In particular,  $R(G) = \overline{R}_{\mathbb{Q}}(G)$  iff any two element generating the same subgroup of  $G$  is conjugate.

And  $\# \hat{G}$  equals the number of conjugacy classes of cyclic subgroups of  $G$ .  $\lrcorner$

**Prop. (24.1.3.30) [Reduction to Cyclic Subgroups].**  $R_{\mathbb{Q}}(G) \otimes \mathbb{Q}$  is generated by  $\{\text{Ind}_C^G(\mathbf{1})\}_{C \leq G \text{ cyclic}}$ . In fact, if  $\{C_1, \dots, C_d\}$  is a system of representative of the conjugacy classes of cyclic subgroups of  $G$ , then  $\{\text{Ind}_{C_i}^G(\mathbf{1})\}$  is an orthogonal basis for  $R_{\mathbb{Q}}(G)$ .  $\lrcorner$

*Proof:* It suffices to show that if  $\theta \in R_{\mathbb{Q}}(G)$  and  $\langle \theta, \text{Ind}_C^G(\mathbf{1}) \rangle = 0$ , then  $\chi = 0$ . By Frobenius reciprocity, this follows from (24.1.3.31).  $\square$

**Lemma (24.1.3.31).** If  $\theta \in R_{\mathbb{Q}}(G)$  s.t.  $\sum_{s \in C} \theta(s) = 0$  for any cyclic subgroup  $C \leq G$ , then  $\theta = 0$ .

In particular, for  $V, V' \in \text{Rep}_{\mathbb{Q}}^{\text{fd}}(G)$ ,  $V \cong V'$  iff we have  $\dim V^C = \dim(V')^C$  for any cyclic subgroup  $C \leq G$ .  $\lrcorner$

*Proof:* We use induction on  $\#G$ . For any  $s \in G$ , if  $x \in \langle s \rangle$  generates  $\langle s \rangle$ , then  $\theta(s) = \theta(x)$  because  $x, s$  are  $(\mathbb{Z}/(m))^*$ -conjugate. And if  $\langle x \rangle \subsetneq \langle s \rangle$ , then by induction hypothesis,  $\theta(x) = 0$ . Thus

$$0 = \sum_{x \in \langle s \rangle} \theta(x) = \varphi(\# \langle s \rangle) \varphi(s),$$

and  $\varphi(s) = 0$ . □

### Reduction to Subgroups

**Prop. (24.1.3.32) [Induction and Restriction of Characters].** Let  $H \leq G$ , then the induction induces an additive homomorphism  $\text{Ind}_H^G : R(H) \rightarrow R(G)$ , and restriction induces a ring homomorphism  $R(G) \rightarrow R(H)$ . The formula  $\text{Ind}(\varphi \cdot \text{res}(\psi)) = \text{Ind}(\varphi) \cdot \psi$  shows the image of  $\text{Ind}$  is an ideal of  $R(G)$ . Also by Frobenius reciprocity (24.1.6.43),  $\text{Ind}$  and  $\text{Res}$  are dual to each other:

$$(\varphi, \text{res } \psi)_H = (\text{Ind } \varphi, \psi)_G.$$

┘

**Thm. (24.1.3.33) [Generalized Artin Theorem].** Let  $X$  be a family of subgroups of a finite subgroup  $G$ . Let  $\text{Ind} : \bigoplus_{H \in X} R_k(H) \rightarrow R_k(G)$  be the ring homomorphism induced by induction, then the following properties are equivalent:

- $G$  is the union of conjugates of the subgroups in  $X$ .
- the cokernel of  $\text{Ind}$  is finite.

┘

*Proof:*  $2 \rightarrow 1$ : By the character of induced representations (24.1.3.14), any function in the image of  $\text{Ind}$  vanishes outside the union of conjugates of the subgroups in  $X$ , so if this is not  $G$ , then the cokernel cannot be finite.

$1 \rightarrow 2$ : Notice the duality of  $\text{Ind}$  and  $\text{Res}$  (24.1.3.32), it suffices to show that  $\text{Res}$  is injective, but this is clear. □

**Cor. (24.1.3.34) [Artin Theorem].** Every  $f \in R_k(G)$  is a rational combination of characters induced from  $k$ -characters of cyclic subgroups of  $G$ . ┘

*Proof:* In (24.1.3.33), choose  $X$  to be the family of cyclic subgroups of  $G$ . □

**Def. (24.1.3.35) [( $k, p$ )-elementary Subgroups].** For  $p \in \text{Prime}$ , a subgroup  $H \leq G$  is called a  $(k, p)$ -**elementary subgroup** of  $G$  if  $H = C \rtimes P$  where  $P$  is a  $p$ -subgroup and  $C$  is a cyclic subgroup s.t. for any  $y \in P$ , there exists  $\sigma_t \in \text{Gal}(k'/k)$  (24.1.3.24) s.t.  $xyx^{-1} = x^t$ .

A subgroup  $H \leq G$  is called  $k$ -**elementary** if it is  $(K, p)$ -elementary for some  $p \in \text{Prime}$ .

By (3.1.8.9), any  $k$ -elementary subgroup of  $G$  is nilpotent thus supersolvable (3.1.8.9). ┘

**Thm. (24.1.3.36) [Generalized Brauer's Theorem, [B-T55]].**

- If  $p \in \text{Prime}$  and  $\#G = p^g l$  where  $(l, p) = 1$ , then  $l \cdot \text{id}$  is contained in the image of

$$\text{Ind} : \bigoplus_{H \leq G \text{ } (k,p)\text{-elementary}} R_k(H) \rightarrow R_k(G).$$

In particular, the cokernel is finite and prime to  $p$ .

•

$$\text{Ind} : \bigoplus_{H \leq G \text{ } k\text{-elementary}} R_k(H) \rightarrow R_k(G)$$

is surjective. ┘

*Proof:* Cf.[Serre]P99. ? □

**Cor.(24.1.3.37)[Reduction to Characters, Brauer].**  $R(G)$  is generated by  $\text{Ind}_H^G(\chi)$  where  $H \leq G$  and  $\chi \in H^\vee$ . ┘

**Cor.(24.1.3.38).** Given  $\varphi \in ZC(G)$ ,  $\varphi \in R_k(G)$  iff  $\varphi|_H \in R_k(H)$  for any  $(k, p)$ -elementary subgroup  $H$  of  $G$ . ┘

*Proof:* Let  $\mathbf{1} = \sum_{H \leq G \text{ } k\text{-elementary}} \text{Ind}_H^G f_H$  where  $f_H \in R_k(H)$ , then

$$\varphi = \sum_{H \leq G \text{ } k\text{-elementary}} \text{Ind}_H^G (f_H \cdot \text{Res}_H^G \varphi).$$

Thus the assertion follows. □

**Cor.(24.1.3.39).**

- $\text{Ind} : \bigoplus_{H \leq G \text{ } k\text{-elementary}} R_k(H) \rightarrow R_k(G)$  is surjective.
- If  $k[H]$  is quasi-split for any  $k$ -elementary subgroup of  $G$ , then  $k[G]$  is quasi-split. ┘

*Proof:* Use the same method of proof as [\(24.1.3.38\)](#). □

**Prop.(24.1.3.40)[2-Dimensional Representations of Cyclic or Dihedral Type].** If  $G \in \mathfrak{Grp}^{\text{fin}}$  and  $(\rho, \mathbb{C}^{\oplus 2}) \in \text{Rep}^{\text{fd}}(G)$ , then  $\text{Im}(\rho)$  is isomorphic to a cyclic group or a dihedral group iff  $\rho = \text{Ind}_H^G(\chi)$  where  $H$  is a subgroup of  $G$  of index 2 and  $\chi \in H^\vee$ . Moreover, in this case,  $\chi \not\cong \chi^g$  for any  $g \in G \setminus H$ . ┘

*Proof:* ? □

### Important representations

**Prop.(24.1.3.41)**  $[Q_8]$ . There is a 2-dimensional representation of the quadratic group  $Q_8 = \{\pm 1, \pm i, \pm j, \pm k\}$ :

$$i \mapsto \begin{bmatrix} 1 & 0 \\ 0 & -1 \end{bmatrix}, \quad j \mapsto \begin{bmatrix} 0 & 1 \\ -1 & 0 \end{bmatrix}, \quad k \mapsto \begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix}$$

┘

**Prop.(24.1.3.42).** For  $n \in \mathbb{Z}_+$ , there is a representation of  $\text{Sym}_n$  on the  $n-1$ -dimensional hypersurface  $\sum x_i = 0$ . ┘

## 4 Symmetric Groups

References are [The Symmetric Group, Sagan].

**Prop. (24.1.4.1).** For  $n \in \mathbb{Z}_+$ ,  $\text{Rep}^{\text{fd}}(\text{Sym}_n) = \text{Rep}_{\mathbb{Q}}^{\text{fd}}(\text{Sym}_n)$ . In particular, all characters of representations of  $\text{Sym}_n$  are valued in  $\mathbb{Z}$ .  $\lrcorner$

*Proof:* This follows from (24.1.3.29).  $\square$

**Def. (24.1.4.2) [Standard Representation of  $\text{Sym}_n$ ].** For  $n \in \mathbb{Z}_+$ , there is a standard  $n$ -dimensional representation of  $\text{Sym}_n$  on  $\mathbb{C}[X_1, \dots, X_n]$  s.t.  $\pi(X_i) = X_{\pi(i)}$  for any  $i \in [n]_+$  and  $\pi \in \text{Sym}_n$ .  $\lrcorner$

**Def. (24.1.4.3) [Permutation Modules].** Suppose  $n \in \mathbb{Z}_+$  and  $\lambda \vdash n$ , the **permutation module** of  $\lambda$  is defined to be

$$M^\lambda = \mathbb{C}\{\{t_1\}, \dots, \{t_k\}\}$$

where  $\{t_1\}, \dots, \{t_k\}$  is a complete list of  $\lambda$ -tabloids (37.5.1.2).

As  $\text{Sym}_n$  acts on the set of tableaux of shape  $\lambda$ , and descends to an action on  $\lambda$ -tabloids, we have an action of  $\text{Sym}_n$  on  $M^\lambda$ .

Then  $M^\lambda$  is a cyclic representation, and  $\dim M^\lambda = n!/\lambda!$ .  $\lrcorner$

**Def. (24.1.4.4) [Polytabloids].**  $\lrcorner$

**Prop. (24.1.4.5).** Let  $t$  be a tableau of size  $n$  and  $\pi \in \text{Sym}_n$ , then

- $R_{\pi t} = \pi R_t \pi^{-1}$ ,
- $C_{\pi t} = \pi C_t \pi^{-1}$ ,
- $\kappa_{\pi t} = \pi \kappa_t \pi^{-1}$ ,
- $e_{\pi t} = \pi e_t$ .

In particular,  $S^\lambda$  is a cyclic  $\text{Sym}_n$ -representation.  $\lrcorner$

*Proof:*  $\square$

**Def. (24.1.4.6) [Specht modules  $S^\lambda$ ].** Let  $n \in \mathbb{Z}_+$ ,  $\lambda \vdash n$ , then define the **Specht module**  $S^\lambda \subset M^\lambda$  to be the submodule generated by the polytabloids  $e_t$  where  $t$  are tableaux of shape  $\lambda$ . Then  $S^\lambda$  is a cyclic  $\text{Sym}_n$ -representation by (24.1.4.5).  $\lrcorner$

### Generators of Specht modules

### Decomposition of $M^\lambda$

## 5 Character Tables Lists

## 6 Locally Profinite Groups

References are [B-Z77, Ber84a] and [Bernstein, Representation of  $p$ -adic Groups].

**Notation (24.1.6.1).**

- Use notations on locally profinite spaces in [Profinite Spaces](#).
- For structure theory of locally profinite groups, see [Locally Profinite Groups](#).

- Let  $G \in \text{locProfGrp}$ . ┘

**Prop. (24.1.6.2) [Small Group Argument].**  $\text{Rep}^{\text{fd}}(G) = \text{Rep}^{\text{fin,alg}}(G)$ . ┘

*Proof:* This is because a small nbhd of  $\mathbf{1} \in \text{GL}(n; \mathbb{C})$  doesn't contain a subgroup. □

### Invariant Distributions

**Def. (24.1.6.3) [Invariant Distributions].** If  $X \in \text{locProf}$  and  $G \times X \rightarrow X$  is a left action, then  $G$  acts on the left on  $C_c^\infty(X)$  by  $g(f)(x) = f(g^{-1}x)$ , and acts on  $\text{Dist}(G)$  by  $g(T)(f) = T(g^{-1}(f))$ .

For  $\chi \in G^\vee$ , denote  $\text{Dist}(G)^{G,\chi} \triangleq \{T \in \text{Dist}(G) | gT = \chi(g)T\}$ . And denote  $\text{Dist}(G)^G \triangleq \text{Dist}(G)^{G,\mathbf{1}}$ . ┘

**Prop. (24.1.6.4).** Any  $\varphi \in C_c^\infty(G)$  is  $K$ -bi-invariant under some compact open subgroup  $K \leq G$ . ┘

*Proof:*  $\varphi$  must be of the form  $\sum a_i \chi_{U_i}$ , where each  $U_i$  is open compact. Then for each element  $x \in U_i$ , there is an open compact group  $U_x$  that  $U_x x \cup x U_x \subset U_i$ , by (12.10.4.3). Now because  $\text{Supp } f$  is compact, f.m. of the  $U_x x \cap x U_x$  covers  $\text{Supp } \varphi$ , thus we consider their intersection  $\cap U_{x_i}$ , which is a compact open subgroup  $K_0$  that  $\varphi$  is  $K_0$ -bi-invariant. □

**Thm. (24.1.6.5) [Localization Principle].** For  $\text{pr} : Z \rightarrow T \in \text{locProf}$ ,  $C_c^\infty(Z)$  and  $\text{Dist}(Z)$  are  $C_c^\infty(T)$ -modules. Then for any weak\*-closed subspace  $M \leq \text{Dist}(Z)$ , we have

$$M = \overline{\oplus_{t \in T} M \cap \text{Dist}(\text{pr}^{-1}(t))}.$$

┘

*Proof:* Cf. [Ber84a]P59. ? □

**Cor. (24.1.6.6).** Let  $\text{pr} : Z \rightarrow T \in \text{locProf}$  and  $G$  acts on  $Z$  preserving fibers of  $\text{pr}$ . Suppose  $\chi \in G^\vee$  s.t.  $\text{Dist}(\text{pr}^{-1}(t))^{G,\chi} = 0$  for each  $t \in T$ , then we have  $\text{Dist}(Z)^{G,\chi} = 0$ . ┘

**Prop. (24.1.6.7) [Localization Principle, Bernstein-Zelevinsky [B-Z77]].** Let  $p : X \rightarrow Y \in \text{locProf}$  and  $\mathcal{F}$  be a cosmooth  $C^\infty$ -sheaf on  $X$ ?. Let  $G$  act on  $X$  and the sheaf  $\mathcal{F}$  that  $p(gx) = p(x)$ , and  $\chi \in G^\vee$ , then:

- Let  $\Gamma_c(X, \mathcal{F})(\chi)$  be the  $C_c^\infty(X)$ -submodule of  $\Gamma_c(X, \mathcal{F})$  generated by  $gf - \chi(g)^{-1}f, g \in G, f \in \Gamma_c(X, \mathcal{F})$ . Then  $\Gamma_c(X, \mathcal{F})/\Gamma_c(X, \mathcal{F})(\chi)$  is a non-degenerate  $C_c^\infty(Y)$ -module by composing  $p$ , so we can define  $\mathcal{G}$  the sheaf on  $Y$  corresponding to this submodule by (4.4.4.15). Then if  $y \in Y$  and  $Z = p^{-1}(y)$ , the stalk

$$\mathcal{G}_y \cong \Gamma_c(Z, \mathcal{F})/\Gamma_c(Z, \mathcal{F})(\chi).$$

- Assume there are no non-zero distributions  $D \in \text{Dist}(p^{-1}(y), \mathcal{F}|_{p^{-1}(y)})$  that satisfies  $gD = \chi(g)D$  for any  $y \in Y$ , then no such  $D$  exists in  $\mathcal{D}(X, \mathcal{F})$ . ┘

*Proof:* 1: Firstly  $\Gamma_c(X, \mathcal{F})/\Gamma_c(X, \mathcal{F})(\chi)$  is a  $C_c^\infty(Y)$ -module because  $\varphi \circ p$  fixes  $\Gamma_c(X, \mathcal{F})(\chi)$ :

$$(\varphi \circ p)(gf - \chi(g)^{-1}f) = g((\varphi \circ p)f) - \chi(g)^{-1}((\varphi \circ p)f),$$

which uses the condition  $p(gx) = p(x)$ . The non-degeneracy is also clear, by (4.4.4.15).

Secondly  $\Gamma_c(Z, \mathcal{F}) \cong \Gamma_c(X, \mathcal{F})/\Gamma_c(U, \mathcal{F})$  by (4.4.4.12), so  $\Gamma_c(Z, \mathcal{F})/\Gamma_c(Z, \mathcal{F})(\chi)$  is isomorphic the quotient of  $\Gamma_c(X, \mathcal{F})$  by  $\Gamma_c(U, \mathcal{F})$  and  $\Gamma_c(X, \mathcal{F})(\chi)$ , because  $\Gamma_c(U, \mathcal{F})$  is stable under action of  $f \mapsto gf - \chi(g)^{-1}f$  (this uses the condition  $p(gx) = p(x)$ ).

We claim the space  $\Gamma_c(U, \mathcal{F})$  is the space  $L$  generated by elements of the form  $(\varphi \circ p)f$ , where  $\varphi \in C_c^\infty(Y)$ ,  $\varphi(y) = 0$ ,  $f \in \Gamma_c(X, \mathcal{F})$ :  $L$  is clearly contained in  $\Gamma_c(U, \mathcal{F})$ , and if  $f \in \Gamma_c(U, \mathcal{F})$ , then  $\text{Supp } f$  is compact and disjoint from  $Z$ , so there is an open compact subset  $U \subset Y$  containing  $p(\text{Supp } f)$  but not  $y$ . Let  $\varphi = \chi_U$ , then  $f = (\chi_U \circ p)f \in L$ .

Then by (4.4.4.15), the stalk  $\mathcal{G}_y$  is isomorphic to  $M/M(y)$ , where  $M = \Gamma_c(X, \mathcal{F})/\Gamma_c(X, \mathcal{F})(\chi)$ . So  $M(y)$  is just the image of the space  $L$  in  $M$  by (4.4.4.16), hence  $\mathcal{G}_y$  is exactly  $\Gamma_c(Z, \mathcal{F})/\Gamma_c(Z, \mathcal{F})(\chi)$ .

2: this follows from 1, as  $gD = \chi(g)D$  is just saying  $D(g^{-1}f - \chi(g)f) = 0$ , or that  $D$  annihilates  $\Gamma_c(Z, \mathcal{F})/\Gamma_c(Z, \mathcal{F})(\chi) = \mathcal{G}_y$  by item 1. So this is equivalent to  $\mathcal{G}_y = 0$  for any  $y$ , which is equivalent to  $\mathcal{G} = 0$ , as  $\mathcal{G}$  is a sheaf.  $\square$

**Cor. (24.1.6.8) [Invariant Distributions on Orbits].** Let  $\gamma$  be an action of  $G$  on  $X \in \text{locProf}$  and a  $C^\infty(X)$ -sheaf. Assume the action is constructible (4.12.1.21) and there are no  $G$ -invariant distribution on any  $G$ -orbit in  $X$ , then there are no non-zero  $G$ -invariant distribution on  $X$ .  $\lrcorner$

*Proof:* Firstly, by (4.12.1.22) and (4.4.4.6) any orbit is locally profinite. If there is a  $G$ -invariant distribution on  $X$ , we may change  $X$  to  $\text{Supp } T$ , which is  $G$ -invariant, thus by (4.12.1.22) there is an open subset  $U \subset X$  that  $G$  acts regularly, thus we reduce to the regular action case.

Then we can consider  $X \rightarrow X/G$ ,  $X/G$  is locally profinite by (4.12.1.10), so Bernstein-Zelevinsky (24.1.6.7) can be used.  $\square$

**Thm. (24.1.6.9) [Frobenius Descent of Distributions, Bernstein-Zelevinsky [B-Z76]].** Let  $G$  is unimodular and acts transitively on  $Z \in \text{locProf}$ . Let  $\text{pr} : X \rightarrow Z \in \text{locProf}$  be  $G$ -equivariant and  $z \in Z, \chi \in G^\vee$ , then there is a canonical isomorphism

$$\Psi : \text{Dist}(\text{pr}^{-1}(z))^{\text{Stab}_G(z), \chi\nu^{-1}} \cong \text{Dist}(X)^{G, \chi} : \Psi(T)(f) = \int_Z \chi(g_z) T(g_z(f)) d\mu(z),$$

where  $\mu$  is a left  $(G, \nu)$ -equivariant Radon measure on  $Z$  for some  $\nu \in G^\vee$  and  $g_z$  is any element in  $\text{Stab}_G(z)$ .

In particular, for any  $T \in \text{Dist}(\text{pr}^{-1}(z))^{\text{Stab}_G(z), \chi\nu^{-1}}$ , we have  $\text{Supp}(\Psi(T)) = G \cdot \text{Supp}(T)$ .  $\lrcorner$

*Proof:* This is a consequence of Frobenius reciprocity, Cf. [B-Z76] 2.21-2.36.  $\square$

**Cor. (24.1.6.10) [Frobenius Descent and Fourier Transform].** Let  $K \in p\text{-NField}$  and  $V \in \text{Vect}^{\text{fin}}/K$  with a  $G$ -invariant non-degenerate bilinear form  $B$ . Suppose  $G$  is unimodular and acts transitively on  $Z \in \text{locProf}$  with unimodular stabilizers, then for the  $G$ -equivariant map  $\text{pr} : Z \times V$ , we have

$$\mathcal{F}_B \circ \Psi^{-1} = \Psi^{-1} \circ \mathcal{F}_B : \text{Dist}(X)^{G, \chi} \cong \text{Dist}(\text{pr}^{-1}(z))^{\text{Stab}_G(z), \chi}.$$

$\lrcorner$

*Proof:* This follows from the explicit formula of  $\Psi$  in (24.1.6.9).  $\square$

**Lemma (24.1.6.11).** Let  $H \leq G$  a closed subgroup, then  $G/H \in \text{locProf}$  by (12.10.4.4), and the projection  $P : C_c(G) \rightarrow C_c(G/H)$  defined in (12.10.3.5) restricts to a projection  $P : C_c^\infty(G) \rightarrow C_c^\infty(G/H)$ , and it is surjective.  $\lrcorner$

*Proof:* Firstly  $P$  maps  $C_c^\infty(G)$  into  $C_c^\infty(G/H)$  because if  $\varphi$  is left invariant under  $K$ , then  $P\varphi$  is also left invariant under  $K$ . For the surjectivity, let  $\varphi \in C_c^\infty(G/H)$ , then  $V = \text{Supp } \varphi$  is open compact, then by (12.10.4.5) there is an open compact subspace  $V$  that  $p(V) = U$ , Then we can define

$$\psi(x) = \chi_V(x)\varphi(p(x))/P(\chi_V)(p(x)),$$

then it is supported on  $V$ , and  $P(\psi) = \varphi$ . Also, it is locally constant, as is easily verified.  $\square$

**Prop. (24.1.6.12) [Left Invariant Distribution].** Any  $T \in \text{Dist}(G)^G$  (24.1.6.3) is the restriction of a unique left Haar measure  $\mu$  on  $G$ .  $\lrcorner$

*Proof:* Any element  $f \in C_c^\infty(G)$  is of the form  $\sum a_i \lambda(h_i) e_K$  for some  $K$ , by (24.1.6.4), where  $e_K = \mu(K)^{-1} \chi_K$ . Because  $T$  is left-invariant,  $T(f) = \sum a_i T(e_K)$ , and  $\int f d\mu = \sum a_i$ . Thus to show  $T$  is a multiple of  $d\mu$ , it suffices to show  $T(e_K)$  is independent of  $K$ .

If  $K_1 \leq K_2$ , then  $K_2 = \coprod_{i=1}^n a_i K_1$ , where  $n = [K_2 : K_1]$ , so  $e_{K_2} = \mu(K_1)/\mu(K_2) \sum_{i=1}^n \lambda(a_i) e_{K_1}$ . Also  $\mu(K_2) = n\mu(K_1)$  by left invariance. Now it is clear  $T(e_{K_1}) = T(e_{K_2})$  by left invariance of  $T$ . Then for any two  $K, K'$ , we can find an open compact group  $K''$  in their intersection, thus  $T(e_K) = T(e_{K'})$ .  $\square$

**Cor. (24.1.6.13).** If  $\chi \in G^\vee$  and  $T \in \text{Dist}(G)^{G,\chi}$  (24.1.6.3), then there is a unique left Haar measure  $\mu$  on  $G$  that  $T(f) = \int_G \chi(g) f(g) d\mu(g)$ .  $\lrcorner$

*Proof:* Consider the distribution  $T'(f) = T(\chi^{-1} \cdot f)$ , then it is left invariant.  $\square$

**Cor. (24.1.6.14) [Invariant Quotient Distribution].** Let  $H \leq G$  be a closed subgroup. then left  $H$ -invariant measures on  $G$  are identified with measures on  $G/H$ .

And if there exists a left  $G$ -invariant distribution  $D$  on  $G/H$ , then  $G/H$  admits a  $G$ -invariant measure (12.10.3.7), whose restriction to  $C_c^\infty(G/H)$  is  $D$ .  $\lrcorner$

*Proof:* Consider the distribution  $D \circ P^\infty$ , which is a left invariant linear functional on  $C_c^\infty(G)$ , (24.1.6.12) shows that it's the restriction of a Haar measure on  $G$ .

Then we can use the same method as in (12.10.3.7) to show  $\Delta_G|_H = \Delta_H$ , and the surjectivity of  $P^\infty$  (24.1.6.11) shows  $D$  is a quotient measure on  $G/H$ .  $\square$

**Prop. (24.1.6.15) [Gelfand Pairs].** Let  $H \leq G$  be a closed subgroup s.t.  $\Delta(G)|_H = \Delta_H$ . Suppose  $\iota$  is an involution on  $G$  that leaves  $H$  invariant and acts trivially on those distributions on  $G$  with are  $H$ -bi-invariant, then for any  $V \in \text{Irr}^{\text{alg}}(G)$ ,

$$\dim(V^*)^H \cdot \dim((V^\vee)^*)^H \leq 1.$$

$\lrcorner$

*Proof:* Given two  $H$ -invariant maps  $l : C \rightarrow \mathbb{C}, m : V^\vee \rightarrow \mathbb{C}$ , by Frobenius reciprocity, we get two maps  $l' : C_c^\infty(H \backslash G) \rightarrow V, m' : C_c^\infty(H \backslash G) \rightarrow V^\vee$  that are surjective, and give rise to  $B : C_c^\infty(\mathcal{H} \times \mathcal{H} \backslash G \times G) \rightarrow V \times V^\vee \rightarrow \mathbb{C}$ .

Then  $B$  satisfies  $B(f, g) = B(i(g), i(f))$ , where  $i(f)(x) = f(\bar{x}^{-1})$ : There is a commutative diagram

$$\begin{array}{ccc} G \times G & \xrightarrow{(x,y) \mapsto xy^{-1}} & G \\ \downarrow (x,y) \mapsto (\iota(y)^{-1}, \iota(x)^{-1}) & & \downarrow \iota \\ G \times G & \xrightarrow{(x,y) \mapsto xy^{-1}} & G \end{array}$$

and the horizontal arrows identify left  $H$ -invariant right  $G$ -invariant distributions on  $G$  with left  $H \times H$ -invariant distributions on  $G \times G$ .

By the surjectivity of  $l', m'$ ,  $\ker(l'), \ker(m')$  are left and right radicals of  $B$  resp., and the above formula shows they determine each other, and  $l', m'$  are determined by their kernels, thus we are done.  $\square$

**Prop. (24.1.6.16) [Gelfand-Kazhdan].** If  $\gamma$  is an action of  $G$  on  $X \in \text{locProf}$ ,  $\sigma$  is a homeomorphism  $X \cong X$ ,  $\mathcal{F}$  is a  $C^\infty$ -sheaf on  $X$ , and we assume:

- $\gamma$  is constructible,
- for each  $g \in G$ , there is a  $g^\sigma \in G$  that  $\gamma(g)\sigma = \sigma\gamma(g^\sigma)$ .
- For some  $n \geq 0$  and  $g_0 \in G$ ,  $\gamma^n = \gamma(g_0)$ .
- If there is a non-zero  $G$ -invariant  $\mathcal{F}$ -distribution  $T$  on a  $G$ -orbit  $S$ , then  $\sigma(S) = S$  and  $\sigma(T) = T$ .

Then any  $G$ -invariant distribution on  $X$  is invariant under  $\sigma$ .  $\lrcorner$

*Proof:* Let  $T$  be a  $G$ -invariant  $\mathcal{F}$ -distribution that  $\sigma T \neq T$ , then  $n > 1$ , and for any  $n$ -th root of unity  $\xi$ , consider  $T_\xi = \sum \xi^{-i} \sigma^i(T)$ . Then

$$\sigma T_\xi = \xi T_\xi, \quad \sum_{\xi} T_\xi = nT, \quad \sum_{\xi} \xi T_\xi = n\sigma(T).$$

so  $\sum_{\xi} (\xi - 1)T_\xi = n(\sigma(T) - T) \neq 0$ , which shows there is a root  $\xi \neq 1$  that  $T_\xi \neq 0$ . Notice  $T_\xi$  is  $G$ -invariant by condition2. Consider the action  $\sigma_x i = \xi \cdot \sigma$ , then  $T_\xi$  is invariant under  $\sigma_\xi$ .

Let  $G'$  be the semi-direct product of  $G$  with  $\sigma_\xi$ , under the action of  $\sigma_\xi^{-1} g \sigma_\xi = g^\sigma$ , then  $G'$  is locally profinite and acts on  $X, \mathcal{F}$ . Clearly this action is also constructible.

Now for any  $G'$ -orbit  $S'$ , we prove there are no  $G'$ -invariant distribution on  $S'$ , because it is in priori  $G$ -invariant, so some distribution exists on some  $G$ -orbit  $S \subset S'$ , but then condition4 shows  $\sigma$  fixes  $S$ , then  $S = S'$  and  $\sigma(T) = T$ . But  $\sigma_\xi(T) = T$ , contradiction. Finally, (24.1.6.8) shows there are no  $G'$ -invariant distribution on  $X$ , contradicting  $T_\xi$ .  $\square$

**Cor. (24.1.6.17) [Gelfand-Kazhdan].** If  $G$  is  $\sigma$ -compact, and  $\gamma$  is an action of  $G$  on  $X \in \text{locProf}$ ,  $\sigma : X \cong X$  is a homeomorphism, and we assume:

- $\gamma$  is constructible,
- for each  $g \in G$ , there is a  $g^\sigma \in G$  that  $\gamma(g)\sigma = \sigma\gamma(g^\sigma)$ .
- For some  $n \geq 0$  and  $g_0 \in G$ ,  $\sigma^n = \gamma(g_0)$ .
- For any  $x$ ,  $x$  and  $\sigma(x)$  are in the same  $G$ -orbit.

Then any  $G$ -invariant distribution on  $X$  is invariant under  $\sigma$ .  $\lrcorner$

*Proof:* We use (24.1.6.17) and take  $\mathcal{F}$  to be just  $C^\infty(X)$ . Then we need to check condition4: for any  $G$ -orbit  $S$  of  $X$  let  $s \in S$  and  $\text{Stab}(s) = H$ ,  $S \cong G/H$  by (4.12.1.22) and (12.10.4.6). Then (24.1.6.14) shows  $T$  is just the  $G$ -invariant measure on  $G/H : T\varphi = \int_{G/H} \varphi(\gamma(g)s)$ . Now condition4 and2 shows  $\sigma T$  is also  $G$ -invariant, thus  $\sigma T = cT$ . Clearly  $c \geq 0$ , and condition3 shows  $c^n = 1$ , thus  $c = 1$ .  $\square$

## Hecke Algebras

For Hecke algebras of Lie groups, see [Hecke Algebras](#).

**Def. (24.1.6.18) [Hecke Algebras of Locally Profinite Groups].** The set  $\mathcal{H}(G)$  of test functions (4.4.4.11) on  $G$  under convolution is an algebra, called the **Hecke algebra (locally profinite groups)** of  $G$ . And for a compact open subgroup  $K$  of  $G$ ,  $\mathcal{H}_K$  is the subspace of  $K$ -bi-invariant functions in  $\mathcal{H}(G)$ .

Notice  $\mathcal{H} = \cup_K \mathcal{H}_K$  by (24.1.6.4). Also  $\mathcal{H}_K$  has a unit  $e_K = \mu(K)^{-1} \chi_K$ . This is easily verified.

Then  $\mathcal{H}_G$  is an idempotented algebra (3.6.5.2).  $\lrcorner$

*Proof:* Define the set  $\mathcal{E}$  of idempotents in  $\mathcal{H}(G)$  as  $e_K$ , where  $K$  is compact open in  $G$ . The fact that  $\mathcal{H}$  is an idempotented algebra follows from (24.1.6.19) and (24.1.6.21).  $\square$

**Prop. (24.1.6.19) [Point Measure].** Consider the point measure  $\delta_g$  for  $g \in G$ , it is not an element in  $\mathcal{H}(G)$ , but it can convolute on  $\mathcal{H}(G)$ :  $(\delta_g * \varphi)(x) = \varphi(g^{-1}x)$ ,  $(\varphi * \delta_g)(x) = \varphi(xg)$ . Then

- If  $g \in K$ , then  $\delta_g * e_K = e_K * \delta_g = e_K$ .
- $\delta_g * e_K * \delta_{g^{-1}} = e_{gKg^{-1}}$ .
- If  $K = K_1 K_2$  is an open subgroup, then  $e_{K_1} * e_{K_2} = e_K$ . In particular,  $e_K * e_K = e_K$ .

$\lrcorner$

**Remark (24.1.6.20).** In fact we should define the Hecke algebra as locally constant distributions on  $G$ , then there equations are more natural. This algebra is equivalent to Hecke algebra by  $f \mapsto f\mu_G$ .  $\lrcorner$

**Prop. (24.1.6.21).**  $\mathcal{H}_K = e_K * \mathcal{H} * e_K = \mathcal{H}[e_K]$ .  $\lrcorner$

*Proof:* Notice by (24.1.6.19), functions in  $e_K * \mathcal{H} * e_K$  is clearly  $K$ -bi-invariant. For the other direction, notice if  $\varphi$  is left and right  $K$ -invariant, then  $\varphi = e_K * \varphi = \varphi * e_K = e_K * \varphi * e_K$ .  $\square$

**Prop. (24.1.6.22) [Smooth Representations and  $\mathcal{H}$ -Modules].** For  $(\pi, V) \in \text{Rep}^{\text{alg}}(G)$  and any  $v \in V$ ,  $g \mapsto \pi(g)v$  can be regarded as a locally constant function with value in  $V$ , thus for any  $\varphi \in \mathcal{H}_G$ ,  $g \mapsto \varphi(g)\pi(g)v$  is locally constant with compact support, thus we can define a representation of the Hecke algebra  $\mathcal{H}_G$  by

$$\pi(\varphi)v = \int_G \varphi(g)\pi(g)v dg$$

which just has nothing to do with integration, and this is compatible with convolution by formal reason. Then this is a smooth  $\mathcal{H}_G$ -module, and this gives an equivalence between the category of smooth (resp. admissible) non-degenerate representations of  $\mathcal{H}(G)$  (3.6.5.4) and the category of smooth (resp. admissible) representations of  $G$  (24.1.6.29).  $\lrcorner$

*Proof:* For any  $v \in V$ , there is an open compact subgroup  $K$  that  $v \in V[e_K]$ , thus  $e_K v = v$ , so  $V$  is smooth. For the equivalence of categories, for any  $\mathcal{H}(G)$ -module  $V$ , we can define a  $G$ -action by linearly extending the action  $\pi(g)e_K v = (\delta_g * e_K)v$ . Notice by associativity of representation and smoothness, this is well-defined on all of  $V$ , and is a representation of  $G$ . Also it is continuous because  $v = e_K v$  for some  $K$  thus  $\pi(g)v = (\delta_g * e_K)v = e_K v = v$  for any  $g \in K$ . Finally these two functors are inverse to each other is also easily checked.  $\square$

**Cor. (24.1.6.23).**  $(-)^K, (-)^{\text{alg}}$  (24.1.2.2) are both exact, by (3.6.5.3).  $\lrcorner$

**Cor. (24.1.6.24).** For  $(\pi, V) \neq 0 \in \text{Rep}^{\text{alg}}(G)$ , the following are equivalent by (3.6.5.6) and (24.1.6.22):

- $\pi$  is irreducible.
- $V$  is simple as  $\mathcal{H}$ -module.
- $V^K$  is either zero or simple as a  $\mathcal{H}_K$ -module for all open compact subgroups  $K \leq G$ .

┘

**Prop. (24.1.6.25)[Fourier Transform].** If  $G$  is Abelian, the Fourier transform induces an isomorphism of algebras

$$\mathcal{H}(G^\vee) \cong C_c^\infty(G) : \varphi \mapsto \varphi^\vee(\xi) = \int_G \varphi(y) \overline{\langle \xi, y \rangle} d\mu(y).$$

┘

*Proof:* By (12.11.1.9) this is an algebra homomorphism. It remains to show that the image are all locally compact, and this is clear from the fact  $\widehat{G}$  is given the compact-open topology (12.11.1.7).  $\square$

### Admissible Smooth Representations

**Prop. (24.1.6.26).**

- For any compact open subset  $K \leq G$ ,  $V^K = ((V^\vee)^K)^*$ .
- $\text{Hom}_G(V, W^\vee) = \text{Hom}(W, V^\vee)$ .
- $V \hookrightarrow (V^\vee)^\vee$ .

┘

*Proof:* 1: Using (24.1.6.22), because  $(\widetilde{V})^K = V^{*K}$ . There is a homomorphism  $V^{*K} \rightarrow V^{K*}$ , it is injective, because if  $f(v) = 0$  for each  $v \in V^K$ , then  $f(w) = f(e_K v) = 0$ . It is also injective, because for each  $f \in V^{K*}$ , the inverse image is  $g(w) = g(e_K w)$ .

2:  $\text{Hom}(V, \widetilde{W}) = \text{Hom}(V, W^*) = \text{Hom}(V \otimes W, \mathbb{C})$ .

3: by the proof of item1,

$$V^{\vee\vee} = \cup_K \left( (\cup_K V^{*K})^{*K} \right) = \cup_K \left( (\cup_K V^{*K})^{K*} \right) = \cup_K (V^{*K*}) = \cup_K (V^{K**}).$$

So the filtered colimits of the injections  $V^K \rightarrow (V^K)^{**}$  gives an injection  $\cup_K (V^{K**})$ .  $\square$

**Cor. (24.1.6.27)[Contragradient Functor is Exact].** The contragradient functor  $V \mapsto V^\vee$  is exact. Because  $(-)^*$ ,  $(-)^{\text{alg}}$  are all exact (24.1.6.23).  $\square$

**Cor. (24.1.6.28).** If  $P$  is projective in  $\mathcal{M}(G)$ , then  $\widetilde{P}$  is injective in  $M(G)$ .  $\square$

*Proof:*  $\text{Hom}(X, P^\vee) = \text{Hom}(P, X^\vee)$ , and notice that the contragradient functor is exact (24.1.6.27).  $\square$

**Def. (24.1.6.29)[Admissible Representations].** An **admissible smooth representation** of  $G$  is a smooth representation  $V \in \text{Rep}^{\text{alg}}(G)$  s.t.  $\dim V^K < \infty$  for any compact open subgroup  $K \leq G$ . The category of admissible smooth representation of  $G$  is denoted by  $\text{Rep}^{\text{adm}}(G)$ .

Then a smooth representation is admissible iff  $V \cong (V^\vee)^\vee$ .  $\square$

*Proof:* If  $V^K$  is of f.d. for each  $K$ , then by the proof of item3 of (24.1.6.26),  $V \cong \widetilde{\widetilde{V}}$ . Conversely, if  $V \cong \widetilde{\widetilde{V}}$ , then  $V^K \cong V^{K**}$ , thus  $V$  must be finite, by (3.5.3.9).  $\square$

**Cor. (24.1.6.30).** For an irreducible admissible representation, the contragradient is also irreducible admissible.

Extensions of admissible representations are admissible, by (24.1.6.23).  $\square$

**Prop. (24.1.6.31) [Decomposition of Admissible Representations].** Let  $K \leq G$  be a compact open subgroup, then  $(\pi, V) \in \text{Rep}(G)$  is smooth iff it decomposes as

$$V = \bigoplus_{\rho \in \text{Rep}(K)} V^\rho,$$

and  $V$  is admissible iff each  $V^\rho$  are all of f.d. In particular, this shows the two notations of admissibility (locally compact group and real reductive groups) are compatible for smooth representations (24.1.6.29)(24.6.4.2).  $\lrcorner$

**Remark (24.1.6.32).** WARNING: The decomposition theorem of compact groups cannot be directly used, as representation may not be of f.d. so may not be unitarizable.  $\lrcorner$

*Proof:* Firstly  $V \subset \sum_{\rho \in \widehat{K}} V(\rho)$ , because any  $v \in V$  is fixed by some compact open subgroup  $K_0$  of  $K$ , and we can choose  $K_0$  to be normal in  $K$  by (4.12.1.6), so for  $\Gamma = K/K_0$ ,

$$v \in V^{K_0} = \bigoplus_{\rho \in \widehat{\Gamma}} V(\rho) \subset \sum_{\rho \in \widehat{K}} V(\rho).$$

Also this sum is direct, because otherwise  $\sum_{\rho \in S} c_\rho v_\rho = 0$ , but let  $K_0$  be the intersection of kernels of  $\rho$ , then this is an equation of elements in representations of  $\Gamma = K/K_0$  finite, so contradicting (24.1.3.8).

Conversely, if this decomposition holds, then each  $v \in V^\rho$  is smooth, because it is fixed by a small open compact nbhd of  $K$ .

If  $\pi$  is admissible, then  $V(\rho) \subset V^{\ker \rho}$  is of f.d.. Conversely, if  $V$  is not admissible, then  $V^{K_0}$  is of infinite dimensional for some  $K_0$  compact compact normal, so  $V^{K_0}$  decomposes as direct sums of  $V(\rho)$  for  $\rho \in \widehat{K/K_0}$ , thus one of these space must be of infinite dimensional.  $\square$

**Def. (24.1.6.33) [Characters of Admissible Representations].** Let  $(\pi, V) \in \text{Rep}^{\text{adm}}(G)$ , then for any  $\varphi \in \mathcal{H}$ , we have  $\varphi \in \mathcal{H}_K$  for some compact open subset of  $G$ , by (24.1.6.18), so  $\text{Im}(\pi(\varphi)) \subset V^K$ , which is of f.d., so we can define the trace of  $\varphi$  as  $\text{tr}(\pi(\varphi)|V^K)$ . Notice this is independent of  $K$  chosen by linear algebra reasons. And this defines a distribution  $\chi_\pi$  on  $\mathcal{H} : \varphi \mapsto \text{tr}(\pi(\varphi)|V^K)$ , called the **character (of admissible representation)** of  $V$ .  $\lrcorner$

**Cor. (24.1.6.34).**  $\text{Irr}^{\text{alg}}(G)$  has enough injectives.  $\lrcorner$

*Proof:* As  $\text{Irr}^{\text{alg}}(G)$  has enough projectives (3.6.5.9)(24.1.6.22), there is a surjection  $P \rightarrow \tilde{X}$ , thus an injection  $\tilde{X} \hookrightarrow \tilde{P}$  (24.1.6.27). Now  $X \hookrightarrow \tilde{X}$  by (24.1.6.26).  $\square$

### Irreducible Admissible Representations

**Prop. (24.1.6.35) [Separation Lemma].** If  $G$  is  $\sigma$ -compact, then for any  $0 \neq h \in \mathcal{H}(G)$ , there exists  $\rho \in \text{Irr}^{\text{adm}}(G)$  s.t.  $\rho(h) \neq 0$ .  $\lrcorner$

*Proof:* Cf. [Bernstein, P20], [Bernstein-Zelevinsky, P19]. ?  $\square$

**Prop. (24.1.6.36) [Schur's Lemma].**

- If  $G$  is a  $\sigma$ -compact, then any  $V \in \text{Irr}^{\text{alg}}(G)$  is of at most countable dimension. In particular,  $\text{End}_G(V) = \mathbb{C}$  by (3.6.1.2).
- For any  $(\pi, V) \in \text{Irr}^{\text{adm}}(G)$ , we have  $\text{End}_G(V) = \mathbb{C}$ .

$\lrcorner$

*Proof:* 1: If it is of at most countable dimension because if  $\xi$  generate  $V$ , then notice its stablizer is compact open, and  $G$  is  $\sigma$ -compact, so  $V$  is at most countable.

2: Let  $K_0$  be a small open compact subgroup that  $V^{K_0} \neq 0$ , then  $V^{K_0}$  is of f.d. and preserved under  $T \in \text{End}_G(V)$ , thus  $T$  has an eigenvalue  $c$ , thus  $T = cI$  on  $V$ .  $\square$

**Prop. (24.1.6.37).** Let  $(\pi_1, V_1), (\pi_2, V_2) \in \text{Irr}^{\text{alg}}(G)$ . If  $V_1^K \cong V_2^K \neq 0$  as  $\mathcal{H}_K$ -module for some compact open subgroup  $K$  of  $G$ , then  $\pi_1 \cong \pi_2$ .  $\square$

*Proof:* This follows immediately from (3.6.5.7).  $\square$

**Prop. (24.1.6.38) [Characters Determine Irreducible Admissible Representations].** Let  $\pi_1, \dots, \pi_n \in \text{Irr}^{\text{adm}}(G)$  be pairwise inequivalent, then their characters  $\text{tr}(\pi_i)$  are linearly independent. In particular, an irreducible admissible representation is determined by its character.  $\square$

*Proof:* Choose compact open subgroup  $K$  that  $V_i^K \neq 0$  for any  $i$ , the hypothesis together with (24.1.6.37) shows  $V_i^K \cong V_j^K$ . Then we finish by (24.7.3.23).  $\square$

**Prop. (24.1.6.39) [Representations of Product Group].** If  $G_1, G_2 \in \text{locProfGrp}$  and  $(\pi_i, M_i) \in \text{Irr}^{\text{adm}}(G_i)$ , then  $M_1 \otimes M_2 \in \text{Irr}^{\text{adm}}(G_1 \times G_2)$ , and  $\text{Irr}^{\text{adm}}(G_1 \times G_2) = \text{Irr}^{\text{adm}}(G_1) \times \text{Irr}^{\text{adm}}(G_2)$ .  $\square$

*Proof:* By (24.1.6.22) and (3.6.5.15), this follows if we have  $\mathcal{H}_{G_1 \otimes G_2} \cong \mathcal{H}_{G_1} \otimes \mathcal{H}_{G_2}$ . And this fact is easily deduced from (4.4.4.13).  $\square$

### Induced Representations and Mackey Theory

**Def. (24.1.6.40) [Smooth Induced Representations].** Let  $H \leq G$  be a closed subgroup and  $(\pi, V) \in \text{Irr}^{\text{alg}}(H)$ , then we can define the (normalized) **smooth induced representation**  $\text{n-Ind}_H^G \pi$  as the space of locally constant  $f$  on  $G$  with values in  $V$  s.t.

$$f(hg) = \sqrt{\frac{\Delta_G(h)}{\Delta_H(h)}} \pi(h) f(g),$$

with the natural right  $G$ -representation. Notice this is compatible with that of unitary representations of locally compact groups, in (24.7.4.3).

The induced representation  $\text{n-Ind}_H^G \pi$  has a subrepresentation  $\text{n-ind}_H^G \pi$  consisting of functions that is compactly supported in  $H \backslash G$ , called the (normalized) **smooth compactly-induced representation** of  $\pi$ .

We can also define the unnormalized versions  $\text{Ind}_H^G$  and  $\text{ind}_H^G$ .  $\square$

**Remark (24.1.6.41).** The normalized factor here is used to make the induction of a unitarizable representation unitarizable (24.1.6.51).  $\square$

**Prop. (24.1.6.42) [Fixed Points of the Induced Representations].** Situation as in (24.1.6.40). Let  $K \subset G$  be an open compact subgroup, and  $\Omega \subset G$  be a system of coset representations of  $H \backslash G / K$ . For each  $g \in G$ , denote  $N_g = H \cap gKg^{-1}$  the compact open subgroup of  $H$ , then the restriction of functions from  $G$  to  $\Omega$  induces an isomorphism of  $(\text{Ind}_H^G(V))^K$  with the  $\prod_{g \in \Omega} V^{N_g}$ . And in this way,  $(\text{ind}_H^G(V))^K$  is mapped to  $\bigoplus_{g \in \Omega} V^{N_g}$ .  $\square$

**Prop. (24.1.6.43).** Let  $B \leq H \leq G$  be closed subgroups, then

- $\text{Ind}_H^G$  and  $\text{ind}_H^G$  are both exact functors  $\text{Rep}^{\text{alg}}(H) \rightarrow \text{Rep}^{\text{alg}}(G)$ .

- $\text{Ind}_H^G \circ \text{Ind}_B^H = \text{Ind}_B^G$  and  $\text{ind}_H^G \circ \text{ind}_B^H = \text{ind}_B^G$ .
- $\text{Ind}_H^G(\sigma)^\vee = \text{ind}_H^G(\sigma^\vee)$ .
- (Smooth Frobenius Reciprocity) If  $(\pi, W) \in \text{Rep}^{\text{alg}}(G)$ ,  $(\rho, V) \in \text{Rep}^{\text{alg}}(H)$ , then there are functorial isomorphisms

$$\text{Hom}_G(\pi, \text{Ind}_H^G(\rho)) = \text{Hom}_H(\pi|_H, \rho \otimes \sqrt{\frac{\Delta_G}{\Delta_H}}), \quad \text{Hom}_G(\text{ind}_H^G(\sigma), \pi) = \text{Hom}_H(\rho \otimes \sqrt{\frac{\Delta_H}{\Delta_G}}, (\pi^\vee|_H)^\vee)$$

⌋

*Proof:* 1: This follows from the description in (3.6.5.3) and (3.6.5.3) by taking colimits.

2: For simplicity we prove for  $G, H, B$  unimodular. An element in  $\text{Ind}_H^G \circ \text{Ind}_B^H(V)$  is an element  $\varphi : G \mapsto \text{Hom}(H, V)$  that satisfies  $\varphi(hg)(h') = (\pi(h)\varphi(g))(h') = \varphi(g)(hh')$ , thus  $\varphi(g)(h) = \varphi(hg)(1)$ . Let  $\Phi(g) = \varphi(g)(1)$ , then  $\Phi$  satisfies  $\Phi(bg) = \pi(b)\Phi(g)$ . So  $\varphi \mapsto \Phi$  is an isomorphism. ind case follows from item 3.

3: For  $f : G \rightarrow V \in \text{Ind}_H^G(\sigma)$ ,  $f' \in G \rightarrow V^\vee \in \text{ind}_H^G(\sigma^\vee)$ ,  $\langle f, f' \rangle$  is compactly supported in  $H \backslash G$ , and  $\langle \pi(h)f, \pi(h)f' \rangle = \frac{\Delta_G(h)}{\Delta_H(h)} \langle f, f' \rangle$ , thus we can define a  $G$ -invariant pairing

$$\langle f, f' \rangle = \int_{H \backslash G} \langle f(g), f'(g) \rangle d\mu_{H \backslash G}(g) \quad (12.10.3.15).$$

This map is a perfect pairing on the  $K$ -fixed part for any compact open  $K$  using description in (24.1.6.42), thus we are done.

4: Given a  $\Phi : W \rightarrow \text{Ind}_H^G V$ , we have a map  $\varphi : W \rightarrow V : \varphi(w) = \Phi(w)(1)$ , then it is verified that  $\varphi \in C(\pi|_H, \rho \otimes \sqrt{\frac{\Delta_G}{\Delta_H}})$ . Conversely, if  $(\varphi : W \rightarrow V) \in C(\pi|_H, \rho \otimes \sqrt{\frac{\Delta_G}{\Delta_H}})$  is given, we can define  $\Phi : W \rightarrow \text{Ind}_H^G V : \Phi(w)(g) = \varphi(\pi(g)w)$ , then  $\Phi(w) \in \text{Ind}_H^G V$  and this is linear in  $w$  (remember to check smoothness). Finally, it is easily verified these maps are inverse to each other. The second assertion follows from item 3 and (24.1.6.26).  $\square$

**Cor. (24.1.6.44).** If  $H \backslash G$  is compact, then  $\text{Ind}_H^G = \text{ind}_H^G$ , and they map admissible representations to admissible representations, by the description in (3.6.5.3), as  $H \backslash G/K$  is both compact and discrete thus finite.  $\square$

**Prop. (24.1.6.45).** If  $H \trianglelefteq G$  and for any  $\rho \in \text{Rep}(H)$ , let  $\rho^g$  be  $\rho$  twisted by conjugation of  $g \in G$ , then  $\text{Ind}_H^G(\rho) \cong \text{Ind}_H^G(\rho^g)$ , and  $\text{ind}_H^G(\rho) \cong \text{ind}_H^G(\rho^g)$ .  $\square$

*Proof:*  $\square$

**Prop. (24.1.6.46).** Let  $H \leq G, K \trianglelefteq G$  be closed subgroups and  $\rho \in \text{Rep}(H)$ , then

$$(\text{Ind}_H^G(\rho))^K \cong \text{Ind}_{H/H \cap K}^{G/K}(\rho^{H \cap K}) \in \text{Rep}^{\text{alg}}(G/K)$$

⌋

*Proof:*  $\square$

**Prop. (24.1.6.47).** Let  $H \leq G$  be a closed subgroup and  $(\pi, V) \in \text{Irr}^{\text{alg}}(H)$ , then there is a  $G$ -invariant map  $P_\pi : C_c^\infty(G) \otimes V \rightarrow \text{ind}_H^G(\pi) :$

$$P_\pi(\varphi, v)(g) = \int_H \varphi(b^{-1}g) \sqrt{\frac{\Delta_G(b)}{\Delta_H(b)}} \pi(b)v db.$$

And if  $\dim \pi < \infty$  and there is an open compact subgroup  $K$  of  $G$  that  $G = HK$ , then this map is surjective.

Moreover,

$$P(\lambda(b)^{-1}\varphi, v) = \sqrt{\Delta_G(b)\Delta_H(b)}P(\varphi, \pi(b)v), \quad b \in H$$

┘

*Proof:* It can be verified that  $P_\pi(\varphi, v)(bg) = \sqrt{\frac{\Delta_G(b)}{\Delta_H(b)}}\pi(b)P_\pi(\varphi, v)$ .

If  $H \backslash G$  is compact, by (12.10.4.5), there is a compact open subset  $K$  of  $G$  that  $G = HK$ , then for any  $f \in \text{Ind}_H^G(\pi) = \sum v_i \otimes f_i$ , consider  $\varphi_i = \chi_{K^{-1}}f_i$ , then  $\sum P(\varphi_i, v_i) = \sum V(H \cap K)f_i v_i = V(H \cap K)f$ .  $\square$

**Prop. (24.1.6.48) [Mackey's Decomposition].** Let  $H, K \leq G$  be closed subgroups and  $\rho \in \text{Irr}^{\text{alg}}(H)$ . If  $s \in G$ , then we can define a new representation of  $H_s = K \cap sHs^{-1}$  as  $\rho^s(g) \mapsto \rho(s^{-1}gs)$ . Then if we use unnormalized induction,

- If either  $H$  or  $K$  is open in  $G$ , then

$$\text{res}_K^G \text{ind}_H^G \rho \cong \bigoplus_{s \in H \backslash G/K} \text{ind}_{H_s}^K \rho^s$$

- If  $K$  is open in  $G$ , then

$$\text{res}_K^G \text{Ind}_H^G \tau \cong \left( \prod_{s \in H \backslash G/K} \text{Ind}_{H_s}^K \tau^s \right)^\infty$$

┘

*Proof:* Cf. [Yam22].  $\square$

**Cor. (24.1.6.49) [Mackey's Intertwining Theorem].** Let  $H \leq G$  be closed and,  $K \leq G$  be open,  $\sigma$  (resp.  $\tau$ ) be a smooth representation of  $K$  (resp.  $H$ ), define  $\tau^s$  as in (24.1.6.48), then if we use unnormalized induction,

- 

$$\text{Hom}_G(\text{ind}_K^G \sigma, \text{Ind}_H^G \tau) \cong \prod_{s \in H \backslash G/K} \text{Hom}_{H_s}(\sigma, \tau^s).$$

- If moreover  $H \backslash HgK \cong H_s \backslash K$  is compact for any  $g \in G$  (e.g.  $K$  is compact) and  $\sigma$  is f.g. over  $K$ , then

$$\text{Hom}_G(\text{ind}_K^G \sigma, \text{ind}_H^G \tau) \cong \bigoplus_{s \in H \backslash G/K} \text{Hom}_{H_s}(\sigma, \tau^s).$$

┘

*Proof:* 1: This is a direct consequence of Mackey's decomposition (24.1.6.48) and Frobenius reciprocity (24.1.6.43):

$$\begin{aligned} \text{Hom}_G(\text{ind}_K^G \sigma, \text{Ind}_H^G \tau) &\cong \text{Hom}_K(\sigma, \text{res}_K^G \text{Ind}_H^G \tau) \cong \text{Hom}_K(\sigma, \left( \prod_{s \in H \backslash G/K} \text{Ind}_{H_s}^K \tau^s \right)^\infty) \\ &\cong \text{Hom}_K(\sigma, \prod_{s \in H \backslash G/K} \text{Ind}_{H_s}^K \tau^s) \cong \prod_{s \in H \backslash G/K} \text{Hom}_K(\sigma, \text{Ind}_{H_s}^K \tau^s) \\ &\cong \prod_{s \in H \backslash G/K} \text{Hom}_{H_s}(\sigma, \tau^s). \end{aligned}$$

2 is similar.  $\square$

**Cor. (24.1.6.50) [Compact Induction Admissible].** If  $H \leq G$  be a closed subgroup s.t.  $H \backslash G$  is compact, then  $\text{Ind}_H^G$  takes admissible representations to admissible representations.  $\lrcorner$

*Proof:* For any compact open subgroup  $K \leq G$ ,  $H \backslash G/K$  is finite, as  $H \backslash G$  is compact and  $K$  is open, then by Mackey's decomposition (24.1.6.48),  $(\text{Ind}_H^G \rho)^K = \oplus_{s \in H \backslash G/K} \rho^{s^{-1}Ks \cap H}$  is of f.d. if  $\rho$  is admissible.  $\square$

### Unitarizable Admissible Representations

**Prop. (24.1.6.51) [Induction of Unitarizable Admissible Representations].** If  $H \leq G$  is a closed subgroup and  $(\pi, \mathcal{H}) \in \text{Rep}^{\text{uni}}(H)$  with  $\mathcal{H}^{\text{alg}} = V \in \text{Rep}^{\text{alg}}(H)$ , then

$$\text{ind}_H^G(V) = \text{ind}_H^G(\mathcal{H})^{\text{alg}} \text{ (24.7.4.3)}.$$

In particular, the induction of a unitarizable representation is unitarizable, by (24.7.4.3) and that fact  $\text{Ind}_H^G(\sigma)^\vee = \text{ind}_H^G(\sigma^\vee)$  (24.1.6.43).  $\lrcorner$

**Prop. (24.1.6.52) [Converse of Schur's Lemma].** If  $(\pi, V) \in \text{Irr}^{\text{adm, uni}}(G)$  and  $\text{Hom}_G(V, V) = \mathbb{C}$ , then  $\pi$  is irreducible.  $\lrcorner$

*Proof:* Cf. [Bump, P523]. ?  $\square$

### Compact Representations

**Def. (24.1.6.53) [Compact Representations].** A **compact representation** of  $G$  is a smooth representation  $(\pi, V) \in \text{Rep}^{\text{alg}}(G)$  s.t. for every  $\xi \in V$  and every compact open subgroup  $K \subset G$ , the function  $D_{\xi, K} : G \rightarrow V : g \mapsto \pi(e_K)\pi(g^{-1})\xi$  has compact support.  $\lrcorner$

**Prop. (24.1.6.54).**  $V \in \text{Rep}^{\text{alg}}(G)$  is compact iff every matrix coefficient of  $V$  is compactly supported. And every f.g. compact representation is admissible.  $\lrcorner$

*Proof:* If  $V$  is compact, for any  $\xi \in V, \xi^\wedge \in V^\wedge, \xi^\wedge \in (V^\wedge)^K$ , then  $\text{Supp } \varphi_{\xi, \xi^\wedge} \in \text{Supp } D_{\xi, K}$  is compact.

For the converse, Cf. [Bernstein Zelevinsky, P26].  $\square$

## 24.2 Positive Characteristic Representations

References are [Ser77, Bon11].

**Notation (24.2.0.1).**

- Use notations on representations defined in [Smooth Representations](#).

┘

### 1 Basics

**Prop. (24.2.1.1) [Dickson].** For any  $p \in \text{Prime}$ , if  $G \subset \text{GL}(2; \overline{\mathbb{F}}_p)$  is a finite subgroup that acts irreducibly on  $\overline{\mathbb{F}}_p^2$ , then it has projective image isomorphic to either a dihedral group,  $\text{Alt}_4$ ,  $\text{Sym}_4$ ,  $\text{Alt}_5$ ,  $\text{PSL}(2; \mathbb{F})$  or  $\text{PGL}(2; \mathbb{F})$ , where  $\mathbb{F} \subset \overline{\mathbb{F}}_p$  is a finite subfield.

If  $p = 2$ , then the projective image must be dihedral.

┘

*Proof:* Cf. [Huppert, B.: Endliche Gruppen I. Springer, Berlin (1967)]2.8.27.

□

### 2 Block Theory

See [Bon11].

### 3 Mixed Characteristic

**Notation (24.2.3.1).**

- Let  $(K, \mathcal{O}_K, \varpi, \kappa) \in p\text{-Field}$ .

┘

**Prop. (24.2.3.2) [Compact Groups Stabilize a Lattice].** Let  $\Gamma \in \text{TopGrp}_{\text{cpct}}$  and  $\rho : \Gamma \rightarrow \text{GL}(n; \overline{\mathbb{Q}}_p)$  be a continuous homomorphism, then there exists a finite extension  $L/\mathbb{Q}_p$  that  $\rho(\Gamma) \subset \text{GL}(n; L)$ , and up to conjugation,  $\rho(\Gamma) \subset \text{GL}(n; \mathcal{O}_L)$ , or equivalently,  $\Gamma$  fixes a  $\mathcal{O}_L$ -lattice.

┘

*Proof:* Notice  $\rho(\Gamma)$  is compact and Hausdorff, so by Baire category theorem, now that  $\text{GL}(n; L)$  is closed in  $\text{GL}(n; \overline{\mathbb{Q}}_p)$  for all  $L/\mathbb{Q}_p$  finite, and all this extensions are countable by primitive element theorem, so there is an  $L$  that  $\rho(\Gamma) \cap \text{GL}(n; L)$  contains an open subset of  $\rho(\Gamma)$ , so it is an open subgroup, thus of finite index, hence by adding all the coset representations into  $L$ , we get a finite extension  $L'$ .

For the second assertion, notice  $\rho(\Gamma)$  is compact in  $\text{GL}(n; L)$ , thus by (20.7.3.10), it is conjugate to  $\text{GL}(n; \mathcal{O}_L)$ .

□

**Def. (24.2.3.3) [Residual Representations].** For any  $\Gamma \in \text{TopGrp}_{\text{cpct}}$  and  $(\rho, V) \in \text{Rep}_K^{\text{fd}}(\Gamma)$ , by (24.2.3.2) we may take a  $\Gamma$ -stable  $\mathcal{O}_K$ -lattice  $\Lambda \subset V$ , and define the **residual representation**  $\bar{\rho}$  to be  $\Gamma \rightarrow \text{GL}(\Lambda/(\varpi_K))$ . Then the semisimplification of  $\bar{\rho}$  is independent of  $\Gamma$  chosen. ?

┘

**Prop. (24.2.3.4).** Situation as in (24.2.3.3),  $\bar{\rho}$  is irreducible iff the only  $\Gamma$ -stable  $\mathcal{O}_L$ -lattices in  $V$  are of the form  $\varpi_K^n \Lambda$  for some  $n \in \mathbb{Z}$ .

┘

**Def. (24.2.3.5) [Residually Disjoint Representations].** Let  $C \in \mathcal{CRing}$  and  $(B, \mathfrak{m}_B, \kappa_B) \subset C$  be a local Henselian ring. For  $G \in \text{Grp}$ , suppose there exist two representations  $(V_1, \rho_1), (V_2, \rho_2) \in \text{Rep}_C^{\text{fd}}(G)$  (24.1.1.1) s.t.

$$\det(1 - gT|V_i) \in B[T]$$

for any  $g \in G$  and  $i \in \{1, 2\}$ . Then they are called **residually disjoint representations** if there exists  $x \in B[G]$  s.t.  $\det(1 - xT|V_1)$  and  $\det(1 - xT|V_2)$  are relatively prime in  $\kappa_B$ .  $\lrcorner$

**Prop. (24.2.3.6).** Situation as in (24.2.3.5), if  $(V_1, \rho_1), (V_2, \rho_2) \in \text{Rep}_C^{\text{fd}}(G)$  are residually disjoint, then there exists  $x_1, x_2 \in B[G]$  s.t.

$$x_i|_{V_j} = \begin{cases} \text{id}_{V_j} & i = j \\ 0 & , i \neq j \end{cases}.$$

 $\lrcorner$ 

*Proof:* This follows from (19.1.2.25).  $\square$

### cde-Triangle

**Prop. (24.2.3.7) [ $p'$ -Groups].** If  $(p, \#G) = 1$ , then

- Each  $\kappa[G]$ -module is projective, and each  $\mathcal{O}_K$ -free  $\mathcal{O}_K[G]$ -module is projective.
- Reduction modulo  $\mathfrak{m}_K$  defines a bijection  $S_K \cong S_\kappa$ .
- After identifying  $S_K$  with  $S_\kappa$ , the matrices  $C, D, E$  are identity matrices.

 $\lrcorner$ 

*Proof:* Cf. [Ser77]P128.  $\color{red}?$   $\square$

**Prop. (24.2.3.8).** Let  $K \subset_{\text{fin}} K' \in \text{Field}$  and  $\theta \in R_{K'}(G)$  s.t.

- $\theta \in \overline{R}_K(G)$ .
- There exists  $n \in \mathbb{Z}_+$  s.t.  $n\theta$  is realized on a projective  $\mathcal{O}_{K'}[G]$ -module.

Then  $x$  can be realized on a unique projective  $\mathcal{O}_K[G]$ -module.  $\lrcorner$

*Proof:* Cf. [Ser77]P134.  $\color{red}?$   $\square$

### Artin and Swan Characters

**Def. (24.2.3.9) [Artin Characters].** and  $L/K$  be an unramified representation with Galois group  $G$ , define a function on  $G$ :

$$a_G(s) = \begin{cases} v(s(\varpi) - \varpi) & , s \neq 1 \\ \sum_{t \neq 1} v(t(\varpi) - \varpi) & , s = 1 \end{cases}.$$

Then  $a_G(s)$  is the character of a representation of  $G$ , and  $a_G$  is called the **Artin character**.

Also define  $\text{Sw}_G = a_G - r_G + 1$ , where  $r_G$  is the regular character, then  $\text{Sw}_G$  is also a character, called the **Swan character**.  $\lrcorner$

*Proof:* Cf. [Ser77]P159.  $\color{red}?$   $\square$

**Prop. (24.2.3.10).** Situation as in (24.2.3.9), then

$$\begin{aligned} \#G \cdot a_G &= \sum_{i=0}^{\infty} \#G_i \cdot \text{Ind}_{G_i}^G(r_{G_i} - 1), \\ \#G \cdot \text{Sw}_G &= \sum_{i=1}^{\infty} \#G_i \cdot \text{Ind}_{G_i}^G(r_{G_i} - 1). \end{aligned}$$

In particular,  $\text{Sw}_G = 0$  iff  $G_1 = 1$ , i.e. iff  $F/E$  is tamely unramified.  $\lrcorner$

*Proof:*

□

**Prop. (24.2.3.11) [Realization of Artin and Swan Characters].** Let  $\ell \in \text{Prime} \setminus \{p\}$ , then

- the Artin character and Swan character can be realized on  $\mathbb{Q}_\ell$ .
- the Swan character can be realized on a projective module over  $\mathbb{Z}_\ell[G]$ , denoted by  $\text{Sw}_G$ .

┘

*Proof:* Because  $a_G = \text{sw}_G + (r_G - 1)$ , it suffices to prove item 2. For this, we use (24.2.3.8). It suffices to show that

$$\#G \cdot \text{Sw}_G = \sum_{i=1}^{\infty} \#G_i \cdot \text{Ind}_{G_i}^G (r_{G_i} - 1)$$

is realizable on a projective  $\mathcal{O}_{K'}[G]$ -module. Because  $(\#G_i, \ell) = 1$ , every  $\mathcal{O}_{K'}[G]$ -module is projective by (24.2.3.7), and thus the induction and also  $\#G \cdot \text{sw}_G$  is projective. □

**Def. (24.2.3.12) [Wild Ramification Index  $b(M)$ ].** Let  $\ell \in \text{Prime} \setminus \{p\}$  and  $M \in \text{Mod}_{\mathbb{F}_\ell}[G]$ , define the **Wild ramification index**

$$b(M) = \left\langle \overline{\text{Sw}_G}, M \right\rangle_{\mathbb{F}_\ell} = \dim \text{Hom}_G(\overline{\text{Sw}_G}, M) = \dim \text{Hom}_{\mathbb{Z}_\ell[G]}(\overline{\text{Sw}_G}, M) \quad (24.2.3.11).$$

Then

- $b$  is additive on  $\text{Mod}_{\mathbb{F}_\ell}[G]$ , because  $\text{Sw}_G$  is projective.
- By (24.2.3.10),

$$b(M) = \sum_{i=1}^{\infty} \frac{\#G_i}{\#G} \dim_{\mathbb{F}_\ell} M/M^{G_i}.$$

- $b(M)$  iff  $G_1$  acts trivially on  $M$ .

┘

## 4 Equal Characteristic

**Notation (24.2.4.1).** Let  $p \in \text{Prime}$  and  $k \in \text{Field}^p$ .

┘

**Prop. (24.2.4.2).** If  $G$  is a  $p$ -group, then  $\text{Irr}_k(G) = \{1\}$ .

┘

*Proof:* For any  $v \in V$ , consider the additive subgroup generated by  $g(s)v$ , then it is a finite group of prime power order. Then (3.1.6.4) shows it has a element other than 0 fixed by all  $G$ , thus it is not irreducible unless trivial representation. □

## 24.3 Representations of Finite Groups of Lie Type

References are [Bon11], [Introduction to Deligne-Lustig Theory, David Schwein], [Representations of finite groups of Lie type, Dign/Michel, 1991].

**Notation (24.3.0.1).**

- Let  $p \in \text{Prime}$ ,  $q \in p^{\mathbb{Z}^+}$ ,  $k \in \text{Field}$ ,  $\#k = q$ ,  $G \in \text{AlgGrp}/k$ .
- Let  $(K, \mathcal{O}_K, \kappa) \in \ell\text{-LField}$ .
- Let  $\ell \in \text{Prime} \setminus p$ .
- Use notations on étale cohomologies defined in [Étale Cohomology Theory](#).

┘

### 1 Finite Groups of Lie Type

**Def. (24.3.1.1) [Finite Groups of Lie Type].** For a reductive group  $G/\bar{k}$  and a Steinberg endomorphism  $F$  of  $G$ , the fixed points  $G(\bar{k})^F$  is called a **finite group of Lie type**.

If  $G$  is defined over some finite subfield  $k$ , i.e.  $G = G_0 \times_k \bar{k}$ , and  $F = \text{Fr}_{G_0}$ , then  $G^F = G_0(k)$  is called a **Chevalley group**. If moreover  $G_0 \in \text{AlgGrp}/k$  is reductive and simply-connected, then  $G_0(k)$  is called a **universal finite group** (of Lie type).

If  $G$  is a finite group of Lie type that is not a Chevalley group, then it is called a **twist group** (of Lie type).

┘

**Prop. (24.3.1.2).** If  $p \in \text{Prime}$  and  $q \in p^{\mathbb{Z}^+}$ ,

- $\# \text{GL}(2; q) = q(q-1)^2(q+1)$ .
- $\# \text{SL}(2; q) = \# \text{PGL}(2; q) = q(q^2-1)$ .
- $\# \text{PSL}(2; q) = \begin{cases} q(q^2-1) & , 2|q \\ \frac{1}{2}q(q^2-1) & , 2 \nmid q \end{cases}$ .

┘

**Thm. (24.3.1.3) [Steinberg].** If  $G \in \text{RedGrp}/\bar{k}$  is simple, and  $F \in \text{End}(G)$  s.t. the fixed point of  $F(\bar{k})$  is finite, then there are exactly the following possibilities:

- (Chevalley Groups)  $F$  is a standard Frobenius:  $A_n, B_n, C_n, D_n, G_2, F_4, E_6, E_7, E_8$ .
- (Steinberg Groups)  ${}^2A_n, {}^2D_n, {}^3D_4, {}^2_6$ .
- (Suzuki Groups)  ${}^2B_2, p = 2$ .
- (Ree Groups)  ${}^2G_2, p = 3$ .
- (Ree Groups)  ${}^2F_4, p = 2$ .

┘

*Proof:*

□

### Examples

**Prop. (24.3.1.4) [SL(n)].**

- $\text{PSL}(2, \mathbb{F}_2) \cong \text{Sym}(3)$ ,
- $\text{PSL}(2, \mathbb{F}_3) \cong \text{Alt}(4)$ ,

- (Jordan1861) For  $k \in \mathbf{Field}$ ,  $\mathrm{PSL}(n, k)$  is a simple group except for  $n = 2$  and  $k \cong \mathbb{F}_2$  or  $\mathbb{F}_3$ .
- $\mathrm{PSL}(2, \mathbb{F}_4) \cong \mathrm{PSL}(2, \mathbb{F}_5) \cong \mathrm{Alt}(5)$ .
- $\mathrm{SU}(n)_{\mathbb{F}_q}$  is a twist of  $\mathrm{SL}(n)_{\mathbb{F}_q}$ , denoted by  ${}^2A_{n-1}(\mathbb{F}_{q^2})$ .

┘

*Proof:* Cf.[DSV03]P74.

□

**Prop.(24.3.1.5).**

┘

## 2 Conjugacy Classes

## 3 Deligne-Lustig Varieties

**Def.(24.3.3.1)**[Deligne-Lustig Varieties].

┘

### Affineness of Deligne-Lustig Varieties

## 4 Deligne-Lustig Theory

Main references are [Finite Groups of Lie Type, Carter], [P. Deligne and G. Lusztig, Representations of reductive groups over finite fields, Ann. of Math. (2) 103 (1976), no.1, 103–161.], [D-L76], [https://www.dpmms.cam.ac.uk/~dbms2/deligne\\_lusztig/](https://www.dpmms.cam.ac.uk/~dbms2/deligne_lusztig/).

Deligne and Lusztig used the  $\ell$ -adic étale cohomology theory to construct all cuspidal representations of  $G(\mathbb{F}_q)$ .

**Remark(24.3.4.1).** Because  $G(\mathbb{F}_q)$  is finite and  $\mathbb{C} \cong \overline{\mathbb{Q}_\ell}$ , we can consider representations  $\mathrm{Rep}(G(\mathbb{F}_q)) = \{\theta : G(\mathbb{F}_q) \rightarrow \mathrm{GL}(\overline{\mathbb{Q}_\ell})\}$ .

┘

**Def.(24.3.4.2)**[Induction Pairs]. A **induction pair** for  $G(\mathbb{F}_q)$  is a pair  $(T, \theta)$ , where  $T \subset G$  is a maximal torus and  $\theta$  is an  $\ell$ -adic character  $T(\mathbb{F}_q) \rightarrow \overline{\mathbb{Q}_\ell}^\times$ .

┘

### Deligne-Lustig Inductions

**Def.(24.3.4.3)**[Deligne-Lustig Inductions]. Let  $(T, \theta)$  be an induction pair(24.3.4.2), the action of  $G(\mathbb{F}_q)$  and  $T(\mathbb{F}_q)$  on  $\tilde{X}_S$  commutes, so for any  $\theta \in \mathrm{Irr}(T(\mathbb{F}_q))$ , the  $\theta$ -isotypic part of  $H_{\mathrm{ét},c}^i(\tilde{X}_T, \overline{\mathbb{Q}_\ell})$  is  $G(\mathbb{F}_q)$ -invariant, thus we can define a **Deligne-Lustig Induction map** that on  $\mathrm{Irr}(G(\mathbb{F}_q))$  is defined by

$$R_T^G : \mathrm{Irr}(T(\mathbb{F}_q)) \rightarrow K_0(\mathrm{Rep}(G(\mathbb{F}_q))) : \theta \mapsto \sum_i (-1)^i H_{\mathrm{ét},c}^i(X_T, \overline{\mathbb{Q}_\ell})^\theta.$$

┘

**Prop.(24.3.4.4).** Let  $(T, \theta)$  be an induction pair, if  $\theta^w \neq \theta$  for any  $w \in W$ , then  $R_T^G(\theta) \in \mathrm{Irr}(G(\mathbb{F}_q))$ .

┘

*Proof:*

□

**Prop.(24.3.4.5).** If  $(T, \theta), (T', \theta')$  are two induction pairs that are not  $G(\mathbb{F}_q)$ -conjugate, then  $(R_T^G(\theta), R_{T'}^G(\theta')) = 0$ .

┘

*Proof:*

□

**Def. (24.3.4.6) [Geometrically Conjugate Pairs].** If  $(T, \theta), (T', \theta')$  are two induction pairs, they are called **geometrically conjugate** if  $(T_{k'}, \theta \circ \text{Nm}_{k'/k}), (T'_{k'}, \theta' \circ \text{Nm}_{k'/k})$  are  $G(k')$ -conjugate for some finite extension  $k'/\mathbb{F}_q$ .  $\lrcorner$

**Prop. (24.3.4.7).** If  $(T, \theta), (T', \theta')$  are two induction pairs that are not geometrically conjugate, then  $R_T^G(\theta), R_{T'}^G(\theta')$  are disjoint.  $\lrcorner$

*Proof:* Cf. [D-L76] Cor6.3.  $\square$

**Def. (24.3.4.8) [Dual Groups].**  $\lrcorner$

**Prop. (24.3.4.9).** The geometric conjugacy classes of induction pairs of  $G$  corresponds to the geometric conjugacy classes of semisimple elements of  $G^*$  (24.3.4.8).  $\lrcorner$

*Proof:*  $\square$

**Def. (24.3.4.10) [Lustig Series].** Let  $S$  be a semisimple conjugacy class of  $G^*$ , the **Lustig series**  $\mathcal{E}(G, S)$  is the set of irreducible representations of  $G$  occurring in  $R_T^G(\theta)$  for any  $(T, \theta)$  in the geometric conjugacy class corresponding to  $S$  via (24.3.4.9). By (24.3.4.7),

$$\text{Irr}(G(\mathbb{F}_q)) = \coprod_{S \in G_{\text{s.st-conj}}^*} \mathcal{E}(G, S).$$

$\mathcal{E}(G, (1))$  is called the set of **unipotent representations**, which are all the irreducible representations appearing in  $R_T^G(1)$  for various  $T$ .  $\lrcorner$

## 5 Howlett-Lehler Theory

This theory decomposes Deligne-Lustig inductions into irreducible components.

## 6 Character Sheaves(Lustig)

References are [Introduction to character sheaves, Lustig], [Algebraic And Geometric Methods In Representation Theory, Lustig, 2014].

**Remark (24.3.6.1).** Let  $(S, \theta)$  be an induction pair (24.3.4.2), there is in fact an isomorphism

$$H_{\text{ét},c}^i(\tilde{X}_S, \overline{\mathbb{Q}}_\ell) \cong H_{\text{ét},c}^i(X_S, \mathcal{F}_\theta) \in \text{Rep}(G(\mathbb{F}_q))$$

where  $\mathcal{F}_\theta$  is the  $\ell$ -adic local system on  $X_S$  corresponding to the  $S(\mathbb{F}_q)$ -torsor and  $\theta$ . Thus much of the Deligne-Lustig theory can be interpreted in the language of sheaves, called **character sheaves**.  $\lrcorner$

## 9 Deligne-Lustig Varieties

**Prop. (24.3.9.1).** Let  $\lrcorner$

**10**  $GL(n)$ 

**Notation (24.3.10.1).** The notation is the same as in (24.11.0.1).  $\lrcorner$

**Principal Series Representations**

**Prop. (24.3.10.2).** Let  $(\pi, V) \in \text{Rep}^{\text{fd}}(GL(2, k))$ , then

- if the representation  $(\pi_1, V)$  is defined by  $\pi_1(g) = \pi(g^{-t})$ , then  $\pi_1 \cong \widehat{\pi}$ .
- if  $n = 2$  and  $(\pi, V)$  is irreducible, let  $\omega$  be the central character of  $\pi$ . If  $(\pi_2, V)$  is defined by  $\pi_2(g) = \omega(\deg g)^{-1} \pi(g)$ , then  $\pi_2 \cong \widehat{\pi}$ .

 $\lrcorner$ 

*Proof:* The proof of (24.11.1.10) applies to this case, noticing a finite group is profinite hence locally profinite.  $\square$

**Lemma (24.3.10.3).** Let  $\chi_1, \chi_2, \mu_1, \mu_2$  be characters of  $F^*$ , consider the principal representations  $\mathcal{B}(\chi_1, \chi_2), \mathcal{B}(\mu_1, \mu_2)$  of  $GL(2, k)$  defined in (24.11.5.1), then

$$\dim \text{Hom}_{GL(2; k)}(\mathcal{B}(\chi_1, \chi_2), \mathcal{B}(\mu_1, \mu_2)) = \delta_{\chi_1, \mu_1} \delta_{\chi_2, \mu_2} + \delta_{\chi_1, \mu_2} \delta_{\chi_2, \mu_1}.$$

 $\lrcorner$ 

*Proof:* Let  $\chi, \mu$  be characters of  $B(k)$  defined as in (24.11.5.1), then by ??, the dimension is just the dimension of space of functions  $\Delta : GL(2, k) \rightarrow \mathbb{C}$  that

$$\Delta(b_2 g b_1) = \mu(b_1) \Delta(g) \chi(b_1), \quad b_1, b_2 \in B(k).$$

Then by the Bruhat decomposition (10.4.4.28),  $\Delta$  is determined by its values on 1 and  $w_0$ . Notice that if  $\chi_1 \neq \mu_1$  or  $\chi_2 \neq \mu_2$ , we can use this condition to show  $\Delta(1) = 0$ , and if  $\chi_1 \neq \mu_2$  or  $\chi_2 \neq \mu_1$ , we can use this condition to show  $\Delta(w_0) = 0$ , and also the construction of  $\Delta$  is clear in other cases.  $\square$

**Prop. (24.3.10.4) [Principal-Series].** Let  $\chi_1, \chi_2, \mu_1, \mu_2$  be characters of  $F^*$ , then  $\mathcal{B}(\chi_1, \chi_2)$  is an irreducible representation of degree  $q = |F| + 1$  unless  $\chi_1 = \chi_2$ , in which case it is the direct sum of two irreducible representations having degree 1 and  $q$ . And  $\mathcal{B}(\chi_1, \chi_2) \cong \mathcal{B}(\mu_1, \mu_2)$  iff  $\{\chi_1, \chi_2\} = \{\mu_1, \mu_2\}$ .  $\lrcorner$

*Proof:* Use (24.3.10.3), then

$$\dim \text{End}_{GL(2, k)}(\mathcal{B}(\chi_1, \chi_2)) = 1 + \delta_{\chi_1, \chi_2}.$$

Now by Peter-Weyl, if a representation  $V$  is isomorphic to  $\sum d_i \pi_i$ , where  $\pi_i$  are irreducible, then  $\dim_G(V) = \sum d_i^2$  (24.7.3.6). Then we now  $\mathcal{B}(\chi_1, \chi_2)$  decomposes into two representations if  $\chi_1 = \chi_2$  and is irreducible if  $\chi_1 \neq \chi_2$ .

In case  $\chi_1 = \chi_2$ , there is an invariant subspace of dimension 1, generated by the function  $f(g) = \chi(\deg g)$ . so the rest representation is of dimension  $q$ , because  $\# GL(2, k)/B(k) = q + 1$ .  $\square$

**Steinberg-Representations**

References are [Period domains over finite and p-adic fields, Dat-Orlik-Rapoport]Chap7.

**Def. (24.3.10.5) [Steinberg-Representation].** We call the  $q$ -dimensional subrepresentation of  $\mathcal{B}(1, 1)$  the **Steinberg-representation(of finite groups)**. It is verified that the  $q$  dimensional subrepresentation of  $\mathcal{B}(\chi, \chi)$  is the twist of the Steinberg representation.  $\lrcorner$

### Weil-Representations

**Prop. (24.3.10.6) [Weil-Representation for  $SL(2; k)$ ].** In situation (26.8.4.8), let  $W = L^2(E)$ , define the modified Fourier transform w.r.t.  $\psi$  as in (12.11.1.34):

$$\widehat{\Phi}(x) = q^{-1} \sum_{y \in E} \Phi(y) \psi(\text{tr}(\bar{x}y)).$$

Then there is a **Weil-representation**  $\omega : SL(2, k) \rightarrow \text{End}(W)$  :

$$(\omega(t(a))\Phi)(x) = \Phi(ax), \quad \omega(n(z))\Phi(x) = \psi(zN(x))\Phi(x), \quad (\omega(w_1)\Phi)(x) = \varepsilon \widehat{\Phi}(x).$$

where we are using the presentation as in 5, and  $\varepsilon = 1$  if  $E/F$  is split, and  $-1$  if it is anisotropic.  $\lrcorner$

**Remark (24.3.10.7).** When  $F$  has characteristic  $\neq 2$ , this is just the Weil representation in (26.8.4.7).  $\lrcorner$

*Proof:* This follows from direct verification, Cf. [Bump, P407].  $\square$

**Prop. (24.3.10.8) [Dihedral Weil Representations for  $GL(2, k)$ ].** Situation as in (26.8.4.8), Define

$$W(\chi) = \{\Phi \in W \mid \Phi(yx) = \chi(y)^{-1} \Phi(x), y \in E_1^*\},$$

then by considering the order of  $E_1^*$ ,  $\dim W(\chi) = q + \varepsilon$ . Also it is verified that  $W(\chi)$  is stable under the Weil representation of  $SL(2, k)$  (24.3.10.6).

Now we want to extend this representation to  $GL(2, k)$  by defining

$$(\omega\left(\begin{bmatrix} a & \\ & 1 \end{bmatrix}\right)\Phi)(x) = \chi(b)\Phi(bx)$$

where  $b$  is arbitrary that  $N(b) = a$ .  $\lrcorner$

**Remark (24.3.10.9).** This is related to (26.8.4.10) and Howe-duality.  $\lrcorner$

*Proof:* It must be shown that this is truly a representation of  $GL(2, k)$ , it suffices to show that

$$\omega\left(\begin{bmatrix} a & \\ & 1 \end{bmatrix}\right)\omega(g)\omega\left(\begin{bmatrix} a^{-1} & \\ & 1 \end{bmatrix}\right) = \omega\left(\begin{bmatrix} a & \\ & 1 \end{bmatrix}\right)g\left(\begin{bmatrix} a^{-1} & \\ & 1 \end{bmatrix}\right),$$

where  $g$  is a generator of  $SL(2; k)$ . This is clear for  $g = t(a)$ , and also clear for  $g = n(z)$ . For  $g = w_1$ , it suffices to check

$$\omega\left(\begin{bmatrix} a & \\ & 1 \end{bmatrix}\right) \circ \wedge \circ \omega\left(\begin{bmatrix} a^{-1} & \\ & 1 \end{bmatrix}\right)\Phi(x) = \widehat{\Phi}(ax)$$

which is subtle but also clear.  $\square$

**Prop. (24.3.10.10) [Split Weil-Representations].** In the split case, the character  $\chi$  of  $E^*$  is of the form  $\chi((x, y)) = \chi_1(x)\chi_2(y)$ , and then condition in (26.8.4.8) just says  $\chi_1 \neq \chi_2$ . Then:

$$(\pi(\chi), W(\chi)) \cong \mathcal{B}(\chi_2, \chi_1)$$

$\lrcorner$

*Proof:* The intertwining operator is given by

$$L : W(\chi) \rightarrow \mathcal{B}(\chi_2, \chi_1) : (L\Phi)(g) = (\omega(g)\Phi)((1, 0)).$$

Firstly  $L\Phi \in \mathcal{B}(\chi_2, \chi_1)$  by direct verification for  $t(a), T_1(k)$  and  $n(z)$ . Then it is an intertwining operator is clear.

Then this is an isomorphism because both are of dimension  $q + 1$  (24.3.10.8) and  $\mathcal{B}(\chi_2, \chi_1)$  is irreducible (24.3.10.4).  $\square$

**Def. (24.3.10.11) [Cuspidal Representation].**  $(\pi, V) \in \text{Rep}^{\text{fd}}(GL(2, k))$  is called a **cuspidal representation** if the Jacquet module  $J(V) = 0$ . Notice in this finite case, this is equivalent to  $V$  has no  $N(k)$ -fixed vector, because the contragradient is well-known as  $\text{Rep}(G)$  is semisimple, and the trivial isotropic parts correspond, unlike the  $p$ -adic case.  $\lrcorner$

**Lemma (24.3.10.12).** If  $(\pi, V)$  is a cuspidal representation of  $GL(2, k)$ , then the dimension of  $V$  is a multiple of  $q - 1$ .  $\lrcorner$

*Proof:* Because  $N(k) \cong F$ , any character of  $N(k)$  is of the form  $\psi_a(n(x)) = \psi(ax)$ . Now decompose the contragradient representation  $V^*$  of  $G$  into isotypic parts of  $N(k):V^* = \bigoplus_{a \in F} V^*(a)$ , then the hypothesis implies  $V^*(0) = 0$ .

Notice that the group  $T_1(k)$  acts transitively on the spaces  $V^*(a), a \neq 0$  by  $\widehat{\pi}\left(\begin{bmatrix} t & \\ & 1 \end{bmatrix}\right)l$ , because

$$\begin{bmatrix} t & \\ & 1 \end{bmatrix} \begin{bmatrix} 1 & x/t \\ & 1 \end{bmatrix} = \begin{bmatrix} 1 & x \\ & 1 \end{bmatrix} \begin{bmatrix} t & \\ & 1 \end{bmatrix}.$$

So the dimension of  $V$  is a multiple of  $q - 1$ .  $\square$

**Prop. (24.3.10.13) [Anisotropic Representation].** In the anisotropic case, the Weil representation  $(\pi(\chi), W(\chi))$  is cuspidal and irreducible.  $\lrcorner$

*Proof:* Suppose it is not cuspidal, then it contains a non-zero  $N(k)$ -fixed vector  $\Phi_0$  (24.3.10.11), which means  $\Phi_0(x) = w(n(z)\Phi_0)(x) = \psi(zN(x))\Phi_0(x)$ . Now  $\Phi_0(0) = 0$  because  $\chi$  is nontrivial on  $E_1^*$ , and if  $x \neq 0$ , then there is a  $z$  that  $\psi(zN(x)) \neq 1$  because  $\psi$  is non-trivial, so  $\Phi_0(x) = 0$  also, so  $\Phi_0 = 0$ , contradiction.

Finally, subrepresentation of cuspidal representation is cuspidal by (24.3.10.11), then  $(\pi(\chi), W(\chi))$  is irreducible, by the fact it is of dimension  $q - 1$  (24.3.10.8) and lemma (24.3.10.12).  $\square$

**Prop. (24.3.10.14) [Classification of Representations of  $GL(2, k)$ ].** There is a list of all irreducible representations of  $GL(2, k)$ :

- $q - 1$  1-dimensional representations  $\chi(\deg g)$ , where  $\chi$  is a character of  $k^\times$ .
- $\frac{(q-1)(q-2)}{2}$  principal series representations of dimension  $q + 1$ .
- $q - 1$  Steinberg representations (with twists) of dimension  $q$ .
- $\frac{q(q-1)}{2}$  cuspidal Weil representations of dimension  $q - 1$ .

$\lrcorner$

*Proof:* All these are irreducible representations by (24.3.10.4) (24.3.10.5) and (24.3.10.13). It suffices to show they are not isomorphic. Notice different kind of representation have different dimensions, thus it suffices to compare the same representations.

For principal series representations  $\mathcal{B}(\chi_1, \chi_2)$ ,  $\chi_1 \neq \chi_2$ , their isomorphisms are known by (24.3.10.4). For Steinberg representations, twisting are clearly different. For cuspidal Weil representations, there are  $q^q - q$  way of choosing  $\chi$  (26.8.4.8) and ? Cf. [Local Langlands For  $GL(2)$ ].

Finally, they are all the irreducible representations by the fact  $\sum d_\sigma^2 = |G| = (q-1)^2 q(q+1)$  (24.1.3.4).  $\square$

### Whittaker Models

**Def. (24.3.10.15) [Whittaker Functionals & Whittaker Models].** Let  $(\pi, V)$  be an irreducible representation of  $GL(2, k)$ , then the notion of **Whittaker functional** and **Whittaker model** is defined as in (24.9.5.2).  $\lrcorner$

**Prop. (24.3.10.16) [Existence and Uniqueness of Whittaker Models].** Let  $\mathcal{G}$  be the representation of  $GL(2, k)$  induced from the character  $\psi_N(n(z)) = \psi(z)$  on  $N(k)$ , then it is multiplicity-free, and every irreducible representation of dimension  $> 1$  occurs in it. Notice that this is just the existence and uniqueness of Whittaker models.  $\lrcorner$

*Proof:* To show multiplicity free, it suffices to show  $\text{End}_{GL(2, k)}(\mathcal{G})$  is commutative, by Shur's lemma (24.7.1.8). Then we use ??, which says this ring is isomorphic to the ring of functions  $\Delta$  on  $G$  that

$$\Delta(n_2 g n_1) = \psi_N(n_2) \Delta(g) \psi_N(n_1).$$

where the multiplication is convolution ??.

Notice it follows from the Bruhat Decomposition (10.4.4.28) that the double coset  $N(k) \backslash GL(2, k) / N(k)$  is uniquely represented by matrices with exactly two non-zero entries. Then it is clear a diagonal coset can support a function  $\Delta$  iff it is a scalar multiple of  $I$ . In other words, the representatives are

$$\begin{bmatrix} a & \\ & a \end{bmatrix}, \quad \begin{bmatrix} & b \\ c & \end{bmatrix}.$$

Consider the involution of  $G$  given by

$$\iota(g) = w_1 g^t w_1^{-1},$$

then it is an anti-involution of  $G$  and it induces isomorphism on  $N(k)$ , so it induces an anti-involution of order two on the ring of functions  $\Delta$  by  $\iota(\Delta)(g) = \Delta(\iota(g))$ . Notice this is an anti-involution because of (12.10.2.5) and the fact a finite group is unimodular. But this anti-involution fixes the representatives as above, so it is in fact identity on these  $\Delta$ , which proves the convolution is commutative.

For the last assertion, just notice the dimension of  $\mathcal{G}$  is  $(q-1)(q^2-1)$ , and the sum dimensions of irreducible representations of dimension  $> 1$  is just  $(q-1)(q^2-1)$  by (24.3.10.14).  $\square$

**Cor. (24.3.10.17).** Frobenius reciprocity (24.7.4.5) implies that the space of Whittaker functionals is of dimension 1 for any irreducible representation of dimension  $> 1$ .  $\lrcorner$

## 11 $SL(n)$

**Def. (24.3.11.1) [Drinfeld Curves].** The **Drinfeld curve** is defined to be the affine plane curve  $\text{Dri} / \mathbb{A}_q^2$

$$\text{Dri} : x^q y - x y^q = 1$$

with completion  $\overline{\text{Dri}} = \text{Dri} \cup \{\infty\} \subset \mathbb{P}_q^2$ .  $\lrcorner$

**Prop. (24.3.11.2).** There is a natural  $\mu_{q+1} \times SL(2, \mathbb{F}_q)$ -action on  $\text{Dri}$ , which induces a map on  $H_{\text{ét},c}^*(\text{Dri}, \mathbb{Q}_\ell)$ . Then we get the Deligne-Lustig induction

$$R_{T'}^G : \mu_{q+1}^* \rightarrow K_0(\text{Rep}^{\text{fd}}(SL(2; \mathbb{F}_q))).$$

┘

*Proof:*

## 24.4 Representations of Semisimple Lie Algebras

References are [?Eti21] and [Car05].

In this section representations of split semisimple Lie algebras are studied.

**Notation (24.4.0.1).**

- Let  $k \in \text{Field}$ .
- Let  $(\mathfrak{g}, \mathfrak{h}, \Phi, \Lambda, \mathfrak{n}^+, \mathfrak{n}^-)$  be a split semisimple Lie algebra over  $k$ .
- Use notations for split semisimple Lie algebras defined in [Notations for Split Semisimple Lie Algebras](#).

⌋

### 1 Semisimple Representations

**Lemma (24.4.1.1).** Every 1-dimensional representation of  $\mathfrak{g}$  is trivial. ⌋

*Proof:* Such a representation vanishes at  $[\mathfrak{g}, \mathfrak{g}]$ , which equals  $\mathfrak{g}$  by (3.7.2.4). □

**Prop. (24.4.1.2) [Semisimple Lie Algebras and Representations, Weyl].** For an arbitrary  $L \in \text{LieAlg}_k$ ,

- If the adjoint representation  $L \rightarrow \mathfrak{gl}_{\mathfrak{g}}$  is semisimple, then  $L$  is semisimple.
- If  $L$  is semisimple and  $k$  has characteristic 0, then  $\text{Rep}(L)$  is semisimple.

⌋

*Proof:* If the adjoint representation of  $L$  is semisimple, then every ideal of  $L$  has a complement, thus if  $\mathfrak{g}$  is not semisimple, it has a dimension 1 quotient. But notice the Lie algebra  $k$  of dimension

1 has non-semisimple representations, for example  $c \mapsto \begin{bmatrix} 0 & 0 \\ c & 0 \end{bmatrix}$ , contradiction.

Semisimplicity of a Lie algebra is invariant under base change, also does simplicity of the category of representations (24.4.1.4), so we can assume that  $k$  is alg.closed. Now we need to show that any proper submodule  $W$  of a  $L$ -module  $V$  has a complement.

Assume first that  $\dim V/W = 1$  and  $W$  is a simple  $L$ -module. This implies  $L$  acts trivially on  $V/W$  by (24.4.1.1). Let  $c_V$  be the Casimir element of  $V$  (3.7.9.11), then  $c_V$  is also trivial on  $V/W$ . And  $c_V$  acts as a nonzero scalar on  $W$  as  $W$  is simple, by (3.7.9.11). Then the kernel of  $c_V$  is of dimension 1, and is a  $\mathfrak{g}$ -complement of  $W$  in  $V$ .

Next if  $\dim V/W = 1$  but  $W$  is not simple  $\mathfrak{g}$ -module, then there is a submodule  $W' \subset W$ . By induction, the  $L$ -submodule  $W/W'$  has a complement  $V'/W'$  in  $V/W'$ . Then  $V'/W'$  has dimension 1, thus by induction,  $V' = W' \oplus L$  for some 1-dimensional  $\mathfrak{g}$ -module. Then  $L$  is complementary to  $W$  in  $V$ .

Finally for the general case, let  $L$  acts on  $\text{Hom}_k(V, W)$ , consider the subspaces  $V_1, W_1$  of  $\text{Hom}_k(V, W)$ , where  $V_1$  is the subspace of maps that restriction to  $W$  is a constant multiple of identity, and  $W_1$  is the subspaces of  $W$  consisting of maps vanishing on  $W$ . They are both  $L$ -modules and  $\dim V_1/W_1 = 1$ . Then the above case shows  $V_1 = W_1 \oplus L$  for some 1-dimensional  $L$ -module  $L$ . Because  $L$  acts trivially on  $L$  (24.4.1.1), this means  $L = \mathbb{F}f$  consists of  $L$ -homomorphisms. But  $f|_W$  is non-zero constant, so the kernel of  $f$  is a complement of  $W$  in  $V$ . □

**Cor. (24.4.1.3).** Let  $(V, \rho) \in \text{Rep}(\mathfrak{g})$  and  $f : \mathfrak{g} \rightarrow V$  a linear map that

$$f([x, y]) = \rho(x)f(y) - \rho(y)f(x),$$

then there exists a  $v_0 \in V$  that  $f(x) = \rho(x)v_0$ .  $\lrcorner$

*Proof:* The condition on  $f$  is equivalent to  $(f, \rho) : \mathfrak{g} \rightarrow \mathfrak{af}(V)$  (3.7.1.11) is a homomorphism of Lie algebras. And this induces a representation  $\rho'$  of  $\mathfrak{g}$  on  $V' = V \oplus k$  that  $\rho'(x)(V') \subset V$  for all  $x \in \mathfrak{g}$ . Because  $\mathfrak{g}$  is semisimple, there is a line  $L \subset V'$  that  $V' = V \oplus L$  and  $\mathfrak{g}$  acts trivially on  $L$  (24.4.1.1).

In other words, there is a vector  $(-v_0, 1)$  that  $\rho'(x)(-v_0, 1) = 0$  for all  $x \in \mathfrak{g}$ . So  $f(x) = \rho(x)(v_0)$  for all  $x$ . So we are done.  $\square$

**Prop. (24.4.1.4) [Semisimplicity and Extension].** For an arbitrary  $L \in \text{LieAlg}_k$ , if  $\text{Rep}(L_K)$  is semisimple for some extension field  $K/k$ , then also is  $\text{Rep}(L)$ .  $\lrcorner$

*Proof:* This is because for any  $(V, \rho) \in \text{Rep}_k(L)$ ,  $K \otimes_k \text{End}(\rho) \cong \text{End}(\rho_K)$ , because this is true for  $\text{End}(V)$ , and being  $L$ -equivariant is a linear condition. Then we can use (3.6.2.25) and (3.6.2.26).  $\square$

**Prop. (24.4.1.5) [Semisimple Representations].** For any arbitrary  $L \in \text{Lie}_k$ , then the following conditions on a representation  $L \rightarrow \mathfrak{gl}_V$  are equivalent:

- $\rho$  is semisimple.
- $\rho(L)$  is reductive and its center consists of semisimple endomorphisms.
- $\rho(\mathfrak{r})$  consists of semisimple endomorphisms.
- The restriction of  $\rho$  to  $\mathfrak{r}$  is semisimple.

$\lrcorner$

*Proof:* 1  $\rightarrow$  2: If  $\rho$  is semisimple, then  $\rho(L)$  is reductive by (3.7.4.4). Its center consists of semisimple endomorphisms by [Mil13]P60<sup>?</sup>.

2  $\rightarrow$  3: This is because if  $\rho(L)$  is reductive, then its center equals its radical and contains  $\rho(\mathfrak{r})$ , so  $\rho(\mathfrak{r})$  consists of semisimple endomorphisms.

3  $\rightarrow$  4: [Mil13]P60<sup>?</sup>.

4  $\rightarrow$  1: [Mil13]P60<sup>?</sup>.  $\square$

**Cor. (24.4.1.6).** Let  $\mathfrak{g}$  be any Lie algebra, and  $\rho, \rho' \in \text{Rep}(\mathfrak{g})$ . If  $\rho$  and  $\rho'$  are semisimple, then so are  $\rho \otimes \rho'$  and  $\rho^\vee$ .

In particular, the category  $\text{Rep}(\mathfrak{g})$  of semisimple representations of a Lie algebra  $\mathfrak{g}$  form a Tannakian category, thus there is an algebraic group  $G$  that  $\text{Rep}^{ss}(\mathfrak{g}) = \text{Rep}(G)$ .  $\lrcorner$

*Proof:* Use the third criterion, for any  $x \in \mathfrak{r}$ , as  $\rho(x), \rho'(x)$  are semisimple, so is  $\rho(x) \otimes \rho'(x)$ , so  $\rho \otimes \rho'$  is also semisimple by (24.4.1.5).  $\square$

### Representations of $\mathfrak{sl}_2(\mathbb{C})$

**Def. (24.4.1.7) [Primitive Elements].** For  $V \in \text{Rep}(\mathfrak{sl}_2)$ , an element  $v \in V$  is called **primitive of weight  $\lambda$**  if it is non-zero and  $Xv = 0, Hv = \lambda v$ .  $\lrcorner$

**Prop. (24.4.1.8).** Every non-zero f.d.  $\mathfrak{sl}_2$ -module contains a primitive element.  $\lrcorner$

*Proof:* an element  $e$  is primitive iff the line generated by  $e$  is stable under the action of  $\{X, H\}$ : if  $Xe = \lambda e$  and  $He = \mu e$ , then using the  $[H, X] = 2X$ , we see that  $2\lambda = 0$ , thus  $\lambda = 0$ , and  $e$  is primitive. So each f.d.  $\mathfrak{sl}_2$ -module contains a primitive element, by Lie's theorem (3.7.1.24).  $\square$

**Prop. (24.4.1.9) [Submodule Generated by Primitive Element].** Let  $V \in \text{Rep}(\mathfrak{sl}_2)$  and  $e \in V$  a primitive element of weight  $\lambda$ . Let  $e_n = Y^n e / n!$ , and  $e_{-1} = 0$ , then we have

$$He_n = (\lambda - 2n)e_n, \quad Ye_n = (n+1)e_{n+1}, \quad Xe_n = (\lambda - n + 1)e_{n-1}.$$

┘

*Proof:* By induction on  $n$ ,

$$HY^n e = ([H, Y] + YH)Y^{n-1}e = (\lambda - 2(n-1) - 2)Y^n e = (\lambda - 2n)e.$$

$Ye_n = (n+1)e_{n+1}$  is obvious.

And

$$\begin{aligned} nXe_n &= XYe_{n-1} = [X, Y]e_{n-1} + YXe_{n-1} \\ &= He_{n-1} + (\lambda - n + 2)Ye_{n-2} \\ &= (\lambda - 2n + 2 + (\lambda - n + 2)(n-1))e_{n-1} \\ &= n(\lambda - n + 1)e_{n-1} \end{aligned}$$

□

**Cor. (24.4.1.10).** Situation as in (24.4.1.9). Only two cases arise: either

- The elements  $\{e_n\}$  are linearly independent.
- The elements  $e_0, e_1, \dots, e_m$  are linearly independent, and  $e_{m+1} = e_{m+2} = \dots = 0$ , and weight  $\lambda$  of  $e$  equals  $m$ .

And if  $V$  is f.d., then case 1 cannot happen, and the subspace  $W$  generated by  $e_0, \dots, e_m$  is a  $\mathfrak{g}$ -module and it is irreducible. ┘

*Proof:* Because each  $e_i$  has different eigenvalue under action of  $H$ , thus if they are all nonzero, then they are linearly independent. If  $e_0, e_1, \dots, e_m$  are linearly independent, and  $e_{m+1} = e_{m+2} = \dots = 0$ , then by the proposition,

$$Xe_{m+1} = (\lambda - m)e_m$$

and  $e_{m+1} = 0$  with  $e_m \neq 0$ , thus  $\lambda = m$ . Now the formulas in (24.4.1.9) shows that  $W$  is a  $\mathfrak{g}$ -module. And if  $W' \subset W$  is a subspace invariant under  $\mathfrak{g}$ , then it contains some eigenvalues  $e_k$  of  $H$ , and then the formulas in (24.4.1.9) shows it contains all  $e_0, e_1, \dots, e_m$ , thus  $W' = W$ . Thus  $W$  is irreducible. □

**Prop. (24.4.1.11) [Irreducible Representations of  $\mathfrak{sl}_2(\mathbb{C})$ ].** Let  $W_m = \{e_0, \dots, e_m\}$  be a  $m+1$ -dimensional vector space and  $\mathfrak{sl}_2$  acts on  $W_m$  by

$$He_n = (m - 2n)e_n, \quad Ye_n = (n+1)e_{n+1}, \quad Xe_n = (m - n + 1)e_{n-1}.$$

Then  $W_m$  is a f.d. irreducible representation of  $\mathfrak{sl}_2$ , and any f.d representation of  $\mathfrak{sl}_2$  of dimension  $m+1$  is isomorphic to one of  $W_m$ . ┘

*Proof:* The first assertion follows from (24.4.1.10) and the fact  $e_0$  is a primitive element. For the second assertion, notice any f.d. representation  $W$  of  $\mathfrak{g}$  contains a primitive element (24.4.1.8) thus by (24.4.1.10) generates an irreducible  $\mathfrak{sl}_2$ -submodule  $W_n$ , thus this submodule equals  $W$ , and  $n+1 = m+1$ , thus  $n = m$ . □

**Remark (24.4.1.12).** Notice this is special case of (24.4.2.16).  $\lrcorner$

**Cor. (24.4.1.13).**  $W_0$  is the just trivial action of  $\mathfrak{sl}_2$ ,  $W_1$  is isomorphic to the natural action of  $\mathfrak{sl}_2$  on  $\mathbb{C}^2$ , and  $W_2$  is isomorphic to the adjoint action of  $\mathfrak{sl}_2$  on itself.  $\lrcorner$

*Proof:* In fact,  $W_1$  can be identified with the vector space  $\mathbb{C}\{x, y\}$  where

$$Hx = x, Hy = -y, Yx = y, Yy = 0, Xy = x, Xx = 0.$$

Then the  $m$ -th symmetric tensor of  $W_1$  is isomorphic to the vector space of polynomials in  $x, y$  of degree  $m$ , and by (3.7.9.2),

$$\begin{aligned} H(C_m^k y^k x^{m-k}) &= (m - 2k)(C_m^k y^k x^{m-k}), \\ Y(C_m^k y^k x^{m-k}) &= (k + 1)(C_m^{k+1} y^{k+1} x^{m-k-1}), \\ X(C_m^k y^k x^{m-k}) &= (m - k + 1)(C_m^{k-1} y^{k-1} x^{m-k+1}). \end{aligned}$$

So it is isomorphic to  $W_{m+1}$ .  $\square$

**Cor. (24.4.1.14) [Representations of  $\mathfrak{sl}_2(\mathbb{K})$ ].** Let  $\mathbb{K} \in \{\mathbb{R}, \mathbb{C}\}$  and  $V \in \text{Rep}^{\text{fd}}(\mathfrak{sl}_2(\mathbb{K}))$ , then

- $V$  is isomorphic to a direct sum of  $W_m$ s,
- The endomorphism on  $V$  induced by  $H$  is diagonalizable and with integral eigenvalues. if  $\pm n$  are eigenvalues of  $H$ , then so are  $n - 2, n - 4, \dots, 4 - n, 2 - n$ .
- For any  $n \geq 0$ , the linear maps

$$Y^n : V^n \rightarrow V^{-n}, X^n : V^{-n} \rightarrow V^n$$

are isomorphisms. In particular,  $V^{-n}$  and  $V^n$  have the same dimensions.  $\lrcorner$

*Proof:* by Weyl's theorem (24.4.1.2), any representation of  $\mathfrak{sl}_2(\mathbb{K})$  is isomorphic to a direct sum of irreducible representations, and the irreducible representations of  $\mathfrak{sl}_2(\mathbb{C})$  clearly comes from real representations of  $\mathfrak{sl}_2(\mathbb{R})$ , thus irreducible representations of  $\mathfrak{sl}_2(\mathbb{R})$  must be of the same form (otherwise tensor with  $\mathbb{C}$  and decompose, and use conjugation).

Because we can assume  $V$  is one of  $W_m$ , so the other assertions are clear.  $\square$

## 2 Verma Modules

**Def. (24.4.2.1) [Weights].** Let  $V \in \text{Rep}(\mathfrak{g})$ . If  $\lambda \in \mathfrak{h}^\vee$ , a vector  $v \in V$  is said to have weight  $\lambda$  iff  $hv = \lambda(h)v$  for any  $h \in \mathfrak{h}$ . The space of vectors in  $V$  of weight  $\lambda$  is denoted by  $V[\lambda]$ . An **integral weight** is a weight  $\lambda$  of the form  $\lambda = \sum n_i \alpha_i^\vee$ , where  $\alpha_i \in \Phi$ , equivalently its values on  $h_i$  are all integers.

$V$  is said to have a **weight decomposition** if  $V = \bigoplus_{\lambda \in \mathfrak{h}^*} V[\lambda]$ .  $\lrcorner$

**Prop. (24.4.2.2).** Any f.d.  $\mathfrak{g}$ -module  $V$  has a weight decomposition, and the weights are all integral.  $\lrcorner$

*Proof:* For any  $i$ ,  $V$  is a  $\mathfrak{s}_i = \{e_i, h_i, f_i\}$ -module (3.7.3.20), so by the representation theory of  $\mathfrak{sl}_2$ ,  $h_i$  acts semisimply on  $V$ , and the eigenvalues are integers. Thus  $\mathfrak{h}$  acts semisimply on  $V$ , thus there is a weight decomposition, and the weights are all integral.  $\square$

**Def. (24.4.2.3) [Highest Weight Representations].** A vector  $v \in V$  is called a **highest weight vector** if it is a weight vector and  $\mathfrak{n}_+ v = 0$ , or equivalently  $e_i v = 0$  for any  $e_i$ . A **highest weight representation** with highest weight  $\lambda$  is a representation that is generated by a highest weight vector of weight  $\lambda$ .  $\lrcorner$

**Prop. (24.4.2.4).** Any  $V \in \mathcal{R}\text{ep}^{\text{fd}}(\mathfrak{g})$  contains a highest weight vector, thus any irreducible f.d.  $\mathfrak{g}$ -representation is a highest weight representation.  $\lrcorner$

*Proof:* Choose a weight  $\lambda$  of  $V$  s.t.  $\langle \lambda, \rho^\vee \rangle$  is maximal, then  $e_i v$  has weight  $\lambda + \alpha_i$ , thus  $e_i v = 0$  for any  $i$ .  $\square$

### Verma Modules

**Def. (24.4.2.5) [Highest Weight Representations].**  $V \in \mathcal{R}\text{ep}(\mathfrak{g})$  is called a **highest weight representation** with highest weight  $\lambda \in \mathfrak{h}^*$  if it is generated by such a nonzero vector.  $\lrcorner$

**Def. (24.4.2.6) [Verma Modules].** Let  $\lambda \in \mathfrak{h}^*$ ,  $I_\lambda \subset U(\mathfrak{g})$  be the left ideal generated by the elements  $\{h - \lambda(h)\}_{h \in \mathfrak{h}}$  and  $e_i$ , then the **Verma module**  $M_\lambda = U(\mathfrak{g})/I_\lambda$  has a weight decomposition, and it is a highest weight representation with highest vector  $v_\lambda = \bar{1}$  with weight  $\lambda$ .  $\lrcorner$

**Prop. (24.4.2.7) [ $M_\lambda$  is Noetherian].**  $M_\lambda$  satisfies ascending chain condition on f.d. submodules.  $\lrcorner$

*Proof:* This is because  $U(\mathfrak{g})$  is left Noetherian (3.7.8.17) and  $M_\lambda = U(\mathfrak{g})/I_\lambda$ .  $\square$

**Prop. (24.4.2.8).** The map  $\varphi : U(\mathfrak{n}_-) \rightarrow M_\lambda : \varphi(x) = x v_\lambda$  is an isomorphism of left  $U(\mathfrak{n}_-)$ -modules.  $\lrcorner$

*Proof:* This follows from PBW theorem.  $\square$

**Cor. (24.4.2.9).**  $M_\lambda$  has a weight decomposition with  $P(M_\lambda) = \lambda - Q^+(\Phi)$ , and weight spaces of  $M_\lambda$  are all of f.d..  $\lrcorner$

**Prop. (24.4.2.10).** If  $V$  is a  $\mathfrak{g}$ -module and  $v \in V$  is a highest weight vector, then there is a unique homomorphism  $M_\lambda \rightarrow V$  of  $\mathfrak{g}$ -modules that maps  $v_\lambda$  to  $v$ .  $\lrcorner$

**Cor. (24.4.2.11).** Every highest weight representation has a decomposition into f.d. weight spaces. And they have a unique highest weight vector up to a scalar.  $\lrcorner$

**Prop. (24.4.2.12) [Quotient of Verma Modules].**  $M_\lambda$  has a unique irreducible quotient  $L_\lambda$ . In particular,  $L_\lambda$  is a quotient of every highest weight representation of  $\mathfrak{g}$  with weight  $\lambda$ , by (24.4.2.10).  $\lrcorner$

*Proof:* It is easy to show that any submodule of  $M_\lambda$  is a direct sum of its weight spaces. It cannot have weight  $\lambda$ , otherwise it generates  $M_\lambda$  by (24.4.2.11). Then the sum  $J_\lambda$  of all proper submodules of  $M_\lambda$  also cannot have weight  $\lambda$ , thus also proper. Then  $L_\lambda = M_\lambda/J_\lambda$  is the unique irreducible quotient of  $M_\lambda$ .  $\square$

**Cor. (24.4.2.13) [Classification of Irreducible Highest Weight Representations].** Any irreducible highest weight representation of  $\mathfrak{g}$  is of the form  $L_\lambda$  where  $\lambda \in \mathfrak{h}^*$ .  $\lrcorner$

**Prop. (24.4.2.14) [Composition Factors of Verma Modules].** The Verma module  $M_\lambda$  has a finite composition series  $M_\lambda = N_0 \supset N_1 \supset \dots \supset N_r = 0$  that each  $N_i/N_{i+1}$  is irreducible and isomorphic to  $L_{\omega(\lambda+\rho)-\rho}$  for some  $\omega \in W$ .  $\lrcorner$

*Proof:* We can find a (not necessarily finite) series  $N_i$  of submodules of  $M_\lambda$  that the subquotients are irreducible as  $M_\lambda$  satisfies ascending chain condition on submodules (24.4.2.7). As each submodule of  $M_\lambda$  has a weight decomposition, so does the subquotients  $N_i/N_{i+1}$ , and we can choose one of its maximal weight  $\mu$ , which satisfies  $\mu < \lambda$ . Then by the property of  $M_\mu$ ,  $N_i/N_{i+1}$  is isomorphic to the unique irreducible quotient  $L_\mu$  (24.4.2.12).

Now if  $L_\mu$  is a subquotient of  $M_\lambda$ , by considering the central character, we get  $\chi_\lambda = \chi_\mu$ . By (24.4.2.22), this implies that  $\mu = \omega(\lambda + \rho) - \rho$  for some  $\omega \in W$ . Finally, the composition series is finite because  $W$  is finite and each weight space of  $W$  is f.d..  $\square$

**Lemma (24.4.2.15).** Let  $V \in \text{Rep}(\mathfrak{g})$  with weight decomposition into f.d. weight spaces. If  $V$  is a sum of f.d.  $\mathfrak{s}_i$ -modules for each  $i$ , then for each  $\lambda \in P$  and  $w \in W$ ,  $\dim V[\lambda] = \dim V[w\lambda]$ .  $\square$

*Proof:* As  $W$  is generated by  $s_i$ , it suffices to prove for  $w = s_i$ ,  $\dim V[\lambda] = \dim V[s_i\lambda]$ .

If  $(\lambda, \alpha_i^\vee) = m \geq 0$  for some  $i$ , consider the operator  $f_i^m : V[\lambda] \rightarrow V[s_i\lambda]$  is an isomorphism by hypothesis and the representation theory of  $\mathfrak{sl}_2$ . Similarly, if  $(\lambda, \alpha_i^\vee) = -m \leq 0$ , then  $e_i^m : V[\lambda] \rightarrow V[s_i\lambda]$  is an isomorphism.  $\square$

**Prop. (24.4.2.16) [Classification of F.D. Irreducible Representations].** F.d. irreducible representations of  $\mathfrak{g}$  are classified by their highest dominant integral weights  $\lambda \in P^+(\Phi)$  via the bijection  $\lambda \mapsto L_\lambda$ . Moreover, for any  $\mu \in P(\Phi)$  and  $w \in W$ ,  $\dim L_\lambda[\mu] = \dim L_\lambda[w\mu]$ .  $\square$

*Proof:* Firstly if  $V \in \text{Rep}^{\text{fd}}(\mathfrak{g})$ , then  $\lambda \in P^+(\Phi)$  by (24.4.2.2). Now if  $\lambda \in P^+$ , then in  $L_\lambda$ ,  $f_i^{\lambda(h_i)+1} v_\lambda = 0$  for any  $i$ , because by (24.4.1.9),  $e_i f_i^{\lambda(h_i)+1} v_\lambda = 0$ , and  $e_j f_i^{\lambda(h_i)+1} v_\lambda = 0$  for  $j \neq i$  as  $v_\lambda$  is a highest weight vector. So  $f_i^{\lambda(h_i)+1} v_\lambda$  generates a proper submodule of  $L_\lambda$ , which must be 0 as it cannot contain  $v_\lambda$ , and  $L_\lambda$  is irreducible.

Thus  $v_\lambda$  generate the  $\mathfrak{s}_i$ -module of highest weight  $\lambda(h_i)$ , and any element of  $\mathfrak{g}$  generate a f.d.  $\mathfrak{s}_i$ -module, so  $V$  is a sum of f.d.  $\mathfrak{s}_i$ -modules for each  $i$ , thus by lemma (24.4.2.15),  $\dim L_\lambda[\mu] = \dim L_\lambda[w\mu]$ . To show  $L_\lambda$  is of f.d., first notice  $P(L_\lambda) \cap P^+$  is finite, and  $WP^+(\Phi) = P(\Phi)$  (3.9.5.16), and the fact  $P(L_\lambda)$  is  $W$ -invariant.  $\square$

**Prop. (24.4.2.17).**  $L_\lambda^* = L_{-w_0(\lambda)}$ .  $\square$

*Proof:* It suffices to show the lowest weight of  $L_\lambda$  is  $w_0\lambda$ :  $w_0\lambda$  is a weight by (24.4.2.16), and if  $\lambda' < w_0\lambda$ , then  $w_0\lambda' > \lambda$ .  $\square$

**Lemma (24.4.2.18).** The representation  $L_n$  of  $\mathfrak{sl}_2$  is of real type if  $n$  is even and of quaternion type if  $n$  is odd.  $\square$

*Proof:*  $L_n = \text{Sym}^n L_1$ , thus we can take the bilinear form  $\text{Sym}^n B$ , where  $B$  is the alternating form on  $L_1 \cong \mathbb{C}^2$ , which is symmetric if  $n$  is even and alternating if  $n$  is odd.  $\square$

**Prop. (24.4.2.19) [Types of Irreducible Representations].** For  $\lambda \in P^+(\Phi)$  s.t.  $\lambda = -w_0\lambda$  (so  $L_\lambda$  is self-dual by (24.4.2.17)), it is of real type if  $n = (2\rho^\vee, \lambda)$  is even and of quaternion type if  $(2\rho^\vee, \lambda)$  is odd.  $\square$

*Proof:* The number  $n$  is the eigenvalue of  $h$  on  $v_\lambda$ , where  $\{h, e, f\}$  is the principal  $\mathfrak{sl}_2$ -subalgebra, and the other eigenvalues are all smaller. Then  $L_\lambda \cong L_n \oplus \bigoplus_{-i < n} L_{m_i}$ , so the invariant form on  $L_\lambda$  restricts to a non-zero invariant form on  $L_n$ , so the assertion follows from (24.4.2.18).  $\square$

**Prop. (24.4.2.20) [Residual Finiteness].** The homomorphism  $U(\mathfrak{g}) \rightarrow \prod_{\lambda \in P^+} \text{End}(L_\lambda)$  is injective.  $\square$

*Proof:* ?

If  $x \in U(\mathfrak{g})$  is in the kernel, then  $x$  acts trivially on  $\Gamma(G) = \bigoplus_{\lambda \in P_+(\Phi)} L_\lambda \otimes L_\lambda^*$ , where  $x$  acts on  $\Gamma(G)$  by differential operators and acts on  $L_\lambda$  only. Then  $x$  acts trivially on  $\Gamma(G)$ , which means  $x = 0$ .  $\square$

### Central Characters of Verma Modules

**Prop. (24.4.2.21) [Central Character  $\chi_\lambda$ ].** As  $M_{\lambda+\rho}$  is generated by a single highest weight vector,  $Z(U(\mathfrak{g}))$  acts on it by a character  $\chi_\lambda \in \text{Spec } Z(U(\mathfrak{g}))$ . How to determine  $\chi_\lambda$ ?  $\lrcorner$

*Proof:*  $\square$

**Prop. (24.4.2.22).** For  $\lambda, \mu \in \mathfrak{h}^*$ ,  $\text{ch}(M_\lambda) = \text{ch}(M_\mu)$  iff  $\mu = w_\bullet \lambda$  for some  $w \in W$ .  $\lrcorner$

*Proof:* Cf. [Carter]P235. ?  $\square$

**Prop. (24.4.2.23) [Action of Casimir Elements].** Let  $c \in Z(U(\mathfrak{g}))$  be the Casimir element, then  $c$  acts on  $M_{\lambda-\rho}$  as scalar multiplication by

$$\chi_\lambda(c) = \langle \lambda, \lambda \rangle - \langle \rho, \rho \rangle.$$

$\lrcorner$

*Proof:* Cf. [Carter]P239.  $\square$

### Fundamental Representations

**Prop. (24.4.2.24) [Fundamental Representations].** The following are equivalent for  $\omega \in P^+$ :

- $\omega$  is minuscule (3.9.5.35).
- All weights of the representation  $L_\omega$  belongs to the orbit  $W\omega$ .
- The restriction of  $L_\omega$  to  $\mathfrak{s}_i$  is a direct sum of 1-dimensional and 2-dimensional subrepresentations.

Such a representation  $L_\omega$  is called a **fundamental representation** of  $\mathfrak{g}$ .  $\lrcorner$

*Proof:* 1  $\rightarrow$  2: By (24.4.2.16), for any weight  $\mu$  of  $L_\omega$ , there is a  $w \in W$  that  $w\mu$  is dominant and  $\omega - w\mu \in Q^+$ . Thus  $w\mu = \omega$  by (3.9.5.37), and  $\mu \in W\omega$ .

2  $\rightarrow$  1: If  $\omega$  is not minuscule, then there is some positive  $\alpha$  that  $(\omega, \alpha^\vee) > 1$ , so  $2(\omega, \alpha) < (\alpha, \alpha)$ , and  $\omega - \alpha$  is a weight of  $L_\omega$  (the weight of  $f_\alpha v_\omega$ , and it is not conjugate to  $\omega$ , as  $(\omega - \alpha, \omega - \alpha) = (\omega, \omega) - 2(\alpha, \omega) + (\alpha, \alpha) < (\omega, \omega)$ ).

2  $\iff$  3: If  $\omega$  is minuscule and  $v \in L_\omega$  be a highest weight vector for  $\mathfrak{s}_i$ , then  $h_{\alpha_i} v = \omega(h_{\alpha_i}) = (\omega, \alpha_i^\vee) = 0$  or  $v$  (3.7.3.21). Thus we get 4 by the representation theory of  $\mathfrak{sl}_2$ . The reverse argument is also true.  $\square$

**Cor. (24.4.2.25).** The character for a fundamental representation  $L_\omega$  is

$$\text{ch}(L_\omega) = \sum_{w \in W} e^{w(\omega)}.$$

$\lrcorner$

**Prop. (24.4.2.26).** Let  $\omega$  be a minuscule weight, then for any dominant integral weight  $\lambda$ ,

$$L_\omega \otimes L_\lambda \cong \bigoplus_{w \in W, \lambda + w\omega \in P^+} L_{\lambda + w\omega}.$$

┘

*Proof:* By Weyl's character formula and (24.4.2.25),

$$\text{ch}(L_\omega \otimes L_\lambda) = \frac{\sum_{\mu \in W\omega} \sum_{w \in W} \varepsilon(w) e^{w(\lambda+\rho)+\mu}}{\Delta} = \frac{\sum_{\gamma \in W\omega} \sum_{w \in W} \varepsilon(w) e^{w(\lambda+\rho+\gamma)}}{\Delta}$$

If  $\lambda + \gamma \notin P^+$ , then  $(\lambda + \gamma, \alpha_i^\vee) < 0$  for some  $i$ . But  $(\gamma, \alpha_i^\vee) \geq -1$  as  $\omega$  is minuscule, so  $(\lambda + \gamma, \alpha_i^\vee) = -1$ , and  $(\lambda + \gamma + \rho, \alpha_i^\vee) = 0$ . Then for such  $\gamma$ , in the summand the  $w$  term cancels with  $ws_i$  term. Thus the summand equals the character for  $\sum_{w \in W} e^{w\omega}$ . Then we finish by (24.4.3.3).  $\square$

**Prop. (24.4.2.27)[Fundamental Representations for Simple Lie Algebras].** By (3.9.6.12),

- for  $B_n$ , the fundamental representation corresponding to the minuscule weights  $\omega_n$  is the **Spin representation** of dimension  $2^n$ , denoted by  $S$ .
- for  $C_n$ , the fundamental representation corresponding to the minuscule weights  $\omega_1$  is the standard representation of  $\mathfrak{sp}_{2n}$ .
- for  $D_n$ , the fundamental representation corresponding to the minuscule weights  $\omega_1, \omega_{n-1}, \omega_n$  are the standard representation and two Spin representations  $S^+, S^-$ .
- for  $E_7$ , the unique fundamental representation has dimension 56<sup>?</sup>.
- for  $E_6$ , the two fundamental representations are dual, and have dimensions 27<sup>?</sup>.

┘

*Proof:* <sup>?</sup>

$\square$

**Prop. (24.4.2.28)[Bott Periodicity for Spin Representations].** Let  $\mathfrak{g} = \mathfrak{so}_m$ , then the behavior of the spin representation of  $\mathfrak{g}$  is

- $S$  is of real type if  $m \equiv 1, 7 \pmod{8}$ .
- $S$  is of quaternionic type if  $m \equiv 3, 5 \pmod{8}$ .
- $S_+, S_-$  are of real type if  $m \equiv 0 \pmod{8}$ .
- $S_+^* \cong S_-$  are of complex type if  $m \equiv 2, 6 \pmod{8}$ .
- $S_+, S_-$  are of quaternionic type if  $m \equiv 4 \pmod{8}$ .

┘

*Proof:* We use (24.4.2.19). If  $\mathfrak{g} = \mathfrak{so}_{2n}$ , then  $\rho^\vee = \rho = \sum \omega_i = (n-1, n-2, \dots, 1, 0)$ . So  $(2\rho^\vee, \omega_{n-1}) = (2\rho^\vee, \omega_n) = \frac{n(n-1)}{2}$ .

If  $\mathfrak{g} = \mathfrak{so}_{2n+1}$ , then it can be verified that  $\rho^\vee = (n, n-1, \dots, 0)$ , so  $(2\rho^\vee, \omega_n) = \frac{n(n+1)}{2}$ .

Also we need to consider  $w_0$ , so  $\mathfrak{so}_{4n+2}$  are of complex type.  $\square$

### 3 Character Formulae

**Def. (24.4.3.1) [Central Characters of a Representation].** For  $V = \oplus_{\mu \in P} V[\mu] \in \mathcal{R}\text{ep}^{\text{fd}}(\mathfrak{g})$ , the **central character** is an analytic function on  $\mathfrak{h}$  that

$$\text{ch}_V(h) = \sum_{\mu \in P} \dim V[\mu] e^{\mu(h)}.$$

In fact  $\chi$  is an element in  $\mathbb{Z}[e^{\alpha_1}, \dots, e^{\alpha_r}, e^{-\alpha_1}, \dots, e^{-\alpha_r}]$ .  $\lrcorner$

#### Weyl's Character Formula

**Thm. (24.4.3.2) [Weyl's Character Formula, Weyl1925].** Let  $\lambda \in P^+$ , then the character of  $L_\lambda \in \mathcal{R}\text{ep}^{\text{fd}}(\mathfrak{g})$  (24.4.2.16) is given by

$$\text{ch}(L_\lambda) = \frac{\sum_{w \in W} \text{sgn}(w) e^{w(\lambda + \rho)}}{e^\rho \prod_{\alpha \in \Phi^+} (1 - e^{-\alpha})}.$$

The denominator  $\Delta_{\mathfrak{g}} = e^\rho \prod_{\alpha \in \Phi^+} (1 - e^{-\alpha})$ , called **Weyl's denominator** of  $\mathfrak{g}$ .  $\lrcorner$

*Proof:* We already know that  $\Delta \chi_\lambda \sum_{\mu \in P} c_\mu e^\mu$  is  $W$ -anti-invariant,  $c_{\lambda + \rho} = 1$ , and  $c_\mu = 0$  unless  $\mu \in \lambda + \rho - Q^+$ , so it suffices to show  $c_\mu = 0$  if  $\mu \in P^+ \cap (\lambda + \rho - Q^+)$  and  $\mu \neq \lambda + \rho$ . ?  $\square$

**Cor. (24.4.3.3) [Characters Determine Representations].** Irreducible f.d. representations of a semisimple Lie algebra is determined by its characters, as the maximal exponent of  $\chi_\lambda$  are different for different  $\lambda$ .  $\lrcorner$

**Cor. (24.4.3.4).** For  $\mathfrak{sl}_2(\mathbb{C})$ ,  $\text{ch}_{W_n}(z) = e^{nz} + e^{(n-2)z} + \dots + e^{-nz} = \frac{e^{(n+1)z} - e^{-(n+1)z}}{e^z - e^{-z}}$ . Notice these functions are linearly independent, so by (24.4.1.14), representations of  $\mathfrak{sl}_2(\mathbb{C})$  are determined by their characters.  $\lrcorner$

**Cor. (24.4.3.5) [Weyl Denominator Formula].**

$$\Delta_{\mathfrak{g}} = \sum_{w \in W} \text{sgn}(w) e^{w(\rho)} \quad (24.4.3.2).$$

*Proof:* This follows from the Weyl character formula (24.4.3.2) by setting  $\lambda = 0$ .  $\square$

**Thm. (24.4.3.6) [Weyl Dimension Formula].** For  $\lambda \in P^+(\Phi^\vee)$ ,

$$\dim L_\lambda = \frac{\prod_{\alpha \in \Phi^+} \langle \alpha, \lambda + \rho^\vee \rangle}{\prod_{\alpha \in \Phi^+} \langle \alpha, \rho^\vee \rangle}$$

*Proof:* Choose an element  $h_\rho \in \mathfrak{h}$  that corresponds to  $\rho \in \mathfrak{h}^*$  via the Killing form, then

$$\chi_\lambda(2th_\rho) = \frac{\sum_{w \in W} \text{sgn}(w) e^{2t \langle w(\lambda + \rho), \rho^\vee \rangle}}{\prod_{\alpha \in \Phi^+} (e^{t \langle \alpha, \rho \rangle} - e^{-t \langle \alpha, \rho \rangle})}.$$

The crucial fact is that we can use Weyl's denominator formula (24.4.3.5) on the nominator, to get

$$\chi_\lambda(2th_\rho) = \frac{\prod_{\alpha \in \Phi^+} (e^{t \langle \alpha, \lambda + \rho \rangle} - e^{-t \langle \alpha, \lambda + \rho \rangle})}{\prod_{\alpha \in \Phi^+} (e^{t \langle \alpha, \rho \rangle} - e^{-t \langle \alpha, \rho \rangle})}.$$

Now taking limit  $t \rightarrow 0$ , we get the desired formula.  $\square$

**Remark (24.4.3.7).** The Weyl dimension formula can be used to determine a representation  $V$  is irreducible or not: First calculate the maximal weight, then used the Weyl dimension formula to calculate the dimension to see if it is equal to the dimension of  $V$ .  $\lrcorner$

**Thm. (24.4.3.8) [Kostant's Multiplicity Theorem].** For  $\lambda \in P^+(\Phi)$ ,

$$\dim L_\lambda[\gamma] = \sum_{w \in W} \operatorname{sgn}(w) \mathfrak{P}(w_\bullet \lambda - \gamma).$$

where  $\mathfrak{P}$  is the Kostant's partition function (3.9.5.21).  $\lrcorner$

*Proof:* This follows from plugging in the formula

$$\Delta_{\mathfrak{g}}^{-1} = \frac{1}{e^\rho \prod_{\alpha \in \Phi^+} (1 - e^{-\alpha})} = \sum_{\alpha \in Q(\Phi)} \mathfrak{P}(\alpha) e^{-(\rho + \alpha)}.$$

to Weyl's character formula (24.4.3.2).  $\square$

**Prop. (24.4.3.9) [Steinberg's Multiplicity Formula].** Let  $\lambda, \mu \in P^+$ , then

$$L_\lambda \otimes L_\mu \cong \sum_{\nu \in P^+} c_{\lambda\mu\nu} L_\nu,$$

where

$$c_{\lambda\mu\nu} = \sum_{w, w' \in W} \varepsilon(w) \varepsilon(w') \mathfrak{P}(w_\bullet \lambda + w'_\bullet \mu - \nu).$$

where  $\mathfrak{P}$  is the Kostant's partition function (3.9.5.21).  $\lrcorner$

*Proof:* Cf. [Cartan, P265].  $\square$

**Cor. (24.4.3.10) [Clebsch-Gordan Rule].** The tensor products of representations of  $\mathfrak{sl}_2(\mathbb{C})$  satisfy

$$W_m \otimes W_n \cong \bigoplus_{i=0}^{\min(m,n)} W_{|m-n|+2i}.$$

*Proof:* This follows from (24.4.3.9) or from (24.4.3.4).  $\square$

#### 4 Category $\mathcal{O}$ (Bernstein-Gelfand-Gelfand)

**Def. (24.4.4.1) [ $\mathcal{O}_{\mathfrak{g}}$ ].** The category  $\mathcal{O}$  is the full subcategory of  $\operatorname{Rep}(\mathfrak{g})$  consisting of f.g.  $\mathfrak{g}$ -modules  $M$  with a weight decomposition and  $P(M) \subset \cup_{i=1}^m (\lambda_i - Q^+)$  for f.m. weights  $\lambda_1, \dots, \lambda_m \in \mathfrak{h}^*$ .  $\lrcorner$

**Prop. (24.4.4.2).** For any  $M \in \mathcal{O}_{\mathfrak{g}}$ , the weight spaces of  $M$  are f.d..  $\lrcorner$

*Proof:* By hypothesis we can assume  $v_1, \dots, v_m$  are generators of  $M$  that are also eigenvectors of  $\mathfrak{h}$ . Let  $E = \sum_{i=1}^m U(\mathfrak{h} \oplus \mathfrak{n}_+) v_i = \sum_{i=1}^m U(\mathfrak{n}_+) v_i$  which is of f.d. by hypothesis on weights of  $M$ . On the other hand, the natural map  $U(\mathfrak{n}^-) \otimes E \rightarrow M$  is surjective, so the assertion follows from the fact that the weight spaces of  $U(\mathfrak{n}^-) \otimes E \rightarrow M$  are f.d..  $\square$

**Prop. (24.4.4.3).** For any  $M \in \mathcal{O}_{\mathfrak{g}}$ , the action of  $Z(U(\mathfrak{g}))$  on  $M$  factors through a f.d. quotient.  $\lrcorner$

*Proof:* By (3.7.8.23),  $Z(U(\mathfrak{g}))$  is f.g., so it suffices to show that each  $z \in Z(U(\mathfrak{g}))$  satisfies a polynomial equation on  $M$ . Let  $\mu_1, \dots, \mu_k \in \mathfrak{h}^*$  s.t.  $M$  is generated by  $E = \oplus M[\mu_i]$ . As  $\dim E < \infty$  by (24.4.4.2) and  $Z(U(\mathfrak{g}))$  preserves  $E$ ,  $z$  satisfies a polynomial equation on  $E$ . Hence  $z$  satisfies the same equation on  $M$ , as  $z$  is in the center and  $E$  generates  $M$ .  $\square$

**Prop. (24.4.4.4).** It is clear that every object  $V \in \mathcal{O}_{\mathfrak{g}}$  has a highest weight, thus the simple objects of  $\mathcal{O}$  are just  $L_{\lambda}$  where  $\lambda \in \mathfrak{h}^*$ .  $\lrcorner$

**Prop. (24.4.4.5) [Finite Length].** Every  $M \in \mathcal{O}$  has finite length.  $\lrcorner$

*Proof:*  $\square$

### Category $\mathcal{O}_{\text{int}}$

**Def. (24.4.4.6) [ $\mathcal{O}_{\text{int}}$ ].** The category  $\mathcal{O}_{\text{int}}$  is the subcategory of representations  $V$  of  $\mathfrak{g}$  that with weight decomposition into f.d. weight spaces that the weights  $P(M) \subset \cup_{i=1}^m (\lambda_i - Q^+)$  for f.m. weights  $\lambda_1, \dots, \lambda_m \in P^{\vee}(R)$ .  $\lrcorner$

**Def. (24.4.4.7) [Characters].** The character for a f.d. representation can be extended to category  $\mathcal{O}_{\text{int}}$  as a formal Laurent series

$$\text{ch}(V) \in \mathbb{Z}[[e^{-\alpha_1^{\vee}}, \dots, e^{-\alpha_r^{\vee}}]][e^{\alpha_1^{\vee}}, \dots, e^{\alpha_r^{\vee}}] : \text{ch}(V)(h) = \sum \dim V[\mu] e^{\mu(h)}.$$

**Prop. (24.4.4.8).** The character of  $M_{\lambda}$  is given by

$$\text{ch}(M_{\lambda}) = \frac{e^{\lambda}}{\prod_{\alpha \in \Phi^+} (1 - e^{-\alpha})} = \frac{e^{\lambda+\rho}}{\Delta_{\mathfrak{g}}} \text{ (24.4.3.2)}.$$

**Prop. (24.4.4.9) [Duality Functor].** Let  $\tau : \mathfrak{g} \rightarrow \mathfrak{g}$  be the Cartan involution, then for any  $V \in \mathcal{O}_{\mathfrak{g}}$ , we can define  $V^{\vee} = (V^{\tau})_{\text{fin}}^*$ . Then

- $V^{\vee}$  has the same character and composition factors as  $V$ .
- $(M_{\lambda})^{\vee} = M_{\lambda^{\vee}}, L_{\lambda}^{\vee} = L_{\lambda}$ .
- The assignment  $V \mapsto V^{\vee}$  is an involutive equivalence of categories  $\mathcal{O} \cong \mathcal{O}^{\text{op}}$  which preserves the decomposition into  $\mathcal{O}_{\chi}(S)$ .
- 

*Proof:*  $\square$

**Prop. (24.4.4.10) [Projective Verma Modules].** If  $\lambda \in \mathfrak{h}^*$  is dominant, then  $M_{\lambda-\rho}$  is a dominant object in  $\mathcal{O}$ , and for any  $V \in \text{Rep}^{\text{fd}}(\mathfrak{g})$ ,  $V \otimes M$  is projective.  $\lrcorner$

*Proof:* ? Cf. [Etingof]P53. ?

The second assertion follows from the fact that tensoring  $V$  is left adjoint to tensoring  $V^*$ .  $\square$

**Prop. (24.4.4.11) [Enough Projectives].**  $\lrcorner$

*Proof:*

□

**Cor. (24.4.4.12).** For any  $\lambda \in \mathfrak{h}^*$ ,  $L_\lambda$  has a projective cover  $P_\lambda$ .

For any  $\lambda, \mu \in \mathfrak{h}^*$ , define  $d_{\lambda, \mu} \in \mathbb{N}$  as

$$\delta_{\lambda, \mu} = \dim \operatorname{Hom}(P_\lambda, L_\mu).$$

┘

### Harish-Chandra Bimodules

**Def. (24.4.4.13) [Harish-Chandra Bimodules].** A **Harish-Chandra bimodule** over  $\mathfrak{g}$  is a  $\mathfrak{g}$ -bimodule  $V$  of finite length (as bimodules) s.t. the adjoint action of  $\mathfrak{g}$  (i.e.  $g(v) = gv - vg$ ) is locally finite (i.e. every  $v \in V$  is contained in a f.d.  $\operatorname{ad}(\mathfrak{g})$ -module). The category of Harish-Chandra bimodules over  $\mathfrak{g}$  is denoted by  $\operatorname{H-C}(\mathfrak{g})$ .

┘

**Def. (24.4.4.14) [Maximal Quotients of  $U(\mathfrak{g})$ ].** For any  $\chi \in \operatorname{Hom}(Z(U(\mathfrak{g})), \mathbb{C})$ , define

$$U_\chi(\mathfrak{g}) = U(\mathfrak{g}) / (z - \chi(z) : z \in Z(U(\mathfrak{g}))),$$

called a **maximal quotient of  $U(\mathfrak{g})$** .

┘

**Prop. (24.4.4.15) [Maximal Quotients].** For any maximal quotient  $U_\chi(\mathfrak{g})$  of  $U(\mathfrak{g})$  and any  $V \in \operatorname{Irr}^{\operatorname{fd}}(\mathfrak{g})$ ,  $\dim \operatorname{Hom}_{\mathfrak{g}}(V, U_\chi(\mathfrak{g})) = \dim V[0]$ .

In particular,  $U_\chi(\mathfrak{g})$  is a Harish-Chandra bimodule (24.4.4.13), and  $V \otimes U_\chi(\mathfrak{g})$  is a Harish-Chandra bimodule for any  $V \in \operatorname{Rep}^{\operatorname{fd}}(\mathfrak{g})$ .

┘

*Proof:* This follows from (3.7.8.21) (Notice  $\operatorname{Hom}_{\mathfrak{g}}(V, U_\chi(\mathfrak{g})) \cong Z(U(\mathfrak{g}))^{\oplus \dim V[0]}$ , so after quotient by the central ideal, it is isomorphic to  $\mathbb{C}^{\dim V[0]}$ ). Notice also that  $V \otimes U_\chi$  is f.g. thus of finite length.

□

**Prop. (24.4.4.16).** Every irreducible  $\mathfrak{g}$ -bimodule  $M$  with right infinitesimal character  $\chi$  that is locally finite under the adjoint action of  $\mathfrak{g}$  (e.g. Harish-Chandra bimodules) is a quotient of some  $V \otimes U_\chi(\mathfrak{g})$  for some  $V \in \operatorname{Rep}^{\operatorname{fd}}(\mathfrak{g})$ . In particular, they are Harish-Chandra bimodule by (24.4.4.15).

┘

*Proof:* Let  $V \subset M$  be a non-zero irreducible  $\mathfrak{g}$ -module under the adjoint action, and consider the tensor bimodule  $V^* \otimes M$ . The canonical sub-bimodule  $V^* \otimes V \subset V^* \otimes M$  is  $\operatorname{ad}(\mathfrak{g})$ -invariant (i.e. commutes with  $\mathfrak{g}$ ), so we have a bimodule homomorphism  $\psi : U(\mathfrak{g}) \rightarrow V^* \otimes M$  which descends to a homomorphism  $U_\chi(\mathfrak{g}) \rightarrow V^* \otimes M$ , which gives rise to a map of bimodules  $V \otimes U_\chi(\mathfrak{g}) \rightarrow M$ , which is surjective because  $M$  is irreducible.

□

**Def. (24.4.4.17) [Maps of Finite Type].**

┘

**Prop. (24.4.4.18).** For any  $M, N \in \operatorname{Rep}(\mathfrak{g})$ ,  $V \in \operatorname{Rep}^{\operatorname{fd}}(\mathfrak{g})$ ,

$$\operatorname{Hom}_{\mathfrak{g}}(V, {}_{\operatorname{ad}} \operatorname{Hom}_{\operatorname{fin}}(M, N)) = \operatorname{Hom}_{\mathfrak{g}}(V \otimes M, N).$$

┘

**Prop. (24.4.4.19).** For  $M, V \in \mathcal{O}_{\mathfrak{g}}$  and  $N \in \operatorname{Rep}^{\operatorname{fd}}(\mathfrak{g})$ , then

$$\operatorname{Hom}_{\operatorname{fin}}(M, V \otimes N) = V \otimes \operatorname{Hom}_{\operatorname{fin}}(M, N).$$

┘

*Proof:* □

**Thm. (24.4.4.20) [Duflo-Joseph].** The action homomorphism  $M_{\chi_{\lambda+\rho}} \rightarrow \text{Hom}_{\text{fin}}(M_\lambda, M_\lambda)$  is an isomorphism. And for any  $V \in \text{Rep}^{\text{fin}}(\mathfrak{g})$ , the natural map  $V \otimes U_{\chi_{\lambda+\rho}} \rightarrow \text{Hom}_{\text{fin}}(M_\lambda, V \otimes M_\lambda)$  is an isomorphism. ┘

*Proof:* Cf.[Rep of Lie Groups, Etingof]P59. ? The second assertion follows from the first and (24.4.4.19). □

**Def. (24.4.4.21) [ $H_\lambda$ ].** For  $\lambda \in \mathfrak{h}^*$  and  $\theta \in \mathfrak{h}^*/W_\bullet$ , there is a functor

$$H_\lambda : \mathcal{O} \rightarrow \text{H-C} : X \mapsto \text{Hom}_{\text{fin}}(M_{\lambda-\rho}, X).$$

┘

**Prop. (24.4.4.22).** If  $\lambda$  is dominant, then  $H_\lambda$  is exact. ┘

*Proof:* For any  $V \in \text{Rep}^{\text{fd}}(\mathfrak{g})$ , by (24.4.4.18),

$$\text{Hom}_{\mathfrak{g}}(V, {}_{\text{ad}}H_\lambda(M)) = \text{Hom}_{\mathfrak{g}}(V \otimes M_{\lambda-\rho}, M).$$

So the assertion follows from the fact that  $V \otimes M_{\lambda-\rho}$  is projective by (24.4.4.10). □

**Prop. (24.4.4.23) [Central Character of Harish-Chandra Bi-modules].** Let  $V \in \text{H-C}^{\text{fd}}(\mathfrak{g})$  and  $\lambda \in \mathfrak{h}^*$ , then

- The left central characters occurring in  $V \otimes U_{\chi_\lambda}$  are  $\chi_{\lambda+\nu}$  where  $\nu$  runs through weights of  $V$ .
- Let  $M$  be a left  $\mathfrak{g}$ -module with central character  $\chi_\lambda$ , then the central characters of  $V \otimes M$  are among  $\chi_{\lambda+\nu}$  where  $\nu$  runs through weights of  $V$ .
- If  $M \neq 0 \in \text{H-C}(\mathfrak{g})$  with left and right central characters  $(\chi_\lambda, \chi_\mu)$ , then there exists  $w \in W$  s.t.  $w_\bullet \lambda - \mu \in P$ .

┘

*Proof:* Cf.[Rep of Lie Groups, Etingof]P60. ?

2: This follows from 1 and the isomorphism  $V \otimes M = (V \otimes U_{\chi_\lambda}) \otimes_{U_{\chi_\lambda}} M$ .

3: ? By (24.4.4.16), any irreducible  $\mathfrak{g}$ -bimodule is a quotient of  $V \otimes U_{\chi_\lambda}$  for some  $V \in \text{Rep}(\mathfrak{g})$  and  $\lambda \in \mathfrak{h}^*$ , then □

**Prop. (24.4.4.24).** There is a decomposition of categories

$$\text{H-C}(\mathfrak{g}) = \bigoplus_{\gamma, \lambda} \text{H-C}_{\chi_{\lambda+\gamma}, \chi_\gamma}(\mathfrak{g})$$

where  $\gamma \in P_+$  and  $\lambda \in \mathfrak{h}^*/\text{Stab}_W(\gamma)_\bullet$ . ┘

*Proof:* Cf.[Rep of Lie Groups, Etingof]P60. ? □

### Principle Series

**Def. (24.4.4.25) [Principle Series].** For  $\lambda, \mu \in \mathfrak{h}^*$  with  $\lambda - \mu \in P$ , define the **principle series representation**  $M(\lambda, \mu) = \text{Hom}_{\text{fin}}(M_{\lambda-\rho}, M_{\mu-\rho}^\vee) \in \text{H-C}_{\chi_\mu, \chi_\lambda}(\mathfrak{g})$ . ? ┘

### Projective Functors

**Def. (24.4.4.26)**  $[\text{Rep}(\mathfrak{g})_f]$ . Denote by  $\text{Rep}(\mathfrak{g})_f$  the category of representations of  $\mathfrak{g}$  with locally finite action of  $Z(\mathfrak{g})$ . Then there is a decomposition of categories:

$$\text{Rep}(\mathfrak{g})_f = \bigoplus_{\chi \in \mathfrak{h}^*/W_\bullet} \text{Rep}(\mathfrak{g})_\chi,$$

where  $\text{Rep}(\mathfrak{g})_\chi$  is the subcategory of modules with generalized central character  $\chi$ .  $\lrcorner$

**Def. (24.4.4.27)**  $[F_V]$ . For  $V \in \text{Rep}^{\text{fd}}(\mathfrak{g})$ , there is an endofunctor  $F_V$  of  $\text{Rep}(\mathfrak{g})_f$  given by  $M \mapsto (V \otimes M)$ . When  $M \in \text{Rep}^{\text{fd}}(\mathfrak{g})_{\chi_\lambda}$ ,  $F(M) = (V \otimes U_{\chi_\lambda}) \otimes_{U_{\chi_\lambda}} M$ , so by (24.4.4.23),

$$F(\text{Rep}(\mathfrak{g})_{\chi_\lambda}) \subset \bigoplus_{\beta \in P(V)} \text{Rep}(\mathfrak{g})_{\chi_\lambda + \beta}.$$

$\lrcorner$

**Prop. (24.4.4.28)**. For  $V \in \text{Rep}^{\text{fd}}(\mathfrak{g})$ ,  $F_{V^*}$  is both left and right adjoint to  $F_V$ .  $\lrcorner$

**Def. (24.4.4.29)** **[Projective Functors]**. A **projective functor of representations** is an endofunctor of  $\text{Rep}(\mathfrak{g})_f$  that is isomorphic to a direct sum of some  $F_V$  where  $V \in \text{Rep}^{\text{fd}}(\mathfrak{g})$ .  $\lrcorner$

**Prop. (24.4.4.30)** **[Projective Functors]**.

- For  $\chi \in \mathfrak{h}^*/W$ , the projection functor to the generalized  $\chi$ -part:  $\Pi_\chi : \text{Rep}(\mathfrak{g})_f \rightarrow \text{Rep}(\mathfrak{g})_\chi$  is a projective functor.
- The category of projective functors form a category which is closed under taking compositions, direct summands and finite direct sums.
- Every projective functor has a left and right adjoint, and the left and right adjoints are equal. ?
- Every projective functor  $F$  has a decomposition  $F = \bigoplus_{\theta, \chi \in \mathfrak{h}^*/W} \Pi_\theta \circ F \circ \Pi_\chi$ .  $\lrcorner$

**Def. (24.4.4.31)** **[Projective  $\chi$ -Functors]**. For  $\chi \in \mathfrak{h}^*/W_\bullet$  and a projective functor  $F$  (24.4.4.29), denote  $F(\chi)$  the restriction of  $F$  to  $\text{Rep}(\mathfrak{g})_\chi^1$ , where  $\text{Rep}(\mathfrak{g})_\chi^1$  is the subcategory of  $\text{Rep}(\mathfrak{g})_\chi$  of modules with central character  $\chi$ .

Then a **projective  $\chi$ -functor** is defined to be an functor from  $\text{Rep}(\mathfrak{g})_\chi^1$  to  $\text{Rep}(\mathfrak{g})_f$  that is isomorphic to a direct sum of some  $F_V(\chi)$  where  $V \in \text{Rep}^{\text{fd}}(\mathfrak{g})$ .  $\lrcorner$

**Prop. (24.4.4.32)**. Let  $\lambda \in \mathfrak{h}^*$  be dominant,  $\chi = \chi_\lambda$  and  $F_1, F_2$  be projective  $\chi$ -functors, then the map

$$\text{Hom}(F_1, F_2) \rightarrow \text{Hom}(F_1(M_{\lambda-\rho}), F_2(M_{\lambda-\rho}))$$

is an isomorphism.  $\lrcorner$

*Proof:* It suffices to prove for  $F_i = F_{V_i}(\theta)$ . Denote  $V = V_1^* \otimes V_2$ , then it suffices to show that

$$\text{Hom}(\text{Id}(\theta), F_V(\theta)) \rightarrow \text{Hom}_{\mathfrak{g}}(M_{\lambda-\rho}, V \otimes M_{\lambda-\rho})$$

is an isomorphism. By (3.6.6.2), the LHS is isomorphic to

$$\text{Hom}_{(U(\mathfrak{g}), U_\chi(\mathfrak{g}))}(U_\chi(\mathfrak{g}), V \otimes U_\chi(\mathfrak{g})) = (V \otimes U_\chi(\mathfrak{g}))^{\mathfrak{g}_{\text{ad}}}.$$

But then the desired isomorphism follows from the Duflo-Joseph theorem (24.4.4.20).  $\square$

**Prop. (24.4.4.33) [Lifting Morphisms of Projective Functors].** Let  $F_1, F_2$  be projective functors, then

- Every map  $\varphi : F_1(\chi) \rightarrow F_2(\chi)$  lifts to a map  $\widehat{\varphi} : F_1|_{\text{Reg}(\mathfrak{g})_\chi} \rightarrow F_2|_{\text{Reg}(\mathfrak{g})_\chi}$ .
- If  $F_1 = F_2$  and  $\varphi^2 = \varphi$ , then we can chose  $\widehat{\varphi}$  s.t.  $\widehat{\varphi}^2 = \widehat{\varphi}$ .
- If  $\varphi$  is an isomorphism, then so is  $\widehat{\varphi}$ .

┘

*Proof:*

□

**Cor. (24.4.4.34).** If  $F_1, F_2$  are projective functors, then any isomorphism  $F_1(M_{\lambda-\rho}) \cong F_2(M_{\lambda-\rho})$  lifts to an isomorphism  $F_1|_{\mathcal{R}\text{ep}(\mathfrak{g})_{\chi_\lambda}} \cong F_2|_{\mathcal{R}\text{ep}(\mathfrak{g})_{\chi_\lambda}}$ , and any decomposition  $F_1(M_{\lambda-\rho}) = \oplus M_i$  lifts to a decomposition  $F = \oplus F_i$  where  $F_i$  are projective functors and  $F_i(M_{\lambda-\rho}) = M_i$ .

In particular, any projective  $\chi$ -functor (24.4.4.31) is of the form  $F(\chi)$  for some projective functor  $F$ .

┘

*Proof:* In priori  $F_i$  are just projective  $\chi$ -functors, but they are in fact restrictions of a projective functor  $F_i \circ \Pi_i$  because we have a decomposition for each  $\chi \in \mathfrak{h}^*/W_\bullet$ , so

$$F = \bigoplus_{\chi} \bigoplus_i F_{\chi,i} \circ \Pi_{\chi}.$$

□

**Cor. (24.4.4.35) [Decompositions of Projective Functors].** For any projective functor  $F$  and  $\chi \in \mathfrak{h}^*/W_\bullet$ ,  $F \circ \Pi_{\chi}$  is a finite direct sum of indecomposable projective functors. In particular,  $F = \bigoplus_{\chi \in \mathfrak{h}^*/W_\bullet} F \circ \Pi_{\chi}$  is a direct sum of indecomposable projective functors.

┘

*Proof:* This follows from the fact  $F \circ \Pi_{\theta}(M_{\lambda-\rho}) \in \mathcal{O}$  is a finite sum of indecomposables (finite by (24.4.4.5)). And then we use (24.4.4.34). □

**Prop. (24.4.4.36) [Indecomposable Projective Functors].** If  $F$  is an indecomposable functor, then  $F = F \circ \Pi_{\chi}$ , and

- $F(M_{\lambda-\rho}) = 0$  if  $\chi \neq \chi_{\lambda}$ .
- $F(M_{\lambda-\rho}) = P_{\mu-\rho}$  for some  $\mu \in \mathfrak{h}^*$  if  $\lambda$  is dominant and  $\chi_{\lambda} = \chi$ .

┘

*Proof:* This is because  $F(M_{\lambda-\rho})$  is both indecomposable and projective. ?

□

$K_0(\mathcal{O}_{\mathfrak{g}})$

**Prop. (24.4.4.37) [BGG Reciprocity].** For  $\lambda, \mu \in \mathfrak{h}^*$ , if we define  $d_{\mu,\lambda}^* \in \mathbb{N}$  as

$$\text{ch}(P_{\lambda}) = \sum_{\mu} d_{\lambda,\mu}^* \text{ch}(M_{\lambda}) = \sum_{\mu} d_{\lambda,\mu}^* \frac{e^{\lambda}}{\prod_{\alpha \in \Phi^+} (1 - e^{-\alpha})} \quad (24.4.4.8),$$

then  $d_{\lambda,\mu}^* = d_{\lambda,\mu}$  (24.4.4.12).

┘

*Proof:* Cf. [Etingof] P66. ?

□

**Thm. (24.4.4.38) [Kazhdan-Lusztig Conjecture, Beilinson-Bernstein/Brylinski-Kashiwara].**

?

┘

*Proof:*

□

**Prop. (24.4.4.39)[Grothendieck Group of  $\mathcal{O}_{\mathfrak{g}}$ ].** The Grothendieck group  $K_0(\mathcal{O}_{\mathfrak{g}})$  is freely generated by  $\delta_{\lambda} = [M_{\lambda-\rho}]$ , and we can construct an inner product on  $K_0(\mathcal{O}_{\mathfrak{g}})$  by declaring this basis to be orthonormal.  $\lrcorner$

**Prop. (24.4.4.40).** Since projective functors are left/right adjoint thus exact, they define endomorphisms of  $K(\mathcal{O}_{\mathfrak{g}})$ . For example, if  $V \in \text{Rep}^{\text{fd}}(\mathfrak{g})$ , then

$$[F_V]\delta_{\lambda} = \sum_{\beta} m_V(\beta)\delta_{\lambda+\beta}$$

by (24.4.4.23).

And If  $P \in \mathcal{O}_{\mathfrak{g}}$  is projective, then for any  $M \in \mathcal{O}$ ,

$$([P], [M]) = \dim \text{Hom}(P, M).$$

⌋

*Proof:*

□

**Prop. (24.4.4.41).**

- If  $F_1, F_2$  are projective functors on  $\mathcal{O}$  with  $[F_1] = [F_2]$ , then  $F_1 = F_2$ .
- If  $(F, F')$  is an adjoint pair of projective functors on  $\mathcal{O}$ , then  $([F], [F'])$  is an adjoint pair on  $K(\mathcal{O})$ . In particular, the left and right adjoints of  $[F]$  are equal by (24.4.4.30).  $\lrcorner$

*Proof:* 1: By (24.4.4.32), it suffices to show that  $F_1(M_{\lambda-\rho}) = F_2(M_{\lambda-\rho})$  for any  $\lambda \in \mathfrak{h}^*$  projective. But these two elements are projective and have the same character, so they are equal.

2: It suffices to show that  $([F]x, y) = (x, [F']y)$ . By (24.4.2.22) and (24.4.4.10), it suffices to check for  $x = [P]$  where  $P \in \mathcal{O}$  is projective. But then the assertion follows from (24.4.4.40).  $\square$

## 24.6 Smooth Representations of Lie Groups

**Notation(24.6.0.1).**

- Use notations on representation theory defined in [Smooth Representations](#).
- Use notations on Lie groups defined in [Lie Groups](#).
- Let  $G \in \mathcal{L}ieGrp_{\text{cntd}}$  with Lie algebra  $\mathfrak{g}$ .
- Let  $K \leq G$  be a maximal compact subgroup.
- Denote  $\mathcal{Z} = Z(U(\mathfrak{g}))$ .
- Let  $(\pi, V) \in \text{Rep}(G)$ , where  $V$  is a separable Fréchet spaces over  $\mathbb{C}$  (Cf. [Casselman, Canonical extensions of Harish-Chandra modules to representations of  $G$ ] and [Wallach, Real reductive groups, 2]).

┘

References are [\[Kna94\]](#).

### 1 Smooth Vectors

**Prop.(24.6.1.1)[Left Invariant Differential Operators].** Consider its left and right regular action  $\lambda, \rho$  on  $C^\infty(G)$  [\(12.10.1.1\)](#). We may write  $dX$  for  $X \in \mathfrak{g}$  as the representation of  $\mathfrak{g}$  via  $\rho$ , then it commutes with  $\lambda$ . Then it induces a map of  $U(\mathfrak{g})$  to the ring of left  $G$ -invariant differential operators on  $G$ . [\(3.7.8.2\)](#).

┘

**Prop.(24.6.1.2)[Center element Bi-invariant].** For  $D \in Z(U(\mathfrak{g}))$ , the differential operator  $D$  defined in [\(24.6.1.1\)](#) is invariant under both left and right regular representations of  $G$ .

┘

*Proof:* The left invariance is general from [\(24.6.1.1\)](#), for the right invariance, Because  $G$  is connected, it suffices to prove invariance for a nbhd of identity of  $G$ , thus suffices to prove

$$\rho(g_t)D = D\rho(g_t), \quad g_t = \exp(tX).$$

For this, let  $\varphi(g, t) = (\rho(g_t)D - D\rho(g_t))(g)$  and take derivative w.r.t  $t$ , then it reads:

$$\frac{\partial}{\partial t}\varphi(g, t) = (DdX\rho(g_t)f - dX\rho(g_t)Df)(g) = dX\varphi(g, t)$$

because  $dX$  commutes with  $D$ . And also  $\varphi(g, 0) = 0$ , so by lemma [\(24.6.1.3\)](#),  $\varphi(g, t) = 0$  for any  $t, g$ .

□

**Lemma(24.6.1.3).** If  $\varphi \in C^\infty(G \times \mathbb{R})$  satisfies

$$\frac{\partial}{\partial t}\varphi(g, t) = dX.\varphi(g, t)$$

for some  $X \in \mathfrak{g}$  and  $\varphi(g, 0) = 0$ , then  $\varphi = 0$ .

┘

*Proof:* Let  $\varphi_g(u, v) = \varphi(g \exp(uX), v)$ , then the condition says

$$\frac{\partial}{\partial u}\varphi_g(u, v) = \frac{\partial}{\partial v}\varphi_g(u, v),$$

which means  $\varphi_g(u, v) = F(u + v)$ , and the fact  $\varphi_g(u, 0) = 0$  shows  $F = 0$ .

□

**Cor.(24.6.1.4).** If  $G = \text{GL}(2; \mathbb{R})^+$ , then  $\mathfrak{g} = \mathfrak{gl}(2; \mathbb{R})$ , and the Casimir element [\(3.7.8.23\)](#)  $\Delta = -1/2(1/2h^2 + ef + fe)$  corresponds via [\(24.6.1.1\)](#) to a bi-invariant differential operator on  $C^\infty(G)$ , and it is called the **Laplace-Beltrami operator**.

┘

### Smooth Vectors

**Def. (24.6.1.5) [Smooth Vectors].** Define the subspace  $V^\infty \leq V$  of **smooth vectors** as  $V^\infty = \bigcap_n V^n$  where

$$V^0 = \{v \in V, \frac{\partial}{\partial t} \exp(t\xi)v \text{ exists, } \forall \xi \in \mathfrak{g}\}, \quad V^n = \{v \in V^{n-1}, T_\xi(v) \in V^{n-1}, \forall \xi \in \mathfrak{g}\}.$$

And  $V^\infty$  is given the inverse limit topology.

Then there is a Lie algebra action of  $\mathfrak{g}$  on  $V^\infty$ . ┘

**Prop. (24.6.1.6) [Action of Distribution on Smooth Vectors].** There is a continuous action of  $\text{Meas}_c(G)$  on  $V^\infty$ :  $T \mapsto \pi(T)$  compatible with the convolution structure on  $\text{Meas}_c(G)$ . ┘

*Proof:* For  $v \in V^\infty$ , define  $F^v(g) = g(v)$ . For  $T \in \text{Meas}_c(G)$ , define  $\pi(T)v = \langle T, F^v \rangle$ . For example,

- $\pi(\delta_x) = \pi(x)$ .
- $\pi(u) = u$  for  $u \in U(\mathfrak{g})$ .
- $\pi(f\mu_{\text{Haar}})v = \int_G f(g)\pi(g)v dg$  for  $f \in C_c(G)$ .
- $\pi(f * g) = \pi(f)\pi(g)$ .

