show that  $\mathfrak{g}_R \neq 0$  only if  $\alpha \in R \cup \{0\}$ , which will suffice. We prove by induction on the height of  $\alpha$ : the height 1 case is trivial, and if  $\alpha = ke_i$ , then the statement is clear as  $\mathfrak{g}^{k\alpha_i} = 0$  for  $k \geq 2$ , because  $\mathfrak{n}_+$  is generated by  $e_i$ . If it is not of the form  $\alpha = ke_i$ ,  $(\alpha, \alpha_i) > 0$  for some  $i$ , so by the representation theory of  $\mathfrak{s}_i \cong \mathfrak{sl}_2$ ,  $\mathfrak{g}^{s_i\alpha} \neq 0$ , where  $s_i\alpha = \alpha - \alpha_i^\vee(\alpha)\alpha_i \notin Q_-$ , thus  $s_i\alpha \in Q_+$ , and then by induction hypothesis  $s_i\alpha \in R$ , so  $\alpha \in R$ .

4:  $\widetilde{\mathfrak{g}(R)}^\alpha$  is 1-dimensional for any  $\alpha$ , so this is also true for  $\mathfrak{g}(R)^\alpha$ . Then  $\mathfrak{g}(R)$  is semisimple with root system  $R$  by (3.7.3.26).  $\square$

**Cor. (3.7.3.29) [Classification of Split Simple Lie Algebras].** By Simple Lie Algebras, split simple Lie algebras over  $k$  are in bijection with Dynkin diagrams  $A_l, l \geq 1, B_l, l \geq 2, C_l, l \geq 3, D_l, l \geq 4$  and  $E_6, E_7, E_8, F_4, G_2$ , by (3.9.6.5).  $\lrcorner$

### Notations for Split Semisimple Lie algebras

**Def. (3.7.3.30) [Notations for Split Semisimple Lie Algebras].** Let  $(\mathfrak{g}, \mathfrak{h})$  be a split semisimple Lie algebra, then

- Its reduced root system is denoted by  $\Phi$  (3.7.3.21).
- Choose a base  $\Delta = \{\alpha_1, \dots, \alpha_r\} \subset \Phi$ , and denote the positive (resp. negative) roots by  $\Phi^+$  (resp.  $\Phi^-$ ).
- Notation for root system is the same as in Notations for a Root System.
- $\mathfrak{g}$  has a weight decomposition  $\mathfrak{g} = \mathfrak{h} \oplus_{\alpha \in \Phi} \mathfrak{g}^\alpha$ .
- $x_\alpha \in \mathfrak{g}^\alpha, y_\alpha \in \mathfrak{g}^{-\alpha}$ , where  $\alpha \in \Phi^+$ .
- $\mathfrak{s}_i = \{x_i, y_i, h_i\}$  is a  $\mathfrak{sl}_2$ -triple, where  $x_i \in \mathfrak{g}^{\alpha_i}, y_i \in \mathfrak{g}^{-\alpha_i}$  (3.7.3.20).
- $\alpha_i^\vee = h_i$  (3.7.3.21).

$\lrcorner$

## 4 Reductive Lie Algebra

**Def. (3.7.4.1) [Reductive Lie Algebra].** A Lie algebra  $\mathfrak{g}$  is called **reductive** if  $\text{rad}(\mathfrak{g}) = Z(\mathfrak{g})$ , or equivalently  $Z(\mathfrak{g}) \subset \text{rad}(\mathfrak{g})$ .  $\lrcorner$

**Prop. (3.7.4.2).** The following conditions on a Lie algebra  $\mathfrak{g}$  are equivalent:

- $\mathfrak{g}$  is reductive.
- The adjoint representation of  $\mathfrak{g}$  is semisimple.
- $\mathfrak{g}$  is a product of a commutative Lie algebra  $\mathfrak{c}$  and a semisimple Lie algebra  $\mathfrak{b}$ .

$\lrcorner$

*Proof:*  $1 \rightarrow 2$ : The adjoint representation factors through the center of  $\mathfrak{g}$ , which is also the radical of  $\mathfrak{g}$ , so it is a representation of  $\mathfrak{g}/\text{rad}(\mathfrak{g})$ , which is semisimple(3.7.1.23), so Weyl's theorem(24.4.1.2) shows the adjoint representation is semisimple.

$2 \rightarrow 3$ : If the adjoint representation is semisimple, then  $\mathfrak{g}$  decomposes as a sum of minimal nonzero ideals  $\mathfrak{a}_i$  of  $\mathfrak{g}$ , and then  $\mathfrak{g}$  is a product of these  $\mathfrak{a}_i$ . Let  $\mathfrak{c}$  be the product of the one-dimensional ideals, then  $\mathfrak{c}$  is in the center thus commutative, and  $\mathfrak{b}$  the product of the remaining ideals, then  $\mathfrak{b}$  is semisimple because it has no solvable ideals.

$3 \rightarrow 1$  is trivial.  $\square$

**Cor. (3.7.4.3).** The decomposition of  $\mathfrak{g}$  into a product of commutative Lie algebra and a semisimple Lie algebra is unique: in fact  $\mathfrak{c}$  is the center of  $\mathfrak{g}$ , and  $\mathfrak{b} = [\mathfrak{g}, \mathfrak{g}]$ , by(3.7.2.4).  $\lrcorner$

**Prop. (3.7.4.4).** A Lie algebra  $\mathfrak{g}$  is reductive iff it has a faithful semisimple representation iff it has a trivial nilpotent radical(3.7.1.34).  $\lrcorner$

*Proof:* If  $\mathfrak{g}$  has a faithful semisimple representation, then the nilpotent radical  $\mathfrak{s} = 0$ , thus by(3.7.1.36),  $\mathfrak{r}$  is in the center of  $\mathfrak{g}$ , thus  $\mathfrak{g}$  is reductive.

Conversely, if  $\mathfrak{g}$  is reductive, then we need to show  $\mathfrak{g}$  has a faithful semisimple representation: For this, we can take the tensor product of the trivial representation of the commutative part and the adjoint representation of the semisimple part(3.7.2.3).

The last assertion is clear from(3.7.1.36).  $\square$

**Cor. (3.7.4.5) [Trace Form Criterion for Reductiveness].** If the trace form  $B_\rho$ (3.7.9.5) is non-degenerate for some representation  $(\rho, V)$  of  $\mathfrak{g}$ , then  $\mathfrak{g}$  is reductive.  $\lrcorner$

*Proof:* If  $x \in \mathfrak{s}$ , then  $\rho(x) = 0$ , thus  $B_\rho(x, y) = 0$  for any  $y$ , thus  $x = 0$ . So  $\mathfrak{s} = 0$ , and  $\mathfrak{g}$  is reductive.  $\square$

**Cor. (3.7.4.6) [Classical Lie Algebras are Reductive].** All classical Lie groups over  $\mathbb{R}$  or  $\mathbb{C}$  are reductive.  $\lrcorner$

*Proof:* Apply(3.7.4.5) their standard representations.  $\square$

**Def. (3.7.4.7) [Borel Subalgebras].** Let  $(\mathfrak{g}, \mathfrak{h})$  be a split reductive Lie algebra with a base  $\Phi$ , and consider the corresponding triangular decomposition  $\mathfrak{g} = \mathfrak{n}_- \oplus \mathfrak{h} \oplus \mathfrak{n}_+$ (3.7.3.21). Denote  $\mathfrak{b}_+ = \mathfrak{h} \oplus \mathfrak{n}_+$ , and call any Lie subalgebra of  $\mathfrak{g}$  conjugate to  $\mathfrak{b}_+$  a **borel subalgebra** of  $\mathfrak{g}$ . The definition is independent of the choice of the Cartan subalgebra  $\mathfrak{h}$ , by(3.7.3.22).  $\lrcorner$

## 5 Compact Lie Algebras

References are [李群讲义, 项武义] and [?Kna96].

**Def. (3.7.5.1)[Compact Lie Algebras].** A **compact Lie algebra** is Lie algebra that is the Lie algebra of a compact Lie group.  $\lrcorner$

**Prop. (3.7.5.2)[Killing Form of Compact Lie Algebras].** The Killing form of a compact Lie algebra  $\mathfrak{g}$  is negatively semi-definite, with the kernel the center of  $\mathfrak{g}$ .  $\lrcorner$

*Proof:* Choose an invariant inner product on  $\mathfrak{g}$  w.r.t. the adjoint representation of  $G$  by(24.7.3.2). Take derivative w.r.t the equation  $(\text{Ad}(g)Y, \text{Ad}(g)Z) = (Y, Z)$ , we get by(16.5.1.12),

$$(\text{ad}(X)Y, Z) + (Y, \text{ad}(X)Z) = 0.$$

so  $\text{ad}(X)$  is skew-symmetric w.r.t. this inner product, thus the eigenvalues are all purely imaginary. Then  $B(x, x) = \text{tr}(\text{ad}(x)\text{ad}(x)) \leq 0$ .  $\square$

**Cor. (3.7.5.3) [Compact Lie Algebra is Reductive].** A compact Lie algebra  $\mathfrak{g}$  is reductive.  $\lrcorner$

*Proof:* Because of the invariant inner form, any ideal  $\mathfrak{a}$  of  $\mathfrak{g}$  has a complement  $\mathfrak{a}^\perp$ , thus the adjoint representation of  $\mathfrak{g}$  is semisimple, thus  $\mathfrak{g}$  is reductive (3.7.4.2).  $\square$

**Cor. (3.7.5.4) [Compact Lie algebra Elements Semisimple].** For a compact Lie algebra  $\mathfrak{g}$ , every element is semisimple, and the eigenvalues of any adjoint operator  $\text{ad}(x)$  is purely imaginary.  $\lrcorner$

*Proof:* Because the Killing form is negative definite, thus its negation is an inner product on  $\mathfrak{g}$ , and  $\text{ad}(x)$  acts by skew-Hermitian matrices, thus has purely imaginary eigenvalues.  $\square$

**Prop. (3.7.5.5).** If  $\mathfrak{g}$  is reductive and the Killing form is negative definite on  $[\mathfrak{g}, \mathfrak{g}]$ , then  $\mathfrak{g}$  is compact.  $\lrcorner$

*Proof:* For the commutative part we can take the torus  $(S^1)^n$ , so it suffices to prove the semisimple case: for this, we consider  $\text{Int}(\mathfrak{g})^0 \subset GL(\mathfrak{g})$ , it is contained in  $O(\mathfrak{g})$  with the inner product defined by the negation of the Killing form, thus it is compact. And the Lie algebra of it is  $\text{Der}(\mathfrak{g}) = \text{ad}(\mathfrak{g})$  (3.7.2.7).  $\square$

**Prop. (3.7.5.6) [Representation of Compact Lie Algebras].** Let  $\mathfrak{g}$  be a compact Lie algebra that is the Lie algebra of a simply-connected compact Lie group, then  $\text{Rep}(\mathfrak{g})$  is semisimple.  $\lrcorner$

*Proof:*  $\square$

## 6 Singular element

### Introduction

Singular element in  $\mathfrak{g}$  is a linear space and is defined by some homogenous ideal in  $S(\mathfrak{g})$ .

The paper [Singular element] of Kostant tells in fact it is defined by some  $r$ -homogenous functions  $M^r$  in  $S(\mathfrak{g})$ , and further describes the properties of this ideal such as the  $G$ -module decomposition and as span of determinant minors.

### Preliminary

Let complex simple Lie algebra  $\mathfrak{g} = \text{Lie } G, n = l + 2r$ . The non-degenerate Killing form  $\mathcal{B} \triangleq (x, y)$  on  $\mathfrak{g}$  generate a nonsingular pair on  $S(\mathfrak{g})$  and  $\wedge(\mathfrak{g})$  by

$$(x_1 \cdots x_k, y_1 \cdots y_k) = \sum_{\sigma \in \Sigma_k} (x_1, y_{\sigma(1)}) \cdots (x_k, y_{\sigma(k)})$$

$$(x_1 \wedge \cdots \wedge x_k, y_1 \wedge \cdots \wedge y_k) = \sum_{\sigma \in \Sigma_k} sg(\sigma) (x_1, y_{\sigma(1)}) \cdots (x_k, y_{\sigma(k)})$$

So  $\mathfrak{g} \longleftrightarrow \mathfrak{g}', S(\mathfrak{g}) \longleftrightarrow S(\mathfrak{g}') \longleftrightarrow$  polynomial functions on  $\mathfrak{g}$ ; and  $S(\mathfrak{g})$  and  $\wedge(\mathfrak{g})$  are  $\mathfrak{g}$  thus  $G$  modules extending the adjoint representation.

recall that  $\delta$  and  $\partial$  are called  $\mathcal{B}$ -dual if  $(\delta x, y) = (x, \partial y)$ . Set antiderivation  $-d$   $\mathcal{B}$ -dual to the operator

$$\partial(x_1 \wedge \cdots \wedge x_p) = \sum_{i < j} (-1)^{i+j+1} [x_i, x_j] \wedge x_1 \wedge \cdots \hat{x}_i \wedge \cdots \hat{x}_j \wedge \cdots \wedge x_p$$

on  $\wedge(\mathfrak{g})$  and antiderivation  $\iota(u)$   $\mathcal{B}$ -dual to the operator  $\epsilon(u)v = u \wedge v$  on  $\wedge(\mathfrak{g})$ .

Element  $v$  of  $S(\mathfrak{g})$  are called **invariant** iff  $gv = v, \forall g \in G$  and element  $u$  of  $S(\mathfrak{g})$  are called **harmonic** iff  $(u, v) = 0, \forall v$  invariant and no constant term.

Denote by  $J, H$  respectively the graded subspace of invariant and harmonic elements, then:

**Prop. (3.7.6.1)**[Separation of Variables (in [Kos63])].  $S(\mathfrak{g}) \cong J \otimes H$ . ┘

### the Ideal of Sing $\mathfrak{g}$

In the projection  $\tau : T(\mathfrak{g}) \longrightarrow U(\mathfrak{g})$ , PBW theorem asserts that  $S(\mathfrak{g}) \longrightarrow U(\mathfrak{g})$  is an isomorphism. Denote:

$$\Gamma = \tau|_{S(\mathfrak{g})}^{-1} \circ \tau$$

$\Gamma$  is a  $G$ -map (as a consequence of the next prop).

Denote by  $\Gamma_{2r,2}$  the subgroup of permutation that preserves the set of unordered pairs  $\{(1,2), (3,4), \dots, (2r-1, 2r)\}$  and let  $\Pi_r$  be a left coset representative of  $\Gamma_{2r,2}$  in  $\Gamma_{2r}$  that  $sg(\Pi_r) = 1$

In [Amitsur-Levitski], Kostant proved:

**Prop. (3.7.6.2)**[in [Kos81]].

$$\begin{aligned} \Gamma(\wedge^{2k}(\mathfrak{g})) &= R^k \in S^k(\mathfrak{g}) \\ \Gamma(x_1 \wedge \dots \wedge x_k) &\longrightarrow \sum_{v \in \Pi_k} [x_{v(1)}, x_{v(2)}] \cdots [x_{v(2k-1)}, x_{v(2k)}] \end{aligned}$$

┘

**Prop. (3.7.6.3)**[in [Kos81]].

$$M = R^r \in H^r$$

so it consists of harmonic functions. ┘

Let  $w \in \wedge^2 \mathfrak{g}$  of rank  $k$  standardized as  $v_1 \wedge v_2 + \dots + v_{2k-1} \wedge v_{2k}$ . Let

$$\text{Rad} w = \{y \in \mathfrak{g} | \iota(y)w = 0\} = \{y \in \mathfrak{g} | (w, \epsilon(y)z) = 0, \forall z\}$$

then  $w$  of rank  $2k \iff w^k \neq 0 \ \& \ w^{k+1} = 0 \iff \dim \text{Rad} w = n - 2k$ .

**Lemma (3.7.6.4).**

$$\iota(y)dx = [y, x]$$

Thus

$$\text{Rad} dx = \mathfrak{g}^x, \text{ Sing } \mathfrak{g} = \{x \in \mathfrak{g} | (dx)^r = 0\}.$$

┘

*Proof:*  $(\iota(y)dx, z) = (dx, y \wedge z) = (x, -[y, z]) = ([y, x], z)$  □

So in order to find the module  $M$ , it's the best to find the dual of

$$\gamma : S(\mathfrak{g}) \longrightarrow \wedge^{\text{even}} \mathfrak{g} : x \longrightarrow -dx$$

Luckily:

**Prop. (3.7.6.5)**[in [Kos81]].  $\gamma$  is  $\mathcal{B}$  dual to  $\Gamma$ , in particular,

$$(\Gamma(\zeta), x) = \frac{(-1)^r}{r!} (\zeta, (dx)^r) \quad (\forall \zeta \in \wedge^{2r} \mathfrak{g} \text{ and } x \in \mathfrak{g})$$

┘

So:  $f(x) = 0, \forall f \in M \iff x \in \text{Singg}$ .

**Cor. (3.7.6.6).** Let  $\mathfrak{a}$  be a CSA of  $\mathfrak{g}$ ,  $\Delta_+(\mathfrak{a})$  be the positive roots, then

$$f|_{\mathfrak{a}} = C_f \cdot \prod_{\beta \in \Delta_+(\mathfrak{a})} \beta \quad (\forall f \in M)$$

┘

*Proof:* This is because that an element in a CSA is singular iff it commutes with an element outside this CSA, and taking root decomposition, this is equivalent to annihilated by a root, and by counting degree, the cor follows.  $\square$

By propositions of [[Kos59]] a **regular nilpotent** element  $e$  is **uniquely** in a nilpotent radical  $\mathfrak{n}$  of a Borel subalgebra and that  $\mathfrak{g}^e \cap [\mathfrak{n}, \mathfrak{n}] = (\text{Singg}) \cap \mathfrak{g}^e$ . So there is a linear function  $\xi$  on  $\mathfrak{g}^e$  that  $\ker \xi = (\text{Singg}) \cap \mathfrak{g}^e$ . Thus:

**Cor. (3.7.6.7).**  $f|_{\mathfrak{g}^e} = C_f \cdot \xi^r \quad (\forall f \in M)$ .

┘

*Proof:* By counting degree, the same reason as before.  $\square$

Now we think of a natural question: Can singular elements be defined by functions of even lower degree? The answer is NO.

**Prop. (3.7.6.8).** Assume  $0 \neq f$  homogenous vanishes on  $\text{Singg}$ , then  $\deg f \geq r$

┘

*Proof:* By the last cor, if  $f$  has degree less than  $r$  then  $f$  vanishes on any CSA, but semisimple regular element, thus CSAs are Zariski dense in  $\mathfrak{g}$  (this is because semisimple elements are defined by a polynomial), so  $f = 0$ .  $\square$

Thus we have established that  $\text{Singg}$  is an algebraic set defined by a set of harmonic  $r$ -homogenous functions on  $\mathfrak{g}$  and not by functions of degree lower than  $r$ .

Next we offer a different formation of  $M$ .

### $M$ as minors of determinants

for a  $\mathcal{B}$  dual basis  $y_i, w_j$ , define a derivation

$$d_W(f \otimes u) = \sum_i^n \partial_{y_i} f \otimes \epsilon(w_i)u \quad \text{on } S(\mathfrak{g}) \otimes \wedge \mathfrak{g}.$$

Here  $\partial_{\sum a_i x_i}$  is defined as  $\sum a_i \frac{\partial}{\partial x_i}$  for a standard basis  $x_i$  of  $\mathfrak{g}$ . It's easy to verify that  $d_W$  is well defined and is a  $G$ -map (Take a different basis  $Aw_i$  and  $Bz_i$ , then  $AB^t = I$ , substitute into the formula of  $d_W$ , it doesn't change).

**Chevalley Thm** tells us  $J$  is a polynomial ring  $\mathbb{C}[p_1, \dots, p_l]$ , where  $p_i$  are homogenous polynomials of fixed degree  $d_i$  and  $\sum_{j=1}^l (d_j - 1) = r$ . So:

$$d_W p_1(x) \wedge \dots \wedge d_W p_l(x) = \sum_{1 \leq i_1 < \dots < i_l \leq n} \phi(y_{i_1}, \dots, y_{i_l})(x) w_{i_1} \wedge \dots \wedge w_{i_l}$$

Where  $\phi(y_{i_1}, \dots, y_{i_l}) = \det \partial_{y_i} p_j$  is homogenous of degree  $r$ . (counting degree).

To see this, notice that  $f \otimes u$  acts as a function from  $\mathfrak{g}$  to  $\wedge \mathfrak{g}$ :  $f \otimes u(x) = f(x)u$ . So:

$$d_W p_j(x) = \sum_{i=1}^n \partial_{z_i} p_j(x) w_i.$$

**Prop. (3.7.6.9).** for any CSA  $\mathfrak{h}$  of  $\mathfrak{g}$  and a basis  $\{v_i\}$  of  $\mathfrak{h}, \forall x \in \mathfrak{h}$ ,

$$d_W p_1(x) \wedge \cdots \wedge d_W p_l(x) = \kappa \cdot \prod_{\phi \in \Delta_+} \phi(y) v_1 \wedge \cdots \wedge v_l$$

┘

**Lemma (3.7.6.10)** [in [Kos63]].  $\{d_W p_1(x), \dots, d_W p_l(x)\}$  is linearly independant iff  $x \in \text{Regg}$ . ┘

*Proof:* Notice that  $d_W p_j$  is a  $\mathfrak{g}$ -map,  $\text{ady} \cdot d_W p_j = d_W p_j([y, x])$  so  $d_W p_j(x)$  commutes with  $\mathfrak{g}^x$ ; so  $\in \mathfrak{g}^x$ . Then the lm tells us when  $y$  is regular,  $d_W p_j(y)$  forms a basis of  $\mathfrak{g}^y$ . Considering in  $\mathfrak{g}^y$ ,  $x$  is regular iff  $\prod_{\phi \in \Delta_+} \phi(x) \neq 0$ , the prop follows.  $\square$

Next we give an explicit expression for  $\gamma_r$ .

It can be verified (taking a  $z_i$  basis) that  $dx = \frac{1}{2} \sum_{i=1}^n w_i \wedge [z_i, x]$ .

Now  $x \in \mathfrak{h}$ ,

$$dx = \sum_{\phi \in \Delta_+} \phi(x) e_\phi \wedge f_{-\phi}$$

(just take the basis  $w_i$  and  $z_i$  as a standard basis of  $\mathfrak{g}$  consisting of  $\{h_i, \dots, h_l, e_\phi, f_\phi\}$ )

So

$$\gamma_r(x^r) = r!(-1)^r \prod_{\phi \in \Delta_+} \phi(x) e_\phi \wedge f_{-\phi}$$

Let  $\mu = i^r v_1 \wedge \cdots \wedge v_l \wedge \prod_{\phi \in \Delta_+} e_\phi \wedge f_{-\phi}$  then  $(\mu, \mu) = 1$ .

Denote  $v^* = \iota(v)\mu$  for  $v \in \wedge \mathfrak{g}$ , then

$$(v_1 \wedge \cdots \wedge v_l)^* = i^r \prod_{\phi \in \Delta_+} e_\phi \wedge f_{-\phi} = C_o \gamma_r(x^r)$$

(notice that  $\iota(u)\iota(v) = \iota(v \wedge u)$  and use lm 1)

**Prop. (3.7.6.11).**  $(d_W p_1(x) \wedge \cdots \wedge d_W p_l(x))^* = \kappa_o \gamma_r(\frac{x^r}{r!}) \neq 0$ . ┘

*Proof:* For  $y \in \mathfrak{h}$  regular, this follows from previous calculations, and notice both side are  $G$ -maps, and semisimple regular elements are Zariski open, conclusion follows.  $\square$

**Lemma (3.7.6.12).**  $(s, t) = (s^*, t^*)$ , so that  $-^*$  is a  $\mathcal{B}$ -isomorphism. ┘

**Prop. (3.7.6.13).** Let  $\{w_1, \dots, w_{2r}\}$  be linearly independent and  $\{u_1, \dots, u_l\}$  be a basis of  $\{w_1, \dots, w_{2r}\}^\perp$ , then

$$\Gamma(w_1 \wedge \cdots \wedge w_{2r}) = \kappa_1 \det \partial_{u_i} p_j \neq 0$$

Thus,  $M$  is the span of all the minors  $\det \partial_{u_i} p_j$ . ┘

*Proof:* By the preceding props,

$$\begin{aligned} \det \partial_{u_i} p_j &= \phi(u_1, \dots, u_l)(x) \\ &= (d_W p_1(x) \wedge \cdots \wedge d_W p_l(x), u_1 \wedge \cdots \wedge u_l) \\ &= ((d_W p_1(x) \wedge \cdots \wedge d_W p_l(x))^*, (u_1 \wedge \cdots \wedge u_l)^*) \\ &= \kappa_o \kappa_2 \left( \phi_r \left( \frac{x^r}{r!} \right), w_1 \wedge \cdots \wedge w_{2r} \right) \\ &= \kappa^{-1} \Gamma(w_1 \wedge \cdots \wedge w_{2r})(x). \end{aligned}$$

$\square$

### $G$ -module structure of $M$

Now we show the  $G$ -module structure of  $M$ .

Let  $\theta$  be the derivative that  $\theta(x)(y) = [x, y]$  on  $\mathfrak{g}$ .  $\text{Cas} = \sum_{i=1}^n \theta(z_i)\theta(w_i)$ .

It's in fact just the action of the Casimir element in center of  $U(\mathfrak{g})$ . Let  $m_l$  and  $M_l$  be the maximal eigenvalue and eigenspace of  $\text{Cas}$ .

For a commutative Lie subalgebra  $\mathfrak{c}$  of rank  $l$ , denote by  $[\mathfrak{c}]$  the line it defines on  $\wedge^l \mathfrak{g}$ . The span of these  $[\mathfrak{c}]$  is denoted  $A_l$ . Notice that  $[g^y] \subset A_l$  for a regular  $y$ , and  $A_l$  is a  $G$ -submodule.

**Prop. (3.7.6.14)** [in [Kos65]].

$$A_l = M_l; \quad m_l = l.$$

┘

An ideal in a Borel subalgebra of  $\mathfrak{g}$  is necessarily spanned by root vectors and a prop of [[K-W09]] says any ideal of  $\dim l$  is (denoted by  $\mathcal{I}$ ) in fact abelian.

A prop in [[Kos65]] asserts that for two different ideals  $\Phi_1, \Phi_2$ , sum of their weight vectors  $\langle \Phi \rangle$  is distinct.

So  $G[\Phi_i]$  is an irreducible  $G$ -module  $V_\Phi$  with highest weight  $\langle \Phi \rangle$  and  $V_\Phi$  are inequivalent  $G$ -modules (because an irreducible representation have only one highest vector).

**Prop. (3.7.6.15)** [in [Kos65]].

$$M_l = \oplus_{\Phi \in \mathcal{I}} V_\Phi.$$

┘

Now denote  $M_{2r}$  image of  $M_l$  under the isomorphism  $u \rightarrow u^*$ , then

**Prop. (3.7.6.16)** [in [K-W09]].  $M_l$  is the span of  $G \cdot [g^x]$  for  $x$  regular.

┘

but by precious prop,

$$[g^x] = \mathbb{C} d_W p_1(x) \wedge \dots \wedge p_l(x).$$

thus  $M_{2r}$  is the span of  $G \cdot (\gamma_r(\frac{x^r}{r!}))$ ,  $x$  regular.

**Prop. (3.7.6.17)** [Final].  $\Gamma|_{M_{2r}} : M_{2r} \rightarrow M$  is an isomorphism and  $M \cong M_{2r} \cong M_l = A_l$  as  $G$ -module.

So  $M$  is a multiplicity one module with  $|\mathcal{I}|$  irreducible components.

┘

*Proof:* Notice that  $\Gamma(\zeta)(x) = (\zeta, \gamma_r(\frac{x^r}{r!}))$  and  $M_{2r}$  is the span of  $G \cdot (\gamma_r(\frac{x^r}{r!}))$ , the first part follows, and the rest is a recapitulation of previous props.  $\square$

## 7 Real Lie Algebra

**Prop. (3.7.7.1)** [Passage from Real to Complex]. If  $\mathfrak{g}_0$  is a Lie algebra over  $\mathbb{R}$  and  $\mathfrak{g} = \mathfrak{g}_0 \otimes \mathbb{C}$  its complexification, then  $\mathfrak{g}_0$  is Abelian/nilpotent/solvable/semisimple iff  $\mathfrak{g}$  does.

┘

**Def. (3.7.7.2).** A **compact real form** is a real subalgebra  $\mathfrak{l}$  of  $\mathfrak{g}$  s.t.  $\mathfrak{g}$  is the complexification of  $\mathfrak{l}$  and  $\mathfrak{l}$  is the lie algebra of a compact simply-connected Lie group.

┘

**Prop. (3.7.7.3).** A real Lie algebra is compact iff there exists an invariant inner product iff the Killing form is negative definite.

┘

*Proof:* One direction is easy, just use the average method to find a  $G$ -invariant inner product and then take derivative. For the other direction, the identity shows that a complement of an ideal is an ideal so  $\mathfrak{g}$  is decomposed into simple lie groups and reduce to the case that  $\mathfrak{g}$  is simple. The ideal is to show that  $\mathfrak{g} \cong \text{ad}(\mathfrak{g})$  is the whole outer derivative group  $\partial(\mathfrak{g})$  (the following lm). So  $\mathfrak{g}$  equals to the identity component of  $\text{Aut}(\mathfrak{g})$  which is a closed subgroup thus closed but it is also a subgroup of the compact group  $O(\mathfrak{g})$  thus it is compact.  $\square$

**Lemma (3.7.7.4).** If a real semisimple Lie algebra  $X$  has an invariant inner product, then every outer derivative is inner. (In fact, this is true by Cartan Criterion for semisimplicity (3.7.2.7)).  $\lrcorner$

*Proof:* since  $\text{ad}(X)$  is skew-symmetric, it's diagonalizable and its eigenvalue is pure imaginary, so the Killing form of  $X$  is negative definite. Now choose the complement  $\mathfrak{a}$  of  $\text{ad}(X)$  in  $\partial(X)$ , then  $\mathfrak{a} \cap X = 0$ . Thus for  $D \in \mathfrak{a}$ ,  $\text{ad}(D(g)) = [D, \text{ad}(g)] = 0$  for all  $g$  in  $X$ , so  $D = 0$ , thus  $\text{ad}(X) = \partial(X)$ .  $\square$

**Prop. (3.7.7.5).** 1. The complexification of the Lie algebra of a connected compact Lie group is reductive.  
2. A complex Lie algebra is semisimple iff it is isomorphic to the complexification of the Lie algebra of a simply-connected compact Lie group. i.e. every complex semisimple Lie algebra has a compact real form.  $\lrcorner$

*Proof:* 1: Because a connected compact Lie group is completely reducible so the does the Lie algebra and so does the complexification. So it is reductive by (3.7.4.1)4.

2: Cf.[Varadarajan Lie Groups Lie algebras and Their Representations]. The idea is to find a real form whose corresponding simply-connected group is compact.  $\square$

**Prop. (3.7.7.6).** If  $\mathfrak{g}$  is the Lie algebra of a matrix Lie group  $G$ , then:

1. every Cartan subalgebra comes from a maximal commutative subalgebra of a compact real form and any two Cartan subalgebras are conjugate under the Ad-action of  $G$ .
2. any two compact real form is conjugate under the Ad-action of  $G$ .
3. any two maximal commutative subalgebra of a compact real form is conjugate under the Ad-action of the corresponding compact compact subgroup.  $\lrcorner$

**Prop. (3.7.7.7).** A real Lie algebra is semisimple iff its complexification is semisimple. Cf.[Varadarajan].  $\lrcorner$

**Cor. (3.7.7.8).** The real Lie algebra of a compact simply-connected group is semisimple.  $\lrcorner$

Note: For the classification of real semisimple Lie algebras, Cf.[李群讲义项武义 §6]

**Prop. (3.7.7.9).** If a complex representation of a Lie group admits an invariant bilinear form, then it is non-degenerate and unique. In fact, this is equivalent to a  $G$ -map from  $V$  to  $V^*$ . Thus there is unique invariant inner product in a compact real form by the preceding proposition.  $\lrcorner$

## 8 Universal Constructions

**Notation (3.7.8.1).**

- In this subsection  $k$  can be a field of any characteristics.
- Let  $\mathfrak{g} \in \text{LieAlg}_k$ .

┘

**Def. (3.7.8.2)[Universal Enveloping Algebra].** The **universal enveloping algebra** of a Lie algebra  $\mathfrak{g}$  is defined to be

$$U(\mathfrak{g}) = T(\mathfrak{g})/J, \quad T(\mathfrak{g}) = \bigoplus_{n=0}^{\infty} \mathfrak{g}^{\otimes n}$$

which is a graded algebra  $T(\mathfrak{g})$  quotients the ideal  $J = (\{x \otimes y - y \otimes x - [xy]\})$ .

There is a natural linear map  $\sigma : \mathfrak{g} \rightarrow U(\mathfrak{g})$ .

┘

**Prop. (3.7.8.3).** The universal enveloping algebra  $U : \mathfrak{g} \mapsto U(\mathfrak{g})$  defines a functor  $\text{LieAlg} \rightarrow \text{Alg}^{\text{asso}}$  that is left adjoint to the canonical functor  $\text{Alg}_k^{\text{asso}} \rightarrow \text{LieAlg}_k$  (3.7.1.2).

┘

*Proof:* For any associative algebra  $A$  and a morphism of Lie algebras  $\mathfrak{g} \rightarrow [A]$ , there is easily seen a morphism  $U(\mathfrak{g}) \rightarrow A$ , and it is unique.  $\square$

**Cor. (3.7.8.4)[Representations as Modules].** A representation of  $\mathfrak{g}$  (3.7.11.4) is the same as a representation of  $U(\mathfrak{g})$ .

┘

**Prop. (3.7.8.5)[Poincaré-Birkhoff-Witt].** Let  $\mathfrak{g}$  be a Lie algebra, define a filtration on  $U(\mathfrak{g})$  by assigning  $F_n U(\mathfrak{g}) =$  the image of  $\bigoplus_{i=0}^n \mathfrak{g}^{\otimes i}$  in  $U(\mathfrak{g})$ . We have  $[F_i U(\mathfrak{g}), F_j U(\mathfrak{g})] \subset F_{i+j-1} U(\mathfrak{g})$ , thus  $gr U(\mathfrak{g})$  has a graded commutative ring structure. Thus there is an algebra homomorphism  $S(\mathfrak{g}) \rightarrow gr U(\mathfrak{g})$ , and this homomorphism is an isomorphism.

If  $\mathfrak{g}$  has a basis  $\{x_i\}$ ,  $i \in I$  and  $<$  is an order on  $I$ , then  $U(\mathfrak{g})$  has a basis consisting of elements  $\{x_{i_1}^{r_1} \cdots x_{i_k}^{r_k}\}$  where  $i_1 < i_2 < \cdots < i_r$ .

┘

*Proof:* We assign any monomial  $a_{i_1} \cdots a_{i_n}$  in  $a_i$ s a pair  $(k, N)$  where  $k$  is the number of factors in a monomial and  $N$  is the number of inversions (meaning the number of pairs  $1 \leq r, s \leq n$  that  $i_r > i_s$ ), pairs  $(k, N)$  are lexicographical ordered. Let  $T^{(k, N)}$  be the space of  $T(\mathfrak{g})$  generated by monomials of index  $(k, N)$ ,  $T^k = \bigcup_{N=1}^{\infty} T^{(k, N)}$ , and  $\mathcal{U}^{(k, N)}, \mathcal{U}^k$  the space of  $T(\mathfrak{g})$  the image of  $T^{(k, N)}, T^k$  in  $\mathcal{U}(\mathfrak{g})$ . We will use induction on  $(k, N)$ . Notice for any  $k$ ,  $T^k = T^{(k, N)}$  for  $N$  large.

To show that the monomials in  $(\star)$  generates  $U(\mathfrak{g})$ , if we have a monomial  $a_{i_1} a_{i_2} \cdots a_{i_s} a_{i_{s+1}} \cdots a_{i_k}$  that  $i_s > i_{s+1}$ , then

$$a_{i_1} a_{i_2} \cdots a_{i_s} a_{i_{s+1}} \cdots a_{i_k} = a_{i_1} a_{i_2} \cdots (a_{i_{s+1}} a_{i_s} + [a_{i_s}, a_{i_{s+1}}]) \cdots a_{i_k},$$

which is in  $\bigcup_{(k', N') < (k, N)} \mathcal{U}^{(k', N')}$ . So we can use induction on  $(k, N)$  to show that any element of  $\mathcal{U}(\mathfrak{g})$  is in  $\bigcup_{k=1}^{\infty} T^{(k, 0)}$ .

From now on, we write  $a_{i_1} a_{i_2} \cdots a_{i_n}$  as  $a_{i_1} a_{i_2} \cdots a_{i_n}$  for simplicity.

To show that the monomials are linearly independent, we first show that there is a linear map

$$\theta : T(\mathfrak{g}) \rightarrow R = \mathbb{C}[z_i]_{i \in I}$$

satisfying the following conditions:

$$\theta(a_{i_1} \cdots a_{i_n}) = z_{i_1} \cdots z_{i_n}, \text{ if } i_1 \leq i_2 \leq \cdots \leq i_n, \quad (\star\star)$$

$$\begin{aligned} & \theta(a_1 \dots a_{i_k} a_{i_{k+1}} \dots a_{i_n}) \\ &= \theta(a_1 \dots a_{i_{k+1}} a_{i_k} \dots a_{i_n}) + \theta(a_1 \dots [a_{i_k} a_{i_{k+1}}] \dots a_{i_n}). \end{aligned} \quad (\star \star \star)$$

We construct this map by construction on  $\cup_{(k', N') \leq (k, N)} U^{(k', N')}$  and use induction on  $(kN)$ . For  $k = 0$ , let  $\theta(1) = 1$ . If  $\theta$  is defined for any monomials of index  $(k, N)$  that  $k < n$ , define  $\theta$  on  $T^{n, 0}$  by  $\theta(a_{i_1} \dots a_{i_n}) = z_{i_1} \dots z_{i_n}$ , then it satisfies  $(\star \star)$ .

And if  $\theta$  is already defined for any  $T^{n, k}$  that  $k < i$ , suppose that the monomial  $a_{i_1} \dots a_{i_n}$  has index  $(n, i)$ , then there is a smallest  $k$  that  $a_{i_1} \dots a_{i_{k+1}} a_{i_k} \dots a_{i_n}$  has index  $i - 1$ . Then we define

$$\theta(a_{i_1} \dots a_{i_n}) = \theta(a_{i_1} \dots a_{i_{k+1}} a_{i_k} \dots a_{i_n}) + \theta(a_{i_1} \dots [a_{i_k}, a_{i_{k+1}}] \dots a_{i_n}).$$

Now we need to check that this definition satisfies  $(\star \star \star)$ :

If there is another  $k'$  that  $i_{k'} > i_{k'+1}$ , then  $k < k'$ . Suppose first that  $k + 1 < k'$ , let  $a_{i_k} = a$ ,  $a_{i_{k+1}} = b$ ,  $a_{i_{k'}} = c$ ,  $a_{i_{k'+1}} = d$ , then

$$\begin{aligned} \theta(\dots ab \dots cd \dots) &= \theta(\dots ba \dots cd \dots) + \theta(\dots [a, b] \dots cd \dots) \\ &= \theta(\dots ba \dots dc \dots) + \theta(\dots ba \dots [cd] \dots) + \theta(\dots [ab] \dots dc \dots) + \theta(\dots [ab] \dots [cd] \dots) \\ &= \theta(\dots ab \dots dc \dots) + \theta(\dots ab \dots [cd] \dots) \end{aligned}$$

where the terms except the first one are all in  $\cup_{(k', N') < (k, N)} T^{(k', N')}$  so the equalities come from induction hypothesis. So it satisfies  $(\star \star \star)$ .

Suppose next that  $k' = k + 1$ , let  $a_{i_k} = a$ ,  $a_{i_{k+1}} = b$ ,  $a_{i_{k+2}} = c$ , then

$$\begin{aligned} \theta(\dots abc \dots) &= \theta(\dots bac \dots) + \theta(\dots [ab]c \dots) \\ &= \theta(\dots bca \dots) + \theta(\dots b[ac] \dots) + \theta(\dots c[ab] \dots) + \theta(\dots [[ab]c] \dots) \\ &= \theta(\dots cba \dots) + \theta(\dots [bc]a \dots) + \theta(\dots b[ac] \dots) + \theta(\dots c[ab] \dots) + \theta(\dots [[ac]b] \dots) + \theta(\dots [a[bc]] \dots) \\ &= \theta(\dots cab \dots) + \theta(\dots [ac]b \dots) + \theta(\dots a[bc] \dots) \\ &= \theta(\dots acb \dots) + \theta(\dots a[bc] \dots) \end{aligned}$$

where the terms except the first one are all in  $\cup_{(k', N') < (k, N)} T^{(k', N')}$  so the equalities come from induction hypothesis, and in the third equality we used the Jacobi identity. So it satisfies  $(\star \star \star)$ .

Now all elements in  $J$  is a linear combination of elements of the form

$$a_1 \dots a_{i_k} a_{i_{k+1}} \dots a_{i_n} - a_1 \dots a_{i_{k+1}} a_{i_k} \dots a_{i_n} - a_1 \dots [a_{i_k} a_{i_{k+1}}] \dots a_{i_n},$$

so the map  $\theta$  factors through  $T(\mathfrak{g}) \rightarrow U(\mathfrak{g})$  to a map  $\bar{\theta} : U(\mathfrak{g}) \rightarrow R$ , and the elements  $a_{i_1} a_{i_2} \dots a_{i_k}, i_1 \leq i_2 \leq \dots \leq i_k$  are mapped to  $z_{i_1} \dots z_{i_n}$ , which are linearly independent in  $R$ , so the elements  $a_{i_1} a_{i_2} \dots a_{i_k}, i_1 \leq i_2 \leq \dots \leq i_k$  are also linearly independent in  $U(\mathfrak{g})$ .  $\square$

**Cor. (3.7.8.6).** The map  $\mathfrak{g} \rightarrow U(\mathfrak{g})$  is injective.  $\lrcorner$

**Cor. (3.7.8.7).**  $U(\mathfrak{g})$  has no zero-divisors.  $\lrcorner$

*Proof:* We can use the identities  $x \otimes y - y \otimes x = [xy]$  to make any element in their right representations under the PBW prop(3.7.8.5), so it is clear that the product of two nonzero elements cannot be 0.  $\square$

**Cor. (3.7.8.8).** If  $\mathfrak{h} \subset \mathfrak{g}$ , then the subalgebra of  $U(\mathfrak{g})$  generated by  $\mathfrak{h}$  is isomorphic to  $U(\mathfrak{h})$ .  $\lrcorner$

*Proof:* There is a natural map  $U(\mathfrak{h}) \rightarrow U(\mathfrak{g})$ , and the image is just the subgroup generated by  $\mathfrak{h}$ . The PBW theorem shows this map is injective.  $\square$

**Cor. (3.7.8.9).** If  $\mathfrak{g} = \mathfrak{a} \times \mathfrak{b}$ , then  $U(\mathfrak{g}) = U(\mathfrak{a}) \otimes U(\mathfrak{b})$ .  $\lrcorner$

**Def. (3.7.8.10) [Coproduct of  $U(\mathfrak{g})$ ].** Let  $\mathfrak{g}$  be a Lie algebra, there is a coproduct  $\Delta$  on  $T(\mathfrak{g})$  defined by  $\Delta(g) = g \otimes 1 + 1 \otimes g$ . This coproduct descends to a coproduct  $\Delta : U(\mathfrak{g}) \rightarrow U(\mathfrak{g}) \otimes U(\mathfrak{g})$ .  $\lrcorner$

*Proof:* It suffices to check that  $\Delta(J) \subset J \otimes T(\mathfrak{g}) + T(\mathfrak{g}) \otimes J$ , and this is because

$$\begin{aligned} \Delta(x \otimes y - y \otimes x - [xy]) &= (x \otimes 1 + 1 \otimes x)(y \otimes 1 + 1 \otimes y) - (y \otimes 1 + 1 \otimes y)(x \otimes 1 + 1 \otimes x) - ([xy] \otimes 1 + 1 \otimes [xy]) \\ &= (x \otimes y - y \otimes x - [xy]) \otimes 1 + 1 \otimes (x \otimes y - y \otimes x - [xy]) \end{aligned}$$

$\square$

**Prop. (3.7.8.11) [ $\mathfrak{g}$ -Module Structure].**  $T(\mathfrak{g})$  is a  $\mathfrak{g}$ -module by adjoint action, and this action descends to a  $\mathfrak{g}$ -module structure on  $U(\mathfrak{g})$ .

In fact, this action is inner:  $\text{ad}(g)(z) = gz - zg$  for  $z \in U(\mathfrak{g})$ . In particular,

$$Z(U(\mathfrak{g})) = U(\mathfrak{g})^{\mathfrak{g}}.$$

$\lrcorner$

*Proof:* It suffices to show that  $\mathfrak{g}J \subset J$  and  $\mathfrak{g}I \subset I$ :

$$\begin{aligned} y(a \otimes b - b \otimes a - [ab]) &= [ya] \otimes b + a \otimes [yb] - [yb] \otimes a - b \otimes [ya] - [y[ab]] \\ &= [ya] \otimes b - b \otimes [ya] - [[ya]b] + a \otimes [yb] - [yb] \otimes a - [a[yb]] \end{aligned}$$

$\square$

**Prop. (3.7.8.12) [Transpose].** There is an anti-automorphism  $u \mapsto u^t$  of  $U(\mathfrak{g})$  that  $X^t = -X$  for  $X \in \mathfrak{g}$ .  $\lrcorner$

*Proof:* We first extend this  $t$  to an automorphism of  $T(\mathfrak{g})$ , then we compose with the obvious anti-automorphism  $T(\mathfrak{g}) \rightarrow T(\mathfrak{g})$ . Then we check that this map descends to  $U(\mathfrak{g})$ :  $(X \otimes Y - Y \otimes X - [X, Y])^t = Y \otimes X - X \otimes Y - [Y, X] \in J$ , so  $J^t \in J$ .  $\square$

**Prop. (3.7.8.13) [Graded Algebra of  $U(\mathfrak{g})$ ].** If we let  $S(\mathfrak{g}) = T(\mathfrak{g})/(x \otimes y - y \otimes x)$  be the universal symmetric algebra of  $\mathfrak{g}$ , then it is a graded algebra. There is a filtered structure on  $U(\mathfrak{g})$  given by  $U_i = \{\text{submodule generated by } a_1 a_2 \dots a_j, j \leq i\}$ , then the associated graded algebra of  $U(\mathfrak{g})$  is isomorphic to  $S(\mathfrak{g})$  by PBW theorem.  $\lrcorner$

**Cor. (3.7.8.14).** If  $W$  is a subspace of  $T^n(L)$  that is sent isomorphically onto  $S^n(L)$ , then the image of  $W$  is a complement of  $U_n(L)$  complementary to  $U_{n-1}(L)$ .  $\lrcorner$

**Cor. (3.7.8.15) [Symmetrization Map].** If  $\text{char } k = 0$ , the symmetrization map  $\sigma : S(\mathfrak{g}) \rightarrow T(\mathfrak{g}) \rightarrow U(\mathfrak{g})$  (3.5.5.2) is an isomorphism of  $\mathfrak{g}$ -modules that

$$U^n(\mathfrak{g}) = \sigma(S^n(\mathfrak{g})) \oplus U^{n-1}(\mathfrak{g}).$$

Moreover, by (3.7.8.11), this isomorphism induces an isomorphism

$$S(\mathfrak{g})^{\mathfrak{g}} \cong Z(U(\mathfrak{g})).$$

$\lrcorner$

*Proof:* It is clearly an isomorphism of vector spaces by (3.7.8.14). It suffices to show the map is compatible with  $\mathfrak{g}$ -actions: Because

$$\begin{aligned}\sigma(y_1 \dots y_n) &= \frac{1}{n!} \sum_{\sigma \in \Sigma_n} y_{\sigma(1)} \dots y_{\sigma(n)}, \\ \sigma(g(y_1 \dots y_n)) &= \sigma([gy_1] \dots y_n + \dots + y_1 \dots [gy_n]) \\ &= \frac{1}{n!} \sum_{\sigma \in \Sigma_n} ([gy_{\sigma(1)}] \dots y_{\sigma(n)} + \dots + y_{\sigma(1)} \dots [gy_{\sigma(n)}]) \\ &= g\left(\frac{1}{n!} \sum_{\sigma \in \Sigma_n} y_{\sigma(1)} \dots y_{\sigma(n)}\right)\end{aligned}$$

□

**Prop. (3.7.8.16).** If  $\text{char } k = 0$ , then the set of primitive elements (3.11.2.4) are just  $\mathfrak{g}$ . ┘

*Proof:* If  $f$  is primitive, then the leading term  $f_0$  of  $f$  is also primitive in  $\text{gr}U(\mathfrak{g}) \cong S(\mathfrak{g})$ . Now consider  $S(\mathfrak{g}) \xrightarrow{\Delta} S(\mathfrak{g}) \otimes S(\mathfrak{g}) \xrightarrow{\mu} S(\mathfrak{g})$ , then if  $f$  is of degree  $n$ , then  $2^n f_0 = 2f_0$ , which means  $n = 1$ . So  $f = c + f_0$ , and  $c = 0$ . □

**Prop. (3.7.8.17)** [ $U(\mathfrak{g})$  is Noetherian]. For a f.d. Lie algebra  $\mathfrak{g}$ ,  $U(\mathfrak{g})$  is left Noetherian. ┘

*Proof:* This is because the graded structure on  $U(\mathfrak{g})$  satisfies  $\text{gr}U(\mathfrak{g}) \cong S(\mathfrak{g}) \cong \mathbb{C}[X_1, \dots, X_n]$  is Noetherian, so  $U(\mathfrak{g})$  is Noetherian itself. □

### Free Lie Algebras

**Def. (3.7.8.18)** [Free Lie Algebras]. For  $X \in \text{Set}$ , we can define the **free Lie algebra**  $FL(X)$  to be the intersection of Lie subalgebras in  $[F(X)]$  containing  $\sigma(X)$ , where  $F(X)$  is the free algebra generated by  $X$ .

Then the free Lie algebra  $FL : X \mapsto FL(X)$  defines a functor  $\text{Set} \rightarrow \text{LieAlg}$  that is left adjoint to the forgetful functor. ┘

*Proof:* We need to show that for any Lie algebra  $L$  and a map of sets  $\theta : X \rightarrow L$ , there is a unique  $\varphi$  completing the upper left triangular diagram:

$$\begin{array}{ccccc} X & \xrightarrow{i} & FL(X) & \longrightarrow & F(X) \\ \downarrow \theta & \swarrow \varphi & & \searrow \bar{\varphi} & \downarrow \bar{\theta} \\ L & \xrightarrow{\sigma} & U(L) & & \end{array}$$

Notice  $\bar{\varphi}^{-1}(\sigma(L))$  is a Lie algebra containing  $X$  thus containing  $FL(X)$ , so it induces a  $\varphi$ .

And for the uniqueness, if there are two  $\varphi_1, \varphi_2$ , then the element that they coincide is a Lie algebra containing  $X$ , thus containing  $FL(X)$ , so  $\varphi_1 = \varphi_2$ . □

**Cor. (3.7.8.19).**  $U(FL(X)) \cong FX$  for any set  $X$ . ┘

*Proof:* Because  $U \circ FL$  and  $F$  are both left adjoint to the forgetful functor  $\text{Alg}^{\text{asso}} \rightarrow \text{Set}$ . □

### Invariant Polynomials

#### $Z(U(\mathfrak{g}))$

**Prop. (3.7.8.20) [Kostant].**  $S\mathfrak{g}$  is a free  $(S\mathfrak{g})^{\mathfrak{g}}$ -module, and for any  $V \in \text{Irr}^{\text{fd}}(\mathfrak{g})$ ,  $\text{Hom}_{\mathfrak{g}}(V, S\mathfrak{g})$  is a free  $(S\mathfrak{g})^{\mathfrak{g}}$ -module of rank  $\dim V[0]$ .  $\lrcorner$

*Proof:* Cf.[Rep of Lie Algebras, Etingof]P42.  $\square$

**Cor. (3.7.8.21) [Kostant].** When  $\text{char } k = 0$ ,  $U(\mathfrak{g})$  is a free  $Z(U(\mathfrak{g}))$ -module, and for any  $V \in \text{Irr}^{\text{fd}}(\mathfrak{g})$ ,  $\text{Hom}_{\mathfrak{g}}(V, U(\mathfrak{g}))$  is a free  $Z(U(\mathfrak{g}))$ -module of rank  $\dim V[0]$ .  $\lrcorner$

*Proof:* This follows from (3.7.8.15).  $\square$

**Thm. (3.7.8.22) [Harish-Chandra Isomorphism].** If  $(\mathfrak{g}, \mathfrak{h})$  is a split semisimple Lie algebra, then there is an isomorphism

$$\text{H-C} : Z(U(\mathfrak{g})) \cong \mathbb{C}[\mathfrak{h}^*]^{W^\bullet}.$$

(It just maps  $z \in Z(L)$  to its pure  $H$  part and transform every indeterminants  $h_i$  to  $h_i - 1$ . e.g.  $z = h^2 + 2h + 1 + 4fe \in Z(\mathfrak{sl}_2)$  is mapped to  $h^2$  in  $S(H)$ .)  $\lrcorner$

*Proof:* Cf.[Etingof, Rep of Lie Groups]P48.  $\square$

**Cor. (3.7.8.23) [Chevalley].** If  $(\mathfrak{g}, \mathfrak{h})$  is a split semisimple Lie algebra, then  $Z(U(\mathfrak{g}))$  is isomorphic to  $k[X_1, \dots, X_{\text{rank } \mathfrak{g}}]$ . In particular,  $Z(U(\mathfrak{sl}_2)) = \mathbb{C}[\frac{1}{2}h^2 + ef + fe]$  (3.7.8.24).  $\lrcorner$

*Proof:* Cf.[Carter]P236.  $\color{red}?$

Because there is a commutative diagram of isomorphisms of algebras:

$$\begin{array}{ccc} S(L)^G & \xrightarrow{\alpha} & P(L)^G \\ \downarrow \eta & & \downarrow \varphi \\ S(H)^W & \xrightarrow{\beta} & P(H)^W \end{array}$$

Where  $P$  is the polynomial ring  $\cong S(L^*)$ , the horizontal is Killing isomorphisms and vertical is the restriction maps. Cf.[Carter prop 13.32]  $\color{red}?$ .

The Harish-Chandra isomorphism (3.7.8.22) gives an isomorphism of algebras  $Z(\mathfrak{g}) \rightarrow S(\mathfrak{h})^W$   $\square$

**Def. (3.7.8.24) [Casimir Element].** If  $\mathfrak{g}$  is semisimple, by (3.7.2.1) the Killing form is non-degenerate, thus we choose a basis  $x_i$  of  $L$  and a dual basis  $y_i$ , then  $c = \sum x_i y_i$  is independent of  $x_i$  chosen by (3.5.11.4), and is called the **Casimir element** of  $U(\mathfrak{g})$ .  $\lrcorner$

**Prop. (3.7.8.25).** If  $\mathfrak{g}$  is semisimple, then the Casimir element lies in  $Z(U(\mathfrak{g}))$ .  $\lrcorner$

*Proof:*  $\square$

### Miscellaneous

**Prop. (3.7.8.26) [Grading on  $U(\mathfrak{sl}_2(\mathbb{C}))$ ].** Let  $H, R, L$  be a basis of  $\mathfrak{sl}_2(\mathbb{C})$  (3.7.2.11), if we define a grading as  $\deg R = 1, \deg H = 0, \deg L = -1$ , then this is descends to a grading on  $U(\mathfrak{g})$ , and the degree 0 part is the ring  $\mathcal{R} = \mathbb{C}[\Delta, H]$ . Also, there is a decomposition:

$$U(\mathfrak{g}) = \bigoplus_{i \geq 0} L^i \mathcal{R} \oplus \bigoplus_{i > 0} R^i \mathcal{R}.$$

$\lrcorner$

## 9 Representations

**Def. (3.7.9.1) [Representations].** A representation of a Lie algebra  $\mathfrak{g}$  over a vector space  $V$  is a Lie homomorphism  $\mathfrak{g} \rightarrow \mathfrak{gl}_V$ . The category of Representations of Lie algebras is denoted by  $\mathcal{Rep}(\mathfrak{g})$ .  $\lrcorner$

**Def. (3.7.9.2) [Tensor Product of Representations].** Let  $(V_1, \pi_1), (V_2, \pi_2)$  be two representations of a Lie algebra  $\mathfrak{g}$ , then  $(V_1 \otimes V_2, \pi_1 \otimes \pi_2)$  is a representation of  $\mathfrak{g}$  given by

$$(\pi_1 \otimes \pi_2)(g)(v_1 \otimes v_2) = \pi_1(g)v_1 \otimes v_2 + v_1 \otimes \pi_2(g)v_2.$$

$\lrcorner$

**Def. (3.7.9.3) [Representation on Tensor Algebras].** If  $(V, \rho)$  is a representation of  $\mathfrak{g}$ , then  $\mathfrak{g}$  acts on  $T(V)$  via (3.7.9.2). Also, the ideals  $I, J$  are invariant under action of  $\mathfrak{g}$ , thus the representation extends to  $\text{Sym}(V)$  and  $\wedge(V)$ . Also it preserves degree, thus it induces representations on  $\text{Sym}^k(V)$  and  $\wedge^k(V)$ .  $\lrcorner$

*Proof:*

$$g(a \otimes a) = g(a) \otimes a + a \otimes g(a) = (a + g(a)) \otimes (a + g(a)) - a \otimes a - g(a) \otimes g(a)$$

and

$$g(a \otimes b - b \otimes a) = g(a) \otimes b + a \otimes g(b) - g(b) \otimes a - b \otimes g(a) = g(a) \otimes b - b \otimes g(a) + a \otimes g(b) - g(b) \otimes a$$

$\square$

**Def. (3.7.9.4) [Dual Representation].** If  $(\varphi, V)$  is a representation of  $\mathfrak{g}$ , we define the **dual representation**  $(\varphi^*, V^\vee)$  as

$$(\varphi^*(g)(v^*), v) = (v^*, \varphi(g)v).$$

$\lrcorner$

**Def. (3.7.9.5) [Trace Form].** The **trace form** of a representation  $(V, \rho)$  of a Lie algebra  $\mathfrak{g}$  is an invariant symmetric form  $\beta_\rho$  defined by  $(x, y) \mapsto \text{tr}(\rho(x) \circ \rho(y))$ .  $\lrcorner$

*Proof:* It is invariant because

$$\begin{aligned} \text{tr}(\rho([x, y]) \circ \rho(z)) &= \text{tr}(\rho(x)\rho(y)\rho(z)) - \text{tr}(\rho(y)\rho(x)\rho(z)) \\ &= \text{tr}(\rho(x)\rho(y)\rho(z)) - \text{tr}(\rho(x)\rho(z)\rho(y)) \\ &= \text{tr}(\rho(x)\rho([y, z])). \end{aligned}$$

$\square$

**Prop. (3.7.9.6).** If  $\rho$  is a faithful representation of  $\mathfrak{g}$  and  $\mathfrak{g}$  is semisimple, then  $\beta_\rho$  is non-degenerate.  $\lrcorner$

*Proof:* The Cartan's criteria (3.7.1.27) shows  $\mathfrak{g}^\perp$  is a solvable sub-Lie algebra, so it must be 0 as  $\mathfrak{g}$  is semisimple (3.7.1.23).  $\square$

**Prop. (3.7.9.7).** Let  $L$  be a simple lie algebra, then any two non-degenerate symmetric invariant bilinear forms on  $L$  is proportional. Because any of this form corresponds to a  $L$ -morphism from  $L$  to  $L^*$ . In particular, when  $L \subset \mathfrak{gl}_n$ , the usual trace is proportional to the Killing form.  $\lrcorner$

**Remark (3.7.9.8) [Rep( $\mathfrak{g}$ )].** For  $\mathfrak{g} \in \text{Lie}_k$ , let  $\text{Rep}^{\text{fd}}(\mathfrak{g})$  denote the category of f.d. representations of  $\mathfrak{g}$ .  
 $\lrcorner$

**Prop. (3.7.9.9) [Schur's Lemma].** Let  $\dim \mathfrak{g} < \infty$  and  $M \in \text{Irr}(\mathfrak{g})$ , then  $\dim M \leq \aleph_0$ . In particular, Shur's lemma holds by (24.1.1.10). In particular,  $Z(U(\mathfrak{g}))$  acts by a character  $\chi : Z(U(\mathfrak{g})) \rightarrow k$ , called the **infinitesimal character** of  $M$ .  
 $\lrcorner$

*Proof:* It is of countable dimensional because  $\dim U(\mathfrak{g})$  is countable.  $\square$

**Prop. (3.7.9.10) [Generalized Eigenspace Decomposition for Nilpotent Lie Algebras].** If  $k = \bar{k}$ ,  $\mathfrak{g}$  is a nilpotent algebra and  $(V, \rho) \in \text{Rep}(\mathfrak{g})$ , then there is a generalized eigenspace decomposition

$$V = \bigoplus_{\lambda \in \mathfrak{g}^*} V^\lambda,$$

where  $V^\lambda$  are the generalized eigenspaces, and they are stable under action of  $\mathfrak{g}$ .  
 $\lrcorner$

*Proof:* We use an induction argument:

If each  $a \in \mathfrak{h}$  has only one eigenvalue, then  $V$  is the generalized eigenspace  $V_\lambda$  for some function  $\lambda$  on  $\mathfrak{h}$ . Then it suffices to show that  $\lambda$  is linear. But this is because by Lie's theorem elements of  $\mathfrak{h}$  has a common eigenvector.

If for some  $a_0$ ,  $\text{ad}(a_0)$  has two eigenvalues. Now  $\mathfrak{h}$  is nilpotent, so  $\mathfrak{h} \subset \mathfrak{h}_0^{a_0}$ , and hence  $\pi(h)V_\lambda^{a_0} \subset V_\lambda^{a_0}$  for any  $\lambda$  by (3.7.1.12).

As  $k$  is alg.closed,  $V$  can be written as a sum of generalized eigenspaces of  $a_0$ , and each generalized eigenspace is a subrepresentation of  $\mathfrak{h}$ , thus we can use induction.  $\square$

**Def. (3.7.9.11) [Casimir Operator].** Let  $\mathfrak{g}$  be a semisimple Lie algebra of dimension  $n$ , and  $\beta : \mathfrak{g} \times \mathfrak{g} \rightarrow k$  a non-degenerate invariant bilinear form on  $\mathfrak{g}$ . Let  $e_i$  be a basis of  $\mathfrak{g}$  and  $e'_i$  be the dual basis under  $\beta$ , then  $c = \sum e_i e'_i \in U(\mathfrak{g})$  is independent of the basis, and lies in the center of  $U(\mathfrak{g})$ .

Now the trace form  $\beta_V$  for a faithful representation  $\mathfrak{g} \rightarrow \mathfrak{gl}_V$  of  $\mathfrak{g}$  is non-degenerate and invariant (3.7.9.6), then the corresponding elements  $c_\rho$  is called the **Casimir element** of  $(V, \rho)$ , and the action  $c_V$  of  $c_\rho$  on  $V$  is called the **Casimir operator** of  $(V, \rho)$ .

The Casimir operator  $c_V$  is a  $\mathfrak{g}$ -module homomorphism, and has trace  $n$ .  
 $\lrcorner$

*Proof:* The independence of basis is by (3.5.11.4). To show it is in the center of  $\mathcal{U}(\mathfrak{g})$ , Cf. [Mil13].P50?.

Casimir operator  $c_V$  is a  $\mathfrak{g}$ -module homomorphism follows from the fact  $c_\rho$  is in the center of  $U(\mathfrak{g})$ , and its trace is

$$\text{tr}(c_V) = \sum_i \text{tr}(e_i e'_i) = \sum_i (\beta_V(e_i, e'_i)) = n$$

$\square$

**Def. (3.7.9.12) [Unimodular Lie Algebras].** A f.d Lie algebra  $\mathfrak{g}$  is called **unimodular** if  $\wedge \text{ad}$  is a trivial representation of  $\mathfrak{g}$ .  
 $\lrcorner$

**Prop. (3.7.9.13).**

- If  $\mathfrak{g} = [\mathfrak{g}, \mathfrak{g}]$ , then  $\mathfrak{g}$  is unimodular.
- If  $\mathfrak{g}$  is nilpotent, then  $\mathfrak{g}$  is unimodular.
- If  $\mathfrak{g}_1, \mathfrak{g}_2$  is nilpotent, then  $\mathfrak{g}_1 \oplus \mathfrak{g}_2$  is unimodular.

- If  $\mathfrak{g}$  is reductive, then  $\mathfrak{g}$  is unimodular. ┘

**Lemma (3.7.9.14) [Zassenhaus].** Let  $\mathfrak{g}$  be a Lie algebra and  $\mathfrak{g}'$  an ideal of  $\mathfrak{g}$ . A representation  $\rho'$  of  $\mathfrak{g}'$  extends to a representation  $\rho$  of  $\mathfrak{g}$  that  $\mathfrak{n}_{\rho'}(\mathfrak{g}') \subset \mathfrak{n}_{\rho}(\mathfrak{g})$  if there exists a Lie subalgebra  $\mathfrak{h}$  of  $\mathfrak{g}$  that  $\mathfrak{g} = \mathfrak{g}' \oplus \mathfrak{h}$  and  $[\mathfrak{h}, \mathfrak{g}'] \subset \mathfrak{n}_{\rho'}(\mathfrak{g}')$ . If moreover  $\text{ad}_{\mathfrak{g}}(x)|_{\mathfrak{g}'}$  is nilpotent for all  $x \in \mathfrak{h}$ , then  $\rho$  can be chosen that  $\mathfrak{h} \subset \mathfrak{n}_{\rho}(\mathfrak{g})$ . ┘

*Proof:* Cf. [Mil13]P65. □

**Prop. (3.7.9.15) [Nilpotent Representation Extension].** Let  $\mathfrak{g}$  be a Lie algebra,  $\mathfrak{a}$  a nilpotent ideal of  $\mathfrak{g}$ , and  $\rho$  a representation of  $\mathfrak{a}$  that  $\rho(x)$  is nilpotent for all  $x \in \mathfrak{a}$ . Then  $\rho$  extends to a representation  $\rho'$  of  $\mathfrak{g}$  that  $\rho'(x)$  is nilpotent for all  $x \in \mathfrak{n}$  the largest nilpotent ideal of  $\mathfrak{g}$ . ┘

*Proof:* □

**Thm. (3.7.9.16) [Ado].** Let  $\mathfrak{g}$  be a Lie algebra over a field  $k$  of char 0, then there exists a faithful representation  $\rho$  of  $\mathfrak{g}$  that  $\rho(\mathfrak{n})$  consists of nilpotent endomorphisms, where  $\mathfrak{n}$  is the largest nilpotent radical. If  $\mathfrak{g}$  is of f.d., then this representation can be chosen to be of f.d.. In particular, any finite dimensional Lie algebra can be embedded in some  $\mathfrak{gl}(n, k)$ . ┘

*Proof:* This is true for any commutative Lie algebras, for example we can use tensor products of  $c \mapsto \begin{bmatrix} 0 & c \\ 0 & 0 \end{bmatrix}$ . Choose a faithful representation of the center  $\mathfrak{c}$  of  $\mathfrak{g}$  that every element is mapped to a nilpotent endomorphism, and then extend it to a representation  $\rho_1$  of  $\mathfrak{g}$  by (3.7.9.15). Let  $\rho_2$  be the adjoint representation of  $\mathfrak{g}$ , and  $\rho = \rho_1 \oplus \rho_2$ . Then  $\ker(\rho) = \ker(\rho_1) \cap \ker(\rho_2) = \ker(\rho_1) \cap \mathfrak{c} = 0$ , so this is faithful. And it sends an element in  $\mathfrak{n}$  to a nilpotent endomorphism because each  $\rho_1$  and  $\rho_2$  do. □

**Remark (3.7.9.17).** In fact, this is true for Lie algebras over a field of char  $p$ , too, Cf. [JACOBSON, N. 1962. Lie algebras.] Chap 6.3. ┘

### Semisimple Representations

For representations of a split semisimple Lie algebra, See [Representations of Semisimple Lie Algebras](#).

## 10 Amitsur-Levitski

### Preliminary

Notice that in this paper, Kostant considers **reductive** lie groups. But in the range of this paper, the abelian part makes no contribution in the alternative part because they commutes with all elements. So We well just consider a **semisimple** Lie algebra in order to get a non-degenerate Killing form.

**Prop. (3.7.10.1).**

$$\Gamma(\wedge^{2k}(\mathfrak{g})) = R^k \in S^k(\mathfrak{g})$$

$$\Gamma(x_1 \wedge \cdots \wedge x_k) = \sum_{v \in \Pi_k} [x_{v(1)}, x_{v(2)}] \cdots [x_{v(2k-1)}, x_{v(2k)}]$$

┘

*Proof:* The proof is in fact simple, just notice that for every  $v \in \Pi_k$  a representative of the subgroup  $\Sigma_{2k,2}$  permuting the unordered pairs  $\{(1,2), (3,4), \dots, (2k-1, 2k)\}$ , the element in  $v\Sigma_{2k,2}$  in fact combine in pairs to  $[x_{v(2i-1)}, x_{v(2i)}]$  and together the  $k!$  permutation of them compose a  $[x_{v(1)}, x_{v(2)}] \cdots [x_{v(2k-1)}, x_{v(2k)}]$ .  $\square$

Later he finds the dual of  $\Gamma$ , that is:

**Prop. (3.7.10.2).**  $\gamma$  is  $\mathcal{B}$  dual to  $\Gamma$ ,

$$(\Gamma(\zeta), y_1 \cdots y_r) = (-1)^r (\zeta, dy_1 \wedge \cdots \wedge dy_r) \quad \forall \zeta \in \wedge^{2r} \mathfrak{g} \text{ and } y_i \in \mathfrak{g}.$$

In particular,

$$\Gamma(\zeta)(x) = \frac{(-1)^r}{r!} (\zeta, (dx)^r) \quad \forall \zeta \in \wedge^{2r} \mathfrak{g} \text{ and } x \in \mathfrak{g}.$$

┘

For the proof just notice that  $(-dw, x_i \wedge x_j) = (w_i, [x_i, x_j])$  and

$$(x_1 \otimes \cdots \otimes x_r, y_1 \otimes \cdots \otimes y_r) = \sum_{\sigma} (x_1, y_{\sigma(1)}) \cdots (x_r, y_{\sigma(r)})$$

So  $\dim$  of  $R^k$  equals the  $\dim$  of image of  $\gamma_r$ , that is, spanned by  $(dx)^k$  (because they are dual).

We say that a representation of  $\mathfrak{g}$  satisfies  $m$ -fold standard identity if the alternating sum of any  $m$  elements of image of  $\mathfrak{g}$  is 0. Obviously, this is equivalent to:

$$\tau(R^k(\mathfrak{g})) \subset \ker \pi_V$$

Now let  $o(\mathfrak{g})$  be the maximum rank of  $dw, w \in \mathfrak{g}$ , then by the discussion of the first paper, when  $\mathfrak{g}$  is semisimple,  $o(\mathfrak{g}) = r$ . So the  $2r$ -identity is satisfied by any representation of  $\mathfrak{g}$ .

Furthermore a prop of [Harish-Chandra] assert for any nonzero element  $u \in U(\mathfrak{g})$ , there is a representation such that  $\pi(U) \neq 0$ . So this is a sharp bound for general representations.

But one might naturally ask: Can we find the specific bound for a particular representation of a specific  $\mathfrak{g}$ ? The answer is YES.

**Prop. (3.7.10.3).**  $\gamma$  vanishes on the ideal  $J'_+ \cdot S(\mathfrak{g})$ .  $\square$

*Proof:* The proof comes from the observation  $\pi$  is a  $G$ -map and by **Cartan-Koszul** theory, invariant elements in  $\wedge \mathfrak{g}$  are naturally isomorphic to the cohomology of  $\mathfrak{g}$  and  $\gamma(w) = -dw$  is clearly exact, Thus  $\gamma(w_1 w_2 \dots w_i) = (-1)^i dw_1 \wedge \cdots \wedge dw_i$  is exact too. So  $\gamma(w) = 0$ .  $\square$

**Cor. (3.7.10.4).**  $M = R^r \in H^r$ , so it consists of harmonic functions.  $\square$

*Proof:*  $(u, \Gamma(y)) = (\gamma(u), y) = 0 \quad \forall u$  invariant, by Thm; so  $R^k = \text{Image } \Gamma$  is harmonic.  $\square$

### Generalized Amitsur-Levitski

Let  $E^k \subset U(\mathfrak{g})$  be spanned by  $y^k, y$  nilpotent in  $\mathfrak{g}$ , and  $Z$  the center.

in [Kos97] Kostant proved that the PBW isomorphism  $\delta : S(\mathfrak{g}) \longrightarrow U(\mathfrak{g})$  induces  $\delta(J) = Z, \delta(H) = E$ .

so  $\tau : T(\mathfrak{g}) \longrightarrow U(\mathfrak{g})$  induces

$$\tau(A^{2k}(\mathfrak{g})) = \delta(R^k(\mathfrak{g})) \subset E^k.$$

Define  $\epsilon(\pi)$  the minimum integer  $k$  that  $\pi(y)^k = 0, \forall y$  nilpotent in  $\mathfrak{g}$ . Then clearly:

**Prop. (3.7.10.5)[Generalized Amitsur-Levitski].**  $\pi$  satisfies the  $2\epsilon(\pi)$ -fold standard identity.  $\lrcorner$

**Prop. (3.7.10.6).** If  $\pi$  satisfies the  $m$ -identity, it satisfies the  $m+1$ -identity (By taking a summation on a fixed first element  $\sigma(1)$ ).  $\lrcorner$

**Prop. (3.7.10.7).**

- Let  $\pi$  be the natural representation of  $\mathfrak{gl}_n$  on  $\mathbb{C}^n$  then  $\epsilon(\pi) = n$ .
- If  $n$  even and  $\pi$  the natural representation of skew-symmetric matrixes on  $\mathbb{C}^n$  then  $\epsilon(\pi) = n - 1$ .

From this one derives the **classical Amitsur-Levitski prop** that  $GL_n(\mathbb{C})$  satisfies the  $n$ -fold standard identity.  $\lrcorner$

*Proof:* 1: the **abstract Jordan decomposition** which assures  $x$  is nilpotent in  $\mathfrak{gl}_n$  if  $\pi(x)$  is nilpotent.

2: comes from the **Lacobson-Morosov** Thm that any nilpotent element of  $\mathfrak{g}$  is contained in a  $\mathfrak{sl}_2$ -triple. Thus we only need to show that  $W$  is reducible considered as this  $\mathfrak{sl}_2$ -triple-module.

But then an irreducible representation of  $\mathfrak{sl}_2$  preserves a non-degenerate bilinear form it must be odd dimensional cause a non-degenerate bilinear form is equivalent to a  $\mathfrak{g}$ -map from  $V$  to  $V^*$ .

And there can be constructed an anti-symmetric form defined on the  $\mathfrak{sl}_2$ -representation on  $\text{Sym}_{2k}[x, y]$  by (3.7.10.9), so there can't exist symmetric  $\mathfrak{g}$ -invariant form. So this representation must be reducible.  $\square$

**Cor. (3.7.10.8)[Classical Amitsur-Levitski].** By (3.7.10.5),

$$[[x_1, x_2, \dots, x_n]] = \sum_{\sigma} \text{sgn}(\sigma) x_{\sigma(1)} x_{\sigma(2)} \cdots x_{\sigma(k)} = 0 \quad \forall x_i \in \mathfrak{gl}_n$$

called  $n$ -fold **standard identity**.

$\lrcorner$

**Prop. (3.7.10.9).** For a construction of the anti-symmetric form, notice

$$\pi(g)f(x_1, x_2) = f(g_{11}x_1 + g_{12}x_2, g_{21}x_1 + g_{22}x_2).$$

Set

$$v_k = \binom{m}{k} x_1^{m-k} x_2^k, \quad \Omega(v_k, v_{m-k}) = (-1)^k \binom{m}{k}. \quad \Omega(v_k, v_p) = 0, \quad k + p \neq m.$$

One verifies:

$$\Omega(g \cdot u, g \cdot v) = (\det g)^m \Omega(u, v) \quad \forall g \in GL(2, \mathbb{C})$$

So when  $m = n - 1$  is odd, this is a symplectic form preserved by  $\mathfrak{sl}_2$ .  $\lrcorner$

### A computable Formula

Finally, Kostant gave a computable formula for determining  $\epsilon(\pi)$ . Clearly we just need to consider irreducible representation.

Let  $\pi_\lambda$  be the irreducible representation of highest weight  $\lambda$ , then the dual representation  $\pi_{\lambda'}$  has highest weight the negative of the lowest weight of  $\pi_\lambda$ , that is,  $-w_o(\gamma)$ .

But then  $\lambda + \lambda'$  is a sum of simple positive roots.  $\lambda + \lambda' = \sum_{i=1}^n m_i \alpha_i$ . Put  $\epsilon(\lambda) = 1 + \sum_{i=1}^n m_i$ . then:

**Prop. (3.7.10.10).**  $\epsilon(\pi_\lambda) = \epsilon(\lambda)$ .  $\lrcorner$

*Proof:* Just choose a  $\mathfrak{sl}_2$ -triple  $\{e, x, f\}$  with  $\alpha(x) = 2 \forall \alpha$  simple root. Then  $\lambda(x)$  and  $-\lambda'(x)$  are respectively the maximal and minimal eigenvalues of  $\pi(x)$ .  $(\lambda + \lambda')(x) = 2(\epsilon(\lambda) - 1)$ . Thus  $f$  has nilpotent degree  $\epsilon(\lambda)$ . And any nilpotent element action increases the eigenvalue of a eigenvector of  $x$  by at least 2, the prop follows.  $\square$

### Further Work

(cf. [Pro76]) Another different proof of the Amitsur-Levitski theorem is given by Kostant using techniques related to **trace identities**. It turns out that method sheds more light. Later is studied the polynomial of matrices invariant under the conjugation action.

Artin conjectured that all the invariants is polynomials of the Trace polynomial  $Tr(A_1 A_2 \cdots A_n)$  (Proved)

And further, the relations among these invariant all turned out to be consequences of the prop of Hamilton-Cayley. All this is made into the **Invariant Theory**.

#### Prop. (3.7.10.11) [Interesting results].

1. If an algebra over a field of characteristic 0 satisfies the identity  $X^n = 0$ , then it satisfies all the identities of  $n \times n$  matrices.
2. The space of multilinear identities of degree  $m$  of  $n \times n$  matrices can be described completely in terms of Young diagrams.

┘

## 11 Lie $p$ -Algebras

**Remark (3.7.11.1).** In this subsection, let  $k$  be a field of characteristic  $p$ .

┘

**Def. (3.7.11.2) [Lie  $p$ -Algebras].** Let  $x_0, x_1$  be elements of a Lie algebra over  $k$  of characteristic  $p$ , then for  $0 < r < p$ , let  $s_r(x_0, x_1)$  denote  $\frac{1}{r}$  times coefficient of  $t^{r-1}$  in the expression of  $\text{ad}_{tx+y}^{p-1}(x)$ .

Then a **Lie  $p$ -algebra** is a Lie algebra  $\mathfrak{g}$  over  $k$  equipped with a map  $x \mapsto x^{[p]} : \mathfrak{g} \rightarrow \mathfrak{g}$  such that

- $(cx)^{[p]} = c^p x^{[p]}$  where  $c \in k$ .
- $\text{ad}(x^{[p]}) = (\text{ad}(x))^p$ .
- $(x + y)^{[p]} = x^{[p]} + y^{[p]} + \sum_{r=1}^{p-1} s_r(x, y)$ .

┘

**Example (3.7.11.3).** If  $L$  is an Abelian Lie algebra, then it can be regarded as a Lie  $p$ -algebra by assigning  $x^{[p]} = 0$ .

If  $A$  is an associative algebra, then it can be given a Lie  $p$ -algebra structure by assigning  $x^{[p]} = x^p$ .

┘

*Proof:* To show  $A$  is a Lie  $p$ -algebra, we check  $\text{ad}(x)^p(y) = (l_x - r_x)^p(y) = l_x^p - r_x^p(y) = \text{ad}(x^p)(y)$ . For the third formula, notice

$$\text{ad}(tx + y)^{p-1}(x) = \sum_{i=0}^{p-1} (-i)^i \binom{p-1}{i} (tx + y)^{p-1-i} x (tx + y)^i$$

Notice that  $(-i)^i \binom{p-1}{i} \equiv 1 \pmod{p}$ , so  $s_r(x, y)$  is equivalent to the sum of words of  $x, y$  with  $r$   $x$ s. So the third formula clearly holds.  $\square$

**Def. (3.7.11.4) [Representations].** A **representation of a Lie  $p$ -algebra**  $\mathfrak{g}$  over a  $k$ -vector space  $V$  is a homomorphism  $\mathfrak{g} \rightarrow \mathfrak{gl}_V$  of Lie  $p$ -algebras.

┘

**Def. (3.7.11.5) [Universal Enveloping  $p$ -Algebra].** The **universal enveloping  $p$ -algebra** of a Lie  $p$ -algebra  $\mathfrak{g}$  is defined to be

$$U^{[p]}(\mathfrak{g}) = T(\mathfrak{g})/J^{[p]}, \quad T(\mathfrak{g}) = \bigoplus_{n=0}^{\infty} \mathfrak{g}^{\otimes n}$$

which is a graded algebra  $T(\mathfrak{g})$  quotients the ideal  $J = (\{x \otimes y - y \otimes x - [xy], x^{\otimes p} - x^{[p]}\})$ .

There is a natural linear map  $\sigma : \mathfrak{g} \rightarrow U^{[p]}(\mathfrak{g})$ . ┘

**Prop. (3.7.11.6).** The universal enveloping  $p$ -algebra  $U^{[p]} : \mathfrak{g} \mapsto U^{[p]}(\mathfrak{g})$  defines a functor  $LiepAlg \rightarrow AssAlg$  that is left adjoint to the canonical functor  $AssAlg_k \rightarrow LiepAlg_k$  (3.7.11.3). ┘

*Proof:* For any associative algebra  $A$  and a morphism of Lie  $p$ -algebras  $\mathfrak{g} \rightarrow [A]$ , there is easily seen a morphism  $U^{[p]}(\mathfrak{g}) \rightarrow A$ , and it is unique. □

**Cor. (3.7.11.7) [Representation as Modules].** A representation of a Lie  $p$ -algebra  $\mathfrak{g}$  (3.7.11.4) is the same as a representation of  $U^{[p]}(\mathfrak{g})$ . ┘

**Prop. (3.7.11.8).** Let  $e_i$  be a  $k$ -vector space basis of  $\mathfrak{g}$ , then the monomials

$$\{e_{i_1}^{n_{i_1}} e_{i_2}^{n_{i_2}} \dots e_{i_r}^{n_{i_r}} \mid i_1 < i_2 < \dots < i_r, 0 < n_{i_k} < p\}$$

for different  $r$  form a basis of  $U^{[p]}(\mathfrak{g})$ . ┘

*Proof:* This is a consequence of PBW theorem (3.7.8.5). □

**Cor. (3.7.11.9).** If  $\dim_k \mathfrak{g} < \infty$ , then so does  $U^{[p]}(\mathfrak{g})$ , and the map  $i : \mathfrak{g} \rightarrow U^{[p]}(\mathfrak{g})$  is injective. ┘

- $[L_0, L_0] = 0$ .

┘

**Def. (3.8.2.3) [Universal Borcherds Algebras].** Let  $I \subset N$  and  $\mathfrak{A} = (a_{ij}) \in \text{Mat}(I \times I; \mathbb{R})$  s.t.

- $a_{ij} < 0$  for  $i \neq j$ .
- If  $a_{ii} > 0$ , then  $2a_{ij}/a_{ii} \in \mathbb{Z}$  for any  $j$ .

┘

**Prop. (3.8.2.4).** Let  $L$  be a universal Borcherds algebra and  $I \in \text{Ideal}(L)$  is contained in  $Z(L)$ . Then  $L/I$  retains the structure of a Borcherds algebra.

┘

*Proof:* Cf.[Car05]P522.

□

**Thm. (3.8.2.5) [Classifying Borcherds Algebras].** Let  $L$  be a Borcherds algebra, then there exists a unique universal Borcherds algebra  $L_u$  (3.8.2.3) and some graded homomorphism  $f : L_u \rightarrow L$  (n.n. unique) s.t.

- $\ker(f) \subset Z(L_u)$ .
- $\text{Im}(f)$  is an ideal of  $L$ .
- $L$  is a semi-direct product of  $\text{Im}(f)$  with an Abelian Lie algebra of outer derivations lying in  $L_0$  and preserving all subspaces  $\mathbb{R}\bar{e}_i$  and  $\mathbb{R}\bar{f}_i$ .

Moreover,  $f$  respects the involutions and the bilinear forms.  $\lrcorner$

*Proof:*  $\square$

### Representations of Borchers Algebras

**Thm. (3.8.2.6) [Borchers' Character Formula].** Let  $L$  be a Borchers algebra,  $\lambda \in P^+$  a dominant integral weight and  $L_\lambda$  the corresponding irreducible highest weight representation, then

$$\text{ch } L_\lambda = \frac{\sum_{w \in W} \varepsilon(w) w \left( \sum_{\Psi} (-1)^{\#\Psi} e^{\lambda + \rho - \Psi} \right)}{e^\rho \prod_{\alpha \in \Phi^+} (1 - e^{-\alpha})^{m_\alpha}},$$

where  $m_\alpha = \dim L[\alpha]$ , and  $\Psi$  runs through all finite subsets of mutually orthogonal imaginary fundamental roots, and  $\rho \in Q \otimes \mathbb{R}$  s.t.

$$\langle \rho, \alpha_i \rangle = \frac{1}{2} \langle \alpha_i, \alpha_i \rangle$$

for any real fundamental root  $\alpha_i$ .

The denominator  $\Delta_L = e^\rho \prod_{\alpha \in \Phi^+} (1 - e^{-\alpha})^{m_\alpha}$  is called the **Borchers' denominator** of  $L$ .  $\lrcorner$

*Proof:*  $\square$

**Thm. (3.8.2.7) [Borchers' Denominator Formula].**

$$\Delta_L = e^\rho \prod_{\alpha \in \Phi^+} (1 - e^{-\alpha})^{m_\alpha} = \sum_{w \in W} w \left( e^\rho \sum_{\Psi} (-1)^{\#\Psi} e^{-\sum \Phi} \right).$$

$\lrcorner$

*Proof:*  $\square$

### the Monstrous Lie Algebra

**Def. (3.8.2.8) [The Monstrous Lie Algebra].** Let  $\mathfrak{A}$  be a  $\mathbb{N} \times \mathbb{N}$  block matrix with blocks of rows and columns parametrized by  $\mathbb{N}$  s.t.

- The  $(i, j)$ -th block  $B_{i,j} \in \text{Mat}(c_j \times c_j; \mathbb{Z})$ , where  $c(i)$  is the coefficient of  $q^i$  in  $j(z)$  (26.3.4.22) if  $i \in \mathbb{Z}_+$  and  $c_0 = 1$ .
- $B_{0,0} = 2$ .
- For  $n \in \mathbb{Z}_+$ , each entry in  $B_{0,n}$  and  $B_{n,0}$  is  $-(n-1)$ .
- For  $m, n \in \mathbb{Z}_+$ , each entry in  $B_{m,n}$  is  $-(m+n)$ .

Then the **Monstrous Lie algebra** is defined to be the Borchers algebra  $\mathfrak{M} = L(\mathfrak{A})/Z(L(\mathfrak{A}))$  (3.8.2.3)(3.8.2.4).  $\lrcorner$

**Thm. (3.8.2.9) [Borcherds' Monstrous Denominator Identity].**

$$j(p) - j(q) = p^{-1} \prod_{m \in \mathbb{Z}_+, n \in \mathbb{Z}} (1 - p^m q^n)^{c_{mn}}.$$

┘

*Proof:* Cf. [Car05]P539. ?

#### 3 Vertex Operator Algebras

#### 4 Moonshine Conjectures

*“In the broad light of day mathematicians check their equations and their proofs, leaving no stone unturned in their search for rigour. But, at night, under the full moon, they dream, they float among the stars and wonder at the miracle of the heavens. They are inspired. Without dreams there is no art, no mathematics, no life.”*

–M. Atiyah

References are [Bor98], [Work of Borcherds], [Vertex Operator Algebras and the Monster], [Infinite-Dimensional Lie Algebras, Kac], [Monstrous Moonshine: The first twenty-five years], [Monstrous moonshine and monstrous Lie superalgebras, Borcherds]

**Thm. (3.8.4.1) [Monstrous Moonshine].** There is a naturally defined graded infinite dimensional module, called the **monstrous module**  $V = \bigoplus_{n \in \mathbb{Z}} V_n$  of the monster group  $\mathbb{M}$  s.t. for any  $g \in \mathbb{M}$ , the McKay-Thompson series

$$T_g(\tau) = \sum_{n \geq -1} \text{tr}(g|V_n) e^{2\pi i n \tau}$$

is a Hauptmodul for a discrete subgroup  $\Gamma \subset \text{SL}(2; \mathbb{Z})$  of genus 0 and period  $r$  at the cusp. ┘

*Proof:* Cf. [Borcherds, 1992]. ?

The proof is sketched as follows:

- [Frenkel-Lepowsky-Meurman] constructed a candidate of the monstrous module  $V$ , and it has an algebraic structure making it a vertex algebra.
- Use the vertex algebra structure on  $V$  and the Goddard-Thorn no-ghost theorem in [Goddard and C. B. Thorn, Compatibility of the dual Pomeron with unitarity and the absence of ghosts in the dual resonance model] to construct a Lie algebra acted on by the monster group, called the **monstrous Lie algebra**.
- Show that the monster Lie algebra is a generalized Kac-Moody algebra (3.8.2.1), then use the (twisted) Weyl-Kac denominator formula to show that  $T_g(\tau)$  is a “completely replicable function”.
- Completely replicable functions were modular functions of Hauptmoduls for genus 0 groups.

□

**Thm. (3.8.4.2) [Duncan-Mertens-Ono, 2017].** There exists an infinite dimensional module

$$V = \bigoplus_{n \in \mathbb{Z}_+, n \equiv 0, 3 \pmod{4}} V_n$$

of the O’Nan group (3.1.11.5)  $\mathbb{ON}$  s.t. for any  $g \in \mathbb{ON}$ , the Mckay-Thompson series

$$F_g(\tau) = q^{-4} + 2 + \sum_{n>0} \text{tr}(g|V_n) e^{2\pi i n \tau}$$

is a meromorphic modular form of weight  $\frac{3}{2}$  on  $\Gamma_0(4N)$ , where  $N$  is the order of  $g$ . ┘

*Proof:* □

### 3.9 Reflection Groups and Coxeter Groups

References are [Ser87, Hum90, Kna96, Mil17, K-P23] and [Etingof, Lie Algebras].

#### Notation(3.9.0.1).

- Let  $V \in \text{Vect}^{\text{fin}}/\mathbb{R}$ .
- We usually use  $W$  to denote a Weyl-group, use  $\Phi$  to denote a root system, use  $\Psi$  to denote an affine root system, use  $\alpha$  to denote a root, use  $\psi$  to denote an affine root.

┘

#### 1 Coxeter-Systems

**Def.(3.9.1.1) [Coxeter-Systems].** A **Coxeter-system** is a pair  $(W, S)$  where  $W \in \text{Grp}$ ,  $S \subset W$  s.t.  $\#S < \infty$  and  $W$  has a representation of the form

$$W = \{S | (st)^{n(s,t)} = 1\},$$

where  $S \subset W$  and  $n(s, s) = 1, n(s, t) \in \mathbb{Z}_{\geq 2} \cup \{\infty\}$  for any  $s, t \in S$ , where  $n(s, t) = \infty$  means no relation between  $s$  and  $t$ . The pair  $(W, S)$  is called a **Coxeter-system**.

The rank of the Coxeter-system is defined to be  $\#S$ .

┘

**Def.(3.9.1.2) [Coxeter-Graphs].** For a Coxeter-system  $(W, S)$ (3.9.1.1), the **Coxeter-graph** is the simple graph  $G(W, S) \in \text{Graph}$  s.t.  $V(G(W, S)) = S$ , and  $s \neq t \in S$  are connected by an edge iff  $n(s, t) \geq 3$ .

$(W, S)$  is called an **irreducible Coxeter-system** if  $G(W, S)$  is connected.

┘

**Def.(3.9.1.3) [Length Functions].** For a Coxeter system  $(W, S)$ (3.9.1.1), define the length function  $\text{length} : W \rightarrow \mathbb{N}$  s.t. for any  $w \in W$ ,  $\text{length}(w)$  is the smallest number  $m \in \mathbb{N}$  s.t.  $w$  can be written as a product of  $m$  elements in  $S$ . A way to write  $w \in W$  as a product of  $\text{length}(w)$ -many elements in  $S$  is called a **reduced expression** of  $w$ .

┘

**Thm.(3.9.1.4) [Representations of Coxeter-Groups].** For a Coxeter-groups  $(W, S)$ (3.9.1.1), let  $V[S] = k\{v_s\}_{s \in S}$ , and define a symmetric bilinear form  $B$  on  $V$  by

$$B(s, s) = 1, \quad B(s, t) = -\cos \frac{\pi}{n(s, t)}, \quad \text{where } s, t \in S.$$

Define reflections

$$\sigma_s : V[S] \rightarrow V[S] : \sigma_s(\lambda) = \lambda - 2B(v_s, \lambda)v_s.$$

It is easy to verify that  $\sigma_s$  preserves  $B$ . Then there is a unique map  $\rho : W \rightarrow \text{O}(V, B)$  sending  $s \in S$  to  $\sigma_s$ , called the **canonical representation of Coxeter-groups**.

┘

*Proof:* We verify that for any  $s \neq t \in S$ , the order of  $\sigma_s \sigma_t$  is exactly  $n(s, t)$ : Let  $W_{s,t}$  be the subspace of  $V$  generated by  $s, t$ , and let  $W_{s,t}^\perp$  be the orthogonal complement w.r.t.  $B$ , then clearly  $\sigma_s, \sigma_t$  preserves  $W_{s,t}$  and fixes elements of  $W_{s,t}^\perp$ .

And on  $W_{s,t}$ , if  $n(s, t) = \infty$ , then it can be verified that  $(\sigma_s \sigma_t)^k v_s = 2k(v_s + v_t) + v_s$ , so  $\sigma_s \sigma_t$  has infinite order, and if  $n(s, t) < \infty$ , then  $B$  is positive-definite on  $W_{s,t}$  and  $v_s, v_t$  has angle  $\pi - \pi/n(s, t)$ . So  $\sigma_s \sigma_t$  is just rotation by angle  $2\pi/n(s, t)$ , which has order  $m$ .

Then we get a map  $\rho : W \rightarrow \text{GL}(V[S])$ . It suffices to show that  $\rho$  is injective:

□

**Thm. (3.9.1.5).** For a Coxeter-groups  $(W, S)$  (3.9.1.1) and  $w \in W, s \in S$ , if  $\text{length}(ws) > \text{length}(w)$ , then  $w(v_s) > 0$ . And if  $\text{length}(ws) < \text{length}(w)$ , then  $w(v_s) < 0$ .  $\lrcorner$

*Proof:* Cf. [Hum90]P111. ?  $\square$

**Cor. (3.9.1.6) [Canonical Representations are Faithful].** For a Coxeter-groups  $(W, S)$  (3.9.1.1), the canonical representation (3.9.1.4) is faithful.  $\lrcorner$

**Prop. (3.9.1.7) [Canonical Representations of Irreducible Coxeter-Groups].** Situation as in (3.9.1.4), if  $(W, S)$  is irreducible (3.9.1.2), then:

- Any properly-contained  $W$ -invariant subspace of  $V[S]$  is contained in the radical  $\text{rad}(V)$ .
  - If  $B$  is degenerate, then  $V$  fails to be completely reducible as a  $W$ -representation.
  - If  $B$  is non-degenerate, then  $V$  is irreducible as a  $W$ -representation.
  - $\text{End}_W(V) = \mathbb{R}$ .
- $\lrcorner$

*Proof:* Cf. [Hum90]P131 ?  $\square$

**Prop. (3.9.1.8) [Conjugations between  $S$ ].** Let  $(W, S)$  be a Coxeter-system, then  $s, s' \in S$  are conjugate in  $W$  iff there exists a sequence  $s_0 = s, s_1, \dots, s_n = s'$  s.t.  $n(s_i, s_{i+1}) \in 2\mathbb{Z} + 1$  for each  $i \in [n-1]$ .  $\lrcorner$

*Proof:* Cf. [Hum90]P110.  $\square$

## 2 Finite Reflection Groups

### Reflections

**Def. (3.9.2.1) [Reflections].** A **reflection** on  $V$  is a linear transformation  $s \in \text{End}(V)$  that has  $\dim V - 1$  eigenvalues 1 and one eigenvalue  $-1$ .  $\lrcorner$

**Prop. (3.9.2.2).** Let  $\alpha \in V$  and  $\alpha^\vee \in V^\vee$  that  $\langle \alpha, \alpha^\vee \rangle = 2$ , then

$$s_\alpha : x \mapsto x - \langle x, \alpha^\vee \rangle \alpha$$

is a reflection, and every reflection reversing the vector  $\alpha$  is of this form.  $\lrcorner$

*Proof:* Clearly  $s_\alpha$  is a reflection, and if  $s$  is any reflection, then  $\alpha^\vee$  is the composition of the quotient map  $V \rightarrow V/H$  with the map  $V/H \rightarrow \mathbb{F}$  sending  $\alpha + H$  to 1.  $\square$

**Lemma (3.9.2.3).** Let  $R \subset V$  be a finite set s.t.  $\text{span}\{R\} = V$ , then for any  $\alpha \in V$ , there exists at most one reflection  $s_\alpha$  reversing  $\alpha$  s.t.  $s_\alpha(R) \subset R$ .  $\lrcorner$

*Proof:* Let  $s, s'$  be two such reflections, then  $t = ss'$  is an automorphism that is identity on both  $\mathbb{F}\alpha$  and  $V/\mathbb{F}\alpha$ . So  $(t-1)^2 = 0$  on  $V$ . So the minimal polynomial of  $T$  divides  $(T-1)^2$ . Also because  $R$  is finite there exists an  $m$  that  $t^m = 1$  on  $R$  thus on  $V$ , so  $t = 1$  as the greatest divisor of  $(T-1)^2$  and  $T^m - 1$  is  $T - 1$ .  $\square$

**Lemma (3.9.2.4).** Let  $V$  be an inner product space, then for any vector  $\alpha$ , there exists a unique reflection  $s_\alpha$  that respects the inner product, which is

$$s_\alpha(x) = x - 2 \frac{(x, \alpha)}{(\alpha, \alpha)} \alpha.$$

┘

**Def. (3.9.2.5) [Reflection Groups].**  $W \leq \text{GL}(n; V)$  is called a **reflection group** if it is generated by reflections (3.9.2.1).

In particular, Coxeter-groups are reflection groups, by (3.9.1.4). ┘

**Prop. (3.9.2.6) [Finite Coxeter-Groups and Finite Reflection Groups].** For a Coxeter group  $(W, S)$  (3.9.1.1), the following are equivalent:

- $\#W < \infty$ .
- The canonical bilinear form  $B$  as in the canonical representation (3.9.1.4) is positive-definite.
- $W$  is a finite reflection group (3.9.2.5).

┘

*Proof:* 1  $\iff$  3 follows from (3.9.1.4) (3.9.1.6).

2  $\rightarrow$  3: If  $B$  is positive-definite, then  $W \leq \text{O}(B)$  is a discrete subgroup, thus finite.

1  $\rightarrow$  2: We may assume that  $(W, S)$  is irreducible, then  $B$  is non-degenerate by (3.9.1.7). But then  $V$  is an irreducible  $W$ -module, so there are up to a scalar only one  $W$ -invariant inner form on  $V$ . As  $W$  is finite we can choose a positive-definite invariant form on  $V$ , so  $B$  must also be positive-definite, as  $B(s, s) = 1 > 0$ .  $\square$

**Thm. (3.9.2.7) [Characterizing Reflection Groups, Shephard-Todd-Chevalley].** For  $\Gamma \leq \text{GL}(n; \mathbb{R})$ ,  $\Gamma$  is a finite reflection group (3.9.2.5) iff  $k[X_1, \dots, X_n]^\Gamma$  is a polynomial ring. And in this case,

- There are homogenous alg.ind polynomials  $p_1, \dots, p_r$ ,  $d_i = \deg(p_i)$ ,  $d_1 \leq d_2 \leq \dots \leq d_r$  s.t.  $k[X_1, \dots, X_n]^\Gamma = k[p_1, \dots, p_r]$ .

•

$$\frac{1}{\#\Gamma} \sum_{\gamma \in \Gamma} \frac{\text{tr}(\gamma)}{\det(1 - \gamma T)} = \prod_{i=1}^r \frac{1}{1 - T^{d_i}} \in k(T).$$

- $(d_1, \dots, d_r)$  are determined by  $\Gamma$ .
- $\#\Gamma = \prod_i d_i$ , and  $\Gamma$  contains  $\sum_i (d_i - 1)$  reflections.
- If  $\Gamma$  is an irreducible subgroup of  $\text{GL}(n; k)$ , then it is an abstractly irreducible group, and  $Z(\Gamma)$  is cyclic of order  $p \cdot \gcd(d_1, \dots, d_r)$ .

┘

*Proof:*  $\square$

## Classifying Finite Reflection Groups

### Weyl-Groups

**Def. (3.9.2.8) [Crystallographic Groups].** A **crystallographic group** is a subgroup of  $\text{GL}(V)$  that fixes some lattice of  $V$ . ┘

**Prop. (3.9.2.9).** If  $(W, S)$  is a Coxeter-system and  $W \leq \text{GL}(V[S])$  is crystallographic(3.9.2.8), then for any  $\alpha, \beta \in \Delta$ ?,  $n(\alpha, \beta) \in \{2, 3, 4, 6\}$ (3.9.2.6).  $\lrcorner$

*Proof:* Choose a  $W$ -invariant inner form on  $V$ , let  $W_{\alpha, \beta} = \mathbb{R}\{\alpha, \beta\}$  and  $W_{\alpha, \beta}^\perp$  be the orthogonal complement of  $W_{\alpha, \beta}$ , and  $s_\alpha s_\beta$  stabilizes  $W_{\alpha, \beta}$  and fixes every element of  $W_{\alpha, \beta}^\perp$ . Thus the trace of  $s_\alpha s_\beta$  is  $\dim V - 2 + 2 \cos \frac{2\pi}{n(\alpha, \beta)}$ . But this must be an integer, so  $n(\alpha, \beta) \in \{2, 3, 4, 6\}$ .  $\square$

**Def. (3.9.2.10) [Weyl-Groups].** A (finite) **Weyl-group** is a finite crystallographic reflection group(3.9.2.8)(3.9.2.5).  $\lrcorner$

**Prop. (3.9.2.11).**  $\lrcorner$

**Prop. (3.9.2.12) [Crystallographic Weyl-Groups].** Cf. [Hum90]P135.  $\lrcorner$

**Def. (3.9.2.13) [Hyperbolic Weyl-Groups].**  $\lrcorner$

### 3 Invariants of Finite Reflection Groups

### 4 Representations of Reflection Groups

**Thm. (3.9.4.1) [Characters of Weyl-Groups].** All finite  $\mathbb{C}$ -representations of a finite Weyl-group(3.9.2.10) is defined over  $\mathbb{Q}$ .  $\lrcorner$

*Proof:* Cf. [Hum90]P181.  $\square$

## 5 Root Systems

**Def. (3.9.5.1) [Root Systems].** A finite subset  $\Phi \subset V$  is called a **root system** if

- $\Phi$  spans  $V$  and doesn't contain 0.
  - For each  $\alpha \in \Phi$ , there exists a reflection(3.9.2.1)  $s_\alpha = \text{id} - \alpha^\vee \otimes \alpha$  for some  $\alpha^\vee \in V^\vee$  s.t.  $\langle \alpha^\vee, \alpha \rangle = 2$  s.t.  $s_\alpha$  reverses vector  $\alpha$  and  $s_\alpha(\Phi) \subset \Phi$ . Notice  $s_\alpha$  is unique by(3.9.2.3).
  - For any  $\alpha, \beta \in \Phi$ ,  $s_\alpha(\beta) - \beta$  is a multiple of  $\alpha$ , or equivalently  $\alpha^\vee(\beta) \in \mathbb{Z}$ .
- Elements of  $\Phi$  are called the **roots** of  $\Phi$ , and  $\{\alpha^\vee\}_{\alpha \in \Phi}$  is called the set of **coroots** of  $\Phi$ .  $\text{rank } V$  is called the **rank of the root system**.

The subgroup  $W(\Phi) \leq \text{GL}(V)$  generated by all  $s_\alpha$  is called the **Weyl group** of  $\Phi$ . The  $W(\Phi)$  is a finite group, as a subgroup of the group of permutations of  $\Phi$ .

Use  $(V, \Phi, W) \in \text{RootSys}$  to denote that  $\Phi$  is a root system of  $V$  with Weyl group  $W$ .

A root system is called **irreducible** iff it cannot be written as a direct sum of two root systems.

$\lrcorner$

**Def. (3.9.5.2) [Reduced Root System].** For  $(V, \Phi) \in \text{RootSys}$ (3.9.5.1), if  $\alpha, \beta \in \Phi$  are multiples of each other i.e.  $\beta = c\alpha$  for some  $c \in k^\times$ , then  $2\langle \beta, \alpha^\vee \rangle = 2c \in \mathbb{Z}$ , also  $2c^{-1} \in \mathbb{Z}$ , so  $c \in \{-1, -1/2, 1/2, 1\}$ .

A **reduced root system** is a root system  $\Phi$  s.t.  $\Phi \cap 2\Phi = \emptyset$ .  $\lrcorner$

**Prop. (3.9.5.3).** Let  $(V, \Phi, W) \in \text{RootSys}$  and  $\alpha, \beta \in \Phi$  s.t.  $\alpha^\vee = \beta^\vee$ , then  $\alpha = \beta$ .  $\lrcorner$

*Proof:* If  $\alpha = \beta$ , then  $s_\alpha(\beta) = \beta - 2\alpha$  and  $s_\beta(\alpha) = \alpha - 2\beta$ . Thus  $(s_\beta s_\alpha)^n \alpha = \alpha + 2n(\beta - \alpha) \in \Phi$ , forcing  $\alpha = \beta$ .  $\square$

**Prop. (3.9.5.4).** A root system  $\Phi$ (3.9.5.1) is irreducible iff the action of  $W(\phi)$  on  $V$  is irreducible.  $\lrcorner$

*Proof:* ? □

**Prop. (3.9.5.5) [Invariant Quadratic Form].** For  $(\Phi, V) \in \text{RootSys}(3.9.5.1)$ , there is a positive bilinear form in  $V$  that is invariant under the action of the Weyl group  $W(\Phi)$ .

Notice that for such a bilinear form, the reflection must be of the form given in (3.9.2.4), or in other words,  $\alpha^\vee(\beta) = (\frac{2\alpha}{(\alpha, \alpha)}, \beta)$ . □

*Proof:* This follows entirely because the Weyl group of  $R$  is finite, as we can take the average of any positive bilinear form under the action of reflections. □

**Def. (3.9.5.6) [Dual Root Systems].** Let  $(V, \Phi) \in \text{RootSys}$ , the set  $\Phi^\vee$  of dual vectors  $\alpha^\vee$  for  $\alpha \in \Phi$  is also a root system in  $V^\vee$ , called the **dual root system** of  $\Phi$ . And  $W(\Phi)^{\text{op}} \cong W(\Phi)$ .

Moreover,  $\Phi^{\vee\vee} \cong \Phi$ . □

*Proof:* Take an invariant quadratic form on  $V$  (3.9.5.5), then it gives an isomorphism  $V \rightarrow V^\vee$ . Then  $\alpha^\vee$  corresponds to  $\frac{2\alpha}{(\alpha, \alpha)}$  under this isomorphism, and there obviously generates  $V$ . If  $\alpha^\vee \in R^\vee$ , we can take the corresponding reflection to be  $s_{\alpha^\vee} = 1 - \alpha \otimes \alpha^\vee$ . Then

$$\begin{aligned} s_{\alpha^\vee}(\beta^\vee)(x) &= (\beta^\vee - \beta^\vee(\alpha)\alpha^\vee)(x) \\ &= \left(x, \frac{2\beta}{(\beta, \beta)}\right) - \frac{(\alpha, \beta)}{(\beta, \beta)} \left(x, \frac{2\alpha}{(\alpha, \alpha)}\right) \\ &= \left(x, \frac{2(\beta - \alpha(\alpha, \beta)/(\alpha, \alpha))}{(\beta, \beta)}\right) \\ &= \left(x, \frac{2s_\alpha(\beta)}{(\beta, \beta)}\right) = (s_\alpha(\beta))^\vee(x). \end{aligned}$$

So  $s_{\alpha^\vee}(\beta^\vee) = (s_\alpha(\beta))^\vee \in R^\vee$ . In this way, we see  $\alpha^{\vee\vee} = \alpha$ , and  $s_{\alpha^\vee}(\beta^\vee) - \beta^\vee = \beta^\vee(\alpha)\alpha^\vee$  is an integral multiple of  $\alpha^\vee$ . Also it can be seen easily from the formula above that the Weyl group is the opposite of the Weyl group of  $\Phi$ . □

**Prop. (3.9.5.7) [Rational Root Systems].** Suppose  $(\Phi, V) \in \text{RootSys}$  and  $V_0$  is the  $\mathbb{Q}$ -vector space spanned by  $\Phi$ , then  $(\Phi, V_0)$  is also a root system over  $\mathbb{Q}$  with  $V_0 \otimes_{\mathbb{Q}} k \cong V$ .

So from now on we focus on the case  $k = \mathbb{Q}$ . □

*Proof:* The non-trivial part is that the isomorphism  $V_0 \otimes_{\mathbb{Q}} \mathbb{F} \cong V$ . The natural map  $i : V_0 \otimes_{\mathbb{Q}} \mathbb{F} \rightarrow V$  is surjective because  $R$  generates  $V$ , and consider its transpose

$$i^* : V^* \rightarrow V_0^* \otimes_{\mathbb{Q}} \mathbb{F},$$

then we can see that this maps  $\alpha^\vee$  to  $\alpha_0^\vee$ , and  $R_0^\vee$  is a root system in  $V_0^*$  (3.9.5.6), thus  $\alpha_0^\vee$  generates  $V_0^\vee$ , and  $i^*$  is surjective, showing  $i$  is injective. □

**Def. (3.9.5.8) [Weyl-Chambers].** For  $(V, \Phi) \in \text{RootSys}/\mathbb{Q}$ , a **Weyl-chamber** is a connected component of  $V_{\mathbb{R}}^* \setminus \bigcup_{\alpha \in \Phi} H'_\alpha$ , where  $H'_\alpha = \{t \in V^* \mid \langle t, \alpha \rangle = 0\}$ . □

**Def. (3.9.5.9) [Bases of Root systems].** A **base of root system** is a subset  $\Delta \subset \Phi$  s.t. every elements of  $\Phi$  can be written uniquely as a linear integral combination of elements of  $\Delta$  with the same sign. Use  $(\Phi, \Delta) \in \text{RootSys}$  to denote that  $\Phi \in \text{RootSys}$  is a root system with a chosen base  $\Delta$ .

If  $\Delta$  is a base of  $\Phi$ , then we let  $\Phi^+$  denote the subset of  $\Phi$  that is non-negative integral combinations of elements of  $\Delta$ , called the **positive roots** of  $\Phi$ , and  $\Phi^- \subset \Phi$  is the subset of non-positive integral combinations of elements of  $\Delta$ , called the **negative roots** of  $\Phi$ .  $\Phi = \Phi^+ \amalg \Phi^-$ . □

**Prop. (3.9.5.10) [Bases exist].** Suppose  $(V, \Phi) \in \text{RootSys}$  and  $t \in V^\vee$  is contained in a Weyl chamber (3.9.5.8). Let  $\Delta_t^+$  (resp.  $\Delta_t^-$ ) be the set of all  $\alpha \in \Phi$  that  $t(\alpha) > 0$  (resp.  $< 0$ ), then  $\Phi = \Delta_t^+ \cup \Delta_t^-$ .

An element of  $\Delta_t^+$  is called **irreducible** if it cannot be written as the sum of two elements in  $\Delta_t^+$ . Let  $\Delta_t$  be the set of irreducible elements of  $\Delta_t^+$ , then  $\Delta_t$  is a base of  $\Phi$ .

In particular,  $(V, \Phi)$  contains a base. And if  $\Delta$  is a base and  $t \in V^\vee$  s.t.  $t(\Delta) > 0$ , then  $\Delta = \Delta_t^+$ . In this way, the set of bases of  $\Phi$  are in bijection with the set of Weyl chambers of  $\Phi$ , where the Weyl-chamber  $C_+(\Phi)$  corresponding to  $\Delta$  is called the **positive Weyl-chamber** w.r.t.  $\Delta$ .  $\lrcorner$

*Proof:* Cf. [Ser87]P38.  $\square$

**Cor. (3.9.5.11).** Suppose  $(V, \Phi) \in \text{RootSys}$  and  $t \in V^\vee$  is contained in a Weyl chamber (3.9.5.8). If  $\Delta$  is a basis of  $V$  contained in  $\Delta_t^+$  that attains the minimal value of  $t$  in  $\Delta_t^+$ , then  $\Delta = \Delta_t^+$  is a base of  $\Phi$ .  $\lrcorner$

**Prop. (3.9.5.12).** For  $(\Phi, V, \Delta) \in \text{RootSys}$ , every positive root  $\beta$  can be written as

$$\beta = \alpha_1 + \dots + \alpha_k$$

s.t.  $\alpha_i \in \Delta$  and  $\sum_{i=1}^r \alpha_i \in \Phi$  for all  $i \in [k]_+$ .  $\lrcorner$

*Proof:* Cf. [Ser87]P40.  $\square$

**Prop. (3.9.5.13) [Half Sum of Positive Roots].** For  $(\Phi, \Delta) \in \text{RootSys}_{\text{red}}$  and  $\alpha \in \Delta$ ,

$$s_\alpha(\Phi^+ \setminus \{\alpha\}) = \Phi^+ \setminus \{\alpha\}.$$

In particular if  $\rho = \frac{1}{2}(\sum_{\alpha \in \Phi^+} \alpha)$ , then  $s_\alpha \rho = \rho - \alpha$ . In particular,  $w(\rho) - \rho \in Q(\Phi)$  for any  $w \in W$ .  $\lrcorner$

*Proof:* If  $\beta \in \Phi^+$ , then  $s_\alpha(\beta) = \beta - c\alpha$  for some  $c > 0$ . Thus  $s_\alpha(\beta) \in \Phi^-$  iff  $\beta = \alpha$ .  $\square$

**Prop. (3.9.5.14) [Base and Dual System].** For  $(\Phi, \Delta) \in \text{RootSys}$ ,  $\Delta^\vee$  is a base of  $\Phi^\vee$ .  $\lrcorner$

*Proof:* By the isomorphism between  $V$  and  $V^\vee$ , it suffices to show the vectors  $\{\alpha^\vee\}_{\alpha \in \Delta}$  is a base for  $\Phi^\vee = \{\alpha^\vee\}_{\alpha \in \Phi}$ . But it is clear if  $S$  is a base corresponding to a vector  $t \in V^*$ , then  $\{\alpha^\vee, \alpha \in S\}$  is the extremal vectors corresponding to  $t$  too, so it is a base by (3.9.5.10).  $\square$

**Def. (3.9.5.15) [Parabolic Subsets].** For  $(\Phi, \Delta) \in \text{RootSys}$ , a **parabolic subset** of  $\Phi$  is a subset  $X \subset \Phi$  s.t. it is closed under addition, and  $X \cup (-X) = \Phi$ .  $\lrcorner$

### Property of the Weyl Groups

**Prop. (3.9.5.16) [Actions of Weyl Groups].** Let  $(\Phi, \Delta, W) \in \text{RootSys}_{\text{red}}$ , then  $W$  acts on  $\Phi$  thus also on  $V$  because  $\Phi$  is a basis of  $V$ , and thus also on  $V^*$  and on the set of bases and Weyl chambers of  $\Phi$ . Then:

1. For any  $t \in V^*$ , there exists  $w \in W$  that  $(w(t), \alpha) \geq 0$  for all  $\alpha \in \Delta$ .
2.  $W$  acts transitively on the set of bases of  $\Phi$ .
3. For each  $\beta \in \Phi$ , there exists some  $w \in W$  s.t.  $w(\beta) \in \Delta$ .
4. The group  $W$  is generated by  $\{s_\alpha\}_{\alpha \in \Delta}$  with relations  $\{(s_\alpha s_\beta)^{n(\alpha, \beta)} = 1\}$ . In particular, it is a Coxeter group (3.9.1.1).

5.  $W$  acts simply transitively on the set of bases of  $\Phi$ , thus also on the set of Weyl chambers(3.9.5.8).  $\lrcorner$

*Proof:* We can in fact prove this for  $W_S$  the group generated by  $s_\alpha$  where  $\alpha \in S$ .

1: Let  $\rho$  be defined in(3.9.5.13), and choose an element  $w \in W_S$  that  $w(t)(\rho)$  is maximal, then  $w(t)(\rho) \geq w(t)s_\alpha(\rho) = w(t)(\rho) - w(t)(\alpha)$ . So  $(w(t), \alpha) \geq 0$ .

2: Let  $S'$  be a base and  $t' \in V^\vee$  that  $t'(S') > 0$ (3.9.5.10), Also by 1 we can find  $w \in W$  that  $w(t)(\alpha) \geq 0$  for all  $\alpha \in S$ . And in fact  $w(t)(\alpha) > 0$  for all  $\alpha \in S$ . So  $S = S_t, S' = S_{w(t)}$ . Thus  $w$  sends  $S'$  to  $S$ .

4: Finally we prove that  $W_S = W$ : because for any  $\beta \in \Phi$ , there exists  $w \in W_S$  that  $w(\beta) \in S$ , so  $s_\beta = w^{-1}s_{w(\beta)}w \in W_S$ . To prove that the relations are full relations?.

5: If  $w \in W$  satisfies  $w(C) = C$ , we may assume  $C$  is the fundamental Weyl chamber, then  $w(S) = S$ , so by(3.9.5.18),  $l(w) = 0$ , so  $w = \text{id}$ .  $\square$

**Def. (3.9.5.17) [Length].** Let  $w \in W$ , define the **length of roots** of  $w$  to be the minimal number  $m$  that  $w$  can be written as a product of  $m$  simple reflections  $s_i$ .  $\lrcorner$

**Prop. (3.9.5.18) [Longest Element  $w_0$ ].** For  $(\Phi, \Delta, W) \in \text{RootSys}$  and  $w \in W$ ,

- Let  $n(w)$  be the number of elements  $\alpha$  in  $\Phi^+$  that  $w(\alpha) \in \Phi^-$ , then  $n(w) = l(w)$ .
- There is a unique element  $w_0 \in W$  with length  $\#\Phi^+$ . In particular,  $w_0 = -1$  if  $-1 \in W$ .
- $w_0(\Phi^+) = \Phi^-$ , and  $w_0^2 = \text{id}$ .

$\lrcorner$

*Proof:* 1: Cf.[Carter, P63]?.

2: By(3.9.5.16) there is a unique element  $w_0 \in W$  mapping  $\Delta$  to  $-\Delta$ , and it has maximal length  $\#\Phi^+$  by item1.

3:  $w_0^2(\Phi^+) = \Phi^+$ , thus  $l(w_0^2) = 0$  and  $w_0^2 = \text{id}$ .  $\square$

**Def. (3.9.5.19) [Height of Weights].** For  $\alpha = \sum n_i \alpha_i \in \Phi$ , then the **height of roots** of  $\alpha$  is denoted by  $\text{ht}(\alpha) = \sum n_i$ .  $\lrcorner$

**Prop. (3.9.5.20) [Highest Roots].** For  $(V, \Phi, \Delta) \in \text{RootSys}$  irreducible, there exists a root  $\tilde{\alpha} = \sum_{\alpha \in \Delta} n_\alpha \alpha$  that for any other root  $\sum_{\alpha \in \Delta} m_\alpha \alpha$ ,  $n_\alpha \geq m_\alpha$ .  $\lrcorner$

*Proof:*  $\square$

**Def. (3.9.5.21) [Kostant's Partition Function].** For  $(V, \Phi, \Delta) \in \text{RootSys}$ , the **Kostant's partition function**  $\mathfrak{P}$  is a function on  $Q(\Phi)$  that  $\mathfrak{P}(\alpha)$  equals the number of ways to write  $\alpha$  as an unordered sum of positive roots in  $\Phi^+$ .  $\lrcorner$

### Cartan Matrix and Dynkin Diagrams

**Prop. (3.9.5.22) [Cartan-Numbers and Cartan-Matrices].** Let  $(V, \Phi) \in \text{RootSys}$  and  $\alpha, \beta$  be two non-propositional roots in a root system  $\Phi$ , then we can put  $n(\alpha, \beta) = \alpha^\vee(\beta) = 2(\alpha, \beta)/(\alpha, \alpha)$ . Then  $n(\alpha, \beta)$  are integers(3.9.5.1), called the **Cartan-numbers**, and  $n(\alpha, \beta)n(\beta, \alpha) = 4 \cos^2 \varphi_{\alpha, \beta}$ , where  $\varphi_{\alpha, \beta}$  is the angle between these two vectors. Then because  $4 \cos^2 \varphi_{\alpha, \beta}$  is an integer, it can only take values 0, 1, 2, 3. Then there are only 7 possibilities of the angles between  $\alpha, \beta$ , and if  $\alpha, \beta$  are not orthogonal, their ration of lengths are determined also by the angle.

The **Cartan-matrix** is the matrix  $(n(\alpha, \beta))_{\alpha, \beta \in S}$ (3.9.5.22).  $\lrcorner$

**Prop. (3.9.5.23) [String of Roots].** If  $\alpha, \beta$  are not proportional and  $n(\beta, \alpha) > 0$ , then  $\alpha - \beta$  is a root. In particular, for  $\alpha, \beta \in S$  where  $S$  is a base of  $R$ ,  $n(\alpha, \beta) \leq 0$ .  $\lrcorner$

*Proof:* (3.9.5.22) shows  $n(\beta, \alpha) = 1$  or  $n(\alpha, \beta) = 1$ . Now  $\alpha - \beta = s_\beta(\alpha)$  or  $-s_\alpha(\beta)$  is a root of  $R$ .  $\square$

**Prop. (3.9.5.24) [Cartan Matrix Determine Reduced Root Systems].** The Cartan matrix depends only on  $(V, \Phi)$  and not on  $\Delta$ , and reduced root systems are determined by its Cartan matrix up to isomorphisms.  $\lrcorner$

*Proof:* The first assertion follows from (3.9.5.16) as every two bases are conjugate. The Cartan matrix determines  $R$  because it determined the inner product between roots in a basis of  $V$ .  $\square$

**Prop. (3.9.5.25).** Let  $E$  be the group of automorphisms of  $S$  that leaves that Cartan matrix invariant, then it can be identified with the set of automorphisms of  $R$  that leave the base  $S$  invariant. Then the group  $\text{Aut}(R)$  is isomorphic to the semi-product  $E \ltimes W$ .  $\lrcorner$

*Proof:* Let  $W$  is generated by  $s_\alpha$  so invariant under  $\text{Aut}(R)$ . Now if  $u \in \text{Aut}(R)$ , then  $u(S)$  is a base of  $R$ , so there exists some  $w \in W$  that  $w(u(S)) = S$ , thus  $u \in EW$ . Also if  $w \in W \cap E$ , then  $\square$

**Def. (3.9.5.26) [Coxeter graphs].** A **coxeter graph** is a finite graph that each pair of distinct vertices are connected by 0, 1, 2 or 3 vertices.  $\lrcorner$

**Def. (3.9.5.27) [Coxeter Graph associated to Root Systems].** Let  $(V, \Phi, \Delta) \in \text{RootSys}$ , then the associated **coxeter graph** is a graph whose nodes are indexed by the elements of  $\Delta$ , and two distinct nodes  $\alpha, \beta$  are connected by  $a(\beta, \alpha)a(\alpha, \beta) = 4 \cos^2 \varphi_{\alpha, \beta}$  edges (3.9.5.22). This is independent of the choice of  $\Delta$ , by (3.9.5.24).  $\lrcorner$

**Prop. (3.9.5.28).** For  $(V, \Phi, \Delta) \in \text{RootSys}$ ,  $\Phi$  is simple iff the Coxeter graph (3.9.5.26) is connected.  $\lrcorner$

*Proof:* By the formula in (3.9.2.4),  $R$  is decomposable iff  $R = R_1 \amalg R_2$  where  $R_1, R_2$  are orthogonal to each other. Then this is equivalent to  $\varphi_{\alpha, \beta} = \pi/2$  for any  $\alpha \in R_1, \beta \in R_2$ .  $\square$

**Def. (3.9.5.29) [Dynkin Diagrams].** The coxeter graphs (3.9.5.27) cannot determine root systems up to isomorphisms, because it cannot distinguish between  $n(\alpha, \beta), n(\beta, \alpha)$ . So there are **Dynkin diagrams** which is constructed from the coxeter diagram by adding a vector from the longer vector to the shorter vector when  $n(\alpha, \beta)n(\beta, \alpha) = 2$  or 3. In particular, Dynkin diagrams determine reduced root systems, by (3.9.5.24).

A **simply-laced Dynkin diagram** is a Dynkin diagram without multiple edges. A **simply-laced root system** is a root system whose associated Dynkin diagram is simply-laced.  $\lrcorner$

### Weight Lattices

**Def. (3.9.5.30) [Weight Lattices].** For  $(V, \Phi) \in \text{RootSys}$ , define the **root lattice** as the  $\mathbb{Z}$ -lattice  $Q(\Phi)$  generated by  $\Phi$ , and also the **weight lattice**  $P(\Phi) = \{x \in V \mid \alpha^\vee(x) \in \mathbb{Z}, \forall \alpha \in \Phi\}$ .  $P(\Phi)$  has a generator by **fundamental weights**  $\omega_i$  s.t.  $\langle \omega_i, \alpha_j^\vee \rangle = \delta_{ij}$ .  $Q(\Phi) \subset P(\Phi)$ , and  $[P(\Phi) : Q(\Phi)]$  is finite because they are both complete lattices.  $\lrcorner$

**Def. (3.9.5.31) [Root Diagrams].** A **root diagram** is a triple  $(V, \Phi, X)$  where  $(V, \Phi) \in \text{RootSys}$  is a root system and  $Q(\Phi) \subset X \subset P(\Phi)$  (3.9.5.30).  $\lrcorner$

**Prop. (3.9.5.32).**  $\rho = \sum_i \omega_i$  (3.9.5.13) (3.9.5.30).  $\lrcorner$

*Proof:* It follows from (3.9.5.13) that  $s_\alpha \rho = \rho - \alpha$ , so  $\langle \rho, \alpha_i^\vee \rangle = 1$ , thus  $\rho = \sum_i \omega_i$  by definition (3.9.5.13).  $\square$

### Dominant and Minuscale Weights

**Def. (3.9.5.33) [Dominant Weights].** For  $(V, \Phi, \Delta) \in \text{RootSys}$ ,

- A **dominant integral weight** is a weight  $\omega \in P(\Phi)$  s.t.  $\langle \omega, \alpha^\vee \rangle \in \mathbb{N}$  for any  $\alpha \in \Phi^+$ . The set of dominant weights is denoted by  $P^+(\Phi)$ .
- $Q^+(\Phi) \subset Q(\Phi)$  is the set of positive combinations of positive roots (3.9.5.9).

┘

**Prop. (3.9.5.34) [Partial-Ordering of Weights].** For  $(V, \Phi, \Delta) \in \text{RootSys}$  and  $x, x' \in V^\vee$ , the following are equivalent:

- $x$  lies in the convex hull of the finite set  $W(G, T).x'$ .
- If  $\tilde{x}, \tilde{x}' \in C_+(\Phi)$  s.t.  $W(G, T)\tilde{x} = W(G, T)x, W(G, T)\tilde{x}' = W(G, T)x'$ , then  $\tilde{x}' - x \in \mathbb{R}_{\geq 0}\Phi^\vee$ .
- If  $\tilde{x}' \in C_+(\Phi)$  s.t.  $W(G, T)\tilde{x}' = W(G, T)x'$ , then  $\tilde{x}' - wx \in \mathbb{R}_{\geq 0}\Phi^\vee$  for any  $w \in W(G, T)$ .

And we denote  $x \prec x'$  if these conditions hold.

┘

*Proof:* Cf. [R-R96] P165. ?

□

**Def. (3.9.5.35) [Minuscale Weights].** A dominant integral weight (3.9.5.33)  $\omega$  for  $(\Phi, \Delta)$  is called a **minuscale weight** if  $\langle \omega, \beta^\vee \rangle \leq 1$  for any positive coroot  $\beta^\vee$ .

┘

**Prop. (3.9.5.36) [Minuscale and Fundamental Weights].** Let  $\theta^\vee = \sum m_i \alpha_i^\vee$  be the maximal coroot, where  $m_i$  are positive integers, and  $m_i = \langle \omega_i, \theta^\vee \rangle$ .

Then any non-zero minuscale weight (3.9.5.35) is fundamental (3.9.5.30), and a fundamental weight  $\omega_i$  is minuscale iff  $m_i = 1$ .

┘

*Proof:* If  $\omega = \sum a_i \omega_i$  is minuscale, the definition (3.9.5.35) requires  $\sum a_i = 1$ , and any other coroot is of the form  $\beta^\vee = \sum n_i \alpha_i^\vee$ , where  $n_i \leq m_i$ , so  $n_i = \langle \omega_i, \beta^\vee \rangle \leq 1$ .

□

**Lemma (3.9.5.37).** If  $\omega \in Q(\Phi)$  and  $|\langle \omega, \beta^\vee \rangle| \leq 1$  for any coroot  $\beta$ , then  $\omega = 0$ .

┘

*Proof:* If not, choose a counterexample  $\omega = \sum m_i \alpha_i$  with  $\sum |m_i| > 0$  minimum, then  $(\omega, \omega) = \sum m_i (\omega, \alpha_i^\vee) > 0$ , so changing  $\omega$  to  $-\omega$  if necessary, we can assume  $m_i > 0$ ,  $(\omega, \alpha_i^\vee) > 0$  for some  $i$ , so  $(\omega, \alpha_i^\vee) = 1$ , and  $s_i \omega = \omega - \alpha_i$  is another counterexample with smaller  $|m_i|$ , contradiction.

□

**Prop. (3.9.5.38).** The following are equivalent for a dominant integral weight  $\omega$  of a root system:

- $\omega$  is minuscale (3.9.5.35).
- If  $\lambda \in P^+(\Phi)$  and  $\omega - \lambda \in Q^+(\Phi)$ , then  $\lambda = \omega$ .

┘

*Proof:* Cf. [Etingof, P141] ?

□

**Prop. (3.9.5.39) [Number of Minuscale Weights].** Every coset in  $P(\Phi)/Q(\Phi)$  contains a unique minuscale weight (3.9.5.35). This gives a bijection between the  $P(\Phi)/Q(\Phi)$  and the set of minuscale weights. In particular, the number of minuscale weights equals the determinant of the Cartan matrix.

┘

*Proof:* For any  $a \in P(\Phi)$ , let  $C = a + Q(\Phi)$  be a coset, let  $\omega \in C \cap P^+(\Phi)$  be an element with minimum  $(\omega, \rho)$ , then for any dominant weight  $\lambda < \omega \in C$ ,  $(\omega - \lambda, \rho) \geq 0$ , so  $\lambda = \omega$ . Thus  $\omega$  is minuscale (3.9.5.38).

Conversely, if  $\omega_1 \neq \omega_2 \in C$  are minuscale, then by (3.9.5.37), there is a positive coroot  $\beta^\vee$  that  $|(\omega_1 - \omega_2, \beta)| > 2$ . But then as  $\omega_1, \omega_2$  are both dominant,  $|(\omega_1 - \omega_2, \beta)| \leq 1$ , contradiction.

□

### Root Data

**Def. (3.9.5.40) [Root Data].** A **root datum** is a triple  $(X, \Phi, \vee)$  where  $X$  is a free  $\mathbb{Z}$ -module,  $\Phi \subset X$  is a finite set, and  $\vee : \Phi \rightarrow X^\vee = \text{Hom}(X, \mathbb{Z})$  is a map satisfying the following:

- $\langle \alpha, \alpha^\vee \rangle = 2$  for any  $\alpha \in \Phi$ .
- $s_\alpha(\Phi) = \Phi$  for any  $\alpha \in \Phi$ , where  $s_\alpha = \text{id} - \alpha^\vee \otimes \alpha : X \rightarrow X$ .
- The subgroup  $W \subset \text{GL}(X)$  generated by  $\{s_\alpha\}_{\alpha \in \Phi}$  is finite, called the **Weyl group** of  $(X, \Phi, \vee)$ . Use  $(X, \Phi, \vee) \in \text{RootDat}$  to denote that  $(X, \Phi, \vee)$  is a root datum.  $\square$

**Prop. (3.9.5.41) [Root Systems Associated to Root Data].** For  $(X, \Phi, \vee) \in \text{RootDat}$  (3.9.5.40), let  $V$  be the  $\mathbb{Q}$ -subspace of  $X_\mathbb{Q}$  generated by  $\Phi$ , then  $(V, \Phi) \in \text{RootSys}$  (3.9.5.1), and  $W(X, \Phi, \vee) \cong W(V, \Phi)$ .

Thus we use the notations for root systems on  $(X, \Phi, \vee)$ . In particular, the **rank of the root datum** is  $\text{rank}_\mathbb{Z} X$  and the **semisimple rank of the root datum** is  $\text{rank } V$ .  $\square$

*Proof:* Any  $\alpha \in \Phi$  is non-zero because  $\langle \alpha, \alpha^\vee \rangle = 2$ . And  $\alpha^\vee(\beta) \in \mathbb{Z}$  for  $\alpha, \beta \in \Phi$  because  $\alpha^\vee \in X^\vee$ .  $W(X, \Phi, \vee) \cong W(V, \Phi)$  follows from (3.9.5.3).  $\square$

**Prop. (3.9.5.42) [Uniqueness of  $\vee$ ].** If  $X$  is a free  $\mathbb{Z}$ -module and  $\Phi \subset X, \Phi^\vee \in X^\vee$  are finite sets, then there exists at most one  $\vee : \Phi \rightarrow X^\vee$  making it into a root datum (3.9.5.40), and this  $\vee$  is injective.

Thus we can also use  $(X, \Phi, \Phi^\vee)$  to denote that  $X$  is a free  $\mathbb{Z}$ -module and  $\Phi \subset X, \Phi^\vee \in X^\vee$  are finite sets and there exists a unique map  $\vee : \Phi \rightarrow \Phi^\vee$  making  $(X, \Phi, \vee)$  a root datum.  $\square$

*Proof:* We show that for  $(X, \Phi, \vee) \in \text{RootDat}$ ,  $\vee$  is determined by  $(X, \Phi, \Phi^\vee)$ : Let  $(V, \Phi)$  be the associated root system, then for any  $\alpha \in \vee$ , the image of  $\alpha$  in  $V^*$  is determined by  $\alpha$  by (3.9.2.3). But then also  $\alpha^\vee$  is determined, because there are no two elements  $\alpha^\vee, \beta^\vee \in \Phi^\vee$  with the same image in  $V^*$ , by (3.9.5.3).  $\square$

**Def. (3.9.5.43) [Semisimple Root Data].** A **semisimple root datum** is a root datum  $(X, \Phi, \vee) \in \text{RootDat}$  s.t.  $Q(\Phi)$  has finite index in  $X$ .  $\square$

**Prop. (3.9.5.44) [Semisimple Root Data and Rational Root Diagrams].** For  $(X, \Phi, \vee) \in \text{RootDat}$  (3.9.5.43),  $(X_\mathbb{Q}, \Phi, X)$  is a root diagram (3.9.5.31). Conversely, for any root diagram  $(V, \Phi, X)$ ,  $(X, \Phi, \vee)$  is a root datum.

Thus a semisimple root datum is equivalent to a rational root diagram.  $\square$

*Proof:*  $Q(\Phi) \subset X$  because  $\Phi \subset X$ ,  $X \subset P(\Phi)$  because  $\Phi^\vee \subset X^\vee$  (3.9.5.30).

Conversely, if  $(V, \Phi, X)$  is a root diagram, then for any  $\alpha \in \Phi$ , we have  $\alpha^\vee \in P(\Phi)^\vee \subset X^\vee$  by definition of  $P(\Phi)$  (3.9.5.30), and the first two conditions of (3.9.5.40) are satisfied by definition of root system (3.9.5.1), and the subgroup of  $\text{GL}(X)$  generated by  $\{s_\alpha\}_{\alpha \in \Phi}$  is finite because it is a subgroup of  $\text{Aut}(\Phi)$ , which is finite, thus  $(X, \Phi, \vee)$  is a root datum.  $\square$

**Prop. (3.9.5.45) [Transpose of  $s_\alpha$ ].** For  $(X, \Phi, \Phi^\vee) \in \text{RootDat}$  (3.9.5.42) and for any  $\alpha \in \Phi, x \in X, y \in X^\vee$ ,

$$\langle s_\alpha(x), y \rangle = \langle x, s_{\alpha^\vee}(y) \rangle,$$

where  $s_{\alpha^\vee} = \text{id} - \alpha \otimes \alpha^\vee$ . And we have  $s_{\alpha^\vee}(\Phi^\vee) = \Phi^\vee$ . More explicitly,  $s_{\alpha^\vee}(\beta^\vee) = (s_\alpha(\beta))^\vee$ . In particular,  $W(\Phi) \cong W(\Phi^\vee)^{\text{op}}$ .  $\square$

*Proof:*  $\langle s_\alpha(x), y \rangle = \langle x - \langle x, \alpha^\vee \rangle \alpha, y \rangle = \langle x, y \rangle - \langle x, \alpha^\vee \rangle \langle \alpha, y \rangle$  and similarly for  $\langle x, s_{\alpha^\vee}(y) \rangle$ .

To show that  $s_{\alpha^\vee}(\beta^\vee) = (s_\alpha(\beta))^\vee$ , Cf. [Mil17]P619?  $\square$

**Prop. (3.9.5.46) [Equivalent Definition of Root Data].** If  $X, X'$  are free  $\mathbb{Z}$ -modules with a perfect pairing  $\langle -, - \rangle : X \times X' \rightarrow \mathbb{Z}$ , and  $\Phi \subset X, \Phi' \subset X'$  are finite sets with a bijection  $\Phi \cong \Phi' : \alpha \mapsto \alpha'$  s.t.

- $\langle \alpha, \alpha' \rangle = 2$  for any  $\alpha \in \Phi$ .
- $s_\alpha(\Phi) = \Phi, s_{\alpha'}(\Phi') = \Phi'$  for  $\alpha \in \Phi$  and  $\alpha' \in \Phi'$ , where  $s_\alpha(x) = x - \langle x, \alpha' \rangle \alpha, s_{\alpha'}(x') = x' - \langle \alpha, x' \rangle \alpha'$ .

denote

$$Q(\Phi) = \mathbb{Z}\Phi \subset X, \quad Q(\Phi') = \mathbb{Z}\Phi' \subset X', \quad V = Q(\Phi)_{\mathbb{R}}, \quad V' = Q(\Phi')_{\mathbb{R}}, \quad X_0 = Q(\Phi')^{\perp},$$

and define  $p : X \rightarrow X' : x \mapsto \sum_{\alpha \in \Phi} \langle x, \alpha' \rangle \alpha'$ . Then:

1. For any  $\alpha \in \Phi, x \in X, y \in X'$ , we have  $\langle s_\alpha(x), y \rangle = \langle x, s_{-\alpha}(y) \rangle$ .
2.  $\langle x, p(x) \rangle = \sum_{\alpha \in \Phi} \langle x, \alpha' \rangle^2 \geq 0$ , with strict inequality if  $x \in \Phi$ .
3. For  $\alpha \in \Phi$ , we have  $2p(\alpha) = \langle \alpha, p(\alpha) \rangle \alpha'$ .
4.  $p$  induces an isomorphism  $V \cong V'$ .
5.  $Q(\Phi) \cap X_0 = 0$  and  $Q(\Phi) + X_0$  has finite index in  $X$ .
6.  $\langle -, - \rangle : V \times V' \rightarrow \mathbb{Q}$  is non-degenerate.
7.  $(X, \Phi, \Phi') \in \text{RootDat}$  (3.9.5.42)

Conversely, every  $(X, \Phi, \Phi') \in \text{RootDat}$  arises in this way.  $\lrcorner$

*Proof:* 1, 2 are trivial.

3: Cf. [Mil17]P616?.

4: By item2 and item3,  $p(Q(\Phi))$  has finite index in  $Q(\Phi')$ , which implies that  $p \otimes \mathbb{Q}$  is surjective. Thus  $\dim V \geq \dim V'$ . But by duality, we also has  $\dim V' \geq \dim V$ , and thus  $p$  is an isomorphism.

5: Firstly  $\ker(p) = X_0$  because  $\langle x, p(x) \rangle = \sum_{\alpha \in \Phi} \langle x, \alpha' \rangle^2$ , thus  $p \otimes \mathbb{Q}$  has kernel  $(X_0)_{\mathbb{Q}}$  and maps  $V$  isomorphically onto  $V'$  by item2, which implies that  $V \oplus (X_0)_{\mathbb{Q}} = X_{\mathbb{Q}}$ . And the assertions follow.

6: If  $x \in Q(\Phi)$  s.t.  $\langle x, V' \rangle = 0$ , then  $x \in Q(\Phi) \cap X_0 = 0$  by item5. As  $\dim V = \dim V'$  by item1, this implies that  $\langle -, - \rangle : V \times V' \rightarrow \mathbb{Q}$  is non-degenerate.

7: We need to show that the subgroup  $W \subset \text{GL}(X)$  generated by  $\{s_\alpha\}_{\alpha \in \Phi}$  is finite. For this, it suffices to show that  $W$  acts faithfully on  $\Phi^\vee$ : If  $w \in W$  s.t.  $w(\alpha) = \alpha$  for all  $\alpha \in \Phi^\vee$ , then  $\langle w(x) - x, \alpha \rangle = 0$  for any  $x \in X$  by (3.9.5.45). But  $w(x) - x \in Q(\Phi)$ , thus  $w(x) = x$  by item4. Thus  $w = \text{id}$ .

Conversely, for  $(X, \Phi, \Phi') \in \text{RootDat}$ , take  $X' = X^\vee$  and  $\Phi' = \Phi^\vee \subset X^\vee$ , then the above conditions are satisfied by (3.9.5.45).  $\square$

**Cor. (3.9.5.47).** For  $(X, \Phi, \Phi^\vee) \in \text{RootDat}$ , the Weyl group  $W(\Phi) \subset \text{GL}(X)$  generated by  $\{s_\alpha\}_{\alpha \in \Phi}$  acts faithfully on  $\Phi$ . In particular,  $\#W(\Phi) < \infty$  (this also follows from (3.9.5.41)).  $\lrcorner$

*Proof:* If  $w(\alpha) = \alpha$  for all  $\alpha \in \Phi^\vee$ , then for all  $x \in X$ , we have

$$\langle w(x) - x, \alpha \rangle = \langle w(x), \alpha \rangle - \langle x, \alpha \rangle = \langle x, w^{-1}\alpha \rangle - \langle x, \alpha \rangle = 0.$$

But it is clear by induction that  $w(x) - x \in Q(\Phi)$ , so by the non-negativity of the pairing, we get  $w(x) = x$  for any  $x \in X$ .  $\square$

**Cor. (3.9.5.48) [Dual Root Data].** For  $(X, \Phi, \Phi^\vee) \in \text{RootDat}$ (3.9.5.42),  $(X^\vee, \Phi^\vee, \Phi)$  is also a root datum, called the **dual root datum** of  $(X, \Phi, \Phi^\vee)$ .

Then the root system associated to  $(X^\vee, \Phi^\vee, \Phi)$ (3.9.5.41) is dual to the root system associated to  $(X, \Phi, \Phi^\vee)$ (3.9.5.6). In particular, they have the same Weyl group.  $\lrcorner$

*Proof:* This is because the conditions in(3.9.5.46) are self-dual. The rest are easy.  $\square$

**Prop. (3.9.5.49) [Classifying Root Data].** For  $(X, \Phi, \Phi^\vee) \in \text{RootDat}$ , using notation as in(3.9.5.46), the map  $\text{pr} : X \rightarrow X' = X/X_0$  is injective on  $Q(\Phi)$  and induces an isomorphism  $V \cong X'_Q$ . In particular,  $(X'_Q, \Phi' = \text{pr}(\Phi))$  is isomorphic to the root system associated to  $(X, \Phi, \Phi^\vee)$ (3.9.5.41). Then we have a map  $Y = X/Q(\Phi) \rightarrow P(\Phi')/Q(\Phi')$ (3.9.5.44) with kernel  $X_0$ .

Conversely, for any  $(V, \Phi) \in \text{RootSys}$  and a f.g.  $\mathbb{Z}$ -module  $Y$  together with a map  $\varphi : Y \rightarrow P(\Phi)/Q(\Phi)$  with torsion-free kernel, define  $X(\varphi)$  to be the kernel of the map

$$P(\Phi) \oplus Y \rightarrow P(\Phi)/Q(\Phi),$$

then  $X(\varphi)$  is a finite free  $\mathbb{Z}$ -module containing  $Q(\Phi) \oplus 0$ . Then  $(X(\varphi), \Phi)$  is a root datum with associated root system  $(V, R)$ .  $\lrcorner$

*Proof:* Why is it a root datum? We can use(3.9.5.46).  $\square$

### Isogenies of Root Data

References are [Mil17].

**Def. (3.9.5.50) [Isogenies of Root Data].** For  $(X, \Phi, \Phi^\vee), (X', \Phi', \Phi'^\vee) \in \text{RootDat}$ , an injective homomorphism  $f : X' \rightarrow X$  with finite cokernel is called an **isogeny of root data** if there is a bijection  $\Phi \cong \Phi' : \alpha \mapsto \alpha'$  and a map  $q : \Phi \rightarrow \max(\text{char } k, 1)^\mathbb{N}$  s.t.

$$f(\alpha') = q(\alpha)\alpha, \quad f^\vee(\alpha^\vee) = q(\alpha)\alpha'^\vee.$$

And  $f$  is called an **central isogeny of root data** if  $q(\alpha) = 1$  for all  $\alpha \in \Phi$ .  $\lrcorner$

**Example (3.9.5.51) [Frobenius Isogenies].** For  $(X, \Phi, \Phi^\vee) \in \text{RootSys}$  and  $q \in \max(\text{char } k, 1)^\mathbb{N}$ , the map  $x \mapsto qx : X \rightarrow X$  is an isogeny(3.9.5.50), called the **Frobenius isogenies**.  $\lrcorner$

**Prop. (3.9.5.52).** An isogeny of root data(3.9.5.50) induces a bijection of the set of bases.  $\lrcorner$

## 6 Simple Root Systems

**Notation (3.9.6.1).**

- Let  $(V, \Phi, \Delta) \in \text{RootSys}$  be simple.

$\lrcorner$

**Lemma (3.9.6.2) [Listing of Irreducible Root Systems].** The coxeter graphs  $\Gamma$  associated to irreducible root systems(3.9.5.27) are exactly the graphs  $A_n(n \geq 1), B_n(n \geq 2), D_n(n \geq 4), E_6, E_7, E_8, F_4, G_2$ . (graphs are given in [Etingod, Lie algebras]P109.)  $\lrcorner$

*Proof:* The existence of these types are given by (3.9.6.3).

For the converse, notice first that for a graph with vertices  $v_i$  and  $v_i, v_j$  are connected with  $A_{ij}$  edges, the quadratic form

$$Q(x_1, \dots, x_n) = \sum_{i=1}^n x_i^2 - \sum_{1 \leq i < j \leq n} \sqrt{A_{ij}} x_i x_j = \left\| \sum x_i v_i \right\|^2$$

is positive definite.

Next we show some constraints on the graph:

- Any subgraph of the coxeter graph, it can be shown that the corresponding quadratic form is also positive definite, in particular non-degenerate.
- : It is a tree: If it contains a circle, consider the subgraph of the circle, then the corresponding quadratic form vanishes on  $(1, 1, \dots, 1)$ , contradiction.
- It doesn't contains subgraphs listed in P77 of [Car05].

Now if  $\Gamma$  contains a triple edge, then it must be  $G_2$ , otherwise it must contain a  $\widehat{G}_2$ . If  $\Gamma$  contains no triple edges, then it contains at most one double edge, otherwise it contains some  $\widehat{C}_l$ ,  $l \geq 2$ . If it contains only one double edge, then it contains no branch points, otherwise it contains some  $\widehat{B}_l$ ,  $l \geq 3$ , so it is a chain with an edge added. If the double edge is in one end, then it is  $B_l$  for some  $l \geq 3$ , otherwise it must be  $F_4$ , in order not to contain  $\widehat{F}_4$ .

Now we assume  $\Gamma$  contains only simple edges. If it contains no branch point, then it is  $A_l$  for some  $l \geq 1$ . But  $\Gamma$  contains at most one branch point, and only 3 edges, otherwise it contains some  $\widehat{D}_l$ ,  $l \geq 4$ . If  $\Gamma$  has only one branch point, then the graph is a center with three branches. One of the branch must be a single vertex, otherwise it contains a  $\widehat{E}_6$ . Then a second branch must have  $\leq 2$  vertices, otherwise it contains a  $\widehat{E}_7$ . If the second branch has a single vertex, then  $\Gamma \cong D_l$  for some  $l \geq 4$ . If the second branch has two vertices, then the third branch has  $\leq 4$  vertices, otherwise it contains some  $\widehat{E}_8$ . So  $\Gamma \cong E_6, E_7$  or  $E_8$ .  $\square$

**Prop. (3.9.6.3) [Classifying Irreducible Root Systems].** Let  $e_n$  be the standard basis of  $\mathbb{R}^n$  with the standard bilinear form, and let  $L_n$  be the subgroup generated by  $e_n$ . Then

- $A_n$ : Let  $V$  be the hyperplane of  $\mathbb{R}^{n+1}$  orthogonal to the vector  $e_1 + \dots + e_{n+1}$ , and  $R$  be the subset of  $L_{n+1} \cap V$  consisting of vectors of length  $\sqrt{2}$ . Then  $(R, V)$  is a root system, and the Weyl group is the permutation group  $S_n$  of  $e_1, \dots, e_{n+1}$ . The polarization with  $t(e_i) = n+1-i$  gives a base consisting of  $\{e_i - e_{i+1}, i = 1, \dots, n\}$  by (3.9.5.11).
- $B_n$ : Let  $V = \mathbb{R}^n$  and  $R$  be the subset of  $L_n$  consisting of vectors of length 1 or  $\sqrt{2}$ . Then  $(R, V)$  is a root system, and the Weyl group is the permutation and sign changes of the vectors  $e_i$ , isomorphic to  $\mathbb{Z}_2^n \rtimes S_n$ . The polarization with  $t(e_i) = n+1-i$  gives a base consisting of  $\{e_1 - e_2, \dots, e_{n-1} - e_n, e_n\}$  by (3.9.5.11).
- $C_n$ : Let  $C_n$  be the dual system of  $B_n$  (3.9.5.6), which by the invariant form isomorphic to the set of  $\mathbb{R}^n$  consisting of vectors  $\pm e_i \pm e_j, \pm 2e_i$ . It has the same Weyl group as  $B_n$ . It has a base consisting of  $\{e_1 - e_2, \dots, e_{n-1} - e_n, 2e_n\}$  by (3.9.5.11).
- $D_n$ : Let  $V = \mathbb{R}^n$  and  $R$  be the set of all vectors of  $L_n$  of length  $\sqrt{2}$ . The Weyl group consists of permutations and sign changes of an even number of the vectors  $e_i$ . The polarization with  $t(e_i) = n-i$  gives a base  $\Delta = \{e_1 - e_2, \dots, e_{n-1} - e_n, e_{n-1} + e_n\}$ .
- $G_2$ : Let  $V = \mathbb{R}[\omega]$  and  $R$  be the subset of  $\mathbb{Z}[\omega]$  of norm 1 or 3. The Weyl group is isomorphic to the dihedral group. It clearly has a base consisting of  $\{1, \omega - 1\}$ .

- $F_4$ : Let  $V = \mathbb{R}^4$ , and let  $R$  be the set of vectors  $\{\pm e_i, \pm e_i \pm e_j, \frac{1}{2}(\pm e_1 \pm e_2 \pm e_3 \pm e_4)\}$ . It can be shown this is a root system. The polarization s.t.

$$t(e_1) = 8, t(e_2) = 3, t(e_3) = 2, t(e_4) = 1,$$

gives a base consisting of  $\{e_2 - e_3, e_3 - e_4, e_4, \frac{1}{2}(e_1 - e_2 - e_3 - e_4)\}$ .

- $E_8$ : Let  $V = \mathbb{R}^8$  and

$$\Phi_{E_8} = \{\pm e_i \pm e_j, i \neq j\} \cup \left\{ \frac{1}{2} \left( \sum_{i=1}^8 \pm e_i \right) \text{ with even number of minus signs} \right\}.$$

The polarization with

$$t(e_1) = 23, t(e_2) = 6, t(e_3) = 5, \dots, t(e_8) = 0$$

gives a base consisting of  $\{e_2 - e_3, \dots, e_7 - e_8, e_7 + e_8, \frac{1}{2}(e_1 - e_2 - \dots - e_7 + e_8)\}$ .

- $E_7$ :  $E_7$  is the intersection of  $E_8$  with the hypersurface  $\sum x_i = 0$ , so

$$\Phi_{E_7} = \{\pm(e_i - e_j), i \neq j\} \cup \left\{ \frac{1}{2} \left( \sum_{i=1}^8 \pm e_i \right) \text{ with 4 minus signs} \right\}.$$

The polarization with

$$t(e_1) = 18, t(e_2) = 7, t(e_3) = 6, \dots, t(e_8) = 1$$

gives a base  $\Delta = \{e_2 - e_3, \dots, e_7 - e_8, \frac{1}{2}(e_1 - e_2 - e_3 - e_4 - e_5 + e_6 + e_7 + e_8)\}$ .

- $E_6$ :  $E_6$  is the intersection of  $E_7$  with the hypersurface  $x_7 + x_8 = 0$ .

$$\Phi_{E_6} = \{e_i - e_j | i \neq j \leq 6\} \cup \{\pm(e_7 - e_8)\} \cup \left\{ \frac{1}{2}(\pm e_1 \pm e_2 \pm \dots \pm e_7) \pm \frac{1}{2}(e_7 - e_8) \text{ with 3 minus signs before } v_i, i \leq 6 \right\}.$$

The polarization  $t$  s.t.

$$t(e_1) = 11, t(e_2) = 4, t(e_3) = 3, t(e_4) = 2, t(e_5) = 1, t(e_6) = 0, t(e_7) = 4, t(e_8) = 3$$

gives a base  $\Delta = \{e_2 - e_3, \dots, e_5 - e_6, e_7 - e_8, \frac{1}{2}(e_1 - e_2 - e_3 - e_4 + e_5 + e_6 - e_7 + e_8)\}$ .  
 $A_n^\vee \cong A_n, B_n^\vee \cong C_n, D_n^\vee \cong D_n, G_2^\vee \cong G_2, F_4^\vee \cong F_4, E_8^\vee \cong E_8, E_7^\vee \cong E_7, E_6^\vee \cong E_6.$  ┐

**Remark (3.9.6.4).** The polarizations  $t$  are intimately related to the averaged coroot  $\rho^\vee$  (3.9.6.9). ┐

**Thm. (3.9.6.5) [Classifying Dynkin Diagrams].** The Dynkin diagrams arising from irreducible root systems are exactly the diagrams  $A_n (n \geq 1), B_n (n \geq 2), C_n (n \geq 3), D_n (n \geq 4), E_6, E_7, E_8, F_4, G_2$ . (graphs are given in [Etingod, Lie algebras]P109.) ┐

*Proof:* This follows easily from (3.9.6.2) and (3.9.6.3). ┐

**Prop. (3.9.6.6) [Non-Reduced Root Systems].** For any  $n \geq 1$ , there is exactly one non-reduced irreducible root system of rank  $n$ , which is  $BC_n$ , the union of  $B_n$  and  $C_n$  in (3.9.6.3). ┐

*Proof:* Cf. [Kna96]P139. ┐

**Prop. (3.9.6.7) [Weight Lattices of Irreducible Root Systems].** Notation as in (3.9.6.3),

- $A_n$ :  $\alpha_i^\vee = \alpha_i$  for  $i \leq n$ , so  $\omega_i = (\frac{n+1-i}{n+1}, \dots, \frac{n+1-i}{n+1}, \frac{-i}{n+1}, \dots, \frac{-i}{n+1})$  ( $i$  terms) for  $1 \leq i \leq n$ . Thus

$$P = \{(x_i) \in \mathbb{R}^n | x_i - x_j \in \mathbb{Z}, \sum x_i = 0\}, \quad Q = \{(x_i) \in \mathbb{Z}^n | \sum x_i = 0\}, \quad P/Q \cong \mathbb{Z}/(n+1).$$

- $B_n$ :  $\alpha_i^\vee = \alpha_i$  for  $i < n$  and  $\alpha_n^\vee = 2e_n$ , so  $\omega_i = (1, \dots, 1, 0, \dots, 0)$  ( $i$  ones) for  $1 \leq i < n$ , and  $\omega_n = (\frac{1}{2}, \dots, \frac{1}{2})$ . Thus

$$P = \mathbb{Z}^n, \quad Q = \mathbb{Z}^n \cup [(\frac{1}{2}, \dots, \frac{1}{2}) + \mathbb{Z}^n], \quad P/Q \cong \mathbb{Z}/(2).$$

- $C_n$ :  $\alpha_i^\vee = \alpha_i$  for  $i < n$  and  $\alpha_n^\vee = e_n$ , so  $\omega_i = (1, \dots, 1, 0, \dots, 0)$  ( $i$  ones) for  $1 \leq i \leq n$ . Then  $P = \{(x_i) \in \mathbb{Z}^n | \sum x_i \in 2\mathbb{Z}\}$  and  $Q = \mathbb{Z}^n$ ,  $P/Q \cong \mathbb{Z}/(2)$ .
- $D_n$ :  $\alpha_i^\vee = \alpha_i$  for  $i \leq n$ , so  $\omega_i = (1, \dots, 1, 0, \dots, 0)$  ( $i$  ones) for  $1 \leq i \leq n-2$ ,  $\omega_{n-1} = (\frac{1}{2}, \dots, \frac{1}{2})$ ,  $\omega_n = (\frac{1}{2}, \dots, \frac{1}{2}, -\frac{1}{2})$ . So  $P/Q \cong (\mathbb{Z}/2\mathbb{Z})^2$  for  $n$  even and  $\mathbb{Z}/4\mathbb{Z}$  for  $n$  odd.
- $G_2$ : It is clear  $\omega_1 = \omega + 1$ ,  $\omega_2 = 2\omega + 1$ . So  $P = Q = \mathbb{Z}[\omega]$ .
- $F_4$ :  $\omega_1 = (1, 1, 0, 0)$ ,  $\omega_2 = (2, 1, 1, 0)$ ,  $\omega_3 = (\frac{3}{2}, \frac{1}{2}, \frac{1}{2}, \frac{1}{2})$ ,  $\omega_4 = (1, 0, 0, 0)$ . So  $P = Q = (\frac{1}{2}, \frac{1}{2}, \frac{1}{2}, \frac{1}{2}) + \mathbb{Z}^4$ .
- $E_8$ :  $\omega_1 = (1, 1, 0, \dots, 0)$ , So  $P = Q = \{(x_1, \dots, x_8) | x_i \in \mathbb{Z} \text{ or } x_i \in \frac{1}{2} + \mathbb{Z}, \sum x_i \in 2\mathbb{Z}\}$ .
- $E_7$ :  $P/Q \cong \mathbb{Z}/(2)$ .
- $E_6$ :  $P/Q \cong \mathbb{Z}/(3)$ .

┘

*Proof:*

□

**Prop. (3.9.6.8)[Maximal Roots].** For  $A_n$ , the maximal root is  $\theta = e_1 - e_{n+1} = \alpha_1 + \dots + \alpha_n = \omega_1 + \omega_n$ . For  $C_n$ , the maximal root is  $\theta = 2e_1 = 2\alpha_1 + \dots + 2\alpha_{n-1} + \alpha_n = 2\omega_1$ .

But for any other irreducible root system  $\Phi$ , the maximal root  $\theta$  is a fundamental root:

- $B_n$ :  $\theta = e_1 + e_2 = \alpha_1 + 2\alpha_2 + \dots + 2\alpha_n = \omega_2$ .
- $D_n$ :  $\theta = e_1 + e_2 = \alpha_1 + 2\alpha_2 + \dots + 2\alpha_{n-2} + \alpha_{n-1} + \alpha_n = \omega_2$ .
- $G_2$ :  $\theta = 2\omega + 1 = 3\alpha_1 + 2\alpha_2 = \omega_2$ .
- $F_4$ :  $\theta = e_1 + e_2 = 2\alpha_1 + 3\alpha_2 + 4\alpha_3 + 2\alpha_4 = \omega_1$ .
- $E_8$ :  $\theta = e_1 + e_2 = 2\alpha_1 + 3\alpha_2 + 4\alpha_3 + 5\alpha_4 + 6\alpha_5 + 4e_6 + 3e_7 + 2e_8 = \omega_1$ .
- $E_7$ :  $\theta = e_1 - e_8 = \alpha_1 + 2\alpha_2 + 3\alpha_3 + 4\alpha_4 + 3\alpha_5 + 2\alpha_6 + 2\alpha_7 = \omega_6$ .
- $E_6$ :  $\theta = \varepsilon_1 - \varepsilon_6 = \alpha_1 + 2\alpha_2 + 3\alpha_3 + 2\alpha_4 + \alpha_5 + 2\alpha_6 = \omega_4$ .

┘

**Prop. (3.9.6.9) [ $\rho$  and  $\rho^\vee$ ].** We write  $\rho_\Phi^\vee \triangleq \rho_{\Phi^\vee}$ . Under the identification of  $V$  and  $V^*$ , If  $(R, S)$  is simply laced, then  $R \cong R^\vee$  via  $\alpha \mapsto \alpha^\vee$ , so by (3.9.6.7),

- $A_n$ :  $\rho_{A_n} = \rho_{A_n}^\vee = (\frac{n}{2}, \frac{n-2}{2}, \dots, -\frac{n}{2}) = \sum_i \frac{i(n+1-i)}{2} \alpha_i$ .
- $B_n$ :  $\rho_{B_n} = \rho_{B_n}^\vee = (\frac{2n-1}{2}, \frac{2n-3}{2}, \dots, \frac{3}{2}, \frac{1}{2}) = \sum_i \frac{i(2n-i)}{2} \alpha_i$ .
- $C_n$ :  $\rho_{C_n} = \rho_{C_n}^\vee = (n, n-1, \dots, 1) = \sum_{i \leq n-1} \frac{i(2n+1-i)}{2} \alpha_i + \frac{n(n+1)}{4} \alpha_n$ .
- $D_n$ :  $\rho_{D_n} = \rho_{D_n}^\vee = (n-1, n-2, \dots, 0) = \sum_{i \leq n-2} \frac{i(2n-1-i)}{2} \alpha_i + \frac{1}{2} \alpha_{n-1} + \frac{n(n-1)}{4} \alpha_n$ .

- $G_2 : \rho_{G_2} = 3\omega + 2 = 5\alpha + 3\beta, \rho_{G_2}^\vee = \frac{10}{3}\omega + \frac{8}{3} = 6\alpha + \frac{10}{3}\beta.$
- $F_4 : \rho_{F_4} = (\frac{11}{2}, \frac{5}{2}, \frac{3}{2}, \frac{1}{2}), \rho_{F_4}^\vee = (8, 3, 2, 1).$
- $E_8 : \rho_{E_8} = \rho_{E_8}^\vee = (23, 6, 5, 4, 3, 2, 1, 0).$
- $E_7 : \rho_{E_7} = \rho_{E_7}^\vee = (18, 7, 6, \dots, 1) - (\frac{23}{4}, \dots, \frac{23}{4}).$
- $E_6 : \rho_{E_6} = \rho_{E_6}^\vee = (\frac{15}{2}, \frac{1}{2}, -\frac{1}{2}, -\frac{3}{2}, -\frac{5}{2}, -\frac{7}{2}, \frac{1}{2}, -\frac{1}{2}).$

┘

**Def. (3.9.6.10) [Coxeter Numbers].** If  $(\Phi, \Delta)$  is an irreducible, define the **Coxeter number** to be  $h_\Phi = (\theta, \rho^\vee) + 1 = \text{ht}(\theta) + 1$ , and the **dual Coxeter number**  $h_\Phi^\vee = (\rho, (\theta)^\vee) + 1$ . Clearly if  $(\Phi, S)$  is simply-laced (3.9.5.29), then  $\Phi \cong \Phi^\vee$  via  $\alpha \mapsto \alpha^\vee$ , so if  $\theta = \sum m_i \alpha_i$ , then  $\theta^\vee = \sum m_i \alpha_i^\vee$ , so  $h_R^\vee = h_R = \sum m_i + 1$ . ┘

**Prop. (3.9.6.11) [Listing of Coxeter Numbers].** We can determine the Coxeter numbers and dual coxeter numbers of irreducible root systems:

- $h_{A_n} = h_{A_n}^\vee = n + 1.$
- $h_{B_n} = 2n$ , and  $\theta^\vee = e_1 + e_2 = \alpha_1^\vee + 2\alpha_2^\vee + \dots + \alpha_n^\vee$ , so  $h_{B_n}^\vee = 2n - 1.$
- $h_{C_n} = 2n$ , and  $\theta^\vee = e_1 = \alpha_1^\vee + \dots + \alpha_n^\vee$ , so  $h_{C_n}^\vee = n + 1.$
- $h_{D_n} = h_{D_n}^\vee = 2n - 2.$
- $h_{G_2} = 6$ , and  $\theta^\vee = \frac{2}{3}(2\omega + 3) = \alpha_1^\vee + 2\alpha_2^\vee$ , so  $h_{G_2}^\vee = 4.$
- $h_{F_4} = 12$ , and  $\theta^\vee = e_1 + e_2 = 2\alpha_1^\vee + 3\alpha_2^\vee + 2\alpha_3^\vee + \alpha_4^\vee$ , so  $h_{F_4}^\vee = 9.$
- $h_{E_8} = h_{E_8}^\vee = 30.$
- $h_{E_7} = h_{E_7}^\vee = 18.$
- $h_{E_6} = h_{E_6}^\vee = 12.$

┘

**Prop. (3.9.6.12) [Listing of Minuscale Weights].** By (3.9.5.39) and (3.9.6.3)(3.9.6.7), we can determine minuscule weights when  $(\Phi, \Delta)$  is irreducible.

- $A_n$ :  $P(\Phi)/Q(\Phi) \cong \mathbb{Z}/(n+1)$ , so it has  $n+1$  minuscule weight, which are all the fundamental weights  $\omega_i$  and 0.
- $B_n$ :  $P(\Phi)/Q(\Phi) \cong \mathbb{Z}/(2)$ , so there is exactly one non-zero minuscule weight, which is  $\omega_n = (\frac{1}{2}, \dots, \frac{1}{2})$ , by (3.9.5.38).
- $C_n$ :  $P(\Phi)/Q(\Phi) \cong \mathbb{Z}/(2)$ , so there is exactly one non-zero minuscule weight, which is  $\omega_n = (1, 0, \dots, 0)$ , by (3.9.5.38).
- $D_n$ :  $\#P(\Phi)/Q(\Phi) = 4$ , so there are exactly 3 non-zero minuscule weights, which are  $\omega_1, \omega_{n-1}$  and  $\omega_n$ , with corresponding fundamental representations of dimension  $2n, 2^{n-1}, 2^{n-1}$ . This is because the maximal coroot  $\beta^\vee = \alpha_1^\vee + 2\alpha_2^\vee + \dots + 2\alpha_{n-2}^\vee + \alpha_{n-1}^\vee + \alpha_n^\vee$ .
- $G_2$ :  $\#P(\Phi)/Q(\Phi) = 1$ , so there are no non-zero minuscule weights.
- $F_4$ : There are no non-zero minuscule weights.
- $E_8$ : There are no non-zero minuscule weights.
- $E_7$ :  $P(\Phi)/Q(\Phi) \cong \mathbb{Z}/2\mathbb{Z}$ , so there is exactly one non-zero minuscule weight.

- $E_6$ :  $P(\Phi)/Q(\Phi) \cong \mathbb{Z}/3\mathbb{Z}$ , so there are exactly two non-zero minuscule weights.  $\lrcorner$

**Prop. (3.9.6.13) [Longest Element  $w_0$ ].** Notice  $-w_0$  (3.9.6.13) is an automorphism of  $(\Phi, \Delta)$  that permutes fundamental weights and simple roots, so it induces an automorphism of the Dynkin diagram of  $\Phi$ . So if the Dynkin diagram of  $\mathfrak{g}$  has no non-trivial automorphism,  $w_0 = -1$ . This is case for  $\Phi = A_1, B_n, C_n, G_2, F_4, E_7$  and  $E_8$ .

For  $D_n$ , if  $n$  is even, then  $-1 \in W$  so  $w_0 = -1$ . If  $n$  is odd, then  $w_0(e_i) = -e_i$  for  $i < n$  and  $w_0(e_n) = e_n$ . Notice also each  $s_i$  acts trivially on  $P(\Phi)/Q(\Phi)$ , so  $-w_0$  acts by  $-1$  on  $P(\Phi)/Q(\Phi)$ .

For  $A_n, n \geq 2$ ,  $P(\Phi)/Q(\Phi) \cong \mathbb{Z}/(n+1)$ , thus  $-w_0$  is the flip of the chain.

Likewise for  $E_6$ ,  $P(\Phi)/Q(\Phi) \cong \mathbb{Z}/3\mathbb{Z}$ , thus  $-w_0$  flips the two minuscule weights.

But for  $D_n$ ,  $P(\Phi)/Q(\Phi) \cong \mathbb{Z}/2\mathbb{Z} \times \mathbb{Z}/2\mathbb{Z}$  for  $n$  even and  $P(\Phi)/Q(\Phi) \cong \mathbb{Z}/4\mathbb{Z}$  for  $n$  odd, so  $-w_0$  preserves the minuscule weights or flip  $w_{n-1}$  and  $w_n$ .  $\lrcorner$

## 7 Notations for a Root System

**Def. (3.9.7.1) [Notations for a Root System].** For a root system  $(\Phi, \Delta)$ ,

- $\Phi^+$  (resp.  $\Phi^-$ ) is the positive (resp. negative) roots w.r.t.  $\Delta$ .
- $\Delta = \{\alpha_1, \dots, \alpha_r\}$ .
- $s_i$  is the reflection w.r.t.  $\alpha_i$ .
- $\theta$  is the maximal root.
- $\theta^\vee$  is the maximal coroot (maximal root of the dual root system). (It may not be dual to  $\theta$ )
- $\rho = \frac{1}{2} \sum_i \alpha_i = \sum \omega_i$ .
- $\rho^\vee$  is  $\rho$  of the dual system  $\Phi^\vee$ .
- The height of weights is defined as in (3.9.5.19).
- $W$  is the Weyl group (3.9.5.1).
- $w_0 \in W$  is the unique element with length  $\#\Phi^+$  (3.9.5.18).
- $n_{ij}$  is the Cartan number  $n(\alpha_i, \alpha_j)$  (3.9.5.22).
- $Q(\Phi)$  is the root lattice (3.9.5.30).
- $Q^+(\Phi)$  is the set of positive combinations of roots (3.9.5.33).
- $P(\Phi)$  is the weight lattice, generated by the fundamental weights  $\omega_i$  (3.9.5.30).
- $P^+(\Phi) \subset P(\Phi)$  is the set of dominant integral weights (3.9.5.33).
- $\mathfrak{P}$  is the Kostant partition function on  $Q(\Phi)$  (3.9.5.21).  $\lrcorner$

## 8 Affine Root Systems

References are [B-T72, Tit74, K-P23].

**Notation (3.9.8.1) [Affine Spaces].**

- Let  $k = \mathbb{R}$ .
- Let  $V \in \mathcal{V}\text{ect}^{\text{fin}}/k$ .

- For an affine  $V$ -torsor  $A$ , denote  $A^*$  the space of affine maps  $A \rightarrow k$ .
- There is a natural exact sequence  $0 \rightarrow k \rightarrow A^* \rightarrow V^* \rightarrow 0$ , where  $A^* \rightarrow V^* : \psi \mapsto \dot{\psi}$  is the derivative map.

┘

**Def. (3.9.8.2) [Affine Root Systems].** For an affine  $V$ -torsor  $A$ , an **affine root system** on  $A$  is a subset  $\Psi \subset A^*$  s.t.

- $\Psi$  consists of non-constant functions, spans  $A^*$ , and its image  $\Phi$  under  $A^* \rightarrow V^*$  is finite.
- For any  $\psi \in \Psi$ , there exists  $\dot{\psi}^\vee \in V$  s.t.  $\langle \psi^\vee, \dot{\psi} \rangle = 2$ , and the reflection  $s_\psi$  on  $A^*$  (3.9.2.1) defined by

$$s_\psi(x) = x - \langle \dot{\psi}^\vee, x \rangle \psi, \text{ where } x \in A^*$$

preserves  $\Psi$ . Such a  $\dot{\psi}^\vee$  is unique by (3.9.2.3). Notice  $s_\psi|_{k^*} = \text{id}_{k^*}$ .

- For any  $\psi, \eta \in \Psi$  we have  $\langle \dot{\eta}^\vee, \dot{\psi} \rangle \in \mathbb{Z}$ .
- For any  $a \in \Phi$ , the set  $\{\psi \in \Psi | \dot{\psi} = a\}$  is discrete.

Elements of  $\Psi$  are called the **affine roots** of  $\Psi$ , and  $\{\dot{\psi}^\vee\}_{\psi \in \Psi}$  is called the set of **affine coroots** of  $\Psi$ .

$\text{rank } V$  is called the **rank of the affine root system**.

The subgroup  $W(\Psi) \leq \text{GL}(A^*)$  generated by  $\{s_\psi\}_{\psi \in \Psi}$  is called the **affine Weyl group** of  $\Psi$ .

Use  $(V, A, \Psi, \Phi, W) \in \text{AffRootSys}$  to denote that  $\Psi$  is an affine root system on the affine  $V$ -torsor  $A$ .

┘

**Cor. (3.9.8.3) [Weyl Group  $W(\Psi)$ ].** For  $(V, A, \Psi, \Phi, W(\Psi)) \in \text{AffRootSys}$  (3.9.8.2) and each root  $\psi \in \Psi$ , denote

$$s_\psi(x) = x - \psi(x)\dot{\psi}^\vee, \text{ where } x \in A,$$

then the image of  $s_\psi$  under the map  $\text{Aff}(A)^{\text{op}} \subset \text{GL}(A^*) : T(f)(x) = f(Tx)$  is just  $s_\psi \in \text{GL}(A^*)$  defined in (3.9.8.2). Thus  $W(\Psi)$  acts on  $A$  on the right, and taking derivative induces a map

$$W(\Psi)^{\text{op}} \rightarrow W(\Phi)^{\text{op}}$$

which dualizes to  $W(\Psi) \rightarrow W(\Phi)$ .

┘

**Def. (3.9.8.4) [Extended Weyl Groups].** For  $(V, A, \Psi, \Phi, W(\Psi)) \in \text{AffRootSys}$  (3.9.8.2), the **extended Weyl-group**  $W(\Psi)^{\text{ext}}$  is the group of affine automorphisms of  $A$  preserving  $\Psi$ , and has derivative in  $W(\Phi)$ . Clearly  $W(\Psi) \leq W(\Psi)^{\text{ext}}$ .

┘

**Prop. (3.9.8.5).** For  $(V, A, \Psi, \Phi, W(\Psi)) \in \text{AffRootSys}$  (3.9.8.2),

- $(V^*, \Phi, W(\Phi)) \in \text{RootSys}$  (3.9.5.1), and for each  $\psi \in \Psi$ ,  $\dot{\psi}^\vee$  is the coroot of  $\psi \in V^*$ .
- For any  $\psi, \eta \in \Psi$ , if  $\eta = r\psi + c$  for some  $r, c \in k$ , then  $r \in \{\pm\frac{1}{2}, \pm 1, \pm 2\}$  and  $\dot{\psi}^\vee = r\dot{\eta}^\vee$ .
- The natural map  $W(\Psi) \rightarrow W(\Phi)$  (3.9.8.3) is surjective.

$(V^*, \Phi, W(\Phi))$  is called the **derived root system** of  $\Psi$ .

┘

*Proof:* 1: The axioms of a root system (3.9.5.1) is easy to check.

2: This follows from (3.9.5.2).

3: Trivial.

□

**Def. (3.9.8.6) [Reduced Affine Root Systems].** A **reduced affine root system** is an affine root system  $\Psi$  (3.9.8.2) s.t.  $\Psi \cap 2\Psi = \emptyset$ .  $\lrcorner$

**Prop. (3.9.8.7).** For  $(V, A, \Psi, \Phi, W(\Psi)) \in \text{AffRootSys}(3.9.8.2)$ ,  $W(\Psi)$  acts properly on  $A$  (3.9.8.3) (4.12.1.11).  $\lrcorner$

*Proof:* Because  $\#W(\Phi) < \infty$  (3.9.5.1), it suffices to prove that the kernel of  $W(\Psi) \rightarrow W(\Phi)$ , which is the subgroup of translations in  $W(\Psi)$ , acts properly on  $A$  (4.12.1.15) characteriszlprooperancrihausroe. Then acting properly means that the subgroup of translations is not dense in  $V$ , which is guaranteed by definition (3.9.8.2).  $\square$

**Prop. (3.9.8.8) [Affine Root Systems are Infinite].** For  $(V, A, \Psi, \Phi, W(\Psi)) \in \text{AffRootSys}(3.9.8.2)$ ,

- $W(\Psi)$  has no fixed point on  $A$ .
- $\#\Psi = \infty$ .
- $\#W(\Psi) = \infty$ .

$\lrcorner$

*Proof:* 1: If  $x \in A$  is fixed by  $W(\Psi)$ , then by (3.9.8.7),  $\psi(x) = 0$  for all  $\psi \in \Psi$ , which means that  $x = 0$  because  $\Psi$  spans  $A^*$ .

2: If  $\#W(\Psi) < \infty$ , then the center of mass of any orbit of the action of  $W(\Psi)$  on  $A$  is fixed by  $W(\Psi)$ , contradicting item 1.

3: By item 2, the kernel of the map  $W(\Psi) \rightarrow W(\Phi)$  is non-trivial, thus has a translation. But  $W(\Psi)$  preserves  $\Psi$ , so  $\Psi$  is infinite.  $\square$

**Prop. (3.9.8.9) [Another Characterization of Affine Root Systems].** For an affine  $V$ -torsor  $A$ , a subset  $\Psi \in A^*$  is an affine root system (3.9.8.2) iff

- $\Phi = \dot{\Psi} \subset V^*$  is a root system on  $V^*$  (3.9.8.20).
- For any  $\psi \in \Psi$ , define the affine endomorphism  $s_\psi$  of  $A$  that fixes the hyperplane  $H_\psi$  and with derivative  $s_{\dot{\psi}}$ , then  $s_\psi$  preserves  $\Psi$ .
- For any  $\alpha \in \Phi$ , the set  $\{\psi \in \Psi | \dot{\psi} = \alpha\}$  contains at least two elements and is discrete in  $A^*$ .

$\lrcorner$

*Proof:* If  $\Psi$  is an affine root system, then these properties are satisfied by (3.9.8.5) (3.9.8.8). Conversely, if these properties are satisfied, then  $\Psi$  doesn't contain constant functions, and by item 3 it spans  $A^*$ . And the other axioms for affine root systems follows easily.  $\square$

**Def. (3.9.8.10) [Irreducible Affine Root Systems].** An **irreducible affine root system** is an affine root system  $(V, A, \Psi, \Phi, W(\Psi))$  (3.9.8.2) s.t.  $\Phi$  is an irreducible root system (3.9.5.1).  $\lrcorner$

**Def. (3.9.8.11) [Simplicial Structure on  $A$ ].** For  $(V, A, \Psi, \Phi, W(\Psi)) \in \text{AffRootSys}(3.9.8.2)$  and  $\psi \in \Psi$ ,  $H_\psi = \{a \in A | \psi(a) = 0\}$  is a sub affine space of  $A$ , called the **affine root hyperplane** associated to  $\psi$ , whose derivative  $\dot{H}_\psi$  is equal to  $H_{\dot{\psi}} = \{v \in V | \dot{\psi}(v) = 0\}$ .

Then the set  $\{H_\psi\}_{\psi \in \Psi}$  is locally finite, and connected components of

$$A \setminus \bigcup_{\psi \in \Psi} H_\psi$$

are called **affine chambers** of this affine root system. And connected components of

$$\bigcup_{\psi \in \Psi} H_\psi \setminus \bigcup_{\psi_1 \neq \psi_2 \in \Psi} H_{\psi_1} \cap H_{\psi_2}$$

are facets of codimension 1 of this affine root system. Continuing this way, we get a polysimplicial structure on  $A$ , and if  $\Psi$  is irreducible(3.9.8.10), this is a simplicial structure.  $\lrcorner$

*Proof:* To show that the set  $\{H_\psi\}$  is locally finite, Cf.[K-P23]P17. For the last assertion, Cf.[Bourbaki]Chapter 5.3.9.Proposition 8.  $\square$

**Prop.(3.9.8.12) [Weyl-Group Action on  $A$ ].** For  $(V, A, \Psi, \Phi, W(\Psi)) \in \text{AffRootSys}(3.9.8.2)$ , with the simplicial structure on  $A$ (3.9.8.11),

1.  $W(\Psi)$  acts as polysimplicial automorphisms on  $A$ .
2. If  $w \in W(\Psi)$  stabilizes a simplex  $\sigma \in A$ , then  $w$  fixes vertices of  $\sigma$ . And this happens iff  $w$  is a product of reflections along hyperplanes containing  $\sigma$ .
3. If  $\sigma, \tau$  are simplexes of a same chamber and  $w\sigma = \tau$  for  $w \in W(\Psi)$ , then  $\sigma = \tau$ .
4.  $W(\Psi)$  acts simply-transitively on the set of chambers of  $A$ .

$\lrcorner$

*Proof:* Cf.[Bourbaki]Chapter5.3.3,Prop1, Thm2.  $\square$

**Cor.(3.9.8.13).** For  $(V, A, \Psi, \Phi, W(\Psi)) \in \text{AffRootSys}(3.9.8.2)$ ,  $W(\Phi)$  is normal in  $W(\Phi)^{\text{ext}}$ (3.9.8.4), and for any chamber  $C \subset A$ , if  $\Xi_C$  is the stablizer of  $C$  in  $W(\Phi)^{\text{ext}}$ , then  $W(\Phi)^{\text{ext}} = W(\Phi) \ltimes \Xi_C$ .  $\lrcorner$

**Def.(3.9.8.14) [Simple Affine Roots].** For  $(V, A, \Psi, \Phi, W(\Psi)) \in \text{AffRootSys}(3.9.8.2)$ , if  $C \subset A$  is a chamber(3.9.8.11), define  $\Psi(C)^+$ (resp.  $\Psi(C)^-$ ) to be the set of those  $\psi \in \Psi$  s.t.  $\psi(C) \geq 0$ (resp.  $\psi(C) \leq 0$ ).

And the set  $\Psi(C)^0$  of indivisible  $\psi \in \Psi$  s.t.  $\psi(C) \in \mathbb{R}_+$  and  $H_\psi$  is a face of  $C$  is called an **affine basis** of  $\Psi$ , and elements of  $\psi(C)^0$  are called **simple affine roots** w.r.t.  $C$ .

If  $S$  is the set of reflections along the elements in  $\Psi(C)^0$ , then  $(W(\Psi), S)$  is a Coxeter-system(3.9.1.1).  $\lrcorner$

*Proof:* Cf.[Bourbaki]Chapter5.3.2, Thm1.1.  $\square$

**Def.(3.9.8.15) [Direct Sum of Affine Root Systems].** For  $(V_1, A_1, \Psi_1), (V_2, A_2, \Psi_2) \in \text{AffRootSys}(3.9.8.2)$ , the natural map  $\oplus : A_1^* \oplus A_2^* \rightarrow (A_1 \oplus A_2)^*$  transports  $\Psi_1 \cup \Psi_2$  bijectively to a subset of  $(A_1 \oplus A_2)^*$  because  $\Psi_i$  contains no constant functions. If we define  $d(\psi_1 \oplus \psi_2) = \dot{\psi}_1 + \dot{\psi}_2$ , then it can be verified that  $\Psi_1 \oplus \Psi_2$  is an affine root system on  $A_1 \oplus A_2$ , called the **direct sum of affine root systems**.  $\lrcorner$

**Prop.(3.9.8.16) [Decomposing into Irreducible Affine Root Systems].** Any affine root system  $(V, A, \Psi, \Phi, W(\Psi)) \in \text{AffRootSys}(3.9.8.2)$  is naturally a direct sum of irreducible affine root systems(3.9.8.10)(3.9.8.15). In particular,  $\Psi$  is irreducible iff it is not a direct sum of two other affine root systems(3.9.8.15).  $\lrcorner$

*Proof:* Cf.[K-P23]P22.  $\square$

**Prop.(3.9.8.17) [Simple Affine Roots as a Basis].** Situation as in(3.9.8.11), if  $C \subset A$  is an affine chamber and  $\Delta = \Psi(C)^0$  is the set of simple affine roots associated to  $C$ (3.9.8.14), then

- $W(\Psi)$  is generated by  $\{s_\psi\}_{\psi \in \Delta}$ .
- $W(\Psi)$  acts simply-transitively on the set of basis of  $\Psi$ .
- $\Psi^{\text{short}} = W(\Psi) \cdot \Delta$ .

- Any  $\psi \in \Psi(C)^+$  (3.9.8.14) is a non-negative integral linear combination of elements of  $\Delta$ . In particular,  $\Delta$  spans  $A^*$ .
- For any  $\psi \neq \eta \in \Delta$ , we have  $\dot{\psi}(\dot{\eta}^\vee) \leq 0$ .

If moreover  $\Psi$  is irreducible (3.9.8.10), then

- $\Delta$  is a basis of  $A^*$ .
- The vertices  $\{x_0, \dots, x_l\}$  of  $C$  are in bijection with  $\Delta$ , s.t.  $\psi_i(x_j) \neq 0$  iff  $i = j$ .

┘

*Proof:* 1: Cf. [Bourbaki]Chap5. 3.1. Lemma2?

2: This follows from (3.9.8.12).

3: This follows from item2.

4: Let  $\Lambda$  be the lattice in  $A^*$  generated by  $\Delta$ , then it is stable under action of each  $s_\psi$  for  $\psi \in \Delta$ . Thus it is stable under action of  $W(\Psi)$ , and item3 implies that  $\Lambda$  is just the lattice generated by  $\Psi$ . Thus any  $\psi \in \Psi(C)^+$  is an integral combination of elements of  $\Delta$ . To show the coefficients are non-negative, notice we can decompose  $\Psi$  into a direct sum of irreducible affine root systems (3.9.8.16), and on each irreducible affine root system, we can evaluate at the vertices of  $C$  and apply item2 below.

5: Cf. [Bourbaki]Chap5. 3.4. Prop3?

1, 2: This is clear because in this case  $C$  is a simplex in  $A$ .

□

**Lemma (3.9.8.18).** Situation as in (3.9.8.11), if  $C \subset A$  is an affine chamber and  $\psi \in \Psi(C)^0$ , then  $s_\psi$  permutes the elements of  $\Psi(C)^+$  that are not proportional to  $\alpha$ .

┘

*Proof:* We may reduce to the case when  $\Psi$  is irreducible. Then for any  $\xi \in \Psi(C)^0$  we have  $s_\psi(\xi) = \xi - \dot{\xi}(\dot{\psi}^\vee)\alpha$ . But any element in  $\Psi(C)^+$  (resp.  $\Psi(C)^-$ ) is uniquely a non-negative combination of elements in  $\Psi(C)^0$ , so the assertion follows.

□

**Prop. (3.9.8.19) [Geometric Meaning of Length Functions for  $W(\Psi)$ ].** Situation as in (3.9.8.14), if length is the length function of the Coxeter-system  $(W(\Psi), S)$ , then

- If  $w \in W(\Psi)$  and  $\psi \in \Psi(C)^0$ , then  $\text{length}(s_\alpha w) > \text{length}(w)$  iff  $w^{-1}\psi \in \Psi(C)^+$ .
- For any  $w \in W(\Psi)$ ,  $\text{length}(w) = \#(w.\Psi(C)^{\text{short},+} \cap \Psi(C)^{\text{short},-})$ .
- If  $w = s_1 \dots s_q$  is a reduced expression where  $s_i = s_{\alpha_i}$  for  $\psi_i \in \Psi(C)^0$ , then

$$w.\Psi(C)^{\text{short},+} \cap \Psi(C)^{\text{short},-} = \{s_q \dots s_{i+1}(\psi_i) | i \in [q]_+\}.$$

┘

*Proof:* 1: By [Bourbaki]Thm5.3.2.1.(2)?,  $\text{length}(sw) > \text{length}(w)$  iff the chambers  $C$  and  $w(C)$  are on the same side of  $H_\psi \subset A$ , or equivalently,  $\alpha(w.C) \in \mathbb{R}_{\geq 0}$ .

2: Use induction on  $\text{length}(w)$ . If  $\text{length}(w) = 1$ , this follows from (3.9.8.18). For  $\text{length}(w) > 1$ , write  $w = s_\psi w'$  where  $\psi \in \Psi(C)^0$ , then

$$\begin{aligned} \#(w.\Psi(C)^{\text{short},+} \cap \Psi(C)^{\text{short},-}) &= \#(w'.\Psi(C)^{\text{short},+} \cap s_\psi.\Psi(C)^{\text{short},-}) \\ &= \#(w'.\Psi(C)^{\text{short},+} \cap (\{\psi\} \cup \Psi(C)^{\text{short},-} \setminus \{-\psi\})) \end{aligned}$$

And notice that  $\psi \in w'.\Psi(C)^{\text{short},+}$  by item1.

3: It follows from item1 that the set  $\{s_q \dots s_{i+1}(\psi_i) | i \in [q]_+\}$  is contained in  $\Psi(C)^+$  and mapped by  $w$  into  $\Psi(C)^-$ . And the equality follows from item2.

□

**Def. (3.9.8.20)** [Associated Affine Root Systems]. For  $(V, \Phi) \in \text{RootSys}(3.9.5.1)$ , take  $A = V^*$  and define

$$\Psi_\Phi = \{\alpha + n | \alpha \in \Phi, n \in I_\alpha\} \subset A^*,$$

where  $I_\alpha = \begin{cases} \mathbb{Z} & , \alpha \in \Phi^{\text{short}} \\ 2\mathbb{Z} + 1 & , \alpha \in \Phi^{\text{long}} \end{cases}$ , then  $(V^*, A, \Psi)$  is a reduced affine root system with derivative  $(V, \Phi)(3.9.8.2)$ , by (3.9.8.9).  $\perp$

**Def. (3.9.8.21)** [Dual Affine Root Systems]. Cf. [K-P23]P26.  $\perp$

**Prop. (3.9.8.22)** [Sliced Root Systems]. For  $(V, A, \Psi, \Phi, W(\Psi)) \in \text{AffRootSys}(3.9.8.2)$  and  $x \in A$ , define  $\Psi_x = \{\psi \in \Psi | \psi(x) = 0\}$ , then

1.  $\Psi_x$  is a root system of the subspace of  $A_x^*$  that it generates.
2.  $d : \Psi_x \rightarrow \Phi$  is injective, making  $\Psi_x$  a sub-root system of  $\Phi$  (but may not be closed).
3. The subset  $\{\psi^\vee | \psi \in \Psi_x\} \subset \Psi^\vee(3.9.8.21)$  is identified with  $\Psi_x^\vee$ .
4. Let  $W(\Psi)_x$  be the stablizer of  $x$  in  $W(\Psi)$ , then the action of  $W(\Psi)_x$  on  $\Psi_x$  identifies  $W(\Psi)_x$  with  $W(\Psi_x)$ .
5. If  $C$  is a chamber of  $A$  containing  $x$ , then  $\Psi_x(C)^0 = \Psi(C)^0 \cap \Psi_x(3.9.8.14)$  is a basis for  $\Psi_x$ , with corresponding set of positive roots  $\Psi_x(C)^+$ .
6.  $C \mapsto \Psi_x(C)^+ = \Psi_x \cap \Psi(C)^+$  is a bijection between the set of chambers containing  $x$  with the set of Weyl-chambers in  $\Psi_x$ .
7. More generally,  $\sigma' \mapsto \Psi_x(\sigma')^+ = \{\psi \in \Psi_x | \psi(\sigma') \geq 0\}$  is an inclusion-preserving bijection between the set of simplexes containing  $x$  to the set of parabolic subsets of  $\Psi_x(3.9.5.15)$ .  $\perp$

*Proof:* 2 is easy. For 1,  $\Psi_x$  doesn't contain 0 because  $\Psi$  doesn't contain constants, and the dual element of  $\psi \in \Psi_x$  is just  $\psi^\vee = \dot{\psi}^\vee \in V \cong (A_x^*)^\vee$ , noticing that  $s_\psi$  preserves  $A_x^*$ .

3: is easy.

4 follows from (3.9.8.12) item 2.

5: All elements of  $\Psi_x(C)^0$  are short. By (3.9.8.17) each  $\psi \in \Psi_x(C)^+$  can be written as a non-negative integral combination of elements of  $\Psi(C)^0$ , but each element of  $\Psi(C)^+$  is non-negative at  $x$ , so this combination only contain those  $\psi_i$  s.t.  $\psi(x) = 0$ , i.e. those  $\psi_i \in \Psi_x(C)^0$ . To show that elements of  $\Psi_x(C)^0$  are linearly independent, write  $C = C_1 \times \dots \times C_n$  as direct sum of irreducible chambers (3.9.8.15), and  $x = (x_1, \dots, x_n)$ , then a linear relation between elements of  $\Psi_x(C)^0$  will induce an affine relation between elements of  $\Psi_{i,x_i}(C_i)^0$ . But elements of  $\Psi_{i,x_i}(C_i)^0$  all vanish at  $x_i$ , so any affine relation is in fact a linear relation, and thus trivial by (3.9.8.17).

6: Any other basis of  $\Psi_x$  is obtained from  $\Psi_x(C)^0$  by action of  $W(\Psi_x) = W(\Psi)_x$  by item 4, and  $W(\Psi_x)$  acts on  $C$  gives all chambers containing  $C$  by (3.9.8.12).

7: It is clear that  $\Psi_x(\sigma')$  is a parabolic subset of  $\Psi_x$ . Conversely, Cf. [K-P23]P28.  $\textcolor{red}{?}$   $\square$

**Def. (3.9.8.23)** [Special Points]. For  $(V, A, \Psi, \Phi, W(\Psi)) \in \text{AffRootSys}(3.9.8.2)$ , a point  $x \in A$  is called

- A **special point** if for each  $\psi \in \Psi$ , there exists  $\psi' \in \Psi_x(3.9.8.22)$  s.t.  $H_\psi$  and  $H_{\psi'}$  are parallel.
- A **extra special point** if  $\Phi_x$  contains a basis of  $\Phi$ .

$\perp$

**Prop. (3.9.8.24)** [Properties of Special Points]. Situation as in (3.9.8.22),

1. special points are vertices of  $A$ .
2.  $d : W(\Psi_x) \rightarrow W(\Phi)$  is injective, and it is surjective iff  $x$  is a special point(3.9.8.23).
3. Any chamber  $C$  contains an extra special point.
4. If  $x \in A$  is extra special, then  $d : \Psi_x^{\text{short}} \rightarrow \Phi^{\text{short}}$  is a bijection.
5. Extra special points are special.
6. If  $\Phi$  is reduced, then special points are extra special.
7. If  $\Psi$  is irreducible, then for any basis  $\Delta$ , there exists  $\psi_0 \in \Delta$  s.t.  $d(\Delta \setminus \psi_0)$  is a basis for  $\Phi$ .

┘

*Proof:* 1: If  $x$  is special, then  $\Psi_x$  contains  $l$ -many independent elements, so  $x$  is a vertex.

2: It is clearly injective by(3.9.8.22). For the second assertion, Cf.[Bourbaki]5.3.10.9.?

3: Take a basis  $\alpha_1, \dots, \alpha_l$  of  $\Phi$ , and take  $\psi_i \in \Psi$  s.t.  $\dot{\psi}_i = \alpha_i$  and  $H_{\psi_i}$  is a wall of  $C$ , then the hyperplanes  $H_{\psi_i}$  intersect at a point, which is extra special.

4: This follows from(3.9.5.16).

5: This follows from item4.

6: If  $\Phi$  is reduced and  $x$  is special, then  $\Psi_x \rightarrow \Phi$  is a bijection.

7: In the irreducible case vertices of  $C$  are in bijection with  $\Psi(C)^0$ (3.9.8.17), so if  $x \in C$  is an extra special vertex(exists by item3), then the elements of  $\Psi(C)^0$  except the one corresponding to  $x$  is a basis of  $\Psi_x$ , by(3.9.8.22) item5.  $\square$

**Prop.(3.9.8.25)[Closed Symmetric Subsets].** For  $(V, A, \Psi, \Phi, W(\Psi)) \in \text{AffRootSys}(3.9.8.2)$ , if  $\Phi' \subset \Phi$  is a closed symmetric subset, and  $W \subset V$  is the subspace annihilated by  $\Phi'$ , then  $\Psi' = \{\psi \in \Psi | \dot{\psi} \in \Phi'\}$  is an affine root system in  $(A/W)^*$ , and is reduced if  $\Psi$  is.  $\square$

*Proof:* Cf.[K-P23]P46.  $\square$

**Def.(3.9.8.26)[Affine Dynkin Diagrams].** For  $(V, A, \Psi, \Phi, W(\Psi)) \in \text{AffRootSys}(3.9.8.2)$ ,  $C \subset A$  an affine chamber(3.9.8.11) and  $\Psi(C)^0$  the corresponding set of simple affine roots(3.9.8.14), then the **affine Dynkin diagram**  $D(\Psi)$  is given as follows:

- Its nodes are elements of  $\Psi(C)^0$ .
- Two nodes  $\psi, \eta \in \Psi(C)^0$  are joined by bonds if  $\dot{\psi}$  or  $\dot{\eta}$  are short, in which case they are joined by  $f(\psi, \eta) = \dot{\psi}(\dot{\eta}^\vee) \cdot \dot{\eta}(\dot{\psi}^\vee)$ -many bonds.
- If  $\dot{\psi}(\dot{\eta}^\vee) \neq \dot{\eta}(\dot{\psi}^\vee) = 1$ , place an arrow on the bonds between  $\psi$  and  $\eta$ , pointing at  $\eta$ .

The isomorphism class of  $D(\Psi)$  is independent of  $C$  chosen, by(3.9.8.12).  $\square$

**Prop.(3.9.8.27) [Affine Dynkin Diagram of Dual Systems].** For  $(V, A, \Psi, \Phi, W(\Psi)) \in \text{AffRootSys}(3.9.8.2)$ ,  $D(\Psi^\vee)$ (3.9.8.26) is obtained from  $D(\Psi)$  by inverting all arrows.  $\square$

*Proof:* ?  $\square$

**Prop.(3.9.8.28) [Dynkin Diagram of Sliced Root Systems].** For  $(V, A, \Psi, \Phi, W(\Psi)) \in \text{AffRootSys}(3.9.8.2)$ , if  $C \subset A$  is an affine chamber and  $\sigma \subset C$  is a facet of  $C$ , then the Dynkin diagram of  $\Psi_\sigma$ (3.9.8.22) is obtained from  $D(\Psi)$  by removing all nodes corresponding to vertices of  $\sigma$ (3.9.8.17).  $\square$

**Prop.(3.9.8.29)[Action of  $W(\Psi)^{\text{ext}}/W(\Psi)$  on  $D(\Psi)$ ].** Cf.[K-P23]P44. ?  $\square$

### Classifying Affine Root Systems

**Prop. (3.9.8.30) [Category of Affine Spaces].** Let

- $\mathcal{C} \in \text{Cat}$  be the category of pairs  $(V, A)$  where  $V \in \text{Vect}^{\text{fin}}/k$  and  $A$  an affine  $V$ -torsor, where the morphisms are affine maps.
- $\mathcal{D} \in \text{Cat}$  be the category of pairs  $(W, \lambda)$  where  $W \in \text{Vect}^{\text{fin}}/k$  and  $\lambda$  a linear functional on  $W$ .

Then the functors

$$F : \mathcal{C} \rightarrow \mathcal{D} : (V, A) \mapsto ((A^*)^\vee, \mathbf{1}_A), f \mapsto (f^*)^\vee,$$

$$G : \mathcal{D} \rightarrow \mathcal{C} : (W, \lambda) \mapsto (\lambda^{-1}(0), \lambda^{-1}(1)), f \mapsto f|_{\lambda^{-1}(1)}$$

are mutually inverse equivalence of categories.  $\lrcorner$

*Proof:* Both natural isomorphisms  $1 \rightarrow G \circ F$  and  $1 \rightarrow F \circ G$  are easy to construct.  $\square$

**Def. (3.9.8.31) [Isomorphisms of Affine Root Systems].** For  $(V_1, A_1, \Psi_1), (V_2, A_2, \Psi_2) \in \text{AffRootSys}$ ,

- A **strong isomorphism of affine root systems** between  $\Psi_1$  and  $\Psi_2$  is an isomorphism  $f : A_1 \rightarrow A_2$  of affine spaces s.t.  $f^* : A_1^* \rightarrow A_2^*$  induces a bijection  $\Psi_1 \cong \Psi_2$  and satisfies: For any  $\eta \in A_1^*$ , if  $\psi = f^*(\eta)$ , then  $\text{df}(\dot{\psi}^\vee) = \dot{\eta}^\vee$ .
- An **isomorphism of affine root system** between  $\Psi_1$  and  $\Psi_2$  is a bijective map  $\varphi : \Psi_1 \cong \Psi_2$  s.t. if  $r, s \in \mathbb{Z}, \psi, \eta \in \Psi_1$  s.t.  $s\psi + r\eta \in \Psi_1$ , then  $\varphi(s\psi + r\eta) = s\varphi(\psi) + r\varphi(\eta)$ .

$\lrcorner$

**Prop. (3.9.8.32) [ $c(\Psi)$ ].** For  $(V, A, \Psi) \in \text{AffRootSys}$  irreducible, and  $C \subset A$  a chamber with corresponding set of simple affine roots  $\Delta$ , then

- There exists a unique collection of positive integers  $(n_\psi)_{\psi \in \Delta}$  without common denominators s.t.  $c(\Psi) = \sum_{\psi \in \Delta} n_\psi \psi$  is a constant function on  $A$ .
- A special vertex  $x$  of  $C$  is extra special iff  $n_\psi = 1$  where  $\psi \in \Delta$  corresponds to  $x$  (3.9.8.17).
- $c(\Psi)$  is independent of  $C$  chosen.

$\lrcorner$

*Proof:* Cf. [K-P23]P31.  $\square$

**Prop. (3.9.8.33).** For  $(V_1, A_1, \Psi_1), (V_2, A_2, \Psi_2) \in \text{AffRootSys}$  irreducible, any isomorphism  $\varphi : \Psi_1 \cong \Psi_2$  (3.9.8.31) extends uniquely to a vector space isomorphism  $f^* : A_1^* \rightarrow A_2^*$  that sends constant functions to constant function, hence descending to a vector space isomorphism  $f^* : V_1^* \cong V_2^*$ . Then:

- For any  $\alpha_1 \in A_1^*, \eta_1 \in \Psi_1$ , we have  $\langle \dot{\alpha}_1, \dot{\eta}_1^\vee \rangle = \langle f^*(\alpha_1), f^*(\eta_1)^\vee \rangle$ .
- There exists  $\epsilon_\varphi \in \{\pm 1\}$  s.t.  $f^*(c(\Psi_1)\mathbf{1}_{A_1}) = \epsilon_\varphi c(\Psi_2)\mathbf{1}_{A_2}$  (3.9.8.32).
- If  $c(\Psi_1) = c(\Psi_2)$  and  $\epsilon_\varphi = 1$ , then  $\varphi$  is a strong isomorphism of affine root systems (3.9.8.31) ( $\dot{\eta}$  is the shorter roots).