□

**Cor. (24.6.1.7).** For any  $f \in C_c^\infty(G)$  and  $v \in V$ ,  $f\mu_{\text{Haar}} \cdot (v) \in V^\infty$ . ┘

*Proof:* Notice  $X\pi(f)v = \pi(X * f)v$ , and we calculate  $X * f$ :

$$(X * f, v) = \int \frac{d}{dt} \pi(e^{tX}y)vf(y)dy = \frac{d}{dt} \int f(y)\pi(e^{tX}y)v dy = \frac{d}{dt} \int f(e^{-tX}y)\pi(y)v dy = \pi(f_X)v$$

where  $f_X(g) = \frac{d}{dt}(e^{-tX}g)|_{t=0}$  is smooth. Iterating, we can show  $\pi(f)v \in V^\infty$ . □

**Cor. (24.6.1.8) [Smooth Vectors Dense].**  $V^\infty$  is dense in  $V$ . ┘

*Proof:* Choose a smooth approximate identity (12.10.2.9)  $\{f_n\}$ , then  $f_n \cdot v \in V^\infty$  converges to  $v$  by continuity, and these vectors are smooth by (24.6.1.7). □

**Cor. (24.6.1.9).** For  $V \in \text{Rep}^{\text{fd}}(G)$ ,  $V^\infty = V$ . In particular, if  $G = K$  is compact, then  $V^{\text{fin}} \subset V^\infty$ . ┘

**Prop. (24.6.1.10) [Fréchet Topology on  $V^\infty$ ].** If  $V \in \mathcal{H}\text{ilbSpa}$ , we can define a Fréchet topology on  $V^\infty$  by the seminorms

$$\{\nu_{X_1, \dots, X_n} : v \mapsto \|X_1 \dots X_n \cdot v\|\}_{X_1, \dots, X_n \in \mathfrak{g}}.$$

Then  $V^\infty$  is complete in this topology. ┘

*Proof:* ? □

**Prop. (24.6.1.11) [Smooth Vectors in  $\mathbb{S}^1$ ].** Let  $K = \mathbb{S}^1$  and  $\rho$  be the regular representation of  $\mathbb{S}^1$  on the Hilbert space  $L^2(\mathbb{S}^1) = L^2[0, 2\pi]$ , then the smooth vectors in  $\rho$  are just precisely the elements of  $C^\infty(\mathbb{S}^1)$ . ┘

*Proof:* Take a Fourier expansion  $f(x) = \sum a_n e^{2\pi i n x}$ . Suppose  $f$  is a  $C^1$  vector, then there is a  $g(x) = \sum b_n e^{2\pi i n x}$  that  $\lim \frac{1}{t}(f_t - f) = g$ , so

$$\lim_{n \rightarrow \infty} \sum_n \left| \frac{1}{t}(e^{2\pi i n t} - 1)a_n - b_n \right|^2 = 0.$$

which means  $b_n = 2\pi i n a_n$ .

So if  $f$  is a  $C^\infty$  vector, then  $|a_n|$  decay rapidly, and  $f$  and all its derivatives converge absolutely so  $f$  is smooth. Conversely, integration shows the Fourier coefficients of any smooth function  $f$  decay rapidly. □

### Examples

**Prop. (24.6.1.12)**[Stone-Newmann]. The Schrödinger representation (12.11.1.21)  $\pi$  of the Heisenberg group  $H(\mathbb{R})$  acting on  $L^2(\mathbb{R})$  is unitary and irreducible, where  $\pi(p_a) = e^{iax}$ , and  $\pi(r_b) = T_b$ .  $\lrcorner$

**Prop. (24.6.1.13)**  $[\widetilde{\mathrm{SL}(2; \mathbb{R})}]$ . Let  $\widetilde{\mathrm{SL}(2; \mathbb{R})}$  be the universal covering of  $\mathrm{SL}(2; \mathbb{R})$ . Then  $\mathrm{Rep}^{\mathrm{fd}}(\widetilde{\mathrm{SL}(2; \mathbb{R})}) = \mathcal{R}\mathrm{ep}^{\mathrm{fd}}(\mathrm{SL}(2; \mathbb{R}))$ . In particular,  $\widetilde{SL_2(\mathbb{R})}$  admits no f.d. faithful representations, and the only quotient groups of it that admit f.d. faithful representations are  $SL_2(\mathbb{R})$  and  $\mathrm{PSL}(2; \mathbb{R})$ .  $\lrcorner$

*Proof:* Let  $\rho : \widetilde{\mathrm{SL}(2; \mathbb{R})} \rightarrow \mathrm{GL}(n; \mathbb{R})$  be a representation inducing a real Lie algebra representation  $\rho_*$ . Consider its complexification  $\rho \otimes \mathbb{C} : \widetilde{\mathrm{SL}(2; \mathbb{R})} \rightarrow \mathrm{GL}(n; \mathbb{C})$ . Because  $SL(2; \mathbb{C})$  is simply connected (16.6.3.1),  $\rho_* \otimes \mathbb{C}$  corresponds to a complex representation  $\rho' : \mathrm{SL}(2; \mathbb{C}) \rightarrow \mathrm{GL}(n; \mathbb{C})$  by (16.5.3.13). Now because  $\widetilde{SL_2(\mathbb{R})}$  is simply connected, so there is a real Lie group homomorphism  $\gamma : \widetilde{\mathrm{SL}(2; \mathbb{R})} \rightarrow \mathrm{SL}(2; \mathbb{C})$  that  $\rho' \circ \gamma = \rho$ . But because  $\rho, \rho'$  both commutes with conjugation, so does  $\gamma$ . Thus the image of  $\gamma$  is in  $\mathrm{GL}(2; \mathbb{R})$ , and  $\rho$  factors through  $\mathrm{SL}(2; \mathbb{R})$ .

There is a quotient map  $\pi : \widetilde{\mathrm{SL}(2; \mathbb{R})} \rightarrow \mathrm{PSL}(2; \mathbb{R})$ , and  $\mathrm{PSL}(2; \mathbb{R})$  has trivial center, so the center of  $\widetilde{\mathrm{SL}(2; \mathbb{R})}$  is contained in  $\ker(\pi)$ , which is isomorphic to  $\pi_1(\mathrm{PSL}(2; \mathbb{R})) = \mathbb{Z}$ , and is central in  $\widetilde{SL_2(\mathbb{R})}$  by (16.5.1.6). so the center of  $\widetilde{SL_2(\mathbb{R})}$  is just  $\mathbb{Z}$ . By what has been proved, for any representation of other covering space of  $\mathrm{PSL}_2(\mathbb{R})$ , the induced representation on  $\widetilde{SL_2(\mathbb{R})}$  factors through  $SL_2(\mathbb{R})$ , thus trivial on the subgroup  $2\mathbb{Z} \subset \mathbb{Z}$ , and the original representation factors through  $SL_2(\mathbb{R})$  or  $\mathrm{PSL}_2(\mathbb{R})$ . So the only possibility of faithful representation is  $SL_2(\mathbb{R})$  or  $\mathrm{PSL}_2(\mathbb{R})$ . For  $\mathrm{PSL}_2(\mathbb{R})$ , take the  $\square$

**Prop. (24.6.1.14)**[F.D. Representations of  $\mathrm{SL}(2; \mathbb{K})$ ]. Let  $\mathbb{K} = \mathbb{C}$  or  $\mathbb{R}$ , then the representations of  $\mathrm{SL}(2; \mathbb{K})$  are isomorphic to direct representations  $(\rho_n, V_n)$ , where  $V_n$  =homogeneous polynomials of degree  $n$  in indeterminants  $x, y$ , and

$$\rho_n \left( \begin{bmatrix} a & b \\ c & d \end{bmatrix} \right) (x^k y^{n-k}) = (ax + by)^k (cx + dy)^{n-k}.$$

$\lrcorner$

*Proof:* We can check these representations truly induce irreducible representations of their Lie algebras  $\mathfrak{sl}(2; \mathbb{K})$ . Notice  $\mathrm{SL}(2; \mathbb{C})$  is simply connected (16.6.3.1), so (24.6.1.13) and (16.5.3.13) gives the result.  $\square$

## 2 Finite-Dimensional Representations

**Prop. (24.6.2.1)**. Any 1 dimensional representations of  $\mathbb{C}^\times$  is of the form

$$z \mapsto z^\mu \bar{z}^\nu$$

for some  $\mu, \nu \in \mathbb{C}$  s.t.  $\mu - \nu \in \mathbb{Z}$ .  $\lrcorner$

**Prop. (24.6.2.2)**. Finite dimensional representations of a semisimple Lie group is completely reducible.  $\lrcorner$

*Proof:* This is because its Lie algebra representation is completely reducible by (24.4.1.2), and each Lie algebra subrepresentation corresponds to a Lie group subrepresentation.  $\square$

### Archimedean Weil-Groups

References are [Kna94].

**Def. (24.6.2.3) [Archimedean Weil Groups].** Define

$$W_{\mathbb{C}} = \mathbb{C}^{\times}, \quad W_{\mathbb{R}} = \mathbb{C}^{\times} \rtimes \text{Gal}(\mathbb{C}/\mathbb{R}).$$

┘

**Prop. (24.6.2.4) [Characters of  $W_{\mathbb{R}}$ ].** Characters of  $W_{\mathbb{R}}$  are parameterized by a pair  $(t, \epsilon) \in \mathbb{C} \times \{\pm 1\}$  as follows:  $(t, \epsilon)$  corresponds to the character  $\phi_{(\epsilon, t)}$  s.t.

$$\phi_{t, \epsilon}(x) = |x|^t, \quad \phi_{t, \epsilon}(\mathbf{c}) = \epsilon.$$

┘

*Proof:* ?

□

**Prop. (24.6.2.5) [Semisimple Representations of  $W_{\mathbb{R}}$ ].** If  $\rho \in \text{Rep}^{\text{fd}}(W_{\mathbb{R}})$  s.t.  $\rho(w)$  is semisimple for any  $w \in W_{\mathbb{R}}$ , then  $\rho$  is semisimple. And if  $\rho$  is irreducible, then  $\dim(\rho) \leq 2$ .

And equivalence classes of irreducible 2-dimensional semisimple representations of  $W_{\mathbb{R}}$  are parameterized by a pair  $(t, m) \in \mathbb{C} \times \mathbb{Z}_+$  as follows:  $(t, m)$  corresponds to the representation

$$\text{Ind}_{W_{\mathbb{C}}}^{W_{\mathbb{R}}} \chi_{t, m}, \quad \text{where } \chi_{t, m}(z) = |z|^t e^{m \arg(z)}, \forall z \in \mathbb{C}^{\times}.$$

┘

*Proof:* Easy because the restriction of  $\rho$  to  $\mathbb{C}^{\times}$  is diagonalizable.

□

### 3 $(\mathfrak{g}, K)$ -Modules

References are [Representations of Reductive Groups, Gaitsgory].

#### $(\mathfrak{g}, K)$ -Modules

**Def. (24.6.3.1)  $(\mathfrak{g}, K)$ -Modules.** If  $K \leq G$  be a maximal compact Lie subgroup (10.5.5.11), then  $K$  acts on  $\mathfrak{g}$  by Ad. Then a  $(\mathfrak{g}, K)$ -**module** is a  $\mathbb{C}$ -vector space with a  $K$ -finite action and a  $\mathfrak{g}$  action that satisfies:

- for  $k \in K, \eta \in \mathfrak{g}$ ,  $T_k T_{\eta} T_k^{-1} = T_{\text{Ad}_k(\eta)}$ .
- The action of  $\mathfrak{k}$  on  $V$  induced by  $K$  agrees with the restriction of the action of  $\mathfrak{g}$ .

An **admissible  $(\mathfrak{g}, K)$ -module** is a  $(\mathfrak{g}, K)$ -module  $V$  s.t.  $\dim V^{\rho} < \infty$  for any  $\rho \in \text{Irr}(K)$ . ┘

**Def. (24.6.3.2) [Contragradient  $(\mathfrak{g}, K)$ -Module].** If  $M$  is an admissible  $(\mathfrak{g}, K)$ -module, then we can define its **contragradient  $(\mathfrak{g}, K)$ -module** as

$$M^{\vee} = (M^*)^{\text{alg}} = \bigoplus_{\rho \in \text{Irr}(K)} (M^{\rho})^*,$$

which is the  $K$ -finite part of the usual dual of  $M$ , and  $\mathfrak{g}$  clearly acts on it. ┘

( $\mathfrak{g}, K$ )-Modules and  $\mathfrak{g}$ -Modules

**Def. (24.6.3.3).** Let  $K_0$  be the unital component of  $K$ , then there are forgetful functors

$$\mathrm{Mod}_{(\mathfrak{g}, K)} \rightarrow \mathrm{Mod}_{(\mathfrak{g}, K_0)} \rightarrow \mathrm{Mod}_{\mathfrak{g}}.$$

┘

**Prop. (24.6.3.4).** The functor  $\mathrm{Mod}_{(\mathfrak{g}, K_0)} \rightarrow \mathrm{Mod}_{\mathfrak{g}}$  is fully faithful, and its essential image is stable under taking submodules.

┘

*Proof:* Cf.[Gaitsgory P39].

□

**Cor. (24.6.3.5).** If  $M \in \mathrm{Mod}_{(\mathfrak{g}, K)}$  is irreducible as a  $\mathfrak{g}$ -module, then it is irreducible.

┘

**Prop. (24.6.3.6).** The functor  $\mathrm{Mod}_{(\mathfrak{g}, K)} \rightarrow \mathrm{Mod}_{\mathfrak{g}}$  sends f.g. objects to f.g. objects.

┘

*Proof:* By(24.6.3.4), it suffices to consider the functor  $(\mathfrak{g}, K) - \mathrm{mod} \rightarrow (\mathfrak{g}, K_0) - \mathrm{mod}$ . Let  $M$  be f.g.  $(\mathfrak{g}, K)$ -module, and  $\cup M_i = M$  be a chain of  $(\mathfrak{g}, K_0)$ -submodules. Pick  $k \in K$  for each element of  $\pi_0(K)(\mathrm{f.m.})$ , then each  $M'_i = \sum_k k(M_i)$  is a  $(\mathfrak{g}, K)$ -submodule, thus  $M'_i = M$  for some  $i$ . Now we can choose  $j$  large that  $k(M_i) \in M_j$  for any  $k$ , then  $M_j = M$  (because we may choose  $M_i$  be f.g.  $(\mathfrak{g}, K_0)$ -modules) ?.

□

**Cor. (24.6.3.7).** The category  $\mathrm{Mod}_{(\mathfrak{g}, K)}$  is Noetherian.

┘

*Proof:* If  $M \in \mathrm{Mod}_{(\mathfrak{g}, K)}$  is f.g. and  $M_1 \subset M$ , then  $M$  is f.g. as  $\mathfrak{g}$ -module, then  $M_1$  is f.g. as  $\mathfrak{g}$ -module by(3.7.8.17). So clearly it is also f.g. as a  $(\mathfrak{g}, K)$ -module.

□

**Prop. (24.6.3.8).** For an irreducible  $(\mathfrak{g}, K)$ -module  $M$ , the underlying  $\mathfrak{g}$ -module is a direct sum of f.m. irreducible components.

┘

*Proof:* By(24.6.3.4), it suffices to prove  $M$  is a direct sum of f.m. irreducible  $(\mathfrak{g}, K_0)$ -modules.  $M$  is f.g. as a  $(\mathfrak{g}, K_0)$ -modules by the proof of(24.6.3.6), so it has a maximal submodule  $M'$  that  $N = M/M'$  is irreducible. Pick  $k \in K$  for each component of  $K$ , consider

$$M'' = \bigcap_k k(M')$$

which is a proper  $(\mathfrak{g}, K)$ -submodule of  $M$ , so it is 0, Hence the map

$$M \rightarrow \oplus (N)^k$$

is injective, where  $N^k$  is  $N$  twisted by conjugate action of  $k$ , so it is a submodule of a semisimple-module, thus semisimple.

□

Properties of  $(\mathfrak{g}, K)$ -Modules

**Cor. (24.6.3.9) [Schur's Lemma].** Schur's lemma holds for irreducible  $(\mathfrak{g}, K)$ -modules.

┘

*Proof:* It suffices to show any endomorphism  $S$  of an irreducible  $(\mathfrak{g}, K)$ -module  $M$  has an eigenvalue. But  $S$  preserves  $M^\rho$  for any  $\rho$ , and  $M^\rho$  is of f.d, thus it has an eigenvalue over  $\mathbb{C}$ .

□

**Prop. (24.6.3.10).** Any irreducible  $(\mathfrak{g}, K)$ -module has a Banach space structure.

┘

*Proof:*

□

Action of  $Z(U(\mathfrak{g}))$ 

**Prop. (24.6.3.11).** Any  $M \in \text{Mod}_{(\mathfrak{g}, K)}$  decomposes as

$$M \cong \bigoplus_{\chi \in \text{Spec}(Z(U(\mathfrak{g})))} M_\chi$$

s.t.  $Z(U(\mathfrak{g}))$  acts on each  $M_\chi$  with a generalized character  $\chi$ . Let  $\text{Mod}_{(\mathfrak{g}, K)}^\chi$  be the full subcategory of  $(\mathfrak{g}, K)$ -modules on which  $Z(U(\mathfrak{g}))$  acts with a generalized character  $\chi$ . **?** Cf.[Gaitsgory P42].  $\lrcorner$

*Proof:*  $Z(U(\mathfrak{g}))$  commutes with  $G$  thus  $K$  action, so it preserves each  $M^\rho$ , which are of f.d..  $\square$

**Prop. (24.6.3.12).** The category  $\text{Mod}_{(\mathfrak{g}, K)}^\chi$  has only f.m. isomorphism classes of irreducible objects.  $\lrcorner$

*Proof:* Cf.[Gaitsgory].  $\square$

**Prop. (24.6.3.13).** If  $M$  is a f.g.  $(\mathfrak{g}, K)$ -module, then for any  $\rho$  of  $K$ ,  $M^\rho$  is f.g. over  $Z(U(\mathfrak{g}))$ .  $\lrcorner$

*Proof:* Cf.[Gaitsgory P43]. **?**  $\square$

**Prop. (24.6.3.14).** For  $M \in \text{Mod}_{(\mathfrak{g}, K)}^\chi$ , the following are equivalent:

- $M$  is f.g..
- $M$  is of finite length.
- $M$  is admissible.

$\lrcorner$

*Proof:*  $2 \rightarrow 1$  is trivial,  $1 \rightarrow 3$  is by (24.6.3.13) (Notice that  $Z(U(\mathfrak{g}))$  acts via  $\chi$ ).

For  $3 \rightarrow 2$ : Use (24.6.3.12), there are only f.m. irreducible classes  $\rho_\alpha$ , let  $\rho = \bigoplus_\alpha \rho_\alpha$ , then if there is a chain of length  $n$ , then there are at least  $n$  linearly independent morphisms in  $\text{Hom}_K(\rho, M)$ . Thus  $n$  is bounded, because  $\dim_K \text{Hom}_K(\rho, M)$  is finite because  $M$  is admissible.  $\square$

**Cor. (24.6.3.15).** The category  $\text{Mod}_{(\mathfrak{g}, K)}^\chi$  is Artinian (4.8.3.34).  $\lrcorner$

**Cor. (24.6.3.16).** Every irreducible  $(\mathfrak{g}, K)$ -module is admissible.  $\lrcorner$

*Proof:* Firstly irreducible module are in  $\text{Mod}_{(\mathfrak{g}, K)}^\chi$  for some  $\chi$ , and then use the proposition and (24.6.3.8).  $\square$

**Cor. (24.6.3.17) [Harish-Chandra Modules].** For a  $M \in \text{Mod}_{(\mathfrak{g}, K)}$ , the following conditions are equivalent:

- $M$  is f.g. and admissible.
- $M$  is f.g. and its support over  $\text{Spec}(Z(U(\mathfrak{g})))$  is finite.
- $M$  is admissible and its support over  $\text{Spec}(Z(U(\mathfrak{g})))$  is finite.
- $M$  is of finite length.

Then such modules are called a **Harish-Chandra module**.  $\lrcorner$

*Proof:* **?**  $\square$

## 4 Reductive Groups

References are [Vogan, Representations of real reductive Lie groups] and [Gaitsgory].

**Notation (24.6.4.1).**

- Let  $\mathbb{K} \in \{\mathbb{R}, \mathbb{C}\}$ .
- Let  $G \in \mathcal{R}\text{edGrp}/\mathbb{K}$  (which is relevant, thus the complex representations of  $G$  and  $G(\mathbb{K})$  are the same, by (10.5.5.8))
- Let  $\mathcal{K} \leq G(\mathbb{K})$  be a maximal compact subgroup (10.5.5.21).

┘

**Def. (24.6.4.2) [Admissible Representation].** Define  $V^{\text{alg}}, V^\rho, V^{K\text{-fin}}$  as in (24.7.3.8)(24.6.1.5).

$V$  is called an **admissible representation** of  $G(\mathbb{R})$  if  $\dim V[\rho] < \infty$  for any  $\rho \in \text{Irr}(K)$ . Notice this notion doesn't depend on the choice of  $K$ , by (10.5.5.8). ┘

**Prop. (24.6.4.3).** For any compact open subset  $K \leq G$  and  $\rho \in \text{Irr}(K)$ ,  $V^\infty \cap V[\rho]$  is dense in  $V[\rho]$ . ┘

*Proof:* ?

□

**Cor. (24.6.4.4).** If  $V$  is admissible, then for any compact open subset  $K \leq G$ ,  $V^{K\text{-fin}} \subset V^{\text{alg}}$  by (24.6.1.9). ┘

### Infinitesimal-Equivalence Classes

**Prop. (24.6.4.5) [Infinitesimal-Equivalence].** If  $V \in \text{Rep}^{\text{adm}}(G)$ , then  $V^{\mathcal{K}\text{-fin}} \in \text{Mod}_{(\mathfrak{g}, \mathcal{K})}^{\text{adm}}$  (24.6.3.1), and the map  $V \mapsto V^{\mathcal{K}\text{-fin}}$  induces a functor

$$\text{Rep}^{\text{adm}}(G) \rightarrow \text{Mod}_{(\mathfrak{g}, \mathcal{K})}^{\text{adm}}.$$

More generally, for any  $V \in \text{Rep}(G)$ ,  $V^\infty \cap V^{K\text{-fin}} \in \text{Mod}_{(\mathfrak{g}, \mathcal{K})}$ , but may not be admissible.

Two  $V_1, V_2 \in \text{Rep}^{\text{adm}}(G)$  are called **infinitesimal-equivalent** iff their images under this functor are isomorphic. ┘

*Proof:* By (24.6.4.4),  $\mathfrak{g}$  can act on  $V^{\mathcal{K}\text{-fin}}$ , and we check  $T_k T_\eta T_{k^{-1}} = T_{\text{Ad}_k \eta}$ , which is by definition. □

**Lemma (24.6.4.6) [Real Analytic Vectors, Harish-Chandra].** Let  $V \in \text{Rep}^{\text{adm}}(G)$  and  $v \in V^{K\text{-fin}}$ , then for any  $\eta \in V^*$ , the function  $g \mapsto \eta(g(v))$  is real analytic on  $G$ , i.e.  $v$  is **weakly-analytic**. ┘

*Proof:* Cf. [Gaitsgory P37].

□

**Prop. (24.6.4.7) [ $\text{Rep}^{\text{adm}}(G)$  and  $\text{Mod}_{(\mathfrak{g}, K)}$ ].**

1. For  $V_1, V_2 \in \text{Rep}^{\text{adm}}(G)$ , if  $S : V_1 \rightarrow V_2 \in \text{TVS}$  s.t.  $S(V_1^{K\text{-fin}}) \subset V_2^{K\text{-fin}}$  and induces a map of  $(\mathfrak{g}, K)$ -modules, then  $S$  is a map of  $G$ -representations.
2. If  $V \in \text{Rep}^{\text{adm}}(G)$ ,  $M = V^{K\text{-fin}}$ , then the functors

$$\{V_1 \subset V\} \mapsto \{V_1^{K\text{-fin}} \subset M\} : (M_1 \subset M) \mapsto \overline{M_1} \subset V$$

induces mutually inverse bijections between  $G$ -subrepresentations of  $V$  and  $(\mathfrak{g}, K)$ -submodules of  $M$ .

┘

*Proof:* 1: It suffices to show for  $v_1 \in V^{K\text{-fin}}$  that  $T_g S(v_1) = S(T_g(v_1))$ . By Hahn-Banach it suffices to show for any  $\eta \in V_2^*$ ,

$$\eta(T_g S(v_1)) = \eta(S(T_g(v_1))).$$

Both sides are analytic in  $g$  by (24.6.4.6), so it suffices to show all their derivatives at 1 are equal, and use the fact  $\pi_0(K) \rightarrow \pi_0(G)$  is surjective (10.5.5.11). And the derivatives equal because  $S$  commutes with  $\mathfrak{g}$ -action.

2: Firstly  $\overline{M}_1$  is a  $G$ -representation: because  $\overline{M}_1 = ((M_1)^\perp)^\perp$  by Hahn-Banach. So it suffices to show for  $v_1 \in M_1$ ,  $\eta(g(v_1)) = 0$  for any  $\eta \in (M_1)^\perp$ . Then this uses analyticity (24.6.4.6) as above and the fact  $M_1$  is a  $(\mathfrak{g}, K)$ -subrepresentation.

For the bijection, notice  $V_1^{K\text{-fin}}$  is dense in  $V_1$  by (24.7.3.18). Conversely, for a  $(\mathfrak{g}, K)$ -submodule  $M_1$ , it suffices to show the image of  $T_{\xi_\rho \mu_{\text{Haar}}}(\overline{M}_1) \subset M_1^\rho$ , by (24.7.3.14). However  $T_{\xi_\rho \mu_{\text{Haar}}}(M_1) \in M_1^\rho$  by (24.7.3.14), so this is true by continuity.  $\square$

**Cor. (24.6.4.8) [Irreducibility of  $(\mathfrak{g}, K)$ -Modules].** For  $V \in \text{Rep}^{\text{adm}}(G)$ ,  $V$  is irreducible iff  $V^{\mathcal{K}\text{-fin}}$  is irreducible as  $(\mathfrak{g}, \mathcal{K})$ -modules.  $\text{┘}$

**Cor. (24.6.4.9) [Irreducible Unitary Representation Determined by Finite Part].** If  $V_1, V_2 \in \text{Irr}^{\text{uni}}(G)$  are infinitesimally-equivalent (24.6.4.5), then they are isomorphic.  $\text{┘}$

*Proof:* Firstly they are admissible by (24.7.5.7), so we can talk about their corresponding  $(\mathfrak{g}, K)$ -modules  $M_i$ , then  $V_i$  are the Hilbert space completion of  $M_i$  by (24.6.4.7).

Now each  $V_i$  has Hermitian forms, so  $V_i^\infty \cong (V_i^*)^\infty$ , and if  $S : V_1^\infty \cong V_2^\infty$ , then  $S^* S$  is an automorphism of  $V_1^\infty$ , thus by (24.6.4.8)(24.6.3.9) it is a scalar map, so after a scalar change, we may assume  $S$  preserves Hermitian structure thus induces an isomorphism of vector spaces  $V_1 \cong V_2$  by continuity. So by (24.6.4.7) it is an isomorphism of  $G$ -representations.  $\square$

**Def. (24.6.4.10) [Irreducible Unitarizable  $(\mathfrak{g}, \mathcal{K})$ -Modules].** An irreducible **unitarizable  $(\mathfrak{g}, \mathcal{K})$ -module** is an irreducible  $(\mathfrak{g}, \mathcal{K})$ -module  $M \in \text{Mod}_{(\mathfrak{g}, \mathcal{K})}^{\text{adm}}$  (24.6.3.1) s.t. it is the  $\mathcal{K}$ -finite part of some unitary representation  $V \in \text{Irr}^{\text{uni}}(G(\mathbb{K}))$  (24.6.4.5). By (24.6.4.8)(24.7.5.7) and (24.6.4.8), such a unitary representation  $V$  is uniquely determined if  $M$  is unitarizable.  $\text{┘}$

### Matrix Coefficients

**Def. (24.6.4.11) [Tempered Representations].**  $\pi \in \text{Irr}^{\text{adm}}(G(\mathbb{K}))$  is called an

- **square-integrable representation(Archimedean)** or **discrete series(Archimedean)** if its matrix coefficients are all contained in  $L^2(G(\mathbb{K}))$  for any  $\varepsilon \in \mathbb{R}_+$ .
- **essentially square-integrable representation(Archimedean)** if the restriction of its matrix coefficients of  $\pi$  to  $G(K)^1$  (20.5.1.2) are all contained in  $L^2(G(\mathbb{K})^1)$  for any  $\varepsilon \in \mathbb{R}_+$ .
- **tempered representation(Archimedean)** if its matrix coefficients are all contained in  $L^{2+\varepsilon}(G(\mathbb{K}))$  for any  $\varepsilon \in \mathbb{R}_+$ .
- **essentially tempered representation(Archimedean)** if the restriction of its matrix coefficients of  $\pi$  are all contained in  $L^{2+\varepsilon}(G(\mathbb{K})^1)$  (20.5.1.2) for any  $\varepsilon \in \mathbb{R}_+$ .

┘

**Prop. (24.6.4.12) [Discrete Series are Unitarizable].** Discrete-series of  $G(\mathbb{K})$  (24.6.4.11) can be realized as subrepresentations of  $L^2(G(\mathbb{K}))$ . In particular, they are always unitarizable.  $\text{┘}$

*Proof:* Cf. [Dixmier,  $C^*$ -algebras] Chap14. ?

 $\square$

**Irreducible Admissible  $(\mathfrak{g}, K)$ -Modules of  $\mathrm{GL}(n; \mathbb{R})$** **Thm. (24.6.4.13)** [Classification of  $\mathrm{Irr}_{(\mathfrak{g}, K)}^{\mathrm{adm}}(\mathrm{GL}(n; \mathbb{R}))$ ]. ┘

*Proof:* ? Cf. [Knapp and G. Zuckerman, Classification theorems for representations of semisimple Lie groups]. □

**Prop. (24.6.4.14)** [Lie Theory]. For  $V \in \mathrm{Mod}_{(\mathfrak{g}, K)}^{\mathrm{adm}}(\mathrm{GL}(2; \mathbb{R})^+)$ ,

- $V^k$  is the space of all vectors  $x \in V$  that  $Hx = kx$ .
- If  $x \in V^k$ , then  $Rx \in V^{k+2}, Lx \in V^{k-2}$ .
- If  $0 \neq x \in V^k$ , then  $\mathbb{C}x = V^k, \mathbb{C}R^n x = V^{k+2n}, \mathbb{C}L^n x = V^{k-2n}$  and

$$V = \mathbb{C}x \oplus \bigoplus_{n>0} \mathbb{C}R^n x \oplus \bigoplus_{n>0} \mathbb{C}L^n x.$$

- Suppose  $\Delta = \lambda$  on  $V$ , then if  $x \in V^k$ , then

$$LRx = (-\lambda - \frac{k}{2}(1 + \frac{k}{2}))x, \quad RLx = (-\lambda + \frac{k}{2}(1 - \frac{k}{2}))x.$$

┘

*Proof:* 1: Let  $W = iH$ . If  $x \in V^k$ , then

$$Wx = \frac{\partial}{\partial t} \pi(e^{tW})x = \frac{d}{dt} \pi(k_t)x = \frac{d}{dt} e^{ikt}x = ikx$$

thus  $Hx = kx$ . And we know  $V$  decomposes as direct sums of representations of  $K$  (24.7.3.5), thus the result follows.

2: Clear from (3.7.2.11).

3: Because the RHS is a  $\mathfrak{g}$ -submodule, by representation of  $\mathfrak{sl}_2(\mathbb{C})$  (24.4.1.11). And it is also a  $K$ -subrepresentation, by item1.

4: By (24.4.1.11). □

**Cor. (24.6.4.15)** [Non-Discrete Case]. For any  $\lambda, \mu \in \mathbb{C}$  that  $\lambda \neq \frac{k}{2}(1 + \frac{k}{2})$  for  $k$  even/odd, there exists at most one isomorphism class of irreducible admissible even/odd  $(\mathfrak{g}, K)$ -module  $V$  on which  $\Delta, I$  acts by  $\lambda, \mu$  respectively, and the  $K$ -type is one vector  $f_k$  for each  $k \in \mathbb{Z}$ . ┘

*Proof:* This follows from the classification of representation of  $\mathfrak{sl}(2; \mathbb{C})$  (24.4.1.11). Notice the action of  $K$  is controlled by (24.6.4.14) item1. □

**Cor. (24.6.4.16)** [Discrete Case]. Let  $k \in \mathbb{Z}^+$  and  $\lambda = \frac{k}{2}(1 + \frac{k}{2})$ . Let  $V$  be an irreducible admissible  $(\mathfrak{g}, K)$ -module with parity equals  $k$ , Let  $\Sigma$  be the  $K$ -types of  $V$ , then  $\Sigma$  is one of the following sets:

- $\Sigma^+(k) = \{l \in \mathbb{Z} | l \equiv k \pmod{2}, l \geq k\}$
- $\Sigma^-(k) = \{l \in \mathbb{Z} | l \equiv k \pmod{2}, l \leq -k\}$
- $\Sigma^0(k) = \{l \in \mathbb{Z} | l \equiv k \pmod{2}, -k < l < k\}$

And there are at most one isomorphism class with each  $\Sigma$ . ┘

*Proof:* This follows from the classification of representation of  $\mathfrak{sl}(2; \mathbb{C})$  (24.4.1.11). Notice the action of  $K$  is controlled by (24.6.4.14) item1. □

**Def. (24.6.4.17)**  $[H(s_1, s_2, \varepsilon)]$ . If  $\lambda \geq 1/4$ , let  $s - 1/2$  be the square root of  $1/4 - \lambda$  which is imaginary, and let  $s_1, s_2$  be determined that  $\mu = s_1 + s_2, s = \frac{1}{2}(s_1 - s_2 + 1)$ .

Consider the 1-dimensional representation  $\sigma$  of  $B(\mathbb{R})^+$  that

$$\sigma\left(\begin{bmatrix} y_1 & x \\ & y_2 \end{bmatrix}\right) = \operatorname{sgn}(y_1)^\varepsilon |y_1|^{s_1} |y_2|^{s_2},$$

If  $s_1, s_2$  are purely imaginary (i.e.  $\mu$  is purely imaginary), then this representation is unitary, and we can consider the induced representation on  $\operatorname{GL}(2; \mathbb{R})^+$  (24.7.4.3), then it is a unitary representation of  $\operatorname{GL}(2; \mathbb{R})^+$ . For  $f \in \operatorname{ind}_{B(\mathbb{R})^+}^G \sigma$ ,

$$f\left(\begin{bmatrix} y_1 & x \\ & y_2 \end{bmatrix} g\right) = \operatorname{sgn}(y_1) |y_1|^{s_1+1/2} |y_2|^{s_2-1/2} f(g)$$

and

$$(f_1, f_2) = \frac{1}{2\pi} \int_0^{2\pi} f_1(k_\theta) \overline{f_2(k_\theta)} d\theta.$$

so  $H(s_1, s_2, \varepsilon)$  is identical to  $L^2[-\pi/2, \pi/2]$  by Iwasawa decomposition (16.6.1.3). Then its  $K$ -finite vectors can be determined, which are sums of

$$f_l(g) = u^{s_1+s_2} y^s e^{il\theta}, l \equiv \varepsilon \pmod{2}.$$

so  $H(s_1, s_2, \varepsilon)$  is admissible.

Even if  $\mu$  is not purely imaginary, we can still define  $H(s_1, s_2, \varepsilon)$  as above, and we consider its smooth vectors  $H^\infty(s_1, s_2, \varepsilon)$ , which are just the smooth functions in  $H(s_1, s_2, \varepsilon)$ , by (24.6.1.11).  $\square$

**Prop. (24.6.4.18).** We can define the regular action of  $G$  on  $H(s_1, s_2, \varepsilon)$  (but may not be unitary), and the subspace  $H^\infty(s_1, s_2, \varepsilon)$  is the space of smooth vectors for this representation.  $\square$

*Proof:* It suffices to define the regular action of  $G$  on  $H^\infty(s_1, s_2, \varepsilon)$  and show it is a bounded operator, so that it can be extended to  $H(s_1, s_2, \varepsilon)$  by continuity.

By Cartan decomposition (16.5.5.1),  $G$  is generated by  $K$  and diagonal matrices of positive entries.  $\rho(K)$  clearly preserves the inner product, so it suffices to consider these matrices.

By (26.1.2.2) and the calculation  $d\theta' = y_1 y_2 D(\theta)^{-2} d\theta$ , we have

$$\int_0^{2\pi} |\pi(\operatorname{diag}(y_1, y_2)) f(k_\theta)|^2 d\theta = (y_1 y_2)^{s_1-1/2} \int_0^{2\pi} D(\theta)^{-s_1+s_2+1} |f(k_{\theta'})|^2 d\theta'.$$

where

$$\theta' = \arctan\left(\frac{y_1}{y_2} \tan \theta\right), \quad D(\theta) = \sqrt{y_1^2 \sin^2 \theta + y_2^2 \cos^2 \theta}.$$

$D(\theta)$  is bounded above and below, thus  $\pi(\operatorname{diag}(y_1, y_2))$  is a bounded operator. Also to show this representation is continuous, it suffices to show for  $|f|_2$  small and  $y_1, y_2$  small,  $|\pi(\operatorname{diag}(y_1, y_2)) f|_2$  is small. And this is also a consequence of the above formula.  $\square$

**Lemma (24.6.4.19).** For  $f_l \in H(s_1, s_2, \varepsilon)$  as in (24.6.4.17), we have

$$H f_l = l f_l, \quad R f_l = \left(s + \frac{l}{2}\right) f_{l+2}, \quad L f_l = \left(s - \frac{l}{2}\right) f_{l-2}, \quad \Delta f_l = \lambda f_l, \quad I f_l = \mu f_l$$

$\square$

*Proof:* Clear from (26.1.2.5) and definition of  $f_l$  (24.6.4.17).  $\square$

**Prop. (24.6.4.20) [Existence of  $(\mathfrak{g}, K)$ -Modules].** Let  $s = \frac{1}{2}(s_1 - s_2 + 1)$ ,  $\lambda = s(1 - s)$ ,  $\mu = (s_1 + s_2)$ , then (subquotients) of the  $(\mathfrak{g}, K)$ -module  $\mathfrak{H}$  of  $H(s_1, s_2, \varepsilon)$  afford classes in (24.6.4.15) and (24.6.4.16). More precisely,  $\Delta$  and  $I$  acts by scalars  $\lambda, \mu$  respectively, and

- If  $s$  is not of the form  $k/2$ ,  $k \equiv \varepsilon \pmod{2}$ , then  $\mathfrak{H}$  is irreducible.
- If  $s \geq 1/2$  and  $s = \frac{k}{2}$  where  $k \geq 1$  is an integer that  $k \equiv \varepsilon \pmod{2}$ , then  $\mathfrak{H}$  has two irreducible invariant subspaces  $\mathfrak{H}_+, \mathfrak{H}_-$  with  $K$ -types  $\Sigma_+, \Sigma_-$  respectively, and the quotient  $\mathfrak{H}/\mathfrak{H}_+ \oplus \mathfrak{H}_-$  is irreducible and has  $K$ -type  $\Sigma^0(k)$ .
- If  $s \leq 1/2$  and  $s = 1 - \frac{k}{2}$  where  $k \geq 1$  is an integer that  $k \equiv \varepsilon \pmod{2}$ . Then  $\mathfrak{H}$  has an invariant subspace  $\mathfrak{H}^0$  with  $K$ -types  $\Sigma^0(k)$  and the quotient  $\mathfrak{H}/\mathfrak{H}^0$  decomposes into two irreducible invariant subspaces  $\mathfrak{H}^+, \mathfrak{H}^-$  with  $K$ -types  $\Sigma_+, \Sigma_-$  respectively.

┘

*Proof:* The action of  $H, R, L, \Delta, I$  is all clear from (24.6.4.19), and the decomposition and irreducibility is all clear from the representation theory of  $\mathfrak{sl}_2$  and (24.6.4.15)(24.6.4.16).  $\square$

**Prop. (24.6.4.21) [List of Irreducible Admissible  $(\mathfrak{g}, K)$ -Modules for  $\mathrm{GL}(2; \mathbb{R})^+$ ].** Every irreducible admissible  $(\mathfrak{g}, K)$ -module may be realized as the space of  $K$ -finite vectors in an admissible representation of  $G$  on a Hilbert space. Let  $\lambda, \mu \in \mathbb{C}$ , and  $\varepsilon = 0, 1$ .

- If  $\lambda$  is not of the form  $\frac{k}{2}(1 - \frac{k}{2})$ , where  $k \equiv \varepsilon \pmod{2}$ , then there exists a unique irreducible admissible  $(\mathfrak{g}, K)$ -module of parity  $\varepsilon$  on which  $\Delta, I$  acts by scalars  $\lambda, \mu$ , denoted by  $P_\mu(\lambda, \varepsilon)$ . These are called the **principal series**.
- If  $\lambda = \frac{k}{2}(1 - \frac{k}{2})$  for some  $1 \leq k \equiv \varepsilon \pmod{2}$ , then there exists three (two for  $k = 1$ ) irreducible admissible  $(\mathfrak{g}, K)$ -module of parity  $\varepsilon$  on which  $\Delta, I$  acts by scalars  $\lambda, \mu$ . Their  $K$ -types are  $\Sigma^\pm, \Sigma^0$  respectively. The irreducible admissible  $(\mathfrak{g}, K)$ -modules of  $K$ -types  $\Sigma^\pm$  are denoted by  $D_\mu^\pm(k)$ . If  $k > 1$ ,  $D_\mu^\pm(k)$  are called **discrete-series** and for  $k = 1$  they are called **limits of discrete-series**.

┘

*Proof:* This is a consequence of (24.6.4.15)(24.6.4.16) and (24.6.4.20).  $\square$

**Prop. (24.6.4.22) [List of Irreducible Admissible  $(\mathfrak{g}, K)$ -Modules for  $\mathrm{GL}(2; \mathbb{R})$ ].** Let  $\mu \in \mathbb{C}$ , and  $\varepsilon = 0, 1$ .

- The f.d. representations are obtained by tensoring the symmetric powers of the standard representation of  $G$  with the 1-dimensional representation of the form  $\chi \circ \det$ .
- If  $\chi_1, \chi_2$  are quasi-characters of  $\mathbb{R}^*$  that  $\chi_1 \chi_2^{-1}$  is not of the form  $y \mapsto \mathrm{sgn}(y)^\varepsilon |y|^{k-1}$ , where  $k \equiv \varepsilon \pmod{2}$ , then there is a irreducible  $(\mathfrak{g}, \mathrm{O}(2; \mathbb{R}))$ -module  $\pi(\chi_1, \chi_2)$ .
- If  $\mu \in \mathbb{R}$  and  $k \geq 1$  is an integer, then there are representations  $D_\mu(k) = (D_\mu^+(k) \oplus D_\mu^-(k))$ , called **discrete series** if  $k \geq 2$  and **limits of discrete series** if  $k = 1$ .

┘

*Proof:* Use (24.1.1.12) on  $\mathrm{SO}(2; \mathbb{R}) \subset \mathrm{O}(2, \mathbb{R})$ . It turns out  $P_\mu(\lambda, \varepsilon)$  can be extended in two ways to a representation of  $\mathrm{O}(2, \mathbb{R})$ :  $H(s_1, \varepsilon_1, s_2, \varepsilon_2)$ , corresponding to item2. It is unitarizable as  $H(s_1, s_2, \varepsilon)$  is unitarizable.

The (limits of) discrete series are conjugate in pairs and combined to give a representation of  $\mathrm{O}(2, \mathbb{R})$ , which is item3. It is unitarizable as it is just  $H(s_1, s_2, \varepsilon)/\mathfrak{H}^0$ .

The case  $D_\mu^0(k)$  are also of type  $I$  and can be extended, and this irreducible representation are exactly the smooth parts of the symmetric representation of  $GL(2, \mathbb{R})$  twisted by  $\chi \circ \det$ .  $\square$

**Cor. (24.6.4.23) [Contragradient].** Let  $G = GL(2; \mathbb{R})$ ,  $K = O(2; \mathbb{R})$ ,  $(\pi, V)$  be an irreducible admissible  $(\mathfrak{g}, K)$ -module, then the contragradient  $\hat{\pi}$  is isomorphic to the  $(\mathfrak{g}, K)$ -module  $T'_k = T_{k-t}$  and  $T'_X = T_{X-t}$ .

And it is also isomorphic to  $\pi \otimes (\omega \circ \det)$ .  $\lrcorner$

*Proof:* This is a consequence of the classification of irreducible  $(\mathfrak{g}, K)$ -modules (24.6.4.21), where the  $K$ -type are unchanged, eigenvalues of  $\Delta$  are unchanged, and eigenvalue of  $I$  is changed to  $-\mu$ , so they are isomorphic.  $\square$

$\text{Irr}^{\text{adm}}(GL(n; \mathbb{K}))$

**Prop. (24.6.4.24).** Any  $\pi \in \text{Irr}^{\text{adm}}(GL(n; \mathbb{K}))$  is infinitesimally-equivalent to an isobaric sum  $\boxtimes_i \pi_i$  where each  $\pi_i \in \text{Irr}^{\text{adm}}(GL(n_i; \mathbb{K}))$  is essentially square-integrable.  $\lrcorner$

*Proof:* Cf. [Getz]P284.  $?$   $\square$

**Thm. (24.6.4.25) [Classifying  $\text{Irr}^{\text{adm}}(GL(n; \mathbb{R}))$  up to Infinitesimal-Equivalence].** Let  $n_1, \dots, n_r \in \{1, 2\}$  and  $n = \sum_i n_i$ , and  $\sigma_i \in \text{Irr}^{n_i}(W_{\mathbb{R}})$  with parameter  $t_i$   $?$ , then  $\lrcorner$

*Proof:*  $\square$

**Thm. (24.6.4.26) [Classifying  $\text{Irr}^{\text{adm}}(GL(n; \mathbb{C}))$  up to Infinitesimal Equivalence, Želobenko--Naimark].** Let  $\sigma_1, \dots, \sigma_n$  be 1-dimensional representations of  $\mathbb{C}^\times$  of the form  $\sigma_i(z) = \arg(z)^{l_i} |z|_{\mathbb{C}}^{t_i}$  where  $l_i \in \mathbb{Z}$ ,  $t_i \in \mathbb{C}$  (24.6.2.1) and  $\text{Re}(t_1) \geq \dots \geq \text{Re}(t_n)$ , then:

- $\sigma_1 \boxtimes \dots \boxtimes \sigma_n \in \text{Irr}^{\text{adm}}(GL(n; \mathbb{C}))$  has a unique quotient  $\sigma_1 \boxplus \dots \boxplus \sigma_n$ .
- Each  $\pi \in \text{Irr}^{\text{adm}}(GL(n; \mathbb{C}))$  is infinitesimally equivalent (24.6.4.5) to a representation of the form  $\sigma_1 \boxplus \dots \boxplus \sigma_n$ .
- Two such representations  $\sigma_1 \boxplus \dots \boxplus \sigma_n, \sigma'_1 \boxplus \dots \boxplus \sigma'_n$  are infinitesimal equivalent iff  $(\sigma_1, \dots, \sigma_n)$  is a permutation of  $(\sigma'_1, \dots, \sigma'_n)$ .  $\lrcorner$

*Proof:*  $?$   $\square$

### Langlands Classifications(Archimedean Local Langlands Correspondence)

References are [Lan89, Kal16a], [Langlands-Shelstad. On the definition of transfer factors].

**Prop. (24.6.4.27) [Langlands Correspondence for  $GL(n; \mathbb{C})$ ].** For any  $\phi \in \text{Rep}_{\text{ss}}^{\text{fd}}(W_{\mathbb{C}})$  of the form  $\phi \cong \text{diag}(\sigma_1, \dots, \sigma_n)$ , we define  $\pi(\rho) = \sigma_1 \boxplus \dots \boxplus \sigma_n \in \text{Irr}^{\text{adm}}(GL(n; \mathbb{C}))$  (24.6.4.26). Then this induces a bijection between equivalence classes in  $\text{Rep}^{n, \text{ss}}(W_{\mathbb{C}})$  and equivalence classes in  $\text{Irr}^{\text{adm}}(GL(n; \mathbb{C}))$ , by (24.6.4.26).

And we have

$$L(\rho; s) = L(\pi(\rho); s), \quad \epsilon(\rho, \psi_v; s) = \epsilon(\pi(\rho), \psi_v; s) \text{ (31.1.1.5)(29.5.4.3)}.$$

$\lrcorner$

*Proof:* For the compatibility of  $L$  and  $\epsilon$ -factors, Cf.[Jacquet, Principal  $L$ -Functions].  $\square$

**Remark (24.6.4.28).** Langlands[Lan89] reduced the classification of irreducible admissible representations of  $G(\mathbb{R})$  to classification of the subset of irreducible tempered representations.

The set of irreducible tempered representations of semi-simple groups are classified by [Knapp-Zuckerman1982].  $\lrcorner$

**Thm. (24.6.4.29) [Archimedean Langlands Correspondence].** For  $K \in \{\mathbb{R}, \mathbb{C}\}$  and  $G \in \text{RedGrp}/K$ , the local Langlands correspondence(29.3.2.2) is true for  $G$ . In particular,  $\lrcorner$

*Proof:* ?  $\square$

**Remark (24.6.4.30)[ $L$ -Indistinguishable Representations, Shelstad].** Two phenomena contribute to this  $L$ -indistinguishability(29.3.2.2): discrete series with the same infinitesimal character, and reducibility of standard induced tempered representations. [Shelstad,  $L$ -indistinguishability for real group] has quantified the statement that these are the only contributing factors, and she has explored the consequences of  $L$ -indistinguishability.  $\lrcorner$

## 24.7 Unitary Representations of Locally Compact Groups

References are [Kna01, Fol16] and [Representation of Lie Groups notes, Etingof].

**Remark (24.7.0.1) [Non-compact Lie Groups].** In this section (continuous) representations of (possibly non-compact) LCG are considered. Notice the representations of compact groups is already considered in [Compact Group](#).

The feature of representations of non-compact groups is that most interesting representations are infinite dimensional and involves topologies.  $\lrcorner$

**Notation (24.7.0.2).**

- Use notations on locally compact groups defined in [Harmonic Analysis on Locally Compact Groups](#).
- Use notations on measure theory defined in [Measure Theory and Functions on  \$\mathbb{R}^n\$](#) .
- Let  $G \in \text{LCG}$ .
- Let  $\mu$  be a left Haar measure on  $G$  and  $\rho$  a right Haar measure on  $G$ .

$\lrcorner$

### 1 Basics

References are [Fol16]Chap3.

**Def. (24.7.1.1) [Unitarizable Representations].** A **unitary representations** of  $G$  is a representation  $\pi$  of  $G$  on a Hilbert space  $\mathcal{H}$  s.t.  $\text{Im}(\pi) \subset U(\mathcal{H})$  (12.7.4.7). The category of unitarizable representations of  $G$  is denoted by  $\text{Rep}^{\text{uni}}(G)$ .

$(\pi, \mathcal{H}) \in \text{Rep}^{\text{uni}}(G)$  is called an **irreducible unitary representation** if it has no non-trivial invariant closed subspaces. the category of Irreducible unitarizable representations of  $G$  is denoted by  $\text{Irr}^{\text{uni}}(G)$  or  $\hat{G}$ .  $\lrcorner$

**Prop. (24.7.1.2).** For a pre-Hilbert space  $\mathcal{H}$  and an action  $\pi : G \times \mathcal{H} \rightarrow \mathcal{H}$ ,  $\pi$  is continuous iff  $\pi : G \mapsto U(\mathcal{H})$  is continuous in the strong operator topology or the weak operator topology.  $\lrcorner$

*Proof:* By (12.7.4.7), the strong and weak operator topologies on  $U(\mathcal{H})$  are the same.

It is clear that if  $\pi : G \times \mathcal{H} \rightarrow \mathcal{H}$  is continuous then  $\pi : G \rightarrow U(\mathcal{H})$  is continuous in the strong operator topology. Conversely, use the inequality

$$\|\pi(g_1)\varphi_1 - \pi(g_2)\varphi_2\| = \|\varphi_1 - \pi(g_1^{-1}g_2)\varphi_2\| \leq \|\varphi_1 - \varphi_2\| + \|\varphi_2 - \pi(g_1^{-1}g_2)\varphi_2\|.$$

$\square$

**Example (24.7.1.3) [Left and Right Unitary Regular Representations].** The **left regular action** of  $G$  on  $L^2(G)$  is defined to be  $L_y f(x) = f(y^{-1}x)$ . The **right regular action** of  $G$  on  $L^2(G)$  is defined to be  $R_y f(x) = f(xy)$ .

These are continuous unitary representations of  $G$ , and they extends the representations on  $C_c(G)$  (12.10.1.1).

More generally, if  $G$  acts on the right on  $X \in \text{LCH}$  and  $\rho$  a right- $G$ -invariant Radon measure on  $X$  (12.3.1.22), then  $G$  has a right acts on  $L^2(X, \mu)$  by  $R_g(f)(x) = f(xg)$  for any  $f \in L^2(X, \rho)$  and  $g \in G$ .  $\lrcorner$

*Proof:* These follows from (12.10.1.2) and (24.7.1.13), using the fact  $C_c(X)$  is dense in  $L^2(X, \rho)$  (12.3.8.7).  $\square$

**Def. (24.7.1.4) [Intertwining Operators].** if  $\pi_1, \pi_2 \in \text{Rep}^{\text{uni}}(G)$ , then the space  $C(\pi_1, \pi_2)$  of **intertwining operators** of  $\pi_1, \pi_2$  as:

$$C(\pi_1, \pi_2) = \{T : \mathcal{H}_{\pi_1} \rightarrow \mathcal{H}_{\pi_2} : T\pi_1(x) = \pi_2(x)T, \quad \forall x \in G\}.$$

And denote  $C(\pi_1, \pi_1)$  by  $C(\pi_1)$ .  $\lrcorner$

**Lemma (24.7.1.5).** The adjoint operator  $S \mapsto S^*$  induces a bijection between the spaces  $C(\pi_1, \pi_2) \cong C(\pi_2, \pi_1)$ .  $\lrcorner$

**Prop. (24.7.1.6) [Cyclic Representations].** Every  $(\pi, \mathcal{H}_\pi) \in \text{Rep}^{\text{uni}}(G)$  is a direct sum of cyclic representations.  $\lrcorner$

*Proof:* Use Zorn's lemma, because for any proper-contained subspace  $V \subset \mathcal{H}_\pi$ , we can choose a non-zero element  $u \in V^\perp$ .  $\square$

**Lemma (24.7.1.7).** Suppose  $(\pi, \mathcal{H}_\pi) \in \text{Rep}^{\text{uni}}(G)$  and  $M \subset \mathcal{H}_\pi$  is a closed subspace. Let  $P$  be the orthogonal projection onto  $M$ , then  $M$  is invariant under  $\pi$  iff  $P \in C(\pi)$ .  $\lrcorner$

*Proof:* If  $P \in C(\pi)$  and  $v \in M$ , then  $\pi(x)v = \pi(x)Pv = P\pi(x)v \in M$ , so  $M$  is  $\pi$ -invariant. Conversely if  $M$  is  $\pi$ -invariant, then so does  $M^\perp$ , so  $\pi(x)Pv = \pi(x)v = P\pi(x)v$ , and also for  $v \in M^\perp$ , so  $\pi(x)P = P\pi(x)$ , for any  $x$ .  $\square$

**Prop. (24.7.1.8) [Schur's Lemma].**

- $\pi \in \text{Rep}^{\text{uni}}(G)$  is irreducible iff  $C(\pi)$  consists only of scalar multiples of identity.
- If  $\pi_1, \pi_2 \in \text{Irr}^{\text{uni}}(G)$  are non-equivalent, then  $C(\pi_1, \pi_2) = 0$ .  $\lrcorner$

*Proof:* 1: if  $\pi$  is reducible, then it contains a non-trivial projection by lemma (24.7.1.7). Conversely, if  $T \neq cI \in C(\pi)$ , then we consider  $A = \frac{1}{2}(T + T^*)$ ,  $B = \frac{1}{2i}(T - T^*)$ , then at least one of them are not  $cI$ . But they are normal, thus by symbolic calculus (12.9.3.3) any  $\chi_E(A)$  for some  $E \subset \mathbb{R}$  Borel is non-trivial (because the spectrum of  $A$  is not a single point) and commutes with  $\pi$ , so  $\mathcal{H}_\pi$  is reducible by (24.7.1.7) again.

2: By (24.7.1.5), for  $T \in C(\pi_1, \pi_2)$ ,  $T^* \in C(\pi_2, \pi_1)$ ,  $TT^* = cI$ ,  $T^*T = cI$ . so  $T = 0$  or  $c^{-1/2}T$  is unitary, and it is an isomorphism between  $\pi_1, \pi_2$ .  $\square$

**Cor. (24.7.1.9).** if  $G$  is Abelian, then  $\dim \pi = 1$  for any  $\pi \in \text{Irr}^{\text{uni}}(G)$ .  $\lrcorner$

*Proof:* If  $\pi$  is a representation of  $G$ , then any  $\pi(x)$  commutes with  $\pi$ , thus  $\pi(x) = c_x \text{id}$  for some  $c_x$ , so every subspace of  $\mathcal{H}_\pi$  is irreducible, thus  $\dim \mathcal{H} = 1$ .  $\square$

**Prop. (24.7.1.10) [Unitary Representations and  $L^1(G)$ -Representations].** Any  $(\pi, \mathcal{H}) \in \text{Rep}^{\text{uni}} G$  determines a non-degenerate \*-representation of  $L^1(G)$  (14.1.1.12) by

$$f \mapsto \pi(f) = \int f(x)\pi(g)d\mu(g).$$

Conversely, any non-degenerate \*-representation of  $L^1(G)$  (14.1.1.12) arises from a unitary representation of  $G$ .  $\lrcorner$

*Proof:* For  $\pi \in \text{Rep}^{\text{uni}}(G)$  and  $f \in L^1(G)$ ,  $u \in \mathcal{H}$ , we can define  $\pi(f)u$  as the vector-valued integrations of  $g \mapsto \pi(g)u$  (12.8.3.20), so

$$(\pi(f)u, v) = \int f(x)(\pi(x)u, v) d\mu(x)$$

for any  $v \in \mathcal{H}$ . Then it is clear that  $u \mapsto \pi(f)u$  is linear, and  $\|\pi(f)u\| \leq \|u\| \|f\|$  by (12.8.3.20). Thus  $\|\pi(f)\| \leq \|f\|_1$ .

For the  $*$ -algebra structure (12.10.2.4), it suffices to prove that

$$\pi(f * f') = \pi(f)\pi(f'), \quad \pi(f^*) = \pi(f)^*,$$

which are true for formal reason:

$$\pi(f * g) = \int \int f(y)g(y^{-1}x)\pi(x)d\mu(y)d\mu(x) = \int \int f(y)g(x)\pi(yx)d\mu(x)d\mu(y) = \pi(f)\pi(g),$$

$$\pi(f^*) = \int \Delta(x^{-1})\overline{f(x^{-1})}\pi(x)dx = \int \overline{f(x)}\pi(x^{-1})dx = \int (f(x)\pi(x))^*dx = \pi(f)^*,$$

and verified by supplying  $u, v$ . For the non-degeneracy, for any  $u \in \mathcal{H}^\times$ , choose a precompact nbhd  $V$  of identity that  $\|\pi(g)u - u\| < \|u\|$  for  $g \in V$ , and let  $f = |V|^{-1}\chi_V$ , then it can be verified that  $\|\pi(f)u\| \neq 0$ .

For the converse, Cf.[Folland P79-81] ? □

**Remark (24.7.1.11) [Left Regular Representations].** For the left regular representation  $\pi_L$  of  $G$  on  $L^2(G)$  (24.7.1.3),  $\pi_L(f)g = f * g$  for any  $f \in L^1(G)$ ,  $g \in L^2(G)$  (12.10.2.7), by (12.10.2.4). ┘

**Prop. (24.7.1.12).** For  $\pi \in \text{Rep}^{\text{uni}}(G)$ ,

- The bicommutant (14.1.2.2) of  $\pi(G)$  and  $\pi(L^1(G))$  are identical.
  - $T \in \mathcal{L}(\mathcal{H})$  intertwines  $\pi$  iff it commutes with every  $\pi(f) \in \pi(L^1(G))$ .
  - A closed subspace  $M$  of  $\mathcal{H}$  is invariant under  $\pi$  iff  $\pi(f)M \subset M$  for any  $f \in L^1(G)$ .
- ┘

*Proof:* 1: Cf.[Folland, P82]. ?

2 follows from 1 noticing the fact that  $T$  commutes with an algebra iff it commutes with its bicommutant.

3 follows from 2 and (24.7.1.7). □

**Prop. (24.7.1.13) [Completion of Unitary Representation].** If  $\mathcal{H}_0$  is a pre-Hilbert space that  $G$  is a topological group acting continuously on  $\mathcal{H}_0$  that preserves the inner product, then if  $\mathcal{H}$  is the Hilbert completion of  $\mathcal{H}_0$ , then the action of  $G$  extends to a continuous unitary action on  $\mathcal{H}$ . ┘

*Proof:* The extension is clear as  $\|\pi(g)f\| = \|f\|$ . For the continuity, for any  $v \in \mathcal{H}$ ,  $g \in G$ ,  $\varepsilon \in \mathbb{R}_+$ , choose  $v_0 \in \mathcal{H}_0$  s.t.  $\|v - v_0\| < \varepsilon/6$ , then there is a nbhd  $W$  of  $g$  that for any  $g_1 \in W$ , we have  $|\pi(g_1)v_0 - \pi(g)v_0| < \varepsilon/3$ .

Then if  $\|v_1 - v\| < \varepsilon/6$  and  $g_1 \in W$ , then

$$\begin{aligned} \|\pi(g_1)v_1 - \pi(g)v\| &= \|\pi(g_1)v_1 - \pi(g_1)v_0 + \pi(g_1)v_0 - \pi(g)v_0 + \pi(g)v_0 - \pi(g)v\| \\ &\leq \|\pi(g_1)v_1 - \pi(g_1)v_0\| + \|\pi(g_1)v_0 - \pi(g)v_0\| + \|\pi(g)v_0 - \pi(g)v\| \\ &= \|v_1 - v_0\| + \|\pi(g_1)v_0 - \pi(g)v_0\| + \|\pi(g)v_0 - \pi(g)v\| \\ &\leq \varepsilon \end{aligned}$$

which shows the action is continuous. □

**Cor. (24.7.1.14).** Given a discrete subgroup  $\Gamma \leq G$ , the right regular action of  $G$  extends to a continuous unitary representation of  $G$  on  $L^2(\Gamma \backslash G, \omega)$ .  $\lrcorner$

*Proof:* Because we can approximate  $f \in L^2(\Gamma \backslash G)$  by compactly supported continuous functions (12.3.8.7), then the  $G$  action is uniformly continuous.  $\square$

**Lemma (24.7.1.15) [Auxiliary Compact Supported Function Approximation].** Let  $G$  be a locally compact Lie group and  $K$  a compact subgroup. If  $(\pi, \mathcal{H})$  is a unitary representation of  $G$  on a Hilbert space, and let  $f \neq 0 \in \mathcal{H}$ , then for any  $\varepsilon > 0$ , there is a  $\varphi \in C_c^\infty(G)$  s.t.  $\pi(\varphi)$  is self-adjoint and  $|\varphi(\rho)f - f| < \varepsilon$ .

Moreover, if  $f \in \mathcal{H}^\xi$  which is the decomposition part for  $K$ , we can assume  $\varphi(kg) = \varphi(gk) = \xi(k)^{-1}\varphi(g)$ . In particular if  $\mathcal{H}^\xi$  is f.d., we find a  $\varphi$  that  $\pi(\varphi)f = f$ .  $\lrcorner$

*Proof:* By continuity, there is a nbhd  $H$  of 1 that  $|\pi(g)f - f| < \varepsilon$ , then we can choose a  $\varphi$  positive real valued with support in  $U$  with integral 1, then  $|\pi(\varphi)f - f| < \varepsilon$  by (12.8.3.22). We can also choose  $\varphi(g) = \varphi(g^{-1})$ , then  $\pi(\varphi)$  is self-adjoint.

For the second case, notice first there is a nbhd  $V$  of 1 that  $kVk^{-1} \in U$  for any  $k \in K$  (4.12.1.6), so let  $\varphi_1$  be a positive real valued function supported in  $V$ , and let

$$\varphi_0(g) = \int_K \varphi_1(kgk^{-1})dk,$$

then  $\varphi_0$  is supported in  $U$  and  $\varphi(kgk^{-1}) = \varphi_0(g)$  for any  $k \in K$ . Assume now that  $\pi(k_\theta) = e^{ik\theta}f$ , then we can use (12.10.3.8) for  $P = G$  to see that

$$\pi(\varphi_0)f = \int_G \varphi_0(h)\pi(h)f dh = \int_G \int_K \varphi_0(hk)\pi(hk)f dk dh = \int_G \int_K \xi(k)\varphi_0(hk)dk \pi(h)f dh = \pi(\varphi)f,$$

where

$$\varphi(g) = \int_K \xi(k)\varphi_0(gk)dk = \int_K \xi(k)\varphi_0(kg)dk.$$

so  $\varphi(k) = \varphi(gk) = \xi^{-1}(k)\varphi(g)$  as required.  $\square$

### Functions of Positive Type

**Def. (24.7.1.16) [Positive-Type Function].** A function of **positive type** on  $G$  is a function  $\varphi \in L^\infty(G)$  that defines a positive linear functional on the  $B^*$ -algebra  $L^1(G)$ , i.e.

$$\int f(x)\overline{f(y)}\varphi(y^{-1}x)d\nu(y)d\mu(x) \geq 0, \text{ where } f \in L^1(G).$$

We denote by  $\text{Pos}(G)$  the set of continuous functions of positive type on  $G$ .  $\lrcorner$

**Prop. (24.7.1.17).** If  $\varphi$  is of positive type, then so does  $\overline{\varphi}$ . (Easy calculation).  $\lrcorner$

**Prop. (24.7.1.18).** If  $\pi \in \text{Rep}^{\text{uni}}(G)$  and  $u \in \mathcal{H}_\pi$ , then  $\varphi(x) = (\pi(x)u, u) \in \text{Pos}(G)$  (24.7.1.16).  $\lrcorner$

*Proof:*  $\varphi$  is continuous by definition, so if  $f \in L^1$ , then

$$\int \int f(x)\overline{f(y)}\varphi(y^{-1}x)d\mu(x)d\mu(y) = \int \int (f(x)\pi(x)u, f(y)\pi(y)u)d\mu(x)d\mu(y) = \|\pi(f)u\|^2 \geq 0.$$

$\square$

**Prop. (24.7.1.19).** If  $f \in L^2(G)$ , then  $f * \tilde{f} \in \text{Pos}(G)$  (12.10.1.3), where  $\tilde{f}(x) = \overline{f(x^{-1})}$ . ┘

*Proof:* Cf.[Folland, P84]. □

**Prop. (24.7.1.20) [Cyclic Representations and Functions of Positive Type].** Any  $\varphi \in \text{Pos}(G)$  arises from a cyclic unitary representation  $\pi_\varphi \in \text{Rep}^{\text{uni}}(G)$  and a cyclic vector  $\varepsilon$  as in (24.7.1.18).

Moreover, if  $\rho, \pi \in \text{Rep}^{\text{uni}}(G)$  are cyclic with cyclic vectors  $u, v$  s.t.  $(\pi(g)u, u) = (\rho(g)v, v)$  for any  $g \in G$ , then there exists  $T \in C(\pi, \rho)$  (24.7.1.4) s.t.  $T(u) = v$ . ┘

*Proof:* Cf.[Folland P84-85]. ?

For the last assertion, by the hypothesis,

$$(\pi(g)u, \pi(h)u) = (\pi(h^{-1}g)u, u) = (\rho(h^{-1}g)v, v) = (\rho(g)v, \rho(h)v),$$

so if we define  $T(\pi(g)u) = \rho(g)v$ , then  $T$  extends by linearity to an isometry between the linear span of  $\{\pi(g)u\}$  to the linear span of  $\{\rho(g)v\}$ . Thus it extends by continuity to a map from  $\mathcal{H}_\pi$  to  $\mathcal{H}_\rho$ . It is easy to verify that  $T \in C(\pi, \rho)$ . □

**Cor. (24.7.1.21).** If  $\varphi \in \text{Pos}(G)$ , then  $\varphi$  can be chosen to be continuous. ┘

**Cor. (24.7.1.22).** If  $\varphi \in \text{Pos}(G)$ , then  $\|\varphi\|_\infty = \varphi(1)$ , and  $\varphi(x^{-1}) = \overline{\varphi(x)}$ . ┘

*Proof:*  $\varphi(x) = (\pi(x)u, u)$  for some representation  $\pi$  and  $u \in \mathcal{H}_\pi$  by (24.7.1.20), so  $|\varphi(x)| \leq \|u\|^2 = \varphi(1)$  and  $\varphi(x^{-1}) = (\pi(x^{-1})u, u) = (u, \pi(x)u) = \overline{\varphi(x)}$ . □

**Def. (24.7.1.23) [Normalized Positive-Type Functions].** We set:

- $\text{Pos}_0(G) = \{\varphi \in \text{Pos}(G) : \|\varphi\|_\infty \leq 1\} = \{\varphi \in \text{Pos}(G) : 0 \leq \varphi(1) \leq 1\}$  (24.7.1.22).
- $\text{Pos}_1(G) = \{\varphi \in \text{Pos}(G) : \|\varphi\|_\infty = 1\} = \{\varphi(1) = 1\}$ .

$\text{Pos}_0(G), \text{Pos}_1(G)$  are weak\*-compact subsets of  $L^\infty(G)$  by Banach-Alaoglu (12.8.4.1). ┘

**Prop. (24.7.1.24) [Cyclic Representations and  $\text{Pos}_1(G)$ ].** It follows from (24.7.1.20) that there is a bijection between  $\text{Pos}_1(G)$  and the set of equivalence classes of cyclic unitary representations of  $G$  with a fixed cyclic generator of unit length. ┘

**Thm. (24.7.1.25) [Extreme Points of  $\text{Pos}_1(G)$ ].** A  $\varphi \in \text{Pos}_1(G)$  is an extreme point iff  $\pi_\varphi$  is irreducible (24.7.1.20). And  $\text{Extrm}(\text{Pos}_0(G)) = \text{Extrm}(\text{Pos}_1(G)) \cup \{0\}$ . ┘

*Proof:* Cf.[Folland P86]. ?

For the last assertion, if  $\varphi_1, \varphi_2 \in \text{Pos}_0(G)$  and  $c_1, c_2 \in \mathbb{R}_+$  s.t.  $c_1 + c_2 = 1$  and  $c_1\varphi_1 + c_2\varphi_2 = 0$ , then  $\varphi_1(1) = \varphi_2(1) = 0$ , thus  $\varphi_1 = \varphi_2 = 0$  by (24.7.1.22). Thus  $0 \in \text{Pos}_0(G)$  is an extreme point. Similarly, if  $c_1\varphi_1 + c_2\varphi_2 \in \text{Pos}_1(G)$ , then  $\varphi_1, \varphi_2 \in \text{Pos}_1(G)$ , thus any  $\varphi \in \text{Pos}_1(G)$  is extreme iff it is extreme in  $\text{Pos}_0(G)$ . Clearly no elements in  $\text{Pos}_0(G) \setminus (\text{Pos}_1(G) \cup \{0\})$  is extreme. □

**Cor. (24.7.1.26).** The convex hull of  $\text{Pos}_1(G)$  is weak\*-dense in  $\text{Pos}_1(G)$ . ┘

*Proof:* Cf.[Fol16]P88 ? □

**Prop. (24.7.1.27) [Two Topologies Coincide].** On  $\text{Pos}_1(G)$ , the compact-open topology coincides with that of the weak\*-topology. ┘

*Proof:* Cf.[Folland Abstract Harmonic Analysis P80]. □

**Prop. (24.7.1.28).** The linear span  $B(G)$  of  $C_c(G) \cap \text{Pos}(G)$  includes all functions of the form  $f * g$  where  $f, g \in C_c(G)$ . And it is dense in  $C_c(G)$  and  $L^p(G)$  for  $p \in (0, \infty)$ .

Denote  $B^p(G) = B(G) \cap L^p(G)$ . ┘

*Proof:* By (24.7.1.19),  $\text{Pos}(G) \cap C_c(G)$  includes all functions of the form  $f * \tilde{f}$  with  $f \in C_c(G)$ , thus its linear span includes all  $f * g$  for  $f, g \in C_c(G)$  by polarization. Thus it is dense in  $C_c(G)$  and  $L^p(G)$  because we can use approximate identity (12.10.2.9). □

**Prop. (24.7.1.29) [Gelfand-Raikov].**  $\hat{G}$  separate points of  $G$ . ┘

*Proof:* Cf. [Folland Abstract Analysis P91]. □

## 2 Dual Spectra

References are [Fol16], [Dixmier, C\*-Algebras], [Fell and Dorian, Representations of \*-algebras, locally compact groups, and Banach \*-algebraic bundles, Vol I].

**Notation (24.7.2.1).**

- Let  $G, G', G_1, G_2 \in \text{LCG}$  be second-countable. ┘

**Prop. (24.7.2.2) [Only Separable Representations].** As  $G$  is second-countable,  $L^p(G)$  is separable for any  $p < \infty$  by taking a approximate identity. In particular, every cyclic representation (e.g. irreducible representations) is separable. In particular, irreducible representations are separable. By (24.7.1.6), it suffices to consider separable representations. ┘

### Group C\*-Algebras

**Def. (24.7.2.3) [Group C\*-Algebras].** For  $f \in L^1(G)$ , define  $\|f\|_* = \sup_{\pi \in \hat{G}} \|\pi(f)\|$  (24.7.1.1)(24.7.1.10). Then this is a seminorm on  $L^1(G)$  and  $\|f\|_* \leq \|f\|_1$  by (24.7.1.10). It will be shown to be a norm in (24.7.2.5). ┘

**Prop. (24.7.2.4).** For any  $f \in L^1(G)$ ,

$$\|f\|_*^2 = \sup_{\pi \in \text{Rep}^{\text{uni}}(G)} \|\pi(f)\|^2 = \sup_{\varphi \in \text{Pos}_1(G)} \int f^* * f \varphi d\mu(g) = \sup_{\varphi \in \text{Extrm}(\text{Pos}_1(G))} \int f^* * f \varphi d\mu(g) \quad (24.7.1.23).$$

┘

*Proof:*  $1 \leq 2$  is trivial, and  $2 \leq 3$  follows from the fact that  $\varphi(g) = (\pi(g)u, u)$  is of positive-type (24.7.1.18) and the fact  $\|\pi(f)u\|^2 = \int f^* * f \varphi d\mu(g)$ .

$3 \leq 4$  follows from (24.7.1.26) and Krein-Milman.  $4 \leq 1$  follows from (24.7.1.20) and (24.7.1.25). □

**Cor. (24.7.2.5) [C\*(G)].**  $\|\cdot\|_*$  (24.7.2.3) is a norm on  $L^1(G)$ , and

$$\|fg\|_* \leq \|f\|_* \|g\|_*, \quad \|f^* * f\|_* = \|f\|_*^2,$$

Thus it can be completed to a C\*-algebra (14.1.1.1), denoted by  $C^*(G)$ . ┘

*Proof:* It suffices to show that if  $f \in L^1(G)$  and  $\|f\|_* = 0$ , then  $f = 0$ . But this is because we consider the left regular unitary action of  $f$  on  $L^1(G)$  (24.7.1.3), then  $\pi(f)g = f * g$  (24.7.1.11). If we take  $g$  to be an approximate identity (12.10.2.9), then we see  $f = 0$  by (12.10.2.10). □

The rest are easy.

**Example (24.7.2.6).** If  $G$  is Abelian, then for any  $f \in L^1(G)$ ,  $\|f\|_* = |f^\vee|_\infty$ , so  $C^*(G) \cong C_0(G^\vee)$  as  $C^*$ -algebras, where  $C_0(G^\vee)$  has the point-wise convergence topology.  $\lrcorner$

**Def. (24.7.2.7) [Primitive Ideals].** By (24.7.1.10) and (24.7.1.12), There is an equivalence of categories

$$\mathcal{R}\text{ep}^{\text{uni}}(G) \cong \mathcal{R}\text{ep}^{\text{non-degenerate}}(C^*(G)). \text{?}$$

identifying irreducible representations.

For  $\pi \in \mathcal{R}\text{ep}^{\text{uni}}(G)$ , define

$$\ker(\pi) = \{f \in C^*(G) | \pi(f) = 0\},$$

which is a closed ideal of  $C^*(G)$ . Ideals of the form  $\ker(\pi)$  for  $\pi \in \widehat{G}$  are called **primitive ideals** of  $C^*(G)$ . The space of all primitive ideals of  $C^*(G)$  is denoted by  $\text{Prim}(G)$ .  $\lrcorner$

**Prop. (24.7.2.8) [Jacobson Topology].** For any non-empty set  $U \subset \text{Prim}(G)$  (24.7.2.7), define

$$\overline{U} = \{J \in \text{Prim}(G) | \cap_{I \in U} I \subset J\},$$

and also set  $\overline{\emptyset} = \emptyset$ . Then for any  $U, V \subset \text{Prim}(G)$ ,

$$U \subset \overline{U}, \quad \overline{\overline{U}} = U, \quad \overline{U \cup V} = \overline{U} \cup \overline{V}.$$

Then by Kuratowski theorem (4.4.1.2), there is a unique topology on  $\text{Prim}(G)$  s.t. in this topology  $\overline{U}$  defined above is the closure of  $U$  for any  $U \subset \text{Prim}(G)$ . This topology is called the **hull-kernel topology** or the **Jacobson-topology** on  $\text{Prim}(G)$ . This topology is has separation property  $T_0$ .  $\lrcorner$

*Proof:* It suffices to prove that  $\overline{U \cup V} = \overline{U} \cup \overline{V}$ .  $U \cup V \subset \overline{U \cup V}$  is clear, and for the converse inclusion, if  $\pi \in \widehat{G}$  satisfies  $\ker(\pi) \notin \overline{U \cup V}$ , then there exists  $f \in \cap_{J \in U} J$  and  $g \in \cap_{J \in V} J$  s.t.  $\pi(f) \neq 0$  and  $\pi(g) \neq 0$ . Take  $u \in \mathcal{H}_\pi$  s.t.  $\pi(f)u \neq 0$ , then since  $\pi$  is irreducible, by (24.7.2.7), there exists  $h \in C^*(G)$  s.t.

$$\pi(g)\pi(h)\pi(f)u \neq 0.$$

But  $g * h * f \in \cap_{J \in U \cup V} J$ , so  $\cap_{J \in U \cup V} J \not\subset \ker(\pi)$ , and hence  $\ker(\pi) \notin \overline{U \cup V}$ .  $\square$

### Fell Topology

**Def. (24.7.2.9) [Fell Topology, Fell [Fel60]].** The map  $\widehat{G} \rightarrow \text{Prim}(G) : \pi \mapsto \ker(\pi)$  (24.7.2.7) is clearly a surjection and pulls back the Jacobson topology (24.7.2.8) to a topology on  $\widehat{G}$ , called the **Fell topology**.  $\lrcorner$

**Prop. (24.7.2.10) [Dixmier].** The Fell topology is the quotient topology of the surjection

$$\text{Extrm}(\text{Pos}_1(G)) \rightarrow \widehat{G} : \varphi \mapsto \pi_\varphi \text{ (24.7.1.24) (24.7.1.25)}$$

$\lrcorner$

*Proof:* Cf. [Dixmier,  $C^*$ -Algebras] Section 3.4.  $\square$

**Prop. (24.7.2.11).** If  $G$  is Abelian, then the Fell topology on  $\widehat{G}$  is just the usual topology defined in (12.11.1.7).

If  $G$  is compact, then the Fell topology is discrete.  $\lrcorner$

*Proof:* For Abelian case, Cf.[Fol16]P226.?

For  $G$  compact, if  $\pi \in \widehat{G}$ , then  $\chi_\pi$  is a scalar product on  $\pi$ , and any  $\pi'(\chi_\pi) = 0$  for any  $\pi' \in \widehat{G} \setminus \{\pi\}$  by Schur orthogonality. Thus  $[\pi]$  is not in the closure of  $\widehat{G} \setminus \{\pi\}$ , which means  $\{\pi\} \subset \widehat{G}$  is open.  $\square$

**Def. (24.7.2.12) [Mackey-Borel Structures, Mackey[Mac57, Mac76]].** For  $n \in \mathbb{Z}_+$ , let  $\mathcal{H}^n = \mathbb{C}^n$  with the natural Hilbert space structure and  $\mathcal{H}^\infty = \ell^2(\mathbb{Z})$ , and for each  $n \in \mathbb{Z}_+ \cup \{\infty\}$ , denote  $R_n(G)$  to be the set of unitary representations of  $G$  on  $\mathcal{H}^n$  (without identifying equivalent representations), and denote  $R(G) = \bigcup_{n \in \mathbb{Z}_+ \cup \{\infty\}} R_n(G)$ .

For each  $n \in \mathbb{Z}_+ \cup \{\infty\}$ , we can define a  $\sigma$ -algebra  $\mathcal{B}_n$  on  $R_n(G)$  to be the smallest algebra s.t. the functions  $\pi \mapsto (\pi(g)u, v)$  are measurable for any  $u, v \in \mathcal{H}^n$ . And let  $\mathcal{B}$  be the colimit  $\sigma$ -algebra on  $R(G)$  (12.3.1.3).

Because  $R(G) \rightarrow \widehat{G}$  is surjective (24.7.2.2), we can define the quotient  $\sigma$ -algebra on  $\widehat{G}$  (12.3.1.3), called the **Mackey-Borel structure** on  $\widehat{G}$ .  $\lrcorner$

**Prop. (24.7.2.13).** The Mackey-Borel structure on  $\widehat{G}$  includes the Borel sets for the Fell topology, but in generally it is strictly larger. For example, the Mackey-Borel structure is separated?? Cf.[Diximier, C\*-Algebras]Section3.8), but every point in  $\widehat{G}$  is a Borel set in the Fell-topology only when  $\widehat{G} \rightarrow \text{Prim}(G)$  is a bijection (24.7.2.9).  $\lrcorner$

*Proof:*

$\square$

### Type 1 Groups

**Def. (24.7.2.14) [Primary Representations].** A **primary representation** or a **factor representation** of  $G$  is a unitary representation  $\pi \in \text{Rep}^{\text{uni}}(G)$  s.t. the von.Newman algebra  $A(\pi)$  generated by  $\pi(G)$  (14.1.2.1) is a factor (14.1.3.2).

In particular, any  $\pi \in \widehat{G}$  is primary, by Schur's lemma (24.7.1.4).  $\lrcorner$

**Def. (24.7.2.15) [Type I Groups].**  $G$  is called a **type I group** if every primary representation of  $G$  (24.7.2.14) is a direct sum of copies of some irreducible representation.  $\lrcorner$

**Example (24.7.2.16) [Type I Groups].**

- Any compact group is of type I, by (24.7.2.29) and (24.7.3.5).
- Any LCA is of type I.
- The Heisenberg groups  $H_n$  are of type I ( Cf.[Fol16]P229).  $\lrcorner$

**Def. (24.7.2.17) [CCR Algebras and GCR Algebras, Kaplansky[Kap51]].** A  $C^*$ -algebra  $A$  is called a **CCR algebra** if for any  $\pi \in \widehat{A}$ ,  $\pi(f)$  is a compact operator for each  $f \in A$ .

A  $C^*$ -algebra  $A$  is called a **GCR algebra** if every non-zero quotient  $C^*$ -algebra of  $A$  possesses a non-zero two-sided ideal of  $A$  that is CCR.  $\lrcorner$

**Def. (24.7.2.18) [CCR Groups and GCR Groups].**  $G$  is called a **CCR group** (reps. **GCR group**) if  $C^*(G)$  is a CCR algebra (resp. **GCR algebra**) (24.7.2.17).  $\lrcorner$

**Thm. (24.7.2.19) [Characterizing Type I Groups, Glimm[Gli61]].** The following are equivalent:

1.  $G$  is of type I.
2. The Fell topology on  $\widehat{G}$  (24.7.2.9) is  $T_0$ .

3. The map  $\widehat{G} \rightarrow \text{Prim}(G)$  is a bijection.
4. The Mackey-Borel structure on  $\widehat{G}$ (24.7.2.12) is countably-separated(12.3.1.5).
5. The Mackey-Borel structure on  $\widehat{G}$  is standard(12.3.1.5).
6. The Mackey-Borel structure on  $\widehat{G}$  coincides with the  $\sigma$ -algebra of Borel sets for the Fell topology.
7. For any  $(\pi, \mathcal{H}_\pi) \in \widehat{G}$ ,  $\pi(C^*(G))$ (24.7.2.3) contains all compact operators on  $\mathcal{H}_\pi$ .
8.  $G$  is GCR.

┘

*Proof:* ? Cf.[Dixmier, C\*-Algebras].

2  $\iff$  3 is trivial by(24.7.2.10) because  $\text{Prim}(G)$  is  $T_0$ (24.7.2.8).

□

**Thm.(24.7.2.20)[CCR Groups are of Type I, Glimm[Gli61]].**  $G$  is a CCR iff the Fell topology on  $\widehat{G}$  is  $T_1$ . In particular, every CCR group is of type I, by(24.7.2.19).

┘

*Proof:* ? Cf.[Dixmier, C\*-Algebras].

□

### Tensor Products

**Lemma(24.7.2.25).** Suppose  $\mathcal{H}_1, \mathcal{H}_2 \in \text{HilbSpa}$  and  $S \subset B(\mathcal{H}_1)$  s.t.  $\Gamma(S) = \mathbb{C}$ . Then

$$\Gamma(S \otimes \text{id}_{\mathcal{H}_2}) = \text{id}_{\mathcal{H}_1} \otimes B(\mathcal{H}_2) \subset B(\mathcal{H}_1 \otimes \mathcal{H}_2)(12.9.4.12).$$

┘

*Proof:* Cf.[?Fi116]P234?.

□

**Prop. (24.7.2.26) [Tensor Products].** Given  $\pi_1 \in \text{Rep}^{\text{uni}}(G_1), \pi_2 \in \text{Rep}^{\text{uni}}(G_2)$ , we have:  $\pi_1 \otimes \pi_2 \in \text{Rep}^{\text{uni}}(G_1 \times G_2)$  is irreducible iff  $\pi_1, \pi_2$  are both irreducible.  $\lrcorner$

*Proof:* One direction is clear. The other direction follows from (24.7.2.25) and Schur's lemma (24.7.1.8).  $\square$

**Prop. (24.7.2.27).** Let  $\mathcal{H}_1, \mathcal{H}_2 \in \mathcal{H}\text{ilbSpa}$  and  $(\pi, \mathcal{H}_1), (\pi', \mathcal{H}_1) \in \text{Irr}^{\text{uni}}(G)$ , then:

- If  $\mathcal{M} \subset \mathcal{H}_1 \otimes \mathcal{H}_2$  is an irreducible subspace for the representation  $\pi \otimes \text{id}_{\mathcal{H}_2}$ , then  $(\pi \otimes \text{id}_{\mathcal{H}_2}, \mathcal{M})$  is equivalent to  $\pi$ .
- If  $\pi \otimes \text{id}_{\mathcal{H}_2} \cong \pi' \otimes \text{id}_{\mathcal{H}_2}$ , then  $\pi \cong \pi'$ .  $\lrcorner$

*Proof:* 1: Cf. [Fol16]P235. ?

2: Take  $v_0 \in \mathcal{H}_2 \setminus \{0\}$  and let  $\mathcal{M} = \mathcal{H}_1 \otimes v_0$ , then  $\mathcal{M}_0$  is invariant and irreducible under  $\pi \otimes I$ , thus  $(\mathcal{M}_0, \pi \otimes 1)$  is isomorphic to  $\pi$ . If  $U$  is an equivalence from  $\pi \otimes \text{id}_{\mathcal{H}_2}$  to  $\pi' \otimes \text{id}_{\mathcal{H}_2}$ , then  $U|_{\mathcal{M}_0}$  is an equivalence from  $(\mathcal{M}, \pi \otimes \text{id}_{\mathcal{H}_2})$  to  $(U(\mathcal{M}), \pi' \otimes \text{id}_{\mathcal{H}_2})$ . The former is equivalent to  $\pi$  and the latter is equivalent to  $\pi'$ , by item 1.  $\square$

**Cor. (24.7.2.28).** For  $\pi_1, \pi'_1 \in \text{Irr}^{\text{uni}}(G_1), \pi_2, \pi'_2 \in \text{Irr}^{\text{uni}}(G_2)$ ,  $\pi_1 \otimes \pi_2 \cong \pi'_1 \otimes \pi'_2$  iff  $\pi_1 \cong \pi'_1, \pi_2 \cong \pi'_2$ .  $\lrcorner$

**Thm. (24.7.2.29) [Primary Representations].** For  $\{\pi_\alpha\}_{\alpha \in I} \subset \text{Irr}^{\text{uni}}(G)$ ,  $\oplus_{\alpha \in I} \pi_\alpha$  is primary (24.7.2.14) iff all the  $\pi_\alpha$  are equivalent.  $\lrcorner$

*Proof:*  $\pi^{\oplus I} \cong \pi \otimes \ell^2(I)$ , so  $C(\pi \otimes \text{id}_{\ell^2(I)}) \cong B(\ell^2(I))$  by Schur's lemma (24.7.1.8) and (24.7.2.25). Conversely, if these  $\pi_\alpha$  are not all equivalent, let  $P$  be a projection onto an isotypic component, then  $P \in C(\oplus_\alpha \pi_\alpha)$ , and for any  $T \in C(\oplus_\alpha \pi_\alpha)$ ,  $T$  maps each isotypic component to itself, by (24.7.2.27) and Schur's lemma (24.7.1.8). Thus  $PT = TP$ , and this implies that  $P$  is in the center of  $C(\oplus_\alpha \pi_\alpha)$ , contradiction.  $\square$

**Thm. (24.7.2.30) [Tensor Products].** If  $G_1, G_2 \in \text{LCG}$  and  $G_1$  is of type I (24.7.2.15), then irreducible unitary representations of  $G_1 \times G_2$  are exactly tensor representations  $\pi_1 \otimes \pi_2$ , where  $\pi_1 \in \text{Irr}^{\text{uni}}(G_1)$  and  $\pi_2 \in \text{Irr}^{\text{uni}}(G_2)$ .  $\lrcorner$

*Proof:*  $\pi_1 \otimes \pi_2$  are irreducible by (24.7.2.26), conversely, for any  $\pi \in (G_1 \times G_2)^\wedge$ , let  $\pi^1(x) = \pi(x, 1)$  and  $\pi^2(y) = \pi(1, y)$ , then  $\pi^1, \pi^2$  are commutative. So if  $T$  is in the center of  $C(\pi^1)$ , then  $T \in C(\pi)$ , which implies  $T \in \mathbb{C}$  by Schur's lemma (24.7.1.8). So  $\pi^1$  is primary. So by hypothesis (24.7.2.15), we can assume  $\mathcal{H}_\pi = \mathcal{H}_1 \otimes \mathcal{H}_2$  and  $\pi^1 \cong \pi_1 \otimes \text{id}_{\mathcal{H}_2}$ . then by Schur's lemma (24.7.1.8) and (24.7.2.25), we can write  $\pi^2 = \text{id}_{\mathcal{H}_1} \otimes \pi_2$  for some representation  $\pi_2$  on  $\mathcal{H}_2$ . Then  $\pi \cong \pi_1 \otimes \pi_2$ .  $\square$

## Direct Integrals

**Def. (24.7.2.31) [Fields of Hilbert Spaces].** For a measurable space  $(A, \mathcal{M})$ , a **measurable field of Hilbert spaces** is a functor  $A \rightarrow \mathcal{H}\text{ilbSpa} : \alpha \mapsto \mathcal{H}_\alpha$  and a countable set of set of vectors  $\{e_i(\alpha)\}_{i \in \mathbb{Z}_+}$  for each  $\alpha \in A$ , s.t.

- The function  $\alpha \mapsto (e_i(\alpha), e_j(\alpha))$  is measurable for any  $i, j \in \mathbb{Z}_+$ .
- $\overline{\text{span}\{e_i(\alpha)\}_{i \in \mathbb{Z}_+}} = \mathcal{H}_\alpha$  for each  $\alpha \in A$ .

For a measurable field of Hilbert spaces  $\{\mathcal{H}_\alpha\}$  on  $A$ , a **measurable Hilbert vector field** is an element  $(f(\alpha))_{\alpha \in A} \in \prod_{\alpha \in A} \mathcal{H}_\alpha$  s.t.  $\alpha \mapsto (f(\alpha), e_i(\alpha))$  is a measurable function for each  $i \in \mathbb{Z}_+$ .

For a measurable field of Hilbert spaces  $\{\mathcal{H}_\alpha\}$  on  $A$ , a **measurable operator field** is an element  $\prod_{\alpha \in A} T_\alpha \in \prod_{\alpha \in A} B(\mathcal{H}_\alpha)$  s.t.  $\alpha \mapsto T(\alpha)f(\alpha)$  is a measurable Hilbert vector field whenever  $f$  is a measurable Hilbert vector field.  $\lrcorner$

**Prop. (24.7.2.32) [Measurable Orthonormal Bases].** Situation as in (24.7.2.31), define  $d(\alpha) = \dim \mathcal{H}_\alpha$ , then for any  $m \in \mathbb{Z}_+ \cup \{\infty\}$ ,  $A_m = \{\alpha \in A \mid d(\alpha) = m\}$  is a measurable subset of  $A$ , and there exists a sequence  $\{u_k\}_{k \in \mathbb{Z}_+}$  of measurable Hilbert vector fields (24.7.2.31) s.t.

- For each  $\alpha \in A$ ,  $\{u_k(\alpha)\}_{k=1}^{d(\alpha)}$  is an orthonormal basis of  $\mathcal{H}_\alpha$ , and  $u_k(\alpha) = 0$  for  $k > d(\alpha)$ .
- For each  $k \in \mathbb{Z}_+$  there exists a measurable partition  $A = \coprod_{l=1}^{\infty} A_l^k$  of  $A$  s.t. on each  $A_l^k$ ,  $u_k(\alpha)$  is a finite linear combination of elements in  $\{e_j(\alpha)\}$  with coefficients depending measurably on  $\alpha$ .

┘

*Proof:* Cf. [Fol16] P239. ?

□

**Cor. (24.7.2.33).** Situation as in (24.7.2.32), a Hilbert vector field  $f$  is a measurable Hilbert vector field (24.7.2.31) iff  $\alpha \mapsto (f(\alpha), u_k(\alpha))$  is a measurable function for each  $k \in \mathbb{Z}_+$ . If  $f, g$  are measurable Hilbert vector fields, then  $\alpha \mapsto (f(\alpha), g(\alpha))$  is a measurable function.

┘

**Cor. (24.7.2.34).** Situation as in (24.7.2.31), a field of operators on  $A$  is measurable iff  $\alpha \mapsto (T(\alpha)e_i(\alpha), e_j(\alpha))$  is a measurable function for any  $\alpha \in A$ .

┘

*Proof:* Use  $(T(\alpha)f(\alpha), e_j(\alpha)) = (f(\alpha), T(\alpha)^*e_j(\alpha))$ , and use (24.7.2.33).

□

**Def. (24.7.2.35) [Direct Integrals of Hilbert Spaces].** Situation as in (24.7.2.31), if  $\mu$  is a measure on  $(A, \mathcal{M})$ , then the **direct integral** (w.r.t.  $\mu$ ) of the spaces  $\mathcal{H}_\alpha$  is the set of measurable Hilbert vector fields  $f$  on  $A$  s.t.

$$\|f\|^2 = \int \|f(\alpha)\|_\alpha^2 d\mu(\alpha) < \infty,$$

denoted by  $\int^\oplus \mathcal{H}_\alpha d\mu(\alpha)$ . Then it is a Hilbert space with inner product

$$(f, g) = \int (f(\alpha), g(\alpha))_\alpha d\mu(\alpha).$$

If  $\mathcal{H}_\alpha = \mathcal{H}$  for each  $\alpha \in A$ , then denote  $L^2(A, \mu; \mathcal{H}) \triangleq \int^\oplus \mathcal{H}_\alpha d\mu(\alpha)$ .

┘

*Proof:* The proof that this is complete is the same as the proof of  $L^2(\mu)$  is complete. ?

□

**Prop. (24.7.2.36).** Situation as in (24.7.2.32), we have an isomorphism of Hilbert spaces

$$\int^\oplus \mathcal{H}_\alpha d\mu(\alpha) \cong L^2(A_\infty, \mu; \ell^2) \oplus \bigoplus_{m \in \mathbb{Z}_+} L^2(A_m, \mu; \mathbb{C}^m).$$

┘

**Def. (24.7.2.37) [Direct Integral of Operators].** Situation as in (24.7.2.35), A measurable field of operators  $\{T(\alpha)\}$  s.t.

$$\|T\|_\infty \triangleq \|\|T(\alpha)\|\|_{L^\infty} < \infty$$

is called an **essentially finite measurable field of operators**, and it defines an operator  $\int^\oplus T(\alpha) d\mu(\alpha)$  on  $\int^\oplus \mathcal{H}_\alpha d\mu(\alpha)$  by mapping  $\{f(\alpha)\}$  to  $\{T(\alpha)f(\alpha)\}$ .

If  $T, S$  are essentially finite measurable field of operators, then

$$\int^\oplus T(\alpha) d\mu(\alpha) + \int^\oplus S(\alpha) d\mu(\alpha) = \int^\oplus (T + S)(\alpha) d\mu(\alpha),$$

$$\int^{\oplus} T(\alpha) d\mu(\alpha) \circ \int^{\oplus} S(\alpha) d\mu(\alpha) = \int^{\oplus} (T \circ S)(\alpha) d\mu(\alpha)$$

$$\left( \int^{\oplus} T(\alpha) d\mu(\alpha) \right)^* = \int^{\oplus} T(\alpha)^* d\mu(\alpha).$$

A special kind of fields of operators is the case when  $T(\alpha)$  are all scalar multiples of  $\text{id}_{\mathcal{H}_\alpha}$ . The set of these operators are called **diagonal operators**.  $\perp$

**Prop. (24.7.2.38).** Situation as in (24.7.2.35), if  $T$  is an essentially finite measurable field of operators, then

$$\left\| \int^{\oplus} T(\alpha) d\mu(\alpha) \right\| = \|T\|_{\infty} \quad (24.7.2.37).$$

In particular,  $T \mapsto \int^{\oplus} T(\alpha) d\mu(\alpha)$  is injective.  $\perp$

*Proof:* Clearly  $\left\| \int^{\oplus} T(\alpha) d\mu(\alpha) \right\| \leq \|T\|_{\infty}$ . Conversely, for any  $f \in \int^{\oplus} \mathcal{H}_\alpha d\mu(\alpha)$  and  $\varphi \in L^\infty(\mu)$ , Cf. [Fol16]P244?  $\square$

### Direct Integral Representations

**Def. (24.7.2.39) [Measurable Fields of Representations].** If  $(A, \mathcal{M}, \mu)$  is a measure space, then a **measurable field of representations** of  $G$  is an element  $\prod_{\alpha \in A} (\pi_\alpha, \mathcal{H}_\alpha) \in \prod_{\alpha \in A} \text{Rep}^{\text{uni}}(G)$  s.t.  $\{\mathcal{H}_\alpha\}$  is a measurable field of Hilbert spaces on  $A$  (24.7.2.31) and  $\alpha \mapsto \pi_\alpha(g)$  is measurable field of operators (24.7.2.31) for any  $g \in G$ .  $\perp$

**Def. (24.7.2.40) [Direct Integral Representations].** Situation as in (24.7.2.39), for any  $g \in G$ , since  $\|\pi_\alpha(g)\| = 1$ , we can form the direct integral operator

$$\pi(g) = \int_A^{\oplus} \pi_\alpha(g) d\mu(\alpha) \quad (24.7.2.37).$$

Then this is a unitary representation of  $G$  on  $\int^{\oplus} \mathcal{H}_\alpha d\mu(\alpha)$  by (24.7.2.37), and it is continuous w.r.t. the strong operator topology by dominated convergence. This  $(\int^{\oplus} \pi_\alpha(g) d\mu(\alpha), \int^{\oplus} \mathcal{H}_\alpha d\mu(\alpha))$  is called the **direct integral representation** of  $\{(\pi_\alpha, \mathcal{H}_\alpha)\}_\alpha$ , denoted by  $\int^{\oplus} (\pi_\alpha, \mathcal{H}_\alpha)$ .  $\perp$

**Prop. (24.7.2.41) [Unitary Representations of Abelian and Compact Groups].** If  $G$  is Abelian or compact, then any  $\pi \in \text{Rep}^{\text{uni}}(G)$  is equivalent to a direct integral of irreducible representations.  $\perp$

*Proof:* Cf. [Fol16]P245.  $\square$

**Thm. (24.7.2.42).** If  $G$  is second-countable and  $(\pi, \mathcal{H}) \in \text{Rep}^{\text{uni}}(G)$  where  $\mathcal{H}$  is separable, and  $B$  is a commutative von. Neumann subalgebra of  $C(\pi)$  (14.1.2.1), then there exists a standard measure space  $(A, \mathcal{M}, \mu)$  (12.3.1.5) and a measurable field of representations  $\{(\pi_\alpha, \mathcal{H}_\alpha)\}$  of  $G$  on  $A$  together with an isomorphism  $U : (\pi, \mathcal{H}) \cong \int^{\oplus} (\pi_\alpha, \mathcal{H}_\alpha) d\mu(\alpha)$  s.t.  $UBU^{-1}$  is the algebra of diagonal operators (24.7.2.37) on  $\int^{\oplus} (\pi_\alpha, \mathcal{H}_\alpha) d\mu(\alpha)$ .  $\perp$

*Proof:* Cf. [Fol16]P246. ?  $\square$

**Thm. (24.7.2.43).** Situation as in (24.7.2.42),

- If  $B$  is the center of  $C(\pi)$ , then  $\pi_\alpha$  is primary for  $\mu$ -a.e.  $\alpha \in A$ .

- $\pi_\alpha$  is irreducible for  $\mu$ -a.e.  $\alpha \in A$  iff  $B$  is a maximal commutative von. Neumann subalgebra algebra of  $C(\pi)$ . ┘

*Proof:* Cf. [Fol16]P247. ? □

**Prop. (24.7.2.44) [Standard Measures on  $\hat{G}$ ].** A **standard measure on  $\hat{G}$**  is a Radon measure  $\hat{\mu}$  on  $\hat{G}$  w.r.t. the Mackey-Borel structure (24.7.2.12) s.t. there exists  $A \subset G$  with  $\hat{\mu}(G \setminus A) = 0$  and  $A$  is standard (12.3.1.5) with the Mackey-Borel structure.

By (24.7.2.19), if  $G$  is of type I, then every Radon measure  $\hat{\mu}$  is standard. ┘

**Prop. (24.7.2.45) [Standard Representations, Mackey [Mac58]].** Notation as in (24.7.2.12), let  $\hat{G}_n$  be the image of  $R_n(G)$ , then there is a canonical measurable field of Hilbert spaces on  $\hat{G}$  s.t.  $\mathcal{H}_\alpha = \mathcal{H}_n$  for any  $\alpha \in R_n(G)$ , called the **canonical field of Hilbert spaces**.

If  $A \subset \hat{G}$  be a subset s.t. the Mackey-Borel structure is standard on  $A$  (12.3.1.5), then there is a measurable field of representations  $\{\pi_\alpha\}$  of  $G$  on this canonical field of Hilbert spaces s.t.  $[\pi_\alpha] = \alpha$  for any  $\alpha \in \hat{G}$ . ┘

*Proof:* Cf. [Mac58]Thm10.2. □

### Quasi-Dual Spectra

**Def. (24.7.2.46) [Quasi-Equivalent Representations].**  $\pi, \rho \in \text{Rep}^{\text{uni}}(G)$  are called **quasi-equivalent** if there are no non-zero subrepresentation  $\pi' \subset \pi$  s.t.  $C(\pi', \rho) = 0$  and there are no non-zero subrepresentation  $\rho' \subset \rho$  s.t.  $C(\rho', \pi) = 0$ .

Let  $\check{G}$  be the set of quasi-equivalence class of primary representations of  $G$  (24.7.2.14), called the **quasi-dual spectra** of  $G$ .

There is a natural injection map  $\hat{G} \rightarrow \check{G}$ , which is a bijection iff  $G$  is of type I (24.7.2.15). ┘

**Def. (24.7.2.47) [Mackey-Borel Structures and Standard Measures].**  $\check{G}$  is endowed with a Mackey-Borel structure similar to (24.7.2.12) and we can define standard measures on  $\check{G}$  as in (24.7.2.44). ┘

**Thm. (24.7.2.48) [Central Decompositions, Ernest [Ern62]].** For any  $(\pi, \mathcal{H}) \in \text{Rep}^{\text{uni}}(G)$  s.t.  $\mathcal{H}$  is separable, there is a standard measure (24.7.2.47)  $\check{\mu}$  on  $\check{G}$  with a standard set  $A \subset \check{G}$  and a measurable field of representations  $\{(\pi_\alpha, \mathcal{H}_\alpha)\}_\alpha$  of  $G$  on  $A$  (24.7.2.39) together with an isomorphism  $U : (\pi, \mathcal{H}) \cong \int_A^\oplus (\pi_\alpha, \mathcal{H}_\alpha) d\check{\mu}(\alpha)$  (24.7.2.40) s.t.

- The center of  $UC(\pi)U^{-1}$  is the algebra of diagonal operators on  $\int^\oplus (\pi_\alpha, \mathcal{H}_\alpha) d\mu(\alpha)$  (24.7.2.37).
- $[\pi_\alpha] = \alpha$  for  $\check{\mu}$ -a.e.  $\alpha \in \check{G}$ .

And such a measure  $\check{\mu}$  is unique up to equivalence, and  $\{\pi_\alpha\}$  is  $\check{\mu}$ -a.e. uniquely defined. This is called the **central decomposition** of  $\pi$ . ┘

*Proof:* Cf. [Dixmier, C\*-Algebras]Section8.4. or [Pedersen, C\*-Algebras and their Automorphism Groups]Section4.12. □

**Cor. (24.7.2.49) [Decomposition of Unitary Representations].** If  $G$  is of type I (24.7.2.15) and  $(\rho, V) \in \text{Rep}^{\text{uni}}(G)$ , then there exists a positive Radon measure  $\mu$  on  $\hat{G}$  and a measurable multiplicity function  $m : \hat{G} \rightarrow \mathbb{Z}_+ \cup \{\infty\}$  s.t.

$$(\rho, V) = \int_{\hat{G}}^\oplus \left( \hat{\oplus}^{m(\pi)} V_\pi \right) d\hat{\mu}(\pi).$$

This  $\mu$  is unique up to equivalence, and  $m(\pi)$  are  $\mu$ -a.e. uniquely defined. ┘

*Proof:* Cf.[Spectral theory of automorphic forms, Clozel]Thm3.3. ? or [Dixmier, C\*-Algebras]Section8.6.  $\square$

**Remark (24.7.2.50)**[Dixmier[Dix64]]. If  $G$  is not of type I, then there exist mutually singular standard measures  $\mu, \nu$  on  $\hat{G}$  s.t.  $\int^\oplus \pi_\alpha d\mu(\alpha) d\mu(\alpha) = \int^\oplus \pi_\alpha d\nu(\alpha) d\mu(\alpha)$  are equivalent primary representations.  $\lrcorner$

*Proof:* Cf.[Dix64].  $\square$

### Plancherel Theorem

**Notation (24.7.2.51).**

- Let  $G, G', G_1, G_2 \in \text{LCG}$  be second-countable and unimodular.

$\lrcorner$

**Def. (24.7.2.52) [Fourier Transform].** For  $f \in L^1(G)$ , the **Fourier transform** of  $f$  is defined to be the measurable field of operators on  $\hat{G}$  (with the Mackey-Borel structure) given by

$$\mathcal{F}f(\pi) = \int_G f(g)\pi(g^{-1})d\mu(g).$$

? Why is it a measurable field of operators.

Notice that  $\mathcal{F}|_{C_c^\infty(X)}$  is just the dual of the matrix coefficient map

$$m_\pi : \pi \otimes \pi^\vee \rightarrow C^\infty(X).$$

$\lrcorner$

**Def. (24.7.2.53).** Define

$$I^1(G) = L^1(G) \cap L^2(G), \quad I^2(G) = I^1(G) * I^1(G),$$

then  $I^2(G) \subset C_0(G)$  because  $L^2(G) * L^2(G) \subset C_0(G)$  ?.

$\lrcorner$

**Thm. (24.7.2.54) [Plancherel Theorem].** Suppose  $G$  is of type I with a Haar measure  $\mu$ , then there is a unique Haar measure  $\hat{\mu}$  on  $\hat{G}$  s.t. the Fourier transform  $f \mapsto \mathcal{F}f$  (24.7.2.52) maps  $I^1(G)$  (24.7.2.53) into  $\int^\oplus \mathcal{H}_\pi \otimes \mathcal{H}_{\bar{\pi}} d\mu(\pi)$ , and extends to a unitary map

$$\mathcal{F} : L^2(G) \rightarrow \int_{\hat{G}}^\oplus \mathcal{H}_\pi \otimes \mathcal{H}_{\bar{\pi}} d\hat{\mu}(\pi)$$

intertwining the two-sided regular representation  $\tau$  with  $\int^\oplus \pi \otimes \bar{\pi} d\mu(\pi)$ . This  $\hat{\mu}$  is called the **Plancherel measure** on  $\hat{G}$ .

In particular,  $\mathcal{F}f(\pi)$  is Hilbert-Schmidt for  $\hat{\mu}$ -a.e.  $\pi \in \hat{G}$ , and for  $f, g \in I^1(G)$ , we have the **Parseval-Plancherel formula**

$$\int_G f(x)\overline{g(x)}d\mu(x) = \int_{\hat{G}} \langle \mathcal{F}f(\pi), \mathcal{F}g(\pi) \rangle_{\text{H-S}} d\hat{\mu}(\pi).$$

(where for Hilbert-Schmidt pairing notice that  $\bar{\pi} \cong \pi^\vee$ ). And for  $h \in I^2$  (24.7.2.53), we have the **Fourier inversion formula**

$$h(g) = \int_{\hat{G}} \langle \mathcal{F}h(\pi), \pi(g) \rangle_{\text{H-S}} d\hat{\mu}(\pi).$$

$\lrcorner$

*Proof:* ? □

**Prop. (24.7.2.55).** Let  $\rho, \lambda$  be the right and left regular representations of  $G$ , resp., and let  $R, L$  be the von. Neumann algebras generated by  $\rho(G)$  and  $\lambda(G)$  resp. Then  $R = C(\lambda), L = C(\rho)$ . ┘

*Proof:* Cf. [Fol16]P254. ? □

### 3 Compact Group

Cf. [群表示论 notes, 薛航] and [Fo15]Chap5.

**Notation (24.7.3.1).**

- Let  $K \in \text{LCG}$  be compact.

┘

#### Unitary Representations

**Prop. (24.7.3.2) [F.d. Representation is Unitary].** If  $(\pi, V) \in \text{Rep}^{\text{fd}}(K)$ , then there is an inner product on  $V$  s.t. the action of  $K$  is unitary. ┘

*Proof:* Choose an arbitrary inner product  $(\cdot, \cdot)_0$  on  $V$ , then consider

$$(u, v) = \int_G (\pi(x)u, \pi(x)v)_0 dx.$$

where  $dx$  is a Haar measure on  $G$ . Then

$$(\pi(y)u, \pi(y)v) = \int_G (\pi(xy)u, \pi(xy)v)_0 dx = \Delta(y) \int_G (\pi(x)u, \pi(x)v)_0 dx = \int_G (\pi(x)u, \pi(x)v)_0 dx$$

because  $G$  is compact hence unimodular (12.10.1.18). Thus this is an inner product on  $V$  that is invariant under  $G$ . □

**Cor. (24.7.3.3) [F.D. Representation of Compact Groups Totally Decomposable].** Any  $\pi \in \text{Rep}^{\text{fd}}(K)$  is completely reducible. ┘

*Proof:* This is because we can assume this representation is unitary by (24.7.3.2), and then for any subrepresentation we can take the orthogonal complement. □

**Lemma (24.7.3.4).** Let  $(\pi, \mathcal{H}) \in \text{Rep}^{\text{uni}}(K)$  and  $u \neq 0 \in \mathcal{H}$  be a unit vector. If the operator  $T$  on  $\mathcal{H}$  is defined by

$$Tv = \int_G (v, \pi(x)u) \pi(x)u dx,$$

then  $T$  is a positive, non-zero compact operator in  $C(\pi)$ . ┘

*Proof:*

$$(Tv, v) = \int_K (v, \pi(x)u) (\pi(x)u, v) dx = \int_K |(\pi(x)u, v)|^2 dx \geq 0,$$

so it is positive. Moreover, if  $v = u$ , then  $x \mapsto |(\pi(x)u, v)|$  is a positive on a nbhd of 1, so  $T \neq 0$ .

Finally, because  $K$  is compact,  $x \mapsto \pi(x)u$  is uniformly continuous, so for any  $\varepsilon > 0$ , there is a disjoint partition  $E_i$  of  $G$  and  $x_i \in E_i$  that if  $x \in E_i$ , then  $\|\pi(x)u - \pi(x_i)u\| \leq \varepsilon/2$ . Then

$$\|(\pi(x)u) \pi(x)u - (\pi(x_i)u) \pi(x_i)u\| \leq \|(v, [\pi(x) - \pi(x_i)]u) \pi(x)u\| + \|(v, \pi(x_i)u) [\pi(x) - \pi(x_i)]u\| < \varepsilon \|v\|.$$

So consider

$$T_\varepsilon(v) = \sum |E_j|(v, \pi(x_j)u) \pi(x_j)u = \sum \int_{E_i} (v, \pi(x_j)u) \pi(x_j)u dx$$

then  $\|T - T_\varepsilon\| < \varepsilon$ , and  $T_\varepsilon$  has f.d image, thus  $T$  is compact, by (12.8.5.3).

Also  $T \in C(\pi)$  because

$$\pi(y)Tv = \int_G (v, \pi(x)u) \pi(yx)u dx = \int_G (v, \pi(y^{-1}x)u) \pi(x)u dx = \int_G (\pi(y)v, \pi(x)u) \pi(x)u dx = T\pi(y)v.$$

□

**Thm. (24.7.3.5) [Unitary Representations of Compact Groups].** Any  $(\rho, V) \in \text{Rep}^{\text{uni}}(K)$  is an orthogonal sum of irreducible unitary subrepresentations. Moreover, the isotopic part  $V^\pi$  for any irreducible representation  $\pi$  of  $G$  is uniquely determined. And any  $\pi \in \text{Irr}(G)$  is of f.d. (thus unitary by (24.7.3.2)).

*Proof:* By taking orthogonal complements and Zorn's lemma, it suffices to show any unitary representation  $\pi$  has an irreducible subrepresentation. Choose  $T$  as in (24.7.3.4), then  $T$  is compact nonzero self-adjoint, so by Riesz-Fredholm (12.8.5.9) it has a finite-dimensional eigenspace, which is  $\pi$ -invariant, and it clearly has an irreducible subrepresentation by taking orthogonal complements.

For the orthogonality, Let  $V^\pi$  be the linear span of invariant subspaces isomorphic to  $\pi$ , for  $L_1, L_2$  of type  $\pi_1 \neq \pi_2$ , then consider the orthogonal projection  $P$  onto  $L_2$ , then  $P|_{L_1} \in C(\pi_1, \pi_2)$ , which vanishes by Schur (24.7.1.8), so they are orthogonal.

The final assertion follows from (24.7.3.20).

□

**Cor. (24.7.3.6).** The cardinality of irreducible constituents of  $V$  that is isomorphic to  $\pi$  is independent of the decomposition, and it is equal to  $\dim \text{Hom}_G(\pi, \rho)$ , and is denoted by  $\text{mult}(\pi, \rho)$ .

*Proof:* Cf. [Folland, P137].

□

**Cor. (24.7.3.7) [Decomposition of Spectrum].** Let  $H \leq K$  be a closed subgroup, then  $K$  acts unitarily on  $L^2(K/H)$ , and it decomposes as

$$L^2(K/H) \cong \widehat{\bigoplus_{\pi \in \widehat{K}} m_H(\pi) \pi}$$

where  $m_H(\pi) = \dim(\pi^*)^H = \dim \pi^H$ .

□

*Proof:* By (24.7.3.5), it suffices to determine the multiplicity of  $\pi$  in  $L^2(K/H)$ , which is just dimension of  $\text{Hom}_K(\pi, L^2(K/H))$ , which can be viewed as  $G$ -invariant  $L^2$  functions on  $K/H$  with values on  $\pi^*$ . For any such function  $f$ ,  $f(1)$  is  $H$ -invariant, and for any  $H$ -invariant vector  $v$ ,  $g \mapsto gv$  is continuous, thus is  $L^2$ . So the dimension of this space is just  $\dim \pi^H$ .

□

### Matrix Coefficients and Peter-Weyl Theorem

**Def. (24.7.3.8) [Finite Vectors].** For  $\rho \in \widehat{K}$ , denote  $V^\rho = \rho \otimes \text{Hom}_K(\rho, V)$  the  $\rho$ -isotypic component in  $V$ . And let  $V^{\text{fin}} = \bigoplus_\rho V^\rho$  the space of **finite vectors** in  $V$  (24.7.3.5).

□

**Def. (24.7.3.9) [Matrix Coefficients].**  $C(K)$  is a representation of  $K \times K$  by  $((g_1, g_2)f)(g) = f(g_1^{-1}gg_2)$ .

For a f.d. representation  $(\pi, V)$  of a topological group  $G$ , we can view  $\text{End}(V)$  as a representation of  $K \times K$  via

$$(g_1, g_2)S = \pi(g_1)S\pi(g_2^{-1})$$

There is a **matrix coefficient map**:

$$\text{MC}_V : \text{End}(V) \rightarrow C(K), \quad \text{MC}_V(S)(g) = \text{MC}_{S,V}(g) = \text{tr}(\pi(g)S|V)$$

which is a map of  $K \times K$ -representations. And denote  $\mathcal{E}_\pi$  the image of  $\text{MC}_V$ , and denote  $L^2(G)^{\text{alg}} = \bigoplus_{\pi \in \widehat{G}} \mathcal{E}_\pi$ .  $\lrcorner$

**Prop. (24.7.3.10)[Schur Orthogonality Conditions].** Let  $(\pi_1, V_1), (\pi_2, V_2) \in \text{Rep}^{\text{fd}}(K)$ , then for any  $S_i \in \text{End}(V_i)$ ,

$$\int_K \text{MC}_{S_1, V_1}(k) \text{MC}_{S_2, V_2}(k) = 0$$

unless  $V_2 \cong V_1^*$ , in which case

$$\int_K \text{MC}_{S_1, V}(k) \text{MC}_{S_2, V^*}(k) = \frac{1}{\dim V} \text{tr}(S_1 \circ S_2^*|V).$$

In particular,  $\mathcal{E}_\pi$  is orthogonal to  $\mathcal{E}_{\pi'}$  for  $[\pi] \neq [\pi']$ , and if  $\{e_i\}$  is any orthonormal basis of  $V$ ,  $\sqrt{d_\pi} \pi_{ij}$  is an orthonormal basis of  $\mathcal{E}_\pi$ , and  $\mathcal{E}_\pi$  is isomorphic to  $\text{End}(V)$  as  $K \times K$ -representations.  $\lrcorner$

*Proof:* Cf.[Gaitsgory P3].  $\square$

**Cor. (24.7.3.11).**  $\text{MC}_{S,V}(k^{-1}) = \text{MC}_{S^*, V^*}(k)$ .  $\lrcorner$

**Prop. (24.7.3.12).**  $\mathcal{E}_\pi$  is invariant under left and right translations of  $G$ , and it is a two-sided ideal in  $L^1(G)$ .  $\lrcorner$

*Proof:* It can be shown that  $f \star \varphi_{u,v} = \varphi_{u, \pi(\bar{f})v}$ , and  $\varphi_{u,v} \star f = \varphi_{\pi(\widehat{f})u, v}$ , where  $\widehat{f}(x) = f(x^{-1})$ .  $\square$

**Prop. (24.7.3.13).** If  $\rho \in \text{Irr}(K)$  and  $V \in \text{Rep}(K)$ , then for any  $S \in \text{End}(\rho^*)$ , the image of

$$\text{MC}_{S, \rho} \cdot \mu_{\text{Haar}} \in \text{Meas}(K)$$

acting on  $V$  (12.8.3.24) belongs to  $V^\rho$ .  $\lrcorner$

*Proof:* Cf.[Gaitsgory P7].  $\square$

**Cor. (24.7.3.14).** For any  $\rho \in \text{Irr}(K)$ , the element  $\xi_\rho \mu_{\text{Haar}} \in \text{Meas}(K)$  acts in any continuous representation  $V$  as a projection with image equal to  $V^\rho$ .  $\lrcorner$

*Proof:* Directly from the proposition and (24.7.3.27).  $\square$

**Prop. (24.7.3.15).**  $\mathcal{E}$  is an algebra, Cf.[Folland, P141]. It is dense in  $C(K)$ , and dense in  $L^p(K)$  for  $p < \infty$ .  $\lrcorner$

*Proof:*  $\square$

**Prop. (24.7.3.16)[Peter-Weyl].**

- $\bigotimes_{\pi \in \widehat{G}} \mathcal{E}_\pi = L^2(K)$ , where  $\mathcal{E}_\pi \cong \text{End}(V_\pi)$ .

- $L^2(K)^{\text{alg}} = \otimes_{\pi \in \widehat{G}} \mathcal{E}_\pi$  identifies with the  $K$ -finite vectors in  $L^2(K)$  w.r.t. the left translation (thus the notation).  $\lrcorner$

*Proof:* 1: By (24.7.3.5), the multiplicity of  $\pi$  in  $L^2(K)$  is just  $\dim \pi$ , and this is just the multiplicity of  $\pi$  in  $\mathcal{E}_\pi$  by (24.7.3.10), so this is a surjection, thus an isomorphism.

2: Clearly every vector in  $\otimes_{\pi \in \widehat{G}} \mathcal{E}_\pi$  is  $K$ -finite. Conversely, if some vector  $v$  is  $K$ -finite, then it generates a finite vector space  $V$  under the left translation action of  $G$ . Now the linear function  $f \mapsto f(1)$  restricts to a linear function  $l$  on  $V$ , and then  $l(L_g^* v) = v(g)$ , so  $v$  is a matrix coefficient of  $V$ , so  $v \in L_{\text{alg}}^2(K)$ .  $\square$

**Cor. (24.7.3.17) [Representations of Product Groups].** Any irreducible representation of a the product group  $G \times H$  for  $G, H$  is of the form  $\rho \boxtimes \psi$  where  $\rho$  and  $\psi$  are irreducible representations of  $G, H$  resp.  $\lrcorner$

*Proof:* By orthogonality of characters (24.7.3.23), there representations are irreducible and different. They are all the representations because they already form a basis in  $L^2(G \times H)$ .  $\square$

**Prop. (24.7.3.18).** For any  $V \in \text{Rep}^{\text{uni}}(K)$ , the subset  $V^{K\text{-fin}}$  is dense in  $V$ .  $\lrcorner$

*Proof:* For any  $v \in V$ , choose a Dirac sequence  $f_n$ , then  $\pi(f_n)v \rightarrow v$ . Then by Peter-Weyl (24.7.3.16), we can choose  $K$ -finite functions  $g_n$  that  $\|g_n - f_n\|_{L^2} < \frac{1}{n}$ . Then  $g_n$  also converges to  $\delta_1$  in the weak topology. Thus

$$\pi(g_n)v \rightarrow v$$

and (24.7.3.13) shows  $\pi(g_n)v \in V^{K\text{-fin}}$ .  $\square$

**Cor. (24.7.3.19).** Matrix coefficients of f.d. representations are dense in  $C(K)$ . (Immediate from the proposition and Peter-Weyl theorem (24.7.3.16).  $\lrcorner$

**Cor. (24.7.3.20).**  $\dim \pi < \infty$  for any  $\pi \in \text{Irr}(K)$ .  $\lrcorner$

*Proof:* This is because  $V^{K\text{-fin}}$  is a sub-representation of  $V$  and it is dense in  $V$ , thus  $V = V^{K\text{-fin}}$  is of f.d. because it is irreducible.  $\square$

### Fourier Analysis on Compact Groups

**Def. (24.7.3.21) [Characters].** If  $V \in \widehat{K}$ , define  $\xi_V = \dim V \cdot \chi_V \in L^2(G)^{\text{alg}}$ .  $\lrcorner$

**Prop. (24.7.3.22).** If we take an invariant inner product on  $V$ , and  $e_i$  an orthonormal basis, then

$$\chi_V(g) = \sum_i (ge_i, e_i),$$

and

$$\chi_{V^*}(g) = \chi_V(g^{-1}) = \overline{\chi_V(g)}, \quad \chi_{V \oplus W} = \chi_V + \chi_W, \quad \chi_{V \otimes W} = \chi_V \cdot \chi_W$$

**Cor. (24.7.3.23) [Orthogonality of Characters].** For  $V, W \in \text{Irr}(K)$

$$\int_K \chi_V(k) \chi_W(k^{-1}) = \int_K \chi_V(k) \chi_{W^*}(k) = \int_K \chi_V(k) \overline{\chi_W(k)}$$

so by (24.7.3.10) this equals 1 if  $V \cong W$  and 0 otherwise.  $\lrcorner$

**Prop. (24.7.3.24).** Let  $(\rho, V) \in \text{Rep}^{\text{fd}}(G)$  with character  $\chi$ , then

- $\chi(1) = \dim V$ .
- $\chi(s^{-1}) = \chi(s)^*$ .
- $\chi(sts^{-1}) = \chi(s)$ .

┘

*Proof:* Notice the eigenvalues of  $\rho(g)$  all have absolute value 1, because this representation is unitarizable (24.7.3.2) thus  $\rho^*(g) = \rho(g)^*$ .  $\square$

**Prop. (24.7.3.25) [Fourier Transform on Compact Groups].** Let  $f \in L^2(K)$ , then by Peter-Weyl (24.7.3.16) and (24.7.3.10),

$$f = \sum_{\pi \in \widehat{G}} \sum_{i,j=1}^{d_\pi} c_{ij}^\pi \pi_{ij}, \quad c_{ij}^\pi = d_\pi \int_G f(x) \overline{\pi_{ij}(x)} dx.$$

So

$$f(x) = \sum_{\pi \in \widehat{G}} \sum_{i,j=1}^{d_\pi} d_\pi \int_G f(y) \overline{\pi_{ij}(y)} \pi_{ij}(x) dy = \sum_{\pi \in \widehat{G}} d_\pi f(y) \text{tr}(\pi(y^{-1}x)) = \sum_{\pi \in \widehat{G}} d_\pi (f * \chi_\pi)(y).$$

Thus

$$f = \sum_{\pi \in \widehat{G}} d_\pi f * \chi_\pi,$$

and  $d_\pi f * \chi_\pi$  are the projection of  $f$  onto  $\mathcal{E}_\pi$  (24.7.3.10).  $\square$

**Cor. (24.7.3.26).**  $\xi_V * \xi_W = 0$  unless  $W \cong V$  and  $\xi_V * \xi_V = \xi_V$  (24.7.3.21).  $\square$

**Cor. (24.7.3.27).** For continuous irreducible representations  $V, W$  of  $K$ ,  $\pi(\xi_V) \in \text{End } W$  equals  $\text{Id}_W$  if  $W \cong V$  and zero otherwise.  $\square$

**Prop. (24.7.3.28).** For  $1 \leq p < \infty$ , the spaces  $L^p(K)$  and  $C(K)$  are Banach algebras under convolution (12.10.2.4), and  $ZL^p(K)$  and  $ZC(K)$  are their centers.  $\square$

*Proof:* By (12.10.2.7),  $\|f * g\|_p \leq \|f\|_1 \|g\|_p \leq \|f\|_p \|g\|_p$ , for  $1 \leq p \leq \infty$ , thus  $L^p(G)$  and  $C(G)$  are Banach algebras.

For  $f \in L^p(K)$ ,  $f * g = g * f$  iff

$$\int_K f(xy) g(y^{-1}) dy = \int_K g(y) f(y^{-1}x) dy = \int_K f(yx) g(y^{-1}) dy, \quad a.e. x$$

for any  $g \in L^p(K)$ , which is equivalent to  $f(xy) = f(yx)$  a.e.  $x, y$ . Similarly for  $f \in C(K)$ .  $\square$

**Lemma (24.7.3.29).** If  $f \in ZL^1(K)$  and  $\pi \in \widehat{K}$ , then  $d_\pi f * \chi_\pi = (\int_K f \overline{\chi_\pi}) \chi_\pi$ .  $\square$

*Proof:* For  $x \in G$ ,

$$\pi(f)\pi(x) = \int_K f(y)\pi(yx)dy = \int_K f(yx^{-1})\pi(y)dy = \int_K f(x^{-1}y)\pi(y)dy = \int_K f(y)\pi(xy)dy = \pi(x)\pi(f)$$

so  $\pi(f)$  is a scalar by Schur's lemma (24.7.1.8). Notice  $f'(g) = f(g^{-1}) \in ZL^1(K)$  also, so

$$d_\pi[f * \chi_\pi](x) = d_\pi \int_K f(y^{-1})(\text{tr} \pi)(yx) dy = d_\pi \text{tr} \left( \int_K f(y^{-1}) \pi(yx) dy \right) = \text{tr} \pi(f') \text{tr}(\pi(x)),$$

and  $\text{tr} \pi(f') = \int_K f(y^{-1}) \text{tr} \pi(y) dy = \int_K f \overline{\chi_\pi}$ .  $\square$

**Prop. (24.7.3.30)[Characters form an Orthonormal Basis].**  $\{\chi_\pi | \pi \in \widehat{K}\}$  is an orthonormal basis for  $ZL^2(K)$ .  $\lrcorner$

*Proof:*  $\chi_\pi \in ZC(K) \subset ZL^2(K)$  by (24.7.3.24), and they are orthonormal by (24.7.3.23). They form a basis by (24.7.3.29) and (24.7.3.25).  $\square$

**Cor. (24.7.3.31).** If  $K$  is compact Abelian and  $\mu(G) = 1$ , then  $\widehat{G}$  is an orthonormal basis of  $L^2(G)$ .  $\lrcorner$

**Prop. (24.7.3.32).** The linear spans of  $\{\chi_\pi | \pi \in \widehat{K}\}$  is dense in  $ZC(K)$  and  $ZL^p(K)$  for  $1 \leq p < \infty$ .  $\lrcorner$

*Proof:* Cf. [Fol15] P148.  $\square$

**Prop. (24.7.3.33)[Real Type].** Let  $V \in \text{Rep}(G)$ , the following are equivalent:

- $V = U \otimes_{\mathbb{R}} \mathbb{C}$  is a complexification of a real representation  $U$  of  $G$ .
- $V$  admits a  $G$ -invariant anti-linear endomorphism  $S$  that  $S^2 = 1$ .
- There is a  $G$ -invariant symmetric form  $B$  on  $V$  inducing an isomorphism  $V \cong V^*$ .

$\lrcorner$

*Proof:*  $1 \iff 2$  is clear.

$2 \rightarrow 3$ : By averaging there is a  $G$ -invariant Hermitian form  $h$  on  $V$ , then we can define  $B(u, v) = h(u, Sv)$ . As  $h'(u, v) = h(Sv, Su)$  is also a  $G$ -invariant Hermitian form,  $h(Sv, Su) = \pm h(u, v)$ , so  $B(v, u) = B(u, v)$ .

$3 \rightarrow 1$ :  $h$  induces a  $G$ -isomorphism  $\bar{\varphi}_h : \bar{V} \cong V^*$ . Then  $\sigma = \bar{\varphi}_h \circ \varphi_B$  is a  $G$ -isomorphism  $V \rightarrow \bar{V}$ . Then  $\bar{\sigma} \circ \sigma : V \rightarrow V$  is a  $G$ -isomorphism, thus by Schur's lemma  $\bar{\sigma} \circ \sigma = \lambda$  for some  $\lambda \in \mathbb{C}$ . More explicitly,  $B(v, u) = H(v, \sigma(u))$  for any  $u, v \in V$ . Because  $B$  is symmetric or symplectic,  $B(u, v) = \pm B(v, u)$ , thus  $H(v, \sigma(u)) = \pm H(u, \sigma(v))$ , and

$$\bar{\lambda}H(v, u) = H(v, \sigma^2(u)) = \pm H(\sigma(u), \sigma(v)) = \pm \overline{H(\sigma(v), \sigma(u))} = \overline{H(u, \sigma^2(v))} = \lambda H(v, u).$$

Thus  $\lambda$  is real. And then we can normalize  $\sigma$  that  $\sigma = \pm 1$ . If  $\sigma^2 = 1$ , then consider  $V_0 = \ker(\sigma - 1)$ , then  $iV_0 = \ker(\sigma + 1)$ , and  $V_0 \oplus iV_0 = V$ . If  $\sigma^2 = -1$ , then consider the action of  $\mathbb{H}$  on  $V$  given by  $(\alpha + \beta j)(v) = \alpha v + \beta \sigma(v)$ . It is an action because  $\sigma$  is anti-linear and  $\sigma^2 = -1$ .  $\square$

**Prop. (24.7.3.34)[Quaternion Type].** Let  $G$  be a topological group and  $V$  is a complex representation, then the following are equivalent:

- $V = W_{\mathbb{C}}$  is a restriction of a quaternionic representation  $W$  of  $G$ .
- $V$  admits a  $G$ -invariant anti-linear endomorphism  $S$  that  $S^2 = -1$ .
- There is a  $G$ -invariant alternating form  $B$  on  $V$  inducing an isomorphism  $V \cong V^*$ .

$\lrcorner$

*Proof:*  $1 \iff 2$  is clear. The proof of  $2 \rightarrow 3 \rightarrow 1$  is the same as the proof of (24.7.3.33).  $\square$

**Prop. (24.7.3.35).** An irreducible complex representation  $V$  of  $G$ , then  $V$  is of real/complex/quaternionic type iff  $\text{End}_{\mathbb{R}[G]}(V) \cong M_2(\mathbb{R})/\mathbb{C}/\mathbb{H}$   $\lrcorner$

*Proof:* By (24.7.3.33), if  $V$  is of real type, then  $V \cong U \otimes_{\mathbb{R}} \mathbb{C} \cong V \oplus V$ , then  $\text{End}_{\mathbb{R}[G]}(V) \cong M_2(\mathbb{R})$ .

By (24.7.3.34), if  $V$  is of quaternionic type, then it is a restriction of a quaternionic representation, so  $\mathbb{H} \subset \text{End}_{\mathbb{R}[G]}(V)$ . And for any  $\mathbb{R}$ -linear endomorphism  $f$  of  $V$ ,  $f = \frac{f+ifoi}{2} + \frac{f-ifoi}{2}$  is a sum of  $\mathbb{C}$ -linear and anti-linear endomorphisms of  $V$ . For an anti-linear endomorphism  $g$ ,  $gj$  is  $\mathbb{C}$ -linear, thus  $f \in \mathbb{H}$ .

If  $V$  is of complex type, then there are no invariant anti-linear endomorphisms, thus  $f = \frac{f+ifoi}{2} + \frac{f-ifoi}{2}$  is  $\mathbb{C}$ -linear, so  $\text{End}_{\mathbb{R}[G]}(V) \cong \mathbb{C}$ .  $\square$

**Prop. (24.7.3.36) [Types of Representations].** Let  $V \in \mathcal{R}\text{ep}^{\text{fd}}(K)$  and  $dk$  be the Haar measure on  $K$  with  $\int_K dk = 1$ , then:

$$\int_K \chi(k^2) dk = \begin{cases} 1 & \iff V \text{ is of real type} \\ 0 & \iff V \text{ is of complex type} \\ -1 & \iff V \text{ is of quaternionic type} \end{cases}$$

┘

*Proof:* Notice that  $\chi(k^2) = \chi_{\text{Sym}^2(V)}(k) - \chi_{\wedge^2(V)}(k)$ , so  $\int_G \chi(k^2) dk = \dim \text{Sym}^2(V)^G - \dim \wedge^2(V)^G$ . Then it is clear by (24.1.1.6).  $\square$

#### 4 Induced Representations

**Lemma (24.7.4.1).** If  $H \leq G$  is a closed subgroup and  $q : G \rightarrow G/H$  is the projection, for any  $(\sigma, \mathcal{H}) \in \mathcal{R}\text{ep}^{\text{uni}}(H)$ , let  $\mathcal{F}_0$  be the space of continuous functions  $f : G \rightarrow \mathcal{H}$  that  $q(\text{Supp}(f))$  is compact and

$$f(x\xi) = \sqrt{\frac{\Delta_H(\xi)}{\Delta_G(\xi)}} \sigma(\xi^{-1}) f(x).$$

Then for any  $\alpha : G \rightarrow \mathcal{H}$  that is continuous with compact support, we have

$$f_\alpha(x) = \int_H \sqrt{\frac{\Delta_G(\eta)}{\Delta_H(\eta)}} \sigma(\eta) \alpha(x\eta) d\eta \in \mathcal{F}_0,$$

and is left uniformly continuous w.r.t  $G$ . Moreover, every element in  $\mathcal{F}_0$  arises in this way.  $\square$

*Proof:* Clearly  $q(\text{Supp } f_\alpha) \subset q(\text{Supp } \alpha)$ , and

$$f_\alpha(x\xi) = \int_H \sqrt{\frac{\Delta_G(\eta)}{\Delta_H(\eta)}} \sigma(\eta) \alpha(x\xi\eta) d\eta = \int_H \sqrt{\frac{\Delta_G(\xi^{-1}\eta)}{\Delta_H(\xi^{-1}\eta)}} \sigma(\xi^{-1}\eta) \alpha(x\eta) d\eta = \sqrt{\frac{\Delta_H(\xi)}{\Delta_G(\xi)}} \sigma(\xi^{-1}) f_\alpha(x).$$

For left uniform continuity, Cf. [Folland, P164].

For the surjectivity, if  $f \in \mathcal{F}_0$ , by (12.10.3.6), there exists  $\psi \in C_c(G)$  that  $\int_H \psi(x\eta) d\eta = 1$  for  $x \in \text{Supp } f$ . So we can let  $\alpha = \psi \cdot f$ , then

$$f_\alpha(x) = \int_H \sqrt{\frac{\Delta_G(\eta)}{\Delta_H(\eta)}} \psi(x\eta) \sigma(\eta) f(x\eta) d\eta = \int_H \psi(x\eta) f(x) d\eta = f(x)$$

$\square$

**Remark (24.7.4.2) [Left and Right Compatibility].** If we consider the right action, then it suffices to consider all the functions  $g(x) = f(x^{-1})$ . Then  $g$  satisfied

$$g(\xi x) = \sqrt{\frac{\Delta_G(\xi)}{\Delta_H(\xi)}} \sigma(\xi) g(x).$$

┘

**Def. (24.7.4.3) [Induced Unitary Representations].** For  $(\sigma, V) \in \mathcal{R}\text{ep}^{\text{uni}}(H)$  and  $f, f' \in \text{ind}_H^G \rho$ , consider the function  $g \mapsto (f(g), f'(g))$ , then it is a function on  $\mathcal{S}(G, \mathcal{H})$  (12.10.3.11), thus

$$(f, f') \mapsto \int_{H \backslash G} (f, f') d\nu_{H \backslash G}(g)$$

is a right  $G$ -invariant Hermitian inner product on  $\text{ind}_H^G \rho$ , thus  $\text{ind}_H^G \rho$  is unitarizable, called the **induced unitary representation** of  $\rho$ .  $\perp$

**Prop. (24.7.4.4) [Induction and Restriction].** If  $(\sigma, \mathcal{H}) \in \mathcal{R}\text{ep}^{\text{uni}}(H)$  and  $(\pi, \mathcal{H}') \in \mathcal{R}\text{ep}^{\text{uni}}(G)$ , then  $\text{ind}_H^G(\sigma \otimes \text{res}(\pi)) \cong \text{ind}_H^G(\sigma) \otimes \pi$ .  $\perp$

**Prop. (24.7.4.5) [Frobenius Reciprocity].** If  $G$  is compact group,  $H \leq G$  is a closed subgroup and  $\pi \in \text{Irr}^{\text{uni}}(G)$ ,  $\rho \in \text{Irr}^{\text{uni}}(H)$ , then

$$C(\pi, \text{ind}_H^G(\rho)) = C(\pi|_H, \rho), \quad \text{mult}(\pi, \text{ind}_H^G(\rho)) = \text{mult}(\rho, \pi|_H).$$

$\perp$

*Proof:* It suffices to prove the first one, the second follows from (24.7.1.5) and (24.7.3.6).

$G/H$  admits a  $G$ -invariant measure as  $\Delta_G = \Delta_H = 1$ . For the rest, it is similar to that of (24.1.6.43), Cf. [Folland, P172].  $\square$

## 5 Reductive Groups

**Notation (24.7.5.1).**

- Let  $\mathbb{K} \in \{\mathbb{R}, \mathbb{C}\}$ .
- Let  $G \in \text{RedGrp}/\mathbb{K}$ .
- Let  $\mathfrak{g} = \text{Lie}(G(\mathbb{K}))$ .
- Use notations on smooth representations of Lie groups defined in [Smooth Representations of Lie Groups](#).

$\perp$

By (24.6.4.9)(24.6.4.5) and the fact that admissible  $(\mathfrak{g}, \mathcal{K})$ -modules can be classified ?, the problem of classifying unitary representations of  $G(\mathbb{K})$  is reduced to the question of which admissible representations are unitary.

**Lemma (24.7.5.2) [Auxiliary Compact Supported Function Approximation].** Let  $G$  be a locally compact Lie group and  $K$  a compact subgroup. If  $\mathcal{H} \in \mathcal{R}\text{ep}^{\text{uni}}(G)$  and  $f \in \mathcal{H} \setminus \{0\}$ , then for any  $\varepsilon \in \mathbb{R}_+$ , there is a  $\varphi \in C_c^\infty(G)$  s.t.  $\pi(\varphi)$  is self-adjoint and  $|\varphi(\rho)f - f| < \varepsilon$ .

Moreover, if  $f \in \mathcal{H}^\xi$  which is the decomposition part for  $K$ , we can assume  $\varphi(kg) = \varphi(gk) = \xi(k)^{-1}\varphi(g)$ . In particular if  $\mathcal{H}^\xi$  is f.d., we find a  $\varphi$  that  $\pi(\varphi)f = f$ .  $\perp$

*Proof:* By continuity, there is a nbhd  $H$  of 1 that  $|\pi(g)f - f| < \varepsilon$ , then we can choose a  $\varphi$  positive real valued with support in  $U$  with integral 1, then  $|\pi(\varphi)f - f| < \varepsilon$  by (12.8.3.22). We can also choose  $\varphi(g) = \varphi(g^{-1})$ , then  $\pi(\varphi)$  is self-adjoint.

For the second case, notice first there is a nbhd  $V$  of 1 that  $kVk^{-1} \in U$  for any  $k \in K$  (4.12.1.6), so let  $\varphi_1$  be a positive real valued function supported in  $V$ , and let

$$\varphi_0(g) = \int_K \varphi_1(kgk^{-1}) dk$$

then  $\varphi_0$  is supported in  $U$  and  $\varphi(kgk^{-1}) = \varphi_0(g)$  for any  $k \in K$ . Assume now that  $\pi(k_\theta) = e^{ik_\theta}f$ , then we can use (12.10.3.8) for  $P = G$  to see that

$$\pi(\varphi_0)f = \int_G \varphi_0(h)\pi(h)f dh = \int_G \int_K \varphi_0(hk)\pi(hk)f dk dh = \int_G \int_K \xi(k)\varphi_0(hk)dk\pi(h)f dh = \pi(\varphi)f$$

where

$$\varphi(g) = \int_K \xi(k)\varphi_0(gk)dk = \int_K \xi(k)\varphi_0(kg)dk$$

so  $\varphi(k) = \varphi(gk) = \xi^{-1}(k)\varphi(g)$  as required.  $\square$

**Prop. (24.7.5.3).** If  $V \in \text{Irr}^{\text{uni}}(G)$ , then the image of the induced action of  $\text{Meas}_c(G)$  is dense in  $\text{End}(V)$  in the strong topology (12.7.3.4).  $\lrcorner$

*Proof:* This follows immediately from the von Neumann theorem (14.1.2.3) and Schur's lemma (24.7.1.8): if we denote the algebra generated by  $\text{Meas}_c(G)$  by  $A$ , then

$$\overline{A} = (A^c)^c = (\mathbb{C})^c = \text{End}(V).$$

$\square$

**Prop. (24.7.5.4).** If  $V \in \text{Rep}(G)$  s.t. the image of the induced action of  $\text{Meas}_c(G)$  is dense in  $\text{End}(V)$  in the strong topology, then for any  $\rho \in \text{Irr}(K)$ , we have

$$\dim(V^\rho) \leq \dim(\rho)^2.$$

$\lrcorner$

*Proof:* Follows directly from the following two lemmas (24.7.5.5)(24.7.5.6).  $\square$

**Lemma (24.7.5.5).** For any  $\rho \in \text{Irr}(K)$ , let  $A_\rho = \xi_\rho \cdot \text{Meas}_c(G) \cdot \xi_\rho$ , this is an algebra that acts on  $V^\rho$  by (24.7.3.14). Then there exists a family of f.d. representations  $\pi$  of  $A_\rho$  that:

- Each  $\pi$  is of dimension  $\leq n = \dim(\rho)^2$ .
- For every element  $a \in A_\rho$ , there exists a  $\pi$  that  $\pi(a)$  is non-trivial.

$\lrcorner$

*Proof:* Consider the set of all irreducible f.d. representations of  $G$ , and  $\pi^\rho$  their  $\rho$ -isotypic parts. Then these are representations of  $A_\rho$ , and for any  $\varphi \in \text{Meas}_c(G)$ , there is a  $\pi$  that  $T_\varphi \neq \text{Id}$ ?, and each  $\pi^\rho$  has dimension  $\leq \dim(\rho)^2$ ?. Cf. [Gaitsgory P46].  $\square$

**Lemma (24.7.5.6).** If  $A$  is an associative algebra equipped with a family of f.d. modules satisfying conditions in (24.7.5.5), then if  $V$  is a representation of  $A$  that the image of  $A$  is dense in  $\text{End}(V)$  in the strong topology, then  $\dim V \leq n$ .  $\lrcorner$

*Proof:* For an associated algebra  $A$ , consider the minimal integer  $r$  that the property  $P(r)$ :

$$\sum_{\sigma \in \Sigma_r} \text{sgn}(\sigma) a_{\sigma(1)} \cdots a_{\sigma(r)} = 0$$

for any  $a_1, \dots, a_r$ , then Amitsur-Levitski showed that for  $A = GL(n, \mathbb{C})$ ,  $r = 2n$  (3.7.10.7).

Now the condition of  $A$  in (24.7.5.5) shows that  $P_{2n}$  is true for  $A$ . If  $\dim V \geq n+1$ , then the image of  $A$  satisfies  $P(2n)$ , so also  $\text{End}(V)$  satisfies  $P(2n)$  because  $A$  is dense in  $\text{End}(V)$ . But  $V$  contains a subgroup  $GL(n+1, \mathbb{C})$ , so it cannot satisfy  $P(2n)$  by (3.7.10.7), contradiction.  $\square$

**Cor. (24.7.5.7)[Irreducible Unitary Representations are Admissible, Harish-Chandra].** If  $V \in \text{Irr}^{\text{uni}}(G)$ , then  $V^{K\text{-fin}} \in \text{Mod}_{(\mathfrak{g}, K)}^{\text{adm}}$ , and  $\dim(V^\rho) \leq \dim(\rho)^2$  for any  $\rho \in \text{Irr}(K)$ . In particular, every unitary irreducible representation of  $G$  is admissible (24.6.4.2).  $\lrcorner$

*Proof:* Follows directly from (24.6.4.8), (24.7.5.3) and (24.7.5.4).  $\square$

**Remark (24.7.5.8).** This only holds for  $G$  real reductive. For example, if  $G = \widetilde{\text{SL}(2; \mathbb{R})}$ , then this Harish-Chandra theorem doesn't hold. One reason is that it doesn't have a non-trivial compact subgroup.  $\lrcorner$

**Prop. (24.7.5.9).** If  $M \in \text{Irr}_{(\mathfrak{g}, K)}^{\text{adm}}$  equipped with an invariant inner product  $((km_1, km_2) = (m_1, m_2), (\xi m_1, m_2) + (m_1, \xi m_2) = 0)$ , then the Hilbert space completion of  $M$  carries a unique unitary  $G$ -representation s.t.  $V^{K\text{-fin}} = M$  as  $(\mathfrak{g}, K)$ -modules.  $\lrcorner$

*Proof:* By (24.7.5.10), the Hermitian form can be extended continuously to the Banach space completion of  $M$ . It suffices to prove the extended Hermitian form is continuous, because then we can choose its completion w.r.t.  $(-, -)$ .

For the invariance, consider  $f(g) = (gm_1, m_2) - (m_1, g^{-1}m_2)$ , then notice  $(a, -)$  are continuous functional on  $V$ , thus by (24.6.4.6) and similar analytic method as in (24.6.4.7) using the invariance of inner product.  $\square$

**Lemma (24.7.5.10).** Situation as in (24.7.5.9),  $M$  has a Banach norm s.t.  $(m, m) \leq \|m\|^2$ .  $\lrcorner$

*Proof:* (24.6.3.10) shows  $M$  does have a Banach norm. Then let  $M \cong V^{K\text{-fin}}$  and  $M^{*\text{alg}} \cong (V^*)^{K\text{-fin}}$ . However the Hermitian form induces  $M \cong M^{*\text{alg}}$ , thus we can form

$$M \xrightarrow{\Delta} M \oplus M \rightarrow V \oplus V^*.$$

let  $V'$  be the closure of the image of  $M$ , then it is a  $G$ -representation by (24.6.4.7), and then

$$(m, m) \leq \|i_1(m)\| \cdot \|i_2(m)\| \leq (\|i_1(m)\| + \|i_2(m)\|)^2.$$

$\square$

**Cor. (24.7.5.11).** The above proposition (24.7.5.9) is true for  $M$  admissible.  $\lrcorner$

**Def. (24.7.5.12) [Admissible Characters].** If  $(\pi, V) \in \text{Irr}^{\text{uni}}(G(K))$  is unitarizable, then for any Hilbert orthonormal basis  $\mathcal{B}_\pi$  of  $V$  and  $f \in C_c^\infty(G(F))$ , the sum

$$\Theta_\pi(f) = \sum_{\varphi \in \mathcal{B}_\pi} (\pi(f)\varphi, \varphi)$$

converges absolutely, and is independent of the basis chosen. The linear functional

$$\Theta_\pi : C_c^\infty \rightarrow \mathbb{C} : f \mapsto \Theta_\pi(f)$$

is called the **admissible character** of  $\pi$ .  $\lrcorner$

*Proof:* Cf. [Knapp, Representation theory of semisimple groups]Thm10.2.  $\square$

### Tempered Representations

**Prop. (24.7.5.13) [Tempered Representations].** Irreducible admissible tempered representations of  $G(\mathbb{K})$  (24.6.4.11) are infinitesimally-equivalent to unitarizable representations.  $\lrcorner$

*Proof:* Cf.[Knapp, Representation theory of semisimple groups]Thm8.53.  $\color{red}?$   $\square$

**Prop. (24.7.5.14) [Tempered Representations and Tempered Distributions].** For  $(\pi, V) \in \text{Irr}^{\text{uni}}(G(K))$ ,  $\pi$  is tempered iff the admissible character  $\Theta_\pi$  of  $\pi$  (24.7.5.12) defines a tempered distribution on a certain Schwartz space on  $G(K)$   $\color{red}?$   $\lrcorner$

*Proof:* Cf.[Knapp, Representation theory of semisimple groups]Thm12.23.  $\color{red}?$   $\square$

**Thm. (24.7.5.15) [Tempered Plancherel Theorem].** There is a Plancherel theorem relating spaces of functions on  $G(K)$  and tempered representations of  $G(K)$ .  $\lrcorner$

*Proof:* Cf.[Wallach. Real reductive groups. 2]13.14.1.  $\color{red}?$   $\square$

### Hecke Algebras

**Prop. (24.7.5.16) [Hecke Algebras of Lie Groups].**

- If  $K$  is a compact Lie group, then the **Hecke algebra**  $\mathcal{H}_K$  is defined to be the ring of smooth functions on  $K$  that is  $K$ -finite under both left and right translations, where the algebra is given by convolution. By Peter-Weyl theorem, these functions are dense in  $C(K)$  and  $L^2(K)$ , and it is an idempotented algebra over  $\mathbb{C}$   $\color{red}?$  Cf.[Bump, P309].
- The **Hecke algebra**  $\mathcal{H}_G$  is defined to be  $\mathcal{H}_G = \mathcal{H}_{\mathcal{K}} \otimes_{U(\mathfrak{k}_{\mathbb{C}})} U(\mathfrak{g}_{\mathbb{C}})$ , where the right action of  $U(\mathfrak{k}_{\mathbb{C}})$  on  $\mathcal{H}_K$  is given by

$$f * D = \rho(D)f,$$

$\color{red}?$  Cf.[Bump, P312]. Why is it independent of  $\mathcal{K}$   $\color{red}?$   $\lrcorner$

*Proof:*  $\square$

**Prop. (24.7.5.17) [Equivalence of Representations Lie Group Case].**

- For a compact Lie group  $K$ , the category  $\mathcal{M}(K)$  of smooth representations of  $\mathcal{H}_K$  is equivalent to the category of unitary representations of  $K$ .
- For a real reductive group  $G$  and a maximal compact subgroup  $K$ , the category of (admissible)( $\mathfrak{g}, K$ )-modules is equivalent to the category of smooth(admissible) modules of  $\mathcal{H}_G$ .  $\lrcorner$

*Proof:* Cf.[Cohomological Induction and Unitary Representations, P75].  $\square$

$\text{Irr}^{\text{uni}}(\text{GL}(n; \mathbb{R})^+)$

Cf.[Vogan, unitary dual of  $\text{GL}(n)$  over an Archimedean field].

**Lemma (24.7.5.18) [Finite Dimensional Case].** The only irreducible f.d. unitary representations of  $\text{GL}(n; \mathbb{R})^+$  are the 1-dimensional characters  $g \mapsto \det(g)^r$  where  $r$  is purely imaginary.  $\lrcorner$

*Proof:* Such a representation defines a continuous map of  $GL(n; \mathbb{R})^+$  into the compact unitary group  $U(n)$ . Now it induces a Lie algebra map  $\mathfrak{sl}_n(\mathbb{R}) \rightarrow \mathfrak{u}_m$ . This map must be trivial because otherwise this is an embedding because  $\mathfrak{sl}_n(\mathbb{R})$  is simple. But this is impossible because the adjoint action of  $\mathfrak{sl}_n(\mathbb{R})$  has real eigenvalues but the adjoint action of  $\mathfrak{u}_m$  are all purely imaginary by (3.7.5.4). So the action is trivial on  $SL(n, \mathbb{R})^+$ , so induces an irreducible representation of  $\det(g)$ , which is clearly 1-dimensional.  $\square$

**Lemma (24.7.5.19).** For  $\mathcal{H} \in \text{Rep}^{\text{uni}}(G)$ , if  $X \in \mathfrak{g}$ , we have

$$(Xu, v) = -(u, Xv),$$

so  $(Xv, w) = -(v, \overline{X}w)$  when complexified. So

$$(Rv, w) = -(v, Lw)$$

for any  $v, w \in \mathcal{H}$ , by (26.1.0.1).  $\lrcorner$

**Lemma (24.7.5.20) [Principal Series].** For the principal series  $P_\mu(\lambda, \varepsilon)$  of  $GL(2; \mathbb{R})^+$ , there exists an irreducible unitary representation in this class if  $\mu$  is purely imaginary and  $\lambda \geq 1/4$  real.  $\lrcorner$

*Proof:* Consider the unitary representation  $H(s_1, s_2, \varepsilon)$  defined in (24.6.4.17), then it is irreducible and its class is  $P_\mu(\lambda, \varepsilon)$  by (24.6.4.20) and (24.6.4.8).  $\square$

**Lemma (24.7.5.21) [Possibilities of Unitary Representations].** Let  $\mathcal{H}$  be a unitary representation of  $GL(2, \mathbb{R})^+$ . Assume  $\Delta, I$  acts by scalars  $\lambda, \mu$  respectively, then

- $\mu$  is purely imaginary and  $\lambda$  is real.
- If the  $(\mathfrak{g}, K)$ -module type of  $\mathcal{H}$  is a principal series  $P_\mu(\lambda, \varepsilon)$ , then  $\lambda > 0$ , and if  $\varepsilon = 1$ ,  $\lambda > 1/4$ .  $\lrcorner$

*Proof:* 1: This follows from (24.7.5.19), as action of  $I$  is skew-symmetric and action of  $\Delta$  is symmetric.

2: By (24.6.4.15),  $V^k \neq 0$  for  $k \equiv \varepsilon \pmod{2}$ , let  $f_k \in V^k$ . Because  $-4\Delta - H^2 + 2H = 4RL$  (26.1.0.1), take  $k = \varepsilon$ , then

$$(-4\lambda - \varepsilon^2 + 2\varepsilon)f_\varepsilon = 4RLf_\varepsilon.$$

But by (24.7.5.19),

$$(4RLf_\varepsilon, f_\varepsilon) = -4(Lf_\varepsilon, Lf_\varepsilon) < 0$$

thus  $4\lambda > 2\varepsilon - \varepsilon^2$ .  $\square$

**Cor. (24.7.5.22) [Reduction of  $\mu$ ].** The infinitesimal equivalence class of representations  $P_\mu(\lambda, \varepsilon)$  or  $D_\mu^\pm(k)$  contains an irreducible unitary representation iff  $\mu$  is purely imaginary and the corresponding class  $P(\lambda, \varepsilon)$  or  $D^\pm(k)$  contains an irreducible unitary representation.  $\lrcorner$

*Proof:*  $\mu$  must be purely imaginary by the proposition. And we may tensoring a unitary representation by a  $\deg(g)^r$ , it is also unitary iff  $r$  is purely imaginary, and this increases the value of action of  $I$  by  $2r$  and doesn't affect  $\mu$  and  $\varepsilon$  because  $\Delta$  has nothing to do with  $u$  (26.1.2.5).  $\square$

**Prop. (24.7.5.23) [Intertwining Integral].** Let  $s = \frac{1}{2}(s_1 - s_2 + 1)$ , define for  $f \in V$ ,

$$M(s) : H^\infty(s_1, s_2, \varepsilon) \rightarrow H^\infty(s_2, s_1, \varepsilon) : (M(s)f)(g) = \int_{N(F)} f(w_0ug)du.$$

Then if  $\text{Re}(s_1 - s_2) > 0$ , the integral is absolutely convergent, and commutes with the action of  $G$ .  $\lrcorner$

*Proof:* Replacing  $f$  with  $\rho(h)f$ , we see that the convergence of  $M(s)(f)(h)$  is equivalent to the convergence of  $M(s)(\rho(h)f)$ , so we assume  $h = 1$ .

We use the identity

$$\begin{bmatrix} & -1 \\ 1 & \end{bmatrix} \begin{bmatrix} 1 & x \\ & 1 \end{bmatrix} = \begin{bmatrix} \Delta_x^{-1} & -x\Delta_x^{-1} \\ & \Delta_x \end{bmatrix} k_{\theta_x}$$

similar to (26.1.2.2) where

$$\Delta_x = \sqrt{1+x^2}, \quad \theta(x) = \arctan(-1/x).$$

Then

$$(M(s)f)(1) = \int_{-\infty}^{\infty} (1+x^2)^{-s} f(k_{\theta(x)}) dx$$

which converges for  $s > 1/2$ , that is  $\operatorname{Re}(s_1 - s_2) > 0$ .

To show  $M(s)f \in H(s_2, s_1, \varepsilon)$ , we check

$$(M(s)f)\left(\begin{bmatrix} 1 & \xi \\ & 1 \end{bmatrix} g\right) = (M(s)f)(g), \quad (M(s)f)\left(\begin{bmatrix} y_1 & \\ & y_2 \end{bmatrix} g\right) = \operatorname{sgn}(y_1)^\varepsilon |y_1|^{s_2+\frac{1}{2}} |y_2|^{s_1-\frac{1}{2}} (M(s)f)(g).$$

The first one is an easy consequence of change of variable, for the second,

$$\begin{aligned} (M(s)f)\left(\begin{bmatrix} y_1 & \\ & y_2 \end{bmatrix} g\right) &= \int f\left(\begin{bmatrix} & -1 \\ 1 & \end{bmatrix} \begin{bmatrix} 1 & x \\ & 1 \end{bmatrix} \begin{bmatrix} y_1 & \\ & y_2 \end{bmatrix} g\right) dx \\ &= \int f\left(\begin{bmatrix} & -1 \\ 1 & \end{bmatrix} \begin{bmatrix} y_1 & \\ & y_2 \end{bmatrix} \begin{bmatrix} 1 & y_1^{-1}y_2x \\ & 1 \end{bmatrix} g\right) dx \\ &= \frac{y_1}{y_2} \int f\left(\begin{bmatrix} y_1 & \\ & y_2 \end{bmatrix} \begin{bmatrix} & -1 \\ 1 & \end{bmatrix} \begin{bmatrix} 1 & x \\ & 1 \end{bmatrix} g\right) dx \\ &= \frac{y_1}{y_2} \operatorname{sgn}(y_1)^\varepsilon |y_1|^{s_2-\frac{1}{2}} |y_2|^{s_1+\frac{1}{2}} \int f\left(\begin{bmatrix} & -1 \\ 1 & \end{bmatrix} \begin{bmatrix} 1 & x \\ & 1 \end{bmatrix} g\right) dx \\ &= \operatorname{sgn}(y_1)^\varepsilon |y_1|^{s_2+\frac{1}{2}} |y_2|^{s_1-\frac{1}{2}} (M(s)f)(g) \end{aligned}$$

To check  $M(s)f$  is smooth, notice that the restriction of  $M(s)f$  to  $K$  equals

$$(M(s)f)(k_t) = \int_{-\infty}^{\infty} (1+x^2)^{-s} f(k_{\theta(x)+t}) dx.$$

The convergence is uniform in  $t$ , thus is smooth in  $t$ .

The commutativity of  $M(s)$  with  $G$ -action is immediate, because left and right action commutes.

□

**Prop. (24.7.5.24).** Let  $f_{k,s}$  be the function  $f_k$  in  $H(s_1, s_2, \varepsilon)$  (24.6.4.17) where  $\operatorname{Re}(s_1 - s_2) > 0$  and  $s = \frac{1}{2}(s_1 - s_2 + 1)$ , then

$$M(s)f_{k,s} = (-i)^k \sqrt{\pi} \frac{\Gamma(s)\Gamma(s-\frac{1}{2})}{\Gamma(s+\frac{k}{2})\Gamma(s-\frac{k}{2})} f_{k,1-s}$$

□

*Proof:* Because  $M(s)$  commutes with  $G$ -action,  $M(s)f_{k,s}$  is a multiple of  $f_{k,1-s}$ , thus it suffices to calculate  $(M(s)f_{k,s})(1)$ , which is

$$(M(s)f)(1) = \int_{-\infty}^{\infty} (1+x^2)^{-s} e^{ik\theta(x)} dx, \quad \theta(x) = \arctan(-1/x)$$

by (24.7.5.23).

This integral then is calculated to be the expression above, by (12.3.9.1).  $\square$

**Lemma (24.7.5.25) [Complementary Series].** For  $\mu$  purely imaginary and  $0 < \lambda < 1/4$  and  $\varepsilon = 0$ , there exists an irreducible unitary representation in this class of the  $(\mathfrak{g}, K)$ -module  $P_\mu(\lambda, 0)$ .  $\lrcorner$

*Proof:* Let  $s_1, s_2$  be complex numbers, we construct first a Hermitian pairing

$$H(s_1, s_2, \varepsilon)_{fin} \times H(-\overline{s_1}, -\overline{s_2}, \varepsilon)_{fin} \rightarrow \mathbb{C} : (f, g') \mapsto \int_K f(k) \overline{g'(k)} dk$$

which is invariant under action of  $G$  by (12.10.3.16). Now let  $s_2 = -\overline{s_1}$ , then  $s = \frac{1}{2}(s_1 - s_2 + 1)$  is real and  $\mu = s_1 + s_2$  is purely imaginary. Then composing this pairing with  $i^\varepsilon M(s) : H(s_1, s_2, \varepsilon)_{fin} \rightarrow H(s_2, s_1, \varepsilon)_{fin} = H(-\overline{s_1}, -\overline{s_2}, \varepsilon)_{fin}$ , then

$$(f, \overline{f'}) = \int_K f(k) \overline{i^\varepsilon M(s) f'(k)} dk.$$

is  $G$ -invariant. We will show that it is positive definite if  $\varepsilon = 0$  and  $1/2 < s < 1$ .

It can be seen from (24.7.5.24) that an orthogonal basis for  $H(s_1, s_2, 0)_{fin}$  under this pairing is  $f_{k,s}$  for  $k$  even. And by (24.7.5.24),

$$(f_{k,s}, f_{k,s}) = (-1)^{k/2} \sqrt{\pi} \frac{\Gamma(s) \Gamma(s - \frac{1}{2})}{\Gamma(s + \frac{k}{2}) \gamma(s - \frac{k}{2})}$$

which is positive for  $1/2 < s < 1$ . Now we obtain a unitary representation of  $G$  on the Hilbert completion of this space (24.7.1.13).

Now we have constructed a unitary representation in the infinitesimal equivalence class  $P_\mu(\lambda, 0)$  with  $\lambda = s(1-s)$ ,  $s = \frac{1}{2}(s_1 - \overline{s_1} + 1)$ , so any  $0 < \lambda < 1/4$  is possible.  $\square$

**Lemma (24.7.5.26).** For any integer  $k$ , there is a bijection between holomorphic functions  $\varphi$  on  $\mathcal{H}$  and smooth functions  $\Phi$  on  $\mathrm{GL}(2; \mathbb{R})^+$  that is invariant under  $Z(R)^+$  and

$$\Phi(gk_\theta) = e^{ik\theta} \Phi(g), \quad L\Phi = 0.$$

$\lrcorner$

*Proof:* The bijection is given by

$$\varphi(z) = y^{-k/2} \Phi \left( \begin{bmatrix} y & x \\ 1 & 1 \end{bmatrix} \right), \quad \Phi(g) = ((y^{k/2} \varphi)[g]_k) i.$$

and the proof is a combination of formal calculation in (26.1.3.10) and (26.1.2.15) forgetting  $\Gamma$ :

$$L_k(y^{k/2} f(z)) = -(z - \overline{z}) \frac{\partial}{\partial \overline{z}} - \frac{k}{2} (y^{k/2} f(z)) = -2iy^{(k+2)/2} \frac{\partial}{\partial \overline{z}} f(z).$$

$\square$

**Lemma (24.7.5.27) [Discrete Series].** For  $k \in \mathbb{Z}_{\geq 2}$ , there exists a unitary representation in the infinitesimal equivalence class  $D^\pm(k)$ , more precisely,

- Let  $L^2(\mathcal{H}, \mu_k)$  be the  $L^2$ -space of holomorphic functions  $f$  on the upper plane  $\mathcal{H}$  w.r.t the measure  $\mu_k = y^k \frac{dx dy}{y^2}$  (12.5.5.3). Then the left action

$$\pi_k(g)f = f[g^{-1}]_k.$$

of  $G$  is unitary and this representation  $\pi_k$  is in the infinitesimal equivalence class  $D^-(k)$ .

- Consider the automorphic of  $\mathrm{GL}(2; \mathbb{R})^+$ :

$$\iota\left(\begin{bmatrix} a & b \\ c & d \end{bmatrix}\right) = \begin{bmatrix} a & -b \\ -c & d \end{bmatrix}$$

then the representation  $\pi_k \circ \iota$  is in the infinitesimal equivalence class  $D^+(k)$

┘

*Proof:* The second one follows from the first one, as  $\iota$  interchanges the action of  $K$  thus the  $K$ -types.