$\lrcorner$

*Proof:* Cf. [K-P23]P34.  $\square$

**Prop. (3.9.8.34) [Isomorphisms and Strong Isomorphisms].** For  $(V, A, \Psi), (V', A', \Psi') \in \text{AffRootSys}$ , if  $\varphi : \Psi \cong \Psi'$  is an isomorphism of affine root system (3.9.8.31), then there exists an affine root system  $\Psi''$  on  $A$  s.t.

- If  $\Psi = \Psi_1 \oplus \dots \Psi_n$ ,  $A = A_1 \oplus \dots A_n$  is the decomposition of  $\Psi$  into irreducible affine root systems (3.9.8.16), then  $\Psi'' = r_1 \Psi_1 \oplus \dots r_n \Psi_n$  for some  $r_1, \dots, r_n \in \mathbb{R}^\times$ .
- The composition of  $\varphi : \Psi \cong \Psi'$  with the obvious bijection  $\Psi'' \cong \Psi$  is a strong isomorphism of affine root systems (3.9.8.31).

┘

*Proof:*  $\varphi : \Psi_i \rightarrow \varphi(\Psi_i)$  is an isomorphism of affine root systems for each  $i$ . If  $f_i^* : A_i^* \rightarrow (A'_i)^*$  is the extension of  $\varphi|_{\Psi_i}$ , then we can choose  $r_i \in \mathbb{R}^\times$  s.t.  $f_i^*(c(\Psi_1)\mathbf{1}_{A_1}) = r_i c(\varphi(\Psi_i))\mathbf{1}_{A'_i}$  (3.9.8.32), then the composition of  $\varphi : \Psi \cong \Psi'$  with the obvious bijection  $\Psi'' \cong \Psi$  is a strong isomorphism of affine root systems by (3.9.8.33).  $\square$

**Thm. (3.9.8.35)[Classifying Irreducible Reduced Affine Root Systems].** Any irreducible reduced affine root system is isomorphic to an affine root system  $\Psi_\Phi$  associated to a root system  $\Phi$  (3.9.8.20), or its dual.  $\square$

*Proof:* Cf. [K-P23]P39.  $\square$

**Cor. (3.9.8.36)[Types of Irreducible Reduced Affine Root Systems].** Isomorphism classes of an irreducible reduced affine root system is determined by its affine Dynkin diagram (3.9.8.26), and they are in bijection with the diagrams in [K-P23]P42.  $\square$

*Proof:* If two affine root systems  $\Psi, \Psi'$  has the same affine Dynkin diagram w.r.t. chambers  $C, C'$  resp., then there is a bijection  $\varphi : \Psi(C)^0 \cong \Psi'(C')^0$ , and by (3.9.8.28) and the root system case, we have  $\Psi_S \cong \Psi'_{\varphi(S)}$  for any subset  $S \subset \Psi(C)^0$ . These isomorphism glue together into an isomorphism  $\Psi \cong \Psi'$  because  $\Psi(C)^0$  is a basis of  $A^*$  (3.9.8.17).  $\square$

The classification follows from (3.9.8.35).  $\square$

**Prop. (3.9.8.37)[Types of Irreducible Non-Reduced Affine Root Systems].** Any irreducible non-reduced affine root system  $\Psi$  is determined by the Dynkin diagram of  $\Psi^{\text{short}}$  and the affine Dynkin diagram of  $\Psi^{\text{long}}$ , and the possible situations are recorded in [K-P23]P41.  $\square$

*Proof:*  $\Phi = d(\Psi)$  is non-reduced and irreducible, so it is of type  $BC_n$ . Because  $\Phi^{\text{short}} \subset d(\Psi^{\text{short}}) \subset \Phi$ ,  $\Phi^{\text{long}} \subset d(\Psi^{\text{long}}) \subset \Phi$ , we see that  $\Psi^{\text{short}}$  is of type  $B_n, C_n^\vee$  or  $BC_n$ , and  $\Psi^{\text{long}}$  is of type  $B_n^\vee, C_n$  or  $BC_n$ . But the Weyl-groups of  $\Psi^{\text{short}}$  and  $\Psi^{\text{long}}$  agree, so?  $\square$

## 3.10 Algebraic K-Theory

References are [Algebraic K-Theory of Fields, Suslin, in Proc. ICM 1986, P222-244], [Algebraic K-Theory, Olivier Isely] and [G-S17], [nLab]. [Totaro, Milnor K-theory is the Simplest Part of Algebraic K-Theory, K-theory 6, 177-189, 1992].

### 1 Milnor K-Groups of Fields

**Def. (3.10.1.1) [ $K_0$ ].** The Grothendieck group  $K_0(A)$  for a ring  $A$  is the free group generated by f.g. projective module over  $A$  modulo exact sequences. Then we have  $P \sim Q$  iff  $P \oplus A^n \cong Q \oplus A^n$  for some  $n$ . This is a functor  $\mathcal{CAlg} \rightarrow \mathbf{Ab}$ .  $\lrcorner$

**Def. (3.10.1.2) [Milnor K-Groups].** For  $k \in \mathbf{Field}$ , define the  $n$ -th **Milnor K-group** to be the groups

$$K_0^{\text{Mil}}(k) = \mathbb{Z}, \quad K_1^{\text{Mil}}(k) = k^\times, \quad K_n^{\text{Mil}}(k) = (k^\times)^{\otimes n} / \{a_1 \otimes \dots \otimes a_n \mid \exists 1 \leq i < j \leq n, a_i + a_j = 1\}, n \geq 2.$$

The elements in  $K_n^{\text{Mil}}(k)$  are called **symbols**, and the class of  $a_1 \otimes \dots \otimes a_m$  is denoted by  $\{a_1, \dots, a_n\}$ .  $\lrcorner$

**Prop. (3.10.1.3) [Total Milnor K-Groups].** For  $m, n \in \mathbb{N}$ , the tensor product  $(k^\times)^{\otimes m} \times (k^\times)^{\otimes n} \rightarrow (k^\times)^{\otimes(m+n)}$  induces a surjective map

$$K_m^{\text{Mil}}(k) \otimes K_n^{\text{Mil}}(k) \rightarrow K_{m+n}^{\text{Mil}}(k),$$

which induces a graded group structure on

$$K_*^{\text{Mil}}(k) = \bigoplus_{n \in \mathbb{N}} K_n^{\text{Mil}}(k).$$

Then  $K_*^{\text{Mil}}(k)$  is graded commutative.  $\lrcorner$

*Proof:* Firstly we show that  $\{x, -x\} = 0$ :

$$\{x, -x\} + \{x, -(1-x)x^{-1}\} = \{x, 1-x\} = 0,$$

so

$$\{x, -x\} = -\{x, 1-x^{-1}\} = \{x^{-1}, 1-x^{-1}\} = 0.$$

Thus for any  $x, y \in k^\times$ ,

$$0 = \{xy, -xy\} = \{x, y\} + \{x, -x\} + \{y, -y\} + \{y, x\}.$$

The general cases follow by induction.  $\square$

**Prop. (3.10.1.4) [Finite Fields].** If  $k \in \mathbf{Field}^{\text{fin}}$ , then for any  $n \geq 2$ ,  $K_n^{\text{Mil}}(k) = 0$ .  $\lrcorner$

*Proof:* By (3.10.1.3), it suffices to show that  $K_2^{\text{Mil}}(k) = 0$ . And if  $\omega$  is a generator of the cyclic group  $k^\times$ , then it suffices to show that  $\{\omega, \omega\} = \{\omega, -1\} = 0$ . If  $\#k = 2^m$ , then

$$0 = \{1, \omega\} = \{\omega^{2^m-1}, \omega\} = (2^m - 1)\{\omega, \omega\},$$

thus we are done. And if  $\text{char } k \neq 2$ , then we can find two non-squares in  $k^\times$  s.t.  $a + b = 1$ . Then

$$0 = \{a, b\} = \{\omega^l, \omega^k\} = kl\{\omega, \omega\},$$

so  $\{\omega, \omega\} = 0$ .  $\square$

### Tame Symbols and Specialization Maps

**Def. (3.10.1.5) [Tame symbols and Specialization Maps].** Let  $(R, K, \kappa)$  be a DVR, then for any  $n \in \mathbb{Z}_+$ , there exists a unique homomorphism

$$\partial^{\text{Mil}} : K_n^{\text{Mil}}(K) \rightarrow K_{n-1}^{\text{Mil}}(\kappa)$$

called the **tame symbol map**, s.t. for any uniformizer  $\varpi$  and units  $u_1, \dots, u_{n-1} \in R^*$ ,

$$\partial^{\text{Mil}}(\{\varpi, u_1, \dots, u_{n-1}\}) = \{\bar{u}_1, \dots, \bar{u}_{n-1}\}.$$

Moreover, for any uniformizer  $\varpi$  and  $n \in \mathbb{Z}_+$ , there exists a **specialization map**

$$s_{\varpi}^{\text{Mil}} : K_n^{\text{Mil}}(K) \rightarrow K_n^{\text{Mil}}(\kappa)$$

s.t.

$$s_{\varpi}^{\text{Mil}}(\{\varpi^{i_1} u_1, \dots, \varpi^{i_n} u_n\}) = \{\bar{u}_1, \dots, \bar{u}_n\}$$

for any  $u_1, \dots, u_n \in R^*$ . ┘

*Proof:* Cf.[Central Simple Algebras]P217. ? □

**Cor. (3.10.1.6).**  $\partial^{\text{Mil}}(\{a, b\}) = (-1)^{v(a)v(b)} \overline{a^{-v(b)} b^{v(a)}}.$  ┘

*Proof:* □

**Thm. (3.10.1.7) [Berrick-Keating].** Let  $R, S \in \mathcal{R}\text{ing}$  and  $U \in \text{Mod}_{R-S}$ , let  $T = \begin{bmatrix} R & U \\ & S \end{bmatrix} \in \mathcal{R}\text{ing}$ , then the map

$$\pi_i : K_i(T) \rightarrow K_i(T) \oplus K_i(S)$$

is an isomorphism for any  $i \in \mathbb{Z}$ . ┘

*Proof:* [The K-Theory of Triangular Matrix Rings, Berrick-Keating, in Applications of algebraic K-theory to algebraic geometry and number theory, 1986]. □

## 2 Bloch-Kato Conjecture

**Lemma (3.10.2.1) [Hilbert's Theorem90 for  $K_2$ ].** Let  $K/k$  be a cyclic Galois field extension with a generator  $\sigma \in \text{Gal}(K/k)$ , then the complex

$$K_2^{\text{Mil}}(K) \xrightarrow{\sigma-1} K_2^{\text{Mil}}(K) \xrightarrow{\text{Nm}_{K/k}} K_2^{\text{Mil}}(k)$$

is exact. ┘

*Proof:* Cf.[Central Simple Algebras]P276. ? □

**Prop. (3.10.2.2) [Galois Symbols].** Let  $k \in \mathcal{F}\text{ield}$ ,  $m \in \mathbb{Z} \cap k^\times$ ,  $n \in \mathbb{Z}_+$ , the boundary map

$$\partial k^\times \rightarrow H^1(k, \mu_m)$$

induces a map

$$\partial^n : (k^\times)^{\otimes n} \rightarrow (H^1(k, \mu_m))^{\otimes n} \xrightarrow{\cup} H^n(k, \mu_m^{\otimes n}),$$

and this map factors through  $K_n^{\text{Mil}}(k)$  and gives a **Galois symbol map**

$$h_{k,m}^n : K_n^{\text{Mil}}(k) \rightarrow H^n(k, \mu_m^{\otimes n}).$$

┘

*Proof:* To show this map factors through  $K_n^{\text{Mil}}(k)$ , it suffices to show for  $n = 2$  and  $\partial^2(a \otimes (1-a)) = 0$ . Take an irreducible factorization

$$x^m - a = \prod_l f_l \in k[x],$$

and let  $\alpha_l$  be a root of  $f_l$  in  $k_{\text{sep}}$ ,  $K_l = k(\alpha_l)$ , then

$$(1-a) = \prod_l \text{Nm}_{K_l/k}(1-\alpha_l).$$

and

$$\partial^2(a \otimes (1-a)) = \sum_l \partial^2(a \otimes \text{Nm}_{K_l/k}(1-\alpha_l)).$$

But

$$\begin{aligned} \partial^2(a \otimes \text{Nm}_{K_l/k}(1-\alpha_l)) &= \partial(a) \cup \partial(\text{Nm}_{K_l/k}(1-\alpha_l)) = \partial(a) \cup \text{cor}_k^{K_l}(1-\alpha_l) \\ &= \text{cor}(\text{res}_k^{K_l}(\partial(a)) \cup (1-\alpha_l)) = \text{cor}(\partial_{K_l}(a) \cup (1-\alpha_l)) \end{aligned}$$

But by definition  $a \in (K_l^\times)^m$ , so  $\partial_{K_l}(a) = 0$ , by (9.8.3.9). Thus  $\partial^2(a \otimes (1-a)) = 0$ .  $\square$

**Thm. (3.10.2.3) [Bloch-Kato Conjecture, Voevodsky-Rost/Merkurjev - Suslin].** Situation as in (3.10.2.2), the Galois symbol (3.10.2.2) induces an isomorphism

$$K_n^{\text{Mil}}(k)/mK_n^{\text{Mil}}(k) \xrightarrow{h_{k,m}^n, \cong} H^n(k, \mu_m^{\otimes n}).$$

┘

*Proof:* The  $n = 1$  case follows from (9.8.3.9).

For the  $n = 2$  case ?  $\square$

### 3.11 Hopf-Algebras

References are [Dri86], [A Brief Introduction To Quantum Groups, Etingof-Semenyakin]. [A Guide to Quantum Groups].

#### 1 Poisson-Algebras

**Def. (3.11.1.1)[Poisson Algebras].** For  $R \in \mathcal{CRing}$ , a **Poisson algebra** is a triple  $(A, \cdot, \{-, -\})$  where  $\cdot, \{-, -\} : A \times A \rightarrow A$  are  $R$ -bilinear operators, s.t.

- $(A, \cdot) \in \mathcal{Alg}_k$ .
- $(A, \{-, -\}) \in \mathcal{LieAlg}_k$ .
- For any  $x, y, z \in A$ ,  $\{x, yz\} = \{x, y\}z + y\{x, z\}$ .

┘

**Cor. (3.11.1.2).** For any  $R \in \mathcal{CRing}$  and a Poisson algebra  $A$  over  $R$ , if  $a \in A$ , then  $\{a, 1\} = 0$ .

┘

**Prop. (3.11.1.3)[Commutator].** For any  $R \in \mathcal{CRing}$  and  $A \in \mathcal{Alg}_R$ , the commutator  $[x, y] = xy - yx$  defines a Poisson algebra structure on  $A$ .

┘

**Prop. (3.11.1.4)[Tensor Products of Commutative Poisson Algebras].** Let  $A, B$  be two commutative Poisson  $k$ -algebras, then there is a canonical Poisson structure on  $A \otimes_k B$ :

$$\{a \otimes a', b \otimes b'\} = \{a, a'\} \otimes bb' + aa' \otimes \{b, b'\}.$$

┘

**Prop. (3.11.1.5).** If  $R \in \mathcal{CRing}$  and  $A$  is a Poisson algebra over  $R$ , then for any  $a, b, c, d, e \in A$ ,

$$\{a, b\}e[c, d] = [a, b]e\{c, d\}.$$

┘

*Proof:* We first show that  $\{a, b\}[c, d] = [a, b]\{c, d\}$  using the two ways of calculating  $[ac, bd]$ , and then we expand the expression

$$\{a, b\}[ec, d] = [a, b]\{ec, d\}$$

to get  $\{a, b\}e[c, d] = [a, b]e\{c, d\}$ . □

#### 2 Coalgebras and Bialgebras

**Def. (3.11.2.1)[Coalgebras].** For  $R \in \mathcal{CRing}$ , a **coalgebra** is a co-monoid object in the category  $\mathcal{Mod}_R$ .

Usually for a coalgebra, its comultiplication is denoted by  $\Delta$ , and counit denoted by  $\varepsilon$ . ┘

**Remark (3.11.2.2) [Yoneda Interpretation].** A coalgebra  $(C, \Delta, \varepsilon)$  needs to satisfy the following relations:

$$\Delta^{(2)} \triangleq (\text{id} \otimes \Delta) \circ \Delta = (\Delta \otimes \text{id}) \circ \Delta,$$

$$\text{mul.} \circ (\text{id} \otimes \varepsilon) \circ \Delta = \text{mul.} \circ (\varepsilon \otimes \text{id}) \circ \Delta = \text{id}.$$

We do not need to verify all the relations defining a coalgebra  $C$ , whenever we have a functorial monoidal structure on all the set  $\text{Hom}_R(H, T)$ , we immediately recover the maps

- (Comultiplication):  $\Delta : C \rightarrow C \otimes_R C$  (or denoted by  $\mu$ ) as  $i_1 \cdot i_2$  in  $\text{Hom}_R(C, C \otimes C)$ ,

- (Counit):  $\varepsilon : C \rightarrow R$  as 1 in  $\text{Hom}_R(C, R) = C^\vee$ .

by Yoneda lemma.

$C^\vee$  is an monoid by definition, and  $C$  is called **cocommutative** iff  $C^\vee$  is commutative.  $\lrcorner$

**Prop. (3.11.2.3) [Tensor Products of Co-Algebras].** Let  $R \in \mathcal{CRing}$  and  $C, D$  be co-algebras over  $R$ , then  $C \otimes D$  is a co-algebras with

$$\Delta_{C \otimes D} = \sigma_{23} \circ (\Delta_C \otimes \Delta_D), \quad \varepsilon_{C \otimes D} = \varepsilon_C \otimes \varepsilon_D.$$

$\lrcorner$

**Def. (3.11.2.4) [Primitive Elements].** Let  $R \in \mathcal{CRing}$  and  $H$  be a coalgebra over  $R$ , then an element  $x \in H$  is called a **primitive element** if  $\mu(x) = 1 \otimes x + x \otimes 1$ . It is called **group-like element** if  $\Delta(x) = x \otimes x$ .  $\lrcorner$

**Def. (3.11.2.5) [Sweedler Notations].** For a coalgebra  $A$  and  $a \in A$ , if  $\Delta(a) = \sum_i a_{1i} \otimes a_{2i}$ , then we can write

$$\Delta(a) = \sum_{\text{Swe}} a_1 \otimes a_2.$$

And similarly, by the first defining relation of (3.11.2.2), we can also write

$$(\text{id} \otimes \Delta) \circ \Delta(a) = (\Delta \otimes \text{id}) \circ \Delta(a) = \sum_{\text{Swe}} a_1 \otimes a_2 \otimes a_3.$$

Then the second defining relation just writes

$$a = \sum_{\text{Swe}} a_1 \varepsilon(a_2) = \sum_{\text{Swe}} \varepsilon(a_1) a_2.$$

$\lrcorner$

**Prop. (3.11.2.6).** For any coalgebra  $(A, \Delta, \varepsilon)$  and  $h \in A$ , by defining relations,

$$h = \sum_{\text{Swe}} \varepsilon(h_1) h_2, \quad \varepsilon(h) = \sum_{\text{Swe}} \varepsilon(h_1) \varepsilon(h_2).$$

$\lrcorner$

**Def. (3.11.2.7) [Co-Derivations].** For a co-algebra  $(C, \Delta, \varepsilon)$ , a **co-derivation** is a map  $d : C \rightarrow C$  s.t. for any  $c \in C$ ,

$$\Delta(d(c)) = d(c_1) \otimes c_2 + c_1 \otimes d(c_2).$$

$\lrcorner$

### Co-Poisson Co-Algebras

**Def. (3.11.2.8) [Lie Co-Algebras].** For  $k \in \text{Field}$ , **Lie co-algebra** over  $k$  is a module  $C \in \text{Vect}_k$  together with a  $k$ -linear map  $q : C \rightarrow C \otimes C$  s.t.

$$(1 + t_2) \circ q = 0$$

$$(1 + t_3 + t_3^2) \circ (q \otimes \text{id}) \circ q = 0.$$

where  $t_3 : C^3 \rightarrow C^3$  is given by  $t_3(v_1 \otimes v_2 \otimes v_3) = v_3 \otimes v_1 \otimes v_2$ .  $\lrcorner$

**Def. (3.11.2.9) [Sweedler Notations].** For  $k \in \mathbf{Field}$  and a Lie co-algebra  $C$  over  $k$  and  $a \in C$ , if  $q(a) = \sum_i a_{1i} \otimes a_{2i}$ , we can write

$$q(a) = \sum_{\text{Swe}} a_{(1)} \otimes a_{(2)}.$$

And similarly, we can also write

$$(q \otimes \text{id}) \circ q(a) = \sum_{\text{Swe}} a_{(1)} \otimes a_{(2)} \otimes a_{(3)}.$$

Then the defining relation of Lie co-algebras writes

$$\begin{aligned} \sum_{\text{Swe}} a_{(1)} \otimes a_{(2)} &= - \sum_{\text{Swe}} a_{(2)} \otimes a_{(1)}, \\ \sum_{\text{Swe}} a_{(1)} \otimes a_{(2)} \otimes a_{(3)} + \sum_{\text{Swe}} a_{(3)} \otimes a_{(1)} \otimes a_{(2)} + \sum_{\text{Swe}} a_{(2)} \otimes a_{(3)} \otimes a_{(1)} &= 0. \end{aligned}$$

┘

**Def. (3.11.2.10) [Co-Poisson Co-Algebras].** For  $k \in \mathcal{CRing}$ , a **co-Poisson co-algebra** is a co-algebra  $(C, \Delta, \varepsilon)$  over  $R$  together with a  $R$ -linear map  $q : C \rightarrow C \otimes C$  s.t.

- $(C, q)$  is a Lie co-algebra (3.11.2.8).
- (Co-Leibniz rule)

$$(\Delta \otimes \text{id}) \circ q = (\text{id} \otimes q) \circ \Delta + \sigma_{23}(q \otimes \text{id}) \circ \Delta.$$

Equivalently,

$$\sum_{\text{Swe}} c_{(1)1} \otimes c_{(1)2} \otimes c_{(2)} = \sum_{\text{Swe}} c_1 \otimes c_{2(1)} \otimes c_{2(2)} + \sum_{\text{Swe}} c_{1(1)} \otimes c_2 \otimes c_{1(2)}.$$

┘

**Cor. (3.11.2.11).** For any co-Poisson co-algebra  $(C, \Delta, \varepsilon, q)$ ,

$$(\text{id} \otimes \Delta) \circ q = (q \otimes \text{id}) \circ \Delta + \sigma_{12}(\text{id} \otimes q) \circ \Delta.$$

┘

**Prop. (3.11.2.12) [Poisson-Algebras and Co-Poisson Co-algebras].** Let  $R \in \mathcal{CRing}$  and  $(C, \Delta, \varepsilon)$  be a co-algebra over  $R$  with an  $R$ -linear map  $q : C \rightarrow C \otimes C$ , then  $(C, q)$  is a co-Poisson structure iff  $(C^*, q^*)$  is a Poisson algebra.

And if  $\sigma : C \rightarrow D$  is a linear map between co-Poisson co-algebras over  $R$ , then  $\sigma$  is a homomorphism of co-Poisson co-algebras iff  $\sigma^* : D^* \rightarrow C^*$  is a homomorphism of Poisson algebras. ┘

**Prop. (3.11.2.13) [Co-Commutator].** For any  $k \in \mathbf{Field}$  and a co-algebra  $(C, \Delta, \varepsilon)$  over  $k$ , the co-commutator  $\Delta' = \Delta - \sigma_{12} \circ \Delta$  defines a co-Poisson co-algebra structure on  $C$ . ┘

**Prop. (3.11.2.14) [Tensor Products of Co-Commutative Co-Poisson Co-Algebras].** Let  $R \in \mathcal{CRing}$  and  $C, D$  be co-commutative co-Poisson co-algebras over  $R$ , then  $C \otimes D$  is also a co-commutative co-Poisson co-algebras with the co-algebra structure given by (3.11.2.3) and

$$q_{C \otimes D} = \sigma_{23} \circ (q_C \otimes \Delta_D + \Delta_C \otimes q_D),$$

i.e.,

$$q_{C \otimes D}(a \otimes b) = (a_{(1)} \otimes b_1) \otimes (a_{(2)} \otimes b_2) + (a_1 \otimes b_{(1)}) \otimes (a_2 \otimes b_{(2)}).$$

┘

*Proof:* ? □

**Prop. (3.11.2.15).** There are no co-Poisson algebra structures on a group co-algebra  $k[\Gamma]$ . ? ┘

*Proof:* □

**Prop. (3.11.2.16).** If  $C$  is a co-commutative co-algebra and  $d_1, d_2$  are two co-derivatives of  $C$  s.t.  $d_1 d_2 = d_2 d_1$ , then the map

$$q : C \rightarrow C \otimes C : q(c) = d_1(c_1) \otimes d_2(c_2) - d_2(c_1) \otimes d_1(c_2)$$

defines a co-Poisson co-algebra on  $C$ . ┘

**Prop. (3.11.2.17).** For any co-commutative co-algebra  $(C, \Delta, \varepsilon, q)$ ,

$$(q \otimes \Delta') \circ \Delta = (\Delta' \otimes q) \circ \Delta.$$

And also

$$(\Delta' \otimes \text{id} \otimes q) \circ \Delta^{(2)} = (q \otimes \text{id} \otimes \Delta') \circ \Delta^{(2)}.$$

┘

*Proof:* These follow from (3.11.2.12) and (3.11.1.5). □

**Prop. (3.11.2.18).** For any co-Poisson co-algebra  $(C, \Delta, \varepsilon, q)$  and  $f \in C^*$ ,  $(f \otimes \text{id}) \circ q : C \rightarrow C$  and  $(\text{id} \otimes f) \circ q : C \rightarrow C$  are co-derivatives of  $C$ . ┘

*Proof:* □

**Prop. (3.11.2.19).** For any co-Poisson co-algebra  $(C, \Delta, \varepsilon, q)$ ,  $(\varepsilon \otimes \text{id}) \circ q = (\text{id} \otimes \varepsilon) \circ q = 0$ , i.e.

$$\sum_{\text{Swe}} \varepsilon(c_{(1)}) c_{(2)} = \sum_{\text{Swe}} c_{(1)} \varepsilon(c_{(2)}) = 0.$$

┘

*Proof:* □

### Bialgebras

**Def. (3.11.2.20) [Bialgebras].** For  $R \in \mathcal{C}\text{Ring}$ , a **bialgebra**  $A$  is a unital  $R$ -algebra  $A$  with algebra homomorphisms  $\Delta, \varepsilon : A \rightarrow A \times A$  s.t.  $(A, \Delta, \varepsilon)$  is a co-algebra over  $R$ . Equivalently,  $\Delta$  and  $\varepsilon$  need to satisfy properties as listed in <https://en.wikipedia.org/wiki/Bialgebra>.

WARNING:  $A$  cannot be defined as the co-unital-monoid algebra in  $\text{Ring}/R$ , because tensor products are not coproducts for non-commutative rings, Cf. <https://math.stackexchange.com/questions/984151/proof-that-the-tensor-product-is-the-coproduct-in-the-category-of-r-algebras>.

┘

**Cor. (3.11.2.21).** For any bialgebra  $(A, \cdot, \Delta, \varepsilon)$ ,  $\Delta(1) = 1$ . ┘

### Co-modules

**Def. (3.11.2.22) [Co-modules].** Let  $A$  be a coalgebra over  $k \in \mathbf{Field}$ , then a right **co-module** is a  $k$ -vector space  $V$  together with a  $k$ -linear map  $\rho : V \rightarrow V \otimes A$  that satisfies

$$(\mathrm{id}_V \otimes \mu) \circ \rho = (\rho \otimes \mathrm{id}_A) \circ \rho, \quad (\mathrm{id}_V \otimes \varepsilon) \circ \rho = \mathrm{id}_V.$$

The map  $\rho$  is called the **co-action**, and a  $k$ -subspace  $W \subset V$  that  $\rho(W) \subset W \otimes A$  is called a **sub-comodule** of  $V$ .  $\lrcorner$

**Def. (3.11.2.23) [Tensor Product of Co-modules].**  $\lrcorner$

### 3 Hopf Algebras

**Def. (3.11.3.1) [Hopf Algebra].** For  $R \in \mathbf{CRing}$ , a **Hopf algebra** over a  $R$  is an  $R$ -bi-algebra  $(A, \mathrm{mul.}, \eta, \Delta, \varepsilon)$  together with an  $R$ -linear isomorphism  $S : A \rightarrow A$  (the antipode) that satisfies:

$$\mathrm{mul.} \circ (\mathrm{id} \otimes S) \circ \Delta = \mathrm{mul.} \circ (S \otimes \mathrm{id}) \circ \Delta = \eta \circ \varepsilon : A \rightarrow A,$$

or equivalently,

$$\sum_{\mathrm{Swe}} a_1 S(a_2) = \sum_{\mathrm{Swe}} S(a_1) a_2 = \varepsilon(a), \quad a \in A.$$

If  $S^2 = \mathrm{id}_A$ , then  $A$  is called an **involutive Hopf algebra**.

Similarly we can define **topological Hopf algebras** or **graded Hopf algebras**.  $\lrcorner$

**Remark (3.11.3.2).** The motivating example is  $A = \mathcal{O}(G)$  where  $G \in \mathbf{Grp}$ .  $\lrcorner$

**Prop. (3.11.3.3).** For a Hopf algebra  $A$ ,  $S$  is an anti-homomorphism both for the algebra structure and coalgebra structure.

And if  $A$  is commutative or co-commutative, then  $A$  is involutive.  $\lrcorner$

*Proof:* Cf. <https://ncatlab.org/nlab/show/Hopf+algebra>, and [Abe (1980), Theorem 2.1.4].  $\square$

**Prop. (3.11.3.4).** For any  $(A, \mathrm{mul.}, \eta, \Delta, \varepsilon, S) \in \mathbf{Hopf}$ ,  $S$  is determined by the bi-algebra structure of  $A$ .  $\lrcorner$

*Proof:*  $\square$

**Example (3.11.3.5) [Group Algebras].** For  $\Gamma \in \mathbf{Grp}$ , the group algebra  $R[\Gamma]$  with the coalgebra structure

$$\Delta : R[\Gamma] \rightarrow R[\Gamma] \times R[\Gamma] : g \mapsto g \otimes g, \quad \varepsilon : R[\Gamma] \rightarrow R : \sum a_g g \mapsto \sum a_g$$

and the antipode

$$S : R[\Gamma] \rightarrow R[\Gamma] : g \mapsto g^{-1}$$

is a Hopf algebra.  $\lrcorner$

**Prop. (3.11.3.6) [Universal Enveloping Algebras].**  $\lrcorner$

**Def. (3.11.3.7) [Hopf Ideal and Quotient Hopf Algebra].** Let  $A$  be a Hopf algebra, then a quotient Hopf algebra is a quotient  $A/I$  that has a Hopf algebra structure compatible with that of  $A$ . In another words, there are commutative diagrams

$$\begin{array}{ccccc} A & \xrightarrow{\Delta} & A \otimes_R A & & A & \xrightarrow{\varepsilon} & R & & A & \xrightarrow{S} & A \\ \downarrow & & \downarrow & & \downarrow & \nearrow & & & \downarrow & & \downarrow \\ A/I & \xrightarrow{\bar{\Delta}} & A/I \otimes_R A/I & & A/I & & & & A/I & \xrightarrow{\bar{S}} & A/I \end{array}$$

In particular, quotient Hopf algebras correspond to ideals of  $A$  s.t.

$$\Delta(I) \subset A \otimes I + I \otimes A, \quad \varepsilon(I) = 0, \quad S(I) \subset I,$$

called **Hopf ideals** of  $A$ . ┘

**Remark (3.11.3.8) [Examples].** If  $\Gamma' \triangleleft \Gamma \in \mathcal{G}rp$ , then  $R[\Gamma]$  has a quotient Hopf algebra  $R[\Gamma/\Gamma']$ . In particular,  $R[t]/(t^n - 1)$  is a quotient Hopf algebra of  $R[t, t^{-1}]$ . ┘

**Def. (3.11.3.9) [Dual Hopf Algebras].** Let  $H$  be a Hopf algebra, matrix coefficients.  $H^0$ . ? ┘

**Prop. (3.11.3.10).**  $\mathcal{R}ep(H) \cong \mathcal{M}od_{H^0}$ . ┘

### Topologists' Hopf Algebras

**Def. (3.11.3.11) [Topologist's Hopf Algebra].** A **topologist's Hopf algebra** over a commutative ring  $R$  is a unital magma object in the dual category of graded  $R$ -algebras with 0-degree term  $R$ , given by maps  $\Delta : A \rightarrow A \otimes A$ , and  $\varepsilon : A \rightarrow R$  the canonical projection map. So in particular,  $\Delta$  is of the form

$$\Delta(\alpha) = 1 \otimes \alpha + \alpha \otimes 1 + \sum_i \alpha'_i \otimes \alpha''_i, |\alpha'_i| > 0, |\alpha''_i| > 0$$

**Prop. (3.11.3.12).** The tensor product of two topologists' Hopf algebra is a topologists' Hopf algebra. ┘

**Prop. (3.11.3.13).** Let  $\mathbb{F}$  be a field, then  $\mathbb{F}[\alpha]/(\alpha^n)$ , where  $\alpha$  is placed at even dimension or  $\mathbb{F}$  has characteristic 2, is a topologists' Hopf algebra iff  $\mathbb{F}$  has positive characteristic  $p$  and  $n$  is a power of  $p$ . ┘

*Proof:* By definition, it is easy to see that  $\alpha$  is primitive, thus

$$\Delta(\alpha^n) = 0 = \sum_{0 < i < n} \binom{n}{i} \alpha^i.$$

Which then implies that  $n$  is a  $p$ -power. □

**Prop. (3.11.3.14) [Hopf-Borel].** Let  $A$  be a topologists' Hopf algebra over a perfect field  $K$ , and  $A$  is of f.d. in each degree, then:

- If  $K$  has characteristic 0,  $A$  is isomorphic as an algebra to the tensor product of an exterior product of odd-dimensional generators and a polynomial ring of even-dimensional generators.

- If  $K$  has characteristic  $p$ , then  $A$  is isomorphic as an algebra to the tensor product of algebras of the following types:
  - $K[\alpha]$ , where  $\alpha$  is even-dimensional if  $p \neq 2$ .
  - $\wedge_K[\alpha]$  where  $\alpha$  is odd-dimensional.
  - $K[\alpha]/(\alpha^{p^i})$ , where  $\alpha$  is even-dimensional if  $p \neq 2$ .

┘

*Proof:* We only prove the 0-characteristic case, Cf. [Hat02]P285. ?

□

#### 4 Commutative Hopf Algebras

**Prop. (3.11.4.1) [Commutative Hopf Algebra].** For  $R \in \mathcal{CRing}$ , a commutative Hopf algebra over  $R$  is equivalent to a cogroup object in  $\mathcal{CAlg}_R$ . A homomorphism of Hopf algebras is a morphism of algebras that represents a natural transformation of functors from  $\mathcal{CAlg}_R$  to  $\mathcal{Grp}$ . ┘

*Proof:* The critical point is to look at the definition of Hopf algebra. In this case,  $S$  is a homomorphism of algebras (3.11.3.3), and notice tensor product is just the product in the dual category, and  $m : A \otimes A \rightarrow A$  is the diagonal in the dual category, thus a cogroup object is a map  $\Delta : A \rightarrow A \otimes A$  together with a map  $\text{inv} : A \rightarrow A$  that

$$m \circ (\text{id} \otimes \text{inv}) \circ \Delta = m \circ (\text{inv} \otimes \text{id}) \circ \Delta \text{id} = \text{id} : A \rightarrow A,$$

which is exactly the definition of the Hopf algebra (3.11.3.1). □

**Cor. (3.11.4.2) [Yoneda Interpretation].** We do not need to verify all the relations defining a Hopf algebra  $H$ , whenever we have a functorial commutative group structure on all the set  $\text{Hom}_R(H, T)$ , we immediately recover the maps:

- (Comultiplication):  $\mu : H \rightarrow H \otimes_R H$  as  $i_1 \cdot i_2$  in  $\text{Hom}_R(H, H \otimes H)$ ,
- (Antipode):  $\iota : H \rightarrow H$  as  $\text{inv}$  in  $\text{Hom}_R(H, H)$ ,
- (Counit):  $\varepsilon : H \rightarrow R$  as  $1$  in  $\text{Hom}_R(H, R) = H^\vee$ .

by Yoneda lemma.

For convenience, we denote the structure maps  $\eta_H : R \rightarrow H, \mu : H \times_R H \rightarrow H, (-)^{-1} : H \rightarrow H$ .

┘

**Prop. (3.11.4.3) [Group Algebras].** Let  $\Gamma$  be a commutative group, then the group algebra  $R[\Gamma]$  (3.11.3.5) represents the group functor that maps a commutative  $R$ -algebra  $S$  to the commutative group  $\text{Hom}_{\mathcal{Grp}}(\Gamma, S^*)$ . ┘

**Cor. (3.11.4.4) [Multiplicative Groups].**  $G_{m,R} = R[t, t^{-1}]$  is a Hopf algebra that represents the group functor of multiplicative groups on  $\mathcal{CAlg}_R$ . ┘

**Cor. (3.11.4.5) [Roots of Unity  $\mu_{n,R}$ ].** Let  $\Gamma \cong \mathbb{Z}/n\mathbb{Z}$ , then  $R[\Gamma] \cong R[t]/(t^n - 1)$  is a Hopf algebra that represents the group functor of multiplicative groups of  $n$ -th roots of unity on  $\mathcal{CAlg}_R$ . ┘

**Prop. (3.11.4.6) [Additive Groups].**  $R[t]$  can be given a Hopf algebra structure that represents the group functor that maps a commutative  $R$ -algebra  $S$  to the additive group  $S^+$ . ┘

**Def. (3.11.4.7)**  $[G_{(a,b),R}]$ . Given elements  $a, b \in R$  that  $ab = 2$ , for any commutative  $R$ -algebra  $S$ , the group  $G_{(a,b),R}(S)$  of elements  $x$  of  $S$  that  $x^2 + ax = 0$  is a group under the mapping  $(m, n) \mapsto m + n + bmn$ . Notice the inverse of  $m$  is  $m$  itself. Then  $R[t]/(t^2 + at)$  can be given a Hopf algebra that represents the functor  $S \mapsto G_{(a,b),R}(S)$ .  $\lrcorner$

**Def. (3.11.4.8)**  $[V_a]$ . Let  $V$  be a vector space over  $k$ , then  $\text{Sym}(V^\vee)$  can be given a Hopf algebra structure representation the functor  $V_a : R \mapsto R \otimes_k V \cong \text{Hom}_k(V^\vee, R)$ .  $\lrcorner$

**Def. (3.11.4.9)** **[Locally Constant Functions]**. Let  $\Gamma$  be a group, then  $\underline{\Gamma}_R = \prod_{\gamma \in \Gamma} R$  represents the group functor that maps an  $R$ -algebra  $T$  to the group of locally constant functions on  $\text{Spec } R$  with value in  $\Gamma$ .  $\lrcorner$

**Remark (3.11.4.10)**. To illustrate the philosophy of (10.1.1.2), we figure out the Hopf structure of the local constant functions: a map  $\prod_{\gamma \in \Gamma} R \rightarrow T$  is equivalent to a set of idempotents  $e_\gamma$  of  $T$  that  $\sum e_\gamma = 1$ . This is equivalent to a locally constant function on  $\text{Spec } T$  that takes value  $\gamma$  on  $V(e_\gamma)$ . Then the product takes values  $\gamma\delta$  on  $V(e_\gamma \otimes e_\delta) \subset \text{Spec } T \otimes T$ , or equivalently takes values  $\gamma$  on  $V(\sum_{gg'=\gamma} e_g \otimes e_{g'})$ , so  $\Delta(e_\gamma) = \sum_{gg'=\gamma} e_g \otimes e_{g'}$ .  $\lrcorner$

**Lemma (3.11.4.11)** **[Modulo  $\ker(\varepsilon)$ ]**. For a Hopf algebra  $A$  over  $R$ , the comultiplication and counit are determined by  $\ker \varepsilon$ :

- $R \oplus \ker \varepsilon \rightarrow A : (a, b) \mapsto a + b$  is an isomorphism of  $R$ -modules.
- $\mu(a) \equiv -\varepsilon(a) + a \otimes 1 + 1 \otimes a \pmod{\ker \varepsilon \otimes_R \ker \varepsilon}$ .
- $\iota(a) \equiv -a \pmod{(\ker \varepsilon)^2}$  for  $a \in \ker \varepsilon$ .

$\lrcorner$

*Proof:* 1: this is because the counit  $0 \rightarrow \ker \varepsilon \rightarrow A \rightarrow R \rightarrow 0$  has an inverse by the  $R$ -algebra map  $R \rightarrow S$ .

2: item1 allows us to write

$$A \otimes_R A = R \oplus (\ker \varepsilon \otimes_R R) \oplus (R \otimes_R \ker \varepsilon) \oplus (\ker \varepsilon \otimes \ker \varepsilon)$$

so for  $a \in A$ ,

$$\mu(a) = b + c \otimes 1 + 1 \otimes d + z$$

where  $b \in R, c, d \in \ker \varepsilon, z \in \ker \varepsilon \otimes_R \ker \varepsilon$ . Then  $a = (\varepsilon \otimes \text{id}_A)(b + c \otimes 1 + 1 \otimes d + z) = b + d$ , and also  $a = b + c$ . Applying  $\varepsilon$  shows  $b = \varepsilon(a)$ , and thus

$$\mu(a) = \varepsilon(a) + (a - \varepsilon(a)) \otimes 1 + 1 \otimes (a - \varepsilon(a)) + z = -\varepsilon(a) + a \otimes 1 + 1 \otimes a + z.$$

3: Let  $\iota(a) = b + c$  where  $b \in R, c \in \ker \varepsilon$ , then

$$\varepsilon(a) = \text{mul.}(\iota \otimes \text{id})(-\varepsilon(a) + a \otimes 1 + 1 \otimes a + z) = -\varepsilon(a) + \iota(a) + a + \text{mul.}(\iota \otimes \text{id})(z)$$

so for  $a \in \ker \varepsilon$ ,  $\iota(a) \equiv -a \pmod{(\ker \varepsilon)^2}$ , as  $\text{mul.}(\iota \otimes \text{id})(z) \in (\ker \varepsilon)^2$ , because  $\iota$  commutes with  $\varepsilon$ .  $\square$

**Prop. (3.11.4.12)** **[Hopf Ideals of Additive Groups]**. Let  $f = \sum_{i=0}^d a_i t^i \in R[t]$  be a monic polynomial  $\neq t$ , then  $(f)$  is a Hopf ideal of  $R[t]$  iff  $R$  is of char  $p > 0$  and the derivative  $f' = 0$ .  $\lrcorner$

*Proof:* We check conditions in (3.11.3.7), the first says  $\sum a_i (t \otimes 1 + 1 \otimes t)^i$  vanishes in  $R[t]/(f) \otimes_R R[t]/(f)$ . But  $f$  is monic, so this is equivalent to  $a_i \binom{i}{j} = 0$  for any  $0 < j < i \leq d$ . But we have  $\gcd_{0 < j < i} \binom{i}{j} = p$  if  $i = p^r$  for some  $r \geq 1$  and 1 otherwise, so  $a_d = 0$  unless  $d$  is a power of  $p$ , and  $p = 0 \in R$  because  $a_d = 1$ . In particular,  $f = \sum_{i=0}^k b_i t^{p^i}$ , and it automatically satisfies the other two conditions.  $\square$

**Cor. (3.11.4.13)**  $[\alpha_{p^r, R}]$ . Let  $R$  be a commutative ring of char  $p > 0$ , then the quotient Hopf algebra  $R[t]/(t^{p^r})$  corresponding to the Hopf ideal  $(t^{p^r})$  is denoted by  $\alpha_{p^r, R}$ .

WARNING:  $\alpha_{p^r, R}$  is isomorphic to  $\mu_{p^r, R}$  as  $R$ -algebras, but they are not isomorphic as Hopf algebras.  $\lrcorner$

**Prop. (3.11.4.14) [Irreducibility of Hopf Algebras]**. For  $k \in \mathbf{Field}$ , the following Hopf algebra contains no proper Hopf ideals:

- $\mathbb{G}_{a, k}$  if char  $k = 0$ .
- $\alpha_{p, k}$  if char  $k = p > 0$ .

$\lrcorner$

*Proof:* Any Hopf ideal of  $k[t]$  is principal, thus this proposition follows from (3.11.4.12).  $\square$

**Def. (3.11.4.15) [Cokernel Hopf Algebra]**. Let  $A \rightarrow B$  be a homomorphism of Hopf Algebras over  $R$ , then the **cokernel Hopf algebra** is the algebra  $B \otimes_A R = B/B \otimes_A \ker(\varepsilon_A)$ , which represents the functor of kernels of  $\mathrm{Hom}_R(B, T) \rightarrow \mathrm{Hom}_R(A, T)$ , thus is a Hopf algebra.  $\lrcorner$

**Lemma (3.11.4.16)**. A Hopf algebra over a field  $k$  is direct limit of Hopf algebra of f.t. over  $k$ .  $\lrcorner$

**Def. (3.11.4.17) [Group-Like Elements]**. Let  $A$  be a Hopf algebra, then a **group-like element**  $a \in A$  is an invertible element that satisfies  $\mu(a) = a \otimes a \in A \otimes A$ .

If  $a$  is a group-like element in a Hopf algebra  $A$ , then  $a = (\varepsilon, \mathrm{id})\mu(a) = \varepsilon(a)a$ , so  $\varepsilon(a) = 1$ .  $\lrcorner$

**Prop. (3.11.4.18) [Group-Like Elements are Linearly Independent]**. Let  $A$  be a Hopf algebra over a field  $k$ , then the set of group-like elements are linearly independent over  $k$ .  $\lrcorner$

*Proof:* If  $e = \sum a_i e_i$  that  $e, e_i$  are all group-like elements, then

$$\mu(e) = e \otimes e = \sum c_i c_j e_i \otimes e_j = \sum c_i \mu(e_i) = \sum c_i e_i \otimes e_i$$

so  $c_i^2 = c_i$  and  $c_i c_j = 0$ . Now also notice  $1 = \varepsilon(e) = \sum c_i \varepsilon(e_i) = \sum c_i$  (3.11.4.17), contradiction.  $\square$

**Cor. (3.11.4.19)**. The set of group-like elements in the Hopf algebra  $k[\Gamma]$  (3.11.4.3) are just the set  $\Gamma \subset k[\Gamma]$ .  $\lrcorner$

**Prop. (3.11.4.20) [Cartier Theorem]**. For  $k \in \mathbf{Field}^0$ , any Hopf algebra  $A$  over  $k$  is reduced.  $\lrcorner$

*Proof:* We can base change to the algebraic closure  $\bar{k}$  of  $k$  and assume  $k$  is alg.closed. Because reducedness is stalkwise and Hilbert's Nullstellensatz, it suffices to show  $A_s$  is reduced at each  $s \in G(k)$ . The translation by  $g \in G(k)$  acts transitively on  $G(k)$ , so it suffices to show it vanishes at the kernel of the counit map  $\ker(\varepsilon)$ . Cf. [Jakob, Stix].

We may assume by taking direct limits that  $A$  is f.g. over  $k$ . Let  $\mathfrak{m}$  be the kernel of the counit  $\varepsilon : A \rightarrow k$ , then  $\mathfrak{m}/\mathfrak{m}^2$  is a f.g.  $k$ -vector space with a basis lifting to  $x_1, \dots, x_r \in \mathfrak{m}$ .

We prove that  $\mathrm{gr}_{\mathfrak{m}}(A)$  is a polynomial ring in  $x_i$ , Cf. [Shatz].  $\square$

**Prop. (3.11.4.21) [Faithfully Flatness]**. If  $A \subset B$  are f.g. Hopf algebras over a field  $k$ , then  $B$  is f.f. over  $A$ .  $\lrcorner$

*Proof:* Cf. [Milne, P73] **?**.  $\square$

**Cor. (3.11.4.22)**. If  $A \subset B$  are Hopf algebras that  $B$  is an integral domain, and let  $K, L$  be their fraction field, then  $B \cap L = A$ . In particular, if  $K = L$ , then  $A = B$ .  $\lrcorner$

*Proof:* Since  $A \rightarrow B$  is f.f. by (3.11.4.21),  $cB \cap A = cA$  for any  $c \in A$  by (3.11.4.21). Thus if  $a/c \in B$  for  $a, c \in A$ , then  $a \in cB \cap A = cA$ , so  $a/c \in A$ .  $\square$

## 5 Clifford Algebras

References are [L-W89] and [Book of Involutions].

**Def. (3.11.5.1) [Clifford Algebra].** Let  $R \in \mathcal{CRing}$  and  $(L, Q) \in \text{QuadSpa}/R$ , the **Clifford algebra** is defined to be  $\text{Cl}(L) = T(L)/\langle v \otimes v - Q(v) \rangle$ . Because the quotient ideal is even, there is a  $\mathbb{Z}/(2)$ -grading on  $\text{Cl}(L)$ :  $\text{Cl}(L) = \text{Cl}^+(L) \oplus \text{Cl}^-(L)$ .  $\lrcorner$

**Def. (3.11.5.2) [Involutions].** By functoriality, there is a map  $\text{O}(L, Q) \rightarrow \text{Aut}(\text{Cl}(L))$ .

The involution  $-\text{Id} \in \text{O}(L, Q)$  induces an involution on  $\text{Cl}(L) : (v_1 v_2 \dots v_n)' \triangleq (-v_n)(-v_{n-1}) \dots (-v_1)$ . This involution preserves the  $\mathbb{Z}/(2)$ -grading.  $\lrcorner$

**Def. (3.11.5.3) [Transpose].** There is a anti-automorphism  $(-)^t : \text{Cl}(L) \rightarrow \text{Cl}(L)$  called the **Clifford transpose** that

$$(v_1 \otimes \dots \otimes v_r)^t = v_r \otimes \dots \otimes v_1, \quad \forall v_1, \dots, v_r \in L.$$

And define the **norm map**:  $Q(x) = x^t x : \text{Cl}(L) \rightarrow \text{Cl}(L)$ , which extends the norm  $Q$  on  $L$ .  $\lrcorner$

**Prop. (3.11.5.4).** Let  $R \in \mathcal{CRing}/\mathbb{Q}$  and  $(L, Q)$  be a quadratic space over  $R$ , then there is a canonical isomorphism of  $R$ -modules

$$\Lambda^* L \cong \text{Cl}(L)$$

compatible with the filtered structure. In particular, we can speak of  $\Lambda^k L \subset \text{Cl}(L, Q)$ .  $\lrcorner$

*Proof:* The map

$$f : L \otimes \dots \otimes L \rightarrow \text{Cl}(L) : v_1 \otimes \dots \otimes v_r \rightarrow \frac{1}{r!} \sum_{\sigma \in \text{Sym}_r} \text{sgn}(\sigma) v_{\sigma(1)} \dots v_{\sigma(r)}$$

descends to a map  $\Lambda^r L \rightarrow \text{Cl}(L)$ .  $\square$

**Prop. (3.11.5.5).** Let  $L = L_1 \oplus L_2$  be an orthogonal decomposition of quadratic spaces over  $R$ , then there is a natural isomorphism of Clifford algebras

$$\text{Cl}(L) \cong \text{Cl}(L_1) \hat{\otimes} \text{Cl}(L_2),$$

where the  $\hat{\otimes}$  is the  $\mathbb{Z}/(2)$ -graded tensor product.  $\lrcorner$

**Def. (3.11.5.6) [Spin Groups].** There are subgroups of  $\text{Cl}^+(L)$ :

$$\text{Spin}(L) = \{g \in \text{Cl}^+(L) : gg' = 1, gLg^{-1} = L\}$$

$$\text{GSpin}(L) = \{g \in \text{Cl}^+(L) : gg' = \lambda(g) \in R^*, gLg^{-1} = L\}.$$

called the **spin group** and **GSpin group** of  $L$ .  $\text{Spin}(L)$  and  $\text{GSpin}(L)$  acts on  $L$  via conjugation.  $\lrcorner$

**Prop. (3.11.5.7).** There is a diagram with exact rows and columns:

$$\begin{array}{ccccccc} 1 & \longrightarrow & \mu_2 & \longrightarrow & \text{Spin}(L) & \longrightarrow & \text{SO}(L) \longrightarrow 1 \\ & & \downarrow & & \downarrow & & \parallel \\ 1 & \longrightarrow & R^* & \longrightarrow & \text{GSpin}(L) & \longrightarrow & \text{SO}(L) \longrightarrow 1 \\ & & \downarrow^2 & & \downarrow_\lambda & & \\ & & R^* & \xlongequal{\quad} & R^* & & \end{array}$$

*Proof:*  $\square$

### Real Clifford Algebras

**Prop. (3.11.5.8) [Real Clifford Algebras].** Let  $\text{Cl}_{r,s}(\mathbb{R})$  denote the real Clifford algebra of the quadratic space  $V \cong \mathbb{R}^{r+s}$  or signature  $r - s$ , and also  $\text{Cl}_n(\mathbb{R}) \triangleq \text{Cl}_{n,0}(\mathbb{R})$ ,  $\text{Cl}_n(\mathbb{R})^* = \text{Cl}_{0,n}(\mathbb{R})$ . Then clearly  $\text{Cl}_{r,s}(\mathbb{R}) \cong \text{Cl}_1(\mathbb{R})^{\widehat{\otimes} r} \widehat{\otimes} \text{Cl}_1^*(\mathbb{R})^{\widehat{\otimes} s}$ , and

$$\text{Cl}_1(\mathbb{R}) \cong \mathbb{C}, \quad \text{Cl}_1^*(\mathbb{R}) \cong \mathbb{R} \oplus \mathbb{R}, \quad \text{Cl}_2(\mathbb{R}) \cong \mathbb{H} \subset \text{Mat}(2; \mathbb{C}), \quad \text{Cl}_2^*(\mathbb{R}) \cong \text{Mat}(2; \mathbb{R}).$$

$$\text{And dim}_{\mathbb{R}} \text{Cl}_{r+s}(\mathbb{R}) = 2^{r+s}. \quad \lrcorner$$

**Def. (3.11.5.9) [Volume Elements and Chirality Elements].** Notation as in (3.11.5.8) and take an orientation of  $\mathbb{R}^{r+s}$ , then for any orientation-compatible orthonormal basis  $v_1, \dots, v_{r+s}$ , we can consider the element  $v_1 v_2 \dots v_{r+s} \in \text{Cl}_{r,s}(\mathbb{R})$ . Then it only depends on the orientation, called the **Clifford volume form**. And

$$\omega^2 = (-1)^{\frac{n(n+1)}{2}+s}, \quad v\omega = (-1)^{n-1}\omega v, \quad \forall v \in \mathbb{R}^{r+s}.$$

In particular, if  $2 \nmid r+s$ , then  $\omega \in Z(\text{Cl}_{r,s}(\mathbb{R}))$ , and if  $2 \mid r+s$ , then  $\varphi\omega = \omega\varphi'$  for any  $\varphi \in \text{Cl}_{r,s}(\mathbb{R})$ .  $\lrcorner$

**Prop. (3.11.5.10) [Volume Decompositions].** Suppose the Clifford volume form (3.11.5.9)  $\omega^2 = 1$ , and denote

$$\pi^+ = \frac{1}{2}(1 + \omega), \quad \pi^- = \frac{1}{2}(1 - \omega),$$

then  $\pi^{\pm}$  are idempotents, with  $\pi^+ + \pi^- = 1$ . And

- If  $2 \nmid r+s$ , then there is a decomposition

$$\text{Cl}_{r,s}(\mathbb{R}) = \text{Cl}_{r,s}^+(\mathbb{R}) \oplus \text{Cl}_{r,s}^-(\mathbb{R}), \quad \text{Cl}_{r,s}^{\pm}(\mathbb{R}) = \text{Cl}_{r,s}(\mathbb{R})\pi^{\pm}.$$

$$\text{and } \alpha(\text{Cl}_{r,s}^{\pm}(\mathbb{R})) = \text{Cl}_{r,s}^{\mp}(\mathbb{R}). \quad \lrcorner$$

**Prop. (3.11.5.11).** For any  $r, s \in \mathbb{N}$ , there is an isomorphism  $\text{Cl}_{r,s}(\mathbb{R}) \cong \text{Cl}_{r+1,s}^0(\mathbb{R})$ .  $\lrcorner$

*Proof:* Take the usual basis  $e_1, \dots, e_{r+1}, e_{r+2}, \dots, e_r$  of  $\mathbb{R}^{r+1+s}$  and define a map

$$f : \mathbb{R}^{r+s} \rightarrow \text{Cl}_{r+1,s}^0(\mathbb{R}) : e_i \mapsto e_{r+1}e_i,$$

then for any  $x = \sum_{i \neq r+1} x_i e_i$ , we have

$$f(x)^2 = \sum_{i,j} x_i x_j e_{r+1} e_{r+1} e_i e_{r+1} e_j = \sum_{i,j} x_i x_j e_i e_j = x \cdot x = -q(x),$$

so  $f$  extends to an algebra homomorphism  $\text{Cl}_{r,s}(\mathbb{R}) \rightarrow \text{Cl}_{r+1,s}^0(\mathbb{R})$ . This is an isomorphism by checking on a linear basis.  $\square$

**Prop. (3.11.5.12).** Let  $L : \text{Cl}_n(\mathbb{R}) \rightarrow \text{Cl}_n(\mathbb{R})$  be the linear map

$$L(\varphi) = - \sum_j e_j \varphi e_j$$

where  $e_j$  is an orthonormal basis of  $\mathbb{R}^n$ . Set  $\tilde{L} = \alpha \circ L$ , then the eigenspaces of  $\tilde{L}$  are the canonical images of  $\Lambda^p(\mathbb{R}^n) \subset \text{Cl}_n(\mathbb{R})$ . In fact,

$$\tilde{L}_{\Lambda^p} = (n - 2p) \text{Id}. \quad \lrcorner$$

*Proof:* In fact,

$$\begin{aligned}
 L(e_1 \dots e_p) &= - \sum_{j=1}^p e_j e_1 e_2 \dots e_p e_j - \sum_{j=p+1}^n e_j e_1 \dots e_p e_j \\
 &= \sum_{j=1}^p (-1)^{p-1} p e_1 e_2 \dots e_p - \sum_{j=p+1}^n (-1)^p e_1 \dots e_p \\
 &= (-1)^{n-2p} e_1 \dots e_p.
 \end{aligned}$$

□

**Prop.(3.11.5.13) [Clifford Multiplication and Interior Products].** Under the canonical vector space isomorphism  $f : \text{Cl}_n(\mathbb{R}) \cong \Lambda^*(\mathbb{R}^n)$ ,

$$f(v\varphi) = v \wedge f(\varphi) - v \lrcorner f(\varphi).$$

┘

*Proof:* Cf.[L-W89]P25.

□

**Prop.(3.11.5.14).**

$$\text{Cl}_{n+2,0} \cong \text{Cl}_{0,n} \otimes \text{Cl}_{2,0}, \quad \text{Cl}_{0,n+2} \cong \text{Cl}_{n,0} \otimes \text{Cl}_{0,2}.$$

by the mapping  $e_i \rightarrow e_i \otimes e'_1 e'_2$ ,  $e_{n+j} \rightarrow 1 \otimes e'_j$ . So we have

$$\text{Cl}_{n+8,0} \cong \text{Cl}_n \otimes \mathbb{R}(16), \quad \text{Cl}_{n+2,0} = \text{Cl}_{n+2,0} \otimes \mathbb{C} = \text{Cl}_{n,0} \otimes \mathbb{C}(2).$$

because  $\mathbb{H} \otimes \mathbb{C} = \mathbb{C}(2)$ , and

$$\begin{bmatrix}
 n & 0 & 1 & 2 & 3 & 4 & 5 & 6 & 7 \\
 \text{Cl}_{n,0} & \mathbb{R} & \mathbb{C} & \mathbb{H} & \mathbb{H} \oplus \mathbb{H} & \mathbb{H}(2) & \mathbb{C}(4) & \mathbb{R}(8) & \mathbb{R}(8) \oplus \mathbb{R}(8) \\
 \text{Cl}_{n,0} & \mathbb{C} & \mathbb{C} \oplus \mathbb{C} & & & & & & 
 \end{bmatrix}.$$

┘

## 6 Quantization

Cf.[Dri85, Dri86].

Quantizing is somewhat like replacing commutative algebras by noncommutative ones. One way to try to construct non-classical examples of quantum groups is to look for deformations, in the category of Hopf algebras, of classical algebras of functions on a group.

### (Co-)Poisson Hopf Algebras

**Def.(3.11.6.1) [Poisson-Hopf Algebras].** A **Poisson Hopf algebra** is a Hopf algebra  $(A, \text{mul.}, \eta, \Delta, \varepsilon, S)$  with a Poisson structure  $\{-, -\}$  s.t.

$$\Delta(\{a, b\}) = \sum_{\text{Swe}} \{a_1, b_1\} \otimes a_2 b_2 + \sum_{\text{Swe}} a_1 b_1 \otimes \{a_2, b_2\}.$$

Notice if  $A$  is commutative, then this just means  $\Delta : A \rightarrow A \otimes A$  is a homomorphism of Poisson structures, by(3.11.1.4).

(The motivating example is  $A = \mathcal{O}(G)$  where  $G$  is a Poisson-Lie group.)

┘

**Cor. (3.11.6.2).** For any Poisson-Hopf algebra  $(A, \text{mul.}, \eta, \Delta, \varepsilon, S, \{-, -\})$  and  $a, b \in A$ ,

$$\sum_{\text{Swe}} \{a, S(b_1)\} b_2 = \sum_{\text{Swe}} S(b_1) \{b_2, a\}.$$

┘

*Proof:* It follows from the Leibniz rule that

$$\sum_{\text{Swe}} \{a, S(b_1)\} b_2 + \sum_{\text{Swe}} S(b_1) \{a, b_2\} = \sum_{\text{Swe}} \{a, S(b_1) b_2\} \stackrel{(3.11.3.1)}{=} \{a, \varepsilon(b)\} \stackrel{(3.11.1.2)}{=} 0.$$

□

**Prop. (3.11.6.3).** If  $k \in \text{Field}$ ,  $\text{char } k \neq 2$ , and  $\mathfrak{g} \in \text{LieAlg}_k$  is non-Abelian, then there are no non-trivial Poisson Hopf algebra structures on  $U(\mathfrak{g})$ . ┘

*Proof:* Cf.[Co-Poisson structures on polynomial Hopf algebras]P816. □

**Prop. (3.11.6.4).** For a Poisson Hopf algebra  $(H, \mu, \eta, \Delta, \varepsilon, S, \{-, -\})$ , the counit  $\varepsilon : H \rightarrow R$  is a Poisson algebra homomorphism:  $\varepsilon(\{a, b\}) = 0$  for any  $a, b \in H$ . And if  $H$  is commutative, then  $S : H \rightarrow H$  is a Poisson algebra anti-homomorphism. ┘

*Proof:* For  $\varepsilon$ , because of the defining relation for coalgebras, for any  $a, b \in A$ ,

$$\varepsilon(\{a, b\}) = \varepsilon(\text{mul.} \circ (\varepsilon \otimes \text{id}) \circ \Delta(\{a, b\})) = \sum_{\text{Swe}} \varepsilon(\{a_1, b_1\}) \varepsilon(a_2 b_2) + \sum_{\text{Swe}} \varepsilon(a_1 b_1) \varepsilon(\{a_2, b_2\}),$$

but also by (3.11.2.6),

$$\varepsilon(\{a, b\}) = \varepsilon(\{\sum_{\text{Swe}} \varepsilon(a_1) a_2, \sum_{\text{Swe}} \varepsilon(b_1) b_2\}) = \sum_{\text{Swe}} \varepsilon(a_1 b_1) \{a_2, b_2\}.$$

similarly,

$$\varepsilon(\{a, b\}) = \sum_{\text{Swe}} \{a_1, b_1\} \varepsilon(a_2 b_2).$$

Thus  $\varepsilon(\{a, b\}) = 2\varepsilon(\{a, b\})$ , so  $\varepsilon(\{a, b\}) = 0$ .

For  $S$ , Firstly for any  $a, b \in A$ ,

$$\{a_1, b_1\} S(a_2 b_2) + a_1 b_1 S(\{a_2, b_2\}) = 0,$$

by (3.11.6.1) and the fact  $\varepsilon(\{a, b\}) = 0$ . Then by (3.11.6.2) (3.11.3.1) and (3.11.3.3),

$$\begin{aligned} \{S(b), S(a)\} &= \sum_{\text{Swe}} \{S(b_1), S(a)\} b_2 S(b_3) \\ (3.11.6.2) &= - \sum_{\text{Swe}} S(b_1) \{b_2, S(a)\} S(b_3) \\ &= - \sum_{\text{Swe}} S(b_1) \{b_2, S(a_1)\} a_2 S(a_3) S(b_3) \\ (3.11.6.2) &= \sum_{\text{Swe}} S(b_1) S(a_1) \{b_2, a_2\} S(a_3) S(b_3) \\ &= - \sum_{\text{Swe}} S(b_1) S(a_1) b_2 a_2 S(\{b_3, a_3\}) \\ (3.11.2.5) &= S(\{a, b\}). \end{aligned}$$

□

**Def. (3.11.6.5) [Co-Poisson Hopf Algebras].** A **co-Poisson Hopf algebra** is a Hopf algebra  $(H, \text{mul.}, \eta, \Delta, \varepsilon, S)$  equipped with a co-Poisson co-algebra structure  $q : H \rightarrow H \otimes H$  (3.11.2.10) s.t. for any  $a, b \in H$ ,

$$q(ab) = q(a)\Delta(b) + \Delta(a)q(b).$$

Notice if  $H$  is co-commutative, then this just means that  $\text{mul.} : H \otimes H \rightarrow H$  is a co-Poisson co-algebra homomorphism, by (3.11.2.14).  $\lrcorner$

**Prop. (3.11.6.6) [Poisson-Hopf Algebras and Co-Poisson Hopf-algebras].** Let  $R \in \mathcal{CRing}$  and  $(H, \text{mul.}, \eta, \Delta, \varepsilon, S)$  be a Hopf algebra over  $R$  with an  $R$ -linear map  $q : H \rightarrow H \otimes H$ , then  $(H, q)$  is a co-Poisson structure iff  $(H^*, q^*)$  is a Poisson-Hopf algebra.

And if  $\sigma : H_1 \rightarrow H_2$  is a linear map between co-Poisson Hopf algebras over  $R$ , then  $\sigma$  is a homomorphism of co-Poisson Hopf algebras iff  $\sigma^* : D^* \rightarrow C^*$  is a homomorphism of Poisson-Hopf algebras.  $\lrcorner$

**Prop. (3.11.6.7).** For a co-Poisson Hopf algebra  $(H, \mu, \eta, \Delta, \varepsilon, S, \{-, -\})$ , the unit  $\eta : R \rightarrow H$  is a co-Poisson co-algebra homomorphism:  $q(1) = 0$ . And if  $H$  is co-commutative, then  $S : H \rightarrow H$  is a co-Poisson co-algebra anti-homomorphism.  $\lrcorner$

*Proof:* This follows from (3.11.6.6) and (3.11.6.4).  $\square$

**Prop. (3.11.6.8) [Co-Poisson Hopf Structures on  $U(\mathfrak{g})$ ].** For  $k \in \mathbf{Field}^0$  and  $\mathfrak{g} \in \mathbf{LieAlg}_k$ , co-Poisson Hopf structures on  $U(\mathfrak{g})$  are equivalent to Lie bi-algebra structures on  $\mathfrak{g}$ .  $\lrcorner$

*Proof:* Cf. [A guide to quantum groups]P178.  $\square$

### Quantization of (Co-)Poisson Hopf Algebras

**Def. (3.11.6.9) [Deformations of Hopf Algebras].** For  $k \in \mathbf{Field}$  and a Hopf algebra  $(A, \text{mul.}, \eta, \Delta, \varepsilon, S)$  over  $k$ , a **deformation of Hopf algebra** is a topological Hopf algebra  $(A_{\hbar}, \text{mul.}, \eta_{\hbar}, \Delta_{\hbar}, \varepsilon_{\hbar}, S_{\hbar})$  over  $k[[\hbar]]$  s.t.

- $A_{\hbar} \cong A[[\hbar]]$  as  $k[[\hbar]]$ -modules.
- $\mu_{\hbar} \equiv \mu(\text{mod } \hbar), \Delta_{\hbar} \equiv \Delta(\text{mod } \hbar)$ .

Two deformations  $A_{\hbar}, A'_{\hbar}$  are called equivalent if there is an isomorphism of Hopf algebras  $f : A_{\hbar} \cong A'_{\hbar}$  over  $k[[\hbar]]$  s.t.  $f \equiv 1(\text{mod } \hbar)$ .  $\lrcorner$

**Def. (3.11.6.10) [Infinitesimal Deformations of Hopf Algebras].** Cf. [A guide to Hopf algebras]P172.  $\lrcorner$

**Def. (3.11.6.11) [Quantization of Poisson-Hopf Algebras].** For  $k \in \mathbf{Field}$  and a commutative Poisson algebra  $(A, \cdot, \{-, -\})$  over  $k$ , a **quantization of Poisson algebra**  $A_{\hbar}$  is a topological associative algebra  $(A_{\hbar}, \cdot_{\hbar}) \in \mathcal{Alg}_{\mathbb{C}[[\hbar]]}$  s.t.

- $A_{\hbar} \cong A[[\hbar]]$  as  $k[[\hbar]]$ -modules.

$$\cdot_{\hbar} = \cdot(\text{mod } \hbar).$$

$$\{\bar{a}, \bar{b}\} \equiv \frac{ab - ba}{\hbar}(\text{mod } \hbar), \quad a, b \in A_{\hbar}.$$

And if  $A$  is a Poisson-Hopf algebra (3.11.6.1), then a **quantization of Poisson-Hopf algebra**  $A_{\hbar}$  is a Hopf algebra deformation of  $A$  over  $k[[\hbar]]$  (3.11.6.9) that is also a quantization of the Poisson structure.  $\lrcorner$

**Def. (3.11.6.12) [Quantization of Poisson-Lie Groups].** if  $(G, \{-, -\})$  is a Poisson-Lie algebra, then a **quantization of Poisson-Lie group**  $\mathcal{F}_h(G)$  is a quantization of the Poisson-Hopf algebra  $\mathcal{O}(G)$  (3.11.6.11). And  $(G, \{-, -\})$  is called the **classical limit** of  $\mathcal{F}_h(G)$ .  $\lrcorner$

**Prop. (3.11.6.13).** Let  $k \in \text{Field}$ ,  $\text{char } k \neq 2$ , and  $\mathfrak{g} \in \text{LieAlg}_k$  is non-Abelian, then there are no non-trivial Poisson Hopf structures on  $U(\mathfrak{g})$ .  $\lrcorner$

*Proof:* ?  $\square$

## Quantized Universal Enveloping Algebras

### 7 Lie Bi-algebras

**Def. (3.11.7.1) [Lie bi-algebras].** For  $k \in \text{Field}$ , a **Lie bi-algebra** is a Lie algebra  $\mathfrak{g} \in \text{LieAlg}_k$  together with a skew-symmetric linear map  $\delta : \mathfrak{g} \rightarrow \mathfrak{g} \otimes \mathfrak{g}$  called the **co-commutator** s.t.

- $\delta^* : \mathfrak{g}^* \otimes \mathfrak{g}^* \rightarrow \mathfrak{g}^*$  is a Lie algebra structure on  $\mathfrak{g}^*$ .
- $\delta$  is a 1-cocycle on  $\mathfrak{g}$  with values in  $\mathfrak{g} \otimes \mathfrak{g}$ , i.e.

$$\delta[X, Y] = (\text{ad}_X \otimes \text{id} + \text{id} \otimes \text{ad}_X)\delta(Y) + (\text{ad}_Y \otimes \text{id} + \text{id} \otimes \text{ad}_Y)\delta(X).$$

$\lrcorner$

### 8 Yang-Baxter Equations

#### Set-Theoretical Solutions

**Def. (3.11.8.1) [Quantum Yang-Baxter Equations].** For  $S \in \text{Set}$ , a map  $R : S \times S \rightarrow S \times S$  is said to satisfy the (set-theoretic) **quantum Yang-Baxter equation** if  $R$  is a bijection and

$$R_{12} \circ R_{13} \circ R_{23} = R_{23} \circ R_{13} \circ R_{12} : S \times S \times S \rightarrow S \times S \times S.$$

$\lrcorner$

**Thm. (3.11.8.2).** Suppose  $G \in \text{Grp}$ , and  $\xi, \eta$  are left and right actions of  $G$  on itself satisfying the following condition:

$$uv = (\xi(u)v)(u\eta(v)), \quad \forall u, v \in G,$$

then

$$R : G \times G \rightarrow G \times G : (u, v) \mapsto (u\eta(v), \xi(u)v)$$

is a solution of the set-theoretic Yang-Baxter equation (3.11.8.1) on  $G$ .  $\lrcorner$

*Proof:* Cf. [ON THE SET-THEORETICAL YANG-BAXTER EQUATION].  $\square$

**Thm. (3.11.8.3) [Universal Braid relations].** Let  $\sigma : S \times S \rightarrow S \times S$  be a non-degenerate solution of the braid relation, and let  $G(S, \sigma)$  be the group generated by  $S$  subject to the relation  $uv \sim yx$  whenever  $\sigma(u, v) = (y, x)$ , with a natural map  $i : S \rightarrow G(S, \sigma)$ . Then there is a unique braiding operator  $\sigma^G$  on  $G(S, \sigma)$  commuting with  $i$ , and it is the initial object in the category of such groups with a braiding operator.  $\lrcorner$

*Proof:* Cf. [ON THE SET-THEORETICAL YANG-BAXTER EQUATION]P16.  $\square$

### 4.1 Categories

*“Mathematicians do not study objects, but relations among objects; they are indifferent to the replacement of objects by others as long the relations don’t change. Matter is not important, only form interests them.”*

–H. Poincaré

References are [Mac98], [Bor94], [Coend Calculus, Fosco Loregian].

**Notation (4.1.0.1).**

- Let  $\mathcal{C} \in \text{Cat}$  (4.1.4.2).

┘

#### 1 Basics

**Def. (4.1.1.1) [Categories, Eilenberg-Mac.Lane1945].** A category  $\mathcal{C}$  consists of the following data:

- A class  $\text{Ob}(\mathcal{C})$  of **objects of  $\mathcal{C}$** .
- For any  $x, y \in \text{Ob}(\mathcal{C})$  a class  $\text{Mor}(x, y)$  of **morphisms from  $x$  to  $y$** .
- For any  $(x, y, z) \in \text{Ob}(\mathcal{C})$ , a map of classes  $\circ : \text{Mor}(y, z) \times \text{Mor}(x, y) \rightarrow \text{Mor}(x, z)$ , called the **composition law** of  $\mathcal{C}$ .

that satisfies:

- (Identity) For any  $x \in \text{Ob}(\mathcal{C})$ , there exists an element  $\text{id}_x \in \text{Mor}(x, x)$  s.t.  $\text{id}_x \circ \varphi = \varphi, \psi \circ \text{id}_x = \psi$  whenever these composition makes sense. It is clear such an element is unique.
- (Associativity)  $(\varphi \circ \psi) \circ \chi = \varphi \circ (\psi \circ \chi)$  whenever these compositions make sense.

┘

**Remark (4.1.1.2).** We will sometimes say  $x \in \mathcal{C}$  to mean that  $x$  is an element of  $\text{Ob}(\mathcal{C})$  and  $f : x \rightarrow y \in \mathcal{C}$  or  $f$  is a morphism in  $\mathcal{C}$  to mean:  $x, y \in \text{Ob}(\mathcal{C})$  and  $f \in \text{Mor}(x, y)$ . Hopefully this won’t make any confusions.

┘

**Def. (4.1.1.3) [Dual Categories].** Let  $\mathcal{C}$  be a category, then the **dual category** of  $\mathcal{C}$  is a category  $\mathcal{C}^{\text{op}}$  with

- $\text{Ob}(\mathcal{C}^{\text{op}}) = \text{Ob}(\mathcal{C})$ .
- For  $x, y \in \text{Ob}(\mathcal{C}^{\text{op}}) = \text{Ob}(\mathcal{C})$ ,  $\text{Mor}_{\mathcal{C}^{\text{op}}}(x, y) = \text{Mor}_{\mathcal{C}}(y, x)$ .
- The composition law of  $\mathcal{C}^{\text{op}}$  is induced from that of  $\mathcal{C}$ .

┘

**Def. (4.1.1.4)[Isomorphisms].** Let  $\mathcal{C}$  be a category, an **isomorphism** in  $\mathcal{C}$  is a morphism  $\varphi \in \text{Mor}(x, y)$  in  $\mathcal{C}$  s.t. there exists a morphism  $\psi \in \text{Mor}(y, x)$  s.t.  $\varphi \circ \psi = \text{id}_y$  and  $\psi \circ \varphi = \text{id}_x$ . it is clear that such a  $\psi$  is unique, and if it exists, it is called the **inverse morphism** of  $\varphi$ .

For  $x, y \in \mathcal{C}$ , if there exists an isomorphism in  $\text{Mor}(x, y)$ ,  $x, y$  are said to be **equivalent objects**.

┘

**Def. (4.1.1.5) [Functors].** Let  $\mathcal{C}, \mathcal{C}'$  be categories, a **functor**  $F$  from  $\mathcal{C} \rightarrow \mathcal{C}'$  consists of the following data:

- a morphism of sets  $\text{Ob}(\mathcal{C}) \rightarrow \text{Ob}(\mathcal{C}') : x \mapsto F(x)$ .
- for any  $x, y \in \text{Ob}(\mathcal{C})$ , a morphism of sets  $\text{Mor}(x, y) \rightarrow \text{Mor}(F(x), F(y)) : f \mapsto F(f)$ .

that satisfies:

- $F(\text{id}_x) = \text{id}_{F(x)}$ .
- $F(\varphi \circ \psi) = F(\varphi) \circ F(\psi)$  whenever  $\varphi \circ \psi$  is defined.

A **contravariant functor** from  $\mathcal{C}$  to  $\mathcal{C}'$  is defined to be a functor from  $\mathcal{C}^{\text{op}}$  to  $\mathcal{C}'$ .

┘

**Def. (4.1.1.6) [Identity Functor  $\text{id}_{\mathcal{C}}$ ].** For any  $\mathcal{C} \in \text{Cat}$ , there is an identity functor  $\text{id}_{\mathcal{C}} : \mathcal{C} \rightarrow \mathcal{C}$ .

┘

**Def. (4.1.1.7) [Natural Transformations].** Let  $\mathcal{C}, \mathcal{C}'$  be categories and  $F, G : \mathcal{C} \rightarrow \mathcal{C}'$  be functors between categories, then a **natural transformation**  $\eta$  from  $F$  to  $G$  consists of an element  $\eta_x$  for each  $x \in \text{Ob}(\mathcal{C})$  s.t. for any  $f : x \rightarrow y \in \mathcal{C}$ , the following diagram is commutative:

$$\begin{array}{ccc} F(x) & \xrightarrow{F(f)} & F(y) \\ \downarrow \eta_x & & \downarrow \eta_y \\ G(x) & \xrightarrow{G(f)} & G(y) \end{array} \cdot$$

Then for any two categories  $\mathcal{C}, \mathcal{C}'$ , there is a category  $\text{Fun}(\mathcal{C}, \mathcal{C}')$  consisting of the set of functors from  $\mathcal{C}$  to  $\mathcal{C}'$ , and natural transformations as morphisms between functors.

┘

**Def. (4.1.1.8) [Final and Initial Objects].** An object  $Z$  of a category is called a **final object** if  $\# \text{Hom}(X, Z) = 1$  for any object  $X$ . It is called **weakly final** if  $\text{Hom}(X, Z) \neq \emptyset$  for every object  $X$ .

Dually an object is called **(weakly)initial** if it is (weakly)initial as an object of  $\mathcal{C}^{\text{op}}$ .

┘

**Def. (4.1.1.9) [Filtered Categories].** A **filtered category** is a category  $\mathcal{I} \in \text{Cat}$  that:

- It is nonempty.
- for any  $a, b \in \mathcal{I}$ , there is some  $c \in \mathcal{I}$  with morphisms  $a \rightarrow c, b \rightarrow c$
- for any two morphisms  $a, b : x \rightarrow y$ , there is a morphism  $c : y \rightarrow z$  that  $c \circ a = c \circ b$ .

┘

**Def. (4.1.1.10) [Fully Faithful Functors].** A functor of category  $F : \mathcal{C} \rightarrow \mathcal{D}$  is called:

- a **full/faithful functor** if for any  $x, y \in \text{Ob}(\mathcal{C})$ ,  $F : \text{Hom}(X, Y) \rightarrow \text{Hom}(F(x), F(y))$  is surjective/injective.
- an **essentially surjective functor** if any object of  $\mathcal{D}$  is equivalent to some  $f(x)$ , where  $x \in \mathcal{C}$ .
- an **equivalence** if there is a functor  $G : \mathcal{D} \rightarrow \mathcal{C}$  that  $F \circ G \cong \text{id}_{\mathcal{D}}$  and  $G \circ F \cong \text{id}_{\mathcal{C}}$ .

┘

**Prop. (4.1.1.11) [Category Equivalences].** A Functor  $\mathcal{C} \rightarrow \mathcal{D}$  is an equivalence if and only if it's fully faithful and essentially surjective.

┘

*Proof:* There exist an object  $G(X) \in \mathcal{C}$  and an isomorphism  $\xi_X : FG(X) \rightarrow X$  for every  $X \in \mathcal{D}$ . Because  $F$  is fully faithful, there exists a unique morphism  $G(f) : G(X) \rightarrow G(Y)$  such that  $F(G(f)) = \xi_Y^{-1} \circ f \circ \xi_X$  for every morphism  $f : X \rightarrow Y$  in  $\mathcal{D}$ . Thus we obtain a functor  $G : \mathcal{C} \rightarrow \mathcal{D}$  as well as a natural isomorphism  $\xi : F \circ G \rightarrow \text{Id}_{\mathcal{D}}$ . Moreover, the isomorphism  $\xi_{F(Z)} : FGF(Z) \rightarrow F(Z)$  decides an isomorphism  $\eta_Z : GF(Z) \rightarrow Z$  for every  $Z \in \mathcal{C}$ . This yields a natural isomorphism  $\eta : G \circ F \rightarrow \text{Id}_{\mathcal{C}}$ .  $\square$

**Def. (4.1.1.12) [Setoids].** A **setoid** is a category that is equivalent to a category that has only the identity morphisms.  $\lrcorner$

**Def. (4.1.1.13) [Groupoids].** A **groupoid** is a category that all morphisms are isomorphisms. The full subcategory of  $\text{Cat}$  consisting of groupoids is denoted by  $\text{Grpd}$ .  $\lrcorner$

**Prop. (4.1.1.14) [Equivalence Relations].** An **equivalence relation** is a groupoid that  $\# \text{Mor}_{\mathcal{C}}(x, y) \leq 1$  for any  $x, y \in \mathcal{C}$ .  $\lrcorner$

**Prop. (4.1.1.15).** A category is equivalent to a setoid iff it is an equivalence relation.  $\lrcorner$

*Proof:*

$\square$

**Def. (4.1.1.16) [Subcategories].** Let  $\mathcal{C}$  be a category, a **subcategory**  $\mathcal{C}'$  of  $\mathcal{C}$  is a category together with a functor  $F : \mathcal{C}' \rightarrow \mathcal{C}$  s.t.  $F : \text{Ob}(\mathcal{C}') \rightarrow \text{Ob}(\mathcal{C})$  is injective and  $F$  is faithful. And it is called a **full subcategory** if  $F$  is fully faithful. It is called a **strictly-full subcategory** if for any  $y \in \mathcal{C}$ ,  $y$  is equivalent to some  $F(x)$ ,  $x \in \text{Ob}(\mathcal{C}')$  iff  $y \in F(\mathcal{C}')$ .  $\lrcorner$

**Def. (4.1.1.17) [Comma Categories].** For a category  $\mathcal{C}$  and an object  $S$ , the **comma category**  $\mathcal{C}/S$  is defined to be the category of arrows  $T \rightarrow S$  with the arrows being compatible arrows over  $S$ .  $\lrcorner$

**Def. (4.1.1.18) [Category of Arrows].** For a category  $\mathcal{C}$ , the category of arrows  $\text{Arr}(\mathcal{C})$  is a category whose objects are arrows in  $\mathcal{C}$  and a morphism  $f \rightarrow g$  is a commutative diagram

$$\begin{array}{ccc} A & \xrightarrow{h} & B \\ \downarrow f & & \downarrow g \\ A' & \xrightarrow{k} & B' \end{array}$$

$\lrcorner$

**Def. (4.1.1.19) [Twisted Arrow Category].** For a category  $\mathcal{C}$ , the category of twisted arrows  $TW(\mathcal{C})$  is a category whose objects are arrows in  $\mathcal{C}$  and a morphism  $f \rightarrow g$  is a diagram

$$\begin{array}{ccc} A & \xleftarrow{h} & B \\ \downarrow f & & \downarrow g \\ A' & \xrightarrow{k} & B' \end{array}$$

$\lrcorner$

**Def. (4.1.1.20) [Epimorphisms and Monomorphisms].** An **epimorphism** in a category is a morphism  $X \rightarrow Y$  that the map  $\text{Map}(Y, Z) \rightarrow \text{Map}(X, Z)$  induced by composition is injective. Dually, an **monomorphism** is an epimorphism in the dual category.

A **balanced category** is a category s.t. every morphism that is both epi and mono is an isomorphism.  $\lrcorner$

**Def. (4.1.1.21) [Connected Objects].** A **connected object** in  $\mathcal{C}$  is an object  $X \in \text{Ob}(\mathcal{C})$  s.t. it is not initial (4.1.1.8), and for any monomorphism  $Y \rightarrow X$  (4.1.1.20), either  $Y$  is initial or  $Y \rightarrow X$  is an isomorphism.  $\lrcorner$

**Def. (4.1.1.22) [Projective and Injective].** A **projective object**  $X$  in a category is an object that for any epimorphism (4.1.1.20)  $Y \rightarrow Z$ ,  $\text{Hom}(X, Y) \rightarrow \text{Hom}(X, Z)$  is surjective. Dually, an **injective object**  $X$  is a projective object in the dual category.  $\lrcorner$

**Def. (4.1.1.23) [Retract].** A morphism  $f$  in a category  $\mathcal{C}$  is called a **retract** of  $g$  if there are morphisms  $F, G : f \rightarrow g$  in  $\text{Mor}(\mathcal{C})$  (4.1.1.18) that  $G \circ F = \text{id}_f$ .  $\lrcorner$

**Def. (4.1.1.24) [Equivalence relations].** For  $\mathcal{C} \in \text{Cat}$  has finite products,  $X_0 \in \mathcal{C}$ , an **equivalence relation on  $X_0$**  is a tuple  $(X_1, u)$ , where  $X_1 \in \mathcal{PSh}(\mathcal{C})$  and  $u \in \text{Hom}(X_1, X_0 \times X_0)$  s.t for any  $X \in \mathcal{C}$ , the map

$$\tilde{X}_1(T) \xrightarrow{u} \tilde{X}_0(T) \times \tilde{X}_0(T)$$

is a bijection of  $\tilde{X}_1(T)$  onto the graph of an equivalence relation on  $\tilde{X}_0(T)$ . Similarly, we can define **pre-relations on  $X_0$** , **relations on  $X_0$**  and **pre-equivalence relations on  $X_0$** .  $\lrcorner$

**Prop. (4.1.1.25) [Involutions].** Situation as in (4.1.1.24), then there is a morphism  $\sigma : F_0 \rightarrow F_0$ ,  $\sigma^2 = \text{id}$ ,  $u_0 \circ \sigma = u_1$ ,  $u_1 \circ \sigma = u_0$ , by the symmetry in the definition of equivalence relations.  $\lrcorner$

**Def. (4.1.1.26) [Categorical Quotients].** Situation as in (4.1.1.24), for an equivalence relation  $u : X_1 \rightarrow X_0 \times X_0$ , a morphism  $v : X_0 \rightarrow X$  is called a categorical quotient if

- $u$  factors through  $u : X_1 \rightarrow X_0 \times_X X_0$ , and  $u : X_1 \rightarrow X_0 \times_X X_0$  is an isomorphism.
- For any  $T \in \mathcal{C}$ , there is a cokernel sequence

$$\text{Mor}(X, T) \rightarrow \text{Mor}(X_0, T) \rightrightarrows \text{Mor}(X_1, T)$$

is exact.  $\lrcorner$

### Representable Functors

**Def. (4.1.1.27) [Presheaves].** A **presheaf** on  $\mathcal{C}$  is a contravariant functor from  $\mathcal{C}$  to  $\text{Set}$ . The category of presheaves on  $\mathcal{C}$  is denoted by  $\mathcal{PSh}(\mathcal{C})$ .  $\lrcorner$

**Prop. (4.1.1.28) [Representability Criterion].** Let  $\mathcal{C}$  be a complete category,  $F : \mathcal{C} \rightarrow \text{Set}$  be a functor. Assume that  $F$  commutes with small limits, and the category  $\mathcal{I}$  of pairs  $(x, f)$  where  $x \in \mathcal{C}$ ,  $f \in F(x)$  has a cofinal family of objects indexed by a set  $I$ , then  $F$  is representable, i.e. there is an object  $x$  that  $F(y) = \text{Mor}_{\mathcal{C}}(x, y)$ , functorial in  $y$ .  $\lrcorner$

*Proof:* Because  $\mathcal{C}$  has small limits, let  $\mathcal{I}'$  be the full subcategory of  $\mathcal{I}$  generated by  $(x_i, f_i)$ , set  $x = \varprojlim_{(x_i, f_i) \in \mathcal{I}'} x_i$ . As  $F$  commutes with limits,  $F(x) = \varprojlim_{(x_i, f_i) \in \mathcal{I}'} F(x_i)$ . Hence there is a universal element  $f \in F(x)$  that maps to  $f_i$  under  $F(x \rightarrow x_i)$ .  $f$  induces a natural transformation  $\xi : \text{Mor}_{\mathcal{C}}(x, -) \rightarrow F(-)$ .

The assumption shows  $\xi$  is surjective. Now let  $x' \rightarrow x$  be the equalizer of all maps  $\varphi : x \rightarrow x$  that  $F(\varphi)f = f$ , then there is a  $f' \in F(x')$  mapping to  $f$ . then the transformation  $\xi'$  defined by  $f'$  is also surjective. Now we also want to show it is injective: if  $a, b \in \text{Mor}_{\mathcal{C}}(x', y)$  mapsto the same element, then we consider the equalizer  $e' : x'' \rightarrow x'$  of  $a, b$ , then the assumption and the fact  $F$  commutes with equalizer shows there is a  $f'' \in F(x'')$  mapping to  $f'$ .

By universality consider a morphism  $\psi : x \rightarrow x''$  that  $F(\psi)f = f''$ , then  $e \circ e' \circ \psi$  is a morphism  $x \rightarrow x$  that fixes  $f$ , thus by construction  $ee'\psi e = e$ , so  $e'\psi e = \text{id}$ , because  $e$  is a monomorphism. Then  $e'$  is an epimorphism, thus  $a = b$ .  $\square$

### Adjunctions

**Def. (4.1.1.29) [Adjunction Pairs].** A pair of functors  $(f, g)$  where  $f : \mathcal{C} \rightarrow \mathcal{D}, g : \mathcal{D} \rightarrow \mathcal{C} \in \text{Cat}$  are called an **adjunction pair** iff there is natural isomorphism of functors:

$$\mathcal{C}^{\text{op}} \times \mathcal{D} \rightarrow \text{Set} : \text{Hom}(f(-), -) \cong \text{Hom}(-, g(-)).$$

Equivalently this means that for any  $X_1 \rightarrow X_2 \in \mathcal{C}, Y_1 \rightarrow Y_2 \in \mathcal{D}$ ,

$$\begin{array}{ccc} f(X_1) & \longrightarrow & Y_1 \\ \downarrow & & \downarrow \\ f(X_2) & \longrightarrow & Y_2 \end{array}$$

is commutative iff its corresponding map

$$\begin{array}{ccc} X_1 & \longrightarrow & g(Y_1) \\ \downarrow & & \downarrow \\ X_2 & \longrightarrow & g(Y_2) \end{array}$$

is commutative.

Denoted an adjunction pair by  $(f, g) : \mathcal{C} \rightleftarrows \mathcal{D}$ .  $\lrcorner$

**Prop. (4.1.1.30) [Units and Counits].** If  $f, g$  are adjoints, then there are natural transformations  $u : \text{id} \rightarrow gf$ , and  $v : fg \rightarrow \text{id}$ , called the **unit/counit maps**. They satisfies  $f \xrightarrow{u} f g f \xrightarrow{v} f$  is  $\text{id}$ , and  $g \xrightarrow{u} g f g \xrightarrow{v} g$  is  $\text{id}$ .

Conversely, if there are natural morphisms  $u, v$  satisfying these two identities, then  $(f, g)$  is an adjunction, by

$$\text{Hom}(fX, Y) \rightarrow \text{Hom}(gfX, gY) \rightarrow \text{Hom}(X, gY) \rightarrow \text{Hom}(fX, fgY) \rightarrow \text{Hom}(fX, Y).$$

$\lrcorner$

*Proof:*

$\square$

**Lemma (4.1.1.31).** Let  $(f, g)$  be an adjunction pair, then

- If  $g \circ f$  is fully faithful, then  $f$  is fully faithful.
- If  $f \circ g$  is fully faithful, then  $g$  is fully faithful.

$\lrcorner$

*Proof:* Cf. [Sta]0FWV.  $\square$

**Prop. (4.1.1.32).** Let  $(f, g)$  be an adjunction pair, then

- $f$  is fully faithful iff  $u : \text{id} \rightarrow gf$  is an isomorphism.

- $g$  is fully faithful iff  $v : fg \rightarrow \text{id}$  is an isomorphism.

┘

*Proof:* 1: If  $\text{id} \cong gf$ , then  $gf$  is fully faithful, so  $f$  is fully faithful by (4.1.1.31). If  $f$  is fully faithful, then for any  $X, Y$ ,

$$\text{Hom}(X, Y) \xrightarrow{u} H(X, gfY) \cong H(fX, fY) \cong H(X, Y)$$

is a canonical isomorphism, so  $u$  is an isomorphism.

2 is dual to 1.

□

**Cor. (4.1.1.33) [Units and Equivalences].** Let  $(F, G)$  be an adjunction pair, then the following are equivalent:

- $F, G$  are both fully faithful.
- the unit and counit are both isomorphisms.
- $F, G$  defines an equivalence of categories.

┘

*Proof:*  $1 \rightarrow 2 \rightarrow 3$  follow from (4.1.1.32). And  $3 \rightarrow 1$  is clear.

□

**Prop. (4.1.1.34) [Adjunction Preserves (Co)Limits].** A right adjoint functor is left exact and it preserves injectives if its left adjoint is exact.

A left adjoint functor is right exact and it preserves projectives if its right adjoint is exact. ┘

**Prop. (4.1.1.35) [Adjoint Functor Theorem].** Let  $G : \mathcal{C} \rightarrow \mathcal{D} \in \mathbf{Cat}$ , assume  $\mathcal{C}$  is complete and  $G$  commutes with small limits. Assume for every  $y \in \mathcal{D}$ , the category of pairs  $(x, f)$  where  $x \in \mathcal{C}$  and  $f \in \text{Mor}_{\mathcal{D}}(y, G(x))$  has a cofinal family of objects indexed by a set  $I$ , then  $G$  has a left adjoint.

Similarly the dual statement holds. ┘

*Proof:* The assumption shows that for any  $y \in \mathcal{D}$ , the functor  $x \mapsto \text{Mor}_{\mathcal{D}}(y, G(x))$  satisfies the condition of (4.1.1.28), thus it is representable by an object denoted by  $F(y)$ . By Yoneda's lemma,  $F$  underlies a functor, and this functor is a left adjoint of  $G$ . □

**Prop. (4.1.1.36) [Groupoidification].** There is a functor  $\mathbf{Grpd} : \mathbf{Cat} \rightarrow \mathbf{Grpd}$  that is left adjoint to the inclusion functor, called the **groupoidification functor**. ┘

*Proof:*

□

**Prop. (4.1.1.37) [Examples of Adjunction pairs].**

- The valuation at  $k$ -th coordinate is left adjoint to the functor  $k_*(A)(i) = \prod_{\text{Hom } i, k} A$  and is exact. So  $k_*$  preserves injectives.
- The sheaf  $\Gamma$  functor is right adjoint to the constant sheaf functor over arbitrary site.
- The inclusion functor is right adjoint to the shification functor over arbitrary site.
- The forgetful functor is right adjoint to the Shification functor, and shification is exact, so it preserves injectives.
- The stalk functor is left adjoint to the skyscraper sheaf operator.

┘

### Limits and Colimits

**Prop. (4.1.1.38) [Products and Equalizers Implies Limits].** If a category admits arbitrary (resp. finite) products and equalizers, then it admits arbitrary (resp. finite) limits. Dually a category that admits coproducts and coequalizers admits all colimits.  $\lrcorner$

*Proof:* The limits over a category  $\mathcal{C}$  is an equalizer of products over the category of arrows in  $\mathcal{C}$ .  $\square$

**Def. (4.1.1.39) [Exact Functors].** A functor  $F : \mathcal{C} \rightarrow \mathcal{D}$  is called a **left exact functor** if it maps finite limits to finite limits. It is called a **right exact functor** if it maps finite colimits to finite colimits. It is called an **exact functor** if it is both left exact and right exact.  $\lrcorner$

**Def. (4.1.1.40) [(Co)Complete Category].** A category is called **(co)complete** if it has all small (co)limits, i.e. (co)limits over small categories (4.1.2.1).  $\lrcorner$

**Def. (4.1.1.41) [Inverse Systems].** An **inverse system** in  $\mathcal{C}$  is a diagram  $\mathbb{Z}_+^{\text{op}} \rightarrow \mathcal{C}$ , where  $\mathbb{Z}_+$  is the category of non-negative integers with a unique morphism  $n \rightarrow m$  iff  $n \leq m$ .  $\lrcorner$

**Prop. (4.1.1.42) [Equivalent Inverse System].** Two inverse systems  $\{A_n\}, \{B_n\}$  are called equivalent if there are two non-decreasing unbounded maps  $\alpha, \beta : \mathbb{Z}_+ \rightarrow \mathbb{Z}_+$  and maps  $\alpha : A_n \rightarrow B_{\alpha(n)}, \beta : B_n \rightarrow A_{\beta(n)}$  that is compatible with the transition maps and for any  $n$ , there is a  $m$  large that  $A_m \rightarrow A_{\beta\alpha(m)} \rightarrow A_n$  coincide with the transition map  $A_m \rightarrow A_n$ , and similar for  $B_n$ . And similarly for colimits.

The limit for two inverse systems are the same, and similarly for colimits.  $\lrcorner$

**Prop. (4.1.1.43) [Filtered Colimit of Sets].** Filtered colimits in  $\mathbf{Set}$  commutes with finite limits.  $\lrcorner$

*Proof:* Cf. [Sta]002W.  $\square$

**Prop. (4.1.1.44) [Cofiltered Limits of Sets].** A cofiltered limit of nonempty sets is nonempty.  $\lrcorner$

*Proof:* Cf. [Sta]086J.  $\square$

**Def. (4.1.1.45) [Mittag-Leffler].** If  $(A_i, \varphi_{ji})$  is a directed inverse system of sets over  $I$ , then it is said to satisfy the **Mittag-Leffler condition** if  $\varphi_{ji}(A_j) \in A_i$  stabilizes. This is clearly true if  $\varphi_{ji}$  is surjective for any  $i, j$ .  $\lrcorner$

**Prop. (4.1.1.46).** If  $(A_n)$  where  $n \in \mathbb{Z}$  is a Mittag-Leffler inverse system of nonempty sets, then  $\lim A_i$  is also nonempty.  $\lrcorner$

*Proof:* Let  $A'_j = \cap_{i \geq j} \varphi_{ji} A_j$ , then  $(A'_j)$  is a filtered system that the transition maps are all surjective, and clearly  $\lim A_j = \lim A'_j$ , so it is nonempty by (4.1.1.44).  $\square$

**Prop. (4.1.1.47).**  $\mathbf{Cat}$  is complete and cocomplete.  $\lrcorner$

*Proof:*  $\square$

### Fiber Product

**Prop. (4.1.1.48).** For a category  $\mathcal{C}$ , the following are equivalent:

- It has arbitrary limits.
- it has arbitrary products and equalizer.

- it has arbitrary products and fibered products.

┘

*Proof:*  $1 \rightarrow 2, 1 \rightarrow 3$  is trivial.  $3 \rightarrow 2$ : The equalizer for  $f, g : X \rightarrow Y$  can be constructed as the base change of  $Y \rightarrow Y \otimes Y$  along  $(f, g) : X \rightarrow Y \times Y$ .  $2 \rightarrow 1$ : for any diagram  $F : I \rightarrow C$ , the fibered pullback can be constructed as the equalizer of two morphisms:

$$s, t : \prod_{i \in \text{Ob}(I)} F(i) \rightarrow \prod_{f:j \rightarrow k \in \text{Mor}(I)} F(k)$$

where  $\pi_{(f:j \rightarrow k)} s = \pi_k$ , and  $\pi_{(f:j \rightarrow k)} t = (Ff)\pi_j$ .

□

**Prop. (4.1.1.49) [Diagonal Base Change].** The diagonal commutes with base change:

$$\begin{array}{ccc} X \times_Y Z & \xrightarrow{\Delta} & (X \times_Y Z) \times_Z (X \times_Y Z) \\ \downarrow & & \downarrow \\ X & \xrightarrow{\Delta} & X \times_Y X \end{array}$$

┘

*Proof:*

□

**Prop. (4.1.1.50).**  $(X \times_E Y) \times_S (Z \times_F W) = (X \times_S Z) \times_{E \times_S F} (Y \times_S W)$ .

┘

*Proof:*

□

**Prop. (4.1.1.51).** For  $f : X \rightarrow T$  and  $g : Y \rightarrow T$  and  $h : T \rightarrow S$ ,  $X \times_T Y = T \times_{T \times_S T} (X \times_S Y)$ . In particular,  $X \times_T Y \rightarrow X \times_S Y$  is a base change of  $T \rightarrow T \times_S T$ .

┘

*Proof:* For any object  $U$ ,

$$\text{Hom}(U, X \times_T Y) = \{s : U \rightarrow X, t : U \rightarrow Y \mid f \circ s = g \circ t\},$$

$$\text{Hom}(U, T \times_{T \times_S T} (X \times_S Y)) = \{r : U \rightarrow T, s : U \rightarrow X, t : U \rightarrow Y \mid h \circ f \circ s = h \circ g \circ t, r = g \circ t, r = f \circ s\},$$

so they are functorially isomorphic. Then by Yoneda's lemma (4.1.3.11) we have the desired isomorphism.

□

**Prop. (4.1.1.52).** The diagonal map  $X \rightarrow X \times_Y X$  is an isomorphism iff  $X \rightarrow Y$  is monomorphism. (Because this is equivalent to  $\text{pr}_1 = \text{pr}_2$ ).

┘

**Def. (4.1.1.53) [Mapping graph].** Let  $f : X \rightarrow Y$  be a morphism in a category with fiber products and finite products, then the **mapping graph**  $\Gamma_f$  of  $f$  is defined to be the pullback

$$\begin{array}{ccc} \Gamma_f & \longrightarrow & X \times Y \\ \downarrow & & \downarrow \\ Y & \xrightarrow{\Delta} & Y \times Y \end{array}.$$

it can be seen that  $\Gamma_f$  is isomorphic to  $X$ .

┘

### Localizations

**Def. (4.1.1.54) [Localized Categories].** Let  $\mathcal{C} \in \text{Cat}$  and  $S \subset \text{Mor}(\mathcal{C})$ , then a functor  $F : \mathcal{C} \rightarrow \mathcal{D}$  is called a **Localized category** of  $\mathcal{C}$  w.r.t  $S$  if it maps morphisms in  $S$  to isomorphisms, and any other functor with this property factors uniquely through  $F$ .  $\perp$

**Def. (4.1.1.55) [Localizing Systems].** For  $\mathcal{C} \in \text{Cat}$ , a class of morphisms  $S$  in  $\mathcal{C}$  is called a left(resp. right) **localizing system** if:

(LS1):  $S$  is closed under composition and contains all the identities.

(LS2): for every  $s \in S$  and  $f$  with the same source(resp. target), there exists  $t \in S, g \in \text{Mor}(\mathcal{C})$  s.t.  $t \circ f = g \circ s$ (resp.  $f \circ t = s \circ g$ ).

(LS3): For  $f, g \in \text{Mor}(\mathcal{C})$  with the same source and target, the existence of a  $t \in S$  s.t.  $ft = gt$  implies(resp. is implied by) the existence of a  $s \in S$  s.t.  $sf = sg$ .

It is called **localizing system** if it is both left localizing and right localizing.  $\perp$

**Def. (4.1.1.56) [Saturated Localizing Systems].** Let  $S$  be a localizing system, then it is called a **saturated localizing system** is moreover it satisfies

- if  $f, g, h \in S$  and  $fg, gh \in S$ , then  $g \in S$ .

$\perp$

**Def. (4.1.1.57) [Gabriel-Zisman Localization].** If  $\mathcal{C} \in \text{Cat}$  and  $S \subset \text{Mor}(\mathcal{C})$ , we construct a category  $S^{-1}\mathcal{C}$  as follows:

- $\text{Ob}(S^{-1}\mathcal{C}) = \text{Ob}(\mathcal{C})$ .
- For  $X, Y \in \text{Ob}(S^{-1}\mathcal{C})$ ,  $\text{Mor}(X, Y) = \{(f, s) | f : X \rightarrow Y', s : Y' \rightarrow Y, s \in S\} / \sim$ , where the equivalence relation is generated by the following relations:  $(f_1, s_1), (f_2, s_2) \in \text{Mor}_{S^{-1}\mathcal{C}}(X, Y)$  are equivalent if there exists some commutative diagram in  $\mathcal{C}$ :

$$\begin{array}{ccccc} X & \xrightarrow{f_1} & Y' & \xleftarrow{s_1} & Y \\ & \searrow f_2 & \downarrow u & \swarrow s_2 & \\ & & Y'' & & \end{array} .$$

the pair  $(f, s)$  is also denoted by  $s^{-1}f$ .

- The composition of two morphisms  $(f : X \rightarrow Y', s : Y' \rightarrow Y)$  and  $(g : Y \rightarrow Z', t : Z' \rightarrow Z)$  is defined to be the equivalence class of  $(hf : X \rightarrow Z'', ut : Z' \rightarrow Z'')$ , where  $h$  and  $u \in S$  are chosen to fit in the commutative diagram

$$\begin{array}{ccc} Y & \xrightarrow{g} & Z \\ \downarrow s & & \downarrow u \\ Y' & \xrightarrow{h} & Z'' \end{array} .$$

- The identity elements  $\text{id}_X \in \text{Mor}(S^{-1}\mathcal{C})$  is defined to be the equivalence class of  $(\text{id}_X, \text{id}_X)$ .

Then these definitions are well-defined and makes  $S^{-1}\mathcal{C}$  a category.

And dually we can define  $S^{-1}\mathcal{C}$  for a right localizing system.  $\perp$

*Proof:* Cf. [Sta]04VG,  $\square$

**Cor. (4.1.1.58) [Comparing Morphisms in  $S^{-1}\mathcal{C}$ ].** Suppose  $\mathcal{C} \in \mathcal{Cat}$  and  $S \subset \text{Mor}(\mathcal{C})$ , then given any finite set of morphism  $g_i : x \rightarrow y$  in  $S^{-1}\mathcal{C}$  with the same target, we can find their representatives  $(f_i, s)$  with common  $s \in S$ .

And two morphisms  $(f_1 : X \rightarrow Y', s : Y \rightarrow Y')$  and  $(f_2 : X \rightarrow Y', s : Y \rightarrow Y')$  are equivalent iff there exists  $a : Y' \rightarrow Y''$  s.t.  $a \circ s \in S$  and  $a \circ f_1 = a \circ f_2$ .  $\lrcorner$

*Proof:* These follow from LS1 and LS2 in the definition (4.1.1.55).  $\square$

**Cor. (4.1.1.59) [ $S^{-1}\mathcal{C}$  is the Localized Category].** If  $\mathcal{C} \in \mathcal{Cat}$  and  $S \subset \text{Mor}(\mathcal{C})$  is a left localizing system, then the rule

$$X \mapsto X, (f : X \rightarrow Y) \mapsto \text{id}_Y^{-1} f$$

defines a functor  $Q : \mathcal{C} \rightarrow S^{-1}\mathcal{C}$  that represents  $S^{-1}\mathcal{C}$  as a localizing category of  $\mathcal{C}$  w.r.t  $S$  (4.1.1.54). And  $Q$  preserves finite colimits.

The dual statement is true for a right localizing system  $S$ .  $\lrcorner$

*Proof:* It is clearly a functor, and for any  $s \in S$ ,  $Q(s)$  is an isomorphism with inverse  $(\text{id}_Y, s)$ . To show that it preserves finite colimits, notice

$$\begin{aligned} \text{Mor}_{S^{-1}\mathcal{C}}(\text{colim}_i X_i, Y) &= \text{colim}_{s:Y \rightarrow Y' \in S} \text{Mor}_{\mathcal{C}}(\text{colim}_i X_i, Y') \\ &= \text{colim}_{s:Y \rightarrow Y' \in S} \lim_i \text{Mor}_{\mathcal{C}}(X_i, Y') \\ (4.1.1.43) \quad &= \lim_i \text{colim}_{s:Y \rightarrow Y' \in S} \text{Mor}_{\mathcal{C}}(X_i, Y') \\ &= \lim_i \text{Mor}_{S^{-1}\mathcal{C}}(X_i, Y) \end{aligned}$$

To show it is the localized category, suppose  $G : \mathcal{C} \rightarrow \mathcal{D}$  is a functor s.t.  $G(s)$  are all isomorphisms for  $s \in S$ , then we can define  $H : S^{-1}\mathcal{C} \rightarrow \mathcal{D} : H(x) = x$ , and  $H((f, s)) = G(s)^{-1} \circ G(f)$ . Then it can be checked that this is well-defined and  $G = H \circ Q$ .  $\square$

**Cor. (4.1.1.60).** If  $\mathcal{C} \in \mathcal{Cat}$  and  $S \subset \text{Mor}(\mathcal{C})$  is a localizing system, then the left localizing category and the right localizing category is canonically isomorphic, by the universal property (4.1.1.54).  $\lrcorner$

**Prop. (4.1.1.61) [Saturation].** If  $\mathcal{C} \in \mathcal{Cat}$  and  $S \subset \text{Mor}(\mathcal{C})$  is a localizing system, then the morphisms in  $\mathcal{C}$  that is mapped to an isomorphism in  $S^{-1}\mathcal{C}$  is the smallest saturated localizing system containing  $S$ , called the **saturation of  $S$** . Moreover, it consists of morphisms  $f \in \text{Mor}(\mathcal{C})$  s.t. there exists  $g, h \in S$  s.t.  $gf, gh \in S$ .  $\lrcorner$

*Proof:* Cf. [Sta]05Q9.  $\square$

**Prop. (4.1.1.62) [Full Subcategories of Localized Categories].** If  $S$  is a left localizing system in a category  $\mathcal{C}$ ,  $\mathcal{C}'$  is a full subcategory of  $\mathcal{C}$  and  $S'$  is a left localizing system of  $\mathcal{C}'$  that  $S' \subset S$ . If for any  $s : X \rightarrow Y \in S$  and  $X \in \mathcal{C}'$ , there is a morphism  $t : Y \rightarrow Z$  that  $Z \in \mathcal{C}'$  and  $t \circ s \in S'$ , then the natural functor  $(S')^{-1}\mathcal{C}' \rightarrow S^{-1}\mathcal{C}$  is fully faithful. And the dual is true for right localizing systems.  $\lrcorner$

*Proof:* This is not hard from the Gabriel-Zisman localization description (4.1.1.57).  $\square$

**Def. (4.1.1.63) [Reflective Localizations].** A **reflective localization** is an adjunction  $(L, R) : \mathcal{C} \rightleftarrows \mathcal{D}$  s.t.  $R$  is fully faithful.  $\lrcorner$

**Prop. (4.1.1.64) [Reflective Localizations as Localizations].** Let  $(L, R) : \mathcal{C} \rightleftarrows \mathcal{D}$  be a reflective localization(4.1.1.63), then  $\mathcal{D}$  is equivalent to the localization  $\mathcal{C}[S^{-1}]$ , where  $S$  is the class of morphisms of  $\mathcal{C}$  that are sent to isomorphisms by  $L$   $\lrcorner$

*Proof:* Cf.[Bor94]P190.  $\square$

**Def. (4.1.1.65) [ $S$ -Local Equivalences].** Let  $\mathcal{C} \in \mathbf{Cat}$  and  $S$  a class of morphisms in  $\mathcal{C}$ .

- $c \in \mathcal{C}$  is called  **$S$ -local** if  $\mathrm{Hom}(c_2, c) \rightarrow \mathrm{Hom}(c_1, c)$  is a bijection for any  $c_1 \rightarrow c_2 \in S$ .
- $f : c_1 \rightarrow c_2 \in \mathcal{C}$  is called an  **$S$ -local equivalence** if for any  $S$ -local object  $c \in \mathcal{C}$ ,  $\mathrm{Hom}(c_2, c) \rightarrow \mathrm{Hom}(c_1, c)$  is a bijection.

$\lrcorner$

**Prop. (4.1.1.66).** Let  $(L, R) : \mathcal{C} \rightleftarrows \mathcal{D}$  is a reflective localization, and let  $S$  be the class of morphisms in  $\mathcal{C}$  that is mapped sent to isomorphisms by  $L$ , then

- The essential image of  $R$  consists precisely of  $S$ -local objects.
- The  $S$ -local

$\lrcorner$

### Group Objects

**Def. (4.1.1.67) [Group Object].** In a category  $\mathcal{C} \in \mathbf{Cat}$  with finite products and a final object  $e$ , a(n) **(Abelian)group object** is an object  $G$  that  $h_G$  is a functor from  $\mathcal{C}$  to  $\mathbf{Grp}$ (resp.  $\mathbf{Ab}$ ). And a homomorphism of group objects is a natural transformation as a functor  $\mathcal{C} \rightarrow \mathbf{Grp}$ .

This is in fact equivalent to a morphism  $m_G : G \times G \rightarrow G$  and  $i_G : G \rightarrow G$ ,  $e_G : e \rightarrow G$  that satisfy the desired commuting diagrams.  $\lrcorner$

**Def. (4.1.1.68) [Group Action].** A **(left)action** of a group object  $G$  on an object  $X$  is a map of presheaves  $h_G \times h_X \rightarrow h_X$  that for any  $U$ ,  $h_G(U) \times h_X(U) \rightarrow h_X(U)$  is a group action. This is equivalent to a morphism  $\mu : G \times X \rightarrow X$  that satisfies the desired commuting diagrams.  $\lrcorner$

**Prop. (4.1.1.69).** Let  $\mu : G \times X \rightarrow X$  be an action of a group object  $G$  on an object  $X$ , there is a commutative diagram

$$\begin{array}{ccc} G \times X & \xrightarrow{(g,x) \mapsto (g,gx)} & G \times X \\ \downarrow (g,x) \mapsto gx & & \downarrow \pi_2 \\ X & \xrightarrow{id} & X \end{array}$$

and the horizontal maps are isomorphisms.  $\lrcorner$

**Cor. (4.1.1.70).** Considering the action of  $G$  on itself, we get

$$\begin{array}{ccc} G \times G & \xrightarrow{(g,h) \mapsto (g,gh)} & G \times G \\ \downarrow m & & \downarrow \pi_2 \\ G & \xrightarrow{id} & G \end{array}$$

and the horizontal maps are isomorphisms.  $\lrcorner$

**Prop. (4.1.1.71).** A unital magma object  $G$  in the category of groups is an Abelian group.  $\lrcorner$

*Proof:* A unital magma object structure endows  $G$  with maps  $(\tilde{m}, \tilde{e})$ , and  $\tilde{m}(ab, cd) = \tilde{m}(a, c)\tilde{m}(b, d)$ , because  $\tilde{m}$  is a morphism of groups. So we can use Eckmann-Hilton argument (3.1.1.5) to show the category multiplication is the same as the group multiplication. So the commutativity of  $\tilde{m}$  with the inverse  $i$  implies that it is Abelian.  $\square$

**Prop. (4.1.1.72).** A right-lax monoidal functor (4.1.5.12) between Cartesian monoidal structures maps a unital magma object to a unital magma object.  $\lrcorner$

**Def. (4.1.1.73) [Categorical Quotient].** Let  $C$  be a category with finite products,  $G$  be a group object in  $C$ ,  $G \times X \rightarrow X$  is a left action (4.1.1.68), then a morphism  $X \rightarrow Y$  is called the **categorical quotient** of  $X$  iff  $Y$  is the coequalizer of  $G \times X \xrightarrow[\text{pr}_2]{\rho} X$ . It is called the **universal categorical quotient** of  $X$  iff its product with  $S$  is the categorical quotient for each element  $S \in C$ , in the category  $C_{/S}$ .  $\lrcorner$

## 2 Presentable Categories

Main references are [Locally presentable and accessible categories].

**Def. (4.1.2.1) [Small Categories].** Given a regular cardinal  $\kappa$  (2.2.12.2),  $S \in \text{Set}$  is called  $\kappa$ -**small** if it has cardinality smaller than  $\kappa$ .  $\mathcal{C} \in \text{Cat}$  is called  $\kappa$ -**small** if  $\text{Ob}(\mathcal{C})$  is  $\kappa$ -small, and the set of all morphisms of  $\mathcal{C}$  is  $\kappa$ -small.

Through out the whole book, we will fix a strongly inaccessible cardinal  $\kappa$  and call a set or category **small** if it is  $\kappa$ -small. And a category is called **essentially small** if it is equivalent to a small category.  $\lrcorner$

**Prop. (4.1.2.2).** Any small cocomplete category is a poset.  $\lrcorner$

*Proof:* [MacLane]P114.  $\square$

**Def. (4.1.2.3) [Compact Objects].** For a regular cardinal  $\kappa$ . Let  $\mathcal{C} \in \text{Cat}$  be a category that admits small colimits, and  $J$  be a  $\kappa$ -filtered poset and a diagram  $\{Y_\alpha\}$  indexed by  $J$ , then for  $X \in \mathcal{C}$ , there is a natural map

$$\varinjlim \text{Hom}(X, Y_j) \rightarrow \text{Hom}(X, \varinjlim Y_j).$$

$X$  is called  $\kappa$ -**compact** if this is an isomorphism for any  $\kappa$ -filtered diagram  $J$ .  $X$  is called **small** if it is  $\kappa$ -compact for some small (4.1.2.1) regular cardinal  $\kappa$ .  $\lrcorner$

**Def. (4.1.2.4) [ $\kappa$ -Accessible Categories].** For a regular cardinal  $\kappa$ , a  $\kappa$ -**accessible category** is a locally small category (4.1.2.1)  $n\text{Cat}$  that satisfies:

- $\mathcal{C}$  admits all  $\kappa$ -filtered colimits.
  - $\mathcal{C}$  is generated by a  $\kappa$ -small set  $S$  consisting of  $\kappa$ -compact objects of  $\mathcal{C}$  under  $\kappa$ -filtered colimits.
- $\mathcal{C}$  is called **accessible** if it is  $\kappa$ -accessible for some small regular cardinal  $\kappa$ . A  $\kappa$ -**accessible functor** is a functor  $F : \mathcal{C} \rightarrow \mathcal{D}$  between  $\kappa$ -cocomplete categories that preserves  $\kappa$ -filtered colimits. And a functor is called a **accessible functor** if it is  $\kappa$ -accessible for some small regular cardinal  $\kappa$ .  $\lrcorner$

**Def. (4.1.2.5) [Locally Presentable Categories].** A **locally presentable category** is a category that is both cocomplete and accessible (4.1.2.4).  $\lrcorner$

**Prop. (4.1.2.6).** Any locally presentable category is complete.  $\lrcorner$

*Proof:*

□

**Example (4.1.2.7) [Locally Presentable Categories].**

- $\mathbf{Set}$  is locally presentable.
- If  $\mathcal{C}$  is a small category, then  $\mathcal{PSh}^{\mathbf{Set}}(\mathcal{C})$  is locally presentable.
- For  $R \in \mathcal{C}\mathbf{Ring}$ ,  $\mathbf{Mod}_R$  and  $\mathbf{Ch}(R)$  are locally presentable.
- If  $T : \mathcal{C} \rightarrow \mathcal{C}$  is an accessible monad on a locally presentable category, then the category of  $T$ -algebras is locally presentable.
- Every Grothendieck topos is locally presentable.
- If  $\mathcal{M}$  is a locally presentable symmetric monoidal category, then  $\mathbf{Cat}_{\mathcal{M}}$  is locally presentable.
- $\mathbf{Top}$  is not locally presentable, but  $\mathcal{CG}$  is locally presentable.

┘

*Proof:*

□

**Cor. (4.1.2.8).**  $\mathbf{Cat}$  is locally presentable.

┘

**Prop. (4.1.2.9) [Adjoint Functor Theorem].** Let  $F : \mathcal{C} \rightarrow \mathcal{D}$  be a functor between locally presentable categories, then

- $F$  is a left adjoint iff it preserves small colimits.
- $F$  is a right adjoint iff it is accessible and preserves small limits.

┘

*Proof:*

□

**Def. (4.1.2.10) [Accessible Reflective Localizations].** An **accessible reflective localization** is a reflective localization (4.1.1.63)  $(L, R) : \mathcal{C} \rightleftarrows \mathcal{D}$  s.t.  $R$  is accessible (4.1.2.4).

┘

**Prop. (4.1.2.11) [Classifying Locally Presentable Categories].** A category is locally presentable iff it is equivalent to an accessible reflective localization (4.1.2.10) of  $\mathcal{PSh}^{\mathbf{Set}}(\mathcal{A})$  for some small category  $\mathcal{A}$ .

┘

*Proof:* Cf. [Locally presentable and accessible categories].

□

### 3 Ends and Coends

**Def. (4.1.3.1) [Dinatural Transformation].** Given categories  $\mathcal{C}, \mathcal{D}$  and functor  $P, Q : \mathcal{C}^{\text{op}} \times \mathcal{C} \rightarrow \mathcal{D}$ , then a **dinatural transformation**  $\alpha : P \rightarrow Q$  is a family of arrows  $\alpha_C : P(C, C) \rightarrow Q(C, C)$  where  $C \in \mathcal{C}$  that for any arrow  $C \rightarrow C' \in \mathcal{C}$ , there is a commutative diagram

$$\begin{array}{ccccc} P(C', C) & \longrightarrow & P(C, C) & \xrightarrow{\alpha_C} & Q(C, C) \\ \downarrow & & & & \downarrow \\ P(C', C') & \xrightarrow{\alpha_{C'}} & Q(C', C') & \longrightarrow & Q(C, C') \end{array}$$

┘

**Def. (4.1.3.2) [Wedge and Cowedge].** Let  $P : \mathcal{C}^{\text{op}} \times \mathcal{C} \rightarrow \mathcal{D}$  be a functor, then a **wedge** for  $P$  is a binatural functor  $\Delta_D \rightarrow P$ , where  $D$  is an object of  $\mathcal{C}$ . Similarly a **cowedge** is a binatural functor  $P \rightarrow \Delta_D$ .  $\lrcorner$

**Def. (4.1.3.3) [End and Coend].** For a functor  $P : \mathcal{C}^{\text{op}} \times \mathcal{C} \rightarrow \mathcal{D}$ , the wedges and cowedges of  $P$  form categories, and we define **end** of  $P$  is just a terminal wedge, denoted by  $\int_C F(C, C)$ , and the **coend** of  $P$  is the initial cowedge, denoted by  $\int^C F(C, C)$ .  $\lrcorner$

Ends and coends are functorial w.r.t natural transformations.  $\lrcorner$

**Prop. (4.1.3.4) [Ends as Colimits].** There is a morphism

$$F \mapsto \bar{F} : \text{Fun}(\mathcal{C}^{\text{op}} \times \mathcal{C}, \mathcal{D}) \rightarrow \text{Fun}(Tw(\mathcal{C}), \mathcal{D}) \quad (4.1.1.19)$$

where we maps  $f : C \rightarrow C'$  to  $F(C, C')$ . Then it can be checked that

$$\int_C F(C, C) = \lim_{Tw(\mathcal{C})} \bar{F}, \quad \int^C F(C, C) = \text{colim}_{Tw(\mathcal{C})} \bar{F}.$$

**Cor. (4.1.3.5).** A functor that preserves (co)limits preserves (co)ends.  $\lrcorner$

**Cor. (4.1.3.6).** For an object  $D \in \mathcal{D}$ , we have isomorphisms:

$$\begin{aligned} \text{Hom}(\int^C F(C, C), D) &\cong \int_C \text{Hom}(F(C, C), D), \\ \text{Hom}(D, \int_C F(C, C)) &\cong \int_C \text{Hom}(D, F(C, C)). \end{aligned}$$

**Prop. (4.1.3.7) [Fubini].** Cf.[Coend Calculus, P20].  $\lrcorner$

**Prop. (4.1.3.8) [Natural Transformation as Ends].** Let  $F, G : \mathcal{C} \rightarrow \mathcal{D}$  be functors, then the set of natural transformations is an coend.  $\lrcorner$

$$\text{Map}(F, G) \cong \int_C \text{Hom}_{\mathcal{D}}(FC, GC)$$

### Kan Extension

Cf.[All Concepts are Kan Extensions].

**Def. (4.1.3.9) [Kan Extensions].** Given functors  $F : \mathcal{C} \rightarrow \mathcal{E}$  and  $K : \mathcal{C} \rightarrow \mathcal{D}$ , a **left Kan extension** of  $F$  along  $K$  is a functor  $\text{Lan}_K F : \mathcal{D} \rightarrow \mathcal{E}$  together with a natural transformation  $\eta : F \rightarrow \text{Lan}_K F \circ K$  that for any other pair  $(G : \mathcal{D} \rightarrow \mathcal{E}, \gamma : F \rightarrow G \circ K)$ ,  $\gamma$  factors uniquely through  $\eta$ .  $\lrcorner$

Dually, a **right Kan extension** of  $F$  over  $K$  is equivalent to a left Kan extension of  $F^{\text{op}}$  over  $K^{\text{op}}$ .  $\lrcorner$

**Prop. (4.1.3.10) [(Co)Limits as Kan Extensions].** If  $\mathcal{D}$  is the final category 1, then the left Kan extension is just the colimit of the diagram defined by  $F$ , and the right Kan extension is just the limit of the diagram defined by  $F$ .  $\lrcorner$

**Prop. (4.1.3.11)[Yoneda's Lemma].** For any  $X \in \mathcal{C}$ ,

$$\mathbf{y}_X : \mathcal{C} \rightarrow \mathbf{Set} : Y \mapsto \mathbf{Hom}(Y, X)$$

is a presheaf on  $\mathcal{C}$ , and  $\mathbf{Hom}(h_X, \mathcal{F}) \cong \mathcal{F}(X)$  for any  $\mathcal{F} \in \mathbf{PSh}(\mathcal{C})$ .

So  $X \rightarrow h_X$  is a fully faithful embedding  $\mathbf{y} : \mathcal{C} \rightarrow \mathbf{PSh}^{\mathbf{Set}}(\mathcal{C})$ . In particular, if a  $X \rightarrow Y$  induces isomorphism  $\mathbf{Hom}(W, X) \rightarrow \mathbf{Hom}(W, Y)$  for every  $W$ , then  $X \cong Y$ .

So we can regard  $\mathcal{C}$  as a fully faithful subcategory of  $\mathbf{PSh}^{\mathbf{Set}}(\mathcal{C})$ .  $\lrcorner$

*Proof:* The map  $\mathbf{Hom}(h_X, \mathcal{F}) \rightarrow \mathcal{F}(X)$  maps a  $u$  to  $u(X)(\text{id}_X)$ . And the inverse map is defined to be  $x \in \mathcal{F}(X) \mapsto (s \in \mathbf{Hom}(Y, X) \mapsto s^*(x) \in \mathcal{F}(Y)) \in \mathbf{Hom}(h_X, \mathcal{F})$ .  $\square$

**Cor. (4.1.3.12).** A **universal object** for a presheaf  $\mathcal{F}$  is a pair  $(X, \zeta)$  that  $\zeta \in \mathcal{F}(X)$  with the property that for any  $U$  and a  $\sigma \in \mathcal{F}(U)$ , there is a unique arrow  $U \rightarrow X$  that  $Ff(\zeta) = \sigma$ .

In fact, a universal object is equivalent to an isomorphism  $h_X \cong \mathcal{F}$ .  $\lrcorner$

**Prop. (4.1.3.13)[Presheaves as Colimits of Presentable Presheaves].** For  $\mathcal{C} \in \mathbf{Cat}$ , any presheaf of sets on  $\mathcal{C}$  is a colimit of presentable presheaves on  $\mathcal{C}$ . More precisely, there is an isomorphism

$$\mathcal{F} \cong \varinjlim_{h_X \rightarrow \mathcal{F}} h_X.$$

From this we see that any functor  $\mathbf{PSh}^{\mathbf{Set}}(\mathcal{C}) \rightarrow \mathcal{D}$  compatible with colimits is determined by its restriction on  $\mathcal{C}$ .  $\lrcorner$

*Proof:* For any presheaf  $\mathcal{G}$ , there is a morphism  $\mathbf{Hom}(\mathcal{F}, \mathcal{G}) \rightarrow \mathbf{Hom}(\varinjlim_{h_X \rightarrow \mathcal{F}} h_X, \mathcal{G})$ , i.e. a set of sections  $f_s \in \mathcal{G}(X)$  for every  $\mathbf{y}_X \xrightarrow{s} \mathcal{F}$ , that if  $t \circ u = s$ , then  $u^*(f_t) = f_s$ . Conversely, by Yoneda lemma, this just says that there is a morphism of presheaves  $\mathcal{F} \rightarrow \mathcal{G} : F(X) \rightarrow G(X) : s \mapsto f_s$ .  $\square$

**Cor. (4.1.3.14)[Yoneda Extensions].** For any  $\mathcal{C} \in \mathbf{Cat}$  and a cocomplete category  $\mathcal{D}$ , then any functor  $Q : \mathcal{C} \rightarrow \mathcal{D}$  extends to a functor  $|\cdot|_Q : \mathbf{PSh}^{\mathbf{Set}}(\mathcal{C}) \rightarrow \mathcal{D}$  s.t.

$$\begin{array}{ccc} \mathcal{D} & \xrightarrow{Q} & \mathcal{D} \\ \downarrow \mathbf{y} & \nearrow |\cdot|_Q & \\ \mathbf{PSh}^{\mathbf{Set}}(\mathcal{C}) & & \end{array}$$

is commutative. Moreover, there is a functor

$$\text{Sing}_Q : \mathcal{C} \rightarrow \mathbf{PSh}^{\mathbf{Set}}(\mathcal{C}) : C \mapsto (X \mapsto \mathbf{Hom}_{\mathcal{D}}(QX, C)).$$

And there is an adjunction

$$|\cdot|_Q : \mathbf{PSh}^{\mathbf{Set}}(\mathcal{C}) \rightleftarrows \mathcal{D} : \text{Sing}_Q.$$

Moreover, this assignment  $Q \mapsto (|\cdot|_Q, \text{Sing}_Q)$  induces an equivalence of categories:

$$\mathbf{Func}(\mathcal{C}, \mathcal{D}) \cong \mathbf{Adj}(\mathbf{PSh}^{\mathbf{Set}}(\mathcal{C}), \mathcal{D}).$$

$\lrcorner$

*Proof:* Define  $|\cdot|_Q$  by colimit as in (4.1.3.13), then  $\text{?}$   $\square$

**Cor. (4.1.3.15).** Any contravariant functor  $Q : \mathcal{C} \rightarrow \mathbf{Set}$  that take colimits to limits is representable.  $\lrcorner$

*Proof:* Use  $\text{Sing}_Q$  as in the last proof,  $Q$  is representable by  $\text{Sing}_Q(\text{pt})$ .  $\square$

**Def. (4.1.3.16)[J-Free Diagram].** For a cocomplete category  $\mathcal{C}$  and a small category  $\mathcal{J}$ , let  $\mathcal{J}^\delta$  be the subcategory of  $\mathcal{J}$  that has the same objects but only the identity morphisms, then an  $\mathcal{J}$ -diagram in  $\mathcal{C}$  is called **J-free** iff it is a left Kan extension of some diagram  $\mathcal{J}^\delta \rightarrow \mathcal{C}$ .  $\lrcorner$

## 4 $n$ -Categories

**Remark (4.1.4.1) [2-Categories].** For  $n \in \mathbb{N}$ ,  $n$ -categories are defined as in (4.7.1.28).  $\lrcorner$

**Prop. (4.1.4.2) [Cat].** There is a 2-category  $\mathbf{Cat}$  consisting of small categories and functors and natural transformations.  $\lrcorner$

**Def. (4.1.4.3) [(2,1)-Categories].** A **(2,1)-category** is a 2-category that all the 2-morphisms (corresponding to a 2-simplex) are isomorphisms.  $\lrcorner$

**Prop. (4.1.4.4) [Final Objects].** An object in a (2,1)-category is a final object (4.7.3.2) iff for any  $y$  there is a morphism  $y \rightarrow x$ , and any two morphisms  $y \rightarrow x$  are isomorphic by a unique 2-morphism.  $\lrcorner$

**Lemma (4.1.4.5) [2-Commutative diagrams].** Let  $\mathcal{C}$  be a 2-category, and  $g : y \rightarrow z, f : x \rightarrow z$  are arrows in  $\mathcal{C}$ , then the diagrams in  $\mathcal{C}$ :

$$\begin{array}{ccc} w & \xrightarrow{a} & x \\ \downarrow b & & \downarrow f \\ y & \xrightarrow{g} & z \end{array}$$

together with a 2-morphism from  $gb$  to  $fa$ , naturally form a 2-category. A diagrams with invertible 2-morphisms are called **2-commutative diagram** in  $\mathcal{C}$ .  $\lrcorner$

**Def. (4.1.4.6) [2-Fibered Products].** Let  $\mathcal{C}$  be a 2-category, and  $g : y \rightarrow z, f : x \rightarrow z$  are arrows in  $\mathcal{C}$ , a **2-fibered product** of  $f, g$  is a final object in the (2,1)-category of 2-commutative diagrams as defined in (4.1.4.5), and it is denoted by  $x \times_z y$ .  $\lrcorner$

## 5 Monoidal Categories

Main references are [Tensor Categories, Etingof], [Lur09].

**Def. (4.1.5.1) [Monoidal Categories].** A **monoidal category** is a category  $\mathcal{C}$  with a functor  $\otimes : \mathcal{C} \times \mathcal{C} \rightarrow \mathcal{C}$  and a unit object  $1$  together with isomorphisms

$$\eta_{A,B,C} : (A \otimes B) \otimes C \rightarrow A \otimes (B \otimes C), \quad \alpha_A : A \otimes \mathbb{1} \rightarrow A, \quad \beta_A : \mathbb{1} \otimes A \rightarrow A$$

s.t.

- $\eta_{A,B,C}, \alpha_A, \beta_B$  are functorial in each coordinate.
- (MacLane Pentagon) The following diagram is commutative:

$$\begin{array}{ccc} & ((A \otimes B) \otimes C) \otimes D & \\ \eta_{A,B,C} \otimes \text{id}_D \swarrow & & \searrow \eta_{A \otimes B, C, D} \\ (A \otimes (B \otimes C)) \otimes D & & (A \otimes B) \otimes (C \otimes D) \\ \downarrow \eta_{A, B \otimes C, D} & & \downarrow \eta_{A, B, C \otimes D} \\ A \otimes ((B \otimes C) \otimes D) & \xrightarrow{\text{id}_A \otimes \eta_{B, C, D}} & A \otimes (B \otimes (C \otimes D)) \end{array}$$

- The following diagram is commutative:

$$\begin{array}{ccc} (A \otimes \mathbb{1}) \otimes B & \xrightarrow{\eta_{A, \mathbb{1}, B}} & A \otimes (\mathbb{1} \otimes B) \\ & \searrow \alpha_A \otimes \text{id}_B & \swarrow \text{id}_A \otimes \beta_B \\ & A \otimes B & \end{array}$$

┘

**Def. (4.1.5.2) [Monoidal Objects].** Let  $(\mathcal{C}, \otimes)$  be a monoidal category, then a **monoidal object** in  $\mathcal{C}$  is an object  $A \in \mathcal{C}$  s.t. there are morphisms  $\mu : A \otimes A \rightarrow A, \varepsilon : \mathbf{1} \rightarrow A$  s.t.

$$\mu(\mu \otimes \text{id}_A) = \mu(\text{id}_A \otimes \mu) \circ \eta_{A,A,A}, \quad \mu(\text{id}_A \otimes \varepsilon) = \alpha_A, \quad \mu(\varepsilon \otimes \text{id}_A) = \beta_A.$$

The full subcategory of monoidal objects in  $\mathcal{C}$  is denoted by  $\mathcal{M}\text{on}(\mathcal{C})$ .

┘

**Def. (4.1.5.3) [Dual and Opposed Category].** Let  $\mathcal{C}$  be a monoidal category, then the **opposed category**  $\mathcal{C}^{opp}$  is the same category as  $\mathcal{C}$  with the tensoring switched, which is also a monoidal category.

The dual category  $\mathcal{C}^{op}$  with the same tensoring is also a monoidal category.

┘

**Def. (4.1.5.4) [Strict Monoidal Categories].** A **strict monoidal category** is a monoidal category that the isomorphisms above (4.1.5.1) are all identities.

┘

**Prop. (4.1.5.5) [Mac Lane Coherence].** In a monoidal category, any two morphisms between two bracketings of a product  $X_1 \otimes \dots \otimes X_n$  constructed using the isomorphisms  $\eta_{A,B,C}$  are equal. Also if some  $X_i$  are 1, then we can also use  $\alpha_A$  and  $\beta_A$ .

┘

**Prop. (4.1.5.6) [Cartesian Monoidal Categories].** For a category with a final object and finite products, the product makes  $\mathcal{C}$  a symmetric monoidal category, called the **Cartesian monoidal structure**.

┘

**Prop. (4.1.5.7).** For any category  $\mathcal{C}$ , the category  $[\mathcal{C}, \mathcal{C}]$  of endofunctors has a natural monoidal structure.

┘

**Def. (4.1.5.8) [Closedness].** A monoidal category  $(\mathcal{C}, \otimes)$  is called **left-closed** if for every  $A \in \mathcal{C}$ , the functor  $N \mapsto A \otimes N$  has a right adjoint  $Y \mapsto {}^A Y$  (or denoted by  $\text{Hom}(A, Y)$  when  $\mathcal{C}$  is symmetric). Dually it is called **right-closed** if  $\mathcal{C}^{opp}$  is left-closed. It is called **closed** if it is both left-closed and right-closed.

For a Cartesian monoidal category  $\mathcal{C}$ ,  $\mathcal{C}$  is called **Cartesian-closed** if it is closed for the Cartesian monoidal structure.

┘

**Prop. (4.1.5.9).**  $\text{Cat}$  is Cartesian closed, and for any  $\mathcal{A}, \mathcal{B}, \mathcal{C} \in \text{Cat}$ , there is an equivalence of categories

$$\text{Func}(\mathcal{A}, \text{Func}(\mathcal{B}, \mathcal{C})) \cong \text{Func}(\mathcal{A} \times \mathcal{B}, \mathcal{C}).$$

┘

*Proof:*

□

**Def. (4.1.5.10) [Reflexive Objects].** Let  $(\mathcal{C}, \otimes)$  be a symmetric monoidal category that is closed, then we denote  $\text{Hom}(Y, \mathbf{1})$  by  $Y^\vee$ , then there is a natural map  $Y \rightarrow (Y^\vee)^\vee$ . If such a map is reflexive, then  $Y$  is called a **reflexive object**.

┘

**Prop. (4.1.5.11).** If  $\mathcal{C}$  is closed, then

$$\varinjlim {}^A B \cong \varprojlim ({}^A B) \quad {}^A (\varinjlim B_i) \cong \varprojlim ({}^A B_i)$$

┘

*Proof:* Because  $\mathcal{C}$  is closed, left and right tensor  $A \otimes -$  and  $- \otimes A$  are both left adjoints thus commutes with colimits. Now  $B \mapsto {}^A B$  is a right adjoint, thus it commutes with limits. And for any  $C \in \mathcal{C}$ ,

$$\begin{aligned} \text{Hom}(C, \varinjlim {}^A B) &\cong \text{Hom}(C \otimes (\varinjlim A_i), B) \cong \text{Hom}(\varinjlim C \otimes A_i, B) \\ &\cong \varprojlim \text{Hom}(C \otimes A_i, B) \cong \varprojlim \text{Hom}(C, {}^{A_i} B) \cong \text{Hom}(C, \varprojlim ({}^{A_i} B)) \end{aligned}$$

so  $\varinjlim {}^A B \cong \varprojlim ({}^{A_i} B)$  by Yoneda's lemma(4.1.3.11).  $\square$

**Def.(4.1.5.12) [Monoidal Functor].** Let  $(\mathcal{C}, \otimes), (\mathcal{D}, \otimes)$  be monoidal categories, then a **right-lax monoidal functor** from  $\mathcal{C}$  to  $\mathcal{D}$  is a functor  $G$  together with morphisms  $\gamma_{A,B} : G(A) \otimes G(B) \rightarrow G(A \otimes B)$  for any  $A, B \in \mathcal{C}$  and a morphism  $e : \mathbb{1}_{\mathcal{D}} \rightarrow G(\mathbb{1}_{\mathcal{C}})$  s.t.

- $\gamma_{A,B}$  is functorial in each coordinate.
- (Hexagon Diagram) The following diagram is commutative:

$$\begin{array}{ccc} (G(A) \otimes G(B)) \otimes G(C) & \xrightarrow{\eta_{G(A), G(B), G(C)}} & G(A) \otimes (G(B) \otimes G(C)) \\ \downarrow \gamma_{A,B} & & \downarrow \gamma_{B,C} \\ G(A \otimes B) \otimes G(C) & & G(A) \otimes G(B \otimes C) \\ \downarrow \gamma_{A \otimes B, C} & \xrightarrow{G(\eta_{A,B,C})} & \downarrow \gamma_{A, B \otimes C} \\ G((A \otimes B) \otimes C) & \longrightarrow & G(A \otimes (B \otimes C)) \end{array}$$

- The following diagrams are commutative:

$$\begin{array}{ccccc} G(A) \otimes \mathbb{1}_{\mathcal{D}} & \xrightarrow{\text{id}_{G(A)} \otimes e} & G(A) \otimes G(\text{id}_{\mathcal{C}}) & \xrightarrow{\gamma_{A, \mathbb{1}_{\mathcal{C}}}} & G(A \otimes \mathbb{1}_{\mathcal{C}}) \\ & \searrow \alpha_{G(A)} & & \swarrow G(\alpha_A) & \\ & & G(A) & & \\ \\ \mathbb{1}_{\mathcal{D}} \otimes G(B) & \xrightarrow{e \otimes \text{id}_{G(B)}} & G(\text{id}_{\mathcal{C}}) \otimes G(B) & \xrightarrow{\gamma_{\mathbb{1}_{\mathcal{C}}, B}} & G(B \otimes \mathbb{1}_{\mathcal{C}}) \\ & \searrow \alpha_{G(B)} & & \swarrow G(\beta_B) & \\ & & G(B) & & \end{array}$$

Moreover, it is called a **monoidal functor** if  $\gamma_{A,B}$  and  $e$  are all isomorphisms.

A **monoidal natural transformation** between right-lax monoidal functors is a natural transformation that commutes with the maps  $\gamma_{A,B}$  and  $e$ .  $\lrcorner$

**Def.(4.1.5.13) [Equivalence of Monoidal Categories].** An equivalence of monoidal categories is a map that is an equivalence of categories as well as a monoidal functor.  $\lrcorner$

**Prop.(4.1.5.14) [Mac Lane Strictness].** Any monoidal category is equivalent to a strict monoidal category.  $\lrcorner$

*Proof:*  $\square$

**Prop. (4.1.5.15) [Examples].** For a monoidal category  $(\mathcal{C}, \otimes)$ , the functor  $X \mapsto \text{Hom}(\mathbb{1}, X)$  is a right-lax monoidal functor from  $\mathcal{C} \rightarrow \text{Set}$  (4.1.5.6).

The morphism  $\pi_0 : A \mapsto \pi_0(A)$  is a monoidal functor from the category of topological spaces  $\mathcal{Top}$  to the category  $\text{Set}$  because it commutes with products.  $\lrcorner$

*Proof:*  $\square$

### Symmetric Monoidal Categories

**Def. (4.1.5.16) [Symmetric Monoidal Category].** A **symmetric monoidal category** is a monoidal category  $(\mathcal{C}, \otimes)$  together with a natural transformation  $\psi$  between  $\otimes$  and  $\otimes \circ \iota : \mathcal{C} \times \mathcal{C} \rightarrow \mathcal{C}$  that  $\psi^2 = \text{id}$  and the following commutative hexagon diagram is commutative:

A **symmetric monoidal functor** between symmetric monoidal categories are required to commute with the braiding  $\psi$ .  $\lrcorner$

### Rigid Monoidal Categories

**Def. (4.1.5.17) [Duals].** Let  $\mathcal{C}$  be a monoidal category and  $V \in \mathcal{C}$ , a **left dual** of  $V$  is an element  $V^*$  together with maps

$$ev_V : V^* \otimes V \rightarrow \mathbb{1}, \quad coev_V : \mathbb{1} \mapsto V \otimes V^*$$

that satisfies

$$V \rightarrow V \otimes V^* \otimes V \rightarrow V, \quad V^* \rightarrow V^* \otimes V \otimes V^* \rightarrow V^*$$

are identities.

Similarly we can define right dual. if  $Y$  is a left/right dual to  $X$ , then  $X$  is right/left dual to  $Y$ .  $\lrcorner$

**Def. (4.1.5.18) [Dual Morphisms].** Let  $f; X \rightarrow Y$  be a morphism and  $X^*, Y^*$  the left duals of  $X$  and  $Y$ , then there is a natural **left dual map**:  $f^* : Y^* \rightarrow X^*$  given by

$$Y^* \rightarrow Y^* \otimes X \otimes X^* \rightarrow Y^* \otimes Y \otimes X^* \rightarrow X^*.$$

$\lrcorner$

**Prop. (4.1.5.19) [Monoidal Functor Preserves Duals].** Let  $F : \mathcal{C} \rightarrow \mathcal{D}$  be a monoidal functor (4.1.5.12) between monoidal categories,  $X \in \mathcal{C}$  is an object with left dual  $X^*$ . Then  $F(X^*)$  is a left dual of  $F(X)$  with evaluation and coevaluation maps

$$ev_{F(X)} : F(X^*) \otimes F(X) \rightarrow F(X^* \otimes X) \rightarrow F(\mathbb{1}_{\mathcal{C}}) \rightarrow \mathbb{1}_{\mathcal{D}},$$

$$coev_{F(X)} : \mathbb{1}_{\mathcal{D}} \rightarrow F(\mathbb{1}_{\mathcal{C}}) \rightarrow F(X \otimes X^*) \rightarrow F(X) \otimes F(X^*).$$

and similarly for right duals.  $\lrcorner$

**Prop. (4.1.5.20) [Adjointness].** Let  $\mathcal{C}$  be a monoidal category and  $V \in \mathcal{C}$  with left dual  $V^*$ , then there are natural adjunction maps

$$\text{Hom}(U \otimes V, W) \cong \text{Hom}(U, W \otimes V^*), \quad \text{Hom}(V^* \otimes U, W) \cong \text{Hom}(U, V \otimes W).$$

$\lrcorner$

*Proof:* The first adjunction map is given by  $f \mapsto (f \otimes \text{id}_{V^*}) \circ (\text{id}_U \otimes coev_V)$ , and the inverse given by  $g \mapsto (W \otimes ev_V) \circ (g \otimes \text{id}_V)$ . The verification and the second one:  $\square$

**Cor. (4.1.5.21).** In particular, we can use Yoneda lemma to show the left/right adjoints are unique if they exist.  $\lrcorner$

**Invertible Objects and Grothendieck Categories**

**Def. (4.1.5.22) [Invertible Objects].** An **invertible object** in a monoidal category is a rigid object  $L$  that the evaluation maps and coevaluation maps are all isomorphisms. ? ⌋

## 4.2 Categories II

References are [Bor94, Mac98], [Coend Calculus, Fosco Loregian].

**Notation (4.2.0.1).**

- Let  $\mathcal{C} \in \mathbf{Cat}$ .

┘

### 1 Tensor Categories

**Notation (4.2.1.1).**

- Let  $k \in \mathbf{Field}$ .

┘

**Def. (4.2.1.2) [Tensor Categories].** A **tensor category** over a field  $k$  is an Artinian Abelian category over  $k$  together with a strict monoidal structure that is bilinear and satisfies  $\mathrm{End}(\mathbf{1}) = k$ .

A **tensor functor** is a functor between tensor categories that is additive and monoidal.

┘

**Prop. (4.2.1.3) [End(1)].** If  $\mathcal{C}$  is a rigid tensor category, then  $\mathrm{End}(\mathbf{1})$  is a ring that acts on objects  $X \in \mathcal{C}$  via  $X \cong \mathbf{1} \otimes X$ . The action of  $\mathrm{End}(\mathbf{1})$  commutes with  $\mathrm{End}(X)$ , in particular,  $\mathrm{End}(\mathbf{1})$  is commutative and  $\mathcal{C}$  is  $\mathrm{End}(\mathbf{1})$ -linear.

┘

### Rigid Tensor Categories

**Def. (4.2.1.4) [Rigid Tensor Categories].** Let  $\mathcal{C}$  be a monoidal category, an element  $X \in \mathcal{C}$  is called **rigid object** if it has left and right duals. A **rigid tensor category** is a tensor category (4.2.1.2) s.t. every object is rigid. In particular, by (4.1.5.20), a rigid tensor category is closed.

┘

**Prop. (4.2.1.5).** If  $\mathcal{C}$  is a rigid tensor category, then the functor

Equivalence of  $\mathcal{C}^{\mathrm{op}}$  and  $\mathcal{C}^{\mathrm{opp}}$ . ?

┘

**Cor. (4.2.1.6).** Any natural transformation of monoidal functors between rigid tensor categories is an isomorphism.

┘

*Proof:* Cf. [Milne, Tannakian Categories, P13]. ?

□

**Prop. (4.2.1.7) [Trace and Rank].** Let  $\mathcal{C}$  be a symmetric rigid tensor category, we can define a trace morphism

$$\mathrm{tr}_X : \mathrm{End}(X) \rightarrow \mathrm{End}(\mathbf{1}) : f \mapsto \mathbf{1} \rightarrow X \otimes X^* \xrightarrow{f \otimes \mathrm{id}} X \otimes X^* \rightarrow X^* \otimes X \rightarrow \mathbf{1}$$

And the **dimension** of  $X$  is defined to be  $\mathrm{tr}_X(\mathrm{id}_X) \in \mathrm{End}(\mathbf{1})$ .

┘

**Prop. (4.2.1.8) [Abelian Rigid Tensor Categories Exact].** If  $\mathcal{C}$  is an Abelian rigid tensor category, then  $\otimes$  commutes with inverse limits and direct limits in each variable.

┘

*Proof:* It commutes with direct limits because it is left adjoint to the Hom functor, and it commutes with inverse limits by considering the opposite category (4.2.1.5).

□

**Prop. (4.2.1.9).**  $\dim(X \otimes Y) = \dim X \cdot \dim Y$ . If there is an exact sequence  $0 \rightarrow X \rightarrow Z \rightarrow Y \rightarrow 0$ , then  $\dim(Z) = \dim(X) + \dim(Y)$ .

┘

**Prop. (4.2.1.10)[Decompositions].** Let  $(\mathcal{C}, \otimes)$  be a rigid Abelian tensor category and if  $U$  is a subobject of  $1$ , then  $1 = U \oplus U^\perp$  where  $U^\perp = \ker(1 \rightarrow U^\vee)$ . Consequently,  $1$  is a simple object iff  $\text{End}(1)$  is a field. And any rigid tensor category can be decomposed as rigid Abelian tensor categories  $\mathcal{C}_I$  with  $\text{End}(1_i)$  being fields.  $\lrcorner$

*Proof:* Let  $V = \text{Coker}(U \rightarrow 1)$ , by tensoring  $0 \rightarrow U \rightarrow 1 \rightarrow V \rightarrow 0$  with  $U \hookrightarrow 1$ , we get exact sequences

$$\begin{array}{ccccccccc} 0 & \longrightarrow & U & \longrightarrow & 1 & \longrightarrow & V & \longrightarrow & 0 \\ & & \uparrow & & \uparrow & \nearrow 0 & \uparrow & & \\ 0 & \longrightarrow & U \otimes U & \longrightarrow & U & \longrightarrow & V \otimes U & \longrightarrow & 0 \end{array}$$

thus  $V \otimes U = 0$  and  $U \otimes U = U$  via  $1 \otimes 1 \cong 1$ .

For the rest, Cf.[Tannakian Categories, Milne, P14].  $\square$

**Def. (4.2.1.11)[Associative Algebra in a Symmetric Tensor Category].**  $\lrcorner$

### Tannakian Categories

**Def. (4.2.1.12)[Fiber Functor].** Let  $\mathcal{C}$  be a  $k$ -linear tensor category, then a **fiber functor** on  $\mathcal{C}$  with values in a  $k$ -algebra  $R$  is a  $k$ -linear exact faithful tensor functor  $\eta : \mathcal{C} \rightarrow \text{Mod}_R$  that takes values in the subcategory  $\mathbf{Proj}_R$ .  $\lrcorner$

**Def. (4.2.1.13)[Tannakian Category].** A **Tannakian category** is a symmetric rigid tensor category (4.2.1.4)  $\mathcal{C}$  that  $\text{End}(1) = k$  together with a fiber functor (4.2.1.12) with values in some  $R \in \mathcal{C}\text{Ring}_k$ .  $\lrcorner$

**Def. (4.2.1.14)[Neutral Tannakian Categories].** A **neutral Tannakian category** is a Tannakian category that the fiber functor is valued in  $k$ . By (10.3.2.6), such a category is equivalent to  $\text{Rep}_k(G)$  for some  $G \in \text{GrpSch}^{\text{aff}}/k$ , and such  $G$  is uniquely defined up to inner automorphisms.  $\lrcorner$

**Remark (4.2.1.15).** In particular, a Tannakian category can be thought of as an abstract version of the category of representations of an affine group scheme that has no distinguished “forgetful” functor, just as a vector space is an abstract version of  $k^n$  that has no distinguished basis.  $\lrcorner$

## 2 Enriched Categories

**Def. (4.2.2.1)[Enriched Categories].** Given a monoidal category  $(\mathcal{C}, \otimes)$ , an **enriched category**  $\mathcal{D}$  over  $\mathcal{C}$  consists of the following data:

- a collection of objects.
- For objects  $X, Y \in \mathcal{D}$ , a mapping object  $\text{Map}_{\mathcal{D}}(X, Y) \in \mathcal{C}$ .
- For objects  $X, Y, Z \in \mathcal{D}$ , a composite map  $\text{Map}_{\mathcal{D}}(X, Y) \otimes_{\mathcal{C}} \text{Map}_{\mathcal{D}}(Y, Z) \rightarrow \text{Map}_{\mathcal{D}}(X, Z)$  that is associative.
- For every  $X \in \mathcal{D}$ , a morphism  $1 \mapsto \text{Map}_{\mathcal{D}}(X, X)$  that satisfies the commutative diagrams of the identity morphism.

$\lrcorner$

**Def. (4.2.2.2)[Category of Enriched Categories].** We can naturally define morphisms and natural transformations of categories enriched over a monoidal category  $\mathcal{C}$ . The resulting category is denoted by  $\text{Cat}_{\mathcal{C}}$ .  $\lrcorner$

**Prop. (4.2.2.3)[Completeness and Cocompleteness].** Let  $\mathcal{C}$  be a complete and cocomplete symmetric monoidal closed category, then  $\text{Cat}_{\mathcal{C}}$  is also complete and cocomplete.  $\lrcorner$

*Proof:* Cf. [H. Wolff. V-cat and V-graph]. ?  $\square$

**Prop. (4.2.2.4) [Transfer of Enriched Structure].** Given a right-lax monoidal functor between monoidal categories  $F : \mathcal{C} \rightarrow \mathcal{C}'$  and a category  $\mathcal{D}$  enriched over  $\mathcal{C}$ , we may obtain a category  $F(\mathcal{D})$  enriched over  $\mathcal{C}'$  by asserting  $\text{Map}_{F(\mathcal{D})}(X, Y) = F(\text{Map}(X, Y))$ . It is an enriched category just by the definition of right-lax monoidal functors.  $\lrcorner$

**Prop. (4.2.2.5)[Underlying Category].** For a category enriched  $\mathcal{D}$  over  $\mathcal{C}$ , by (4.1.5.15), we can transfer the structure via  $\mathcal{C} \rightarrow \text{Set} : X \mapsto \text{Hom}(1, X)$ , and the resulting category is called the underlying category of  $\mathcal{D}$ .  $\lrcorner$

**Prop. (4.2.2.6).**

- A category enriched in  $\text{Set}$  is just a usual category.
- A right-closed monoidal category is enriched over itself if we define  $\text{Map}(X, Y) = Y^X$ . (Check).  $\lrcorner$

**Def. (4.2.2.7) [Tensor Category].** Let  $\mathcal{C}$  be a right-closed monoidal category and  $\mathcal{D}$  a category enriched over  $\mathcal{C}$ , then  $\mathcal{D}$  is called **tensor over  $\mathcal{C}$**  if for any  $C \in \mathcal{C}$  and  $X \in \mathcal{D}$ , there is an isomorphism of functors

$$\eta : \text{Map}_{\mathcal{D}}(X, -)^C \cong \text{Map}_{\mathcal{D}}(X \otimes C, -).$$

for some element  $X \otimes C \in \mathcal{D}$ .

In particular, this implies  $\text{Hom}_{\mathcal{C}}(C, \text{Map}(X, Y)) \cong \text{Hom}_{\mathcal{D}}(X \otimes C, Y)$ , thus  $X \otimes C$  is determined up to a unique isomorphism, and the map  $(X, C) \mapsto X \otimes C$  defines a functor  $\mathcal{D} \times \mathcal{C} \rightarrow \mathcal{D}$  that there are natural morphisms

$$X \otimes (C \otimes D) \cong (X \otimes C) \otimes D.$$

Dually, if  $\mathcal{C}$  is left-closed and there is an object  ${}^C X$  that there is an isomorphism of functors

$${}^C \text{Map}(-, X) \cong \text{Map}(-, {}^C X)$$

then  $\mathcal{D}$  is called **cotensor over  $\mathcal{C}$** .  $\lrcorner$

*Proof:*  $\square$

**Prop. (4.2.2.8).** If  $\mathcal{C}$  is a right-closed monoidal category, then it is naturally tensor over itself, as defined in (4.2.2.6).  $\lrcorner$

### Lifting Property and Small Object Argument

**Def. (4.2.2.9)[lifting Properties].** Let  $\mathcal{C}$  be a category and  $p : A \rightarrow B, q : X \rightarrow Y$  be morphisms, then  $p$  is said to have **left lifting property** w.r.t  $q$  and  $q$  is said to have **right lifting property** w.r.t  $p$

if given any diagram 
$$\begin{array}{ccc} A & \longrightarrow & X \\ \downarrow p & \nearrow & \downarrow q \\ B & \longrightarrow & Y \end{array}$$
, there is a dotted arrow completing the diagram.

For a set  $A$  of morphisms of  $\mathcal{C}$ , let  $l(A)$  denote the morphisms that have left lifting property w.r.t  $A$  and  $r(A)$  the morphisms that have right lifting property w.r.t  $A$ .  $\lrcorner$

**Def. (4.2.2.10) [Weakly Saturated Class].** Let  $\mathcal{C}$  be a category with all small colimits, then a class of morphisms of  $\mathcal{C}$  is called **weakly saturated** if it satisfies:

- Closed under pushout.
- Closed under transfinite composition: Let  $\alpha$  be an ordinal and  $\{D_\beta\}_{\beta < \alpha}$  be a system of objects in  $\mathcal{C}_{C/}$  indexed by  $\alpha$ . For  $\beta < \alpha$ , let  $D_{<\beta}$  be the colimit of system  $\{D_\gamma\}_{\gamma < \beta}$  in  $\mathcal{C}_{C/}$ , then if each  $D_{<\beta} \rightarrow D_\beta$  is in  $S$ , then  $C \rightarrow D_{<\alpha}$  is in  $S$ .
- Closed under Retraction: In the category of morphisms of  $\mathcal{C}$ , if there is a morphism  $F : f \rightarrow g, G : g \rightarrow f$  that  $G \circ F = \text{id}$ , and  $g \in S$ , then  $f \in S$ .

┘

**Cor. (4.2.2.11).** The second condition implies all isomorphisms are in  $S$ , and  $S$  is closed under composition.

┘

**Prop. (4.2.2.12) [Lifting and Retraction].** For a diagram  $\begin{array}{ccc} X & \xlongequal{\quad} & X \\ \downarrow i & \nearrow s & \downarrow p \\ Z & \xrightarrow{f} & Y \end{array}$  represents  $p$  as a retraction of

$u$ , as the diagram  $\begin{array}{ccccc} X & \xrightarrow{i} & Z & \xrightarrow{s} & X \\ \downarrow p & & \downarrow f & & \downarrow p \\ Y & \xlongequal{\quad} & Y & \xlongequal{\quad} & Y \end{array}$  shows.

Dually a diagram  $\begin{array}{ccc} X & \xrightarrow{i} & Y \\ \downarrow q & \nearrow s & \downarrow f \\ Z & \xlongequal{\quad} & Z \end{array}$  represents  $q$  as a retraction of  $i$ .

┘

**Prop. (4.2.2.13) [Small Object Argument].** Let  $\mathcal{C}$  be a presentable category and  $A_0 = \{\varphi_i : C_i \rightarrow D_i\}$  be a small collection of morphisms in  $\mathcal{C}$ , then there is a morphism  $T : \mathcal{C}^{[1]} \rightarrow \mathcal{C}^{[2]}$  taking morphisms  $f : X \rightarrow Z$  in  $\mathcal{C}$  to the diagram

$$\begin{array}{ccc} & Y & \\ f' \nearrow & & \searrow f'' \\ X & \xrightarrow{f} & Z \end{array}$$

That  $f'$  belongs to the weakly saturated class generated by  $A_0$  and  $f'' \in r(A_0)$ .

Moreover, if  $\kappa$  is a regular cardinal that each  $C_i, D_i$  is  $\kappa$ -compact, then  $T$  commutes with  $\kappa$ -filtered colimits.

┘

*Proof:* Cf.[HTT, P788].

□

**Lemma (4.2.2.14).**  $l(A)$  is weakly saturated for any set of morphisms  $A$  (Clear).

┘

**Cor. (4.2.2.15) [Generated Weakly Saturated Class].** For any presentable category  $\mathcal{C}$  and  $A$  a set of morphisms in  $\mathcal{C}$ ,  $l(r(A))$  is the smallest weakly saturated class of morphisms containing  $A$ .

┘

*Proof:* One direction of inclusion is by (4.2.2.14), for the other, if  $f : X \rightarrow Z \in l(r(A))$ , then there is a factorization  $X \xrightarrow{f'} Y \xrightarrow{f''} Z$ , where  $f' \in \overline{A}$  and  $f'' \in r(A)$ , thus  $f \in l(f'')$ , thus  $f$  is retraction of  $f'$ :

$$\begin{array}{ccc} X & \xrightarrow{f'} & Y \\ \downarrow f & \nearrow g & \downarrow f'' \\ Z & \xrightarrow{\quad} & Z \end{array} \Rightarrow \begin{array}{ccccc} X & \longrightarrow & X & \longrightarrow & X \\ \downarrow f & & \downarrow f' & & \downarrow f \\ Z & \xrightarrow{g} & Y & \xrightarrow{f''} & Z \end{array}$$

Thus  $f \in \overline{A}$ .

□

### Trees

Cf.[HTT, Appendix]

## 3 Fibered Categories

### Categories of Categories

**Def. (4.2.3.1) [2-Category of Categories over Categories].** There is a 2-category of categories over  $\mathcal{C}$ , denoted by  $\text{Cat}(\mathcal{C})$ , where the 1-morphisms are morphisms of categories over  $\mathcal{C}$  and the 2-morphisms are base-preserving natural transformations.

Two categories over  $\mathcal{C}$  are called **equivalent** if they are equivalent in this 2-category.  $\lrcorner$

**Prop. (4.2.3.2) [2-Fibered Products in the Categories of Categories].** 2-fibered products exists in  $\text{Cat}(\mathcal{C})$ .  $\lrcorner$

*Proof:* For  $F : \mathcal{A} \rightarrow \mathcal{C}, G : \mathcal{B} \rightarrow \mathcal{C} \in \text{Cat}(\mathcal{C})$ , we can define  $\mathcal{A} \times_{\mathcal{C}} \mathcal{B} \in \text{Cat}(\mathcal{C})$  as follows:

- Objects are the triples  $(A, B, f)$  where  $A \in \mathcal{A}, B \in \mathcal{B}$  and  $f : F(A) \rightarrow G(B)$  is an isomorphism in  $\mathcal{C}$ .
- Morphisms from  $(A, B, f)$  to  $(A', B', f')$  are pairs  $(a, b)$  where  $a : A \rightarrow A', b : B \rightarrow B'$  s.t. the diagram

$$\begin{array}{ccc} F(A) & \xrightarrow{f} & G(B) \\ \downarrow F(a) & & \downarrow G(b) \\ F(A') & \xrightarrow{f'} & G(B') \end{array}$$

is commutative.

$\mathcal{A} \times_{\mathcal{C}} \mathcal{B}$  is a category both over  $\mathcal{A}$  and over  $\mathcal{B}$ , and it fits into a 2-fiber products diagram

$$\begin{array}{ccc} \mathcal{A} \times_{\mathcal{C}} \mathcal{B} & \longrightarrow & \mathcal{B} \\ \downarrow & & \downarrow \\ \mathcal{A} & \longrightarrow & \mathcal{C} \end{array}$$

where the invertible 2-morphism is given by  $\psi_{(\mathcal{A}, \mathcal{B}, f)} = f : F(A) \rightarrow G(B)$ .

The verification that this defines a final object in the 2-category of 2-commutative diagrams is in [Sta]02X9.  $\square$

**Cor. (4.2.3.3).** There is an equivalence of fibre categories:

$$(\mathcal{X} \times_{\mathcal{S}} \mathcal{Y})_U \cong \mathcal{X}_U \times_{\mathcal{S}_U} \mathcal{Y}_U.$$

In particular,  $\mathcal{A} \times_{\mathcal{C}} \mathcal{B}$  is a groupoid iff  $\mathcal{A}, \mathcal{B}$  are all groupoids.  $\lrcorner$

**Prop. (4.2.3.4).** Let  $\mathcal{A} \rightarrow \mathcal{C}, \mathcal{B} \rightarrow \mathcal{C}, \mathcal{C} \rightarrow \mathcal{D}$  be functors between categories, then there is a 2-fiber product diagram

$$\begin{array}{ccc} \mathcal{A} \times_{\mathcal{C}} \mathcal{B} & \longrightarrow & \mathcal{A} \times_{\mathcal{D}} \mathcal{B} \\ \downarrow & & \downarrow \\ \mathcal{C} & \xrightarrow{\Delta_{\mathcal{C}/\mathcal{D}}} & \mathcal{C} \times_{\mathcal{D}} \mathcal{C} \end{array}$$

$\lrcorner$

*Proof:*

$\square$

### Fibered Categories

**Def. (4.2.3.5) [(Co)Cartesian-Arrows].** Let  $\text{pr} : \mathcal{F} \rightarrow \mathcal{C}$  be a morphism, then a **Cartesian-arrow** is an arrow  $\varphi : C' \rightarrow C$  in  $\mathcal{F}$  s.t. for any  $C'' \in \text{Ob}(\mathcal{F})$ , the map

$$\text{Hom}(C'', C') \rightarrow \text{Hom}(C'', C) \times_{\text{Hom}(\text{pr}(C''), \text{pr}(C))} \text{Hom}(\text{pr}(C''), \text{pr}(C'))$$

is a bijection. A **coCartesian arrow** is an arrow that corresponds to a Cartesian diagram in  $\mathcal{F}^{\text{op}} \rightarrow \mathcal{C}^{\text{op}}$ .  $\lrcorner$

**Prop. (4.2.3.6).**

- If  $f$  is Cartesian, then  $f \circ g$  is Cartesian iff  $g$  is Cartesian.
- An arrow in  $\mathcal{F}$  whose image is an isomorphism is Cartesian iff it is itself an isomorphism.

$\lrcorner$

*Proof:* Easy.  $\square$

**Def. (4.2.3.7) [Quasi-Fibration].** A functor  $F : \mathcal{C} \rightarrow \mathcal{D}$  is called a **quasi-fibration** if for any  $X \in \mathcal{C}$  and an isomorphism  $f : F(X) \cong Y$ , there is an isomorphism  $\bar{f} : X \rightarrow \bar{Y}$  mapping to  $f$ .  $\lrcorner$

**Def. (4.2.3.8) [2-Category of Fibered Categories].** A **fibered category** over  $\mathcal{C}$  is a category over  $\mathcal{C}$   $\text{pr} : \mathcal{F} \rightarrow \mathcal{C}$  s.t. for any  $\eta \in \mathcal{F}$  and an arrow  $f : U \rightarrow \text{pr}(\eta)$ , there is a Cartesian arrow (4.2.3.5)  $\xi \rightarrow \eta$  in  $\mathcal{F}$  lifting  $f$ . A **cofibered category** over  $\mathcal{C}$  is a category  $p : \mathcal{F} \rightarrow \mathcal{C}$  that the dual category  $\text{pr}^{\text{op}} : \mathcal{F}^{\text{op}} \rightarrow \mathcal{C}^{\text{op}}$  is a fibered category.

A morphism of fibered categories over  $\mathcal{C}$  is a morphism of categories over  $\mathcal{C}$  that maps Cartesian morphisms to Cartesian morphisms. A 2-morphism of fibered categories is the same as a 2-morphism of categories over categories.  $\lrcorner$

**Def. (4.2.3.9) [Split Fibered Categories].** A **split fibered category** is a fibered category  $\mathcal{F} \rightarrow \mathcal{C}$  that comes from a functor  $\mathcal{C}^{\text{op}} \rightarrow \text{Cat}$ .  $\lrcorner$

**Def. (4.2.3.10) [Cleavage].** A **cleavage** of a fibered category  $\pi : \mathcal{F} \rightarrow \mathcal{C}$  is a choice of Cartesian arrow  $f^*$  lifting  $f$  for any  $f \in \text{Arr}(\mathcal{C})$ .  $\lrcorner$

**Lemma (4.2.3.11).** Let  $F : \mathcal{F} \rightarrow \mathcal{G} \in \text{FibCat}(\mathcal{C})$  s.t.  $\mathcal{F}(U) \rightarrow \mathcal{G}(U)$  are fully faithful for any  $U \in \mathcal{C}$ , then  $F$  is fully faithful.  $\lrcorner$

*Proof:* To show  $F$  is fully faithful, it suffices to show for objects  $X, Y$  lying over  $U, V$ ,  $F$  induces a bijection of morphisms from  $x$  to  $y$  lying over a fixed  $f : U \rightarrow V$ . Choose a Cartesian morphism  $f^*y \rightarrow y$  in  $\mathcal{S}_1$  lying over  $f$ , then this induces a bijection between morphisms from  $x$  to  $y$  lying over  $f$  and  $\text{Hom}_{\mathcal{S}_{1,U}}(x, f^*y)$ . Similarly, because  $F$  preserves Cartesian morphisms, we get a bijection between morphisms  $F(x) \rightarrow F(y)$  lying over  $f$  and  $\text{Hom}_{\mathcal{S}_{2,U}}(F(x), F(f^*y))$ . Then the desired bijection follows from the hypothesis.  $\square$

**Prop. (4.2.3.12) [Equivalence of Fibered Categories].** For  $F : \mathcal{F} \rightarrow \mathcal{G} \in \text{FibCat}(\mathcal{C})$ ,  $F$  is an equivalence iff the restriction  $F_U : \mathcal{F}(U) \rightarrow \mathcal{G}(U)$  is an equivalence of categories for any object  $U$  of  $\mathcal{C}$ .  $\lrcorner$

*Proof:* One direction is trivial: for the other, the proof is similar to the fact essentially surjective+fully faithful implies equivalence.

Because  $F(U)$  are equivalences, for any object  $\xi$  of  $\mathcal{G}$  over  $U$ , pick an object  $G\xi$  in  $\mathcal{F}(U)$  together with an isomorphism  $\alpha_\xi : \xi \cong F(G\xi)$ . And for any morphism  $\xi \rightarrow \eta$ , by (4.2.3.11), there is a unique arrow  $G\varphi : G\xi \rightarrow G\eta$  that  $F(G\varphi) = \alpha_\eta \circ \varphi \circ \alpha_\xi^{-1}$ .

Thus clearly there is a 2-isomorphism  $\text{id}_{\mathcal{G}} \cong F \circ G$ . It remains to construct an 2-isomorphism  $\text{id}_{\mathcal{F}} \cong G \circ F$ : For any object  $\xi'$  over  $U$ , since  $F(U)$  is fully faithful, there is a unique isomorphism  $\beta_{\xi'} : \xi' \cong G \circ F(\xi)$  in  $\mathcal{F}(U)$  that  $F\beta_{\xi'} = \alpha_{F\xi'}$ . Then this is easily checked to be an 2-isomorphism  $\beta : \text{id}_{\mathcal{F}} \cong F \circ G$ .  $\square$

**Prop. (4.2.3.13)[2-Fiber Products of Fibered Categories].** 2-fiber products exists in the category of fibered categories, and it coincides with that defined in (4.2.3.2).  $\lrcorner$

*Proof:* it suffices to show for fibered categories  $\mathcal{X}, \mathcal{Y}$  over  $\mathcal{C}$ ,  $\mathcal{X} \times_{\mathcal{C}} \mathcal{Y}$  is also fibered over  $\mathcal{C}$ . Let  $(x, y, \varphi)$  be an object of  $\mathcal{X} \times_{\mathcal{C}} \mathcal{Y}$  mapping to  $U \in \mathcal{C}$  and  $f : V \rightarrow U$  is a morphism in  $\mathcal{C}$ , choose Cartesian morphisms  $a : f^*x \rightarrow x$ ,  $b : f^*y \rightarrow y$  lying over  $f$ , then  $F(a)$  and  $G(b)$  are Cartesian. Since  $\varphi : F(x) \rightarrow G(y)$  is an isomorphism, by the property of Cartesian morphisms, there exists a unique isomorphism  $f^*\varphi : F(f^*x) \rightarrow G(f^*y) \in \mathcal{S}_V$  that  $G(b) \circ f^*\varphi = \varphi \circ F(a)$ . In other words,  $(F(a), F(b)) : (V, f^*x, f^*y, f^*\varphi) \rightarrow (U, x, y, \varphi)$  is a morphism in  $\mathcal{X} \times_{\mathcal{S}} \mathcal{Y}$ .

The verification that this morphism is Cartesian is omitted.  $\square$

**Lemma (4.2.3.14).** Let  $\mathcal{S} \rightarrow \mathcal{C}$  be a fibered category that factors through  $\mathcal{C}/U$  where  $U \in \mathcal{C}$ , then  $\mathcal{S} \rightarrow \mathcal{C}/U$  is also a fibered category.  $\lrcorner$

*Proof:* Cf. [Sta]02XR.  $\square$

**Def. (4.2.3.15)[ $G$ -Equivariant Object].** Let  $G : \mathcal{C}^{\text{op}} \rightarrow (\text{Grp})$  be a group functor and  $p_{\mathcal{F}} : \mathcal{F} \rightarrow \mathcal{C}$  a fibered category, and  $X$  an object of  $\mathcal{C}$  with an action of  $G$ . A  **$G$ -equivariant object** of  $\mathcal{F}(X)$  is an object  $\rho$  of  $\mathcal{F}(X)$  that there is an action of  $G \circ p_{\mathcal{F}}$  on  $\rho$  and for any object  $U$  and  $\xi \in \mathcal{F}(U)$ , the function  $p_{\mathcal{F}} : \text{Hom}_{\mathcal{F}}(\xi, \rho) \rightarrow \text{Hom}_{\mathcal{C}}(U, X)$  is  $G(U)$ -equivariant.

The category  $\mathcal{F}^G(X)$  of  $G$ -equivariant objects of  $\mathcal{F}(X)$  consisting of  $G \circ p_{\mathcal{F}}$ -equivariant morphism of  $G$ -equivariant objects.  $\lrcorner$

**Prop. (4.2.3.16).** Let  $\pi_2$  is the projection  $G \otimes X \rightarrow X$ ,  $\rho$  be an object of  $\mathcal{F}(X)$ , then a  $G$ -equivariant structure on  $\rho$  is the same as a Cartesian arrow  $\beta : \pi_2^*\rho \rightarrow \rho$  that  $p_{\mathcal{F}}\beta = \alpha$ , and satisfies the desired commutative diagram corresponding to  $(gh)x = g(hx)$ . And a morphism of  $G$ -equivariant objects just corresponds to a morphism of pairs  $(\rho, \beta)$ .  $\lrcorner$

*Proof:* Cf. [Vistoli, P68].  $\square$

**Def. (4.2.3.17)[Presheaf of Arrows].** Let  $\mathcal{F}$  be a fibered category over  $\mathcal{C}$ , and  $\xi, \eta \in \mathcal{F}(S)$ , then we can define a quasi-functor  $\text{Hom}_{\mathcal{S}}(\xi, \eta) \rightarrow (\mathcal{C}/S)$ , where

$$\text{Hom}_{\mathcal{S}}(\xi, \eta)(U/S) = \{(\xi_1 \rightarrow \xi, \eta_1 \rightarrow \eta, \varphi)\}$$

where  $\xi_1 \rightarrow \xi, \eta_1 \rightarrow \eta$  are Cartesian arrows over  $U \rightarrow S$ , and  $\varphi : \xi_1 \rightarrow \eta_1 \in \mathcal{F}(U)$ . The arrows in  $\text{Hom}_{\mathcal{S}}(\xi, \eta)$  are uniquely defined by the property of Cartesian arrows. Then it is a quasi-functor, by (4.2.3.28).

Then it is equivalence to a presheaf  $\underline{\text{Hom}}_{\mathcal{S}}(\xi, \eta)$ , by (4.2.3.29). Equivalently, this presheaf can be defined by designating a choice of Cartesian arrows.  $\lrcorner$

**Prop. (4.2.3.18)[Splitting a Fibered Category].** Let  $\mathcal{F} \rightarrow \mathcal{C}$  be a fibered category, then there exists a canonically defined split fibered category  $\tilde{\mathcal{F}} \rightarrow \mathcal{C}$  with a canonical equivalence of fibered categories  $\tilde{\mathcal{F}} \rightarrow \mathcal{F}$  over  $\mathcal{C}$ .  $\lrcorner$

*Proof:* There is a functor  $\mathcal{C}^{\text{op}} \rightarrow \mathcal{Cat} : U \mapsto \text{Hom}(h_U, \mathcal{F})$ , with corresponds to a split fibered category  $\tilde{\mathcal{F}}$ . There is an obvious morphism  $\tilde{\mathcal{F}} \rightarrow \mathcal{F}$ , sending an object  $\varphi : h_U \rightarrow \mathcal{F}$  to  $\varphi(\text{id}_U) \in \mathcal{F}(U)$ . And for any  $f : U \rightarrow V \in \mathcal{C}$  and a  $\varphi : h_U \rightarrow \mathcal{F}$ , we send  $f^*\varphi \rightarrow \varphi \in \tilde{\mathcal{F}}$  to  $\varphi(f : V/U \rightarrow U/U) \in \mathcal{F}$ . Then we get a canonical map of fibered categories  $\tilde{\mathcal{F}} \rightarrow \mathcal{F}$  over  $\mathcal{C}$ . It is an equivalence of categories by (4.2.3.12) and (4.2.3.31).  $\square$

### Categories Fibered in Groupoids, Sets and Equivalence Relations

**Def. (4.2.3.19)[Category Fibered in Groupoids].** A category (co)fibered in groupoids/sets/equivalence relations over  $\mathcal{C}$  is a category  $\mathcal{F}$  (co)fibered over  $\mathcal{C}$  (4.2.3.8) s.t.  $\mathcal{F}(U)$  is a groupoid/setoids/equivalence relations (4.1.1.14) for any  $U \in \mathcal{C}$ . Also we call a category fibered in equivalence relations over  $\mathcal{C}$  a **quasi-functor**.  $\lrcorner$

**Prop. (4.2.3.20)[Characterization of Category Fibered in Groupoids].** Let  $\mathcal{F}$  be a category over  $\mathcal{C}$ , then  $\mathcal{F}$  is fibered over groupoids over  $\mathcal{C}$  iff

- Every morphism in  $\mathcal{F}$  is Cartesian.
- Given any  $\eta \in \mathcal{F}, U \in \mathcal{C}$  and a morphism  $f : U \rightarrow p_{\mathcal{F}}(\eta)$ , there is an arrow  $\varphi : \xi \rightarrow \eta \in \mathcal{F}$  mapping to  $f$ .

And dually for cofibered categories.  $\lrcorner$

*Proof:* If these two holds, then  $\mathcal{F}$  is clearly fibered over  $\mathcal{C}$ , and for any arrow  $f : \xi \rightarrow \eta$  in  $\mathcal{F}(U)$ , there is a morphism  $g : \eta \rightarrow \xi$  that is right inverse to  $f$ , then clearly it is the inverse.

Conversely, if  $\mathcal{F}$  is fibered over  $\mathcal{C}$ , it suffices to check1: for any arrow  $f$ , the image in  $\mathcal{C}$  can be lifted to a Cartesian diagram in  $\mathcal{F}$ , and differs  $f$  by an isomorphism, thus  $f$  is also Cartesian by (4.2.3.6).  $\square$

**Cor. (4.2.3.21).** if  $\mathcal{A}$  is a category fibered in groupoids over  $\mathcal{B}$  and  $\mathcal{B}$  is a category fibered in groupoids over  $\mathcal{C}$ , then  $\mathcal{A}$  is a category fibered in groupoids over  $\mathcal{C}$ .  $\lrcorner$

**Prop. (4.2.3.22)[Associated Category Fibered in Groupoids].** Let  $\mathcal{F} \rightarrow \mathcal{C}$  be a fibered category, then the **associated category fibered in groupoids**  $\mathcal{F}_{\text{cart}}$  is the category obtained by deleting all the non-Cartesian arrows. Then  $\mathcal{F}_{\text{cart}}$  is a category fibered in groupoids over  $\mathcal{C}$ .  $\lrcorner$

*Proof:* Firstly  $\mathcal{F}_{\text{cart}}$  is a category by (4.2.3.6), and it is a category fibered in groupoids by (4.2.3.20).  $\square$

**Def. (4.2.3.23)[Rigid Fibered Categories].** A **rigid fibered category** is a fibered category whose associated category fibered groupoids is fibered in setoids. Equivalently, there are no isomorphisms above any  $\text{id}_U$ .  $\lrcorner$

**Prop. (4.2.3.24)[2-Fibered Products of Categories Fibered in Groupoids].** The 2-fibered products of categories fibered in groupoids over  $\mathcal{C}$  is a category fibered in groupoids over  $\mathcal{C}$ .  $\lrcorner$

*Proof:* The 2-fibered products exist by (4.2.3.13), and using (4.2.3.3), it is fibered in groupoids because the 2-fibered products of groupoids is a groupoid by (4.2.3.3).  $\square$

**Prop. (4.2.3.25)[Characterization of Categories Fibered in Setoids].** Let  $\mathcal{F}$  be a category over  $\mathcal{C}$ , then  $\mathcal{F}$  is fibered in setoids over  $\mathcal{C}$  iff for any object  $\eta$  of  $\mathcal{F}$  and an arrow  $f : U \rightarrow p_{\mathcal{F}}\eta \in \mathcal{C}$ , there is a unique arrow  $\xi \rightarrow \eta$  mapping to  $f$ .  $\lrcorner$

*Proof:* Let  $\mathcal{F}$  be a category fibered in sets, then pick a Cartesian arrow  $\tilde{f}$  over  $f$ , then any other lifting factors through this lifting by the property of Cartesian, then it is identity, because  $\mathcal{F}(U)$  is a setoid.

Conversely, if the hypothesis holds, then clearly  $\mathcal{F}(U)$  is a setoid, and the fibered category condition holds, because of the uniqueness.  $\square$

**Cor. (4.2.3.26) [Presheaves and Categories Fibered in Setoids].** Let  $\mathcal{C}$  be a category, then categories fibered in setoids over  $\mathcal{C}$  are exactly those equivalent to a presheaf over  $\mathcal{C}$ .  $\lrcorner$

**Cor. (4.2.3.27).** In particular, for any object  $X \in \mathcal{C}$ , the presheaf  $h_X$  determines a category fibered in sets, which is just the comma category  $\mathcal{C}/X \rightarrow \mathcal{C}$ .  $\lrcorner$

**Prop. (4.2.3.28) [Characterization of Quasi-Functors].** A category  $\mathcal{F}$  over  $\mathcal{C}$  is a quasi-functor iff:

- Given any object  $\eta \in \mathcal{F}$  and an arrow  $f : U \rightarrow p_{\mathcal{F}}\eta$ , there is a lifting  $\xi \rightarrow \eta$  mapping to  $f$ . And given any two such extensions, there is a morphism  $\xi' \rightarrow \xi$  commuting them.
- Given any two objects  $\xi, \eta \in \mathcal{F}$  and an arrow  $f : p_{\mathcal{F}}\xi \rightarrow p_{\mathcal{F}}\eta$ , there is at most one arrow  $\tilde{f} : \xi \rightarrow \eta$  lifting  $f$ .

$\lrcorner$

*Proof:*

$\square$

**Prop. (4.2.3.29).** A fibered category over  $\mathcal{C}$  is a quasi-functor iff it is equivalent to a presheaf.  $\lrcorner$

*Proof:* If it is equivalent to a functor, then  $\mathcal{F}(U)$  is equivalent to a setoid, thus it is an equivalent relation, by (4.1.1.15). Conversely, if  $\mathcal{F}$  is a quasi-functor, then it is fibered in groupoids, thus by (4.2.3.20) every morphism is Cartesian, and if we denote  $\Phi(U)$  the equivalence classes of  $\mathcal{F}(U)$ , then a morphism  $U \rightarrow V$  will induce a morphism  $\Phi(U) \rightarrow \Phi(V)$  by the property of Cartesian arrows. Then clearly this defines a presheaf that is equivalent to  $\mathcal{F}$ .  $\square$

### Representability

**Def. (4.2.3.30) [Representable Fibered Category].** A fibered category is called **representable** if it is equivalent to the fibered category  $\mathcal{C}/X$  defined in (4.2.3.27) for some  $X \in \mathcal{C}$ .  $\lrcorner$

**Prop. (4.2.3.31) [2-Categorical Yoneda Lemma].** Let  $\mathcal{F}$  be a fibered category over  $\mathcal{C}$  and  $X \in \mathcal{C}$ , there is an equivalence of categories:

$$\mathrm{Hom}_{\mathcal{C}}((\mathcal{C}/X), \mathcal{F}) \cong \mathcal{F}(X) : \varphi \mapsto \varphi(\mathrm{id}_X)$$

$\lrcorner$

*Proof:* To show this functor is essentially surjective, choose a choice of pullbacks of  $\mathcal{F}$ , for any  $\xi \in \mathcal{F}(X)$ , we define a  $F : \mathcal{C}/X \rightarrow \mathcal{F}$  that maps a  $\varphi : U \rightarrow X$  to  $\varphi^*\xi$ , and to any morphism in  $\mathcal{C}/X$  an arrow in  $\mathcal{F}$  induced by Cartesian property.

To show it is fully faithful, notice a natural transformation of  $\varphi, \psi \in \mathrm{Hom}_{\mathcal{C}}((\mathcal{C}/X), \mathcal{F})$  is determined by their value on  $\mathrm{id}_X$ , and any map  $\varphi(\mathrm{id}_X) \rightarrow \psi(\mathrm{id}_X)$  induces a natural transformation, by Cartesian properties.  $\square$

**Cor. (4.2.3.32) [Characterization of Representability].** Translating the 2-Yoneda lemma and (4.2.3.12), we see that a fibered category  $\mathcal{F}$  is representable by  $X \in \mathcal{C}$  iff  $\mathcal{F}$  is fibered in groupoids, and there is an object  $\xi \in \mathcal{F}(X)$  that for any object  $\rho \in \mathcal{F}$ , there is a unique arrow  $\rho \rightarrow \xi$ .  $\lrcorner$

**Cor. (4.2.3.33).** If  $\mathcal{X}, \mathcal{Y}$  are fibered categories over  $\mathcal{C}$  representable by  $U, V$  resp., then there is an isomorphism of sets

$$\mathrm{Hom}_{\mathcal{C}}(\mathcal{X}, \mathcal{Y})/2\text{-isomorphisms} \cong \mathrm{Hom}_{\mathcal{C}}(U, V)$$

⌋

*Proof:* By Yoneda lemma there is an equivalence  $\mathrm{Hom}_{\mathcal{C}}(\mathcal{X}, \mathcal{Y}) \cong \mathrm{Hom}_{\mathcal{C}}(U, V)$ , and then  $\mathrm{Hom}_{\mathcal{C}}(\mathcal{X}, \mathcal{Y})$  is an equivalence relation by (4.1.1.15), so the isomorphism is clear.  $\square$

**Def. (4.2.3.34)[Representable 1-Morphisms].** Let  $\mathcal{C}$  be a category and  $F : \mathcal{X} \rightarrow \mathcal{Y}$  be a morphism of categories fibered over  $\mathcal{C}$ , then  $F$  is called **representable** if for any  $U \in \mathcal{C}$  and a morphism  $\mathcal{C}/U \rightarrow \mathcal{Y}$ , the fibered category  $(\mathcal{C}/U) \times_{\mathcal{Y}} \mathcal{X} \rightarrow \mathcal{C}/U$  is representable (4.2.3.30) (Notice it is a fibered category by (4.2.3.13) and (4.2.3.14)).  $\lrcorner$

**Prop. (4.2.3.35)[Diagonal and Representability].** Let  $\mathcal{S}$  be a category fibered in groupoids over  $\mathcal{C}$ . Assume  $\mathcal{C}$  has fibered product, then the following are equivalent:

- $\Delta_{\mathcal{S}} : \mathcal{S} \rightarrow \mathcal{S} \times_{\mathcal{C}} \mathcal{S}$  is representable.
- For every  $U \in \mathcal{C}$ , any  $G : \mathcal{C}/U \rightarrow \mathcal{S}$  is representable.

⌋

*Proof:* Cf. [Sta]02YA.

The key to this proposition is the fibered product diagram (4.2.3.13)(4.1.1.49)

$$\begin{array}{ccc} X \times_{\mathcal{F}} Y & \longrightarrow & \mathcal{F} \\ \downarrow & & \downarrow \Delta \\ X \times_S Y & \xrightarrow{f \times g} & \mathcal{F} \times_S \mathcal{F} \end{array}$$

which still holds in the 2-commutative sense.

So if  $\Delta_{\mathcal{F}}$  is schematic, then  $X \times_{\mathcal{F}} Y$  is a scheme, so  $X \rightarrow \mathcal{F}$  is schematic, for any scheme  $X$ . Conversely, consider the fibered products

$$\begin{array}{ccccc} \mathcal{F} \times_{\mathcal{F} \times_S \mathcal{F}} X & \longrightarrow & X \times_{\mathcal{F}} X & \longrightarrow & \mathcal{F} \\ \downarrow & & \downarrow & & \downarrow \Delta \\ X & \xrightarrow{\Delta} & X \times_S X & \xrightarrow{f \times g} & \mathcal{F} \times_S \mathcal{F} \end{array}$$

induced by  $h = f \times g : X \mapsto \mathcal{F} \times_S \mathcal{F}$ . So in order to prove  $\Delta_{\mathcal{F}}$  is schematic, it suffices to prove  $\mathcal{F} \times_{\mathcal{F} \times_S \mathcal{F}} X$  is a scheme, and for this, it suffices to prove  $X \times_{\mathcal{F}} X$  is a scheme. But  $X \times_{\mathcal{F}} X \rightarrow X$  is a pullback of  $X \rightarrow \mathcal{F}$ , so it is a scheme.  $\square$

### 1 Monads and Categories

**Def. (4.3.1.1) [Monad].** Let  $\mathcal{C}$  be a category, a **monad** on  $\mathcal{C}$  is an endofunctor  $\mathcal{C} \rightarrow \mathcal{C}$  together with two natural morphisms:

- (multiplication)  $\mu : T \circ T \rightarrow T$ .
- (unit)  $\text{id}_{\mathcal{C}} \rightarrow T$ .

that satisfies associativity and unit diagrams.  $\lrcorner$

**Def. (4.3.1.2) [Algebras over Monads].** An **algebra over a monad**  $T$  is an object  $X$  together with a morphism  $\alpha : TX \rightarrow X$  that satisfies the diagrams for an algebra.  $\lrcorner$

### 2 Group Formation

The goal of this subsection is to give a formation that encompass both the group theory and algebraic group theory.

**Def. (4.3.2.1) [Group Formations].** A **group formation** is a category  $\mathcal{C} \in \mathbf{Cat}$  with a class of arrows  $\mathcal{S} \in \mathcal{C}$  consisting of monomorphisms, satisfying the following axioms:

- $G$  is complete and cocomplete.
- $G$  has a zero object  $e$ .
- $\mathcal{S}$  is stable under pullbacks.
- If  $N \rightarrow H \rightarrow G \in \mathcal{S}$  and  $H \rightarrow G$  is a monomorphism, then  $N \rightarrow H \in \mathcal{S}$ .
- Let  $N \rightarrow G \in \mathcal{S}$ , then  $N$  is called a **normal subobject** of  $G$ , and  $N = \ker(G \rightarrow \text{Coker}(N \rightarrow G))$ .
- For  $G \in \mathcal{C}$ , co-products exist in  $\mathcal{C}/G$ , and if  $N \rightarrow G, H \rightarrow G \in \mathcal{S}$ , then the co-product is also in  $\mathcal{S}$ , denoted by  $NH \rightarrow G$ .
- Let  $N \rightarrow G \in \mathcal{S}$  and  $H \rightarrow G$  a monomorphism, then
  - there is a natural isomorphism:  $H/N \cap H \cong HN/N$ .
  - If  $N \rightarrow G \in \mathcal{S}$ , then there is a natural isomorphism  $G/NH \cong (G/N)/(H/H \cap N)$ .

$\lrcorner$

**Prop. (4.3.2.2).**  $\lrcorner$

### 3 Filtrations of a Category

**Def. (4.3.3.1) [Filtrations in a Category].** Let  $\mathcal{C}$  be a category with an initial object, a **filtration** of an object  $X$  in  $\mathcal{C}$  is a family  $\mathcal{F} = (X_t)_{t \in \mathbb{R}}$  of subobjects of  $X$  indexed by  $\mathbb{R}$  that satisfies:

- (decreasing property) if  $s \leq t$ , then  $X_s \rightarrow X$  factors through  $X_t$ .
- (separation property) for sufficiently small  $t$ ,  $X_t$  is the initial object.

- (exhaustiveness) for sufficiently large  $s$ ,  $X_s = X$ .
- (right locally constant property) for any  $t \in \mathbb{R}$ , there exists  $\delta > 0$  that for any  $s \in [t, t + \delta)$ , the morphism  $X_t \rightarrow X_s$  are isomorphisms.
- (finite jump) the jump set of  $\mathcal{F}$  is finite.

Naturally, we define morphisms of filtrations.  $\lrcorner$

**Def. (4.3.3.2) [Pullback and Pushforward Filtrations].** Suppose fibered products exist in  $\mathcal{C}$ , for any morphism  $f : X \rightarrow Y$  and a filtration  $\mathcal{G} = (Y_t) \rightarrow Y$ , then the family  $f^*\mathcal{G} = (Y_t \otimes_Y X) \rightarrow X$  is a filtration on  $X$ , called the **pullback filtration**.

If  $f : X \rightarrow Y$  and  $\mathcal{F} = (X_t) \rightarrow X$  is a filtration on  $X$ , then if there is a filtration  $f_*\mathcal{F}$  on  $Y$  and a morphism of filtrations  $\mathcal{F} \rightarrow f_*\mathcal{F}$  compatible with  $f$ , then  $f_*\mathcal{F}$  is called the **pushforward filtrations**.  $\lrcorner$

## 4 Galois Categories

References are [Gro71, B-S15].

**Prop. (4.3.4.1) [Profinite Automorphism Groups].** For  $\mathcal{C} \in \mathbf{Cat}$  and  $F : \mathcal{C} \rightarrow \mathbf{Set}$ , the map

$$\mathrm{Aut}(F) \rightarrow \prod_{X \in \mathcal{C}} \mathrm{Aut}(F(X))$$

identifies  $\mathrm{Aut}(F)$  with a closed subset of  $\prod_{X \in \mathcal{C}} \mathrm{Aut}(F(X))$ . In particular, if  $\#F(X) < \infty$  for any  $X \in \mathcal{C}$ , then  $\mathrm{Aut}(F) \in \mathbf{ProfGrp}$ .  $\lrcorner$

*Proof:* Cf. [Sta]0BMR.  $\square$

**Prop. (4.3.4.2).** For  $G \in \mathbf{TopGrp}$ , consider  $\mathcal{C} = G\text{-finSet}$  and  $F : \mathcal{C} \rightarrow \mathbf{finSet}$  the forgetful functor, then  $\mathrm{Aut}(F)$  with the profinite topology defined in (4.3.4.1) is isomorphic to the profinite completion of  $G$ .  $\lrcorner$

*Proof:* Cf. [Sta]0BMU.  $\square$

**Prop. (4.3.4.3).** If  $G \in \mathbf{TopGrp}$  and  $F : G\text{-finSet} \rightarrow \mathbf{finSet}$  is an exact functor, then  $F$  is isomorphic to the forgetful functor.  $\lrcorner$

*Proof:* Cf. [Sta]0BMV.  $\square$

**Def. (4.3.4.4) [Galois-Categories].** A **Galois-category** is a pair  $(\mathcal{C}, F)$  where  $\mathcal{C} \in \mathbf{Cat}$  and  $F : \mathcal{C} \rightarrow \mathbf{finSet} \in \mathbf{Cat}$  s.t.

- $\mathcal{C}$  has finite limits and colimits,
- Each object of  $\mathcal{C}$  is a finite co-product of connected objects (4.1.1.21).
- $F$  reflects isomorphisms and is exact.

$\lrcorner$

**Prop. (4.3.4.5) [Properties of Galois-Categories].** If  $(\mathcal{C}, F)$  is a Galois-category (4.3.4.4) and  $X \rightarrow Y \in \mathbf{Cat}$ , then

- $F$  is faithful.
- $X \rightarrow Y$  is a monomorphism iff  $F(X) \rightarrow F(Y)$  is injective.

- $A \in \mathcal{C}$  is initial iff  $F(A) = \emptyset$ .
- $Z \in \mathcal{C}$  is final iff  $F(Z) = \text{pt.}$
- If  $X, Y$  are both connected objects(4.1.1.21), then  $X \rightarrow Y$  is an epimorphism.
- If  $X$  is a connected object and  $a, b : X \rightarrow Y \in \mathcal{C}$ , then  $a = b$  iff  $F(a)$  and  $F(b)$  agree on one element of  $F(X)$ .
- If  $X = \coprod_{i \in [n]_+} X_i$  and  $Y = \coprod_{j \in [m]_+} Y_j$  for  $m, n \in \mathbb{N}$  where  $X_i, Y_j$  are connected objects, then there exists a map  $\alpha : [n]_+ \rightarrow [m]_+$  s.t.  $X \rightarrow Y$  comes from a collection of maps  $X_i \rightarrow Y_{\alpha(i)}$ .

┘

**Def. (4.3.4.6) [Galois-Objects].** If  $(\mathcal{C}, F)$  is a Galois-category(4.3.4.4) and  $X \in \mathcal{C}$  is a connected object(4.1.1.21), then  $\# \text{Aut}(X) \leq \# F(X)$  by(4.3.4.5). We say  $X$  is a Galois-object if  $\# \text{Aut}(X) = \# F(X)$ , or equivalently  $\text{Aut}(X)$  acts transitively on  $F(X)$ .

┘

**Prop. (4.3.4.7) [Connected Objects Dominated by Galois-Objects].** If  $(\mathcal{C}, F)$  is a Galois-category(4.3.4.4) and  $X \in \mathcal{C}$  is a connected object(4.1.1.21), then there exists a Galois-object  $Y \in \mathcal{C}$ (4.3.4.6) with  $\text{Mor}(Y, X) \neq \emptyset$ .

┘

*Proof:* Cf.[Sta]0BN2.?

□

**Prop. (4.3.4.8).** If  $(\mathcal{C}, F)$  is a Galois-category(4.3.4.4) and  $X \in \mathcal{C}$  is a connected object(4.1.1.21), then the action of  $\text{Aut}(F)$  on  $F(X)$  is transitive.

┘

*Proof:* Cf.[Sta]0BN3.

□

**Prop. (4.3.4.9).** If  $(\mathcal{C}, F)$  is a Galois-category(4.3.4.4) and  $G = \text{Aut}(F)$  with the profinite topology defined as in(4.3.4.1), the functor  $F : \mathcal{C} \rightarrow G\text{-finSet}$  is an equivalence of categories.

┘

*Proof:* Cf.[Sta]0BN4.

□

**Prop. (4.3.4.10) [Exact Functors and Homomorphism of Automorphism Groups].** If  $(\mathcal{C}, F), (\mathcal{C}', F')$  are Galois-categories(4.3.4.4) and  $H : \mathcal{C} \rightarrow \mathcal{C}'$  is a category, then there exists an isomorphism  $t : F' \circ H \rightarrow F$ . The choice of  $t$  determines a continuous homomorphism  $h : \text{Aut}(F') \rightarrow \text{Aut}(F)$  and a 2-commutative diagram

$$\begin{array}{ccc} \mathcal{C} & \xrightarrow{H} & \mathcal{C}' \\ \downarrow & & \downarrow \\ \text{Aut}(F)\text{-finSet} & \xrightarrow{h} & \text{Aut}(F')\text{-finSet} \end{array}$$

And the map  $h$  is independent of  $t$  up to  $G$ -inner automorphisms.

Conversely, given a continuous homomorphism  $h : \text{Aut}(F') \rightarrow \text{Aut}(F)$ , there exists an exact functor  $H : \mathcal{C} \rightarrow \mathcal{C}'$  an isomorphism  $t$  recovering  $h$  as above.

┘

*Proof:* By(4.3.4.9), we may assume that  $\mathcal{C} = \text{Aut}(F)\text{-finSet}$  and  $\mathcal{C}' = \text{Aut}(F')\text{-finSet}$ . Then the existence of  $t$  follows from(4.3.4.3). The uniqueness of  $t$  up to  $G$ -inner automorphism is obvious. The final statement is also trivial.

□

## 5 Harder-Narasimhan Formalism

References are [Pot20].

**Def. (4.3.5.1) [Harder-Narasimhan Formalism].** A **Harder-Narasimhan formalism** consists of

- An exact category  $\mathcal{C}$  (4.8.2.1).
- A function  $\deg : \text{Ob}(\mathcal{C}) \rightarrow \mathbb{Z}$  that is additive w.r.t. short exact sequences.
- An exact faithful **generic fiber functor** to an Abelian category  $F : \mathcal{C} \rightarrow \mathcal{A}$  that induces for each object  $F : \mathcal{E} \in \mathcal{C}$  a bijection

$$\{\text{strict objects of } \mathcal{E}\} \cong \{\text{subobjects of } F(\mathcal{E})\}$$

where a **strict subobject** is an object that can be prolonged to an exact sequence.

- An additive function  $\text{rank} : \mathcal{A} \rightarrow \mathbb{N}$  on  $\mathcal{A}$  that  $\text{rank}(\mathcal{L}) = 0 \iff \mathcal{L} = 0$ , and its composition with  $F$  is also called rank.
- If  $u : \mathcal{E} \rightarrow \mathcal{E}'$  is a morphism in  $\mathcal{C}$  that  $F(u)$  is an isomorphism, then  $\deg(\mathcal{E}) \leq \deg(\mathcal{E}')$  with equality iff  $u$  is an isomorphism.

┘

**Cor. (4.3.5.2).**

- We are free to choose the "kernel" for  $u$  that  $F(u)$  is surjection.
- The subobjects of subobjects are subobjects, by axiom3.

┘

**Def. (4.3.5.3) [Saturation].** Let  $X'$  be a subobject of  $X$ , then we let  $\widetilde{X'}$  denote the strict subobject of  $X$  corresponding to the subobject  $F(X')$  of  $F(X)$ , called the **saturation** of  $X'$ . The saturation satisfies:

- 
- 
- 

┘

*Proof:* Cf. [Pot20]P3. □

**Prop. (4.3.5.4).** Every morphism  $f : X \rightarrow Y$  has a kernel and a image in  $\mathcal{C}$ , and  $0 \rightarrow \ker f \rightarrow X \rightarrow \text{Im } f \rightarrow 0$  is an exact sequence. ┘

*Proof:* Cf. [Pot20]P3. □

**Prop. (4.3.5.5) [HN-Formalism on the Category of Filtered Vector Spaces].** If  $L/K$  is a field extension, there is a category  $\text{Vect Fil}_{L/K}$  consisting of  $(V, \text{Fil}^\bullet)$  where  $V \in \text{Vect}_K$  and  $\text{Fil}^\bullet$  is a finite filtration on  $V \otimes_K L$ . It is an exact category by declaring exact sequences be those induce exact sequences on the gradeds.

The generic fiber functor is  $\text{Vect Fil}_{L/K} \rightarrow \text{Vect}_K : (V, \text{Fil}^\bullet) \mapsto V$ , and rank is as usual, the **Hodge-Tate degree** is defined to be

$$t_{\text{H-T}}((V, \text{Fil}^\bullet)) = \sum i \dim_L \text{gr}^i(V \otimes_K L).$$

This is a HN-filtration. ┘

*Proof:* The axioms can be directly checked, noticing that a subfiltration  $W_n$  of a filtration  $V_n$  is a strict object iff  $W_k = W_n \cap V_k$ .  $\square$

**Def. (4.3.5.6) [Slopes].** In a HN-formalism, the **slope** is defined to be  $\text{slope}(E) = \frac{\deg(E)}{\text{rank}(E)}$ .

$\mathcal{E}$  is called **semistable of slope**  $\lambda$  iff  $\text{slope}(\mathcal{E}) = \lambda$ , and  $\text{slope}(\mathcal{E}') \leq \lambda$  for any nonzero strict subobject  $\mathcal{E}' \subset \mathcal{E}$ .  $\lrcorner$

**Prop. (4.3.5.7).** If  $0 \rightarrow \mathcal{E}' \rightarrow \mathcal{E} \rightarrow \mathcal{E}'' \rightarrow 0$  be a short exact sequence in  $\mathcal{C}$ , then:

- If two of them have the same slope, then so does the third.
- If two of them have different slope, then we know the ordering of these slopes.

$\lrcorner$

*Proof:* Just notice that the degree and rank are all additive functions.  $\square$

**Prop. (4.3.5.8).** If  $\mathcal{E}$  is semistable of slope  $\lambda$ , then for any morphism  $u : \mathcal{E} \rightarrow \mathcal{E}''$  that  $F(u)$  is surjective,  $\mu(\mathcal{E}'') \geq \lambda$ .  $\lrcorner$

*Proof:* Take the kernel of  $F(u)$  in  $\mathcal{A}$ , which corresponds to a strict object  $\mathcal{E}'$  of  $\mathcal{E}$ , and  $0 \rightarrow \mathcal{E}' \rightarrow \mathcal{E} \rightarrow \mathcal{E}'' \rightarrow 0$  is exact, so we can use (4.3.5.19).  $\square$

**Cor. (4.3.5.9).** If  $\mathcal{E}, \mathcal{F}$  are semistable of slopes  $\lambda > \mu$ , then  $\text{Hom}_{\mathcal{C}}(\mathcal{E}, \mathcal{F}) = 0$ .  $\lrcorner$

*Proof:* Notice  $F$  is faithful.  $\square$

**Prop. (4.3.5.10) [Semistable Objects].** If  $f : \mathcal{E} \rightarrow \mathcal{F}$  be a map of vector bundles of the same slope  $\lambda$ , then  $\ker(f)$  and  $\text{Coker}(f)$  are all semistable vector bundles of slope  $\lambda$ , and if  $0 \rightarrow \mathcal{E}' \rightarrow \mathcal{E} \rightarrow \mathcal{E}'' \rightarrow 0$  is exact and  $\mathcal{E}', \mathcal{E}''$  are semistable of slope  $\lambda$ , then so does  $\mathcal{E}$ .  $\lrcorner$

*Proof:* Use  $F(f)$  to find the "coimage"  $A$  and the "image"  $B$  of  $f$ , then there is a map from  $F(A)$  to  $F(B)$  which is an isomorphism, but they have the same degree and rank, thus  $A \cong B$  by the last axiom. And the image must have slope  $\lambda$ . Then  $\ker(f), \text{Coker}(f)$  all can be defined, and they have the same slope  $\lambda$  by (4.3.5.19).

$\ker(f)$  is semistable because strict subobjects of  $\ker(f)$  are also strict subobjects of  $\mathcal{E}$  (4.3.5.2). And for  $\text{Coker}(f)$ , if it is not semistable, choose  $\overline{\mathcal{F}'} \subset \text{Coker}(f)$  that has slope  $> \lambda$ , let  $\mathcal{F}'$  be the inverse image, then  $0 \rightarrow \text{Im}(f) \rightarrow \mathcal{F}' \rightarrow \overline{\mathcal{F}'} \rightarrow 0$ , then by (4.3.5.19)  $\text{slope}(\mathcal{F}') > \lambda$ , contradicting the semi-stability of  $\mathcal{F}$ .

For the extension,  $\text{slope}(\mathcal{E}) = \lambda$  by (4.3.5.19), and for a strict subobject  $\mathcal{F}$  of  $\mathcal{E}$ , then we can find  $F', F''$  be strict objects of  $\mathcal{E}', \mathcal{E}''$  respectively that there is an exact sequence  $0 \rightarrow \mathcal{F}' \rightarrow \mathcal{F} \rightarrow \mathcal{F}'' \rightarrow 0$ ?, which shows  $\text{slope}(\mathcal{F}) \leq \lambda$ , so  $\mathcal{E}$  is semistable.  $\square$

### Harder-Narasimhan Filtration

**Lemma (4.3.5.11) [Final Subobjects of Maximal Slope].** Let  $X$  be an object of  $\mathcal{C}$  and  $X', X''$  its subobjects of maximal slope, then  $X' + X''$  and  $X' \cap X''$  are also of maximal slope.  $\lrcorner$

*Proof:* Cf. [Pot20] P8.  $\square$

**Def. (4.3.5.12).** Given an object  $X$  of  $\mathcal{C}$ , consider the following condition on a nonzero subobject  $X'$  of  $X$ :

For all subobjects  $X''$  of  $X$  properly containing  $X'$ ,  $\mu(X'') < \mu(X')$ .  $\lrcorner$

**Def. (4.3.5.13) [SCSS].** Let  $X'$  be a subobject of  $X$ , then the following conditions are equivalent:

- $X'$  satisfies condition (4.3.5.12) and is semistable.
- $X'$  satisfies condition (4.3.5.12) and is of maximal slope.
- $X'$  is the final object of  $X$  of maximal slope.

If  $X'$  satisfies these equivalent conditions and  $X' \neq X$ , then  $X$  is called a **strongly contradicting semi-stability** or SCSS of  $X$ .  $\lrcorner$

*Proof:* Cf. [Pot20]P8.  $\square$

**Prop. (4.3.5.14).** Every object  $X$  of  $\mathcal{C}$  admits a SCSS.  $\lrcorner$

**Def. (4.3.5.15) [Harder-Narasimhan Filtration].** Let  $\mathcal{E} \in \mathcal{C}$ , a chain of strict objects  $0 \subset \mathcal{E}_0 \subsetneq \mathcal{E}_1 \subsetneq \dots \subsetneq \mathcal{E}_m = \mathcal{E}$  is called a **Harder-Narasimhan filtration** iff each quotient  $\mathcal{E}_i/\mathcal{E}_{i-1}$  is semistable of slope  $\lambda_i$  and  $\lambda_1 > \lambda_2 > \dots > \lambda_m$ .  $\lrcorner$

**Prop. (4.3.5.16) [Faltings].** Every object  $\mathcal{E} \in \mathcal{C}$  has a unique functorial Harder-Narasimhan filtration.  $\lrcorner$

*Proof:* For uniqueness: if there are two filtrations, it suffices to show that  $\mathcal{E}'_1 = \mathcal{E}_1$ , because notice by (4.3.5.2)  $\mathcal{E}_i$  is a strict subobject of  $\mathcal{E}_j$  for any  $i < j$ , so we finish by induction on the length of the filtration and considering  $\mathcal{E}/\mathcal{E}_1$ .

For this, firstly  $\lambda_1 = \lambda'_1$ , suppose the contrary and  $\lambda_1 > \lambda'_1$ , then  $\lambda_1 > \lambda'_i$  for each  $i$ , so  $\text{Hom}(\mathcal{E}_1, \mathcal{E}'_i/\mathcal{E}'_{i-1}) = 0$  for each  $i$  by (4.3.5.32), so by induction  $\text{Hom}(\mathcal{E}_1, \mathcal{E}) = 0$ , contradiction.

Next by the same reason as in the proof above,  $\mathcal{E}_1 \hookrightarrow \mathcal{E}$  has image in  $\mathcal{E}'_1$ , and the reverse is true for  $\mathcal{E}'_1$ , so  $\mathcal{E}_1 \cong \mathcal{E}'_1$  in  $\mathcal{E}$ .

For existence: Use induction on  $\text{rank}(\mathcal{E})$ . If  $\mathcal{E}$  is semistable, then we finish. Otherwise, there is a strict subobject  $\mathcal{F}$  and  $0 \rightarrow \mathcal{F} \rightarrow \mathcal{E} \rightarrow \mathcal{G} \rightarrow 0$  that  $\text{slope}(\mathcal{F}) > \text{slope}(\mathcal{E})$ , so  $\text{rank}(\mathcal{F}), \text{rank}(\mathcal{G}) < \text{rank}(\mathcal{E})$ . Now by induction  $\mathcal{F}$  and  $\mathcal{G}$  has HN-filtration, thus by argument as above, we see that  $\mathcal{E}$  cannot have strict subobject with slope bigger than slopes appearing in the HN-filtration of  $\mathcal{F}, \mathcal{G}$ . So if we choose a strict subobject of  $\mathcal{E}_1$  of maximal rank among the strict subobjects of maximal slope, we claim the subobjects of  $\mathcal{E}/\mathcal{E}_1$  all have slopes smaller than  $\text{slope}(\mathcal{E}_1)$ : if some  $\text{slope}(\mathcal{G}) \geq \text{slope}(\mathcal{E}_1)$ , consider its inverse image  $\mathcal{G}'$ , then  $0 \rightarrow \mathcal{E}_1 \rightarrow \mathcal{G}' \rightarrow \mathcal{G} \rightarrow 0$ , thus  $\text{slope}(\mathcal{G}') \geq \text{slope}(\mathcal{E}_1)$  and has bigger rank, contradiction. So we can use induction on  $\mathcal{E}/\mathcal{E}_1$ .  $\square$

## HN-Polygons

### Harder-Narasimhan Categories

This subsection is unnecessary. Main references are [Harder-Narasimhan Categories]

**Def. (4.3.5.17) [Harder-Narasimhan Categories].** A **Harder-Narasimhan category** consists of a geometric exact category  $(\mathcal{C}, \mathcal{E}, A)$  (4.8.2.11) consists of

1. A function  $\deg : \text{Ob}(\mathcal{C}_A) \rightarrow \mathbb{R}$  that is additive w.r.t short exact sequences in  $\mathcal{E}_A$ .
2. A function  $\text{rank} : \text{Ob}(\mathcal{C}) \rightarrow \mathbb{N}$  on  $\mathcal{A}$  that is additive w.r.t short exact sequences in  $\mathcal{E}$ ,  $\text{rank}(X) = 0 \iff X = 0$ .

The **slope** of a nonzero object  $X$  is defined to be  $\mu(X) = \deg(X)/\text{rank } X$ . And  $\mathcal{X}$  is called **semistable of slope**  $\lambda$  iff  $\mu(X) = \lambda$ , and  $\mu(X') \leq \lambda$  for any nonzero geometric subobject  $X' \subset X$ .

And the category satisfies the following axiom:

- **NH:** For any nonzero geometric object  $X$ , there exists a geometric subobject  $X_{des} \subset X$  that

$$\mu(X_{des}) = \sup\{\mu(Y) | Y \text{ is a non-zero geometric subobject of } X\}$$

and moreover, any nonzero geometric subobject  $Z$  of  $X$  that  $\mu(Z) = \mu(X_{des})$  is a geometric subobject of  $X_{des}$ .

Notice that  $X_{des}$  is semistable and unique up to isomorphisms, called the **destablization** of  $X$ .  $\lrcorner$

**Cor. (4.3.5.18).** A geometric object of rank 1 is semistable.  $\lrcorner$

*Proof:* For any nonzero geometric subobject  $X' \subset X$ ,  $\text{rank } X' = \text{rank } X = 1$ , so  $\text{rank } X/X' = 0$  hence  $X/X' = 0$  and  $X' \cong X$ . Then clearly  $\mu(X') = \mu(X)$  and  $X$  is semistable.  $\square$

**Cor. (4.3.5.19).** If  $0 \rightarrow \mathcal{E}' \rightarrow \mathcal{E} \rightarrow \mathcal{E}'' \rightarrow 0$  be a short exact sequence in  $\mathcal{E}_A$ , then:

- If two of them have the same slope, then so does the third.
- If two of them have different slope, then we know the ordering of these slopes.

$\lrcorner$

*Proof:* Just notice that the degree and rank are all additive functions.  $\square$

**Prop. (4.3.5.20) [Abelian Categories as Harder-Narasimhan Categories].** Let  $(\mathcal{C}, \mathcal{E}, A)$  be a geometric exact category (4.8.2.11) with functions  $\deg$  and  $\text{rank}$  s.t.  $\mathcal{C} \in \mathcal{AbCat}$  and  $\mathcal{E}$  is the set of short exact sequences, then  $(\mathcal{C}, \mathcal{E}, A, \deg, \text{rank})$  is a Harder-Narasimhan category (4.3.5.17).  $\lrcorner$

*Proof:* We need to check HN: induct on  $\text{rank } X$ : The condition is clear when  $X$  is semistable, in particular when  $\text{rank } X = 1$  (4.3.5.18), and when  $X$  is not semistable, let  $Y$  be a geometric subobject of  $X$  that  $\mu(X') > \mu(X)$  and  $\text{rank } X'$  is maximal, then by induction hypothesis, there is a destablization  $Y_{des}$ , and we want to show  $X'_{des}$  is just  $X_{des}$ : Let  $Y$  be a nonzero geometric subobject of  $X$ . If  $Y$  is a geometric subobject of  $X'$ , then  $\mu(Y) \leq \mu(X'_{des})$ . If  $Y$  is not a geometric subobject of  $X'$ , then  $Y + X'$  is greater than  $X'$ , and  $\text{rank}(Y + X') > \text{rank } X'$ , so by maximality,  $\mu(Y + X') \leq \mu(X) < \mu(X')$ . Moreover, there is an exact sequence

$$0 \rightarrow Y \cap X' \rightarrow Y \oplus X' \rightarrow Y + X' \rightarrow 0$$

so

$$\begin{aligned} \deg Y &= \deg(Y \cap X') + \deg(Y + X') - \deg(X') \\ &< \mu(X'_{des}) \text{rank}(Y \cap X') + \mu(X')(\text{rank}(Y + X') - \text{rank}(X')) \\ &\leq \mu(X'_{des})(\text{rank}(Y \cap X') + \text{rank}(Y + X') - \text{rank}(X')) \\ &= \mu(X'_{des}) \text{rank}(Y). \end{aligned}$$

In particular, if  $\mu(Y) = \mu(X'_{des})$ , then  $Y$  must be a geometric subobject of  $X'$  hence a geometric subobject of  $X'_{des}$ . so HN holds for  $X$ .  $\square$

**Def. (4.3.5.21) [Harder-Narasimhan Filtration].** Let  $\mathcal{X}$  be a nonzero geometric object, a chain of admissible monomorphisms  $0 = X_0 \rightarrow X_1 \rightarrow \dots \rightarrow X_m = X$  is called a **Harder-Narasimhan filtration** of  $X$  iff each quotient  $\mathcal{E}_i/\mathcal{E}_{i-1}$  are all semistable of slope  $\lambda_i$  and  $\lambda_1 > \lambda_2 > \dots > \lambda_m$ , called the slopes associated to  $X$ .  $\lrcorner$

**Prop. (4.3.5.22) [Harder-Narasimhan Filtrations Exist].** Let  $(\mathcal{C}, \mathcal{E}, A, \deg, \text{rank})$  be a Harder-Narasimhan category (4.3.5.17), then the Harder-Narasimhan filtration exists for any nonzero geometric object  $X$ .  $\lrcorner$

*Proof:* We induct on the rank of  $X$ : if  $X$  is semistable, this is clear, so we are done in the case  $\text{rank } X = 1$  by (4.3.5.18). We choose  $X_1 = X_{des}$ , then  $X_{des}$  is semistable and  $X' = X/X_{des} \neq 0$ . Now  $\text{rank } X' < \text{rank } X$ , we can apply induction hypothesis to obtain a HN-filtration  $0 = X'_1 \xrightarrow{f'_1} X'_2 \rightarrow \dots \rightarrow X'_{n-1} \xrightarrow{f'_{n-1}} X'_n = X'$ . Now let  $X_i = X \times_{X'} X'_i$  (exists by Ex6(4.8.2.1)), then  $X_1 = X_{des}$ . Since  $X \rightarrow X'$  is an admissible epimorphism,  $X_i \rightarrow X'_i$  are also admissible epimorphisms, and there are Cartesian diagrams

$$\begin{array}{ccc} X_i & \xrightarrow{f_i} & X_{i+1} \\ \downarrow \pi_i & & \downarrow \pi_{i+1} \\ X'_i & \xrightarrow{f'_i} & X'_{i+1} \end{array}$$

and  $f_i$  are monomorphisms, so  $f_i$  is the kernel of  $X_{i+1} \rightarrow X'_{i+1}/X'_i$ , which is an admissible epimorphism, so  $f_i$  is admissible. There are natural isomorphisms  $\varphi_i : X_{i+1}/X_i \rightarrow X'_{i+1}/X'_i$  (Cf. [Harder-Narasimhan Filtrations]), and axiom A6(4.8.2.11) shows  $\varphi$  is compatible with the geometric structure, so  $X_{i+1}/X_i$  are all semistable, and notice

$$\mu(X_2/X_1) = \frac{\text{rank}(X_2)\mu(X_2) - \text{rank}(X_1)\mu(X_1)}{\text{rank}(X_2) - \text{rank}(X_1)} < \mu(X_1)$$

so  $0 \rightarrow X_1 \rightarrow X_2 \rightarrow \dots \rightarrow X_m = X$  is a HN-filtration for  $X$ .  $\square$

**Prop. (4.3.5.23) [HN-Formalism for Filtrations in an Abelian Category].** Let  $\mathcal{C}$  be an Abelian category and  $\mathcal{E}$  the set of all short exact sequences in  $\mathcal{C}$ ,  $A(X)$  is the set of isomorphism classes of filtrations on  $X$ , then  $(\mathcal{C}, \mathcal{E}, A)$  is a geometric exact category, by (4.8.2.15), given any additive rank function on  $\mathcal{C}$ , and define a degree function for any filtration  $\mathcal{F} = (X_\lambda)$  as

$$\deg(\mathcal{F}) = \int_{\mathbb{R}} \lambda d \text{rank } X_\lambda,$$

then  $\deg$  is additive w.r.t short exact sequences of filtrations, and  $(\mathcal{C}, \mathcal{E}, A, \deg, \text{rank})$  is a Harder-Narasimhan filtration.

Then a filtration is semistable iff it has only one jump. Then the HN-filtration of a filtration is just the jump set ordered decreasingly.  $\lrcorner$

**Prop. (4.3.5.24) [HN Formalism for Vector Spaces with Two Norms].** The vector spaces with two norms is a Harder-Narasimhan category, Cf. [Harder-Narasimhan Filtrations, P9].  $\lrcorner$

**Prop. (4.3.5.25) [HN-Formalism for Torsion-Free Sheaves].** The category of torsion-free sheaves on a geometrically normal projective variety of dimension  $d \geq 1$  over a field  $K$  is a Harder-Narasimhan category. Cf. [Harder-Narasimhan Filtrations, P10].  $\lrcorner$

**Prop. (4.3.5.26) [HH-Formalism for Hermitian Adelic Bundle].** Let  $K$  be a number field, then the category of Hermitian adelic bundle over  $K$  is a Harder-Narasimhan category. Cf. [Harder-Narasimhan Filtrations, P10].  $\lrcorner$

**Prop. (4.3.5.27) [HN Formalism for Filtered Vector Spaces Field].** If  $L/K \in \text{Field}$ , there is a category  $\text{FilVect}_{L/K}$  consisting of  $(V, \text{Fil})$  where  $V \in \text{Vect}/K$  and  $\text{Fil}$  is a (finite) filtration of vectors spaces over  $L$  on  $V \otimes_K L$  (4.3.3.1). It is a geometric exact category by (4.8.2.15) and a Harder-Narasimhan category by (4.3.5.20) where the rank is as usual, and the degree is defined to be

$$\deg((V, \text{Fil})) = \int_{\mathbb{R}} \lambda d \text{rank } V_\lambda \quad (4.3.5.23)$$

$\lrcorner$

### Slope Inequalities and Functoriality

**Def. (4.3.5.28) [Additional Conditions].** In this subsection, we assume the Harder-Narasimhan filtration satisfies the following axiom that is  $\lrcorner$

**Def. (4.3.5.29) [Slope Inequality Axioms].** To show the functoriality of the Harder-Narasimhan filtration, we need the following axiom:

- (SI): If  $X_1, X_2$  are two semistable geometric objects that  $\mu(X_1) > \mu(X_2)$ , then there are no non-zero morphism from  $X_1$  to  $X_2$  compatible with the geometric structures (4.8.2.12).  $\lrcorner$

**Prop. (4.3.5.30).** If SI holds, then  $\lrcorner$

**Prop. (4.3.5.31).** If  $\mathcal{E}$  is semistable of slope  $\lambda$ , then for any morphism  $u : \mathcal{E} \rightarrow \mathcal{E}''$  that  $F(u)$  is an isomorphism,  $\text{slope}(\mathcal{E}'') \geq \lambda$ .  $\lrcorner$

*Proof:* Take the kernel of  $F(u)$  in  $\mathcal{A}$ , which corresponds to a strict object  $\mathcal{E}'$  of  $\mathcal{E}$ , and  $0 \rightarrow \mathcal{E}' \rightarrow \mathcal{E} \rightarrow \mathcal{E}'' \rightarrow 0$  is exact, so we can use (4.3.5.19).  $\square$

**Cor. (4.3.5.32).** If  $\mathcal{E}, \mathcal{F}$  are semistable of slopes  $\lambda > \mu$ , then  $\text{Hom}_{\mathcal{C}}(\mathcal{E}, \mathcal{F}) = 0$ .  $\lrcorner$

**Prop. (4.3.5.33) [Semistable Vector Bundles Form a Weak Serre Subcategory].** If  $f : \mathcal{E} \rightarrow \mathcal{F}$  be a map of vector bundles of the same slope  $\lambda$ , then  $\ker(f)$  and  $\text{Coker}(f)$  are all semistable vector bundles of slope  $\lambda$ , and if  $0 \rightarrow \mathcal{E}' \rightarrow \mathcal{E} \rightarrow \mathcal{E}'' \rightarrow 0$  is exact and  $\mathcal{E}', \mathcal{E}''$  are semistable of slope  $\lambda$ , then so does  $\mathcal{E}$ .  $\lrcorner$

*Proof:* Use  $F(f)$  to find the "coimage"  $A$  and the "image"  $B$  of  $f$ , then there is a map from  $F(A)$  to  $F(B)$  which is an isomorphism, but they have the same degree and rank, thus  $A \cong B$  by the last axiom. And the image must have slope  $\lambda$ . Then  $\ker(f), \text{Coker}(f)$  all can be defined, and they have the same slope  $\lambda$  by (4.3.5.19).

$\ker(f)$  is semistable because strict subobjects of  $\ker(f)$  are also strict subobjects of  $\mathcal{E}$  (4.3.5.2). And for  $\text{Coker}(f)$ , if it is not semistable, choose  $\overline{\mathcal{F}'} \subset \text{Coker}(f)$  that has slope  $> \lambda$ , let  $\mathcal{F}'$  be the inverse image, then  $0 \rightarrow \text{Im}(f) \rightarrow \mathcal{F}' \rightarrow \overline{\mathcal{F}'} \rightarrow 0$ , then by (4.3.5.19)  $\text{slope}(\mathcal{F}') > \lambda$ , contradicting the semi-stability of  $\mathcal{F}$ .

For the extension,  $\text{slope}(\mathcal{E}) = \lambda$  by (4.3.5.19), and for a strict subobject  $\mathcal{F}$  of  $\mathcal{E}$ , then we can find  $F', F''$  be strict objects of  $\mathcal{E}', \mathcal{E}''$  respectively that there is an exact sequence  $0 \rightarrow \mathcal{F}' \rightarrow \mathcal{F} \rightarrow \mathcal{F}'' \rightarrow 0$ ?, which shows  $\text{slope}(\mathcal{F}) \leq \lambda$ , so  $\mathcal{E}$  is semistable.  $\square$

## 4.4 Topology I

References are [Mun00, Jec03, Mor19].

### Notation (4.4.0.1).

- Use notations on set theory defined in [Set Theory](#).
- Let  $X \in \mathcal{Top}$  (4.4.1.1).
- I usually use  $U \subset X$  to denote an open subset, and  $Z \subset X$  to denote a closed subset.

┘

### 1 Basics

**Def. (4.4.1.1) [Topological Spaces and Continuous Functions].** For  $X \in \mathcal{Set}$ , a **topology** on  $X$  is a subset  $\mathcal{T} \subset \mathcal{P}(X)$  s.t.

- $\emptyset \in \mathcal{T}, X \in \mathcal{T}$ .
- If  $\{U_\alpha\}_{\alpha \in I} \subset \mathcal{T}$ , then  $\cup_{\alpha \in I} U_\alpha \in \mathcal{T}$ .
- If  $U, V \in \mathcal{T}$ , then  $U \cap V \in \mathcal{T}$ .

A **topological space** is a pair  $(X, \mathcal{T})$  where  $X \in \mathcal{Set}$  and  $\mathcal{T} \subset \mathcal{P}(X)$  is a topology on  $X$ . Any element of  $\mathcal{T}$  is called an **open subset** of  $X$ .

For  $X, Y \in \mathcal{Top}$ , a map  $f : X \rightarrow Y$  is called a **continuous map** if for any open subset  $U \subset Y$ ,  $f^{-1}(U) \subset X$  is also open.

The category of topological spaces is denoted by  $\mathcal{Top}$ .

┘

**Prop. (4.4.1.2) [Kuratowski Closure Operators, Kuratowski [Kur66]].** For  $X \in \mathcal{Set}$ , a **Kuratowski closure operator** is a map  $\mathcal{P}(X) \rightarrow \mathcal{P}(X) : A \rightarrow A^*$  s.t.

- $\emptyset^* = \emptyset$ ,
- $A \subset A^*$  for any  $A \in \mathcal{P}(X)$ .
- $(A^*)^* = A^*$  for any  $A \in \mathcal{P}(X)$ .
- $(A \cup B)^* = A^* \cup B^*$  for any  $A, B \in \mathcal{P}(X)$ .

Then Given a Kuratowski operator on  $X$ ,  $\mathcal{T} = \{U \in \mathcal{P}(X) \mid (U^c)^* = U^c\}$  is a topology on  $X$  (4.4.1.1), and for any  $A \in \mathcal{P}(X)$ ,  $A^*$  is the closure of  $A$  in this topology.

┘

*Proof:* Clearly  $\emptyset, X$  are closed in this topology. If  $A, B \in \mathcal{P}(X)$  s.t.  $A^* = A, B^* = B$ , then  $(A \cup B)^* = A^* \cup B^* = A \cup B$  by hypothesis. If  $\{U_\alpha\}_{\alpha \in I} \subset \mathcal{P}(X)$  s.t.  $U_\alpha^* = U_\alpha$  for each  $\alpha \in I$ , then  $(\cap_\alpha U_\alpha)^* \subset U_\alpha^* = U_\alpha$  by item 4, thus  $(\cap_\alpha U_\alpha)^* \subset \cap_\alpha U_\alpha$ . But then we must have  $(\cap_\alpha U_\alpha)^* = \cap_\alpha U_\alpha$  by item 2.  $\square$

**Def. (4.4.1.3) [Limits].** For  $X \in \mathcal{Top}$ , and  $(x_n)_{n \in \mathbb{Z}} \subset X$ ,  $y \in X$  is called a **limit of sequence** if for any open subset  $U \subset X$ , there exists some  $N_U \in \mathbb{Z}_+$  s.t. for any  $N > N_U$ ,  $x_N \in U$ .

Let  $S \subset X$  be a subspace, then  $x \in X$  is called a **limit point** of  $S \subset X$  if for any open subset  $U \subset X$ ,  $(U \cap S) \setminus \{x\} \neq \emptyset$ .

$x \in X$  is called an **isolated point** of  $X$  if  $x$  is not a limit point of  $X \subset X$ . Equivalently,  $\{x\} \subset X$  is open. A closed subspace of  $X$  without isolated points is called a **perfect subspace**.

┘

**Def. (4.4.1.4) [Semi-continuous Functions].** A function from  $X \rightarrow [-\infty, \infty]$  is called **upper semi-continuous** iff  $f^{-1}([-\infty, a))$  are all open. It is called **lower semi-continuous** iff  $f^{-1}((a, \infty])$  are all open.

┘

**Def. (4.4.1.5) [Separable Topological Spaces].** A **separable topological space** is a topological space (4.4.1.1) it has a countable dense subset.  $\lrcorner$

**Def. (4.4.1.6) [Product Topology].** Arbitrary product exists in  $\mathcal{Top}$ , and it is constructed as follows: for a family of topology spaces  $(X_i)_I$ , the product  $\prod_I X_i$  is the set-theoretic product endowed with the topology generated by the basis  $\pi_i^{-1}(U_i)$  for  $U_i$  open in  $X_i$ .  $\lrcorner$

**Prop. (4.4.1.7) [Limits and Colimits].** Arbitrary limits and colimits exist in the category of topological spaces. The limits is given as a subspace of the product topology, and the colimits  $X = \text{colim } X_i$  is given a topology that  $U \subset X$  is open iff  $U \cap X_i$  is open for each  $i$ .  $\lrcorner$

**Prop. (4.4.1.8) [Pullback Space].** Let  $E \rightarrow X$  and  $f : X' \rightarrow X$  be maps of spaces, then there is a pullback map  $f^*E = E \times_X X' \rightarrow X'$ , called the **pullback space**.  $\lrcorner$

**Def. (4.4.1.9) [Quotient Topology].** Let  $f : X \rightarrow Y$  be a surjective map of spaces, and  $X$  has a topology, then we can define a **quotient topology** on  $Y$  that  $U \subset Y$  is open iff  $f^{-1}(U)$  is open in  $X$ . It has the universal property that any continuous map  $X \rightarrow Z$  that factors through  $f$  set-theoretically factors through  $f$  as a continuous map.

Such a map is called a **quotient map**.  $\lrcorner$

**Prop. (4.4.1.10).** A surjective open map  $\text{pr}$  is a quotient map.  $\lrcorner$

*Proof:* It is clearly that a subset  $U$  is open iff  $\text{pr}^{-1}(U)$  is open.  $\square$

**Def. (4.4.1.11) [Glueing Space].** Let  $A \subset X \in \mathcal{Top}$  and  $f : A \rightarrow Y \in \mathcal{Top}$ , then we have the glueing space  $Y \coprod_f X$ .  $\lrcorner$

**Def. (4.4.1.12) [Mapping Cylinder].** Let  $f : X \rightarrow Y$  be a map, then we define the **mapping cylinder**  $M(f) = Y \coprod_f X \times I$ , where  $X \times \{0\} \subset X \times I$  mapsto  $Y$  by  $f$ .  $\lrcorner$

**Def. (4.4.1.13) [Cone].** For  $X \in \mathcal{Top}$ , define the **cone over**  $X$  to be the space  $C(X) = (X \times I)/(X \times \{1\})$ . Notice that  $C(\emptyset) = \text{pt}$ .  $\lrcorner$

**Def. (4.4.1.14) [Mapping Cone].** Let  $f : X \rightarrow Y$  be a map, then we define the **mapping cone**  $C(f) = M(f)/X \times \{1\}$ .  $\lrcorner$

**Lemma (4.4.1.15).** If  $f : X \rightarrow Y$  is a surjective continuous map that  $f(E) \neq Y$  for any proper closed subspace of  $X$ , then for any  $U \subset X$  open,  $f(U) \subset \overline{Y \setminus f(X \setminus U)}$ .  $\lrcorner$

*Proof:* Take  $y \in f(U)$  and a nbhd  $V$  of  $y$  in  $Y$ , we show that  $V$  intersect  $Y \setminus f(X \setminus U)$ :  $W = U \cap f^{-1}(V)$  is nonempty, thus  $f(X \setminus W) \neq Y$ , take  $y' \in Y \setminus f(X \setminus W)$ , then it is clear  $y' \in Y \setminus f(X \setminus U)$ , and  $y' \in V$ .  $\square$

**Def. (4.4.1.16) [Locally Closed Subset].** A subset  $Z$  of  $X$  is called **locally closed** if for any  $z \in Z$ , there is a nbhd  $U$  of  $z$  in  $X$  that  $U \cap Z$  is closed in  $Z$ . Equivalently, a locally closed subset is the intersection of an open subset with a closed subset.  $\lrcorner$

*Proof:* An intersection of an open subset and a closed subset is clearly locally closed. Conversely, if  $Z$  is locally closed, we choose for each  $z \in Z$  a nbhd  $U_z$  that  $U_z \cap Z$  is closed in  $U_z$ , then we can show  $Z = \overline{Z} \cap \bigcup_z U_z$ . This is because if  $x \in \overline{Z} \cap \bigcup_z U_z$ , then  $x \in U_z$  for some  $z$ , and also  $x \in \overline{Z}$ , thus  $x$  is in  $Z$ .  $\square$

### Filter Langrange

**Def. (4.4.1.17) [Convergence and Filter].** For a filter  $\mathcal{F}$  on a topological space,  $\mathcal{F}$  **converges** to a point  $y$  iff any open set containing  $y$  is in  $\mathcal{F}$ .

If  $X$  is a set and  $Y$  is a topological space and  $X \rightarrow Y$  is a function, then  $y \in Y$  is a  **$\mathcal{F}$ -limit of  $f$**  if  $f_*\mathcal{F}$  converges to  $y$ .  $\lrcorner$

**Prop. (4.4.1.18) [Ultrafilter Convergence Theorem].** Let  $X, Y$  be a topological space, then:

1.  $Y$  is compact iff any ultrafilter on  $Y$  has a limit point.
2.  $Y$  is Hausdorff iff any ultrafilter on  $Y$  has at most one limit point.
3. a function  $f : X \rightarrow Y$  is continuous iff for any filter on  $X$  converging to  $x$ , the filter  $f_*(\mathcal{F})$  converges to  $y$ .

$\lrcorner$

*Proof:*

1. If  $Y$  is compact but every point is not a limit point, then for any  $x$ , there is an open set  $U_x$  that  $U_x \notin \mathcal{F}$ , but then f.m. of them covers  $Y$ , which is in  $\mathcal{F}$ , so one of them must be in  $\mathcal{F}$  by (2.2.10.7), contradiction.  
Conversely, if  $\cup_I U_i = X$  but no finite union of them cover  $X$ , then  $X - U_i$  satisfies the finite intersection property, so there is an ultrafilter containing all  $X - U_i$  by (2.2.10.4) and (2.2.10.5). Then clearly any point  $x$  is not a limit point of  $\mathcal{F}$ .
2. If  $Y$  is Hausdorff and  $x, y$  are both limit point of a filter  $\mathcal{F}$ , then there are two non-intersecting nbhd of them in  $\mathcal{F}$ , so its intersection  $\emptyset \in \mathcal{F}$ , contradiction.  
Conversely, if  $x, y$  are two point that their nbhds both intersect, then their nbhds together satisfies the finite intersection property, so there is an ultrafilter containing all of them, by (2.2.10.4) and (2.2.10.5), thus converging to both  $x$  and  $y$ .
3. This is an easy consequence considering the filter of all the nbhd containing  $x$ .

$\square$

### Connected Components

**Def. (4.4.1.19) [Connectedness].**  $X \in \mathcal{T}\text{op}$  is called **connected** if it satisfies: for any open subset  $U, V$  of  $X$  that  $U \cup V = X$  and  $U \cap V = \emptyset$ , either  $U = \emptyset$  or  $V = \emptyset$ .

$X$  is called **locally connected** if there is a basis of  $X$  consisting of connected open subsets of  $X$ .  $\lrcorner$

**Def. (4.4.1.20) [Path-Connectedness].** A space  $X$  is called **path-connected** if any two points of  $X$  can be connected by an arc.

$X$  is called **locally path-connected** if there is a basis of  $X$  consisting of path-connected open subsets of  $X$ .  $\lrcorner$

**Prop. (4.4.1.21).** If  $X$  is an ordered set with the least upper bound property and satisfies: for any  $x < y \in X$ , there exists  $z \in X$  s.t.  $x < z < y$ . Then  $X$  is connected, so are intervals and rays in  $X$ .  $\lrcorner$

*Proof:* Let  $Y$  be an interval or ray in  $X$ . Suppose for contradiction  $Y = A \amalg B$ , where  $A, B$  are open and non-empty in  $Y$ . Choose  $a \in A, b \in B$ , then  $[a, b] \subset Y$ . Let  $A_0 = A \cap [a, b]$  and  $B_0 = B \cap [a, b]$ , and  $c = \sup A_0 \in [a, b]$ .

Then  $c \notin B_0$ : If  $c \in B_0$ , then  $c \neq a$ , and because  $B_0$  is open, there exists some  $a \leq d < c$  s.t.  $(d, c] \subset B_0$ . So  $d$  is a smaller upper bound for  $A_0$ , contradiction.

And also  $c \notin A_0$ : If  $c \in A_0$ , then  $c \neq b$ , and because  $A_0$  is open, there exists some  $c < e \leq b$  s.t.  $[c, e) \subset A_0$ . Then by hypothesis, there exists  $z \in (c, e) \subset A_0$ , contradicting the fact  $c$  is an upper bound for  $A_0$ .

Then we derived a contradiction that  $c \notin Y$ , which proves  $Y$  is connected.  $\square$

**Def. (4.4.1.22) [Connected Components].** In a topological space  $X$ , if  $x \in X$ , the **connected component** of  $x$  is the maximal connected subspace of  $X$  containing  $x$ . The **path-connected component** of  $x$  is the maximal path-connected subspace of  $X$  containing  $x$   $\lrcorner$

**Prop. (4.4.1.23).**

- Any connected component of  $X$  is closed.
- If  $X$  is locally connected, then any connected component of  $X$  is clopen.
- If  $X$  is locally path-connected, then any path-connected component of  $X$  is open, and any connected component is also open.  $\lrcorner$

**Prop. (4.4.1.24) [Clopen Subsets and Connected Components].** Let  $X$  be a normal topological space and  $x \in X$ , then the connected component of  $X$  containing  $x$  is the intersection of clopen subsets containing  $x$ , denoted by  $A$ .  $\lrcorner$

*Proof:* Assume  $A$  splits into two components  $B, D$ . Since  $A$  is closed,  $B$  and  $D$  are both closed, because  $X$  is normal there are disjoint open neighborhoods  $U$  and  $V$  around  $B$  and  $D$ , respectively. The open sets  $U$  and  $V$  cover the intersection of all clopen neighborhoods of  $A$ , so cause  $X$  is compact, there must exist a finite number of clopen sets around  $A$ , say  $A_1, \dots, A_n$  such that  $U \cup V$  covers  $K = \bigcap_{i=1}^n A_i$ .

Note that  $K$  is clopen. We can assume that  $x \in U$ . It is not difficult to see that  $K \cap U$  is clopen and does not contain all of  $A$ , contradicting the definition of  $A$ .  $\square$

**Cor. (4.4.1.25).** For a compact Hausdorff topological space  $X$  and a point  $x \in X$ , the connected component of  $X$  containing  $x$  is the intersection of all compact open neighborhoods of  $x$ , because  $X$  is normal (4.4.7.6).  $\lrcorner$

**Def. (4.4.1.26) [Totally Disconnected Space].** A space is called **totally disconnected** iff any connected subset of  $X$  contains only one point.  $\lrcorner$

**Prop. (4.4.1.27).** A subspace of a totally disconnected space is totally disconnected, because totally disconnected is equivalent to the only connected subsets are pt sets.  $\lrcorner$

**Def. (4.4.1.28) [Cantor-Sets, Brouwer].** A **Cantor-set** is a nonempty, perfect, compact, metrizable and zero dimensional topological space. Equivalently, it is a topological space homeomorphic to the classical ternary Cantor-set.  $\lrcorner$

*Proof:*  $\square$

### Extremally Disconnected Space

**Def. (4.4.1.29) [Extremally Disconnected Space].** A topological space  $S$  is called **extremally disconnected** if the closure of any open subset of  $X$  is open.  $\lrcorner$

**Prop. (4.4.1.30).** Let  $X$  be an extremally disconnected space, If  $U, V$  are disjoint open subsets of  $X$ , then  $\overline{U}, \overline{V}$   $\lrcorner$

*Proof:* Because  $V \cap \overline{U} = \emptyset$ , thus similarly  $\overline{V} \cap \overline{U} = \emptyset$ .  $\square$

**Lemma (4.4.1.31).** Let  $f : X \rightarrow Y$  be a continuous surjective map of compact Hausdorff spaces that  $Y$  is extremally disconnected and  $f(Z) \neq Y$  for any proper closed subspace of  $X$ , then  $f$  is a homeomorphism.  $\lrcorner$

*Proof:* By (4.4.2.11) it suffices to show that  $f$  is injective. Suppose  $f(x) = f(x') = y$ , then choose disjoint nbhd  $U, U'$  of  $x, x'$ , and  $T = f(X \setminus U), T' = f(X \setminus U')$  closed in  $Y$ , then  $Y = T \cup T'$  and  $y$  is contained in the closure of  $Y \setminus T$  and  $Y \setminus T'$  by (4.4.1.15), but this contradicts (4.4.1.30).  $\square$

**Prop. (4.4.1.32) [Projective Spaces].** Compact Hausdorff extremally disconnected spaces are exactly the projective objects in the category of compact Hausdorff spaces.  $\lrcorner$

*Proof:* Assume  $X$  is projective, let  $U \subset X$  be open, and the complement by  $Z$ , then consider the surjection  $\overline{U} \amalg Z \rightarrow X$ , and let  $\sigma$  be the projection, then  $\sigma(U) \subset \overline{U}$ , thus  $\sigma^{-1}(\overline{U}) = \overline{U}$ , and it is open.

Conversely, if  $X$  is extremally disconnected, then by (4.4.2.13), there is a compact subset  $E \subset Y$  that  $f(E) = X$  and  $f(E') \neq X$  for all closed subspace  $E' \subset E$ . Then (4.4.1.31) says  $f|_E$  is a homeomorphism, and the inverse of it gives a desired section.  $\square$

**Prop. (4.4.1.33) [Gleason].** In an extremally disconnected space  $X$ , a convergent sequence is eventually constant. In particular,  $\mathbb{Z}_p$  is a profinite group that is not extremally disconnected.  $\lrcorner$

*Proof:* Cf. [Projective Topological Spaces]  $\square$

## 2 Compactness

**Def. (4.4.2.1) [Quasi-Compact Space].** A topological space is called **compact** or **quasi-compact** iff any open covering of it has a finite sub-covering. A subspace of a topological space is called **precompact** if its closure is compact.  $\lrcorner$

**Def. (4.4.2.2) [Quasi-Compact Morphism].** A map of topological spaces is called a **quasi-compact morphism** if the inverse image of any quasi-compact open subset is quasi-compact open.  $\lrcorner$

**Prop. (4.4.2.3) [Alexander Subbase Theorem].** A topological space is compact iff the closed subsets has the finite intersection property (2.2.10.3). In fact, it suffices to show that the family of complements of a subbasis of open sets has the finite intersection property.  $\lrcorner$

*Proof:* Cf. [Sta]08ZP.  $\square$

**Prop. (4.4.2.4).** Let  $X$  be a totally ordered set with the least upper bound property, then each closed interval of  $X$  is compact in the order topology. In particular, this applies to a complete totally ordered set  $X$  (2.2.3.22).  $\lrcorner$

*Proof:* Let  $a < b$  and  $\mathcal{U}$  a covering of  $[a, b]$ . We first show that for any  $x \in [a, b]$ , there exists some  $x < y \leq b$  that  $[x, y]$  can be covered by at most two elements of  $\mathcal{U}$ : If  $x$  has an immediate successor, then take  $y$  to be it. If  $x$  has no immediate successor, choose an element  $U$  of  $\mathcal{U}$  containing  $x$ , then  $U$  contains some  $[x, c)$ . Choose  $y \in [x, c)$ , then  $[x, y]$  is covered by a single element of  $\mathcal{U}$ .

Now let  $C$  be the set of points  $y \in (a, b]$  that  $[a, y]$  can be covered by f.m. elements of  $\mathcal{U}$ . We showed before this set is non-empty. Let  $c$  be the least upper bound of  $C$ , then  $a < c \leq b$ .

Next, we show  $c \in C$ : take an element  $U$  of  $\mathcal{U}$  containing  $c$ , then  $U$  contains some  $(d, c]$ . There must be some element of  $C$  lying in the interval  $(d, c]$ , otherwise  $d$  is an upper bound of  $C$ . Then  $[a, y]$  is covered by f.m. elements of  $\mathcal{U}$ , so  $c \in C$ .

Finally, we show  $c = b$ , but this is because otherwise we can find  $c < y \leq b$  that  $[c, y]$  is covered by 2 elements, thus  $y \in C$ , so  $y \leq c$ , contradiction.  $\square$

**Prop. (4.4.2.5) [Tychonoff].** An arbitrary direct product of compact topological spaces is compact.  $\lrcorner$

*Proof:* We prove the finite intersection property. If  $A$  is a family of subsets that any finite intersection of closure of them is nonempty, then consider a maximal family  $\mathfrak{D}$  of subsets containing  $A$  that any finite intersection of closures of them is nonempty, it exists by Zorn's lemma. Consider the projection of  $\mathfrak{D}$  onto a coordinate, then by Hypothesis, it has an intersection  $x_\alpha$ . Now we want to show  $x = (x_\alpha)$  belongs to each  $D \in \mathfrak{D}$ .

If  $U_\beta$  is any subbasis element containing  $x$ , then  $U_\beta$  intersect each  $\mathfrak{D}$  because  $x_\beta \in \pi_\beta(D)$ , so it is in  $\mathfrak{D}$ , by maximality of  $\mathfrak{D}$ . So the finite intersections are also in  $\mathfrak{D}$ , so all local basis of  $x$  are in  $\mathfrak{D}$ . This means that local basis intersect each element of  $\mathfrak{D}$ , that is, all closure of elements in  $\mathfrak{D}$  contains  $x$ .  $\square$

**Def. (4.4.2.6) [Sequentially Compact].** A subset  $A$  in a space  $X$  is called **sequentially compact** iff any sequence of points in  $A$  has a convergent subsequence in  $X$ . It is called **self sequentially compact** if it is sequentially compact in itself.  $\lrcorner$

**Prop. (4.4.2.7).**  $f : X \rightarrow Y$ ,  $X$  is compact and  $Y$  is Hausdorff, then for a descending chain  $Y_i$  of closed subsets of  $X$ ,

$$f\left(\bigcap_n Y_n\right) = \bigcap_n f(Y_n).$$

$\lrcorner$

*Proof:* The left side is compact, so if  $x \notin f(\bigcap_n Y_n)$ , there is a closed subsets  $x \in T$  that  $T \cap f(\bigcap_n Y_n) = \emptyset$ , so  $f^{-1}(T) \cap Y_n = \emptyset$ , so  $f^{-1}(T) \cap Y_n = \emptyset$  for some  $n$ , hence  $x \notin f(Y_n)$ .  $\square$

**Prop. (4.4.2.8) [Fixed Point Theorem].** If  $X$  is a compact metric space  $M$ ,  $T$  is a continuous map  $X \rightarrow X$  that  $d(x, y) < d(Tx, Ty)$ , then  $T$  has a unique fixed point in  $X$ .  $\lrcorner$

*Proof:* The uniqueness is obvious, for the existence, first notice  $T$  is obviously continuous, so consider  $d(x, Tx)$ , this is a continuous function on  $M$ , so it contains a minimum value, if it not 0, then  $d(Tx, T^2x) < d(x, Tx)$ , which is a contradiction.  $\square$

**Def. (4.4.2.9) [Proper Map].** A **proper map** is a continuous map s.t. the inverse image of compact subsets are compact.  $\lrcorner$

**Prop. (4.4.2.10).** If  $X$  is compact and  $Y$  is Hausdorff, then a continuous map  $f : X \rightarrow Y$  is proper.  $\lrcorner$

**Cor. (4.4.2.11).** A continuous bijective map from a compact space to a Hausdorff space is a homeomorphism.  $\lrcorner$

**Prop. (4.4.2.12) [Proper Continuous Maps Closed].** Let  $f : X \rightarrow Y$  be a proper continuous map with  $Y$  locally-compact Hausdorff, then  $f$  is a closed map.  $\lrcorner$

*Proof:* Let  $K \subset X$  closed, and  $y \in \overline{f(K)}$ . Choose precompact open nbhd  $U$  of  $y$ , then  $f^{-1}(\overline{U})$  is compact in  $X$ , so  $f(K \cap f^{-1}(\overline{U})) = f(K) \cap \overline{U}$  is compact and thus closed in  $Y$ . Then  $y \in f(K)$ , and  $f(K)$  is closed.  $\square$

**Lemma (4.4.2.13).** Let  $f : X \rightarrow Y$  be a continuous map of compact Hausdorff spaces, then there exists a smallest closed subset  $E$  of  $X$  that  $f(E) = Y$ .  $\lrcorner$

*Proof:* Use Zorn's lemma, noticing that the intersection of a chain of possible  $E_i$ s also maps to  $Y$ , by the intersection property (4.4.2.3).  $\square$

### Stone-Čech Compactification

**Def. (4.4.2.14) [Stone-Čech Compactification].** The **Stone-Čech Compactification**  $\beta$  is defined to be a functor from the category of sets to the category of compact Hausdorff space that is left adjoint to the forgetful functor.

The construction of  $\beta(X)$  is as follows:  $\beta X$  = the set of all ultrafilters on  $X$ , and the topology is generate by  $U_A = \{\mathcal{F} | A \in \mathcal{F}\}$  as a basis of clopen subsets. For a map  $f : X \rightarrow Y$ , the map  $\beta X \rightarrow \beta Y$  is given by  $f_*$ .  $\lrcorner$

*Proof:* First  $\beta X$  is a compact Hausdorff space: it is compact because if there are sets  $A_i$  that any ultrafilter contains at least one of them, then f.m. of them must cover  $X$ , otherwise  $X - A_i$  satisfies the finite intersection property thus is contained in some ultrafilter, by (2.2.10.4) and (2.2.10.5), contradiction, Then by (2.2.10.7) shows that any ultrafilter contains one of them. It is Hausdorff because for any two different ultrafilter, there must be an  $A$  that  $A \in \mathcal{F}_1$  and  $X - A \in \mathcal{F}_2$ .  $f_*$  is continuous because  $f^{-1}(U_A) = U_{f^{-1}(A)}$ .

Now for any map  $f : X \rightarrow Y$  where  $Y$  is a topological space, map an ultrafilter  $\mathcal{F}$  to the unique limit point of  $f_*\mathcal{F}$  in  $Y$  (existence and uniqueness by (4.4.1.18)). This map is continuous from  $\beta X$  to  $Y$  because for any open set  $V \subset Y$ ,  $U_{f^{-1}(V)}$  is mapped into  $V$ . And for any  $\beta X \rightarrow Y$  continuous, consider  $X \rightarrow Y$  which maps  $x$  to the image of the principle ultrafilter  $\mathcal{F}_x$  in  $Y$ .

This two map are mutually converses to each other, first for a  $f : X \rightarrow Y$ ,  $X \rightarrow \beta X \rightarrow Y$  is  $f$  itself, because the pushout of the principle ultrafilter clearly converges to  $f(x)$ . And for a  $\beta X \rightarrow Y$ , if  $\mathcal{F}$  doesn't map to  $\lim f_*\mathcal{F}$  but mapped to some  $t$ , then by definition, there is a nbhd  $U$  of  $t$  that  $f^{-1}(U) \notin \mathcal{F}$ , but by continuity, there is a  $\mathcal{F} \in U_B$  mapped into  $U$ . But then  $B \in f^{-1}(U)$ , otherwise if  $x \in B - f^{-1}(U)$ , then  $\mathcal{F}_x$  is mapped to  $U$ , contradiction, so  $f^{-1}(U)$  containing  $B$  is also in  $\mathcal{F}$ , contradiction.  $\square$

**Lemma (4.4.2.15).** In fact, the spaces in the image of the Stone-Čech compactification are all profinite spaces.  $\lrcorner$

*Proof:* As shown before, for any two different ultrafilter, there must be an  $A$  that  $A \in \mathcal{F}_1$  and  $X - A \in \mathcal{F}_2$ ,  $U_A$  is open and closed.  $\square$

**Prop. (4.4.2.16) [Stone Representation Theorem].** The Stone-Čech compactification  $\beta$  gives an equivalent of categories from the category of Boolean algebras to the category of profinite spaces.  $\lrcorner$

*Proof:*  $\beta B$  is a profinite space by lemma (4.4.2.15), and  $B$  can be recovered from  $\beta B$  as the Boolean algebra of all clopen subsets of  $\beta B$ , because  $\beta B$  is compact. This is a inverse isomorphism because ?  $\square$

**Prop. (4.4.2.17).** The Stone-Čech compactification of a set  $\beta S_0$  is extremally disconnected.  $\lrcorner$

*Proof:* We check condition (4.4.1.32): For any surjection  $S' \rightarrow \beta S_0$ , we may take a lift  $S_0 \rightarrow S$  arbitrarily, then by definition there is a morphism  $\beta S_0 \rightarrow S'$  extending this morphism. It is a section by the universal property.  $\square$

### Locally-Compact Space

**Def. (4.4.2.18) [Locally-Compact Space].** A Hausdorff space is called **locally-compact** if for any point  $x$ , there is a compact subset containing a nbhd of  $x$ .  $\lrcorner$

**Prop. (4.4.2.19).** If  $X$  is Hausdorff, then  $X$  is locally-compact iff for any  $x \in X$  and  $x \in U \subset X$  open, there exists a precompact nbhd  $V$  that  $x \in V \subset \bar{V} \subset U$ .  $\lrcorner$

*Proof:* One direction is trivial. For the other, for any  $x \in X$  and a nbhd  $U$  of  $x$ , let  $U_0$  be a precompact nbhd of  $X$ , then  $\bar{U}_0 \setminus U$  is closed thus compact and disjoint from  $x$ . Because  $X$  is Hausdorff, we can find a nbhd  $V'$  of  $x$  that  $\bar{V}'$  is disjoint from  $\bar{U}_0 \setminus U$ . Now let  $V = V' \cap U_0$ , then  $\bar{V} \subset \bar{U}_0$  is closed thus compact, and  $\bar{V} \subset \bar{V}' \cap \bar{U}_0 \subset U$ .  $\square$

**Cor. (4.4.2.20).** Open subsets and closed subsets of a locally-compact Hausdorff space  $X$  is locally-compact Hausdorff.  $\lrcorner$

*Proof:* If  $A \subset X$  is closed and  $x \in A$ , then there exists a precompact nbhd  $U$  of  $x \in X$ , then  $A \cap \bar{U}$  is closed in  $\bar{U}$  thus compact, and contains the nbhd  $U \cap A$  of  $x \in A$ , so  $A$  is locally-compact.

If  $A \subset X$  is open,  $x \in A$ , let  $x \in U \subset A$ , and  $U$  open in  $X$ , then we can apply (4.4.2.19) to find a precompact nbhd  $V$  that  $x \in V \subset \bar{V} \subset U$ , so  $A$  is locally-compact.  $\square$

**Prop. (4.4.2.21) [One-Point Compactification].** Let  $X$  be a space, then  $X$  is locally-compact Hausdorff iff there exists a compact Hausdorff space  $Y$  containing  $X$  s.t.  $Y \setminus X$  is a single point. Moreover, in this case,  $Y$  is unique up to homeomorphisms, called the **one-point compactification** of  $X$ .  $\lrcorner$

*Proof:* Cf. [Mun00]P183.  $\square$

**Cor. (4.4.2.22).** A space  $X$  is homeomorphic to an open subset of a compact open subspace iff it is locally-compact Hausdorff, by (4.4.2.21) and (4.4.2.20).  $\lrcorner$

**Prop. (4.4.2.23).** A locally-compact second countable Hausdorff space  $X$  has a countable basis consisting of precompact open subsets. In particular,  $X$  is  $\sigma$ -compact.  $\lrcorner$

*Proof:* Choose a countable basis  $\{U_n\}$  of  $X$ . For any  $x \in X$  and any nbhd  $U$  of  $x$ , there exists a precompact  $U_x \subset U$  containing  $x$  by (4.4.2.19). Then for some  $n(x)$ ,  $U_{n(x)} \subset U_x$  containing  $x$ , so  $U_{n(x)}$  is precompact. Thus the set of  $U_n$  that is precompact forms a countable basis of  $X$ .  $\square$

**Prop. (4.4.2.24).** If  $f : X \rightarrow Y$  is a quotient map and  $Z$  is locally-compact, then  $X \times Z \rightarrow Y \times Z$  is also a quotient map.  $\lrcorner$

*Proof:* Consider  $W$  as  $Y \times Z$  in the quotient map topology, then  $X \times Z \rightarrow W$  is continuous, which means  $X \rightarrow \text{Map}(Z, W)$  is continuous. But then  $Y \rightarrow \text{Map}(Z, W)$  is continuous because  $Y$  is a quotient map. Applying (4.4.3.7), we see  $Y \times Z \rightarrow W$  is continuous.  $W \rightarrow Y \times Z$  is continuous by quotient map hypothesis, so  $Y \times Z \cong W$ .  $\square$

### Compactly Generated Spaces

**Def. (4.4.2.25) [Compactly Generated Spaces].** A **compactly generated space** is a space that is the colimit of its compact Hausdorff subspaces. The category of compactly generated spaces is denoted by  $\mathcal{CG}$ .  $\lrcorner$

**Prop. (4.4.2.26).** For  $X \in \mathcal{CG}$  and  $Y \in \mathcal{Top}$ , a set-theoretical map  $f : X \rightarrow Y$  is continuous iff for any  $K \in \mathcal{Top}$  compact Hausdorff and a map  $i : K \rightarrow X$ , the composite map  $K \rightarrow Y$  is continuous.  $\lrcorner$

**Prop. (4.4.2.27) [Compact Generating Functor].** There is a **compact generating functor**  $(-)_c : \mathcal{Top} \rightarrow \mathcal{CG}$  right adjoint to the inclusion functor.  $\lrcorner$

*Proof:*  $k$  is constructed by  $X \mapsto \varinjlim_{K \subset X, K \text{ compact}} K$ . Notice  $X_c = X$  set-theoretically. It is easy to verify that if  $Y \in \mathcal{CG}$  and  $Y \rightarrow X$  is continuous, then the set-theoretical map  $Y \rightarrow X_c$  is also continuous. So  $(-)_c$  is right adjoint to the inclusion functor.  $\square$

**Cor. (4.4.2.28).**  $\mathcal{CG}$  is both complete and cocomplete, and the colimits coincide with colimits in  $\mathcal{Top}$ .  $\lrcorner$

**Cor. (4.4.2.29).**  $\mathcal{CG}$  is Cartesian closed (4.1.5.8).  $\lrcorner$

**Cor. (4.4.2.30).** The right adjoint to the Cartesian product is the compactification of the mapping space functor (4.4.3.1), by (4.4.3.6) and (4.4.2.27).  $\lrcorner$

**Prop. (4.4.2.31).** Locally compact Hausdorff topological spaces are compactly generated.  $\lrcorner$

*Proof:* For  $X \in \mathcal{Top}$ , if  $Z \subset X$  satisfies  $Z \cap K$  is closed for any compact Hausdorff subset  $K \subset X$ , for any  $x \in X$ , there exists a precompact nbhd  $U$  of  $x \in X$ , so  $Z \cap \overline{U}$  is closed, and  $Z \cap U$  is closed in  $U$ . Thus  $Z$  is closed in  $X$ .  $\square$

**Prop. (4.4.2.32).** Quotients and closed subspaces of a compactly generated space are compactly generated. Colimits of compactly generated spaces are compactly generated.  $\lrcorner$

*Proof:* These follow from (4.4.2.25).  $\square$

**Prop. (4.4.2.33).** If  $X \in \mathcal{CG}$  and  $Y$  is locally-compact Hausdorff, then  $X \times Y \in \mathcal{CG}$ .  $\lrcorner$

*Proof:* Notice by (4.4.3.7), a map  $X \times Y \rightarrow Z$  is continuous iff  $C \times Y \rightarrow Z$  is continuous for any compact Hausdorff subset  $C \subset X$ . The assertion is equivalent to  $X \times Y \rightarrow (X \times Y)_c$  is continuous, which is then equivalent to  $C \times Y \rightarrow (X \times Y)_c$  continuous for any compact subset  $C \subset X$ . But  $Y$  is compactly generated, and  $C$  is locally-compact, thus it suffices to show  $C \times C' \rightarrow (X \times Y)_c$  is continuous for any compact subset  $C' \subset Y$ . Then this is true because  $C \times C'$  is compact.  $\square$

## 3 Mapping Spaces

### Compact-Open Topology on Mapping Spaces

**Def. (4.4.3.1) [Compact-Open Topology].** The **compact-open topology** on a function space  $\text{Map}(X, Y)$  is a topology generated by the sets  $(K, U) = \{f : f(K) \subset U\}$ , where  $K$  is compact in  $X$  and  $U$  is open in  $Y$ .  $\lrcorner$

**Prop. (4.4.3.2).** For  $X' \rightarrow X, Y \rightarrow Y' \in \mathcal{Top}$ , the induced map  $\text{Map}(X, Y) \rightarrow \text{Map}(X', Y')$  is continuous. In particular, if  $X \cong X'$  and  $Y \cong Y'$ , then  $\text{Map}(X, Y) \cong \text{Map}(X', Y')$ .  $\lrcorner$

**Prop. (4.4.3.3).** If  $Y$  is compact and  $X$  a metric space, then the compact open topology on  $\text{Map}(Y, X)$  coincides with the uniform topology on functions.  $\lrcorner$

*Proof:* If  $f \in (K, U)$ , then  $f(K) \subset U$ , then there is a  $\varepsilon > 0$  that  $B(K, \varepsilon) \subset U$ , thus  $B(f, \varepsilon) \subset (K, U)$ .

For any  $f \in \text{Map}(Y, X)$ ,  $f(Y)$  is compact thus there are f.m. open balls  $B(f(y_i), \frac{\varepsilon}{3})$  that covers  $f(Y)$ . Now if  $K_i = \overline{f^{-1}(B(f(y_i), \frac{\varepsilon}{3}))}$ , then  $\cup K_i = Y$ , and  $f \in \cap_i (K_i, B(f(y_i), \frac{\varepsilon}{2}))$ . Also  $\cap_i (K_i, B(f(y_i), \frac{\varepsilon}{2})) \subset B(f, \varepsilon)$ , because for any  $g \in \cap_i (K_i, B(f(y_i), \frac{\varepsilon}{2}))$  and  $y \in K_i$ ,  $|f(y) - g(y)| \leq |f(y) - f(y_i)| + |f(y_i) - g(y)| < \frac{\varepsilon}{2} + \frac{\varepsilon}{2} = \varepsilon$ .  $\square$

**Def. (4.4.3.4)[Relative Maps].** Let  $A \subset X$  and  $B \subset Y$ , we denote by  $\text{Map}((X, A), (Y, B))$  the subspace of  $\text{Map}(X, Y)$  consisting of continuous functions  $f : X \rightarrow Y$  that map  $A$  into  $B$ .  $\lrcorner$

**Prop. (4.4.3.5)[Composition is Continuous].** For  $X, Y, Z \in \mathcal{T}\text{op}$ , if  $Y \in \text{LCH}$ , then the composition map

$$\text{Map}(Y, Z) \times \text{Map}(X, Y) \rightarrow \text{Map}(X, Z)$$

is continuous. In particular,  $\text{Map}(Y, Z) \times Y \rightarrow Z$  is continuous.  $\lrcorner$

*Proof:* For any compact  $K \subset X$ , open  $U \subset Y$  and  $g \circ f \in (K, U)$ ,  $f(K) \subset g^{-1}(U) \subset Y$ . Because  $Y$  is locally-compact, there is an precompact open subset  $V$  that  $f(K) \subset V \subset \overline{V} \subset g^{-1}(U)$ , then  $(\overline{V}, U) \times (K, V)$  maps into  $(K, U)$ .  $\square$

**Lemma (4.4.3.6)[Subbasis].** Let  $X$  be Hausdorff,  $W_\alpha$  be a subbasis of  $Y$ , then  $(K, W_\alpha)$  where  $K \subset X$  compact is a subbasis of  $\text{Map}(X, Y)$ .  $\lrcorner$

*Proof:* If  $f \in (K, U) \subset \text{Map}(X, Y)$ , let  $U = \bigcup_\beta U_\beta$ , where  $U_\beta = \bigcap_{j=1}^{k(\beta)} W_{\beta,j}$ . Now  $K \subset \bigcup_\beta f^{-1}(U_\beta)$ , because  $K$  is compact Hausdorff thus the partition of unity (4.4.7.8) gives us f.m. compact subsets  $K_1, \dots, K_n$  of  $K$  that  $K_i \subset f^{-1}(U_{\beta_i})$  for some  $\beta$ . Then

$$f \in \bigcap_{i=1}^n \bigcap_{j=1}^{k(\beta_i)} (K_i, W_{\beta_i,j}) = \bigcap_{i=1}^n (K_i, U_{\beta_i}) \subset (K, \bigcup_{i=1}^n U_{\beta_i}) \subset (K, U).$$

$\square$

**Prop. (4.4.3.7)[Adjointness of Mapping Space].** For  $Y \in \text{LCH}$ , then

$$\text{Map}(X \times Y, Z) \cong \text{Map}(X, \text{Map}(Y, Z))$$

as sets. And if moreover  $X$  is Hausdorff, then it is a homeomorphism.

In particular, the compact-open topology on  $\text{Map}(Y, Z)$  is the coarsest topology s.t.

$$\text{Map}(Y, Z) \times Y \rightarrow Z$$

is continuous.  $\lrcorner$

*Proof:* Let  $\varphi \in \text{Map}(X \times Y, Z)$ , for any  $x \in X$ , take  $\varphi(x) : Y \rightarrow Z : \varphi(x)(y) = \varphi(x, y)$ , then  $\varphi(x)$  is continuous, and  $\tilde{\varphi} : X \mapsto \text{Map}(Y, Z) : x \mapsto \varphi(x)$  is continuous: for any compact  $K \subset Y$  and open  $U \subset Z$ ,  $\tilde{\varphi}^{-1}((K, U)) = \{x \in X \mid \varphi(x \times K) \subset U\}$ , which is open.

Conversely, for any  $\psi : X \rightarrow \text{Map}(Y, Z)$ , let  $\tilde{\psi} : X \times Y \rightarrow Z$  be given by  $\tilde{\psi}(x, y) = \psi(x)(y)$ . Then  $\tilde{\psi}$  is continuous: For any open  $U \subset Z$ , if  $(x, y) \in \tilde{\psi}^{-1}(U)$ , then  $\psi(x)y \subset U$ . Because  $\psi(x)$  is continuous, there is a nbhd  $W$  of  $y \in Y$  that  $\varphi(x)(W) \subset U$ . Then because  $Y$  is locally-compact

Hausdorff, there is a precompact nbhd  $V$  of  $y \in Y$  that  $y \in V \subset \bar{V} \subset W$ . Then  $\psi^{-1}((\bar{V}, U))$  is a nbhd of  $x \in X$ , and  $(x, y) \in (\psi^{-1}((\bar{V}, U)), V) \subset \tilde{\psi}^{-1}(U)$ , thus  $\tilde{\psi}^{-1}(U)$  is open, and  $\tilde{\psi}$  is continuous.

Now let  $F : \varphi \mapsto \tilde{\varphi}$  and  $G : \psi \mapsto \tilde{\psi}$ , then we show  $F, G$  are both continuous: By (4.4.3.6),  $(K, (L, U))$  is a subbasis of  $\text{Map}(X, \text{Map}(Y, Z))$ .  $F$  is continuous because  $F((K \times L, U)) = (K, (L, U))$ .  $G$  is continuous because  $X \times Y$  is Hausdorff and for any  $J$  compact in  $X \times Y$ ,  $J \times J \xrightarrow{(\text{pr}_1, \text{pr}_2)} X \times Y$  is continuous, so for any  $U \subset Z$  open, there exists  $J_1 \subset X, J_2 \subset Y$  compact s.t.  $G((J_1, (J_2, U))) \subset (J, U)$ .  $\square$

**Cor. (4.4.3.8).** If  $Y$  is locally-compact and Hausdorff,  $A \subset X, B \subset Y, C \subset Z$ , then

$$\text{Map}((X \times Y, X \times B \cup A \times Y), (Z, C)) \cong \text{Map}((X, A), \text{Map}((Y, B), (Z, C)))$$

as sets, and if moreover  $X$  is Hausdorff, then it is a homeomorphism.  $\lrcorner$

**Def. (4.4.3.9) [Admissible Topology].** For  $X, Y \in \mathcal{T}\text{op}$ , an **admissible topology** on  $\text{Map}(X, Y)$  is a topology that makes the evaluation map  $e : \text{Map}(X, Y) \times X \rightarrow Y$  continuous.  $\lrcorner$

**Prop. (4.4.3.10).** The compact-open topology on  $\text{Map}(X, Y)$  is coarser than admissible topology on it (4.4.3.9). And if  $X$  is locally-compact Hausdorff, then it is admissible.  $\lrcorner$

*Proof:* It suffices to show any  $(K, U)$  is open in  $\text{Map}(X, Y)$ . Let  $f \in (K, U)$ , then for any  $x \in K$ ,  $e(f, x) \in U$ , thus there is a nbhd  $U_x$  of  $f$  and a nbhd  $W_x$  of  $x$  that  $e(U_x \times W_x) \subset U$ . Now because  $K$  is compact, we can choose a nbhd  $V$  of  $f$  that  $e(V \times K) \subset U$ . Thus  $f \in V \subset (K, U)$ , and  $(K, U)$  is open in  $\text{Map}(X, Y)$ . If  $Y$  is locally-compact Hausdorff, then  $\text{Map}(Y, Z) \times Y \rightarrow Z$  continuous by applying (4.4.3.5) with  $X = \text{pt}$ .  $\square$

### Mapping Spaces in $\mathcal{CG}$

**Def. (4.4.3.11) [Mapping Spaces].** For  $X, Y \in \mathcal{CG}$ , the mapping space  $\text{Map}_c(X, Y)$  is the compact generation (4.4.2.27) of the space of continuous functions from  $X$  to  $Y$  with the topology generated by the sets  $(K, U) = \{f : f(i(K)) \subset U\}$ , where  $K$  is a compact Hausdorff space,  $i : K \rightarrow X$  and  $U$  is open in  $Y$ .  $\lrcorner$

**Prop. (4.4.3.12).** For  $X' \rightarrow X, Y \rightarrow Y' \in \mathcal{CG}$ , the induced map  $\text{Map}_c(X, Y) \rightarrow \text{Map}_c(X', Y')$  is continuous. In particular, if  $X \cong X'$  and  $Y \cong Y'$ , then  $\text{Map}_c(X, Y) \cong \text{Map}_c(X', Y')$ .  $\lrcorner$

**Lemma (4.4.3.13) [Evaluations are Continuous].** For  $X, Y \in \mathcal{CG}$ , the composition map

$$\text{Map}_c(Y, X) \times_c Y \rightarrow X$$

is continuous.  $\lrcorner$

*Proof:* It suffices to prove that for any compact Hausdorff space  $K, F$  mapping into  $\text{Map}(Y, X), Y$ ,  $K \times F \rightarrow X$  is continuous: For  $(f_0, y) \in \text{Map}_c(Y, X) \times_c Y$  and  $f_0(y) \in U$ , as  $f_0$  is continuous, there exists a nbhd  $N$  of  $y \in Y$  s.t.  $f_0(\overline{N \cap F}) \subset U$ , and then  $(f_0, y) \in (K \cap (\overline{N \cap F}, U), N \cap F)$  is mapped into  $U$ .  $\square$

**Prop. (4.4.3.14) [Adjointness of Mapping Space].** For  $X, Y, Z \in \mathcal{CG}$ , there is a natural homeomorphism

$$\text{Map}_c(X \times_c Y, Z) \cong \text{Map}_c(X, \text{Map}_c(Y, Z))$$

$\lrcorner$

*Proof:* Let  $\varphi \in \text{Map}_c(X \times_c Y, Z)$ , for any  $x \in X$ , take  $\varphi(x) : Y \rightarrow Z : \varphi(x)(y) = \varphi(x, y)$ , then  $\varphi(x)$  is continuous, and  $\tilde{\varphi} : X \mapsto \text{Map}(Y, Z) : x \mapsto \varphi(x)$  is continuous: if  $\varphi(x) \in (K, U)$ ,  $\tilde{\varphi}^{-1}((K, U)) = \{x \in X | \varphi(x \times i(K)) \subset U\}$ , which is open.

To prove this construction is continuous, notice we have already seen that if  $f : X \times_c Y \rightarrow Z$  is continuous then  $f : Y \rightarrow \text{Map}_c(X, Z)$  is continuous. Apply this to

$$\text{Map}_c(Y \times_c X, Z) \times_c Y \times_c X \rightarrow Z$$

we see that

$$X \times_c \text{Map}_c(Y \times_c X, Z) \rightarrow \text{Map}_c(Y, Z)$$

is continuous, and

$$\text{Map}_c(Y \times_c X, Z) \rightarrow \text{Map}_c(X, \text{Map}_c(Y, Z))$$

is continuous. Similarly, as

$$\text{Map}_c(X, \text{Map}_c(X, Z)) \times_c Y \times_c X \rightarrow Z$$

is continuous, we get

$$\text{Map}_c(X, \text{Map}_c(Y, Z)) \rightarrow \text{Map}_c(X \times_c Y, Z)$$

is continuous, and it is clearly the inverse to the construction above.  $\square$

**Cor. (4.4.3.15).** For  $X, Y, Z \in \mathcal{CG}$ ,  $A \subset X, B \subset Y, C \subset Z$ , then there is a natural homeomorphism

$$\text{Map}((X \times Y, X \times B \cup A \times Y), (Z, C)) \cong \text{Map}((X, A), \text{Map}((Y, B), (Z, C)))$$

$\lrcorner$

**Cor. (4.4.3.16).** products in  $\mathcal{CG}$  commute with colimits.  $\lrcorner$

**Cor. (4.4.3.17) [Compositions are Continuous].** For  $X, Y, Z \in \mathcal{CG}$ , the composition map

$$\text{Map}_c(Y, Z) \times_c \text{Map}_c(X, Y) \rightarrow \text{Map}_c(X, Z)$$

is continuous.  $\lrcorner$

*Proof:* It suffices to show that

$$\text{Map}_c(Y, Z) \times_c \text{Map}_c(X, Y) \times_c X \rightarrow Z$$

is continuous, and this follows from (4.4.3.13).  $\square$

### Construction of Spaces

**Def. (4.4.3.18) [Path Spaces].** For  $f : A \rightarrow B \in \mathcal{T}\text{op}$ , let  $E_f$  be the subspace of  $A \times \text{Map}(I, B)$  consisting of pairs  $(a, \gamma)$  that  $\gamma(0) = a$ .

The fibers of  $E_f \rightarrow B$  are called **homotopy fibers** of  $f$ .  $\lrcorner$

**Def. (4.4.3.19) [ $n$ -Loop Space].** The  $n$ -loop space of  $X$  is defined to be  $\Omega^n(X, x_0) = M(I^n, \partial I^n; X, x_0)$ . Then by (4.4.3.8) we have

$$\Omega(\Omega^n(X, x_0), \tilde{x}_0) \cong \Omega^{n+1}(X, x_0).$$

$\lrcorner$

**Prop. (4.4.3.20) [Loop spaces are Homotopy Fibers].** Let  $f : x_0 \rightarrow B$  be a point, then  $E_f$  is the **path space**  $PB$  of all paths starting from  $x_0$ , and the homotopy fiber over  $x_0$  is just the loop space  $\Omega(X, x_0)$ .  $PB$  is contractible, with the contraction given by  $H : PB \times I \rightarrow PB : \gamma_t(x) = \gamma(tx)$ .  $\lrcorner$

## 4 Profinite Spaces

**Def. (4.4.4.1) [Profinite Spaces].** A topological space is called a **profinite space** if it is a cofiltered limit of finite discrete topological spaces. The category of profinite spaces is denoted by  $\mathcal{P}\text{rof}$ .

A profinite space is the same thing as a totally disconnected, compact Hausdorff topological space. Thus a closed subspace of a profinite space is profinite.  $\lrcorner$

*Proof:* The profinite spaces are clearly totally disconnected, compact Hausdorff (by Tychonoff).

Conversely, if it is totally disconnected and compact Hausdorff, let  $\mathcal{I}$  be the set of clopen decompositions  $X = \coprod_I U_i$  of  $X$ , then for each  $I \subset \mathcal{I}$ , there is a map  $X \rightarrow I$ , and there is a partial order on the decompositions of  $X$ . We show that the map  $X \rightarrow \lim_{I \subset \mathcal{I}} I$  is a homeomorphism. It is injective by (4.4.1.26)(4.4.1.24)(4.4.7.6). It is surjective by compactness of  $X$ , and it is clearly open, thus homeomorphism by (4.4.2.11).  $\square$

**Cor. (4.4.4.2).** A cofiltered limit of profinite spaces is profinite.  $\lrcorner$

**Prop. (4.4.4.3).** Any open covering of a profinite space has a clopen disjoint subcover.  $\lrcorner$

*Proof:* By (4.4.4.1), we may assume that  $X = \lim_{i \in I} X_i$ , where  $X_i$  is finite. Let  $f_i$  be the projection, as the limit is filtered, a fundamental family of nbhds of a point  $(x_i)_{i \in I}$  is  $\{f_j(x_j)\}_{j \in I}$ . Then for each covering, we may assume it is finite  $X = \cup_{i \in I} f_i^{-1}(x_i)$ , choose a  $j > i$  for each  $i$ , as  $I$  is cofiltered, then  $X = \coprod_{x \in X_j} f_j^{-1}(x)$  satisfies the desired property.  $\square$

**Prop. (4.4.4.4).** If  $X$  is quasi-compact and any connected component of  $X$  is the intersection of clopen sets containing it (e.g.  $X$  is normal (4.4.1.24)), then  $\pi_0(X)$  is a profinite space.  $\lrcorner$

*Proof:*  $\pi_0(X)$  is an image of  $X$ , so it is quasi-compact, also it is clearly totally disconnected. To show it is Hausdorff, let  $C, D$  be disjoint connected components of  $X$ , then  $C = \cap U_\alpha$ , where  $U_\alpha$  are clopen. Since  $C \cap D = \emptyset$ ,  $U_\alpha \cap D = \emptyset$  for some  $\alpha$ . and then the image of  $U_\alpha$  separates  $C$  and  $D$  in  $\pi_0(X)$ .  $\square$

### Locally Profinite Space

**Def. (4.4.4.5) [Locally Profinite Space].** A **locally profinite space** is a totally disconnected, locally-compact Hausdorff topological space. The category of locally profinite space is denoted by  $\text{loc}\mathcal{P}\text{rofSpa}$ .  $\lrcorner$

**Prop. (4.4.4.6).** A locally closed subsets of a locally profinite space is locally profinite. And compact subsets are profinite.  $\lrcorner$

*Proof:* Closed subsets are clearly locally profinite, for the open subsets, it is also locally-compact.  $\square$

**Cor. (4.4.4.7).** Any open covering of a compact subsets of a locally profinite space has an clopen disjoint subcover, by (4.4.4.3).  $\lrcorner$

**Prop. (4.4.4.8).** The set of all compact open subsets form a basis of the topology of  $G$ .  $\lrcorner$

**Prop. (4.4.4.9).** If  $X \in \text{loc}\mathcal{P}\text{rofSpa}$  and  $K$  is a compact subspace of  $X$ . Let  $K \subset \cup U_\alpha$  be an open covering, then there exist f.m. disjoint open compact subsets  $V_i \subset X$  that each  $V_i \cap K \subset U_\alpha$  for some  $\alpha$ , and  $K \subset \cup V_i$ .  $\lrcorner$

*Proof:* Because  $K$  is profinite (4.4.4.6), (4.4.4.3) shows there is a finite disjoint compact open subcover  $W_i$  of  $U_\alpha$ , then  $W_i = V_i \cap K$  for  $V_i$  compact, and using compactness of  $W_i$ , we can assume  $V_i$  is compact. Finally to make  $V_i$  disjoint, we can let  $V_i = V_i \setminus (\cup_{k=1}^{i-1} V_k)$ .  $\square$

### Structure Sheaves and Distributions

References are [Representations of the Group  $\mathrm{GL}(n; F)$  over Local Fields, Bernstein-Zelevinsky] and [Representation of  $p$ -adic Groups, Bernstein].

**Notation (4.4.4.10).**

- Use notations on sheaf theory defined in ?.

┘

**Def. (4.4.4.11) [Structure Sheaves and Distributions].** For  $X \in \mathrm{locProfSpa}$ , the structure sheaf  $C_X^\infty$  on  $X$  is defined to be the locally constant sheaf  $\underline{\mathbb{Z}}$  on  $X$ .

The space  $C_c^\infty(X)$  of **test functions** (or **smooth functions**) on  $X$  is the set of locally constant continuous functions with compact supports.

For  $W \in \mathcal{Ab}$ , the space of  $(W$ -valued) **distributions (profinite)** on  $X$  with values in  $W$  is defined to be  $\mathrm{Dist}(X, W) \triangleq \mathrm{Hom}(C_c^\infty(X), W)$ . And denote  $\mathrm{Dist}(X) = \mathrm{Dist}(X, \mathbb{C})$ .

More generally, if  $\mathcal{F}$  is a  $C_X^\infty$ -sheaf, then the space of **distributions on  $\mathcal{F}$**  on  $X$  valued in  $W$  is defined to be  $\mathrm{Dist}(X, \mathcal{F}; W) \triangleq \mathrm{Hom}(\Gamma_c(X, \mathcal{F}), W)$ . ┘

**Prop. (4.4.4.12) [Distributions, Bernstein-Zelevinsky[B-Z76]].** If  $X \in \mathrm{locProfSpa}$ ,  $\mathcal{F} \in \mathrm{Mod}(C_X^\infty)$ ,  $W \in \mathcal{Ab}$ , then for any open subset  $U \subset X$  and  $Z = X \setminus U$ , there is an exact sequence:

$$0 \rightarrow \Gamma_c(U, \mathcal{F}; W) \rightarrow \Gamma_c(X, \mathcal{F}; W) \rightarrow \Gamma_c(Z, \mathcal{F}; W) \rightarrow 0.$$

thus also an exact sequence:

$$0 \rightarrow \mathrm{Dist}(Z, \mathcal{F}; W) \rightarrow \mathrm{Dist}(X, \mathcal{F}; W) \rightarrow \mathrm{Dist}(U, \mathcal{F}; W) \rightarrow 0.$$

In particular, there is an exact sequence

$$0 \rightarrow \mathrm{Dist}(Z) \rightarrow \mathrm{Dist}(X) \rightarrow \mathrm{Dist}(U) \rightarrow 0.$$

┘

*Proof:* The left exactness is clear. To show the right surjectivity, let  $f \in \Gamma_c(Z, \mathcal{F})$ , then for each  $x \in \mathrm{Supp}(f)$ , there is a compact open nbhd  $U_x$  that  $f$  restricts to an element of  $\Gamma(U_x, \mathcal{F})$ . Then these  $U_x$  cover  $\mathrm{Supp}(f)$ , then by (4.4.4.7), there is a disjoint finite cover  $\{U_i\}$  of  $\mathrm{Supp}(f)$  that  $f$  are induced by  $f_i \in \Gamma(U_i, \mathcal{F})$ . Now we can replace  $U_i$  by  $U_i \setminus \bigcup_{j < i} U_j$  to let  $U_i$  be disjoint, then  $f$  extends to an element of  $\bigcup U_i$ .  $\square$

**Prop. (4.4.4.13).** If  $X, Y$  are both locally profinite, then

$$C_c^\infty(X \times Y) = C_c^\infty(X) \otimes C_c^\infty(Y)$$

┘

*Proof:* Because the subspaces of the form  $U \times V$  for  $U, V$  open form a subbasis of  $X \times Y$ , so any compact open subset of  $X \times Y$  is a disjoint union of sets of the form  $U \times V$ .  $\square$

**Def. (4.4.4.14) [Cosmooth  $C_c^\infty(X)$ -Modules].** A **cosmooth  $C_c^\infty(X)$ -module** is a  $C_c^\infty(X)$ -module  $M$  that for any  $m \in M$ , there exists some compact open  $U \subset X$  that  $m = \chi_U m$ . ┘

**Prop. (4.4.4.15) [Cosmooth  $C_c^\infty(X)$ -Module and  $C^\infty(X)$ -Sheaves].** Let  $\mathcal{F}$  be a  $C_X^\infty$ -sheaf on  $X$ , then the space  $\Gamma_c(X, \mathcal{F})$  is a cosmooth  $C_c^\infty(X)$ -module (4.4.4.14), and this defines an equivalence of categories between the category of non-degenerate  $C_c^\infty(X)$ -modules and  $C^\infty(X)$ -sheaves.

Notice that in this case, a  $C_c^\infty(X)$ -module  $M$  being non-degenerate is equivalent to: for any  $m \in M$ , there is a compact open subset  $U$  that  $\chi_U m = m$ .  $\lrcorner$

*Proof:* For any non-degenerate  $C_c^\infty(X)$ -module  $M$ , define a sheaf  $\mathcal{F}_M$  of the compatible stalks in  $\prod_{x \in X} M/M(x)$ , where

$$M(x) = \{m \in M \mid \chi_U m = 0 \text{ for some } x \in U\}.$$

Then we show these two functors are inverse to each other: One direction is clear, as the sheaf  $\mathcal{F}$  is just the sheaf of compatible stalks in  $\prod_{x \in X} \mathcal{F}_x$ , and it is easy to see  $\mathcal{F}_x \cong M/M(x)$ . For the other direction, any element in  $\Gamma_c(X, \mathcal{F}_M)$  is induced from  $f_i \in \Gamma(U_i, \mathcal{F}_M)$ , where  $U_i$  are pairwise disjoint compact open subsets, by (4.4.4.7), and it is easy to see  $\Gamma(U_i, \mathcal{F}_M) = \chi_U M$ . Thus  $\Gamma_c(X, \mathcal{F}_M) = C_c^\infty(X)M$ , and the non-degeneracy of  $M$  shows  $\Gamma_c(X, \mathcal{F}_M) \cong M$ .  $\square$

**Remark (4.4.4.16).** Notice that  $M(x)$  can be equivalently defined to be the space spanned by the elements

$$\{gm \mid g \in C_c^\infty(X), g(x) = 0, m \in M\}.$$

$\lrcorner$

## 5 Real Numbers

References are [Mun00].

### Topology

**Prop. (4.4.5.1) [ℝ is Connected].** ℝ is connected, and so are intervals and rays in ℝ.  $\lrcorner$

*Proof:* This follows from (4.4.1.21), as the hypothesis is satisfied by (2.2.9.1) and the fact for any  $a < b \in \mathbb{R}$ ,  $a < \frac{a+b}{2} < b$ .  $\square$

**Prop. (4.4.5.2).**  $\mathbb{R}^n$  satisfies the Heine-Borel property (4.4.8.7), i.e. bounded closed sets are compact.  $\lrcorner$

*Proof:* It suffices to consider the square metric. If  $A$  is bounded, then  $A$  is in  $[-N, N]^n$  for some number  $N$ .  $[-N, N]^n$  is compact by (4.4.2.4) and (4.4.2.5).  $\square$

**Prop. (4.4.5.3).** Let  $I = [a, b] \subset \mathbb{R}$  be a closed interval and  $F : I \rightarrow \mathbb{R}$  a continuous function s.t.  $I \subset F(I)$ , then there exists  $x \in I$  s.t.  $F(x) = x$ .  $\lrcorner$

*Proof:* Let  $F(c) = a, F(d) = b$ , then  $c \geq a$  and  $d \leq b$ . So  $F(c) \leq c, F(d) \geq d$ . And then the fact that  $\mathbb{R}$  is connected implies that there exists  $x \in I$  s.t.  $F(x) = x$ .  $\square$

### Borel Set

**Def. (4.4.5.4).** Let  $U$  be an ultrafilter on a set  $I$  and  $\{a_I\}$  be a bounded sequence of real numbers. Then a number  $a$  is called the  $U$ -limit of  $\{a_I\}$  is for every  $\varepsilon > 0, \{i \in I \mid |a_i - a| < \varepsilon\} \in U$ .

There is at most one limit, because  $\{i \in I \mid |a_i - a| < \varepsilon\}, \{i \in I \mid |a_i - b| < \varepsilon\}$  will be disjoint hence cannot both be in  $U$ .  $\lrcorner$

**Prop. (4.4.5.5) [Generalized Limit].** Let  $U$  be an ultrafilter on  $\mathbb{N}$ , then for any bounded sequence of real numbers  $\{a_n\}$ ,  $\lim_U a_n$  exists. i.e. There is a functional from  $l^\infty$  to  $\mathbb{R}$ .

And if  $\{a_n\}$  has a limit pt  $a$  in the usual sense, then  $\lim_U a_n = a$  for any non-principal ultrafilter  $U$ , because any  $\{i \in I \mid |a_i - a| < \varepsilon\}$  is cofinite hence in  $U$  (2.2.10.9).  $\square$

*Proof:* Let  $A_x = \{n \mid a_n < x\}$ . Then  $A_x$  is monotone, then we can choose  $c = \sup\{x \mid A_x \notin U\}$  (2.2.3.22). And it is easily verified that  $c = \lim_U a_n$ .  $\square$

**Cor. (4.4.5.6) [Density Measure].** There exists a measure  $m$  on  $\mathbb{N}$  that  $m(A) = d(A)$  for each set  $A \subset \mathbb{N}$  that has a density  $d(A)$ .  $\square$

*Proof:* Let  $U$  be a non-principal ultrafilter on  $\mathbb{N}$  (2.2.10.9), let  $m(A) = \lim_U \frac{A(n)}{n}$ . It is clearly additive and monotone. And it equals the density by (4.4.5.5)  $\square$

## 6 Separation Axioms

**Prop. (4.4.6.1).** Any Quasi-compact  $T_0$  space  $X$  contains a closed point.  $\square$

*Proof:* Consider the family of non-empty closed subsets of  $X$ , there is a minimal element by quasi-compactness. Choose a minimal element  $T$ , and let  $x \in T$ , then  $\overline{\{x\}} = T$ . Then  $x$  is closed, otherwise there is some  $x' \neq x \in \overline{\{x\}}$ , and  $\{x'\} \neq \{x\}$  because  $X$  is  $T_0$ .  $\square$

### Hausdorff

**Prop. (4.4.6.2).** If  $X$  is a Hausdorff space and  $S_1 \supset S_2 \supset \dots$  is a nested chain of compact connected subsets of  $X$ , then  $S = \bigcap S_i$  is also compact and connected.  $\square$

*Proof:*  $S$  is clearly compact. Suppose it is disconnected, then  $S = A_1 \cup A_2$  is a disjoint union of compact open subsets. Then we can find two open disjoint subset  $U_1, U_2$  of  $X$  s.t.  $A_i = U_i \cap S$ . Then by the compactness of  $S_1$  and (4.4.2.3), it can be shown that  $S_n \in U_1 \cup U_2$  for  $n$  large, so  $S_n$  is disconnected, contradiction.  $\square$

### Hausdorffization

Cf.[the Hausdorff Quotient].

### Regular

### Completely Regular

### Normal (T4)

**Prop. (4.4.6.3) [Urysohn lemma].** Let  $X$  be normal,  $A$  and  $B$  two closed subset of  $X$ , then there exists a continuous map from  $X$  to  $[0, 1]$  that maps  $A$  to 0 and  $B$  to 1.  $\square$

*Proof:* Use the countability of rational numbers to construct a family of  $U_q$  s.t.

$$p < q \Rightarrow \bar{U}_p \subset U_q$$

Then choose  $f(x) = \inf\{p \in \mathbb{Q} \mid x \in U_p\}$ , then this  $f$  meets the requirement.  $\square$

**Cor. (4.4.6.4) [Tietze extension].** If  $X$  is normal and  $Y$  is a closed subspace, then any continuous function  $f$  on  $Y$  can be extended to a continuous function on  $X$ .  $\square$

*Proof:*  $\square$

## 7 Paracompactness

**Def. (4.4.7.1) [Paracompactness].**  $X \in \mathcal{Top}$  is called **paracompact** if any open covering  $\mathcal{U}$  of  $X$  has a locally finite open refinement covering.  $\lrcorner$

**Prop. (4.4.7.2) [Characterization of Paracompactness].** If  $X$  is regular, then TFAE:

1. Each open cover of  $X$  has an open locally finite refinement.
2. Each open cover of  $X$  has a locally finite refinement.
3. Each open cover of  $X$  has a closed locally finite refinement.
4. Each open cover of  $X$  is even. i.e. for any cover, there is an open nbhd  $V$  of diagonal of  $X \times X$  such that  $\forall x, V[x] = \{y | (x, y) \in V\}$  refines the cover.
5. Each open cover of  $X$  has an open  $\sigma$ -discrete refinement.
6. Each open cover of  $X$  has an open  $\sigma$ -locally finite refinement.

If this is satisfied, then  $X$  is called **paracompact**.  $\lrcorner$

*Proof:*  $6 \rightarrow 2$ : Just minus every open set the part of open sets that appeared in families that ordered before it.  $2 + 4 \rightarrow 1$ : Use the lemma below, we can transform the cover  $\mathcal{A}$  into  $V[\mathcal{A}] \cap U_A$  which is an open locally finite cover

Cf. [General Topology Kelley] and [Mun00]P254.  $\square$

**Lemma (4.4.7.3).** If  $X$  satisfies 4, let  $U$  be a nbhd of diagonal of  $X \times X$ , then there exists a symmetric nbhd of diagonal s.t.  $V \circ V \subset U$ , where  $U \circ V = \{(x, z) | (x, y) \in U, (y, z) \in V, \exists y\}$ .  $\lrcorner$

*Proof:*  $\forall x$  in  $X$ , there is a nbhd s.t.  $W[x] \times W[x] \subset U$ , this is an open cover, so there is a nbhd  $R$  of diagonal s.t.  $R[x]$  refines it. Hence  $R[x] \times R[x] \subset U$ . Let  $V = R \cap R^{-1}$ ,  $V \circ V$  is the union of sets  $V[x] \times V[x]$ , so  $V \circ V \subset U$ .  $\square$

**Lemma (4.4.7.4).** In the preceding proposition, if  $X$  satisfies 4, Let  $\mathcal{A}$  be a locally finite (resp. discrete i.e. intersect only one) family of subsets of  $X$ , then use the last lemma, there is a nbhd  $V$  of diagonal of  $X \times X$  such that  $V[\mathcal{A}] = \{y | (x, y) \in V, \exists x \in A\}$  is locally finite (resp. discrete).  $\lrcorner$

*Proof:* Choose for every pt a nbhd satisfy the property, then it is an open cover. Choose a diagonal nbhd  $U$  for the property 4, then choose coordinate symmetric nbhd  $V$  of diagonal s.t.  $V \circ V \subset U$ . If  $V[x]$  intersect  $V[A]$ , then  $V \circ V[x]$  intersect  $A$ . Done.  $\square$

**Prop. (4.4.7.5).** A locally-compact second-countable Hausdorff space  $X$  is paracompact.  $\lrcorner$

*Proof:* Let  $\mathcal{U}$  be a covering of  $X$ , because  $X$  is second countable and locally-compact, by (4.4.2.23), we may assume  $\mathcal{U}$  is a countable covering and consisting of precompact subsets. Moreover, we can change  $U_n$  to  $U'_n = \cup_{i=1}^n U_i$ , because if  $\{B_\alpha\}$  is a locally finite refinement of  $\{\cup_{i=1}^n U_i\}$ , then  $\{B_\alpha \cap U_\alpha\}$  is a locally finite refinement of  $\{U_i\}$ . So  $U_n \subset U_{n+1}$ , and because  $\overline{U}_n$  is compact, we may assume  $\overline{U}_n \subset U_{n+1}$ .

Now let  $K_n = \overline{U}_{n+1} \setminus U_n$  (where  $U_0 = \emptyset$ ), then  $K_n$  are all compact, and  $W_n = U_{n+1} \setminus \overline{U}_{n-2}$  is an open subset containing  $K_n$ . So there are f.m. open subsets of  $W_n$  that cover  $K_n$ . There open subsets is then a refinement covering of  $\mathcal{U}$ , and they are locally finite, because any  $x \in X$  is contained in  $U_n$  for some  $n$ .  $\square$

**Prop. (4.4.7.6) [Paracompact Spaces are Normal].** A Hausdorff paracompact space  $X$  is normal. In particular, a compact Hausdorff space is normal.  $\lrcorner$

*Proof:* Firstly  $X$  is regular: Let  $x \in X$  and  $B$  a closed subset disjoint from  $x$ , then because  $X$  is Hausdorff, there is a covering of  $B$  by open subsets  $V_\alpha$  that  $x \notin \overline{V}_\alpha$ . Now consider the open covering  $\{X \setminus B, V_\alpha\}$  of  $X$ , then there is a locally finite refinement  $\{B_\beta\}$ . Those  $B_\alpha$  that intersect  $B$  is then a locally finite covering of  $B$ . Let  $U$  be the union of these open subsets, then  $B \subset U$  and  $x \notin \overline{U}$ , because of the locally finiteness.

To prove  $X$  is normal, we do the same but  $x$  replaced by a closed subset disjoint from  $B$  and use regularity.  $\square$

**Lemma (4.4.7.7)[Shrinking Lemma].** Let  $X$  be a paracompact Hausdorff space and  $\{U_\alpha\}_{\alpha \in I}$  an open covering of  $X$ , then there is an open covering  $\{V_\alpha\}$  of  $X$  that  $\overline{V}_\alpha \subset U_\alpha$  for any  $\alpha$ .  $\lrcorner$

*Proof:* Let  $\mathcal{A}$  be the family of open subsets  $A$  of  $X$  that  $\overline{A} \subset U_\alpha$  for some  $\alpha$ , then because  $X$  is normal (4.4.7.6),  $\mathcal{A}$  is a covering of  $X$ . Then we find a locally finite open covering  $\mathcal{B}$  of  $\mathcal{A}$ , and let the covering map be  $B_\beta \subset U_{f(\beta)}$ , then we can get a covering  $\mathcal{V}$  of  $X$  indexed by  $I$  that  $V_\alpha = \cup_{f(\beta)=\alpha} B_\beta$ . This is also locally finite, and  $\overline{V}_\alpha \subset U_\alpha$  by the locally finiteness of  $\mathcal{B}$ .  $\square$

**Thm. (4.4.7.8)[Partition of unity].** In a paracompact Hausdorff space, given any open cover  $\{U_\alpha\}$ , there exists a partition of unity  $\{\rho_\alpha\}$  that  $\text{Supp } \rho_\alpha \subset U_\alpha$ , and  $\{\text{Supp}(\rho_\alpha)\}$  is locally finite. Moreover, if  $X$  is locally-compact (4.4.2.18), we can assume each  $\text{Supp}(\rho_\alpha)$  is compact.  $\lrcorner$

*Proof:* Using shrinking lemma (4.4.7.7) twice, we can find locally finite open coverings  $\{W_\alpha\}, \{V_\alpha\}$  that  $\overline{W}_\alpha \subset V_\alpha$ ,  $\overline{V}_\alpha \subset U_\alpha$ . Because  $X$  is normal, we can find functions  $\psi_\alpha$  on  $X$  that  $\psi(W_\alpha) = 1, \psi_\alpha(X \setminus V_\alpha) = 0$ . Then  $\text{Supp}(\psi) \subset \overline{V}_\alpha \subset U_\alpha$ , so  $\{\text{Supp}(\psi_\alpha)\}$  is locally finite. So we can define  $\Phi(x) = \sum_\alpha \psi_\alpha(x)$ .  $\Phi(x) > 0$  for any  $x$  because  $\{W_\alpha\}$  is a covering of  $X$ . Finally, we define  $\rho_\alpha = \psi_\alpha / \Phi$ , then this is a partition of unity dominated by  $\{U_\alpha\}$ .

If  $X$  is locally-compact,  $\{U_\alpha\}$  has a refinement covering given by precompact open subsets by (4.4.2.19).  $\square$

## 8 Metric Spaces

**Def. (4.4.8.1)[Metrics].** For  $X \in \text{Set}$ , a **metric** on  $X$  is a map  $\text{dist} : B \times B \rightarrow \mathbb{R}_{\geq 0} \cup \{\infty\}$  s.t.

- $\text{dist}(x, y) = 0 \iff x = y$  for all  $x, y \in B$ .
- $\text{dist}(x, y) = \text{dist}(y, x)$  for all  $x, y \in B$ .
- $\text{dist}(x, z) + \text{dist}(z, y) \leq \text{dist}(x, y)$  for all  $x, y, z \in B$ . (where we assume that  $x + \infty = \infty$  for any  $x \in \mathbb{R}_{\geq 0}$  and  $\infty + \infty = \infty$ ).

$\lrcorner$

**Def. (4.4.8.2)[Metric Balls].** Let  $X \in \text{Set}$  and  $\text{dist}$  a metric on  $X$  (4.4.8.1). For  $E \subset X, \delta \in \mathbb{R}_+$ , define the **metric balls**

$$\mathbb{D}(E, \delta) = \{y \in X : \text{dist}(x, y) < \delta \exists x \in E\}, \quad \overline{\mathbb{D}}(E, \delta) = \{y \in X : \text{dist}(x, y) \leq \delta \exists x \in E\}.$$

$\lrcorner$

**Def. (4.4.8.3)[Metric Spaces].** A **metric space** is defined to be a pair  $(X, \text{dist})$  where  $X \in \text{Set}$  and  $\text{dist} : X \times X \rightarrow \mathbb{R}_{\geq 0} \cup \{\infty\}$  is a metric on  $X$  (4.4.8.1).

Then  $X$  has a topological structure given by  $d$  by defining the set of open balls  $\{\overline{\mathbb{D}}(x, \delta)\}_{x \in X, \delta \in \mathbb{R}_+}$  as a topological basis.

And a **metrizable space** is a topological space whose topology is induced by a metric as above. The category of metric spaces is the subcategory of  $\text{Cat}$  consisting of metric spaces, denoted by  $\text{MetSpa}$ .  $\lrcorner$

**Example (4.4.8.4) [Non-Metrizable Spaces].** An uncountable product of  $\mathbb{R}$  is not a metrizable space (4.4.8.3).  $\lrcorner$

*Proof:* Cf. [Mun00]P133.  $\square$

**Def. (4.4.8.5) [Bounded Subsets].** For  $(X, \text{dist}) \in \text{MetSpa}$  (4.4.8.3), a subset  $E \subset X$  is called a **bounded subset** if there exists  $x \in X$  and  $r \in \mathbb{R}_+$  s.t.  $E \subset \mathbb{D}(B, r)$  (4.4.8.2).  $\lrcorner$

**Prop. (4.4.8.6) [Metric Spaces are Paracompact].** Any metric space is paracompact (4.4.7.1).  $\lrcorner$

*Proof:* Cf. [Mun00]P257.  $\square$

**Def. (4.4.8.7) [Heine-Borel Property].**  $X \in \text{MetSpa}$  (4.4.8.3) is said to have the **Heine-Borel property** if every closed and bounded subset (4.4.8.5) of  $X$  is compact.  $\lrcorner$

**Prop. (4.4.8.8) [Bounded Actions on Metric Spaces].** Let  $(X, \text{dist}) \in \text{MetSpa}$  and  $A$  is a subset of isometries of  $X$ . If  $\{g(x)\}_{g \in A}$  is bounded for some  $x \in X$ , then this holds for any  $x \in X$ . If this happens,  $A$  is said to be a set of **bounded isometric actions** on  $X$ .  $\lrcorner$

*Proof:* For any  $x, y \in X$  and  $g \in A$ , we have

$$\text{dist}(g(y), y) \leq \text{dist}(g(y), g(x)) + \text{dist}(g(x), x) + \text{dist}(x, y) = 2\text{dist}(x, y) + \text{dist}(g(x), x).$$

$\square$

### Geodesics Metric Spaces

References are [Metric spaces of non-negative curvature].

**Def. (4.4.8.9) [Length of Curve Segments].** For  $(X, \text{dist}) \in \text{MetSpa}$  (4.4.8.3) and a curve segment  $\gamma : [0, 1] \rightarrow X$ , the **length of  $\gamma$**  is defined to be

$$\text{length}(\gamma) = \sup_{n \in \mathbb{Z}_+} \sup_{0=t_0 < t_1 < \dots < t_n} \sum_{i \in [n]_+} \text{dist}(\gamma(t_i), \gamma(t_{i-1})) \in \mathbb{R}_{\geq 0} \cup \{\infty\}.$$

$\gamma$  is called a **rectifiable curve segment** if  $\text{length}(\gamma) < \infty$ . And  $\gamma$  is called a **geodesic curve segment** if it satisfies that for all  $0 \leq t_1 < t_2 \leq 1$ , we have

$$\text{length}(\gamma|_{[t_1, t_2]}) = \text{dist}(\gamma(t_1), \gamma(t_2)) = \text{length}(\gamma)|t_1 - t_2|.$$

$\lrcorner$

**Def. (4.4.8.10) [Geodesic Metric Spaces].** A **geodesic metric space** is a metric space  $X \in \text{MetSpa}$  (4.4.8.3) s.t. every two points  $x, y \in X$  is the two ends of a geodesic curve segment (4.4.8.9). And a **uniquely-geodesic metric space** is a geodesic metric space s.t. any two geodesic curve segments connecting  $x$  and  $y$  has the same image.

For a uniquely-geodesic metric space and  $x, y \in X$ , denote  $[x, y]$  the image of the geodesic from  $x$  to  $y$ .  $\lrcorner$

**Def. (4.4.8.11) [Length Spaces].** For a metric space  $(X, \text{dist})$  (4.4.8.3), define

$$\text{dist}_{\text{length}} : X \times X \rightarrow \mathbb{R}_{\geq 0} \cup \{\infty\} : (x, y) \mapsto \sup_{\gamma \text{ a curve connecting } x, y} \text{length}(\gamma),$$

then  $(X, \text{dist}_{\text{length}})$  is a metric space (4.4.8.3), and  $(X, \text{dist})$  is called a **length space** if  $\text{dist}_{\text{length}} = \text{dist}$ .  $\lrcorner$

**Prop. (4.4.8.12)[Geodesic Metric Spaces are Length Spaces].** Any geodesic metric space(4.4.8.10) is a length space(4.4.8.11).

For any  $(X, \text{dist}) \in \text{MetSpa}$ ,  $(X, \text{dist}_{\text{length}})$  is a length space.  $\lrcorner$

**Prop. (4.4.8.13)[Negatively-Curved Metric Spaces].** A non-positively-curved metric space is a metric space  $(X, \text{dist}) \in \text{MetSpa}$  s.t. for any  $x, y \in X$ , there exists  $m \in X$  s.t. for any  $z \in X$  we have

$$\text{dist}(x, z)^2 + \text{dist}(z, y)^2 \geq 2\text{dist}(m, z)^2 + \frac{1}{2}\text{dist}(x, y)^2.$$

$\lrcorner$

**Prop. (4.4.8.14) [Negatively-Curved Metric Spaces are Uniquely-Geodesic].** Any non-positively-curved geodesic metric space  $X \in \text{MetSpa}$ (4.4.8.10)(4.4.8.13) is uniquely-geodesic(4.4.8.10), and for any  $x, y \in X$ , the midpoint of  $[x, y]$ (4.4.8.10) is the unique point  $m$  in(4.4.8.13) that can make the statement true(4.4.8.13).  $\lrcorner$

*Proof:* For  $x, y \in X$ , if  $m$  is the point that makes the statement happen, then for midpoint  $m'$  of any geodesic containing  $x, y$ , plug in  $z = m'$ , we get  $\text{dist}(m, m') = 0$ , thus  $m = m'$ .  $\square$

**Def. (4.4.8.15)[Convex Subsets].** For a uniquely-geodesic metric space  $(X, \text{dist}) \in \text{MetSpa}$ (4.4.8.10),

- A **convex subset** is a subset  $M \subset X$  s.t.  $[x, y] \subset M$  for any  $x, y \in M$ .
- The **radius(convex subset)** for a convex subset  $M \subset X$  is defined to be  $r(M) = \inf_{x \in M} \text{diam}(x, M)$ .
- A **barycenter** of a convex subset  $M$  is a point  $x \in M$  s.t.  $\text{diam}(x, M) = r(M)$ .

Notice that intersections of convex subsets are convex subsets.  $\lrcorner$

**Prop. (4.4.8.16).** For a non-positively-curved metric space  $(X, \text{dist}) \in \text{MetSpa}$ (4.4.8.13), then for any  $z \in X$  and  $r \in \mathbb{R}_+$ , the closed metric ball  $\overline{\mathbb{D}}(z, r)$ (4.4.8.2) is a convex subset of  $X$ (4.4.8.15).  $\lrcorner$

*Proof:* For any  $x, y \in \overline{\mathbb{D}}(z, r)$ , let  $m$  be the midpoint of  $[x, y]$ , then  $m \in \overline{\mathbb{D}}(z, r)$  by(4.4.8.13)(4.4.8.14). Then we can also take the midpoint of  $[m, x]$  and  $[m, y]$ , thus showing that there is a dense subset of  $[x, y]$  contained in  $\overline{\mathbb{D}}(z, r)$ . Hence  $[x, y] \subset \overline{\mathbb{D}}(z, r)$  as  $\overline{\mathbb{D}}(z, r)$  is closed.  $\square$

**Cor. (4.4.8.17)[Convex Hulls].** For a non-positively-curved metric space  $(X, \text{dist}) \in \text{MetSpa}$ (4.4.8.13) and a subset  $M \subset X$ , the **convex hull** of  $M$  is defined to be the smallest closed convex subsets of  $X$  containing  $M$ , denoted by  $\text{Conv}(M)$ .

If  $M$  is bounded in  $X$ , then so is  $\text{Conv}(M)$ , by(4.4.8.16).  $\lrcorner$

### Convergence in Metric Spaces

**Prop. (4.4.8.18) [Continuity for Metric Spaces].** For  $(X, \text{dist}_X), (Y, \text{dist}_Y) \in \text{MetSpa}$ , a map  $f : X \rightarrow Y$  is continuous iff for any  $x \in X$  and any  $\varepsilon \in \mathbb{R}_+$ , there exists  $\delta \in \mathbb{R}_+$  s.t. for any  $y \in X$ ,

$$\text{dist}_X(x, y) < \delta \implies \text{dist}_Y(f(x), f(y)) < \varepsilon.$$

$\lrcorner$

*Proof:* Cf.[Munkres, P129].  $\square$

**Prop. (4.4.8.19) [Sequential-Continuity].** For  $(X, \text{dist}_X), (Y, \text{dist}_Y) \in \text{MetSpa}$ , a map  $f : X \rightarrow Y \in \text{Set}$  is continuous iff for any convergent sequence  $\{x_n\} \rightarrow x \in X$ , the sequence  $\{f(x_n)\}$  converges to  $f(x)$ .  $\lrcorner$

*Proof:* Cf.[Munkres, P130]. □

**Def. (4.4.8.20) [Uniform Convergence].** For  $X \in \mathcal{Top}$  and  $(Y, \text{dist}_Y) \in \mathcal{MetSpa}$ , a sequence of maps  $\{f_n\} : X \rightarrow Y$  is said to **converge uniformly** to a function  $f : X \rightarrow Y$  if for any  $\varepsilon \in \mathbb{R}_+$ , there exists  $N \in \mathbb{Z}_+$  s.t. for any  $n \geq N$  and  $x \in X$ , we have

$$\text{dist}_Y(f_n(x), f(x)) < \varepsilon.$$

┘

**Prop. (4.4.8.21) [Uniform Limit Theorem].** Let  $X \in \mathcal{Top}$ ,  $(Y, \text{dist}_Y) \in \mathcal{MetSpa}$  and  $\{f_n\} : X \rightarrow Y$  is a sequence of continuous maps that converges uniformly to a map  $f : X \rightarrow Y$ , then  $f$  is also continuous. ┘

*Proof:* Cf.[Munkres, P132]. ? □

### Complete Metric Spaces

**Def. (4.4.8.22) [Cauchy Sequences].** A **Cauchy sequence** in a metric space  $X \in \mathcal{MetSpa}$  (4.4.8.3) is a sequence  $(x_n)_{n \in \mathbb{Z}_+} \in X^{\mathbb{Z}_+}$  s.t. for any  $\varepsilon \in \mathbb{R}_+$ , there exists  $N \in \mathbb{Z}_+$  s.t.  $d(x_m, x_n) < \varepsilon$  for any  $m, n \in \mathbb{Z}_{\geq N}$ . ┘

**Def. (4.4.8.23) [Complete Metric Spaces].** A **complete metric space** is a metric space  $X$  (4.4.8.3) s.t. every Cauchy sequence (4.4.8.22) has a limit in  $X$ . ┘

**Def. (4.4.8.24) [Totally-Bounded Subsets].** For  $(X, \text{dist}) \in \mathcal{MetSpa}$ , a subset  $E \subset X$  is called a **totally bounded subset** iff for every  $\varepsilon \in \mathbb{R}_+$ , there exists a finite set  $F \subset X$  s.t.  $E \subset B(F, \varepsilon)$ . This definition is compatible with that in the case of a topological vector space (12.7.1.11) when it is an  $F$ -space. ┘

**Prop. (4.4.8.25).** The closure of a totally bounded set in a metric space is totally bounded. ┘

*Proof:* For each  $\varepsilon > 0$ , choose a finite set  $F$  that  $E \subset B(F, \varepsilon/2)$ , then  $\overline{E} \subset B(F, \varepsilon)$ . □

**Prop. (4.4.8.26) [Totally Bounded Metric Spaces are Separable].** A totally-bounded metric space  $X \in \mathcal{MetSpa}$  (4.4.8.24) is separable. ┘

*Proof:*  $\cup N_n$  is dense and countable in  $X$ , where  $N_n$  is a finite  $1/n$ -net of  $X$ . □

**Prop. (4.4.8.27) [Sequence lemma, Hausdorff].** Let  $X$  be a complete metric space, then:

1. A sequentially compact (4.4.2.6) subset  $M$  is totally bounded and the converse is true if  $X$  is complete.
2. A subset  $M$  is compact iff it is self-sequentially compact iff it is closed and sequentially compact.
3. A subset  $M$  is precompact iff it is sequentially compact (4.4.2.6).

┘

*Proof:* 1: If  $M$  is not totally bounded, then for some  $\varepsilon > 0$ , we can choose consecutively a sequence of points  $x_i$  that  $d(x_i, x_j) \geq \varepsilon$ , this cannot have a convergent subsequence in  $X$ .

Conversely, if  $M$  is totally bounded, choose a  $1/k$ -net for each  $k$ , then for any sequence in  $M$ , there is a  $y_i$  that some infinite subsequence  $\{x_n^{(1)}\} \subset B(y_1, 1)$ , and consecutively find infinite subsequences  $\{x_n^{(m)}\} \subset B(y_k, 1/k)$ , then finally choose the diagonal, then it is a Cauchy sequence.

2: If it is compact, given a sequence, if no point is a convergent point, then each point has a nbhd that contains at most one point of the sequence. Then by compactness, there are at most f.m. points, contradiction. A compact set must have the convergent point in itself because it is closed as  $M$  is Hausdorff.

Conversely, if it is self-sequentially compact, then it is totally bounded by 1. so if  $M$  is not compact, then for each  $n$  it has  $1/n$ -net  $N_n$ , then there is at least one  $x_n$  that  $B(x_n, 1/n)$  cannot be covered by f.m. of the covering, The sequence  $\{x_n\}$  has a subsequence  $\{x_{n_k}\}$  that is convergent to  $x$ . But  $x \in M$  is in some open cover, so  $B(x_{n_k}, 1/n_k)$  is contained in some open cover, contradiction.

That closed and sequentially compact is equivalent to self sequentially compact is obvious.

3: If it is precompact, then it is sequentially compact by 2, conversely, if  $x_i$  is a sequence in  $\overline{M}$ , then choose  $|y_n - x_n| \leq 1/n$ , so some sequence  $y_{n_k}$  is convergent to  $y_0 \in \overline{M}$ , so  $x_{n_k}$  also converges to  $y_0$ . So  $\overline{M}$  is self-sequentially compact, so it is compact by 2.  $\square$

**Cor. (4.4.8.28) [Arzela-Ascoli].** For  $X \in \text{CHaus}$ ,  $F \subset C(X)$  is a sequentially compact(precompact, by(4.4.8.27)) subset iff it is uniformly bounded and equicontinuous.  $\lrcorner$

*Proof:* As  $C(M)$  is complete metric space, sequentially compact is equivalent to totally bounded. If it is totally bounded, then it is clearly uniformly bounded, and for every  $\varepsilon > 0$ , find a  $\varepsilon/3$ -net for  $F$ , which means f.m. functions in  $F$  that any other function is  $\varepsilon/3$ -close to one of them. So they are equicontinuous.

Conversely, if it is uniformly bounded and equicontinuous, for every  $\varepsilon > 0$ , find a finite covering of  $M$  that for any two points  $x, y$  in one cover of them,  $|f(x) - f(y)| < \varepsilon/3$  for all  $f \in F$ . Then choose for each covering a point  $x_i$ , consider  $f : F \rightarrow \mathbb{C}^n : \varphi \mapsto (\varphi(x_1), \dots, \varphi(x_n))$ , then the image is bounded, hence precompact by(4.4.5.2), so it is totally bounded by(4.4.8.27). So we can choose a  $\varepsilon/3$ -net  $\varphi_k$  for  $x_i$  simultaneously, and it is by  $\varepsilon/3$  argument that these  $\varphi_k$  is a  $\varepsilon$ -net for  $F$ .  $\square$

**Prop. (4.4.8.29)[Fixed point theorem for Contractions].** If  $X$  is a complete metric space(4.4.8.23) and  $f : X \rightarrow X$  satisfies  $\text{dist}(f(x), f(y)) \leq \lambda \text{dist}(x, y)$  for some  $0 \leq \lambda < 1$ , then  $f$  has a unique fixed point in  $X$ . If  $X$  is moreover compact, then any  $f$  satisfying  $\text{dist}(f(x), f(y)) < \text{dist}(x, y)$  for all  $x, y \in X$  will have a unique fixed point.  $\lrcorner$

*Proof:*  $x + f(x) + f^2(x) + \dots$  is the fixed point. And uniqueness is easy. For the compact case, notice the image  $\text{Im } f^n$  is a descending chain, it must stable to some  $T$ . If  $x, y \in Y$  attains the diameter of  $Y$ , and let  $x = f(X), y = f(Y)$ , where  $X, Y \in T$ , then  $\text{dist}(x, y) < \text{dist}(X, Y) \leq \text{dist}(x, y)$ , contradiction.  $\square$

**Prop. (4.4.8.30)[Dilations are Closed].** If  $X, Y \in \text{MetSpa}$  s.t.  $X$  is complete, then if  $f : X \rightarrow Y$  is continuous dilation, i.e.  $d(f(x_1), f(x_2)) \geq d(x_1, x_2)$ , then  $f(X)$  is closed.

So a continuous dilation map on a complete metric space is a closed map.  $\lrcorner$

*Proof:* If  $y \in \overline{f(X)}$ , then because  $Y$  is metric, there are  $x_n$  that  $y = \lim f(x_n)$ . Thus  $\{f(x_n)\}$  is Cauchy in  $Y$ , and  $\{x_n\}$  is Cauchy too. So there is a  $x = \lim x_n$ , and clearly  $f(x) = y$ .  $\square$

**Thm. (4.4.8.31)[Bruhat-Tits Fixed-Point Lemma, Bruhat-Tits[B-T72]].** Let  $(X, \text{dist}) \in \text{MetSpa}$  be a complete non-positively-curved space(4.4.8.23)(4.4.8.13),

- Any non-empty closed bounded(4.4.8.5) and convex(4.4.8.15) subset  $M \subset X$  has a unique barycenter(4.4.8.15).
- If  $M \subset X$  is a non-empty bounded subset and  $G \in \text{Grp}$  acts on  $X$  by isometries and preserves  $M$ , then  $G$  has a fixed point in  $X$ . And  $M$  is closed, this fixed point can be taken in  $M$ .

┘

*Proof:* 1: Let  $r = \inf_{x \in M} \text{diam}(x, M)$ . Firstly we prove the following: If  $\varepsilon \in \mathbb{R}_+$  and  $x, y \in M$  s.t.  $\text{diam}(x, M) < r + \varepsilon$  and  $\text{diam}(y, M) < r + \varepsilon$ , then  $\text{dist}(x, y) < 16r\varepsilon$ : Let  $m$  be the midpoint of  $[x, y]$ , which is contained in  $M$  because  $M$  is convex. Thus there exists  $z \in M$  s.t.  $\text{dist}(m, z) > r - \varepsilon$ . Then the assertion follows directly from the inequality in (4.4.8.13).

Then the uniqueness follow immediately, and for the existence, choose a sequence  $\{x_i\}_{i \in \mathbb{Z}_+} \in M$  s.t.  $\text{diam}(x_i, M) \rightarrow r$ , then it follows from the claim above that  $x_i$  is a Cauchy-sequence and converges to some  $x$  which is in  $M$  because  $M$  is closed. And then  $\text{diam}(x, M) = r$  by continuity, so  $x$  is a barycenter of  $M$ .

2: The barycenter of the convex hull  $\text{Conv}(M)$  of  $M$  (4.4.8.17) is fixed by  $G$ , by item1. □

**Remark (4.4.8.32).** This is the analogue of the Cartan fixed-point theorem (Cf. [Eberlein, Geometry of nonpositively curved manifolds] Prop 1.4.6.). ┘

**Cor. (4.4.8.33) [Bounded Group of Isometries has Fixed Points].** Let  $(X, \text{dist}) \in \text{MetSpa}$  be a non-empty complete non-positively-curved space (4.4.8.23) (4.4.8.13). If  $G \in \text{Grp}$  is a bounded group of isometric actions (4.4.8.8) on  $X$ , then  $G$  has a fixed point. ┘

*Proof:* For any  $x \in X$ ,  $M = \{g(x)\}_{g \in G}$  is a subset bounded under the action of  $G$ , then we can use (4.4.8.31). □

**Prop. (4.4.8.34) [Closest-Point Map].** Let  $(X, \text{dist}) \in \text{MetSpa}$  be a complete non-positively-curved space (4.4.8.23) (4.4.8.13) and  $Y \subset X$  a closed convex subset, then

- For any  $x \in X$ , there exists a unique point  $\text{pr}_Y(x) \in Y$  closest to  $x$ .
  - $\text{pr}_Y : X \rightarrow Y$  is a continuous function.
  - $\text{pr}_Y$  is equivariant w.r.t. any isometry of  $X$  preserving  $Y$ .
- ┘

*Proof:* We first prove the following claim: For any  $x \in X$  and  $\varepsilon \in \mathbb{R}_+$ , if  $y_1, y_2 \in Y$  s.t.  $\text{dist}(x, y_1) < \text{dist}(x, Y) + \varepsilon$ ,  $\text{dist}(x, y_2) < \text{dist}(x, Y) + \varepsilon$ , then we have  $\text{dist}(y_1, y_2)^2 < 16r\varepsilon$ : Let  $m$  be the midpoint of  $[x, y]$ , which is contained in  $M$  because  $M$  is convex. Thus there exists  $z \in M$  s.t.  $\text{dist}(m, z) > r - \varepsilon$ . Then the assertion follows directly from the inequality in (4.4.8.13).

1: The uniqueness follows immediately from the claim above, and for the existence, choose a sequence  $\{y_i\}_{i \in \mathbb{Z}_+} \in Y$  s.t.  $\text{diam}(y_i, x) \rightarrow \text{dist}(x, Y)$ , then it follows from the claim above that  $y_i$  is a Cauchy-sequence and converges to some  $y$  which is in  $Y$  because  $Y$  is closed. And then  $\text{diam}(x, y) = \text{dist}(x, Y)$  by continuity,

2: If  $(x_n)_{n \in \mathbb{Z}_+}$  is a sequence of points in  $X$  converges to  $x$ , then

$$\text{dist}(x, \text{pr}_Y(x)) \leq \text{dist}(x, \text{pr}_Y(x_n)) \leq \text{dist}(x, x_n) + \text{dist}(x_n, \text{pr}_Y(x_n)) \leq \text{dist}(x, x_n) + \text{dist}(x_n, \text{pr}_Y(x)),$$

Taking  $n \rightarrow \infty$  we get  $\text{dist}(x, \text{pr}_Y(x_n)) \rightarrow \text{dist}(x, \text{pr}_Y(x))$ , thus by the claim we proved above, we see  $\text{pr}_Y(x_n) \rightarrow \text{pr}_Y(x)$ . Thus  $\text{pr}_Y$  is continuous by (4.4.8.19).

3: For any isometry  $f : X \rightarrow X$  preserving  $Y$  and  $x \in X$ ,

$$\text{dist}(f(x), \text{pr}_Y(f(x))) < \text{dist}(f(x), f(\text{pr}_Y(x))) = \text{dist}(x, \text{pr}_Y(x)),$$

and the same inequality for  $f^{-1}$  shows that this is an equality. Thus  $\text{pr}_Y(f(x)) = f(\text{pr}_Y(x))$  by uniqueness in item1. □

### Compact Metric Spaces

**Lemma (4.4.8.35) [Lebesgue-Number Lemma].** For any open covering  $U_i$  of a compact metric space  $(X, \text{dist}) \in \text{MetSpa}$ , there exists a  $\delta > 0$  that any subset  $X$  of diameter smaller than  $\delta$  is contained in some  $U_i$ .  $\lrcorner$

*Proof:* If  $X$  is in the covering  $U_i$ , then there is nothing to prove, otherwise, it suffices to assume the covering is a finite covering, let  $C_i = X - U_i$ , and let  $f(x) = \frac{1}{n} \sum d(x, C_i)$ . Notice  $f(x) > 0$ , because  $x \notin C_i$  for some  $C_i$ . Now it is also continuous, so it has a minimal value  $\delta > 0$ .

Now if  $B$  has diameter smaller than  $\delta$ , then if  $x_0 \in B$ ,  $\delta < f(x_0) < d(x, C_{i_0})$ , where  $d(x, C_{i_0})$  is the maximal among  $d(x, C_k)$ , and  $B \in B(x, \delta)$ , thus  $B \in U_{i_0}$ .  $\square$

**Prop. (4.4.8.36) [Uniform Continuity Theorem].** If  $f : X \rightarrow Y$  is a continuous map between two metric spaces that  $X$  is compact, then  $f$  is uniformly continuous.  $\lrcorner$

*Proof:* Take an open covering of  $Y$  with balls  $B(y_i, \varepsilon/2)$  of diameter  $\varepsilon/2$ , and consider their inverse image, then choose the lebesgue number  $\delta$  for this covering (4.4.8.35), we see that for any  $d(x, y) < \delta$ ,  $d(f(x), f(y)) < \varepsilon$ .  $\square$

**Prop. (4.4.8.37).** If  $f$  is an isometry of a compact metric space  $X$ , then it is a bijection thus an homeomorphism.  $\lrcorner$

*Proof:* It is clearly injective. If it is not surjective, then choose a  $x \notin \text{Im}(f)$ , because  $\text{Im}(f)$  is compact hence closed in  $X$ ,  $d(x, \text{Im}(f)) = \varepsilon > 0$ . Now consider the minimal  $N$  that we can cover  $X$  with open subsets of diameter smaller than  $\varepsilon$ , this  $N$  exists because  $X$  is compact. Now if  $U_i$  covers  $X$ , then the one that contains  $x$  cannot intersect with  $\text{Im}(f)$ . But  $f^{-1}(U_i)$  is an open cover of  $X$  with smaller numbers of open subsets, contradiction.  $\square$

## 9 Baire-Spaces

**Def. (4.4.9.1) [Baire-Spaces].** For  $X \in \mathcal{T}\text{op}$ , a subset  $E \subset X$  is called of **Baire-first category** if  $E \subset \cup_{i \in \mathbb{Z}_+} Z_i$ , where each  $Z_i \subset X$  is a closed subset s.t.  $\text{Int}(Z_i) = \emptyset$ .  $E$  is called of **Baire-second category** if it is not of first category.

A **Baire-space** is a topological space s.t. any nonempty open subsets of it is of second category.  $\lrcorner$

**Prop. (4.4.9.2) [Baire-Category Theorem].** Any complete metric space (4.4.8.23) or locally-compact Hausdorff space is a Baire space.  $\lrcorner$

*Proof:* Choose consecutively (precompact) open subsets that don't intersect  $\overline{E_n}$  to look for a limit point.  $\square$

## 10 Uniform Spaces

**Def. (4.4.10.1) [Uniform Spaces].**  $\lrcorner$

**Def. (4.4.10.2) [Cauchy Filter in the Topological Group Case].** A **Cauchy filter** is a topological Abelian group is a filter  $\mathcal{F}$  that for any nbhd  $U$  of 0, there exists  $E \in \mathcal{F}$  that  $x - y \in U$  if  $x, y \in E$ .  $\lrcorner$

**Def. (4.4.10.3) [Complete Uniform Spaces].** A topological Abelian group is called **complete uniform space** iff it is Hausdorff, and any Cauchy filter has a limit.  $\lrcorner$

## 11 Manifolds

**Def. (4.4.11.1) [Locally-Euclidean Spaces].** ┘

**Prop. (4.4.11.2) [Paracompactness for Manifolds].** For a connected Hausdorff locally-Euclidian space (4.4.11.1), the condition of paracompact, second countable and existence of a compact exhaustion is equivalent. ┘

*Proof:* Cf. [Paracompactness and second countable]. □

**Def. (4.4.11.3) [Manifolds].** For  $n \in \mathbb{N}$ , a (topological) **manifold** of dimension  $n$  is a topological space that is Hausdorff, second-countable and locally-Euclidean (4.4.11.1). By (4.4.11.2), the last condition is equivalent to saying it is paracompact.

The category of topological manifolds of dimension  $n$  is denoted by  $\text{Mani}^n$ . Denote  $\text{Mani} \triangleq \bigcup_{n \in \mathbb{N}} \text{Mani}^n$ . ┘

**Thm. (4.4.11.4) [Annulus Theorem, Rado-Moise-Quinn-Kirby].** For any map  $h : \mathbb{R}^n \rightarrow \mathbb{R}^n$  that maps  $\mathbb{D}^n$  into its interior, there is a homeomorphism  $\mathbb{D}^n \setminus h(\mathbb{D}^n) \cong \mathbb{S}^{n-1} \times \mathbb{I}$  that identifies  $\partial \mathbb{D}^n$  and  $h(\partial \mathbb{D}^n)$  with  $\mathbb{S}^{n-1} \times \{0\}, \mathbb{S}^{n-1} \times \{1\}$  resp. ┘

*Proof:* □

**Def. (4.4.11.5) [Jordan-Curves].** A **Jordan-curve** in a topological space  $X$  is an injective closed curve  $\gamma : [a, b] \rightarrow X$ . ┘

**Thm. (4.4.11.6) [Jordan-Curve Theorem, Jordan1887].** Let  $\gamma$  be a Jordan curve in  $\mathbb{R}^2$ , then  $\mathbb{R}^2 \setminus \gamma$  has exactly two components, one is bounded, denoted by  $\text{int} \gamma$ , while the other is unbounded. ┘

*Proof:* □

### Triangularizations

**Def. (4.4.11.7) [Triangularizations].** A **triangularizable space** is a topological space that is homeomorphic to the geometrization of a simplicial set  $X$  (4.6.3.8) s.t.

- $X$  is generated by its  $n$ -simplices for some  $n \in \mathbb{Z}$ .
- For any  $A, B \in X_n$ ,  $A \cap B = \emptyset$  or  $A \cap B \in X_{n-1}$ .
- For any  $Z \in X_{n-1}$ , there are at most two  $A \in X_n$  s.t.  $Z \subset A$ .

Any such homeomorphism is called a **triangularization** of this space. ┘

**Thm. (4.4.11.8) [Triangularization of Surfaces, Rado1920].** Any compact connected topological surface (4.4.11.12) is triangularizable. ┘

*Proof:* ? □

**Def. (4.4.11.9) [Pachner Moves].** Let  $M$  be a triangulated  $n$ -dimensional manifold, and let  $C \subset M$  be a sub-triangulated manifold of dimension  $n$  with an isomorphism  $\varphi : C \rightarrow C' \subset \partial \Delta_{n+1}$ . Then the **Pachner move** on  $N$  associated to  $C$  is the triangulated manifold

$$N' = (N \setminus C) \cup_{\varphi} (\partial \Delta_{n+1} \setminus C').$$

┘

**Example (4.4.11.10).** For surfaces, there are two Pachner moves (4.4.11.9) (and their inverses):

- $(ABC) \cup (ACD) \mapsto (ABD) \cup (BCD)$ .
- $(ABC) \mapsto (ABD) \cup (BCD) \cup (CAD)$ .

┘

**Thm. (4.4.11.11) [Pachner1991].** Given any closed surface  $\Sigma$ , any two triangulations of  $\Sigma$  (4.4.11.7) is related by a finite sequence of isotopies and Pachner moves (4.4.11.9). ┘

*Proof:* ┘

### Surfaces

**Def. (4.4.11.12) [Topological Surfaces].** A **topological surface** (with boundaries) is a topological manifold of dimension 2 (with boundaries). ┘

**Def. (4.4.11.13) [Planer Glueing Diagram].** A **planer glueing diagram** is a polygon with some glueing of its edges with orientations clockwise such that no three edges are glued together. We can label the edges by symbols and their inverses. different symbols are considered not glued together. For example,  $aba^{-1}b^{-1}, abab$ .

A **compact planer glueing diagram** is a planer glueing diagram that every symbol appear exactly twice in the the edges of the polygon. ┘

**Prop. (4.4.11.14).** The space correspond to a planer glueing diagram is a compact topological surface with boundaries.

The space correspond to a compact planer glueing diagram is a compact topological surface. ┘

*Proof:* It is compact as a quotient of a compact space. It can verified that it is locally Euclidean at each space. And it is clearly Hausdorff. ┘

**Lemma (4.4.11.15).**  $T^2 \# RP^2 \cong RP^2 \# RP^2 \# RP^2$ . ┘

*Proof:* By (4.4.11.13), it suffices to show that  $aabcb^{-1}c^{-1}$  is homeomorphic to  $eeffgg$ . For this, use cut-and-paste. ? ┘

**Thm. (4.4.11.16) [Classification of Surfaces].** Any compact topological surface is homeomorphic to exactly one of the following:  $S^2, \#^n T^2$  or  $\#^n RP^2$ ,  $n \in \mathbb{Z}_+$ . The corresponding planer diagram is  $aa^{-1}, a_1b_1a_1^{-1}b_1^{-1} \dots a_nb_na_n^{-1}b_n^{-1}, e_1e_1e_2e_2 \dots e_ne_n$ . ┘

*Proof:* By triangularization theorem (4.4.11.8), it is easy to see that any compact surface is the space corresponding to a compact planer diagram. Then it suffices to show any compact planer diagram is isomorphic to either  $aa^{-1}, a_1b_1a_1^{-1}b_1^{-1} \dots a_nb_na_n^{-1}b_n^{-1}, e_1e_1e_2e_2 \dots e_ne_n$ .

Firstly we can reduce to the case where all vertices are glued together: Take a vertex  $P$ , then we can spot all the vertices that are glued to  $P$ . If these are not all the vertices, we can find an edge  $e = PQ$ , and let  $RPQ$  be a triangle, then we can cut this triangle out to paste along the edge pairing  $e$ . Then we can reduce the number of vertices glued to  $P$ . Eventually, we can eliminate  $P$ .

Secondly we can collet all edges with the same orientation (i.e.  $\dots a \dots a \dots$ ) to be adjacent: (i.e.  $\dots aa \dots$ ). To do this, suppose  $a = P_1Q_1 = P_2Q_2$ , we simply cut along the line  $P_1P_2$  and glue  $a$  together.

Now if all edges glued together are of the same orientations, then it is clearly isomorphic to  $\#^n RP^2$ . Otherwise there are edged  $a, a^{-1}$  glued together with the opposite orientation. Then

there must be another pair  $b, b^{-1}$  s.t. these four pairs are ordered by  $a, b, a^{-1}, b^{-1}$ . This is because otherwise there will be two vertices. Then by some cut-and-paste, we can move these edges together as  $\dots aba^{-1}b^{-1} \dots$ . By induction, we can make all edges with the opposite orientations together and in pairs.

Thus our diagram is a connected sum of  $\mathbb{T}^2$  and  $\mathbb{RP}^2$ . Then we can reduce the diagram to one of the three kinds by (4.4.11.15).

Finally, it suffices to show these three kinds are different: Their Euler characteristics are

$$\chi(\mathbb{S}^2) = 2, \quad \chi(\#^n \mathbb{T}^2) = 2 - 2n, \quad \chi(\#^n \mathbb{RP}^2) = 2 - n.$$

So the only case their Euler characters equal are  $\chi(\#^n \mathbb{T}^2) = \chi(\#^{2n} \mathbb{RP}^2)$ . But in this case, they are still not homeomorphic, as  $H_2(\#^n \mathbb{T}^2) = \mathbb{Z}$  and  $H_2(\#^{2n} \mathbb{RP}^2) = 0$ .  $\square$

## 12 Commonly Used Spaces

**Def. (4.4.12.1) [Torus].** The ( $n$ -dimensional) **torus**  $\mathbb{T}^n$  is defined to be  $\mathbb{T}^n = (\mathbb{S}^1)^n$ .  $\lrcorner$

**Def. (4.4.12.2) [ $\mathbb{RP}^n$ ].** The **real projective space**  $\mathbb{RP}^n$  is the  $\mathbb{R}$ -points of  $\mathbb{P}_{\mathbb{R}}^n$  with the canonical topology.  $\lrcorner$

**Def. (4.4.12.3) [Möbius-Band].** The **Möbius-band** is the space defined to be the planer glueing diagram  $abac$ .  $\lrcorner$

**Def. (4.4.12.4) [Klein-Bottle].** The **Klein-bottle**  $\mathbb{K}^2$  is the space defined by the planer glueing diagram  $aba^{-1}b$ .  $\lrcorner$

## 4.5 Model Categories

Main references are [Model Category and Simplicial Methods, Goerss], [Model Categories, Kan-  
tor], [Homotopy Theories and Model Categories, Dwyer/Spalinski], [Lur09], [Hovey, Model Cate-  
gories].

**Def. (4.5.0.1).** If  $\mathcal{C} \in \mathbf{Cat}$  and  $S$  is a class of morphisms in  $\mathcal{C}$ , we denote  $l(S)$  the set of morphisms that has left lifting property w.r.t. all morphisms in  $\mathcal{C}$ , and  $r(S)$  the set of morphisms that have right lifting property w.r.t. all morphisms in  $\mathcal{C}$ . Then  $l(S)$  is stable under pushout and  $r(S)$  is stable under pull backs.  $\lrcorner$

**Def. (4.5.0.2) [Model Structure].** A **model structure** on a category  $\mathcal{C}$  is three classes of morphisms: **fibrations**, **cofibrations** and **weak equivalences** that satisfy the following axioms: (Denote a **A trivial (co)fibration** is a (co)fibration that is also a weak equivalence.)

M1  $\mathcal{C}$  has finite limits and colimits.

M2 (two out of three) If two of  $f, g, fg$  is weak equivalence, then so is the third.

M3 (retracts) Fibrations, cofibrations and weak equivalences are closed under retract.

M4 (lifting property) We have a lifting property with a cofibration  $i$  and fibration  $p$  when either of them is a weak equivalence.

M5 (factorization) Any map  $f$  can be factored as  $pi$  where  $i$  is trivial cofibration and  $p$  is a fibration, and also as  $pi$  where  $i$  is a cofibration and  $p$  is a trivial fibration.

**Remark (4.5.0.3).** Notice the axioms are symmetric in fibrations and cofibrations, thus the opposite category  $\mathcal{C}^{\text{op}}$  has a natural model structure. So whenever we write a theorem, we should always remember its dual counterpart.  $\lrcorner$

**Lemma (4.5.0.4) [Closedness].** A model category satisfies the retraction axiom iff:

- fibration =  $r(\text{trivial cofibrations})$ ,
- cofibration =  $l(\text{trivial fibrations})$ ,
- weak equivalence =  $uv$ , where  $v \in l(\text{fibrations})$  and  $u \in r(\text{cofibrations})$ .

*Proof:* If these are satisfied, retraction axiom is easy: A retract satisfies the same lifting properties. Hence retraction of a (co)fibration is a (co)fibration. For retracts weak equivalences, Cf.[Quillen, Homotopical Algebra, Chap5.2].

Conversely, using (4.2.2.12), we first factorize a  $p = f \circ i$ , where  $i$  is a trivial cofibration, then because  $p \in r(i)$ ,  $p$  is a retraction of  $f$  hence a fibration. And similarly for cofibrations and weak equivalences.  $\square$

**Cor. (4.5.0.5).** In a model category,  
trivial fibrations =  $r(\text{cofibrations})$ ,  
trivial cofibrations =  $l(\text{fibrations})$ .  $\lrcorner$

*Proof:* The proof is the same as that of (4.5.0.4).  $\square$

**Cor. (4.5.0.6).** In a model category, the class of (trivial)fibrations is stable under base change and the class of (trivial)cofibrations is stable under cobase change.  $\lrcorner$

**Prop. (4.5.0.7).** Let  $p$  be a fibration in  $C_{cf}$ , then  $p \in r(\text{Cof})$  iff  $\gamma(p)$  is an isomorphism, Cf.[Quillen 5.2]. So if conditions of(4.5.0.4) are satisfied (i.e.  $C$  is a closed model category),  $\gamma(f)$  is an isomorphism iff  $f$  is a weak equivalence by the characterization of weak-equivalence of(4.5.0.4).  $\lrcorner$

*Proof:*  $\square$

**Def. (4.5.0.8) [Left Proper Model Categories].** A model category is called **left proper** if weak equivalences are stable under cobase change by cofibrations. Dually it is called **right proper** if weak equivalences are stable under base change by fibrations.  $\lrcorner$

**Prop. (4.5.0.9) [Cofibration is Left Proper].** For a pushout diagram

$$\begin{array}{ccc} A & \xrightarrow{i} & B \\ \downarrow j & & \downarrow j' \\ A' & \xrightarrow{i'} & B' \end{array}$$

in a model category  $\mathcal{C}$ , if  $i$  is cofibration and  $A, A'$  are cofibrant, and  $j$  is weak equivalence, then  $j'$  is also weak equivalence.  $\lrcorner$

*Proof:* It suffices to show  $j'$  is an isomorphism in  $\text{Ho}(\mathcal{C})$ (4.5.1.15). For this, by Yoneda lemma, it suffices to show  $\text{Hom}_{\text{Ho}(\mathcal{C})}(B', Z) \cong \text{Hom}_{\text{Ho}(\mathcal{C})}(B, Z)$  for any fibrant object  $Z$ .

For surjectivity, by(4.5.1.18), it suffices to show  $\pi(B', Z) \cong \pi(B, Z)$ . Given a map  $f : B \rightarrow Z$ , because  $j$  is weak equivalence, there is a map  $g : A' \rightarrow Z$  that  $g \circ j \sim f \circ i$ . Then by(4.5.1.10), there is a  $f' \sim f$  that  $f' \circ i = g \circ j$ , which determines a morphism  $B' \rightarrow Z$ .

For injectivity, If  $P$  is a path object that  $H : B \rightarrow P$  induces a homotopy between maps  $s \circ j', s' \circ j'$ , then we need to extend this homotopy to  $\tilde{H} : B' \rightarrow P$ , and the method is the argument is the same as above.  $\square$

**Cor. (4.5.0.10).** If  $\mathcal{M}$  is a model category s.t. each object is cofibrant, then  $\mathcal{M}$  is left proper.  $\lrcorner$

## 1 Homotopies

**Def. (4.5.1.1) [Cylinder Objects].** A **cylinder object** for an object  $X$  is an object  $X \wedge I$  which gives a factorization of the natural map  $X \amalg X \rightarrow X$  as  $X \amalg X \xrightarrow{i} X \wedge I \xrightarrow{j} X$ , where  $j \in W$ . It is called a **good cylinder object** if  $i$  is a cofibration, and **very good cylinder object** if  $j$  is trivial fibration. By factorization axiom, every object has a very good cylinder object.

There are two natural morphisms  $X \mapsto X \wedge I$ , denoted by  $\partial_0$  and  $\partial_1$ .

Dually we can define **path object**  $Y^I$  for  $Y$ , and every object has a very good path object.  $\lrcorner$

**Prop. (4.5.1.2).** If  $A$  is cofibrant and  $A \wedge I$  is a cylinder object for  $A$ , then  $\partial_i : A \rightarrow A \times I$  are trivial cofibrations.  $\lrcorner$

*Proof:* Because it's pushout of  $\emptyset \rightarrow A$  and  $\sigma \circ \partial_i = \text{id}_A$ .  $\square$

**Cor. (4.5.1.3).** if  $f \sim^l g$ , then  $f$  is a weak equivalence iff  $g$  is a weak equivalence.  $\lrcorner$

*Proof:* This is because  $f = H \circ \partial_0, g = H \circ \partial_1$ , and we can use(4.5.1.2).  $\square$

**Def. (4.5.1.4) [Homotopies].** Two morphisms  $f, g : X \rightarrow Y$  are called **(good/very good) left homotopic**, denoted by  $f \sim^l g$  iff there is a (good/very good) cylinder object  $X \amalg X \rightarrow X \wedge I$  with  $X \wedge I \rightarrow Y$  that induce  $(f, g) : X \amalg X \rightarrow Y$ . Dually for right homotopies. And we denote by  $\pi^l(A, B)/\pi^r(A, B)$  the equivalence classes of  $\text{Hom}(A, B)$  under the equivalence relation generated by left/right homotopies.

If  $f, g \in \text{Hom}(X, Y)$  and  $\varphi \in \text{Hom}(Y, Z)$  that  $\varphi \circ f = \varphi \circ g$ , then  $f, g$  is called **left homotopic over  $Z$**  if there is a homotopy  $H$  of  $f \sim^l g$  that  $\varphi H$  is the trivial homotopy. Dually for **right homotopic under  $X$** .  $\lrcorner$

**Lemma (4.5.1.5) [Very Good Homotopies].** For  $f, g \in \text{Hom}(X, Y)$ , if  $f \sim^l g$ , then  $f, g$  are good left homotopic. And if  $Y$  is fibrant, then  $f, g$  are moreover very good left homotopic.  $\lrcorner$

*Proof:* The first assertion is each, just choose a factorization of the cylinder object  $X \amalg X \xrightarrow{i} X \wedge I' \xrightarrow{j} X \wedge I$  that  $i$  is cofibrant. If  $Y$  is fibrant, then we further factorize  $X \wedge I' \xrightarrow{i} X \wedge I'' \xrightarrow{j} X$ , where  $i$  is cofibrant and  $j$  is trivial fibration, then by two out of three,  $i$  is also trivial cofibration, and it suffices to extend the homotopy  $X \wedge I' \rightarrow Y$  to  $X \wedge I'' \rightarrow Y$ , and this is because  $Y$  is fibrant.  $\square$

**Prop. (4.5.1.6) [Homotopy is Equivalence Relation].** If  $A$  is cofibrant, then the left homotopy is an equivalence relation on  $\text{Hom}(A, B)$ .  $\lrcorner$

*Proof:* Reflexivity and symmetry is trivial, the only problem is transitivity, so we construct a glueing  $A \wedge I''$  as the pushout of  $\partial_1 : A \rightarrow A \wedge I$  and  $\partial'_0 : A \rightarrow A \wedge I'$ .  $A \wedge I'' \rightarrow A$  is a weak equivalence by the universal property and (4.5.0.4), so this is a cylinder object. The rest is easy.  $\square$

**Prop. (4.5.1.7) [Properties of Left Homotopies].** If  $A$  is cofibrant and  $f, g \in \text{Hom}(A, B)$ , then

1. If  $f, g$  are right homotopic, then  $s \rightarrow B^I$  can be chosen to be trivial Cof.
  2. If  $f, g$  are right homotopic, then so does  $uf \sim ug$  or  $fv \sim gv$ . Thus if  $A$  is cofibrant, there is a composition map:  $\pi^r(A, B) \times \pi^r(B, C) \rightarrow \pi^r(A, C)$ .
  3. For any trivial fibration  $X \rightarrow Y$ ,  $\pi^l(A, X) \rightarrow \pi^l(A, Y)$  is a bijection.
- And dual arguments hold for fibrant objects.  $\lrcorner$

*Proof:*

1. factorize  $B \rightarrow B^I$  to  $B \rightarrow B^{I'} \rightarrow B^I$  where  $B \rightarrow B^{I'} \in \text{TCof}$  and  $B^{I'} \rightarrow B^I \in W$ , so  $B^{I'}$  is also a cylinder object and the homotopy  $A \rightarrow B^I$  can be lifted to  $A \rightarrow B^{I'}$ .

2. there is a diagram

$$\begin{array}{ccc} B & \xrightarrow{su} & C^I \\ \downarrow s & & \downarrow (d_0, d_1) \\ B^I & \xrightarrow{(d_0 u, d_1 u)} & C \times C \end{array}$$

which has a lifting  $\varphi$ , then composed with  $A \rightarrow B^I$

will give the desired homotopy.

3. the map is well-defined, it is surjective because of lifting property, and it is injective because  $A \amalg A \rightarrow A \times I \in \text{Cof}$  so the homotopy can be lifted to  $X$ .  
Cf. [Homotopy Theories and Model Categories, P20, 21].  $\square$

**Lemma (4.5.1.8) [Left and Right Homotopies].** If  $X$  is cofibrant, then for  $f, g \in \text{Hom}(X, Y)$ , if  $f \sim_l g$ , then  $f \sim_r g$ . And the dual conclusion holds for  $Y$  fibrant.

In particular, for morphisms between bifibrant objects, left and right homotopic are equivalent.

⌋

*Proof:* Consider a cylinder object  $j : X \wedge I \rightarrow X$  for  $X$  and a path object for  $Y$ . Suppose  $f, g$  are left homotopic via a map  $H : X \wedge I \rightarrow Y$ , then we consider the diagram

$$\begin{array}{ccccc} X & \xrightarrow{f} & Y & \xrightarrow{\quad} & Y^I \\ \downarrow \partial_1 & & \searrow & \nearrow & \downarrow \\ X \wedge I & \xrightarrow{(f \circ j) \times H} & Y \times Y & & Y^I \end{array}.$$

Then it can be solved by some  $\tilde{H}$  because  $\partial_1$  is trivial cofibration (4.5.1.2), and then it can be checked  $H \circ \partial_1$  gives the desired right homotopy.  $\square$

**Prop. (4.5.1.9) [Whitehead's Theorem].** Let  $X, Y \in \mathcal{C}$  be bifibrant, then a map  $f : X \rightarrow Y$  is an equivalence iff there is a  $g : X \rightarrow Y$  that  $fg$  and  $gf$  are homotopic to id.  $\square$

*Proof:* Cf. [Homotopy Theories and Model Categories, P23].  $\square$

**Prop. (4.5.1.10) [Lifting Criterion].** Let  $\mathcal{C}$  be a model category and  $i : A \rightarrow B$  be a cofibration between cofibrant objects, and  $X$  is fibrant,  $g : B \rightarrow X, f : A \rightarrow X$  satisfies  $g \circ i \sim f$ , then there is a  $g' \sim g$  that  $g' \circ i = f$ .  $\square$

*Proof:* Choose a good cylinder object  $C(A)$  for  $A$  and factorize

$$C(A) \coprod_{A \coprod A} (B \coprod B) \rightarrow C(B) \rightarrow B$$

where the first map is cofibration and the second is trivial fibration, then  $C(B)$  is a good cylinder object for  $B$ .

The homotopy is given by a map  $C(A) \coprod_A B \rightarrow X$ , and we check  $(A) \coprod_A B \rightarrow C(B)$  is a trivial cofibration (check  $C(A) \coprod_A B \rightarrow B$  is weak equivalence using (4.5.0.6) and check  $C(A) \coprod_A B \rightarrow C(A) \coprod_A \coprod_A (B \coprod B)$  is a cofibration as a cobase change of  $A \rightarrow B$  and  $C(A) \coprod_A \coprod_A (B \coprod B) \rightarrow C(B)$  is a cofibration by definition), so the homotopy extends to a homotopy  $C(B) \rightarrow X$ , which is a homotopy between  $g$  and some  $g'$  and  $g' \circ i = f$ .  $\square$

**Def. (4.5.1.11).** Let  $C_c, C_f, C_{cf}$  denote the full subcategory of cofibrant, fibrant and cofibrant-fibrant objects. And we define  $\pi C_c$  as the category module right homotopy equivalence between morphisms, dually for  $\pi C_f$ .

Notice (4.5.1.7) assures  $\pi C_c, \pi C_f$  are truly categories.

Notice for  $C_{cf}$ , left homotopy is equivalent to right homotopy by (4.5.1.8), so  $\pi C_{cf}$  is full subcategory for both  $\pi C_c$  and  $\pi C_f$ .  $\square$

**Lemma (4.5.1.12) [Fibrant and Cofibrant Replacement].** For an object  $X$  in a model category  $\mathcal{C}$ , the axioms show there is a cofibrant object  $QX$  and a trivial fibration  $QX \rightarrow X$ . Also there is a fibrant object  $RX$  and a trivial cofibration  $X \rightarrow RX$ . We fix choices of  $Q, R$  that is identity on bifibrant objects, and consider it a mapping from  $\mathcal{C}$  to  $\mathcal{C}$ .

Then given any morphism  $f : X \rightarrow Y$ , there is a morphism  $\tilde{f} : QX \rightarrow QY$  lifting  $f$ , and  $\tilde{f}$  depends up to left and right homotopy only on  $f$ . And if  $Y$  is fibrant, then it depends up to left and right homotopy only on the left homotopy classes of  $f$ .

Dually assertions also holds, so we have functors:  $Q : \mathcal{C} \rightarrow \pi C_c$  and  $R : \mathcal{C} \rightarrow \pi C_f$ .  $\square$

*Proof:* The existence of the lifting follows from the fact  $QX$  is fibrant and  $QY \rightarrow Y$  is trivial fibration. The uniqueness of left homotopy follows from (4.5.1.7), and also right homotopy, because  $QX$  is cofibrant and use (4.5.1.8). For the last assertion, notice when  $Y$  is fibrant, (4.5.1.7) shows the left homotopy class of  $QX \rightarrow Y$  is determined, and use (4.5.1.7) again, the class of  $f$  is also determined.  $\square$

**Cor. (4.5.1.13).** The restrictions define functors  $Q' : \pi\mathcal{C}_c \rightarrow \pi\mathcal{C}_{cf}$  and  $R' : \pi\mathcal{C}_f \rightarrow \pi\mathcal{C}_{cf}$ .  $\lrcorner$

**Def. (4.5.1.14) [Homotopy Category].** For any model category  $\mathcal{C}$ , we construct a **homotopy category**  $\text{Ho}(\mathcal{C})$  whose objects are the same as  $\mathcal{C}$ , but  $\text{Hom}_{\text{Ho}(\mathcal{C})}(X, Y) = \text{Hom}_{\pi\mathcal{C}_{cf}}(RQX, RQY) = \pi(RQX, RQY)$ .

There is a functor  $\gamma : \mathcal{C} \rightarrow \text{Ho}(\mathcal{C})$  by sending  $X$  to  $RQX$ , by (4.5.1.12).  $\lrcorner$

**Prop. (4.5.1.15) [Weak Equivalence and Isomorphisms].** A morphism in  $\mathcal{C}$  maps to an isomorphism in  $\text{Ho}(\mathcal{C})$  iff it is a weak equivalence. The morphisms in  $\text{Ho}(\mathcal{C})$  are generated by the image of morphisms in  $\mathcal{C}$  and the inverse of images of weak equivalences in  $\mathcal{C}$ .  $\lrcorner$

*Proof:* If  $f \in \mathcal{C}$  is a weak equivalence, then  $f' = RQ(f)$  is also a weak equivalence, by two out of three lemma. Then Whitehead theorem (4.5.1.9) shows  $f'$  is an isomorphism in  $\pi\mathcal{C}_{cf}$  hence in  $\text{Ho}(\mathcal{C})$ . Conversely, if  $f'$  has an inverse in  $\text{Ho}(\mathcal{C})$ , then  $f'$  is a weak equivalence by Whitehead (4.5.1.9) again, and so is  $f$ .

For the last assertion, just notice  $\text{Hom}(RQX, RQY) \rightarrow \text{Hom}_{\text{Ho}(\mathcal{C})}(X, Y)$  is a surjection, and  $X \rightarrow RQX, Y \rightarrow RQY$  are weak equivalence hence are isomorphisms in  $\text{Ho}(\mathcal{C})$ .  $\square$

**Cor. (4.5.1.16).** If  $F, G : \text{Ho}(\mathcal{C}) \rightarrow \mathcal{D}$  are two functors and  $t : F \circ \gamma \rightarrow G \circ \gamma$  is a natural transformation, then  $t$  also gives a natural transformation  $F \rightarrow G$ .  $\lrcorner$

*Proof:* This is because the objects of  $\text{Ho}(\mathcal{C})$  are the same as that of  $\mathcal{C}$ , and the morphisms are generated by  $\gamma(f)$  and  $\gamma(g)^{-1}$  where  $g$  is a weak equivalence. Then the desired transformation commutative diagrams commute.  $\square$

**Lemma (4.5.1.17).** Let  $\mathcal{C}$  be a model category and  $F : \mathcal{C} \rightarrow \mathcal{D}$  be a functor taking weak equivalences to isomorphisms, then if  $f \sim^l g$  or  $f \sim^r g$ ,  $F(f) = F(g)$ .  $\lrcorner$

*Proof:* We only prove for left homotopy and the right homotopy is dual: given the cylinder object  $A \wedge I$ , just need to prove that  $F(\partial_0) = F(\partial_1)$ .  $\square$

**Prop. (4.5.1.18).** Suppose  $A$  is cofibrant and  $X$  is fibrant, then the map  $\gamma : \text{Hom}(A, X) \rightarrow \text{Hom}_{\text{Ho}(\mathcal{C})}(A, X)$  is surjective, and induces a bijection  $\pi(A, X) \cong \text{Hom}_{\text{Ho}(\mathcal{C})}(A, X)$ .  $\lrcorner$

*Proof:* (4.5.1.17) shows  $\gamma$  identifies homotopic maps. Consider the following commutative diagram:

$$\begin{array}{ccc} \pi(RA, QX) & \longrightarrow & \pi(A, X) \\ \downarrow \gamma & & \downarrow \gamma \\ \text{Hom}_{\text{Ho}(\mathcal{C})}(RA, QX) & \longrightarrow & \text{Hom}_{\text{Ho}(\mathcal{C})}(A, X) \end{array} \quad .$$

The second vertical arrow is isomorphism by (4.5.1.15), the first arrow is isomorphism by (4.5.1.7).

The left vertical arrow is identity by construction, so the right vertical arrow is also isomorphism.  $\square$

**Cor. (4.5.1.19).** There is a natural isomorphism  $\pi\mathcal{C}_{cf} \cong \text{Ho}(\mathcal{C})$ .  $\lrcorner$

**Prop. (4.5.1.20) [Homotopy Category as Localizing Category].** Let  $\mathcal{C}$  be a model category and  $W$  the class of weak equivalences, then the functor  $\gamma : \mathcal{C} \rightarrow \text{Ho}(\mathcal{C})$  is the localizing category of  $\mathcal{C}$  w.r.t  $W$ .  $\lrcorner$

*Proof:* Cf. [Homotopy Theories and Model Categories, P29]. ?  $\square$

## 2 Quillen Adjunctions and Derived Functors

**Def. (4.5.2.1) [Quillen Adjunctions].** An adjunction  $(F, G) : \mathcal{C} \rightleftarrows \mathcal{D}$  between model categories is called a **Quillen adjunction** if  $F$  preserves cofibrations and  $G$  preserves fibrations. By adjointness and (4.5.0.4), in fact  $F$  preserves also trivial cofibrations and  $G$  preserves trivial fibrations.

Moreover, it is called a **Quillen equivalence** if for any cofibrant object  $C \in \mathcal{C}$  and fibrant object  $D \in \mathcal{D}$ , a map  $C \rightarrow G(D)$  is a weak equivalence iff the adjoint map  $F(C) \rightarrow D$  is a weak equivalence.  $\lrcorner$

**Def. (4.5.2.2) [Derived Functors].** Let  $\mathcal{C}$  be a model category and  $F : \mathcal{C} \rightarrow \mathcal{D}$  a functor, then a **left derived functor** of  $F$  is a left Kan extension of  $F$  along  $\gamma : \mathcal{C} \rightarrow \text{Ho}(\mathcal{C})$ .

Dually we can define **right derived functors**.  $\lrcorner$

**Prop. (4.5.2.3) [Existence of Derived Functors].** In the situation of (4.5.2.2), if  $F$  maps weak equivalences between cofibrant objects to isomorphisms in  $\mathcal{D}$ , then the left derived functor  $(LF, t)$  exists, and for each cofibrant object  $X$ , the morphism  $t_X : LF(X) \rightarrow F(X)$  is an isomorphism.

Dually for the right derived functor case.  $\lrcorner$

*Proof:* Cf. [Homotopy Theories and Model Categories, P42].  $\square$

**Lemma (4.5.2.4).** Let  $\mathcal{C}$  be a model category and  $F : \mathcal{C}_c \rightarrow \mathcal{D}$  be a functor that maps trivial cofibrations in  $\mathcal{C}_c$  to isomorphisms, then  $F$  maps right-homotopic morphisms to the same morphism.  $\lrcorner$

*Proof:* Let  $H : A \rightarrow B^I$  be a right homotopy between  $f$  and  $g$ , where  $B^I$  is a very good path object (4.5.1.5), then  $B \rightarrow B^I$  is a trivial cofibration, and thus mapped by  $F$  to an isomorphism. Then we can show  $F(\partial_0) = F(\partial_1)$ , and then  $F(f) = F(g)$ .  $\square$

**Def. (4.5.2.5) [Total Left Derived Functors].** Let  $F : \mathcal{C} \rightarrow \mathcal{D}$  be a morphism of model categories, then a **total derived functor**

$$LF : \text{Ho}(\mathcal{C}) \rightarrow \text{Ho}(\mathcal{D})$$

is defined to be a left derived functor of the morphism  $\mathcal{C} \rightarrow \mathcal{D} \rightarrow \text{Ho}(\mathcal{D})$ .  $\lrcorner$

**Lemma (4.5.2.6) [Brown].** Let  $F$  be a morphism of model categories that maps trivial cofibration between cofibrant objects to weak equivalences, then it preserves weak equivalences between cofibrant objects.  $\lrcorner$

*Proof:* If  $f : A \rightarrow B$  is a weak equivalence between cofibrant objects, then we can factor the morphism  $(f, \text{id}) : A \amalg B \rightarrow B$  as  $A \amalg B \xrightarrow{q} C \xrightarrow{p} B$  that  $q$  is cofibration and  $p$  is trivial fibration. It can be shown that  $q \circ \partial_i : B \rightarrow C$  are trivial fibrations and  $C$  is cofibrant, thus  $F(q \circ \partial_i)$  are weak equivalences, and hence also  $F(p)$  is weak equivalence and so does  $F(f)$ .  $\square$

**Prop. (4.5.2.7) [Total Derived Functors and Quillen Equivalence].** If  $(F, G)$  is a pair of Quillen functors between two model categories  $\mathcal{C}, \mathcal{D}$ , then total derived functors

$$LF : \text{Ho}(\mathcal{C}) \rightleftarrows \text{Ho}(\mathcal{D}) : RG$$

exists and form an adjunction pair. And if  $(F, G)$  is a Quillen equivalence, then  $(LF, RG)$  defines an equivalence of homotopy categories.  $\lrcorner$

*Proof:* By (4.5.2.3) and its dual and (4.5.2.6), the total derived functors  $LF, RG$  exist.

Next for  $A$  cofibrant in  $\mathcal{C}$  and  $X$  fibrant in  $\mathcal{D}$ , we can show the adjunction map  $\text{Hom}(A, G(X)) \cong \text{Hom}(F(A), X)$  preserves homotopy equivalence relations (4.5.1.8) and induces an isomorphism  $\pi(A, G(X)) \cong \pi(F(A), X)$ : If  $H : A \wedge I \rightarrow X$  is a good homotopy between  $f, g$ , then  $A \wedge I$  is cofibrant, and because  $F$  preserves colimits and because of (4.5.2.6),  $F(A \wedge I)$  is cylinder object for  $F(A)$ , thus  $f^\flat \sim g^\flat$ . A dual argument shows the converse.

Now for any  $A \in \mathcal{C}$  and  $X \in \mathcal{D}$ , there is a bijection

$$\text{Hom}_{\text{Ho}(\mathcal{C})}(A, RG(X)) \cong \pi(QA, G(SX)) \cong \pi(F(QA), SX) \cong \text{Hom}_{\text{Ho}(\mathcal{D})}(LFA, X)$$

where the first isomorphism is due to the fact  $QA \rightarrow RQA$  is trivial cofibration and  $G(SX)$  is fibrant, thus we can use (4.5.1.7), dually for the last isomorphism.

Finally if  $(F, G)$  is a Quillen equivalence, then consider the unit map:

$$A \rightarrow RG(LF(A)).$$

If  $A$  is cofibrant, then this is  $A \rightarrow G(SF(A))$  which is a weak equivalence because  $F(A) \rightarrow SF(A)$  does, so it is an isomorphism in  $\text{Ho}(\mathcal{C})$ . Now any object in  $\text{Ho}(\mathcal{C})$  is isomorphic to a cofibrant object, we know the unit map is an isomorphism. Dually the counit map is an isomorphism, thus  $LF, GF$  are a pair of equivalences.  $\square$

### 3 Combinatorial Model Structure

Cf. [HTT, A.2.6]

**Def. (4.5.3.1) [Cofibrantly-Generated Model Categories].** A cofibrantly-generated model category is a model category  $\mathcal{C}$  that

- there is a small set  $I$  of generating cofibrations that generates the class of cofibrations as the minimal weakly saturated class containing  $I$ .
- there is a small set  $J$  of generating trivial cofibrations that generates the class of trivial cofibrations as the minimal weakly saturated class containing  $J$ .

┘

**Def. (4.5.3.2) [Combinatorial Model Categories, Smith].** A combinatorial model category is a cofibrantly generated (4.5.3.1) and locally presentable (4.1.2.5) model category.  $\square$

**Prop. (4.5.3.3) [Smith].** Let  $\mathcal{M}$  be a combinatorial model category and  $\mathcal{M}^{[1]}$  the category of arrows, then the full subcategory generated by fibrations, weak equivalences, or trivial fibrations are all full accessible (4.1.2.4) subcategories of  $\mathcal{M}^{[1]}$ .  $\square$

*Proof:* Cf. [Lur09]P818.  $\square$

**Prop. (4.5.3.4) [Constructing Combinatorial Model Categories].** Let  $\mathcal{M}$  be a locally presentable category and  $W, C$  be classes of morphisms in  $\mathcal{M}$  s.t.

- $C$  is a weakly saturated class generated by a small subset  $C_0$ .
- $C \cap W$  is a weakly saturated class.
- $W \subset A^{[1]}$  is a full accessible subcategory.
- $W$  satisfies the 2-out-of-3 property.

- $r(C) \subset W$ .

Then  $\mathcal{M}$  admits a combinatorial model category with

- Cofibrations:  $C$ .
- Weak equivalences:  $W$ .
- Fibrations:  $r(C \cap W)$ .

┘

*Proof:* Cf. [Lur09]P821.

□

**Lemma (4.5.3.5).** Situation as in (4.5.3.4), the class  $C \cap W$  is a weakly saturated class generated by a small subset  $S \subset C \cap W$ .

┘

*Proof:* Cf. [Lur09]P819.

□

**Prop. (4.5.3.6) [Constructing Left Proper Model Categories].** Let  $\mathcal{M}$  be a locally presentable category with a class  $W$  of morphisms and a small set of morphisms  $C_0$  s.t.

- $W$  is a perfect class ?,
- $C_0$  is stable under cobase change.
- $W$  is stable under cobase change by  $C_0$ .
- $r(C_0) \subset W$ .

Then there is a left proper combinatorial model category on  $\mathcal{M}$  with

- Cofibrations: The weakly saturated closure  $C$  of  $C_0$ .
- Weak Equivalences:  $W$ .
- Fibrations:  $r(C \cap W)$ .

Moreover, any left proper combinatorial model category arises in this way.

┘

*Proof:* Cf. [Lur09]P823.

□

## 4 Generating new Model Categories

**Prop. (4.5.4.1) [Overcategories and Undercategories].** If  $\mathcal{C}$  is a model category and  $A \in \mathcal{C}$ , then the undercategory  $\mathcal{C}_{A/}$  and the overcategory  $\mathcal{C}_{/A}$  have natural model structures.

┘

*Proof:*

□

**Prop. (4.5.4.2) [Transfer Model Structures via Left Adjoint].** Let

$$F : \mathcal{C} \rightleftarrows \mathcal{D} : G$$

be an adjoint pair of categories and

- $\mathcal{C}, \mathcal{D}$  are complete and cocomplete,
- $\mathcal{C}$  is a cofibrantly generated model category,
- $\mathcal{C}, \mathcal{D}$  are presentable categories and  $G$  is an accessible functor.
- If we define a morphism  $f$  in  $\mathcal{B}$  a fibration/weak equivalent iff  $G(f)$  is a fibration/weak equivalence, and a cofibration iff it has left lifting property w.r.t. trivial fibrations, then  $\mathcal{B}$  has a path object factorization and a fibrant replacement operator.

Then this defines a cofibrantly generated model category on  $\mathcal{B}$ , and makes  $(F, G)$  a Quillen adjunction.  $\lrcorner$

*Proof:* It suffices to show that the factorization property holds: In fact, it suffices to show if  $I, J$  are generating classes of cofibrations and trivial cofibrations, then  $F(I), F(J)$  are generating classes of cofibrations and trivial cofibrations. But this suffices to show  $F(J)$  is a weak equivalence. For this, show that any morphism in  $\mathcal{B}$  that has left lifting properties w.r.t. all fibrations is a weak equivalence using hypothesis item4. ?  $\square$

### Bousfield Localizations

Cf.[P.S. Hirschhorn. Model categories and their localizations].

**Def. (4.5.4.3) [Bousfield Localizations].** Let  $\mathcal{M}, \mathcal{M}'$  be model categories with the same underlying category, then  $\mathcal{M}'$  is called a **Bousfield localization** of  $\mathcal{M}$  if

- $\text{Cof}(\mathcal{M}) = \text{Cof}(\mathcal{M}')$ .
- $\text{Weak}(\mathcal{M}) \subset \text{Weak}(\mathcal{M}')$ .

$\lrcorner$

## 5 Enriched and Monoidal Model Categories

**Def. (4.5.5.1) [Left Quillen Bifunctor].** Let  $\mathcal{A}, \mathcal{B}, \mathcal{C}$  be model categories, then a functor  $\mathcal{A} \times \mathcal{B} \rightarrow \mathcal{C}$  is called a **left Quillen bifunctor** if

- For any cofibrations  $i : A \rightarrow A' \in \mathcal{A}, B \rightarrow B' \in \mathcal{B}$ , the induced map

$$i \wedge j : F(A', B) \coprod_{F(A, B)} F(A, B') \rightarrow F(A', B')$$

is a cofibration in  $\mathcal{C}$ .

- $F$  preserves small colimits separably in each variables.

$\lrcorner$

**Def. (4.5.5.2) [Monoidal Model Category].** A **monoidal model category** is a monoidal category  $\mathcal{S}$  equipped with a model structure that:

- The tensor product  $\otimes : \mathcal{S} \times \mathcal{S} \rightarrow \mathcal{S}$  is a left Quillen bifunctor.
- The unit objects  $1 \in \mathcal{S}$  is cofibrant.
- The monoidal structure is closed.

$\lrcorner$

**Def. (4.5.5.3) [Enriched Model Category].** Given a monoidal model category  $\mathcal{S}$ , an  **$\mathcal{S}$ -enriched model category** is an  $\mathcal{S}$ -enriched category  $\mathcal{A}$  with a model structure satisfying:

- $\mathcal{A}$  is tensored and cotensored over  $\mathcal{S}$ . ?
- the tensor product  $\mathcal{A} \times \mathcal{S} \rightarrow \mathcal{S}$  is a left Quillen bifunctor (4.5.5.1).

$\lrcorner$

**Prop. (4.5.5.4).** The second condition in (4.5.5.3) is equivalent to the following: For a cofibration  $i : U \rightarrow V$  and a fibration  $p : X \rightarrow Y$ , the induced map

$$\text{Map}(V, X) \xrightarrow{(i^*, p_*)} \text{Map}(U, X) \times_{\text{Map}(U, Y)} \text{Map}(V, Y)$$

is a fibration in  $\mathcal{S}$ , and trivial fibration if any of  $i, p$  is weak equivalence.  $\lrcorner$

*Proof:* Use the adjunction relations to write it out?  $\square$

**Def. (4.5.5.5) [Fibrant Enriched Categories].** Let  $\mathcal{A}$  be a  $\mathcal{S}$ -enriched category, then we denote  $\mathcal{A}^\circ$  the subcategory of bifibrant objects of  $\mathcal{A}$ , which is also a  $\mathcal{S}$ -enriched category.  $\lrcorner$

## 6 Diagram Categories

[Lur09]A.2.8. A.3.3., A.3.5.

**Prop. (4.5.6.1) [(Injective)Projective Model Categories].** Let  $\mathcal{S}$  be an excellent model category and  $\mathcal{A}$  a combinatorial  $\mathcal{S}$ -enriched model category,  $\mathcal{C}$  a small  $\mathcal{S}$ -enriched category, then there are two model structures on  $\mathcal{A}^{\mathcal{C}}$ :

- The **projective model category**  $\text{Func}(\mathcal{C}, \mathcal{A})_{\text{Proj}}$  with
  - Fibrations: **projective fibrations**  $F$  s.t.  $F(C) \rightarrow G(C)$  is a fibration in  $\mathcal{A}$  for each  $C \in \mathcal{C}$ .
  - Weak equivalences:  $F$  s.t.  $F(C) \rightarrow G(C)$  is a weak equivalence in  $\mathcal{A}$  for each  $C \in \mathcal{C}$ .
  - Cofibrations: **projective cofibrations** determined by the above two.
- The **injective model category**  $\text{Func}(\mathcal{C}, \mathcal{A})_{\text{inj}}$  with
  - Cofibrations: **injective cofibrations**  $F$  s.t.  $F(C) \rightarrow G(C)$  is a cofibration in  $\mathcal{A}$  for each  $C \in \mathcal{C}$ .
  - Weak equivalences:  $F$  s.t.  $F(C) \rightarrow G(C)$  is a weak equivalence in  $\mathcal{A}$  for each  $C \in \mathcal{C}$ .
  - Fibrations: **injective fibrations** determined by the above two.

$\lrcorner$

*Proof:* Cf. [Lur09]P868, P828.  $\square$

**Cor. (4.5.6.2).** Both model categories are left/right proper iff  $\mathcal{A}$  is.  $\lrcorner$

**Cor. (4.5.6.3).** Projective cofibrations are injective cofibrations, and injective fibrations are projective fibrations.  $\lrcorner$

**Prop. (4.5.6.4).** Let  $\mathcal{C}$  be a model category and let

$$\begin{array}{ccc} A & \xrightarrow{j} & A_1 \\ \downarrow i & & \downarrow \\ A_0 & \longrightarrow & A_0 \amalg_A A_1 \end{array}$$

be a pushout diagram, then it is a homotopy pushout diagram if either of the following is satisfied:

- $j$  is a cofibration and  $A, A_0$  are cofibrant.
- $j$  is a cofibration and  $\mathcal{C}$  is left proper.

$\lrcorner$

*Proof:*

$\square$

## Reedy Model Categories

### Homotopy Colimits and Limits

Should be redone in the general language of diagram categories. ?

**Def. (4.5.6.5) [Homotopy Colimits and Limits].** In a model category  $\mathcal{M}$ , for any diagram  $A_0 \leftarrow A \rightarrow A_1$ , there exists a commutative diagram

$$\begin{array}{ccccc} A'_0 & \xleftarrow{i} & A' & \xrightarrow{j} & A'_1 \\ \downarrow & & \downarrow & & \downarrow \\ A_0 & \xleftarrow{\quad} & A & \xrightarrow{\quad} & A_1 \end{array} .$$

such that  $A'$  is cofibrant, and  $i, j$  are both cofibrant, and the vertical arrows are weak equivalences.

Then it can be shown that  $A'_0 \coprod_{A'} A'_1$  only depends on  $A_0 \leftarrow A \rightarrow A_1$  up to weak equivalence. Then a commutative diagram

$$\begin{array}{ccc} A & \longrightarrow & A_1 \\ \downarrow & & \downarrow \\ A_0 & \longrightarrow & C \end{array}$$

is called a **homotopy colimit** if for any such cofibrant replacement,

$$A'_0 \coprod_{A'} A'_1 \rightarrow A_0 \coprod_A A_1 \rightarrow C$$

is a weak equivalence.

Dually we can define homotopy limits. ┘

*Proof:* ? □

**Cor. (4.5.6.6).** Weakly equivalent diagrams induce weakly equivalent homotopy colimits. ┘

**Prop. (4.5.6.7).** In a model category  $\mathcal{M}$ , a diagram

$$\begin{array}{ccc} A & \xrightarrow{j} & A_1 \\ \downarrow & & \downarrow \\ A_0 & \longrightarrow & A_0 \coprod_A A_1 \end{array}$$

is a homotopy limit if  $j$  is cofibrant, and either

- $A, A_0$  are cofibrant, or
  - $\mathcal{M}$  is left proper.
- ┘

*Proof:* ? □

## 7 Model Structures on $\mathcal{Cat}_S$

**Def. (4.5.7.1) [Homotopy Category].** Let  $S$  be a monoidal model category, then there is a natural monoidal structure on the homotopy category  $hS$  (4.5.1.14), and the functor  $S \mapsto hS$  is monoidal, thus we can transfer from a category  $\mathcal{C}$  enriched over  $S$  to an  $hS$ -enriched category, called the **homotopy category** of  $\mathcal{C}$ .  $\lrcorner$

**Def. (4.5.7.2) [Weak Equivalences of Enriched Categories].** Let  $S$  be a monoidal model category and  $\mathcal{Cat}_S$  be the category of categories enriched over  $S$ , then a morphism  $F : \mathcal{C} \rightarrow \mathcal{D} \in \mathcal{Cat}_S$  is called a **weak equivalence** if it induced an isomorphism of their homotopy categories, or equivalently,

- $F$  is essentially surjective,
  - For any  $X, Y \in \mathcal{C}$ ,  $\text{Map}_{\mathcal{C}}(X, Y) \rightarrow \text{Map}_{\mathcal{D}}(FX, FY)$  is a weak equivalence in  $S$ .
- $\lrcorner$

**Def. (4.5.7.3) [Generating Cofibrations in  $\mathcal{Cat}_S$ ].** Let  $S$  be a monoidal model category,  $A$  is an object of  $S$ , then we can denote  $[1]_A$  the  $S$ -enriched category consists of objects  $\{X, Y\}$  and that  $\text{Hom}(X, X) = \text{Hom}(Y, Y) = 1_S$ ,  $\text{Hom}(X, Y) = A$ ,  $\text{Hom}(Y, X) = \emptyset$ . And if  $1_S$  is the initial object of  $S$ , then we denote  $[1]_{1_S}$  by  $[1]_S$ . Also we denote  $[0]_S$  the  $S$ -enriched category consisting of one element and the morphism space is  $1_S$ .

Let  $[1]_S^\sim$  be the category consisting of two objects  $\{X, Y\}$  that  $\text{Hom}(Z_1, Z_2) = 1_S$  for any  $Z_1, Z_2 \in S$ .

Let  $C_0$  be the class of morphisms in  $\mathcal{Cat}_S$  consisting of

- $\emptyset \rightarrow [0]_S$ .
  - The induced map  $[1]_S \rightarrow [1]_{S'}$  where  $S \rightarrow S'$  ranges over a generating class of cofibrations of  $S$ .
- $\lrcorner$

**Prop. (4.5.7.4) [Model Category on  $\mathcal{Cat}_S$ ].** Let  $S$  be a combinatorial monoidal model category that every object of  $S$  is cofibrant and the collection of weak equivalences of  $S$  is stable under filtered colimits, then there exists a left proper combinatorial model structure on  $\mathcal{Cat}_S$  that

- The class of cofibrations in  $\mathcal{Cat}_S$  is the smallest weakly saturated class generated by  $C_0$  defined in (4.5.7.3),
  - The weak equivalences are as defined in (4.5.7.2).
- $\lrcorner$

*Proof:* Cf. [HTT, P856].  $\square$

**Cor. (4.5.7.5).** Let

$$f : S \rightleftarrows S' : g$$

be a Quillen adjunction between monoidal model categories satisfying conditions in (4.5.7.4), then they induces a Quillen adjunction

$$F : \mathcal{Cat}_S \rightleftarrows \mathcal{Cat}_{S'} : G$$

and this is a Quillen equivalence if  $(f, g)$  is.  $\lrcorner$

*Proof:*

$\square$

**Prop. (4.5.7.6).** Let  $\mathcal{C}, \mathcal{D}$  be  $\mathcal{S}$ -enriched model categories and

$$F : \mathcal{C} \xrightleftharpoons{\text{Quillen}} \mathcal{D} : G$$

is a Quillen adjunction of underlying model categories. Assume every objects of  $\mathcal{C}$  is cofibrant and the maps  $\beta_{X,S} : S \otimes F(X) \rightarrow F(S \otimes X)$  is a weak equivalence for  $X \in \mathcal{C}, S \in \mathcal{S}$  cofibrant, then the following are equivalent:

- $(F, G)$  is a Quillen equivalence.
- $G$  determines a weak equivalence (4.5.7.2) of the underlying  $\mathcal{S}$ -enriched categories  $\mathcal{D}_{cf} \rightarrow \mathcal{C}_{cf}$ .

┘

*Proof:* Cf.[HTT, P853].

□

**Def. (4.5.7.7) [Local Fibrations].** Let  $\mathcal{C}$  be an  $\mathcal{S}$ -enriched category where  $\mathcal{S}$  is a monoidal model category, then a morphism  $f \in \mathcal{C}$  is called an **equivalence** if it maps to an isomorphism in  $h\mathcal{C}$ .

$\mathcal{C}$  is called **locally fibrant** if for any  $X, Y \in \mathcal{C}$ , the mapping space  $\text{Map}(X, Y)$  is fibrant in  $\mathcal{S}$ .

An  $\mathcal{S}$ -enriched functor  $F : \mathcal{C} \rightarrow \mathcal{C}'$  is called a **local fibration** if the following conditions are satisfied:

- for any  $X, Y \in \mathcal{C}$ , the induced map  $\text{Map}(X, Y) \rightarrow \text{Map}(FX, FY)$  is a fibration in  $\mathcal{S}$ .
- the induced map  $h\mathcal{C} \rightarrow h\mathcal{C}'$  is a quasi-fibration of categories.

┘

**Def. (4.5.7.8) [Invertibility Hypothesis].** We say a monoidal model category  $\mathcal{S}$  satisfies the **invertibility hypothesis** if: For any cofibrant morphism  $[1]_{\mathcal{S}} \rightarrow \mathcal{C}$  (4.5.7.3) of  $\mathcal{S}$ -enriched categories, and maps to a morphism  $f$  which is invertible in the homotopy category  $h\mathcal{C}$ , take the pushout:

$$\begin{array}{ccc} [1]_{\mathcal{S}} & \xrightarrow{i} & \mathcal{C} \\ \downarrow & & \downarrow j \\ [1]_{\mathcal{S}}^{\sim} & \longrightarrow & \mathcal{C}\langle f^{-1} \rangle \end{array} .$$

then  $j$  is a weak equivalence of  $\mathcal{S}$ -enriched categories (4.5.7.2).

┘

**Def. (4.5.7.9) [Excellent Model Category].** An **excellent model category** is a monoidal model category  $\mathcal{S}$  that The monoidal structure is symmetric.

- $\mathcal{S}$  is combinatorial,
- Every monomorphism in  $\mathcal{S}$  is a cofibration, and the collection of cofibrations is stable under products,
- The class of weak equivalences in  $\mathcal{S}$  is stable under filtered colimits,
- $\mathcal{S}$  satisfies the invertibility condition (4.5.7.8)

┘

**Lemma (4.5.7.10).** Let  $T : \mathcal{S} \rightarrow \mathcal{S}'$  be a monoidal functor between monoidal model categories satisfies axioms besides invertibility hypothesis, that is also a left Quillen functor, then if  $\mathcal{S}'$  satisfies invertibility hypothesis, so does  $\mathcal{S}$ .

┘

*Proof:* Cf.[HTT, P862]. ?

□

**Prop. (4.5.7.11) [Fibration and Local Fibration].** If  $\mathcal{S}$  is an excellent model category, then

- An  $\mathcal{S}$ -enriched category  $\mathcal{C}$  is a fibrant object in  $\text{Cat}_{\mathcal{S}}$  iff it is locally fibrant (4.5.7.7).
- Let  $F : \mathcal{C} \rightarrow \mathcal{D}$  be an  $\mathcal{S}$ -enriched functor and  $\mathcal{D}$  is fibrant in  $\text{Cat}_{\mathcal{S}}$ , then  $F$  is fibrant in  $\text{Cat}_{\mathcal{S}}$  iff it is a local fibration.

┘

*Proof:* Cf. [HTT, P863].

## 4.6 Simplicial Homotopy Theory

Main references are [Jardine Simplicial Homotopy Theory], [Lur09].

**Notation (4.6.0.1).**

- Use notations from [Model Categories](#).

┘

### 1 Simplicial Objects

**Def. (4.6.1.1) [Simplex Category].** The **simplex category**  $\Delta$  consists of simplicial objects  $[n]$  for each  $n \geq 0$  and there maps are order-preserving maps.

$\Delta$  has a subcategory  $\Delta_+$  consisting of the same objects but the morphisms are all surjective order-preserving maps.

For  $\mathcal{C} \in \mathcal{T}\text{op}$ , a **simplicial object** in  $\mathcal{C}$  is a functor  $\Delta^{\text{op}} \rightarrow \mathcal{C}$ . A **cosimplicial object** in  $\mathcal{C}$  is a simplicial object in  $\mathcal{C}^{\text{op}}$ . The category of simplicial objects in  $\mathcal{C}$  is denoted by  $s\mathcal{C}$ .

Given a simplicial or cosimplicial object in  $\mathcal{A}$ , its **underlying degeneracy map** is defined to be?

┘

**Prop. (4.6.1.2).** If  $\mathcal{C}$  is complete or cocomplete, then so is  $s\mathcal{C}$ .

┘

**Def. (4.6.1.3).**  $\Delta^n$  is the simplicial set  $\Delta^n([m]) = \text{Hom}([m], [n])$ .

┘

**Def. (4.6.1.4) [Augmentation].** If  $X$  is a simplicial object in a category, then an **augmentation** of  $X$  is a morphism  $d : A \rightarrow X$  that  $dd_0 = dd_1$ . In case  $\mathcal{C}$  is  $\text{Mod}_R$ , this is equivalent to a morphism  $\pi_0(X) \rightarrow A$  (5.8.2.2).

┘

**Def. (4.6.1.5) [s-Free Simplicial Objects].**  $X \in s\mathcal{C}$  is called **s-free** if the underlying category  $\Delta_+^{\text{op}} \rightarrow \mathcal{C}$  is  $\Delta^{\text{op}}$ -free (4.1.3.16).

Equivalently, an  $s$ -free object is a simplicial object  $X$  that there are objects  $Z_n \in \mathcal{C}$  that  $X_n = \coprod_{\varphi: [n] \rightarrow [k]} \varphi^* Z_k$ . Moreover, a simplicial morphism of simplicial objects are called  $s$ -free if the underlying diagram  $X_+ \rightarrow Y_+$  is of the form  $X_+ \rightarrow X_+ \coprod Y_0$  where  $Y_0$  is  $s$ -free.

┘

**Prop. (4.6.1.6) [ $s\mathcal{C}$  is a Simplicial Category].** Let  $s\mathcal{C}$  be the category of simplicial  $\mathcal{C}$ -objects, then it can be made into a simplicial category which is also tensored and cotensored (4.2.2.7) over  $s\text{Set}$ .

┘

*Proof:* We define first a action of  $s\text{Set}$  on  $s\mathcal{C}$ :

$$\otimes : s\text{Set} \times s\mathcal{C} \rightarrow s\mathcal{C} : (K, X) \mapsto (K \otimes X)_n = \coprod_{K_n} X_n,$$

with the simplicial maps determined by that of  $K$  and  $X$ .

Also there is a action of  $s\text{Set}^{\text{op}}$  on  $s\mathcal{C}$ :

$$(-)^- : s\text{Set}^{\text{op}} \times s\mathcal{C} \rightarrow s\mathcal{C} : (K \otimes X)_n = \coprod_{K_n} X_n$$

with the simplicial maps determined by that of  $K$  and  $X$ .

Then there is an adjointness

$$\text{Hom}_{s\mathcal{C}}(K \otimes X, Y) \cong \text{Hom}_{s\mathcal{C}}(X, Y^K)$$

for any simplicial set  $K$ .

Next we define  $\text{Map}_{s\mathcal{C}}(X, Y) \subset \text{Set}_\Delta$  as  $(\text{Map}_{s\mathcal{C}}(X, Y))_n = \text{Hom}_{s\mathcal{C}}(X \otimes \Delta^n, Y)$ , then there are functorial isomorphisms

$$\text{Map}_{s\mathcal{C}}(K \otimes X, Y) \cong \text{Map}_{s\mathcal{C}}(X, Y^K) \cong \text{Map}_{\text{Set}_\Delta}(K, \text{Map}_{s\mathcal{C}}(X, Y))$$

(easy to check). So we are done.  $\square$

**Remark (4.6.1.7) [Realization Functor].** For  $\mathcal{C} \in \text{Cat}$  that has countable colimits, there is a **simplicial realization functor**

$$|-| : s\mathcal{C} \rightarrow \mathcal{C} : X \mapsto \varinjlim_{\Delta_+^{\text{op}}} X_n.$$

$\lrcorner$

## 2 Topological Categories

**Def. (4.6.2.1) [Topological Categories].** A **topological category** is a category that is enriched over the category  $\mathcal{C}\mathcal{G}$  of compactly generated and Hausdorff spaces. The category of topological categories is denoted by  $\text{Cat}_{\mathcal{C}\mathcal{G}}$ .

Two topological categories is called **strongly equivalent** if they are equivalent as enriched categories.  $\lrcorner$

**Def. (4.6.2.2) [Homotopy Category of a Topological Category].** Given a topological category  $\mathcal{C}$ , the **homotopy category**  $h\mathcal{C}$  of  $\mathcal{C}$  is defined to be the category transferred from  $\mathcal{C}$  (4.2.2.4) by the right-lax monoidal functor  $\pi_0$  (4.1.5.15).  $\lrcorner$

**Def. (4.6.2.3) [Homotopy Category of Spaces].** Let  $\mathcal{C}$  be the category of CW complexes that the morphisms are given the compact-open topology, then its homotopy category  $\mathcal{H}$  is called the **homotopy category of spaces**.  $\lrcorner$

## 3 Simplicial Sets

### Simplicial Sets

**Remark (4.6.3.1).** The fact that any simplicial set  $X$  is a colimit of  $\Delta^n$  (4.1.3.13) is important in proving properties of constructions of simplicial set.  $\lrcorner$

**Def. (4.6.3.2) [Objects and Morphisms].** Given a simplicial set  $S$ , its **objects** are just objects in  $S([0])$ , and its **morphisms** are objects in  $S([1])$ .  $\lrcorner$

**Def. (4.6.3.3) [Simplicial Sets and Categories].** There is an embedding  $\Delta \rightarrow \text{Cat} : [n] \rightarrow [n]$  regarding  $[n]$  as a category, which by Yoneda extension (4.1.3.14) and (4.1.1.47) corresponds to an adjunction

$$\tau_1 : s\text{Set} \rightleftarrows \text{Cat} : N$$

where  $\tau_1$  is called the **fundamental category functor** and  $N : \text{Cat} \rightarrow s\text{Set}$  is the **nerve functor**.  $\lrcorner$

**Prop. (4.6.3.4) [Nerve Functor is Fully Faithful].** The nerve functor  $N : \text{Cat} \rightarrow s\text{Set}$  is fully faithful. Equivalently, by (4.1.1.32), for any  $\mathcal{C} \in \text{Cat}$ , there is a natural isomorphism  $\tau_1(N(\mathcal{C})) \cong \mathcal{C}$ .  $\lrcorner$

**Prop. (4.6.3.5) [Natural Transformation and Homotopy].** A natural transformation will induce homotopic nerve map. thus a pair of adjoint functors will induce a simplicial homotopy between their nerve.  $\lrcorner$

*Proof:*  $\square$

**Prop. (4.6.3.6) [Characterizing Nerves].** For  $K \in s\text{Set}$ ,

- there exists  $\mathcal{C} \in \text{Cat}$  that  $K \cong N(\mathcal{C})$  iff for each  $0 < i < n$  and each diagram

$$\begin{array}{ccc} \Lambda_i^n & \longrightarrow & K \\ \downarrow & \nearrow \text{dotted} & \\ \Delta^n & & \end{array}$$

there exists uniquely a dotted arrow.

- there exists  $\mathcal{C} \in \text{Grpd}$  that  $K \cong N(\mathcal{C})$  iff for each  $0 \leq i \leq n$  and each diagram

$$\begin{array}{ccc} \Lambda_i^n & \longrightarrow & K \\ \downarrow & \nearrow \text{dotted} & \\ \Delta^n & & \end{array}$$

there exists uniquely a dotted arrow.  $\lrcorner$

*Proof:* [HTT, P9].  $\square$

**Def. (4.6.3.7) [Fundamental Groupoid Functor].** Let  $\pi_1 = \text{Grp} \circ \tau_1 : s\text{Set} \rightarrow \text{Grpd}$ , called the **fundamental groupoid functor**, then by (4.6.3.3) and (4.1.1.36), there is an adjunction

$$\pi_1 : s\text{Set} \rightleftarrows \text{Grpd} : N$$

**Def. (4.6.3.8) [Topological Realization Functor].** There is a functor  $\Delta \rightarrow \mathcal{CG} : [n] \mapsto \Delta^n$ , which by Yoneda extension (4.1.3.14) corresponds to an adjunction

$$|\cdot| : s\text{Set} \rightleftarrows \mathcal{CG} : \text{Sing}$$

called the **topological geometrization** functor and the singular complex functor.  $\lrcorner$

**Def. (4.6.3.9) [Classifying Spaces of a Category].** For  $\mathcal{C} \in \text{Cat}$ , the **classifying space** of  $\mathcal{C}$  is defined to be  $\mathbb{B}\mathcal{C} = |N(\mathcal{C})| \in \mathcal{CG}$ .  $\lrcorner$

**Prop. (4.6.3.10).** The geometrization as a functor from  $s\text{Set} \rightarrow \mathcal{CG}$  preserves finite limits.

The three kinds of geometrization of a bisimplicial set is the same: geometrization the diagonal simplicial set, the twice geometrization of left(resp. right) simplicial set.  $\lrcorner$

*Proof:* Cf.[Jardine P9]. ?  $\square$

**Def. (4.6.3.11) [Weak (Homotopy) Equivalences].** A morphism of simplicial sets  $S \rightarrow T$  is called a **weak equivalence** if the induced map  $|S| \rightarrow |T|$  (4.6.3.8) is a weak homotopy equivalence.  $\lrcorner$

### Constructing Simplicial Sets

**Def. (4.6.3.12) [Opposite Simplicial Sets].** There is an involution in the simplex category  $\iota : \Delta \rightarrow \Delta$  that maps any ordered set to its reverse order. Then for any simplicial set  $S : \Delta^{\text{op}} \rightarrow \text{Set}$ , there is another simplicial set  $S^{\text{op}} = S \circ \iota$ , called the **opposite simplicial set**.  $\lrcorner$

**Prop. (4.6.3.13).** For  $\mathcal{C} \in \text{Cat}$ , there is a natural isomorphism of simplicial sets  $N(\mathcal{C})^{\text{op}} \cong N(\mathcal{C}^{\text{op}})$ .  $\lrcorner$

**Def. (4.6.3.14) [Mapping Spaces].** For  $X, Y \in s\text{Set}$ , the **mapping space**  $\text{Map}(X, Y)$  or  $Y^X$  is a simplicial set s.t.

$$\text{Map}(X, Y)_n = \text{Hom}_{s\text{Set}}(\Delta^n \times X, Y).$$

$\lrcorner$

**Prop. (4.6.3.15) [Closed Cartesian Monoidal Structure].**  $s\text{Set}$  is a closed Cartesian monoidal category, and for any  $X, Y, Z \in s\text{Set}$ , there is an isomorphism of simplicial sets

$$\text{Map}(X, \text{Map}(Y, Z)) \cong \text{Map}(X \times Y, Z).$$

$\lrcorner$

*Proof:*

$\square$

**Prop. (4.6.3.16).** For  $\mathcal{A}, \mathcal{B} \in \text{Cat}$ , there is a natural isomorphism of simplicial sets  $N(\text{Func}(\mathcal{A}, \mathcal{B})) \cong \text{Map}(N(\mathcal{A}), N(\mathcal{B}))$ .  $\lrcorner$

*Proof:* There are natural bijections

$$\begin{aligned} N(\text{Func}(\mathcal{A}, \mathcal{B}))_n &= \text{Func}([n] \times \mathcal{A}, \mathcal{B}) \\ (4.6.3.4) \quad &\cong \text{Map}(N([n] \times \mathcal{A}), N(\mathcal{B})) \\ &\cong \text{Map}(\Delta^n \times N(\mathcal{A}), N(\mathcal{B})) \\ &= \text{Map}(N(\mathcal{A}), N(\mathcal{B}))_n, \end{aligned}$$

and they form an isomorphism of simplicial sets.  $\square$

**Cor. (4.6.3.17).** For any  $x \in S_m, x' \in S'_n$ , there is a unique  $y \in (S * S')_{m+n+1}$  s.t.  $y|_{[0, \dots, m]} \cong x, y|_{[m+1, \dots, m+n+1]} \cong x'$ .  $\lrcorner$

**Def. (4.6.3.18) [Joins].** Let  $S, S' \in s\text{Set}$ , then the **join** of  $S, S'$  is defined to be the simplicial set that for all any finite ordered set  $J$ ,

$$(S \star S')(J) = \cup_{J=I \amalg I'} S(I) \times S'(I').$$

where  $I, I'$  satisfies  $i < i'$  for any  $i \in I, i' \in I'$ . And the glueing is natural.  $\lrcorner$

**Prop. (4.6.3.19).**

- $\Delta^i \star \Delta^j \cong \Delta^{i+j+1}$ .
- The join operation is a functor  $s\text{Set} \rightarrow s\text{Set}$  that preserves colimits in each coordinate,
- $s\text{Set}$  is a symmetric monoidal category under the join operation.
- If  $\mathcal{C}, \mathcal{C}' \in \text{Cat}$ , there is a natural isomorphism  $N(\mathcal{C}) \star N(\mathcal{C}') \cong N(\mathcal{C} \star \mathcal{C}')$ .

┘

*Proof:* All these are clear. □

**Def. (4.6.3.20) [Cones].** For a simplicial set  $K$ , the **left/right cone** of  $K$  are defined to be the join  $K^{\triangleleft} = \Delta^0 \star K$  and  $K^{\triangleleft} = K \star \Delta^0$ .

For a map  $f : X \rightarrow S$ , the **left/right cone** of  $f$  are defined to be  $S \coprod_X X^{\triangleleft}$  and  $S \coprod_X X^{\triangleleft}$ . ┘

**Example (4.6.3.21).**  $(\Lambda_2^2)^{\triangleleft} \cong (\Lambda_0^2)^{\triangleleft} \cong \Delta^1 \times \Delta^1$ . ┘

**Def. (4.6.3.22) [Overcategories and undercategories].** For  $p : K \rightarrow S \in s\mathbf{Set}$ , there is a simplicial set  $S_{/p}$  that

$$\mathrm{Hom}(Y, S_{/p}) \cong \mathrm{Hom}_p(Y \star K, S) \triangleq \mathrm{Hom}_{s\mathbf{Set}_{K/}}(Y \star K, S)$$

And dually we can define the **undercategories**.

There are canonical maps  $S_{/p} \rightarrow S$  and  $S_{p/} \rightarrow S$ . ┘

*Proof:* We just define  $(S_{/p})_n = \mathrm{Hom}_p(K \star \Delta^n, S)$ , then the condition holds for  $\Delta^n$ , and use the fact every simplicial set is a colimit of  $\Delta^n$ s (4.6.3.1), and both sides commutes with colimits in  $Y$  by (4.6.3.19). □

**Def. (4.6.3.23).** For  $\mathcal{C}_0 \subset \mathcal{C} \in s\mathbf{Set}$  and any diagram  $p : K \rightarrow \mathcal{C}$ , denote  $\mathcal{C}_{/p}^0 = \mathcal{C}^0 \times_{\mathcal{C}} \mathcal{C}_{/p}$ . ┘

**Prop. (4.6.3.24).** For  $p : A \rightarrow B \in \mathbf{Cat}$ , there is a natural isomorphism of simplicial sets

$$N(B_{/p}) \cong N(B)_{/N(p)}.$$

┘

*Proof:* There is a natural map from LHS to RHS, and we also have natural isomorphisms

$$\begin{aligned} N(B_{/p})_n &= \mathrm{Hom}([n], B_{/p}) \\ &= \mathrm{Hom}_{\mathbf{Cat}_{A/}}(A \rightarrow [n] \star A, A \xrightarrow{p} B) \\ (4.6.3.4) &= \mathrm{Hom}_{s\mathbf{Set}_{N(A)/}}(N(A) \rightarrow N([n] \star A), N(A) \xrightarrow{N(p)} N(B)) \\ (4.6.3.19) &= \mathrm{Hom}_{s\mathbf{Set}_{N(A)/}}(N(A) \rightarrow \Delta^n \star N(A), N(A) \xrightarrow{N(p)} N(B)) \\ &= \mathrm{Hom}_{s\mathbf{Set}}(\Delta^n, N(B)_{/N(p)}) = (N(B)_{/N(p)})_n \end{aligned}$$

□

**Prop. (4.6.3.25) [Generating Simplicial Sets].** Let  $\mathcal{U}$  be a collection of simplicial sets that:

- $\mathcal{U}$  is stable under isomorphisms,
- $\mathcal{U}$  is stable under disjoint union,
- $\Delta^n \subset \mathcal{U}$  for any  $n$ ,

- If there is a pushout diagram 
$$\begin{array}{ccc} X & \longrightarrow & X' \\ \downarrow f & & \downarrow \\ Y & \longrightarrow & Y' \end{array}$$
 and  $X, X', Y \in \mathcal{U}$  and  $f$  is a monomorphism, then

$$Y' \in \mathcal{U},$$

- suppose we are given a sequence of monomorphisms between objects in  $\mathcal{U}$  indexed over  $\mathbb{N}$ , then the colimit belongs to  $\mathcal{U}$ .