For the first one, firstly it is a unitary representation: for  $z' = g(z) = x' + iy'$ , we have

$$y' = \frac{ad - bc}{|cz + d|^2} y$$

and  $\mu_z = \mu_{z'}$ , thus

$$\|\pi(g^{-1})f\|^2 = \int_{\mathcal{H}} |f(z')|^2 \frac{(ad - bc)^k}{|cz + d|^{2k}} y^k \mu_z = \int_{\mathcal{H}} |f(z')|^2 (y')^k \mu_{z'} = \|f\|^2.$$

For the infinitesimal equivalence class, we consider the orthogonal basis  $\varphi_n = \left(\frac{z-i}{z+i}\right)^n \frac{(2i)^k}{(z+i)^k}$  and prove

$$\pi(k_\theta^{-1})\varphi_n = e^{2\pi i(k+2n)\theta} \varphi_n.$$

Then this will determine the  $K$ -type of  $\pi_k$ . This can be proven by direct calculation, Cf.[Ngo, P39].

□

**Cor. (24.7.5.28).** By (24.7.5.26) and the measure  $\mu_k$  we choose, it is clear that there is an isometry between  $L^2(\mathcal{H}, \mu_k)$  and a subspace of  $L^2(G/Z)$  that is compatible with the left  $G$  action on  $L^2(G)$ , but the left and right action on  $L^2(G/Z)$  is isomorphic, as  $f(t) \mapsto f(t^{-1})$  intertwine them, because  $G/Z$  is unimodular. So this representation is **square integrable**, i.e. it can be embedded in  $L^2(G/Z)$ . ┘

**Lemma (24.7.5.29) [Limits of Discrete Series].** There exists a unitary representation in the infinitesimal equivalence class  $D^\pm(1)$ . ┘

*Proof:* These two classes already appear in the unitary representation  $H(0, 0, 1)$ , by (24.6.4.20). □

**Prop. (24.7.5.30) [List of Irreducible Unitary Representations of  $\mathrm{GL}(2, \mathbb{R})^+$ ].** Let  $\mu$  be purely imaginary,

- The 1-dimensional representation  $g \mapsto |\deg(g)|^\mu$ .
- The unitary principal series  $P_\mu(\lambda, \varepsilon)$ , where  $\varepsilon = 0, 1$  and  $\lambda \geq 1/4$ .

- The complementary series representations  $P_\mu(\lambda, 0)$  where  $0 < \lambda < 1/4$ .
- The holomorphic discrete series  $D_\mu^0(k) (k \geq 2)$  and limits of discrete series ( $k = 1$ )  $D_\mu^\pm(k)$ .

Notice each of these infinitesimal equivalence classes of irreducible representations has a unique representative that is a unitary representation by (24.6.4.9).  $\lrcorner$

*Proof:* By (24.6.4.8) and (24.6.4.9), the conclusion follows from the classification of  $(\mathfrak{g}, K)$ -modules (24.6.4.21) and determining which infinitesimal class has a unitary representative, which follows from (24.7.5.18)(24.7.5.21), (24.7.5.20)(24.7.5.22), (24.7.5.25)(24.7.5.27), (24.7.5.29).  $\square$

**Cor. (24.7.5.31).** Similar as in (24.6.4.22), by (24.6.4.8), we can classify all irreducible unitary representations of  $GL(2, \mathbb{R})$ .  $\lrcorner$

## 6 Semisimple Lie Groups

References are [Knapp, Representations of Semisimple Lie Groups].

### Nilpotent Lie Groups

**Prop. (24.7.6.1).** If  $G \in \text{LieGrp}$  is simply-connected and nilpotent, then for any sub-Lie-algebra  $\mathfrak{h} \subset \mathfrak{g}$ , there is a unique connected subgroup  $H \leq G$  with  $\text{Lie}(H) = \mathfrak{h}$ ?. And any  $\lambda \in \mathfrak{g}^*$  s.t.  $\lambda([\mathfrak{h}, \mathfrak{h}]) = 0$  has a unique lifting to a character  $\sigma_\lambda$  of  $H$ ?.  $\lrcorner$

*Proof:*

$\square$

**Thm. (24.7.6.2) [Kirillov].** Let  $G \in \text{LieGrp}$  be simply-connected. For any  $\lambda \in \mathfrak{g}^*$ , let  $\mathfrak{h} \subset \mathfrak{g}$  be a maximal Lie subalgebra s.t.  $\lambda([\mathfrak{h}, \mathfrak{h}]) = 0$ , then there exists  $H = \exp(\mathfrak{h})$  and  $\sigma_\lambda \in H^\vee$  as in (24.7.6.1). Then  $\text{ind}_H^G(\sigma_\lambda)$  is irreducible, and its equivalent class only depends on the orbit of  $\lambda$  under the coadjoint action  $\text{Ad}^*$ . Then the map

$$\mathcal{O}_{\text{Ad}^*} \rightarrow \widehat{G} : \lambda \mapsto \text{ind}_H^G(\sigma_\lambda)$$

is a bijection which is a homeomorphism w.r.t. the natural quotient topology on  $\mathcal{O}_{\text{Ad}^*}$  and the Fell topology on  $\widehat{G}$  (24.7.2.9).  $\lrcorner$

*Proof:* Cf. [Representations of Nilpotent Lie Groups and Their Applications].  $\square$

### Solvable Lie Groups

**Thm. (24.7.6.3)** [Takenouchi[Tak57]/Bernat[Ber65]/Auslander-Kostant[A-K71]]. A simply-connected Lie group is of type I iff the space of coadjoint orbits is countably-separated, and every  $\lambda \in \mathfrak{g}^*$  has lift to the group  $G_\lambda = \{g \in G | \text{Ad}^*(g)\lambda = \lambda\}$ .

This is the case for any exponential solvable Lie groups (i.e. when  $\exp_G$  is an isomorphism).  $\lrcorner$

*Proof:* •

$\square$

## 7 Unitary Groups

**Prop. (24.7.7.1) [Parameters for Representations of  $U(m; \mathbb{R})$ ].** The Langlands parameters of irreducible representations of the definite unitary group  $U(m; \mathbb{R})$  is determined by their restriction to  $W_{\mathbb{C}} \cong \mathbb{C}^{\times}$ , which are up to conjugacy all the morphisms of the form

$$\phi(z) = \text{diag}((z/\bar{z})^{a_1}, \dots, (z/\bar{z})^{a_m}).$$

On the other hand, if we regard  $U(m; \mathbb{R})$  as a subgroup of  $GL(m; \mathbb{C})$ , the restrictions of the rational irreducible algebraic representations  $W_{\underline{k}}$  of  $GL(m; \mathbb{C})$  for any  $k_1 \geq \dots \geq k_m \in \mathbb{Z}$  (whose highest weight w.r.t. the standard Borel subgroup is the character  $\delta_{\underline{k}} : (z_1, \dots, z_m) \mapsto \prod_i z_i^{k_i}$ ) to  $U(m; \mathbb{R})$  form a system of irreducible representations of  $U(m; \mathbb{R})$ .  $W_{\underline{k}}$  is said to have **regular weights** if  $k_1 > k_2 > \dots > k_m$ .

The relation of the two descriptions of  $\text{Irr}^{\text{uni}}(U(m; \mathbb{R}))$  is given by

$$a_i = k_i + \frac{m-1}{2} - i.$$

┘

*Proof:* ? Cf. [Bergeron-Clozel, Spectre automorphe des variétés hyperboliques et applications topologiques] Prop 4.3.2 and □

## 24.8 Lie Algebras II

### 1 Springer Theory

**Notation(24.8.1.1).**

- Let  $G$  be a simply-connected complex Lie group with Lie algebra  $\mathfrak{g}$  and a Borel subgroup  $B$  generated by a maximal torus  $T$  and 1-dimensional subgroups  $\exp(te_i)$  for  $e_i$ .
- Let  $\mathcal{F}$  be the flat variety of  $G$  consisting of Borel subalgebras  $\mathfrak{b} \subset \mathfrak{g}$ .

┘

**Def.(24.8.1.2).**

┘

## 24.9 Admissible Representations of $p$ -adic Reductive Groups

References are [B-Z76, B-Z77, Sil78, Tad86, Kud94, Bum97, P-R08, G-H11], [admissible dual of  $\mathrm{GL}(N)$  via compact open subgroups, Bushnell-Kutzko], [Getz, automorphic Representations], [Bernstein. Representations of  $p$ -adic groups], [Casselman, Introduction to the theory of admissible representations of  $p$ -adic reductive groups].

### Notation(24.9.0.1).

- Use notations on representations of locally profinite groups defined in [Locally Profinite Groups](#).
- Use group-theoretic notations as in [\(3.1.2.15\)](#).
- Let  $p \in \text{Prime}$ .
- Let  $(K, \mathcal{O}_K, \mathfrak{p}_K, \varpi, \kappa) \in p\text{-LField}$ . Let  $q = \#\kappa$ .
- Fix a non-trivial character  $\psi : K \rightarrow \mathbb{C}^\times$ .
- Choose the Haar measure  $dx$  on  $K$  that is self-dual w.r.t.  $\psi$  as in [\(12.11.1.34\)](#).
- Let  $G \in \text{RedGrp}/K$ .
- If  $G$  is quasi-split, choose a Borel subgroup  $B \leq G$  and let  $U = R_u(B), T = B/U$ .
- Let  $\mathfrak{g} = \mathrm{Lie}(G(K))$ .
- Use notations on root data defined in [Reflection Groups and Coxeter Groups](#).
- Let  $Z \in \text{AlgGrp}/K$  be the maximal split torus contained in the center of  $G$ .
- Let  $n \in \mathbb{Z}_+$ .
- For any  $\chi \in (\mathcal{O}_K^*)^\vee$ , by continuity, there is a minimum  $v \in \mathbb{N}$  that  $\chi(1 + \mathfrak{p}^v) = 1$ , and  $\mathfrak{p}^v$  is called the **conductor of character** of  $\chi$ .

┘

### Notation(24.9.0.2). If moreover $G = \mathrm{GL}(n)$ ,

- Use the notations on  $\mathrm{GL}(n)$  defined in [General Linear Groups](#).
- For  $\alpha \in \mathbb{A}^{n-1}(K)$ , let  $\psi_{N,\alpha}$  be a character of  $\mathrm{Unip}(K)$  given by  $\psi_{\mathrm{Unip}}(g) = \sum_i \psi(\alpha_i g_{i,i+1})$ .
- Denote  $\mathcal{K} = \mathrm{GL}(n; \mathcal{O}_K)$ , which is the maximal compact subgroup of  $\mathrm{GL}(n; K)$  up to conjugacy [\(20.7.3.10\)](#).
- For  $k \in \mathbb{Z}_+$ , define subgroups  $\mathrm{Unip}_k(n; K)$  of  $\mathrm{Unip}(n; K)$  as follows:  $\mathrm{Unip}_k(n; K)$  is the group of unipotent matrices that  $v(e_{ij}) \geq k(i-j)$ . Then  $\cup_{k>0} \mathrm{Unip}_k(n, K) = \mathrm{Unip}(n, K)$ . In particular,  $\mathrm{Unip}(n, K)$  is exhausted by compact open subgroups.

┘

## 1 Basics

References are [Representations of  $p$ -adic Groups Bernstein]. [[?Bum98](#)]Chap4.

### Geometry

**Def.(24.9.1.1) [Unramified Quasi-Characters].** A **unramified quasi-character** on  $K$  is a quasi-character  $\chi$  that  $\chi(\mathcal{O}_K^*) = 1$ .

Define  $\alpha(\chi) = \chi(\varpi)$  if  $\chi$  is unramified and 0 otherwise, called the **Satake parameter** of  $\chi$ . ┘

## Hecke Algebras

### Smooth Representations

**Prop. (24.9.1.2) [Irreducible Smooth Representations are Admissible].**  $\text{Irr}^{\text{alg}}(G(K)) = \text{Irr}^{\text{adm}}(G(K))$ .  $\lrcorner$

*Proof:* ? Cf. [Getz]Thm8.3.5. We only prove for  $G = \text{GL}(n)$ .

By (24.9.3.7)(24.9.3.8) and (24.9.3.5), it suffices to prove for  $\pi$  quasi-cuspidal. But then this follows from (24.9.3.9)(24.11.1.13) and (24.1.6.54).  $\square$

## 2 Bernstein Centers

References are [Ber84].

**Def. (24.9.2.1) [Bernstein Centers].** The **Bernstein center**  $G$  is defined to be  $\mathcal{Z}(G(K)) \triangleq \text{End}(\mathbf{1}_{\text{Rep}^{\text{adm}}(G(K))})$ .

For any  $\pi \in \text{Irr}^{\text{adm}}(G(K))$ , elements of  $\mathcal{Z}(G(K))$  acts on  $\pi$  as scalars. Thus there is a map

$$\mathcal{Z}(G(K)) \rightarrow \text{Map}(\text{Irr}^{\text{adm}}(G(K)), \mathbb{C}),$$

called the **infinitesimal character of Bernstein center** of  $G$ .

And we can describe explicitly which functions on  $\text{Irr}^{\text{adm}}(G(K))$  come from elements of the Bernstein center ?.  $\lrcorner$

**Prop. (24.9.2.2).** Bernstein center can also be described as conjugation-invariant distributions acting on  $\mathcal{T}(G(K))$ . ?  $\lrcorner$

## 3 Supercuspidal Representations

### Jacquet-Functors

**Def. (24.9.3.1) [Jacquet-Functors].** Let  $P = LU$  be a parabolic subgroup of  $G$  and  $(\pi, V) \in \text{Rep}^{\text{alg}}(G(F))$ , then

$$V_U = V / (\text{span}\{\rho(u)v - v | u \in U\}) = V/V(U)$$

is naturally a  $L \cong P/U$  representation, so we can define the **Jacquet functor**:

$$J_P^G : \text{Rep}^{\text{alg}}(G(F)) \rightarrow \text{Rep}^{\text{alg}}(L(F)) : V \mapsto V_U.$$

Given a character  $\psi$  of  $U(F)$ , similarly  $V_{U,\psi} = V / (\text{span}\{\rho(u)v - \psi(u)v | u \in U\}) = V/V(U, \psi)$  is a  $Z(K)$ -module, we can also define similarly the **twisted Jacquet functor**

$$J_{P,\psi}^G : \text{Rep}^{\text{alg}}(G(F)) \rightarrow \text{Rep}^{\text{alg}}(Z(K)) : V \mapsto V_{U,\psi}.$$

For convenience, define the **normalized Jacquet functor**:  $r_P^G = \sqrt{\frac{\Delta_P}{\Delta_G}} \otimes J_P^G$ .

$J_P^G, J_{P,\psi}^G, r_P^G$  are exact functors, by (24.1.2.6).  $\lrcorner$

**Prop. (24.9.3.2) [Finite Length Property].**  $J_P^G, J_{P,\psi}^G, r_P^G$  map smooth representations of finite length to smooth representations of finite length.  $\lrcorner$

*Proof:* If  $V$  is a f.g.  $G$ -module, then it is a f.g.  $P$ -module, because  $G = PK$ , and  $Kv_i$  is of f.d. for any  $v \in V$ . Thus the quotient  $V_U$  of  $V$  is also f.g..

For finite length ?, Cf. [Bernstein-Zelevinsky2, P8].  $\square$

### Parabolic Inductions

**Def. (24.9.3.3) [Parabolic Inductions].** Let  $P = LU$  be a parabolic subgroup of  $G$  and denote  $\text{pr} : P \rightarrow P/U \cong L$ . The (normalized) **parabolic induction** functor  $\text{n-Ind}_P^G$  is the functor

$$\text{n-Ind}_P^G : \text{Rep}^{\text{alg}}(L) \rightarrow \text{Rep}^{\text{alg}}(G) : \rho \mapsto \text{n-Ind}_P^G(\rho \circ \text{pr}) \quad (24.1.6.40).$$

There are also other functors

$$\text{n-ind}_P^G : \text{Rep}^{\text{alg}}(L) \rightarrow \text{Rep}^{\text{alg}}(G) : \rho \mapsto \text{n-ind}_P^G(\rho \circ \text{pr}) \quad (24.1.6.40).$$

$$\text{Ind}_P^G : \text{Rep}^{\text{alg}}(L) \rightarrow \text{Rep}^{\text{alg}}(G) : \rho \mapsto \text{Ind}_P^G(\rho \circ \text{pr}) \quad (24.1.6.40).$$

$$\text{ind}_P^G : \text{Rep}^{\text{alg}}(L) \rightarrow \text{Rep}^{\text{alg}}(G) : \rho \mapsto \text{ind}_P^G(\rho \circ \text{pr}) \quad (24.1.6.40).$$

┘

**Prop. (24.9.3.4) [Parabolic Induction and Jacquet Functor].** For any parabolic subgroup  $P$ ,  $\text{n-Ind}_P^G$  (24.9.3.3) is right adjoint to the normalized Jacquet-functor  $r_P^G$  (24.9.3.1). ┘

*Proof:* For  $\sigma \in \text{Rep}^{\text{alg}}(L)$ ,  $\rho \in \text{Rep}^{\text{alg}}(G)$ ,

$$\text{Hom}_{P/U}(\sqrt{\Delta_P} \otimes (\text{res}_P^G(\sigma))_U, \rho) \cong \text{Hom}_P(\text{res}_P^G(\sigma), \sqrt{\delta_P} \otimes (\rho \circ \text{pr})) = \text{Hom}_G(\sigma, \text{n-Ind}_P^G(\rho \circ \text{pr})).$$

□

**Prop. (24.9.3.5) [Admissibility and Finite Length Property].**  $\text{n-Ind}_P^G$  is an exact functor, and it maps admissible representations to admissible representations and maps finite length representations to finite length representations. ┘

*Proof:* The exactness follows from [B-Z77]1.9. ?

The admissibility follows from (24.1.6.50) and the Iwasawa-decomposition.

For finite length. Cf. [Prasad, Representation theory of  $\text{GL}(n)$  over non-Archimedean local fields]Thm4.1 ? or [BZ1]2.26. □

**Prop. (24.9.3.6) [Transitivity of Parabolic Inductions].** ┘

### Supercuspidal Representation

References are [B-Z77, Kud94].

**Def. (24.9.3.7) [Supercuspidal Representations].**  $(\pi, V) \in \text{Rep}^{\text{alg}}(G(K))$  is called a **quasi-cuspidal representation** if for any properly-contained parabolic subgroup  $P = LU$  of  $G$ , we have  $r_P^G(V) = 0$ . A **cuspidal representation** is a representation that is both quasi-cuspidal and admissible. The category of cuspidal representations is denoted by  $\text{Rep}^{\text{cusp}}(G(F))$ . ┘

**Prop. (24.9.3.8) [Supercuspidal Dichotomy].** If  $\pi \in \text{Irr}^{\text{alg}}(G(F))$ , then either  $\pi$  is (quasi-)cuspidal, or  $\pi$  is a subrepresentation of  $I_P^G(\rho)$ , where  $P = LU$  is a proper parabolic subgroup of  $G$ , and  $\rho \in \text{Irr}^{\text{alg}}(L(F))$  is (quasi-)cuspidal. ┘

*Proof:* If  $\pi$  is not (quasi-)cuspidal, choose a minimal parabolic  $P$  that  $r_P^G(\pi) \neq 0$ . As  $r_P^G(\pi)$  is f.g. (24.9.3.2), by (24.1.2.10), it has an irreducible subquotient  $\sigma$ . Then

$$0 \neq \text{Hom}_M(r_P^G \pi, \sigma) = \text{Hom}_G(\pi, I_P^G \sigma).$$

And by minimality,  $\sigma$  is (quasi-)cuspidal by (24.11.2.4). □

**Thm. (24.9.3.9) [Characterizing Supercuspidal Representations, Harish-Chandra].** then for  $(\pi, V) \in \text{Rep}^{\text{alg}}(\text{GL}(n; K))$ , the following are equivalent:

1.  $\pi$  is quasi-cuspidal (24.9.3.7).
2. For any principal congruence subgroup  $\mathcal{K}_m$ , the function  $D_{\xi, K} : G \rightarrow V : g \mapsto \pi(e_K)\pi(g^{-1})\xi$  has compact support modulo  $Z(K)$ .
3. Every matrix coefficient of  $\pi$  is compactly supported modulo  $Z(K)$ .
4. The restriction of  $\pi$  to  $G_n^0$  is compact.

┘

*Proof:*  $2 \rightarrow 3$  is verbatim as that of (24.1.6.54),  $3 \rightarrow 4$  is easy.  $4 \rightarrow 2$  follows from the definition of compact representations and the fact  $\text{GL}(n; K)/G_n^0 Z(K)$  is finite.

$1 \iff 2$ : Cf. [Bernstein-Zelevinsky, P34]. ?

□

**Cor. (24.9.3.10) [Contragradients of Cuspidal Representations].** For  $\pi \in \text{Rep}^{\text{cusp}}(\text{GL}(n; K))$ ,  $\pi^\vee \in \text{Rep}^{\text{cusp}}(\text{GL}(n; K))$  too.

┘

**Prop. (24.9.3.11) [Supercuspidal Representations Exist].** If  $\text{char } K = 0$ , then supercuspidal representations of  $G(K)$  exist.

┘

*Proof:* Cf. [Beuzart-Plessis, A short proof of the existence of supercuspidal representations for all reductive  $p$ -adic groups].

□

### Generalized Steinberg-Representations

**Def. (24.9.3.12) [Generalized Steinberg-Representations].** For a parabolic subgroup  $P \leq G$ , define the generalized **Steinberg-representation**

$$\text{St}_P^G \triangleq \text{Ind}_P^G(\mathbf{1}) / \sum_{Q \supset P} \text{Ind}_Q^G(\mathbf{1}) \in \text{Rep}^{\text{alg}}(G(K)) \quad (24.9.3.3),$$

where  $Q$  runs through all parabolic subgroups containing  $P$ .

For example, if  $G = \text{GL}(2)$ ,  $\text{St}_2$  has length 2, and there are exact sequences:

$$0 \rightarrow 1 \rightarrow \text{val}^{-1/2} \times \text{val}^{1/2} \rightarrow \text{St}_2 \rightarrow 0, \quad 0 \rightarrow \text{St}_2 \rightarrow \text{val}^{1/2} \times \text{val}^{-1/2} \rightarrow 1 \rightarrow 0$$

┘

**Prop. (24.9.3.13) [Generalized Steinberg-Representations].** Let  $K_0^{\text{f.l.}}(G(K))$  be the Grothendieck-group of finite length smooth representations of  $G(K)$ , then

- For any parabolic subgroup  $P \leq G$ ,  $\text{St}_P^G$  (24.9.3.12) is the unique irreducible quotient representation of  $\text{Ind}_P^G(\mathbf{1})$ .
- For any parabolic subgroup  $P \leq G$ , the map  $Q \mapsto \text{St}_Q^G$  is a bijection from the set of parabolic subgroups of  $G$  containing  $P$  to the set of Jordan-Hölder constituents of  $\text{Ind}_P^G(\mathbf{1})$ .
- For parabolic subgroups  $P, P' \leq G$ ,  $P \sim P' \iff \text{St}_P^G \cong \text{St}_{P'}^G$ .
- Let  $\Delta_0$  be a set of simple roots of the relative root system of  $G$ , and for each subset  $I \leq \Delta_0$ , let  $P_I$  be the parabolic subgroup corresponding to  $I$ . Then for each subset  $I \leq \Delta_0$ , there is an exact sequence of smooth representations

$$0 \rightarrow \text{Ind}_G^G(\mathbf{1}) \rightarrow \bigoplus_{\substack{I \subset K \subset \Delta_0 \\ \#\Delta_0 \setminus K=1}} \text{Ind}_{P_K}^G \rightarrow \bigoplus_{\substack{I \subset K \subset \Delta_0 \\ \#\Delta_0 \setminus K=2}} \text{Ind}_{P_K}^G \rightarrow \dots \rightarrow \bigoplus_{\substack{I \subset K \subset \Delta_0 \\ \#K \setminus I=1}} \text{Ind}_{P_K}^G \rightarrow \text{Ind}_{P_I}^G \rightarrow \text{St}_{P_I}^G \rightarrow 0.$$

where the differential is defined by  $\text{?}$ .

┘

*Proof:* Cf.[Period domains over finite and p-adic fields, Dat-Orlik-Rapoport]P304.  $\text{?}$

□

#### 4 Admissible Invariant Distributions(Harish-Chandra)

References are [HC99].

**Notation(24.9.4.1).**

- Let  $\text{char } K = 0$ .

┘

**Def.(24.9.4.2) [Regularity Polynomial].** Let  $l = \text{rank } \mathfrak{g}$  and for  $X \in \mathfrak{g}$ , let  $\eta_{\mathfrak{g}}(X)$  be the coefficient of  $T^l$  in the polynomial  $\det(T - \text{ad}X)$ , then  $\eta_{\mathfrak{g}}$  is a polynomial function on  $\mathfrak{g}$ , whose zero set is the set of singular elements in  $\mathfrak{g}$ .

┘

**Prop.(24.9.4.3) [Finitely Many Nilpotent Orbits].** The set of nilpotent elements in  $\mathfrak{g}$  a union of f.m.  $G(K)$ -orbits, which are called the **nilpotent orbits**.

Since  $\text{char } K = 0$ , the set  $\mathcal{O}(0)$  of nilpotent orbits in  $\mathfrak{g}$  is finite.

And a  $G$ -orbit  $\mathcal{O}$  is nilpotent iff  $0 \in \overline{\mathcal{O}}$ .

┘

*Proof:* Cf.[HC99].  $\text{?}$

□

#### Fourier Transform on Lie Algebras

**Def.(24.9.4.4) [Fourier Transformations].** Let  $\mathfrak{g} = \text{Lie}(G)$  and  $B$  be a  $K$ -valued non-degenerate symmetric  $G$ -invariant bilinear form on  $\mathfrak{g}$   $\text{?}$ . And let  $dX$  be a Haar-measure on  $\mathfrak{g}$ . Then we can define Fourier transform on  $\mathfrak{g}$ : For  $f \in C_c^\infty(\mathfrak{g})$ , denote

$$\mathcal{F}f(Y) = \int_{\mathfrak{g}} f(X)\psi(B(X, Y))dX,$$

then  $\mathcal{F}$  is a linear bijection of  $C_c^\infty(\mathfrak{g})$  with itself, and we can also define the Fourier transform of a distribution on  $\mathfrak{g}$ .

┘

**Prop.(24.9.4.5).** If  $\mathcal{O}$  is a  $G$ -orbit in  $\mathfrak{g}$ , then  $\mathcal{O}$  carries a  $G$ -invariant measure  $\mu_{\mathcal{O}}$ .

┘

*Proof:* Cf.[Rao, Orbital integrals in reductive groups].  $\text{?}$

□

**Prop.(24.9.4.6).** For a  $G$ -orbit  $\mathcal{O}$  in  $\mathfrak{g}$ ,  $\mathcal{F}\mu_{\mathcal{O}}$  is a locally  $L^1$ -function on  $\mathfrak{g}$  that is locally constant on the set of regular elements in  $\mathfrak{g}$ .

┘

*Proof:*  $\text{?}$

□

#### 5 Generic representations

**Notation(24.9.5.1).**

- Let  $G$  be quasi-split.

┘

**Def.(24.9.5.2) [ $\psi$ -Generic Represnetations].** For  $(\pi, V) \in \text{Irr}^{\text{adm}}(G(K))$  and  $\psi \in U(K)^\vee$ ,

- a  **$\psi$ -Whittaker functional** on  $V$  is a  $U(K)$ -equivariant map  $\lambda : V \rightarrow \mathbb{C}_\psi$  (Compare with (26.1.4.9).)
- a  **$\psi$ -Whittaker model** is a subrepresentation of  $\text{Ind}_{U(K)}^{G(K)}(\mathbb{C}_\psi)$  that is isomorphic to  $\pi$  and consists of functions  $\varphi$  of moderate growth.

$\pi$  is said to be a  **$\psi$ -generic representation** if it admits a non-zero  $\psi$ -Whittaker functional. This only depends on the  $(B/U)(K)$ -orbit of  $\psi$ ?

And it is said to be a **generic representation** if it is  $\psi$ -generic for some generic unipotent character  $\psi \in U(K)^\vee$  (10.4.4.23).  $\lrcorner$

**Cor. (24.9.5.3) [Whittaker Functionals and Whittaker Models].** Situation as in (24.9.5.2), if  $\lambda$  is a Whittaker functional of  $\pi$ , then the space of functions

$$W_v(g) = \lambda_v(\pi(g)v)$$

for  $v \in V$  is a Whittaker model for  $\pi$ .  $\lrcorner$

*Proof:* A Whittaker model is equivalent to a  $\text{GL}(n; K)$ -homomorphism  $V \rightarrow \text{Ind}_{\text{Unip}(n; K)}^{\text{GL}(n; K)}(\mathbf{1}(\psi_{\text{Unip}}))$ , which by smooth Frobenius reciprocity (24.1.6.43) is equivalent to a  $\text{Unip}(n; K)$ -homomorphism  $V \rightarrow \mathbf{1}(\psi_{\text{Unip}})$ , which is just a Whittaker functional. So this proposition is equivalent to (24.9.5.5).  $\square$

**Remark (24.9.5.4).** Generic representations are important (at least for  $\text{GL}(n)$ ) because for any  $F \in \mathbf{NField}$  and  $\pi \in \text{Irr}^{\text{auto}}(\text{GL}(n)/F)$ , all the local components  $\pi_v$  are generic, by (26.6.4.7).

Whittaker models are important because we can use it to attach local Euler factors for such representations.  $\lrcorner$

**Thm. (24.9.5.5) [Local Multiplicity One, Shalika [Sha74]/Gelfand-Kazhdan [G-K75]].** For  $(\pi, V) \in \text{Irr}^{\text{adm}}(G)$  and a generic unipotent character  $\psi \in U(K)^\vee$  (10.4.4.23), the space of  $\psi$ -Whittaker functionals for  $\pi$  has dimension  $\leq 1$ . Equivalently, there exists at most one  $\psi$ -Whittaker model for  $\pi$ , by (24.9.5.3).  $\lrcorner$

**Remark (24.9.5.6).** The condition that  $\psi$  is generic cannot be removed, by Exercise 11.2 of [Getz].  $\lrcorner$

*Proof:* We only prove for  $G = \text{GL}(n)$ ?

Define another representation  $\pi'(g) = \pi(\iota(g)^{-1})$  (24.11.1.17), then this representation is isomorphic to  $\pi_1$  defined in (24.11.1.10) ( $\pi(w^0)$  induces an isomorphism), which is isomorphic to the contragredient of  $\pi$ , so there is a pairing on  $V$  that

$$(\pi(g)\xi, \eta) = (\xi, \pi(\iota(g))\eta).$$

Now for any smooth functional  $\Lambda$ , there is an element  $[\Lambda]$  that  $(\xi, [\Lambda]) = \Lambda(\xi)$ .

Now for any linear functional  $\Lambda$  on  $V$  and  $\varphi \in \mathcal{H}_G$ , we can define another smooth linear function  $(\Lambda * \varphi)(\xi) = \Lambda(\pi(\varphi)\xi)$ . Then clearly  $\varphi * (\varphi_1 * \varphi_2) = (\Lambda * \varphi_1) * \varphi_2$ . We need the following lemma:

**Lemma (24.9.5.7).**

- $\pi(g)[\Lambda * \varphi] = [\Lambda * \rho(\iota(g)^{-1})\varphi]$ .
- If  $L$  is a smooth functional,  $[L * \varphi] = \pi(\iota(\varphi))[L]$ .
- If  $L$  is a Whittaker functional,  $[\Lambda * \lambda(u)\varphi] = \psi_N(u)[\Lambda * \varphi]$ .

$\lrcorner$

*Proof:* 1:

$$\begin{aligned} (\xi, \pi(g)[\Lambda * \varphi]) &= (\pi(\iota(g))\xi, [\Lambda * \varphi]) = (\Lambda * \varphi)(\pi(\iota(g))\xi) \\ &= \int_G \Lambda(\pi(h)\pi(\iota(g))\xi) \varphi(h) dh = \int_G \Lambda(\pi(h)\xi) \varphi(h\iota(g)^{-1}) dh = (\xi, [\Lambda * \rho(\iota(g)^{-1})\varphi]). \end{aligned}$$

$$2: (\xi, [L * \varphi]) = (L * \varphi)(\xi) = L(\pi(\varphi)\xi) = (\pi(\varphi)\xi, [L]) = (\xi, \pi(\iota(\varphi))[L]).$$

3:

$$\begin{aligned} (\xi, [\Lambda * \lambda(u)\varphi]) &= (\Lambda * \lambda(u)\varphi)(\xi) = \int_G \Lambda(\pi(g)\xi) \varphi(u^{-1}g) dg \\ &= \int_G \Lambda(\pi(u)\pi(g)\xi) \varphi(g) dg \\ &= \psi_N(u)(\Lambda * g)(\xi) = \psi_N(u)(\xi, [\Lambda * \varphi]) \end{aligned}$$

□

Now if  $\Lambda_1, \Lambda_2$  are two Whittaker functionals, we will show they are propositional: we define a distribution  $\Delta$  on  $G$  that  $\Delta(\varphi) = \Lambda_1([\Lambda_1 * \varphi])$ , then by the lemma above, (24.11.1.17) can be applied to  $\bar{\Delta}$  so we have  $\Delta = \iota(\Delta)$ .

Next we show for any linear functional  $\Lambda$ ,  $V = \{[\Lambda * \varphi] | \varphi \in \mathcal{H}\}$ : Notice the RHS is  $G$ -invariant by (24.9.5.7), and it is not empty by smoothness technique. To go further, need another lemma:

**Lemma (24.9.5.8).** If  $\varphi \in \mathcal{H}$  satisfies  $\Lambda_1 * \varphi = 0$ , then  $\Lambda_2 * \varphi = 0$ . ┘

*Proof:* Firstly, all  $\Lambda_1 * \pi(g)\varphi = 0$ , which follows from (24.9.5.7) item1. Hence,

$$\Lambda_2([\Lambda_1 * \lambda(g)\iota(\varphi)]) = \Delta(\iota(\rho(\iota(g)^{-1})\varphi)\varphi) = \Delta(\rho(\iota(g)^{-1})\varphi) = \Lambda_2([\Lambda_1 * \rho(\iota(g)^{-1})\varphi]) = 0.$$

hence by linearity, for any  $\sigma \in \mathcal{H}$ ,  $\Lambda_2([\Lambda_1 * \sigma * \iota(\varphi)]) = 0$ , which by (24.9.5.7) item2 is equivalent to  $\Lambda_2(\pi(\varphi)[\Lambda_1 * \varphi]) = 0 = (\Lambda_2 * \varphi)[\Lambda_1 * \varphi]$ , because  $\Lambda_1 * \sigma$  is smooth. But we know  $[\Lambda * \varphi]$  can be any  $v \in V$ , thus  $\Lambda_2 * \varphi = 0$ . □

By the lemma, we can define a map  $T : V \rightarrow V : T([\Lambda_1 * \varphi]) = [\Lambda_2 * \varphi]$ , which is a  $G$ -homomorphism by (24.9.5.7), and it is defined on all of  $V$ , so  $T\xi = c\xi$  for some  $c$ , then we see  $\Lambda_2 = c\Lambda_1$ , by a smoothness technique. □

**Prop. (24.9.5.9).** A Whittaker functional for  $(\pi, V)$  is the same as a linear functional on  $J_{\text{Unip}(n;K), \psi_N}(V)$ .

In particular, for  $(\pi, V) \in \text{Irr}^{\text{adm}}(\text{GL}(n; K))$ ,  $\dim J_{\text{Unip}(n;K), \psi_N}(V) \leq 1$ , by (24.9.5.5). ┘

## Existence of Whittaker Models

### 6 Unramified Representations

**Notation (24.9.6.1).**

- Let  $(G, B, T, W)$  be unramified reductive (20.5.2.25).
- Let  $S \leq T$  be the maximal split torus.
- Let  $U = R_u(B)$ .
- Let  $\mathcal{K} = \mathcal{G}(\mathcal{O}_K) \leq G(K)$  be a hyperspecial subgroup (20.7.2.1).
- Let  $\sigma_K \in \text{Gal}_K$  be a geometric Frobenius.

┘

**Def. (24.9.6.2) [Unramified Hecke Algebras].** Define

$$C^\infty(\mathcal{K} \backslash G(K) / \mathcal{K}) \stackrel{\Delta}{=} \mathcal{H}_{\mathcal{K}}(G(K)) \quad (24.1.6.18),$$

called the **unramified Hecke algebra** or **spherical Hecke algebra** of  $G$ . By (20.7.2.12), for different choice of  $\mathcal{K}$ , the spherical Hecke algebras are conjugate by an elements of  $(G/Z(G))(k)$ .

This unramified Hecke algebra has a spherical idempotent (3.6.5.10)  $e_{\mathcal{K}}$ , where the anti-involution is given by  $?$ . In particular, it is commutative. ┘

**Def. (24.9.6.3) [Unramified Representations].**  $(\pi, V) \in \text{Irr}^{\text{adm}}(G(K))$  is called a  $\mathcal{K}$ -**unramified representation** if it contains a  $\mathcal{K}$ -fixed vector, or equivalently, its corresponding  $\mathcal{H}_{\mathcal{K}}(G(K))$ -module via the correspondence (24.1.6.22) is spherical (3.6.5.11).

And if  $\pi$  is unramified, the dimension of spherical vectors is exactly 1 by (3.6.5.11). The action of  $\mathcal{H}_{\mathcal{K}}(G(K))$  on this subspace is an additive character, called the **spherical character** of  $\pi$  (3.6.5.11). ┘

**Prop. (24.9.6.4) [Unramified Representations and Spherical Characters].** Two unramified irreducible representation  $\pi, \pi' \in \text{Irr}^{\text{adm}}(G)$  are equivalent iff their spherical characters are equal, by (3.6.5.12).

Conversely, Every additive character  $\psi : \mathcal{H}_{\mathcal{K}}(G(K)) \rightarrow \mathbb{C}$  arises as a spherical character for some unramified representation  $\pi \in \text{Irr}^{\text{adm}}(G(K))$  (24.9.6.3). ┘

*Proof:* Cf. [Laumon, Cohomology of Drinfeld modular varieties] Prop D.1.8.  $?$  ┘

**Prop. (24.9.6.5).** By Cartan decomposition (20.7.2.14), the unramified Hecke algebra  $\mathcal{H}_{\mathcal{K}}(G)$  has a basis consisting of elements of the form  $c_{\lambda} = \mathbf{1}_{\mathcal{K}\lambda(\varpi)\mathcal{K}}$  for  $\lambda \in P^+(\Phi(G, \hat{S}))$  ┘

**Prop. (24.9.6.6) [Degrees of Double Cosets].** If  $G$  is split reductive, then for any  $\lambda \in P^+(\Phi)$ , we have

$$\deg(c_{\lambda}) = \sum_{y \in W\lambda W} q^{\ell(y)} / \sum_{w \in W} q^{\ell(w)} = \frac{\#(G/P_{\lambda})(\kappa)}{q^{\dim(G/P_{\lambda})}} \cdot q^{\langle \lambda, 2\rho \rangle}.$$

where  $\ell : X^{\bullet}(\hat{T}) \rtimes W \rightarrow \mathbb{Z}$  is the length function ( $?$  Cf. [Lus83]). ┘

*Proof:* This follows from Bruhat-Tits decomposition  $?$ . ┘

### Satake-Isomorphisms

References are [Gro98], [Getz], [Cartier79].

**Thm. (24.9.6.7) [Chevalley's Restriction Theorem].** For  $(G, T, W) \in \text{RedGrp}/K$  split reductive, there is an isomorphism

$$\text{Spec} \left( \mathcal{O}(T)^{W(G, T)} \right) = T/W(G, T) \cong G/\text{conj} = \text{Spec} \left( \mathcal{O}(G)^G \right).$$

And  $(G/\text{conj})(\mathbb{C})$  is exactly the set of closed conjugacy classes of  $G(\mathbb{C})$ . ┘

*Proof:* Cf. [Steinberg, Regular elements of semisimple algebraic groups] Section 6  $?$  ┘

**Def. (24.9.6.8) [Satake-Transform].** Suppose  $G$  is split reductive. For  $f \in \mathcal{H}_{\mathcal{K}}(G(K); \mathbb{Z})$ , the **Satake transform** of  $f$  is defined to be

$$\mathrm{CT}_p(f)(t) = \delta(t)^{1/2} \int_{U(K)} f(tn) dn, \text{ where } t \in T(K).$$

Then  $\mathrm{CT}_p(f)$  is a function on  $T(K)/T(\mathcal{O}_K) = X_{\bullet}(T)$  with values in  $\mathbb{Z}[q^{1/2}, q^{-1/2}]$ , and is invariant under the action of  $W$ .  $\lrcorner$

*Proof:* ?  $\square$

**Lemma (24.9.6.9) [Satake-Isomorphisms, Satake [Sat63]].** If  $G$  is split reductive, then the Satake transform (24.9.6.8) induces an isomorphism

$$\mathrm{CT}_p : \mathcal{H}_{\mathcal{K}}(G(K); \mathbb{Z}[q^{1/2}, q^{-1/2}]) \cong \mathbb{Z}[X_{\bullet}(T)]^W [q^{1/2}, q^{-1/2}].$$

And if  $\rho \in X^{\bullet}(T)$ , then it induces an isomorphism

$$\mathrm{CT}_p : \mathcal{H}_{\mathcal{K}}(G(K); \mathbb{Z}) \otimes \mathbb{Z}[q] \cong \mathbb{Z}[q][X_{\bullet}(T)]^W.$$

More explicitly, there exists  $b_{\lambda}(\mu) \in \mathbb{Z}$  for any  $\mu, \lambda \in P^+(\Phi^{\vee})$  s.t.

$$\mathrm{CT}_p(c_{\lambda}) = q^{\langle \lambda, \rho \rangle} \mathrm{ch}(V_{\lambda}) + \sum_{\mu < \lambda \in P^+(\Phi^{\vee})} b_{\lambda}(\mu) q^{\langle \lambda, \rho \rangle} \mathrm{ch}(V_{\mu}).$$

$\lrcorner$

*Proof:* ? Cf. [Gro98].

Then the isomorphism follows easily from Cartan decomposition (20.7.2.14).  $\square$

**Thm. (24.9.6.10) [Satake-Isomorphism, Satake-Langlands].** If  $G/K$  is unramified, then there is an isomorphism of algebras

$$\mathrm{CT}_p : \mathcal{H}_{\mathcal{K}}(G(K)) \cong \mathcal{O}(\hat{T} \rtimes \sigma_K)^{\kappa^N}.$$

$\lrcorner$

*Proof:* ? Cf. [Getz].  $\square$

**Cor. (24.9.6.11) [Unramified Langlands-Correspondence].** If  $G$  is split reductive, then the Satake isomorphism (24.9.6.10) induces a bijection between the set of semisimple conjugacy classes of  $\hat{G}(\mathbb{C})$  and  $\mathrm{Irr}^{\mathrm{unr}}(G(K))$  s.t. for any  $\pi \in \mathrm{Irr}^{\mathrm{unr}}(G)$ , the evaluation of the spherical character of  $\pi$  on any  $f \in \mathcal{H}_{\mathcal{K}}(G(K))$  is given by the evaluation of  $\mathrm{CT}_p(f)$  on the Satake parameter  $s(\pi) \in \hat{T}$ .

The **Satake parameter** of  $\pi \in \mathrm{Irr}^{\mathrm{unr}}(G(K))$  is denoted by  $[s(\pi)]$  for some  $s(\pi) \in \hat{G}(\mathbb{C})$ , which is usually chosen in  $\hat{T}(\mathbb{C})$ .  $\lrcorner$

*Proof:* This follows from Chevalley restriction theorem (24.9.6.7), (10.2.1.19) and (24.9.6.4).  $\square$

**Cor. (24.9.6.12).** If  $G_1, G_2 \in \mathrm{RedGrp}/K$  are unramified, and  $\mathcal{K}_1 \leq G_1(K), \mathcal{K}_2 \leq G_2(K)$  are hyperspecial subgroups, then any morphism  ${}^{\mathrm{L}}G_1 \rightarrow {}^{\mathrm{L}}G_2$  induces a morphism of Hecke algebras

$$\mathcal{H}_{\mathcal{K}_2}(G_2(K)) \rightarrow \mathcal{H}_{\mathcal{K}_1}(G_1(K)).$$

$\lrcorner$

*Proof:* ? □

**Prop. (24.9.6.13).** The Satake parameter (24.9.6.11) of the trivial representation of  $G$  is given by  $s(\pi) = 2\rho(q^{1/2})$ . ┘

*Proof:* ? □

**Prop. (24.9.6.14).** Suppose  $G$  is split reductive. For  $s \in \widehat{G}(\mathbb{C})$ , denote  $\pi(s) \in \text{Irr}^{\text{unr}}(G(K))$  corresponding to  $s$  via (24.9.6.11), then  $\pi(s)$  is tempered iff  $\overline{\langle s \rangle} \subset \widehat{G}(\mathbb{C})$  is compact. And Macdonald [Mac71] determined the Plancherel measure on the unramified unitary dual of  $G$ . ┘

*Proof:* ? □

### Kazhdan-Lusztig Polynomials

**Notation (24.9.6.15).**

- In this subsubsection, we assume that  $G$  is split reductive.

┘

**Prop. (24.9.6.16)** [ $d_\lambda \mu$ ]. By (24.9.6.9) there exists  $d_\lambda(\mu) \in \mathbb{Z}$  s.t. for any  $\lambda \in P^+(\Phi^\vee)$ ,

$$q^{\langle \lambda, \rho \rangle} \text{ch}(V_\lambda) = \text{CT}(c_\lambda) + \sum_{\mu < \lambda \in P^+(\Phi^\vee)} d_\lambda(\mu) \text{CT}_p(c_\mu) \quad (24.9.6.5).$$

To understand  $\text{CT}_p$ , it suffices to understand these  $d_\mu(\lambda)$ . ┘

**Prop. (24.9.6.17)** [ $q$ -Analogue of Kostant's Partition Function]. For  $\mu \in Q(\Phi^\vee)$ , denote

$$\widehat{P}_X(\mu) = \sum_{\mu = \sum_{\alpha \in \Phi^+} n(\alpha^\vee) \alpha^\vee} X^{-\sum_{\alpha \in \Phi^+} n(\alpha^\vee)} \in \mathbb{Z}[X, X^{-1}].$$

where  $\mu = \sum_{\alpha \in \Phi^+} n(\alpha^\vee) \alpha^\vee$  is an expression of  $\mu$  as a non-negative sum of positive coroots. Then

$$X^{\langle \mu, \rho \rangle} \widehat{P}_X(\mu)$$

is a polynomial in  $X$  with integer coefficients, and has constant coefficient 1 if  $\mu \geq 0$ .

Moreover,  $\widehat{P}_1(\mu) = \mathfrak{P}(\mu)$  (3.9.5.21). ┘

**Thm. (24.9.6.18)** [Lusztig-Kato Polynomials, Lusztig [Lus83]/Kato [Kat82]]. For any  $\mu < \lambda \in P^+(\Phi^\vee)$ ,

$$P_{\mu, \lambda}(q) \triangleq d_\lambda(\mu) = q^{\langle \lambda - \mu, \rho \rangle} \sum_{w \in W} \text{sgn}(w) \widehat{P}(w(\lambda + \rho^\vee) - (\mu + \rho^\vee))(q) \quad (24.9.6.16).$$

is a Kazhdan-Lusztig polynomial for the affine Weyl group of  $\widehat{G}$ . In particular, by theory of Kazhdan-Lusztig polynomials,  $P_{\mu, \lambda}$  is a polynomial with non-negative integral coefficients of degree  $< \langle \lambda - \mu, \rho \rangle$ . ┘

*Proof:* ? □

The constant coefficients is 1 because  $\langle \lambda - w_\bullet \lambda, \rho \rangle > 0$  unless  $w = \text{id}$ .

**Cor. (24.9.6.19) [A Simple Situation].** Situation as in (24.9.6.18), if  $P_{\mu,\lambda}$  has constant coefficient 1, and  $P_{\mu,\lambda}(1) = \dim V_\lambda[\mu]$  by Kostant's multiplicity theorem (24.4.3.8). In particular, for any  $\mu, \lambda \in P^+(\Phi^\vee)$ ,

$$\dim V_\lambda[\mu] \leq 1 \implies d_{\mu,\lambda} = P_{\mu,\lambda}(q) = \dim V_\lambda[\mu].$$

┘

**Example (24.9.6.20).** If  $G$  is simple adjoint and  $\lambda$  is the highest coroot corresponding to  $\text{Ad} \in \text{Rep}^{\text{fd}}(\widehat{G})$ , then

$$P_{0,\lambda}(q) = \sum_{i=1}^l q^{m_i-1},$$

where  $m_1, \dots, m_l$  are the exponents of  $\mathfrak{g}$  ?.

┘

*Proof:* ? Cf. [Lus83]P226. □

**Example (24.9.6.21) [GL(n)].** If  $G = \text{GL}(n)$ ,  $B = \text{B}(n)$ ,  $T = T(n)$ ,  $\mathcal{K} = \text{GL}(n; \mathcal{O}_K)$ , then  $\mathcal{H}_{\mathcal{K}}(G; \mathbb{Z})$  has a basis given by representatives:

$$\{c_{\lambda_i} : \lambda_i = \text{diag}(\underbrace{1, \dots, 1}_{r \text{ many 1s}}, 0, \dots)\}_{i \in [n-1]_+} \cup \{c_{\lambda_{-1}} : \lambda_{-1} = \text{diag}(-1, \dots, -1)\} \quad (24.9.6.16).$$

Then by (24.9.6.16),

$$\text{CT}_p(c_{\lambda_i}) = q^{i(n-i)/2} \text{ch}(\wedge^r \text{Std}), \quad \text{CT}_p(c_{\lambda_{-1}}) = e^{\lambda_{-1}}.$$

┘

*Proof:*  $\lambda_i$  are minuscule and  $V_{\lambda_i} = \wedge^r \text{Std}$  and  $V_{\lambda_{-1}} = \det^{-1}$ . So we can use (24.9.6.19). □

**Example (24.9.6.22).** For  $G = \text{PGL}(2)$ ,  $\widehat{G} = \widehat{G} = \text{SL}(2)$  and  $X^\bullet(\widehat{T}) = \mathbb{Z}\chi$ , where  $\chi$  is the standard representation of  $\widehat{G}$ . Then in this case  $\dim V_\lambda[\mu] \leq 1$  for any  $\lambda, \mu \in P^+(\Phi^\vee)$ , so by (24.9.6.19), we have:

$$q^{\frac{n}{2}} \text{ch}(\text{Sym}^n \text{Std}) = \text{CT}_p \left( \sum_{m \in [n], m \equiv n \pmod{2}} T_{\varpi^m} \right).$$

┘

**Example (24.9.6.23).** For  $G = \text{GSp}(2n)$  and  $\widehat{G} = \text{GSpin}(2n+1)$  and minuscule coweight  $\omega_n \in X^\bullet(\widehat{T})^+$  (24.4.2.27), by (24.9.6.16),

$$\text{CT}_p(c_{\omega_n}) = q^{\frac{n(n+1)}{4}} \text{ch}(\text{Spin}).$$

┘

**Example (24.9.6.24).** For  $G = \text{PSp}_4 \cong \text{SO}(5)$ ,  $\widehat{G} = \text{Sp}(4) \cong \text{O}(5)$  and the fundamental weight  $\omega_1 = \varepsilon_1 \in X_\bullet(T)$ , we have  $V_{\omega_1} = \text{Std}$ . Thus by (24.9.6.19),

$$q^2 \text{ch}(V_{\omega_1}) = \text{CT}_p(c_{\omega_1}) + 1.$$

┘

**Example (24.9.6.25).** For  $G = G_2$ ,  $\widehat{G} = G_2$  and the fundamental weights  $0 \leq \omega_1 \leq \omega_2$ ,  $V_{\omega_1}$  is the 7-dimensional fundamental representation and  $V_{\omega_2}$  is the 14-dimensional adjoint representation. Thus

$$P_{0,\omega_1}(q) = 1 = P_{\omega_1,\omega_2}(q).$$

And by (24.9.6.20),

$$P_{0,\omega_2}(q) = 1 + q^4,$$

because  $\mathfrak{g}_2$  has exponent  $m_1 = 1, m_2 = 5$ ?. Thus

$$q^3 \operatorname{ch}(V_{\omega_1}) = \operatorname{CT}_p(c_{\omega_1}) + 1, \quad q^5 \operatorname{ch}(V_{\omega_2}) = \operatorname{CT}_p(c_{\omega_2}) + \operatorname{CT}_p(c_{\omega_1}) + (q^4 + 1).$$

┘

### Unramified principal Series

#### Spherical Whittaker Function and Spherical Functions

See [Casselman, W., The unramified principal series of  $p$ -adic groups I: the spherical function, Compositio Math. 40 (1980), 387-406.] and [Casselman, W. and J. Shalika, The unramified principal series of  $p$ -adic groups II: the Whittaker function, Compositio Math. 40 (1980), 207-231.] for more general calculations.

**Def. (24.9.6.26) [Spherical Whittaker Function].** The **spherical Whittaker function** of a generic unramified representation is the spherical vector  $W^0$  in the Whittaker model normalized that  $W_0(1) = 1$ ?.

For  $n = 2$ , we can define another normalization  $W_0(g) = \Lambda(\pi(g)\varphi_K)$ , where  $\Lambda$  is the Whittaker functional defined in (24.11.5.8) and  $\varphi_K$  is the normalized spherical vector defined in (24.11.6.1). ┘

## 7 Iwahori-Spherical Representations

References are [P-R08, Bor76].

**Thm. (24.9.7.1) [Borel-Matsumoto Theorem].** Any Iwahori-spherical representation is a subrepresentation of an unramified principal series. ┘

### Unitarizable Representations

**Prop. (24.9.8.1).** If  $V \in \operatorname{Irr}^{\operatorname{adm}}(G(F))$  is unitarizable, then  $V \cong V^\vee$ . ┘

**Thm. (24.9.8.2) [Harish-Chandra[HC70]/Bernstein(74)].** For any  $\pi \in \operatorname{Irr}^{\operatorname{uni}}(G)$ , we have  $V^{\operatorname{alg}} \in \operatorname{Rep}^{\operatorname{adm}}(G)$ . ┘

*Proof:* ? □

**Thm. (24.9.8.3) [Unitary Representations and Smooth Representations].** For  $V \in \mathcal{R}\text{ep}^{\text{uni}}(G)$ ,  $V$  is irreducible iff  $V^{\text{alg}} \in \mathcal{R}\text{ep}^{\text{alg}}(G(F))$  is irreducible.  $\lrcorner$

**Remark (24.9.8.4).** This is an analogue of the Archimedean case (24.6.4.7)(24.7.5.7).  $\lrcorner$

*Proof:* If  $V$  is reducible, then  $V^{\text{alg}}$  is irreducible by (24.1.2.3). If  $V$  is irreducible and  $\emptyset \neq M_1 \subset M$ ,  $\overline{M_1}$  is  $G$ -stable, thus equals  $V$ . Thus it suffices to show that  $\overline{M_1}^{\text{alg}} = M_1$ . Then it suffices to show for each compact open subset  $K \leq G(F)$  and  $\rho \in \text{Irr}(K)$ , the image of  $T_{\xi_\rho \mu_{\text{Haar}}}(\overline{M_1}) \subset M_1^\rho$ , by (24.7.3.14). However  $T_{\xi_\rho \mu_{\text{Haar}}}(M_1) \in M_1^\rho$  by (24.7.3.14). Because  $\dim M_1^\rho < \infty$  as  $V$  is admissible (24.9.8.2), this holds true by continuity.  $\square$

**Cor. (24.9.8.5) [Irreducibility of Algebraic Representations].** For  $V \in \mathcal{R}\text{ep}^{\text{uni}}(G)$ ,  $V$  is irreducible iff  $V^{\text{alg}}$  is irreducible.  $\lrcorner$

**Prop. (24.9.8.6) [Infinitesimally Equivalent Representations].** The map  $(-)^{\text{alg}} : \mathcal{R}\text{ep}^{\text{uni}}(G(K)) \rightarrow \text{Irr}^{\text{adm}}(G(K))$  (24.9.8.3) is injective.  $\lrcorner$

**Remark (24.9.8.7).** This is an analogue of the Archimedean case (24.6.4.9).  $\lrcorner$

*Proof:* If  $S : V_1^{\text{alg}} \cong V_2^{\text{alg}}$ , because each  $V_i$  has a Hermitian form, we have  $V_i^{\text{alg}} \cong (V_i^*)^{\text{alg}}$ , and  $S^*S$  is an automorphism of  $V_i^{\text{alg}}$ , which is a scalar multiplication by (24.1.6.36). Thus by a possibly scalar change, we may assume that  $S$  preserves the Hermitian structure, and thus defines an isomorphism  $V_1 \cong V_2$  by continuity.  $\square$

**Prop. (24.9.8.8) [Twists and Unitary Central Characters].** For any  $\pi \in \mathcal{R}\text{ep}^{\text{adm}}(G(F))$  that has a central character, there exists a unique positive-real-valued character  $\chi$  of  $G$  s.t.  $\pi \otimes \chi$  has a unitary central character.  $\lrcorner$

*Proof:* Cf. [Admissible representations of  $p$ -adic groups, Casselman] Prop 5.2.5.  $\square$

**Def. (24.9.8.9) [Complementary Series].** A **complementary series representation** of  $G(K)$  is a unitarizable representation of  $G(K)$  that is not tempered.  $\lrcorner$

### Tempered Representations

**Def. (24.9.8.10) [(Essentially) Discrete-Series].** Let  $(\pi, V) \in \text{Irr}^{\text{adm}}(G(K))$  and  $r \in \mathbb{R}_+$ , then  $\pi$  is called a **essentially  $L^r$ -integrable representation** the matrix coefficients for  $V$  are all  $L^r$ -integrable on  $G(K)^1$  (20.5.1.2). It is called a  **$L^r$ -integrable representation** if the matrix coefficients for  $V$  are all  $L^r$ -integrable on  $G(K)$ .

Essentially  $L^2$ -representations are also called **essentially square-integrable representations (non-Archimedean)**, and  $L^2$ -representations are called **square-integrable representations (non-Archimedean)** or **discrete-series (non-Archimedean)**.  $\lrcorner$

**Def. (24.9.8.11) [Tempered Representations].**  $\pi \in \text{Irr}^{\text{adm}}(G(K))$  is called an **essentially tempered representation** if it is a  $L^{2+\varepsilon}$ -integrable representation for any  $\varepsilon > 0$ .

An essentially tempered representation is called a **tempered representation** if moreover the central character  $\omega_\pi$  is unitary.  $\lrcorner$

**Prop. (24.9.8.12) [Tempered Representations are Unitarizable].** Any irreducible tempered representation of  $G(K)$  (24.9.8.11) is unitarizable.  $\lrcorner$

*Proof:* Cf.[Silberger. Introduction to harmonic analysis on reductive  $p$ -adic groups]Cor4.5.13.  $\square$

**Prop. (24.9.8.13) [Characterizing Tempered Representations].** For  $\pi \in \text{Irr}^{\text{adm}}(G(K))$  with unitary central character, the following are equivalent:

- $\pi$  is tempered.
- Each matrix coefficient of  $\pi$  defines a tempered distribution on  $G(K)$ .
- The distribution character of  $\pi$  is tempered.

┘

*Proof:* For explanation and proof, Cf.[Sil78]4.5 and [Sil82]2.6. Maybe can also be found in[HC99].  $\square$

**Prop. (24.9.8.14) [Silberger].** If  $\pi \in \text{Irr}^{\text{adm}}(G(K))$  is essentially  $L^r$ -integrable for some  $r \in \mathbb{R}_+$ , then it is essentially  $L^{r'}$ -integrable for any  $r' \in \mathbb{R}_{\geq r}$ .  $\square$

*Proof:* Cf.[Sil82]2.5.  $\square$

**Thm. (24.9.8.15) [Tempered Plancherel Theorem].** There is a tempered Plancherel theorem relating spaces of functions on  $G(K)$  and tempered representations of  $G(K)$ .  $\square$

*Proof:* Cf.[Waldspurger. La formule de Plancherel pour les groupes  $p$ -adiques].?  $\square$

### Irreducible Generic Unramified Unitarizable Representations

## 9 Langlands Classifications

Generalization of the Langlands classification of  $\text{GL}(n)$  to other reductive groups lacks a complete determination of discrete series. Notice that the classification of supercuspidal representations is already finished in [C.J. Bushnell and P.C. Kutzko, The admissible dual of  $\text{GL}(N)$  via compact open subgroups, Princeton university press, Princeton, (1993).]

### Shalika Germs

### Howe's Theorem

**Thm. (24.9.9.1) [Howe].** For a compact subset  $\omega \subset \mathfrak{g}$ , denote  $J(\omega)$  the space of  $G$ -invariant distributions on  $\mathfrak{g}$  with support in  $\text{Ad}(G)\omega$ .

For a lattice  $L$  in  $\mathfrak{g}$  and a distribution  $T$  on  $\mathfrak{g}$ , denote  $j_L(T)$  the restriction of  $T$  to  $C_c(\mathfrak{g}/L)$ .

Then for any compact subset  $\omega \subset \mathfrak{g}$  and a lattice  $T$  in  $\mathfrak{g}$ , we have  $\dim j_L J(\omega) < \infty$ .  $\square$

*Proof:* Cf.[HC99]Thm12.1?  $\square$

**Remark (24.9.9.2).** Waldspurger[Une formule des traces locale pour les algèbres de Lie  $p$ -adiques] generalized this to the case of weighted orbital integrals.  $\square$

**Thm. (24.9.9.3).** Let  $\omega \subset \mathfrak{g}$  be a compact subset and  $T \in J(\omega)$ (24.9.9.1), then there exists a locally  $L^1$ -function  $F$  on  $\mathfrak{g}$  s.t.

- $\hat{T}(f) = \int_{\mathfrak{g}} F(X) f(X) dX$  for any  $f \in C_c^\infty(\mathfrak{g})$ .
- $F$  is locally constant on  $\text{reg}(\mathfrak{g})$ .
- $|\eta_{\mathfrak{g}}|^{1/2} \cdot F$ (24.9.4.2) is locally bounded on  $\mathfrak{g}$ .

┘

*Proof:* Cf.[HC99]Thm4.4.  $\square$

### Admissible Distributions

**Def. (24.9.9.4) [Admissible Distributions].** For a unimodular  $G \in \text{locProfGrp}$ ,  $K_0 \leq G$  a compact open subgroup and  $\Theta$  a distribution on an open  $G$ -invariant subset  $U$  of  $G$  and  $\gamma \in U$ ,  $\Theta$  is called a  $(G, K_0)$ -**admissible distribution** at  $\gamma$  if

- $\gamma K_0 \subset U$ ,
- For any open subgroup  $K \leq K_0$  and  $\sigma \in \text{Irr}(K)$ , we have  $\Theta * \chi_\sigma = 0$  on  $\gamma K_0$  unless  $G$  intertwines  $\mathbf{1}_{K_0}$  and  $\sigma$ .

Suppose  $\Theta$  is  $(G, K_0)$ -admissible at  $\gamma$  and  $K_1 \leq K_0$  is an open subgroup, then  $\Theta$  is also  $(G, K_1)$ -admissible at  $\gamma$ . And  $\Theta$  is called a  $G$ -**admissible distribution** if it is  $(G, K_0)$ -admissible for some  $K_0$ .  $\lrcorner$

*Proof:*  $\text{?}$  Cf. [HC99]P74.  $\square$

**Prop. (24.9.9.5) [Admissible Characters are Admissible].** For a unimodular  $G \in \text{locProfGrp}$  and  $\pi \in \text{Irr}^{\text{adm}}(G)$ ,  $\Theta_\pi \triangleq \chi_\pi$  is a  $G$ -admissible distribution on  $G$  (24.9.9.4).  $\lrcorner$

*Proof:*  $\text{?}$  Cf. [Clozel, Characters of non-connected, reductive p-adic groups].  $\square$

**Thm. (24.9.9.6) [ $G$ -admissible Distributions around Semisimple Elements, Harish-Chandra].**

Let  $\Theta$  be a  $G$ -invariant distribution on a  $G$ -invariant open subset  $U \subset G$ , and  $\gamma \in U$  is a semisimple element s.t.  $\Theta$  is  $G$ -admissible at  $\gamma$  (24.9.9.4), then  $\Theta$  coincides with a locally  $L^1$ -function around  $\gamma$ .  $\lrcorner$

*Proof:* Cf. [HC99]Thm16.1  $\text{?}$   $\square$

**Thm. (24.9.9.7) [Local Character Expansions, Harish-Chandra].** For  $\pi \in \text{Irr}^{\text{adm}}(G(K))$ , there exists  $c_{\mathcal{O}}(\pi)$  for each  $\mathcal{O} \in \mathcal{O}(0)$  (24.9.4.3) s.t.

$$\chi_\pi(\exp(Y)) = \sum_{\mathcal{O} \in \mathcal{O}(0)} c_{\mathcal{O}}(\pi) \mathcal{F}\mu_{\mathcal{O}}(Y)$$

for any regular  $Y$  in a nbhd of  $0 \in \mathfrak{g}$ .  $\lrcorner$

*Proof:* Cf. [HC99]Thm16.2.  $\square$

**Thm. (24.9.9.8) [Howe].** For  $G = \text{GL}(n)$ , Howe observed that the functions  $\mathcal{F}\mu_{\mathcal{O}}$  in (24.9.9.7) have nice forms, thus showed that  $c_{\mathcal{O}}(\pi) \in \mathbb{Z}$  for any  $\pi \in \text{Irr}^{\text{cusp}}(G(K))$  and  $\mathcal{O} \in \mathcal{O}(0)$ .  $\lrcorner$

*Proof:* Cf. [The Fourier transform and germs of characters, Howe].  $\square$

**Thm. (24.9.9.9) [Harish-Chandra [HC99]].** If  $(\pi, V) \in \text{Irr}^{\text{adm}}(G(K))$ , then  $\chi_\pi$  (24.1.6.33) is represented by a locally integrable function on  $G(K)$  that is locally constant on the regular elements of  $G(K)$ , i.e. for any  $\varphi \in \mathcal{H}(G(K))$ , we have

$$\text{tr}(\pi(\varphi)) = \int_G \chi_\pi(g) \varphi(g) dg.$$

And  $\chi_\pi$  is stable under conjugation by  $G(K)$ . Moreover,  $|D_G|^{1/2} \chi_\pi \text{?}$  is locally bounded on  $G$ .  $\lrcorner$

*Proof:* Cf. [HC99]Thm16.3.  $\text{?}$   $\square$

### Formal Degrees

**Thm. (24.9.9.10) [Harish-Chandra].** There exists  $c \in \mathbb{R}_+$  s.t.  $c_0(\pi) = c \cdot d(\pi)$  for any  $\pi \in \text{Irr}^{\text{cusp}, \text{uni}}(G(K))$ , where  $d(\pi)$  is the **formal degree** of  $\pi$ .  $\lrcorner$

*Proof:* ? Cf. [HC99]Thm22.3  $\square$

**Prop. (24.9.9.11) [Formal Degrees, Harish-Chandra-Rogawski].** Harish-Chandra derived a formula for the leading term  $c_0(\pi)$  for  $\pi \in \text{Irr}^{\text{cusp}}(G(K))$ , and Rogawski proved it for any  $\pi \in \text{Irr}^{\text{disc}}(G(K))$ .  $\lrcorner$

*Proof:* Cf. [HC99]Thm22.3 and [Rogawski, An application of the wilding to orbital integrals]. ?  $\square$

**Prop. (24.9.9.12) [Howe/Harish-Chandra[HC99]].** It is possible to normalize the Haar measure on  $G(K)/Z$  s.t.  $d(\pi) \in \mathbb{Z}$  for any  $\pi \in \text{Irr}^{\text{cusp}, \text{uni}}(G(K))$ .  $\lrcorner$

*Proof:*  $\square$

**Prop. (24.9.9.13) [Huntsinger].** For  $\pi \in \text{Irr}^{\text{temp.}}(G(K))$ ,  $c_0(\pi) = 0$  iff  $\pi \notin \text{Irr}^{\text{disc}}(G(K))$ .  $\lrcorner$

*Proof:* [Vanishing of the leading term in Harish-Chandra's local character expansion].  $\square$

**Thm. (24.9.9.14).** Rodier showed that  $\pi \in \text{Irr}^{\text{adm}}(G(K))$  is generic iff  $c_{\mathcal{O}}(\pi) \neq 0$  for some regular nilpotent orbit  $\mathcal{O}$ . And Mœglin-Waldspurger showed that if  $\mathcal{O}$  is maximal among the nilpotent orbits s.t.  $c_{\mathcal{O}}(\pi) \neq 0$ , then  $c_{\mathcal{O}}(\pi)$  is related to the dimension of a degenerate or generalized Whittaker models.  $\lrcorner$

*Proof:* Cf. [Rodier, Modèle de Whittaker et caractères de représentations] and [Mœglin-Waldspurger, Modèles de Whittaker dégénérés pour des groupes  $p$ -adiques].  $\square$

## 24.10 Supercuspidal Representations of $p$ -adic Reductive Groups

### 1 $GL(n)$

References are [Local Langlands Correspondence for  $GL(2)$ ], [Bushnell and P. Kutzko. The admissible dual of  $GL(N)$  via compact open subgroups].

**Prop. (24.10.1.1)[Bushnell-Kutzko].** All cuspidal representations of  $GL(n, F)$  can be constructed by induction from open subgroups.  $\square$

*Proof:* Cf.[Bushnell, C. and P. Kutzko, The admissible dual of  $GL(N)$  via compact open subgroups, Princeton University Press, Princeton (1993).]  $\square$

### 2 $SL(n)$

[Bushnell and P. Kutzko. The admissible dual of  $SL(N)$ ]

## 24.11 Admissible Representations of $\mathrm{GL}(n)$ over $p$ -adic Fields

References are [B-Z76, B-Z77, Tad86, Kud94, Bum97, P-R08, G-H11], [admissible dual of  $\mathrm{GL}(N)$  via compact open subgroups, Bushnell-Kutzko]

**Notation(24.11.0.1).**

- Let  $p \in \text{Prime}$ .
- Let  $(K, \mathcal{O}_K, \mathfrak{p}_K, \varpi) \in p\text{-LField}$ .
- Fix a non-trivial character  $\psi : K \rightarrow \mathbb{C}^\times$ .
- Choose the Haar measure  $dx$  on  $K$  that is self-dual w.r.t.  $\psi$  as in(12.11.1.34).
- Use group-theoretic notations as in(3.1.2.15).
- Use notations on admissible representations of  $p$ -adic reductive groups defined in [Admissible Representations of  \$p\$ -adic Reductive Groups](#).
- Let  $n \in \mathbb{Z}_+$ .
- Use the notations on  $\mathrm{GL}(n)$  defined in [General Linear Groups](#).
- For  $\alpha \in \mathbb{A}^{n-1}(K)$ , let  $\psi_{\mathrm{Unip}, \alpha}$  be a character of  $\mathrm{Unip}(n; K)$  given by  $\psi_{\mathrm{Unip}}(g) = \sum_i \psi(\alpha_i g_{i, i+1})$ . If  $\alpha = (1, \dots, 1)$ , then  $\psi_{\mathrm{Unip}, \alpha}$  is just denoted by  $\psi_{\mathrm{Unip}}$ .
- Denote  $\mathcal{K} = \mathrm{GL}(n; \mathcal{O}_K)$ , which is the maximal compact subgroup of  $\mathrm{GL}(n; K)$  up to conjugacy(20.7.3.10).
- Denote  $G_n^0 = \det^{-1}(\mathcal{O}_K^*) \subset \mathrm{GL}(n; K)$ .
- Define subgroups  $\mathrm{Unip}^k(n, K)$  of  $\mathrm{Unip}(n, K)$  as  $\mathrm{Unip}^k(n, K)$  is the group of unipotent matrices that  $v(e_{ij}) \geq k(i - j)$ . Then  $\cup_{k>0} \mathrm{Unip}^k(n, K) = \mathrm{Unip}(n, K)$ . In particular,  $\mathrm{Unip}(n, K)$  is exhausted by compact open subgroups.
- For any  $\chi \in (\mathcal{O}_K^*)^\vee$ , by continuity, there is a minimum  $v \in \mathbb{N}$  that  $\chi(1 + \mathfrak{p}^v) = 1$ , and  $\mathfrak{p}^v$  is called the **conductor of character** of  $\chi$ .

┘

### 1 Basics

References are [Representations of  $p$ -adic Groups Bernstein]. [Bum97]Chap4.

#### Geometry

**Prop.(24.11.1.1).**  $\mathrm{GL}(n; K)$  is unimodular, and the modular function of  $B(K)$  is  $\Delta_B\left(\begin{bmatrix} x & y \\ & z \end{bmatrix}\right) = \frac{z}{x}$  by(12.10.1.20). Also denote  $\delta = \Delta_B^{-1}$ .

┘

**Prop.(24.11.1.2)[Diagonal Quasi-Characters].** Let  $\chi_1, \dots, \chi_n$  be quasi-characters of  $K^\times$ , then define two quasi-characters  $\chi, \chi'$  on  $T(K)$ :

$$\chi(\mathrm{diag}(y_1, \dots, y_n)) = \chi_1(y_1) \cdots \chi_n(y_n), \quad \chi'(\mathrm{diag}(y_1, \dots, y_n)) = \chi_n(y_1) \cdots \chi_1(y_n).$$

When  $n = 2$ , the quasi-character  $\chi$  on  $T(K)$  is called **regular** if  $\chi_1 \neq \chi_2$ , and **dominant** if  $|\chi_1(\varpi)| < |\chi_2(\varpi)|$ .

┘

**Def. (24.11.1.3) [Principal Congruence Subgroups].** There is a map  $\pi : \mathcal{K} \rightarrow \mathrm{GL}(n; \mathcal{O}_K/(\varpi^m))$ , the kernel of which is called the **principal congruence subgroup** of level  $m$ , denoted by  $\mathcal{K}_m$ .  $\lrcorner$

**Def. (24.11.1.4) [Partitions and Level Subgroups].** Let  $\alpha = (n_1, \dots, n_k)$  be a partition of  $n$ , define

$$\mathrm{GL}(\alpha) = \mathrm{GL}(n_1) \times \dots \times \mathrm{GL}(n_k), \quad \mathcal{K}_\alpha = \mathcal{K} \cap \mathrm{GL}_\alpha(F), \quad B_\alpha = B \cap \mathrm{GL}_\alpha, \quad D_\alpha = D \cap \mathrm{GL}_\alpha.$$

And for a principal congruence subgroup  $\mathcal{K}_m$  of  $\mathrm{GL}(n; K)$  (24.11.1.3),  $\mathcal{K}_m \cap \mathrm{GL}_\alpha(K)$  is called a principal congruence subgroup of  $\mathrm{GL}_\alpha(F)$ .

Denote  $U_\alpha$  the subgroup of  $U_n$  That  $a_{ij} = 0$  for  $i, j$  in the same segment of  $\alpha$  and  $i \neq j$ . Let  $P_\alpha = \mathrm{GL}_\alpha \ltimes U_\alpha$  be the parabolic subgroup corresponding to .

For  $\beta \prec \alpha$ , denote

$$U_\beta(\alpha) = U_\beta \cap \mathrm{GL}_\alpha, \quad P_\beta(\alpha) = P_\beta \cap \mathrm{GL}_\alpha = \mathrm{GL}_\beta \ltimes U_\beta(\alpha).$$

Let  $N = \mathcal{K}_m \cap G_\alpha$  be a principal congruence subgroup, denote

$$N_\beta^+(\alpha) = N \cap U_\beta(\alpha), \quad N_\beta^-(\alpha) = N \cap \bar{U}_\beta(\alpha), \quad N_\beta^0(\alpha) = N \cap \mathrm{GL}_\beta(F).$$

Moreover, define  $\mathcal{K}_0(\mathfrak{a}) = \pi^{-1}(B(\mathcal{O}_F/\mathfrak{a}))$ ,  $\mathcal{K}_1(\mathfrak{a}) = \pi^{-1}(N(\mathcal{O}_F/\mathfrak{a}))$ . In particular,  $\mathcal{K}_0(\mathfrak{p})$  are called the **Iwahori subgroups**, a vector is called **Iwahori fixed** iff it is  $\mathcal{K}_0(\mathfrak{p})$ -fixed.  $\lrcorner$

**Def. (24.11.1.5) [Mirabolic Levels].** For  $m \in \mathbb{N}$ , the **mirabolic subgroups**  $\mathcal{K}_{0,1}(m)$  of  $\mathrm{GL}(n; \mathcal{O}_K)$  is defined to be the inverse image of the mirabolic subgroup  $M_n(\mathcal{O}_K/\mathfrak{p}_K^m)$  (3.1.2.15) under the map  $\mathrm{GL}(n; \mathcal{O}_K) \rightarrow \mathrm{GL}(n; \mathcal{O}_K/\mathfrak{p}_K^m)$ .  $\lrcorner$

**Prop. (24.11.1.6) [Iwahori Factorizations].** For  $1 \neq \mathfrak{a} \in \mathrm{Ideal}^\times \mathcal{O}_K$ , there are **Iwahori factorizations**

$$K_0(\mathfrak{a}) = N_-(\mathfrak{a})T(\mathcal{O})N(\mathcal{O}), \quad K_1(\mathfrak{a}) = N_-(\mathfrak{a})T(\mathfrak{a})N(\mathcal{O}).$$

$$N = N_\beta^-(\alpha)N_\beta^0(\alpha)N_\beta^+(\alpha) = N_\beta^+(\alpha)N_\beta^0(\alpha)N_\beta^-(\alpha).$$

$\lrcorner$

*Proof:* This is by column and row reduction. Cf.[Bernstein-Zelevinsky 1, P32]. ?  $\square$

**Cor. (24.11.1.7).** Denote  $K_0 = K_0(\mathfrak{a})$  or  $K_1(\mathfrak{a})$ , and  $T_0 = T(\mathcal{O})$  or  $T(\mathfrak{a})$  respectively, then we can decompose the Haar measure on  $K_0$  as

$$\int_{K_0} \varphi(k) dk = \int_{N_-(\mathfrak{a})} \int_{T_0} \int_{N(\mathcal{O})} \varphi(n_- t_0 n) dn dt_0 dn_- = \int_{N_-(\mathfrak{a})} \int_{T_0} \int_{N(\mathcal{O})} \varphi(n t_0 n_-) dn dt_0 dn_-.$$

$\lrcorner$

*Proof:* Use (12.10.3.9), noticing all groups here are compact.  $\square$

**Cor. (24.11.1.8) [Iwahori-Bruhat Decomposition].**

$$\mathrm{GL}(2; K) = B(K)\mathcal{K}_0(\mathfrak{p}) \coprod B(K)w_0\mathcal{K}_0(\mathfrak{p}) \text{ (24.11.1.4).}$$

? How about the general case?  $\lrcorner$

*Proof:* By pulling back the Bruhat decomposition of  $\mathrm{GL}(2; \kappa)$  to  $\mathcal{K} = \mathrm{GL}(2; \mathcal{O}_K)$ , we have

$$\mathcal{K} = K_0(\mathfrak{p}) \cup K_0(\mathfrak{p})w_0K_0(\mathfrak{p}).$$

The Iwahori factorization shows  $K_0(\mathfrak{p}) = (K_0(\mathfrak{p}) \cap B(K))N_-(\mathfrak{p})$ . Then this implies

$$\mathcal{K} = K_0(\mathfrak{p}) \cup (K_0(\mathfrak{p}) \cap B(K))w_0K_0(\mathfrak{p}),$$

because  $w_0^{-1}N_-(\mathfrak{p})w_0 \in K_0(\mathfrak{p})$ . Then Iwasawa decomposition  $G = B\mathcal{K}$  gives the desired result. Notice this decomposition is clearly disjoint.  $\square$

**Prop. (24.11.1.9).**

- If an open subgroup  $N \leq \mathrm{GL}(n; K)$  contains  $\mathrm{Unip}(n; K)$ , then it must contain  $\mathrm{SL}(n; K)$ .
- Any open normal subgroup  $N \trianglelefteq \mathrm{GL}(n; K)$  must contain  $\mathrm{SL}(n; K)$ .

┘

*Proof:* 1: By Bruhat decomposition (10.4.4.28), it suffices to show that  $N$  contains  $B(n; K) \cap \mathrm{SL}(n; K)$ . And this is easy to see.

2: this normal subgroup contains any unipotent matrix close enough to  $\mathbf{1}$ . But by the theory of Jordan forms (3.5.4.2), any unipotent subgroup is conjugate to a matrix close enough to  $\mathbf{1}$ . Thus  $\mathrm{Unip}(n; K) \subset N$ . and then by item1 it contains  $\mathrm{SL}(n; K)$ .  $\square$

### Hecke Algebras

**Prop. (24.11.1.10) [Contragradient Representations, Gelfand-Kazhdan[G-K75]].** If  $(\pi, V) \in \mathrm{Irr}^{\mathrm{adm}}(\mathrm{GL}(n; K))$ , then:

- If  $\pi_1$  is defined by  $\pi_1(g) = \pi(g^{-t})$ , then  $\pi^\vee \cong \pi_1$ .
- If  $n = 2$  and  $\omega$  is the central character of  $\pi$ , then  $\pi^\vee \cong \pi(\omega^{-1})$ .

┘

*Proof:* 1: It is clear that the character (24.1.6.33) of a representation is conjugation invariant, thus by (24.11.1.18) it is transpose invariant.

Now the character of  $\pi_1$  is  $\chi_1(\varphi) = \chi(\varphi'')$ , where  $\varphi''(g) = \varphi(g^{-t})$ , and this equals  $\chi(\varphi')$  where  $\varphi'(g) = \varphi(g^{-1})$ , because the character is transpose invariant. It is also clear that  $\widehat{\varphi}' = \pi(\varphi)^t$  on a finite space  $V^K$ , then  $\widehat{\chi}(\varphi) = \chi(\varphi') = \chi_1(\varphi)$ , so by (24.1.6.38)  $\pi \cong \pi_1$ .

- 2: If  $n = 2$ , we use further the property that if  $g = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$ , then

$$g^{-1} = (\deg g)^{-1} \begin{bmatrix} d & -b \\ -c & a \end{bmatrix} = (\deg g)^{-1} \begin{bmatrix} & 1 \\ -1 & \end{bmatrix} g^t \begin{bmatrix} & 1 \\ -1 & \end{bmatrix}^{-1}$$

then the assertion is clear using item1.  $\square$

**Cor. (24.11.1.11).** Let  $\pi \in \mathrm{Irr}^{\mathrm{adm}}(\mathrm{GL}(n; K))$ , then  $\pi$  is irreducible iff  $\pi^\vee$  is irreducible.  $\lrcorner$

### Smooth Representations

**Def. (24.11.1.12)[Twists].** Let  $(\pi, V) \in \text{Irr}^{\text{alg}}(\text{GL}(n; K))$ , for any quasi-character  $\chi$  of  $K^\times$ , denote  $\pi(\chi)$  the representation  $\pi \otimes (\chi \circ \det)$ . And for  $s \in \mathbb{C}$ , denote  $\pi(s)$  the representation of  $\pi$  tensored by the 1-dimensional representation  $g \mapsto |\det(g)|^s$ .  $\lrcorner$

**Lemma (24.11.1.13).** Let  $(\pi, V) \in \text{Rep}^{\text{alg}}(\text{GL}(n; K))$ , then  $\pi|_{G_n^0}$  splits into a finite direct sum of irreducible representations of  $G_n^0$ .  $\lrcorner$

*Proof:* This follows from (24.1.2.16).  $\square$

**Lemma (24.11.1.14).** If  $(\pi, V) \in \text{Rep}^{\text{alg}}(\text{GL}(n; K))$  satisfies  $V$  is generated by  $V^{K_m}$ , then for any submodule  $V'$ ,  $V'$  is generated by  $V^N \cap V'$ .  $\lrcorner$

*Proof:* Cf. [B-Z76]P38.  $\square$

**Prop. (24.11.1.15)[Finite Length Representations, Howe].** Let  $(\pi, V) \in \text{Rep}^{\text{alg}}(\text{GL}(n; K))$ , then  $\pi$  is of finite length iff it is admissible and f.g..  $\lrcorner$

*Proof:* A finite length representation is admissible by (24.9.1.2) and (24.1.6.30). For the converse, as  $V$  is f.g., take  $N$  compact open s.t.  $V$  is generated by  $V^N$ , and  $\dim V^N < \infty$  as  $V$  is admissible. Then by (24.11.1.13):  $V' \rightarrow V' \cap V^N$  is an injection from the set of subrepresentations of  $V$  to the set of subspaces of  $V^N$ , thus  $V$  is of finite length.  $\square$

### Invariant Distributions

**Thm. (24.11.1.16)** [Mirabolic-Invariant Distributions, Bernstein[Ber84a]].  
 $\text{Dist}(\text{GL}(n; K))^{\text{Ad}_{M_n(K)}} = \text{Dist}(\text{GL}(n; K))^{\text{GL}(n; K)}$ .  $\lrcorner$

*Proof:* ?  $\square$

**Prop. (24.11.1.17)[Transpose Invariant Distribution].** If  $\Delta \in \mathcal{D}(\text{GL}(n; K))$  is a distribution that satisfies

$$\lambda(u)\Delta = \psi_N(u)^{-1}\Delta, \quad \rho(u)\Delta = \psi_N(u)\Delta,$$

where  $\psi$  is defined in (26.1.4.9), then  $\Delta$  is stable under involution  $\iota : \text{GL}(n; K) \rightarrow \text{GL}(n; K) : \iota(g) = w^0 g^t w^0$  (24.11.0.1).  $\lrcorner$

*Proof:* Firstly notice that  $\iota$  fixes  $\text{Unip}(n; K)$ , and  $\psi_N(\iota(g)) = \psi_N(g)$ , so  $\iota(\Delta)$  also satisfies these equations, so we can replace  $\Delta$  by  $\Delta - \iota(\Delta)$ , then assume  $\iota(\Delta) = -\Delta$  and prove  $\Delta = 0$ .

Consider the group  $G$  that is a semi-direct product

$$1 \rightarrow \text{Unip}(n; K) \times \text{Unip}(n; K) \rightarrow G \rightarrow \mathbb{F}_2$$

and  $\iota \in \mathbb{F}_2$  acts on  $\text{Unip}(n; K) \times \text{Unip}(n; K)$  by  $(u_1, u_2) \mapsto (\iota(u_2)^{-1}, \iota(u_1)^{-1})$ .

Define a character  $\chi$  on  $G$  by  $\chi((u_1, u_2)) = \psi_N(u_1)^{-1}\psi_N(u_2)$ ,  $\chi(\iota) = -1$ , then  $G$  acts on  $\text{GL}(n, K)$  by

$$\sigma((u_1, u_2)) = \lambda(u_1)\rho(u_2), \quad \sigma(\iota) = \iota$$

then the conditions are summarized into a single condition:

$$\sigma(g)\Delta = \chi(g)\Delta.$$

We only prove for  $n = 2$ : ?

Consider the action of  $\text{Unip}(n; K) \times \text{Unip}(n; K)$  on  $GL(2; K)$  by left-right action, then we can use (24.1.6.16) and (24.1.6.17), because the action is constructive, by (20.5.2.10), and  $\iota \text{Unip}(n; K) \iota = \text{Unip}(n; K)$ , and  $\iota$  preserves orbits except for  $\text{diag}\{a, d\}, a \neq d$ .

But there are no desired distribution on this orbit: this orbit is homeomorphic to  $N(K)$  via  $u \mapsto u \text{diag}(a, d)$ , and the distribution is transferred to a left invariant distribution, thus by (24.1.6.12) it is just the Haar measure

$$\Delta(f) = c_1 \int_{\text{Unip}(n; K)} f(u \begin{bmatrix} a & b \\ & d \end{bmatrix}) \psi_{\text{Unip}}(u) du.$$

We notice using a right-invariant version of (24.1.6.12) that

$$\Delta(f) = c_2 \int_{N(K)} f\left(\begin{bmatrix} a & b \\ & d \end{bmatrix} u\right) \psi_N(u) du = c_2 \int_{N(K)} f(u \begin{bmatrix} a & b \\ & d \end{bmatrix}) \psi_N\left(\begin{bmatrix} a & b \\ & d \end{bmatrix}^{-1} u \begin{bmatrix} a & b \\ & d \end{bmatrix}\right) du$$

as  $N(K)$  is unimodular. Notice now  $c_1 \psi_N(u) = c_2 \psi_N\left(\begin{bmatrix} a & b \\ & d \end{bmatrix}^{-1} u \begin{bmatrix} a & b \\ & d \end{bmatrix}\right)$  cannot happen for all  $u$ , as this implies  $c_1 = c_2$  by choosing  $u = I$ , and then  $\psi(x) = \psi(ax/d)$ , which is impossible by (12.11.1.36). So if some  $u$  this is not equal, then we find a function supported at a nbhd of  $u$ , then this two distributions cannot be equal.  $\square$

**Prop. (24.11.1.18) [Transpose Invariant Distributions].** If  $D \in \text{Dist}(GL(n; K))^{\text{Ad}_G}$  (24.1.6.3), then it is also invariant under transpose.  $\lrcorner$

*Proof:* This follows from (24.1.6.17), as we look at the conjugate action of  $GL(n; K)$  on itself, with  $\sigma$  being the transposition. Conjugate action is constructive, by (20.5.2.10), and  $g^\sigma = g^{-t}$ , and a matrix is conjugate to its transpose (3.5.4.19).  $\square$

### Finite dimensional Representations

**Prop. (24.11.1.19).**  $\text{Irr}^{\text{fin, alg}}(GL(n; K)) = GL(n; K)^\vee$ .  $\lrcorner$

*Proof:* By the no-small-subgroup argument, the kernel of this representation contains an open normal subgroup. But any open normal subgroup of  $GL(n; V)$  contains  $SL(n; V)$  by (24.11.1.9), thus this is a representation of  $K^\times$ , which must be of 1-dimensional by (24.1.6.36).  $\square$

**Lemma (24.11.1.20) [2-Dimensional Smooth Representation of  $K^\times$ ].** Any  $\rho \in \text{Rep}^{\text{alg, dim}=2}(K^\times)$  is one of the following:

- $\rho(t) = \text{diag}(\xi(t), \xi'(t))$ , where  $\xi, \xi'$  are two quasi-characters of  $K^\times$ .
- $\rho(t) = \xi(t) \begin{bmatrix} 1 & v(t) \\ & 1 \end{bmatrix}$ , where  $\xi$  is a quasi-character of  $K^\times$ .

$\lrcorner$

*Proof:* There exists a 1-dimensional invariant subspace spanned by  $x$  by (24.1.6.36), on which  $K^\times$  acts by a quasi-character  $\xi$ , and consider the quotient space, on which  $K^\times$  acts by a quasi-character  $\xi'$ . choose  $y$  that is linearly-independent of  $x$ , then  $\rho(t)y = \xi'(t)y + \lambda(t)x$ , and

$$\lambda(tu) = \xi'(u)\lambda(t) + \lambda(u)\xi(t)$$

which is symmetric in  $t, u$ .

If  $\xi \neq \xi'$ ,

$$\lambda(t)(\xi(u) - \xi'(u)) = \lambda(u)(\xi(t) - \xi'(t))$$

therefore  $\lambda(t) = C(\xi(t) - \xi'(t))$ , so  $z = y - Cx$  is fixed by  $\rho(K^\times)$ .

If  $\xi = \xi'$ , then  $\lambda/\xi$  is an additive character of  $K^\times$ , thus it is trivial on  $\mathcal{O}^*$ , so  $\lambda(t) = cv(t)$ .  $\square$

### Zelevinsky-Segments

**Def. (24.11.1.21) [Zelevinsky-Segments].** For  $\pi \in \text{Irr}^{\text{adm}}(\text{GL}(n; K))$ , a **Zelevinsky-segment**  $\Delta(\pi, m)$  is an ordered  $m$ -tuple  $(\pi, \pi(1), \dots, \pi(m-1))$  of Tate twists of  $\pi$ .

For two segments  $\Delta(\pi_1, m)$  and  $\Delta(\pi_2, n)$ , they are called **linked segments** if  $\Delta(\pi_1, m) \subsetneq \Delta(\pi_2, n)$ ,  $\Delta(\pi_2, n) \subsetneq \Delta(\pi_1, m)$ , and  $\Delta(\pi_1, m) \cup \Delta(\pi_2, n)$  is also a segment. And  $\Delta(\pi_1, m)$  is said to **precedes**  $\Delta(\pi_2, n)$  if  $\pi_2 = \pi_1(m)$ .  $\lrcorner$

**Def. (24.11.1.22) [Dual Segments].** For a segment  $\Delta(\pi, m) = (\pi, \pi(1), \dots, \pi(m-1))$ , its **dual segment**  $\Delta^\vee$  is the segment  $(\pi^\vee(1-m), \pi^\vee(2-m), \dots, \pi) = \Delta(\pi^\vee(1-m), m)$ .  $\lrcorner$

**Def. (24.11.1.23) [ $\pi(\Delta)$ ].** Let  $\Delta = \Delta(\pi, m)$  be a Zelevinsky-segment of length  $m$  and degree  $mn$ , we can define  $\pi(\Delta) \in \text{Irr}^{\text{adm}}(\text{GL}(mn; K))$  by

$$\pi(\Delta) \stackrel{\triangle}{=} \pi \times \pi(1) \times \dots \times \pi(m-1) \stackrel{\triangle}{=} \text{n-Ind}_{P(n, n, \dots, n)}^{\text{GL}(mn; K)} (\otimes \pi_i)$$

$\lrcorner$

**Def. (24.11.1.24) [Zelevinsky-Conditions].** A tuple of Zelevinsky-segments  $(\Delta_1, \dots, \Delta_r)$  (24.11.1.21) is said to satisfy the **Zelevinsky condition** if for each  $i < j$ ,  $\Delta_i$  doesn't precedes  $\Delta_j$  (24.11.1.21).  $\lrcorner$

## 2 Supercuspidal Representations

### Jacquet-Functors

**Notation (24.11.2.1).**

- Use notations on Jacquet functors defined in [Jacquet-Functors](#).

$\lrcorner$

**Prop. (24.11.2.2).** For any  $a \in \mathbb{G}_m^{n-1}(F)$ ,

$$J_{\text{Unip}(n; K), \psi_a, \text{Unip}(n; K)}(V) \cong J_{\text{Unip}(n; K), \psi_{\text{Unip}(n; K)}}(V) \text{ (24.11.0.1)}$$

$\lrcorner$

*Proof:* This is because  $\pi(a)$  maps  $V(\text{Unip}(n; K), \psi_a, \text{Unip})$  isomorphically to  $V(\text{Unip}(n; K), \psi_{\text{Unip}})$ , thus induces an isomorphism  $J_{\text{Unip}(n; K), \psi_a, \text{Unip}}(V) \cong J_{\text{Unip}(n; K), \psi_{\text{Unip}}}(V)$ .  $\square$

**Lemma (24.11.2.3) [Jacquet].** If  $(\pi, V) \in \text{Rep}^{\text{alg}}(\text{GL}(n; K))$ , then using the notations as in (24.11.1.7), where  $\mathfrak{a}$  is a proper ideal,  $V^{K_0}$  and  $V^{N_-(\mathfrak{a})T_0}$  have the same image in the Jacquet module  $J(V)$ .  $\lrcorner$

*Proof:* One inclusion is trivial, for the other, if  $x \in V^{N_-(\mathfrak{a})T_0}$  then  $x_1 = \int_{K_0} \pi(k) x dk$  lies in  $V^{K_0}$ , so it suffices to show  $x$  and  $x_1$  have the same image in  $J(V)$ . But by (24.11.1.7)

$$x_1 = \int_{N_-(\mathfrak{a})} \int_{T_0} \int_{N(\mathcal{O})} \pi(nt_0 n_-) x dn dt_0 dn_- = \int_{N(\mathcal{O})} \pi(n) x dn$$

and notice  $p(\pi(n)x) = p(x)$ .  $\square$

**Prop. (24.11.2.4)[Jacquet Modules are Admissible].** If  $(\pi, V) \in \mathrm{Rep}^{\mathrm{alg}}(\mathrm{GL}(2; K))$ , then

- Using the notation as in (24.11.1.7), if  $\mathfrak{a}$  is a proper ideal, then the projection map  $p : V \mapsto J(V)$  induces a surjection of  $V^{K_0} \rightarrow J(V)^{T_0}$ .
- If  $(\pi, V)$  is admissible, then  $J(V)$  is also admissible representation of  $T(F)$ .

? For  $\mathrm{GL}(n; K)$  case, Cf.[Bernstein-Zelevinsky1, P33].? ┘

*Proof:* 2 follows from 1 because we can choose  $T_0 = T(\mathfrak{a})$  to be arbitrarily small, then it is of f.d., thus admissible.

For 1, notice first that any  $x \in J(V)^{T_0}$  is an image of a  $x_1 \in V^{T_0}$ , because  $p(\pi(t)x) = \pi(t)p(x) = p(x)$ , thus we can choose  $x_1 = \frac{1}{V(T_0)} \int_{T_0} \pi(t)x dt$ .

Thus for any f.d. subspace  $\overline{U}$  of  $J(V)^{T_0}$ , we can find a f.d.  $U \subset V^{T_0}$  that is mapped isomorphically onto  $\overline{U}$ . Now  $U$  is fixed by some  $N_-(\mathfrak{p}^n)$  for  $n$  large, so  $U$  is fixed by  $N_-(\mathfrak{p}^n)T_0$ . Notice  $\mathfrak{a} = \mathfrak{p}^m$  for some  $m$ , and

$$\pi(d)N_-(\mathfrak{p}^n)T_0\pi(d)^{-1} = N_-(\mathfrak{a})T_0, \quad d = \begin{bmatrix} \varpi^{n-m} & \\ & 1 \end{bmatrix},$$

so  $\pi(d)U$  is stabilized by  $N_-(\mathfrak{a})T_0$ . Hence by lemma (24.11.2.3),  $\pi(d)p(U) = p(\pi(d)U) \subset p(V^{K_0})$ , so the dimension of  $\overline{U}$  is bounded by dimension of  $V^{K_0}$ , so we can choose  $\overline{U}$  just to be  $J(V)^{T_0}$ . Now  $\pi(d)$  commutes with  $T(F)$ , so we have  $\pi(d)J(V)^{T_0} = J(V)^{T_0} \subset p(V^{K_0})$ . The reverse containment is clear. □

### Supercuspidal Representation

References are [B-Z77, Kud94].

**Prop. (24.11.2.5)[Representation Lifted from Finite Case].** Let  $(\pi_0, V_0) \in \mathrm{Irr}^{\mathrm{cusp}}(\mathrm{GL}(2; \mathbb{F}_q))$ , then it is representation of  $\mathcal{K}$  by the projection  $\mathcal{K} \rightarrow \mathrm{GL}(2; \mathbb{F}_q)$ , with central character  $\omega_0$ . Extend  $\omega_0$  to a character  $\omega$  of  $K^\times$ , then extend  $\pi_0$  to a representation of  $\mathcal{K}Z(K)$  with central character  $\omega$ . Finally let  $(\pi, V) = \mathrm{ind}_{\mathcal{K}Z(K)}^{\mathrm{GL}(2; K)} \pi_0$ . Then  $\pi$  is a unitarizable cuspidal irreducible admissible representation of  $\mathrm{GL}(2; K)$ . ┘

*Proof:* To show it is admissible, we use Mackey's intertwining formula (24.1.6.49). By (24.1.6.31), it suffices to show for any  $\rho \in \mathrm{Irr}^{\mathrm{adm}}(\mathcal{K})$ ,  $\dim \mathrm{Hom}_{\mathcal{K}}(\pi_0, \rho) < \infty$ . By  $p$ -adic Cartan decomposition (24.1.6.49), a representative set for  $\mathcal{K} \backslash G / \mathcal{K}Z(K)$  is  $\left\{ \begin{bmatrix} 1 & \\ & \varpi^n \end{bmatrix}, 0 \leq n \in \mathbb{Z} \right\}$ . Notice  $\pi_0$  is of f.d., thus it suffices to show that only f.m.  $\mathrm{Hom}_{K_0(\mathfrak{p}^n)}(\pi_0, \rho^{\varpi^n}) \neq 0$ . For this, notice that by continuity, for  $n$  large,  $\rho^{\varpi^n} \left( \begin{bmatrix} 1 & b \\ & 1 \end{bmatrix} \right) = \mathrm{id}$  for any  $b \in \mathcal{O}$ , thus any  $\varphi \in \mathrm{Hom}_{K_0(\mathfrak{p}^n)}(\pi_0, \rho^{\varpi^n}) \neq 0$  factors through the Jacquet module of  $\pi$ , which is 0 as  $\pi_0$  is cuspidal.

By (24.1.6.51),  $\pi$  is unitarizable. And then by (24.1.6.52), it suffices to show that  $\dim \mathrm{End}(\pi) = 1$ . By Mackey theory again,

$$\mathrm{Hom}_G(\pi, \pi) \subset \mathrm{Hom}_G(\pi, \mathrm{Ind}_{\mathcal{K}Z(K)}^{\mathrm{GL}(2, K)} \pi_0) = \prod_{n \geq 0} \mathrm{Hom}_{K_0(\mathfrak{p}^n)}(\pi_0, \rho^{\varpi^n})$$

by the same reason as above, for  $n > 0$ , this is 0, and for  $n = 0$ , this has dimension 1 because  $\pi_0$  is an irreducible representation of  $K$ .

It remains to show  $\pi$  is cuspidal: Use Mackey theory again. By  $p$ -adic Cartan decomposition (20.7.2.15), a representative set for  $\mathcal{K} \backslash G / \mathcal{K} Z(K)$  is  $\left\{ \begin{bmatrix} 1 & \\ & \varpi^n \end{bmatrix}, 0 \leq n \in \mathbb{Z} \right\}$ . Now it suffices to show  $\text{Hom}_{\text{Unip}(2,K)}(\pi_0, 1) = 0$ . But this is because  $\pi_0$  is cuspidal.  $\square$

**Prop. (24.11.2.6) [f.m.  $K$ -Spherical Supercuspidal Representations].** Let  $K$  be a compact open subgroup of  $\text{GL}(n; K)$ , then there are only finitely many isomorphism classes of irreducible supercuspidal representations of  $G \circ$  with a  $K$  fixed vector.  $\perp$

*Proof:* ? Cf. [Bernstein. Harvard lecture notes on representations of  $p$ -adic reductive groups] Proposition 21 in Section 3.  $\square$

### 3 Generic representations

**Prop. (24.11.3.1).**

- The definition of generic representations of  $\text{GL}(n; K)$  is independent of  $\psi$  chosen, by (24.11.2.2).
- For a quasi-character  $\chi$  of  $K^\times$ ,  $\pi$  is generic iff  $\pi(\chi)$  is generic, as  $J_{\text{Unip}(n,K), \psi_{\text{Unip}}}(\pi) = J_{\text{Unip}(n,K), \psi_{\text{Unip}}}(\pi(\chi))$ .  $\perp$

**Prop. (24.11.3.2) [Contragradient of Generic Representations].** The contragradient of a generic representation  $\pi \in \text{Irr}^{\text{adm}}(\text{GL}(n; K))$  is also generic. In fact, if  $\mathcal{W}(\pi; \psi)$  is a Whittaker model for  $\pi$  w.r.t.  $\psi$ , then  $\widetilde{W} = \{W(w^0 g^{-t}) | W \in \mathcal{W}(\pi; \psi)\}$  (24.11.0.1) is a Whittaker model for  $\widetilde{\pi}$  w.r.t.  $\overline{\psi}$ .  $\perp$

*Proof:* This follows from (24.11.1.10).  $\square$

### Existence of Whittaker Models

**Thm. (24.11.3.3) [Generic Representations of  $\text{GL}(n)$ ].**  $Q(\Delta_1, \dots, \Delta_k) \in \text{Irr}^{\text{adm}}(\text{GL}(n; K))$  is generic iff no two of  $\Delta_i$  are linked, in which case

$$\pi = Q(\Delta_1) \times \dots \times Q(\Delta_k).$$

In particular,  $\pi$  is generic iff its Gelfand-Kirillov dimension is maximal among those irreducible admissible representations with the same cuspidal supports.  $\perp$

*Proof:* Cf. [Induced Representations of Reductive  $p$ -adic Groups, Zelevinsky(1980)]. ?  $\square$

**Prop. (24.11.3.4) [Gauges for Whittaker Models].** If  $\pi \in \text{Irr}^{\text{adm}}(\text{GL}(n; K))$  is unitary and generic, then there exists a gauge function, i.e. a function  $\xi > 0$  on  $\text{GL}(n; K)$  that is invariant under the action of center, left action of  $\text{Unip}(n; K)$  and right action of  $\mathcal{K}$ , and given on  $A$  by

$$\xi(a) = \varphi(\alpha_1(a), \dots, \alpha_n(a)) |\alpha_1 \dots \alpha_n(a)|^{-t}$$

for some  $t \in \mathbb{R}_{\geq 0}$  and  $\varphi \geq 0 \in \mathcal{S}(K^{r-1})$ , s.t. any  $W \in \mathcal{W}(\pi; \psi)$  is bounded by  $\xi$ .  $\perp$

*Proof:* Cf. [Automorphic forms on  $\text{GL}(3)$ , 1] Prop 2.3.6 ?  $\square$

**Def. (24.11.3.5) [Sheaf on  $F$  associated to  $V$ ].** As  $\mathrm{Unip}(2) \cong \mathbb{A}^1$ , any smooth representation  $V$  of  $\mathrm{Unip}(2, K)$  corresponds to a smooth  $\mathcal{H}(F)$ -module by (24.1.6.22), thus we can view it as a  $C_c^\infty(F)$ -module by

$$\varphi(v) = \int_{\mathrm{Unip}(2, K)} \widehat{\varphi}(x) \pi(u) v dx.$$

Then this module is smooth thus non-degenerate by (24.1.6.22), then we can define  $\mathcal{S}(V)$  the sheaf associated to  $V$ , as in (4.4.4.15).  $\lrcorner$

**Cor. (24.11.3.6).** Let  $V$  be a smooth  $B(K)$ -sheaf and let  $a \in K$ , then the stalk

$$\mathcal{S}(V)_a \cong \begin{cases} J(V) & a = 0 \\ J_{\psi_a}(V) \cong J_\psi(V) & a \neq 0 \end{cases}.$$

$\lrcorner$

*Proof:* By definition (4.4.4.15), the stalk is  $V$  modulo the subgroup consisting of elements  $v$  that  $\chi_U \cdot v = 0$ , where  $U = a + \mathfrak{p}^k$  for some large  $k$ . Back the definition of  $\mathcal{S}(V)$ , consider the Fourier transform

$$\widehat{\chi_{a+\mathfrak{p}^k}}(x) = \overline{\psi(ax)} V(\mathfrak{p}^k) \chi_{\mathfrak{p}^{n-k}}(x)$$

where  $\mathfrak{p}^n$  is the conductor of  $\psi$ . Thus

$$\chi_{a+\mathfrak{p}^k} v = C \int_{\mathfrak{p}^{n-k}} \overline{\psi(ax)} \pi \left( \begin{bmatrix} 1 & x \\ & 1 \end{bmatrix} \right) v dx = 0$$

for large  $k$ , which is equivalent to  $v \in V_{N, \psi_a}$  by (24.1.2.8). Finally,  $J_{\psi_a}(V) \cong J_\psi(V)$  by (24.11.2.2).  $\square$

**Cor. (24.11.3.7) [Existence of Whittaker Functional].**  $(\pi, V) \in \mathrm{Rep}^{\mathrm{adm}}(\mathrm{GL}(2; K))$  has a Whittaker functional unless it factors through the determinant map. In particular, if  $\pi$  is irreducible, then  $\dim J_\psi(V) = 1$  iff  $\dim V > 1$ .  $\lrcorner$

*Proof:* The existence of a Whittaker functional is equivalent to the fact  $J_\psi(V) \neq 0$ , which is the stalk of the sheaf  $\mathcal{S}(V)$ . If it vanishes, then  $\mathcal{S}(V)$  is a skyscraper sheaf by (24.11.3.6), and by the correspondence of  $\mathcal{S}(V)$  and  $V$  (4.4.4.15),  $V$  equals  $\Gamma(F, \mathcal{S}(V)) = J(V)$ , thus  $\mathrm{Unip}(2, K)$  acts trivially on  $V$ .

So also all the conjugates of  $\mathrm{Unip}(2, K)$  acts trivially, so  $\mathrm{SL}(2; K)$  acts trivially, by 5, thus the representation factors through the quotient  $K^\times$ , the rest is clear.

Finally, if it is irreducible, then it factors through the determinant map iff  $V \cong \mathbb{C}$  and  $\pi(g) = \chi(\det(g))$ , by (24.1.6.36). So  $J_\psi(V) = 0$  as  $\psi$  is non-trivial.  $\square$

### Kirillov Model

References are [Ber84a]

**Def. (24.11.3.8) [Kirillov Models].** For  $(\pi, V) \in \mathrm{Irr}^{\mathrm{adm}}(\mathrm{GL}(n; K))$ , a **Kirillov model**  $\mathcal{K}(\pi)$  is a subrepresentation of  $\mathrm{Ind}_{\mathrm{Unip}(n, K)}^{M_n(K)}(\psi)$  that is isomorphic to  $\pi|_{M_n(F)}$ .

When  $n = 2$ , it is equivalently a subspace of  $C^\infty(K^\times)$  with an action of  $M_2(F)$  that satisfies

$$\left[ \pi \left( \begin{bmatrix} a & b \\ & 1 \end{bmatrix} \right) \varphi \right](x) = \psi(bx) \varphi(ax)$$

and isomorphic to  $(\pi, V)$  via the isomorphism  $v \mapsto \varphi_v$ .  $\lrcorner$

*Proof:* The last assertion is because  $M_2(F) = \text{Unip}(2, K)T_1(F)$ , thus the value of a function in  $\text{Ind}_{N(K)}^{B_1(F)}(\psi)$  is determined by its restriction on  $T_1(F) \cong K^\times$ .  $\square$

**Prop. (24.11.3.9).** The action of  $M_n(K)$  on  $\text{ind}_{\text{Unip}(n, K)}^{M_n(K)}(\psi)$  as defined in (24.11.3.8) is irreducible.  $\lrcorner$

*Proof:* ?

Let  $U$  be a non-zero invariant subspace of  $\text{ind}_{\text{Unip}(n, K)}^{M_n(K)}(\psi)$ , we will show that for any  $a \in K^\times$ ,  $U$  contains  $\chi_U$  for any sufficiently small nbhd  $U$  of  $a$ . Let  $\varphi \in U$  and  $\varphi(b) \neq 0$ , then by action of  $\begin{bmatrix} b/a & \\ & 1 \end{bmatrix}$ , we may assume  $\varphi(a) \neq 0$ .

If  $f \in C_c^\infty(F)$ ,  $f$  acts on  $\varphi$  via

$$\pi(f)\varphi = \int_F f(x)\pi\left(\begin{bmatrix} 1 & x \\ & 1 \end{bmatrix}\right)\varphi dx,$$

which in fact a finite sum of elements in  $N(K)v$ . Then  $\pi(f)\varphi(y) = \int_F f(x)\psi(xy)\varphi(y)dx = \widehat{f}(y)\varphi(y)$ . By the isomorphism  $\mathcal{H}_F \cong C_c^\infty(F)$  (24.1.6.25), we can choose  $f$  that  $\widehat{f} = \varphi(a)^{-1}\chi_U$  for a small nbhd  $U$  of  $a$  that  $\varphi$  is constant on  $U$ , then  $\pi(f)\varphi = \chi_U$ .  $\square$

**Lemma (24.11.3.10).** For  $(\pi, V) \in \text{Irr}^{\text{adm}}(\text{GL}(2; K))$ , if  $\dim V = \infty$ , then  $V^{\text{Unip}(2, F)} = 0$ .  $\lrcorner$

*Proof:* Cf. [Bump, P464] ?

The stabilizer of  $v$  is open, thus by (24.11.1.9) it is fixed by all  $\text{SL}(2; K)$ . Also it is fixed by the center  $Z(K)$ . Now  $\text{GL}(2; K)/\text{SL}(2; K)Z(K) \cong K^\times/(K^\times)^2$  which is finite by (19.1.5.13), thus the invariant subspace generated by  $v$  is of f.d., contradiction.  $\square$

**Lemma (24.11.3.11).** If  $(\pi, V) \in \text{Irr}^{\text{adm}}(\text{GL}(2; K))$ , and  $\Lambda$  is a Whittaker functional on  $V$ , then for  $v \neq 0 \in V$ , there exists some  $a \in K^\times$  that  $\Lambda(\pi\left(\begin{bmatrix} a & \\ & 1 \end{bmatrix}\right)v) \neq 0$ .  $\lrcorner$

*Proof:* For any  $a \in K^\times$ , it is clear that the kernel of the map  $v \mapsto \Lambda(\pi\left(\begin{bmatrix} a & \\ & 1 \end{bmatrix}\right)v)$  contains  $V_{N, \psi_a}$  ?? but by local multiplicity one (24.9.5.5),  $\dim J_{\psi_a}(V) \leq 1$ , and this map is non-trivial because  $\Lambda$  is non-trivial, thus the kernel is exactly  $V_{N, \psi_a}$ .

Thus if  $\Lambda(\pi\left(\begin{bmatrix} a & \\ & 1 \end{bmatrix}\right)v) = 0$ , then  $v$  is the section of  $\mathcal{S}(V)$  that vanishes at all  $a \neq 0$ , thus for any  $x \in F$ ,  $v' = v - \pi\left(\begin{bmatrix} 1 & x \\ & 1 \end{bmatrix}\right)v$  vanishes at every  $a \in F$ , thus  $v' = 0$ . Then  $v = 0$  by (24.11.3.10).  $\square$

**Prop. (24.11.3.12)[Kirillov Model and Whittaker Model].** For  $(\pi, V) \in \text{Irr}^{\text{adm}}(\text{GL}(2; K))$ , if it has a Whittaker functional  $\Lambda$ , then it has a Whittaker model  $\mathcal{W}$  consisting of functions  $W_v(g) = \Lambda(\pi(g)v)$ , and we can define functions on  $K^\times$  by

$$\varphi_v(a) = W_v\left(\begin{bmatrix} a & \\ & 1 \end{bmatrix}\right).$$

Then  $G$  acts on  $\mathcal{K}(\pi)$  by acting on the subscript. Then it is a Kirillov model for  $V$ , consisting of functions that is compactly supported on  $K$ .

Conversely, if  $\{\varphi_v | v \in V\}$  is a Kirillov model for  $(\pi, V)$ , then we can construct functions on  $\text{GL}(2; K)$  by  $W_v(g) = \varphi_{\pi(g)v}(1)$ . Then this is a Whittaker model for  $V$ .  $\lrcorner$

*Proof:* The equations can be checked by hand. To given an action  $\pi(\varphi_v) = \varphi_{\pi(g)v}$  on  $\{\varphi_v | v \in V\}$ , we need to show that  $W_v \mapsto \varphi_v$  is injective, which is true by (24.11.3.11). Then  $v \mapsto \pi_v$  is an isomorphism.

It remains to show that  $\varphi_v \in C_c^\infty(K^\times)$ . As  $\pi$  is a smooth representation, for any  $v$ ,  $W_v$  is stable under  $N(\mathfrak{p}^k)$  for some  $k$ , thus by equation above,  $\varphi_v(a) = \psi_a(n)\varphi_v(a)$  for all  $a$  and  $n \in N(\mathfrak{p}^k)$ . Then if  $|a|$  is sufficiently large,  $\psi_a(n) \neq 0$  for some  $n \in N(\mathfrak{p}^k)$ , implying  $\varphi_v(y) = 0$ .  $\square$

**Prop. (24.11.3.13) [Kirillov Model and Jacquet Functor, Gelfand-Kirillov [G-K75]].** Let  $(\pi, V) \in \mathrm{Irr}^{\mathrm{adm}, \mathrm{generic}}(\mathrm{GL}(2; K))$ , having a Kirillov model by (24.11.3.12), then there is an exact sequence of vector spaces

$$0 \rightarrow \mathrm{ind}_{\mathrm{Unip}(n, K)}^{M_n(K)}(\psi) \rightarrow \mathcal{K}(\pi) \rightarrow J_{\mathrm{Unip}(n; K)}(\pi) \rightarrow 0.$$

┘

*Proof:*  $V_N$  is generated by elements of the form  $v' = \pi\left(\begin{bmatrix} 1 & x \\ & 1 \end{bmatrix}\right)v - v$ . Notice  $\varphi_{v'}(y) = (\psi(xy) - 1)\varphi_v(y)$ , as  $\psi$  is continuous, when  $|y|$  is small,  $\varphi_{v'}(y) = 0$ .

To show that  $C_c^\infty(K^\times) \subset V_N$ , notice  $V_N$  is non-zero, because  $\dim V = \infty$  but  $\dim J(V)$  is finite (24.11.5.14). Notice  $V_N$  is stable under  $B(K)$  action, thus it must be  $C_c^\infty(K^\times)$  by (24.11.3.9).  $\square$

**Prop. (24.11.3.14).** If  $(\pi, V)$  is an irreducible generic admissible representation of  $\mathrm{GL}(2; K)$  thus having a Kirillov model. If  $\chi$  is a quasi-character of  $T(F)$  that  $\pi(t)\bar{\varphi}_v = (\delta^{1/2}\chi)(t)\bar{\varphi}_v \in J(V)$ , then for  $|t|$  small,  $\varphi_v(t)$  is a constant multiple of  $|t|^{1/2}\chi_1(t)$ .  $\square$

*Proof:* Let  $t_0 \in \mathfrak{p} \setminus \mathfrak{p}^2$ , then

$$\pi\left(\begin{bmatrix} t_0 & \\ & 1 \end{bmatrix}\right)\varphi - |t_0|^{1/2}\chi_1(t_0)\varphi \in V_N,$$

thus by (24.11.3.13), there exists some  $\varepsilon(t_0) > 0$  that

$$\varphi(tu) - |t|^{1/2}\chi_1(t)\varphi(u) = 0$$

for  $t = t_0$  and  $|u| \leq \varepsilon(t_0)$ . Because both sides are locally constant on  $t$ , by the compactness of  $\mathfrak{p} \setminus \mathfrak{p}^2$ , there exists some  $\varepsilon > 0$  that for the equation is true for all  $t \in \mathfrak{p} \setminus \mathfrak{p}^2$  and  $|u| \leq \varepsilon$ .

Now any element  $t \in \mathfrak{p}$  can be factored into product of elements in  $\mathfrak{p} \setminus \mathfrak{p}^2$ , so by induction this is true for any  $t \in \mathfrak{p}$ . Thus we are done.  $\square$

**Lemma (24.11.3.15) [Gelfand Uniqueness Principle].** Let  $(\pi, V) \in \mathrm{Irr}^{\mathrm{adm}}(\mathrm{GL}(2; K))$ , and let  $\chi$  be a quasi-character of  $K^\times$ , then there are at most two essentially different values of  $s$  that there are at least two linear functionals  $L : V \rightarrow \mathbb{C}$  that satisfies

$$L(\pi\left(\begin{bmatrix} y & \\ & 1 \end{bmatrix}\right)v) = \chi(y)|y|^s L(v).$$

┘

**Remark (24.11.3.16).** In fact, for any  $s$ , there exists at most one such linear functional?  $\square$

*Proof:* If  $\dim V = 1$ , this is trivial. Otherwise  $\dim V = \infty$  and  $(\pi, V)$  has a Kirillov model. Identify  $V$  with its Kirillov model. Suppose  $L_1, L_2$  are two linear functionals that satisfies the equation, consider their restriction to  $V_N = C_c^\infty(K^\times)$ , on which  $B_1(F)$  acts, thus  $L_1, L_2$  are linearly dependent when restricted to  $V_N$  by (24.1.6.13). Thus there exists constants  $c_1, c_2$  that  $c_1 L_1 + c_2 L_2$  factors through  $J(V)$ .  $\dim J(V) \leq 2$  by (24.11.5.14). So by (24.11.1.20) for all but two possible choices of  $s$ ,  $c_1 L_1 + c_2 L_2 = 0$ , thus there are two linear functionals only for possibly two choices of  $s$ .  $\square$

### Newvectors

References are [Schmidt, Some remarks on local newforms for  $\mathrm{GL}(2)$ ].

**Prop. (24.11.3.17)** [Newvectors, Gelfand-Kazhdan[G-K71]]. For  $(\pi, V) \in \mathrm{Irr}^{\mathrm{adm}}(\mathrm{GL}(n; K))$ , there exists  $m \in \mathbb{N}$  s.t.  $V^{\mathcal{K}_{0,1}(m)} \neq 0$  (24.11.1.5). And if  $m_0$  is the smallest such  $m$ ,  $V^{\mathcal{K}_{0,1}(m_0)}$  is denoted by the space of **newvectors** for  $\pi$ .  $\lrcorner$

*Proof:* ? Cf.[G-H11]P44.  $\square$

**Thm. (24.11.3.18)** [New Vectors are Unique, Casselman[Cas73]/Jacquet-Shapiro-Shalika[JSS81]]. For  $(\pi, V) \in \mathrm{Irr}^{\mathrm{adm}}(\mathrm{GL}(n; K))$ , the space of new vectors is 1-dimensional (24.11.3.17). And the smallest  $m$  s.t.  $V^{\mathcal{K}_{0,1}(m_0)} \neq 0$  is just the conductor  $c(\pi)$  (29.3.1.31).  $\lrcorner$

*Proof:* ?  $\square$

**Cor. (24.11.3.19).** For any  $\pi \in \mathrm{Irr}^{\mathrm{adm}}(\mathrm{GL}(n; K))$ , there exists an irreducible representation of  $\mathrm{GL}(n; \mathcal{O}_K)$  appearing in  $\pi|_{\mathrm{GL}(n; \mathcal{O}_K)}$  with multiplicity 1.  $\lrcorner$

*Proof:* This follows from (24.1.6.31) and (24.11.3.18).  $\square$

**Prop. (24.11.3.20).** The conductor (29.3.1.31) of an irreducible principle series  $\pi(\chi_1, \chi_2)$  is equal to  $c(\chi_1) + c(\chi_2)$ .

The conductor of the Steinberg representation is 1. The conductor of a supercuspidal representation is at least 2.

The conductor of the central character of a supercuspidal representation with conductor  $r$  is at most  $\lfloor \frac{r}{2} \rfloor$ .  $\lrcorner$

*Proof:* Cf.[Schmidt, Some remarks on local newforms for  $\mathrm{GL}(2)$ ] and [Atkin-Li, Twists of newforms and pseudo-eigenvalues of W-operators]. ?  $\square$

## 4 Bernstein-Zelevinsky Classification

References are [B-Z76, B-Z77, Zel80].

**Prop. (24.11.4.1)** [Composition Factors and Permutations]. Let  $n \in \mathbb{Z}_+$  and  $\kappa = (\kappa_1, \dots, \kappa_r), \lambda = (\lambda_1, \dots, \lambda_s)$  be two ordered partition of  $n$ . Let  $(\pi_i, V_i) \in \mathrm{Irr}^{\mathrm{cusp}}(\mathrm{GL}(\kappa_i; K))$  (24.1.6.40) and  $(\pi'_j, V'_j) \in \mathrm{Irr}^{\mathrm{cusp}}(\mathrm{GL}(\lambda_j; K))$  (24.1.6.40), then the following are equivalent:

- $r = s$  and  $(\kappa, \{\pi_i\})$  is a permutation of  $(\lambda_j, \{\pi'_j\})$ .
- There is a non-zero intertwining operator

$$\pi_1 \times \dots \times \pi_r \rightarrow \pi'_1 \times \dots \times \pi'_s.$$

- Some subquotient of  $\pi_1 \times \dots \times \pi_r$  is isomorphic to some subquotient of  $\pi'_1 \times \dots \times \pi'_s$ .
- The composition factors of  $\pi_1 \times \dots \times \pi_r$  and  $\pi'_1 \times \dots \times \pi'_s$  are the same.  $\lrcorner$

*Proof:* Cf. Theorem 2.9(a) in [B-Z77]. ?

Notice  $\pi_1 \times \dots \times \pi_r$  is admissible of finite length by (24.9.3.5).  $\square$

**Cor. (24.11.4.2).**  $\mathrm{Hom}(\chi_1 \times \dots \times \chi_n, \mu_1 \times \dots \times \mu_n) \neq 0$  only if  $\{\chi_1, \dots, \chi_n\} = \{\mu_1, \dots, \mu_n\}$ .  $\lrcorner$

**Thm. (24.11.4.3).** For any Zelevinsky segment  $\Delta$  of length  $m$  (24.11.1.21), the representation  $\pi(\Delta)$  has length  $2^{m-1}$ .  $\lrcorner$

*Proof:*  $\square$

**Thm. (24.11.4.4) [Zelevinsky-Quotient Representations].** Let  $\Delta$  be a Zelevinsky-segment, then  $\pi(\Delta)$  has a unique irreducible subrepresentation  $Z(\Delta)$  and a unique irreducible quotient representation  $Q(\Delta)$ , called the **Zelevinsky-quotient representation** associated to  $\Delta$ .  $\lrcorner$

*Proof:*  $\square$

**Thm. (24.11.4.5) [Langlands Quotients].** Let  $(\Delta_1, \dots, \Delta_r)$  be a tuple of Zelevinsky segments satisfying the Zelevinsky condition (24.11.1.24), then  $Q(\Delta_1) \times \dots \times Q(\Delta_r) \in \text{Rep}^{\text{adm}}(GL(\sum n_i m_i; K))$  admits a unique irreducible quotient  $Q(\Delta_1, \dots, \Delta_r)$ , called the **Langlands quotient**. Moreover,  $Q(\Delta_1, \dots, \Delta_r)$  is independent of the order of  $\Delta_1, \dots, \Delta_r$  (as long as they satisfy the Zelevinsky condition (24.11.1.24)).  $\lrcorner$

*Proof:*  $\square$

**Thm. (24.11.4.6) [Bernstein-Zelevinsky [B-Z77]].** Any  $(\pi, V) \in \text{Irr}^{\text{adm}}(GL(n; K))$  is isomorphic to one of the form  $\pi \cong Q(\Delta_1, \dots, \Delta_r)$  where  $\Delta_i = \Delta(\pi_i, m_i)$  and  $\sum n_i m_i = n$  for a unique tuple of segments  $(\Delta_1, \dots, \Delta_r)$  satisfying Zelevinsky condition up to permutation.  $\lrcorner$

*Proof:*  $\square$

**Thm. (24.11.4.7).** Let  $(\Delta_1, \dots, \Delta_r)$  be a tuple of segments satisfying the Zelevinsky condition, then  $Q(\Delta_1, \dots, \Delta_r)$  is irreducible iff no two elements are linked.  $\lrcorner$

*Proof:*  $\square$

**Prop. (24.11.4.8) [Zelevinsky].**  $Q(\Delta_1, \dots, \Delta_r)^\vee = Q(\Delta_1^\vee, \dots, \Delta_r^\vee)$ .  $\lrcorner$

*Proof:* Cf. [Ze] 3.3., 9.4. ?  $\square$

**Prop. (24.11.4.9).** Dual statements of (24.11.4.5)(24.11.4.6)(24.11.4.7)(24.11.4.8) hold, i.e.  $Z(\Delta_1) \times \dots \times Z(\Delta_r)$ , which admits a unique irreducible subrepresentation  $Z(\Delta_1, \dots, \Delta_r)$ .  $\lrcorner$

*Proof:*  $\square$

**Def. (24.11.4.10) [Supercuspidal Supports].** For a  $\pi = Q(\Delta_1, \dots, \Delta_r) \in \text{Irr}^{\text{adm}}(GL(n; K))$ , where  $\Delta_i = (\pi_i, m_i)$ , define the **supercuspidal supports** of  $\pi$  as the set

$$\text{Supp}(\pi) = \{\pi_i(j)\}_{1 \leq i \leq r, 1 \leq j \leq m_i - 1}.$$

$\lrcorner$

**Prop. (24.11.4.11) [Constituents of  $Q(\Delta_1) \times \dots \times Q(\Delta_r)$ ].** The constituents of  $Q(\Delta_1) \times \dots \times Q(\Delta_r) \in \text{Rep}^{\text{adm}}(GL(n; K))$  are exactly the representations  $Q(\Delta'_1, \dots, \Delta'_r)$ , where the multiset  $\{\Delta'_1, \dots, \Delta'_r\}$  are obtained from the multiset  $\{\Delta_1, \dots, \Delta_r\}$  by successively replacing two linked segments  $\{\Delta^1, \Delta^2\}$  by  $\{\Delta^1 \cap \Delta^2, \Delta^1 \cup \Delta^2\}$ .  $\lrcorner$

*Proof:* Cf. [Zel80] Thm 7.1 ?  $\square$

### Zelevinsky Involutions

**Prop. (24.11.4.12).** For  $n \in \mathbb{Z}_+$ , denote  $\mathcal{R}_n(K) = \text{Rep}^{\text{adm, finite length}}(\text{GL}(n; K))$  and  $\mathcal{R}(K) = \bigoplus_{n \in \mathbb{N}} \mathcal{R}_n(K)$ . Then

$$([\pi_1], [\pi_2]) \mapsto [\pi_1 \times \pi_2]$$

defines a graded ring structure on  $\mathcal{R}(K)$ . And then  $\mathcal{R}(K)$  is isomorphic to the ring of polynomials on the set of Zelevinsky segments.  $\lrcorner$

*Proof:* Cf. [Ze]1.9.  $\square$

**Prop. (24.11.4.13).**

- The map  $t : \mathcal{R}(K) \rightarrow \mathcal{R}(K) : Q(\Delta) \mapsto Z(\Delta)$  defines a graded involution of  $\mathcal{R}(K)$ .
- $t$  perserves irreducible representations.
- $t(Q(\Delta_1, \dots, \Delta_r)) = Z(\Delta_1, \dots, \Delta_r)$ ,  $t(Z(\Delta_1, \dots, \Delta_r)) = Q(\Delta_1, \dots, \Delta_r)$ . In particular,  $t$  commutes with contragredients, by (24.11.4.8)(24.11.4.9).  $\lrcorner$

*Proof:*  $\square$

### Examples

**Prop. (24.11.4.14)[Principal Series].** For  $n = 2$ , the principle series (24.11.5.1)  $\chi_1 \boxtimes \chi_2$  are irreducible except the following two cases:

- If  $\chi_2 = \chi_1(1)$ , then  $\chi_1 \times \chi_2$  has a 1-dimensional invariant subspace and the quotient representation is irreducible.
- If  $\chi_2 = \chi_1(-1)$ , then  $\chi_1 \times \chi_2$  has an irreducible invariant subspace of codimension 1.

In these cases, the infinity-dimensional irreducible representations are called the **Steinberg representations**  $\text{St}_2(\chi_1, \chi_2)$ .  $\lrcorner$

*Proof:* Firstly we prove if  $\mathcal{B}(\chi_1, \chi_2)$  has a non-trivial subspace, then it has a non-trivial subspace of dimension 1 or codimension 1: Let  $V'$  be the invariant subspace and  $V''$  the quotient space, by the exactness of Jacquet functor (24.9.3.1) and (24.9.5.9), at least one of  $J_\psi(V')$ ,  $J_\psi(V'')$  vanishes. If  $J_\psi(V') = 0$ , then by (24.11.3.7) it factors through the determinant map, thus it has a 1-dimensional invariant space. If  $J_\psi(V'') = 0$ , then we can use (24.11.5.4) and (24.1.6.27) to dualize.

Next, if  $\mathcal{B}(\chi_1, \chi_2)$  has a 1-dimensional subspace  $V = \{f\}$ , then  $\pi(g)f = \rho(\det(g))f$  for some quasi-character  $\rho$  of  $K^\times$ . Now consider the fact  $f \in \mathcal{B}(\chi_1, \chi_2)$ , take  $b = \text{diag}(y, y^{-1})$ , then  $(\delta^{1/2}\chi)(b) = 1$ , showing  $\chi_1\chi_2^{-1} = |\cdot|^{-1}$ . The codimension1 case is dual by (24.1.6.27) and (24.11.5.4), so  $\mathcal{B}(\chi_1, \chi_2)$  is irreducible except when  $\chi_1\chi_2^{-1} = |\cdot|^{\pm 1}$ .

Finally, if  $\chi_1\chi_2^{-1} = |\cdot|^{-1}$ , let  $\chi_1 = \chi|\cdot|^{-1/2}$ , then  $f(g) = \chi(\det(g))$  is an invariant 1-dimensional subspace, and this is the only 1-dimensional invariant subspace that factors through the determinant map, because if  $f(g) = \chi'(\det(g)) \in \mathcal{B}(\chi_1, \chi_2)$ , then  $\chi' = \chi_1|\cdot|^{-1/2} = \chi_2|\cdot|^{-1/2} = \chi$ .

Also the quotient representation is irreducible because the same argument by Jacquet module shows if it is non-irreducible, then it has an invariant subspace of dimension 1 that  $G$  action factors through the determinant map or of codimension 1, which means there are two invariant 1-dimensional subspace that the  $G$ -action factors through the determinant map, or a invariant subspace of codimension1 of  $\mathcal{B}(\chi_1, \chi_2)$ , the latter case contradicting the argument above. For the former case, we get a 2-dimensional subrepresentation of  $\mathcal{B}(\chi_1, \chi_2)$  that factors through the determinant map.

The argument above shows it is generated by  $\chi(\det())$  and some function  $f$ , but  $f$  must satisfy  $f(g) = \chi(\det(g))f(1) + a$ , which is possible only if  $a = 0$ , so  $f = \chi \circ \det$ , contradiction.

The codimension 1 case is dual by (24.1.6.27) and (24.11.5.4).  $\square$

**Cor. (24.11.4.15) [Classification of  $\text{Irr}^{\text{adm}}(GL(2; K))$ ].** The  $n = 2$  case is particularly clear: any  $\pi \in \text{Irr}^{\text{adm}}(GL(2; K))$  has the following possibilities:

1.  $\pi$  is supercuspidal.
2.  $\pi = Q(\chi \otimes \text{val}^{-1/2}, \chi \otimes \text{val}^{1/2})$ , which equals  $\text{St}_2(\chi)$ .
3.  $\pi = \chi_1 \times \chi_2$ , where  $\chi_1, \chi_2$  are not linked, which is the irreducible principal series.
4.  $\pi = Q(\chi \otimes \text{val}^{1/2}, \chi \otimes \text{val}^{-1/2})$ , which equals  $\mathbf{1}(\chi)$ .

$\lrcorner$

**Def. (24.11.4.16) [Generalized Speh-Representations].** A **generalized Speh-representation** of  $GL(n; K)$  is a unitary representation of the form

$$\text{Speh}(\pi_0; t) \triangleq Q(\pi_0(\frac{t-1}{2}), t) \text{ (24.11.4.4)}.$$

where  $td = n$  and  $\pi_0 \in \text{Irr}^{\text{cusp, uni}}(GL(d; K))$ . Notice that when  $\pi_0 = \mathbf{1}$ , then  $\text{Speh}(\pi_0; t) = \text{St}(\mathbf{1}; t)$  are generalized steinberg-representations (24.9.3.12).  $\lrcorner$

## 5 Principal Series Representations

**Def. (24.11.5.1) [Principal Series Representations].** Given a diagonal quasi-character  $\chi = (\chi_1, \dots, \chi_n)$  of  $T(K)$ ,  $\chi_1 \times \dots \times \chi_n \in \text{Rep}^{\text{alg}}(GL(n; K))$  is called a **principal series representation** of  $G$ . It is admissible of finite length by (24.9.3.5).  $\lrcorner$

**Lemma (24.11.5.2).** By (24.1.6.47), we have a map  $P : C_c^\infty(G(K)) \rightarrow \chi_1 \times \dots \times \chi_n$ :

$$(P\varphi)(g) = \int_{B(K)} \varphi(b^{-1}g)(\delta^{1/2}\chi)(b)db$$

Then this map is intertwining and surjective. Moreover, we have

$$P(\lambda(b)^{-1}\varphi) = (\delta^{-1/2}\chi)(b)P(\varphi), \quad b \in B(K)$$

$\lrcorner$

**Prop. (24.11.5.3).** The representation  $\chi_1 \times \dots \times \chi_n$  admits at most one Whittaker functional. In other words,  $\dim J_\psi(\chi_1 \times \dots \times \chi_n) \leq 1$ . in fact, it is exactly one, as will be shown by (24.11.4.14) and (24.11.3.7).  $\lrcorner$

*Proof:* Let  $\Lambda : V \rightarrow \mathbb{C}$  be a Whittaker functional, then we define a distribution  $\Delta$  on  $GL(2; K)$  as  $\Delta(\varphi) = \Lambda(P\varphi)$ . Then

$$\lambda(b)\Delta = (\delta^{-1/2}\chi)(b)\Delta, b \in B(K), \quad \rho(n)\Delta = \psi_N(n)^{-1}\Delta, n \in N(K)$$

by (24.11.5.2). Because  $P$  is surjective (24.11.5.2), it suffices to show that these  $\Delta$  are unique up to scalar.

Consider the left-right action of  $B(K) \times N(K)$  on  $G(F)$ , then there are  $n!$  orbits  $B(K)WN(K)$  by Bruhat decomposition(10.4.4.28). For  $w \neq 1$ , the orbit  $B(K)wN(K)$  is isomorphic to  $B(K) \times N(K)$  via  $(b, n) \mapsto bwn^{-1}$ , thus the restriction of  $\Delta$  on  $B(K)wN(K)$  must be of the form

$$\Delta_1(\varphi) = C \int_{B(K)} \int_{N(K)} \varphi(bwn^{-1}) \psi_N(n) (\delta^{1/2} \chi^{-1})(b) db dn$$

by(24.1.6.12). This is the unique map that satisfies the condition.

As for the distribution on  $B(K)$ , the same reasoning shows the restriction of  $\Delta$  on  $B(K)$  must be of the form

$$\Delta_2(\varphi) = C \int_{B(K)} \varphi(b) (\delta^{1/2} \chi^{-1})(b) db,$$

but it satisfies  $\rho(n)\Delta_2 = \Delta_2$ , so there are no distribution on  $B(K)$ . Finally, (4.4.4.12) gives us the result.  $\square$

**Cor.(24.11.5.4).**  $(\chi_1 \times \dots \times \chi_n)^\vee \cong \chi_1^{-1} \times \dots \times \chi_n^{-1}$ .  $\lrcorner$

*Proof:* If  $f \in \mathcal{B}(\chi_1, \chi_2)$ ,  $f' \in \mathcal{B}(\chi_1^{-1}, \chi_2^{-1})$ , then the pairing  $(f, f') = \int_K f(k) f'(k) dk$  is  $G$ -invariant by(12.10.3.16), so this defines a smooth functional  $l_{f'}$ , and it is non-degenerate, the mapping  $f' \mapsto l_{f'}$  is injective(by letting  $f = 1/f'$  on a  $B(K)$ -orbit that  $f'$  is non-zero) from  $\mathcal{B}(\chi_1^{-1}, \chi_2^{-1})$  to  $\mathcal{B}(\chi_1, \chi_2)^\vee$ . Now by symmetry the other side is also injective, and we are done because  $(V^\vee)^\vee \cong V$ (24.1.6.29).  $\square$

### Intertwining Integrals and Whittaker Functionals

**Prop.(24.11.5.5)[Intertwining Integral].** Let  $\xi_i$  be two characters of  $K^\times$ , and  $\chi_i = |\cdot|^{s_i} \xi_i$ ,  $(\pi, V) = \chi_1 \times \chi_2$ ,  $(\pi', V') = \chi_2 \times \chi_1$ . Define for  $f \in V$ ,

$$Mf : \mathrm{GL}(2; K) \rightarrow \mathbb{C} : Mf(g) = \int_{\mathrm{Unip}(2; K)} f(w_0 u g) du$$

then if  $\mathrm{Re}(s_1 - s_2) > 0$ , the integral is absolutely convergent,  $Mf \in V'$ , and  $M$  is a nonzero intertwining, so  $V \cong V'$  if they are both irreducible.  $\lrcorner$

*Proof:* Should compare this proof with(24.7.5.23).

For the convergence, it suffices to check for  $\begin{bmatrix} 1 & x \\ & 1 \end{bmatrix}$ ,  $|x|$  large, but then

$$f\left(\begin{bmatrix} & -1 \\ 1 & \end{bmatrix} \begin{bmatrix} 1 & x \\ & 1 \end{bmatrix} g\right) = f\left(\begin{bmatrix} x^{-1} & -1 \\ & x \end{bmatrix} \begin{bmatrix} 1 & \\ x^{-1} & 1 \end{bmatrix} g\right) = |x|^{-1} (\chi_1^{-1} \chi_2)(x) f\left(\begin{bmatrix} 1 & \\ x^{-1} & 1 \end{bmatrix} g\right)$$

and because  $f$  is locally constant, when  $|x|$  is large,  $f\left(\begin{bmatrix} 1 & \\ x^{-1} & 1 \end{bmatrix} g\right) = f(g)$ , thus the convergence on the unbounded region is dominated by

$$\int_{|x| > q^N} |x|^{-1} |(\chi_1^{-1} \chi_2)(x)| dx = \int_{|x| > q^N} |x|^{-s_1 + s_2 - 1} dx,$$

which converges for  $\mathrm{Re}(s_1 - s_2) > 0$ .

To show  $Mf \in V'$ , we need to check

$$Mf\left(\begin{bmatrix} 1 & x \\ & 1 \end{bmatrix} g\right) = Mf(g), \quad Mf\left(\begin{bmatrix} y_1 & \\ & y_2 \end{bmatrix} g\right) = |y_1/y_2|^{1/2} \chi_2(y_1) \chi_1(y_2) Mf(g).$$

The first is trivial and for the second:

$$Mf\left(\begin{bmatrix} y_1 & \\ & y_2 \end{bmatrix} g\right) = \int_F f\left(\begin{bmatrix} y_2 & \\ & y_1 \end{bmatrix} \begin{bmatrix} & -1 \\ 1 & \end{bmatrix} \begin{bmatrix} 1 & y_2 y_1^{-1} x \\ & 1 \end{bmatrix} g\right) dx$$

so it is clear.

Finally  $M$  is clearly intertwining, and it is not trivial by looking at the function  $f$ :

$$f = \left| \frac{y_1}{y_2} \right|^{\frac{1}{2}} \chi_1(y_1) \chi_2(y_2) \chi_{\mathcal{O}_F}(x), \text{ where } g = \begin{bmatrix} y_1 & z \\ & y_2 \end{bmatrix} \begin{bmatrix} & -1 \\ 1 & \end{bmatrix} \begin{bmatrix} 1 & x \\ & 1 \end{bmatrix}$$

and vanish if  $g \in B(K)$ . Notice the representation of  $g$  is unique by Bruhat decomposition. Then  $Mf(1) = 1$ .  $\square$

**Prop. (24.11.5.6) [Analytic Continuation of Intertwining Integral].** Let  $\xi_i$  be two characters of  $K^\times$ ,  $\chi_i = |\cdot|^{s_i} \xi_i$ ,  $(\pi_{s_1, s_2}, V_{s_1, s_2}) = \chi_1 \times \chi_2$ ,  $(\pi'_{s_2, s_1}, V'_{s_2, s_1}) = \chi_2 \times \chi_1$ .

Notice that by Iwasawa decomposition (20.7.2.16), an arbitrary  $f \in \mathcal{B}(\chi_1, \chi_2)$  is determined by its restriction on  $K$ , and if a function  $f_0$  on  $K$  satisfies

$$f_0\left(\begin{bmatrix} y_1 & x \\ & y_2 \end{bmatrix} k\right) = \xi_1(y_1) \xi_2(y_2) f_0(k), \quad y_1, y_2 \in \mathcal{O}^*,$$

then  $f_0$  can extend uniquely to an element  $f_{s_1, s_2} \in V_{s_1, s_2}$  for any  $s_1, s_2$ , called the **flat sections** of  $f_0$ .

Then the intertwining integral  $Mf_{s_1, s_2}$  defined in (24.11.5.5) is analytic for the dominant  $\chi$  in the flat family, and has an analytic continuation to all  $s_1, s_2$  that  $\chi_1 \neq \chi_2$ , and defines a nonzero operator  $V_{s_1, s_2} \rightarrow V'_{s_2, s_1}$ .  $\square$

*Proof:* The proof is parallel to that of (24.11.5.5).

$$Mf_{s_1, s_2}(g) = \int_{|x| \leq q^N} f_{s_1, s_2}\left(\begin{bmatrix} & -1 \\ 1 & \end{bmatrix} \begin{bmatrix} 1 & x \\ & 1 \end{bmatrix} g\right) dx + \int_{x \geq q^{N+1}} |x|^{-s_1 + s_2 - 1} (\xi_1^{-1} \xi_2)(x) dx f_{s_1, s_2}(g)$$

the first term can easily be extended, and the second term vanishes if  $\xi_1^{-1} \xi_2$  ramifies, and equals something like a multiple of  $\frac{(\chi_1^{-1} \chi_2(\varpi))^{N+1}}{1 - \chi_1^{-1} \chi_2(\varpi)}$ , which extends unless  $\chi_1 = \chi_2$ .

For the intertwining property, it is because equalities maintain along analytic continuation, in particular, it is non-trivial as  $Mf_{s_1, s_2}(1) = 1$ .  $\square$

**Cor. (24.11.5.7).**  $Z(\chi_1, \chi_2) \cong Z(\chi_2, \chi_1)$ ,  $\sigma(\chi_1, \chi_2) \cong \sigma(\chi_2, \chi_1)$ . If  $\mathcal{B}(\chi_1, \chi_2)$  is irreducible, then  $\pi(\chi_1, \chi_2) \cong \pi(\chi_2, \chi_1)$ . Moreover, there are no other isomorphisms between these representations.  $\square$

*Proof:* It suffices to show there are no other isomorphisms, and this is by (24.11.4.2).  $\square$

**Prop. (24.11.5.8) [Whittaker functional of  $\mathcal{B}(\chi_1, \chi_2)$ ].** There is a Whittaker functional on  $\mathcal{B}(\chi_1, \chi_2)$  defined by

$$\Lambda(f) = \int_F f(w_0 \begin{bmatrix} 1 & x \\ & 1 \end{bmatrix}) \psi(-x) dx.$$

This integral is absolutely convergent if  $\chi$  is dominant and is analytic for the flat family of  $\chi$ , by method the same as in the proof of (24.11.5.5). And this can also be extended to all  $\chi$  (as flat section (24.11.5.6)) by defining

$$\Lambda(f) = \lim_{k \rightarrow \infty} \int_{\mathfrak{p}^{-k}} f(w_0 \begin{bmatrix} 1 & x \\ & 1 \end{bmatrix}) \psi(-x) dx.$$

┘

**Remark (24.11.5.9).** Compare with (26.6.4.3).

┘

*Proof:* This makes sense because it stabilize as  $k \rightarrow \infty$ : when  $k$  is large,

$$\int_{\mathfrak{p}^{-k-1} \setminus \mathfrak{p}^{-k}} f(w_0 \begin{bmatrix} 1 & x \\ & 1 \end{bmatrix}) \psi(-x) dx = q^{-k-1} f(1) \int_{\mathfrak{p}^{-k-1} \setminus \mathfrak{p}^{-k}} \psi(-x) (\chi_1^{-1} \chi_2)(x) dx$$

By continuity (See the proof of (24.11.5.5)). If  $\psi(t) \neq 0$ , choose  $k$  large that  $\chi_1^{-1} \chi_2(x) = \chi_1^{-1} \chi_2(x+t)$  for any  $x \in \mathfrak{p}^{-k-1} \setminus \mathfrak{p}^{-k}$ , thus this integral vanishes.  $\square$

**Remark (24.11.5.10).** For general  $n$ , this method won't work, and another method is used in Bernstein, J., Letter to Piatetski-Shapiro (1985). To appear in Cogdell and Piatetski-Shapiro (book in preparation.) to extend analytically.

┘

**Prop. (24.11.5.11).** If  $\chi_1 \times \chi_2$  is irreducible, with the notations in (24.11.5.5), the intertwining integral  $M : \chi_1 \times \chi_2 \rightarrow \chi_2 \times \chi_1$  satisfies

$$\Lambda' \circ M = \xi_1 \xi_2^{-1} (-1) \gamma(1 - s_1 + s_2, \xi_1^{-1} \xi_2, \psi) \Lambda,$$

where  $\Lambda$  is the Whittaker functional defined in (24.11.5.8), and  $\gamma(s, \chi, \psi)$  is the local constant defined in (29.5.2.8).  $\square$

*Proof:* Cf. [Bump, P485]. ?

┘

**Cor. (24.11.5.12) [Composition of Intertwining Integrals].** If  $\mathcal{B}(\chi_1, \chi_2)$  is irreducible,  $M : \mathcal{B}(\chi_1, \chi_2) \rightarrow \mathcal{B}(\chi_2, \chi_1)$ ,  $M' : \mathcal{B}(\chi_2, \chi_1) \rightarrow \mathcal{B}(\chi_1, \chi_2)$  are intertwining integrals, then

$$M' \circ M = \gamma(1 - s_1 + s_2, \xi_1^{-1} \xi_2, \psi) \gamma(1 + s_1 - s_2, \xi_1 \xi_2^{-1}, \psi) \cdot \text{Id}.$$

If  $\mathcal{B}(\chi_1, \chi_2)$  is reducible,  $M' \circ M = 0$ .

┘

*Proof:* The irreducible case follows from the proposition. For the reducible case, let  $\chi_1 \chi_2^{-1} = |\cdot|$ , the intertwining integral  $\mathcal{B}(\chi_2, \chi_1) \rightarrow \mathcal{B}(\chi_1, \chi_2)$  is non-zero, so the image is either  $\mathcal{B}(\chi_1, \chi_2)$  or  $\pi(\chi_1, \chi_2)$ . In the first case,  $\mathcal{B}(\chi_2, \chi_1)$  has a infinite dimensional proper quotient, contradiction. The intertwining integral  $\mathcal{B}(\chi_1, \chi_2) \rightarrow \mathcal{B}(\chi_2, \chi_1)$  is non-zero, so the image is either  $\mathcal{B}(\chi_2, \chi_1)$  or  $\sigma(\chi_1, \chi_2)$ . In the first case,  $\mathcal{B}(\chi_1, \chi_2)$  has a 1-dimensional quotient, contradiction.  $\square$

### Jacquet Module

**Prop. (24.11.5.13) [Jacquet Module of  $\chi_1 \times \dots \times \chi_n$ ].** Let  $\chi_i$  be quasi-characters of  $K^\times$ , then the Jacquet module of  $\chi_1 \times \dots \times \chi_n$  has dimension  $n!$ .

And if  $n = 2$ , the representation of  $T(F)$  on the Jacquet module is isomorphic to the representation

$$t \mapsto \begin{cases} \begin{bmatrix} (\delta^{1/2}\chi)(t) & \\ & (\delta^{1/2}\chi')(t) \end{bmatrix}, & \chi_1 \neq \chi_2 \\ (\delta^{1/2}\chi)(t) \begin{bmatrix} 1 & v(t_1/t_2) \\ & 1 \end{bmatrix}, & \chi_1 = \chi_2 = \chi \end{cases}.$$

┘

*Proof:* Firstly we show  $\dim J(\mathcal{B}(\chi_1, \chi_2)) = 2$ : Let  $\Lambda : V \rightarrow \mathbb{C}$  be a functional that  $\Lambda(\rho(n)v) = \Lambda(v)$  for  $n \in N(K)$ , then we define a distribution  $\Delta$  on  $GL(2, K)$  as  $\Delta(\varphi) = \Lambda(P\varphi)$ . Then

$$\lambda(b)\Delta = (\delta^{-1/2}\chi)(b)\Delta, b \in B(K), \quad \rho(n)\Delta = \Delta, n \in N(K)$$

by (24.11.5.2). Because  $P$  is surjective (24.11.5.2), it suffices to show that there are exactly two linearly independent such  $\Delta$ .

Consider the left-right action of  $B(K) \times N(K)$  on  $GL(2; K)$ , then there are  $n!$  orbits  $B(K)WN(K)$  by Bruhat decomposition (10.4.4.28). For  $w \neq 1$ , the orbit  $B(K)w \text{Unip}(K)$  is isomorphic to  $B(K) \times \text{Unip}(K)$  via  $(b, n) \mapsto bwn^{-1}$ , thus the restriction of  $\Delta$  on it must be of the form

$$\Delta_1(\varphi) = C \int_{B(K)} \int_{\text{Unip}(K)} \varphi(bwn^{-1})(\delta^{1/2}\chi^{-1})(b) db dn$$

by (24.1.6.12).

As for the distribution on  $B(K)$ , the same reasoning shows the restriction of  $\Delta$  on  $B(K)$  must be of the form

$$\Delta_2(\varphi) = C \int_{B(K)} \varphi(b)(\delta^{1/2}\chi^{-1})(b) db,$$

and it truly satisfies  $\rho(n)\Delta_2 = \Delta_2$ . Finally, (4.4.4.12) gives us the result.

Next we consider  $J(V)$  as a 2-dimensional  $T(F)$ -representation must be of the two forms in (24.11.1.20), it suffices to distinguish these two cases.

Denote  $V = \chi_1 \boxtimes \chi_2$ . Consider for any quasi-character  $\mu$  of  $T(F)$ ,

$$\text{Hom}_{T(F)}(J(V), \delta^{1/2}\mu) \cong \text{Hom}_{B(K)}(V, \delta^{1/2}\mu) \cong \text{Hom}_{GL(2, K)}(V, \mathcal{B}(\mu_1, \mu_2)).$$

So (24.11.4.2)(24.11.5.7) can be used, so if  $\chi_1 \neq \chi_2$ , there are two  $\mu$  that can make the Hom group non-vanish, so it is the first case. If  $\chi_1 = \chi_2$ , then  $V$  is irreducible, and there is only one  $\mu$  that makes this Hom group non-vanish, and the Hom group is of dimension 1 by Schur's lemma, so it is the second case.  $\square$

**Prop. (24.11.5.14) [Jacquet Modules are Finite Dimensional].** For  $(\pi, V) \in \text{Irr}^{\text{adm}}(GL(n; K))$ , we have  $\dim J_{\text{Unip}(n, K)}(V) \leq n!$ , and if it is nonzero, then  $\pi$  is a subrepresentation of some  $\chi_1 \times \dots \times \chi_n$ .

┘

*Proof:* If  $J_{\text{Unip}(n, K)}(V) \neq 0$ , then  $\pi$  is isomorphic to a subrepresentation of some  $\chi_1 \times \dots \times \chi_n$  by the adjunction (24.9.3.4). Then by exactness of Jacquet functor (24.9.3.1),  $J(V)$  is a subspace of  $J(\chi_1 \times \dots \times \chi_n)$ , which has dimension  $n!$  (24.11.5.13).  $\square$

**Prop. (24.11.5.15) [Jacquet Functor of  $\sigma(\chi_1, \chi_2)$ ].** Suppose  $\chi_1, \chi_2$  are quasi-characters of  $K^\times$  that  $\chi_1\chi_2^{-1} = | - |^{-1}$ , then  $\mathcal{B}(\chi_1, \chi_2)$  is reducible, then the Jacquet modules of  $\pi(\chi_1, \chi_2)$  and  $\sigma(\chi_1, \chi_2)$  are 1-dimensional, and the characters of  $T(F)$  they afford are  $\delta^{1/2}\chi$  and  $\delta^{1/2}\chi'$ .  $\square$

*Proof:* Clearly the Jacquet module of a representation  $\mathbb{1}(\chi)$  is of dimension 1, so by the exactness of Jacquet functor (24.9.3.1) and (24.11.5.13), the Jacquet functor for  $\sigma(\chi_1, \chi_2)$  is also of dimension 1.

For the determination of the Jacquet module, notice for any representation  $(\pi, V)$  of  $GL(2, K)$ ,

$$\mathrm{Hom}_{T(F)}(J(V), \delta^{1/2}\mu) \cong \mathrm{Hom}_{B(K)}(V, \delta^{1/2}\mu) \cong \mathrm{Hom}_{GL(2, K)}(V, \mathcal{B}(\mu_1, \mu_2)).$$

So for  $\pi = \pi(\chi_1, \chi_2)$ ,  $\mathrm{Hom}_{T(F)}(J(V), \delta^{1/2}\mu) = \mathbb{C}$  for  $\mu = \chi$ , so  $J(\pi(\chi_1, \chi_2))$  is  $\delta^{1/2}\chi$ . For  $\pi = \sigma(\chi_1, \chi_2)$ , then  $\mathrm{Hom}_{T(F)}(J(V), \delta^{1/2}\mu) = \mathbb{C}$  for  $\mu = \chi'$  by (24.11.5.7), so  $J(\sigma(\chi_1, \chi_2))$  is  $\delta^{1/2}\chi'$ .  $\square$

### Kirillov Modules of Principal Series

**Prop. (24.11.5.16) [Kirillov Model of Principal Series].** Let  $\pi(\chi_1, \chi_2)$  be an irreducible principal series,

- If  $\chi_1 \neq \chi_2$ , then the Kirillov model of  $\pi(\chi_1, \chi_2)$  consists of smooth functions  $\varphi$  on  $K^\times$  that is compactly supported on  $F$  and  $\varphi(t)$  is a linear combination of the function  $|t|^{1/2}\chi_1(t)$  and  $|t|^{1/2}\chi_2(t)$  when  $|t|$  is small.
- If  $\chi_1 = \chi_2$ , then the Kirillov model of  $\pi(\chi_1, \chi_1)$  consists of smooth functions  $\varphi$  on  $K^\times$  that is compactly supported on  $F$  and  $\varphi(t)$  is a linear combination of the function  $|t|^{1/2}\chi_1(t)$  and  $v(t)|t|^{1/2}\chi_1(t)$  when  $|t|$  is small.

$\square$

*Proof:* First assume that  $\chi_1 = \chi_2$ , then by (24.11.5.13), there are two functions  $\varphi_1, \varphi_2$  that satisfies

$$\pi(t)\bar{\varphi}_1 = (\delta^{1/2}\chi)(t)\bar{\varphi}_1, \quad \pi(t)\bar{\varphi}_2 = (\delta^{1/2}\chi)(t)\bar{\varphi}_2 + v(t_1/t_2)(\delta^{1/2}\chi)(t)\bar{\varphi}_1.$$

Then by (24.11.3.14),  $\varphi_1(u) = C|u|^{1/2}\chi_1(u)$  for  $|u|$  small, and because  $\bar{\varphi}_1 \neq 0 \in J(V)$ ,  $C \neq 1$  by (24.11.3.13), and we can assume that  $C = 1$ . Then for any  $t_0 \in \mathfrak{p} \setminus \mathfrak{p}^2$ ,

$$\pi\left(\begin{bmatrix} t_0 & \\ & 1 \end{bmatrix}\right)\varphi_2 - |t_0|^{1/2}\chi_1(t_0)[\varphi_1 + \varphi_2] \in V_N.$$

Thus by (24.11.3.13), there exists some constant  $\varepsilon(t_0)$  that

$$\varphi_2(tu) = |t|^{1/2}\chi_1(t)\varphi_2(u) + |tu|^{1/2}\chi_1(tu).$$

is true for  $t = t_0$  and  $|u| \leq \varepsilon(t_0)$ . Notice both sides are locally constant on  $t$ , so this is true for  $t$  near  $t_0$ . Because  $\mathfrak{p} \setminus \mathfrak{p}^2$  is compact, there is a  $\varepsilon$  that this is true for any  $t \in \mathfrak{p} \setminus \mathfrak{p}^2$  and  $|u| \leq \varepsilon$ .

Now any element  $t \in \mathfrak{p}$  can be factored into product of elements in  $\mathfrak{p} \setminus \mathfrak{p}^2$ , so by induction

$$\varphi_2(tu) = |t|^{1/2}\chi_1(t)\varphi_2(u) + v(t)|tu|^{1/2}\chi_1(tu).$$

for any  $t \in \mathfrak{p}$  and  $|u| \leq \varepsilon$ . So the theorem is true for  $\varphi_1$  and  $\varphi_2$ , thus true for any other function because they differs from a linear combination of these two by an element in  $V_N$ , which vanishes for  $|t|$  small, by (24.11.3.13).

Case1 is similar and easier.  $\square$

**Prop. (24.11.5.17) [Kirillov Model of Steinberg Representations].** Let  $\sigma(\chi_1, \chi_2)$  be a Steinberg representation of  $\mathrm{GL}(2; K)$ , where  $\chi_1\chi_2^{-1} = |\cdot|^{-1}$ , then the Kirillov model of  $\sigma(\chi_1, \chi_2)$  consists of smooth functions  $\varphi$  on  $K^\times$  that is compactly supported on  $F$  and  $\varphi(t)$  is a constant multiple of  $|t|^{1/2}\chi_2(t)$  when  $|t|$  is small.  $\square$

*Proof:* The proof is the same as that of (24.11.5.16), with (24.11.5.15) used instead of (24.11.5.13).  $\square$

## 6 Unramified Representations

**Def. (24.11.6.1) [Normalized Spherical Vector].** Let  $\chi_1, \dots, \chi_n$  be nonramified quasi-characters of  $K^\times$ , then  $\mathcal{B}(\chi_1, \dots, \chi_n)$  contains a  $K$ -fixed vector  $\varphi_K$  that is defined to be

$$\varphi_K(bk) = (\delta^{1/2}\chi)(b), b \in B(K), k \in \mathcal{K}$$

Notice this is well-defined, because for  $u \in B(K) \cap \mathcal{K}$ ,  $(\delta^{1/2}\chi)(u) = 1$ .  $\varphi_K$  is  $\mathcal{K}$ -spherical, and we refer to it the **normalized spherical vector** in  $V$ . Such a  $\mathcal{B}(\chi_1, \dots, \chi_n)$  is called a **unramified principal series** if it is irreducible.

Notice when  $n = 2$  and  $\chi_2 = \chi_1 \otimes \mathrm{val}$ , this spherical vector just spans the 1-dimensional invariant subspace in (24.11.4.14).  $\square$

**Cor. (24.11.6.2).** When  $n = 2$ , under the Satake isomorphism (29.3.2.9), the Hecke operators  $T(\mathfrak{p}) = \begin{bmatrix} \varpi & \\ & 1 \end{bmatrix}$  and  $R_p = \varpi I$  are mapped to

$$q^{1/2}(t_1 + t_2), \quad t_1 t_2,$$

resp.  $\square$

*Proof:* For any unramified spherical representation with Satake parameters  $\alpha_1, \alpha_2$ , using the representative of  $\mathcal{K} \begin{bmatrix} \varpi & \\ & 1 \end{bmatrix} \mathcal{K}$  over  $\mathcal{K}$  as in (26.3.2.8),

$$\begin{aligned} (T(\mathfrak{p})\varphi_K)(1) &= \int_{\mathcal{K}} \begin{bmatrix} \varpi & \\ & 1 \end{bmatrix}_{\mathcal{K}} \varphi_K(g) dg = \sum_{\gamma \in K} \begin{bmatrix} \varpi & \\ & 1 \end{bmatrix}_{K/K} \varphi_K(\gamma) \\ &= (\Delta^{1/2}\chi) \left( \begin{bmatrix} 1 & \\ & \varpi \end{bmatrix} \right) + q(\Delta^{1/2}\chi) \left( \begin{bmatrix} \varpi & \\ & 1 \end{bmatrix} \right) = q^{1/2}(\alpha_1 + \alpha_2) \end{aligned}$$

and similarly for  $R(\mathfrak{p})$ .  $\square$

**Cor. (24.11.6.3) [Unramified Representation of  $\mathrm{GL}(n; K)$ , Zelevinsky].** Every irreducible admissible unramified representation (24.9.6.3)  $(\pi, V) \in \mathrm{Irr}^{\mathrm{adm}}(\mathrm{GL}(n; K))$  is of the form  $Q(\chi_1, \chi_2, \dots, \chi_n)$  as in Bernstein-Zelevinsky Classification, where  $\chi_i$  are unramified quasi-characters, representing Zelevinsky segments of length 1.  $\square$

*Proof:* Use the Satake isomorphism to find Satake parameters of unramified quasi-characters  $\chi_i$  that makes the representation of  $\mathcal{H}_K \cong \mathbb{C}[t_1, t_1^{-1}, \dots, t_n, t_n^{-1}]^W$  isomorphic to that of  $\pi$ , then by (3.6.5.3),  $\chi_1 \times \chi_2 \times \dots \times \chi_n$  has a unique irreducible subquotient that has the same spherical character as  $\pi$ , then by (3.6.5.12), this subquotient is isomorphic to  $\pi$ . Now use the fact we can change the order of  $\chi_i$  s.t. it is just  $Q(\Delta_1, \Delta_2, \dots, \Delta_n)$ .  $\square$

**Prop. (24.11.6.4)[Intertwining Operator on Spherical Vector].** For  $\chi_1, \chi_2$  unramified with Satake parameter  $\alpha_i$ , consider  $M : \mathcal{B}(\chi_1, \chi_2) \rightarrow \mathcal{B}(\chi_2, \chi_1)$ , then

$$M\varphi_{K,\chi} = \frac{1 - q^{-1}\alpha_1\alpha_2^{-1}}{1 - \alpha_1\alpha_2^{-1}}\varphi_{K,\chi'}.$$

┘

*Proof:* Clearly this equation is true up to scalar because  $M$  is intertwining, so it suffices to calculate  $(M\varphi_K)(1)$ . For this, we assume  $\chi$  is dominant (24.3.2.10) because we can use analytic continuation. Then

$$(M\varphi_K)(1) = \int_F \varphi_K(w_0 \begin{bmatrix} 1 & x \\ & 1 \end{bmatrix}) dx.$$

The integral is 1 on  $\mathcal{O}$ , and for  $m > 0$ , on  $\mathfrak{p}^{-m} \setminus \mathfrak{p}^{-m+1}$ , by (24.11.5.5), it equals  $q^{-m}\alpha_1^m\alpha_2^{-m}q^m(1-q^{-1})$ , so the total sum is  $1 + (1 - q^{-1})\alpha_1\alpha_2^{-1}/(1 - \alpha_1\alpha_2^{-1})$ .  $\square$

**Prop. (24.11.6.5).** If  $\chi_1, \chi_2$  are nonramified,  $V = \mathcal{B}(\chi_1, \chi_2)$ ,  $K_0(\mathfrak{p})$  is the Iwahori subgroup (24.11.1.4), then the composition

$$V^{K_0(\mathfrak{p})} \hookrightarrow V \rightarrow J(V)$$

is an isomorphism. In particular, it is of dimension 2.  $\square$

*Proof:* Firstly notice  $V^{K_0(\mathfrak{p})}$  has dimension  $\leq 2$ , because of the decomposition (24.11.1.8) and definition, and  $J(V)$  has dimension 2 by (24.11.5.13), so it suffices to show the map is surjective. The image is just  $J(V)^{T(\mathcal{O})}$  by (24.11.2.4). But by (24.11.5.13) and the fact  $\chi_i$  are nonramified, all of  $J(V)$  are  $T(\mathcal{O})$ -fixed, thus  $J(V)^{T(\mathcal{O})} = J(V)$ .  $\square$

**Cor. (24.11.6.6)[Casselman Basis].** When  $\chi_1 \neq \chi_2$ , we can easily find a basis of  $V^{K_0(\mathfrak{p})}$ , that is

$$L_1(\varphi) = \varphi(1), \quad L_0(\varphi) = (M\varphi)(1)$$

where  $M$  is intertwining integral defined in (24.11.5.6). These are  $N(K)$ -invariant, thus define functionals on  $J(V) \cong V^{K_0(\mathfrak{p})}$ . They are linearly independent checked on  $T(F)$ .

Then the dual basis  $\varphi_0, \varphi_1 \in V^{K_0(\mathfrak{p})}$  are called the **Casselman basis**.

$\varphi_0$  has a simple form: using Iwahori-Bruhat decomposition (24.11.1.8),

$$\varphi_0(g) = \begin{cases} (\Delta^{1/2}\chi)(b) & g = bw_0k \in B(K)wK_0(\mathfrak{p}) \\ 0 & \text{otherwise} \end{cases}.$$

┘

*Proof:* It is easily verified that this formula is well-defined and defines a Iwahori-fixed vector, so it suffices to evaluate it by  $L_i$ . Clearly  $L_1(\varphi_0) = 0$ , and for  $L_0(\varphi_0)$ , notice that

$$w_0 \begin{bmatrix} 1 & x \\ & 1 \end{bmatrix} \in B(K)w_0K_0(\mathfrak{p})$$

iff  $x \in \mathcal{O}$ , so  $L_0(\varphi_0) = 1$ .  $\square$

**Lemma (24.11.6.7).** When  $\chi_1 \neq \chi_2$  nonramified and  $m \geq 0$ , the function

$$F_m(g) = \int_{\mathcal{O}} \varphi_K(g \begin{bmatrix} 1 & x \\ & 1 \end{bmatrix} a_m) dx, \quad a_m = \begin{bmatrix} \varpi^m & \\ & 1 \end{bmatrix}$$

is an Iwahori-fixed vector, and

$$F_m = q^{-m/2} \alpha_2^m M(\varphi_K)(1) \varphi_0 + q^{-m/2} \alpha_1^m \varphi_1$$

┘

*Proof:*

$$\int_{K_0(\mathfrak{p})} \pi(ka_m) \varphi_K dk = \int_{N_-(\mathfrak{p})} \int_{T(\mathcal{O})} \int_{N(\mathcal{O})} \varphi_K(gn_- t_0 n a_m) dn dt_0 dn_- \quad (24.11.1.6)$$

noticing that  $a_m^{-1} t_0 n_- a_m \in K$  as  $m \geq 0$ , so the integrand is independent of  $t_0, n_-$  and equals  $F_m$ , and it is clearly Iwahori-fixed. And

$$c_1 = L_1(F_m) = F_m(1) = \varphi_K(a_m) = (\Delta^{1/2} \chi)(a_m) = q^{-m/2} \alpha_1^m.$$

Similarly, for  $\chi$  dominant,

$$c_0 = L_0(F_m) = \int_{\text{Unip}(K)} F_m(w_0 n) dn = \int_{\text{Unip}(K)} \int_{\text{Unip}(\mathcal{O})} \varphi_K(w_0 n n' a_m) dn' dn.$$

By Fubini, the  $n'$  can be omitted, thus it equals  $(M\varphi_K)(a_m) = (\Delta^{1/2} \chi')(a_m)$ . □

### Spherical Whittaker Function and Spherical Functions

See [Casselman, W., The unramified principal series of  $p$ -adic groups I: the spherical function, Compositio Math. 40 (1980), 387-406.] and [Casselman, W. and J. Shalika, The unramified principal series of  $p$ -adic groups II: the Whittaker function, Compositio Math. 40 (1980), 207-231.] for more general calculations.

**Def. (24.11.6.8) [Spherical Whittaker Function].** The **spherical Whittaker function** of a generic unramified representation is the spherical vector  $W^0$  in the Whittaker model normalized that  $W_0(\mathbf{1}) = 1$ .

For  $n = 2$ , we can define another normalization  $W_0(g) = \Lambda(\pi(g)\varphi_K)$ , where  $\Lambda$  is the Whittaker functional defined in (24.11.5.8) and  $\varphi_K$  is the normalized spherical vector defined in (24.11.6.1). ┘

*Proof:* To prove that  $W^0(\mathbf{1}) \neq 0$ , Cf. [C-S80]. ? □

**Prop. (24.11.6.9).** We may assume that the conductor of  $\psi$  is  $\mathcal{O}$ , because any other character is of the form  $x \mapsto \psi(ax)$ , thus

$$W_0(g, \psi_a) = \int_F \varphi_K(w_0 \begin{bmatrix} 1 & x \\ & 1 \end{bmatrix} g) \psi(-ax) dx = |a|^{-1/2} \chi_2(a) W_0\left(\begin{bmatrix} a & \\ & 1 \end{bmatrix} g, \psi\right),$$

(and also by analytic continuity). In particular,  $\mu(\mathcal{O}) = 1$  (19.4.2.6).

Notice that

$$W_0\left(\begin{bmatrix} 1 & x \\ & 1 \end{bmatrix} \begin{bmatrix} z & \\ & z \end{bmatrix} gk\right) = \psi(x) \omega(z) W_0(g), \quad z \in K^\times, k \in K,$$

where  $\omega = \chi_1 \chi_2$ , so to calculate  $W_0$ , it suffices to compute  $W_0\left(\begin{bmatrix} \varpi^m & \\ & 1 \end{bmatrix} = a_m\right)$ . ┘

**Remark (24.11.6.10).** We want to calculate the spherical Whittaker function  $W_0$  explicitly because it is used to evaluate the local part of the global L-function (29.5.5.5).  $\lrcorner$

**Lemma (24.11.6.11) [Calculating  $W_0$ ].** For  $\mathcal{B}(\chi_1, \chi_2)$  with Satake parameters  $\alpha_1, \alpha_2$ , the spherical Whittaker function satisfies

$$W_0(1) = 1 - q^{-1}\alpha_1\alpha_2^{-1}, \quad W_0(a_m) = 0$$

for  $m < 0$ .  $\lrcorner$

*Proof:* As in the proof of (24.11.5.5), because  $\varphi_{\mathcal{K}}$  is  $\mathcal{K}$ -invariant, we have

$$\begin{aligned} \int_{\mathcal{O}} \varphi_{\mathcal{K}}(w_0 \begin{bmatrix} 1 & x \\ & 1 \end{bmatrix}) \psi(-x) dx &= 1, \\ \int_{\mathfrak{p}^{-1} \setminus \mathcal{O}} \varphi_{\mathcal{K}}(w_0 \begin{bmatrix} 1 & x \\ & 1 \end{bmatrix}) \psi(-x) dx &= q^{-1}\alpha_1\alpha_2^{-1} \int_{\mathfrak{p}^{-1} \setminus \mathcal{O}} \psi(-x) dx = -q^{-1}\alpha_1\alpha_2^{-1}, \\ \int_{\mathfrak{p}^{-k-1} \setminus \mathfrak{p}^{-k}} \varphi_{\mathcal{K}}(w_0 \begin{bmatrix} 1 & x \\ & 1 \end{bmatrix}) \psi(-x) dx &= q^{-k-1}\alpha_1^{k+1}\alpha_2^{-k-1} \int_{\mathfrak{p}^{-k-1} \setminus \mathfrak{p}^{-k}} \psi(-x) dx = 0, \quad k \geq 1. \end{aligned}$$

For  $W_0(a_m)$ , choose  $x \in \mathcal{O}$  that  $\psi(\varpi^m x) \neq 1$ , then

$$W_0(a_m) = W_0(a_m \begin{bmatrix} 1 & x \\ & 1 \end{bmatrix}) = W_0(\begin{bmatrix} 1 & \varpi^m \\ & 1 \end{bmatrix} a_m) = \psi(\varpi^m x) W_0(a_m)$$

so  $W_0(a_m) = 0$ .  $\square$

**Lemma (24.11.6.12) [Functional Equation].** For fixed  $g$ ,  $W_0(g)$  is an analytic function of  $\alpha_1, \alpha_2$ , and  $(1 - q^{-1}\alpha_1\alpha_2^{-1})^{-1}W_0(g)$  is symmetric in  $\alpha_1, \alpha_2$ .  $\lrcorner$

*Proof:* The Whittaker functional is defined by calculated by continuation (24.11.5.8), and for  $\chi$  dominant,  $W_0$  is analytic (24.11.5.8), thus by calculation in (24.11.6.11), its value at 1 is identically 1, thus so does its analytic continuation. Then to check after switching  $\alpha_1, \alpha_2$  it is the same meromorphic function, it suffices to show for all irreducible principal series  $\mathcal{B}(\chi_1, \chi_2)$ . But in this case,  $\mathcal{B}(\chi_1, \chi_2) \cong \mathcal{B}(\chi_2, \chi_1)$ , so their Whittaker model thus spherical Whittaker function differ only by a scalar, thus the same.  $\square$

**Prop. (24.11.6.13) [Calculating  $W_0$ ].**

$$(1 - q^{-1}\alpha_1\alpha_2^{-1})^{-1}W_0(a_m) = \begin{cases} q^{-m/2} \frac{\alpha_1^{m+1} - \alpha_2^{m+1}}{\alpha_1 - \alpha_2} & m \geq 0 \\ 0 & m < 0 \end{cases}$$

$\lrcorner$

*Proof:* By?? we can assume  $\chi$  is dominant and use analytic continuation.

$$W_0(a_m) = \int_F F_m(w_0 \begin{bmatrix} 1 & x \\ & 1 \end{bmatrix}) \psi(-x) dx,$$

by (24.11.5.8) (24.11.6.7) and a change of variable. Then use (24.11.6.7), we see that

$$W_0(a_m) = C_1 q^{-m/2} \alpha_1^m + C_0 q^{-m/2} \alpha_2^m$$

where

$$C_0 = (M\varphi_K)(1) \int_F \varphi_0(w_0 \begin{bmatrix} 1 & x \\ & 1 \end{bmatrix}) \psi(-x) dx$$

And  $\int_F \varphi_0(w_0 \begin{bmatrix} 1 & x \\ & 1 \end{bmatrix}) \psi(-x) dx = 1$ , by the same consideration as in the proof of (24.11.6.6).

Finally,  $(M\varphi_K)(1)$  can be calculated by (24.11.6.4), and the requirement of (24.11.6.12) will determine  $C_1$ .  $\square$

**Prop. (24.11.6.14) [Spherical Function].** For a spherical irreducible admissible representation  $(\pi, V)$  of  $GL(2; K)$ , its contragradient  $\widehat{V}$  is also spherical (3.6.5.11). Then we define the **spherical function**

$$\sigma(g) = (\pi(g)v, \widehat{v})$$

where  $v, \widehat{v}$  are spherical and normalized that  $\langle v, \widehat{v} \rangle = 1$ . This is bi-invariant under  $K$ -action By (24.11.6.3).

By (24.11.6.3),  $(\pi, V)$  is of the form  $\chi(\det(g))$  or  $\pi(\chi_1, \chi_2)$  for  $\pi_i$  nonramified. In the former case the spherical function is just  $\chi \circ \det$ . Now we only consider the latter interesting case, for which there is a spherical functional  $\widehat{v} : \varphi \mapsto \int_K \varphi(k) dk$ , and it is 1 on the normalized spherical vector  $v$  (24.11.6.1), and

$$\sigma(g) = \int_K (\pi(g)\varphi_K)(k) dk = \int_K \varphi_K(kg) dk$$

┘

**Prop. (24.11.6.15) [Macdonald Formula].** The spherical function for unramified principal series behave well under  $Z(K)$ -action and is  $K$ -binvariant, so in order to compute it, it suffices to compute its value on  $a_m$ . We have:

$$\sigma(a_m) = \frac{q^{-m/2}}{1+q^{-1}} \left[ \alpha_1^m \frac{1-q^{-1}\alpha_2\alpha_1^{-1}}{1-\alpha_2\alpha_1^{-1}} + \alpha_2^m \frac{1-q^{-1}\alpha_1\alpha_2^{-1}}{1-\alpha_1\alpha_2^{-1}} \right].$$

┘

*Proof:* First notice that

$$\int_K F_m(k) dk = \int_K \int_{\mathcal{O}} \varphi_K(k \begin{bmatrix} 1 & x \\ & 1 \end{bmatrix} a_m) dx dk = \int_K \varphi_K(ka_m) dk$$

by a change of variable. Then by (24.11.6.7), this equals

$$\left[ \int_K \varphi_0(k) dk \right] q^{-m/2} \alpha_2^m \frac{1-q^{-1}\alpha_1\alpha_2^{-1}}{1-\alpha_1\alpha_2^{-1}} + \left[ \int_K \varphi_1(k) dk \right] q^{-m/2} \alpha_1^m.$$

Next we calculate  $\int_K \varphi_0(k) dk$  directly: By (24.11.6.6), this equals the volume of  $K \cap (K_0(\mathfrak{p})w_0K_0(\mathfrak{p})) = K_0(\mathfrak{p})w_0K_0(\mathfrak{p})$ .  $K/K_0(\mathfrak{p}) \cong GL(2; \mathbb{F}_q)/B(\mathbb{F}_q)$  has cardinality  $q+1$ , and by pulling back the Bruhat decomposition of  $GL(2, \mathbb{F}_q)$ ,  $K_0(\mathfrak{p})w_0K_0(\mathfrak{p})$  consists of  $q$  left cosets of  $K_0(\mathfrak{p})$ . So

$$\int_K \varphi_0(k) dk = \frac{q}{1+q}.$$

Finally the expression is symmetric in  $\alpha_1, \alpha_2$ , because the spherical vectors in  $V, \widehat{V}$  are unique (3.6.5.11), and  $\widehat{\mathcal{B}(\chi_1, \chi_2)} = \mathcal{B}(\chi_2, \chi_1)$ . Also, the expression is a combination of  $\alpha_i^m$  and the coefficient is independent of  $m$ , so it can be determined as above.  $\square$

## 7 Iwahori-Spherical Representations

References are [P-R08, Bor76].

**Thm. (24.11.7.1) [Iwahori-Spherical Representations, Casselman].**  $\pi \in \text{Irr}^{\text{adm}}(\text{GL}(n; K))$  is Iwahori-spherical iff the supercuspidal support of  $\pi$  consists of unramified quasi-characters of  $K^\times$ .

This can be generalized to other groups. ?

*Proof:*

□

## 8 Unitarizable, Tempered & $L^2$ -Representations

References are [Tad86] and [Vogan, The unitary dual of  $\text{GL}(n; \mathbb{R})$  over an Archimedean field].

**Remark (24.11.8.1) [Casselman].** For any  $\pi \in \text{Rep}^{\text{alg}}(\text{GL}(n; K))$ , there exists a unique real-valued quasi-character  $\chi$  of  $K$  that the central character of  $\pi \otimes (\chi \circ \det)$  is unitary.

*Proof:*

□

**Thm. (24.11.8.2) [Tempered Representations of  $\text{GL}(n; K)$ , Jacquet/Zelevinsky [Zel80]].** Let  $n \in \mathbb{Z}_+$ , then  $\pi \in \text{Irr}^{\text{adm}}(\text{GL}(n; K))$  is

- essentially square-integrable iff it is of the form  $Q(\Delta)$  for a single Zelevinsky segment  $\Delta$ .
- discrete series iff it is of the form  $Q(\Delta)$  for a single Zelevinsky segment, and the central character of  $\sigma(\frac{m-1}{2})$  is unitary, where  $\Delta = \Delta(\sigma, m)$ .
- tempered iff  $\pi = Q(\Delta_1, \dots, \Delta_r) = Q(\Delta_1) \times \dots \times Q(\Delta_r)$ , where each  $Q(\Delta_i)$  is a discrete series. In particular, tempered representations are generic by (24.11.3.3).

□

*Proof:* Cf. [Generic Representations, Jacquet(1977)] and [B-Z77].

1: [Zel80]9.3.

2: This follows from item1 and (24.9.8.8)(24.11.1.19).

□

**Cor. (24.11.8.3) [Classification of Irreducible tempered representations of  $\text{GL}(2; K)$ ].** Irreducible tempered representations of  $\text{GL}(2; K)$  are one of the following form:

- Cuspidal representation with unitary central characters.
- Steinberg representations  $\text{St}_2(\chi)$  with unitary central characters  $\chi$ .
- Irreducible principal representations  $\chi_1 \times \chi_2$  with  $\chi_1, \chi_2$  unitary.

□

*Proof:* This follows from (24.11.8.2) and (24.11.4.15).

□

## Unitarizable Representations

References are [Ber84a, Tad86].

**Prop. (24.11.8.4) [Matrix Coefficients of Unitarizable Representations are Bounded].** Every matrix coefficient function of a unitarizable representation on  $\text{GL}(n; K)$  is a bounded function on  $\text{GL}(n; K)$ .

□

*Proof:*  $|(\pi(g)u, v)| \leq \|u\| \cdot \|v\|$ .  $\square$

**Prop. (24.11.8.5) [Tempered Representations are Unitarizable].** Any irreducible tempered representation of  $GL(n; K)$  is unitarizable.  $\lrcorner$

*Proof:* Firstly, any discrete series are unitarizable: Cf. [G-H11]1, P364.  $\color{red}?$

And the parabolic induction of a unitarizable representation is also unitarizable by (24.11.4.2). Thus the assertion follows from (24.11.8.2).  $\square$

**Thm. (24.11.8.6) [Bernstein [Ber84a]].** Let  $(\pi, V) \in \text{Irr}^{\text{adm}}(GL(n; K))$ , then each  $M_n$ -invariant pairing  $B : V \times V^\vee \rightarrow \mathbb{C}$  is proportional to the standard pairing.  $\lrcorner$

*Proof:* Cf. [Ber84a]Thm5.1  $\color{red}?$   $\square$

**Cor. (24.11.8.7) [Bernstein [Ber84a]].** Any irreducible unitarizable representation  $\pi$  of  $GL(n; K)$  is irreducible when restricted to  $M_n$ .  $\lrcorner$

*Proof:* Cf. [Ber84a]Thm5.4  $\color{red}?$   $\square$

**Cor. (24.11.8.8).** If  $P \leq G$  is a levi subgroup and  $(\pi, V) \in \text{Irr}^{\text{uni}}(P(K))$ , then  $I_{P(K)}^{G(K)}(\pi)$  is irreducible.  $\lrcorner$

*Proof:* Cf. [Ber84a]Section8.2.  $\square$

**Prop. (24.11.8.9) [Bounds on Parameters of Principal Series of  $GL(n; K)$ ].** Let  $\chi_1 \times \dots \times \chi_n$  be a unitarizable principle series of  $GL(n; K)$  and  $|\chi_i| = \|\sigma_i$  for  $\sigma_i \in \mathbb{R}$ . Denote  $\rho_i = (n - 2i + 1)/2$ , then for any  $k \in [n]_+$ ,

$$|\sigma_1 + \dots + \sigma_k| \leq \rho_1 + \dots + \rho_k.$$

Moreover, if  $\pi$  is generic, unramified and unitarizable, then  $|\sigma_i| < 1/2$  for any  $i$ .  $\lrcorner$

*Proof:* Cf. [G-H11]2, P79. and [J-S81]P515.  $\color{red}?$   $\square$

**Lemma (24.11.8.10) [Possibility of Unitarizable principal Series for  $GL(2)$ ].** If  $\mathcal{B}(\chi_1, \chi_2)$  is unitarizable, then either  $\chi_1, \chi_2$  are all characters or  $\chi_1 = \overline{\chi_2}^{-1}$ .  $\lrcorner$

*Proof:* There is an anti-linear  $GL(2; K)$ -map  $\mathcal{B}(\chi_1, \chi_2) \rightarrow \mathcal{B}(\overline{\chi_1}, \overline{\chi_2})$  which is conjugation, so if there is a  $GL(2; K)$ -invariant Hermitian pairing  $(-, -)$  on  $\chi_1 \times \chi_2$ , then  $(f_1, f_2) \mapsto (f_1, \overline{f_2})$  will be a non-degenerate  $GL(2; K)$ -invariant bilinear pairing

$$(\chi_1 \times \chi_2) \times (\overline{\chi_1} \times \overline{\chi_2}) \rightarrow \mathbb{C}.$$

So  $\mathcal{B}(\chi_1, \chi_2) \cong \mathcal{B}(\overline{\chi_1}^{-1}, \overline{\chi_2}^{-1})$ , so  $\chi_i$  are characters or  $\chi_1 = \overline{\chi_2}^{-1}$  by (24.11.4.2).  $\square$

**Lemma (24.11.8.11).** Let  $\chi \in K^\vee$  and  $s \in \mathbb{R} \setminus \{0, 1/2\}$  (so that  $\chi(s) \times \chi(-s)$  is irreducible), then  $\chi(s) \times \chi(-s)$  is unitarizable iff  $0 < |s| < 1/2$ .  $\lrcorner$

*Proof:* For  $|s| < 1/2$ , we show  $\mathcal{B}(\chi_s, \chi_{-s})$  is unitary: Modify the intertwining operator  $M_s^* = (1 - q^{-2s})M_s$  (24.11.5.6), then it is definable for  $s = 0$ , by calculation in (24.11.5.6), so the modified Hermitian product

$$(-, -)^* = (1 - q^{-2s})(-, -)$$

is defined at  $s = 0$ , and is positive/negative definite, because in this case it is irreducible and unitarizable (24.11.8.5). The eigenvalue of this Hermitian form deforms continuously, and it is never zero because it is non-degenerate as said above (only when  $s \neq 1/2$  because we need  $M_s$  to be isomorphism), so it is always definite and  $\mathcal{B}(\chi_s, \chi_{-s})$  is unitarizable.  $\square$

**Prop. (24.11.8.12) [Complementary Series for  $\mathrm{GL}(2)$ ].** An irreducible principal series  $\mathcal{B}(\chi_1, \chi_2)$  is unitary iff either  $\chi_1, \chi_2$  are all characters, or there is a unitary character  $\chi_0$  and  $s \in (0, 1/2)$  that  $\chi_1 = \chi_0(s), \chi_2 = \chi_0(-s)$ , which are exactly the complementary series (24.9.8.9).  $\lrcorner$

*Proof:* This follows immediately from the lemmas (24.11.8.5)(24.11.8.10)(24.11.8.11) above.  $\square$

**Lemma (24.11.8.13) [Basic Type Unitarizable Representations of  $\mathrm{GL}(n; K)$ ].**

- Let  $m, d \in \mathbb{Z}_+$ , and  $\pi$  a discrete series of  $\mathrm{GL}(m; K)$ . Then

$$u(\pi; d) = Q(\pi(\frac{d-1}{2}), \dots, \pi(-\frac{d-1}{2}))$$

is an irreducible unitarizable representation of  $\mathrm{GL}(md; K)$ .

- $I_{P_{md, md}(K)}^{\mathrm{GL}(2md; K)}(u(\pi; d)(s), u(\pi(s); d)(-s)) = u(\pi(s); d) \times u(\pi(-s); d)$ , where  $\pi$  is a discrete series of  $\mathrm{GL}(n; K)$  and  $s \in (0, 1/2)$ .  $\lrcorner$

*Proof:* Why are they unitarizable? Cf. [Tad86] ThmA.8 and Prop4.2. ?  $\square$

**Thm. (24.11.8.14) [Classification of Unitarizable Representations of  $\mathrm{GL}(n; K)$ ].** Let  $n \in \mathbb{Z}_+$  and  $\kappa = (\kappa_1, \dots, \kappa_r)$  be an ordered partition of  $n$ . If  $\pi_i$  are irreducible unitarizable representations of  $\mathrm{GL}(\kappa_i, K)$  as described in (24.11.8.13), then  $I_{P_\kappa(K)}^{\mathrm{GL}(n; K)}(\pi_1, \dots, \pi_r) = \pi_1 \times \dots \times \pi_r$  is an irreducible unitarizable representation of  $\mathrm{GL}(n; K)$ .

And conversely, any irreducible unitarizable representation of  $\mathrm{GL}(n; K)$  is one of this form, up to permutation of  $\pi_i$ .  $\lrcorner$

*Proof:* Cf. [Tad86] Thm. D. ?  $\square$

**Lemma (24.11.8.15) [Basic Type Generic Unitarizable Representations of  $\mathrm{GL}(n; K)$ ].** The following representations of  $\mathrm{GL}(n; K)$  are irreducible, generic and unitarizable:

- Discrete series, by (24.11.8.2) and (24.11.8.5).
- $I_{P_{n, n}(K)}^{\mathrm{GL}(2n; K)}(\pi(s), \pi(-s))$ , where  $\pi$  is a discrete series of  $\mathrm{GL}(n; K)$  and  $s \in (0, 1/2)$ .  $\lrcorner$

*Proof:* 2: Notice if  $\pi = Q((\pi_1, m))$ , then this is just  $Q((\pi_1 \otimes |\det|^s, m)) \times Q((\pi_1 \otimes |\det|^{-s}, m))$ , thus generic by (24.11.3.3). It is unitarizable by (24.11.8.13).  $\square$

**Thm. (24.11.8.16) [Classification of Generic Unitarizable Representations of  $\mathrm{GL}(n; K)$ ].** Let  $n \in \mathbb{Z}_+$  and  $\kappa = (\kappa_1, \dots, \kappa_r)$  be an ordered partition of  $n$ . If  $\pi_i$  are irreducible generic unitarizable representations of  $\mathrm{GL}(\kappa_i, K)$  as described in (24.11.8.15), then  $I_{P_\kappa(K)}^{\mathrm{GL}(n; K)}(\pi_1, \dots, \pi_r) = \pi_1 \times \dots \times \pi_r$  is an irreducible generic unitarizable representation of  $\mathrm{GL}(n; K)$ .

And conversely, any irreducible generic unitarizable representation of  $\mathrm{GL}(n; K)$  is one of this form, up to permutation of  $\pi_i$ .  $\lrcorner$

*Proof:* This follows from (24.11.8.14) and (24.11.3.3).  $\square$

### Irreducible Generic Unramified Unitarizable Representations

## 24.12 Local Langlands for $\mathrm{GL}(n)$

References are [B-K93, Hen93, Kud94, Rog00, H-T01, Wed08, Sch13, Bus19].

**Notation (24.12.0.1).**

- Let  $p \in \text{Prime}$ .
- Fix  $\ell \in \text{Prime} \setminus \{p\}$  and an isomorphism  $\iota_\ell : \overline{\mathbb{Q}_\ell} \cong \mathbb{C}$ .
- Let  $(K, \mathcal{O}_K, \varpi_K, \kappa) \in p\text{-NField}$ .
- Fix a square root  $|\cdot|_K^{1/2} : K^\times \rightarrow \overline{\mathbb{Q}_\ell}^\times$  s.t.  $\iota \circ |\cdot|_K^{1/2}$  is valued in  $\mathbb{R}_{>0}$ .
- Let  $\mathbf{1} \neq \psi \in K^\vee$ .
- Let  $(K_r, \mathcal{O}_r, \varpi_K, \kappa_r)/K$  be an unramified extension of degree  $r$ .

┘

### 1 Local Langlands for $p$ -adic $\mathrm{GL}(n)$

References are [Kud94, Yao17, Wed08].

**Prop. (24.12.1.1) [LLC for  $\mathrm{GL}(1)$ ].** Local class field theory told us that there is an isomorphism  $\mathrm{Art}_K : K^\times \cong W_K^{\mathrm{ab}} \cong \mathrm{WD}_K^{\mathrm{ab}}$ ,

Notice by Schur's lemma, any irreducible smooth representation of  $K^\times$  is 1-dimensional and factors through some  $U_K$ . And a Weil-Deligne representation is now a continuous map  $W_K^{\mathrm{ab}} \rightarrow \mathbb{C}^\times$ . but it must factor through some  $U_K$ , so these two sets are bijective by  $\mathrm{Art}_K$ . ┘

**Thm. (24.12.1.2) [LLC for  $\mathrm{GL}(n)$ , Hasse(30)/Tunnell(78)/Kutzko(80)/Harris-Taylor[H-T01]/Henniart(84, 86, 88, 93, 00)[Hen00].** There exists a unique collection of bijections  $\{\mathrm{rec}_n\}_{n \in \mathbb{Z}_+}$  between sets:

$$\mathrm{rec}_n : \mathrm{Irr}^{\mathrm{adm}}(\mathrm{GL}(n; K)) \xrightarrow{\cong} \mathfrak{wd}_{\varphi\text{-s.st}}^n(W_K)$$

satisfying the following properties:

1. For a quasi-character  $\chi$  of  $K^\times$ ,  $\mathrm{rec}_1(\chi) = \chi \circ \mathrm{Art}_K^{-1}$  (19.7.2.11).
2. For a quasi-character  $\chi$  of  $K^\times$  and  $\pi \in \mathrm{Irr}^{\mathrm{adm}}(\mathrm{GL}(n; K))$ ,

$$\mathrm{rec}_n(\pi(\chi)) = \mathrm{rec}_n(\pi) \otimes \mathrm{rec}_1(\chi).$$

3. For any  $\pi \in \mathrm{Irr}^{\mathrm{adm}}(\mathrm{GL}(n; K))$  with central character  $\omega$ ,

$$\det(\mathrm{rec}_n(\pi)) = \mathrm{rec}_1(\omega).$$

4. For any  $\pi \in \mathrm{Irr}^{\mathrm{adm}}(\mathrm{GL}(n; K))$ ,  $\mathrm{rec}_n(\pi^\vee) = \mathrm{rec}_n(\pi)^*$ .
5. For any two  $\pi_1 \in \mathrm{Irr}^{\mathrm{adm}}(\mathrm{GL}(n_1; K))$ ,  $\pi_2 \in \mathrm{Irr}^{\mathrm{adm}}(\mathrm{GL}(n_2; K))$ ,

$$L(\pi_1 \times \pi_2; s) = L(\mathrm{rec}_{n_1}(\pi_1) \otimes \mathrm{rec}_{n_2}(\pi_2); s), \quad \epsilon(\pi_1 \times \pi_2, \psi; s) = \epsilon(\mathrm{rec}_{n_1}(\pi_1) \otimes \mathrm{rec}_{n_2}(\pi_2); s) \text{ (29.3.1.29) (31.1.1.3)}.$$

Moreover, these bijections also preserve two more invariants:

1. For any  $L/K \in \text{GalField}^{\mathrm{fin}}$ ,  $\{\mathrm{rec}_{L,n}\}$  and  $\{\mathrm{rec}_{K,n}\}$  preserves  $\mathrm{Gal}(L/K)$ -actions?.
2. Conductor:  $c(\pi) = c(\mathrm{rec}_n(\pi))$  (29.3.1.31) (31.1.1.3).

3. Depth:  $d(\pi) = d(\text{rec}_n(\pi))$ ? Cf.[Moy-Prasad]

Should be written more clearly like [Kaletha-Shin]Theorem1.2.4.?

┘

*Proof:* The uniqueness follows from(24.12.1.5)?.

The existence of  $\{\text{rec}_n\}$  satisfying the first 5 properties are constructed in Harris-Taylor's Proof.

The conductors are preserved because of the definition(29.3.1.31) and(31.1.1.4) and the fact  $\text{rec}_n$  preserves  $\epsilon$ -factors.

For depth:?

For Galois invariance:?

□

**Prop.(24.12.1.3) [Reduction to Supercuspidal Representations, Bernstein-Zelevinsky[B-Z77]].** By Bernstein-Zelevinsky classification4, it suffices to construct  $\text{rec}_n$  for irreducible cuspidal representations, then for any  $\pi = Q(\Delta_1, \dots, \Delta_r) \in \text{Irr}^{\text{adm}}(\text{GL}(n; K))$ , where  $\Delta_i = \Delta_i(\pi_i, m_i)$ , we can define

$$\text{rec}_n(\pi) = \bigoplus_{i=1}^r \text{rec}_{n_i}(\pi_i) \otimes \text{Sp}(m_i) \in \mathfrak{w}\mathfrak{d}_{\varphi\text{-s.st}}^n(W_K)(25.1.2.23).$$

┘

*Proof:* Check this satisfies the properties 1-5.?

□

**Cor.(24.12.1.4).** If  $\pi \in \text{Irr}^{\text{adm}}(\text{GL}(n; K))$  and  $\text{rec}_n(\pi) = (\rho_0, V, N)$ , then  $\rho_0$  only depends on the supercuspidal support of  $\pi$ (24.11.4.10).

┘

**Thm.(24.12.1.5)[Uniqueness of the Correspondence, Henniart[Hen93]].** For  $n \in \mathbb{Z}_{\geq 2}$ , suppose  $\pi, \pi' \in \text{Irr}^{\text{cusp}}(\text{GL}(n; K))$  s.t. for any  $m \in [n-1]_+$  and  $\tau \in \text{Irr}^{\text{cusp}}(\text{GL}(m; K))$ , we have

$$\epsilon(\pi \times \tau, \psi; s) = \epsilon(\pi' \times \tau, \psi; s)$$

then  $\pi \cong \pi'$ .

┘

*Proof:* Cf.[Hen93].

□

**Remark(24.12.1.6).** If one only requires that

$$L(\pi_1; s) = L(\text{rec}_{n_1}(\pi_1); s), \quad \epsilon(\pi_1; s) = \epsilon(\text{rec}_{n_1}(\pi_1); s),$$

then  $\sigma_n$  cannot be determined uniquely.

┘

**Prop.(24.12.1.7) [Gamma Factor Determines Representations].** For  $(\pi_1, V_1), (\pi_2, V_2) \in \text{Irr}^{\text{adm, generic}}(\text{GL}(2; K))$ , if  $\gamma(\pi_1, \xi, \psi; s) = \gamma(\pi_2, \xi, \psi; s)$  for any quasi-character  $\xi$  of  $K^\times$ , then  $\pi_1 \cong \pi_2$ .

┘

*Proof:* Identify  $V_i$  with their Kirillov models, and let  $V_0 = V_1 \cap V_2$ . Then it suffices to show that  $\pi_1(w_1), \pi_2(w_1)$  acts the same on  $V_0$ : This is because  $V_0$  contains  $C_c^\infty(K^*)$ , and  $B(K)$  action on  $V_1, V_2$  are the same by(24.11.3.8), and  $GL(2, F)$  is generated by  $B(F)$  and  $w_1$ . Then  $V_0 = V_1 = V_2$  as they are irreducible representations.

For  $\varphi \in V$ , let  $\varphi_i = \pi_i(w_1)\varphi$ , then it suffices to show  $\varphi_1(1) = \varphi_2(1)$ : For other  $a$ ,

$$\varphi_i(a) = (\pi_i \left( \begin{bmatrix} a & \\ & 1 \end{bmatrix} \begin{bmatrix} & 1 \\ -1 & \end{bmatrix} \right) \varphi)(1) = (\pi_i \left( \begin{bmatrix} & 1 \\ -1 & \end{bmatrix} \begin{bmatrix} 1 & \\ & a \end{bmatrix} \right) \varphi)(1)$$

and  $\pi_1\left(\begin{bmatrix} 1 & \\ & a \end{bmatrix}\right)\varphi = \pi_2\left(\begin{bmatrix} 1 & \\ & a \end{bmatrix}\right)\varphi$ .  
For  $n \in \mathbb{Z}$ , let

$$F_\xi(n) = \int_{\mathfrak{q}^{-n} \setminus \mathfrak{q}^{-n+1}} (\varphi_1(y) - \varphi_2(y)) \xi(y) d^\times y,$$

then  $F_\xi(0)$  only depends on the restriction of  $\xi$  to  $\mathcal{O}^*$ , and  $F_\xi(0) = 0$  for all but f.m. characters  $\xi$  of  $\mathcal{O}^*$ :  $\varphi_1 - \varphi_2$  is a locally constant function that is fixed by  $U \subset \mathcal{O}^*$ , so in order  $F_\xi(0) \neq 0$ , at least  $\xi$  should be trivial on  $U$ , and there are f.m. such characters. Thus the hypothesis of Fourier transform on  $\mathcal{O}^*$  is satisfied (12.11.1.24) and

$$\varphi_1(1) - \varphi_2(1) = \sum_{\xi \in (\mathcal{O}^*)^\wedge} F_\xi(0).$$

The hypothesis and the functional equation (29.5.5.9) shows  $Z(s, \varphi_1, \xi) = Z(s, \varphi_2, \xi)$  for any quasi-character  $\xi$  of  $F^*$ , so

$$\sum_n F_\xi(n) \|v\|^{-sn} = Z(s, \varphi_1, \xi) - Z(s, \varphi_2, \xi) = 0$$

and  $F_\xi(n) = 0$  for  $n$  sufficiently small, thus  $F_\xi(n) = 0$  for all  $n$ . In particular,  $F_\xi(0) = 0$ , for any  $\xi$ .  $\square$

**Thm. (24.12.1.8) [Injectivity of the Correspondence].** Any set of maps  $\text{rec}_n : \text{Irr}^{\text{cusp}}(GL(n; K)) \rightarrow \mathfrak{wd}_{\varphi\text{-s.st}}^n(W_K)$  satisfying the properties listed in (24.12.1.2) must be injective.  $\lrcorner$

*Proof:* By the definition of Rankin-Selberg  $L$ -factors (29.3.1.32) and (31.1.1.3),

$$\text{rec}(\pi) = \text{rec}(\pi') \iff \text{ord}_{s=0} L(\text{rec}(\pi)^\vee \otimes \text{rec}(\pi'); s) < 0 \iff L(\pi^\vee \times \pi'; s) < 0 \iff \pi = \pi'.$$

$\square$

**Thm. (24.12.1.9) [Surjectivity, Numerical Local Langlands Correspondence, Henriart [Hen88]].** For any  $n \in \mathbb{Z}_+$ ,  $d \in \mathbb{N}$  and quasi-character  $\chi$  of  $K^\times$ , the subset of  $\text{Irr}^{\text{adm, cusp}}(GL(n; K))$  of representations with conductor  $d$  and central character  $\omega$  is finite, and the subset of  $\text{Irr}_{\varphi\text{-s.st}}^n(\text{WD}_K)$  of representations with conductor  $d$  and determinant  $\omega$  is finite. Moreover, this two sets have the same cardinality.

In particular, any map  $\text{rec}_n : \text{Irr}^{\text{cusp}}(GL(n; K)) \rightarrow \text{Irr}_{\varphi\text{-s.st}}^n(\text{WD}_K)$  satisfying properties listed in (24.12.1.2) must be surjective.  $\lrcorner$

*Proof:* ?  $\square$

### Properties of the Correspondence

**Prop. (24.12.1.10) [Properties of the Correspondence].**  $\pi \in \text{Irr}^{\text{adm}}(GL(n; K))$  is

- supercuspidal iff  $\text{rec}_n(\pi)$  is irreducible, by (25.1.2.19) and Bernstein-Zelevinsky Classification.
- essentially square-integrable iff  $\text{rec}_n(\pi)$  is indecomposable, by (25.1.2.23) and Bernstein-Zelevinsky Classification.
- (Gross-Prasad-Rallis) generic iff  $L(\text{Ad}(\text{rec}_n(\pi)); s)$  has no pole at  $s = 1$ , by (29.3.1.34).
- unramified iff  $\text{rec}_n^\ell(\pi)$  is unramified (25.1.2.22). Moreover,  $\text{rec}_n^\ell(Q(\chi))(\sigma_K) \sim \text{diag}(\chi_1, \dots, \chi_n)$ , by (24.12.1.3).

- Iwahori-spherical iff  $\text{rec}_n(\pi)$  is  $I_K$ -spherical (25.1.2.22), by (24.11.7.1).
- tempered iff the representation  $\eta \in \text{Rep}^{\text{fd}}(L_F)$  corresponding to  $\text{rec}_n(\pi)$  (29.3.1.15) satisfies  $\eta(W_F)$  is bounded iff  $\eta(\sigma_K)$  has only eigenvalues on the unit circle.
- depth-0 iff  $\text{rec}_n^\ell(\pi)$  is tamely ramified.

⌋

*Proof:* For temperedness, Cf. [Wed08]?: Because

$$\text{rec}(\Delta_1 \boxtimes \dots \boxtimes \Delta_n) = \text{rec}(Q(\Delta_1)) \oplus \dots \oplus \text{rec}(Q(\Delta_n)),$$

we are reduced to the case that  $\pi = Q(\Delta)$  and to prove that  $\pi$  is a discrete series iff  $\eta(\sigma_K)$  has only eigenvalues on the unit circle. Now  $\pi$  is square-integrable iff its central character  $\omega_\pi$  is unitary. But  $\omega_\pi \circ \text{Art}_K^{-1} = \det(\text{rec}_n(\pi))$  by (24.12.1.2), so the assertion follows by noticing that all the absolutely values of eigenvalues of  $\eta(w)$  are equal (Making explicit the equivalence (29.3.1.15)).

For depth-0: ?

□

**Prop. (24.12.1.11) [LLC for  $\text{GL}(2)$ ].** Let  $\pi \in \text{Irr}^{\text{adm}}(\text{GL}(n; K))$ ,

1. If  $\pi$  is a supercuspidal, then  $\text{rec}_2(\pi) = (\rho, 0)$ ,  $\rho$  irreducible, by (24.12.1.10).
2. If  $\pi$  is a principal series  $\chi_1 \boxtimes \chi_2$ , then  $\text{rec}_2(\pi) = (\chi_1 \oplus \chi_2, 0)$ .
3. If  $\pi = \chi$ , then  $\text{rec}_2(\pi) = (\chi \oplus \chi(1), 0)$ .
4. If  $\pi = \text{St}_2(\chi)$ , then  $\text{rec}_2(\chi) = \text{Sp}(2)(\chi) = (\chi \oplus \chi(1), N)$  (25.1.2.23), where  $N$  sends  $\chi$  to  $\chi(1)$  and vanish on  $\chi(1)$ .

⌋

## 2 Harris-Taylor's Proof

The sketch is as follows:

- Choose a CM field  $F$  and  $w \in \Sigma_F^{\text{fin}}$  s.t.  $F_w \cong K$ .
- Look at the cohomology of projective  $(n-1)$ -dimensional PEL-type Shimura pro-variety  $X = \varprojlim_{m \in \mathbb{Z}_+} X_m$  associated to the reductive group  $G/\mathbb{Q}$  s.t.

$$G \otimes \mathbb{Q}_p \cong \mathbb{Q}_p^\times \times \text{GL}(n; K) \times \mathbf{G}_{D_p}$$

- For each  $\xi \in \text{Irr}_{\mathbb{Q}}^{\text{fd}}(G)$ , we can associate a lisse  $\overline{\mathbb{Q}_\ell}$ -sheaf  $L_\xi$  on  $X$ . The cohomologies

$$H^i(X, L_\xi) = \varinjlim_{U \in G(\mathbf{A}_{F,f})} H_{\text{ét}}^i((X_U)_{\overline{F}}, L_\xi)$$

are infinite-dimensional  $\overline{\mathbb{Q}_\ell}$ -representations of  $G(\mathbf{A}_{F,f}) \times \text{Gal}_F$ . We can choose  $\xi$  s.t.  $H^i(X, L_\xi) = 0$  for  $i \neq n-1$ .

- There is a map

$$R_\xi : \text{Irr}^{\text{adm}}(G(\mathbf{A}_f)) \rightarrow \text{Rep}^{\text{fd}}(W_K) : \Pi \mapsto \text{Hom}_{G(\mathbf{A}_{F,f})}(\Pi, H^{n-1}(X, L_\xi)).$$

- The decomposition  $G(\mathbf{A}_f) = \mathbb{Q}_p^\times \times \text{GL}(n; K) \times (\text{other terms})$  gives a decomposition  $\Pi = \Pi_0 \otimes \Pi_w \otimes \Pi^w$ . For any  $\pi \in \text{Irr}^{\text{cusp}}(\text{GL}(n; K))$ , we can find such a  $\Pi$  s.t.  $\Pi_w$  is an unramified twist of  $\pi$ ,  $\Pi_0$  is unramified and  $R_\xi(\Pi) \neq 0$ .

- Choose an integral model  $\tilde{X}_m$  of  $X_m \otimes F_v$  and consider the completions  $R_{K,n,m}$  of the local rings of a certain stratum of the special fibre of  $\tilde{X}_m$ , which is the deformation space of the unique 1-dimensional special formal  $\mathcal{O}_K$ -module  $\Sigma_{K,n,m}$  of  $\mathcal{O}_K$ -height  $n$  with Drinfeld level- $m$  structure over  $\bar{\kappa}$ . These spaces have canonical vanishing cycle sheaves  $\psi_{n,m}^i$  and their limit  $\psi_n^i$  are endowed with an admissible action of the subgroup  $A_{K,n} \subset \mathrm{GL}(n; K) \times D_{K,1/n}^\times \times W_K$  consisting of elements  $(\gamma, \delta, \sigma)$  s.t.

$$|\det \gamma|^{-1} \cdot |\mathrm{Nmrd}(\delta)| \cdot |\mathrm{Art}_K^{-1} \sigma| = 1$$

- (Harris-Taylor Construction Theorem B) Local Jacquet-Langlands theory associates to each  $\pi \in \mathrm{Irr}^{\mathrm{cusp}}(\mathrm{GL}(n; K))$  a  $\rho = \mathrm{J-L}(\pi^\vee) \in \mathrm{Irr}^{\mathrm{adm}}(D_{K,1/n}^*)$ . Then there exists  $r_\ell(\pi) \in \mathrm{Rep}_{\mathbb{Q}_\ell}^n(W_K)$  s.t.

$$[\pi \otimes r_\ell(\pi)]^{\mathrm{s.st}} = \sum_{i=0}^{n-1} (-1)^{n-1-i} [\mathrm{Hom}_{D_{K,1/n}^*}(\psi_n^i, \mathrm{J-L}(\pi^\vee))]^{\mathrm{s.st}}.$$

and

$$n[R_\xi(\Pi) \otimes \chi(\Pi_0 \circ \mathrm{Nm}_{K/\mathbb{Q}_p})]^{\mathrm{s.st}} \in \mathbb{Z}[r(\pi)]^{\mathrm{s.st}}.$$

- To show the last assertion, one gives a description of  $H^{n-1}(X, L_\xi)^{\mathbb{Z}_p^\times}$  in which  $[\mathrm{Hom}_{D_{K,1/n}^*}(\psi_n^i, \mathrm{J-L}(\pi^\vee))]$  occurs (Theorem D).
- Define  $\mathrm{rec}_n(\pi) = r_\ell(\pi^\vee(\frac{1-n}{2}))$ .

### 3 Scholze's Proof

**Remark (24.12.3.1).** The local Langlands correspondence for essentially- $L^2$  and generalized Speh representations (24.11.4.16) of  $\mathrm{GL}(n; K)$  are realized in the cohomology of the moduli space of 1-dimensional  $p$ -divisible groups of height  $n$ .

To construct Galois representations, Harris and Taylor consider the cohomology of unitary Shimura varieties that split at  $p$ , uses it to construct  $\ell$ -adic Galois representations associated to certain cuspidal automorphic representations of  $\mathrm{GL}(n)$ , and proves a local-global compatibility result at places of bad reduction. This is achieved by counting points on Igusa varieties.

This method and its generalizations allow one to compute the trace of arbitrary Hecke correspondences at  $p$  on a Shimura variety. But Scholze restrict attention to Hecke operators at  $p$  coming from the maximal compact subgroup and reduce all counting problems to counting problems for the maximal compact level structure, for which one can just appeal Kottwitz's point-counting methods.

┘

**Thm. (24.12.3.2)** [Test Function Characterization of Local Langlands, Scholze [Sch13]].

- (a) For each  $n \in \mathbb{Z}_+$ , there is a unique map

$$\sigma_n : \mathrm{Irr}^{\mathrm{adm}}(\mathrm{GL}(n; K)) \rightarrow \mathfrak{w}\mathfrak{d}_{\psi\text{-s.st}}^n(W_K)$$

s.t. for any  $\tau \in W_K$  and any  $h \in C_c^\infty(\mathrm{GL}(n; \mathcal{O}_K))$ , we have

$$\mathrm{tr}(f_{\tau,h}|\pi) = \mathrm{tr}(\tau|\sigma_n(\pi))\mathrm{tr}(h|\pi) \quad (24.12.5.4),$$

**?** Explain why must choose  $h$ . Write  $\mathrm{rec}'(\pi) = \sigma_n(\pi)(\frac{1-n}{2})$ .

- (b) If  $\pi \in \mathrm{Irr}^{\mathrm{adm}}(\mathrm{GL}(n; K))$  is a constituent of  $\pi_1 \times \dots \times \pi_r$ , then  $\mathrm{rec}'(\pi) = \mathrm{rec}'(\pi_1) \oplus \dots \oplus \mathrm{rec}'(\pi_r)$ .

- (c)  $\text{rec}'$  induces a bijection between  $\text{Irr}^{\text{cusp}}(\text{GL}(n; K))$  and  $\text{Irr}_{\varphi\text{-s.st}}^n(W_K)$ .
- (d) The restriction of  $\text{rec}'$  to supercuspidal representations is compatible with twists, central characters, duals, and  $L$ - and  $\epsilon$ -factors of pairs, hence  $\text{rec}' = \text{rec}$  as in (24.12.1.2), by (24.12.1.5).  $\lrcorner$

*Proof:* (a) and (b) follow from (24.12.3.3) and (24.12.3.5).

For (c), use computation of  $I_K$ -invariant nearby cycles for simple Shimura varieties. This computation leads to a direct proof of the bijective correspondence for supercuspidal representations, without using the numerical local Langlands correspondence. ?

Finally, for the proof of (d): By Brauer induction and linearity, it suffices to assume that  $\pi$  is induced from characters. It suffices to show that: For any  $\pi_1 \in \text{Irr}^{\text{adm}}(\text{GL}(n_1; K))$ ,  $\pi_2 \in \text{Irr}^{\text{adm}}(\text{GL}(n_2; K))$ , there exists  $F \in \mathbf{NField}$  with  $w \in \Sigma_F^{\text{fin}}$  s.t.  $K \cong F_w$ , and two potentially Abelian  $\pi_i \in \text{Irr}^{\text{auto}}(\text{GL}(n_i)/F)$ ,  $\pi_2 \in \text{Irr}^{\text{auto}}(\text{GL}(n_2)/F)$  s.t.  $(\Pi_i)_w$  is an unramified twist of  $\pi_i$ . Cf. proof of [H-T01] VII.2.10. ?

Then the compatibility follows from Henniart's method of twisting with highly ramified characters, cf. Corollary 2.4 of [Hen00]. ?  $\square$

**Prop. (24.12.3.3) [Dévissage for Constructing Galois Representations].** For  $n \in \mathbb{Z}_+$ , suppose (a) and (b) of (24.12.3.2) hold for all  $n' < n$  and the following hold:

1. If  $\pi = \pi_1 \times \dots \times \pi_r \in \text{Rep}^{\text{adm}}(\text{GL}(n; K))$  where  $\pi_i \in \text{Irr}^{\text{adm}}(\text{GL}(n_i; K))$ , then

$$\text{tr}(f_{\tau, h}|\pi) = \text{tr} \left( \tau \Big| \bigoplus_{1 \leq i \leq r} \sigma(\pi_i) \left( \frac{n - n_i}{2} \right) \right) \text{tr}(h|\pi).$$

2. For  $\pi \in \text{Irr}^{\text{adm}}(\text{GL}(n; K))$  that is either essentially- $L^2$  or a generalized Speh representation (24.11.4.16), then there exists a virtual finite dimensional representation  $\sigma(\pi)$  of  $W_K$  with  $\mathbb{Q}_+$  coefficients of dimension  $n$  s.t.

$$\text{tr}(f_{\tau, h}|\pi) = \text{tr}(\tau|\sigma(\pi)) \text{tr}(h|\pi).$$

3. If  $\pi \in \text{Irr}^{\text{cusp}}(\text{GL}(n; K))$ , then  $\sigma(\pi)$  is a genuine representation of  $W_K$ .

Then (a) and (b) of (24.12.3.2) hold true for  $n$ , by defining  $\sigma(\pi)$  as follows: If  $\pi$  has supercuspidal support  $\{\pi_1, \dots, \pi_r\}$  (with multiplicity), then we define

$$\sigma_n(\pi) = \bigoplus \sigma(\pi_i) \left( \frac{1 - n_i}{2} \right).$$

$\lrcorner$

*Proof:* Firstly, the uniqueness of  $\sigma_n$  follows from the fact the elements mapping to a positive power of  $\sigma_K$  determines a Weil-Deligne representation up to semisimplification. ?

What is Bernstein center ? Let  $f_{\tau}$  be the function on the Bernstein center that acts through the scalar  $\text{tr}(\tau|\sigma(\pi) \left( \frac{n-1}{2} \right))$  on any  $\pi \in \text{Irr}^{\text{adm}}(\pi)$ . ?

Then to prove (a) and (b) of (24.12.3.2), it suffices to show that

$$\text{tr}(f_{\tau, h}|\pi) = \text{tr}(f_{\tau} * h|\pi)$$

for any  $\pi \in \mathrm{Irr}^{\mathrm{adm}}(\mathrm{GL}(n; K))$ . If  $\pi$  is induced or supercuspidal, then this is true by the hypothesis listed. By (24.12.3.4), it suffices to check for any generalized Speh representation  $\pi = \mathrm{St}(\pi_0; t)$  (24.11.4.16). Choose  $h_0 \in C_c^\infty(\mathrm{GL}(n; K))$  as in item1 of (24.12.3.4), then

$$\mathrm{tr}(f_{\tau, h_0} | \pi') = \mathrm{tr}(f_\tau * h_0 | \pi')$$

holds for any tempered  $\pi' \in \mathrm{Irr}^{\mathrm{adm}}(\mathrm{GL}(n; K))$ : This is true ?  $\square$

**Lemma (24.12.3.4) [Testing on Tempered Representations and Generalized Speh Representations].**

- Let  $d \in \mathbb{Z}_+, t \in \mathbb{Z}_{\geq 2}, n = dt, \pi_0 \in \mathrm{Irr}^{\mathrm{cusp}, \mathrm{uni}}(\mathrm{GL}(d; K))$  and  $\pi = \mathrm{St}(\pi_0, t)$ . Then there exists  $h \in C_c^\infty(\mathrm{GL}(n; \mathcal{O}_K))$  s.t.  $\mathrm{tr}(h | \pi) = 0$  for any  $\pi \in \mathrm{Irr}^{\mathrm{adm}}(\mathrm{GL}(n; F))$  that is tempered but not of the form  $\pi = \pi_0(iy_1) \times \dots \times \pi_0(iy_t)$  where  $y_i \in \mathbb{R}$ . And for these  $\pi$ ,  $\mathrm{tr}(h | \pi) \neq 0$ .
- If  $h \in C_c^\infty(\mathrm{GL}(n; K))$  s.t. for all  $\pi \in \mathrm{Irr}^{\mathrm{adm}}(\mathrm{GL}(d; K))$  that is tempered but non-square-integrable or  $\pi = \mathrm{St}(\pi_0, t)$  for some  $d \in \mathbb{Z}_+, t \in \mathbb{Z}_{\geq 2}, n = dt, \pi_0 \in \mathrm{Irr}^{\mathrm{cusp}, \mathrm{uni}}(\mathrm{GL}(d; K))$ ; then  $\mathrm{tr}(h | \pi) = 0$  for any  $\pi \in \mathrm{Irr}^{\mathrm{adm}}(\mathrm{GL}(n; K))$ .

┘

*Proof:* Kazhdan's density theorem ? and  $\square$

**Prop. (24.12.3.5) [Constructing Galois Representations].** The hypotheses of (24.12.3.3) are true for any  $n \in \mathbb{Z}_+$ . In particular, (a) and (b) of (24.12.3.2) hold true for any  $n \in \mathbb{Z}_+$ .  $\square$

*Proof:* 1 is proved in Theorem 6.4. of [Sch13], by relating the deformation spaces of one-dimensional  $p$ -divisible groups to the deformation spaces of their infinitesimal parts. ?

2. Firstly by (24.12.6.3),  $K$  can be realized as  $K = F_w$  with notation as in (24.12.6.1) and (24.12.6.1). Then we can apply (24.12.7.8) to  $\pi^\vee$  to get  $\pi_f \in \mathrm{Irr}^{\mathrm{adm}}(\mathbf{G}(\mathbf{A}_f))$  s.t.

- $H_\xi^*(\pi_f) \neq 0$ .
- $\pi_{p,0}$  is unramified.
- $\pi_w = \pi \otimes \chi$  for some unramified quasi-character  $\chi$  of  $K^\times$ .

Then we apply (24.12.7.7) to get

$$\mathrm{tr}(f_{\tau, h}^\vee | \pi^\vee \otimes \chi) = \frac{1}{a(\pi_f)} \mathrm{tr}(\tau([H_\xi[\pi_f]] \otimes \chi_{\pi_{p,0}}) \mathrm{tr}(h^\vee | \pi^\vee \otimes \chi)).$$

Then we can take  $\sigma(\pi) = \frac{1}{a(\pi_f)} [H_\xi[\pi_f]]^\vee \otimes \chi_{\pi_{p,0}}^{-1} \otimes \chi^{-1}$  ?, which has dimension  $n$  by (24.12.6.7).

3: It suffices to show that  $\sigma(\pi) \in K_0(\mathrm{Rep}^{\mathrm{fd}}(W_K))$ . For this, Cf. [Sch13]P705 ?  $\square$

### Bijjective Correspondence for Supercuspidal Representations

**Thm. (24.12.3.6) [Supercuspidal Representations are Realized on Lubin-Tate Spaces].** Let  $[R\psi_n]$  be the alternating sum of the global section of the vanishing cycles for the Lubin-Tate tower, then it's endowed with an admissible action of the subgroup  $A_{K,n} \subset \mathrm{GL}(n; K) \times D_{K,1/n}^\times \times W_K$  consisting of elements  $(\gamma, \delta, \sigma)$  s.t.

$$|\det \gamma|^{-1} \cdot |\mathrm{Nmrd}(\delta)| \cdot |\mathrm{Art}_K^{-1} \sigma| = 1$$

.

Let  $\rho \in \text{Irr}^{\text{adm}}(D_{K,1/n}^*)$  s.t.  $\pi = \text{J-L}(\rho) \in \text{Irr}^{\text{cusp}}(\text{GL}(n; K))$ . Then

$$[R\psi](\rho) = (-1)^{n-1} \pi^\vee|_{\text{GL}(n; \mathcal{O}_K)} \otimes \sigma(\pi) \in K_0 \left( \text{Rep}^{(\text{adm}, \text{cont})}(\text{GL}(n; \mathcal{O}_K) \times W_K) \right) \quad (24.12.3.3) \text{?}.$$

┘

*Proof:* Cf.[Sch13]P704.?

This follows from (24.12.5.7).? □

**Def. (24.12.3.7)[Functorial Extension of Class Field Theory].** A **functorial extension of class field theory** is a family of maps

$$\text{rec}'_n : \text{Irr}^{\text{adm}}(\text{GL}(n; K)) \rightarrow \text{Rep}^n(W_K)$$

for each  $K \in p\text{-NField}$  and  $n \in \mathbb{Z}_+$ , s.t. the following holds:

- For a quasi-character  $\chi$  of  $K^\times$ ,  $\text{rec}'_1(\chi) = \chi \circ \text{Art}_K^{-1}$  (19.7.2.11).
- If  $\pi \in \text{Irr}^{\text{adm}}(\text{GL}(n; K))$  is a constituent of  $\pi_1 \boxtimes \dots \boxtimes \pi_t$ , then  $\sigma(\pi) = \sigma(\pi_1) \oplus \dots \oplus \sigma(\pi_t)$ .
- For a quasi-character  $\chi$  of  $K^\times$  and  $\pi \in \text{Irr}^{\text{adm}}(\text{GL}(n; K))$ ,

$$\text{rec}'_n(\pi(\chi)) = \text{rec}'_n(\pi) \otimes \text{rec}'_1(\chi).$$

- If  $K'/K$  is a cyclic Galois extension of prime degree and  $\pi \in \text{Irr}^{\text{cusp}}(\text{GL}(n; K))$  with  $\Pi = \text{BC}_K^{K'}(\pi) \in \text{Irr}^{\text{adm}}(\text{GL}(n; K'))$ , then  $\text{rec}'(\Pi) = \text{rec}'(\pi)|_{W_{K'}}$ .
- If  $\pi \in \text{Irr}^{\text{adm}}(\text{GL}(n; K))$  and  $\text{rec}'(\pi)$  is unramified, then  $\pi$  is Iwahori-spherical.

┘

**Thm. (24.12.3.8)[Bijective Correspondence for Supercuspidal Representations].** Suppose  $\text{rec}'_n$  is a functorial extension of local class field theory (24.12.3.7), then

$$\text{rec}'_n : \text{Irr}^{\text{cusp}}(\text{GL}(n; K)) \cong \text{Rep}^n(W_K)$$

is a bijection for any  $K \in p\text{-NField}$  and  $n \in \mathbb{Z}_+$ . ┘

*Proof:* ? Cf.[Sch13]P707. □

#### 4 $p$ -divisible Groups and Vanishing Cycles

**Def. (24.12.4.1)[ $p$ -divisible Groups].** Let  $S \in \text{Sch}/\mathcal{O}_K$  s.t.  $p$  is locally nilpotent?, then a  $\varpi$ -divisible  $\mathcal{O}_K$ -module  $H$  over  $S$  is a  $p$ -divisible group  $G \in p\text{Div}(S)$  together with  $\iota : \mathcal{O}_K \rightarrow \text{End}_S(H)$  s.t. the two induced actions of  $\mathcal{O}_K$  on  $\text{Lie}_S(G)$  are equal.

For any  $\varpi$ -divisible  $\mathcal{O}_K$ -module  $G/S$ , we have  $[K : \mathbb{Q}_p] \mid \text{ht}(G)$ ?. So we can define the  $\mathcal{O}_K$ -**height**  $\text{ht}_{\mathcal{O}_K}(G) = \text{ht}(G)/[K : \mathbb{Q}_p]$ . ┘

**Def. (24.12.4.2)[Drinfeld-level- $m$ -Structures].** A **Drinfeld-level- $m$ -structure** on a 1-dimensional  $\varpi$ -divisible  $\mathcal{O}_K$ -module  $H/S$  is a tuple of sections  $(X_1, \dots, X_n) \in H[\varpi^m]$  s.t.

$$\sum_{i_1, \dots, i_n \in \mathcal{O}_K/(\varpi^m)} [i_1 X_1 + \dots + i_n X_n] = [H[\varpi^m]]$$

as relative Cartier divisors over  $S$ . ┘

### D-Groups

**Def. (24.12.4.3) [Local Simple Unitary Groups].** For  $D'/\mathbb{Q}_p$  is a semisimple algebra with a maximal order  $\mathcal{O}_{D'}$ , define  $D = \mathrm{Mat}(n; K) \times D'$  with maximal order  $\mathcal{O}_D = \mathrm{Mat}(n; \mathcal{O}_K) \times \mathcal{O}_{D'}$ .

Define  $\mathbf{G}_{D'} = \mathrm{Res}_{\mathcal{O}_K/\mathbb{Z}_p}(\mathcal{O}_D^*)$  and  $\mathbf{G}_D = \mathrm{Res}_{\mathcal{O}_K/\mathbb{Z}_p} \mathrm{GL}(n) \times \mathbf{G}_{D'}$ .  $\lrcorner$

**Def. (24.12.4.4) [D-Groups].** Let  $S \in \mathrm{Sch}$  s.t.  $p$  is locally nilpotently, then a  $D'$ -group over  $S$  is an étale  $p$ -divisible group  $H$  over  $S$  together with an action

$$\iota : \mathcal{O}_{D'}^{\mathrm{op}} \rightarrow \mathrm{End}(H)$$

s.t.  $H[p]$  is free of rank 1 over  $\mathcal{O}_{D'}^{\mathrm{op}}/(p)$ .  $\lrcorner$

**Def. (24.12.4.5)  $((\mathcal{O}_K, D')$ -Groups).** For  $S \in \mathrm{Sch}/\mathcal{O}_K$ , an  $(\mathcal{O}_K, D')$ -group over  $S$  is a  $p$ -divisible group  $\underline{H}/S$  with an action

$$\iota : \mathcal{O}_D^{\mathrm{op}} \rightarrow \mathrm{End}(\underline{H})$$

s.t.  $\underline{H}$  decomposes as a product  $\underline{H} = H^{\oplus n} \times H'$  under the action of  $\mathcal{O}_D^{\mathrm{op}} \cong \mathrm{Mat}(n; \mathcal{O}_K)^{\mathrm{op}} \times \mathcal{O}_{D'}^{\mathrm{op}}$  where  $H$  is a 1-dimensional  $\varpi$ -divisible  $\mathcal{O}_K$ -module of height  $n$  and  $H'$  is a  $D'$ -group (24.12.4.4).

And a **level- $m$ -structure** on a  $(\mathcal{O}_K, D')$ -group  $\underline{H}$  is a Drinfeld-level- $m$ -structure on  $H$  and an isomorphism of  $\mathcal{O}_{D'}^{\mathrm{op}}$ -modules  $\mathcal{O}_{D'}^{\mathrm{op}}/(p^m) \cong H'[p^m]$  ?.  $\lrcorner$

**Prop. (24.12.4.6) [Dieudonné Parameters].** An  $(\mathcal{O}_K, D')$ -group  $\underline{H}$  over  $\kappa_r$  is equivalent to a Dieudonné module  $\underline{M}$  over  $W(\kappa_r)$  s.t. there is an isomorphism of  $\mathcal{O}_D \otimes W(\kappa_r)$ -module

$$\underline{M} \cong \mathcal{O}_D \otimes W(\kappa_r).$$

Thus  $\underline{M}$  is represented by an element  $\delta_0 \in \mathbf{G}_D(W(\kappa_r)[\frac{1}{p}])$  up to  $\sigma_K$ -conjugacy. This  $\delta_0$  is called the **Dieudonné paramter** of  $\underline{H}$ .  $\lrcorner$

### Deformations of $p$ -adic Spaces

**Def. (24.12.4.7)  $[\overline{H}_\beta]$ .** Take  $r \in \mathbb{Z}_+$  and a 1-dimensional  $\varpi$ -divisible  $\mathcal{O}_K$ -module  $\overline{H}_\beta$  of height  $n$  over  $\kappa_r$ , whose Dieudonné module is given by an element

$$\beta \in \mathrm{GL}(n; \mathcal{O}_{K_r}) \mathrm{diag}(\varpi_K, 1, \dots, 1) \mathrm{GL}(n; \mathcal{O}_{K_r})$$

up to  $\sigma_K$ -conjugacy.  $\lrcorner$

**Def. (24.12.4.8) [Deformation Spaces].** Let  $\mathrm{Spf} R_\beta$  be the formal deformation space of  $\overline{H}_\beta$  as  $\varpi$ -divisible  $\mathcal{O}_K$ -modules over  $\mathcal{O}_{K_r}$ , with universal deformation  $H_\beta$ . ?

For  $m \in \mathbb{Z}_+$ , let  $R_{\beta, m}$  be the covering of  $R_\beta$  parametrizing Drinfeld-level- $m$ -structures on  $H_\beta$ .  $\lrcorner$

**Prop. (24.12.4.9).**

- $R_\beta \cong \mathcal{O}_{K_r}[[T_1, \dots, T_{n-1}]]$ .
  - $R_{\beta, m}/R_\beta$  is a finite Galois covering with Galois group  $\mathrm{GL}(\mathcal{O}_K/(\varpi^m))$ , étale in the generic fiber.
  - $R_{\beta, m}$  is regular.
- $\lrcorner$

*Proof:* Cf. [Sch13]P672.  $\square$

**Def. (24.12.4.10) [Deformation Spaces].** For a  $(\mathcal{O}_K, D')$ -group  $\overline{H}$  over  $\kappa_r$ , there is a deformation space  $\mathrm{Spf} R_{\overline{H}}$  of deformations of  $\overline{H}$  over  $\mathcal{O}_{K_r}$  with universal deformation  $\underline{H}$ , and a covering map  $R_{\overline{H},m}/R_{\overline{H}}$  parametrizing level- $m$ -structures on the universal deformation.  $\lrcorner$

**Prop. (24.12.4.11) [Comparison of Deformation Spaces].** If  $\overline{H} \cong \overline{H}_\beta^{\oplus n} \otimes \overline{H}'$ , then

- The canonical map  $\mathrm{Spf} R_{\overline{H}} \rightarrow \mathrm{Spf} R_\beta$  is an isomorphism.
- The canonical map  $\mathrm{Spf} R_{\overline{H},m} \rightarrow \mathrm{Spf} R_{\beta,m} \times_{\mathrm{Spf} R_\beta} (H'[p^m])^*$  is an isomorphism, where  $(H'[p^m])^*$  is the set of  $\mathcal{O}_D^{\mathrm{op}}$ -generators of  $H'[p^m]$ . In particular,  $\mathrm{Spf} R_{\overline{H},m}/\mathrm{Spf} R_{\overline{H}}$  is a finite Galois cover with Galois group  $\mathrm{GL}(n; \mathcal{O}_K/(\varpi^m)) \times (\mathcal{O}_{D'}/(p^m))^*$ .  $\lrcorner$

*Proof:* This follows from the fact there are no deformations of a  $D'$ -group, by rigidity of étale covers.  $\square$

**Def. (24.12.4.12) [Lubin-Tate Tower].** For  $\beta$  basic, the tower

$$(\mathrm{Spf} R_{n,m})_{m \in \mathbb{Z}_+} = \left( \mathrm{Spf} R_{\beta,m} \otimes_{\mathcal{O}_r} \check{\mathcal{O}}_K \right)_{m \in \mathbb{Z}_+}$$

is called the **Lubin-Tate tower** of height  $n$ . This doesn't depend on  $\beta$ , because there exists a unique 1-dimensional formal  $\mathcal{O}_K$ -module of height  $n$  over  $\overline{\kappa}$  and a unique Drinfeld-level- $m$ -structure for any  $m$ .  $\lrcorner$

**Prop. (24.12.4.13).** There is a compatible action of  $A_{K,n} \subset \mathrm{GL}(n; K) \times D_{K,1/n}^\times \times W_K$  consisting of elements  $(\gamma, \delta, \sigma)$  s.t.

$$|\det \gamma|^{-1} \cdot |\mathrm{Nmrd}(\delta)| \cdot |\mathrm{Art}_K^{-1} \sigma| = 1$$

on the Lubin-Tate tower, where

- $\mathrm{GL}(n; K)$  acts on the Drinfeld-level-structures,
- $D_{K,1/n}^\times$  acts on the trivialization of the special fiber.
- $W_K$  acts as Frobenius.  $\lrcorner$

## Vanishing Cycles

**Def. (24.12.4.14) [Vanishing Cycles].** For  $\mathcal{X} \in \mathrm{Sch}^{\mathrm{ft}}/\mathcal{O}_{\check{K}}$  with generic fiber  $X/\check{K}$ , the formalism of vanishing cycles is used to relate the cohomology of  $\overline{X}$  and the cohomology of  $X_{K^s}$  together the action of  $I_K$ .

Consider the diagram  $\overline{X} \xrightarrow{i} X \xleftarrow{\bar{j}} X_{K^s}$  and  $\Lambda \in \mathcal{A}b^{\mathrm{fin}}$ , then the **sheaf of vanishing cycle** of  $\mathcal{X}/\mathcal{O}_{\check{K}}$  is defined to be

$$\Psi_{\mathcal{X}}^\bullet(\Lambda) = i^* R^\bullet \bar{j}_* \Lambda \in \mathrm{Sh}(\overline{X}_{\mathrm{\acute{e}t}}),$$

which has an action of  $I_K$ .  $\lrcorner$

**Prop. (24.12.4.15) [Proper case].** If  $\mathcal{X}/\mathcal{O}_{\check{K}}$  is proper, then proper base change implies  $i^* : H_{\mathrm{\acute{e}t}}^p(\mathcal{X}, R^q \bar{j}_* \Lambda) \cong H_{\mathrm{\acute{e}t}}^p(\overline{X}, i^* R^q \bar{j}_* \Lambda)$ . And the spectral sequence for  $\bar{j}$  implies

$$H_{\mathrm{\acute{e}t}}^p(\overline{X}, \Psi^n(\Lambda)) \implies H_{\mathrm{\acute{e}t}}^{p+q}(X_{K^s}, \Lambda).$$

which is  $I_K$ -invariant. If moreover,  $\mathcal{X}/\mathcal{O}_K$  is smooth, then by (9.4.6.36), this spectral sequence degenerate at page 2 and  $\Psi^n(\Lambda) = \begin{cases} \Lambda & , n = 0 \\ 0 & , n \geq 2 \end{cases}$ , inducing an isomorphism

$$H_{\text{ét}}^n(\overline{X}, \Lambda) \implies H_{\text{ét}}^n(X_{K^s}, \Lambda).$$

where  $I_K$  acts trivially. ┘

**Def. (24.12.4.16) [Formal Vanishing Cycles].** The vanishing cycle is defined verbatim in the Berkovich formal schemes setting, and the resulting sheaves are called **formal vanishing cycles**. But Scholze didn't pass to the maximal unramified extension (the Lubin-Tate tower) as Harris-Taylor did, and we can get more informations. ┘

**Thm. (24.12.4.17) [Formal Vanishing Cycles on the Deformation Tower].** Consider the formal vanishing cycles on the tower  $\{\text{Spf } R_{\beta, m}\}_{m \in \mathbb{Z}_+}$ :

$$\Psi_{\beta}^i = \varinjlim_{m \in \mathbb{Z}_+} H^0(\overline{\text{Spf } R_{\beta, m}}, \Psi_{\text{Spf } R_{\beta, m}}^i \overline{\mathbb{Q}_{\ell}}).$$

Then

$$H^0(\overline{\text{Spf } R_{\beta, m}}, R^i \psi_{\text{Spf } R_{\beta, m}} \overline{\mathbb{Q}_{\ell}}) \in \text{Rep}^{\text{fd}}(W_{K_r} \times \text{GL}(n; \mathcal{O}_K/(\varpi^m))),$$

and it vanishes unless  $i \in [0, n-1]$ .

In particular  $\Psi_{\beta}^i, [\Psi_{\beta}] \in \text{Rep}^{(\text{cont}, \text{adm})}(W_{K_r} \times \text{GL}(n; \mathcal{O}_K))$ . ┘

*Proof:* Cf. [Sch13] P673. □

**Prop. (24.12.4.18) [Isomorphism of Formal Vanishing Cycles].** Define the formal vanishing cycles as

$$\Psi_{\underline{H}}^i = \varinjlim_{m \in \mathbb{Z}_+} H^0(R_{\underline{H}}, \Psi_{\text{Spf } R_{\underline{H}, m}}^i \overline{\mathbb{Q}_{\ell}}),$$

then they has an action of  $W_{K_r} \times \mathbf{G}_D(\mathbb{Z}_p)$ . And by (24.12.4.11), there is a  $W_{K_r} \times \mathbf{G}_D(\mathbb{Z}_p)$ -equivariant isomorphism

$$\Psi_{\underline{H}}^i \cong \Psi_{\beta}^i \otimes C_c^{\infty}(\mathcal{O}_{D'}^*; \overline{\mathbb{Q}_{\ell}}).$$

┘

*Proof:* □

**Def. (24.12.4.19) [Vanishing Cycles on the Lubin-Tate Tower].** Define the vanishing cycles as

$$\Psi_n = \varinjlim_{m \in \mathbb{Z}_+} H^0(\overline{\text{Spf } R_{n, m}}, \Psi_{\text{Spf } R_{n, m}}^i \overline{\mathbb{Q}_{\ell}}),$$

with an action of  $A_{K, n}$  induced by (24.12.4.13). Then  $\Psi_n \in \text{Rep}^{(\text{adm}, \text{alg}, \text{cont})}(\text{GL}(n; \mathcal{O}_K) \times \mathcal{O}_{D_{K, 1/n}}^* \times I_K)$ , and it vanishes unless  $i \in [0, n-1]$ . ┘

*Proof:* The smoothness of  $\mathcal{O}_{D_{K, 1/n}}^*$ -action follows from comparison theorem Corollary 4.5 of [Vanishing cycles for formal schemes. 2, Berkovich], Cf. proof of [H-T01], Lemma II.2.8. The rest follows from (24.12.4.17). □

## 5 Local Cyclic Base Change

**Prop. (24.12.5.1).**  $K_r/K$  be the unramified extension of degree  $r$ , then  $\mathfrak{N}_{\sigma^{-1}} : \mathrm{GL}(n; K_r) \rightarrow \mathrm{GL}(n; K)$  defines an injection from the  $\sigma$ -conjugacy classes of  $\mathrm{GL}(n; K_r)$  to the conjugacy classes of  $\mathrm{GL}(n; K)$  (10.5.1.14). In fact, if  $\gamma = \mathfrak{N}_{\sigma^{-1}}(x)$ , then  $G_{x,\delta}$  is an inner form of  $G_\gamma$ .  $\lrcorner$

*Proof:* Cf. [Arthur-Clozel]P3.  $\square$

**Prop. (24.12.5.2) [Cyclic Base Change].** If  $\gamma = \mathrm{Nm}(x)$ , we can define orbital integrals and twisted orbital integrals:

$$\mathrm{TOrb}_\delta(\varphi) = \int_{G_{\delta,\sigma} \backslash \mathrm{GL}(n; K_r)} \varphi(g^{-1} \delta g^\sigma) \frac{dg_r}{dt},$$

$$\mathrm{Orb}_\gamma(f) = \int_{G_\gamma \backslash \mathrm{GL}(n; K)} \varphi(g^{-1} \delta g) \frac{dg}{dt}.$$

Then for any  $\varphi \in C_c^\infty(\mathrm{GL}(n; K_r))$ , there exists  $f \in C_c^\infty(\mathrm{GL}(n; K))$  s.t. for any regular  $\gamma \in \mathrm{GL}(n; K)$ ,

$$\mathrm{Orb}_\gamma(f) = \begin{cases} \mathrm{TOrb}_{\gamma,\sigma}(\varphi) & , \gamma = \mathrm{Nm} \delta, \delta \in \mathrm{GL}(n; K_r) \\ 0 & , \text{otherwise} \end{cases}.$$

$\lrcorner$

*Proof:* Cf. [Arthur-Clozel]P20.  $\square$

### Test Functions

**Def. (24.12.5.3) [Test Functions].** For any  $\tau \in \sigma_k^r I_K$  and  $h \in \mathcal{T}(\mathrm{GL}(n; \mathcal{O}_K); \mathbb{Q})$ , define

$$\psi_{\tau,h}(\beta) = \begin{cases} \mathrm{tr}(\tau \times h^\vee | [\Psi_\beta]) & , \beta \in \mathrm{GL}(n; \mathcal{O}_{K_r}) \mathrm{diag}(\varpi_K, 1, \dots, 1) \mathrm{GL}(n; \mathcal{O}_{K_r}) \\ 0 & , \text{otherwise} \end{cases} \quad (24.12.4.17).$$

Then  $\varphi_{\tau,h} \in C_c^\infty(\mathrm{GL}(n; K_r); \mathbb{Q})$ , and is independent of  $\ell$ .  $\lrcorner$

*Proof:* Cf. [Sch13]P674 ?. This uses algebrization theorem and a result of Mieda on independence of  $\ell$ .  $\square$

**Def. (24.12.5.4) [Base Change Test Function,  $f_{\tau,h}$ ].** Define  $f_{\tau,h} \in \mathcal{T}(\mathrm{GL}(n; K); \mathbb{Q})$  s.t. it has matching twisted orbital integral with  $\varphi_{\tau,h} \in C_c^\infty(\mathrm{GL}(n; K_r); \mathbb{Q})$  (24.12.5.2) w.r.t. the Haar measures neutralized by  $\mathrm{GL}(n; \mathcal{O}_K)$ .

Notice  $f$  is not unique but its orbital integrals are, thus its trace on any representation  $\rho \in \mathrm{Irr}^{\mathrm{adm}}(\mathrm{GL}(n; K))$  is well-defined by Weyl's integration formula ?.  $\lrcorner$

**Def. (24.12.5.5).** For any  $\tau \in W_{K_r}$  and  $h \in C_c^\infty(\mathrm{GL}(n; \mathcal{O}_K); \mathbb{Q})$ ,  $h' \in C_c^\infty(\mathcal{O}_{D'}^*; \mathbb{Q})$ , define the function

$$\varphi_{\tau,h,h'}(\delta_0) = \mathrm{tr} \left( \tau \times h^\vee \times h' \mid [\Psi_{\overline{H}}] \right) \quad (24.12.4.18).$$

if  $\overline{H}$  has Dieudonné paramter  $\delta_0$  (24.12.4.6), and 0 if there is not such  $\overline{H}$ . Then by (24.12.5.3),  $\varphi_{\tau,h,h'} \in C_c^\infty(\mathbf{G}_D(W(\kappa_r)[\frac{1}{p}]))$  and is independent of  $\ell$ .  $\lrcorner$

**Prop. (24.12.5.6) [Base Change Test Functions].**  $\varphi_{\tau,h,h'} \in C_c^\infty(\mathbf{G}_D(W(\kappa_r)[\frac{1}{p}]); \mathbb{Q})$  corresponds to  $f_{\tau,h}^\vee \times h' \in C_c^\infty(\mathbf{G}_D(\mathbb{Q}_p); \mathbb{Q})$ .  $\lrcorner$

*Proof:* Cf.[Sch13]P688.?

□

**Prop.(24.12.5.7)[Relation to Lubin-Tate space].** Since  $\beta$  is basic, we can associate  $d = \mathrm{Nm}(\beta) \in D_{K,1/n}^\times$  with the same characteristic polynomial. Then for any  $\tau \in W_{K_\tau}$  and  $h \in C_c^\infty(\mathrm{GL}(n; \mathcal{O}_K))$ , we have

$$\varphi_{\tau,h}(\beta) = \mathrm{tr} \left( \tau \times d^{-1} \times h^\vee |[R\psi] \right).$$

┘

*Proof:* Cf.[Sch13]P704.

□

## 6 Simple Shimura Varieties

**Notation(24.12.6.1).**

- Let  $F_0 \in \mathbf{NField}$  be totally real with  $2|[F_0 : \mathbb{Q}]$ .
- Let  $\tau \in \Sigma_{F_0}^\infty$  and  $x_0 \in \Sigma_{F_0}^{\mathrm{fin}}$ .
- Let  $\mathcal{K} \subset \mathbb{C}$  be an imaginary quadratic field s.t. the rational prime below  $x_0$  splits in  $\mathcal{K}$ .
- Let  $F = F_0\mathcal{K}$  and  $S_F(x_0) = \{x, x^c\}$ .
- Let  $w \in \Sigma_F^{\mathrm{fin}}$  with  $u = w \cap \mathcal{K}$  and  $p = w \cap \mathbb{Q}$  s.t.  $p$  is split in  $\mathcal{K}$  and  $w \notin \{x, x^c\}$  (in particular,  $\mathbb{D}$  is split at  $w$ ).
- Let  $K = F_w$  with residue field  $\kappa$ . Let  $n \in \mathbb{Z}_+$ .

┘

**Prop.(24.12.6.2)[Division Rings and Simple Unitary Groups].** There exists  $\mathbb{D} \in \mathbf{Az}_F$  of dimension  $n^2$  with an involution  $*$  of second kind, and a homomorphism  $h_0 : \mathbb{C} \rightarrow \mathbb{D}_\tau$  s.t.

- $x \mapsto h_0(\mathbf{i})^{-1}x^*h_0(\mathbf{i})$  is a positive involution on  $\mathbb{D}_\mathbb{R}$ .
- $\mathbb{D}$  splits at all places  $v \in \Sigma_F \setminus \{x, x^c\}$ .
- Define  $\mathbf{G}_0 \subset \mathrm{Res}_{F/F_0}(\mathbb{D}^*) \in \mathbf{AlgGrp}/F_0$  representing the functor

$$\mathbf{G}_0 : R \mapsto \{g \in (\mathbb{D} \otimes_{F_0} R)^* | gg^* = 1\},$$

then  $\mathbf{G}_0$  is quasi-split at all non-split places of  $F_0$ , unitary of signature  $(1, n-1)$  at  $\tau$  and unitary of signature  $(0, n)$  at all other infinite places of  $F_0$ .

Define

$$\mathbf{G} \in \mathbf{RedGrp}/\mathbb{Q} : R \mapsto \{g \in (\mathbb{D} \otimes R)^* | gg^* \in R^*\},$$

together with the amplitude map  $\nu : \mathbf{G} \rightarrow \mathbf{G}_m$  with kernel  $\mathbf{G}_1$ .

┘

*Proof:* Take  $\mathbb{D} = B^{\mathrm{op}}$  as in [H-T01]Lemma 1.7.1?.

□

**Prop.(24.12.6.3)[Globalization].** Any  $K \in p\text{-}\mathbf{NField}$  can be realized as  $K = F_w$  for some  $F$  and  $w$  with the setting as in(24.12.6.1) and(24.12.6.1).

┘

*Proof:*

□

**Prop. (24.12.6.4)**[Shimura Varieties]. Situation as in (24.12.6.2), we can regard  $h_0$  as a map  $\mathbb{S} \rightarrow \mathbf{G}_{\mathbb{R}}$ . Then the datum  $(\mathbf{G}, h^{-1})$  defines a tower of Shimura varieties

$$\varprojlim_{\mathcal{K} \subset \mathbf{G}(\mathbf{A}_f)} \mathrm{Sh}_{\mathcal{K}}(\mathbf{G}, h^{-1})$$

with reflex field  $E = \tau(F)$ . ┘

*Proof:* By [Kot92] and [Sch13]P691. □

### Automorphic Vector Bundles

**Thm. (24.12.6.5)**[Matsushima's formula].

$$\mathrm{inj} \lim_U H^i(X_U(\mathbb{C}), \mathcal{L}_{\iota_{\ell}(\xi)}^{\mathrm{top}}) \cong \bigoplus_{\pi \in \mathrm{Irr}^{\mathrm{auto}}(\mathbf{G}/\mathbb{Q})} \pi_f \otimes H^i(\mathrm{Lie} \mathbf{G}(\mathbb{R}), U, \pi_{\infty} \otimes \iota_{\ell}(\xi))^{\# \ker^1(\mathbb{Q}, \mathbf{G})}.$$

┘

*Proof:* □

**Def. (24.12.6.6)**[Cohomology of Automorphic Vector Bundles]. For any  $\xi \in \mathrm{Irr}_{\overline{\mathbb{Q}_{\ell}}}(\mathbf{G})$ , we can get a lisse sheaf  $\mathcal{L}_{\xi, \mathcal{K}} \subset \mathrm{Loc}_{\overline{\mathbb{Q}_{\ell}}}^{\mathrm{\acute{e}t}}(\mathrm{Sh}_{\mathcal{K}}(\mathbf{G}))$  for any open compact  $\mathcal{K} \subset \mathbf{G}(\mathbf{A}_f)$  that is small enough. The action of  $\mathbf{G}(\mathbf{A}_f)$  on  $\mathrm{Sh}_{\mathcal{K}}(\mathbf{G})$  extends to  $\mathcal{L}_{\xi, \mathcal{K}}$ , and we can consider the cohomologies

$$H_{\xi}^* = \varinjlim_{\mathcal{K}} H_{\mathrm{\acute{e}t}}^*(\mathrm{Sh}_{\mathcal{K}}(\mathbf{G})_{\overline{F}}, \mathcal{L}_{\xi, \mathcal{K}}) \in \mathrm{Rep}^{(\mathrm{cont}, \mathrm{adm})}(\mathrm{Gal}_F \times \mathbf{G}(\mathbf{A}_f)).$$

Then:

- There is a decomposition  $H_{\xi}^i = \bigoplus_{\pi_f} \pi_f \otimes H_{\xi}^i[\pi_f]$ , where  $\pi_f$  runs over  $\mathrm{Irr}_{\overline{\mathbb{Q}_{\ell}}}^{\mathrm{adm}}(\mathbf{G}(\mathbf{A}_f))$  and  $H_{\xi}^i[\pi_f] \in \mathrm{Rep}_{\overline{\mathbb{Q}_{\ell}}}^{\mathrm{fd}}(\mathrm{Gal}_F)$ .

•

$$\dim H_{\xi}^i[\pi_f] = \# \ker^1(\mathbb{Q}, \mathbf{G}) \sum_{\pi_{\infty}} m_{\tau}(\iota_{\ell}(\pi) \otimes \pi_{\infty}) \dim H^i(\mathrm{Lie} \mathbf{G}(\mathbb{R}), U_{\tau}, \pi_{\infty} \otimes \iota_{\ell}(\xi)),$$

where  $\pi_{\infty}$  runs through  $\mathrm{Irr}(\mathbf{G}(\mathbb{R}))$  and  $m(\pi)$  is the multiplicity of  $\pi$  in  $\mathcal{A}(\mathbf{G}/\mathbb{Q})$ .

- $H_{\xi}^i[\pi_f] \in \mathrm{Rep}_{\overline{\mathbb{Q}_{\ell}}}^{\mathrm{fd}}(\mathrm{Gal}_F)$  is pure of weight  $i + w(\xi)$  and deRham.

•

┘

*Proof:* Cf. [H-T01]P104. ? □

**Prop. (24.12.6.7)**[Kottwitz]. For any  $\pi_f \in \mathrm{Irr}^{\mathrm{adm}}(\mathbf{G}(\mathbf{A}_f))$  and  $\xi \in \mathrm{Irr}_{\overline{\mathbb{Q}_{\ell}}}^{\mathrm{adm}}(\mathbf{G})$ , consider

$$H_{\xi}^*[\pi_f] \in K_0(\mathrm{Rep}(\mathrm{Gal}_F)) \text{ (24.12.6.6)}.$$

Then either  $\pi_f$  only appears in odd dimensions or only appears in even dimensions. Thus  $\pm H_{\xi}^*[\pi_f]$  is a genuine representation.

And there exists  $a(\pi_f) \in \mathbb{N}$  s.t.  $\dim(\pm H_{\xi}^*[\pi_f]) = a(\pi_f)n$  for any  $\xi$ . ┘

*Proof:* Cf. [Kot92] ?. □

### Integral Models

**Prop. (24.12.6.8) [Integral Models for  $\mathbf{G}$ ].** Notation as in (24.12.6.1), if we denote  $D' = \prod_{w'|u, w' \neq w} \mathbb{D}_{w'}$  and  $D = \prod_{w'|u} \mathbb{D}_{w'}$ , and choose a maximal order  $\mathcal{O}_{\mathbb{D}_p}$  for any  $\mathfrak{p} \in S_F(u)$ , then  $\mathcal{O}_D = \mathrm{Mat}(n; \mathcal{O}_K) \times \mathcal{O}_{D'}$ , putting us in the situation of (24.12.4.3). And we have:

$$\mathbf{G}_{\mathbb{Q}_p} = (\mathbf{G}_D)_{\mathbb{Q}_p} \times \mathbf{G}_m = \mathrm{Res}_{K/\mathbb{Q}_p} \mathrm{GL}(n) \times (\mathbf{G}_{D'})_{\mathbb{Q}_p} \times \mathbf{G}_m \text{ (24.12.4.3)}.$$

In particular, this gives an integral model of  $\mathbf{G}_{\mathbb{Q}_p}$  over  $\mathbb{Z}_{(p)}$ .

Define the maximal subgroup

$$\mathcal{K}_p^0 = \mathrm{Mat}(n; \mathcal{O}_K) \times \mathcal{O}_{D'}^* \times \mathbb{Z}_p^* \in \mathbf{G}(\mathbb{Z}_p),$$

and for any  $m \in \mathbb{Z}_+$ , define the congruence subgroups

$$\mathcal{K}_p^m = (1 + \varpi^m \mathrm{Mat}(n; \mathcal{O}_K)) \times (1 + p^m \mathcal{O}_{D'}) \times \mathbb{Z}_p^* \subset \mathbf{G}(\mathbb{Z}_p).$$

┘

**Prop. (24.12.6.9) [PEL-Type Integral Models].** Consider the functor on  $\mathrm{NSch}/\mathcal{O}_K$  mapping  $S \in \mathrm{NSch}/\mathcal{O}_K$  to isomorphism classes of tuples  $(A, \lambda, \iota, \bar{\eta}^p, \bar{\eta}_p)$  where

- $A \in \mathrm{AbVar}/S$  is a projective Abelian scheme of relative dimension  $n^2[F_0 : \mathbb{Q}]$  up to prime-to- $p$  isogeny.
- $\lambda : A \rightarrow A^\vee$  is a polarization of degree prime to  $p$ .
- $\iota$  is a  $*_{D^{\mathrm{op}}}$  homomorphism  $\mathcal{O}_{D^{\mathrm{op}}} \rightarrow \mathrm{End}_S(A)$  satisfying the determinant condition.
- $\bar{\eta}^p$  is a  $\mathcal{K}^p$ -level structure away from  $p$ .
- $\eta_p$  a level- $m$ -structure on  $\underline{H}(A)$  where  $\underline{H}(A) \oplus \underline{H}(A)^\vee \cong T_p(A)$  corresponding to  $\mathcal{O}_{D^{\mathrm{op}}} \otimes \mathbb{Z}_p \cong \mathcal{O}_D^{\mathrm{op}} \times \mathcal{O}_D$ .

and when  $\mathcal{K}^p$  is small, this functor is represented by a projective scheme  $\mathrm{Sh}_{\mathcal{K}^p, m}$ , and the generic fiber of  $\mathrm{Sh}_{\mathcal{K}^p, m}$  is a disjoint union of  $\#\mathrm{III}^1(\mathbb{Q}, \mathbf{G})$  copies of the canonical model  $\mathrm{Sh}_{\mathcal{K}_p^m, \mathcal{K}^p}(\mathbf{G}, \{h^{-1}\})$  localized at  $w$ .

┘

*Proof:* Cf. [H-T01] Section 3.1 and 3.4. □

**Prop. (24.12.6.10) [Group Actions].** For any  $\xi \in \mathrm{Irr}_{\overline{\mathbb{Q}_\ell}}^{\mathrm{adm}}(\mathbf{G})$ , we can associate lisse  $\overline{\mathbb{Q}_\ell}$ -sheaves on  $\mathrm{Sh}_{\mathcal{K}^p, m}$  compatible with the sheaf  $\mathcal{F}_{\xi, \mathcal{K}_p^m, \mathcal{K}^p}$  on the generic fiber.

And there is an obvious action of  $\mathcal{O}_D^* \times \mathbf{G}(\mathbf{A}_f^p)$  on these integral models compatible with these lisse sheaves. ┘

*Proof:* □

## 7 Global methods

**Notation (24.12.7.1).**

- Use notations defined in [Simple Shimura Varieties](#).

┘

### Langlands-Kottwitz Method

**Def. (24.12.7.2).** Define

$$f = h^\vee \times h' \times \mathbf{1}_{\mathbb{Z}_p^*} \times f^p \in C_c^\infty(\mathbf{G}(\mathbf{A}_f))$$

where

$$h \in C_c^\infty(\mathrm{GL}(n; \mathcal{O}_K); \mathbb{Q}), \quad h' \in C_c^\infty(\mathcal{O}_{D'}^*; \mathbb{Q}), \quad f^p = \frac{1}{\mathrm{Vol}(K^p)} \mathbf{1}_{K^p g^p K^p}$$

where  $g^p \in \mathbf{G}(\mathbf{A}_f^p)$  and  $K^p \subset \mathbf{G}(\mathbf{A}_f^p)$  is a sufficiently small compact open subgroup.

Fix  $m \in \mathbb{Z}_+$  s.t.  $h^\vee \times h' \times \mathbf{1}_{\mathbb{Z}_p^*}$  is bi- $\mathcal{K}_p^m$ -invariant. ┘

For  $\tau \in W_K^+$  with  $\deg(\tau) = r$ , we want to evaluate  $\mathrm{tr}(\tau \times f|[H_\xi])$  via Lefschetz trace formula. ?

**Prop. (24.12.7.3).**

$$\pi_* R\psi \mathcal{L}_{\xi, \mathcal{K}^p, m} = (\pi_* R\psi \overline{\mathbb{Q}_\ell}) \otimes \mathcal{L}_{\xi, \mathcal{K}^p, 0}.$$

┘

**Lemma (24.12.7.4).** There is a canonical isomorphism

$$\hat{\mathcal{O}}_{\mathrm{Sh}_{K^p, 0, x}} \cong R_{\underline{H}_y} \otimes \check{\mathcal{O}}_K.$$

┘

*Proof:* Cf. [Sch13]P697. ?

□

**Thm. (24.12.7.5).**

$$\mathrm{tr}(\tau \times h^\vee \times h' \times \mathbf{1}_{\mathbb{Z}_p^*} \times f^p|[H_\xi]) = \sum_{(\gamma_0: \gamma, \delta)} c(\gamma_0: \gamma, \delta) \mathrm{Orb}_\gamma(f^p) \mathrm{TOrb}_{\delta\sigma_0}(\varphi_{\tau, h, h'} \times \mathbf{1}_{p^{-1}W(\kappa_r)^*}) \mathrm{tr}(\gamma_0|\xi).$$

where

- $\gamma_0 \in \mathbf{G}(\mathbb{Q})$  is a semisimple element that becomes elliptic in  $\mathbf{G}(\mathbb{R})$ ,
- $\gamma \in \mathbf{G}(\mathbf{A}_f^p)$  s.t.  $\gamma \sim \gamma_0 \in \mathbf{G}(\overline{\mathbb{Q}_\ell})$  for any  $\ell \in \mathrm{Prime} \setminus \{p\}$ ,
- $\delta \in \mathbf{G}(F)$  with conditions.

┘

*Proof:* Cf. [Sch13]P698.

□

**Cor. (24.12.7.6) [Test Function Trace Formula].**

$$n\mathrm{tr}(\tau \times h^\vee \times h' \times \mathbf{1}_{\mathbb{Z}_p^*} \times f^p|[H_\xi]) = \mathrm{tr}(\mathbf{1} \times f_{\tau, h}^\vee \times h' \times \mathbf{1}_{p^{-r'}\mathbb{Z}_p^*} \times f^p|[H_\xi]).$$

┘

*Proof:* Cf. [Sch13]P698.

□

### Cohomology of Shimura Varieties

**Prop. (24.12.7.7).** Notation as in [Simple Shimura Varieties](#), assume that  $\pi_f \in \mathrm{Irr}^{\mathrm{adm}}(\mathbf{G}(\mathbf{A}_f))$  s.t.  $H_\xi^*(\pi_f) \neq 0$  [\(24.12.6.6\)](#), and in the decomposition  $\pi_p = \pi_w \otimes \pi_p^w \otimes \pi_{p,0}$  corresponding to

$$\mathbf{G}(\mathbb{Q}_p) = \mathrm{GL}(n; F_w) \times (D')^\times \times \mathbb{Q}_p^\times \text{ [\(24.12.6.8\)](#),$$

assume  $\pi_{p,0}$  is unramified and let  $\chi_{\pi_{p,0}} = (\pi_{p,0} \circ \mathrm{Art}_{\mathbb{Q}_p}^{-1})|_{W_K}$  be a quasi-character of  $W_K$ . Then for any  $\tau \in W_K^+$  and  $h \in C_c^\infty(\mathrm{GL}(n; \mathcal{O}_K))$ , we have

$$\mathrm{tr}(f_{\tau,h}^\vee | \pi_w) = \frac{1}{a(\pi_f)} \mathrm{tr}(\tau | [H_\xi[\pi_f]] \otimes \chi_{\pi_{p,0}}) \mathrm{tr}(h^\vee | \pi_w).$$

┘

*Proof:* Take  $h' \in C_c^\infty(\mathcal{O}_{D'}^*; \mathbb{Q})$  s.t.  $\mathrm{tr}(h' | \pi_p^w) = 1$ , and take  $m \in \mathbb{Z}_+$  s.t. both  $h^\vee \times h' \times \mathbf{1}_{\mathbb{Z}_p^*}$  and  $f_{\tau,h}^\vee \times h' \times \mathbf{1}_{p^{-r'}\mathbb{Z}_p}^*$  are both  $\mathrm{bi}\text{-}\mathcal{K}_p^m$ -invariant [\(24.12.6.8\)](#), and  $\pi_p^{\mathcal{K}_p^m} \neq 0$ . And we take  $\mathcal{K}^p \subset \mathbf{G}(\mathbf{A}_f^p)$  s.t.  $(\pi_f^p)^{\mathcal{K}^p} \neq 0$ , and let  $\mathcal{K} = \mathcal{K}^p \mathcal{K}_p^m$ .

Because  $\dim H^*(\mathrm{Sh}_{\mathcal{K}}, \mathcal{L}_{\xi, \mathcal{K}}) < \infty$ , there are only f.m.  $\pi_f \in \mathrm{Irr}^{\mathrm{adm}}(\mathbf{G}(\mathbf{A}_f))$  that is invariant under  $\mathcal{K}$  and  $H_\xi^*[\pi_f] \neq 0$  [?](#). So we can choose  $f^p \in C_c^\infty(\mathbf{G}(\mathbf{A}_f^p))$  bi-invariant under  $\mathcal{K}^p$  s.t.  $\mathrm{tr}(f^p | \pi_f^p) = 1$ , and satisfying the following: whenever  $\pi'_f \in \mathrm{Irr}^{\mathrm{adm}}(\mathbf{G}(\mathbf{A}_f))$  is  $\mathcal{K}$ -spherical and  $\mathrm{tr}(f^p | \pi'^p_f) \neq 0$ , we have  $\pi'^p_f \cong \pi_f^p$ , thus also  $\pi_f \cong \pi'_f$  by [\(24.12.7.12\)](#).

Applying [\(24.12.7.6\)](#), we get

$$n \mathrm{tr}(\tau | [H_\xi^*[\pi_f]]) \mathrm{tr}(h^\vee | \pi_w) = na(\pi_f) \mathrm{tr}(f_{\tau,h}^\vee | \pi_w) \pi_{p,0}(p^{-r'}),$$

and the assertion follows. □

**Thm. (24.12.7.8) [Globalization, Harris-Taylor].** If  $\pi \in \mathrm{Irr}^{\mathrm{adm}}(\mathrm{GL}(n)/K)$  that is either essentially square-integrable or generalized Speh [\(24.11.4.16\)](#), then there exists  $\pi_f \in \mathrm{Irr}^{\mathrm{adm}}(\mathbf{G}(\mathbf{A}_f))$  and  $\xi \in \mathrm{Irr}_{\mathbb{Q}_\ell}(\mathbf{G})$  s.t. (notation as in [\(24.12.7.7\)](#)):

- $H_\xi^*(\pi_f) \neq 0$  [\(24.12.6.6\)](#).
- $\pi_{p,0}$  is unramified.
- $\pi_w$  is an unramified twist of  $\pi$ .

┘

*Proof:* Cf. [\[H-T01\] 6.2.5 and 6.2.11](#) [?](#). □

**Cor. (24.12.7.9) [A variant Globalization].** If  $\pi \in \mathrm{Irr}^{\mathrm{adm}}(\mathrm{GL}(n)/K)$  is essentially square-integrable, then there exists  $\Pi \in \mathrm{Irr}^{\mathrm{cusp}}(\mathrm{GL}(n)/F)$  s.t.

- $\Pi^\vee \cong \Pi^c$ .
- $\Pi$  is regular  $C$ -algebraic [\(30.1.3.2\)](#).
- $\Pi_x$  is supercuspidal.
- $\Pi_w$  is an unramified twist of  $\pi$ .

┘

*Proof:* Cf. [\[H-T01\] Cor. 6.2.6](#) [?](#). □

**Prop. (24.12.7.10) [Clozel's Base Change].** Suppose  $\pi \in \text{Irr}^{\text{cusp}}(\mathbf{G}/\mathbb{Q})$  is cohomological for  $\xi' \in \text{Irr}_{\mathbb{C}}(\mathbf{G})$ , then there is a unique  $\text{BC}(\pi) = (\psi, \Pi) \in \text{Irr}^{\text{auto}}(\text{Res}_{\mathcal{K}/\mathbb{Q}} \mathbf{G}_m \times \text{Res}_{F/\mathbb{Q}} D^{\times})$  s.t.

- $\psi = \psi_{\pi}|_{\mathbf{I}_{\mathcal{K}}}^{\mathbf{c}}$ .
- If  $p \in \text{Prime}$  is split in  $\mathcal{K}$ , then  $\text{BC}(\pi)_p = \text{BC}(\pi_p)$ .
- For a.e.  $p \in \text{Prime}$  that is inert in  $\mathcal{K}$ , we have  $\text{BC}(\pi_p) = \text{BC}(\pi)_p$ .
- $\Pi$  is cohomological for  $\xi'_{\mathcal{K}}?$ .
- $\psi|_{\mathcal{K}_{\infty}^{\times}}^{\mathbf{c}} = \xi'|_{\mathcal{K}_{\infty}^{\times}}^{-1}$ .
- $\psi_{\Pi}|_{\mathbf{I}_E} = \psi^{\mathbf{c}}/\psi$ .

┘

*Proof:* Cf. [H-T01]6.2.1.?

□

**Cor. (24.12.7.11).** It follows from strong multiplicity one (29.3.6.7) and the theorem that: if  $\pi, \pi' \in \text{Irr}^{\text{auto}}(\mathbf{G}/\mathbb{Q})$  are cohomological for  $\xi' \in \text{Irr}_{\mathbb{C}}(\mathbf{G})$  and  $\pi_p \cong \pi'_p$  for a.e.  $p \in \text{Prime}$ , then  $\pi_p \cong \pi'_p$  for any  $p \in \text{Prime}$  that is split in  $\mathcal{K}$ .

┘

**Cor. (24.12.7.12) [Harris-Taylor].** If  $\pi, \pi' \in \text{Irr}^{\text{adm}}(\mathbf{G}(\mathbf{A}_f))$  and  $\xi \in \text{Irr}_{\overline{\mathbb{Q}_{\ell}}}(\mathbf{G})$  s.t.

- $\pi^p \cong (\pi')^p$ .
- $[H_{\xi}^*[\pi_f]] \neq 0$ .
- $[H_{\xi}^*[\pi'_f]] \neq 0$ .

Then  $\pi \cong \pi'$ .

┘

*Proof:* It follows from (24.12.6.6) that both  $\pi, \pi'$  are automorphic and cohomological for  $\iota_{\ell}(\xi)$ . Then the assertion follows from (24.12.7.11), noticing that  $p$  is split in  $\mathcal{K}$  (24.12.6.1). □

**Prop. (24.12.7.13) [Clozel's Descent].** Suppose  $\Pi \in \text{Irr}^{\text{auto}}(D^{\times}/F)$  and  $\psi$  is a Hecke character of  $\mathcal{K}$  s.t.

- $\Pi \cong \Pi^*$ .
- $\psi_{\Pi}|_{\mathbf{I}_{\mathcal{K}}} = \psi^{\mathbf{c}}/\psi$ .
- $\Pi$  is cohomological for  $\xi'_{\mathcal{K}}$ .
- $\xi'|_{\mathcal{K}_{\infty}^{\times}}^{-1} = \psi|_{\mathcal{K}_{\infty}^{\times}}^{\mathbf{c}}$ .

Then there is a  $\pi \in \text{Irr}^{\text{auto}}(\mathbf{G}/\mathbb{Q})$  s.t.

- $\text{BC}(\pi) = (\psi, \Pi)$ .
- $\pi$  is cohomological for  $\xi'$ .
- $\dim H_{\iota_{\ell}^{-1}(\xi')}^{-1}[\iota_{\ell}^{-1}\pi_f] \neq 0$ .

┘

*Proof:* Cf. [H-T01]6.2.9.?

□

**Prop. (24.12.7.14) [Descending from  $D^{\times}$  to  $\mathbf{G}$ ].** Let  $\Pi \in \text{Irr}^{\text{auto}}(D^{\times})$  s.t.  $\Pi \cong \Pi^*$  and  $\Pi$  is regular  $C$ -algebraic, then there exists a Hecke character  $\psi$  of  $\mathcal{K}$  and  $\xi' \in \text{Irr}(\mathbf{G}/\mathbb{C})$  s.t.

- $\psi_{\Pi}|_{\mathbf{I}_{\mathcal{K}}} = \psi^{\mathbf{c}}/\psi$ .
- $\Pi$  is cohomological for  $\xi'_{\mathcal{K}}?$ .

- $\xi'|_{\mathcal{K}_\infty^\times}^{-1} = \psi|_{\mathcal{K}_\infty^\times}^c$ .
- $\psi(\mathcal{O}_{\mathcal{K},x_0}^\times) = 1$ .

┘

*Proof:* Cf. [H-T01] Lemma 6.2.10. ?

□

**Thm. (24.12.7.15)** [Jacquet-Langlands plus Base Change, Harris-Taylor]. Let  $\Pi \in \text{Irr}^{\text{cusp}}(GL(n)/F)$  s.t.

- $\Pi^\vee \cong \Pi^c$ .
- $\Pi$  is regular  $C$ -algebraic (30.1.3.2).
- $\Pi_x$  is square-integrable.

Then there exists

- Some  $\pi_f \in \text{Irr}^{\text{adm}}(\mathbf{G}(\mathbf{A}_f))$ ,
- Some  $\xi \in \text{Rep}^{\text{fd}}(\mathbf{G})$  s.t.  $H_\xi^*[\pi_f] \neq 0$  (24.12.6.6).
- Some algebraic Hecke character  $\psi$  of  $\mathcal{K}$  (19.4.1.27) satisfying the following: For any  $w \in \Sigma_F^{\text{fin}}$  with  $u = w \cap \mathcal{K}$  and  $p' = w \cap \mathbf{Q}$  s.t.  $p'$  is split in  $\mathcal{K}$  and  $w \notin \{x, x^c\}$ , we have

$$\pi_w \cong \Pi_w, \quad \pi_{p',0} \cong \psi_u \text{ (24.12.7.7)}.$$

Moreover, for any  $p' \in \text{Prime}$  that is split in  $\mathcal{K}$ , we can arrange  $(\pi_f, \xi, \psi)$  s.t.  $\pi_{p',0}$  is unramified.

┘

*Proof:* Use global Jacquet-Langlands correspondence (29.3.6.7) to obtain  $\rho \in \text{Irr}^{\text{auto}}(\mathbb{D}^\times)$  s.t.  $J\text{-L}(\rho) \cong \Pi$  (24.12.6.2), then  $\rho \cong \rho^*$  and  $\rho_\infty$  is regular  $C$ -algebraic. Then (24.12.7.13) (24.12.7.14) and the properties of the base-change map (24.12.7.10) finish the proof. □

**Cor. (24.12.7.16)** [Theorem 10.6 of Scholze, Deligne-Brylinski (86)/Carayol (86)/Harris-Taylor [H-T01]]. Let  $\Pi \in \text{Irr}^{\text{cusp}}(GL(n)/F)$  s.t.

- $\Pi^\vee \cong \Pi^c$ .
- $\Pi$  is regular  $C$ -algebraic (30.1.3.2).
- $\Pi_x$  is square-integrable.

Then there exists  $a \in \mathbb{Z}_+$  and  $R(\Pi) \in \text{Rep}_{\mathbb{Q}_\ell}^{\text{an}}(\text{Gal}_K)$  s.t. for any  $v \in \Sigma_F^{\text{fin}} \setminus S(\ell)$ , we have

$$R(\Pi)|_{W_{F_v}} = a\sigma_{n,v}(\Pi_v) \text{ (24.12.3.2)}.$$

Moreover, for each  $v \in \Sigma_F^{\text{fin}}$ , the representation  $\Pi_v$  is tempered.

┘

*Proof:* This is Theorem C of Harris-Taylor. ?

Take  $\pi_f, \xi, \psi$  as in (24.12.7.15),  $a = a(\pi_f)$  (24.12.7.7). Take  $\chi_\psi$  be a character of  $\text{Gal}_F$  corresponding to  $\psi$  under the global class field theory. And let

$$R(\Pi) = [H_\xi^*(\pi_f)]^\vee \otimes \chi_\psi^{-1}.$$

Then the assertion is trivial if  $v \in \Sigma_F^{\text{fin}} \setminus (S_F(\ell) \cup \{x, x^c\})$  is split over  $F_0$  and  $\pi_{p',0}$  is unramified, where  $p' = v \cap \mathbf{Q}$ . ? Then by Chebotarev density theorem, this determines  $\frac{1}{a}R(\Pi)$  uniquely. ? But for any such  $p' \in \text{Prime}$ , we can arrange that  $\pi_{p',0}$  is unramified, so this condition can be dropped.

Now for an arbitrary  $v$ , we can take a real quadratic field  $R$  that is linearly disjoint with  $F$  s.t. the rational prime under  $x$  splits in  $R$ , and the completion of  $R$  and  $\mathcal{K}$  at the rational prime under  $v$  are isomorphic. Let  $\tilde{F}_0 = F_0 R$  and  $\tilde{F} = F R$ , and choose  $\tilde{v}$  and  $\tilde{x}$  above  $v$  and  $x$  in  $\tilde{F}$  s.t.  $\tilde{v} \notin \{\tilde{x}, \tilde{x}^c\}$ .

Then we can take  $\tilde{\Pi} \in \text{Irr}^{\text{auto}}(\text{GL}(n)/\tilde{F})$  to be the cyclic base change of  $\Pi$ , which continues to have the properties listed. Hence we get an  $R(\tilde{\Pi})$  that satisfies the assertion for any  $\tilde{v} \in \Sigma_F^{\text{fin}} \setminus (S_{\tilde{F}}(\ell) \cup \{\tilde{x}, \tilde{x}^c\})$  split over  $\tilde{F}_0$ . By Chebotarev density theorem,  $\frac{1}{a}R(\tilde{\Pi}) = \frac{1}{a}R(\Pi)|_{\text{Gal}_{\tilde{F}}}$ . Then applying the above split case to  $\tilde{v}$  finishes the proof.

Using  $p$ -adic Hodge theory, it would be no problem to show that one can choose  $a = 1$ , cf. proof of Proposition VII.1.8 in [H-T01]. Also, this holds for any CM field  $F$ , cf. proof of Theorem VII.1.9 of [H-T01]. ?  $\square$

**Cor. (24.12.7.17).** Let  $\Pi \in \text{Irr}^{\text{cusp}}(\text{GL}(n)/F)$  s.t.

- $\Pi^\vee \cong \Pi^c$ .
- $\Pi(\frac{n-1}{2})$  is regular  $C$ -algebraic(30.1.3.1).
- $\Pi_x$  is square-integrable for some  $x \in \Sigma_F^{\text{fin}}$  that is split over  $F_0$ .

Then there exists  $a \in \mathbb{Z}_+$  and  $R(\Pi) \in \text{Rep}_{\mathbb{Q}_\ell}^{\text{an}}(\text{Gal}_K)$  s.t. for any  $v \in \Sigma_F^{\text{fin}} \setminus S(\ell)$ , we have

$$R(\Pi)|_{W_{F_v}} = a \text{rec}'_v(\Pi_v)$$

┘

*Proof:* It suffices to find a Hecke character  $\chi$  of  $F$  s.t.  $\chi^{-1} = \chi^c$  and  $\chi_\infty(\frac{n-1}{2})$  is  $C$ -algebraic, which can be done as in the proof of Corollary 7.2.8 of [H-T01]. ?  $\square$

## 8 Lubin-Tate Space

**Prop. (24.12.8.1)[Relation to Lubin-Tate Towers].** Let  $\rho \in \text{Irr}^{\text{adm}}(D_{K,1/n}^\times)$  s.t.  $\text{J-L}(\rho)$  is supercuspidal, then

$$[R\psi][\rho] \cong (-1)^{n-1} \pi^\vee|_{\text{GL}(n; \mathcal{O}_K)} \times \sigma_n(\pi)$$

as a virtual representation of  $\text{GL}(n; \mathcal{O}_K) \times W_K$ . ┘

*Proof:* ?  $\square$

**Cor. (24.12.8.2).** For any  $\pi \in \text{Irr}^{\text{cusp}}(\text{GL}(n; K))$ ,  $\sigma_n(\pi)$  is a genuine representation of  $W_K$ . ┘

*Proof:* By(24.11.3.19), there exists an irreducible representation of  $\text{GL}(n; \mathcal{O}_K)$  that occurs in  $\pi^\vee|_{\text{GL}(n; \mathcal{O}_K)}$  with multiplicity 1. Then by(24.12.8.1),  $\square$

**Prop. (24.12.8.3) [Bijective Correspondence for Supercuspidal Representations].** The correspondences  $\text{rec}'_n$  defined in(24.12.3.2) is a functorial extension of class field theory(24.12.3.7). In particular, it induces a bijection

$$\text{rec}'_n : \text{Irr}^{\text{cusp}}(\text{GL}(n; K)) \cong \text{Rep}^n(W_K)$$

for any  $n \in \mathbb{Z}_+$ . ┘

*Proof:* ? Cf.[Sch13]P705.  $\square$

## 9 Inertial Local Langlands Correspondence

**Prop. (24.12.9.1) [Inertial Correspondence].** Under the local langlands correspondence (24.12.1.2), if  $\pi, \pi' \in \text{Irr}^{\text{adm}, \text{generic}}(GL(n))$ ,

- $\pi|_{\mathcal{K}} \cong \pi'|_{\mathcal{K}}$  iff  $\text{rec}_n(\pi)|_{I_K} \cong \text{rec}_n(\pi')|_{I_K}$ .
- (Paskunas) Let  $\tau$  be a Weil-Deligne inertia type of  $I_K$  that extends to an  $n$ -dimensional irreducible F-semisimple representation of  $W_K$ , then there exists a unique  $\sigma_\tau \in \text{Irr}^{\text{alg}}(K)$  s.t. for any infinite-dimensional  $\pi \in \text{Irr}^{\text{adm}}(GL(n; K))$ ,  $\pi|_{\mathcal{K}}$  contains  $\sigma_\tau$  iff  $\text{rec}_n(\pi)|_{I_K} \cong \sigma$ .

┘

*Proof:*

**Notation(25.1.0.1).**

- Use notations on representations defined in [Smooth Representations](#).
- Use notations on positive characteristic representations defined in [Positive Characteristic Representations](#).
- Use notations on Galois cohomology defined in [Cohomology of Arithmetic Fields](#).

┘

**Remark(25.1.0.2).** For  $K \in \mathbf{Field}$ ,  $E \in \mathbf{Field}^{\text{top}}$ , the theory of Galois representations study the category  $\mathcal{R}\text{ep}_E^{\text{fd}}(\text{Gal}_K)$ .

┘

#### 1 Basics

**Def.(25.1.1.1)[Galois Representations].** For any  $K \in \mathbf{Field}$ ,  $p \in \mathbf{Prime}$ ,

- an **Artin representation** of  $K$  is a f.d. smooth  $\mathbb{C}$ -representation of  $\text{Gal}_K$ .
- a  **$p$ -adic Galois representation** of  $K$  is a f.d. continuous  $\mathbb{Z}_p$ -representation of  $\text{Gal}_K$ . If  $K \in p\text{-LField}$ , this is called a  **$p$ -adic local Galois representation**(of  $K$ ).
- a  **$p$ -adic integral Galois representation** of  $K$  is a f.d. continuous  $\mathbb{Q}_p$ -representation of  $\text{Gal}_K$ . If  $K \in p\text{-LField}$ , this is called a  **$p$ -adic local integral Galois representation**(of  $K$ ).
- if  $K \in p\text{-LField}$ ,  $\ell \in \mathbf{Prime} \setminus \{p\}$ , then an  **$\ell$ -adic Galois representation** of  $K$  is a f.d. continuous  $\mathbb{Q}_\ell$ -representation of  $\text{Gal}_K$ .

┘

**Cor.(25.1.1.2)[Artin Representations as  $\ell$ -adic(or  $p$ -adic) Representations].** A choice of isomorphism(19.1.2.18)  $\overline{\mathbb{Q}}_p \cong \overline{\mathbb{Q}}_\ell \cong \mathbb{C}$  induces a bijection between Artin representations and  $\ell$ -adic(or  $p$ -adic) representations with open kernels.

┘

**Prop.(25.1.1.3)[Brauer-Nesbitt].** If two  $n$ -dimensional representations have the same char polynomial and  $\text{char } k = 0$ , or  $\text{char } k > n$  and they have the same character, then their semisimplification are the same.

┘

*Proof:* The proof is not hard, use the Artin-Wedderburn theorem, and the fact the representation may not be semisimple.  $\square$

**Def. (25.1.1.4) [Restricted Local Galois Representations].** By (19.3.1.24), if  $F \in \mathbf{GField}$ , for any  $v \in \Sigma_F$ , a Galois representation  $\rho$  of  $F$  can be restricted to a Galois representations  $\rho_v$  of  $\mathrm{Gal}_{F_v}$ , called the **restricted local Galois representation**.  $\lrcorner$

**Def. (25.1.1.5) [Cyclotomic Characters and Tate Twists].** For  $K \in \mathbf{Field}$  and  $p \in \mathbf{Prime}$ , the  $p$ -adic **cyclotomic character**  $\chi_p$  of  $\mathrm{Gal}_K$  is the character corresponding to the 1-dimensional  $p$ -adic Tate module of  $\mathbb{G}_{a,K}$ .

For any  $(\rho, V) \in \mathrm{Rep}_{\mathbb{Z}_p}^{\mathrm{fd}}(\mathrm{Gal}_K)$  or  $(\rho, V) \in \mathrm{Rep}_{\mathbb{Q}_p}^{\mathrm{fd}}(\mathrm{Gal}_K)$ , we can define the **Tate twist**  $\rho(n)$  for any  $n \in \mathbb{Z}$  as the representation twisted by  $n$ -th power of the cyclotomic character  $\chi_p^n$ .  $\lrcorner$

**Def. (25.1.1.6) [Tate Duals].** For any  $(\rho, V) \in \mathrm{Rep}_{\mathbb{Z}_p}^{\mathrm{fd}}(\mathrm{Gal}_K)$  or  $(\rho, V) \in \mathrm{Rep}_{\mathbb{Q}_p}^{\mathrm{fd}}(\mathrm{Gal}_K)$ , the **Tate dual**  $V^D$  of  $V$  is defined to be  $V^D = V^\vee(1)$ .  $\lrcorner$

## 2 $\ell$ -adic Local Galois Representations

**Def. (25.1.2.1) [Notations].**

- Let  $p \in \mathbf{Prime}$ ,
- Let  $(K, \mathcal{O}_K, \varpi_K, \kappa) \in p\text{-LField}$  with  $\#\kappa = q$ .
- Let  $\ell \in \mathbf{Prime} \setminus \{p\}$ .
- $t_\ell : I_K/R_K \rightarrow \mathbb{Z}_\ell$  be the additive  $\ell$ -adic tame character (19.1.5.25).
- Let  $\sigma_K \in \mathrm{Gal}_K$  be a fixed geometric Frobenius element.
- Let  $\chi = \chi_\ell$  be the unramified cyclotomic character (25.1.1.5)  $\widehat{\mathbb{Z}} \cong \mathrm{Gal}_K/I_K \rightarrow \mathbb{Z}_\ell : \sigma_K \mapsto q$ .  $\lrcorner$

**Def. (25.1.2.2) [Properties of Galois Representations].** For  $A \in \mathbf{TopCRing}$  and  $\rho \in \mathrm{Rep}_A^{\mathrm{fd}}(\mathrm{Gal}_K)$ ,

- $\rho$  is called an **odd representation** if  $\det \rho(c) = -1$ , and an **even representation** otherwise.
- $\rho$  is said to be an **unramified Galois representation** if  $\rho(I_K) = 1_A$ .
- $\rho$  is said to be a **flat Galois representation** if for any Artinian quotient  $A/I$  of  $A$ , the quotient representation  $\bar{\rho}|_{\mathrm{Gal}_K}$  is isomorphic to the representation of  $\mathrm{Gal}_K$  on the geometric points of a finite flat group scheme over  $\mathcal{O}_K$ .
- If  $\rho \in \mathrm{Rep}_{\mathbb{Q}_\ell}^2(\mathrm{Gal}_K)$ , then it is said to be a **Steinberg-type Galois representation** if its corresponding Weil-Deligne representation (25.1.2.26) is isomorphic to  $(\chi_\ell \otimes \mathrm{id}, \mathbb{Q}_\ell^2, \begin{bmatrix} 0 & 1 \\ 0 & 0 \end{bmatrix})$ .  $\lrcorner$

**Prop. (25.1.2.3).** If  $(\rho, V) \in \mathrm{Rep}^n(\Gamma)$ , then it has a filtration  $0 = V_0 \subset V_1 \subset \dots \subset V_n = V$  where  $V_{i+1}/V_i$  is irreducible, then there is a semisimplification of  $\rho$ , which is  $\rho^{\mathrm{ss}} = \oplus V_{i+1}/V_i$ .  $\lrcorner$

**Prop. (25.1.2.4) [Induced Galois Representations].** Let  $n \in \mathbb{Z}_+$  s.t.  $p \nmid n$ , then any  $(\rho, V) \in \mathrm{Irr}^n(\mathrm{Gal}_K)$  is induced from a character  $\chi$  of  $L^\times$  for a field extension  $L/K$  of degree  $n$ .  $\lrcorner$

*Proof:* Suppose  $\chi$  factors through a normal subgroup  $\mathrm{Gal}(L/K)$ . It suffices to show  $\rho$  is an induced representation from a subgroup, then use induction. Suppose it is not, then consider the filtration of Galois groups  $R_{L/K} \subset I_{L/K} \subset \mathrm{Gal}(L/K)$ .  $R_v$  is a pro- $p$ -group, thus all irreducible f.d. representations are  $p$ -powers, by (24.1.3.17), thus it is 1-dimensional. Now  $R_v$  is a normal subgroup, by (24.1.2.15),  $R_v$  acts by scalars on  $V$ . Now the exact sequence  $1 \rightarrow R_v \rightarrow I_v \rightarrow I_v/R_v \rightarrow 0$  is a

split exact sequence(19.1.4.18), and  $I_v/R_v$  is cyclic, thus  $\rho|_{I_v}$  also contains a character, and the same argument as above shows  $I_v$  acts by characters. Then a twist of  $\rho$  factors through  $G/I_v$ , which is a cyclic group, contradiction.  $\square$

### Artin and Swan Conductors

**Def.(25.1.2.5) [Local Artin and Swan Conductors, Artin[Art31]].** For  $(\rho, V) \in \text{Rep}^{\text{fd}}(\text{Gal}_K)$ , define the **Artin conductor(local)**

$$a(\rho) = a(\chi_\rho) = \sum_{i \in \mathbb{N}} \frac{1}{[G_0 : G_i]} \dim(V/V^{G_i})$$

and the **Swan conductor(local)**

$$b(\rho) = b(\chi_\rho) = \sum_{i \in \mathbb{Z}_+} \frac{1}{[G_0 : G_i]} \dim(V/V^{G_i}).$$

where  $G_i$  are the higher ramification groups of  $G$ (19.1.4.20).  $\lrcorner$

**Prop.(25.1.2.6) [Functoriality of Artin  $L$ -Factors, Artin[Art31]].** The Artin and Swan conductors(25.1.2.5) satisfy the following functorial properties:

- $L_v(F, \mathbf{1}; s) = L_v(\mathbf{1}; s)$ (31.1.1.1).
- For  $\rho, \rho' \in \text{Rep}^{\text{fd}}(\text{Gal}_K)$ , we have

$$a(\rho \oplus \rho') = a(\rho) + a(\rho'), \quad b(\rho \oplus \rho') = b(\rho) + b(\rho')$$

- If  $K \subset_{\text{fin}} M$ ,  $\rho \in \text{Rep}^{\text{fd}}(\text{Gal}_M)$ , then

$$a(\text{Ind}_K^M \rho) = v(\mathfrak{d}_{M/K}) \dim \rho + a(\rho) \cdot f_{M/K}.$$

$\lrcorner$

*Proof:* ?  $\square$

**Prop.(25.1.2.7) [Conductor-Discriminant Formula].** For  $L/F \in \text{GalField}^{\text{fin}}$ ,

$$\text{disc}(L/F) = \prod_{\rho \in \text{Irr}(\text{Gal}(L/F))} \mathfrak{f}(F, \rho)^{\dim \rho}.$$

$\lrcorner$

*Proof:* Cf.[Neu99]P534.  $\square$

### Weil Representations

References are [Wed08, Yao17, G-R10].

**Prop.(25.1.2.8) [Primitive Weil Representation].**  $\pi \in \text{Rep}^{\text{fd}}(W_K)$  is called **primitive** if it is not induced from a representation of a proper subgroup. Then for any primitive representation of  $W_F$ , it factors through  $C_{E/F}$  for some finite extension  $E/F$  by continuity, and by Clifford's theorem(24.1.2.15), the normal subgroup  $C_E$  acts by scalars, so the image of  $W_{E/F}$  in  $\text{GL}(V)$  is a finite group.  $\lrcorner$

**Def. (25.1.2.9) [Twisting Character of  $W_K$ ].** For  $s \in \mathbb{C}$ , define the quasi-character  $\omega_s : W_F \rightarrow \mathbb{C}^\times$  :  
 $x \mapsto \|x\|^s$ .  $\lrcorner$

**Prop. (25.1.2.10) [Twisting of Weil Representation, Deligne].**  $\rho \in \text{Irr}(W_K)$  factors through  $\text{Gal}_K$  iff  $\#\rho(W_K) < \infty$ .

For any  $\rho \in \text{Irr}(W_K)$ , there exists some  $s \in \mathbb{C}$  that  $\omega_s \otimes \rho$  factors through  $W_K \rightarrow \text{Gal}_K$ .  $\lrcorner$

*Proof:*  $\ker(\rho|_{I_K})$  is an open subgroup of  $I_K$ . Conjugation by  $\sigma$  induces a permutation on the finite subgroup  $\rho(I_K)$ , so there is some  $n$  that  $\rho^n = \text{id}$  on  $\rho(I_K)$ , which means  $\rho(\sigma^n)$  commutes with each elements of  $W_K$ , thus it is a scalar by Schur's lemma. Thus we can chose  $s$  that  $(\omega_s \otimes \rho)(\sigma^n) = 0$ , then  $\omega_s \otimes \rho$  is trivial on  $U = \langle \sigma^n, \ker(\rho|_{I_K}) \rangle$ , which is a subgroup of  $W_F$  of finite index. Thus the image is finite.

Also the closed subgroup  $\overline{U} = \overline{\langle \sigma^n, \ker(\rho|_{I_K}) \rangle} \subset \text{Gal}_K$  if of finite index, and  $\overline{U} \cap W_K = U$ , thus  $W_K/U \cong \text{Gal}_K/\overline{U}$ , and this representation extends to  $\text{Gal}_K$ .  $\square$

**Cor. (25.1.2.11) [Galois-Type Representations].** As  $W_K$  is dense in  $\text{Gal}_K$ ,  $\text{Rep}^{\text{fd}}(\text{Gal}_K) \subset \text{Rep}^{\text{fd}}(W_K)$  as a full subcategory. The representations in this subcategory are called **representations of Galois-type**.

(25.1.2.10) shows  $\text{Irr}(\text{Gal}_K)$  is almost the same as  $\text{Irr}(W_K)$ .  $\rho \in \text{Irr}(W_K)$  is of Galois-type iff it has a finite image.  $\lrcorner$

**Prop. (25.1.2.12) [Semisimple Weil Representations].** Let  $L \in \text{Field}$ ,  $\overline{L} = L$  and  $\rho \in \text{Rep}_L^{\text{fd}}(W_K)$  that  $\#\rho(I_K) < \infty$ , the following are equivalent:

- $\rho(\sigma)$  is semisimple for any  $\sigma \in W_K$ .
- $\rho(\sigma_K)$  is semisimple.
- $\rho$  is a semisimple representation.

$\lrcorner$

*Proof:* Because  $\langle \rho(\sigma_K) \rangle$  is a subgroup of  $\rho(W_K)$  of finite index, 1 and 3 are equivalent by (24.1.2.16).

Notice that for any  $x \in W_K$ , there exists  $n \in \mathbb{Z}_+$  s.t.  $\rho(x^n)$  lies in the center of  $\rho(W_K)$ : ?

Then there exists ? Cf. [Yao17]P4.  $\square$

**Def. (25.1.2.13) [ $\ell$ -Integral Representations].** For  $\rho \in \text{Rep}_{\mathbb{Q}_\ell}^{\text{fd}}(W_K)$ , by (25.1.2.10), the eigenvalues of  $r$  are  $\ell$ -adic units iff the eigenvalues of  $\rho(\sigma) \in \mathcal{O}_{\mathbb{Q}_\ell}^*$ , iff the characteristic polynomial of  $\rho(\sigma)$  are in  $\mathcal{O}_{\mathbb{Q}_\ell}[T]$  and  $|\det(\rho(\sigma))| = 1$ . Such a representation is called an  **$\ell$ -integral representation**.  $\lrcorner$

**Def. (25.1.2.14) [Types of 2-Dimensional Representations].** By (25.1.2.8), any  $\rho \in \text{Rep}^2(W_F)$  has finite image in  $\text{PGL}(2; \mathbb{C}) \cong \text{SO}(3; \mathbb{R})$  (16.6.1.13). Thus by conjugacy into  $\text{SO}(3; \mathbb{R})$ , the image is isomorphic to a cyclic, dihedral, tetrahedral, octahedral or icosahedral group by (15.4.1.8), called the **type of Artin representation**.  $\lrcorner$

**Def. (25.1.2.15) [Dihedral Weil Representation].** A **dihedral Weil representation** is a representation  $W_F \rightarrow \text{GL}(2; \mathbb{C})$  that is induced from a quasi-character of  $W_E$  for some quadratic extension  $E/F$ . (What's the relation with (25.1.2.14)?)  $\lrcorner$

**Prop. (25.1.2.16) [Induced Weil Representations].** If  $(p, n) = 1$  and  $K \in p\text{-NField}$ , then any  $\rho \in \text{Irr}^n(W_K)$  is induced from a quasi-character of  $W_L$  (equivalently  $E^\times$ ) where  $L/K \in p\text{-LField}$ ,  $[L : K] = n$ .  $\lrcorner$

*Proof:* By (24.7.4.4), the class of such induced extensions are stable under twisting by  $\omega_s$ , thus using (25.1.2.10), we can assume that the representation factors through  $\text{Gal}_F$ , thus through  $\text{Gal}(K/F)$  for some finite extension  $K/F$ , thus the assertion follows from (25.1.2.4).  $\square$

### Weil-Deligne Representations

References are [G-R10].

**Def. (25.1.2.17)[Weil-Deligne Groups].** The **Weil-Deligne group**  $\mathrm{WD}_K$  is the group scheme  $W_K \rtimes \mathbb{G}_a \in \mathrm{GrpSch}/\mathbb{Q}$  given by the action

$$wxw^{-1} = |w|x.$$

┘

**Def. (25.1.2.18)[Weil-Deligne Representations, Weil[Wei51]/Deligne].** For  $L \in \mathrm{Field}^0$ , the category  $\mathfrak{wd}_L(W_K)$  of **Weil-Deligne representations** of  $W_K$  over  $L$  consists of triples  $(\rho, V, N)$ , where  $(\rho, V) \in \mathrm{Rep}_L^{\mathrm{alg}, \mathrm{fin}}(W_K)$  and  $N \in \mathrm{End}(V)$  s.t.

$$\mathrm{Ad}(\rho(x))N = |x|.N, \text{ where } x \in W_K.$$

Equivalently, a Weil-Deligne representation is a  $(\rho, V) \in \mathrm{Rep}_L^{\mathrm{alg}, \mathrm{fin}}(W_K)$  together with a map  $N : V \mapsto V(1) \in \mathrm{Rep}_L^{\mathrm{alg}, \mathrm{fin}}(W_K)$  (25.1.1.5).

Equivalently, a Weil-Deligne representation is a representation of the group scheme  $\mathrm{WD}_K$  (25.1.2.17) over  $L$ , by ?.

$\mathfrak{wd}_{\mathbb{C}}(W_K)$  is also denoted by  $\mathfrak{wd}(W_K)$ .

┘

**Prop. (25.1.2.19).** For  $L \in \mathrm{Field}^0$  and  $(\rho, V, N) \in \mathfrak{wd}_L(W_K)$ ,  $N$  is nilpotent.

And  $(\rho, V, N)$  is irreducible iff  $N = 0$  and  $\rho$  is irreducible.

┘

*Proof:* Because  $q^{-1} \cdot N = \sigma N \sigma^{-1} \cong N$ , if  $\lambda$  is an eigenvalue of  $N$ , then  $\lambda/p$  is also an eigenvalue of  $N$ . So  $N$  has no non-zero eigenvalues, thus nilpotent. The last assertion follows from the fact  $\ker N$  is stable under  $W_K$ .  $\square$

**Remark (25.1.2.20).**  $\ell$ -adic Weil-Deligne representations are exactly the continuous  $\ell$ -adic representations of  $W_K$ , as will be illustrated in (25.1.2.26).  $\square$

**Def. (25.1.2.21).** Define tensor product and inner Homs:  $(\rho_1, V_1, N_1) \otimes (\rho_2, V_2, N_2) = (\rho_3, V_3, N_3)$  where

$$V_3 = V_1 \otimes V_2, \quad \rho_3(x)(v_1 \otimes v_2) = \rho_1(x)v_1 \otimes \rho_2(x)v_2, \quad N_3(v_1 \otimes v_2) = N_1(v_1) \otimes v_2 + v_1 \otimes N_2(v_2).$$

and also  $\mathrm{Hom}((\rho_1, V_1, N_1), (\rho_2, V_2, N_2)) = (\rho_3, V_3, N_3)$  where

$$V_3 = \mathrm{Hom}(V_1, V_2), \quad (\rho_3(x)\varphi)(v_1) = \rho_2(x)(\varphi(\rho_1(x)^{-1}(v_1))), \quad (N_3\varphi)(v_1) = N_2(\varphi(v_1)) - \varphi(N_1(v_1)).$$

And also the dual  $\rho^\vee = \mathrm{Hom}(\rho, \mathbf{1})$ .

┘

**Def. (25.1.2.22) [Properties of Weil-Deligne Representations].**  $\rho = (\rho_0, V, N) \in \mathfrak{wd}_L(W_K)$  is called

- **Frobenius-semisimple** if  $\rho_0(\sigma_K)$  is semisimple.
- **unramified** if  $\rho_0(I_K) = \mathbf{1}$  and  $N = \mathbf{0}$ .
- **$I_K$ -spherical** if  $\rho_0(I_K) = \mathbf{1}$ .

┘

**Def. (25.1.2.23)**  $[\mathrm{Sp}(m)]$ . For  $m \in \mathbb{Z}_+$ , define the representation  $\mathrm{Sp}_m(\rho) \in \mathfrak{wd}(W_K)$  given by

$$\mathrm{Sp}(m) = \mathbb{C}\{e_0, \dots, e_{m-1}\}$$

with

$$\mathrm{Sp}_m(x)(e_i) = |x|^i e_i, \quad N e_i = e_{i+1} (e_m = 0)$$

Then  $(\rho, V, N) \in \mathfrak{wd}(W_K)$  is indecomposable iff it is of the form  $\rho_0 \otimes \mathrm{Sp}_m$  where  $\rho_0 \in \mathrm{Irr}(W_K)$  and  $m \in \mathbb{Z}_+$ .  $\lrcorner$

**Thm. (25.1.2.24)** **[Grothendieck's  $\ell$ -adic Monodromy Theorem]**. For  $\mathbb{Q}_\ell \subset_{\mathrm{fin}} L$  and  $(\rho, V) \in \mathrm{Rep}_L^{\mathrm{fd}}(W_K)$ ,

- There exists an open subgroup  $I'_K \leq I_K$  and a uniquely determined nilpotent operator  $N \subset \mathrm{End}(V)$  s.t. for all  $\sigma \in I'_K$ ,  $\rho(\sigma) = \exp(t_\ell(\sigma)N)$ .
- For any  $x \in W_K$ ,

$$\rho(x)N\rho(x^{-1}) = |x|.N.$$

$\lrcorner$

*Proof:* The uniqueness of  $N$  is clear. Conversely, by continuity  $\mathrm{Gal}_K$  stabilizes an  $\mathcal{O}_L$ -lattice of  $V$ , and reduction modulo  $\ell$  gives a representation  $\bar{\rho}$ .  $\ker(\bar{\rho}) \subset \mathrm{Gal}_K$  corresponds to a finite extension  $K''/K$ . Since the kernel of  $\mathrm{GL}(\Lambda) \rightarrow \mathrm{GL}(\Lambda/(\ell))$  is pro- $\ell$ , we see that action of  $\rho|_{I_{K''}}$  must factor through the tame character  $t_\ell : I_{K''} \rightarrow \mathbb{Z}_\ell(1)$ . Because for any  $x \in \mathrm{Gal}_{K''}$ ,  $t_\ell(x\sigma x^{-1}) = \chi_{\mathrm{cycl}}(x)t_\ell(\sigma)$  (19.1.5.25), so if  $a$  is an eigenvalue of  $\sigma$ , then  $a^{\chi(x)}$  is also an eigenvalue of  $\sigma$  for any  $x \in \mathrm{Gal}_{K''}$ . This implies  $a$  is a root of unity, and implies that there exists a finite extension  $K'/K''$  s.t.  $\rho(I_{K'})$  are all unipotent. Let  $\sigma' \in I_{K'}$  s.t.  $\rho(\sigma')$  is a topological generator of  $\rho(I_{K'})$ , and define  $N = \log(\rho(\sigma'))$ , then this  $N$  satisfies the property.  $\square$

**Cor. (25.1.2.25)** **[Potentially Unramified]**. If  $\mathbb{Q}_\ell \subset_{\mathrm{fin}} L$  and  $\rho \in \mathrm{Rep}_L^{\mathrm{alg}, \mathrm{fin}}(W_K)$  is semisimple, then  $\#\rho(I_K) < \infty$ .  $\lrcorner$

*Proof:* Choose a finite extension  $K'/K$  s.t.  $I_{K'} \subset I'_K$  as in (25.1.2.24), then  $\rho|_{I_{K'}}$  is both unipotent and semisimple (24.1.2.15).  $\square$

**Thm. (25.1.2.26)** **[ $\ell$ -adic Weil-Deligne Representations, Deligne]**. For  $\mathbb{Q}_\ell \subset_{\mathrm{fin}} L$ , there is an equivalence of categories

$$\mathrm{WD}_\ell : \mathrm{Rep}_L^{\mathrm{fd}}(W_K) \cong \mathfrak{wd}_L(W_K) : (\rho, V) \mapsto (\rho_\sigma, V, N)$$

where  $N$  is given in (25.1.2.24), and for any  $x \in I_K$ ,

$$\rho_\sigma(\sigma_K^n x) = \rho(\sigma_K^n x) \exp(-t_\ell(x)N).$$

Moreover, by (25.1.2.11) and (25.1.2.13), this map induces an equivalence:

$$\mathrm{WD}_\ell : \mathrm{Rep}_L^{\mathrm{fd}}(\mathrm{Gal}_K) \cong \mathfrak{wd}_L^{\ell\text{-int}}(W_K).$$

And  $\rho$  is unramified iff  $\mathrm{WD}_\ell(\rho)$  is unramified.  $\lrcorner$

*Proof:* The image is a Weil-Deligne representation by (25.1.2.24).  $\mathrm{WD}_\ell$  is a functor and is an equivalence by the uniqueness of  $N$  (25.1.2.24).  $\square$

**Cor. (25.1.2.27)**. For  $\mathbb{Q}_\ell \subset_{\mathrm{fin}} L$  and  $\rho \in \mathrm{Rep}_L^{\mathrm{fd}}(\mathrm{Gal}_K)$  with  $\mathrm{WD}_\ell(\rho) = (\rho_0, N)$  (25.1.2.26), the following are equivalent:

- $\rho$  is potentially semisimple.
- $\rho$  is  $\sigma_K$ -semisimple and  $\#\rho(I_K) < \infty$ .
- $\rho_0$  is  $\sigma_K$ -semisimple and  $N = 0$ .

┘

*Proof:* 1 and 3 are equivalent by (25.1.2.26). 3 implies 2 is obvious. To show 2 implies 1, notice  $\rho \otimes \bar{L}$  is a semisimple representation of  $\langle \rho(\sigma_K) \rangle$ , which is a subgroup of finite index of  $\rho(\text{Gal}_K)$ , so by (24.1.2.16),  $\rho \otimes \bar{L}$  is a semisimple representation of  $\text{Gal}_K$ .  $\square$

**Def. (25.1.2.28) [Induction of Weil-Deligne Representations].** For  $L/K \in p\text{-LField}$  and let  $(\rho_0, V, N) \in \mathfrak{w}\mathfrak{d}(W_L)$ , define the **induction**

$$\text{Ind}_K^L(\rho_0, N) = (\text{Ind}_L^K \rho_0, \tilde{N}), \quad \text{where } (\tilde{N}f)(g) = |g|.N(f(g)) \quad \forall f : W_K \rightarrow V \in \text{Ind}_K^L(V).$$

And restrictions are defined routinely.  $\square$

### 3 Mod $\ell$ Local Galois Representations

**Notation (25.1.3.1).** Use notation as in (25.1.2.1).  $\square$

**Def. (25.1.3.2) [Decomposed Generically].** An unramified representation

$$\bar{\rho} : \text{Gal}_K \rightarrow \text{GL}(n, \overline{\mathbb{F}}_\ell)$$

is called **decomposed generically** if the eigenvalues  $\{\lambda_1, \dots, \lambda_n\}$  of  $\bar{\rho}(\varphi)$  satisfies  $\lambda_i/\lambda_j \notin \{1, q\}$  for any  $1 \leq i \neq j \leq n$ .  $\square$

### 4 Global Galois Representations

**Def. (25.1.4.1) [Global Artin and Swan Conductors].** Let  $L/F \in \text{GField}$  and  $(\rho, V) \in \text{Rep}^{\text{fd}}(\text{Gal}(L/F))$ . For  $v \in \Sigma_F^{\text{fin}}$ , let  $G_v = G_{v,0} \supset G_{v,1} \supset \dots \supset G_{v,m} = 0$  be higher ramification groups at  $v$ , then the **Artin conductor(global)** of  $\rho$  is defined to be the ideal in  $\mathcal{O}_F$ :

$$\mathfrak{f}(\rho) = \prod_{v \in \Sigma_F^{\text{fin}}} \mathfrak{p}_v^{f_v(\rho)}, \quad f_v(\rho) = f(\rho_v) \quad (25.1.2.5).$$

And the **Swan conductor(global)**

$$\mathfrak{b}(\rho) = \prod_{v \in \Sigma_F^{\text{fin}}} \mathfrak{p}_v^{b_v(\rho)}, \quad b_v(\rho) = b(\rho_v) \quad (25.1.2.5).$$

┘

**Prop. (25.1.4.2) [Conductor-Discriminant-Formula].** For any Galois extension of global fields  $L/F$ ,

$$\mathfrak{d}_{L/F} = \prod_{\rho \in \text{Irr}(\text{Gal}(L/F))} \mathfrak{f}(F, \rho)^{\chi_\rho(1)}$$

┘

*Proof:* Cf. [Neu99]P534.  $\square$

## 5 Deforming Galois Representations(Mazur)

**Def.(25.1.5.1) [ $p$ -Finiteness Condition,  $\Phi_p$ ].**  $G \in \text{ProfGrp}$  is said to satisfy the  $p$ -finiteness condition  $\Phi_p$  if the following equivalent conditions hold:

- The pro- $p$ -completion of  $G$  is topologically f.g..
- The Abelianization  $G_0$  of the pro- $p$ -completion of  $G$  is finite over  $\mathbb{Z}_p$ .
- $\# \text{Hom}(G_0, \mathbb{F}_p) < \infty$ .

┘

**Prop.(25.1.5.2).** Algebraic fundamental groups of smooth varieties over  $\mathbb{Z}$  satisfy the  $p$ -finiteness condition.

In particular, if  $K \in p\text{-LField}$ ,  $\text{Gal}_K$  satisfies the  $p$ -finiteness condition. And if  $F \in \text{NField}$  and  $\emptyset \subset_{\text{fin}} S \subset \Sigma_F$ , then  $\text{Gal}_{F,S}$  satisfies the  $p$ -finiteness condition.

┘

*Proof:* ?

□

**Prop.(25.1.5.3).** Let  $(A, k)$  be a Noetherian complete local ring and  $\Pi \in \text{ProfGrp}$ , then for any continuous representation  $\rho : \Pi \rightarrow \text{GL}(n; A)$ , the residue representation  $\bar{\rho}$  is absolutely irreducible iff

$$r : A[[\Pi]] \rightarrow \text{Mat}(n; A)$$

is subjective.

┘

*Proof:*

□

**Def.(25.1.5.4) [Residual Representation].** Let  $F \in \text{NField}$  and  $W \in \text{Irr}_{\mathbb{Q}_\ell}(\text{Gal}_F)$ . Choose any invariant  $\overline{\mathcal{O}_\ell}$ -lattice  $L \subset W$ , we can consider the residual representation  $\text{Gal}_F \rightarrow \text{GL}(L) \rightarrow \text{GL}(L/(p))$ . Then this residual representation is uniquely determined up to semisimplification, called the **residual representation** of  $W$ .

┘

*Proof:* ?

□

**Def.(25.1.5.5) [Deformations of Representations].** Let  $G \in \text{Grp}$ ,  $\text{pr} : A_1 \rightarrow A$  be a map of Noetherian complete local rings that induces an isomorphism on residue fields, and  $\rho \in \text{Rep}_{A_0}^{\text{fd}}(G)$ , then a **deformation representation** of  $\rho$  to  $A_1$  is an equivalence class of  $\rho_1 \in \text{Rep}_{A_1}^{\text{fd}}(G)$  s.t.  $\text{GL}(\text{pr}) \circ \rho_1 = \rho$ , where two such  $\rho_1$  are equivalent iff they are conjugate by an element in  $\ker(\text{GL}(\text{pr}))$ .

┘

**Def.(25.1.5.6) [Galois Deformation Theorems].** Fix  $\ell \in \text{Prime}$ ,  $F \in \text{NField}$ , and  $\bar{\rho} : \text{Gal}_F \rightarrow \text{GL}(n; \overline{\mathbb{F}_\ell})$ , we want to lift  $\bar{\rho}$  to a compatible Galois representation of  $\text{Gal}_F$  over some number field  $E$ . Consider the following hypothesizes:

**Residual Conditions** Conditions on the representation  $\bar{\rho}$ , e.g. irreducible/surjective.

**Semi-Global Conditions** Conditions on the lifting  $\rho : \text{Gal}_F \rightarrow \text{GL}(n; \overline{\mathbb{Q}_\ell})$ , e.g. fixed determinant/self-dual/skew-self-dual.

**Local Conditions at  $w$**  Conditions on the restriction of the lifting  $\rho : \text{Gal}_F \rightarrow \text{GL}(n; \overline{\mathbb{Q}_\ell})$  to  $\text{Gal}_{F_w}$  for some  $w \in \Sigma_F$ .

Then a **deformation problem theorem** is a theorem of the following form:

If  $\bar{\rho}$  satisfies the **Residual Conditions**, and if some lifting  $\rho : \text{Gal}_F \rightarrow \text{GL}(n; \overline{\mathbb{Q}_\ell})$  satisfies the **Semi-Global Conditions** and **Local Conditions at  $w$**  for any  $w \in \Sigma_F$ , and is strongly potentially automorphic(30.1.4.2) over a number field  $E$  with some conditions, then any lifting satisfying the **Semi-Global Conditions** and **Local Conditions at  $w$**  for any  $w \in \Sigma_F$  is strongly potentially automorphic over the same number field  $E$ .

┘

### Deformation Spaces

**Thm. (25.1.5.7) [Representability of Deformation Problems].** Let  $N \in \mathbb{Z}_+$  and  $\bar{\rho} : \text{Gal}_{F,S} \rightarrow \text{GL}(N; k)$  be absolutely irreducible, then the deformation problem:

$$\{ \text{Noetherian complete local rings with residue field } k \} \rightarrow \text{Set} : A \mapsto \{ \text{Set of liftings of } \bar{\rho} \text{ to } A \}$$

is representable by a universal object

$$\rho : \text{Gal}_{F,S} \rightarrow \text{GL}(N; R(\bar{\rho})).$$

┘

*Proof:* ?

□

**Prop. (25.1.5.8) [Schlessinger's Criteria].**

┘

**Remark (25.1.5.9).** Determination of the Krull dimension of  $R(\bar{\rho})$  is equivalent to the determination of the truth or falsity of the Leopoldt Conjecture for  $p$  and the number field  $K$ . ?

┘

### Zariski Tangent Spaces

## 6 Representations from Geometry

**Prop. (25.1.6.1).** Let  $k \in \text{Field}$  and  $E \in \text{EllCur}/k$ , then for any  $N \in \mathbb{Z} \cap k^\times$ , there is an action of  $\text{Gal}_k$  on  $E[N] \cong (\mathbb{Z}/(N))^2$ , giving a representation

$$\rho_{E,N} : \text{Gal}_k \mapsto \text{GL}(2, \mathbb{Z}/(N)).$$

Let  $\bar{\rho}_{E,N}$  denote the representation  $\text{Gal}_k \mapsto \text{GL}(2, \mathbb{Z}/(N))/\{\pm 1\}$ . Then  $\rho_{E,N}$  is surjective iff  $\bar{\rho}_{E,N}$  is surjective.

┘

*Proof:* Notice if  $\bar{\rho}_{E,N}$  is surjective, then either  $\begin{bmatrix} & -1 \\ 1 & \end{bmatrix}$  or  $\begin{bmatrix} & 1 \\ -1 & \end{bmatrix}$  is in the image, thus  $-1$  is in the image.

□

**Def. (25.1.6.2) [Tate modules representations].** For  $\ell \in \mathbf{P}$ , the action of  $\text{Gal}_k$  on the Tate module  $T_\ell(E)$  (20.9.6.19) is denoted by  $\rho_{E,\ell^\infty}$ . Equivalently,

$$\rho_{E,\ell^\infty} = \varprojlim_{n \in \mathbb{Z}_+} \rho_{E,\ell^n}.$$

If  $\text{char } k = 0$ , we can assemble all the  $T_\ell(E), \ell \in \mathbf{P}$  together to get a representation

$$\rho_E : \text{Gal}_k \rightarrow \text{End}(E(k^s)_{\text{tor}}) \cong \text{GL}(2, \hat{\mathbb{Z}}).$$

┘

**Prop. (25.1.6.3) [Determinant of Tate Modules].** If  $(K, k)$  be a CDVR and  $E \in \text{EllCur}/K, \ell \in \mathbf{P} \setminus \{\text{char } k\}$ , then  $\det(\rho_{E,\ell^\infty}) \cong \chi_\ell$  (25.1.1.5), by Weil pairing (20.9.7.10).

┘

**Prop. (25.1.6.4) [Serre].** If  $p \in \text{Prime}$  and  $\mathbb{Q}_p \subset_{\text{fin}} K$  is a local field with ramification index  $e$ . Let  $E \in \text{EllCur}/K$  with semistable reduction, then if  $2e < p - 1$ , then the image of  $I_K$  under the projective representation associated to  $\rho_{E,p}$  contains an element of order  $\geq (p - 1)/e$ .

┘

*Proof:* ? □

**Thm. (25.1.6.5) [Serre].** Assume  $E \in \text{EllCur}/\mathbb{Q}$  is non-CM, then  $\text{Im}(\rho_E) \subset \text{GL}(2, \widehat{\mathbb{Z}})$  has finite index.  
In particular, there exists  $N \in \mathbb{Z}_+$  s.t.  $\rho_{E,p}$  is surjective for any  $p \geq N$ . ┘

*Proof:* Cf. [Abelian l-adic representations and elliptic curves, Serre]. ? □

**Conj. (25.1.6.6) [Serre's Uniformity Problem].** There exists a number  $N \in \mathbb{Z}_+$  s.t. for any  $E \in \text{EllCur}/\mathbb{Q}$  non-CM,  $\rho_{E,p}$  is surjective for any  $p \in \text{Prime}_{\geq N}$ . ┘

*Proof:* □

## 25.2 $p$ -adic Local Galois Representations

References are [Berger, Galois representations and  $(\varphi, \Gamma)$ -modules], [Ser98, Car19]. and [notes on  $p$ -adic Hodge, Conrad], [notes on  $p$ -adic Hodge, Serin Hong].

### Notation (25.2.0.1).

- This is a continuation of the section [Galois Representations\(Basics\)](#).
- Use notations defined in [Smooth Representations](#).
- Use notations defined in [Untils and Fargues-Fontaine Curves](#).
- Let  $(K, \mathcal{O}_K, \mathfrak{m}_K, \kappa) \in p\text{-Field}$ ,
- $K_0 = W(\kappa)[\frac{1}{p}]$  its maximal unramified subextension of  $K$ .
- The Frobenius action on  $K_0$  is denoted by  $\varphi_0$ .

┘

### 1 $\mathbb{C}_K$ -Admissibility

#### $\mathbb{C}_K$ -Admissibility

**Prop. (25.2.1.1) [Variant of Hilbert's Theorem90].** Any  $V \in \text{Rep}_{\widehat{K^{\text{ur}}}}^{\text{fd}}(\text{Gal}(K^{\text{ur}}/K))$  is trivial. In particular, any unramified f.d. representation of  $\text{Gal}_K$  is  $\widehat{K^{\text{ur}}}$ -admissible thus  $\mathbb{C}_p$ -admissible, which is a special case of (25.2.1.2). ┘

*Proof:* Denote by  $\mathcal{O}$  the ring of integers of  $\widehat{K^{\text{ur}}}$  and  $\mathfrak{m}$  the maximal ideal, Let  $W$  be a f.d.  $\widehat{K^{\text{ur}}}$ -semi-linear representation,  $(v_{1,0}, \dots, v_{d,0})$  a basis of  $W$  over  $\widehat{K^{\text{ur}}}$  and  $\mathcal{O}_W$  the  $\mathcal{O}$ -span of  $(v_{1,0}, \dots, v_{d,0})$ , then we are going to construct a sequence of tuples  $(v_{1,n}, \dots, v_{d,n})$  that  $v_{i,n+1} \equiv v_{i,n} \pmod{\mathfrak{m}^n}$  and  $\text{Frob}_q(v_{i,n}) \equiv v_{i,n} \pmod{\mathfrak{m}^n}$  for all  $i$  and  $n$ .

Use induction on  $n$ : the case  $n = 1$  follows from the fact  $\mathcal{O}_W/\mathfrak{m}\mathcal{O}_W$  is trivial as a  $\bar{k}$ -semi-linear representation of  $\text{Gal}_k$ . To prove this, notice there is a finite extension  $l$  of  $k$  and an  $l$ -semi-linear representation  $W_L$  of  $\text{Gal}(l/k)$  that  $\bar{k} \otimes_l W_L \cong \mathcal{O}_W/\mathfrak{m}\mathcal{O}_W$ , then the assertion follows from Hilbert's theorem90(10.2.5.12).

For general  $n$ , we are looking for vectors  $w_1, \dots, w_d \in \mathcal{O}_W$  that  $\text{Frob}_q(v_{i,n} + \pi^n w_i) \equiv v_{i,n} + \pi^n w_i \pmod{\mathfrak{m}^{n+1}}$ , which is equivalent to  $\text{Frob}_q \bar{w}_i - \bar{w}_i = \frac{\text{Frob}_q v_{i,n} - v_{i,n}}{\pi^n}$  in  $\mathcal{O}_W/\mathfrak{m}\mathcal{O}_W$ . To prove this, notice  $\text{Frob}_q - \text{id}$  is surjective on  $\mathcal{O}_W/\mathfrak{m}\mathcal{O}_W$ , which follows from the fact  $\mathcal{O}_W/\mathfrak{m}\mathcal{O}_W$  is trivial as proved above and  $\text{Frob}_q - \text{id}$  is surjective on  $\bar{k}$ .

Now  $v_{i,n}$  are Cauchy sequences and they converges to a tuple  $v_i$  that  $G_{K^{\text{ur}}/K}$  acts trivially and it is an  $\mathcal{O}$ -basis of  $\mathcal{O}_W$ , as its reduction modulo  $\mathfrak{m}$  is a basis of  $\mathcal{O}_W/\mathfrak{m}\mathcal{O}_W$ , so it is a  $\widehat{K^{\text{ur}}}$ -basis of  $W$ .  $\square$

**Prop. (25.2.1.2) [ $\mathbb{C}_p$ -Admissibility].** For  $(\rho, V) \in \text{Rep}_{\mathbb{Q}_p}^{\text{fd}}(\text{Gal}_K)$ , the following are equivalent:

- $V$  is  $\mathbb{C}_p$ -admissible.
- $\#\rho(I_K) < \infty$ .
- $V$  is  $L\widehat{K^{\text{ur}}}$ -admissible for some finite extension  $L/K$ .

┘

*Proof:* Cf. [p-adic Period Rings Intro, P18]. ?

2  $\rightarrow$  3: This follows from (25.2.1.1).  $\square$

**Cor. (25.2.1.3)** [ $H_{\text{cont}}^0(\text{Gal}_K, \mathbb{C}_p(\psi))$ , **Sen-Tate**].  $H_{\text{cont}}^0(\text{Gal}_K, \mathbb{C}_p(\psi)) = \begin{cases} K & , \# \psi(I_K) < \infty \\ 0 & , \# \psi(I_K) = \infty \end{cases}$ . In particular,

$$H_{\text{cont}}^0(\text{Gal}_K, \mathbb{C}_p(m)) = \begin{cases} K & , m = 0 \\ 0 & , m \neq 0 \end{cases}.$$

┘

*Proof:* This follows from (24.1.1.20) and (25.2.1.2). For the last assertion, the cyclotomic extension of  $K$  thus also the cyclotomic character of  $G_K$  is infinitely unramified, thus  $\chi_{\text{cycl}}^s$  factors through a finite quotient iff  $s = 0$ .  $\square$

**Cor. (25.2.1.4)** [**Potentially Unramified**]. If  $\eta : \text{Gal}_K \rightarrow \mathbb{Z}_p^*$  is a character and there is  $y \in \mathbb{C}_K^\times$  that  $\eta(g) = g(y)/y$ , then there exists a finite Abelian extension  $L$  of  $K$  that  $\eta|_{G_L}$  is unramified, i.e.  $\eta$  is **potentially unramified**.  $\square$

**Cor. (25.2.1.5)**. For any  $n, m \in \mathbb{Z}$ ,

$$\text{Hom}_{\text{Gal}_K}(\mathbb{C}_K(n), \mathbb{C}_K(m))$$

is of one-dimensional over  $K$  if  $n = m$ , and vanishes otherwise.  $\square$

*Proof:* Let  $W = \text{Hom}_{\mathbb{C}_p}(\mathbb{C}_K(n), \mathbb{C}_K(m)) = \mathbb{C}_K(m - n)$ , then the desired space is  $W^{\text{Gal}_K}$ , and the assertion follows from (25.2.1.3).  $\square$

### $H_{\text{cont}}^1$ of $\text{Gal}_K$ -Actions on $\mathbb{C}_p(\psi)$

**Def. (25.2.1.6)** [**Notations**]. Let  $K_\infty/K$  an Abelian extension s.t.  $\Gamma(K_\infty/K) \cong \mathbb{Z}_p$ , and  $H_K = \text{Gal}_{K_\infty}$ . Such  $K_\infty$  always exists, for example we can take a subextension of  $K_\infty = K(p^{\frac{1}{p^\infty}})$ .

Let  $\Gamma_m = \Gamma_0^m$  and  $K_m$  the fixed field of  $\Gamma_m$ .

Decompose  $\Gamma = \Sigma \times \Gamma_0$  and let  $\gamma$  be a topological generator of  $\Gamma_0$ , then every element of  $\Gamma_0$  can be written as  $\gamma^t$  for some  $t \in \mathbb{Z}_p$ . Denote  $\gamma_s = \gamma^{p^s}$ .  $\square$

**Lemma (25.2.1.7)**. Giving an  $\sigma \in \text{Gal}(K/\mathbb{Q}_p)$ , if  $x, y \in \mathfrak{m}_{\mathbb{C}_p}$  that  $x \equiv y \pmod{\pi_K^n}$ , then  $[\pi_K]^\sigma(x) \equiv [\pi_K]^\sigma(y) \pmod{\pi_K^{n+1}}$ , where  $f^\sigma$  is given by action of  $\sigma$  on the coefficients.  $\square$

*Proof:* This is because the coefficients of  $[\pi_K]^\sigma$  are divisible by  $\pi_K$  except for degree  $q$ , where it is  $x^q - y^q = (x - y)(x^{q-1} + x^{q-2}y + \dots + y^{q-1})$  which is divisible by  $\pi_K^{n+1}$  because the residue field of  $K$  is of order  $q$ .  $\square$

**Prop. (25.2.1.8)**. If we let the action of  $\sigma \in \text{Gal}(K/\mathbb{Q}_p)$  on the residue field giving by  $\bar{\sigma} : \kappa \rightarrow \bar{\mathbb{F}}_p : x \mapsto x^{q_\sigma}$ , where  $q_\sigma = p^{n_\sigma}$  is a  $p$ -power, given an element  $\eta = (\eta_0, \eta_1, \dots) \in T(G)$ , we have  $\eta^{q_\sigma} \equiv [\pi_K]^\sigma(\eta_{n+1}^{q_\sigma}) \pmod{\pi_K}$ , hence the above lemma (25.2.1.7) shows that  $[\pi_K^n]^\sigma \eta_n^{q_\sigma} \equiv [\pi_K^{n+1}]^\sigma(\eta_{n+1}^{q_\sigma}) \pmod{\pi_K^{n+1}}$ , so  $[\pi_K^n]^\sigma(\eta_n^{q_\sigma})$  is a Cauchy sequence, converging to an element  $\mu_\sigma$  (don't care about  $\eta$ ).

If  $g \in \text{Gal}_K$ , then  $g(\eta_n) = [\chi_K(g)](\eta_n)$ , hence take  $q_\sigma$ -th power,  $g(\eta_n^{q_\sigma}) \equiv [\chi_K(g)]^\sigma(\eta_n^{q_\sigma}) \pmod{\pi_K}$ , then

$$[\chi_K(g)]^\sigma [\pi_K^n]^\sigma(\eta_n^{q_\sigma}) \equiv [\pi_K^n]^\sigma g(\eta_n^{q_\sigma}) = g([\pi_K^n]^\sigma \eta_n^{q_\sigma}) \pmod{\pi_K}.$$

hence by limiting,  $g(\mu_\sigma) = [\chi_K(g)]^\sigma(\mu_\sigma)$ .  $\square$

**Lemma (25.2.1.9).**

$$v_p(\mu_\sigma) = \begin{cases} \frac{q_\sigma}{e_K(q-1)} + \frac{1}{e_K} & n(\sigma) \neq 0 \\ \frac{1}{e_K(q-1)} + v_p(\sigma(\pi_K) - \pi_K) & n(\sigma) = 0 \end{cases}$$

┘

*Proof:* By (10.7.3.30), we know the Newton polygon of  $[\pi_K^n]^\sigma$ . When  $n(\sigma) \neq 0$ ,  $v(\eta_1^{q_\sigma}) = \frac{q_\sigma}{e_K(q-1)} > \frac{1}{e_K(q-1)}$ , so the valuation of  $[\pi_K]^\sigma(\eta_1^{q_\sigma})$  equals the valuation of its degree 1 term, which is  $v(\pi_K \eta_1^{q_\sigma}) = \frac{q_\sigma}{e_K(q-1)} + \frac{1}{e_K}$ . Now we have by (25.2.1.8), we have  $[\pi_K]^\sigma \eta^{q_\sigma} \equiv [\pi_K^2]^\sigma(\eta_2^{q_\sigma}) \pmod{\pi_K^2}$ , and  $\frac{q_\sigma}{e_K(q-1)} + \frac{1}{e_K} < 2/e_K$ , so valuation already stable at degree 1, and  $v(\mu_\sigma) = v([\pi_K]^\sigma(\eta_1^{q_\sigma}))$ .

If  $q_\sigma = 1$ , it's more delicate, because degree 1 and degree  $q$  term has the same minimal valuation, so they may jump to higher valuations. Notice  $[\pi_K^n](\eta_n) = 0$ , so  $[\pi_K^n]^\sigma(\eta_n) = ([\pi_K^n]^\sigma - [\pi_K^n])(\eta_n)$ . And we have by (19.1.4.22), for  $x \in \mathcal{O}_K$ ,  $v(\sigma(x) - x) \geq v(x) + v(\frac{\sigma(\pi_K)}{\pi_K} - 1) + \delta_{v(x),0}v(\pi_K)$ , with equality when  $v_p(x) = q/e_K$ . So by the Newton polygon, the minimum valuation of the coefficient of  $[\pi_K^n]^\sigma - [\pi_K^n]$  appear at degree  $p^{n-1}$  and possibly  $p^n$ . The valuation of  $\eta_n$  is too small ( $\frac{1}{e_K p^{n-1}(p-1)}$ ) that we don't need to consider other degrees but can assure that degree  $p^{n-1}$  is of minimum valuation, which is  $v(\eta_n^{p^{n-1}}) + v(\sigma(\pi_K) - \pi_K) = \frac{1}{e_K(q-1)} + v_p(\sigma(\pi_K) - \pi_K)$ .  $\square$

**Prop. (25.2.1.10).** For any  $\sigma \in \text{Gal}(K/\mathbb{Q}_p) \setminus \{\text{id}\}$ , there is an element  $\alpha_\sigma \in \mathbb{C}_p^*$  that  $\sigma \circ \chi_K(g) = g(\alpha_\sigma)/\alpha_\sigma$  for all  $g \in \text{Gal}_K$ , where  $\chi_K$  is the Lubin-Tate character.  $\square$

*Proof:* We let  $\alpha_\sigma = \log_{\mathcal{F}_\pi}^\sigma(\mu_\sigma)$ , by (25.2.1.9),  $1/e_K < \mu_\sigma < \infty$ , so by the Newton polygon analysis of  $\log_{\mathcal{F}_\pi}$  (10.7.3.31),  $\alpha_\sigma$  has the same valuation of  $\mu_\sigma$ , in particular,  $\alpha_\sigma \neq 0$ . Then

$$g(\alpha_\sigma) = \log_{\mathcal{F}_\pi}^\sigma(g(\mu_\sigma)) = (\log_{\mathcal{F}} \circ [\chi_K(g)])^\sigma(\mu_\sigma) = (\chi_K(g) \cdot \log_{\mathcal{F}_\pi})^\sigma(\mu_\sigma) = \sigma(\chi_K(g)) \cdot \alpha_\sigma.$$

$\square$

**Cor. (25.2.1.11).**  $\log_p(\sigma(\chi_K(g))) = g(\log(\alpha_\sigma)) - \log_p(\alpha_\sigma)$ .  $\square$

**Prop. (25.2.1.12)** [ $H_{\text{cont}}^1(\text{Gal}_K, \mathbb{C}_p(\psi))$ , Tate [Tat67]]. Let  $\psi : \text{Gal}_K \rightarrow \mathbb{Z}_p^*$  be a character, then we can form a representation  $\mathbb{C}_p(\psi)$  of  $\text{Gal}_K$  on  $\mathbb{C}_p$  that  $\rho(\sigma)(x) = \psi(\sigma)\sigma(x)$ . This is an action because  $\text{Gal}_K$  acts trivial on  $\mathbb{Z}_p^*$ . Then we have

$$H_{\text{cont}}^1(\text{Gal}_K, \mathbb{C}_p(\psi)) = \begin{cases} 0 & , \# \psi(I_K) = \infty \\ \text{a } K\text{-vector space of dimension 1} & , \# \psi(I_K) < \infty \end{cases}.$$

┘

*Proof:* If  $\# \psi(I_K) < \infty$ , then by (25.2.1.2),  $\mathbb{C}_p(\psi) \cong \mathbb{C}_p$  as  $\text{Gal}_K$ -representations. So we may assume  $\psi = \mathbf{1}$ . And we take  $K_\infty$  to be any  $\mathbb{Z}_p$ -extension of  $K$ .