Then  $\mathcal{U} = s\text{Set}$ . ┘

*Proof:* Use induction on the dimension of  $S$ , and notice  $S$  is glued together using their simplexes. ┘

### Fibrations and Anodynes

**Def. (4.6.3.26) [Fibrations].** A morphism of simplicial sets is called a

- **Kan fibration** iff it has right lifting property w.r.t all  $\Lambda_i^n \rightarrow \Delta^n, 0 \leq i \leq n$ .
- **left fibration** iff it has right lifting property w.r.t. all inclusions  $\Lambda_i^n \subset \Delta^n, 0 \leq i < n$ .
- **right fibration** iff it has right lifting property w.r.t all inclusions  $\Lambda_i^n \subset \Delta^n, 0 < i \leq n$ .
- **inner fibration** iff it has right lifting property w.r.t all inclusions  $\Lambda_i^n \subset \Delta^n, 0 < i < n$ .

So a morphism between topological spaces  $X \rightarrow Y$  is a Serre fibration iff  $S(X) \rightarrow S(Y)$  is a Kan fibration (4.6.3.8). ┘

**Def. (4.6.3.27) [Anodynes].** A morphism of simplicial set is called a

- **anodyne** iff it has left lifting property w.r.t. all Kan fibrations.
  - **left anodyne** iff it has left lifting property w.r.t. all left fibrations.
  - **right anodyne** iff it has left lifting property w.r.t all right fibrations.
  - **inner anodyne** iff it has right lifting property w.r.t all inner fibrations.
- ┘

**Def. (4.6.3.28) [Trivial (Kan) Fibrations].** A morphism  $X \rightarrow S$  of simplicial sets that has right lifting property w.r.t. all inclusions  $\partial\Delta^n \rightarrow \Delta^n$  is called a **trivial fibration**.

A **cofibration** is a morphism that has left lifting property w.r.t all trivial fibrations. By (4.2.2.15) a cofibration of simplicial sets is just an inclusion. ┘

**Lemma (4.6.3.29) [Join and Anodynes].** If  $f : A_0 \subset A$  and  $g : B_0 \subset B$  are inclusions of simplicial sets, then

$$h : (A_0 \star B) \coprod_{A_0 \star B_0} (A \star B_0) \subset A \star B$$

is a(n)

- inner anodyne if either  $f$  is right anodyne or  $g$  is left anodyne, then
  - left anodyne if  $f$  is left anodyne.
- ┘

*Proof:* 1: By symmetry we assume  $f$  is right anodyne. Notice the class of all morphisms  $f$  that the conclusion holds is weakly saturated because  $\star$  commutes with colimits, so it suffice to check for  $f : \Lambda_j^n \subset \Delta^n$ . Then similarly it suffices to check for  $g : \partial\Delta^m \subset \Delta^m$ , but then the inclusion is just  $\Lambda_j^{m+n+1} \subset \Delta^{m+n+1}$ , which is left anodyne.

2 is similar. ┘

**Prop. (4.6.3.30) [Anodynes].**

- The saturated class generated by either of the following three classes of monomorphisms are both left anodynes:

1.  $\Lambda_k^n \subset \Delta^n$ ,  $0 \leq k < n$ .
2.  $(\Delta^m \times \{0\}) \coprod (\partial \Delta^m \times \Delta^1) \subset \Delta^m \times \Delta^1$ .
3.  $(S' \times \{0\}) \coprod (S \times \Delta^1) \subset S' \times \Delta^1$ , where  $S \subset S'$ .

Similar conclusion holds for right anodynes and together implies the similar conclusion for anodynes.

•

┘

*Proof:*

- 2 and 3 are equivalence because any inclusion comes from attaching cells (4.6.3.3).  
Now inclusions in 2 are compositions of pushouts of inclusions  $\Lambda_k^{n+1} \subset \Delta^{n+1}$ , where  $0 \leq k \leq n$ , thus it is generated by 1. Conversely,  $\Lambda_i^n \subset \Delta^n$  is a retract of  $(\Delta^n \times \{0\}) \coprod (\Lambda_i^n \times \Delta^1) \subset \Delta^n \times \Delta^1$ : Cf.[HTT, P64].

•

□

**Cor.(4.6.3.31) [Products and Anodynes].** Let  $A \subset A'$  be a(n) left(inner) anodyne and  $B \subset B'$ , then so does the induced map

$$(A \times B') \coprod_{A \times B} (A' \times B) \rightarrow A' \times B'.$$

┘

*Proof:* For left anodyne, the proof is similar to that of (4.6.3.29), just check for classes 3 of (4.6.3.30), and use the fact

$$(S' \times \Delta^1) \times B \coprod (S' \times \{0\}) \coprod (S \times \Delta^1) \times B' \rightarrow (S' \times \Delta^1) \times B'$$

is just

$$(S' \times B \coprod S \times B') \times \Delta^1 \coprod (S' \times B') \times \{0\} \rightarrow (S' \times B') \times \Delta^1.$$

which is left(inner) anodyne. And similarly for inner anodynes.

□

### Left Fibration

**Remark(4.6.3.32) [Left and Right Fibrations Dual].** The theory of left fibrations is dual to the theory of right fibrations, thus we don't study right fibrations.

┘

**Prop.(4.6.3.33) [Left Fibration and CoFibered in Groupoids].** Let  $F : \mathcal{C} \rightarrow \mathcal{D}$  be a functor, then  $\mathcal{C}$  is a category cofibered in groupoids over  $\mathcal{D}$  iff the induced functor  $N(F) : N(\mathcal{C}) \rightarrow N(\mathcal{D})$  is a left fibration of simplicial sets.

┘

*Proof:* By (4.6.3.6),  $N(F)$  is an inner fibration, thus it suffices to check for  $\Lambda_0^n \rightarrow \Delta^n$ . For  $n = 1$ , this is the definition of cofibered category (4.2.3.8), and  $n = 2$  is just the surjectivity of the map defining CoCartesian arrows (4.2.3.5), and  $n = 3$  is equivalent to the injectivity of the map defining Cocartesian arrows. And for  $n > 3$ , then extension is automatic for nerves.

□

**Remark(4.6.3.34) [Right Fibrations and Fibered Categories].** The (left)right fibration is the  $\infty$ -categorical analogue of (co)fibered categories in usual category theory.

┘

**Remark (4.6.3.35).** Given a left fibration  $X \rightarrow S$  is more or less similar to given a functor from the homotopy category  $hS$  to the  $\infty$ -category  $\mathcal{H}$  of spaces.  $\lrcorner$

*Proof:* Cf.[HTT, P58]. ?  $\square$

**Prop. (4.6.3.36) [Over(Under)categories and Fibrations].** Given a diagram of simplicial sets:

$$A \subset B \xrightarrow{p} X \xrightarrow{q} S.$$

Let  $r = q \circ p$ ,  $p_0 = p|_A$ ,  $r_0 = r|_A$ , and  $q$  is an inner fibration, then

- the induced map  $X_{p/} \rightarrow X_{p_0/} \times_{S_{r_0/}} S_{r/}$  is a left fibration. And dual argument holds for overcategories.
- If  $q$  is a left fibration or  $A \subset B$  is right anodyne, then  $X_{p/} \rightarrow X_{p_0/} \times_{S_{r_0/}} S_{r/}$  is a trivial fibration.
- If  $q$  is moreover a left fibration, then the induced map  $X_{/p} \rightarrow X_{/p_0} \times_{S_{/r_0}} S_{/r}$  is a left fibration.  $\lrcorner$

*Proof:* These just follow from (4.6.3.29).  $\square$

**Prop. (4.6.3.37) [Homotopy Extension Lifting Property].** For  $p : X \rightarrow S, i : A \subset B \in s\text{Set}$ , consider the map

$$q : X^B \rightarrow X^A \times_{S^A} S^B.$$

- If  $p$  is a left fibration, then  $q$  is a left fibration.
- If  $p$  is a left fibration  $i$  is a left anodyne, then  $q$  is a trivial fibration.
- If  $i : \{0\} \subset \Delta^1$ , then  $p$  is a left fibration iff  $q$  is a trivial fibration.
- If  $p$  is an inner fibration, then  $q$  is an inner fibration.
- If  $p$  is an inner fibration and  $i$  is an inner anodyne, then  $q$  is a trivial fibration.  $\lrcorner$

*Proof:* First notice that a right lifting of  $q$  w.r.t a map  $Z \rightarrow Z'$  is equivalent to a right lifting of  $p$  w.r.t the map  $Z \times B \coprod Z' \times A \rightarrow Z' \times B$ . Then the conclusions follow from (4.6.3.31) and (4.6.3.30).  $\square$

**Prop. (4.6.3.38) [Homotopy Section and Left Fibration].** Let  $p : X \rightarrow S \in s\text{Set}$  and  $s : S \rightarrow X$  be section of  $p$ , and let  $h \in \text{Hom}_S(X \times \Delta^1, X)$  that  $h|_{X \times \{0\}} = s \circ p$  and  $h|_{X \times \{1\}} = \text{id}$ , then  $s$  is a left anodyne.  $\lrcorner$

*Proof:* Cf.[HTT, P65].  $\square$

**Prop. (4.6.3.39) [Left Fibration and Functor to Spaces].** Let  $X \rightarrow S$  be a left fibration, then the fibers are all Kan complexes by (4.7.1.27), and for any edge  $f : s \rightarrow s' \in S$ , we can solve the lifting diagram

$$\begin{array}{ccc} \{0\} \times X_s & \xrightarrow{\quad} & X \\ \downarrow & \nearrow \text{dashed} & \downarrow \\ \Delta^1 \times X_s & \xrightarrow{\quad} & \Delta^1 \xrightarrow{f} S \end{array}$$

because the left hand side is left anodyne by (4.6.3.31), thus getting a morphism  $f_! : X_s \rightarrow X_{s'}$ .

Then this determines a functor from  $hS$  to  $\mathcal{H}$  the homotopy category of spaces.  $\lrcorner$

*Proof:* First notice  $f_!$  is uniquely defined up to homotopy: given to dotted arrow solving the diagram, we can use the lifting property w.r.t. the map

$$\left(\Delta^1 \times \partial\Delta^1 \times X_s\right) \coprod_{\{0\} \times \partial\Delta^1 \times X_s} \left(\{0\} \times \Delta^1 \times X_s \rightarrow \Delta^1 \times \Delta^1 \times X_s\right),$$

which is a left anodyne by (4.6.3.31), to get a homotopy between them.

Next if  $\eta \in \text{Hom}_{\mathcal{H}}(K, X_s), \eta' \in \text{Hom}_{\mathcal{H}}(K, X_{s'})$ , then  $\eta' = f_! \circ \eta$  iff there is a map  $q : K \times \Delta^1 \rightarrow X$  that  $q \circ p$  is given by the mapping  $X_s \times \Delta^1 \rightarrow \Delta^1 \xrightarrow{f} S$ , and  $p|_{K \times \{0\}}, p|_{K \times \{1\}}$  have homotopy types  $\eta, \eta'$  resp..

Then for any  $g \circ f \cong h \in S$ , which is depicted by a 2-complex, we can use the left anodyne  $X_u \times \{0\} \subset X_u \times \Delta^2$  to get a morphism  $p : X_u \times \Delta^2 \rightarrow X$ , then  $p|_{X_u \times \{1\}} \cong f_!, p|_{X_u \times \{2\}} \cong h_!$ , and the map  $p|_{X_u \times \Delta\{1,2\}}$  witnesses the fact  $g_! \circ f_! \cong h_!$ .  $\square$

### Kan Fibrations

**Remark (4.6.3.40) [Kan Complexes and Groupoids].** Kan complexes are  $\infty$ -categorical analogy of groupoids, by (4.7.1.27) and (4.6.3.6).  $\lrcorner$

**Lemma (4.6.3.41).** If a left fibration  $p : S \rightarrow T$  is a weak homotopy equivalence of Kan complexes, then it is a surjection on vertices.  $\lrcorner$

*Proof:* Because it is homotopy equivalence, for any  $t \in T$ , there is a morphism  $p(s) \rightarrow t$  for some  $s \in S$  (Kan complex used), thus it lifts to a morphism in  $S$ , so surjective on vertices.  $\square$

**Lemma (4.6.3.42) [Fibrations of Kan Complexes].** If  $S \rightarrow T$  is a left fibration and  $T$  is a Kan complex, then  $p$  is a Kan fibration.  $\lrcorner$

*Proof:* Firstly  $S$  is a Kan complex. Let  $A \subset B$  be anodyne morphisms, we need to show  $p : S^B \rightarrow S^A \times_{T^A} T^B$  is surjective on vertices. Since  $S, T$  are complexes,  $S^B \rightarrow S^A$  and  $T^B \rightarrow T^A$  are trivial fibrations by (4.6.3.37). Cf. [HTT, P66]. ?

Notice this is an immediate consequence of (4.6.3.47), because the homotopy category of a Kan complex is a groupoid, by (4.7.1.27), so  $f_!$  must be isomorphisms.  $\square$

**Prop. (4.6.3.43) [Examples of Kan Complexes].**

- The singular complex of topological space is a Kan complex.
- The nerve of a category is a Kan complex iff the category is a groupoid, by (4.6.3.33).
- Simplicial  $R$ -module are Kan complexes, by (5.8.1.1).

$\lrcorner$

*Proof:*

$\square$

**Prop. (4.6.3.44).** The bar resolution  $BG$  is a Kan fibration for every group  $G$ .  $\lrcorner$

*Proof:*

$\square$

**Prop. (4.6.3.45).** A principal  $G$  fibration, i.e.  $X \rightarrow X/G$  where  $X$  is a simplicial object of  $G$ -sets that  $G$  acts freely on  $X_n$ , is a Kan fibration.  $\lrcorner$

**Lemma (4.6.3.46) [Left Fibrations and Trivial Kan Fibrations].** Let  $p : S \rightarrow T \in s\mathbf{Set}$  be a left fibration that all the fibers are contractible, then  $p$  is a trivial Kan fibration.  $\lrcorner$

*Proof:* By duality, it suffices to prove for right fibrations. Because fiber is nonempty, it has right lifting property w.r.t  $\emptyset \subset \Delta^0$ , and for  $n > 0$ , let  $\partial\Delta^n \rightarrow S$  be any map, then to show the lifting property, we may take fiber product and assume  $T = \Delta^n$ , thus  $S$  is an  $\infty$ -category. Cf.[HTT, P66].  $\square$

**Prop. (4.6.3.47) [Characterizing Kan-Fibrations].** Let  $p : S \rightarrow T \in s\mathbf{Set}$  be a left fibration, then  $p$  is a Kan-extension iff the morphism  $f_!$  defined in (4.6.3.39) is an isomorphism in  $\mathcal{H}$  for any morphism  $f \in T$ .  $\lrcorner$

*Proof:* Cf.[HTT, P66].  $\square$

**Def. (4.6.3.48) [Kan-Quillen Model Structure].** There is a combinatorial left and right proper model structure on  $s\mathbf{Set}$  called the **Kan-Quillen model structure** with

- Weak equivalences: weak equivalences (4.6.3.11).
- Cofibrations: inclusions,
- Fibrations: Kan fibrations.

$\lrcorner$

*Proof:* Cf.[Jardine P62]. ?  $\square$

**Prop. (4.6.3.49) [Quillen].** The geometrization functor and the singular complex functor (4.6.3.8) defines a Quillen equivalence:

$$|\cdot| : s\mathbf{Set} \rightleftarrows \mathcal{CG} : \mathbf{Sing},$$

where the RHS is Serre-Quillen model category (4.13.7.28) and the LHS is the Kan-Quillen model category (4.6.3.48).

The functor  $|\cdot| \circ \mathbf{Sing}$  is also denoted by  $\Gamma : \mathcal{CG} \rightarrow \mathcal{CG}$ .  $\lrcorner$

*Proof:* Cf.[May, P125]. ?  $\square$

**Cor. (4.6.3.50).** The localized category of  $\mathcal{CG}$  and  $s\mathbf{Set}$  at weak homotopy equivalence classes are the same, and it is just the homotopy category of spaces  $\mathcal{H}$ , by (4.5.2.7).  $\lrcorner$

**Cor. (4.6.3.51).** By (4.6.3.43), for any  $S \in s\mathbf{Set}$ ,  $S \rightarrow \mathbf{Sing} |S|$  is a fibrant replacement w.r.t. the Kan-Quillen model category.  $\lrcorner$

### Marked Simplicial Sets

**Def. (4.6.3.52) [Marked Simplicial Sets].** A **marked simplicial set** is a pair  $(X, \mathcal{E}_X)$  where  $X \in s\mathbf{Set}$  and  $\mathcal{E}_X \subset X_1$  is a set of edges containing all the degenerate ones. The category of marked simplicial sets is denoted by  $s\mathbf{Set}^+$ .  $\lrcorner$

## 4 Simplicial Categories

**Def. (4.6.4.1) [Simplicial Categories].** The category  $s\mathbf{Cat}$  of **simplicial categories** consists of categories enriched over the Cartesian monoidal category  $s\mathbf{Set}$ .  $s\mathbf{Cat}$  is complete and cocomplete, by (4.2.2.3) and (4.6.3.15)(4.6.1.2).  $\lrcorner$

**Def. (4.6.4.2) [Homotopy Category].** There are singular complex functor and geometrization functor that induce isomorphism of  $h(s\mathbf{Set}) \cong h(\mathcal{CG})$  by (4.6.3.50), thus the theory of simplicial categories and topological categories are the same.  $\lrcorner$

### Bergner Model Structure

**Def. (4.6.4.3) [Dwyer-Kan Equivalences].** A **Dwyer-Kan equivalence of simplicial categories** is a weak equivalence of simplicial categories as enriched categories(4.6.4.16).  $\lrcorner$

**Def. (4.6.4.4) [Bergner Model Structure].** There is a left proper combinatorial model structure **Bergner model structure** on  $s\mathcal{Cat}$  called the **Bergner model structure** with

- Weak equivalences: Dwyer-Kan equivalences(4.6.4.3).
- Fibrations:  $F : \mathcal{C} \rightarrow \mathcal{D}$  that is an quasi-fibration(4.2.3.7) and for any  $x, y \in \mathcal{C}$ ,  $\text{Map}_{\mathcal{C}}(x, y) \rightarrow \text{Map}_{\mathcal{D}}(Fx, Fy)$  is a Kan-fibration.
- Cofibrations:

$\lrcorner$

*Proof:* ? Cf.[Bergner. A model category structure on the category of simplicial categories] or [Lurie].  $\square$

### Simplicial Nerves

**Def. (4.6.4.5) [Thickened Finite Ordered Sets].** Let  $J$  be a finite ordered set, define a simplicial category  $\mathfrak{C}[\Delta^J]$  as follows:

- The objects are elements of  $J$ .
- For  $i, j \in J$ ,  $\text{Mor}(i, j) = N(P_{i,j})$ , where  $P_{i,j}$  is the poset  $\{I \subset [i, j] | i, j \in I\}$ .
- The composition of simplicial sets is induced by the union of partially ordered sets  $P_{i,j} \times P_{j,k} \subset P_{i,k}$ .

$\lrcorner$

**Def. (4.6.4.6) [Coherent Nerves].** by Yoneda-extension and(4.6.4.1), the functor  $\Delta \rightarrow s\mathcal{Cat} : [n] \mapsto \mathfrak{C}[\Delta^n]$  corresponds to an adjunction

$$\mathfrak{C} : s\mathcal{Set} \rightleftarrows s\mathcal{Cat} : N_{\Delta}$$

where  $N_{\Delta}$  is called the **coherent nerve** functor, and

$$(N_{\Delta}(\mathcal{C}))_n = \text{Hom}_{\mathcal{Cat}_{\Delta}}(\mathfrak{C}[\Delta^n], \mathcal{C}).$$

If  $\mathcal{C}$  is a topological category, then define the **topological nerve** to be the simplicial nerve of  $\text{Sing}(\mathcal{C})$ .

By the definition and the adjointness of(4.6.3.8), the nerve functor  $N_{\Delta}$  is right adjoint to the functor  $|\cdot| \circ \mathfrak{C}$  or  $\mathfrak{C}$ .  $\lrcorner$

**Remark (4.6.4.7).** It should be checked that to give a 2-complex in  $N_{\Delta}(\mathcal{C})$  is equivalent to giving morphisms  $f, g, h \in \mathcal{C}$  and a path from  $g \circ f$  to  $h$ .  $\lrcorner$

**Thm. (4.6.4.8)**  $[\mathfrak{C} : s\mathcal{Set} \xrightleftharpoons{\text{Quillen}} s\mathcal{Cat} : N_{\Delta}]$ . The adjunction(4.6.4.6) is a Quillen adjunction w.r.t. the Joyal model category on  $s\mathcal{Set}$ (4.6.4.19) and the Bergner model category on  $s\mathcal{Cat}$ (4.6.4.4).

In particular, a theory of  $(\infty, 1)$ -categories given by the model of simplicial sets and the model of simplicial categories are the same?.  $\lrcorner$

*Proof:* Cf.[HTT, P89].?

Firstly we show  $\mathfrak{C}$  preserves cofibrations. It suffices to show that  $\mathfrak{C}[\partial\Delta^n] \subset \mathfrak{C}[\Delta^n]$  is a cofibration(4.5.7.4). But notice this two simplicial category only differ at  $\text{Hom}_{\mathfrak{C}[\partial\Delta^n]}(0, n)$  is the boundary of the simplicial cube  $(\Delta^1)^{n-1} \cong \text{Hom}_{\mathfrak{C}[\Delta^n]}(0, n)$ , thus the inclusion is a pushout of the inclusion  $[1]_{\partial(\Delta^1)^{n-1}} \subset [1]_{(\Delta^1)^{n-1}}$ , which is a cofibration by(4.5.7.3).

Left properness is clear(4.5.0.9).  $\mathfrak{C}$  preserves weak equivalences by(4.6.4.12) and(4.5.7.4), so  $(\mathfrak{C}, N)$  is a Quillen adjunction. To show it is a Quillen equivalence: It suffices to check for each simplicial set  $S$  and fibrant simplicial category  $\mathcal{C}$ , a map  $u : S \rightarrow N(\mathcal{C})$  is a categorical equivalence iff the adjoint map  $v : \mathfrak{C}[S] \rightarrow \mathcal{C}$  is an equivalence of simplicial categories. But  $v$  factors as

$$\mathfrak{C}[S] \xrightarrow{\mathfrak{C}[u]} \mathfrak{C}[N(\mathcal{C})] \xrightarrow{w} \mathcal{C}$$

and the counit map  $w$  is an equivalence by(4.6.4.14).  $\square$

**Cor.(4.6.4.9).** The coherent nerve of a Bergner-fibrant(4.6.4.4) simplicial category is an  $\infty$ -category.  $\lrcorner$

**Prop.(4.6.4.10)[Kan Fibrations Nerve Inner Fibrations].** Let  $F : \mathcal{C} \rightarrow \mathcal{D}$  be a map of simplicial categories that for any  $C, C' \in \mathcal{C}$ ,  $\text{Map}(C, C') \rightarrow \text{Map}(F(C), F(C'))$  is a Kan fibration, then the induced map of simplicial sets  $N(\mathcal{C}) \rightarrow N(\mathcal{D})$  is an inner fibration.  $\lrcorner$

*Proof:* This is because a lifting of  $N(\mathcal{C}) \rightarrow N(\mathcal{D})$  w.r.t.  $\lambda_j^n \subset \Delta^n$  is equivalent to a lifting of  $\mathcal{C} \rightarrow \mathcal{D}$  w.r.t.  $\mathfrak{C}[\Lambda_j^n] \subset \mathfrak{C}[\Delta^n]$ . But this lifting is equivalent to a lifting of  $\text{Map}(F(0), F(n)) \rightarrow \text{Map}(F'(0), F'(n))$  w.r.t. the anodyne map  $\text{Map}_{\mathfrak{C}[\Lambda_j^n]} \subset \text{Map}_{\mathfrak{C}[\Delta^n]}$ , which is a cube removing the interior and a face.  $\square$

**Cor.(4.6.4.11).** The topological nerve of a topological category  $\mathcal{C}$  is an  $\infty$ -category, as the singular complex of a topological space is always a Kan complex, by(4.6.3.43).  $\lrcorner$

**Def.(4.6.4.12)[Homotopy Category].** For  $S \in s\text{Set}$ , the **homotopy category**  $hS$  is defined to be the homotopy category(4.6.3.50) of the simplicial category  $\mathfrak{C}[S]$ (4.6.4.6), which is an  $\mathcal{H}$ -enriched category. A map of simplicial sets is called a **categorical equivalence** if their homotopy categories are equivalent as  $\mathcal{H}$ -enriched categories.  $\lrcorner$

**Remark(4.6.4.13).**  $f : S \cong T \in s\text{Set}$  is a categorical equivalence iff  $\mathfrak{C}(f) : \mathfrak{C}[S] \rightarrow \mathfrak{C}[T]$  is a Dwyer-Kan equivalence(4.6.4.3).  $\lrcorner$

**Lemma(4.6.4.14).** Let  $\mathcal{C}$  be fibrant simplicial category, then the counit map  $u : \text{Map}_{\mathfrak{C}[N_{\Delta}(\mathcal{C})]}(x, y) \rightarrow \text{Map}_{\mathcal{C}}(x, y)$  is a weak homotopy equivalence of simplicial sets.  $\lrcorner$

*Proof:* Cf.[HTT, P72].  $\square$

**Lemma(4.6.4.15).** Let  $\mathcal{C}$  be a topological category, then the counit map  $|\mathfrak{C}(N(\mathcal{C}))| \cong \mathcal{C}$ (4.6.4.6) is an equivalence of topological categories.  $\lrcorner$

*Proof:* By the Quillen equivalence between  $s\text{Set}$  and  $\mathcal{C}\mathcal{G}$ (4.6.3.49), this follows from(4.6.4.14), as by(4.5.7.11) and(4.6.3.43),  $\text{Sing}(\mathcal{C})$  is a fibrant simplicial category.  $\square$

**Prop.(4.6.4.16) [Topological Category and  $\infty$ -Category Equivalent].** The adjunction pair  $(|\mathfrak{C}[\cdot]|, N)$  defines a bijection between equivalent classes of topological(or simplicial) categories and  $\infty$ -categories.  $\lrcorner$

*Proof:* It suffices to show the units and counits are equivalences:

$$|\mathfrak{C}[N(\mathcal{C})]| \cong \mathcal{C}, \quad S \mapsto N(|\mathfrak{C}[S]|).$$

The first is (4.6.4.15), and the second follows from the first by remark (4.6.4.13).  $\square$

**Prop. (4.6.4.17).** For  $S, S' \in s\text{Set}$ , the natural map  $\mathfrak{C}[S \times S'] \rightarrow \mathfrak{C}[S] \times \mathfrak{C}[S']$  is an equivalence of simplicial categories.  $\lrcorner$

*Proof:* If  $S, S'$  are nerves of fibrant simplicial categories  $\mathcal{C}, \mathcal{C}'$ , then we have a diagram  $\mathfrak{C}[S \times S'] \rightarrow \mathfrak{C}[S] \times \mathfrak{C}[S'] \rightarrow \mathcal{C} \times \mathcal{C}'$ . Then by the two out of three axiom, the assertion follows from the fact that for any fibrant simplicial category  $\mathcal{D}$ ,  $\mathfrak{C}[N(\mathcal{D})] \rightarrow \mathcal{D}$  is an equivalence (4.6.4.15).

Now for general  $S, S'$ , we can find a categorical equivalences  $S \rightarrow N(|\mathfrak{C}[S]|) = T$ , and then  $S \times S' \rightarrow T \times T'$  is also categorical equivalence by (4.6.4.17), and we are done, by (4.6.4.19).  $\square$

### Joyal Model Structure

**Lemma (4.6.4.18)[Inner Anodyne is Categorical Equivalence].** Every inner anodyne map  $A \rightarrow B$  of simplicial sets is a categorical equivalence.  $\lrcorner$

*Proof:* The class of morphisms  $f$  that  $\mathfrak{C}(f)$  is a trivial cofibration is weakly saturated (because  $\mathfrak{C}$  is a left adjoint (4.6.4.6) and (4.5.0.5)), then it suffices to check for  $\Lambda_j^n \subset \Delta^n$ . Then  $\mathfrak{C}[\Lambda_j^n] \subset \mathfrak{C}[\Delta^n]$  is a pushout of  $[i]_K \subset [1]_{(\Delta^1)^{n-1}}$ , where  $K$  is obtained from  $(\Delta^1)^{n-1}$  by moving a face and the interior. Thus it is a trivial cofibration (4.5.7.4).  $\square$

**Prop. (4.6.4.19)[Joyal Model Structure].** There is a left proper combinatorial model structure called **Joyal model structure** on  $s\text{Set}$ , with:

- Cofibrations: monomorphisms.
- Weak equivalences: categorical equivalences defined in (4.6.4.12).
- Fibrations: **categorical fibrations** or **Joyal-fibrations** which has the right lifting property w.r.t. trivial cofibrations.  $\lrcorner$

*Proof:* Cf. [HTT, P89]. ?  $\square$

**Cor. (4.6.4.20).** if  $K, A, B \in s\text{Set}$  and  $f : A \rightarrow B$  is a categorical equivalence, then  $A \times K \rightarrow B \times K$  is also a categorical equivalence.  $\lrcorner$

*Proof:* Choose a factorization  $B \rightarrow Q$ , which is an inner anodyne and  $Q \in \infty\text{-Cat}$ , by small object argument (4.2.2.13), then  $B \times K \rightarrow Q \times K$  is also an inner anodyne map (4.6.3.31), hence a categorical equivalence (4.6.4.18), so we can assume  $B$  is an  $\infty$ -category. Similarly we can reduce to the case  $A, K$  are also  $\infty$ -categories.

For the rest, Cf. [HTT, P92].  $\square$

**Prop. (4.6.4.21)[ $\infty$ -Category Fibrant in Joyal Model].**  $C \in s\text{Set}$  is Joyal-fibrant iff it is an  $\infty$ -category.  $\lrcorner$

*Proof:* Fibrant objects are  $\infty$ -categories, by (4.6.4.18). For the converse, fix an  $\infty$ -category and an inclusion  $A \subset B$ , given a map  $A \rightarrow \mathcal{C}$ , the inclusion  $\mathcal{C} \subset C \coprod_A B$  is also a categorical equivalence because Joyal model structure is left proper (4.6.4.19), thus  $\mathcal{C}$  is a retract of  $\mathcal{C} \coprod_A B$  by (4.6.4.22), which gives an extension  $B \rightarrow \mathcal{C}$ .  $\square$

**Lemma (4.6.4.22).** Let  $\mathcal{C} \subset \mathcal{D} \in s\mathbf{Set}$  be a categorical equivalence and  $\mathcal{C} \in \mathbf{Cat}_\infty$ , then  $\mathcal{C}$  is a retract of  $\mathcal{D}$ .  $\lrcorner$

*Proof:* Include  $\mathcal{D}$  into an  $\infty$ -category by small object argument and (4.6.4.18), we may assume  $\mathcal{D}$  is also an  $\infty$ -category. So we finish by applying (4.7.1.25) for  $A = \mathcal{C}$  and  $B = \mathcal{D}$ .  $\square$

**Cor. (4.6.4.23).** Any  $S \in s\mathbf{Set}$  is weakly equivalent to an  $\infty$ -category.  $\lrcorner$

**Def. (4.6.4.24) [Joyal Joins].** For  $X, Y \in s\mathbf{Set}$ , define the **Joyal Join**

$$X \diamond Y = X \coprod_{X \times Y \times \{0\}} (X \times Y \times \Delta^1) \coprod_{X \times Y \times \{1\}} Y = (X \coprod Y) \coprod_{X \times Y \times \partial \Delta^1} (X \times Y \times \Delta^1).$$

By (4.5.6.7), this is a homotopy colimit w.r.t. the Joyal model category, so if  $X \rightarrow X', Y \rightarrow Y'$  are categorical equivalences,  $X \diamond Y \rightarrow X' \diamond Y'$  is also a categorical equivalence (4.5.6.6).  $\lrcorner$

**Prop. (4.6.4.25).** There is a projection map  $X \diamond Y \rightarrow \Delta^1$ , and a map  $X \times Y \times \Delta^1 \rightarrow X \star Y$  that is compatible with projection onto  $\Delta^1$ , thus inducing a map

$$X \diamond Y \rightarrow X \star Y$$

that is compatible with projection onto  $\Delta^1$ . Then this map is a categorical equivalence.  $\lrcorner$

*Proof:* Because both  $\diamond$  and  $\star$  commutes with filtered colimits, by (4.5.3.3), it suffices to show for  $X$  with only f.m. non-degenerate simplexes. Then we use induction. The case  $X = \emptyset$  is trivial, and if  $X = X' \coprod_{\partial \Delta^n} \Delta^n$ , because Joyal model category is left proper (4.6.4.19), by (4.5.6.7),  $X \diamond Y \rightarrow X \star Y$  is a homotopy pushout of  $X' \diamond Y \rightarrow X' \star Y$ . Then it suffices to show for  $X = \Delta^n$ .

By similar reason, because  $\Delta^{\{0,1\}} \coprod_{\{1\}} \Delta^{\{1,2\}} \coprod_{\{2\}} \coprod \dots \coprod_{\{n-1\}} \Delta^{\{n-1,n\}} \rightarrow \Delta^n$  is an anodyne ?, and anodyne are categorical equivalences (4.6.4.18), and homotopy limits of categorical equivalences are categorical equivalences by (4.5.6.6), it suffices to prove for  $X = \Delta^0$  or  $X = \Delta^1$ . The same argument then shows it suffices to prove for  $Y = \Delta^0$  or  $Y = \Delta^1$ . And in each case the desired map is an isomorphism.  $\square$

**Cor. (4.6.4.26).** If  $S \rightarrow S', T \rightarrow T'$  are categorical equivalences, then  $S \star T \rightarrow S' \star T'$  is also a categorical equivalence, by (4.6.4.24).  $\lrcorner$

**Cor. (4.6.4.27).** For  $X, Y \in s\mathbf{Set}$ , there is a natural equivalence of simplicial categories

$$\mathfrak{C}[X \star Y] \cong \mathfrak{C}[X] \star \mathfrak{C}[Y].$$

$\lrcorner$

*Proof:* Cf. [Lur09]P240.  $\square$

## 5 Simplicial Model Categories

**Def. (4.6.5.1) [Simplicial Model Categories].** A **simplicial model category** is a  $s\mathbf{Set}$ -enriched model category (4.5.5.3).  $\lrcorner$

**Prop. (4.6.5.2) [Simplicial Model Category Criterion].** Let  $\mathcal{C}$  be a simplicial category that is equipped with a model structure that every object of  $\mathcal{C}$  is cofibrant and the collection of weak equivalences is stable under filtered colimits, then  $\mathcal{C}$  is a simplicial model category iff the following conditions holds:

- $\mathcal{C}$  is both tensored and cotensored over  $\mathbf{Set}_\Delta$ .
- Given a cofibration of simplicial sets  $i : K \rightarrow L$  and a cofibration  $C \rightarrow D \in \mathcal{C}$ , the induced map  $(C \otimes L) \coprod_{C \otimes K} D \otimes K \rightarrow D \otimes L$  is a cofibration in  $\mathcal{C}$ .
- The natural map  $C \otimes \Delta^n \rightarrow C \otimes \Delta^0 \cong C$  is a weak equivalence in  $\mathcal{C}$ .

┘

*Proof:* Cf.[HTT, P850].

□

**Prop.(4.6.5.3).** Let  $\mathcal{C}$  be a simplicial model category and  $X$  cofibrant and  $Y$  fibrant, then  $K = \text{Map}(X, Y)$  is a Kan complex, and there is a canonical bijection  $\pi_0 K \cong \text{Hom}_{\text{Ho}(\mathcal{C})}(X, Y)$ .

┘

*Proof:* Use(4.5.5.4).

□

### Model-Categorical Yoneda Extensions

**Def.(4.6.5.4)**  $[U(\mathcal{C})]$ . For  $\mathcal{C} \in \mathbf{Cat}$ , denoted  $U(\mathcal{C}) = \mathcal{P}\text{Sh}(\mathcal{C}, s\mathbf{Set})_{\text{Proj}}$ , which is a left and right proper combinatorial model category, by(4.6.3.48) and(4.5.6.1)(4.5.6.2). And there is a natural functor

$$s \downarrow : \mathcal{C} \mapsto \mathcal{P}\text{Sh}(\mathcal{C}, \mathbf{Set}) \rightarrow \mathcal{P}\text{Sh}(\mathcal{C}, s\mathbf{Set}).$$

┘

**Prop.(4.6.5.5)** **[Model-Categorical Yoneda Extensions]**. Let  $\mathcal{C} \in \mathbf{Cat}$ ,  $\mathcal{M}$  be a model category, then for any functor  $Q : \mathcal{C} \rightarrow \mathcal{M}$ , there is a Quillen adjunction  $(L, R) : U(\mathcal{C}) \xrightleftharpoons{\text{Quillen}} \mathcal{M}$  together with a natural weak equivalence  $L \circ s \downarrow \cong Q \in \text{Func}(\mathcal{C}, \mathcal{M})$ . And the category of such extensions is contractible.

┘

*Proof:* Cf.[D. Dugger. Universal homotopy theories].

□

### Exponentiation in Model Categories

#### Localizations and Presentations

**Def.(4.6.5.6)** **[S-Local and S-Equivalences]**.

┘

**Prop.(4.6.5.7)** **[Localizations of Simplicial Model Categories]**. Let  $\mathcal{M}$  be a left proper combinatorial simplicial model category and  $S \subset \text{Cof}(\mathcal{M})$  be a small subset, then there is a left proper combinatorial simplicial model category  $S^{-1}\mathcal{M}$  with the same underlying category as  $\mathcal{M}$  and

- Cofibrations:  $\text{Cof}(\mathcal{M})$ .
- Weak Equivalences:  $S$ -equivalences in  $\mathcal{M}$ .
- Fibrations: defined by the above two.

And  $X \in \mathcal{M}$  is fibrant in  $S^{-1}\mathcal{M}$  iff  $X$  is  $S$ -local and fibrant in  $\mathcal{M}$ .

┘

*Proof:* Cf.[Lur09]P906.

□

**Prop.(4.6.5.8).** Let  $\mathcal{M}$  be a left proper combinatorial simplicial model category, then

- Any combinatorial Bousfield localization(4.5.4.3) of  $\mathcal{M}$  is of the form  $S^{-1}\mathcal{M}$ , where  $S \subset \text{Cof}(\mathcal{M})$  is a small subset.
- For any two small subset  $S, T \subset \text{Cof}(\mathcal{M})$ ,  $S^{-1}\mathcal{M}$  and  $T^{-1}\mathcal{M}$  coincide iff the class of  $S$ -local objects and  $T$ -local objects coincide.

┘

*Proof:* Cf.[Lur09]P908. □

**Prop.(4.6.5.9) [Combinatorial Model Categories have Presentations].** Every combinatorial model category  $\mathcal{M}$  has a presentation, i.e. there exists a  $\mathcal{C} \in \mathbf{Cat}$  a set  $S$  of morphisms in  $U(A)$  and a Quillen equivalence

$$U(\mathcal{C})[S^{-1}] \xrightleftharpoons{\text{Quillen}} \mathcal{M}(4.6.5.7).$$

┘

*Proof:* [D. Dugger. Combinatorial model categories have presentations]. □

## 6 Covariant Model Structure

**Prop.(4.6.6.1) [Covariant Model Structure].** For  $S \in s\mathbf{Set}$ , a map  $X \rightarrow Y \in (\mathbf{Set}_\Delta)_S$  is called a

- **covariant cofibration** if it is a monomorphism.
- **covariant equivalence** if the induced map  $X^\triangleleft \coprod_X S \rightarrow Y^\triangleleft \coprod_Y S$  is a categorical equivalence(4.6.4.12).

Then these define a left proper combinatorial model structure on  $(\mathbf{Set}_\Delta)_S$ . ┘

*Proof:* Cf.[HTT, P69]. □

**Lemma(4.6.6.2).** Every left anodyne map in  $(\mathbf{Set}_\Delta)_S$  is a covariant equivalence. ┘

*Proof:* Cf.[HTT, P69]. □

**Prop.(4.6.6.3) [Covariant Model Structure].**  $(\mathbf{Set}_\Delta)_S$  is a simplicial model category with the contravariant model structure and the simplicial structure where

$$\text{Map}(X, Y) = Y^X \times_{S^X} \{\varphi\} \in \mathbf{Set}_\Delta$$

where  $\varphi : X \rightarrow S$  is the structure map. ┘

*Proof:* We use(4.6.5.2), it suffices to check that  $X \times \Delta^n \rightarrow X \times \Delta^0$  is a covariant equivalence. But it has a section, which is a left anodyne by(4.6.3.31), thus it is a covariant equivalence by(4.6.6.2). □

**Cor.(4.6.6.4) [Contravariant Model Structure].** Let  $S$  be a simplicial set, then the covariant model is usually not self-dual, and we can define a **contravariant model structure** as follows:

- A **contravariant cofibration** is a monomorphism of simplicial sets.
- $f$  is a **contravariant equivalence** in  $(\mathbf{Set})_S$  iff  $f^{op}$  is a covariant equivalence in  $(\mathbf{Set})_{S^{op}}$ .
- $f$  is a **contravariant fibration** in  $(\mathbf{Set})_S$  iff  $f^{op}$  is a covariant fibration in  $(\mathbf{Set})_{S^{op}}$ .

┘

**Prop.(4.6.6.5) [Base Change].** For  $S \rightarrow S' \in s\mathbf{Set}$ , the forgetful functor and base change functor  $j_!, j^*$  defines a Quillen adjunction of covariant models:

$$j_! : (\mathbf{Set}_\Delta)_S \xrightleftharpoons{\text{Quillen}} (\mathbf{Set}_\Delta)_{S'} : j^*$$

┘

*Proof:* it is clearly a pair of adjoints, and  $j_!$  preserves cofibrations.  $j_!$  also preserves covariant equivalences: Cf.[HTT, P71] ?. Thus it is a Quillen adjunction.  $\square$

**Lemma (4.6.6.6).** Let  $S' \subset S$  be simplicial sets, let  $p : X \rightarrow S$  be a map and  $q : Y \rightarrow S$  be a right fibration. Let  $X' = X \times_S S', Y' = Y \times_S S'$ , then the restriction map

$$\varphi : \text{Map}_{(\text{Set}_\Delta)_{/S}}(X, Y) \rightarrow \text{Map}_{(\text{Set}_\Delta)_{/S'}}(X', Y')$$

is a Kan fibration.  $\lrcorner$

*Proof:* Firstly it is a right fibration because it has right lifting property w.r.t. right anodyne inclusion  $A \rightarrow B$ : this is because  $(A \times X') \coprod (A \times X) \subset B \times X$  is also a right anodyne (4.6.3.31). Next we apply this to the inclusion  $\emptyset \subset S'$  to see that  $\text{Map}_{(\text{Set}_\Delta)_{/S'}}(X', Y')$  is a Kan complex (4.7.1.27), and then  $\varphi$  is a Kan fibration by (4.6.3.42).  $\square$

**Lemma (4.6.6.7).** Let  $p : X \rightarrow S$  be an object of  $(\text{Set}_\Delta)_{/S}$ , then  $p$  is a right fibration iff it is a covariant fibrant object in  $(\text{Set}_\Delta)_{/S}$ .  $\lrcorner$

*Proof:* Cf.[HTT, P85].  $\square$

**Def. (4.6.6.8) [Pointwise Equivalence].** Let  $X \rightarrow Y$  be a map in  $\text{RFib}(S)$ , then  $f$  is called a **pointwise equivalence** iff the induced map  $X_s \rightarrow Y_s$  is a homotopy equivalence of Kan complexes (4.7.1.27) for any  $s \in S$ .  $\lrcorner$

**Lemma (4.6.6.9).** Let  $f : X \rightarrow Y$  be a morphism in  $\text{RFib}(S)$ , then the following are equivalent:

- $f$  is a pointwise equivalence.
- $f$  is an equivalence in the simplicial category  $(\text{Set})_{/S}$ .
- For any  $A \in (\text{Set})_{/S}$ ,  $f$  induces a homotopy equivalence of Kan complexes:  $\text{Map}_{(\text{Set}_\Delta)_{/S}}(A, X) \rightarrow \text{Map}_{(\text{Set}_\Delta)_{/S}}(A, Y)$ .  $\lrcorner$

*Proof:* Cf.[HTT, P82].  $\square$

**Prop. (4.6.6.10) [Equivalences].** In the situation of (4.6.6.8),  $f$  is a pointwise equivalence iff it is a contravariant equivalence iff it is a categorical equivalence.  $\lrcorner$

*Proof:* Cf.[HTT, 2.2.3.13, 3.3.1.5] ?.  $\square$

**Prop. (4.6.6.11) [Contravariant Fibration as Right Fibration].** Let  $f : X \rightarrow Y$  be a map in  $\text{RFib}(S)$ , then  $f$  is a contravariant fibration in  $(s\text{Set})_{/S}$  iff it is a right fibration.  $\lrcorner$

*Proof:* Cf.[HTT, P86].  $\square$

### Straightening and Unstraightening

**Def. (4.6.6.12) [Straightening and Unstraightening].** Fix a simplicial set  $S$ , a simplicial category  $\mathcal{C}$  and a functor  $\mathcal{C}[S] \rightarrow \mathcal{C}^{\text{op}}$ . Given an object  $X \in (\text{Set}_\Delta)_{/S}$ , let  $v$  be the cone point of  $X^\triangleright$ . Then the simplicial category  $\mathcal{M} = \mathcal{C}[X^\triangleright] \coprod_{\mathcal{C}[X]} \mathcal{C}^{\text{op}}$  can be viewed as a correspondence ? between  $\mathcal{C}^{\text{op}}$  and  $\Delta^0$ , thus giving a simplicial functor

$$\text{St}_\varphi X : \mathcal{C} \rightarrow \text{Set}_\Delta : C \mapsto \text{Map}_{\mathcal{M}}(C, v).$$

Then  $St_\varphi$  is called the **straightening functor** associated to  $\varphi$ . And we denote by  $St_S$  the functor  $St_\varphi$  where  $\varphi : \text{id}_{\mathfrak{C}[S]}$ .

By the adjoint functor theorem (4.1.1.35),  $St_\varphi$  has a left adjoint called **unstraightening functor**  $UnSt_\varphi$ .  $\lrcorner$

**Prop. (4.6.6.13).** Let  $S$  be a simplicial set,  $\mathfrak{C}$  a simplicial category and  $\varphi : \mathfrak{C}[S] \rightarrow \mathfrak{C}^{\text{op}}$  a simplicial functor, then the straightening and unstraightening functor determines a Quillen adjunction

$$St_\varphi : (\text{Set}_\Delta)_S \xrightleftharpoons{\text{Quillen}} \text{Set}_\Delta^\mathfrak{C} : UnSt_\varphi$$

determines a Quillen adjunction, where the LHS has the contravariant model structure and the RHS has the projective model structure. And if  $\varphi$  is an equivalence of simplicial categories, then  $(St_\varphi, Un_\varphi)$  is a Quillen equivalence.  $\lrcorner$

*Proof:*  $\square$

### Unstraightening of Right Fibrations

**Prop. (4.6.6.14).** For every simplicial set  $S$ , the unstraightening  $Un_S$  induces an equivalence of simplicial categories

$$(\text{Set}_\Delta^{\mathfrak{C}[S]^{\text{op}}})_{cf} \rightarrow \text{RFib}(S).$$

(4.5.5.5), where the RHS is the category of fibrations  $X \rightarrow S$ .  $\lrcorner$

*Proof:* Cf. [HTT, P83].  $\square$

## 7 Cartesian Fibrations

**Remark (4.6.7.1).** The theory of Cartesian fibrations is an analogue of the theory of fibered categories.  $\lrcorner$

**Def. (4.6.7.2) [ $p$ -Cartesian].** Let  $p : X \rightarrow S$  be an inner fibration and  $f : x \rightarrow y$  is an edge of  $X$ , then  $f$  is called a  **$p$ -Cartesian** if the induced map

$$X_{/f} \rightarrow X_{/y} \times_{S_{/p(y)}} S_{/p(f)}$$

is a trivial Kan fibration.  $\lrcorner$

**Remark (4.6.7.3).** For  $\mathfrak{C} \in \text{Cat}$  and  $p : N(\mathfrak{C}) \rightarrow \Delta^1 \in s\text{Set}$ , a morphism  $f \in \mathfrak{C}$  is  $p$ -Cartesian iff it is Cartesian in the usual sense.  $\lrcorner$

**Prop. (4.6.7.4) [Characterization of Cartesian Fibrations].** Let  $p : \mathfrak{C} \rightarrow \mathcal{D}$  be an inner fibration of  $\infty$ -categories, then an edge  $f : Y \rightarrow Z \in \mathfrak{C}$  is  $p$ -Cartesian iff for every object  $X \in \mathfrak{C}$ , there is a Cartesian diagram

$$\begin{array}{ccc} \text{Map}(X, Y) & \longrightarrow & \text{Map}(X, Z) \\ \downarrow & & \downarrow \\ \text{Map}(p(X), p(Y)) & \longrightarrow & \text{Map}(p(X), p(Z)) \end{array} .$$

*Proof:* Cf. [HTT, P131].  $\square$

### Cartesian Fibrations

**Def. (4.6.7.5) [Cartesian Fibration].** A **Cartesian fibration** is an inner anodyne map  $p : X \rightarrow S$  that for any edge  $f : x \rightarrow y \in S$  and a vertex  $\tilde{y}$  mapping to  $y$ , there is a  $p$ -Cartesian edge  $\tilde{f}$  with  $p(\tilde{f}) = f$ . The dual of a Cartesian fibration is called a **coCartesian fibration**.  $\lrcorner$

**Prop. (4.6.7.6).** The class of Cartesian fibrations is stable under compositions and base change.  $\lrcorner$

**Prop. (4.6.7.7) [Cartesian Fibration and Right Fibration].** Let  $p : X \rightarrow S$  be an inner fibration, then the following are equivalent:

- $p$  is a Cartesian fibration and the every edge of  $X$  is  $p$ -Cartesian.
- $p$  is a right fibration.
- $p$  is a Cartesian fibration and every fiber  $X_s$  is a Kan complex.

$\lrcorner$

*Proof:* Cf.[HTT, P122]. ?

$\square$

**Def. (4.6.7.8) [Locally Cartesian Fibration].** A map  $X \rightarrow S$  of simplicial sets is called a **locally Cartesian fibration** if it is an inner fibration and for every edge  $\Delta^1 \rightarrow S$ , the pullback  $X \times_S \Delta^1 \rightarrow \Delta^1$  is a Cartesian fibration.  $\lrcorner$

**Prop. (4.6.7.9) [Cartesian and Locally Cartesian].** Let  $p : X \rightarrow S$  be a locally Cartesian fibration, then the following are equivalent:

- $p$  is a Cartesian fibration.
- Given a composition  $fg \cong h$  in the homotopy category, if  $f, g$  are both locally  $p$ -Cartesian, then  $h$  is also locally  $p$ -Cartesian.
- Every locally  $p$ -Cartesian edge in  $X$  is  $p$ -Cartesian.

$\lrcorner$

*Proof:* Cf.[HTT, P124].

$\square$

**Prop. (4.6.7.10).** Given maps of  $\infty$ -categories:  $\mathcal{C} \xrightarrow{p} \mathcal{D} \xrightarrow{q} \mathcal{E}$ , if  $q, q \circ p$  are both locally Cartesian fibrations and  $p$  maps locally  $(q \circ p)$ -Cartesian maps to locally  $q$ -Cartesian maps and for any  $Z \in \mathcal{E}$ ,  $p$  induces a categorial equivalence  $\mathcal{C}_Z \rightarrow \mathcal{D}_Z$ , then  $p$  is a categorial equivalence.  $\lrcorner$

*Proof:* Cf.[HTT, P132]. ?

$\square$

**Prop. (4.6.7.11).** Categorical equivalences between  $\infty$ -categories are stable under base change of Cartesian fibrations of  $\infty$ -categories.  $\lrcorner$

*Proof:* Cf.[HTT, P132].

$\square$

## 8 Simplicial Homology

**Prop. (4.6.8.1).** For a Kan fibration  $X$ , there can be defined a homotopy groups  $\pi_n$  that they agree with  $\pi_i(|X|)$  thus also  $\pi_i(S|X|)$ , Cf.[Weibel P263]. Thus we see that  $|BG|$  is truly the Eilenberg-MacLane spaces  $BG$ .  $\lrcorner$

## 9 Cyclic Homology Theory

References are [欧阳恩林, 循环同调].

### Combinatorial Category

**Def. (4.6.9.1).** The **Segal category**  $\text{Fin}_*$  is the category of pointed finite sets. A morphism is called **inert** iff  $|f^{-1}(\{i\})| = 1$  for all  $i \neq *$ . It is called **active** iff  $f^{-1}(\{*\}) = \{*\}$ .

A morphism can be uniquely factorized as a composition  $gh$ , where  $h$  is inert and  $g$  is active.  $\lrcorner$

**Prop. (4.6.9.2).** There is a morphism  $\text{Cut} : \Delta^{\text{op}} \rightarrow \text{Fin}_*$  where we interpret  $[n] \in \text{Fin}_*$  as the set of cut in  $[n]$ , and

$$\text{Cut}(\alpha)(i) = \begin{cases} j & , \alpha(j-1) < i \leq \alpha(j) \exists j \in [n]_+ \\ 0 & , \text{otherwise} \end{cases}$$

$\lrcorner$

**Prop. (4.6.9.3).** The category of functors from the  $E_\infty = \text{Fin}_*$  to  $\text{Cat}$  that

$$X([n]) \xrightarrow{\prod_{i=2}^n X(\rho^i)} \prod_{i=1}^n X([1]) \quad n \geq 0$$

and  $X([0])$  is the final object, is equivalent to the category of symmetric unital monoidal categories with base category  $(X([1]))$ . (Because the commutativity of morphisms encodes the fact that the tensor action is symmetric).

Similarly, the category of functors from the  $\Delta^{\text{op}}$  to  $\text{Cat}$  that

$$X([n]) \xrightarrow{\prod_{i=2}^n X(\rho^i)} \prod_{i=1}^n X([1]) \quad n \geq 0$$

is equivalent to the category of symmetric unital monoidal categories  $(X([1]))$ . And it is symmetric iff it factors through  $\text{Cut} : \Delta^{\text{op}} \rightarrow \text{Fin}_*$ .  $\lrcorner$

**Def. (4.6.9.4).** The **Conne cyclic category**  $\Delta_C$  is a category containing  $\Delta$  that  $\text{Aut}_{\Delta_C}([n])$  is  $C_{n+1}$ . And every morphism  $[n] \rightarrow [m]$  in  $\Delta_C$  can be uniquely written as the form  $\varphi g$ , where  $\varphi \in \text{Hom}_\Delta([n], [m])$  and  $g \in \text{Aut}_{\Delta_C}([n])$ .

$\Delta_C^{\text{op}}$  is isomorphic to  $\Delta_C$  Cf.[杨恩林循环同调 P31], thus  $\Delta$  and  $\Delta^{\text{op}}$  are all subcategories of  $\Delta_C$ .

$\lrcorner$

**Def. (4.6.9.5).** The category  $\Delta_S$  is the category that  $\text{Aut}_{\Delta_S}([n]) \cong S^n$  and every morphism  $[n] \rightarrow [m]$  in  $\Delta_S$  can be uniquely written as the form  $\varphi g$ , where  $\varphi \in \text{Hom}_\Delta([n], [m])$  and  $g \in \text{Aut}_{\Delta_S}([n])$ .  $\lrcorner$

**Def. (4.6.9.6).** For a category  $C$ , a **cyclic object** in  $C$  is a functor  $\Delta_C^{\text{op}} \rightarrow C$ .

For example, the functor that maps  $[n]$  to  $C_{n+1}$  and the functor maps to the pull back of the order of the cyclic, is a cyclic object.  $\lrcorner$

### Hochschild Homology(Jeremy Hahn)

**Def. (4.6.9.7)[Hochschild Homology Group].** Let  $R$  be a commutative ring and  $A$  a flat  $R$ -algebra,  $A^{\text{env}} = A \otimes_R A^{\text{op}}$ . Then an  $A^{\text{env}}$ -module is equivalent to an  $(A, A)$ -bimodule.

If  $M$  is an  $(A, A)$ -bimodule, then we define **Hochschild homology group**  $HH_n(A/R, M) = \text{Tor}_n^{\text{env}}(M, A)$ . And also we denote  $HH_n(A/R) = HH_n(A/R, M)$ .

$H_n(A, M)$  is a  $Z(A)$  module by the action of  $Z(A)$  on  $M$  and  $HH_*$  defines a functor  $\mathcal{C}\text{Ring}_R \rightarrow \text{Mod}_R$ .  $\lrcorner$

**Def. (4.6.9.8)[Hochschild Complex].** Let  $R$  be a commutative ring and  $A$  a flat  $R$ -algebra, we define  $A^{env} = A \otimes_R^L A^{op}$ , and  $HH(A/R) = A \otimes_{A^{env}}^L A \in D(A)$ .  $\lrcorner$

**Def. (4.6.9.9)[Flat Case].** For a flat  $R$ -algebra  $A$  and a  $(A, A)$ -bimodule  $M$ , there is a simplicial module  $C(A, M)$  called the **Hochschild complex** of  $A$  with coefficient in  $M$ , with  $M_n = M \otimes A^n$  that

$$d_i(m, a_1, \dots, a_n) = \begin{cases} (m_0 a_1, a_2, \dots, a_n) & i = 0 \\ (a_n m_0, a_1, \dots, a_{n-1}) & i = n \\ (m_0, a_1, \dots, a_i a_{i+1}, \dots, a_n) & \text{otherwise} \end{cases}$$

$$s_j(m, a_1, \dots, a_n) = (m, a_1, \dots, a_{j-1}, 1, a_{j+1}, \dots, a_n)$$

The homology group of the Moore complex associated to the Hochschild complex is just  $HH_n(A, M)$ . The Moore complex is of the form

$$\dots \rightarrow M \otimes A \otimes A \otimes A \xrightarrow{\partial_3} M \otimes A \otimes A \xrightarrow{\partial_2} M \otimes A \xrightarrow{\partial_1} M \xrightarrow{\partial_0} 0 \rightarrow 0 \rightarrow \dots$$

where

$$\partial_1(m \otimes a) = ma - am, \quad \partial_2(m \otimes a_1 \otimes a_2) = ma_1 \otimes a_2 - m \otimes a_1 a - 2 + a_2 m \otimes a_1$$

$$\partial_3(m \otimes a_1 \otimes a_2 \otimes a_3) = ma - 1 \otimes a_2 \otimes a_3 - m \otimes a_1 a_2 \otimes a_3 + m \otimes a_1 \otimes a_2 a_3 - a_3 m \otimes a_1 \otimes a_2.$$

$\lrcorner$

*Proof:*

$\square$

**Example (4.6.9.10).**

- $HH_n(R, R) = R$  if  $n = 0$  and 0 otherwise.
- $HH_0(A/R, A/R) = A_{ab}$ .
- If  $A \in \mathcal{Ab}$ ,  $HH_1(A, A) \cong \Omega_{A/R}^1$  is given by  $a \otimes x \mapsto adx$  by (5.4.3.4).
- For a symmetric  $(A, A)$ -module  $M$ , thus we have  $H_1(A, M) = M \otimes_A A^{ab}$  and  $H_1(A, M) = M \otimes_A \Omega_{A/R}^1$ . And if  $M$  is flat,  $H_n(A, M) = M \otimes_A H_n(A, A)$ . ?

$$\bullet \quad HH_n(R[X]/R) = \begin{cases} R[X] & n = 0 \\ \Omega_{R[X]/R}^1 & n = 1 \\ 0 & \text{otherwise} \end{cases}.$$

$\lrcorner$

**Example (4.6.9.11)[ $HH(\mathbb{F}_p/\mathbb{Z})$ ].** Because  $\mathbb{F}_p \otimes_{\mathbb{Z}}^L \mathbb{F}_p = (\mathbb{F}_p \xrightarrow{0} \mathbb{F}_p)$ . ?

$$HH_*(\mathbb{F}_p, \mathbb{Z}) \cong \mathbb{F}_p[X_1, X_2, \dots, ] / (X_i X_j = \binom{i+j}{i} X_{i+j})$$

where  $\deg(X_i) = 2i, \partial X_i = 0$ .

$\lrcorner$

**Prop. (4.6.9.12).** Suppose  $A, B$  are  $R$ -algebras, then

$$HH(A \otimes_R^L B/R) = HH(A/R) \otimes_R^L HH(B/R).$$

$\lrcorner$

**Cor. (4.6.9.13).**  $HH(R[X_1, \dots, X_n]/R) = \Omega_{R[X_1, \dots, X_n]/R}^*$ .  $\lrcorner$

**Prop. (4.6.9.14).** If  $A$  is a commutative  $R$ -algebra, then  $HH(A/R)$  is naturally a commutative dga. In particular,  $HH_*(A/R)$  is a graded ring.  $\lrcorner$

**Prop. (4.6.9.15) [Spectral Sequence].** For a commutative ring  $A$  and a symmetric  $A$ -bimodule  $M$ , there is a spectral sequence

$$E_{pq}^2 = \text{Tor}_p^R(H_p(A, A), M) \Rightarrow H_{p+q}(A, M).$$

$\lrcorner$

### Hochschild Homology

**Prop. (4.6.9.16) [Hochschild-Kostant-Rosenberg].** The isomorphism  $\Omega_{A/R}^1 \cong HH_1(A)$  extends to a graded ring map

$$\Psi : \Omega_{A/k}^* \rightarrow H_*(A, A)$$

. If  $A/R$  be smooth algebra and  $R$  Noetherian, then  $\Psi$  is an isomorphism of graded algebra. Cf. [Weibel P322], [阳恩林循环同调 P133].  $\lrcorner$

**Def. (4.6.9.17) [Tsygan's Double Complex].** For a cyclic object  $M$  in an Abelian category, let  $t_*$  be the cyclic morphism and  $\partial_n = \sum_{i=0}^n (-1)^i d_i$ ,  $\partial'_n = \sum_{i=0}^{n-1} (-1)^i d_i$ ,  $N_n = \sum_{k=0}^n ((-1)^n t_n)^k$ , then there is a double complex  $CC(M)$ :

$$\begin{array}{ccccc} \downarrow \partial & & \downarrow -\partial' & & \downarrow \partial \\ M_1 & \xleftarrow{1-(-1)^1 t} & M_1 & \xleftarrow{N} & M_1 & \xleftarrow{1-(-1)^1 t} \\ \downarrow \partial & & \downarrow -\partial' & & \downarrow \partial \\ M_0 & \xleftarrow{1-(-1)^0 t} & M_0 & \xleftarrow{N} & M_0 & \xleftarrow{1-(-1)^0 t} \end{array}$$

That the column are 2-cyclic. Cf. [Weibel P337]. The first column is called the **Hochschild complex of  $M$** :  $C^h(M)$ , the second column is called **acyclic complex of  $M$**  (4.6.9.18)  $C^a(M)$ . And we can even augment a cokernel column on the left, which is the complex of  $M$  modulo the cyclic action, called the **Conne complex**  $C^\lambda(M)$ .

We define the **Cyclic Homotopy Group**  $HC_n(M) = H_n(\text{Tot} CC(M))$  and when  $M$  is the cyclic module  $C(A)$  (4.6.9.9), denote  $CC(C(A)) = CC(A)$ ,  $HC_n(A) = HC_n(C(A))$ .  $\lrcorner$

**Lemma (4.6.9.18).** The second column is exact and  $h = t_{n+1}s_n$  is a null-homotopy. Cf. [阳恩林循环同调 P122].  $\lrcorner$

**Lemma (4.6.9.19).** Notice the rows are in fact a group homology  $\text{Hom}(\mathbb{Z}/(n+1)\mathbb{Z}, M_n)$ , thus when  $\mathbb{Q} \in R$ , we have the rows are acyclic because the group homology is killed by  $|G|$  (9.8.1.8), thus  $HC_*(M) \cong H_*^\lambda(M)$  are isomorphisms by spectral sequence.  $\lrcorner$

**Prop. (4.6.9.20) [Conne SBI Sequence].** For a cyclic module  $M$ , there is a long exact sequence

$$\cdots \rightarrow HH_n(M) \xrightarrow{I} HC_n(M) \xrightarrow{S} HC_{n-2}(M) \xrightarrow{B} HH_{n-1}(M) \rightarrow \cdots$$

$\lrcorner$

*Proof:* shift the diagram 2 column right, then there is an exact sequence of double complexes and notice the second column is exact(4.6.9.18), thus we have the kernel is quasi-isomorphic to  $C^h(M)$ . So the sequence follows.  $\square$

**Cor. (4.6.9.21).**  $HC_0(A) = HH_0(A) = A_{ab}$ .

When  $A \in \mathcal{A}b$ ,  $HC_1(A) = \text{Coker}(HC_0(A) \xrightarrow{B} HH_1(A)) = \Omega_{A/R}^1/dA$  as a  $R$  module, because we can verify that  $B(a) = a \otimes 1 - 1 \otimes a$ .  $\lrcorner$

**Cor. (4.6.9.22).** For a morphism of two cyclic objects,  $HH_*(M) \cong HH_*(M')$  iff  $HC_n(M) \cong HC_n(M')$ . (Use five lemma).  $\lrcorner$

**Def. (4.6.9.23).** A **mixed complex**  $(M, b, B)$  is a complex with  $b : M_n \rightarrow M_{n-1}$  and  $B : M_n \rightarrow M_{n+1}$  that makes  $M$  into a double chain complex. And there is a **Conne double complex** associated with this mixed complex. And similarly there is a same **SBI** sequence associated to the following diagram:

$$\begin{array}{ccccc}
 & \downarrow & & \downarrow & & \downarrow \\
 M_2 & \xleftarrow{B} & M_1 & \xleftarrow{B} & M_0 \\
 \downarrow b & & \downarrow b & & \\
 C_1 & \xleftarrow{B} & C_0 & & \\
 \downarrow b & & & & \\
 C_0 & & & & 
 \end{array}$$

From a cyclic object  $M$ , we notice that the  $2k$ -th column is acyclic(4.6.9.18), thus there is a snake-like connection homomorphism  $B$  that makes  $M$  into a mixed complex  $BM$ . Cf.[Weibel P344]. And the Conne double complex will compute the same cyclic homology with previous defined cyclic homology, Cf.[Weibel P345].

Notice for this  $B$ ,  $B_*$  on homology is exactly the composition  $BI$ .  $\lrcorner$

**Prop. (4.6.9.24).** Let  $R \rightarrow A \in \mathcal{C}Ring$  and  $M \in \text{Mod}_A$  then there is a natural morphism

$$M \otimes_A \Omega_{A/R}^n \xrightarrow{\varepsilon_n} H_n(A, M) \xrightarrow{\pi_n} M \otimes_A \Omega_{A/R}^n.$$

such that  $\pi_n \circ \varepsilon_n = n!$ .

We first define a map  $\varepsilon_n : M \otimes \wedge^n A \rightarrow H_n(A, M)$  that

$$\varepsilon_n(m, a_1, \dots, a_n) = \sum \text{sgn}(\sigma)(m, a_{\sigma^{-1}(1)}, \dots, a_{\sigma^{-1}(n)})$$

then define  $\varepsilon_n(m \otimes x da_1 \wedge \dots \wedge da_n) = \varepsilon_n(mx, a_1, \dots, a_n)$ . And we verify that this map is well-defined and maps into  $Z_n(C(A, M))$ , Cf.[阳恩林循环同调 P99].

Then we define  $\pi_n(m, a_1, \dots, a_n) = m \otimes da_1 \wedge \dots \wedge da_n$  and verify easily that this vanish on  $B_n(C(A, M))$ . And it is easy to verify  $\pi_n \circ \varepsilon_n = n!$ .  $\lrcorner$

**Prop. (4.6.9.25).** When  $A$  is a unital  $R$ -algebra, there is a commutative diagram

$$\begin{array}{ccc}
 \Omega_{A/R}^n & \xrightarrow[(d)]{(n+1)d} & \Omega_{A/R}^{n+1} \\
 \uparrow \scriptstyle \pi_n \downarrow \scriptstyle \varepsilon_n & & \uparrow \scriptstyle \pi_{n+1} \downarrow \scriptstyle \varepsilon_{n+1} \\
 HH_n(A) & \xrightarrow{B_*} & HH_{n+1}(A)
 \end{array}$$

$\lrcorner$

*Proof:* We notice  $B = (1 - (-1)^n t) sN$  :

$$(m, a_1, \dots, a_n) \mapsto \sum_{i=0}^n (-1)^{in} (1, a_i, \dots, a_n, m, a_1, \dots, a_{i-1}) - \sum_{i=0}^n (-1)^{in} (a_i, 1, a_{i+1}, \dots, a_n, m, a_1, \dots, a_{i-1}).$$

Cf.[阳恩林循环同调 P128]. □

**Cor.(4.6.9.26).** For a commutative unital  $R$ -algebra  $A$ , there is a functorial  $\varepsilon_n : \Omega_{A/R}^n / d\Omega_{A/R}^{n-1} \rightarrow HC_n(A)$  making the following diagram commutative:

$$\begin{array}{ccccccc} \xrightarrow{0} \Omega^{n-1}/d\Omega^{n-2} & \xrightarrow{d} & \Omega^n & \longrightarrow & \Omega^n/d\Omega^{n-1} & \xrightarrow{0} & \Omega^{n-2}/d\Omega^{n-3} \longrightarrow \dots \\ & & \downarrow \varepsilon_{n-1} & & \downarrow \varepsilon_n & & \downarrow \varepsilon_{n-2} \\ \longrightarrow & HC_{n-1} & \xrightarrow{B} & HH_n & \xrightarrow{I} & HC_n & \xrightarrow{S} HC_{n-2} \xrightarrow{B} \dots \end{array}$$

which is induced by the cokernel. Cf.[阳恩林循环同调 P130]. When  $\mathbb{Q} \in R$ ,  $\varepsilon_n$  is a split injection. ┘

**Prop.(4.6.9.27).** When  $\mathbb{Q} \in R$ ,  $\frac{1}{n!}\pi_n$  induces a morphism of mixed complexes  $(BA, \partial, B) \rightarrow (\Omega_{A/R}^*, 0, d)$  by(4.6.9.24), thus there is a natural map

$$HC_n(A) \rightarrow \Omega_{A/R}^n / d\Omega_{A/R}^{n-1} \bigoplus_{i>0} H_{dR}^{n-2i}(A).$$

┘

**Prop.(4.6.9.28) [Morita Invariance].**  $\text{Tr} : HH_*(M_r(A), M_r(M)) \cong HH_*(A, M)$  by the trace and inclusion functors. Cf.[阳恩林循环同调 Morita Invariance]. In particular, there is an isomorphism  $HH_*(M_r(A)) \cong HH_*(A)$ , thus also  $HC_*(M_r(A)) \cong HC_*(A)$  by(4.6.9.20). ┘

**Prop.(4.6.9.29) [Karoubi].**  $BG$  is a cyclic group, and then the cyclic homology group  $HC_n(G, A) \cong \bigoplus_{k \geq 0} H_{n-2k}(G, A)$ . Cf.[Weibel P339]. ┘

## 4.7 $\infty$ -Categories

References are [Joy02], [Lur09], [Lur11], [Infinity Categories from Scratch], [A whirlwind tour of the world of  $(\infty, 1)$ -categories], [Gro15], [Introduction to  $\infty$ -Categories].

**Notation (4.7.0.1).**

- Use notations defined in [Simplicial Homotopy Theory](#).

┘

### 1 $\infty$ -Categories

**Def. (4.7.1.1) [ $\infty$ -Category].** An  $\infty$ -category is a simplicial set that has lifting property w.r.t any  $\Lambda_i^n \rightarrow \Delta^n$ , where  $0 < i < n$ . ┘

**Cor. (4.7.1.2).** By (4.6.3.6), the nerve of a category is an  $\infty$ -category. ┘

**Def. (4.7.1.3) [Sub- $\infty$ -Categories].** Let  $\mathcal{C} \in \text{Cat}_\infty$  and  $\mathcal{D}_0 \subset \mathcal{C}_0$  be a subset of vertices, then there is a sub-simplicial set  $\mathcal{D} \subset \mathcal{C}$  consisting of simplexes with all vertices in  $\mathcal{C}$ . Then it is also an  $\infty$ -category, called the  $\infty$ -category spanned by  $\mathcal{D}_0$ . ┘

**Prop. (4.7.1.4) [Characterizing  $\infty$ -Categories].**  $\mathcal{C} \in s\text{Set}$  is an  $\infty$ -category iff the restriction map

$$\text{Map}(\Delta^2, \mathcal{C}) \rightarrow \text{Map}(\Lambda_1^2, \mathcal{C})$$

is a trivial Kan fibration. ┘

*Proof:* This follows immediately from (4.6.3.30). □

**Def. (4.7.1.5) [Homotopy Categories of  $\infty$ -Categories].** For  $\mathcal{C} \in \text{Cat}_\infty$ , the homotopy category of  $\mathcal{C}$  (4.6.4.12) has a simpler description: Let  $f, g : X \rightarrow Y \in \mathcal{C}$  be called **homotopic maps** if there is

a 2-complex of the form 
$$\begin{array}{ccc} & X & \\ \text{id} \nearrow & & \searrow f \\ X & \xrightarrow{g} & Y \end{array}$$
.  $f : X \rightarrow Y$  is called an **equivalence** if there exists a map  $g : Y \rightarrow X$  s.t.  $f \circ g \cong \text{id}_Y$  and  $g \circ f \cong \text{id}_X$ .

Then the homotopy relation is an equivalence relation, and the composition of homotopic maps are homotopic, and we get a category  $\text{Ho}(\mathcal{C})$ . Then this category is naturally isomorphic to  $\tau_1(\mathcal{C})$  (4.6.3.3). ┘

*Proof:* [Lur09]P32. □

**Prop. (4.7.1.6) [Equivalence of  $\infty$ -Categories].** Categorical equivalence (4.6.4.12) between  $\infty$ -categories is an equivalence relation (4.6.4.12), by Joyal model category (4.6.4.19). ┘

**Def. (4.7.1.7) [Underlying  $\infty$ -Categories of Simplicial Model Categories].** Let  $\mathcal{M}$  be a simplicial model category (4.6.5.1), then  $N_\Delta(\mathcal{M}_{cf})$  is an  $\infty$ -category by (4.6.4.4) ?, called the **underlying  $\infty$ -category** of  $\mathcal{M}$ . ┘

**Lemma (4.7.1.8).** Let  $\mathcal{S} = s\text{Set}$ , then the map  $\beta_{X, \mathcal{S}}$  is a weak equivalence for every cofibrant object  $X \in \mathcal{C}$ . ┘

*Proof:* Cf. [HTT, P853]. □

**Prop. (4.7.1.9)[Quillen Equivalent Simplicial Model Categories Give Equivalent Underlying  $\infty$ -Categories].** Let  $\mathcal{C}, \mathcal{D}$  be simplicial model categories and

$$F : \mathcal{C} \xrightarrow[\text{Quillen}]{} \mathcal{D} : G$$

is a Quillen equivalence, every element of  $\mathcal{C}$  is cofibrant, and  $G$  is a simplicial functor, then  $G$  induces an equivalence of their underlying  $\infty$ -categories  $N_{\Delta}(\mathcal{D}_{cf}) \cong N_{\Delta}(\mathcal{C}_{cf})$ .  $\lrcorner$

*Proof:* This is because  $G : \mathcal{D}_{cf} \rightarrow \mathcal{C}_{cf}$  is an equivalence of simplicial categories, by (4.5.7.6) and (4.7.1.8), and then (4.6.4.16) shows  $N_{\Delta}(G) : N_{\Delta}(\mathcal{D}_{cf}) \rightarrow N_{\Delta}(\mathcal{C}_{cf})$  is an equivalence of  $\infty$ -categories.  $\square$

**Def. (4.7.1.10)[Homotopy Coherent Diagrams].** Let  $\mathcal{C} \in \text{Cat}_{\infty}$  and  $\mathcal{J} \in \text{Cat}$ , then a **homotopy coherent  $\mathcal{I}$ -diagram** is a map  $N(\mathcal{J}) \rightarrow \mathcal{C} \in s\text{Set}$ .  $\lrcorner$

### Categorical Constructions

**Def. (4.7.1.11)[Categorical Constructions].** A **categorical construction** is a functorial construction  $T : (s\text{Set})^m \times (s\text{Set}^{\text{op}})^n \rightarrow s\text{Set}$  s.t.

- For  $\mathcal{C}_i \in \text{Cat} \subset s\text{Set}$ ,  $T(\mathcal{C}_1, \dots, \mathcal{C}_n) \subset \text{Cat} \subset \text{Cat}_{\infty}$ .
- For  $\mathcal{C}_i \in \text{Cat}_{\infty} \subset s\text{Set}$ ,  $T(\mathcal{C}_1, \dots, \mathcal{C}_n) \subset \text{Cat}_{\infty}$ .
- If for each  $i$ ,  $\mathcal{C}_i, \mathcal{D}_i \in \text{Cat}_{\infty} \subset s\text{Set}$  are categorically equivalent, then  $T(\mathcal{C}_1, \dots, \mathcal{C}_n)$  and  $T(\mathcal{D}_1, \dots, \mathcal{D}_n)$  are equivalent  $\infty$ -categories.  $\lrcorner$

**Prop. (4.7.1.12)[Opposite  $\infty$ -Categories].** For  $\mathcal{C}, \mathcal{D} \in \text{Cat}_{\infty}$ ,

- The opposite (4.6.3.12)  $\mathcal{C}^{\text{op}}$  is also an  $\infty$ -category.
- If  $\mathcal{C} \rightarrow \mathcal{D}$  is a categorical equivalence, then  $\mathcal{C}^{\text{op}} \rightarrow \mathcal{D}^{\text{op}}$  is also a categorical equivalence.

Thus the opposite construction is a categorical construction, by (4.6.3.13).  $\lrcorner$

*Proof:*  $\square$

**Prop. (4.7.1.13)[Mapping Spaces of  $\infty$ -Categories].** Let  $\mathcal{C}, \mathcal{D} \in \text{Cat}_{\infty}$  and  $K, K' \in s\text{Set}$ , then

- $\text{Map}(K, \mathcal{C})$  is also an  $\infty$ -category.
- If  $f : \mathcal{C} \rightarrow \mathcal{D}$  is a categorical equivalence, then the induced map  $\text{Map}(K, \mathcal{C}) \rightarrow \text{Map}(K, \mathcal{D})$  is also a categorical equivalence.
- If  $g : K \rightarrow K'$  is a categorical equivalence, then the induced map  $\text{Map}(K', \mathcal{C}) \rightarrow \text{Map}(K, \mathcal{C})$  is also a categorical equivalence.

In particular, mapping space is a categorical construction, by (4.6.3.16).  $\lrcorner$

*Proof:* 1 follows from (4.6.3.31). 2, 3 follow from [HTT, P94]. ?  $\square$

**Prop. (4.7.1.14)[Joins of  $\infty$ -Categories].** Let  $\mathcal{C}, \mathcal{D} \in \text{Cat}_{\infty}$ , then

- The join (4.6.3.18)  $\mathcal{C} * \mathcal{D}$  is also an  $\infty$ -category.
- If  $\mathcal{C} \rightarrow \mathcal{C}', \mathcal{D} \rightarrow \mathcal{D}' \in \text{Cat}_{\infty}$  are categorical equivalences, then  $\mathcal{C} * \mathcal{D} \rightarrow \mathcal{C}' * \mathcal{D}'$  is also a categorical equivalence.

In particular, the join is a categorical construction by (4.6.3.19).  $\lrcorner$

*Proof:* 1: Given a morphism  $p : \Lambda_i^n \rightarrow S \star S'$ , if the image is in  $S$  or  $S'$ , then it can be extended to  $\Delta^n$  by hypothesis. Thus we may assume that it maps  $\{0, \dots, j\}$  into  $S$  and  $\{j+1, \dots, n\}$  into  $S'$ , then we restrict  $p$  to get a morphism  $\Delta^{\{0, \dots, j\}} \rightarrow S, \Delta^{\{j+1, \dots, n\}} \rightarrow S'$ , which determines a map  $\Delta^n \cong \Delta^j * \Delta^{n-j-1}$  (4.6.3.19)  $\rightarrow S \star S'$ , and it extends  $p$  by (4.6.3.17).

2 follows from (4.6.4.26).  $\square$

**Prop. (4.7.1.15) [Homotopic Maps].** If  $X$  is an  $\infty$ -category, then so does  $X^B$  for any simplicial set  $B$ , by (4.6.3.37).

And we can call two maps in  $\text{Map}(B, X)$  **homotopic** if they are equivalent as vertices in  $X^B$  (4.7.1.5).  $\lrcorner$

**Lemma (4.7.1.16).** Let  $p : \mathcal{C} \rightarrow \mathcal{D}$  be a left fibration of  $\infty$ -categories and  $f : X \rightarrow Y$  be a morphism that  $p(f)$  is an equivalence in  $\mathcal{D}$ , then  $f$  is an equivalence in  $\mathcal{C}$ . Compare with (4.2.3.6).  $\lrcorner$

*Proof:* Let  $\bar{g}$  be a homotopy inverse to  $f$ , then there is a 2-complex

$$\begin{array}{ccc} & p(Y) & \\ p(f) \nearrow & & \searrow \bar{g} \\ p(X) & \xrightarrow{\quad} & p(X) \end{array}$$

and by left fibration property lifts to a 2-complex

$$\begin{array}{ccc} & Y & \\ f \nearrow & & \searrow g \\ X & \xrightarrow{\quad} & X \end{array}.$$

So  $f$  admits a left homotopy inverse, and by the same reason,  $g$  admits a left homotopy inverse, thus  $g$  has a left homotopy inverse, and it can be chosen to be  $f$ .  $\square$

**Lemma (4.7.1.17) [Equivalence Lifts via Left Fibrations].** Let  $p : \mathcal{C} \rightarrow \mathcal{D}$  be a left fibration of  $\infty$ -categories, if  $\bar{X} \in \mathcal{D}$  and  $Y \in \mathcal{C}$  and  $\bar{f} : \bar{X} \rightarrow p(Y)$  is an equivalence, then  $\bar{f}$  can be lifted to a morphism in  $\mathcal{C}$ . (Which is also an equivalence by (4.7.1.16)).  $\lrcorner$

*Proof:*  $\square$

**Prop. (4.7.1.18) [Equivalence and Left Extension].** Let  $\mathcal{C}$  be an  $\infty$ -category and  $\varphi$  an edge, then  $\varphi$  is an equivalence iff for any  $n \geq 2$  and every map  $\Lambda_0^n \rightarrow \mathcal{C}$  that  $f_0|_{\Delta^{\{0,1\}}} = \varphi$ , there exists an extension of  $f_0$  to  $\Delta^n$ .  $\lrcorner$

*Proof:* If  $\varphi$  is an equivalence, then consider the diagram

$$\begin{array}{ccc} \{0\} & \longrightarrow & \mathcal{C}/\Delta^{n-2} \\ \downarrow & \nearrow \varphi' & \downarrow q \\ \Delta^1 & \xrightarrow{\quad} & \mathcal{C}/\partial\Delta^{n-2} \end{array}$$

Because  $\mathcal{C}/\partial\Delta^{n-2} \rightarrow \mathcal{C}$  is right fibration (4.6.3.36), and by the dual of (4.7.1.16),  $\varphi'$  is an equivalence, thus by the dual of (4.7.1.17) the dotted arrow exists.

Conversely, if the condition holds, then we can use a diagram  $\Lambda_0^2 \rightarrow \mathcal{C}$  to find a morphism  $\psi$  that  $\psi \circ \varphi \cong \text{id}$ , and we can also use a diagram  $\Lambda_0^3 \rightarrow \mathcal{C}$  to witness the fact  $\varphi \circ \psi \cong \text{id}$ , so  $\varphi$  is an equivalence.  $\square$

**Cor. (4.7.1.19).** An equivalence in  $\text{Map}(K, \mathcal{C})$  is equivalent to a map  $K \times \Delta^1 \rightarrow \mathcal{C}$  that  $\{x\} \times \Delta$  are all mapped to equivalences in  $\mathcal{C}$ .  $\square$

*Proof:* ? Cf.[HTT, P106].  $\square$

**Def. (4.7.1.20) [Space of Morphisms].** For vertices  $x, y$  in a simplicial set  $S$ , we want to define a representative for  $\text{Map}_{hS}(x, y)$  other than  $\text{Map}_{\mathcal{C}[S]}(x, y)$ . We define the **space of right morphisms**

$$\text{Hom}_S^R(x, y) = S_{/y} \times_S \{x\}.$$

The definition is not symmetric, instead, we define the **space of left morphisms**  $\text{Hom}_S^L(x, y) = (\text{Hom}_{S^{op}}^R(x, y))^{op}$ .

Also we can define  $\text{Hom}_S(x, y) = \{x\} \times_S S^{\Delta^1} \times_S \{y\}$ , then there are natural inclusions:

$$\text{Hom}_S^R(x, y) \hookrightarrow \text{Hom}_S(x, y) \hookleftarrow \text{Hom}_S^L(x, y).$$

**Prop. (4.7.1.21).** If  $\mathcal{C} \in \text{Cat}_\infty$  and  $x, y \in \mathcal{C}$ , then  $\text{Hom}_{\mathcal{C}}^R(x, y)$  is a Kan complex, and the inclusions defined in (4.7.1.20) are weak equivalences.  $\square$

*Proof:* This is obvious, because the right lifting diagram w.r.t.  $\Lambda_j^n \subset \Delta^n, 0 < j \leq n$  is equivalent to an extension  $\Lambda_j^n \star \Delta^0 \subset \Delta^{n+1}$  that satisfies  $\tilde{u}|_{\Delta_{\{0, \dots, n\}}} = x$ . It can be solved by a two-step extension where the first is by identity extension and then extend using inner fibration property.

For the last assertion, Cf.[HTT, 4.2.1.8]. ?  $\square$

**Prop. (4.7.1.22).** Let  $p : \mathcal{C} \rightarrow \mathcal{D}$  be an inner fibration of  $\infty$ -categories, then the induced maps on the spaces of right morphisms are Kan fibrations.  $\square$

*Proof:* Since  $p$  is an inner fibration, the induced map  $\tilde{\varphi} : \mathcal{C}_{/Y} \rightarrow \mathcal{D}_{/p(Y)} \times_{\mathcal{D}} \mathcal{C}$  is a right fibration by (4.6.3.36), and the morphism on  $\text{Hom}_{\mathcal{C}}^R(X, Y)$  is obtained from  $\tilde{\varphi}$  by restricting to fiber over  $X$ , thus also a right fibration. And by (4.7.1.21) and (4.6.3.42).  $\square$

**Lemma (4.7.1.23).** Let  $\mathcal{C} \rightarrow \mathcal{D}$  be a fully faithful map of  $\infty$ -categories and  $p : K \rightarrow \mathcal{C} \in s\text{Set}$ , then the map of  $\infty$ -categories (4.7.1.24)

$$\mathcal{C}_{j/} \times_{\mathcal{C}} \{x\} \rightarrow \mathcal{D}_{pj/} \times_{\mathcal{D}} \{p(x)\}$$

is a homotopy equivalence.  $\square$

*Proof:* Cf.[HTT, P134].  $\square$

**Prop. (4.7.1.24) [Overcategories and Undercategories].**

- If  $\mathcal{C}$  be an  $\infty$ -category and  $p : K \rightarrow \mathcal{C}$  be a morphism, then the projection  $\mathcal{C}_{p/} \rightarrow \mathcal{C}$  is a left fibration. In particular,  $\mathcal{C}_{p/}$  is itself an  $\infty$ -category. Dually,  $\mathcal{C}_{/p}$  is also an  $\infty$ -category.
- Let  $p : \mathcal{C} \rightarrow \mathcal{D} \in \text{Cat}_\infty$  be an equivalence of  $\infty$ -categories and let  $j : K \rightarrow \mathcal{C} \in s\text{Set}$ , then the induced map  $\mathcal{C}_{j/} \rightarrow \mathcal{D}_{pj/}$  is an equivalence of  $\infty$ -categories. The dual holds for undercategories. In particular, the overcategories and undercategories are categorical constructions, by (4.6.3.24).  $\square$

*Proof:* 1: We use the proposition (4.6.3.36) in case  $S = \Delta^0, A = \emptyset, X = \mathcal{C}$ .

2: There is a factorization  $\mathcal{C}_{j/} \xrightarrow{f} \mathcal{D}_{pj/} \times_{\mathcal{D}} \mathcal{C} \xrightarrow{g} \mathcal{D}_{pj/}$ . (4.7.1.23)(4.7.1.24) shows  $\mathcal{C}_{j/}$  and  $\mathcal{D}_{pj/} \times_{\mathcal{D}} \mathcal{C}$  are fiberwise equivalent left fibrations over  $\mathcal{C}$ , thus by (4.6.7.7) and (4.6.7.10),  $f$  is a categorical equivalence. Also,  $g$  is a categorical equivalence by (4.6.7.11). So we are done. ? Cf.[HTT, P135].  $\square$

**Prop. (4.7.1.25)[Lifting of Homotopies].** Let  $p : \mathcal{C} \rightarrow \mathcal{D}$  be a categorical equivalence of  $\infty$ -categories and  $A \subset B$  be an inclusion of simplicial sets. Let  $f_0 : A \rightarrow \mathcal{C}, g : B \rightarrow \mathcal{D}$  be any maps that  $h_0 : A \times \Delta^1 \rightarrow \mathcal{D}$  be an equivalence between  $g|_A$  and  $p \circ f_0$ , then there exists a map  $B \rightarrow \mathcal{C}$  and an equivalence  $h : B \times \Delta^1 \rightarrow \mathcal{D}$  between  $g$  and  $p \circ f$  that  $h_0 = h|_{A \times \Delta^1}$ .  $\lrcorner$

*Proof:* Working with simplexes, it suffices to prove for  $A = \partial\Delta^n \subset B = \Delta^n$ . The case  $n = 0$  is true because categorical equivalence is essentially surjective. For  $n > 0$ , we need to construct  $h$  from  $h|_{\Delta^n \times \{0\}} \coprod \partial\Delta^n \times \Delta^1$ , and this is a composition of pushout of  $\Lambda_k^{n+1} \subset \Delta^{n+1}$ . For  $k \neq 0$ , the extension is clear because  $\mathcal{D}$  is  $\infty$ -category, and for  $k = 0$ , we need to use [HTT, P136].  $\square$

### $\infty$ -Groupoids(or Kan Complexes/Spaces)

**Def. (4.7.1.26) [ $\infty$ -Groupoid].** An  $\infty$ -groupoid or an **anima** is an  $\infty$ -category  $\mathcal{C}$  that  $\mathrm{Ho}(\mathcal{C})$  is a groupoid(4.7.1.5), or equivalently, all morphisms are equivalences. The full subcategory of  $\mathrm{Cat}_\infty$  consisting of  $\infty$ -groupoids are denoted by  $\mathrm{Grpd}_\infty$ .  $\lrcorner$

**Prop. (4.7.1.27) [ $\infty$ -Groupoids  $\iff$  Kan Complex].** For  $\mathcal{C} \in s\mathrm{Set}$ , the following are equivalent:

- $\mathcal{C}$  is an  $\infty$ -groupoid.
- $\mathcal{C} \rightarrow \Delta^0$  is a left fibration.
- $\mathcal{C} \rightarrow \Delta^0$  is a right fibration.
- $\mathcal{C}$  is a Kan complex.

$\lrcorner$

*Proof:* 1, 2 are equivalent by(4.7.1.18), and dually 1, 3 are equivalent, and 4 = 2 + 3.  $\square$

### $n$ -Categories

**Def. (4.7.1.28) [ $n$ -Categories].** For  $\mathcal{C} \in s\mathrm{Set}$  and  $n \geq -1$ , then  $\mathcal{C}$  is called an  $n$ -category if it is an  $\infty$ -category and:

- Given any maps  $f, f' : \Delta^n \rightarrow \mathcal{C}$  that are homotopic(4.7.1.15) relative to  $\partial\Delta^n$ , then  $f = f'$ .
- For any  $m > n$  and maps  $f, f' : \Delta^m \rightarrow \mathcal{C}$  that coincide on  $\partial\Delta^m$ , then  $f = f'$ .

Also  $\mathcal{C}$  is called an  $(-2)$ -category iff it is isomorphic to  $\Delta^0$ .

The definition of an  $n$ -category is equivalent to the following: if  $f, f' : K \rightarrow \mathcal{C}$  satisfies  $f|_{sk^n K}$  is homotopic to  $f'|_{sk^n K}$  relative to  $sk^{n-1}K$ , then  $f = f'$ .  $\lrcorner$

**Cor. (4.7.1.29).** If  $\mathcal{C}$  is an  $n$ -category and  $m > n$ , then the restriction map  $\mathrm{Hom}(\Delta^m, \mathcal{C}) \rightarrow \mathrm{Hom}(\partial\Delta^m, \mathcal{C})$  is bijective.(use  $\infty$ -category property to extend).  $\lrcorner$

**Prop. (4.7.1.30).** A  $(-1)$ -category is seen to be isomorphic to  $\emptyset$  or  $\Delta^0$ . A 0-category is equivalent to the nerve of a partially ordered set.  $\lrcorner$

*Proof:*  $\square$

**Prop. (4.7.1.31)[ $\mathrm{Cat}$  and  $\mathrm{Cat}_1$ ].** For a simplicial set  $S$ , the following are equivalent:

- $u : S \rightarrow N(hS)$ (4.6.3.3) is an isomorphism of simplicial sets.
- There is a small category  $\mathcal{C}$  that  $S \cong N(\mathcal{C})$ .
- $S$  is a 1-category.

$\lrcorner$

*Proof:* It suffices to show  $3 \rightarrow 1$ : we induct on the dimension:  $n = 0$  is trivial and  $n = 1$  follows from the definition of 1-category (4.7.1.28). For  $n > 1$ , the injectivity of  $u$  follows from induction hypothesis and (4.7.1.28), and for surjectivity, for a map  $\Delta^n \rightarrow N(hS)$ , choose  $0 < i < n$  and let lift  $\Lambda_i^n$  to  $S$ , then use the fact  $S$  is an  $\infty$ -category to lift to  $\Delta^n$ , and now it coincide on  $N(hS)$  because it is a nerve of a category.  $\square$

**Prop. (4.7.1.32).** If  $\mathcal{C}$  is an  $n$ -category, then for any simplicial set  $X$ ,  $\mathcal{C}^X$  is also an  $n$ -category.  $\lrcorner$

*Proof:* This is because  $sk^p(K \times X) \subset sk^p(K) \times X$  for any simplicial set  $K$  and integer  $p$ , and use (4.7.1.28).  $\square$

**Prop. (4.7.1.33).** Let  $n \geq 1$  and  $\mathcal{C}$  an  $\infty$ -category, then  $\mathcal{C}$  is an  $n$ -category iff it satisfies the unique lifting property w.r.t. the inclusion  $\Lambda_i^m \subset \Delta^m$ , where  $0 < i < m$ .  $\lrcorner$

*Proof:* Cf.[HTT, P109].  $\square$

**Def. (4.7.1.34) [ $n$ -Truncated Kan Complexes].** Let  $X$  be a Kan complex and  $k \geq -1$ , then a Kan complex is called  **$k$ -truncated** if for every  $i > k$  and every point  $x \in X$ , we have  $\pi_i(X, x) \cong *$ . And it is called  **$(-2)$ -truncated** if it is contractible.  $\lrcorner$

**Prop. (4.7.1.35).** A  $(-1)$ -truncated Kan complex is either empty or contractible. A 0-contractible Kan complex is a Kan complex that  $X \rightarrow \pi_0(X)$  is a homotopy equivalence.  $\lrcorner$

*Proof:* ?.  $\square$

**Prop. (4.7.1.36) [Equivalent to an  $n$ -Category].** Let  $\mathcal{C}$  be an  $\infty$ -category and  $n \geq -1$ , then the following conditions are equivalent:

- There is a minimal model  $\mathcal{C}' \subset \mathcal{C}$  that is  $n$ -truncated.
- $\mathcal{C}$  is categorically equivalent to an  $n$ -truncated category.
- For any  $X, Y \in \mathcal{C}$ , the mapping space  $\text{Map}(X, Y)$  is  $(n - 1)$ -truncated.

$\lrcorner$

*Proof:* Cf.[HTT, P112].  $\square$

**Cor. (4.7.1.37).** A Kan complex is categorically equivalent to an  $n$ -category iff it is  $n$ -truncated.  $\lrcorner$

*Proof:* Cf.[HTT, P113] ?.  $\square$

**Cor. (4.7.1.38).** Let  $\mathcal{C}$  be an  $\infty$ -category and  $K$  a simplicial set, if  $\text{Map}(C, D)$  is  $n$ -truncated for any objects  $C, D \in \mathcal{C}$ , then the  $\infty$ -category  $\mathcal{C}^K$  has the same property.  $\lrcorner$

*Proof:* Cf.[HTT, P114].  $\square$

## 2 $\infty$ -Category of $\infty$ -Categories

**Def. (4.7.2.1) [Models on  $s\text{Set}^+$ ].** There is a simplicial model structure on  $s\text{Set}^+$  (4.6.3.52) s.t. the fibrant and cofibrant objects are exactly objects of the form  $\mathcal{C}^\natural$  where  $\mathcal{C}$  is an  $\infty$ -category, and  $\mathcal{C}^\natural = (\mathcal{C}, \mathcal{E}_{\mathcal{C}})$  where  $\mathcal{E}_{\mathcal{C}}$  is the set of equivalences in  $\mathcal{C}$  (4.7.1.5).  $\lrcorner$

*Proof:* ?  $\square$

**Def. (4.7.2.2) [ $\text{Cat}_\infty$ ].** The underlying  $\infty$ -category  $\text{Cat}_\infty = N_\Delta(s\text{Set}_{cf}^+)$  of  $s\text{Set}^+$  is called the **category of  $\infty$ -category of  $\infty$ -categories**. It can be verified that the fundamental category of  $\text{Cat}_\infty$  consists of equivalent classes of  $\infty$ -categories.  $\lrcorner$

**Def. (4.7.2.3) [Relative Mapping Spaces].** Let  $p : X \rightarrow S, q : Y \rightarrow S \in s\text{Set}$ , then define  $\text{Map}_S(X, Y) = \text{Map}_{\text{Cat}_\infty/T}(X, Y) \in s\text{Set}$ .  $\lrcorner$

### $(\infty, n)$ -Categories

**Def. (4.7.2.4) [  $(\infty, n)$ -Categories ].** For  $n \in \mathbb{N}$ , an  $(\infty, n)$ -category is an  $\infty$ -category s.t. for  $k > n$ , any  $k$ -maps is invertible<sup>?</sup>. In particular, an  $(\infty, 0)$ -category is just an  $\infty$ -groupoid.  $\lrcorner$

**Def. (4.7.2.5) [  $\mathcal{G}rpd_\infty$  ].** The underlying  $\infty$ -category  $N_\Delta(\mathbf{Kan})$  of  $s\mathbf{Set}$  with the Joyal model structure (4.6.4.19) is denoted by  $\mathcal{G}rpd_\infty$ . Then it is a sub- $\infty$ -category of  $\mathbf{Cat}_\infty$ , and it is an  $(\infty, 1)$ -category.  $\lrcorner$

*Proof:* <sup>?</sup>  $\square$

### 3 Limits and Colimits

**Remark (4.7.3.1) [Universal Properties].** The objects in an  $\infty$ -category characterized by a universal property will be a contractible Kan complex.  $\lrcorner$

**Def. (4.7.3.2) [Final Objects].** For  $\mathcal{C} \in \mathbf{Cat}_\infty$ ,  $x \in \mathcal{C}$  is called a **final object** if the canonical map  $\mathcal{C}_{/x} \rightarrow \mathcal{C} \in s\mathbf{Set}$  is a trivial Kan fibration. Equivalently, for any  $y \in \mathcal{C}$ ,  $\mathrm{Map}_{\mathcal{C}}^R(y, x)$  is a contractible Kan complex. It is clear that the sub- $\infty$ -category of final objects in  $\mathcal{C}$  is either empty or a contractible Kan complex.

Dually we can define initial objects.  $\lrcorner$

*Proof:* If  $x$  is a final object, then  $\mathrm{Map}_{\mathcal{C}}^R(y, x)$  is the fiber of  $\mathcal{C}_{/x} \rightarrow \mathcal{C}$  over  $x$  (4.7.1.20), so it is a contractible Kan-complex by (4.7.1.27). The converse follows from (4.6.3.46).  $\square$

**Cor. (4.7.3.3).** For  $\mathcal{C} \in \mathbf{Cat}_\infty$  with a final object  $*$ , we fix a final object, then there is a section  $\mathcal{C} \rightarrow \mathcal{C}_{/*}$ , which maps each  $C \in \mathcal{C}$  to a morphism  $C \rightarrow * \in \mathcal{C}$ . We fix such a morphism. The dual is true for initial objects.  $\lrcorner$

**Prop. (4.7.3.4).** If  $\mathcal{C} \in \mathbf{Cat}_\infty$  and  $*$   $\in \mathcal{C}$  is final, then for any diagram  $p : K \rightarrow \mathcal{C}$ ,  $*$  is also final in  $\mathcal{C}_{p/}$ .<sup>?</sup>  $\lrcorner$

**Def. (4.7.3.5) [Limits and Colimits].** For  $\mathcal{C} \in \mathbf{Cat}_\infty$  and  $p : K \rightarrow \mathcal{C} \in \mathbf{Cat}$ , a **colimit** of  $p$  is defined to be an initial object of  $\mathcal{C}_{p/}$ , and a **limit** of  $p$  is defined to be a final object of  $\mathcal{C}_{/p}$ . By (4.7.3.2), (co)limits are defined up to a contractible choice, and we may use  $(\varinjlim_p) \varprojlim_p$  to denote any one of them.  $\lrcorner$

**Def. (4.7.3.6).** For  $\mathcal{C}, \mathcal{D} \in \mathbf{Cat}_\infty$ , let  $\mathrm{Func}^L(\mathcal{C}, \mathcal{D})$  denote the sub- $\infty$ -category of  $\mathrm{Func}(\mathcal{C}, \mathcal{D})$  consisting of functors preserving colimits, and let  $\mathrm{Func}^R(\mathcal{D}, \mathcal{C})$  denote the sub- $\infty$ -category of  $\mathrm{Func}(\mathcal{D}, \mathcal{C})$  consisting of functors preserving limits.  $\lrcorner$

**Prop. (4.7.3.7).** For  $\mathcal{C}, \mathcal{D} \in \mathbf{Cat}_\infty$ , there is a natural equivalence of  $\infty$ -categories  $\mathrm{Func}^L(\mathcal{C}, \mathcal{D}) \cong \mathrm{Func}^R(\mathcal{D}, \mathcal{C})^{\mathrm{op}}$ .  $\lrcorner$

*Proof:* Cf. [Lur09]P356.  $\square$

### Cofinal Diagrams

**Def. (4.7.3.8) [Cofinal Maps].** A **cofinal map**  $p : S \rightarrow T \in s\mathbf{Set}$  is a map s.t. for any right fibration  $X \rightarrow T \in s\mathbf{Set}$ ,

$$\mathrm{Map}_T(T, X) \rightarrow \mathrm{Map}_T(S, X) \in s\mathbf{Set} \text{ (4.7.2.3)}$$

is a homotopy equivalence.  $\lrcorner$

**Prop. (4.7.3.9) [Cofinal Maps give Same Colimits].** For  $v : K' \rightarrow K \in s\mathbf{Set}$ , the following are equivalent:

- $v$  is cofinal.
- for any  $\mathcal{C} \in \mathbf{Cat}_\infty$  and  $p : K \rightarrow \mathcal{C} \in s\mathbf{Set}$ , the induced map  $\mathcal{C}_{p/} \rightarrow \mathcal{C}_{p \circ v/}$  is an equivalence of  $\infty$ -categories.

┘

*Proof:* Cf. [Lur09]P226. □

### Computing Diagrams

**Prop. (4.7.3.10) [Reducing to Coherent Colimits].** For any  $K \in s\mathbf{Set}$ , there exists a category  $\mathcal{J} \subset \mathbf{Cat}$  and a cofinal map  $N(\mathcal{J}) \rightarrow K \in s\mathbf{Set}$ . ┘

*Proof:* Cf. [Lur09]P255. □

**Prop. (4.7.3.11) [Colimits in Overcategories].** Let  $\mathcal{C} \in \mathbf{Cat}_\infty$  and  $q : T \rightarrow \mathcal{C} \in s\mathbf{Set}$ ,  $p : K \rightarrow \mathcal{C}_{/q}$ , and  $p_0 : K \xrightarrow{p} \mathcal{C}_{/q} \rightarrow \mathcal{C}$ . If  $p_0$  has a colimit, then

- $p$  also has a colimit, and the colimit is preserved by the  $\mathrm{pr} : \mathcal{C}_{/q} \rightarrow \mathcal{C}$ .
- $x \in \mathcal{C}_{/q}$  is a colimit of  $p$  iff  $\mathrm{pr}(x) \in \mathcal{C}$  is a colimit of  $p_0$ .

┘

*Proof:* Cf. [Lur09]P48. □

**Cor. (4.7.3.12) [Colimits in Diagram Categories].** For  $K, S \in s\mathbf{Set}$ , let  $\mathcal{C}$  be an  $\infty$ -category that admits  $K$ -indexed colimits, then

- the  $\infty$ -category  $\mathrm{Func}(S, \mathcal{C})$  (4.7.1.13) also admits  $K$ -indexed colimits.
- $p : K^\triangleright \rightarrow \mathrm{Func}(S, \mathcal{C})$  is a colimit diagram iff for each  $C \in \mathcal{C}$ , the evaluation  $p_C : K^\triangleright \rightarrow \mathcal{C}$  is a colimit diagram.

┘

*Proof:* Cf. [Lur09]P315. □

### Kan Extensions

**Def. (4.7.3.13) [ $p$ -Left Kan Extensions].** For a commutative diagram of  $\infty$ -categories

$$\begin{array}{ccc} \mathcal{C}^0 & \xrightarrow{F_0} & \mathcal{D} \\ \downarrow & \nearrow F & \downarrow p \\ \mathcal{C} & \longrightarrow & \mathcal{D}' \end{array},$$

$F$  is called a  **$p$ -left Kan extension** of  $F_0$  if for any  $C \in \mathcal{C}$ , the induced diagram

$$\begin{array}{ccc} \mathcal{C}_{/C}^0 & \xrightarrow{F_C} & \mathcal{D} \\ \downarrow & \nearrow F & \downarrow p \\ (\mathcal{C}_{/C}^0)^\triangleright & \longrightarrow & \mathcal{D}' \end{array},$$

exhibits  $C$  as a  $p$ -colimit ? of  $F_C$ . ┘

**Lemma (4.7.3.14) [Existence of  $p$ -Left Kan Extensions].** Given a commutative diagram of  $\infty$ -categories

$$\begin{array}{ccc} \mathcal{C}^0 & \xrightarrow{F_0} & \mathcal{D} \\ \downarrow & \nearrow F & \downarrow p \\ \mathcal{C} & \longrightarrow & \mathcal{D}' \end{array},$$

then there exists a  $p$ -left Kan extension  $F$  iff for any  $C \in \mathcal{C}$  the composition

$$\mathcal{C}_{/p}^0 \rightarrow \mathcal{C}^0 \xrightarrow{F_0} \mathcal{D}$$

admits a  $p$ -colimit. ┘

*Proof:* Cf. [Lur09]P282. □

**Lemma (4.7.3.15).** Let  $\mathcal{C} \rightarrow \mathcal{D}' \xleftarrow{p} \mathcal{D} \in \mathbf{Cat}_\infty$  where  $p$  is a Joyal-fibration, and  $\mathcal{C}^0 \subset \mathcal{C}$  a full subcategory, the the restriction functor

$$i^* : \mathrm{Func}_{\mathcal{D}'}(\mathcal{C}, \mathcal{D}) \rightarrow \mathrm{Func}_{\mathcal{D}'}(\mathcal{C}^0, \mathcal{D})$$

has right lifting property w.r.t. all  $\partial\Delta^n \rightarrow \Delta^n$  s.t. the map  $\partial\Delta^n$  maps  $\{0\}$  to a functor  $F : \mathcal{C} \rightarrow \mathcal{D}$  which is a  $p$ -left Kan extension (4.7.3.13) of  $F|_{\mathcal{C}^0}$ , ┘

*Proof:* Cf. [Lur09]P279. □

**Prop. (4.7.3.16).** Let  $\mathcal{C} \rightarrow \mathcal{D}' \xleftarrow{p} \mathcal{D} \in \mathbf{Cat}_\infty$  where  $p$  is a Joyal-fibration, and  $\mathcal{C}^0 \subset \mathcal{C}$  a full subcategory. Let

- $\mathcal{K} \subset \mathrm{Func}_{\mathcal{D}'}(\mathcal{C}, \mathcal{D})$  be the full subcategory of functors  $F : \mathcal{C} \rightarrow \mathcal{D}$  which are  $p$ -left Kan extensions (4.7.3.13) of  $F|_{\mathcal{C}^0}$ ,
- $\mathcal{K}' \subset \mathrm{Func}_{\mathcal{D}'}(\mathcal{C}^0, \mathcal{D})$  be the category of functors  $F_0 : \mathcal{C}^0 \rightarrow \mathcal{D}$  s.t. for any  $C \in \mathcal{C}$ , the induced functor  $\mathcal{C}_{/C}^0 \rightarrow \mathcal{D}$  has a  $p$ -colimit.

Then the restriction functor  $i^* : \mathcal{K} \rightarrow \mathcal{K}'$  is a trivial Kan fibration. ┘

*Proof:* This follows immediately from (4.7.3.14) and (4.7.3.15). □

**Cor. (4.7.3.17) [Functorial Left Kan Extensions].** Let  $\mathcal{C} \rightarrow \mathcal{D}' \xleftarrow{p} \mathcal{D} \in \mathbf{Cat}_\infty$  where  $p$  is a Joyal-fibration, and  $\mathcal{C}^0 \subset \mathcal{C}$  a full subcategory. Suppose that every functor  $F_0 : \mathcal{C}^0 \rightarrow \mathcal{D}$  over  $\mathcal{D}'$  admits a  $p$ -left Kan extension (4.7.3.13), then the restriction

$$i^* : \mathrm{Func}_{\mathcal{D}'}(\mathcal{C}, \mathcal{D}) \rightarrow \mathrm{Func}_{\mathcal{D}'}(\mathcal{C}^0, \mathcal{D})$$

admits a section  $i_!$  whose essential image are exactly those  $F$  which are  $p$ -left Kan extension of  $F|_{\mathcal{C}^0}$ . Any such  $i_!$  is called the **left Kan extension functor**. Moreover, this  $i_!$  is left adjoint to  $i^*$ :

$$i^* : \mathrm{Func}_{\mathcal{D}'}(\mathcal{C}, \mathcal{D}) \rightleftarrows \mathrm{Func}_{\mathcal{D}'}(\mathcal{C}^0, \mathcal{D}) : i_!$$

┘

*Proof:* Cf. [Lur09]P284. □

## 4 Adjunctions

### Correspondences

**Def. (4.7.4.1) [Correspondence].** Let  $\mathcal{C}, \mathcal{D}$  be  $\infty$ -categories, an **correspondence** between  $\mathcal{C}, \mathcal{D}$  is defined to be an  $\infty$ -category  $\mathcal{M}$  and a map  $\mathcal{M} \rightarrow \Delta^1$  s.t.  $\mathcal{C} \cong \mathcal{M}_0$  and  $\mathcal{D} \cong \mathcal{M}_1$ . ┘

### Adjunctions

**Def. (4.7.4.2) [Adjunctions].** An **adjunction** between  $\infty$ -categories  $\mathcal{C}, \mathcal{D} \in \mathbf{Cat}_\infty$  is a map  $q : \mathcal{M} \rightarrow \Delta^1 \in s\mathbf{Set}$  that is both Cartesian fibration and coCartesian fibration, together with equivalences  $\mathcal{M}_{\{0\}} \cong \mathcal{C}, \mathcal{M}_{\{1\}} \cong \mathcal{D}$ .

If  $\mathcal{M} \rightarrow \Delta^1$  is an adjunction and  $f : \mathcal{C} \rightarrow \mathcal{D}, g : \mathcal{D} \rightarrow \mathcal{C}$  are the associated functors, then  $f$  is said to be **left adjoint** to  $g$  and  $g$  is said to be **right adjoint** to  $f$ .  $\lrcorner$

**Def. (4.7.4.3) [Unit Transformations].** For a pair of functors  $f : \mathcal{C} \rightarrow \mathcal{D}, g : \mathcal{D} \rightarrow \mathcal{C}$  between  $\infty$ -categories, a **unit transformation** for  $(f, g)$  is a morphism  $u : \mathrm{id} \rightarrow g \circ f \in \mathrm{Func}(\mathcal{C}, \mathcal{C})$  s.t. for any  $C \in \mathcal{C}, D \in \mathcal{D}$ , the composition

$$\mathrm{Map}_{\mathcal{D}}(f(C), D) \xrightarrow{g} \mathrm{Map}_{\mathcal{C}}(gf(C), g(D)) \xrightarrow{u(C)} \mathrm{Map}_{\mathcal{C}}(C, g(D))$$

is a homotopy equivalence.  $\lrcorner$

**Prop. (4.7.4.4) [Unit Transformations and Adjunctions].** For a pair of functors  $f : \mathcal{C} \rightarrow \mathcal{D}, g : \mathcal{D} \rightarrow \mathcal{C}$ ,  $f$  is left adjoint to  $g$  iff there is a unit transformation  $u : \mathrm{id} \rightarrow g \circ f$ .  $\lrcorner$

*Proof:* Cf. [Lur09]P339.  $\square$

**Prop. (4.7.4.5) [Adjunction and Limits].** Left adjoints between  $\infty$ -categories preserve small colimits and right adjoints between  $\infty$ -categories preserves small limits.  $\lrcorner$

*Proof:* Cf. [Lur09]P345.  $\square$

### Localizations

**Def. (4.7.4.6) [Localization of  $\infty$ -Categories].** A functor  $\mathcal{C} \rightarrow \mathcal{D} \in \mathbf{Cat}_\infty$  is called a **localization of  $\infty$ -category** if it admits a fully faithful right adjoint.  $\lrcorner$

## 5 Presentable $\infty$ -Categories

### $\infty$ -Categories of Presheaves

**Def. (4.7.5.1) [ $\infty$ -Category of Presheaves].** For  $S \in s\mathbf{Set}$ , there exists an  $\infty$ -category  $\mathcal{P}\mathrm{Sh}_\infty^{\mathrm{Set}}(S) = \mathrm{Func}(S^{\mathrm{op}}, \mathcal{S}) \subset \mathbf{Cat}_\infty$  by (4.7.1.13), called the  **$\infty$ -category of presheaves on  $S$** . More generally, for any  $\mathcal{C} \in \mathbf{Cat}_\infty$ ,  $\mathcal{P}\mathrm{Sh}_\infty^{\mathrm{Set}}(S; \mathcal{C}) = \mathrm{Func}(S^{\mathrm{op}}, \mathcal{C})$  is called the  **$\infty$ -category of  $\mathcal{C}$ -valued presheaves on  $S$** .  $\lrcorner$

**Prop. (4.7.5.2) [Cocompleteness].** For  $S \in s\mathbf{Set}$  and  $\mathcal{C} \in \mathbf{Cat}_\infty$  that is cocomplete, then  $\mathcal{P}\mathrm{Sh}(S; \mathcal{C})$  is also cocomplete by (4.7.3.12). In particular,  $\mathcal{P}\mathrm{Sh}_\infty^{\mathrm{Set}}(S)$  is cocomplete.  $\lrcorner$

**Def. (4.7.5.3) [Yoneda Embedding].** For  $K \in s\mathbf{Set}$ , let  $\mathcal{C} = \mathfrak{C}[K]$ , then the mapping space construction defines a map

$$\mathcal{C}^{\mathrm{op}} \times \mathcal{C} \rightarrow \mathbf{Kan} : (X, Y) \mapsto \mathrm{Sing} | \mathrm{Map}_{\mathcal{C}}(X, Y) |$$

by (4.6.3.43). And there is a natural map  $\mathfrak{C}[K^{\mathrm{op}} \times K] \rightarrow \mathcal{C}^{\mathrm{op}} \times \mathcal{C}$ , so we have a map

$$\mathfrak{C}[K^{\mathrm{op}} \times K] \rightarrow \mathbf{Kan}$$

which corresponds to a map

$$K^{\mathrm{op}} \times K \rightarrow N_\Delta(\mathbf{Kan}) = \mathbf{Grpd}_\infty.$$

and induces a map

$$\jmath_{\Delta} : K \mapsto \text{Func}(K^{\text{op}}, \text{Grpd}_{\infty}) = \mathcal{P}\text{Sh}_{\infty}^{\text{Set}}(K),$$

When  $\mathcal{C} \in \text{Cat}$  and  $K = N(\mathcal{C})$  this is compatible with the usual Yoneda embedding composed with simplicial enhancement, so it is called the **Yoneda embedding**.  $\lrcorner$

**Prop. (4.7.5.4) [ $\infty$ -Categorical Yoneda Lemma].** For  $K \in s\text{Set}$ , the Yoneda embedding (4.7.5.3)  $\jmath : K \rightarrow \mathcal{P}\text{Sh}_{\infty}^{\text{Set}}(K)$  is fully faithful.  $\lrcorner$

*Proof:* Cf. [Lur09]P316.  $\square$

**Prop. (4.7.5.5).** let  $\mathcal{C} \in \text{Cat}_{\infty}$ , then  $\jmath_{\Delta} : \mathcal{C} \rightarrow \mathcal{P}\text{Sh}_{\infty}^{\text{Set}}(\mathcal{C})$  preserves all small limits.  $\lrcorner$

*Proof:* Cf. [Lur09]P316.  $\square$

**Lemma (4.7.5.6).** Let  $S \in s\text{Set}$ , and  $\mathcal{C} \in \text{Cat}_{\infty}$ , then

- Any functor  $F : \mathcal{P}\text{Sh}_{\infty}^{\text{Set}}(S) \rightarrow \mathcal{C}$  is a left Kan extension of  $f|_S$  iff  $f$  preserves all small colimits.
- If  $\mathcal{C}$  is cocomplete, then any functor  $S \rightarrow \mathcal{C}$  has a left Kan extension  $\mathcal{P}\text{Sh}_{\infty}^{\text{Set}}(S) \rightarrow \mathcal{C}$ .

$\lrcorner$

*Proof:* Cf. [Lur09]P322.  $\square$

**Thm. (4.7.5.7) [ $\infty$ -Categorical Yoneda Extensions].** Let  $S \in s\text{Set}$  and  $\mathcal{C}$  be a cocomplete  $\infty$ -category, the Yoneda embedding  $\jmath_{\Delta} : S \rightarrow \mathcal{P}\text{Sh}_{\infty}^{\text{Set}}(S)$  induces an equivalence of  $\infty$ -categories

$$\text{Func}^L(\mathcal{P}\text{Sh}_{\infty}^{\text{Set}}(S), \mathcal{C}) \cong \text{Func}(S, \mathcal{C}).$$

$\lrcorner$

*Proof:* This follows from (4.7.3.17) and (4.7.5.6).  $\square$

**Cor. (4.7.5.8).** For  $S \in s\text{Set}$ ,  $\mathcal{P}\text{Sh}_{\infty}^{\text{Set}}(S)$  is generated by  $S$  under small colimits. In particular,  $\text{Grpd}_{\infty}$  is generated by  $\Delta^0$  under small colimits.  $\lrcorner$

*Proof:* If  $\mathcal{C} \subset \mathcal{P}\text{Sh}_{\infty}^{\text{Set}}(S)$  is a strictly full subcategory stable under small colimits containing  $\jmath_{\Delta}(S)$ , then  $\mathcal{C}$  is cocomplete by (4.7.5.2), and then  $\jmath_{\Delta} : S \rightarrow \mathcal{C}$  is of the form  $F \circ \jmath_{\Delta}$  by (4.7.5.7) where  $F : \mathcal{P}\text{Sh}_{\infty}^{\text{Set}}(S) \rightarrow \mathcal{C}$  preserves small colimits. Then we can regard  $F$  as a self-map of  $\mathcal{P}\text{Sh}_{\infty}^{\text{Set}}(S)$  that is identity on  $\text{id} : S \rightarrow S$ . Thus by (4.7.5.7) again,  $F$  is equivalent to  $\text{id}_S$ . Thus every object of  $\mathcal{P}\text{Sh}_{\infty}^{\text{Set}}(S)$  is equivalent some elements in  $\mathcal{C}$ , so  $\mathcal{C} = \mathcal{P}\text{Sh}_{\infty}^{\text{Set}}(S)$ .  $\square$

### Accessible $\infty$ -Categories

### Presentable $\infty$ -Categories

**Def. (4.7.5.9) [Presentable  $\infty$ -Category].** An  $\infty$ -category is called a **presentable  $\infty$ -category** if it is accessible and cocomplete.  $\lrcorner$

**Prop. (4.7.5.10) [Simpson].** For  $\mathcal{C} \in \text{Cat}_{\infty}$  is presentable iff it is an accessible reflective localization **?** of an  $\mathcal{P}\text{Sh}_{\infty}^{\text{Set}}(\mathcal{D})$  for some  $\mathcal{D} \in \text{Cat}_{\infty}$ .  $\lrcorner$

*Proof:* Cf. [HTT, P5.5.1.1].  $\square$

**Prop. (4.7.5.11).** A presentable  $\infty$ -category is complete.  $\lrcorner$

*Proof:* Cf.[HTT, P5.5.2.4]. □

**Prop. (4.7.5.12) [Presentable  $\infty$ -Categories as Simplicial Model Categories].**  $\mathcal{C} \in \mathcal{C}at_\infty$  is presentable iff it is equivalent to the underlying category  $N_\Delta(\mathcal{M}_{cf})$  for some combinatorial simplicial model category  $\mathcal{M}$ . ┘

*Proof:* □

**Thm. (4.7.5.13) [Adjoint Functor Theorem].** Let  $F : \mathcal{C} \rightarrow \mathcal{D}$  be a functor between presentable  $\infty$ -categories, then

- $F$  admits a right adjoint iff it preserves small colimits.
  - $F$  admits a left adjoint iff it preserves small limits and  $\kappa$ -filtered colimits for some regular cardinal  $\kappa$ .
- ┘

*Proof:* [HTT. 5.5.2.9]. □

### Compactly Generated $\infty$ -Categories

## 4.8 Abelian Categories and Triangulated Categories

References are [Sta], [Ver96] and [G-M03].

### 1 Additive Categories

**Def. (4.8.1.1) [Preadditive Categories].**  $\mathcal{A} \in \mathbf{Cat}$  is called a **preadditive category** if:

- **A1:**  $\mathcal{A}$  is enriched over  $(\mathbf{Ab}, \oplus)$ .

┘

**Def. (4.8.1.2) [Zero Element].** Let  $\mathcal{A}$  be a preadditive category and  $x \in \mathcal{A}$ , then the following are equivalent:

- $x$  is initial.
- $x$  is final.
- $\mathrm{id}_x = 0 \in \mathrm{Mor}(x, x)$ .

Such an element is called a **zero element** in  $\mathcal{A}$ , denoted by  $0$ . If  $0$  exists, then a morphism  $\alpha : x \rightarrow y$  factors through  $0$  iff  $\alpha = 0$ .

┘

*Proof:* Cf. [Sta]00ZZ.

□

**Cor. (4.8.1.3).** An additive functor transforms a zero object to a zero object.

┘

**Prop. (4.8.1.4) [Finite Direct Sums].** If  $\mathcal{A}$  is a preadditive category and  $x, y \in \mathcal{A}$ . If one of  $x \times y$  and  $x \coprod y$  exists, then so does the other, and they are isomorphic, called the **direct sum** of  $x, y$ , denoted by  $x \oplus y$ .

┘

*Proof:* Cf. [Sta]0101.

□

**Def. (4.8.1.5) [Additive Functors].** A functor between preadditive categories  $F : \mathcal{C} \rightarrow \mathcal{D}$  is called an **additive functor** if it is a morphism of  $\mathbf{Ab}$ -enriched categories.

┘

**Def. (4.8.1.6) [Left and Right Orthogonal Subcategories].** Let  $\mathcal{B} \subset \mathcal{A}$  be a preadditive subcategory, then the right **orthogonal subcategory** of  $\mathcal{B}$  in  $\mathcal{A}$  is defined to be the full subcategory  $\mathcal{B}^\perp \subset \mathcal{A}$  consisting of objects  $C \in \mathcal{A}$  s.t.  $\mathrm{Hom}_{\mathcal{A}}(B, C) = 0$  for any  $B \in \mathcal{B}$ . Similarly we can define **left orthogonal subcategories**  ${}^\perp\mathcal{B}$ .

┘

### Additive Categories

**Def. (4.8.1.7) [Additive Categories].** A preadditive category  $\mathcal{A}$  (4.8.1.1) is called an **additive category** iff moreover it satisfies

- **A2:** There exists a zero element (4.8.1.2).
- **A3:**  $\mathcal{A}$  admits finite sums and finite products (so they are equal by (4.8.1.4)). Also, the sum induce the Abelian structure of  $\mathrm{Hom}(X, Y)$ .

We use the symbol  $\mathcal{A} \in \mathbf{AddCat}$  to mean that  $\mathcal{A}$  is an additive category.

┘

**Prop. (4.8.1.8) [Characterizing Direct Sum Decompositions].** If  $\mathcal{A}$  is a preadditive category with zero object,  $x, y, z \in \mathcal{A}$ , then  $z$  is the product and sum of  $x, y$  in  $\mathcal{A}$  iff there are four morphism that satisfies some identities.

┘

*Proof:* Cf. [Sta]0102.

□

**Cor. (4.8.1.9).** An additive functor between additive categories transforms finite direct sums to direct sums.  $\lrcorner$

**Def. (4.8.1.10) [Kernels, Cokernels, Images and Coimages].** Let  $\mathcal{A}$  be a preadditive category and  $f : X \rightarrow Y$  is a map, then

- the **kernel** of  $f$  is the fiber product
 
$$\begin{array}{ccc} \ker(f) & \longrightarrow & X \\ \downarrow & & \downarrow f \\ 0 & \longrightarrow & Y \end{array}$$
- the **cokernel** of  $f$  is the fiber pushforward
 
$$\begin{array}{ccc} X & \xrightarrow{f} & Y \\ \downarrow & & \downarrow \\ 0 & \longrightarrow & \text{Coker}(f) \end{array}.$$
- the **image** of  $f$  is the cokernel of the kernel.
- the **coimage** of  $f$  is the kernel of the cokernel.

$\lrcorner$

**Cor. (4.8.1.11).** If they exist, then kernel and coimage are monomorphisms, and cokernel and image are epimorphisms, by general non-sense.  $\lrcorner$

**Def. (4.8.1.12) [Strict Morphisms].** If the image and coimage of  $f$  exist, then there is a natural decomposition  $f : X \rightarrow \text{Im}(f) \rightarrow \text{Coim}(f) \rightarrow Y$ , by the universal property. Then  $f$  is called a **strict morphism** if  $\text{Im}(f) \rightarrow \text{Coim}(f)$  is an isomorphism.  $\lrcorner$

**Def. (4.8.1.13) [Exact Sequence].** A diagram  $0 \rightarrow X \xrightarrow{f} Y \xrightarrow{g} Z \rightarrow 0$  is called an **exact sequence** if  $f$  is the kernel of  $g$  and  $g$  is the cokernel of  $f$ .

Clearly for such an exact sequence,  $f$  is a strict monomorphism and  $g$  is a strict epimorphism. Conversely, any strict monomorphism of strict epimorphism can be extended to an exact sequence.  $\lrcorner$

**Def. (4.8.1.14) [Kernel of an Additive Functor].** The **kernel of an additive functor** (4.8.1.5) between additive categories is the full subcategory of objects that are mapped to 0.  $\lrcorner$

**Def. (4.8.1.15) [Compact Objects].** Let  $\mathcal{D}$  be an additive category with arbitrary direct sums, then a **compact object**  $K \in \mathcal{D}$  is an object that

$$\bigoplus_i \text{Hom}(K, E_i) \rightarrow \text{Hom}(K, \bigoplus_i E_i)$$

is bijective for any set  $I$  and objects  $E_i \in \mathcal{D}$ .  $\lrcorner$

### Karoubian Categories

**Def. (4.8.1.16) [Karoubian Categories].** A **Karoubian category** is an additive category (4.8.1.7)  $\mathcal{A}$  that satisfies the following equivalent conditions:

- Every idempotented endomorphism of an object of  $\mathcal{A}$  has a kernel.
- Every idempotented endomorphism of an object of  $\mathcal{A}$  has a cokernel.
- Every idempotented endomorphism  $p : z \rightarrow z$  induces a direct sum decomposition  $z = x \oplus y$  (exists by A3) that  $p$  corresponds to the projection  $z \rightarrow x$ .

┘

*Proof:*  $1 \rightarrow 3$ : Let  $p : z \rightarrow z$  be an idempotent, let  $x = \ker(p)$ ,  $y = \ker(1 - p)$ , then there are maps  $x \rightarrow z$ ,  $y \rightarrow z$ . Then  $p : z \rightarrow z$  factors through  $z \rightarrow y \rightarrow z$ . Similarly  $(1 - p) : z \rightarrow z$  factors through  $z \rightarrow x \rightarrow z$ . Then it can be verified that  $z = x \oplus y$  is a direct sum decomposition (4.8.1.8).

$2 \rightarrow 3$  is dual.

$3 \rightarrow 1$ ,  $3 \rightarrow 2$  are easy by (4.8.1.8). □

**Prop. (4.8.1.17).** Let  $\mathcal{D}$  be a preadditive category,

- if  $\mathcal{A}$  has countable products and kernels of morphisms that have a right inverse, then  $\mathcal{A}$  is Karoubian.
- Dually, if  $\mathcal{A}$  has countable coproducts and cokernels of morphisms that have a left inverse, then  $\mathcal{A}$  is Karoubian.

┘

*Proof:* Given any idempotent morphism  $e : X \rightarrow X$ ,  $e$  has a kernel iff  $W \mapsto \ker(\text{Mor}(M, X) \xrightarrow{e} \text{Mor}(M, X))$  is representable. Notice that for any Abelian group  $A$ ,

$$\ker(e : A \rightarrow A) = \ker(\Phi : \prod_{\mathbb{Z}} A \rightarrow \prod_{\mathbb{Z}} A)$$

where

$$\Phi(a_1, a_2, \dots) = (ea_1 + (1 - e)a_2, ea_2 + (1 - e)a_3, \dots)$$

and it has a right inverse

$$\Psi(a_1, a_2, \dots) = (a_1, (1 - e)a_1 + ea_2, (1 - e)a_2 + ea_3, \dots)$$

thus the kernel exists. □

### Coherent Functors

**Def. (4.8.1.18) [Coherent Functors].** For  $\mathcal{A} \in \text{AddCat}$ , a **coherent functor** on  $\mathcal{A}$  is a functor  $F \in \text{PSh}(\mathcal{A})$  s.t. there exists a morphism  $s \rightarrow t \in \mathcal{A}$  and  $F$  is the cokernel of the map  $\mathcal{A}(s) \rightarrow \mathcal{A}(t)$ .

Then the class of coherent functors on  $\mathcal{A}$  form an additive category with cokernels, denoted by  $\text{Coh}(\mathcal{A})$ . ┘

*Proof:* Cf. [Neeman, Triangulated Categories]. □

**Prop. (4.8.1.19).** Any additive functor between additive categories  $f : \mathcal{A} \rightarrow \mathcal{B}$  extends via Yoneda map  $\mathcal{A} \rightarrow \text{Coh}(\mathcal{A})$  to a right exact functor  $f^* : \text{Coh}(\mathcal{A}) \rightarrow \text{Coh}(\mathcal{B})$  (4.8.1.18). ┘

## 2 Exact Categories

Main references are [Exact categories, Theo].

**Def. (4.8.2.1) [Exact Categories].** Let  $\mathcal{C}$  be an small additive category and  $\mathcal{E}$  be a set of short sequences

$$0 \rightarrow X \rightarrow Y \rightarrow Z \rightarrow 0$$

in  $\mathcal{C}$ . If  $0 \rightarrow X \xrightarrow{\varphi} Y \xrightarrow{\psi} Z \rightarrow 0$  is in  $\mathcal{E}$ , we call  $\varphi$  an **admissible monomorphism** and  $\psi$  an **admissible epimorphism**. Then  $(\mathcal{C}, \mathcal{E})$  is called an **exact category** if it satisfies:

- **Ex1:** For  $X \in \mathcal{C}$ ,  $\text{id}_X$  is both an admissible monomorphism and an admissible epimorphism.
- **Ex2:** For any triangle  $0 \rightarrow X \xrightarrow{\varphi} Y \xrightarrow{\psi} Z \rightarrow 0$  in  $\mathcal{E}$ ,  $\varphi$  is the kernel of  $\psi$  and  $\psi$  is the cokernel of  $\varphi$ .
- **Ex3:** If  $f, g$  are admissible monomorphisms, then so is  $gf$ . If  $f, g$  are admissible epimorphisms, then so is  $gf$ .
- **Ex4:** Admissible monomorphisms are stable under pushouts and admissible epimorphisms are stable under pullbacks.

┘

**Cor. (4.8.2.2).** If  $(\mathcal{C}, \mathcal{E})$  is an exact category and  $X, Y \in \mathcal{C}$ , then  $0 \rightarrow X \rightarrow X \oplus Y \rightarrow Y \rightarrow 0$  is in  $\mathcal{E}$ . ┘

*Proof:* The first is a pushout of  $0 \rightarrow A$ , and the second is a pullback of  $B \rightarrow 0$ . ┐

**Cor. (4.8.2.3).** If  $\mathcal{C} \in \mathcal{Ab}$  and  $\mathcal{E}$  the set of exact sequences in  $\mathcal{C}$ , then  $(\mathcal{C}, \mathcal{E})$  is an exact category. And if  $\mathcal{E}'$  the set of split exact sequences in  $\mathcal{C}$ , then  $(\mathcal{C}, \mathcal{E}')$  is also an exact category. ┘

**Thm. (4.8.2.4) [Obscure Axiom].** If  $(\mathcal{C}, \mathcal{E})$  is an exact category, and if  $f : X \rightarrow Y \in \mathcal{C}$  is a morphism having a kernel and there is a morphism  $g : Z \rightarrow X$  that  $fg$  is an admissible epimorphism, then so is  $f$ . Dual assertion holds for admissible monomorphisms. ┘

*Proof:* ? Cf. [Keller, Chain complexes and stable categories, P28], [Exact Categories, Theo]P10. ┐

**Cor. (4.8.2.5).** If  $(i, p), (i', p')$  are triangles, then  $(i \oplus i', p \oplus p')$  is exact iff  $(i, p), (i', p')$  are both exact. ┘

*Proof:* If  $0 \rightarrow A' \rightarrow A \rightarrow A'' \rightarrow 0, 0 \rightarrow B' \rightarrow B \rightarrow B'' \rightarrow 0$  are both exact, then notice for any  $C \in \mathcal{C}$ ,  $0 \rightarrow A' \oplus C \rightarrow A \oplus C \rightarrow A'' \rightarrow 0$  is exact ( $A \oplus C \rightarrow A''$  is a composition of  $A \oplus C \rightarrow A'' \oplus C$  and  $A'' \oplus C \rightarrow A''$ ). Hence by composition,  $A' \oplus B' \rightarrow A \oplus B$  is an admissible monomorphism. So  $0 \rightarrow A' \oplus B' \rightarrow A \oplus B \rightarrow A'' \oplus B'' \rightarrow 0$  is exact because it is clearly a kernel-cokernel triangle.

For the converse, it is clear that  $(i, p), (i', p')$  are kernel-cokernel pairs. And notice  $\begin{bmatrix} 1 \\ 0 \end{bmatrix} i = \text{diag}(i, i') \begin{bmatrix} 1 \\ 0 \end{bmatrix}$  is an admissible monomorphism, so  $i$  is an admissible monomorphism by the obscure axiom. ┐

**Prop. (4.8.2.6).** The pullback of an admissible monomorphism along an admissible epimorphism is an admissible monomorphism. Dual assertion holds for admissible epimorphisms. ┘

*Proof:* Let  $A \rightarrow B$  be an admissible monomorphism with kernel  $C$ , and  $B' \rightarrow B$  be an admissible epimorphism, then the pullback  $A'$  exists by the axiom. Then we can prove that  $A' \rightarrow B'$  is the kernel of the admissible epimorphism  $B' \rightarrow B \rightarrow C$ , thus an admissible epimorphism. ┐

### Quasi-Abelian Categories

**Def. (4.8.2.7) [Quasi-Abelian Categories].** A **quasi-Abelian category** is an additive category (4.8.1.7) s.t. strict epimorphisms are stable under pullbacks and strict monomorphisms are stable under pushforwards. ┘

**Prop. (4.8.2.8).** A quasi-Abelian category is naturally an exact category. ┘

*Proof:* It suffices to show that strict monomorphisms and strict epimorphisms are stable under compositions. Suppose  $u : E \rightarrow F, v : F \rightarrow G$  are strict epimorphisms, and  $w = v \circ u$ , then there is a commutative diagram

$$\begin{array}{ccccc}
 & & \ker(w) & \longrightarrow & \ker(v) \\
 & \nearrow & \downarrow i_w & & \downarrow i_v \\
 \ker(u) & \xrightarrow{i_u} & E & \xrightarrow{u} & F \\
 & & \searrow w & & \downarrow v \\
 & & & & G
 \end{array} ,$$

and the upper-right square is a pullback square. Then it suffices to show that  $w$  is the cokernel of  $i_w$ , which is easy.

The argument for strict monomorphisms are dual.  $\square$

**Prop.(4.8.2.9) [Characterizing Quasi-Abelian Categories].** An additive category  $\mathcal{A}$  is quasi-Abelian iff there are Abelian categories  $\mathcal{A}^\sharp$  and  $\mathcal{A}^\flat$  and fully faithful additive embeddings  $\mathcal{A} \subset \mathcal{A}^\sharp, \mathcal{A} \subset \mathcal{A}^\flat$  s.t.

- If  $A \rightarrow E$  is a monomorphism in  $\mathcal{A}^\sharp$  and  $E \in \mathcal{A}$ , then  $A \in \mathcal{A}$  too.
- If  $E \rightarrow B$  is an epimorphism in  $\mathcal{A}^\flat$  and  $E \in \mathcal{A}$ , then  $B \in \mathcal{A}$  too.

If this is the case, then the short exact sequences in  $\mathcal{A}$  are exactly those which are exact in  $\mathcal{A}^\sharp$  and/or  $\mathcal{A}^\flat$ .  $\lrcorner$

*Proof:* Cf.[Schneider]Lemma1.2.34.  $\square$

**Example(4.8.2.10).** The category of torsion-free sheaves on a smooth projective variety is a quasi-Abelian category.  $\lrcorner$

*Proof:*  $\square$

### Geometric Exact Categories

**Def.(4.8.2.11)[Geometric Exact Categories].** A **geometric exact category** consists of an exact category  $(\mathcal{C}, \mathcal{E})$  and a mapping  $A$  from  $\text{Ob}(\mathcal{C})$  to  $\text{Set}$  together with morphisms:

- a morphism  $f^* : A(X) \rightarrow A(Y)$  for any admissible monomorphism  $f : X \rightarrow Y$ .
- a morphism  $g_* : A(X) \rightarrow A(Z)$  for any admissible epimorphism  $g : X \rightarrow Z$ .

that satisfies the following axioms:

- **A1:**  $A(0) = \text{pt}$ .
- **A2:** If  $i, j$  are admissible monomorphisms, then  $(ji)^* = i^*j^*$ .
- **A3:** If  $p, q$  are admissible epimorphisms, then  $(qp)_* = q_*p_*$ .
- **A4:**  $\text{id}_X^* = (\text{id}_X)_* = \text{id}_{A(X)}$ .
- **A5:** If  $f : X \rightarrow Y$  is an isomorphism, then  $f^*f_* = f_*f^* = \text{id}$ .

- **A6:** For any Cartesian and Cocartesian diagram
 
$$\begin{array}{ccc}
 X & \xrightarrow{u} & Y \\
 \downarrow p & & \downarrow q \\
 Z & \xrightarrow{v} & W
 \end{array}$$
 , if  $u$  is admissible monomorphism

or  $q$  is admissible epimorphism, then  $v^*q_* = p_*u^*$ .

- **A7:** If  $X \xrightarrow{u} Y \xrightarrow{v} Z$  is a diagram in  $\mathcal{C}$  that  $u$  is an admissible epimorphism and  $v$  is an admissible monomorphism, and if  $h_X \in A(X), h_Z \in A(Z)$  satisfy  $u_*(h_X) = v^*(h_Z)$ , then there exists  $h \in A(X \oplus Z)$  that  $(\text{id}, vu)^*(h) = h_X$  and  $\pi_{2*}(h) = h_Z$ . (Notice  $(\text{id}, vu)$  is an admissible monomorphism because it is composition of  $X \rightarrow X \oplus Z$  with the isomorphism  $(\pi_1, vu\pi_1 + \pi_2) : X \oplus Z \rightarrow X \oplus Z$ ).

For any  $X \in \mathcal{C}$ , an element of  $A(X)$  is called a **geometric structure** on  $X$ .

Exact categories can be viewed as geometric exact categories by asserting  $A(X) = \text{pt}$  for all  $X \in \mathcal{C}$ .  $\lrcorner$

**Def.(4.8.2.12) [Morphisms compatible with the Geometric Structure].** Let  $(\mathcal{C}, \mathcal{E}, A)$  be a geometric exact category, if  $(X', h'), (X'', h'')$  are two geometric objects, then a morphism  $f : X' \rightarrow X''$  is said to be a **morphism compatible with the geometric structure** if there exists a geometric object  $(X, h)$  and an admissible monomorphisms  $u : X' \rightarrow X$  and an admissible epimorphism  $v : X \rightarrow X''$  that  $h' = u^*(h)$  and  $h'' = v_*(h)$  and  $f = vu$ .

The composition of two morphisms compatible with the geometric structure is also a morphism compatible with the geometric structure.

We denote  $\mathcal{C}_A$  the category of geometric objects of  $\mathcal{C}$ , and  $\mathcal{E}_A$  the set of diagrams of geometric objects  $0 \rightarrow X' \xrightarrow{u} X \xrightarrow{v} X'' \rightarrow 0$  that the underlying diagram is in  $\mathcal{E}$  and  $u, v$  are compatible with the geometric structures.  $\lrcorner$

**Prop.(4.8.2.13) [Hermitian Spaces].** The f.d. Hermitian spaces over  $\mathbb{C}$  or f.d. normed vector spaces over  $\mathbb{R}$  form a geometric exact category.  $\lrcorner$

*Proof:* Cf.[Harder-Narasimhan Categories, P4].  $\square$

**Prop.(4.8.2.14) [F.D. Ultranormed Banach Spaces].** Let  $K$  be a complete valued field, then the category of f.d. ultranormed Banach spaces over  $K$  (19.1.6.5) is a geometric exact category.  $\lrcorner$

*Proof:* It suffices to check axiom A7, but  $vu$  has  $\text{norm} \leq 1$ , and for any  $\varphi : E \rightarrow F$  of  $\text{norm} \leq 1$ , we can endow  $E \oplus F$  with the maximum norm, then in the decomposition  $E \xrightarrow{(\text{id}, \varphi)} E \oplus F \xrightarrow{\pi_2} F$ , we have  $(\text{id}, \varphi)^*(h) = h_E$  and  $(\pi_2)_*(h) = h_F$ .  $\square$

**Prop.(4.8.2.15) [Filtrations in an Abelian Category].** The filtrations (4.3.3.1) in an Abelian category form a geometric exact category.  $\lrcorner$

*Proof:* Cf.[Harder-Narasimhan Categories, P5].  $\square$

### 3 Abelian Categories

**Def.(4.8.3.1) [Abelian Categories].** An **Abelian category** is a preadditive category  $\mathcal{A} \in \text{Cat}(4.8.2.7)$  s.t. every morphism is strict (4.8.1.12). We use the symbol  $\mathcal{A} \in \text{AbCat}$  to mean that  $\mathcal{A}$  is an Abelian category.

We use the notation  $\mathcal{A} \in \text{AbCat}$  to denote that  $\mathcal{A}$  is an Abelian category.  $\lrcorner$

**Remark(4.8.3.2).** WARNING: An additive category that epimorphism+monomorphism is isomorphism need not be an Abelian category. Cf.[<https://mathoverflow.net/questions/41722/is-every-balanced-pre-abelian-category-abelian>] for a counter-example.  $\lrcorner$

**Prop.(4.8.3.3).** For  $\mathcal{A} \in \text{AbCat}$ , the functors

$$\mathcal{C} \rightarrow \mathcal{A}b : Y \mapsto \text{Hom}(X, Y),$$

and

$$\mathcal{C}^{\text{opp}} \rightarrow \mathcal{A}b : Y \mapsto \text{Hom}(Y, X)$$

are both left exact. (Note that left and right is seen on the image).  $\lrcorner$

**Def. (4.8.3.4) [Injectives and Surjectives].** For  $\mathcal{A} \in \mathcal{A}b\mathcal{C}at$ , a morphism  $f : X \rightarrow Y \in \mathcal{A}$  is called an **injection** if  $\ker f = 0$ , in which case  $X$  is called a **subobject** of  $Y$ . And  $f$  is called a **surjection** if  $\text{Coker } f = 0$ , in which case  $Y$  is called a **quotient** of  $X$ .

$f$  is an injection iff it is a monomorphism, it is a surjection iff it is an epimorphism.  $\lrcorner$

**Def. (4.8.3.5) [Simple Objects].** For  $\mathcal{A} \in \mathcal{A}b\mathcal{C}at$ , an object  $x \in \text{Ob}(\mathcal{A})$  is called a **simple object** if  $x \neq 0$  and the only subobjects of  $x$  are  $0$  and  $x$  (4.8.3.4).  $\lrcorner$

**Prop. (4.8.3.6).** Axiom A3 asserts the good existence of product and sum of objects as we wanted, and it can be used to prove that monomorphism and epimorphism are stable under pushout and pullback.

But this uses A4 strongly, Cf. [MacLane Categories for working mathematicians P203]. (For epimorphism, first prove  $0 \rightarrow X \times_U Y \rightarrow X \times Y \rightarrow U \rightarrow 0$  is exact when  $X \rightarrow U$  is epi).  $\lrcorner$

**Prop. (4.8.3.7).** equalizer and finite product derives finite limit, thus finite limits and finite colimits exists in Abelian categories.  $\lrcorner$

**Prop. (4.8.3.8) [Mitchell's embedding theorem].** If  $\mathcal{A} \in \mathcal{A}b\mathcal{C}at$  is small, then there exists  $R \in \text{Ring}$ , not necessary commutative and a fully faithful and exact functor  $\mathcal{A} \rightarrow \text{Mod}_R$  that preserves kernel and cokernel. WARNING: it may not preserve sum and product, let alone limits and colimits.  $\lrcorner$

*Proof:*  $\square$

**Prop. (4.8.3.9).** If  $\mathcal{A} \in \mathcal{A}b\mathcal{C}at$  and  $\mathcal{C} \in \mathcal{C}at$ , then  $\text{Hom}(\mathcal{C}, \mathcal{A}) \in \mathcal{A}b\mathcal{C}at$ . In particular,  $\text{Ch}^{\mathbb{Z}}(\mathcal{A}) \in \mathcal{A}b\mathcal{C}at$  (4.8.7.1).  $\lrcorner$

### Localization

**Prop. (4.8.3.10) [Localization Category].** If  $\mathcal{C}$  is a preadditive category and  $S$  is a left or right localizing system of  $\mathcal{C}$ , then there exists a natural additive structure on  $S^{-1}\mathcal{C}$  and a localizing functor  $\mathcal{C} \rightarrow S^{-1}\mathcal{C}$  that is additive.  $\lrcorner$

*Proof:* Cf. [Sta]05QD.  $\square$

**Lemma (4.8.3.11).** If  $\mathcal{C}$  is additive and  $S$  is localizing, let  $X$  be an element of  $\mathcal{C}$ , then:  $Q(X) = 0$  iff there is a morphism  $0 : X \rightarrow Y$  that is an element of  $S$  iff there is a morphism  $0 : Z \rightarrow X$  that is an element of  $S$  iff there is a morphism  $0 : Z \rightarrow X$  that is an element of  $S$   $\lrcorner$

*Proof:* If such  $0 : X \rightarrow Y \in S$ , then it maps to isomorphisms in  $S^{-1}(\mathcal{C})$  by (4.1.1.59), so  $Q(X) = 0$ . If  $Q(X) = 0$ , then the morphism  $0 \rightarrow X$  is mapped to an isomorphism, so by (4.1.1.61), there are  $g, h$  that  $fg = hf = 0$ , so  $Z \rightarrow 0 \rightarrow X \in S$ . Dually for the other direction.  $\square$

**Prop. (4.8.3.12) [Localized Abelian Categories].** If  $\mathcal{A}$  is Abelian and  $S$  is localizing, then  $S^{-1}\mathcal{A}$  is an Abelian category and  $\mathcal{A} \rightarrow S^{-1}\mathcal{A}$  is exact.  $\lrcorner$

*Proof:* By (4.1.1.59) and its dual,  $\mathcal{A} \rightarrow S^{-1}\mathcal{A}$  preserves finite limits and colimits.  $\square$

**Serre-Subcategories**

**Def. (4.8.3.13)[Serre-Subcategories].** A **Serre-subcategory** of an Abelian category is a non-empty full subcategory  $\mathcal{C}$  that if

$$A \rightarrow B \rightarrow C$$

is exact and  $A, C \in \text{Ob}(\mathcal{C})$ , then  $B \in \text{Ob}(\mathcal{C})$ .

A **weak Serre-subcategory** of an Abelian category is a non-empty full subcategory  $\mathcal{C}$  s.t. if

$$A \rightarrow B \rightarrow C \rightarrow D \rightarrow E$$

is exact and  $A, B, D, E \in \mathcal{C}$ , then  $C \in \mathcal{C}$ . ┘

**Prop. (4.8.3.14).**

- A Serre category is equivalent to a full subcategory  $\mathcal{A}$  that contains 0, all the subobjects and quotient objects of  $\mathcal{A}$ , and extensions of objects of  $\mathcal{A}$  are in  $\mathcal{A}$ .
- A weak Serre category is equivalent to a full subcategory  $\mathcal{A}$  that contains 0, and all the kernels, cokernels between objects in  $\mathcal{A}$ , and all the extensions of objects in  $\mathcal{A}$ .

In these cases,  $\mathcal{A}$  is an Abelian category and the functor  $i : \mathcal{A} \rightarrow \mathcal{C}$  is exact. ┘

*Proof:* One direction of these two are trivial, it suffices to prove the converse. For the first,  $0 \rightarrow \text{Im } A \rightarrow B \rightarrow \text{Im } B \rightarrow 0$ , so  $B \in \mathcal{C}$ . For the second,  $0 \rightarrow \text{Coker}(A \rightarrow B) \rightarrow C \rightarrow \ker(D \rightarrow E) \rightarrow 0$ , so  $C \in \mathcal{C}$ . □

**Prop. (4.8.3.15)[Quotients by Serre-Subcategories].** For an exact functor  $F$  between Abelian categories, the kernel of  $F$  is a Serre subcategory. And any Serre subcategory is the kernel of an essentially surjective exact functor  $Q : \mathcal{A} \rightarrow \mathcal{A}/\mathcal{C}$ , and this functor satisfies the universal property that any exact functor between Abelian categories  $F : \mathcal{A} \rightarrow \mathcal{C}$  that  $\mathcal{C} \subset \ker(F)$  factors uniquely through  $\mathcal{A}/\mathcal{C}$ . ┘

*Proof:* The full subcategory of  $\ker(F)$  is clearly a Serre subcategory by checking the definition. Conversely, consider  $S = \{ \text{all the morphisms that has kernel and cokernel in } \mathcal{C} \}$ , first we prove it is a localizing system (4.1.1.55).

The long exact sequence (4.8.8.4) shows that if  $f, g \in S$ , then  $gf \in S$ . For other verifications, Cf. [Sta]02MS?.

Next we construct  $\mathcal{C}/\mathcal{A}$  as  $S^{-1}\mathcal{C}$ . Consider which objects are mapped to 0 in  $\mathcal{C}/\mathcal{A}$ , use (4.8.3.11) and consider the kernel and cokernel, it is easy to see that  $\ker(Q) = \mathcal{C}$ . If another category  $\mathcal{D}$  and  $F : \mathcal{C} \rightarrow \mathcal{D}$  satisfies  $\mathcal{C}$  is mapped to 0, then it is clear that elements in  $S$  is mapped to isomorphism, so it factors through  $\mathcal{C}/\mathcal{A}$  by universal property (4.1.1.59). □

**Prop. (4.8.3.16)[ $K_0$  Group of Serre-Subcategories].** Let  $\mathcal{A}$  be an Abelian category and  $\mathcal{C}$  a Serre subcategory, with  $\mathcal{A}/\mathcal{C} = \mathcal{B}$  (4.8.3.15). Then

- The exact functors  $\mathcal{C} \rightarrow \mathcal{A} \rightarrow \mathcal{B}$  induces an exact sequence

$$K_0(\mathcal{C}) \rightarrow K_0(\mathcal{A}) \rightarrow K_0(\mathcal{B}) \rightarrow 0,$$

- The kernel of  $K_0(\mathcal{C}) \rightarrow K_0(\mathcal{A})$  is generated by elements of the form

$$[\ker(\psi)/\text{Im}(\varphi)] - [\ker(\varphi)/\text{Im}(\psi)]$$

where  $\varphi, \psi : M \rightarrow M$  are pairs of maps that  $\varphi \circ \psi = \psi \circ \varphi = 0$ . ┘

*Proof:* Cf. [Sta]02MX. □

### Artinian Abelian Categories

**Def. (4.8.3.17) [Artinian Abelian Categories].** For  $\mathcal{C} \in \mathbf{AbCat}$ ,

- $\mathcal{C}$  is called an **Artinian Abelian category** if every object of  $\mathcal{C}$  satisfies descending chain condition for subobjects (4.8.3.4).
- $\mathcal{C}$  is called a **Noetherian Abelian category** if every object of  $\mathcal{C}$  satisfies the ascending chain condition for subobjects.

┘

**Prop. (4.8.3.18) [Artinian Noetherian Abelian Categories].** For  $\mathcal{C} \in \mathbf{AbCat}$ ,  $\mathcal{C}$  is Artinian and Noetherian iff for any object  $A \in \mathbf{Ob}(\mathcal{C})$  there is a filtration of subobjects

$$0 = A_0 \subset A_1 \subset \dots \subset A_n = A$$

s.t.  $A_i/A_{i-1} \in \mathcal{C}$  are simple objects (4.8.3.5) for each  $i \in [n]_+$ .

┘

*Proof:* Cf. [Sta]0FCJ.

□

**Prop. (4.8.3.19) [Jordan-Holder].** Let  $\mathcal{C} \in \mathbf{AbCat}$  be Artinian (4.8.3.17), then any maximal length filtration of an element  $X$  has the same length, and the set of quotients  $X_{k+1}/X_k$  is the same, up to order.

┘

*Proof:* Cf. [Sta]0FCK.

□

### Grothendieck Abelian Category

References are [Rings of Quotients]

**Def. (4.8.3.20) [Grothendieck-Abelian Categories].** A **Grothendieck-Abelian category** is an Abelian category  $\mathcal{A}$  satisfying the following axioms:

**AB3:** It is a locally small cocomplete Abelian category.

**AB5:** Small filtered colimits are exact. This is equivalent to { for any family of subobjects  $\{A_i\}$  of  $A$  to  $B$  indexed by inclusion can induce a morphism  $\sum A_i \rightarrow B$  (internal sum) } ?

**GEN:** It has a **generator**, which is an object  $U \in \mathcal{A}$  s.t. for any proper subobject  $N \subsetneq M$ , there is a map  $U \rightarrow M$  that doesn't factor through  $N$ .

┘

**Def. (4.8.3.21) [Further Grothendieck-Axioms].** For a Grothendieck Abelian category  $\mathcal{A}$ , we can also formulate the following axioms:

**AB4:** Arbitrary direct sums are exact.

**AB6:** For any index set  $J$  and filtered categories  $I_j, j \in J$  and diagrams indexed over  $I_j$ , the natural map

$$\varinjlim_{i_j \in I_j} \prod_{j \in J} M_{i_j} \rightarrow \prod_{j \in J} \varinjlim_{i_j \in I_j} M_{i_j}$$

is an isomorphism.

**Dual Axioms:** Axioms with an \* meaning that the dual category satisfies something.

┘

**Prop. (4.8.3.22).** If  $\mathcal{A}$  is a Grothendieck Abelian category, then so is  $\mathcal{PSh}^{\text{Set}}(\mathcal{A})$ .

┘

*Proof:* For the presheaf, the only problem is the existence of generator, for that, just construct a family of presheaves and sum them. Take  $Z_X = i_{f_X}(U)$ , where  $U$  is the generator of  $\mathcal{A}$  and  $f = \text{pt} \rightarrow \mathcal{A}^C : \text{pt} \rightarrow U$ . Then  $F(X) = \text{Hom}(Z_X, F)$  by adjointness(7.1.2.9). So they are a family of generators.  $\square$

**Prop. (4.8.3.23).** Any Grothendieck Abelian category has a functorial injective embedding.  $\lrcorner$

*Proof:* Cf.[Sta]079H. ?  $\square$

**Prop. (4.8.3.24) [Representability on Grothendieck Category].** A contravariant functor from a Grothendieck category to  $\text{Set}$  is representable iff it takes colimits to limits.  $\lrcorner$

*Proof:*  $M \oplus M \rightarrow M$  with induce a map  $F(M) \times F(M) \rightarrow F(M)$  thus  $F(M)$  is a semigroup, and the inverse of  $\text{id}_M$  in  $\text{Hom}(M, M)$  maps to a  $F(M) \rightarrow F(M)$  which is the inverse, Thus in fact  $F$  is a left adjoint functor to  $\mathcal{A}b$ .

Let  $U$  be a generator,  $A = \sum_{s \in F(U)} U$ , let  $s_{univ} = (s) \in F(A) = \prod_{s \in F(U)} F(U)$ . let  $A'$  be the largest objects that  $s_{univ}$  restricts to 0 in  $A'$ , let  $\bar{s}_{univ}$  be in  $F(A/A')$  that maps to  $s_{univ}$  in  $F(A)$  (because  $F$  is left exact). Then we claim  $(A/A', \bar{s}_{univ})$  represents  $F$ . Cf.[Sta]07D7. ?  $\square$

**Cor. (4.8.3.25) [Grothendieck Categories are Cocomplete].** Any Grothendieck category satisfies  $\text{AB3}^*$ .  $\lrcorner$

*Proof:* It suffices to show that small direct products exist. And this is because  $F = \prod_i \text{Hom}(-, M_i)$  commutes with colimits.  $\square$

**Prop. (4.8.3.26) [Grothendieck Categories are Locally Presentable].** Any Grothendieck category is locally presentable. In fact, for an Abelian category with exact filtered colimits, it is a Grothendieck Abelian category iff it is locally presentable.  $\lrcorner$

*Proof:* Cf.[Colimits and homological algebra, Krause]Cor5.2. ?  $\square$

**Cor. (4.8.3.27).** If  $F : \mathcal{C}^{\text{op}} \rightarrow \text{Set}$  commutes with small colimits, then  $F$  is a left adjoint.  $\lrcorner$

*Proof:* ?  $\square$

### Examples of Grothendieck Category

**Prop. (4.8.3.28) [Modules].** For  $R \in \text{Alg}$ ,  $\text{Mod}_R$  is a Grothendieck Abelian category. More generally, for  $R, S \in \text{Alg}$ ,  $\text{Mod}_{R-S} = \text{Mod}_{R \otimes S^{\text{op}}}$  is a Grothendieck Abelian category.  $\lrcorner$

*Proof:* This is clear, by(5.1.1.27).  $\square$

**Prop. (4.8.3.29) [Sheaf of Modules].**  $\text{Sh}(\mathcal{O})$  for a ringed site  $(\mathcal{C}, \mathcal{O})$  is a Grothendieck Abelian category.  $\lrcorner$

*Proof:* It is obviously an Abelian category and have filtered colimits as presheaves, which are exact because colimits in the category of Abelian groups are exact, and for a family of generators, take  $j_! \mathcal{O}_U$  as the representative for  $\Gamma(U, -)$ , which is the sheaf associated to the sheaf  $Z_U$  in the proof of(4.8.3.22).  $\square$

**Cor. (4.8.3.30).** Let  $\mathcal{C}$  be a site, the categories  $\mathcal{P}\text{Sh}(\mathcal{C})$  and  $\text{Sh}(\mathcal{C})$  are Grothendieck Abelian categories.  $\lrcorner$

*Proof:* For the presheaf, Cf.(4.8.3.22). For the sheaf, it follows from (4.8.3.29).  $\square$

**Remark(4.8.3.31).** The category of Abelian sheaves doesn't satisfy AB4\*, i.e. not every limit of epimorphisms is epimorphism.  $\lrcorner$

*Proof:* Consider the constant sheaf  $\prod_{q \in [0,1]} B(\frac{p}{q}, \frac{1}{q})$  on  $[0, 1]$ .  $\square$

**Prop.(4.8.3.32) [Quasi-Coherent Sheaves].** For  $X \in \mathcal{S}ch$ ,  $\mathcal{QCoh}(X)$  is Grothendieck category, and there is a **coherentor** left adjoint to the forgetful functor.  $\lrcorner$

*Proof:* Firstly  $\mathcal{QCoh}(X) \in \mathcal{AbCat}$  by(7.5.1.3), and on affine open set, the colimit is an  $\mathcal{Qco}$  sheaf, thus the colimit exists in  $\mathcal{Qco}$  and equals the colimit in the category of sheaves, thus filtered colimits is exact because  $\mathcal{Mod}(\mathcal{O}_X)$  is Grothendieck(4.8.3.29). The generator exists, Cf.[Sta]077P.

The coherentor exists by the fact that  $h_{\mathcal{F}}$  commutes with colimits and by the property of Grothendieck category(4.8.3.24).  $\square$

### Others

**Def.(4.8.3.33)[Essential Morphism].** In an Abelian category, an injection  $A \rightarrow B$  is called **essential** iff every non-zero subobject of  $B$  intersects  $A$ . A surjection is called **essential** iff every proper subobject of  $A$  is not mapped to  $B$ .  $\lrcorner$

**Def.(4.8.3.34) [Noetherian Abelian Category].** In a Grothendieck Abelian category  $\mathcal{A}$ , an object  $M$  is called **finitely generated** if for every ascending chain

$$M_1 \subset M_2 \subset \dots \subset M$$

with  $\cup_i M_i = M$ , we have  $M_i = M$  for some  $i$ .

$\mathcal{A}$  is called **Noetherian** iff a subobject of a f.g. object is f.g..  $\mathcal{A}$  is called **Artinian** iff every f.g. object has finite length<sup>?</sup>.  $\lrcorner$

## 4 Triangulated Categories

References are [Triangulated Categories, Neeman].

**Notation(4.8.4.1).**

- Let  $\mathcal{D} \in \mathcal{TriCat}$ (4.8.4.2).

**Def.(4.8.4.2) [Triangulated Categories].** A **triangulated category** is an additive category  $\mathcal{T}$ (4.8.1.7) with an additive automorphism  $\Sigma : \mathcal{T} \cong \mathcal{T}$  denoted by  $X \mapsto X[1]$  and a set of **distinguished triangles**  $\text{Tri}(\mathcal{T})$  that is stable under isomorphism, and satisfying the following axioms:

**(TR1):**  $X \xrightarrow{\text{id}} X \rightarrow 0 \rightarrow X[1] \in \text{Tri}(\mathcal{D})$ . Any morphism  $X \xrightarrow{u} Y$  can be completed to some  $X \xrightarrow{u} Y \rightarrow C(u) \rightarrow X[1] \in \text{Tri}(\mathcal{T})$ . Such an object  $C(u)$  is called the **mapping cone** of  $u$ .

**(TR2):**  $X \xrightarrow{f} Y \xrightarrow{g} Z \xrightarrow{h} X[1] \in \text{Tri}(\mathcal{D})$  iff  $Y \xrightarrow{g} Z \xrightarrow{h} X[1] \xrightarrow{-\Sigma(f)} Y[1] \in \text{Tri}(\mathcal{D})$ .

**(TR3):** Any two consecutive morphisms of two distinguished triangles can be extended to a morphism of distinguished triangles.

**(TR4):** If  $X \xrightarrow{f} Y \xrightarrow{g} Z$  are morphisms, then there are maps  $C(f) \rightarrow C(gf)$ ,  $C(gf) \rightarrow C(g)$  by TR3, Then  $C(f) \rightarrow C(gf) \rightarrow C(g) \rightarrow C(f)[1] \in \text{Tri}(\mathcal{D})$ .

A **triangulated subcategory** is an additive subcategory  $\mathcal{D}'$  stable under  $[1]$  and  $[-1]$  together with a subclass of triangles in  $\mathcal{D}'$  that forms a triangulated category.

We use the symbol  $\mathcal{A} \in \text{TriCat}$  to denote that  $\mathcal{A}$  is a triangulated category.  $\lrcorner$

**Def. (4.8.4.3) [Notations].** We use the tuple  $(X, Y, Z, f, g, h)$  to represent a distinguished triangle  $X \xrightarrow{f} Y \xrightarrow{g} Z \xrightarrow{h} X[1]$ .  $\lrcorner$

**Prop. (4.8.4.4).** Given  $(X, Y, Z, f, g, h), (X', Y', Z', f', g', h')$ , they are both in  $\text{Tri}(\mathcal{D})$  iff  $(X \oplus X', Y \oplus Y', Z \oplus Z', f \oplus f', g \oplus g', h \oplus h')$  is in  $\text{Tri}(\mathcal{D})$ .  $\lrcorner$

*Proof:* [Sta]05QS.  $\square$

**Cor. (4.8.4.5).**  $(X, X \oplus Y, Y, (1, 0), (0, 1), 0)$  is a distinguished triangle.  $\lrcorner$

**Prop. (4.8.4.6).** There is a natural notation of a product of triangulated categories.  $\lrcorner$

**Def. (4.8.4.7) [Cohomological Functors and Exact Functors].** A functor from a triangulated category to an Abelian category is called a **cohomological functor** if it maps a distinguished triangle to a long exact sequence. Similarly, we can define homological functors.

Conversely, a  $\delta$ -**functor** is a functor from an Abelian category to a triangulated category together with a map from the category of exact sequences to the category of distinguished triangles.

A functor  $F$  between two triangulated category is called an **exact functor** if it maps distinguished triangles to distinguished triangles, and there is an isomorphism of functors  $\xi : F \circ [1] \rightarrow [1] \circ F$ .  $\lrcorner$

**Prop. (4.8.4.8).** An exact functor between triangulated categories is additive.  $\lrcorner$

*Proof:* Cf. [Sta]05QY.  $\square$

**Def. (4.8.4.9) [Bi-Exact Functors].** Let  $\mathcal{D}, \mathcal{D}', \mathcal{E} \in \text{TriCat}$ , a **bi-exact bifunctor**  $F : \mathcal{D} \times \mathcal{D}' \rightarrow \mathcal{E}$  is a functor that for any  $X \in \mathcal{D}$ ,  $F(X, -) : \mathcal{D}' \rightarrow \mathcal{E}$  is an exact functor and for any  $Y \in \mathcal{D}'$ ,  $F(-, Y) : \mathcal{D} \rightarrow \mathcal{E}$  is an exact functor. By (4.8.4.8), any bi-exact functor is bi-additive.  $\lrcorner$

**Prop. (4.8.4.10) [Adjunction of Exact Functors].** If  $(F, G) : \mathcal{D} \rightleftharpoons \mathcal{D}'$  is an adjunction pair between triangulated categories and  $F$  is exact, then  $G$  is also an exact functor between triangulated categories.  $\lrcorner$

*Proof:* Use adjunction, we can show that  $G$  commutes with  $[1]$ , and if  $A \rightarrow B \rightarrow C \rightarrow A[1] \in \text{Tri}(\mathcal{D}')$ , choose a distinguished triangle  $G(A) \rightarrow G(B) \rightarrow X \rightarrow G(A)[1] \in \text{Tri}(\mathcal{D})$ , then by (TR3) we get a map of distinguished triangles  $(F(G(A)), F(G(B)), F(X)) \rightarrow (A, B, C)$ , which by adjunction defines a map of distinguished triangles  $(G(A), G(B), X) \rightarrow (G(A), G(B), G(C))$ , which shows  $X \cong G(C)$ , and then  $(G(A), G(B), G(C))$  is in  $\text{Tri}(\mathcal{D})$ .  $\square$

**Prop. (4.8.4.11).** If  $(F, G) : \mathcal{D} \rightleftharpoons \mathcal{D}'$  is an adjunction pair between triangulated categories and  $F, G$  are exact,  $F$  is fully faithful and  $\ker(G) = 0$ , then this is an equivalence of categories.  $\lrcorner$

*Proof:* By (4.1.1.32),  $u : \text{id} \rightarrow gf$  is an isomorphism. Now for any  $X \in \mathcal{D}'$ , choose a distinguished triangle  $(F(G(X)), X \rightarrow Y) \in \text{Tri}(\mathcal{D}')$ , which corresponds to  $(G(F(G(X))), G(X), G(Y)) \in \text{Tri}(\mathcal{D})$ , and by (4.1.1.30),  $G(X) \xrightarrow{u_X} GFG(X) \rightarrow G(X)$  is  $\text{id}_X$ , so we get an isomorphism of triangles  $(G(F(G(X))), G(X), G(Y)) \cong (G(X), G(X), 0)$ , so  $G(Y) \cong 0$ , and  $Y = 0$  by hypothesis. So  $v : FG \rightarrow \text{id}$  is also an isomorphism, so  $(F, G)$  is an equivalence.  $\square$

**Lemma (4.8.4.12).** If  $(X, Y, Z, f, g, h) \in \text{Tri}(\mathcal{D})$ , then  $g \circ f = 0$ .  $\lrcorner$

*Proof:* By TR1  $(X, X, 0, \text{id}, 0, 0)$  is a distinguished triangle, and by TR3 there is a map of distinguished triangles

$$\begin{array}{ccccccc} X & = & X & \longrightarrow & 0 & \longrightarrow & X[1] \\ \parallel & & \downarrow f & & \downarrow & & \parallel \\ X & \xrightarrow{f} & Y & \xrightarrow{g} & Z & \xrightarrow{h} & X[1] \end{array},$$

so  $g \circ f = 0$ . □

**Prop. (4.8.4.13) [Long Exact Sequences].** Let  $C \in \mathcal{D}$ , then  $\text{Hom}_{\mathcal{D}}(-, C)$  (resp.  $\text{Hom}_{\mathcal{D}}(C, -)$ ) is a homological (resp. cohomological) functor (4.8.4.7). ┘

*Proof:* By (4.8.4.4), for any distinguished triangle  $(X, Y, Z, f, g, h)$ ,  $\text{Hom}(C, X) \rightarrow \text{Hom}(C, Y) \rightarrow \text{Hom}(C, Z)$  is 0, and if  $a \in \text{Hom}(C, Y)$  is mapped to  $0 \in \text{Hom}(C, Z)$ , then the morphism  $(a, 0) : (C, 0) \mapsto (Y, Z)$  extends to a morphism of distinguished triangles  $(b, a, 0) : (C, C, 0, \text{id}, 0, 0) \rightarrow (X, Y, Z, f, g, h)$ , thus  $f \circ b = a$ . □

The converse case is dual. □

**Cor. (4.8.4.14).** If  $(a, b, c) : (X, Y, Z, f, g, h) \rightarrow (X', Y', Z', f', g', h') \in \text{Tri}(\mathcal{D})$  that two of  $a, b, c$  are isomorphisms, then this is an isomorphism of triangles.

In particular, the completion in TR1 is unique (may up to non-unique isomorphism) by TR3. ┘

*Proof:* By 5-lemma,  $\text{Hom}(C, X) \rightarrow \text{Hom}(C, X')$  is an isomorphism, then  $X \rightarrow X'$  is an isomorphism by Yoneda lemma. □

**Prop. (4.8.4.15).**  $f : X \rightarrow Y \in \mathcal{D}$  is an isomorphism iff  $C(f) = 0$ . ┘

*Proof:* There is a morphism  $(\text{id}_X, f, 0) : (X, X, 0, \text{id}, 0, 0) \rightarrow (X, Y, C(f), f, g, h)$  by (TR1) and (TR3). By (4.8.4.14),  $f$  is an isomorphism iff  $0 \rightarrow C(f)$  is an isomorphism, which is equivalent to  $Z = 0$ . □

**Prop. (4.8.4.16).** In  $\mathcal{D}$ , any commutative diagram

$$\begin{array}{ccc} X & \longrightarrow & Y \\ \downarrow & & \downarrow \\ X' & \longrightarrow & Y' \end{array}$$

can be extended to a diagram

$$\begin{array}{ccccccc} X & \longrightarrow & Y & \longrightarrow & Z & \longrightarrow & X[1] \\ \downarrow & & \downarrow & & \downarrow & & \downarrow \\ X' & \longrightarrow & Y' & \longrightarrow & Z' & \longrightarrow & X'[1] \\ \downarrow & & \downarrow & & \downarrow & & \downarrow \\ X'' & \longrightarrow & Y'' & \longrightarrow & Z'' & \longrightarrow & X''[1] \\ \downarrow & & \downarrow & & \downarrow & & \downarrow \\ X[1] & \longrightarrow & Y[1] & \longrightarrow & Z[1] & \longrightarrow & X[2] \end{array}$$

where the lower right is anti-commutative. ┘

*Proof:* Let  $(X, Y, Z), (X', Y', Z'), (X, X', X''), (Y, Y', Y''), (X, Y, A)$  be distinguished triangles, then we can find maps  $a : Z \rightarrow A, b : A \rightarrow Y', a' : X'' \rightarrow A, b' : A \rightarrow Z$  by TR3(4.8.4.2). Then TR4 says  $(Z \rightarrow A, Y''), (X'' \rightarrow Z \rightarrow Z')$  is distinguished.

Now let  $(X'', Y'', Z'')$  be distinguished, then we use TR4 again to  $(X'', A, Y'')$ , then  $(Z', Z'', Z[1])$  is distinguished, thus so does  $(Z \rightarrow Z' \rightarrow Z'')$ .

Now it is left to verify the anti-commutativity of the righthdown square, for this, Cf.[Sta]05R0.

□

**Def. (4.8.4.17) [Exceptional Objects].** If  $k \in \text{Field}$  and  $\mathcal{D} \in \text{TriCat}_k$ , then an **exceptional object** in  $\mathcal{D}$  is an object  $E \in \mathcal{D}$  s.t.

$$\text{Hom}^i(E, E) = \begin{cases} 0 & , i \in \mathbb{Z}^\times \\ k & , i = 0 \end{cases}$$

┘

**Def. (4.8.4.18) [Generating Objects].** A family of objects  $\{X_\alpha\}_\kappa$  is said to **generate**  $\mathcal{D}$  if any triangulated subcategory of  $\mathcal{C}$  containing  $\{X_\alpha\}_\kappa$  is equivalent to  $\mathcal{D}$  through the inclusion. ┘

**Prop. (4.8.4.19) [Equivalence and Generators].** Let  $F : \mathcal{C} \rightarrow \mathcal{D} \in \text{TriCat}$  be an exact functor, Suppose that

- $\{X_\alpha\}_\kappa$  is a family of objects generating  $\mathcal{C}$ .
- $\{F(X_\alpha)\}_\kappa$  generate  $\mathcal{D}$ .
- $F$  induces isomorphisms  $\text{Hom}(X_i, X_j[l]) \cong \text{Hom}(F(X_i), F(X_j)[l])$  for any  $i, j \in \kappa$  and  $l \in \mathbb{Z}$ .

Then  $F$  is an exact equivalence. ┘

*Proof:* Let  $\mathcal{C}' \subset \mathcal{C}$  be the full subcategory consisting o objects  $Y$  s.t.

$$\text{Hom}(X_i[l], Y) \xrightarrow{F} \text{Hom}(F(X_i)[l], FY)$$

is an isomorphism for any  $i \in \kappa$  and  $l \in \mathbb{Z}$ . Then  $\mathcal{C}'$  is a strictly full triangulated subcategory of  $\mathcal{C}$ . Since  $\mathcal{C}'$  contains all  $X_i$ , it is just equal to  $\mathcal{C}$ . The same arguing then shows that the full subcategory consisting o objects  $Y$  s.t.

$$\text{Hom}(Y, Z) \xrightarrow{F} \text{Hom}(FY, FZ)$$

for any  $Z \in \mathcal{C}$  is also a full triangulated subcategory thus also  $\mathcal{C}$ . Finally,  $F(\mathcal{C})$  is a subcategory of  $\mathcal{D}$  equivalent to  $\mathcal{D}$ , thus  $F$  is an equivalence of categories, which is also an exact equivalence by(4.8.4.10). □

### Triangulated Subcategories

**Def. (4.8.4.20) [Saturated Triangulated Subcategories].** A full triangulated subcategory  $\mathcal{D}' \subset \mathcal{D}$  is called a **saturated triangulated subcategory** if whenever  $X \oplus Y$  is isomorphic to an object of  $\mathcal{D}'$ ,  $X, Y$  are all isomorphic to an object of  $\mathcal{D}'$ . ┘

**Def. (4.8.4.21) [Thick Triangulated Subcategories].** A full triangulated subcategory  $\mathcal{C} \subset \mathcal{D}$  is called a **thick triangulated subcategory** if objects  $X, Y \in \mathcal{D}$  must lie in  $\mathcal{C}$ , provided there exists a morphism  $f : X \rightarrow Y$  s.t.

- $f$  factors through an object in  $\mathcal{C}$ , and
- $f$  has a mapping cone  $C(f) \in \mathcal{C}$ .

⌋

**Prop. (4.8.4.22) [Orthogonal Triangulated Subcategories].** Let  $\mathcal{B} \subset \mathcal{D}$  a full triangulated subcategory, then  ${}^\perp\mathcal{B}$  and  $\mathcal{B}^\perp$  are also full triangulated subcategories of  $\mathcal{D}$ . ⌋

*Proof:*

□

**Def. (4.8.4.23) [Semi-Orthogonal Decompositions].** A **semi-orthogonal decomposition** of  $\mathcal{D}$  is a sequence  $(\mathcal{B}_0, \dots, \mathcal{B}_n)$  of full triangulated subcategories s.t.  $\mathcal{B}_j \in \mathcal{B}_i^\perp$  (4.8.4.22) whenever  $0 \leq j < i \leq n$ , and  $\mathcal{D}$  is generated by  $\{\mathcal{B}_i\}$ .

And if each  $\mathcal{B}_i$  consists of a single exceptional object of  $\mathcal{D}$  (4.8.4.17), then this sequence is called a **full exceptional sequence** of  $\mathcal{A}$ . ⌋

**Prop. (4.8.4.24) [Kernels are Saturated Triangulated Subcategories].** For  $\mathcal{D}, \mathcal{D}' \in \text{TriCat}$  and  $\mathcal{A} \in \text{AbCat}$ ,

- Let  $F : \mathcal{D} \rightarrow \mathcal{D}'$  be an exact functor, then the full subcategory of  $\mathcal{D}$  consisting of objects  $X$  that  $F(X) = 0$  is a strictly full saturated triangulated subcategory of  $\mathcal{D}$ , called the **kernel** of  $F$ .
- Let  $H : \mathcal{D} \rightarrow \mathcal{A}$  be a (co)homological functor. then the full subcategory of  $\mathcal{D}$  consisting of objects  $X$  that  $F(X[n]) = 0$  for all  $n$  is a strictly full saturated triangulated subcategory of  $\mathcal{D}$ , called the **kernel** of  $H$ .

⌋

*Proof:* Cf. [Sta]05RC, 05RD.

□

### Localizations of Triangulated Category

**Def. (4.8.4.25) [Compatible Localizing Systems].** A localizing system (4.1.1.55)  $S \subset \mathcal{D}$  is said to be compatible with the triangulated structure if it satisfies the following axioms:

**(LS4):** For  $s \in S$ ,  $s[n] \in S$  for any  $n \in \mathbb{Z}$ .

**(LS5):** Any two consecutive morphisms of two distinguished triangle can be extended to a morphism of distinguished triangles by morphisms in  $S$ .

⌋

**Cor. (4.8.4.26).** Let  $\mathcal{D}$  be a triangulated category. If a class of morphisms  $S$  satisfy (LS1), (LS5) and (LS6), then (LS2) holds as well. ⌋

*Proof:* Let  $f : X \rightarrow Y \in \mathcal{D}$  and  $s : X \rightarrow X' \in S$ , we can use (TR1) and (TR2) to extend these to a morphism of distinguished triangles

$$\begin{array}{ccccccc} X & \xrightarrow{f} & Y & \longrightarrow & Z & \longrightarrow & X[1] \\ \downarrow s & & \downarrow s' & & \parallel & & \downarrow s[1] \\ X' & \longrightarrow & Y' & \longrightarrow & Z & \longrightarrow & X'[1] \end{array}$$

The right extension is dual.

□

**Prop. (4.8.4.27) [Exact Functors and Saturated Localizing Systems].** For  $\mathcal{D}, \mathcal{D}' \in \text{TriCat}$  and  $\mathcal{A} \in \text{AbCat}$ ,

- If  $F : \mathcal{D} \rightarrow \mathcal{D}'$  is an exact functor and

$$S = \{f \in \mathcal{D} \mid F(f) \text{ is an isomorphism}\},$$

then  $S$  is a saturated localizing system compatible with the triangulated structure (4.8.4.25).

- If  $H : \mathcal{D} \rightarrow \mathcal{A}$  is a (co)homological functor and

$$S = \{f \in \mathcal{D} \mid H^i(f) \text{ is an isomorphism}\},$$

then  $S$  is a saturated localizing system compatible with the triangulated structure (4.8.4.25).  $\lrcorner$

*Proof:* Cf. [Sta]05R4, 05R6.  $\square$

**Prop. (4.8.4.28) [Localized Triangulated Categories].** Let  $S \subset \mathcal{D}$  be a localizing system compatible with the triangulated structure, then there is a unique triangulated category structure on  $S^{-1}\mathcal{D}$  that the localization functor  $Q : \mathcal{D} \rightarrow S^{-1}\mathcal{D}$  (4.1.1.54) is exact.

Moreover,  $S^{-1}\mathcal{D}$  satisfies the following universal properties:

- If  $\mathcal{A}$  is an Abelian category and  $H : \mathcal{D} \rightarrow \mathcal{A}$  is a cohomological functor that  $H(s)$  are isomorphisms for all  $s \in S$ , then the unique factorization  $H' : S^{-1}\mathcal{D} \rightarrow \mathcal{A}$  s.t.  $H' \circ Q = H$  (4.1.1.59) is also a cohomological functor.
- If  $\mathcal{D}'$  is a triangulated category and  $F : \mathcal{D} \rightarrow \mathcal{D}'$  is an exact functor that  $F(s)$  are isomorphisms for all  $s \in S$ , then the unique factorization  $F' : S^{-1}\mathcal{D} \rightarrow \mathcal{D}'$  s.t.  $F' \circ Q = F$  (4.1.1.59) is also an exact functor.  $\lrcorner$

*Proof:* Cf. [Sta]05R6.  $\square$

**Cor. (4.8.4.29) [Kernel of Localizing Functor].** An object  $Z \in \mathcal{D}$  is in the kernel of the localizing functor  $Q : \mathcal{D} \rightarrow S^{-1}\mathcal{D}$  iff it satisfies the following equivalent conditions:

- There exists  $Z'$  s.t.  $0 : Z \rightarrow Z' \in S$ .
- There exists  $Z'$  s.t.  $0 : Z' \rightarrow Z \in S$ .
- There exists  $Z'$  and a distinguished triangle  $(X, Y, Z \oplus Z', f, g, h)$  that  $f \in S$ .  $\lrcorner$

*Proof:* Cf. [Sta]05R8.  $\square$

**Prop. (4.8.4.30) [Triangulated Subcategories of Localized Triangulated Categories].** Let  $\mathcal{D}$  be a triangulated category and  $S$  is a localizing system compatible with the triangulated structure. Let  $\mathcal{D}'$  be a full triangulated subcategory of  $\mathcal{D}$  and  $S'$  is a localizing system of  $\mathcal{D}'$ . If either of the following holds:

- For any  $s : X \rightarrow Y \in S$  and  $X \in \mathcal{D}'$ , there is a morphism  $t : Y \rightarrow Z$  that  $Z \in \mathcal{D}'$  and  $t \circ s \in S'$ .
- The same as in item1 but with arrows reversed.

Then the natural functor  $(S')^{-1}\mathcal{D}' \rightarrow S^{-1}\mathcal{D}$  is fully faithful.  $\lrcorner$

*Proof:* This is immediate from (4.1.1.62).  $\square$

### Quotients of Triangulated Categories

**Prop. (4.8.4.31) [Full Triangulated Subcategories and Localizing Systems].**

- If  $\mathcal{D}' \subset \mathcal{D}$  is a full triangulated subcategory, then

$$S = \{f : X \rightarrow Y \in \mathcal{D}' \mid \text{there exists a distinguished triangle } (X, Y, Z, f, g, h), Z \in \mathcal{D}'\}$$

is a localizing system compatible with the triangulated structure of  $\mathcal{D}$ . And  $S$  is saturated iff  $\mathcal{D}'$  is saturated.

- If  $S$  is a localizing system of  $\mathcal{D}$ , then  $\mathcal{D}' = \ker(\mathcal{D} \rightarrow S^{-1}\mathcal{D})$  (4.8.4.28)(4.8.4.24) is a saturated full triangulated subcategory of  $\mathcal{D}$ .

┘

*Proof:* 1: Cf. [Sta]05RH. □

**Def. (4.8.4.32) [Quotient Triangulated Categories].** Let  $\mathcal{B} \subset \mathcal{D}$  be a full triangulated subcategory, define the **quotient triangulated category**  $\mathcal{D}/\mathcal{B}$  as the localized triangulated category  $S^{-1}\mathcal{D}$ , where  $S$  is the localizing system associated to  $\mathcal{B}$  (4.8.4.31).

Moreover,  $\mathcal{D}/\mathcal{B}$  satisfies the following universal properties:

- If  $\mathcal{A} \in \text{AbCat}$  and  $H : \mathcal{D} \rightarrow \mathcal{A}$  is a cohomological functor s.t.  $\mathcal{B} \subset \ker(H)$ , then  $H$  factors uniquely through  $\mathcal{D}/\mathcal{B}$  by a functor  $H'$ , and  $H'$  is also a cohomological functor.
- If  $\mathcal{D}' \in \text{TriCat}$  and  $F : \mathcal{D} \rightarrow \mathcal{D}'$  is an exact functor s.t.  $\mathcal{B} \subset \ker(F)$ , then  $F$  factors uniquely through  $\mathcal{D}/\mathcal{B}$  by a functor  $F'$ , and  $F'$  is also an exact functor.

┘

*Proof:* The universal properties follow from the universal properties of localized triangulated categories (4.8.4.28) and the definition of  $S$  (4.8.4.31), using the long exact sequence or (4.8.4.15). □

**Prop. (4.8.4.33) [Saturation].** Let  $\mathcal{D}' \subset \mathcal{D}$  be a full triangulated subcategory, then the kernel of the quotient map  $\mathcal{D} \rightarrow \mathcal{D}/\mathcal{D}'$  (4.8.4.32) is a strictly full saturated subcategory consisting of objects  $Z \in \mathcal{D}$  that  $Z \oplus Z'$  is an object of  $\mathcal{D}'$  for some object  $Z' \in \mathcal{D}$ . In particular, it is the smallest saturated triangulated subcategory containing  $\mathcal{D}'$ , called the **saturation of  $\mathcal{D}'$** . ┘

*Proof:* The kernel is a strictly full saturated subcategory by (4.8.4.24). The description of the objects of kernel follows from the definition (4.8.4.32)(4.8.4.31) and (4.8.4.29). □

### Representability

References are [Triangulated Categories, Neeman] and [Brown Representation, Krause].

**Def. (4.8.4.34) [Generators].** Let  $\mathcal{D}$  be a triangulated category, a **generator of  $\mathcal{D}$**  is an object of  $\mathcal{D}$  s.t. for any object  $K$  of  $\mathcal{D}$ , there exists some integer  $n$  and a non-zero map  $E[n] \rightarrow K$ . ┘

**Prop. (4.8.4.35).** For  $\mathcal{T} \in \text{TriCat}$ , the compact objects of  $\mathcal{D}$  form a Karoubian, saturated, strictly full triangulated category of  $\mathcal{T}$ . ┘

*Proof:* Cf. [Sta]09QH. □

**Def. (4.8.4.36) [Compactly Generated Triangulated Categories].** Let  $\mathcal{D} \in \text{TriCat}$  with arbitrary small direct sums, then  $\mathcal{D}$  is said to be a **compactly generated triangulated category** if there exists a set of compact objects  $\{E_i\}$  that  $\bigoplus E_i$  is a generator of  $\mathcal{D}$  (4.8.4.34). ┘

**Thm. (4.8.4.37) [Brown’s Representability Theorem, Neeman[?Nee96]/Krause].** Suppose  $\mathcal{T} \in \mathbf{TriCat}$  has arbitrary small direct sums and is generated by a set of perfect objects, then a functor  $F : \mathcal{T} \rightarrow \mathcal{Ab}^{\mathrm{op}}$  is cohomological and transforms direct sums into products, then  $F$  is representable.

In particular, the hypothesis is satisfied when  $\mathcal{T}$  is compactly generated (4.8.4.36) (e.g. when  $\mathcal{T} = D(\mathcal{A})$  for some Grothendieck Abelian category  $\mathcal{A} \in \mathcal{AbCat}$ ).  $\lrcorner$

*Proof:* Cf. [Sta]0A8F, 0F5X or [Krause, A Brown representability theorem].  $\square$

**Cor. (4.8.4.38) [Adjointness Lemma].** Let  $\mathcal{T} \in \mathbf{TriCat}$  with arbitrary small direct sums that is compactly generated (4.8.4.36) and  $F : \mathcal{T} \rightarrow \mathcal{T}'$  an exact functor of triangulated categories that preserves direct sums, then  $F$  has an exact right adjoint.

The hypothesis is satisfied when  $\mathcal{T} = D(\mathcal{A})$  for some Grothendieck Abelian category  $\mathcal{A} \in \mathcal{AbCat}$ .  $\lrcorner$

*Proof:* By Brown’s representability theorem (4.8.4.37), for any  $Y \in \mathcal{T}'$ , there is an object  $G(Y) \in \mathcal{T}$  that represents the contravariant cohomological functor  $\mathcal{T} \rightarrow \mathcal{Ab} : X \mapsto \mathrm{Hom}_{\mathcal{T}'}(F(X), Y)$  (4.8.4.13). Then  $G$  is a functor by Yoneda’s lemma. It is exact by (4.8.4.10).  $\square$

**Prop. (4.8.4.39) [Vector Space Representability].** Let  $k \in \mathbf{Field}$  and  $\mathcal{D} \in \mathbf{TriCat}_k$  has direct sums and is compactly generated. Denote  $\mathcal{D}_c$  the subcategory of compact objects in  $\mathcal{D}$  (4.8.1.15). If  $H : \mathcal{D}_c^{\mathrm{op}} \rightarrow \mathcal{Vect}_k$  is a  $k$ -linear cohomological functor s.t.  $\dim_k(H(X)) < \infty$  for any  $X \in \mathcal{D}_c$ , then  $H = \mathcal{Y}_Y$  for some  $Y \in \mathcal{D}$ .  $\lrcorner$

*Proof:* Cf. [Sta]0FYG.  $\square$

## Serre Functors

References are [Representable functors, Serre functors, and mutations, Bondal].

**Def. (4.8.4.40) [Serre Functors].** Let  $k \in \mathbf{Field}$ ,  $\mathcal{A} \in \mathbf{TriCat}_k$  s.t.  $\dim_k \mathrm{Hom}(A, B) < \infty$  for any  $A, B \in \mathcal{A}$ , then a **Serre functor** on  $\mathcal{A}$  is defined to be an additive equivalence  $F : \mathcal{A} \cong \mathcal{A}$  s.t. there are functorial isomorphisms

$$\varphi_{E,G} : \mathrm{Hom}_{\mathcal{A}}(E, G) \cong \mathrm{Hom}_{\mathcal{A}}(E, F(G))^*$$

and the composition

$$(\varphi_{F(E), F(G)})^* \circ \varphi_{E,G} : \mathrm{Hom}(E, G) \rightarrow \mathrm{Hom}(E, F(G))^* \rightarrow \mathrm{Hom}(F(E), F(G))$$

coincides with the isomorphism induced by  $F$ .  $\lrcorner$

**Prop. (4.8.4.41).** Let  $k \in \mathbf{Field}$ ,  $\mathcal{A} \in \mathbf{TriCat}_k$  s.t.  $\dim_k \mathrm{Hom}(A, B) < \infty$  for any  $A, B \in \mathcal{A}$ , then

- Any Serre functor on  $\mathcal{A}$  is exact.
- A Serre functor on  $\mathcal{A}$  (4.8.4.40) is unique up to a graded natural isomorphism if it exists.  $\lrcorner$

*Proof:* Cf. [B-K89] ?  $\square$

## 5 Sibling Functors

**Def. (4.8.5.1) [Sibling Functors].** For  $\mathcal{A} \in \mathcal{AbCat}$ , two exact functors  $F, F' : D^b(\mathcal{A}) \rightarrow \mathcal{D}$  are called **sibling functors** if  $F|_{\mathcal{A}} \cong F'|_{\mathcal{A}}$  and  $F(K) \cong F'(K)$  for any  $K \in D^b(\mathcal{A})$ .  $\lrcorner$

## 6 T-Structures and Slicings

**Def. (4.8.6.1)[T-Structures].** A **T-structure** on a triangulated category  $\mathcal{D}$  (4.8.4.2) is a pair of strictly full subcategories  $\mathcal{D}^{\leq 0}$  and  $\mathcal{D}^{\geq 0}$  s.t. if we denote  $\mathcal{D}^{\leq n} = \mathcal{D}^{\leq 0}[-n]$  and  $\mathcal{D}^{\geq n} = \mathcal{D}^{\geq 0}[-n]$ , then

1. If  $A \in \mathcal{D}^{\leq 0}$  and  $B \in \mathcal{D}^{\geq 1}$ , then  $\text{Hom}(A, B) = 0$ .

2.  $\mathcal{D}^{\leq 0} \subset \mathcal{D}^{\leq 1}$ ,  $\mathcal{D}^{\geq 1} \subset \mathcal{D}^{\geq 0}$ .

3. For any  $E \in \mathcal{D}$ , there is a distinguished triangle  $(A, E, B)$  with  $A \in \mathcal{D}^{\leq 0}$  and  $B \in \mathcal{D}^{\geq 1}$ .

And  $\mathcal{D}$  is said to be **bounded w.r.t. this T-structure** iff each object in  $\mathcal{D}$  is contained in  $\mathcal{D}^{\geq a} \cap \mathcal{D}^{\leq b}$  for some  $a, b \in \mathbb{Z}$ .

We use the symbol  $(\mathcal{D}, \mathcal{D}^{\leq 0}, \mathcal{D}^{\geq 0}) \in t\text{-TriCat}$  or  $\mathcal{D} \in t\text{-TriCat}$  to denote that  $(\mathcal{D}, \mathcal{D}^{\leq 0}, \mathcal{D}^{\geq 0})$  is a triangulated category with the T-structure  $(\mathcal{D}^{\leq 0}, \mathcal{D}^{\geq 0})$ .  $\lrcorner$

**Def. (4.8.6.2) [Truncations].** For  $\mathcal{D} \in t\text{-TriCat}$  and  $E \in \mathcal{D}$ , by item3 of (4.8.6.1) there exists a distinguished triangle  $(A, E, B)$  with  $A \in \mathcal{D}^{\leq 0}$  and  $B \in \mathcal{D}^{\geq 1}$ . Then it follows from the long exact sequence (4.8.4.13) that for any  $X \in \mathcal{D}^{\leq 0}$ ,

$$\text{Hom}(X, A) \cong \text{Hom}(X, E).$$

In other words,  $A$  is initial w.r.t. morphisms from  $\mathcal{D}^{\leq 0}$  to  $E$ . Thus by using the axiom of choice, we can define a **truncation functor**

$$\tau_{\leq 0} : \mathcal{D} \rightarrow \mathcal{D}^{\leq 0}$$

right adjoint to the inclusion functor  $\mathcal{D}^{\leq 0} \subset \mathcal{D}$ .

Similarly, we can define the truncation functor

$$\tau_{\geq 0} : \mathcal{D} \rightarrow \mathcal{D}^{\geq 0}$$

left adjoint to the inclusion functor  $\mathcal{D}^{\geq 0} \subset \mathcal{D}$ . And by shifting, we can define all  $\tau_{\leq n}$  and  $\tau_{\geq n}$  for  $n \in \mathbb{Z}$ .

In particular, there are canonical **truncation distinguished triangles**

$$(\tau_{\leq n} E, E, \tau_{\geq n+1} E).$$

$\lrcorner$

**Prop. (4.8.6.3) [Orthogonality].** For  $\mathcal{D} \in t\text{-TriCat}$  and  $E \in \mathcal{D}, n \in \mathbb{Z}_+$ , the following are equivalent:

- $E \in \mathcal{D}^{\geq n+1}$ .
- $\text{Hom}(A, E) = 0$  for any  $A \in \mathcal{D}^{\leq n}$ .

$\lrcorner$

*Proof:* We may assume  $n = 0$ . And  $1 \rightarrow 2$  follows from the definition. For  $2 \rightarrow 1$ , it suffices to show that  $\tau_{\leq n} E = 0$ . For this, use the adjunction

$$\text{Hom}(\tau_{\leq 0} E, \tau_{\leq 0} E) = \text{Hom}(\tau_{\leq 0} E, E) = 0.$$

$\square$

**Cor. (4.8.6.4) [Extension Property].** Suppose  $(X, Y, Z)$  is a distinguished triangle and  $n \in \mathbb{Z}$ .

- If  $X, Z \in \mathcal{D}^{\leq n}$ , then  $Y \in \mathcal{D}^{\leq n}$ .
- If  $X \in \mathcal{D}^{\leq n}$  and  $Y \in \mathcal{D}^{\leq n+1}$ , then  $Z \in \mathcal{D}^{\leq n}$ .

┘

*Proof:* These follow from the orthogonality property above.  $\square$

**Cor. (4.8.6.5).** Let  $\mathcal{D} \in \text{TriCat}$  and  $\alpha, \beta$  are two T-structures s.t.  ${}^\alpha\mathcal{D}^{\leq 0} \subset {}^\beta\mathcal{D}^{\leq 0}$  and  ${}^\alpha\mathcal{D}^{\geq 0} \subset {}^\beta\mathcal{D}^{\geq 0}$ , then the two T-structures are the same.  $\square$

**Prop. (4.8.6.6) [Compatibility].** Let  $\mathcal{D}$  be a triangulated category with a T-structure, then for  $m, n \in \mathbb{Z}$ ,

$$\tau_{\geq m}(\mathcal{D}^{\leq n}) \subset \mathcal{D}^{\leq n}, \quad \tau_{\leq m}(\mathcal{D}^{\geq n}) \subset \mathcal{D}^{\geq n}.$$

And if  $m > n$ ,

$$\tau_{\geq m}(\mathcal{D}^{\leq n}) = \tau_{\leq n}(\mathcal{D}^{\geq m}) = 0.$$

┘

*Proof:* If  $m > n$  and  $X \in \mathcal{D}^{\leq n}$ , then  $\text{Hom}(X, \tau_{\geq m}(X)) = 0$ , and then by adjunction  $\text{Hom}(\tau_{\geq m}(X), \tau_{\geq m}(X)) = 0$ , so  $\tau_{\geq m}(X) = 0$ .

If  $m \leq n$  and  $X \in \mathcal{D}^{\leq n}$ , then there is a truncation distinguished triangle  $(\tau_{\leq m-1}X, X, \tau_{\geq m}X)$ , so it follows from the extension property 2 that  $\tau_{\geq m}X \in \mathcal{D}^{\leq n}$ .  $\square$

**Def. (4.8.6.7) [Cores].** For  $\mathcal{D} \in t\text{-TriCat}$ , the **core** of  $\mathcal{D}$  is defined to be the full subcategory

$$\mathcal{D}^\heartsuit \triangleq \mathcal{D}^{\geq 0} \cap \mathcal{D}^{\leq 0} \subset \mathcal{D}.$$

┘

**Prop. (4.8.6.8) [Cores are Abelian Categories].** If  $\mathcal{D} \in t\text{-TriCat}$ , then  $\mathcal{D}^\heartsuit$  is an Abelian category, and a sequence

$$0 \rightarrow X \xrightarrow{u} Y \xrightarrow{v} Z \rightarrow 0$$

in  $\mathcal{D}^\heartsuit$  is exact iff there exists some distinguished triangle  $(X[0], Y[0], Z[0], u, v, w)$  in  $\mathcal{D}$ .  $\square$

*Proof:* ?  $\square$

**Prop. (4.8.6.9).** For  $\mathcal{D} \in t\text{-TriCat}$  and  $X, Z \in \mathcal{D}^\heartsuit$ ,

$$\text{Ext}_{\mathcal{D}^\heartsuit}^1(Z, X) = \text{Hom}(Z, X[1]).$$

┘

*Proof:* ?  $\square$

**Prop. (4.8.6.10) [Core of Bounded T-structures].** Let  $\mathcal{D} \subset \text{TriCat}$  and  $\mathcal{A} \subset \mathcal{D}$  a full additive subcategory, then  $\mathcal{A}$  is the core of a bounded T-structure iff the following conditions are true:

- If  $k_1 > k_2 \in \mathbb{Z}$ , then  $\text{Hom}_{\mathcal{D}}(A[k_1], B[k_2]) = 0$  for any  $A, B \in \mathcal{A}$ .
- For any  $E \neq 0 \in \mathcal{D}$ , there is a finite sequence of integers  $k_1 > k_1 > \dots > k_n \in \mathbb{Z}$  and a collection of triangles

$$\begin{array}{ccccccc} 0 = E_0 & \xrightarrow{\quad} & E_1 & \longrightarrow & \dots & \longrightarrow & E_{n-1} & \xrightarrow{\quad} & E_n = E \\ & \swarrow \text{dotted} & \searrow & & & & \swarrow \text{dotted} & \searrow & \\ & & A_1 & & & & & & A_n \end{array}$$

with  $A_i \in \mathcal{A}[k_i]$  for any  $i \in [n]_+$ .

*Proof:* If  $\mathcal{A}$  is the core of a bounded T-structure, then clearly these two conditions are true. Conversely, these conditions suffice to verify the conditions in (4.8.6.1).  $\square$

**Def. (4.8.6.11)[Cohomology Functors].** For  $\mathcal{D} \in t\text{-TriCat}$  and  $n \in \mathbb{Z}$ , the  $n$ -th cohomology functor is defined to be

$$H^n : \mathcal{D} \rightarrow \mathcal{D}^\vee : X \mapsto \tau_{\leq 0} \tau_{\geq 0}(X[n]) = (\tau_{\leq n} \tau_{\geq n} X)[n].$$

### Slicings

**Def. (4.8.6.12)[Slicings].**

**Prop. (4.8.6.13).** Let  $\mathcal{P}$  be a slicing of a triangulated category  $\mathcal{D} \in \text{TriCat}$ , then for any interval  $I \subset \mathbb{R}$  of length  $< 1$ , the full subcategory  $\mathcal{P}(I) \subset \mathcal{D}$  is quasi-Abelian.

## 7 Chain Complexes

**Def. (4.8.7.1)[Chain Complexes].** A **chain complex** over an additive category  $\mathcal{A}$  is  $?$ . The category of complexes over  $\mathcal{A}$  is denoted by  $\text{Ch}^{\mathbb{Z}}(\mathcal{A})$ .

**Prop. (4.8.7.2).** For any Abelian category  $\mathcal{A}$ ,  $\text{Ch}^{\mathbb{Z}}(\mathcal{A})$  is an Abelian category.

**Prop. (4.8.7.3).** The natural inclusion  $\mathcal{A} \subset \text{Ch}^{\mathbb{Z}}(\mathcal{A})$  embeds  $\mathcal{A}$  as a full subcategory of  $\text{Ch}^{\mathbb{Z}}(\mathcal{A})$ , and  $H^0$  is just the left adjoint.

An object  $K \in \text{Ch}^{\mathbb{Z}}(\mathcal{A})$  is called **discrete** if it is in the essential image of this embedding.