If  $\# \psi(I_K) = \infty$ , then we can take a finite extension  $K'/K$  that is contained in the fixed field  $K_\psi$  of  $\ker(\psi)$  such that  $\text{Gal}(K_\psi/K') \cong \mathbb{Z}_p$  ?. Notice that there is an inf-res exact sequence

$$0 \rightarrow H_{\text{cont}}^1(\Gamma(K'/K), H^0(\text{Gal}_{K'}, \mathbb{C}_\infty(\psi))) \rightarrow H_{\text{cont}}^1(\text{Gal}_K, \mathbb{C}_p(\psi)) \rightarrow H_{\text{cont}}^1(\text{Gal}_{K'}, \mathbb{C}_p(\psi)),$$

So by (25.2.1.3), it suffices to show that  $H_{\text{cont}}^1(\text{Gal}_{K'}, \mathbb{C}_p(\psi)) = 0$ . For this reason, we may change notation to assume that  $K_\infty = K_\psi$  and  $K_\psi = K$ .

Now there is an inf-res exact sequence

$$0 \rightarrow H_{\text{cont}}^1(\text{Gal}(K_\infty/K), \widehat{K_\infty}(\psi)) \rightarrow H_{\text{cont}}^1(\text{Gal}_K, \mathbb{C}_p(\psi)) \rightarrow H_{\text{cont}}^1(H_K, \mathbb{C}_p(\psi)),$$

$\psi$  is trivial on  $H_K$ , so  $\mathbb{C}_p(\psi) \cong \mathbb{C}_p$  as  $H_K$ -representations, thus we may assume  $\psi = \text{id}$ . Let  $f \in Z_{\text{cont}}^1(H_K, \mathbb{C}_p(\psi))$  be a cocycle, as  $H_K$  is compact,  $f(H_K) \in p^{-k}\mathcal{O}_{\mathbb{C}_p}$  for some integer  $k$ . So the lemma below (25.2.1.13) shows that we can move  $f$  cohomologously to higher valuation, i.e.  $f(g) = \sum x_i - g(\sum x_i)$ , so  $f$  is a coboundary. This means that  $H_{\text{cont}}^1(H_K, \mathbb{C}_p(\psi)) = 0$ .

Thus we are reduced to the study of the first term. Let  $\gamma$  be a topological generator of  $\Gamma(K_\infty/K)$ , by (9.8.5.4) we know  $H_{\text{cont}}^1(\Gamma_K, \widehat{K}_\infty(\psi)) = \widehat{K}_\infty(\psi)/1 - \gamma$ .

For  $n$  large, we have a decomposition  $\widehat{K}_\infty(\psi) = K_n(\psi) \oplus X_n(\psi)$  by (19.1.5.38), and  $1 - \gamma^n$  is invertible on  $X_n(\psi)$ . Now  $1 - \gamma^n = (1 - \gamma)(1 + \gamma + \dots + \gamma^{n-1})$ , so  $1 - \gamma$  is also invertible in  $X_n(\psi)$ . And on  $K_n(\psi)$ , if  $\psi$  is of infinite order, then  $1 - \gamma$  is injective, because if  $x$  is fixed, then  $x = \psi(\gamma)^n \gamma^n(x) = \psi(\gamma)^N x$ , which implies  $\psi(\gamma)$  is of finite order. But it is also surjective because it is a  $K$ -linear mapping of  $K_n$ . So  $\widehat{K}_\infty(\psi)/1 - \gamma = 0$ . On the other hand, if  $\psi = \mathbf{1}$  then  $K_n/1 - \gamma = K_n/\ker(\text{tr}_{K_n/K}) = K$ .  $\square$

**Lemma (25.2.1.13).** If  $f : H_K \rightarrow p^n\mathcal{O}_{\mathbb{C}_p}$  is a continuous cocycle, then there exists a  $x \in p^{n-1}\mathcal{O}_{\mathbb{C}_p}$  that the cohomologous cocycle  $g \mapsto f(g) - (x - g(x))$  has values in  $p^{n+1}\mathcal{O}_{\mathbb{C}_p}$ .  $\lrcorner$

*Proof:*  $p^{n+2}\mathcal{O}_{\mathbb{C}_p}$  is open in  $p^n\mathcal{O}_{\mathbb{C}_p}$ , so there is a finite extension  $L/K$  that  $f(H_L) \in p^{n+2}\mathcal{O}_{\mathbb{C}_p}$ . By (19.1.5.32), there is a  $z \in \mathcal{O}_{L_\infty}$  that  $\text{tr}_{L_\infty/K_\infty}(z) = p$ , so there is a  $y \in p^{-1}\mathcal{O}_{L_\infty}$  that  $\text{tr}_{L_\infty/K_\infty}(y) = 1$ .

Now for a set of representatives  $Q$  of  $H_K/H_L$ , denote  $x_Q = \sum_{h \in Q} h(y)f(h)$ , then for  $g \in H_K$ ,  $g(Q)$  is also a set of representative, and

$$g(x_Q) = \sum_{h \in Q} gh(y)gf(h) = \sum_{h \in Q} gh(y)(f(gh) - f(g)) = x_{g(Q)} - f(g),$$

because  $\text{tr}(y) = 1$ . So  $f(g) - (x_Q - g(x_Q)) = x_{g(Q)} - x_Q$ . The RHS is in  $p^{n+1}\mathcal{O}_{\mathbb{C}_p}$ , because: if we let  $gh_i = h_{g(i)}a_i$ , where  $a_i \in H_L$ , then  $x_{g(Q)} - x_Q = \sum h_{g(i)}(y)f(h_{g(i)}a_i) - \sum h_{g(i)}(y)f(h_{g(i)}) = \sum h_{g(i)}(y)h_{g(i)}(f(a_i))$ , which is in  $p^{n+1}$  because  $h_{g(i)}(y) \in p^{-1}\mathcal{O}_{\mathbb{C}_p}$  and  $f(a_i) \in p^{n+2}\mathcal{O}_{\mathbb{C}_p}$  by the choice of  $L$ .  $\square$

**Prop. (25.2.1.14).** The 1-dimensional  $K$ -vector space  $H_{\text{cont}}^1(\text{Gal}_K, \mathbb{C}_p)$  is generated by the cocycle  $[g \mapsto \log_p \chi(g)]$ .  $\lrcorner$

*Proof:* By the proof of (25.2.1.12), we know that  $H^1(\Gamma_K, K_n) \xrightarrow{f} H^1(\text{Gal}_K, \mathbb{C}_p)$  is an isomorphism. for  $\alpha \in K$ , if  $\chi(g) = \gamma^k$ , then  $f(\alpha)(g) = (1 + \gamma + \dots + \gamma^{k-1})(\alpha) = k\alpha = \alpha \cdot \log_p(\chi(g))/\log_p(\gamma)$ . So by continuity,  $f$  is a multiple of  $[g \mapsto \log_p(\chi(g))]$ .  $\square$

**Lemma (25.2.1.15).** And  $f \in \text{Hom}(I_K^{\text{ab}}, \mathbb{Q}_p)$  is of the form  $f(g) = \text{tr}_{K/\mathbb{Q}_p}(\beta_f \log_p \chi_K(g))$  for some  $\beta_f \in K$ .  $\lrcorner$

*Proof:* By (19.7.2.28),  $\chi_K$  is a canonical isomorphism  $I_K^{\text{ab}} \cong \mathcal{O}_K^*$ . Any  $f \in \text{Hom}(\mathcal{O}_K^*, \mathbb{Q}_p)$  is of the form  $f(y) = \text{tr}_{K/\mathbb{Q}_p}(\beta_f \log_p(y))$  for some  $\beta_f \in K$ , because: by (19.1.5.16), when  $n$  is large,  $\log_p$  is a bijection between  $U_K^n$  and  $\pi_K^n \mathcal{O}_K$ .

$\pi_K^n \mathcal{O}_K \rightarrow \mathbb{Q}_p$  can be extended to a map  $K \rightarrow \mathbb{Q}_p$  as  $\mathbb{Q}_p$  is divisible. Now trace is a invertible bilinear form on  $K$ , so the assertion is true on  $U_K^n$  for some  $n$ , and because  $U_K^n$  is of finite index in  $\mathcal{O}_K^*$  and  $\mathbb{Q}_p$  is of char 0, this is true for all  $\mathcal{O}_K^*$ .  $\square$

**Prop. (25.2.1.16).** The map  $H^1(\text{Gal}_K, \mathbb{Q}_p) \rightarrow H^1(\text{Gal}_K, \mathbb{C}_p)$  is given as follows: as  $f \in H^1(\text{Gal}_K, \mathbb{Q}_p)$  must factor through  $\text{Gal}_K^{\text{ab}}$ , if the restriction of  $f$  to  $I_K^{\text{ab}}$  corresponds to  $\beta_f$ , then  $f$  maps to  $\beta_f : (g \mapsto \log_p \chi(g))$ .  $\lrcorner$

*Proof:*  $f(g) = \text{tr}_{K/\mathbb{Q}_p}(\beta_f \log_p \chi_K(g))$  on  $I_K$ , but this map extends to map on  $G_K$ . So  $f(g) = \text{tr}_{K/\mathbb{Q}_p}(\beta_f \log_p \chi_K(g)) + c(g)$  for a unramified map  $c$  on  $G_K$ .

Now by (9.8.5.3),  $H^1(G, \widehat{\mathbb{Q}}_p^{ur}/\mathbb{Q}_p)$  vanish because  $H^1(G, \overline{\mathbb{F}}_p)$  vanish (9.8.3.1), so there is a  $z \in \widehat{\mathbb{Q}}_p^{ur}$  that  $c(g) = g(z) - z$ . And

$$\text{tr}_{K/\mathbb{Q}_p}(\beta_f \log_p \chi_K(g)) = \sum_{\sigma} \sigma(\beta_f \log_p \chi_K(g)) = \beta_f \text{tr}_{K/\mathbb{Q}_p}(\log_p \chi_K(g)) + \sum_{\sigma} (\sigma(\beta_f) - \beta_f) \sigma(\log_p \chi_K(g)).$$

Notice (25.2.1.10) gives a  $\beta_{\sigma}$  that  $\sigma(\log_p \chi_K(g)) = g(\beta_{\sigma}) - \beta_{\sigma}$ , and  $\text{tr}_{K/\mathbb{Q}_p}(\log_p \chi_K(g)) = \log_p \chi(g)$  because  $(N_{K/\mathbb{Q}_p} \chi_K(g))^{-1} = (\chi(g))^{-1}$ , as they both correspond via local CFT to the element in  $G_K^{ab}$  which acts by  $g$  on  $L_{\pi}$  and id on  $K^{ur}$ . Thus the result.  $\square$

## 2 Hodge-Tate Representations

References are [Sen80] and [Car19].

### Hodge-Tate Representations

**Def. (25.2.2.1) [ $B_{\text{H-T}}$ ].** Let  $B_{\text{H-T}} = \mathbb{C}_K[t, t^{-1}]$ ,  $B'_{\text{H-T}} = \mathbb{C}_K((t))$ , and let  $G_K$  acts on it by  $g(at^i) = g(a)\chi_{\text{cycl}}(g)t^i$ . In addition, there is a filtration on  $B'_{\text{H-T}}$  given by  $\text{Fil}^m B'_{\text{H-T}} = t^m \mathbb{C}_p[[t]]$ , then the graded ring of  $B'_{\text{H-T}}$  is isomorphic to  $B_{\text{H-T}}$ . (25.2.1.3) shows that  $B_{\text{H-T}}^{\text{Gal}_K} = (B'_{\text{H-T}})^{\text{Gal}_K} = K$ .

$B_{\text{H-T}}$  and  $B'_{\text{H-T}}$  are  $\text{Gal}_K$ -regular (24.1.1.18).  $\lrcorner$

*Proof:*  $B'_{\text{H-T}}$  is  $\text{Gal}_K$ -regular because it is a field. For  $B_{\text{H-T}}$ ,  $B_{\text{H-T}} \subset \text{Frac}(B_{\text{H-T}}) \subset B'_{\text{H-T}}$ , taking  $\text{Gal}_K$ -fixed points shows (H2). For (H3), if  $\mathbb{Q}_p x$  is stable under  $\text{Gal}_K$  and  $x$  is not of the form  $at^i$ , then we can get a non-trivial  $\text{Gal}_K$ -fixed point of  $\mathbb{C}_K(j-i)$ , which is impossible by (25.2.1.3).  $\square$

**Cor. (25.2.2.2) [Hodge-Tate Representations].** Let  $W \in \text{Rep}_{\mathbb{C}_K}(\text{Gal}_K)$ . For  $k \in \mathbb{Z}$ , let

$$W\{k\} = \{x \in W \mid g(x) = \chi_{\text{cycl}}^k(g)x\} \subset W(-k)$$

then

$$\bigoplus_{k \in \mathbb{Z}} (\mathbb{C}_K(k) \otimes_K W\{k\}) \rightarrow W$$

is injective.  $W$  is called a **Hodge-Tate representation** if this is an isomorphism.  $\lrcorner$

*Proof:* Notice  $B_{\text{H-T}} \cong \bigoplus_{m \in \mathbb{Z}} \mathbb{C}_K(m) \in \text{Rep}_{\mathbb{C}_K}(\text{Gal}_K)$ , so

$$B_{\text{H-T}} \otimes_K (B_{\text{H-T}} \otimes_{\mathbb{C}_K} W)^{\text{Gal}_K} \cong B_{\text{H-T}} \otimes_K \bigoplus_{m \in \mathbb{Z}} (\mathbb{C}_K(m) \otimes_K W\{m\}) \hookrightarrow B_{\text{H-T}} \otimes_{\mathbb{C}_K} W.$$

is injective by (24.1.1.19).  $\square$

**Cor. (25.2.2.3) [Hodge-Tate Representations].**  $V \in \text{Rep}_{\mathbb{Q}_p}^{\text{fd}}(\text{Gal}_K)$  is called a **Hodge-Tate representation** if it is  $B_{\text{H-T}}$ -admissible. The category of Hodge-Tate representations are denoted by  $\text{Rep}_{\mathbb{Q}_p}^{\text{H-T}}(\text{Gal}_K)$ .

Then  $V \in \text{Rep}_{\mathbb{Q}_p}^{\text{fd}}(\text{Gal}_K)$  is Hodge-Tate iff it is  $B'_{\text{H-T}}$ -admissible iff  $\mathbb{C}_K \otimes_{\mathbb{Q}_p} V$  is Hodge-Tate thus decomposes as

$$\mathbb{C}_K \otimes_{\mathbb{Q}_p} V \cong \mathbb{C}_K(n_1) \oplus \dots \oplus \mathbb{C}_K(n_d) \in \text{Rep}_{\mathbb{C}_K}(\text{Gal}_K).$$

$\lrcorner$

*Proof:* If  $\mathbb{C}_K \otimes_{\mathbb{Q}_p} V$  is Hodge-Tate, then clearly  $\dim_K (B_{\text{H-T}} \otimes_{\mathbb{Q}_p} V)^{\text{Gal}_K} = \dim_{\mathbb{Q}_p} V$ , thus  $V$  is  $B_{\text{H-T}}$ -admissible (24.1.1.20). Conversely,  $\dim_K (B_{\text{H-T}} \otimes_{\mathbb{Q}_p} V)^{\text{Gal}_K} = \dim_{\mathbb{Q}_p} V = d$  implies  $V$  is Hodge-Tate by (25.2.2.2). The equivalence with  $B'_{\text{H-T}}$ -admissibility is similar.  $\square$

**Def. (25.2.2.4) [Hodge-Tate Weights].** For  $V \in \text{Rep}_{\mathbb{Q}_p}^{\text{H-T}}(\text{Gal}_K)$ ,  $V$  is said to have **Hodge-Tate weight**  $i$  with multiplicity  $d_i$  if  $\dim_K W\{i\} = d_i$ .

$V$  is called **Hodge-Tate regular** if each Hodge-Tate weight is multiplicity-free.

In particular,  $\mathbb{Q}_p(n)$  has a single Hodge-Tate weight  $n$ .  $\lrcorner$

**Prop. (25.2.2.5).** If  $K' \subset \overline{K} \in \text{Field}$ , then for  $W \in \text{Rep}_{\mathbb{C}_K}^{\text{fd}}(\text{Gal}_K)$ , the natural maps

$$K' \otimes_K D_K(W) \rightarrow D_{K'}(W), \quad \widehat{K^{\text{ur}}} \otimes_K D_K(W) \rightarrow D_{\widehat{K^{\text{ur}}}}(W)$$

are isomorphisms. In particular,

$$\text{Rep}_{\mathbb{Q}_p}^{\text{fd}}(\text{Gal}_K) \cap \text{Rep}_{\mathbb{Q}_p}^{\text{H-T}}(\text{Gal}_{K'}) = \text{Rep}_{\mathbb{Q}_p}^{\text{fd}}(\text{Gal}_K) \cap \text{Rep}_{\mathbb{Q}_p}^{\text{H-T}}(I_K) = \text{Rep}_{\mathbb{Q}_p}^{\text{H-T}}(\text{Gal}_K).$$

$\lrcorner$

*Proof:* For  $K' \subset \overline{K}$ ,  $D_K(W) = D_{K'}(W)^{\text{Gal}(K'/K)}$ , thus the isomorphism follows from Galois descent (24.1.1.15). For  $\widehat{K^{\text{ur}}}$ , Cf. [Conrad, P20] ?  $\square$

### 3 Sen-Tate Theory

#### Colmez-Sen-Tate Conditions

#### Sen's Theory

**Remark (25.2.3.1).** Sen's theory goes further than  $\text{Rep}_{\mathbb{Q}_p}^{\text{H-T}}(\text{Gal}_K)$  and to study  $\text{Rep}_{\mathbb{C}_K}^{\text{fd}}(\text{Gal}_K)$ .  $\lrcorner$

**Prop. (25.2.3.2) [Hilbert's Theorem90 for  $\text{Gal}_{K_\infty}$ ].** Any  $W \in \text{Rep}_{\mathbb{C}_p}^{\text{fd}}(\text{Gal}_K)$  is trivial as a  $\mathbb{C}_p$ -semi-linear representation of  $\text{Gal}_{K_\infty}$ . In particular, there is an isomorphism

$$\mathbb{C}_K \otimes_{\widehat{K_\infty}} W^{\text{Gal}_{K_\infty}} \cong W \in \text{Rep}_{\mathbb{C}_K}(\text{Gal}_{K_\infty}).$$

$\lrcorner$

*Proof:* The proof is similar to that of (25.2.1.1).

Let  $\mathcal{O}_W$  be any  $\mathcal{O}_{\mathbb{C}_p}$ -lattice in  $W$ . Firstly we construct a  $\mathbb{C}_p$ -basis  $w_1, \dots, w_d$  of  $W$  that  $w_i \in \mathcal{O}_W$  and  $gw_i \equiv w_i \pmod{p^2 \mathcal{O}_W}$  for all  $g \in \text{Gal}_{K_\infty}$  and  $p\mathcal{O}_W \subset \mathcal{O}_{\mathbb{C}_p} w_1 \oplus \dots \oplus \mathcal{O}_{\mathbb{C}_p} w_d$ .

By continuity there is a finite Galois extension  $L/K$  that ? Cf. [p-adic Hodge Intro, P23].  $\square$

**Prop. (25.2.3.3).** By (25.2.3.2), the next step of Sen's theory is to study  $W \in \text{Rep}_{\widehat{K_\infty}}(\Gamma_K)$ . To this attempt, Sen considers the subspace of  $\Gamma_K$ -finite vectors in  $W$ , they form a vector space  $W_0 \subset W$  over  $K_\infty$ . Then there exists an integer  $r$  and a basis  $(v_1, \dots, v_d)$  of  $W$  that the  $K_r$ -span of  $v_i$  are stable under  $\Gamma_K$ -actions.

Obviously, these  $v_i$  are  $G_K$ -finite, thus in particular

$$\widehat{K_\infty} \otimes_{K_\infty} W_0 \cong W.$$

$\lrcorner$

*Proof:* Cf.[p-adic Hodge Intro, P25].? □

**Cor. (25.2.3.4) [Sen's Operator].** Combining the previous two propositions, let  $W \in \text{Rep}_{\mathbb{C}_p}^{\text{fd}}(\text{Gal}_K)$ , denote  $\widehat{W}_\infty = W^{G_{\overline{K}/K_\infty}}$  and  $W_\infty$  the set of  $\Gamma_K$ -finite vectors of  $\widehat{W}_\infty$ , then

$$\mathbb{C}_p \otimes_{K_\infty} W_\infty \cong W.$$

Let  $v_1, \dots, v_d$  be given by (25.2.3.3),  $W_r = \bigoplus K_r v_i$ . For  $g \in G_K$ , let  $\rho_W(g)$  be the endomorphism of  $W_r$  given by action of  $g$ , then  $\rho_W(\gamma_s)$  is linear when  $s \geq r$ , and because  $\gamma_s$  converges to id,  $\log \rho_W(\gamma_s)$  is defined for  $s$  large. Then **Sen's operator**  $\Phi_W$  is defined to be  $\Phi_W = \frac{\log \rho(\gamma_s)}{p^s}$ , or equivalently  $\Phi_W(v) = \lim_{t \rightarrow 0} \frac{\gamma^t(v) - v}{t}$ .

Sen's operator is defined over  $K$ , as it commutes with  $\Gamma_K$  seen from the limit form, and its kernel is the  $\mathbb{C}_p$ -subspace of  $W$  generated by elements invariant under  $\Gamma_K$ . ┘

*Proof:* It is evident that fixed points of  $\Gamma_K$  are killed by  $\Phi_W$ . Conversely, the kernel of  $\Phi_W$  on  $W_\infty$  is stable under action of  $G_K$ , thus is a sub-representation of  $\Gamma_K$  in  $W_\infty$ , and because  $W_\infty$  consists of finite vectors, the  $G_K$ -action is continuous w.r.t the discrete topology, and Hilbert's theorem90(10.2.5.12) shows this subspace is generated by elements invariant under  $G_K$ . □

**Prop. (25.2.3.5) [Sen's Category].** Let  $\text{Sen}(K, K_\infty)$  be the category of f.d.  $K_\infty$ -vector spaces equipped with an endomorphism defined over  $K$ , then the construction sending  $W$  to  $(W_\infty, \Phi_W)$  induces a functor

$$\text{Sen} : \text{Rep}_{\mathbb{C}_p}^{\text{fd}}(\text{Gal}_K) \rightarrow \text{Sen}(K, K_\infty).$$

This functor commutes with direct sums, and also under tensor products, with the Sen's operator given by

$$\Phi_{W \otimes W'} = \Phi_W \otimes \text{id}_{W'} + \text{id}_W \otimes \Phi_{W'}.$$

This functor is faithful, but in general not full. However, it reflects isomorphisms. ┘

*Proof:* This functor is faithful because  $W_\infty$  generates  $W$  as a  $\mathbb{C}_p$ -vector space. To show it reflects isomorphism, Let  $f : W_\infty \rightarrow W'_\infty$  be an isomorphism commuting with Sen's operator, then it extends by linearity to an isomorphism of  $\mathbb{C}_p$ -vector spaces  $W \rightarrow W'$ , and  $f$  is  $\Gamma_s$ -equivariant for some  $s$  by the definition of Sen's operator. Then considering the space of  $\Gamma_s$ -equivariant  $\mathbb{C}_p$ -linear morphisms from  $W$  to  $W'$ , Hilbert's theorem90 shows there is a basis  $f_i$  consisting of  $G_K$ -equivariant morphisms. Then it remains to show there exists a linear  $K$ -combination of  $f_i$  that is invertible. This is possible because it is true for  $K_s$ , as  $f$  is invertible, and  $K$  is an infinite field. □

**Cor. (25.2.3.6).**  $W \in \text{Rep}_{\mathbb{C}_p}^f(\text{Gal}_K)$  is trivial iff  $\Phi_W = 0$ . ┘

*Proof:* As  $\mathcal{S}$  reflects isomorphisms, compare with the trivial representation  $\mathbb{C}_p^d$ . □

**Prop. (25.2.3.7) [Hodge-Tate Representations and Sen's Operators].** A representation  $V \in \text{Rep}_{\mathbb{Q}_p}^{\text{fd}}(G_K)$  is Hodge-Tate iff the Sen's operator  $\Phi_{\mathbb{C}_p \otimes_{\mathbb{Q}_p} V}$  is semisimple with eigenvalues in  $\mathbb{Z}$ . For a general  $V$ , the eigenvalues of  $\Phi_{\mathbb{C}_p \otimes_{\mathbb{Q}_p} V}$  is called the **generalized Hodge-Tate weights** of  $V$ . ┘

*Proof:* If  $V$  is a Hodge-Tate representation, then clearly  $\Phi_W(v) = \lim_{t \rightarrow 0} \frac{\gamma^t(v) - v}{t}$  acts by  $k$  on  $\mathbb{C}_p(k)$ , thus it is semisimple with eigenvalues in  $\mathbb{Z}$ . Conversely, on the  $i$ -eigenspace of  $\Phi$ , tensoring  $\chi_{\text{cycl}}^{-i}$ ,  $\Phi$  acts trivially, then because the kernel of  $\Phi$  are the fixed points of  $\Gamma_K$ (25.2.3.4), thus this eigenspace is isomorphic to  $\mathbb{C}_p(i)^d$ , so  $V$  is Hodge-Tate. □

#### 4 Fontaine's Rings

**Notation (25.2.4.1).** In this subsection, we denote  $B_{\text{dR}}, B_{\text{crys}}$  etc. to denote Fontaine's ring w.r.t. the perfectoid field  $\mathbb{C}_K$  defined in [Fontaine's Period Rings](#).  $\lrcorner$

**Lemma (25.2.4.2).** Let  $\varepsilon = (\dots, \varepsilon_1, \varepsilon_0) \in \mathcal{O}_{\mathbb{C}_K}^\flat$  s.t.  $\varepsilon_0 = 1$  and  $\varepsilon_1 \neq 1$ , then  $|\varepsilon - 1| = \frac{p}{p-1}$ .  $\lrcorner$

*Proof:*

$$|\varepsilon - 1| = |(\varepsilon - 1)^\sharp|_{\mathbb{C}_K} = |\lim_{n \rightarrow \infty} (\varepsilon_n - 1)^{p^n}|_{\mathbb{C}_K} = \lim_{n \rightarrow \infty} p^n |\varepsilon_n - 1| = \lim_{n \rightarrow \infty} \frac{p^n}{p^{n-1}(p-1)} = \frac{p}{p-1}$$

□

**Prop. (25.2.4.3) [ $\mathbb{Q}_p$ -Line in  $B_{\text{dR}}$ ].**  $\theta([\varepsilon] - 1) = \varepsilon_0 - 1 = 0$ , so  $[\varepsilon] - 1 \in \ker \theta$ , and we can define

$$t_\varepsilon = \log([\varepsilon]) = \sum_{n \geq 1} (-1)^{n-1} \frac{([\varepsilon] - 1)^n}{n} \in B_{\text{dR}}^+.$$

Then this is a uniformizer in the CDVR  $B_{\text{dR}}^+$ . Moreover, any other choice of  $\varepsilon$  is of the form  $\varepsilon' = \varepsilon^a$  for  $a \in \mathbb{Z}_p$ , then  $t_{\varepsilon'} = at_\varepsilon$ , and  $\gamma(t_\varepsilon) = \chi_{\text{cycl}}(\gamma)t$  for any  $\gamma \in \text{Gal}_K$ .  $\lrcorner$

*Proof:*  $t_\varepsilon$  is a uniformizer because  $[\varepsilon] - 1$  is:  $[\varepsilon^{1/p}] - 1$  is a unit in  $B_{\text{dR}}$ , and

$$\eta = \frac{[\varepsilon] - 1}{[\varepsilon^{1/p}] - 1} = 1 + [\varepsilon^{1/p}] + \dots + [\varepsilon^{(p-1)/p}]$$

is distinguished, because if  $\eta = \sum [c_n]p^n$ , consider reducing to the residue field:  $W(\mathcal{O}_{\mathbb{C}_K}^\flat) \rightarrow W(\mathcal{O}_{\mathbb{C}_K}^\flat/t)$ , then  $\bar{\varepsilon} = 1$  by (25.2.4.2), and  $\bar{\eta} = p$ , thus  $|c_0| < 1, |c_1 - 1| < 1$ , so it is distinguished (5.5.4.20), thus a uniformizer by (27.7.1.2).

For the last assertion, by the formal property of log, it suffices to show that if  $a_i \rightarrow a \in \mathbb{Z}_p$ , then  $[\varepsilon^{a_i}] \rightarrow [\varepsilon^a] \in B_{\text{dR}}$ . Then it suffices to show that for  $a \in \mathbb{Z}_p, |a|$  small,

$$|[\varepsilon^a] - 1| \rightarrow 0.$$

And this can be done with the topology given in (27.7.1.20)?  $\lrcorner$

**Cor. (25.2.4.4).**  $\text{gr}(B_{\text{dR}}) \cong B_{\text{H-T}}$ .  $\lrcorner$

**Cor. (25.2.4.5).**  $B_{\text{dR}}$  is  $\text{Gal}_K$ -regular, but  $B_{\text{dR}}^+$  is not  $\text{Gal}_K$ -regular.  $\lrcorner$

*Proof:*  $B_{\text{dR}}$  is  $\text{Gal}_K$ -regular because it is a field.  $B_{\text{dR}}^+$  is not  $\text{Gal}_K$ -regular because  $\mathbb{Q}_p t_\varepsilon$  is stable under  $\text{Gal}_K$ -action but  $t_\varepsilon$  is not invertible in  $B_{\text{dR}}^+$ .  $\lrcorner$

**Prop. (25.2.4.6) [Galois Actions].**  $\text{Gal}_K$  acts on  $\mathcal{O}_{\mathbb{C}_K}/(p)$  thus acts on  $\mathcal{O}_{\mathbb{C}_K}^\flat$  and on  $A_{\text{inf}}$ . Then Fontaine's functor  $\theta : A_{\text{inf}} \rightarrow \mathcal{O}_{\mathbb{C}_K}$  is  $\text{Gal}_K$ -equivariant, thus  $\ker \theta$  is  $\text{Gal}_K$ -stable, so  $\text{Gal}_K$ -acts on  $B_{\text{dR}}^+$  and  $B_{\text{dR}}$ , and  $B_{\text{dR}} \rightarrow \mathbb{C}_K$  is  $\text{Gal}_K$ -equivariant.  $\lrcorner$

**Prop. (25.2.4.7).** There is a canonical lifting of  $\bar{K} \rightarrow \mathbb{C}_K$  along  $B_{\text{dR}}^+ \rightarrow \mathbb{C}_K$ , and it is  $\text{Gal}_K$ -equivariant. However, this embedding is not continuous, thus there is no embedding  $\mathbb{C}_K \subset B_{\text{dR}}^+$ .  $\lrcorner$

*Proof:*  $K_0 = W(k)[\frac{1}{p}] \subset W(\mathcal{O}_{\mathbb{C}_K}^\flat)[\frac{1}{p}] = B_{\text{inf}} \subset B_{\text{dR}}$ , and it follows from Hensel's lemma that any element in  $\overline{K}$  lifts uniquely to an element of  $B_{\text{dR}}^+$ , so  $\overline{K} \subset B_{\text{dR}}^+$ , and is  $\text{Gal}_K$ -invariant, by uniqueness and the fact  $B_{\text{dR}} \rightarrow \mathbb{C}_K$  is  $\text{Gal}_K$ -equivariant (25.2.4.6).

For the last assertion, if the embedding is continuous, the  $B_{\text{dR}}^+ \rightarrow \mathbb{C}_K$  has a section, and the filtration splits so  $B_{\text{dR}} \cong B_{\text{H-T}}$ .  $\square$

**Prop. (25.2.4.8).**

- $K = (B_{\text{dR}}^+)^{\text{Gal}_K} = B_{\text{dR}}^{\text{Gal}_K}$
- $K_0 = B_{\text{crys}}^{\text{Gal}_K}$ , and the canonical morphism  $K \otimes_{K_0} B_{\text{crys}} \rightarrow B_{\text{dR}}$  is injective.
- $\mathbb{Q}_p = B_e^{\text{Gal}_K}$ .
- $\mathbb{Q}_p = (\text{Fil}^0 B_\mu)^{\text{Gal}_K}$  for  $\mu = \text{crys}$  or  $\mu \geq 1$ .

┘

*Proof:* 1: Firstly  $K \subset B_{\text{dR}}$  and is invariant under  $\text{Gal}_K$  by (25.2.4.7). On the other hand, the exact sequence

$$0 \rightarrow \text{Fil}^{m+1} B_{\text{dR}} \rightarrow \text{Fil}^m B_{\text{dR}} \rightarrow \mathbb{C}_p(m) \rightarrow 0 \quad (25.2.4.13).$$

induces an injection

$$B_{\text{dR}}^{\text{Gal}_K} \cap \text{Fil}^m B_{\text{dR}} / B_{\text{dR}}^{\text{Gal}_K} \cap \text{Fil}^{m+1} B_{\text{dR}} \hookrightarrow \mathbb{C}_p(m)^{\text{Gal}_K}.$$

Thus  $B_{\text{dR}}^{\text{Gal}_K} = B_{\text{dR}}^{\text{Gal}_K} = K$ .

2: The injectivity of  $K \otimes_{K_0} B_{\text{crys}} \rightarrow B_{\text{dR}}$  Cf. [Laurent Fargues and Jean-Marc Fontaine Prop10.2.8].

3: From 2 and notice  $B_e = B_{\text{crys}}^{\varphi=\text{id}}$ .

4: Cf. [Period Rings, P45]. ?

┘

**Lemma (25.2.4.9).** Let  $W \in \text{Vect}_K^{\text{fd}}$ , then the map:

$$\{\text{Filtrations on } W\} \rightarrow \{\text{Gal}_K\text{-stable } B_{\text{dR}}^+\text{-lattice in } W \otimes_K B_{\text{dR}}\} : \text{Fil} \mapsto \text{Fil}^0(W \otimes_K B_{\text{dR}})$$

is bijective and the inverse is given by  $\Gamma \mapsto \{(t^n \Gamma)^{\text{Gal}_K} \subset (B_{\text{dR}} \otimes_{B_{\text{dR}}^+} \Gamma)^{\text{Gal}_K} = W\}_{n \in \mathbb{Z}}$ .  $\square$

*Proof:* Cf. [Laurent Fargues and Jean-Marc Fontaine Prop10.4.3]. ?  $\square$

### deRham and Crystalline Representations

**Def. (25.2.4.10) [deRham, Crystalline and Semistable Representations].** Situation as in (25.2.4.8), for  $V \in \text{Rep}_{\mathbb{Q}_p}^{\text{fd}}(\text{Gal}_K)$ ,

- $V$  is called a **deRham representation** iff  $V$  is  $B_{\text{dR}}$ -admissible??, or equivalently

$$\dim_K(B_{\text{dR}} \otimes_{\mathbb{Q}_p} V)^{\text{Gal}_K} = \dim_{\mathbb{Q}_p} V.$$

The category of deRham representations of  $\text{Gal}_K$  are denoted by  $\text{Rep}_{\mathbb{Q}_p}^{\text{dR}}(\text{Gal}_K)$ .

- $V$  is called a **crystalline representations** iff  $V$  is  $B_{\text{crys}}$ -admissible, or equivalently

$$\dim_{K_0}(B_{\text{crys}} \otimes_{\mathbb{Q}_p} V)^{\text{Gal}_K} = \dim_{\mathbb{Q}_p} V.$$

The category of crystalline representations of  $\text{Gal}_K$  are denoted by  $\text{Rep}_{\mathbb{Q}_p}^{\text{crys}}(\text{Gal}_K)$ .  $\square$

**Def. (25.2.4.11) [ $\text{Rep}'_{B_e}(\text{Gal}_K)$ ].** Denote by  $\text{Rep}'_{B_e}(\text{Gal}_K)$  the category of finite locally free  $B_e$ -modules  $M$  with a semi-linear  $\text{Gal}_K$ -action that there exists a  $\text{Gal}_K$ -invariant  $B_{\text{dR}}^+$ -lattice  $\Gamma \in M \otimes_{B_e} B_{\text{dR}}$  that  $G_K$  acts continuously.  $\square$

### Summary

**Prop. (25.2.4.12) [Diagram of Inclusions].**

$$\begin{array}{ccccccccc}
 B_{\text{inf}}^+ & \longrightarrow & B_{\mu}^+ & \hookrightarrow & B_{\text{crys}}^+ & \hookrightarrow & B_{\mu}^+ & \hookrightarrow & B_{\text{max}}^+ & \hookrightarrow & B_{\text{dR}}^+ \\
 & & \downarrow & & \downarrow & & \downarrow & & \downarrow & & \downarrow \\
 & & B_{\mu} & \hookrightarrow & B_{\text{crys}} & \hookrightarrow & B_{\mu} & \hookrightarrow & B_{\text{max}} & \hookrightarrow & B_{\text{dR}} \\
 & & (\mu > p-1) & & & & (1 \leq \mu \leq p-1) & & = B_1^+ & & 
 \end{array}$$

┘

**Prop. (25.2.4.13) [Properties of  $B_{\text{dR}}$ ].**

- $B_{\text{dR}}$  is a discretely valued field with residue field  $\mathbb{C}_K$  and valuation ring  $B_{\text{dR}}^+$ .
- $B_{\text{dR}}$  is an algebra over  $\widehat{\overline{K^{\text{ur}}}} = \overline{K} \widehat{K^{\text{ur}}}$  but not over  $\mathbb{C}_K$ .
- $B_{\text{dR}}$  has a special uniformizer  $t_{\varepsilon}$  s.t.  $\mathbb{Q}_p t_{\varepsilon} \cong \mathbb{Q}_p(1) \in \mathcal{R}\text{ep}_{\mathbb{Q}_p}(\text{Gal}_K)$ .
- $B_{\text{dR}}$  has a filtration  $\{\text{Fil}^m B_{\text{dR}} = t_{\varepsilon}^m B_{\text{dR}}^+\}$ , and  $B_{\text{dR}}^{\text{gr}} \cong B_{\text{H-T}}$  as graded rings.
- $B_{\text{dR}}^{\text{Gal}_K} = K$ .

┘

*Proof:* 1 follows from (27.7.1.18), 2 follows from (25.2.4.7). 3 follows from (25.2.4.3). 4 follows from (25.2.4.4). 5 follows from (25.2.4.8).  $\square$

**Prop. (25.2.4.14) [Properties of  $B_{\text{crys}}$ ].**

- $B_{\text{crys}}$  is an algebra over  $\widehat{K^{\text{ur}}}$ .
- $B_{\text{crys}}$  has a Frobenius endomorphism  $\varphi$ .
- There is a canonical embedding  $B_{\text{crys}} \otimes_{K_0} K \hookrightarrow B_{\text{dR}}$ , and  $t_{\varepsilon} \in B_{\text{crys}}$ .
- $B_{\text{crys}}^{\text{Gal}_K} = K_0$ .
- $(B_{\text{crys}} \cap B_{\text{dR}}^+)^{\varphi=1} = \mathbb{Q}_p$ .

┘

*Proof:* ?  $\square$

## 5 deRham Representations

**Lemma (25.2.5.1).** Let  $V$  be a finite  $\mathbb{Q}_p$ -vector space with an action of  $\text{Gal}_K$ , then the action is continuous iff the induced action on  $V \otimes_{\mathbb{Q}_p} B_{\text{dR}}^+$  is continuous.  $\square$

*Proof:* This is because the action of  $\text{Gal}_K$  on  $B_{\text{dR}}^+$  is continuous, and  $V$  has the induced topology in  $V \otimes_{\mathbb{Q}_p} B_{\text{dR}}^+$ .  $\square$

**Prop. (25.2.5.2) [ $\mathbb{C}_K$ -admissible Representations are deRham].**  $\mathcal{R}\text{ep}_{\mathbb{Q}_p}^{\mathbb{C}_K\text{-adm}}(\text{Gal}_K) \subset \mathcal{R}\text{ep}_{\mathbb{Q}_p}^{\text{dR}}(\text{Gal}_K)$ .  $\square$

*Proof:* For  $V \in \mathcal{R}\text{ep}_{\mathbb{Q}_p}^{\mathbb{C}_K}$ , by (25.2.1.2), there exists a finite extension  $L/K$  s.t.  $V$  is  $L\widehat{K^{\text{ur}}}$ -admissible. Thus  $V$  is deRham as  $L\widehat{K^{\text{ur}}} \subset B_{\text{dR}}$  (25.2.4.13).  $\square$

**Prop. (25.2.5.3) [Potentially deRham are deRham].** Let  $K' \subset \mathbb{C}_K$  be another  $p$ -adic field, then

$$\mathrm{Rep}_{\mathbb{Q}_p}(\mathrm{Gal}_K) \cap \mathrm{Rep}_{\mathbb{Q}_p}^{\mathrm{dR}}(\mathrm{Gal}_{K'}) = \mathrm{Rep}_{\mathbb{Q}_p}^{\mathrm{dR}}(\mathrm{Gal}_K).$$

In particular, being deRham is not sensible to ramifications, which is a bad feature compared to being crystalline or semistable.  $\lrcorner$

*Proof:* Because  $\widehat{K^{\mathrm{ur}}} \subset \widehat{(K')^{\mathrm{ur}}}$  is of finite degree, it suffices to prove for two cases:  $K'/K$  is finite or  $K' = \widehat{K^{\mathrm{ur}}}$ . But the finite case follows from Galois descent the same as??. The second case follows from [Conrad, P80] ?  $\square$

**Prop. (25.2.5.4) [Filtered  $D_{\mathrm{dR}}$ ].** For  $V \in \mathrm{Rep}_{\mathbb{Q}_p}^{\mathrm{fd}}(\mathrm{Gal}_K)$ , there is a finite filtration  $\mathrm{Fil}$  on  $D_{\mathrm{dR}}(V)$  s.t.

$$\mathrm{Fil}^m D_{\mathrm{dR}}(V) = (t^m B_{\mathrm{dR}} \otimes_E V)^{\mathrm{Gal}_K} \subset D_{\mathrm{dR}}(V).$$

$\lrcorner$

**Prop. (25.2.5.5) [deRham Representations are Hodge-Tate].** For  $V \in \mathrm{Rep}_{\mathbb{Q}_p}^{\mathrm{fd}}(\mathrm{Gal}_K)$ ,

- there is an injection of graded vector spaces

$$\mathrm{gr}(D_{\mathrm{dR}}(V)) \hookrightarrow D_{\mathrm{H-T}}(V),$$

- If  $V \in \mathrm{Rep}_{\mathbb{Q}_p}^{\mathrm{dR}}(\mathrm{Gal}_K)$ , the map in item1 is an isomorphism, and  $V$  is Hodge-Tate.
- If  $V \in \mathrm{Rep}_{\mathbb{Q}_p}^{\mathrm{dR}}(\mathrm{Gal}_K)$ ,

$$B_{\mathrm{dR}} \otimes_K D_{\mathrm{dR}}(V) \cong B_{\mathrm{dR}} \otimes_{\mathbb{Q}_p} V$$

identifies filtrations.  $\lrcorner$

*Proof:* 1: Consider the exact sequences

$$0 \rightarrow \mathrm{Fil}^{m+1} B_{\mathrm{dR}} \rightarrow \mathrm{Fil}^m B_{\mathrm{dR}} \rightarrow \mathbb{C}_p(m) \rightarrow 0 \text{ (25.2.4.13)}.$$

Tensoring  $V$  and taking  $\mathrm{Gal}_K$ -invariants give injections

$$h : \mathrm{gr}^m(D_{\mathrm{dR}}(V)) \hookrightarrow V(m)^{\mathrm{Gal}_K},$$

giving the injection  $\mathrm{gr}(D_{\mathrm{dR}}(V)) \hookrightarrow D_{\mathrm{H-T}}(V)$ .

2: If  $V \in \mathrm{Rep}_{\mathbb{Q}_p}^{\mathrm{dR}}(\mathrm{Gal}_K)$ , this is an isomorphism by dimension reason, and  $V$  is Hodge-Tate by dimension reason.

3: Firstly notice  $\mathrm{Fil}^m(B_{\mathrm{dR}} \otimes_K D_{\mathrm{dR}}(V)) \subset \mathrm{Fil}^m(B_{\mathrm{dR}} \otimes_{\mathbb{Q}_p} V)$  is trivial, thus it suffices to show that the induced map

$$f : \mathrm{gr}(B_{\mathrm{dR}} \otimes_K D_{\mathrm{dR}}(V)) \rightarrow \mathrm{gr}(B_{\mathrm{dR}} \otimes_{\mathbb{Q}_p} V) = B_{\mathrm{H-T}} \otimes_{\mathbb{Q}_p} V$$

is an isomorphism. But notice

$$B_{\mathrm{H-T}} \otimes \mathrm{gr}(D_{\mathrm{dR}}(V)) \xrightarrow{g} \mathrm{gr}(B_{\mathrm{dR}} \otimes_K D_{\mathrm{dR}}(V)) \xrightarrow{f} B_{\mathrm{H-T}} \otimes_{\mathbb{Q}_p} V$$

equals  $B_{\mathrm{H-T}} \otimes h$ , so  $g$  is an isomorphism because it is surjective, and thus  $f$  is also an isomorphism.  $\square$

**Cor. (25.2.5.6).** 1-dimensional Hodge-Tate representations are deRham.  $\lrcorner$

*Proof:* This is because if  $V \cong \mathbb{Q}_p(\psi)$  where  $\psi$  is a character of  $\text{Gal}_K$ , and  $\mathbb{C}_p \otimes_E V \cong \mathbb{C}_p(m)$ , then by Sen-Tate (25.2.1.3),  $\psi(-m)$  is potentially unramified, thus  $\mathbb{C}_p$ -admissible by (25.2.1.2), and thus deRham (25.2.5.2).  $\square$

**Remark (25.2.5.7) [ $D_{\text{dR}}$  Insensitive to Ramifications].**  $D_{\text{dR}}$  is far from fully faithful. In fact, any unramified representation  $V$  is deRham by (25.2.5.3), and  $D_{\text{dR}}(V)$  is a simple filtration with graded ring  $K^d[0]$ , but  $V$  can be different from trivial representation.  $\lrcorner$

**Prop. (25.2.5.8).** The functor  $D_{\text{dR}} : \text{Rep}_{\mathbb{Q}_p}^{\text{dR}}(\text{Gal}_K) \rightarrow \text{Fil Vect}_K$  is faithful and exact, and commutes with taking tensor products and duals. Moreover, the perfect pairing in (24.1.1.21) is a perfect pairing of filtered vector spaces.  $\lrcorner$

*Proof:* Let  $0 \rightarrow V_1 \rightarrow V \rightarrow V_2 \rightarrow 0 \in \text{Rep}_{\mathbb{Q}_p}^{\text{dR}}(\text{Gal}_K)$  be an exact sequence, then  $V_i$  are also Hodge-Tate by (25.2.5.5), so there is an exact sequence

$$0 \rightarrow \text{gr}(D_{\text{dR}}(V_1)) \rightarrow \text{gr}(D_{\text{dR}}(V)) \rightarrow \text{gr}(D_{\text{dR}}(V_2)) \rightarrow 0,$$

showing that

$$0 \rightarrow D_{\text{dR}}(V_1) \rightarrow D_{\text{dR}}(V) \rightarrow D_{\text{dR}}(V_2) \rightarrow 0$$

is an exact sequence of filtered vector spaces.

For tensor product, it suffices to show that

$$\text{gr}(D_{\text{dR}}(V_1) \otimes D_{\text{dR}}(V_2)) \rightarrow \text{gr}(D_{\text{dR}}(V_1 \otimes V_2))$$

is an isomorphism, which reduces to

$$D_{\text{H-T}}(V_1) \otimes D_{\text{H-T}}(V_2) \cong D_{\text{H-T}}(V_1 \otimes V_2) \text{ (24.1.1.21)}.$$

For perfect pairing, it suffices to show that the map

$$D_{\text{dR}}(V^\vee) \rightarrow D_{\text{dR}}(V)^\vee$$

is an isomorphism of filtered vector spaces. But then it reduces to the isomorphism

$$D_{\text{H-T}}(V^\vee) \cong D_{\text{H-T}}(V)^\vee \text{ (24.1.1.21)}.$$

$\square$

**Prop. (25.2.5.9) [Extensions of deRham Representations].** If  $0 \rightarrow V_1 \rightarrow V \rightarrow V_2 \rightarrow 0$  is an exact sequence in  $\text{Rep}_{\mathbb{Q}_p}^{\text{fd}}(\text{Gal}_K)$  s.t.  $V_1, V_2$  are deRham, and the Hodge-Tate weights of  $V_1$  are strictly larger than that of  $V_2$ , then  $V$  is deRham.

In particular, any upper-triangular representation with diagonal  $(\mathbb{Q}_p(a_1), \mathbb{Q}_p(a_2), \dots, \mathbb{Q}_p(a_n))$  with  $a_1 > a_2 > \dots > a_n$  is deRham.  $\lrcorner$

*Proof:* By twisting, we may assume that all Hodge-Tate weights of  $V_1$  are positive and Hodge-Tate weights of  $V_2$  are non-positive. There is an exact sequence

$$0 \rightarrow D_{\text{dR}}(V_1) \rightarrow D_{\text{dR}}(V) \rightarrow D_{\text{dR}}(V_2) = \text{Fil}^0 D_{\text{dR}}(V_2)$$

so it suffices to show that  $\mathrm{Fil}^0 D_{\mathrm{dR}}(V) \rightarrow \mathrm{Fil}^0 D_{\mathrm{dR}}(V_2)$  is surjective. But it follows from (9.8.4.4) that there is an exact sequence

$$\mathrm{Fil}^0 D_{\mathrm{dR}}(V) \rightarrow \mathrm{Fil}^0 D_{\mathrm{dR}}(V_2) \rightarrow H_{\mathrm{cont}}^1(\mathrm{Gal}_K, B_{\mathrm{dR}}^+ \otimes_{\mathbb{Q}_p} V_1).$$

So it suffices to show that  $H^1(\mathrm{Gal}_K, B_{\mathrm{dR}} \otimes_{\mathbb{Q}_p} V_1) = 0$ . The exact sequence

$$0 \rightarrow t_\varepsilon^{m+1} B_{\mathrm{dR}} \otimes_{\mathbb{Q}_p} V_1 \rightarrow t_\varepsilon^m B_{\mathrm{dR}} \otimes_{\mathbb{Q}_p} V_1 \rightarrow \mathbb{C}_p(m) \otimes_{\mathbb{Q}_p} V_1 \rightarrow 0$$

induces a surjection  $H_{\mathrm{cont}}^1(\mathrm{Gal}_K, t_\varepsilon^{m+1} B_{\mathrm{dR}} \otimes_{\mathbb{Q}_p} V_1) \twoheadrightarrow H_{\mathrm{cont}}^1(\mathrm{Gal}_K, t_\varepsilon^m B_{\mathrm{dR}} \otimes_{\mathbb{Q}_p} V_1)$  by hypothesis. Notice  $B_{\mathrm{dR}}^+$  is  $t_\varepsilon$ -complete, so we can use approximation technique similar to (9.8.5.3) to show that  $H_{\mathrm{cont}}^1(\mathrm{Gal}_K, t_\varepsilon^m B_{\mathrm{dR}} \otimes_{\mathbb{Q}_p} V_1) = 0$ .  $\square$

**Remark (25.2.5.10).** For an example of  $V \in \mathcal{R}\mathrm{ep}_{\mathbb{Q}_p}^{\mathrm{H-T}}(\mathrm{Gal}_K)$  that is not deRham, Cf.[Conrad, P78].  $\lrcorner$

### $B_{\mathrm{dR}}$ -Representations

Fontaine in [Arithmétique des représentations galoisiennes  $p$ -adiques, 2004] studied  $\mathcal{R}\mathrm{ep}_{B_{\mathrm{dR}}}(\mathrm{Gal}_K)$  in similar spirit of Sen's theory. He firstly showed that any  $B_{\mathrm{dR}}$ -representations descends to a  $K_\infty((t))$ -representation  $W$ , and similar to Sen's operator, Fontaine defined a  $K_\infty$ -linear derivative  $\nabla_W : W \rightarrow W$ .

## 6 Crystalline Representations

References are [Crystalline Representations and F-crystals, Kisin].

**Prop. (25.2.6.1).** Let  $L/K$  be a finite field extension, then

$$\mathcal{R}\mathrm{ep}_{\mathbb{Q}_p}(\mathrm{Gal}_K) \cap \mathcal{R}\mathrm{ep}_{\mathbb{Q}_p}^{\mathrm{crys}}(\mathrm{Gal}_L) = \mathcal{R}\mathrm{ep}_{\mathbb{Q}_p}^{\mathrm{crys}}(\mathrm{Gal}_K).$$

$\lrcorner$

*Proof:* Cf.[Period Rings, P52]. ?

$\square$

**Prop. (25.2.6.2) [Unramified Representations are crystalline].**

$$\mathcal{R}\mathrm{ep}_{\mathbb{Q}_p}^{\mathrm{fd}, \mathrm{ur}}(\mathrm{Gal}_K) \subset \mathcal{R}\mathrm{ep}_{\mathbb{Q}_p}^{\mathrm{fd}, \mathbb{C}_p\text{-adm}, \mathrm{crys}}(\mathrm{Gal}_K).$$

$\lrcorner$

*Proof:* By (25.2.1.1), any unramified  $V \in \mathcal{R}\mathrm{ep}_{\mathbb{Q}_p}^{\mathrm{fd}}(\mathrm{Gal}_K)$  is  $\widehat{K}^{\mathrm{ur}}$ -admissible, thus  $B_{\mathrm{crys}}$ -admissible as  $\widehat{K}^{\mathrm{ur}} \subset B_{\mathrm{crys}}$  (25.2.4.14). And  $V$  is also  $\mathbb{C}_p$ -admissible by (25.2.1.1).

To show the converse inclusion, use (25.2.1.2)(24.1.1.17) and the fact  $L\widehat{K}^{\mathrm{ur}} \cap B_{\mathrm{crys}} = \widehat{K}_0^{\mathrm{ur}}$  ?.  $\square$

**Remark (25.2.6.3).** For examples of  $V \in \mathcal{R}\mathrm{ep}_{\mathbb{Q}_p}^{\mathrm{dR}}(\mathrm{Gal}_K)$  that is not crystalline, Cf.[Period Rings, P52]. ?

$\lrcorner$

**Prop. (25.2.6.4) [Crystalline Representation].** The functor

$$\mathcal{D} : \mathcal{R}\mathrm{ep}_{B_e}(G_K)' \rightarrow \varphi\text{-Mod}_{K_0} : W \mapsto (W \otimes_{B_e} B_{\mathrm{crys}})^{\mathrm{Gal}_K}$$

are left adjoint to the functor

$$\mathcal{V} : \varphi\text{-Mod}_{K_0} \rightarrow \mathcal{R}\mathrm{ep}_{B_e} G_K' : (D, \varphi_D) \mapsto (D \otimes_{K_0} B_{\mathrm{crys}})^{\varphi_D \otimes \varphi = \mathrm{id}}$$

Moreover,  $\mathcal{V}$  is fully faithful,  $\mathrm{id} \cong \mathcal{D} \circ \mathcal{V}$ ,  $\mathcal{V} \circ \mathcal{D} \hookrightarrow \mathrm{id}$ , and  $M \in \mathcal{R}\mathrm{ep}_{B_e}(\mathrm{Gal}_K)$  is in the image of  $\mathcal{V}$  iff  $\mathcal{V}(\mathcal{D}(M)) \cong M$ .  $\lrcorner$

*Proof:* Cf.[Laurent Fargues and Jean-Marc Fontaine Prop10.2.12].  $\square$

**Cor.(25.2.6.5).** In particular, a  $B_e$ -representation is crystalline iff it is in the image of  $\mathcal{V}$ . Now we define a Vector bundle  $\mathcal{E}$  on  $X$  to be crystalline iff the  $H^0(X \setminus \{\infty\}, \mathcal{E})$  is crystalline.  $\lrcorner$

## 7 Semi-stable Representations

**Thm.(25.2.7.1) [ $p$ -adic Monodromy Theorem, Colmez/André-Kedlaya-Mebkhout].**  $V \in \mathcal{R}\text{ep}_{\mathbb{Q}_p}(\text{Gal}_K)$  is deRham iff it is potentially semistable.  $\lrcorner$

*Proof:* ?  $\square$

**Cor.(25.2.7.2).** For  $V \in \mathcal{R}\text{ep}_{\mathbb{Q}_p}^{\text{fd}}(\text{Gal}_K)$ , we have the following implications:

$$\begin{array}{ccccc}
 \text{unramified} = \mathbb{C}_p\text{-adm} + \text{crystalline} & \xRightarrow{\quad} & \text{crystalline} & \xRightarrow{\quad} & \text{semi-stable} \\
 \Downarrow & & \Downarrow & & \Downarrow \\
 \mathbb{C}_p\text{-adm} = \text{pot.unramified} = \text{Hodge-Tate with weights } 0 & \implies & \text{pot.crys} & \implies & \text{de Rham} = \text{pot.semi-stable} \\
 & & & & \Downarrow \\
 & & & & \text{Hodge-Tate}
 \end{array}$$

$\lrcorner$

**Prop.(25.2.7.3) [deRham Representation gives Weil-Deligne Representations].** For  $K \in p\text{-LField}$ , there is a functor

$$\text{WD} : \mathcal{R}\text{ep}_{\mathbb{Q}_\ell}^{\text{dR}}(\text{Gal}_K) \rightarrow \mathfrak{wd}(W_K).$$

$\lrcorner$

*Proof:* ? Cf.[Fontaine-Mazur, Geometric Galois Representations]  $\square$

## Ordinary Representations

**Def.(25.2.7.4) [Ordinary Galois-Representations].** Let  $K \in p\text{-LField}$  and  $n \in \mathbb{Z}_+$ , then a continuous representation  $\rho : \text{Gal}_K \rightarrow \text{GL}(n; \overline{\mathbb{Q}_p})$  is called an **ordinary Galois-representation** if the following conditions hold:

- $\rho$  can be upper-triangularized with diagonal entries given by  $\text{diag}(\chi_1, \chi_2, \dots, \chi_n)$ .
- There exists  $b \in (\mathbb{Z}^n)^{\text{Hom}(K, \overline{\mathbb{Q}_p})}$  s.t.  $b_{v,1} < b_{v,2} < \dots < b_{v,n}$  for all  $v \in \text{Hom}(K, \overline{\mathbb{Q}_p})$ , and

$$(\chi_i \circ \text{Art}_K)(\alpha) = \prod_{v \in \text{Hom}(K, \overline{\mathbb{Q}_p})} v(\alpha)^{b_{\tau, i}}$$

for  $\alpha$  in an open subgroup  $U \leq K^\times$ .

And  $\rho$  is called an **ss-ordinary Galois-representation** if we can choose  $U = \mathcal{O}_K$ . And  $\rho$  is called an **cr-ordinary Galois-representation** if it is ordinary and crystalline(in which case it is also ss-ordinary?).  $\lrcorner$

**Prop. (25.2.7.5)[Ordinary Representations are DeRham].** Situation as in (25.2.7.4), if  $\rho : \text{Gal}_K \rightarrow \text{GL}(n; \overline{\mathbb{Q}_p})$  is ordinary (resp. ss-ordinary), then it is deRham (resp. semi-stable), with

$$\text{H-T}_v(\rho) = \{-b_{v,1}, -b_{v,2}, \dots, -b_{v,n}\}$$

for each  $v \in \text{Hom}(K, \overline{\mathbb{Q}_p})$ .

If  $\rho$  is ss-ordinary and for each  $i \in [n-1]_+$  there exists some  $v \in \text{Hom}(K, \overline{\mathbb{Q}_p})$  s.t.  $b_{v,i} + 1 < b_{v,i+1}$ , then  $\rho$  is cr-ordinary.  $\lrcorner$

*Proof:* Cf. [Nek,  $p$ -adic height pairings] Prop. 1.24, 1.26 and 1.28, and [Gee-Geraghty, Companion forms for unitary and symplectic groups] Lemma 3.1.4 ?.  $\square$

## 8 Barsotti-Tate Representations

### 9 $(\varphi, \Gamma)$ -Modules

References are [Fontaine90: Représentations  $p$ -adiques des corps locaux], [Fontaine94a: Le corps des périodes  $p$ -adiques] and [Fontaine94b: Représentations  $p$ -adiques semi-stables]. I'm mostly following [Berger, Galois representations and  $(\varphi, \Gamma)$ -modules].

**Def. (25.2.9.1) [ $\varphi$ -Modules].** Let  $\varphi_0 : A \rightarrow A \in \mathcal{C}\text{Ring}$  and  $M \in \text{Mod}_A$ , then an additive map  $\varphi : M \rightarrow M$  is called  $\varphi_0$ -**semi-linear** iff  $\varphi(am) = \varphi_0(a) \cdot \varphi(m)$  for  $a \in A$ . A  $\varphi$ -**module** over  $(A, \varphi_0)$  is an  $A$ -module  $M$  with a  $\varphi_0$ -semi-linear  $\varphi$ . The category of  $\varphi$ -modules over  $A$  is denoted by  $\varphi\text{-Mod}_A$ .

Giving a  $A$ -module  $M$  and a  $\varphi : M \rightarrow M$ , there is a map  $\Phi : A \otimes_{\varphi_0, A} M = (\varphi_0)_* M \rightarrow M : \lambda \otimes m \rightarrow \lambda \varphi(m)$ , which is a  $A$ -module map iff  $\varphi$  is  $\varphi_0$ -semi-linear.

If we define a ring  $A[\varphi]$  as the free group  $A[X]$  modulo the relation  $Xa = \varphi(a)X$  and ring relations in  $A$ , then it is a ring, and a  $\varphi$ -module over  $(A, \varphi)$  is equivalent to a left  $A[\varphi]$ -module.

Thus  $\varphi\text{-Mod}_A$  is a Grothendieck Abelian category with tensor products, and moreover, the kernel as  $A[\varphi]$ -module is the same as the kernel as a  $A$ -module.  $\lrcorner$

**Def. (25.2.9.2).** If there is a map  $\alpha : (A_1, (\varphi_0)_1) \rightarrow (A_2, (\varphi_0)_2)$  that commutes with  $(\varphi_0)_i$ , then we have a **pullback** from  $\Phi\mathcal{M}_1$  to  $\Phi\mathcal{M}_2$ :  $\alpha^*(M) = A_2[\varphi] \otimes_{A_1[\varphi]} M$  (25.2.9.1).  $\lrcorner$

**Def. (25.2.9.3) [Étale  $\varphi$ -Modules].** If  $A$  is Noetherian, then a  $\varphi$ -module  $M$  is called **étale** iff it is f.g. and the corresponding  $\Phi : (\varphi_0)_* M \rightarrow M$  in (25.2.9.1) is an isomorphism. The subcategory of étale  $\varphi$ -modules is denoted by  $\varphi\text{-Mod}^{\text{ét}}(A)$ .

In case when  $\varphi_0$  is a bijection,  $\Phi$  is a bijection iff  $\varphi$  is a bijection.  $\lrcorner$

*Proof:* If  $\varphi_0$  is a bijection, then  $M \rightarrow (\varphi_0)_* M$  is a bijection by  $\lambda \otimes m \rightarrow \varphi_0^{-1}(\lambda)m$ .  $\square$

**Prop. (25.2.9.4).** If  $A$  is Noetherian and  $A_{\varphi_0}/A$  is flat, then  $\varphi\text{-Mod}^{\text{ét}}(A)$  is a Tannakian category.  $\lrcorner$

*Proof:* 0 is the zero object, the canonical sum&product are clearly étale. And we need to check the kernel and cokernel are étale. But we have an exact sequence  $0 \rightarrow \ker \rightarrow M \rightarrow N \rightarrow \text{Coker} \rightarrow 0$  so we tensor with  $A_{\varphi_0}$  to get a morphism of sequences that  $\varphi_{0*} M \rightarrow M$ ,  $\varphi_{0*} N \rightarrow N$  are both bijective, so by 5-lemma, it is bijection at kernel and cokernel, so they are étale.  $\square$

**Def. (25.2.9.5) [Dual Étale  $\varphi$ -Modules].** For  $E \in \text{Field}$ ,  $M \in \varphi\text{-Mod}^{\text{ét}}(E)$ , the isomorphism  $\Phi : (\varphi_0)_* M \cong M$  induces an isomorphism

$$\Phi^t : M^\vee \cong ((\varphi_0)_* M)^\vee = (\varphi_0)_* M^\vee.$$

Thus the dual  $\Phi^{-t} : (\varphi_0)_* M^\vee \cong M^\vee$  shows  $M^\vee$  is also an étale  $\varphi$ -module.  $\lrcorner$

**Prop. (25.2.9.6)** [ $\mathbb{F}_p$ -Representations and Étale  $\varphi$ -Modules]. Let  $E \in \mathbf{Field}^p$ , then

- For any  $V \in \mathcal{R}\mathrm{ep}_{\mathbb{F}_p}^{\mathrm{fd}}(\mathrm{Gal}_E)$ ,  $V$  is  $E^{\mathrm{sep}}$ -admissible, and

$$D_{E^{\mathrm{sep}}}(V) = (E^{\mathrm{sep}} \otimes V)^{\mathrm{Gal}_E}$$

has a  $\varphi$ -action, and it is an étale  $\varphi$ -module.

- For any  $M \in \varphi\text{-Mod}(E)$ ,

$$\mathbb{V}(M) = (E^{\mathrm{sep}} \otimes_E M)^{\varphi=\mathrm{id}}$$

is a  $\mathbb{F}_p$ -representation of  $\mathrm{Gal}_E$ , and there is an injection

$$\alpha_M : E^{\mathrm{sep}} \otimes_{\mathbb{F}_p} \mathbb{V}(M) \hookrightarrow E^{\mathrm{sep}} \otimes_E M.$$

- These two functors define an equivalence of Tannakian categories (4.2.1.13)

$$D_{E^{\mathrm{sep}}} : \mathcal{R}\mathrm{ep}_{\mathbb{F}_p}(\mathrm{Gal}_E) \cong \varphi\text{-Mod}^{\mathrm{\acute{e}t}}(E) : \mathbb{V}.$$

┘

*Proof:* 1:  $V$  is  $E^{\mathrm{sep}}$ -admissible by (24.1.1.15). To show it is étale, it suffices to show that  $\varphi : D_{E^{\mathrm{sep}}}(V) \rightarrow D_{E^{\mathrm{sep}}}(V)$  is bijective. Let  $e_1, \dots, e_n$  be a basis of  $D_{E^{\mathrm{sep}}}(V)$ , and  $v_1, \dots, v_n$  be a basis of  $V$ , then  $\underline{e} = \underline{v}B$  for some matrix  $B \in \mathrm{GL}(n; E^{\mathrm{sep}})$ . Then if  $[\varphi]\underline{e} = A\underline{e}$  for  $A \in \mathrm{Mat}(n; E)$ , then  $A = B^{-1}\varphi(B)$ , and  $\det(A) = \det(B)^{p-1} \neq 0$ , so  $\varphi$  is bijective.

2: It suffices to show that if  $v_1, \dots, v_h \in \mathbb{V}(M)$  are linearly dependent over  $E^{\mathrm{sep}}$ , then they are dependent over  $\mathbb{F}_p$ . For this, we use induction on  $h$ : Suppose  $\sum \lambda_i v_i = 0$ , we may assume that  $v_h = -1$ , so  $v_h = \sum_{i=1}^{h-1} \lambda_i v_i$ , and by an action of  $\varphi$ , then  $\sum_{i=1}^{h-1} (\lambda_i^p - \lambda_i) v_i = 0$ , so by induction hypothesis,  $\lambda_i \in \mathbb{F}_p$ .

3: For  $V \in \mathcal{R}\mathrm{ep}_{\mathbb{F}_p}(\mathrm{Gal}_E)$ , because  $E$  is  $E^{\mathrm{sep}}$ -admissible,

$$\mathbb{V}(D_{E^{\mathrm{sep}}}(V)) = (E^{\mathrm{sep}} \otimes_E D_{E^{\mathrm{sep}}}(V))^{\mathrm{Gal}_E} \cong (E^{\mathrm{sep}} \otimes_{\mathbb{F}_p} V)^{\mathrm{Gal}_E} = V.$$

Conversely, there is a

To show these are isomorphisms of Tannakian categories, one can easily show that both  $D_{E^{\mathrm{sep}}}$  and  $\mathbb{V}$  preserve tensor products and they identify identity elements  $\mathbb{F}_p$  and  $E$ .  $\square$

**Cor. (25.2.9.7).** For  $E \in \mathbf{Field}^p$  and  $d \in \mathbb{Z}_+$ ,  $\mathcal{R}\mathrm{ep}_{\mathbb{F}_p}^d(\mathrm{Gal}_E)$  is in bijection with the conjugacy classes of matrices in  $\mathrm{GL}(d; E)$  where

$$A \sim B \iff \exists P \in \mathrm{GL}(d; E), B = P^{-1}AP.$$

┘

### Galois-Representations and Étale $\varphi$ -Modules

**Notation (25.2.9.8).**

- Let  $\kappa \in \mathbf{Field}^p$ ,  $\mathcal{O}_K \triangleq \mathrm{Coh}(\kappa)$  (5.5.2.30), and  $K = \mathcal{O}_K[\frac{1}{p}]$ . There is a natural Frobenius  $\varphi : K \rightarrow K$ .
- Obsolete: We used  $E = \kappa$ ,  $\mathcal{O}_{\mathcal{E}} = \mathcal{O}_K$ .

┘

**Prop. (25.2.9.9).** By the functoriality of Cohen rings ?, if  $\mathcal{O}_{\check{K}} = \text{Coh}(\bar{\kappa})\mathcal{E}^{\text{ur}} = \mathcal{O}_{\mathcal{E}^{\text{ur}}}[\frac{1}{p}]$ , then there is a bijection  $\text{Gal}(\mathcal{E}^{\text{ur}}/\mathcal{E}) \cong \text{Gal}_E$ . Thus there are  $\text{Gal}_K$ -action and  $\varphi$ -action on  $\mathcal{O}_{E^{\text{ur}}}, \mathcal{E}^{\text{ur}}$  and by continuity extends to actions on  $\mathcal{O}_{\widehat{\mathcal{E}^{\text{ur}}}}, \widehat{\mathcal{E}^{\text{ur}}}$ , and

$$(\mathcal{O}_{\widehat{\mathcal{E}^{\text{ur}}}})^{\text{Gal}_E} = \mathcal{E}, \quad (\mathcal{E}^{\text{ur}})^{\text{Gal}_E} = \mathcal{O}_E, (\mathcal{O}_{\widehat{\mathcal{E}^{\text{ur}}}})^{\varphi=\text{id}} = \mathbb{Q}_p, \quad (\mathcal{E}^{\text{ur}})^{\varphi=\text{id}} = \mathbb{Z}_p.$$

┘

*Proof:* ?

□

**Prop. (25.2.9.10).** For  $M \in \varphi\text{-Mod}^{\text{ft}}(\mathcal{O}_{\mathcal{E}})$ ,  $M$  is étale over  $\mathcal{O}_E$  iff  $M/(p)$  is étale over  $E$ .

┘

*Proof:* This is because étale is equivalent to the matrix of  $\varphi$  is a bijection, which is equivalent to its reduction modulo  $p$  is a bijection.

□

**Def. (25.2.9.11) [Effective  $\varphi$ -Modules].** An **effective  $\varphi$ -module** over  $\mathcal{E}$  is a  $\varphi$ -module  $(D, \varphi) \in \varphi\text{-Mod}_{\mathcal{E}}$  s.t. there is a complete  $\mathcal{O}_E$ -lattice  $M$  of  $D$  that  $\varphi(M) \subset M$ .

┘

**Def. (25.2.9.12) [Stably-Étale  $\varphi$ -Modules].** A **stably-étale  $\varphi$ -module** over  $\mathcal{E}$  is a  $\varphi$ -module over  $\mathcal{E}$  s.t. there exists a  $\varphi$ -stable  $\mathcal{O}_{\mathcal{E}}$ -lattice in  $\mathcal{E}$  that is an étale  $\varphi$ -module over  $\mathcal{O}_E$ . Then the category of stably-étale  $\varphi$ -modules is a Tannakian category, denoted by  $\varphi\text{-Mod}^{\text{st.ét}}(\mathcal{O}_{\mathcal{E}})$ .

┘

*Proof:* For  $\mathcal{O}_{\mathcal{E}}$  this follows from (25.2.9.4), and for  $\mathcal{E}$ , notice if  $D = M[\frac{1}{p}]$ ,  $D' = M'[\frac{1}{p}]$ , then

$$\text{Hom}_{\varphi\text{-Mod}^{\text{ét}}(\mathcal{E})}(D, D') = \text{Hom}_{\varphi\text{-Mod}^{\text{ét}}(\mathcal{O}_{\mathcal{E}})}(L, L')[\frac{1}{p}]$$

and  $p : D' \rightarrow D'$  is an isomorphism, so it follows that  $\varphi\text{-Mod}^{\text{ét}}(\mathcal{O}_{\mathcal{E}})$  is also Abelian.

□

**Prop. (25.2.9.13).** Any  $V \in \text{Rep}_{\mathcal{O}_{\widehat{\mathcal{E}^{\text{ur}}}}}(\text{Gal}_E)$  is trivial.

┘

*Proof:* Cf.[Fontaine-Ouyang]P34. ?

□

**Thm. (25.2.9.14) [Classification of  $\text{Rep}_{\mathbb{Z}_p}(\text{Gal}_{\kappa})$ ].** For  $V \in \text{Rep}_{\mathbb{Z}_p}(\text{Gal}_{\kappa})$ ,

$$\mathbb{M}(V) = (\mathcal{O}_{\widehat{\mathcal{E}^{\text{ur}}}} \otimes_{\mathbb{Z}_p} V)^{\text{Gal}_E}$$

is an étale  $\varphi$ -module over  $\mathcal{O}_{\mathcal{E}}$ , and for any  $M \in \varphi\text{-Mod}^{\text{ét}}(\mathcal{O}_{\mathcal{E}})$ ,

$$\mathbb{V}(M) = (\mathcal{O}_{\widehat{\mathcal{E}^{\text{ur}}}} \otimes_{\mathcal{O}_{\mathcal{E}}} M)^{\varphi=\text{id}}$$

is a  $\mathbb{Z}_p$ -representation of  $\text{Gal}_E$ . And these two functors define an equivalence of categories:

$$\mathbb{M} : \text{Rep}_{\mathbb{Z}_p}(\text{Gal}_E) \cong \varphi\text{-Mod}^{\text{ét}}(\mathcal{O}_{\mathcal{E}}) : \mathbb{V}.$$

┘

*Proof:* To show  $\mathbb{M}(V)$  is étale, Cf.[Fontaine]P35.

By (25.2.9.15), we have an isomorphism

$$\mathcal{O}_{\widehat{\mathcal{E}^{\text{ur}}}} \otimes_{\mathbb{Z}_p} \mathbb{V}(M) \cong \mathcal{O}_{\widehat{\mathcal{E}^{\text{ur}}}} \otimes_{\mathcal{O}_{\mathcal{E}}} M,$$

and by (25.2.9.13),

$$\mathcal{O}_{\widehat{\mathcal{E}}^{\text{ur}}} \otimes_{\mathcal{O}_{\mathcal{E}}} \mathbb{M}(V) \cong \mathcal{O}_{\widehat{\mathcal{E}}^{\text{ur}}} \otimes_{\mathbb{Z}_p} V.$$

Thus

$$\begin{aligned} \mathbb{V}(\mathbb{M}(V)) &= (\mathcal{O}_{\widehat{\mathcal{E}}^{\text{ur}}} \otimes_{\mathcal{O}_{\mathcal{E}}} \mathbb{M}(V))^{\varphi=\text{id}} \cong (\mathcal{O}_{\widehat{\mathcal{E}}^{\text{ur}}} \otimes_{\mathbb{Z}_p} V)^{\varphi=\text{id}} = V(25.2.9.9), \\ \mathbb{M}(\mathbb{V}(M)) &= (\mathcal{O}_{\widehat{\mathcal{E}}^{\text{ur}}} \otimes_{\mathbb{Z}_p} \mathbb{V}(M))^{\text{Gal}_E} \cong (\mathcal{O}_{\widehat{\mathcal{E}}^{\text{ur}}} \otimes_{\mathcal{O}_{\mathcal{E}}} M)^{\text{Gal}_E} = M(25.2.9.9). \end{aligned}$$

□

**Lemma (25.2.9.15).** Situation as in (25.2.9.14),

$$\mathcal{O}_{\widehat{\mathcal{E}}^{\text{ur}}} \otimes_{\mathbb{Z}_p} V(M) \cong \mathcal{O}_{\widehat{\mathcal{E}}^{\text{ur}}} \otimes_{\mathcal{O}_{\mathcal{E}}} M.$$

┘

*Proof:* Cf. [Fontaine-Ouyang]P36. ?

□

**Thm. (25.2.9.16) [Classification of  $\text{Rep}_{\mathbb{Q}_p}(\text{Gal}_E)$ ].**

- For  $V \in \text{Rep}_{\mathbb{Q}_p}(\text{Gal}_E)$ ,

$$\mathbb{D}(V) = (\widehat{\mathcal{E}}^{\text{ur}} \otimes_{\mathbb{Q}_p} V)^{\text{Gal}_E}$$

is an stably-étale  $\varphi$ -module over  $\mathcal{E}$ , and there is a natural isomorphism

$$\widehat{\mathcal{E}}^{\text{ur}} \otimes_{\mathcal{E}} \mathbb{D}(V) \cong \widehat{\mathcal{E}}^{\text{ur}} \otimes_{\mathbb{Q}_p} V.$$

- for any  $D \in \varphi\text{-Mod}^{\text{st.ét}}(\mathcal{E})$ ,

$$\mathbb{V}(D) = (\widehat{\mathcal{E}}^{\text{ur}} \otimes_{\mathcal{E}} D)^{\varphi=\text{id}}$$

is a  $\mathbb{Q}_p$ -representation of  $\text{Gal}_E$ , and there is a natural isomorphism

$$\widehat{\mathcal{E}}^{\text{ur}} \otimes_{\mathbb{Q}_p} \mathbb{V}(D) \cong \widehat{\mathcal{E}}^{\text{ur}} \otimes_{\mathcal{E}} D,$$

- These two functors define an equivalence of Abelian Tannakian categories (4.2.1.13):

$$\mathbb{M} : \text{Rep}_{\mathbb{Q}_p}(\text{Gal}_E) \cong \varphi\text{-Mod}^{\text{sst.ét}}(\mathcal{E}) : \mathbb{D}.$$

┘

*Proof:* For any  $V \in \text{Rep}_{\mathbb{Q}_p}^{\text{fd}}(\text{Gal}_E)$ , by (24.2.3.2), there exists a stable  $\mathbb{Z}_p$ -lattice, thus

$$\widehat{\mathcal{E}}^{\text{ur}} \otimes_{\mathbb{Q}_p} V = (\mathcal{O}_{\widehat{\mathcal{E}}^{\text{ur}}} \otimes_{\mathbb{Z}_p} T) \left[ \frac{1}{p} \right], \quad \mathbb{D}(V) = \mathbb{D}(T) \left[ \frac{1}{p} \right] = \mathcal{E} \otimes_{\mathcal{O}_{\mathcal{E}}} \mathbb{D}(T).$$

and for any  $D \in \varphi\text{-Mod}^{\text{st.ét}}(\mathcal{E})$ , there exists an  $\mathcal{O}_{\mathcal{E}}$ -lattice stable under  $\varphi$ , which is an étale  $\varphi$ -module over  $\mathcal{O}_E$ . Thus

$$\widehat{\mathcal{E}}^{\text{ur}} \otimes_{\mathcal{E}} D = (\mathcal{O}_{\widehat{\mathcal{E}}^{\text{ur}}} \otimes_{\mathcal{O}_{\mathcal{E}}} M) \left[ \frac{1}{p} \right], \quad \mathbb{V}(D) = V(M) \left[ \frac{1}{p} \right] = \mathbb{Q}_p \otimes_{\mathbb{Z}_p} \mathbb{V}(M).$$

Thus it is clear that the assertion follows from that of (25.2.9.14). □

**Cor. (25.2.9.17).** Étale modules over  $E$  of rank  $d$  are of the form  $M_A = \oplus_{i=1}^d E e_i$  with

$$\varphi : M \rightarrow M : \varphi(\lambda e_j) = \lambda^p \sum_{i=1}^d a_{ij} e_i.$$

Isomorphism classes of  $d$ -dimensional  $\mathbb{Q}_p$ -representations of  $\text{Gal}_E$  are in bijection with the isomorphism classes of matrixes in  $\text{GL}(d; \mathcal{O}_{\mathcal{E}})$  where

$$A \sim B \iff \exists P \in \text{GL}(d; \mathcal{E}), B = P^{-1} A \varphi(P).$$

┘

$(\varphi, \Gamma)$ -Modules

**Def. (25.2.9.18) [  $(\varphi, \Gamma)$ -modules ].** If  $A \in \mathcal{TopCRing}$  with a Frobenius ring map  $\varphi_0 : A \rightarrow A \in \mathcal{TopCRing}$ , and  $A$  has an action of  $\Gamma \in \mathcal{TopGrp}$  that commutes with  $\varphi_0$ , then a  $(\varphi, \Gamma)$ -**module**  $M$  is a  $\varphi$ -module  $M$  over  $A$  with a semi-linear action of  $\Gamma$  that commutes with  $\varphi$ .

If  $A$  is complete and  $\varphi$  is flat, then an **étale**  $(\varphi, \Gamma)$ -**module**  $M$  is a  $(\varphi, \Gamma)$ -module that the  $\varphi$ -module structure is étale (25.2.9.3).

Similar to  $\varphi$ -modules,  $(\varphi, \Gamma)$ -modules form a Tannakian category. ? ⌋

**Thm. (25.2.9.19) [Classification of  $\mathcal{Rep}_{\mathbb{Q}_p}(\text{Gal}_K)$ ].** Cf. [Fontaine, Ouyang]. ⌋

Overconvergent  $(\varphi, \Gamma)$ -ModulesFiltered  $(\varphi, N)$ -Modules

**Def. (25.2.9.20) [  $(\varphi, N, \text{Gal}(L/K))$ -Modules ].** Let  $(L, \kappa_L)/(K, \kappa) \in \mathcal{GalField}$  and  $L_0 = L \cap K_0$ , then the category  $(\varphi, N)\text{-Mod}_{L/K}$  of  $(\varphi, N, \text{Gal}(L/K))$ -modules consists of f.d.  $L_0$ -spaces  $V_0$  with

- a  $\varphi_0$ -semi-linear endomorphism,
- a  $L_0$ -linear endomorphism  $N$ ,
- a semi-linear continuous action of  $\text{Gal}(L/K)$  (w.r.t the discrete topology).

That satisfies:

- $N\varphi = p\varphi N$ ,
- $N, \varphi$  commutes with  $\text{Gal}(L/K)$ -actions.

Notice that the condition implies  $N$  maps the subspace of  $\varphi$ -slope  $l$  to the subspace of  $\varphi$ -slope  $l - 1$ , in particular,  $N$  is nilpotent. ⌋

**Prop. (25.2.9.21).** Situation as in (25.2.9.20),  $(\varphi, N)\text{-Mod}_{L/K}$  is an Abelian Tannakian category, where the actions on the tensor is defined to as follows:

$$\varphi(v \otimes w) = \varphi(v) \otimes \varphi(w), \quad N(v \otimes w) = N(v) \otimes w + v \otimes N(w), \quad g(v \otimes w) = g(v) \otimes g(w).$$

⌋

**Def. (25.2.9.22) [Filtered  $(\varphi, N, \text{Gal}(L/K))$ -Modules, Fontaine[Fon94a]].** Let  $L/K$  be a Galois extension with residue field  $\kappa_L$  and  $L_0 = L \cap K_0$ . Then the category  $(\varphi, N)\text{-Fil Mod}_{L/K}$  of **filtered**  $(\varphi, N, \text{Gal}(L/K))$ -**module** consists of tuples

$$(V, \varphi, N, \text{Gal}(L/K), \text{Fil}^\bullet)$$

where

- $(V, \varphi, N, \text{Gal}(L/K)) \in (\varphi, N)\text{-Mod}_{L/K}$  (25.2.9.20),
- $(V \otimes_{L_0} L, \text{Fil}^\bullet) \in \text{Fil}_L$ .

The category  $\varphi\text{-Fil Mod}_{L/K}$  of **filtered  $\varphi$ -modules(isocrystals)** over  $K$  is the Abelian subcategory of  $(\varphi, N, \text{Gal}(L/K))\text{-Fil Mod}_{L/K}$  with  $N = 0$ .  $\varphi\text{-Fil Mod}_{L/K}$  is also denoted by  $\varphi\text{-Fil Mod}_K$ . ⌋

**Prop. (25.2.9.23) [HN-Formalism for Filtered  $\varphi$ -Modules].** The category  $\varphi\text{-Fil Mod}_{L/K}$  (25.2.9.22) is a HN-formalism where  $\mathcal{A}$  is the Abelian category  $\varphi\text{-Mod}(L_0)$  (25.2.9.20), the rank is defined as usual and the degree is defined to be

$$\deg((V, \varphi, \text{Fil}^\bullet)) = t_{\text{H-T}}(V_L, \text{Fil}^\bullet) - t_N(V, \varphi)$$

where  $t_{\text{H-T}}$  is the Hodge-Tate degree (4.3.5.27) and  $t_N = v_p(\det(\varphi|V))$ . This is a HN-formalism. ⌋

*Proof:* The proof is clear, the same as that of (4.3.5.27).  $\square$

**Def. (25.2.9.24) [Weakly Admissible  $\varphi$ -Modules].** The category  $\varphi\text{-Fil Mod}_{L/K}^{\text{weak. adm}}$  of **weakly admissible  $\varphi$ -modules** is the subcategory of  $\varphi\text{-Fil Mod}_{L/K}$  consisting of objects that are semistable of slope 0 w.r.t the HN-formalism (25.2.9.23). It is an Abelian category by (4.3.5.33).

More explicitly, it is a filtered  $\varphi$ -module  $(V, \varphi, \text{Fil}^\bullet)$  s.t. for any non-empty subobject  $(V', \varphi', \text{Fil}'^\bullet)$ , we have

$$\sum_{i \in \mathbb{Z}} i \dim_L \text{gr}_{\text{Fil}'^\bullet}^i(V' \otimes_{L_0} L) \leq v_p(\det(\varphi|V)),$$

and the equality holds for  $(V, \varphi, \text{Fil}^\bullet)$ .  $\lrcorner$

**Prop. (25.2.9.25)**  $[\varphi\text{-Fil Mod}_{L/K}^{\text{weak. adm}}$  **is Tannakian, Faltings[Fal95]].** The subcategory  $(\varphi, N)\text{-Fil Mod}_{L/K}^{\text{weak. adm}} \subset (\varphi, N)\text{-Fil Mod}_{L/K}$  is stable under tensor products and duals. In particular,  $(\varphi, N)\text{-Fil Mod}_{L/K}^{\text{weak. adm}}$  is an Tannakian category.  $\lrcorner$

*Proof:* [Tensor Products in  $p$ -adic Hodge, Totaro, P9,12].  $\square$

**Cor. (25.2.9.26).** The subcategory  $\varphi\text{-Fil Mod}_K^{\text{weak. adm}} \subset \varphi\text{-Fil Mod}_K$  is stable under tensor products and duals.  $\lrcorner$

**Cor. (25.2.9.27).** Tensor product of semistable filtered isocrystals in  $(\varphi, N)\text{-Fil Mod}_{L/K}$  is also semistable.  $\lrcorner$

*Proof:* This is because shifting the filtration of a semistable filtered isocrystal of slope  $c$  down by  $c$  gives a weakly admissible filtered isocrystal.  $\square$

**Def. (25.2.9.28) [Admissible Filtered  $\varphi$ -Modules].**

$$D_{\text{crys}} : \text{Rep}_{\mathbb{Q}_p}^{\text{crys}}(\text{Gal}_K) \rightarrow \varphi\text{-Fil Mod}_K^{\text{weak. adm}}$$

is a fully faithful tensor functor. Objects in the image are called **admissible filtered  $\varphi$ -modules**.  $\lrcorner$

*Proof:* ?  $\square$

**Thm. (25.2.9.29) [Weakly Admissible Implies Admissible, Colmez-Fontaine[C-F00]].** The natural map  $D_{\text{crys}}$  (25.2.9.28) induces an isomorphism of Tannakian categories

$$\text{Rep}_{\mathbb{Q}_p}^{\text{crys}}(\text{Gal}_K) \cong \varphi\text{-Fil Mod}_K^{\text{weak. adm}}.$$

*Proof:*  $\square$

## 10 $(\varphi, \Gamma)$ -Modules over the Robba Ring

**Notation (25.2.10.1).**

- Let  $p \in \text{Prime}$ ,  $K \in p\text{-NField}$ ,  $\Gamma = \mathbb{Z}_p^*$ .
- Use notations on Robba rings define in Robba Ring.
- Let  $H_p = \ker(\text{cycl}_p) \subset \text{Gal}_{\mathbb{Q}_p}$ .

$\lrcorner$

**Prop. (25.2.10.2)**[Fontaines Ring  $B^{\dagger, \text{rig}}$ ]. There exists a  $(\text{Gal}_{\mathbb{Q}_p}, K)$ -regular ring  $B^{\dagger, \text{rig}}$  with an action of  $\text{Gal}_{\mathbb{Q}_p}$  and Frobenius  $\varphi$  s.t.  $(B^{\dagger, \text{rig}})^{H_p} = \mathcal{R}_K$ , and we can define

$$D_{\dagger, \text{rig}} : \text{Rep}_K^{\text{fd}}(\text{Gal}_K) \rightarrow (\varphi, \Gamma)\text{-Mod}^{\text{ét}}(\mathcal{R}_K) : V \mapsto (V \otimes_{\mathbb{Q}_p} B^{\dagger, \text{rig}})^{H_p}.$$

┘

*Proof:* Cf.[Ber02]Section3.4.?

□

**Thm. (25.2.10.3)**[Colmez]. The functor  $D_{\dagger, \text{rig}}$  induces a tensor equivalence

$$\text{Rep}_K^{\text{fd}}(\text{Gal}_{\mathbb{Q}_p}) \cong (\varphi, \Gamma)\text{-Mod}^{\text{ét, slope}=0}(\mathcal{R}_K).$$

┘

*Proof:* Cf.[P. Colmez, Série principale unitaire pour  $\text{GL}_2(\mathbb{Q}_p)$  et représentations triangulines de dimension 2]Prop2.7.?

□

### Triangularizable $(\varphi, \Gamma)$ -Modules

**Def. (25.2.10.4)** [Classification of 1-Dimensional  $(\varphi, \Gamma)$ -Modules]. Let  $\delta : \mathbb{Q}_p^* \rightarrow K^*$  be a continuous character, then there is a 1-dimensional  $(\varphi, \Gamma)$ -module over  $\mathcal{R}_K$  with basis  $x$  s.t.  $\varphi(a) = \delta(p)a$ ,  $\gamma(a) = \delta(\gamma)a$ . Then

- Any  $(\varphi, \Gamma)$ -module of rank 1 over  $\mathcal{R}_K$  is isomorphic to  $R_K(\delta)$  for a unique  $\delta$ . And it is isoclinic of slope  $v(\delta(p))$ ?
- $\text{Ext}_{(\varphi, \Gamma)}(\mathcal{R}_K(\delta_2), \mathcal{R}_K(\delta_1))$  has dimension 1 except when  $\delta_1 \delta_2^{-1} = x^{-i}$  or  $\chi_{\text{cycl}} x^i$  for  $i \in \mathbb{N}$  (where  $x : \mathbb{Q}_p^* \rightarrow K^*$  is the natural inclusion), in which case it has dimension 2.

┘

*Proof:* Cf.[P. Colmez, S'erie principale unitaire pour  $\text{GL}_2(\mathbb{Q}_p)$  et repr'esentations triangulines de dimension 2]Section0.1.?

□

**Def. (25.2.10.5)** [Triangularizable Representations]. A  $(\varphi, \Gamma)$ -module  $D$  over  $\mathcal{R}_K$  is called a **triangularizable  $(\varphi, \Gamma)$ -module** if there is a complete flag of  $(\varphi, \Gamma)$ -submodules which are direct summands of  $D$ .

A Galois representation  $V \in \text{Rep}_K^{\text{fd}}(\text{Gal}_{\mathbb{Q}_p})$  is called triangularizable if  $D_{\dagger, \text{rig}}(V)$  is triangularizable.

For any triangularizable  $(\varphi, \Gamma)$ -module  $D$  over  $\mathcal{R}_K$ , the graded pieces  $\text{gr}_i(D)$  are isomorphic to  $\mathcal{R}_K(\delta_i)$  where  $\delta_i : \mathbb{Q}_p^\times \rightarrow L^\times$  by (25.2.10.4). These characters  $\delta_i$  are called the **parameters of  $D$** . ┘

### $p$ -adic Hodge Theory of $(\varphi, \Gamma)$ -Modules

**Thm. (25.2.10.6)** [Comparison of Fontaine's Functors]. For  $V \in \text{Rep}_{\mathbb{Q}_p}^{\text{fd}}(\text{Gal}_{\mathbb{Q}_p})$  and  $* \in \{\text{crys}, \text{dR}, \text{Sen}\}$ ,

$$D_*(D_{\dagger, \text{rig}}(V)) = D_*(V).$$

┘

*Proof:* Cf.[Ber02]Thm0.2 and Section5.3, [L. Berger, E'quations diff'erentielles  $p$ -adiques et  $(\varphi, N)$ -modules filtr'es] and [P. Colmez, Les conjectures de monodromie  $p$ -adiques]Prop5.6.?

## 26 | Automorphic Representations

### 26.1 Archimedean Automorphic Representations

References are [HC68, P-R94, Bor97, Bum97], [Automorphic Forms and  $L$ -Functions for the Group  $\mathrm{GL}(n; \mathbb{R})$ , Goldfeld], [Classification of Irreducible Representations of Real Algebraic Groups, Langlands] and [course notes given by Liang Xiao], [Classical Automorphic Forms, Iwaniec].

**Notation (26.1.0.1).**

- Let  $K \in \{\mathbb{R}, \mathbb{C}\}$ .
- Let  $G$  be a real reductive group.
- Define a height on  $G$  is induced from an inclusion

$$(\rho, \rho^{-1}) : G \rightarrow \mathrm{Mat}(n; \mathbb{R}) \times \mathrm{Mat}(n; \mathbb{R}) : g \mapsto (g, g^{-1}).$$

where  $\rho$  is a faithful representation of  $G$ . This choice of  $\rho$  is not important here.

- Use notations on arithmetic of algebraic groups defined in [Arithmetic of Algebraic Groups](#).
- Use notations on arithmetic subgroups defined in [Arithmetic Subgroups\(Fundamental Domains\)](#).
- Let  $Z(G)$  be a greatest  $\mathbb{Q}$ -split torus in the center of  $G$ .
- Let  $\mathcal{K} \leq G(\mathbb{R})$  be a maximal compact subgroup.
- If  $G = \mathrm{GL}(n; K)^+$ , denote  $G_1 = \mathrm{SL}(n; K)$ ,  $\mathcal{K} = \mathrm{SO}(n; K)$ ,  $B$  the upper triangular matrices,  $\mathrm{Unip}(n; K)$  the group of unipotent upper triangular matrices in  $G$ ,  $T$  the group of diagonal matrices.
- Define right regular action  $\rho$  of  $G$  on  $C^\infty(G)$ , and also the left regular action  $\lambda$ . We will write  $dX$  for  $X \in \mathfrak{g}$  as the representation of Lie algebra of  $G$  via  $\rho$ , then it commutes with  $\lambda$ . So it induces a map of  $U(\mathfrak{g})$  to the ring of left  $G$ -invariant differential operators on  $G$  [\(24.6.1.1\)](#).
- Denote  $\mathcal{Z} = Z(U(\mathfrak{g}))$ .
- Fix an additive character  $\psi : K \rightarrow \mathbb{C}^\times$ .
- Define a character  $\psi_{\mathrm{Unip}}$  on  $\mathrm{Unip}(n; K)$  by

$$\varphi_{\mathrm{Unip}}(u) = \psi\left(\sum_{i=1}^{n-1} u_{i,i+1}\right).$$

- Let  $\chi \in \Gamma^\vee$ .

- Let  $\omega$  be a character of the center  $Z(\mathbb{R}) \subset G$ . Assume that  $\omega(-1) = \chi(-1)$ .

┘

**Def. (26.1.0.2) [Archimedean Norm].** Take an embedding  $G \hookrightarrow \mathrm{GL}(n)$  and define the norm on  $G$  by

$$\|g\| = \max(|g_{ij}|, |g_{ij}^{-1}|).$$

┘

**Prop. (26.1.0.3).** Choose an Archimedean norm (26.6.0.4), then there exists  $C \in \mathbb{R}_+$  s.t.

$$\|xy\| \leq C \|x\| \|y\|.$$

┘

## 1 Basics

**Def. (26.1.1.1) [Form Spaces].** Let  $C^\infty(\Gamma \backslash G, \chi, \omega)$  be the space of smooth functions  $f \in C^\infty(G)$  s.t.

$$f(\gamma g) = \chi(\gamma) f(g), \text{ where } \gamma \in \Gamma, g \in G,$$

$$f(zg) = \omega(z) f(g), \text{ where } z \in Z(\mathbb{R}), g \in G.$$

Let the subspace  $C_c^\infty(\Gamma \backslash G, \chi, \omega)$  be those functions  $f$  that  $|f|$  is compactly supported in  $G_1$ . Similarly we define  $C(\Gamma \backslash G, \chi, \omega)$  and  $C_c(\Gamma \backslash G, \chi, \omega)$ .

**Def. (26.1.1.2) [Archimedean Automorphic Forms].** Let the space of **automorphic forms**  $\mathcal{A}(\Gamma \backslash G, \chi, \omega)$  be the subspace of  $C^\infty(\Gamma \backslash G, \chi, \omega)$  (26.1.1.1) consisting of  $\mathcal{K}$ -finite and  $\mathcal{Z}$ -finite functions satisfies the **condition of moderate growth**:  $|F(g)| < C \|g\|^N$  (26.1.0.2) for some  $C \in \mathbb{R}_+, N \in \mathbb{Z}$ .

And  $f$  is said to be **rapidly decreasing** if for any  $N \in \mathbb{Z}$ , there exists  $C_N \in \mathbb{R}_+$  s.t.  $|F(g)| < C_N \|g\|^{-N}$  (26.1.0.2).

When  $\omega$  is trivial on  $Z^+(\mathbb{R})$ , let  $\mathcal{A}(\Gamma \backslash G, \chi, k)$  be the subspace of  $\mathcal{A}(\Gamma \backslash G, \chi)$  consisting of functions  $f$  that  $\rho(k_\theta)(f) = e^{ik\theta} f$ .

Automorphic forms are real analytic, by (26.1.1.15).

┘

**Def. (26.1.1.3) [Cuspidal Forms for  $\mathrm{GL}(2)$ ].** If  $\infty$  is a cusp of  $\Gamma$ , then  $\{\pm 1\}\Gamma_\infty = \{\pm 1\} \left\langle \begin{bmatrix} 1 & r \\ & 1 \end{bmatrix} \right\rangle$ , so a  $F \in \mathcal{A}(\Gamma \backslash G, \chi, \omega)$  is called **cuspidal** at  $\infty$  iff  $\chi(\tau_r) \neq 1$  or

$$\int_0^r F\left(\begin{bmatrix} 1 & x \\ & 1 \end{bmatrix} g\right) dx = 0.$$

for any  $g \in G$ . Notice this is independent of  $r$  chosen.

More generally, if  $a$  is a cusp of  $\Gamma$ , then choose  $\xi \in \mathrm{SL}(2; \mathbb{R})$  that  $\xi(\infty) = a$ , then for  $F \in \mathcal{A}(\Gamma \backslash G, \chi, \omega)$ ,  $F'(g) = F(\xi g) \in \mathcal{A}(\Gamma' \backslash G, \chi', \omega)$ , where  $\Gamma' = \xi^{-1}\Gamma\xi$ ,  $\chi'(\gamma') = \chi(\xi\gamma'\xi^{-1})$  (Because left and right actions commute). Then  $F$  is called **cuspidal** at  $a$  iff  $F'$  is cuspidal at  $\infty$ .

The subspace of cuspidal forms is denoted by  $\mathcal{A}_0(\Gamma \backslash G, \chi, \omega) \subset \mathcal{A}(\Gamma \backslash G, \chi, \omega)$ .

┘

### $L^p$ -Spaces

**Def. (26.1.1.4) [ $L^p$ -Spaces].** For  $p \in \mathbb{R}_{\geq 1}$ ,  $L^p(\Gamma \backslash G, \chi, \omega)$  is defined to be the space of functions on  $G$  that satisfies conditions in (26.1.1.1) and is  $L^p$ -integrable on  $\Gamma \backslash Z(\mathbb{R}) \backslash G(\mathbb{R})$  (because it can descend) with the quotient Haar measure (16.6.1.3). ┘

$L_0^p(\Gamma \backslash G, \chi, \omega)$  is the subspace of  $L^p(\Gamma \backslash G, \chi, \omega)$  consisting of cuspidal elements, where cuspidality is defined the same way as in (26.1.1.3) but in the sense that holds for a.e.  $g$ .

When  $G = \mathrm{GL}(2)$ ,  $L^p(\Gamma \backslash \mathrm{GL}(2), \chi, \omega, k)$  be the subspace of  $L^2(\Gamma \backslash \mathrm{GL}(2), \chi, \omega)$  consisting of functions  $F$  that  $\rho(k_\theta)F = e^{ik\theta}F$ . ┘

**Prop. (26.1.1.5).** For  $p \in \mathbb{R}_{\geq 1}$ , the space  $C_c(\Gamma \backslash G, \chi, \omega)$  is dense in  $L^p(\Gamma \backslash G, \chi, \omega)$ . ┘

*Proof:* Firstly we show  $C_c(\Gamma \backslash G, \chi)$  is dense in  $L^2(\Gamma \backslash G, \chi)$ . Let  $\mathcal{F}$  be a Poincaré fundamental domain for  $\Gamma$  in  $\mathrm{SL}(2; \mathbb{R})$  (26.1.1.10), then elements in  $C_c(\mathcal{F})$  can be extended to elements of  $C_c(\Gamma \backslash G, \chi)$ , and in this way,  $L^2(\Gamma \backslash G, \chi)$  is identified with  $L^2(\mathcal{F})$ , so the claim follows from (12.3.8.7). □

**Cor. (26.1.1.6).** The right regular action of  $G$  extends to a continuous unitary representation of  $G$  on  $L^2(\Gamma \backslash G, \chi, \omega)$ , and  $L_0^2(\Gamma \backslash G, \chi, \omega)$  is invariant under this representation. ┘

*Proof:* We must verify continuity, and this is clear using the proposition because we can choose a compact supported function  $f$  to approximate, then the right action is uniformly continuous. The unitarity is clear. The invariance of  $L_0^2(\Gamma \backslash G, \chi)$  is clear. □

**Remark (26.1.1.7).** Can this be extended to arbitrary locally compact group  $G$ ? ?, compare with (24.7.1.14). ┘

**Prop. (26.1.1.8) [ $L^p$ -Functions are of Moderate Growth].** Let  $p \in \mathbb{R}_{\geq 1}$  and  $f \in L^p(\Gamma \backslash G, \chi, \omega)$ . If  $f$  is  $\mathcal{K}$ -finite and  $\mathcal{Z}$ -finite, then  $f$  is automatically of moderate growth (26.1.1.2), thus an automorphic form. ┘

*Proof:* Because  $Z(\mathbb{R})\Gamma \backslash G(\mathbb{R})$  has finite volume ?, it suffices to prove for  $p = 1$ . For this, Cf. [BJ79]. ? □

### Siegel Sets

**Def. (26.1.1.9) [Siegel Sets].** ┘

**Prop. (26.1.1.10) [Poincaré Fundamental Domain].** Fundamental domain for  $\Gamma \subset \mathrm{GL}(2; \mathbb{R})$  acting on  $\mathcal{H}$  is defined in (12.10.3.4). There is a well-shaped open subset  $F$  with a set  $F \subset F' \subset \bar{F}$  that  $F'$  is a fundamental domain for  $\Gamma$  acting on  $\mathcal{H}$ .

Notice that if  $\mathcal{F}$  is a fundamental domain for  $\Gamma$  in  $\mathcal{H} \cong \mathrm{SL}(2; \mathbb{R})/\mathrm{SO}(2)$ , then the inverse image of  $\mathcal{F}$  is a fundamental domain for  $\Gamma$  in  $\mathrm{SL}(2; \mathbb{R})$ , because a.e.  $z \in \mathcal{H}$  is not fixed by any  $\gamma \in \Gamma$ . ┘

*Proof:* Choose a  $z \in \mathcal{H}$  which is not fixed by any  $\gamma \in \Gamma$ , then for any  $\gamma \in \Gamma$ , draw the circle of points that have the same distance to  $z$  and  $\gamma(z)$ , then the intersection of all the part containing  $z$  is a fundamental domain. ? □

**Prop. (26.1.1.11) [Siegel].** If a Poincaré fundamental domain  $\Omega$  has finite area, then  $\partial\Omega$  is a union of f.m. geodesics, and  $\partial\bar{\Omega} \cap X$  is finite, and  $\Gamma(\partial\bar{\Omega} \cap X)$  is the set of cusps for  $\Gamma$ . ┘

*Proof:* The volume of  $\Omega$  has a relation with the angles of geodesics of  $\Omega$ , so it can only have f.m. vertices with interior angle  $< 0.9\pi$ . And the  $\Gamma$ -orbits of these angles intersect  $\bar{\Omega}$  at f.m. vertices, which is because they consists of  $\Gamma$ -conjugates with the same distance with  $z_0$ , and a compact set meets f.m. geodesics of  $\Omega$ , because  $\Gamma z_0$  is discrete in  $\mathcal{H}$ . In particular,  $\Gamma$  has f.m. vertices in the boundary.

Now if  $\Gamma$  has infinitely many vertices, there is a vertex  $b$  that all its  $\Gamma$ -conjugates have angles  $> 0.9\pi$ , then consider the  $\Gamma$ -conjugates of  $\Omega$  with a vertex  $b$ , then all their angle at  $b > 0.9\pi$ , but this cannot be possible geometrically.

For any cusp  $x$  of  $\Gamma$ , suppose the Poincare fundamental domain is defined using  $z$ , notice there is a  $\gamma \in \Gamma$  that  $d(\gamma x, z)$  attains minimum, then  $\gamma x$  must be in the boundary of  $\Gamma$ , as  $d(\gamma_0 z, \gamma x) = d(z, \gamma x)$ , and no other  $z$  are closer to  $\gamma x$ .  $\square$

**Prop. (26.1.1.12)[Siegel Set and Fundamental Set].** Siegel set is a nicely shaped substitutes for a fundamental domain:

- Let  $a_1, \dots, a_n \in \mathbb{R} \cup \{\infty\}$  be a representation of the  $\Gamma$ -orbits of cusps of  $\Gamma$ (26.1.1.11), let  $\xi \in SL(2, \mathbb{R})$  be chosen that  $\xi_i(a_i) = \infty$ . If  $c > 0, d > 0$  be chosen suitably, then the set  $\cup \xi_i^{-1} \mathcal{F}_{c,d}$  contains a fundamental domain of  $\Gamma$ .
- Suppose  $\infty$  is a cusp of  $\Gamma$ , then if  $d$  is large enough, then  $\mathcal{F}_d^\infty$  contains a fundamental domain for  $\Gamma$ .

┘

*Proof:* 1:  $\xi_i \Gamma \xi_i^{-1}$  contains a unipotent subgroup generated by  $\begin{bmatrix} 1 & \delta_i \\ & 1 \end{bmatrix}$ , so if  $d \geq \delta_i$ , then  $\xi_i^{-1} \mathcal{F}_{c,d}$  contains a nbhd of the cusp  $a_i$  in the fundamental domain  $F$  of  $\Gamma$ . so  $F - \cup \xi_i^{-1} \mathcal{F}_{c,d}$  is precompact in  $\mathcal{H}$ , by (26.1.1.11). Now if  $c = 0, d = \infty$ , then  $F - \cup \xi_i^{-1} \mathcal{F}_{c,d} = \emptyset$ , then this is true for some  $c, d$ .

For 2: because  $\infty$  is a cusp, we may assume  $F \in \mathcal{H} \cap \{x > 0\}$ . If  $d$  is large, then  $d$  will contain each of the pieces  $\xi_i^{-1} \mathcal{F}_{c,d} \cap F$  in item 1.  $\square$

**Prop. (26.1.1.13)[Compatibility of Growth Conditions].** Let  $G/\mathbb{R}$  be semisimple,  $f$  be a function on  $\Gamma \backslash G(\mathbb{R})$ , then the following are equivalent:

- $f$  is of moderate growth/rapidly decreasing (26.1.1.2).
- $f$  is of moderate growth/rapidly decreasing on each cusp of  $\Gamma$ ?
- $f$  is of moderate growth/rapidly decreasing on each Siegel set  $\mathfrak{S}_{i,c,d}$ .

┘

*Proof:* Cf. [Bor97] P5.11. ? We only prove for  $SL(2; \mathbb{R})$ .  $\square$

### Harish-Chandra Theorem

**Thm. (26.1.1.14)[Harish-Chandra].** If  $f \in C^\infty(G)$  is both  $K$ -finite and  $\mathcal{Z}$ -finite, then

- $f$  is real analytic.
- $U(\mathfrak{g})f$  is an admissible  $(\mathfrak{g}, K)$ -module.
- There exists  $\alpha \in C_c^\infty(G)$  that

$$\alpha(kgk^{-1}) = \alpha(g), \forall k \in \mathcal{K}, \quad f * \alpha = f.$$

- If  $|f(g)| < C \|g\|^N$ , then all  $U(\mathfrak{g})f$  satisfies similar inequalities with the same  $N$ , i.e.  $f$  is uniformly of moderate growth.

⌋

*Proof:* We prove only for  $G = \mathrm{SL}(2)$ . See [Harish-Chandra, Discrete series for semisimple Lie groups, II. Explicit determination of the characters. Acta. Math. 116 (1966)] or [Gan's notes, P24] for the general case. ?

Because  $W$  lies in the Lie algebra of  $K$  and  $W = iH$ , the hypothesis implies  $\mathcal{R}f$  is f.d., where  $\mathcal{R} = \mathbb{C}[\Delta, H]$ . Let  $V$  be the smallest closed  $G$ -invariant subspace of  $C^\infty(G)$  containing  $f$  and let  $V_0 = U(\mathfrak{g})f$ .

We first prove that

$$V_0 = \bigoplus_{n=-\infty}^{\infty} (V_0 \cap V(n)).$$

Notice there is a continuous projection of  $V$  onto  $V(n)$ :

$$E_n \varphi(g) = \frac{1}{2\pi} \int_0^{2\pi} e^{-in\theta} \varphi(gk_\theta) d\theta,$$

because  $f$  is  $K$ -finite, there is an  $N$  s.t.  $f = \sum_{n=-N}^N E_n f$ . Then notice any  $Df$  is also  $K$ -finite because  $D$  is combination of polynomials in  $R, L, H$  and  $R, L, H$  shift the weights, so the LHS is contained in the RHS. It's left to show now  $E_n Df \in V_0$  for any  $n$ :  $E_n Df$  can be extracted using Lagrange polynomial in  $H$ , so it is clearly in  $V_0$ .

Next we show  $V_0 \cap V(n)$  is of f.d.: Let  $f_1, \dots, f_k$  be a basis of  $\mathcal{R}f$ , because each  $f_k$  is  $K$ -finite. so if we use the decomposition of  $U(\mathfrak{sl}_2(\mathbb{C}))$  (3.7.8.26), only the  $R, L$  shifting of the  $E_n f$  will be considered, and clearly each  $V_0 \cap V(n)$  is of f.d.

Now we show  $f$  is analytic: because  $f$  is  $\mathcal{Z}$ -finite, there is an equation  $P(\Delta)f = 0$  where  $P$  is a monic function, and because  $\Delta$  commutes with  $E_k$  and  $f$  is  $K$ -finite,  $P(\Delta)E_k f = 0$ . Now the  $P(\Delta)E_k f = P(\Delta_k)E_k f$  by (26.1.2.5) and (26.1.3.23), and  $P(\Delta_k)$  is an elliptic operator, so  $E_k f$  is analytic by (13.1.8.5).

Now we show  $V$  is the closure of  $V_0$ : Suppose not, then by Hahn-Banach there is a non-zero continuous linear functional  $\Lambda$  on  $V$  that  $\Lambda(V_0) = 0$ . If  $F \in C^\infty(G)$ , let  $\varphi_F(g) = \Lambda(\rho(g)F)$ , and let  $\varphi = \varphi_f$ . Clearly  $dX\varphi_F = \varphi_{dXF}$ , so  $D\varphi_F = \varphi_{DF}$ , which implies  $\varphi$  is  $\mathcal{Z}$ -finite and smooth, and also  $K$ -finite because  $f$  does. So by what we have proved,  $\varphi$  is analytic. But now  $\varphi$  is analytic and  $D\varphi(1) = \varphi_{DF}(1) = 0$  because  $Df \in V_0$ , so  $\varphi = 0$  by Taylor expansion. So  $\Lambda(\rho(g)f) = 0$  for any  $g$ , contradiction because  $\rho(g)f$  is dense in  $V$ .

So actually  $V(n) \subset V_0$ , because  $E_n V_0 = V_0 \cap V(n) \subset V(n)$  is dense, and  $V_0 \cap V(n)$  is of f.d., so  $V(n) \subset V_0 = V_n$  (12.8.1.8) and  $V_0 = \bigoplus V(n)$  is an admissible  $(\mathfrak{g}, K)$ -module.

Let  $J$  be the convolution algebra (because  $G$  is unimodular) of functions  $\alpha$  that  $\alpha(kgk^{-1}) = \alpha(g)$ , then it can be checked that convolution  $- * \alpha$  commutes with action of  $K$ , so  $f * J$  is in the same  $K$ -type space as  $f$ , thus  $K$ -finite and in a f.d. space.

Now we can approximate  $f$  by  $f * J$ : choose a Dirac sequence  $\{\alpha_n\} \in C_c^\infty(G_1)$ , we may replace  $\{\alpha_n\}$  by the function  $\beta_n(g) = \int_K \alpha_n(k^{-1}gk) dk$  to obtain a Dirac sequence in  $J$ . Then  $f * \alpha_n \rightarrow f$  uniformly on compact sets. But  $f * J$  is f.d., so there are some  $f * \alpha = f$ .

Finally for the growth estimate, it suffices to check for  $D \in \mathfrak{g}$ . Then  $dX(f) = dX(f * \alpha) = f * (dX\alpha)$ , from which the estimate is clear.  $\square$

**Cor.(26.1.1.15) [Automorphic Forms Generate Admissible  $(\mathfrak{g}, K)$ -Modules].** The space  $\mathcal{A}(\Gamma \backslash G, \chi, \omega)$  and  $\mathcal{A}_0(\Gamma \backslash G, \chi, \omega)$  are stable under the action of  $U(\mathfrak{g})$ , and for  $f \in \mathcal{A}(\Gamma \backslash G, \chi, \omega)$ ,  $f$  is analytic and  $U(\mathfrak{g})f$  is an admissible  $(\mathfrak{g}, K)$ -module.

Moreover, if  $f$  satisfies condition of moderate growth (26.1.1.2) and  $D \in U(\mathfrak{g})$ , then  $Df$  satisfies similar conditions with the same constant  $N$ .  $\lrcorner$

*Proof:* It suffices to prove for  $\mathcal{A}(\Gamma \backslash G, \chi, \omega)$  because the cuspidality condition is clearly preserved by right action.

We want to use Harish-Chandra theorem (26.1.1.14) on  $G(K)/Z(K)$ . Now  $|f|$  is constant on each fiber of  $G(K) \rightarrow G(K)/Z(K)$ . it suffices to compare the norm on  $G(K)$  and  $G(K)/Z(K)$ .

We do this only for  $\mathrm{GL}(2; \mathbb{R})$ ?  $\color{red}$

The condition of moderate growth is compatible because the minimal  $\|g\|$  in a  $Z(\mathbb{R})$ -orbit is achieved when  $\deg g = 1$  (26.1.1.2). So all the assertion follows from that of (26.1.1.14) and its proof.  $\square$

## 2 $\mathrm{GL}(n)$

**Notation (26.1.2.1).** Let  $G = \mathrm{GL}(n)$ . And if  $n = 2$ ,

- $G$  acts on  $\mathcal{H}$  through linear fractional transformation (16.6.1.10) and fixes the measure  $y^{-2} dx dy$ . We will denote  $a, b, c, d$  the linear functionals on  $\mathrm{Mat}(2; \mathbb{R})$  s.t. for  $\gamma \in \mathrm{Mat}(2, \mathbb{R})$ ,  $\gamma = \begin{bmatrix} a(\gamma) & b(\gamma) \\ c(\gamma) & d(\gamma) \end{bmatrix}$ .
- Use the Lie algebra notations (3.7.2.11):

$$H = \begin{bmatrix} 0 & -i \\ i & 0 \end{bmatrix}, \quad R = \frac{1}{2} \begin{bmatrix} 1 & i \\ i & -1 \end{bmatrix}, \quad L = \frac{1}{2} \begin{bmatrix} 1 & -i \\ -i & -1 \end{bmatrix} \quad W = \begin{bmatrix} 0 & 1 \\ -1 & 0 \end{bmatrix} = iH.$$

and the Casimir element in  $\mathcal{Z}$ :

$$\Delta = -\frac{1}{4}(H^2 + 2RL + 2LR).$$

- Let  $\Gamma \leq G$  be a discrete subgroup s.t.  $\mathrm{Vol}(\Gamma \backslash \mathcal{H}) < \infty$ . we may also assume that  $-1 \in \Gamma \subset \mathrm{SL}(2; \mathbb{R})$ .  $\lrcorner$

**Prop. (26.1.2.2).**

$$k_\theta \begin{bmatrix} y_1 & \\ & y_2 \end{bmatrix} = \begin{bmatrix} y_1 y_2 D(\theta)^{-1} & \xi D(\theta)^{-1} \\ & D(\theta) \end{bmatrix} k_{\theta'}.$$

where

$$\theta' = \arctan\left(\frac{y_1}{y_2} \tan \theta\right), \quad D(\theta) = \sqrt{y_1^2 \sin^2 \theta + y_2^2 \cos^2 \theta}, \quad \xi = (y_2^2 - y_1^2) \sin \theta \cos \theta.$$

$\lrcorner$

*Proof:* Hint: find  $\theta'$  first.  $\square$

**Prop. (26.1.2.3) [Gelfand].** Let  $G = \mathrm{GL}(n; \mathbb{R})^+$ ,  $\mathcal{K} = \mathrm{SO}(n)$ , denote  $C_c^\infty(\mathcal{K} \backslash G / \mathcal{K})$  to be the smooth functions  $\varphi \in C^\infty(G)$  that  $\varphi(k_1 g k_2) = \varphi(g)$ , then  $C_c^\infty(\mathcal{K} \backslash G / \mathcal{K})$  is commutative.  $\lrcorner$

*Proof:* Consider the map  $\varphi \mapsto \widehat{\varphi} : \widehat{\varphi}(g) = \varphi(g^t)$ , then it is an anti-involution of  $C_c^\infty(K \backslash G / K)$ :

$$(\widehat{\varphi_1 * \varphi_2})(g) = \int_G \varphi_1(g^t h) \varphi_2(h^{-1}) dh = \int_G \widehat{\varphi_2}(h^{-t}) \widehat{\varphi_1}(h^t g) dh = \int_G \widehat{\varphi_2}(h) \widehat{\varphi_1}(h^{-1} g) dh = (\widehat{\varphi_2} * \widehat{\varphi_1})(g)$$

But we find  $\widehat{\varphi} = \varphi$ , because we can use (16.5.5.1),  $\varphi(g) = \varphi(d) = \widehat{\varphi}(d) = \widehat{\varphi}(g)$ .  $\square$

**Prop. (26.1.2.4).** Let  $G = \mathrm{GL}(2; \mathbb{R})^+$ ,  $\mathcal{K} = \mathrm{SO}(2)$ , let  $\sigma \in K^\vee$ , then  $C_c^\infty(\mathcal{K} \backslash G / \mathcal{K}, \sigma)$  is commutative.  
 $\perp$

*Proof:* The proof is the same as that of (26.1.2.3), but modified as

$$\widehat{\varphi}(g) = \varphi\left(\begin{bmatrix} -1 & \\ & 1 \end{bmatrix} g^t \begin{bmatrix} -1 & \\ & 1 \end{bmatrix}\right).$$

□

**Prop. (26.1.2.5).** In the coordinate (16.6.1.3), we have the following equation:

$$\frac{\partial}{\partial R} = e^{2i\theta} \left( iy \frac{\partial}{\partial x} + y \frac{\partial}{\partial y} + \frac{1}{2i} \frac{\partial}{\partial \theta} \right), \quad \frac{\partial}{\partial L} = e^{-2i\theta} \left( -iy \frac{\partial}{\partial x} + y \frac{\partial}{\partial y} - \frac{1}{2i} \frac{\partial}{\partial \theta} \right), \quad \frac{\partial}{\partial H} = -i \frac{\partial}{\partial \theta}$$

So in particular

$$\Delta = -y^2 \left( \frac{\partial^2}{\partial x^2} + \frac{\partial^2}{\partial y^2} \right) + y \frac{\partial^2}{\partial x \partial \theta}.$$

□

*Proof:*  $H = -iW$ , and  $\exp(tW) = k_t = \begin{bmatrix} \cos t & \sin t \\ -\sin t & \cos t \end{bmatrix}$ , so  $dW = \partial/\partial\theta$  is clear.

For  $dR$ , first notice that

$$k_\theta \exp(tR) = \exp(e^{2i\theta} R) k_\theta,$$

as

$$\begin{aligned} k_\theta \exp(tR) k_{-\theta} &= C^{-1} \begin{bmatrix} e^{i\theta} & \\ & e^{-i\theta} \end{bmatrix} \exp(te) \begin{bmatrix} e^{-i\theta} & \\ & e^{i\theta} \end{bmatrix} C = C^{-1} \begin{bmatrix} e^{i\theta} & \\ & e^{-i\theta} \end{bmatrix} \begin{bmatrix} 1 & t \\ & 1 \end{bmatrix} \begin{bmatrix} e^{-i\theta} & \\ & e^{i\theta} \end{bmatrix} C \\ &= C^{-1} \begin{bmatrix} 1 & e^{2i\theta} t \\ & 1 \end{bmatrix} C \\ &= \exp(e^{2i\theta} t R) \end{aligned}$$

where  $C$  is the Cayley transformation, notation as in (3.7.2.11),

Now

$$(dRf)(g) = \frac{d}{dt} f(bk_\theta \exp(tR)) = \frac{d}{dt} f(b \exp(e^{2i\theta} t R) k_\theta) = e^{2i\theta} \frac{d}{dt} f(b \exp(tR) k_\theta)$$

Then notice

$$R = 1/2H + \begin{bmatrix} 0 & i \\ 0 & 0 \end{bmatrix} + 1/2 \begin{bmatrix} 1 & 0 \\ 0 & -1 \end{bmatrix}, \quad \exp(tR) \sim k_{t/2} + \begin{bmatrix} 1 & it \\ & 1 \end{bmatrix} + \begin{bmatrix} e^{t/2} & \\ & e^{-t/2} \end{bmatrix}$$

so we get the desired result.

For  $dL$  the calculation is similar to that of  $dR$ . □

**Def. (26.1.2.6) [Cusps].** A **cusp** of  $\Gamma$  is a point in  $\mathbb{P}^1(\mathbb{R})$  whose stablizer in  $\Gamma$  contains a non-trivial parabolic element (16.6.1.2).

Let  $\infty$  be a cusp, then  $\{\pm 1\}\Gamma_\infty = \{\pm 1\}\langle \begin{bmatrix} 1 & r \\ & 1 \end{bmatrix} \rangle$  for some  $r > 1$ . Then if  $\Gamma_\infty = \langle -\begin{bmatrix} 1 & r \\ & 1 \end{bmatrix} \rangle$ , then it is called an **irreducible cusp**, otherwise it is called a **regular cusp**. Similarly, for any other cusp  $a = \xi(\infty)$ , where  $\xi \in \mathrm{SL}(2; \mathbb{R})$ , we called  $a$  is regular/irregular cusp iff  $\infty$  is regular/irregular cusp w.r.t.  $\Gamma' = \xi^{-1}\Gamma\xi$ .  
 $\perp$

Define  $C(\Gamma \backslash G, \chi, k)$  or  $C_c(\Gamma \backslash G, \chi, k)$  to be the subspace of  $C(\Gamma \backslash G, \chi)$  or  $C_c(\Gamma \backslash G, \chi)$  consisting of functions  $F$  s.t.  $\rho(k_\theta)F = e^{ik\theta}F$ .

When  $\omega$  is the character of  $Z(\mathbb{R})$  that  $\omega(Z(\mathbb{R}^+)) = 1$ , then we denote  $C^\infty(\Gamma \backslash G, \chi) = C^\infty(\Gamma \backslash G, \chi, \omega)$ .  $\lrcorner$

**Prop. (26.1.2.7) [Hecke Operators].** Similar as in (26.3.2.4), we can define the action of  $\mathcal{R}_N$  on  $C^\infty(\Gamma_0(N) \backslash \mathcal{G}, \chi_d)$ :

$$T_\alpha(f)(g) = \sum_i \chi_d(\alpha_i)^{-1} f(\alpha_i g), \quad \text{if } \Gamma_0(N) \alpha \Gamma_0(N) = \coprod_i \Gamma_0(N) \alpha_i.$$

and preserves automorphic or cuspidal forms.  $\lrcorner$

*Proof:* This is an action because if  $\Gamma_0(N) \alpha \Gamma_0(N) = \coprod_i \Gamma_0(N) \alpha_i$ ,  $\Gamma_0(N) \beta \Gamma_0(N) = \coprod_j \Gamma_0(N) \beta_j$ , then  $[\alpha][\beta] = \coprod_{i,j} \Gamma_0(N) \alpha_i \beta_j$ .

Also  $f(\gamma x) = \chi(\gamma) f(x)$  for  $\gamma \in \Gamma_0(N)$  because  $\Gamma_0(N) \backslash \Gamma_0(N) \alpha \Gamma_0(N)$  is right  $\Gamma_0(N)$ -invariant.  $\square$

$\Gamma \backslash \mathcal{H}$

**Def. (26.1.2.8) [Holomorphic Right Weight Action].** Besides the right weight action (26.1.3.19), there is a right action of  $\mathrm{GL}(2; \mathbb{R})^+$  on  $C^\infty(\mathcal{H})$ :

$$f[\gamma]_k(z) = \deg(\gamma)^{k-1} (cz + d)^{-k} f\left(\frac{az + b}{cz + d}\right).$$

*Proof:* This is an action because?  $\square$

**Remark (26.1.2.9).** This action is related to that of (26.1.3.19) via (26.1.3.22).  $\lrcorner$

**Lemma (26.1.2.10).** If  $f$  is a holomorphic function on  $\mathcal{H}$  and  $\gamma \in \mathrm{SL}(2; \mathbb{R})$  satisfies  $\gamma^n \neq 1$  for some  $n \in \mathbb{Z}^\times$  and  $f[\gamma]_k = f$ , then  $f = 0$ .  $\lrcorner$

*Proof:* Use a Cayley transformation  $\mathcal{H} \rightarrow \mathbb{D}$  to map the fixed point to origin, then  $\gamma$  corresponds to  $\mathrm{diag}(\alpha, \alpha^{-1})$ , where  $\alpha$  is not a root of unity. Then if  $f(z) = \sum a_n z^n$ , the formula  $f[\gamma]_k = f$  says  $a_n \alpha^{2n+k} = a_n$ . Because  $\alpha^{2n+k} \neq 1$  for any  $n$ ,  $a_n = 0$  for any  $n$ , thus  $f = 0$ .  $\square$

**Def. (26.1.2.11) [Form Spaces].** if  $\Gamma$  is a discrete subgroup of  $G_1$ , let  $C^\infty(\Gamma \backslash \mathcal{H}, \chi, k)$  be the space of smooth functions on  $\mathcal{H}$  s.t.

$$f[\gamma]_k = \chi(\gamma) f, \quad \forall \gamma \in \Gamma \text{ (26.1.2.8)}.$$

And elements in  $C^\infty(\Gamma \backslash \mathcal{H}, 1, 0)$  are called **automorphic forms**.

Let the subspace  $C_c^\infty(\Gamma \backslash \mathcal{H}, \chi, k)$  be those functions  $f$  that  $|f|$  is compactly supported in  $\Gamma \backslash \mathcal{H}$ .  $\lrcorner$

**Def. (26.1.2.12) [Behavior at Cusps].** If  $\infty$  is a cusp of  $\Gamma$ , then  $\Gamma$  contains some  $\tau_r = \begin{bmatrix} 1 & r \\ & 1 \end{bmatrix}$  for  $r > 0$ ,

then a continuous function  $f(x + iy)$  on  $\mathcal{H}$  is called

- **of at most linear exponential growth** at  $\infty$  iff  $|f(x + iy)| = O(e^{Ny})$  for  $y \rightarrow \infty$  for some  $N \in \mathbb{Z}_+$ .
- **of moderate growth** at  $\infty$  iff  $|f(x + iy)| = O(y^N)$  for  $y \rightarrow \infty$  for some  $N \in \mathbb{Z}_+$ .
- **decay rapidly** at  $\infty$  iff  $|f(x + iy)| \leq y^{-N}$  for any  $N \in \mathbb{Z}_+$ .

- **cuspidal** at  $\infty$  iff either  $\chi(\tau_r) \neq 1$  or  $\int_0^r f(z+u)du = 0$  for any  $z \in \mathcal{H}$ .

If  $f$  is meromorphic on  $\mathcal{H}$  then we have a Fourier expansion

$$f(z) = \sum_{n=-\infty}^{\infty} a_n e^{2\pi i n z / r} = \sum_{n=-\infty}^{\infty} a_n q^n = T(q).$$

Then  $f$  is called **meromorphic/holomorphic/vanishes** at the cusp  $\infty$  iff  $T(q)$  does at  $q = 0$ .

The general cusp case is reduced to the  $\infty$  case the same way as in (26.1.1.3). Notice this is independent of possible  $r$  chosen.  $\perp$

**Prop. (26.1.2.13) [Hecke Operators].** Similar as in (26.3.2.4), we can define the action of  $\mathcal{R}_N$  on  $C^\infty(\Gamma_0(N) \backslash \mathcal{H}, \chi_d, k)$ :

$$T_\alpha(f) = \sum_i \chi_d(\alpha_i)^{-1} f[\alpha_i]_k \quad (26.1.2.8), \text{ where } \Gamma_0(N) \alpha \Gamma_0(N) = \coprod_i \Gamma_0(N) \alpha_i.$$

and preserves automorphic or cuspidal automorphic forms.  $\perp$

*Proof:* This is an action because if  $\Gamma_0(N) \alpha \Gamma_0(N) = \coprod_i \Gamma_0(N) \alpha_i$ ,  $\Gamma_0(N) \beta \Gamma_0(N) = \coprod_j \Gamma_0(N) \beta_j$ , then  $[\alpha][\beta] = \coprod_{i,j} \Gamma_0(N) \alpha_i \beta_j$ .

Also  $T_\alpha(f)[\gamma]_k = T_\alpha(f)$  for  $\gamma \in \Gamma_0(N)$  because  $\Gamma_0(N) \backslash \Gamma_0(N) \alpha \Gamma_0(N)$  is right  $\Gamma_0(N)$ -invariant.  $\square$

### $L^2$ -Spaces

**Def. (26.1.2.14) [Peterson Inner Product].** Notice that if  $f, g \in C^\infty(\Gamma \backslash \mathcal{H}, \chi, k)$  (26.1.2.11), then  $f \bar{g} y^k$  is invariant under action of  $\Gamma$ , so we define the Hilbert space  $L^2(\Gamma \backslash \mathcal{H}, \chi, k)$  as the square-integrable functions in the inner product (26.1.0.1):

$$(f, g)_{\text{Pet}} = \int_{\Gamma \backslash \mathcal{H}} f(z) \bar{g}(z) y^k \frac{dx dy}{y^2}.$$

$\perp$

**Prop. (26.1.2.15) [Two Form Spaces Equal].** There is an isomorphism of Hilbert spaces

$$\sigma_k : C^\infty(\Gamma \backslash \mathcal{H}, \chi, k) \cong C^\infty(\Gamma \backslash G, \chi, k) : (\sigma_k f)(g) = f[g]_k(i).$$

that preserves the inner products thus induces an isomorphism

$$\sigma_k : L^2(\Gamma \backslash \mathcal{H}, \chi, k) \cong L^2(\Gamma \backslash G, \chi, k)$$

And we have (26.1.3.23):

$$\sigma_{k+2} R_k = dR \sigma_k, \quad \sigma_{k-2} L_k = dL \sigma_k, \quad \sigma_k \Delta_k = \Delta \sigma_k.$$

Also cuspidality and the behaviors at the cusps are compatible.

Also if  $\Gamma = \Gamma_0(N)$ , this isomorphism is compatible with the Hecke operator actions (26.1.2.13) and (26.1.2.7).  $\perp$

*Proof:* It can be verified that the inverse of  $\sigma_k$  is given by

$$f(z) = y^{-k/2} F\left(\begin{bmatrix} y & x \\ & 1 \end{bmatrix}\right)$$

More precisely, if coordinates (16.6.1.3),

$$F(u, x, y, \theta) = y^{k/2} f(x + iy) e^{ik\theta}, \quad f(z) = y^{-k/2} F(1, x, y, 0).$$

Check the left action of  $\Gamma$  and  $Z^+(\mathbb{R})$ : For  $\Gamma$  actions (26.1.2.8) and (26.1.1.1), this is because  $\sigma_k(f)(\gamma g) = f[\gamma g]_k(i) = \sigma_k(f[\gamma]_k)$ . Finally check that  $\sigma_k$  preserves inner product, which is immediate from (26.1.2.14) (26.1.1.4) and (16.6.1.3).

The equations between  $R_k, L_k, \Delta_k$  and  $R, L, \Delta$  are easily verified from (26.1.2.5) and (26.1.3.23).

The action of Hecke operators are compatible by the form  $(\sigma_k f)(g) = (f|_k g)(i)$  as above.

Compatibility of behaviors at cusps: For cuspidality, compare (26.1.2.12) and (26.1.1.3). For growth conditions, this follows from (26.1.1.13).  $\square$

### Cuspidal Representations

### Unramified Representations

### Unitarizable, Tempered and $L^2$ -Representations

**Thm. (26.1.2.16) [Classification of  $\text{Irr}^{\text{auto}}(\text{GL}(2)/\mathbb{Q})$ ].** Let  $\chi(-1) = (-1)^\varepsilon$ ,  $\varepsilon = 0, 1$ , (26.1.5.2) shows the representation  $\mathcal{H} = L^2_0(\Gamma \backslash G, \chi)$  decomposes into Hilbert space direct sums of irreducible representations, and  $\Delta$  acts as real scalars  $\lambda$  on each irreducible subspace (24.6.4.21), and  $\mu$  acts by 0. So comparing the classification of representations of  $\text{GL}(2; \mathbb{R})$  (24.7.5.30), we can list what representation can appear in it by looking at eigenvalues  $\lambda$  of  $\Delta$ :

- $\mathbf{1}$  is only f.d. irreducible unitary subrepresentation of  $G$  occurring in  $\mathcal{H}$ .
- If  $\lambda \neq \frac{k}{2}(1 - \frac{k}{2})$  for any  $k \in \varepsilon + 2\mathbb{N}$ , then  $\lambda \geq \frac{\varepsilon}{2}(1 - \frac{\varepsilon}{2})$ , and this subrepresentation is isomorphic to  $P(\lambda, \varepsilon)$ . And let  $k' \equiv \varepsilon \pmod{2}$  be any integer, then the multiplicity of  $P(\lambda, \varepsilon)$  is equal to the multiplicity of the eigenvalue  $\lambda$  of  $\Delta_{k'}$  on  $L^2(\Gamma \backslash \mathcal{H}, \chi, k')$  because  $L^2(\Gamma \backslash \mathcal{H}, \chi, k') \cong L^2(\Gamma \backslash G, \chi, k')$  by (26.1.2.15).
- If  $\lambda = \frac{k}{2}(1 - \frac{k}{2})$  for some  $k \in \varepsilon + 2\mathbb{N}$ , then this subrepresentation is isomorphic to either  $D^+(k)$  or  $D^-(k)$ , and  $D^\pm(k)$  have the same multiplicity in  $\mathcal{H}$ , equal to the dimension  $\dim(M_k(\Gamma, \chi))$  (26.3.1.3) of holomorphic modular forms of weight  $k$  for  $\Gamma$ .  
Also if  $k' \equiv \varepsilon \pmod{2}$  is any integer  $\geq k$  (resp.  $\leq -k$ ), then the multiplicity of  $D^+(k)$  (resp.  $D^-(k)$ ) is equal to the multiplicity of the eigenvalue  $\lambda$  of  $\Delta_{k'}$  on  $L^2(\Gamma \backslash \mathcal{H}, \chi, k')$  because  $L^2(\Gamma \backslash \mathcal{H}, \chi, k') \cong L^2(\Gamma \backslash G, \chi, k')$  by (26.1.2.15).

┘

*Proof:* These follow from classification of irreducible representations of  $\text{GL}(2; \mathbb{R})^+$  (24.7.5.31).

Relation with modular forms: by (24.6.4.16), the multiplicity of  $D^+(k)$  equals the dimension of the  $\frac{k}{2}(1 - \frac{k}{2})$ -eigenspace of  $\Delta_k$  on  $L^2(\Gamma \backslash \mathcal{H}, \chi, k)$ , and (26.1.3.10) shows the dimension of space of functions annihilated by  $\Delta_k$  equals the dimension of modular forms of weight  $k$ . Finally notice that complex conjugation interchanges  $L^2(\Gamma \backslash \mathcal{H}, \chi, k)$  and  $L^2(\Gamma \backslash \mathcal{H}, \chi, -k)$  and  $\overline{\Delta_k} = \Delta_{-k}$  (26.1.3.23), so the multiplicity of  $D^+(k)$  and  $D^-(k)$  equal.  $\square$

### 3 Maass Forms

#### Maass Forms

**Def. (26.1.3.1) [Maass Operator].** The **Maass differential operators** on  $C^\infty(\mathcal{H})$  is defined to be

$$R_k = 2i \frac{\partial}{\partial z} + ky^{-1} = i \left( \frac{\partial}{\partial x} - i \frac{\partial}{\partial y} \right) + ky^{-1}, \quad L_k = -2iy^2 \frac{\partial}{\partial \bar{z}} = -iy^2 \left( \frac{\partial}{\partial x} + i \frac{\partial}{\partial y} \right).$$

and

$$\Delta_k = -y^2 \left( \frac{\partial^2}{\partial x^2} + \frac{\partial^2}{\partial y^2} \right) + iky \left( \frac{\partial}{\partial x} + i \frac{\partial}{\partial y} \right) + \frac{k}{2} \left( 1 - \frac{k}{2} \right) = -L_{k+2} R_k - \frac{k}{2} \left( 1 + \frac{k}{2} \right) = -R_{k-2} L_k + \frac{k}{2} \left( 1 - \frac{k}{2} \right).$$

In particular,

$$\Delta_{k+2} \circ R_k = R_k \circ \Delta_k, \quad \Delta_{k-2} \circ L_k = L_k \circ \Delta_k.$$

And  $\Delta_k$  is a symmetric (unbounded) operator on  $L^2(\mathcal{H})$  (26.1.2.14) with domain  $C_c^\infty(\mathcal{H})$ . ┘

*Proof:* For the formula: ?

For the symmetry: composed with the measure, the order 2 part is just the ordinary Laplacian, and the order 1 part becomes  $iky \left( \frac{\partial}{\partial x} + i \frac{\partial}{\partial y} \right)$ , then notice

$$\int_{\mathcal{H}} iky \left[ \left( \frac{\partial}{\partial x} + \frac{\partial}{\partial y} \right) f \bar{g} + f \left( \frac{\partial}{\partial x} + \frac{\partial}{\partial y} \right) \bar{g} \right] y^k \frac{dx dy}{y^2} = i \int_{\mathcal{H}} d \left( y^{k-1} f \bar{g} dy + y^{k-1} f \bar{g} dx \right) = 0$$

as  $f, g$  are compactly supported. □

**Prop. (26.1.3.2) [Maass Operator and Weight Action].** For  $f \in C^\infty(\mathcal{H})$ ,  $g \in G$ ,

$$(R_k f)[g]_{k+2} = R_k(f[g]_k), \quad (L_k f)[g]_{k-2} = L_k(f[g]_k), \quad (\Delta_k f)[g]_k = \Delta_k(f[g]_k) \quad (26.1.2.8)$$

┘

*Proof:* For  $R_k$ , because scalar doesn't matter, we may assume  $g \in \text{SL}(2; \mathbb{R})$ , and let  $w = \frac{az+b}{cz+d}$ , then

$$\frac{\partial}{\partial z} = \frac{\partial w}{\partial z} \frac{\partial}{\partial w} = (cz+d)^{-2} \frac{\partial}{\partial w}, \quad (w - \bar{w}) = \frac{z - \bar{z}}{|cz+d|^2}.$$

So

$$(w - \bar{w}) \frac{\partial}{\partial w} = \left( \frac{(cz+d)^2}{|cz+d|^2} \right) (z - \bar{z}) \frac{\partial}{\partial z}.$$

And for any  $\varphi \in C^\infty(\mathcal{H})$ ,

$$(z - \bar{z}) \frac{\partial}{\partial z} \left( \left( \frac{c\bar{z}+d}{|cz+d|} \right)^k \varphi \right) = (z - \bar{z}) \left( \frac{c\bar{z}+d}{|cz+d|} \right)^k \frac{\partial \varphi}{\partial z} + \frac{k}{2} \left[ \left( \frac{c\bar{z}+d}{|cz+d|} \right)^{k+2} - \left( \frac{c\bar{z}+d}{|cz+d|} \right)^k \right] \varphi.$$

This is because

$$\frac{\partial}{\partial z} |cz+d| = \frac{c}{2} \frac{|cz+d|}{cz+d}, \quad \frac{\partial}{\partial z} \left( \frac{c\bar{z}+d}{|cz+d|} \right)^k = -\frac{k}{2} c(z-\bar{z}) \frac{(c\bar{z}+d)^k}{|cz+d|^k (cz+d)} = \frac{k}{2} \left[ \left( \frac{c\bar{z}+d}{|cz+d|} \right)^{k+2} - \left( \frac{c\bar{z}+d}{|cz+d|} \right)^k \right].$$

Thus,

$$\begin{aligned} R_k(f|_k g) &= [(z - \bar{z}) \frac{\partial}{\partial z} + \frac{k}{2}] \left( \frac{c\bar{z}+d}{|cz+d|} \right)^k f(w) = [(z - \bar{z}) \left( \frac{c\bar{z}+d}{|cz+d|} \right)^k \frac{\partial}{\partial z} + \frac{k}{2} \left( \frac{c\bar{z}+d}{|cz+d|} \right)^{k+2}] f(w) \\ &= \left( \frac{c\bar{z}+d}{|cz+d|} \right)^{k+2} [(w - \bar{w}) \frac{\partial}{\partial w} + \frac{k}{2}] f(w) = ((R_k f)|_{k+2} g)(z). \end{aligned}$$

The case of  $L_k$  is similar, and the formula for  $\Delta_k$  follows. □

**Cor. (26.1.3.3).** The operator  $R_k, L_k, \Delta_k$  maps functions between  $C^\infty(\Gamma \backslash \mathcal{H}, \chi, k)$  and arises and decreases weights respectively.  $\lrcorner$

**Prop. (26.1.3.4).** For  $f \in C^\infty(\Gamma \backslash \mathcal{H}, \chi, k), g \in C^\infty(\Gamma \backslash \mathcal{H}, \chi, k+2)$ , if one of them decays rapidly at all cusps, then

$$(R_k f, g) = (f, -L_{k+2} g) \quad (26.1.2.14).$$

In particular,  $\Delta_k = -L_{k+2} R_k - k$  is symmetric on the subspace of  $L^2(\Gamma \backslash \mathcal{H}, \chi, k)$  generated by rapidly decaying functions ( $\Delta_k$  is unbounded and defined only on  $C^\infty(\Gamma \backslash \mathcal{H}, \chi, k)$  now, but will be extended to  $L^2(\Gamma \backslash \mathcal{H}, \chi, k)$  in (26.1.5.5) when  $\Gamma \backslash \mathcal{H}$  is compact).  $\lrcorner$

*Proof:* Let  $\omega = y^k f(z) \overline{g(z)} d\bar{z}$ . It can be shown by definition and using (12.4.1.9) that  $\omega(\gamma z) = \omega(z)$ , so  $\omega$  descends to a differential form on  $\Gamma \backslash \mathcal{H}$ , and because one of  $f, g$  decays rapidly at all cusps,

$$\begin{aligned} 0 &= \int_{\Gamma \backslash \mathcal{H}} d(y^k f(z) \overline{g(z)} d\bar{z}) = - \int_{\Gamma \backslash \mathcal{H}} \left[ \frac{\partial}{\partial y} (y^k f \bar{g}) + i \frac{\partial}{\partial x} (y^k f \bar{g}) \right] dx \wedge dy \\ &= - \int_{\Gamma \backslash \mathcal{H}} \left[ \left( i y^{k+2} \frac{\partial}{\partial x} f + y^{k+2} \frac{\partial f}{\partial y} + k y^{k+1} f \right) \bar{g} - \overline{\left( i y^{k+2} \frac{\partial g}{\partial x} - y^{k+2} \frac{\partial g}{\partial y} \right) f} \right] \frac{dx dy}{y^2} \\ &= \int_{\Gamma \backslash \mathcal{H}} [y^{k+2} (R_k f) \bar{g} + y^k f \overline{(L_{k+2} g)}] \frac{dx dy}{y^2}. \end{aligned}$$

so the conclusion follows.  $\square$

**Cor. (26.1.3.5).** If  $\lambda$  is an eigenvector of  $\Delta_k$  on  $C^\infty(\Gamma \backslash \mathcal{H}, \chi, k)$ , then either  $\lambda = \frac{l}{2}(1 - \frac{l}{2})$ , where  $1 \leq l \leq k$  and  $l \equiv k \pmod{2}$ , or  $\lambda \geq \frac{\varepsilon}{2}(1 - \frac{\varepsilon}{2})$ , where  $\varepsilon = (\text{rem } ()k \pmod{2})$ . In particular, eigenvalues of  $\Delta_0$  are  $\geq 0$  and eigenvalues of  $\Delta_1$  are  $\geq 1/4$ .  $\lrcorner$

*Proof:* This can be done by repeatedly using  $\Delta_{k-2} L_k = L_k \Delta_k$  to reduce to the case  $k = \varepsilon$ : If  $L^{ol} f = 0$  for some  $l$ , then  $\lambda = \frac{l}{2}(1 - \frac{l}{2})$ , and if  $L^{ol} f \neq 0$ , then reduce to  $0 \leq k \leq 1$  case, and we can use (24.7.5.21). Alternatively, this can be deduced from (26.1.2.16).  $\square$

**Prop. (26.1.3.6) [Bol's Identity].** Let  $D = \frac{1}{2\pi i} \frac{\partial}{\partial z} = q \frac{\partial}{\partial q}$ , then for any  $k \in \mathbb{Z}_+$ ,

$$D^{\circ(k-1)} = \frac{1}{(-4\pi)^{k-1}} R_{2-k}^{\circ(k-1)}.$$

$\lrcorner$

*Proof:* Cf. [Period functions for Maass wave forms] (4.15).  $\square$

**Def. (26.1.3.7) [Maass Forms].** A twisted **Maass form** of weight  $k$  and parameter  $s$  for  $\Gamma$  is an element in  $C^\infty(\Gamma \backslash \mathcal{H}, \chi, k)$  (26.1.2.11) that is an eigenform for  $\Delta_k$  of eigenvalue  $\lambda = \frac{1}{4} - s^2$  and is of moderate growth at cusps of  $\Gamma$  (26.1.2.12). The space of Maass forms are denoted by  $\mathcal{A}_{\text{Maass}}(\Gamma \backslash \mathcal{H}, \chi, k)$ . The space of cuspidal Maass forms are denoted by  $\mathcal{A}_{\text{cusp Maass}}(\Gamma \backslash \mathcal{H}, \chi, k)$ .

A Maass form of weight 0 and  $\chi = 1$  is sometimes just called a Maass form. The space of Maass forms is denoted by  $\mathcal{A}_{\text{Maass}}(\Gamma \backslash \mathcal{H})$ .  $\lrcorner$

**Def. (26.1.3.8) [Weak Maass Forms].** A **weak Maass form** of weight  $k$  and parameter  $s$  for  $\Gamma$  is an element in  $C^\infty(\Gamma \backslash \mathcal{H}, \chi, k)$  (26.1.2.11) that is an eigenform for  $\Delta_k$  and is of at most linear exponential growth at cusps of  $\Gamma$  (26.1.2.12).  $\lrcorner$

**Prop. (26.1.3.9) [Hecke Operators on Maass Forms].** If  $\Gamma = \Gamma_0(N)$ , the space of Maass forms is stable under the action of the Hecke algebra on  $C^\infty(\Gamma_0(N) \backslash \mathcal{H}, \chi, k)$  (26.1.3.21), by (26.1.3.2).  $\lrcorner$

**Prop. (26.1.3.10) [Holomorphic Modular Forms as Maass Forms].**

$$\mathrm{MF}_k(\Gamma, \chi) = \mathcal{A}_{\mathrm{Maass}}(\Gamma \backslash \mathcal{H}, \chi, k)^{L_k=0}, \quad \mathrm{SF}_k(\Gamma, \chi) \cong \mathcal{A}_{\mathrm{cusp Maass}}(\Gamma \backslash \mathcal{H}, \chi, k)^{L_k=0}.$$

$\lrcorner$

*Proof:* This is because  $L_k = 2iy^2 \frac{\partial}{\partial \bar{z}}$  (26.1.3.23). Also, if  $f$  is a holomorphic modular form, then each  $y^{k/2} f[\gamma]_k$  is bounded by a polynomial of  $y$  at  $\infty$ , and conversely, if  $f(q)$  is bounded by a polynomial of  $\log(1/|q|)$ , then ?? shows  $f$  is holomorphic at each cusp.  $\square$

**Prop. (26.1.3.11) [Non-holomorphic Eisenstein series as Maass Forms].** The non-holomorphic Eisenstein series  $E(\nu + 1/2; s)$  is a Maass form of parameter  $\nu$  for  $\Gamma(1)$ .  $\lrcorner$

*Proof:*  $E(s, \nu + 1/2)$  is automorphic and of moderate growth by (26.9.2.3) and (26.9.2.1).

To show  $E(s, \nu + 1/2)$  is an eigenfunction of  $\Delta$ , if  $\mathrm{Re}(\nu) > 1/2$ , notice  $\Delta(y^{\nu+1/2}) = (\frac{1}{4} - \nu^2)y^{\nu+1/2}$ , and  $\Delta$  is invariant under action of  $\mathrm{SL}(2; \mathbb{Z})$ , thus each  $\mathrm{Im}(\gamma(y^{\nu+1/2}))$  is an eigenfunction for  $\Delta$  of eigenvalue  $\frac{1}{4} - \nu^2$ , so the same is true for  $E(s, \nu + 1/2)$ .

For general  $\nu$ , this can be seen from the Fourier coefficients of  $E(s, \nu + 1/2)$  (26.9.2.2): ?  $\square$

**Prop. (26.1.3.12) [Maass Forms as Automorphic Forms].** If  $f \in \mathcal{A}_{\mathrm{Maass}}(\Gamma \backslash \mathcal{H}, \chi, k)$ , then  $\sigma_k(f) \in C^\infty(\Gamma \backslash G, \chi, k)$  (26.1.2.15), and is an eigenform of  $\Delta$ . In particular it is  $K$ -finite,  $\mathcal{Z}$ -finite, of moderate growth by (26.1.2.15), and it is cuspidal iff  $\sigma_k(f)$  is cuspidal, so  $\sigma_k(f) \in \mathcal{A}(\Gamma \backslash G, \chi, k)$ . And  $f$  is cuspidal iff  $\sigma_k(f)$  is cuspidal.

In fact, there are a bijections

$$\mathcal{A}_{\mathrm{Maass}}(\Gamma \backslash \mathcal{H}, \chi, k, \lambda) \cong \mathcal{A}(\Gamma \backslash G, \chi, k, \lambda), \quad \mathcal{A}_{\mathrm{Maass}}(\Gamma \backslash \mathcal{H}, \chi, k) \cong \mathcal{A}(\Gamma \backslash G, \chi, k)^{\Delta\text{-s.st}}$$

$$\mathcal{A}_{\mathrm{cusp Maass}}(\Gamma \backslash \mathcal{H}, \chi, k) \cong \mathcal{A}_0(\Gamma \backslash G, \chi, k), \quad \mathcal{A}_{\mathrm{cusp Maass}}(\Gamma \backslash \mathcal{H}, \chi) \cong \mathcal{A}_0(\Gamma \backslash G, \chi) = L_0^2(\Gamma \backslash G, \chi)^{K\text{-fin}}.$$

this is because when  $f$  is cuspidal,  $\Delta$  is semisimple on the finite dimensional subspace  $\mathcal{Z}f$  because of the spectral decomposition of  $L_0^2(\Gamma \backslash G, \chi, k)$  (26.1.5.8).  $\lrcorner$

**Cor. (26.1.3.13) [Modular Forms as Automorphic Forms].** Combine this and (26.1.3.10), we get a bijection

$$\mathrm{MF}_k(\Gamma, \chi) \cong \mathcal{A}(\Gamma \backslash G, \chi, k)^{L=0}$$

that induces a bijection

$$\mathrm{SF}_k(\Gamma, \chi) \cong \mathcal{A}_0(\Gamma \backslash G, \chi, k)^{L=0}.$$

$\lrcorner$

**Cor. (26.1.3.14) [Finitely Many Maass Forms of Given Type].**  $\dim \mathcal{A}_{\mathrm{Maass}}(\Gamma_0(N) \backslash \mathcal{H}, \chi, k, \lambda) < \infty$ .  $\lrcorner$

*Proof:* This follows from (26.1.1.15).  $\square$

**Conj. (26.1.3.15) [Selberg Conjecture].** Let  $\Gamma$  be a congruence subgroup, for any  $f \in \mathcal{A}_{\mathrm{cusp Maass}}(\Gamma \backslash \mathcal{H}, \chi, k)$ , the eigenvalue  $\lambda$  of  $\Delta_0$  satisfies  $\lambda \geq 1/4$ , or equivalently, the parameter  $s$  is purely imaginary. In this case, the cuspidal representation generated by  $f$  is tempered.

This conjecture is true for  $\Gamma = \Gamma(1)$  but wrong for some other congruence subgroups.  $\lrcorner$

*Proof:*  $\square$

### Harmonic Maass Forms

References are [Harmonic Maass Forms, Mock Modular Forms, And Quantum Modular Forms, Ono], [Harmonic Maass Forms and Mock Modular Forms, theory and applications, Ono].

**Def. (26.1.3.16) [Harmonic Maass Forms].** For  $k \in \frac{1}{2}\mathbb{Z}$ , the space  $H_k^!(\Gamma, \chi)$  of **harmonic Maass forms of moderate growth** of weight  $k$  consists of weak Maass forms (26.1.3.8) of eigenvalue  $\frac{k}{2}(1 - \frac{k}{2})$ .

The space  $H_k(\Gamma, \chi)$  of **harmonic Maass forms** consists of harmonic Maass forms of moderate growth s.t. for each cusp  $a$ , there exists a Laurent polynomial  $P_{f,a}(\tau) \in \mathbb{C}[q^{-1}]$  s.t.

$$f|_k(\tau) - P_{f,a}(\tau) = O(e^{-\varepsilon y}) \quad (26.1.2.8)$$

as  $y \rightarrow \infty$ , where  $\varepsilon \in \mathbb{R}_+$ . Such  $P_{f,a}$  is called the **principle part** of  $f$  at  $a$ .

$\text{MF}_k^!(\Gamma, \chi) \subset H_k(\Gamma, \chi)$ , by (26.1.3.10). ┘

**Prop. (26.1.3.17).** ┘

**Def. (26.1.3.18) [Mock Modular Forms].** A **Mock modular form** is the holomorphic part  $f^+$  of a harmonic Maass form  $f$  s.t.  $f^- \neq 0$ . ┘

### Hecke Theory of Maass Forms

#### Obsolete Original Form Spaces

**Def. (26.1.3.19) [Right Weight Action].** There are right actions of  $\text{GL}(2, \mathbb{R})^+$  on  $C^\infty(\mathcal{H})$  defined to by

$$(f|_k \gamma)(z) = \left( \frac{c\bar{z} + d}{|cz + d|} \right)^k f\left( \frac{az + b}{cz + d} \right)$$

┘

*Proof:* It is an action because ? □

**Def. (26.1.3.20) [(Original)Form Spaces].** if  $\Gamma$  is a discrete subgroup of  $G_1$ , let  $C^\infty(\Gamma \backslash \mathcal{H}, \chi, k)$  be the space of smooth functions on  $\mathcal{H}$  that

$$f|_k \gamma = \chi(\gamma) f, \quad \forall \gamma \in \Gamma.$$

And elements in  $C^\infty(\Gamma \backslash \mathcal{H}, 1, 0)$  are called **automorphic functions**.

Let the subspace  $C_c^\infty(\Gamma \backslash \mathcal{H}, \chi, k)$  be those functions  $f$  that  $|f|$  is compactly supported in  $\Gamma \backslash \mathcal{H}$ . ┘

**Prop. (26.1.3.21) [Hecke Operators].** Similar as in (26.3.2.4), we can define the action of  $\mathcal{R}_N$  on  $C^\infty(\Gamma_0(N) \backslash \mathcal{H}, \chi_d, k)$ :

$$T_\alpha(f) = \sum_i \chi_d(\alpha_i)^{-1} f|_k \alpha_i \quad (26.1.3.19), \quad \text{if } \Gamma_0(N) \alpha \Gamma_0(N) = \coprod_i \Gamma_0(N) \alpha_i.$$

and preserves automorphic or cuspidal automorphic forms. ┘

*Proof:* This is an action because if  $\Gamma_0(N) \alpha \Gamma_0(N) = \coprod_i \Gamma_0(N) \alpha_i$ ,  $\Gamma_0(N) \beta \Gamma_0(N) = \coprod_j \Gamma_0(N) \beta_j$ , then  $[\alpha][\beta] = \coprod_{i,j} \Gamma_0(N) \alpha_i \beta_j$ .

Also  $T_\alpha(f)|_k \gamma = T_\alpha(f)$  for  $\gamma \in \Gamma_0(N)$  because  $\Gamma_0(N) \backslash \Gamma_0(N) \alpha \Gamma_0(N)$  is right  $\Gamma_0(N)$ -invariant. □

**Prop. (26.1.3.22)[Relations between Original and Classical Form Spaces].** The relation between the two definitions of form space  $C^\infty(\Gamma \backslash H, \chi, k)$  in (26.1.2.11) and (26.1.3.20) is that:

If  $f(z)$  is a classical automorphic function, then  $f'(z) = y^{k/2}f(z)$  is an original automorphic function. And this is a bijection.  $\square$

*Proof:*

$$(y^{k/2}f)|_k\gamma(z) = \left(\frac{c\bar{z}+d}{|cz+d|}\right)^k y^{k/2}f\left(\frac{az+b}{cz+d}\right) \cdot \frac{\det(\gamma)^{k/2}}{|cz+d|^k} = y^{k/2} \frac{\det(\gamma)^{k/2}}{(cz+d)^k} f\left(\frac{az+b}{cz+d}\right) = y^{k/2}f[\gamma]_k(z)$$

$\square$

**Def. (26.1.3.23)[Original Maass Operator].** The Maass differential operators on  $C^\infty(\mathcal{H})$  is defined to be

$$R_k = (z - \bar{z})\frac{\partial}{\partial z} + \frac{k}{2} = iy\frac{\partial}{\partial x} + y\frac{\partial}{\partial y} + \frac{k}{2}, \quad L_k = -(z - \bar{z})\frac{\partial}{\partial \bar{z}} - \frac{k}{2} = -iy\frac{\partial}{\partial x} + y\frac{\partial}{\partial y} - \frac{k}{2}$$

and

$$\Delta_k = -y^2\left(\frac{\partial^2}{\partial x^2} + \frac{\partial^2}{\partial y^2}\right) + ik y \frac{\partial}{\partial x} = -L_{k+2}R_k - \frac{k}{2}\left(1 + \frac{k}{2}\right) = -R_{k-2}L_k + \frac{k}{2}\left(1 - \frac{k}{2}\right)$$

$\Delta_k$  is a symmetric(unbounded) operator on  $L^2(\mathcal{H})$  with domain  $C_c^\infty(\mathcal{H})$ .  $\square$

*Proof:* For the formula: **?**

For the symmetry: composed with the measure, the order2 part is just the ordinary Laplacian, and the order 1 part becomes  $iy^{-1}\frac{\partial}{\partial x}$ , then notice

$$\int_{\mathcal{H}} iy^{-1}\left(\frac{\partial f}{\partial x}\bar{g} + f\frac{\partial \bar{g}}{\partial x}\right)dx dy = i \int_{\mathcal{H}} d(y^{-1}f\bar{g}dy) = 0$$

as  $f, g$  are compactly supported.  $\square$

**Prop. (26.1.3.24)[Maass Operator and Weight Action].** For  $f \in C^\infty(\mathcal{H}), g \in G$ ,

$$(R_k f)|_{k+2}g = R_k(f|_k g), \quad (L_k f)|_{k-2}g = L_k(f|_k g), \quad (\Delta_k f)|_k g = \Delta_k(f|_k g)$$

$\square$

*Proof:* For  $R_k$ , because scalar doesn't matter, we may assume  $g \in SL_2(\mathbb{R})$ , and let  $w = \frac{az+b}{cz+d}$ , then

$$\frac{\partial}{\partial z} = \frac{\partial w}{\partial z} \frac{\partial}{\partial w} = (cz+d)^{-2} \frac{\partial}{\partial w}, \quad (w - \bar{w}) = \frac{z - \bar{z}}{|cz+d|^2}.$$

So

$$(w - \bar{w})\frac{\partial}{\partial w} = \left(\frac{cz+d}{|cz+d|^2}\right)(z - \bar{z})\frac{\partial}{\partial z}.$$

And for any smooth function  $\varphi \in C^\infty(\mathcal{H})$ ,

$$(z - \bar{z})\frac{\partial}{\partial z}\left(\left(\frac{c\bar{z}+d}{|cz+d|}\right)^k \varphi\right) = (z - \bar{z})\left(\frac{c\bar{z}+d}{|cz+d|}\right)^k \frac{\partial \varphi}{\partial z} + \frac{k}{2}\left[\left(\frac{c\bar{z}+d}{|cz+d|}\right)^{k+2} - \left(\frac{c\bar{z}+d}{|cz+d|}\right)^k\right]\varphi.$$

This is because

$$\frac{\partial}{\partial z}|cz+d| = \frac{c}{2} \frac{|cz+d|}{cz+d}, \quad \frac{\partial}{\partial z} \left( \frac{c\bar{z}+d}{|cz+d|} \right)^k = -\frac{k}{2} c(z-\bar{z}) \frac{(c\bar{z}+d)^k}{|cz+d|^k(cz+d)} = \frac{k}{2} \left[ \left( \frac{c\bar{z}+d}{|cz+d|} \right)^{k+2} - \left( \frac{c\bar{z}+d}{|cz+d|} \right)^k \right].$$

Thus,

$$\begin{aligned} R_k(f|_k g) &= [(z-\bar{z}) \frac{\partial}{\partial z} + \frac{k}{2}] \left( \frac{c\bar{z}+d}{|cz+d|} \right)^k f(w) = [(z-\bar{z}) \left( \frac{c\bar{z}+d}{|cz+d|} \right)^k \frac{\partial}{\partial z} + \frac{k}{2} \left( \frac{c\bar{z}+d}{|cz+d|} \right)^{k+2}] f(w) \\ &= \left( \frac{c\bar{z}+d}{|cz+d|} \right)^{k+2} [(w-\bar{w}) \frac{\partial}{\partial w} + \frac{k}{2}] f(w) = ((R_k f)|_{k+2} g)(z). \end{aligned}$$

The case of  $L_k$  is similar, and  $\Delta_k$  follows.  $\square$

**Cor. (26.1.3.25).** The operator  $R_k, L_k, \Delta_k$  maps functions between  $C^\infty(\Gamma \backslash \mathcal{H}, \chi, k)$  and arises and decreases weights respectively.  $\lrcorner$

## 4 Whittaker Models

**Def. (26.1.4.1) [Whittaker Function Space].** For  $\psi \in \widehat{\mathbb{R}}$ , denote  $W_\psi =$  the space of smooth functions  $f$  on  $\mathrm{GL}(n; \mathbb{R})^+$  that satisfies

$$f(ug) = \psi_{\mathrm{Unip}(n)}(u)f(g), \quad u \in \mathrm{Unip}(n)$$

A function  $f \in W$  is called:

- of **moderate growth** if for any compact set  $\Omega \subset G$ ,  $|f(\begin{bmatrix} y & \\ & 1 \end{bmatrix} g)| < C|y|^k$  for some  $C, k > 0$  for any  $g \in \Omega$  when  $|y| \rightarrow \infty$ .
- **rapidly decreasing** if for any compact set  $\Omega \subset G$  and  $k \in \mathbb{R}$ ,  $|f(\begin{bmatrix} y & \\ & 1 \end{bmatrix} g)| < C|y|^k$  for some  $C$  for any  $g \in \Omega$  when  $|y| \rightarrow \infty$ .  $\lrcorner$

**Lemma (26.1.4.2) [Whittaker Function].** Let  $\mu, \lambda \in \mathbb{C}$  and  $k \in \mathbb{Z}$ . Let  $W(\lambda, \mu, k)$  be the space of functions  $f \in W(26.1.4.1)$  on  $G$  s.t.  $\Delta f = \lambda f$ ,  $If = \mu f$ ,  $f \in (C^\infty(G))^k$  and  $f$  is of moderate growth, then  $W(\lambda, \mu, k)$  is 1-dimensional, and functions in this space are actually rapidly decreasing and analytic.

Moreover, the operators  $R, L$  map  $W(\lambda, \mu, k)$  into  $W(\lambda, \mu, k+2)$ ,  $W(\lambda, \mu, k-2)$  respectively.

Also, for  $|y| \rightarrow 0$  and  $\mu$  imaginary,  $W(\lambda, \mu, k)$  is bounded by a  $|y|^{-1/2}$  for some  $\varepsilon > 0$ .  $\lrcorner$

*Proof:* For  $f \in W(\lambda, \mu, k)$ , in coordinate (16.6.1.3), we have

$$f(g) = u^\mu \psi(x) e^{ik\theta} w(y), \quad w(y) = f\left(\begin{bmatrix} y^{1/2} & \\ & y^{-1/2} \end{bmatrix}\right)$$

Thus it suffices to study the behavior of  $w(y)$ . By the expression of  $\Delta$  (26.1.2.5), if  $\psi(x) = e^{iax}$ , then

$$w'' + (-a^2 + \frac{k}{2y} + \frac{\lambda}{y^2})w = 0$$

And this is the Whittaker's equation, and the only moderate growth function is rapidly decreasing and analytic. This is by direct calculation in [A course of Modern Analysis, Whittaker/Watson(1927)]<sup>?</sup>.

For the action of  $R, L$ , they preserve  $W$  because they are right actions. And  $Rf, Lf$  have the same eigenvalue of  $\Delta, I$  because  $\Delta, I$  are in the center of  $U(\mathfrak{g})$ . They shift the weight by (26.1.2.15) and (26.1.3.24).  $\square$

**Prop. (26.1.4.3) [Uniqueness of Whittaker Models for  $GL(2; \mathbb{R})$ ].** For  $(\pi, V) \in \text{Irr}^{\text{adm}}((\mathfrak{g}, K))$ , there exists at most one space  $W(\pi, \psi) \in W$  consisting of  $K$ -finite functions  $f \in W$  that is of moderate growth, and is invariant under the action of  $U(\mathfrak{g})$  and  $K$ , and is infinitesimal equivalent to  $(\pi, V)$ .

Moreover, functions in  $W(\pi, \psi)$  are actually rapidly decreasing and analytic. The space  $W(\pi, \psi)$  is called the **Whittaker model** of  $\pi$ , if it exists.  $\lrcorner$

*Proof:* By (24.6.3.9),  $\Delta, I$  acts by scalars  $\lambda, \mu$  on  $V$ . By (24.6.4.14) or (24.6.4.22) if  $V^k \neq 0$ , then  $\dim V^k = 1$ . If  $V^k \neq 0$ , then the image of  $V^k$  under the isomorphism with  $W(\pi, \psi)$  is in the space  $W(\lambda, \mu, k)$ . Thus  $W(\pi, \psi)$  is the direct sum of the  $W(\lambda, \mu, k)$  for all  $k$  that  $V^k \neq 0$ , so uniquely determined by (26.1.4.2). And the rapid decreasing and analytic properties are also consequences of (26.1.4.2).  $\square$

**Prop. (26.1.4.4).** If  $(\pi, V) \in \text{Irr}^{\text{adm}}((\mathfrak{g}, K))$  has a Whittaker model, then there exists some  $\xi \in V$  that  $W_\xi(1) \neq 0$ .  $\lrcorner$

*Proof:* Because  $K$  intersect each connected component of  $G$ , we can assume some  $W_\xi$  is non-zero on  $K^0$ , thus by analyticity (26.1.4.3), its derivatives at 1 are not identically 0, thus there exists some  $D \in U(\mathfrak{g})$  that  $DW_\xi(1) = W_{D\xi}(1) \neq 0$ .  $\square$

**Prop. (26.1.4.5) [Whittaker Models for  $GL(n; \mathbb{C})$ ].** This result is true if  $\mathbb{R}$  is replaced by  $\mathbb{C}$ .  $\lrcorner$

*Proof:* Cf. [Automorphic Forms on  $GL(2)$ , Jacquet/Langlands (1970) Thm5.3. P232]<sup>?</sup>.  $\square$

**Prop. (26.1.4.6) [Fourier-Maass Expansion].**  $\lrcorner$

*Proof:*  $\square$

**Cor. (26.1.4.7) [Rapidly Decreasing].** Cuspidal automorphic forms are rapidly decreasing at any Siegel set.  $\lrcorner$

*Proof:* Cf. [Gan's Notes, P26]<sup>?</sup>.  $\square$

**Prop. (26.1.4.8) [Existence of Whittaker Models].** The Whittaker model exists for the  $\lrcorner$

**Prop. (26.1.4.9) [Local Multiplicity One Theorem, Shalika [Sha74]].** Given a unitary irreducible representation  $V$  of  $GL(n; F)$ , a **Whittaker functional** on  $V^\infty$  is a  $\text{Unip}(n; F)$ -map  $\lambda : V^\infty \rightarrow \psi_N$ .

Then the space of Whittaker functionals on  $V^\infty$  is at most 1-dimensional.  $\lrcorner$

*Proof:* <sup>?</sup>  $\square$

## 5 Spectral Problems

### The Spectral Problems for $\Gamma \backslash \mathcal{H}$ Compact

**Def. (26.1.5.1).** In this subsection we assume  $\Gamma \backslash G_1$  is compact, or equivalently  $\Gamma \backslash \mathcal{H}$  is compact, because  $K$  is compact. This condition makes  $C^\infty(\Gamma \backslash \mathcal{H}, \chi) = L^2(\Gamma \backslash \mathcal{H}, \chi)$ , and will make the decomposition having only discrete parts(26.1.5.2).  $\lrcorner$

**Prop. (26.1.5.2) [ $L^2(\Gamma \backslash G, \chi)$  Totally Decomposable].** The space  $L^2(\Gamma \backslash G, \chi)$  decomposes into a Hilbert space direct sum of subspaces that are invariant and irreducible under the right regular action  $\rho$ .  $\lrcorner$

*Proof:* This follows from(29.1.4.2).  $\square$

**Lemma (26.1.5.3).** Let  $\sigma$  be the character on  $K$  that  $\sigma(k_\theta) = e^{-ik\theta}$ ,  $C_c^\infty(K \backslash G/K, \sigma)$  is commutative by(26.1.2.4), let  $\xi$  be a character of it. Let  $H(\xi)$  be the subspace of  $f \in L^2(\Gamma \backslash G, \chi, k)$  that  $\pi(\varphi)f = \xi(\varphi)f$  for  $\varphi \in C_c^\infty(K \backslash G/K, \sigma)$ .

Then  $H(\xi)$  are of f.d. and different  $H(\xi), H(\eta)$  are orthogonal that  $\oplus_\xi H(\xi) = L^2(\Gamma \backslash G, \chi, k)$ .  $\lrcorner$

*Proof:* Suppose  $0 \neq f \in H(\xi)$ , then by(24.7.5.2), we can find a  $\varphi \in C_c^\infty(K \backslash G/K, \sigma)$  s.t.  $\rho(\varphi)f \neq 0$ . And by hypothesis  $\rho(\varphi)f = \xi(\varphi)f$ , thus  $\xi(\varphi) \neq 0$ , and  $f$  is an eigenvalue of  $\rho(\varphi)$  which is compact and self-adjoint, so the  $\xi(\varphi)$ -eigenspace of  $\rho(\varphi)$  is f.d. and  $H(\varphi)$  is contained in this space, thus f.d.

To show the orthogonality, choose  $\varphi \in C_c^\infty(K \backslash G/K, \sigma)$  that  $\xi(\varphi) \neq \eta(\varphi)$ . Considering  $\varphi = \varphi_1 + i\varphi_2$ , where  $\rho(\varphi_1), \rho(\varphi_2)$  are both self-adjoint, then we may assume  $\varphi$  is self-adjoint. Then  $H(\xi), H(\eta)$  are contained in different eigenspaces of  $\rho(\varphi)$ , so they are orthogonal.

Finally for the direct sum, it suffices to show that if  $f$  is orthogonal to all  $H(\xi)$ , then  $f = 0$ . Given  $f$ , let  $\varphi_0 \in C_c^\infty(K \backslash G/K, \sigma)$  be chosen that  $\rho(\varphi_0)f$  is near  $f$  that  $\rho(\varphi_0)f, f$  are not orthogonal(24.7.5.2).

Consider the eigenspace decomposition of  $\rho(\varphi_0)$  on  $L^2(\Gamma \backslash G, \chi, k)$ , then  $f = f_0 + f_1 + f_2 + \dots$ , then  $\rho(\varphi_0)f = \lambda_1 f + \lambda_2 f + \dots$ . Because  $f$  is not orthogonal to  $\rho(\varphi_0)f$ , thus  $f_i$  is not orthogonal to  $f$  for some  $i \geq 1$ . Let  $V$  be the  $\lambda_i$ -eigenspace of  $\rho(\varphi_0)$ , then  $V$  is f.d. and invariant under  $\rho(\varphi)$  for all  $\varphi \in C_c^\infty(K \backslash G/K, \sigma)$  because  $C_c^\infty(K \backslash G/K, \sigma)$  is commutative(26.1.2.4). So  $V$  is a direct sum of elements of the spaces  $H(\xi)$ , so  $V$  is orthogonal to  $f$ , contradiction.  $\square$

**Prop. (26.1.5.4).** The space  $L^2(\Gamma \backslash \mathcal{H}, \chi, k)$  decomposes into a Hilbert space direct sum of eigenspaces for  $\Delta_k$ .  $\lrcorner$

*Proof:* By(26.1.2.15), it suffices to prove for  $L^2(\Gamma \backslash G, \chi, k)$  and  $\Delta$ . Because  $\Delta$  are in the center of  $U(\mathfrak{g})$ ,  $H(\xi)$  are all  $\Delta$ -invariant. So we finish by the lemma(26.1.5.3), as each  $H(\xi)$  is f.d. so  $\Delta$  is a self-adjoint operator on  $H(\xi)$ , because  $C_c^\infty(\Gamma \backslash G, \chi)$  is dense(26.1.1.5). So it is a direct sum of  $\Delta$ -eigenspaces.  $\square$

**Prop. (26.1.5.5).**

- The eigenvalues  $\lambda_i$  of  $\Delta_k$  on  $L^2(\Gamma \backslash \mathcal{H}, \chi, k)$  tends to  $\infty$ , and satisfies  $\sum \lambda_i^{-2} < \infty$ .
- The laplacian  $\Delta_k$  has an extension to a self-adjoint operator on the Hilbert space  $L^2(\Gamma \backslash \mathcal{H}, \chi, k)$ .  $\lrcorner$

*Proof:* Cf.[Bump P185].?  $\square$

### General Spectral Problems

**Prop. (26.1.5.6)** [Gelfand, Graev and Piatetski-Shapiro]. Let  $\varphi \in C_c^\infty(G)$ , then

- There exists a constant  $C(\varphi)$  that for all  $f \in L_0^2(\Gamma \backslash G, \chi, \omega)$ , we have  $\|\rho(\varphi)f\|_{C(G)} \leq C(\varphi)\|f\|_2$ .
- $\rho(\varphi)$  is a compact operator on  $L_0^2(\Gamma \backslash G, \chi, \omega)$ .

Notice this generalizes (29.1.4.8).  $\square$

*Proof:* We may assume  $\Gamma$  has cusps, otherwise this is proved in (29.1.4.8). Conjugating  $\Gamma$  by an element of  $\mathrm{SL}(2; \mathbb{R})$ , we may assume that  $\infty$  is a cusp for  $\Gamma$ , and  $\Gamma_\infty$  is generated by  $\begin{bmatrix} 1 & 1 \\ 0 & 1 \end{bmatrix}$ . Then it suffices to prove that

$$\sup_{g \in \mathcal{G}_{c,d}} |\rho(\varphi)f(g)| \leq C_0 \|f\|_2,$$

because we can do the same for other cusps of  $\Gamma$ , and use (26.1.1.12) to show that  $\sup_{g \in F} |\rho(\varphi)f(g)| \leq C_0 \|f\|_2$ , hence for all  $g \in \mathcal{H}$ .

Now let  $\varphi_\omega(g) = \int_{R^*} \varphi(zg)\omega(z)dz$ , then

$$\begin{aligned} \rho(\varphi)f(g) &= \int_{Z(\mathbb{R}) \backslash G} f(gh)\varphi_\omega(h)dh \\ &= \int_{Z(\mathbb{R}) \backslash G} f(h)\varphi_\omega(g^{-1}h)dh \\ &= \int_{\Gamma_\infty Z(\mathbb{R}) \backslash G} \sum_{\gamma \in \Gamma_\infty} f(\gamma h)\varphi_\omega(g^{-1}\gamma h)dh \\ &= \int_{\Gamma_\infty Z(\mathbb{R}) \backslash G} K(g, h)f(h)dh, \end{aligned}$$

where  $K(g, h) = \sum_{\gamma \in \Gamma_\infty} \chi(\gamma)\varphi_\omega(g^{-1}\gamma h)$ . Then we can estimate the kernel  $K(g, h)$  and show it decays rapidly for  $h$  when  $g$  is fixed, and this will give the desired result, Cf. [Bump, P286] ?.

2: Let  $X(\Gamma)$  be the space obtained by compactifying  $\Gamma \backslash G_1$  by adjoining cusps, and let  $\Sigma$  be the image of the unit ball in  $L_0^2(\Gamma \backslash G, \chi, \omega)$  under  $\rho(\varphi)$ , then we can extend each  $|\rho(\varphi)f|$  to  $X(\Gamma)$  that it vanish at the cusps, by the corollary to item1 below (26.1.5.7), then  $\Sigma$  is bounded in the  $L^\infty$ -norm by item1, and it is also equicontinuous, because its derivatives can be bounded uniformly for  $f$ :

$$(X\rho(\varphi)f)(g) = \rho(\varphi_X)f(g), \quad \varphi_X(g) = \frac{\partial}{\partial t}\varphi(\exp(-tX)g).$$

so the conclusion of item1 applied to  $\varphi_X$ s shows the uniformly boundedness. Now Arzela-Ascoli shows that  $\Sigma$  is precompact in  $C(X(\Gamma))$ , thus also in  $L^2(X(\Gamma))$ .  $\square$

**Cor. (26.1.5.7).** If  $\varphi \in C_c^\infty(G)$  and  $f \in L_0^2(\Gamma \backslash G, \chi, \omega)$  (26.1.1.4), then  $\rho(\varphi)f$  is smooth and rapidly decreasing at cusps.  $\square$

*Proof:* This is contained in the proof of (26.1.5.6) above, Cf. [Bump, P286] ?.  $\square$

**Prop. (26.1.5.8)** [ $L_0^2(\Gamma \backslash G, \chi, \omega)$  **Totally Decomposable**]. The space  $L_0^2(\Gamma \backslash G, \chi, \omega)$  decomposes into a Hilbert space direct sum of irreducible subrepresentations of  $G$ , and if  $H$  is such a subrepresentation, then the  $H^{K-\text{fin}} \subset H$  is dense, and  $H^{K-\text{fin}} \in \mathrm{Irr}^{\mathrm{adm}}((\mathfrak{g}, K))$  is contained in  $\mathcal{A}_0(\Gamma \backslash G, \chi, \omega)$ .

Moreover,  $\mathcal{A}_0(\Gamma \backslash G, \chi, \omega)$  is just the smooth part of  $L_0^2(\Gamma \backslash G, \chi, \omega)$ .  $\square$

*Proof:* The proof is exactly the same as that of (26.1.5.2), but where we use (26.1.5.6) in place of (29.1.4.8). Lemma (24.7.5.2) is indispensable.

$H^{K-\text{fin}} \in \text{Irr}^{\text{adm}}(\mathfrak{g}, K)$  by (24.7.5.7). To show it is contained in  $\mathcal{A}_0(\Gamma \backslash G, \chi, \omega)$ , it suffices show that  $H^k \subset \mathcal{A}_0(\Gamma \backslash G, \chi, \omega)$  for any  $k$ . For this, if  $0 \neq f \in H_k$ , choose by (24.7.5.2) a function  $\varphi \in C_c^\infty(G)$  that  $\rho(\varphi)f \neq 0$ , thus we can assume  $\rho(\varphi)(f) = f$  by (24.7.5.2) and (29.1.4.8), as  $\dim H^k < \infty$  by (24.7.5.4). Then by (26.1.5.7)  $f$  is smooth and decay rapidly, and it is clearly  $K$ -finite and  $\mathcal{Z}$ -finite, thus  $f \in \mathcal{A}_0(\Gamma \backslash G, \chi, \omega)$ .

The last assertion follows as any cuspidal form decays rapidly thus is contained in  $L_0^2(\Gamma \backslash G, \chi, \omega)$  (26.1.4.7).  $\square$

**Cor. (26.1.5.9) [Finite Multiplicity, Harish-Chandra].**

- $L_0^2(\Gamma \backslash G, \chi, \omega) = \bigoplus_{\pi} \pi^{m(\pi)}$ , where  $m(\pi) \in \mathbb{Z}_+$ .
- Let  $\mathcal{A}(\Gamma \backslash G, \chi, \omega, \lambda)$  be the  $\lambda$ -eigenspace of  $\Delta$  on  $\mathcal{A}(\Gamma \backslash G, \chi, \omega)$ , and  $\mathcal{A}(\Gamma \backslash G, \chi, \omega, \lambda, k)$  be the  $k$ -part in  $K$ -decomposition of  $\mathcal{A}(\Gamma \backslash G, \chi, \omega, \lambda)$ , and  $\mathcal{A}_0(\Gamma \backslash G, \chi, \omega, \lambda, k)$  the cuspidal part, then  $\dim \mathcal{A}_0(\Gamma \backslash G, \chi, \omega, \lambda, k) < \infty$ .

┘

*Proof:* 1: Let  $(\pi, V)$  be an irreducible unitary representation of  $G$ , let  $k$  be chosen that  $V^k \neq 0$ , let  $0 \neq \xi \in V^k$ , then by (24.7.5.2) there is a  $\varphi \in C_c^\infty(G)$  that  $\pi(\varphi)\xi = \xi$  and  $\pi(\varphi)$  is self-adjoint by (24.7.5.2) and (29.1.4.8), as  $\dim V^k < \infty$  by (24.7.5.4). Now consider for any continuous linear map  $T : V \rightarrow L_0^2(\Gamma \backslash G, \chi, \omega)$ ,  $T\xi$  lies in the 1-eigenspace of the compact self-adjoint operator  $\rho(\varphi)$ , which is of f.d. as  $\rho(\varphi)$  is compact by (26.1.5.6). Of course,  $T$  is determined by  $T\xi$  because  $V$  is irreducible, so these  $T$  form a f.d. vector space, so the multiplicity is finite.

2: This follows from the first, because by (26.1.5.8) the  $K$ -finite parts of an irreducible subrepresentation of  $L_0^2(\Gamma \backslash G, \chi, \omega)$  are just the space of cuspidal forms contained in it, and  $\lambda, k$  determined the action of  $\Delta, I$ , so there are at most onw representation of  $G$  that satisfies these, by classification in (24.6.4.22) and (24.6.4.9), and they appear for finite multiplicity by item1, and for each of them, the  $k$ -part is of f.d., because they are admissible (24.7.5.7). So the conclusion follows.  $\square$

**Thm. (26.1.5.10) [Fundamental Theorem of Harish-Chandra].** In fact, Harish-Chandra showed that for any finite codimensional ideal  $J \subset \mathcal{Z}$ , The subspace  $\mathcal{A}(\Gamma \backslash G, \chi, \omega, J)$  of automorphic forms annihilated by  $J$  is an admissible  $(\mathfrak{g}, K)$ -module. In particular, any  $\pi \in \text{Irr}^{\text{adm}}(\mathfrak{g}, K)$  appears in  $\mathcal{A}(\Gamma \backslash G, \chi, \omega, J)$  with finite multiplicity. ?  $\square$

*Proof:* ?  $\square$

### Eisenstein Series

**Prop. (26.1.5.11).** Let  $\mathcal{A}^2(\Gamma \backslash G, \chi, \omega) = \mathcal{A}(\Gamma \backslash G, \chi, \omega) \cap L^2(\Gamma \backslash G, \chi, \omega)$ , then this is exactly the space of smooth  $K$ -finite  $\mathcal{Z}$ -finite vectors in the discrete spectrum  $L_{\text{disc}}^2(\Gamma \backslash G, \chi, \omega)$ .  $\square$

*Proof:*  $\square$

## 26.2 Spectral Theory of Automorphic Forms

References are [Spectral Methods in Automorphic Forms, Iwaniec].

### 1 Quantum Unique Ergodicity

**Thm. (26.2.1.1) [Holowinsky].** Let  $f$  be a Hecke cusp form of weight  $k$  for  $\mathrm{SL}(2; \mathbb{Z})$ , and let  $F_k(z) = y^{k/2} f(z)$ , then

- If  $\varphi$  is a Maass cusp form which is also an eigenfunction of all the Hecke operators, then

$$|\langle \varphi F_k, F_k \rangle| \ll_{\varphi, \varepsilon} (\log k)^{-\frac{1}{30} + \varepsilon}.$$

- If  $\psi \in C_c^\infty(0, \infty)$ , then

$$\left| \langle E(\cdot|\psi) F_k, F_k \rangle - \frac{3}{\pi} \langle E(\cdot|\psi), 1 \rangle \right| \ll_{\psi, \varepsilon} (\log k)^{-\frac{2}{15} + \varepsilon}.$$

┘

*Proof:*

□

**Cor. (26.2.1.2).** When  $k \geq \infty$ , the zeros of the Hecke cusp form of weight  $k$  become equidistributed w.r.t. the measure  $\frac{3}{\pi} \frac{dx dy}{y^2}$ . ┘

*Proof:* Cf. [RUDNICK, On the asymptotic distribution of zeros of modular forms].

□

**Prop. (26.2.1.3) [Rudnick].** If the quantum unique ergodicity is true for  $\mathrm{GL}(2)$ , then the zeros of these eigenforms are equidistributed w.r.t.  $d\tilde{v}$ . ┘

## 26.3 Modular Forms I

**Notation (26.3.0.1).**

- Use notations on automorphic forms defined in [Archimedean Automorphic Representations](#).

┘

### 1 Modular Forms

#### Siegel Modular Forms

**Def. (26.3.1.1) [Siegel Modular Forms].** Let  $\Gamma \subset \mathrm{Mp}(2; \mathbb{R})$  be a subgroup commensurable with  $\mathrm{Mp}(2; \mathbb{Z})$ , and let  $(\rho, V_\rho) \in \mathrm{Rep}^{\mathrm{fd}}(\Gamma)$  that factors through a finite quotient of  $\Gamma$ , and let  $k \in \frac{1}{2}\mathbb{Z}$ , then a **Siegel modular form** of weight  $k$  and type  $\rho$  for  $\Gamma$  is a holomorphic function  $f \in \mathcal{O}(\mathcal{H}; V_\rho)$

s.t. for  $\gamma = \begin{pmatrix} a & b \\ c & d \end{pmatrix}, \pm\sqrt{c\tau + d} \in \Gamma$ ,

$$f\left(\frac{a\tau + b}{c\tau + d}\right) = (\pm\sqrt{c\tau + d})^{2k} \rho_M(\gamma) f(\tau).$$

┘

**Def. (26.3.1.2) [Holomorphic Siegel Modular Forms]. ?**

The space of holomorphic Siegel modular forms is denoted by  $\mathrm{MF}_k(\Gamma, \rho)$ .

┘

**Def. (26.3.1.3) [Siegel Modular Forms(of half Integral Weights)].** Let  $\Gamma \subset \mathrm{Mp}(2; \mathbb{R})$  be a discrete subgroup commensurable with  $\mathrm{Mp}(2; \mathbb{Z})$ , and let  $(\rho, V_\rho) \in \mathrm{Rep}^{\mathrm{fd}}(\Gamma)$  that factors through a finite quotient of  $\Gamma$ , and let  $k \in \frac{1}{2}\mathbb{Z}$ , then the space  $\mathrm{MF}_k^!(\Gamma, \rho)$  of (weakly holomorphic) **Siegel modular form** of weight  $k$  and type  $\rho$  for  $\Gamma$  consists of functions  $f \in C^\infty(\mathcal{H}; V_\rho)$  s.t.

- $f$  is holomorphic.
- (weak modularity) For  $\gamma = \begin{pmatrix} a & b \\ c & d \end{pmatrix}, \pm\sqrt{c\tau + d} \in \Gamma$ ,

$$f\left(\frac{a\tau + b}{c\tau + d}\right) = (\pm\sqrt{c\tau + d})^{2k} \rho_M(\gamma) f(\tau).$$

- $f$  is meromorphic at the cusps(26.1.2.12), i.e. for any  $g = f[\gamma]_k$ , the coefficients of the expansion

$$g(\tau) = \sum_{n \in \mathbb{Q}} \sum_{\gamma} c_{n,\gamma} q^n e_\gamma$$

vanishes for  $n$  small. Equivalently,  $f[\gamma]_k$  are all meromorphic at  $\infty$  for  $\gamma \in \mathrm{Mp}(\mathbb{Q})$ .

And a meromorphic modular form  $f$  is called a **holomorphic modular form** iff it is holomorphic and holomorphic at cusps(26.1.2.12). The subspace of holomorphic modular forms in  $\mathrm{MF}^!(\Gamma, \rho)$  is denoted by  $\mathrm{MF}(\Gamma, \rho)$ .

A meromorphic modular form of weight 0 is called a **modular function**.

Denote  $\mathrm{MF}_k^!(\Gamma, \mathbf{1}) = \mathrm{MF}_k^!(\Gamma)$ ,  $\mathrm{MF}_k(\Gamma, \mathbf{1}) = \mathrm{MF}_k(\Gamma)$ , and moreover we denote by  $\mathrm{SF}_k(\Gamma, \rho)$  the set of **holomorphic cusp forms** consisting of all  $f \in \mathrm{MF}_k(\Gamma, \rho)$  that vanishes at the cusps(26.1.2.12), and denote  $\mathrm{SF}_k(\Gamma, \mathbf{1}) = \mathrm{SF}_k(\Gamma)$ .

Denote by  $\mathrm{MF}^!(\Gamma) = \bigoplus_{k \geq 0} \mathrm{MF}_k^!(\Gamma)$  the graded ring of meromorphic modular forms,  $\mathrm{MF}(\Gamma) = \bigoplus_{k \geq 0} \mathrm{MF}_k(\Gamma)$  the graded algebra of holomorphic modular forms for  $\Gamma$ ,  $\bigoplus_{k \geq 0} \mathrm{SF}_k(\Gamma)$  is a graded ideal of  $\mathrm{MF}(\Gamma)$ .

┘

**Prop. (26.3.1.4) [Fourier Expansions of Modular Forms].** Let  $N \in \mathbb{Z}_+, k \in \mathbb{N}$  and  $\Gamma \subset \Gamma(1)$  be a modular form of level  $N$ . Then  $f \in \Omega(\mathcal{H}, \mathbb{C})$  is in  $\text{MF}_k(\Gamma)$  iff it is weakly modular, and there exists some  $r \in \mathbb{Z}_+$  s.t.  $f$  has a Fourier expansion

$$f(\tau) = \sum_{n \in \mathbb{N}} a_n e^{2\pi i n / N},$$

where  $a_n = O(n^r)$ . ┘

*Proof:* Cf. [Diamond, modular forms] P17. □

**Thm. (26.3.1.5) [Valence Formula].** If  $f \in \text{MF}_{2k}^!(\Gamma)$ , then

$$\frac{1}{2} \sum_{Q \text{ elliptic points with period 2}} \text{ord}_Q(f) + \frac{1}{3} \sum_{Q \text{ elliptic points with period 3}} \text{ord}_Q(f) + \sum_{Q \text{ others}} \text{ord}_Q(f) = kd/6,$$

where the sum is over a set of representatives for points in  $\Gamma \backslash \mathcal{H}^*$ . ┘

*Proof:* Cf. [Milne, P53]. ? □

**Def. (26.3.1.6) [Hauptmodul].** Let  $\Gamma$  be a discrete subgroup of  $\text{SL}(2; \mathbb{R})$  with exactly one cusp,  $k > 0$ , a **Hauptmodul** for  $\Gamma$  is an element in  $M^!(\Gamma)$  s.t. it is holomorphic on  $\mathcal{H}$  and has a simple pole at the cusp with residue 1, i.e. its Fourier series at the cusp is of the form

$$f(\tau) = q^{-1} + a_0 + a_1 q + \dots$$

┘

**Prop. (26.3.1.7) [Petersson Inner Product].** For a congruence subgroup  $\Gamma \subset \Gamma(1)$  (20.4.5.9) and  $k \in \mathbb{Z}_+, f \in \text{MF}_k(\Gamma, \chi)$  and  $g \in \text{SF}_k(\Gamma, \chi)$ ,  $f \bar{g} y^k$  is invariant under the action of  $\Gamma$ , thus we can define

$$(f, g)_{\text{Pet}} = (f, g)_{\Gamma, k} \triangleq \frac{1}{[\text{SL}(2, \mathbb{Z}) : \{\pm 1\}\Gamma]} \int_{\Gamma \backslash \mathcal{H}} f \bar{g} y^k \frac{dx dy}{y^2},$$

which is finite, and restricts to an inner product on  $S_k(\Gamma, \chi)$ . Moreover, this inner form is invariant of the  $\Gamma$  chosen. ┘

*Proof:* To show it is finite, notice that  $\Gamma \backslash \mathcal{H}$  is a finite translations of the fundamental domain of  $\Gamma(1)$ , and for  $\alpha \in \text{SL}(2; \mathbb{Z})$ ,

$$\int_{\alpha(D)} f \bar{g} y^k \frac{dx dy}{y^2} = \int_D f \circ \alpha \cdot \overline{g \circ \alpha} y(\alpha(z))^k \frac{dx dy}{y^2} = \int_D f[\alpha]_k \cdot \overline{g[\alpha]_k} y^k \frac{dx dy}{y^2},$$

and  $f[\alpha]_k, g[\alpha]_k$  are modular forms for  $\Gamma' = \alpha^{-1} \Gamma \alpha, \chi'(\gamma') = \chi(\alpha \gamma \alpha^{-1})$ , thus it suffices to prove the integral is finite on the fundamental domain  $F$  for  $\Gamma(1)$  (20.4.5.17). For this, notice  $g$  is of exponential decay for  $y$ , thus the integral is bounded by  $\int_{y_1}^{\infty} e^{-cy} y^{k-2} dy < \infty$ . □

**Prop. (26.3.1.8).** If  $\alpha \in \text{GL}(2, \mathbb{R})^+, f \in \text{MF}_k(\Gamma)$  and  $g \in \text{SF}_k(\alpha^{-1} \Gamma \alpha)$ , then

$$(f[\alpha]_k, g)_{\alpha^{-1} \Gamma \alpha} = (f, g[\alpha^{-1}]_k)_{\Gamma}.$$

┘

*Proof:* This is because for there is an isomorphism  $\alpha : \alpha^{-1}\Gamma\alpha\backslash\mathcal{H} \cong \Gamma\backslash H$ , and for any left  $\Gamma$ -invariant function  $\varphi$ ,

$$\int_{\alpha^{-1}\Gamma\alpha\backslash H} \varphi(\alpha(\tau))d\mu(\tau) = \int_{\Gamma\backslash H} \varphi(\tau)d\mu(\tau)$$

and  $(f\overline{g[\alpha^{-1}]y^k})(\alpha\tau) = (f[\alpha]_k\overline{gy^k})(\tau)$ .  $\square$

**Prop.(26.3.1.9) [Lower Bound on Petersson Inner Products].** For any  $N \in \mathbb{Z}_+$  and  $f = \sum_{n \in \mathbb{Z}_+} a_n q^n \in \text{SF}(\Gamma(N))$ ,

$$[\Gamma(1) : \Gamma(N)] \cdot \|f\|_{\text{Pet}} \geq \sum_{n \in \mathbb{Z}_+} \frac{|a_n|^2}{4\pi n e^{4\pi n}}.$$

┘

*Proof:* Integrate on the region  $\{\tau = x + iy : |x| \leq 1/2, y \geq 1\}$ .  $\square$

**Prop.(26.3.1.10) [Twisted Modular Forms].** For  $N \in \mathbb{Z}_+$  and  $\chi \in \text{Diri}(N)$ , we can define  $\text{MF}_k(N, \chi) = \text{MF}_k(\Gamma_0(N), \chi_d)$  (26.3.1.3)(20.4.5.10) and  $\text{SF}_k(N, \chi) = \text{SF}_k(\Gamma_1(N)) \cap \text{MF}_k(N, \chi)$ . Then there are direct sum decompositions:

$$\text{MF}_k(\Gamma_1(N)) = \bigoplus_{\chi \in \text{Diri}(N), \chi(-1) = (-1)^k} \text{MF}_k(N, \chi), \quad \text{SF}_k(\Gamma_1(N)) = \bigoplus_{\chi \in \text{Diri}(N), \chi(-1) = (-1)^k} \text{SF}_k(N, \chi).$$

Moreover, the summands are orthogonal w.r.t. the Petersson inner product (26.3.1.7).  $\square$

*Proof:* Cf.[Diamond, P418].  $\square$

**Cor.(26.3.1.11) [Reduction to  $\Gamma_0(N)$ ].** For any congruence subgroup  $\Gamma(N)$ , there exists  $\alpha \in \text{GL}(2, \mathbb{Q})^+$  s.t.  $\text{diag}(1, N)\Gamma_1(N)\text{diag}(1, 1/N) \subset \Gamma(N)$ . Thus if  $f \in \text{MF}_k(\Gamma(N))$ ,  $f[\text{diag}(1, N)]_k \subset \text{MF}_k(\Gamma_1(N))$ , which is a combination of modular forms in  $\text{MF}_k(\Gamma_0(N), \chi)$ . Thus the study of congruence modular forms reduces to the study of  $\text{MF}_k(N, \chi)$ .  $\square$

### Cusp Forms

**Def.(26.3.1.12) [Poincaré Series].** For any Fuchsian subgroup  $\Gamma \subset \Gamma(1)$ ,  $T = \begin{bmatrix} 1 & 1 \\ & 1 \end{bmatrix}$ . Let  $h$  be the minimal positive integer that  $T^h \subset \Gamma$ , and define  $\Gamma_0$  the subgroup of  $\Gamma$  generated by  $T^h$ . Then we define the **Poincaré series of weight  $2k$  and character  $n$  for  $\Gamma$**  to be the series

$$\varphi_{k,n}(z) = \sum_{\Gamma_\infty \backslash \Gamma'} \frac{e^{\frac{2\pi i n \gamma(z)}{h}}}{(cz + d)^{2k}},$$

where  $\Gamma'$  is the image of  $\Gamma$  in  $\Gamma(1)/\{\pm 1\}$ .  $\square$

**Prop.(26.3.1.13).** For  $k \in \mathbb{Z}_+, n \in \mathbb{N}$ , The Poincaré series (26.3.1.12)  $\varphi_{2k,n}$  converge absolutely on compact subsets of  $\mathcal{H}$ , and  $\varphi_{2k,n} \in \text{MF}_{2k}(\Gamma)$ . Moreover,

- $\varphi_{2k,0}(\tau)$  vanishes at all finite cusps, and  $\varphi_{2k,0}(i\infty) = 1$ .
- For  $n \geq 1$ ,  $\varphi_{2k,n}(\tau) \in \text{SF}_k(\Gamma)$ .

┘

*Proof:* Cf.[Gunning, Lectures on Modular Forms]3.9. ?  $\square$

**Prop. (26.3.1.14) [Cusp Forms are Spanned by Poincaré Series].** For any Fuchsian subgroup  $\Gamma \subset \Gamma(1)$  and  $k \in \mathbb{Z}_+, n \in \mathbb{N}$ , if  $f = \sum_{n \in \mathbb{Z}_+} a_n e^{2\pi i n z/h} \in \text{SF}_k(\Gamma)$ , then

$$(f, \varphi_{2k,n})_{\text{Pet}} = \frac{h^{2k}(2k-2)!}{(4\pi)^{2k-1}} n^{1-2k} a_n.$$

Thus the Poincaré series  $\{\varphi_{2k,n}(z)\}_{n \in \mathbb{Z}_+}$  span  $S_{2k}(\Gamma)$ . ┘

*Proof:* Cf. [Gunning, Lectures on Modular Forms] 3.11.Thm 5. ? □

### Modular Forms of Half Integral Weights

References are [Modular Forms of Half Integral Weight, Shimura].

**Prop. (26.3.1.15) [Theta Functions].** It follows from (26.8.2.5) that

$$\theta\left(\frac{\tau}{4\tau+1}\right) = \theta\left(-\frac{1}{4(-1/(4\tau)-1)}\right) = \sqrt{2i\left(\frac{1}{4\tau}+1\right)} = \theta\left(-\frac{1}{4\tau}-1\right) = \sqrt{4\tau+1}\theta(\tau).$$

Thus by (20.4.5.12),  $\theta^2 \in \text{MF}_1(\Gamma_0(4), \chi_{-4})$ . ┘

**Prop. (26.3.1.16) [Dedekind  $\eta$ -Function].** The Dedekind  $\eta$ -function (10.7.2.6)

$$\eta(\tau) = e^{2\pi i \tau/24} \prod_{n \in \mathbb{Z}_+} (1 - e^{2\pi i n \tau})$$

belongs to  $\text{MF}_{1/2}(\Gamma(1), \chi)$ . ┘

*Proof:* To show this, it suffices to show

$$\eta(\gamma(z)) = \varepsilon(\gamma)(cz+d)^{1/2}\eta(z)$$

for every  $\gamma \in \Gamma(1)$ , where  $\varepsilon(\gamma)$  is a 24-th root of unity. Because  $[\gamma]_k$  is an action (26.3.1.3), by 5, it suffices to show for  $S = \begin{bmatrix} & -1 \\ 1 & \end{bmatrix}$  and  $T = \begin{bmatrix} 1 & \\ & 1 \end{bmatrix}$ . The case for  $T$  is clear from the last expression of  $\eta(z)$ . For  $S$ , it suffices to show that

$$\eta(-1/\tau) = \sqrt{\frac{\tau}{i}} \cdot \eta(\tau).$$

This is true when  $\tau = i$ . So it suffices to show its logarithm derivative:

$$\frac{\eta'(-1/z)}{\eta(-1/z)} z^{-2} = \frac{1}{2z} + \frac{\eta'(z)}{\eta(z)}.$$

And notice

$$\frac{\eta'(z)}{\eta(z)} = \frac{2\pi i}{24} (1 - 24 \sum_{n \in \mathbb{Z}_+} \frac{ne^{2\pi i n z}}{1 - e^{2\pi i n z}}) = \frac{2\pi i}{24} (1 - 24 \sum_{n \in \mathbb{Z}_+} \sigma(n) e^{2\pi i n z}) = \frac{2\pi i}{24} E_2(z).$$

So the assertion follows from (26.3.4.14). □

**Thm. (26.3.1.17) [Serre-Stark].** Every modular forms of weight  $1/2$  (for any level) is a linear combination of unary theta functions. ┘

## 2 Hecke Algebras

**Def. (26.3.2.1) [Hecke Algebra of Level  $N$ ].** For  $N \in \mathbb{Z}_+$ , the **Hecke algebra of level  $N$**  is defined to be

$$\mathcal{H}_N = \prod_{p \in \text{Prime} \setminus S(N)} \mathcal{H}_{\mathcal{K}_p}(\text{GL}(2; \mathbb{Q}))$$

It is commutative ┘

### Hecke Operators

**Prop. (26.3.2.2).** If  $\Gamma_1, \Gamma_2$  are congruence subgroups of  $X$ , then for any  $\alpha \in \text{GL}^+(2; \mathbb{Q})$ , the double coset

$$\Gamma_1 \alpha \Gamma_2 = \coprod_i \Gamma_1 \beta_i$$

for some  $\beta_i \in \text{GL}^+(2, \mathbb{Q})$ . Then we can define a map

$$\text{Div}(X(\Gamma_1)) \rightarrow \text{Div}(X(\Gamma_2)) : [\tau] \mapsto [\beta_i \tau],$$

which induces a morphism  $\text{Jac}(\Gamma_1) \rightarrow \text{Jac}(\Gamma_2)$  ?. ┘

**Prop. (26.3.2.3) [Action on Modular Forms].** Let  $\Gamma_1, \Gamma_2$  be congruence subgroups of  $\text{GL}^+(2, \mathbb{R})$ , then ┘

**Prop. (26.3.2.4) [Hecke Operators].** The Hecke algebra  $\Gamma \backslash \text{GL}^+(2; \mathbb{Q}) / \Gamma$  acts on  $\text{MF}_k(\Gamma)$  via

$$T_\alpha(f) = \sum_i f[\alpha_i]_k \text{ (26.1.2.8)}, \text{ where } \Gamma \alpha \Gamma = \coprod_i \Gamma \alpha_i.$$

And it preserves  $\text{SF}_k(\Gamma)$ . ┘

*Proof:* This is an action because if  $\Gamma_0(N) \alpha \Gamma_0(N) = \coprod_i \Gamma_0(N) \alpha_i$ ,  $\Gamma_0(N) \beta \Gamma_0(N) = \coprod_j \Gamma_0(N) \beta_j$ , then  $[\alpha][\beta] = \coprod_{i,j} \Gamma_0(N) \alpha_i \beta_j$ .

Also  $T_\alpha(f)[\gamma]_k = T_\alpha(f)$  for  $\gamma \in \Gamma_0(N)$  because  $\Gamma_0(N) \backslash \Gamma_0(N) \alpha \Gamma_0(N)$  is right  $\Gamma_0(N)$ -invariant. And they are holomorphic at cusps because  $f$  is holomorphic at cusps thus all  $f[\alpha_i]_k$  are holomorphic at cusps. Moreover, if  $f$  vanishes at cusps, then all  $f[\alpha_i]_k$  vanishes at cusps. □

### $\Gamma_1(N)$ cases

References are [D-S16].

**Def. (26.3.2.5) [Twisted Hecke Actions on  $\text{MF}_k(N, \chi)$ ].** For any  $N \in \mathbb{Z}_+$  and  $f \in \text{MF}_k(N, \chi)$ ,  $\mathcal{H}_N$  acts on  $f$  by

$$T_\alpha(f) = \sum_i \chi_d(\alpha_i)^{-1} f[\alpha_i]_k, \text{ where } \Gamma_0(N) \alpha \Gamma_0(N) = \coprod_i \Gamma_0(N) \alpha_i.$$

This twists makes  $T_\alpha(f) \in \text{MF}_k(N, \chi)$ . It also preserves  $\text{SF}_k(N, \chi)$ . ┘

**Prop. (26.3.2.6) [Adjoint of Hecke Operators].** With respect to the Petersson inner product on  $\text{SF}_k(\Gamma_1(N))$ , for any  $p \in \text{Prime} \setminus S(N)$ ,

$$\langle p \rangle^* = \langle p \rangle^{-1}, \quad T(p)^* = \langle p \rangle^{-1} T(p).$$

┘

*Proof:* Cf.[?D-S16]P187. □

**Cor. (26.3.2.7) [Hecke Eigenforms].** There is a basis consisting of eigenfunctions for  $\mathcal{H}_N$ , called the **Hecke eigenforms**. ┘

*Proof:* This is because  $\mathcal{H}_N$  is commutative(26.3.2.1) and they act by self-adjoint operators(26.3.2.6). □

**Def. (26.3.2.8)  $[T(p)]$ .** For  $p \in \text{Prime}$ ,

$$\Gamma_1(N) \begin{bmatrix} 1 & \\ & p \end{bmatrix} \Gamma_1(N) = \begin{cases} \coprod_{j \in [p-1]} \Gamma_1(N) \begin{bmatrix} 1 & j \\ & p \end{bmatrix} & , p|N \\ \coprod_{j \in [p-1]} \Gamma_1(N) \begin{bmatrix} 1 & j \\ & p \end{bmatrix} \coprod \Gamma_1(N) \begin{bmatrix} m & n \\ N & p \end{bmatrix} \begin{bmatrix} p & \\ & 1 \end{bmatrix} & , p \nmid N \end{cases}.$$

Thus for any  $f \in \text{MF}_k(N, \chi)$ ,

$$T(p)f = \begin{cases} \sum_{j \in [p-1]} f \left[ \begin{bmatrix} 1 & j \\ & p \end{bmatrix} \right]_p & , p|N \\ \sum_{j \in [p-1]} f \left[ \begin{bmatrix} 1 & j \\ & p \end{bmatrix} \right]_p + f \left[ \begin{bmatrix} m & n \\ N & p \end{bmatrix} \begin{bmatrix} p & \\ & 1 \end{bmatrix} \right]_k & , p \nmid N. \end{cases}$$

┘

*Proof:* Cf.[?D-S16]P171 ?. □

**Cor. (26.3.2.9).**

1.  $T(1) = \text{id}$ .
2. If  $(m, n) = 1$ , then  $T(m)T(n) = T(mn)$ .
3. If  $p$  is a prime that  $(p, N) = 1$  and  $n \geq 1$ , then  $T(p^n) \cdot T(p) = T(p^{n+1}) + pR(p) \cdot T(p^{n-1})$ , where  $R(p)$  is the coset  $\Gamma_1(N) \begin{bmatrix} p & \\ & p \end{bmatrix} \Gamma_1(N)$ .

4.  $\mathcal{H}_N$  is generated by  $T(p), R(p), R(p)^{-1}$  for  $p \in \text{Prime} \setminus S(N)$ .

So we can define  $\mathcal{H}'_N = \mathbb{Z}\{T(p), R(p), R(p)^{-1}\}_{p \in \text{Prime}}$ , called the **extended Hecke algebra of level  $N$** . It is also commutative. ┘

*Proof:* 1: Trivial.

2: This follows from Chinese remainder theorem.

3: Omitted.

4: This follows from  $p$ -adic Cartan decomposition. □

**Prop. (26.3.2.10) [Explicit Formula for Hecke Operators].** Let  $f = \sum_{m \in \mathbb{Z}} a_m(f) q^m \in \text{MF}_k(N; \chi)$ , then for any  $m, n \in \mathbb{Z}_+$ ,

$$a_m(T_n(f)) = \sum_{d|(m,n)} \chi(d) d^{k-1} a_{mn/d^2}(f).$$

┘

*Proof:* Because  $T(n)$  is multiplicative(26.3.2.9), it suffices to prove for  $n = p^k$  where  $p \in \text{Prime}, k \in \mathbb{Z}_+$ . □

**Cor. (26.3.2.11).**  $a_1(T_n(f)) = a_n(f)$  for any  $f \in \text{SF}_k(\Gamma_1(N))$  and  $n \in \mathbb{Z}_+$ . In particular, there is a perfect pairing

$$\text{SF}_k(N, \chi) \times (\mathcal{H}_N)_{\mathbb{C}} \rightarrow \mathbb{C} : (f, t) \mapsto a_1(t(f)).$$

┘

### New Forms

**Def. (26.3.2.12) [Old and New Forms].** For  $d|N$ , define be the subspaces of  $\text{SF}_k(N, \chi)$ :

$$\text{SF}_k(N, \chi)[d] = \{f + g[\text{diag}(d, 1)]_k \text{ where } f, g \in S_k(N/d, \chi_0), \chi = \chi_0 \mathbf{1}_d\},$$

and let

$$\text{SF}_k(N, \chi)^{\text{old}} = \sum_{p \in S(N)} \text{SF}_k(N, \chi)[p],$$

called the space of **old forms of level  $N$** . Also the space

$$\text{SF}_k(N, \chi)^{\text{new}} = (\text{SF}_k(N, \chi)^{\text{old}})^{\perp},$$

called the space of **new forms of level  $N$** .

┘

**Remark (26.3.2.13).** The dimension of newforms and oldforms are calculated by [Dimensions of the Spaces of Cusp Forms and Newforms on  $\Gamma_0(N)$  and  $\Gamma_1(N)$ ].

┘

**Thm. (26.3.2.14) [Atkin-Lehler [A-L70]].** If  $f = \sum_{n \in \mathbb{Z}_+} a_n(f)q^n \in \text{SF}_k(\Gamma_1(N))$  satisfies  $a_n(f) = 0$  for any  $n \in \mathbb{Z}_+$  s.t.  $(n, N) = 1$ , then  $f \in \text{SF}_k(\Gamma_1(N))^{\text{old}}$  (26.3.2.12).

┘

*Proof:* Cf. [D-S16]P191.

□

**Prop. (26.3.2.15) [Eigenform Basis].**  $\text{SF}_k(N, \chi)^{\text{old}}$  and  $\text{SF}_k(N, \chi)^{\text{new}}$  are both stable under  $\mathcal{H}'_N$  (26.3.2.1). In particular, they have a orthogonal basis of Hecke eigenforms for the Hecke operators, by (26.3.2.6) (26.3.2.7).

$f \in \text{SF}_k(N, \chi)$  is called a **normalized newform** if it is a Hecke eigenform and  $a_1(f) \neq 0$ . Equivalently, it satisfies

1.  $a_1(f) = 1$ .
2.  $a_{p^r}(f) = a_p(f)a_{p^{r-1}}(f) - \chi(p)p^{k-1}a_{p^{r-2}}(f)$  for all  $p \in \text{Prime}$  and  $r \in \mathbb{Z}_{\geq 2}$ .
3.  $a_{mn}(f) = a_m(f)a_n(f)$  for all  $m, n \in \mathbb{Z}_+$  s.t.  $(m, n) = 1$ .

┘

*Proof:* Cf. [D-S16]P189?

For the equations, Cf. [D-S16]P199.

□

**Prop. (26.3.2.16) [Normalized Newforms].** If  $0 \neq f = \sum a_n(f)q^n \in \text{SF}_k(N, \chi)^{\text{new}}$  (26.3.2.12) is an eigenform for all  $\{T(n)\}_{n \in \mathbb{Z}_+ \setminus (N)}$  with eigenvalues  $\lambda(n)$ , then  $a_1(f) \neq 0$ . And if  $a_1(f) = 1$ , then  $T(m)f = a_m(f)f$  for all  $m \in \mathbb{Z}_+$ . Such  $f$  is called a **Normalized newform**.

┘

*Proof:* By (26.3.2.10),  $a_1(T(n)f) = a_n(f)$ . So if  $c_1(f) = 0$ , then  $c_n(f) = 0$  for any  $n \in \mathbb{Z}_+ \setminus (N)$ , which implies that  $f$  is an oldform by (26.3.2.14), contradiction. Thus  $a_1(f) \neq 0$ .

Assume  $a_1(f) = 1$ . For any  $m \in \mathbb{Z}_+$ , denote  $g_m = T(m)f - a_m(f)f$ , then  $g_m \in \text{SF}_k(N, \chi)^{\text{new}}$ , and it is an eigenform for all  $\{T(n)\}_{n \in \mathbb{Z}_+ \setminus (N)}$ , but  $a_1(g_m) = 0$ . So  $g_m = 0$  by the argument as above. Thus  $T(m)f = a_m(f)f$  for any  $m \in \mathbb{Z}_+$ .

□

**Prop. (26.3.2.17)**[Standard Basis for  $\mathrm{SF}_k(N, \chi)$ ]. The set

$$\{f(n\tau) : n, M \in \mathbb{Z}_+, nM|N, f \in \mathrm{SF}_k(M, \chi_0)^{\mathrm{new}} \text{ is a normalized newform, } \chi = \chi_0 \mathbf{1}_{N/M}\}$$

is a basis of  $\mathrm{SF}_k(N, \chi)$ .  $\lrcorner$

*Proof:* It is clear from the definition of oldforms and newforms (26.3.2.12) that these elements span  $\mathrm{SF}_k(N, \chi)$ . To show that they are linearly independent, suppose there is a non-trivial linear relation

$$\sum_{i,j} c_{i,j} f_i(n_{ij}\tau)$$

with minimal possible term. Then all  $f_i$  have the same eigenvalues away from  $N$ , because otherwise we can use the operator  $T_p - a_p(f_1)$  to get a shorter linear relation. But then all  $f_i$  are equal by strong multiplicity one  $?$ .  $\square$

**Cor. (26.3.2.18).** For any normalized eigenform  $g \in \mathrm{SF}_k(N, \chi)$ , there exists unique  $M \in \mathbb{Z}_+$  s.t.  $M|N$  and  $\chi_0 \in \mathrm{Diri}(M)$  s.t.  $\chi_0$  lifts to  $\chi$ , and a unique normalized newform  $f \in \mathrm{SF}_k(M, \chi_0)^{\mathrm{new}}$  s.t.  $a_p(f) = a_p(g)$  for all  $p \in \mathrm{Prime} \setminus S(N/M)$ .  $\lrcorner$

*Proof:* The uniqueness follows from strong multiplicity one  $?$ .  $\square$

### 3 Dimension Formulae

**Def. (26.3.3.1)**[Notations]. In this subsection,

- $\Gamma$  is a **congruence subgroup** of  $\mathrm{SL}(2, \mathbb{Z})$ .
- $g$  is the genus of  $X(\Gamma)$ .
- $d$  is the degree of the map  $X(\Gamma) \rightarrow X(1)$  which is equal to  $[\mathrm{SL}(2, \mathbb{Z}) : \{\pm 1\}\Gamma]$ .
- $\varepsilon_2$  is the number of elliptic points with period 2.
- $\varepsilon_3$  is the number of elliptic points with period 3.
- $\varepsilon_\infty$  is the number of cusps.
- $\varepsilon_\infty^{\mathrm{reg}}$  is the number of regular cusps (26.1.2.6).
- $\varepsilon_\infty^{\mathrm{irr}}$  is the number of irregular cusps.

$\lrcorner$

**Prop. (26.3.3.2)**[Genus Formula].

$$g = 1 + \frac{d}{12} - \frac{\varepsilon_2}{4} - \frac{\varepsilon_3}{3} - \frac{\varepsilon_\infty}{2}.$$

$\lrcorner$

*Proof:* Cf. [Diamond, P68].  $?$   $\square$

**Thm. (26.3.3.3)**[Dimension Formulae for  $k$  Even]. For  $k \in 2\mathbb{Z}$ ,

$$\dim(\mathrm{MF}_k(\Gamma)) = \begin{cases} \frac{(k-1)d}{12} + (\frac{1}{4} - \{\frac{k}{4}\})\varepsilon_2 + (\frac{1}{3} - \{\frac{k}{3}\})\varepsilon_3 + \frac{1}{2}\varepsilon_\infty & k \geq 2 \\ 1 & k = 0 \\ 0 & k < 0 \end{cases}$$

and

$$\dim(\mathrm{SF}_k(\Gamma)) = \begin{cases} \frac{(k-1)d}{12} + (\frac{1}{4} - \{\frac{k}{4}\})\varepsilon_2 + (\frac{1}{3} - \{\frac{k}{3}\})\varepsilon_3 - \frac{1}{2}\varepsilon_\infty & k \geq 4 \\ g & k = 2 \\ 0 & k \leq 0 \end{cases}$$

┘

*Proof:* Cf.[Diamond P87].

□

**Cor.(26.3.3.4).** For any Fuchsian group  $\Gamma \subset \mathrm{SL}(2, \mathbb{R})$  and  $k \in \mathbb{Z}$ ,

$$\dim \mathrm{MF}_k(\Gamma) \leq \frac{\mathrm{Vol}(\mathrm{SL}(2; \mathbb{R})/\Gamma)}{4\pi} \cdot k + 1.$$

In particular,  $\mathrm{MF}_0(\Gamma) = 0$ .

┘

*Proof:* Cf.[Modular Forms, 1-2-3]P12.

□

**Cor.(26.3.3.5).** For any Fuchsian subgroup  $\Gamma \subset \mathrm{SL}(2; \mathbb{R})$ , any three  $f, g, h \in \mathrm{MF}_*(\Gamma)$  are not alg.independent.

┘

*Proof:* Otherwise for  $n$  large,  $\dim \mathrm{MF}_n(\Gamma) = \Omega(n^2)$ .

□

**Prop.(26.3.3.6)[Dimension Formulae for  $k$  Odd].** For  $k$  odd,

- if  $k < 0$  or  $-1 \in \Gamma$ , then  $\mathrm{MF}_k(\Gamma) = \mathrm{SF}_k(\Gamma) = 0$ .
- If  $k \geq 3$ ,  $-1 \notin \Gamma$ , then

$$\dim(\mathrm{MF}_k(\Gamma)) = (k-1)(g-1) + \lfloor \frac{k}{3} \rfloor \varepsilon_3 + \frac{k}{2} \varepsilon_\infty^{\mathrm{reg}} + \frac{k-1}{2} \varepsilon_\infty^{\mathrm{irr}}$$

$$\dim(\mathrm{SF}_k(\Gamma)) = (k-1)(g-1) + \lfloor \frac{k}{3} \rfloor \varepsilon_3 + (\frac{k}{2} - 1) \varepsilon_\infty^{\mathrm{reg}} + \frac{k-1}{2} \varepsilon_\infty^{\mathrm{irr}}$$

- If  $k = 1$ ,  $-1 \notin \Gamma$ , then

$$\dim(\mathrm{MF}_1(\Gamma)) \begin{cases} = \varepsilon_\infty^{\mathrm{reg}}/2 & \varepsilon_\infty^{\mathrm{reg}} > 2g-2 \\ \geq \varepsilon_\infty^{\mathrm{reg}}/2 & \varepsilon_\infty^{\mathrm{reg}} \leq 2g-2 \end{cases}, \quad \dim(\mathrm{SF}_1(\Gamma)) = \dim(\mathrm{MF}_1(\Gamma)) - \varepsilon_\infty^{\mathrm{reg}}/2.$$

┘

*Proof:* Cf.[Diamond P91].

□

### Explicite Dimension Formulae for $\Gamma(N), \Gamma_1(N), \Gamma_0(N)$

**Lemma(26.3.3.7).** For  $N \in \mathbb{Z}_{\geq 2}$ ,

$$\mathrm{SL}(2, \mathbb{Z}) \rightarrow \mathrm{SL}(2, \mathbb{Z}/(N))$$

is surjective.

┘

*Proof:* Cf.[?D-S16]P101.

□

**Prop.(26.3.3.8)[Degrees for  $\Gamma(N), \Gamma_1(N), \Gamma_0(N)$ ].**

- The degree of the mapping  $X(N) \rightarrow X(1)$  is

$$d = d_N = [\mathrm{SL}(2, \mathbb{Z}) : \{\pm 1\}\Gamma(N)] = \begin{cases} 1/2N^3 \prod_{p|N} (1 - 1/p^2) & N > 2 \\ 6 & N = 2 \end{cases}$$

- There is a coset decomposition  $\Gamma_1(N) = \coprod_{j=1}^N \Gamma(N) \begin{bmatrix} 1 & j \\ 0 & 1 \end{bmatrix}$ , in particular,  $d = [\mathrm{SL}(2, \mathbb{Z}) : \{\pm 1\}\Gamma_1(N)] = d_N/N, N \geq 2$ .
- There is a coset decomposition  $\Gamma_0(N) = \coprod_{y \bmod N, (y, N)=1} \Gamma_1(N) \begin{bmatrix} x & k \\ N & y \end{bmatrix}$ , where  $x, k$  are chosen that  $xy - kN = 1$ . In particular,  $d = [\mathrm{SL}(2, \mathbb{Z}) : \Gamma_0(N)] = 2d_N/N\varphi(N), N \geq 2$ .

┘

*Proof:* 1: By (26.3.3.7), the map  $\mathrm{SL}(2, \mathbb{Z}) \rightarrow \mathrm{SL}(2, \mathbb{Z}/N\mathbb{Z})$  is surjective, so  $[\Gamma(N) : \Gamma(1)] = \#\mathrm{SL}(2, \mathbb{Z}/N\mathbb{Z})$ . Let  $N = \prod p_i^{n_i}$ , then  $\mathrm{SL}(2, \mathbb{Z}/N\mathbb{Z}) \cong \prod_i \mathrm{SL}(2, \mathbb{Z}/p_i^{n_i}\mathbb{Z})$ , and calculating depending on  $e_{11}$  is invertible or  $e_{12}$  is invertible,  $\#\mathrm{SL}(2, \mathbb{Z}/p_i^{n_i}\mathbb{Z}) = 2(p^{n_i} - p^{n_i-1})p^{2n_i} - (p^{n_i} - p^{n_i-1})^2 p^{n_i} = p_i^{3n_i} - p_i^{3n_i-2}$ . Thus  $\#\mathrm{SL}(2, \mathbb{Z}/(N)) = N^3 \prod_{p|N} (1 - p^{-2})$ , and we get the desired formula.  $\square$

**Prop. (26.3.3.9) [Elliptic Points for  $\Gamma(N), \Gamma_1(N), \Gamma_0(N)$ ].** For  $N \in \mathbb{Z}_+$ ,

- There are on elliptic points for  $\Gamma(N)$  for  $N \geq 2$ .
- There are on elliptic points for  $\Gamma_1(N)$  for  $N \geq 4$ .
- The elliptic points of period 2 for  $\Gamma_0(N)$  corresponds to the ideals  $J \subset \mathrm{Ideal}(\mathbb{Z}[i])$  s.t.  $\mathbb{Z}[i]/J \cong \mathbb{Z}/(N)$ , and the elliptic points of period 3 for  $\Gamma_0(N)$  corresponds to the ideals  $J \subset \mathrm{Ideal}(\mathbb{Z}[\omega])$  s.t.  $\mathbb{Z}[\omega]/J \cong \mathbb{Z}/(N)$ .

┘

*Proof:* Cf. [Diamond]P56, 95. ?

$\square$

**Lemma (26.3.3.10).** Let  $s = a/c, s' = a'/c' \in \mathbb{P}^1(\mathbb{Q})$  with  $(a, c) = (a', c') = 1$ , then for any  $\gamma \in \mathrm{SL}(2, \mathbb{Z})$ ,

$$s' = \gamma(s) \iff \begin{bmatrix} a' \\ c' \end{bmatrix} = \pm \gamma \begin{bmatrix} a \\ c \end{bmatrix}.$$

┘

*Proof:*

$\square$

**Lemma (26.3.3.11).** Let  $s = a/c, s' = a'/c' \in \mathbb{P}^1(\mathbb{Q})$  with  $(a, c) = (a', c') = 1$ , then

- $\Gamma(N)s' = \Gamma(N)s \iff \begin{bmatrix} a' \\ c' \end{bmatrix} \equiv \pm \begin{bmatrix} a \\ c \end{bmatrix} \pmod{N}$
- $\Gamma_1(N)s' = \Gamma_1(N)s \iff \begin{bmatrix} a' \\ c' \end{bmatrix} \equiv \pm \begin{bmatrix} a + jc \\ c \end{bmatrix} \pmod{N}$ , for some  $j \in \mathbb{Z}$ .
- $\Gamma_0(N)s' = \Gamma_0(N)s \iff \begin{bmatrix} ya' \\ c' \end{bmatrix} \equiv \begin{bmatrix} a + jc \\ cy \end{bmatrix} \pmod{N}$ , for some  $y$  relatively prime to  $N$  and some  $j \in \mathbb{Z}$ .

┘

*Proof:* Use(26.3.3.10).

1: One direction is clear, for the other, If  $\begin{bmatrix} a' \\ c' \end{bmatrix} \equiv \pm \begin{bmatrix} a \\ c \end{bmatrix} \pmod{N}$ , take  $b, d$  that  $ac - bd = 1$ , then  $\gamma = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$  maps  $\begin{bmatrix} 1 \\ 0 \end{bmatrix}$  to  $\begin{bmatrix} a \\ c \end{bmatrix}$ . As  $\Gamma(N)$  is normal in  $\Gamma(1)$ , it suffices to prove for  $\begin{bmatrix} a \\ c \end{bmatrix} = \begin{bmatrix} 1 \\ 0 \end{bmatrix}$ . Then  $a' \equiv 1 \pmod{N}$ , take integers  $\beta, \delta$  that  $a'\delta - c'\beta = (1 - \alpha')/N$ , let  $\gamma = \begin{bmatrix} a' & \beta N \\ c' & \delta N \end{bmatrix}$ , then  $\gamma \in \Gamma(N)$  and  $\begin{bmatrix} a' \\ c' \end{bmatrix} = \gamma \begin{bmatrix} 1 \\ 0 \end{bmatrix}$ .

2 follows from 1 and the coset decomposition  $\Gamma_1(N) = \coprod_{j=1}^N \Gamma(N) \begin{bmatrix} 1 & j \\ & 1 \end{bmatrix}$ .

3: There is a coset decomposition  $\Gamma_0(N) = \coprod_{y \in (\mathbb{Z}/(N))^*} \Gamma_1(N) \begin{bmatrix} x & k \\ N & y \end{bmatrix}$ , where  $x, k$  are chosen that  $xy - kN = 1$ . Then

$$\begin{aligned} \Gamma_0(N)s' = \Gamma_0(N)s &\iff \begin{bmatrix} a' \\ c' \end{bmatrix} \equiv \pm \begin{bmatrix} xa + kc + jcy \\ cy \end{bmatrix} \pmod{N}, \exists j, (y, N) = 1 \\ &\iff \begin{bmatrix} ya' \\ c' \end{bmatrix} \equiv \begin{bmatrix} a + jc \\ cy \end{bmatrix} \pmod{N}, \exists j, (y, N) = 1 \end{aligned}$$

□

**Prop. (26.3.3.12)[Cusps for  $\Gamma(N), \Gamma_1(N), \Gamma_0(N)$ ].** For  $N \in \mathbb{Z}_+$ ,

- $\varepsilon_\infty(\Gamma_0(N)) = \sum_{d|N} \varphi((d, N/d))$ .
- 

┘

*Proof:* 1: By(26.3.3.11), if  $\Gamma_0(N)s' = \Gamma_0(N)s$ , then  $\begin{bmatrix} ya' \\ c' \end{bmatrix} \equiv \begin{bmatrix} a + jc \\ c \end{bmatrix} \pmod{N}$ , which means first  $(c, N) = (c', N)$ . So we consider the equivalence classes with  $(c, N) = d$ . In this case any equivalence class has a representative that  $c = d$ . Consider the equivalence relations between them, then  $\begin{bmatrix} a' \\ d \end{bmatrix}$  represents the same cusp as  $\begin{bmatrix} a \\ d \end{bmatrix}$  iff  $(y_0 + iN/d)a' \equiv a + jd \pmod{N}$  for some  $i, j$ , which is equivalent to  $a' \equiv y_0 a \pmod{(c, N, a'N/d) = (d, N/d)}$ . So there are  $\sum_{d|N} \varphi((d, N/d))$  many equivalence classes(cusps). □

**Prop. (26.3.3.13)[Regular Cusps].** All the cusps of  $\Gamma_0(N)$  and  $\Gamma(N)$  are regular. The only irregular cusp of  $\Gamma_1(N)$  are  $s = 1/2$  for  $N = 4$ . ┘

*Proof:* Cf.[?D-S16]P103. □

**Thm. (26.3.3.14)[Lists of Statistics for  $\Gamma_0(N), \Gamma_1(N), \Gamma(N)$ ].** For  $N \in \mathbb{Z}_+$ ,

| $\Gamma$                     | $d$                        | $\varepsilon_2$                                                                    | $\varepsilon_3$                                                                    | $\varepsilon_\infty$                            |
|------------------------------|----------------------------|------------------------------------------------------------------------------------|------------------------------------------------------------------------------------|-------------------------------------------------|
| $\Gamma_0(N), N > 2$         | $\frac{2d_N}{N\varphi(N)}$ | $\begin{cases} \prod_{p N}(1 + (\frac{-1}{p})) & 4 \nmid N \\ 0 & 4 N \end{cases}$ | $\begin{cases} \prod_{p N}(1 + (\frac{-3}{p})) & 9 \nmid N \\ 0 & 9 N \end{cases}$ | $\sum_{d N} \varphi((d, N/d))$                  |

┘

*Proof:* These follow from (26.3.3.2)(26.3.3.3)(26.3.3.6)(26.3.3.14) and (26.3.3.13). □

**Remark (26.3.3.17) [Dimension for  $\text{MF}_1$ ].** The only case that is not calculated is the dimensions of  $\dim(M_1(\Gamma))$ . But we may use (26.3.3.4) to get that

$$\dim \text{MF}_1(\Gamma_1(N)) \leq \frac{d_N}{12N} + 1.$$

┘

**Cor. (26.3.3.18) [Low Genus Cases].** For  $N \in \mathbb{Z}_+$ ,

- $g(X(N)) = 0$  iff  $N \in \{1, 2, 3, 4, 5\}$ .
- $g(X(N)) = 1$  iff  $N = 6$ .
- $g(X_1(N)) = 0$  iff  $N \in \{1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 12\}$ .
- $g(X_1(N)) = 1$  iff  $N \in \{11, 14, 15\}$ .
- $g(X_0(N)) = 0$  iff  $N \in \{1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 12, 13, 16, 18, 25\}$ .
- $g(X_0(N)) = 1$  iff  $N \in \{11, 14, 15, 17, 19, 20, 21, 24, 27, 32, 36, 49\}$ .

┘

*Proof:* If  $N = \prod_p p^{e_p}$ ,

1, 2:

3, 4:

$$g(X_1(N)) = 1 + \frac{1}{24} \prod_{p|N} p^{2e_p} \left(1 - \frac{1}{p^2}\right) - \frac{1}{4} \prod_p p^{e_p-2} (p-1)[(p+1) - e_p(p-1)],$$

so if  $g(X_1(N)) = 0$ ,

$$\prod_p \frac{p^{e_p}(p+1)}{[(p+1) + e_p(p-1)]} < 6.$$

Then it can be verified that  $e_2 \leq 3, e_3 \leq 2, e_5 \leq 1, e_7 \leq 1, e_{11} \leq 1, e_p = 0$  for  $p > 11 \in \mathbf{P}$ . Then the assertion follows. 4 is similar.

5, 6: ?

□

### Low Dimensional Tabulatetes

**Prop. (26.3.3.19).** Let  $N, k \in \mathbb{Z}_+$  s.t.  $2k(N+1) = 24$ , then

$$\text{SF}_{2k}(\Gamma_0(N)) = \text{SF}_{2k}(\Gamma_1(N)) = \mathbb{C}.g(\tau).$$

where  $g(\tau) = (\eta(\tau)\eta(N\tau))^k$ . ┘

*Proof:* Cf. [Koblitz]P130 or [Diamond]P75.

By ?,  $g(\tau)^{N+1} = \Delta(\tau)\Delta(N\tau) \in \text{SF}_{24}(\Gamma_0(N))$ , and it is non-vanishing on  $\mathcal{H}$  as  $\Delta$  does (26.3.4.23). So  $(f(\tau)/g(\tau))^{N+1} \in \text{MF}_0^!(\Gamma_0(N))$ .

But  $\text{ord}_{\tau=\infty} g(\tau)^{N+1} = N+1$ , and

$$g^{N+1}[S]_{24}(\tau) = N^{-12} q_N^{N+1} \prod [(1 - q_N^n)^{24} (1 - q_N^n)^{24}],$$

so  $\text{ord}_{\tau=0} g(\tau)^{N+1} = N+1$ . So  $(f(\tau)/g(\tau))^{N+1} \in \text{MF}_0(\Gamma_0(N)) = \mathbb{C}$  (26.3.3.4). □

#### 4 Elliptic Eisenstein Series

**Def. (26.3.4.1) [Eisenstein Series].** Let  $\Gamma$  be a congruence subgroup of  $\Gamma(1)$ , define the space of elliptic **Eisenstein series**  $\text{Eis}_k(\Gamma, \chi)$  to be the orthogonal complement of  $\text{SF}_k(\Gamma, \chi)$  in  $\text{MF}_k(\Gamma, \chi)$ . Also denote  $\text{Eis}_k(\Gamma) = \text{Eis}_k(\Gamma, 1)$ .  $\lrcorner$

**Prop. (26.3.4.2) [Dimensions of Eisenstein Series].** Notation as in (26.3.3.1), by (26.3.3.3) and (26.3.3.6), the dimensions of the space of Eisenstein series satisfy:

$$\dim(E_k(\Gamma)) = \begin{cases} \varepsilon_\infty & k \geq 4, 2|k \\ \varepsilon_\infty - 1 & k = 2 \\ 1 & k = 0 \\ \varepsilon_\infty^{\text{reg}} & k \geq 3, 2|k+1, -1 \notin \Gamma \\ \varepsilon_\infty^{\text{reg}}/2 & k = 1, -1 \notin \Gamma \\ 0 & k < 0 \text{ or } 2|k+1, -1 \in \Gamma \end{cases}$$

And also the dimension of  $E_k(\Gamma_0(N)), E_k(\Gamma_1(N)), E_k(\Gamma(N))$  can be read off from (26.3.3.16).  $\lrcorner$

#### Eisenstein Series for $\Gamma(1)$

**Def. (26.3.4.3).** In this subsection, denote  $q = e^{2\pi i \tau}$ .  $\lrcorner$

**Prop. (26.3.4.4) [Weakly Modular Forms and Lattices].** Let  $\mathcal{L}$  be the set of lattices in  $\mathbb{C}$ . If  $F : \mathcal{L} \rightarrow \mathbb{C}$  is a function of weight  $2k$ , i.e.  $F(\lambda\Gamma) = \lambda^{-2k}F(\Gamma)$  for  $\lambda \in \mathbb{C}^*$ , then  $f(z) = F(\Gamma(z, 1))$  is a weakly modular form on  $\mathcal{H}$  for  $\Gamma(1)$  of weight  $2k$ , and this is a bijection between functions of weight  $2k$  on  $\mathcal{L}$  and weakly modular functions on  $\mathcal{H}$  for  $\Gamma(1)$  of weight  $2k$ .  $\lrcorner$

*Proof:* By the hypothesis, there is a function  $f$  on  $\mathcal{H}$  that for any  $w_1, w_2$  with  $w_1/w_2 \in \mathcal{H}$ ,

$$F(\Gamma(w_1, w_2)) = w_2^{-2k} f(w_1/w_2).$$

Then the invariance of  $F$  under  $\text{SL}(2, \mathbb{Z})$  action implies  $f$  is weakly modular of weight  $2k$ .  $\square$

**Prop. (26.3.4.5) [Eisenstein Series for  $\text{SL}(2, \mathbb{Z})$ ].** Let  $k \in 2\mathbb{Z}_{\geq 2}$  and  $\Gamma$  a lattice of  $\mathbb{C}$ , define the **Eisenstein series of weight  $k$**  to be

$$G_k(\Gamma) = \sum_{\omega \in \Lambda, \omega \neq 0} \frac{1}{\omega^k},$$

and also for a complex number  $z$ , let  $\Lambda_z$  be the lattice generated by 1 and  $z$ , and let  $G_k(z) = G_k(\Gamma_z)$ . Then  $G_k(z) \in \text{MF}_k(\Gamma(1))$ , and

$$G_k(z) = 2\zeta(k) + 2 \frac{(2\pi i)^k}{(k-1)!} \sum_{n=1}^{\infty} \sigma_{k-1}(n) q^n$$

And denote

$$E_k(z) = G_k(z)/2\zeta(k) = \sum_{(m,n) \in \mathbb{Z}^2 \setminus (0,0), \gcd(m,n)=1} \frac{1}{(m\tau + n)^k} = 1 - \frac{2k}{B_k} \sum_{n=1}^{\infty} \sigma_{k-1}(n) q^n$$

the **normalized Eisenstein series**.  $\lrcorner$

*Proof:*  $G_k(z)$  is weakly modular of weight  $k$  by (26.3.4.4). For the expansion, notice by (12.4.3.11),

$$\pi \cot(\pi z) = \frac{1}{z} + \sum_{n=1}^{\infty} \left( \frac{1}{z+n} + \frac{1}{z-n} \right),$$

and by definition

$$z \cot(\pi z) = \pi i - \frac{\pi i}{1-q} = \pi i - 2\pi i \sum_{n=1}^{\infty} q^n$$

where  $z \in \mathcal{H}$ .

Taking  $(k-1)$ -th derivative of this, we get

$$\sum_{n \in \mathbb{Z}} \frac{1}{(z+n)^k} = \frac{(-2\pi i)^k}{(k-1)!} \sum_{n=1}^{\infty} n^{k-1} q^n,$$

thus

$$\begin{aligned} G_k(z) &= \sum_{(m,n) \neq (0,0)} \frac{1}{(n\tau + m)^k} \\ &= 2\zeta(k) + 2 \sum_{n=1}^{\infty} \sum_{m \in \mathbb{Z}} \frac{1}{(n\tau + m)^k} \\ &= 2\zeta(k) + \frac{2(-2\pi i)^k}{(k-1)!} \sum_{n=1}^{\infty} \sum_{a=1}^{\infty} a^{k-1} q^{an} \\ &= 2\zeta(k) + 2 \frac{(2\pi i)^k}{(k-1)!} \sum_{n=1}^{\infty} \sigma_{k-1}(n) q^n \end{aligned}$$

Finally the assertion about  $E_k(z)$  follows from (31.3.5.3).

To show the Eisenstein series is orthogonal to any cusp form, notice for any cusp form  $f \in \mathcal{S}_k(\Gamma(1))$ ,

$$f(\gamma\tau)(\operatorname{Im}(\gamma\tau))^k = f(z)\overline{\tau(\gamma, z)}^{-k} \operatorname{Im}(z)^k$$

and by (26.3.4.5)

$$G_k(\tau) = \sum_{(m,n) \neq 0 \in \mathbb{Z}^2} \frac{1}{(m\tau + n)^k} = \sum_{\Gamma(1)_{\infty} \setminus \Gamma(1)} \frac{1}{\tau(\gamma, \tau)^k},$$

so

$$\begin{aligned} \int_{\Gamma(1) \setminus \mathcal{H}} f(\tau) \overline{G_k(z)} y^k \frac{dx dy}{y^2} &= \int_{\Gamma(1) \setminus \mathcal{H}} \sum_{\Gamma(1)_{\infty} \setminus \Gamma(1)} f(z) \overline{\tau(\gamma, z)}^{-k} y^k \frac{dx dy}{y^2} \\ &= \int_{\Gamma(1) \setminus \mathcal{H}} \sum_{\Gamma(1)_{\infty} \setminus \Gamma(1)} f(\gamma z) (\operatorname{Im}(\gamma z))^k \frac{dx dy}{y^2} \\ &= \int_{\Gamma(1)_{\infty} \setminus \mathcal{H}} f(z) (\operatorname{Im} z)^k \frac{dx dy}{y^2} \\ &= \int_0^{\infty} \left[ \int_0^1 f(x + iy) dx \right] y^{k-2} dy = 0 \end{aligned}$$

as  $f$  is a cusp form. □

**Cor. (26.3.4.6).** By (26.3.4.5) and (10.7.1.12):

$$\begin{aligned} E_4(z) &= 1 + 240 \sum_{n=1}^{\infty} \sigma_3(n)q^n, & E_6(z) &= 1 - 504 \sum_{n=1}^{\infty} \sigma_5(n)q^n \\ E_8(z) &= 1 + 480 \sum_{n=1}^{\infty} \sigma_7(n)q^n, & E_{10}(z) &= 1 - 264 \sum_{n=1}^{\infty} \sigma_9(n)q^n \\ E_{12}(z) &= 1 + \frac{65520}{691} \sum_{n=1}^{\infty} \sigma_{11}(n)q^n, & E_{14}(z) &= 1 - 24 \sum_{n=1}^{\infty} \sigma_{13}(n)q^n. \end{aligned}$$

┘

**Cor. (26.3.4.7) [Ramanujan Identities].** By (26.3.4.8),

$$\dim \text{MF}_6(\Gamma(1)) = \dim \text{MF}_8(\Gamma(1)) = \dim \text{MF}_{10}(\Gamma(1)) = \dim \text{MF}_{14}(\Gamma(1)) = 1,$$

so there are identities:

$$E_4^2 = E_8, \quad E_4 E_6 = E_{10}, \quad E_6 E_8 = E_4 E_{10} = E_{14}$$

which give equations like:

$$\begin{aligned} \sigma_7(n) &= \sigma_3(n) + 120 \sum_{m=1}^{n-1} \sigma_3(m) \sigma_3(n-m) \\ 11\sigma_9(n) &= 21\sigma_5(n) - 10\sigma_3(n) + 1054 \sum_{m=1}^{n-1} \sigma_3(m) \sigma_5(n-m). \end{aligned}$$

┘

**Cor. (26.3.4.8) [Modular Forms for  $\Gamma(1)$ ].**

$$\text{MF}_*(\Gamma(1)) = \mathbb{C}[E_4, E_6], \quad \text{SF}_*(\Gamma(1)) = \Delta \cdot \text{MF}_*(\Gamma(1)).$$

Thus for  $k \geq 4$  even,

$$\dim(S_k(\Gamma(1))) = \begin{cases} \lfloor \frac{k}{12} \rfloor - 1 & k \equiv 2 \pmod{12} \\ \lfloor \frac{k}{12} \rfloor & \text{otherwise} \end{cases}.$$

$$\text{MF}_k(\Gamma(1)) = \text{MF}_k(\Gamma(1)) \oplus \mathbb{C}E_k.$$

┘

*Proof:* Cf. [Diamond P88] or [Koblitz, Modular Forms]P118. □

**Cor. (26.3.4.9).**  $\text{MF}(\Gamma(1)) = \text{MF}(\Gamma(1), \mathbb{Z})_{\mathbb{C}}$ ,  $\text{SF}(\Gamma(1)) = \text{SF}(\Gamma(1), \mathbb{Z})_{\mathbb{C}}$  (26.3.5.4). ┘

*Proof:* By (26.3.4.20),  $E_4, E_6$  have Fourier coefficients in  $\mathbb{Z}$ . □

### Eisenstein Series for $\Gamma_0(N)$

Cf. [Diamond] or [Koblitz]P131 or [Hida, L-Functions and Eisenstein Series]P127.

**Prop. (26.3.4.10).** For  $k, N \in \mathbb{Z}_+, k \geq 3$  and  $\chi \in \text{Diri}(N)$  s.t.  $\chi(-1) = (-1)^k$ , there is an Eisenstein series

$$G_{k,\chi}(\tau) = \frac{1}{2}L(1-k, \chi) + \sum_{n \in \mathbb{Z}_+} \left( \sum_{d|n} \chi(d) d^{k-1} \right) e^{2\pi i \tau} \in \text{MF}_k(\Gamma_0(N), \chi).$$

┘

*Proof:*

□

**Prop. (26.3.4.11) [Connection with Dedekind eta-Functions].** For  $p \in \text{Prime}_{\geq 3}$ , let

$$h(\tau) = \prod_{a_2=1}^{p-1} G_3^{(0,a_2)((\bmod p))}(\tau), \quad f(\tau) = \prod_{a_2=1}^{\frac{p-1}{2}} G_3^{(0,a_2)((\bmod p))}(\tau),$$

then

- $h(\tau) = (-1)^{(p-1)/2} f(\tau)$ ,
- $f(\tau) \in \text{MF}_{3(p-1)/2}(\Gamma_0(p), \left(\frac{-}{p}\right))$ ,  $h(\tau) \in \text{MF}_{3(p-1)}(\Gamma_0(p))$ .
- $f(\tau)$  is a constant multiple of  $(\eta^p(\tau)/\eta(p\tau))^3$ .

┘

*Proof:* Cf. [Koblitz]P135, 136. ?

□

### General Eisenstein Series

#### Quasimodular Forms

**Def. (26.3.4.12) [Almost Modular Forms].** For a discrete subgroup  $\Gamma \subset \text{SL}(2; \mathbb{R})$ , let  $\widehat{M}_k^{\leq p}(\Gamma)$  be the space of functions in  $C^\infty(\mathcal{H})$  of the form  $F(\tau) = \sum_{r=0}^p f_r(\tau)(-4\pi y)^{-r}$ , where  $f_r$  are holomorphic on  $\mathcal{H}$  and holomorphic at the cusps, and  $F[\gamma]_k = F$  for any  $\gamma \in \Gamma$ .

Denote  $\widehat{\text{MF}}_k(\Gamma) = \cup_{p=0}^\infty \widehat{\text{MF}}_k^{\leq p}(\Gamma)$  and the graded ring  $\widehat{\text{MF}}_*(\Gamma) = \oplus_{k \geq 0} \widehat{\text{MF}}_k(\Gamma)$ , called the space of **almost modular forms**.

┘

**Def. (26.3.4.13) [Quasi-Modular Forms].** The graded ring  $\widetilde{\text{MF}}_*(\Gamma)$  of **quasi-modular forms** is defined to be the constant terms( $f_0$ ) of functions in  $\widehat{\text{MF}}_*(\Gamma)$ . Any almost modular function is determined by its constant term, so  $\widetilde{\text{MF}}_*(\Gamma)$  is canonically isomorphic to  $\widehat{\text{MF}}_*(\Gamma)$ . ?

┘

*Proof:*

□

### Eisenstein Series of Weight 2

**Def. (26.3.4.14) [ $E_2(\tau)$ ].** Denote

$$G_2(\tau) = \frac{1}{2} \sum_{n \neq 0} \frac{1}{n^2} + \frac{1}{2} \sum_{m \neq 0} \sum_{n \in \mathbb{Z}} \frac{1}{(m\tau + n)^2}.$$

This summation is convergent but not absolutely convergent, and

$$E_2(\tau) = \frac{6}{\pi^2} G_2(\tau) = 1 - 24q - 72q^2 + \dots \in \widetilde{M}_2^{\leq 1}(\Gamma(1))$$

with

$$G_2^*(\tau) = G_2(\tau) - \frac{\pi}{2\operatorname{Im}(\tau)}, \quad E_2^*(\tau) = \frac{6}{\pi^2} G_2^*(\tau) = E_2(\tau) - \frac{3}{\pi\operatorname{Im}(\tau)} \in \widehat{M}_2^{\leq 1}(\Gamma(1)).$$

In particular,  $E_2(\tau)$  satisfies

$$E_2[\gamma]_2(\tau) = E_2(\tau) + \frac{12}{2\pi i} \frac{c}{c\tau + d}, \quad \gamma \in \Gamma(1)$$

┘

*Proof:* For  $\varepsilon \in \mathbb{R}_+$ , define

$$G_{2,\varepsilon}(\tau) = \sum_{(m,n) \in \mathbb{Z}^2 \setminus (0,0)} \frac{1}{(m\tau + n)^2 |m\tau + n|^\varepsilon},$$

then it is absolutely convergent and

$$G_{2,\varepsilon}(\gamma(\tau)) = (cz + d)^2 |cz + d|^{2\varepsilon} G_{2,\varepsilon}(\tau).$$

Then it suffices to show that  $\lim_{\varepsilon \rightarrow 0} G_{2,\varepsilon}(\tau) = G_2^*(\tau)$ .

Define

$$I_\varepsilon(\tau) = \int_{-\infty}^{\infty} \frac{dt}{(z + t)^2 |z + t|^{2\varepsilon}},$$

then

$$G_{2,\varepsilon}(\tau) - \sum_{m \in \mathbb{Z}_+} I_\varepsilon(m\tau) = \sum_{n \in \mathbb{Z}_+} \frac{1}{n^{2+2\varepsilon}} + \sum_{m \in \mathbb{Z}_+} \left( \sum_{n \in \mathbb{Z}} \frac{1}{(m\tau + n)^2 |m\tau + n|^{2\varepsilon}} - \int_n^{n+1} \frac{dt}{(m\tau + t)^2 |m\tau + t|^{2\varepsilon}} \right).$$

This sum is absolutely convergent for  $\varepsilon > -1/2$ , thus when  $\varepsilon \rightarrow 0$ , it just equals  $G_2(\tau)$ .

On the other hand, for  $\varepsilon > -1/2$ ,

$$I_\varepsilon(x + iy) = \int_{-\infty}^{\infty} \frac{dt}{(x + t + iy)^2 ((x + t)^2 + y^2)^\varepsilon} = \frac{I(\varepsilon)}{y^{1+2\varepsilon}},$$

where  $I(\varepsilon) = \int_{-\infty}^{\infty} (t + i)^{-2} (t^2 + 1)^{-\varepsilon} dt$ . We have  $I(0) = 0$ , and

$$I'(0) = \int_{-\infty}^{\infty} \frac{\log(t^2 + 1)}{(t + i)^2} dt = \left( \frac{1 + \log(t^2 + 1)}{t + i} - \arctan t \right) \Big|_{-\infty}^{\infty} = -\pi.$$

For  $\varepsilon \in \mathbb{R}_+$ ,  $\sum_{m \in \mathbb{Z}_+} I_\varepsilon(m\tau) = I(\varepsilon) \zeta(1 + 2\varepsilon) / y^{1+2\varepsilon}$ , so  $\lim_{\varepsilon \rightarrow 0} \sum_{m \in \mathbb{Z}_+} I_\varepsilon(m\tau) = -\pi/2y$ . □

### Eisenstein Series of Weight 1

**Prop. (26.3.4.15).** For  $N \in \mathbb{Z}_+$ ,  $k = 1$ , we can modify to give a definition of

$$G_{1,\chi}(\tau) \in \text{MF}_1(\Gamma_0(N), \chi).$$

┘

**Prop. (26.3.4.16) [Eisenstein Series of Weight 1].** For  $N \in \mathbb{Z}_+$ , the set

$$\{E^{\psi,\varphi,1}\}$$

is a basis for  $\text{Eis}_1(\Gamma_1(N))$ . In fact, for any  $\chi \in \text{Diri}(N)$ , the set

$$\{E^{\psi,\varphi,1}, \varphi\psi = \chi\}$$

is a basis for  $\text{Eis}_1(\Gamma(N), \chi)$  (26.3.4.1).

┘

*Proof:* Cf. [Diamond]P141. □

### Derivatives

**Prop. (26.3.4.17) [Derivations of Modular Forms].** Let  $\Gamma$  be a discrete subgroup of  $\text{SL}(2; \mathbb{R})$  and  $f \in \text{MF}_k(\Gamma)$ , then

$$Df \triangleq \frac{1}{2\pi i} \frac{\partial}{\partial \tau} f = q \frac{\partial}{\partial q} f = \sum_{n=1}^{\infty} n a_n q^n$$

satisfies

$$(Df)[\gamma]_{k+2}(\tau) = (Df)(\tau) + \frac{k}{2\pi i} \frac{c}{cz+d} f(z), \quad \gamma \in \Gamma.$$

In particular, by (26.3.4.14),  $\theta_k(f) = D(f) - \frac{k}{12} E_2 f \in \text{MF}_{k+2}(\Gamma)$ , called the **Serre derivation** of  $f$ .

┘

*Proof:* This follows from differentiating the equation  $f(\frac{az+b}{cz+d}) = (cz+d)^k f(z)$ . □

**Cor. (26.3.4.18).**

$$D(E_2) = \frac{E_2^2 - E_4}{12}, \quad D(E_4) = \frac{E_2 E_4 - E_6}{3}, \quad D(E_6) = \frac{E_2 E_6 - E_4}{2}$$

┘

*Proof:*  $D(E_4)$  and  $D(E_6)$  follows from (26.3.4.17) by comparing coefficients, for  $D(E_2)$ , differentiating the equation  $E_2(\frac{a\tau+b}{c\tau+d}) = (c\tau+d)^2 E_2(\tau) + \frac{12}{2\pi i} c(c\tau+d)$ , we get

$$D(E_2)[\gamma]_4(z) = D(E_2)(z) + \frac{2c}{2\pi i} \frac{E_2(\tau)}{c\tau+d} + \frac{12c^2}{(2\pi i)^2} \frac{1}{(c\tau+d)^2}.$$

Thus by (26.3.4.14), we see  $D(E_2) - \frac{1}{12} E_2^2 \in \text{MF}_4(\Gamma(1))$ , then we can compare coefficients. □

**Prop. (26.3.4.19) [Structure of  $\widetilde{M}_*(\Gamma)$ ].** Let  $\Gamma$  be a discrete subgroup of  $\text{SL}(2; \mathbb{R})$ , then

- $D(\widetilde{M}_k^{\leq p}(\Gamma)) \subset \widetilde{M}_{k+2}^{\leq p+1}(\Gamma)$ . In particular,  $D(\widetilde{M}_*(\Gamma)) \subset \widetilde{M}_*(\Gamma)$ .

- If  $\varphi \in \widetilde{M}_2^{\leq 1}(\Gamma)$ , then for any  $k, p \in \mathbb{N}$ ,  $\widetilde{M}_k^{\leq p}(\Gamma) = \bigoplus_{r=0}^p M_{k-2r}(\Gamma)\varphi^r$ . In particular,  $\widetilde{M}_*(\Gamma(1)) = \mathbb{C}[E_2, E_4, E_6]$ .
- If  $\varphi \in \widetilde{M}_2^{\leq 1}(\Gamma)$ , then for  $p, k \geq 0$ ,

$$\widetilde{M}_k^{\leq p}(\Gamma) = \begin{cases} \bigoplus_{r=0}^p D^r(M_{k-2r}(\Gamma)), & p < k/2 \\ \bigoplus_{r=0}^{k/2-1} D^r(M_{k-2r}(\Gamma)) \oplus \mathbb{C} \cdot D^{k/2-1}\varphi, & p \geq k/2 \end{cases}$$

┘

*Proof:* Cf. [BGHZ]P59.

□

### $\Delta$ -Function and $j$ -Function

**Def. (26.3.4.20) [Discriminant Function].** The modular **discriminant function**

$$\Delta(q(\tau)) = \frac{(2\pi)^{12}}{1728} (E_4^3 - E_6^2) = \sum_{n \in \mathbb{Z}_+} \tau(n) q^n = (2\pi)^{12} (q - 24q^2 + 252q^3 - 1472q^4 + 4830q^5 - 6048q^6 - 16744q^7 + \dots)$$

by (26.3.4.6). So  $\Delta(z) \in \text{SF}_{12}(\Gamma(1))$ , and the coefficients  $\tau(n)$  are called the **Ramanujan  $\tau$ -function**.

┘

**Cor. (26.3.4.21).**

$$E_6^2 - E_{12} = -(1008 + \frac{24 \cdot 2730}{691}) \frac{\Delta(z)}{(2\pi)^{12}}.$$

In particular,  $\tau(n) \equiv \sigma_{11}(n) \pmod{691}$ .

┘

*Proof:* Consider  $E_6^2 - E_{12} \in \text{SF}_{12}(\Gamma(1))$ , and  $\text{SF}_{12}(\Gamma(1))$  is 1-dimensional and generated by  $\Delta$  (26.3.4.8), thus  $E_6^2 - E_{12} = c\Delta$  for some constant  $c \in \mathbb{C}$ . By comparing the degree 1 term of both sides:

$$\begin{aligned} \frac{\Delta(z)}{(2\pi)^{12}} (q(\tau)) &= \frac{1}{1728} (E_4^3(q) - E_6^2(q)) = q - 24q^2 + \dots \\ E_{12}(\tau) &= 1 + \frac{24 \cdot 2730}{691} \sum_{n=1}^{\infty} \sigma_{11}(n) q^n, \quad E_6(z) = 1 - 504 \sum_{n=1}^{\infty} \sigma_5(n) q^n \end{aligned}$$

by (26.3.4.6) and (26.3.4.20), so  $c = -1008 - \frac{24 \cdot 2730}{691}$ . Then the formula

$$691(E_6^2 - E_{12}) = 691c\Delta,$$

modulo 691 gives  $\tau(n) \equiv \sigma_{11}(n) \pmod{691}$ .

□

**Cor. (26.3.4.22) [ $j$ -Function].** By (26.3.1.5), the discriminant function  $\Delta(z)$  has exactly one simple zero at  $\infty$ , thus we can define the  **$j$ -function** on  $\mathcal{H}$  as

$$j : \mathcal{H} \rightarrow \mathbb{C}, j(q(\tau)) = 1728 \frac{E_4(\tau)^3}{E_4^3(\tau) - E_6^2(\tau)} = \frac{1}{q} + 744 + 196884q + 21493760q^2 + 864299970q^3 + \dots \in \frac{1}{q} + \mathbb{Z}[[q]]$$

which is an automorphic function for  $\Gamma(1)$ , and it induces an isomorphism

$$j : X(1) \cong \mathbb{P}_{\mathbb{C}}^1.$$

In particular,  $\text{MF}_0^!(\Gamma(1)) = \mathbb{C}(j(z))$ .

┘

*Proof:* To show it surjects onto  $\mathbb{C}$ , notice it induces a holomorphic map  $X(1) \cong \mathbb{P}^1 \rightarrow \mathbb{P}^1$ , and it maps  $\infty$  to  $\infty$  with no ramification, thus it has degree 1. So it is surjective.  $\square$

**Prop. (26.3.4.23).**

$$\Delta(q(\tau)) = (2\pi)^{12} \eta(q(\tau))^{24} = q \prod_{n=1}^{\infty} (1 - q^n)^{24}.$$

In particular,  $\Delta(\tau)$  is non-vanishing on  $\tau \in \mathcal{H}$ .  $\lrcorner$

*Proof:* By (26.3.1.16),  $\eta^{24}(\tau) \in \text{SF}_{12}(\Gamma(1))$ , which has dimension 1 and is spanned by  $\Delta(\tau)$  (26.3.4.8). Thus the assertion follows by comparing coefficients.  $\square$

### Zeros of Eisenstein Series

**Thm. (26.3.4.24) [Rankin-Swinnerton-Dyer].** If  $n \in \mathbb{N}$ ,  $s \in \{2, 3, 4, 5, 0, 7\}$  and  $k = 6n + s \geq 2$ , then the Eisenstein series  $E_{2k} \in M_{2k}(\Gamma(1))$  has at least weighted zero exactly  $s/12$  at  $i$  and  $\omega$  (which suffices to determine its zeros), and all the other  $n$  zeros are non-elliptic and located on arc between  $i$  and  $\omega$ .  $\lrcorner$

*Proof:* Firstly, by the valence formula (26.3.1.5) and by rationality reason,  $E_{2k}$  has at least weighted zero  $s/6$  at  $i$  and  $\omega$ . So by valence formula, it suffices to show that  $E_{2k}$  has at least  $n$  zeros on the arc between  $i$  and  $\omega$ .

Let

$$\begin{aligned} F_{2k}(\theta) &= \frac{1}{2} e^{ik\theta} E_{2k}(e^{i\theta}) \\ &= \frac{1}{2} \sum_{(c,d) \in \mathbb{Z}^2 \setminus (0,0), \gcd(c,d)=1} \frac{1}{(ce^{i\theta/2} + de^{-i\theta/2})^{2k}} \\ &= 2 \cos(k\theta) + \frac{1}{2} \sum_{(c,d) \in \mathbb{Z}^2 \setminus (0,0), c^2+d^2>1, (c,d)=1} \frac{1}{(ce^{i\theta/2} + de^{-i\theta/2})^{2k}}. \end{aligned}$$

Then it suffices to show that  $F_{2k}(\theta)$  has at least  $n$  zeros when  $\theta \in (\pi/2, 2\pi/3)$ . For this, we may assume  $n \geq 1$ . Notice for these theta,

$$|ce^{i\theta/2} + de^{-i\theta/2}|^2 = c^2 + 2cd \cos \theta + d^2 \geq \frac{1}{2}(c^2 + d^2),$$

and for  $N \in \mathbb{Z}_{\geq 5}$ , the number of integral solutions to  $c^2 + d^2 = N$  is at most  $2(2\sqrt{N} + 1) \leq 5\sqrt{N}$ .

$$\begin{aligned} \left| \frac{1}{2} \sum_{c^2+d^2>1, (c,d)=1} \frac{1}{(ce^{i\theta/2} + de^{-i\theta/2})^{2k}} \right| &\leq 1 + 3^{-k} + 4\left(\frac{5}{2}\right)^{-k} + \sum_{N=10}^{\infty} 5\sqrt{N} \left(\frac{N}{2}\right)^{-k} \\ &\leq 1 + 3^{-k} + 4\left(\frac{2}{5}\right)^k + \frac{5 \cdot 9^{\frac{3}{2}}}{k - \frac{3}{2}} \left(\frac{2}{9}\right)^k \\ &< 1.0214 \end{aligned}$$

Thus, when  $m \in \mathbb{Z}$  and  $k/2 \leq m \leq 2/3k$ ,  $F_{2k}(m\pi/k)$  is strictly positive or negative according as  $m$  is even or odd. So by intermediate property (3.2.10.9), there are at least  $\lfloor \frac{2k}{3} \rfloor - \lceil \frac{k}{2} \rceil = n$  zeros when  $\theta \in (\pi/2, 2\pi/3)$ .  $\square$

## 5 Arithmetics

**Prop. (26.3.5.1) [Number Field of  $f$ ].** If  $f \in \text{SF}_k(\Gamma_1(N))$  is a normalized eigenform, then the coefficients  $a_n(f)$  are algebraic integers, and generate a number field  $K_f$ , called the **number field of  $f$** .  
 $\perp$

*Proof:* Cf. [Diamond, P238].  $\square$

**Prop. (26.3.5.2).** if  $f \in \text{SF}_2(N, \chi)$  is a normalized eigenform, then for any  $\sigma \in \text{Gal}_{\mathbb{Q}}$ ,  $f^\sigma$  is also a normalized eigenform in  $\text{SF}_2(N, \chi^\sigma)$ , where  $\chi^\sigma(n) = \chi(n)^\sigma$ . And if  $f$  is a newform, then so is  $f^\sigma$ .  $\perp$

*Proof:* Cf. [Diamond, P239].  $\color{red}?$   $\square$

**Cor. (26.3.5.3) [Integrality of Modular Forms].**  $S_2(\Gamma_1(N))$  has a basis of modular forms with integral coefficients.  $\perp$

*Proof:* Let  $f \in S_2(\Gamma_1(N))$  be a newform of level  $M|N$ , and  $K_f$  the number field of  $f$ . Let  $\alpha_1, \dots, \alpha_d$  be a  $\mathbb{Z}$ -basis of  $\mathcal{O}_K$ , and  $\Sigma^\infty = \{\sigma_1, \dots, \sigma_d\}$  the set of embeddings of  $K$  into  $\mathbb{C}$ . Let

$$g_i = \sum_{j=1}^d \sigma_j(\alpha_i) f^{\sigma_j},$$

then by linear independence of characters, the matrix  $(\sigma_i(\alpha_j))$  is non-degenerate, so  $\text{span}\{g_1, \dots, g_d\} = \text{span}\{f, \dots, f^{\sigma_d}\}$ , and  $g_i \in S_2(\Gamma_1(N))$  by (26.3.5.2). Then by (26.3.2.12), applying this for all old and new forms of  $S_2(\Gamma_1(N))$ , the assertion follows.  $\square$

**Prop. (26.3.5.4) [Integral Modular Forms].** If  $A \subset \mathbb{C}$  be a subring, denote  $\text{MF}_k(\Gamma; A) = \text{MF}_k(\Gamma) \cap A[[q]]$ .  $\perp$

## 6 Modular Forms Mod $p$

**Notation (26.3.6.1).**

- Let  $p \in \text{Prime}$ .
- Let  $F \in \text{NField}$  and  $v \in S_F(p)$ .
- Let  $\Gamma \in \text{SL}(2; \mathbb{Z})$  be a congruence subgroup.

$\perp$

**Def. (26.3.6.2) [Modular Forms Mod  $p$ ].** Denote  $\text{MF}_k(\Gamma; \kappa_v) = M_k(\Gamma; \mathcal{O}_F) \otimes \kappa_v$ , called the space of **modular forms mod  $p$  of weight  $k$** .  $\perp$

**Prop. (26.3.6.3) [Surm[Stu87]].** If  $k \in \mathbb{Z}_+$ ,  $f, g \in \text{MF}_k(\Gamma, \mathcal{O}_F)$  satisfies their first  $\lfloor k[\Gamma(1) : \Gamma]/12 + 1 \rfloor$  terms of Fourier coefficients are equal modulo  $\mathfrak{m}_v$ , then  $f \equiv g \pmod{\mathfrak{m}_v}$ .  $\perp$

*Proof:*

$\square$

**Prop. (26.3.6.4) [Serre's Equality].** There is an isomorphism  $\text{MF}_{p+1}(\Gamma(1); \mathbb{F}_p) \cong \text{MF}_2(\Gamma_0(p); \mathbb{F}_p)$ .  $\perp$

*Proof:* Because  $E_k(z)1 - \frac{2k}{B_k} \sum_{n=1}^{\infty} \sigma_{k-1}(n)q^n$ , and by Kummer's congruence (33.1.1.16)  $\text{ord}_p(B_{p-1}) = -1$ , thus  $E_{p-1} \pmod{1} \pmod{p}$ . Then multiplying by  $E_{p-1} : M_2(\Gamma_0(p), \mathbb{F}_p) \rightarrow M_{p+1}(\Gamma_0(p), \mathbb{F}_p)$  raises the level by  $p-1$ . Then we compose with the natural averaging map  $M_{p+1}(\Gamma_0(p), \mathbb{F}_p) \rightarrow M_{p+1}(\text{SL}(2, \mathbb{Z}), \mathbb{F}_p)$ , which is dual to the natural inclusion  $M_{p+1}(\text{SL}(2, \mathbb{Z}), \mathbb{F}_p) \rightarrow M_{p+1}(\Gamma_0(p), \mathbb{F}_p)$ .

Why isomorphism.  $\color{red}?$   $\square$

## 7 Non-Congruent Modular Forms

Cf.[Non-Congruent Modular Forms, Ling Long].

**Thm. (26.3.7.1) [Unbounded Denominators Conjecture].** Let  $N$  be any positive integer and let  $f(\tau) \in \mathbb{Z}[[q^{1/N}]]$  for  $q = e^{\pi i \tau}$  be a holomorphic function on the upper half plane. Suppose there exists an integer  $k$  and a finite index  $\Gamma \subset SL(2, \mathbb{Z})$  that  $f$  is  $\Gamma$ -invariant, and  $f$  is meromorphic at the cusps of  $\Gamma$ , then  $f(\tau)$  is a modular form for some congruent subgroup of  $SL(2, \mathbb{Z})$ .  $\lrcorner$

*Proof:* Cf.[the Unbounded Denominator Conjecture].  $\square$

## 26.4 Modular Forms II

References are [\[Shi78\]](#).

**Notation(26.4.0.1).**

- Use notations as in [Archimedean Automorphic Representations](#).

┘

### 1 Hilbert Modular Forms

**Notation(26.4.1.1).**

- Let  $p \in \text{Prime}$ .
- Let  $(F, \mathcal{O}_F) \in \text{NField}$  be totally real.
- Let  $d = [F : \mathbb{Q}]$ .
- Let  $\Sigma_F^\infty = \{\tau_1, \dots, \tau_d\}$ .
- Let  $\mathfrak{c} \in \text{Gal}_F$  be a complex conjugation.
- Let  $h = \text{cl}^+(F)$ .
- Let  $\text{GL}(2; F)^+$  be the set of matrices in  $\text{GL}(2; F)$  with totally real determinant.
- Let  $\mathfrak{n} \in \text{Ideal}^\times(\mathcal{O}_F)$ .
- Let  $\mathfrak{n}^p \in \text{Ideal}^\times(\mathcal{O}_F)$  be the smallest ideal containing  $\mathfrak{n}$  and prime to  $(p)$ .
- Let  $\{\mathfrak{t}_\kappa\}_{\kappa \in \text{Cl}^+(F)} \subset \text{Ideal}^\times(F)$  be a representative for  $\text{Cl}^+(F)$ . s.t.  $(\|\mathfrak{t}_\kappa\|, \|\mathfrak{n}\|p) = 1$  for each  $\kappa$ .
- Let  $\psi_0$  be a character of  $(\mathcal{O}_F/\mathfrak{n})^*$ .
- Let  $\psi$  be a character of  $\text{Cl}^{\text{n}\infty}(F)$  s.t.  $\psi$  restricts to  $\psi_0$ .

┘

### Archimedean Hilbert Modular Forms

**Def.(26.4.1.2)[Congruence Subgroups].** For  $\mathfrak{c} \in \text{Ideal}^\times(\mathcal{O}_F)$ ,  $\mathfrak{b} \in I(F)$  and  $\psi_0 \in ((\mathcal{O}_F/\mathfrak{c})^*)^\vee$ , denote

$$\Gamma(\mathfrak{b}, \mathfrak{c}) = \left\{ \begin{bmatrix} a & b \\ c & d \end{bmatrix} \in \text{GL}(2; F)^+, a, d \in \mathcal{O}_F, b \in \mathfrak{b}^{-1}, c \in \mathfrak{c}\mathfrak{b}^{-1}, ad - bc \in \mathcal{O}_F^\times \right\},$$

┘

**Def.(26.4.1.3) [Archimedean Hilbert Modular Forms].** For  $\mathbf{k} = (k_1, \dots, k_d) \in \mathbb{Z}^d$ ,  $\mathfrak{c} \in \text{Ideal}^\times(\mathcal{O}_F)$ ,  $\mathfrak{b} \in I(F)$  and  $\psi_0 \in ((\mathcal{O}_F/\mathfrak{c})^\times)^\vee$ , an **Archimedean Hilbert modular form** of weight  $\mathbf{k}$  w.r.t.  $\Gamma(\mathfrak{b}, \mathfrak{c})$  with nebentypus  $\psi_0$  is a holomorphic function  $f \in \mathcal{O}(\mathcal{H}^d)$  s.t.

- $f[\alpha]_{\mathbf{k}} = \psi_0(a)f$  for each  $\alpha \in \Gamma(\mathfrak{b}, \mathfrak{c})$  [\(26.4.1.2\)](#),
- Because  $f$  is invariant under the translation by elements in  $\mathfrak{b}^{-1}$ , it has a Fourier expansion

$$f(z) = \sum_{\mu \in \mathfrak{b}\mathfrak{d}_F^{-1}} c(\mu, f) e^{2\pi i \sum_{i=1}^n \tau_i(\mu) z_i}.$$

Then we require that  $f$  is holomorphic at cusps, i.e.  $c(\mu, f) = 0$  unless  $\mu$  is totally non-negative.

The space of such forms is denoted by  $\mathrm{MF}_k(\Gamma(\mathfrak{b}, \mathfrak{c}), \psi_0)$ .

And  $f$  is called an **Archimedean Hilbert cusp form** if the constant term of  $f[\alpha]_k$  vanishes for each  $\alpha \in \mathrm{GL}(2; F)$ . The space of Archimedean Hilbert cusp forms is denoted by  $\mathrm{SF}_k(\Gamma(\mathfrak{b}, \mathfrak{c}), \psi_0)$ .  $\lrcorner$

**Prop. (26.4.1.4).** Situation as in (26.4.1.3), we have:

- $\mathrm{MF}_k(\Gamma(\mathfrak{b}, \mathfrak{c}), \psi_0) = \mathrm{SF}_k(\Gamma(\mathfrak{b}, \mathfrak{c}), \psi_0)$  unless  $k_1 = \dots = k_d$ .
- $\mathrm{MF}_k(\Gamma(\mathfrak{b}, \mathfrak{c}), \psi_0) = 0$  unless  $k_1 = \dots = k_d \geq 0$  or  $k_i \in \mathbb{Z}_+$  for each  $i$ .

$\lrcorner$

*Proof:* Cf. [Shi78]P640. ?

$\square$

**Def. (26.4.1.5) [Fields of Definition of  $f$ , Klingen(1960)].** Situation as in (26.4.1.3), for  $f \in \mathrm{MF}_k(\Gamma(\mathfrak{b}, \mathfrak{c}), \psi_0)$ , let  $\mathbb{Q}(f) = \mathbb{Q}\{c(\mu, f) | \mu \in \mathfrak{b}\mathfrak{d}_F^{-1}, \mu \gg 0\}$ , then  $\mathbb{Q}(f)$  is f.g. over  $\mathbb{Q}$  and contains  $c(0, f)$ .  $\lrcorner$

*Proof:* Cf. [Shi78]P642. ?

To show  $c(0, f) \in \mathbb{Q}(f)$ , because there are no constant modular forms, the linear functionals  $c(\mu; -)$  for  $\mu \in \mathfrak{b}\mathfrak{d}_F^{-1}, \mu \gg 0$  generates  $\mathrm{MF}_k(\Gamma(\mathfrak{b}, \mathfrak{c}); \psi_0)^\vee$ . Let  $B^\vee$  be a basis of  $\mathrm{MF}_k(\Gamma(\mathfrak{b}, \mathfrak{c}); \psi_0)^\vee$  consisting of linear functionals  $c(\mu; -)$ , then the  $\mathbb{Q}$ -span of the dual basis  $B$  of  $B^\vee$  in  $\mathrm{MF}_k(\Gamma(\mathfrak{b}, \mathfrak{c}); \psi_0)$  contains  $\mathrm{MF}_k(\Gamma(\mathfrak{b}, \mathfrak{c}), \psi_0; \mathbb{Q})$ . And  $\mathrm{MF}_k(\Gamma(\mathfrak{b}, \mathfrak{c}), \psi_0; \mathbb{Q})$  generates  $\mathrm{MF}_k(\Gamma(\mathfrak{b}, \mathfrak{c}), \psi_0)$  by (26.4.1.6), so the  $\mathbb{Q}$ -space of  $B$  is just  $\mathrm{MF}_k(\Gamma(\mathfrak{b}, \mathfrak{c}), \psi_0; \mathbb{Q})$ . But then  $c(0; -)$  also take  $\mathbb{Q}$ -values on  $\mathrm{MF}_k(\Gamma(\mathfrak{b}, \mathfrak{c}), \psi_0; \mathbb{Q})$ , thus it is in the linear span of linear functions of the form  $c(\mu; -)$  for  $\mu \gg 0$ .  $\square$

**Prop. (26.4.1.6) [Rational Hilbert Modular Forms, Shimura[Shi78]].** Situation as in (26.4.1.3), for  $A \subset \mathbb{C} \in \mathcal{C}\mathrm{Ring}$ , denote  $\mathrm{MF}_k(\Gamma(\mathfrak{b}, \mathfrak{c}), \psi_0; A)$  the space of Hilbert modular forms with Fourier coefficients in  $A$ , then

$$\mathrm{MF}_k(\Gamma(\mathfrak{b}, \mathfrak{c}), \psi_0; \mathbb{Z}) \otimes \mathbb{C} = \mathrm{MF}_k(\Gamma(\mathfrak{b}, \mathfrak{c}), \psi_0).$$

$\lrcorner$

*Proof:* ? Cf. [Shi78]Prop1.7.

$\square$

### Hilbert Modular Forms

**Def. (26.4.1.7) [Hilbert Modular Forms].** For  $\mathfrak{n} \in \mathrm{Ideal}^\times(\mathcal{O}_F)$ , a **Hilbert modular form** of level  $\mathfrak{n}$  and nebentypus  $\psi_0$  is a tuple  $\mathbf{f} = (f_\kappa)_{\kappa \in \mathrm{Cl}^+(F)}$  where  $f_\kappa \in \mathrm{MF}_k(\Gamma(t_\kappa \mathfrak{d}, \mathfrak{n}), \psi_0)$  (26.4.1.3).

The space of such functions is denoted by  $\mathrm{MF}_k(\mathfrak{n}, \psi_0)$ , i.e.

$$\mathrm{MF}_k(\mathfrak{n}, \psi_0) = \prod_{\kappa \in \mathrm{Cl}^+(F)} \mathrm{MF}_k(\Gamma(t_\kappa \mathfrak{d}, \mathfrak{n}), \psi_0).$$

Also define the space of **Hilbert cusp forms**

$$\mathrm{SF}_k(\mathfrak{n}, \psi_0) = \prod_{\kappa \in \mathrm{Cl}^+(F)} \mathrm{SF}_k(\Gamma(t_\kappa \mathfrak{d}, \mathfrak{n}), \psi_0),$$

and we denote

$$\mathrm{MF}_k(\mathfrak{n}) = \bigoplus_{\psi \in ((\mathcal{O}_F/\mathfrak{n})^*)^\vee} \mathrm{MF}_k(\mathfrak{n}, \psi_0), \quad \mathrm{SF}_k(\mathfrak{n}) = \bigoplus_{\psi \in ((\mathcal{O}_F/\mathfrak{n})^*)^\vee} \mathrm{SF}_k(\mathfrak{n}, \psi_0).$$

$\lrcorner$

**Def. (26.4.1.8) [Dirichlet Series of Hilbert Modular Forms].** Let  $\mathbf{f} = (f_\kappa)_{\kappa \in \text{Cl}^+(F)} \in \text{MF}_k(\mathbf{n})$ . Any  $\mathfrak{a} \in \text{Ideal}^\times(\mathcal{O}_F)$  is of the form  $(\mu)\mathfrak{t}_i^{-1}$  for some  $i$  and some totally positive  $\mu$  by (26.4.1.1). For  $\mathfrak{a} \in I(F)$ , define

$$c(\mathfrak{a}, \mathbf{f}) = \begin{cases} c(\mu, f_\kappa) \|\mathfrak{t}_i\|^{-k/2} & , \mathfrak{a} = (\mu)\mathfrak{t}_\kappa^{-1} \in \text{Ideal}^\times(\mathcal{O}_F) \\ 0 & , \text{otherwise} \end{cases}, \quad c_\kappa(0, \mathbf{f}) = c(0, f_\kappa) \|\mathfrak{t}_\kappa\|^{-k/2}.$$

Then the **Dirichlet series** of  $\mathbf{f}$  is defined by

$$L(\mathbf{f}; s) = \sum_{\mathfrak{a} \in \text{Ideal}^\times(\mathcal{O}_F)} \frac{c(\mathfrak{a}, \mathbf{f})}{\|\mathfrak{a}\|^s}.$$

And if  $\mathbf{g}$  is another modular form, let the **Dirichlet series** of  $\mathbf{f} \otimes \mathbf{g}$  is given by

$$L(\mathbf{f} \otimes \mathbf{g}; s) = \sum_{\mathfrak{a} \in \text{Ideal}^\times(\mathcal{O}_F)} \frac{c(\mathfrak{a}, \mathbf{f})c(\mathfrak{a}, \mathbf{g})}{\|\mathfrak{a}\|^s}.$$

┘

### Hecke Operators

**Def. (26.4.1.9) [Hecke Operators].** There are commutative operators  $\{T_n(\mathfrak{a}), S_n(\mathfrak{a})\}_{\mathfrak{a} \in \text{Ideal}^\times(\mathcal{O}_F)}$  on  $\text{MF}_k(\mathbf{n})$  with relations

$$\begin{aligned} T_n(\mathfrak{a})T_n(\mathfrak{b}) &= \sum_{\mathfrak{a}+\mathfrak{b} \subset \mathfrak{c}} \|\mathfrak{c}\|^{k-1} S_n(\mathfrak{c})T_n(\mathfrak{c}^{-2}\mathfrak{a}\mathfrak{b}). \\ \sum_{\mathfrak{a} \in \text{Ideal}^\times(\mathcal{O}_F)} T_n(\mathfrak{a}) \|\mathfrak{a}\|^{-s} &= \prod_{v \in \Sigma_F^{\text{fin}}} \left(1 - T_n(\mathfrak{p}_v) \|v\|^{-s} + S_n(\mathfrak{p}_v) \|v\|^{k+1-2s}\right)^{-1}. \\ c(\mathfrak{a}, \mathbf{f}|T_n(\mathfrak{b})) &= \sum_{\mathfrak{a}+\mathfrak{b} \subset \mathfrak{c}} \|\mathfrak{c}\|^{k-1} c(\mathfrak{c}^{-2}\mathfrak{a}\mathfrak{b}, \mathbf{f}|S_n(\mathfrak{c})). \\ c_\kappa(0, T(\mathfrak{a})\mathcal{F}) &= \sum_{\mathfrak{b}|\mathfrak{a}, [\mathfrak{b}]=[\mathfrak{t}_\kappa], [\mathfrak{a}]=[\mathfrak{t}_\kappa]} \frac{\|\mathfrak{t}_\kappa\|^{k/2}}{\|\mathfrak{t}_\kappa \mathfrak{b}^2 \mathfrak{a}^{-1}\|^{k/2}} \lambda_{\mathfrak{b}} \|\mathfrak{b}\| c_{\kappa \mathfrak{b}^2 \mathfrak{a}^{-1}}(0, \mathcal{F}). \end{aligned}$$

┘

*Proof:* Cf. [Wil86].

□

**Prop. (26.4.1.10) [Central Characters and Eigenvalues].** For  $\mathbf{n} \in \text{Ideal}^\times(\mathcal{O}_F)$ , if  $\mathbf{f} \in \text{MF}_k(\mathbf{n}, \psi_0)$  is a common eigenvalue of  $S(\mathfrak{p})$  for each  $\mathfrak{p} \in \Sigma_F^{\text{fin}} \setminus S_F(\mathbf{n})$ , then there exists an Artin Hecke character  $\psi$  of  $F$  s.t.  $S(\mathfrak{a})\mathbf{f}(z) = \psi(\mathfrak{a})f(z)$  for each  $\mathfrak{a} \in \text{Ideal}^\times(\mathcal{O}_F)$ .

Define

$$\text{MF}_k(\mathbf{n}, \psi) = \{\mathbf{f} \in \text{MF}_k(\mathbf{n}, \psi_0) : S(\mathfrak{a})\mathbf{f} = \psi(\mathfrak{a})\mathbf{f}, \forall \mathfrak{a} \in \text{Ideal}^\times(\mathcal{O}_F)\} \quad (26.4.1.9)$$

and

$$\text{SF}_k(\mathbf{n}, \psi) = \{\mathbf{f} \in \text{SF}_k(\mathbf{n}, \psi_0) : S(\mathfrak{a})\mathbf{f} = \psi(\mathfrak{a})\mathbf{f}, \forall \mathfrak{a} \in \text{Ideal}^\times(\mathcal{O}_F)\} \quad (26.4.1.9)$$

And  $\mathbf{f}$  is said to have central character  $\psi$  if  $\mathbf{f} \in \text{MF}_k(\mathbf{n}, \psi)$ . And  $f \in \text{MF}_k(\mathbf{n}; \psi)$  is called a normalized **Hilbert eigenform** if it is a common eigenvalue for all these operators  $\{T_n(\mathfrak{a}), S_n(\mathfrak{a})\}_{\mathfrak{a} \in \text{Ideal}^\times(\mathcal{O}_F)}$  and  $c(\mathcal{O}_F, \mathbf{f}) = 1$ . In this case,  $S(\mathfrak{a})\mathbf{f} = \psi(\mathfrak{a})\mathbf{f}$  and  $T(\mathfrak{a})\mathbf{f} = c(\mathfrak{a}, \mathbf{f})\mathbf{f}$  for each  $\mathfrak{a} \in \text{Ideal}^\times(\mathcal{O}_F)$ .

┘

*Proof:* Cf.[Shi78]Prop2.1? □

**Prop. (26.4.1.11) [Algebraicity of Eigenvalues].** For any  $\mathfrak{a} \in \text{Ideal}^\times(\mathcal{O}_F)$ , the eigenvalues of  $T(\mathfrak{a})$ (26.4.1.9) are algebraic integers. Moreover, if  $k_1 = \dots = k_d$ , then the eigenvalues of  $T'(\mathfrak{a})$  are algebraic integers. ┘

*Proof:* Cf.[Shi78]P650. ? □

**Prop. (26.4.1.12) [Galois Conjugates].** The Galois conjugate of a Hilbert modular form is also a Hilbert modular form. ┘

*Proof:* Cf.[Shi78]? □

**Prop. (26.4.1.13) [Rational Hilbert Modular Forms, Shimura].** For  $A \subset \mathbb{C} \in \mathcal{CRing}$ , denote  $\text{MF}_k(\mathfrak{n}, \psi; A)$  the space of Hilbert modular forms with Fourier coefficients in  $A$ , then

$$\text{MF}_k(\mathfrak{n}; \mathbb{Z}) \otimes \mathbb{C} = \text{MF}_k(\mathfrak{n}).$$

┘

*Proof:* ? Cf.[Shimura, some arithmetic properties of modular forms of one and several variables]Thm7. □

**Def. (26.4.1.14) [Peterson Inner Product].** For  $\Gamma \subset \text{GL}(2; F)^\times$  be a congruence subgroup(26.4.1.2) and  $f, g \in \text{MF}_k(\Gamma)$  s.t. either  $f$  or  $g$  is a cusp form, define

$$\langle f, g \rangle_{\text{Pet}} = \frac{1}{\text{Vol}(\Gamma \backslash \mathcal{H}^d)} \int_{\Gamma \backslash \mathcal{H}^d} \overline{f(z)} g(z) y^k d\mu(z).$$

And for  $\mathfrak{c} \in \text{Ideal}^\times(\mathcal{O}_F)$  and  $\mathbf{f} = (f_\kappa), \mathbf{g} = (g_\kappa) \in \text{MF}_k(\mathfrak{c})$  s.t. either  $\mathbf{f}$  or  $\mathbf{g}$  is a cusp form, define

$$\langle \mathbf{f}, \mathbf{g} \rangle_{\text{Pet}} = \sum_{\kappa \in \text{Cl}^+(F)} \langle f_\kappa, g_\kappa \rangle_{\text{Pet}}.$$

┘

**Prop. (26.4.1.15) [Adjoint of Hecke Operators].** If  $y \in Y$  and  $(\det y, \mathfrak{c}) = 1$ , then

$$\psi^*(\det y) \langle \mathbf{f} | WyW, \mathbf{g} \rangle_{\text{Pet}} = \langle \mathbf{f}, \mathbf{g} | WyW \rangle_{\text{Pet}}$$

for any  $\mathbf{f}, \mathbf{g} \in \text{MF}_k(\mathfrak{c}, \psi)$ . ┘

*Proof:* Cf.[?Hil78]P652. □

**Cor. (26.4.1.16).** If  $(\mathfrak{m}, \mathfrak{c}) = 1$  and  $\mathbf{f} \in \text{MF}_k(\mathfrak{c}, \psi)$  satisfies  $T(\mathfrak{m})\mathbf{f} = \lambda(\mathfrak{m})\mathbf{f}$ , then  $\lambda(\mathfrak{m}) = \psi^*(\mathfrak{m})\overline{\lambda(\mathfrak{m})}$ . ┘

*Proof:* ? □

**Prop. (26.4.1.17) [Hilbert Newforms].** Given  $\mathbf{f} \in \text{MF}_k(\mathfrak{n}, \psi)$  and  $\mathfrak{q} \in \text{Ideal}^\times(\mathcal{O}_F)$ , there exists a unique  $\mathbf{f}|_{\mathfrak{q}} \in \text{MF}_k(\mathfrak{n}\mathfrak{q}, \psi)$  s.t.

$$c(\mathfrak{a}, \mathbf{f}|_{\mathfrak{q}}) = c(\mathfrak{a}\mathfrak{q}^{-1}, \mathbf{f}).$$

for any  $\mathfrak{a} \in \text{Ideal}(\mathcal{O}_F)$ .

For  $\mathfrak{n} \in \text{Ideal}^\times(\mathcal{O}_F)$ , denote

$$\text{SF}_k(\mathfrak{n}, \psi)^{\text{old}} = \{\mathbf{g}|_{\mathfrak{q}_v} : v \in \Sigma_F^{\text{fin}}, v|\mathfrak{n}, \mathbf{g} \in \text{SF}_k(\mathfrak{n}/\mathfrak{q}_v, \psi)\}.$$

and denote  $\text{SF}_k(\mathfrak{n}, \psi)^{\text{new}}$  the orthogonal complement of  $\text{SF}_k(\mathfrak{n}, \psi)^{\text{old}}$  in  $\text{SF}_k(\mathfrak{n}, \psi)$ .

By (26.4.1.15),  $\text{SF}_k(\mathfrak{n}, \psi)^{\text{new}}$  is stable under  $T(\mathfrak{p})$  for a.e.  $\mathfrak{p} \in \Sigma_F^{\text{fin}}$ , so  $\text{SF}_k(\mathfrak{n}, \psi)^{\text{new}}$  has basis consisting of forms that are eigenforms for a.e.  $T(\mathfrak{p})$ . Then by [Miyake, On automorphic forms on  $\text{GL}(2)$  and Hecke operators]?, this basis consists of eigenforms. An eigenform in  $\text{SF}_k(\mathfrak{n}, \psi)^{\text{new}}$  is called a **normalized Hilbert newform** if  $c(\mathcal{O}_F, \mathbf{f}) = 1$ .

If  $\mathfrak{f}$  is a newform in  $\text{SF}_k(\mathfrak{n}, \psi)^{\text{new}}$ ,  $\mathbf{f}$  is said to have **conductor**  $\mathfrak{n}$ . ┘

*Proof:* Cf. [Shi78]P651. □

**Def. (26.4.1.18) [Fields of Definition of  $\mathbf{f}$ ].** Suppose  $k_1 \equiv \dots \equiv k_d$  and  $\mathbf{f} \in \text{SF}_k(\mathfrak{c}, \psi)^{\text{new}}$  is a newform, denote  $\mathbb{Q}(\mathbf{f}) = \mathbb{Q}\{c(\mathfrak{a}, \mathbf{f}) | \mathfrak{a} \in \text{Ideal}^\times(\mathcal{O}_F)\}$  (26.4.1.8) with ring of integer  $\mathcal{O}_{\mathbf{f}}$ . Then

- $\mathbb{Q}(\mathbf{f})$  contains the values  $\psi^*(\mathfrak{m})$  for each  $\mathfrak{m} \in \text{Ideal}^\times(\mathcal{O}_F)$ .
- $\mathbb{Q}(\mathbf{f})$  is generated by  $C(\mathfrak{p}, \mathbf{f})$  for a.e.  $\mathfrak{p} \in \Sigma_F^{\text{fin}}$ .
- $\mathbb{Q}(\mathbf{f}) \in \text{NField}$  and is either CM or totally real. ┘

*Proof:* ? Cf. [Shi78]P654. □

### Adelic Hilbert Modular Forms

Cf. [Shi78](2.15).

**Prop. (26.4.1.19) [Local Component of Adic Hilbert Modular Forms].** Let  $v \in \Sigma_F^{\text{fin}} \setminus S_F(\mathfrak{n})$ ,  $\psi : \text{Cl}^{\text{fin}}(F) \rightarrow \mathbb{C}^\times$ , and  $\mathbf{f} \in \text{SF}_k^0(\mathfrak{n}\mathfrak{p}_v, \psi)$  be a normalized newform, then  $\pi_{\mathbf{f}, v}$  is an unramified twist of the Steinberg representation and

$$c(\mathfrak{p}_v, \mathbf{f})^2 = \psi(\mathfrak{p}_v) \|v\|^{k-2}.$$

Conversely, if  $\mathbf{f} \in \text{SF}_k^0(\mathfrak{n}\mathfrak{p}_v, \psi)$  is an eigenform and the above equation holds, then  $\mathfrak{p}_v$  divides the conductor of  $\mathbf{f}$ . ┘

*Proof:* ? Cf. [VIEWING MODULAR FORMS AS AUTOMORPHIC REPRESENTATIONS]. □

## 2 $\Lambda$ -adic Hilbert Modular Forms

**Notation (26.4.2.1).**

- Let  $p \in \text{Prime}$ .
- Let  $q = p^{1+\delta_{p,2}}$ .
- Let  $\omega$  be the Teichmüller character  $(\mathbb{Z}/(q))^\times \rightarrow \mathbb{Z}_p^*$ .
- Let  $(K, \mathcal{O}, \mathfrak{m}, \kappa) \in p\text{-NField}$ .
- Let  $\mathbb{Q}_\infty$  be the cyclotomic  $\mathbb{Z}_p$ -extension of  $\mathbb{Q}$ .
- Let  $\gamma \in \text{Gal}(F_\infty/F)$  be a topological generator and  $u = \chi_{\text{cycl}}(\gamma)$ .
- Let  $\Lambda_{\mathcal{O}} = \mathcal{O}[[T]] \cong \mathbb{Z}_p[\text{Gal}(\mathbb{Q}_\infty/\mathbb{Q})]$ ,  $F_\Lambda = \text{Frac}(\Lambda_{\mathcal{O}})$ . ┘

**Def. (26.4.2.2) [Specialization Maps].** Define

$$\mathfrak{X} = \{(k, \zeta) \in \mathbb{Z}_{\geq 2} \times \mu_{p^\infty} : \zeta^{p^r} = 1\},$$

and for each  $(k, \zeta) \in \mathfrak{X}$ , define a  $\mathcal{O}$ -homomorphism

$$v_{k, \zeta} : \Lambda_{\mathcal{O}} \rightarrow \mathcal{O}[\zeta] : T \mapsto \zeta u^{k-2} - 1 \quad (26.4.2.1),$$

and denote  $P_{k, \zeta}$  the kernel  $(T - \zeta u^{k-2} - 1)$ , which is a prime divisor  $1q2$  of  $\Lambda_{\mathcal{O}}$ .  $\lrcorner$

**Def. (26.4.2.3) [ $\Lambda$ -adic Hilbert Modular Forms].** A  $\Lambda$ -adic Hilbert modular form  $\mathcal{F}$  of level  $\mathfrak{n}$  is given by a set of elements

$$\begin{cases} c(\mathfrak{a}, \mathcal{F}) \in \Lambda_{\mathcal{O}} & , \mathfrak{a} \in \text{Ideal}^\times(\mathcal{O}_F) \\ c_\kappa(0, \mathcal{F}) \in \Lambda_{\mathcal{O}} & , \kappa \in \text{Cl}^+(F) \end{cases}.$$

s.t. for any  $(k, \zeta) \in \mathfrak{X}$  (26.4.2.1) with the exact order of  $\zeta$  being  $p^r$ , there exists a  $\mathbf{f}_{k, \zeta} \in \text{MF}_k(\mathfrak{n}p^r; \mathcal{O}[\zeta])$ , with

$$c(\mathfrak{a}, \mathbf{f}_{k, \zeta}) = v_{k, \zeta}(c(\mathfrak{a}, \mathcal{F})), \quad \mathfrak{a} \in \text{Ideal}^\times(\mathcal{O}_F), \quad c_\kappa(0, \mathbf{f}_{k, \zeta}) = v_{k, \zeta}(c_\kappa(0, \mathcal{F})) \quad (26.4.2.2) (26.4.1.8).$$

The space of  $\Lambda$ -adic Hilbert modular forms with level  $\mathfrak{n}$  is denoted by  $\text{MF}(\mathfrak{n}; \Lambda_{\mathcal{O}})$ , and define the subspace of  $\Lambda$ -adic Hilbert cusp forms  $\text{SF}(\mathfrak{n}; \Lambda_{\mathcal{O}})$  to be the subspace of  $\text{MF}(\mathfrak{n}; \Lambda_{\mathcal{O}})$  consisting of forms  $\mathcal{F}$  s.t.  $c_\kappa(0, \mathcal{F}) = 0$  for each  $\kappa \in \text{Cl}^+(F)$ .  $\lrcorner$

**Def. (26.4.2.4) [Hecke Action on  $\Lambda$ -adic Hilbert Modular Forms].** For  $\mathfrak{a} \in \text{Ideal}^\times(\mathcal{O}_F)$ , if

$$\|\mathfrak{a}\|^{k-2} S(\mathfrak{a}) \mathbf{f}_{k, \zeta} = v_{k, \zeta}(\lambda_{\mathfrak{a}} \mathbf{f}_{k, \zeta})$$

holds for each  $(k, \zeta) \in \mathfrak{X}$ , then we define the **Hecke operator**

$$S(\mathfrak{a}) \mathcal{F} = \lambda_{\mathfrak{a}} \mathcal{F}.$$

If  $S(\mathfrak{a})$  exists for each  $\mathfrak{a} \in \text{Ideal}^*(\mathcal{O}_F)$ , then there exists a  $\Lambda$ -adic Hilbert modular form  $\mathcal{G}$  s.t.

$$\mathbf{g}_{k, \zeta} = T(\mathfrak{a}) \mathbf{f}_{k, \zeta}$$

for each  $\mathfrak{a} \in \text{Ideal}^*(\mathcal{O}_F)$  and  $(k, \zeta) \in \mathfrak{X}$ . So we define the **Hecke operator**

$$T(\mathfrak{a}) \mathcal{F} = \mathcal{G},$$

which is given explicitly as

$$c(\mathfrak{m}, T(\mathfrak{n}) \mathcal{F}) = \sum_{\mathfrak{m} + \mathfrak{n} \subset \mathfrak{a}} \lambda_{\mathfrak{a}} \|\mathfrak{a}\| c(\mathfrak{a}^{-2} \mathfrak{m} \mathfrak{n}, \mathcal{F}), \quad \mathfrak{m}, \mathfrak{n} \in \text{Ideal}^\times(\mathcal{O}_F),$$

$$c_\kappa(0, T(\mathfrak{a}) \mathcal{F}) = \sum_{\mathfrak{b} | \mathfrak{a}, [\mathfrak{b}] = [t_b], [\mathfrak{a}] = [t_a]} \lambda_{\mathfrak{b}} \|\mathfrak{b}\| c_{\kappa b^2 a^{-1}}(0, \mathcal{F}).$$

by (26.4.1.9).  $\lrcorner$

**Def. (26.4.2.5) [Central Characters and Cusp Forms].** For any limit character

$$\chi : \varprojlim_r \mathrm{Cl}^{\mathrm{np}^r \infty}(F) \rightarrow \Lambda_{\mathcal{O}},$$

a  $\Lambda$ -adic Hilbert modular form  $\mathcal{F}$  is said to have central character  $\psi$  if  $S(\mathfrak{a})^* \mathcal{F}$  (26.4.2.4) exists for each  $\mathfrak{a} \in \mathrm{Ideal}^\times(\mathcal{O}_F)$  and  $\lambda_{\mathfrak{p}_v} = \chi(\mathfrak{p}_v)$  for any  $v \in \Sigma_F^{\mathrm{fin}} \setminus S_F(\mathrm{np})$ .

The space of  $\Lambda$ -adic Hilbert modular forms with level  $\mathfrak{n}$  and central character  $\chi$  is denoted by  $\mathrm{MF}(\mathfrak{n}, \chi; \Lambda_{\mathcal{O}})$ , and let  $\mathrm{SF}(\mathfrak{n}, \chi; \Lambda_{\mathcal{O}})$  be the subspace of  $\mathrm{MF}(\mathfrak{n}, \chi; \Lambda_{\mathcal{O}})$  consisting of  $\Lambda$ -adic Hilbert cusp forms.

Then  $\mathrm{MF}(\mathfrak{n}, \chi; \Lambda_{\mathcal{O}})$  is a torsion-free  $\Lambda$ -module.  $\lrcorner$

*Proof:*  $\mathrm{MF}(\mathfrak{n}, \chi; \Lambda_{\mathcal{O}})$  is a torsion-free because if  $g \in \Lambda_{\mathcal{O}}^\times$  s.t.  $g(T)\mathcal{F} = 0$ , then  $g(\zeta - 1)v_{2,\zeta}(\mathcal{F}) = 0$  for a.e.  $\zeta \in \mu_{p^\infty}$  (26.4.2.2). Thus  $\mathcal{F} = 0$  by Weierstrass preparation theorem (19.1.7.7).  $\square$

**Def. (26.4.2.6) [ $\Lambda$ -adic Hilbert Modular Forms over Extension Fields].** For any finite extension  $L/F_{\Lambda_{\mathcal{O}}}$  and any limit character  $\chi : \varprojlim_r \mathrm{Cl}^{\mathrm{np}^r \infty}(F) \rightarrow \Lambda_{\mathcal{O}}$ , define

$$\mathrm{MF}(\mathfrak{n}, \chi; \mathcal{O}_L) = \mathrm{MF}(\mathfrak{n}, \chi; \Lambda_{\mathcal{O}}) \otimes \mathcal{O}_L, \quad \mathrm{SF}(\mathfrak{n}, \chi; \mathcal{O}_L) = \mathrm{SF}(\mathfrak{n}, \chi; \Lambda_{\mathcal{O}}) \otimes \mathcal{O}_L.$$

$$\mathrm{MF}(\mathfrak{n}, \chi; L) = \mathrm{MF}(\mathfrak{n}, \chi; \mathcal{O}_L) \otimes L, \quad \mathrm{SF}(\mathfrak{n}, \chi; L) = \mathrm{SF}(\mathfrak{n}, \chi; \mathcal{O}_L) \otimes L.$$

By Galois theory and (26.4.1.12), this definition only depends on  $L$  but not on  $\mathcal{O}_K$ .  $\lrcorner$

**Def. (26.4.2.7) [Fields of Definition of  $\mathcal{F}$ ].** Situation as in (26.4.2.5), for a normalized eigenform  $\mathcal{F} \in \mathrm{MF}(\mathfrak{m}; \chi; \Lambda_{\mathcal{O}})$ , let  $M_{\mathcal{F}}$  be the field generated by Hecke eigenvalues of  $\mathcal{F}$  over  $\Lambda_{\mathcal{O}}$ , with integral ring  $\Lambda_{\mathcal{F}}$ . It is a finite extension of  $\Lambda_{\mathcal{O}}$ . ?  $\lrcorner$

### Ordinary Hilbert Modular Forms

**Def. (26.4.2.8) [Ordinary Hilbert Modular Forms].**  $\mathbf{f} \in \mathrm{MF}_k(\mathfrak{n}, \psi)$  is called a **ordinary modular form** at  $\lambda \in \Sigma_F^{\mathrm{fin}}$  if for any  $v \in S_F(\|\lambda\|)$ , the equation

$$T^2 - c(\mathfrak{p}_v, \mathbf{f})T + \psi(\mathfrak{p}_v) \|v\|^{k-1}$$

has at least one root  $\alpha_v(f)$  that is a unit mod  $\lambda$ .

Notice that for  $k \geq 2$ , this is equivalent to  $v_\lambda(c(\mathfrak{p}_v, \mathbf{f})) = 0$  for each  $v \in S_F(\|\lambda\|)$ .  $\lrcorner$

**Def. (26.4.2.9) [Hida's Stabilization Operator  $e$ ].** Denote  $U_p = T_{\mathrm{np}}(p)$  and define the operator

$$e = \varprojlim_r U_p^{r!}$$

which acts on  $\mathrm{MF}_k(\mathrm{np}^r, \mathcal{O})$  with the uniform topology for any  $r, k \in \mathbb{Z}_+$ .  $\lrcorner$

*Proof:* For  $m \in \mathbb{Z}_+$  large, the action of  $U_p^{p^m}$  on  $A = \mathrm{MF}_k(\mathrm{np}^r, \mathcal{O})/\mathfrak{m}_K \mathrm{MF}_k(\mathrm{np}^r, \mathcal{O})$  is semisimple, so a suitable power  $U_p^M$  is idempotent on  $A$ . But then  $U_p^{p^n M}$  is an idempotent on  $\mathrm{MF}_k(\mathrm{np}^r, \mathcal{O})/\mathfrak{m}_K^n \mathrm{MF}_k(\mathrm{np}^r, \mathcal{O})$ . Then  $e$  acts on  $\mathrm{MF}_k(\mathrm{np}^r, \mathcal{O})$  by taking limits over  $n$ .  $\square$

**Def. (26.4.2.10) [ $p$ -Stabilized Newforms].** A  $p$ -stabilized newform is a Hilbert modular eigenform that is a newform away from  $p$ , and for  $\mathfrak{p} \in S_F(p)$ , they are eigenforms for the operator  $U_p$  (26.4.2.9) with unit eigenvalues.

A  $\lambda$ -stabilized newform of weight  $k \geq 2$  is an eigenform of the form  $e\mathbf{f}$  (26.4.2.9) where  $\mathbf{f}$  is a normalized Hilbert newform (26.4.1.17).

The Dirichlet series of

If  $k \geq 2$  and  $\mathbf{f} \in \text{MF}(\mathbf{n}, K)$  is ordinary, then  $e\mathbf{f}$  is an eigenform of level  $\mathbf{m}\mathfrak{P}$  where  $\mathfrak{P}$  is the product of primes above  $p$  that doesn't divide  $\mathbf{m}$ .

Denote

$$\text{MF}_k^0(\mathbf{n}, \psi) \triangleq e \text{MF}_k(\mathbf{n}, \psi), \quad \text{SF}_k^0(\mathbf{n}, \psi) \triangleq e \text{SF}_k(\mathbf{n}, \psi).$$

┘

**Def. (26.4.2.11) [Cyclotomic Characters].** A limit character  $\chi : \varprojlim_r \text{Cl}^{np^r\infty}(F) \rightarrow \Lambda_{\mathcal{O}}$  is called **cyclotomic** if for each  $(k, \zeta) \in \mathfrak{X}$ , we have

- $\chi_{k, \zeta} = (v_{k, \zeta} \circ \chi) \omega^{2-k}$  factor through  $I^{np^r\infty} \rightarrow \text{Gal}(F^{n\infty}(\mu_{p^r})/F)$ .
- There exists  $c \in \mathbb{R}_+$  s.t.  $\# \text{Im}(\chi_{k, \zeta}) \geq cp^r$ .

To give an example of cyclotomic character, for a ray class character  $\psi : \text{Cl}^{n\infty} \rightarrow \mathbb{C}^\times$ , let  $\mathcal{O}_\psi$  be the extension of  $\mathbb{Z}_p$  generated by  $\text{Im}(\psi)$ , then there is a limit character

$$\psi : \varprojlim_r I^{np^r} \rightarrow \Lambda_{\mathcal{O}_\psi} : \mathfrak{a} \mapsto \psi(\mathfrak{a})(1+T)^{\log_u(\|\mathfrak{a}\|)}.$$

┘

### $p$ -Stabilized $\Lambda$ -adic Newforms

**Def. (26.4.2.12) [ $p$ -Stabilized(Ordinary)  $\Lambda$ -adic Modular Forms].** Hida's stabilization operator  $e$  (26.4.2.9) extends to an idempotent operator on  $\text{MF}(\mathbf{n}, \psi; \Lambda_{\mathcal{O}})$  compatible with specializations.

Denote  $\text{MF}^0(\mathbf{n}, \psi; \Lambda_{\mathcal{O}}) = e \text{MF}(\mathbf{n}, \psi; \Lambda_{\mathcal{O}})$ , called the space of **ordinary  $\Lambda$ -adic modular forms**.

┘

*Proof:* For  $(k, \zeta) \in \mathfrak{X}$  with  $\zeta$  of exact order  $p^r$ , let  $\pi_{k, \zeta} \in \Lambda \in \Lambda_{\mathcal{O}}$  be a minimal polynomial of  $\zeta u^{k-2} - 1$  over  $K$ , then the kernel of

$$v_{k, \zeta} : \text{MF}(\mathbf{n}, \psi; \Lambda_{\mathcal{O}}) \rightarrow \text{MF}_k(\mathbf{n}p^r, \mathcal{O}[\zeta])$$

are those with coefficients in  $\pi_{k, \zeta} \Lambda_{\mathcal{O}}$ . So we can define  $e\mathcal{F}$  modulo  $(\pi_{k, \zeta})$ , and define  $e\mathcal{F} \in \text{MF}(\mathbf{n}, \psi; \Lambda_{\mathcal{O}})$  as their limit, because  $\cap \pi_{k, \zeta} = 0$ . □

**Thm. (26.4.2.13) [Hida].** If  $\psi$  is cyclotomic ?, then  $\text{MF}^0(\mathbf{n}, \psi; \Lambda_{\mathcal{O}})$  is a f.g.  $\Lambda_{\mathcal{O}}$ -module. ┘

*Proof:* Let  $\mathcal{F}_1, \dots, \mathcal{F}_t \in \text{MF}^0(\mathbf{n}, \chi; \Lambda_{\mathcal{O}})$  be independent over  $\Lambda$ , and let  $N = \Lambda\{F_1, \dots, F_t\}$  and  $W = (N \otimes F_{\Lambda}) \cap \text{MF}^0(\mathbf{n}, \chi; \Lambda_{\mathcal{O}})$ , then  $W/N$  is a torsion  $\Lambda$ -module, and if  $\mathfrak{a}_1, \dots, \mathfrak{a}_t \in \text{Ideal}^\times(\mathcal{O}_F)$  s.t.  $D = \det(c(\mathfrak{a}_i, \mathcal{F}_j)) \in \Lambda^\times$ , then  $W/N$  is annihilated by  $D$ . Because  $\Lambda$  is Noetherian and  $\text{MF}^0(\mathbf{n}, \psi; \Lambda_{\mathcal{O}})$  is torsion-free (26.4.2.5), it suffices to show that  $t$  is bounded.

Consider the maps

$$v_{k, 1} : N/P_{k, 1}N \rightarrow \text{MF}_k^0(\mathbf{n}p, \mathcal{O}),$$

When  $k$  is sufficiently large s.t.  $v_{k, 1}(D) \neq 0$ , this map is injective, but the dimension of the RHS is bounded independent of  $k$  by (26.4.2.14), which shows that  $t$  is bounded. □

**Lemma (26.4.2.14).** For fixed  $\mathbf{n}$ ,  $\dim \text{MF}_k^0(\mathbf{n}, K)$  is bounded independent of  $k$ . ┘

*Proof:* ? Cf.[Wil88]P539. It is proven by group cohomology method.

Firstly the dimension from Eisenstein series are bounded by ? (or use the description of this space in [W1]Prop1.5.)  $\square$

**Cor. (26.4.2.15).** Denote

$$\mathrm{SF}^0(\mathfrak{np}^\infty, \psi; \Lambda) = \bigcup_{r \in \mathbb{N}} \mathrm{SF}^0(\mathfrak{np}^r, \psi; \Lambda),$$

then  $\mathrm{SF}^0(\mathfrak{np}^\infty, \psi)$  if f.g. over  $\Lambda_{\mathcal{O}}$ . In fact, if  $\mathfrak{c}(\psi)|\mathfrak{n}$ , then  $\mathrm{SF}^0(\mathfrak{np}^\infty, \psi; \Lambda) = \mathrm{SF}^0(\mathfrak{np}, \psi; \Lambda)$  is f.g. over  $\Lambda_{\mathcal{O}}$  by (26.4.2.13).  $\lrcorner$

*Proof:* If  $\mathfrak{c}(\psi)|\mathfrak{n}$  and  $\mathcal{F} \in \mathrm{SF}^0(\mathfrak{np}^\infty, \psi; \Lambda)$ , it suffices to show that for any  $(k, \zeta) \in \mathfrak{X}$ , we have  $\mathbf{f}_{k, \zeta} \in \mathrm{SF}_k(\mathfrak{np}^{r+1})$ .  $\square$

**Prop. (26.4.2.16).** If  $\mathcal{F}$  is given by a set of elements

$$\begin{cases} c(\mathfrak{a}, \mathcal{F}) \in \Lambda_{\mathcal{O}} & , \mathfrak{a} \in \mathrm{Ideal}^\times(\mathcal{O}_F) \\ c_\kappa(0, \mathcal{F}) \in \Lambda_{\mathcal{O}} & , \kappa \in \mathrm{Cl}^+(F) \end{cases}.$$

s.t. there exists  $M \in \mathbb{Z}_+$  s.t. for any  $(k, \zeta) \in \mathfrak{X}$  (26.4.2.1) with the exact order of  $\zeta$  being  $p^r$  and  $k \geq M$ , there exists a  $\mathbf{f}_{k, \zeta} \in \mathrm{MF}_k^0(\mathfrak{np}^r, \psi_{k, \zeta}; \mathcal{O}[\zeta])$  (26.4.2.11), with

$$c(\mathfrak{a}, \mathbf{f}_{k, \zeta}) = v_{k, \zeta}(c(\mathfrak{a}, \mathcal{F})), \quad \mathfrak{a} \in \mathrm{Ideal}^\times(\mathcal{O}_F), \quad c_\kappa(0, \mathbf{f}_{k, \zeta}) = v_{k, \zeta}(c_\kappa(0, \mathcal{F})) \text{ (26.4.2.2) (26.4.1.8)},$$

then  $\mathcal{F} \in \mathrm{MF}^0(\mathfrak{n}; \chi; \Lambda_{\mathcal{O}})$ .  $\lrcorner$

*Proof:* Cf.[Wil90]P505.  $\square$

### $\Lambda$ -adic Newforms

**Def. (26.4.2.17) [ $\Lambda$ -adic Hilbert Newforms].** A normalized  $\Lambda$ -adic eigenform  $\mathcal{F} \in \mathrm{SF}^0(\mathfrak{np}^\infty, \chi; \Lambda_{\mathcal{O}_L})$  is called a  **$\Lambda$ -adic Hilbert newform** of level  $\mathfrak{n}$  if for a.e.  $(k, \zeta) \in \mathfrak{X}$  and any lifts  $\tilde{v}_{k, \zeta}$  of  $v_{k, \zeta}$  to  $L$ , we have  $\tilde{v}_{k, \zeta}(\mathcal{F})$  is a  $p$ -stabilized newform of level divisible by  $\mathfrak{n}^p$ .

The space generated by normalized  $\Lambda$ -adic newforms of level  $\mathfrak{mp}^\infty$  and level  $\chi$  is denoted by  $\mathrm{SF}^0(\mathfrak{np}^\infty, \chi; \Lambda_{\mathcal{O}_L})^{\mathrm{new}}$ .  $\lrcorner$

**Prop. (26.4.2.18).** A normalized  $\Lambda$ -adic eigenform  $\mathcal{F} \in \mathrm{MF}^0(\mathfrak{np}^\infty, \chi; \Lambda_{\mathcal{O}_L})$  is a  $\Lambda$ -adic newform (26.4.2.17) if  $\tilde{v}_{k, \zeta}(\mathcal{F})$  is a  $p$ -stabilized newform of level divisible by  $\mathfrak{n}^p$  for any infinite set of primes  $\tilde{v}_{k, \zeta}$ .  $\lrcorner$

*Proof:* Cf.[Wil88]P552. ?  $\square$

**Prop. (26.4.2.19) [A Newform Basis for  $\mathrm{MF}^0(\mathfrak{np}^\infty, \chi; L)$ ].** Let

$$U = \{\mathcal{F}(\mathfrak{a}z) : \mathfrak{a}\mathfrak{m}p^\infty | \mathfrak{np}^\infty, \mathcal{F} \in \mathrm{MF}^0(\mathfrak{mp}^\infty, \chi)^{\mathrm{new}} \text{ is a normalized newform}\},$$

and  $L/F_\Lambda$  is a finite extension s.t. all normalized newforms in  $U$  are defined (which exists by (26.4.2.15)). Then  $U$  spans  $\mathrm{MF}^0(\mathfrak{np}^\infty, \chi; L)$ .  $\lrcorner$

*Proof:* Cf.[Wil88]P552. ? We only prove for cusp forms.  $\square$

**Def. (26.4.2.20) [Λ-adic ℓ-newforms].** Suppose  $\mathcal{O}$  contains the image of  $\chi$  and  $L/F_\Lambda$  is a finite extension.  $\ell \in \Sigma_F^{\text{fin}} \setminus S(\mathfrak{np})$ , there are two maps

$$\varphi_1, \varphi_2 : \text{SF}^0(\mathfrak{np}^\infty, \chi; L) \rightarrow \text{SF}^0(\mathfrak{nl}p^\infty, \chi; L) : \varphi_1(\mathcal{F}) = \mathcal{F}, \quad \varphi_2(\mathcal{F}) = \mathcal{F}|_\ell.$$

Denote  $\text{SF}^0(\mathfrak{nl}p^\infty, \chi; L)^{\ell\text{-old}} = \text{Im}(\varphi_1) + \text{Im}(\varphi_2)$ .

If  $L$  contains all the eigenvalues for the eigenforms in  $\text{SF}^0(\mathfrak{nl}p^\infty, \chi; L)$ , then we can define

$$\text{SF}^0(\mathfrak{nl}p^\infty, \chi; L)^{\ell\text{-new}} = L \cdot \{ \mathcal{F}(\mathfrak{a}z) : \mathfrak{a}mp^\infty | \mathfrak{np}^\infty, \ell | \mathfrak{m}, \mathcal{F} \in \text{SF}^0(\mathfrak{mp}^\infty, \chi)^{\text{new}} \}.$$

and by (26.4.2.19), it satisfies

$$\text{SF}^0(\mathfrak{nl}p^\infty, \chi; L) = \text{SF}^0(\mathfrak{nl}p^\infty, \chi; L)^{\ell\text{-old}} \oplus \text{SF}^0(\overline{\mathfrak{nl}}, \chi; L)^{\ell\text{-new}}$$

For general  $L$ , we can define

$$\text{SF}^0(\mathfrak{nl}p^\infty, \chi; L)^{\ell\text{-new}} = \ker(U_\ell^2 - \chi(\ell)) \in \text{SF}^0(\mathfrak{nl}p^\infty, \chi; L),$$

by (26.4.1.19). ┘

**Def. (26.4.2.21) [Congruence Modules, Ribet].** Situation as in (26.4.2.20), for  $\mathcal{F} \in \text{SF}^0(\mathfrak{np}^\infty, \chi)^{\ell\text{-new}}$ , define  $\Lambda_{\mathcal{F}}$ -modules

$$\begin{aligned} H_{\mathcal{F}}(\ell) &= \{ \mathcal{H} \in \text{SF}^0(\mathfrak{nl}p^\infty, \chi, M_{\mathcal{F}})^{\ell\text{-new}} : \mathcal{H} = \mathcal{G} - u\mathcal{F} - v\mathcal{F}|_\ell, \\ &\quad \mathcal{G} \in \text{SF}^0(\mathfrak{nl}p^\infty, \chi; \Lambda_{\mathcal{F}}), \mathcal{F} \in \text{SF}^0(\mathfrak{np}^\infty, \chi; \Lambda_{\mathcal{F}}), u, v \in M_{\mathcal{F}} \}. \end{aligned}$$

$$C_{\mathcal{F}}(\ell) = H_{\mathcal{F}}(\ell) / \left( \text{SF}^0(\mathfrak{nl}p^\infty, \chi; M_{\mathcal{F}})^{\ell\text{-new}} \cap \text{SF}^0(\mathfrak{nl}p^\infty, \chi; \Lambda_{\mathcal{F}}) \right) \quad ?$$

where  $C_{\mathcal{F}}(\ell)$  is called the **congruence module** for  $\mathcal{F}$ , which measures how far the direct sum decomposition above fails to be a direct decomposition over  $\mathcal{O}_L$ .

Moreover, for any finite extension  $L/M_{\mathcal{F}}$ , we can define analogously  $H_L(\ell)$  and  $C_L(\ell)$ . ┘

**Prop. (26.4.2.22).** There is a  $\Lambda_{\mathcal{F}}$ -module map

$$\gamma : C_{\mathcal{F}}(\ell) \rightarrow M_{\mathcal{F}}/\Lambda_{\mathcal{F}} : \mathcal{H} = \mathcal{G} - u\mathcal{F} - v\mathcal{F}|_\ell \mapsto u.$$

Then this map is injective and the image is annihilated by  $w_\ell = (\alpha(\mathfrak{p}_\ell, \mathcal{F})^2 - \chi(\ell))(\beta(\mathfrak{p}_\ell, \mathcal{F})^2 - \chi(\ell)) \in \Lambda_{\mathcal{F}}$ . In particular,  $\gamma$  defines an isomorphism of  $C_{\mathcal{F}}(\ell)$  onto a fractional ideal  $\mathfrak{a}_{\mathcal{F}, \ell}$  of  $\Lambda_{\mathcal{F}}$  contained in  $w_\ell^{-1}\Lambda_{\mathcal{F}}$ . ┘

*Proof:* This map is well-defined because if  $\mathcal{H} = \mathcal{G} - u\mathcal{F} - v\mathcal{F}|_\ell = \mathcal{G}' - u'\mathcal{F} - v'\mathcal{F}|_\ell$ , then  $u - u' \in \Lambda_{\mathcal{F}}$  and  $v - v' \in \Lambda_{\mathcal{F}}$  by (26.4.2.19).

If  $\mathcal{H} = \mathcal{G} - u\mathcal{F} - v\mathcal{F}|_\ell$  and  $u \in \Lambda_{\mathcal{F}}$ , we show that  $v \in \Lambda_{\mathcal{F}}$ : In this case

$$v(U_\ell^2 - \chi(\ell))\mathcal{F}|_\ell = vc(\ell, \mathcal{F})\mathcal{F} - v\psi(\ell)(\|\ell\| + 1)\mathcal{F}|_\ell$$

has coefficients in  $\Lambda_{\mathcal{F}}$ . Thus  $v \in \Lambda_{\mathcal{F}}$ .

Apply  $U = (U_\ell^2 - \alpha_\ell(\mathcal{F})^2)(U_\ell^2 - \beta_\ell(\mathcal{F})^2)$  to the equation, where  $\alpha_\ell(\mathcal{F}), \beta_\ell(\mathcal{F})$  are the two roots of  $T^2 - c(\ell, \mathcal{F})T + \chi(\ell)\|\ell\| = 0$ , then  $U\mathcal{F} = U\mathcal{F}|_\ell = 0$ , and  $U\mathcal{H} = w_\ell\mathcal{H}$  by definition. So  $w_\ell\mathcal{H}$  has coefficients in  $\Lambda_{\mathcal{F}}$ . But then by (26.4.2.19),  $w_\ell u, w_\ell v \in \Lambda_{\mathcal{F}}$ . ┘

**Conj. (26.4.2.23).** Situation as in (26.4.2.22),  $w_\ell \mathfrak{a}_{\mathcal{F}, \ell} \not\subseteq P_i$  for  $P_i$  not above  $p$ . ┘

*Proof:* ?

□

**Thm& Conj.Cor.(26.4.2.24) [Congruence Theorem, Wiles].** This is true for  $F = \mathbb{Q}$  by [Ribet, Congruence relations between modular forms] and [Diamond].

In general, there exists  $v \in \Lambda_{\mathcal{F}}$  and  $c \in \mathbb{Z}$  depending on  $\mathcal{F}$  s.t.

$$\operatorname{div}(w_{\ell} \mathbf{a}_{\mathcal{F}, \ell}) \leq c \operatorname{div}(1 + \|\ell\|) + \operatorname{div}(v).$$

## 4 Embedding into $\Lambda$ -adic Modular Forms

**Thm. (26.4.4.1) [Embedding into  $\Lambda$ -adic Modular Forms, Hida [Hid86]/Wiles [Wil88]].** For a  $p$ -stabilized normalized newform (26.4.2.10)  $\mathbf{f} \in \text{SF}_k^0(\mathfrak{n}, \psi; \mathcal{O})^{\text{new}}$ , there exists a finite extension  $L/F_{\Lambda_{\mathcal{O}}}$  and an eigenform  $\mathcal{F} \in \text{SF}^0(\mathfrak{n}p^\infty, \psi\omega^{k-2}; \mathcal{O}_L)$  s.t.  $\mathcal{F} \equiv \mathbf{f} \pmod{\tilde{P}_k}$  for some prime  $\tilde{P}_{k,1} \in \text{Spec}(\mathcal{O}_L)$  over  $P_k \in \text{Spec}(\Lambda)$ .  $\lrcorner$

*Proof:* ? Cf. [Wil88]P546.

Let me briefly mention how to deduce lifting for all  $k$ : Wiles defined a Eisenstein series  $\mathbf{E}$  of level  $p$ -power and all constant terms 1, Then he find eigenforms with level dividing  $\mathfrak{n}p^\infty$  that is  $p$ -near to  $\mathbf{e}(\mathbf{f}\mathbf{E}^{p^m})$ , which is  $p$ -near to  $\mathbf{f}$ . These forms have large weights, so they have liftings. But there are only f.m.  $\Lambda$ -adic eigenforms of level  $\mathfrak{n}p^\infty$  (26.4.2.13), so there are infinitely liftings to a single  $\Lambda$ -adic eigenforms  $\mathcal{F}$ . Then take limit  $m$ , we see that  $\mathcal{F}$  is a lifting of  $\mathbf{f}$ .

extensions Because there are only f.m.  $\Lambda$ -adic eigenforms with  $\mathfrak{n}p^\infty$ -level (26.4.2.13),  $\square$

**Lemma (26.4.4.2).** Suppose  $\mathcal{O}$  is large enough s.t. it contains all the eigenvalues of the eigenforms in  $\text{SF}_k(\mathfrak{n}, \psi)$ , then  $\lrcorner$

*Proof:*

$\square$

**Lemma (26.4.4.3).** Let  $v \in \Sigma_F^{\text{fin}} \setminus (p)$  and  $\mathbf{g} \in \text{SF}_k(\mathfrak{n}, \psi; \mathcal{O})$  is a normalized eigenform, then each root of  $T^2 - c(\mathfrak{p}_v, \mathbf{p})T + \psi(\mathfrak{p}_v) \|v\|^{k-1}$  is either 0 or a unit modulo  $\mathfrak{m}$ .  $\lrcorner$

*Proof:* ? Cf. [Wil88]P550.

$\square$

## 5 Hecke Algebras and Eisenstein Ideals

**Def. (26.4.5.1) [Hecke Algebra  $\mathbf{T}$ ].** Let  $\mathbf{T}$  be the subring of  $\text{End}(\text{SF}^0(\mathfrak{np}^\infty, \chi; F_{\Lambda_\chi}))$  generated over  $\Lambda_\chi$  by all the Hecke operators  $T_{\mathfrak{np}(\mathfrak{m})}$  where  $\mathfrak{m}$  runs through all the integral ideals of  $\mathcal{O}_F$ .  $\lrcorner$

**Prop. (26.4.5.2) [Hecke Algebra  $\mathbf{T}$ ].** Let  $\chi$  be a primitive even ray class character of  $\text{Cl}^n(F)$  and  $\{\mathcal{F}_i\}$  be a set of normalized newforms in  $\text{SF}^0(\mathfrak{mp}^\infty, \chi; F_{\Lambda_\chi})^{\text{new}}$  where  $\mathfrak{mp}^\infty | \mathfrak{np}^\infty$ , and let  $\{\mathcal{F}_i\}_{i \in I}$  represents the equivalence classes of conjugation over  $F_{\Lambda_\chi}$ .

Let  $A = \prod_i L_{\mathcal{F}_i}$  be the  $F_{\Lambda_\chi}$ -algebra, then the Hecke algebra  $\mathbf{T}$  (26.4.5.1) acts on  $A$  via

$$\mathbf{T} \mapsto \text{diag}(c(\mathcal{O}_F, T\mathcal{F}_i)).$$

(Notice that to be naturally defined, need to check that  $T\mathcal{F}_i = 0$  implies  $T\mathcal{F}_i^\sigma = 0$  ?). Then this map induces an isomorphism

$$\mathbf{T} \otimes_{\Lambda_\chi} L \cong A \otimes_{\Lambda_\chi} L \cong \prod_{\mathcal{F}_i} L,$$

where  $L/F_{\Lambda_\chi}$  is a finite extension s.t. all the  $\mathcal{F}_i$  are defined (which exists by (26.4.2.15)), by (26.4.2.19) and strong multiplicity one. Then by comparing dimension, we get an isomorphism

$$\mathbf{T} \otimes_{\Lambda_\chi} F_{\Lambda_\chi} \cong A.$$

$\lrcorner$

**Prop. (26.4.5.3).** Situation as in (26.4.5.2), denote  $W = A \otimes A$  on which  $\text{Gal}_F$  acts via  $\oplus_i \rho_{\mathcal{F}_i}$ . This action commutes with the action of  $\mathbf{T}$ .

If  $\theta$  is an irreducible divisor of  $\hat{G}_\chi^0(T)$  (26.4.3.3), which determines a prime ideal  $\mathfrak{P} \in \text{Spec}(\mathbf{T})$  via (26.4.3.4). Then there is an inclusion of local rings  $\Lambda_{\chi, \theta} \subset \mathbf{T}_{\mathfrak{P}}$  s.t.

$$\Lambda_{\chi, \theta} / (\hat{G}_\chi^0(T)) \cong \mathbf{T}_{\mathfrak{P}} / I_{\text{Eis}}.$$

$\lrcorner$

*Proof:* ?

$\square$

**Prop. (26.4.5.4) [Two Types of  $\mathbf{T}_{\mathfrak{P}}$ -Modules].** Situation as in (26.4.5.3), if  $\mathcal{L} \subset W_{\mathfrak{P}}$  is a stable lattice (i.e. a f.g.  $\text{Gal}_F$ -stable  $\mathbf{T}_{\mathfrak{P}}$ -module s.t.  $\mathcal{L} \otimes F_{\Lambda_\chi} = W_{\mathfrak{P}}$ ), then any irreducible subquotient of  $\mathcal{L}/\mathfrak{P}\mathcal{L}$  is one of the following type:

- $V \cong \mathbf{T}_{\mathfrak{P}}/\mathfrak{P}$  where  $\text{Gal}_F$  acts trivially,
- $V \cong \mathbf{T}_{\mathfrak{P}}/\mathfrak{P}$  where  $\text{Gal}_F$  acts via character  $\eta$ , where  $\eta(-1)$  corresponds to  $\chi$  (26.4.2.11) via class field theory.

These two types are called **type 1** and **type  $\eta$**  modules resp. They are disjoint types because  $\eta$  is odd and  $2 \notin \mathfrak{P}$  ?. And a  $\mathbf{T}_{\mathfrak{P}}[\text{Gal}_F]$ -module is called **type 1** and **type  $\eta$**  modules resp. if all their irreducible components are **type 1** and **type  $\eta$**  resp..  $\lrcorner$

*Proof:* ? Cf. [Wil90]P511.  $\square$

**Lemma (26.4.5.5) [Type 1 Deprived Lattice].** Situation as in (26.4.5.4), given any stable lattice  $\mathcal{L} \subset W_{\mathfrak{P}}$ , there exists a sublattice  $\mathcal{L}' \subset \mathcal{L}$  s.t.  $\mathcal{L}/\mathcal{L}'$  is of type 1 and any such sublattice of  $\mathcal{L}$  with this property is contained in  $\mathcal{L}'$ . In particular,  $\mathcal{L}'$  has no type 1 quotients, and it is called the **type 1 deprived lattice** of  $\mathcal{L}$ .  $\lrcorner$

*Proof:* ? Cf.[Wil90]P511. □

**Prop. (26.4.5.6).** Situation as in (26.4.5.4), there exists a stable lattice  $\mathcal{L} \subset W_{\mathfrak{P}}$  s.t.  $X = \mathcal{L}/I_{\text{Eis}}\mathcal{L}$  (26.4.3.3) has no type 1 quotient and there is an exact sequence of  $\mathbf{T}_{\mathfrak{P}}[\text{Gal}_F]$ -modules:

$$0 \rightarrow C \rightarrow X \rightarrow M \rightarrow 0$$

s.t.