**Def. (4.8.7.4)[Shifting of Complexes].** For  $\mathcal{A} \in \text{AddCat}$ , there is a **shifting of complex functor**  $[1] : \text{Ch}^{\mathbb{Z}}(\mathcal{A}) \rightarrow \text{Ch}^{\mathbb{Z}}(\mathcal{A})$  s.t. for  $K^\bullet \in \text{Ch}^{\mathbb{Z}}(\mathcal{A})$ ,

$$K^\bullet[1]_n = K^\bullet_{n+1}, \quad d_{K^\bullet[1]}^n = -d_{K^\bullet}^{n+1}.$$

**Def. (4.8.7.5)[Truncation of Complexes].** Let  $\mathcal{A}$  be an Abelian category and  $A^\bullet \in \text{Ch}^{\mathbb{Z}}(\mathcal{A})$ , there are several ways to truncate  $A^\bullet$ :

- The **stupid truncation**  $\sigma_{\leq n} A = \dots \rightarrow A_{n-1} \rightarrow A_n \rightarrow 0 \rightarrow \dots$ . There is a morphism  $A \rightarrow \sigma_{\leq n} A$ .
- The stupid truncation  $\sigma_{\geq n} A = \dots \rightarrow 0 \rightarrow A_n \rightarrow A_{n+1} \rightarrow \dots$ . There is a morphism  $\sigma_{\geq n} A \rightarrow A$ .
- The **canonical truncation**  $\tau_{\leq n} A = \dots \rightarrow A_{n-1} \rightarrow \ker(d_n) \rightarrow 0 \rightarrow \dots$ . There is a natural morphism  $\tau_{\leq n} A \rightarrow A$  that induces isomorphism on cohomology groups on degree  $\leq n$ .
- The canonical truncation  $\tau_{\geq n} A = \dots \rightarrow 0 \rightarrow \text{Coker}(d_{n-1}) \rightarrow A_{n+1} \rightarrow \dots$ . There is a natural morphism  $A \rightarrow \tau_{\geq n} A$  that induces isomorphism on cohomology groups on degree  $\geq n$ .

**Cor. (4.8.7.6).** There are exact sequences of complexes

$$0 \rightarrow \tau_{\leq n} A^\bullet \rightarrow A^\bullet \rightarrow \tau_{\geq n+1} A^\bullet \rightarrow 0$$

$$0 \rightarrow \sigma_{\geq n+1} A^\bullet \rightarrow A^\bullet \rightarrow \sigma_{\leq n} A^\bullet \rightarrow 0$$

**Def. (4.8.7.7)[Cone & Cylinder].** The **mapping cone** of  $f : K^\bullet \rightarrow L^\bullet$  is the complex  $C(f)^\bullet$  that:

$$C(f) = K[1]^\bullet \oplus L^\bullet, \quad d(k^{i+1}, l^i) = (-d_K k^{i+1}, f(k^{i+1}) + d_L l^i)$$

The **mapping cylinder** of  $f : K^\bullet \rightarrow L^\bullet$  is the complex  $\text{Cyl}(f)$  that:

$$\text{Cyl}(f) = K^\bullet \oplus K[1]^\bullet \oplus L^\bullet, \quad d(k^i, k^{i+1}, l^i) = (d_K k^i - k^{i+1}, -d_K k^{i+1}, f(k^{i+1}) + d_L l^i)$$

It is a shame I haven't see clearly the similarity of this with the topological cone and cylinder, should study it further.  $\perp$

**Def. (4.8.7.8)[Double Complexes].** A **double complex** over an Abelian category is a complex over  $\text{Comp}(\mathcal{A})$  (4.8.7.2).  $\perp$

**Def. (4.8.7.9)[Totalization].** Given a double complex  $K^{\bullet,\bullet}$  over an Abelian category  $\mathcal{A}$ , the associated **total complexes** is defined to be

$$\begin{aligned} (\text{Tot}^\Pi(K))^n &= \prod_{n=p+q} K^{p,q}, & d^n &= \prod_{n=p+q} (d_1^{p,q} + (-1)^p d_2^{p,q}) \\ (\text{Tot}^\oplus(K))^n &= \bigoplus_{n=p+q} K^{p,q}, & d^n &= \sum_{n=p+q} (d_1^{p,q} + (-1)^p d_2^{p,q}) \end{aligned}$$

$\perp$

**Def. (4.8.7.10)[Hom Complexes].** Let  $\mathcal{A}$  be an Abelian category and  $P^\bullet, Q^\bullet \in K(\mathcal{A})$ , we define **Hom complex**  $\text{Hom}^\bullet(P^\bullet, Q^\bullet)$  to be

$$\text{Hom}^n(P^\bullet, Q^\bullet) = \prod \text{Hom}_i(P^i, Q^{n+i}),$$

with the differential giving by  $d(\{f_k\})_i = \{df_i - (-1)^i f_{i+1}d\}$  and suitable signatures.

It is clear that  $H^n(\text{Hom}^\bullet(P^\bullet, Q^\bullet)) = \text{Hom}_{K(\mathcal{A})}(P^\bullet, Q^\bullet[n])$ .  $\perp$

### Homotopy Category $K(\mathcal{A})$

**Def. (4.8.7.11)[Homotopies of Complexes].**  $\perp$

**Def. (4.8.7.12)[ $K(\mathcal{A})$ ].** Let  $\mathcal{A}$  be an additive category, the **homotopy category of complexes**  $K(\mathcal{A})$  is the category whose objects are complexes in  $\mathcal{A}$  and whose morphisms are homotopy classes of morphism between complexes.  $\perp$

**Prop. (4.8.7.13)[Distinguished Triangle of  $K^*(\mathcal{A})$ ].** For any morphism  $K^\bullet \rightarrow L^\bullet$ , there exists a termwise-splitting exact sequence of Complexes commuting in  $K(\mathcal{A})$ .

$$\begin{array}{ccccccc} K^\bullet & \longrightarrow & L^\bullet & & & & \\ \parallel & & \downarrow \alpha & & & & \\ 0 & \longrightarrow & K^\bullet & \longrightarrow & \text{Cyl}(f) & \longrightarrow & C(f) \longrightarrow 0 \\ & & & & \downarrow \beta & & \parallel \\ & & 0 & \longrightarrow & L^\bullet & \longrightarrow & C(f) \longrightarrow K^\bullet[1] \longrightarrow 0 \end{array}$$

where  $\beta\alpha = \text{id}$  and  $\alpha\beta \sim \text{id}$ . And  $K^\bullet \rightarrow L^\bullet \rightarrow C(f) \rightarrow K^\bullet[1]$  is called a distinguished triangle. Any exact triple of complexes in  $\text{Kom}(\mathcal{A})$  is quasi-isomorphic to a distinguished triangle. In fact, we can define the distinguished triangle in  $K(\mathcal{A})$  as that induced by a split exact sequence, Cf.[Sta]014L.

Notice all this can imitate the similar parallel construction in the category of topological spaces.

$\perp$

*Proof:* Cf.[Gelfand P157] □

**Cor.(4.8.7.14)[Long Exact Sequences].** A distinguished triangle will induce a long exact sequence of cohomology groups, for this, just need to verify that the  $\delta$ -homomorphism and the morphism  $C(f) \rightarrow K^\bullet[1]$  induce the same map of cohomology groups. ┘

**Cor.(4.8.7.15).** A morphism of complexes  $f : K^\bullet \rightarrow L^\bullet$  is quasi-iso iff  $C(f)$  is acyclic. It is homotopic to 0 iff  $f$  can be extended to a morphism  $C(f) \rightarrow L$ . ┘

**Prop.(4.8.7.16)[ $K(\mathcal{A})$  is Triangulated].** If  $\mathcal{A}$  is an additive category, then  $K^*(\mathcal{A}) \in \text{TriCat}(4.8.4.2)$ , with shifting functors defined in(4.8.7.4) and distinguished triangles defined in(4.8.7.13).

And an additive functor will induce exact functor between  $K^*$  because distinguished is split. ┘

*Proof:* Cf.[Sta]014S. or [Gelfand P246]. □

**Prop.(4.8.7.17).** An additive functor  $F : \mathcal{A} \rightarrow \mathcal{B}$  between additive categories induces an exact functor  $K(\mathcal{A}) \rightarrow K(\mathcal{B})$ . Moreover, this functor maps quasi-isomorphisms to quasi-isomorphisms(4.8.8.1). ┘

*Proof:* Cf.[Sta]014X. □

**Def.(4.8.7.18)[Bounded Subcategories].** ┘

**Prop.(4.8.7.19).** Let  $\mathcal{A}$  be an Abelian category,

- If  $A^\bullet \subset K^+(\mathcal{A})$ , then  $\tau_{\leq n}(A^\bullet) \rightarrow A^\bullet$  is a quasi-isomorphism for  $n$  sufficiently large.
  - If  $A^\bullet \subset K^-(\mathcal{A})$ , then  $A^\bullet \rightarrow \tau_{\geq n}A^\bullet$  is a quasi-isomorphism for  $n$  sufficiently small.
- ┘

## Unbounded Complexes

**Lemma(4.8.7.20)[Left Resolutions of Unbounded Complexes].** Let  $\mathcal{A}$  be an Abelian category and  $\mathcal{P}$  be a subset of objects of  $\mathcal{A}$ . Assume that every object of  $\mathcal{A}$  is a quotient of an object of  $\mathcal{P}$ , then for any complex  $K^\bullet$ , there exists a commutative diagram

$$\begin{array}{ccccccc} P_1^\bullet & \longrightarrow & P_2^\bullet & \longrightarrow & \dots & & \\ \downarrow & & \downarrow & & & & \\ \tau_{\leq 1}K^\bullet & \longrightarrow & \tau_{\leq 2}K^\bullet & \longrightarrow & \dots & & \end{array}$$

where the vertical arrows are quasi-isomorphisms, and each  $P_n^\bullet$  is a bounded above complex with terms in  $\mathcal{P}$ , and each  $P_n^\bullet \rightarrow P_{n+1}^\bullet$  are termwise-split injections and the cokernel is also a complex with terms in  $\mathcal{P}$ . ┘

*Proof:* Cf.[Sta]06XX. □

## 8 Cohomology of Complexes

**Def.(4.8.8.1)[Quasi-isomorphism].** ┘

**Prop.(4.8.8.2)[Five lemma].** In an Abelian category, if there is a diagram

$$\begin{array}{ccccccccc} * & \longrightarrow & * & \longrightarrow & * & \longrightarrow & * & \longrightarrow & * \\ \downarrow s & & \downarrow g & & \downarrow f & & \downarrow h & & \downarrow i \\ * & \longrightarrow & * & \longrightarrow & * & \longrightarrow & * & \longrightarrow & * \end{array}$$

Where the rows are exact and  $g, h$  are isomorphisms. If  $i$  is injective, then  $f$  is surjective; if  $s$  is surjective, then  $f$  is injective. ┘

*Proof:* Rotate the diagram counterclockwise  $90^\circ$ . Then use the two different filtration both converge (4.10.7.8).  $\square$

**Prop. (4.8.8.3)[Snake lemma].** In an Abelian category, if there is a diagram

$$\begin{array}{ccccccc} & & * & \xrightarrow{i} & * & \longrightarrow & * \longrightarrow 0 \\ & & \downarrow f & & \downarrow g & & \downarrow h \\ 0 & \longrightarrow & * & \longrightarrow & * & \xrightarrow{s} & * \end{array}$$

where the rows are exact, then there is a long exact sequence

$$\ker f \rightarrow \ker g \rightarrow \ker h \rightarrow \operatorname{Coker} f \rightarrow \operatorname{Coker} g \rightarrow \operatorname{Coker} h$$

And if  $i$  is injective, then the first one is injective; if  $s$  is surjective, then the last one is surjective.  $\lrcorner$

*Proof:* Rotate the diagram counterclockwise  $90^\circ$ . Then use the two different filtration both converge (4.10.7.8).  $\square$

**Cor. (4.8.8.4).** In an Abelian category, if  $f : A \rightarrow B, g : B \rightarrow C$ , then there is a long exact sequence:

$$0 \rightarrow \ker f \rightarrow \ker gf \rightarrow \ker g \rightarrow \operatorname{Coker} f \rightarrow \operatorname{Coker} gf \rightarrow \operatorname{Coker} g \rightarrow 0.$$

$\lrcorner$

*Proof:* Use snake lemma(as modules), there is a diagrams:

$$\begin{array}{ccccccc} & & A & \xrightarrow{f} & B & \longrightarrow & \operatorname{Coker} f \longrightarrow 0 \\ & & \downarrow gf & & \downarrow g & & \downarrow \\ 0 & \longrightarrow & C & = & C & \longrightarrow & 0 \end{array}$$

So by Snake lemma,

$$\ker gf \rightarrow \ker g \rightarrow \operatorname{Coker} f \rightarrow \operatorname{Coker} gf \rightarrow \operatorname{Coker} g \rightarrow 0.$$

As Abelian category is dual, we can do this dually to get:

$$0 \rightarrow \ker f \rightarrow \ker gf \rightarrow \ker g \rightarrow \operatorname{Coker} f \rightarrow \operatorname{Coker} gf.$$

They splint together to get the desired long exact sequence.  $\square$

**Prop. (4.8.8.5).** For a  $3 \times 3$  diagram of complexes, the connection homomorphism satisfies an anti-commutative diagram:

$$\begin{array}{ccc} H^{q-1}(Z'') & \xrightarrow{\delta} & H^q(X'') \\ \downarrow \delta & & \downarrow -\delta \\ H^q(Z) & \xrightarrow{\delta} & H^{q+1}(X) \end{array}$$

by (4.8.4.16) as the category  $K(\mathcal{A})$  is triangulated.  $\lrcorner$

**Prop. (4.8.8.6)[Universal Coefficient Theorem].** Should be somewhere in [Weibel].  $\lrcorner$

**Def. (4.8.8.7) [Herbrand Quotient].** For a complex of  $R$ -modules cyclic of order 2, we define the **additive Herbrand quotient** as  $\text{length}_R(H^0) - \text{length}_R(H^1)$ , when both are definable and the **multiplicative Herbrand quotient** as  $|H^0|/|H^1|$  when they are both finite.  $\lrcorner$

**Prop. (4.8.8.8).** For an exact sequence  $0 \rightarrow M \rightarrow N \rightarrow K \rightarrow 0$  of complexes of cyclic order 2, we have  $h(N) = h(M) + h(K)$  and  $h^*(N) = h^*(M)h^*(K)$  in the sense that if two of them are definable, then so is the third. This is an easy consequence of long exact sequence.  $\lrcorner$

**Prop. (4.8.8.9).** If each term of this complex has finite length, then  $h(M) = 0$ . If each term is finite, then  $h^*(M) = 0$ . This is a consequence of isomorphism theorem. So we have, if a morphism of complexes has kernel and cokernel finite, then it induces an isomorphism on  $h$  or  $h^*$ .  $\lrcorner$

*Proof:*

$\square$

## 9 Injectives & Projectives

**Remark (4.8.9.1).** The use of injection resolutions can be replaced by the use of  $\infty$ -categories. ??  $\lrcorner$

**Def. (4.8.9.2) [Injective Objects].** An **injective object** in a Abelian category is a  $I$  s.t.  $\text{Hom}(-, I)$  is an exact functor, equivalently, maps to  $I$  can be extended along injections.

A **projective object** in a Abelian category is a  $I$  s.t.  $\text{Hom}(I, -)$  is an exact functor, equivalently, maps to  $I$  can be pulled back along surjections.  $\lrcorner$

**Prop. (4.8.9.3).** Product of injective elements are injective, sums of projective elements are projective.  $\lrcorner$

**Prop. (4.8.9.4).** In an Abelian category, the direct summand of a projective object is projective. (The summand has definition in an Abelian category).  $\lrcorner$

**Prop. (4.8.9.5).** If a functor  $f$  between Abelian categories is left adjoint to an exact functor, then it preserves injectives. Dually for projectives.  $\lrcorner$

**Prop. (4.8.9.6).** If  $A$  is an Abelian category, the chain complex category  $Ch(A)$  is abelian by (4.8.3.9). A chain complex  $P$  is projective iff it is a split exact complex of projective objects. The same is true by dual argument for injectives.  $\lrcorner$

*Proof:* If  $K$  is projective, use the surjection  $C(\text{id}_K) \rightarrow K[1]$ , there is a homotopy between  $\text{id}_K$  and 0. Thus we have  $x = dhx + hdx$ . And if  $dhx = hdy$ , then  $dhd y = 0$ , thus  $dy = 0$ , so  $K = dhK \oplus hdK$  and thus  $K[n] = B_n \oplus B_{n+1}$ . Thus  $K$  is a direct product of  $0 \rightarrow B \rightarrow B \rightarrow 0$ . And this one is projective if  $B$  is projective.  $\square$

**Prop. (4.8.9.7) [Check Injectives].** In a Grothendieck Abelian category with generator  $U$ , an object is injective iff it is extendable over subobjects of  $U$ . (AB5 assures we can extend by Zorn's lemma. Then use GEN, Cf. [Sta]079G ?). If it is a family of objects, it suffices to extend over each one of them.  $\lrcorner$

*Proof:*

$\square$

### Injective Resolutions

**Prop. (4.8.9.8) [Horseshoe Lemma].** For an exact sequence  $0 \rightarrow X_1 \rightarrow X \rightarrow X_2 \rightarrow 0$  and an injective resolution of  $X_1$  and  $X_2$ , there is an injective resolution of  $X$  commuting with them. (Choose them one-by-one, in fact,  $I_n = I_n^1 \oplus I_n^2$  using the injectivity of  $I_n^1$ . Snake lemma told us that the cokernel is an exact sequence, use that to define the next one.  $\lrcorner$

**Prop. (4.8.9.9).** For two liftings of morphisms  $X_1 \rightarrow Y_1$  and  $X_2 \rightarrow Y_2$ , there is a lifting of the morphism  $X \rightarrow Y$  compatible with that. Cf. [Weibel P2.4.6].  $\lrcorner$

**Prop. (4.8.9.10) [Cartan-Eilenberg Resolution].** For a complex  $K \in K^+(\mathcal{A})$ , a **Cartan-Eilenberg resolution** of  $K$  consists of a 2-complex  $I^{\bullet, \bullet}$  and a map of complexes  $K \rightarrow I^{\bullet, 0}$  that the induced complexes:

$$\begin{aligned} 0 \rightarrow K^i \rightarrow I^{i,0} \rightarrow I^{i,2} \rightarrow \dots \\ 0 \rightarrow B^i(K) \rightarrow B_x^i(I^{\bullet,0}) \rightarrow B_x^i(I^{\bullet,1}) \rightarrow \dots \\ 0 \rightarrow Z^i(K) \rightarrow Z_x^i(I^{\bullet,0}) \rightarrow Z_x^i(I^{\bullet,1}) \rightarrow \dots \\ 0 \rightarrow H^i(K) \rightarrow B_x^i(I^{\bullet,0}) \rightarrow H_x^i(I^{\bullet,1}) \rightarrow \dots \end{aligned}$$

are all injective resolutions, and the exact sequences

$$\begin{aligned} 0 \rightarrow B_x^i(I^{\bullet,j}) \rightarrow Z_x^i(I^{\bullet,j}) \rightarrow H_x^i(I^{\bullet,j}) \rightarrow 0 \\ 0 \rightarrow Z_x^i(I^{\bullet,j}) \rightarrow I^{\bullet,j} \rightarrow Z_x^i(I^{\bullet,j}) \rightarrow 0 \end{aligned}$$

split.

Then if  $\mathcal{I}_{\mathcal{B}}$  is sufficiently large, for any  $K$  in  $K(\mathcal{B})$  there is a Cartan-Eilenberg resolution.  $\lrcorner$

*Proof:* Cf. [Gelfand P210], [Weibel P146]. ?  $\square$

**Cor. (4.8.9.11).** For a CE resolution of a complex  $K \in K^+(\mathcal{B})$ , the spectral sequence can be applied and shows  $K \rightarrow \text{Tot}(L)$  is a quasi-isomorphism, i.e.  $\text{Tot}(L)$  is an injective resolution of  $K$ .  $\lrcorner$

**Cor. (4.8.9.12) [Functoriality of Cartan-Eilenberg Resolution].** If  $f : A \rightarrow B$  is a chain map and  $A \rightarrow P, B \rightarrow Q$  are Cartan-Eilenberg resolutions, then there is a double complex map  $\tilde{f} : P \rightarrow Q$  extending  $f$ . And if  $f$  is homotopic to  $g$ , then  $\tilde{f}$  is homotopic to  $\tilde{g}$ . In other words, we have a functor  $K(\mathcal{A}) \rightarrow K(\mathcal{I}_{\mathcal{A}}^{\bullet, \bullet})$

In particular, for any two Cartan-Eilenberg resolutions  $P, Q$  of  $A$  and an additive functor  $F$ , the chain complex  $\text{Tot}^{\Pi}(F(P))$  and  $\text{Tot}^{\Pi}(F(Q))$  are chain homotopy equivalent.  $\lrcorner$

**Def. (4.8.9.13) [Injective Amplitude].** Let  $\mathcal{A}$  be an Abelian category with sufficiently injectives, then  $K \in D(\mathcal{A})$  is said to have **finite injective dimension** if  $K \subset D^b(\mathcal{I}_{\mathcal{A}})$ . It is said to have **injective amplitude** in  $[a, b]$  iff  $K \subset D^{[a,b]}(\mathcal{I}_{\mathcal{A}})$ .  $\lrcorner$

**Prop. (4.8.9.14).** Suppose  $\mathcal{A}^{\bullet} \rightarrow \mathcal{I}^{\bullet}$  is an injective resolution of sheaves on  $(\mathcal{C}, \mathcal{O})$ , then the induced map of presheaves with values in  $D_{\infty}(\mathbb{Z})$ :

$$|\mathcal{A}^{\bullet}| \rightarrow |\mathcal{I}^{\bullet}|$$

identifies  $|\mathcal{I}^{\bullet}|$  with the shiftification of  $|\mathcal{A}^{\bullet}|$ .  $\lrcorner$

*Proof:* ?  $\square$

## 10 Tensor Category Case

In this subsection we consider complexes over a tensor category (4.2.1.2)  $\mathcal{A}$ .

**Lemma (4.8.10.1) [Koszul Sign Rule].** There is an isomorphism of complexes

$$\sigma : C^\bullet \otimes D^\bullet \rightarrow D^\bullet \otimes C^\bullet : \sigma(x \otimes y) = (-1)^{mn} y \otimes x$$

where  $x \in C^m$  and  $y \in D^n$ . ┘

*Proof:*

$$\partial(\sigma(x \otimes y)) = \partial((-1)^{mn} y \otimes x) = (-1)^{mn} (\partial y \otimes x) + (-1)^{mn+n} (y \otimes \partial x) = (-1)^n \sigma(x \otimes \partial y) + \sigma(\partial x \otimes y) = \sigma(\partial(x \otimes y))$$

□

**Prop. (4.8.10.2) [Commutative Monoidal Structure on  $\text{Ch}^{\mathbb{Z}}(\mathcal{A})$ ].** The functor

$$\text{Ch}^{\mathbb{Z}}(\mathcal{A}) \times \text{Ch}^{\mathbb{Z}}(\mathcal{A}) \rightarrow \text{Ch}^{\mathbb{Z}}(\mathcal{A}) : (C^\bullet, D^\bullet) \mapsto \text{Tot}^\oplus(C^\bullet \otimes D^\bullet)$$

endows  $\text{Ch}^{\mathbb{Z}}(\mathcal{A})$  with a (non-strict) commutative monoidal structure. ┘

*Proof:* Commutativity follows from (4.8.10.1). Associativity follows from the definition of totalization (4.8.7.9). □

**Prop. (4.8.10.3) [Commutative Monoidal Structure on  $K^*(\mathcal{A})$ ].** This monoidal functor descends to a strict monoidal structure on  $K^*(\mathcal{A})$ . ┘

*Proof:* □

**Prop. (4.8.10.4) [Tensoring is Exact].** Let  $L^\bullet \in K(\mathcal{A})$ , then tensoring functor  $\text{Tot}^\oplus(- \oplus L^\bullet)$  is an exact functor between triangulated categories. ┘

*Proof:* □

**Prop. (4.8.10.5).** An  $R$ -module  $I$  is injective iff for any injective homomorphism from  $I$  to any  $R$ -module splits. ┘

*Proof:* The critical point is that we can always embed  $I$  to an injective hull  $J$  by (4.8.3.23), then  $J = I \oplus J'$ , so  $I$  is clearly injective. □

**Prop. (4.8.10.6) [K-Injective under Change of Rings].** If  $R \rightarrow S$  is a ring map, then

1. If  $R \rightarrow S$  is flat and  $I^\bullet$  is a  $K$ -injective complex of  $S$ -modules, then  $I^\bullet$  is  $K$ -injective as a complex of  $R$ -modules.
2. If  $R \rightarrow S$  is surjective and  $I^\bullet$  is a complex of  $S$ -modules that is  $K$ -injective as a complex of  $R$ -modules, then it is  $K$ -injective as a complex of  $S$ -modules.
3. If  $I^\bullet$  is a  $K$ -injective complex of  $R$ -modules, then  $\text{Hom}_R(S, I^\bullet)$  is  $K$ -injective as a complex of  $S$ -modules.

┘

*Proof:* 1: This is because  $\text{Hom}_{K(R)}(M^\bullet, I^\bullet) = \text{Hom}_{K(S)}(M^\bullet \otimes_R S, I^\bullet)$  and (4.10.2.1), as tensoring  $S$  is exact.

2: This is because  $\text{Hom}_{K(R)}(N^\bullet, I^\bullet) = \text{Hom}_{K(S)}(N^\bullet, I^\bullet)$  for a complex of  $S$ -modules  $N^\bullet$  and (4.10.2.1).

3: This is because  $\text{Hom}_{K(S)}(N^\bullet, \text{Hom}_R(S, I^\bullet)) = \text{Hom}_{K(R)}(N^\bullet, I^\bullet)$ , and (4.10.2.1). □

## 4.9 Stable $\infty$ -Categories

References are [nLab], [Lur11]

**Notation(4.9.0.1).**

- Use notations defined in  $\infty$ -Categories.

┘

### 1 Stable $\infty$ -Categories

**Def.(4.9.1.1) [Zero Objects].** A **zero object** in an  $\infty$ -category is an object that is both initial and final. A **pointed  $\infty$ -category** is an  $\infty$ -category with a zero object.

In a pointed  $\infty$ -category  $\mathcal{C}$ , the subcategory of zero objects is a trivial Kan complex. And for any  $x, y \in \mathcal{C}$ ,  $\text{Map}(x, y)$  (4.7.1.20) is a trivial Kan complex, by (4.5.8.3) and (4.7.1.21). So there is a **zero morphism**  $0 : x \rightarrow y$  that is unique up to contractible choice.

┘

**Def.(4.9.1.2) [ $\infty$ -Category of Pointed Objects].** For  $\mathcal{C} \in \text{Cat}_\infty$  with a final object  $*$ , denote  $\mathcal{C}^{\text{pt}} = \mathcal{C}_{*/}$ , called the  **$\infty$ -category of pointed objects** in  $\mathcal{C}$ . Then  $\mathcal{C}_*$  is pointed, and there is a map  $(-)_- : \mathcal{C}_* \rightarrow \mathcal{C}$ , and there is also a map  $(-)_+ : \mathcal{C} \rightarrow \mathcal{C}_*$  given by adding a final object. Then we have an adjunction between  $\infty$ -categories:

$$(-)_+ : \mathcal{C} \rightleftarrows \mathcal{C}^{\text{pt}} : (-)_-$$

┘

*Proof:*

□

**Prop.(4.9.1.3).** Let  $\mathcal{C}$  be a pointed presentable  $\infty$ -category, then evaluation at  $S^0 \in \text{Grpd}_\infty^{\text{pt}}$  induces an equivalence of  $\infty$ -categories

$$\text{Func}^L(\text{Grpd}_\infty^{\text{pt}}, \mathcal{C}) \cong \mathcal{C}.$$

┘

*Proof:*

□

**Def.(4.9.1.4) [Triangles in  $\infty$ -Categories].** A **triangle** is a pointed  $\infty$ -category  $\mathcal{C}$  is a diagram

$$\tau : \Delta^1 \times \Delta^1 \rightarrow \mathcal{C} : \begin{array}{ccc} x & \longrightarrow & y \\ \downarrow & \searrow & \downarrow \\ 0 & \longrightarrow & z \end{array}$$

where  $0$  is a zero object. It is called a **fiber sequence** if this diagram is a pullback diagram, and called a **cofiber sequence** if this diagram is a pushout diagram. Denote  $\text{Tri}(\mathcal{C}) \subset \text{Func}(\Delta^1 \times \Delta^1, \mathcal{C})$  the full sub- $\infty$ -category of triangles.

┘

**Def.(4.9.1.5) [Cofiber Maps and Fiber Maps].** If  $\mathcal{C}$  is a pointed  $\infty$ -category which admits cofibers, then by (4.7.3.16) and (4.7.3.17), there is a **fiber sequence map**

$$\text{Cof} : \text{Func}(\Delta^1, \mathcal{C}) \rightarrow \text{Func}(\Delta^1 \times \Delta^1, \mathcal{C}).$$

unique up to contractible choice. And its composition with  $ev_{(1,1)}$  is also denoted by  $\Sigma : \text{Func}(\Delta^1, \mathcal{C}) \rightarrow \mathcal{C}$ . The dual is true for fibrations.

┘

**Prop. (4.9.1.6) [Cofiber Map Preserves Colimits].** If  $\mathcal{C}$  is a pointed  $\infty$ -category which admits cofibers, choose a zero object  $0$ , then any  $\text{Cof} : \text{Func}(\Delta^1, \mathcal{C}) \rightarrow \mathcal{C}$  is left adjoint to a functor  $\mathcal{C} \rightarrow \mathcal{C}_{0/} \rightarrow \text{Func}(\Delta^1, \mathcal{C})$  which maps each  $C \in \mathcal{C}$  to a morphism  $0 \rightarrow C$ . In particular,  $\text{Cof}$  preserves small colimits by (4.7.4.5). Dually,  $\text{Fib}$  preserves small limits.  $\lrcorner$

*Proof:*  $\square$

**Def. (4.9.1.7) [Suspension and Loop Diagrams].** For  $\mathcal{C} \in \text{Cat}_\infty$ , denote  $\mathcal{C}^\Sigma \subset \text{Func}(\Delta^1 \times \Delta^1, \mathcal{C})$  the full  $\infty$ -subcategory of cofiber sequences of the form

$$\tau : \Delta^1 \times \Delta^1 \rightarrow \mathcal{C} : \begin{array}{ccc} x & \longrightarrow & 0' \\ \downarrow & \searrow & \downarrow \\ 0 & \longrightarrow & z \end{array}$$

where  $0, 0'$  are zero objects.

Dually, define  $\mathcal{C}^\Omega \subset \text{Func}(\Delta^1 \times \Delta^1, \mathcal{C})$  the full  $\infty$ -subcategory of exact triangles of the form

$$\tau : \Delta^1 \times \Delta^1 \rightarrow \mathcal{C} : \begin{array}{ccc} x & \longrightarrow & 0' \\ \downarrow & \searrow & \downarrow \\ 0 & \longrightarrow & z \end{array}$$

where  $0, 0'$  are zero objects.  $\lrcorner$

**Def. (4.9.1.8) [Suspension Functors and Loop Functors].** If  $\mathcal{C} \in \text{Cat}_\infty$  is a pointed  $\infty$ -category with admits cofibers, then same argument as in (4.9.1.5) shows that  $\mathcal{C}^\Sigma \rightarrow \mathcal{C}$  is a trivial Kan fibration, so there is a section  $\Sigma : \mathcal{C} \rightarrow \mathcal{C}^\Sigma$ , called a **suspension functor**. And its composition with  $ev_{(1,1)}$  is also denoted by  $\Sigma : \mathcal{C} \rightarrow \mathcal{C}$ .

Dually, if  $\mathcal{C}$  is a pointed  $\infty$ -category which admits fibers, we can define **loop functors**. If  $\mathcal{C}$  admits both fibers and cofibers, for  $C \in \mathcal{C}$  and  $n \in \mathbb{N}$ , denote  $X[n] = \Sigma^n(X)$ ,  $X[-n] = \Omega^n(X)$ .  $\lrcorner$

**Def. (4.9.1.9) [Stable  $\infty$ -Category].** A **stable  $\infty$ -category** is a pointed  $\infty$ -category  $(\mathcal{C}, 0)$  s.t.

- $\mathcal{C}$  admits cofibers and fibers.
- A triangle in  $\mathcal{C}$  is a fiber sequence iff it is a cofiber sequence.

Notice that  $\mathcal{C}$  is stable iff  $\mathcal{C}^{\text{op}}$  is stable.  $\lrcorner$

**Prop. (4.9.1.10).** If  $\mathcal{C}$  is a pointed category which admits both cofibers and fibers, then there is an adjunction

$$\Sigma : \text{Ho}(\mathcal{C}) \rightleftarrows \text{Ho}(\mathcal{C}) : \Omega.$$

And if  $\mathcal{C}$  is stable, they are mutually inverse to each other.  $\lrcorner$

*Proof:*  $\square$

**Prop. (4.9.1.11) [HA.1.1.3.4].** A stable  $\infty$ -category is complete and cocomplete. And pullback squares and pushout squares coincide.  $\lrcorner$

**Prop. (4.9.1.12).** Let  $\mathcal{C}$  be a pointed  $\infty$ -category, then the following are equivalent:

- $\mathcal{C}$  is stable.
- $\mathcal{C}$  admits finite colimits, and the suspension functor  $\Sigma : \mathcal{C} \rightarrow \mathcal{C}$  is an equivalence.
- $\mathcal{C}$  admits finite limits, and the loop functor  $\Omega : \mathcal{C} \rightarrow \mathcal{C}$  is an equivalence.

$\lrcorner$

*Proof:* Cf. [HA, 1.4.2.27].  $\square$

### Homological Algebra

**Prop. (4.9.1.13) [Homotopy Groups].** Let  $\mathcal{C}$  be a pointed  $\infty$ -category that admits cofibers, then for any  $X, Y \in \mathcal{C}$ , there is a bijection

$$\mathrm{Hom}_{\mathrm{Ho}(\mathcal{C})}(\Sigma^n(X), Y) \cong \pi_n \mathrm{Map}_{\mathcal{C}}(X, Y).$$

┘

*Proof:* ?

□

**Def. (4.9.1.14) [Ext Groups].** For a pointed  $\infty$ -category  $\mathcal{C}$  and  $X, Y \in \mathcal{C}$ , denote  $\mathrm{Ext}^n(X, Y) = \mathrm{Hom}_{\mathrm{Ho}(\mathcal{C})}(X[-n], Y)$  (4.9.1.8), called the  $n$ -th **Ext group**. ┘

**Prop. (4.9.1.15).** Let  $\mathcal{C}$  be a pointed  $\infty$ -category that admits cofibers, then any diagram

$$\begin{array}{ccc} X & \xrightarrow{f} & 0 \\ \downarrow & & \downarrow f' \\ 0' & \longrightarrow & Y \end{array}$$

in  $\mathcal{C}$  corresponds to a homotopy class of morphisms  $\theta \in \mathrm{Hom}_{\mathrm{Ho}(\mathcal{C})}(X[1], Y)$ . Then in this way, the diagram

$$\begin{array}{ccc} X & \xrightarrow{f'} & 0' \\ \downarrow & & \downarrow f' \\ 0 & \longrightarrow & Y \end{array}$$

corresponds to  $-\theta \in \mathrm{Hom}_{\mathrm{Ho}(\mathcal{C})}(X[1], Y)$ , where the group structure is given by (4.9.1.13). ┘

*Proof:* Cf. [Lur11]P25. □

**Lemma (4.9.1.16).** Let  $\mathcal{C}$  be a pointed  $\infty$ -category that admits cofibers, and the suspension functor  $\Sigma$  is an equivalence, then  $\mathrm{Ho}(\mathcal{C})$  is an additive category (4.8.1.7). ┘

*Proof:* It follows from (4.9.1.13) and the compatibility of group structures on  $\pi_n$  that  $\mathcal{C}$  is preadditive. To show it is additive, Cf. [Lur11]P24. ? □

**Def. (4.9.1.17) [Distinguished Triangles].** Let  $\mathcal{C}$  be a pointed  $\infty$ -category which admits cofibers, then a diagram  $X \xrightarrow{f} Y \xrightarrow{g} Z \xrightarrow{h} X[1]$  in  $\mathrm{Ho}(\mathcal{C})$  is called a **distinguished triangle** if there exists a diagram  $\Delta^1 \times \Delta^2 \rightarrow \mathcal{C}$  as shown:

$$\begin{array}{ccccc} X & \xrightarrow{\tilde{f}} & Y & \longrightarrow & 0 \\ \downarrow & & \downarrow \tilde{g} & & \downarrow \\ 0' & \longrightarrow & Z & \xrightarrow{\tilde{h}} & W \end{array}$$

s.t.

- Both  $0, 0'$  are zeros.
- both square are pushout squares.
- $\tilde{f}$  lifts  $f$ ,  $\tilde{g}$  lifts  $g$ .
- $h : Z \rightarrow X[1]$  equals  $\tilde{h}$  composed with an equivalence  $W \cong X[1]$  determined by the outer rectangle.

┘

**Prop. (4.9.1.18) [Stable  $\infty$ -Categories and Triangulated Categories].** Let  $\mathcal{C}$  be a stable  $\infty$ -category, then the translation functor defined (4.9.1.8) and distinguished triangles defined in (4.9.1.17) endow  $\mathrm{Ho}(\mathcal{C})$  with the structure of a triangulated category (4.8.4.2). ┘

*Proof:* Cf. [Lur11]P27. ┐

**Def. (4.9.1.19) [Exact Functors].** An **exact functor** between stable  $\infty$ -categories is a functor  $F : \mathcal{C} \rightarrow \mathcal{D}$  that is left and right exact and preserves fiber sequences. ┘

**Prop. (4.9.1.20).** Let  $\mathrm{Cat}_{\infty}^{\mathrm{Ex}} \subset \mathrm{Cat}_{\infty}$  be the subcategory of all stable  $\infty$ -categories and exact functors, then it admits all small limits and small filtered colimits, and they are preserved by the inclusion. ┘

*Proof:* Cf. [HA1.1.4.4., 1.1.4.6.] ┐

**Def. (4.9.1.21) [T-Structures].** A  $T$ -structure on a stable  $\infty$ -category  $\mathcal{C}$  is a pair of full subcategories  $\mathcal{C}_{\geq 0}, \mathcal{C}_{\leq 0}$  that ┘

**Prop. (4.9.1.22).** For any  $n \in \mathbb{Z}$ ,  $\mathcal{C}_{\leq n} \subset \mathcal{C}$  is a localization, thus admits a left adjoint  $\tau_{\leq n}$ , called the **truncation functor**. Dually for  $\tau_{\geq n}$ . ┘

*Proof:* Cf. [HA, P1.2.1.5]. ┐

**Def. (4.9.1.23) [Heart].** The **heart**  $\mathcal{C}^{\heartsuit} \subset \mathcal{C}$  is defined to be the full subcategory of  $\mathcal{C}_{\leq 0} \cap \mathcal{C}_{\geq 0} \subset \mathcal{C}$ . ┘

### Spectra Objects and Stabilization

**Def. (4.9.1.24) [Spectra].** A **spectrum** is an object in the universal  $(\infty, 1)$ -category  $\mathrm{Sp} = \mathrm{Sp}(\mathrm{Top}) \cong \mathrm{Sp}(\mathrm{Grpd}_{\infty})$  ┘

**Def. (4.9.1.25) [Homology Groups of Spectra].** ┘

**Def. (4.9.1.26) [Connective Spectra].** A **connective spectrum** is a spectrum (4.9.1.24) that the negative homotopy groups vanish. ┘

**Prop. (4.9.1.27).** There are equivalences between the following categories **?**:

- connected spectra.
- infinite loop spaces.
- group-like  $\mathbb{E}_{\infty}$ -spaces.

┘

*Proof:* ┐

┐

**Def. (4.9.1.28) [ $\mathbb{E}_{\infty}$ -Rings].** An  **$\mathbb{E}_{\infty}$ -ring** is an object in  $\mathcal{C}\mathrm{Mon}_{\infty}(\mathrm{Sp}(\mathrm{Grpd}_{\infty}))$  (4.9.1.24). ┘

**Cor. (4.9.1.29).** For  $(\mathcal{C}, 0) \in \mathrm{Cat}_{\infty}^{\mathrm{pt}}$ , the following are equivalent:

- $\mathcal{C}$  is stable.
- $\mathcal{C}$  admits finite finite colimits and the suspension functor  $\Sigma : \mathcal{C} \rightarrow \mathcal{C}$  is an equivalence.
- $\mathcal{C}$  admits finite finite limits and the loop functor  $\Sigma : \mathcal{C} \rightarrow \mathcal{C}$  is an equivalence.

┘

*Proof:* Cf. [Lur11]P149. ┐

┐

### Presentable Stable $\infty$ -Categories

#### 2 Monoidal $\infty$ -Categories

**Def. (4.9.2.1) [Monoidal  $\infty$ -Categories].** A **monoidal  $(\infty, 1)$ -category** is a tuple  $(\mathcal{C}, \otimes)$  where

- $\mathcal{C}$  is a simplicial set.
- $\otimes : \mathcal{C} \rightarrow N(\Delta)^{\text{op}}$  is a coCartesian fibration.
- For  $n \in \mathbb{N}$  and  $0 \leq i \leq n-1$ , the induced  $(\infty, 1)$ -functor  $\mathcal{C}_{[n]} \rightarrow \mathcal{C}_{\{i, i+1\}}$  determines an equivalence of  $(\infty, 1)$ -categories

$$\mathcal{C}_{[n]} \rightarrow \mathcal{C}_{\{0,1\}} \times \dots \times \mathcal{C}_{\{n-1,n\}} \cong (\mathcal{C}_{[1]})^n$$

⌋

**Def. (4.9.2.2) [ $\mathbb{A}_\infty$ -Rings].** Let  $\mathcal{C}$  be a stable monoidal  $(\infty, 1)$ -category (4.9.2.1) with the  $(\infty, 1)$ -functor

$$p_\infty : \mathcal{C} \rightarrow N(\Delta)^{\text{op}},$$

an  **$\mathbb{A}_\infty$ -Ring** is a lax monoidal section of  $p_\infty$ .

⌋

#### Monoidal $(\infty, 1)$ -Categories

**Def. (4.9.2.3) [Symmetric Monoidal  $(\infty, 1)$ -Categories].** A symmetric monoidal  $(\infty, 1)$ -category is an  $(\infty, 1)$ -category which is  $\infty$ -tuply monoidal. Equivalently, it is a commutative algebra in the  $(\infty, 1)$ -category of  $(\infty, 1)$ -categories.

Or equivalently, it is a coCartesian fibration of simplicial sets

$$\pi : \mathcal{C}^\otimes \rightarrow N(\text{finSet}_*)$$

s.t. for any  $n \in \mathbb{N}$ , the associated functor  $\mathcal{C}_{[n]}^\otimes \rightarrow \mathcal{C}_{[1]}^\otimes$  determines an equivalence of  $(\infty, 1)$ -categories.

⌋

*Proof:* ?

□

**Def. (4.9.2.4) [ $\mathbb{E}_\infty$ -Algebras (Commutative Monoids)].** Let  $\mathcal{C}$  be a symmetric monoidal  $(\infty, 1)$ -category, then an  **$\mathbb{E}_\infty$ -algebra** of a **commutative monoid** in  $\mathcal{C}$  is a lax monoidal  $(\infty, 1)$ -functor  $*$   $\rightarrow \mathcal{C}$ ?. The  $(\infty, 1)$ -category of commutative monoids in  $\mathcal{C}$  is denoted by  $\mathcal{C}\text{Mon}_\infty(\mathcal{C})$ .

⌋

**Def. (4.9.2.5) [ $\mathbb{E}_\infty$ -Space].** An  **$\mathbb{E}_\infty$ -space** is a commutative  $\infty$ -monoid in  $\text{Grpd}_\infty$  (4.7.2.5), i.e.

$$\mathbb{E}_\infty\text{-Spa} = \mathcal{C}\text{Mon}_\infty(\text{Grpd}_\infty).$$

It is also denoted by  $\mathcal{C}\text{Mon}_\infty$ .

⌋

**Def. (4.9.2.6) [Commutative Ring Spectra ( $\mathbb{E}_\infty$ -Rings)].** An  **$\mathbb{E}_\infty$ -ring** or a **commutative ring spectra** is a commutative monoid in the stable  $(\infty, 1)$ -category of spectra?.

⌋

**Prop. (4.9.2.7) [ $\infty$ -Abelianization].** There is an  $(\infty, 1)$ -functor

$$\mathcal{A}b_\infty : \text{Grpd}_\infty \rightarrow \mathcal{C}\text{Mon}_\infty \text{ (4.9.2.5)}$$

that is left adjoint to the

## 4.10 Derived Categories

Main references are [G-M03] and [Sta]. Need to be refreshed by the language of  $\infty$ -categories ?

### 1 Derived Categories

**Def. (4.10.1.1) [Derived Categories].** For  $\mathcal{A} \in \mathbf{AbCat}$ , the full subcategory  $Ac(\mathcal{A})$  of  $K(\mathcal{A})$  consisting of acyclic complexes is a strictly full saturated triangulated subcategory, and its associated saturated localizing system is the class  $\mathbf{QIso}(\mathcal{A})$  of quasi-isomorphisms.

Thus the kernel of the localizing functor  $Q_{\mathcal{A}} : K(\mathcal{A}) \rightarrow \mathbf{QIso}(\mathcal{A})^{-1}K(\mathcal{A})$  is  $Ac(\mathcal{A})$ , and  $H^0$  factors through  $Q_{\mathcal{A}}$ . Then the quotient triangulated category (4.8.4.32)

$$D(\mathcal{A}) = K(\mathcal{A})/Ac(\mathcal{A}) = \mathbf{QIso}(\mathcal{A})^{-1}K(\mathcal{A})$$

is called the **derived category** of  $\mathcal{A}$ . ┘

*Proof:* As  $H^0$  is a cohomological functor on  $K(\mathcal{A})$  (4.8.7.14), these follow from ?? and (4.8.4.33). □

**Cor. (4.10.1.2) [Universal Properties of Derived Categories].** For  $\mathcal{A} \in \mathbf{AbCat}$ ,

- By (4.8.4.28), the derived category  $D(\mathcal{A})$  has the universal property that any exact functor between Distinguished categories  $F : K(\mathcal{A}) \rightarrow \mathcal{D}$  s.t. quasi-isomorphisms is mapped to isomorphisms uniquely factors through  $D(\mathcal{A})$ .
- Let  $F : \mathcal{A} \rightarrow \mathcal{B} \in \mathbf{AbCat}$ , then  $F$  induces an exact functor  $F : K(\mathcal{A}) \rightarrow K(\mathcal{B}) \in \mathbf{TriCat}$  (4.8.7.17), and it maps quasi-isomorphisms to quasi-isomorphisms, so by item1 induces a morphism of categories  $\mathcal{D}(\mathcal{A}) \rightarrow \mathcal{D}(\mathcal{B})$ . ┘

**Prop. (4.10.1.3) [Universal  $\delta$ -Functors].** The functor  $\mathrm{Ch}^{\mathbb{Z}}(\mathcal{A}) \rightarrow D(\mathcal{A})$  is a  $\delta$ -functor. ┘

*Proof:* Cf. [Sta] 014Z. ? □

**Prop. (4.10.1.4) [T-structures].** Let  $\mathcal{A} \in \mathbf{AbCat}$  and  $K^{\bullet} \in K(\mathcal{A})$ , then for any  $a \in \mathbb{Z}$ , truncations induces a distinguished triangle

$$\tau_{\leq a}K^{\bullet} \rightarrow K^{\bullet} \rightarrow \tau_{\geq a+1}K^{\bullet} \rightarrow \tau_{\leq a}K^{\bullet}[1].$$

In particular,  $K(\mathcal{A})$  and  $D(\mathcal{A})$  are triangulated categories with T-structures (4.8.6.1). ┘

*Proof:* This distinguished triangle comes from the exact sequence  $0 \rightarrow \tau_{\leq a}K^{\bullet} \rightarrow K^{\bullet} \rightarrow K^{\bullet}/\tau_{\leq a}K^{\bullet}$  via the  $\delta$ -functor (4.10.1.3) and the fact  $K^{\bullet}/\tau_{\leq a}K^{\bullet} \rightarrow K^{\bullet} \rightarrow \tau_{\geq a+1}K^{\bullet}$  is a quasi-isomorphism thus an isomorphism in  $D(\mathcal{A})$ . □

### Triangulated Subcategories of $D(\mathcal{A})$

**Prop. (4.10.1.5).** Let  $\mathcal{A} \in \mathbf{AbCat}$  and  $\mathcal{L}$  a full triangulated subcategory of  $K(\mathcal{A})$ , let  $S = \mathcal{L} \cap \mathbf{QIso}(\mathcal{A})$ , then  $S$  is the saturated localizing system compatible with the triangulated structure associated to the cohomological functor  $H^0$  restricted to  $\mathcal{L}$  (4.8.4.27), then we can form the localizing triangulated category  $S^{-1}\mathcal{L}$  (4.8.4.28) and there is a natural exact functor of triangulated categories  $S^{-1}\mathcal{L} \rightarrow D(\mathcal{A})$  by the universal property (4.8.4.28). ┘

**Prop. (4.10.1.6) [Full Subcategories of  $D(\mathcal{A})$ ].** Let  $\mathcal{L} \subset \tilde{\mathcal{L}}$  be full triangulated subcategories of  $K(\mathcal{A})$ , and  $S = \mathcal{L} \cap \text{QIso}(\mathcal{A})$ ,  $\tilde{S} = \tilde{\mathcal{L}} \cap \text{QIso}(\mathcal{A})$ . If either of the following holds:

- For any  $s : L_1 \rightarrow \tilde{L}_1 \in \tilde{S}$  and  $L_1 \in \mathcal{L}$ , there is a morphism  $t : \tilde{L}_1 \rightarrow L_2$  that  $L_2 \in \mathcal{L}$  and  $t \circ s \in \tilde{S}$ .
- The same as in item1 but with arrows reversed.

then the natural functor  $S^{-1}\mathcal{L} \subset \tilde{S}^{-1}\tilde{\mathcal{L}}$  is fully faithful.  $\lrcorner$

*Proof:* This follows immediately from (4.10.1.5) and (4.8.4.30).  $\square$

**Cor. (4.10.1.7) [Bounded Derived Categories].** For  $*$  =  $-$ ,  $+$ ,  $b$ , the triangulated categories  $D^*(\mathcal{A})$  are the localized category of  $K^*(\mathcal{A})$  at the classes of isomorphism in  $K^*(\mathcal{A})$  (4.10.1.5). Then they are naturally full subcategories of  $D(\mathcal{A})$ , by (4.10.1.6), as the condition is satisfied by (4.8.7.19).  $\lrcorner$

**Def. (4.10.1.8) [Derived Category of Serre Subcategories].** If  $\mathcal{B}$  is a Serre subcategory of an Abelian category  $\mathcal{A}$ , let  $D_{\mathcal{B}}^*(\mathcal{A})$  be the full subcategory of  $D^*(\mathcal{A})$  consisting of objects  $X$  that  $H^n(X) \in \mathcal{B}$  for all  $n$ , then  $D_{\mathcal{B}}^*(\mathcal{A})$  is a strictly full saturated triangulated subcategory of  $D^*(\mathcal{A})$ , as it is just the kernel of the cohomological functor  $H^0 : D^*(\mathcal{A}) \rightarrow \mathcal{A} \rightarrow \mathcal{A}/\mathcal{B}$  (4.8.3.15) (4.8.4.24).

Also there are natural exact functors  $D^*(\mathcal{B}) \rightarrow D_{\mathcal{B}}^*(\mathcal{A})$ , and  $D^*(\mathcal{A})/D_{\mathcal{B}}^*(\mathcal{A}) \rightarrow D^*(\mathcal{A}/\mathcal{B})$  (4.8.4.32).  $\lrcorner$

**Prop. (4.10.1.9).** The map  $D^*(\mathcal{A}) \rightarrow D^*(\mathcal{A}/\mathcal{B})$  is essentially surjective.  $\lrcorner$

*Proof:* Cf. [Sta]06XL.  $\square$

**Prop. (4.10.1.10).** Let  $\mathcal{B} \subset \mathcal{A}$  be a Serre subcategory and suppose that for any surjection  $X \rightarrow Y \in \mathcal{A}$  with  $Y \in \mathcal{B}$ , there is a subobject  $X' \subset X$  that  $X' \rightarrow Y$  is surjective, then the exact functor  $D^*(\mathcal{B}) \rightarrow D_{\mathcal{B}}^*(\mathcal{A})$  is an equivalence for  $*$  =  $-$  or  $b$ .  $\lrcorner$

*Proof:* Cf. [Sta]0FCL.  $\square$

**Prop. (4.10.1.11).** If  $(\mathcal{C}, \mathcal{O})$  is a ringed site and  $\mathcal{A} \subset \text{Mod}_{\mathcal{O}}$  is the Serre subcategory of torsion modules, then the functor  $D(\mathcal{A}) \rightarrow D_{\mathcal{A}}(\mathcal{O})$  is an equivalence.  $\lrcorner$

*Proof:* Cf. [Sta]0DD7.  $\square$

**Prop. (4.10.1.12) [Embedding of  $\mathcal{A}$  in  $D(\mathcal{A})$ ].** For  $A \in \text{AbCat}$ , the natural inclusion  $i : \mathcal{A} \subset D(\mathcal{A})$  induces an equivalence of  $\mathcal{A}$  with the subcategory of  $D(\mathcal{A})$  consisting of complexes with cohomology concentrated at degree 0.

An object  $K \in D(\mathcal{A})$  is called **discrete** if it is in the essential image of this inclusion.  $\lrcorner$

*Proof:* The natural map  $H^0 : D(\mathcal{A}) \rightarrow \mathcal{A}$  is inverse to  $i$ , so  $i$  is faithful. To show it is full, let  $(L, f, s^{-1})$  be a morphism from  $i(M)$  to  $i(N)$ , then we get a morphism  $(H^0(L), H^0(f), H^0(s)^{-1})$ , and these two morphisms are both dominated by the morphism  $(\sigma^{\geq n} L, \sigma^{\leq n} \circ f, (\sigma^{\leq n} \circ s)^{-1})$ , so they are equal morphisms in  $D(\mathcal{A})$ . But  $(H^0(L), H^0(f), H^0(s)^{-1}) = i(s^{-1}f)$  is in the image of  $i$ , so  $i$  is full.

The assertion that any complex with cohomology groups concentrated at degree 0 is true by using truncation functors (4.8.7.19).  $\square$

**Prop. (4.10.1.13) [K-Groups].** For  $A \in \text{AbCat}$ , the embedding (4.10.1.12) induces an isomorphism of  $K$ -groups  $K_0(\mathcal{A}) \cong K_0(D^b(\mathcal{A}))$  (11.1.2.1).  $\lrcorner$

*Proof:* The map  $\mathcal{A} \rightarrow D^b(\mathcal{A})$  is a  $\delta$ -functor by (4.10.1.3), thus by (11.1.2.2) induces a map  $K_0(\mathcal{A}) \cong K_0(D^b(\mathcal{A}))$ . There is a reverse map  $K_0(D^b(\mathcal{A})) \rightarrow K_0(\mathcal{A}) : X \mapsto \sum_i (-1)^i H^i(X)$ , which is inverse the the map above: one direction is clear, for the other, use induction and the truncation triangles (4.10.1.4).  $\square$

**Def. (4.10.1.14) [Perfect Complexes].** For  $\mathcal{A} \in \mathbf{AbCat}$ , a **perfect complex** in  $D(\mathcal{A})$  is an object that is isomorphic to a bounded complex.  $\lrcorner$

### Operations on the Derived Category

**Lemma (4.10.1.15) [Direct Sum].** If  $\mathcal{A} \in \mathbf{AbCat}$  has exact countable direct sums, then  $D(\mathcal{A})$  has countable direct sums given by term-wise direct sums.  $\lrcorner$

*Proof:* A system of morphisms  $K_i^\bullet \rightarrow L^\bullet$  is a system of quasiisomorphisms  $M_i^\bullet \rightarrow K_i^\bullet$  and  $M_i \rightarrow L^\bullet$ . Then by hypothesis  $\oplus M_i^\bullet \rightarrow \oplus K_i^\bullet$  is a quasi-iso, thus defines a morphism  $\oplus K_i^\bullet \rightarrow L^\bullet$ . It can be verified that this morphism is unique.  $\square$

**Lemma (4.10.1.16) [Termwise Colimit as Hocolim].** Let  $\mathcal{A} \in \mathbf{AbCat}$  and  $L_n^\bullet$  be a system of complexes of  $\mathcal{A}$ . Assume colimits over  $\mathbb{N}$  exists and are exact over  $\mathcal{A}$ , then the termwise colimit  $L^\bullet$  is a derived colimit in  $D(\mathcal{A})$ .  $\lrcorner$

*Proof:* We have an exact sequence

$$0 \rightarrow \oplus L_n^\bullet \rightarrow \oplus L_n^\bullet \rightarrow L^\bullet \rightarrow 0$$

and the termwise direct sum is the direct sum in  $D(\mathcal{A})$  by (4.10.1.15), and then  $L^\bullet$  is a derived colimit, by (4.8.7.13).  $\square$

### Bounded (Co)Homological Dimensions

**Def. (4.10.1.17) [Bounded Cohomological Dimensions].** An exact functor between two derived categories  $F : D(\mathcal{A}) \rightarrow D(\mathcal{B})$  is called has **cohomological dimension bounded by  $N$**  if  $F(D^{\leq m}(\mathcal{A})) \subset D^{\leq m+N}(\mathcal{B})$ . Dually, it has **homological dimension bounded by  $N$**  if  $F(D^{\geq m}(\mathcal{A})) \subset D^{\geq m-N}(\mathcal{B})$ .  $\lrcorner$

**Prop. (4.10.1.18).** If  $(F, G) : D(\mathcal{A}) \rightleftharpoons D(\mathcal{B})$  is an adjunction pair of exact functors, then  $F$  has cohomological dimension bounded by  $N$  iff  $G$  has homological dimension bounded by  $N$ .  $\lrcorner$

*Proof:* If  $F$  has cohomological dimension bounded by  $N$ , let  $K \in D^{\geq m}(\mathcal{B})$ , then

$$\mathrm{Hom}_{D(\mathcal{A})}(\tau_{\leq m-N-1} GK, GK) = \mathrm{Hom}_{D(\mathcal{B})}(F\tau_{\leq m-N-1} GK, K) = 0.$$

The dual case is similar.  $\square$

## 2 K-injectives and K-Adapted Classes

**Prop. (4.10.2.1) [K-injectives].** For  $\mathcal{A} \in \mathbf{AbCat}$ , a complex  $I^\bullet$  in  $K(\mathcal{A})$  is called a **K-injective** object iff it satisfies the following equivalent conditions:

- $\mathrm{Hom}_{K(\mathcal{A})}(S^\bullet, I^\bullet) = 0$  for any acyclic  $S^\bullet$  in  $K(\mathcal{A})$ .
- $\mathrm{Hom}_{K(\mathcal{A})}(N^\bullet, I^\bullet) \cong \mathrm{Hom}_{K(\mathcal{A})}(M^\bullet, I^\bullet)$  for quasi-iso  $M^\bullet \rightarrow N^\bullet$ .

- Dually, we can define **K-projective** objects.

### K-Adapted Classes

**Def. (4.10.2.11)[K-Adapted Classes].** Let  $\mathcal{A}$  be an Abelian category,  $\mathcal{D}$  a triangularized category and  $F : K(\mathcal{A}) \rightarrow \mathcal{D}$  a triangularized functor, a **K-adapted class** for  $F$  is a full triangulated subcategory  $\mathcal{R} \subset K(\mathcal{A})$  that

- If  $I \rightarrow I'$  is a quasi-isomorphism in  $\mathcal{R}$ , then  $F(I) \rightarrow F(I')$  is an isomorphism in  $\mathcal{D}$ .
- Every  $A^\bullet \in K(\mathcal{A})$  admits some quasi-isomorphism  $A^\bullet \rightarrow I^\bullet$  where  $I^\bullet \in \mathcal{R}$ .

┘

**Cor. (4.10.2.12)[K-Injective is K-Adapted].** If  $\mathcal{A}$  has sufficiently many K-injectives, then the class of K-injectives is K-adapted to any left exact functor  $F$ , by (4.10.2.2) and (4.10.2.1). ┘

### 3 Derived Functors

**Def. (4.10.3.1)[Right Derived Functors].** Let  $\mathcal{A}$  be an Abelian category,  $E$  a triangularized category and  $F : K(\mathcal{A}) \rightarrow E$  an exact functor between triangulated categories. Then a **right derived functor** of  $F$  is an exact functor  $RF : D(\mathcal{A}) \rightarrow E$  together with a natural transformation  $\eta : F \rightarrow RF \circ Q_{\mathcal{A}}$  that satisfies the following universal property: For any exact functor  $G : D(\mathcal{A}) \rightarrow E$  and a natural transformation  $\eta' : F \rightarrow G \circ Q_{\mathcal{A}}$ , there is a natural transformation  $\theta : RF \rightarrow G$  that  $\eta' = (\theta \star Q_{\mathcal{A}}) \circ \eta$ .

In particular, if  $RF$  exists, then it is unique up to unique isomorphism of exact functors. ┘

**Prop. (4.10.3.2)[Derived Functors via K-Adapted Classes].** Let  $\mathcal{A}$  be an Abelian category,  $\mathcal{D}$  a triangularized category and  $F : K(\mathcal{A}) \rightarrow E$  an exact functor, if there exists a K-adapted class  $\mathcal{R}$  for  $F$ , then  $RF$  exists. Moreover, for  $I \in \mathcal{R}$ , the morphism  $\eta_I : F(I) \rightarrow RF \circ Q_{\mathcal{A}}(I)$  is an isomorphism in  $\mathcal{D}$ . ┘

*Proof:* Let  $S = \mathcal{R} \cap \text{QIso}(\mathcal{A})$ , then  $\mathcal{R}, K(\mathcal{A})$  and the localizing systems  $S, \text{QIso}(\mathcal{A})$  satisfy the conditions in (4.10.1.6), so  $\iota : S^{-1}\mathcal{R} \subset D(\mathcal{A})$  is a full triangulated subcategory, and it is also essentially surjective, thus it is an equivalence of categories. Let  $I$  be a right adjoint of the inclusion, then  $I$  is also an exact functor (4.8.4.10), and there is a natural isomorphism  $\zeta : \text{id}_{D(\mathcal{A})} \cong \iota \circ I$ .

By the universal property, there is an exact functor  $F_{\mathcal{R}} : S^{-1}\mathcal{R} \rightarrow E$  extending  $F|_{\mathcal{R}}$ . Define

$$RF = F_{\mathcal{R}} \circ I : D(\mathcal{A}) \rightarrow E.$$

To construct  $\eta : F \rightarrow RF \circ Q_{\mathcal{A}}$ , for any  $X \in \text{Ob}(K(\mathcal{A})) = \text{Ob}(D(\mathcal{A}))$ , the isomorphism  $\zeta$  gives an isomorphism  $X \cong \iota(I(X))$ , which is represented by a roof  $(R, f, s^{-1}), f, s \in \text{QIso}(\mathcal{A})$ , and we can assume  $R \in \text{Ob}(\iota(S^{-1}\mathcal{R})) = \text{Ob}(\mathcal{R})$  by hypothesis, thus  $s \in S$ , and  $F(s)$  is an isomorphism in  $E$  by hypothesis. Thus we get a morphism  $\eta_X : F(s)^{-1} \circ F(f) : F(X) \rightarrow F(\iota(I(X))) = RF(Q_{\mathcal{A}}(X))$ . This  $\eta_X$  is independent of the representation given, because if there is another dominant roof  $(R', t \circ f, (t \circ s)^{-1})$ , where  $t : R \rightarrow R' \in S$ , then  $F(t \circ s)^{-1} \circ F(t \circ f) = F(s)^{-1} \circ F(f) \in E$ .

And for a morphism  $f : X \rightarrow Y \in K(\mathcal{A})$ ,  $\zeta$  gives a commutative diagram

$$\begin{array}{ccc} X & \xrightarrow{\zeta_X} & \iota(I(X)) \\ \downarrow f & & \downarrow \iota(I(f)) \\ Y & \xrightarrow{\zeta_Y} & \iota(I(Y)) \end{array}$$

in  $D(\mathcal{A})$  where  $\zeta_X, \zeta_Y$  are represented by  $(R_X, f_X, s_X^{-1}), (R_Y, f_Y, s_Y^{-1})$ , and  $I(f)$  is represented  $(R_0, f_0, s_0^{-1})$ , then we can construct roof to realize this commutative diagram in  $K(\mathcal{A})$  and show

there is a commutative diagram

$$\begin{array}{ccc}
 F(X) & \xrightarrow{F(s_X)^{-1} \circ F(f_X)} & RF(Q_{\mathcal{A}}(X)) \\
 \downarrow F(f) & & \downarrow F(s_0)^{-1} \circ F(f_0) = RF \circ Q_{\mathcal{A}}(f) \\
 F(Y) & \xrightarrow{F(s_Y)^{-1} \circ F(f_Y)} & RF(Q_{\mathcal{A}}(Y))
 \end{array}$$

in  $E$ , which means  $\eta : F \rightarrow RF \circ Q_{\mathcal{A}}$  is a natural isomorphism.

Notice that  $\eta_I$  is an isomorphism for  $I \in \mathcal{R}$ , because in this case  $F(f_I), F(s_I)$  are both isomorphisms.

It remains to show the universal properties of  $\eta$ : Given any exact functor  $G : D(\mathcal{A}) \rightarrow E$  and a natural transformation  $\eta' : F \rightarrow G \circ Q_{\mathcal{A}}$ , for any  $X \in \text{Ob}(K(\mathcal{A})) = \text{Ob}(D(\mathcal{A}))$ , we get a morphism  $\eta'_X : F(X) \rightarrow G(X)$  in  $E$ . Notation as before, because  $\eta'$  is a natural transformation, we get a commutative diagram in  $K(\mathcal{A})$

$$\begin{array}{ccc}
 F(X) & \xrightarrow{\eta'_X} & G(X) \\
 \downarrow F(f) & & \downarrow G(Q_{\mathcal{A}}(f)) \\
 F(R_X) & \xrightarrow{\eta'_{R_X}} & G(R_X) \\
 \uparrow F(s) & & \uparrow G(Q_{\mathcal{A}}(s)) \\
 F(\iota(I(X))) & \xrightarrow{\eta'_{\iota(I(X))}} & G(\iota(I(X)))
 \end{array}$$

In  $E$ . As  $\zeta_X = (R_X, f, s^{-1})$  is an isomorphism between  $X$  and  $\iota(I(X))$ ,  $f, s$  are both quasi-isomorphisms, thus the vertical arrows are both isomorphisms, and we get a commutative diagram

$$\begin{array}{ccc}
 F(X) & \xrightarrow{\eta'_X} & G(X) \\
 \downarrow \eta_X & & \downarrow G(\zeta_X) \\
 RF(Q_{\mathcal{A}}(X)) & \xrightarrow{\eta'_{\iota(I(X))}} & G(\iota(I(X)))
 \end{array}$$

So we can define

$$\theta_X = (G(\zeta_X))^{-1} \circ \eta'_{\iota(I(X))} : RF(Q_{\mathcal{A}}(X)) \rightarrow G(X),$$

then it is functorial in  $X$  as both  $\eta'_{\iota(I(X))}$  and  $G(\zeta_X)$  are functorial in  $X$ , so defines a natural transformation  $RF \circ Q_{\mathcal{A}} \rightarrow G$  that  $(\theta \star Q_{\mathcal{A}}) \circ \eta = \eta'$ .

For the uniqueness of  $\eta$ : For any  $X \in \text{Ob}(S^{-1}\mathcal{R}) = \text{Ob}(\mathcal{R})$ ,  $\eta_X$  is an isomorphism, thus  $\eta_X$  is determined, but  $\iota : S^{-1}\mathcal{R} \rightarrow D(\mathcal{A})$  is essentially surjective, so  $\eta_X$  is determined for any  $X \in D(\mathcal{A})$ .

□

**Cor.(4.10.3.3) [Derived Functors via K-Injective Classes].** Let  $\mathcal{A} \in \text{AbCat}$ ,  $E \in \text{TriCat}$  and  $F : K^*(\mathcal{A}) \rightarrow E$  an exact functor, if  $K^*(\mathcal{A})$  has enough K-injectives, then the class of K-injectives is K-adapted to  $F$  (4.10.2.12), so  $RF : D^*(\mathcal{A}) \rightarrow E$  exists. Moreover, for any K-injective  $I^\bullet$ , the morphism  $\eta_{I^\bullet} : F(I^\bullet) \rightarrow RF \circ Q_{\mathcal{A}}(I^\bullet)$  is an isomorphism in  $E$  ┘

**Cor. (4.10.3.4) [Derived Functors via Injectives].** Let  $\mathcal{A}, \mathcal{B} \in \mathcal{AbCat}$  s.t  $\mathcal{A}$  has enough injective and exact countable products, and  $F : \mathcal{A} \rightarrow \mathcal{B}$  an additive functor, then  $K^*(F) : K^*(\mathcal{A}) \rightarrow D^*(\mathcal{A}) \rightarrow D^*(\mathcal{B})$  is an exact functor by (4.8.7.16), and  $K^*(\mathcal{A})$  has enough K-injectives by (4.10.2.9).

However, this is useless unless  $F$  is left exact in which case we see  $R^0 F(A) = F(A)$  for any  $A \in \mathcal{A}$  by (4.10.3.3).  $\lrcorner$

**Cor. (4.10.3.5) [Naturality].** If  $\eta : F \rightarrow F'$  is a natural transformation of left-exact functors, then by universal property (4.10.3.1), there is a natural transformation  $R\eta : RF \rightarrow RF'$  inducing a long exact sequence about cohomology groups extending  $\eta$ .  $\lrcorner$

**Prop. (4.10.3.6) [Composition of Derived Functors].** Let  $\mathcal{A}, \mathcal{B} \in \mathcal{AbCat}$  and  $\mathcal{D} \in \mathcal{TriCat}$ . If  $F : K^*(\mathcal{A}) \rightarrow K^*(\mathcal{B}), G : K^*(\mathcal{B}) \rightarrow \mathcal{D}$  are exact functors between triangulated categories, and  $\mathcal{R}_{\mathcal{A}}$  is K-adapted to  $F$  and  $G \circ F$ ,  $\mathcal{R}_{\mathcal{B}}$  is K-adapted to  $G$ , then the natural transformation  $R(G \circ F) \rightarrow RG \circ RF$  is an isomorphism.  $\lrcorner$

*Proof:*  $RF$  is isomorphic to  $F$  on  $\mathcal{R}_{\mathcal{A}}$ , so for any  $A^\bullet \in K^*(\mathcal{A})$ , choose some quasi-isomorphism  $A^\bullet \rightarrow R$ , where  $R \in \mathcal{R}_{\mathcal{A}}$ , then there is a commutative diagram

$$\begin{array}{ccccc} R(G \circ F)(A^\bullet) & \xrightarrow{\cong} & R(G \circ F)(R) & \xrightarrow{\cong} & G \circ F(R) \\ \downarrow & & \downarrow & & \downarrow \text{id} \\ RG \circ RF(A^\bullet) & \xrightarrow{\cong} & RG \circ RF(R) & \xrightarrow{\cong} & G \circ F(R) \end{array}$$

$$G \circ F(R) \cong G(F(R)) \rightarrow RG(F(I^\bullet)) \cong RG \circ RF(A^\bullet),$$

and we are done.  $\square$

**Def. (4.10.3.7) [Universal  $\delta$ -Functors].** A **universal  $\delta$ -functor** between Abelian categories is one that any natural transformation from  $T^0$  to another  $\delta$ -functor will generate a  $\delta$ -map. A **effaceable  $\delta$ -functor** is one that for any  $n > 0$  and any object  $A$ , there is an injection  $A \rightarrow B$  that  $T^n(A) \rightarrow T^n(B) = 0$ .  $\lrcorner$

**Prop. (4.10.3.8) [Grothendieck].** A  $\delta$ -functor is universal if it is effaceable.  $\lrcorner$

*Proof:* We construct by induction on  $n$ . choose a  $0 \rightarrow A \rightarrow B \rightarrow C \rightarrow 0$  such that  $T^{n+1}(A) \rightarrow T^{n+1}(B) = 0$  then there is an isomorphism  $T^{n+1}(A) \cong \text{Coker}(T^n(B) \rightarrow T^n(C))$ , and so we can construct the map on  $T^{n+1}$  induces by

$$\text{Coker}(T^n(B) \rightarrow T^n(C)) \rightarrow \text{Coker}(G^n(B) \rightarrow G^n(C)) \rightarrow G^{n+1}(A).$$

This can be verified to be a  $\delta$  map.  $\square$

**Prop. (4.10.3.9).** The derived functors form a universal  $\delta$ -functor (when it exists).  $\lrcorner$

*Proof:* It is a  $\delta$  functor by (4.10.1.1), it is universal by (4.10.3.8).  $\square$

**Prop. (4.10.3.10).** Derived functor commutes with filtered colimits on a Grothendieck Abelian category, this is by AB5.  $\lrcorner$

**Prop. (4.10.3.11) [Hypercohomology].** Given an Abelian category  $\mathcal{A}$  with enough injectives,  $\mathcal{B}$  a complete Abelian category,  $F : \mathcal{A} \rightarrow \mathcal{B}$  a left exact functor, and  $K \in \mathcal{K}(\mathcal{A})$ , we can define the **right**

**hyper-derived functor** of  $F$  at  $K$  as  $\mathbb{R}F(K) = \text{Tot}^\Pi F(P) \in K(\mathcal{B})$  where  $K \rightarrow P$  is a Cartan-Eilenberg resolution of  $K$ . and the **hypercohomologies** of  $F$  at  $K$  as  $R^n F(K) = H^n(\text{Tot}^\Pi F(P))$ . Dually we can define the left hyper-derived functor and hyperhomologies.

For complexes in  $K^+(\mathcal{A})$ , there is no restriction and the right derived-hyper functor descends to a functor from  $D^+(\mathcal{A}) \rightarrow D^+(\mathcal{B})$ .

When the Abelian category  $\mathcal{A}$  satisfies AB3\* and AB4\*, i.e. the direct product is exact, then  $\text{Tot}^\Pi$  of the Cartan-Eilenberg resolution of any complex is a quasi-isomorphism to it by the dual of (4.8.9.11). (Take horizontal filtration, AB4\* assures it collapse).  $\lrcorner$

### Derived Bifunctors

**Def. (4.10.3.12) [Right Derived Functors of Bi-Exact Bi-Functors].** Let  $\mathcal{A}, \mathcal{B}$  be Abelian categories and  $F : K(\mathcal{A}) \times K(\mathcal{B}) \rightarrow \mathcal{D}$  be bi-exact bifunctor between triangulated categories, a **right derived functor** of  $F$  is a bi-exact bifunctor  $RF : D(\mathcal{A}) \times D(\mathcal{B}) \rightarrow \mathcal{D}$  together with a natural transformation  $\eta : F \rightarrow RF \circ (Q_{\mathcal{A}} \times Q_{\mathcal{B}})$  that satisfies the following universal property: For any bi-exact bifunctor  $G : \mathcal{D}(\mathcal{A}) \times \mathcal{D}(\mathcal{B}) \rightarrow \mathcal{D}$  and a natural transformation  $\eta' : F \rightarrow G \circ (Q_{\mathcal{A}} \times Q_{\mathcal{B}})$ , there is a natural transformation  $\theta : RF \rightarrow G$  that  $\eta' = (\theta \star (Q_{\mathcal{A}} \times Q_{\mathcal{B}})) \circ \eta$ .

In particular, if  $RF$  exists, then it is unique up to unique isomorphisms of bi-exact bi-functors.  $\lrcorner$

**Prop. (4.10.3.13) [Deriving Bi-Exact Functors].** Let  $\mathcal{A}_1, \mathcal{A}_2$  be Abelian categories and  $F : K(\mathcal{A}_1) \times K(\mathcal{A}_2) \rightarrow \mathcal{D}$  be bi-exact bifunctor between triangulated categories, if  $\mathcal{R}_i$  are full subcategories of  $\mathcal{A}_i$  s.t.

- If  $R_i \rightarrow R'_i$  are quasi-isomorphisms in  $\mathcal{R}_i$ , the induced map  $F(R_1, R_2) \rightarrow F(R'_1, R'_2)$  is an isomorphism in  $\mathcal{D}$ .
- Any  $A_i^\bullet \in K(\mathcal{A}_i)$  admits some quasi-isomorphism  $A_i^\bullet \rightarrow I_i^\bullet$  where  $I_i^\bullet \in \mathcal{R}_i$ .

Then the right derived functor (4.10.3.12)  $RF$  exists. Moreover, for any  $R_i \in \mathcal{R}_i$ ,  $\eta_{R_1, R_2} : F(R_1, R_2) \rightarrow RF \circ (Q_{\mathcal{A}_1} \times Q_{\mathcal{A}_2})(R_1, R_2)$  is an isomorphism.  $\lrcorner$

*Proof:* Let  $S_i = \mathcal{R}_i \cap \text{QIso}(\mathcal{A}_i)$ , then  $\mathcal{R}_i, K(\mathcal{A}_i)$  and the localizing systems  $S_i, \text{QIso}(\mathcal{A}_i)$  satisfy the conditions in (4.10.1.6), so  $\iota : S_i^{-1}\mathcal{R}_i \subset D(\mathcal{A}_i)$  is a full triangulated subcategory, and it is also essentially surjective, thus it is an equivalence of categories. Let  $I_i$  be a right adjoint of the inclusion, then  $I_i$  is also an exact functor (4.8.4.10), and there is a natural isomorphism  $\zeta_i : \text{id}_{D(\mathcal{A}_i)} \cong \iota_i \circ I_i$ .

By hypothesis of universal properties, the functor  $F$  extends to an exact functor  $F_{\mathcal{R}} : \prod_i S_i^{-1}\mathcal{R}_i \rightarrow \mathcal{D}$ . Define

$$RF = F_{\mathcal{R}} \circ \prod_i \mathcal{I}_i : \prod_i D(\mathcal{A}_i) \rightarrow \mathcal{D}.$$

The rest of the proof is verbatim as that of (4.10.3.2).  $\square$

**Remark (4.10.3.14).** This proposition can be naturally extended to any multi-exact multi-functors. In fact, I suppose this can be deduced from the usual derived functors by considering the tensor product category  $\mathcal{A} \otimes \mathcal{B}$ , Cf. [Basic Concepts of Enriched Category Theory, Kelly].  $\lrcorner$

**Prop. (4.10.3.15) [Derived Functors of Adjunctions].** Let  $\mathcal{A}_1, \mathcal{A}_2$  be Abelian categories and  $(F, G)$  be an adjunction between  $K(\mathcal{A}_1)$  and  $K(\mathcal{A}_2)$ , and  $\mathcal{R}_i$  are full subcategories of  $\mathcal{A}_i$  s.t.

- If  $R_i \rightarrow R'_i$  are quasi-isomorphisms in  $\mathcal{R}_i$ , the induced map  $F(R'_1, R_2) \rightarrow \text{Hom}_{\mathcal{B}}(R_1, R'_2)$  is an isomorphism in  $D(\mathcal{A}_b)$ .
- Any  $A_1^\bullet \in K(\mathcal{A}_1)$  admits some quasi-isomorphism  $A_1^\bullet \rightarrow I_1^\bullet$  where  $I_1^\bullet \in \mathcal{R}_1$ .

• Any  $A_2^\bullet \in K(\mathcal{A}_2)$  admits some quasi-isomorphism  $I_1^\bullet \rightarrow A_2^\bullet$  where  $I_2^\bullet \in \mathcal{R}_2$ .  
then there is a functorial isomorphism

$$R\mathrm{Hom}(LF(A^\bullet), B^\bullet) \cong R\mathrm{Hom}(A^\bullet, RG(B^\bullet)) \in D(\mathcal{A}b)$$

for  $A^\bullet \in K(\mathcal{A}), B^\bullet \in K(\mathcal{B})$ . In particular,

$$\mathrm{Hom}(LF(A^\bullet), B^\bullet) \cong \mathrm{Hom}(A^\bullet, RG(B^\bullet)) \in \mathcal{A}b$$

┘

*Proof:* Regard both sides as right derived functors of the isomorphic bi-exact bi-functors

$$K(\mathcal{A})^{op} \times K(\mathcal{B}) \rightarrow D(\mathcal{A}b) : (A^\bullet, B^\bullet) \mapsto \mathrm{Hom}_B^\bullet(F(A^\bullet), B^\bullet) \cong \mathrm{Hom}_A^\bullet(A^\bullet, G(B^\bullet)) \in D(\mathcal{A}b).$$

Then the functorial isomorphism follows from universal properties. □

**Prop. (4.10.3.16).** Situation as in (4.10.3.15), for any  $K^\bullet \in K(\mathcal{A}_2)$ , there is a commutative diagram of adjunction maps

$$\begin{array}{ccc} LF \circ G(K^\bullet) & \longrightarrow & F \circ G(K^\bullet) \\ \downarrow & & \downarrow \\ LF \circ RG(K^\bullet) & \longrightarrow & K^\bullet \end{array}$$

┘

*Proof:* Cf. [Sta]0FPI. □

### Internal Hom

**Def. (4.10.3.17) [Internal Hom].** If  $\mathcal{A}$  is an Abelian category and  $K(\mathcal{A})$  has enough K-injectives or enough K-projectives, thus by (4.10.3.13), we can define the **internal Hom**

$$R\mathrm{Hom} : D(\mathcal{A})^{op} \times D(\mathcal{A}) \rightarrow D(\mathcal{A})$$

as the right derived functor of the bi-exact bifunctor  $\mathrm{Hom}^\bullet : K(\mathcal{A})^{op} \times K(\mathcal{A}) \rightarrow D(\mathcal{A}b)$ . ┘

**Prop. (4.10.3.18) [Ext Groups].** For  $X, Y \in D(\mathcal{A})$ , define the **ext groups**

$$\mathrm{Ext}_{\mathcal{A}}^i(X, Y) = H^i(R\mathrm{Hom}(X, Y)) = \mathrm{Hom}_{D(\mathcal{A})}(X[0], Y[i]).$$

┘

*Proof:* To show  $H^i(R\mathrm{Hom}(X, Y)) = \mathrm{Hom}_{D(\mathcal{A})}(X[0], Y[i])$ , choose a K-injective resolution  $Y \rightarrow I^\bullet$  of  $Y$ , then

$$H^i(R\mathrm{Hom}(X, Y)) = H^i(\mathrm{Hom}^\bullet(X, I^\bullet)) = \mathrm{Hom}_{K(\mathcal{A})}(X, I^\bullet[n]) = \mathrm{Hom}_{D(\mathcal{A})}(X, I^\bullet[n]) = \mathrm{Hom}_{D(\mathcal{A})}(X, Y[n])$$

by (4.8.7.10) and the definition (4.10.2.1). □

**Prop. (4.10.3.19).** If  $P^\bullet \rightarrow X^\bullet$  is a projective resolution, then  $\mathrm{Ext}^i(X^\bullet, Y^\bullet) = \mathrm{Hom}_{K(\mathcal{A})}(P^\bullet[-i], Y^\bullet)$ .

If  $Y^\bullet \rightarrow I^\bullet$  is an injective resolution, then  $\mathrm{Ext}^i(X^\bullet, Y^\bullet) = \mathrm{Hom}_{K(\mathcal{A})}(X^\bullet, I^\bullet)$ . ┘

**Prop. (4.10.3.20).** If  $X \in D^{\leq a}(\mathcal{A})$  and  $Y \in D^{\geq b}(\mathcal{A})$ , then for  $i < b - a$ ,  $\text{Ext}^i(X, Y) = 0$ , and  $\text{Ext}^{b-a}(X, Y) = \text{Hom}(H^a(X), H^b(Y))$ .

In particular, for  $A, B \in \mathcal{A}$ ,  $\text{Ext}^i(A, B) = 0$  for  $i < 0$  and  $\text{Ext}^0(A, B) = \text{Hom}(A, B)$ .  $\lrcorner$

*Proof:* This is because  $X$  can be represented by  $K^{\leq a}(\mathcal{P})$  or  $Y$  can be represented by  $K^{\geq b}(\mathcal{I})$ .  $\square$

**Prop. (4.10.3.21) [Long Exact Sequences].** Let  $0 \rightarrow A_1 \rightarrow A_2 \rightarrow A_3 \rightarrow 0$  be an exact sequence in  $\mathcal{A}$ , then it is distinguished in  $D(\mathcal{A})$ , so by (4.8.4.13), for any  $B \in \mathcal{A}$ , there is a long exact sequence

$$0 \rightarrow \text{Hom}(B, A_1) \rightarrow \text{Hom}(B, A_2) \rightarrow \text{Hom}(B, A_3) \rightarrow \text{Ext}^1(B, A_1) \rightarrow \text{Ext}^1(B, A_2) \rightarrow \dots,$$

and similarly a long exact sequence

$$0 \rightarrow \text{Hom}(A_3, B) \rightarrow \text{Hom}(A_2, B) \rightarrow \text{Hom}(A_1, B) \rightarrow \text{Ext}^1(A_3, B) \rightarrow \text{Ext}^1(A_2, B) \rightarrow \dots$$

$\lrcorner$

**Def. (4.10.3.22) [Yoneda Extensions].** Let  $\mathcal{A}$  be an Abelian category and  $A, B \in \mathcal{A}$ , a **Yoneda extension** of  $B$  by  $A$  of degree  $d$  is an exact sequence

$$0 \rightarrow A \rightarrow Z_{d-1} \rightarrow \dots \rightarrow Z_0 \rightarrow B \rightarrow 0.$$

One Yoneda extension is said to **dominate** another if there is a map of extensions s.t. restricts to  $\text{id}_A$  and  $\text{id}_B$ . Two Yoneda extensions of degree  $d$  is called **equivalent** if they are dominated by a common Yoneda extension. (Notice this is an equivalence relation by (4.10.3.23)).  $\lrcorner$

**Prop. (4.10.3.23) [Ext and Yoneda Extensions].** There is a map from the equivalence classes of Yoneda extensions of degree  $d$  of  $B$  over  $A$  to  $\text{Ext}^d(B, A)$ , which maps the exact sequence  $0 \rightarrow A \rightarrow Z_{d-1} \rightarrow \dots \rightarrow Z_0 \rightarrow B \rightarrow 0$  to  $f s^{-1} \in \text{Hom}_{D(\mathcal{A})}(B[0], A[d])$ , where  $f : (A \rightarrow Z_{d-1} \rightarrow \dots \rightarrow Z_0) \rightarrow A[d]$ , and  $s : (A \rightarrow Z_{d-1} \rightarrow \dots \rightarrow Z_0) \rightarrow B[0]$ .

and corresponds to the set of  $i$ -term extensions of  $Y$  by  $X$ . There is a natural map

$$\text{Ext}_{\mathcal{A}}^i(X, Y) \times \text{Ext}_{\mathcal{A}}^i(Y, Z) \rightarrow \text{Ext}_{\mathcal{A}}^{i+j}(X, Z)$$

by composition or equivalently the conjunction of extensions.  $\lrcorner$

*Proof:* Cf. [Sta]06XU.  $\square$

**Prop. (4.10.3.24) [Explicit Addition as Extensions].** In an Abelian category with enough injectives, the extension  $\text{Ext}^1(N, M)$  is equivalent with the Abelian group of extensions with Baer sum as addition.  $\lrcorner$

*Proof:* We choose a projective resolution  $0 \rightarrow K \rightarrow P \rightarrow N \rightarrow 0$ , so  $\text{Hom}(K, M) \rightarrow \text{Ext}^1(N, M)$  is surjective, so choose a lifting and the pushout  $0 \rightarrow M \rightarrow L \rightarrow N \rightarrow 0$  with be the corresponding extension, Now the Baer sum is easy to define and verify.  $\square$

**Prop. (4.10.3.25).** If  $\mathcal{A}$  is an Abelian category and  $p \geq 0$  s.t.  $\text{Ext}^p(A, B) = 0$  for any  $A, B \in \mathcal{A}$ , then  $\text{Ext}^i(A, B) = 0$  for any  $i \geq p$  and  $A, B \in \mathcal{A}$ .  $\lrcorner$

*Proof:* Any Yoneda extension of degree  $i$  is a conjunction of extensions of degree  $p$  and degree  $i - p$ .  $\square$

**Cor. (4.10.3.26).** If  $\mathcal{A}$  is an Abelian category s.t.  $\text{Ext}^2(A, B) = 0$  for any  $A, B \in \mathcal{A}$ , then each object of  $D^b(\mathcal{A})$  is isomorphic to a direct sum of cohomologies.  $\lrcorner$

*Proof:* Let  $K$  be represented by  $K^\bullet \in D^{[a,b]}(\mathcal{A})$ . We use induction on  $b - a$ . If  $b - a > 0$ , then there is a distinguished triangle  $\tau_{\leq b-1}K \rightarrow K^\bullet \rightarrow H^b(K)[-b] \rightarrow \tau_{\leq b-1}K^\bullet[1]$  (4.10.1.4). If we can prove  $H^b(K)[-b] \rightarrow \tau_{\leq b-1}K^\bullet[1]$  is 0, then we finish by (4.8.4.5). But by induction and the hypothesis,

$$\text{Hom}_{D(\mathcal{A})}(H^b(K)[-b], \tau_{\leq b-1}(K^\bullet)[1]) = \oplus_{i < b} \text{Ext}_{\mathcal{A}}^{b-i+1}(H^b(K), H^i(K)),$$

which vanishes by hypothesis.  $\square$

### Acyclic Objects

**Prop. (4.10.3.27) [*F*-Acyclic Objects].** For a left exact functor  $F$ , an object  $X$  is (right) $F$ -acyclic if  $RF$  is defined for  $X$ , and the natural map  $F(X) \rightarrow RF(X)$  is an isomorphism, or equivalently  $R^iF(X) = 0$  for all  $i > 0$ .

Then there is an adapted class of  $F$  iff the class of  $F$ -acyclic objects  $\text{Acy}(F)$  is sufficiently large, and in this case adapted classes of  $F$  are exactly sufficiently large subclasses of  $\text{Acy}(F)$ , and  $\text{Acy}(F)$  contains all injectives (But the class of injectives may not be sufficiently large!).  $\lrcorner$

*Proof:* Cf. [Gelfand P195].  $\square$

**Prop. (4.10.3.28) [Leray's Acyclicity Lemma].** Let  $F : \mathcal{A} \rightarrow \mathcal{B}$  be an additive functor and  $RF$  is everywhere defined, then for a complex  $A^\bullet$  in  $K^+(\mathcal{A})$  consisting of  $F$ -acyclic objects, the natural map  $F(A^\bullet) \rightarrow RF(A^\bullet)$  is an isomorphism.  $\lrcorner$

*Proof:* Cf. [Sta]015E. This may be equivalent to (4.10.3.27).  $\square$

**Prop. (4.10.3.29) [Acyclic Criterion].** Let  $F$  be a left exact functor from an Abelian category  $\mathcal{C}$  of enough injectives to another Abelian category,  $T$  is a class of objects of  $\mathcal{C}$  that satisfies:

- $T$  is sufficiently large.
- Cokernel of maps between elements of  $T$  is in  $T$  and  $0 \rightarrow F(A) \rightarrow F(A') \rightarrow F(\text{Coker}) \rightarrow 0$  is exact. (To use induction).

Then every object of  $T$  is  $F$ -acyclic.  $\lrcorner$

*Proof:* Cf. [[Sta]05T8].  $\square$

**Prop. (4.10.3.30) [Injectives are adapted].** By (4.10.2.5), if  $\mathcal{A}$  contains sufficiently many injectives, then injective objects are adapted to any left exact functor  $F$ . (Because  $\text{id}$  on acyclic injective complexes is homotopic to 0 by the lemma).  $\lrcorner$

## 4 $D_\infty(R)$

### 5 (Co)Homological Dimension

**Prop. (4.10.5.1).** If  $\mathcal{A}$  has enough projectives, then the projective dimension of an object  $X$  is the length of projective resolutions. (Use resolution and long sequence).  $\lrcorner$

**Prop. (4.10.5.2) [Hilbert Theorem].** For an Abelian category  $\mathcal{A}$ , the category  $\mathcal{A}[T]$  is an Abelian category. If  $\mathcal{A}$  has enough projectives and have infinite direct sum, then  $\text{dhp}_{\mathcal{A}[T]}(X, t) \leq \text{dhp}_{\mathcal{A}}(X) + 1$  and equality with  $t = 0$ .  $\lrcorner$

**Cor. (4.10.5.3).** The Categories  $\mathcal{A}b$  and  $K[X]\text{-mod}$  have homological dimension 1.  $K[X_i, \dots, X_k]$  has homological dimension  $k$ .  $\lrcorner$

**Def. (4.10.5.4) [Injective Amplitude].** Let  $\mathcal{A}$  be an Abelian category with enough injectives,  $K \in D(\mathcal{A})$  is said to have **finite injective dimension** if  $K \in D^b(\mathcal{I})$ . It is said to have **injective amplitude in  $[a, b]$**  if  $K \in D^{[a, b]}(\mathcal{I})$ .  $\lrcorner$

**Prop. (4.10.5.5).** Let  $\mathcal{A}$  be an Abelian category and  $K \in D(\mathcal{A})$ ,

- If  $K \in D^b(\mathcal{A})$  and  $H^i(K)$  all have finite injective dimensions, then  $K$  also has finite injective dimension.
- If  $K$  is represented by  $K^\bullet \in K^b(\mathcal{A})$ , and  $K^i$  all have finite injective dimensions, then  $K$  also has finite injective dimension.

$\lrcorner$

*Proof:* 1 follows from the Grothendieck spectral sequence applied to the functor  $\text{Hom}(N, -)$  for any  $N \in \mathcal{A}$  and the CE resolution of  $K$  (4.8.9.10).

2 follows from 1 as we can use induction to show all  $H^i(K)$  has finite injective dimensions.  $\square$

## 6 Derived Limits and Colimits

**Def. (4.10.6.1) [Derived (Co)Limits].** Let  $\mathcal{D}$  be a triangulated category, and  $(K_n, f_n)$  is an inverse system of objects in  $\mathcal{D}$ , then an object  $K$  is called the **derived colimit** of it iff there  $\oplus K_n$  exists and there is a distinguished triangle

$$\oplus K_n \rightarrow \oplus K_n \rightarrow K \rightarrow \oplus K_n[1]$$

where the first map is given by  $(1 - f_n)$ . By TR1, the derived colimit exists as long as  $\oplus K_n$  exists, and by TR3 (4.8.4.13), the colimit is unique if it exists. And by TR3 again a morphism of systems induces a morphism of colimits.

The definition of **derived limit** is dual.  $\lrcorner$

**Prop. (4.10.6.2) [Cofinality of Hocolim].** Let  $\mathcal{D}$  be a triangulated category and  $(K_n, f_n)$  be a system, if  $0 \leq n_{i_0} < n_{i_1} < \dots$  be a sequence of integers, then there is an isomorphism  $ho \text{ colim } K_{n_i} \rightarrow ho \text{ colim } K_n$ .  $\lrcorner$

*Proof:* Cf. [[Sta]0CRJ].  $\square$

**Lemma (4.10.6.3).** Let  $\mathcal{A}$  be an Abelian category with countable products and enough injectives, then the derived limit  $R \lim$  for any inverse system in  $D^+(\mathcal{A})$  exists.  $\lrcorner$

*Proof:* It suffices to show  $\prod K_i^\bullet$  exists in  $D(\mathcal{A})$ . But every  $K_n^\bullet$  has a  $K$ -injective resolution  $I_n^\bullet$ , by (4.8.9.10)(4.10.2.5). And then  $\prod K_n^\bullet$  is represented by  $\prod I_n^\bullet$ , by (4.10.2.7).  $\square$

**Def. (4.10.6.4) [Rlim].** Rlim on an Abelian category  $\mathcal{A}$  with countable products and enough injectives is defined to be the right derived functor of  $\lim : \mathcal{A}^{\mathbb{N}} \rightarrow \mathcal{A}$ . Equivalently, it is just the derived limit (4.10.6.1)(4.10.6.3) in  $D(\mathcal{A})$  restricted to the case where each  $K_n$  is discrete.  $\lrcorner$

**Prop. (4.10.6.5).** Let  $R \lim \mathcal{A}$  exists on  $\mathcal{A}$ , if  $K_n, f_n$  is a system of objects in  $D^+(\mathcal{A})$ , then there are exact sequences

$$0 \rightarrow R^1 \lim(H^m(K_n), f_n) \rightarrow R^{m+1} \lim(K_n, f_n) \rightarrow \lim(H^m(K_n), f_n) \rightarrow 0.$$

Immediately from the definition (4.10.6.1).  $\lrcorner$

## 7 Spectral Sequence

Reference for this section is [Weibel Ch5]. All the definition below is dual for homology and cohomology, just rotate the diagram 180 degree.

We work in an Abelian category.

**Def. (4.10.7.1).** A convergent **Spectral Sequence** is a three-dimensional arrange of entries  $E_r^{p,q}$  that:

1.  $d_r : E_r^{p,q} \rightarrow E_r^{p+r,q-r+1}$  that  $d_r d_r = 0$ .
2.  $H^{p,q}(E_r^{p,q}) \cong E_{r+1}^{p,q}$ . And  $E_r^{p,q}$  has a direct limit  $E_\infty^{p,q}$ .
3. There is a complex  $E^\bullet$  and a decreasing bounded filtration  $F^p E^n$  on each  $E^n$  and  $E_\infty^{p,q} \cong F^p E^{p+q} / F^{p+1} E^{p+q}$ .

┘

**Def. (4.10.7.2) [Notations For Cohomological Spectral Sequence].**

- The cohomology filtration is called **bounded below**  $F^{n_s} E^n = 0$  for some  $n_s$ , it is called **bounded above**  $F^{n_s} E^n = E^n$  for some  $n_s$ .
- The cohomology filtration is called **exhaustive** iff  $\cup F^i E^n = E^n$ .
- The spectral sequence is called **regular** iff  $d_{pq}^r = 0$  for sufficiently large  $r$ .
- A spectral sequence is said to **weakly converges** to  $E^\bullet$  if there is a filtration

$$\dots \subset F^t H^n \subset F^{t-1} H^n \subset \dots \subset F^s H^n \subset \dots \subset H^n$$

that  $E_\infty^{pq} \cong F^p H^{p+q} / F^{p+1} H^{p+q}$ .

- A spectral sequence **approaches**  $E^\bullet$  if it weakly converges to  $E^\bullet$ .
- A spectral sequence **converges** to  $E^\bullet$  if it approaches  $E^\bullet$ , it is regular, and  $E^n = \varprojlim (E^n / F^p E^n)$ .
- If a first quadrant spectral sequence converges to  $E^\bullet$ , then the morphisms  $E_0^{n,0} \rightarrow E_\infty^{n,0} \subset E^n$  and  $E^n \rightarrow E_\infty^{0,n} \rightarrow E_0^{0,n}$  are called the **edge morphisms**.

┘

**Prop. (4.10.7.3) [Notation for Filtrations on Homological Complexes].** Let  $C_\bullet$  be a complex and  $\dots \subset F_{p-1} C \subset F_p C \subset \dots \subset C$  be filtrations of complexes. Then it is called **exhaustive** if  $C = \cup F_p C$ . It is called **Hausdorff** if  $\cap F_p C = 0$ . It is called **complete** if  $C = \varprojlim C / F_p C$ .

┘

**Def. (4.10.7.4) [Spectral Sequence of a Filtered Complex].** For a complex  $K^\bullet$  and a filtration  $F^p K^n$  on  $K^n$ , we have a natural spectral sequence

$$E_1^{pq} = H^{p+q}(F^p E^{p+q} / F^{p+1} E^{p+q}), \quad E^n = H^n(K^\bullet), \quad F^p E^n = H^n(F^p K^\bullet).$$

For a morphism of filtered complexes that are isomorphism for some  $r$ , induction on the exact sequence  $0 \rightarrow F^p E^n \rightarrow F^{p+1} E^n \rightarrow E_\infty^{p,n-p}$  and use five-lemma shows it induces isomorphism on  $H^* E$ .

┘

**Prop. (4.10.7.5) [Comparison Theorem].** For a morphism  $F$  between two convergent spectral sequences, if it is an isomorphism for some  $r$ , then it induce isomorphism on the infinite homologies.

┘

*Proof:* Clearly  $F$  induces isomorphisms on  $E_\infty^{p,q}$ . Because there are exact sequence

$$0 \rightarrow F^{p+1}H^n \rightarrow F^pH^n \rightarrow E_\infty^{p,n-p} \rightarrow 0$$

we can use five lemma and induction to show that  $F$  induces isomorphisms on  $F^pH^n/F^sH^n$ . Then because  $H^n = \cup F^pH^n$ , we can take colimit to show  $F$  induces isomorphisms on  $H^n/F^sH^n$ , then take inverse limits, we are done.  $\square$

**Prop. (4.10.7.6) [Classical Convergence].** If the filtration on a complex  $C_\bullet$  is bounded below and exhaustive for all  $C_n$ , then there is a spectral sequence that is also bounded below and converges to  $H_\bullet(C_\bullet)$ .  $\lrcorner$

*Proof:* Cf[Gelfand P203] for cohomological case and [Weibel P135] for homological case.  $\square$

**Prop. (4.10.7.7) [Complete convergence].** If the filtration is complete, exhaustive and the spectral sequence is regular, then the spectral sequence weakly converges to  $H_\bullet(C_\bullet)$ . And if it is also bounded above, then it converges to  $H_\bullet(C_\bullet)$ .  $\lrcorner$

*Proof:* Cf.[Weibel, P139].  $\square$

There are two examples, the stupid filtration and the canonical filtration, the canonical filtration is natural and factors through  $D(\mathcal{A})$ .

**Prop. (4.10.7.8) [Spectral Sequence of a Double Complex].** A double complex has two natural filtration of the total complex, they defines two spectral sequence, one has

$$E_{2,x}^{p,q} = H_x^p(H_y^{q,\bullet}(L^{\bullet,\bullet}))$$

and the other has

$$E_{2,y}^{p,q} = H_y^p(H_x^{q,\bullet}(L^{\bullet,\bullet})).$$

Cf.[Gelfand P209]. In fact under reflection, there is only one spectral sequence. For the horizontal filtration, the differential goes vertical first, for the vertical filtration, the differential goes horizontal first. The differential goes one way, the convergence goes reversely.

If both the filtration is finite and bounded, in particular if  $E$  is in the first quadrant, then they both converges to  $H^n(E)$ , this will generate important consequences.  $\lrcorner$

**Cor. (4.10.7.9).** If a double complex in the first quadrant has its all column acyclic (3rd-quadrant pointing), then the total complex is acyclic. Thus a morphism of double complex inducing quasi-isomorphism on each column induces a quasi-isomorphism on the total complex.

If a double complex has  $H_p(C_{*,q}) = 0, \forall p > 0, q$ , then

$$H_n(\text{Tot}C_{*,*}) = H_n(\text{Coker}(C_{1,*} \rightarrow C_{0,*}))$$

$\lrcorner$

**Prop. (4.10.7.10) [Horizontal Filtration].** For a second-quadrant-free homology double complex, the filtration is bounded below and exhaustive for  $\text{Tot}^\oplus$ , so the classical convergence(4.10.7.6) applies and there is a convergence

$$E_{p,q}^2 = H_p^h H_q^v(C) \Rightarrow H_{p+q} \text{Tot}^\oplus(C).$$

For a fourth-quadrant free homology double complex, the filtration is complete and exhaustive for  $\text{Tot}^\Pi$ , so the complete convergence(4.10.7.7) applies and there is a weak convergence

$$E_{p,q}^2 = H_p^h H_q^v(C) \Rightarrow H_{p+q} \text{Tot}^\Pi(C).$$

$\lrcorner$

**Cor. (4.10.7.11)[Grothendieck Spectral Sequence].** If  $\mathcal{A}, \mathcal{B}, \mathcal{C}$  be Abelian categories,  $\mathcal{B}$  have enough injectives and  $F : K^+(\mathcal{A}) \rightarrow K^+(\mathcal{B}), G : K^+(\mathcal{B}) \rightarrow K^+(\mathcal{C})$  are exact functors between triangulated categories. If  $\mathcal{R}_{\mathcal{A}}$  is adapted to  $F, G \circ F$ , then for any  $X^\bullet \in K^+(\mathcal{A})$ , there is a spectral sequence convergence(to upper left)

$$E_2^{p,q} = R^p G(R^q F(X)) \implies E^\infty = R^n(G \circ F)(X).$$

And if  $\mathcal{R}_{\mathcal{A}} = \mathcal{I}_{\mathcal{A}}$ , this spectral sequence is functorial in  $X^\bullet$ .

In particular, this applies to the case that  $F$  is right adjoint to an exact functor and both  $\mathcal{A}, \mathcal{B}$  have enough injectives.  $\lrcorner$

*Proof:* Choose a functorial injective resolution  $X \mapsto I_X^\bullet$  (4.10.2.9), let  $K^\bullet = F(I_X^\bullet) = RF(X)$ , and choose a functorial CE resolution of  $K^\bullet$  (4.8.9.10), because the resolutions for  $B^i \rightarrow Z^i \rightarrow H^i$  and  $Z^i \rightarrow K^i \rightarrow B^{i+1}$  split and  $G$  is additive, we have

$$H_x^{q,\bullet}(G(L^{\bullet,\bullet})) = G(H_x^{q,\bullet}(L^{\bullet,\bullet})) = RG(H^q(K))$$

So

$$E_{2,y}^{p,q} = H_y^p(H_x^{q,\bullet}(L^{\bullet,\bullet})) = R^p G(H^q(K)) = R^p G(R^q F(X))$$

and

$$E^\bullet = RG(\text{Tot}(L)) = G(\text{Tot}(L)) = RG(K) = RG \circ RF(X) \cong R(G \circ F)(X) \text{ (4.10.3.6)}.$$

$\square$

**Cor. (4.10.7.12).** The low degree parts read:

$$0 \rightarrow R^1 G(F(A)) \rightarrow R^1(G \circ F)(A) \rightarrow G(R^1 F(A)) \rightarrow R^2(G)(F(A)) \rightarrow R^2(G \circ F)(A).$$

(Check definition). More generally, if  $R^p G(R^q F(A)) = 0, 0 < q < n$ , then

$$R^m G(F(A)) \cong R^m(G \circ F)(A) \quad m < n$$

And

$$0 \rightarrow R^n G(F(A)) \rightarrow R^n(G \circ F)(A) \rightarrow G(R^n F(A)) \rightarrow R^{n+1} G(F(A)) \rightarrow R^{n+1}(G \circ F)(A).$$

$\lrcorner$

**Remark (4.10.7.13).** The Grothendieck spectral sequence is very important.  $\lrcorner$

**Cor. (4.10.7.14)[Spectral Sequence for Hypercohomologies].** For chain complex  $K$  in  $K^+(\mathcal{A})$  and a left exact functor  $F$ , the CE resolution will generate two spectral sequences by (4.10.7.10):

$$E_{2,x}^{p,q} = H_x^p(R^q F(A)) \Rightarrow \mathbb{R}^{p+q}(A), \text{ when } A \text{ is bounded below}$$

$$E_{2,y}^{p,q} = (R^p F)(H^q(A)) \Rightarrow \mathbb{R}^{p+q}(A). \text{ weakly convergent}$$

where the RHS is the hypercohomologies (4.10.3.11).  $\lrcorner$

## 4.11 Differential Graded Algebras

Main references are [Ker] and [Sta].

**Def. (4.11.0.1) [Differential Graded Algebras].** A **differential graded algebra** or *DGA* is a chain complex  $A^\bullet$  of  $R$ -modules with  $R$ -linear maps  $A^m \times A^n \rightarrow A^{m+n}$  that

$$d(ab) = d(a)b + (-1)^n ad(b).$$

that makes  $\oplus A^n$  into an associative and unital  $R$ -algebra.

Notice the first condition is equivalent to giving a map  $\text{Tor}(A^\bullet \times_R A^\bullet) \rightarrow A$ .

For a differential algebra  $A^\bullet$ , a right **differential module** is defined naturally. The tensor operation gives a closed symmetric monoidal structure  $\mathcal{M}_A$ .

Notice a usual  $R$ -algebra  $A$  can be seen as a differential graded algebra as  $A^0 = A$  and  $A^n = 0$  for  $n > 0$ .

And as in the case of chain complexes, the category of differential modules over  $A$  can be given a derived category.  $\lrcorner$

**Def. (4.11.0.2).** A differential graded algebra  $A^\bullet$  is called **commutative** if  $ab = (-1)^{\deg(a)\deg(b)}ba$ . It is called **strictly commutative** if moreover  $a^2 = 0$  for  $\deg(a)$  odd.  $\lrcorner$

**Def. (4.11.0.3).** For two differential graded algebras  $A, B$ , the tensor graded algebra  $A^\bullet \otimes B^\bullet$  is given by the  $\text{Tor}(A^\bullet \otimes_R B^\bullet)$ .  $\lrcorner$

### 1 dg-Categories

**Def. (4.11.1.1) [dg-Categories].** Given a DGA  $A$ , a **dg-category** over  $A$  is a category enriched over the monoidal category  $\mathcal{M}_A$  (4.11.0.1). Let  $dgCat_A$  denote the category of small dg-categories over  $A$  where morphisms are given by monoidal functors.  $\lrcorner$

**Def. (4.11.1.2) [Homotopy Categories].** Because  $H^0$  and  $Z^0$  are right-lax monoidal functors from  $\text{Ch}(R)$  to  $\text{Mod}(R)$ , given a dg-category  $\mathcal{C}$ , by transferring, we can get categories  $H^0(\mathcal{C})$  and  $Z^0(\mathcal{C})$  enriched over  $\text{Mod}_{A^0}$ .  $\lrcorner$

**Def. (4.11.1.3) [Equivalences].** A morphism between dg-categories are called an **equivalence** if induces quasi-isomorphisms on all hom-complexes.  $\lrcorner$

**Prop. (4.11.1.4) [Model Category of dg-Categories].** There is a cofibrantly generated model category on  $dgCat_A$ , where weak equivalences are quasi-equivalences and the fibrations are morphisms  $F : \mathcal{A} \rightarrow \mathcal{B}$  that:

- induces component-wise surjections on hom-complexes.
- given an isomorphism  $g : F(X) \rightarrow Y \in H^0(\mathcal{B})$ , there is an isomorphism in  $H^0(\mathcal{A})$  lifting  $g$ .

This monoidal structure is induced from that of the case  $A = R$  and the right-lax monoidal functor  $\text{Ch}(R) \rightarrow \mathcal{M}(A)$  given by  $M^\bullet \mapsto A \otimes M$ .  $\lrcorner$

*Proof:* Cf. [Tabuada, Goncalo. Une structure de catgorie de modles de Quillen sur la catgorie des dg- catgories. C. R. Acad. Sci. Paris Sr. I Math. 340 (1) (2005), 15-19. (2005), 3309?3339.]  $\square$

### 2 Sheaves of DGAs

## 4.12 Topology II

**Notation(4.12.0.1).**

- Use notations on Topology Theory defined in [Topology I](#).
- Use notations on Group Theory defined in [Group Theory](#).
- Use notations on Category Theory defined in ??.
- Let  $X \in \mathcal{T}\text{op}$ .
- Let  $G \in \mathcal{T}\text{opGrp}$ ([4.12.1.1](#)).

┘

### 1 Topological Groups

**Def.(4.12.1.1) [Topological Groups].** A **topological group** is a group object in the category of groups([4.1.1.67](#)). ┘

**Prop.(4.12.1.2).** If  $U$  is a nbhd of  $\mathbf{1}$  in a topological group, then there is a nbhd  $V$  of  $\mathbf{1}$  that  $VV \subset U$ . ┘

*Proof:* Consider the map  $G \times G \rightarrow G$  continuous, and it maps  $(\mathbf{1}, \mathbf{1})$  to  $\mathbf{1} \in U$ , so the preimage of  $U$  contains a nbhd of  $(\mathbf{1}, \mathbf{1})$ , thus some  $V_1 \times V_2$ , then choose  $V = V_1 \cap V_2$ . ┘

**Prop.(4.12.1.3).** Let  $G$  be a connected topological group, then for any nbhd  $U$  of  $e$ ,  $G = \bigcup_{n=1}^{\infty} (U \cup U^{-1})^n$ .  
In particular, any open subgroup of  $G$  equals  $G$ . ┘

*Proof:* This is because the RHS is an open subgroup of  $G$ , so all its cosets in  $G$  are also open, so it equals  $G$  as  $G$  is connected. ┘

**Prop.(4.12.1.4) [Separating Axioms].** The following are equivalent:

- $e$  is a closed pt.
- $G$  is  $T_1$ .
- $G$  is Hausdorff( $T_2$ ).
- $G$  is regular.
- $G$  is completely regular

┘

*Proof:* ┘

**Prop.(4.12.1.5).** A Hausdorff topological group is completely regular. ┘

*Proof:* Use a sequence of neighbourhood of identity to construct a uniform metric on  $G$ . Then set  $\phi(x) = \min\{1, 2\sigma(a, x)\}$ . Cf.[Abstract Harmonic Analysis Ross §8.4] ┘

**Prop.(4.12.1.6).** For a compact subset  $K$  and a nbhd  $U$  of  $e$  in a topological group, there exists a nbhd  $V$  of  $e$  that  $xVx^{-1} \subset U$  for any  $x \in K$ . ┘

*Proof:* For any  $x$ , there exists a nbhd  $W_x$  of  $x$  and a nbhd  $V_x$  of  $e$  that  $txt^{-1} \in U$  for any  $t \in W_x$  and  $y \in V_x$ . Let f.m.  $W_{x_i}$  cover  $K$ , then  $V = \bigcap V_{x_i}$  satisfies the condition. ┘

**Prop. (4.12.1.7).** A compact open nbhd of  $e$  in a Hausdorff topological group contains an open subgroup of  $G$ .  $\lrcorner$

*Proof:* Cf.[Etale Cohomology Fulei P147]  $\square$

**Prop. (4.12.1.8)[Homogenous Space].** Let  $G$  be a topological group and  $H$  a closed subgroup.  $G/H$  is the quotient space in the quotient topology(4.4.1.9), then it is Hausdorff.  $\lrcorner$

*Proof:* If  $\bar{x} \neq \bar{y}$ , then consider a preimage  $xy^{-1} \in G \setminus H$ , then we can find some open subset  $V$  that  $VV \subset G \setminus H$  by(4.12.1.2), thus  $\bar{x} + \bar{V} \cap \bar{y} + \bar{V} = \emptyset$ . Hence  $G/H$  is Hausdorff.  $\square$

### Group Actions

**Prop. (4.12.1.9)[Quotient by Group Action is Open].** Let  $X \in \text{Top}$  and  $G \times X \rightarrow X$  be a group action, then the quotient map  $\pi : X \rightarrow X/G$  is open.  $\lrcorner$

*Proof:* This is because the  $\pi^{-1}(\pi(U)) = \bigcup_{g \in G} gU$ .  $\square$

**Def. (4.12.1.10)[Regular Action].** An **regular action** is an action  $\gamma : G \times X \rightarrow X$  that satisfies the following equivalent conditions:

- the graph of  $\gamma$  in  $X \times X$  is closed.
- The diagonal  $\Delta_{X/G} \subset X/G \times X/G$  is closed.
- $X/G$  is Hausdorff.

$\lrcorner$

*Proof:*  $2 \iff 3$  is clear, for 1, 2, notice  $X/G \times X/G \cong (X \times X)/(G \times G)$ , and the inverse image of  $\Delta$  in  $X \times X$  is just the graph of  $\gamma$ .  $\square$

**Def. (4.12.1.11)[Proper Action].** A **proper action** is an action  $\gamma : G \times X \rightarrow X$  that the graph map  $\Gamma : G \times X \rightarrow X \times X$  is a proper map.  $\lrcorner$

**Prop. (4.12.1.12)[Proper Action is Regular].** A proper action(4.12.1.11) of  $G$  on  $X \in \text{LCH}$  is a regular action.  $\lrcorner$

*Proof:* This follows from(4.4.2.12).  $\square$

**Def. (4.12.1.13)[Proper Discontinuous Actions].** A group action is called **proper discontinuous** iff any elements  $x, y \in H$  there are nbhds  $U_x, U_y$  that  $\{g \in G | g(U_x) \cap U_y \neq \emptyset\}$  is finite.  $\lrcorner$

**Def. (4.12.1.14)[Covering Space Action].** A **covering space action** is action of a topological group  $G$  on a topological space  $Y$  is called if for any  $y \in Y$ , there is a nbhd  $U$  that  $g(U) \cap U = \emptyset$  if  $g \neq 1$ .  $\lrcorner$

**Prop. (4.12.1.15)[Characterization of Proper Actions].** Let  $\gamma : G \times X \rightarrow X$  be a group action that  $X$  is Hausdorff, then  $\gamma$  is a proper action(4.12.1.11) iff any  $K \subset X$  compact, the set  $G_K = \{g \in G | g(K) \cap K \neq \emptyset\}$  is compact.

In particular, if  $H \leq G$  is an open subgroup of finite index, then  $G$  acts properly on  $X$  iff  $H$  acts properly on  $X$ .  $\lrcorner$

*Proof:* Let  $\Gamma : G \times X \rightarrow X \times X$  be the graph.

1  $\rightarrow$  2:  $G_K = \pi_1(\Gamma^{-1}(K \times K))$ , thus it is compact.

2  $\rightarrow$  1: Let  $L \subset M \times M$  be compact, then  $L \subset \pi_1(L) \times \pi_2(L)$ , and  $L$  is closed. Let  $K = \pi_1(L) \cup \pi_2(L)$ , then  $\Gamma^{-1}(L) \subset \Gamma^{-1}(\pi_1(L) \times \pi_2(L)) \subset G_K \times K$ , which is a closed subset of a compact set, so  $\Gamma^{-1}(L)$  is compact, and  $\Gamma$  is a proper map.  $\square$

**Prop. (4.12.1.16).** If  $G$  is a compact topological group, then any group action  $\gamma : G \times X \rightarrow X$  on a Hausdorff space  $X$  is proper.  $\lrcorner$

**Prop. (4.12.1.17) [Orbit of Proper Maps].** Let  $\theta$  be a proper action of  $G$  on a Hausdorff space  $X$ , then each orbit map  $\theta^{(p)}$  is proper. In particular, if  $X$  is locally compact, then the orbits are all closed (4.4.2.12).  $\lrcorner$

*Proof:* For any compact subset  $K \subset X$ ,  $(\theta^{(p)})^{-1}(K)$  is closed by continuity and is contained in  $G_{K \cup \{p\}}$ , thus is compact.  $\square$

**Prop. (4.12.1.18) [Properly Discontinuous Map is Proper].** If  $G$  acts properly discontinuously on a topological space  $H$ , then for any compact subsets  $K_1, K_2 \in H$ ,  $\{g \in G \mid K_2 \cap g(K_1) \neq \emptyset\}$  is finite. In particular, if  $H$  is Hausdorff, then it is a proper action.  $\lrcorner$

*Proof:* Notice for any two points we can find nbhds that f.m.  $g$  intersects these two nbhds, so we can use the compactness to find f.m. pair of nbhds to cover  $K_2$ , and then use these nbhds to cover  $K_1$  and finish the proof.  $\square$

**Prop. (4.12.1.19) [Proper Free Action is a Covering Space Action].** Let  $G \times X \rightarrow X$  be a proper free action on a locally compact Hausdorff space, then it is a covering space action.  $\lrcorner$

*Proof:* For any  $p \in X$ , choose a precompact nbhd  $U$  of  $x$ , then  $G_{\overline{U}}$  is finite, then shrink  $U$ .  $\square$

**Prop. (4.12.1.20) [Continuity].** Let a topological group  $G$  acts freely and properly on a space  $X$ . If  $G$  and  $X/G$  are both connected, then  $X$  is connected.  $\lrcorner$

*Proof:* If  $U, V$  are open subsets of  $X$  that  $U \cap V = \emptyset, U \cup V = X$ , then  $\pi(U), \pi(V)$  are open by (4.12.1.9). Now  $\pi(U) \cap \pi(V) = \emptyset$ , because otherwise there is a  $G$ -orbit of  $X$  intersecting both  $U$  and  $V$ , contradiction the fact  $G$  is connected. Then  $\pi_1(U) = \emptyset$  or  $\pi(V) = \emptyset$ , thus  $U = \emptyset$  or  $V = \emptyset$ , and  $X$  is connected.  $\square$

**Def. (4.12.1.21) [Constructible Action].** An action of a topological group  $G$  on a topological space  $X$  is called **constructible** if its graph is constructible in  $X \times X$  (4.12.2.10).  $\lrcorner$

**Prop. (4.12.1.22).** Let  $\gamma : G \times X \rightarrow X$  be an action

- $\gamma$  is constructible iff the diagonal  $\Delta_{X/G} \subset X/G \times X/G$  is constructible.
  - If  $\gamma$  is constructible and  $X$  is non-empty, then there is a  $G$ -invariant open subset  $U \subset X$  that  $G$  acts regularly.
  - For a constructible action, each  $G$ -orbit is locally closed.
- $\lrcorner$

*Proof:* Cf. [Bernstein-Zelevinsky, P54].  $\square$

### Totally Disconnectedness

**Prop. (4.12.1.23).** A compact topological group is totally disconnected iff the intersection of all compact open nbhds of  $e$  equals  $\{e\}$ .  $\lrcorner$

*Proof:* If it is totally disconnected, then  $\{1\}$  is closed, so  $G$  is Hausdorff(4.12.1.4), so by(4.4.1.25), the assertion is true. Conversely, if the intersection of all compact open nbhds of  $e$  equals  $\{e\}$ , then  $\{1\}$  is closed because  $G$  is a group.  $\square$

**Prop. (4.12.1.24).** A precompact nbhd of a  $e$  in a totally disconnected topological group contains a compact open subgroup.  $\lrcorner$

*Proof:* Cf.[Etale Cohomology Fulei P147].  $\square$

## 2 Spaces from Algebraic Geometry

### Noetherian Space

**Def. (4.12.2.1) [Noetherian Spaces].** A **Noetherian space** is a space  $X \in \mathcal{T}_{\text{op}}$  that any descending chain of closed subsets stabilizes. A **locally Noetherian space** is a space  $X \in \mathcal{T}_{\text{op}}$  that every point has a nbhd  $U$  s.t.  $U$  is a Noetherian space.  $\lrcorner$

**Prop. (4.12.2.2).** A Noetherian space is quasi-compact and all subsets of it in the induced topology is Noetherian hence quasi-compact.  $\lrcorner$

*Proof:* Let  $T \subset X$ , for a chain of closed subsets  $Z_i \cap T$  of  $T$ ,  $Z_1, Z_1 \cap Z_2, \dots$  stabilize in  $X$ , hence the chain stabilize in  $T$ .  $\square$

**Prop. (4.12.2.3).** If  $X$  can be covered by f.m. Noetherian subspaces, then  $X$  is Noetherian.  $\lrcorner$

*Proof:*  $\square$

**Prop. (4.12.2.4) [Noetherian Space F.M. Irreducible Components].** A Noetherian space has only f.m. irreducible component, hence it has only f.m. connected components.  $\lrcorner$

*Proof:* Let  $\mathcal{C}$  be the family of closed subset that has infinitely many component, then there is a minimal object, but it is not irreducible, one of the component has infinitely many components and be smaller.  $\square$

### Quasi-Separated

**Def. (4.12.2.5) [Quasi-Separated].** A space  $X$  is called **quasi-separated** if the diagonal morphism is quasi-compact(4.4.2.2). If  $X$  has a basis consisting of quasi-compact open subsets, then this is equivalent to any intersection of two quasi-compact open subsets is quasi-separated open.  $\lrcorner$

### Specialization & Generalization

**Def. (4.12.2.6) [Specializations and Generalizations].** Let  $X \in \mathcal{T}_{\text{op}}$  then  $x$  is said to be a **specialization of  $y$**  if  $x \in \overline{\{y\}}$ . And in this case  $y$  is said to be a **generalization of  $x$** .

And they are called **immediate specializations/generalizations** if there are no other points  $z \in X$  s.t.  $y \rightarrow z \rightarrow x$ .  $\lrcorner$

**Def. (4.12.2.7)[Going Up and Down].** A map  $f$  of spaces is said to satisfy the **going-up property** iff specialization lifts along  $f$ . It is said to satisfy the **going-down property** iff generalization lifts along  $f$ .  $\lrcorner$

**Prop. (4.12.2.8).** A closed map satisfies going-up.  $\lrcorner$

*Proof:* If  $y \rightarrow y'$ ,  $f(x) = y$ , consider  $f(\overline{\{x\}})$ , it is closed and contains  $y$ , so it contains  $y'$ , thus the result.  $\square$

### Constructible Sets

**Def. (4.12.2.9)[Retrocompact Subsets].** A subset of  $X$  is called **retrocompact** if the inclusion map is quasi-compact (4.4.2.2).  $\lrcorner$

**Def. (4.12.2.10)[Constructible Subset].** A subset of  $X$  is called **constructible** if it is a finite union of sets of the form  $U \cap V^c$  where  $U, V$  are open and retrocompact in  $X$ . In the case when  $X$  is Noetherian, by (4.12.2.2), all subsets are retrocompact hence constructible sets are just union of locally closed subsets of  $X$ .

A set of  $X$  is called **locally constructible** if locally it is constructible. If  $X$  is quasi-compact, then a locally constructible set is just a constructible set.  $\lrcorner$

**Prop. (4.12.2.11).** The set of constructible subsets of  $X$  is a Boolean algebra.  $\lrcorner$

*Proof:* Cf. [Sta]005H.  $\square$

**Prop. (4.12.2.12)[Constructible and Subsets].**

- If  $U$  is open in  $X$ , then for any  $E$  constructible in  $X$ ,  $E \cap U$  is constructible in  $U$ .
- If  $U$  is retrocompact open and  $E$  is constructible in  $U$ , then  $E$  is constructible in  $X$ .

$\lrcorner$

*Proof:* Easy.  $\square$

**Prop. (4.12.2.13).** Any constructible subsets of  $X$  is retrocompact.  $\lrcorner$

*Proof:* It suffices to prove  $U_i \cap V_i^c \cap W$  is quasi-compact for  $W$  quasi-compact, but this is because it is a closed subspace of the quasi-compact subspace  $U_i \cap W$ .  $\square$

**Cor. (4.12.2.14).** An open subset of  $X$  is constructible iff it is retrocompact, a closed subset of  $X$  is constructible iff its complement is retrocompact by (4.12.2.11).  $\lrcorner$

**Prop. (4.12.2.15).** If  $X = V_1 \cup \dots \cup V_m$  is a finite union of retrocompact open subsets, then a subset  $E \subset X$  is constructible in  $X$  iff  $E \cap V_i$  is constructible in  $V_i$  for each  $i$ .  $\lrcorner$

*Proof:* Cf. [Sta]053W.  $\textcolor{red}{?}$   $\square$

**Def. (4.12.2.16)[Constructible topology].** The **constructible topology**  $X_{cons}$  on a quasi-compact space  $X$  is generated by the open subsets  $U, U^c$ , where  $U$  is a quasi-compact open.

Notice that the space is quasi-compact, so the constructible topology is the coarsest topology that every constructible subset of  $X$  is both open and closed.  $\lrcorner$

**Prop. (4.12.2.17).** Let  $X$  be quasi-compact and quasi-separated, then any constructible subset of  $X$  is quasi-compact. In particular, if  $Y$  is closed in  $X$ , then  $Y$  is constructible iff it is quasi-compact.  $\lrcorner$

*Proof:* For  $Y = \bigcup_{i=1}^n (U_i - V_i)$ , with  $U_i, V_j$  quasi-compact open in  $X$ , then  $U_i - V_i$  is closed in  $U_i$  thus quasi-compact, and then  $Y$  is quasi-compact.  $\square$

**Prop. (4.12.2.18).** Let  $E$  be a constructible subset of a space  $X$ , if  $E$  is dense in then  $E$  contains some open dense subset of its closure.  $\lrcorner$

*Proof:* Let  $Y = \bigcup_{i=1}^k Y_i$  where  $Y_i$  are locally closed. Denote  $Z_i = \overline{Y_i} \setminus Y_i$ ,  $Z = \bigcup Z_i$ ,  $W = \overline{Y} \setminus Z$ . Then  $W \subset Y$ , and we show that  $W$  is open dense in  $\overline{Y}$ : As  $Y_i$  are locally closed,  $Y_i$  is open in  $\overline{Y_i}$ , thus  $Z_i$  is closed, and  $Z$  is closed, so  $W$  is open in  $\overline{Y}$ . To show  $W$  is dense in  $\overline{Y}$ : If some open subset  $U$  of  $\overline{Y}$  satisfies  $U \cap Z_i$ , then  $U$  cannot be contained in any  $Z_i$ , so we can inductively show  $U \setminus Z_1, U \setminus (Z_1 \cup Z_2), \dots$  are non-empty, which is a contradiction.  $\square$

### Irreducible

**Def. (4.12.2.19) [Irreducible Space].** A space is called **irreducible** iff there are no two nonempty nonintersecting open subsets. Thus an open subset of an irreducible set is dense and irreducible.  $\lrcorner$

**Prop. (4.12.2.20).** If  $Y$  is irreducible in  $X$ , then  $\overline{Y}$  is also irreducible.  $\lrcorner$

*Proof:* Any two nonempty open sets of  $\overline{Y}$  must intersect  $Y$  thus must intersect.  $\square$

**Prop. (4.12.2.21).** If  $X \in \mathcal{T}_{\text{op}}$  and  $U \subset X$  is open, then  $Y \mapsto \overline{Y}$  is a order preserving bijection between irreducible closed subspaces of  $U$  and irreducible closed subspaces of  $X$  meeting  $U$ .  $\lrcorner$

### Jacobson Space

**Def. (4.12.2.22).** Let  $X$  be a space and  $X_0$  the set of closed pts of  $X$ , then  $X$  is called **Jacobson** iff  $\overline{Z \cap X_0} = Z$  for every closed subset  $Z$  of  $X$ . This is equivalent to every non-empty locally closed subset of  $X$  contains a closed pt.

Thus there is a correspondence between closed subsets of  $X_0$  and closed subsets of  $X$ , so they have the same Krull dimension.  $\lrcorner$

**Prop. (4.12.2.23).** Being Jacobson is local. And for an open covering  $U_i$  of  $X$ ,  $X_0 = \bigcup U_{i,0}$ .  $\lrcorner$

*Proof:* Firstly, if  $X = \bigcup U_i$  where  $U_i$  are Jacobson,  $X_0 \cap U_i = U_{i,0}$ . One direction is trivial, for the other, let  $x$  be closed in  $U_i$ , then consider  $\{x\} \cap U_j$ . If  $x \notin U_j$ , this is empty, if  $x \in U_j$ , consider  $T = \{x\} \cup (U_j - U_i \cap U_j)$ , then  $T$  is closed in  $U_j$ , so by hypothesis, closed pts of  $U_j$  are dense in  $T$ , so  $x$  must be closed in  $U_j$ , so  $x$  is closed in  $X$ . Now clearly  $X$  is Jacobson.

Conversely, if  $X$  is Jacobson, for a closed subset  $Z$  of  $U_i$ ,  $X_0 \cap \overline{Z}$  is dense in  $\overline{Z}$ , so  $X_0 \cap Z$  is dense in  $Z$ , then clearly  $U_i$  is Jacobson.  $\square$

**Cor. (4.12.2.24).** If  $X$  is Jacobson, then any locally constructible sets of  $X$  is Jacobson. And its closed pts are closed in  $X$ .  $\lrcorner$

*Proof:* By the proposition, we only have to prove for constructible sets. For  $T = \bigcup T_i$  where  $T_i$  is locally closed, then a locally closed set in  $T$  has a non-empty intersection  $T \cap T_i$  which is also locally closed for some  $i$ .

Hence it has a closed pt in  $X$  hence in  $T$ , so  $T$  is Jacobson. The second assertion is implicit in the proof.  $\square$

**Prop. (4.12.2.25).** If  $X$  is Jacobson, then an open set  $U$  of  $X$  is compact iff  $U \cap X_0$  is compact, hence an open set  $U$  is retrocompact iff  $U \cap X_0$  is retrocompact.

Hence the constructible sets of  $X$  correspond to the constructible sets of  $X_0$ .

And Irreducible closed subsets correspond to irreducible subsets of  $X_0$ .  $\lrcorner$

### Krull-Dimension

**Def. (4.12.2.26) [Krull-Dimensions].** The **Krull-dimension** of a topological space is the length of the longest chain of closed irreducible subsets.

The **local Krull-dimension**  $\dim_x(X) = \min\{\dim U \mid x \in U \subset X \text{ open in } X\}$ .  $\lrcorner$

**Prop. (4.12.2.27).** If  $Y \subset X$ , then  $\dim Y \leq \dim X$ , because the closure of any chain of  $Y$  is a chain of  $X$  by (4.12.2.20).

For an open covering  $\{U_i\}$  of  $X$ ,  $\dim X = \sup \dim U_i$ , because for any chain of closed irreducible subsets, if  $U_i$  intersects the minimal one, then  $\dim U_i = \text{length of this chain}$ .  $\lrcorner$

**Prop. (4.12.2.28).**  $\dim X = \sup \dim_x(X)$ .  $\lrcorner$

*Proof:* The right is smaller than the left by (4.12.2.27), and for any chain  $Z_0 \subset Z_1 \subset \dots \subset Z_n$  of irreducible closed subset of  $X$ , if I choose a point  $x \in Z_0$ , then  $\dim_x(X) \geq n$ .  $\square$

**Prop. (4.12.2.29).** In case  $X = \text{Spec } A$  for a Noetherian ring  $A$ ,  $\dim X = \sup \dim A_p$ , because  $A$  is of finite ?  $\lrcorner$

**Def. (4.12.2.30) [Codimensions].** Let  $X \in \mathcal{T}\text{op}$  and  $Y \subset X$  be an irreducible closed subspace, then the **codimension** of  $Y$  in  $X$  is defined to be the supremum of lengths  $e$  of chains  $Y = Y_0 \subset Y_1 \subset \dots \subset Y_e = X$ , denoted by  $\text{codim}(Y, X)$ .  $\lrcorner$

**Prop. (4.12.2.31) [Codimensions are Local].** Let  $X \in \mathcal{T}\text{op}$  and  $Y \subset X$  be an irreducible closed subspace. If  $U \subset X$  is an open subset s.t.  $Y \cap U \neq \emptyset$ , then  $\text{codim}(Y, X) = \text{codim}(Y \cap U, U)$ .  $\lrcorner$

*Proof:* Cf. [Sta]02I4. ?  $\square$

### Catenary spaces and Dimension Functions

**Def. (4.12.2.32) [Catenary Space].**  $X \in \mathcal{T}\text{op}$  is called **catenary space** iff for any inclusion of irreducible closed subsets of  $X$ , their codimension is finite and every maximal chain of irreducible closed subsets has the same dimension. This is equivalent to  $\text{codim}(X, Y) + \text{codim}(Y, Z) = \text{codim}(X, Z)$ .  $\lrcorner$

**Prop. (4.12.2.33).** Catenary is a local property, by (4.12.2.21).  $\lrcorner$

**Def. (4.12.2.34) [Dimension Function].** For  $X \in \mathcal{T}\text{op}$ , consider the specialization relation (4.12.2.6), a **dimension function** is a function  $\delta : |X| \rightarrow \mathbb{Z}$  that

- if  $y$  is a specialization of  $x$  in  $X$ , then  $\delta(y) < \delta(x)$ .
- if it is a direct specialization, then  $\delta(y) = \delta(x) - 1$ .

The dimension function is usually considered only when the space is sober.  $\lrcorner$

**Prop. (4.12.2.35).** Let  $X \in \mathcal{T}\text{op}$  be sober and catenary with a catenary function, then  $X$  is catenary, and if  $x$  is a specialization of  $x$  in  $X$ , then

$$\delta(x) - \delta(y) = \text{codim}(\overline{\{y\}}, \overline{\{x\}}).$$

$\lrcorner$

*Proof:* This is clear from the definitions (4.12.2.30).  $\square$

**Prop. (4.12.2.36).** If  $X \in \mathcal{T}\text{op}$  be locally Noetherian and sober, and  $\delta, \delta'$  are two dimension functions on  $X$ , then  $\delta - \delta'$  is locally constant on  $X$ .  $\lrcorner$

*Proof:* We may assume  $X$  is Noetherian, so it has only f.m. irreducible components by (4.12.2.4), then  $\delta - \delta'$  is locally constant on the  $X$  minus the irreducible components not passing through  $x$  by (4.12.2.35).  $\square$

### Sober Spaces

**Def. (4.12.2.37) [Sober Spaces].** A **sober space** is a topological space  $X \in \mathcal{Top}$  s.t. every irreducible closed subset has a unique generic point.  $\lrcorner$

**Prop. (4.12.2.38).** A sober space (4.12.2.37) is  $T_1$ . Conversely, a finite  $T_0$  space is sober.  $\lrcorner$

*Proof:* The first assertion is because if  $x \in \overline{\{y\}}$  and  $y \in \overline{\{x\}}$ , then  $\overline{\{x\}} = \overline{\{y\}}$ , and this irreducible closed subset has two generic point, contradiction.

If the space is finite, then for a closed irreducible subset  $T = \{x_1, \dots, x_n\}$ ,  $T = \cup \overline{\{x_i\}}$ , as it is irreducible,  $T = \overline{\{x_i\}}$  for some  $x_i$ , and  $i$  is unique as it is  $T_1$ , so  $X$  is sober.  $\square$

**Prop. (4.12.2.39) [Soberization].** There is a left adjoint  $t$  to the forgetful functor from the Sober spaces.  $t(X)$  consists of irreducible closed subsets of  $X$ , and use  $t(Y)$  for  $Y$  closed as closed subsets. for a map  $f : X \rightarrow Z$  to a sober space  $Z$ , the extension maps the generic point of an irreducible  $Y$  to the generic point of the closure of  $f(Y)$ .  $\lrcorner$

**Def. (4.12.2.40) [Zariski-Space].** A Noetherian sober space (4.12.2.37) is called a **Zariski-space**.  $\lrcorner$

**Prop. (4.12.2.41) [Catenary and Sober Spaces].** Let  $X \in \mathcal{Top}$  be locally Noetherian, sober, then  $X$  is catenary iff any point  $x \in X$  has a nbhd  $U$  which has a dimension function.  $\lrcorner$

*Proof:* Cf. [Sta]02IC.

The other direction follows from (4.12.2.35) and (4.12.2.33).  $\square$

### 3 Spectral Spaces

References are [Sta]5.23 and [Adic Spaces].

**Def. (4.12.3.1) [Spectral Space].** A **spectral space** is a qcqs (4.12.2.5) sober space s.t. the quasi-compact opens form a basis for the topology.

A space is called **locally spectral** iff it has an open covering by spectral spaces.

A morphism  $f : X \rightarrow Y$  between locally spectral spaces is called a **spectral map** if for any open spectral spaces  $U \subset f^{-1}(V)$ ,  $f : U \rightarrow V$  is quasi-compact.  $\lrcorner$

**Prop. (4.12.3.2) [Connected Components of Spectral Spaces].** If  $X$  is a spectral space (4.12.3.1), then any connected component of  $X$  is an intersection of clopen subsets.  $\lrcorner$

*Proof:* Let  $x \in X$  and  $S$  be the intersection of all clopen subsets of  $X$  containing  $x$ , then it suffices to show  $S$  is connected. Suppose  $S = B \amalg C$  with  $B, C$  closed, then  $B, C$  are compact, thus there exist quasi-compact opens  $U, V \subset X$  that  $B = U \cap S, C = V \cap S$ . Then  $U \cap V \cap S = \emptyset$ . Now  $U \cap V$  is quasi-compact also, so there exists some clopen  $Z_\alpha$  containing  $x$  that  $Z_\alpha \cap U \cap V = \emptyset$ . Similarly, there exists some clopen  $Z_\beta$  containing  $x$  that  $Z_\beta \subset U \cup V$ . Then  $Z_\gamma = Z_\alpha \cap Z_\beta$  is clopen and contained in  $U \Delta V$ , Then Both  $Z_\gamma \cap U$  and  $Z_\gamma \cap V$  is clopen, so  $U = \emptyset$  or  $V = \emptyset$ .  $\square$

**Cor. (4.12.3.3).** Let  $X$  be a spectral space, then for a subset  $T$  of  $X$ ,  $T$  is an intersection of clopen subsets of  $X$  iff  $T$  is closed in  $X$  and is a union of connected components of  $X$ .  $\lrcorner$

*Proof:* If  $T$  is an intersection of clopen subsets, then  $T$  is clearly a union of connected components of  $X$ . Conversely, if  $T$  is a union of connected components of  $X$ , if  $x \notin T$ , let  $C$  be a connected components containing  $x$ . Then  $C$  is an intersection of clopen subsets, by (4.12.3.2). These subsets are closed under finite intersections, so by the compactness of  $T$ , there is a clopen subset containing  $T$  but not  $x$ , so we are done.  $\square$

**Prop. (4.12.3.4).** The product of two spectral spaces(4.12.3.1) is spectral.  $\lrcorner$

*Proof:* Cf.[Sta]0907? $\square$

**Prop. (4.12.3.5).** If  $X$  is quasi-compact and every connected component of  $X$  is an intersection of clopen subsets, then  $\pi_0(X)$  is a profinite space. In particular, this applies when  $X$  spectral, by(4.12.3.2).  $\lrcorner$

*Proof:* Cf. [Sta]0900. $\square$

### Constructible Topology

**Lemma (4.12.3.6).** If  $X$  is a finite  $T_0$  space, then it is spectral(4.12.3.1) and every subset of  $X$  is constructible.  $\lrcorner$

*Proof:* Cf.[Adic Space Morel, P26].  $\square$

**Prop. (4.12.3.7).** If  $X$  is a spectral space, then the constructible topology(4.12.2.16) is Hausdorff, totally disconnected and quasi-compact.  $\lrcorner$

*Proof:* The space is sober hence  $T_0$ (4.12.2.38), and then the constructible topology is Hausdorff and totally disconnected.

To show quasi-compactness, it suffices to show that the family  $\mathcal{C}$  of quasi-compact open and complement quasi-compact open subsets has the finite intersection property(4.4.2.3). Notice elements in  $\mathcal{C}$  are all quasi-compact. Now if there is a family that has the finite intersection property by has intersection 0, by Zorn's lemma, there is a maximal one of them,  $\mathcal{B}$ . Now let  $Z$  be the intersection of all the closed subsets in  $\mathcal{B}$ , then it is non-empty as  $X$  is quasi-compact. And we claim  $Z$  is irreducible: otherwise  $Z = Z_1 \cup Z_2$ , thus there are quasi-compact open sets  $U_1, U_2$  that  $U_1 \cap Z_1 \neq \emptyset, U_1 \cap Z_2 = \emptyset, U_2 \cap Z_2 \neq \emptyset, U_2 \cap Z_1 = \emptyset$ . then let  $B_i = X - U_i$ , then  $B_1, B_2$  cannot be added to  $\mathcal{B}$  by maximality, so there is a finite intersection  $T_1, T_2$  that  $B_i \cap T_i = \emptyset$ . But then  $Z \cap T_1 \cap T_2 = \emptyset$ , but  $Z$  is an intersection of closed subsets, thus some finite intersection of closed subsets in  $\mathcal{B}$  will  $\cap T_1 \cap T_2 = \emptyset$ , contradiction.

So now  $Z$  is irreducible, but then for every element  $B \in \mathcal{B}$ ,  $Z \cap B$  contains the generic point of  $Z$ , thus the intersection of  $B$  is not empty, contradiction.  $\square$

**Cor. (4.12.3.8).** Let  $X$  be a spectral space, then

- The constructible topology is finer than the original topology.
- A subset  $X$  is constructible iff it is clopen in the constructible topology of  $X$ .
- If  $U$  is open in  $X$ , then the constructible topology induces the constructible topology on  $U$ .

$\lrcorner$

*Proof:*

1: Every open subset of  $X$  is a union of its quasi-compact open subsets, so it is open in the constructible topology.

2: Clearly constructible subset is clopen in the constructible topology. Conversely, if  $Y$  is clopen, then  $Y$  is a union of constructible subsets, but also it is quasi-compact, so it is a finite union of constructible subsets, thus constructible.

3: Cf.[Mor19] P28.  $\square$

**Prop. (4.12.3.9).** If  $E \subset X$  is closed in the constructible topology, then it is a spectral space with the induced topology, and the inclusion map is spectral.  $\lrcorner$

*Proof:* Cf. [Mor19]P34. □

**Prop. (4.12.3.10).** For a set  $E$  closed in the constructible topology in a spectral space,

- Every point of  $\overline{E}$  is a specialization of elements in  $E$ . Thus if  $E$  is stable under specialization, then it is closed.
- If  $E$  is open in the constructible topology and stable under generalization, then it is open. ┘

*Proof:* Cf. [Sta]0903? □

**Prop. (4.12.3.11).** For a map between spectral spaces  $f : X \rightarrow Y$ , the following are equivalent:

- $f$  is spectral.
- $f$  is quasi-compact.
- $f : X_{\text{cons}} \rightarrow Y_{\text{cons}}$  is continuous.

And if this is true, then  $f : X_{\text{cons}} \rightarrow Y_{\text{cons}}$  is proper. ┘

*Proof:*  $1 \rightarrow 2 \rightarrow 3$  is trivial, an open subset of  $X$  is quasi-compact iff it is clopen in the constructible topology (4.12.3.8), so  $3 \rightarrow 2$ . For  $2 \rightarrow 1$ , notice that if  $U \subset f^{-1}(V)$  are open spectrals, and  $W \subset U$  is quasi-compact open, then  $f^{-1}W \cap U$  is quasi-compact open, because  $X$  is quasi-separated.

Finally,  $f$  is proper because  $X_{\text{cons}}, Y_{\text{cons}}$  is compact Hausdorff (4.12.3.7), then use (4.4.2.10). □

### Criterion of Spectralness

**Lemma (4.12.3.12).** Let  $X$  be a quasi-compact  $T_0$  space that is has a subbasis consisting of quasi-compact open subsets that is stable under finite intersections. Let  $X'$  be the topology generated by the quasi-compact open subsets and their complements, then the following are equivalent:

- $X$  is spectral.
- $X'$  is compact Hausdorff, and its topology has a basis consisting of open and closed subsets.
- $X'$  is quasi-compact. ┘

*Proof:* Cf. [Adic Space Morel P30]. □

**Prop. (4.12.3.13) [Hochster's Criterion of Spectrality].** Let  $X' = (X_0, \mathcal{T}')$  be a quasi-compact topological space, and let  $\mathcal{U}$  be the family of clopen subsets of  $\mathcal{T}'$ , let  $\mathcal{T}$  be the topology generated by  $\mathcal{U}$ , let  $X = (X_0, \mathcal{T})$ .

Then if  $X$  is  $T_0$ , then it is spectral, and every element of  $\mathcal{U}$  is quasi-compact open in  $X$ , and  $X' = X_{\text{cons}}$ . ┘

*Proof:* Cf. [Adic Space Morel, P29]. □

**Prop. (4.12.3.14) [Spectral and Inverse Limit].** A space is spectral iff it is an inverse limit of finite sober (finite  $T_1$  (4.12.2.38)) spaces. ┘

*Proof:* Cf. [Sta]09XX. □

**Prop. (4.12.3.15) [Inverse Limits of Spectral Spaces].** An inverse limit of spectral spaces by spectral maps is a spectral space. ┘

*Proof:* ? □

**Prop. (4.12.3.16) [Spec and Spectral Space].** A spectral space is exactly the underlying space of spectrum of some ring.  $\lrcorner$

*Proof:* The spectrum of a ring is qc: if  $\cup D(f_i) = \text{Spec } A$ , then  $(f_i) = (1)$ , so f.m. of them generate (1). And similarly it is quasi-separable and  $D(f) = \text{Spec } A_f$  is quasi-compact. For the other direction, Cf. [M. Hochster. Prime ideal structure in commutative rings, Thm6] ?.  $\square$

**Cor. (4.12.3.17).** Every quasi-compact irreducible scheme is homeomorphic to an affine scheme.  $\lrcorner$

**Cor. (4.12.3.18) [Characterization of Spectral Spaces].** The following are equivalent for a topological space  $T$ :

1.  $T \cong \text{Spec } R$  for some ring  $R$ .
2.  $T \cong \varprojlim T_i$  where  $\{T_i\}$  is an inverse system of finite  $T_0$  spaces.
3.  $T$  is spectral.

$\lrcorner$

*Proof:* This follows from (4.12.3.16) and (4.12.3.14).  $\square$

### w-localness

**Def. (4.12.3.19) [pro-Zariski Localization].** A map of spectral spaces  $f : W \rightarrow V$  is called a **Zariski localization** if  $W = \coprod_i U_i$  where  $U_i \rightarrow V$  is a quasi-compact open immersion. A **pro-Zariski localization** is a cofiltered limit of Zariski localizations of  $V$ .  $\lrcorner$

**Def. (4.12.3.20) [w-Local].** A spectral space is called **w-local** if the set of closed pts of  $X$  is closed and any point of  $X$  specializes to a unique closed pt. A morphism of  $w$ -local spaces are called **w-local** if it is spectral and maps closed pts to closed pts.  $\lrcorner$

**Prop. (4.12.3.21).** If  $X$  is  $w$ -local and  $Y \subset X$  is a closed subset, then  $Y$  is also  $w$ -local.  $\lrcorner$

*Proof:*  $Y$  is spectral by (4.12.3.9).  $Y_0$  is closed because  $Y_0 = Y \cap X_0$ . And the second assertion is also trivial.  $\square$

**Prop. (4.12.3.22).** Let  $X$  be a spectral space and  $T$  profinite, then  $Y = X \times_{\pi_0(X)} T$  is also spectral and  $T = \pi_0(Y)$ . If moreover  $X$  is  $w$ -local, then  $Y$  is also  $w$ -local and  $Y \rightarrow X$  is  $w$ -local.  $\lrcorner$

*Proof:* Cf. [Sta]096C.  $\square$

**Def. (4.12.3.23) [Localization Along a Closed Set].** Given a closed set  $Z$  of a spectral set  $X$ , the pro-open subset of  $X$  consisting of all points that specializes to a point of  $Z$  is called the **localization of  $X$  along  $Z$** . And  $X$  is called **local along  $Z$**  if  $X_0 \subset Z$ .  $\lrcorner$

**Prop. (4.12.3.24).** A spectral space that is local along a closed  $w$ -local subset  $Z \subset X$  with  $\pi_0(Z) \cong \pi_0(X)$ , is also  $w$ -local.  $\lrcorner$

*Proof:*  $X_0 = Z_0$  is clearly closed, and if a pt  $x$  of  $X$  specializes to two closed pts of  $Z$ , then the  $\pi_0$  map is not injective, contradiction.  $\square$

## 4.13 Algebraic Topology I: Homotopies

References are [May99, AGP02, Hat02], [同调论, 姜伯驹], [<https://ncatlab.org/nlab/show/Introduction+to+Homotopy+Theory#HomotopyGroupsOfTopologicalSpaces>].

**Notation (4.13.0.1).**

- Use notations on topology defined in [Topology I](#).
- All spaces are assumed to be compactly generated, and products and mapping spaces are assumed to be compact generated versions.

┘

### 1 Homotopy Types

**Def. (4.13.1.1) [Retraction].** A **retraction** of a space  $X$  to a subspace  $A$  is a map  $r : X \rightarrow A$  that  $r|_A = \text{id}_A$ .

┘

**Def. (4.13.1.2) [Homotopy].** A **homotopy**  $f_t : X \rightarrow Y$  is a family of maps  $f_t$  for every  $t \in I$  that  $f : X \times I \rightarrow Y$  is continuous. For two homotopies  $F : X \times I \rightarrow Y$  and  $F' : X \times I \rightarrow Y$  s.t.  $F_1 = F'_0$ , we can define the **composite homotopy**  $F' \cdot F : X \times I \rightarrow Y$ .

Two maps  $f_0, f_1 : X \rightarrow Y$  are called **homotopic** if there is a homotopy  $f_t : X \rightarrow Y$  connecting them. Homotopy relations are denoted by  $f_0 \cong f_1$ .

Let  $A$  be a subspace of  $X$ , then a **homotopy relative to  $A$**  is a homotopy  $f_t : X \rightarrow Y$  whose restriction to  $A$  is fixed.

Let  $E_1, E_2$  be spaces over  $B$ , then maps  $f_0, f_1 : E_1 \rightarrow E_2$  over  $B$  are called **fiber homotopic** if there is a homotopy  $f_t : E_1 \rightarrow E_2$  connecting them that each  $f_t$  are maps over  $B$ . Homotopy relations over  $B$  are denoted by  $f_0 \cong_B f_1$ .

┘

**Def. (4.13.1.3) [Homotopy Equivalences].** A map  $f : X \rightarrow Y$  is called a **homotopy equivalence** if there is a map  $g : Y \rightarrow X$  that  $f \circ g \cong \text{id}$  and  $g \circ f \cong \text{id}$ .

A space having the homotopy type of a point is called **contractible**.

A map  $f : X \rightarrow Y$  over  $B$  is called a **fiber homotopy equivalence** if there is a map  $g : Y \rightarrow X$  over  $B$  that  $f \circ g \cong_B \text{id}$  and  $g \circ f \cong_B \text{id}$ .

┘

**Def. (4.13.1.4) [Deformation Retraction].** A **deformation retraction** of a space  $X$  onto a subspace  $A$  is a homotopy  $f_t : X \rightarrow X, t \in I$  that  $f_0 = \text{id}, f_1(X) = A$  and  $f_t|_A = \text{id}_A$  for all  $t$ .

┘

**Prop. (4.13.1.5).** A map  $X \rightarrow Y$  is a homotopy equivalence iff the mapping cylinder deformation retracts onto  $X$ .

┘

*Proof:* ?

□

**Def. (4.13.1.6) [Excisive Triads].** A **triad of spaces** is a triple  $(X; A, B)$  s.t.  $A \subset X, B \subset X$ . An **excisive triad** is a triad  $(X; A, B)$  s.t.  $A^\circ \cup B^\circ = X$ .

┘

### Relative Spaces

**Def. (4.13.1.7) [Relative Spaces].** The category  $\mathcal{CG}^{\text{rel}}$  is the category of pairs  $(X, A)$  where  $A \subset X \in \mathcal{CG}$ , and morphisms in  $\mathcal{CG}^{\text{rel}}$  are equivariant maps.

┘

**Def. (4.13.1.8) [Smash Products].** **smash products** in  $\mathcal{CG}^{\text{rel}}$  are defined to be  $(X, A) \wedge (Y, B) = (X \times Y, (X, A) \vee (Y, B))$ , where  $(X, A) \vee (Y, B) = X \times B \cup A \times Y \subset X \times Y$ .  $\lrcorner$

**Def. (4.13.1.9) [Cones and Suspensions].** For  $(X, A) \in \mathcal{Top}^{\text{rel}}$ , the **cone** over  $(X, A)$  is defined to be  $C(X, A) = (X, A) \wedge (\mathbb{I}, \{1\})$ . The **suspension** of  $(X, A)$  is defined to be  $\Sigma(X, A) = (X, A) \wedge \mathbb{S}^1$ .  $\lrcorner$

**Prop. (4.13.1.10) [ $\mathcal{CG}^{\text{rel}}$  is Closed].** For  $(X, A), (Y, B), (Z, C) \in \mathcal{CG}^{\text{rel}}$ , by (4.4.3.15) there is a homeomorphism

$$\text{Map}((X, A) \wedge (Y, B), (Z, C)) \cong \text{Map}((X, A), \text{Map}((Y, B), (Z, C))).$$

In particular,  $\mathcal{CG}^{\text{rel}}$  is a closed symmetric monoidal category.  $\lrcorner$

**Def. (4.13.1.11) [Pointed Spaces].** The category  $\mathcal{CG}^{\text{pt}}$  is the subcategory of  $\mathcal{CG}^{\text{rel}}$  consisting of pairs  $(X, A)$  s.t.  $A \cong \text{pt}$ . It is stable under finite products.

We can define similarly homotopies of maps between pointed spaces, and denote  $\langle X, Y \rangle$  the homotopy classes of maps from  $X$  to  $Y$ .  $\lrcorner$

**Def. (4.13.1.12) [Smash Products].** For  $X, Y \in \mathcal{CG}^{\text{pt}}$ , the **smash product**  $X \wedge Y$  is defined to be  $X \wedge Y = X \times Y / X \vee Y$ , where  $X \vee Y = X \coprod_* Y$ , called the **wedge sum** of  $X$  and  $Y$ . Similar to (4.13.1.9), we can define cones and suspensions of pointed spaces.

Then the smash product and wedge sums are commutative and associative, and they satisfy

$$(X \vee Y) \wedge Z = X \wedge Z \vee Y \wedge Z.$$

Because of (4.13.1.14), the smash product and wedge sums are also denoted by  $X \otimes Y$  and  $X \oplus Y$ .  $\lrcorner$

*Proof:* For the identities, use the fact product commutes with colimits (4.4.3.16).  $\square$

**Prop. (4.13.1.13) [Smash Products, and Homotopy].** Suspensions preserves homotopy, as  $\Sigma(X \wedge I) = X \wedge I \wedge \mathbb{S}^1 \cong (X \wedge \mathbb{S}^1) \wedge I$ .  $\lrcorner$

**Prop. (4.13.1.14) [ $\mathcal{CG}^{\text{pt}}$  is Closed].** For  $X, Y, Z \in \mathcal{CG}^{\text{pt}}$ , by (4.13.1.10), there is a bijection

$$\text{Map}(X \wedge Y, Z) \cong \text{Map}(X, \text{Map}(Y, Z)).$$

In particular,  $\mathcal{CG}^{\text{pt}}$  is a closed symmetric monoidal category.  $\lrcorner$

**Def. (4.13.1.15) [Well-Pointed Spaces].** A pointed space  $(X, *) \in \mathcal{CG}^{\text{pt}}$  is called a **well-pointed space** if  $*$   $\rightarrow X$  is a cofibration. The category of well-pointed spaces is denoted by  $\mathcal{CG}^{\text{well-pt}}$ .  $\lrcorner$

**Def. (4.13.1.16) [Augmentation].** There is a functor  $\mathcal{CG} \rightarrow \mathcal{CG}^{\text{well-pt}} : X \mapsto X_+ = (X \coprod \text{pt}, \text{pt})$ .  $\lrcorner$

**Prop. (4.13.1.17).** The cone construction

$$\mathcal{Top}^{\text{rel}} \rightarrow \mathcal{Top} : (X, A) \mapsto C(A \rightarrow X)$$

preserves homotopy equivalence.  $\lrcorner$

**Prop. (4.13.1.18) [Path Spaces and Loop Spaces].** For  $X \in \mathcal{CG}^{\text{pt}}$ , define the **path space**  $P(X) = \text{Map}(\mathbb{I}, \{0\}, X)$ , and define the **loop space**  $\Omega(X) = \text{Map}(\mathbb{S}^1, X)$ .

Then by (4.13.1.14), there are homeomorphism of spaces

$$\text{Map}(\Sigma(X), Y) \cong \text{Map}(X, \Omega(Y)).$$

Thus also

$$\langle \Sigma(X), Y \rangle \cong \langle X, \Omega(Y) \rangle.$$

$\lrcorner$

**Def. (4.13.1.19) [Weak Products].** For  $\{X_\alpha\}_\Sigma \in \mathcal{CG}^{\text{pt}}$ , define the **weak product**  $\prod' X_\alpha$  as

$$\prod' X_\alpha = \varinjlim_{S \subset \Sigma, \#S < \infty} \bigvee_{i \in S} X_i$$

with base point  $\prod *$ . ┘

## 2 Isotopies

**Def. (4.13.2.1) [Isotopies].** For  $V, M \in \mathcal{Mani}$ , an **isotopy** from  $V$  to  $M$  is a map  $V \times I \rightarrow M$  s.t. for any  $t \in I$ , the map  $F_t : V \rightarrow M$  is an embedding. ┘

**Prop. (4.13.2.2) [Alexander's Trick].** If  $f, g : \mathbb{D}^n \rightarrow \mathbb{D}^n$  be two self-homeomorphisms that there is an isotopy  $F : \mathbb{D}^n \times I \rightarrow \mathbb{D}^n$  between  $f|_{\partial\mathbb{D}^n}$  and  $g|_{\partial\mathbb{D}^n}$ , then there exists an isotopy between  $f$  and  $g$  extending  $F$ . ┘

*Proof:* Firstly, if  $g = \text{id}_{\mathbb{D}^n}$  and  $f$  fixes every points on the boundary, then an isotopy connecting  $f$  to the identity is given by

$$J(x, t) = \begin{cases} tf(x/t) & , 0 \leq \|x\| < t \\ x & , t \leq \|x\| \leq 1 \end{cases}.$$

In general, isotopy  $g^{-1}F : \mathbb{D}^n \times I \rightarrow \mathbb{D}^n$  between  $g^{-1}f|_{\partial\mathbb{D}^n}$  and  $\text{id}_{\partial\mathbb{D}^n}$  can be extended to an isotopy from  $F' : \text{Cone}(g^{-1}f|_{\partial\mathbb{D}^n})$  to  $\text{id}_{\mathbb{D}^n}$ . Then  $\text{Cone}(g^{-1}f|_{\partial\mathbb{D}^n})$  and  $g^{-1}f$  are identical on  $\partial\mathbb{D}^n$ , so by the argument above, they are isotopic. Then  $g^{-1}f \cong \text{id}_{\mathbb{D}^n}$ , which gives an isotopy between  $f$  and  $g$ . □

**Cor. (4.13.2.3) [Homogeneity Lemma].** If  $M \in \mathcal{Mani}_{\text{cntd}, \partial}$  and  $x, y \in M$  are interior points, then there exists a self-homeomorphism of  $M$  taking  $x$  to  $y$  that is isotopic to  $\text{id}_M$ . ┘

**Prop. (4.13.2.4).** Any orientation-preserving self-homeomorphism  $f$  of  $\mathbb{S}^d$  is isotopic to  $\text{id}_{\mathbb{S}^d}$ . ┘

*Proof:* By the decomposition of  $\mathbb{S}^d$  into two hemispheres and using the annulus theorem (4.4.11.4), we see we can isotopy  $f$  to a map that fixes the equator. Then we can use Alexander's trick (4.13.2.2). □

## 3 CW Complexes

**Def. (4.13.3.1) [CW Complexes].** A **CW complex** is a space  $X$  that  $\emptyset \rightarrow X$  is cofibrantly generated by  $\mathbb{S}^n \rightarrow \mathbb{D}^n$ .

For a CW complex  $X$ , a **representation of  $X$**  is given as follows:

- $\text{sk}_0 X$  is a discrete set, whose elements are regarded as 0-cells.
- Inductively, form the  **$n$ -skeleton**  $\text{sk}_n X$  from  $\text{sk}_{n-1} X$  by adding  **$n$ -cells**  $e_\alpha^n$  via maps  $\varphi_\alpha : \mathbb{S}^{n-1} \rightarrow \text{sk}_{n-1} X$ .
- Let  $X = \bigcup \text{sk}_n X$  be given the quotient topology from  $\coprod_n \text{sk}_n X$ .

We will also call the image of  $e_\alpha^n$  as an  $n$ -cell. The category of CW complexes is denoted by  $\mathcal{CW}$ . Any CW complex is compactly generated, by definition. ┘

**Def. (4.13.3.2) [Sub-CW Complexes].** For a CW complex  $X$ , a **subcomplex**  $Y \subset X$  is a subspace  $Y \subset X$  s.t. the cells with images in  $Y$  makes  $Y$  a CW complex. ┘

**Def. (4.13.3.3)[Finite CW Complexes].**

- A **CW complex of finite dimension** is a CW complex  $X$  s.t.  $X = \text{sk}_n X$  for some  $n \in \mathbb{N}$ .
- A **CW complex of finite type** is a CW complex  $X$  that has only finitely many  $n$ -cells for each  $n$ .
- A **finite CW complex** is a CW complex that is both of finite dimensional and of finite type.
- A **locally finite CW complex** is a CW complex that each cell intersect only f.m. other cells.

⌋

**Prop. (4.13.3.4)[Dimension of CW Complexes].** Given a representation of a CW complex of finite dimension  $X$ ,  $\dim X$  is defined to be the minimal  $n$  s.t.  $X = \text{sk}_n X$ . Then this dimension is independent of the presentation given.

⌋

*Proof:*

□

**Prop. (4.13.3.5).** Any compact subspace  $K$  of a CW complex  $X$  is contained in a finite subcomplex. In particular, a CW complex is compact iff it is finite.

⌋

*Proof:* Firstly  $K$  intersects with only f.m. interiors of cells of  $X$  (where we assume the interior of a point in  $\text{sk}_0 X$  is the point itself): otherwise take  $S = \{x_1, x_2, \dots\}$  be an infinite sequence of points lying in different cells, then  $S \cap e_\alpha$  is closed for any cell  $e_\alpha$  of  $X$ , so  $S$  is closed. But the same argument show any single point of  $S$  is also closed, so  $S$  is discrete, so  $S$  is finite, contradiction.

Then it suffices to show that any cell meets only f.m. cells: for this we can use induction on  $\dim X$ , and notice that for any cell  $e_\alpha$ , the image of its attaching map is compact.

□

**Prop. (4.13.3.6)[Miyazaki].** Any CW complex is paracompact Hausdorff, thus also normal by (4.4.7.6).

⌋

*Proof:* To show it is Hausdorff, for any two points  $x, y$ , it is not hard to find disjoint precompact nbhds of  $x, y$  by induction on cells.

To show it is paracompact, Cf. [Rudolph Fritsch and Renzo Piccinini, Cellular Structures in Topology]Thm1.3.5.?

□

**Prop. (4.13.3.7).** A CW complex is locally compact iff it is locally finite. A connected CW complex is metrizable iff it is locally finite.

⌋

*Proof:* Cf. [Rudolph Fritsch and Renzo Piccinini, Cellular Structures in Topology, Cambridge University Press, 1990.]Prop1.5.7.

□

**Prop. (4.13.3.8)[Product of CW Complexes].** For  $X, Y \in \mathcal{CW}$ , then the compactly generated product space  $X \times_c Y$  admits a CW complex structure with

$$\text{sk}_n X = \cup_{i+j=n} \text{sk}_i X \times \text{sk}_j Y.$$

And if either  $X$  or  $Y$  is locally compact or both  $X, Y$  have countably many cells, then  $X \times_c Y = X \times Y$ .

⌋

*Proof:* Given presentations of CW complexes of  $X, Y$ , we can define the CW complex structure on  $X \times Y$  by choosing homeomorphisms of pairs

$$(\mathbb{D}^n, \mathbb{S}^n) \cong (\mathbb{D}^p \times \mathbb{D}^q, \mathbb{D}^p \times \mathbb{S}^{q-1} \cup \mathbb{S}^{p-1} \times \mathbb{D}^q),$$

where  $p + q = n$ . Then it is a CW structure on  $X \times_c Y$  by (4.4.3.16).

For the last assertion, the case  $X$  is locally compact follows from (4.4.2.33). The case that  $X, Y$  both have countably many cells follow from [Hatcher, P524].?

□

**Prop. (4.13.3.9) [Cellular Maps].** Given  $X, Y \in \mathcal{CW}$ , a **cellular map**  $f : X \rightarrow Y \in \mathcal{CW}$  is a map s.t.  $f(\text{sk}_n X) \subset \text{sk}_n Y$  for any  $n \in \mathbb{N}$ . And a **cellular homotopy** between two cellular maps  $f, g : X \rightarrow Y$  is a homotopy  $F : X \times I \rightarrow Y$  between  $f$  and  $g$  s.t.  $F$  is a cellular map.  $\lrcorner$

**Prop. (4.13.3.10) [CW Structure on Compact Manifolds].**  $\text{Mani}_{\text{cpct}} \in \mathcal{CW}^{\text{fin}}$ .  $\lrcorner$

*Proof:*

$\square$

**Def. (4.13.3.11) [Relative CW complexes].** A **relative CW complex** is a pair  $(A, X)$  s.t.  $A \rightarrow X$  is cofibrantly generated by  $\mathbb{S}^n \rightarrow \mathbb{D}^n$ . The category of relative CW complexes is denoted by  $\mathcal{CW}^{\text{rel}}$ . A **pointed CW complex** is a pointed space  $(X, *) \in \mathcal{Top}^{\text{pt}}$  s.t.  $X$  has a presentation as a CW complex with  $*$   $\in X^0$ . The category of pointed CW complexes is denoted by  $\mathcal{CW}^{\text{pt}}$ . Cellular maps in  $\mathcal{CW}^{\text{rel}}$  is defined similarly as that of (4.13.3.9).  $\lrcorner$

**Prop. (4.13.3.12) [Pathspace is CW Complex].** The homotopy fibers (4.4.3.18) of any map  $f : A \rightarrow B$  between CW complexes are homotopic to a CW complex.  $\lrcorner$

*Proof:* [Milnor, 1959]. or [Rudolph Fritsch and Renzo Piccinini, Cellular Structures in Topology].  $\square$

**Cor. (4.13.3.13) [Loop Space].** For  $X \in \mathcal{CW}^{\text{pt}}$ , the loop space (4.4.3.19)  $\Omega X$  is homotopic to a pointed CW complex. In particular, if  $X$  is of f.t., then so does  $\Omega X$ .  $\lrcorner$

*Proof:* This is a special case of (4.13.3.12) applied to  $A = \{*\}$ , by (4.4.3.20).  $\square$

### Common CW complexes

**Def. (4.13.3.14) [Infinite Vector Spaces].** Let  $\mathbb{K} = \mathbb{R}, \mathbb{C}$  or  $\mathbb{H}$ , then the **infinite vector space**  $\mathbb{K}^\infty$  is the CW complex  $\varinjlim_n \mathbb{K}^n$ .

There can be given a norm map on  $\mathbb{K}^\infty$ , as the canonical embedding is norm preserving.  $\lrcorner$

**Prop. (4.13.3.15) [Grassmannian].** Let  $\mathbb{K} = \mathbb{R}, \mathbb{C}$  or  $\mathbb{H}$ , then the **Grassmannian**  $\text{Gr}(k, \mathbb{K}^n)$  admits a CW complex structure.  $\lrcorner$

*Proof:* Cf. [Algebraic Topology Miller, P46] or [Characteristic Classes, Milnor]. ?  $\square$

**Def. (4.13.3.16) [Infinite Grassmannian].** Let  $\mathbb{K} = \mathbb{R}, \mathbb{C}$  or  $\mathbb{H}$ , then the **infinite Grassmannian**  $\text{Gr}(k, \mathbb{K}^\infty)$  is the CW complex  $\varinjlim_n \text{Gr}(k, \mathbb{K}^n)$  (16.5.2.12).

In particular,  $\text{Gr}(1, \mathbb{K}^\infty) \cong \varinjlim_n \mathbb{K}\mathbb{P}^n$  is defined to be the **infinite projective space**  $\mathbb{K}\mathbb{P}^\infty$ .  $\lrcorner$

**Def. (4.13.3.17) [Infinite Stiefel Manifold].** Let  $\mathbb{K} = \mathbb{R}, \mathbb{C}$  or  $\mathbb{H}$ , then the **infinite Stiefel Manifold**  $V_k(\mathbb{K}^\infty)$  is the CW complex  $\varinjlim_n V_k(\mathbb{K}^n)$  where  $V_k(\mathbb{K}^n)$  is the set of orthonormal  $k$ -frames (16.5.2.12).  $V_1(\mathbb{K}^\infty) = \varinjlim_n \mathbb{S}^n$  is called the **infinite sphere**. It is isomorphic to

$$\mathbb{S}^\infty = \varinjlim_k S^{2k+1} = \varinjlim_k \mathbb{C}^{2k+1} \setminus \{0\} / \mathbb{R}^+ = (\mathbb{C}^\infty \setminus \{0\}) / \mathbb{R}_+^\times.$$

$\lrcorner$

**Prop. (4.13.3.18).**  $V_k(\mathbb{K}^\infty)$  is contractible.  $\lrcorner$

*Proof:* We prove for  $\mathbb{S}^\infty$ , the proof for  $V_k(\mathbb{K}^\infty)$  is verbatim, using Smith orthogonalization. There is a map  $H : \mathbb{S}^\infty \times I \rightarrow \mathbb{S}^\infty$  defined by

$$H((x_1, x_2, \dots), t) = ((1-t)x_1, tx_2 + (1-t)x_1, tx_3 + (1-t)x_2, \dots)/N$$

where  $N$  is the norm of the non-zero element  $((1-t)x_1, tx_2 + (1-t)x_1, tx_3 + (1-t)x_2, \dots)$ . The image of  $H_1$  is in the subspace  $\mathbb{S}_1^\infty$  of elements  $(x_1, x_2, \dots)$  with  $x_1 = 0$ . Notice there is another map  $H' : \mathbb{S}_1^\infty \times I \rightarrow \mathbb{S}^\infty$  defined by

$$H'((0, x_2, \dots), t) = (t, (1-t)x_2, (1-t)x_3, \dots)/N'$$

where  $N'$  is the norm of the non-zero element  $(t, (1-t)x_2, (1-t)x_3, \dots)$ . Then the composition homotopy  $(H' \circ H_1) \cdot H$  gives the desired homotopy from  $\text{id}_{\mathbb{S}^\infty}$  to a constant map.  $\square$

**Prop. (4.13.3.19).**  $\mathbb{RP}^\infty = \mathbb{S}^\infty / \{\pm 1\} = (\mathbb{C}^\infty \setminus \{0\}) / \mathbb{R}^\times$ .  $\lrcorner$

**Def. (4.13.3.20) [James Reduced Product].** Let  $X$  be a space with a basepoint  $e$ , let the **James reduced product** space  $J(X)$  be the quotient of  $\coprod_n X^n$  under the identification  $(x_1, \dots, x_j, \dots, x_n) \sim (x_1, \dots, \hat{x}_j, \dots, x_n)$  if  $x_j = e$ .

$J(X)$  is a union of subspaces  $J_m(X)$ , where  $J_m(X)$  is the quotient space of  $X^m$  under the identification  $(x_1, \dots, x_j, e, \dots, x_n) \sim (x_1, \dots, e, x_j, \dots, x_n)$ . If  $(X, e)$  is a CW-pair, then  $J_m$  is obtained from  $X^m$  by glueing together its  $m$  subcomplexes where one of the coordinates is  $e$ . It is then clear  $J$  is a CW complex.  $\lrcorner$

**Def. (4.13.3.21) [Infinite Symmetric Product].** Let  $X$  be a space with a basepoint  $e$ , define the **infinite symmetric product** as the quotient of  $J(X)$  by permutations. If  $X$  is a simplicial complex (4.13.4.1), then  $SP(X)$  is a CW-complex.  $\lrcorner$

*Proof:* Cf. [Hat02]P482.  $\square$

## 4 Simplicial Complexes

**Def. (4.13.4.1) [Simplicial Complexes].** A **simplicial complex** is a pair  $X = (|X|, \mathcal{C})$  where  $|X| \in \text{Set}$  and  $\mathcal{C} \subset \mathcal{P}(X)$  s.t. if  $\sigma \in \mathcal{C}$  and  $\tau \subset \sigma$ , then  $\tau \in \mathcal{C}$ .

A **subcomplex** of  $(|X|, \mathcal{C})$  is a simplicial complex  $(X', \mathcal{C}')$  with an injection  $i : X' \hookrightarrow X$  s.t.  $i(\mathcal{C}') \subset \mathcal{C}$ .

A **simplicial map** of simplicial complexes  $f : (|X'|, \mathcal{C}') \rightarrow (|X|, \mathcal{C})$  is a map of sets  $|f| : |X'| \rightarrow |X| \in \text{Set}$  s.t.  $f(\mathcal{C}') \subset \mathcal{C}$  and  $\# \sigma = \# f(\sigma)$  for each complex  $\sigma$  in  $X$ .

A **simplicial retraction** is a simplicial map  $f : X \rightarrow Y$  where  $Y$  is a simplicial subcomplex of  $X$  and  $f|_Y = \text{id}_Y$ .  $\lrcorner$

**Def. (4.13.4.2) [Chamber Complexes].** For a simplicial complex  $X = (|X|, \mathcal{C})$  (4.13.4.1),

- A **simplex** in  $X$  is an element in  $\mathcal{C}$ .
- The **dimension of simplex** of a simplex  $\sigma \in \mathcal{C}$  is defined to be  $\dim(\sigma) = \# \sigma - 1$ .
- The **dimension of simplicial complex** of  $X$  is defined to be the supremum of dimension of simplexes in  $\mathcal{C}$ .
- Two simplexes of the same dimension  $n \in \mathbb{Z}_+$  are called **adjacent simplexes** if their intersection has cardinality  $n - 1$ .

- A **simplicial chamber** of  $X$  is a simplex that is not contained in other simplexes of  $X$ .
- A **simplicial gallery** of simplicial chambers is a sequence  $(C_0, \dots, C_n)$  of chambers s.t.  $C_i$  and  $C_{i+1}$  are adjacent for each  $i \in [n-1]$ . A **non-stutter gallery** is a simplicial gallery s.t.  $C_i \neq C_{i+1}$  for any  $i$ .
- $X$  is called a **chamber complex** if each two chambers in  $X$  is connected by a gallery (in particular, all chambers in  $X$  has the same dimension).
- $(|X'|, C') \subset X$  is called a **chamber subcomplex** if it is a chamber complex of the same dimension as  $X$ .
- $X$  is called a **thin chamber complex** if it is a chamber complex of dimension  $n \in \mathbb{Z}_+$  and each simplex of dimension  $n-1$  is contained in exactly 2 chambers.
- $X$  is called a **thick chamber complex** if it is a chamber complex of dimension  $n \in \mathbb{Z}_+$  and each simplex of dimension  $n-1$  is contained in at least 3 chambers.

┘

## 5 Homotopy Groups

**Def. (4.13.5.1) [Homotopy Groups].** For  $(X, *) \in \mathcal{Top}^{\text{pt}}$  and  $n \in \mathbb{N}$ , define the **homotopy groups**  $\pi_n(X) = \pi_n(X, *) = \langle \mathbb{S}^n, X \rangle$ , which is a pointed set.

And  $\pi_1(X)$  is a group as  $\mathbb{S}^1$  has a cogroup structure:  $\mathbb{S}^1 \rightarrow \mathbb{S}^1 \wedge \mathbb{S}^1$ . Similarly,  $\pi_n(X) = \pi_1(\Omega^{n-1}X)$  are also groups, and the group structure are given by the cogroup structure  $\mathbb{S}^n \rightarrow \mathbb{S}^n \wedge \mathbb{S}^n$ . ┘

**Prop. (4.13.5.2) [Loop Spaces and Homotopy Groups].**  $\pi_{i+1}(M) \cong \pi_i(\Omega(M))$ . ┘

*Proof:* This follows from the fact  $\mathbb{S}^n = \Sigma^n(\mathbb{S}^0)$  and (4.13.1.18). ┐

**Prop. (4.13.5.3) [Homotopy Groups are Abelian].** For  $X \in \mathcal{CG}^{\text{pt}}$ , the homotopy group  $\pi_n(X)$  is an Abelian group for  $n \geq 2$ . ┘

*Proof:* By (4.13.5.2), it suffices to show for  $n = 2$ , and  $\pi_2(X) = \pi_1(\Omega X)$  is Abelian by (4.14.2.30) and (4.14.2.24). ┐

**Cor. (4.13.5.4).** For any  $X \in \mathcal{CG}$ ,  $\langle \Sigma(X), Y \rangle$  is a group and  $\langle \Sigma^2(X), Y \rangle$  is an Abelian group. ┘

**Prop. (4.13.5.5) [Homotopy Groups and Change of Basepoints].** Let  $X \in \mathcal{CG}$  and  $\gamma : \mathbb{I} \rightarrow X$  be a path from  $a$  to  $b$ , then for any  $n \in \mathbb{Z}_+$ , we can define a map  $\gamma_{\#} : \pi_n(X, a) \rightarrow \pi_n(X, b)$  as follows: For any  $f : (\mathbb{I}^n, \partial I^n) \rightarrow (X, a)$ , identify  $\mathbb{I}^n$  with the subspace of  $\mathbb{R}^n$  consisting of vectors  $\mathbf{x}$  s.t.  $d(\mathbf{x}) \leq \frac{1}{2}$ , where  $d((x_1, \dots, x_n)) = \min(|x_i|)$ , and

$$\gamma_{\#}(f) : (\mathbb{I}^n, \partial I^n) \rightarrow X : \mathbf{x} \mapsto \begin{cases} f(2\mathbf{x}) & , \|\mathbf{x}\| \leq \frac{1}{4} \\ \gamma(4\|\mathbf{x}\| - 1) & , \frac{1}{4} \leq \|\mathbf{x}\| \leq 1 \end{cases}$$

Then for any  $x_0 \in X$ , this defines an actions of  $\pi_1(X, x_0)$  on  $\pi_n(X, x_0)$  by group homomorphisms for any  $n \in \mathbb{Z}_+$ . And for  $n = 1$ , this is just the conjugation action. ┘

*Proof:* It is a well-defined action because any homotopy between two maps  $f_1, f_2 : (\mathbb{I}^n, \partial I^n) \rightarrow (X, a)$  can generate a homotopy between  $\gamma_{\#}(f_1)$  and  $\gamma_{\#}(f_2)$ , and it is an action by group homomorphism because there is a homotopy between  $\gamma_{\#}(f) \cdot \gamma_{\#}(g)$  and  $\gamma_{\#}(f \cdot g)$ , which is easy to write out. ┐

**Def. (4.13.5.6) [Simple Spaces].** A space  $X \in \mathcal{CG}$  is called a **simple topological space** if for any  $x_0 \in X$ , the action of  $\pi_1(X, x_0)$  defined in (4.13.5.5) is trivial.  $\lrcorner$

**Def. (4.13.5.7) [Weak Homotopy Equivalences].**  $f : X \rightarrow Y \in \mathcal{CG}$  is called a **weak homotopy equivalence** iff it induces isomorphism  $\pi_n((X, x_0)) \cong \pi_n(Y, f(x_0))$  for any  $n \in \mathbb{N}$  and  $x_0 \in X$ .  $\lrcorner$

**Prop. (4.13.5.8).** Let  $f_0, f_1 : X \rightarrow Y \in \mathcal{CG}$  be maps and  $h : \mathbb{I} \times X \rightarrow Y$  be a homotopy  $x_0 \in X$ , then if  $\gamma : \mathbb{I} \rightarrow Y : t \mapsto h(t, x_0)$ , then

$$\gamma_{\#} \circ \gamma_{\#}(f_0)_* = (f_1)_*.$$

$\lrcorner$

*Proof:* For  $f : f : (\mathbb{I}^n, \partial \mathbb{I}^n) \rightarrow (X, x_0)$  is easy to write out a homotopy between  $\gamma_{\#}(f_0)_*(f)$  and  $(f_1)_*(f)$ .  $\square$

**Cor. (4.13.5.9).** Any homotopy equivalence is a weak homotopy equivalence.  $\lrcorner$

**Def. (4.13.5.10) [Relative Homotopy Groups].** For an inclusion  $i : (A, *) \subset (X, *) \in \mathcal{Top}^{\text{pt}}$ ,  $n \in \mathbb{Z}_+$ , define the **relative homotopy groups**  $\pi_n(X, A) = \pi_n(X, A, *) = \pi_{n-1}(P(X; *, A))$ , where  $P(X; *, A)$  is the homotopy fiber of  $i$  ?. Equivalently, if we denote  $\mathbb{J}^n = \partial \mathbb{I}^{n-1} \times \mathbb{I} \cup \mathbb{I}^{n-1} \times \{0\} \subset \mathbb{I}^n$  for  $n \geq 2$  and  $\mathbb{J}^1 = \{0\} \subset \mathbb{I}^1$ , then

$$\pi_n(X, A) = [(\mathbb{I}^n, \partial \mathbb{I}^n, \mathbb{J}^n), (X, A, *)].$$

This is a pointed set for  $n = 1$ , a group for  $n = 2$ , and an Abelian group for  $n \geq 3$ .  $\lrcorner$

**Prop. (4.13.5.11) [Long Exact Sequence of Relative Homotopy Groups].**  $\lrcorner$

*Proof:*  $\square$

**Cor. (4.13.5.12) [Covering Spaces and Homotopy Groups].** If  $E \rightarrow B$  is a covering space, then  $\pi_n(E) \rightarrow \pi_n(B)$  is an isomorphism for  $n \geq 2$ .  $\lrcorner$

**Prop. (4.13.5.13).** If  $X \in \mathcal{CG}^{\text{pt}}$  is contractible, then  $\pi_n(X) = 0$  for any  $n \geq 0$ .  $\lrcorner$

**Prop. (4.13.5.14) [Products and Homotopy Groups].** For  $X, Y \in \mathcal{CG}^{\text{pt}}$ ,  $\pi_n(X \times Y) = \pi_n(X) \times \pi_n(Y)$  for any  $n \in \mathbb{N}$ .  $\lrcorner$

**Prop. (4.13.5.15) [Colimits and Homotopy Groups].** If  $X = \varinjlim_i X_i \in \mathcal{CG}^{\text{pt}}$  is a filtered colimits, there are natural isomorphisms

$$\varinjlim_i \pi_n(X_i) \cong \pi_n(X)$$

for each  $n \in \mathbb{N}$ .  $\lrcorner$

*Proof:* This follows from the fact any compact subset of  $X$  is contained in some  $X_i$  ?.  $\square$

**Def. (4.13.5.16) [ $n$ -Connectedness].** For  $n \in \mathbb{N}$ ,  $(X, A) \in \mathcal{CG}^{\text{rel, pt}}$  is called  **$n$ -connected** if  $\pi_i(X, A) = *$  for any  $i \leq n$ .  $X \in \mathcal{Top}^{\text{pt}}$  is called  **$n$ -connected** if  $\pi_i(X) = *$  for any  $i \leq n$ .  $\lrcorner$

**Def. (4.13.5.17) [ $n$ -Equivalences].** For  $n \in \mathbb{Z}_+$ ,  $f : (X, A) \rightarrow (Y, B) \in \mathcal{Top}^{\text{rel}}$  is called an  **$n$ -equivalence** if  $f_* : \pi_p(X, A) \rightarrow \pi_p(Y, B)$  are isomorphisms for  $p < n$ , and surjective for  $p = n$ .  $\lrcorner$

**Thm. (4.13.5.18) [Excision for Homotopy Groups].** if  $m, n \geq 0$ ,  $(X; A, B)$  is an excisive triad s.t.  $(A, A \cap B)$  is  $m$ -connected and  $(B, A \cap B)$  is  $n$ -connected, then  $(A, A \cap B) \rightarrow (A \cup B, A)$  is an  $m + n$ -equivalence.  $\lrcorner$

*Proof:* Cf.[Hatcher P360].  $\square$

**Cor. (4.13.5.19).** For  $n > 1$ ,  $\pi_n(\bigvee_{\alpha} S^{\alpha})$  is free Abelian with  $\pi_n(S^n)$  as generators. This is because  $(\prod_{\alpha} S^n, \bigvee_{\alpha} S^n)$  is  $(2n - 1)$ -connected thus use excision, because  $\pi_n(\prod_{\alpha} S^n)$  is easy to calculate.  $\lrcorner$

**Prop. (4.13.5.20).** If  $f : X \rightarrow Y$  is an  $n$ -equivalence between  $(n - 1)$ -connected spaces, then the quotient map  $\text{pr} : (M(f), X) \rightarrow (C(f), *)$  is an  $2n$ -equivalence. And if  $X, Y$  are both  $n$ -connected, then  $\text{pr}$  is an  $2n + 1$ -equivalence.  $\lrcorner$

*Proof:*  $\square$

**Cor. (4.13.5.21) [Quotients and Homotopy Groups].** For  $n \in \mathbb{Z}_+$ , if  $i : A \rightarrow X$  is a cofibration that is a  $n$ -equivalence of  $(n - 1)$ -connected space, then the map  $(X, A) \rightarrow (X/A, *)$  is a  $2n$ -equivalence. And if  $A, X$  are  $n$ -connected, then this is a  $2n + 1$ -equivalence.  $\lrcorner$

*Proof:* This follows from the commutative diagram

$$\begin{array}{ccc} (M(i), A) & \longrightarrow & (C(i), *) \\ \downarrow & & \downarrow \\ (X, A) & \longrightarrow & (X/A, *) \end{array}$$

where the vertical maps are homotopy equivalences, by (4.13.7.7).  $\square$

**Prop. (4.13.5.22) [Suspension and Homotopy Groups, Freudenthal].** For  $X \in \mathcal{CG}^{\text{well-pt}}$ , there are maps

$$\Sigma_* : \pi_p(X) \rightarrow \pi_{p+1}(\Sigma(X)) : f \in \langle \mathbb{S}^p, X \rangle \mapsto \Sigma(f) \in \langle \mathbb{S}^{p+1} \cong \Sigma(\mathbb{S}^p), \Sigma(X) \rangle \quad (4.13.1.13).$$

Then if  $n \in \mathbb{N}$ ,  $X \in \mathcal{CG}^{\text{well-pt}}$  and  $X$  is  $n$ -connected, then  $\Sigma_*$  is bijective for  $p \leq 2n$  and surjective for  $p = 2n + 1$ .

In particular,  $\Sigma^n(X)$  is  $(n - 1)$ -connected.  $\lrcorner$

*Proof:* Cf.[May, P85].  $\square$

**Def. (4.13.5.23) [Stable Homotopy].** For  $X \in \mathcal{CG}^{\text{well-pt}}$ , using the suspension (4.13.5.22), we can form the colimit

$$\pi_p^s(X) = \varinjlim_{n \in \mathbb{N}} \pi_{p+n}(\Sigma^n(X)).$$

Then by (4.13.5.22),

$$\pi_p^s(X) = \pi_{p+n}(\Sigma^n(X)), \quad n \geq p + 2.$$

$\lrcorner$

**Prop. (4.13.5.24).** The homotopic direct limit of a family of homotopy equivalence is a homotopy equivalence. Cf.[Morse Theory Milnor].  $\lrcorner$

### Fundamental Groups

**Def. (4.13.5.25) [Simply Connected].** A space is called **simply connected** if it is connected and  $\pi_1(X, x) = 0$  for some point  $x \in X$ .  $\lrcorner$

**Prop. (4.13.5.26).** For a connected subset  $K \subset \mathbb{C}$ , the following are equivalent:

- $K$  is simply-connected,
- For any Jordan curve  $\gamma \subset K$ ,  $\text{int}(\gamma) \subset K$ .
- $\mathbb{P}^1(\mathbb{C}) \setminus K$  is connected.

Is this really true?  $\lrcorner$

*Proof:*  $3 \rightarrow 2$ : If  $\gamma \subset K$  is a Jordan curve,  $\text{int}(\gamma)$  and  $\text{Ext}(\gamma)$  is an open partition of  $\mathbb{P}^1(\mathbb{C}) \setminus K$ . As  $\mathbb{P}^1(\mathbb{C}) \setminus K$  is connected,  $\text{int}(\gamma) \setminus K = \emptyset$ .  $\lrcorner$

?

**Def. (4.13.5.27) [Semilocally Simply Connected].** A space is called **semilocally simply connected** if for any point  $x \in X$ , there is a nbhd  $U$  of  $x$  that the image of the inclusion-induced map  $\pi_1(U, x) \rightarrow \pi_1(X, x)$  is trivial.  $\lrcorner$

**Prop. (4.13.5.28) [Van Kampen].** If  $X$  is a union of path-connected subsets  $A_\alpha$  all containing  $x_0$  that  $A_\alpha \cap A_\beta$  and  $A_\alpha \cap A_\beta \cap A_\gamma$  are all path-connected, then  $*\pi_1(A_\alpha) / \sim$  where  $\sim$  is generated by  $i_*(\pi_1(A_\alpha \cap A_\beta)) \in \pi_1(A_\alpha) \sim i_*(\pi_1(A_\alpha \cap A_\beta)) \in A_\beta$  for every  $\alpha, \beta$ .  $\lrcorner$

*Proof:* Cf.[Hatcher P52].  $\lrcorner$

**Prop. (4.13.5.29) [Wedge Sums].** If  $X_i \in \mathcal{CG}^{\text{well-pt}}$  and  $X = \bigvee X_i$ , then  $\pi_1(X) = *_i \pi_1(X_i)$ .  $\lrcorner$

## 6 CW Approximations

**Prop. (4.13.6.1) [CW Complex has Homotopy Extension Property].** For  $(X, A) \in \mathcal{CW}^{\text{rel}}$ ,  $X \times \{0\} \cup A \times I$  is a deformation retract of  $X \times I$ , thus  $(X, A)$  has the homotopy extension property (4.13.7.1).  $\lrcorner$

*Proof:* Cf.[Hat02]P15.  $\lrcorner$

**Lemma (4.13.6.2) [Compression and Homotopies].** For  $n \in \mathbb{Z}_+$ ,  $f : B \rightarrow Y \in \mathcal{CG}$ , the following are equivalent:

- $f_*$  induces an injection on  $\pi_n$  and a surjection on  $\pi_{n+1}$ .
- Any map  $(\mathbb{D}^n, \mathbb{S}^n) \rightarrow (Y, B) \in \mathcal{Top}^{\text{rel}}$  is homotopic rel  $\mathbb{S}^n$  to a map  $\mathbb{D}^n \rightarrow B$ .

*Proof:* Cf.[May, P70].?  $\lrcorner$

**Thm. (4.13.6.3) [Compression Theorem].** If  $n \in \mathbb{Z}_+$ ,  $(X, A) \in \mathcal{CW}^{\text{rel}}$  has relative dimension  $\leq n$  and  $f : B \rightarrow Y$  an  $n$ -equivalence, then any map  $(X, A) \rightarrow (Y, B) \in \mathcal{CG}^{\text{rel}}$  is homotopic rel  $A$  to a map  $X \rightarrow B$ .

In particular, (relative) homotopy doesn't depend on (2-degree)higher dimensional cells, (but might on lower one).  $\lrcorner$

*Proof:* Use (4.13.6.2) on each cells.  $\lrcorner$

**Thm. (4.13.6.4) [Whitehead].** If  $f : Y \rightarrow Z \in \mathcal{CG}$  is an  $n$ -equivalence, then  $[X, Y] \rightarrow [X, Z]$  is bijective for  $X \in \mathcal{CW}^{\text{pt}}$  of dimension  $\leq n - 1$ , and surjective for  $\dim X = n$ .  $\lrcorner$

*Proof:* The surjectivity follows from the compression theorem for the pair  $(\emptyset, X) \in \mathcal{CW}^{\text{rel}}$ , and the injectivity follows from the compression theorem applied to  $(X \times \mathbb{I}, X \times \partial\mathbb{I}) \in \mathcal{CW}^{\text{rel}}$ .  $\square$

**Cor. (4.13.6.5).** If  $Y \rightarrow Z \in \mathcal{Top}^{\text{pt}}$  is a weak-equivalence, then  $\langle X, Y \rangle \rightarrow \langle X, Z \rangle$  is an equivalence for any  $X \in \mathcal{CW}^{\text{pt}}$ .  $\lrcorner$

**Cor. (4.13.6.6) [Whitehead].** For  $n \in \mathbb{Z}_+$ , an  $n$ -equivalence of CW complexes of dimension  $\leq n - 1$  is a homotopy equivalence.

A weak equivalence of CW complexes is a homotopy equivalence.  $\lrcorner$

*Proof:* Let  $e : Y \rightarrow Z \in \mathcal{CW}$  satisfies the hypothesis, then because  $e_* : [Z, Y] \rightarrow [Z, Z]$  is a bijection by compression theorem (4.13.6.3), there exists  $f : Z \rightarrow Y$  s.t.  $e \circ f \cong \text{id}$ . Thus  $e \circ f \circ e \cong e$ . Then since  $e_* : [Y, Y] \rightarrow [Y, Z]$  is also a bijection by compression theorem,  $f \circ e \cong \text{id}$ .  $\square$

**Cor. (4.13.6.7).** If  $X \in \mathcal{CW}^{\text{pt}}$  and  $\pi_n(X) = 0$  for all  $n$ , then  $X$  is contractible.  $\lrcorner$

**Cor. (4.13.6.8) [Whitehead Combinatorial Homotopy Theorem I].** ? If  $M$  and  $K$  is dominated by CW complexes, then any weak homotopy equivalence is an homotopy equivalence. If the map is an inclusion, then it is a deformation retract. In particular, if  $M$  is manifold, then it is dominated by its tubular nbhd, so this theorem is applied.  $\lrcorner$

*Proof:* For inclusion, use compression, and in general use mapping cylinder and cellular approximation.  $\square$

### Cellular and CW Approximations

**Lemma (4.13.6.9).** For  $n \in \mathbb{Z}_+$ ,  $f : (X, A) \in \mathcal{CW}^{\text{rel}}$  has no  $m$ -cells for  $m \leq n$ , then  $(X, A)$  is  $n$ -connected. In particular,  $(X, X^n)$  is  $n$ -connected.  $\lrcorner$

*Proof:* It suffices to show that any map  $f : (\mathbb{I}^n, \partial\mathbb{I}^n, \mathbb{J}^n) \rightarrow (X, A, *)$  is homotopic to a map  $(\mathbb{I}^n, \mathbb{J}^n) \rightarrow (A, *) \text{ rel } \mathbb{J}^n$  (4.13.5.1). For this, notice that the image is compact, thus we can assume that  $(X, A)$  is finite ?. Thus by doing one cell by one cell, it suffices to show for  $X = A \coprod_{f, \mathbb{S}^n} \mathbb{D}^n$ . In this case, notice that by simplicial approximation, we can find a homotopic map  $f \cong f'$  that  $f'$  avoids some point in  $(\mathbb{D}^n)^o$  ?. Then we can use projection to construct a homotopy.  $\square$

**Thm. (4.13.6.10) [Cellular Approximationss].** Any map  $f : (X, A) \rightarrow (Y, B) \in \mathcal{CW}^{\text{rel}}$  is homotopic rel  $A$  to a cellular map.

In particular, any  $f : X \rightarrow Y \in \mathcal{CW}$  is homotopic to a cellular map.  $\lrcorner$

*Proof:* This follows from (4.13.6.9).  $\square$

**Remark (4.13.6.11).** The cellular approximation makes the computation of homotopy theoretically easier, but the difficulty comes from the complexity of the homotopy group of the sphere.  $\lrcorner$

**Remark (4.13.6.12).** In fact, all the rest of this subsubsection can be rewritten by the geometric realization functor  $\Gamma(X) \rightarrow X$  (4.6.3.8). It is functorial in the level of spaces. ?  $\lrcorner$

**Prop. (4.13.6.13) [ $n$ -Connected CW Models].** For a pair  $(A, X)$ , if  $A$  is CW complex, then there is a  $n$ -connected (4.13.5.16) CW pairs  $(Z, A) \rightarrow (X, A)$  that is identity on  $A$ , and  $\pi_i(Z) \rightarrow \pi_i(X)$  is isomorphism for  $i > n$  and injection for  $i = n$ .

Such a pair  $(Z, A)$  is called a  $n$ -connected CW model of  $(X, A)$ , and moreover it can be constructed from  $A$  by attaching cells of dimension greater than  $n$ .  $\lrcorner$

*Proof:* Cf.[Hatcher P353].  $\square$

**Cor. (4.13.6.14).** For an  $n$ -connected CW pair  $(X, A)$ , there exist a homotopic  $(Z, A) \cong (X, A) \text{ rel } A$  that  $Z \setminus A$  has only cells of dimension greater than  $n$ .  $\lrcorner$

*Proof:* Choose the  $n$ -connected approximation as above. The map induce and isomorphism on  $\pi_{>n}$  by definition and on  $\pi_{<n}$  because  $\pi_i(A) \rightarrow \pi_i(Z)$  and  $\pi_i(A) \rightarrow \pi_i(X)$  are isomorphisms. And on  $\pi_n$ , it is injective by definition and surjective because  $\pi_n(A) \rightarrow \pi_n(Z) \rightarrow \pi_n(X)$  is isomorphism. Hence we know that the collapsed mapping cylinder at is weak-homotopy equivalent to  $Z$ , thus it deforms into  $Z$  by (4.13.6.8), thus  $Z \rightarrow X \text{ rel } A$  by (4.13.1.5).  $\square$

**Cor. (4.13.6.15) [Functorial CW Approximations].** A **CW approximation** of a space  $X$  is a CW complex  $Z$  and a weak homotopy equivalence  $Z \rightarrow X$ . A **CW approximation** of a pair  $(X, A)$  is pair of CW complexes  $(Z, Z_0)$  and a morphism  $(Z, Z_0) \rightarrow (X, A)$  that induces isomorphisms on both relative and absolute homotopy groups.

Thus there exists a CW approximation for any space  $A$ , and also there exists a CW approximation for any pair  $(X, X_0)$ .  $\lrcorner$

*Proof:* Just choose  $A$  to be a set containing a point for each connected component of  $X$ , then  $\pi_0(Z) \rightarrow \pi_0(X)$  is surjective hence injective.

For pairs, first approximate  $X_0$  and use the mapping cylinder to get a embedding. ?  $\square$

**Prop. (4.13.6.16) [Functoriality of CW Models].** Given  $n$ -connected CW model  $f : (Z, A) \rightarrow (X, A)$  and  $f' : (Z', A') \rightarrow (X', A')$ , then any map of pairs  $g : (X, A) \rightarrow (X', A')$  can be extended to a map of pairs  $h : (Z, A) \rightarrow (Z', A')$  that  $gf \cong f'h \text{ rel } A$ . And such a map  $h$  is unique up to homotopy  $\text{rel } A$ .  $\lrcorner$

*Proof:* Cf.[Hatcher, P355].  $\square$

**Cor. (4.13.6.17) [Uniqueness of CW approximation].** The CW approximation is unique up to homotopy.  $\lrcorner$

**Cor. (4.13.6.18) [Localizing Category].** Together with Whitehead combinatorial homotopy theorem (4.13.6.8) the homotopy category of spaces defined in (4.6.2.3) is the category of spaces  $\mathcal{CG}$  localized by the class of weak homotopy equivalence classes.  $\lrcorner$

**Prop. (4.13.6.19) [CW Approximation of Excisive Triads].** Cf.[May, 79].  $\lrcorner$

## 7 Fibrations and Cofibrations

### Cofibrations

**Def. (4.13.7.1) [Homotopy Extension Property].**  $(X, A) \in \mathcal{Top}^{\text{rel}}$  is said to satisfy the **homotopy extension property** if every map  $X \times \{0\} \coprod_{A \times \{0\}} A \times I \rightarrow Y$  can be extended to a map  $X \times I \rightarrow Y$ .  $\lrcorner$

**Def. (4.13.7.2) [Cofibrations].** A **cofibration** is a map  $j : A \rightarrow X$  that for every map  $X \times \{0\} \coprod_{A \times \{0\}} A \times I \rightarrow Y$  can be extended to a map  $X \times I \rightarrow Y$ .

This implies  $X \times \{0\} \cup A \times I \rightarrow X \times I$  has a left inverse. And the converse is clearly true.

Then a cofibration is just a topological embedding with closed image that  $(X, A)$  has the homotopy extension property (4.13.7.1).