- $C \cong \mathcal{L}^+/I_{\text{Eis}}\mathcal{L}^+$  is of type 1 (26.4.5.4).
- $M$  if of type  $\eta$  (26.4.5.4) and  $M \cong \mathbf{T}_{\mathfrak{P}}/I_{\text{Eis}}$  as  $\mathbf{T}_{\mathfrak{P}}$ -modules. ┘

*Proof:* ? Cf.[Wil90]P514. □

**Prop. (26.4.5.7).** Situation as in (26.4.5.6), if we denote  $H_{\infty} = F_{\chi}(\mu_{p^{\infty}})$  and let  $N_{\infty}$  be the splitting field of the exact sequence  $0 \rightarrow C \rightarrow X \rightarrow M \rightarrow 0$  over  $H_{\infty}$ , then there is a pairing

$$G \times M \rightarrow C : (\sigma, m) \mapsto \sigma \tilde{m} - \tilde{m}, \quad \tilde{m} \text{ any lifting of } m \text{ in } X.$$

Then this pairing induces a  $\text{Gal}_{H_{\infty}/F}$ -equivariant map

$$\varphi : G \rightarrow \text{Hom}_{\mathbf{T}_{\mathfrak{P}}/I_{\text{Eis}}}(M, C),$$

which induces an isomorphism of  $\mathbf{T}_{\mathfrak{P}}$ -modules  $\tilde{G} = \varphi(G)_{\theta} = \text{Hom}_{\mathbf{T}_{\mathfrak{P}}/I_{\text{Eis}}}(M, C) \cong C$ . ┘

*Proof:* Cf.[Wil90]P514. ? □

**Cor. (26.4.5.8).** Situation as in (26.4.5.7), we have

$$\text{Fitt}_{\Lambda_{\theta}}(\tilde{G}) \subset (\hat{G}_{\chi}^0(T)).$$

In particular, the characteristic polynomial of  $\gamma - 1$  on  $\tilde{G}$  is divisible in  $\Lambda_{\chi, \theta}$  by

$$\hat{G}_{\chi}^0(u^{-1}(1+T)^{-1} - 1).$$

┘

## 6 Ramanujan-Peterson Conjecture for Hilbert Modular Forms

**Thm. (26.4.6.1) [Brylinki-Labesse].** For  $\mathbf{f} \in \text{SF}_k^0(\mathfrak{m}; \chi)$ , the roots of  $T^2 - c(\ell, \mathbf{f})T + \chi(\ell) \|\ell\|^{k-1}$  are  $\|\ell\|$ -Weil numbers for  $\ell \in \Sigma_F^{\text{fin}}$  outside a finite set depending on  $\mathbf{m}$ . ┘

*Proof:* Cf.[Wil88]P555. □

## 7 Pseudo-Characters

**Lemma (26.4.7.1) [Families of Galois Representations, Wiles[Wil88]].** Let  $\{\mathbf{a}_i\}_{i \in \mathbb{N}}$  be an infinite set of prime divisors of  $\mathcal{O}_L$ , and for each  $i \in \mathbb{N}$ , we are given a continuous Galois representation

$$\rho_i : \text{Gal}_F \rightarrow \text{GL}(2; \widetilde{\mathcal{O}_L/\mathfrak{a}_i})$$

s.t.

- Each  $\rho_i$  is unramified outside a set  $S_i \subset \Sigma_F^{\text{fin}}$  of analytic density 0,
- For any  $v \in \Sigma_F^{\text{fin}}$ , there exists  $a_v, \varepsilon_v \in \mathcal{O}_F$  s.t.

$$\text{tr}\rho_i(\sigma_v) = a_v, \quad \det \rho_i(\sigma_v) = \varepsilon_v$$

whenever  $v \notin \Sigma_i$ .

- There exists a complex conjugation  $\mathbf{c}$  that is odd for each  $\rho_i$ .

Then there exists a continuous semisimple representation  $\rho : \text{Gal}_F \rightarrow \text{GL}(2; L)$  s.t.

$$\text{tr}\rho(\sigma_v) = a_v, \quad \det \rho(\sigma_v) = \varepsilon_v$$

for  $v \in \Sigma_F^{\text{fin}} \setminus \cup_i S_i$ .

Moreover, if  $S = \cup_i S_i$  has analytic density 0, then  $\rho$  is uniquely determined, and  $\rho$  is irreducible iff some  $\rho_i$  is.  $\square$

*Proof:* We may exclude primes above  $p$  from  $\{\mathfrak{a}_i\}$ . Since  $\mathcal{O}_L/\mathfrak{a}_i$  is a DVR, we can fix a basis of  $(\widetilde{\mathcal{O}_L/\mathfrak{a}_i})^2$  s.t.  $\rho_i(\mathbf{c}) = \text{diag}(-1, 1)$ . Firstly we assume  $p \neq 2$ .

Denote  $\rho_i(\sigma) = \begin{bmatrix} a_\sigma^i & b_\sigma^i \\ c_\sigma^i & d_\sigma^i \end{bmatrix}$ , and let  $x_{\sigma, \tau}^i = b_\sigma^i c_\tau^i$ .

For any  $R \in \mathbb{C}\text{Ring}$ , consider the following data:  $(a_\sigma, d_\sigma, x_{\sigma, \tau})$  where

- $a_\tau, d_\tau$  are continuous function from  $\text{Gal}_F$  to  $R$ ,
- $x_{\sigma, \tau}$  is a continuous function from  $\text{Gal}_F \times \text{Gal}_F$  to  $R$ .

s.t.

- $a_{\sigma\tau} = a_\sigma a_\tau + x_{\sigma, \tau}$ .
- $d_{\sigma\tau} = d_\sigma d_\tau + x_{\tau, \sigma}$ .
- $x_{\sigma\tau, \rho\gamma} = a_\sigma a_\gamma x_{\tau, \rho} + a_\sigma d_\rho x_{\tau, \gamma} + d_\tau d_\rho x_{\sigma, \gamma}$ .
- $a_1 = d_1 = 1, x_{\sigma, 1} = x_{1, \sigma} = 0$ .
- $x_{\sigma, \tau} x_{\rho, \eta} = x_{\sigma, \eta} x_{\rho, \tau}$ .

called a **pseudo-character** of  $\text{Gal}_F$  valued in  $R$ . Then each  $\rho_i$  gives a pseudo-character of  $\text{Gal}_F$  valued in  $\mathcal{O}_L/\mathfrak{a}_i$ . Moreover, they are in fact valued in  $\mathcal{O}_L/\mathfrak{a}_i$ :

$$a_\sigma = \frac{1}{2}(\text{tr}\rho(\sigma) - \text{tr}\rho(\sigma\mathbf{c})), \quad d_\sigma = \frac{1}{2}(\text{tr}\rho(\sigma) + \text{tr}\rho(\sigma\mathbf{c})), \quad x_{\sigma, \tau} = a_{\sigma\tau} - a_\sigma a_\tau.$$

We use induction on  $r$  to construct pseudo-representations  $\alpha_r$  valued in  $\mathcal{O}_L/(\mathfrak{a}_1 \cap \dots \cap \mathfrak{a}_r)$  s.t.  $\alpha_r \equiv \tilde{\rho}_i \pmod{\mathfrak{a}_i}$  for each  $i \in [r]_+$ . Suppose  $\alpha_r$  is constructed, we first notice that  $\alpha_r \equiv \tilde{\rho}_{r+1} \pmod{(\mathfrak{a}_1 \cap \dots \cap \mathfrak{a}_r, \mathfrak{a}_{r+1})}$ , because their trace of  $\sigma_v$  on them are equal for a.e.  $v \in \Sigma_F^{\text{fin}}$ , and the data is determined by the traces as above. Then using the exact sequence

$$0 \rightarrow \mathcal{O}_L/\mathfrak{m}_1 \cap \mathfrak{m}_2 \rightarrow \mathcal{O}_L/\mathfrak{m}_1 \oplus \mathcal{O}_L/\mathfrak{m}_2 \rightarrow \mathcal{O}_L/(\mathfrak{m}_1, \mathfrak{m}_2) \rightarrow 0,$$

we can find a common lift  $\alpha_{r+1}$  valued in  $\mathcal{O}_L/(\mathfrak{a}_1 \cap \dots \cap \mathfrak{a}_{r+1})$  of  $\alpha_r$  and  $\tilde{\rho}_{r+1}$ .

Taking limits  $r \rightarrow \infty$ , we get a pseudo-representation  $\alpha$  valued in  $\mathcal{O}_L$  because  $L$  is a local ring. Then we construct a representation  $\rho : \text{Gal}_F \rightarrow \text{GL}(2; \mathcal{O}_L)$  with  $\tilde{\rho} = \alpha$ : If  $x_{\sigma, \tau} = 0$  for each  $\sigma, \tau \in \text{Gal}_F$ , then we take  $\rho(\sigma) = \text{diag}(a_\sigma, d_\sigma)$ , and if  $x_{\sigma_0, \tau_0} \neq 0$ , then we denote

$$c_\tau = x_{\sigma_0, \tau}, \quad b_\sigma = x_{\sigma, \tau_0}/x_{\sigma_0, \tau_0},$$

then we can check  $\rho(\sigma) = \begin{bmatrix} a_\sigma & b_\sigma \\ c_\sigma & d_\sigma \end{bmatrix}$  is a representation with  $\tilde{\rho} = \alpha$  ?. Then we consider the semisimplification of  $\rho$ .

Finally for  $p = 2$ , we only have  $\rho_i(\sigma)$  take values in  $\frac{1}{2}\mathcal{O}_L/\mathfrak{a}_i$ . So we can modify the definition of pseudo-representation to be the data  $(2a_\sigma, 2d_\sigma, 4x_{\sigma,\tau}, \text{tr}\sigma)$  and modify the relations in the obvious way and include the relation  $2\text{tr}\sigma = (2a_\sigma) + (2d_\sigma)$ . The rest goes through as before. ?

The uniqueness of  $\rho$  follows from Chebotarev density theorem, and the irreducibility is easy.  $\square$

**Remark (26.4.7.2).** If  $p \neq 2$  and  $\mathcal{O}_L$  has the property that each prime divisor is principal (e.g. it is a UFD), then we may take  $\rho$  to be valued in  $\mathcal{O}_L$ : Let  $\mathfrak{c}$  be the ideal generated by all the elements  $\{x_{\sigma_0,\tau}\}_{\tau \in \text{Gal}_F}$ , and let  $\text{div } \mathfrak{c} = \text{div } \theta$  for some  $\theta \in \mathcal{O}_L^\times$ , then we can modify the definition of  $\rho$  to be

$$c_\sigma = x_{\sigma_0,\tau}/\theta, \quad b_\sigma = x_{\sigma,\tau_0}\theta/x_{\sigma_0,\tau_0} \in \mathcal{O}_L.$$

┘

## 8 Galois Representations attached to Hilbert Modular Forms

**Thm. (26.4.8.1)** [Galois Representations attached to Cuspidal Newforms, Eischler-Shimura/Deligne/Deligne-Serre/Shimura/Rogawski-Tunnell [R-T83]/Carayol [Car86]/Mazur-Wiles [M-W86]/Wiles [Wil88]]. For any normalized newform  $f \in \text{SF}(\mathfrak{n}, \psi)^{\text{new}}$  and  $\lambda \in \Sigma_{K_f}^{\text{fin}}$  which is ordinary for  $\mathbf{f}$  (26.4.2.8), there exists a unique continuous irreducible Galois representation

$$\rho_{\mathbf{f},\lambda} : \text{Gal}_F \rightarrow \text{GL}(2; \mathcal{O}_{\mathbf{f},\lambda})$$

s.t. for any  $v \in \Sigma_F^{\text{fin}} \setminus S_F(\mathfrak{n} \parallel \lambda)$ ,  $\rho_{\mathbf{f},\lambda}$  is unramified at  $v$ , and

$$\text{tr}(\sigma_v | \rho_{\mathbf{f},\lambda}) = c(\mathfrak{p}_v, \mathbf{f}), \quad \det(\sigma_v | \rho_{\mathbf{f},\lambda}) = \psi(v) \|v\|^{k-1}.$$

Moreover,

1. If  $k = 1$ , then

- $\#\text{Im}(\rho_{\mathbf{f},\lambda}) < \infty$ , thus lifts to an Artin representation  $\rho_{\mathbf{f}}$ ,
- $\rho_{\mathbf{f}}$  is unramified outside  $\mathfrak{c}$ .
- $\text{tr}(\sigma_v | \rho_{\mathbf{f}}) = c(v, \mathbf{f})$  and  $\det(\sigma_v | \rho_{\mathbf{f}}) = \psi(v)$  for each  $v \in \Sigma_F^{\text{fin}} \setminus S_F(\mathfrak{c})$ .

2. For  $v \in S_F(\parallel \lambda \parallel)$ ,  $\rho_{\mathbf{f},\lambda}|_{\text{Gal}_v}$  is equivalent to the form  $\begin{bmatrix} \varepsilon_1 & * \\ & \varepsilon_2 \end{bmatrix}$ , where  $\varepsilon_2$  is unramified and  $\varepsilon_2(\sigma_v) = \alpha_v(\mathbf{f})$  (26.4.2.8).

3. (Local-global compatibility) For any  $v \in \Sigma_F^{\text{fin}} \setminus S_F(\parallel \lambda \parallel)$ ,  $\text{WD}_v(\rho_v) \cong \text{rec}(\pi_{\mathbf{f},v})(-\frac{1}{2})$  up to semisimplification.

┘

*Proof:* Firstly, it suffices to prove that a representation  $\rho_\lambda : \text{Gal}_F \rightarrow \text{GL}(2; F')$  for some extension  $F'/\mathbb{Q}(\mathbf{f})$  exists, because if such  $\rho$  exists, it is irreducible by (26.4.8.5), and it must be odd ?, so we can choose a basis s.t.  $\rho(\mathfrak{c}) = \text{diag}(-1, 1)$ . Then by the calculation in the proof of (26.4.7.1) and Chebotarev density theorem,  $\rho$  is valued in  $\text{GL}(2; \mathbb{Q}(\mathbf{f})_\lambda)$  (26.4.1.18). Then by (24.2.3.2),

By (26.4.4.1), we can lift  $\mathbf{f}$  to an eigenform  $\mathcal{F} \in \mathrm{SF}^0(\mathfrak{n}p^\infty, \psi\omega^{k-2}, \mathcal{O}_L)$  for some finite extension  $L/F_\Lambda$  s.t.  $\mathbf{f} = \mathcal{F}(\bmod \tilde{P}_k)$  for some  $\tilde{P}_k$  above  $P_k = (T - (u^{k-2} - 1)) \in \mathrm{Spec}(\mathcal{O}_\Lambda)$ . The  $\Lambda$ -adic newform associated to  $\mathcal{F}$  gives a representation  $\rho_{\mathcal{F}}$  by (26.4.8.6). The reduction of  $\rho_{\mathcal{F}}$  gives the desired representation  $\rho_{\mathbf{f},\lambda}$ . (notice that the semisimplification doesn't depend on the stable lattice  $\mathcal{L}$ ) Cf. [Wil88]P562.

For the “moreover” part:

1. See (26.4.8.4).
2. This follows from (26.4.8.6).
3. If  $\mathfrak{p}_v \nmid \mathfrak{n}$ , this is immediate from the characteristic polynomial relations above, and if  $\pi_{\mathbf{f},v}$  is not a principle representation, this follows from Carayol's result. And by twisting  $\mathbf{f}$  by a quasicharacter, we can assume that  $c(\mathfrak{p}_v, \mathbf{f}) \neq 0$ .

Lift  $\mathbf{ef}$  to a  $\Lambda$ -adic eigenform  $\mathcal{F}$  using (26.4.4.1), and let  $\mathcal{F}^*$  be the newform part of  $\mathcal{F}$ . Then  $U(\mathfrak{p}_v)\mathcal{F}^* = c(\mathfrak{p}_v, \mathcal{F})$  if  $\mathfrak{p}_v$  divides the level of  $\mathcal{F}^*$ , and  $T(\mathfrak{p}_v)\mathcal{F}^* = (c(\mathfrak{p}_v, \mathcal{F}) + \beta(\mathfrak{p}_v, \mathcal{F}))\mathcal{F}^*$ , where  $\beta(\mathfrak{p}_v, \mathcal{F}) = c(\mathfrak{p}_v, \mathcal{F})^{-1}\chi(\mathfrak{p}_v)\|v\|$ .

Recall that the Galois representation attached to  $\mathcal{F}^*$  is constructed by congruences  $\{\mathcal{F}^* \equiv \mathcal{G}_i(\bmod P_i)\}_{i \in \mathbb{Z}_+}$  for some set of eigenforms  $\mathcal{G}_i$ , and we may assume that  $c(\mathfrak{p}_v, \mathcal{G}_i) \neq 0$  for each  $i$ . Then Carayol's method applies to each specialization  $\mathbf{g}$  of these  $\mathcal{G}_i$  because  $\mathbf{g}$  will be Steinberg at some finite prime (Cf. Lemma 1.4.3), so  $\mathrm{WD}_v(\rho_{\mathbf{g}})^{\varphi\text{-s.st}} \cong \mu_1 \oplus \mu_2$  where  $\mu_2$  is unramified,  $\mu_2(\sigma_v) = \alpha_v(\mathbf{g})$  and  $\mu_1\mu_2 = \chi(1)$ . Then the same proof as in (26.4.8.7) shows that the same holds for  $\mathcal{G}_i$ . Then this holds for  $\mathcal{F}^*$  modulo  $P_i$ , and by specialization, it holds for  $\mathbf{f}$ .

□

**Lemma (26.4.8.2) [Weight 2 base case, Carayol [Car86]].** Situation as in (26.4.8.1), if either  $[F : \mathbb{Q}]$  is odd or  $\pi_{\mathbf{f},w}$  is supercuspidal or special for some  $w \in \Sigma_F^{\mathrm{fin}}$ , then there exists a continuous Galois representation

$$\rho_{\mathbf{f},\lambda} : \mathrm{Gal}_F \rightarrow \mathrm{GL}(2; \mathcal{O}_{\mathbf{f},\lambda})$$

s.t. for any  $v \in \Sigma_F^{\mathrm{fin}} \setminus S_F(\mathfrak{n} \|\lambda\|)$ ,  $\rho_{\mathbf{f},\lambda}$  is unramified at  $v$ , and

$$\mathrm{tr}(\sigma_v | \rho_{\mathbf{f},\lambda}) = c(\mathfrak{p}_v, \mathbf{f}), \quad \det(\sigma_v | \rho_{\mathbf{f},\lambda}) = \psi(v) \|v\|^{k-1}.$$

If moreover we have  $k = 2$ , then for any  $v \in S_F(\|\lambda\|)$  s.t.  $\pi_{\mathbf{f},v}$  is a principle representation,  $\rho_{\mathbf{f},\lambda}|_{\mathrm{Gal}_v}$  is equivalent to the form  $\begin{bmatrix} \varepsilon_1 & * \\ & \varepsilon_2 \end{bmatrix}$ , where  $\varepsilon_2$  is unramified and  $\varepsilon_2(\sigma_v) = \alpha_v(\mathbf{f})$  (26.4.2.8).  $\square$

*Proof:* Cf. [Wil88]Lemma 2.1.5. and [W1]Thm 2.2.

For the moreover part:

If  $[F : \mathbb{Q}]$  is odd, choose a quaternion algebra  $B \in \mathrm{Az}_F$  which is split at an infinite place  $\tau : F \rightarrow \mathbb{C}$ , ramified at all the remaining infinite places and split at all finite places. Then [Hida, abelian varieties with complex multiplication as factors of the Jacobians of Shimura curve] proved that

**Lemma (26.4.8.3).** There exists  $A_{\mathbf{f}} \in \mathrm{AbVar}^{[\mathbb{Q}(\mathbf{f}) : \mathbb{Q}]}$  together with an embedding  $\theta : \mathbb{Q}(\mathbf{f}) \hookrightarrow \mathrm{End}_F(A_{\mathbf{f}})$  s.t. for each  $\lambda \in \Sigma_F^{\mathrm{fin}}$ , the associated  $\lambda$ -adic representation is just  $\rho_{\mathbf{f},\lambda}$  as in (26.4.8.1).  $\square$

If  $v \nmid \mathfrak{n}$ , consider the endomorphism ring  $E$  generated by  $\mathcal{O}_{\mathbf{f}}$  and  $\sigma_v$  acting on  $(A_{\mathbf{f}})_{\kappa(v)}$ , then the  $p$ -adic representation attached to the Dieudonné modular  $D(T_p A_{\mathbf{f}})$  and the  $\ell$ -adic representation of  $A_{\mathbf{f}}$  has the same trace on  $E$ .

□

**Lemma (26.4.8.4) [Weight 1 case].** If  $k = 1$ , the “moreover” part of the theorem holds.  $\lrcorner$

*Proof:* This follows from Deligne-Serre method ?. The main part is to construct a mod  $p$  Galois representation attached to  $\mathbf{f}$ . But in this case  $\rho_{\mathbf{f}}$  is ordinary outside  $\mathfrak{c}$  (26.4.2.8) because  $\psi(\mathfrak{p}_v)$  is a unit, so we can construct it by the main part of the theorem.  $\square$

**Lemma (26.4.8.5).** Situation as in (26.4.8.1), when  $\rho_{\mathbf{f}, \lambda}$  exists, it is absolutely irreducible.  $\lrcorner$

*Proof:* Cf. [Wil86] prop 2.1 ?

If it is not irreducible, then its semisimplification is two characters. But it is locally algebraic, i.e. they can be extended to Hecke characters. Thus the  $L$ -function of  $\mathbf{f}$  is the product of two Hecke  $L$ -functions with some local factors deleted. But then some twist of  $f$  has a pole, contradicting Jacquet-Langlands.  $\square$

### Galois Representations attached to $\Lambda$ -adic Modular Forms

**Thm. (26.4.8.6) [Galois Representations attached to  $\Lambda$ -adic Modular Forms, Hida [Hid86]/Wiles [Wil88]].** Suppose  $L/F_{\Lambda}$  is a finite extension and  $\mathcal{F} \in \mathrm{SF}^0(\mathfrak{n}p^{\infty}, \chi; L)$  is a  $\Lambda$ -adic newform (26.4.2.17), then there exists a unique continuous irreducible Galois representation

$$\rho_{\mathcal{F}} : \mathrm{Gal}_F \rightarrow \mathrm{GL}(2; L)$$

s.t. for any  $v \in \Sigma_{K_{\mathbf{f}}}^{\mathrm{fin}} \setminus S_{K_{\mathbf{f}}}(\mathfrak{n}p)$ ,  $\rho_{\mathcal{F}}$  is unramified at  $v$ , and

$$\mathrm{tr}(\sigma_v | \rho_{\mathcal{F}}) = c(\mathfrak{p}_v, \mathcal{F}), \quad \det(\sigma_v | \rho_{\mathcal{F}}) = \chi(\mathfrak{p}_v) \|\sigma_v\|.$$

Moreover, for  $v \in S_F(p)$ ,  $\rho_{\mathcal{F}}|_{\mathrm{Gal}_v}$  is equivalent to the form  $\begin{bmatrix} \varepsilon_1 & * \\ & \varepsilon_2 \end{bmatrix}$ , where  $\varepsilon_2$  is unramified and  $\varepsilon_2(\sigma_v) = \alpha_v(\mathcal{F})$  (26.4.2.8).  $\lrcorner$

*Proof:* If  $\rho_{\mathcal{F}}$  exists, then it is irreducible by (26.4.8.5). Then  $\rho_{\mathcal{F}}$  is unique by Chebotarev density and (3.6.2.13). Next we prove existence:

Choose  $\ell \in \Sigma_F^{\mathrm{fin}} \setminus S_F(\mathfrak{m}np)$ , and let  $L/M_{\mathcal{F}}$  be a finite extension containing all the Hecke eigenvalues of the newforms in  $\mathrm{SF}^0(\mathfrak{n}lp^{\infty}, \chi)^{\ell\text{-new}}$ . Let  $\mathbf{T} \subset \mathrm{End}(\mathrm{SF}^0(\mathfrak{n}lp^{\infty}, \chi; L)^{\ell\text{-new}})$  denote the endomorphism ring generated over  $\mathcal{O}_L$  by the Hecke operators  $\{T(\mathfrak{m}) : \ell \nmid \mathfrak{m}\}$ .

Let  $I = \mathrm{Ann}_{\mathbf{T}}(C_L(\ell)) \subset \mathbf{T}$  (26.4.2.21). Since  $T(\mathfrak{m}) - c(\mathfrak{m}, \mathcal{F}) \in I$  for each  $\mathfrak{m}$  prime to  $\ell$  (by definition (26.4.2.21)), we see that  $\mathbf{T}/I \cong \mathcal{O}_L/\mathfrak{b}_{\ell}$  for some  $\mathfrak{b}_{\ell} \in \mathrm{Ideal}^{\times}(\mathcal{O}_F)$ . Since  $C_{\mathcal{F}}(\ell) \otimes \mathcal{O}_L \subset C_L(\ell)$ , we have

$$\mathrm{div}_L(\mathfrak{b}_{\ell}) \geq -\mathrm{div}_L(\mathfrak{a}_{\mathcal{F}, \ell}) \geq \mathrm{div}_L(w_{\ell}) - \mathrm{div}_L(v) - c \mathrm{div}_L(1 + \|\ell\|) \quad (\star)$$

for some fixed  $v \in \Lambda_{\mathcal{F}}$  and  $c \in \mathbb{Z}$  by (26.4.2.22) and (26.4.2.24), where  $w_{\ell} = (\alpha_{\ell}(\mathcal{F})^2 - \chi(\mathfrak{p}_{\ell}))(\beta_{\ell}(\mathcal{F})^2 - \chi(\mathfrak{p}_{\ell}))$ .

Let  $\{\mathcal{F}_i(\mathfrak{a}_{ij}z)\}_{i,j}$  be a newform basis for  $\mathrm{SF}^0(\mathfrak{n}lp^{\infty}, \chi; L)^{\ell\text{-new}}$  where  $\mathcal{F}_i$  are newforms of level  $\mathfrak{m}$  s.t.  $\ell \nmid \mathfrak{m} \nmid lp^{\infty}$  (26.4.2.19), inducing an isomorphism  $\mathrm{SF}^0(\mathfrak{n}lp^{\infty}, \chi; L)^{\ell\text{-new}} \cong A = \oplus_{i,j} L$ . Then  $\mathbf{T}$  acts on  $A$ , then  $A \cong T \otimes L$  as a  $T$ -module, because the eigenvalues are different.

Now let  $\mathrm{Gal}_F$  acts on  $W = A \oplus A$  through  $\bigoplus_{i,j} \rho_{\mathcal{F}_i} \otimes L$ , where  $\rho_{\mathcal{F}_i}$  exists because a.e. specialization of  $\mathcal{F}_i$  is  $\ell$ -new ?, thus Steinberg at  $\ell$  by (26.4.1.19), so we can use lemma (26.4.8.7) below. This action commutes with the action of  $\mathbf{T}$  ?.

Suppose  $Q$  be a prime of  $\mathcal{O}_L$  containing  $\mathfrak{b}_\ell$ , with  $Q \cap \mathbf{T} = \mathfrak{P}$ . Pick a basis of  $W_{\mathfrak{P}}$  as  $T_{\mathfrak{P}} \otimes L$ -module consisting of  $\mathfrak{c}$ , then we get a representation

$$\rho : \text{Gal}_F \rightarrow \text{GL}(2; \mathbf{T}_{\mathfrak{P}} \otimes L)$$

and a pseudo-representation  $\tilde{\rho}$  valued in  $\mathbf{T}_{\mathfrak{P}}$  as in the proof of (26.4.7.1). By reducing modulo  $I$ , we get a pseudo-representation  $\tilde{\rho}$  valued in  $\mathbf{T}_{\mathfrak{P}}/I \cong \mathcal{O}_{L,Q}/\mathfrak{b}_\ell$ , s.t. for each prime  $\mathfrak{q} \nmid n\ell p$ ,  $\tilde{\rho}$  has the right trace and determinant modulo  $I$ . And by the proof of (26.4.7.1),  $\tilde{\rho}(\text{mod } I)$  takes value in  $\Lambda_{\mathcal{F},P}/\mathfrak{b}_\ell \cap \Lambda_{\mathcal{F},P}$ , thus reducing modulo  $P$ , we get a representation  $\rho_P : \text{Gal}_F \rightarrow \text{GL}(2; \widetilde{\Lambda_{\mathcal{F}}/P})$  with the right trace and character away from  $n\ell p$ .

Now by (26.4.8.9), we can pick an infinite set  $A = \{(P_i, \ell_i)\}$  of pairs where  $\ell_i \in \Sigma_F^{\text{fin}} \setminus S_F(n\ell p)$ ,  $P_i$  are prime divisors of  $\Lambda_{\mathcal{F}}$ , and  $v_{P_i}(w_{\ell_i}) > 0$ , s.t.  $S = \{\ell_i : \ell_i \in A\}$  has density zero, and we can assume  $v_{P_i}(\mathfrak{b}_{\ell_i}) > 0$  by  $(\star)$ . Then by the argument above, we obtain representations

$$\rho_i : \text{Gal}_F \rightarrow \text{GL}(2; \Lambda_{\mathcal{F}}/P_i).$$

unramified outside  $n\ell_i p$  and having desired characteristic polynomial of  $\sigma_v$  when  $v \in \Sigma_F^{\text{fin}} \setminus S_F(n\ell_i p)$ . Then by (26.4.7.1), we get a semisimple continuous Galois representation

$$\rho_A : \text{Gal}_F \rightarrow \text{GL}(2; M_{\mathcal{F}})$$

unramified outside  $S \cup S_F(n\ell p)$  and for  $v \in \Sigma_F^{\text{fin}} \setminus S \cup S_F(n\ell p)$ , the characteristic polynomial of  $\sigma_v$  is  $T^2 - c(\mathfrak{p}_v, \mathcal{F})T + \chi(\mathfrak{p}_v) \|v\|$ .

But since  $S$  has density zero, for any  $\ell \in S$ ,  $\rho_S \cong \rho_{S \setminus \{\ell\}}$ . Thus  $\rho$  is unramified outside  $S_F(n\ell p)$ , with the right characteristic polynomial of  $\sigma_v$ .

To show that  $\rho_{\mathcal{F}}|_{\text{Gal}_v}$  is of the required form, notice when modulo  $P_i$  for each  $i$ , it is of the required form, and we use the same method as in the proof of (26.4.8.7). ?  $\square$

**Lemma (26.4.8.7).** Situation as in (26.4.8.6), the theorem holds if either of the following holds:

- $[F : \mathbb{Q}]$  is odd,
- For infinitely many  $(k, \zeta) \in \mathfrak{X}$ , there exists a lifting  $\tilde{v}_{k,\zeta}(\mathcal{F})$  with the property that the associated  $\pi = \otimes'_v \pi_v \in \text{Irr}^{\text{auto}}(\text{GL}(2)/F)$  has some finite component that is Steinberg or supercuspidal.

┘

*Proof:* Cf. [W1188]P565. ?

Each of the two hypotheses implies representations  $\text{Gal}_F \rightarrow \text{GL}(2; \mathcal{O}_L/\tilde{P}_{k,\zeta})$  associated to  $\tilde{v}_{k,\zeta}(\mathcal{F})$  for infinitely many  $(k, \zeta) \in \mathfrak{X}$  by work of Carayol (26.4.8.2), and these representation are all odd, thus  $\rho_{\mathcal{F}}$  exists by (26.4.7.1).

For  $v \in S_F(p)$ , see the restriction of  $\rho_{\mathcal{F}}$  to  $\text{Gal}_v$ , let  $\varepsilon_2$  be the unramified representation of  $\text{Gal}_v$  s.t.  $\alpha(\sigma_v) = \alpha_v(\mathcal{F})$ , consider the two representations  $\rho$  and  $\varepsilon_2^{-1} \det \rho \oplus \varepsilon_2$ , then they have the same trace on  $\text{Gal}_v$  modulo  $\tilde{P}_{k,\zeta}$  for infinitely many  $(k, \zeta) \in \mathfrak{X}$ , so their traces are equal, and these two representations are isomorphic up to semisimplification by (3.6.2.13). It suffices to show that  $\rho|_{\text{Gal}_v}$  has a subrepresentation isomorphic to  $\varepsilon_2^{-1} \det \rho$ . If not,  $\varepsilon_2^{-1} \det \rho \neq \varepsilon_2$ , and  $\rho|_{\text{Gal}_v}$  is isomorphic to a representation of the form  $\sigma \mapsto \begin{bmatrix} \varepsilon_2(\sigma) & b_\sigma \\ & d_\sigma \end{bmatrix}$ . Then for infinitely many  $(k, \zeta) \in \mathfrak{X}$ ,  $\rho(\text{mod } \tilde{P}_{k,\zeta})$  is given by Carayol's method, and  $\varepsilon_2^{-1} \det \rho \neq \varepsilon_2(\text{mod } \tilde{P}_{k,\zeta})$ . In this case, (26.4.8.2) shows that  $\rho|_{\text{Gal}_v}$  has a subrepresentation isomorphic to  $\varepsilon_2^{-1} \det \rho$  ?, thus  $b_\sigma = 0$  for all  $\sigma$ , and  $\rho|_{\text{Gal}_v}$  is semisimple, thus also has a subrepresentation isomorphic to  $\varepsilon_2^{-1} \det \rho$ .  $\square$

**Lemma (26.4.8.8) [An Infinite Set of Primes].** ┘

*Proof:*

□

**Lemma (26.4.8.9) [An infinite Set of Divisors].** As  $\ell$  varies, there are infinitely many prime divisor  $P$  of  $\Lambda_{\mathcal{F}}$  dividing  $w_{\ell}$ . ┘

*Proof:* Suppose that when  $\ell$  varies, there exists a finite set of prime divisors  $P_i$  of  $\Lambda_{\mathcal{F}}$  and  $N_1 \in \mathbb{Z}_+$  s.t.  $\text{div } w_{\ell} \leq \sum N_1 \sum_i P_i$ , then the same holds true for  $\text{Nm}_{\Lambda_{\mathcal{F}}/\Lambda_{\mathcal{X}}} w_{\ell}$  in  $\Lambda_{\mathcal{X}}$ . Then there exists  $k \in \mathbb{Z}_+$  s.t.  $v_p(\text{Nm}(w_{\ell})(\zeta - 1)) < k$  where  $\zeta$  is as in (26.4.8.8). But for  $\ell \in S_k$  as in lemma (26.4.8.8), we have  $v_p(w_{\ell}(\zeta - 1)) \geq k$ , contradiction.

Then if the assertion is not true, then there exists a prime divisor  $P$  of  $\Lambda_{\mathcal{F}}$  s.t. for any  $k, n \in \mathbb{Z}_+$ ,  $v_P(w_{\ell}) \geq k$  for  $\ell$  in a positive portion of primes in  $S_n$  (26.4.8.8).

But this cannot happen: ?

## 26.6 Adelic Automorphic Representations

References are [B-J79, Bum97, Gan07, G-H11, G-H24], [Automorphic Forms on  $GL(2)$ , Jacquet and Langlands(1970)]. [Introduction to Langlands Program, Cogdell].

**Notation (26.6.0.1).**

- Fix  $F \in \mathbf{NField}$ .
- Use notations on ideles and adeles defined in [Adeles and Ideles](#).
- Fix  $\psi = \prod_v \psi_v$  an additive character of  $\mathbf{A}_F/F$ .
- Fix a connected reductive group  $G \in \mathbf{RedGrp}/F$ .
- Fix a maximal compact subgroup  $\mathcal{K}_\infty \leq G(F \otimes \mathbb{R})$  (the choice of  $\mathcal{K}_\infty$  is not so important because any two maximal compact subgroups of  $G(F \otimes \mathbb{R})$  are conjugate (10.5.5.21)), a compact open subgroup  $\mathcal{K}_f \leq G(\mathbf{A}_{F,f})$ , and denote  $\mathcal{K} = \mathcal{K}_f \mathcal{K}_\infty \leq G(\mathbf{A}_F)$ .
- Use notations on arithmetics of algebraic groups defined in [Arithmetic of Algebraic Groups](#).
- Let  $Z$  be the largest  $F$ -split torus contained in the center of  $G$ .
- Use notations on smooth representations of  $p$ -adic groups defined in [Admissible Representations of  \$p\$ -adic Reductive Groups](#).
- Use notations on Archimedean automorphic forms defined in [Archimedean Automorphic Representations](#).
- If  $G = GL(n)$ , use notations on subgroups of  $GL(n)$  defined in [Group-Theoretic Notations for  \$GL\(n\)\$](#) , and use notations on smooth representations of  $GL(n)$  defined in [Admissible Representations of  \$GL\(n\)\$  over  \$p\$ -adic Fields](#).
- Fix an admissible character  $\omega \in ([Z]_F)^\vee$ . Notice if  $G = GL(n)$ ,  $\omega$  is just a Hecke character.

┘

**Def. (26.6.0.2) [Lie Algebra].** Let  $\mathfrak{g}_\infty = \mathrm{Lie}(G(\mathbf{A}_\infty))$ ,  $\mathcal{Z}(\mathfrak{g}) = Z(U(\mathfrak{g}_\infty))$ .

┘

**Def. (26.6.0.3).** For  $\alpha \in F^{n-1}$ , let  $\psi_{N,\alpha}$  be a character of  $N(F)$  given by  $\psi_N(g) = \sum_i \psi(\alpha_i g_{i,i+1})$ . For  $\alpha = (1, \dots, 1)$ , denote  $\psi_{N,\alpha}$  by  $\psi_N$ .

┘

**Def. (26.6.0.4) [Adelic Norm].** Take an embedding  $G \hookrightarrow GL(n)$  over  $F$ . Define the norm on  $G(\mathbf{A}_F)$  by

$$\|g\| = \prod_v \max(|g_{ij}|_v, |g_{ij}^{-1}|_v).$$

Notice that if  $v \in \Sigma_F^{\mathrm{fin}}$  and  $g \in GL(m; \mathcal{O}_v)$ , then  $\|g\|_v = 1$ , so it is definable. And  $\|g\|$  is bounded below by a positive constant  $c$ .

┘

**Prop. (26.6.0.5).** Choose an Adelic norm (26.6.0.4), then there exists  $C \in \mathbb{R}_+$  s.t.

$$\|xy\| \leq C \|x\| \|y\|.$$

┘

## 1 Automorphic Representations

### Admissible Representations and Tensor Product Theorem

**Def. (26.6.1.1) [Admissible Representations].** A **smooth representation** of  $G(\mathbf{A}_F)$  is defined to be a TVS  $V \in \text{TVS}/\mathbb{C}$  with a commuting smooth  $G(\mathbf{A}_{F,f})$ -action and a  $(\mathfrak{g}_\infty, K_\infty)$ -module structure (10.5.5.22). The category of smooth representations of  $G(\mathbf{A}_F)$  is denoted by  $\text{Rep}^{\text{alg}}(G/F)$ .

Any  $(\pi, V) \in \text{Rep}^{\text{alg}}(G(\mathbf{A}_F))$  induces a representation of  $\mathcal{K} = \mathcal{K}_f \times \mathcal{K}_\infty$ . Then this representation is called an **admissible representation** iff every vector is  $\mathcal{K}$ -finite, and  $\dim V^\rho < \infty$  for any  $\rho \in \text{Irr}(\mathcal{K})$ . By (24.1.6.31), it can be checked that this is equivalent to: for any irreducible representation  $\rho_\infty$  of  $K_\infty$  and an open compact subgroup  $U \subset \mathcal{K}_f$ ,  $\dim V^{\rho_\infty} \cap V^U < \infty$ . The category of admissible representations of  $G(\mathbf{A}_F)$  is denoted by  $\text{Rep}^{\text{adm}}(G/F)$ .  $\lrcorner$

**Def. (26.6.1.2) [Restricted Tensor Representation].** Given a set of locally compact groups  $G_v$  and a.e. their compact subgroups  $K_v$ ,  $(\rho_v, V_v) \in \text{Rep}^{\text{alg}}(G_v)$ ,  $\xi_v^0 \in V_v^{K_v}$  are given for a.e.  $v$ , then we can define the **restricted tensor representation**

$$(\rho, V) = \bigotimes_v' (\rho_v, V_v, \xi_v^0)$$

of  $G(\mathbf{A}_F) = \prod' (G_v, K_v)$  on  $\bigotimes_v' V_v$  by

$$\rho(\bigotimes_v g_v)(\bigotimes_v \xi_v) = \bigotimes_v \rho_v(g_v) \xi_v.$$

$\lrcorner$

**Def. (26.6.1.3) [Global Hecke Algebra].** For  $v \in \Sigma_F$ , let  $\mathcal{H}_{G(F_v)}$  be the Hecke algebras constructed in (24.1.6.18) and (24.7.5.16). As  $\mathcal{H}_{G(F_v)}$  has a spherical idempotent  $e_v^0 = e_{K_v}$  (26.6.1.1), we can define the **global Hecke algebra**

$$\mathcal{H}_{G(\mathbf{A}_F)} = \bigotimes_v' (\mathcal{H}_{G(F_v)}, e_v^0).$$

Then by definition of representations in (26.6.1.17) and (24.7.5.17)(24.1.6.22),

$$\text{Rep}^{\text{alg}}(G(\mathbf{A}_F)) = \text{Rep}^{\text{alg}}(\mathcal{H}_{G(\mathbf{A}_F)}).$$

$\lrcorner$

**Thm. (26.6.1.4) [Tensor Product Theorem, Flath [Fla79]].** For  $(\rho, V) \in \text{Irr}^{\text{adm}}(G/F)$ , there exists uniquely for each  $v \in \Sigma_F^\infty$  a  $(\rho_v, V_v) \in \text{Irr}^{\text{adm}}((\mathfrak{g}_\infty, K_v))$ , and for each  $v \in \Sigma_F^{\text{fin}}$  a  $(\pi_v, V_v) \in \text{Irr}^{\text{alg}}(G(F_v))$  s.t. for a.e.  $v$ ,  $V_v$  contains a non-zero  $\mathcal{K}_v$ -fixed vector  $\xi_v^0$ , and

$$(\rho, V) = \bigotimes_v' (\rho_v, V_v, \xi_v^0).$$

Conversely, any such a restricted tensor product is in  $\text{Irr}^{\text{adm}}(G/F)$ .  $\lrcorner$

*Proof:* By considering the global Hecke algebra, this follows immediately from (26.6.1.3) and (24.7.5.17)(24.1.6.22).  $\square$

**Cor. (26.6.1.5) [Contragradient Representations].** For any  $\rho = \bigotimes_v \rho_v \in \text{Irr}^{\text{adm}}(G/F)$ , we can define the **contragradient representation** of  $\rho$  as  $\rho^\vee = \bigotimes_v \rho_v^\vee$  (24.1.2.9)  $\in \text{Irr}^{\text{adm}}(G/F)$ .  $\lrcorner$

**Cor. (26.6.1.6)** [Irreducible Representations of  $K$ ].

$$\mathrm{Irr}(K) = \bigotimes_v^{\prime} \mathrm{Irr}(K_v).$$

┘

*Proof:* This is similar to the proof of (26.6.1.4). □

### Automorphic Representations

**Def. (26.6.1.7)** [ $L^2$ -Space]. Define  $L^2(G/F, \omega)$  the space of all measurable functions  $\varphi$  on  $G(\mathbf{A}_F)$  s.t.

$$\varphi(zg) = \omega(z)\varphi(g), \forall z \in Z(\mathbf{A}), \quad \varphi(\gamma g) = \varphi(g), \forall \gamma \in G(F)$$

and  $\varphi$  is square integrable module the center:

$$\int_{[G]_F} |\varphi(g)|^2 dg < \infty.$$

w.r.t. the Tamagawa measure on  $G(\mathbf{A}_F)$  (20.5.4.5).

Then the right action of  $G(\mathbf{A}_F)$  on  $L^2(G/F, \omega)$  is continuous, by (24.7.1.14).

We also denote  $L^2([G]) \triangleq L^2(G/F, \mathbf{1})$ . ┘

**Remark (26.6.1.8)** [Motivation]. To motivate this definition, notice in the isomorphism

$$L^2(\mathrm{SL}(2; \mathbb{Z}) \backslash \mathcal{H}) \cong L^2(\mathrm{SL}(2; \mathbb{Q}) \backslash \mathrm{SL}(2; \mathbf{A}) / \mathrm{SO}(2; \mathbb{R}) \mathcal{K}),$$

removing  $K$  gives cusp modular functions of all level, and removing  $\mathrm{SO}(2; \mathbb{R})$  gives the Hilbert space of all cusp forms ?. Thus  $L^2(G(F) \backslash G(\mathbf{A}_F))$  gives all the informations needed. ┘

**Def. (26.6.1.9)** [Cuspidality]. A measurable function  $\varphi : [G]_F \rightarrow \mathbb{C}$  is called **cuspidal** iff for any proper parabolic subgroup  $P = MU$ , where  $U$  is the unipotent radical, we have

$$\int_{[U]_F} \varphi(ng) dn = 0 \quad (20.5.4.3)$$

for a.e.  $g \in A_G \backslash G(\mathbf{A}_F)$ . Notice this integral is convergent when  $\varphi$  is continuous because  $[U]$  is compact by (20.5.4.8). (Why is it definable for measurable functions ?)

In fact, it suffices to check for a set of representative of conjugacy classes of maximal parabolic subgroups  $P$ , by [HC68] ?.

The closed space of all cuspidal elements in  $L^2([G])$  is denoted by  $L_0^2([G], \omega)$  or  $L_{\mathrm{cusp}}^2([G], \omega)$ .  $L_0^2([G], \omega)$  is stable under the right action of  $A_G \backslash G(\mathbf{A}_F)$ . ┘

**Example (26.6.1.10)**. A function  $\varphi \in L^2(\mathrm{GL}(n)/F, \omega)$  is cuspidal (26.6.1.9) iff

$$\int_{\mathrm{Mat}_{r \times s}(F) \backslash \mathrm{Mat}_{r \times s}(\mathbf{A}_F)} \varphi \left( \begin{bmatrix} \mathbf{1}_r & X \\ & \mathbf{1}_s \end{bmatrix} g \right) dX = 0$$

a.e.  $g$  for any  $r + s = n, 1 < r < n$ . ┘

**Def. (26.6.1.11)** [Adelic Smooth Functions].

- The space  $C^\infty(G(\mathbf{A}_F))$  of **smooth functions on  $G(\mathbf{A}_F)$**  is defined to be the restricted tensor product  $\bigotimes' C^\infty(G(F_v))$  w.r.t.  $f_{v,0} = \mathbf{1}_{\mathcal{K}_v}$ .
- The space  $\mathcal{T}(G(\mathbf{A}_F))$  of **adelic compactly supported smooth functions** or **adelic test functions** on  $G(\mathbf{A}_F)$  is defined to be the restricted tensor product  $\bigotimes' \mathcal{T}(G_v)$  w.r.t.  $f_{v,0} = \mathbf{1}_{\mathcal{K}_v}$ .  $\mathcal{T}(G(\mathbf{A}_F))$  acts on  $L^2(G(F) \backslash G(\mathbf{A}_F), \omega)$  on the right.
- $G(\mathbf{A}_F)$  acts on  $C^\infty(G(\mathbf{A}_F))$  by right translation, and induces an action of  $\mathfrak{g}_\infty$  thus an action of  $U(\mathfrak{g}_\infty)$  on it. A function  $f$  is called  **$\mathcal{Z}(\mathfrak{g})$ -finite** if it is contained in a f.d. space that is invariant under the action of  $\mathcal{Z}(\mathfrak{g})$  (26.6.0.2).
- A function  $f : G(\mathbf{A}_F) \rightarrow \mathbb{C}$  is said to **have moderate growth** iff  $|f(g)| \leq C \|g\|^N$  (26.6.0.4) for some constant  $C > 0$  and any  $g \in G(\mathbf{A}_F)$ .
- A function  $f : G(\mathbf{A}_F) \rightarrow \mathbb{C}$  is said to be **rapidly decreasing** if for any  $k \in \mathbb{Z}_+$ ,  $|f(g)| \leq C_k \|g\|^{-k}$  for any  $g \in G(\mathbf{A}_F)$  and some constant  $C_k$ .

┘

**Prop. (26.6.1.12) [Moderate Growth and Siegel-Sets].** A function  $\varphi : [G] \rightarrow \mathbb{C}$  is of moderate growth (on  $G(\mathbf{A}_F)$ ) (26.6.1.11) if for any Siegel set  $\mathcal{S}$ , there exists  $(c, r) \in \mathbb{R}_+ \times \mathbb{R}$  s.t.

$$|\varphi(nmsk)| \leq c\alpha(s)^r$$

for all  $(n, m, s, k) \in \Omega_N \times \Omega_M \times A_{T_0}(t) \times \mathcal{K}$  and  $\alpha \in \Delta$ .

┘

*Proof:* Cf. [G-H24]P162.  $\mathcal{S}$

□

**Def. (26.6.1.13) [Adelic Automorphic Forms].** We denote by  $\mathcal{A}(G/F, \omega)$  the space of **adelic automorphic forms** consisting of smooth functions  $\varphi$  on  $G(\mathbf{A}_F)$  (26.6.1.11) s.t.

1.  $\varphi(z\mathbf{g}) = \omega(z)\varphi(\mathbf{g}), \forall z \in Z(\mathbf{A}_F)$ .
2.  $\varphi(\gamma\mathbf{g}) = \varphi(\mathbf{g})$ , where  $\mathbf{g} \in G(\mathbf{A}_F), \gamma \in G(F)$ .
3.  $\varphi$  is  $\mathcal{K}$ -finite and  $\mathcal{Z}(\mathfrak{g})$ -finite (26.6.1.11).
4.  $\varphi$  of moderate growth (26.6.1.11).

And denote by  $\mathcal{A}_0(G/F, \omega)$  the automorphic forms that is cuspidal in sense of (26.6.1.9), called the space of **cuspidal forms**. If we want to emphasize  $\mathcal{K}$  then we write  $\mathcal{A}(G/F, \mathcal{K}, \omega) \triangleq \mathcal{A}(G/F, \omega)$ .

$\mathcal{A}(G/F, \omega)$  is a  $(\mathfrak{g}_\infty, \mathcal{K}_\infty)$ -module (24.6.3.1), and  $G(\mathbf{A}_{F,f})$  acts smoothly on it making it an admissible  $G(\mathbf{A}_{F,f})$ -representation (24.1.6.29):

$$(\mathfrak{g}, \mathcal{K}_\infty) \times G(\mathbf{A}_{F,f}) \times \mathcal{A}(G/F, \omega) \rightarrow \mathcal{A}(G/F, \omega) : (X, k, \mathbf{g}, \Phi) \mapsto (x \mapsto X\Phi(xk\mathbf{g})).$$

These two actions are commutative, and the subspace  $\mathcal{A}_0(G/F, \omega)$  is stable under both actions. Thus  $\mathcal{A}(G/F, \omega), \mathcal{A}_0(G/F, \omega) \in \text{Rep}^{\text{adm}}(G/F)$  (26.6.1.1). ┘

**Prop. (26.6.1.14) [Adelic Automorphic Forms and Archimedean Automorphic Forms].** Suppose  $f$  is killed by an ideal  $J_\infty$  of finite codimension in  $\mathcal{Z}(\mathfrak{g})$ , and is invariant under the action of a compact open subset  $\mathcal{K}_f \leq G(\mathbf{A}_{F,f})$ . Let

$$G(F) \backslash G(\mathbf{A}_F) / \mathcal{K}_f = \coprod_i \Gamma_i \backslash G(F \otimes \mathbb{R})$$

as in (20.5.3.24), then there is an isomorphism of  $(\mathfrak{g}_\infty, K_\infty)$ -modules

$$\mathcal{A}(G(F)\backslash G(A), \omega, J_\infty)^{\mathcal{K}_f} \cong \bigoplus_i \mathcal{A}(\Gamma_i \backslash G(A_\infty), \mathbf{1}, \omega_\infty, J_\infty) \quad (26.1.5.10),$$

┘

**Cor. (26.6.1.15).** If a smooth function  $f$  on  $G(\mathbf{A}_F)$  satisfies item 1-3 in (26.6.1.13) and  $f \in L^2(G/F, \omega)$  (26.6.1.7), then  $f$  is automatically of moderate growth (26.6.1.11) and thus an automorphic form. ┘

*Proof:* This follows from (26.6.1.14) and (26.1.1.8). ┐

**Prop. (26.6.1.16) [Analytic Properties].** Any automorphic form  $f$  is real analytic when restricted to  $G(\mathbf{A}_\infty)$ , and is of moderate growth.

Any cusp form  $f$  is rapidly decreasing. In particular,  $f \in L^2_{\text{cusp}}(G/F)$ . ┘

*Proof:* It is real analytic by (26.1.1.15). The growth condition reduces immediately to the Archimedean case (26.1.4.7). ┐

**Def. (26.6.1.17) [Automorphic Representations].**  $\mathcal{A}(G/F, \omega), \mathcal{A}_0(G/F, \omega) \in \text{Rep}^{\text{adm}}(G/F)$  by definition (26.6.1.13). So  $\pi \in \text{Irr}^{\text{adm}}(G/F)$  is called

- an **automorphic representation** of  $G$  over  $F$  if  $\pi$  can be realized as a subquotient of  $\mathcal{A}(G/F, \omega)$  for some  $\omega$ ,
- an **automorphic cuspidal representation** of  $G$  over  $F$  if  $\pi$  can be realized as a subrepresentation of  $\mathcal{A}_0(G(F)\backslash G(\mathbf{A}_F), \omega)$  for some  $\omega$ .
- an **tempered automorphic representation** of  $G$  over  $F$  if  $\pi$  is an automorphic representation s.t. for each  $v \in \Sigma_F$ ;  $\pi_v \in \text{Irr}^{\text{adm}}(G(F_v))$  (or  $\text{Mod}^{\text{adm}}_{(\mathfrak{g}_v, \mathcal{K}_v)}$ ) is tempered (24.9.8.11) (24.6.4.11).

The category of automorphic representations of  $G(\mathbf{A}_F)$  is denoted by  $\text{Irr}^{\text{auto}}(G/F, \omega)$ . And the category of cuspidal representations of  $G(\mathbf{A}_F)$  is denoted by  $\text{Irr}^{\text{cusp}}(G/F, \omega)$ . ┘

**Remark (26.6.1.18).** There is a general method of constructing subrepresentations of  $\mathcal{A}(G(F)\backslash G(\mathbf{A}_F), \omega)$  using Eisenstein series ?, but no known methods for constructing subrepresentations of  $\mathcal{A}_0(G(F)\backslash G(\mathbf{A}_F), \omega)$ . ┘

**Thm. (26.6.1.19) [Automorphic Representations are Admissible, Harish-Chandra].**

$$\text{Irr}^{\text{cusp}}(G/F, \omega) \subset \text{Irr}^{\text{auto}}(G/F, \omega) \subset \text{Irr}^{\text{adm}}(G/F).$$

┘

*Proof:* Let  $V_1 \subset V_2 \subset \mathcal{A}(G(F)\backslash G(A), \omega)$  be submodules s.t  $V_2/V_1 \cong \pi \in \text{Irr}^{\text{auto}}(G/F, \omega)$ , then we can assume  $V_2$  is generated by an element  $f \in V_2 \setminus V_1$ , because otherwise change  $V_2$  by the submodule  $V'_2$  generated by  $f$  and  $V_1$  by  $V_1 \cap V'_2$ .

Suppose  $f$  is killed by an ideal  $J_\infty$  of finite codimension in  $\mathcal{Z}(\mathfrak{g})$ , and is invariant under the action of a compact open subset  $\mathcal{K}_f \leq G(\mathbf{A}_{F,f})$ . Let

$$G(F)\backslash G(\mathbf{A}_F)/\mathcal{K}_f = \coprod_{i=1}^h \Gamma_i \backslash G(F \otimes \mathbb{R})$$

as in (20.5.3.24), then there is an isomorphism of  $(\mathfrak{g}_\infty, \mathcal{K}_\infty)$ -modules

$$\mathcal{A}(G(F) \backslash G(\mathbf{A}_F), \omega, J_\infty)^{\mathcal{K}_f} \cong \bigoplus_{i=1}^h \mathcal{A}(\Gamma_i \backslash G(F \otimes \mathbb{R}), \mathbf{1}, \omega_\infty, J_\infty) \quad (26.1.5.10),$$

which is admissible by the fundamental theorem of Harish-Chandra (26.1.5.10). Thus  $V_2 \subset \mathcal{A}(G(F) \backslash G(\mathbf{A}_F), \omega, J_\infty)^{\mathcal{K}_f}$  is also admissible, and so is  $\pi$ .  $\square$

**Def. (26.6.1.20) [Galois Conjugate of Automorphic Representations].** For  $\pi \in \text{Irr}^{\text{auto}}(G/F)$  and any  $\sigma \in \text{Aut}(F)$ , defined  $\sigma(\pi)$  to be the set of functions  $\sigma(\pi)(g)(x) = g(\sigma^{-1}(x))$ . Then  $\sigma(\pi)$  is also automorphic.  $\lrcorner$

*Proof:* If  $\pi$  is realized in the subspace of  $\mathcal{A}(G/F, \omega)$  of the form  $\{f(g)\}_{f \in V}$ , then  $\sigma(\pi)$  is realized in the subspace of  $\mathcal{A}(G/F, \omega)$  of the form  $\{f(\sigma(g))\}_{f \in V}$ .  $\square$

### Discrete Automorphic Representations

**Def. (26.6.1.21) [Discrete (Unitary) Automorphic Representations].** A **discrete automorphic representations** of  $G(\mathbf{A}_F)$  is an irreducible unitary representation  $\pi$  of  $G(\mathbf{A}_F)$  that is equivalent to a subrepresentation of  $L^2(G/F, \omega)$ .

And it is called a **discrete cuspidal automorphic representation** if it is equivalent to a subrepresentation of  $L^2_{\text{cusp}}(G/F, \omega)$ . We will see in (26.6.2.5) that a discrete cuspidal automorphic representation is naturally in bijection with cuspidal automorphic representation.  $\lrcorner$

**Prop. (26.6.1.22) [Discrete-Series Representations].** If  $(\pi, \mathcal{H})$  is a discrete automorphic representation of  $G(\mathbf{A}_F)$  (26.6.1.21), then  $V^{\mathcal{K}\text{-fin}}$  is an  $A_G$ -trivial automorphic representation of  $G$  over  $F$  (26.6.1.17). And two discrete automorphic representations  $(\pi_1, \mathcal{H}_1), (\pi_2, \mathcal{H}_2)$  of  $G(\mathbf{A}_F)$  are equivalent iff  $V_1^{\mathcal{K}\text{-fin}} \cong V_2^{\mathcal{K}\text{-fin}} \in \text{Irr}^{\text{auto}}(G/F)$ .

So we can define a **discrete-series representation** of  $G$  over  $F$  to be an automorphic representation  $(\pi, V) \in \text{Irr}^{\text{auto}}(G/F)$  that is equivalent to the  $\mathcal{K}$ -finite part of some discrete automorphic representation of  $G$  (26.6.1.21).  $\lrcorner$

*Proof:* Cf. [Getz]P172. ?  $\square$

**Def. (26.6.1.23) [Weakly-Embedded Representations].** A discrete-series  $\pi \in \text{Irr}^{\text{uni}}(A_G \backslash G(\mathbf{A}_F))$  is called a **weakly-embedded representation** if there exists a **tempered embedding**  $\pi^{\mathcal{K}\text{-fin}} \hookrightarrow C^\infty([G]_F)$  s.t. the image is  $L^{2+\varepsilon}$  for any  $\varepsilon \in \mathbb{R}_+$ .  $\lrcorner$

### Parabolic Inductions

References are [Lan79].

**Notation (26.6.1.24).**

- Let  $G \in \text{RedGrp}/F$ .

$\lrcorner$

**Prop. (26.6.1.25) [Parabolic Inductions, Langlands].** Let  $P \leq G$  be a parabolic subgroup with a Levi subgroup  $M$ , and  $\sigma = \otimes'_v \sigma_v \in \text{Irr}^{\text{cusp}}(M/F)$ , then

$$I_{P(\mathbf{A}_F)}^{G(\mathbf{A}_F)}(\sigma) = \bigotimes_v^I I_{P(F_v)}^{G(F_v)}(\sigma_v) \in \text{Rep}^{\text{adm}}(G(\mathbf{A}_F)) \quad (26.6.1.1).$$

Then for a.e.  $v \in \Sigma_F$ ,  $\sigma_v$  has a unique unramified constituent  $\pi_v^0$ , and the constituents of  $I_{P(\mathbf{A}_F)}^{G(\mathbf{A}_F)}(\sigma)$  are exactly those representations  $\pi = \otimes'_v \pi_v$  where  $\pi_v$  is a constituent of  $I_{P(F_v)}^{G(F_v)}(\sigma_v)$  and  $\pi_v = \pi_v^0$  for a.e.  $v$ .  $\lrcorner$

*Proof:* Cf.[Automorphic Representations, Langlands]  $\square$

**Remark (26.6.1.26) [Cuspidal Support is not Unique].** The pair  $(M, \sigma)$  may not be unique up to conjugacy. It is unique for  $\mathrm{GL}(n)$ , by [J-S81a]Thm4.4, but in general it is false. For example, Waldspurger showed for  $G = \mathrm{PGSp}(4)$  that there are cuspidal representations  $\pi$  that are abstractly isomorphic to a subquotient of some  $I_P(\sigma)$  with  $\sigma$  cuspidal on  $M = \mathrm{GL}(2)$ . These are called **CAP representations**.  $\lrcorner$

**Thm. (26.6.1.27) [Any Automorphic Representation comes from a Parabolic Induction].**  $\pi \in \mathrm{Irr}^{\mathrm{adm}}(G(\mathbf{A}_F))$  is automorphic (26.6.1.17) iff it is a constituent of  $I_P^G(\sigma)$  for some parabolic subgroup  $P \leq G$  with a Levi subgroup  $M$  and  $\sigma \in \mathrm{Irr}^{\mathrm{cusp}}(M/F)$ .  $\lrcorner$

*Proof:* Cf.[Automorphic Representations, Langlands]  $\square$

**Def. (26.6.1.28) [Isobaric Automorphic Representations].** By (26.6.1.25) and (26.6.1.27), any  $\pi \in \mathrm{Irr}^{\mathrm{auto}}(G/F)$  is a subquotient of  $I_{P(\mathbf{A}_F)}^{G(\mathbf{A}_F)}(\sigma; \lambda)$  where  $P = LU \leq G$  is a parabolic,  $\sigma \in \mathrm{Irr}^{\mathrm{cusp}}(L/F)$  and  $\lambda \in (\mathfrak{a}_L)_{\mathbb{C}}^*$  (Cf. [G-H24]Chap10). Then  $\pi$  is called an **isobaric automorphic representation** if  $\pi$  is the canonical subquotient (the Langlands quotient (26.6.1.25)), i.e.  $\pi_v = \pi_{1,v} \boxplus \dots \boxplus \pi_{r,v}$  for any  $v \in \Sigma_F$ . An isobaric automorphic representation is denoted by

$$\pi = \pi_1 \boxplus \dots \boxplus \pi_r.$$

If  $G = \mathrm{GL}(n)$ , then by LLC,  $\pi$  being isobaric is equivalent to the  $L$ -parameter of  $\pi_v$  being the direct sum of  $L$ -parameters of  $\pi_v$  for each  $v \in \Sigma_F$ .  $\lrcorner$

### Central Extensions

**Prop. (26.6.1.29).** If  $1 \rightarrow \mathbb{G}_m \rightarrow G' \rightarrow G \rightarrow 1 \in \mathrm{RedGrp}/F$  is a central extension, then automorphic forms on  $G$  are identified with automorphic forms on  $G'$  that are trivial on  $\mathbb{G}_m$ .  $\lrcorner$

*Proof:* ?  $\square$

## 2 Cuspidal Spectra

**Thm. (26.6.2.1) [Gelfand-Piatetski-Shapiro].** The subspace  $L_{\mathrm{cusp}}^2([G]) \subset L^2([G])$  is closed, and  $R_{\mathrm{cusp}}(f)$  is a trace class for each  $f \in C_c^\infty(A_G \backslash G(\mathbf{A}_F))$ .  $\lrcorner$

*Proof:* Cf.[Getz]P241.  $\square$

**Cor. (26.6.2.2) [Gelfand-Piatetski-Shapiro].** There is a Hilbert space direct sum decomposition

$$L_{\mathrm{cusp}}^2([G]) = \widehat{\bigoplus_{\pi \in \mathrm{Irr}^{\mathrm{uni}}(A_G \backslash G(\mathbf{A}_F))} m(\pi) \pi},$$

where  $m(\pi) < \infty$  for any  $\pi \in \mathrm{Irr}^{\mathrm{uni}}(A_G \backslash G(\mathbf{A}_F))$ .  $\lrcorner$

*Proof:* Cf.[Getz]P241.  $\square$

**Lemma (26.6.2.3) [Gelfand-Graev-Piatetski-Shapiro].** Let  $\varphi \in C_c^\infty(G(\mathbf{A}_F))$ , then

- There exists a constant  $C(\varphi)$  that for all  $f \in L_{\text{cusp}}^2(G/F, \omega)$ , we have  $\|\rho(\varphi)f\|_\infty \leq C(\varphi) \|f\|_2$ .
- $\rho(\varphi)$  is a compact operator on  $L_{\text{cusp}}^2(G/F, \omega)$ .

┘

*Proof:* The proof is the same as that of (26.1.5.6), but use global Siegel sets (20.5.4.16), Cf. [Bump, P297] ? .

□

**Thm. (26.6.2.4) [Cuspidal Spaces Totally Decomposable, Gelfand-Graev-Piatetski-Shapiro].** The space  $L_{\text{cusp}}^2(G(F) \backslash G(\mathbf{A}_F), \omega)$  (26.6.1.7) decomposes into a Hilbert space direct sum of irreducible invariant subspaces over  $G(\mathbf{A}_F)$ .

┘

*Proof:* The proof is exactly the same as (26.1.5.2), but where we use (26.6.2.3) in place of (29.1.4.8) and lemma ?? in place of lemma (24.7.5.2).

□

**Thm. (26.6.2.5) [Irreducible Cuspidal Representations are Admissible, Gelfand-Graev-Piatetski-Shapiro [GGS69]].** If  $(\pi, V) \in \text{Irr}^{\text{uni}}(G(\mathbf{A}_F))$  is contained in the decomposition of  $\mathcal{H} = L_{\text{cusp}}^2(G/F, \omega)$  in (26.6.2.4), then  $V^{\mathcal{K}\text{-fin}} \subset V$  is dense,  $V^{\mathcal{K}\text{-fin}} \subset \mathcal{A}_0(G/F, \omega)$  (26.6.1.13) and  $(\pi, V^{\mathcal{K}\text{-fin}}) \in \text{Irr}^{\text{adm}}(G/F, \omega)$ .

And there is a decomposition

$$L_{\text{cusp}}^2(G(F) \backslash G(\mathbf{A}_F), \omega)^{\mathcal{K}\text{-fin}} = \mathcal{A}_0(G(F) \backslash G(\mathbf{A}_F), \omega) \cong \bigoplus_{\pi \in \text{Irr}^{\text{cusp}}(G/F, \omega)} m(\pi) \pi,$$

with  $m(\pi) < \infty$ .

In particular, discrete cuspidal automorphic forms for  $G$  are naturally in bijection with cuspidal automorphic forms for  $G$  (26.6.1.21), compatible with the decomposition (26.6.2.2).

┘

*Proof:* Cf. [G-H24] P265.

This is general by (24.7.5.7), and for the containment  $V^{\mathcal{K}\text{-fin}} \subset \mathcal{A}_0(G(F) \backslash G(\mathbf{A}_F), \omega)$ , use a similar argument as in (26.1.5.8) using a similar lemma as lemma (26.1.5.7).

$V^{\mathcal{K}\text{-fin}}$  is admissible by (26.6.1.19).  $m(\pi) < \infty$  by the similar proof as in (26.1.5.9). ?

□

### 3 $\text{Irr}^{\text{auto}}(\text{GL}(n)/F)$

References are [Bum97] Chap3, [G-H11, G-H11b].

#### Basics

**Prop. (26.6.3.1).**  $\text{GL}(n; \mathbf{A}_F)$  is unimodular.

┘

*Proof:* This is because  $\text{GL}(n; F_v)$  is unimodular for any  $v \in \Sigma_F$  and because we can calculate the restricted product measure by (12.10.3.24).

□

**Def. (26.6.3.2) [Level Subgroups].** For  $\mathfrak{m} \in \text{Ideal}^\times(\mathcal{O}_F)$ , define compact open subgroups

$$\mathcal{K}_0(\mathfrak{m}) = \text{pr}^{-1}(B(\mathcal{O}_F/\mathfrak{m})), \quad \mathcal{K}_{0,1}(\mathfrak{m}) = \text{pr}^{-1}(M(\mathcal{O}_F/\mathfrak{m})) \subset \text{GL}(2; \mathbf{A}_{F,f}) \text{ (24.11.1.5)}.$$

┘

**Prop. (26.6.3.3).** If  $F = \mathbb{Q}$ , then the inclusion induces homeomorphisms

$$\Gamma_0(N) \backslash \mathrm{GL}(2; \mathbb{R})^+ \cong \mathrm{GL}(2; \mathbb{Q}) \backslash \mathrm{GL}(2; \mathbf{A}) / \mathcal{K}_0(N).$$

$$\Gamma_0(N) \backslash \mathrm{SL}(2; \mathbb{R}) \cong \mathrm{GL}(2; \mathbb{Q}) Z(\mathbf{A}) \backslash \mathrm{GL}(2; \mathbf{A}) / \mathcal{K}_0(N)$$

Thus the definition of congruence subgroups(20.4.5.9) are compatible with that of(20.5.3.24)  $\lrcorner$

*Proof:* Because  $\mathrm{cl}(\mathbb{Q}) = 1$  and  $\det(\mathcal{K}_0(N)) = \prod_{v \in \Sigma_F^{\mathrm{fin}}} \mathcal{O}_v^*$ , item3 of(20.5.3.23) shows

$$\mathrm{GL}(2; \mathbf{A}) = \mathrm{GL}(2; \mathbb{Q}) \mathrm{GL}(2; \mathbb{R}) \mathcal{K}_0(N) = \mathrm{GL}(2; \mathbb{Q}) \mathrm{GL}(2; \mathbb{R})^+ \mathcal{K}_0(N).$$

So

$$\mathrm{GL}(2; \mathbb{Q}) \backslash \mathrm{GL}(2; \mathbf{A}) \cong \mathrm{GL}(2; \mathbb{Q}) \backslash \left( \mathrm{GL}(2; \mathbb{Q}) \mathrm{GL}(2; \mathbb{R})^+ \mathcal{K}_0(N) \right) \cong \Gamma_0(N) \backslash \left( \mathrm{GL}(2; \mathbb{R})^+ \mathcal{K}_0(N) \right).$$

Now taking quotient on the right by  $\mathcal{K}_0(N)$  gives the desired assertion.

2 follows from 1 by modulo the center.  $\square$

**Cor. (26.6.3.4).** The quotient space  $\mathrm{GL}(n; F) Z(\mathbf{A}_F) \backslash \mathrm{GL}(n; \mathbf{A}_F)$  has finite measure.  $\lrcorner$

*Proof:* For the general case, Cf.[Humphreys, Arithmetic Groups, (1980)?].

Because  $\mathcal{K}_0(N)$  is compact, it suffices to prove that  $\mathrm{GL}(n; F) Z(\mathbf{A}_F) \backslash \mathrm{GL}(n; \mathbf{A}_F) / \mathcal{K}_0(N)$  has finite measure(because  $\mathrm{GL}(n; F)$  and  $\mathrm{GL}(n; A)$  are both unimodular, the measure is compatible). But this space is homeomorphic to  $\Gamma_0(N) \backslash \mathrm{SL}(2; \mathbb{R})$ , which has finite measure because  $\Gamma(1) \backslash \mathrm{SL}(2, \mathbb{R})$  does and  $\Gamma_0(N)$  is of finite index in  $\Gamma(1)$ .  $\square$

**Prop. (26.6.3.5) [Contragradient Representations].** For  $(\pi, V) \in \mathrm{Irr}^{\mathrm{cusp}}(\mathrm{GL}(n)/F, \omega)$ ,

- its contragradient  $(\pi^\vee, V^\vee) \in \mathrm{Irr}^{\mathrm{cusp}}(\mathrm{GL}(n)/F, \omega^{-1})$ , and  $V^\vee$  can be chosen to be the space of all functions  $g \mapsto \varphi(g^{-t})$  where  $\varphi \in V$ .
- if  $n = 2$ , then  $\pi^\vee \cong \pi \otimes (\omega^{-1} \circ \det)$ .

$\lrcorner$

*Proof:* It suffices to analyze each place. Notice for cuspidal representations, it suffices to show for finite places, because we can use strong multiplicity one(26.6.5.1).

For admissible case we only prove for  $n = 2$  and  $F$  totally real(the problem is we haven't studied  $\mathbb{C}$ ).?

Let  $\hat{V}$  be the space of functions of the form  $\hat{\varphi}(g) = \varphi(g^{-t})$ , then the right action of  $G$  on  $\hat{V}$  corresponds back to the restriction of the right action composed with the automorphism  $g \mapsto g^{-t}$ . Thus the result follows from(24.11.1.10) and its Archimedean analogy for  $(\mathfrak{g}_\infty, K_\infty)$ -modules(24.6.4.23).  $\square$

**Def. (26.6.3.6) [Global New Vectors].** For  $(\pi, V) \cong \otimes'_v (\pi_v, V_v, \xi_v^0) \in \mathrm{Irr}^{\mathrm{cusp}}(\mathrm{GL}(n)/F)$ , a **new vector(global)**  $\xi$  for  $\pi$  is defined to be a restricted tensor product of local new vectors of  $\pi_v$ (24.11.3.17) s.t.  $\xi_v$  is the distinguished vector  $\xi_v^0$  for a.e.  $v \in \Sigma_F$ , and for  $v \in \Sigma_F^\infty$ ,  $\xi_v$  generates an irreducible representation of  $\mathcal{K}_v$ .  $\lrcorner$

Adelization

**Prop. (26.6.3.7) [Global Hecke Algebra].** There are isomorphisms

$$\Gamma_0(N) \backslash G_0(N) / \Gamma_0(N) \text{ (20.4.5.13)} \cong \prod'_{v \in \text{Prime} \setminus S(N)} \mathcal{K}_v \backslash \text{GL}(2; \mathbb{Q}_v) / \mathcal{K}_v.$$

$$\Gamma_0(N) \backslash G_0(N) \cong \prod'_{v \in \text{Prime} \setminus S(N)} K_v \backslash \text{GL}(2; \mathbb{Q}_v)$$

which induces an isomorphism  $\mathcal{R}_N \cong \prod_{v \in \text{Prime} \setminus S(N)} \mathcal{H}_{\mathcal{K}_v}$  (26.3.2.1)(24.9.6.3).  $\lrcorner$

**Prop. (26.6.3.8) [Adelization of Maass Forms].** Let  $\chi \in \text{Diri}(N)$  and  $\omega$  be the adelized Hecke character of  $\chi$  (19.4.1.24). Define a character  $\chi_d$  on  $\Gamma_0(N)$  by

$$\chi_d \left( \begin{bmatrix} a & b \\ c & d \end{bmatrix} \right) = \chi(d),$$

and define a character  $\lambda_d$  of  $\mathcal{K}_0(N)$  (26.6.3.2) by

$$\lambda_d \left( \begin{bmatrix} a & b \\ c & d \end{bmatrix} \right) = \prod_{v \in S(N)} \omega_v(d_v).$$

By (26.6.3.3), there is a homeomorphism

$$\Gamma_0(N) \backslash \text{GL}(2; \mathbb{R})^+ \cong \text{GL}(2; \mathbb{Q}) \backslash \text{GL}(2; \mathbf{A}) / \mathcal{K}_0(N) \cong \text{GL}(2; \mathbb{Q}) \backslash \left( \text{GL}(2; \mathbb{Q}) \text{GL}(2; \mathbb{R})^+ \mathcal{K}_0(N) \right) / \mathcal{K}_0(N),$$

which induces an isomorphism

$$f \mapsto \Phi_f : C^\infty(\Gamma_0(N) \backslash \text{GL}(2; \mathbb{R})^+, \chi_d) \cong C^\infty(\text{GL}(2)/\mathbb{Q}, \omega)[\lambda_d] \text{ (26.1.1.1)(26.6.1.13)(26.6.3.2)}$$

$$\Phi_f(\gamma g_\infty k_0) = f(g_\infty) \lambda_d(k_0), \text{ where } \gamma \in \text{GL}(2; \mathbb{Q}), g_\infty \in \text{GL}(2; \mathbb{R})^+, k_0 \in \mathcal{K}_0(N).$$

And this map clearly identifies  $\mathcal{K}_\infty$ -finiteness properties because the images are  $\mathcal{K}_{0,1}(N)$ -fixed, and also identifies  $\mathcal{Z}$ -finiteness properties and moderate growth conditions, thus induces an isomorphism

$$\mathcal{A}(\Gamma_0(N) \backslash \text{GL}(2; \mathbb{R})^+, \chi_d) \cong \mathcal{A}(\text{GL}(2)/\mathbb{Q}, \omega)[\lambda_d] \text{ (26.1.1.2)(26.6.1.13)}$$

compatible with  $(\mathfrak{g}_\infty, \mathcal{K}_\infty)$ -action.

This map also identifies cuspidality, thus it induces an isomorphism

$$\mathcal{A}_0(\Gamma_0(N) \backslash \text{GL}(2; \mathbb{R})^+, \chi_d) \cong \mathcal{A}_0(\text{GL}(2; \mathbb{Q}) \backslash \text{GL}(2; \mathbf{A}), \omega)[\lambda_d].$$

And by (26.1.3.10) also induces isomorphisms

$$\text{MF}_k(\Gamma_0(N), \chi) \cong \mathcal{A}(\text{GL}(2; \mathbb{Q}) \backslash \text{GL}(2; \mathbf{A}), \omega)^{L=0}[\lambda_d](k),$$

$$\text{SF}_k(\Gamma_0(N), \chi) \cong \mathcal{A}_0(\text{GL}(2; \mathbb{Q}) \backslash \text{GL}(2; \mathbf{A}), \omega)^{L=0}[\lambda_d](k),$$

where  $(k)$  means  $\mathcal{K}_\infty$  acts by  $k_\theta \mapsto e^{k\theta}$ .  $\lrcorner$

*Proof:* Firstly  $\Phi_f$  is well-defined because if  $g_\infty, g'_\infty \in \mathrm{GL}(2; \mathbb{R})^+$  satisfies  $g'_\infty = \gamma g_\infty k_0$  for some  $\gamma \in \mathrm{GL}(2; \mathbb{R})$  and  $k_0 \in \mathcal{K}_0(N)$ , then by (26.6.3.3),  $\gamma \in \Gamma_0(N)$  and  $g'_\infty = \gamma g_\infty$ . So  $f(g'_\infty) = f(g_\infty) \lambda_d(k_0)$  by (19.4.1.24).

To show that  $\Phi_f(zg) = \omega(z)\Phi_f(g)$  for  $z \in Z(\mathbf{A})$ , notice by (19.4.1.20),  $\mathbf{I} = \mathbb{Q}^\times \times \mathbb{R}_+ \times \widehat{\mathbb{Z}}^\times$ , and for these elements  $\Phi_f(zg) = \omega(z)\Phi_f(g)$ .

It identifies moderate growth because of (26.6.0.5).

To show cuspidality, notice  $x \mapsto \gamma \begin{bmatrix} 1 & x \\ & 1 \end{bmatrix} g$  is left-invariant under  $a$  if  $g^{-1} \begin{bmatrix} 1 & a \\ & 1 \end{bmatrix} g \in \mathcal{K}_0(N)$ . but such  $a$  is open in  $\mathbf{A}$ , thus contains some open compact subgroup  $U_f \subset \mathbf{A}_f$ . Notice by strong approximation,  $\mathbf{A} = \mathbb{Q} \times \mathbb{R} \times \widehat{\mathbb{Z}}$ , thus there is an isomorphism  $\mathbb{R}/M \cong \mathbb{Q} \backslash \mathbf{A} / \widehat{\mathbb{Z}}$ . Now let  $g = \gamma g_\infty k_0$ , then

$$\int_{\mathbf{A}/\mathbb{Q}} \Phi_f \left( \begin{bmatrix} 1 & a \\ & 1 \end{bmatrix} g \right) = C \int_{\mathbb{R}/M} \Phi_f \left( \begin{bmatrix} 1 & x \\ & 1 \end{bmatrix} g \right) dx = C \lambda(k_0) \int_0^M f(\gamma^{-1} \begin{bmatrix} 1 & x \\ & 1 \end{bmatrix} \gamma g_\infty) dx,$$

which vanishes for each  $g$  iff  $f$  is cuspidal at every cusp. For similar reason,  $\Phi_f$  is of moderate growth iff  $f$  is of moderate growth at every cusp.  $\square$

**Prop. (26.6.3.9) [Strong Multiplicity One for Cusp Forms].**

- Let  $f$  be a cuspidal eigenfunction in  $\mathcal{A}_0(\Gamma_0(N) \backslash \mathrm{GL}(2; \mathbb{R})^+, \chi)$  for Hecke operators  $\{T_p : p \in \text{Prime} \setminus S(N)\}$ , then  $\Phi_f$  is contained in a unique irreducible subspace  $(\pi_f, V_f) \subset L_0^2(\mathrm{GL}(2; \mathbb{Q}) \backslash \mathrm{GL}(2; \mathbf{A}), \omega)$ .
- If  $f, g$  are cuspidal eigenfunctions for a.e. Hecke operators in  $\mathcal{A}_0(\Gamma_0(N) \backslash \mathrm{GL}(2; \mathbb{R})^+, \chi)$  with the same eigenvalues, then  $f = g$ .

In particular, any Hecke eigenform  $\pi_f$  generates a cuspidal representation  $\pi_f$ .  $\lrcorner$

*Proof:* 2: By (26.6.2.4), it suffices to consider the projection of  $\Phi_f$  to any  $(\pi, V) \in \mathrm{Irr}^{\mathrm{cusp}}(\mathrm{GL}(2)/\mathbb{Q})$ . By (26.6.3.7),  $\Phi_f$  is an eigenform of the Hecke operator  $T_p$  for  $p \in \text{Prime} \setminus S(N)$ . But it is also eigenvalues of the Hecke operator  $R_p$ , and  $\mathcal{H}_{\mathbb{Q}_p}$  is generated by  $T_p, R_p, R_p^{-1}$  by (26.3.2.9), so  $\pi_p$  is unramified with determined eigenvalues for a.e.  $p \in \text{Prime}$ . But then  $\pi_p$  is determined by (3.6.5.12), and  $(\pi, V)$  is determined by the strong multiplicity one theorem (26.6.5.1).

1 follows from 2 because if  $\pi$  is a component of  $L_0^2(\mathrm{GL}(2; \mathbb{Q}) \backslash \mathrm{GL}(2; \mathbf{A}), \omega)$  that the projection of  $\Phi_f$  is non-zero, then it has the same Hecke eigenvalue as  $\Phi_f$ , so it must be just  $\Phi_f$  by item 2.

Cf. [Bump, P344].  $\square$

**Prop. (26.6.3.10) [Compatibility of Hecke Operators].** Cf. [Viewing modular forms as automorphic representations] Chap 5. ?  $\lrcorner$

**Prop. (26.6.3.11) [Local Properties of Adelize Cusp Modular Forms].** If  $f(z) = \sum_{n \in \mathbb{Z}_+} a_n q^n \in \mathrm{SF}_k(N, \chi_0)$  is a normalized eigenform with associated automorphic representation  $\pi_f = \otimes'_p \pi_{f,p}$ , then

1.  $\pi_{f,\infty}$  is a discrete series of weight  $k$ .
2. For  $p \in \text{Prime} \setminus S(N)$ ,  $\pi_{f,p}$  is an unramified principal series with  $T_p$  and  $S_p$  acting via multiplication by  $a_p p^{1-k/2}$  and  $\psi(p)$ . Thus the Satake parameters are the two roots of  $T^2 - a_p T + \chi(p) p^{k-1} = 0$ .
3. If  $p|N$ ,  $N = p^r N'$  with  $(p, N') = 1$ ,  $f$  is  $p$ -new and  $f = f'(\chi)$  with  $f'$   $p$ -primitive (i.e. has the least conductor among its twists) and  $c(\psi_p \chi_p^{-1}) = r$ , then  $\pi_{f,p} \cong \pi(\chi_1 \chi, \chi_2 \chi)$  is a principal series where  $\chi_2$  is unramified,  $\chi_2(p) = a_p p^{(1-k)/2}$  and  $\chi_1 = \psi_p \chi_2^{-1}$ .

4. If  $N = pN'$  with  $(p, N') = 1$  and  $\psi_p$  is unramified, then  $\pi_{f,p}$  is the twist of the Steinberg representation by an unramified character  $\chi$  with  $\chi(p) = a_p p^{(2-k)/2}$ .
5. In all other cases,  $\pi_{f,p}$  is supercuspidal, and can be determined by algorithm in [Loeffler-Weinstein, computation of local components of a newform].

┘

*Proof:* 1: This follows from the fact  $L\Phi_f = 0$ ???: The hypothesis implies that  $\pi_{f,p}$  is invariant under the action of  $\mathrm{GL}(2; \mathbb{Z}_p)$ , thus must be an unramified representation. And we can identify the Satake parameters via (26.6.3.7).

3: In this case  $\pi_{f,p}$  cannot be a supercuspidal representation because of (24.11.3.20), and it cannot be a twist of Steinberg representation because  $f$  is  $p$ -primitive.

4: In this case  $\pi_{f,p}$  cannot be a supercuspidal representation because the conductor of a supercuspidal representation is at least 2 (24.11.3.20), and it cannot be a principal series because  $\psi_p$  is unramified. □

**Prop. (26.6.3.12) [Local Properties of Adelize Maass Forms].** Notice if  $f$  comes from a Maass form, then [G-H11] documented the properties of the adelized Maass form  $\Phi_f$  in detail. ┘

**Prop. (26.6.3.13) [Newforms and New Vectors].** Let  $\Phi : \mathrm{GL}(2; \mathbf{A}) \rightarrow \mathbb{C}$  be an adelic cusp form with character  $\omega$ , then the following are equivalent:

- $\Phi$  is a newform in some  $(\pi, V) \in \mathrm{Irr}^{\mathrm{cusp}}(\mathrm{GL}(2)/\mathbb{Q})$ .
- $\Phi$  is the adelization of some newform  $f$  (26.6.3.8).

┘

### Classification of $\mathrm{Irr}_{\mathrm{disc}}^{\mathrm{auto}}(\mathrm{GL}(n)/F)$

**Thm. (26.6.3.14) [Mœglin-Waldspurger].** For  $N \in \mathbb{Z}_+$ ,  $\mathrm{Irr}_{\mathrm{disc}}^{\mathrm{auto}}(\mathrm{GL}(N)/F)$  consists exactly of isobaric automorphic representations (26.6.1.28) of the form

$$\pi\left(\frac{n-1}{2}\right) \boxplus \pi\left(\frac{n-3}{2}\right) \boxplus \pi\left(\frac{1-n}{2}\right)$$

where  $m|N$  and  $n = N/m$ , and  $\pi \in \mathrm{Irr}^{\mathrm{cusp}}(\mathrm{GL}(m)/F)$ . And these representations are pairwise different. ┘

*Proof:* Cf. [Mœglin-Waldspurger89]? □

**Def. (26.6.3.15) [ $\mathcal{A}(\mathrm{GL}(n)/F)$ ].** For  $N \in \mathbb{Z}_+$ , we define  $\mathcal{A}(\mathrm{GL}(n)/F)$  to be the set of isobaric automorphic representations of the form

$$\pi\left(\frac{n-1}{2}\right) \boxplus \pi\left(\frac{n-3}{2}\right) \boxplus \pi\left(\frac{1-n}{2}\right)$$

where  $m|N$  and  $n = N/m$ , and  $\pi \in \mathrm{Irr}_{\mathrm{disc}}^{\mathrm{auto}}(\mathrm{GL}(m)/F)$ . In particular, we have  $\mathrm{Irr}_{\mathrm{disc}}^{\mathrm{auto}}(\mathrm{GL}(N)/F) \subset \mathcal{A}(\mathrm{GL}(n)/F)$  by (26.6.3.14). ┘

#### 4 Whittaker-Models

**Def. (26.6.4.1) [Whittaker-Models].** The notion of **Whittaker-model** and **Whittaker functional** w.r.t. a generic character  $\psi$ , genericness is defined the same as in the local case (24.9.5.2).  $\lrcorner$

**Prop. (26.6.4.2) [Uniqueness of Global Whittaker Models].** For  $(\pi, V) \in \text{Irr}^{\text{adm}}(\text{GL}(2)/F)$ ,  $(\pi, V)$  has a Whittaker model w.r.t  $\psi$  iff each  $(\pi_v, V_v)$  (26.6.1.4) has a Whittaker model  $\mathcal{W}(\pi_v, \psi_v)$ . If this is the case, then  $\mathcal{W}(\pi, \psi)$  is unique and

$$\mathcal{W}(\pi, \psi) = \bigotimes'_v (W_v, W_v^0),$$

where  $W_v^0$  are the unique spherical function (24.11.6.13) of  $\mathcal{W}_v$  normalized s.t.  $W_v^0(\mathcal{K}_v) = 1$ .  $\lrcorner$

*Proof:* Let  $(\pi, V) = \otimes'_v (\pi_v, V_v)$  w.r.t a.e. spherical vectors  $\xi_v^0$  by tensor product theorem (26.6.1.4), and  $(\pi_v, V_v)$  are spherical a.e.  $v$ .

Firstly if every  $(\pi_v, V_v)$  has a Whittaker model, the  $W$  in the proposition is truly a Whittaker model: functions in  $\mathcal{W}(\pi, \psi)$  are clearly smooth and  $K$ -finite, and they have moderate growth because each local part is, and for a.e.  $v$ ,  $\mathcal{W}_v(\pi, \psi)$  is compactly supported on  $|x|_v \leq 1$ . And there is a canonical isomorphism of  $V$  onto  $\mathcal{W}(\pi, \psi)$  by letting  $(W_\xi)_v = W_v^0$  if  $\xi_v = \xi_v^0$  and

$$W_\xi(g) = \prod_v W_{v, \xi_v}(g_v).$$

This is definable because  $g_v \in K_v$  for a.e.  $v$  thus  $W_{v, \xi_v}(g_v) = W_v^0(g_v) = 1$  for a.e.  $v$ .

Because the local Whittaker models are all rapidly decreasing, and the spherical Whittaker model vanishes for  $|\xi_v|_v > 1$ , thus  $W$  is also rapidly decreasing, and is a Whittaker model for  $\pi$ .

Secondly if  $\mathcal{W}$  is a Whittaker model for  $(\pi, V)$ , denote  $\xi \mapsto W_\xi$  the isomorphism of  $V$  onto  $\mathcal{W}$ . Notice there exists some  $\xi \in V$  that  $W_\xi(1) \neq 0$ : if  $W_\xi(g_\infty g_f) \neq 0$ , then  $W_{\pi(g_f)\xi}(g_\infty) \neq 0$ , and argue the same way as in (26.1.4.4). We may assume  $\xi^0 = \otimes_v \xi_v^0$  that  $W_{\xi^0}(1) = 1$ .

Consider the "pullback" of  $W$  to  $\text{GL}(n; F_v)$  via  $\xi$ , then they are clearly Whittaker models for  $(\pi_v, V_v)$  thus unique (20.7.3.10) (26.1.4.3), and also  $W_{v, \xi_v^0}(1) = 1$ . So  $W_v^0$  exists a.e. uniquely. Now we prove  $W$  is of the form we said above, this will prove uniqueness.

Then we need to prove

$$W_\xi(g) = \prod_v W_{v, \xi_v}(g_v)$$

We only need to prove for one  $\xi = \xi^0$ , because  $\mathcal{W}, \mathcal{W}(\pi_v, \psi_v)$  are both irreducible. And also we can assume  $g_v = 1, a.e.$ , because  $(W_\xi)_v(g_v) = W_{v, \xi_v}(g_v) = 1, a.e.$ . Then we are in the finite case and we can multiply by scalars at f.m.  $v$  s.t. this equation is true and nonzero for  $g$ .  $\square$

**Thm. (26.6.4.3) [Shalika-Expansions and Existence of Whittaker-Models, Shalika [Sha74]].**

For  $(\pi, V) \in L_{\text{cusp}}^2(\text{GL}(n)/F)$  and  $\Phi \in V$ , define

$$W_{\psi, \Phi}(g) = \int_{\text{Unip}(n, F) \setminus \text{Unip}(n; \mathbf{A}_F)} \Phi(ug) \psi_{\text{Unip}}(-u) du,$$

then  $\text{GL}(n; \mathbf{A}_F)$  acts on these functions, and they form a Whittaker model  $\mathcal{W}(\pi, \psi)$ .  $W_{\pi, \Phi}(g)$  is called the **Fourier-Whittaker coefficients** for  $\Phi$ .

And we have a Fourier-expansion formula:

$$\Phi(g) = \sum_{\gamma \in \text{Unip}(n-1; F) \setminus \text{GL}(n-1; F)} W_{v, \psi_v}(\Phi) \left( \begin{bmatrix} \gamma & \\ & 1 \end{bmatrix} g \right),$$

which converges absolutely and uniformly on compact subsets of  $\text{GL}(n; \mathbf{A}_F)$ .  $\lrcorner$

**Remark (26.6.4.4).** This is false for some other groups, for the reason that the Fourier-inversion may not be true, thus it may happen that all the Fourier coefficients vanish. For example, holomorphic Siegel modular forms on  $\mathrm{Sp}(n)$  don't have Whittaker models.  $\lrcorner$

*Proof:* We only prove for  $n = 2$ . For general case, see [Cogdell.  $L$ -functions and converse theorems for  $\mathrm{GL}(n)$ ]Section1.1.?

For any  $g \in \mathrm{GL}(n; \mathbf{A}_F)$ , consider  $F(n) = \varphi(ng)$  on  $\mathrm{Unip}(\mathbf{A}_F)$ , then it is a continuous function on  $\mathrm{Unip}(F) \backslash \mathrm{Unip}(\mathbf{A}_F)$ , and  $\mathrm{Unip}(F) \backslash \mathrm{Unip}(\mathbf{A}_F)$  is compact(19.4.1.3), so by Fourier inversion formula(12.11.1.18),

$$F(x) = \sum_{\alpha \in F} C(\alpha) \psi(\alpha x), \quad C(\alpha) = \int_{\mathrm{Unip}(n, F) \backslash \mathrm{Unip}(n, A)} \varphi \left( \begin{bmatrix} 1 & x \\ & 1 \end{bmatrix} g \right) \psi(-\alpha x) dx.$$

Now  $C(0) = 0$  because  $\varphi$  is cuspidal, and if  $\alpha \in F^\times$ , as  $\varphi$  is automorphic,

$$\begin{aligned} C(\alpha) &= \int_{\mathrm{Unip}(n; F) \backslash \mathrm{Unip}(n; \mathbf{A}_F)} \varphi \left( \begin{bmatrix} \alpha & \\ & 1 \end{bmatrix} \begin{bmatrix} 1 & x \\ & 1 \end{bmatrix} g \right) \psi(-\alpha x) dx \\ &= \int_{A/F} \varphi \left( \begin{bmatrix} 1 & \alpha x \\ & 1 \end{bmatrix} \begin{bmatrix} \alpha & \\ & 1 \end{bmatrix} g \right) \psi(-\alpha x) dx = W_\varphi \left( \begin{bmatrix} \alpha & \\ & 1 \end{bmatrix} g \right). \end{aligned}$$

Substitute  $x = 0$ , we get  $\Phi(g) = \sum_{\alpha \in F^\times} W_\Phi \left( \begin{bmatrix} \alpha & \\ & 1 \end{bmatrix} g \right)$ .

Now we show  $\{W_\Phi\}$  is Whittaker model: they all satisfies  $W_\Phi(ng) = \psi(n)W_\Phi(g)$  by construction, and because  $W_{X\varphi} = XW_\varphi$ ,  $\rho(g)W_\varphi = W_{\rho(g)\varphi}$ , it is clear that this space is invariant under action of  $\mathrm{GL}(2, A_f)$  and  $(\mathfrak{g}_\infty, K_\infty)$ , and also it is of moderate growth in  $y$  because  $\varphi$  does(26.6.1.13) and  $N(F) \backslash N(A)$  is compact, and it consists of  $K$ -finite vectors because  $V$  is admissible(26.6.2.5). Finally, the Fourier inversion shows that  $\varphi \mapsto W_\varphi$  is non-zero, thus injective.  $\square$

**Cor. (26.6.4.5) [Cuspidal Forms Decay Rapidly].** Any cuspidal form on  $\mathrm{GL}(2; \mathbf{A}_F)$  is rapidly decreasing for  $|y| \rightarrow \infty$ .

Moreover, it also decays rapidly when  $|y| \rightarrow 0$ .  $\lrcorner$

**Remark (26.6.4.6).** This is proved already in(26.6.1.16).  $\lrcorner$

*Proof:* To show it is rapidly decreasing, use the Fourier expansion formula, and the fact the Whittaker model is product of local Whittaker models. Also for  $v \in \Sigma_F^{\mathrm{fin}}$ , the local Kirillov model is compactly supported(24.11.3.12), and for  $v \in \Sigma_F^\infty$ , the Whittaker model is rapidly decreasing(26.1.4.3), notice for any  $g \in \mathrm{GL}(2, A)$ , for any  $C$ , the number of  $a \in K^*$  that  $\varphi \left( \begin{bmatrix} a & \\ & 1 \end{bmatrix} g \right) \neq 0$  and  $|a|_\infty < C$  is bounded by a polynomial of  $C$ , thus it is rapidly decreasing.

For  $|y| \rightarrow 0$ , as  $\varphi$  is automorphic, notice

$$\varphi \left( \begin{bmatrix} y & \\ & 1 \end{bmatrix} \right) = \varphi(w_0 \begin{bmatrix} 1 & \\ & y \end{bmatrix} w_0) = \omega(y)(\pi(w_0)\varphi) \left( \begin{bmatrix} y^{-1} & \\ & 1 \end{bmatrix} \right).$$

$\square$

**Cor. (26.6.4.7).** Every local component of a cuspidal representation of  $\mathrm{GL}(n; \mathbf{A}_F)$  is generic, by(26.6.4.2).  $\lrcorner$

## 5 Multiplicity One Theorems

**Thm. (26.6.5.1) [Strong Multiplicity One for  $\mathrm{GL}(n)$ , Shalika/Jacquet-Shalika].** If  $(\pi, V), (\pi', V') \in \mathrm{Irr}^{\mathrm{cusp}}(\mathrm{GL}(n)/F, \omega)$  (26.6.1.22) satisfy  $\pi_v \cong \pi'_v$  a.e.  $v$ , then  $\pi \cong \pi'$ , and  $V = V' \subset L_{\mathrm{disc}}^2(\mathrm{GL}(n; F) \backslash \mathrm{GL}(n; \mathbf{A}_F))$ .

The same holds true if  $\pi, \pi'$  are isobaric automorphic representations (26.6.1.28).  $\square$

*Proof:* We only prove for  $n = 2$  and the case  $\pi_1, \pi_2$  are cuspidal and isomorphic on Archimedean places ?. For general  $n$ , Cf. [Euler products and the classification of automorphic representations 1, Jacquet-Shalika]P553 ?, [Representations of the Group  $\mathrm{GL}(n; K)$  where  $K$  is a local field, Gelfand-Kazhdan], [Euler Subgroups, in Lie Groups and their Representations, Piatetski-Shapiro(1975)]. For the Archimedean places, Cf. [Base Change for  $\mathrm{GL}(2)$ , Langlands(1980)Lemma3.1]

Firstly if  $\pi_v \cong \pi'_v$  for every place  $v$ , then their corresponding Whittaker model is the same (multiplied by a scalar) by (26.6.4.2). Then by (26.6.4.3) we have a Fourier expansion formula

$$\varphi(g) = \sum_{\alpha \in F^\times} W_\varphi \left( \begin{bmatrix} \alpha & \\ & 1 \end{bmatrix} g \right).$$

Thus  $V = V'$ .

In case that  $\pi_v \cong \pi'_v$  only outside a finite set  $S$ , we choose functions  $W_v, W'_v$  in the local Whittaker model for  $\pi_v, \pi'_v$  s.t. if  $v \notin S$ ,  $W_v = W'_v$  and  $W_v$  is the unique spherical function normalized that  $W_v(K_v) = 1$  a.e.  $v$ , and if  $v \in S$ , they are chosen that

$$F(y) = W_v \left( \begin{bmatrix} y & \\ & 1 \end{bmatrix} \right) = W'_v \left( \begin{bmatrix} y & \\ & 1 \end{bmatrix} \right) \in C_c^\infty(F_v^\times),$$

which is possible by (24.11.3.13). And we define

$$\varphi(g) = \sum_{\alpha \in F^*} W \left( \begin{bmatrix} \alpha & \\ & 1 \end{bmatrix} g \right), \quad \varphi'(g) = \sum_{\alpha \in F^*} W' \left( \begin{bmatrix} \alpha & \\ & 1 \end{bmatrix} g \right),$$

$$W(g) = \prod_v W_v(g_v), \quad W'(g) = \prod_v W'_v(g_v).$$

as in (26.6.4.3).

Then we claim  $\varphi = \varphi'$  on  $\mathrm{GL}(2; \mathbf{A}_F)$ :  $\varphi \in V, \varphi' \in V'$  are automorphic, thus  $\varphi = \varphi'$  on  $\mathrm{GL}(2; F) \backslash \mathrm{GL}(2; \mathbf{A}_F^S)$  by continuity, which is just  $\mathrm{GL}(2; \mathbf{A}_F)$  by weak approximation, so we have a  $\varphi \in V \cap V'$ , meaning  $V = V'$ .  $\square$

**Thm. (26.6.5.2) [Multiplicity One for  $\mathrm{SL}(2)$ , Ramakrishnan].** For  $F \in \mathbf{NField}$ , in the spectral decomposition

$$L_{\mathrm{cusp}}^2(\mathrm{SL}(2; F) \backslash \mathrm{SL}(2; \mathbf{A}_F)) = \bigoplus_{m \in \mathrm{Irr}^{\mathrm{cusp}}(\mathrm{SL}(2)/F)} m_\pi \pi,$$

we have  $m_\pi \leq 1$  for any  $\pi$ .  $\square$

*Proof:* ?  $\square$

## 6 Ramanujan-Conjecture

**Conj. (26.6.6.1) [Generalized Ramanujan-Conjecture].** If  $G \in \text{RedGrp}/F$ , and  $\pi \in \text{Irr}^{\text{cusp, loc. generic}}(G/F, \omega)$ , then  $\pi$  is tempered (24.9.8.11) (24.6.4.11).  $\lrcorner$

*Proof:* ?  $\square$

**Conj. Cor. (26.6.6.2) [Ramanujan].** If  $\pi = \otimes' \pi_v \in \text{Irr}^{\text{cusp}}(\text{GL}(n)/F, \omega)$ , then for any  $v \in \Sigma_F$ ;  $\pi_v$  is tempered. This should follow from the generalized Ramanujan-conjecture (26.6.6.1), as any  $\pi \in \text{Irr}^{\text{cusp}}(\text{GL}(n)/F, \omega)$  is generic by (26.6.4.3).  $\lrcorner$

*Proof:*  $\square$

**Prop. (26.6.6.3).** The Ramanujan-conjecture (26.6.6.1) for  $\text{GL}(n)$  means that: for  $v \in \Sigma_F^{\text{fin}}$ , each eigenvalue of  $c_v(\pi)$  has absolute value 1, and for  $v \in \Sigma_F^\infty$ , it means that  $\text{Re}(\mu_{j, \pi_v}) = 0$ .  $\lrcorner$

*Proof:* ?  $\square$

**Conj. Cor. (26.6.6.4) [Selberg Eigenvalue Conjecture].** For  $F = \mathbb{Q}$  and  $G = \text{GL}(2)$ , the Ramanujan conjecture for the infinite place (26.6.6.2) is equivalent to the following: For any  $N \in \mathbb{Z}_+$  and any eigenvalue  $\lambda$  of the Laplacian on  $L_0^2(\Gamma_0(N) \backslash \mathcal{H})$ , we have  $\lambda \geq 1/4$ .  $\lrcorner$

*Proof:* ?  $\square$

**Prop. (26.6.6.5).** The Ramanujan conjecture (26.6.6.1) implies the Ramanujan-Petersson conjecture (29.5.4.9).  $\lrcorner$

*Proof:* The Ramanujan-Petersson conjecture says the eigenvalue  $\lambda_p$  of  $T_p$  on  $f$  satisfies  $|\lambda_p| \leq 2p^{1/2}$ . Consider the irreducible cuspidal representation  $\pi_f$  generated by  $\Phi_f$  (26.6.3.9), then  $T_p$  is the same as the eigenvalue of the local Hecke algebra  $T_p$  on  $\Phi_f$ . But  $\pi_{f,p}$  is unramified, thus by (24.11.8.12) it is unitary principal or complementary. But notice if the Satake parameters of  $\pi_{f,p}$  are  $\alpha_i$ , then  $\lambda_p = p^{1/2}(\alpha_1 + \alpha_2)$ , Then it suffices to show that  $|\alpha_1 + \alpha_2| \leq 2$ , which is equivalent to  $\pi_p$  being tempered (24.11.8.12).  $\square$

## 7 Eisenstein Series

References are [Bump, Chap3].

Langlands' theory of Eisenstein series reduces the study of all the automorphic representations to the discrete ones (26.6.1.17).

## 26.7 $(\mathfrak{g}, \mathcal{K}_\infty)$ -Cohomologies

References are [B-W00].

**Notation (26.7.0.1).**

- Let  $G, G_1, G_2 \in \text{RedGrp}/\mathbb{Q}$ .
- Let  $\mathcal{K}_\infty \leq G(\mathbb{R}), \mathcal{K}_{i\infty} \leq G_i(\mathbb{R})$  be maximal compact subgroups.
- Let  $\mathfrak{g} = \text{Lie}(G_\mathbb{R}), \mathfrak{k} = \text{Lie}(\mathcal{K}_\infty)$ .
- Let  $\theta : \mathfrak{g} \rightarrow \mathfrak{g}$  be a Cartan involution s.t.  $\mathfrak{g}^\theta = \mathfrak{k}$ .<sup>?</sup>
- Let  $\mathfrak{p} = \mathfrak{g}^{\theta=-1}$ .
- Let  $A_G \leq G(\mathbb{R})$  be the identity component in the real topology of the maximal  $\mathbb{Q}$ -split torus in  $Z(G)$  with Lie algebra  $\mathfrak{a}_G$ .
- Let  $\mathcal{K}_f \subset G(\mathbf{A}_f)$  be a compact open subgroup, and  $\mathcal{K} = \mathcal{K}_f \mathcal{K}_\infty$ .
- Let  $X = A_G \backslash G(\mathbb{R}) / \mathcal{K}_\infty$  and let  $\text{Sh}_\mathcal{K}(G) = G(\mathbb{Q}) \backslash (X \times G(\mathbf{A}_f) / \mathcal{K}_f)$  be the Shimura manifold.

┘

### 1 $(\mathfrak{g}, \mathcal{K}_\infty)$ -Cohomologies

**Def. (26.7.1.1)  $[(\mathfrak{g}, \mathfrak{k})\text{-Cohomologies}]$ .** For  $\mathcal{A} \in \text{Mod}_\mathfrak{g}$  and  $q \in \mathbb{N}$ , let

$$C^q(\mathfrak{g}, \mathfrak{k}; \mathcal{A}) = \text{Hom}_\mathfrak{k}(\wedge^q(\mathfrak{g}/\mathfrak{k}), \mathcal{A}),$$

where the action of  $\mathfrak{k}$  on  $\mathfrak{g}/\mathfrak{k}$  is the adjoint action  $\text{ad}$ . Define

$$d : C^q(\mathfrak{g}, \mathfrak{k}; \mathcal{A}) \rightarrow C^{q+1}(\mathfrak{g}, \mathfrak{k}; \mathcal{A}) :$$

$$(df)(x_0, \dots, x_q) = \sum_{i=1}^q (-1)^i x_i \cdot f(x_0, \dots, \widehat{x}_i, \dots, x_q) + \sum_{1 \leq i < j \leq q} (-1)^{i+j} f([x_i, x_j], x_0, \dots, \widehat{x}_i, \dots, \widehat{x}_j, \dots, x_q).$$

Then this  $d$  is well-defined and  $d \circ d = 0$ , thus making  $C^\bullet(\mathfrak{g}, \mathfrak{k}; \mathcal{A})$  into a complex. Denote  $H^q(\mathfrak{g}, \mathfrak{k}; \mathcal{A})$  its  $q$ -th cohomology group.

┘

**Def. (26.7.1.2)  $[(\mathfrak{g}, \mathcal{K}_\infty)\text{-Cohomologies}]$ .** For  $\mathcal{A} \in \text{Mod}_{(\mathfrak{g}, \mathcal{K}_\infty)}$ ,  $\mathcal{K}_\infty$  acts on  $C^q(\mathfrak{g}, \mathfrak{k}; \mathcal{A})$  (26.7.1.1) by adjoint action on  $\mathfrak{k}$  and action on  $\mathcal{A}$ .<sup>?</sup>, thus we can define

$$C^\bullet(\mathfrak{g}, \mathcal{K}_\infty; \mathcal{A}) = C^q(\mathfrak{g}, \mathfrak{k}; \mathcal{A})^{\mathcal{K}_\infty}.$$

Then  $d$  defines a differential on  $C^\bullet(\mathfrak{g}, \mathcal{K}_\infty; \mathcal{A})$ , making it a complex. Its  $q$ -th cohomology group is denoted by  $H^q(\mathfrak{g}, \mathcal{K}_\infty; \mathcal{A})$ , called the  $(\mathfrak{g}, \mathcal{K}_\infty)$ -cohomology of  $\mathcal{A}$ .

┘

**Thm. (26.7.1.3) [Künneth Formula].** If  $\mathcal{A}_i$  are admissible  $(\mathfrak{g}_i, \mathcal{K}_i)$ -modules, then for any  $n \in \mathbb{N}$ , we have natural isomorphisms

$$H^n(\mathfrak{g}_1 \oplus \mathfrak{g}_2, \mathcal{K}_{1\infty} \times \mathcal{K}_{2\infty}; \mathcal{A}_1 \otimes \mathcal{A}_2) = \bigoplus_{p+q=n} H^p(\mathfrak{g}_1, \mathcal{K}_1; \mathcal{A}_1) \otimes H^q(\mathfrak{g}_2, \mathcal{K}_2; \mathcal{A}_2).$$

┘

*Proof:* Cf.[B-W00]Section1.1.3. ?

□

**Thm. (26.7.1.4) [Poincaré Duality].** If  $\mathcal{A}$  is an admissible irreducible  $(\mathfrak{a}_G \backslash \mathfrak{g}, \mathcal{K}_\infty)$ -module, then for any  $q \in \mathbb{N}$  we have

$$H^q(\mathfrak{a}_G \backslash \mathfrak{g}, \mathcal{K}_\infty; \mathcal{A}) \cong H^{\dim X - q}(\mathfrak{a}_G \backslash \mathfrak{g}, \mathcal{K}_\infty; \mathcal{A}^\vee)^\vee.$$

┘

*Proof:* Cf.[B-W00]Prop1.7.6.

□

**Prop. (26.7.1.5).** Let  $V \in \text{Irr}(G)$ , then

$$H^\bullet(\mathfrak{g}, \mathcal{K}_\infty; V \otimes \mathbb{C}) = \begin{cases} 0 & , V \neq \mathbf{1} \\ (\wedge^\bullet \mathfrak{p})^{\mathcal{K}_\infty} & , V = \mathbf{1} \end{cases} \quad (26.7.0.1).$$

┘

*Proof:* Cf.[B-W00]Cor2.3.2.

□

**Thm. (26.7.1.6) [Concentration of  $(\mathfrak{g}, \mathcal{K}_\infty)$ -Cohomologies].** For  $V \in \text{Irr}(G)$ , let

$$\mathcal{P}(V) = \{\theta\text{-stable parabolic subalgebra } \mathfrak{q} \leq \mathfrak{g}_\mathbb{C} : V^{\text{rad}(\mathfrak{q})} = 1\}.$$

and let

$$c(V) = \min\{\dim(\text{rad}(\mathfrak{q}) \cap \mathfrak{p}) : \mathfrak{q} \in \mathcal{P}(V)\}.$$

Then if  $\mathfrak{g}$  is semisimple,  $\pi_\infty \in \text{Irr}_{(\mathfrak{g}, \mathcal{K}_\infty)}$ ,  $V \in \text{Irr}(G)$  s.t. the largest subalgebra of  $\mathfrak{g}$  acting trivially on  $\pi_\infty$  is contained in  $\mathfrak{k}$ , then

$$H^i(\mathfrak{g}, \mathcal{K}_\infty; \pi_\infty \otimes V)$$

vanishes for any  $i < c(V^*)$ .

┘

*Proof:* Cf.[B-W00]Thm2.10.1.

## 26.8 Theta Correspondence

References are [Pra93, Pra98], [Correspondances de Howe sur un corps  $p$ -adique, Moeglin-Vineras-Waldspurger] and [Local Theta Correspondence notes, Gan-Kudla-Takeda].

### 1 Weil Representations

**Notation (26.8.1.1).**

- Use notations on Schrödinger representations defined in [Schrödinger Representations](#).
- Let  $K \in \mathbf{Field}$  be a finite field or a local field, and  $\text{char } K \neq 2$ .
- If  $K \in p\text{-LField}$ , denote it by  $(K, \mathcal{O}_K, \mathfrak{m}_K, \varpi_K)$ .
- Let  $\psi \in (K^\times)^\vee$ .
- Let  $W$  be a f.d. symplectic space over  $K$ .

⌋

**Def. (26.8.1.2) [Heisenberg Groups].** The **Heisenberg group**  $H(W)$  of  $W$  is defined to be the set  $W \times K$  endowed with the group law:

$$(w_1, t_2) \cdot (w_2, t_2) = (w_1 + w_2, t_1 + t_2 + \frac{1}{2}(w_1, w_2)).$$

In particular,  $H(W)$  is a central extension of  $W$  by  $K$ :

$$0 \rightarrow K \rightarrow H(W) \rightarrow W \rightarrow 0.$$

Especially, we can take any  $V \in \mathcal{V}\text{ect}^{\text{fd}}/K$  and  $W = V \times V^*$ , with the symplectic pairing given by

$$\left( (v_1, f_1), (v_2, f_2) \right) = f_2(v_1) - f_1(v_2).$$

In this case, the corresponding Heisenberg group is denoted by  $H(V)$ .

⌋

**Prop. (26.8.1.3) [Schrödinger representations].** Let  $n \in \mathbb{Z}_+$ ,  $V \in \mathcal{V}\text{ect}_K^n$ . Then there is a surjective homomorphism

$$\tau : H(V) \rightarrow A(V) : (v^*, v, x) \mapsto (v^*, v, \psi(x)\psi(-\langle v, v^* \rangle)) \quad (12.11.1.20).$$

$A(V)$  acts on  $L^2(V)$  by the Schrödinger representation (12.11.1.21):  $(\rho(v^*, v, t)\Phi)(u) = t\psi(-2\langle u, v^* \rangle)\Phi(u + v)$ , and this induces an action  $\pi$  of  $H$  on  $L^2(G)$ :  $(\rho(v^*, v, x)\Phi)(u) = t\psi(-2\langle u, v^* \rangle)\Phi(u + v)$ . ⌋

**Prop. (26.8.1.4) [Heisenberg Group for Quadratic Spaces].** If  $V$  is a quadratic space, then we can identify  $V$  with  $V^*$ . Thus  $\text{SL}(2; K)$  acts on  $H(V)$  by

$$\begin{bmatrix} a & b \\ c & d \end{bmatrix} (v_1, v_2, x) = (av_1 + bv_2, cv_1 + dv_2, x),$$

and acts on  $A(V)$  by

$$\begin{bmatrix} a & b \\ c & d \end{bmatrix} (v_1, v_2, t) = (av_1 + bv_2, cv_1 + dv_2, t\psi(-acB(v_1, v_1) - bdB(v_2, v_2))).$$

These two actions are compatible with  $\tau$ .

$O(V)$  acts on  $H(V)$  by  $g(v_1, v_2, x) = (gv_1, gv_2, x)$ , and similarly acts on  $A(V)$ , compatible with  $\tau$ .

Recall the Fourier transform on  $V$  is w.r.t. the pairing  $(v, v^*) \mapsto \psi(-2B(v, v^*))$ .  $\lrcorner$

**Prop. (26.8.1.5) [Projective Weil Representation].** By (3.5.11.26), for any symplectic space  $W$ , we may choose isotropic subspaces  $X, Y$  of  $W$  s.t.  $W = X \oplus Y$ . Then the pairing induces an isomorphism  $Y \cong X^*$ . Then  $H(W) \cong H(X)$ , with a Schrödinger representation  $\pi$  on  $L^2(X)$  (26.8.1.3).

Then there exists a unitary projective representation  $\omega_1$  of  $\mathrm{Sp}(W)$  on  $L^2(X)$  realized on the Bruhat-Schwartz space  $\mathcal{S}(X)$  s.t.

- For  $g \in \mathrm{Sp}(W), h \in H(X)$ ,  $\omega_1(g)\pi(h)\omega_1(g)^{-1} = \pi(g(h))$ .
- $(\omega_1(\begin{bmatrix} \mathbf{1} & B \\ & \mathbf{1} \end{bmatrix})\Phi)(v) = \psi(\frac{X^t B X}{2})\Phi(v)$ .
- $(\omega_1(\begin{bmatrix} A & \\ & A^{-t} \end{bmatrix})\Phi)(v) = |\det A|^{1/2} \chi(a) \Phi(av)$ , where  $\chi(a) \in \mathbb{T}^1$ .
- $\omega_1(\begin{bmatrix} & \mathbf{1} \\ -\mathbf{1} & \end{bmatrix})\Phi = \gamma(B)\Phi^\vee$ , where  $\gamma(B) \in \mu_8$ .

$\lrcorner$

*Proof:* Because the action of  $\mathrm{Sp}(W)$  on  $A(X)$  preserves the center, thus by (12.11.1.21), for any  $g \in \mathrm{Sp}(W)$ , there exists a unitary automorphism  $\omega_1(g)$  of  $L^2(X)$  that

$$\omega_1(g)\pi(h)\omega_1(g)^{-1} = \pi(g(h)).$$

To check the properties of  $\omega_1$ , it suffices to check this equation for  $h = (v, 0, 1)$  or  $(0, v, 1)$  (because these elements generate  $A(X)$ ), using the fact  $\rho$  action on  $L^2(X)$  is irreducible (12.11.1.21). ?  $\square$

**Thm. (26.8.1.6) [Weil Representation].** The projective representation  $\omega_1$  of  $\mathrm{Sp}(W)$  lifts uniquely to a true representation  $\omega$  of  $\mathrm{Mp}(W)$ , called the (local) **Weil representation**. Sometimes we also call the smooth part of this representation the Weil representation.

Notice that this representation depends on  $\psi$ .  $\lrcorner$

*Proof:* Cf. [LINEAR SYMMETRIES OF FREE BOSON FIELDS] Thm 5.1.  $\square$

**Prop. (26.8.1.7) [Weil Representations and Restrictions].** Let  $K/k$  be a separable extension of fields, then  $\psi_K : x \mapsto \psi(\mathrm{tr}(x))$  is a non-trivial character of  $K$ . And if  $(W, (-, -))$  is a f.d. symplectic space over  $K$ , then  $(\mathrm{res}_{K/k} W, \mathrm{tr}_{K/k}(-, -))$  is a symplectic space over  $k$ , and we have an inclusion  $\mathrm{Sp}(W) \subset \mathrm{Sp}(\mathrm{res}_{K/k}(W))$ .

Then the restriction of the Weil representation for  $\mathrm{Sp}(\mathrm{res}_{K/k}(W))$  on  $\mathrm{Sp}(W)$  is just the Weil representation (w.r.t. the character  $\psi_K$ ).  $\lrcorner$

*Proof:* There is a trace map  $\mathrm{tr} : H(W) \rightarrow H(\mathrm{res}_{K/k}(W))$ , and for the Schrödinger representation  $\pi : H(\mathrm{res}_{K/k} W) \rightarrow U(L^2(V))$  is the Schrödinger representation of  $H(W)$  with character  $\psi_K$ . Then the rest is easy.  $\square$

**Def. (26.8.1.8) [Lattice Model of Weil Representations].** Let  $\mathcal{L}$  be an integral lattice of  $W$ , and denote  $\mathcal{S}_{\mathcal{L}, \psi}(W)$  the space of locally constant compactly supported functions on  $W$  s.t.

$$f(x + a) = \psi((x, a))f(x)$$

for any  $x \in W$  and  $a \in \mathcal{L}$ . And let  $\mathcal{S}_m(W)$  be the subspace of  $\mathcal{S}_{\mathcal{L},\psi}(W)$  consisting of functions that are supported on  $\varpi^{-m}\mathcal{L}$ . Also let  $\mathcal{S}_m(W)^+$  and  $\mathcal{S}_m(W)^-$  be the subspace of odd and even functions resp..

Then it is easy to see that  $\dim \mathcal{S}_m(W) = \#(\varpi^{-m}\mathcal{L}/\mathcal{L}) = q^{2mn}$ .

Then there is a model of the Weil representation of  $\mathrm{Sp}(W)$  on  $\mathcal{S}_{\mathcal{L},\psi}(W)$ , s.t. for  $g \in \mathrm{Sp}(\mathcal{L})$ ,  $(gf)(x) = f(gx)$ .  $\lrcorner$

*Proof:* ? Cf.[MVW].  $\square$

**Prop. (26.8.1.9) [Defining Fields of the Weil Representation].** The Weil representation of  $\mathrm{SL}(2)$  can be defined over a number field because it is sum of its even and odd pieces, both of which are defined over number fields: the even piece because it occurs in an explicit principal series, and the odd piece because it is induced from compact open subgroup.  $\lrcorner$

*Proof:* ?  $\square$

### $\mathcal{K}$ -Types of Weil Representations

**Prop. (26.8.1.10) [Maximal Subgroups].** Suppose  $p \in \mathrm{Prime}_{\geq 3}$  and  $k \in p\text{-LField}$ , then the metaplectic covering of  $\mathrm{Sp}(W)$  splits over  $\mathrm{Sp}(\mathcal{L})$ ?, where  $\mathrm{Sp}(\mathcal{L})$  is the maximal compact subgroup of  $\mathrm{Sp}(W)$  stabilizing a lattice  $\mathcal{L}$  of  $W$ ?.  $\lrcorner$

Let  $\{\Gamma(i)\}$  be the standard filtration on  $\mathrm{Sp}(\mathcal{L})$  s.t.  $\Gamma(0) = \mathrm{Sp}(\mathcal{L})$ , and  $\Gamma(i) = \ker(\mathrm{Sp}(\mathcal{L}) \rightarrow \mathrm{Sp}(\mathcal{L}/\varpi^i))$ .  $\lrcorner$

*Proof:*  $\square$

**Prop. (26.8.1.11) [ $K$ -Types of the Weil Representation].** Suppose  $\psi$  has trivial conductor, the restriction of the Weil representation  $\omega$  of  $\mathrm{Sp}(W)$  to the maximal compact subgroup  $\mathrm{Sp}(\mathcal{L})$  (by (26.8.1.10)) decomposes as

$$\omega = \omega_0 \oplus \bigoplus_{m \in \mathbb{Z}_+} (\omega_{2m}^+ \oplus \omega_{2m}^-),$$

where  $\omega_0$  is the trivial representation, and for  $m \in \mathbb{Z}_+$ ,  $\omega_{2m}^\pm$  are irreducible representations of  $\mathrm{Sp}(\mathcal{L}/(\varpi^{2m}))$  of dimension  $\frac{1}{2}[q^{mn} - q^{(m-1)n}]$ .  $\lrcorner$

*Proof:* Denote  $\omega_{2m}^\pm = \mathcal{S}_m^\pm / \mathcal{S}_{m-1}^\pm$  (26.8.1.8). Clearly  $\mathrm{Sp}(\mathcal{L})$  leaves the spaces  $\mathcal{S}_m^\pm$  invariant, and also  $\Gamma(2m)$  acts trivially on  $\mathcal{S}_m$ .

For  $m \in \mathbb{Z}_+$ , notice  $\Gamma(m)/\Gamma(2m)$  is Abelian. To show that  $\omega_{2m}^\pm$  are irreducible representations, look at its restriction to  $\Gamma(m)/\Gamma(2m)$ . For any  $g = 1 + \varpi^m\gamma \in \Gamma(m)$ ,  $f \in \mathcal{S}_m$ ,  $x \in \varpi^{-m}\mathcal{L}$ ,

$$(gf)(x) = f(gx) = f(x + \varpi^m\gamma x) = \psi((x, \varpi^m\gamma x))f(x) = \psi((x, gx))f(x).$$

So the characters appearing in the decomposition of  $\omega_{2m}^\pm$  belongs to  $\{\psi_x\}_{x \in \varpi^{-m}\mathcal{L}}$ , where  $\psi_x(g) = \psi((x, gx))$ .

Notice that  $\psi_x = \psi_y$  iff  $x \equiv \pm y \pmod{\mathcal{L}}$ ?. And if  $f$  is a vector s.t.  $\Gamma(m)/\Gamma(2m)$  acts by  $\psi_x$ , then for any  $A \in \mathrm{Sp}(\mathcal{L})$ ,  $Af$  is a vector s.t.  $\Gamma(m)/\Gamma(2m)$  acts by  $\psi_{Ax}$ . Also notice  $\mathrm{Sp}(\mathcal{L})$  acts transitively on  $\varpi^{-m}\mathcal{L} \setminus \varpi^{-m+1}\mathcal{L}$ ?, so any irreducible representation of  $\mathrm{Sp}(\mathcal{L})/\Gamma(2m)$  restricted to  $\Gamma(m)/\Gamma(2m)$  must has dimension at least  $\frac{1}{2}[q^{mn} - q^{(m-1)n}]$ , which is exactly the dimension of  $\omega_{2m}^\pm$ . So  $\omega_{2m}^\pm$  are irreducible.  $\square$

### Character Formula for Weil Representations of $\mathrm{SL}(2)$

**Prop. (26.8.1.12) [Weil Representation associated to Quadratic Fields].** Let  $L/K$  be an extension of local fields with quadratic character  $\omega_{L/K} : K^\times \rightarrow \{\pm 1\}$ . The norm 1 elements  $E^1$  can be regarded as elements in  $\mathrm{SL}(2; F)$ , and the metaplectic cover of  $\mathrm{SL}(2; F)$  splits over  $L^1$ ?. In fact, for any character  $\gamma$  of  $L^\times$  whose restriction to  $K^\times$  is  $\omega_{L/K}$ , one can construct such a splitting.

Let  $\psi \in K^\vee$  and  $\delta \in L^\times$  s.t.  $\mathrm{tr}_{L/K}(\delta) = 0$ . Then  $\delta$  gives a symplectic structure on  $E$  by  $(x, y) = \mathrm{tr}(\delta x \bar{y})$ . Let  $\omega(\psi, \delta)$  be the Weil representation of  $\mathrm{Sp}(E) \cong \mathrm{SL}(2; F)$ , and let  $\omega(\psi, \delta, \gamma)$  be the restriction of  $\omega(\psi, \delta)$  to  $E^1$  via the splitting induced by  $\gamma$ .  $\lrcorner$

**Prop. (26.8.1.13) [Rogawski].** Let  $\chi \in (E^1)^\vee$ , then  $\chi$  appears in  $\omega(\psi, \delta, \gamma)$  iff

$$\varepsilon(\gamma \chi_E^{-1}, \psi_E) = \chi(-1) \gamma(2\delta),$$

where  $\chi_E(x) = \chi(x/\bar{x})$ ,  $\psi_E(x) = \psi(\mathrm{tr}(x))$ .  $\lrcorner$

*Proof:* Cf. [The multiplicity formula for A-packets] Prop 3.4.  $\square$

### General Weil Representations

References are [Splitting metaplectic covers of dual reductive pairs, Kudla].

**Notation (26.8.1.14).**

- Let  $\mathbb{C} \neq K \in \mathbf{LField}$ .
  - Let  $D/K$  be a division algebra with an involution  $\tau$  and center  $L$  s.t.  $L^\tau = K$  (there are three cases).
  - Let  $\epsilon \in \{\pm 1\}$ .
- $\lrcorner$

**Def. (26.8.1.15) [Tensor Symplectic Vector Spaces].** Let  $W = D^{2n} = X \oplus Y$  be the left  $D$ -vector space with a  $\epsilon$ -skew-Hermitian form

$$\langle (x_1, y_1), (x_2, y_2) \rangle = y_2^{\tau t} x_1 - \epsilon x_2^{\tau t} y_1.$$

and  $G = \mathrm{U}(W)$ .

Let  $(V, (-, -))$  be a right  $D$ -vector space of dimension  $m$  with a  $\epsilon$ -Hermitian form.

Then define

$$\mathbb{W} = V \otimes_D W, \langle -, - \rangle = \kappa \mathrm{trrd}_{D/F} ((-, -) \otimes \langle -, - \rangle^\tau).$$

where  $\kappa = 1$  if  $D = F$  and  $\kappa = 1/2$  otherwise, is a symplectic vector space of dimension  $2nmd$ .  $\lrcorner$

## 2 Theta Functions

### Lattices

**Def. (26.8.2.1) [Quadratic Lattices].** Let  $V$  be a real inner product space with an Haar measure  $\mu$  normalized that for an orthonormal basis  $e_i$  of  $V$ ,  $V/\mathbb{Z}\{e_i\}$  has volume 1, then we can identify  $V$  with  $V^*$  by this inner product. Let  $\Gamma$  be a full lattice, then its  $\mathbb{Z}$ -dual  $\Gamma^D$  is defined to be the lattice  $V^D = \{y \in V \mid (x, y) \in \mathbb{Z}, \forall x \in \Gamma\}$ . the **level** of  $\Gamma$  is defined to be the minimal  $N \in \mathbb{Z}_+$  s.t.  $N.V^D \subset V$ . It is called a **unimodular lattice** if  $\mathrm{Vol}(V/\Gamma) = 1$ .

$\Lambda$  is called a **even lattice** iff  $(x, x) \in 2\mathbb{Z}$  for any  $x \in \Gamma$ .  $\lrcorner$

**Def. (26.8.2.2) [Theta Functions].** Situation as in (26.8.2.1), for any  $x_0 \in \Gamma$ , we can define **theta functions**

$$\theta_{\Gamma, x_0} : \mathcal{H} \times \mathbb{C} \rightarrow \mathbb{C} : \theta_{\Gamma, x_0}(\tau, z) = \sum_{x \in \Gamma} e^{-\pi i[(x, x)\tau + (x, x_0)z]}.$$

and

$$\theta_{\Gamma}(\tau) = \theta_{\Gamma, 0}(\tau, 0), \quad \Theta_{\Gamma}(t) = \theta_{\Gamma}(it) = \sum_{x \in \Gamma} e^{-\pi t(x, x)}.$$

┘

**Cor. (26.8.2.3).** With the notation as in (26.8.2.2), the theta function satisfies

$$\Theta_{\Gamma}(t) = \frac{t^{-n/2}}{\mu(V/\Gamma)} \Theta_{\Gamma^D}(t^{-1})$$

┘

*Proof:* Notice that  $\Theta_{s\Gamma}(t) = \Theta_{\Gamma}(s^2 t)$ , so this formula follows from (12.11.3.16) applied to  $t^{-1/2}\Gamma$  and  $f(x) = e^{-\pi(x, x)}$ .  $\square$

**Thm. (26.8.2.4) [Hecke-Schoenberg].** Given  $k \in \mathbb{Z}_+$  and a lattice  $\Gamma$  of rank  $k$ , level  $N$  and discriminant  $\Delta$ , then

$$\theta_{\Gamma}(\tau) \in \text{MF}_k(\Gamma_0(N), \chi_D) \text{ (26.8.2.2)}.$$

┘

*Proof:* Cf. [Classical Automorphic Forms, Iwaniec] Chap 10.  $\square$

**Cor. (26.8.2.5) [Simple Theta Function].** The simple theta function  $\theta$  defined by

$$\theta(\tau) = \sum_{n \in \mathbb{Z}} e^{2\pi i n^2 \tau}$$

satisfies

$$\theta(\tau + 1) = \theta(\tau), \quad \theta\left(-\frac{1}{4\tau}\right) = \sqrt{-2i\tau} \theta(\tau).$$

┘

### Self-Dual Lattices

**Def. (26.8.2.6) [Self-Dual Lattices].** Situation as in (26.8.2.2), a **self-dual lattice** is a lattice  $\Gamma$  in  $V$  that  $V^D = V$ . Equivalently, if  $\{f_i\}$  is a  $\mathbb{Z}$ -basis of  $\Gamma$ , then the matrix  $A = ((e_i, e_j))_{i,j}$  is a matrix with integer coefficients and determinant 1. The last equivalence is because  $\Gamma' \subset \Gamma$  equals  $\Gamma$  if  $\mu(V/\Gamma) = \mu(V/\Gamma')$ , but this is equivalent to  $\mu(V/\Gamma) = 1$ , because  $\mu(V/\Gamma) \cdot \mu(V/\Gamma') = 1$ .  $\square$

**Example (26.8.2.7) [ $E_{8k}$ ].** Let  $V = \mathbb{R}^{8k}$  with the canonical inner product, denote  $E_{8k}$  the set of vectors  $\sum_i x_i e_i$  in  $V$  that

$$2x_i \in \mathbb{Z}, \quad x_i - x_j \in \mathbb{Z}, \quad \sum_{i=1}^{8k} x_i \in 2\mathbb{Z}.$$

Notice  $E_8$  is compatible with the root system  $E_8$  (3.9.6.3), and the root system just consists of all vectors in  $E_8$  of length  $\sqrt{2}$ .

Then  $E_{8k}$  is a self-dual and even.  $\square$

**Cor. (26.8.2.8).** Let  $k \geq 2$ , then all the vectors in  $E_{8k}$  of length  $\sqrt{2}$  are  $\{\pm e_i \pm e_j | i \neq j\}$ .  $\lrcorner$

**Remark (26.8.2.9).** For more examples of self-dual lattices, see [Ser73] Chap5.  $\lrcorner$

**Prop. (26.8.2.10) [Theta Function for Self-Dual Even Lattices].** Let  $\Gamma \subset V$  be a self-dual even lattice (26.8.2.6), then the dimension  $n$  of  $V$  is divisible by 8, and the theta function  $\theta_\Gamma(z) \in M_{n/2}(\Gamma(1))$ .  $\lrcorner$

*Proof:* We first show that

$$\theta_\Gamma(-1/z) = (-iz)^{n/2} \theta_\Gamma(z)$$

and because both sides are holomorphic functions on  $\mathcal{H}$ , it suffices to show this for  $z = it, t > 0$ . Thus it suffices to show

$$\Theta_\Gamma(t^{-1}) = t^{-n/2} \Theta_\Gamma(t).$$

And this is just (26.8.2.3), because  $\Gamma$  is self-dual (26.8.2.6).

Then  $\theta_\Gamma[ST]_{n/2} = (-i)^{n/2} \theta_\Gamma(20.4.5.17)$ , but  $(ST)^3 = 1$ , so  $(-i)^{3n/2} = 1$ , so  $8|n$ , and  $\theta_\Gamma \in M_{n/2}(\Gamma(1))$ .  $\square$

**Thm. (26.8.2.11) [Siegel's Mass Formula].** Cf. [Chao Li].  $\lrcorner$

**Prop. (26.8.2.12) [Theta Function for Non-Even Self-Dual Lattices].** If we consider theta function for non-even self-dual lattices in  $\mathbb{R}^n$ , then we get a modular form of weight  $n/2$  w.r.t. the subgroup of  $\mathrm{SL}(2, \mathbb{Z})$  generated by the elements  $S$  and  $T^2$ . This image of this subgroup has index 3 in  $\mathrm{PSL}(2, \mathbb{Z})$ , and it has two cusps, thus two Eisenstein series.

In particular, we can apply this to the lattice  $\{e_i\}$ , and use this information to obtain formula giving the number of ways to represent an integer into a sum of  $n$  squares.  $\lrcorner$

*Proof:*  $\square$

## Twisted Theta Functions

### 3 Jacobi Forms

Cf. [Jacobi Forms, Zagier].

**Def. (26.8.3.1) [Jacobi Forms].** A **Jacobi form** for  $\mathrm{SL}(2, \mathbb{Z})$  is a holomorphic function  $\varphi : \mathcal{H} \times \mathbb{C} \rightarrow \mathbb{C}$  s.t.

- For any  $\begin{bmatrix} a & b \\ c & d \end{bmatrix} \in \mathrm{SL}(2, \mathbb{Z})$ ,

$$\varphi\left(\frac{a\tau + b}{c\tau + d}, \frac{z}{c\tau + d}\right) = (c\tau + d)^k e^{2\pi i \frac{mcz}{c\tau + d}} \varphi(\tau, z).$$

- For any  $\lrcorner$

**Prop. (26.8.3.2).** The theta functions  $\theta_{\Gamma, x_0}(\tau, z)$  defined in (26.8.2.2) is a Jacobi form of weight  $\mathrm{rank} \Gamma / 2$  and index  $(x_0, x_0)$ .  $\lrcorner$

#### 4 Local Theta Correspondence

**Notation (26.8.4.1).**

- Use notations as in 1.
- Let  $(K, \mathcal{O}_K, \mathfrak{p}, \varpi) \in p\text{-LField}$ .
- Let  $\psi \in (K^\times)^\vee$ .
- Let  $W$  be a symplectic space over  $K$ .

┘

**Def. (26.8.4.2) [Howe Dual Pairs].** A pair of reductive subgroups  $(G_1, G_2)$  of  $\mathrm{Sp}(W)$  is called a **Howe dual pair** if

$$Z_{\mathrm{Sp}(W)}(G_1) = G_2, \quad Z_{\mathrm{Sp}(W)}(G_2) = G_1.$$

┘

**Example (26.8.4.3) [Howe Dual Pairs].**

- Let  $V$  be an orthogonal space and  $W$  a symplectic space, then  $V \otimes W$  is naturally a symplectic space, and there is a map  $O(V) \times \mathrm{Sp}(W) \rightarrow \mathrm{Sp}(V \otimes W)$ , which makes  $(O(V), \mathrm{Sp}(W))$  a Howe dual pair. ?
- Let  $K/k$  be a quadratic extension,  $V$  a Hermitian space over  $K$ ,  $W$  a skew-Hermitian space over  $K$ , then  $V \otimes W$  is naturally a symplectic space given by

$$(v_1 \otimes w_1, v_2 \otimes w_2) = \mathrm{tr}_{K/k}((v_1, v_2) \cdot (w_1, w_2)).$$

And there is a map  $O(V) \times \mathrm{Sp}(W) \rightarrow \mathrm{Sp}(V \otimes W)$ , which makes  $(O(V), \mathrm{Sp}(W))$  a Howe dual pair. ?

┘

**Def. (26.8.4.4) [Seesaw Pairs, Kudla].** Two Howe dual pairs  $(G, G'), (H, H')$  in  $\mathrm{Sp}(W)$  is called a (Kudla) **seesaw pair** if  $H \subset G$  and  $G' \subset H'$ .

┘

**Example (26.8.4.5) [Seesaw Pairs].**

- $$\begin{array}{ccc} \mathrm{Sp}(W_1 \oplus W_2) & & O(V) \times O(V) \\ & \searrow & \swarrow \\ \mathrm{Sp}(W_1) \times \mathrm{Sp}(W_2) & & O(V) \end{array} .$$
- $$\begin{array}{ccc} O(V_1 \oplus V_2) & & \mathrm{Sp}(W) \times \mathrm{Sp}(W) \\ & \searrow & \swarrow \\ O(V_1) \times O(V_2) & & \mathrm{Sp}(W) \end{array} .$$
- $$\begin{array}{ccc} O(V_1 \oplus V_2) & & \mathrm{Sp}(W) \times \mathrm{Sp}(W) \\ & \searrow & \swarrow \\ O(V_1) \times O(V_2) & & \mathrm{Sp}(W) \end{array} .$$

┘

**Prop. (26.8.4.6) [Local Theta Lifts].** Let  $k \in p\text{-LField}$ . For any Howe dual pair  $(G_1, G_2)$  of  $\text{Sp}(W)$ , let  $\tilde{G}_i$  be the inver image of  $G_i$ , then  $\tilde{G}_1, \tilde{G}_2$  commute. For any  $\pi \in \text{Irr}^{\text{alg}}(\tilde{G}_1)$ , consider the restriction  $\omega$  of the smooth Weil representation on  $\tilde{G}_1 \times \tilde{G}_2$ , and define

$$A(\pi) = \omega / \cap \{ \ker \varphi : \varphi \in \text{Hom}_{\tilde{G}_1}(\omega, \pi) \}.$$

Then  $A(\pi) \in \text{Irr}^{\text{alg}}(\tilde{G}_1 \times \tilde{G}_2)$ , which is of the form  $\pi \otimes \theta_0(\pi)$ , where  $\theta_0(\pi) \in \text{Irr}^{\text{alg}}(\tilde{G}_2)$ .

Then  $\theta_0(\pi)$  has finite length. And if  $p \neq 2$ , then it has a unique irreducible quotient, denoted by  $\theta(\pi)$ , called the **local theta lift** of  $\pi$ .  $\lrcorner$

*Proof:* Cf.[Waldspurger, Demonstration d'une conjecture de duality de Howe dans le cas  $p$ -adique,  $p \neq 2$ ].  $\square$

### Examples

**Prop. (26.8.4.7) [Even Dimensional case].** If  $\dim V = 2n$  and denote  $\Delta = (-1)^n \det(B) \in F^\times / (F^\times)^2$ ,  $\chi : F^\times \rightarrow \{\pm 1\}$  the quadratic character  $a \mapsto (\Delta, a)_F$  (19.5.5.5), and  $\gamma(B)$  as defined in (19.5.5.12), then the projection representation of  $\text{SL}(2; F)$  in (26.8.1.5) is a true representation.

It suffices to check the relations (3.1.5.9). Use (19.5.5.17) to show that  $\gamma(B)^2 = \chi(-1)$ . And it suffices to show that

$$w_1 \begin{bmatrix} a^{-1} & \\ & a \end{bmatrix} \begin{bmatrix} 1 & -a \\ & 1 \end{bmatrix} w_1 \begin{bmatrix} 1 & -a^{-1} \\ & 1 \end{bmatrix} \Phi = \begin{bmatrix} 1 & a \\ & 1 \end{bmatrix} w_1 \Phi$$

The LHS equals  $\gamma(B)^2 |a|^{-n} \mathcal{F}(\Phi * F_{-a^{-1}B})$ , which by (19.5.5.12) and (19.5.5.16) equals  $\gamma(B) \mathcal{F}(\Phi) F_{aB}$ , which is just the RHS.  $\lrcorner$

**Def. (26.8.4.8) [Setup for Dihedral Weil Representation].** Let  $E$  be a 2-dimensional commutative semisimple algebra over  $F$ , then  $E = F \oplus F$  and  $F$  embeds diagonally, called the **split case**; or  $E$  is the unique quadratic extension of  $F$ , called the **anisotropic case**. Let the automorphism of  $E$  given by

$$x \mapsto \bar{x} : \begin{cases} (\xi, \eta) = (\eta, \xi), & E = F \oplus F \\ \text{The non-trivial Galois automorphism,} & E \text{ is a field} \end{cases}.$$

Let  $\text{tr}(x) = x + \bar{x}$ ,  $N(x) = x\bar{x}$ . Let  $E_1^* = \{x \in E^* | N(x) = 1\}$ .

There is an embedding  $\iota$  of  $E$  into  $GO(E) \subset \text{GL}(2; F)$ : for  $E = F \oplus F$ , it embeds diagonally, and for  $E$  a field,  $E$  embeds by left action on itself. Notice  $\iota(\overline{x})(\overline{y}) = \iota(\bar{x})(y)$ , thus  $GO(E) \cong E^* \rtimes \{c\}$  ?.

Let  $\psi$  be a character of  $E^*$  that is non-trivial on  $E_1^*$ .  $\lrcorner$

**Prop. (26.8.4.9) [Theta Correspondence of Dihedral Representations].** Let  $\psi$  be a character of  $E^*$ , then by (24.1.1.12),  $\psi$  extends to a representation of  $GO(E)$  iff  $\psi(x) = \psi(\bar{x})$ , which is equivalent to  $\psi(x) = 1$  on  $E_1^*$ , by Hilbert's theorem90 or direct inspection. Then by (24.1.1.12), in the other case,  $\text{ind}_{E^*}^{GO(E)} \psi$  is an irreducible representation of  $GO(E)$ , and Howe duality predicts an irreducible smooth representation of  $GL(2, F)$ . In case  $E$  is a field or  $F$  is finite, we can construct this representation directly, in (26.8.4.10) and (24.3.10.8).  $\lrcorner$

**Prop. (26.8.4.10) [Dihedral Representations].** Let  $E/F$  be a quadratic extension of non-Archimedean local fields, then  $E$  is a quadratic space over  $F$  by the norm form, and let  $\xi$  be a

quasi-character of  $E^*$  that doesn't factor through the norm map  $N : E^* \rightarrow F^*$ . Let  $U_{\xi, \psi}$  be the space of functions  $\Phi \in C_c^\infty(E)$  that satisfy

$$\Phi(yv) = \xi(y)^{-1} \Phi(v), \quad \forall y \in E^*, N(y) = 1,$$

and let  $\chi : F^* \rightarrow \{\pm 1\}$  be the quadratic character attached to the extension  $E/F$  (19.7.2.14), and let  $GL(2, F)_+$  be the subgroup of  $GL(2, F)$  that the determinants are norms from  $E$ , which is an open normal subgroup of index 2, then there exists an irreducible admissible representation  $\omega_{\xi, \psi}$  of  $GL(2, F)_+$  on  $U_{\xi, \psi}$  s.t.

$$(\omega_{\xi, \psi} \left( \begin{bmatrix} a & \\ & 1 \end{bmatrix} \right) \Phi)(v) = |a|^{1/2} \xi(b) \Phi(bv), \quad \forall b \in E^*, N(b) = a \in F^*$$

$$(\omega_{\xi, \psi} \left( \begin{bmatrix} 1 & x \\ & 1 \end{bmatrix} \right) \Phi)(v) = \psi(xN(v)) \Phi(v)$$

$$(\omega_{\xi, \psi} \left( \begin{bmatrix} a & \\ & a^{-1} \end{bmatrix} \right) \Phi)(v) = |a| \chi(a) \Phi(av)$$

$$(\omega_{\xi, \psi}(w_1) \Phi) = \gamma(N) \hat{\Phi}.$$

Then the representation  $\omega_\xi$  of  $GL(2, F)$  induced from this representation of  $GL(2, F)_+$  is irreducible and cuspidal.  $\perp$

**Remark (26.8.4.11).** This dihedral representation is the only cuspidal representation of  $GL(2; F)$ , by [Tunnell 1978 or 1979].  $\textcolor{red}{?}$   $\perp$

*Proof:* Notice in this case, the character  $\chi$  defined in (26.8.4.7) is the same as the quadratic character corresponding to  $E/F$ : let  $E = F(\sqrt{D})$ , then  $N_{E/F} = \langle 1, -D \rangle$ , thus  $(a, D)_F = 1$  iff  $\langle a, D, -1 \rangle$  is universal iff  $a$  is represented by  $\langle 1, -D \rangle$ , which is equivalent to  $a \in N_{E/F}(E^*)$ . Then by (26.8.4.7), we have an action of  $SL(2, F)$  on  $L^2(E)$ , and we can extend it to  $GL(2, F)_+$  satisfying all these equations (  $\textcolor{red}{?}$  by direct verification). And it can be verified  $U_{\xi, \psi}$  is stable under this action.

We show this action is smooth: Every  $\varphi \in U_{\xi, \psi}$  is stable under some  $K(\mathfrak{p}^n)$  for  $n$  large: By (24.11.1.6), it suffices to prove it is stable under  $N_-(\mathfrak{p}^n)$ ,  $T(\mathfrak{p}^n)$  and  $N(\mathfrak{a})$ . By action of  $w_1$ , it suffices to show it is stable under the latter two. But this is clear from the equations above.

Similarly, to show it is admissible, it suffices to show for any ideal  $\mathfrak{a}$ , the space of functions fixed by  $N(\mathfrak{a})$  and  $N_-(\mathfrak{a})$  is of f.d.: It is clear from equation 2 that if  $\varphi$  is fixed by  $N(\mathfrak{a})$ , then there is a fractional ideal  $\mathfrak{a}'$  that  $\text{Supp}(\varphi) \subset N^{-1}(\mathfrak{a}')$ . Similarly for  $\mathcal{F}(\varphi)$ . These two conditions means  $\varphi$  has bounded support and fixed by some open subgroup, these functions are f.d..

To show  $\omega_{\xi, \psi}$  and  $\omega_\xi$  are irreducible: Let  $B_1(F)_+$  be the subgroup of  $B_1(F)$  consisting of matrices  $\left\{ \begin{bmatrix} a & b \\ & 1 \end{bmatrix} \mid a \in N_{E/F}(E^*) \right\}$ , let  $\mathcal{K}_+$  the restriction of  $\omega_{\xi, \psi}$  to  $B_1(F)_+$ . Define a map

$$\Lambda : C_c^\infty(N(E^*)) \rightarrow \mathcal{K}_+ : (\Lambda \varphi)(v) = \xi(v)^{-1} |N(v)|^{-1/2} \varphi(N(v)),$$

then this is an isomorphism, and is  $B_1(F)$ -invariant, where  $B_1(F)$  acts on  $C_c^\infty(N(E^*))$  as in (24.11.3.8). Thus by Mackey decomposition (24.1.6.48),

$$\text{res}_{B_1(F)} \text{ind}_{GL(2; F)_+}^{GL(2; F)} \omega_{\xi, \psi} \cong \text{ind}_{B_1(F)_+}^{B_1(F)} \omega_{\xi, \psi} \cong \text{ind}_{N(F)}^{B_1(F)} \psi,$$

which is irreducible by (24.11.3.9). thus  $\omega_\xi$  is irreducible, thus also does  $\omega_{\xi, \psi}$ .

A byproduct of the above argument is that  $\omega_\xi$  is cuspidal.  $\square$

### Theta Correspondence and Langlands Functoriality

One would like to understand the theta correspondence in terms of Langlands' functoriality

## 5 Global Theta Correspondence

**Notation (26.8.5.1).**

- Let  $F \in \mathbf{NField}$ ,
- Let  $W = X \oplus Y$  be a non-degenerate symplectic space over  $F$  where  $X, Y$  are isotropic subspaces.

┘

### Global Weil Representations

**Def. (26.8.5.2) [Global Weil Representations].** The restricted tensor product of the local projective Weil representations of  $\mathrm{Sp}(W_v)$  on  $\mathcal{S}(X(F_v))$  is a projective representation of  $\mathrm{Sp}(W)(\mathbf{A}_F)$  on  $\mathcal{S}(X(\mathbf{A}_F))$ .

Then this projective representation lifts to a true representation of  $\mathrm{Mp}(W)(\mathbf{A}_F)$  on  $\mathcal{S}(X(\mathbf{A}_F))$ , called the (global) **Weil representation**.

┘

*Proof:*

□

**Prop. (26.8.5.3) [Weil].** The covering  $\mathrm{Mp}(W)(\mathbf{A}_F) \rightarrow \mathrm{Sp}(W)(\mathbf{A}_F)$  splits over  $\mathrm{Sp}(W)(F)$ .

┘

*Proof:*

□

### Theta Lifts

**Def. (26.8.5.4) [Theta Kernels].** The **theta kernel** on  $\mathcal{S}(X(\mathbf{A}_F))$  is defined by

$$\Theta(g, \Phi)(x) = \sum_{y \in X(F)} \omega(g)\Phi(x+y) \text{ where } \Phi \in \mathcal{S}(X(\mathbf{A}_F)), g \in \mathrm{Mp}(W)(\mathbf{A}_F), x \in X(\mathbf{A}_F).$$

Then this is well-defined, and ?

┘

**Def. (26.8.5.5) [Theta Functions].** For any  $\Phi \in \mathcal{S}(X(\mathbf{A}_F))$ , there is a function

$$\theta_\Phi : \mathrm{Sp}(W)(F) \backslash \mathrm{Mp}(W)(\mathbf{A}_F) \rightarrow \mathbb{C} : g \mapsto \theta_\Phi(g) = \Theta(g, \Phi)(0) \text{ (26.8.5.4)}.$$

Then this is an automorphic function. ? It has the property  $\theta_\Phi(hg) = \theta_{\omega(h)\Phi}(g)$  for  $h \in \mathrm{Mp}(W)(\mathbf{A}_F)$ .

┘

*Proof:* To show the sum is convergent: ?

□

**Def. (26.8.5.6) [Theta Lifts].** Let  $(G_1, G_2)$  be a Howe dual pair in  $\mathrm{Sp}(W)$  (26.8.4.2), and  $f \in \mathcal{A}_0(G_1(F) \backslash G_1(\mathbf{A}_F))$ ,  $\Phi \in \mathcal{S}(X(\mathbf{A}_F))$ , define

$$\theta_\Phi(f) : G_2(F) \backslash G_2(\mathbf{A}_F) \rightarrow \mathbb{C} : g_2 \mapsto \theta_\Phi(f)(g_2) = \int_{G_1(F) \backslash G_1(\mathbf{A}_F)} \theta_\Phi(g_1 g_2) f(g_1) dg_1 \text{ (26.8.5.5)}.$$

Then this is an automorphic function ? . Moreover, the space  $\{\theta_\varphi(f) : \varphi \in \mathcal{S}(X)(\mathbf{A}_F)\}$  is  $\tilde{G}_2(\mathbf{A}_F)$  invariant by (26.8.5.5).

Denote

$$\Theta(\mathcal{A}, \psi) = \{\theta_\Phi(f) : \Phi \in \mathcal{S}(X)(\mathbf{A}_F), f \in \mathcal{A}_0(G_1(F) \backslash G_1(\mathbf{A}_F))\} \in \mathcal{A}(G_2(F) \backslash G_2(\mathbf{A}_F)),$$

called the **theta lifts of cuspidal representations** of  $G_1$ . And any irreducible subquotient of it is called a representation obtained via **theta correspondence**.  $\lrcorner$

**Remark (26.8.5.7) [Questions].** 1: When is  $\Theta(\mathcal{A}, \psi)$  non-zero?

2: What is the relation of the space of theta lifts to local theta correspondences.  $\lrcorner$

**Thm. (26.8.5.8) [Rallis].** If all the theta lifts (26.8.5.6) are cusp forms, then the space generated by them is irreducible and identifies with  $\otimes_v (\pi_v^\vee)$ .  $\lrcorner$

*Proof:* Cf. [Rallis, On Howe Duality Conjecture].  $\square$

**Thm. (26.8.5.9) [Theta Correspondence for  $(\mathrm{PGL}(2), \widetilde{\mathrm{SL}(2)})$ , Waldspurger].** For any  $\pi \in \mathrm{Irr}^{\mathrm{cusp}}(\mathrm{PGL}(2)/F)$ ,  $\lrcorner$

*Proof:* ?  $\square$

### Orthogonal Theta Lifts

**Notation (26.8.5.10).**

- Let  $F \in \mathbf{NField}$ .
- Let  $\psi_0 : F \backslash \mathbf{A}_F \rightarrow \mathbb{C}^\times$  be the standard additive character.
- Let  $V \in \mathrm{QuadSpa}^m/F$  be non-degenerate with  $m$  even.
- Let  $r$  be the Witt index of  $V$  (19.5.2.5).
- Then  $(O(V), \mathrm{Sp}(n))$  is a Howe dual pair. Denote  $H = O(V), G = \mathrm{Sp}(n)$ .
- Let  $\mathcal{K} \in \mathrm{Sp}(n; \mathbf{A}_F)$  be the maximal compact subgroup ?.
- Denote  $\varrho_n = \frac{n+1}{2}, s_0 = \frac{m}{2} - \varrho_n$ .

$\lrcorner$

**Def. (26.8.5.11) [Standard Maximal Compact Groups].**  $\mathrm{Sp}(n)$  is defined over  $\mathbb{Z}$ , and for any  $v \in \Sigma_F$ , define the standard maximal compact subgroups  $\mathcal{K}_v$  of  $\mathrm{Sp}(n; F_v)$  to be

$$\mathcal{K}_v = \begin{cases} \mathrm{Sp}(n; \mathcal{O}_{F_v}) & , v \in \Sigma_F^{\mathrm{fin}} \\ \mathrm{Sp}(n; \mathcal{O}_{F_v}) \cap \mathrm{Sp}(2n) & , v \in \Sigma_F^\infty \end{cases}.$$

And denote  $\mathcal{K} = \prod_{v \in \Sigma_F} \mathcal{K}_v$ .

Then any  $g \in G(\mathbf{A}_F)$  can be written as  $g = pk$ , where  $p = \begin{bmatrix} A & * \\ 0 & A^{-t} \end{bmatrix} \in P_{\mathrm{Sie}}(\mathbf{A}_F)$  and  $k \in \mathcal{K}$ .

Then we denote

$$|A(g)|_{\mathbf{A}} = |\det(A)|_{\mathbf{A}},$$

which is well-defined.  $\lrcorner$

**Def. (26.8.5.12) [Siegel Theta Functions].** For  $\Phi \in S(V^n(\mathbf{A}_F))$  and  $g \in G(\mathbf{A}_F), h \in H(\mathbf{A}_F)$ , the **Siegel Theta function**(26.8.5.5) is

$$\theta_\Phi(g, h) = \sum_{x \in V^n} \omega(g, h) \Phi(x),$$

which is smooth of moderate growth?, and the **Siegel Theta lifts** is

$$\text{Int}(g, \Phi) = \int_{H(F) \backslash H(\mathbf{A}_F)} \theta(g, h; \Phi) dh \text{ (26.8.5.12)}.$$

where  $dh$  is normalized s.t.  $\text{Vol}(H(F) \backslash H(\mathbf{A}_F)) = 1$ . Then this integral is absolutely convergent if  $2\varrho_n < m - r$  or  $r = 0$ (26.8.5.10).  $\lrcorner$

*Proof:* Cf.[Wei65]Prop8.?.  $\square$

**Def. (26.8.5.13) [Degenerate principal Series].** Denote

$$I_v(\chi; s) = I_P^G(\chi(s)),$$

which consists of  $\mathcal{K}$ -finite functions  $f^{(s)}$  on  $\text{Sp}(n; \mathbf{A}_F)$  s.t.

$$f^{(s)}(pg) = \chi_{\text{disc}(V)}(\det(A)) |\det(A)|^m f(g), \text{ where } p = \begin{bmatrix} A & * \\ & A^{-t} \end{bmatrix} \in P(\mathbf{A}_F).$$

Where  $\lrcorner$

### Unitary Theta Lifts

**Notation (26.8.5.14).**

- Let  $E/F \in \mathbf{NField}$  be a CM field.
- Let  $\mathbf{1} \neq \psi : F \backslash \mathbf{A}_F \rightarrow \mathbb{C}^\times$ .
- Let  $\chi_{E/F}$  be the quadratic Hecke character associated to  $E/F$ .
- Let  $V \in \text{HermSpa}^m(E/F)$  be non-degenerate.
- Let  $r$  be the Witt index of  $V$ (19.5.2.5).
- Let  $\chi$  be a Hecke character of  $E$  s.t.  $\chi|_{\mathbf{I}_F} = \chi_{E/F}^m$ .
- Then  $(\text{U}(V), \text{U}(n, n)_F)$ (10.5.3.19) is a Howe dual pair. Denote  $H = \text{U}(V), G = \text{U}(n, n)$ .  $G$  has a model over  $\mathcal{O}_F$ .
- Let  $P_{\text{Sie}} \subset G$  be the Siegel parabolic subgroup.
- Let  $S(V^n(\mathbf{A}_F))$  be the subspace of  $\mathcal{S}(V^n(\mathbf{A}_F))$  consisting of functions that corresponds to polynomials in the Fock model?.
- $(G, H)$  is a Howe dual pair, and let  $\omega_{\psi, \chi}$  be the Weil representation of  $G(\mathbf{A}_F) \times H(\mathbf{A}_F)$  acting on  $\mathcal{S}(V^n(\mathbf{A}_F))$ .
- Denote  $\varrho_n = \frac{n+1}{2}, s_0 = \frac{m}{2} - \varrho_n$ .

$\lrcorner$

**Def. (26.8.5.15) [Standard Maximal Compact Groups].**  $U(n, n)_F$  is defined over  $\mathcal{O}_F$ , and for any  $v \in \Sigma_F$ , define the standard maximal compact subgroups  $\mathcal{K}_v$  of  $U(n, n)(F_v)$  to be

$$\mathcal{K}_v = \begin{cases} U(n, n)(\mathcal{O}_{F_v}) & , v \in \Sigma_F^{\text{fin}} \\ U(n, n)(\mathcal{O}_{F_v}) \cap U(2n) & , v \in \Sigma_F^\infty \end{cases}.$$

And denote  $\mathcal{K} = \prod_{v \in \Sigma_F} \mathcal{K}_v$ .

Then any  $g \in G(\mathbf{A}_F)$  can be written as  $g = pk$ , where  $p = \begin{bmatrix} A & * \\ 0 & \mathbf{c}(A)^{-t} \end{bmatrix} \in P_{\text{Sie}}(\mathbf{A}_F)$  and  $k \in \mathcal{K}$ .

Then we denote

$$|A(g)|_{\mathbf{A}} = |\det(A)|_{\mathbf{A}},$$

which is well-defined. ┘

**Def. (26.8.5.16) [Local Degenerate Principal Series].** Let  $v \in \Sigma_F$  be inert for  $E/F$ , thus  $E_v/F_v$  is a quadratic extension. Denote

$$I_v(\chi; s) = I_{P(F_v)}^{G(F_v)}(\chi(s)),$$

which consists of  $\mathcal{K}_v$ -finite functions  $f^{(s)}$  on  $G(F_v)$  s.t.

$$f^{(s)}(pg) = \chi_v(\det(A)) |\det(A)|_v^{s + \frac{n}{2}} f^{(s)}(g), \text{ where } p = \begin{bmatrix} A & * \\ & \mathbf{c}(A)^{-t} \end{bmatrix} \in P(F_v).$$

A **standard holomorphic section**  $f^{(s)}$  is a holomorphic section s.t. its restriction to  $\mathcal{K}_v$  is independent of  $s$ .

Let  $R_v(V, \chi)$  denote the image of the intertwining operator

$$S(V^n) \rightarrow I_v(\chi) : \Phi_v \mapsto \theta_{\Phi_v}(g, 1) \text{ (26.8.5.5),}$$

┘

## 6 Borchers Products

References are [Borchers] and [Borchers Products on  $0(2, 1)$  and Chern Classes of Heegner Divisors].

**Def. (26.8.6.1) [Modular Forms with Heegner Points].** A meromorphic modular function  $f$  for  $SL(2; \mathbb{Z})$  is said to have a Heegner divisor if its zeros and poles are supported at the cusp  $i\infty$  and CM points. ┘

## 26.9 Eisenstein Series

*“...I had not recognized in 1966, when I discovered after many months of unsuccessful search a promising definition of automorphic  $L$ -function, what a fortunate, although, and this needs to be stressed, unforeseen by me, or for that matter anyone else, blessing it was that it lay in the theory of Eisenstein series.”*

– R. P. Langlands.

**Remark (26.9.0.1).** The motivation to study Eisenstein series is that  $L$ -functions appear as constant terms of Eisenstein series.  $\lrcorner$

### 1 Eisenstein Series for $P_{1,n-1}$

References are [J-S76].

**Def. (26.9.1.1)** [Eisenstein Series for  $P_{1,n-1}$ ].  $\lrcorner$

### 2 Non-Holomorphic Eisenstein Series for $GL(2)$

References are [Bump, Chap3] and [Diamond]Chap4.10.