Cofibrations is stable under cobase change and coproducts.  $\perp$

*Proof:* ?  $\square$

**Def. (4.13.7.3) [NDR-Pairs].** An neighborhood deformation retraction pair, or an **NDR-pair** is a pair  $(X, A) \in \mathcal{T}op^{rel}$  s.t. there is a map  $u : X \rightarrow I$  s.t.  $u^{-1}(0) = A$ , and a homotopy  $f_t : X \rightarrow X \text{ rel } A$  s.t.  $f_0 = id_X$ , and  $f_1(u^{-1}([0, 1])) \subset A$ .  $\perp$

**Prop. (4.13.7.4) [NDR Pairs and Cofibrations].** If  $A \subset X$  is closed, then  $(X, A)$  is a NDR-pair (4.13.7.3) iff  $A \rightarrow X$  is a cofibration.  $\perp$

*Proof:* Cf. [May, P45]. ?  $\square$

**Prop. (4.13.7.5) [CW-Pairs are Cofibrations].** By compression theorem (4.13.6.3), for any CW-pair  $(A, X)$ ,  $A \rightarrow X$  is a cofibration.  $\perp$

**Def. (4.13.7.6) [Hurewicz Cofibration].** A **closed Hurewicz cofibration**  $i : A \subset B$  is a closed inclusion of spaces that  $B \times \{0\} \coprod A \times I \rightarrow B \times I$  has left extension property w.r.t any map  $Y \rightarrow pt$ .  $\perp$

**Prop. (4.13.7.7) [Quotient a Contractible Cofibration].** If  $A \rightarrow X$  is a cofibration and  $A$  is contractible, then the quotient map  $X \rightarrow X/A$  is a homotopy equivalence. In particular, this applies to  $(X, A) \in \mathcal{CW}^{rel}$ , by (4.13.6.1).  $\perp$

*Proof:* Let  $f_t : X \rightarrow X$  be a homotopy extending a contraction of  $A$  to a point, with  $f_0 = id$ . Since  $f_t(A) \subset A$ , they descends to a homotopy  $\bar{f}_t : X/A \rightarrow X/A$ . Because  $f_1(A)$  is a point, there is a map  $g$  in the following diagram

$$\begin{array}{ccc} X & \xrightarrow{f_1} & X \\ \downarrow \pi & \nearrow g & \downarrow \pi \\ X/A & \xrightarrow{\bar{f}_1} & X/A \end{array} .$$

So  $g$  and  $\pi$  are inverse homotopy equivalences, because  $f_1 \cong f_0 = id$  and  $\bar{f}_1 \cong \bar{f}_0 = id$ .  $\square$

**Prop. (4.13.7.8).** Let  $X$  be a normal space, then an inclusion  $j : A \hookrightarrow X$  is a cofibration iff  $A \hookrightarrow V$  is a cofibration for some open nbhd  $V$  of  $j(A) \subset X$ .  $\perp$

*Proof:* Cf. [AGP02]P92.  $\square$

**Prop. (4.13.7.9) [Homotopic Glueing Functions].** Let  $A \rightarrow X_1$  be a cofibration with  $X$  Hausdorff, and we have attaching maps  $f, g : A \rightarrow X_0$  that is homotopic, then  $X_0 \coprod_f X_1 \cong X_0 \coprod_g X_1 \text{ rel } X_0$ .  $\perp$

*Proof:* Now choose a homotopy  $H : A \times I \rightarrow X_0$  connecting  $f$  and  $g$ , then  $H$  induces a quotient space  $Z = X_0 \coprod_H (X_1 \times I)$ . Let  $X = X_0 \coprod_f X_1, Y = X_0 \coprod_g X_1$ , then there are natural inclusion maps  $i : X_1 \rightarrow Z, j : Y \rightarrow Z$ , and there are also deformation retractions  $Z \rightarrow X, Z \rightarrow Y$  constructed as follows:

Choose a deformation retraction  $r$  of  $X_1 \times I$  onto  $X_1 \times \{0\} \amalg A \times I$  (4.13.7.1), and  $H$  induces a map  $\overline{H} : D^n \times \{0\} \amalg S^n \times I \rightarrow S^n \amalg_f D^n$ , making the following diagram commutative

$$\begin{array}{ccc}
 A \times I & \xrightarrow{\quad} & X_1 \times I \\
 \downarrow H & & \downarrow r \\
 & A \times I \amalg X_1 \times \{0\} & \\
 & \downarrow \overline{H} & \\
 X_0 & \xrightarrow{\text{id}} & X_0 \amalg_f X_1
 \end{array}$$

which by definition defines a deformation retraction  $r_1 : X_0 \amalg_H (X_1 \times I) \rightarrow X_0 \amalg_f X_1$ . Similarly we have deformation retraction  $r_2 : Z \rightarrow Y$ . So  $r_2 \circ i$  and  $r_1 \circ j$  induce an homotopy equivalence between  $X$  and  $Y$ .  $\square$

**Prop. (4.13.7.10).** If  $A \rightarrow X, A \rightarrow Y$  are cofibrations, and  $f : X \rightarrow Y$  is a homotopy equivalence that  $f|_A = \text{id}_A$ , then  $f$  is a homotopy equivalence rel  $A$ .  $\lrcorner$

*Proof:* Cf.[Hatcher] P16.  $\square$

**Cor. (4.13.7.11).** If  $j : A \rightarrow X$  is a cofibration which is also a homotopy equivalence, and  $X$  is Hausdorff, then  $A$  is a deformation retraction of  $X$ .  $\lrcorner$

### Serre Fibrations

**Def. (4.13.7.12) [Serre Fibration].** A **Serre fibration** is the right lifting class of  $D^n \times \{0\} \rightarrow D^n \times I$  for every  $n$ . This is equivalent to: for any homotopy of  $\partial D^n$  and a image  $D^n$ , there is a homotopy of  $D^n$ .

In particular, Serre fibrations are stable under base change, by (4.5.0.1).  $\lrcorner$

**Prop. (4.13.7.13).** Being a Serre fibration is local on the target.  $\lrcorner$

*Proof:* Cf.[Homotopical Point of View]P127.  $\square$

**Prop. (4.13.7.14) [Long Exact Sequence of Serre Fibration].** Let  $\pi : E \rightarrow X$  be a Serre fibration, let  $b_0 \in B$  and  $x_0 \in F = \pi^{-1}(b_0)$ , then the map  $\pi_* : \pi_n(E, F, x_0) \rightarrow \pi_n(B, b_0)$  is an isomorphism for all  $n \geq 1$ . In particular, there is a long exact sequence

$$\dots \rightarrow \pi_n(F, x_0) \rightarrow \pi_n(E, x_0) \rightarrow \pi_n(B, b_0) \rightarrow \pi_{n-1}(F, x_0) \rightarrow \dots \rightarrow \pi_0(B, b_0) \rightarrow 0.$$

by (4.13.5.11).  $\lrcorner$

*Proof:* Cf.[Hat02]P376. [nLab].  $\square$

### Hurewicz Fibrations

**Def. (4.13.7.15) [Hurewicz Fibrations].** A **Hurewicz fibration** is a map  $p : X \rightarrow Y \in \mathcal{CG}$  that has right lifting property w.r.t maps  $A \times \{0\} \rightarrow A \times [0, 1]$  for any  $A \in \mathcal{CG}$ . in particular, a Hurewicz fibration is a Serre fibration (4.13.7.12).

Hurewicz fibrations are stable under base change.  $\lrcorner$

**Prop. (4.13.7.16) [Comparing Fibers of a Hurewicz Fibration].** If  $\pi : E \rightarrow B$  is a Hurewicz fibration, then for any arc  $\gamma$  in  $B$  with  $\gamma(0) = a, \gamma(1) = b$ , there is a homotopy equivalence  $f_\gamma : \pi^{-1}(a) \cong \pi^{-1}b$ , and the homotopy class of  $f_\gamma$  only depends on the homotopy class of  $\gamma$ .

In other words, a Hurewicz fibration over  $B$  determines a contravariant functor  $\Pi_1(B) \rightarrow \text{Ho}(\mathcal{CG})$ .

┘

*Proof:* This follows from the homotopy lifting property.  $\square$

**Cor. (4.13.7.17).** For a Hurewicz fibration  $E \rightarrow B$ , if  $B$  is contractible, then it is fiber homotopy equivalent to a trivial fiber bundle.  $\perp$

**Prop. (4.13.7.18).** Let  $\pi : E \rightarrow B, \pi' : E' \rightarrow B$  be Hurewicz fibrations and  $f : E \rightarrow E'$  be a map over  $B$  that is also a homotopy equivalence, then  $f$  is a fiber homotopy equivalence.  $\perp$

*Proof:* Cf. [Miller, P141]  $\color{red}?$   $\square$

**Prop. (4.13.7.19) [Homotopy Invariance of Pullbacks].** Let  $\pi : E \rightarrow X$  be a Hurewicz fibration and  $f_0, f_1 : Y \rightarrow X \in \mathcal{CG}$  are two maps that are homotopic, then the two Hurewicz fibrations  $f_0^*E/Y, f_1^*E/Y$  are fiber homotopy equivalent.  $\perp$

*Proof:* Cf. [Miller, P140]  $\color{red}?$   $\square$

**Prop. (4.13.7.20) [Homotopy Fiber of Contractible Fibration].** Let  $f : E \rightarrow B$  be a Hurewicz fibration with  $E$  contractible, then the homotopy fibers (4.4.3.18)  $F$  over  $b_0$  is weak homotopy equivalent to  $\Omega(B, b_0)$ .  $\perp$

*Proof:* Let  $x_0 \in \pi^{-1}(b_0)$ . If we compose the contraction of  $E$  to  $x_0$  with  $\pi$ , then we get for each  $x \in E$  a path  $\gamma_x$  from  $\pi(x)$  to  $b_0$ . Then these give a map  $E \rightarrow PB : x \mapsto \pi\gamma_x^{-1}$ , which is a lift of

$\pi$ . Then this map gives a commutative diagram

$$\begin{array}{ccccc} F & \longrightarrow & E & \longrightarrow & B \\ \downarrow & & \downarrow & & \parallel \\ \Omega(B, b_0) & \longrightarrow & PB & \longrightarrow & B \end{array}$$

that gives a map of their

corresponding long exact sequences (4.13.7.14). Thus  $F \rightarrow \Omega(B, b_0)$  is a weak homotopy equivalence because  $E, PB$  are both contractible (4.4.3.20).  $\square$

**Prop. (4.13.7.21) [Pathspaces are Hurewicz Fibrations].** For any map  $f : A \rightarrow B$ , the map  $\pi : E_f \rightarrow B : (a, \gamma) \mapsto \gamma(1)$  from the pathspace (4.4.3.18) is a Hurewicz fibration.

In particular, take  $A = \{x_0\}$ , then the path space  $PB \rightarrow B$  is a Hurewicz fibration.  $\perp$

*Proof:* Firstly this map is continuous by (4.4.3.5). To verify the homotopy lifting property, let  $g_t : X \rightarrow B$  be a homotopy and  $\tilde{g}_0 : X \rightarrow E_f$  be a lifting, let  $\tilde{g}_0(x) = (h(x), \gamma_x)$ . Define a lift  $\tilde{g}_t : X \rightarrow E_f$  by  $\tilde{g}_t(x) = (h(x), \gamma_x \cdot g_{[0,t]}(x))$ . The second term is concatenation, which can be defined because  $g_0(x) = \pi\tilde{g}_0(x) = \gamma_x(1)$ .

To check this is a continuous homotopy, by (4.4.3.7), it suffices to show  $A \times I \times I \rightarrow B : (x, s, t) \mapsto$

$$\gamma_x \cdot g_{[0,s]}(x)(t) = \begin{cases} \gamma(x, (1+t)s) & s \leq \frac{1}{1+t} \\ g_{(1+t)s-1}(x) & s \geq \frac{1}{1+t} \end{cases} \text{ is continuous.} \quad \square$$

**Cor. (4.13.7.22) [Homotopy Fibers].** We can embed  $A$  into  $E_f$  by mapping  $x$  to  $(x, \gamma_x)$ , where  $\gamma_x$  is the trivial loop at  $x$ . Then  $A$  is a deformation contraction of  $E_f$ , by restricting to shorter and shorter initial segments:  $H_t : E_f \rightarrow E_f : (a, \gamma) \mapsto (a, \gamma_t)$ , where  $\gamma_t(x) = \gamma(tx)$ .

Then we factored  $f$  as a homotopy equivalence followed by a fibration:  $A \rightarrow E_f \rightarrow B$ .

If  $x_0 \in X$  and  $F_f$  is the fiber of  $E_f$  over  $x_0$ , then a map  $(I^{i+1}, \partial I^{i+1}, J^i) \rightarrow (A, B, x_0)$  is the same as a map  $(I^i, \partial I^i) \rightarrow (F_f, \gamma_0)$ , where  $\gamma_0$  is the trivial loop at  $x_0$ . Thus  $\pi_{i+1}(A, B, x_0) = \pi_i(F_f, \gamma_0)$ .  $\perp$

**Prop. (4.13.7.23) [Pathspace of a Hurewicz Fibration].** If  $\pi : E \rightarrow B$  is a fibration, then the inclusion  $E \rightarrow E_\pi$  (4.13.7.22) is a fiber homotopy equivalence. In particular, the homotopy fibers of  $\pi$  are homotopy equivalent to the actual fibers.  $\lrcorner$

*Proof:*  $\square$

**Prop. (4.13.7.24) [Fibration Sequence].** Given a fibration  $\pi : E \rightarrow B$  with  $F = \pi^{-1}(b_0)$ ,  $x_0 \in F$ , there is a sequence

$$\dots \rightarrow \Omega^2(B, b_0) \rightarrow \Omega(F, x_0) \rightarrow \Omega(E, x_0) \rightarrow \Omega(B, b_0) \rightarrow F \rightarrow E \rightarrow B \rightarrow 0$$

where any two consecutive maps form a fibration, up to homotopy.  $\lrcorner$

*Proof:* By (4.13.7.23), the inclusion  $i$  of  $F$  to the homotopy fiber  $F_\pi$  over  $\pi$  over  $p$  is a homotopy equivalence, and it extends to a map  $i : F_p \rightarrow E : (x, \gamma) \mapsto x$ , which is also a Hurewicz fibration, because it is the pullback of the fibration  $PB \rightarrow B$  (4.13.7.21).

Thus we can take the homotopy fiber  $F_i$  of  $i : F_p \rightarrow E$  over  $x_0$ , and similarly there is a fibration  $j : F_i \rightarrow F$ , and  $F$  is naturally homotopic to the actual fiber of  $i$ , which is just  $\Omega(B, b_0)$ .  $\square$

### Model Category Structures

**Lemma (4.13.7.25) [Cofibrant Replacement].** Any map  $f : X \rightarrow Y$  is a composition  $X \rightarrow M_f \rightarrow Y$ . Notice  $M_f \rightarrow Y$  is a homotopy equivalence and  $X \rightarrow M_f$  is cofibrant by (4.13.7.4).  $\lrcorner$

**Cor. (4.13.7.26) [Homotopy equivalence and mapping cylinder].** A map  $f : X \rightarrow Y$  is a homotopy equivalence iff  $X$  is a deformation retraction of the mapping cylinder  $M_f$ . In particular, two spaces are homotopically equivalent iff there is a third space containing both of them as deformation retractions.  $\lrcorner$

*Proof:* Cf. [Hatcher] P16.  $\square$

**Lemma (4.13.7.27) [Fibrant Replacement].** Any map  $f : X \rightarrow Y$  is a composition  $X \rightarrow N(f) \rightarrow Y$ , where  $N(f) = X \times_Y Y^I$ , where  $Y^I \rightarrow Y$  is evaluation at  $\{0\}$ , and  $X \rightarrow N(f)$  is given by  $x \mapsto (x, c_{f(x)})$ , where  $c_{f(x)} \in Y^I$  is the constant map  $f(x)$ .

It is true that  $\lrcorner$

*Proof:*  $X \rightarrow N(f)$  is homotopy inverse to the projection map: We can use the homotopy  $N(f) \times I \rightarrow N(f) : (\chi, a) \mapsto \chi_a : t \mapsto \chi(at)$ .

To show that  $N(f) \rightarrow Y$  is a fibration, Cf. [May, 50] ?.  $\square$

**Prop. (4.13.7.28) [Serre-Quillen].** The category  $\mathcal{CG}$  can be given a **Serre-Quillen model structure** with

- Weak equivalences: weak homotopy equivalence,
- Fibrations: Serre fibrations,
- Cofibrations: Retracts of morphisms  $X \rightarrow Y$  where  $Y$  is obtained from  $X$  by attaching cells.  $\lrcorner$

*Proof:* Cf. [Homotopy Theories and Model Categories, Chap8].  $\square$

**Prop. (4.13.7.29).** The homotopy category  $\text{Ho}(\text{Top})$  of the Serre-Quillen model structure is equivalent to the homotopy category of spaces  $\mathcal{H}$ .  $\lrcorner$

*Proof:*

□

**Lemma (4.13.7.30).** Every map can be decomposed as a homotopy equivalence followed by a fibration, by the construction of homotopy fibers. ┘

*Proof:*

□

**Prop. (4.13.7.31) [Hurewicz-Strøm].** The category  $\mathcal{CG}$  can be given a **Hurewicz-Strøm model structure** with

- Weak equivalences: homotopy equivalences.
- Cofibrations: closed Hurewicz cofibrations.
- Fibrations: Hurewicz fibrations.

┘

*Proof:* Cf.[strum paper].

□

**Prop. (4.13.7.32).** The homotopy category of the Hurewicz-Strøm model structure is equivalent to the usual category of homotopy types. ┘

## 8 Calculations of Homotopy Groups

**Prop. (4.13.8.1).** For  $0 < k < n \in \mathbb{Z}$ ,  $\pi_k(\mathbb{S}^n) = 0$ . And for  $0 < n$ ,  $\pi_0(\mathbb{S}^n) = *$ . ┘

*Proof:* This follows from cellular approximation(4.13.6.10) and the canonical CW structure on  $\mathbb{S}^n$ . □

**Prop. (4.13.8.2).** For  $i \geq 2$ ,  $\pi_1(\mathbb{RP}^i) \cong \mathbb{Z}/(2)$ , and  $\pi_n(\mathbb{RP}^i) \cong \pi_n(\mathbb{S}^i)$  for  $n \neq 1$ . ┘

*Proof:* This follows from the fiber sequence  $\mathbb{Z}/(2) \rightarrow \mathbb{S}^n \rightarrow \mathbb{RP}^n$  and(4.13.5.12). □

**Lemma (4.13.8.3).** There is a covering space  $\mathbb{R} \rightarrow \mathbb{S}^1$  with fiber  $\mathbb{Z}$ , thus  $\pi_1(\mathbb{S}^1) \cong \mathbb{Z}$ . ┘

**Prop. (4.13.8.4) [Hopf Fibration].** By(4.15.1.12) and(4.13.7.14), there is a long exact sequence

$$\dots \rightarrow \pi_i(\mathbb{S}^1) \rightarrow \pi_i(\mathbb{S}^3) \rightarrow \pi_i(\mathbb{S}^2) \rightarrow \pi_{i-1}(\mathbb{S}^1) \rightarrow \dots \rightarrow \pi_0(\mathbb{S}^2) \rightarrow 1.$$

Thus  $\pi_i(\mathbb{S}^3) \cong \pi_i(\mathbb{S}^2)$  for  $i \geq 3$ , and  $\pi_2(\mathbb{S}^2) \cong \pi_1(\mathbb{S}^1) \cong \mathbb{Z}$ (4.13.8.3). ┘

**Prop. (4.13.8.5) [Finiteness of Sphere Homotopy].** For  $p > n > 1$ ,  $\pi_p(\mathbb{S}^n)$  are all finite except for  $\pi_{4n-1}(\mathbb{S}^{2n})$ . ┘

*Proof:*

□

**Prop. (4.13.8.6) [Basic Sphere Homotopy].** For  $n \in \mathbb{Z}_+$ , there are maps  $\pi_i(\mathbb{S}^n) \rightarrow \pi_{i+1}(\mathbb{S}^{n+1})$  that is an isomorphism for  $i < 2n - 1$  and surjective for  $i = 2n - 1$ .

In particular,  $\pi_n(\mathbb{S}^n) \cong \pi_2(\mathbb{S}^2) \cong \mathbb{Z}$  for any  $n \geq 2$ . ┘

*Proof:* This follows from Freudenthal suspension theorem(4.13.5.22). The last assertion follows from(4.13.8.3). □

**Prop. (4.13.8.7).**  $\pi_4(\mathbb{S}^3) \cong \pi_4(\mathbb{S}^2) \cong \mathbb{Z}/(2)$ . ┘

*Proof:*

□

**Prop. (4.13.8.8).** for  $i \leq 2m$ ,  $\pi_i G_m(\mathbb{C}^{2m}) \cong \pi_{i-1} U(m)$ , and

$$\pi_{i-1} U(m) \cong \pi_{i-1} U(m+1) \cong \dots$$

and for  $j \neq 1$ ,  $\pi_j U(m) \cong \pi_j SU(m)$ .

Similarly,  $\pi_i \Omega_1(2m) \cong \pi_{i+1} O(2m)$  for  $i \leq n-4$ . (16.4.2.12), Cf[Morse Theory Milnor Prop23.4]. ⊥

**Cor. (4.13.8.9)[Bott Periodicity theorem for Unitary Groups].** The stable homotopy group  $\pi_i U$  has period 2.  $\pi_{2k+1} U \cong 0$  and  $\pi_{2k} U \cong \mathbb{Z}$ . ⊥

*Proof:* Use the last proposition and long exact sequence to show that for  $1 \leq i \leq 2m$ ,

$$\pi_{i-1} U = \pi_{i-1} U(m) \cong \pi_i G_m(\mathbb{C}^{2m}) \cong \pi_{i+1} SU(2m) \cong \pi_{i+1} U.$$

Notice that  $U(m) \rightarrow U(2m)/U(m) \rightarrow G_m(\mathbb{C}^{2m})$

□

**Prop. (4.13.8.10) [Bott Periodicity for O].** For the infinite dimensional orthogonal space  $O$ ,  $\Omega_8(16r) \cong O(r)$ ,  $\Omega_4(8r) \cong Sp(2r)$ . So  $\Omega_8 \cong O$  and  $\Omega_4 O \cong Sp$ . Thus by (4.13.5.2),

$$\pi_i(O) = \mathbb{Z}/(2), \mathbb{Z}/(2), 0, \mathbb{Z}, 0, 0, 0, \mathbb{Z}, \dots, \quad \pi_i(Sp) = 0, 0, 0, \mathbb{Z}, \mathbb{Z}/(2), \mathbb{Z}/(2), 0, \mathbb{Z}, \dots$$

respectively. (Use (16.4.2.13)) Cf.[Morse Theory Prop24.7].

⊥

**Prop. (4.13.8.11).** If a simply-connected finite complex  $X$  is not contractible, then infinitely many of its homotopy groups are non-zero. ⊥

*Proof:* Cf.[Jean-Pierre Serre, Cohomologie modulo 2 des complexes d'Eilenberg-MacLane]

□

## 4.14 Algebraic Topology II: Homologies and Cohomologies

**Notation (4.14.0.1).**

- Use notations on homotopy theory defined in [Algebraic Topology I: Homotopies](#).

⌋

### 1 Homologies

#### Axiomatic Homologies

**Def. (4.14.1.1) [Eilenberg-Steenrod Homology Theories, Eilenberg-Steenrod 1945].** A **Eilenberg-Steenrod homology theory** is given by the following data:

- A functor  $E_p(-) : \text{Ho}(\mathcal{T}\text{op}^{\text{rel}}) \rightarrow \mathcal{A}\text{b}$  for any  $p \in \mathbb{Z}$ . For  $X \in \mathcal{T}\text{op}$ , denote  $H_p(X, \emptyset)$  by  $E_p(X)$ .
- For any  $p \in \mathbb{Z}$ , an equivariant **boundary map**  $\partial : E_p(X, A) \rightarrow E_{p-1}(A)$  for any  $(X, A) \in \text{Ho}(\mathcal{T}\text{op}^{\text{rel}})$ .

that satisfies

**Exact Sequence:** For  $(X, A) \in \mathcal{T}\text{op}^{\text{rel}}$ , there is a natural long exact sequence

$$\cdots \rightarrow E_p(A) \rightarrow E_p(X) \rightarrow E_p(X, A) \xrightarrow{\partial} E_{p-1}(A) \rightarrow \cdots$$

**Excision:** For any excisive triad  $(X; A, B)$  (4.13.1.6), the inclusion  $(A, A \cap B) \rightarrow (X, B)$  induces an isomorphism

$$E_p(A, A \cap B) \cong E_p(X, B)$$

**Additivity:** If  $(X, A) = \coprod_{\alpha} (X_{\alpha}, A_{\alpha})$ , then there are natural isomorphisms

$$\bigoplus_{\alpha} E_p(X_{\alpha}, A_{\alpha}) \cong E_p(X, A).$$

By functorial CW approximations on relative spaces (4.13.6.15), CW approximation of excisive triads (4.13.6.19) and Whitehead theorem (4.13.6.6), such a theory is equivalent to a theory restricted to all CW complexes with cellular maps as morphisms. ⌋

**Prop. (4.14.1.2) [Cofibrations].** Given an Eilenberg-Steenrod homology theory  $E_*$ , for any cofibration  $i : A \rightarrow X \in \mathcal{T}\text{op}$ , there is a natural isomorphism

$$E_*(X, A) \cong E_*(X/A, *).$$

⌋

*Proof:* As  $i$  is a cofibration,  $C(A) \rightarrow C(i) = X \coprod_{A \times \{0\}} C(A)$  is also a cofibration. Consider the commutative diagram

$$\begin{array}{ccc} E_*(X \coprod_{A \times \{0\}} (A \times [0, 2/3]), A \times [1/3, 2/3]) & \longrightarrow & E_*(C(i), (A \times [1/3, 1]) / (A \times \{1\})) \\ \downarrow & & \downarrow \\ E_*(X, A) & \longrightarrow & E_*(X/A, *) \end{array}$$

Then the upper horizontal map is an isomorphism by excision, and the vertical maps are isomorphisms by homotopy invariance: The right vertical map is

$$(C(i), (A \times [1/3, 1]) / (A \times \{1\})) \cong (C(i), C(A)) \cong (X/A, *)$$

by (4.13.7.7). Then the lower horizontal map is also an isomorphism. □

**Def. (4.14.1.3) [Reduced Homology Theories].** A **reduced Eilenberg-Steenrod homology theory** is given by the following data: A functor  $\tilde{E}_*(-) : \text{Ho}(\mathcal{CG}^{\text{well-pt}}) \rightarrow \mathcal{Ab}$  for any  $p \in \mathbb{Z}$  that satisfies

**Exactness:** For any cofibration  $i : A \rightarrow X \in \mathcal{CG}^{\text{well-pt}}$ , the sequences

$$\tilde{E}_p(A) \rightarrow \tilde{E}_p(X) \rightarrow \tilde{E}_p(X/A)$$

are exact.

**Suspension:** For any  $X \in \mathcal{CG}^{\text{well-pt}}$ , there are natural isomorphisms

$$\Sigma_* : \tilde{E}_p(X) \cong \tilde{E}_{p+1}(\Sigma X).$$

**Additivity:** If  $X = \bigvee_{\alpha} X_{\alpha}$ , then there are natural isomorphisms

$$\bigoplus_{\alpha} \tilde{E}_p(X_{\alpha}) \cong \tilde{E}_p(X).$$

By functorial CW approximations on pointed spaces(4.13.6.15), such a theory is equivalent to a theory restricted to all CW complexes with cellular maps as morphisms.  $\lrcorner$

**Prop. (4.14.1.4) [Reduction to Reduced Homology Theories].** Giving an Eilenberg-Steenrod homology theory is equivalent to giving a reduced Eilenberg-Steenrod homology theory. Thus from now on we will not distinguish from a reduced ES-homology theory and an ES-homology theory.  $\lrcorner$

*Proof:* Given an ES homology theory  $E_*$ , for  $X \in \mathcal{T}\text{op}^{\text{pt}}$ , define  $\tilde{E}_*(X) = E_*(X, *)$ , then the maps  $* \rightarrow X \rightarrow *$  induce a natural splitting  $E_*(X) \cong \tilde{E}_*(X) \oplus E_*(*)$ . Then it is easy to show  $\tilde{E}_*$  is a reduced ES homology theory by(4.14.1.2): For suspension, because  $C(X)$  is contractible and  $X \rightarrow C(X)$  is a cofibration, the long exact sequence for  $C(X)/X \cong \Sigma(X)$  and(4.14.1.2) implies the isomorphism

$$\Sigma^{-1} : \tilde{E}_{p+1}(\Sigma(X)) \cong \tilde{E}_{p+1}(C(X)/X) \cong E_{p+1}(C(X), X) \xrightarrow{\partial} \tilde{E}_p(X).$$

Conversely, if  $\tilde{E}_*$  is a reduced ES homology theory, define  $E_*(X, A) = \tilde{E}_*(C(A \rightarrow X))$  where  $C(A \rightarrow X)$  is pointed over the cone point. In particular,  $E_*(X) = \tilde{E}_*(X_+)$ (4.13.1.16). We also define the boundary map as

$$\partial : E_*(X, A) \cong \tilde{E}_*(C(i_+)) \xrightarrow{\partial} \tilde{E}_*(\Sigma(A_+)) \xrightarrow{\Sigma^{-1}} E_{*-1}(A_+),$$

where  $\partial$  comes from  $\Sigma(A_+) \cong C(i_+)/X_+$ .

To show  $E_*$  is a ES homology theory: additivity is clear. The homotopy invariance follows from(4.13.1.17). To show exactness?. To show excision?. Cf.[May, P110].

To show that these two constructions are inverse to each other, it suffices to show that the  $\partial$  and  $\Sigma$  defined are inverse to each other?.  $\square$

**Lemma (4.14.1.5).** Let  $E$  be an ES-homology theory and  $B \subset A \subset X$ , then there is a functorial long exact sequence

$$\cdots \rightarrow E_p(A, B) \rightarrow E_p(X, B) \rightarrow E_p(X, A) \xrightarrow{\partial} E_{p-1}(A, B) \rightarrow \cdots,$$

where  $\partial : E_p(X, A) \rightarrow E_{p-1}(A) \rightarrow E_{p-1}(A, B)$ .  $\lrcorner$

*Proof:* This follows from diagram chase or using the functorial CW approximations(4.13.6.15).  $\square$

**Lemma (4.14.1.6).** If  $E$  be an ES-homology theory and  $(X; A, B)$  is an excisive triad, then the natural map

$$E_*(A, A \cap B) \oplus E_*(B, A \cap B) \rightarrow E_*(X, A \cap B)$$

is an isomorphism.  $\lrcorner$

*Proof:* This is done by using the CW approximations for excisive triads (4.13.6.19).  $\square$

**Prop. (4.14.1.7) [Mayer-Vietoris Sequences].** Let  $E$  be an ES-homology theory and  $(X; A, B)$  be an excisive triad, then there is a long exact sequence

$$\cdots \rightarrow E_p(A \cap B) \xrightarrow{((i_1)_*, (i_2)_*)} E_p(A) \oplus E_p(B) \xrightarrow{(\tilde{j}_1)_* - (\tilde{j}_2)_*} E_p(X) \xrightarrow{\Delta} E_{p-1}(A \cap B) \rightarrow \cdots,$$

where  $\Delta$  is the composite

$$E_p(X) \rightarrow E_p(X, B) \cong E_p(A, A \cap B) \xrightarrow{\partial} E_{p-1}(A \cap B).$$

$\lrcorner$

*Proof:* Cf. [May, P112].  $\square$

**Prop. (4.14.1.8) [Relative Mayer-Vietoris Sequences].** The relative MV-sequence is related to the MV-sequence (4.14.1.7) by

$$\begin{array}{ccccccc} \cdots & \longrightarrow & E_p(Y, A \cap B) & \longrightarrow & E_p(Y, A) \oplus E_p(Y, B) & \longrightarrow & E_p(Y, X) \longrightarrow E_{p-1}(Y, A \cap B) \longrightarrow \cdots \\ & & \downarrow \partial & & \downarrow \partial \oplus \partial & & \downarrow \partial \\ \cdots & \longrightarrow & E_p(A \cap B) & \longrightarrow & E_p(A) \oplus E_p(B) & \longrightarrow & E_p(X) \longrightarrow E_{p-1}(A \cap B) \longrightarrow \cdots \end{array}$$

$\lrcorner$

**Prop. (4.14.1.9) [Colimits].** If  $X = \varinjlim_{i \in \mathbb{N}} X_i$ , then there is a natural isomorphism

$$\varinjlim E_*(X_i) \cong E_*(X).$$

$\lrcorner$

*Proof:* Cf. [May, P115].  $\square$

**Cor. (4.14.1.10).** For a reduced ES-homology theory  $\tilde{E}_*$  and  $(X_i)_{i \in \mathbb{N}} \in \mathcal{T}^{\text{pt}}$ , there are natural isomorphisms

$$\varinjlim \tilde{E}_*(X_i) \cong \tilde{E}_*\left(\coprod_i X_i\right) \quad (4.13.1.19).$$

$\lrcorner$

### The Ordinary Homology Theory

**Def. (4.14.1.11) [Ordinary Homology Theories].** For  $\Lambda \in \mathcal{A}b$ , an **ordinary homology theory** with coefficients in  $\Lambda$  is a generalized homology theory (4.14.2.1) that satisfies the additional axiom

$$\textbf{Dimension: } E_p(\text{pt}) = \begin{cases} \Lambda & , p = 0 \\ 0 & , p \neq 0 \end{cases}.$$

┘

**Def. (4.14.1.12) [Ordinary Reduced Homology Theories].** For  $\Lambda \in \mathcal{A}b$ , an **ordinary reduced homology theory** with coefficients in  $\Lambda$  is a reduced homology theory (4.14.1.3) that satisfies the additional axiom

$$\text{Dimension: } \tilde{E}_p(S^0) = \begin{cases} \Lambda & , p = 0 \\ 0 & , p \neq 0 \end{cases}.$$

┘

**Def. (4.14.1.13) [Hurewicz Homomorphism].** For an ordinary homology theory  $H_*$ , if we denote the generator of  $\tilde{H}_0(\mathbb{S}^0)$  by  $a_0$ , and  $a_n = \Sigma^n(a) \in \tilde{H}_n(\mathbb{S}^n)$ , then for any  $X \in \mathcal{CG}^{\text{pt}}$ , define the **Hurewicz homomorphism**

$$\text{Hur}_X : \pi_n(X) \rightarrow \tilde{H}_n(X) : f \mapsto f_*(a_n).$$

┘

**Prop. (4.14.1.14).** For  $n \in \mathbb{Z}_+$ ,  $X \in \mathcal{Top}^{\text{pt}}$ ,  $\text{Hur}_X$  is a homomorphism of groups. ┘

*Proof:* Cf.[May, P117]. ┘

**Prop. (4.14.1.15) [Generalized Hurewicz theorem].** If  $n \geq 2$  and  $(X, A)$  is a  $(n-1)$ -connected pair of spaces, then the Hurewicz map induces an isomorphism

$$\pi_n(X, A) / \sim \pi_1(A) \cong H_n(X, A),$$

and  $H_k(X, A) = 0, k < n$ . Moreover, the Hurewicz map  $\pi_{n+1}(X, A) \rightarrow H_{n+1}(X, A)$  is surjective. ┘

*Proof:* Cf.[Hatcher P371 and 390Ex23]. ? ┘

**Cor. (4.14.1.16) [Converse Whitehead].** If  $f : X \rightarrow Y$  is a map of simple pointed spaces that induces isomorphisms on all homology groups, then  $f$  is a weak homotopy equivalence. ┘

*Proof:* We may change  $Y$  to the mapping cylinder of  $f$ , then notice all the relative homology groups  $H_n(Y, X)$  vanishes by long exact sequence, and then by the generalized Hurewicz theorem,  $\pi_n(Y, X) = 0$ , and then  $f$  is a weak homotopy equivalence, by (4.13.5.11). ┘

**Thm. (4.14.1.17) [Hurewicz].** For  $n \in \mathbb{Z}_+$ , if  $X \in \mathcal{CG}^{\text{pt}}$  is  $(n-1)$ -connected, then  $\text{Hur}_X : \pi_n(X) \rightarrow \tilde{H}_n(X)$  induces an isomorphism  $\pi_n(X)^{\text{ab}} \cong \tilde{H}_n(X)$ . In particular, if  $n > 1$ ,  $\pi_n(X) \cong \tilde{H}_n(X)$  (4.13.5.1). ┘

*Proof:* Cf.[May, P118]. ┘

### The Cellular and Singular Realizations

**Def. (4.14.1.18) [Degree of Maps].** For any  $f : \mathbb{S}^n \rightarrow \mathbb{S}^n \in \mathcal{Top}$ , we can choose a base point and use cellular approximation to make it homotopic to a cellular map  $(\mathbb{S}^n, *) \rightarrow (\mathbb{S}^n, *)$ , and define the **degree of  $f$**  to be the multiplying factor of  $f_* : \pi_n(\mathbb{S}^n) \cong \mathbb{Z} \rightarrow \pi_n(\mathbb{S}^n) \cong \mathbb{Z}$  (4.13.8.6).

Then this degree is independent of the base point chosen simply by rotation. ┘

**Prop. (4.14.1.19).** The antipodal map  $\mathbb{S}^n \rightarrow \mathbb{S}^n$  has degree  $(-1)^{n-1}$ . ┘

*Proof:* This is because the antipodal map is a composition of  $n+1$  reflections, and each reflection is an  $n$ -suspension of a reflection on  $\mathbb{S}^1 \rightarrow \mathbb{S}^1$ , which clearly has degree  $-1$ . Thus we finish by (4.13.8.6). ┘

**Def. (4.14.1.20) [Cellular Complex on CW].** Given  $X \in \mathcal{CW}$  with presentation  $X = \cup_i X^i$ , we can define the **cellular homology groups** as follows: Let  $C_\bullet(X)$  be the complex with  $C_p(X)$  the free Abelian group generated by the  $p$ -cells of  $X$ , and the map  $C_p(X) \rightarrow C_{p-1}(X)$  is given by  $e_\alpha \mapsto a_{\alpha\beta} e_\beta$ , where for any  $n$ -cell  $\alpha$  and  $n-1$ -cell  $\beta$ ,  $a_{\alpha\beta}$  is the degree(4.14.1.18) of the map

$$S^{p-1} \xrightarrow{\alpha} X^{p-1} \rightarrow X^{p-1}/X^{p-2} \xrightarrow{\beta^{-1}} S^{p-1}.$$

Then  $C_\bullet(X)$  is truly a complex. More generally, for any  $\Lambda \in \mathcal{Ab}$ , we can define  $C_\bullet(X; \Lambda) = C_\bullet(X) \otimes \Lambda$ .  $\lrcorner$

*Proof:* Cf. [May, P99] ?.  $\square$

**Def. (4.14.1.21) [Cellular Homology Groups].** For  $X \in \mathcal{CW}$  and a subcomplex  $A \subset X$ , there is an inclusion  $C_*(A) \rightarrow C_*(X)$ . If we define  $C_*(X, A) = C_*(X)/C_*(A)$ . Define the homology groups  $H_p(X) = H_p(C_\bullet(X))$ ,  $H_p(X, A) = H_p(C_\bullet(X, A))$ .

then the long exact sequence associated to the exact sequence  $0 \rightarrow C_*(A) \rightarrow C_*(X) \rightarrow C_*(X, A) \rightarrow 0$  gives a boundary map  $\partial : H_p(X, A) \rightarrow H_{p-1}(A)$ .

More generally, for any  $\Lambda \in \mathcal{Ab}$ , we can define  $C_\bullet(X, A; \Lambda)$  and also  $H_p(X; \Lambda)$ ,  $H_p(X, A; \Lambda)$ .  $\lrcorner$

**Def. (4.14.1.22) [Cellular Complex of Products].** For  $X, Y \in \mathcal{CW}$ , with the CW structure on  $X \times Y$  given in(4.13.3.8), then

$$C_\bullet(X) \otimes C_\bullet(Y) \cong C_\bullet(X \times Y).$$

$\lrcorner$

*Proof:* The map  $C_\bullet(X) \otimes C_\bullet(Y) \cong C_\bullet(X \times Y)$  is given by  $e_\alpha \otimes e_\beta \mapsto (-1)^{|\alpha||\beta|} e_{\alpha \times \beta}$ .

It is clear that this is an isomorphism up to sign. Fo the sign problem, see [May, P101].  $\square$

**Prop. (4.14.1.23).** The cellular homology groups in(4.14.1.21) defines a ES-homology theory(4.14.2.1).  $\lrcorner$

*Proof:* For homotopy invariance, notice a homotopy  $X \times I \rightarrow Y$  between  $f, g : X \rightarrow Y$  will induce a map

$$C_\bullet(X) \otimes C_\bullet(I) \rightarrow C_\bullet(Y)$$

by(4.14.1.22), and with the canonical CW structure,  $C_\bullet(I)$  is just  $0 \rightarrow \mathbb{Z} \xrightarrow{(1, -1)} \mathbb{Z} \oplus \mathbb{Z} \rightarrow 0$ . By writting it out, this gives exactly a homotopy between the two maps  $f_*, g_*$ . Additivity, excision and exactness is clear.  $\square$

**Def. (4.14.1.24) [Singular Homologies].** For  $X \in \mathcal{Top}$ ,  $\Lambda \in \mathcal{Ab}$ , the **singular cohomology groups** with coefficients in  $R$  is defined to be  $H_{\text{sing},*}(X; \Lambda) = H_*(\Gamma(X); R)$ (4.6.3.8). This is the just the homology on  $\mathcal{Top}^{\text{rel}}$  corresponding to the cellular homology on CW-pairs.  $\lrcorner$

**Thm. (4.14.1.25) [Uniqueness of Ordinary Homology Theories].** There exists a unique ordinary homology theory, i.e. the one defined in(4.14.1.21).  $\lrcorner$

*Proof:* Cf. [May, P119].  $\square$

## 2 Cohomologies

**Remark (4.14.2.1) [Eilenberg-Steenrod Cohomology Theories].** The whole basic theory of cohomologies is dual to that of homologies, so it is omitted here.

We only focus on new features appearing.  $\lrcorner$

**Def. (4.14.2.2) [Cohomological Operators].** Given reduced ES-cohomology theories  $\tilde{E}^*, \tilde{F}^*, p, n \in \mathbb{Z}$ , a **cohomological operator** of type  $p$  and degree  $n$  is a natural homomorphism  $\tilde{E}^p \rightarrow \tilde{F}^{p+n}$ .

A **stable cohomological operator** of degree  $n$  is a sequence of cohomological operators  $\Phi_p^n$  of type  $p$  and degree  $n$  that commutes with the suspension isomorphism.  $\lrcorner$

### Ordinary Cohomology Theories

**Thm. (4.14.2.3) [Uniqueness of Ordinary Homology Theories].** There exists a unique ordinary cohomology theory, i.e. the one give by cellular cohomology groups.  $\lrcorner$

*Proof:* The proof is the same as that of (4.14.1.25).  $\square$

**Prop. (4.14.2.4) [Universal Coefficient Theorem].** See (4.8.8.6).  $\lrcorner$

**Cor. (4.14.2.5).** A map between topological spaces that induce isomorphism on arbitrary homology group induce isomorphisms on cohomology groups.  $\lrcorner$

**Def. (4.14.2.6) [Cup Product].** For  $X, Y \in \mathcal{CW}$ , as  $C_\bullet(X) \otimes C_\bullet(Y) \cong C_\bullet(X \times Y)$  (4.14.1.22), for any  $R \in \mathcal{CAlg}$ , there is a chain homomorphism

$$\mathrm{Hom}^\bullet(C_\bullet(X), R) \otimes \mathrm{Hom}^\bullet(C_\bullet(Y), R) \rightarrow \mathrm{Hom}^\bullet(C_\bullet(X \times Y), R),$$

which induces a natural **cross product map**

$$H^*(X; R) \otimes H^*(Y; R) \rightarrow H^*(X \times Y; R).$$

And composing with the diagonal map  $\Delta_X : X \rightarrow X \times X$  gives a **cup product map**

$$H^*(X; R) \times H^*(X; R) \rightarrow H^*(X \times X; R)$$

that makes  $H^*(X; R)$  into a unital commutative graded  $R$ -algebra.  $\lrcorner$

*Proof:* Cf. [May, P139].  $\square$

**Def. (4.14.2.7) [Bockstein Homomorphism].**  $\lrcorner$

**Prop. (4.14.2.8).** the square of the Bockstein homomorphism  $H^n(X, \mathbb{F}_p) \rightarrow H^{n+2}(X, \mathbb{F}_p)$  is trivial.  $\lrcorner$

*Proof:* There is a commutative diagram of commutative rings

$$\begin{array}{ccccccc} 0 & \longrightarrow & \mathbb{Z} & \xrightarrow{\times m} & \mathbb{Z} & \longrightarrow & \mathbb{Z}/(m) \longrightarrow 0 \\ & & \downarrow & & \downarrow & & \downarrow \\ 0 & \longrightarrow & \mathbb{Z}/(m) & \xrightarrow{\times m} & \mathbb{Z}/(m^2) & \longrightarrow & \mathbb{Z}/(m) \longrightarrow 0 \end{array}$$

which induces commutative diagrams

$$\begin{array}{ccc} H^n(X, \mathbb{Z}/(m)) & \xrightarrow{\tilde{\beta}} & H^{n+1}(X, \mathbb{Z}) \\ \parallel & & \downarrow \rho \\ H^n(X, \mathbb{Z}/(m)) & \xrightarrow{\beta} & H^n(X, \mathbb{Z}/(m)) \end{array}$$

so  $\beta = \rho\tilde{\beta}$ , and  $\beta^2 = \rho\tilde{\beta}\rho\tilde{\beta} = 0$ , as  $\tilde{\beta}\rho = 0$  by long exact sequence.  $\square$

**Prop. (4.14.2.9) [Lefschetz Fixed Point Theorem].**  $\lrcorner$

**Prop. (4.14.2.10) [Wedge Sums].** For  $M, N \in \mathcal{T}_{\text{op}}$ ,  $\tilde{H}^i(M \wedge N) = \tilde{H}^i(M) \otimes \tilde{H}^i(N)$ .  $\lrcorner$

*Proof:*  $\square$

**Prop. (4.14.2.11) [Connected Sums].** Let  $M, N \in \mathcal{M}_{\text{ani}, \text{cntd}, \text{cpct}}^d$ , the cohomology of  $M \# N$  is ?  $\lrcorner$

And if  $M, N$  are orientable, then  $H^*(M \# N) = 1 \oplus [\tilde{H}^*(M) \oplus \tilde{H}^*(N)/([M] - [N])]$ .  $\lrcorner$

*Proof:* As  $M \# N / S^{d-1} = M \vee N$ , there is a long exact sequence

$$\dots \rightarrow \tilde{H}^i(M \vee N) \rightarrow \tilde{H}^i(M \# N) \rightarrow \tilde{H}^i(S^{d-1}) \rightarrow \tilde{H}^{i+1}(M \# N) \rightarrow \dots$$

Thus by (4.14.2.10),  $\tilde{H}^i(M \# N) = \tilde{H}^i(M) \oplus \tilde{H}^i(N)$  for  $i \neq d-1, d$ . And there is an exact sequence

$$0 \rightarrow \tilde{H}^{d-1}(M \vee N) \rightarrow \tilde{H}^{d-1}(M \# N) \rightarrow \mathbb{Z} \rightarrow \tilde{H}^d(M \vee N) \rightarrow \tilde{H}^d(M \# N) \rightarrow 0.$$

If  $M, N$  are both orientable, then so does  $M \# N$ , and the sequence looks like

$$0 \rightarrow \tilde{H}^{d-1}(M \vee N) \rightarrow \tilde{H}^{d-1}(M \# N) \xrightarrow{0} \mathbb{Z} \rightarrow \mathbb{Z} \otimes \mathbb{Z} \rightarrow \mathbb{Z} \rightarrow 0.$$

and  $\tilde{H}^{d-1}(M \vee N) \cong \tilde{H}^{d-1}(M \# N)$ .

If only one of  $M, N$  is orientable, then similarly,  $\tilde{H}^{d-1}(M \vee N) \cong \tilde{H}^{d-1}(M \# N)$ .

If neither  $M, N$  are orientable, then nor does  $M \# N$ , and the sequence looks like

$$0 \rightarrow \tilde{H}^{d-1}(M \vee N) \rightarrow \tilde{H}^{d-1}(M \# N) \rightarrow \mathbb{Z} \rightarrow 0 \otimes 0 \rightarrow 0 \rightarrow 0.$$

which splits ?, so  $\tilde{H}^{d-1}(M \# N) \cong \tilde{H}^{d-1}(M \vee N) \oplus \mathbb{Z}$ .  $\square$

### Cup and Cap Products

Main references are [Hat02] Chap3.2.

**Prop. (4.14.2.12).** The cup product will restrict to a relative version:

$$H^*(X, A) \times H^*(X, B) \rightarrow H^*(X, A \cup B),$$

This implies that if  $X$  is a union of  $n$  contractible open set, then the cup product of  $n$ -elements vanish. In particular, the cup product in a suspension vanishes.  $\lrcorner$

**Prop. (4.14.2.13) [Künneth Formula].** The cross product  $H^*(X, \mathbb{R}) \otimes_R H^*(Y, \mathbb{R}) \rightarrow H^*(X \times Y, \mathbb{R})$  is an isomorphisms of rings if  $X, Y$  are CW complexes and  $H^*(Y, \mathbb{R})$  are a finite free  $R$ -modules for any  $k$ .  $\lrcorner$

*Proof:* Cf. [Hat02] P219.  $\square$

**Def. (4.14.2.14) [Cap Products].**  $\lrcorner$

### Cohomology of Fiber Bundles

**Prop. (4.14.2.15) [Leray-Hirsch].** For a fiber bundle  $F \rightarrow E \rightarrow B$  and a ring  $R$  s.t.  $H^n(F, R)$  is f.g free for all  $n$ , and there exist classes  $c_j$  of  $H^*(E)$  that constitute a basis for each fiber  $F$ , then

$$H^*(B, R) \otimes H^*(F, R) \rightarrow H^*(E, R)$$

is an isomorphism of  $H^*(B, R)$ -modules. ┘

*Proof:* □

**Cor. (4.14.2.16).**

- $H^*(U(n); \mathbb{Z}) = \Lambda_{\mathbb{Z}}[x_1, x_3, \dots, x_{2n-1}]$ .
  - $H^*(SU(n, \mathbb{R}); \mathbb{Z}) = \Lambda_{\mathbb{Z}}[x_3, \dots, x_{2n-1}]$ .
  - $H^*(Sp(n); \mathbb{Z}) = \Lambda_{\mathbb{Z}}[x_3, x_7, \dots, x_{4n-1}]$ .
- ┘

**Prop. (4.14.2.17).**  $H^*(\mathbb{G}(n, \mathbb{K}^\infty); \mathbb{Z})$  where  $\mathbb{K} = \mathbb{R}, \mathbb{C}, \mathbb{H}$  is generated by the symmetric polynomials, where for  $\mathbb{R}$  the coefficient is  $\mathbb{Z}_2$ . ┘

*Proof:* Use the flag variety and first calculate for  $\infty$ . Then use Poincare duality to show it is mapped onto the symmetric polynomials. Cf.[Hatcher P435]. □

**Prop. (4.14.2.18) [Leray-Serre].** For a Serre fibration, e.g. fiber bundle,  $F \rightarrow E \rightarrow B$ , that  $B$  is simply connected, then there is a spectral sequence

$$E_2^{pq} = H_p(B, H_q(F)) \Rightarrow H_{p+q}(E) \quad E_2^{pq} = H^p(B, H^q(F)) \Rightarrow H^{p+q}(E)$$
┘

**Cor. (4.14.2.19) [Wang Sequence].** When  $B = S^n$ , there is a long exact sequence:

$$\cdots \rightarrow H_q(F) \rightarrow H_q(E) \rightarrow H_{q-n}(F) \rightarrow H_{q-1}(F) \rightarrow H_{q-1}(E) \rightarrow \cdots$$
┘

**Cor. (4.14.2.20) [Gysin Sequence].** When  $F = S^n$ , there is a long exact sequence:

$$\cdots \rightarrow H_{p-n}(B) \rightarrow H_p(E) \rightarrow H_p(B) \rightarrow H_{p-n-1}(B) \rightarrow H_{p-1}(E) \rightarrow \cdots$$
┘

### H-Spaces

**Def. (4.14.2.21) [H-Spaces].** An **H-space** is a unital magma object in  $\text{Ho}(\mathcal{CG}^{\text{pt}})$ . Equivalently, an H-space is a pointed space  $X \in \mathcal{CG}^{\text{pt}}$  with a map  $\mu : X \times X \rightarrow X \in \text{Ho}(\mathcal{CG}^{\text{pt}})$  s.t.  $X \rightarrow \{*\} \times X \rightarrow X$  and  $X \rightarrow X \times \{*\} \rightarrow X$  is homotopic to  $\text{id}_X$ .

An **associative H-space** is an H-space s.t.  $\mu_X$  is associative in  $\mathcal{Top}^{\text{pt}} / \sim$ . Similarly, we can define group-H-spaces and commutative H-spaces.

An H-space is called strictly associative(or a monoid space) if it comes from a unital associative object in the category of spaces. ┘

**Remark (4.14.2.22).** The definition of a H-space structure can be modified when  $X$  is a CW complex. In fact, when  $(X, e)$  is a CW-pair, if there exists a map  $\mu : X \times X \rightarrow X$  and a point  $e \in X$  that  $X \rightarrow \{e\} \times X \rightarrow X$  and  $X \rightarrow X \times \{e\} \rightarrow X$  is homotopic to  $\text{id}_X$ , then  $\mu$  can be homotoped that  $e$  is a strict identity.  $\lrcorner$

*Proof:* ?  $\square$

**Prop. (4.14.2.23).** If  $H$  is an H-space, then for any  $X \in \mathcal{T}\text{op}^{\text{pt}}$ ,  $\langle X, H \rangle$  is a magma. Moreover, if  $H$  is a commutative associative group H-space, then  $\langle X, H \rangle \in \mathcal{A}\text{b}$ .  $\lrcorner$

**Prop. (4.14.2.24)[Loop Spaces are H-Spaces].** For any  $X \in \mathcal{T}\text{op}^{\text{pt}}$ ,  $\Omega(X)$  is an associative group-H-space, and  $\Omega^2(X)$  is a associative commutative group-H-space.  $\lrcorner$

*Proof:* The multiplication is given by concatenation of loops. It is continuous by adjunction arguments.  $\square$

**Prop. (4.14.2.25).**  $\mathbb{C}\mathbb{P}^\infty$  can be given a commutative strictly associative H-space structure. More generally,  $B(\mathbb{Z}/n) \cong (\mathbb{C}^\infty \setminus \{0\})/(\mathbb{R}^+ \times \mu_n)$  (4.15.3.16) can be given a commutative strictly associative H-space structure. In particular this applies to  $\mathbb{R}\mathbb{P}^\infty$ .  $\lrcorner$

*Proof:* We can regard  $\mathbb{C}^\infty$  as the space of polynomials with complex coefficients, then the polynomial multiplication gives a map  $(\mathbb{C}^\infty \setminus \{0\}) \times (\mathbb{C}^\infty \setminus \{0\}) \rightarrow \mathbb{C}^\infty \setminus \{0\}$  that descends to a map  $B(\mathbb{Z}/n) \times B(\mathbb{Z}/n) \rightarrow B(\mathbb{Z}/n)$ . And  $e = (1, 0, \dots, 0, \dots)$  is the unit.  $\square$

**Prop. (4.14.2.26).** The James reduced product  $J(X)$  (4.13.3.20) is a strictly associative H-space with multiplication given by  $(x_1, \dots, x_n)(y_1, \dots, y_m) = (x_1, \dots, x_n, y_1, \dots, y_m)$ , and the identity  $e$ . This H-space structure also descends to a H-space structure on  $SP(X)$  (4.13.3.21).  $\lrcorner$

**Prop. (4.14.2.27).** The universal cover of a H-space is a H-space.  $\lrcorner$

*Proof:* Take an arbitrary lift that maps  $(\tilde{e}, \tilde{e})$  to  $\tilde{e}$ . Notice the homotopy can also be lifted.  $\square$

**Prop. (4.14.2.28)[Cohomology Ring].** The cohomology ring of a H-space is a topologists' Hopf algebra, by Kunneth formula and naturality.  $\lrcorner$

**Cor. (4.14.2.29).**  $\mathbb{C}\mathbb{P}^n$  is not a H-space.  $\lrcorner$

*Proof:* This is because  $H^*(\mathbb{C}\mathbb{P}^n, \mathbb{Z}) = \mathbb{Z}[\alpha]/\alpha^n$ ,  $|\alpha| = 2$ , which is not a topologist's Hopf algebra, by (3.11.3.13).  $\square$

**Prop. (4.14.2.30).** The fundamental group of an H-space is Abelian.  $\lrcorner$

*Proof:* This is because  $\pi_1$  preserves products, so takes unital magma space to unital magma objects (4.1.1.72). And the unital magma objects in the category of groups is the Abelian groups (4.1.1.71).  $\square$

**Prop. (4.14.2.31)[Adam].**  $\mathbb{S}^0, \mathbb{S}^1, \mathbb{S}^3, \mathbb{S}^7$  are the only spheres that have H-structures.  $\lrcorner$

*Proof:* Firstly  $S^1 \subset \mathbb{C}, S^3 \subset \mathbb{H}, S^7 \subset \mathbb{O}$  are submonoids, so they have H-structures. ?  $\square$

**Cor. (4.14.2.32).**  $\mathbb{R}\mathbb{P}^n$  has a H-structure iff  $n = 1, 3, 7$ .  $\lrcorner$

*Proof:* This is because the universal cover of a H-space is a H-space (4.14.2.27). Also  $\mathbb{S}^1, \mathbb{S}^2, \mathbb{S}^3, \mathbb{S}^7$  are monoid spaces, and  $-1$  are in their center, so the quotients are also monoid spaces.  $\square$

### Examples of Calculations

**Cor. (4.14.2.33).**

$$H^*(\mathbb{RP}^n, \mathbb{F}_2) = \mathbb{F}_2[a]/a^{n+1}, |a| = 1, \quad H^*(\mathbb{CP}^n, \mathbb{Z}) = \mathbb{Z}[\alpha]/\alpha^{n+1}, |\alpha| = 2$$

┘

*Proof:* We prove for  $\mathbb{RP}^n$ , the  $\mathbb{CP}^n$  case is similar. Use induction. For  $n = 1$ , this is clear. For  $n > 1$ , notice  $\mathbb{RP}^n$  is the  $n-1$ -skeleton of  $\mathbb{RP}^n$ , thus the map of rings  $H^*(\mathbb{RP}^n, \mathbb{F}_2) \rightarrow H^*(\mathbb{RP}^{n-1}, \mathbb{F}_2)$  maps the generator of  $H^2(\mathbb{RP}^n, \mathbb{F}_2)$  to the generator  $a$  of  $H^2(\mathbb{RP}^{n-1}, \mathbb{F}_2)$ . Then by hypothesis  $a^{n-1} \neq 0$ . The  $H^{n-1}(\mathbb{RP}^n, \mathbb{F}_2) \cong H_1(\mathbb{RP}^n, \mathbb{F}_2) \cong \mathbb{Z}/(2)$  is generated by  $\alpha^{n-1}$ . Then the Poincaré duality shows that  $\alpha \cup \alpha^{n-1} \neq 0$ , so we are done.  $\square$

**Cor. (4.14.2.34).** For  $n > 1$ , the natural homomorphism  $H^n(\mathbb{RP}^n, \mathbb{Z}/2\mathbb{Z}) \rightarrow H^n(S^n, \mathbb{Z}/2\mathbb{Z})$  is 0.  $\quad \text{┘}$

*Proof:* Because the cohomology ring map maps  $a \in H^1(\mathbb{RP}^n, \mathbb{Z}/2\mathbb{Z})$  to  $0 \in H^1(S^n, \mathbb{Z}/2\mathbb{Z}) = 0$ .  $\square$

**Prop. (4.14.2.35)** [ $H^*(K, \mathbb{F}_2)$ ]. The cohomology ring of the Klein bottle  $K$  is  $H^*(K, \mathbb{Z}/(2)) = \mathbb{F}_2[x, y]/(xy, x^2 - y^2, x^3, y^3)$ .  $\quad \text{┘}$

*Proof:* Let  $\varphi \in C^0(K, \mathbb{Z}/(2))$  be the dual of  $v$ ,  $\alpha, \beta, \gamma \in C^1(K, \mathbb{Z}/(2))$  be the dual of  $a, b, c$ , and  $\mu, \lambda \in C^2(K, \mathbb{Z}/(2))$  be the dual of  $A, B$ , then

$$\partial(\varphi)(a) = \partial(\varphi)(b) = \partial(\varphi)(c) = 0$$

$$\delta(\alpha)(A) = \alpha(\partial(A)) = \alpha(a + b - c) = 1, \quad \delta(\alpha)(B) = \alpha(\partial(B)) = \alpha(b + c - a) = -1$$

$$\delta(\beta)(A) = \beta(\partial(A)) = \beta(a + b - c) = 1, \quad \delta(\beta)(B) = \beta(\partial(B)) = \beta(b + c - a) = 1$$

$$\delta(\gamma)(A) = \gamma(\partial(A)) = \gamma(a + b - c) = -1, \quad \delta(\gamma)(B) = \gamma(\partial(B)) = \gamma(b + c - a) = 1$$

So

$$H^0(K, \mathbb{Z}/(2)) = \mathbb{Z}/(2)\varphi, \quad H^1(K, \mathbb{F}_2) = \mathbb{F}_2(\alpha + \beta) \oplus \mathbb{F}_2(\alpha + \gamma), \quad H^2(K, \mathbb{F}_2) = (\mathbb{F}_2\mu \oplus \mathbb{F}_2\lambda)/(\mu + \lambda).$$

Now we calculate the cup product:

$$(\alpha + \beta) \cup (\alpha + \beta)(A) = (\alpha + \beta)(a) \cdot (\alpha + \beta)(b) = 1$$

$$(\alpha + \beta) \cup (\alpha + \gamma)(A) = (\alpha + \beta)(a) \cdot (\alpha + \gamma)(b) = 0$$

$$(\alpha + \gamma) \cup (\alpha + \gamma)(A) = (\alpha + \gamma)(a) \cdot (\alpha + \gamma)(b) = 0$$

$$(\alpha + \beta) \cup (\alpha + \beta)(B) = (\alpha + \beta)(b) \cdot (\alpha + \beta)(c) = 0$$

$$(\alpha + \beta) \cup (\alpha + \gamma)(B) = (\alpha + \beta)(b) \cdot (\alpha + \gamma)(c) = 1$$

$$(\alpha + \gamma) \cup (\alpha + \gamma)(B) = (\alpha + \gamma)(b) \cdot (\alpha + \gamma)(c) = 0$$

Then  $(\alpha + \beta) \cup (\alpha + \beta) = (\alpha + \beta) \cup (\alpha + \gamma) = \mu \in H^2(K, \mathbb{Z}/(2))$ . Now if we set  $\alpha + \beta = x, \beta + \gamma = y$ , then the cohomology ring

$$H^*(K, \mathbb{Z}/(2)) = \mathbb{Z}/(2)[x, y]/(xy, x^2 - y^2, x^3, y^3).$$

$\square$

**Prop. (4.14.2.36)** [ $H^*(L, \mathbb{Z}/(m))$ ]. Let  $L$  be the Lens space, then the cohomology ring is calculated at [Hat02]P304.  $\quad \text{┘}$

*Proof:*  $\square$

### 3 Manifolds

#### Orientations

**Prop. (4.14.3.1).** Let  $d \in \mathbb{Z}_+$ ,  $R \in \mathcal{CAlg}$ ,  $M \in \text{Mani}^d$ ,  $X \subset M$ , then for any  $x \in M$ , choose a nbhd  $U$  of  $x \in M$  s.t.  $U \cong \mathbb{R}^n$ , then by excision and exactness,

$$H_d(M, M \setminus \{x\}) \cong H_d(U, U \setminus \{x\}) \cong \tilde{H}_{d-1}(U \setminus \{x\}) \cong \tilde{H}_{d-1}(\mathbb{S}^{d-1}) \cong R.$$

┘

**Prop. (4.14.3.2) [Vanishing].** For  $M \in \text{Mani}_{\text{cpct}, \text{cntd}, \partial}^d$ ,  $\Lambda \in \mathcal{Ab}$ ,  $H_i(M; \Lambda) = 0$  for  $i > d$ , and  $\tilde{H}_d(M; \Lambda) = 0$  unless  $M$  is compact without boundary.

┘

*Proof:*

□

**Def. (4.14.3.3) [ $R$ -Fundamental Class].** Let  $R \in \mathcal{CRing}$ ,  $M \in \text{Mani}_{\text{cntd}}^d$ ,  $X \subset M$ , an  $R$ -fundamental class of  $M$  at  $X$  is an element  $z \in H_d(M, M \setminus X)$  s.t. for any  $x \in X$ , the map

$$H_d(M, M \setminus X) \rightarrow H_d(M, M \setminus \{x\})$$

maps  $z$  to a generator of  $H_d(M, M \setminus \{x\}) \cong R$  (4.14.3.1).

┘

**Def. (4.14.3.4) [ $R$ -Orientation].** Let  $R \in \mathcal{CAlg}$ ,  $M \in \text{Mani}_{\text{cntd}}^d$ ,  $X \subset M$ , an  $R$ -orientation of  $M$  is an open cover  $\{U_i\}$  of  $M$  and  $R$ -fundamental classes  $z_i$  of  $M$  at  $U_i$  s.t.  $z_i, z_j$  restricts to the same element in  $H_d(M, M \setminus (U_i \cup U_j))$ .

For  $M \in \text{Mani}_{\text{cntd}, \partial}^d$ , an  $R$ -orientation is an  $R$ -orientation of  $M^\circ$ .

┘

**Prop. (4.14.3.5) [ $R$ -Fundamental Classes and  $R$ -Orientations].** For  $R \in \mathcal{CAlg}$ ,  $M \in \text{Mani}^d$  and  $K \subset M$  compact, then

- $H_i(M, M \setminus K, R) = 0$  for  $i > d$ .
- Any  $R$ -orientation of  $M$  defines an  $R$ -fundamental class of  $M$  at  $K$  that is compatible for  $x \in K$ .

In particular, if  $M$  is compact, then an  $R$ -orientation is equivalent to an  $R$ -fundamental class.

┘

*Proof:* Firstly, if  $K \subset U$  and  $U \cong \mathbb{R}^n$  is a coordinate chart on which the  $R$ -orientation is defined, then by excision and exactness,

$$H_i(M, M \setminus K, R) \cong H_i(U, U \setminus K, R) \cong H_{i-1}(U \setminus K, R)$$

which vanishes for  $i > n$  by vanishing theorem (4.14.3.2). And the  $R$ -orientation restricts to  $K$ .

In general,  $K$  can be written as a sum of compact subsets each contained in a coordinate char on which the  $R$ -orientation is defined. Then using induction, it suffices to show that if the results hold for  $K, L, K \cap L$ , then it holds for  $K \cup L$ : item1 follows from the MV-sequence

$$H_{i+1}(M, M \setminus (K \cup L)) \rightarrow H_i(M, M \setminus (K \cup L)) \rightarrow H_i(M, M \setminus K) \oplus H_i(M, M \setminus L) \rightarrow H_i(M, M \setminus (K \cap L)).$$

For item2, the same MV-sequence with  $R$ -coefficients and  $i = d$  together with the definition of  $R$ -orientation classes (4.14.3.4) shows there exists a fundamental class at  $K \cap L$  that restricts to the fundamental classes at  $K$  and  $L$ .

□

**Prop. (4.14.3.6) [Orientation Dichotomy].** For  $d \in \mathbb{Z}_+$ ,  $M \in \text{Mani}_{\text{cntd}, \text{cpct}}^d$ , there are only two cases:

- $M$  is non-orientable, and  $H_d(M) = 0$ .
- $M$  is orientable, and the map  $H_d(M) \rightarrow H_d(M, M \setminus \{x\}) \cong \mathbb{Z}$  (4.14.3.1) is an isomorphism for any  $x \in M$ .

┘

*Proof:* For any  $R \in \mathcal{CAlg}$ , as  $M \setminus \{x\}$  is connected and non-compact,  $H_d(M \setminus \{x\}; R) = 0$  by (4.14.3.2), thus

$$H_d(M, R) \rightarrow H_d(M, M \setminus \{x\}; R) \cong R$$

is injective. Thus  $H_d(M) \cong 0$  or  $\mathbb{Z}$ . In particular, by universal coefficients theorem,

$$H_d(M) \otimes \mathbb{F}_p \rightarrow H_d(M, M \setminus \{x\}) \otimes \mathbb{F}_p$$

is injective for any  $p \in \text{Prime}$ . Then it is clear to see that  $H_d(M) \rightarrow H_d(M, M \setminus \{x\})$  is an isomorphism for any  $x \in M$ . □

**Prop. (4.14.3.7) [Fundamental Classes on Manifolds with Boundaries].** For  $M \in \text{Mani}_{\partial}^d$ ,  $\partial M \neq 0$ , an  $R$ -orientation on  $M$  determines an  $R$ -orientation of  $\partial M$ . Moreover, the fundamental class  $[\partial M]_R$  defined by (4.14.3.5) comes from the partial of a unique element  $[M]_R \in H_d(M, \partial M; R)$ , called the  **$R$ -fundamental class determined the orientation**. ┘

*Proof:* By collar nbhd theorem,  $M \cong M^o$ , and by vanishing theorem,  $H_d(M) \cong H_d(M^o) = 0$ , thus  $H_d(M, \partial M; R) \rightarrow H_{d-1}(\partial M; R)$  is injective. Let  $N$  be an open collar of  $\partial M$ , then  $H_d(M^o, M^o \cap N; R) \cong H_n(M, \partial M; R)$ . Also,  $M \setminus N$  is compact, so the orientation on  $M^o$  defines a fundamental class in  $H_d(M, M^o \cap N; R) \cong H_n(M, \partial M; R)$ . Then this class determined the orientation on every point of  $M^o$ , and determines the orientation on  $\partial M$ , Cf. [May, P170] ?. □

**Prop. (4.14.3.8) [Orientation Coverings].** ┘

*Proof:* □

**Cor. (4.14.3.9) [Two Orientations].** If  $M \in \text{Mani}_{\text{cntd}}^d$ , then if  $M$  is orientable, it has exactly two orientations. And if  $M$  is simply connected or  $\pi_1(M)$  has no subgroup of index 2, then  $M$  is orientable. ┘

**Def. (4.14.3.10) [Connected Sums].** For  $M, N \in \text{Mani}_{\text{cntd}, \text{cpct}}^d$ , define the **connected sum**  $M \# N$  as follows: Take a subset  $D \subset M$ ,  $D' \subset N$  that are contained in coordinate charts (orientable coordinates charts if  $M, N$  are oriented).  $\varphi : U \cong \mathbb{R}^d$ ,  $\varphi' : U' \cong \mathbb{R}^d$  s.t.  $\varphi(D) \cong \mathbb{D}^d \cong \varphi'(D')$ . Then define

$$M \# N = (M \setminus D) \coprod_{\partial D \cong \partial D'} (N \setminus D')$$

where  $\partial D \cong \partial D'$  is an orientation-reversing homeomorphism when  $M, N$  are both orientable. This is independent of  $D, D'$  and the homeomorphism  $\partial D \cong \partial D'$  chosen. ┘

*Proof:* Firstly we show that  $M \setminus D$  is independent of  $D$  chosen: As  $M$  is locally path connected and connected, it is path connected, Then we can consider a chain of charts isomorphic to  $\mathbb{R}^d$  that connects any two such subsets  $D, D'$ . Then reducing to affine charts, it suffices to show for the case  $M \cong \mathbb{R}^d$ . In this case, we can use isotopy of  $M$  to make  $D \subset D'$ , and then use the coordinate charts and

annulus theorem(4.4.11.4) to show that  $D' \setminus D$  is isomorphic to  $\mathbb{S}^{d-1} \times \mathbb{I}$ . Then the homeomorphism  $M \setminus D \cong M \setminus D'$  can be easily given.

Now we show the connected sum is independent of the homeomorphism chosen:  $\partial D$  and  $\partial D'$  are given orientations by the coordinate charts, and in the non-orientable case, use the argument above on the orientation covering of  $M$ (4.14.3.8), we know there exists a self-homeomorphism of  $M$  that is isotopic to  $\text{id}_M$  that reverses the orientation on  $\partial D$ . Thus in both cases, we can assume  $\partial D \cong \partial D'$  is orientation-preserving. Now(4.13.2.4) shows any such homeomorphism is isotopic, and using the coordinate charts, we can extend the isotopy to a nbhd of nbhd of  $\partial D$ . Thus the connected sum is well-define.  $\square$

**Remark(4.14.3.11).** WARNING: The connected sum may be different in the orientable case if we change one of the orientations:  $\mathbb{CP}^2 \# \mathbb{CP}^2$  is not homeomorphic to  $\mathbb{CP}^2 \# \overline{\mathbb{CP}^2}$ .  $\lrcorner$

*Proof:*

$\square$

**Prop.(4.14.3.12).** For  $M \in \text{Mani}_{\text{cpct}}$ ,  $\text{id}_M$  is not homotopic to a constant map, because they induce different maps on  $[M]_2$ .  $\lrcorner$

### Poincaré Duality

**Lemma(4.14.3.13) [Poincaré Duality].** For  $R \in \mathcal{CAlg}$ , if  $M \in \text{Mani}_{\text{cntd, cpct}}^d$  is  $R$ -oriented, then for any  $p \in \mathbb{Z}$ , there is an isomorphism

$$D = (-) \cap [M]_R : H^p(M; R) \cong H_{n-p}(M; R).$$

In particular,  $H^n(X, \mathbb{F}_2) \cong \mathbb{Z}/(2)$ , and the non-trivial element is called the **fundamental homology class mod 2**, denoted by  $[M]_2$ .  $\lrcorner$

*Proof:* which follows immediately from(7.9.2.29) and(7.3.5.9). (Should also attain the compact cohomology case if we know the relation of compact sheaf cohomology better).  $\square$

**Prop.(4.14.3.14) [Relative Poincaré Duality].** Let  $R \in \mathcal{CAlg}$ ,  $M \in \text{Mani}_{\text{cpct}, \partial}^d$  be  $R$ -orientable with fundamental class  $[M]_R \in H_d(M, \partial M; R)$ , then for any  $\Lambda \in \text{Mod}_R$ , capping with  $[M]_R$  defines isomorphisms

$$H^p(M, \partial M; \Lambda) \cong H_{d-p}(M), \quad H^p(M; \Lambda) \cong H_{d-p}(M, \partial M; \Lambda).$$

$\lrcorner$

*Proof:* Cf.[May, P170] ?.

$\square$

**Cor.(4.14.3.15).** For  $M \in \text{Mani}_{\text{cntd, cpct, orntd}}^d$ , for any  $p \in \mathbb{Z}$ , there is a perfect pairing

$$H^p(M)_{\text{lf}} \times H^{n-p}(M)_{\text{lf}} \rightarrow \mathbb{Z} : (\alpha, \beta) \mapsto \langle \alpha \cup \beta, [M] \rangle.$$

$\lrcorner$

*Proof:* By universal coefficient theorem ?,  $H^p(M)_{\text{lf}} \cong \text{Hom}(H_p(M), \mathbb{Z})$ . So if  $\alpha \in H^p(M)$  is non-zero in  $H^p(M)_{\text{lf}}$ , there exists  $a \in H_p(M)$  s.t.  $\langle a, \alpha \rangle = 1$ . Then by Poincaré duality(4.14.3.13), there exists  $\beta \in H^{d-p}(M)$  s.t.  $\beta \cap [M] = a$ . Thus  $\langle \alpha \cup \beta, [M] \rangle = \langle \alpha, \beta \cap [M] \rangle = 1$ .  $\square$

**Def. (4.14.3.16) [Intersection Pairing].** Let  $k \in \mathbb{N}$ ,  $M \in \text{Mani}_{\text{cpct,orntd,cntd}}^{2k}$ . The Poincaré duality (4.14.3.15) shows the cup product pairing

$$H^k(M; \mathbb{Q}) \times H^k(N; \mathbb{Q}) \rightarrow \mathbb{Q} : (\alpha, \beta) \mapsto \langle \alpha \cup \beta, [M] \rangle$$

is non-degenerate, called the **intersection pairing** of  $M$ . Notice if  $k$  is odd, it is skew-symmetric, and if  $k$  is even, it is symmetric.  $\lrcorner$

**Def. (4.14.3.17) [Index].** For  $M \in \text{Mani}_{\text{cpct,orntd,cntd}}^d$ , define the **index of**  $M$  as the index of the symmetric intersection pairing of  $M$  if  $d = 4k$ , and 0 otherwise. The index of  $M$  is denoted by  $I(M)$ .  $\lrcorner$

**Prop. (4.14.3.18).** For  $M, N \in \text{Mani}_{\text{cpct,orntd,cntd}}$ ,  $I(M \times N) = I(M)I(N)$ .  $\lrcorner$

*Proof:* Cf. [May, P167].  $\square$

**Prop. (4.14.3.19).** For  $k \in \mathbb{N}$ ,  $k \in \text{Field}$ ,  $M \in \text{Mani}_{\text{cpct}, \partial}^{2k+1}$ , then

$$\dim_k H_k(\partial M; k) = 2 \dim \ker(H_k(\partial M; k) \xrightarrow{i_*} H_k(M; k)) = 2 \dim \text{Im}(H^k(\partial M; k) \xrightarrow{i^*} H^k(M; k)).$$

$\lrcorner$

*Proof:* There is a commutative diagram

$$\begin{array}{ccccc} H^k(\partial M; k) & \xrightarrow{i^*} & H^k(M; k) & \xrightarrow{\partial} & H^{k+1}(M, \partial M; k) \\ \downarrow D & & \downarrow D & & \downarrow D \\ H_{k+1}(M, \partial M; k) & \xrightarrow{\partial} & H_k(M; k) & \xrightarrow{i_*} & H_k(\partial M; k) \end{array}$$

where the vertical arrows are isomorphisms and  $i_*$  is the vector dual of  $i^*$  by universal coefficient theorem. Thus the theorem follows.  $\square$

**Prop. (4.14.3.20) [Gysin Sequence].** Cf. [姜伯驹同调论].  $\lrcorner$

### Euler Characteristic

**Def. (4.14.3.21) [Euler Characteristic].** For any  $X \in \mathcal{T}\text{op}$  with finite  $\mathbb{Z}$ -homologies, define the **Euler character** of  $X$  to be

$$\chi(X) = \sum_i (-1)^i H_i(X; \mathbb{Z}).$$

Then by universal coefficients theorem (4.14.2.4),

$$\chi(X) = \sum_i (-1)^i H_i(X; k)$$

for any  $k \in \text{Field}$ .

The condition holds for  $X \in \mathcal{CW}^{\text{fin}}$ , in particular any  $X \in \text{Mani}_{\text{cpct}}$  (4.13.3.10).  $\lrcorner$

**Prop. (4.14.3.22).** For any  $i \in \mathbb{N}$ ,  $X \in \text{Mani}_{\text{cpct,cntd}}^{2i+1}$ ,  $\chi(X) = 0$ .  $\lrcorner$

*Proof:* This follows from Poincaré duality for  $\mathbb{F}_2$ -coefficients.  $\square$

**Prop. (4.14.3.23)[Euler Characteristic and Boundary].** For  $i \in \mathbb{N}$ ,  $M \in \text{Mani}_{\text{cpct}, \partial}^{2i+1}$ , then  $\chi(\partial M) = 2\chi(M)$ . ┘

*Proof:* Consider the “double”  $\widetilde{M}$  of  $M$  along  $\partial M$ , then  $\widetilde{M} \in \text{Mani}_{\text{cpct}}^{2i+1}$ . It is clear by excision and collar neighborhood theorem that  $\chi(\widetilde{M}) + \chi(\partial M) = 2\chi(M)$ . Then we use (4.14.3.22). □

**Cor. (4.14.3.24).** If  $N \in \text{Mani}_{\text{cpct}}$  is a boundary of some other  $M \in \text{Mani}_{\text{cpct}, \partial}$ , then  $\chi(N) = 0$ . ┘

*Proof:* If  $\dim N$  is odd, this is (4.14.3.22). If  $\dim N$  is even, this is (4.14.3.23). □

**Prop. (4.14.3.25).** For any  $i \in \mathbb{N}$ ,  $M \in \text{Mani}_{\text{cpct}, \text{orntd}}^{4i+2}$ ,  $\chi(M)$  is even. ┘

*Proof:* The parity of  $\chi(M)$  is the same as  $H^{2i+1}(M, \mathbb{Q})$ , which is odd by (4.14.3.16) and (3.5.11.26). □

**Prop. (4.14.3.26)[Morse Inequality].** For any  $X \in \mathcal{CW}$ ,

$$\chi(X) \leq \sum (-1)^i c_i(X),$$

where  $c_i(X)$  is the number of  $i$ -dimensional cells. (Use the dimension counting of the long exact sequence). ┘

**Prop. (4.14.3.27).** For  $M \in \text{Mani}_{\text{cpct}, \text{orntd}, \text{cntd}}^d$ ,  $I(M) \equiv \chi(M) \pmod{2}$ . ┘

*Proof:* If  $d$  is odd,  $I(M) = 0 = \chi(M)$  is even by (4.14.3.22). If  $d = 4k + 2$ , then  $I(M) = 0$  and  $\chi(M)$  is even by (4.14.3.25). if  $d = 4k$ , then  $I(M) \equiv \chi(M) \equiv \dim H^{2k}(M, \mathbb{Q})$ . □

### deRham Cohomology

**Prop. (4.14.3.28)[de Rham Comparison].** For  $X \in \text{Mani}_{\text{sm}}$ ,  $G \in \mathcal{Ab}$ , by (7.3.5.11).

$$H_{\text{dR}}^*(X, G) \cong H^*(X, \underline{G}).$$

┘

**Prop. (4.14.3.29) [Homotopy Axiom for deRham Cohomology].** Two homotopic map between smooth manifolds induce the same map on deRham Cohomology. ┘

*Proof:* We only have to prove the case of  $M \times \mathbb{R} \rightarrow M$ , where any constant section map induces an isomorphism  $H_{\text{dR}}^*(M \times I) \cong H_{\text{dR}}^*(M)$ . Because any homotopy is a morphism  $M \times I \rightarrow N$  where  $f$  and  $g$  are the sections 0 and 1.

For the zero section, we define  $K : a + bdt \mapsto \int_0^t b$ . This is the desired homotopy, Cf.[Differential Forms in Algebraic Topology Bott Tu]. □

## 4 Applications

**Prop. (4.14.4.1)[No Contraction to the Boundary].** For  $M \in \text{Mani}_{\text{cpct}, \partial}^d$ , there are no retraction from  $M$  onto  $\partial M$ . ┘

*Proof:* We may assume  $\partial M$  is connected and non-empty, otherwise clearly there are no retraction. If it has a retraction,  $H_{d-1}(\partial M, \mathbb{F}_2) \rightarrow H_{d-1}(M, \mathbb{F}_2)$  has a left inverse. Thus It suffices to show that  $H_{d-1}(\partial M, \mathbb{Z}/(2)) \rightarrow H_{d-1}(M, \mathbb{Z}/(2))$  is 0. So it suffices to show that  $H_d(M, \partial M, \mathbb{Z}/(2)) \rightarrow H_{d-1}(\partial M, \mathbb{Z}/(2))$  is surjective. And this follows from (4.14.3.7) and (4.14.3.6) as the image of  $[M]_2$  is  $[\partial M]_2$ , which generates  $H_{d-1}(\partial M, \mathbb{F}_2)$ . □

**Prop. (4.14.4.2) [Brouwer Fixed-Point Theorem].** For any  $f : \mathbb{D}^n \rightarrow \mathbb{D}^n \in \mathcal{Top}$ ,  $\text{Fix}(f) \neq \emptyset$ .  $\lrcorner$

*Proof:* If  $\text{Fix}(f) = \emptyset$ , consider the intersection of the ray  $f(x)x$  with  $S^{n-1}$ , then it depends continuously on  $x$ , and this defines a function from  $\mathbb{D}^n$  to  $S_n$  that is identity on  $S^n$ , but then this is a retraction from  $\mathbb{D}^n \rightarrow S^n$ , which is impossible by (4.14.4.1).  $\square$

**Prop. (4.14.4.3).** If  $M \in \text{Mani}_{\text{cnd}, \partial}^d$  is contractible and  $\partial M \neq \emptyset$ , then  $\partial M$  is a homotopy sphere.  $\lrcorner$

*Proof:* As  $M^o \sim M$  is contractible, it is orientable by (4.14.3.9). Then by relative Poincaré duality (4.14.3.14) and the long exact sequence,

$$H_p(\partial M) \cong H_{p+1}(M, \partial M) \cong H^{d-p-1}(M) = 0.$$

$\square$

**Lemma (4.14.4.4).** If  $m > n \in \mathbb{Z}_+$ , any map  $f : \mathbb{RP}^m \rightarrow \mathbb{RP}^n$  induces  $f_* = 0 : \pi_1(\mathbb{RP}^m) \rightarrow \pi_1(\mathbb{RP}^n)$ .  $\lrcorner$

*Proof:* As  $\pi_1(\mathbb{RP}^m) = \begin{cases} \mathbb{Z}/(2) & , m > 1 \\ \mathbb{Z} & , m = 1 \end{cases}$ . The assertion is clearly true for  $n = 1$ . And if  $n \in \mathbb{Z}_+$ ,  $f_* \neq 0$ , then by the naturality of Hurewicz homomorphism (4.14.1.17),  $f_* \neq 0 : H_1(\mathbb{RP}^m) \rightarrow H_1(\mathbb{RP}^n)$ . Then by universal coefficient theorem, so is  $f^* \neq 0 : H^1(\mathbb{RP}^n, \mathbb{F}_2) \rightarrow H^1(\mathbb{RP}^m, \mathbb{F}_2)$ . But  $f^*$  is a ring homomorphism and  $H^*(\mathbb{RP}^m)$  is generated by  $a = f^*(a') \in H^1(\mathbb{RP}^m)$  (4.14.2.33), so  $a^{n+1} = f^*((a')^{n+1}) = 0$ , contradiction.  $\square$

**Lemma (4.14.4.5).** For  $m > n \in \mathbb{Z}_+$ , there are no antipodal maps  $f : \mathbb{S}^m \rightarrow \mathbb{S}^n$ , i.e.  $f(x) = -f(-x)$ .  $\lrcorner$

*Proof:* Any such map induces a map  $\mathbb{RP}^m \rightarrow \mathbb{RP}^n$ , which induces 0 on  $\pi_1$ , so by covering space theory, there exists a lifting  $\mathbb{RP}^m \rightarrow \mathbb{S}^n$ . The composition  $\mathbb{S}^m \rightarrow \mathbb{RP}^m \rightarrow \mathbb{S}^n$  is the original map, by the theory of covering spaces, as  $\mathbb{S}^n$  is connected and they agree at least on one point. But then  $f$  takes antipodal maps to the same point, contradiction.  $\square$

**Thm. (4.14.4.6) [Borsuk-Ulam].** For ant map  $f : \mathbb{S}^n \rightarrow \mathbb{R}^n$ , there exists  $x \in \mathbb{S}^n$  s.t.  $f(x) = f(-x)$ .  $\lrcorner$

*Proof:* If  $f(x) \neq f(-x)$  for any  $x \in \mathbb{S}^n$ , then we can define a map  $\mathbb{S}^n \rightarrow \mathbb{S}^{n-1}$  that maps  $x$  to the intersection of the ray  $0, f(x) - f(-x)$  with  $\mathbb{S}^n$ . Then this map is antipodal, which contradicts (4.14.4.5).  $\square$

**Thm. (4.14.4.7) [Brouwer Degree Theorem].** Let  $f : \mathbb{R}^n \rightarrow \mathbb{R}^n \in \mathcal{Top}$  and  $0 \in \Omega \subset \mathbb{R}^n$  be an open compact subset with continuous boundary s.t.  $\langle x, f(x) \rangle > 0$  for any  $x \in \partial\Omega$ , then there exists  $x \in \Omega$  s.t.  $f(x) = 0$ .  $\lrcorner$

*Proof:*

$\square$

## 5 Obstruction Theory & General Cohomology Theories

### Towers

**Prop. (4.14.5.1) [Towers].** There are Whitehead Towers and Postnikov Towers for a CW complex  $X$ .

$$\cdots \rightarrow Z_2 \rightarrow Z_1 \rightarrow Z_0 \rightarrow X \rightarrow \cdots \rightarrow X_2 \rightarrow X_1 \rightarrow X_0$$

$Z_n$  annihilate  $\pi_{\leq n}(X)$ ,  $X_n$  remains only  $\pi_{\leq n}(X)$ . The towers can be chosen to be fibrations, with fibers  $K(\pi_n X, n)$  by (4.13.7.30).  $\lrcorner$

**Prop. (4.14.5.2).** There is a Postnikov towers of :

$$\dots \rightarrow \mathbf{B}\text{FiveBrane} \rightarrow \mathbf{B}\text{String}(n) \rightarrow \mathbf{B}\text{Spin}(n) \rightarrow \mathbf{B}\text{SO}(n) \rightarrow \mathbf{B}\text{O}(n),$$

with corresponding obstructions  $w_1(X), w_2(X)$  and  $p_1(X)/2$ .  $\lrcorner$

**Prop. (4.14.5.3)[Obstructions].** If a connected abelian CW complex  $X$  ( $\pi_1(X)$  abelian and action on higher homotopy trivial) and  $(W, A)$  satisfies  $H^{n+1}(W, A; \pi_n X) = 0$  for all  $n$ , then  $A \rightarrow X$  can extend to a map  $M \rightarrow X$ .  $\lrcorner$

*Proof:* Cf.[Hatcher P417].  $\square$

**Cor. (4.14.5.4).** A map between Abelian CW complexes that induce isomorphisms on homology is a homotopy equivalence.  $\lrcorner$

*Proof:* Notice that  $\pi_1(X)$  acts trivially on  $\pi_1(Y, X)$  and use Hurewicz.  $\square$

## 6 Brown Representability

**Prop. (4.14.6.1).** For any  $Z \in \mathcal{T}\text{op}^{\text{pt}}$ , the functor

$$\langle -, Z \rangle : \mathcal{CW}^{\text{pt}} \rightarrow \text{Set}^{\text{pt}}$$

satisfies:

**Exactness:** If  $A \subset X$  is a subcomplex, then there is an exact sequence

$$\langle X/A, Z \rangle \rightarrow \langle X, Z \rangle \rightarrow \langle A, Z \rangle.$$

**Additivity:** If  $X = \bigvee_i X_i \in \mathcal{CW}^{\text{pt}}$ , then

$$\langle X, Z \rangle \cong \prod_i \langle X_i, Z \rangle.$$

$\lrcorner$

*Proof:* 1 follows from the fact that  $A \rightarrow X$  is a cofibration(4.13.7.5). 2 is trivial.  $\square$

## Spectrum

**Def. (4.14.6.2) [Prespectrums].** A **prespectrum** is a sequence of pointed spaces  $(T_n)_{n \in \mathbb{Z}}$  together with maps  $\sigma_n \in \langle \Sigma T_n \rightarrow T_{n+1} \rangle \cong \langle T_n, \Omega T_{n+1} \rangle$ .

An  $\Omega$ -**Spectrum** is an prespectrum  $(T_n)_{n \in \mathbb{Z}}$  s.t.  $\sigma_n$  are all weak-homotopy equivalences.  $\lrcorner$

**Def. (4.14.6.3) [Suspension Prespectrums].** For  $X \in \mathcal{T}\text{op}^{\text{pt}}$ , the sequence of pointed spaces  $(\Sigma^n(X))_{n \in \mathbb{Z}}$  (where we define  $\Sigma^{-1} = \Omega$ ) is a prespectrum, called the **suspension prespectrum** of  $X$ . If  $X = S^0$ , this is called the **sphere spectrum**.  $\lrcorner$

**Prop. (4.14.6.4)[Prespectrum and Homotopy Theories].** Let  $(T_n)_{n \in \mathbb{N}}$  be a prespectrum consisting of pointed CW complexes s.t.  $T_n$  is  $(n-1)$ -connected for any  $n \in \mathbb{N}$ , then

$$\tilde{E}_p(X) = \varinjlim_n \pi_{p+n}(X \wedge T_n)$$

is a reduced homology theory on  $\mathcal{CW}^{\text{pt}}$ .  $\lrcorner$

*Proof:* Cf.[May, P176]. □

**Prop. (4.14.6.5) [ $\Omega$ -Prespectrum and ES-Cohomology theories].** If  $K_n$  is an  $\Omega$ -spectrum, i.e.  $K_n \cong \Omega K_{n+1}$  weak equivalence, then the functors  $X \mapsto \langle X, K_n \rangle$  define a reduced ES-cohomology theory on  $\mathcal{CW}^{\text{pt}}$  ┘

*Proof:* By(4.14.6.1), these functors satisfy the additivity and exactness. The natural suspension isomorphism is given by

$$\Sigma : \langle X, T_n \rangle \rightarrow \langle \Sigma(X), \Sigma T_n \rangle \cong \langle \Sigma(X), \Sigma T_n \rangle,$$

which is an isomorphism by(4.13.6.5). □

**Thm. (4.14.6.6) [Brown Representability].** Any reduced ES-cohomology theory on  $\mathcal{CW}^{\text{pt}}$  is represented by a  $\Omega$ -prespectrum. ┘

*Proof:* ? □

### Eilenberg-MacLane Spaces

**Def. (4.14.6.7) [Eilenberg-MacLane Spaces].** For  $\Lambda \in \mathcal{Ab}$ , an **Eilenberg-MacLane space** is defined to be a pointed CW complex  $K(\Lambda, n) \in \mathcal{CW}^{\text{pt}}$  s.t.  $\pi_k(K(\Lambda, n)) = \begin{cases} \Lambda & , k = n \\ 0 & , \text{otherwise} \end{cases}$ . ┘

**Prop. (4.14.6.8) [Eilenberg-MacLane Spaces and Homologies].** For  $X \in \mathcal{CW}^{\text{pt}}, \Lambda \in \mathcal{Ab}$ , there are isomorphisms

$$\tilde{H}_p(X; \Lambda) \cong \varinjlim_{p+n} \pi_{p+n}(X \wedge K(\Lambda, n)).$$

┘

*Proof:* Cf.[May, P176]. □

**Prop. (4.14.6.9) [Eilenberg-MacLane Spaces and Cohomologies].** For  $\Lambda \in \mathcal{Ab}, X \in \mathcal{CW}^{\text{pt}}, n \in \mathbb{N}$ ,  $K(\Lambda, n)$  are unique up to weak homotopy, and there are natural isomorphisms

$$\tilde{H}^n(X; \Lambda) \cong \langle X, K(\Lambda, n) \rangle.$$

┘

*Proof:* Given a  $K(\Lambda, n)$ , if we define  $K(\Lambda, m) = \Sigma^{m-n}(K(\Lambda, n))$ , then these are all CW complexes by(4.13.3.13), and it defines an ordinary cohomology theory: The dimension axiom follows from the definition of  $K(\Lambda, n)$ , and it is a reduced ES-cohomology theory by(4.13.6.5) and(4.14.6.10). Thus the asserted isomorphism follows from(4.14.2.3).

This shows in particular that  $K(\Lambda, n)$  are unique up to homotopy by Yoneda lemma. □

**Cor. (4.14.6.10) [Uniqueness of Eilenberg-MacLane Spaces].**  $K(\Lambda, n)$  is unique up to homotopy, and  $\Omega(K(\Lambda, n)) \sim K(\Lambda, n-1) \in \mathcal{CW}^{\text{pt}}$ . ┘

**Prop. (4.14.6.11) [Eilenberg-MacLane Spaces Exist].** Take  $K(\Lambda, n) = \Gamma(B(\Lambda, n))$ (4.15.3.10), where  $\Lambda$  is regarded as a discrete subgroup.

Note  $K(G, 1)$  is constructed the same as by(4.6.8.1). ┘

*Proof:* □

**Prop. (4.14.6.12) [Cohomology Operators].** Cohomological operators  $\tilde{H}^p(-; \Lambda) \rightarrow \tilde{H}^{p+n}(-; \Lambda')$  are in bijection with elements in  $\tilde{H}^{p+n}(K(\Lambda, p); \Lambda')$ , by (4.14.6.9) and Yoneda lemma. ┘

**Prop. (4.14.6.13) [Examples].**

- $K(\mathbb{Z}, 1) = S^1 = U(1)$ .
  - $K(\mathbb{Z}, 2) = \mathbb{CP}^\infty$ .
  - $K(\mathbb{Z}/(2), 1) = \mathbb{RP}^\infty$ .
- ┘

*Proof:* 1 is clear.

2: This is because by (4.15.1.17),  $S^\infty \rightarrow \mathbb{CP}^\infty$  is a locally trivial bundle with fiber  $S^1$ , and  $S^\infty$  is contractible by (4.13.3.18) thus by (4.13.7.14),  $\pi_2(\mathbb{CP}^\infty) = \mathbb{Z}$  and  $\pi_n(\mathbb{CP}^\infty) = 0$  for  $n \neq 2$ .

3: This is because by (4.15.1.17),  $S^\infty \rightarrow \mathbb{CP}^\infty$  is a locally trivial bundle with fiber  $\{\pm 1\}$ , and  $S^\infty$  is contractible by (4.13.3.18) thus by (4.13.7.14),  $\pi_2(\mathbb{CP}^\infty) = \mathbb{Z}/2\mathbb{Z}$  and  $\pi_n(\mathbb{CP}^\infty) = 0$  for  $n \neq 2$ . □

### Steenrod Powers

**Prop. (4.14.6.14) [Steenrod Powers].** There are stable cohomology operators

$$\text{Sq} : H^*(X, \mathbb{F}_2) \rightarrow H^*(X, \mathbb{F}_2) : x \in H^k(X, \mathbb{F}_2) \mapsto \sum_{i \in \mathbb{N}} \text{Sq}^i(x), \quad \text{Sq}^i(x) \in H^{k+i}(X, \mathbb{F}_2)$$

called **Steenrod Powers** that satisfies

- $\text{Sq}(\alpha \cup \beta) = \text{Sq}(\alpha) \cup \text{Sq}(\beta)$ .
- $\text{Sq}^i(\alpha) = \alpha^2$  if  $i = |\alpha|$ , and 0 if  $i > |\alpha|$ .

For  $p \in \mathbf{P}$ , the total Steenrod powers  $P$  is a similar map from  $H^n(X, \mathbb{F}_p) \rightarrow H^{n+*}(X, \mathbb{F}_p)$  that  $P^i(\alpha) = \alpha^p$  if  $2i = |\alpha|$  and 0 if  $2i > |\alpha|$ . ┘

*Proof:* Cf. [Hatcher P497]. ? □

**Prop. (4.14.6.15) [Adam Relations].** For  $0 < i < 2j \in \mathbb{Z}$ ,

$$\text{Sq}^i \text{Sq}^j = \sum_{0 \leq k \leq \lfloor \frac{i}{2} \rfloor} \binom{j-k-1}{i-2k} \text{Sq}^{i+j-k} \text{Sq}^k \in \text{End}(H^*(-, \mathbb{F}_2))$$

**Remark (4.15.0.1).** Any base space  $B$  in this section is assumed to be paracompact. Instead, we may require in the definition of locally trivial bundles s.t. there exists a trivialization that is dominated by a partition of unity on  $B$ .  $\lrcorner$

### 1 Fiber Bundles

**Def. (4.15.1.1) [Fiber Bundles].**  $\pi : E \rightarrow X \in \mathcal{CG}$  is called a **fiber bundle** with fiber  $F$  if every fiber  $\pi^{-1}(x)$  is homeomorphic to  $F$ . If any  $x \in X$  has a nbhd  $U$  together with a homeomorphism  $\pi^{-1}(U) \cong U \times F$  over  $U$ , then it is called a **locally trivial bundle**. And a **numerical locally trivial bundle** is a locally trivial bundle  $\pi : E \rightarrow X$  s.t. there is a numerical covering  $\{U_i \rightarrow X\}$  s.t. there are homeomorphisms  $\pi^{-1}(U_i) \cong U_i \times F$  over  $U_i$  for each  $i$ .  $\lrcorner$

**Prop. (4.15.1.2) [Dold].** If  $\pi : E \rightarrow X \in \mathcal{CG}$  and there is a numerical covering  $\{U_i \rightarrow X\}$  s.t.  $\pi^{-1}(U_i) \rightarrow U_i$  are Hurewicz fibrations, then  $\pi$  is a Hurewicz fibration.  $\lrcorner$

*Proof:* Cf. [Tammo tom Dieck, Algebraic Topology] Chap13?  $\square$

**Cor. (4.15.1.3) [Fiber Bundles are Hurewicz Fibrations].** Every numerical locally trivial bundle is a Hurewicz fibration.  $\lrcorner$

**Prop. (4.15.1.4) [Pullback Bundle].** Let  $\pi : E \rightarrow X$  be a fiber bundle with fiber  $F$  and  $f : Y \rightarrow X$  a map, then the pullback space  $f^*E \rightarrow Y$  (4.4.1.8) is also a fiber bundle over  $Y$  with fiber  $F$ , called the **pullback bundle**.  $\lrcorner$

**Prop. (4.15.1.5).** If  $E \rightarrow B, E' \rightarrow B'$  are fiber bundles both with compact Hausdorff fibers/or both with discrete fibers/, and  $f : E/B \rightarrow E'/B'$  is a bundle map that induces isomorphisms on the fibers, then  $E \cong f^*E'$  over  $B$ .  $\lrcorner$

*Proof:*  $\square$

**Lemma (4.15.1.6).** Suppose  $\pi : E \rightarrow B \times I$  is a fiber bundle whose restriction to  $B \times [0, a]$  and  $B \times [a, 1]$  are all trivial for some  $a \in I$ , then  $E \rightarrow B \times I$  is a trivial bundle.  $\lrcorner$

*Proof:* Choose trivializations  $\varphi_1 : B \times [0, a] \times B \times F \rightarrow \pi^{-1}(B \times [0, a])$ , and  $\varphi_2 : B \times [a, 1] \times B \times F \rightarrow \pi^{-1}(B \times [a, 1])$ , then these induces a map

$$B \times \{a\} \times F \xrightarrow{\varphi_1|} \pi^{-1}(B \times \{a\}) \xrightarrow{\varphi_2^{-1}|} B \times \{a\} \times F,$$

of the form  $(b, a, v) \mapsto (b, a, g(b)v)$ , where  $g : B \rightarrow \text{Homeo}(F)$  is continuous. Then we get a trivialization

$$B \times I \times F \rightarrow E : \varphi(b, t, v) = \begin{cases} \varphi_1(b, t, v) & t \leq a \\ \varphi_2(b, t, g(b)v) & t \geq a \end{cases}.$$

$\square$

**Lemma (4.15.1.7).** Let  $E \rightarrow B \times I$  be a fiber bundle, then there exists a covering  $\{U_i\}$  of  $B$  that  $E$  is trivial on each  $U_i \times I$ .  $\lrcorner$

*Proof:* For each  $b \in B$ , we can find a nbhd  $U_b$  and a division  $0 = s_0 < s_1 < \dots < s_n = 1$  that  $E$  is trivial on each of  $U_b \times [s_i, s_{i+1}]$ . Then by (4.15.1.6),  $E$  is trivial on  $U_b \times I$ . Then these  $\{U_b\}$  is a covering of  $X$  that  $E$  is trivial on each  $U_b \times I$ .  $\square$

**Lemma (4.15.1.8).** Let  $\pi : E \rightarrow B \times I$  be a fiber bundle, where  $B$  is a paracompact space, and  $r : B \times I \rightarrow B \times I$  defined by  $r(b, x) = (b, 1)$ , then there exists a bundle morphism  $f$  over  $r$  that induces an isomorphism  $r^*E \cong E$  over  $B \times I$ .  $\lrcorner$

*Proof:* By (4.15.1.7), we can choose a covering  $\{U_\alpha\}$  of  $B$  that  $E$  is trivial over each  $U_\alpha \times I$ , and let  $\psi_\alpha$  be a partition of unity  $1 = \sum \psi_i$  that  $\text{Supp}(\psi_i) \subset U_i$  and  $\{\text{Supp}(\psi_i)\}$  is locally finite. We also define  $\mu_\alpha(x) = \frac{\psi_\alpha(x)}{\max\{\psi_\beta(x)\}}$ , then  $\mu_\alpha$  are all continuous and subordinate to  $\{U_\alpha\}$ , and for each  $x \in B$ ,  $\max\{\mu_\alpha(x)\} = 1$ .

Let  $\varphi_\alpha : U_i \times I \times F \rightarrow \pi^{-1}(U_i \times I)$  be the local trivializations. We define a bundle map  $f_\alpha : E/B \times I \rightarrow E/B \times I$  by identity outside  $\pi^{-1}(U_i \times I)$  and  $f_\alpha(\varphi_\alpha(b, t, v)) = \varphi_\alpha(b, \max(\mu_\alpha(x), t), v)$ , then  $f_\alpha$  is continuous and induces an isomorphism  $f_\alpha^*E \cong E$  over  $B \times I$ . Now choose a well-ordering on  $\alpha$ , by local finiteness, for each  $v \in E$ , there is a nbhd  $W_v \times I$  of  $\pi(v) \in B \times I$  that  $W_v \cap U_\alpha \neq \emptyset$  for only  $\alpha$  in a finite set  $\{\alpha_1, \dots, \alpha_m\}$  with  $\alpha_1 < \alpha_2 < \dots < \alpha_m$ . Then we define a bundle map  $f : E \rightarrow E$  that  $f|_{\pi^{-1}(W_v \times I)} = f_{\alpha_m} \circ \dots \circ f_{\alpha_1}$ . Then this is well-defined, and it is a bundle map over  $r$  that induces an isomorphism  $f^*E \cong E$ .  $\square$

**Prop. (4.15.1.9) [Homotopy Invariance of Fiber Bundles].** Let  $E' \rightarrow B'$  be fiber bundles. If  $f, g : B \rightarrow B'$  are two homotopic maps with  $B$  paracompact, then there is a bundle isomorphism  $f^*E' \cong g^*E'$ .  $\lrcorner$

*Proof:* Let  $F : B \times I \rightarrow B'$  be a homotopy from  $f$  to  $g$ , and let  $i_v : B \rightarrow B \times I : i_v(b, x) = (b, v)$  for  $v = 0, 1$ . Let  $r : B \times I \rightarrow B \times I$  be the retraction defined by  $r(b, x) = (b, 1)$ , then by (4.15.1.8), there is an isomorphism of fiber bundles

$$f^*E' \cong (F \circ i_0)^*E' \cong i_0^*F^*E' \cong i_0^*r^*F^*E' \cong i_1^*F^*E' \cong g^*E'.$$

$\square$

**Prop. (4.15.1.10) [Cone Bundles].** Let  $E/X$  be a fiber bundle with fiber  $F$ , then we can construct a new fiber bundle  $\text{Cone}(E)/X$  with bundle  $C(F)$ .  $\lrcorner$

**Cor. (4.15.1.11).** This is because we can use the transformation characterization to extend maps  $U_i \cap U_j \rightarrow \text{Aut}(F)$  to maps  $U_i \cap U_j \rightarrow \text{Aut}(C(F))$ .  $\lrcorner$

**Prop. (4.15.1.12) [Hopf Fibration].** There is a locally trivial fiber bundle  $S^3 \rightarrow S^2$  with fiber  $S^1$ , called the **Hopf fibration**.  $\lrcorner$

*Proof:* Cf. [AGP02]P129.  $\square$

□

### Covering Space

**Def. (4.15.1.20) [Covering Space].** A **covering space** is a fiber bundle  $E \rightarrow X$  with discrete fibers. ┘

**Prop. (4.15.1.21).** if  $X$  and  $Y$  are Hausdorff spaces,  $f : X \rightarrow Y$  is a local homeomorphism,  $X$  is compact, and  $Y$  is connected, then  $f$  a covering map. ┘

*Proof:* First,  $f$  is surjective (using the connectedness), and that for each  $y \in Y$ ,  $f^{-1}(y)$  is finite. Because  $X$  is compact, there exists a finite open cover of  $X$  by  $\{U_i\}$  such that  $f(U_i)$  is open and  $f|_{U_i} : U_i \rightarrow f(U_i)$  is a homeomorphism. For  $y \in Y$ , let  $\{x_1, \dots, x_n\} = f^{-1}(y)$  (the  $x_i$  all being different points). Choose pairwise disjoint neighborhoods  $U_1, \dots, U_n$  of  $x_1, \dots, x_n$ , respectively (using the Hausdorff property).

By shrinking the  $U_i$  further, we may assume that each one is mapped homeomorphically onto some neighborhood  $V_i$  of  $y$ .

Now let  $C = X \setminus (U_1 \cup \dots \cup U_n)$  and set

$$V = (V_1 \cap \dots \cap V_n) \setminus f(C)$$

$V$  should be an evenly covered nbhd of  $y$ . □

**Prop. (4.15.1.22).** If  $\pi : \tilde{B} \rightarrow B$  is a local onto homeomorphism with the property of lifting arcs. Let  $\tilde{B}$  be arcwise connected and  $B$  simply connected, then  $\pi$  is a homomorphism. ┘

*Proof:* only need to prove injective. If  $p_1$  and  $p_2$  map to the same point, then they can be connected, and the image is a loop thus contractable, contradiction. □

**Cor. (4.15.1.23).** If  $\tilde{B}$  is locally arcwise connected and  $B$  is locally simply connected, then  $\pi$  is a covering map. ┘

*Proof:* Choose the connected components of a simply connected nbhd of a point  $p$  and use (4.15.1.22). □

**Prop. (4.15.1.24)[Homotopy Lifting Property].** Given a covering space  $\pi : \tilde{X} \rightarrow X$ , and a homotopy  $f_t : Y \rightarrow X$ , and a map  $f_0 : Y \rightarrow \tilde{X}$  lifting  $f_0$ , then there is a unique homotopy  $\tilde{f}_t : Y \rightarrow \tilde{X}$  of  $\tilde{f}_0$  lifting  $f_t$ .  $\lrcorner$

*Proof:* Let  $U_\alpha$  be a covering of  $X$  that the We first construct a lift  $\tilde{F} : N \times I \rightarrow \tilde{X}$  for  $N$  a nbhd near some point  $y_0 \in Y$ . Because  $f$  is continuous, there is a nbhd  $N$  of  $y_0$  and a partition  $0 = t_0 < t_1 < \dots < t_m = 1$  of  $I$  that each  $N \times [t_i, t_{i+1}]$  is mapped into some  $U_\alpha$ . Then we can construct a lifting  $\tilde{F} : N \times I \rightarrow \tilde{X}$  by induction using the local homeomorphism property of covering space.

Next we show the uniqueness in the special case that  $Y$  is a point. This can also be done using a partition of  $I$  and induction.

Finally we can construct lifting near every point  $y \in Y$ , and also they coincide on the overlap because of the uniqueness we just proved. So these liftings glue together to give a lifting  $\tilde{f}_t : Y \rightarrow \tilde{X}$ .  $\square$

**Cor. (4.15.1.25).** The map  $\pi_* : \pi_1(\tilde{X}, \tilde{x}_0) \rightarrow \pi_1(X, x_0)$  induced by the covering map is injective. And the image of this map consists of homotopy types of loops that based at  $x_0$  whose lift starting at  $\tilde{x}_0$  are also loops.  $\lrcorner$

*Proof:* This is because a homotopy of a the image of a loop to trivial loop in  $\tilde{X}$  can be lifted to a homotopy of the loop itself to trivial loop. And this homotopy also fixes the endpoint, because the lifting of a trivial loop must be a trivial loop.

For the second assertion, one direction is easy, for the other, if a loop is homotopic to the image of a loop of  $\tilde{X}$ , then it is itself the image of a loop of  $\tilde{X}$ .  $\square$

**Prop. (4.15.1.26)[Degree of a Covering].** Let  $\pi : \tilde{X} \rightarrow X$  be a covering map, then the cardinality of  $\pi^{-1}(x)$  is a locally constant function of  $x$ . Thus if  $X$  is constant, this cardinality is fixed for any  $x \in X$ , and it is called the degree of the covering.

The number of sheets of a covering with  $\tilde{X}$  path-connected equals the index of  $\pi_*(\pi_1(\tilde{X}, \tilde{x}_0))$  in  $\pi_1(X, x_0)$ .  $\lrcorner$

*Proof:* For a loop  $g$  in  $X$  based at  $x_0$ , let  $\tilde{g}$  be its lift to  $\tilde{X}$  starting at  $\tilde{x}_0$ . Now if  $h \in \pi_*(\pi_1(\tilde{X}, \tilde{x}_0))$ , then the loop  $h \cdot g$  has lift that has the same ending as  $\tilde{g}$ . So we get a map from the quotient set  $\pi_1(X, x_0)/\pi_*(\pi_1(\tilde{X}, \tilde{x}_0))$  to  $p^{-1}(x_0)$  mapping  $\pi_*(\pi_1(\tilde{X}, \tilde{x}_0))[g]$  to  $\tilde{g}(1)$ . This map is injective, and it is surjective because  $\tilde{X}$  is path-connected. Then we are done.  $\square$

**Prop. (4.15.1.27) [Unique Lifting Property].** Let  $\pi : (\tilde{X}, \tilde{x}_0) \rightarrow (X, x_0)$  be a covering space and  $f : (Y, y_0) \rightarrow (X, x_0)$  be a map with  $Y$  path-connected and locally path-connected, then a lift  $\tilde{f} : (Y, y_0) \rightarrow (\tilde{X}, \tilde{x}_0)$  exists iff  $f_*(\pi_1(Y, y_0)) \subset \pi_*(\pi_1(\tilde{X}, \tilde{x}_0))$ . And when  $Y$  is connected, this lifting is unique.

In particular, a covering space has unique path lifting property.  $\lrcorner$

*Proof:* One direction is clear, for the other, to construct a lifting, choose a path  $\gamma$  from  $y_0$  to  $y$ , the path  $f\gamma$  has a unique lifting  $\tilde{f}\gamma$  starting from  $\tilde{x}_0$ . Define  $\tilde{f}(y) = \tilde{f}\gamma$ . This is a well-defined map: if  $\gamma'$  is another path from  $y_0$  to  $y$ , then  $f\gamma^{-1}f\gamma'$  is a loop that is homotopic to the image of a loop at  $\tilde{x}_0$ . Now we can lift this homotopy, and then  $f\gamma^{-1}f\gamma'$  is also the image of a loop at  $\tilde{x}_0$ , which must be  $\tilde{f}\gamma^{-1}\tilde{f}\gamma'$  by uniqueness. So  $\tilde{f}$  is well-defined.

It can be verified that  $\tilde{f}$  is continuous.

The uniqueness is clear, because if there are two lifts, the points that they are equal and the points that they are not are both open in  $Y$ .  $\square$

**Prop. (4.15.1.28) [Galois Theory of Covers].** Let  $(X, x_0)$  be a path-connected and locally path-connected and semilocally simply-connected space (4.13.5.27), then

- there is a connected and simply-connected covering space  $\tilde{X}$  of  $X$ , called a **universal cover** of  $X$ .
- $\pi_1(X, x_0)$  acts continuously and properly on  $\tilde{X}/X$ .
- For any subgroup  $H$  of  $\pi_1(X, x_0)$ , there is a connected covering space  $\pi : X_H \rightarrow X$  that  $\pi_*(\pi_1(X_H, \tilde{x}_0)) = H$  for a suitably chosen base point  $\tilde{x}_0$ . And this covering space is unique up to isomorphism over  $(X, x_0)$ . Thus by (4.15.1.27), there is an inclusion-preserving bijection between isomorphism classes of covering spaces over  $X$  and the the set of conjugacy classes of subgroups of  $\pi_1(X, x_0)$ .

┘

*Proof:* Cf. [Hat02]P64, P67. ?

□

**Def. (4.15.1.29) [Normal Covering Spaces].** A **Galois covering space** is a covering space  $\pi : \tilde{X} \rightarrow X$  that for any  $x \in X$  and two elements  $\tilde{x}, \tilde{x}' \in \pi^{-1}(x)$ , there is a covering isomorphism of  $\tilde{X}/X$  taking  $\tilde{x}$  to  $\tilde{x}'$ .

┘

**Prop. (4.15.1.30).** Let  $\pi : (\tilde{X}, \tilde{x}_0) \rightarrow (X, x_0)$  be a path-connected covering space of a path-connected, locally path-connected space  $X$ , and let  $H$  be the subgroup  $\pi_*(\pi_1(\tilde{X}, \tilde{x}_0)) \subset \pi_1(X, x_0)$ , then

- The covering space is Galois iff  $H$  is normal in  $\pi_1(X, x_0)$ .
- The group  $G(\tilde{X})$  of covering transformations of  $\tilde{X}$  is isomorphic to  $N(H)/H$ .

┘

*Proof:* 1: Let  $\tilde{x}_1, \tilde{x}_2 \in \pi^{-1}(x_0)$  and  $\gamma$  a path from  $\tilde{x}_1$  to  $\tilde{x}_2$  corresponding to an element of  $\pi_1(X, x_0)$ , then  $H$  is normal is equivalent to  $\pi_*(\pi_1(\tilde{X}, \tilde{x}_1)) = \pi_*(\pi_1(\tilde{X}, \tilde{x}_2))$ . Then the lifting criterion shows there is a covering transformation taking  $\tilde{x}_1$  to  $\tilde{x}_2$ . The converse is also true.

2: From the above argument, we can define a map  $N(H) \rightarrow G(\tilde{x})$  by mapping a  $\gamma \in N(H)$  to a covering transformation mapping  $\tilde{x}_0$  to  $\tilde{x}_1$ . And the kernel of this map is exactly those  $\gamma$  lifting to a loop at  $\tilde{x}_0$ , which are exactly the elements of  $H$ .

□

**Prop. (4.15.1.31) [Covering Space Action].** If  $G \in \text{Grp}$  and  $G \times Y \rightarrow Y$  is a covering space action (4.12.1.14), then the quotient map  $Y \mapsto Y/G$  is a Galois covering space. And if  $Y$  is path-connected,  $G$  is the group of covering transformations.

┘

*Proof:* The condition on the action shows it is locally a homeomorphism, thus it is a covering space. And it is a normal covering space because  $g_1 g_2^{-1}$  takes any  $g_1(x)$  to  $g_2(x)$ . The group of covering transformations is just  $G$ , because the covering transformation on a path-connected space is determined by its action on a single point.

□

## 2 Vector Bundles

### Basics

**Def. (4.15.2.1) [Vector Bundle].** Let  $\mathbb{K} = \mathbb{R}$  or  $\mathbb{C}$ , a  **$\mathbb{K}$ -vector bundle** of dimension  $n$  over a topological space  $X$  is a fiber bundle over  $X$  with fiber  $\mathbb{K}^n$  that each trivialization  $\varphi_\alpha$  restricts to  $\mathbb{K}$ -linear isomorphisms on the fibers. The category of vector bundles over  $X$  is denoted by  $\text{Vect}_{\mathbb{K}}(X)$ . A **vector bundle homomorphism**  $E \rightarrow F$  is a map of spaces over  $X$  that the maps on the fibered are all  $\mathbb{K}$ -linear.

Then a  $\mathbb{K}$ -vector bundle of dimension  $n$  over  $X$  is just an associated  $GL(n, \mathbb{K})$ -bundle with fiber  $\mathbb{K}^n$  over  $X$ . In particular, there is a bijection  $\text{Vect}_{\mathbb{K}}^n(X) \cong \mathcal{P}_{GL(n, \mathbb{K})}(X)$  by (4.15.3.7).  $\lrcorner$

**Def. (4.15.2.2) [Trivial Vector Bundles].** For any  $n \in \mathbb{N}$ , the **trivial vector bundle** of rank  $n$  is denoted by  $e^n$ .  $\lrcorner$

**Prop. (4.15.2.3) [Constructions of Vector Bundles].** Let  $T : (\text{Vect}^f / \mathbb{K})^{\otimes n} \rightarrow \text{Vect}^f / \mathbb{K}$  be a functor that is either covariant or contravariant for each of its factor that  $T : \prod_i \text{Hom}(V_i, W_i) \rightarrow \text{Hom}(T(V_i), T(W_i))$  is continuous, then we have a functor  $T : \text{Vect}(X)^n \rightarrow \text{Vect}(X)$  that is either covariant or contravariant for each of its factor.  $\lrcorner$

*Proof:* Cf. [Ati64]P6.  $\square$

**Cor. (4.15.2.4).** In this way, given a vector bundles  $E, F$  on  $X$ , we can construct

$$E \oplus F, \quad E \otimes F, \quad \text{Hom}(E, F) \cong E^* \otimes F, \quad E^*, \quad T^n E, \quad \wedge^i E.$$

$\lrcorner$

**Prop. (4.15.2.5) [Existence of Hermitian Metric].** There exists a Hermitian (Riemannian) metric on any bundle  $E$  over a paracompact space  $X$ . In this way,  $E^* \cong E(\overline{E})$ .  $\lrcorner$

*Proof:* Choose a metric on each trivialization open subset and use partition of unity to glue.  $\square$

**Cor. (4.15.2.6).** A vector bundle over a paracompact space can have its transform maps  $\in O(n)$  (or  $U(n)$ ).  $\lrcorner$

*Proof:* We can choose the metric on it compatible with the given metric. In this way, the transform map is  $\in O(n)$  (or  $U(n)$ ).  $\square$

**Cor. (4.15.2.7) [Semisimplicity of  $\text{Vect}(B)$ ].** Any exact sequence of vector bundles over a paracompact space  $B$  splits.  $\lrcorner$

*Proof:* Because we can take the orthogonal complement.  $\square$

**Cor. (4.15.2.8).** If  $f : X \rightarrow Y$  is a homotopy equivalence, then  $f^* : \text{Vect}(Y) \rightarrow \text{Vect}(X)$  is an isomorphism.  $\lrcorner$

In particular, if  $X$  is contractible, then every bundle over  $X$  is trivial.  $\lrcorner$

**Def. (4.15.2.9) [Orientations of Vector Bundles].** Let  $\pi : E \rightarrow X$  be a vector bundle of rank  $n$  over a space  $X$  and  $\mathbb{R} \cong \mathbb{Z}$  or  $\mathbb{Z}/2\mathbb{Z}$ , then a **orientation of  $E$**  with coefficient  $R$  is a functions that assigns a generator  $u_x$  of  $H^n(E_x, 0, R) \cong R$  for any  $x \in X$  s.t. for any  $x \in X$ , there is a nbhd  $U$  of  $x \in X$  and an element  $u \in H^n(\pi^{-1}U, \pi^{-1}(0), R)$  s.t.  $u$  pulls back to  $u_x$  via  $(E_x, 0) \subset (\pi^{-1}U, \pi^{-1}(0))$  for any  $x \in U$ . In particular, any vector bundle is  $\mathbb{F}_2$ -orientable.  $\lrcorner$

**Prop. (4.15.2.10) [Orientation of Complex Vector Bundles].** For  $E/X \in \text{Vect}_{\mathbb{C}}(X)$ , the underlying real bundle has a preferred orientation, which is compatible with direct sums.  $\lrcorner$

In particular, the tangent bundle of a complex manifold gives rise to a unique orientation of the underlying real manifold.  $\lrcorner$

*Proof:* Let  $a_1, \dots, a_n$  be a complex basis for  $E$ , then take the real basis to be  $a_1, ia_1, \dots, a_n, ia_n$ . This orientation is stable under  $GL(n, \mathbb{C})$  transformation, as  $GL(n, \mathbb{C})$  is connected.  $\square$

**Prop. (4.15.2.11).** If  $E$  is a complex vector bundle over  $X$ , then  $E \otimes_{\mathbb{R}} \mathbb{C} \cong E \oplus \overline{E}$  as complex vector bundles.  $\lrcorner$

**Lemma (4.15.2.12).** Suppose  $\pi : E \rightarrow B \times I$  is a fiber bundle whose restriction to  $B \times [0, a]$  and  $B \times [a, 1]$  are all trivial for some  $a \in I$ , then  $E \rightarrow B \times I$  is a trivial bundle.  $\lrcorner$

*Proof:* The proof is similar to that of (4.15.1.6)  $\square$

**Lemma (4.15.2.13).** Let  $E \rightarrow B \times I$  be a fiber bundle, then there exists a covering  $\{U_i\}$  of  $B$  that  $E$  is trivial on each  $U_i \times I$ .  $\lrcorner$

*Proof:* The proof is similar to that of (4.15.1.7)  $\square$

**Lemma (4.15.2.14).** Let  $\pi : E \rightarrow B \times I$  be a fiber bundle, where  $B$  is a paracompact space, and  $r : B \times \mathbb{I} \rightarrow B \times I$  defined by  $r(b, x) = (b, 1)$ , then there exists a bundle morphism  $f$  over  $r$  that induces an isomorphism  $r^*E \cong E$  over  $B \times \mathbb{I}$ .  $\lrcorner$

*Proof:* The proof is similar to that of (4.15.1.8)  $\square$

**Prop. (4.15.2.15) [Homotopy Invariance of Vector Bundles].** Let  $E' \rightarrow B'$  be a vector bundle. If  $f, g : B \rightarrow B'$  are two homotopic maps with  $B$  paracompact, then there is a bundle isomorphism  $f^*E' \cong g^*E'$ .  $\lrcorner$

*Proof:* The proof is similar to that of (4.15.1.9)  $\square$

### Bundles of Finite Type

**Def. (4.15.2.16) [Bundles of Finite Type].** Let  $X$  be a paracompact Hausdorff space, then a **vector bundle of finite type** over  $X$  is a vector bundle over  $X$  that has a covering by f.m. trivialization maps. The category of  $k$ -dimensional vector bundles over  $X$  of f.t. is denoted by  $\text{Vect}_k^{\text{ft}}(X)$ . Trivially, any vector bundle over a compact space is of f.t..  $\lrcorner$

**Prop. (4.15.2.17) [Vector Bundles on the Quotient].** Let  $Y$  be a closed subspace of  $X$ ,  $E$  a vector bundle over  $X$ , then a trivialization  $\alpha : E|_Y \cong Y \times V$  defines a bundle  $E/\alpha$  over  $X/Y$ . The isomorphism class of  $E/\alpha$  only depends on the homotopy type of  $\alpha$ .  $\lrcorner$

*Proof:* To show it is a vector bundle, notice the trivialization  $\alpha$  extends to a  $\square$

**Prop. (4.15.2.18) [Splitting Principle].** For a vector bundle  $E \rightarrow X$ , there is a space  $Y \rightarrow X$  that  $p^*$  is injective on  $H^*(-, \mathbb{Z})$  and  $p^*E$  splits as a sum of line bundles. This proposition is useful when proving theorems about characteristic classes.  $\lrcorner$

*Proof:* It suffices to find a  $Y$  that  $p^*E$  has a subbundle, then choose its orthogonal part, and use induction. For this, choose  $Y = P(E)$ , then  $Y$  has a tautological bundle, which is a subbundle of  $p^*E$ , and  $Y$  is fibered over  $X$  with fiber  $\mathbb{P}^n$ , and we want to use Leray-Hirsch, so check the fact  $H^*(\mathbb{P}^n)$  is free and generated by the first Chern class, by (4.15.4.17) and (7.7.2.1). And Chern class is functorial, so the powers of Chern class of  $f^*E$  will generate the cohomology ring of any stalks.  $\square$

**Prop. (4.15.2.19).** For any bundle  $E$  over a compact Hausdorff space  $X$ , there is a surjective bundle map  $X \otimes \mathbb{R}^n \rightarrow E$  for some  $n \geq 0$ .  $\lrcorner$

*Proof:* Choose a finite cover of trivialization of  $E$ , then we can glue these maps together via a partition function.  $\square$

**Cor. (4.15.2.20) [Negation of Bundles].** For any vector bundle  $E$  on a compact space  $X$ , there is a vector bundle  $F$  that  $E \oplus F$  is a trivial bundle.  $\lrcorner$

*Proof:* Choose a bundle map  $\mathbb{R}^n \times X \rightarrow E$  that is surjective, then the kernel of this map is a bundle  $F$ , such that  $E \oplus F \cong \mathbb{R}^n$  (By taking a Hermitian metric (4.15.2.5) and taking the orthogonal bundle).  $\square$

**Cor. (4.15.2.21) [Global Transversal Sections].** For a vector bundle over a compact manifold, there exists a global section transversal to the zero section, in particular, if  $\dim E > M$ , then it has no zero.  $\lrcorner$

*Proof:* Choose a bundle map  $\mathbb{R}^n \times X \rightarrow E$  that is surjective, and then use parametric transversality theorem (16.1.1.53) to prove there is a section that is transversal.  $\square$

**Prop. (4.15.2.22) [Constructing Vector Bundles].**  $\lrcorner$

**Cor. (4.15.2.23).** There is a natural isomorphism  $\text{Vect}_n(S(X)) \cong [X, GL(n, \mathbb{C})]$ .  $\lrcorner$

*Proof:* Write  $\Sigma(X) = C^+(X) \amalg C^-(X)$ , and  $C^\pm(X)$  are both contractible, thus  $E$  are trivial restricted to them (4.15.2.8). Let  $\alpha^\pm$  be the trivialization isomorphism, then  $\alpha^+ \circ \alpha^-$  is a bundle map of  $X \times \mathbb{R}^n$ , which is equivalent to a map  $\alpha : X \rightarrow GL(n, \mathbb{C})$ . The homotopy type of  $\alpha$  is determined because  $C^\pm(X)$  are both contractible, and vice versa.  $\square$

**Prop. (4.15.2.24) [Vector Bundles as Modules].**  $\Gamma$  induces an equivalence between the category of vector bundles over  $X$  and the category of finitely projective modules over  $C(X)$ .  $\lrcorner$

*Proof:* Clearly a bundle induces a module over  $C(X)$ . And it is a fully faithful functor. Now the image is the subcategory of finite projective modules, because every bundle is a direct summand of a trivial bundle, and a trivial bundle corresponds to a finite free  $C(X)$ -modules.  $\square$

### Thom isomorphism

**Prop. (4.15.2.25) [Thom Class].** Let  $R = \mathbb{Z}$  or  $\mathbb{F}_2$  and an  $R$ -orientable vector bundle  $E$  over base  $B$  of rank  $n$ .

Then there exists uniquely **Thom class**  $u_E \in H^n(E, E \setminus B, R)$  that induce the preferred generator  $H^n(E_x, E_x \setminus \{0\}, R)$  (4.15.2.9) on every fiber. Then the relative Leray-Hirsch will give an isomorphism

$$\varphi_R : H^i(B, R) \cong H^{i+n}(E, E \setminus B, R) : x \mapsto \pi^*(x) \cup u_E.$$

For  $\mathbb{F}_2$  coefficient there exists a Thom class, and for orientable bundle there exists a  $\mathbb{Z}$ -Thom class. Notice that fiber bundle over a simply connected base is orientable.  $\lrcorner$

*Proof:*  $\square$

**Cor. (4.15.2.26) [Naturality].**

- Let  $B' \rightarrow B$  be a map and  $E/B$  be an  $R$ -orientable vector bundle, which induces a map  $f^* : H^n(E, E_0, R) \rightarrow H^n(f^*(E), E'_0, R)$ . Then  $f^*u_E \cong u_{f^*(E)}$ .
- The Thom class  $u_E$  maps to  $u_{E,2}$  under the change of coefficients  $\mathbb{Z} \rightarrow \mathbb{Z}/2\mathbb{Z}$ .  $\lrcorner$

**Prop. (4.15.2.27).** Similarly, for a orientable fiber bundle  $S^{n-1} \rightarrow E \rightarrow B$ , make it a  $D^n \rightarrow E' \rightarrow B$  bundle, then  $E'$  is homotopy equivalent to  $B$  so there is a Gysin sequence

$$\rightarrow H^{i-n}(B) \xrightarrow{\smile e} H^i(B) \rightarrow H^i(E) \rightarrow H^{i-n+1}(B) \rightarrow$$

Where the Euler class  $e$  is chosen to commute with the Thom isomorphism.  $\lrcorner$

### Examples of Vector Bundles

**Def. (4.15.2.28) [ $n$ -Universal  $k$ -Vector Bundle].** Let  $K = \mathbb{R}$  or  $\mathbb{C}$ , endow  $\mathbb{K}^n$  with the canonical Hermitian metric, define  $E_k(\mathbb{K}^n)$  be the subspace of  $\text{Gr}(k, \mathbb{K}^n) \times \mathbb{K}^n$  consisting of pairs  $(W, v)$  that  $v \in W$ . Then this is a vector bundle over the Grassmannian  $\text{Gr}(k, \mathbb{K}^n)$  (16.5.2.12), called the  **$n$ -universal  $k$ -vector bundles**, or the **tautological bundles**.  $\lrcorner$

*Proof:* We construct localization maps: endow  $\mathbb{K}^n$  with the natural metric. For  $W_0 \in G_k(\mathbb{K}^n)$ , then the subspace  $U$  of  $G_k(\mathbb{K}^n)$  consisting of  $W$  that  $W \cap W_0^\perp = \emptyset$  is a nbhd of  $W_0$ , and it is naturally homeomorphic to  $\text{Hom}(W_0, W_0^\perp)$ . There is an isomorphism

$$\pi^{-1}(U) \cong U \times W_0 : (f, (f + \text{id})w_0) \mapsto (f, w_0).$$

□

**Prop. (4.15.2.29) [Universal Vector Bundle].** Because by (4.15.3.23)  $E_k(\mathbb{K}^\infty)/\text{Gr}(k, \mathbb{K}^\infty)$  is the universal bundle, there is a map  $i_k : \text{Gr}(k, \mathbb{K}^\infty) \rightarrow \text{Gr}(k+1, \mathbb{K}^\infty)$  s.t.  $i_k^*(E_{k+1}(\mathbb{K}^\infty))$  is the bundle  $E_k(\mathbb{K}^\infty) \oplus \mathbb{K}$ . Then it can be shown

$$BU(\mathbb{K}) = \text{colim}_k (\text{Gr}(k, \mathbb{K}^\infty) \xrightarrow{i_k} \text{Gr}(k+1, \mathbb{K}^\infty))$$

is a CW complex.

Moreover, there are maps  $w_{k,l} : \text{Gr}(k, \mathbb{K}^\infty) \times \text{Gr}(l, \mathbb{K}^\infty) \rightarrow \text{Gr}(k+l, \mathbb{K}^\infty)$  that corresponds to the bundle  $E_k(\mathbb{K}^\infty) \times E_l(\mathbb{K}^\infty)$ , and these maps induces an H-space structure on  $BU$ .  $\lrcorner$

*Proof:*  $\square$

**Prop. (4.15.2.30) [Tautological Line Bundles].** For  $\text{Gr}(1, \mathbb{R}^{n+1}) \cong \mathbb{RP}^n$ , the line bundle  $E_1(\mathbb{R}^{n+1})$  is denoted by  $\gamma_n^1$ .

Then the tangent bundle  $\tau_n$  of  $\mathbb{RP}^n$  is isomorphic to  $\text{Hom}(\gamma_n^1, \gamma_n^\perp)$ , where  $\gamma_n^\perp$  is the orthogonal complement of  $\gamma_n^1$  in  $e_{\mathbb{RP}^n}^{n+1}$  (with the canonical norm).  $\lrcorner$

*Proof:* This is because a tangent vector at  $x \in \mathbb{RP}^n$  is equivalent to a homomorphism  $[x]$  to  $[x]^\perp$ .

? How to prove this rigorously.  $\square$

**Cor. (4.15.2.31).**  $\tau_n \oplus e^1 \cong (\gamma_n^1)^{n+1}$ .  $\lrcorner$

*Proof:* By (4.15.2.30),  $\tau_n \oplus e^1 \cong \text{Hom}(\gamma_n^1, \gamma_n^1) \oplus \text{Hom}(\gamma_n^1, \gamma_n^\perp) = \text{Hom}(\gamma_n^1, \mathbb{R}^n) = (\gamma_n^1)^{*n}$ . Then we are done because  $\gamma_n^1$  is self-dual because it has a Euclidean metric (4.15.2.5).  $\square$

**Prop. (4.15.2.32) [Pullback the Universal Bundle].** For  $V \in \text{Vect}/\mathbb{K}$ , for any continuous map  $\varphi : X \rightarrow \text{Gr}(k, V)$ , we get a subspace  $E_\varphi = \{(x, v) \in X \times V \mid v \in \varphi(x)\} \subset X \times V$ . This is a vector bundle over  $X$ , and it is a subbundle of the trivial bundle  $X \times V \rightarrow X$ . In fact,  $E_\varphi \cong f^*E_k(V)$  (4.15.2.28).  $\lrcorner$

**Cor. (4.15.2.33).** Let  $f : X' \rightarrow X$  and  $\varphi : X \rightarrow \text{Pr}(V)$ , then  $f^*(E_\varphi) = E_{\varphi \circ f}$ .  $\lrcorner$

**Prop. (4.15.2.34) [Infinite Universal  $k$ -Vector Bundle].** The  $n$ -universal  $k$ -vector bundles  $E_k(\mathbb{K}^n)$  (4.15.2.28) for various  $n$  gets together to a bundle  $E_k(\mathbb{K}^\infty)$  on  $\text{Gr}(k, \mathbb{K}^\infty)$  that the pullback of  $E_k(\mathbb{K}^\infty)$  via  $i : \text{Gr}(k, \mathbb{K}^n) \rightarrow \text{Gr}(k, \mathbb{K}^\infty)$  is  $E_k(\mathbb{K}^n)$ .  $\lrcorner$

**Def. (4.15.2.35) [Hopf Bundle].** Define a map  $\varphi : \mathbb{C}P^n \rightarrow G_1(\mathbb{C}^{n+1})$  that  $\varphi([z]) = [z]$ , then this defines a vector bundle on  $\mathbb{C}P^n$  by (4.15.2.32), called the **dual of Hopf bundle**. The **Hopf bundle** is defined to be the dual of the dual of Hopf bundle.  $\lrcorner$

### 3 Principal Bundles

Reference are [Principal Bundles and Classifying Spaces] and [L-W89].

**Def. (4.15.3.1) [Principal Bundles].** For  $G \in \mathcal{TopGrp}$ , a **principal  $G$ -bundle** is a fiber bundle  $pr : P \rightarrow X$  with a right  $G$ -action over  $X$  that is simply transitive on each fiber.

For  $B \in \mathcal{Top}$ , denote  $\mathcal{P}_G(B)$  the isomorphism classes of principal bundles on  $B$ .  $\lrcorner$

**Example (4.15.3.2).** Let  $X \in \mathcal{TopGrp}$  be paracompact Hausdorff.

- If  $E \in \mathcal{Vect}^n(X)$ , then the point-wise bases of  $E$  form a principal  $GL(n)$ -bundle over  $X$ , denoted by  $P_{GL}(E)$ .
- If  $E \in \mathcal{Vect}_{\text{orntd}}^n(X)$ , then the point-wise orientation-compatible bases of  $E$  form a principal  $GL(n)$ -bundle over  $X$ , denoted by  $P_{GL^+}(E)$ .
- If  $E \in \mathcal{Vect}_{\text{Riem}}^n(X)$ , then the point-wise orthonormal bases of  $E$  form a principal  $O(n)$ -bundle over  $X$ , denoted by  $P_O(E)$ .
- If  $E \in \mathcal{Vect}_{\text{Riem,orntd}}^n(X)$ , then the point-wise orientation-compatible orthonormal bases of  $E$  form a principal  $SO(n)$ -bundle over  $X$ , denoted by  $P_O(E)$ .
- The universal covering space  $\tilde{X} \rightarrow X$  is a principal  $\pi_1(X)$ -bundle.

$\lrcorner$

**Prop. (4.15.3.3) [Classifying Principal Bundles].** It is clear(or follows from(7.3.2.18)) that there is a bijection

$$\mathcal{P}_G(B) \cong \check{H}^1(X, G)(9.8.4.1).$$

$\lrcorner$

**Def. (4.15.3.4) [Associated Bundles].** Let  $G \in \mathcal{TopGrp}$ . For a principal bundle(4.15.3.1)  $\pi : P \rightarrow X$  and any  $F \in \mathcal{Top}$  with an action  $\rho : G \rightarrow \text{Homeo}(F)$ , the **associated bundle** of  $(pr, \rho)$  is the total space of  $P \times F$  module the equivalence  $[gg_0, v] = [g, g_0v]$ . This is a  $F$ -fiber bundle over  $X$ .  $\lrcorner$

**Prop. (4.15.3.5) [Homogenous Space].** For  $G \in \mathcal{LieGrp}$  and  $H \leq G$  a closed subgroup, the quotient  $H \backslash G$  can be given a structure of a  $G$ -homogenous space and  $G \rightarrow H \backslash G$  is a principal  $H$ -bundle.  $\lrcorner$

*Proof:*

$\square$

**Prop. (4.15.3.6).** The projection  $\mathbb{S}^{2n+1} \rightarrow \mathbb{CP}^n$  is a principal  $\mathbb{S}^1$ -bundle.  $\lrcorner$

*Proof:*

$\square$

**Prop. (4.15.3.7) [Associated Bundles].** If  $G \in \mathcal{TopGrp}$  and  $G$  acts freely on  $F \in \mathcal{Top}$ , then an **associated  $G$ -bundle with fiber  $F$**  is a locally trivial  $F$ -bundles with a  $G$ -action $?$ .

Then the isomorphism classes of associated  $G$ -bundles with fiber  $F$  over  $B$  is in bijection with  $\mathcal{P}_G(B)$ .  $\lrcorner$

*Proof:*  $?$

$\square$

### Classifying Space

**Def. (4.15.3.8)[Classifying Spaces].** For  $G \in \mathcal{TopGrp}$ , a **classifying space** of  $G$  is a space  $B(G) \in \mathcal{Top}$  together with a principal  $G$ -bundle  $E(G) \rightarrow B(G)$  s.t.  $E(G)$  is contractible.

Notice  $\pi_{n+1}(BG) = \pi_n(G)$  by (4.13.7.14). ┘

**Thm. (4.15.3.9)[Classifying Spaces and Principal Bundles].** If  $G \in \mathcal{TopGrp}$  and  $E(G) \rightarrow B(G)$  is a classifying space for  $G$ , then for any  $B \in \mathcal{Top}$  that is paracompact, the pullback induces a bijection

$$[B, B(G)] \cong \mathcal{P}_G(B).$$

In particular, the classifying spaces is uniquely defined up to homotopy, if it exists. ┘

*Proof:* ?? □

**Prop. (4.15.3.10)[Classifying Spaces Exist].** For  $G \in \mathcal{TopGrp}$ , define

$$\begin{aligned} E_*(G) &\in s\mathcal{Top} : E_n(G) = G^{n+1} \\ d_i((g_1, \dots, g_{n+1})) &= \begin{cases} (g_2, \dots, g_{n+1}) & , i = 0 \\ (g_1, g_{i-1}, g_i g_{i+1}, g_{i+2}, \dots, g_{n+1}) & , 1 \leq i \leq n \end{cases} \\ s_i((g_1, \dots, g_n)) &= (g_1, \dots, g_i, e, g_{i+1}, \dots, g_n), \quad 0 \leq i \leq n \end{aligned}$$

And

$$\begin{aligned} B_*(G) &\in s\mathcal{Top} : B_n(G) = G^n \\ d_i((g_1, \dots, g_n)) &= \begin{cases} (g_2, \dots, g_n) & , i = 0 \\ (g_1, g_{i-1}, g_i g_{i+1}, g_{i+2}, \dots, g_n) & , 1 \leq i \leq n-1 \\ (g_1, \dots, g_n) & i = n \end{cases} \\ s_i((g_1, \dots, g_{n-1})) &= (g_1, \dots, g_i, e, g_{i+1}, \dots, g_{n-1}), \quad 0 \leq i \leq n-1. \end{aligned}$$

Then there is a map

$$\text{pr} : E_*(G) \rightarrow B_*(G) \in s\mathcal{Top} : (g_1, \dots, g_{n+1}) \in E_n(G) \mapsto (g_1, \dots, g_n) \in B_n(G).$$

Denote  $E(G) = |E_*(G)|$ ,  $B(G) = |B_*(G)|$ , then  $\text{pr}$  induces a map  $\text{pr} : E(G) \rightarrow B(G)$ .  $B(G)$  is called the **classifying space** of  $G$ . ┘

**Cor. (4.15.3.11).** Any group  $G$  is a fundamental group of a topological space. ┘

**Prop. (4.15.3.12).** Situation as in (4.15.3.10), there is a right action of  $G$  on  $E_*(G)$  on the last coordinates, which induces an action of  $G$  on  $E(G)$ , and  $B(G) \cong E(G)/G$ . Then if  $(G, e)$  is well-pointed,  $E(G) \rightarrow B(G)$  is a locally trivial bundle with fiber  $G$ , and  $E(G)$  is contractible. In particular,  $G \cong \Omega(BG)$ , by (4.13.7.20). ┘

*Proof:* ?. Cf.[Milnor, Construction of Universal Fiber Bundles, I, II]. □

**Cor. (4.15.3.13).** For  $G, G' \in \mathcal{TopGrp}$ ,

$$E(G \times G') \cong E(G) \times E(G'), \quad B(G \times G') \cong B(G) \times B(G').$$

┘

**Cor. (4.15.3.14).** If  $G$  is commutative, then  $G \times G \rightarrow G$  is a homomorphism that makes  $B(G)$  a commutative topological group. Then we can define for any  $n \in \mathbb{N}$ ,

$$B(G, n) = B^{\circ n}(G).$$

┘

**Prop. (4.15.3.15).**  $[X, BG] \cong G$ -bundles on  $X$ . And  $BG$  is Abelian if  $G$  is Abelian. Thus the classifying space  $BG$  is unique up to homotopy equivalence because they all represent the functor from the CW homotopy category to the set of  $G$ -bundles on it.

┘

*Proof:* Cf.[Principal Bundles and Classifying Space P13].

□

**Prop. (4.15.3.16)[Examples of Classifying Spaces].**

- $B(\mathbb{Z}/n\mathbb{Z}) \cong \mathbb{S}^\infty/(\mathbb{Z}/n) = (\mathbb{C}^\infty \setminus \{0\})/(\mathbb{R}^+ \times \mu_n)$  (4.13.3.17). In particular,  $B(\mathbb{Z}/2) \cong \mathbb{RP}^\infty$  (4.13.3.19).
- $BSU(2, \mathbb{R}) = \mathbb{HP}^\infty$ .
- $B(\mathbb{Z}^g) = \mathbb{T}^g$  because  $\mathbb{R} \rightarrow \mathbb{T}^1$  is a universal cover, this can be seen observing only has to satisfy the sum of inner angle is  $\pi$ .
- $BO(n), BU(n), BSp(n)$  are respectively the infinite Grassmannians  $\text{Gr}(n, \mathbb{R}^\infty), \text{Gr}(n, \mathbb{C}^\infty), \text{Gr}(n, \mathbb{H}^\infty)$ , because there is a locally trivial fiber bundle (4.15.1.16)  $U(n, \mathbb{K}) \rightarrow V_n(\mathbb{K}^\infty) \rightarrow \text{Gr}(n, \mathbb{K}^\infty)$ , and  $V_n(\mathbb{K}^\infty)$  is contractible (4.13.3.18). In particular,  $B(\mathbb{Z}/2) = \mathbb{RP}^\infty$  and  $BS^1 = \mathbb{CP}^\infty$ .

┘

*Proof:*

□

**Def. (4.15.3.17)[Admissible Subgroups].** An **admissible subgroup** of a topological group  $G$  is a subgroup  $H \leq G$  s.t.  $G \rightarrow G/H$  is a principal  $H$ -bundle. In particular, this is the case for  $G \in \mathcal{L}\text{ieGrp}$  and  $H \leq G$  closed, by (4.15.3.5).

┘

**Prop. (4.15.3.18).** If  $H$  is an admissible subgroup of  $G$ , then there is a homotopy fiber sequence  $G/H \rightarrow BH \rightarrow BG$ .

┘

*Proof:* Cf.[Principal Bundles and Classifying Space P22].

□

**Cor. (4.15.3.19).** There are homotopy equivalences  $\Omega BK \cong K$  and  $B\Omega K \cong K$ .

┘

**Prop. (4.15.3.20).** If  $H$  is an admissible normal subgroup of  $G$ , then there is a homotopy fiber sequence  $BH \rightarrow BG \rightarrow B(G/H)$ .

┘

*Proof:*

□

**Cor. (4.15.3.21).**

- there are fiber bundles  $\mathbb{S}^0 \rightarrow BSO(n) \rightarrow BO(n)$  and similarly for  $BSU(n)$  and  $BSp(n)$ .
- there are fiber bundles  $\mathbb{S}^n \rightarrow BO(n) \rightarrow BO(n+1)$ .
- there are fiber bundles  $U(n)/T^n \rightarrow (\mathbb{CP}^\infty)^n \rightarrow BU(n)$ , where  $U(n)/T^n$  is the variety of complete flags in  $\mathbb{C}^n$ .
- for a discrete group  $H \subset G$ ,  $BH \rightarrow BG$  is a covering map.

- there are fiber bundles  $BSO(n) \rightarrow BO(n) \rightarrow \mathbb{RP}^\infty$  and similarly for  $\mathbb{C}$  and  $\mathbb{H}$ .
- there are fiber bundles  $\mathbb{RP}^\infty \rightarrow B\text{Spin}(n) \rightarrow BSO(n)$ .

┘

*Proof:* These are all classifying spaces of Lie groups. □

**Prop. (4.15.3.22) [Classifying Line Bundles].** Note that  $K(\mathbb{Z}, 2) = \mathbb{CP}^\infty = B(K(\mathbb{Z}, 1)) = BU(1)$  (4.15.3.16), thus we have a bijection  $H^2(X, \mathbb{Z}) \cong [X, K(\mathbb{Z}, 2)] \cong \text{Vect}_{\mathbb{C}}^1(X)$ . Similarly, we have a bijection  $H^1(X, \mathbb{Z}/2\mathbb{Z}) \cong \text{Vect}_{\mathbb{R}}^1(X)$ . ┘

**Prop. (4.15.3.23) [Universal Real Bundle].** Let  $X$  be paracompact, then there is a natural bijection

$$[X, \text{Gr}(k, \mathbb{K}^\infty)] \rightarrow \text{Vect}_{\mathbb{K}}^k(X) : f \mapsto f^* E_k(\mathbb{K}^\infty). \quad (4.15.3.16)(4.15.2.34)$$

┘

*Proof:* Because  $E$  is of f.t., we can find a f.d. vector space  $W$  with a metric and a vector bundle epimorphism  $\varphi : X \times W \rightarrow E$  via partition of unity. Then we can take the map  $\varphi : X \rightarrow G_k(W) : x \mapsto \ker(\varphi_x)^\perp$ . Then  $f^* E_k(\mathbb{K}^\infty) \cong E$  via restriction of  $\varphi$ . The last assertion follows from the definition of  $E_k(\mathbb{K}^\infty)$  (4.15.2.34) and (4.15.2.15).

Cf. [AGP02]P284. ? □

**Cor. (4.15.3.24).** By (4.14.6.13), there are isomorphisms

$$\text{Vect}_1^{\mathbb{R}}(X) \cong [X, \text{Gr}(1, \mathbb{R}^\infty)] = [X, K(\mathbb{Z}/(2), 1)] = H^1(X, \mathbb{Z}/(2)).$$

$$\text{Vect}_1^{\mathbb{C}}(X) \cong [X, \text{Gr}(1, \mathbb{C}^\infty)] = [X, K(\mathbb{Z}, 2)] = H^2(X, \mathbb{Z}).$$

┘

### Cohomology of Classifying Spaces

**Prop. (4.15.3.25).**  $H_*(\mathbf{BG}, \mathbb{Z}) \cong H_*(\Lambda, \mathbb{Z})$  and  $H^*(\mathbf{BG}, \mathbb{Z}) \cong H^*(G, \mathbb{Z})$ . ┘

*Proof:* Because  $EG$  is weakly contractible,  $S_*(EG)$  is a free  $\mathbb{Z}[G]$ -module resolution of  $\mathbb{Z}$  and  $S_*(EG)_G$  is identified with  $S_*(BG)$ . The rest is easy. □

**Def. (4.15.3.26) [Whitney Sums].** ┘

**Prop. (4.15.3.27).** The diagonal map  $O(1)^n \rightarrow O(n)$  induces a map

$$\omega : (\mathbb{RP}^\infty)^n \cong (\mathbf{BO}(1))^n \rightarrow \mathbf{BO}(n).$$

The conjugation by permutation matrices preserves  $O(1)^n$ , thus induces a covariant action on this map. The action on  $\mathbf{BO}(n)$  is identity ?, and the action on  $(\mathbf{BO}(1))^n$  is by permutation.

Then it induces a map

$$H^*(\mathbf{BO}(n)) \rightarrow H^*((\mathbf{BO}(1))^n)^{\mathfrak{S}_n} \cong \mathbb{F}_2[\sigma_1, \sigma_2, \dots, \sigma_n]$$

where  $\sigma_i$  are the elementary symmetric functions. This is injective and thus surjective when tensoring any field, thus it is a bijection ?.

Denote the inverse image of  $\sigma_i$  by  $w_i$ , then

$$H^*(\mathbf{BO}(n)) \cong \mathbb{F}_2[w_1, \dots, w_n], \quad |w_i| = i$$

and these elements satisfy

- $c_0 = 1$ .
- $i_1^*(c_1)$  is the canonical generator of  $H^2(\mathbf{BU}(1))$ .
- $i_n^*(w_i) = c_i$ .
- $p^*(w_i) = \sum_{j=0}^i w_j \otimes w_{i-j}$ .

## 4 Characteristic Classes

References are [Cohomology of Classifying Space, Toda] and [M-S74, L-W89, May99].

**Def. (4.15.4.1) [Characteristic Classes].** For an ES-cohomology theory  $E^*$ ,  $p \in \mathbb{Z}, n \in \mathbb{N}$ , a **characteristic class** functor of degree  $p$  for  $n$ -dimensional  $\mathbb{K}$ -bundles is a natural assignment  $c : \mathcal{V}\text{ect}_{\mathbb{K}}^n(X) \rightarrow E^p(X)$  for any  $X \in \mathcal{T}\text{op}$  paracompact Hausdorff that is functorial w.r.t. pullbacks.

By (4.15.3.23), there is a bijection between characteristic class functors of degree  $p$  with elements in  $E^p(\mathbf{BO}(n))$ . ┘

### Stiefel-Whitney Classes

**Def. (4.15.4.2) [Stiefel-Whitney Classes].** A **Stiefel-Whitney class** is a total characteristic class functor  $w : \mathcal{V}\text{ect}_{\mathbb{R}}(X) \rightarrow H^*(X, \mathbb{F}_2)$  for each  $X \in \mathcal{T}\text{op}$  paracompact Hausdorff s.t. the following hold:

- $w(E) = 1 + w_1(E) + \dots + w_n(E) \in H^*(X, \mathbb{F}_2)$ ,  $|w_i| = i, n = \text{rank}(E)$ .
- $f^*(w(E)) = w(f^*(E))$ .
- $w(E \oplus F) = w(E)w(F)$ .
- On the tautological bundle  $\gamma_1^1$  over  $\mathbb{RP}^1$ ,  $w(\gamma_1^1) = 1 + w_1(\gamma_1^1)$  and  $w_1(\gamma_1^1)$  is the unique non-trivial element in  $H^1(\mathbb{RP}^1, \mathbb{F}_2)$ . ┘

**Prop. (4.15.4.3) [Existence and Uniqueness of Stiefel-Whitney Classes].** There exists uniquely a Stiefel-Whitney class functor, and they can be defined using the Thom isomorphism

$$\varphi_E : H^i(B; \mathbb{F}_2) \cong H^{i+n}(E, E \setminus B; \mathbb{F}_2) \quad (4.15.2.25)$$

as

$$w(E) = \varphi_E^{-1} \text{Sq}(\varphi_E(1)) \in H^*(B; \mathbb{F}_2) = \varphi_E^{-1} \text{Sq}(u_E).$$
┘

*Proof:* Cf.[May, P191] and [Milnor, P92].?

□

**Prop. (4.15.4.4).** For  $B \in \mathcal{T}\text{op}$  paracompact Hausdorff,  $E, E' \in \mathcal{V}\text{ect}_{\mathbb{R}}(B)$ , then

- If  $E$  is trivial,  $w(E) = 1$ .
- If  $E \oplus E'$  is trivial, then

$$w(E') = w(E)^{-1} = 1 + w_1 + (w_1^2 + w_2) + (w_1^3 + w_3) + (w_1^4 + w_1^2 w_2 + w_2^2 + w_4) + \dots$$

- Let  $\gamma_n^1$  be the tautological line bundle over  $\mathbb{R}P^n$  (4.15.2.30), then  $w(\gamma_n^1) = 1 + a$ .
- Let  $\xi, \eta$  be vector bundles on  $M, N$ , then

$$w(\xi \times \eta) = \pi_1^* w(\xi) \cup \pi_2^* w(\eta) = w(\xi) \times w(\eta)$$

in  $H^*(M \times N, \mathbb{F}_2)$ .

┘

*Proof:* 1: A trivial bundle is the pullback of a bundle over pt, thus  $w(f^*(E)) = w^*(e(E)) = 1$ .

2 is trivial.

3: This is because  $E_1(\mathbb{R})/\mathbb{R}P^1 \rightarrow E_1(\mathbb{R}^n)/\mathbb{R}P^n$  is a bundle map, thus  $w_1(E_1(\mathbb{R}^n))$  pulls back to  $w_1(E_1(\mathbb{R})) \neq 0$ , thus  $w_1(E_1(\mathbb{R}^n)) = a$ .

4: This follows from the definition that  $\xi \times \eta = \pi_1^* \xi \oplus \pi_2^* \eta$  and Künneth formula (4.14.2.13). □

**Cor. (4.15.4.5) [Tangent and Normal Bundles].** Let  $M$  be a submanifold of a smooth manifold  $N$ , let  $\mathcal{T}_M, \mathcal{T}_N$  be the tangent bundles and  $\nu$  the normal bundle, then

$$w(\mathcal{N}_{M/N}) = w(\mathcal{T}_N)w(\mathcal{T}_M)^{-1}$$

┘

*Proof:* This follows from the smooth nbhd theorem.?

□

**Prop. (4.15.4.6) [Čech Cohomology Interpretation].** By (4.15.3.3), each  $V \in \mathcal{V}\text{ect}_{\mathbb{R}}^n(X)$  corresponds to an element  $\xi_V \in H^1(X, \mathcal{O}(n))$ , and the map  $w_1 : H^1(X, \mathcal{O}(n)) \rightarrow H^1(X; \mathbb{Z}/(2))$  induced from (7.3.2.19) the exact sequence

$$0 \rightarrow \mathcal{SO}(n) \rightarrow \mathcal{O}(n) \rightarrow \mathbb{Z}/(2) \rightarrow 0$$

just maps  $\xi_V$  to the first Siefel-Whitney class of  $V$  (4.15.4.2).

And if  $V$  is orientable, then  $V$  corresponds to an element  $\xi_V \in H^1(X, \mathcal{O}(n))$ , and the map  $w_2 : H^1(X, \mathcal{SO}(n)) \rightarrow H^2(X; \mathbb{Z}/(2))$  induced from (7.3.2.19) the exact sequence

$$0 \rightarrow \mathbb{Z}/(2) \rightarrow \text{Spin}(n) \rightarrow \mathcal{SO}(n) \rightarrow 0$$

just maps  $\xi_V$  to the second Siefel-Whitney class of  $V$  (4.15.4.2). And then we have a Čech representation of  $w_2(V)$ .┘

*Proof:* To prove this, we should show the definitions are natural and check on  $\mathbf{BSO}(n)$  or  $\mathbf{BO}(n)$ , basically because  $V_n(\mathbb{R}^\infty)$  is contractible. □

**Prop. (4.15.4.7) [Wu Formula].** For  $E \in \mathcal{V}\text{ect}_{\mathbb{R}}(B)$ ,

$$\text{Sq}^i(w_j) = \sum_{t=0}^i \binom{j+t-i-1}{t} w_{i-t} w_{j+t}$$

┘

*Proof:* Use splitting principal. □

**Def. (4.15.4.8) [Characteristic Classes of Smooth Manifolds].** For  $M \in \mathcal{M}\text{ani}_{\text{sm}}$ , denote  $w(M) = w(TM)$ . ┘

**Prop. (4.15.4.9) [Wu Formula].** For  $M \in \mathcal{M}\text{ani}_{\text{sm}, \text{cpct}}^d$ , define the **Wu class**  $v = \sum v_i \in H^*(M, \mathbb{F}_2)$  s.t.

$$\langle \nu(M) \cup x, [M]_2 \rangle = \langle \text{Sq}(x), [M]_2 \rangle$$

for any  $x \in H^*(M, \mathbb{F}_2)$ . In particular,  $\nu_k(M)_k \cup x = \text{Sq}^k(x)$  for any  $x \in H^{d-k}(M, \mathbb{F}_2)$ . Notice such a class exists by Poincaré duality.

Then the Stiefel-Whitney class of  $M$  is given by the Wu class:

$$w(M) = \text{Sq}(\nu(M)) \text{ (4.14.6.14)}.$$

┘

*Proof:* Cf. [Milnor, P132]. □

**Cor. (4.15.4.10) [Homotopy Invariance of Stiefel-Whitney Classes for Manifolds].** The Stiefel-Whitney classes only depends on the homotopy type of  $M$ , and pullbacks of Stiefel-Whitney classes along smooth maps between smooth manifolds only depends on the homotopy type of the map. ┘

**Def. (4.15.4.11) [Stiefel-Whitney Numbers].** Let  $M$  be a closed smooth manifold of dimension  $n$ , then for each tuple  $(i_1, \dots, i_k)$  with  $i_1 + \dots + i_k = n$ , define the **Stiefel-Whitney number**

$$w_{i_1, \dots, i_k}(M) = (w_{i_1}(TM) \cup \dots \cup w_{i_k}(TM), [M]) \in \mathbb{Z}/2\mathbb{Z}.$$

┘

### Euler Classes

**Def. (4.15.4.12) [Euler Classes].** Axioms for **Euler classes** for orientable real bundles  $E/B$ :

- $e(e^1) = 0$ .
- For any map  $f : B' \rightarrow B$ ,  $f^*(e(E)) = e(f^*(E))$ .
- $e(E \oplus F) = e(E)e(F)$ .
- for the opposite orientation  $-E$ ,  $e(-E) = -e(E)$ .

┘

**Prop. (4.15.4.13) [Existence of Euler Classes].** For any oriented  $E/B \in \mathcal{V}\text{ect}_{\mathbb{R}}(B)$ , let  $e(E)$  be defined as the image of the Thom class (4.15.2.25) under the maps

$$\varphi_E^{-1} : H^n(E, E_0, \mathbb{Z}) \rightarrow H^n(E, \mathbb{Z}) \cong H^n(B, \mathbb{Z}).$$

or equivalently,  $e(E) = \varphi^{-1}(u_E \cup u_E)$  where  $u_E$  is the Thom class and  $\varphi_{\mathbb{Z}}$  is the Thom isomorphism (4.15.2.25). then it is the desired Euler class. ┘

*Proof:* ?

1: If  $E$  has a non-zero section  $s : B \rightarrow E_0$ , then  $B \xrightarrow{s} E_0 \subset E \rightarrow B$  is identity, thus

$$H^n(B) \xrightarrow{\pi^*} H^n(E) \rightarrow H^n(E_0) \xrightarrow{s^*} H^n(B)$$

is the identity. But  $H^n(B) \xrightarrow{\pi^*} H^n(E) \rightarrow H^n(E_0)$  equals the restriction of  $u_E$  to  $E_0$ , which is 0.

2: This  $e(E)$  is compatible with base change by (4.15.2.26) and the definition.

3: For products, Cf.[Milnor, P100].

4: If the orientation is reversed, then  $u_{-E} = -u_E$ . □

**Cor. (4.15.4.14).**

- For a trivial line bundle,  $e(E) = 0$ .
- For an odd dimensional vector space  $E/B$ ,  $2e(E) = 0$ .

┘

*Proof:* 1: A trivial bundle is the pullback of a bundle over pt, thus  $e(f^*(E)) = f^*(e(E))$  is trivial.

2: This is because there is an orientation preserving isomorphism  $(-1) : E/B \cong (-E)/B$  that is isomorphism on the base, so  $e(-E) = e(E)$ . □

**Cor. (4.15.4.15) [Euler classes and Whitney Classes].** For a vector bundle  $E/B$  of rank  $n$ , the natural map  $H^n(B, \mathbb{Z}) \rightarrow H^n(B, \mathbb{Z}/2\mathbb{Z})$  maps the Euler class  $e(E)$  to the top Whitney class  $w_n(E)$ .

┘

*Proof:*  $e(E) = \varphi^{-1}(u_E \times u_E)$ , which maps to  $\varphi_2^{-1}(u_{E,2} \cup u_{E,2}) = \varphi_2^{-1}(Sq^n(u_{E,2})) = w_n(E)$  by (4.15.2.26). □

**Prop. (4.15.4.16) [Euler Class and Euler Characteristic].** For  $M \in \text{Mani}_{\text{cpct,sm,orntd}}$ , then

$$\langle e(\mathcal{T}_M), [M] \rangle = \chi(M).$$

┘

*Proof:* ?

□

### Chern Classes

**Def. (4.15.4.17) [Chern Classes].** Axioms for **Chern classes** for complex bundles:

- $c(E) = 1 + c_1(E) + \dots + c_n(E) \in H^*(X, \mathbb{Z})$ ,  $|c_i| = 2i, n = \deg(E)$ .
- $f^*(c(E)) = c(f^*(E))$ .
- $c(E \oplus F) = c(E)c(F)$ .
- For the tautological bundle  $\eta$  over  $\mathbb{CP}^\infty$ ,  $c_1(\eta)$  corresponds to the element  $\text{id} \in [\mathbb{CP}^\infty, \mathbb{CP}^\infty] \cong H^2(\mathbb{CP}^\infty)$ .

┘

**Prop. (4.15.4.18).** There exists uniquely a natural transformation  $c : \text{Vect}_{\mathbb{C}}(X) \rightarrow H^*(X, \mathbb{Z})$  satisfying these axioms. (For this, it suffice to calculate the cohomology ring of  $\mathbf{BGL}(n)(\mathbb{C})$ , Cf.[Cohomology of Classifying Space Toda]). ┘

**Cor. (4.15.4.19).** For a trivial bundle  $E = \underline{\mathbb{C}}$ ,  $c_i(E) = 0$  for  $i > 0$ , because  $E$  is a pullback from a bundle on pt.

In particular, for any complex vector bundle  $E$ ,  $c(E \oplus \underline{\mathbb{C}}) = c(E)$ .  $\lrcorner$

**Prop. (4.15.4.20) [First Chern Class Map].** A complex line bundle can be seen as an element of  $H^1(X, \underline{\mathbb{C}}^*)$ , by (7.3.2.14), by the exact sequence

$$0 \rightarrow \underline{\mathbb{Z}} \rightarrow \underline{\mathbb{C}} \xrightarrow{e^{2\pi i}} \underline{\mathbb{C}}^* \rightarrow 0$$

( $\underline{\mathbb{C}}$  is sheaf of smooth functions from  $X$  to  $\mathbb{C}$ ) which gives a map  $H^1(X, \underline{\mathbb{C}}^*) \rightarrow H^2(X, \underline{\mathbb{Z}})$ , called the **first Chern class map**. It is called so because it gives the first Chern class of this complex line bundle. It is also an isomorphism because  $\underline{\mathbb{C}}$  is fine sheaf so acyclic.  $\lrcorner$

*Proof:* Only have to prove they are equal in  $H^2(X, \mathbb{C})$ . We choose a totally convex covering  $U_i$  of  $X$  by (16.3.4.21), then it is a fine cover, so by (7.3.2.15) the Čech cohomology and sheaf cohomology equal.

Use the Chern-Weil map definition of the Chern class, a connection on a line bundle satisfies  $\nabla e_\alpha = \omega_\alpha e_\alpha$ , and if  $e_\beta = e_\alpha g_{\alpha\beta}$ , then  $\omega_\beta = g_{\alpha\beta}^{-1} \omega_\alpha g_{\alpha\beta} + g_{\alpha\beta}^{-1} dg_{\alpha\beta} = \omega_\alpha + d(\log g_{\alpha\beta})$ . So  $\Omega_\alpha = d\omega_\alpha$  locally, and the first Chern class is giving by  $\Omega_\alpha$  in  $H^2(X, \mathbb{C})$ .

Then we need to understand the deRham isomorphism. For the exact sequence  $0 \rightarrow \underline{\mathbb{C}} \rightarrow \mathcal{A}^0 \rightarrow \mathcal{A}^1 \rightarrow \dots$ , it has a splitting:  $0 \rightarrow \underline{\mathbb{C}} \rightarrow \mathcal{K}^1 \rightarrow 0$  and  $0 \rightarrow \mathcal{K}^1 \rightarrow 0 \rightarrow \mathcal{A}^1 \rightarrow \mathcal{K}^2 \rightarrow 0$ , this gives

$$0 \rightarrow H^1(X, \mathcal{K}^1) \xrightarrow{\delta} H^2(X, \underline{\mathbb{C}}) \rightarrow 0, \quad \mathcal{A}^1(X) \rightarrow \mathcal{K}^2(X) \xrightarrow{\delta} H^1(X, \mathcal{K}^1) \rightarrow 0.$$

because  $\mathcal{A}^k$  are fine sheaves. The composite of them is just the de Rham isomorphism (Here we are identifying  $H^2(X, \underline{\mathbb{C}})$  to  $H^2(X, \mathbb{C})$  by (7.3.5.9)). Tracking the lifting, we notice  $\Omega$  is mapped to the cocycle  $\{\log g_{\alpha\beta} + \log g_{\beta\gamma} - \log g_{\alpha-\beta}\}$ , which is exactly the image of the first Chern class map.  $\square$

**Cor. (4.15.4.21).** Complex line bundles are characterized by the first Chern class up to smooth isomorphism, because  $H^1(X, \underline{\mathbb{C}}^*) \rightarrow H^2(X, \underline{\mathbb{Z}})$  is an isomorphism.  $\lrcorner$

**Prop. (4.15.4.22) [Chern Classes and Stiefel-Whitney Classes].** For any  $V \in \text{Vect}_{\mathbb{C}}^n(X)$ , denote by  $V_{\mathbb{R}}$  the underlying  $\mathbb{R}$ -vector space of  $V$ , then

$$w_{2i}(V_{\mathbb{R}}) \equiv c_i(V) \in H^{2i}(X, \mathbb{Z}/(2)).$$

$\lrcorner$

*Proof:* This follows from (4.15.3.31).  $\square$

### Pontryagin Classes

**Def. (4.15.4.23) [Pontryagin Classes].** The Pontryagin classes are defined as  $p_k(E) = (-1)^k c_{2k}(E_{\mathbb{C}}) \in H^{4k}(X, \mathbb{Z})$ .  $\lrcorner$

**Def. (4.15.4.24) [Pontryagin Number].** Let  $M$  be a closed manifold of dimension  $4n$ , then for each tuple  $I = (i_1, \dots, i_k)$  with  $i_1 + \dots + i_k = n$ , define the **Pontryagin numbers**

$$p_I(M) = (p_{i_1}(TM) \cup \dots \cup p_{i_k}(TM), [M]) \in \mathbb{Z}.$$

$\lrcorner$

**Prop. (4.15.4.25) [Pontryagin Number of Product Manifolds].** Let  $M, N$  be closed submanifolds of dimension  $4m, 4n$  resp., then for any tuple  $I = (i_1, \dots, i_k)$  with  $i_1 + \dots + i_k = m + n$ ,

$$p_I(M \times N) = \sum_{I_1, I_2 | I_1 \amalg I_2 = I} p_{I_1}(M) p_{I_2}(N)$$

where the summation is over all partitions  $I_1, I_2$  of  $m, n$  resp.. ┘

*Proof:* Cf. [Milnor, P193]. □

### Combinatorial Pontryagin Classes

See [Milnor]Chap20.

### Calculations and Applications

**Prop. (4.15.4.26).**  $w(\mathbb{RP}^n) = (1 + a)^{n+1}$ . In particular,  $w(\mathbb{RP}^n) = 1$  iff  $n = 2^k - 1$  for some  $k$ . ┘

*Proof:* This follows from (4.15.2.31). □

**Cor. (4.15.4.27).** Let  $n = 2^k - 1 - r$ , where  $r \leq 2^{k-1} - 1$ , then  $\mathbb{RP}^n$  can be immersed into  $\mathbb{R}^{n+d}$  iff  $d \geq r$ . ┘

*Proof:* By (4.15.4.5), the normal bundle  $\nu$  satisfies  $w(\nu) = (1+a)^r$ , and  $r < n$ , thus  $d = \text{rank}(\nu) \geq r$ . □

**Cor. (4.15.4.28).** If  $n+1 = 2^r m$ , then there doesn't exist  $2^r$ -linearly independent vector fields on  $\mathbb{RP}^n$ . ┘

*Proof:* This is because if there is, then  $w(\mathbb{RP}^n)$  has degree  $\leq n - 2^r = 2^r(m-1) - 1$ , but in fact it equals  $(1 + a^{2^r})^m$  has leading term  $a^{2^r(m-1)}$ . □

**Remark (4.15.4.29).** By considering irreducibility, we can prove stronger results, like  $\tau_{\mathbb{RP}^4}$  doesn't contain a subbundle of rank 2. ┘

## 5 K-Theory

**Def. (4.15.5.1) [Topological K-Groups].** For  $X \in \mathcal{T}_{\text{op}_{\text{cpt}}}$ , the **K-group**  $K(X)$  is defined to be  $K_0(\text{Vect}(X))$  (11.1.2.6), which is a ring under sum and tensor. Two vector bundles  $E, F$  are called **stably equivalent** if  $[E] = [F]$ .

There is a degree map  $\deg K(X) \rightarrow \mathbb{Z}$ , and the kernel is denoted by  $\widetilde{K}(X)$ . There is a canonical splitting  $K(X) \cong \widetilde{K}(X) \oplus \mathbb{Z}$ . ┘

**Prop. (4.15.5.2).** Any  $f : X \rightarrow Y \in \mathcal{T}_{\text{op}}$  induces a group morphism  $f^* : K(Y) \rightarrow K(X)$ . By (4.15.1.9), this map only depends on  $f \in [X, Y]$ . ┘

**Prop. (4.15.5.3).** By (4.15.2.20), over a compact Hausdorff space,  $E, F$  is stably equivalent iff  $E \oplus \mathbb{R}^n \cong F \oplus \mathbb{R}^n$  for some  $n$ . ┘

**Thm. (4.15.5.4) [Periodicity Theorem].** Let  $L$  be a line bundle over  $X$ , then as a  $K(X)$ -algebra,  $K(P(L \oplus 1))$  is generated by  $[H]$ , and is subject to the single relation  $([H] - [1])([L][H] - [1]) = 0$ . ┘

*Proof:* Cf.[K theory, Atiyah, P46].  $\square$

**Cor. (4.15.5.5).**  $K(S^2)$  is generated by  $[H]$  as a  $K(\text{pt})$ -module, and is subject to the single relation  $([H] - [1])^2 = 0$ .  $\lrcorner$

**Cor. (4.15.5.6).** There is an isomorphism  $\mu : K(X) \otimes K(S^2) \rightarrow K(X \times S^2)$ , where  $\mu(a \otimes b) = (\pi_1^* a)(\pi_2^* b)$ .  $\lrcorner$

**Def. (4.15.5.7) [Setup for Proof of Periodicity Theorem].** Given a line bundle  $E$  over  $X$ , we can associate a projective bundle  $P(E)$  that  $P(E)_x = P(E_x)$ . Now denote  $P^0$  the subspace of  $P(E)$  consisting of all vectors of length  $\leq 1$  and  $P_\infty$  the subspace consisting of all vectors of length  $\geq 1$  together with the infinity section. There are projections  $\pi_0 : P_0 \rightarrow X$  and  $\pi_\infty : P_\infty \rightarrow X$ , which are homotopy equivalences.

Now by (4.15.2.8),  $\lrcorner$

## 6 Adam Operators

## 7 Cobordism

**Def. (4.15.7.1) [Bordism Groups].** For  $X \in \text{Top}$ , define the **bordism group**  $\Omega_n(X)$  to be the set of pairs  $(M, f)$  where  $M$  is a closed smooth manifold of dimension  $n$  and  $f : M \rightarrow X$  is a continuous map, under the equivalence relation that  $(M_0, f_0) \sim (M_1, f_1)$  iff there is an  $n+1$  manifold  $N$  and a map  $F : N \rightarrow X$  that  $\partial F = f_1 \amalg f_2$ . This is a vector space over  $\mathbb{F}_2$ .

Let  $\Omega_n = \Omega_n(\text{pt})$ , then for any  $m, n$ , there is a map  $\Omega_m \times \Omega_n \rightarrow \Omega_{m+n} : (M, N) \mapsto M \times N$ , so  $\Omega_*$  is a graded commutative ring.  $\lrcorner$

**Prop. (4.15.7.2) [Thom].** If  $N \in \text{Mani}_{\text{sm, cpct}, \partial}^{n+1}$  and  $\partial(N) = M$ , then all the Stiefel-Whitney numbers of  $M$  vanish.

Conversely, if  $M \in \text{Mani}_{\text{sm, cpct}}^n$  with all Stiefel-Whitney numbers 0, then it is the boundary of a compact smooth manifold with boundary.  $\lrcorner$

*Proof:* Let  $[N] \in H_{n+1}(N, M)$  be the fundamental homology class of the pair, then  $\partial([N]) = [M]$ . Let  $\tau_N, M$  be the tangent bundle of  $N, M$ , then  $\tau_N|_M = \tau_M \oplus \mathbb{R}^1$ , because there is an outward pointing normal bundle. Thus the Stiefel-Whitney classes of  $M$  comes from restriction of that of  $N$ . Now the composite  $H^n(N) \rightarrow H^n(M) \xrightarrow{\delta} H^n(N, M)$  is 0, so  $\delta(w_{i_1, \dots, i_k}(M)) = 0$ . thus

$$\langle w_{i_1, \dots, i_k}(M), [M] \rangle = \langle \delta(w_{i_1, \dots, i_k}(M)), [N] \rangle = 0.$$

Conversely, Cf.[Stong, Notes on Cobordism Theory]. ?  $\square$

**Prop. (4.15.7.3).** For  $m \in \mathbb{Z}_+$ ,  $\mathbb{RP}^{2m-1}$  is a boundary and  $\mathbb{RP}^{2m}$  is not a boundary.  $\lrcorner$

*Proof:* Consider the fiber bundle  $S^1 \rightarrow \mathbb{RP}^{2n-1} \rightarrow \mathbb{CP}^n$ , its cone bundle is  $D^1 \rightarrow M^n \rightarrow \mathbb{CP}^{2n-1}$ , which has boundary  $\mathbb{RP}^{2n-1}$ .

$\mathbb{RP}^{2m}$  is not a boundary by (4.15.7.2) and the fact its top Stiefel-Whitney class is non-zero.  $\square$

**Thm. (4.15.7.4) [Thom].**

$$\Omega_* = \mathbb{F}_2[t_2, t_4, t_5, \dots]$$

is a graded polynomial algebra where there's one generator  $t_n \in \Omega_n$  for each  $n \neq 2^k - 1$ .

Also  $\Omega_*(X) = H_*(X, \Omega_*) \cong H_*(X, \mathbb{F}_2) \otimes_{\mathbb{F}_2} \Omega_*$ .  $\lrcorner$

*Proof:*

□

**Cor. (4.15.7.5).** A map  $f : X \rightarrow Y$  induces a map  $f_* : \Omega_n(X) \rightarrow \Omega_n(Y)$ . This map only depends on the homotopy type of  $f$ . ┘

### Oriented Cobordism

**Def. (4.15.7.6)[Oriented Bordism Groups].** When  $X$  is an orientable manifold, define the **oriented bordism group**  $\Omega_n^{so}(X)$  to be the set of pairs  $(M, f)$  where  $M$  is an oriented smooth manifold of dimension  $n$  and  $f : M \rightarrow X$  is a continuous map preserving orientation, under the equivalence relation that  $(M_0, f_0) \sim (M_1, f_1)$  iff there is an  $n+1$  manifold  $N$  and a map  $F : N \rightarrow X$  that  $\partial F = (-f_1) \amalg f_0$ .

Let  $\Omega_n^{so} = \Omega_n^{so}(\text{pt})$ , then for any  $m, n$ , there is a map  $\Omega_m^{so} \times \Omega_n^{so} \rightarrow \Omega_{m+n}^{so} : (M, N) \mapsto M \times N$ , and  $M \times N \cong (-1)^{mn} N \times M$ , so  $\Omega_*^{so}$  is a graded anti-commutative ring. ┘

**Prop. (4.15.7.7).** The relation of (oriented) bordism is truly an equivalence class. It suffices to show transitivity, and this is because we can piece together two manifold with boundaries by collar neighborhood theorem(16.1.1.7). ┘

**Prop. (4.15.7.8).** If  $N \in \text{Mani}_{\text{sm, cpct, orntd}, \partial}^{n+1}$  and  $\partial(N) = M$ , then all the Pontryagin numbers of  $M$  vanish. ┘

*Proof:* Let  $[N] \in H_{n+1}(N, M)$  be the fundamental homology class of the pair, then  $\partial([N]) = [M]$ . Let  $\tau_N, M$  be the tangent bundle of  $N, M$ , then  $\tau_N|_M = \tau_M \oplus \mathbb{R}^1$ , because there is an outward pointing normal bundle. Thus the Stiefel-Whitney classes of  $M$  comes from restriction of that of  $N$ . Now the composite  $H^n(N) \rightarrow H^n(M) \xrightarrow{\delta} H^n(N, M)$  is 0, so  $\delta(w_{i_1, \dots, i_k}(M)) = 0$ . thus

$$\langle w_{i_1, \dots, i_k}(M), [M] \rangle = \langle \delta(w_{i_1, \dots, i_k}(M)), [N] \rangle = 0.$$

□

**Prop. (4.15.7.9)[Mayer-Vitories].** Let  $X = U \cup V$  where  $U, V$  are open subsets of  $X$ , ? ┘

**Thm. (4.15.7.10)[Thom].**

$$\Omega_*^{so} \otimes_{\mathbb{Z}} \mathbb{Q} \cong \mathbb{Q}[u_1, \dots, u_n, \dots],$$

where  $u_i \in \Omega_{4i}^{so}$  and is represented by  $[\mathbb{CP}^{2i}]$ . Moreover,

- $\Omega_0^{so} = \mathbb{Z}$ .
- $\Omega_1^{so} = 0$ .
- $\Omega_2^{so} = 0$ .
- $\Omega_3^{so} = 0$ .
- $\Omega_4^{so} = \mathbb{Z}$ , generated by  $\mathbb{CP}^2$ .
- $\Omega_5^{so} = \mathbb{Z}/2\mathbb{Z}$ , generated by  $Y^5$ .
- $\Omega_6^{so} = 0$ .
- $\Omega_7^{so} = 0$ .
- $\Omega_8^{so} = \mathbb{Z} \oplus \mathbb{Z}$ , generated by  $\mathbb{CP}^4$  and  $\mathbb{CP}^2 \times \mathbb{CP}^2$ .

- $\Omega_9^{so} = \mathbb{Z}/2\mathbb{Z} \oplus \mathbb{Z}/2\mathbb{Z}$ , generated by  $Y^9$  and  $Y^5 \times \mathbb{CP}^2$ .
- $\Omega_{10}^{so} = \mathbb{Z}/2\mathbb{Z}$ , generated by  $Y^5 \times Y^5$ .
- $\Omega_{11}^{so} = \mathbb{Z}/2\mathbb{Z}$ , generated by  $Y^{11}$ .
- $\Omega_n^{so} \neq 0$  for  $n \geq 8$ .

┘

*Proof:* Cf.[Milnor, P203].

By (4.15.7.8), for any partition  $I$  of  $k$ , there is a map  $\Omega_{4k} \rightarrow \mathbb{Z} : M \mapsto p_I(M)$ . These maps can be used to show that the products  $\{\mathbb{CP}^{2i_1} \times \mathbb{CP}^{2i_r} \mid \sum i_r = k\}$  are linearly independent in  $\Omega_{4k}$  by (4.15.4.25).  $\square$

**Prop.(4.15.7.11) [Index and Oriented Cobordism].** If  $k \in \mathbb{N}$ ,  $W \in \text{Mani}_{\text{cntd,orntd,cpct}}^{4k+1}$ , then the index  $I(M) = 0$ .  $\square$

*Proof:* This follows from the fact the image of  $H^{2k}(W) \xrightarrow{i^*} H^{2k}(M)$  is a half-dimensional subspace (4.14.3.19) that the intersection product is trivial:

$$\langle i^* \alpha \cup i^* \beta, \partial[W] \rangle = \langle \alpha \cup \beta, i_* \partial[W] \rangle = 0.$$

Then it is by linear algebra? that the signature of this pairing is 0.  $\square$

**Def.(4.15.7.12) [Stably Framed Manifold].** A **stably framed manifold** is a smooth manifold  $M$  of dimension  $n$  together with an isomorphism  $TM \oplus \mathbb{R}^N \cong \mathbb{R}^{N+n}$  for some  $N$ .  $\square$

**Def.(4.15.7.13) [Framed Bordism Groups].** Because  $T(\partial N) \oplus \mathbb{R} \cong TN|_{\partial N}$ , we have the notion of a stably framed bordism  $\Omega_n^{fr}(X)$ . Denote  $\Omega_n^{fr} = \Omega_n^{fr}(\text{pt})$ .  $\square$

**Prop.(4.15.7.14).**  $S^3 \cong SU(2)$  is naturally framed, and this generates  $\Omega_3^{fr} \cong \mathbb{Z}/24$ .  $\square$

**Thm.(4.15.7.15) [Pontryagin].**  $\Omega_n^{fr} \cong \pi_{n+N}(S^N)$ .  $\square$

## 8 Applications

**Prop.(4.15.8.1).** A simply connected manifold is orientable. (Use the orientable double cover).  $\square$

## 4.16 Stable Homotopy Theory

## 5 | Commutative Algebras

### 5.1 Commutative Algebra I

References are [A-M69, Mat80], [Sta]Chap10, [Commutative Algebra with a View Towards Algebraic Geometry] and [Wei94]Chap4.

Commutative rings are studied in this subsection.

**Notation (5.1.0.1).**

- All rings and algebras in this section is assumed to be commutative.
- Let  $0 \neq A, 0 \neq R \in \mathcal{CRing}$ .

┘

#### 1 Basics

**Def. (5.1.1.1) [Integral Monoids].** An **integral monoid** is a monoid  $M \in \mathcal{CMon}^{0,1}$  s.t. for any  $a, b \in M$ ,  $ab = 0$  implies  $a = 0$  or  $b = 0$ . ┘

**Def. (5.1.1.2) [Ideals].** For an arbitrary  $R \in \mathcal{CMon}^{0,1}$ , an **ideal** of  $R$  is a subgroup  $I \leq R$  that is a left ideal. The category of ideals of  $R$  is denoted by  $\text{Ideal}(R)$ . ┘

**Prop. (5.1.1.3) [Quotients].** For  $I \in \text{Ideal}(R)$ , there is a **quotient ring**  $R/I \in \mathcal{CRing}_R$  with the universal property: any  $f : R \rightarrow R' \in \mathcal{CRing}$  that vanishes on  $I$  factors through  $R/I$ . ┘

*Proof:* ┘

**Prop. (5.1.1.4).** The quotient map induces an order-preserving bijection of ideals of  $A/I$  and ideals of  $A$  containing  $I$ . ┘

**Prop. (5.1.1.5) [Prime Avoidance].** Let  $n \in \mathbb{Z}_+$ ,  $I \in \text{Ideal}(R)$  and  $\{P_i\}_{i \in [n]_+} \in \text{Spec}(R)$  s.t.  $I \not\subseteq P_i$  for any  $i$ , then  $I \not\subseteq \cup P_i$ . ┘

*Proof:* Use induction on  $n$ . For  $n = 1$  this is trivial. For  $n \geq 2$ , let  $z_i \in I \setminus \cup_{j \neq i} P_j$ . Now consider  $z = z_1 \cdot z_{n-1} + z_n$ . If  $z \in P_i$  for some  $i < n$ , then  $z_n \in P_i$ , contradiction. If  $z \in P_n$ , then some  $z_i, i < n$  is in  $P_n$  because  $P_n$  is a prime ideal, contradiction. ┘

**Prop. (5.1.1.6) [Existence of a Maximal Ideal].**  $R$  has a maximal ideal. ┘

*Proof:* Use Zorn's lemma, the union of a chain of ideals is an ideal. ┘

**Cor. (5.1.1.7).** Any non-trivial ideal is contained in a maximal ideal. ┘

*Proof:* If  $I \subset A$  is a non-trivial ideal, then  $A/I$  is a non-zero ring, thus  $A/I$  has a maximal ideal, which corresponds to a maximal ideal of  $A$  containing  $I$  (5.1.1.4).  $\square$

**Thm. (5.1.1.8) [Chinese Remainder Theorem, S. Tzu300-400].** Let  $n \in \mathbb{Z}_+$  and  $\mathfrak{a}_1, \dots, \mathfrak{a}_n \in \text{Ideal}(A)$  be pairwise coprime ideals, then for any  $x_1, \dots, x_n \in A$ , there exists  $x \in A$  s.t.  $x \equiv x_i \pmod{\mathfrak{a}_i}$ .  $\square$

*Proof:* The case  $n = 1$  is trivial, and if  $n = 2$ , then by hypothesis  $1 = x_1 + x_2$  where  $x_i \in \mathfrak{a}_i$ . Then for any  $x_1, x_2 \in A$ , we can consider  $x = x_1 a_1 + x_2 a_2$ .

Suppose  $n \geq 3$ . Then for any  $i \in \mathbb{Z}_{\geq 2}$ , there exists  $a_i \in \mathfrak{a}_1, b_i \in \mathfrak{a}_i$  s.t.  $1 = a_i + b_i$ . Then

$$1 = \prod_{i=2}^n (a_i + b_i) \in \mathfrak{a}_1 + \prod_{i=2}^n \mathfrak{a}_i.$$

So by the  $n = 2$  case, there exists  $y_1 \in A$  s.t.

$$y_1 \equiv 1 \pmod{\mathfrak{a}_1}, \quad y_1 \equiv 0 \pmod{\mathfrak{a}_i}, \forall i \geq 2.$$

By the same argument, for any  $j \in [n]_+$ , there exists  $y_j \in A$  s.t.

$$y_j \equiv 1 \pmod{\mathfrak{a}_j}, \quad y_j \equiv 0 \pmod{\mathfrak{a}_i}, \forall i \neq j.$$

So for any  $x_1 \in A$ , we can just take  $x = \sum_{i=1}^n x_i y_i$ .  $\square$

**Prop. (5.1.1.9).** If  $r(I)$  and  $r(J)$  are coprime, then  $I, J$  are coprime.  $\square$

*Proof:* As  $a + b = 1$ , and  $a^m \in I, b^n \in J, 1 = (a + b)^{m+n} \in I + J$ .  $\square$

**Def. (5.1.1.10) [Local Ring].**  $R$  is called a **local ring** if it has only one maximal ideal. Equivalently, there is a prime ideal  $\mathfrak{m}$  that any element in  $R \setminus \mathfrak{m}$  is invertible. A local ring is denoted by  $(R, \mathfrak{m}) \in \text{locCRing}$ .

$R$  is called a **semilocal ring** if it has only f.m. maximal ideals.  $\square$

*Proof:* If  $\mathfrak{m}$  is the maximal ideal, then for any  $x \in R$ , if  $(x)$  is not all of  $R$ , then  $x$  is contained in a maximal ideal by (5.1.1.6), which can only be  $\mathfrak{m}$ . Conversely, if there is a prime ideal  $\mathfrak{m}$  that any element in  $R \setminus \mathfrak{m}$  is invertible, then clearly every non-trivial ideal is included in  $\mathfrak{m}$ .  $\square$

**Prop. (5.1.1.11).** Any quotient of a local ring is also a local ring.  $\square$

**Def. (5.1.1.12) [Local Ring Map].** A map between two local rings are called **local ring map** iff it maps non-invertible elements to non-invertible elements, equivalently,  $f^{-1}(\mathfrak{m}_S) = \mathfrak{m}_R$ .  $\square$

**Def. (5.1.1.13) [Ideal of Definition].** In a Noetherian local ring  $(R, \mathfrak{m})$ , an ideal  $I \subset R$  is called an **ideal of definition** if  $\sqrt{I} = \mathfrak{m}$ .  $\square$

**Prop. (5.1.1.14) [Ideals of Products and Filters].** If  $F_i, i \in I$  is a collection of fields, then the prime ideals in the ring  $\prod F_i$  is in bijection with the ultrafilters on  $I$ , where the ultrafilter  $\mathcal{F}$  corresponds to the ideal  $p_{\mathcal{F}} = \{(a_i) | \text{the set of coordinates that } a_i = 0 \text{ is in } \mathcal{F}\}$ . And in the same way, ideals of  $\prod F_i$  corresponds to the filters on  $I$ .  $\square$

*Proof:* Clearly  $p_{\mathcal{F}}$  is an ideal, and if  $\mathcal{F}$  is an ultrafilter, let  $Z(a)$  be the coordinates that  $a$  is zero on, and notice  $Z(ab) = Z(a) \cup Z(b)$ , then  $ab \in p$  iff  $a \in p$  or  $b \in p$ , by (2.2.10.7), so it is a prime ideal.

Conversely, notice that any two  $a, b$  with  $Z(a) = Z(b)$  differs by a unit, so  $\mathcal{F}_p = \{Z(a) | z \in p\}$  is easily checked to be a filter. And if  $p$  is a prime, then for any  $A \subset I$ , let  $a, b \in \prod F_i$  be that  $Z(a) = A, Z(b) = I - A$ , then  $ab = 0 \in p$ , so  $a \in p$  or  $b \in p$ .  $\square$

**Def. (5.1.1.15)[Torsion-Free Modules].** Let  $S \subset A$  be a set in a commutative ring, then an  $A$ -module  $M$  is called  **$S$ -torsion-free** if for any  $\{x \in M \mid Sx = 0\} = 0$ .  $\lrcorner$

**Prop. (5.1.1.16)[Maximal Torsion-Free Quotient].** Let  $S \subset A$  be a set, the functor from the category of torsion-free  $A$ -modules to the category of  $A$ -modules has a left adjoint, called the **maximal  $S$ -torsion-free quotient**.  $\lrcorner$

*Proof:* A quotient of  $M$  is determined by the kernel. It suffices to prove if  $M/N_1, M/N_2$  are both  $S$ -torsion-free, then  $M/N_1 \cap N_2$  is also  $S$ -torsion-free: This is easy.  $\square$

**Prop. (5.1.1.17).** Let  $A$  be a ring and  $B$  a finite  $A$ -algebra. if  $A \rightarrow B$  is epimorphism in the category of rings, then  $A \rightarrow B$  is surjective.  $\lrcorner$

*Proof:* Notice that  $h^B \rightarrow h^A$  is injective iff  $h^B \times_{h^A} h^B \cong h^B$ , or equivalently,  $B \times_A B \rightarrow B$  is an isomorphism. Now we can localize  $A$  at maximal ideals, thus we can assume  $A$  is local, with maximal ideal  $\mathfrak{m}$  and residue field  $k$ . And then use Nakayama lemma, it suffices to show that  $k \rightarrow B/\mathfrak{m} = C$  is surjective. But  $C \times_k C \cong C$ , so  $\dim_k C = 1$  or  $0$ , which means  $k \rightarrow C$  is surjective.  $\square$

**Def. (5.1.1.18) [Locally Nilpotent].** A **locally nilpotent ideal** is an ideal consisting of nilpotent elements.  $\lrcorner$

**Prop. (5.1.1.19).** If  $I \in \text{Ideal}(A)$  is a locally nilpotent(5.1.1.18), then  $1 + I \rightarrow 1 + I : x \mapsto x^n$  is an isomorphism.  $\lrcorner$

*Proof:* The converse is given by  $x \mapsto (1 + x)^{1/n} = 1 + \binom{1/n}{1}x + \binom{1/n}{2}x^2 + \dots$   $\square$

**Cor. (5.1.1.20).** If  $I$  is a locally nilpotent ideal of  $A$ , then a unit in  $A$  is an  $n$ -th power iff it is an  $n$ -th power in  $A/I$ .  $\lrcorner$

*Proof:* If  $a \equiv b^n \pmod{I}$ , then  $b$  is also a unit, and  $ab^{-n} = c^n$  for some  $n$  by(5.1.1.19), thus  $a$  is a  $n$ -th power.  $\square$

**Def. (5.1.1.21)[Ring Maps Essentially of Finite Type(Finite Presentations)].**  $f : R \rightarrow S$  is said to be **essentially of finite type** if  $S$  is a localization of a ring  $S' \in \mathcal{CRing}/R$  locally of f.t..

$f : R \rightarrow S$  is said to be **essentially of finite presentation** if  $S$  is a localization of a ring  $S' \in \mathcal{CRing}/R$  locally of f.p..  $\lrcorner$

### Tensor Product, Limits and Colimits

**Remark (5.1.1.22)[Tensor Product].** Tensor product is defined in(3.2.4.13). Notice that in case the rings are all commutative, there are no need to distinguish between left and right modules.  $\lrcorner$

**Def. (5.1.1.23)[Tensor Algebras].** For a module  $M$  over a commutative ring  $R$ , we define the

- **tensor algebra** operator from  $\text{Mod}_R$  to graded algebras over  $R$  that is left adjoint to the forgetful functor. It can be defined as follows:

$$T(M) = \bigoplus_{n \geq 0} \otimes^n M$$

as the module, and the algebra structure determined by the canonical map  $\otimes^m M \times \otimes^n M \rightarrow \otimes^{m+n} M$ .

- **exterior product**  $\wedge^k M$  as the module with the universal property that  $\text{Hom}_B(\wedge^k M, N)$  is the set of all morphisms  $M^n \rightarrow N$  that vanishes on all elements that have two equal coordinates.
- **exterior algebra** operator  $\wedge$  from  $\text{Mod}_R$  to the category of strict graded commutative algebras over  $R$  that is left adjoint to the forgetful functor. It can be defined as follows:  $\wedge(M) = T(M)/(x \otimes x)$ , where  $x \in M$ , or equivalently  $\wedge(M) = \bigoplus_{k \geq 0} \wedge^k(M)$ .
- **symmetric algebra** operator  $S$  from  $\text{Mod}_R$  to  $\mathcal{C}\text{Ring}_R$  that is left adjoint to the forgetful functor. It can be defined as follows:  $\wedge(M) = T(M)/(x \otimes y - y \otimes x)$  where  $x, y \in M$ .

┘

**Cor. (5.1.1.24).** The construction of  $T(M)$ ,  $\wedge M$  and  $\text{Sym}(M)$  commutes with all colimits, because they are all left adjoints.

┘

**Prop. (5.1.1.25) [Tensor Product and Quotient].** Let  $R$  be a commutative ring and  $I, J$  be ideals of  $R$ , then  $R/I \otimes_R R/J \cong R/(I + J)$ .

┘

*Proof:* This follows from the universal property of quotient and tensoring.

□

**Prop. (5.1.1.26).** There is a pullback square

$$\begin{array}{ccc} R/I \cap J & \longrightarrow & R/I \\ \downarrow & & \downarrow \\ R/J & \longrightarrow & R/(I + J) \end{array}$$

┘

*Proof:* The pullback is just the elements in  $R/I \times R/J$  that map to the same element in  $R/(I + J)$ . If  $(x + I, y + J)$  maps to the same element  $z + I + J$ , then  $x = y + i + j$ , so  $x - i = y + j$ , and the pullback lies in the image of  $\Delta : R \mapsto R/I \times R/J$ . Now the kernel is just  $I \cap J$ .

□

**Prop. (5.1.1.27) [Filtered Colimits of Modules are Exact].** If  $R \in \text{Ring}$  and  $\mathcal{I}$  be an index category that each connected components of  $\mathcal{I}$  is filtered, then taking colimits over  $\mathcal{I}$  is exact in the category  $\text{Mod}_R$ .

┘

*Proof:* It is clearly right exact. To check left exactness, Cf. [Sta]04B0.?

□

**Cor. (5.1.1.28) [Filtered Colimits of Abelian Groups are Exact].** Filtered colimits are exact in  $\text{Ab}$ .

┘

**Prop. (5.1.1.29).** Let  $k$  be a field and  $A, B$  be  $k$ -algebras and let  $\mathfrak{b} \subset A \otimes_k B$  be an ideal. Then among the ideals  $\mathfrak{a} \subset A$  that  $\mathfrak{b} \subset \mathfrak{a} \otimes_k B$ , there exists a smallest one.

┘

*Proof:* Choose a  $k$ -basis of  $B$ , then the smallest ideal  $\mathfrak{a}$  is just the ideal generated by all the  $A$ -coefficients of elements of  $\mathfrak{b}$ .

□

## Localization

**Def. (5.1.1.30) [Localization as Filtered Colimit].** Let  $A$  be a commutative ring and  $S$  be a multiplicatively closed subset of  $A$  containing 1 and not containing 0, the localization  $S^{-1}A$  is defined to be a ring over  $A$  that any ring map  $A \rightarrow B$  that maps elements of  $S$  to units factors through  $S^{-1}A$ .

$S^{-1}A$  can be constructed as

$$\varinjlim_{s \in S} A$$

where the ordering is defined to be  $s < t$  if  $t = sr$  for some  $r \in S$ , and if  $t = sr$ , there is a map from  $A_s$  to  $A_t$  defined by multiplying by  $r$ . This is easily seen to be a filtered colimit. There is easily seen to be the localization.  $\lrcorner$

**Prop. (5.1.1.31) [Localization is exact].**  $S^{-1}$  is an exact functor from  $\text{Mod}_R$  to  $\text{Mod}_R$ . Because it is a filtered colimit (4.8.3.28)(5.1.1.27).  $\lrcorner$

**Cor. (5.1.1.32).**  $(R/I)_{\bar{P}} \cong R_P/IR_P$ , in particular,  $k(R/P) \cong R_P/PR_P$ .  $\lrcorner$

**Def. (5.1.1.33) [Total Ring of Fractions].** For any ring  $R$ , the set of non-zerodivisors in  $R$  is a multiplicatively closed set  $S$ , and the localization  $\text{Frac}(R) = S^{-1}R$  is called the **total ring of fractions** of  $R$ .  $\lrcorner$

**Prop. (5.1.1.34) [Localization along an Ideal].** Let  $I$  be an ideal of  $A$ , then the localization of  $A$  along  $I$  is the ring  $\tilde{A}$  that  $\text{Spec } \tilde{A}$  is the localization of  $\text{Spec } A$  along  $V(I)$  as defined in (4.12.3.23) (because  $\text{Spec } A$  is spectral, by (4.12.3.16)).

Equivalently, it can be defined as  $\tilde{A} = S^{-1}A$ , where  $S = A \setminus (\cup_{\mathfrak{p} \in V(I)} \mathfrak{p})$ . (It can be checked that  $S$  is multiplicatively closed).

Notice then  $I \subset \text{rad } \tilde{A}$ .

For  $f \in A$ , we call the localization of  $A$  along  $f$  the  **$f$ -localization** of  $A$ . In fact, it is the universal  $A$ -algebra that  $f \in \text{rad } \tilde{A}$ .  $\lrcorner$

**Prop. (5.1.1.35).** Let  $R$  be a commutative ring,  $f_1, \dots, f_n \in R$ , and  $M$  an  $R$ -module, then  $M \rightarrow \oplus_i M_{f_i}$  is injective iff  $M \rightarrow \oplus_i M : m \mapsto (mf_1, \dots, mf_n)$  is injective.  $\lrcorner$

*Proof:* Cf. [Sta]0565.  $\square$

**Prop. (5.1.1.36).** For any ring  $A$ ,  $A \rightarrow \prod A_{\mathfrak{m}}$  is injective, where  $\mathfrak{m}$  are maximal ideals of  $A$ .

For a domain  $A$ ,  $A = \bigcap A_{\mathfrak{m}}$  inside the fraction field of  $A$ , where  $\mathfrak{m}$  are maximal ideals of  $A$ .  $\lrcorner$

*Proof:* if  $g \in \text{Frac}(A)$  is in the RHS, then  $I = \{x \in A \mid xg \in A\}$  is an ideal of  $A$  not contained in any maximal ideal, thus  $I = 1$  (5.1.1.7), and thus  $g \in A$ .  $\square$

**Lemma (5.1.1.37).** Let  $R$  be a ring and  $\mathfrak{p}$  be a prime, then there exists an  $f \in R$ ,  $f \notin \mathfrak{p}$  that  $R_f \subset R_{\mathfrak{p}}$ , if any of the following holds:

- $R$  is a domain.
- $R$  is Noetherian.
- $R$  is reduced and has f.m. irreducible components.

$\lrcorner$

*Proof:* Cf. [Sta]0BX1.  $\square$

**Def. (5.1.1.38) [Identifying Local Rings].** A ring map  $A \rightarrow B$  is said to **identify local rings** if for every prime  $\mathfrak{q} \subset B$ , the map  $A_{\varphi^{-1}(\mathfrak{q})} \rightarrow B_{\mathfrak{q}}$  is an isomorphism.  $\lrcorner$

**Prop. (5.1.1.39).** The property of identifying local rings is stable under base change and composition. (This is immediate from (5.1.1.40)).  $\lrcorner$

**Prop. (5.1.1.40) [Tensor Product and Localization].** For a ring map  $R \rightarrow S$ , let  $q \subset \text{Spec } S$ ,  $p = q \cap R$ , then  $(M \otimes_R S)_q = M_p \otimes_{R_p} S_q$  for any  $R$ -module  $M$ .  $\lrcorner$

*Proof:*  $(M \otimes_R S)_q = M \otimes_R S_q = M \otimes_R R_p \otimes_{R_p} S_q = M_p \otimes_{R_p} S_q$ .  $\square$

### Noetherian

**Def. (5.1.1.41) [Noetherian Module].** Let  $R \in \mathcal{CRing}$  and  $M \in \text{Mod}_R$ , then  $M$  is called a **Noetherian module** if any ascending chain of submodules stabilizes.

$R$  is called a **Noetherian ring** iff  $R$  is Noetherian over itself.  $\lrcorner$

**Prop. (5.1.1.42).** Let  $R \in \mathcal{CRing}$  and  $0 \rightarrow M_1 \rightarrow M \rightarrow M_2$  be an exact sequence in  $\text{Mod}_R$ , then  $M$  is Noetherian iff  $M_1, M_2$  are both Noetherian.  $\lrcorner$

**Prop. (5.1.1.43) [Hilbert Basis Theorem, Hilbert1888].** Let  $A$  be a Noetherian ring, then quotient ring, f.g. module, f.g. algebra, localization and power series of  $A$  are Noetherian. Hence graded algebra of a Noetherian ring  $A$  by an ideal  $I$  is Noetherian. Products of Noetherian rings are Noetherian.  $\lrcorner$

*Proof:* Only need to prove  $A[X]$  and  $A[[X]]$ , localization and others are quotients of these. For an ascending chain of ideal  $I_j$  of  $A[X]$ , we consider the coefficients ideal  $I_{i,j}$  of  $X^i$  of  $I_j$ , then there are only f.m. different  $I_{i,j}$ s, so we have  $I_j$  stabilize as well.

Similarly for  $A[[X]]$ , we prove any ideal  $I$  is f.g. Consider the lowest terms coefficient ideal at degree  $i$ , then it is ascending and stabilize, then a set of generators as a whole generate  $I$ .  $\square$

**Remark (5.1.1.44).** The subring of a Noetherian ring is NOT necessarily Noetherian, by the example of  $k[X_1, \dots, X_n, \dots] \subset k(X_1, \dots, X_n, \dots)$ .  $\lrcorner$

**Prop. (5.1.1.45).** When  $A$  is Noetherian and is quipped with  $I$ -adic topology, then  $I$  is f.g., and there is a surjective ring map  $A[[X]] \rightarrow A^\wedge$ , mapping to the generators of  $I$ , hence the completion is Noetherian. (It is surjective can be seen by the Cauchy sequence construction of completion).  $\lrcorner$

**Prop. (5.1.1.46).** If  $R \rightarrow R'$  is ring map of f.t., then if  $S \in \mathcal{CRing}/R$  and  $S$  is Noetherian, then  $S \otimes_R R'$  is Noetherian, because  $S \otimes_R R'$  is of f.t. over  $S$ , and use (5.1.1.43).  $\lrcorner$

**Cor. (5.1.1.47).** For  $k \in \text{Field}$ ,  $S \in \mathcal{CRing}/k$ , then for any f.g. field extension  $K/k$ ,  $S \otimes_k K$  is Noetherian. (Because there is a f.g. algebra  $B$  over  $k$  that  $K$  is the localization of  $B$ , and use (5.1.1.43)).  $\lrcorner$

**Prop. (5.1.1.48).** If  $R$  is Noetherian and  $M$  is a f.g.  $R$ -module, then there is a filtration  $\{M_i\}$  of  $M$  that the quotients are all isomorphic to  $R_{\mathfrak{p}_i}$  where  $\mathfrak{p}_i$  are primes.  $\lrcorner$

*Proof:*  $M$  is generated by  $x_i$ , so  $(x_1) \cong R/I_1$ , and so we modulo  $x_i$ , then the result follows by induction. So we may assume  $M = R/I$ . We use Noetherian condition to choose a maximal element  $J$  that is a counterexample, then  $J$  is not a prime, so there are  $a, b \notin J$  that  $ab \in J$ . Then we have a filtration  $0 \subset aR/(J \cap aR) \subset R/J$ . Notice  $R/(J + bR) \rightarrow aR/(J \cap aR) \rightarrow 0$ , and the second quotient is  $R/(J + aR)$ , so they all can be factorized.  $\square$

**Prop. (5.1.1.49).** A Noetherian ring has only f.m. minimal prime ideals.  $\lrcorner$

*Proof:* This is a consequence of (7.4.1.20) (7.4.1.21) and (4.12.2.4).  $\square$

**Prop. (5.1.1.50) [Cohen].** If  $R \in \mathcal{CRing}$  and every prime ideal is f.g., then  $R$  is Noetherian.  $\lrcorner$

*Proof:* Suppose  $P$  is not Noetherian. Firstly the set of non-finitely generated ideals has the chain property: if  $I_i$  is a chain of non-f.g. ideals of  $R$ , then  $I = \cup_{i \in \Phi} I_i$  is non-f.g., otherwise there are

$(f_i) = I$ , but  $\{f_i\} \in I_h$  for some  $h$ , thus  $I_h$  is f.g.. Then we use the Zorn's lemma to find a maximal non-f.g. ideal  $I$ . We show that  $I$  is a prime ideal:

$I \neq R$  because  $R = (1)$ . So if  $a, b \in R \setminus I$  that  $ab \in I$ , then  $I + (a)$  and  $I + (b)$  is f.g. by  $p_i + r_i a$ , by maximality, and let  $K = (P : a)$ , then  $I \subset I + (b) \subset K$ , thus  $K$  is f.g., so does  $aK$ .

Now I claim  $I = (p_1) + \dots + (p_n) + aK$ : one direction is clear, and if  $r \in I \subset I + (a)$ , then  $r = \sum c_i(p_i + r_i a)$ , thus  $(\sum c_i r_i) a = r - \sum c_i p_i \in I$ , thus  $\sum c_i r_i \in K$ , thus  $r = \sum c_i p_i + (\sum c_i r_i) a \in (p_1) + \dots + (p_n) + aK$ .

So now  $I$  is f.g., contradiction, which shows  $I$  is a prime, but this contradicts the hypothesis.  $\square$

**Prop. (5.1.1.51) [Modules over Noetherian Ring are Noetherian].** Let  $R$  be a Noetherian ring, then any submodule of a finite module  $M$  over  $R$  is finite. Thus any module over  $R$  is a Noetherian module (5.1.1.41). In particular, any module over  $R$  is of f.p.  $\lrcorner$

*Proof:* it suffices to prove the first assertion: we use induction on the minimal number of generators of  $M$ : if it is generated by 1 element, then  $M \cong R/I$  for some ideal  $I$ , thus  $N \subset M$  is isomorphic to some  $J/I$ , so it is finite because  $J$  is finite. If the minimal number of generators of  $M$  is greater than 1, then there exists an exact sequence

$$0 \rightarrow M' \rightarrow M \rightarrow M'' \rightarrow 0$$

where  $M', M''$  has fewer number of generators. Now there is also an exact sequence

$$0 \rightarrow N \cap M' \rightarrow N \rightarrow \overline{N} \rightarrow 0,$$

and the minimal number of generators of  $N$  is smaller than the sum of that of  $M'$  and  $M''$ , thus it is also finite.  $\square$

**Prop. (5.1.1.52) [Artin-Tate [A-T51]].** Let  $R$  be a Noetherian ring and  $S$  a f.g.  $R$ -algebra. If  $T \subset S$  is an  $R$ -subalgebra that  $S$  is a finite module over  $T$ , then  $T$  is f.g. over  $R$ .  $\lrcorner$

*Proof:* Let  $x_1, \dots, x_n \in S$  generate  $S$  as an  $R$ -algebra, and let  $y_1, \dots, y_m$  generate  $S$  as an  $T$ -module. Then there exists  $a_{ij} \in T$  s.t.  $x_i = \sum_j a_{ij} y_j$ . There also exists  $b_{ijk}$  s.t.  $y_i y_j = \sum_k b_{ijk} y_k$ . Let  $T' \subset T$  be the subalgebra generated by the elements  $\{a_{ij}\}$  and  $\{b_{ijk}\}$ , then it is f.g. over  $R$  thus a Noetherian ring (5.1.1.43).

$S$  is a surjective image of  $S' = T'[Y_1, \dots, Y_m]/(Y_i Y_j - \sum_k b_{ijk} Y_k)$ , which is a finite module over  $T'$ , so  $S$  is also finite module over  $T'$ . Then  $T \subset S$  is also finite over  $T'$ , thus f.g. over  $R$ .  $\square$

**Prop. (5.1.1.53) [Krull-Akizuki].** If  $R$  is a Noetherian domain of dimension 1 with fraction field  $K$ ,  $L/K$  a finite extension of fields, then for any ring  $A$  s.t.  $R \subset A \subset L$ ,  $A$  is Noetherian.  $\lrcorner$

*Proof:* Cf. [Sta]00PG.  $\square$

## 2 Lengths

**Def. (5.1.2.1) [Lengths].** The **length** of a  $R$ -module  $M$  is the supremum of lengths of chains of submodules of  $M$ , denoted by  $\text{length}_R(M)$ .  $\lrcorner$

**Prop. (5.1.2.2).** Length is an additive function on  $\text{Mod}_R$ .  $\lrcorner$

*Proof:* Cf. [Sta]00IV.  $\square$

**Prop. (5.1.2.3).** If  $\text{length}_R(M) < \infty$ , then any maximal chain of submodules has the same length.  $\lrcorner$

*Proof:* Let  $l(M)$  be the minimal length of a maximal chain, then if  $M \subsetneq N$ , then firstly  $l(M) < l(N)$ , because a maximal chain of  $M$  restricts to a maximal chain of  $N$ , and if the length is the same, then each term is in  $M$ , so  $N \subset M$ , contradiction. Now any chain has length  $l(M)$ , because if there is a chain  $M_i$ , then  $l(M_0) < l(M_1) < \dots < l(M)$ .  $\square$

**Prop. (5.1.2.4).** Let  $R \in \mathcal{CRing}$  and  $S$  a multiplicative set of  $R$ , then  $\text{length}_R(M) \geq \text{length}_{S^{-1}R}(S^{-1}M)$ .  
 $\lrcorner$

*Proof:* This is because any  $S^{-1}R$ -submodule of  $S^{-1}M$  is of the form  $S^{-1}N$  where  $N$  is a  $R$ -submodule of  $M$ .  $\square$

**Prop. (5.1.2.5).** If  $R$  is a ring with a maximal ideal  $\mathfrak{m}$ ,  $M$  is an  $R$ -module that  $\mathfrak{m}M = 0$ , then  $\text{length}_R(M) = \dim_{k(\mathfrak{m})}(M)$ .  
 $\lrcorner$

**Prop. (5.1.2.6) [Length over a Local Ring].** Let  $(R, \mathfrak{m})$  be a local ring, and  $M \in \text{Mod}_R$  is of finite length, then  $\mathfrak{m}^n M = 0$  for some  $n \in \mathbb{N}$ .

Conversely, if  $\mathfrak{m}$  is f.g. and  $M$  is a finite  $R$ -module, and  $\mathfrak{m}^n M = 0$  for some  $n \in \mathbb{N}$ , then  $\text{length}_R(M) < \infty$ .  
 $\lrcorner$

*Proof:*  $M$  is clearly a finite module over  $R$ . Take  $n = \text{length}_R(M)$ . If  $f_1, \dots, f_n \in \mathfrak{m}$  and  $x \in M$  s.t.  $f_1 \dots f_n x \neq 0$ , then by Nakayama the submodules

$$0 \subset (f_1 \dots f_n)x \subset (f_2 \dots f_n)x \subset (f_n)x \subset M$$

are all different, so  $\text{length}_R(M) \geq n$ , contradiction.

For the converse, use additivity on the filtration  $0 = \mathfrak{m}^n M \subset \mathfrak{m}^{n-1} M \subset \dots \subset M$ , where each quotient is finite over  $R$  and annihilated by  $\mathfrak{m}$ , so we conclude by (5.1.2.5).  $\square$

**Prop. (5.1.2.7).** If  $(A, \mathfrak{m})$  is a local ring and  $B$  is a ring over  $A$  with f.m. maximal ideals  $\mathfrak{m}_i$  s.t. each  $\mathfrak{m}_i$  is over  $\mathfrak{m}$  and  $k(\mathfrak{m}_i)/k(\mathfrak{m})$  is finite, then there for any  $M \in \text{Mod}_B$  with  $\text{length}_B M < \infty$ ,

$$\text{length}_A M = \sum_i [k(\mathfrak{m}_i) : k(\mathfrak{m})] \text{length}_{B_{\mathfrak{m}_i}} M_{\mathfrak{m}_i}.$$

$\lrcorner$

**Prop. (5.1.2.8).** Let  $A \rightarrow B$  be a flat local maps of local rings, then for any  $M \in \text{Mod}_A$ ,

$$\text{length}_A(M) \text{length}_B(B/\mathfrak{m}_A B) = \text{length}_B(M \otimes_A B).$$

$\lrcorner$

*Proof:* Cf. [Sta]02M1. ?  $\square$

**Cor. (5.1.2.9).** Let  $A \rightarrow B \rightarrow C$  be local maps of local rings,  $C/B$  is flat, and  $\mathfrak{m}_A$  the maximal ring of  $A$ , then

$$\text{length}_B(B/\mathfrak{m}_A B) \text{length}_C(\mathfrak{m}_B C) = \text{length}_C(C/\mathfrak{m}_B C).$$

$\lrcorner$

**Prop. (5.1.2.10) [Order of Vanishing].** If  $R$  is a semi-local Noetherian domain of dimension 1 and  $a, b$  are not zero-divisors, then  $f(a) = \text{length}(R/(a))$  satisfies  $f(a) + f(b) = f(ab) < \infty$ .

So this  $R \subset K$  and has fraction field  $K$ , then  $f$  extends to an additive function on  $K^*$ , denoted by  $\text{ord}_R(f)$ .  $\lrcorner$

*Proof:* It is finite by [Sta]00PF. It is additive because length is additive (5.1.2.1) and  $0 \rightarrow R/(a) \rightarrow R(ab) \rightarrow R(b) \rightarrow 0$ .  $\square$

### 3 Artinian Ring

**Def. (5.1.3.1) [Artinian Rings].** A ring  $A$  is called **Artinian** if any descending chain of ideals of  $A$  stabilizes.

For example, a f.g.  $k$ -algebra that is a finite  $k$ -module is an Artinian ring.  $\lrcorner$

**Lemma (5.1.3.2).** Let  $A$  be an Artinian ring, then  $A$  has f.m. maximal ideals.  $\lrcorner$

*Proof:* Suppose for the contrary that there are infinitely many maximal ideals  $\mathfrak{m}_1, \dots, \mathfrak{m}_n, \dots$ , then we can consider the chain of ideals  $\mathfrak{m}_1 \supset \mathfrak{m}_1 \cap \mathfrak{m}_2 \supset \dots$ . Then it is an infinite descending chain, by Chinese remainder theorem, contradicting the fact that  $A$  is Artinian.  $\square$

**Lemma (5.1.3.3).** If  $A$  is an Artinian ring, then the Jacobson radical is nilpotent.  $\lrcorner$

*Proof:* Consider the Jacobson radical  $I$ ,  $I^n = I^{n+1}$  for some  $n$ , let  $J = \text{Ann}(I^n)$ , it suffices to show  $J = A$ . If not, choose a minimal  $J'$  that contains  $J$  but not  $J$  (exists by Artinian property), then  $J' = J + Ax$ , and  $IJ' \subset J$  by Nakayama, so  $xI^{n+1} \subset JI^n = 0$ , so  $x \in J$ , contradiction.  $\square$

**Prop. (5.1.3.4) [Characterization of Artinian Rings].** The following are equivalent:

1.  $A$  is Artinian.
2.  $A$  is Noetherian of dimension 0.
3.  $\text{length}_A A < \infty$ .
4.  $A$  is a finite product of local Artinian rings.
5.  $A$  is Noetherian, Jacobson (5.2.6.4), and has f.m. maximal ideals.

$\lrcorner$

*Proof:* 1  $\iff$  3: if  $\text{length}_A A < \infty$ , then  $A$  is clearly Artinian. Conversely, if  $A$  is Artinian, then by (5.1.3.2)(5.1.3.3)(5.2.6.7)  $A$  a finite product of its localization of maximal ideals, so we may assume  $A$  is local with maximal ideal  $\mathfrak{m}$ . Then  $\mathfrak{m}^n = 0$  for some  $n$  by (5.1.3.3), and  $\mathfrak{m}^i/\mathfrak{m}^{i+1}$  has length the same as their dimension as a  $A/\mathfrak{m}$  vector space, by (5.1.2.5), which is finite because  $A$  is Artinian, so  $\text{length}_A A < \infty$ .

1 + 3  $\rightarrow$  5:  $A$  has f.m. maximal ideals by (5.1.3.2). It is Jacobson by (5.1.3.3).  $\text{length}_A A < \infty$  clearly implies  $A$  is Noetherian.

5  $\rightarrow$  2: By (5.2.6.7).

2  $\rightarrow$  5: all prime ideals are maximal, so  $\text{Spec } A$  is discrete, so  $A$  has f.m. maximal ideals, and it is clearly Jacobson.

5  $\rightarrow$  3: By (5.2.6.7),  $R$  is a product of its local rings, and the local rings are all Noetherian and Jacobson (5.2.6.6), so by Nakayama, they have finite lengths. So also  $R$  has finite length.

5  $\rightarrow$  4: By lemma (5.2.6.7) below,  $A$  is a product of its localization, and its localizations also satisfies 5, and by 5  $\rightarrow$  3  $\rightarrow$  1, they both have descending conditions.

4  $\rightarrow$  5: An Artinian ring is Noetherian and Jacobson by 1 + 3  $\rightarrow$  5, then so does their product.

$\square$

**Cor. (5.1.3.5) [Reduced Artinian Ring].** A reduced local Artinian ring is a field. In particular, A reduced Artinian ring is a product of fields.  $\lrcorner$

*Proof:* An Artinian local ring  $A$  is Jacobson (5.1.3.4) so the maximal ideal  $\mathfrak{m} = 0$  as  $A$  is reduced.

$\square$

**Prop. (5.1.3.6).** For an Artinian local ring  $A$ , the following are equivalent:

1.  $A$  is a PID.
2. the maximal ideal  $\mathfrak{m}$  is principal.
3.  $\dim_k(\mathfrak{m}/\mathfrak{m}^2) \leq 1$ .

┘

*Proof:* It suffices to prove  $3 \rightarrow 1$  : If  $\mathfrak{m} = \mathfrak{m}^2$ , then  $\mathfrak{m} = 0$  by Nakayama, so  $A$  is a field. If  $\dim_k(\mathfrak{m}/\mathfrak{m}^2) = 1$ , then  $\mathfrak{m}$  is principle by Nakayama. And  $\mathfrak{m}$  is nilpotent by (5.1.3.4), so for any ideal  $a$  there is a minimal  $n$  that  $a \subset \mathfrak{m}^n$ . Now choose  $y \in a - \mathfrak{m}^{n+1}$ , then  $y = ux^r$ , and  $u \notin (x)$ , so  $u$  is a unit, thus  $x^r \in a$ , meaning  $a = \mathfrak{m}^n$  hence principal.  $\square$

## 4 Local Properties

**Def. (5.1.4.1)[Local properties].** A property  $P$  of rings or modules over a ring is called **local property** iff  $X$  has  $P$  iff  $X_{f_i}$  all has  $P$  for a covering  $(f_1, \dots, f_n) = 1$ .

A property of morphisms of rings is called **local on the target** iff  $R \rightarrow S$  has  $P$  iff  $R_{f_i} \rightarrow S_{f_i}$  has  $P$  for a covering  $(f_1, \dots, f_n) = 1$  in  $R$ .  $\square$

**Prop. (5.1.4.2)[Stalkwise Properties].** For a commutative ring  $R$ , a property  $P$  is called stalkwise if  $A$  satisfies  $P$  iff all  $A_{\mathfrak{m}}$  satisfies  $P$  where  $\mathfrak{m}$  are maximal ideals, and iff all  $A_{\mathfrak{p}}$  satisfies  $P$  where  $\mathfrak{p}$  are prime ideals of  $A$ .

1. Trivial is stalkwise for modules over  $R$ . Hence so does injectivity and surjectivity because localization is exact.
2. Torsion-free is stalkwise for modules over  $R$  if  $R$  is integral.
3. Flatness for modules over  $R$ .
4. Flatness for rings over  $R$  on the source.
5. Formal unramifiedness for rings over  $R$ , both on the target and source.
6. (universally)catenary is stalkwise.
7. reducedness is stalkwise.
8. Integral+integrally closed is stalkwise.
9. normal is stalkwise.
10. regular is stalkwise.

┘

*Proof:*

1. It suffice to prove an element is trivial on every localization then it is 0. For this, consider the annihilator  $\text{Ann}(x)$ , it is not contained in any maximal ideal so it contains 1.
2. if  $xf = 0$  but  $f \neq 0$ , then  $x \in \text{Ann}(f) \neq (1)$ , so  $\text{Ann}(f) \subset \mathfrak{m}$  maximal, so  $f$  is torsion in  $M_{\mathfrak{m}}$  over  $R_{\mathfrak{m}}$ . Conversely, if  $f$  is torsion in  $R_{\mathfrak{m}}$ , then it is clearly torsion over  $R$ .
3. We use the definition (5.4.1.2). Notice  $(IM)_{\mathfrak{p}} = I_{\mathfrak{p}}M_{\mathfrak{q}}$  and every ideal of  $R_{\mathfrak{p}}$  is of the form  $I_{\mathfrak{p}}$ . Then use the fact injective is stalkwise (5.1.4.2).
4. We use the definition (5.4.1.2). Notice  $(I \otimes_R S)_{\mathfrak{q}} = I_{\mathfrak{p}} \otimes_{R_{\mathfrak{p}}} S_{\mathfrak{q}}$  for all primes  $\mathfrak{q}$  of  $S$  and  $\mathfrak{p} = \mathfrak{q} \cap R$ . And every ideal of  $R_{\mathfrak{p}}$  is of the form  $I_{\mathfrak{p}}$ . Then use the fact injective is stalkwise (5.1.4.2)

5. Because formally unramified is equivalent to  $\Omega_{R/S} = 0$  (5.4.6.1), so we get the result by functorial properties of  $\Omega_{S/R}$  (5.4.3.6) and triviality is stalkwise (5.1.4.2).
6. For any two prime ideals  $\mathfrak{p} \subset \mathfrak{q}$ , we can choose a maximal ideal containing them.
7. use (5.1.1.36).
8. If  $A$  is integrally closed, then clearly any localization of  $A$  is integrally closed. Conversely, if  $r \in K(A)$  is integral over  $A$  but  $r \notin A$ , let  $I = \{s \in A \mid rs \in A\}$ , then  $I \neq A$ , so  $I \subset \mathfrak{m}$  for some maximal ideal  $\mathfrak{m}$ , then  $r \notin A_{\mathfrak{m}}$ , so  $A_{\mathfrak{m}}$  is not integrally closed, contradiction.
9. By definition.
10. By definition.

□

**Remark (5.1.4.3).** Our main technique of proving local properties are using affine communication theorem (7.4.1.2). ┘

**Prop. (5.1.4.4) [Local Properties].** For a fixed ring  $R$ ,

1. Every property that is stalkwise is a local property. (5.1.4.2) The properties listed below should be not stalkwise.
2. Every property that satisfies faithfully flat descent is a local property. The properties listed below should not satisfy faithfully flat descent.
3. Noetherian.
4. F.t. ring maps on the source.
5. F.p. ring maps on the source.
6. N-1 and N-2 and universally Japanese for rings.
7. Nagata for rings.

┘

*Proof:*

- 1.
- 2.
3. If  $A$  is Noetherian, then  $A_{f_i}$  are Noetherian by (5.1.1.43). Conversely, if  $A_{f_i}$  are all Noetherian and  $I_1 \subset I_2 \subset \dots$  is an ascending chain of ideals of  $A$ , consider  $A \rightarrow \prod A_{f_i}$  faithfully flat, thus  $I_1 \otimes_A (\prod A_{f_i}) \subset I_2 \otimes_A (\prod A_{f_i}) \subset \dots$  is an ascending chain of  $\prod A_{f_i}$ . Now  $\prod A_{f_i}$  are Noetherian by (5.1.1.43), so this chain stabilizes. But this ring map is faithfully flat, so the original chain must also stabilize.
4. Let  $(g_1, \dots, g_n) = 1$ , choose  $\sum h_i g_i = 1$ , and let  $x_{ij} = y_{ij}/g_i^{n_{ij}}$  generates  $S_{g_i}$ . Now let  $S'$  be the sub- $R$ -algebra of  $S$  generated by  $y_{ij}, g_i, h_j$ . Then  $(S')_{f_i} \rightarrow S_{f_i}$  is surjective for any  $i$ , so  $S' \rightarrow S$  is also surjective, by (5.1.4.2). Then  $S' = S$ , and  $S$  is f.g. over  $R$ .
5. Cf. [Sta]00EP.
6. If  $A$  is N-1, then  $A_{f_i}$  are N-1 because taking integral closure commutes with localization. The same for N-2. Conversely, if all  $A_{f_i}$  are N-1 or N-2, so is  $A$  because finiteness is local (5.1.4.4). The universal Japanese case follows from the N-2 case.
7. This follows from the localness of Noetherian and N-2 (5.1.4.4).

□

## 5 Fitting Ideals

**Def. (5.1.5.1) [Fitting Ideals].** Let  $R \in \mathcal{CRing}$  and  $M$  be a finite  $R$ -module, then for any presentation

$$\bigoplus_{j \in J} R \rightarrow R^{\oplus n} \rightarrow M \rightarrow 0$$

given by a  $n \times J$  matrix  $A$ , the ideal generated by the  $(n - k) \times (n - k)$  matrices of  $A$  is independent of the presentation chosen, called the  $k$ -th **Fitting ideal** of  $A$ , denoted by  $\text{Fitt}_k(M)$ .  $\lrcorner$

## 6 Rings and Categories

### Quotient by Equivalence Relations

**Prop. (5.1.6.1) [Quotients by Equivalence Relations].** Let  $u_0, u_1 : A_0 \rightarrow A_1$  be an equivalence in the dual category of  $\mathcal{CRing}_{R_0}$  (4.1.1.24). If  $u_0$  is locally free of constant rank  $r$ , then a quotient  $u : A \rightarrow A_0$  exists, and  $u$  is locally free of constant rank  $r$ .  $\lrcorner$

*Proof:* Cf. [Mil17b]P592.  $\square$

## 7 Spectra

**Lemma (5.1.7.1).** In  $\text{Spec } A$ , a subset  $U$  is retrocompact iff it is quasi-compact iff it is a finite union of standard opens  $D(f_i)$ . In particular, any constructible subset of  $\text{Spec } A$  is a finite union of morphisms of the form  $D(f_i) \cap V(g_1, \dots, g_m)$ .  $\lrcorner$

*Proof:* Retrocompact is quasi-compact because  $\text{Spec } A$  is quasi-compact. A quasi-compact subset is equivalent to a finite union of  $D(f_i)$ . Now for any quasi-compact subset  $V = \bigcup_j D(g_j)$ ,  $U \cap V = \bigcup_{ij} D(f_i g_j)$  is also quasi-compact, so  $\bigcup_i D(f_i)$  is retrocompact.  $\square$

**Lemma (5.1.7.2).** Let  $R$  be a ring, then

- the image of any standard open subsets of  $\text{Spec } R[X]$  is qc open in  $\text{Spec } R$ .
- for  $g, f \in R[X]$  with  $g$  monic, the image of  $D(f) \cap V(g)$  is qc open in  $\text{Spec } R$ .

 $\lrcorner$ 

*Proof:* 1: For any prime  $\mathfrak{p}$  of  $R$ , the primes mapping to  $\mathfrak{p}$  has a minimal one,  $\mathfrak{p}[X]$ , so  $\mathfrak{p}$  is in the image of  $\text{Spec } R[X] \rightarrow \text{Spec } R$  iff  $f \in \mathfrak{p}[X]$ , which means the image is  $D(a_0, a_1, \dots, a_n)$ , where  $f = a_0 + a_1 X + \dots + a_n X^n$ .

2:  $R[X]/g$  is finite free over  $R$ , let  $P(T) = T^d + r_{d-1}T^{d-1} + \dots + r_0$  be the characteristic polynomial of  $f$  acting on  $R[X]/g$  by left multiplication, then  $\mathfrak{p} \in V(r_0, \dots, r_{d-1})$  iff  $f$  acts nilpotently on  $R[X]/g \otimes_R k(\mathfrak{p})$ , which is equivalent to  $\mathfrak{p}$  being in the image of  $D(f) \cap V(g)$  (by base change to  $k(\mathfrak{p})$  argument).  $\square$

**Lemma (5.1.7.3) [Affine Chevalley].** The  $\text{Spec}$  map of a f.p. ring map maps constructible sets to constructible sets.  $\lrcorner$

*Proof:* Suppose  $S = R[X_1, \dots, X_n]/(f_1, \dots, f_m)$ , then it suffices to show for the case  $S = R/(f_1, \dots, f_m)$  and  $S = R[X]$ .

If  $S = R/(f_1, \dots, f_m) = R/I$ , it suffices to show the image of  $D(\bar{g}) \cap V(\bar{h}_1, \dots, \bar{h}_m)$  is retrocompact in  $\text{Spec } R$ : in fact its image is just  $D(g) \cap V(h_1, \dots, h_m) \cap V(I)$ , where  $g, h_i$  are any inverse images in  $R$ .

For the second case, we first prove some localizing result: If  $S = R_f$ , then the compact open subsets of  $\text{Spec } S$  are compact open subsets of  $\text{Spec } R$ , so  $\text{Spec } S \rightarrow \text{Spec } R$  maps constructible sets to constructible sets. Now for any  $c \in R$ ,  $\text{Spec } R = \text{Spec } R/c \amalg \text{Spec } R_c$ , so to prove the proposition for  $R$ , it suffices to prove for  $R_c$  and  $R/c$ .

Let  $D(f) \cap V(g_1, \dots, g_n) \subset \text{Spec } R[X]$ , where  $f, g_i$  are polynomials. We can use induction on the degree series  $\deg(g_1) \leq \deg(g_2) \leq \dots \leq \deg(g_n)$ . If the leading coefficient of  $g_1$  is invertible, then we can use reduction to  $R/c$  and  $R_c$  to either reduce the degree of  $g_1$  or reduce to the case it is invertible. If it is invertible, then we can use Euclidean division. Eventually, it can be reduced to the case  $D(f) \cap V(g)$  where  $g$  is monic, or  $D(f)$ . This is proved in the above lemma(5.1.7.2).  $\square$

**Lemma (5.1.7.4).** For a Noetherian local ring  $(A, \mathfrak{m})$ ,  $\text{Spec } A - \mathfrak{m}$  is affine iff  $\dim A \leq 1$ .  $\lrcorner$

*Proof:* if  $\dim A = 0$ , this is true, if  $\dim A = 1$ , let  $f \in \mathfrak{m}$  not in any other minimal primes of  $A$ , then  $\text{Spec } A - \mathfrak{m} = \text{Spec } A_f$ .

Conversely, Cf.[Sta]0BCR.  $\square$

### Idempotents

**Prop. (5.1.7.5)[Clopen Subsets].** The clopen subsets of  $\text{Spec } A$  corresponds to idempotents in  $A$ .  $\lrcorner$

*Proof:* Notice that  $A$  is the global section of  $\text{Spec } A$ , so for any clopen subset  $U \subset \text{Spec } A$ , we can take the section  $e$  which is 1 on  $U$  and 0 on  $\text{Spec } A \setminus U$ . Then  $e^2 = e$ .  $\square$

**Cor. (5.1.7.6).** A local ring has no non-trivial idempotents, and then an idempotent is defined by the maximal ideals that it vanishes.  $\lrcorner$

**Cor. (5.1.7.7).** If  $I$  is an ideal of  $R$  that  $I = I^2$ , and  $I$  is f.g., then  $V(I)$  is open and closed in  $\text{Spec } R$ , and  $V(I) = R_e$  for some idempotent  $e$ .  $\lrcorner$

*Proof:* By Nakayama, there is a  $f = 1 - e$  with  $e \in I$  that  $fI = 0$ . So  $e - e^2 = 0$  and  $f^2 = f$ .  $V(I) = D(f) = D(e)$ .  $\square$

**Lemma (5.1.7.8).** If  $I$  is a locally nilpotent ideal, then  $R \rightarrow R/I$  induces a bijection on idempotents.  $\lrcorner$

*Proof:* Because  $R \rightarrow R/I$  induces a homeomorphism on the spectra, and clopen subsets of the spectrum corresponds to the idempotents(5.1.7.5).  $\square$

**Lemma (5.1.7.9).** Let  $R$  be a ring and  $T \subset \text{Spec } R$  is a set. Then the following are equivalent:

- $T$  is closed and is a union of connected components of  $\text{Spec } R$ .
- $T$  is an intersection of clopen subsets.
- $T = V(I)$  where  $I$  is generated by idempotents.

$\lrcorner$

*Proof:* 1 and 2 are equivalent by(4.12.3.3), and  $2 \rightarrow 3 \rightarrow 1$  are easy.  $\square$

**Prop. (5.1.7.10).** Let  $R$  be a ring, then any connected component of  $\text{Spec } R$  is of the form  $V(I)$ , where  $I$  is an ideal generated by idempotents that any idempotent of  $R$  maps to either 0 or 1 in  $R/I$ .  $\lrcorner$

*Proof:* By(4.12.3.2) and(4.12.3.16), a connected component of  $\text{Spec } R$  is an intersection of clopen subsets, so it is of the form  $V(I)$  where  $I$  is generated by idempotents. The last assertion is equivalent to  $V(I)$  being connected.  $\square$

### Going-up and down

**Def. (5.1.7.11) [Going-up and Going Down].** Going-up and down for topological spaces is defined in (4.12.2.7). A ring map  $R \rightarrow S$  is said to satisfy the going-up property iff its Spec map does, equivalently, for any prime ideal  $\mathfrak{q} \subset S$  and prime ideal  $\mathfrak{p} \subset \mathfrak{q} \cap R$ , there exists a prime ideal  $\mathfrak{q}' \subset \mathfrak{q}$  that  $\mathfrak{q}' \cap R = \mathfrak{p}$ .

It is said to satisfy the going-down property iff its Spec map does, equivalently, for any prime ideal  $\mathfrak{q} \subset S$  and prime ideal  $\mathfrak{q} \cap R \subset \mathfrak{p}$ , there exists a prime ideal  $\mathfrak{q}' \subset \mathfrak{q}$  that  $\mathfrak{q}' \cap R = \mathfrak{p}$ .  $\lrcorner$

**Prop. (5.1.7.12).** Going-up and Going-down are stable under composition, trivially.  $\lrcorner$

**Prop. (5.1.7.13) [Integral Map satisfies Going-Up].** Integral ring map satisfies going-up (5.2.1.5). Flat ring map satisfies going-down (5.4.1.18).  $\lrcorner$

**Lemma (5.1.7.14).** If the image of the Spec map of a ring map is closed under specialization, then this image is closed.  $\lrcorner$

*Proof:* Let it be  $R \rightarrow S$ , let  $I$  be the kernel, then the image is contained in  $V(I)$ , so we may replace  $R$  be  $R/I$ , then  $R \subset S$ . Now we show the image contains all the minimal primes of  $R$ : for a minimal prime  $\mathfrak{p}$ ,  $A_{\mathfrak{p}} \subset B_{\mathfrak{p}}$ , thus  $B_{\mathfrak{p}}$  is not-empty, and thus has a maximal ideal, whose intersection with  $A_{\mathfrak{p}}$  can only be  $\mathfrak{p}$  by hypothesis, thus  $\mathfrak{p}$  is in the image of Spec. Then the image is all of Spec  $R$  by hypothesis, thus closed.  $\square$

**Cor. (5.1.7.15) [Going-up and Spec Closed].** Going-up is equivalent to Spec map closed.  $\lrcorner$

*Proof:* If going-up holds, then Spec map is closed by (5.1.7.14). Conversely, a closed map satisfies going-up, by (4.12.2.8).  $\square$

**Prop. (5.1.7.16).** If  $R \rightarrow S$  is a ring map that satisfies going-up, and  $P \subset S$  is a maximal ideal, then  $P \cap R$  is also a maximal ideal.  $\lrcorner$

**Prop. (5.1.7.17) [Krull].** If  $A \subset B$  is an integral extension of integral domains, and  $A$  is normal, then going-down holds.  $\lrcorner$

*Proof:* Let  $L_1, K$  be the fraction fields of  $B, A$  resp., and let  $L$  be the normal extension of  $K$  contained in  $L_1$ ,  $C$  the integral closure of  $A$  in  $L$ . Let  $P \in \text{Spec } B$  and  $\mathfrak{p} = P \cap A$ ,  $\mathfrak{p}' \subset \mathfrak{p}$ . Take a prime ideal  $Q' \in \text{Spec } C$  lying over  $\mathfrak{p}'$ , and by going-up applied to  $A \subset C$  (5.1.7.13), there is a prime ideal  $Q_1$  lying over  $\mathfrak{p}$  that  $Q' \subset Q_1$ . Take  $Q \in \text{Spec } C$  lying over  $P$ , then by (5.3.5.13) there is a  $\sigma \in G_{L/K}$  that  $\sigma(Q_1) = Q$ . Set  $P' = \sigma(Q') \cap B$ , then  $P' \subset P$  is a prime of  $B$  lying over  $\mathfrak{p}'$ , so going-down holds for  $A \subset B$ .  $\square$

**Prop. (5.1.7.18) [Going-down and Spec Open].** If Spec map is open, then going-down holds.  $\lrcorner$

*Proof:*  $\square$

### Minimal Primes and Irreducible Components

**Prop. (5.1.7.19) [Minimal Primes Exists].** Every nonzero ring contains a minimal prime ideal.  $\lrcorner$

*Proof:* Firstly prime ideal exists, by (5.1.1.6), and we use Zorn's lemma to find a minimal prime ideal: it suffices to show the intersection of a chain of prime ideals is a prime ideal, this is not hard.  $\square$

**Lemma (5.1.7.20).** If  $\mathfrak{p}$  is a minimal prime of  $R$ , then  $\mathfrak{p}R_{\mathfrak{p}}$  is locally nilpotent by (5.2.6.1). In particular, if  $R$  is reduced, then  $R_{\mathfrak{p}}$  is a field.  $\square$

**Prop. (5.1.7.21) [Zerodivisors in a Reduced Ring].** Let  $R$  be a reduced ring, then

- $R \rightarrow \prod_{\mathfrak{p} \text{ minimal}} R_{\mathfrak{p}}$  is an embedding into a product of fields.
- $\cup_{\mathfrak{p} \text{ minimal}} \mathfrak{p}$  is the set of zerodivisors of  $R$ .

$\square$

*Proof:* 1: By (5.1.7.20),  $R_{\mathfrak{p}}$  are fields. In particular, the kernel of  $R \rightarrow R_{\mathfrak{p}}$  is  $\mathfrak{p}$ . Then the kernel of the map  $R \rightarrow \prod_{\mathfrak{p} \text{ minimal}} R_{\mathfrak{p}}$  is  $\cap_{\mathfrak{p} \text{ minimal}} \mathfrak{p} = 0$  by (5.2.6.1).

2: If  $xy = 0$  and  $x \neq 0$ , then  $x \notin \mathfrak{p}$  for some minimal prime  $\mathfrak{p}$  by (5.2.6.1), thus  $y \in \mathfrak{p}$ . Conversely, if  $y \in \mathfrak{p}$  for some minimal prime  $\mathfrak{p}$ , then  $y$  is mapped to  $0 \in R_{\mathfrak{p}}$ , which means there are some  $x \notin \mathfrak{p}$  that  $xy = 0$ .  $\square$

**Prop. (5.1.7.22).** If  $R$  is a ring with f.m. minimal primes  $\mathfrak{q}_i$  and  $\cup_i \mathfrak{q}_i$  is the set of zerodivisors of  $R$ , then the ring of fractions of  $R$  (5.1.1.33) is equal to  $\prod_i R_{\mathfrak{q}_i}$ .  $\square$

*Proof:* Cf. [Sta]02LX.  $\square$

**Prop. (5.1.7.23) [Irreducible Components of Spectrum].** The irreducible closed subsets of  $\text{Spec } R$  are exactly the sets of the form  $V(\mathfrak{p})$  for some prime  $\mathfrak{p} \subset R$ . The irreducible components of  $\text{Spec } R$  are exactly the sets of the form  $V(\mathfrak{p}_i)$  for some minimal prime  $\mathfrak{p}_i$ .  $\square$

**Prop. (5.1.7.24).** If  $R$  be a ring and  $\mathfrak{p}$  a minimal prime of  $R$ . If  $W \subset \text{Spec } R$  is a quasi-compact open subset of  $\text{Spec } R$  not containing  $\mathfrak{p}$ , then there exists some  $f \in R$  that  $\mathfrak{p} \subset D(f)$  and  $D(f) \cap W = \emptyset$ .  $\square$

*Proof:*  $W$  is of the form  $\cup_{i=1}^r D(f_i)$ . As  $\mathfrak{p} \notin D(f_i)$ ,  $f_i \in \mathfrak{p}$  for each  $i$ . Then (5.1.7.20) says  $f_i$  are nilpotent in  $R_{\mathfrak{p}}$ , so there is some  $g \in R$  that  $gf_i$  are nilpotent in  $R$  for any  $i$ , which means  $g$  satisfies the requirement.  $\square$

**Prop. (5.1.7.25).** For  $R \subset S$ , all the minimal primes of  $R$  are in the image of the Spec map of a minimal prime of  $S$ .  $\square$

*Proof:* Localize w.r.t. to the minimal prime  $\mathfrak{p}$ , then it is a local ring with only one prime. And  $S_{\mathfrak{p}}$  is nonzero because localization is exact, so it has a maximal ideal  $\mathfrak{q}$ . Now we choose a minimal prime of  $S$  contained in  $\mathfrak{q}$ , then it is also mapped to  $\mathfrak{p}$ .  $\square$

### Universal Homeomorphism

Cf. [Sta]10.45 and [Sta]28.44.

**Prop. (5.1.7.26).** If  $\varphi : R \rightarrow S \in \mathcal{C}\text{Ring}$  and  $p$  is a prime number that satisfies:

- $S$  is generated over  $R$  by elements  $x$  that there is  $n$  that  $x^{p^n} \in \varphi(R)$  and  $p^n x \in \varphi(x)$ .
- $\ker(\varphi)$  is locally nilpotent.

then  $\text{Spec } S \rightarrow \text{Spec } R$  is a homeomorphism, and any base change of  $\varphi$  satisfies the above conditions, so it is a universal homeomorphism.

In particular, this applies to any base change of a field extension  $k'/k$  that is purely inseparable, because it is f.f. hence injective.  $\square$

*Proof:* Cf. [Sta]0BRA.  $\square$

## 5.2 Commutative Algebra II

References are [Sta].

**Notation (5.2.0.1).**

- Use notations as in 3.2.
- Let  $A, R \in \mathcal{CRing}$ .

┘

### 1 Integral Extensions

**Def. (5.2.1.1) [Totally Integrally Closed].** For  $A \rightarrow B \in \mathcal{CRing}$ ,  $f \in B$  is called **almost integral** (or totally integral when almost mathematics is performed:) over  $A$  if  $f^{\mathbb{N}}$  lies in a f.g.  $A$ -module of  $B$ . It is clear that the elements of totally integral elements of  $B$  is a subring. And  $A$  is called **totally integrally closed** in  $B$  iff any  $f \in B$  totally integral over  $A$  is in  $A$ . ┘

**Prop. (5.2.1.2).** For a ring map  $\varphi : A \rightarrow B$ , an element  $x$  is integral over  $A$  iff  $x$  is contained in a finite  $A$ -module in  $B$ . In particular, the elements of  $B$  that are integral over  $A$  is a ring containing  $\varphi(A)$ . ┘

*Proof:* If  $x$  is integral, then  $\varphi(A)[x]$  is finite. If  $\varphi(A)[x]$  is finite, then there is a set of generators of polynomials in  $x$ . Then for  $m$  large,  $x^m = \sum a_i f_i(x)$ , so  $x$  is integral over  $A$ . ┐

**Prop. (5.2.1.3) [Integral Extension of Field].** For  $A \subset B$ , if  $B$  is integral over  $A$ , then  $A$  is a field iff  $B$  is a field. ┘

*Proof:* If  $A$  is a field,  $y^{-1} = -a_n^{-1}(y^{n-1} + \dots + a_{n-1}) \in B$ . If  $B$  is a field,  $x^{-1} = -(b_1 + b_2x + \dots + b_mx^{m-1}) \in A$ . ┐

**Cor. (5.2.1.4).** If  $B$  is integral over  $A$ , then a prime  $\mathfrak{p} \subset B$  is maximal iff  $\mathfrak{p} \cap A$  is maximal. ┘

*Proof:* Look at the integral extension  $A/(\mathfrak{p} \cap A) \rightarrow B/\mathfrak{p}$ . ┐

**Prop. (5.2.1.5) [Going-Up].** Let  $A \rightarrow B$  integral. Then:

1. There is no inclusion relation between prime ideals of  $B$  lying over a fixed prime ideal of  $A$ .
2. if  $A \subset B$ , then the Spec map is surjective. In particular, for any  $\mathfrak{p} \subset A$ ,  $\mathfrak{p}B \cap A = \mathfrak{p}$ .
3. The going-up holds. In particular, the Spec map of an integral ring map is closed, by (5.1.7.15). ┘

*Proof:*

1. If  $\mathfrak{p} \cap A = \mathfrak{p}' \cap A = \mathfrak{q}$ , Localize at  $\mathfrak{q}$ , then  $\mathfrak{p}, \mathfrak{p}'$  are both maximal ideals of  $B_{\mathfrak{q}}$  by (5.2.1.4), they cannot contain each other.
2. For any prime  $\mathfrak{p}$  of  $A$ , since  $A_{\mathfrak{p}} \subset B_{\mathfrak{p}}$ ,  $B_{\mathfrak{p}} \neq 0$ , so it has a maximal ideal (5.1.1.6), and use (5.2.1.4).
3. for any prime ideal  $\mathfrak{q}$  of  $B$  and  $\mathfrak{p} = \mathfrak{q} \cap A$ , replace  $A \rightarrow B$  by  $A/\mathfrak{p} \subset B/\mathfrak{q}$ , then we can use 2. ┐

┘

## 2 Graded Rings

Cf.[Matsumura Ch11].

**Def. (5.2.2.1) [Graded Rings].** A **graded ring** is a ring  $A = \bigoplus_{n \in \mathbb{Z}} A_n$  that  $A_m A_n \subset A_{m+n}$ . A **graded module** over a graded ring  $A$  is a module  $M = \bigoplus_{n \in \mathbb{Z}} M_n$  that  $A_m M_n \subset M_{m+n}$ .

Notice that often we mean  $\mathbb{Z}^{\geq 0}$ -graded rings when we say graded rings. For a  $\mathbb{Z}^{\geq 0}$ -graded ring  $A$ , the subset  $A_+ = \bigoplus_{n=1}^{\infty} A_n$  is an ideal of  $A$ , called the **irrelevant ideal**.  $\lrcorner$

**Def. (5.2.2.2) [Twisted Modules].** Let  $A$  be a graded ring and  $M$  a graded  $A$ -module, denote  $M(n)$  the graded  $A$ -module s.t.  $M(n)_m = M_{m+n}$ .  $\lrcorner$

**Lemma (5.2.2.3).** Let  $A = \bigoplus_{n=0}^{\infty} A_n$  be a graded ring, then a set of homogenous elements  $f_i \in A_+$  generate  $A$  as an algebra over  $A_0$  iff they generate  $A_+$  as an ideal of  $A$ .  $\lrcorner$

*Proof:* If  $f_i$  generate  $A$  as algebra over  $A_0$ , then every element of  $A_+$  is a polynomial in  $f_i$  with constant coefficients in  $A_0$ , thus  $f_i$  generates  $A_+$  as an ideal. Conversely, if  $f_i$  generate  $A_+$  as an ideal, then for any homogenous element  $f$  we can use induction on the degree of  $f$  to show that  $f$  is a polynomial in  $f_i$ .  $\square$

**Prop. (5.2.2.4) [Noetherian Graded Rings].** A graded ring  $A = \bigoplus_{n=0}^{\infty} A_n$  is Noetherian iff  $A_0$  is Noetherian and  $A_+$  is f.g. as an ideal of  $A$ .  $\lrcorner$

*Proof:* If  $A$  is Noetherian, then clearly  $A_+$  is f.g. and  $A_0 = A/A_+$  is Noetherian. Now if  $A_+$  is f.g. as an ideal of  $A$ , then it is generated by f.m. homogenous elements  $f_i$ , so we see  $f_i$  generates  $A$  as an algebra over  $A_0$ , which means  $A$  is a quotient of a polynomial ring over  $A_0$ , thus Noetherian by (5.1.1.43).  $\square$

**Def. (5.2.2.5) [Homogenous Ideals].** Let  $A_{\bullet}$  be a graded ring, then a **homogenous ideal**  $I_{\bullet}$  of  $A_{\bullet}$  is a ring that is generated by homogenous elements.  $\lrcorner$

**Prop. (5.2.2.6) [Equivalent definition of Homogenous Ideals].** Let  $S_{\bullet}$  be a graded ring, then

- an ideal  $I$  of  $S_{\bullet}$  is homogenous iff it contains the degree  $n$  part of each of its element for any  $n$ .
- The set of homogenous ideals of  $S_{\bullet}$  is stable under sum, product, intersection and radical.
- A non-trivial homogenous ideal  $I$  of  $S_{\bullet}$  is a prime ideal iff for any homogenous elements  $a, b$ , if  $ab \in I$ , then  $a \in I$  or  $b \in I$ .

$\lrcorner$

*Proof:* 1: If  $I$  contains the degree  $n$  part of each of its element for any  $n$ , then clearly it is generated by homogenous elements. Conversely, if it is generated by homogenous elements, then any element  $f = \sum a_i f_i$ , where  $f_i$  is homogenous. Then we can see  $[f]_n = \sum [a_i]_{n-\deg f_i} f_i$  is also in  $I$ .

2: Use 1 and the definition. For radicals, we show  $\sqrt{I}$  contains all its homogenous parts: if  $f \in \sqrt{I}$ , then  $f^n \in I$  for some  $n$ , then we see that the minimal degree part  $[f]_m$  of  $f$  also satisfies  $[f]_m^n \in I$ , because  $I$  contains the homogenous parts of each of its elements. Then we can use induction to show that all the homogenous parts of  $f$  is in  $\sqrt{I}$ .

3: One direction is trivial, for the other, if  $a = \sum a_i, b = \sum b_i$  satisfies  $ab \in I$ , and  $a \notin I, b \notin I$ , and  $a_i, b_j$  homogenous. Let  $i_0, j_0$  be the minimal numbers that  $a_{i_0} \notin I, b_{j_0} \notin I$ , then  $a_{i_0} b_{j_0}$  is not in  $I$ , contradicting the fact  $I$  is homogenous.  $\square$

**Prop. (5.2.2.7).** Let  $R \rightarrow S$  be a homomorphism of graded rings, then the integral closure of  $R$  in  $S$  is a homogenous ideal of  $S$ .  $\lrcorner$

*Proof:* consider the base change  $\varphi : R \otimes_{R_0} R_0[t, t^{-1}] \rightarrow S \otimes_{S_0} S_0[t, t^{-1}]$ , where  $\deg(t) = 0$ , and the integral closure is denoted by  $A$ . Then there is an automorphism of  $\varphi: s \mapsto t^{\deg s} s$ . This automorphism thus preserves the integral closure. if  $s = s_n + s_{n+1} + \dots + s_m \in S$  is integral over  $R$ , to show each  $s_i$  are integral over  $S$ . We may assume  $n > 0$  because  $s_0$  is clearly integral over  $R_0$ . Now we use induction on  $m$ . If  $m > n$ , consider  $t^n s_n + \dots + t^m s_m$  is also in  $A$ , we see  $(t^m - t^n)s_i \in A$  by induction hypothesis.

Notice  $S \subset S[t, t^{-1}]/(t^m - t^n - 1) = S[t]/(t^m - t^n - 1)$  is injective, and the image of  $(t^m - t^n)s_i$  is  $s_i$ , which is integral over  $R[t]/(t^m - t^n - 1)$ , and this ring is finite over  $R$ , so  $s_i$  is also integral over  $R$ .  $\square$

**Prop. (5.2.2.8).** Let  $A$  be a graded ring that is f.g. over  $A_0$  and  $M$  be a f.g. graded  $A$ -module, then each  $M_n$  is a finite  $S_0$ -module.  $\lrcorner$

**Def. (5.2.2.9) [Reductions of Graded Rings].** Let  $S$  be a graded ring and  $d \geq 1$ , define  $S^{(d)}$  the graded ring  $\oplus_{n \geq 0} S_{nd}$ . And for a graded  $S$ -module  $M$ , define  $M^{(d)} = \oplus_{n \in \mathbb{Z}} M_{nd}$ .  $\lrcorner$

**Prop. (5.2.2.10).** If  $S$  is a graded ring that is f.g. over  $S_0$ , then for  $d$  sufficiently divisible,  $S^{(d)}$  is generated by the degree 1 part over  $S_0$ .  $\lrcorner$

*Proof:* Let  $S$  be generated by homogenous elements  $f_1, \dots, f_r$ . Let  $M = \text{lcm}(\deg(f_1), \dots, \deg(f_r))$ , then for any  $f \in S_{Nm}$  and  $N \geq r$ , by pigeonhole principle, there are some  $i$  s.t.  $f_i^{M/\deg(f_i)} | f$ . Thus any monomials of degree  $nrM$  is a product of polynomials of degree  $rM$ . So  $d = rM$  satisfies the hypothesis.  $\square$

### Topology Defined by Ideals

**Def. (5.2.2.11) [Filtrations on Graded Modules].** Let  $A$  be a ring,  $M$  a graded  $A$ -module, and  $\mathfrak{a}$  be an ideal of  $A$ , an  $\mathfrak{a}$ -filtration of  $M$  is a descending sequence of submodules  $M = M_0 \supset M_1 \supset \dots$  that  $\mathfrak{a}M_n \subset M_{n+1}$ . It is called a **stable filtration** iff there is an  $N$  that  $\mathfrak{a}M_n = M_{n+1}$  for  $n \geq N$ .

For an ideal  $\mathfrak{a} \subset A$ , there can be associated a graded ring  $A^* = \oplus \mathfrak{a}^n$ , and an  $\mathfrak{a}$ -filtration  $M$  can be associated a graded module over  $A^* : M^* = \oplus M_n$ . When  $A$  is Noetherian, then so is  $A^*$ , because it is a quotient of a polynomial ring over  $A$  (5.1.1.43).  $\lrcorner$

**Lemma (5.2.2.12).** If  $A$  is a Noetherian ring and  $M$  is a f.g.  $A$ -module that has a  $\mathfrak{a}$ -filtration  $M_n$ , then  $M^*$  is f.g. over  $A^*$  iff  $M_n$  is a stable filtration.  $\lrcorner$

*Proof:* As every  $M_n$  is finite over  $A$ , if it is stable, then  $M^*$  is generated over  $A^*$  by all the generator of  $M_n, n \leq N$ , so it is f.g.. Conversely, if it is f.g., then it is clear that  $M_n$  is a stable filtration.  $\square$

**Prop. (5.2.2.13) [Artin-Rees].** For  $A$  Noetherian and  $I$  an ideal, let  $N \subset M$  be finite  $A$ -modules, then if  $M_n$  is a stable filtration of  $M$ , then  $M_n \cap N$  is a stable filtration of  $N$ .

In particular, let  $M_n = I^n M$ , then  $I^n M \cap N = I^{n-r}(I^r M \cap N)$ , hence the  $I$ -adic topology on  $M$  induce the  $I$ -adic topology on  $N$ .  $\lrcorner$

*Proof:* This is immediate from the lemma above, as  $N^*$  is an  $A^*$ -submodule of  $M^*$ , and  $A^*$  is Noetherian (5.2.2.11).  $\square$

**Cor. (5.2.2.14) [Krull's Intersection Theorem].** Notation as in (5.2.2.13), let  $N = \bigcap_{n=0}^{\infty} I^n M$ , then the  $I$ -adic topology on  $N$  is trivial, by Artin-Rees, thus  $IN = N$ . So Nakayama tells us there is an element  $a \in 1 + I$  that  $aN = 0$ . Thus if  $I \subset \text{rad}(A)$  or  $A$  is an integral domain,  $N = 0$ . This can be used to use induction to prove some theorem.

In particular, for any prime ideal  $\mathfrak{p}$  containing  $I$ , use the above on  $R_{\mathfrak{p}}$  shows  $N_{\mathfrak{p}} = 0$ . But also  $N$  is f.g., so there exists an element  $g \notin \mathfrak{p}$  that  $N_g = 0$ .  $\lrcorner$

**Cor. (5.2.2.15) [Krull].** For  $A$  Noetherian, if  $I \subset \text{rad}(A)$  or  $A$  is a domain, then  $\bigcap_{n=0}^{\infty} I^n = 0$ .  $\lrcorner$

**Prop. (5.2.2.16).** Notice for any ring  $A$  and a non-zero-divisor  $f$ , if  $I = \bigcap_{n=0}^{\infty} f^n A$ , then  $fI = I$ , needless of the Noetherian property.  $\lrcorner$

*Proof:* If  $x \in I$ ,  $x = fy$ , because  $x \in f^n A$ ,  $fy = f^n t$  for some  $t$ , so  $y = f^{n-1}t$ , so  $f \in I$ . Thus  $I = fI$ .  $\square$

**Def. (5.2.2.17) [Hilbert-Serre].** Let  $A$  be a Noetherian graded ring with  $A_0$  Artinian that  $A_+$  is generated by  $A_1$ . For a f.g. graded  $A$ -module  $M = \bigoplus M_n$ , we have  $l(M_n)$  is a numerical polynomial of  $n$  (2.6.1.14) for  $n$  sufficiently large, called the **Hilbert Polynomial**. Its degree is the dimension of  $\text{Supp } M \subset \text{Proj}(A)$ .  $\lrcorner$

*Proof:* We prove by induction on the minimal number of generators of  $A_1$  (it is finite by (5.2.2.4)). If it is 0, then  $M_n = 0$  for  $n$  large and the result holds. Now choose  $x \in S_1$  as one of the minimal set of generators, then the induction hypothesis applies to  $S/(x)$ .

Firstly, if  $x$  acts nilpotently on  $M$ , then we do induction on the minimal number  $r$  that  $x^r M = 0$ . If  $r = 1$ , then  $M$  is a module over  $S/(x)$  and the assertion holds. If  $r > 1$ , then we can find an exact sequence  $0 \rightarrow M' \rightarrow M \rightarrow M'' \rightarrow 0$  that  $M', M''$  has smaller  $r$ , then we have the desired result, because  $l$  is additive.

Next, if  $x$  doesn't act nilpotently on  $M$ , let  $M' \subset M$  is the largest submodule that  $x$  acts nilpotently, then there is an exact sequence  $0 \rightarrow M' \rightarrow M \rightarrow M/M' \rightarrow 0$ . So we can assume multiplication by  $x$  is injective on  $M$ .

Let  $\overline{M} = M/xM$ , then for any  $d$ , there are exact sequences

$$0 \rightarrow M_d \xrightarrow{x} M_{d+1} \rightarrow \overline{M}_{d+1}.$$

so  $l(M_{d+1}) - l(M_d) = l(\overline{M}_{d+1})$ . Then we finish by (2.6.1.15).  $\square$

**Cor. (5.2.2.18).** Let  $k$  be a field,  $I \subset k[X_1, \dots, X_n]$  be a non-zero graded ideal, and  $M = k[X_1, \dots, X_n]/I$ , then the numerical polynomial  $n \mapsto \dim_k(M_n)$  has degree  $< d - 1$ .  $\lrcorner$

*Proof:* The numerical polynomial associated to  $k[X_1, \dots, X_n]$  is  $n \mapsto \binom{n-1+d}{d-1}$ , and for any non-zero homogenous element  $f \in I$  of degree  $e$ ,  $f \cdot k[X_1, \dots, X_n]_{d-e} \subset I_d$ , thus  $\dim_k(M_n) < \binom{n-1+d}{d-1} - \binom{n-e-1+d}{d-1}$ , which means the numerical polynomial has degree  $< d - 1$ .  $\square$

**Prop. (5.2.2.19) [Hilbert Polynomial and Dimension].** For a Noetherian local ring  $A$ , the Hilbert polynomial of a f.g. module  $M$  w.r.t  $\mathfrak{m}$  has degree  $\dim M$ . And  $\dim M$  is the smallest integer  $r$  s.t. there exists  $x_1, \dots, x_r$  that  $l(M/x_1 M + \dots, x_r M) < \infty$ .  $\lrcorner$

*Proof:* Cf. [Mat P76].  $\square$

### 3 Completions

This subsection should be combined with the derived completion.

**Prop. (5.2.3.1).** Let the topology on a  $A$ -module be defined by countable filtration of submodules, then iff  $M$  is complete, then  $M/N$  is complete in the quotient topology.  $\lrcorner$

*Proof:* Write  $x_{i+1} - x_i = y_i + z_i$  with  $y_n \in M_n$  and  $z_n \in N$ , then the image of the limit of  $\sum y_i$  is the limit of  $\overline{x_i}$ .  $\square$

**Def. (5.2.3.2) [Completeness].** Let  $I$  be an ideal of  $R$ , the  $I$ -adic completion of a  $R$ -module is a functor  $\varphi : M \mapsto \widehat{M} = \lim M/I^n M$ . An  $R$ -module is called  $I$ -adically complete if the natural map  $M \rightarrow \widehat{M}$  is an isomorphism.

This is compatible with the general notion of completion of a topological Abelian groups (12.2.1.7).  $\lrcorner$

**Prop. (5.2.3.3).** Let  $R$  be a ring and  $I \subset R$  be an ideal,  $\varphi : M \rightarrow N$  be a map of  $R$ -modules. Then

- If  $M/IM \rightarrow N/IN$  is surjective, then  $\widehat{M} \rightarrow \widehat{N}$  is surjective. In particular, this holds for  $M \rightarrow N$  surjective.
- If  $0 \rightarrow K \rightarrow M \rightarrow N \rightarrow 0$  is exact and  $N$  is flat, then  $0 \rightarrow \widehat{K} \rightarrow \widehat{M} \rightarrow \widehat{N} \rightarrow 0$  is exact.
- $M \otimes_R \widehat{R} \rightarrow \widehat{M}$  is surjective for any finite  $R$ -module  $M$ .

$\lrcorner$

*Proof:* Cf. [Sta]0315.  $\square$

**Prop. (5.2.3.4).** Let  $I \in \text{Ideal}(A)$  be a f.g. ideal and  $M \in \text{Mod}_A$ , then  $\widehat{M}$  is  $I$ -adically complete and  $I^n \widehat{M} = \ker(\widehat{M} \rightarrow M/I^n M) = (I^n M)^\wedge$ . In particular,  $R^\wedge/I^n R^\wedge \cong R/I^n$ .  $\lrcorner$

*Proof:* Because  $I$  is f.g., so does  $I^n$ . If  $I^n = (f_1, \dots, f_r)$ . Applying (5.2.3.3) to  $(f_1, \dots, f_r) : M^r \rightarrow I^n M$  shows

$$\widehat{M}^r \rightarrow (I^n M)^\wedge = \varprojlim_{m \geq n} I^n M/I^m M = \ker(\widehat{M} \rightarrow M/I^n M),$$

but the image is clearly  $I^n \widehat{M}$ , so  $\widehat{M}/I^n \widehat{M} \cong M/I^n M$ . Taking inverse limit yields  $(M^\wedge)^\wedge = M^\wedge$ .  $\square$

**Cor. (5.2.3.5) [F.g. Completions are Complete].** Let  $I \in \text{Ideal}(A)$  is f.g. and  $(M_n)$  an inverse system of  $A$ -modules that  $I^n M_n = 0$ , then  $M = \lim M_n$  is  $I$ -adically complete.  $\lrcorner$

*Proof:* We have maps  $M \rightarrow M/I^n \rightarrow M_n$ , taking limit, we get  $M \rightarrow \widehat{M} \rightarrow M$ , so  $M$  is a direct summand of  $\widehat{M}$ . Since  $\widehat{M}$  is  $I$ -adically complete by (5.2.3.4), so does  $M$ .  $\square$

**Prop. (5.2.3.6).** If  $I$  is a f.g. ideal of  $A$  and  $(M_n)_{n \in \mathbb{Z}_+}$  is an inverse system of  $A$ -modules s.t.  $M_n = M_{n+1}/I^n M_{n+1}$ , then  $M = \lim M_n$  is  $I$ -adically complete and  $M/I^n M = M_n$ .  $\lrcorner$

*Proof:*  $\widehat{M}$  is  $I$ -adically complete by (5.2.3.5), and  $M \rightarrow M_n$  are all surjective because the transition maps are surjective. Consider the inverse system  $N_n = \ker(M \rightarrow M_n)$ . Since  $M_n = M_{n+1}/I^n M_{n+1}$ , the map  $N_{n+1} + I^n M \rightarrow N_n$  is surjective, and thus  $N_{n+1}/(N_{n+1} \cap I^{n+1} M) \rightarrow N_n/(N_n \cap I^n M)$  is surjective.

Taking the inverse limit of the exact sequences

$$0 \rightarrow N_n/(N_n \cap I^n M) \rightarrow M/I^n M \rightarrow M_n \rightarrow 0,$$

we get an exact sequence

$$0 \rightarrow \varprojlim N_n / (N_n \cap I^n M) \rightarrow \widehat{M} \rightarrow M.$$

As  $M$  is  $I$ -adically complete,  $\widehat{M} = M$ , thus  $\varprojlim N_n / (N_n \cap I^n M) = 0$ , thus  $N_n / (N_n \cap I^n M) = 0$  for any  $n$  as  $n$  the transition maps are surjective. Then  $M/I^n M = M_n$ , as desired.  $\square$

**Cor. (5.2.3.7) [Spectrum Map of Completions].**  $\text{Spec } R^\wedge \rightarrow \text{Spec } R$  has image  $\text{Spec } R/I \subset \text{Spec } R$ . This follows from (5.2.3.16) and  $R/I \cong R^\wedge/I$ .  $\lrcorner$

**Prop. (5.2.3.8).** If  $I$  is an ideal of  $R$  and  $0 \rightarrow M \rightarrow N \rightarrow Q \rightarrow 0$  is an exact sequence that  $Q$  is annihilated by a power of  $I$ , then completion produces an exact sequence

$$0 \rightarrow \widehat{M} \rightarrow \widehat{N} \rightarrow Q \rightarrow 0$$

$\lrcorner$

*Proof:* If  $I^c Q = 0$ , then  $Q/I^n Q = Q$  for  $n \geq c$ , and  $I^n M \subset M \cap I^n N \subset I^{n-c} M$  because of this. Then  $\widehat{M} = \varprojlim M / (M \cap I^n N)$  by (4.1.1.42), and we apply (5.9.3.2) to the inverse system of exact sequences

$$0 \rightarrow M / (M \cap I^n N) \rightarrow N / I^n N \rightarrow Q \rightarrow 0$$

to conclude.  $\square$

**Cor. (5.2.3.9).** If  $t \in A$  is a non-zero-divisor and  $0 \rightarrow M \rightarrow N \rightarrow Q \rightarrow 0 \in \text{Mod}_A$  is an exact sequence s.t.  $tQ = 0$ , then  $M$  is  $t$ -adically complete iff  $N$  is  $t$ -adically complete.  $\lrcorner$

*Proof:* Use snake lemma.  $\square$

**Cor. (5.2.3.10) [Non-zero-divisors].** Take  $I = (f)$  and  $M = N = R$ , then we see that if  $f$  is a nonzero-divisor in  $R$  then  $f$  is a nonzero-divisor in  $\widehat{R}$ .  $\lrcorner$

**Prop. (5.2.3.11).** The completion of a submodule  $N \subset M$  is the closure of  $\varphi(N)$  (By direct construction). The completion of  $M/N$  is  $M^*/N^*$  because it is right exact.  $\lrcorner$

**Cor. (5.2.3.12).** If  $N$  is open in  $M$  then  $M/N \cong M^\wedge/N^\wedge$  because  $M/N$  is discrete hence complete.  $\lrcorner$

**Lemma (5.2.3.13).** Let  $A$  be a ring and  $I = (f_1, \dots, f_r)$  be a f.g. ideal. If  $M \rightarrow \varprojlim M/f_i^n M$  is surjective for each  $i$ , then  $M \rightarrow \varprojlim M/I^n M$  is also surjective.  $\lrcorner$

*Proof:* Note that  $\varprojlim M/I^n M = \varprojlim M/(f_1^n, \dots, f_r^n)M$ , as  $I^n \subset (f_1^n, \dots, f_r^n) \subset I^n$ , and elements in  $\varprojlim M/(f_1^n, \dots, f_r^n)M$  can be written as an infinite sum  $\xi = \sum_n \sum_i f_i^n x_{n,i}$ . There is an element  $x_i$  mapping to  $\sum_n f_i^n x_{n,i}$  for any  $i$ , thus  $\sum_i x_i$  maps to  $\xi$ .  $\square$

**Lemma (5.2.3.14).** For  $I \subset J \in \text{Ideal}(A)$ , if  $M$  is  $J$ -adically complete and  $I$  is f.g., then  $M$  is  $I$ -adically complete.  $\lrcorner$

*Proof:* It is clearly  $I$ -adically Hausdorff, and for completeness, by (5.2.3.13) it suffices to show for  $I = (f)$ : Let  $x_n \in M$  with  $x_n - x_{n+1} \in f^n M$ , then  $\{x_n\}$  is  $J$ -adically Cauchy, thus there is an element  $x$  that  $x - x_n \in J^n$ , and we can replace  $x_n$  by  $x_n - x$  to assume  $x_n \in J^n$ . Now we prove  $x_n \in (f^n)$ : assume  $x_n - x_{n+1} = f^n z_n$ , then

$$x_n = f^n(z_n + f z_{n+1} + \dots).$$

This equation is true because it is  $J$ -adically Cauchy.  $\square$

**Prop. (5.2.3.15).** If  $(A, \mathfrak{m}_A) \rightarrow (B, \mathfrak{m}_B)$  is a local homomorphism of local rings s.t.  $\mathfrak{m}_A, \mathfrak{m}_B$  are f.g. and  $\dim S \otimes \kappa(\mathfrak{m}) < \infty$ , then

- $\widehat{B}$  is equal to the  $\mathfrak{m}$ -adic completion of  $B$ .
- $\widehat{B}$  is a finite module over  $\widehat{A}$ .

┘

*Proof:* 1: Because  $B/\mathfrak{m}_A B$  is Artinian local (5.1.3.1), we have  $\mathfrak{m}_B \subset \sqrt{\mathfrak{m}_A B}$  because Artinian rings are Jacobson (5.1.3.4). Because  $\mathfrak{m}_B$  is f.g., we have  $\mathfrak{m}_B^n \subset \mathfrak{m}_A B$  for some  $n \in \mathbb{Z}_+$ . So the assertion follows.

2: This follows from (5.2.3.5) and (5.2.3.17). □

### Properties of Complete Rings

**Prop. (5.2.3.16).** If  $A$  is  $I$ -adically complete, then  $I \subset \text{rad } A$ . ┘

**Prop. (5.2.3.17).** Let  $I \in \text{Ideal}(A)$  s.t.  $A$  is  $I$ -adically complete and  $M \in \text{Mod}_A$ . Suppose  $M$  is  $I$ -adically separated and  $M/IM$  is a finite  $A/I$ -module, then  $M$  is a finite  $A$ -module. ┘

*Proof:* Cf. [Sta]031D. □

**Prop. (5.2.3.18).** Let  $A$  be a ring with a non-zero-divisor  $t$ , then any limit of  $t$ -adically complete algebras is  $t$ -adically complete. ┘

*Proof:* Check the definition directly. □

**Prop. (5.2.3.19) [Zariski Rings].** A Noetherian  $I$ -adic ring is called **Zariski ring** if it satisfies the following equivalent conditions:

- Every finite module is Hausdorff in the  $I$ -adic topology.
- Every submodule in a finite module is closed in the  $I$ -adic topology.
- Every ideal is closed.
- $I \subset \text{rad } A$ .
- $A^\wedge/A$  is f.f.

Hence every complete Hausdorff ring is Zariski. ┘

*Proof:* 1  $\rightarrow$  2: Apply it to the submodule  $M/N$ .

3  $\rightarrow$  4: If  $I \not\subset m$ , then  $I^n + m = A$ , thus  $\overline{M} = A$ , contradiction.

4  $\rightarrow$  1: by intersection theorem (5.2.2.14).

4  $\rightarrow$  5: for any maximal ideal  $m$ ,  $I \subset m$  so it is open, thus  $A^*/mA^* = A/m \neq 0$  by (5.2.3.12) thus f.f. by (5.4.1.5).

5  $\rightarrow$  1: by (5.4.1.20), for any  $m$  maximal, there is a maximal ideal  $m'$  lying over  $m$ , so  $IA^* \subset m'^*$  by (5.2.3.24), thus  $I \subset m$ , hence  $I \subset \text{rad } A$ . □

**Cor. (5.2.3.20).** In a Zariski ring  $A$ , maximal ideals are open, thus  $A/m \cong A^*/mA^*$  by (5.2.3.12), thus  $\text{Spec } A^* \rightarrow \text{Spec } A$  is bijection on closed pt. ┘

**Prop. (5.2.3.21) [Cohen Structure Theorem].** If  $A$  is a complete local ring containing a field  $k$  that the residue field is separably generated over  $k$ , then there is a field  $K$  containing  $k$  that is a Cohen ring, i.e. complete local ring with a prime number as a uniformizer, that has the same residue field as  $A$ . ┘

*Proof:*

□

**Lemma (5.2.3.22) [Complete Interchanging Lemma].** If  $R$  is a commutative ring,  $x, y \in R$ , if  $x$  is not a zero-divisor in  $R$  and  $R$  is  $x$ -adically complete, and  $y$  is not a zero-divisor in  $R/x$  and  $R/x$  is  $y$ -adically complete, then the same is true with  $x, y$  interchanged.  $\lrcorner$

*Proof:* ?

□

### Completion of Noetherian Rings

**Prop. (5.2.3.23).** When  $A$  is Noetherian and  $M \in \text{Mod}_A$  is finite, the natural map  $M \otimes_A A^\wedge \rightarrow M^\wedge$  is an isomorphism (use  $M$  is finite presentation and tensor & completion is right exact), and five lemma.  $\lrcorner$

**Cor. (5.2.3.24) [Flatness of Noetherian Completions].** When  $A$  is Noetherian,  $A \rightarrow A^\wedge$  is flat (because flatness is check for finite module).

And when  $A$  is complete Hausdorff, any finite module  $M \in \text{Mod}_A$  is complete Hausdorff and hence any its submodule is complete thus closed in it. Hence the the completion of a submodule  $N \subset M$  is  $\varphi(N)A^\wedge \subset M^\wedge = MA^\wedge$ . In fact this implies complete Hausdorff adic-ring is Zariski.  $\lrcorner$

**Remark (5.2.3.25).** WARNING: If  $A$  is not Noetherian, in general  $A \rightarrow A^\wedge$  is not flat, Cf. [Sta]0AL8.  $\lrcorner$

**Prop. (5.2.3.26).** Let  $A$  be Noetherian and  $I, J \in \text{Ideal}(A)$ . If  $A$  is  $I$ -adically complete and  $A/I$  is  $J$ -adically complete, then  $A$  is  $J$ -adically complete.  $\lrcorner$

*Proof:* Cf. [Sta]0DYC.

□

## 4 Dimension

**Def. (5.2.4.1) [Dimensions and Heights].** For a  $A$ -module  $M$ ,  $\dim(M)$  is defined as  $\dim(A/\text{Ann}(M))$ .

The **height** of an ideal  $I$  in  $A$  is defined as the infimum of heights of the prime ideals over  $I$ .

The **dimension (Commutative Rings)** of  $R$  is defined to be the supremum of heights of prime ideals of  $R$ .  $\lrcorner$

**Prop. (5.2.4.2).**  $\dim A = \sup \dim A_{\mathfrak{p}}$ .  $\lrcorner$

**Def. (5.2.4.3) [Catenary Rings].**  $A$  is called **catenary ring** if for any pair of primes  $\mathfrak{p} \subset \mathfrak{q} \subset A$ , any maximal chain of primes  $\mathfrak{p} = \mathfrak{p}_0 \subset \mathfrak{p}_1 \subset \dots \subset \mathfrak{p}_e = \mathfrak{q}$  has the same length. A Noetherian ring is called **universally catenary ring** if all f.g. algebras over it are catenary.  $\lrcorner$

**Prop. (5.2.4.4).**  $A$  is catenary iff  $\text{Spec } A$  is a catenary space (4.12.2.32).  $\lrcorner$

**Prop. (5.2.4.5).** Any quotient ring and localization of a (universally)catenary ring is catenary. Any quotient of a Noetherian universally catenary ring is universally catenary. Catenary and universally catenary are stalkwise properties (5.1.4.2).  $\lrcorner$

**Prop. (5.2.4.6).** If  $(A, \mathfrak{m})$  is a Noetherian local ring, then  $A$  is catenary iff  $\mathfrak{p} \rightarrow \dim(A/\mathfrak{p})$  is a dimension function on  $\text{Spec } A$ .  $\lrcorner$

*Proof:* This follows from (4.12.3.16) (4.12.2.41) and (4.12.2.35).  $\lrcorner$

□

**Example (5.2.4.7) [Universally Catenary Rings].** The following are same examples of universally catenary Rings:

- A f.g. algebra over a universally catenary ring.
- A Noetherian C.M. rings.
- 1-dimensional Noetherian domains,
- Fields.

┘

*Proof:* Cf. [Sta]00NM. ?

□

**Def. (5.2.4.8) [Hilbert Polynomials].** Let  $(A, \mathfrak{m})$  be a Noetherian local ring,  $I$  an ideal of definition, then

┘

### Dimension of Noetherian Local Rings

**Prop. (5.2.4.9).** For a Noetherian local ring  $R$ , the following three numbers are equal:

- $\dim R$ .
- $d(R)$ .
- the minimal number of elements needed to generate an ideal of definition of  $R$  (5.1.1.13).

A **system of parameters** is  $d$  elements  $g_1, \dots, g_d$  that generate an ideal of definition of  $R$ , where  $d = \dim R$ .

┘

*Proof:* Cf. [Sta]00KQ. ?

□

**Cor. (5.2.4.10).** The dimension of a Noetherian local ring is finite, by item3. Thus the codimension of a subscheme in a Noetherian scheme is finite.

┘

**Cor. (5.2.4.11).** If  $A$  is a Noetherian local ring with maximal ideal  $\mathfrak{m}$ , then  $\dim A \leq \dim_k \mathfrak{m}/\mathfrak{m}^2$ .

┘

*Proof:* By Nakayama, if  $x_1, \dots, x_d \in \mathfrak{m}$  generate  $\mathfrak{m}/\mathfrak{m}^2$ , then  $(x_1, \dots, x_d) = \mathfrak{m}$ .

□

### Dimension and Ring Extensions

**Prop. (5.2.4.12) [Dimension and Going-Up(Down)].** If  $A \rightarrow B$  is a ring map that Spec map is surjective and  $A \rightarrow B$  satisfies either going-up or going-down, then  $\dim B \geq \dim A$ .

┘

*Proof:* The hypothesis implies any chain of primes in  $A$  can lifted to a chain of primes in  $B$ . □

**Prop. (5.2.4.13) [Dimensions and Noetherian Ring Extensions].** Let  $A \rightarrow B$  be a map between Noetherian rings,  $P$  a prime ideal of  $B$ ,  $\mathfrak{p} = P \cap A$ , then:

- $\text{ht}(P) \leq \text{ht}(\mathfrak{p}) + \text{ht}(P/\mathfrak{p}B)$ , in other words  $\dim(B_P) \leq \dim(A_{\mathfrak{p}}) + \dim(B_P/\mathfrak{p}B_P)$ .
- equality holds if going-down holds. For example, if it is flat (5.1.7.13).

┘

*Proof:* 1: Localize at  $\mathfrak{p}$  and  $P$ , we may assume  $A, B$  are local rings with maximal ideals  $\mathfrak{p}$  and  $P$ , then use the characterization (5.2.4.9) of dimension, if  $x_1, \dots, x_d$  generate an ideal of definition of  $A_{\mathfrak{p}}$  and  $y_1, \dots, y_e$  generate an ideal of definition of  $B_P/\mathfrak{p}B_P$ , then  $x_1, \dots, x_d, y_1, \dots, y_e$  generate an ideal of definition of  $B_P$ .

2: If going down holds, for any chain of primes in  $B_P$  containing  $\mathfrak{p}B_P$ , we can lift the chain of primes in  $A_{\mathfrak{p}}$  to a chain of primes in  $B_P$  to get a longer chain, thus we get the other direction of inequality.  $\square$

**Prop. (5.2.4.14) [Dimension of Integral Extensions].** Let  $A \rightarrow B$  be an integral ring map, then:

1. Spec maps closed points to closed points, and  $\dim(A) \geq \dim(B)$ , which equality if  $A \subset B$ .
2. If  $A, B$  is Noetherian,  $\text{ht}(P) \leq \text{ht}(P \cap A)$
3. If  $A, B$  is Noetherian and going down holds, then  $\text{ht}(J) = \text{ht}(J \cap A)$  for any ideal  $J \subset B$ .  $\lrcorner$

*Proof:* 1: By (5.2.1.5), there is no inclusion relation between prime over a fixed prime, so  $\dim(B) \leq \dim(A)$ . On the other hand, if  $A \subset B$ , then Spec map is surjective going-up holds (5.2.1.5), so  $\dim(B) \geq \dim(A)$  (5.2.4.12).

2: Follows from (5.2.4.13)(1) since  $\text{ht}(P/(P \cap A)B) = 0$  by (5.2.1.5).

3: In this case,  $\text{ht}(P) = \text{ht}(P \cap A)$  holds by (5.2.4.13)(2), then use the surjectiveness of Spec for the integral extension  $A/J \cap A \subset B/J$  (5.2.1.5).  $\square$

**Cor. (5.2.4.15).** if  $A \rightarrow B$  is integral and faithfully flat, then  $\dim A = \dim B$ .  $\lrcorner$

*Proof:* This follows from (5.2.4.14) and (5.4.1.27).  $\square$

**Prop. (5.2.4.16) [Dimension and Completion].** For a local ring  $A$ ,  $\dim A = \dim \hat{A}$ .  $\lrcorner$

*Proof:*  $\square$

### Noetherian Normalization

**Prop. (5.2.4.17).** For a Noetherian ring  $A$ ,  $\dim A[X] = \dim A + 1$ .  $\lrcorner$

*Proof:* Let  $\mathfrak{p}$  be a prime ideal of  $A$  and let  $\mathfrak{q}$  be a prime ideal of  $A[X]$  maximal among primes lying over  $\mathfrak{p}$ , then  $\text{ht}(\mathfrak{q}/\mathfrak{p}A[X]) = 1$ . In fact, by localizing, we can assume  $\mathfrak{p}$  is a maximal ideal, then  $A[x]/\mathfrak{p}A[x]$  is a polynomial ring over a field thus a PID and  $\text{ht}(\mathfrak{q}/\mathfrak{p}A[X]) = 1$ . Thus  $\text{ht}(\mathfrak{q}) = \text{ht}(\mathfrak{p}) + 1$  by (5.2.4.13). Now we are done, because  $\text{Spec } A[X] \rightarrow \text{Spec } A$  is surjective.  $\square$

**Prop. (5.2.4.18) [Krull's Height Theorem].** In a Noetherian domain  $R$ , the height of an ideal generated by  $n$  elements is at most  $n$ .  $\lrcorner$

*Proof:* Let  $\mathfrak{p}$  be a minimal ideal containing  $(f_1, \dots, f_n)$ , then it suffices to show  $\dim(R_{\mathfrak{p}}) \leq n$ . In this case,  $(f_1, \dots, f_n)$  is an ideal of definition of  $R_{\mathfrak{p}}$ , thus we can use (5.2.4.9).  $\square$

**Prop. (5.2.4.19) [Number of Generators].** To show an ideal  $I \subset A$  cannot be generated by smaller than  $n$  element, choose a maximal ideal  $\mathfrak{m}$ , then show that  $\dim_{A/\mathfrak{m}} I/\mathfrak{m}I \geq n$ .  $\lrcorner$

**Cor. (5.2.4.20).**

- $(x, z)$  is not principal in  $k[x, y, z]$ .
- $(wz - xy)$  is not principal in  $k[x, y, z]$ .
- $(xy, yz, xz)$  is not generated by two elements in  $k[x, y, z]$ .  $\lrcorner$

**Lemma (5.2.4.21).** Let  $A = k[X_1, \dots, X_n]$  be a polynomial ring over a field  $k$ , and  $I$  is an ideal of  $A$  of height  $r$ , then we can choose  $Y_1, \dots, Y_n \in A$  that  $A$  is integral over  $k[Y_1, \dots, Y_n]$  and  $I \cap k[Y_1, \dots, Y_n] = (Y_1, \dots, Y_r)$ .  $\lrcorner$

*Proof:* We use induction on  $r$ .  $r = 0$  is easy. For  $r = 1$ , let  $f(X)$  be any non-zero polynomial in  $I$ , then we can assign suitable integral weights  $d_1 = 1, d_2, \dots, d_n$  to  $X_i$  that monomials of  $f$  have different weights. Put  $Y_i = X_i - X_1^{d_i}$  for  $i \geq 2$ , and

$$Y_1 = f(X) = f(X_1, Y_2 + X_1^{d_2}, \dots, Y_n + X_1^{d_n}) = a_1 X_1^N + g(X_1, Y_2, \dots, Y_n)$$

where  $g$  has degree in  $X_1$  lower than  $N$ . Then  $X_1$  is integral over  $k[Y_1, \dots, Y_n]$ , and hence  $X_i = Y_i + X_1^{d_i}$  is also integral over  $k[Y]$ .

Now  $(Y_1)$  is a prime ideal in  $k[Y]$  of height 1 and  $(Y_1) \in I \cap k[Y]$ . Also notice  $I \cap k[Y]$  has height 1 by (5.2.4.14) (Because going-down holds by (5.1.7.17)), so  $(Y_1) = I \cap k[Y]$ .

For  $r \geq 2$ , let  $J \subset I$  be an ideal with height  $r - 1$ , let  $J$  be an ideal of  $k[X]$  contained in  $I$  that  $\text{ht}(J) = r - 1$ . (This is possible by choosing  $f_i$  out of all minimal primes containing  $(f_1, \dots, f_{r-1})$  and use Krull's Height Theorem). By induction hypothesis, there exists  $Z_1, \dots, Z_n$  that  $k[X]$  is integral over  $k[Z]$ , and  $J \cap k[Z] = (Z_1, \dots, Z_{r-1})$ . Now  $\text{ht}(I \cap k[Z]) = r$  by the same argument above, thus there exist  $f \in I \cap k[Z] \setminus (Z_1, \dots, Z_{r-1})$ , and do the same for  $r = 1$  again, we can find the desired  $Y_i$  that  $Y_k = Z_k$  for  $k \leq r - 1$ .  $\square$

**Prop. (5.2.4.22) [Noetherian Normalization Theorem].** If  $k \in \mathbf{Field}$  and  $A \in \mathcal{CRing}/k$  is f.g. over  $k$ . then there are  $r$  alg. independent elements  $y_i$  that  $A$  is integral over  $k[y_i]$ .  $\lrcorner$

*Proof:* Let  $A = k[X_1, \dots, X_n]/I$  and  $\text{height}(I) = n - r$ , then by the lemma we can choose  $Y_1, \dots, Y_n$  that  $k[X_1, \dots, X_n]$  is integral over  $k[Y_1, \dots, Y_n]$  (so  $Y_1, \dots, Y_n$  are algebraically independent) and  $I \cap k[Y_1, \dots, Y_n] = (Y_{r+1}, \dots, Y_n)$ . Now we can just choose  $y_i = Y_i$  for  $i \leq r$ .  $\square$

**Cor. (5.2.4.23) [Dimension and Transcendental Degree].** If  $A$  is a f.g. integral ring over a field  $k$ , then  $\dim A = \text{tr. deg}_k A$ .  $\lrcorner$

*Proof:* This is because integral extensions of integral Noetherian rings have the same dimensions (5.2.4.14) and their fraction fields have the same transcendental degrees.  $\square$

**Cor. (5.2.4.24).** Let  $A, B$  be f.g. algebras over a field  $k$ , then  $\dim(A \otimes_k B) = \dim A + \dim B$ .  $\lrcorner$

**Cor. (5.2.4.25) [Dimension and Field Base Change].** Let  $K/k$  be a field extension and  $S$  a f.g. algebra over  $k$ , then  $\dim S = \dim S \otimes_k K$ .  $\lrcorner$

*Proof:* By Noetherian normalization, there exists a finite injective map  $k[d_1, \dots, d_n] \rightarrow S$  where  $n = \dim S$ . Then there exists a finite injective map  $K[d_1, \dots, d_n] \rightarrow S_K$ , so  $\dim S \otimes_k K = n$ , by (5.2.4.14) and (5.2.4.17).  $\square$

**Prop. (5.2.4.26) [Codimensions and Field Base Change].** Let  $K/k$  be a field extension and  $S$  a f.g.  $k$ -algebra. Let  $\mathfrak{q}$  be a prime of  $S$  and  $\mathfrak{q}_K$  be a prime of  $S_K$  lying over  $\mathfrak{q}$ , then

$$\dim(S_K \otimes_S k(\mathfrak{q}))_{\mathfrak{q}_K} = \dim(S_K)_{\mathfrak{q}_K} - \dim S_{\mathfrak{q}} = \text{tr. deg}_k k(\mathfrak{q}) - \text{tr. deg}_K k(\mathfrak{q}_K).$$

Moreover, for any  $\mathfrak{q}$ , we can choose  $\mathfrak{q}_K$  so that this number is 0.  $\lrcorner$

*Proof:* Cf. [Sta]0CWE.  $\square$

### Local Dimension over Fields

**Prop. (5.2.4.27) [Local Dimension].** Let  $S$  be an algebra f.g. over a field  $k$ ,  $X = \operatorname{Spec} S$  and  $x \in X$ , then the following three numbers are equal:

- the local dimension (4.12.2.26)  $\dim_x(X)$ .
- $\max \dim(Z)$  where  $Z$  runs through irreducible components of  $X$  passing through  $x$ .
- $\min \dim(S_{\mathfrak{m}})$ , where  $\mathfrak{m}$  are maximal ideals containing  $\mathfrak{p}_x$ .

┘

*Proof:* Cf. [Sta]00OT. □

**Lemma (5.2.4.28).** Let  $k$  be a field and  $S$  a f.g.  $k$ -algebra,  $X = \operatorname{Spec} S$ ,  $x \in X$ , then

$$\dim_x(X) = \dim S_{\mathfrak{p}} + \operatorname{tr. deg}_k k(\mathfrak{p}).$$

┘

*Proof:* Cf. [Sta]00P1. □

**Cor. (5.2.4.29).** Let  $S' \rightarrow S$  be a surjection of f.g. algebras over a field  $k$ ,  $\mathfrak{p}$  a prime ideal of  $S$  and  $\mathfrak{p}'$  its inverse image in  $S'$ , corresponding to  $x, x'$  in  $X = \operatorname{Spec} S$ ,  $X' = \operatorname{Spec} S'$  resp., then

$$\dim_{x'}(X') - \dim_x(X) = \operatorname{ht}(\mathfrak{p}') - \operatorname{ht}(\mathfrak{p}).$$

┘

**Def. (5.2.4.30) [Relative Dimension].** Let  $R \rightarrow S$  be a ring map of f.t., and  $\mathfrak{q} \subset S$  be a prime over  $\mathfrak{p} \subset R$ , then we define the **relative dimension** of  $S/R$  at  $\mathfrak{q}$  to be  $\dim_{\mathfrak{q}}(\operatorname{Spec} S)_{\mathfrak{p}}$ . The supremum of all these numbers over  $\mathfrak{q} \subset \operatorname{Spec} S$  is called the relative dimension of  $S/R$ , denoted by  $\dim(S/R)$ . ┘

**Lemma (5.2.4.31) [Local Dimension and Field Extension].** Let  $K/k$  be a field extension,  $S$  be a f.g.  $k$ -algebra, and  $X = \operatorname{Spec} S$ . Now if  $\mathfrak{p}_K$  is an element of  $S_K$  lying over  $\mathfrak{p} \subset S$ , then  $\dim_{\mathfrak{p}}(S) = \dim_{\mathfrak{p}_K}(S_K)$ . ┘

*Proof:* The proof is by reduction to polynomial ring. Let  $S = k[X_1, \dots, X_n]/I$ , let  $\mathfrak{p}'_K, \mathfrak{p}'$  be primes of  $k[X_1, \dots, X_n]$  and  $K[X_1, \dots, X_n]$  that is the image of  $x$  and  $x_K$ , then there is a commutative diagram

$$\begin{array}{ccc} K[X_1, \dots, X_n]_{\mathfrak{q}'_K} & \longrightarrow & (S_K)_{\mathfrak{q}_K} \\ \downarrow & & \downarrow \\ k[X_1, \dots, X_n]_{\mathfrak{q}'} & \longrightarrow & S_{\mathfrak{q}} \end{array}.$$

The vertical arrows are flat because they are local morphisms of flat maps, and their fibers are the same, so by (7.6.3.17),  $\operatorname{ht}(\mathfrak{q}'_K) - \operatorname{ht}(\mathfrak{q}') = \operatorname{ht}(\mathfrak{q}_K) - \operatorname{ht}(\mathfrak{q})$ . Also use (5.2.4.29) on the horizontal maps, then we get the desired assertion. □

**Prop. (5.2.4.32) [Semicontinuity of Dimensions].** Let  $f : R \rightarrow S$  be a ring map of f.t., then the map  $\mathfrak{q} \mapsto \dim_{\mathfrak{q}}(S/R)$  is a upper-semicontinuous function on  $\operatorname{Spec}(S)$ .

Moreover, if  $f$  is of f.p., then the set  $\{\mathfrak{q} \mid \dim_{\mathfrak{q}}(S/R) \leq n\}$  is quasi-compact open in  $\operatorname{Spec}(S)$ . ┘

*Proof:* Cf. [Sta]00QH, 00QJ. □

## 5 Support and Associated Primes

**Def. (5.2.5.1) [Support of a Module].** The **support**  $\text{Supp}(M)$  of a module  $M \in \text{Mod}_R$  is the set of all  $\mathfrak{p} \in \text{Spec}(R)$  that  $M_{\mathfrak{p}} \neq 0$ . When  $M$  is f.g.,  $\text{Supp}(M) = V(\text{Ann}(M))$ .  $\lrcorner$

**Prop. (5.2.5.2) [Support is Non-Empty].** The support of a nonzero module is not empty, because triviality is stalkwise by (5.1.4.2).  $\lrcorner$

**Prop. (5.2.5.3).** If  $0 \rightarrow N \rightarrow M \rightarrow Q \rightarrow 0$ , then we have  $\text{Supp}(M) = \text{Supp}(N) \cup \text{Supp}(Q)$ , this is because localization is exact.  $\lrcorner$

**Cor. (5.2.5.4).**  $\lrcorner$

**Prop. (5.2.5.5).** Let  $(R, \mathfrak{m})$  be a Noetherian local ring and  $M$  a finite  $R$ -module,  $f \in \mathfrak{m}$ , then

$$\dim \text{Supp}(M) - 1 \leq \dim(\text{Supp}(M/fM)) \leq \dim(\text{Supp}(M))$$

$\lrcorner$

*Proof:* Cf. [Sta]0B52.  $\square$

**Prop. (5.2.5.6).** Let  $0 = M_0 \subset M_1 \subset \dots \subset M_n = M$  be a filtration of  $M$  that  $M_i/M_{i-1} \cong R/\mathfrak{p}_i$  where  $\mathfrak{p}_i$  are primes, by (5.1.1.48), then  $\text{Supp}(M) = \cup_i V(\mathfrak{p}_i)$ .

In particular, the minimal primes in  $\{\mathfrak{p}_i\}$  are the same as the minimal primes of  $\text{Supp}(M)$ . Moreover, the multiplicity of a prime  $\mathfrak{p}_i$  equals  $\text{length}_{R_{\mathfrak{p}}} M_{\mathfrak{p}}$ .  $\lrcorner$

*Proof:* Cf. [Sta]00L7.  $\square$

**Prop. (5.2.5.7).** Let  $(R, \mathfrak{m})$  be a Noetherian local ring and  $M$  a non-zero finite  $R$ -module, then  $\text{Supp}(M) = V(\mathfrak{m})$  iff  $\text{length}_R(M) < \infty$ .  $\lrcorner$

*Proof:* Cf. [Sta]00L5.  $\textcolor{red}{?}$   $\square$

**Prop. (5.2.5.8).** Let  $A$  be Noetherian and  $I$  be an ideal, then  $I^n M = 0$  for some  $n$  iff  $\text{Supp}(M) \subset V(I)$ .  $\lrcorner$

*Proof:* If  $I^n M = 0$ , then if  $I \not\subseteq P$ , then  $M_P = 0$ . Conversely, we have a filtration of  $M$ , and by (5.2.5.3) we have all the  $P_i$  include  $I$ , so  $I^n$  annihilate  $M$ .  $\square$

**Prop. (5.2.5.9).** If  $R$  is a ring and  $M$  is a f.p.  $R$ -module, then  $\text{Supp}(M)$  is a closed subset of  $\text{Spec } R$  whose complement is quasi-compact.  $\lrcorner$

*Proof:* Let  $R^m \rightarrow R^n \rightarrow M \rightarrow 0$ , then the support of  $M$  is just the locus that some minor of the linear map from  $R^m \rightarrow R^n$  doesn't vanish. Then its complement is quasi-compact.  $\square$

**Prop. (5.2.5.10).** Let  $(R, \mathfrak{m})$  be a Noetherian local ring and  $M$  is a finite  $R$ -module, then  $d(M) = \dim(\text{Supp}(M))$ .  $\lrcorner$

*Proof:* Cf. [Sta]00L8.  $\square$

**Prop. (5.2.5.11).** Let  $R$  be a Noetherian ring and  $0 \rightarrow M' \rightarrow M \rightarrow M'' \rightarrow 0$  be an exact sequence of finite  $R$ -modules, then  $\dim \text{Supp}(M) = \max(\dim \text{Supp}(M'), \dim \text{Supp}(M''))$ .  $\lrcorner$

*Proof:* Cf. [Sta]0B51.  $\square$

### Associated Primes of a Module

**Def. (5.2.5.12) [Associated Primes of a Module].** The **weakly associated primes**  $\text{Ass}(M)$  of an  $A$ -module  $M$  is the set of minimal primes of  $A/\text{Ann}(m)$  for some  $m \in M$ .

The **associated primes**  $\text{Ass}(M)$  is the set of primes  $\{p = \text{Ann}(m)\}$  where  $m \in M$ .  $\lrcorner$

**Prop. (5.2.5.13).**  $\text{Ass}_R(M) \subset \text{WeakAss}_R(M)$ , and if  $R$  is Noetherian, the converse is also true.  $\lrcorner$

*Proof:* Cf. [Sta]058A.  $\square$

**Prop. (5.2.5.14) [Associated Primes and Exact Sequence].** For an exact sequence  $0 \rightarrow M_1 \rightarrow M \rightarrow M_2 \rightarrow 0$ ,  $\text{WeakAsso}(M) \subset \text{WeakAsso}(M_1) \cup \text{WeakAsso}(M_2)$  and  $\text{WeakAsso}(M_1) \subset \text{WeakAsso}(M)$ .

$\lrcorner$

*Proof:* Cf. [Sta]0548.  $\square$

**Cor. (5.2.5.15) [F.M. Associated Primes].** For a finite module  $M$  over a Noetherian ring  $A$ ,  $\text{Ass}_A(M)$  is finite by (5.1.1.48).  $\lrcorner$

**Prop. (5.2.5.16) [Associated Primes and Support].**  $\text{WeakAsso}(M) \subset \text{Supp } M$ , and their minimal elements are the same.

If  $M \neq 0$ ,  $\text{WeakAsso}(M) \neq \emptyset$  by (5.2.5.2), and  $\text{WeakAsso}(A/I)$  contains all the minimal primes over  $I$ .  $\lrcorner$

*Proof:* If  $\mathfrak{p} = \text{Ann}(m)$ , then  $m$  is nonzero in  $M_{\mathfrak{p}}$ , so  $M_{\mathfrak{p}}$  is nonzero, i.e.  $\mathfrak{p} \in \text{Supp}(M)$ .

For the second assertion, we first prove for  $M$  finite, and then write any module as sum of finite submodules, and use the fact  $\text{Supp}$  and  $\text{ass}$  are all unions of those of the submodules. Cf. [Sta]05C4 0588.  $\square$

**Prop. (5.2.5.17) [Weakly Associated Primes and Zero-divisors].** Let  $M$  a  $R$ -module, then the union of the weakly associated primes of  $M$  is the set of zero-divisors in  $M$ .  $\lrcorner$

*Proof:* Elements in associated points are zero-divisors obviously, and conversely, if  $xm = 0$ , then  $x \in \text{Ann}(m)$  and  $\text{Ann}(m)$  has an associated point  $\mathfrak{q}$  by (5.2.5.16). Now  $x$  must be in  $\mathfrak{q}$  and  $\mathfrak{q}$  is also an associated point of  $M$  by (5.2.5.16). Cf. [Sta]05C3.  $\square$

**Cor. (5.2.5.18).** Use the prime avoidance (5.1.1.5), we can prove if  $R$  is Noetherian and  $M$  is a finite  $R$ -module, then  $I \subset \mathfrak{p}$  for some  $\mathfrak{p} \in \text{WeakAss}(M)$  iff  $I$  consists of zero-divisors.  $\lrcorner$

**Prop. (5.2.5.19) [Associated Primes and Maps].** For a ring map  $\varphi : R \rightarrow S$  and a  $S$ -module  $M$ , then

$$\text{Spec}(\varphi)(\text{Ass}_S(M)) \subset \text{Ass}_R(M) \subset \text{WeakAss}_R(M) \subset \text{Spec}(\varphi)(\text{WeakAss}_S(M)).$$

Equalities hold if  $S$  is Noetherian. Also  $\text{WeakAss}_R(M) = \text{Spec}(\varphi)(\text{WeakAss}_S(M))$  if  $\varphi$  is a finite ring map.  $\lrcorner$

*Proof:* Cf. [Sta]05C7, 05E1.

We prove it is equal. If  $\mathfrak{p} = \text{Ann}_R(m)$ , then we let  $I = \text{Ann}_S(m)$ , then  $R/\mathfrak{p} \subset S/I \subset M$ , so by (5.1.7.25), there is a minimal prime of  $S$  over  $I$  that are mapped to  $\mathfrak{p}$ , now this prime is in  $\text{Ass}(S/I)$  by (5.2.5.16) and also in  $\text{Ass}_S(M)$  by (5.2.5.14).  $\square$

**Prop. (5.2.5.20) [Associated Primes and Localization].** Let  $\varphi : \operatorname{Spec} S^{-1}A \rightarrow \operatorname{Spec} A$  and  $M$  an  $A$ -module, then

$$\operatorname{Ass}_A(S^{-1}M) = \operatorname{Spec}(\varphi)(\operatorname{WeakAsso}_{S^{-1}A}(S^{-1}M)) = \operatorname{WeakAsso}_A(M) \cap \varphi(\operatorname{Spec}(S^{-1}R)).$$

┘

*Proof:* Cf. [Sta]05C9?.

The first equality is by (5.2.5.19). For the second, if  $\operatorname{Ann}_A(x) = \mathfrak{p}$  and  $\mathfrak{p} \cap S = \emptyset$ , then  $\operatorname{Ann}_{S^{-1}A}(x/1) = S^{-1}(\mathfrak{p})$ . Conversely, if  $\operatorname{Ann}_{S^{-1}A}(x/s) = S^{-1}\mathfrak{p}$ , then  $\mathfrak{p} \cap S = \emptyset$ , and  $\operatorname{Ann}_A(x) \subset S^{-1}\mathfrak{p} \cap A = \mathfrak{p}$ .  $\square$

**Cor. (5.2.5.21) [Associated Primes are Stalkwise].** Let  $R$  be a ring and  $M$  an  $R$ -module,  $\mathfrak{p} \subset R$ , then the following are equivalent:

- $\mathfrak{p} \subset \operatorname{WeakAss}(M)$ .
- $\mathfrak{p}R_{\mathfrak{p}} \subset \operatorname{WeakAss}(M_{\mathfrak{p}})$ .
- $M_{\mathfrak{p}}$  contains some element  $m$  that  $\sqrt{\operatorname{Ann}(m)} = \mathfrak{p}R_{\mathfrak{p}}$ .

┘

*Proof:*  $1 \rightarrow 2$ :  $\mathfrak{p}$  is a minimal prime of  $I = \operatorname{Ann}(m)$  for some  $m \in M$ , so  $I_{\mathfrak{p}}$  is the minimal prime of  $\operatorname{Ann}(m) \subset R_{\mathfrak{p}}$ .

$2 \rightarrow 3$ : As  $\mathfrak{p}R_{\mathfrak{p}}$  is the maximal prime, it is the only prime over  $\operatorname{Ann}(m)$ , so  $\mathfrak{p}R_{\mathfrak{p}} = \sqrt{\operatorname{Ann}(m)}$ .

$3 \rightarrow 1$ : This means there are some  $m \in M$  that  $\sqrt{I_{\mathfrak{p}}} = \mathfrak{p}R_{\mathfrak{p}}$ , which means that  $\mathfrak{p}$  is a minimal prime over  $\operatorname{Ann}(m)$ .  $\square$

**Prop. (5.2.5.22).** If  $M$  is an  $R$ -module, then  $M \rightarrow \prod_{\mathfrak{p} \in \operatorname{WeakAss}(M)} M_{\mathfrak{p}}$  is injective.  $\square$

*Proof:* Cf. [Sta]05CB.

If  $m \neq 0 \in M$ , there is an associated prime  $\mathfrak{p}$  of  $Rm$  (5.2.5.16), then it is an associated prime of  $M$ , and then  $(x)_{\mathfrak{p}} \subset M_{\mathfrak{p}}$  is not zero.  $\square$

**Def. (5.2.5.23) [Embedded Primes].** A non-minimal prime in  $\operatorname{Ass}_R(M)$  is called a **embedded prime**. Equivalently, it is an associated point that is not a generic point of  $\operatorname{Supp}(M)$ .  $\square$

**Prop. (5.2.5.24).** For a reduced ring  $R$ ,  $\operatorname{WeakAss}_R(R)$  is just the set of minimal primes of  $R$ .  $\square$

*Proof:* Cf. [Sta]0EMA.  $\square$

**Cor. (5.2.5.25) [Reduced Ring No Embedded Primes].** A reduced ring has no embedded primes, because it has no nilpotent elements. Hence all its associated primes are just the minimal primes.  $\square$

**Def. (5.2.5.26) [Unmixed Ideals].**  $I$  is called **unmixed** if primes in  $\operatorname{Ass}(A/I)$  all have the same height. In particular, they don't contain each other.  $\square$

### Primary Decomposition

**Def. (5.2.5.27).** For  $R$  Noetherian, a  $R$ -module  $M$  is called **coprimary** iff it has only one associated primes. A submodule  $N$  of  $M$  is called  **$p$ -primary** iff  $\operatorname{Ass}(M/N) = \{p\}$ . A ring is called  **$p$ -primary** iff  $(0)$  is  $p$ -primary.

Notice coprimary is equivalent to the following: if  $a \in A$  is a zero divisor for  $M$ , then for each  $x \in M$ , there is a  $n$  that  $a^n x = 0$ , i.e. **locally nilpotent**. And for ideals in a Noetherian ring, this is equivalent to  $r(I)$  is a prime.  $\square$

*Proof:* If  $M$  is  $p$ -primary, if  $x \in M$  is nonzero, then  $\text{Ass}(Rx) = \{p\}$ , so  $p$  is the unique minimal element of  $\text{Supp}(Rx) = V(\text{Ann}(x))$  by (5.2.5.16). So  $p$  is the radical of  $\text{Ann}(x)$ , i.e.  $a^n x = 0$  for some  $n$  (5.2.6.2).

Conversely, we know the ideal  $p$  of locally nilpotent elements equals the union of the associated primes (5.2.5.17), so if  $q \in \text{Ass}M = \text{Ann}(x)$ , then by definition,  $p \subset q$ . So  $p = q$ , and thus  $\text{Ass}M = \{p\}$ .  $\square$

**Lemma (5.2.5.28).** A primary ring has no nontrivial idempotent element, because  $e$  and  $1 - e$  will all belong to the same minimal ideal  $p$ .  $\perp$

**Lemma (5.2.5.29).** The intersection of  $p$ -primary submodules are  $p$ -primary. (Because there is a injection  $M/Q_1 \cap Q_2 \rightarrow M/Q_1 \oplus M/Q_2$ ).  $\perp$

**Lemma (5.2.5.30)[Associated Prime and Primary Decomposition].** If  $N = \cap Q_i$  is an irredundant primary decomposition and if  $Q_i$  belongs to  $p_i$ , then we have  $\text{Ass}(M/N) = \{p_1, \dots, p_r\}$ .  $\perp$

*Proof:* There is a injection  $M/N \rightarrow M/Q_1 \oplus \dots M/Q_r$  which shows  $\text{Ass}(M/N) \subset \{p_1, \dots, p_r\}$ . And for the inverse, notice  $Q_2 \cap \dots \cap Q_r/N$  is a submodule of  $M/Q_1$ , which shows  $\text{Ass}(Q_2 \cap \dots \cap Q_r/N) = \{p_1\}$  by (5.2.5.16).  $\square$

**Prop. (5.2.5.31).** If  $N$  is a  $p$ -primary submodule of a  $R$ -module  $M$ , and  $p'$  is a prime ideal, then

- $N_{p'} = M_{p'}$  if  $p \not\subset p'$ .
- $N = M \cap N_{p'}$  if  $p \subset p'$ .

$\perp$

*Proof:*  $M_{p'}/N_{p'} = (M/N)_{p'}$ , and  $\text{Ass}((M/N)_{p'}) = \text{Ass}(M/N) \cap \{\text{primes contained in } p'\} = \emptyset$  by (5.2.5.20). So  $M_{p'} = N_{p'}$  by (5.2.5.16).

For the second, notice it suffices to show  $M/N \rightarrow M_{p'}/N_{p'}$  is injective. But this is because  $A - p'$  contains no nonzero-divisor, by (5.2.5.17).  $\square$

**Cor. (5.2.5.32) [Second Uniqueness of Primary Decomposition].** For an irredundant primary decomposition  $N = \cap Q_i$ , if  $Q_1$  corresponds to  $p_1$  and  $p_1$  is minimal in  $\text{Ass}(M/N)$ , then  $Q_1 = M \cap N_{p_1}$ . In particular, the minimal prime part of a irredundant primary decomposition is uniquely determined.  $\perp$

*Proof:* By the above proposition, there are elements  $u_i$  of  $Q_i$ ,  $i \neq 1$  that are mapped to units in  $M_{p_1}$ , so  $Q_1 \cdot u_2 u_3 \dots u_r$  is mapped onto the image of  $Q_1 \rightarrow M_{p_1}$ . Then  $Q_1 = M \cap (Q_1)_{p_1} = M \cap N_{p_1}$ .  $\square$

**Prop. (5.2.5.33).** If  $R$  is Noetherian and  $M$  is a  $R$ -module, there are  $p$ -primary submodules  $Q(p)$  for each  $p \in \text{Ass}M$  that  $(0) = \bigcap_{p \in \text{Ass}M} Q(p)$ .  $\perp$

*Proof:* For a  $p \in \text{Ass}M$ , we seek  $Q(p)$  to be the maximal submodule  $N$  that  $p \notin \text{Ass}N$ . This has a maximal ideal because of Zorn and the fact  $\text{Ass}(\cup N_\lambda) = \cup \text{Ass}(N_\lambda)$ . Then We have  $\text{Ass}(M/Q(p)) = \{p\}$ , otherwise there is another  $p'$ , then there is a  $Q'/Q(p) \cong A/p'$ . Now  $Q'$  is bigger than  $Q(p)$ . Finally,  $(0) = \bigcap_{p \in \text{Ass}M} Q(p)$  because it has no associated primes.  $\square$

**Cor. (5.2.5.34)[Primary Decomposition].** If  $M$  is f.g. over a Noetherian ring  $R$ , then any submodule has a primary decomposition. (Notice  $M$  has only f.m. associated primes).  $\perp$

**Def. (5.2.5.35) [Symbolic Power].** For a prime ideal  $\mathfrak{p}$  in a Noetherian ring, The  $n$ -th **symbolic power**  $\mathfrak{p}^{(n)}$  is defined to be the  $\mathfrak{p}$ -primary component of  $\mathfrak{p}^n$ , who has only one minimal prime(hence one associated prime). The symbolic power is giving by  $\mathfrak{p}^n A_{\mathfrak{p}} \cap A$  by (5.2.5.32).  $\perp$

## 6 Jacobson Radical and Nilradical

### Nilradical

**Def. (5.2.6.1) [Nilradical].** For  $R \in \mathcal{CRing}$ , the **nilradical** of  $R$  is defined to be the ideal consisting of nilpotent elements.  $\lrcorner$

**Prop. (5.2.6.2).** The nilradical  $\mathfrak{n}$  of a ring  $A$  (5.2.6.1) is the intersection of all prime ideals.  $\lrcorner$

*Proof:* Every nilpotent element is contained in every prime, and if  $a$  is not nilpotent, then the localization  $A_a$  is nonzero, hence there is a maximal ideal, i.e. there is a prime of  $A$  not containing  $a$ .  $\square$

**Cor. (5.2.6.3).** In particular,  $\text{Spec } A/\mathfrak{n} \rightarrow \text{Spec } A$  is a homeomorphism, and  $A \rightarrow A/\mathfrak{n}$  induces a bijection on idempotents and units.  $\lrcorner$

### Jacobson Ring

**Def. (5.2.6.4) [Jacobson Ring].** A commutative ring is called **Jacobson** if every prime ideal is an intersection of maximal ideals. In particular, the Jacobson radical equals the nilradical. This is equivalent to every radical ideal is an intersection of maximal primes.  $\lrcorner$

**Prop. (5.2.6.5).**  $R$  is Jacobson iff  $\text{Spec } R$  is Jacobson space (4.12.2.22). In particular, the closed pts are dense in any closed subsets (Hilbert's Nullstellensatz satisfied).  $\lrcorner$

*Proof:* We need to show that a locally closed subset contains a closed pt, we assume this set is of the form  $V(I) \cap D(f)$ ,  $I$  is radical, then  $f \notin I$ , then by the condition, there is a  $I \subset \mathfrak{m}$  that  $f \notin \mathfrak{m}$ , thus the result.

Conversely, for a radical ideal, let  $J = \cap_{I \subset \mathfrak{m}} \mathfrak{m}$ , then  $J$  is radical and  $V(J)$  is the closure of  $V(I) \cap X_0$ ,  $V(I) = V(J)$ , and because they are both radical,  $I = J$ .  $\square$

**Cor. (5.2.6.6).** Being Jacobson is a local property, and quotient of Jacobson ring is Jacobson, and maximal ideals of  $R_f$  are maximal in  $R$ . (Immediate from (5.2.6.5) (4.12.2.23) and (4.12.2.24)).  $\lrcorner$

**Prop. (5.2.6.7).** If a Jacobson ring  $A$  has f.m. maximal ideals, then it is the product of its localizations at maximal primes and  $\dim A = 0$ .  $\lrcorner$

*Proof:* Any prime ideal  $\mathfrak{p}$  is a finite intersection of maximal ideals, so it equals one of them, so  $\dim A = 0$ . Now  $A/I = \oplus A/\mathfrak{m}_i$  by Chinese remainder theorem, so  $\text{Spec } A/I$  is discrete with  $n$  pts, so by (5.1.7.8) there are  $n$  idempotents  $e_i$  that  $e_i \equiv \delta_{ij} \pmod{\mathfrak{m}_j}$ ,  $\sum e_i = 1$ . Thus  $R = \prod Re_i$ . And  $Re_i$  is just the localization at a maximal prime.  $\square$

**Lemma (5.2.6.8).** If  $R$  is a Jacobson domain and  $R \subset K$  where  $K$  is a field, and  $K$  is f.g. over  $R$ , then  $R$  is a field and  $K/R$  is a finite field extension.  $\lrcorner$

*Proof:* By induction, it suffices to consider the monogenic case  $A = R[a]$ . So  $a$  is algebraic over quotient field of  $R$  because  $A$  is a field. Let  $\sum r_i t^i$  be a polynomial satisfied by  $a$ , and let  $\mathfrak{m}$  be a maximal ideal of  $R$  that  $r_n \notin \mathfrak{m}$  (exists because  $\text{rad } R = 0$ ). Then Nakayama says  $\mathfrak{m}A \not\subseteq A$ . Then  $\mathfrak{m} = 0$  because  $A$  is a field, hence  $R$  is a field.  $\square$

**Lemma (5.2.6.9).** Let  $R \subset A$  be commutative domains s.t.  $A$  is f.g. over  $R$ , then  $\text{rad } A = 0$  if  $\text{rad } R = 0$ .  $\lrcorner$

*Proof:* By induction, it suffices to consider the case  $A = R[a]$ . If  $a$  is transcendental over quotient field of  $R$ , then we finish by (3.6.3.12). Now assume  $a$  is algebraic over quotient field of  $R$ , let  $\sum r_i t^i, \sum s_i t^i$  be the polynomials satisfied by  $a, b$  of minimal degrees, then  $s_0 = -\sum_{i=1}^m s_i b^i \neq 0 \in \text{rad } A$ , and  $r_n s_0 \neq 0$ .

From the fact  $\text{rad } R = 0$ , we can find a maximal ideal  $\mathfrak{m}$  that  $r_n s_0 \notin \mathfrak{m}$ . Then Nakayama says

$$\mathfrak{m} \cdot S^{-1}A \not\subseteq S^{-1}A.$$

In particular,  $\mathfrak{A} \not\subseteq A$ . Choose a maximal ideal of  $A$  containing  $\mathfrak{m}A$ , then it cannot contain  $s_0$ , contradicting  $s_0 \in \text{rad } A$ .  $\square$

**Prop. (5.2.6.10) [Generalized Nullstellensatz].** If  $R$  is Jacobson and  $S$  is a finitely generated  $R$ -algebra, then:

- $S$  is Jacobson.
- The maximal ideal of  $S$  intersect with  $R$  a maximal ideal, and the quotient ring extension is finite, (in particular algebraic).

In particular, a f.g. algebra over a ring of dimension 0, (e.g. Artinian ring or field) is Jacobson.

┘

*Proof:* To show  $S$  is Jacobson, consider for any prime  $\mathfrak{p} \subset A$ ,  $A/\mathfrak{p}$  is a f.g. domain over  $R/\mathfrak{p} \cap R$ . Because  $R$  is Jacobson,  $\text{rad}(R/\mathfrak{p} \cap R) = 0$ , so  $\text{rad}(A/\mathfrak{p}) = 0$ , by (5.2.6.9). And this shows  $A$  is Jacobson.

If  $\mathfrak{m}$  is maximal in  $S$ , then  $R/\mathfrak{m} \cap R \rightarrow S/\mathfrak{m}$  satisfies the condition of (5.2.6.8), by (5.2.6.6), so the first two assertions are proved.  $\square$

**Cor. (5.2.6.11).** If  $R$  is Jacobson and  $S \in \mathcal{CAlg}^{\text{fg}}(R)$  is reduced, then  $\bigcap_{\mathfrak{m} \subset R \text{ maximal}} \mathfrak{m}S = 0$ .  $\square$

*Proof:* This is because

$$\bigcap_{\mathfrak{m} \subset R \text{ maximal}} \mathfrak{m}S \subset \bigcap_{\mathfrak{M} \subset S \text{ maximal}} (\mathfrak{M} \cap R)S \subset \bigcap_{\mathfrak{M} \subset S \text{ maximal}} \mathfrak{M} = 0.$$

$\square$

### Zariski-Pairs

**Def. (5.2.6.12) [Zariski-Pairs].** A pair  $(A, I)$  is called a **Zariski-pair** iff  $I$  is contained in the Jacobson radical of  $A$ .  $\square$

**Prop. (5.2.6.13).** If  $(A, I)$  is a Zariski-pair (5.2.6.12), then the map  $A \rightarrow A/I$  induces a bijection between the idempotents.  $\square$

*Proof:* idempotents are determined by the maximal ideals that it vanishes (5.1.7.6), and  $A \rightarrow A/I$  induces a bijection on the maximal ideals.  $\square$

## 7 Dedekind-Domains

**Def. (5.2.7.1) [Dedekind-Domains].** A **Dedekind-domain** is an integrally-closed Noetherian domain of dimension 1. A UFD is a Dedekind domain by (5.3.5.2).  $\square$

**Prop. (5.2.7.2) [Characterizing].** For a domain  $R$ , the following are equivalent:

1.  $R$  is a Dedekind domain.
2.  $R$  is Noetherian and each  $R_{\mathfrak{m}}$  is DVR for any maximal ideal  $\mathfrak{m}$ .
3. each ideal of  $R$  can be written as a product of prime ideals uniquely.

┘

*Proof:* 1  $\iff$  2 as normal is a stalkwise and (5.3.5.21).

3  $\rightarrow$  2: If 3 is true, then  $\mathfrak{p} \neq \mathfrak{p}^2$  for each prime  $\mathfrak{p}$ , so choose  $x \in \mathfrak{p} - \mathfrak{p}^2$ , then for each  $y \in \mathfrak{p}$ ,  $(x, y) = \prod p_i$ , then exactly one  $p_i$  (may assume  $p_1$ ) is contained in  $\mathfrak{p}$ , so  $(x, y)R_{\mathfrak{p}} = p_1R_{\mathfrak{p}}$ . Now in fact  $(x)R_{\mathfrak{p}} = p_1R_{\mathfrak{p}}$ , because  $(x, y^2)R_{\mathfrak{p}}$  is also a prime, so  $y = ax + by^2$  in  $R_{\mathfrak{p}}$ ,  $(1 - by)y = ax \in (x)R_{\mathfrak{p}}$  is a prime, so  $y \in (x)R_{\mathfrak{p}}$ . This is for all  $y \in \mathfrak{p}$ , so  $(x)R_{\mathfrak{p}} = p_1R_{\mathfrak{p}}$ .

Now if  $(x) = \mathfrak{p}_1 \cdots \mathfrak{p}_r$ , then  $p_1R_{\mathfrak{p}} = pR_{\mathfrak{p}}$ , so  $p_1 = p$ , and  $p$  is f.g. by the lemma (5.2.7.3) below.  $\mathfrak{p}$  is arbitrary, so  $R$  is Noetherian and  $R_{\mathfrak{m}}$  is DVR for  $\mathfrak{m}$  maximal, by (5.3.5.21).

1  $\rightarrow$  3 : if 1 is true, then any ideal is a unique intersection of primary ideals, and primary ideals are their radical are different, so they are coprime (5.1.1.9), so this is in fact a unique decomposition into products of primary ideals. And any primary ideal is a power of its radical, because this is the case after localization.  $\square$

**Lemma (5.2.7.3).**  $I, J$  be ideals in a ring  $A$  and  $IJ = (f)$  where  $f$  is a non-zero-divisor, then  $I, J$  are f.g. and finitely locally free of rank 1 as  $A$ -modules.  $\square$

*Proof:* The second assertion implies the first, by (5.3.1.7).  $f = \sum x_i y_i$ , and  $x_i y_i = a_i f$ , so  $\sum a_i = 1$  as  $f$  is non-zero-divisor. Now we show  $I_{a_i}$  as  $J_{a_i}$  is free of rank 1. Now after localization,  $f = xy$ , so  $x, y$  are non zero divisors. Now if  $x' \in I$ , then  $x'y = af = axy$  for some  $a$ , so  $x' = ax$ .  $\square$

### Fractional Ideals

**Def. (5.2.7.4) [Fractional Ideals].** For an integral domain  $(\mathcal{O}, K)$ , then an  $\mathcal{O}$ -submodule  $M$  of  $K$  is called a **fractional ideal** if  $xM \subset A$  for some  $x \in K^\times$ .

Every f.g. submodule in  $K$  is a fractional ideal, and if  $\mathcal{O}$  is Noetherian, then the converse is true, because it is of the form  $x^{-1}\mathfrak{a}$ .  $\square$

**Prop. (5.2.7.5).** Situation as in (5.2.7.4), an  $A$ -submodule  $M \subset K$  is called an **invertible ideal** if there is an  $A$ -submodule  $N \subset K$  that  $MN = A$ . If this is the case, then  $M, N$  are f.g., because there are  $\sum x_i y_i = 1$ , so  $M$  is generated by  $x_i$  and  $N$  is generated by  $y_i$ .  $\square$

**Prop. (5.2.7.6).** Situation as in (5.2.7.4), Invertibility is a stalkwise property.  $\square$

*Proof:* Notice  $(A : M)_{\mathfrak{p}} = (A_{\mathfrak{p}} : M_{\mathfrak{p}})$ , and  $M$  is invertible iff  $M(A : M) = A$ . Then use the fact isomorphism is stalkwise (5.1.4.2).  $\square$

**Lemma (5.2.7.7).** A local domain  $A$  is a DVR iff every non-zero fractional ideal of  $A$  is invertible.  $\square$

*Proof:* If is a DVR, let  $\mathfrak{m} = (x)$ , for any fractional ideal  $M$  let  $yM \subset A = (x^r)$ , then  $M = (x^{r-s})$ , where  $v(y) = s$ . Conversely, if every non-zero fractional ideal of  $A$  is invertible, then they are all f.g. (5.2.7.5), so  $A$  is Noetherian. Now it suffices to prove that every ideal of  $A$  is a power of  $\mathfrak{m}$ , by (5.3.5.21). If this is not true, choose a maximal element  $\mathfrak{a}$  in the set of ideals that is not a power of  $\mathfrak{m}$  (by Noetherian), then  $\mathfrak{m}^{-1}\mathfrak{a} \subset \mathfrak{m}^{-1}\mathfrak{m} = A$ , and  $\mathfrak{m}^{-1}\mathfrak{a} \supset \mathfrak{a}$ , but it is not  $\mathfrak{a}$ , so  $\mathfrak{m}^{-1}\mathfrak{a} = \mathfrak{m}^k$  for some  $k$ , so  $\mathfrak{a} = \mathfrak{m}^{k+1}$ , contradicton.  $\square$

**Prop. (5.2.7.8) [Dedekind Domain Fractional Ideals are Invertible].** An integral domain is a Dedekind domain iff every non-zero fractional ideal is invertible.  $\lrcorner$

*Proof:* Immediate from (5.2.7.7) and (5.2.7.2)(5.2.7.6).  $\square$

**Def. (5.2.7.9) [Class Group].** For an integral domain  $\mathcal{O}$ , denote  $\text{Cl}(\mathcal{O})$  the Abelian group of invertible fractional ideals of  $\mathcal{O}$  modulo principal fractional ideals, called the **class group** of  $\mathcal{O}$ .  $\lrcorner$

**Prop. (5.2.7.10) [Localizations of Dedekind Domains].** Let  $(\mathcal{O}, F)$  be a Dedekind domain and  $S \subset \text{Spec } \mathcal{O}$  be a finite subset of maximal ideals of  $\mathcal{O}$ , let  $\mathcal{O}_S$  denote the localization of  $\mathcal{O}$  at all such  $\mathfrak{p}_i$ . Then there is an exact sequence of Abelian groups:

$$1 \rightarrow \mathcal{O}^* \rightarrow \mathcal{O}_S^* \rightarrow \bigoplus_{\mathfrak{p} \in S} F^\times / \mathcal{O}_{\mathfrak{p}}^* \rightarrow \text{Cl}(\mathcal{O}) \rightarrow \text{Cl}(\mathcal{O}_S) \rightarrow 1.$$

$\lrcorner$

*Proof:* The only non-trivial map is the map  $\bigoplus_{\mathfrak{p} \in S} F^\times / \mathcal{O}_{\mathfrak{p}}^* \rightarrow \text{Cl}(\mathcal{O})$  given by  $(\overline{a_{\mathfrak{p}}})$  mapsto  $\prod_{x \in S} \mathfrak{p}^{v_{\mathfrak{p}}(a_x)}$ .  $\square$

### Extensions of Dedekind Domains

References are [Neu99]Chap1.8..

**Prop. (5.2.7.11) [Krull-Akizuki].** If  $A$  is a Noetherian domain of dimension 1 with fraction field  $K$  and  $K \subset_{\text{fin}} L \in \mathbf{Field}$ , then the integral closure  $B$  of  $A$  in  $L$  is a Dedekind domain with fraction field  $L$ , and  $\text{Spec } B \rightarrow \text{Spec } A$  is surjective, and have finite fibers and induces finite residue field extension.  $\lrcorner$

*Proof:* Cf. [Sta]09IG or [Neu99]P77. ?  $\square$

**Cor. (5.2.7.12).** The integral closure of a Dedekind domain in a finite extension fields of its quotient fields is again a Dedekind domain.  $\lrcorner$

**Def. (5.2.7.13) [Situation].** Let  $(\mathcal{O}_K, K)$  be a Dedekind domain,  $K \subset_{\text{fin}} L \in \mathbf{Field}$ , and  $\mathcal{O}_L$  the integral closure of  $\mathcal{O}_K$  in  $L$ , which is also a Dedekind domain by (5.2.7.11).  $\lrcorner$

**Prop. (5.2.7.14).** Situation as in (5.2.7.13), if  $\alpha_1, \dots, \alpha_n$  is a basis of  $L/K$  that is contained in  $\mathcal{O}_L$ , and  $d = d(\alpha_1, \dots, \alpha_n)$  (3.2.6.33), then

$$d\mathcal{O}_L \subset \mathcal{O}_K \{\alpha_1, \dots, \alpha_n\}.$$

$\lrcorner$

*Proof:* For any  $\alpha = a_1\alpha_1 + \dots + a_n\alpha_n \in \mathcal{O}_L$ ,  $a_i \in K$ ,  $\alpha$  satisfies the following equations

$$\text{tr}_{L/K}(\alpha_i \alpha) = \sum_j \text{tr}_{L/K}(\alpha_i \alpha_j) a_j$$

for any  $i$ . Notice  $\text{tr}(\alpha_i \alpha) \in \mathcal{O}_K$ , so  $da_j \in \mathcal{O}_K$  by linear algebra.  $\square$

**Prop. (5.2.7.15).** Situation as in (5.2.7.13), if  $L/K$  is separable and  $\mathcal{O}_K$  is a PID, then every f.g.  $\mathcal{O}_L$ -module in  $L$  is a free  $\mathcal{O}_K$ -module of rank  $[L : K]$ . In particular,  $\text{rank}_{\mathcal{O}_K} \mathcal{O}_L = [L : K]$ .  $\lrcorner$

*Proof:* Let  $\alpha_1, \dots, \alpha_n$  be a basis of  $L/K$  that is contained in  $\mathcal{O}_L$ , and let  $d = \text{disc}(\alpha_1, \dots, \alpha_n) \neq 0$  by (3.2.6.34), then by (5.2.7.14),  $d\mathcal{O}_L \subset \mathcal{O}_K\{\alpha_1, \dots, \alpha_n\}$ . Notice any generator of the torsion-free module  $\mathcal{O}_L$  over  $\mathcal{O}_K$  is a generator of the field  $L/K$ , so  $\text{rank}_{\mathcal{O}_K} \mathcal{O}_L \geq [L : K]$ . Now if  $M \subset L$  is a free  $\mathcal{O}_L$ -module with a set of generators  $\mu_1, \dots, \mu_r$ , then we can take  $a \in \mathcal{O}_K$  s.t.  $a\mu_i \in \mathcal{O}_L$ . Then

$$adM \subset d\mathcal{O}_L \subset \mathcal{O}_K\{\alpha_1, \dots, \alpha_n\}.$$

And then

$$[L : K] \leq \text{rank}_{\mathcal{O}_K} \mathcal{O}_L \leq \text{rank}_{\mathcal{O}_K} M = \text{rank}_{\mathcal{O}_K}(adM) \leq [L : K].$$

and the assertion follows.  $\square$

**Prop. (5.2.7.16)[Integral Basis of Joins].** Situation as in (5.2.7.13), if  $L/K, L'/K$  are two finite Galois extensions in  $\bar{K}$  s.t.  $L \cap L' = K$ , and let  $\omega_1, \dots, \omega_n$  (resp.  $\omega'_1, \dots, \omega'_{n'}$ ) be an integral basis of  $L/K$  (resp.  $L'/K$ ) with discriminants  $d$  (resp.  $d'$ ) (3.2.6.33). Suppose that  $(d, d') = \mathcal{O}_K$ , then  $\omega_i \omega'_j$  is an integral basis of  $LL'/K$  with discriminant  $d^{n'}(d')^n$ .  $\square$

*Proof:* The hypothesis implies that  $[LL' : K] = nn'$ , so  $\{\omega_i \omega'_j\}$  is a basis of  $LL'/K$  that is integral. To show it is an integral basis, if  $\alpha = \sum_{i,j} a_{ij} \omega_i \omega'_j \in \mathcal{O}_{LL'}$ , we need to show that  $a_{ij} \in \mathcal{O}_K$ . Let  $\beta_i = \sum a_{ij} \omega_j$ , and let  $\text{Gal}(LL'/L) = \{\sigma_1, \dots, \sigma_n\}$ ,  $\text{Gal}(LL'/L) = \{\sigma'_1, \dots, \sigma'_{n'}\}$ ,

$$T = (\sigma'_i \omega'_j)_{i,j}, \quad \underline{a} = (\sigma'_1 \alpha, \dots, \sigma'_{n'} \alpha)^t, \quad \underline{b} = (\beta_1, \dots, \beta_{n'})^t,$$

then  $\det(T)^2 = d'$ , and  $\underline{a} = T\underline{b}$ . So  $\det(T)\underline{a} = T^* \underline{b}$  has integral entries, and  $d'b$  is integral. Thus  $d'a_{ij} \in \mathcal{O}_K$  for each  $i, j$ . Dually,  $da_{ij} \in \mathcal{O}_K$ . Thus by hypothesis,  $a_{ij} \in \mathcal{O}_K$ .

To calculate the discriminant,

$$d = d(\{\omega_i \omega'_j\}) = \det(\{\sigma_k \sigma'_l \omega_i \omega'_j\}_{k,\ell,i,j})^2 = \det((\sigma_k \omega_i)_{k,i} \otimes (\sigma'_l \omega'_j)_{l,j})^2 = \det((\sigma_k \omega_i)_{k,i})^{2n'} \det((\sigma'_l \omega'_j)_{l,j})^{2n} = d^{n'}(d')^n$$

$\square$

**Def. (5.2.7.17)[Conductors].** Let  $R \subset S \in \mathcal{C}\text{Ring}$  the **conductor(ring)** of  $R$  in  $S$  is defined to

$$\mathfrak{c} = \{\alpha \in R \mid \alpha S \subset R\}.$$

And if  $(R, K)$  is an integral domain, the **conductor of  $R$**  is defined to be the conductor of  $R$  in the integral closure of  $R$  w.r.t.  $K$ .  $\square$

**Prop. (5.2.7.18).** Let  $R$  be a Noetherian integral domain with integral closure  $S$ , then the conductor of  $R$  in  $S$  is nonzero iff  $S$  is f.g. as a  $R$ -module.  $\square$

*Proof:* This follows from (5.2.7.4).  $\square$

**Def. (5.2.7.19)[Conductors of an Element].** In situation (5.2.7.13) and  $\alpha \in \mathcal{O}_L$ , then the **conductor(integral element)** of  $\alpha$  w.r.t  $K$  is the conductor of  $\mathcal{O}_K[\alpha]$  in  $\mathcal{O}_L$  (5.2.7.17), denoted by  $\mathfrak{d}(\alpha)$ . It is non-zero by (5.2.7.4) as  $\mathcal{O}_L$  is f.g. over  $\mathcal{O}_K[\alpha]$ .  $\square$

**Prop. (5.2.7.20)[Inertia and Ramification].** Situation as in (5.2.7.13), let  $\mathfrak{p}$  be a maximal ideal of  $\mathcal{O}_K$ , then  $\mathfrak{p}\mathcal{O}_L \cap \mathcal{O}_L \neq 0$  by (5.2.1.5). Let  $\mathfrak{p}\mathcal{O}_L = \prod_i \mathfrak{P}_i^{e_i}$  be a decomposition. Denote  $e_i$  the **ramification degree** of  $\mathfrak{P}_i$  over  $\mathfrak{p}$ , and  $f_i = [\mathcal{O}_L/\mathfrak{P}_i : \mathcal{O}_K/\mathfrak{p}]$  the **inertia degree** of  $\mathfrak{P}_i$  over  $\mathfrak{p}$ .  $\square$

**Prop. (5.2.7.21) [Fundamental Identity].** Situation as in (5.2.7.13), if  $\mathcal{O}_L$  is a finite  $\mathcal{O}_K$ -module, then for any  $\mathfrak{p} = \prod_i \mathfrak{P}_i^{e_i}$ ,

$$\sum e_i f_i = [L : K].$$

And this is the case when  $L/K$  is separable.  $\lrcorner$

*Proof:* By hypothesis,  $\mathcal{O}_{L,\mathfrak{p}}$  is a finite  $\mathcal{O}_{K,\mathfrak{p}}$ -module of rank  $[L : K]$ , thus  $\mathcal{O}_L/\mathfrak{p}$  is an  $\mathcal{O}_K/\mathfrak{p}\mathcal{O}_L$ -module of rank  $n$ . Notice there is an isomorphism  $\mathcal{O}_L/\mathfrak{p}\mathcal{O}_L \cong \prod_i \mathcal{O}_L/\mathfrak{P}_i^{e_i}$ , thus

$$[L : K] = \sum_i \dim_{\mathcal{O}_L/\mathfrak{p}} \mathcal{O}_L/\mathfrak{P}_i^{e_i} = \sum_i e_i f_i.$$

If  $L/K$  is separable, let  $\{\alpha_1, \dots, \alpha_n\}$  be a basis of  $L/K$  with  $\alpha_i \in \mathcal{O}_K$ , then as  $d(\alpha_1, \dots, \alpha_n) \neq 0$  by (3.2.6.34),  $\mathcal{O}_L \subset d^{-1}(\alpha_1 \mathcal{O}_K + \dots + \alpha_n \mathcal{O}_K)$  by (5.2.7.14). So it is a finite  $\mathcal{O}_K$ -module, as  $\mathcal{O}_K$  is Noetherian.  $\square$

**Prop. (5.2.7.22) [Decompositions in a Galois Extension].** Situation as in (5.2.7.13), if  $L/K$  is Galois, then for any  $\mathfrak{p} \in \text{Spec}(\mathcal{O}_K)$ ,  $\text{Gal}(L/K)$  acts transitively on the set of primes over  $\mathfrak{p}$ .  $\lrcorner$

*Proof:* If  $\mathfrak{P}, \mathfrak{P}'$  are two primes over  $\mathfrak{p}$  but  $\mathfrak{P}' \neq \sigma \mathfrak{P}$  for any  $\sigma \in \text{Gal}(L/K)$ , then by Chinese remainder theorem, there exists  $x \in \mathcal{O}_L$  s.t.

$$x \equiv 0 \pmod{\mathfrak{P}'}, \quad x \equiv 1 \pmod{\sigma \mathfrak{P}}, \forall \sigma \in \text{Gal}(L/K).$$

But then  $\text{Nm}_{L/K}(x) = \prod_{\sigma \in \text{Gal}(L/K)} \sigma(x) \in \mathfrak{P}' \cap \mathfrak{O}_K = \mathfrak{p}$ , but none of  $\sigma(x)$  is in  $\mathfrak{P}$ , so  $\prod_{\sigma \in \text{Gal}(L/K)} \sigma(x) \notin \mathfrak{P} \cap \mathcal{O}_K = \mathfrak{p}$ , contradiction.  $\square$

**Thm. (5.2.7.23) [Dedekind-Kummer].** Situation as in (5.2.7.13), suppose  $L = K(\theta)$ , where  $\theta \in \mathcal{O}_L$  has minimal polynomials  $p(X) \in \mathcal{O}_K[X]$  (such a  $\theta$  exists if  $L/K$  is separable, by (3.2.6.18)). Let  $\mathfrak{d}$  be the conductor of  $\theta$ , then for any prime ideal  $\mathfrak{p}$  of  $\mathcal{O}_K$  prime to  $\mathfrak{d}$ , let

$$\bar{p}(X) = \prod_i \bar{p}_i(X)^{e_i}$$

be the decomposition of  $\bar{p}(X)$  into irreducible factors in  $\mathcal{O}_K/\mathfrak{p}[X]$ , where  $\bar{p}_i(X) \in \mathcal{O}_K[X]$  are monic polynomials, then

- $\mathfrak{P}_i = \mathfrak{p}\mathcal{O} + p_i(\theta)\mathcal{O}_L$  are different primes ideals in  $\mathcal{O}_L$ .
- $\mathfrak{p}\mathcal{O}_L = \prod_i \mathfrak{P}_i^{e_i}$ .
- The inertia degree  $f_i$  equals  $\deg(\bar{p}_i(X))$ .

$\lrcorner$

*Proof:* Cf. [Neu99] P48.  $\square$

**Def. (5.2.7.24) [Ramification Notations].** Situation as in (5.2.7.20), let  $\mathfrak{p}\mathcal{O}_L = \prod_{i=1}^r \mathfrak{P}_i^{e_i}$ , then

- $\mathfrak{p}$  **splits completely** in  $L$  if  $r = [L : K]$ .
- $\mathfrak{p}$  is **non-split** in  $L$  if  $r = 1$ .
- $\mathfrak{P}_i$  is **unramified over**  $\mathfrak{p}$  if  $e_i = 1$  and  $\kappa(\mathfrak{P}_i)/\kappa(\mathfrak{p})$  is separable.
- $\mathfrak{P}_i$  is **ramified in** over  $\mathfrak{p}$  if it is not unramified over  $\mathfrak{p}$ .
- $\mathfrak{P}_i$  is **totally ramified over**  $\mathfrak{p}$  if it is ramified over  $\mathfrak{p}$  and  $f_i = 1$ .

- $\mathfrak{p}$  is called **unramified in  $L$**  if all  $\mathfrak{P}_i$  are unramified over  $\mathfrak{p}$ .
- $\mathfrak{p}$  is called **ramified in  $L$**  if some  $\mathfrak{P}_i$  is ramified over  $\mathfrak{p}$ .
- $L/K$  is called a **unramified extension** if all maximal ideals of  $\mathcal{O}_K$  are unramified.

┘

**Prop. (5.2.7.25) [Almost Every Prime is Unramified].** Situation as in (5.2.7.13), then a.e. maximal prime  $\mathfrak{p}$  of  $\mathcal{O}_K$  is unramified in  $L$ , by (5.2.7.39). ┘

**Prop. (5.2.7.26).** Situation as in (5.2.7.13),  $\mathcal{O}_L \otimes_{\mathcal{O}_K} \mathcal{O}_{K,\mathfrak{p}} = \prod_i \mathcal{O}_{L,\mathfrak{P}_i}$ . ┘

*Proof:* Cf. [MIT notes, 11.7]. ┘

**Prop. (5.2.7.27).** If a prime  $\mathfrak{p}$  splits completely in two separable extension  $LM$  of  $K$ , then it also splits completely in the composite  $LM$ . ┘

*Proof:* We use the language of valuation. The extension of a valuation  $v$  of  $K$  corresponds to the set of equivalent classes of algebra map from  $L$  to  $\overline{K_v}$  module conjugacy over  $K_v$ . So We only need to show that two different maps of  $LM$  are not conjugate over  $K_v$ . But the restrict of them to  $L$  or  $M$  is different, thus not conjugate over  $K_v$  by the assumption. ┘

**Cor. (5.2.7.28).** A prime splits completely in a separable extension  $L/K$  if it splits completely in  $\tilde{L}/K$ . ┘

*Proof:* This is because the Galois closure is the composite of the conjugates of  $L$ . ┘

### Differents and Discriminants

**Def. (5.2.7.29) [Differents].** Situation as in (5.2.7.13), if  $L/K$  is separable, then there is a **trace form** on  $L$ :  $(x, y) \rightarrow \text{tr}(xy)$ , which is non-degenerate by (3.2.6.32).

We define the **dual module** for a fractional ideal  $I$  of  $\mathcal{O}_L$  as  $I^\vee = \{x \in L \mid \text{tr}(xI) \in \mathcal{O}_K\}$ . This is truly a fractional ideal because if  $\alpha_i \in \mathcal{O}_L$  is a basis of  $L/K$  and  $d = \det(\text{tr}(\alpha_i \alpha_j)) \in \mathcal{O}_K^\times$  (3.2.6.34), then for any  $a \in I \cap \mathcal{O}_L$ ,  $ad \cdot I^\vee \in \mathcal{O}_L$ , because if  $x = \sum x_i \alpha_i \in I^\vee$ , then  $\sum ax_i \text{tr}(\alpha_i \alpha_j) = \text{tr}(xa \alpha_j) \in \mathcal{O}_K$ , so solve the equation shows  $da x_i \in \mathcal{O}_K$ .

The **different of  $K/L$**  is defined to be  $\mathfrak{d}_{L/K} = ((\mathcal{O}_L)^\vee)^{-1} \in \text{Ideal}(\mathcal{O}_L)$ . ┘

**Prop. (5.2.7.30) [Properties of Differents].** Different is compatible with composition, localization w.r.t. a prime ideal and completion. ┘

*Proof:* Cf. [Neu99]P195. ┘

**Cor. (5.2.7.31).**  $\mathfrak{d}_{L/K} = \prod_{\mathfrak{P}} \mathfrak{d}_{L_{\mathfrak{P}}/K_{\mathfrak{P}}}$ . ┘

**Prop. (5.2.7.32).** If  $\mathcal{O}_L = \mathcal{O}_K[\alpha]$ , then  $\mathfrak{d}_{L/K} = (f'(\alpha))$ , where  $f(X) = \text{Irr}(\alpha, K; X)$ . ┘

*Proof:* By (3.2.6.30), if  $f(X)/(X - \alpha) = \beta_0 + \beta_1 X + \dots + \beta_{n-1} X^{n-1}$ , then  $\mathcal{O}_L^\vee = f'(\alpha)^{-1}(\beta_0, \dots, \beta_{n-1})$ . Now the result follows if  $(\beta_0, \dots, \beta_{n-1}) = \mathcal{O}_L$ , which is easy to see if we write  $\beta_i$  as polynomials of  $\alpha$ . ┘

**Cor. (5.2.7.33).** If  $L/K$  is finite separable extension of local fields, then

$$v_L(\mathfrak{d}_{L/K}) = \sum_{\sigma \in G, \sigma \neq 1} i_{L/K}(\sigma) = \int_{-1}^{\infty} (|\text{Gal}(L/K)_t| - 1) dt.$$

Notation as in (19.1.4.23). ┘

**Prop. (5.2.7.34) [Different as Annihilator of Kähler Differential].** Situation as in (5.2.7.13), if  $L/K$  is separable, the different  $\mathfrak{d}_{L/K}$  is the annihilator of  $\Omega_{\mathcal{O}_L/\mathcal{O}_K}$ .  $\square$

*Proof:* It suffices to show the exact sequence

$$0 \rightarrow \mathfrak{d}_{L/K} \rightarrow \mathcal{O}_L \rightarrow \Omega_{\mathcal{O}_L/\mathcal{O}_K},$$

but because exactness is stalkwise (5.1.4.2), we can localized at a maximal ideal, then by (19.1.4.2),  $\mathcal{O}_L = \mathcal{O}_K[x]$  is monogenous, thus  $\Omega_{\mathcal{O}_L/\mathcal{O}_K}$  is cyclic, and the annihilator of  $dx$  is  $f'(x)$ . So by (5.2.7.32) we are done.  $\square$

**Prop. (5.2.7.35) [Ramification and Different].** Situation as in (5.2.7.13), if  $L/K$  is separable, a maximal ideal  $\mathfrak{P} \in \text{Spec}(\mathcal{O}_L)$  is ramified over  $\mathcal{O}_K$  (5.2.7.24) iff  $\mathfrak{P} \mid \mathfrak{d}_{L/K}$ .

Let  $e$  be the ramification of  $\mathfrak{P}$ , then the power  $s$  of  $\mathfrak{P}$  in  $\mathfrak{d}_{L/K}$  is

$$\begin{cases} s = e - 1 & \mathfrak{P} \text{ tamely ramified} \\ e \leq s \leq e - 1 + v_{\mathfrak{P}}(e) & \mathfrak{P} \text{ wildly ramified} \end{cases}.$$

$\square$

*Proof:* Cf. [Neu99]P199. ?  $\square$

**Def. (5.2.7.36) [Discriminants].** Situation as in (5.2.7.13), if  $L/K$  is separable, the **discriminant of field extension**  $L/K$  is defined to be the set  $\text{disc}(L/K)$  consisting of discriminants  $\text{disc}(\alpha_1, \dots, \alpha_n)$  (3.2.6.33) where  $\{\alpha_i\}$  is a basis of  $L/K$  s.t.  $\alpha_i \in \mathcal{O}_L$ .

Because  $\text{disc}(\alpha_1, \dots, \alpha_n) \in \mathcal{O}_K^\times$  (3.2.6.34) and  $\text{tr}_{L/K}$  is  $\mathcal{O}_K$ -linear,  $\text{disc}(L/K) \in \text{Ideal}(\mathcal{O}_K)^\times$ .  $\square$

**Prop. (5.2.7.37) [Differents and Discriminants].** Situation as in (5.2.7.13), we have

$$\text{disc}(L/K) = \text{Nm}_{L/K} \mathfrak{d}_{L/K}.$$

$\square$

*Proof:* Cf. [Neu99]P201.  $\square$

**Cor. (5.2.7.38) [Compositions and Discriminants].** Situation as in (5.2.7.13), if  $K \subset_{\text{fin}} L \subset_{\text{fin}} M \in \text{Field}$  are separable extensions, we have

$$\text{disc}(M/K) = \text{disc}(L/K)^{[M:L]} \text{Nm}_{L/K}(\text{disc}(M/L)).$$

$\square$

*Proof:* Apply  $\text{Nm}_{M/K} = \text{Nm}_{L/K} \circ \text{Nm}_{M/L}$  to the equation  $\mathfrak{d}_{M/K} = \mathfrak{d}_{M/L} \mathfrak{d}_{L/K}$  (5.2.7.30), we get

$$\text{disc}(M/K) = \text{Nm}_{L/K}(\text{disc}(M/L)) \text{Nm}_{L/K}(\mathfrak{d}_{L/K}^{[M:L]}) = \text{Nm}_{L/K}(\text{disc}(M/L)) \text{disc}(L/K)^{[M:L]}.$$

$\square$

**Cor. (5.2.7.39) [Ramification and Discriminant].** Situation as in (5.2.7.13), if  $L/K$  is separable, then a maximal ideal  $\mathfrak{p} \in \text{Spec}(\mathcal{O}_K)$  ramifies in  $L$  (5.2.7.24) iff  $\mathfrak{p} \mid \text{disc}(L/K)$ .

In particular, only f.m. maximal ideals of  $\mathcal{O}_K$  are ramified in  $L/K$ , and the extension is unramified iff  $\text{disc}(L/K) = 1$ .  $\square$

*Proof:* This follows from (5.2.7.35) and (5.2.7.37).  $\square$

**Cor. (5.2.7.40).**  $\text{disc}(L/K) = \prod_{\mathfrak{P}} \text{disc}(L_{\mathfrak{P}}/K_{\mathfrak{P}})$ .  $\square$

*Proof:* This follows from (5.2.7.31) and (5.2.7.37).  $\square$

### 5.3 Commutative Algebra III

**Notation(5.3.0.1).**

- Let  $R \in \mathcal{CRing}$ .

┘

#### 1 Projective

References are [Projective Modules], [Sta] and [Vak17].

**Def. (5.3.1.1)[Projective Modules].** A module  $P$  over  $R$  is called **projective module** iff  $\text{Hom}(P, -)$  is exact, or equivalent, for any surjective map of modules  $F \rightarrow Q \rightarrow 0$ ,  $\text{Hom}(P, F) \rightarrow \text{Hom}(P, Q)$  is surjective.

┘

**Prop. (5.3.1.2).** Localization and tensor product preserves projective because they are left adjoints. And when tensoring f.f. map, then the converse is also true(5.4.2.1).

┘

**Prop. (5.3.1.3).** A module over a ring is projective iff it is a direct summand of a free module, in particular, it is flat. Moreover, there is a free module  $Q$  that  $P \oplus Q = F$  free.

┘

*Proof:* For the second assertion, we can choose an arbitrary  $Q$  that  $P \oplus Q$  free, and see  $\bigoplus_{\mathbb{N}}(P \oplus Q)$  is free. □

**Lemma (5.3.1.4).** A projective module is a direct sum of countably generated projective modules. ┘

*Proof:* This follows from(3.2.4.28). □

**Prop. (5.3.1.5)[Projective over Local Ring].** A projective module  $P$  over a local ring  $R$  or a PID is free. ┘

*Proof:* Local ring case: By(5.3.1.4) and(3.2.4.29), it suffices to show that any element  $x$  of  $P$  is contained in a free direct summand of  $P$ . Because  $P$  is projective, it is a direct summand of a free module  $F$ ,  $F = P \oplus Q$ . Let  $B$  be a basis of  $F$  that the number of basis element in the expression of  $x$  is minimal. Let  $x = \sum a_i e_i$ . Then no  $a_i$  is contained in the ideal generated by other  $a_j$ , otherwise we can choose another basis to show this is minimal. Let  $e_i = y_i + c_i$  be decompositions into  $P$  and  $Q$  components, and write  $y_i = \sum a_{ij} e_j + t_i$ , where  $t_i$  is combination of elements in  $B$  other than  $e_i$ . Now it suffices to show  $\det(a_{ij})$  is invertible, because in this way  $\{y_i\} \cup (B \setminus \{x_1\})$  is a basis of  $F$  and  $x = \sum a_i y_i$  because  $x \in P$ . And  $N = \text{span}\{y_i\}$  is a summand of  $P$  because  $N \subset P$  and both  $N, P$  are summands of  $F$ .

To show  $\det(a_{ij})$  is invertible, notice that by plugging  $y_i = \sum b_{ij} e_j + t_i$  into  $\sum a_i e_i = \sum a_i y_i$  shows  $a_j = \sum a_i a_{ij}$ , thus by the argument before,  $a_{ij}$  are non-invertible for  $i \neq j$  and  $1 - a_{ii}$  is non-invertible, so  $a_{ii}$  is invertible. Because  $R$  is a local ring, we can easily see  $\det(a_{ij})$  is invertible.

PID case: directly from(3.2.4.21). □

**Prop. (5.3.1.6).** If  $I \in \text{Ideal}(R)$  is nilpotent and  $\overline{P}$  is a projective  $R/I$ -module, then there exists a projective  $R$ -module  $P$  that  $P/IP \cong \overline{P}$ . ┘

*Proof:* Cf.[Sta]P07LV. □

### Finite Projective Modules

**Prop. (5.3.1.7) [Finite Projective Modules].** For  $M \in \text{Mod}_R$ , the following are equivalent:

1.  $M$  is finite projective.
2.  $M$  is f.p. and flat.
3.  $M$  is f.p. and all its localizations at (maximal) primes are free.
4.  $M$  is finite locally free.
5.  $M$  is finite and locally free.
6.  $M$  is finite and all its localizations at primes are free and the function  $x \rightarrow \text{rank}_{\kappa(x)}(M \otimes_R \kappa(x))$  is a locally constant function on  $\text{Spec } R$ .

The category of finite projective modules over  $R$  is denoted by  $\text{Mod}^{\text{f.proj}}/R$ .  $\lrcorner$

*Proof:*  $1 \rightarrow 2$ :  $M \otimes K = R^m$  for some  $K$  and  $m$ , so  $K$  is finite and  $M = R^m/K$  is f.p. And  $M$  is flat because it is a summand of  $R^n$  (5.4.1.4).

$2 \rightarrow 4$ : For any prime  $p$ , choose a basis for the  $k(p)$ -vector space  $M \otimes k(p)$ , then by Nakayama, their inverse image generate  $M_g$  for some  $g \notin p$  (3.2.4.8), and the kernel  $K$  of this generation is finite because  $M_g$  is f.p. And  $K \otimes k(p) = 0$  by the flatness of  $M_g$ . Then by Nakayama again there is a  $g' \notin p$  that  $M_{gg'} = 0$  (3.2.4.8).

$4 \rightarrow 3$ : Because f.p. is local (5.1.4.4).

$3 \rightarrow 2$ : Because flatness is trivial.

$4 \rightarrow 5$ : Because finite is local (5.1.4.4).

$5 \rightarrow 4, 4 \rightarrow 6$ : Trivial.

$6 \rightarrow 4$ : Cf. [Sta]00NX.?

$2 + 3 + 4 + 5 + 6 \rightarrow 1$ : Cf. [Sta]00NX.?

Consider the stalk, it is all free by (5.3.1.2) and (5.3.1.5), thus by (7.5.1.38), it is locally free.  $\square$

**Cor. (5.3.1.8) [Partially Stalkwise].** If  $P$  is f.p., then finite projectiveness is a stalkwise property for  $P$ .  $\lrcorner$

**Cor. (5.3.1.9) [Projective and Flat].** A finite module over a Noetherian ring is projective iff it is flat.  $\lrcorner$

**Cor. (5.3.1.10).** If  $M$  is finite projective, then the canonical map  $\text{Hom}(M, N) \otimes L \rightarrow \text{Hom}(M, N \otimes L)$  is an isomorphism.  $\lrcorner$

*Proof:* By proposition above  $M$  is f.p. and finite locally free, so by (5.3.7.7) and tensor commutes with localization, we can check locally, where  $M$  is finite free so the isomorphism is obvious.  $\square$

**Def. (5.3.1.11) [Characteristic Polynomials for Finite Projective Modules].** Let  $M$  be a finite projective module over a ring  $A$ . then we can define a characteristic polynomial in  $A[X]$  for any map of  $A$ -modules  $M \rightarrow M$ : if  $M$  is free, then this map is defined as usual. In general, we can find an open covering  $\text{Spec } A_{f_i}$  of  $\text{Spec } A$  that  $M_{f_i}$  is free over  $A_{f_i}$ . Thus we can define the characteristic polynomial locally and glue them together to get a characteristic polynomial in  $A[X]$ .

In particular, we can also define trace and norm of a  $A$ -module map  $M \rightarrow M$ . And when  $B$  is a locally free  $A$ -algebra, then there are trace and norm maps  $\text{tr} : B \rightarrow A$  and  $Nm : B \rightarrow A$ .  $\lrcorner$

**Prop. (5.3.1.12).** Let  $R$  be a ring and  $I$  be a locally nilpotent ideal. If  $\overline{P}$  is a finite projective module over  $R/I$ , then there exists a finite projective  $R$ -module  $P$  that  $P/IP \cong \overline{P}$ .  $\lrcorner$

*Proof:* Cf.[Sta]0D47. □

**Prop. (5.3.1.13).** Let  $M$  be a  $R$  module and  $I$  a nilpotent ideal of  $R$ . If  $M/IM$  is a projective  $R/I$ -module and  $M$  is flat over  $R$ , then  $M$  is a projective  $R$ -module. ┘

*Proof:* Cf.[Sta]05CG. □

**Thm. (5.3.1.14) [Serre-Suslin].** Every finite projective module over the polynomial ring  $k[x_1, \dots, x_n]$  is free. ┘

*Proof:* Cf.[?Lan05]P850. ? □

### Duality of Projective Modules

**Prop. (5.3.1.15) [Basis Criterion of Projectiveness].** An  $A$ -module  $P$  is projective iff there are elements  $x_i$  in  $P$  and  $f_i$  in  $P^*$  that for any  $x$ ,  $f_i(x) = 0$  a.e.  $i$ , and  $\sum f_i(x)x_i = x$ . Moreover,  $P$  is finite projective iff there are f.m. of them. ┘

*Proof:* If  $P$  is projective, as a summand of a free module, then we can choose the coordinates of the inclusion map as  $f_i$ , and choose the image of the quotient map of the coordinate as  $x_i$ . The converse is verbatim. □

**Cor. (5.3.1.16) [Finite Projective Duality].** If  $P$  is projective, then  $P \rightarrow P^{**}$  is injective, and if  $P$  is finite projective, then it is an isomorphism. ┘

*Proof:* If  $f(x) = 0$  for all  $f \in P^*$ , then the proposition says  $x = 0$ . And if  $P$  is finite projective, it can be seen  $x_i, f_i$  forms a "basis" of  $P^*$  (finiteness used), so  $f_i$  generate  $P^*$ , and similarly  $x_i$  generate  $P$ , so  $P \rightarrow P^{**}$  is surjective. □

**Cor. (5.3.1.17).** If  $P$  is projective over  $R$ , then  $P^* \neq 0$ . ┘

**Cor. (5.3.1.18).** In the meanwhile of the proof, we already get: if  $P$  is finite projective, then  $P^*$  is finite projective, by (5.3.1.15). ┘

**Cor. (5.3.1.19).** If  $P$  is finite projective, the the map  $P \otimes M \rightarrow \text{Hom}(P^*, M)$  is an isomorphism. ┘

*Proof:* In (5.3.1.10), let  $N = R$  and let  $M = P^*$ , then use the fact  $P \cong P^{**}$ . □

**Thm. (5.3.1.20) [Quillen-Suslin].** For  $k \in \text{Field}$ , any finite projective module over  $k[X_1, \dots, X_k]$  is free. (Highly nontrivial). ┘

*Proof:* Cf.[?Lan05]P850. □

**Prop. (5.3.1.21).**  $\prod^{\mathbb{N}} \mathbb{Z}$  is not free over  $\mathbb{Z}$ , by (3.1.3.4). ┘

## 2 Injective

**Prop. (5.3.2.1) [Baer's Criterion].** A right  $R$ -module  $I$  is injective iff for every right ideal  $J$  of  $R$ , every map  $J \rightarrow I$  can be extended to a map  $R \rightarrow I$ . (Directly from (4.8.9.7)). ┘

**Cor. (5.3.2.2).** A module over a PID is injective iff it is divisible. ┘

**Cor. (5.3.2.3).**  $A$  is injective iff  $\text{Ext}^1(R/I, A) = 0$  for every ideal  $I$  of  $R$ . ┘

**Cor. (5.3.2.4)[Rank].** Let  $M$  a finite projective  $R$ -module, then  $M$  is said to have rank  $n$  if  $M/\mathfrak{m}M$  is of rank  $n$  over the field  $R/\mathfrak{m}$  for any arbitrary maximal ideal  $\mathfrak{m}$  of  $R$ .  $\lrcorner$

**Prop. (5.3.2.5).** The category of  $R$ -mod has enough injectives by (4.8.3.28), and it has enough projectives trivially.  $\lrcorner$

**Prop. (5.3.2.6).** If  $I$  is an injective  $A$ -module, then for any ideal  $\alpha$  of  $A$ ,  $\Gamma_\alpha(I) = \{m | \alpha^n m = 0\}$  for some  $n$  is injective.  $\lrcorner$

*Proof:* Use Baer criterion, for any ideal  $b$  of  $A$ , it is f.g. so there is a  $n$  that  $\phi(\alpha^n b) = 0$ , and Artin-Rees tells us that  $\phi(\alpha^N \cap b) = 0$  for some  $N$ . So we have an extension of  $\phi$  over  $b/b \cap \alpha^N$  to  $A/\alpha^N \rightarrow I$ , and this obviously factor through  $\Gamma_\alpha(I)$ , so it is done.  $\square$

**Prop. (5.3.2.7).** For an injective module  $A$ -module  $I$ ,  $I \rightarrow I_f$  is surjective.  $\lrcorner$

*Proof:* we have the sheaf of modules  $\tilde{I}$  is flabby (7.7.1.5), thus the map to the stalk is surjective.  $\square$

### Pontryagin-Duality

References are [Weibel Homological Algebra].

**Def. (5.3.2.8)[Pontryagin-Duals].** The **Pontryagin-dual**  $M^\vee$  of a left  $R$ -module  $M \in \text{Mod}_R$  is the right  $R$ -module  $\text{Hom}_{\text{Ab}}(M, \mathbb{Q}/\mathbb{Z})$ , where  $(fr)(b) = f(rb)$ .

It is easily verified that if  $A \neq 0$ , then  $A^\vee \neq 0$ , and  $\mathbb{Q}/\mathbb{Z}$  is an injective  $\mathbb{Z}$ -module, thus the Pontryagin dual is faithfully exact.  $\lrcorner$

**Prop. (5.3.2.9).**  $M$  is flat  $R$ -module iff  $M^\vee$  is an injective right  $R$ -module (Because  $\text{Hom}(-, \mathbb{Q}/\mathbb{Z})$  is exact).  $\lrcorner$

## 3 Homological Dimension

**Def. (5.3.3.1).** For a  $R$ -mod  $A$ , the **projective dimension**  $\text{pd}(A)$  is the minimal length of a projective resolution of  $A$ . The **injective dimension**  $\text{id}(A)$  is the minimal length of an injective resolution of  $A$ . The **flat dimension**  $\text{fd}(A)$  is the minimal length of a flat resolution of  $A$ .  $\lrcorner$

**Prop. (5.3.3.2).** If  $R$  is Noetherian, then  $\text{fd}(A) = \text{pd}(A)$  for every f.g. module  $A$ .  $\lrcorner$

*Proof:* Use (5.3.3.3), we see that if we choose a syzygy and look at the  $n$ -th term, then it is f.p and flat, so we have it is projective by (5.4.1.14).  $\square$

**Lemma (5.3.3.3)[pd].** If  $\text{Ext}^{d+1}(A, B) = 0$  for every  $B$ , then for every resolution

$$0 \rightarrow M \rightarrow P_{d-1} \rightarrow \dots, P_1 \rightarrow P_0 \rightarrow A \rightarrow 0$$

where  $P_k$  is projective, then  $M$  is projective. Hence we have  $\text{pd}(A) \leq d$ . (Use dimension shifting, the following two are the same).  $\lrcorner$

**Lemma (5.3.3.4)[id].** If  $\text{Ext}^{d+1}(A, B) = 0$  for every  $A$ , then for every resolution

$$0 \rightarrow B \rightarrow P_0 \rightarrow \dots, P_{n-1} \rightarrow M \rightarrow 0$$

where  $P_k$  is injectives, then  $M$  is injective. Hence we have  $\text{id}(B) \leq d$   $\lrcorner$

**Lemma (5.3.3.5)[fd].** If  $\text{Tor}_{d+1}(A, B) = 0$  for every  $B$ , then for every resolution

$$0 \rightarrow M \rightarrow F_{d-1} \rightarrow \dots, F_1 \rightarrow F_0 \rightarrow A \rightarrow 0$$

where  $F_k$  is flat, then  $M$  is flat. Hence we have  $fd(A) \leq d$  ┘

**Prop. (5.3.3.6)[Global Dimension Theorem].** The following are the same for any ring  $R$  and called the **left global dimension** of  $R$ :

1.  $\sup\{id(B)\}$
  2.  $\sup\{pd(A)\}$
  3.  $\sup\{pd(R/I)\}$
  4.  $\sup\{d : \text{Ext}_R^d(A, B) \neq 0 \text{ for some module } A, B\}$ .
- ┘

*Proof:* This follows from (5.3.3.3), (5.3.3.4) and (5.3.2.3). □

**Prop. (5.3.3.7).** A  $\mathbb{Z}$  has global dimension 1 because injective is equivalent to divisible, and this shows that a quotient of an injective is injective. ┘

**Prop. (5.3.3.8)[Tor Dimension Theorem].** The following are the same for any ring  $R$  and called the **Tor dimension** of  $R$ :

1.  $\sup\{fd(A)\}$  for  $A$  a left module.
  2.  $\sup\{fd(B)\}$  for  $B$  a right module.
  3.  $\sup\{pd(R/I)\}$  for  $I$  a left ideal.
  4.  $\sup\{pd(R/J)\}$  for  $J$  a right ideal.
  5.  $\sup\{d : \text{Tor}_d^R(A, B) \neq 0 \text{ for some module } A, B\}$ .
- ┘

*Proof:* This follows from (5.3.3.5) applied to  $R$  and  $R^{op}$  and also (5.4.1.2). □

**Prop. (5.3.3.9)[Change of Rings].** Let  $S \rightarrow R$  be a ring map, let  $A \in \text{Mod}_R$ , then we have  $pd_S(A) \leq pd_R(A) + pd_S(R)$ . ┘

*Proof:* Use the Cartan-Eilenberg resolution and the total complex has length  $pd_R(A) + pd_S(R)$ . □

## 4 Depth

### Regular sequences

**Def. (5.3.4.1) [Regular Sequences].** If  $R$  is a commutative ring and  $M$  is an  $R$ -module, then a sequence  $(f_1, \dots, f_n)$  of elements of  $R$  is called a **M-regular sequence** if  $f_k$  is a nonzero-divisor of  $M/(f_1, \dots, f_{k-1})$  and  $M/(f_1, \dots, f_n) \neq 0$ . If  $M = R$ , then it is simply called a **regular sequence**. ┘

**Prop. (5.3.4.2).** If  $R$  is a **local ring**,  $M$  a finite  $R$ -module, and  $(f_1, \dots, f_n)$  is a  $M$ -regular sequence, then a permutation of this sequence is also an  $M$ -regular sequence. ┘

*Proof:* By transposition of adjacent indices, we can assume  $n = 2$ . Then  $x$  is a non-zero-divisor, and  $x \in \mathfrak{m}$ , so Now  $(x, y)$  is an  $M$ -regular sequence iff  $M \otimes_R^L R/x$  is discrete and  $M \otimes_R^L R/x \otimes_R^L R/y$  is discrete. Then it suffices to prove  $y$  is injective on  $M$ : If  $ym = 0$ , then  $m = xm'$  for some  $m'$ , because  $y$  is injective on  $M/x$ , and then  $ym' = 0$  also because  $x$  is injective on  $M$ . Then  $x$  is surjective on  $\ker(y)$ , thus  $\ker(y) = 0$  by Nakayama.  $\square$

**Prop. (5.3.4.3).** Let  $R$  be a ring and  $0 \rightarrow M_1 \rightarrow M_2 \rightarrow M_3 \rightarrow 0$  be an exact sequence of  $R$ -modules. Then if a sequence  $(f_1, \dots, f_r) \in R^r$  is both  $M_1$ -regular and  $M_3$ -regular, then it is also  $M_2$ -regular.  $\lrcorner$

*Proof:* Use the snake lemma,  $\ker(f_1|_M) = 0$ , and  $0 \rightarrow M_1/fM_1 \rightarrow M_2/fM_2 \rightarrow M_3/fM_3 \rightarrow 0$ , then use induction.  $\square$

**Prop. (5.3.4.4).** For any integers  $e_i \geq 1$ ,  $(f_1, \dots, f_n)$  is a  $M$ -regular iff  $(f_1^{e_1}, \dots, f_n^{e_n})$  is  $M$ -regular.  $\lrcorner$

*Proof:* Use induction on  $n$ .  $n = 1$  is trivial, and it suffices to show that  $(f_1^e, f_2, \dots, f_n)$  is  $M$ -regular. Then we use induction on  $e$ : There is an exact sequence  $0 \rightarrow M/f_1M \rightarrow M/f_1^eM \rightarrow M/f_1^{e-1}M \rightarrow 0$ , so by (5.3.4.3), if  $(f_1, \dots, f_n)$  is a  $M$ -regular, then  $(f_1^e, f_2, \dots, f_n)$  is  $M$ -regular. Conversely, if  $(f_1^e, f_2, \dots, f_n)$  is  $M$ -regular, then  $f_2$  is injective on  $M/f_1^eM$ , so also injective on  $M/f_1M$ , thus injective on  $M/f_1^{e-1}M$  by induction hypothesis, and also there is a further exact sequence  $0 \rightarrow M/(f_1, f_2)M \rightarrow M/(f_1^e, f_2)M \rightarrow M/(f_1^{e-1}, f_2)M \rightarrow 0$ , so we can consider  $f_3$ , and then so on, thus show  $(f_1^e, f_2, \dots, f_n)$  is  $M$ -regular.  $\square$

**Prop. (5.3.4.5).** Let  $R$  be a ring, then the following are equivalent:

- any permutation of  $(f_1, \dots, f_r)$  is a regular sequence.
- Any subsequence of  $(f_1, \dots, f_r)$  is a regular sequence.
- $(f_1X_1, \dots, f_rX_r)$  is a regular sequence of  $R[X]$ .

$\lrcorner$

*Proof:*  $1 \rightarrow 2$ : Trivial.  $2 \rightarrow 1$ : Use induction on  $r$ : If  $r = 2$  and  $(x, y)$  is regular, we have  $M \otimes_R^L R/x, M \otimes_R^L R/y$  are both discrete, and  $M \otimes_R^L R/x \otimes_R^L R/y$  is also discrete, thus  $M \otimes_R^L R/y \otimes_R^L R/x$  is also discrete and  $(y, x)$  is regular. For  $r > 2$ , it suffices to show  $f_{\sigma(r)}$  is regular in  $M/(f_{\sigma(1)}, \dots, f_{\sigma(r-1)})$ . If  $\sigma(r) = r$ , then we are done, otherwise,  $f_r$  and  $f_{\sigma(r)}$  are both injective on  $M/(f_1, \dots, \widehat{f_{\sigma(r)}}, \dots, f_{r-1})$  by induction hypothesis, and  $(f_{\sigma(r)}, f_r)$  is a regular sequence for this ring, then so is  $(f_r, f_{\sigma(r)})$  by the  $r = 2$  case, thus we are done.

$3 \iff 2$ : Notice as a  $R$ -module,  $R[X_1, \dots, X_r]/(f_1X_1, \dots, f_iX_i)$  is a direct sum of the modules  $R/I_E X_1^{e_1} \dots X_r^{e_r}$ , where  $I_E$  is generated by those  $f_j$  that  $j \leq i$  and  $e_j > 0$ . Then  $f_{i+1}X_{i+1}$  is injective on this iff  $f_{i+1}$  is injective on  $R/I_E$  for any  $E$ . Then it is clear that this is equivalent to 2.  $\square$

**Def. (5.3.4.6) [Quasi-Regular Sequence].** Let  $f_1, \dots, f_c \in R$  and  $J = (f_1, \dots, f_c)$ , let  $M$  be a  $R$ -module, then there is a canonical map  $M/JM \otimes_{R/J} R/J[X_1, \dots, X_c] \rightarrow \otimes_{n \geq 0} J^n M/J^{n+1}M$ . Then  $(f_1, \dots, f_c)$  is called  $M$ -quasi-regular sequence iff this is an isomorphism.  $\lrcorner$

### Depth

**Prop. (5.3.4.7) [Rees].** For a f.g. module  $M$  and  $IM \neq M$ ,

$$\text{depth}_I(M) = \min\{i \mid \text{Ext}_A^i(A/I, M) \neq 0\} = \min\{i \mid \text{Ext}_A^i(N, M) \neq 0\}$$

where  $\text{depth}_I(M)$  is the length of the maximal  $M$ -regular sequence in  $I$ ,  $N$  is a finite  $A$ -module with  $\text{Supp}(N) \subset V(I)$ .  $\lrcorner$

*Proof:* If No elements of  $I$  are  $M$ -regular, then  $i \subset \cup \text{Ass}(M)$  thus in one of them, so  $\text{Hom}_{A_p}(k, M_p) \neq 0$ , and we have  $N_p/PN_p = N \otimes_A k_p$  nonzero by Nakayama, thus  $\text{Hom}_k(N \otimes_A k_p, k_p) \neq 0$ , thus  $\text{Hom}_{A_p}(N_p, M_p) = (\text{Hom}_A(N, M))_p \neq 0$ , so  $\text{Ext}_A^0(N, M) \neq 0$ . Other dimensions follows by induction, consider the cokernel of  $M \xrightarrow{a_1} M$ .

Conversely, use induction, then we have an injection  $\text{Ext}_A^i(N, M) \xrightarrow{a_1} \text{Ext}_A^i(N, M)$  for  $i < n$ . And the condition shows that  $I \subset \sqrt{\text{Ann}(M)}$ , so  $a_1^n N = 0$ , thus the result.  $\square$

**Cor. (5.3.4.8).** Two maximal regular sequence in a f.g. module have the same length.  $\lrcorner$

**Cor. (5.3.4.9).** For a module  $M$  over a Noetherian ring  $A$ , we know  $\Gamma_I(M) = \{m \mid I^n m = 0 \text{ for some } n\}$ , and  $H_I^n$  is its right derived functor, then we have  $\text{depth}_I(M) \geq n \iff H_I^i(M) = 0$  for  $i < n$ . (Because derived functor commutes with colimits, consider  $N = A/I^k$ ).  $\lrcorner$

**Lemma (5.3.4.10)[Ischebeck].** For a Noetherian local ring  $A$ , if  $M, N$  are finite modules, then we have  $\text{Ext}_A^i(N, M) = 0$  for  $i < \text{depth}(M) - \dim N$ .  $\lrcorner$

*Proof:*  $\square$

**Prop. (5.3.4.11).** Let  $A$  be a local ring and  $M$  is finite  $A$ -module, then  $\text{depth}(M) \leq \dim A/P \leq \dim M$  for every  $P \in \text{Ass}(M)$ . (Because  $\text{Hom}(A/P, M) \neq 0$ .)  $\lrcorner$

*Proof:*  $\square$

**Prop. (5.3.4.12)[Auslander-Buchsbaum Formula].** For a local ring  $R$ , if  $M$  is a finitely generated  $R$ -mod, if  $\text{pd}(M) < \infty$ , then we have  $\text{depth}(R) = \text{depth}(M) + \text{pd}(M)$ .  $\lrcorner$

*Proof:* Cf.[Weibel P109].  $\square$

### Cohen-Macaulay

**Def. (5.3.4.13)[Cohen-Macaulay Modules].** For  $A$  Noetherian local, a f.g.  $A$ -module  $M$  is called **Cohen-Macaulay** if  $\text{depth}(M) = \dim M$ . In view of (5.3.4.11), this is equivalence to  $\text{depth}(M) = \dim A/P$  for all  $P \in \text{Ass}(M)$ . A **Cohen-Macaulay ring** is a ring  $A$  that is Cohen-Macaulay over itself.

A localization of a C.M local ring is C.M, so we call a ring **Cohen-Macaulay** if all its localization at primes are C.M.  $\lrcorner$

**Prop. (5.3.4.14)[Gorenstein Ring].** A ring  $R$  is called **Gorenstein** iff  $\text{id}_R R < \infty$ . A Gorenstein local ring is C.M. In this case,  $\text{depth}(R) = \text{id}_R R = \dim R$ , and  $\text{Ext}_R^q(R/m, R) \neq 0 \iff q = \dim R$ .  $\lrcorner$

*Proof:* Cf.[Weibel P107].  $\square$

**Prop. (5.3.4.15).** A ring is C.M. iff for all ideals, the associated primes of  $A/I$  all have the same height as  $I$ , i.e. unmixed.  $\lrcorner$

*Proof:*  $\square$

**Prop. (5.3.4.16).** If a local ring is C.M. and  $I = (x_1, \dots, x_r)$  is a regular sequence, then  $(x_1, \dots, x_r)$  is  $\lrcorner$

*Proof:* ? Isn't this always true?  $\square$

**Prop. (5.3.4.17).** Let  $A$  is a Noetherian local ring and  $M$  a f.g. module, if a set of elements  $(x_1, \dots, x_r)$  forms a regular sequence for  $M$ , then  $\dim M/(x_1, \dots, x_r) = \dim M - r$ . The converse is also true when  $A$  is C.M. If this is the case, then  $A/(x_1, \dots, x_r)$  is also C.M.  $\lrcorner$

*Proof:* By (5.2.2.19), we have  $<$ , for the converse,  $\text{Supp}(M/fM) = \text{Supp}(M) \cap \text{Supp}(A/fA) = \text{Supp}(M) \cap V(f)$ , and when  $f$  is  $M$ -regular,  $V(f)$  doesn't contain any  $\text{Ass}(M)$  thus no minimal elements of  $\text{Supp}(M)$ , so  $\dim(M/fM) < \dim M$ , thus we have  $>$ .  $\square$

When  $A$  is C.M.:?  $\square$

**Prop. (5.3.4.18).** Let  $R \rightarrow S$  be a local homomorphism of Noetherian local rings, if  $R$  is C.M. and  $S$  is finite flat over  $R$  or  $S$  is flat over  $R$  and  $\dim S \leq \dim R$ , then  $S$  is C.M., and  $\dim R = \dim S$ .  $\lrcorner$

*Proof:* Cf. [Sta]00R5.  $\square$

## 5 Normal & Regular Rings

### Normal Ring

**Def. (5.3.5.1) [Normal Rings].** A **normal domain** is a domain and is integrally closed in its fraction field.

A domain is normal iff all its localizations are normal, so we can define a **normal ring** to be a ring that all its stalks are normal local rings. In particular, a normal ring is reduced.  $\lrcorner$

*Proof:* The localization of a normal domain is normal, and the converse follows from  $A = \bigcap A_{\mathfrak{m}}$  (5.1.1.36).  $\square$

**Prop. (5.3.5.2) [UFD is Normal].** A UFD is a normal domain.  $\lrcorner$

*Proof:* If  $A$  is a UFD, then for any  $x \in \text{Frac}(A)$  integral over  $A$ , checking the primes dividing the coefficients, we see  $x \in A$ .  $\square$

**Prop. (5.3.5.3).** A normal ring  $R$  is integrally closed in its ring of fractions.  $\lrcorner$

*Proof:* Let  $x \in Q(R)$  be integral over  $R$ , and  $I = \{f \in R \mid fx \in R\}$ , then for any prime  $\mathfrak{p}$  of  $R$ ,  $R \rightarrow R_{\mathfrak{p}}$  is injective, so  $R_{\mathfrak{p}} \subset \text{Frac}(R) \otimes_R R_{\mathfrak{p}}$ , and  $x \otimes 1$  is integral over  $R_{\mathfrak{p}}$ , thus  $x \otimes 1 \in R_{\mathfrak{p}}$ , which means  $x \otimes 1 = 1 \otimes a/f$  for some  $a, f \in R, f \notin \mathfrak{p}$ . This means  $f'(fx - a) = 0 \in Q(R)$  for some  $f' \notin \mathfrak{p}$ , so  $ff' \in I$ , and thus  $I$  is not contained in any prime ideal, so  $I = R$  and  $x \in R$ .  $\square$

**Prop. (5.3.5.4).** Let  $R$  be a reduced ring with f.m. minimal prime ideals, then the following are equivalent:

- $R$  is a normal ring.
- $R$  is integrally closed in its ring of fractions.
- $R$  is a finite product of normal domains.

In particular, a Noetherian normal domain is a finite product of normal domains (5.1.1.49).  $\lrcorner$

*Proof:*  $3 \rightarrow 1$  is trivial,  $1 \rightarrow 2$  is by (5.3.5.3), for  $2 \rightarrow 3$ : let  $\mathfrak{p}_i$  be the minimal prime ideals of  $R$ , then  $\text{Frac}(R) = \prod_{i=1}^r Q_{\mathfrak{p}_i}$  (5.1.7.22), with each  $Q_{\mathfrak{p}_i}$  field because  $R$  is reduced. Denote the idempotents of  $\text{Frac}(R)$  by  $e_i$ . Then  $e_i$  is integral thus in  $R$ . These idempotents make  $R$  into a product of domains, which are just  $R/\mathfrak{p}_i$ , because the kernel of the map  $R \rightarrow R_{\mathfrak{p}_i}$  is  $\mathfrak{p}_i$ . Now  $R$  is integrally closed in  $\text{Frac}(R)$  implies each  $R/\mathfrak{p}_i$  is integrally closed in  $R_{\mathfrak{p}_i}$ , thus  $R$  is a finite product of normal domains.  $\square$

**Def. (5.3.5.5) [Normalization].** The **normalization** of an integral domain is the alg.closure of it in its quotient field. It commutes with localization.  $\lrcorner$

**Example (5.3.5.6).** The normalization of  $\mathbb{R}[X, Y]/(X^2 + Y^2)$  is  $\mathbb{C}[X]$ , because the map

$$\mathbb{R}[X, Y]/(X^2 + Y^2) \rightarrow \mathbb{C}[X] : X \mapsto X, Y \mapsto iX$$

is injective, and  $i, X$  are both integral over  $\mathbb{R}[X, Y]/(X^2 + Y^2)$ .  $\lrcorner$

**Def. (5.3.5.7) [Completely Normal Domains].** A domain is called **completely normal** iff all almost normal elements are in  $A$ , i.e.  $\{u | \exists a, au^n \in A \ \forall n\} \in A$ . For Noetherian ring, completely normal is equivalent to normal.  $\lrcorner$

*Proof:* Cf. [Sta]00GX.  $\square$

**Prop. (5.3.5.8) [Power Series over Domain Domain].**  $A$  is a normal domain, then so does  $A[[X]]$ . If  $A$  is Noetherian normal domain, then so does  $A[[X]]$ .  $\lrcorner$

*Proof:* Cf. [Sta]030A, 0BI0.  $\square$

**Prop. (5.3.5.9).** Direct limits of normal rings are normal.  $\lrcorner$

*Proof:* Let  $\mathfrak{p}$  be an ideal of  $R = \varinjlim R_i$ ,  $\mathfrak{p}_i = \mathfrak{p} \cap R_i$ , then  $R_{\mathfrak{p}} = \varinjlim (R_i)_{\mathfrak{p}_i}$ , so it suffices to prove for normal domains, the rest is easy.  $\square$

**Prop. (5.3.5.10) [Closure in Separable Extension].** Let  $R$  be a Noetherian normal domain with field of fraction  $K$  and  $L/K$  is a finite separable field extension, then the integral closure  $S$  of  $R$  in  $L$  is finite over  $R$ .  $\lrcorner$

*Proof:* Let  $\text{tr} : L \times L \rightarrow K : (x, y) \mapsto \text{tr}(xy)$  be the trace pairing, then as  $L/K$  is finite separable, this is non-degenerate. Now if  $x \in L$  is integral over  $R$ , then  $\text{tr}(x) \in R$ . So if  $x_1, \dots, x_n$  are integral and form a basis of  $L$  over  $K$ , then  $M = \{y \in L | \langle x_i, y \rangle \in R\}$  is an  $R$ -module and  $M \cong R^n$ , and  $S \subset M$ , so  $S$  is finite over  $R$  as  $R$  is Noetherian.  $\square$

**Prop. (5.3.5.11) [Field Extension].** Let  $A$  be a  $K$ -algebra and  $L/K \in \mathbf{Field}$ , then if  $A_L$  is a normal integral domain, so is  $A$ . And the converse is also true if  $L/K$  is separable.  $\lrcorner$

**Prop. (5.3.5.12) [Algebraic Hartogs's Lemma].** A principal ideal  $A$  in a Noetherian normal domain is unmixed and  $A = \bigcap_{\text{ht } p=1} A_p$ .  $\lrcorner$

*Proof:* Cf. [Matsumura P124].  $\textcolor{red}{?}$  [Rising Sea, P320], [Sta]031T.  $\square$

**Prop. (5.3.5.13) [Krull].** If  $A$  is a normal domain with fraction field  $K$ ,  $L$  is a normal extension field of  $K$  and  $B$  is the integral closure of  $A$  in  $L$  that  $A \subset B$  is integral, then any two prime ideals of  $B$  lying over a prime in  $A$  are conjugate by an action of  $G_{L/K}$ .  $\lrcorner$

*Proof:* Firstly if  $G_{L/K}$  is finite, and  $P, P'$  be primes of  $B$  that  $P \cap A = P' \cap A$ . Let  $P_i = \sigma_i(P)$ . If  $P' \neq P_i$  for any  $i$ , then  $P' \not\subseteq P_i$  for any  $i$  by (5.2.1.5), so there is some  $x \in P'$  not in any of  $P_i$ . Now let  $y = (\prod_i \sigma_i(x))^q$  where  $q = 1$  if  $\text{char}(K) = 0$  and  $q = p^r$  for  $r$  large if  $\text{char}(K) = p$ , then  $y \in K$  thus in  $A$  because  $A$  is normal, and it is not in  $P$  by hypothesis. But  $y \in P' \cap A = P \cap A$ , contradiction.

For the infinite field extension case, let  $K'$  be the fixed field of  $G_{L/K}$  so that  $K'/K$  is purely inseparable, then there is clearly exactly one prime of  $K'$  over any prime of  $A$ . So we can assume  $L/K$  is Galois, then use profinite group technique to find a  $\sigma \in G_{L/K}$  that  $\sigma(P) = P'$ .  $\square$

**Prop. (5.3.5.14) [Hironaka].** Let  $A$  be a local Noetherian domain that is a localization of an algebra of f.t. over a field  $k$ . Let  $t \in A$  that

- $tA$  has only one minimal associated prime ideal  $p$ .
- $t$  generate the maximal ideal of  $A_p$ .
- $A/p$  is normal.

Then  $p = tA$  and  $A$  is normal. ┘

*Proof:* Cf.[Hartshorne P264]. □

**Prop. (5.3.5.15) [Quadratic Extension is Normal].** If  $A$  is a UFD that 2 is invertible in  $A$  and  $f \in A \setminus A^2$ , then  $A[T]/(T^2 - f)$  is integral and normal. ┘

*Proof:* It is integral by (3.2.3.14). To show it is normal, assume  $F(T) \in B[T]$  that  $f(\alpha) = 0$ , where  $\alpha \in K(B) \setminus B$ , then by replacing  $F$  by  $\overline{F}F$ , we can assume  $F(T) \in A[T]$ . We can assume  $\alpha \notin K(A)$ , thus  $\alpha = g + hZ$ , then the minimal polynomial of  $\alpha$  is  $Q(T) = T^2 - 2gT + (g^2 - h^2f) \in K(A)[T]$ . Then  $F(T) = P(T)Q(T)$  in  $K(A)[T]$ . By Gauss's lemma,  $2g, g^2 - h^2f \in A$ , so  $g, f \in A$  by hypothesis. □

**Cor. (5.3.5.16).** If  $k$  is a field of characteristic  $\neq 2$ , then

- $k[x_1, \dots, x_n]/(x_1^2 + \dots + x_m^2)$  is integral normal for  $n \geq m \geq 3$ .
  - $k[x, y, z, w]/(wz - xy)$  is normal. (Diagonalize).
- ┘

**Prop. (5.3.5.17).**  $\mathbb{Z}[\sqrt{n}]$  is integrally closed for  $n \equiv 3 \pmod{4}$ , and  $\mathbb{Z}[\frac{1+\sqrt{n}}{2}]$  is integrally closed for  $n \equiv 1 \pmod{4}$ , by (19.3.1.46). ┘

### Regular Ring

**Def. (5.3.5.18) [Regular Rings].** A Noetherian local ring  $(A, \mathfrak{m}, k)$  is called **regular local** iff it  $\text{rank}_k \mathfrak{m}/\mathfrak{m}^2 = \dim A$ . This is equivalent to  $\text{rank}_k \mathfrak{m}/\mathfrak{m}^2 \leq \dim A$ , or  $\text{gr } A \cong k[X_1, \dots, X_d]$  by (5.2.2.19).

Localization of a regular local ring at primes are regular local, Cf.[Sta]0AFS. Hence we define a **regular ring** to be a Noetherian ring that all its localization at primes are regular local. ┘

*Proof:* Cf.[Matsumura P139]. □

**Prop. (5.3.5.19).** If  $A$  is regular, then  $A[X_1, \dots, X_n]$  is regular, and  $A[[X_1, \dots, X_n]]$  is regular. ┘

*Proof:* Cf.[Matsumura P176]. □

**Prop. (5.3.5.20) [Auslander-Buchsbaum].** A regular local ring is UFD. In particular it is a normal domain. Thus a regular ring is normal and thus reduced (5.3.5.1). ┘

*Proof:* Cf.[Matsumura P142],[Weibel P106]. □

**Cor. (5.3.5.21).** A regular local ring of dimension 0 is a field, and a regular local ring of dimension 1 is a DVR. ┘

**Prop. (5.3.5.22).** A regular local ring is Gorenstein hence C.M.. ┘

*Proof:* □

**Prop. (5.3.5.23)[Regular Local Ring and Regular Sequences].** Let  $(R, \mathfrak{m})$  be a regular local ring of dimension  $d$ ,

- If  $x_1, \dots, x_c$  be a sequence that maps to linearly independent elements in  $\mathfrak{m}/\mathfrak{m}^2$ , then  $(x_1, \dots, x_c)$  is a regular sequence, and  $R/(x_1, \dots, x_c)$  is a regular local ring of dimension  $d - c$ .
- If  $I \subset \mathfrak{m}$  and  $R/I$  is a regular local ring, then  $I = (x_1, \dots, x_c)$  where  $(x_1, \dots, x_c)$  is a regular sequence.
- If  $(x_1, \dots, x_c)$  is a regular sequence in  $\mathfrak{m}$  and  $R/(x_1, \dots, x_c)$  is a regular local ring, then  $R$  is also a regular local ring.

┘

*Proof:* 1: We can complete it to a sequence  $(x_1, \dots, x_d)$  that  $(x_1, \dots, x_d)$  generate  $\mathfrak{m}/\mathfrak{m}^2$ , then by Nakayama  $(x_1, \dots, x_d) = \mathfrak{m}$ . Now by Krull's height theorem(5.2.4.18),  $R/(x_1)$  has dimension  $\geq d - 1$  and  $(x_2, \dots, x_d)$  generate the maximal ideal, so  $R/(x_1)$  is a regular local ring by definition. Now  $x_1 \neq 0$  because  $R$  is a domain(5.3.5.20), thus we can use induction to show  $(x_1, \dots, x_c)$  is a regular sequence.

2: Let  $\dim(R/I) = d - c$ , then the hypothesis shows  $(I + \mathfrak{m}^2)/\mathfrak{m}^2 \cong I/\mathfrak{m}I$  has rank  $c$ , thus we can choose  $(x_1, \dots, x_c) \in I$  that generate  $I/\mathfrak{m}I$ . Thus by Nakayama  $I = (x_1, \dots, x_c)$ , and  $(x_1, \dots, x_c)$  is a regular sequence by item1.

3: By induction, it suffices to prove the  $c = 1$  case, then any lift of  $x_1$  together with  $d - 1$  generator of the maximal ideal of  $R/\mathfrak{m}$  is a set of generator of  $\mathfrak{m}$ . □

**Cor. (5.3.5.24).** A regular local ring is C.M., by item1. ┘

**Prop. (5.3.5.25).** If a quotient of a Noetherian local ring by a non-zerodivisor is regular, then it is itself regular. ┘

**Prop. (5.3.5.26)[Serre].** A Noetherian local ring  $A$  is regular iff the global dimension of  $A$  is finite. ┘

*Proof:* Cf.[Mat P139]. □

**Prop. (5.3.5.27).** For  $A$  a regular local ring and  $M$  a f.g.  $A$ -module,

$$pd(M) + \text{depth } M = \dim A.$$

Cf.[Hartshorne P237]. ┘

**Cor. (5.3.5.28).** For a f.g. module  $M$  over a regular local ring  $A$ ,  $pd(M) \leq n$  iff  $\text{Ext}^i(M, A) = 0$  for all  $i > n$ . ┘

*Proof:* This is because we can use dimension shifting to show  $\text{Ext}^i(M, N) = 0$  for all  $N$  f.g., then(5.3.3.3) says that  $pd(M) \leq n$ . □

**Prop. (5.3.5.29)[Regular and Regular Sequence].** Let ┘

**Prop. (5.3.5.30).** Let  $R \rightarrow S$  be a flat local homomorphism of Noetherian local rings that  $R$  is regular,  $S/\mathfrak{m}_S$  is regular, then  $S$  is also regular. ┘

*Proof:* Cf.[Sta]031E. □

**Serre's Regularity Conditions  $R_k$  &  $S_k$** 

**Def. (5.3.5.31) [Serre's Conditions].**  $R \in \mathcal{CRing}$  is called  $R_k$  iff for all prime  $p$  of height  $\leq k$ ,  $A_p$  is regular. And a ring is called **regular in codimension 1** if it is  $R_1$ .

$R \in \mathcal{CRing}$  is called  $S_k$  iff  $\text{depth}(A_p) \geq \min(k, \text{ht}(p))$  for all prime  $p$ .

A module  $M$  is called  $S_k$  iff  $\text{depth}(M_p) \geq \min(k, \dim \text{Supp } M_p)$  for all prime  $p$ . ┘

**Prop. (5.3.5.32).**

- $M$  is  $S_1$  iff  $M$  has no associated embedded primes. Cf. [Sta]031Q.
- A Noetherian ring is reduced iff it is  $R_0$  and  $S_1$ . Cf. [Sta]031R.
- (Serre Criterion) A Noetherian ring is normal iff it is  $R_1$  and  $S_2$ . Cf. [Sta]031S.
- A ring is C.M. iff it is  $S_N$ . ┘

*Proof:* □

**Cor. (5.3.5.33) [Regular and Normal].** A regular ring is normal, and normal ring is regular in codimension 1. ┘

*Proof:* By (5.3.5.32), it suffices to prove that a regular ring satisfies  $R_1$  and  $S_2$ . A regular ring is C.M. (5.3.5.22) so it is  $S_2$  by (5.3.5.32), it is  $R_1$  by (5.3.5.18) □

**Cor. (5.3.5.34) [Normal and Regular of Dimension 1].** A Noetherian local ring of dim 1 is normal iff it is regular. i.e. integral domain and integrally closed iff maximal ideal is principal. **This is practical when verifying a curve is regular.** ┘

**6 Geometric Properties**

**Def. (5.3.6.1).**

- A  $k$ -algebra  $S$  is called **geometrically reduced/integral/connected**... over a field  $k$  iff for any field extension  $k'/k$ ,  $\text{Spec } S_{k'}$  is reduced/integral/connected....
- A Noetherian  $k$ -algebra  $S$  is called **geometrically regular** iff for any f.g. field extension  $K/k$ ,  $S_K$  is regular (Notice  $A \otimes_k k'$  is Noetherian (5.1.1.47), so this makes sense). ┘

**Prop. (5.3.6.2) [Geometrically reduced].** If  $S$  is a  $k$ -algebra, the following are equivalent.

1.  $S$  is geometrically reduced.
2.  $S \otimes_k \bar{k}$  is reduced.
3.  $S \otimes_k k^{\text{perf}}$  is reduced.
4.  $S \otimes_k k'$  is reduced for any finite purely inseparable field extension  $k'/k$ .
5.  $S \otimes_k k^{1/p}$  is reduced.
6. residue fields of  $S$  at maximal points are reduced.
7.  $S \otimes_k R$  is reduced for every reduced  $k$ -algebra  $R$ . ┘

*Proof:*  $1 \rightarrow 7$ : We can assume  $R$  is f.g., thus  $R$  is contained in a finite product of fields Cf.[Sta]030V?, and then we can assume  $R$  is a product of fields, and we are done.

$1 \rightarrow 2 \rightarrow 3 \rightarrow 4$  is clear.  $3 \rightarrow 5$  is clear.

$4 \rightarrow 1$ : For any field extension  $K/k$ , we can assume WLOG  $K/k$  is f.g., thus?

$5 \rightarrow 1$ : ? 6: ? Cf.[Sta]030V and [Gortz 135]. □

**Prop. (5.3.6.3)[Geometrically Irreducible].** Let  $S$  be a  $k$ -algebra, the following are equivalent:

1.  $S$  is geometrically irreducible.
  2. For any finite separable field extension  $k'/k$ , the spectrum of  $S_{k'}$  is irreducible.
  3. The spectrum of  $S_{k^{\text{sep}}}$  is irreducible.
  4. The spectrum of  $S_{\bar{k}}$  is irreducible.
- ┘

*Proof:* Cf.[Sta]037K. ? □

**Prop. (5.3.6.4).** If  $R, S \in \mathcal{C}\text{Ring}/k$  and  $S/k$  is geometrically irreducible, then the map

$$\text{Spec}(R \otimes_k S) \rightarrow \text{Spec } R$$

induces a bijection on irreducible components. ┘

*Proof:* Cf.[Sta]037O. ? □

**Cor. (5.3.6.5)[Geometrically Irreducible Normal Integral Domains].** Let  $(R, K) \in \mathcal{C}\text{Ring}/k$  be an integral domain. If  $K$  contains no non-trivial finite separable field extension  $k'$  of  $k$ , then  $R$  is geometrically integral. The converse holds if  $R$  is normal. ┘

*Proof:* If  $R$  is not geometrically irreducible, then for some separable field extension  $k'/k \in \mathbf{Field}$ ,  $R \otimes_k k' \subset K \otimes_k k'$  is not integral. Thus  $K$  must contain a non-trivial separable field extension of  $k$ . Conversely, if  $R$  is normal, for any non-trivial finite separable field extension  $k'/k \in \mathbf{Field}$ ,  $k' \subset R$  because  $R$  is normal. Thus  $R \otimes_k k'$  is not integral. □

**Prop. (5.3.6.6)[Geometrically Integral].** For  $S \in \mathcal{C}\text{Ring}/k$ , the following are equivalent:

1.  $S$  is geometrically integral.
  2. For any finite separable field extension  $k'/k$ ,  $S_{k'}$  is an integral domain.
  3.  $S_{\bar{k}}$  is an integral domain.
  4.  $S \otimes_k R$  is an integral domain for any integral domain  $R$  over  $k$ .
- ┘

*Proof:* This follows from (5.3.6.3)(5.3.6.2) and (5.3.6.4). □

**Prop. (5.3.6.7).** It suffices to check geometrically regular for  $k'/k$  finite purely inseparable. ┘

*Proof:* Cf.[Sta]0381. ? □

## 7 Finitely Presentedness

### Finite Presented Modules

**Def. (5.3.7.1)[Finitely Presented Modules].** A finitely presented module is a module of the form  $R^m/R^n$ .

Finite presentation is stable under base change because tensoring is right exact.  $\lrcorner$

**Prop. (5.3.7.2).** Given an exact sequence of  $R$ -modules  $0 \rightarrow M_1 \rightarrow M_2 \rightarrow M_3 \rightarrow 0$ ,

- If  $M_1, M_3$  are f.p., then so does  $M_2$ .
- If  $M_3$  is f.p. and  $M_2$  is f.g., then  $M_1$  is f.g.
- If  $M_2$  is f.p. and  $M_1$  is f.g., then  $M_3$  is f.p.

$\lrcorner$

*Proof:* 1: e can find an commutative diagram 
$$\begin{array}{ccccccc} 0 & \longrightarrow & R^m & \longrightarrow & R^{m+n} & \longrightarrow & R^m \longrightarrow 0 \\ & & \downarrow & & \downarrow & & \downarrow \\ 0 & \longrightarrow & M_1 & \longrightarrow & M_2 & \longrightarrow & M_3 \longrightarrow 0 \end{array}$$
 and use the

snake lemma to see the kernel is f.g..

2: Use the diagram 
$$\begin{array}{ccccccc} R^m & \longrightarrow & R^n & \longrightarrow & M & \longrightarrow & 0 \\ \downarrow \alpha & & \downarrow & & \downarrow \text{id} & & \\ 0 & \longrightarrow & M_1 & \longrightarrow & M_2 & \longrightarrow & M_3 \longrightarrow 0 \end{array}$$
 and snake lemma, then image and

cokernel of  $\alpha$  are all finite, so  $M_1$  is finite.

3: Choose a presentation  $R^m \rightarrow R^n \rightarrow M_2$  and a surjection  $f : R^k \rightarrow M_1$ , then we can lift  $f$  to  $R^k \rightarrow R^n$ , and then  $M_3$  can be written as a quotient  $R^{m+k} \rightarrow R^n \rightarrow M_3$ .  $\square$

**Cor. (5.3.7.3).** A direct summand of a f.p. module is f.p..  $\lrcorner$

**Prop. (5.3.7.4).** If  $R \rightarrow S$  is a f.g. ring map and a  $S$ -module  $M$  is f.p. over  $R$ , then it is f.p. over  $S$ .  $\lrcorner$

*Proof:* Let  $S = R[x_1, \dots, x_n]$ , and  $M = R[y_1, \dots, y_m]/(\sum a_{ij}y_j), 1 \leq i \leq t$ , then as  $M$  is a  $S$ -module, we let  $x_i y_j = \sum a_{ijk} y_k$ , and forms a quotient  $S^{mn+t} \rightarrow S^m \rightarrow N \rightarrow 0$ , where  $S^{mn+t}$  corresponds to the relations  $\sum a_{ij}y_j$  and  $x_i y_j - \sum a_{ijk} y_k$ . Then there is a surjective  $A$ -module map  $N \rightarrow M$ , and we check it is injective: if  $z = \sum b_j y_j$  are mapped to 0, where  $b_j \in S$ , then we can transform  $z$  into the shape  $\sum c_j y_j$ , where  $c_j \in R$  by relations  $x_i y_j - \sum a_{ijk} y_k$ . Thus it is zero by definition.  $\square$

**Prop. (5.3.7.5)[Direct Limits of F.P. Modules].** Any module is a direct limit of f.p. modules. This can be seen by considering all finite submodules and f.m relations between them.  $\lrcorner$

**Prop. (5.3.7.6)[Characterizing Finite and F.P. Modules].** Let  $N$  be an  $R$ -module, then

- $N$  is finite  $R$ -module iff for any filtered colimits  $M = \varinjlim M_i$  of  $R$ -modules, the map  $\varinjlim \text{Hom}(N, M_i) \rightarrow \text{Hom}(N, \varinjlim M_i)$  is injective.
- $N$  is a f.p.  $R$ -module iff for any filtered colimits  $M = \varinjlim M_i$  of  $R$ -modules, the map  $\varinjlim \text{Hom}(N, M_i) \rightarrow \text{Hom}(N, \varinjlim M_i)$  is a bijection.

$\lrcorner$

*Proof:* 1: If  $N$  is generated by  $x_i$  and a map  $f : N \rightarrow M_i$  maps to  $0 \in \text{Hom}(N, \varinjlim M_i)$ , then there is a  $j$  that  $f : M \rightarrow M_i \rightarrow M_j$  is 0. Thus  $f = 0$ . Conversely,  $N$  is the sum of its f.g. submodules  $N'$ ,

thus  $N \rightarrow \varinjlim N/N_i = 0$ , which implies the identity map  $N \rightarrow N$  vanishes for some  $N/N'$  where  $N'$  is a finite submodule of  $N$ , so  $N = N'$  and  $N$  is a finite.

2: If  $M$  is f.p., we can get the assertion by writing  $M$  as a quotient of free modules and use the fact filtered colimit is exact (5.1.1.27). Conversely, write  $N$  as a filtered colimits of f.p. modules (5.3.7.5), then  $\text{id} : M \rightarrow M$  factors through some f.p. module, so it is a direct summand of a f.p. module, thus f.p. by (5.3.7.3).  $\square$

**Cor. (5.3.7.7) [FP and Localization].** For  $M$  f.p.,  $S^{-1} \text{Hom}_R(M, N) = \text{Hom}_{S^{-1}R}(S^{-1}M, S^{-1}N)$  for any  $R$ -module  $N$ . (Use the presentation and Hom is left exact).  $\square$

*Proof:*  $\text{Hom}_{S^{-1}R}(S^{-1}M, S^{-1}N) \cong \text{Hom}_R(M, S^{-1}N)$  by duality, and then we can use (5.3.7.6), as localization is a filtered colimit.  $\square$

### Finitely Presented Ring Map

**Def. (5.3.7.8) [Finitely Presented Ring Map].** A ring map is called **of finite presentation** iff it is a quotient of a free algebra by a free algebra.  $\square$

**Prop. (5.3.7.9).** Finite presentation is stable under composition (choose a presentation form to see) and base change because tensoring is right exact.

It is local on the source and target by (5.1.4.4).  $\square$

**Prop. (5.3.7.10).** For  $S$  f.p. over  $R$ , then the kernel of any surjective ring map  $R[X_1, \dots, X_n] \xrightarrow{\alpha} S$  is f.g..  $\square$

*Proof:* Let  $S = R[Y_1, \dots, Y_m]/(f_1, \dots, f_k)$ , then if  $\alpha(X_i) \cong g_i(Y)$ , then  $\alpha : R[X_1, \dots, X_n] \rightarrow R[X_1, \dots, X_m, Y_1, \dots, Y_m]/(f_1, \dots, f_k, X_i - g_i)$ . And the  $Y_i$  are in the image, thus we let  $Y_i$  are mapped onto by  $h_j(X)$ , then  $\ker \alpha = (f_i(h_j(X)), X_i - g_i(X))$ .  $\square$

**Prop. (5.3.7.11).** If  $g \circ f : R \rightarrow S' \rightarrow S$  is of finite presentation and  $f$  is of finite type, then  $g$  is of finite presentation.  $\square$

*Proof:* Let  $S' = R[y_1, \dots, y_a]$  and  $S = R[X_1, \dots, X_n]/(f_1, \dots, f_m)$ , then let  $h_i(X) \cong y_i$  in  $S$ , then  $S = S'[X_1, \dots, X_n]/(f_1, \dots, f_m, h_i - y_i)$ .  $\square$

**Prop. (5.3.7.12) [Normal Form of F.P.].** If  $S$  is f.p. over  $R$  that  $S$  has a presentation  $S = R[X_1, \dots, X_n]/I$  that  $I/I^2$  is free over  $S$ , then  $S$  has a presentation  $R[X_1, \dots, X_m]/(f_1, \dots, f_c)$  that  $(f_1, \dots, f_c)/(f_1, \dots, f_c)^2$  is freely generated by  $f_1, \dots, f_c$ .  $\square$

*Proof:* Cf. [Sta]07CF.  $\square$

**Prop. (5.3.7.13) [Finite Type Locally of Finite Presentation].** If  $R \rightarrow S$  is a injective map of f.t. of domains, then there are  $f \neq 0 \in R, g \neq 0 \in S$  that  $R_f \rightarrow S_{fg}$  is of f.p.  $\square$

*Proof:* Use induction on the number of generators of  $S/R$ . If  $S = R[x]$ , then  $S = R[X]/\mathfrak{q}$ . If  $q = 0$ , then  $S$  is of f.p.. If  $g = fx^d + a_{d-1}x^{d-1} + \dots + a_0$  be a polynomial of minimal degree in  $\mathfrak{q}$ , then  $R \rightarrow S_f$  is of f.p.

The more generator case can be reduced to the single generator case, because f.p. ring map is stable under composition (5.3.7.9).  $\square$

**Lemma (5.3.7.14) [Filtered Colimits and F.P.].** Let  $R \rightarrow A$  be a ring map, then the category of f.p.  $R$ -algebras  $A'$  with an  $R$ -algebra map  $A' \rightarrow A$  is filtered, and the colimit is just  $A$ .  $\square$

*Proof:* Cf. [0BUF].  $\square$

## 8 Nagata & Excellent Rings

**Def. (5.3.8.1)[Japanese & Nagata Rings].** Let  $R$  be a domain with quotient field  $K$ , then  $R$  is called **N-1** iff the integral closure of  $R$  in  $K$  is a finite  $R$ -module.

$R$  is called **N-2** or **Japanese** iff for any finite field extension  $L/K$ , its integral closure in  $L$  is a finite  $R$ -module.

A ring  $R$  is called **universally Japanese** if for any domain  $S$  of f.t. over  $R$ ,  $S$  is Japanese.

A ring  $R$  is called **Nagata** if it is Noetherian and for any prime  $p$ ,  $R/p$  is Japanese.

All these properties are local properties(5.1.4.4). And they are in fact stable under any localizations. ┘

**Prop. (5.3.8.2)[Nagata].** Let  $R$  be a ring, the following are equivalent:

- $R$  is Nagata,
  - any f.g.  $R$ -algebra is Nagata.
  - $R$  is universally Japanese and Noetherian.
- ┘

*Proof:* Cf.[Sta]0334. □

**Prop. (5.3.8.3)[Nagata and Formal Fibers].** Let  $(A, \mathfrak{m})$  be a Noetherian local ring, then  $A$  is Nagata iff the formal fibers of  $A$  are geo.reduced. ┘

*Proof:* Cf.[Sta]0BJ0. □

### Excellent Rings

**Def. (5.3.8.4)[G-Rings].** A **G-ring** is a Noetherian ring s.t. for any prime  $\mathfrak{p} \subset R$ , the map  $R_{\mathfrak{p}} \rightarrow R_{\mathfrak{p}}^{\wedge}$  is regular. ┘

**Def. (5.3.8.5)[Excellent Rings].** A **quasi-excellent ring** is a ring that is Noetherian, G-ring and J-2. A **excellent ring** is a quasi-excellent ring that is universally catenary. ┘

**Prop. (5.3.8.6).** Quasi-excellent rings are Nagata. ┘

*Proof:* Cf.[Sta]07QV. □

**Prop. (5.3.8.7)[Examples].** The following rings and f.g. algebras over them are excellent rings:

- fields.
- Noetherian complete local rings
- Dedekind domain with fraction field of characteristic 0.

In particular, ring of integers in all local fields and number fields are excellent. ┘

*Proof:* Cf.[Sta]0335. □

**Cor. (5.3.8.8).** The above rings are all Nagata, by(5.3.8.6). ┘

## 9 Separability

Main references are [Matsumura Ch10], [Weibel Chap P309] and [Sta]10.41, 10.43.

**Def. (5.3.9.1) [Separable Algebra].** A f.d semisimple algebra  $R$  over a field  $k$  is called **separable** iff for every field extension  $K/k$ ,  $R \otimes_k K$  is semisimple.  $\lrcorner$

**Def. (5.3.9.2).** A field extension  $K/k$  is called **separably generated** iff it  $K$  is a separable algebraic extension of a purely transcendental field  $L/k$ .

A field extension  $K/k$  is called **separable** iff all f.g. subextensions are separably generated.

An algebra  $A/k$  is called **separable** iff  $A \otimes_k k'$  is reduced for any  $k'/k$  algebraic.  $\lrcorner$

**Prop. (5.3.9.3).** If  $k \subset K$  is a f.g. field extension, then there is a finite purely inseparable field extension  $k \subset k'$  that  $k' \subset K$  is separable.  $\lrcorner$

*Proof:*  $\square$

**Prop. (5.3.9.4) [Separable and Geo.Reduced].** Let  $K/k$  be a field extension, then  $K/k$  is separable iff  $K/k$  is geometrically reduced.  $\lrcorner$

*Proof:* Cf. [Sta]030W.  $\square$

**Cor. (5.3.9.5).** If  $K/k$  is a separable field extension and  $S$  is a reduced  $k$ -algebra, then  $S \otimes_k K$  is reduced.  $\lrcorner$

*Proof:* Cf. [Sta]030U.  $\square$

**Cor. (5.3.9.6).** A separably generated field extension is separable.  $\lrcorner$

## 10 Henselian Ring

References are [Sta]Chap10.148.

**Def. (5.3.10.1) [Henselian Local Rings].** A local ring  $(\mathcal{O}_K, \mathfrak{m}_K, \kappa)$  is called a **Henselian local ring** iff for every  $f \in R[X]$  and  $a_0 \in k$  that  $\bar{f}(a_0) = 0$  and  $\bar{f}'(a_0) \neq 0$ , then there is a root  $\alpha$  of  $f$  lifting  $a_0$ . It is called **strictly-Henselian** if moreover  $\kappa = \kappa^{\text{sep}}$ .  $\lrcorner$

### Henselian Pairs

**Def. (5.3.10.2) [Henselian Pairs].** A **Henselian pair** is a Zariski-pair  $(A, I)$  (5.2.6.12) s.t. : For any  $f, g \in A[T]$  monic s.t.  $\bar{f} = \bar{g}\bar{h} \in A/I[T]$  and  $\bar{g}, \bar{h}$  are coprime and monic, there is a factorization  $f = gh$  lifting the decomposition.  $\lrcorner$

In particular, if  $f$  has a simple root  $\bar{x}$  in  $A/I$ , then it has a root  $x \in A$  lifting  $\bar{x}$ .  $\lrcorner$

**Prop. (5.3.10.3).** Filtered limits of Henselian pairs is Henselian, this is clear from the definition (5.3.10.2).  $\lrcorner$

**Lemma (5.3.10.4).** If  $A$  is a ring with ideal  $I$ , if  $\bar{f} = \bar{g}\bar{h}$  be a factorization of a polynomial  $f \in A[T]$  in  $A/I[T]$ , then there is an étale ring map  $A \rightarrow A'$  that  $A/IA \cong A'/IA'$ , and a factorization  $f = g'h' \in A'[T]$  lifting the factorization.  $\lrcorner$

*Proof:* Cf. [Sta]0ALH.  $\square$

**Prop. (5.3.10.5) [Topological Invariance of Étale Sites].** If  $I$  is locally nilpotent, then  $(A, I)$  is Henselian, in particular  $A_{\text{ét}} \cong (A/I)_{\text{ét}}$  (5.3.10.9).  $\lrcorner$

*Proof:* First if  $A \rightarrow S$  is étale, then  $A/I \rightarrow S/IS$  is étale by base change (5.4.7.5) and the map is essentially surjective by (5.4.7.15). And any map  $B/IB \rightarrow B'/IB'$  can be lifted to  $B \rightarrow B'$  because étale is smooth and use (5.4.5.16). And the lifting is unique, otherwise if  $f, g$  are two lifting, because étale is unramified, so if we choose an idempotent  $e$  generating the kernel of  $B \otimes_A I \rightarrow B \rightarrow B$  (5.4.6.10), then  $f \otimes g(e) \in IB'$ , which is locally nilpotent, thus  $f \otimes g(e) = 0$ , thus  $f = g$ .

For then Henselian,  $I$  is clearly contained in the Jacobson radical, and for the decomposition, by (5.3.10.4) there is an étale map  $A \rightarrow A'$  that  $A/IA \cong A'/IA'$  that lifts the factorization, but  $A = A'$ , by what we have seen above.  $\square$

**Cor. (5.3.10.6) [Complete Pair is Henselian].** If  $(A, I)$  is a pair that  $A$  is  $I$ -adically complete, then  $(A, I)$  is Henselian.  $\lrcorner$

*Proof:*  $I$  is in the Jacobson radical because  $1 + I$  consists of units, and by (5.3.10.5) and (5.3.10.4) we can lift the decomposition to  $A/I^n$  inductively. As  $A = \lim A/I^n$ , we are done.  $\square$

**Prop. (5.3.10.7) [Equivalent Definitions of Henselian Pair].** The following are all equivalent to  $(A, I)$  being Henselian:

- Given any étale ring map  $A \rightarrow A'$ , then any  $A' \rightarrow A/I$  lifts to an  $A$ -algebra map  $A' \rightarrow A$ .
- For any finite/integral  $A$ -algebra  $B$ , the map  $B \rightarrow B/IB$  induces a bijection on idempotents.
- (Gabber)  $(A, I)$  is Zariski and every monic polynomial  $f(T) \in A[T]$  of the form  $T^n(T-1) + a_n T^n + \dots + a_1 T + a_0$  with  $a_i \in I$  has a root  $\alpha \in 1 + I$ .

Moreover, root in item3 is unique.  $\lrcorner$

*Proof:* Cf. [Sta]09XI.  $\square$

**Cor. (5.3.10.8).** if  $(A, I)$  is Henselian and  $A \rightarrow B$  is integral, then  $(B, IB)$  is also Henselian.  $\lrcorner$

**Prop. (5.3.10.9) [Henselian Liftings].** If  $(A, I)$  is a Henselian pair (5.3.10.2), then the base change functor  $A_{\text{ét}} \cong (A/I)_{\text{ét}}$  is an equivalence of categories.  $\lrcorner$

*Proof:* Cf. [Sta]09ZL. ?  $\square$

**Prop. (5.3.10.10).** A Zariski-pair  $(R, I)$  (5.2.6.12) is Henselian (5.3.10.2) iff the pair  $(\mathbb{Z} \oplus I, I)$  is Henselian. In particular, the property of being Henselian only depends on the non-unital ring  $I$ .  $\lrcorner$

*Proof:* Cf. [Almost Ring Theory, 5.1.9].  $\square$

## 5.4 Commutative Algebra IV

**Notation (5.4.0.1).**

- Let  $R \in \mathcal{CRing}$ .

┘

### 1 Flatness

**Def. (5.4.1.1) [Flatness].** A module  $M$  over a ring  $R$  is called **flat** if  $M \otimes_R - : \text{Mod}_R \rightarrow \text{Mod}_R$  is an exact functor. This is compatible with the definition (7.2.2.15).

And  $R \rightarrow S \in \mathcal{CRing}$  is called a **flat ring map** if  $S$  is flat as an  $R$ -module.

┘

**Prop. (5.4.1.2).** Flatness need only be checked for finite modules, and it is equivalent to  $\text{Tor}_1(M, A/I) = 0$  for any f.g. ideal  $I$  (i.e.  $I \otimes M \rightarrow M$  is injective).

┘

*Proof:* This is because of (7.3.3.12) and the fact tensor product commutes with colimit.

□

**Cor. (5.4.1.3).** If  $0 \rightarrow M' \rightarrow M \rightarrow M'' \rightarrow 0$ , then  $M'$  and  $M''$  flat implies  $M$  is flat.

┘

**Prop. (5.4.1.4).** If  $M$  is flat then  $\text{Tor}_i^A(M, N) = 0$  for all  $i > 0$ , because we have: if  $0 \rightarrow M_1 \rightarrow M_2 \rightarrow M_3 \rightarrow 0$ ,  $M_2, M_3$  flat, then  $M_1$  is flat (Use 9 entry sequence and the fact that Tor is symmetric (5.9.2.5)). So  $\text{Tor}_{n+1}(M_3, N) = \text{Tor}_n(M_1, N) = 0$  by induction.

And a direct summand of a flat module is flat. Thus we have the class of flat modules is adapted  $- \otimes N$  for all  $N$  (because free is flat).

┘

**Prop. (5.4.1.5) [Faithfully Flatness].** The following are equivalent:

- $M$  is flat and for any  $N \neq 0$ ,  $N \otimes_R M \neq 0$ .
- $M$  is flat and for any (maximal) prime ideal  $\mathfrak{m}$  of  $R$ ,  $k(\mathfrak{m}) \otimes_R M \neq 0$ . (When  $\mathfrak{m}$  is maximal, which means  $\mathfrak{m}M \neq M$ ).

And such a  $M$  is called **faithfully flat** over  $R$ .

And  $R \rightarrow S \in \mathcal{CRing}$  is called a **faithfully flat ring map** if  $S$  is faithfully flat as an  $R$ -module.

┘

*Proof:*  $1 \rightarrow 2$  is easy.  $2 \rightarrow 1$ : any nonzero module has a submodule  $R/I$ , choose a maximal ideal  $\mathfrak{m}$  containing  $I$ , then  $(A/I) \otimes_A M \subset N \otimes_A M$  surjects to  $k(\mathfrak{m}) \otimes_A M \neq 0$ .

□

**Prop. (5.4.1.6) [Flatness and Base Change].**

- (Faithfully) Flatness is stable under base change.
- Flatness satisfies f.f. descent (5.4.2.1).
- Flatness is stable under filtered colimit because filtered colimit commutes with tensoring (3.2.4.13) and is exact (5.1.1.27). In particular,  $S^{-1}A$  is flat (5.1.1.30).
- Let  $S \rightarrow S'$  be a map of  $R$ -algebras,  $M$  is an  $S$ -module,  $M' = M \otimes_S S'$ , then if  $M$  is flat over  $R$ , so does  $M'$ . The converse also holds if  $S \rightarrow S'$  is f.f..
- If  $R \rightarrow S$ , and a  $S$ -module  $M$  is  $R$ -flat and  $S$ -f.f., then  $R \rightarrow S$  is flat.

┘

*Proof:*

4: For any injection of  $R$ -modules  $N \rightarrow N'$ , use the fact  $\ker(N \otimes_R M \rightarrow N' \otimes_R M) \otimes_S S' = \ker(N \otimes_R M' \rightarrow N' \otimes_R M')$ .

5: For any injection of  $R$ -modules  $N \rightarrow N'$ , use the fact  $\ker(N \otimes_R S \rightarrow N' \otimes_R S) \otimes_S M = \ker(N \otimes_R M \rightarrow N' \otimes_R M)$ .  $\square$

**Prop. (5.4.1.7) [Equational Criterion of Flatness].** For a  $R$ -module  $M$ , a relation  $\sum f_i x_i = 0$  where  $f_i \in R, x_i \in M$  are called **trivial** iff  $\vec{x} = A \vec{y}$  for some  $A \in M_{n \times n}(R)$ ,  $\vec{y} \in M^n$ , and  $\vec{f}^t A = 0$ . Then  $M$  is flat iff all relations of elements of  $M$  is trivial.  $\lrcorner$

*Proof:* Assume  $M$  is flat over  $R$ , and  $\sum f_i x_i = 0$  is a relation in  $M$ . Let  $I = (f_1, \dots, f_n)$  and let  $K = \ker(R^n \rightarrow I : (x_i) \mapsto \sum x_i f_i)$ , then  $\sum f_i \otimes x_i = 0 \in I \otimes_R M$  by flatness, then  $\sum e_i \otimes x_i \in K \otimes_R M$ . Let  $\sum e_i \otimes x_i = \sum k_j \otimes y_j$ , and  $k_j = \sum_i a_{ij} e_i$ , then this is the desired relations.

Conversely, suppose every relation is trivial, and  $I$  is an ideal of  $R$ , let  $x = \sum f_i \otimes x_i \in I \otimes M$  be an element mapping to  $0 \in R \otimes M = M$ , then  $\sum f_i x_i$  is a relation, so it is trivial, and then  $x = \sum f_i \otimes x_i = \sum f_i \otimes (a_{ij} y_j) = \sum (f_i a_{ij}) y_j = 0$ .  $\square$

**Prop. (5.4.1.8) [Gorodov-Lazard].** Any flat  $A$ -module is isomorphic to a direct limit of finite free modules.  $\lrcorner$

*Proof:* Cf. [Sta]058G.  $\square$

**Prop. (5.4.1.9) [Flat Modules are Torsion-Free].** Flat modules are torsion-free.  $\lrcorner$

*Proof:* If  $x \in R$  is a nonzero-divisor,  $R \xrightarrow{x} R$  is injective, thus  $M \xrightarrow{x} M$  is also injective.  $\square$

**Prop. (5.4.1.10) [Flat over Local Rings].** A finite module  $M$  over a local ring  $A$  is flat iff it is free. In particular, finite modules over a field are all flat.  $\lrcorner$

*Proof:* Let  $A/\mathfrak{m} = k$ , choose a  $k$ -basis  $x_i$  of  $M/\mathfrak{m}M$ , then they generate  $M$  by Nakayama. It suffices to prove that  $x_i$  are independent over  $R$ . For this, use equational criterion of flatness (5.4.1.7), we prove that if  $x_i$  is independent over  $k$ , then they are independent over  $A$ . Use induction, if  $x \neq 0$  in  $M/\mathfrak{m}M$ , if  $fx = 0$  for some  $f \in A$ , then  $x = \sum a_j y_j$  that  $fa_j = 0$ , but then some  $a_j$  is a unit, so  $f = 0$ .

If  $\sum f_i x_i = 0$ , then by hypothesis,  $f_i \in \mathfrak{m}$ , and there are  $y_j$  that  $x_i = \sum a_{ij} y_j$ ,  $\sum f_i a_{ij} = 0$ . As  $x_n \notin \mathfrak{m}M$ , there is a  $a_{nj} \notin \mathfrak{m}$ , so  $f_n = \sum (-a_{ij}/a_{nj}) f_i$ . then  $\sum_{i \neq n} f_i (x_i - a_{ij}/a_{nj} x_n) = 0$ , but  $x_i - a_{ij}/a_{nj} x_n$  is also independent over  $k$ , so by induction,  $f_i = 0$ , also does  $f_n$ , so we are done.  $\square$

**Prop. (5.4.1.11) [Flatness over Bézout-Domains].** If  $M \in \text{Mod}_R$  and  $R$  is a Bézout-domain, then  $M$  is flat over  $R$  iff it is torsion-free.  $\lrcorner$

*Proof:* One direction is clear by (5.4.1.9). If it is torsion-free, we use the equational criterion of flatness (5.4.1.7):

Let  $\sum a_i x_i = 0$  where  $a_i \in R^*, x_i \in M$ , then consider  $(a_1, \dots, a_n) = (a)$ , thus  $a_i = ab_i$  for some  $b_i \in R$ , and  $\sum c_i b_i = 1$  for some  $c_i \in R$  as  $R$  is a domain. Because  $M$  is torsion-free,  $\sum_i b_i x_i = 0$ . Notice  $\vec{x} = (1 - \vec{c} \vec{b}^t) \vec{x}$ , so we can take  $\vec{y} = \vec{x}$ ,  $A = 1 - \vec{c} \vec{b}^t$ . Then  $\vec{b}^t A = \vec{b}^t - \vec{b}^t \vec{c} \vec{b}^t = 0$ .  $\square$

**Cor. (5.4.1.12) [Flatness over Valuation Rings].** A module over a valuation ring is flat iff it is torsion-free. In particular, if  $(A, \mathfrak{m}, \varpi) \in \text{DVR}$ , then  $M \in \text{Mod}_A$  is flat iff  $\varpi : M \rightarrow M$  is injective.  $\lrcorner$

*Proof:* Because valuation ring is Bézout (12.2.2.8), we can use (5.4.1.11).  $\square$

**Cor. (5.4.1.13) [Flat Modules over Dedekind-Domains].** If  $A$  is a Dedekind-domain (5.2.7.1) and  $M \in \text{Mod}_A$ , then  $M$  is flat over  $A$  flat iff it is torsion-free over  $A$ .  $\lrcorner$

*Proof:* Because flatness and torsion-freeness is stalkwise (5.1.4.2), so it suffices to prove for its localizations, which are DVRs (5.2.7.2), so the result follows from (5.4.1.12).  $\square$

**Prop. (5.4.1.14) [Finite Flat is Locally Free].** Finitely presented flat module is equivalent to finite projective and equivalent to finite locally free. (Immediate from (5.3.1.7)).  $\lrcorner$

**Prop. (5.4.1.15).** if  $M$  is a flat  $R$ -module, then  $IM \cap JM = (I \cap J)M$  for ideals of  $A$ .  $\lrcorner$

*Proof:* Tensoring the exact sequence  $0 \rightarrow I \cap J \rightarrow I \oplus J \rightarrow J \cup I \rightarrow 0$  with  $M$ .  $\square$

**Prop. (5.4.1.16) [Local & Infinitesimal Criterion of Flatness].** Suppose  $(A, \mathfrak{m}) \rightarrow (B, \mathfrak{n}) \in \text{NlocCRing}$  and  $M \in \text{Mod}_{B/\mathfrak{m}^n}$ , then the following are equivalent:

- $M$  is flat over  $A$ .
- $\text{Tor}_1^A(M, A/\mathfrak{m}) = 0$ .
- $M/\mathfrak{m}^n M$  is flat over  $A/\mathfrak{m}^n$  for sufficiently large  $n$ .

$\lrcorner$

*Proof:*  $1 \rightarrow 2, 1 \rightarrow 3$  is trivial. For the converse, we need to prove  $\text{Tor}_1^A(M, A/I) = 0$  for any ideal  $I \subset A$ , or  $I \otimes M \rightarrow M$  is injective.

If 2 holds, then  $\text{Tor}_1^A(M, N) = 0$  for any  $A$ -module of finite length, because by devissage we can reduce  $N$  to  $A/\mathfrak{m}$ .

Tensoring the exact sequence  $0 \rightarrow \mathfrak{m}^n \cap I \rightarrow I \rightarrow I/I \cap \mathfrak{m}^n \rightarrow 0$  with  $M$ , we get

$$\mathfrak{m}^n \cap I \otimes M \rightarrow I \otimes M \rightarrow (I/I \cap \mathfrak{m}^n) \otimes M \rightarrow 0$$

and also the exact sequence  $0 \rightarrow I/I \cap \mathfrak{m}^n \rightarrow R/\mathfrak{m}^n \rightarrow R/(I + \mathfrak{m}^n) \rightarrow 0$  gives

$$0 \rightarrow (I/I \cap \mathfrak{m}^n) \otimes M \rightarrow M/\mathfrak{m}^n M \rightarrow M/(I + \mathfrak{m}^n)M \rightarrow 0$$

by the fact  $R/(I + \mathfrak{m}^n)$  has finite length in case2 or the fact they are all  $R/\mathfrak{m}^n M$  modules in case3.

Thus the kernel of  $I \otimes M \rightarrow M$  is contained in  $(\mathfrak{m}^n \cap I) \otimes M$  for any  $n$ , which means it is contained in  $\mathfrak{m}^n(I \cap M)$  for any  $n$  by Artin-Rees (5.2.2.13). Thus the kernel is trivial by Krull's intersection theorem (5.2.2.14) as  $I \otimes M$  is finite over  $S$ .  $\square$

### Flat Ring Maps

**Prop. (5.4.1.17) [Flatness is Local].** Flatness for ring maps (5.4.1.1) is stalkwise both on the target and source, thus flatness is local both on the target and the source (5.1.4.2).  $\lrcorner$

**Cor. (5.4.1.18) [Going-down].** Going-down holds for flat ring map.  $\lrcorner$

*Proof:* The ring map  $R_{\mathfrak{p}'} \rightarrow S_{\mathfrak{q}'}$  is flat by (5.4.1.17), thus it is f.f. by (5.4.1.22). Then (5.4.1.20) says  $\mathfrak{p} \subset \mathfrak{p}'$  is in the image.  $\square$

**Prop. (5.4.1.19).** If  $f : A \rightarrow B, g : B \rightarrow C \in \text{CRing}$  are flat ring maps (5.4.1.1), then so is  $g \circ f : A \rightarrow C \in \text{CRing}$ .  $\lrcorner$

*Proof:* Cf. [GAGA Serre P26].  $\square$

**Prop. (5.4.1.20).** The following are equivalent:

- $A \rightarrow B$  is f.f.
- It is flat and  $\text{Spec } B \rightarrow \text{Spec } A$  is surjective.
- It is flat and  $\text{Spec}$  map contains all the closed pts.

┘

*Proof:* This follows from (5.4.1.5) as we see that  $\mathfrak{p}$  is in the image of  $\text{Spec}$  map iff  $k(\mathfrak{p}) \otimes_A B \neq 0$ .  $\square$

**Cor. (5.4.1.21).** Integral flat injective ring extension is f.f., by (5.2.1.5). ┘

**Cor. (5.4.1.22).** Flat local ring map of local rings is f.f.. ┘

**Cor. (5.4.1.23).** Filtered colimits of f.f. rings over  $R$  is f.f. ┘

*Proof:* It is flat by (5.4.1.6), and for a maximal ideal  $\mathfrak{m}$  of  $R$ ,  $S_i/\mathfrak{m}S_i$  is non-zero, hence the direct limit is non-zero because 1 is contained. So  $\mathfrak{m}$  is in the image, hence it is f.f. by (5.4.1.20).  $\square$

**Cor. (5.4.1.24) [Filtered Colimit of Flat Ring Maps].** If  $I$  is filtered and  $R_i \rightarrow S_i$  are (faithfully) flat ring maps, then  $\text{colim}_I R_i \rightarrow \text{colim}_I S_i$  is (faithfully) flat. ┘

*Proof:* For any  $\text{colim } R_i$ -module  $M$ ,  $(\text{colim } S_i) \otimes_{\text{colim } R_i} M = \text{colim}(S_i \otimes_{R_i} M)$ , so it is flat, because  $\text{colim}$  is exact. For the faithfully flatness, for any maximal ideal  $\mathfrak{m}$  of  $\text{colim } R_i$ , let  $\mathfrak{m}_i = \mathfrak{m} \cap R_i$ , then  $S_i/\mathfrak{m}_i S_i \neq 0$ , thus the direct limit is also  $\neq 0$ , so  $\mathfrak{m}$  is in the image, hence it is f.f. by (5.4.1.20).  $\square$

**Prop. (5.4.1.25).** If  $R \rightarrow S$  is (faithfully) flat ring map and  $M$  is a (faithfully) flat  $S$ -module, then  $M$  is a (faithfully) flat  $R$ -module. In particular, (faithfully) flatness is stable under composition. Also (faithfully) flatness is stable under base change. ┘

**Prop. (5.4.1.26).** If  $B$  is flat over  $A$ , then

$$\text{Tor}_i^A(M, N) \otimes B = \text{Tor}_i^B(M_{(B)}, N_{(B)}), \quad \text{Ext}_i^A(M, N) \otimes B = \text{Ext}_i^B(M_{(B)}, N_{(B)}).$$

┘

**Prop. (5.4.1.27) [Faithfully Flat Ring Maps are Injective].** A f.f. ring map  $R \rightarrow S$  is universally injective. In particular, tensoring with  $R/I$ , we get  $R \cap IS = I$  for an ideal  $I$  of  $R$ . ┘

*Proof:* Because  $R \rightarrow S$  is f.f., we only need to show that  $N \otimes_R S \rightarrow N \otimes_R S \otimes_R S$  is injective for any  $N$ , but this is true because it has a left inverse.  $\square$

**Prop. (5.4.1.28).** A f.f. map between valuation rings is equivalent to an injective local homomorphism. ┘

**Prop. (5.4.1.29).** A flat ring map maps a non-zero-divisor to a non-zero-divisor, because if we consider the principal ideal generated by it, then (5.4.1.2) shows the ideal in  $M$  is also injective, so it is not a zero-divisor. ┘

**Thm. (5.4.1.30) [Flat Maps are Open].** The  $\text{Spec}$  map of a ring map  $R \rightarrow S$  of f.p. that satisfies going-down (e.g. flat), is open. ┘

*Proof:*  $S \rightarrow S_f$  satisfies going-down and is of f.p, so we see that  $R \rightarrow S_f$  satisfies going down. It suffices to prove the image of this map is open. By Chevalley, the image is constructible, and it is stable under generalization. So it is open by (4.12.3.10).  $\square$

**Cor. (5.4.1.31).** The Spec map  $f$  of a f.f. ring map is a quotient map.  $\lrcorner$

**Prop. (5.4.1.32) [Noetherian Completions are Flat].** If  $A$  is Noetherian and  $I$  is an ideal, the the  $I$ -adic completion  $\hat{A}$  is flat over  $A$  by (5.2.3.24).  $\lrcorner$

**Cor. (5.4.1.33) [Flatness and Completions].** For  $f : A \rightarrow B \in \mathcal{NlocCRing}$ ,  $f$  is flat iff  $\hat{f} : \hat{A} \rightarrow \hat{B}$  is flat.  $\lrcorner$

*Proof:* This follows from the fact that  $A \rightarrow \hat{A}, B \rightarrow \hat{B}$  are f.f. (5.4.1.32)(5.4.1.30) and faithfully flat descent (5.4.2.1).  $\square$

**Prop. (5.4.1.34) [Generic Freeness+F.P.].** If  $R$  is reduced,  $S$  a f.g.  $R$ -algebra and  $M \in \mathcal{Mod}_S^{\text{fg}}$ , then there exists an open dense subset  $U \subset \text{Spec } R$  that there is a covering of  $U$  by standard opens  $D(f)$  s.t.

- $M_f$  and  $S_f$  are free over  $R_f$ .
- $S_f$  is a f.p.  $R_f$ -algebra.
- $M_f$  is a f.p.  $S_f$ -module.

In particular, it is generically flat.  $\lrcorner$

*Proof:* Cf. [Sta]051Z. ?  $\square$

**Prop. (5.4.1.35) [Miracle Flatness].** Let  $f : A \rightarrow B \in \mathcal{NlocCRing}$  s.t.

- $A$  is regular.
- $B$  is Cohen-Macaulay.
- $\dim B = \dim A + \dim(A/f(\mathfrak{m}_A)B)$ ,

then  $f$  is flat.  $\lrcorner$

*Proof:* Cf. [Sta]00R4.  $\square$

**Prop. (5.4.1.36) [Slicing Criterion for Flat Modules on the Target].** Let  $R \rightarrow S$  be a local homomorphism of local rings s.t.

- $S$  is essentially of f.p. over  $R$ ,
- $M$  is of f.p. over  $S$ ,
- $\text{Tor}_1^R(M, R/I) = 0$ .
- $M/IM$  is flat over  $R/I$ .

Then  $M$  is flat over  $R$ .  $\lrcorner$

*Proof:* Cf. [Sta]0471. ?  $\square$

**Prop. (5.4.1.37) [Slicing Criterion for Flatness on the Source].** Let  $(R, \mathfrak{m}) \rightarrow (S, \mathfrak{n}) \in \mathcal{locCRing}$  and  $t \in S$  s.t.

- $S$  is essentially of f.p. over  $R$ ,
- $S$  is flat over  $R$ ,
- $t \in (S/\mathfrak{m}S)^\times$ .

Then  $S/tS$  is flat over  $R$ , and  $t \in S^\times$ .  $\lrcorner$

*Proof:* Cf. [Sta]046Z.  $\square$

**Prop. (5.4.1.38) [Fibral Criterion of Flat Modules].** Let  $R \rightarrow S \rightarrow S'$  be local homomorphisms of local rings and  $\mathfrak{m}$  is the maximal ideal of  $R$ . If

- $R \rightarrow S'$  is essentially of f.p.
- $R \rightarrow S$  is essentially of f.t.
- $0 \neq M \in \text{Mod}_{S'}$  is of f.p. over  $S$ .
- $M/\mathfrak{m}M$  is flat over  $S/\mathfrak{m}S$ .
- $M$  is flat over  $R$ .

Then  $S$  is essentially of f.p. and flat over  $R$  and  $M$  is flat over  $S$ . ┘

*Proof:* [Sta]05UV. □

## 2 Faithfully Flat Descent

**Prop. (5.4.2.1) [Faithfully Flat Descent].** List of properties that descent through faithfully flat morphism. Let  $R \rightarrow R'$  be a f.f. ring map.

1. Finiteness for modules over a ring.
2. F.p. for modules over a ring.
3. Flatness for modules over a ring.
4. Finite locally freeness and invertibility for modules over a ring.
5. Mittag-Leffler for modules over a ring.
6. Projectiveness for modules over a ring.
7. F.g. for ring maps.
8. F.p. for ring maps, both on the target and source.
9. (Formal)Smoothness for ring maps.
10. Noetherian for rings.
11. Reducedness for rings.
12. Normal for rings.
13. Regular for rings. (But notice regular is only étale-local(5.4.7.29) but not fppf-local).
14. Being Noetherian and has property  $(R_k)$  for rings.
15. Local Complete Intersection ring maps.

┘

*Proof:*

1. Cf. [Sta]03C4.
2. Cf. [Sta]03C4.
3. Let  $M$  be a  $R$ -module, and  $M' = M \otimes_R R'$ , if  $M'$  is  $R$ -flat, then for any  $R$ -module  $N$ ,  $(N \otimes_R M) \otimes_R S = (N \otimes_R S) \otimes_S M'$ , so as  $\cdot \otimes_R S$  is exact and reflects exactness,  $\cdot \otimes_R M$  is exact, so  $M$  is  $R$ -flat.
4. This follows from f.f. descent for f.p. and flatness and(5.3.1.7).
5. Cf. [Sta]05A5.

6. Cf. [Sta]05A9.
7. Cf. [Sta]00QP.
8. Cf. [Sta]00QQ, 00EP.
9. Use criterion (5.4.5.3), we see by flatness that the sequence  $I/I^2 \rightarrow \Omega_{P/R} \otimes_P S \rightarrow \Omega_{S/R} \rightarrow 0$  commutes with flat base change, and when it is f.f., then use (5.4.3.6) and descent for projectiveness (5.4.2.1) that  $\Omega_{S/R}$  is projective, so it is a split exact sequence. The smooth case follows from definition (5.4.5.12) as f.p. can descend.
10. Because for  $S \rightarrow S'$  faithfully flat and a chain of ideals  $I_k$  in  $S$ ,  $I_k S' = I_k \otimes_S S'$ , and  $I_k S'$  is stable if  $S'$  is Noetherian, so also  $I_k$  is stable because it is faithfully flat.
11.  $S \rightarrow S'$  is f.f. hence injective (5.4.1.27).
12. Normality is stalkwise, so it suffices to assume  $R \rightarrow S$  is f.f. and  $R, S$  are both local. Then  $S$  is normal integral thus by (5.4.1.27),  $R$  is also normal integral. Now if  $a/b \in R$ , then  $a/b \in S$ ,  $a \in bS$ , thus  $a \in bS \cap R = bR$  by (5.4.1.27), so  $a/b \in R$ .
13. Cf. [Sta]07NG.?
14. Cf. [Sta]0353.
15. flatness and f.p. both satisfies f.f. descent, so it suffices to show that if  $\mathfrak{p}' \subset R'$  is a prime lying over  $\mathfrak{p} \subset R$ , then  $S \otimes_R k(\mathfrak{p})$  is a local complete intersection iff  $S' \otimes_{R'} k(\mathfrak{p}') = S \otimes_R k(\mathfrak{p}) \otimes_{k(\mathfrak{p})} k(\mathfrak{p}')$  is a local complete intersection, and this follows from [Sta]00SI.

□

**Prop. (5.4.2.2) [fpqc-Poincaré Lemma].** If a ring map  $A \rightarrow B$ , either has a section  $B \rightarrow A$ , or it is faithfully flat, then the Amitsur complex  $s(M)$  for the canonical descent datum (with augmentation):

$$0 \rightarrow M \rightarrow B \otimes_A M \rightarrow B \otimes_A B \otimes_A M \rightarrow \dots$$

with Čech-like maps, is exact.

┘

*Proof:* In the case  $A \rightarrow B$  has a section  $s$ , It suffices to construct a nullhomotopy of the case  $M = A$ . Then we can just let  $h(e_0 \otimes e_1 \otimes \dots \otimes e_r) = s(e_0)e_1 \otimes \dots \otimes e_r$ .

The f.f. case can be reduced to the first case by tensoring  $B$  to consider  $B \rightarrow B \otimes_A B$ , because it has a section.

□

**Cor. (5.4.2.3) [Glueing Functions].** If  $R \in \mathcal{CRing}$ ,  $M \in \text{Mod}_R$  and  $f_1, \dots, f_n \in R$  s.t.  $(f_1, \dots, f_n) = (1)$ , then there is an exact sequence

$$0 \rightarrow M \rightarrow \prod_i M_{f_i} \rightrightarrows \prod_{i,j} M_{f_i f_j}.$$

In particular this holds for  $M = R$ .

┘

*Proof:* This is just (5.4.2.2) applied to  $A \rightarrow \prod_i A_{f_i}$ , which is faithfully flat.

□

### Formal Glueing of Modules

References are [Sta]Chap15.88 and 15.89.

**Lemma (5.4.2.4).** Let  $f : R \rightarrow S \in \mathcal{C}\text{Ring}$  and  $I = (f_1, \dots, f_r) \subset R$  be an ideal, then for any  $M \in \text{Mod}_R$  we can define a complex

$$0 \rightarrow M \xrightarrow{\alpha} M \otimes_R S \times \prod M_{f_i} \xrightarrow{\beta} \prod (M \otimes_R S)_{f_i} \times \prod M_{f_i f_j},$$

where  $\alpha(m) = (m \otimes 1, m, \dots, m)$ ,  $\beta(m', m_1, \dots, m_t) = (m' - m_1 \otimes 1, m' - m_2 \otimes 1, \dots, m' - m_t \otimes 1, m_1 - m_2, \dots, m_{t-1} - m_t)$ .

Suppose that  $R \rightarrow S$  is flat and  $R/I \rightarrow S/IS$  is an isomorphism, then this complex is exact.  $\lrcorner$

*Proof:* Cf. [Sta]05EK.  $\square$

**Def. (5.4.2.5) [Category of Gluing Data].** Let  $S \in \mathcal{C}\text{Ring}/R$  and  $I = (f_1, \dots, f_r) \subset R$  be an ideal, then we define the category  $\text{Glu}(R \rightarrow S, f_1, \dots, f_r)$  of gluing data consisting of objects  $M = (M', M_i, \alpha_i, \alpha_{ij})$  where  $M'$  is a  $S$ -module,  $M_i$  are  $R_{f_i}$ -modules,  $\alpha_i : (M')_{f_i} \rightarrow M_i \otimes_R S$  and  $\alpha_{ij} : (M_i)_{f_j} \rightarrow (M_j)_{f_i}$  are isomorphisms s.t.

- $\alpha_{ij} \circ \alpha_i = (\alpha_j)_{f_i}$ .
- $\alpha_{jk} \circ \alpha_{ij} = \alpha_{ik}$ .

There is a canonical functor  $\text{Can} : \text{Mod}_R \rightarrow \text{Glu}(R \rightarrow S, f_1, \dots, f_r)$  and also a morphism  $H^0 : \text{Glu}(R \rightarrow S, f_1, \dots, f_r) \rightarrow \text{Mod}_R$  where

$$H^0(M) = \ker(M' \times \prod M_i \rightarrow \prod M'_{f_i} \times \prod (M_i)_{f_j}).$$

$H^0$  is a left inverse of  $\text{Can}$ , by (5.4.2.4).  $\lrcorner$

**Lemma (5.4.2.6).** If  $R \rightarrow S$  is flat, then  $\text{Glu}(R \rightarrow S, f_1, \dots, f_r)$  is an Abelian category, and  $\text{Can}$  is an exact functor that commutes with arbitrary colimits.

If moreover  $(f_1, \dots, f_r) = R$ , then  $\text{Can}$  and  $H^0$  induces an equivalence of categories.  $\lrcorner$

*Proof:* The kernels and cokernels can be constructed because  $- \otimes_R S$  is exact, and  $\text{Can}$  is exact because  $R_{f_i}$  and  $S$  are flat over  $R$ , and also tensoring commutes with taking colimits.

For the last assertion, by (5.4.2.5) it suffices to show that  $\text{Can}$  is essentially surjective. For this, just use (5.4.2.3) on both  $R$  and  $S$ .  $\square$

**Prop. (5.4.2.7).** In the setting of (5.4.2.5), if  $R/I \rightarrow S/IS$  is an isomorphism, then  $\text{Can}$  and  $H^0$  induces an equivalence of categories.  $\lrcorner$

*Proof:* Cf. [Sta]05ER.  $\square$

**Cor. (5.4.2.8).** If  $R \rightarrow S$  is a flat ring map and  $f \in R$  that  $R/fR \cong S/fS$  is an isomorphism, then there is a pullback diagram of categories:

$$\begin{array}{ccc} \text{Mod}_R & \longrightarrow & \text{Mod}_{R_f} \\ \downarrow & & \downarrow \\ \text{Mod}_S & \longrightarrow & \text{Mod}_{S_f} \end{array}$$

and we can also restrict to the category of f.g./f.p/flat/projective(any property satisfying f.f. descent) modules.  $\lrcorner$

*Proof:* For the last assertion, notice  $R \rightarrow R^\wedge \times \prod R_{f_i}$  is f.f. by (5.2.3.7), then use f.f. descent (5.4.2.1).  $\square$

**Cor. (5.4.2.9).** If  $R$  is a Noetherian ring,  $f \in R$  and  $R^\wedge$  the  $f$ -adic completion of  $R$ , then there is an pullback of categories:

$$\begin{array}{ccc} \text{Mod}_R & \longrightarrow & \text{Mod}_{R_f} \\ \downarrow & & \downarrow \\ \text{Mod}_{R^\wedge} & \longrightarrow & \text{Mod}_{R_f^\wedge} \end{array}$$

and we can also restrict to the category of f.g./f.p/flat/projective(any property satisfying f.f. descent) modules.  $\lrcorner$

*Proof:* This satisfies the hypothesis of (5.4.2.7) by (5.2.3.24).  $\square$

**Lemma (5.4.2.10).** If  $f \in R$  and  $R \rightarrow R' \in \mathcal{CRing}$  induces an isomorphism  $R/(f^n) \cong R'/(f^n)$  for any  $n \in \mathbb{Z}_+$ , then for any  $f$ -power torsion  $R$ -module  $M$ , the map  $M \rightarrow M \otimes_R R'$  is an isomorphism.  $\lrcorner$

*Proof:* Cf. [Sta]0BNK.  $\square$

**Lemma (5.4.2.11).** If  $f \in R$  and  $R \rightarrow R' \in \mathcal{CRing}$  induces an isomorphism  $R/(f^n) \cong R'/(f^n)$  for any  $n \in \mathbb{Z}_+$ , then for any  $M \in \text{Mod}_R$ ,  $M$  is finite iff  $M \otimes_R (\hat{R} \oplus R[f^{-1}])$  is finite over  $\hat{R} \oplus R[f^{-1}]$ .  $\lrcorner$

**Def. (5.4.2.12) [Gluing Pairs and Glueing Modules].** For  $R' \in \mathcal{CRing}/R$  and  $f \in R$  s.t.  $R/(f^n) \cong R'/(f^n)$  for any  $n \in \mathbb{Z}_+$ ,  $(R \rightarrow R', f)$  is called a **gluing pair** if the sequence

$$0 \rightarrow R \rightarrow R' \oplus R[f^{-1}] \rightarrow R'[f^{-1}] \rightarrow 0$$

is exact. The pair  $(R, f)$  is called a gluing pair if  $(R \rightarrow \hat{R}, f)$  is a gluing pair (This makes sense by (5.2.3.6)).

This is equivalent to  $R[f^\infty] \rightarrow R'[f^\infty]$  is bijective.

$M \in \text{Mod}_R$  is called a **glueable module** for  $(R \rightarrow R^\wedge, f)$  if the sequence

$$0 \rightarrow M \rightarrow M_{R'} \oplus M_{R[f^{-1}]} \rightarrow M_{R'[f^{-1}]} \rightarrow 0$$

is exact.

This is equivalent to  $M[f^\infty] \rightarrow M_{R'}[f^\infty]$  is a bijection. And when  $(R \rightarrow R', f)$  is a gluing pair, this is equivalent to  $M[f^\infty] \rightarrow M_{R'}[f^\infty]$  is injective.  $\lrcorner$

*Proof:* Cf. [Sta]0BNR, 0BNW, 08NX.  $\square$

**Prop. (5.4.2.13) [Flatness, Non-Zero-Divisors and Gluing].** For  $R' \in \mathcal{CRing}/R$  and  $f \in R$ ,  $(R \rightarrow R', f)$  is a gluing pair (5.4.2.12) when  $R \rightarrow R^\wedge$  is flat. In particular  $(R, f)$  is a gluing pair then  $R$  is Noetherian or  $f$  is not a zero-divisor (5.2.3.10).

If  $(R \rightarrow R', f)$  is a gluing pair, then  $M$  is glueable if  $\text{Tor}_1^R(M, R')$  is  $f$ -power torsion, or equivalently  $\text{Tor}_1^R(M, R'_f) = 0$ . In particular this is the case when  $M$  is flat over  $R$  or  $f$  is not a zero-divisor for  $M$ . And when  $R \rightarrow R'$  is flat, any  $R$ -module  $M$  is glueable, in particular this is the case for  $(R, f)$  when  $R$  is Noetherian.  $\lrcorner$

*Proof:* If  $R \rightarrow R^\wedge$  is flat, then tensoring  $R^\wedge$  gives an exact sequence

$$0 \rightarrow R[f^n] \otimes_R R^\wedge \rightarrow R^\wedge \xrightarrow{f^n} R^\wedge,$$

and  $R[f^n] \otimes_R R^\wedge \cong R[f^n]$  by (5.4.2.10), so  $R[f^\infty] \cong R^\wedge[f^\infty]$  and  $(R \rightarrow R^\wedge, f)$  is a glueing pair (5.4.2.12).

If  $R$  is Noetherian, then  $R \rightarrow R^\wedge$  is flat by (5.4.2.10).

If  $f$  is not a zero-divisor, then  $f$  is also not a zero-divisor in  $R^\wedge$  by (5.2.3.10), so  $(R \rightarrow R^\wedge, f)$  is a glueing pair (5.4.2.12).

For the second assertion, Cf. [Sta]0BNX.  $\square$

**Thm. (5.4.2.14) [Beauville-Laszlo].** Let  $(R \rightarrow R', f)$  be a glueing pair (5.4.2.12), then there are pull-back diagrams of categories:

$$\begin{array}{ccccc} \{\text{glueing } R\text{-modules}\} \subset \text{Mod}_R & \longrightarrow & \text{Mod}_{R'[\frac{1}{f}]} & & \text{Mod}_R^{\text{flat}} \longrightarrow \text{Mod}_{R'[\frac{1}{f}]}^{\text{flat}} & & \text{Mod}_R^{\text{fin,lf}} \longrightarrow \text{Mod}_{R'[\frac{1}{f}]}^{\text{fin,lf}} \\ \downarrow & & \downarrow & , & \downarrow & & \downarrow \\ \text{Mod}_{R'} & \longrightarrow & \text{Mod}_{R'[\frac{1}{f}]} & & \text{Mod}_{R'}^{\text{flat}} \longrightarrow \text{Mod}_{R'[\frac{1}{f}]}^{\text{flat}} & & \text{Mod}_{R'}^{\text{fin,lf}} \longrightarrow \text{Mod}_{R'[\frac{1}{f}]}^{\text{fin,lf}} \end{array}$$

Similar diagram holds for  $\text{Mod}^{f\text{-regular}}$ .  $\lrcorner$

*Proof:* ? For glueable  $R$ -module,  $M \mapsto M \otimes (R' \oplus R[f^{-1}])$  is faithfully flat by the exact sequences in (5.4.2.12). Thus it suffices to check this map is essentially surjective.

Firstly, for  $M' \in \text{Mod}_{R'}$  and  $M_1 \in \text{Mod}_{R[f^{-1}]}$  with an isomorphism  $\alpha : M_1 \otimes R \cong M'[f^{-1}]$ , the map of  $R$ -modules  $d : M' \oplus M[f^{-1}] \rightarrow M'[f^{-1}]$  is surjective: For  $z \in M'[f^{-1}]$ , write  $\alpha^{-1}(z) = \sum y_i \otimes g_i$  where  $g_i \in R'$  and  $y_i \in M'$ . Then there exists  $n \in \mathbb{Z}_+$  and  $y'_i \in M'$  s.t.  $\alpha(y_i \otimes 1) = y'_i / f^n$  for each  $i$ . Write  $g_i = a_i + f^n b_i$  with  $a_i \in R$  and  $b_i \in R'$  (which can be done because  $R/(f^n) \cong R'/(f^n)$ ), then for  $y = \sum a_i y_i \in M_1$  and  $x = \sum b_i y'_i$ , we have  $d(x, -y) = z$ .

Then we have an exact sequence

$$0 \rightarrow M \rightarrow M' \oplus M[f^{-1}] \xrightarrow{d} M'[f^{-1}] \rightarrow 0.$$

for some  $M \in \text{Mod}_R$ . It suffices to show that this induces an isomorphism  $M \otimes (R' \oplus R[f^{-1}]) \cong M' \oplus M[f^{-1}]$ . For this, Cf. [Sta]0BP7. ?

For the second diagram, we need to show that  $M \in \text{Mod}_R$  is flat if  $M \otimes R[f^{-1}]$  is flat over  $R[f^{-1}]$  and  $M \otimes R'$  is flat over  $R'$ . Cf. [Sta]0BP7. ?

For the second diagram, we need to show that  $M \in \text{Mod}_R$  is finite presented and flat if  $M \otimes R[f^{-1}]$  is finitely presented and flat over  $R[f^{-1}]$  and  $M \otimes R'$  is finitely presented and flat over  $R'$ .  $M$  is flat by the second diagram, and it is finite by (5.4.2.11). Let  $0 \rightarrow K \rightarrow R^{\oplus n} \rightarrow M \rightarrow 0$  be an exact sequence, then this exact sequence is also exact after tensoring  $R' \oplus R[f^{-1}]$  because  $M$  is flat, so  $K \otimes_R (R' \oplus R[f^{-1}])$  is finite over  $R' \oplus R_f$ , thus  $K$  is finite over  $R$  by (5.4.2.11). So we proved that  $M$  is finitely presented over  $R$ .

For the last assertion, use (5.4.2.13).  $\square$

**Cor. (5.4.2.15).** If  $R \in \mathcal{C}\text{Ring}$  and  $f \in R$  is a nonzero-divisor, denote by  $\hat{R}$  the  $f$ -adic completion of  $R$ , then there is a pullback diagram of categories:

$$\begin{array}{ccccc} \text{Mod}_R & \longrightarrow & \text{Mod}_{R[\frac{1}{f}]} & & \text{Mod}_R^{\text{flat}} \longrightarrow \text{Mod}_{R[\frac{1}{f}]}^{\text{flat}} & & \text{Mod}_R^{\text{fin,lf}} \longrightarrow \text{Mod}_{R[\frac{1}{f}]}^{\text{fin,lf}} \\ \downarrow & & \downarrow & , & \downarrow & & \downarrow \\ \text{Mod}_{\hat{R}} & \longrightarrow & \text{Mod}_{\hat{R}[\frac{1}{f}]} & & \text{Mod}_{\hat{R}}^{\text{flat}} \longrightarrow \text{Mod}_{\hat{R}[\frac{1}{f}]}^{\text{flat}} & & \text{Mod}_{\hat{R}}^{\text{fin,lf}} \longrightarrow \text{Mod}_{\hat{R}[\frac{1}{f}]}^{\text{fin,lf}} \end{array}$$

Similar diagram holds for  $\text{Mod}^{f\text{-regular}}$ .  $\lrcorner$

*Proof:* By (5.2.3.4),  $R/(f^n) \rightarrow \hat{R}/(f^n)$  is an isomorphism for any  $n \in \mathbb{Z}_+$ , so  $(R \rightarrow R^\wedge, f)$  is a glueing pair, and any  $M \in \text{Mod}_R$  a glueing module by (5.4.2.13), so we can use (5.4.2.14) above.  $\square$

### 3 Kähler Differentials

**Def. (5.4.3.1) [Derivations].** For  $R \in \mathcal{A}lg_S$  and  $M \in \mathcal{M}od_R$ , a **derivation** over  $S$  from  $R$  to  $M$  is a morphism  $\delta : R \rightarrow M \in \mathcal{M}od_S$  s.t.  $\delta(ab) = a\delta(b) + b\delta(a)$  for any  $a, b \in R$ . The set of all derivatives from  $R$  to  $M$  over  $S$  is denoted by  $\text{Der}_S(R, M)$ , which is an  $S$ -module.  $\lrcorner$

**Def. (5.4.3.2) [ $A \ltimes_R M$ ].** For any  $A \in \mathcal{A}lg_R$ , there is a functor

$$A \ltimes_R (-) : \mathcal{M}od_A \rightarrow (\mathcal{A}lg_R)_{/A}$$

s.t.  $A \ltimes_R M = A \otimes_R M$  as a module with algebra structure given by

$$(a, x)(b, y) = (ab, ay + bx), \text{ where } a, b \in A, x, y \in M.$$

Then for any  $X \in (\mathcal{A}lg_R)_{/A}$  and  $M \in \mathcal{M}od_A$ , there is a bijection of sets

$$\text{Hom}_{(\mathcal{A}lg_R)_{/A}}(X, A \ltimes_R M) \cong \text{Der}_R(X, M),$$

where  $M$  is an  $X$ -algebra via  $X \rightarrow A \rightarrow M$ .  $\lrcorner$

**Def. (5.4.3.3) [Kähler Differential].** For  $S \in \mathcal{A}lg_R$ , the **Kähler Differential**  $\Omega_{S/R}$  is defined as a left  $S$ -module s.t.  $\text{Der}_R(S, M) \cong \text{Hom}_S(\Omega_{S/R}, M)$  for any  $M \in \mathcal{M}od_S$ . In particular,  $\text{Der}_R(S, S)$  is the  $S$ -dual of  $\Omega_{S/R}$ .  $\lrcorner$

**Prop. (5.4.3.4).** One construction is by the free group generated by elements of  $R$  module some relations.

It can also be constructed as follows: there are two ring maps  $\lambda_i$  from  $S$  to  $S \otimes_R S$ , and one map  $\varepsilon$  from  $S \otimes_R S$  to  $S$ . Let  $I = \ker \varepsilon$  as a  $R$  module by  $\lambda_1$ , then  $I/I^2 \cong \Omega_{S/R}$  by (5.4.3.8) that

$$0 \rightarrow I/I^2 \rightarrow \Omega_{S \otimes_R S/S} \otimes_{S \otimes_R S} S \rightarrow \Omega_{S/S} \rightarrow 0.$$

So  $I/I^2 \cong \Omega_{S/R} \otimes_S (S \otimes_R S) \otimes_{S \otimes_R S} S \cong \Omega_{S/R}$ . And it can be verified that  $a \otimes 1 - 1 \otimes a$  corresponds to  $da$ .  $\lrcorner$

**Prop. (5.4.3.5) [Adjointness].** The functor  $X \rightarrow A \otimes_X \Omega_{X/R}$  from  $(\mathcal{A}lg_R)_{/A}$  to  $\mathcal{M}od_A$  is left adjoint to the functor  $A \ltimes_R (-)$  defined in (5.4.3.2).  $\lrcorner$

*Proof:* Because they are both equivalent to  $\text{Der}_R(X, M)$ .  $\square$

**Cor. (5.4.3.6) [Functoriality].** From the first construction, we can see directly that for a family of morphisms  $R_i \rightarrow S_i$ ,

$$\Omega_{\text{colim } S_i / \text{colim } R_i} = \text{colim } \Omega_{S_i / R_i}.$$

In particular, we have:

$$T^{-1}\Omega_{B/A} = \Omega_{T^{-1}B/A}, \quad \Omega_{S^{-1}B/S^{-1}A} = S^{-1}\Omega_{B/A}.$$

Moreover, we have

$$\Omega_{S/R} \otimes_R R' = \Omega_{S \otimes_R R' / R'}, \quad (S \otimes_R \Omega_{T/R}) \oplus (T \otimes_R \Omega_{S/R}) \cong \Omega_{S \otimes_R T / R}$$

by universal properties.  $\lrcorner$

*Proof:* We prove for the localization: it suffices to show the following two assertions:

1.  $S^{-1}\Omega_{A/B} \cong \Omega_{S^{-1}A/B}$ .
2. If  $T \subset B$  is a multiplicatively closed subset that  $i(t)$  are all invertible in  $A$ , then  $\Omega_{A/T^{-1}B} \cong \Omega_{A/B}$ .

We check the universal properties: For any  $S^{-1}A$ -module  $M$ ,

$$\mathrm{Hom}_{S^{-1}A}(S^{-1}\Omega_{A/B}, M) \cong \mathrm{Hom}_{S^{-1}A}(S^{-1}A \otimes_A \Omega_{A/B}, M) \cong \mathrm{Hom}_A(\Omega_{A/B}, M) \cong \mathrm{Der}_B(A, M),$$

$$\mathrm{Hom}_{S^{-1}A}(\Omega_{S^{-1}A/B}, M) \cong \mathrm{Der}_B(S^{-1}A, M)$$

There is a map  $\mathrm{Der}_B(S^{-1}A, M) \rightarrow \mathrm{Der}_B(A, M)$  by restriction, and the converse is given by

$$d \mapsto d\left(\frac{a}{s}\right) = \frac{sda - ads}{s^2}.$$

This is well-defined as

$$d\left(\frac{at}{st}\right) = \frac{std(at) - atd(st)}{s^2t^2} = \frac{sda - ads}{s^2},$$

and it satisfies

$$\begin{aligned} d\left(\frac{a_1}{t_1} + \frac{a_2}{t_2}\right) &= d\left(\frac{a_1t_2 + a_2t_1}{t_1t_2}\right) \\ &= \frac{(a_1d(t_2) + t_2d(a_1) + a_2d(t_1) + t_1d(a_2))t_1t_2 - (a_1t_2 + a_2t_1)(t_1d(t_2) - t_2d(t_1))}{t_1^2t_2^2} \\ &= \frac{t_1t_2^2d(a_1) + t_1^2t_2d(a_2) - a_2t_1^2d(t_2) + a_1t_2^2d(t_1)}{t_1^2t_2^2} \\ &= d\left(\frac{a_1}{t_1}\right) + d\left(\frac{a_2}{t_2}\right) \end{aligned}$$

$$\begin{aligned} d\left(\frac{a_1a_2}{t_1t_2}\right) &= \frac{(a_1d(a_2) + a_2d(a_1))t_1t_2 - a_1a_2(t_1d(t_2) + t_2d(t_1))}{t_1^2t_2^2} \\ &= \frac{a_1(t_2d(a_1) - a_2d(t_2))}{t_1t_2^2} + \frac{a_2(t_1d(a_2) - a_1d(t_1))}{t_2t_1^2} \\ &= \frac{a_1}{t_1}d\left(\frac{a_2}{t_2}\right) + \frac{a_2}{t_2}d\left(\frac{a_1}{t_1}\right) \end{aligned}$$

Thus this  $d$  is an extension of the derivative to  $S^{-1}A$ . Thus we get the desired isomorphism by Yoneda lemma.  $\square$

**Prop. (5.4.3.7) [Jacobi-Zariski Sequences].** For a sequence of commutative rings:  $A \rightarrow B \rightarrow C$ , there is an exact sequence

$$C \otimes_B \Omega_{B/A} \rightarrow \Omega_{C/A} \rightarrow \Omega_{C/B} \rightarrow 0$$

of  $C$ -modules. It has a left inverse and splits iff any derivation over  $A$  from  $B$  to a  $C$ -module can be extended to a derivation over  $A$  from  $C$  to  $M$ . This is trivially true when  $B \rightarrow C$  has a retraction, and true when  $C/B$  is formally smooth by (5.4.5.5).  $\lrcorner$

*Proof:* Taking  $\mathrm{Hom}$  with an arbitrary  $C$ -module  $M$ , by universal property, we need to check the exactness of  $0 \rightarrow \mathrm{Der}_B(C, M) \rightarrow \mathrm{Der}_A(C, M) \rightarrow \mathrm{Der}_A(B, M)$ , which is easy.  $\square$

**Prop. (5.4.3.8)[Second Exact Sequence].** (This is a special case of (8.1.1.5)). If  $S' = S/I$ , then there is an exact sequence of  $R'$ -modules:

$$I/I^2 \rightarrow \Omega_{S/R} \otimes_S S' \rightarrow \Omega_{S'/R} \rightarrow 0.$$

Where  $f \in I$  is mapped to  $df \otimes 1$  and it has a left inverse and splits iff  $S/I^2 \rightarrow S'$  has a right inverse. And in fact  $\Omega_{S/R} \otimes_S S' \cong \Omega_{(S/I^2)/R} \otimes_S S'$ .  $\lrcorner$

*Proof:* For a  $S/I$ -module  $M$ , we check:

$$0 \rightarrow \text{Der}_R(S/I, M) \rightarrow \text{Der}_R(S, M) \rightarrow \text{Hom}_{S/I}(I/I^2, M)$$

To prove  $\Omega_{S/R} \otimes_S S' \cong \Omega_{(S/I^2)/R} \otimes_S S'$ , we apply  $\text{Hom}$  for a  $S'$ -module  $M$ .

So to prove the left exactness, we may assume  $I^2 = 0$ . If we have an inverse  $\Omega_{S/R} \otimes_S S' \rightarrow I$ , then it gives a derivation  $D : A \rightarrow I$  that is identity on  $I$ , so  $a - D(a)$  gives a  $R$ -ring map  $S \rightarrow S'$  that is trivial on  $I$  (because  $I^2 = 0$ ). Hence it gives a  $S/I \rightarrow S'$  that is inverse to the projection.

For the converse, if  $d : S/I \rightarrow S'$  is a right inverse, then  $a - d(\bar{a})$  is a derivation  $S \rightarrow I$ , which is identity on  $I$ , so it gives an inverse map  $\Omega_{S/R} \otimes_S S' \rightarrow I$  by universal property.  $\square$

**Cor. (5.4.3.9).** If  $R \rightarrow S$  is of f.p., then  $\Omega_{S/R}$  is of f.p. over  $S$ . If  $R \rightarrow S$  is of f.t., then  $\Omega_{S/R}$  is of f.t. over  $S$ . (Follows from the second exact sequence (5.4.3.8) and (5.4.3.10)).  $\lrcorner$

**Cor. (5.4.3.10)[Examples].**

1.  $\Omega_{A[X_1, \dots, X_n]/A} = A[X_1, \dots, X_n]\{dX_1, \dots, dX_n\}$ .
2. If  $S = A[X_i]/\{f_j\}$ , then  $\Omega_{S/A} = S[dX_i]/\{df_j\}$ .
3.  $\Omega_{A[X_i]/k} = \Omega_{A/k} \otimes_A A[X_i] \oplus A[X_i]\{dX_1, \dots, dX_n\}$ .
4. (Standard Étale Algebra) For  $A = R[x]_g/(f)$ , where  $f'$  has image invertible in  $A$ ,  $\Omega_{A/R} = 0$ .
5. The differential for the inclusion  $k[y^2, y^3] \rightarrow k[y]$  is  $k[y]/(2y, 3y^2)\{dy\}$ .

$\lrcorner$

**Cor. (5.4.3.11).** 1: Use the differential operator and universal property.

2: Use item 1 and (5.4.3.8).

3: Use item 1 and the fact (5.4.3.8) splits because any derivative of  $A/k$  can be extended to derivative of  $B/k$  by acting on the coefficients.

4:

5: Use definition.  $\lrcorner$

**Cor. (5.4.3.12).** If  $S/I$  is a field  $k$  that embeds in  $S$ , then  $I/I^2 \cong \Omega_{S/k} \otimes_S k$ .  $\lrcorner$

**Prop. (5.4.3.13).** Let  $k \subset K \subset L$  be fields, and  $L/K$  f.g., then

$$\dim_L \Omega_{L/k} \geq \dim_K \Omega_{K/k} + \text{tr. deg}(L/K).$$

Equality holds if  $L/K$  is separably generated, i.e. separable over a transcendental basis. If  $K = k$ , then the equality holds iff  $L/k$  is separably generated. In particular,  $L/k$  is separable algebraic extension iff  $\Omega_{L/k} = 0$ .  $\lrcorner$

*Proof:* Take a subfield  $K \subset K(t_1, \dots, t_n) \subset L$  that  $L$  is separable algebra over  $K(t_1, \dots, t_n)$ . Then it suffices to add one element a time, so we may assume  $L = K(\alpha)$ .

1: If  $\alpha$  is transcendental over  $K$ , then  $\Omega_{K[\alpha]/t} \cong \Omega_{K/k} \otimes K[\alpha] \oplus K[\alpha]dt$  by (5.4.3.10), and by localization (5.4.3.6) we get  $\Omega_{L/K} \cong \Omega_{K/k} \otimes_K L \oplus Ldt$ , thus  $\text{rank } \Omega_{L/k} = \text{rank } \Omega_{K/k} + 1$ .

2: If  $\alpha$  is separable over  $K$ , then there is a monic polynomial  $f \in K[X]$  that  $K[\alpha] \cong K[X]/(f)$ . Then  $f'$  is invertible in  $K[\alpha]$ , and by (5.4.3.10)  $\Omega_{K[\alpha]/k} = \Omega_{K/k} \otimes_K L \oplus LdX/(d(f) + f'dX) \cong \Omega_{K/k} \otimes_K L$ . Thus  $\text{rank } \Omega_{L/k} = \text{rank } \Omega_{K/k}$ .

3: If  $K$  has characteristic  $p$  and  $L = K[X]/(X^p - a)$  and  $d_{K/k}(a) = 0$ , then  $\Omega_{K[\alpha]/k} = \Omega_{K/k} \otimes_K L \oplus LdX/(d(a)) \cong \Omega_{K/k} \otimes_K L \oplus LdX$ . Thus  $\text{rank } \Omega_{L/k} = \text{rank } \Omega_{K/k} + 1$ .

4: If  $K$  has characteristic  $p$  and  $L = K[X]/(X^p - a)$  and  $d_{K/k}(a) \neq 0$ , then  $\Omega_{K[\alpha]/k} = \Omega_{K/k} \otimes_K L \oplus LdX/(d(a))$  has rank  $\text{rank } \Omega_{K/k}$ .

Thus the assertion is clear.  $\square$

**Prop. (5.4.3.14) [Differential and Regularity].** Let  $B$  be a Noetherian local ring containing its residue field  $k$  and  $k$  is perfect, then  $\Omega_{B/k}$  is a free  $B$ -module of rank  $\dim B$  iff  $B$  is regular. [Hartshorne Ex.2.8.1] has a generalization of this fact.  $\lrcorner$

*Proof:* One way is by (5.4.3.12). Conversely, if  $B$  is regular, then it is integral (5.3.5.20), so  $\Omega_{B/k} \otimes_B K = \Omega_{K/k}$  (5.4.3.6) is of  $K$ -dimension  $\text{tr. deg } K/k = \dim B$ , where  $K$  is the quotient field of  $B$ , and  $\Omega_{B/k} \otimes k \cong m/m^2$  is of  $k$ -dimension  $\dim B$  once again. These two facts shows that  $\Omega_{B/k}$  is free  $B$ -module of rank  $\dim B$  by (5.4.8.1).  $\square$

**Prop. (5.4.3.15).** The Kähler differential  $\Omega_{\mathcal{O}_L/\mathcal{O}_K}$  for an extension of number fields is cyclic.  $\lrcorner$

*Proof:* Because it is locally cyclic (5.2.7.34).  $\square$

## 4 Complete Intersections

### Koszul Complex

**Prop. (5.4.4.1) [Koszul Complex].** The complex of  $\mathbb{Z}[X_1, \dots, X_n]$ -modules  $K_\bullet$ , where

$$K_r = \wedge^{r+1} \mathbb{Z}[dX_1, \dots, dX_n] \otimes_{\mathbb{Z}} \mathbb{Z}[X_1, \dots, X_n]$$

and the morphism is given linearly by

$$\iota : dX_{i_0} \wedge dX_{i_1} \wedge \dots \wedge dX_{i_r} \mapsto \sum_k X_{i_k} dX_{i_0} \wedge \dots \wedge dX_{i_{k-1}} \wedge dX_{i_{k+1}} \wedge \dots \wedge dX_{i_r}$$

Then this is a free resolution of  $\mathbb{Z}$  over  $\mathbb{Z}[X_1, \dots, X_n]$ .  $\lrcorner$

*Proof:* We can use induction. If  $r = 1$ , then this is clear. For the induction process, if  $\iota(dX_1 \wedge \alpha + \beta) = 0$ , and  $\beta \in K_i$ , where  $\beta, \alpha$  has no  $dX_1$  involved. Notice if  $dX_1 \wedge \alpha \in K_0$ , then we may assume  $\alpha$  has no constant coefficient, because this is impossible.

then  $X_1\alpha - dX_1 \wedge \iota(\alpha) + \iota(\beta) = 0$ . Then we see that  $\iota(\alpha) = 0$ . We can write  $\alpha = \alpha_0 + X_1\alpha_1 + X_1^2\alpha_2 + \dots$ , where  $\alpha_i$  has no  $X_i$  involved, then we see that  $\iota(\alpha_i) = 0$ , then by induction hypothesis  $\alpha = \iota(\alpha')$  (notice  $\alpha_0$  has no constant coefficient), and  $\iota(\beta) + X_1\iota(\alpha') = 0$ . If  $\beta = X_1\beta_1 + \beta_2$ , where  $\beta_2$  has no  $X_1$  involved, then  $\iota(\beta_2) = 0$ , so  $\beta_2 = \iota(\beta'_2)$ , and  $\iota(\beta_1 + \alpha') = 0$ , so  $\beta_1 + \alpha' = \iota(\beta'_1)$ . So

$$dX_1 \wedge \alpha + \beta = dX_1 \wedge \iota(\alpha') + \iota(X_1\beta'_1 + \beta'_2) - X_1\alpha' = \iota(X_1\beta'_1 + \beta'_2 - dX_1 \wedge \alpha').$$

And in degree 0, this is clear.  $\square$

**Def. (5.4.4.2) [Koszul Complex].** Let  $A$  be a ring and  $I = (f_1, \dots, f_n) \in A$  is an ideal, then the **Koszul complex** for  $Kos(A, f_1, \dots, f_n)$  is an object in  $D(A)$  defined by

$$Kos(A, f_1, \dots, f_n) = A \otimes_{\mathbb{Z}[X_1, \dots, X_n]}^L \mathbb{Z},$$

where  $A$  is a  $\mathbb{Z}[X_1, \dots, X_n]$ -algebra by mapping  $X_i \rightarrow f_i$ . If  $M$  is an  $A$ -module, then we define  $Kos(M, f_1, \dots, f_n) = M \otimes_A^L Kos(A, f_1, \dots, f_n)$ .  $\lrcorner$

**Prop. (5.4.4.3).** If  $f_1, \dots, f_n \in R$ , then  $I = (f_1, \dots, f_n)$  annihilates  $H^*(K(f_1, \dots, f_n))$ . In particular,  $Kos(A, f_1, \dots, f_n)$  is in the image of  $D(A/I) \subset D(A)$ .  $\lrcorner$

*Proof:* This is because every  $H^i(A \otimes_{\mathbb{Z}[X_1, \dots, X_n]}^L \mathbb{Z})$  is an  $H^0(A \otimes_{\mathbb{Z}[X_1, \dots, X_n]}^L \mathbb{Z}) = A/I$ -algebra, because it is a simplicial algebra.  $\square$

**Prop. (5.4.4.4).**  $K(A, f_1, \dots, f_n, g_1, \dots, g_m) = K(A, f_1, \dots, f_n) \otimes_A K(A, g_1, \dots, g_m)$ . (Easy).  $\lrcorner$

**Prop. (5.4.4.5).** The cone of the map

$$f_n : K(f_1, \dots, f_{n-1}) \rightarrow K(f_1, \dots, f_{n-1})$$

is isomorphic to  $K(f_1, \dots, f_n)$ .  $\lrcorner$

*Proof:* This is because  $\mathbb{Z}[X] \xrightarrow{X} \mathbb{Z}[X] \rightarrow \mathbb{Z}$  is an exact triangle, so  $A \xrightarrow{f_n} A \rightarrow A \otimes_{\mathbb{Z}[X]}^L \mathbb{Z}$  is an exact triangle, so  $Kos(A, f_1, \dots, f_{n-1}) \xrightarrow{f_n} K(A, f_1, \dots, f_{n-1}) \rightarrow K(A, f_1, \dots, f_n)$  is an exact triangle.  $\square$

**Prop. (5.4.4.6).** Let  $A$  be a ring and  $M$  be an  $A$ -module. Let  $f_1, \dots, f_{r-1}, f, g$  be elements of  $A$ , then there is a natural distinguished triangle

$$Kos(M, f_1, \dots, f_{r-1}, f) \rightarrow Kos(M, f_1, \dots, f_{r-1}, fg) \rightarrow Kos(M, f_1, \dots, g).$$

$\lrcorner$

*Proof:* We use (5.4.4.5) to consider  $Kos(M, f_1, \dots, f_{r-1}, f)$  as a cone of  $f_n : Kos(M, f_1, \dots, f_{r-1}) \rightarrow Kos(M, f_1, \dots, f_{r-1})$ . Then this distinguished triangle is given by (4.8.4.16) applied to the diagram

$$\begin{array}{ccc} Kos(M, f_1, \dots, f_{r-1}) & \xrightarrow{\quad} & Kos(M, f_1, \dots, f_{r-1}) \\ \downarrow f & & \downarrow fg \\ Kos(M, f_1, \dots, f_{r-1}) & \xrightarrow{g} & Kos(M, f_1, \dots, f_{r-1}) \end{array}$$

$\square$

**Prop. (5.4.4.7) [Koszul Complex and Čech Complex].** Let  $A$  be a commutative ring and  $I = (f_1, \dots, f_n) \subset A$ ,  $K_n^\bullet = Kos(A, f_1^n, \dots, f_r^n) = A \otimes_{\mathbb{Z}[X_1, \dots, X_r]}^L \mathbb{Z}$ . Then there are natural maps

$$\dots \rightarrow K_3^\bullet \rightarrow K_2^\bullet \rightarrow K_1^\bullet$$

compatible with the inverse system  $H^0(K_n^\bullet) = A/(f_1^n, \dots, f_r^n)$ . Then there is a description of  $R \operatorname{colim} K_n^\bullet$  (5.9.5.6) as the alternating Čech complex

$$R \rightarrow \bigoplus_{i_0} R_{f_{i_0}} \rightarrow \bigoplus_{i_0 < i_1} R_{f_{i_0} f_{i_1}} \rightarrow \dots \rightarrow R_{f_1 f_2 \dots f_r}$$

where  $R$  sits in degree 0.  $\lrcorner$

*Proof:* Cf.[Sta]0913, which is not hard.  $\square$

**Def. (5.4.4.8) [Koszul-Regular Sequence].** Let  $A$  be a ring and  $(f_1, \dots, f_n) \in A$  be a sequence, then  $f_1, \dots, f_n$  is called  **$M$ -Koszul-regular** iff  $\text{Kos}(M, f_1, \dots, f_n) = 0$ . It is called **Koszul-regular** iff  $\text{Kos}(A, f_1, \dots, f_n) = 0$ .  $\lrcorner$

**Prop. (5.4.4.9).** If  $(f_1, \dots, f_r)$  is  $(M\text{-Koszul})$ regular and  $n_i > 0$ , then  $(f_1^{n_1}, \dots, f_r^{n_r})$  is also  $(M\text{-Koszul})$ regular.  $\lrcorner$

*Proof:* This follows from (5.4.4.6).  $\square$

**Prop. (5.4.4.10) [Regular and Koszul-Regular].** A  $M$ -regular sequence (5.3.4.1) is  $M$ -Koszul-regular. A regular sequence is Koszul-regular.  $\lrcorner$

*Proof:* Let  $(f_1, \dots, f_r)$  be a regular sequence. The assertion is clear when  $r = 1$ . For the induction:

$$\begin{aligned} \text{Kos}(M, f_1, \dots, f_n) &= \text{Kos}(M, f_2, \dots, f_n) \otimes_{\mathbb{Z}[X]}^L \mathbb{Z} = \text{Kos}(A, f_2, \dots, f_n) \otimes_A^L M \otimes_{\mathbb{Z}[X]}^L \mathbb{Z} \\ &= \text{Kos}(A/f_1, f_2, \dots, f_n) \otimes_{A/f_1}^L M/f_1 M = \text{Kos}(M/f_1 M, f_2, \dots, f_n) \end{aligned}$$

so we can use induction.  $\square$

### Complete Intersections

**Def. (5.4.4.11) [Global Complete Intersections].**  $R \rightarrow S \in \mathcal{C}\text{Ring}$  is called a **global intersection** if  $S = R[x_1, \dots, x_n]/(f_1, \dots, f_c)$  that every non-empty fiber of  $\text{Spec } S \rightarrow \text{Spec } R$  has dimension  $n - c$ .  $\lrcorner$

**Prop. (5.4.4.12).** Global intersection is stable under base change and composition. And  $S \rightarrow S_f$  a global intersection, so it is stable under localization.  $\lrcorner$

*Proof:* Base change: this is because flatness, f.p. is stable under base change, and the fibers are the same.

Localization:  $S_f = S[X]/(fX - 1)$  has trivial fibers.

Composition: It suffices to assume  $R$  is a field and calculate the dimension of the fibers, which is true by dimension formula (5.2.4.13).  $\square$

**Prop. (5.4.4.13) [Noetherian Approximation].** Let  $S = R[X_1, \dots, X_n]/(f_1, \dots, f_c)$  is a global intersection over  $R$ , then there is a f.g.  $\mathbb{Z}$ -algebra  $R_0 \subset R$  that  $f_i \in R_0[X_1, \dots, X_n]$ , and  $S_0 = R_0[X_1, \dots, X_n]/(f_1, \dots, f_c)$  is a global intersection over  $R$ .  $\lrcorner$

*Proof:* Cf.[Sta]00SU.  $\square$

**Prop. (5.4.4.14) [Complete Intersection is Regular].** Let  $S = R[X_1, \dots, X_n]/(f_1, \dots, f_c)$  be a global complete intersection, then  $\text{Spec } S \rightarrow \text{Spec } R[X_1, \dots, X_n]$  is a regular embedding (7.6.7.1), and  $S \in \mathcal{C}\text{Ring}^{\text{flat}}/R$ .  $\lrcorner$

*Proof:* Cf.[Sta]00SV.  $\square$

### Local Complete Intersections

**Def. (5.4.4.15) [Local Complete Intersections].**  $R \rightarrow S$  is called a **local complete intersection** locally is a global complete intersection (5.4.4.11). Local complete intersections are flat, by (5.4.4.14).  $\lrcorner$

**Cor. (5.4.4.16).** Local complete intersection is local on the source and target. In fact satisfies f.f. descent (5.4.2.1).  $\lrcorner$

**Prop. (5.4.4.17).** If  $S$  is a f.t.  $k$ -algebra and  $K/k$  is a field extension, then  $S$  is a local complete intersection iff  $S_K$  is a local complete intersection.  $\lrcorner$

**Prop. (5.4.4.18) [Global Intersections and Fibers].** Let  $R \rightarrow S$  be a ring map and  $\mathfrak{q} \subset S$  be a prime lying over  $\mathfrak{p} \subset R$ , then the following are equivalent:

- $R \rightarrow S$  is a global complete intersection around  $\mathfrak{q}$ .
- $R \rightarrow S$  is a f.p. around  $\mathfrak{q}$ ,  $S_{\mathfrak{q}}/R_{\mathfrak{p}}$  is flat, and (the fiber)  $S_{\mathfrak{q}}/\mathfrak{p}S_{\mathfrak{q}}$  is a local complete intersection ring over  $k(\mathfrak{p})$ .  $\lrcorner$

*Proof:*  $1 \rightarrow 2$  follows from (5.4.4.14). For  $2 \rightarrow 1$ , Cf. [Sta]00SY.  $\square$

**Prop. (5.4.4.19) [Local Complete Intersection over Fields is Stalkwise].** For a f.g.  $k$ -algebra  $S$ ,  $S$  is a local complete intersection iff all localization at (maximal) primes are complete intersection local rings over  $k$ . In particular, being local complete intersection is a stalkwise property.  $\lrcorner$

*Proof:* This is because over field everything is f.p. and flat, and use (5.4.4.18).  $\square$

**Prop. (5.4.4.20).** If  $S$  is a f.g. local complete intersection over a field  $k$ , then it is a CM ring.  $\lrcorner$

*Proof:* Cf. [Sta]00SB.  $\square$

**Def. (5.4.4.21) [Complete Intersection Local Rings].** Let  $A$  be a local ring essentially of f.t. over a field  $k$ , then  $A$  is called a **complete intersection local ring** over  $k$  if there exists a surjection  $R \rightarrow A$  from a regular local ring essentially of f.t. over  $k$  that the kernel is generated by a regular sequence.  $\lrcorner$

**Prop. (5.4.4.22).** When  $A$  is f.g. local ring over a field  $k$ , then  $A$  is a complete intersection local ring iff  $A$  is local complete intersection over  $k$  (5.4.4.11).  $\lrcorner$

*Proof:* Cf. [Sta]00SC.  $\square$

See more in [Sta]Chap 23.8.

## 5 Smooth Maps

### Formally Smooth Ring Maps

**Def. (5.4.5.1) [Formally Smooth Ring Maps].**  $R \rightarrow S \in \mathcal{CRing}$  is called a **formally smooth ring map** if has right lifting property w.r.t all ring maps  $A \rightarrow A/I$  where  $I \in \text{Ideal}(A)$  s.t.  $I^2 = 0$ .

Formal smooth is stable under base change and composition, by universal property.

For  $R \rightarrow R[T_1, \dots, T_n]$  is formally smooth for any  $n \in \mathbb{Z}_+$ .  $\lrcorner$

**Prop. (5.4.5.2).** Let  $S \in \mathcal{C}\text{Ring}/R$  with a presentation  $S = P/J$  where  $P \in \mathcal{C}\text{Ring}/R$  is formally smooth (e.g. polynomial algebra) and  $J \in \text{Ideal}(P)$  is stable under  $R$ . Then  $S$  is formally smooth over  $R$  iff there is a map  $S \rightarrow P/J^2$  that is right converse to the obvious projection.  $\lrcorner$

*Proof:* One way is from the definition of formally smooth applied to  $P/J^2$  and  $J$ . Conversely, for any  $A$  and  $I$ , we notice the map  $P \rightarrow S \rightarrow A/I$  can be lifted to  $P \rightarrow A$ , and  $J$  is mapped to  $I$ , so  $J^2$  is mapped to 0, so we have a map  $P/J^2 \rightarrow A$ . Then  $S \rightarrow P/J^2 \rightarrow A$  is the lifting.  $\square$

**Cor. (5.4.5.3).** If  $P \rightarrow S$  is a presentation of  $S/R$  by polynomial algebra with kernel  $I$ , then  $S/R$  is formal smooth iff

$$0 \rightarrow I/I^2 \rightarrow \Omega_{P/R} \otimes_P S \rightarrow \Omega_{S/R} \rightarrow 0$$

is split exact as in (5.4.3.8).  $\lrcorner$

*Proof:* This sequence is split exact iff  $P/J^2 \rightarrow S$  has a right converse, by (5.4.3.8).  $\square$

Now we consider the relation of formal smoothness and Kähler differentials.

**Cor. (5.4.5.4) [Equivalence Definition].**  $S/R$  is formally smooth iff  $NL_{S/R}$  is quasi-isomorphic to a projective  $S$ -module at degree 0.  $\lrcorner$

*Proof:* If  $S/R$  is formally smooth, then choose a presentation will suffice by (5.4.5.3). The converse is also true by projectiveness and (5.4.5.3).  $\square$

**Cor. (5.4.5.5).** If  $C/B$  is formally smooth, then the Jacobi-Zariski sequence

$$0 \rightarrow C \otimes_B \Omega_{B/A} \rightarrow \Omega_{C/A} \rightarrow \Omega_{C/B} \rightarrow 0$$

as in (5.4.3.7) is split exact, by (8.1.1.5). In particular, any derivation of  $B$  to a  $C$ -module can be extended to a derivation  $C$  to a  $C$ -module.  $\lrcorner$

**Cor. (5.4.5.6).** If  $A \rightarrow B \rightarrow C$  with  $A \rightarrow C$  formally smooth and  $B \rightarrow C$  surjective with kernel  $I$ , then there is a split sequence

$$0 \rightarrow I/I^2 \rightarrow \Omega_{B/A} \otimes_B C \rightarrow \Omega_{C/A} \rightarrow 0$$

by (8.1.2.6).  $\lrcorner$

### Standard Smooth Algebra

**Def. (5.4.5.7) [Standard Smooth Ring Maps].** A **standard smooth ring** over  $R$  is a algebra  $S = R[X_1, \dots, X_n]/(f_1, \dots, f_c)$ , where  $c \leq n$  and  $J(\frac{f_1, \dots, f_c}{X_1, \dots, X_c})$  is invertible in  $S$ .  $\lrcorner$

**Prop. (5.4.5.8) [Standard Smooth Localization].** If  $R \rightarrow S$  is standard smooth, then  $R \rightarrow S_g$  is standard smooth, and  $R_f \rightarrow S_f$  is standard smooth (because stable under base change (5.4.5.9)).  $\lrcorner$

*Proof:* For localization at  $g \in S$ , let  $h$  be an inverse image of  $g$  in  $R[X_1, \dots, X_n]$ , then  $S_g = R[X_1, \dots, X_n, X_{n+1}]/(f_1, \dots, f_c, X_{n+1}h - 1)$ , and it is standard smooth.  $\square$

**Prop. (5.4.5.9).** Standard smoothness is stable under base change and composition.  $\lrcorner$

*Proof:* For base change, notice the Jacobi matrix is the base change of the Jacobi matrix, so it is also invertible. For composition, write out the presentation, the determinant is the product of the presentation.  $\square$

**Lemma (5.4.5.10) [Kähler Differential of Smooth Algebra is Free].** The Kähler differential of a standard smooth algebra  $S$  over a field  $k$  is free of rank  $\dim S$ , and  $(f_1, \dots, f_c)/(f_1, \dots, f_c)^2$  is free over  $S$  with basis  $f_1, \dots, f_c$ . Moreover,  $S$  is pure dimensional.  $\lrcorner$

*Proof:* The naive cotangent complex for  $S/R$  is

$$d : (f_1, \dots, f_c)/(f_1, \dots, f_c)^2 \rightarrow S[dX_1, \dots, dX_n].$$

By hypothesis and linear algebra it is a split injection, and  $\Omega_{S/R} = S[dX_{c+1}, \dots, dX_n]$ , so it is free of rank  $n - c = \dim S$ , because  $S$  is a global complete intersection (5.4.5.11).  $\square$

**Prop. (5.4.5.11) [Standard Smooth and Complete Intersection].** A standard smooth algebra  $S = R[X_1, \dots, X_n]/(f_1, \dots, f_c)$  is a global complete intersection (5.4.4.11).  $\lrcorner$

*Proof:* It suffices to show any fiber of  $S$  has dimension  $n - c$ . For this, notice  $S \otimes_R k(\mathfrak{p})$  is also standard smooth, then we reduce to the field case. Now  $I = (f_1, \dots, f_c)$  satisfies  $I/I^2 \rightarrow \oplus S dx_i$  is a split injection. For any maximal ideal  $\mathfrak{m}$  containing  $I$ , tensoring  $k(\mathfrak{m})$ , we get an injection  $I/\mathfrak{m}I \rightarrow \oplus k(\mathfrak{m}) dx_i$ . Notice there is a commutative diagram

$$\begin{array}{ccc} I & \longrightarrow & S/\mathfrak{m} \otimes I \cong I/\mathfrak{m}I \\ \downarrow d & & \downarrow \text{incl} \\ \oplus S dx_i & \xrightarrow{dx_i \mapsto 1 \otimes x_i} & S/\mathfrak{m} \otimes \mathfrak{m} \cong \mathfrak{m}/\mathfrak{m}^2 \end{array} .$$

And the lower horizontal map is an isomorphism by Hilbert's Nullstellensatz, so the image of  $f_i$  in  $\mathfrak{m}_i/\mathfrak{m}_i^2$  are linearly independent over  $k(\mathfrak{m})$ , thus we can use (5.3.5.23) to show that  $\dim S = n - c$ .  $\square$

### Smoothness

**Def. (5.4.5.12) [Smooth Ring Map].**  $R \rightarrow S \in \mathcal{C}\text{Ring}$  is called a **smooth ring map** if it satisfies the following equivalent conditions:

- It is of f.p. and the naive cotangent complex  $NL_{S/R}$  is quasi-isomorphic to a finite locally free  $S$ -module placed at degree 0. In other words,

$$0 \rightarrow I/I^2 \rightarrow \Omega_{P/R} \otimes_P S \rightarrow \Omega_{S/R} \rightarrow 0$$

is exact and  $\Omega_{S/R}$  is finite locally free. By (8.1.1.1), we only need to prove for a single presentation of  $S$ .

- It is locally standard smooth.
- It is formally smooth and of f.p..

We say  $S$  is smooth at  $x$  if it is smooth on a nbhd of  $x$ .  $\lrcorner$

*Proof:*  $1 \rightarrow 3$ : by (5.4.5.4).  $3 \rightarrow 1$ : By (5.4.5.4),  $\Omega_{S/R}$  is f.p. and projective, so it is finite projective.

At this point we already know that the first definition is stable under base change and composition, because f.p. and formal smoothness both do (5.4.5.1)(5.3.7.9).

And also the first definition is local on source because f.p. does (5.1.4.4) and  $NL$  commutes with localization (8.1.1.6) so we can use the local properties of triviality (5.1.4.2) and finite projectiveness (5.3.1.7).

Now it is also local on the source because it is stable under base change and composition and  $R \rightarrow R_{f_i}$  does by locality on the source.

2  $\rightarrow$  1: Now the property are all local on source. It suffices to prove a standard smooth map is smooth. This follows from (5.4.5.10).

1  $\rightarrow$  2: We need to prove, assuming the first definition, it is locally standard smooth. For this, Cf. [Sta]00TA ? .  $\square$

**Cor. (5.4.5.13).** Smoothness is stable under composition and base change. Smoothness is local on the source and target (In particular,  $R \rightarrow R_f$  is smooth). (Already proved in the proof of (5.4.5.12)).  $\lrcorner$

**Prop. (5.4.5.14) [Smooth Maps are Complete-Intersections].** A smooth map is a local complete-intersection (5.4.4.15), hence flat.  $\lrcorner$

*Proof:* Clear from (5.4.5.12).  $\square$

**Prop. (5.4.5.15) [Noetherian Descent].** A smooth ring map  $R \rightarrow S$  is a base change of smooth ring map over a ring f.g. over  $\mathbb{Z}$ .  $\lrcorner$

*Proof:* Use the equivalence definition (5.4.5.2), we know that there is a map

$$S = R[X_1, \dots, X_n]/(f_1, \dots, f_c) \rightarrow R[X_1, \dots, X_n]/(f_1, \dots, f_c)^2,$$

which if we write  $\sigma(X_i) = h_i$ , then must satisfy

$$f_i(h_1, \dots, h_n) = \sum a_{ijk} f_j f_k.$$

Then we consider the subalgebra generated by  $f_i, h_i, a_{ijk}$ , then by the same reason, they form a smooth algebra over  $\mathbb{Z}$ , and its tensor with  $R$  gives out  $S$ .  $\square$

**Cor. (5.4.5.16) [Strong Lifting Property].** Smooth ring maps satisfy right lifting property w.r.t. any ring map  $A \rightarrow A/I \in \mathcal{C}\text{Ring}$ , where  $I \in \text{Ideal}(A)$  is locally nilpotent.  $\lrcorner$

*Proof:* By (5.4.5.15),  $R \rightarrow S$  is a base change of a smooth ring map  $R_0 \rightarrow S_0$  where  $R_0$  is f.g. over  $\mathbb{Z}$ . Now if  $S_0$  is generated by  $x_1, \dots, x_n$  and  $a_1, a_n \in A$  maps to the image of  $x_1, \dots, x_n$  in  $A/I$ , then consider the subring  $A_0$  generated by  $R_0$  and  $a_i$ , and let  $I_0 = A_0 \cap I$ , then it suffices to prove this case followed by base change. But now  $A_0$  is f.g. over  $\mathbb{Z}$ , so it is Noetherian, and then  $I$  is nilpotent, thus we have a desired lifting.  $\square$

**Prop. (5.4.5.17) [Stalkwise].** If  $R \rightarrow S$  is f.p., then it is smooth iff it is  $S_q/R_p$  is smooth for every (maximal) prime  $q$  of  $S$  and  $p$  under it.  $\lrcorner$

*Proof:* Because of f.p., we only need to check triviality of  $H_1(NL)$  and finite projectivity of  $\Omega_{S/R}$  (5.4.5.12). But both triviality and finite projectivity is stalkwise (5.1.4.2). (Notice  $R \rightarrow R_p$  is smooth).  $\square$

**Cor. (5.4.5.18) [Smooth Locus and Flat Base Change].** If  $R \rightarrow S$  is of f.p. and  $R \rightarrow R'$  is flat. Then the smooth locus of  $S' = S \otimes_R R'/R'$  is the inverse image of smooth locus of  $S/R$ .  $\lrcorner$

*Proof:* One direction is because smooth is stable under base change. Conversely, the local ring map is f.f., so  $H_1(NL_{S'/R'}, q) = H_1((NL_{S/R} \otimes_S S')_q) = H_1(NL_{S/R, p} \otimes_{S_p} S'_q)$ . Then the result follows as  $S'_q/S_p$  is f.f. and triviality and finite projective descents for f.f. map (5.4.2.1).  $\square$

**Lemma (5.4.5.19).** A global complete intersection  $S = R[X_1, \dots, X_n]/(f_1, \dots, f_c)$  is smooth at a point  $\mathfrak{p}$  iff the Jacobian has rank  $\geq n - \dim_{\mathfrak{q}}(S)$  at  $\mathfrak{q}$ , i.e.  $J(\frac{f_1, \dots, f_c}{X_1, \dots, X_c})$  is not in  $\mathfrak{q}$  for some permutation of  $X_1, \dots, X_n$ .  $\lrcorner$

*Proof:* This is a special case of (5.4.5.24). However, we need to prove it first here. If it is smooth at  $\mathfrak{q}$ , then  $\Omega_{S/R}$  is locally free of dimension  $\geq n - \dim_{\mathfrak{q}}(S)$  at  $\mathfrak{q}$  by (5.4.5.10), so the Jacobian has rank  $\geq n - \dim_{\mathfrak{q}}(S)$ . Conversely, if  $g = J(\frac{f_1, \dots, f_c}{X_1, \dots, X_c}) \notin \mathfrak{q}$ , then  $S_g = R[X_1, \dots, X_n, X_{n+1}]/(f_1, \dots, f_c, gX_{n+1} - 1)$  is a standard smooth map.  $\square$

**Prop. (5.4.5.20)[Fiberwise].** For a ring map  $R \rightarrow S$  and  $\mathfrak{q}$  is a prime of  $S$  over  $\mathfrak{p}$ . Then  $S/R$  is smooth at  $\mathfrak{q}$  iff  $S/R$  is of f.p. around  $\mathfrak{q}$  and  $S_{\mathfrak{q}}/R_{\mathfrak{p}}$  is flat and  $S \otimes_R k(\mathfrak{p})/k(\mathfrak{p})$  is smooth at  $\mathfrak{q}$ .  $\lrcorner$

*Proof:* One direction is because smooth is flat, f.p. and stable under base change. Conversely, by (5.4.5.14) and (5.4.4.18), change  $R$  to  $R_g$  for some  $g \notin \mathfrak{p}$ , we may assume  $S = R[X_1, \dots, X_n]/(f_1, \dots, f_c)$  is a global complete intersection. Then we may use (5.4.5.19) to see the map is smooth on the standard open subset defined by the product of Jacobians of  $f_i$ .  $\square$

**Prop. (5.4.5.21).** If  $A \rightarrow A[X_1, \dots, X_n] \rightarrow R$  is smooth, then  $A[X_1, \dots, X_n] \rightarrow R$  is smooth.  $\lrcorner$

*Proof:* The desired map is firstly of f.p. by (5.3.7.11), and it can be verified to be formally smooth, because  $A[X_1, \dots, X_n]$  is free.  $\square$

### Smooth over Fields

**Lemma (5.4.5.22).** Let  $S$  be f.g. over a alg.closed field  $k$  and  $\mathfrak{m}$  a maximal ideal, then the following are equivalent:

- $S_{\mathfrak{m}}$  is regular.
- $\dim_k \Omega_{S/k} \otimes_S k \leq \dim S_{\mathfrak{m}}$
- $\dim_k \Omega_{S/k} \otimes_S k = \dim S_{\mathfrak{m}}$
- $S/k$  is smooth at  $\mathfrak{m}$ .

$\lrcorner$

*Proof:* Cf. [Sta]00TS.  $\square$

**Prop. (5.4.5.23)[Differential Criterion of Smoothness].** For a ring  $S$  f.g. over a field  $k$ ,  $S$  is smooth in a nbhd of  $\mathfrak{q}$  iff  $\dim_{k(\mathfrak{q})} \Omega_{S/k} \otimes k(\mathfrak{q}) \leq \dim_{\mathfrak{q}}(S)$ .

And in this case, equality hold, and  $S_{\mathfrak{q}}$  is regular.  $\lrcorner$

*Proof:* Cf. [Sta]00TT.

If  $S$  is smooth at  $x$ , then  $\Omega_{S/R}$  is finite free on a nbhd of  $x$  of rank equals to the dimension (5.4.5.10), so the equation holds.

Conversely, if  $\dim_{k(x)} \Omega_{S/k} \otimes k(x) \leq \dim_x(X)$ , then  $\square$

**Cor. (5.4.5.24)[Jacobian Criterion of Smoothness].** For a f.p. ring  $S = R[X_1, \dots, X_n]/(f_1, \dots, f_c)$  and  $\mathfrak{q} \subset S$ ,  $S$  is smooth at  $\mathfrak{q}$  iff the Jacobian has rank  $\geq n - \dim_{\mathfrak{q}}(S)$  at  $\mathfrak{q}$  iff the Jacobian has rank  $= n - \dim_{\mathfrak{q}}(S)$  at  $\mathfrak{q}$ .  $\lrcorner$

**Lemma (5.4.5.25).** Let  $k$  be a field and  $(R, \mathfrak{m}, \kappa)$  be a Noetherian local ring containing  $k$ . If the residue field of  $R$  is a f.g. field extension of  $k$ , then the derivation map

$$\mathfrak{m}/\mathfrak{m}^2 \rightarrow \Omega_{R/k} \otimes_R \kappa$$

is injective.  $\lrcorner$

*Proof:* Cf.[Sta]00TU. □

**Prop. (5.4.5.26)[Smooth and Regular at Geometric Points].** Let  $S$  be f.g. over a field  $k$ , if  $k(\mathfrak{q})/k$  is separable (e.g. char 0) for  $\mathfrak{q}$  a prime of  $S$ , then  $S$  is smooth at  $\mathfrak{q}$  iff it is regular at  $\mathfrak{q}$ . ┘

*Proof:* Let  $R = S_{\mathfrak{q}}$  with maximal ideal  $\mathfrak{m}$ . By (5.4.5.25) and (5.4.3.8) there is an exact sequence

$$0 \rightarrow \mathfrak{m}/\mathfrak{m}^2 \rightarrow \Omega_{R/k} \otimes_R k(\mathfrak{q}) \rightarrow \Omega_{k(\mathfrak{q})/k} \rightarrow 0.$$

Since  $k(\mathfrak{q})/k$  is separable,  $\dim_{k(\mathfrak{q})} \Omega_{k(\mathfrak{q})/k} = \text{tr. deg}(k(\mathfrak{q})/k)$ . So

$$\dim_{k(\mathfrak{q})}(\Omega_{R/k} \otimes_R k(\mathfrak{q})) = \dim_{k(\mathfrak{q})} \mathfrak{m}/\mathfrak{m}^2 + \text{tr. deg}(k(\mathfrak{q})/k) \geq \dim R + \text{tr. deg}(k(\mathfrak{q})/k) = \dim_{\mathfrak{q}}(S)$$

with identity iff  $R$  is regular (The last identity comes from (7.6.3.7)). So we are done by differential criterion of smoothness (5.4.5.23). □

**Prop. (5.4.5.27) [Smooth over Fields and Geo.Regular].** Let  $S$  be f.g. over a field  $k$ , then  $S$  is smooth over  $k$  iff  $S$  is geo.regular (5.3.6.1). In particular, by (5.3.6.7), if  $k = k^{\text{perf}}$ , then smooth over  $k$  is equivalent to regular. ┘

*Proof:* If  $S$  is smooth at  $x$ , then all its base change is smooth at  $x$  (5.4.5.13), and the stalk is regular by (5.4.5.23), so it is geometrically regular at  $x$ .

Conversely, if  $X$  is geometrically regular, then for any point  $x \in X$ ,  $k(x)$  is f.g. over  $k$ , so by (5.3.9.3) there is a finite purely inseparable extension  $k'/k$  that the compositum  $k'k(x)$  is separable over  $k'$ . Then by (5.1.7.26),  $\text{Spec } A \otimes_k k'$  is homeomorphic to  $\text{Spec } A$ , so there is a unique prime  $p'$  of  $X_{k'}$  over  $X$ , and its residue field is  $k'k(x)$ . So by (5.4.5.26), as  $k'k(x)/k'$  is separable,  $X_{k'}$  is smooth over  $k'$  at  $p'$ . And f.f. descent for smoothness (5.4.2.1) says  $X$  is also smooth over  $k$  at  $p$ . □

**Cor. (5.4.5.28)[Differential and Smoothness].** Let  $k$  be a field of characteristic 0 and  $S$  a f.g. algebra over  $k$ , and  $\mathfrak{q}$  a prime ideal of  $S$ , if  $\Omega_{S/k, \mathfrak{q}}$  is free over  $S_{\mathfrak{q}}$ , then  $S$  is smooth in a nbhd of  $\mathfrak{q}$ . ┘

*Proof:* Cf.[Sta]00TX. □

**Prop. (5.4.5.29)[Generic Smoothness].** Let  $R \rightarrow S$  be an injective ring map of f.t. with  $R, S$  domains, then it is smooth at (0) iff the quotient field map is separable. ┘

*Proof:* If  $S$  is smooth at 0, then replacing  $S$  by  $S_g$  for some  $g$ , we can assume  $R \rightarrow S$  is smooth. Then  $K \rightarrow S \otimes_R K$  is also smooth (5.4.5.13), and also for any field extension  $K'$  of  $K$ . Then  $S \otimes_R K'$  is regular, by (5.4.5.23), a priori reduced (7.4.1.5). Thus  $S \otimes_R K$  is geometrically reduced. Hence also  $L$  is geometrically reduced over  $K$ , thus separable, by (5.3.9.4).

Conversely, by (5.4.1.34), we may assume  $R \rightarrow S$  is of f.p., thus to show it is smooth at (0), it suffices to show  $S \otimes_R K$  is smooth at (0), by (5.4.5.20). Then this follows from (5.4.5.26). □

### Smoothing Ring Maps

**Prop. (5.4.5.30).** A regular homomorphism of Noetherian rings is a filtered colimit of smooth ring maps. ┘

*Proof:* Cf.[Sta]07GC. □

## 6 Unramified Maps

### Formally Unramified Ring Maps

**Def. (5.4.6.1) [Formally Unramified Ring Maps].**  $R \rightarrow S \in \mathcal{CRing}$  is called **formally unramified** if for any  $A \in \mathcal{CRing}/R$  and  $I \in \text{Ideal}(A)$  s.t.  $I^2 = 0$ , a map  $S \rightarrow A/I$  has at most one extension to a map  $S \rightarrow A$ .

Formally unramifiedness is equivalent to  $\Omega_{S/R} = 0$ . So it is stable under composition by Jacobi-Zariski sequence (5.4.3.7).  $\lrcorner$

*Proof:* Let  $J = \ker(S \otimes_R S \rightarrow S)$ , let  $A_{univ} = S \otimes_R S/J^2$ , then  $J/J^2 \cong \Omega_{S/R}$  (5.4.3.4), so we have two natural map from  $S$  to  $A_{univ}$ , they differ by the universal differential  $S \rightarrow \Omega_{S/R}$ . If  $S/R$  is unramified, then  $ds = 0$  for all  $s \in S$ , so  $\Omega_{S/R} = 0$ .

Conversely, if there is a  $A$  and  $A/J$  that there are two liftings  $\tau_1, \tau_2$ , then we let  $A_{univ} \rightarrow A$  defined by  $s_1 \otimes s_2 \rightarrow \tau_1(s_1)\tau_2(s_2)$ , this is well-defined, and because  $A_{univ} \cong S$ , this map descends to  $S$ , so  $\tau_1(s_1s_2) = \tau_2(s_1s_2)$ .  $\square$

**Prop. (5.4.6.2) [Formally Unramified are Stalkwise].** Formally unramified is stalkwise both on the source and target (5.1.4.2).  $\lrcorner$

**Prop. (5.4.6.3).** Colimits of formally unramified rings over  $R$  is formally unramified.  $\lrcorner$

*Proof:* Trivial from the definition.  $\square$

### Unramified Ring Maps

**Def. (5.4.6.4) [Unramified Maps].** An **unramified ring map** is a ring map that is formally unramified and f.g..

A **G-unramified ring map** is a ring map that is formally unramified and of f.p..

These two notions are stable under composition and base change. These two notions are local on the source and target.  $R \rightarrow R_f$  is  $G$ -unramified. (5.4.6.1)(5.1.4.2)  $\lrcorner$

**Prop. (5.4.6.5).**  $R \rightarrow R/I$  is unramified, and if  $I$  is f.g., then it is  $G$ -unramified. (Trivial).  $\lrcorner$

**Prop. (5.4.6.6) [Stalkwise and Fiberwise].** If  $R \rightarrow S$  is of f.t(f.p.), then it is unramified ( $G$ -unramified) at a prime  $q$  of  $S$  iff  $(\Omega_{S/R})_q = 0$  iff  $\Omega_{S/R} \otimes_S k(q) = 0$  iff  $(\Omega_{S \otimes k(p)/k(p)})_q = 0$  iff  $\Omega_{S \otimes k(p)/k(p)} \otimes k(q) = 0$ .  $\lrcorner$

*Proof:* By Nakayama, two pair of them are equivalent, and if  $\Omega_{S/R,q} = 0$ , then  $\Omega_{S/R,g} = 0$  for some  $g \notin q$  (because support of finite module is open), so  $R \rightarrow S_g$  is ( $G$ -)unramified. And notice in fact  $\Omega_{S/R} \otimes_S k(q) = \Omega_{S \otimes k(p)/k(p)} \otimes_{k(p)} k(q)$ .  $\square$

**Prop. (5.4.6.7) [Unramified F.g. Ring Maps].** For  $R \rightarrow S \in \mathcal{CRing}$ , if  $S$  is unramified at  $\mathfrak{q} \in \text{Spec}(S)$  over  $\mathfrak{p} \in \text{Spec}(R)$ , then  $\mathfrak{p}S_{\mathfrak{q}} = \mathfrak{q}S_{\mathfrak{q}}$  and  $\kappa(\mathfrak{q})/\kappa(\mathfrak{p})$  is finite separable. And the converse is true if  $S$  is of f.t. over  $R$ .  $\lrcorner$

*Proof:* Suppose  $R \rightarrow S_g$  is unramified with  $g \in S \setminus \mathfrak{q}$ , then  $S \otimes \kappa(\mathfrak{p})$  is unramified over  $\kappa(\mathfrak{p})$ , hence by (5.4.5.23), it is also smooth, so it is étale, and (5.4.7.9) gives the result.

For the converse, Cf[Sta]02FM.  $\color{red}?$   $\square$

**Prop. (5.4.6.8) [Unramified Maps are Quotient of Standard Étale Maps].** A ring map is unramified iff it is locally a quotient of a standard Étale map.  $\lrcorner$

*Proof:* Cf. [Sta]0395.  $\square$

**Prop. (5.4.6.9).** Any  $G$ -unramified map is a base change of a  $G$ -unramified map over a ring  $R_0$  f.g. over  $\mathbb{Z}$ . And similarly any unramified map is a quotient of a base change of a  $G$ -unramified map over a ring  $R_0$  f.g. over  $\mathbb{Z}$ .  $\lrcorner$

*Proof:* Let  $S = R[X_1, \dots, X_n]/(g_1, \dots, g_c)$ , then we have  $dX_i = \sum a_{ij}dg_j + a_{ijk}g_jdX_k$ , so we let  $R_0$  be generated by  $g_i, a_{ij}, a_{ijk}$ , so  $S_0 = R_0[X_1, \dots, X_n]/(g_1, \dots, g_c)$  is  $G$ -unramified.  $\square$

**Prop. (5.4.6.10) [Unramifiedness and Idempotent].** If  $R \rightarrow S$  is of f.t., then it is unramified iff  $S \times_R S \rightarrow S$  is isomorphic to  $S \otimes_R S \rightarrow (S \otimes_R S)_e$  for some diagonal idempotent  $e \in S \otimes_R S$  that  $e \ker(\mu) = 0$ , i.e.  $S \otimes_R S \cong S \times S'$ .  $\lrcorner$

*Proof:* If it is  $G$ -unramified, the kernel  $I$  satisfies  $I/I^2 = 0$ , and  $I$  is f.g. (by  $x_i \otimes 1 - 1 \otimes x_i$ ) so we can use (5.1.7.7).  $\square$

Conversely, the existence of the diagonal idempotent  $e$  implies that  $I = I^2$ .  $\square$

### Loca-Unramified Ring Maps

**Def. (5.4.6.11) [Local-Unramified Ring Maps].** Let  $f : (A, \mathfrak{m}_A, \kappa_A) \rightarrow (B, \mathfrak{m}_B, \kappa_B) \in \mathcal{CRing}$  be a local ring map between Noetherian local rings, then  $f$  is called a **local-unramified ring map** if

- $\mathfrak{m}_A B = \mathfrak{m}_B$ ,
- $\kappa_B/\kappa_A$  is finite separable.
- $B$  is essentially of f.t. over  $A$  (5.1.1.21).  $\lrcorner$

**Prop. (5.4.6.12) [Local-Unramified and Unramified].** Let  $f : (A, \mathfrak{m}_A, \kappa_A) \rightarrow (B, \mathfrak{m}_B, \kappa_B) \in \mathcal{CRing}$  be a local ring map between Noetherian local rings. If  $f$  is unramified, then  $f$  is local-unramified (5.4.6.11), and the converse is true if  $f$  is of f.t..  $\lrcorner$

*Proof:* This follows from (5.4.6.7).  $\square$

**Prop. (5.4.6.13) [Properties of Local-Unramified Ring Maps].** Let  $f : (A, \kappa_A) \rightarrow (B, \kappa_B) \in \mathcal{CRing}$  be a local ring map between Noetherian local rings.

- If  $f$  is local-unramified (5.4.6.11), then  $\hat{B}$  is a finite  $\hat{A}$ -module.
- If  $f$  is local-unramified and  $\kappa_A = \kappa_B$ , then  $\hat{B}$  is a quotient of  $\hat{A}$ .
- If  $f$  is local-unramified and  $\kappa_A = \kappa_A^{\text{sep}}$ , then  $\hat{B}$  is a quotient of  $\hat{A}$ .  $\lrcorner$

*Proof:* 1: This follows from (5.2.3.15).

2: This follows from item1 and Nakayama's lemma.

3: This follows from item2.  $\square$

**Prop. (5.4.6.14) [Local-Unramified Map between Noetherian Complete Local Rings].** If  $f : (A, \kappa_A) \rightarrow (B, \kappa_B) \in \mathcal{CRing}$  is a local ring map between Noetherian local rings essentially of f.t. (5.1.1.21), then  $f$  is local-unramified iff  $\hat{f} : \hat{A} \rightarrow \hat{B}$  is local-unramified iff  $\hat{f}$  is unramified.  $\lrcorner$

*Proof:*  $f$  is local-unramified iff  $\hat{f}$  is local-unramified, because  $\mathfrak{m}_{\hat{A}} = \mathfrak{m}_A \hat{A}$  and  $B \rightarrow \hat{B}$  is faithfully flat (5.4.1.32).

If  $\hat{f}$  is local-unramified, then  $\hat{A} \rightarrow \hat{B}$  is finite by (5.4.6.13), thus  $\hat{f}$  is unramified by (5.4.6.12).

If  $\hat{f}$  is unramified, then  $\hat{f}$  is local-unramified, by (5.4.6.12).  $\square$

## 7 Étale Maps

### Formally Étale

**Def. (5.4.7.1) [Étale Ring Maps].** A ring map  $R \rightarrow S$  is called **formally étale ring map** iff it is formally smooth(5.4.5.1) and formally unramified(5.4.6.1).  $\lrcorner$

**Prop. (5.4.7.2).** Colimits of formally étale rings over  $R$  is formally étale. (The liftings are compatible because of uniqueness).  $\lrcorner$

**Prop. (5.4.7.3).** For any multiplicative set  $S \subset R$ ,  $R \rightarrow S^{-1}R$  is formally étale.  $\lrcorner$

*Proof:* It suffice to prove that if  $\varphi(s)$  is invertible modulo  $I$ , then  $\varphi(s)$  is invertible, but this is true because  $I$  is nilpotent.  $\square$

### Étale Map

**Def. (5.4.7.4) [Étale Ring Maps].**  $R \rightarrow S \in \mathcal{CRing}$  is called **étale ring map** if it is of f.p. and the naive cotangent complex is exact, i.e.  $I/I^2 \cong \Omega_{P/R} \otimes_P S$ .

In particular, étale is equivalent to smooth & formally unramified( $\Omega_{R/S} = 0$ ).  $\lrcorner$

**Cor. (5.4.7.5) [Properties of Étale Ring Maps].**

1. Étalemap is stable under base change and composition.
2. Étalemap is local on the source and target. In particular,  $R \rightarrow R_f$  is étale.
3. If  $R \rightarrow S$  is of f.p. and  $R \rightarrow R'$  is flat. Then the set of primes in  $S' = S \otimes_R R'$  that has a nbhd that is étale over  $R'$  is the inverse image of set of primes in  $S$  that has a nbhd that is étale over  $R$ . (The same as(5.4.5.18)).
4. Étale map are smooth, hence flat(5.4.5.14).
5. Any étale map is a base change of an étale map over a ring  $R_0$  f.g. over  $\mathbb{Z}$ . (Cf.[Sta]00U2).  $\lrcorner$

**Cor. (5.4.7.6) [Étale Localness of Differential].** For ring morphisms  $A \rightarrow R \rightarrow S$ , if  $R \rightarrow S$  is étale, then  $\Omega_{S/A} = \Omega_{R/A} \otimes_R S$ .  $\lrcorner$

*Proof:* This follows from(5.4.7.4) and(5.4.5.5).  $\square$

**Prop. (5.4.7.7) [Jacobson Criterion for Étaleness].** Étale ring maps are standard smooth(5.4.5.7).

Conversely,  $S = R[X_1, \dots, X_n]/(f_1, \dots, f_n) \in \mathcal{CRing}/R$  is étale iff  $\text{Jac} \left( \frac{f_1, \dots, f_n}{X_1, \dots, X_n} \right)$  is invertible in  $S$ .  $\lrcorner$

*Proof:*  $I/I^2 \cong \Omega_{P/R} \otimes_P S$ , so  $I/I^2$  is free, so by(5.3.7.12), there is a presentation of  $S$  that  $f_1, \dots, f_c$  freely generate  $I/I^2$ , then obviously  $c = n$  and  $J(\frac{f_1, \dots, f_c}{X_1, \dots, X_n})$  is invertible in  $S$ , i.e.  $S$  is standard smooth.  $\square$

**Cor. (5.4.7.8) [Example of Étale Maps].** For any  $n \in \mathbb{Z}_+$ ,

$$S = R[X_1, \dots, X_n, X_{n+1}]/\left(f_1, \dots, f_n, X_{n+1} \det\left(\frac{f_1, \dots, f_n}{X_1, \dots, X_n}\right) - 1\right) \in \mathcal{CRing}/R$$

is étale over  $R$ .  $\lrcorner$

**Prop. (5.4.7.9).** If  $R \rightarrow S$  is étale at a nbhd of a prime  $q$  of  $S$  over  $p$ , then  $pS_q = qS_q$ , and  $k(q)/k(p)$  is finite separable.  $\lrcorner$

*Proof:* We can replace  $S$  by  $S_q$  so  $S_q/R$  is étale. Then  $S \otimes k(p)/k(p)$  is étale, that is  $S_p/pS_p$  is a finite product of finite separable fields, so  $S_q/pS_q = (S_p/pS_p)_q =$  some separable closed field.  $\square$

**Lemma (5.4.7.10).** If  $R \rightarrow S \in \mathcal{CRing}$  is étale and  $q$  is a prime of  $S$  over  $p$ , then  $S/R$  is étale in a nbhd of  $q$  if

- $R \rightarrow S$  is of f.p.
- $R_p \rightarrow S_q$  is flat.
- $pS_q = qS_q$ .
- $k(q)/k(p)$  is a finite separable field extension.

 $\lrcorner$ 

*Proof:* Cf. [Sta]00U6.  $\square$

**Prop. (5.4.7.11) [Étale=Flat & G-Unramified].**  $R \rightarrow S \in \mathcal{CRing}$  is étale (5.4.7.4) iff it is flat and G-unramified (5.4.6.4) (i.e. of f.p. and  $\Omega_{S/R} = 0$ ).  $\lrcorner$

*Proof:* One direction is by definition, and the converse is by (5.4.7.10) and (5.4.6.7).  $\square$

**Prop. (5.4.7.12).** A ring map of f.p. is formally étale iff it is étale.  $\lrcorner$

*Proof:* In the f.p. case, formally smooth is equivalent to smooth (5.4.5.12).  $\square$

**Prop. (5.4.7.13).** If  $S, S' \in \mathcal{CRing}/R$  are étale, then any  $S \rightarrow S' \in \mathcal{CRing}/R$  is étale.  $\lrcorner$

*Proof:*  $S \rightarrow S'$  is of f.p. by (5.3.7.11), the rest Cf. [Sta]00U7.  $\square$

**Prop. (5.4.7.14) [Étale Algebra seen explicitly as Finite Projective Modules].** Étale algebras are finite projective, by (5.3.1.7). And we can see this clearly as follows: There is an diagonal idempotent as it is unramified (5.4.6.10), If  $e = \sum a_i \otimes b_i$ , then we can realize  $S$  as a direct command of  $R^n$  through maps

$$S \xrightarrow{\alpha} R^n \xrightarrow{\beta} S$$

where  $\alpha(f) = (\text{tr}_{S/R}(fa_i))$ , and  $\beta((g_i)) = \sum g_i b_i$ .  $\lrcorner$

*Proof:* We check that  $\beta \circ \alpha = \text{id}$ : Notice first that  $\text{tr}_{i_2}(e) = \text{tr}_{S/S}(1) = 1$ , following from the decomposition above, so  $\sum \text{tr}_{S/R}(a_i) b_i = 1$ , thus shows that  $\beta \alpha(1) = 1$ .

Now for general  $f$ , using the formula  $(f \otimes 1)e = (1 \otimes f)e$ , we get  $\sum \text{tr}(fa_i) b_i = \sum \text{tr}(a_i) b_i f = f$ .  $\square$

**Prop. (5.4.7.15).** For  $I \in \text{Ideal}(R)$ , any étale ring map  $R/I \rightarrow \bar{S} \in \mathcal{CRing}$  comes from an étale ring map  $R \rightarrow S$ .  $\lrcorner$

*Proof:* Use (5.4.7.7), an étale map is of the form  $\bar{S} = R/I[X_1, \dots, X_n]/(\bar{f}_1, \dots, \bar{f}_n)$  that  $\delta = J(\frac{f_1, \dots, f_n}{X_1, \dots, X_n})$  is invertible in  $S$ , then we take  $S = R[X_1, \dots, X_n, X_{n+1}]/(f_1, \dots, f_n, X_{n+1}\delta - 1)$ , then it is étale by (5.4.7.8) and maps to  $\bar{S}$ .  $\square$

**Prop. (5.4.7.16) [Étale Ring Maps of Dedekind-Domains].** If  $A \rightarrow B \in \mathcal{CRing}$  is étale and  $A$  is a Dedekind-domain (5.2.7.1), then  $B$  is a finite product of Dedekind-domains.  $\lrcorner$

*Proof:* Cf. [Sta]0AP2.  $\square$

### Standard Étale Ring Maps

**Def. (5.4.7.17) [Standard Étale Ring Maps].** a **standard étale ring map** is a ring map  $R \rightarrow R' = R[X]_{gf}/(f) \in \mathcal{CRing}$  where  $f$  is monic and  $g \in R[X]$ . A standard étale ring map is étale by Jacobian criterion(5.4.7.7).

Standard étale is stable under base change and principal localization, but not stable under composition.  $\lrcorner$

**Prop. (5.4.7.18) [Étale and Standard Étale].** A ring map is étale iff it is locally standard étale on the source.  $\lrcorner$

*Proof:* Cf.[Sta]00UE. ?  $\square$

**Prop. (5.4.7.19).** Giving any ring  $R$  and a prime  $p$ , if there is a finite separable extension  $L/k(p)$ , then there is a standard étale map  $R \rightarrow R'$  that for some  $q'$ ,  $k(q') \cong L$  over  $k$ .  $\lrcorner$

*Proof:*  $L = k(p)[\alpha]$  by primitive element theorem, so the minimal polynomial of  $\alpha$  is separable, and if we change  $\alpha$  to  $c\alpha$  for some  $c \in k(p)$ , we can assume  $f$  can be lifted to a  $f \in R[X]$ . Now  $f'(\alpha)$  is invertible in  $L$ , so there is a map from  $R[X]_{f'}/(f)$  to  $L$ , whose kernel gives the desired prime  $q$ .  $\square$

### Local-Étale Ring Maps

**Def. (5.4.7.20) [Local-Étale Ring Maps].** A **local-étale ring map** is a local homomorphism  $f : A \rightarrow B$  between Noetherian local rings that is flat and local-unramified(5.4.6.11).  $\lrcorner$

**Prop. (5.4.7.21) [Local-Étale and Étale].** If  $f : A \rightarrow B$  is a local homomorphism between Noetherian local rings of f.t., then  $f$  is étale iff  $f$  is local-étale(5.4.7.20).  $\lrcorner$

*Proof:* This follows from(5.4.6.12).  $\square$

**Prop. (5.4.7.22) [Local-Étale Map between Noetherian Complete Local Rings].** If  $f : (A, \kappa_A) \rightarrow (B, \kappa_B) \in \mathcal{CRing}$  is a local ring map between Noetherian local rings essentially of f.t.(5.1.1.21), then  $f$  is local-étale(5.4.7.20) iff  $\hat{f} : \hat{A} \rightarrow \hat{B}$  is local-étale iff  $\hat{f}$  is étale. And in this case,  $\hat{B} = \hat{A}^{[\kappa_B : \kappa_A]}$  as  $\hat{A}$ -modules.  $\lrcorner$

*Proof:* By(5.4.6.14) and(5.4.7.11), it suffices to show that  $f$  is flat iff  $\hat{f}$  is flat. But this follows from(5.4.1.33).

For the last assertion, notice that  $\hat{B}$  is finite flat over  $\hat{A}$ (5.4.6.13), thus finite free.  $\square$

### Étale over Fields

**Prop. (5.4.7.23) [Étale Algebra over Fields].**  $R \in \mathcal{CRing}/k$  is étale iff it is a finite product of finite separable extensions of  $k$ .  $\lrcorner$

*Proof:* If  $k'/k$  is finite separable, then  $k' = k(\alpha)$  for some  $\alpha$  by primitive element theorem, thus  $k' = k[X]/(f)$  that  $f'$  is invertible in  $k'$ , thus it is étale by(5.4.7.7).

Conversely, Cf.[Sta]00U3.  $\square$

**Cor. (5.4.7.24) [Étale over Perfect Fields].** Let  $k$  be a perfect field. If  $R$  is a  $k$ -algebra that is a finite as a  $k$ -module, then it is étale over  $k$  iff it is reduced.  $\lrcorner$

*Proof:* If it is étale, then it is reduced, by (5.4.7.23). Conversely, if it is finite and reduced, then it is a reduced Artinian ring (5.1.3.4), so a product of fields over  $k$ , so étale as  $k$  is perfect.  $\square$

**Prop. (5.4.7.25) [Étale and Trace Form].** Let  $A$  be a f.d.  $k$ -algebra, then  $A$  is étale over  $k$  iff the trace form:  $A \times A \rightarrow k : (a, b) \mapsto \text{tr}_{A/k}(ab)$  is non-degenerate.  $\perp$

*Proof:* If it is étale, then the trace form is non-degenerate by (5.4.7.23) and (3.2.6.32). Conversely, if the trace form is non-degenerate, then  $A$  is reduced, because if  $a \in A$  is nilpotent, then  $ab$  are nilpotent for any  $b \in A$ , and  $\text{tr}_{A/k}(ab) = 0$ . Then as a reduced Artinian ring,  $A$  is isomorphic to a product of fields, then by (3.2.6.32), all the fields are separable over  $k$ .  $\square$

**Prop. (5.4.7.26) [Étale and Unramified over Fields].** For  $k \in \text{Field}$ , a f.g.  $k$ -algebra is étale iff it is (G-)unramified over  $k$ , by (5.4.5.23).  $\perp$

**Prop. (5.4.7.27) [Largest Étale Subalgebras].** For  $k \in \text{Field}$  and  $A \in \mathcal{C}\text{Ring}^{\text{ft}}/k$  there exists a maximal étale  $k$ -subalgebra of  $A$ . Also this subalgebra commutes with arbitrary field base change.  $\perp$

*Proof:* If  $R$  is an étale subalgebra of  $A$ , then  $R_{\bar{k}}$  is étale over  $\bar{k}$ , thus isomorphic to  $(\bar{k})^n$  for some  $n$ . Now  $n$  is smaller than the number of connected components of  $\text{Spec } A_{\bar{k}}$ , which is finite. So it suffices to show the composite of two étale subalgebras of  $A$  is étale. For this, notice  $RR'$  is a quotient of  $R \otimes_k R'$ , which is a finite product of finite separable fields over  $k$ , thus its quotient is also a finite product of finite separable fields over  $k$ , which is étale.  $\square$

### Étale Descents

**Prop. (5.4.7.28) [Dimension is Étale-Local].** If  $A \rightarrow B \in \mathcal{C}\text{Ring}$  is étale and  $\mathfrak{q} \in \text{Spec}(B)$  with  $\mathfrak{q} \cap A = \mathfrak{p}$ , then  $\dim(A_{\mathfrak{p}}) = \dim(B_{\mathfrak{q}})$ .  $\perp$

*Proof:* Cf. [Sta]07QP. ?  $\square$

**Prop. (5.4.7.29) [Regular is Étale-Local].** If  $A \rightarrow B \in \mathcal{C}\text{Ring}$  is étale and  $\mathfrak{q} \in \text{Spec}(B)$  with  $\mathfrak{q} \cap A = \mathfrak{p}$ , then  $A_{\mathfrak{p}}$  is regular iff  $B_{\mathfrak{q}}$  is regular.  $\perp$

*Proof:* Cf. [Sta]0AH0.  $\square$

## 8 Local Algebras

References are [Local Algebra, Serre].

**Prop. (5.4.8.1).** If  $A$  is a Noetherian local integral domain with residue field  $k$  and quotient field  $K$ , if  $M$  is a f.g.  $A$ -module that  $\dim_k M \otimes_A k = \dim_K M \otimes_A K = r$ , then  $M$  is free of rank  $r$ .

In other words, if the rank of  $M$  at the generic point and closed pt of  $B$  are the same, then  $M$  is free.  $\perp$

*Proof:* First  $M$  is generated by  $r$  elements by Nakayama and the kernel  $R$  of  $A^r \rightarrow M$  vanishes when tensoring  $K$ , thus vanish because it is torsion-free.  $\square$

**Prop. (5.4.8.2).** Let  $A \rightarrow B$  be a local ring map of local rings that

- $B$  is finite as an  $A$ -module.
- $\mathfrak{m}_B$  is a f.g. ideal.

- $A/\mathfrak{m}_A \cong B/\mathfrak{m}_B$ .
- $\mathfrak{m}_A/\mathfrak{m}_A^2 \cong \mathfrak{m}_B/\mathfrak{m}_B^2$ .

Then  $A \rightarrow B$  is surjective. ┘

*Proof:* By Nakayama, to show it is surjective, it suffices to show  $A/\mathfrak{m}_A \rightarrow B/\mathfrak{m}_A B$  is surjective, then it suffices to show  $\mathfrak{m}_A \otimes_A B \rightarrow \mathfrak{m}_B$  is surjective. For this, use Nakayama again on  $B$  to reduce to the fact  $\mathfrak{m}_A \otimes_A B/\mathfrak{m}_B \rightarrow \mathfrak{m}_B \otimes B/\mathfrak{m}_B$  is surjective, which is satisfied because this is just  $\mathfrak{m}_A/\mathfrak{m}_A^2 \rightarrow \mathfrak{m}_B/\mathfrak{m}_B^2$ . □

## 5.5 $p$ -adic Commutative Algebras

**Notation (5.5.0.1).**

- Let  $p \in \text{Prime}$ .

┘

### 1 $\mathbb{F}_p$ -Algebras

**Def. (5.5.1.1) [Relative Frobenius Maps].** Let  $S \rightarrow R$  be a ring map, then the **relative Frobenius**  $\varphi_{R/S}$  is the map  $R \otimes_{S, \text{Frob}} S \rightarrow R$  induced by universal property. ┘

**Def. (5.5.1.2) [Perfect Rings].**  $R \in \mathcal{CRing}/\mathbb{F}_p$  is called a **perfect ring** iff the Frobenius map  $\varphi : P \rightarrow P$  is an isomorphism. It is called **semi-perfect** if  $\varphi$  is surjective. This is compatible with the definition (3.2.6.19) when  $R$  is a field. ┘

**Prop. (5.5.1.3) [Perfection and Coperfection].** If  $R$  is of char  $p$ , we define  $R_{\text{perf}} = \varinjlim_{\varphi} R$  and  $R^{\text{perf}} = \varprojlim_{\varphi} R$ .

The  $(\cdot)_{\text{perf}}$  and  $(\cdot)^{\text{perf}}$  are respectively the left and right adjoint to the forgetful functor from the category of perfect rings to the category of rings of characteristic  $p$ .

In particular, the category of perfect rings admits limits and colimits, and it equals the limits and colimits in the category of rings. ┘

*Proof:* Firstly, both  $R_{\text{perf}}$  and  $R^{\text{perf}}$  are perfect: for  $R_{\text{perf}}$ , every element in  $R_{\text{perf}}$  is represented by an element  $a_n \in R_n$ , and this element is equivalent to  $a_n^p \in R_{n+1}$ , so its  $p$ -th root is  $a_n \in R_{n+1}$ . For  $R^{\text{perf}}$ , an element  $(\dots, x_n, \dots, x_0)$  has  $p$ -th root  $(\dots, x_{n+1}, \dots, x_1)$ .

Second it is easily checked to be a functor because  $\varphi$  is natural. The universal property is easy.

□

**Prop. (5.5.1.4) [Perfection Kills Nilextensions].** If  $f : R \rightarrow S \in \mathcal{CRing}/\mathbb{F}_p$  is surjective with nilpotent kernel, then  $R_{\text{perf}} \rightarrow S_{\text{perf}}$  and  $R^{\text{perf}} \rightarrow S^{\text{perf}}$  are both isomorphisms. ┘

*Proof:*  $-\text{perf}$  map is clearly surjective, and it is injective because if  $a$  maps to 0, then  $\text{Frob}^k(a) \in \ker f$  for some  $k$ , so it is nilpotent, so  $\text{Frob}^{k+n}(a) = 0$ .

$-\text{perf}$  is clearly injective, and it is surjective because: suppose  $\ker f^n = 0$ , then for a  $(s_n) \in S$ , let  $t_m$  be the inverse image of  $s_{mn}$ , for each  $m$ , and let  $x = (x_n), x_{mn-k} = \text{Frob}^k t_m$ , then  $(x) \in R^{\text{perf}}$  and  $x$  maps to  $s$ . ┘

**Def. (5.5.1.5) [Perfectly Finitely Presented].** A map of perfect  $\mathbb{F}_p$ -algebras  $B \rightarrow A$  are called **perfectly finitely presented** if  $A = (A_0)_{\text{perf}}$  for some f.p.  $B$ -algebra  $A_0$ . ┘

**Prop. (5.5.1.6) [Aberbach-Hochster].** Let  $R$  be a perfect  $\mathbb{F}_p$ -algebra,  $f_1, \dots, f_r \in R$ , and consider the ideal  $I = \sqrt{(f_1, \dots, f_r)} \in R$ . Then  $R/I$  has flat dimension  $\leq r$  as an  $R$ -module. ┘

*Proof:* We only prove for  $r = 1$ .

We show  $I = \varinjlim_{f^{1/p^n-1/p^{n+1}}} R$ . The map is given by  $(a_n) \mapsto f^{1/p^n} a_n$ . This is injective because if  $f^{1/p^n} a = 0$ , then  $f^{1/p^{n+1}} a = 0$  by perfectness, thus  $a$  is killed by the transition map  $f^{1/p^n-1/p^{n+1}}$ . □

**Prop. (5.5.1.7) [Perfect Algebras are Tor Independent].** For any two perfect  $A$ -algebras  $B, C$  where  $A$  is a perfect  $\mathbb{F}_p$ -algebra,  $\text{Tor}_i^A(B, C) = 0$  for  $i > 0$ . ┘

*Proof:*  $A \rightarrow B$  can be written as a composition of a perfection of a free  $A$ -algebra and a quotient. The perfection of free algebra is flat, thus we can assume  $B = A/I$ . By a filtered colimit argument again, we can assume  $I = (f_1^{\frac{1}{p^\infty}}, \dots, f_r^{\frac{1}{p^\infty}})$  is perfectly f.p. By induction, we can assume  $r = 1$ . Now the lemma (5.5.1.6) applied to  $R = C$  shows that  $IC = \varinjlim_{f^{1/p^n} - 1/p^{n+1}} C = I \otimes_A^L C$ , so  $B \otimes_A^L C = C/IC$  is discrete.  $\square$

**Prop. (5.5.1.8).** If  $R$  is a perfect  $\mathbb{F}_p$ -algebra,  $I$  is a radical ideal, and  $J = R[I] \subset R$ , then  $J$  and  $I + J$  are both radical, and the square

$$\begin{array}{ccc} R & \longrightarrow & R/I \\ \downarrow & & \downarrow \\ R/J & \longrightarrow & R/I + J \end{array}$$

is both a fiber pullback and pushout square of commutative rings.  $\square$

*Proof:*  $J$  is clearly a radical, and notice that  $I + J$  is the kernel of the map  $R \rightarrow R/I \otimes_R R/J = R/I + J$  (5.1.1.25), and the target is a colimit of perfect rings thus perfect, by (5.5.1.3). Thus  $I + J$  is also perfect, thus a radical ideal.

By (5.1.1.26), to show the map is a pullback square, it suffices to show that  $I \cap J = 0$ . If  $x \in I \cap J$ , then  $x^2 = 0$ , thus  $x^p = 0$ , so  $x = 0$ .  $\square$

### Tilting

**Def. (5.5.1.9) [Tilting].** For any  $R \in \mathcal{CRing}$ , the  $(p$ -adic)**tilting** of  $R$  is defined to be  $R^b = (R/(p))^{\text{perf}}$ , endowed with the profinite topology.  $\square$

**Prop. (5.5.1.10).** If  $R$  is a f.g. algebra over an alg.closed field  $k$  of char  $p$ , then  $R^b \cong k^{\pi_0(\text{Spec } R)}$ .  $\square$

*Proof:* It suffice to prove for  $\text{Spec } R$  connected and reduced, because by (5.5.1.4). We first prove the case  $\text{Spec } R$  is irreducible, i.e.  $R$  is integral:

In this case, choose a closed point  $x$ , then there is a map  $R \rightarrow \widehat{R}_x$ , where  $\widehat{R}_x$  is the  $\mathfrak{m}_x$ -adic completion. By Krull (5.2.2.15) and the fact  $R$  is integral, this map is injective, so it suffices to show that  $0 = (\widehat{R}_x)^{\text{perf}} = \varinjlim (R_x/\mathfrak{m}_x^n)^{\text{perf}}$ . But  $(-)^{\text{perf}}$  is a right adjoint so commutes with colimits and  $\widehat{R}_x = \varinjlim R_x/\mathfrak{m}_x^n$ . But  $(R_x/\mathfrak{m}_x^n)^{\text{perf}} = (R_x/\mathfrak{m}_x)^{\text{perf}} = k^{\text{perf}} = k$ , by (5.5.1.4) again.

If  $R$  is not irreducible, ?  $\square$

**Prop. (5.5.1.11) [Examples of Tilting].**

- $\mathbb{F}_p[t]_{\text{perf}} = \mathbb{F}_p[t^{\frac{1}{p^\infty}}]$ ,  $\mathbb{F}_p[t]^b = \mathbb{F}_p[t]^{\text{perf}} = \mathbb{F}_p$ .
- $(\mathbb{Z}_p)^b = \mathbb{F}_p$ .
- If  $R$  is a perfect ring of char  $p$  and  $f \in R$  is a non-zerodivisor, then  $(R/f)^{\text{perf}}$  is the  $f$ -adic completion of  $R$ . In particular,  $(\mathbb{F}_p[t^{\frac{1}{p^\infty}}]/(t))^{\text{perf}} \cong \widehat{\mathbb{F}_p[t^{\frac{1}{p^\infty}}]}$ .
- $(\widehat{\mathbb{Z}_p[p^{\frac{1}{p^\infty}}]})^{\text{perf}} \cong \widehat{\mathbb{F}_p[t^{\frac{1}{p^\infty}}]} \cong \widehat{\mathbb{F}_p[t]_{\text{perf}}} \cong (\mathbb{F}_p[t]_{\text{perf}}/(t))^{\text{perf}}$ .

$\square$

*Proof:* The first two are trivial, for the third, notice  $\widehat{R}_f = \varprojlim_n R/f^n = \varprojlim_n R/f^{p^n}$ , and there are

$$\begin{array}{ccc} R/f & \xrightarrow{\varphi} & R/f \\ \downarrow \varphi^{k+1} & & \downarrow \varphi^k \\ R/f^{p^{k+1}} & \xrightarrow{i} & R/f^{p^k} \end{array}, \text{ so } \varprojlim_n R/f^{p^n} \cong (R/f)^{\text{perf}}.$$

For the fourth, only the first equivalence needs proving, the others are consequences of the first three items. Then notice

$$(\widehat{\mathbb{Z}_p[p^{\frac{1}{p^\infty}}]})^b \cong \varprojlim (\widehat{\mathbb{Z}_p[p^{\frac{1}{p^\infty}}]}/p^k)^{\text{perf}} \cong (\widehat{\mathbb{Z}_p[p^{\frac{1}{p^\infty}}]}/p)^{\text{perf}} \cong (\mathbb{F}_p[t^{\frac{1}{p^\infty}}]/t)^{\text{perf}} \cong \widehat{\mathbb{F}_p[t^{\frac{1}{p^\infty}}]}$$

The last isomorphism by item3.  $\square$

**Prop. (5.5.1.12).** If  $R \in \mathcal{C}\text{Ring}$  is a  $p$ -adically complete,  $\pi \in R^\times, p \in (\pi)$ , then the map  $R \rightarrow R/p$  induces an homeomorphism of monoids:

$$\varprojlim_{x \rightarrow x^p} R \cong \varprojlim_{\varphi} R/\pi \stackrel{(5.5.1.4)}{=} \varprojlim_{\varphi} R/p = R^b$$

┘

*Proof:* Injectivity: if  $(a_n), (b_n) \in \varprojlim_{x \rightarrow x^p} R$  satisfies  $a_n \equiv b_n \pmod{\pi}$  for all  $n$ , then applying power lifting(2.6.1.10),  $a_n \equiv b_n \pmod{\pi^{n+k}}$  for all  $k$ , so  $a_n = b_n$ .

Surjectivity: for  $(\bar{a}_n) \in R^b$ , choose arbitrary lifting  $a_n$ , then  $a_{n+k+1}^p \equiv a_{n+k} \pmod{\pi}$  for all  $n+k$ , so  $k \mapsto a_{n+k}^{p^k}$  is a Cauchy sequence by power lifting(2.6.1.10) again, thus converging to some point  $b_n$ . then it's easily checked that  $b_{n+1}^p = (\lim a_{n+1+k}^{p^k})^p = \lim a_{n+1+k}^{p^{k+1}} = b_n$ . so  $(b_n)$  maps to  $(\bar{a}_n)$ .

For the topology: it is clearly continuous, and for the reverse, if  $(a_i), (b_i)$  satisfies that  $a_i \equiv b_i \pmod{\pi}$  for  $i < k$ , then the image in  $\varprojlim_{x \rightarrow x^p} R$  satisfies  $x_i \equiv y_i \pmod{p^{k-i}}$  for  $i < k$ , thus it is open.  $\square$

**Cor. (5.5.1.13) [Sharp Map].** From this proposition, we get a multiplicative **sharp map**:

$$\sharp : R^b \rightarrow R : (\bar{a}_n) \mapsto \lim_{k \rightarrow \infty} a_k^{p^k},$$

and its image is just the elements that has a compatible system of  $p^k$ -th roots  $x^{\frac{1}{p^k}}$ . These elements are also called **perfect**.  $\square$

**Cor. (5.5.1.14) [Addition in  $R^b$ ].** From the isomorphism(5.5.1.12) above, we can read what the addition looks like in the presentation  $\varprojlim_{\varphi} R$ : if  $(f_n), (g_n)$  are two elements, then their addition is given by  $(h_n)$ , where  $h_n = \lim_k (f_{n+k} + g_{n+k})^{p^k}$ .  $\square$

**Cor. (5.5.1.15) [Fontaine's Map].** By(8.1.4.4), the natural map  $R^b \rightarrow R/p$  induces a map  $\theta_R : W(R^b) \rightarrow R$  of rings, called the **Fontaine's map**, which writes as  $\sum [a_i]p^i \mapsto \sum a_i^\sharp p^i$ . And we denote  $A_{\text{inf}}(R) = W(R^b)$  the **infinitesimal Fontaine's ring** of  $R$ .  $\square$

**Prop. (5.5.1.16).** If  $R$  is  $p$ -complete, the Fontaine's functor  $\theta_R$  is surjective iff  $R/p$  is semiperfect.  $\square$

*Proof:* As  $R$  is  $p$ -complete,  $\theta$  is surjective iff it is surjective modulo  $p$ . Because its reduction modulo  $p$  is  $R^b \rightarrow R/p$  is surjective as  $\varphi : R/p \rightarrow R/p$  does.  $\square$

**Prop. (5.5.1.17) [Tilting as a Valuation Ring].** If  $R$  is a domain or a valuation ring, then the same is true for  $R^b$ . In the valuation case, the valuation of  $R^b$  can in fact be chosen to be  $|\cdot| \circ \sharp$ , so in particular, the rank of  $R^b$  is no more than the rank of  $R$ .  $\lrcorner$

*Proof:* Use the isomorphism  $\varprojlim_{x \rightarrow x^p} R \cong \varprojlim_{\varphi} R/p = R^b$  (5.5.1.12).

For the domain case, if  $(a_n)(b_n) = 0$ , then  $a_nb_n = 0$ , so  $a_0 = 0$  or  $b_0 = 0$ , so  $(a_n) = 0$  or  $(b_n) = 0$ . Similarly, if  $R$  is a valuation ring, then  $R^b$  is firstly a domain, and it suffices to prove that for any  $(a_n), (b_n) \in R^b$ , the quotient of one by another is in  $R^b$ , by (12.2.2.3). For this, because  $R$  is valuation ring, we may assume  $a_0/b_0 \in R$ , so  $a_n/b_n$  is also in  $R$ , because their power do, and  $R$  is normal (12.2.2.6), thus  $(a_n)/(b_n) \in R^b$ .

For the valuation given, notice in the above proof,  $|(a_n)| \leq |(b_n)|$  iff  $|a_0| \leq |b_0|$ , so the valuation are equivalent to  $|\cdot| \circ \sharp$  by (12.2.3.14), so it can be chosen to be so.  $\square$

**Prop. (5.5.1.18) [Tilting and Completion].** If  $R = A/I$  with  $A/p$  perfect, then  $R^b$  identifies with the  $I$ -adic completion of  $A/p$ .  $\lrcorner$

*Proof:*  $R^b = \varprojlim_{\varphi} R/p = \varprojlim_{\varphi} A/(p, I)$ . But there are commutative diagrams

$$\begin{array}{ccc} A/(p, I) & \xrightarrow{\varphi} & A/(p, I) \\ \downarrow \varphi^{n+1} & & \downarrow \varphi^n \\ A/(p, I^{n+1}) & \longrightarrow & A/(p, I^n) \end{array}$$

where the vertical arrows are isomorphisms because  $A/p$  is perfect. So the conclusion follows.  $\square$

## 2 Witt-Theory

References are [Wit36, Rab14] and [Michiel Hazewinkel, Formal Groups and Applications], [ $p$ -divisible groups, lecture, Zink].

### Witt-Vectors

**Prop. (5.5.2.1) [ $\Lambda(A)$ ].** For  $A \in \mathcal{CRing}$ , define  $\Lambda(A) \triangleq 1 + TA[[T]]$ . Then there exists  $X_n, Y_n \in \mathbb{Z}[T_1, \dots, T_n]$  independent of  $A$  for each  $n \in \mathbb{Z}_+$ , s.t. every element  $f = 1 + \sum_{n \in \mathbb{Z}_+} x_n T^n \in \Lambda(A)$  can be written in the form

$$f = \prod_{n \in \mathbb{Z}_+} (1 - y_n T^n)$$

s.t.  $y_n = Y_n(x_1, \dots, x_n)$  and  $x_n = X_n(y_1, \dots, y_n)$  for each  $n \in \mathbb{Z}_+$ .  $\lrcorner$

*Proof:* By functoriality and universality, it suffices to prove for  $A = \mathbb{Z}[\{X_n\}_{n \in \mathbb{Z}_+}]$ . In this case, we can find  $y_n$  one by one, which are clearly polynomials only depending on the first  $n$  coordinates. The existence of  $X_n$  is clear from the equation  $1 + \sum_{n \in \mathbb{Z}_+} x_n T^n = \prod_{n \in \mathbb{Z}_+} (1 - y_n T^n)$ .  $\square$

**Def. (5.5.2.2) [Divisor Stable Subsets].** A non-empty subset  $P \subset \mathbb{Z}_+$  is called **divisor-stable** if it is stable under taking divisors.

If  $P = \mathbb{Z}_+$ , denote  $\Delta_P = \widehat{\Delta}$ ,  
 if  $P = \{1, p, p^2, \dots\}$ , denote  $\Delta_P = \Delta_p$ ,  
 if  $P = \{1, p, \dots, p^k\}$ , denote  $\Delta_P = \Delta_{p,k}$ .  $\lrcorner$

**Def. (5.5.2.3) [Witt-Polynomials, Witt[[Wit36](#)]].** For  $n \in \mathbb{Z}_+$ , the  $n$ -th **Witt-polynomial** is defined to be

$$\mathbb{W}_n = \sum_{d|n} dX_d^{n/d} \in \mathbb{Z}[\{X_d : d|n\}].$$

For example,

$$\mathbb{W}_{p^k} = X_1^{p^k} + pX_p^{p^{k-1}} + \dots + p^n X_{p^n}.$$

┘

**Def. (5.5.2.4) [Witt-Vectors, Witt[[Wit36](#)]].** For a divisor-stable set  $P \subset \mathbb{Z}_+$  ([5.5.2.2](#)), define  $\Delta_P = \mathbb{Z}[\{X_n | n \in P\}]$  and consider the functor

$$W_P : \mathcal{CRing} \rightarrow \mathbf{Set} : A \mapsto W_P(A) = \mathrm{Hom}(\Delta_P, A) \cong \prod_P A \text{ ([5.5.2.6](#))},$$

then  $W_P$  is an exact functor.

If  $P = \mathbb{Z}_+$ ,  $W_P(A)$  is denoted by  $\widehat{W}(A)$ .

If  $P = \{1, p, p^2, \dots\}$ ,  $W_P(A)$  is denoted by  $W_p(A)$ , called the  **$p$ -typical Witt-vector** on  $A$ .

If  $P = \{1, p, \dots, p^k\}$ ,  $W_P(A)$  is denoted by  $W_{p,k}(A)$ , called the **truncated  $p$ -typical Witt-vector** on  $A$ . ┘

**Prop. (5.5.2.5) [ $\widehat{W}(A)$  and  $\Lambda(A)$ ].** For each  $A \in \mathcal{CRing}$ , there is a natural bijection of sets:

$$\widehat{W}(A) \cong \Lambda(A) : (x_1, \dots, x_n, \dots) \mapsto f_x = \prod_{n \in \mathbb{Z}_+} (1 - x_n T^n) \text{ ([5.5.2.1](#))},$$

And if  $\mathbb{Q} \subset A$ , there is a natural isomorphism of Abelian groups

$$D = T \frac{d \log}{dT} : \Lambda(A) \cong TA[[T]].$$

Moreover,

$$D(f_x(T)) = \sum_{n \in \mathbb{Z}_+} \mathbb{W}_n(x) t^n, \text{ where } t \in \widehat{W}(A) \text{ ([5.5.2.3](#))}. \quad \text{┘}$$

*Proof:* For each  $x \in \widehat{W}(A)$ ,

$$D(f_x(T)) = \sum_{n \in \mathbb{Z}_+} \frac{nx_n T^n}{1 - x_n T^n} = \sum_{n \in \mathbb{Z}_+} (nx_n T^n + nx_n^2 T^{2n} + nx_n^3 T^{3n} + \dots),$$

so  $D(f_x(T)) = \sum_{n \in \mathbb{Z}_+} \mathbb{W}_n(x) t^n$ . ┘

**Prop. (5.5.2.6) [Ring Structure on  $W_P(A)$ , Witt[[Wit36](#)]].** Situation as in ([5.5.2.4](#)), there is a unique commutative ring scheme structure on  $\mathbf{W}_P \stackrel{\Delta}{=} \mathrm{Spec} \Delta_P$  s.t. the map

$$W_* : \mathbb{Z}[\{X_n\}_{n \in P}] \rightarrow \Delta_P : X_n \mapsto \mathbb{W}_n \in \Delta_P \text{ ([5.5.2.3](#))}$$

induces a homomorphism of ring schemes  $\mathbf{W}_P \rightarrow \mathrm{Spec} \mathbb{Z}[X_P]$ , where the ring structure on  $\mathrm{Spec} \mathbb{Z}[X_P]$  is given by

$$\times : \mathbb{Z}[X_P] \rightarrow \mathbb{Z}[X_P] \otimes \mathbb{Z}[Y_P] : X_n \mapsto X_n \otimes Y_n, \quad + : \mathbb{Z}[X_P] \rightarrow \mathbb{Z}[X_P] \otimes \mathbb{Z}[Y_P] : X_n \mapsto X_n \otimes 1 + 1 \otimes Y_n.$$

Moreover, for any divisor-stable set  $P' \subset P$ , the natural map  $\Delta_{P'} \rightarrow \Delta_P$  induces a homomorphism of ring schemes.

Then  $W_P : \mathcal{C}\text{Ring} \rightarrow \text{Set}$  prolongs to a functor  $W_P : \mathcal{C}\text{Ring} \rightarrow \mathcal{C}\text{Ring}$ , and there is a natural ring homomorphism

$$W_* : W_P(A) \rightarrow \prod_P A : f \mapsto (f(W_n))_{n \in P} \quad (5.5.2.3).$$

For  $f \in W_P(A)$ ,  $W_*(f) = (f(W_n))_{n \in P}$  is called the **ghost-coordinate** of  $x$ .  $\lrcorner$

*Proof:* Firstly we show that there exists polynomials  $S_n, P_n \in \mathbb{Z}[\{X_n, Y_n\}_{n \in P \cap [n]_+}]$  s.t.

$$W_n(\{S_m\}_{m \in P}) = W_n(\{X_m\}_{m \in P}) + W_n(\{Y_m\}_{m \in P}) \in \mathbb{Z}[\{X_m, Y_m\}_{m \in P}],$$

$$W_n(\{P_m(X_i, Y_i)\}_{m \in P}) = W_n(\{X_m\}_{m \in P}) \cdot W_n(\{Y_m\}_{m \in P}) \in \mathbb{Z}[\{X_m, Y_m\}_{m \in P}].$$

For this, Cf. [\[Rab14\]Section3](#)?

After this, we show this is a ring scheme. This follows from the definition as all coefficients are in  $\mathbb{Z}$ .  $\square$

**Cor. (5.5.2.7).** Situation as in the proof of (5.5.2.6),

- For each  $n \in P$ , there exists  $f_n \in \mathbb{Z}[\{X_{P \cap [n-1]_+}, Y_{P \cap [n-1]_+}\}]$  s.t.

$$S_n(\{X_n, Y_n\}_{n \in P}) = X_n + Y_n + f_n(\{X_{P \cap [n-1]_+}, Y_{P \cap [n-1]_+}\}).$$

- $S_1 = X_1 + Y_1$ .

$\lrcorner$

*Proof:*  $\square$

**Prop. (5.5.2.8) [Witt-Coordinates].** Situation as in (5.5.2.4), there is another map

$$\varphi_* : W_P(A) \rightarrow \prod_P A : f \mapsto (f(X_n))_{n \in P}$$

which is an isomorphism of sets but not an isomorphism of groups.

For  $x \in W_P(A)$ ,  $\varphi_*(x)$  is called the **Witt-coordinate** of  $x$ . All coordinates of elements in  $x$  will be assumed to be in the Witt-coordinate by default.

Then the map  $W_* \circ \varphi_*^{-1}$  is given by

$$W_* \circ \varphi_*^{-1} : \prod_P A \rightarrow \prod_P A : \mathbf{x} = \varphi(x_n)_{n \in P} \mapsto {}^W(W_n(\mathbf{x}))_{n \in P}.$$

And calculating in the natural coordinates are operated by the polynomials in the proof of (5.5.2.6):

$$\varphi(x_n)_{n \in P} + \varphi(y_n)_{n \in P} = \varphi(S_n(\mathbf{x}, \mathbf{y}))_{n \in P},$$

$$\varphi(x_n)_{n \in P} \cdot \varphi(y_n)_{n \in P} = \varphi(P_n(\mathbf{x}, \mathbf{y}))_{n \in P}.$$

In particular,  $\varphi(0)$  is the zero element and  $\varphi(1, 0, \dots)$  is the unit element.  $\lrcorner$

**Cor. (5.5.2.9) [Ghost-Coordinates are Injective].** Situation as in (5.5.2.4),  $W_* : W_P(A) \rightarrow \prod_P A$  is injective if  $A$  is  $n$ -torsion-free for any  $n \in P$ , and an isomorphism iff  $n$  is invertible in  $A$  for any  $n \in P$ .

This is very useful because it can prove equations by checking on each  $W_n$ . Also when checking universal equations, it is even not necessary that  $A$  is  $n$ -torsion-free, because any ring  $A$  is a quotient of a free  $\mathbb{Z}$ -algebra.  $\lrcorner$

*Proof:* It suffices to prove for  $W_* \circ \varphi_*^{-1}$ . Using the Witt polynomials and prove inductive on  $n \in P$  s.t. if  $x = \varphi(x_n)$  is mapped to 0, then  $x_n = 0$  for any  $n \in P$ .

In case  $n$  is invertible in  $A$  for any  $n \in P$ , solve  $\varphi(x_n)$  out of  $W(x_n)$  inductively.  $\square$

**Def. (5.5.2.10) [Topology on  $W_P(A)$ ].** For a divisor-stable set  $P \subset \mathbb{Z}_+$  (5.5.2.2) and any  $A \in \mathcal{CRing}$ , the natural map

$$W_P(A) \rightarrow \varprojlim_{n \in \mathbb{Z}_+} W_{P \cap [n]_+}(A)$$

is an isomorphism of rings, so we can define the **natural topology** on  $W_P(A)$  is as the profinite topology.

Then this topology makes  $W_P(A)$  a topological ring, and it is discrete iff  $\#P < \infty$ , and  $W_P$  is a functor from  $\mathcal{CAlg}$  to the category of profinite rings.  $\lrcorner$

**Prop. (5.5.2.11).** Let  $P$  be a divisor-stable set and  $A \in \mathcal{CAlg}$ , then for  $x = (x_n), y = (y_n) \in W_P(A)$ , if  $x_n y_n = 0$  for any  $n \in P$ , then

$$x + y = \varphi(x_n + y_n) \in W_P(A).$$

$\lrcorner$

*Proof:* It suffices to prove on  $\Delta_P$ . By (5.5.2.9), it suffices to prove  $W_n((x_n + y_n)) = W_n(x) + W_n(y)$  for any  $n \in P$ . This is true because

$$W_n((x_n + y_n)) = \sum_{d|n} d(x_d + y_d)^{n/d} = \sum_{d|n} dx_d^{n/d} + \sum_{d|n} dy_d^{n/d} = W_n(x) + W_n(y).$$

$\square$

**Prop. (5.5.2.12) [Teichmüller -Lifts].** For a divisor-stable set  $P \subset \mathbb{Z}_+$  (5.5.2.2) and  $A \in \mathcal{CRing}$ , denote  $[a] = \varphi(a, 0, \dots) \in W_P(A)$  for each  $a \in A$ . Then for any  $x = \varphi(x_n) \in W_P(A)$ ,

$$[a]x = \varphi(a^n x_n)_{n \in P}.$$

In particular,  $[\cdot] : A \rightarrow W_P(A)$  is multiplicative, called the **Teichmüller-lift** function of  $A$ .  $\lrcorner$

*Proof:* It suffices to prove for  $\Delta_P$  (5.5.2.6). By (5.5.2.9) and taking a torsion-free cover of  $A$ , it suffices to prove  $W_n((a^n x_n)) = W_n([a]x)$  for any  $n \in P$ . This is because

$$W_n((a^n x_n)) = \sum_{d|n} d(a^d x_d)^{n/d} = a^n \sum_{d|n} dx_d^{n/d} = W_n([a])W_n(x) = W_n([a]x).$$

$\square$

### Frobenius and Verschiebung-Maps

**Def. (5.5.2.13) [Verschiebung-Maps].** Let  $P \subset \mathbb{Z}_+$  be a divisor-stable subset and  $n \in \mathbb{Z}_+$ . For each  $A \in \mathcal{CRing}$ , define

$$V_n : W_P(A) \rightarrow W_P(A) : \varphi(x_m) \mapsto \varphi(y_m), \text{ where } y_m = \begin{cases} 0 & , n \nmid m \\ x_{m/n} & , n|m \end{cases}.$$

Then  $V_n$  is a functorial continuous additive map, called the **Verschiebung-map**. Moreover, for each  $m \in P$ , we have

$$W_m(V_n(x)) = \begin{cases} 0 & , n \nmid m \\ nW_{m/n}(x) & , n|m \end{cases}.$$

And if  $P = \mathbb{Z}_+$ , under the bijection  $\widehat{W}(A) \cong \Lambda(A)$  (5.5.2.5)  $V_n : \Lambda(A) \rightarrow \Lambda(A)$  is given by  $V_n(f(t)) = f(t^n)$ .  $\lrcorner$

*Proof:* By compatibility with change of  $P$  (5.5.2.6), it suffices to prove for  $P = \mathbb{Z}_+$ , and then the assertion is clear and the continuity follows by compatibility with change of  $P$  and taking inverse limits.

For  $n, m \in \mathbb{Z}_+$  denote  $y = V_n(x)$ , then when  $n \nmid m$ , then

$$W_m(V_n(x)) = \sum_{d|m} dy_d^{m/d} = 0$$

because whenever  $d|m$ , we have  $n \nmid d$ . And if  $m = nm'$ , then

$$W_m(V_n(x)) = \sum_{d|m} dy_d^{m/d} = \sum_{d|m'} (nd)y_{nd}^{m'/d} = n \sum_{d|m'} dx_d^{m'/d} = nW_{m'}(x).$$

$\square$

**Def. (5.5.2.14) [Frobenius-Maps, Cartier[Car67]].** Let  $P \subset \mathbb{Z}_+$  be a divisor-stable subset and  $n \in \mathbb{Z}_+$  s.t.  $nP \subset P$ , then there is a natural transformation  $F : W_P \mapsto W_P$  of topological-ring-valued functors called the **Frobenius-map for Witt-rings** s.t. for each  $x \in W_P(A)$  and  $m \in P$  we have

$$W_m(F_n(x)) = W_{mn}(x).$$

And when  $P = \mathbb{Z}_+$ , under the bijection  $\widehat{W}(A) \cong \Lambda(A)$  (5.5.2.5)  $F_n$  is given by

$$F_n(f) = \text{Nm}_{A[[T]]/A[[T^n]]}(f).$$

$\lrcorner$

*Proof:* Cf. [Rab14]P17?  $\square$

**Prop. (5.5.2.15) [Frobenius and Verschiebung-Maps].** Let  $m, n \in \mathbb{Z}_+$  and  $P \subset \mathbb{Z}_+$  is a divisor-stable subset s.t.  $mP \subset P, nP \subset P$ . Let  $A \in \mathcal{CAlg}$ , let  $x, y \in W_P(A)$ , then

- $V_n \circ V_m = V_m \circ V_n = V_{mn}$ .
- $F_n \circ V_n = n \cdot \text{id}$ .
- $V_n(F_n(x)y) = xV_n(y)$ .
- $F_n([a]) = [a^n]$  for each  $a \in A$ .
- If  $(m, n) = 1$ , then  $V_m \circ F_n = F_n \circ V_m$ .
- $(V_n(x))^m = n^{m-1}V_n(X^m)$ .

$\lrcorner$

*Proof:* These are all formal identities of polynomials, so by functoriality and universality, it suffices to prove for  $A \in \mathcal{CRing}/\mathbb{Q}$ . in this case, it suffices to check on the ghost-coordinate (5.5.2.9), which follows easily from (5.5.2.13) and (5.5.2.14).  $\square$

**Prop. (5.5.2.16)** [ $F_p$  and  $V_p$ ]. If  $P \subset \mathbb{Z}_+$  is a divisor-stable subset and  $p \in \mathbf{Prime}$  s.t.  $pP \subset P$ , then for each  $A \in \mathcal{CRing}$ ,  $x \in W_P(A)$  and  $y = F_p(x)$ , we have

- $y_m \equiv x_m^p \pmod{pA}$  for each  $m \in P$ .
  - $F_p(x) \equiv x^p \pmod{pW_P(A)}$ .
- In particular, if  $A \in \mathcal{CRing}^p$ , then
- $F_p \circ V_p = V_p \circ F_p = p$ .
  - $F_p((x_n)_{n \in P}) = (x_n^p)_{n \in P}$ , which is an automorphism if  $A$  is perfect.
  - $p = F_p \circ V_p(1) = (0, 1, 0, \dots)$ .

⌋

*Proof:* Cf. [Rab14]P19?.

□

**Prop. (5.5.2.17)** [Cartier-Homomorphisms]. Let  $P \subset \mathbb{Z}_+$  be a divisor-stable subset and  $A \in \mathcal{CRing}$  s.t. no element of  $P$  is a zero-divisor of  $A$ . Suppose  $A$  is equipped with ring homomorphism  $\varphi_p : A \rightarrow A$  for each  $p \in P \cap \mathbf{Prime}$ , s.t.

- $\varphi_p(x) \equiv x^p \pmod{pA}$  for each  $x \in A$ .
- $\varphi_p \circ \varphi_q = \varphi_q \circ \varphi_p$  for any  $p, q \in P \cap \mathbf{Prime}$ .

For each  $n = \prod_i p_i^{e_i} \in P$ , we can define

$$\varphi_n = \varphi_{p_1}^{(e_1)} \circ \dots \circ \varphi_{p_k}^{(e_k)},$$

then there exists a unique ring homomorphism  $\delta : A \rightarrow W_P(A)$  s.t.  $W_n \circ \delta = \varphi_n$  for each  $n \in P$ , called the **Cartier-homomorphism** of  $A$ . ⌋

*Proof:* Let  $T \subset \mathbb{Z}_+$  be the multiplicative subset generated by  $P$ , and define  $A' = T^{-1}A$ , then  $W_* : W_P(A') \cong \prod_P A'$  (5.5.2.9). then each  $\varphi_n$  extends to  $A'$ , and we can define

$$\delta = W_*^{-1} \left( \prod_P \varphi_n \right) : A' \rightarrow \prod_P A' \rightarrow W_P(A'),$$

which satisfies the requirement. Then it suffices to show that  $\delta(A) \subset W_P(A)$ .

For  $x \in A$  and  $y = \delta(x)$ , we will show by induction on  $n \in P$  s.t.  $y_n \in A$ . For  $n = 1$ ,  $y_1 = w_1(y) = \sigma_1(x) = x \in A$ . Now let  $1 \leq n = \prod_i p_i^{e_i} \in P$ , take a prime factor  $p_i | n$ , and denote  $m = n/p_i$ , then by induction we have

$$\varphi_m(y) = \sum_{d|m} dy_d^{m/d} \in A$$

with  $y_d \in A$ . Then

$$\varphi_n(y) = \varphi_{p_i} \left( \sum_{d|m} dy_d^{m/d} \right) = \sum_{d|m} d\varphi_{p_i}(y_d)^{m/d}.$$

For each  $d|m$ , let  $v_p(d) = s$ , then

$$\varphi_{p_i}(y_d)^{m/d} \equiv y_d^{m/d} \pmod{p^{e_i-s}A}$$

by (2.6.1.10). So  $d\varphi_{p_i}(y_d)^{m/d} \equiv dy_d^{m/d} \pmod{p^{e_i}A}$ , and

$$\varphi_n(y) \equiv \sum_{d|m} dy_d^{m/d} \equiv \sum_{d|n, d \neq n} dy_d^{n/d} \pmod{p^{e_i}A}.$$

Then Chinese remainder theorem implies that

$$\varphi_n(y) \equiv \sum_{d|n, d \neq n} dy_d^{n/d} \pmod{nA},$$

and

$$y_n = \frac{1}{n} \left( \varphi_n(y) = \sum_{d|n, d \neq n} dy_d^{n/d} \right) \in A.$$

□

### $p$ -Typical Witt Vectors

**Notation (5.5.2.18).**

- We abbreviate  $W_p(A)$  to  $W(A)$  and  $W_{p,k}(A)$  to  $W_k(A)$ . And we write

$$\varphi(x_0, x_1, \dots) \triangleq \varphi(x_1, x_p, x_{p^2}, \dots).$$

And we write

$$\mathbf{w}_0 \triangleq \mathbf{W}_1 = X_0, \quad \mathbf{w}_1 \triangleq \mathbf{W}_p = X_0^p + pX_1, \quad \mathbf{w}_2 \triangleq \mathbf{W}_{p^2} = X_0^{p^2} + pX_1 + p^2X_0, \dots$$

┘

**Def. (5.5.2.19) [Frobenius and Verschiebung-Maps].** For each  $A \in \mathcal{CRing}$ , we denote the Frobenius-map  $F_p : W(A) \rightarrow W(A)$  (5.5.2.14) by  $\varphi_A$ , and the Verschiebung-map  $V_p : W(A) \rightarrow W(A)$  by  $\text{Ver}_A$ . Then by (5.5.2.15) and (5.5.2.16), for each  $x, y \in W(A)$ , we have

- $\varphi \circ \text{Ver} = p$ .
- $\text{Ver}(\varphi(x)y) = x \text{Ver}(y)$ .
- $\varphi([a]) = [a^p]$ .
- $\text{Ver}(x)^p = p^{p-1} \text{Ver}(x^p)$ .
- $\varphi((x_0, x_1, \dots, x_n, \dots)) = (y_0, y_1, \dots, y_n, \dots)$  where  $y_i \equiv x_i^p \pmod{pA}$  for each  $i \in \mathbb{N}$ .
- $\varphi(x) \equiv x^p \pmod{pW(A)}$ .

And if  $A \in \mathcal{CRing}^p$ , then

- $\varphi \circ \text{Ver} = \text{Ver} \circ \varphi = p$ .
- $\varphi((x_0, x_1, \dots, x_n, \dots)) = (x_0^p, x_1^p, \dots, x_n^p, \dots)$ , which is an automorphism if  $A$  is perfect.
- $p = \varphi(\text{Ver}(1)) = (0, 1, 0, \dots)$ .

┘

**Prop. (5.5.2.20) [Cartier-Homomorphism].** If  $A \in \mathcal{CRing}^p$  is equipped with a lift of Frobenius  $\varphi$ , then there exists a unique ring homomorphism  $\delta : A \rightarrow W(A)$  s.t.  $\mathbf{w}_n(\delta(a)) = \varphi^{(n)}(a)$  for each  $a \in A$  and  $n \in \mathbb{N}$ .

┘

*Proof:* This follows from (5.5.2.17).

□

**Prop. (5.5.2.21)** [Structure of  $\Delta_p$ ]. The ring structure on  $\text{Spec } \Delta_p$  (5.5.2.6) is given by

$$+ : \Delta_p \rightarrow \Delta_p \otimes \Delta_p : X_{p^k} \mapsto S_k(X_P, Y_P), \quad \times : \Delta_p \rightarrow \Delta_p \otimes \Delta_p : X_{p^k} \mapsto P_k(X_P, Y_P)$$

where

$$S_1 = X_1 + Y_1, \quad S_2 = X_p + Y_p + \sum_{i=1}^{p-1} \frac{1}{p} \binom{p}{i} X_1^i Y_1^{p-i},$$

$$P_1 = X_1 Y_1, \quad P_2 = X_1^p Y_p + X_p Y_1^p + p X_p Y_p.$$

┘

*Proof:*

□

**Cor. (5.5.2.22)** [ $W_2$ ]. Let  $W_2 = W_P$  where  $P = \{1, p\}$ , then  $W_2(A)$  is the set  $A \times A$  (as the natural coordinates) with the addition and multiplication given by

$$(x_0, x_1) + (y_0, y_1) = (x_0 + y_0, x_1 + y_1 + \frac{x_0^p + y_0^p - (x_0 + y_0)^p}{p}), \quad (x_0, x_1)(y_0, y_1) = (x_0 y_0, x_0^p y_1 + y_0^p x_1 + p x_1 y_1)$$

There are two natural morphism of rings  $\mathbf{w}_1, \mathbf{w}_2 : W_2(A) \rightarrow A$ :

$$\mathbf{w}_1((x_0, x_1)) = x_0, \quad \mathbf{w}_2((x_0, x_1)) = x_0^p + p x_1.$$

┘

**Prop. (5.5.2.23)**. For  $k \in \mathbb{Z}_+$  and  $A \in \mathcal{CAlg}$ , the kernel of  $\mathbf{w}_1 : W_{p,k}(A) \rightarrow A$  is a nilpotent ideal.

┘

*Proof:* Cf. [Basic Algebra 2, Jacobson] P508. ?

□

**Cor. (5.5.2.24)**. An element  $x \in W_{p,k}(A)$  is a unit iff  $W_1(x) \in A$  is a unit.

┘

**Example (5.5.2.25)** [ $p$ -Typical Witt Vectors].

- $W_p(\mathbb{F}_q)$  is the unramified extension of  $\mathbb{Z}_p$  of degree  $\log_p q$ .
- $W_p(\overline{\mathbb{F}_p})$  is the completion of the maximal unramified extension of  $W_p(\mathbb{F}_p)$ .

┘

*Proof:*

□

**Def. (5.5.2.26)** [Witt-Vectors over Valued Rings]. If  $\kappa \in \text{Perf}^p$  has a complete valuation  $v$ , then we can endow  $W(\kappa)$  with a finer topology: we let  $w_k(x) = \inf_{i \leq k} v(x_i)$ , where  $x = \sum p^i f(x_i)$ . Now  $w_k(x + y) \geq \inf(w_k(x), w_k(y))$  by (5.5.3.10). The **weak topology** of  $W(\kappa)$  is defined by the semi-valuations  $w_k$ .

┘

**Prop. (5.5.2.27)**. If  $a, b \in \mathcal{O}_R + p^{n+1}W(R)$ , then

$$p^n v(a_n - b_n) \geq w_n(a - b) \geq \inf_{k \leq n} p^{-k} v(a_{n-k} - b_{n-k}).$$

So we see that a sequence is Cauchy in  $W(R)$  if each coordinate is Cauchy in  $R$ , so  $W(R)$  is complete in the weak topology.

┘

*Proof:* Firstly the last proposition follows from the first because we can always multiply by a  $f(\alpha)$  to make the first  $n$  coordinate in  $\mathcal{O}_R$ .

The first is nearly an immediate consequence of (5.5.3.10).  $\square$

**Prop. (5.5.2.28).**  $\mathcal{O}_{\mathcal{E}} = W(K^{\frac{1}{p^\infty}})$  is a complete ring with maximal ideal  $p\mathcal{O}_{\mathcal{E}}$ . And  $\mathcal{O}_{\mathcal{E}}[\frac{1}{p}] = \mathcal{E}$  is complete ring of character  $p$ . And the same construction of  $\overline{K^{\frac{1}{p^\infty}}}$  yields the completion of maximal unramified extension of  $\mathcal{O}_{\mathcal{E}}$ , and the Galois group is the same as  $G_K$ .  $\lrcorner$

**Prop. (5.5.2.29) [van Der Kallen].** If  $A \rightarrow B \in \mathcal{C}\text{Ring}$  is étale, then  $W_r(A) \rightarrow W_r(B)$  is also étale. Moreover, if  $A \rightarrow A' \in \mathcal{C}\text{Ring}$  with  $B' = B \otimes_A A'$ , then the natural map

$$W_r(A') \otimes_{W_r(A)} W_r(B) \rightarrow W_r(B')$$

is also an isomorphism.  $\lrcorner$

*Proof:* Cf. [Integral  $p$ -adic Hodge, BMS].  $\square$

### Cohen-Rings

**Def. (5.5.2.30) [Cohen-Rings].** For any  $k \in \text{Field}^p$ , there exists a unique absolutely-unramified (i.e. maximal ideal generated by  $p$ ) DVR of type  $(0, p)$  and residue field  $k$ , called the **Cohen-ring** for  $k$ , denoted by  $\text{Coh}(k)$ .  $\lrcorner$

*Proof:* Cf. [Fontaine-OuYang]P185. ?  $\square$

**Cor. (5.5.2.31).**  $W(k) \subset \text{Coh}(k) \subset W(k^{\text{perf}})$ .  $\lrcorner$

### 3 $p$ -Local Rings

**Def. (5.5.3.1) [ $p$ -Local Rings].** A  **$p$ -local commutative ring** is a commutative ring  $A \in \mathcal{C}\text{Ring}$  s.t.  $p \in \text{rad } A$ .  $\lrcorner$

**Prop. (5.5.3.2).** Let  $A$  be a  $p$ -adically complete ring, then  $A$  is  $p$ -local, by (5.2.3.16).  $\lrcorner$

**Prop. (5.5.3.3).** If  $A$  is  $p$ -adically complete and has bounded  $p$ -torsions, the  $p$ -completion of a smooth  $A$ -algebra is  $p$ -completely smooth.  $\lrcorner$

*Proof:* This follows from (5.9.7.4) and (5.9.6.16).  $\square$

**Def. (5.5.3.4) [ $p$ -Normal Rings].** A  $p$ -torsion-free ring  $R$  is called  **$p$ -normal** if  $R$  is  $p$ -root closed in  $R[\frac{1}{p}]$ .  $\lrcorner$

### Complete Discrete Valuation Rings

Structure of complete  $p$ -local DVRs will be studied in this subsubsection.

References are [Ser79], [Integral  $p$ -adic Hodge, BMS].

**Def. (5.5.3.5) [Strict  $p$ -Ring].** A  **$p$ -ring** is a topological ring  $A \in \text{Top}\mathcal{C}\text{Ring}$  which is complete Hausdorff in the topology defined by the decreasing chain of ideals  $\mathfrak{a}_1 \supset \mathfrak{a}_2 \supset \cdots$  s.t.  $\mathfrak{a}_m \mathfrak{a}_n \subset \mathfrak{a}_{m+n}$  and  $\kappa \triangleq A/\mathfrak{a}_1 \in \text{Perf}^p$ .

It is called a **strict  $p$ -ring** if moreover  $\mathfrak{a}_n = (p^n)$  and  $p \in A^\times$ .  $\lrcorner$

**Prop. (5.5.3.6)[Teichmüller-Lifts].** For a  $p$ -ring  $A \in \mathcal{CRing}$ (5.5.3.5), there exists a unique section map  $[-] : k \rightarrow A$  that is multiplicative, called the **Teichmüller-lift** function.

If  $\text{char } A = p$ , then the Teichmüller-lift is also additive (but not in general). And an element is in the image of the Teichmüller-lift function iff it is a  $p^n$ -th power for any  $n \in \mathbb{Z}_+$ .

If  $A$  is a strict  $p$ -ring, then each element of  $A$  is of the form

$$x = \sum_{n \in \mathbb{N}} [x_n] p^n.$$

┘

*Proof:* For any  $\lambda \in k$ , the  $\lambda^{p^{-n}}$  is unique in  $k$ , and if we consider  $U_n$  the set of all  $x^{p^n}$  where  $x$  is a lift of  $\lambda^{p^{-n}}$ , then  $U_n$  is a descending set. Moreover, the diameter converges to 0, because  $a \equiv b \pmod{\mathfrak{a}_1}$  implies  $a^{p^n} \equiv b^{p^n} \pmod{\mathfrak{a}_{n+1}}$  as  $p \in \mathfrak{a}_1$ . So it converses to a unique point  $f(\lambda)$  in  $A$ . And we see that any other  $f'$  maps  $\lambda$  to a  $p^n$ -th root hence in  $U_n$  for any  $n$ , hence it map be equal to  $f(\lambda)$ . The rest is easy.  $\square$

**Cor. (5.5.3.7) [Equal Characteristic case].** For  $(A, \kappa) \in \text{CDVR}$ , if  $\text{char } \kappa = \text{char } A$  and  $\kappa = \kappa^{\text{perf}}$ , then  $A \cong \kappa[[T]]$ .  $\square$

**Def. (5.5.3.8) [(0, p)-type case].** For  $(A, \kappa, K) \in \text{CDVR}$  of  $(0, p)$ -type, we have  $e = v(p) \geq 1$ , called the **absolute ramification index** of  $A$ . It is called **absolutely unramified** iff  $e = 1$ .  $\square$

**Prop. (5.5.3.9) [Universal Strict  $p$ -Ring].** The **universal strict  $p$ -ring** is the ring  $S_p = \mathbb{Z}_p \left[ \left\{ X_i^{p^{-n}} \right\}_{i \in \mathbb{N}, n \in \mathbb{Z}_+} \right] \in \mathcal{CRing}$ . Its residue ring is  $\mathbb{F}_p \left[ \left\{ X_i^{p^{-n}} \right\}_{i \in \mathbb{N}, n \in \mathbb{Z}_+} \right]$  which is perfect.  $X_i$  are all Teichmüller-lifts, as they have all  $p^n$ -roots(5.5.3.6).

Now we consider the  $*$   $\in \{+, -, \times\}$  in  $\hat{S}$ . then there are polynomials  $Q_i^* \in \mathbb{F}_p \left[ \left\{ X_i^{p^{-n}} \right\}_{i \in \mathbb{N}, n \in \mathbb{Z}_+} \right]$  s.t.

$$x * y = \sum_{n \in \mathbb{N}} [Q_n^*(x, y)] p^n.$$

In fact, we have

$$Q_n^+ = S_{p^n}(X_0^{p^{-n}}, Y_0^{p^{-n}}, X_1^{p^{-n+1}}, Y_1^{p^{-n+1}}, \dots, X_{n-1}^{p^{-1}}, Y_{n-1}^{p^{-1}}, X_n, Y_n) \quad (5.5.2.6),$$

$$Q_n^\times = P_{p^n}(X_0^{p^{-n}}, Y_0^{p^{-n}}, X_1^{p^{-n+1}}, Y_1^{p^{-n+1}}, \dots, X_{n-1}^{p^{-1}}, Y_{n-1}^{p^{-1}}, X_n, Y_n)$$

┘

*Proof:* ? Cf. [Rab14]Thm1.5.  $\square$

**Prop. (5.5.3.10)[Universal Law of  $p$ -Rings].** For any strict  $p$ -ring  $(A, \kappa)$ (5.5.3.5) and  $*$   $\in \{+, -, \times\}$ , the calculation of  $*$  in  $A$  is dominated by  $Q_i^*$  defined in(5.5.3.9), i.e.

$$\left( \sum_{i \in \mathbb{N}} [\alpha_i] p^i \right) * \left( \sum_{i \in \mathbb{N}} [\beta_i] p^i \right) = \sum_{i \in \mathbb{N}} [Q_i^*(\alpha_0, \alpha_1, \dots, \beta_0, \beta_1, \dots)] p^i.$$

In particular, if  $A$  is a strict  $p$ -ring, then the structure of  $A$  is determined by these polynomials  $\{Q_i^*\}$ .  $\square$

*Proof:* There is a surjective local ring map  $\theta : \mathbb{Z}_p \left[ \left\{ X_i^{p^{-n}}, Y_i^{p^{-n}} \right\}_{i \in \mathbb{N}, n \in \mathbb{Z}_+} \right] \rightarrow A$  induced by  $X_i \mapsto [\alpha_i], Y_i \mapsto [\beta_i]$  as Teichmüller-lifts all have  $p^{-n}$ -th roots (5.5.3.6). So the assertion follows from (5.5.3.9) and the fact  $\theta([a]) = [\bar{\theta}(a)]$  for each  $a \in \kappa$ , which follows from the construction of Teichmüller-lifts (5.5.3.6).  $\square$

**Prop. (5.5.3.11) [Universal Properties of Strict  $p$ -Rings].** For two  $p$ -ring  $(A, \kappa), (A', \kappa')$  that  $A$  is strict (5.5.3.5), any  $\varphi : \kappa \rightarrow \kappa' \in \mathcal{C}\text{Ring}$  lifts to a unique ring homomorphism  $g : A \rightarrow A'$ . In particular, two strict  $p$ -ring with the same residue ring is canonically isomorphic.  $\square$

*Proof:* We have already seen that ring homomorphism commutes with Teichmüller lift. Now we define

$$g(a) = \sum g([\alpha_i])p^i = \sum [\varphi(\alpha_i)]p^i,$$

and this is the unique choice. It is a ring homomorphism by universal law of (5.5.3.10).  $\square$

**Lemma (5.5.3.12) [Strict  $p$ -Rings and Witt-Vectors].** If  $(A, \kappa)$  is strict  $p$ -ring (5.5.3.5) s.t.  $\kappa = \kappa^{\text{perf}}$ , then the map

$$f : W_p(k) \rightarrow A : {}^\varphi(x_1, x_p, x_{p^2}, \dots) \mapsto \sum_{n \in \mathbb{N}} [x_{p^n}^{1/p^n}] p^n \text{ (5.5.2.4) (5.5.3.6)}$$

is an isomorphism of topological rings.  $\square$

*Proof:* This follows by combining (5.5.3.6) (5.5.2.8) and (5.5.3.9).  $\square$

**Prop. (5.5.3.13) [ $W_p$  For Perfect Rings].** For  $\kappa \in \text{Perf}^p$ , there exists uniquely a strict  $p$ -ring  $W(\kappa)$  (5.5.3.5) with residue ring  $\kappa$ , which is just the ring of Witt vectors  $W_p(\kappa)$ .

Then  $W_p$  is a faithful functor from  $\text{Perf}^p$  to the category of  $p$ -rings with perfect residue fields that is left adjoint to the functor mapping a  $p$ -ring with perfect residue fields to its residue field, by (5.5.3.11).  $\square$

*Proof:* For a canonical ring  $\mathbb{F}_p[X_\alpha^{p^{-n}}], \mathbb{Z}_p[X_\alpha^{p^{-n}}]$  is a strict  $p$ -ring. Now arbitrary perfect  $p$ -ring is a quotient of  $\mathbb{F}_p[X_\alpha^{p^{-n}}]$ , so we can construct its strict  $p$ -ring  $W(k)$  as the quotient of  $\widehat{\mathbb{Z}}[X_\alpha^{p^{-n}}]$ . Uniqueness follows from (5.5.3.11).

Notice it is nothing mysterious, it is just the set of all formal sum  $\sum f(x_i)p^i$  under the operation defined in (5.5.3.9). See also (5.5.3.12).  $\square$

**Cor. (5.5.3.14).** For each  $k \in \mathbb{Z}_+, W_{p,k}(\mathbb{F}_p) \cong \mathbb{Z}/(p^k)$ . And  $W_p(\mathbb{F}_p) \cong \mathbb{Z}_p$ .  $\square$

**Prop. (5.5.3.15) [Witt-Rings and  $p$ -Rings].** Suppose  $K \in \text{Perf}^p$  and  $(A, \kappa)$  is a  $p$ -ring (5.5.3.5), then any  $f : K \rightarrow \kappa$  lifts uniquely to a commutative diagram

$$\begin{array}{ccc} W_p(K) & \xrightarrow{F} & R \\ \downarrow \mathbf{w}_{p^0} & & \downarrow \\ K & \xrightarrow{f} & \kappa \end{array} .$$

$\square$

*Proof:* Define

$$F : W_p(K) \rightarrow R : x = \sum_{n \in \mathbb{N}} [x_{p^n}^{1/p^n}] p^n \mapsto \sum_{n \in \mathbb{N}} [f(x_{p^n}^{1/p^n})] p^n,$$

then it is clearly a continuous bijection. So it suffices to show that  $F$  is a ring homomorphism. This follows by combining (5.5.3.6) (5.5.2.8) and (5.5.3.9).

The uniqueness follows from that fact that each  $[a] \in W_p(K)$  is a Teichmüller-lift, and any such  $F$  must commute with taking Teichmüller-lifts, by the proof of (5.5.3.6).  $\square$

#### 4 $\delta$ -Rings

**Def. (5.5.4.1) [ $\delta$ -Ring].** For  $R \in \mathcal{CRing}$ , a  $(p)$ - $\delta$ -ring structure on  $R$  characterizes the deficit in lifting the Frobenius action on  $R/p$ . i.e.  $\varphi(x) = x^p + p\delta(x)$ . A  $\delta$ -ring is a pair  $(R, \delta)$  where  $R \in \mathcal{CRing}$  and  $\delta : R \rightarrow R \in \mathbf{Set}$  is a map s.t.  $\delta(0) = \delta(1) = 0$ , and satisfies:

$$\delta(xy) = x^p\delta(y) + y^p\delta(x) + p\delta(x)\delta(y), \quad \delta(x+y) = \delta(x) + \delta(y) - \frac{(x+y)^p - x^p - y^p}{p}.$$

$\delta$ -rings naturally form a category, denoted by  $\mathcal{CRing}^\delta$ . And in case  $A$  is  $p$ -torsionfree, a  $\delta$ -structure on  $A$  is the same as a lifting of the Frobenius on  $A/p$ .  $\lrcorner$

**Def. (5.5.4.2) [ $\delta$ -Pairs].** The category of  $\delta$ -pairs consists of pairs  $(A, I)$  where  $A$  is a  $\delta$ -ring and  $I$  is an ideal of  $A$  that morphisms  $\varphi : (A, I) \rightarrow (B, J)$  are  $\delta$ -ring maps  $A \rightarrow B$  that  $\varphi(I) \subset J$ .  $\lrcorner$

**Prop. (5.5.4.3) [ $\delta$ -Rings and  $W_2$ ].** A  $\delta$ -ring structure on  $A$  is the same as a section of the map  $W_1 : W_2(A) \rightarrow A$ , and a morphism of  $\delta$ -rings is a commutative diagram of sections.  $\lrcorner$

*Proof:* By the description of  $W_2$  in (5.5.2.22), this is clear, the morphism is given by  $A \rightarrow W_2(A) : x \mapsto (x, \delta(x))$ .  $\square$

**Lemma (5.5.4.4) [Initial  $\delta$ -Algebra].** We usually work with  $\delta$ -algebras over  $\mathbb{Z}_{(p)}$ . Then there is an initial object in the category of  $\delta$ -rings, given by  $(\mathbb{Z}_{(p)}, \delta)$  with  $\delta(x) = \frac{x-x^p}{p}$ .  $\lrcorner$

**Prop. (5.5.4.5).** For  $(A, \delta) \in \mathcal{CRing}^\delta$ ,  $\varphi : x \mapsto x^p + p\delta(x)$  commutes with  $\delta$ .  $\lrcorner$

*Proof:* We need to check  $\delta(x^p + p\delta(x)) = \delta(x)^p + p\delta(\delta(x))$ . This is hard to check, but we can check  $\varphi(\frac{\varphi(x)-x^p}{p}) = \frac{\varphi(\varphi(x))- \varphi(x)^p}{p}$ , so the conclusion is true when  $A$  is  $p$ -torsion-free. But by (5.5.4.10), every  $\delta$ -ring is a quotient of a free thus  $p$ -torsion-free ring, thus the equation is also true for arbitrary  $A$ .  $\square$

**Def. (5.5.4.6) [Commutative Coalgebra  $\mathbb{Z}[\delta]$ ].** Denote  $\mathbb{Z}[\delta] = \mathbb{Z}[e, \delta_1, \dots, \delta_n, \dots]$ . Using the formulas in (5.5.4.1), we can write  $\delta^{\circ n}(xy)$  and  $\delta^{\circ n}(x+y)$  as functions of  $\delta^{\circ i}(x), \delta^{\circ i}(y)$  for  $0 \leq i \leq n$ , i.e.

$$\delta^n(xy) = M_n(x, \delta(x), \delta^{\circ 2}(x), \dots, \delta^{\circ n}(x), y, \delta(y), \dots, \delta^{\circ n}(y))$$

$$\delta^n(x+y) = S_n(x, \delta(x), \delta^{\circ 2}(x), \dots, \delta^{\circ n}(x), y, \delta(y), \dots, \delta^{\circ n}(y))$$

Then we can change  $\delta^{\circ n}$  to  $\delta_n$  to define a commutative ring scheme structure on  $\mathrm{Spec} \mathbb{Z}[\delta]$ :

$$\times : \mathbb{Z}[\delta] \rightarrow \mathbb{Z}[\delta] \otimes \mathbb{Z}[\delta] : \delta_n \mapsto M_n, \quad + : \mathbb{Z}[\delta] \rightarrow \mathbb{Z}[\delta] \otimes \mathbb{Z}[\delta] : \delta_n \mapsto S_n.$$

it is easily prove by induction that if we denote  $\mathbb{Z}[\varphi] = \mathbb{Z}[e, \varphi, \varphi_2, \dots, \varphi_n, \dots]$ , and  $\text{Spec } \mathbb{Z}[\varphi]$  the commutative ring scheme with the ring structure given by

$$\times : \mathbb{Z}[\varphi] \rightarrow \mathbb{Z}[\varphi] \otimes \mathbb{Z}[\varphi] : \varphi_n \mapsto \varphi_n \otimes \varphi_n, \quad + : \mathbb{Z}[\varphi] \rightarrow \mathbb{Z}[\varphi] \otimes \mathbb{Z}[\varphi] : \varphi_n \mapsto \varphi_n \otimes 1 + 1 \otimes \varphi_n,$$

then the map

$$\mathbb{Z}[\varphi] \rightarrow \mathbb{Z}[\delta] : \varphi_n \mapsto \text{expansion of } \varphi^{\circ n} \in \mathbb{Z}[e, \delta_1, \dots, \delta_n]$$

induces a homomorphism of ring schemes  $\text{Spec } \mathbb{Z}[\delta] \rightarrow \text{Spec } \mathbb{Z}[\varphi]$ .

There is a natural functor:

$$[\delta] : \mathbb{Z}[\delta] \rightarrow \mathbb{Z}[\delta] : \delta_i \mapsto \delta_{i+1}$$

┘

**Lemma (5.5.4.7) [ $\delta$ -Component].** Let  $\varphi = e^p + p\delta$  be a polynomial in  $e, \delta$ , then there are polynomials  $\Theta_n \in \mathbb{Z}[e, \delta_1, \delta_2, \dots, \delta_n]$  s.t.

$$\varphi^{\circ n} = \Theta_0^{p^n} + p\Theta_1^{p^{n-1}} + \dots + p^n \Theta_n = W_{p^n}(\Theta_0, \dots, \Theta_n), \forall n$$

In particular,  $\Theta_0 = e, \Theta_1 = \delta$ .

Moreover,  $\mathbb{Z}[\Theta_0, \Theta_1, \dots, \Theta_n] = \mathbb{Z}[e, \delta_1, \delta_2, \dots, \delta_n]$  for any  $n$ .

┘

*Proof:* Use equation  $\varphi \circ \varphi^n = \varphi^n \circ \varphi$  and module  $p^n \mathbb{Z}[\Theta_0, \Theta_1, \dots, \Theta_n]$ . ?

□

**Prop. (5.5.4.8) [Witt Vectors as  $\delta$ -Rings].** By (5.5.4.7), there is an isomorphism of algebras

$$\Delta_p \cong \mathbb{Z}[\delta] : X_{p^n} \mapsto \Theta_n,$$

but it is also an isomorphism of ring schemes because of the uniqueness property of (5.5.2.6).

Then for any  $A \in \mathcal{CAlg}$ , every element of  $W_p(A)$  has a  $\delta$ -coordinates:

$$f \in W_p(A) = \text{Hom}(\Delta_p, A) \mapsto (f(e), f(\delta_1), f(\delta_2), \dots)_\delta.$$

Let  $W_p(A)$  be defined as in (5.5.2.4), then  $[\delta] : \mathbb{Z}[\delta] \rightarrow \mathbb{Z}[\delta]$  induces a homomorphism  $\delta : W_p(A) \rightarrow W_p(A)$  that can be checked to be a  $\delta$ -functor from our definition of coalgebra structure on  $\mathbb{Z}[\delta]$ . Thus  $W_p$  is a functor  $\mathcal{CAlg} \rightarrow \mathcal{CAlg}^\delta$ .

┘

**Prop. (5.5.4.9) [Witt Vectors as an Right Adjoints].**  $W_p$  is right adjoint to the forgetful functor  $\mathcal{CAlg}^\delta \rightarrow \mathcal{CAlg}$ .

┘

*Proof:* Given a ring homomorphism  $f : B \rightarrow A$ , let

$$f^\delta : B \rightarrow W_p(A) : x \mapsto (f(x), f(\delta(x)), f(\delta^{\circ 2}(x)), \dots)_\delta,$$

Then  $f^\delta$  is a  $\delta$ -ring homomorphism: It is a homomorphism by our definition of the ring structure on  $\text{Spec } \mathbb{Z}[\delta]$  (5.5.4.6), and it is a  $\delta$ -ring homomorphism by our definition  $\delta$ -ring structure (5.5.4.8).

And it is easy to see  $f^\delta$  is the unique  $\delta$ -ring homomorphism  $B \rightarrow W(A)$  that restricts to  $f : B \rightarrow A$ , thus

$$\text{Hom}^\delta(B, W(A)) \cong \text{Hom}(B, A).$$

□

**Prop. (5.5.4.10) [Free  $\delta$ -Rings].** The ring  $\mathbb{Z}\{x_i\}$  is a ring on the free generators  $\{x, \delta(x_i), \delta^2(x_i), \dots\}$  and the Frobenius morphism defined by asserting  $\varphi(\delta^i(x)) = \delta^i(x)^p + p\delta^{i+1}(x)$ .

Generally we can define the **free  $\delta$ -ring** generated by  $\{x_i\}$  over a  $\delta$ -ring  $A$  as the tensor  $A \otimes \mathbb{Z}\{x_i\}$ , and it satisfies the universal property.

Then the Frobenius action is f.f. ⌋

*Proof:* It is easily verified that for any  $\delta$ -ring  $R$  over  $A$  and a map of sets  $\{x_i\} \rightarrow R$ , there is a unique morphism  $\mathbb{Z}_{(p)}\{x_i\} \rightarrow R$  sending  $x$  to  $f$ , thus verifying the universal property.

For the f.f., notice it is a colimit of  $\varphi_n : \mathbb{Z}[x, \delta(x), \dots, \delta^n(x)] \rightarrow \mathbb{Z}[x, \delta(x), \dots, \delta^{n+1}(x)]$ , so by (5.4.1.24), it suffices to show  $\varphi_n$  are all f.f.. We decompose this map as  $n$  maps:

$$\mathbb{Z}[x, \delta(x), \dots, \delta^n(x)] \cong \mathbb{Z}[x, \delta(x), \dots, (\delta^i(x))^p, \dots, \delta^n(x)] \subset \mathbb{Z}[x, \delta(x), \dots, \delta^n(x)]$$

which are all f.f., so it is f.f. □

**Cor. (5.5.4.11) [Frobenius is Fpqc locally Surjective].** For a  $\delta$ -ring  $A$  and an element  $x \in A$ , there is a faithfully flat morphism of  $\delta$ -rings  $A \rightarrow B$  that the image of  $x$  in  $B$  is of the form  $\varphi(y)$  for some  $y \in B$ . ⌋

**Cor. (5.5.4.12).** Set  $B$  as the pushout of the diagram  $\mathbb{Z}_{(p)}\{s\} \leftarrow \mathbb{Z}_{(p)}\{t\} \rightarrow A$ , where the arrows sends  $t$  to  $\varphi(s)$  and  $x$ .  $B$  exists by (5.5.4.13) and the underlying ring is the same as the ring pushout, thus  $A \rightarrow B$  is faithfully flat by (5.5.4.10). ⌋

**Prop. (5.5.4.13) [Limits and Colimits of  $\delta$ -Rings].**  $\mathcal{CAlg}^\delta$  admits limits and colimits, and their underlying rings are just the ring-theoretical limit and colimit, as the forgetful functor  $\mathcal{CAlg}^\delta \rightarrow \mathcal{CAlg}$  has both left and right adjoints (5.5.4.9)(5.5.4.10). ⌋

*Proof:* Use (5.5.4.3), the construction of limits is straightforward, as  $W_2$  commutes with limits. To construct colimits, notice the morphisms  $A_i \rightarrow W_2(A_i)$  induces a morphism

$$\varinjlim A_i \rightarrow \varinjlim W_2(A_i) \rightarrow W_2(\varinjlim A_i)$$

and clearly this map is a section of  $W_2(\varinjlim A_i) \rightarrow \varinjlim A_i$ , thus given a  $\delta$ -ring structure on  $\varinjlim A_i$ .

It is a colimit because any commutative diagrams  $\varphi_i : (A_i \rightarrow W_2(A_i)) \rightarrow (B \rightarrow W_2(B))$  induces a unique commutative diagram

$$\begin{array}{ccccc} \varinjlim_i A_i & \longrightarrow & \varinjlim W_2(A_i) & \xrightarrow{\varinjlim W_2(\varphi_{ij})} & W_2(\varinjlim A_i) \\ \downarrow \varinjlim \varphi_i & & \downarrow & \swarrow W_2(\varinjlim \varphi_i) & \\ B & \longrightarrow & W_2(B) & & \end{array} .$$

□

### Extension of $\delta$ -Structures

**Lemma (5.5.4.14) [Quotients].** Let  $A$  be a  $\delta$ -ring and  $I$  be an ideal, then if  $I$  is stable under  $\delta$ , then there is a natural  $\delta$ -structure on  $A/I$  compatible with  $A$ . In general, if  $J$  is an ideal of  $A$ , then there is a universal  $\delta$ - $A$ -algebra  $B = A/J$ , where  $J = \cup_{n \geq 0} \delta^n(I)$ . It is the universal  $\delta$ - $A$ -algebra that the image of  $I$  is 0. ⌋

**Lemma (5.5.4.15) [Localization].** Let  $A$  be a  $\delta$ -ring and  $S$  be a multiplicative set of  $A$  that  $\varphi(S) \in S$ , then there is a unique  $\delta$ -structure on  $S^{-1}A$ , and it satisfies the universal property.  $\lrcorner$

*Proof:* Firstly if  $A$  is  $p$ -torsionfree, in this case a  $\delta$ -structure is the same as a lifting of the Frobenius on  $A/p$ , thus the proposition is clear because  $\varphi_{S^{-1}A} : S^{-1}A \rightarrow S^{-1}A$  is uniquely determined.

Generally, we choose a free  $\delta$ -ring  $F$  and a surjection  $\alpha : F \rightarrow A$ , then  $T = \alpha^{-1}S$  is multiplicative, and  $T^{-1}F$  admits a unique  $\delta$ -structure. But now  $S^{-1}A = T^{-1}F \otimes_F A$ , so there is a  $\delta$ -structure on  $S^{-1}A$  as the colimit, so compatible with that of  $S^{-1}A$ . Then it's also the unique one (because if there is another one, the colimit properties gives a morphism of  $\delta$ -rings above  $\text{id}_{S^{-1}A}$ , which must be identity).  $\square$