**Def. (26.9.2.1)** [Non-Holomorphic Eisenstein Series]. The non-holomorphic Eisenstein series of weight  $s$  is defined to be

$$E^*(z, s) = \frac{1}{2} L_{\mathbb{R}}(2s) \sum_{(m,n) \neq 0 \in \mathbb{Z}^2} \frac{(\operatorname{Im}(z))^s}{|mz + n|^{2s}} = L_{\mathbb{R}}(2s) \sum_{\gamma \in \overline{\Gamma}_{\infty} \backslash \overline{\Gamma}(1)} (\operatorname{Im}(\gamma(z)))^s$$

It is absolutely convergent for  $\operatorname{Re}(s) > 1$ , and is automorphic for  $\Gamma(1)$  (26.1.3.20).  $\lrcorner$

**Prop. (26.9.2.2)** [Fourier Expansion of  $E(z, s)$ ]. The Fourier coefficients of  $E(z, s)$  is of the form

$$E^*(z, s) = \sum_{n=-\infty}^{\infty} a_n(y, s) e^{2\pi i r x},$$

where

$$a_0(y, s) = \Lambda(2s)y^s + \Lambda(2-2s)y^{1-s}$$

and for  $n \neq 0$ ,

$$a_n(y, s) = 2|n|^{-s+1/2} \sigma_{2s-1}(|n|) \sqrt{y} K_{s-1/2}(2\pi|n|y),$$

where  $K_{s-1/2}(z)$  is the K-Bessel function (12.6.3.1). In particular,

$$E^*(z, s) = \Lambda(2s)y^s + \Lambda(2-2s)y^{1-s} + 4\sqrt{y} \sum_{n \in \mathbb{Z}_+} n^{\frac{1}{2}-s} \sigma_{2s-1}(n) K_{s-\frac{1}{2}}(2\pi ny) \cos(2\pi nx)$$

$\lrcorner$

*Proof:*

$$a_r(y, s) = \int_0^1 E^*(x + iy, s) e^{-2\pi i r x} dx = \int_0^1 \frac{1}{2} \pi^{-s} \Gamma(s) \sum_{(m,n) \neq 0 \in \mathbb{Z}^2} \frac{y^s}{|mz + n|^{2s}} e^{-2\pi i r x} dx.$$

The term with  $m = 0$  only contributes to  $a_0$ , and equals  $\pi^{-s}\Gamma(s)\zeta(2s)y^s$ . For the rest we may assume  $m > 0$  by symmetry, then they contribute to

$$\begin{aligned} & \pi^{-s}\Gamma(s)y^s \sum_{m=1}^{\infty} \sum_{n=-\infty}^{\infty} \int_0^1 [(mx+n)^2 + m^2y^2]^{-s} e^{-2\pi irx} dx \\ &= \pi^{-s}\Gamma(s)y^s \sum_{m=1}^{\infty} \sum_{n \bmod m} \int_{-\infty}^{\infty} [(mx+n)^2 + m^2y^2]^{-s} e^{-2\pi irx} dx \\ &= \pi^{-s}\Gamma(s)y^s \sum_{m=1}^{\infty} m^{-2s} \sum_{n \bmod m} e^{2\pi irn/m} \int_{-\infty}^{\infty} (x^2 + y^2)^{-s} e^{-2\pi irx} dx \end{aligned}$$

Notice  $\sum_{n \bmod m} e^{2\pi irn/m} = \begin{cases} m & m|r \\ 0 & \text{otherwise} \end{cases}$ , thus the calculation reduces to (12.6.3.5).  $\square$

**Prop. (26.9.2.3) [Functional Equation].**  $E^*(z, s)$  has meromorphic continuation to all  $s \in \mathbb{C}$ , and it is analytic except at  $s = 1$  or  $s = 0$ , where the residue at  $s = 1$  is  $1/2$  for any  $z$ , and it satisfies the functional equation

$$E^*(z, s) = E^*(z, 1 - s).$$

and  $E(x + iy, s) = O(y^\sigma)$  for  $y \rightarrow \infty$ , where  $\sigma = \max(\operatorname{Re}(s), 1 - \operatorname{Re}(s))$ .  $\lrcorner$

*Proof:* This follows from the Fourier expansion of  $E^*(z, s)$  (26.9.2.2). Each term  $a_r(y, s)$  has analytic extension to all  $s$ , except that  $a_0$  has simple poles at  $s = 0$  and  $s = 1$  by (35.5.2.5) (the pole at  $s = 1/2$  was neutralized). And the functional equation and the convergence is clear from the properties of K-Bessel functions (12.6.3.2). For the residue, it suffices to show the residue of  $\pi^{-s/2}\Gamma(s/2)\zeta(s)$  at 0 is  $-1$  (35.5.2.5).  $\square$

**Prop. (26.9.2.4) [Kronecker's First Limit Formula].**

$$2E^*(z, s) = \frac{1}{s-1} + \gamma_0 - \log(4\pi y |\eta(z)|^4) + O(s-1).$$

And a similar formula is true for  $s = 0$ , by the functional equation (26.9.2.3).  $\lrcorner$

*Proof:* Cf. [Kronecker's First Limit Formula, Revisited].  $\square$

**Prop. (26.9.2.5) [Eisenstein Series of Mixed Type].** The Eisenstein series of mixed type is defined to be

$$E_{k,s}(z) = \sum_{(m,n) \in \mathbb{Z}^2 \setminus (0,0)} \frac{y^s}{(mz+n)^k |mz+n|^{2s}}, k \in \mathbb{Z}, s \in \mathbb{C}.$$

Then

$$R_k(y^{k/2} E_{k,s}(z)) = (k+s)y^{(k+2)/2} E_{k+2,s}(z).$$

and  $y^{k/2} E_{k,s}(z)$  is a Maass form in  $(z)$  of weight  $k$ . Its better to consult the paper <https://arxiv.org/abs/1803.08210> for the Fourier expansion of  $E_{k,s}$ .  $\lrcorner$

*Proof:*

$$((z - \bar{z}) \frac{\partial}{\partial z} + k/2) \left[ \frac{\left( \frac{z - \bar{z}}{2i} \right)^{s+k/2}}{(mz+n)^{s+k} (m\bar{z}+n)^s} \right]$$

$$\begin{aligned}
&= (z - \bar{z}) \left( \frac{\frac{s+k/2}{2i} \left( \frac{z-\bar{z}}{2i} \right)^{s-1+k/2} (mz+n)^{s+k} - \left( \frac{z-\bar{z}}{2i} \right)^{s+k/2} m(s+k)(mz+n)^{s+k-1}}{(m\bar{z}+n)^s (mz+n)^{2s+2k}} \right) + \frac{k}{2} \frac{\left( \frac{z-\bar{z}}{2i} \right)^{s+k/2}}{(mz+n)^{s+k} (m\bar{z}+n)^s} \\
&= \frac{\left( \frac{z-\bar{z}}{2i} \right)^{s+k/2}}{(mz+n)^{s+k+1} (m\bar{z}+n)^s} [(s+k/2)(mz+n) - (z-\bar{z})m(s+k) + \frac{k}{2}(mz+n)] \\
&= (k+s) \frac{\left( \frac{z-\bar{z}}{2i} \right)^{s-1+(k+2)/2}}{(mz+n)^{s+k+1} (m\bar{z}+n)^{s-1}} \\
&= (k+s) y^{(k+2)/2} E_{k+2, s-1}(z)
\end{aligned}$$

□

**Prop. (26.9.2.6) [Rankin-Selberg].** Let  $\varphi \in C^\infty(\Gamma(1) \backslash \mathcal{H})$  be decreasing rapidly along  $y \rightarrow \infty$  and  $\varphi(z) = \sum_{n \in \mathbb{Z}} \varphi_n(y) e^{2\pi i n x}$  be its Fourier expansion. Call  $\varphi_0$  the constant term of  $\varphi$ . Consider the Mellin transform

$$M(s, \varphi_0) = \int_0^\infty \varphi_0(y) y^s \frac{dy}{y} \quad (12.5.4.2), \quad \Lambda(s, \varphi_0) = \Lambda(2s) M(s-1, \varphi_0).$$

As  $\varphi(s, \varphi_0)$  is bounded as a function on  $y$  and decay rapidly,  $M(s, \varphi)$  is absolutely convergent for  $\operatorname{Re}(s) > 0$ .

Then

$$\Lambda(s, \varphi_0) = \int_{\Gamma(1) \backslash \mathcal{H}} E^*(z, s) \varphi(z) \frac{dx dy}{y^2}$$

and thus has a meromorphic continuation to all  $s$  and satisfies a functional equation, with at most simple poles at  $s = 0$  or  $1$ ,

$$\operatorname{Res}_{s=1} \Lambda(s, \varphi_0) = \frac{1}{2} \int_{\Gamma(1) \backslash \mathcal{H}} \varphi(z) \frac{dx dy}{y^2}.$$

┘

*Proof:* Using (26.9.2.1),

$$\begin{aligned}
\int_{\Gamma(1) \backslash \mathcal{H}} \varphi(z) \frac{dx dy}{y^2} &= \Lambda(2s) \sum_{\gamma \in \Gamma_\infty \backslash \Gamma(1)} \int_{\Gamma(1) \backslash \mathcal{H}} (\operatorname{Im}(\gamma(z)))^s \varphi(\gamma(z)) \frac{dx dy}{y^2} \\
&= \Lambda(2s) \int_{\Gamma_\infty \backslash \mathcal{H}} \operatorname{Im}(z)^s \varphi(z) \frac{dx dy}{y^2} \\
&= \Lambda(2s) \int_0^\infty y^{s-1} \int_0^1 \varphi(x + iy) dx \frac{dy}{y} \\
&= \Lambda(2s) \int_0^\infty \varphi_0(y) y^{s-1} \frac{dy}{y} \\
&= \Lambda(s, \varphi_0)
\end{aligned}$$

The assertion about the meromorphic continuation and the residue follows from the equation above and (26.9.2.3). □

## 26.10 Automorphic Forms on Unitary Groups

**Prop. (26.10.0.1)**[Ramakrishnan, 2000]. Multiplicity one theorem is true for cuspidal representations on  $\mathrm{SL}(2)$ .  $\lrcorner$

*Proof:*  $\square$

**Prop. (26.10.0.2)** [Blasius, 1994]. Multiplicity one theorem is false for cuspidal representations on  $\mathrm{SL}(n)$ ,  $n \geq 3$ .  $\lrcorner$

*Proof:*  $\square$

### 1 Definite Unitary Groups

References are [Automorphic Forms on Unitary Groups, Eischen].

Unitary groups have associated Shimura varieties, which provide convenient structure for studying algebraic aspects of automorphic forms. We have substantial results about Galois representations associated to automorphic forms on unitary groups (e.g. [Ski12, Che04, Che09, CH13, Har10]). In addition, we have convenient representations of the  $L$ -functions associated automorphic forms on unitary groups, which are useful both for proving analytic properties and for extracting algebraic information (and even  $p$ -adic properties, as seen in [EHLS20]). Working with unitary groups has enabled major developments, including a proof of the main conjecture of Iwasawa Theory for  $\mathrm{GL}_2$  [SU14] and the rationality of special values of certain automorphic  $L$ -functions (including [Shi00, Har97, Har08, Har84, Bou15]), as well as progress toward cases of the Bloch – Kato conjecture (including [SU06, Klo09, Klo15, Wan19]), and the Gan – Gross – Prasad conjecture (many recent developments, including [Xue14, Xue19, Zha14, Liu14, Yun11, JZ20, He17, BP20, BPLZZ21]).

**Def. (26.10.1.1)** [Definite Unitary Groups]. Let  $m \in \mathbb{Z}_+$ ,  $E/\mathbb{Q}$  be a CM field and  $G \in \mathrm{AlgGrp}/\mathbb{Q}$  be a unitary group attached to  $E/\mathbb{Q}$  and the central simple algebra  $\mathbb{D} \cong \mathrm{Mat}(m; E)$  with an involution (10.5.3.21).

Then for any  $p \in \mathrm{Prime}$ ,

- If  $p = \mathfrak{p}_v \mathfrak{p}_{v'}$  is a splitting in  $E$ , then  $v : E \rightarrow \mathbb{Q}_p$  induces an isomorphism  $G(\mathbb{Q}_p) \cong \mathrm{GL}(m; \mathbb{Q}_p)$ .
- If  $p$  is inert or ramified in  $E$ , then  $G(\mathbb{Q}_p)$  is a unitary group attached to  $E_p/\mathbb{Q}_p$ .
- Each embedding  $E \rightarrow \mathbb{C}$  gives an isomorphism between  $G(\mathbb{R})$  and a Archimedean unitary group  $\mathrm{U}(p, q)$ , where  $p + q = m$  is the signature.

$G$  is called a **definite unitary group** if  $G(\mathbb{R})$  is of signature  $(n, 0)$  or  $(0, n)$ .  $\lrcorner$

**Def. (26.10.1.2)** [Quasi-Split Definite Unitary Groups]. Let  $E/\mathbb{Q}$  be a CM field,  $m \in \mathbb{Z}_+$ , and let  $\mathrm{U}(m) \in \mathrm{AlgGrp}/\mathbb{Q}$  be the unitary group attached to the positive-definite  $\mathfrak{c}$ -Hermitian form

$$q((z_1, \dots, z_m)) = \sum_{i=1}^m \mathrm{Nm}(z_i)$$

as in (26.10.1.1), then

- $\mathrm{U}(m)$  is a definite unitary group.
- If  $p \in \mathrm{Prime}$  doesn't split in  $E$  and  $m \not\equiv 2 \pmod{4}$ , then  $\mathrm{U}(m)(\mathbb{Q}_p)$  is the quasi-split unitary group attached to  $E_p/\mathbb{Q}_p$ .

- If  $m \not\equiv 2 \pmod{4}$ , then  $U(m)$  is the unique  $m$ -variable unitary group attached to  $E/\mathbb{Q}$  that is quasi-split at every finite place and compact at infinity. And if  $m \equiv 2 \pmod{4}$ , then there is no group with these properties.

┘

*Proof:* This follows easily from (19.5.5.11). For  $m \equiv 2 \pmod{4}$ , this follows from Hasse's principle ?.

□

**Prop. (26.10.1.3).** For any definite unitary group  $G$  and  $\pi \in \text{Irr}^{\text{auto}}(G/\mathbb{Q})$ ,  $\pi_\infty$  is algebraic and  $\pi_f$  is defined over  $\overline{\mathbb{Q}}$ .

┘

### Galois Representations attached to Automorphic Representations

**Notation (26.10.1.4).**

- Situation as in (26.10.1.1), let  $G \in \text{AlgGrp}/\mathbb{Q}$  be a definite unitary group.
- Fix a prime  $p \in \text{Prime}$  that is split in  $E$ .
- Fix an embedding  $\iota_p : \overline{\mathbb{Q}} \rightarrow \overline{\mathbb{Q}_p}$ , and  $v \in S_E(p)$  the place of  $E$  induced by  $\iota_p$ .
- Fix a prime  $\ell \in \text{Prime}$  that is non-split in  $E$ .
- 

┘

**Def. (26.10.1.5) [Unramified Representations of  $G(\mathbb{Q}_\ell)$ ].** If  $\ell$  is unramified in  $E$ , then  $G(\mathbb{Q}_\ell)$  is an unramified unitary group ?, so we can talk about unramified representations of  $G(\mathbb{Q}_\ell)$ .

If  $\ell$  is inert in  $E$ , then we can also talk about unramified representations of  $G(\mathbb{Q}_\ell)$  meaning a representation of  $G(\mathbb{Q}_\ell)$  that has a non-zero vector invariant under a **very special maximal compact subgroup** ?, Cf. [B-C09].

┘

**Conj. (26.10.1.6) [Galois Representations attached to Automorphic Representations of  $U(m)$ ].** Let  $\pi \in \text{Irr}^{\text{auto}}(U(m)/\mathbb{Q})$  s.t.  $\pi_\infty$  has regular weight, then there is a continuous semisimple Galois representation

$$\rho_\pi : \text{Gal}_E \rightarrow \text{GL}(m; \overline{\mathbb{Q}_p})$$

s.t.

- If  $\ell = \mathfrak{p}_x \mathfrak{p}_{x'}$  is split in  $E$  and  $\pi_\ell$  is unramified, then  $\rho_\pi$  is unramified above  $\ell$  and  $\det(1 - \sigma_x | \rho_\pi)$  is given by the characteristic polynomial of the Langlands conjugacy class of  $\pi_x(\frac{1-m}{2})$ .
- If  $\pi_\ell$  is unramified, then  $\rho_\pi$  is unramified at each prime over  $\ell$ .
- If  $\ell = \mathfrak{p}_x \mathfrak{p}_{x'}$  splits in  $E$ , then the nilpotent monodromy operator of the Weil-Deligne representation attached to  $\rho_\pi|_{W_{E_x}}$  is in the closure of the conjugacy class of  $N(\pi_x(\frac{1-m}{2}))$  in  $\text{Mat}(m; \overline{\mathbb{Q}_p})$ .
- If  $x$  is a prime over  $\ell$  and  $\pi_\ell$  is a non-monodromic principle series (Cf. [B-C09] P166 ?), then the Weil-Deligne representation attached to  $\rho_\pi|_{W_{E_x}}$  has trivial monodromy.
- The  $p$ -adic representation  $\rho_\pi|_{\text{Gal}_{E_v}}$  is deRham, and its Hodge-Tate weights are

$$\{-a_1, \dots, -a_m\} + \frac{m-1}{2}$$

where the restriction to  $\mathbb{C}^\times$  of the  $L$ -parameter of  $\pi_\infty$  (24.7.7.1) is given by  $z \mapsto \text{diag}((z/\bar{z})^{a_1}, \dots, (z/\bar{z})^{a_m})$ .

┘

## 2 Quaternionic Modular Forms

References are [Modular Forms on Exceptional Groups, Pollack].

## 27 | $p$ -adic Geometry

### 27.1 $\mathbb{F}_p$ -Algebraic Stacks

References are [B-S17, Zhu17].

**Notation (27.1.0.1).**

- Let  $p \in \text{Prime}$ .
- let  $k \in \text{Field}^p$  s.t.  $k = k^{\text{perf}}$ .

┘

**Prop. (27.1.0.2).** Let  $R \rightarrow S \in \text{Perf}^p$  be injective and integral, and let  $M \in \text{Mod}_R$  s.t.  $M \otimes_R S$  is flat over  $S$ , then  $M$  is flat over  $R$ .

┘

*Proof:* Cf. [Zhu17]P477.

□

### 1 Perfect Algebraic Stacks

#### Perfect Algebraic Spaces

**Def. (27.1.1.1) [Perfect Schemes].**  $X \in \text{Sch}/\mathbb{F}_p$  is called a **perfect algebraic space** if the Frobenius is an isomorphism on it.

Let  $\text{PerfSch}/k$  be the site of perfect qcqs  $\mathbb{F}_p$ -schemes endowed with the v-topology (7.1.4.44).

┘

**Def. (27.1.1.2) [Perfection].** There is a **perfection of scheme** functor

$$(-)^{\text{perf}} : \text{Sch}/k \rightarrow \text{PerfSch}^p/k : X \mapsto X^{\text{perf}} \triangleq \varprojlim (\cdots \xrightarrow{\varphi_X} X \xrightarrow{\varphi_X} X).$$

$X^{\text{perf}}$  can also be defined by glueing of the perfection functors  $R \rightarrow R_{\text{perf}}$  on affine open subschemes (5.5.1.3) as it commutes with colimits.

In particular,  $(-)^{\text{perf}}$  commutes with inverse limits.

┘

**Prop. (27.1.1.3) [Perfections are Universal Homeomorphism].** For  $X \in \text{Sch}/k$ ,  $X^{\text{perf}} \rightarrow X$  is a universal homeomorphism. In particular, by (7.1.4.23) and (7.2.10.3), there is an equivalence of categories:

$$(-)^{\text{perf}} : X_{\text{ét}} \cong (X^{\text{perf}})_{\text{ét}}.$$

┘

*Proof:* Cf. [Sta]0BRD.?

□

**Prop. (27.1.1.4) [Perfect Algebraic Spaces as Functors].** The composition of functors between categories

$$\mathcal{Y} : \mathcal{A}lgSp^{\text{perf}}/k \rightarrow \mathcal{A}lgSp_k \rightarrow \mathcal{S}h(\mathcal{A}ff_{\text{fpqc}}/k) \rightarrow \mathcal{S}h(\mathcal{P}erf\mathcal{A}ff_{\text{fpqc}}/k)$$

is fully faithful. ⌋

*Proof:* Cf. [Zhu17]469. □

**Prop. (27.1.1.5) [Perfection and Properties of Morphisms, Zhu [Zhu17]/Bhatt-Scholze [B-S17]].**

For  $f : X \rightarrow Y \in \mathcal{A}lgSp/k$ , the following properties holds true for  $f$  iff it holds true for  $f^{\text{perf}}$ :

1. Quasi-compact.
2. Quasi-separated.
3. Affine.
4. Quasi-finiteness.
5. Separated.
6. Integral.
7. Universally closed.
8. Universal homeomorphism.

The following properties holds for  $f^{\text{perf}}$  if it holds for  $f$ :

1. (Closed/Open)immersion.
2. Étale .
3. (Faithfully)Flat.

⌋

*Proof:* Cf. [B-S17]3.4 or [Zhu17]LemmaA.7. ?

The quasi-finiteness follows from the fact that  $X^{\text{perf}} \rightarrow X$  is a homeomorphism (27.1.1.3). □

**Prop. (27.1.1.6) [Perfection and Line Bundles].** If  $X \in \mathcal{S}ch_{\text{qcqs}}/\mathbb{F}_p$ , the perfection  $X^{\text{perf}} \rightarrow X$  induces an isomorphism  $\text{Pic}(X)_{[1/p]} \cong \text{Pic}(X^{\text{perf}})$ . ⌋

**Prop. (27.1.1.7) [Perfection and Ampleness].** If  $X \in \mathcal{S}ch_{\text{qcqs}}/k$  and  $\mathcal{L} \in \text{Pic}(X)$ , then  $\mathcal{L}$  is ample iff the pullback to  $X^{\text{perf}}$  is ample. ⌋

*Proof:* Using the identification

$$\Gamma(X^{\text{perf}}, \mathcal{L}^{\otimes n}) \cong \varinjlim_{f \mapsto f^p} \Gamma(X, \mathcal{L}^{\otimes np^m}) \quad \text{?}$$

this follows from (27.1.1.3) and affineness part of (27.1.1.5). □

**Prop. (27.1.1.8) [Universal Homeomorphisms and Isomorphisms].** If  $f : X \rightarrow Y \in \mathcal{P}erf\mathcal{S}ch_{\text{qcqs}}/k$  is a universal homeomorphism, then  $f$  is an isomorphism. In particular, by (27.1.1.5), for  $f_0 : X_0 \rightarrow Y_0 \in \mathcal{S}ch/\mathbb{F}_p$ ,  $f_0$  is a universal homeomorphism iff  $f_0^{\text{perf}}$  is an isomorphism.

The same statement holds for  $f : X \rightarrow Y \in \mathcal{A}lgSp^{\text{perf, pfp}}/k$  that is separated. ⌋

*Proof:* ? Cf. [B-S17]P345 or [Zhu17]P472. □

**Prop. (27.1.1.9) [Limits of Perfect Schemes].** If  $(X_i)$  is a cofiltered inverse system in  $\mathcal{P}\text{erfSch}_{\text{qcqs}}$  with affine transition maps, then the limit  $X \triangleq \varprojlim_i X_i$  exists in  $\mathcal{P}\text{erfSch}_{\text{qcqs}}$ , and agrees with the limit taken in  $\mathcal{S}\text{ch}_{\text{qcqs}}$ .

And the pullback functor defines an equivalence of categories:

$$2\text{-}\varinjlim \mathcal{P}\text{erfSch}^{\text{pfp}}/X_i \cong \mathcal{P}\text{erfSch}^{\text{pfp}}/X.$$

┘

*Proof:* Use the arguments in [EGA4]Section8.8. ?

□

**Prop. (27.1.1.10) [Perfect Base Change].** If

$$\begin{array}{ccc} X' & \xrightarrow{g'} & X \\ \downarrow f' & & \downarrow f \\ Y' & \xrightarrow{g} & Y \end{array} \in \mathcal{P}\text{erfSch}_{\text{qcqs}}/k$$

is Cartesian, then for any  $K \in D_{\text{Qcoh}}(X)$ , the base change map (7.3.3.18)

$$\text{L}g^* \text{R}f_* K \rightarrow \text{R}f'_* \text{L}g' K$$

is an isomorphism.

┘

*Proof:* It suffices to prove for  $X$  affine. Let  $X = \text{Spec } B, Y = \text{Spec } A, Y' = \text{Spec } A',$  and  $X' = \text{Spec } B \otimes_A A',$  then it suffices to prove that

$$K \otimes_A^{\text{L}} A' \cong K \otimes_B^{\text{L}} B'.$$

This follows from the fact  $B \otimes_A A' = B \otimes_A^{\text{L}} A',$  by (5.5.1.7).

┘

### Perfect Algebraic Stacks

**Def. (27.1.1.13) [Perfect Algebraic Stacks].** A **perfect algebraic stack** over  $k$  is a stack  $\mathcal{X} \in \mathcal{A}\text{lgSta}/k$  s.t.

- The diagonal  $\Delta_{\mathcal{X}}$  is represented by a perfect algebraic space over  $k$ .
- There exists  $U \in \mathcal{A}\text{lgSp}^{\text{perf}}/k$  and a perfectly smooth surjective map (it is automatically representable). Any such  $U$  is called a **smooth atlas** of  $\mathcal{X}$ .

(27.1.1.1).

The category of perfect algebraic stacks over  $k$  is denoted by  $\mathcal{A}\text{lgSta}^{\text{perf}}/k$ .

┘

**Remark (27.1.1.14).** WARNING: Unlike the case of algebraic spaces, perfect algebraic stacks may not be an algebraic stack, and the perfection of an algebraic stack may not exist. ?

┘

**Def. (27.1.1.15) [Properties of Algebraic Stacks].**  $X \in \mathcal{A}\text{lgSta}^{\text{perf}}/k$  is called

- A **quasi-compact perfect algebraic stack** if there exists a quasi-compact smooth atlas  $U \rightarrow X$  (27.1.1.13).
- A **perfect algebraic stack (locally) of f.t.** if there exists a smooth atlas  $U \rightarrow X$  s.t.  $U$  is (locally)perfectly of f.t. over  $k$  (27.1.2.2).  
And a morphism  $f : X \rightarrow Y \in \text{Sta}(\text{Perf}_{\text{fpqc}}/k)$  is called
- A **separated morphism of perfect algebraic stacks** if the diagonal  $\Delta_f$  is perfectly proper.
- A **quasi-separated morphism of perfect algebraic stacks** if the diagonal  $\Delta_f$  is quasi-compact and quasi-separated.
- A **Deligne-Mumford morphism of perfect algebraic stacks** if the diagonal is étale .

┘

## 2 Perfect Algebraic Spaces Perfectly of Finite Type

**Prop. (27.1.2.1)[Perfectly Finitely Presented Morphisms].**  $f : X \rightarrow Y \in \text{PerfSch}_{\text{qcqs}}/k$  (27.1.1.1), the following are equivalent:

- Any open affine subscheme  $\text{Spec } B \subset X$  mapping to an open affine subscheme  $\text{Spec } A \subset Y$ ,  $A \rightarrow B$  is perfectly f.p. (5.5.1.5).
- There is an open affine covering  $\text{Spec } A_i \rightarrow X$  mapping to an open affine covering  $\text{Spec } B_i \rightarrow Y$  that  $B_i \rightarrow A_i$  are all perfectly f.p.
- For any cofiltered system  $\{Z_i\} \in \text{PerfSch}/Y$  with affine transition maps, there is a bijection  $\varinjlim \text{Hom}_Y(Z_i, X) \cong \text{Hom}_Y(\varprojlim Z_i, X)$ .

And in this case,  $f$  is called a **perfectly finitely presented morphism**.

In particular, being perfectly finitely presented is local on the base and target.

┘

*Proof:* Cf. [B-S17]P346?.

□

**Def. (27.1.2.2)[Perfect Algebraic Spaces locally perfectly of Finite Type].** A **perfect algebraic space locally perfectly of finite type** over  $k$  is a perfect algebraic space  $X \in \text{AlgSp}^{\text{perf}}/k$  s.t. there exist an étale affine cover  $\{U_i\}$  of  $X$  s.t. each  $U_i$  is the perfection of an affine scheme of finite type over  $k$ . And it is moreover called a **perfect algebraic space perfectly of finite type** if it is moreover quasi-compact.

A **perfect algebraic space perfectly of finite presentation** over  $k$  is a perfect algebraic space  $X \in \text{AlgSp}^{\text{perf}}/k$  that is quasi-compact and perfectly of f.t..

┘

**Prop. (27.1.2.3)[Finite Presented Models].** Any  $f : X \rightarrow Y \in \text{AlgSta}^{\text{perf}, \text{pfp}}/k$  (27.1.2.2) is a perfection of some  $f' \in \text{AlgSp}^{\text{pf}}/k$ .

┘

*Proof:* Cf. [Zhu17]P472.

□

**Prop. (27.1.2.4).** If  $f : X \rightarrow Y \in \text{PerfSch}_{\text{qcqs}}/k$  is perfectly of finite presentation, perfectly proper and surjective with geometrically connected fibers, then we have  $Rf_* \mathcal{O}_X = \mathcal{O}_Y$ .

┘

*Proof:* Cf. [B-S17]P364?.

□

**Cor. (27.1.2.5)[Isomorphism can be Checked Pointwise].** If  $f : X \rightarrow Y \in \text{PerfSch}^{\text{pfp}, \text{proper}}/k$  s.t.  $f_{\bar{y}}$  is an isomorphism for each geometric point  $\bar{y}$  of  $Y$ , then  $f$  is an isomorphism.

┘

*Proof:* By (27.1.2.3) we can choose a finite type model  $f_0$  of  $f$ , then  $f_0$  is proper and quasi-finite by (27.1.1.5), thus finite, in particular affine. But it follows from (27.1.2.4) that  $Rf_* \mathcal{O}_X = \mathcal{O}_Y$ .

□

**Def. (27.1.2.6) [Perfectly Proper Morphisms].** A morphism  $f : X \rightarrow Y \in \mathcal{AlgSta}^{\text{perf}, \text{pfp}}/k$  is called a **perfectly proper morphism** if it is separated and universally closed.  $\lrcorner$

**Prop. (27.1.2.7).** If  $f : X \rightarrow Y \in \mathcal{AlgSp}^{\text{perf}, \text{pfp}}/k$  is a perfectly proper morphism (27.1.2.6) with geometrically connected fibers, then the natural map  $\mathcal{O}_Y \rightarrow f_*\mathcal{O}_X$  is an isomorphism.  $\lrcorner$

*Proof:* Cf. [Zhu17]P473.  $\square$

**Prop. (27.1.2.8).** If  $f : X \rightarrow Y \in \text{PerfSch}_{\text{qcqs}}/k$  is perfectly of finite presentation, perfectly proper and surjective with geometrically connected fibers, then  $\mathcal{O}_Y \rightarrow f_*\mathcal{O}_X$  is an isomorphism, and the pullback functor  $\text{Coh}_{\text{lf}}(Y) \rightarrow \text{Coh}_{\text{lf}}(X)$  is fully faithful. The same assertion holds for  $\text{Coh}_{\text{lf}}(W_n(Y)) \rightarrow \text{Coh}_{\text{lf}}(W_n(X))$  or  $\text{Coh}_{\text{lf}}(W(Y)) \rightarrow \text{Coh}_{\text{lf}}(W(X))$ .  $\lrcorner$

*Proof:* Using Hom-bundle, it suffices to prove that  $\mathcal{E} \rightarrow f_*f^*\mathcal{E}$  is an isomorphism for each  $\mathcal{E} \in \text{Coh}_{\text{lf}}(Y)$ . For this it suffices to show for  $X, Y$  affine. Choosing a finite type model  $f_0 : X_0 \rightarrow Y_0$  of  $f$  (27.1.2.3), it suffices to show that  $\mathcal{O}_{Y_0} \rightarrow (f_0)_*\mathcal{O}_{X_0}$  is an isomorphism after perfection. But  $\text{Spec}((f_0)_*\mathcal{O}_{X_0}) \rightarrow Y_0$  is finite because of properness, and surjective, and is universally injective because  $f$  has geometrically connected fibers, so it is a universal homeomorphism (7.4.5.25), and its perfection is an isomorphism by (27.1.1.8).  $\square$

**Thm. (27.1.2.9) [Fibral Criterion for Descending Vector Bundles].** If  $f : X \rightarrow Y \in \mathcal{AlgSp}^{\text{perf}, \text{pfp}, \text{proper}}/k$  is surjective s.t. all geometric fibers are connected, then for each  $\mathcal{E} \in \text{Coh}_{\text{lf}}(X)$ ,  $\mathcal{E}$  descends to  $Y$  iff  $\mathcal{E}_{\bar{y}}$  is trivial for each geometric point  $\bar{y}$  of  $Y$ .  $\lrcorner$

*Proof:* Cf. [B-S17]P366.  $\square$

**Def. (27.1.2.10) [Perfectly Smooth Morphisms].** A morphism  $f : X \rightarrow Y \in \mathcal{AlgSp}^{\text{perf}, \text{pfp}}/k$  is called a **perfectly smooth morphism** if for each  $x \in X$ , there exists an étale nbhd  $(U, u) \in \text{PerfSch}$  of  $(X, x)$  and an étale nbhd  $(V, v) \in \text{PerfSch}$  of  $(Y, f(x))$  s.t.  $(U, u) \rightarrow (Y, f(x))$  factors through  $(U, u) \xrightarrow{h} (V, v) \rightarrow (Y, f(x))$ , and  $h$  factors as  $h = \text{pr} \circ h'$ , where  $h' : U \rightarrow V \times (\mathbb{A}^n)^{\text{perf}}$  is étale and  $\text{pr} = \text{pr}_1 : V \times (\mathbb{A}^n)^{\text{perf}} \rightarrow V$ .

A morphism  $f : X \rightarrow Y \in \mathcal{AlgSta}^{\text{perf}, \text{pfp}}/k$  is called a **perfectly smooth morphism** if there exists a smooth atlas  $U \rightarrow X$  s.t.  $U \rightarrow X \rightarrow Y$  is perfectly smooth (which is automatically representable?).

Notice if  $f$  is the perfection of a smooth morphism, then it is perfectly smooth, by (7.6.6.7).  $\lrcorner$

**Prop. (27.1.2.11).** If  $G \in \mathcal{AlgGrp}/k$ , then the stack  $\mathbf{BG}^{\text{perf}}$  is a perfectly smooth perfect algebraic stack over  $k$  (27.1.2.10).  $\lrcorner$

*Proof:* ?  $\square$

## Vector Bundles

**Prop. (27.1.2.12) [Models for Vector Bundles].** Let  $X \in \mathcal{AlgSp}^{\text{perf}, \text{pfp}}/k$  and  $\mathcal{E} \in \text{Coh}_{\text{lf}}(X)$ , then there exists  $X_0 \in \mathcal{AlgSp}^{\text{pf}}/k$  and  $\mathcal{E}_0 \in \text{Coh}_{\text{lf}}(X_0)$  s.t.  $X = X_0^{\text{perf}}$  and  $\mathcal{E} = (X \rightarrow X_0)^*\mathcal{E}_0$ .  $\lrcorner$

*Proof:* Cf. [Zhu17]P473?.  $\square$

**Cor. (27.1.2.13) [Relative Grassmannian].** If  $X \in \mathcal{AlgSp}^{\text{perf}, \text{pfp}}/k$  and  $\mathcal{E} \in \text{Coh}_{\text{lf}}^n(X)$ ,  $i \in \mathbb{N}$ , then the functor that assigns to each  $f : Y \rightarrow X \in \text{PerfSch}_{\text{qcqs}}/X$  the set of rank  $i$  quotients  $\mathcal{Q}$  of  $f^*\mathcal{E}$  is represented by a perfect algebraic space  $\text{Gr}^{\text{perf}}(\mathcal{E}, i)$  which is the perfection of a proper scheme over  $X$ . And if  $X \in \text{PerfSch}^{\text{pfp}}/k$ , then  $\text{Gr}^{\text{perf}}(\mathcal{E}, i)$  is the perfection of a smooth projective scheme over  $X$ .  $\lrcorner$

*Proof:* If  $(X_0, \mathcal{E}_0)$  is a model of  $(X, \mathcal{E})$  (27.1.2.12), then the functor is represented by  $\mathrm{Gr}^{\mathrm{perf}}(i, \mathcal{E}) \stackrel{\Delta}{=} \mathrm{Gr}(\mathcal{E}_0, i)^{\mathrm{perf}}$  (10.9.2.14) (the proof of this fact should be similar to the proof of (27.1.2.12)).  $\square$

### 3 Perfect Group Schemes

**Prop. (27.1.3.1).** For any  $H \in \mathrm{PerfSch}^{\mathrm{pfp}}/k$  (27.1.2.2), there exists  $H_0 \in \mathrm{AlgGrp}^{\mathrm{sm}}/k$  s.t.  $H = H_0^{\mathrm{perf}}$ . In particular,  $H$  is perfectly smooth (27.1.2.10).  $\lrcorner$

*Proof:* Cf. [Zhu17]P475.  $\square$

**Thm. (27.1.3.2) [Quotients by Perfect Groups].** Suppose  $H \in \mathrm{GrpSch}^{\mathrm{perf}, \mathrm{pfp}}/k$  acts freely on  $X \in \mathrm{PerfAff}^{\mathrm{pfp}}/k$  (i.e.  $(\lambda, \mathrm{id}) : H \times X \rightarrow X \times X$  is a monomorphism). then  $X/H \stackrel{\Delta}{=} \mathcal{Y}_X / \mathcal{Y}_H \in \mathrm{Sh}(\mathrm{PerfAff}_{\mathrm{fpqc}}/k)$  (27.1.1.4) is representable by a perfect scheme perfectly of finite presentation over  $k$ . If in addition  $(\lambda, \mathrm{id})$  is a closed embedding, then  $X/H \in \mathrm{AlgSp}^{\mathrm{perf}, \mathrm{sep}}/k$ .  $\lrcorner$

*Proof:* Cf. [Zhu17]P476.  $\square$

**Prop. (27.1.3.3) [Group Actions].** Suppose  $H \in \mathrm{GrpSch}_{\mathrm{cnd}}^{\mathrm{perf}, \mathrm{pfp}}/k$  acts on  $X \in \mathrm{AlgSp}^{\mathrm{perf}, \mathrm{sep}, \mathrm{pfp}}/k$ . If  $x \in |X|_0$  and  $H_x$  is the stablizer of  $x$  in  $H$ , then  $H/H_x \rightarrow X$  (27.1.3.2) is a locally closed embedding.  $\lrcorner$

*Proof:* Cf. [Zhu17]P477.  $\square$

**Prop. (27.1.3.4) [Perfect Torsors].** For  $H \in \mathrm{GrpSch}^{\mathrm{aff}}/k$  and  $X \in \mathrm{AlgSp}/k$ , If  $E/X \in \mathrm{Sh}(\mathrm{Aff}_{\mathrm{fpqc}}/k)$  is an  $H$ -torsor (7.1.1.16), then  $E$  is represented by an algebraic space affine over  $X$ . And if  $H, X$  are both perfect, then  $E$  is also perfect.  $\lrcorner$

*Proof:* This is because  $E^{\mathrm{perf}} \rightarrow E$  is a morphism of  $H$ -torsors, thus an isomorphism.  $\square$

**Prop. (27.1.3.5) [De-perfection of Perfect Torsors].** For  $H \in \mathrm{GrpSch}^{\mathrm{aff}, \mathrm{sm}}/k$  and  $X \in \mathrm{AlgSp}^{\mathrm{perf}}/k$ , then the functor  $(-)^{\mathrm{perf}} : \mathrm{Tors}_H(X) \rightarrow \mathrm{Tors}_{H^{\mathrm{perf}}}(X)$  is an equivalence of groupoids.  $\lrcorner$

*Proof:* Cf. [Zhu17]P468.  $\square$

### 4 $\ell$ -Adic Sheaves

**Notation (27.1.4.1).**

- Let  $\ell \in \mathrm{Prime} \setminus \{p\}$ .

**Prop. (27.1.4.2) [Constructible  $\ell$ -adic Sheaves].** For  $X \in \mathrm{AlgSp}^{\mathrm{perf}, \mathrm{pfp}}/k$ , we can define  $D_{\mathrm{const}}^b(X, \overline{\mathbb{Q}}_\ell)$ . And if  $\varepsilon : X \rightarrow X'$  is a model for  $X$ , then there is a pair of equivalence of categories:

$$\varepsilon^* : D_{\mathrm{const}}^b(X', \overline{\mathbb{Q}}_\ell) \cong D_{\mathrm{const}}^b(X, \overline{\mathbb{Q}}_\ell) : \varepsilon_*$$

One can define six operations between these categories, and usual proper base change or smooth base change holds for perfectly proper or perfectly smooth maps.  $\lrcorner$

*Proof:* Cf. [Zhu17]P478.  $\square$

**Prop. (27.1.4.3) [Perverse Sheaves].** For  $X \in \mathcal{A}lgSp^{\text{perf}, \text{pfp}}/k$ , proper base change and smooth base change hold. In particular, we can define the category  $\text{Perv}_\ell(X)$  of perverse sheaves on  $X$ .

And we have the notion of the Goresky-Macpherson intermediate extension, and for every  $X$ , the intersection cohomology sheaf  $\text{IC}_{X, \ell}$ . The restriction of  $\text{IC}_{X, \ell}$  to each perfectly smooth open subset  $U$  is canonically isomorphic to  $\overline{\mathbb{Q}}_\ell[2 \dim X](\dim X)$ .  $\lrcorner$

*Proof:* ?  $\square$

**Prop. (27.1.4.4).**  $\lrcorner$

**Prop. (27.1.4.5) [Chern Classes for Homogenous Spaces].** For  $G \in \mathcal{A}lgGrp_{\text{cntd}}/k$  and  $X \in \mathcal{A}lgSp^{\text{perf}, \text{sep}, \text{pfp}}/k$ , we can define the characteristic class

$$c(E) : R_{G, \ell} \rightarrow H_{\text{ét}}^*(X_{\overline{k}}, \overline{\mathbb{Q}}_\ell).$$

$\lrcorner$

*Proof:* Cf. [Zhu17]P479.  $\square$

**Prop. (27.1.4.6) [Lefschetz Trace Formulae].** Lefschetz trace formulae (9.6.2.13) holds for morphism of separated pfp perfect algebraic spaces over  $\mathbb{F}_q$ .  $\lrcorner$

*Proof:* ?  $\square$

**Prop. (27.1.4.7) [Equivariant Perverse Sheaves].** For  $J \in \mathcal{G}rpSch^{\text{perf}, \text{aff}}/k$  and  $X \in \mathcal{A}lgSp^{\text{perf}, \text{sep}, \text{pfp}}/k$  with an action  $\lambda$  of  $J$ , the category  $\text{Perv}_{J, \ell}(X)$  of  **$J$ -equivariant perverse sheaves** on  $X$  consists of pairs  $(A, \varphi)$  where  $A \in \text{Perv}_\ell(X)$  and  $\varphi : \text{pr}_2^* A \cong \lambda^* A \in \text{Perv}_\ell(F)$  is an isomorphism.

For a closed normal subgroup  $J_1 \trianglelefteq J$ ,

- If  $J_1$  acts freely on  $X$ , then  $\text{pr} : X \rightarrow X/J_1$  induces an equivalence of categories

$$\text{pr}^*[\dim J_1] : \text{Perv}_{J/J_1, \ell}(X/J_1) \cong \text{Perv}_{J, \ell}(X).$$

- If  $J_1$  is cntd and acts trivially on  $X$ , then there is a natural equivalence of categories:

$$\text{Perv}_{J/J_1, \ell}(X) \cong \text{Perv}_{J, \ell}(X).$$

$\lrcorner$

*Proof:* Cf. [Zhu, An introduction to affine Grassmannians and the geometric Satake equivalence]A.1.4.  $\square$

**Prop. (27.1.4.8) [Equivariant Cohomologies].** Situation as in (27.1.4.7), for  $A \in \text{Perv}_J(X)$ , we can define the  **$J$ -equivariant cohomology**  $H_J^*(X_{\overline{k}}, A)$ . ? Cf. [Zhu17]P481.

Then for a closed normal subgroup  $J_1 \trianglelefteq J$ ,

- If  $J_1$  acts freely on  $X$ , then for each  $A \in \text{Perv}_{J/J_1, \ell}(X/J_1)$ , there are natural isomorphisms

$$H_{J, \ell}^*(X_{\overline{k}}, \text{pr}^* A) \cong H_{J/J_1, \ell}^*((X/J_1)_{\overline{k}}, A).$$

- If  $J_1$  is the perfection of a unipotent group and acts trivially on  $X$ , then for each  $A \in \text{Perv}_{J, \ell}(X)$ , there are natural isomorphisms

$$H_{J, \ell}^*(X_{\overline{k}}, A) \cong H_{J/J_1, \ell}^*(X_{\overline{k}}, A).$$

$\lrcorner$

*Proof:* Cf. [Zhu17]P482.  $\square$

## 27.2 Formal and Rigid Geometry

References are [BGR84, Bos15].

**Notation (27.2.0.1).**

- Let  $(K, |\cdot|_K, \mathcal{O}_K, \kappa)$  be a complete non-Archimedean valued field.
- Use notations on affinoid  $K$ -algebras defined in [Affinoid Algebras](#).

┘

### 1 Affinoid $K$ -Spaces

**Def. (27.2.1.1) [Affinoid  $K$ -Space].** An affinoid  $K$ -algebra  $A$  can be viewed as the function ring on the space  $\mathrm{Sp} A$  of maximal ideals of  $A$  with the usual Zariski topology called the **affinoid  $K$ -space associated to  $A$** . A morphism of affinoid algebras induce a map on their affinoid spectra. This is because residue fields of maximal ideals are finite over  $K$ . So we *define* the category of affinoid  $K$ -spaces as the opposite category of affinoid  $K$ -algebras.

┘

**Cor. (27.2.1.2).** The category of affinoid spaces admits fiber products, because of (12.2.4.31).

┘

**Prop. (27.2.1.3).** By the properties of a Jacobson space (4.12.2.25)(4.12.2.22), the affinoid  $K$ -space has good properties w.r.t. closed, open hence irreducible compared to  $\mathrm{Spec} A$  in Zariski topology. In particular, it is a Noetherian space.

┘

**Def. (27.2.1.4) [Canonical Topology].** The affinoid  $K$ -space has another topology, called the **canonical topology**, generated by  $X(f, \varepsilon) = \{x | f(x) \leq \varepsilon\}$  as a subbasis. And this topology is in fact generated by  $X(f) = X(f, 1)$  as a subbasis.

┘

*Proof:* For the last assertion, notice  $f(x)$  assume value in  $|\overline{K}|$ , which is dense in  $\mathbb{R}_+$ , so we can assume  $\varepsilon \in |\overline{K}|$  (by approximation from below), hence  $\varepsilon^n = |c|$ , where  $c \in K$ , so  $X(f, \varepsilon) = X(f^n, c) = X(c^{-1}f^n)$ .  $\square$

**Prop. (27.2.1.5).**  $\{x | f(x) = \varepsilon\}$  is open in  $\mathrm{Sp} A$ .

┘

*Proof:* We let  $f(x) = \varepsilon$  and  $k = A/\mathfrak{m}_x$ , let the minipoly of  $f$  in  $A/\mathfrak{m}_x$  be  $P$  of degree  $n$ , and let  $g = P(f)$ , then  $g(x) = 0$ , and if  $|g(y)| < \varepsilon^n$ , then  $|f(y)| = \varepsilon$ , otherwise  $|f(y) - \alpha_i| \geq |\alpha_i| = \varepsilon$  for every root  $\alpha_i$  of  $P$ , hence  $|P(f(y))| \geq \varepsilon^n$ , contradiction.  $\square$

**Cor. (27.2.1.6).** By the proof, we have,  $X(f_1, \dots, f_r)$ ,  $f_i \in \mathfrak{m}_x$  forms a basis of  $x$  in  $\mathrm{Sp} A$ . (Replace every  $X(f_i)$  by  $\{y | |f_i(y)| = \varepsilon\}$ , then by some  $X(g_i)$  for  $g_i \in \mathfrak{m}_x$ ).

┘

**Def. (27.2.1.7) [Affinoid Subdomain].** For an affinoid  $K$ -space  $X$ , a subset  $U$  is called a **affinoid subdomain** of  $X$  if there is an closest affinoid space map  $X' \rightarrow X$  with image in  $U$ , i.e. any other these maps factor through it. The definition is weird but the situation is clarified by the following proposition.

┘

**Prop. (27.2.1.8).** For an affinoid subdomain  $i : X' \rightarrow X$ ,

- $i$  is injective and  $\mathrm{Im} i = U$ .
- $i^*$  induce an isomorphism  $A/\mathfrak{m}_{i(x)}^k \cong A'/\mathfrak{m}_x^k$ .
- $\mathfrak{m}_x = \mathfrak{m}_{i(x)} A'$ .

┘

*Proof:* Consider a point  $y \in U$ , there is a commutative diagram

$$\begin{array}{ccc} A & \xrightarrow{i^*} & A' \\ \downarrow & \swarrow \alpha & \downarrow \\ A/\mathfrak{m}_y^n & \xrightarrow{\sigma} & A'/\mathfrak{m}_y^n A' \end{array}.$$

Then there is a map  $\alpha : A' \rightarrow A/\mathfrak{m}_y^n$  that makes the upper diagram commutative by universal property of subdomain, and the lower triangle is commutative by universal properties again. Then we see  $\sigma$  is surjective and notice the kernel of the projection is  $\mathfrak{m}_y A'$  is in the kernel of  $\alpha$ , thus  $\sigma$  is injective.

Now the case  $n = 1$  shows  $\mathfrak{m}_y A'$  is maximal, hence  $i$  is surjective and the inverse image is just one point.  $\square$

**Prop. (27.2.1.9) [Special Subdomains].** There are three special affinoid subdomain of  $X$ : **Weierstrass domain**  $X(f_1, \dots, f_r)$ , **Laurent domain**  $X(f_1, \dots, f_r, g_1^{-1}, \dots, g_s^{-1})$ , **rational domain**  $X(\frac{f_1}{f_0}, \dots, \frac{f_r}{f_0}) = \{x \mid |f_i(x)| \leq |f_0(x)|\}$  for  $(f_0, \dots, f_r) = (1)$ . They are all open by (27.2.1.5).  $\lrcorner$

*Proof:* The Weierstrass domain corresponds to  $A \rightarrow A\langle X_1, \dots, X_r \rangle / (X_i - f_i)$ .

The Laurent domain corresponds to  $A \rightarrow A\langle X_1, \dots, X_{r+s} \rangle / (X_i - f_i, 1 - X_{r+j} g_j)$ .

The rational domain corresponds to  $A \rightarrow A\langle X_1, \dots, X_r \rangle / (f_i - f_0 X_i)$ .

They are affinoid subdomains is in fact, easily checked.  $\square$

**Lemma (27.2.1.10).** Weierstrass domain are Laurent, and Laurent domain are rational, this is because intersection of rational domains are rational.

Any rational domain is a Weierstrass domain of a Laurent domain.  $\lrcorner$

*Proof:* Notice a Laurent subdomain is a finite intersections of  $X(\frac{f}{1})$  and  $X(\frac{1}{g})$ , so it is rational.

For a rational domain  $U$ ,  $f_0$  is a unit in  $\mathcal{O}(U)$ , hence its inverse has a bounded value, then  $|cf_0| > 1$  for some  $c \in K^*$ . Hence  $U$  is Weierstrass in  $X((cf_0)^{-1})$ .  $\square$

**Cor. (27.2.1.11) [Pullback & Composition of Affinoid Subdomain].** The pullback (hence intersections) of affinoid subdomains is affinoid subdomain and it is just the set-theoretic inverse image, and specialness are preserved.

The affinoid subdomain of an affinoid subdomain is affinoid subdomain, and Weierstrassness and rationalness are preserved (while Laurentness not).  $\lrcorner$

*Proof:* Pullback: fiber product exist in the category of affinoid  $K$ -spaces, then the universal property is checked. The set-theoretic property follows from (27.2.1.8).

Speciality: Clear.

Transitivity: Clear by universal property.

For the speciality, if  $V = X(f_i)$ ,  $U = V(g_j)$  is Weierstrass, then because by (12.2.4.27)  $A$  is dense in  $A\langle f_i \rangle$ , we can replace  $g_j$  by elements from  $A$ , by adding elements of small sup-norm, because valuation is non-Archimedean. Then  $U = X(f_i, g_j)$ . For the rational subdomain  $V = X(\frac{f_1}{f_0}, \dots, \frac{f_r}{f_0})$ , use (27.2.1.10), it suffices to prove for  $U = V(g)$  or  $U = V(g^{-1})$ . For this, notice the image of  $A[f_0^{-1}]$  is dense in  $A\langle \frac{f_1}{f_0}, \dots, \frac{f_r}{f_0} \rangle$ , by (12.2.4.27), so as before, we change  $g$  that it  $g_0 f_0^n g \in A$  for some  $n$ . Now

$$V(g) = V \cap \{x \in X \mid |g_0(x)| \leq |f_0^n(x)|\}, \quad V(g^{-1}) = V \cap \{x \in X \mid |g_0(x)| \geq |f_0^n(x)|\}.$$

But now  $f_0^n$  is a unit in  $A\langle \frac{f_1}{f_0}, \dots, \frac{f_r}{f_0} \rangle$ , so  $|f(x)|_{\sup} \geq |c|$  for some  $c \in K^*$ , so

$$V(g) = V \cap X\left(\frac{g_0}{f_0^n}, \frac{c}{f_0^n}\right), \quad V(g^{-1}) = V \cap X\left(\frac{f_0^n}{g_0}, \frac{c}{g_0}\right).$$

is rational in  $X$ .  $\square$

**Cor. (27.2.1.12).** For a special subdomain  $U$  of  $X$ , the canonical topology induces the canonical topology of  $U$ , by the transitivity property of affinoid subdomains and (27.2.1.10). In fact, by (27.2.1.14), any affinoid subdomain is open and the topology coincides.  $\lrcorner$

**Prop. (27.2.1.13).** Let  $\varphi : Y = \mathrm{Sp} B \rightarrow X = \mathrm{Sp} A$  be a morphism, if  $x$  is a point of  $X$  that  $A/\mathfrak{m}_x \rightarrow B/\mathfrak{m}_x B$  is a surjection, then there is an affinoid nbhd  $U$  of  $x$  that  $\varphi$  restricts to a closed immersion on  $\varphi^{-1}(U)$ . If  $A/\mathfrak{m}_x^n \cong B/\mathfrak{m}_x^n$  for all  $n$ , then there is an affinoid nbhd  $U$  of  $x$  that  $\varphi$  restricts to an isomorphism  $\varphi^{-1}(U) \cong U$ .  $\lrcorner$

*Proof:* Cf.[Rigid and Formal Geometry P57].  $\square$

**Cor. (27.2.1.14).** Every affinoid subdomain of  $X$  is open and has the restriction topology of  $X$  (canonical topology), because it satisfies the second condition of (27.2.1.13), by (27.2.1.8).  $\lrcorner$

**Lemma (27.2.1.15).** If  $f \in A\langle X_1, \dots, X_n \rangle$  is  $X_n$ -distinguished of order  $\leq s$  for each element of  $\mathrm{Sp} A$ , then the set of elements that  $f$  is  $X_n$ -distinguished of exact order  $s$  is a rational subdomain of  $A$ .  $\lrcorner$

*Proof:* Let  $f = \sum f_v X_n^v$ , let the constant coefficient of  $f_v$  be  $a_v$ , then the set is in fact  $U = \{x \in \mathrm{Sp} A \mid |a_v(x)| \leq |a_s(x)|\}$ . This is because, if  $f$  is distinguished of order  $s_x$  at  $x$ , then  $a_{s_x} \neq 0$  because  $f_{s_x}$  is a unit, and  $|a_v|_x \leq |f_v|_x \leq |f_{s_x}|_x = |a_{s_x}|_x$  for  $v \leq s_x$  and strict inequality holds for  $v > s_x$ . In particular,  $a_0, \dots, a_s$  cannot have a common zero, so it is truly a rational subdomain.  $\square$

**Prop. (27.2.1.16).** If  $f \in A\langle X_1, \dots, X_n \rangle$  is  $X_n$ -distinguished of order  $s$  for each element of  $\mathrm{Sp} A$ , then the map

$$A\langle X_1, \dots, X_{n-1} \rangle \rightarrow A\langle X_1, \dots, X_n \rangle / (f)$$

is finite.  $\lrcorner$

*Proof:* Cf.[Rigid And Formal Geometry P79].  $\square$

### Presheaf of Affinoid Functions

**Def. (27.2.1.17)[G-Topology on Affinoid Spaces].** The **weak Grothendieck category** (affine topology) on an affinoid space  $X$  has coverings defined by the finite cover between affinoid subdomains, called **affinoid coverings**.

The **strong Grothendieck category** (fpqc topology) on an affinoid space  $X$  is defined by: objects are unions of affinoid subdomains  $U = \cup U_i$  that for any morphism from an affinoid space  $\varphi : Z \rightarrow U \subset X$ , the pullback covering  $\cup \varphi^{-1}(U_i)$  has a finite subcover by affinoid subdomains. A covering is defined by the same finiteness property.

The strong Grothendieck topology satisfies completeness conditions  $G_0, G_1, G_2$  defined in (7.1.1.12), as easily verified.

The weak Grothendieck topology is a temporary notion, it will be obsolete after Tate's acyclicity theorem is proved. Admissible opens and admissible coverings are notions w.r.t. the strong Grothendieck topology.  $\lrcorner$

*Proof:* The weak Grothendieck category is a Grothendieck category by (27.2.1.11). The strong Grothendieck category is a Grothendieck category because: the finiteness condition lifts along base change, and also for base change, because we can first choose a finite subcover, then choose a finite subcover of the base change covering of that finite covering.  $\square$

**Def. (27.2.1.18) [Rational Coverings and Laurent Coverings].** For  $n$  functions  $f_1, \dots, f_n$  without common zeros, the rational subdomains  $U_i = X(\frac{f_1}{f_i}, \dots, \frac{f_n}{f_i})$  is an affinoid covering, called a **rational covering**. For  $n$  functions  $f_1, \dots, f_n$ , there is a **Laurent covering**  $X(\prod f_i^{\varepsilon_i}), \varepsilon_i = \pm 1$ .  $\lrcorner$

**Prop. (27.2.1.19).** Morphisms of affinoid spaces are continuous in weak Grothendieck topology by (27.2.1.11). It is also continuous in the strong Grothendieck topology, as one can check the finiteness conditions.  $\lrcorner$

**Prop. (27.2.1.20).** Let  $X$  be an affinoid  $K$ -space, for any  $f \in \mathcal{O}_X(X)$ , consider the following sets:

$$U_1 = \{x : |f(x)| < 1\}, \quad U_2 = \{x : |f(x)| > 1\}, \quad U_3 = \{x : |f(x)| > 0\}.$$

Then any finite union of sets of the form is admissible, and any finite cover by finite union of sets of the form is an admissible covering.  $\lrcorner$

*Proof:* We first show that  $U_1$  is admissible open, the others are similar. Let  $\varepsilon_n$  be an ascending sequence of elements in  $\sqrt{|K^*|}$  converging to 1, then  $U_1 = \cup_n X(\varepsilon_n^{-1}f)$  is a union of open subsets because  $\varepsilon_n \in \sqrt{|K^*|}$ . Now for any affinoid space  $Z$  mapping into  $U_1$ ,  $|\varphi^*(f)(z)|_{\sup} < 1$  for all  $z \in Z$ , thus by maximum principle (12.2.4.22),  $|f|_{\sup} < 1$ , thus the cover  $U_1 = \cup_n X(\varepsilon_n^{-1}f)$  can be refined by a finite cover. This proves that it is admissible open.

For the admissibility of covering, the proof is similar, but use the following lemma (27.2.1.21).  $\square$

**Lemma (27.2.1.21).** For any affinoid  $K$ -algebra  $A$ , if  $f_i, g_j, h_k$  are system of functions on  $A$  that: for every  $x \in A$ , either  $|f_i(x)| < 1$ ,  $|g_j| > 1$  or  $h_k(x) > 0$ , then we can replace  $>, <$  by  $\geq, \leq$  and elements in  $\sqrt{|K^*|}$  that the same condition is true.  $\lrcorner$

*Proof:* Cf. [Rigid and Formal Geometry P97].  $\square$

**Cor. (27.2.1.22).** The strong Grothendieck category is finer than the Zariski category, because any standard affine open set is of the form  $U_3$  and also Zariski covering is open covering because  $\mathrm{Sp}(A)$  is Noetherian (12.2.4.17).  $\lrcorner$

**Def. (27.2.1.23) [Presheaf of Affinoid Functions].** There is a **presheaf of affinoid functions** defined on the weak Grothendieck topology because of the universal property of the affinoid subdomains.

Then the stalk  $\mathcal{O}_{X,x}$  are local ring with maximal ideal  $\mathfrak{m}_x \mathcal{O}_{X,x}$ . Hence let  $X = \mathrm{Sp} A$ , the stalk map factor thorough  $A \rightarrow A_{\mathfrak{m}_x} \hookrightarrow \mathcal{O}_{x,X}$ , and

$$A/\mathfrak{m}_x^n \cong A_{\mathfrak{m}_x}/\mathfrak{m}_x^n A_{\mathfrak{m}_x} \cong \mathcal{O}_{X,x}/\mathfrak{m}_x^n \mathcal{O}_{X,x}$$

so it induces isomorphisms between their  $\mathfrak{m}_x$ -adic completions.  $\lrcorner$

*Proof:* By (27.2.1.8), there is an isomorphism  $K' = \mathcal{O}_X(X)/\mathfrak{m}_x \cong \mathcal{O}_X(U)/\mathfrak{m}_x \mathcal{O}(U)$ . Take the converse and pass to direct colimit (it is exact),  $\mathcal{O}_{X,x}/\mathfrak{m}_x \mathcal{O}_{X,x} \cong K'$ . This map will be regarded as evaluation at  $x$ . The kernel  $\mathfrak{m}_x \mathcal{O}_{X,x}$  is a maximal ideal. There are no other maximal ideals in  $\mathcal{O}_{X,x}$  because if  $f$  is not in the kernel, then  $f(x) \neq 0$ , and multiply by an element in  $K^*$ , it can be made  $|f(x)| \geq 1$ , and then  $U(f^{-1})$  is an affinoid subdomain containing  $x$  that  $f$  is invertible in it.

For the second assertion, for an affinoid subdomain  $\mathrm{Sp} A'$ , there are maps

$$A/\mathfrak{m}^n \rightarrow A'/\mathfrak{m}^n \rightarrow \mathcal{O}_{X,x}/\mathfrak{m}^n \mathcal{O}_{X,x}.$$

We first show these are isomorphisms: the first map is an isomorphism by (27.2.1.8), then take direct colimit, the composition map is also isomorphism.

$A/\mathfrak{m}_x^n \cong A_{\mathfrak{m}_x}/\mathfrak{m}_x^n A_{\mathfrak{m}_x}$  is classical.

$A_{\mathfrak{m}_x} \hookrightarrow \mathcal{O}_{x,X}$  is injective because by Krull's intersection theorem (5.2.2.15),  $A_{\mathfrak{m}_x} \hookrightarrow \mathcal{O}_{x,X} \rightarrow \widehat{\mathcal{O}_{X,x}} \cong \widehat{A_{\mathfrak{m}_x}}$  is injective.  $\square$

**Cor. (27.2.1.24).**  $f \in A = \mathcal{O}_X(X)$  vanish iff it vanish at every stalk, this is because  $A \rightarrow \prod_{\mathfrak{m}} A_{\mathfrak{m}} \rightarrow \prod \mathcal{O}_{X,x}$  is injective.  $\lrcorner$

**Cor. (27.2.1.25).** Giving a covering of affinoid subdomain of an affinoid space  $X_i \rightarrow X$ , then  $\mathcal{O}_X(X) \rightarrow \prod \mathcal{O}_{X_i}(X_i)$  is an injection. (This is because the kernel vanishes at each stalk.)  $\lrcorner$

**Cor. (27.2.1.26).** For a subdomain of an affinoid space  $X$ , the corresponding ring map is flat.  $\lrcorner$

*Proof:* Cf.[Formal and Rigid Geometry P68].  $\square$

**Prop. (27.2.1.27).** The stalk  $\mathcal{O}_{X,x}$  is Noetherian, in particular, it is  $\mathfrak{m}$ -adically separated by Krull's intersection theorem(5.2.2.15).  $\lrcorner$

*Proof:* First it is  $\mathfrak{m}$ -adically separated, because by(27.2.1.23), for a  $f \in \cap \mathfrak{m}^n \mathcal{O}_{X,x}$ , we can choose an affinoid subdomain  $\text{Sp } A$  that  $f \in A$ (27.2.1.8), then  $f \in \mathfrak{m}^n A$ , so by Krull's intersection theorem(5.2.2.15), we have  $f = 0$  in  $A_{\mathfrak{m}}$ .

In the same way, any f.g. ideal  $\mathfrak{a}$  of  $\mathcal{O}_{X,x}$  is  $\mathfrak{m}$ -adically closed, this is because it is generated by an ideal in the affinoid algebra of a nbhd, and then  $\mathcal{O}_{x,X}/\mathfrak{a}$  is separated as the stalk of an affinoid algebra  $A'/\mathfrak{a}'$ .

Now pass a chain of f.g. ideals to their completion, then that chain is stationary because  $\hat{\mathcal{O}}_{X,x} = \hat{A}_{\mathfrak{m}_x}$  is Noetherian(5.1.1.45). And now this chain is also stationary because ideals are closed in  $\mathfrak{m}$ -adic topology.  $\square$

### Locally Closed Immersions

**Def. (27.2.1.28) [Immersion].** A morphism of affinoid spaces is called a **closed immersion** iff the corresponding ring map is surjective. It is called a **locally closed immersion** iff it is injective and the stalk map are all surjective. It is called an **open immersion** iff it is injective and the corresponding stalk maps are isomorphism. All these notions are stable under compositions.

An affinoid subdomain is an open immersion by(27.2.1.8)(27.2.1.23) and(27.2.1.27).  $\lrcorner$

**Lemma (27.2.1.29).** Base change by affinoid subdomain of closed/locally closed/open immersions are of the same type.  $\lrcorner$

*Proof:* This is obvious for locally close and open, because affinoid subdomains are open(27.2.1.14), for the closed immersion, use(12.2.4.33).  $\square$

**Prop. (27.2.1.30).** A closed immersion of affinoid spaces is equivalent to a locally closed immersion that the corresponding ring map is finite.  $\lrcorner$

*Proof:* Cf.[Rigid and Formal Geometry P70]. A closed immersion  $X' \rightarrow X$  is a locally closed immersion because the canonical topology of  $\text{Sp } A$  restricts to the canonical topology on  $\text{Sp } A/\mathfrak{a}$ (27.2.1.4), then use(12.2.4.33), and the fact direct limit is exact.  $\square$

**Prop. (27.2.1.31)[Clopen Immersion].** The image of an open and closed immersion is Zariski closed and open. In particular, it is a Weierstrass subdomain.  $\lrcorner$

*Proof:* Cf.[Rigid and Formal Geometry P71].  $\square$

**Def. (27.2.1.32).** A **Runge immersion** is a closed immersion followed by an open immersion of Weierstrass subdomain. Runge immersion is stable under base change of affinoid subdomains by(27.2.1.29)  $\lrcorner$

**Prop. (27.2.1.33) [Equivalent Definition of Runge Immersions].** For a morphism  $\sigma : A \rightarrow A'$ ,  $\mathrm{Sp} A' \rightarrow \mathrm{Sp} A$  is a Runge immersion iff  $\sigma(A)$  is dense in  $A'$  iff  $\sigma(A)$  contains a set of affinoid generator of  $A'$  over  $A$ .  $\lrcorner$

*Proof:* For a Runge immersion,  $\sigma(A)$  is dense in  $A'$ , because this is true for Weierstrass subdomain and closed immersion.

If  $\sigma(A)$  is dense in  $A'$ , then by (12.2.4.29), we can modify a set of affinoid generators by a set of affinoid generators in  $\sigma(A)$ .

If  $h_i$  is a set of affinoid generators in  $\sigma(A)$ , then  $A \rightarrow A\langle h_i \rangle \rightarrow A'$  is a Runge immersion.  $\square$

**Cor. (27.2.1.34).** Runge immersion is stable under composition.  $\lrcorner$

**Prop. (27.2.1.35).** An open and Runge immersion is an immersion of Weierstrass subdomain.  $\lrcorner$

*Proof:* By localizing on this Weierstrass subdomain, and notice Weierstrass subdomain is stable under composition (27.2.1.11), we reduce to clopen immersion case, and result follows by (27.2.1.31).  $\square$

**Lemma (27.2.1.36) [Extension of Runge Immersion].** For a morphism of affinoid spaces  $X' \rightarrow X = \mathrm{Sp} A$ , if  $f_1, \dots, f_n, g$  generate  $A$ , for  $\varepsilon \in \sqrt{\{|K^*|\}}$ , denote  $X_\varepsilon = \{x \mid |f_i(x)| \leq \varepsilon |g|\}$ , this is a rational subdomain. The inverse image of  $X_\varepsilon$  is  $X'_\varepsilon$ , then if  $X'_{\varepsilon_0} \rightarrow X_{\varepsilon_0}$  is a Runge immersion for some  $\varepsilon_0$ , then there is a  $\varepsilon > \varepsilon_0$  that  $X'_\varepsilon \rightarrow X_\varepsilon$  is also a Runge immersion.  $\lrcorner$

*Proof:* Cf. [Rigid and Formal Geometry P73].  $\square$

**Prop. (27.2.1.37) [Gerritzen-Grauert].** For a locally closed immersion  $\varphi : X' \rightarrow X$ , there is a finite cover of  $X$  of rational subdomains  $X_i$  that  $\varphi^{-1}(X_i) \rightarrow X_i$  are Runge immersions.  $\lrcorner$

*Proof:* Cf. [Formal and Rigid Geometry P79].  $\square$

**Cor. (27.2.1.38) [Gerritzen-Grauert].** Any affinoid subdomain is equivalent to a finite union of rational subdomains.  $\lrcorner$

*Proof:* An affinoid subdomain is an open immersion by (27.2.1.28), so  $\varphi^{-1}(X_i) \rightarrow X_i$  is open and Runge, so it is Weierstrass by (27.2.1.35). In particular,  $X \cap X_i$  is rational in  $X$  by transitivity, thus the result.  $\square$

### Tate's Acyclicity

**Lemma (27.2.1.39) [Reduction of Weak Grothendieck Topology].**

- Every affinoid covering has a refinement of rational covering.
  - For every rational covering, there is a Laurent covering  $\{V_i\}$  that restriction on each  $V_i$  is rational covering generated by units.
  - Every rational covering generated by units has a refinement of Laurent covering.
- $\lrcorner$

*Proof:* 1: By (27.2.1.38), we can assume the covering consists of rational subdomains  $U_i = X(\frac{f_{i1}, \dots, f_{ii_k}}{f_{i0}})$ , then consider the elements  $f_{v_1 \dots v_n} = \prod_{i=1}^n f_{iv_i}$ , where at least some  $v_i = 0$ . Denote the set of these elements by  $I$ .

Firstly, these elements has no common zero on  $X$ , thus generating a rational covering of  $X$ : for any  $x \in U_i$ ,  $f_{i0}$  doesn't vanish at  $x$ , thus the product  $\prod_{j \neq i} f_{jv_j}$  vanishes for all choices of  $v_j$ , but this is impossible because for each  $j$ ,  $(\{f_{ik}\}_k) = (1)$ .

Secondly, this is a refinement of  $U_i$ : We show  $X_{f_{v_1 \dots v_n}} \subset U_k$  where  $v_k = 0$ . For this, consider  $x \in X_{f_{v_1 \dots v_n}}$ , then  $x \in U_j$  for some  $j$ . If  $j = k$ , we are done, otherwise,

$$|f_{v_1 \dots \mu_k \dots v_n}(x)| \leq |f_{v_1 \dots 0 \dots \mu_k \dots v_n}(x)| \leq |f_{v_1 \dots v_n}(x)|.$$

Where the last inequality is because  $(v_1, \dots, 0, \dots, \mu_k, \dots, v_n)$  has a 0, thus  $f_{v_1 \dots 0 \dots \mu_k \dots v_n} \in I$ .

2: For a rational covering,  $f_i$  is invertible in the ring of  $U = X(\frac{f_0}{f_i}, \dots, \frac{f_n}{f_i})$ , thus it has a inverse that attains maximum value on  $U$  (12.2.4.22). Hence there is a  $c \in K^*$  that  $|c|^{-1} < \inf(\max\{|f_i(x)|\})$ .

I claim the Laurent covering w.r.t. the elements  $cf_0, \dots, cf_n$  satisfies the requirement. Because for example, on  $V = X((cf_0) \cdots (cf_s)(cf_{s+1})^{-1} \cdots (cf_n)^{-1})$ ,  $|f_i(x)| < |f_j(x)|$  for  $i \leq s < j$ , so the covering restricted to  $V$  is just the rational covering generated by  $f_{s+1}, \dots, f_n$ , and they are all invertible in  $\mathcal{O}(V)$ .

3: In fact the Laurent covering generated by the element  $f_i f_j^{-1}$  for  $i < j$  is a refinement of the rational covering generated by  $f_1, \dots, f_n$ , because in any one of this Laurent subdomains  $V$ , for any two  $i, j$ , either  $|f_i(x)| < |f_j(x)|$  or  $|f_j(x)| < |f_i(x)|$  for all  $x \in V$ , so there is a maximal one  $f_s$ , then  $V \subset X(\frac{f_0}{f_s}, \dots, \frac{f_n}{f_s})$ .  $\square$

**Prop. (27.2.1.40) [Tate's Acyclicity Theorem].** The presheaf of affinoid functions on an affinoid space  $X = \text{Sp } A$  is a sheaf w.r.t the weak Grothendieck category. In fact, for any  $A$ -module  $M$ , the presheaf  $\widetilde{M} = M \otimes_A \mathcal{O}_X$  is a sheaf w.r.t. the weak Grothendieck topology, called the **quasi-coherent** sheaf on  $X$ .

Moreover, for any finite cover of affinoid subdomains, the Čech cohomology group  $\check{H}^q(\text{Sp } A, \widetilde{M})$  vanish for  $q \neq 0$ .  $\perp$

*Proof:* It suffices to prove the last assertion. First reduce to the case of Laurent covering by (27.2.1.39) and (7.3.2.10)(7.3.2.11). Noticing the base change invariance of the specialities of affinoid subdomains (27.2.1.11). Even more, by (7.3.2.12) and an induction process, it suffices to prove for the simple Laurent covering  $X(f), X(f^{-1})$ .

It suffices to prove for the sheaf of affinoid functions  $\mathcal{O}_X$ , because for any Qco sheaf  $\widetilde{M}$ , choose a free resolution of  $M$ , then use dimension shifting, notice the covering is finite (the flatness of the algebra map (27.2.1.26) is used to deduce the long exact sequence).

For the sheaf  $\mathcal{O}_X$ , the main tool is the following commutative diagram:

$$\begin{array}{ccccccc}
 & & 0 & & 0 & & \\
 & & \downarrow & & \downarrow & & \\
 & & (X-f)A\langle X \rangle \times (1-fY)A\langle Y \rangle & \xrightarrow{\delta''} & (X-f)A\langle X, X^{-1} \rangle & \longrightarrow & 0 \\
 & & \downarrow & & \downarrow & & \\
 0 \longrightarrow & A & \xrightarrow{\epsilon'} & A\langle X \rangle \times A\langle Y \rangle & \xrightarrow{\delta'} & A\langle X, X^{-1} \rangle & \longrightarrow 0 \\
 & \parallel & & \downarrow & & \downarrow & \\
 0 \longrightarrow & A & \xrightarrow{\epsilon} & A\langle f \rangle \times A\langle f^{-1} \rangle & \xrightarrow{\delta} & A\langle f, f^{-1} \rangle & \longrightarrow 0
 \end{array}$$

where  $\delta'$  is given by  $(h_1(X), h_2(Y)) \mapsto h_1(X) - h_2(X^{-1})$ , and  $\delta''$  is induced by  $\delta'$ . The columns are all exact, and the first row and the second row are exact.  $\epsilon$  is injective by (27.2.1.25). Then the last row is also exact, by spectral sequence.  $\square$

**Prop. (27.2.1.41) [Strong/Weak Topos The same].** If  $X$  is an affinoid  $K$ -space, the category of sheaves w.r.t the strong Grothendieck topology is equivalent to the category of sheaves w.r.t. the weak Grothendieck topology by pushforward and pullback of sheaves by (7.1.2.25) because the strong and weak Grothendieck category satisfies the conditions.

In particular, this applies to the case  $\mathcal{O}_X$  by (27.2.1.40), the resulting sheaf is called the **sheaf of rigid analytic functions** on  $X$ , also denoted by  $\mathcal{O}_X$ .  $\square$

## 2 Rigid Analytic Spaces

**Def. (27.2.2.1) [G-Ringed K-Spaces].** A **G-ringed  $K$ -space** is a pair  $(X, \mathcal{O}_X)$  where  $X$  is a  $G$ -topological space (7.1.1.11) and  $\mathcal{O}_X$  is a sheaf of  $K$ -algebras. It is called **local G-ringed  $K$ -space** if the stalks are all local rings. Their morphisms are defined routinely.  $\square$

**Prop. (27.2.2.2) [Morphisms Between Affinoid Spaces].** An affinoid  $K$ -space with the sheaf of analytic functions  $(X, \mathcal{O}_X)$  (27.2.1.41) is an example of local  $G$ -ringed  $K$ -space (27.2.1.23).

A continuous homomorphism of rings induces a local  $G$ -ringed morphism. And all morphisms come from these.

Moreover, an affinoid  $K$ -space is a complete  $G$ -ringed  $K$ -space (i.e. rigid) (7.1.1.12).  $\square$

*Proof:* It is a  $G$ -space by (27.2.1.40)(27.2.1.41), morphisms by (27.2.1.19), notice the  $\mathfrak{m}_x$  generate the maximal ideal of  $\mathcal{O}_{X,x}$  (27.2.1.23), so the morphism is local.

To show all morphisms are like these, we need to show a morphism  $\sigma : A \rightarrow B$  gives at most one  $\mathrm{Sp} B \rightarrow \mathrm{Sp} A$ : the morphism is local, so it maps  $\mathfrak{m}_{\varphi(x)}$  to  $\mathfrak{m}_x$ , and from the commutative diagram

$$\begin{array}{ccc} A/\mathfrak{m}_{\varphi(x)} & \longrightarrow & B/\mathfrak{m}_x \\ \downarrow \cong & & \downarrow \cong \\ \mathcal{O}_{\varphi(x), \mathrm{Sp} A}/\mathfrak{m}_{\varphi(x)} \mathcal{O}_{\varphi(x), \mathrm{Sp} A} & \longrightarrow & \mathcal{O}_{x, \mathrm{Sp} B}/\mathfrak{m}_x \mathcal{O}_{x, \mathrm{Sp} B} \end{array}$$

(27.2.1.23) shows  $\mathfrak{m}_{\varphi(x)}$  is mapped into  $\mathfrak{m}_x$ , so  $\mathfrak{m}_{\varphi(x)} = (\sigma^*)^{-1}\mathfrak{m}_x$ , which shows  $\varphi$  is unique set-theoretically, and on the level of structure sheaf, the uniqueness of  $\mathcal{O}_{\mathrm{Sp} A}(V) \rightarrow \mathcal{O}_{\mathrm{Sp} B}(\varphi^{-1}(V))$  is unique by the definition of affinoid subdomain (27.2.1.7).  $\square$

**Def. (27.2.2.3) [Rigid Spaces].** The category of **rigid (analytic) space** is a full subcategory of local  $G$ -ringed  $K$ -spaces (27.2.2.1) s.t. it is  $G_0, G_1, G_2$ -complete (7.1.1.12), and it has an admissible covering  $\{X_i \rightarrow X\}_i$  s.t.  $(X_i, \mathcal{O}_X|_{X_i})$  are affinoid  $K$ -spaces (27.2.1.1) with the strong  $G$ -topology (27.2.1.17).

It follows easily that an admissible open subset of a rigid space is again rigid.  $\square$

**Prop. (27.2.2.4) [Glueing Rigid Spaces].** Glueing rigid analytic spaces is legitimate, so does glueing morphisms on the source.  $\square$

*Proof:* First glue the set, then use (7.1.1.14) to glue  $G$ -topology, finally the glue of structure sheaf is similar to (7.1.5.3).  $\square$

**Cor. (27.2.2.5) [Spectrum Adjointness].** If  $X$  is rigid and  $Y$  is affinoid, then  $\mathrm{Hom}(X, Y) \cong \mathrm{Hom}(\mathcal{O}_Y(Y), \mathcal{O}_X(X))$ .  $\square$

*Proof:* This follows from (27.2.2.2) and glueing (27.2.2.4).  $\square$

**Prop. (27.2.2.6) [Fiber Products].** Fiber products exist in the category of rigid analytic space. This is fiber product of affinoid spaces are affinoid so we can glue them by universal property, the same as (7.2.7.15).  $\square$

**Prop. (27.2.2.7).** An affinoid space is connected in the weak Grothendieck topology iff it is connected in the strong Grothendieck topology iff it is connected in the Zariski topology.  $\square$

*Proof:* Firstly the weak and strong are equal because any strong covering of  $X$  has a refinement of weak covering, and a weak covering is a strong covering. So it suffices to prove the equivalence of the last two.

One direction is trivial, for the other direction, use Tate's acyclicity, if  $X_1, X_2 \rightarrow \mathrm{Sp} A$ ,  $X_1 \cap X_2 = \emptyset$ , then  $A = \mathcal{O}_X(X_1) \times \mathcal{O}_X(X_2)$ , so  $\mathrm{Spec} A$  is not connected, neither do  $\mathrm{Sp} A$ .  $\square$

**Prop. (27.2.2.8).** We can define the connected components of  $X$  as the equivalence classes of elements that can be reached using connected admissible open subsets of  $X$ . Then the connected components are admissible and forms an admissible cover of  $X$ .  $\square$

*Proof:* Notice that there exists a finite covering consisting of connected Zariski subsets, by (27.2.2.7) and the fact  $\mathrm{Sp} A$  has f.m. connected components because  $\mathrm{Spec} A$  does as  $A$  is Noetherian (12.2.4.13) and (27.2.1.3).

Thus we are done, because by (27.2.1.22), a Zariski covering is admissible, and clearly the connected components of  $X$  are just this Zariski covering.  $\square$

### Rigid GAGA

**Lemma (27.2.2.9).** Let  $Z \in \mathrm{Aff}^{\mathrm{ft}}/K$ , and  $Y$  a rigid  $K$ -space, then the set of morphisms of local  $G$ -ringed spaces  $(Y, \mathcal{O}_Y) \rightarrow (Z, \mathcal{O}_Z)$  corresponds to  $K$ -algebra morphisms from  $\mathcal{O}_Z(Z)$  to  $\mathcal{O}_Y(Y)$ .  $\square$

*Proof:* Cf. [Formal and Rigid Geometry P111].  $\square$

**Def. (27.2.2.10) [Rigid Analytification].** There is a partial functor  $X^{\mathrm{rig}}$  from the category of schemes  $X$  locally algebraic over a valued field  $K$  to the category of rigid analytic  $K$ -spaces that are right adjoint to the forgetful functor from the category of rigid  $K$ -spaces to local ringed  $K$ -space, called the **rigid GAGA functor**.

The existence of this functor is proven in (27.2.2.14).  $\square$

**Def. (27.2.2.11) [Analytification of Affine Schemes].** Let  $T_n(r)$  be the elements  $\sum a_v \zeta^v$  in  $T_n$  that  $\lim a_v r^{|v|} = 0$ . Then choose a  $c \in K$ ,  $|c| > 1$ , define  $T_n^{(i)} = T_n(|c|^i)$ . Then  $T_n^{(i)} = K\langle c^{-i}X_1, \dots, c^{-i}X_n \rangle$ , so clearly  $\mathrm{Sp}(T_n^{(i)})$  is an affinoid subdomain of  $\mathrm{Sp}(T_n^{(i+1)})$  by (27.2.1.9). Thus there is a chain of inclusions of affinoid subdomains:

$$B^n = \mathrm{Sp}(T_n^{(0)}) \hookrightarrow \mathrm{Sp}(T_n^{(1)}) \hookrightarrow \mathrm{Sp}(T_n^{(2)}) \hookrightarrow \dots$$

Then we can use (27.2.2.4) to glue them together as  $\mathbb{A}_K^{n, \mathrm{rig}}$ .  $\square$

**Prop. (27.2.2.12).** The maximal spectrum  $\mathrm{Spm}(K[X_i]) = \cup_n \mathrm{Sp}(T_n^{(i)})$  as sets.  $\square$

*Proof:* It suffices to show the following two.

- For any maximal ideal  $\mathfrak{m} \subset T_n$ ,  $\mathfrak{m}' = \mathfrak{m} \cap K[X_i]$  is maximal.
- For any maximal ideal  $\mathfrak{m}' \subset K[X_i]$ , there is some  $N$  that  $\mathfrak{m}' T_n^{(i)}$  is maximal in  $T_n^{(i)}$  for all  $i > N$ .

For 1: Consider the  $K \subset K[X_i]/\mathfrak{m}' \subset T_n/\mathfrak{m}$ ,  $T_n/\mathfrak{m}$  is a finite extension of  $K$  by (12.2.4.11), then so does  $K[X_i]/\mathfrak{m}'$ , by (5.2.1.3). To prove  $\mathfrak{m}' = \mathfrak{m} \cap K[X_i]$ , consider the following diagram:

$$\begin{array}{ccc} K[X_i]/\mathfrak{m}' & \longrightarrow & T_n/\mathfrak{m}'T_n \\ \parallel & & \downarrow \\ K[X_i]/\mathfrak{m}' & \longrightarrow & T_n/\mathfrak{m} \end{array}$$

As  $K[X_i]/\mathfrak{m}'$  is finite over  $K$ , it is complete, but  $K[X_i]$  is dense in  $T_n$ , thus the horizontal maps are surjective. But then the lower horizontal is isomorphism, then the upper horizontal is also isomorphism, and then the vertical map is isomorphism, thus we are done.

For 2,  $K[X_i]/\mathfrak{m}'$  is a finite extension of  $K$ , thus has a unique valuation, let  $N$  be large that  $|\overline{X}_i| \leq |c|^N$ , then for  $i > N$ , the quotient map factors uniquely as  $K[X_i] \rightarrow T_n^{(i)} \rightarrow K/\mathfrak{m}'$ . Then the kernel  $\mathfrak{m}$  of  $T_n^{(i)}$  is a maximal ideal (same reason as before) that satisfies  $\mathfrak{m} \cap K[X_i] = \mathfrak{m}'$ . Then we finish by item 1.  $\square$

**Cor. (27.2.2.13) [Analytification for Affine Schemes].** Similarly, for an affine scheme  $Z = \text{Spec } K[X_i]/\mathfrak{a}$  of f.t over  $K$ , we construct its analytification  $Z^{\text{rig}}$  as the glue of the inclusions:

$$\text{Sp}(T_n^{(0)}/\mathfrak{a}) \hookrightarrow \text{Sp}(T_n^{(1)}/\mathfrak{a}) \hookrightarrow \dots$$

Then  $Z^{\text{rig}}$  is the analytification of  $K[X_i]/\mathfrak{a}$ .

And we see from the proof of (27.2.2.12) the maximal spectrum  $\text{Max}(K[X_i]/\mathfrak{a}) = \cup_n \text{Spa}(T_n^{(i)}/\mathfrak{a})$  as sets.  $\lrcorner$

*Proof:* The canonical map  $K[X_i]/\mathfrak{a} \rightarrow T_n^{(i)}/\mathfrak{a}$  glue together to be a morphism  $\mathcal{O}_Z(Z) \rightarrow \mathcal{O}_{Z^{\text{rig}}}(Z^{\text{rig}})$ , which by (27.2.2.9) corresponds to a map  $Z^{\text{rig}} \rightarrow Z$  of local ringed spaces.

Now any other morphism  $Y \rightarrow Z$  from a rigid  $K$ -space  $Y$  to  $Z$ , choose an affinoid  $K$ -space covering  $Y_i$  of  $Y$ , then the map  $Y_i \rightarrow Z$  corresponds by (27.2.2.9) to a morphism  $\sigma : K[X_i]/\mathfrak{a} \rightarrow \mathcal{O}_{Y_i}(Y_i)$ , thus if we choose  $i$  large enough that  $|\sigma(X_i)| \leq |c|^i$ , then  $\sigma$  can be extended uniquely to

$$K[X_i]/\mathfrak{a} \rightarrow T_n^{(i)}/\mathfrak{a} \xrightarrow{\sigma} \mathcal{O}_{Y_i}(Y_i),$$

By the universality of affinoid subdomains. This  $\sigma$  corresponds to a morphism  $Y_i \rightarrow \text{Sp}(T_n^{(i)}) \rightarrow Z^{\text{rig}}$ , and these clearly glue together to give a morphism  $Y \rightarrow Z^{\text{rig}}$ , thus proving the universal property.  $\square$

**Prop. (27.2.2.14) [General Analytification].** For  $X \in \text{Sch}^{\text{loc.ft}}/K$ , choose an affine covering  $\{Z_i\}$  of  $X$  and consider the analytifications of  $Z_i$  (27.2.2.13), then  $Z_i \cap Z_j$  obviously has the inverse image as the rigid analytification by universal property, thus unique, so the analytifications of  $Z_i$  can be glued to an analytification of  $X$ .

Moreover,  $|X^{\text{rig}}| = |X|_0$ , because this is the case for  $Z_i$  (27.2.2.11).  $\lrcorner$

**Prop. (27.2.2.15).** Rigid analytification preserves fiber products.  $\lrcorner$

*Proof:* This follows from the construction of fibered product of schemes (7.2.7.15), so we only need to prove the affine case. For this, Cf. [U. Köpf, Über eigentliche Familien algebraischer Varietäten über affinoiden Räumen. Schriftenr, Satz 1.8].  $\square$

**Prop. (27.2.2.16) [Stalks].** For a point  $z \in Z^{\text{rig}}$ , the completions of  $\mathcal{O}_{Z^{\text{rig}},z}$  and  $\mathcal{O}_{Z,z}$  are the same.  $\lrcorner$

*Proof:* Cf. [U. Köpf, Über eigentliche Familien algebraischer Varietäten über affinoiden Räumen. Schriftenr, Satz 2.1].  $\square$

### A way to construct Rigid Analytic Spaces

**Prop. (27.2.2.17).** Let  $n \in \mathbb{Z}_+$ ,  $K \in p\text{-NField}$  and  $K' \subset \mathbb{C}_K$  be a complete field containing  $K$ . Suppose  $X \subset \mathbb{P}^n$ ,  $T \subset \mathbb{P}^m$  are projective schemes, and  $H \subset (X \times T)_{K'}$ . For  $t \in T(K)$ , denote  $H_t \subset X_K$  be the fiber, then there is an admissible open subset of  $X_{K'}^{\text{rig}}$  with underlying set

$$X(\mathbb{C}_p) \setminus \bigcup_{t \in T(K)} H_t.$$

┘

*Proof:* For each  $z \in \mathbb{P}^n(\mathbb{C}_p)$  or  $z \in \mathbb{P}^m(\mathbb{C})$ , choose an affine unimodular representative  $\tilde{z} \in \mathbb{A}^{n+1}(\mathbb{C}_p)$  or  $\tilde{z} \in \mathbb{A}^{m+1}(\mathbb{C}_p)$  with  $\max(|\tilde{z}_i|) = 1$ .

Let  $H$  be defined by a family of homogeneous polynomials

$$f_\alpha(X_0, \dots, X_n, T_0, \dots, T_m)$$

with  $\mathcal{O}_{K'}$ -coefficients, then the functions  $|f_\alpha(\tilde{x}, \tilde{t})|$  are independent of the representatives chosen, so denoted by  $|f_\alpha(x, t)|$ . For  $\varepsilon \in \mathbb{R}_+$  and  $t \in T(K)$ , consider the tubular nbhd

$$H_t(\varepsilon) = \{x \in X(\mathbb{C}_p) : |f_\alpha(x, t)| \leq \varepsilon, \forall \alpha\}.$$

Then it is easy to see that when  $t' \in T$  with  $\|\tilde{t}' - \tilde{t}\|$  small enough, we will have  $H_{t'}(\varepsilon) \subset H_t(\varepsilon)$ . Because the set of unimodular representatives in  $K^{m+1} \setminus \{0\}$  is compact, there exists a finite set  $S_\varepsilon \subset T(K)$  s.t.

$$\bigcup_{t \in S_\varepsilon} H_t(\varepsilon) = \bigcup_{t \in T(K)} H_t(\varepsilon).$$

Then  $X(\mathbb{C}_p) \setminus \bigcup_{t \in T(K)} H_t(\varepsilon)$  is an admissible open subset of  $X^{\text{rig}}$ , which is because for each  $\alpha$ ,

$$\{x \in \mathbb{P}^n(\mathbb{C}_p) : |f_\alpha(x)| \geq \varepsilon\}$$

is admissible open, as it is on the  $n$  admissible opens of  $\mathbb{P}^n$ .

Now define  $X_\varepsilon = X(\mathbb{C}_p) \setminus \bigcup_{t \in T(K)} H_t(\varepsilon)$ , then by the definition of strong Grothendieck topology, we need to show that any map

$$f : Y \rightarrow \bigcup_{\varepsilon \in \mathbb{R}_+} X_\varepsilon = X(\mathbb{C}_p) \setminus \bigcup_{t \in T(K)} H_t$$

from some affinoid space  $Y$  factors through some  $X_\varepsilon$ . Now for each  $t \in T(K)$ , there exists  $\varepsilon_t \in \mathbb{R}_+$  s.t.  $f(Y) \subset X(\mathbb{C}_p) \setminus H_t(\varepsilon_t)$  by maximum principal(12.2.4.22). But by the continuity argument of  $H_t(\varepsilon)$  as above, we can choose  $\varepsilon_{t'} = \varepsilon_t$  for  $t'$  sufficiently near to  $t$ . Thus we can choose a common  $\varepsilon$  for each  $t \in T(K)$ , and the assertion is proved.  $\square$

### 3 Coherent Sheaves on Rigid Spaces

**Prop. (27.2.3.1).** For an affinoid  $K$ -space  $X$ , there is a Qco module construction  $M \rightarrow M \otimes_A \mathcal{O}_X$  as in(27.2.1.40) in the weak Grothendieck topology, and it extends uniquely to a sheaf w.r.t. the strong Grothendieck topology by(27.2.1.41), also denoted by  $M \otimes_A \mathcal{O}_X$ . This is a faithfully exact, fully faithful functor between Abelian categories from  $\mathcal{A}b$  to  $\mathcal{O}_X$ -modules, and it preserves tensor product and direct sums.  $\square$

*Proof:* Because  $\Gamma(X, M \otimes_A \mathcal{O}_X) = M$  and obviously fully faithful, this map is fully faithful, and it is exact because the restriction map of an affinoid subdomain is flat (27.2.1.26), and shification is exact.  $\square$

**Def. (27.2.3.2) [Coherent Sheaves].** For an  $\mathcal{O}_X$ -module  $\mathcal{F}$  on a rigid space  $X$ , **finite type, of finite presentation, coherence** are defined w.r.t the strong topology as  $X$  is a ringed site. All these notions are stable under passing to an admissible open subspaces.  $\lrcorner$

*Proof:* For the passing of coherence to admissible open subspaces, use the fact that restriction maps are flat (27.2.1.26).  $\square$

**Cor. (27.2.3.3).** Notice  $\mathcal{O}_X^n = A^n \otimes_A \mathcal{O}_X$ , by (27.2.3.1) and the fact  $A$  is Noetherian, passing to a refinement covering,  $\mathcal{F}$  is coherent iff there is an admissible affinoid covering  $\mathfrak{U}: X_i \rightarrow X$  that  $F|_{X_i}$  is associated to a finite  $\mathcal{O}_{X_i}$ -module. In this case,  $\mathcal{F}$  is said to be  **$\mathfrak{U}$ -coherent**. Thus the coherent sheaves form a weak Serre subcategory of  $\mathcal{O}_X$ -modules.

In particular,  $\mathcal{O}_X$  is coherent.  $\lrcorner$

**Prop. (27.2.3.4).** If  $\mathcal{F}, \mathcal{G}$  are all  $\mathfrak{U}$ -coherent modules, then:

- $\mathcal{F} \otimes_{\mathcal{O}_X} \mathcal{G}$  and  $\mathcal{F} \oplus \mathcal{G}$  are  $\mathfrak{U}$ -coherent,
- if  $\mathcal{F} \rightarrow \mathcal{G}$  is a  $\mathcal{O}_X$ -module morphism, then the kernel and image are all  $\mathfrak{U}$ -coherent.
- If  $\mathcal{I}$  is a  $\mathfrak{U}$ -coherent sheaf of ideal of  $\mathcal{O}_X$ , then  $\mathcal{I}\mathcal{F}$  is  $\mathfrak{U}$ -coherent.

$\lrcorner$

*Proof:* The first and the second are consequences of (27.2.3.1), noticing  $A_i$  is Noetherian. The third is an image of  $\mathcal{I} \otimes_{\mathcal{O}_X} \mathcal{F}$ .  $\square$

**Lemma (27.2.3.5).** If  $\mathcal{F}$  is  $\mathfrak{U}$  coherent for a simple Laurent covering  $\mathfrak{U}$ , then  $H^1(\mathfrak{U}, \mathcal{F}) = 0$ .  $\lrcorner$

*Proof:* The goal is to show any element in  $\mathcal{F}(U_1 \cap U_2)$  can be represented by  $u_1 + u_2$ , where  $u_i \in \mathcal{F}(U_i)$ . Let  $U_1 = \text{Sp } A\langle f \rangle, U_2 = \text{Sp } A\langle f^{-1} \rangle, U_1 \cap U_2 = \text{Sp } A\langle f, f^{-1} \rangle$ . Now  $A\langle f \rangle = A\langle X \rangle / (X - f), A\langle f^{-1} \rangle = A\langle Y \rangle / (Yf - 1), A\langle f, f^{-1} \rangle = A\langle X, Y \rangle / (X - f, Yf - 1)$ , and we endow them with the residue norm.

Now we want to give norms to  $M_1 = \mathcal{F}(U_1), M_2 = \mathcal{F}(U_2), M_{12} = \mathcal{F}(U_1 \cap U_2)$ .  $M_i$  are finite  $\mathcal{O}_X(U_i)$ -modules, so there are elements  $v_i, w_j, i \leq m, j \leq n$  that generate  $M_1, M_2$  respectively. So there are attached morphisms

$$(A\langle f \rangle)^m \rightarrow M_1, \quad (A\langle f^{-1} \rangle)^n \rightarrow M_2, \quad (A\langle f, f^{-1} \rangle)^m \rightarrow M_{12}$$

And endow them with the residue norm, which is complete..

Notice that to prove the assertion, it suffice to show for each  $\varepsilon > 0$ , there is an  $\alpha$  that for each  $u \in M_{12}$ , there are  $u_1$  and  $u_2$  in  $M_i$  respectively that  $|u_i| < \alpha|u|$  and  $|u - u_1 - u_2| < \varepsilon|u|$ , because then we can use iteration and completeness to get the result.

Giving  $\beta > 1$ , any  $g \in A\langle f, f^{-1} \rangle$  can be lifted to an element  $\sum c_{ij} X^i Y^j$  that  $|c_{ij}| \leq \beta|g|$ . Then by regrouping terms that  $i \geq j$  or  $i < j$ , there are two element  $g^+ \in A\langle f \rangle$  and  $g^- \in A\langle f^{-1} \rangle$  that  $g^+ + g^-$  restricts to  $g$  on  $U_1 \cap U_2$ , and  $|g^+|, |g^-| \leq \beta|g|$ .

Now that  $\mathcal{F}$  is coherent, so  $v_i$  and  $w_j$  both generate  $M_{12}$  separately. Then there are equations  $v_i = \sum c_{ij} w_j$  and  $w_i = \sum d_{ij} v_j$ , where  $c_{ij}, d_{ij} \in A\langle f, f^{-1} \rangle$ . The image of  $A\langle f \rangle$  is dense in  $A\langle f, f^{-1} \rangle$  (12.2.4.27), so there are elements  $c'_{ij} \in A\langle f^{-1} \rangle$  s.t.  $\max_{ijl} |c_{ij} - c'_{ij}| |d_{jl}| < \beta^{-2} \varepsilon$ .

Now I claim the above approximation process is true for  $\alpha = \beta^2 \max(|c'_{ij}| + 1)$ . For this, notice for any  $u = \sum a_i v_i$  with  $a_i \in A\langle f, f^{-1} \rangle$ , which we may assume  $|a_i| \leq \beta|u|$  by the definition of the norm on  $M_{12}$ , then  $a_i = a_i^+ + a_i^-$ , that  $|a_i^*| \leq \beta|a_i|$ . Consider the following element

$$u^+ = \sum a_i^+ v_i \in M_1, \quad u^- = \sum a_i^- \sum c'_{ij} w_j \in M_2$$

Then it is easily verified that  $|u^*| < \alpha|u|$ , and

$$u - u^- - u^+ = \sum \sum a_i^- (c_{ij} - c'_{ij}) w_j = \sum \sum \sum a_i^- (c_{ij} - c'_{ij}) d_{jl} v_l.$$

which has norm smaller than  $\max |a_i^- (c_{ij} - c'_{ij}) d_{jl}| \leq \beta^2 |u| \cdot \beta^{-2} \varepsilon = \varepsilon |u|$ , finishing the proof.  $\square$

**Prop. (27.2.3.6) [Kiehl].** An  $\mathcal{O}_X$ -module  $\mathcal{F}$  on an affinoid  $K$ -space  $\mathrm{Sp} A$  is coherent iff it is associated to a finite  $A$ -module.  $\lrcorner$

*Proof:* The converse is obvious, for the other direction, by (27.2.1.39), it suffices to prove for  $\mathfrak{U}$  a Laurent covering, and further, it suffices to prove for the simplest Laurent covering  $X(f), X(f^{-1}) \rightarrow X$  because:  $U(f, g) \cup U(f, g^{-1}) \cup U(f^{-1}, g) \cup U(f^{-1}, g^{-1}) = (U(f, g) \cup U(f, g^{-1})) \cup (U(f^{-1}, g) \cup U(f^{-1}, g^{-1}))$ .

Thus the above lemma shows that  $H^1(\mathfrak{U}, \mathcal{F}) = 0$ . Now I prove that for any finite affinoid covering  $\mathfrak{U} = \cup \mathrm{Sp} A_i$ , if  $H^1(\mathfrak{U}, \mathcal{F}) = 0$  for any coherent sheaf  $\mathcal{F}$ , then any  $\mathfrak{U}$ -coherent sheaf  $\mathcal{F}$  is associated to a finite  $A$ -module, this will finish the proof.

Consider any maximal ideal  $\mathfrak{m}_x$  of  $A$ ,  $\mathfrak{m}_x \otimes_A \mathcal{O}_X$  is a coherent sheaf as  $\mathfrak{m}_x$  is finite because  $A$  is Noetherian, so there is a short exact sequence

$$0 \rightarrow \mathfrak{m}_x \mathcal{F} \rightarrow \mathcal{F} \rightarrow \mathcal{F}/\mathfrak{m}_x \mathcal{F} \rightarrow 0$$

of  $\mathfrak{U}$ -coherent sheaves, because  $A/\mathfrak{m}_x$  is a field, thus flat.

Now for any affinoid space  $U'$  in  $U_i$  for some  $i$ , the section of this exact sequence is exact, because the ring morphism associated to an affinoid subdomain is flat (27.2.1.26). In particular, this can be applied to any intersections of  $U_i$ , in particular the Čech complex of these sheaves. Then the long exact sequence and the fact  $H^1(\mathfrak{U}, \mathfrak{m}_x \mathcal{F}) = 0$  shows

$$0 \rightarrow \mathfrak{m}_x \mathcal{F}(X) \rightarrow \mathcal{F}(X) \rightarrow \mathcal{F}/\mathfrak{m}_x \mathcal{F}(X) \rightarrow 0$$

Next we want to show  $\mathcal{F}/\mathfrak{m}_x \mathcal{F}(X) \rightarrow \mathcal{F}/\mathfrak{m}_x \mathcal{F}(U_i)$  is isomorphism for any  $x \in U_i$ . To prove this, first for any affinoid subspace  $U' = \mathrm{Sp} B$  contained in some  $U_j$ , let  $U' \cap U_i = \mathrm{Sp} B_i$ ,  $\mathcal{F}|_{U'} = M' \otimes_A \mathcal{O}_{U'}$ , we show  $\mathcal{F}/\mathfrak{m}_x \mathcal{F}(U') \cong \mathcal{F}/\mathfrak{m}_x \mathcal{F}(U' \cap U_i)$ , this is equivalent to

$$M'/\mathfrak{m}_x M' \rightarrow M'/\mathfrak{m}_x M' \otimes_B B_i = M'/\mathfrak{m}_x M' \otimes_{B/\mathfrak{m}_x B} B_j/\mathfrak{m}_x B_j$$

is an isomorphism. But  $B/\mathfrak{m}_x B \cong B_j/\mathfrak{m}_x B_j$ : This is true when  $x \in U'$  by (27.2.1.8), and they are both trivial ring if  $x \notin U'$ . Then look at the morphism of Čech complex induced by  $\mathcal{F}/\mathfrak{m}_x \mathcal{F} \rightarrow \mathcal{F}/\mathfrak{m}_x \mathcal{F}|_{U_i}$ , then it is an isomorphism, by what we just proved, so its  $H^0$  is also isomorphism, which is  $\mathcal{F}/\mathfrak{m}_x \mathcal{F}(X) \cong \mathcal{F}/\mathfrak{m}_x \mathcal{F}(U_i)$ .

Finally, by the commutative diagram 
$$\begin{array}{ccc} \mathcal{F}(X) & \longrightarrow & \mathcal{F}/\mathfrak{m}_x \mathcal{F}(X) \\ \downarrow & & \downarrow \\ \mathcal{F}(U_i) & \longrightarrow & \mathcal{F}/\mathfrak{m}_x \mathcal{F}(U_i) \end{array}$$
, the right vertical arrow is isomorphism, so if denote  $\mathcal{F}(U_i)$  by  $M_i$ , then  $\mathcal{F}(X)$  generate  $M_i/\mathfrak{m}_x M_i$  for every  $x$ , then consider

$L = M_i/\mathcal{F}(X)$ , then  $\mathfrak{m}_x L = L$  for every  $x$ , then by Nakayama, for each maximal ideal  $\mathfrak{m}$ , there is a  $m \in \mathfrak{m}$  that  $(1 + m)L = 0$ , so  $\text{Ann}(L) = (1)$ , so  $L = 0$ , i.e.  $\mathcal{F}(X)$  generate  $M_i$  for each  $i$ .

Now choose  $f_i$  in  $\mathcal{F}(X)$  that generate  $M_i$  simultaneously, then the map  $\mathcal{O}_X^n \rightarrow \mathcal{F}$  is a surjection of  $\mathfrak{U}$ -coherent sheaves, its kernel  $\mathcal{G}$  is also coherent by (27.2.3.4), now all the above argument works for  $\mathcal{G}$ , so there is a surjection  $\mathcal{O}_X^m \rightarrow \mathcal{G}$ , so  $\mathcal{O}_X^m \rightarrow \mathcal{O}_X^n \rightarrow \mathcal{F} \rightarrow 0$ , so  $\mathcal{F}$  is associated to the cokernel of the map  $A^m \rightarrow A^n$ .  $\square$

**Cor. (27.2.3.7).** Coherence for a  $\mathcal{O}_X$ -module on a rigid  $K$ -space is affinoid local on the target.  $\lrcorner$

### Cohomology on Rigid Analytic Spaces

**Lemma (27.2.3.8).** The category of  $\mathcal{O}_X$ -modules on a rigid  $K$ -space is a Grothendieck category by (4.8.3.29).  $\lrcorner$

**Def. (27.2.3.9) [Derived Cohomologies].** Consider the right derived functor for  $\Gamma$  and more general  $f_*$ , these are left exact by (7.1.2.9). Then  $R^p f_* \mathcal{F} = (f_* \mathcal{H}^p(\mathcal{F}))^\sharp$  by Grothendieck spectral sequence.

The Čech-to-Derived spectral sequence (7.3.2.13) is applied:  $H^p(\{U_i \rightarrow U\}, \mathcal{H}^q(F)) \Rightarrow H^{p+q}(U, F)$ ,  $\check{H}^p(U, \mathcal{H}^q(F)) \Rightarrow H^{p+q}(U, F)$  and  $\check{H}^1(U, F) \cong H^1(U, F)$ .

In particular, if  $H^q(U_{i_0 i_1 \dots i_r}, \mathcal{F}) = 0, q > 0$ , then  $H^p(\{U_i \rightarrow U\}, \mathcal{F}) = H^p(U, \mathcal{F})$  (7.3.2.15). And it is enough to have  $\check{H}^q(U_{i_0 i_1 \dots i_r}, \mathcal{F}) = 0, q > 0$  by (7.3.2.16).  $\lrcorner$

**Cor. (27.2.3.10).** A Qco sheaf on an affinoid space has vanishing higher sheaf cohomology by Tate's acyclicity (27.2.1.40) and (7.3.2.16).  $\lrcorner$

### Properties of Rigid $K$ -Spaces

This subsection is strongly suggested to read after reading the parallel part of schemes.

**Def. (27.2.3.11).** A morphism is called a **closed immersion** if there is an admissible affinoid covering that it restricts to a closed immersion of affinoid spaces (It is compatible with definition (27.2.1.28) before by (27.2.3.15)). It is called an **open immersion** iff it is injective and the corresponding stalk maps are isomorphisms. The **(quasi-)separatedness, quasi-compactness, finiteness** are defined similarly as for schemes.  $\lrcorner$

**Lemma (27.2.3.12) [Nike's Trick].** In a rigid analytic  $K$ -space  $X$  and  $\text{Sp } A, \text{Sp } B$  be affinoid subspaces, then there is an admissible affinoid covering of  $\text{Sp } A \cap \text{Sp } B$ .  $\lrcorner$

*Proof:* This is analogous to the scheme case (7.4.1.1), but the proof is different:  $X$  has an admissible covering, this restricts to an admissible covering of  $\text{Sp } A \cap \text{Sp } B$ , and any admissible covering can be refined by an affinoid admissible covering.  $\square$

**Prop. (27.2.3.13) [Affinoid Communication Theorem].** A property  $P$  of affinoid open subsets of  $X$  is called **affinoid local** if:  $\text{Sp } A$  has  $P \Rightarrow$  all affinoid subdomains of  $\text{Sp } A$  has  $P$ , and any admissible affinoid cover of  $\text{Sp } A$  has  $P \Rightarrow \text{Sp } A$  has  $P$ . Notice a stalk-wise property is obviously affine-local.

Now if we call  $X$  has  $\tilde{P}$  if there is an admissible affinoid covering  $A_i \rightarrow X$  that  $A_i$  has  $P$ . Then the following are equivalent:

- all open affinoid subsets of  $X$  has  $P$ .
- all open subspace of  $X$  has  $\tilde{P}$ .
- $X$  has a cover of open subspaces that has  $\tilde{P}$ .

- $X$  has  $\tilde{P}$ .

┘

*Proof:* The proof is the same as the scheme case (7.4.1.2). □

**Prop. (27.2.3.14).** Separated morphism is quasi-separated because closed immersion is affinoid hence quasi-compact (27.2.1.3). ┘

**Prop. (27.2.3.15) [Finite Morphism].** For a morphism  $\varphi : X \rightarrow Y$  of rigid  $K$ -spaces

- It is finite iff the inverse image of any affinoid space is affinoid, and  $\varphi_* \mathcal{O}_Y$  is a coherent  $\mathcal{O}_X$ -module. In particular, finiteness is local on the target because coherence do.
- It is closed immersion iff it is finite and  $\mathcal{O}_Y \rightarrow \varphi_* \mathcal{O}_X$  is surjective, this shows the definition of closed immersion is compatible with before.

┘

*Proof:* Coherence is affinoid local on the target by Kiehl's theorem, so it suffices to prove the inverse image of any affinoid space is affinoid for a finite morphism: Consider any affinoid subdomain  $U \subset X$  with inverse image  $\varphi^{-1}(U)$ , by Kiehl's theorem,  $B = \mathcal{O}_X(f^{-1}(U))$  is finite over  $A = \mathcal{O}_Y(U)$ , thus can be given an affinoid  $K$ -algebra structure (12.2.4.34). Now

$$\varphi^{-1}(U) \xrightarrow{\chi} \mathrm{Sp} B \xrightarrow{\rho'} \mathrm{Sp} A$$

$\chi$  is locally an isomorphism, as  $\rho$  is finite, so  $\chi$  is an isomorphism.

The second assertion is because locally  $\mathcal{O}_Y, \varphi_* \mathcal{O}_X$  are both Qco so surjectivity is equivalent to the global section is surjective (27.2.3.1). □

**Prop. (27.2.3.16).** Closed/Open immersion, quasi-compactness, (quasi-)separatedness are all local on the target, and stable under base change. ┘

*Proof:* Closed immersion is local on the target because finiteness do and surjectiveness of  $\mathcal{O}_Y \rightarrow \varphi_* \mathcal{O}_X$  is checked locally. Open immersion is local on the target because stalk and injectivity are all checked locally.

Then Closed/Open immersion are stable under base change because the affinoid case is true (27.2.1.29).

Quasi-compact is easily seen local on the target and stable under base change.

(Quasi-)Separatedness is local on the target because closed immersion and quasi-compact do.

(Quasi-)Separatedness is stable under base change because closed immersion and quasi-compact do, because diagonal commutes with base change (4.1.1.49). □

**Prop. (27.2.3.17).** Morphisms between affinoid  $K$ -spaces are separated. Moreover, because of localness, any finite morphism is separated. ┘

*Proof:* The diagonal is  $\mathrm{Sp} A \rightarrow \mathrm{Sp} A \hat{\otimes}_B A$ , whose ring map is surjective. □

**Prop. (27.2.3.18).** By (4.1.1.51), for  $X \rightarrow S$  and  $Y \rightarrow S$ , the map  $X = X \times_Y Y \rightarrow X \times_S Y$  is an immersion. It is closed immersion if  $Y \rightarrow S$  is separated, and it is qc if  $Y \rightarrow S$  is quasi-separated. ┘

**Cor. (27.2.3.19).** If  $s : S \rightarrow X$  is a section of  $f : X \rightarrow S$ , the above proposition applies to this case, because  $S = S \times_X X \rightarrow S \times_S X = X$ . ┘

**Prop. (27.2.3.20).** A morphism is quasi-separated iff there is an admissible affinoid covering  $W_i$  that, for any two affinoid open  $U, V$  that are mapped to an affinoid open, their intersection is quasi-compact. This is because quasi-compact is local on the target.

A morphism is separated iff there is an admissible affinoid covering  $W_i$  that, for any two affinoid open  $U, V$  that are mapped to an affinoid open, their intersection is affinoid open and  $\mathcal{O}(U) \hat{\otimes}_{\mathcal{O}(W_i)} \mathcal{O}(V) \rightarrow \mathcal{O}(U \cap V)$  is surjective. This is because closed immersion is local on the target (27.2.3.16).  $\lrcorner$

**Cor. (27.2.3.21).** If  $g \circ f$  is (quasi-)separated, then so is  $f$ .  $\lrcorner$

**Cor. (27.2.3.22).** If  $X$  is (quasi-)separated, then  $X \rightarrow Y$  is (quasi-)separated.  $\lrcorner$

### Étale Topology on Rigid Analytic Spaces

**Def. (27.2.3.23) [Étale Sites].** The étale sites of rigid analytic spaces has coverings given by  $Y \rightarrow X$  that is étale and there exists an admissible affinoid covering  $\{Y_i \rightarrow Y\}$  s.t.  $\{Y_i \rightarrow X\}$  is an admissible covering of  $X$ .  $\lrcorner$

**Prop. (27.2.3.24).** Any étale surjective map  $Y \rightarrow X$  factors uniquely as  $Y \rightarrow X' \rightarrow X$  where  $Y \rightarrow X'$  is an étale covering and  $X' \rightarrow X$  is étale and bijective on points.  $\lrcorner$

*Proof:* ?  $\square$

**Def. (27.2.3.25) [Lisse  $\mathbb{Q}_p$ -Sheaves].** Locally constant sheaves of  $\mathbb{Z}/(p^n)$ -modules on a rigid analytic space is defined as in étale sites of schemes, and so is the definition of sheaves of  $\mathbb{Z}_p$ -modules.

And lisse  $\mathbb{Q}_p$ -sheaves are lisse  $\mathbb{Z}_p$ -sheaves on an étale covering of  $X$  (27.2.3.23), with the Hom set tensored with  $\mathbb{Q}_p$ .

$\text{LocSys}_{\mathbb{Q}_p}^{\text{ét}}(X)$  is a tensor category, and each  $x \in |X|$  defines a fiber functor valued in  $\text{Vect}^{\text{fin}}/\mathbb{Q}_p$ .

$\lrcorner$

## 4 Proper Mapping Theorem

**Def. (27.2.4.1) [Relatively Compact Subsets].** For a rigid space  $X$  over affinoid space  $Y$ , if  $U \subset U' \subset X$  be affinoid subspaces,  $U$  is called **relatively compact** in  $U'$  iff there is a set of affinoid generators  $f_i$  of  $\mathcal{O}_X(U')$  over  $\mathcal{O}_Y(Y)$  that  $|f_i(x)| < 1$  on  $U$ . This is denoted by  $U \Subset_Y U'$ .  $\lrcorner$

**Prop. (27.2.4.2).** If  $X_1, X_2$  are affinoid spaces over an affinoid space  $Y$ , and  $U_i$  are affinoid space of  $X_i$ , then

- if  $U_1 \Subset_Y X_1$ , then  $U_1 \times_Y X_2 \Subset_{X_2} X_1 \times_Y X_2$ .
- if  $U_i \Subset_Y X_i$ , then  $U_1 \times_Y U_2 \Subset_Y X_1 \times_Y X_2$ .
- If  $U_i \Subset_Y X_i$ , and  $X_i$  are affinoid subspaces of a rigid space separable over  $Y$ , then  $U_1 \cap U_2 \Subset_Y X_1 \cap X_2$ .
- If  $U_1 \Subset_Y X_1$ , and  $i : T \rightarrow X_1$  is a closed immersion, then  $i^{-1}(U_1) \Subset_Y i^{-1}(X_1)$ .

The proof is easy. For the last one, should notice  $|f(x)| = |f(i(x))|$ , because it is closed immersion, so the residue field is the same.  $\lrcorner$

**Def. (27.2.4.3) [Proper Morphism].** A **proper** morphism  $\varphi : X \rightarrow Y$  of rigid  $K$ -spaces is a separated morphism that there is an admissible affinoid covering  $Y_i$  of  $Y$  that there are two admissible affinoid coverings  $X_{ij}, X'_{ij}$  of  $\varphi^{-1}(Y_i)$  that  $X_{ij} \Subset_{Y_i} X'_{ij}$  for any  $i, j$ .  $\lrcorner$

**Prop. (27.2.4.4).** Properness is stable under base change and composition ┘

*Proof:* The base change follows directly from (27.2.4.2).

For the composition, Cf.[Formal and Rigid Geometry P131](difficult). □

**Prop. (27.2.4.5).** Properness is local on the target. ┘

*Proof:* This is because separatedness is local on the target (27.2.3.16) and the second condition of properness is itself local. □

**Prop. (27.2.4.6).** If  $g \circ f : X \rightarrow Y \rightarrow Z$  is proper and  $g$  is separated, then  $f$  is proper. ┘

*Proof:* By ??,  $\tau : X \rightarrow X \times_Z Y$  is closed immersion, and  $f$  is separated by (27.2.3.21). Now proper is local, so we may assume  $Z$  is affinoid, so there are two admissible covering  $X_i, X'_i$  of  $X$  that  $X_i \subseteq_Z X'_i$ , and choose an admissible affinoid covering  $Y_i \rightarrow Y$ , then  $X_j \times_Z Y_i, X'_j \times_Z Y_i$  are admissible coverings of  $Y_i$  that is  $X_j \times_Z Y_i \subseteq_{Y_i} X'_j \times_Z Y_i$ . And it can be pulled back to an affinoid admissible coverings of  $f^{-1}(Y_i)$  that  $\tau^{-1}(X_j \times_Z Y_i) \subseteq_{Y_i} \tau^{-1}(X'_j \times_Z Y_i)$ , because  $\tau$  is closed immersion. So  $X \rightarrow Y$  is proper. □

**Prop. (27.2.4.7).** Finite morphism is proper, in particular, closed immersion is proper. ┘

*Proof:* Finite morphism is separated by (27.2.3.17), and locally, assume both space are affinoid,  $X = \text{Sp } B \rightarrow \text{Sp } A = Y$ , then  $B$  is a finite  $A$ -module, in priori a f.g.  $A$ -algebra, so there is a set of generators  $f_i$  of  $B$  over  $A$  that (by multiplying a constant in  $K^*$ )  $|f_i|_{\text{sup}} < 1$  (12.2.4.22), so  $X \subseteq_Y X$ , hence it is proper. □

**Prop. (27.2.4.8)[Proper and Analytification].** For a morphism between schemes locally of f.t. over  $K$ , it is proper iff its rigid analytification is proper. ┘

*Proof:* Cf.[U. Köpf, Über eigentliche Familien algebraischer Varietäten über affinoiden Räumen. Schriftenr. Math. Inst. Univ. Münster, 2. Serie, Heft 7 (1974) Satz 2.16]. □

For the following: Cf.[Formal and Rigid Geometry P132].

**Prop. (27.2.4.9)[Proper Mapping theorem, Kiehl].** The higher direct images of a proper map of rigid analytic spaces takes coherent sheaves to coherent sheaves. ┘

*Proof:* □

**Prop. (27.2.4.10).** For a scheme  $X$  locally of f.t. over  $K$ , an  $\mathcal{O}_X$ -module  $\mathcal{F}$  on  $X$  gives rise to an  $\mathcal{O}_{X^{\text{rig}}}$ -module on  $X^{\text{rig}}$ , and it is coherent iff  $\mathcal{F}$  is coherent. ┘

*Proof:* □

**Prop. (27.2.4.11).** For a proper scheme over  $K$ ,  $H^q(X, \mathcal{F}) \cong H^q(X^{\text{rig}}, \mathcal{F}^{\text{rig}})$  for  $\mathcal{F}$  coherent. ┘

*Proof:* □

**Prop. (27.2.4.12).** When  $X$  is proper, coherent sheaves on  $X^{\text{rig}}$  corresponds to coherent sheaves on  $X$ . This gives an analog of Chow's theorem when applied to  $X = \mathbb{P}_K^n$  and  $\mathcal{F}'$  is a sheaf of ideals in  $\mathcal{O}_{X^{\text{rig}}}$ . ┘

*Proof:* □

## 5 Formal Schemes

References for this subsection is [Har77, Bos15] and [Topics in Algebraic Geometry, Illusie].

**Def. (27.2.5.1) [Formal Spectrum  $\mathrm{Spf} A$ ].** For  $(A, \mathfrak{a}) \in \mathrm{AdicCRing}(12.2.1.10)$  s.t.  $A$  is  $\mathfrak{a}$ -adically complete and separated, define  $\mathrm{Spf} A$  be the ringed space with underlying topological space  $\mathrm{Spec}(A/\mathfrak{a})$  (open primes of  $A$ ), and the structure sheaf  $\mathcal{O}$  that  $\mathcal{O}(D(f)) = A\langle f^{-1} \rangle$  (12.2.1.13), called the **formal spectrum of  $A$** .  $\lrcorner$

*Proof:* To construct this sheaf, we first check that  $\mathcal{O}(D(f)) = A\langle f^{-1} \rangle = \varprojlim_n (A/\mathfrak{a}^n[f^{-1}])$  defines a sheaf on the site of subspaces of  $\mathrm{Spf} A$  of the form  $D(f)$ : For any open covering  $\{D(f_i)\}$  of  $D(f)$ , there are exact sequences:

$$0 \rightarrow (A/\mathfrak{a}^n)_f \rightarrow \prod_i (A/\mathfrak{a}^n)_{f_i} \rightarrow \prod_{i,j} (A/\mathfrak{a}^n)_{f_i f_j}$$

by (5.4.2.3). Then we take inverse limit, which is exact by Mittag-Leffler (5.9.3.2), to get an exact sequence, which is just the sheaf condition of  $\mathcal{O}$ . Then, we can use (7.1.2.25) to extend this sheaf to a sheaf on  $\mathrm{Spf} A$ .

? Or we notice that  $\mathcal{O} = \varprojlim_n \mathcal{O}_{\mathrm{Spec}(A/\mathfrak{a}^n)}$ .  $\square$

**Prop. (27.2.5.2) [Stalks of  $\mathrm{Spf} A$ ].** Let  $x \in \mathrm{Spf} A$  correspond to a prime  $\mathfrak{p}_x$  in  $A$ . Then the stalk of  $\mathrm{Spf} A$  at  $x$  is just  $\mathcal{O}_x = \varinjlim_{x \in D(f)} A\langle f^{-1} \rangle$ , which is a local ring with maximal ideal  $\mathfrak{m}_x$  containing  $\mathfrak{p}_x \mathcal{O}_x$ . Moreover,  $\mathfrak{m}_x = \mathfrak{p}_x \mathcal{O}_x$  iff  $\mathfrak{a}$  is f.g.. So  $\mathrm{Spf} A$  is a local ringed space, called the **affine formal scheme** of  $A$ .  $\lrcorner$

*Proof:* Cf. [Bos15] P159. ?  $\square$

**Remark (27.2.5.3).** In many case, for example in Scholze's treatment of the  $p$ -adic geometry, the ideal of definition  $\mathfrak{a}$  is assumed to be f.g., because we need this to show that the  $\mathfrak{a}$ -adic completion of  $A[f^{-1}]$  is  $(\mathfrak{a})$ -adically complete (5.2.3.6), so that we can interpret  $D(f) \subset \mathrm{Spf} A$  as an affine formal scheme  $\mathrm{Spf}(A\langle f^{-1} \rangle)$  (12.2.1.14).

Another way to get around this finiteness condition is to consider formal spectrum for a larger class of rings, called the **admissible rings**, which is a complete and separated topological ring with a basis consisting of open ideals, and with an ideal of definition  $\mathfrak{a}$  that  $\mathfrak{a}^n \rightarrow 0$  for  $n \rightarrow 0$ .  $\lrcorner$

**Prop. (27.2.5.4) [Affine Formal Adjointness].** Morphisms between local-topological-ringed spaces  $\mathrm{Spf} B \rightarrow \mathrm{Spf} A$  corresponds to continuous homomorphisms  $A \rightarrow B$ .  $\lrcorner$

**Def. (27.2.5.5) [Formal Schemes].** The category of **formal schemes** is the full subcategory of the category of local-topological-ringed topological spaces  $(X, \mathcal{O}_X)$  consisting of objects that is locally isomorphic to an affine formal scheme  $\mathrm{Spf} A$  (27.2.5.1).

The category of formal schemes contains the category of schemes, by mapping  $\mathrm{Spec} A$  to  $\mathrm{Spf} A$ , where  $A$  is endowed with the discrete topology.  $\lrcorner$

**Prop. (27.2.5.6) [Glueing and Fiber Products].** Formal Schemes can easily be glued, and also spectrum adjointness holds as in (27.2.2.5). Finally there are fibered products, constructed as in (7.2.7.15), where the affine case corresponds to completed tensor product (12.2.1.15).  $\lrcorner$

**Def. (27.2.5.7) [Formal Completion of Schemes Along a Closed Subscheme].** For  $X \in \mathrm{Sch}$  and  $Y \subset X$  a closed subscheme, consider the sheaf  $\mathcal{O}_Y^\wedge$  defined by restricting the projective limit  $\varprojlim_n \mathcal{O}_X/\mathcal{I}(Y)^n$  to  $Y$ , then  $(Y, \mathcal{O}_Y^\wedge)$  is a formal scheme (27.2.5.5), called the **formal completion** of  $X$  along  $Y$ .  $\lrcorner$

**Def. (27.2.5.8) [Properties of Morphisms between Formal Schemes].** A morphism  $f : \mathfrak{X} \rightarrow \mathfrak{Y}$  between formal schemes is called **finite type/étale/smooth/etc.** if for each  $Z \in \text{Sch}$ , the fiber product  $\mathfrak{X} \times_{\mathfrak{Y}} Z \in \text{Sch}$ , and  $\mathfrak{X} \times_{\mathfrak{Y}} Z \rightarrow Z$  satisfies the desired property.  $\lrcorner$

**Def. (27.2.5.9) [Underlying Reduced Schemes].** For each formal scheme  $\mathfrak{X}$ , there exists a unique reduced scheme  $\mathfrak{X}_{\text{red}} \in \text{Sch}_{\text{red}}$  with a morphism of local-topological-ringed spaces  $\mathfrak{X}_{\text{red}} \rightarrow \mathfrak{X}$  s.t. for each  $Z \in \text{Sch}_{\text{red}}$ , the natural map  $\text{Hom}(Z, \mathfrak{X}_{\text{red}}) \rightarrow \text{Hom}(Z, \mathfrak{X})$  is a bijection.  $\lrcorner$

*Proof:* ?  $\square$

**Def. (27.2.5.10) [Formally Locally Finite Type Morphisms].** A morphism  $f : \mathfrak{X} \rightarrow \mathfrak{Y}$  between formal schemes is called **formally of finite type**(resp. **formally locally of finite type**) if the morphism  $f_{\text{red}} : \mathfrak{X}_{\text{red}} \rightarrow \mathfrak{Y}_{\text{red}} \in \text{Sch}$  is of finite type(resp. locally of finite type).  $\lrcorner$

### Noetherian Adic Formal Schemes

Cf.[Hartshorne Chap2.9] and [Sta]30.23. and Illusie.

**Def. (27.2.5.11) [Noetherian Formal Adic Schemes].**  $\lrcorner$

**Def. (27.2.5.12) [Coherent Sheaves on Noetherian Formal Adic Schemes].**  $\lrcorner$

**Prop. (27.2.5.13).** Let  $A$  be a Noetherian ring and  $I$  an ideal, let  $X$  be a proper scheme over  $A$  and  $\mathcal{F}$  a coherent sheaf on  $X$ , then for any  $p \geq 0$ , the inverse systems  $(H^p(X, I^n \mathcal{F}))$  and  $(I^n H^p(X, \mathcal{F}))$  are isomorphic pro- $A$ -modules.  $\lrcorner$

*Proof:* Cf.[Sta]02OA.  $\square$

**Thm. (27.2.5.14) [Theorem of Formal Functions].** Let  $A$  be a Noetherian ring with an ideal  $I$ ,  $X$  be a proper scheme over  $A$  and  $\mathcal{F}$  a coherent scheme on  $X$ . Then for any  $p \geq 0$ , the system of maps

$$H^p(X, \mathcal{F})/I^n H^p(X, \mathcal{F}) \rightarrow H^p(X, \mathcal{F}/I^n \mathcal{F})$$

induce an isomorphism of limits

$$H^p(X, \mathcal{F})^\wedge \cong \varprojlim_n H^p(X, \mathcal{F}/I^n \mathcal{F}).$$

*Proof:* Cf.[Sta]02OC.  $\square$

**Prop. (27.2.5.15) [Grothendieck's Existence Theorem].** Cf.[Sta]0883.  $\lrcorner$

**Prop. (27.2.5.16) [Grothendieck's Algebrization Theorem].** Cf.[Sta]089A.  $\lrcorner$

### Admissible Formal Schemes

**Remark (27.2.5.17) [Setup].** For a good theory of admissible formal schemes, let the base ring  $R$  be an adic ring with an ideal of definition  $I$  that satisfies either one of the following situation:

- $R$  is an adic valuation ring with a principal ideal of definition.
- $R$  is Noetherian and has no  $I$ -torsion.

$\lrcorner$

**Def. (27.2.5.18)** [Underlying Reduced Schemes]. ┘

**Def. (27.2.5.19)** [Admissible Formal Schemes]. Let  $R$  be an adic ring, then a formal  $R$ -scheme  $X$  is called **locally formally of finite type/finite presentation/admissible** if there is an open affine covering  $\text{Spf } A_i$  of  $X$  that  $A_i$  satisfies those properties (12.2.1.16).

$X$  is called **formally of finite type** if it is locally of topologically finite type and quasi-compact. It is called **formally of finite presentation** if it is locally of topologically finite presentation, quasi-compact and quasi-separated. ┘

**Prop. (27.2.5.20)**. A map  $f : X \rightarrow Y$  of  $R$ -formal schemes is locally formally of finite type (27.2.5.19) iff  $f_{\text{red}} : X_{\text{red}} \rightarrow Y_{\text{red}}$  (27.2.5.18) is locally of finite type. ┘

*Proof:* ? □

**Prop. (27.2.5.21)** [Induced Admissible Formal Subscheme]. Let  $X$  be a formal  $R$ -scheme that is locally of topologically finite type, and let  $\mathcal{O}_X$  be its structure sheaf. Then we can look at the ideal sheaf  $\mathcal{I} \subset \mathcal{O}_X$  consisting of all elements locally killed by a power of  $I^n$ . This is a qco sheaf, as  $\mathcal{I}(U) = \{f \in \mathcal{O}(U) \mid I^n f = 0 \text{ for some } n\}$ , because the quotient by the RHS is locally topologically of finite type and has no  $I$ -torsion, thus admissible, by (12.2.1.18), and admissibility is local (12.2.1.19).

In particular we can take the closed subscheme  $X_{\text{adm}} \subset X$  corresponding to  $\mathcal{I}$ , then it is an admissible formal scheme, called the **induced admissible formal subscheme** of  $X$ . ┘

**Prop. (27.2.5.22)**. ┘

**Def. (27.2.5.23)** [Admissible Formal Blowing-up]. ┘

### Formal Models of Rigid Analytic Spaces

**Notation (27.2.5.24)**.

- Let  $(\mathcal{O}_K, K)$  be a complete valuation field of height 1. ┘

**Prop. (27.2.5.25)** [Raynaud's Generic Fiber Functor]. The functor  $A \mapsto A \otimes_{\mathcal{O}_K} K$  from the category of  $\mathcal{O}_K$ -algebras topologically of finite type to the category of affinoid  $K$ -algebras ? extends to a functor

$$(-)^{\text{rig}} : \mathfrak{X} \rightarrow \mathfrak{X}^{\text{rig}}$$

from the category of admissible formal schemes over  $\mathcal{O}_K$  to  $\text{Rig Spa}/K$ .  $\mathfrak{X}^{\text{rig}}$  is called the **Raynaud generic fiber** of  $\mathfrak{X}$ . ┘

*Proof:* Cf. [Bos15]P174. ? □

**Def. (27.2.5.26)** [Formal Models]. In view of (27.2.5.25), one would like to describe all formal  $\mathcal{O}_K$ -schemes s.t. the generic fiber  $\mathfrak{X}^{\text{rig}}$  is isomorphic to a given rigid  $K$ -space  $\mathfrak{X}_K$ . But first notice  $A \mapsto A \otimes_{\mathcal{O}_K} K$  kills all  $\mathcal{O}_K$ -torsion, in particular the generic fiber functor only depends on the induced admissible formal scheme  $\mathfrak{X}_{\text{adm}}$  (27.2.5.21).

So given  $\mathfrak{X} \in \text{Rig Spa}/K$ , any admissible formal  $\mathcal{O}_K$ -scheme  $\mathfrak{X}$  satisfying  $\mathfrak{X}^{\text{rig}} \cong \mathfrak{X}_K$  is called a **formal  $R$ -model** of  $\mathfrak{X}_K$ . ┘

**Prop. (27.2.5.27)** [Raynaud(1972)]. The Raynaud's generic fiber functor maps admissible formal blowing-ups of admissible formal schemes (27.2.5.23) to isomorphisms of rigid analytic spaces, and it induces an equivalence of categories between:

- The category of quasi-compact admissible formal  $\mathcal{O}_K$ -schemes (27.2.5.19), localized by admissible formal blowing-ups.
- $\text{Rig Spa}^{\text{qcqs}}/K$ .

⌋

## 6 Berkovich's Rigid Spaces

References are [Berkovich, Spectral theory and analytic geometry over non-Archimedean fields].

**Def. (27.2.6.1) [Berkovich's Spectra].** For a Banach ring  $A$ , the **Berkovich spectrum**  $M(A)$  is defined to be the set of all bounded multiplicative semi-norms on  $A$  (19.1.1.3) (including Archimedean norms), endowed with the weakest topology s.t. the functions  $|\cdot| \mapsto |f|$  is continuous for any  $f \in A$ . ⌋

**Def. (27.2.6.2) [Comparing Affinoid Algebras and Berkovich's Spectra].** If  $K \in p\text{-Field}$  and  $A$  is an affinoid Tate  $K$ -algebra, then  $\text{Spm}(A)$  with the canonical topology (27.2.1.4) is naturally a subspace of  $M(A)$  (27.2.6.1), by identifying  $\mathfrak{m} \in \text{Spm}(A)$  with the unique bounded multiplicative semi-norm on  $A$  with kernel  $\mathfrak{m}$ , because  $\dim_K A/\mathfrak{m} < \infty$  (12.2.4.11). In this way,  $\text{Spm}(A)$  is identified with set of bounded multiplicative semi-norms  $|\cdot|$  on  $A$  s.t.  $\dim_K A/\ker(|\cdot|) < \infty$ . ⌋

**Def. (27.2.6.3) [Berkovich's Spaces].** The Berkovich spectrum  $M(A)$  of a Banach ring (27.2.6.1) is endowed with affinoid subdomains as in rigid affinoid cases, and a **Berkovich's analytic space** is a locally ringed  $G$ -spaces that are locally isomorphic to Berkovich spectra of Banach rings. ⌋

**Def. (27.2.6.4) [Strict Berkovich Spaces].** A **strict Berkovich space** is a Berkovich space (27.2.6.3). ⌋

**Example (27.2.6.5) [Berkovich's Affine Spaces].** For  $K \in p\text{-Field}$ , the **Berkovich's analytic affine space** is defined to be

$$\mathbb{A}_K^n = \{\text{multiplicative seminorms on } K[T_1, \dots, T_n] \text{ whose restriction to } K \text{ is bounded}\}$$

together with the weakest topology defined by  $f \in K[T_1, \dots, T_n]$ .

Then it is a strict Berkovich space (27.2.6.4) as an increasing union of open balls, i.e Berkovich's version of affinoid Tate spaces. ⌋

**Prop. (27.2.6.6).** For  $K \in p\text{-Field}$ ,

- Any Berkovich spaces over  $K$  are arcwise-connected.
- If  $X = M(A)$  where  $A$  is an affinoid  $K$ -algebra, then  $\dim |X| = \dim A$ .
- Smooth Berkovich spaces are locally contractible.

⌋

*Proof:*    ? □

**Prop. (27.2.6.7)[Strict Berkovich Analytic Spaces as Rigid Analytic Spaces].** For  $K \in p\text{-Field}$ , there is a functor from the category of separated strict Berkovich spaces over  $K$  to the category of separated rigid analytic spaces that

$$X \mapsto X_0 = \{x \in X \mid [\kappa(x) : K] < \infty\}.$$

And this functor is fully faithful, and preserves tensor products. ┘

*Proof:*    ? □

## 27.3 Adic Spaces

References are [Hub93], [Hub96], [Mor19], [Bha17], [Wed14], [S-W20], [Sch12].

**Notation (27.3.0.1).**

- Use notations as in [Topological Commutative Algebra\(Adic Rings\)](#).

┘

### 1 (Continuous)Valuation Spectrums

References are [Mor19].

**Def. (27.3.1.1) [Riemann-Zariski Space].** Let  $K \in \mathbf{Field}$  and  $A \subset K \in \mathbf{CRing}$ , the Riemann-Zariski space  $RZ(K, A)$  is defined to be the space of all valuation subrings of  $K$  containing  $A$  with the topology generated by

$$U(x_1, \dots, x_n) = \{P \in RZ(K, A) \mid x_1, \dots, x_n \in P\}.$$

$RZ(K, 0)$  is also denoted by  $RZ(K)$ .  $RZ(K, A)$  is just isomorphic to  $\mathrm{Spa}(K, A^{itc})$ , so it is spectral by (27.3.2.4). ┘

**Cor. (27.3.1.2).** Clearly the specialization relations of  $RZ(K, A)$  is identical to inclusion relations. ┘

**Def. (27.3.1.3) [Valuation Spectrum].** For  $A \in \mathbf{CRing}$ , the **valuation spectrum**  $\mathrm{Spv}(A) \in \mathbf{Top}$  is the set of equivalent classes of valuations on  $A$ , topologized by the open subsets

$$\mathrm{Spv}(A)(\frac{f}{g}) = \{x \in \mathrm{Spa}(A) \mid |f(x)| \leq |g(x)| \neq 0\}.$$

$\mathrm{Spv}(A)$  is spectral, with sub-basis generated by  $\mathrm{Spv}(\frac{f}{g})$

There is a kernel map  $\ker : \mathrm{Spv}(A) \rightarrow \mathrm{Spec} A$  sending a valuation to its kernel (support). Then this map is continuous, and the fiber of this map over  $\mathfrak{p}$  is just isomorphic to the Riemann-Zariski space  $RZ(k(\mathfrak{p}))$ .

Moreover, the map  $\ker : \mathrm{Spv}(A) \rightarrow \mathrm{Spec} A$  is spectral, as the kernel of  $D(f)$  is  $U(\frac{f}{f})$ . ┘

#### Specialization Relations in $\mathrm{Spv}(A)$

**Def. (27.3.1.4) [Vertical Specializations].** Let  $x, y \in \mathrm{Spv}(A)$ . We say that  $x$  is a vertical specialization of  $y$  if  $x$  is a specialization of  $y$  and  $\mathfrak{p}_x = \mathfrak{p}_y$ . ┘

#### Valuations with Support Conditions

**Def. (27.3.1.5) [ $\mathrm{Spv}(A, J)$ ].** We define a space  $\mathrm{Spv}(A, J) \subset \mathrm{Spv}(A)$  by

$$\mathrm{Spv}(A, J) = \{x \in \mathrm{Spv}(A) \mid r(x) = x\} = \{x \in \mathrm{Spv}(A) \mid c\Gamma_x(J) = \Gamma\}.$$

with the subset topology from  $\mathrm{Spv}(A)$ . ┘

**Prop. (27.3.1.6).**

- $\mathrm{Spv}(A, J)$  is a spectral space.

- A basis of quasi-compact open subsets for the topology is given by the sets  $U(\frac{f_1, \dots, f_n}{g})$  where  $J \subset \sqrt{(f_1, \dots, f_n)}$ .
- The retraction  $r : \mathrm{Spv}(A) \rightarrow \mathrm{Spv}(A, J)$  is a spectral map.

┘

*Proof:* Cf.[Mor19]P52.

□

### Continuous Valuation Spectrum

**Def. (27.3.1.7) [Continuous Valuations].** For  $A \in \mathrm{HubCRing}$ , define  $\mathrm{Cont}(A) \in \mathcal{T}\mathrm{op}$  as the subspace of  $\mathrm{Spv}(A)$ (27.3.1.3) consisting of continuous valuations on  $A$ . Then

$$\mathrm{Cont}(A) = \{x \in \mathrm{Spv}(A, A^{00}A) \mid x(A^{00}) < 1\}$$

┘

*Proof:* Cf.[Mor19]P64.

□

**Cor. (27.3.1.8) [Cont(A) is Spectral].** For any Huber ring  $A$ ,  $\mathrm{Cont}(A)$  is a spectral space, with a basis of quasi-compact open subsets given by  $U(\frac{f_1, \dots, f_n}{g})$ , where  $A^{00} \subset \sqrt{(f_1, \dots, f_n)}$ , or equivalently  $(f_1, \dots, f_n)$  is open??.

┘

*Proof:* This is because

$$\mathrm{Cont}(A) = \mathrm{Spv}(A, A^{00}A) - \bigcup_{g \in A^{00}} U(\frac{1}{g}),$$

which is an open subset of  $\mathrm{Spv}(A, A^{00}A)$ , thus the assertion follows from(27.3.1.6) and(4.12.3.9). □

## 2 Adic Spectra

**Def. (27.3.2.1) [Adic Spectra].** For any  $(A, A^+) \in \mathrm{HubPair}$ (12.2.5.13), the **adic spectrum** of  $(A, A^+)$  is defined to be

$$\mathrm{Spa}(A, A^+) = \{x \in \mathrm{Cont}(A) \mid x(A^+) \leq 1\}.$$

And for  $A \in \mathrm{HubCRing}$ , denote  $\mathrm{Spa} A = \mathrm{Spa}(A, A^0)$ , where  $A^0$  is the ring of power-bounded elements(12.2.5.8).

The shape of these open sets is dictated by the desired properties that both  $\{x \mid f(x) \neq 0\}$  and  $\{x \mid f(x) \leq 1\}$  be open. These desiderata combine features of classical algebraic geometry and rigid geometry, respectively.

This adic spectrum construction(27.3.2.1) defines a functor

$$\mathrm{Spa} : \mathrm{HubPair}^{\mathrm{op}} \rightarrow \mathcal{T}\mathrm{op}.$$

And for any ring of integers  $A^+$  of  $A$ ,  $\mathrm{Spa} A = \mathrm{Spa}(A, A^0) \hookrightarrow \mathrm{Spa}(A, A^+)$  is an immersion of spaces, by(12.2.5.13). ┘

**Def. (27.3.2.2) [Kernel map].** Taking kernels of valuations gives a map  $\ker : \mathrm{Spa}(A, A^+) \rightarrow \mathrm{Spec} A$ . This map is continuous, as the inverse image of  $D(f)$  is  $\mathrm{Spa}(A, A^+)(\frac{f}{f})$ . We call a subset a **Zariski open subset** of  $\mathrm{Spa}(A, A^+)$  iff it is open in the initial topology along  $\ker$ . ┘

**Def. (27.3.2.3) [Rational Subsets].** A rational subset of  $\mathrm{Spa}(A, A^+)$  is defined to be

$$\mathrm{Spa}(A, A^+)(\frac{f_1, \dots, f_n}{g}) = \{x \in \mathrm{Spa}(A, A^+) | x(f_i) \leq x(g)\},$$

where  $(f_i)$  is an open ideal.  $\lrcorner$

**Prop. (27.3.2.4) [Adic Spectra are Spectral].** The adic spectrum  $\mathrm{Spa}(A, A^+)$  is spectral, and the rational subsets (27.3.2.3) form a basis consisting of quasi-compact open subsets.  $\lrcorner$

*Proof:* Firstly  $\mathrm{Spa}(A, A^+)$  is closed in the constructible topology of  $\mathrm{Cont}(A)$ : for any  $a \in A$ ,

$$\{x \in \mathrm{Cont}(A) | |a|_x \leq 1\} = U(\frac{1, a}{1})$$

is a quasi-compact open subset of  $\mathrm{Cont}(A)$ , so constructible, thus  $\mathrm{Spa}(A, A^+) = \cap_{a \in A^+} \{x \in \mathrm{Cont}(A) | |a|_x \leq 1\}$  is closed in the constructible topology.

So the assertions follow from (4.12.3.9) and (27.3.1.8).  $\square$

**Remark (27.3.2.5).** In spite of the proposition that adic spectra are spectral, it is very different from classical algebraic geometry. For example, the generalizations of a point  $y$  is totally ordered (localization of the valuation ring), but this nearly never happen for an affine variety.  $\lrcorner$

**Remark (27.3.2.6).** The rational subsets are stable under intersection, and form a basis for the topology of  $\mathrm{Spa}(A, A^+)$ . But in general  $\mathrm{Spa}(\frac{f}{g})$  is not quasi-compact, in particular,  $\ker : \mathrm{Spa}(A, A^+) \rightarrow \mathrm{Spec} A$  is not quasi-compact.  $\lrcorner$

**Cor. (27.3.2.7) [Detecting Nilpotence Locally].** If  $(A, A^+)$  is an affinoid Tate ring and  $f \in A$ , then  $f \in A^{00}$  iff  $|f(x)|^n \rightarrow 0$  for all  $x \in \mathrm{Spa}(A, A^+)$ .  $\lrcorner$

*Proof:* If  $f$  is topological nilpotent, then  $f^N \in tA^+$  for some  $n$ , so  $|f(x)|^{nN} \leq |t(x)|^n \rightarrow 0$  because  $x$  is continuous. Conversely, if  $|f(x)|^n \rightarrow 0$  for all  $x$ , then  $X = \cup_n X(\frac{f^n}{t})$ . But  $X$  is quasi-compact, so  $|f(x)|^n \leq |t(x)|$  for all  $x$ , for some  $n$ . So by (27.3.2.17)  $f^n \in tA^+$ . Now  $A^+$  is a filtered colimits of rings of definitions (12.2.5.14), so  $f^n \in tA_0$  for some  $tA_0$ , which shows that  $f \in A^{00}$ .  $\square$

**Def. (27.3.2.8) [Specialization Map].** The specialization map

$$\mathrm{Sp} : \mathrm{Spa}(A, A^+) \rightarrow \mathrm{Spec}(A^+/A^{00})$$

that maps a point  $x$  to the inverse image of the maximal ideal of  $R_x$  along the valuation map  $A^+ \rightarrow R_x$  it corresponds. It clearly lies in  $\mathrm{Spec}(A^+/A^{00})$  as any pseudo-uniformizer is mapped to a pseudo-uniformizer in  $R_x$  thus in the maximal ideal.

This map is continuous and spectral, unlike that the kernel map (27.3.2.6): the inverse image of a  $D(f)$  for  $f \in A^+$  is the set of points  $x \in \mathrm{Spa}(A, A^+)$  that  $x(f)$  is a unit, i.e.  $|x(f)| = 1$ . As  $|x(f)| \leq 1$  for all  $f \in A^+$ , this set is just  $\mathrm{Spa}(A, A^+)(\frac{1}{f})$ , so specialization map  $\mathrm{sp}$  is both continuous and spectral.  $\lrcorner$

### Completed Residue Fields

**Def. (27.3.2.9) [Completed Residue Fields].** Let  $x \in \mathrm{Spa}(A, A^+)$ , then we denote by  $k(x)$  the fraction field of  $A/\mathfrak{p}_x$ , with a valuation ring  $k^+(x)$ . If  $x$  is not analytic, we set  $\widehat{\kappa}(x) = \kappa(x)$ ,  $\widehat{\kappa}^+(x) = \widehat{k}^+(x)$ . If  $x$  is analytic, we set  $\widehat{\kappa}(x) = \kappa(x)^\wedge$ ,  $\widehat{\kappa}^+(x) = \kappa^+(x)^\wedge$ .  $(\widehat{\kappa}(x), \widehat{\kappa}^+(x))$  is called the **completed residue field** of  $x$ .  $\lrcorner$

**Prop. (27.3.2.10)[Vertical Generalizations].** The morphism

$$\mathrm{Spa}(\kappa(x), \kappa(x)^+) \rightarrow \mathrm{Spa}(A, A^+)$$

induces a homeomorphism onto the set of vertical generalizations of  $x$ .

$x$  is analytic iff  $\kappa(x)$  is microbial.  $\lrcorner$

*Proof:* For the first assertion, if  $x$  is not analytic, then  $\mathrm{Spa}(k(x), k(x)^+) \cong RZ(k(x), k(x)^+)$  is homeomorphic to the vertical generalizations of  $x$ .

If  $x$  is analytic, then by (27.3.2.17),  $\mathrm{Spa}(\kappa(x), \kappa(x)^+) \rightarrow \mathrm{Spa}(k(x), k(x)^+)$  is a homeomorphism. And now we need to check more that if  $R \in RZ(k(x), k(x)^+)$  corresponds to a vertical generalization  $y$ , then  $|\cdot|_R$  is continuous iff  $|\cdot|_y$  is continuous. For this, see [Mor19]107.

The second assertion follows from (12.2.6.7).  $\square$

**Prop. (27.3.2.11)[Residue of Rational Subsets].** Let  $f : (A, A^+) \rightarrow (A \langle \frac{T}{s} \rangle, A \langle \frac{T}{s} \rangle^+)$  be a rational localization (27.3.2.3), and  $y \in \mathrm{Spa}(A \langle \frac{T}{s} \rangle, A \langle \frac{T}{s} \rangle^+)$  with  $x = \mathrm{Spa}(f)(y)$ , then the canonical map  $(k(x), k(x)^+) \rightarrow (k(y), k(y)^+)$  induces an isomorphism of Huber pairs  $(\kappa(x), \kappa(x)^+) \cong (\kappa(y), \kappa(y)^+)$  after completion.  $\lrcorner$

*Proof:* Cf. Morel P108.  $\color{red}{?}$   $\square$

**Def. (27.3.2.12)[Adic Points].** An **adic point** is an adic space  $\mathrm{Spa}(K, K^+)$  where

- $(K, K^+) \in \mathrm{HubPair}$ ,
- $K \in \mathbf{Field}$ , and  $K$  is either complete non-Archimedean or discrete,
- $K^+$  is an open and bounded valuation subring (hence integrally closed).

An **analytic adic point** is an adic point s.t.  $K$  is complete non-Archimedean.  $\lrcorner$

**Remark (27.3.2.13).** The adic point is not a point in general. In fact, if  $K$  is non-Archimedean,  $\mathrm{Spa}(K, K^+)$  is totally ordered by inclusion  $\color{red}{?}$ , with a unique closed point corresponding to  $K^+$  and a unique generic point corresponding to  $\mathcal{O}_K$ .  $\lrcorner$

**Prop. (27.3.2.14)[Valuation Ring Characterization of Spa].** For  $(A, A^+) \in \mathrm{HubPair}$ , there is a natural bijection between  $\mathrm{Spa}(A, A^+)$  and the set of maps  $\varphi : (A, A^+) \rightarrow (K, K^+)$  that  $\mathrm{Spa}(K, K^+)$  is an adic point where  $K_x = \kappa(x)$  and  $x$  corresponds to the image of the closed point of  $\mathrm{Spa}(K, K^+)$  under the map  $\mathrm{Spa}(\varphi)$ . And  $x$  is analytic iff the corresponding adic point  $\mathrm{Spa}(K, K^+)$  is analytic.  $\lrcorner$

*Proof:* Let  $\varphi : (A, A^+) \rightarrow (K, K^+)$  be a map of Huber pairs, then correspond the maps gives a continuous valuation on  $A$  which is in  $\mathrm{Spa}(A, A^+)$  and  $\mathfrak{p}_x = \ker(\varphi)$ . Notice  $x$  is the image of the closed point of  $\mathrm{Spa}(K, K^+)$ . And we get a map  $k(x) \rightarrow K$  such that  $k(x)^+ = k(x) \cap K^+$ , and that has dense image by assumption, so after completion (when non-Archimedean) induces an isomorphism  $(\kappa(x), \kappa(x)^+) \cong (K, K^+)$ . Thus this is a bijection of sets.  $\square$

**Prop. (27.3.2.15)[Uniformity].** If  $A$  is uniform, then the map

$$A \rightarrow \prod_{x \in |\mathrm{Spa}(A, A^+)|} \kappa(x)$$

is a homeomorphism of  $A$  onto its image, where  $\kappa(x)$  is the completed residue field (27.3.2.9).  $\lrcorner$

*Proof:* [Berkovich, Étale cohomology for non-Archimedean analytic spaces].  $\color{red}{?}$   $\square$

**Cor. (27.3.2.16).** Let  $\tilde{\mathcal{O}}_X$  be the sheafification of  $\mathcal{O}_X$ , then if  $A$  is uniform,  $A \rightarrow H^0(X, \tilde{\mathcal{O}}_X)$  is injective.  $\lrcorner$

*Proof:* In fact,  $A \rightarrow H^0(X, \tilde{\mathcal{O}}_X) \rightarrow \prod_x \kappa(x)$  is injective.  $\square$

### Properties of Adic Spectrums

**Prop. (27.3.2.17) [Properties of Adic Spectrums].**

- The completion map  $(A, A^+) \rightarrow (\hat{A}, \hat{A}^+)$  induces an homeomorphism on the adic spectrums that preserves rational subsets.
- $\text{Spa}(A, A^+)$  vanishes iff its completion  $\hat{A}$  vanishes.
- (Adic Nullstellensatz)  $A^+ = \{f \in A \mid |x(f)| \leq 1, \forall x \in \text{Spa}(A, A^+)\}$ .
- If  $A$  is complete, then  $f \in A$  is a unit iff  $|f|_x \neq 0$  for all  $x \in \text{Spa}(A, A^+)$ .
- If  $A$  is Tate, then  $f$  is topologically nilpotent iff  $|f|_x^n \rightarrow 0$  for any  $x \in \text{Spa}(A, A^+)$ .

┘

*Proof:* 1: Use the valuation ring characterization (27.3.2.14), a point of  $x$  determined a continuous map  $(A, A^+) \rightarrow (K, K^+)$ . Now this extends to a map under completion, thus determines a point of  $\text{Spa}(\hat{A}, \hat{A}^+)$ , so the Spa map is surjective. And injectivity follows from the fact  $A$  is dense in  $\hat{A}$ .

For the homeomorphism, just notice that if  $f_i - f'_i, g - g' \in t^{N+1}\hat{A}$ , then

$$\text{Spa}\left(\frac{f_1, \dots, f_n}{g}\right) = \text{Spa}\left(\frac{f'_1, \dots, f'_n}{g'}\right).$$

where  $f_n = t^N$ . So now  $A$  is dense in  $\hat{A}$ , if we choose  $f_i, g \in A$ , then this rational subset is clearly induced from  $A$ .

2: Cf. [Mor19]P104.

3: Cf. [Mor19]P91.

4: Cf. [Mor19]P106.

5: Cf. [Mor19]P106.

□

**Cor. (27.3.2.18) [Generalizations in Adic Spectrum].** The above proposition shows that the generalization relations of Spa are easily determined, for an element  $y$ , all generalizations of  $y$  are in bijection with  $\text{Spec}(R_y/(t))$  as a poset, thus totally ordered, and each  $y$  has a unique generic point as generalization, because it is microbial.

Moreover,  $\text{Spa}(A, A^0)$  is closed under generalization in  $\text{Spa}(A, A^+)$ , and they have the same set of generic points.

┘

*Proof:* The last assertion is because the generalizations of a point  $y$  is just valuation rings containing  $R_y$ , and  $R_y$  contains  $A^0/\mathfrak{p}_y$ , so does its generalizations. And for any generic point  $x \in \text{Spa}(A, A^+)$ ,  $A^0$  is mapped to the valuation ring  $R_x$ , because it is a rank 1 valuation, so if  $t^k f^{\mathbb{N}} \subset R_x$ , then  $f \in R_x$  because otherwise we have  $|t| < |f^{-n}|$  for  $n$  large.

□

**Def. (27.3.2.19) [Specialization Map].** The specialization map

$$\text{Sp} : \text{Spa}(A, A^+) \rightarrow \text{Spec}(A^+/A^{00})$$

that maps a point  $x$  to the inverse image of the maximal ideal of  $R_x$  along the valuation map  $A^+ \rightarrow R_x$  it corresponds. It clearly lies in  $\text{Spec}(A^+/A^{00})$  as any pseudo-uniformizer is mapped to a pseudo-uniformizer in  $R_x$  thus in the maximal ideal.

This map is continuous and spectral, unlike that the kernel map (27.3.2.6): the inverse image of a  $D(f)$  for  $f \in A^+$  is the set of points  $x \in \text{Spa}(A, A^+)$  that  $x(f)$  is a unit, i.e.  $|x(f)| = 1$ . As  $|x(f)| \leq 1$  for all  $f \in A^+$ , this set is just  $\text{Spa}(A, A^+)(\frac{1}{f})$ , so specialization map  $\text{sp}$  is both continuous and spectral.

┘

**Prop. (27.3.2.20) [Maximal Hausdorff Quoteint].** Let  $X = \mathrm{Spa}(A, A^+)$  be an affinoid Tate space, the if  $\overline{X}$  is the quotient of  $X$  by the equivalence relation generated by specialization, then  $\overline{X}$  is the Hausdorffization of  $X$ , i.e.  $\overline{X}$  is Hausdorff.  $\lrcorner$

*Proof:* To show  $\overline{X}$  is Hausdorff, if  $x, y \in X$  is not mapped to the same point in  $\overline{X}$ , then by (27.3.2.18), we may assume  $x, y$  is generic in  $X$ , and  $\overline{\{x\}} \cap \overline{\{y\}} = \emptyset$ . Now we must find two disjoint open subsets of  $x, y$  that is stable under specialization. Cf. [Bhatt Perfectoid Spaces P75].  $\square$

### Constructions of Adic Spectrums

**Prop. (27.3.2.21) [Direct Limits of Uniform Affinoids].** The direct limits exists in the category of uniform affinoid Tate rings. and  $A^+ = \mathrm{colim} A_i^+$ .

Moreover,

$$|\mathrm{Spa}(A, A^+)| \cong \varinjlim_i |\mathrm{Spa}(A_i, A_i^+)|$$

as a homeomorphism of spectral spaces, and each rational subset of  $\mathrm{Spa}(A, A^+)$  is pulled back from some rational subset of  $\mathrm{Spa}(A_i, A_i^+)$ .

The same conclusion also hold in the category of complete uniform affinoid Tate rings (For the homeomorphism, (27.3.2.17) is used).  $\lrcorner$

*Proof:* Suppose the colimit index has a minimal element  $i_0$ , let  $t$  be a pseudo-uniformizer, then each  $A_i^+$  is a ring of definition with pseudo-uniformizer  $t$ . Now we set  $A = \mathrm{colim} A_i$  with ring of definitions  $A^+ = \mathrm{colim} A_i^+$ , then  $A^+$  is integrally closed in  $A$ , thus  $(A, A^+)$  is truly a uniform affinoid Tate ring. Now we check it is the colimit: For any compatible map  $(A_i, A_i^+) \rightarrow (B, B^+)$ , there is a map  $f : (A, A^+) \rightarrow (B, B^+)$  as abstract rings. We check it is continuous: we may assume  $B^+$  is the ring of definition, then  $t^n A^+ \subset f^{-1}(t^n B^+)$ , thus it is continuous.

For the adic spectrum, now a point  $x \in \mathrm{Spa}(A, A^+)$  is determined by the map of uniform affinoid Tate rings  $(A, A^+) \rightarrow (k(\mathfrak{p}), R_x)$ , and by the universal property, it is defined by a compatible set of maps  $(A_i, A_i^+) \rightarrow (k(\mathfrak{p}), R_x)$ . Now it is easy to see the desired bijection of topological spaces, as the elements defining rational subsets are pullbacks from some  $A_i$ .  $\square$

**Prop. (27.3.2.22) [Perfection of Adic Spectrum].** Let  $(A, A^+)$  be an affinoid Tate ring of char  $p$ , then

- The Frobenius map induces a homeomorphism on the adic spectrum of  $(A, A^+)$ .
- If  $(A, A^+)$  is uniform, then there is a perfection functor, which is left adjoint to the forgetful functor from the category of perfect uniform affinoid Tate rings to the category of affinoid Tate rings. And it is just  $(A_{\mathrm{perf}}, A_{\mathrm{perf}}^+)$ .
- The natural map  $(A, A^+) \rightarrow (A_{\mathrm{perf}}, A_{\mathrm{perf}}^+)$  induces a homeomorphism on the adic spectrum.  $\lrcorner$

*Proof:* 1: The Frobenius pulls a valuation a multiple of itself, thus equals itself.

2: Clearly  $A_{\mathrm{perf}}^+$  is integrally closed in  $A^+$  and is in  $A_{\mathrm{perf}}^0$ . It suffices to show  $(A_{\mathrm{perf}}, A_{\mathrm{perf}}^+)$  is uniform, but this is because  $A_{\mathrm{perf}}^0 = (A_{\mathrm{perf}})^0 \subset (t^{-n} A_0)_{\mathrm{perf}} = t^{-n} (A_0)_{\mathrm{perf}}$ .

3: The Spa map is checked to be continuous and injective, for the converse, using the microbial valuation ring characterization, a point  $x$  of  $\mathrm{Spa}(A, A^+)$  corresponds to a map  $A^+$  to a complete field  $k^+(x)$ , thus a map  $A_{\mathrm{perf}}^+ \rightarrow k^+(x)_{\mathrm{perf}}$ , now  $k^+(x) \rightarrow k^+(x)_{\mathrm{perf}}$  is faithfully flat that preserves pseudo-uniformizers, thus it is a point  $y$  that maps to  $x$ .  $\square$

### 3 Affinoid Adic Spaces

**Lemma (27.3.3.1) [Functions on Rational Subsets].** If  $X = \mathrm{Spa}(A, A^+)$  is an affinoid adic space, and  $U$  is a rational subset, then there is a unique complete affinoid Tate ring  $(\mathcal{O}_X(U), \mathcal{O}_X^+(U))$  over  $(A, A^+)$  s.t. the map of spectra

$$\mathrm{Spa}(\mathcal{O}_X(U), \mathcal{O}_X^+(U)) \rightarrow \mathrm{Spa}(A, A^+)$$

is universal w.r.t. all the complete affinoid Tate space with a map to  $X$  that has image in  $U$ .

And in this case, this Spa map is a homeomorphism identifying the rational subsets contained in  $U$  to rational subsets of  $\mathrm{Spa}(\mathcal{O}_X(U), \mathcal{O}_X^+(U))$ . In particular,  $U$  is quasi-compact.  $\lrcorner$

*Proof:* ? See Hub94 P1.3 for the proof in the Huber ring case.

Choose a ring of definition  $(A_0, t)$ , and  $U = \mathrm{Spa}(A, A^+)(\frac{f_1, \dots, f_n}{g})$  for  $f_i, g \in A_0$ , and  $f_n = t^{??}$ , and let  $B = A[g^{-1}]$  and  $B_0 = A_0[\frac{f_i}{g}]$ . Then  $B = B_0[t^{-1}]$  (notice that  $A_0[t^{-1}] = A$ ). So  $B$  is a Tate  $A$ -algebra with ring of definition  $(B_0, t)$ . Now if  $B^+$  is the integral closure of the subring of  $B$  generated by  $A^+[\frac{f_i}{g}]$ , then  $(B, B^+)$  is an affinoid Tate ring. Set  $(\mathcal{O}_X(U), \mathcal{O}_X^+(U))$  to be its completion.

By construction  $\mathrm{Spa}(\mathcal{O}_X(U), \mathcal{O}_X^+(U))$  maps into  $U$ , because  $x(g) \neq 0$  because  $g$  is a unit, and  $|x(f_i)| \leq |x(g)|$  as  $f_i/g \in B^+$ .

Now check universal property: if  $\mathrm{Spa}(C, C^+)$  maps into  $U$ , then  $g$  is a unit in  $C$  by (27.3.2.17), and then  $f_i/g \in C^+$  by (27.3.2.17) again. Now  $C^0$  is the filtered colimit of all rings of definition, so there is a ring of definition  $C_0$  that contains  $A_0$  and all  $f_i/g$  ((12.2.5.17) is used). Then this gives a map of affinoid Tate rings that maps  $B_0$  into  $C_0$ , and when passed to completion, induces a map  $\mathcal{O}_X(U) \rightarrow C$  of Tate algebras. Now also  $B^+$  is mapped into  $C^+$  because  $C^+$  is integrally closed, so we are done.

For the last assertion, by (27.3.2.17), we only have to prove  $\mathrm{Spa}(B, B^+) \rightarrow U$  is a homeomorphism preserving rational subsets, for this, the injectivity is clear as  $B$  is a localization of  $A$ . And the surjectivity follows immediately from the valuation ring characterization and universal property. Continuity is also clear.

For the openness, for any rational subset  $X(\frac{f_1, \dots, f}{g})$  of  $X = \mathrm{Spa}(B, B^+)$ , because  $B = A[g^{-1}]$ ,  $g$  is unit in  $B$ , we can assume that  $f_i, g \in A_0$ . Now we show  $U \cap \mathrm{Spa}(A, A^+)(\frac{f_1, \dots, f}{g})$  is rational, for this, it suffices to add a  $t^N$  to  $f_i$ , and this is possible, as  $X(\frac{f_1, \dots, f}{g})$  is quasi-compact by (27.3.2.4). (This is in fact similar to the proof that continuous bijection from compact to Hausdorff is homeomorphism).  $\square$

**Remark (27.3.3.2).** The proof goes through with complete replaced by Zariski or Henselian, because we only use item5 of (27.3.2.17), which is true for all Zariski pairs.

And by looking at the construction, if a rational subset  $U$  has a representation  $X(\frac{f_1, \dots, f_n}{g})$ , then  $f_i \in \mathcal{O}_X^+(U)$ , and  $g$  is invertible in  $\mathcal{O}_X(U)$ .  $\lrcorner$

#### Stalks

**Def. (27.3.3.3) [Stalks].** The stalks of an affinoid adic space is defined as in the case of schemes, i.e. the colimit of the function ring of rational subsets containing  $x$ , without topology, and similarly for the **integral stalk**. notice that the function rings are defined by universal property w.r.t to complete Huber pairs, so the stalks only depend on the completion of  $(A, A^+)$ .  $\lrcorner$

**Lemma (27.3.3.4).** Let  $U$  be an open subset of  $X = \mathrm{Spa}(A, A^+)$  and  $f, g \in \mathcal{O}_X(U)$ , then  $V = \{x \in U \mid |f|_x \leq |g|_x \neq 0\}$  is an open subset of  $X$ .  $\lrcorner$

*Proof:* Cf. Morel P116. ?

□

**Prop. (27.3.3.5) [Valuations on the Stalks].** Let  $X = \mathrm{Spa}(A, A^+)$  be an affinoid adic space, and  $x \in X$ , then:

- There is a valuation  $x$  on  $\mathcal{O}_{X,x}$  extending that on  $A$ , and  $\mathcal{O}_{X,x}^+ = \{f \in \mathcal{O}_{X,x} \mid |f(x)| \leq 1\}$ .
- $\mathcal{O}_{X,x}$  is local with maximal ideal  $\mathfrak{m}_x = \ker x$ , and  $\mathcal{O}_{X,x}^+$  is local with maximal ideal  $\{f \in \mathcal{O}_{X,x} \mid |f(x)| < 1\}$ .
- If  $\kappa(x)$  is the residue field of  $\mathcal{O}_{X,x}$  and  $\kappa(x)^+$  be the image of  $\mathcal{O}_{X,x}^+$  in  $\kappa(x)$ , then  $k^+(x)$  is naturally a valuation ring, and  $(\kappa(x), \kappa(x)^+)$  is an affinoid field over  $(A, A^+)$ . In particular, there is an isomorphism between the residue fields of  $\mathcal{O}_{X,x}^+$  and  $k^+(x)$ .
- If  $\varphi : (A, A^+) \rightarrow (B, B^+)$  is a morphism of Huber pairs and  $y \in \mathrm{Spa}(B, B^+)$  is a point that  $\mathrm{Spa}(\varphi)(y) = x$ , then the morphism of rings  $\mathrm{Spa}(\varphi)_x^b : \mathcal{O}_{X,x} \rightarrow \mathcal{O}_{Y,y}$  induced by  $\mathrm{Spa}(\varphi)$  is such that  $|\cdot|_x \circ \mathrm{Spa}(\varphi)_x^b = |\cdot|_y$ . In particular,  $\mathrm{Spa}(\varphi)_x^b$  is a morphism of local rings. Also it sends  $\mathcal{O}_{X,x}^+$  to  $\mathcal{O}_{Y,y}^+$  and this is a morphism of local rings.

If moreover  $A$  is Tate, then we have:

- The ring  $\mathcal{O}_{X,x}^+$  is  $t$ -adically Henselian, and  $\mathcal{O}_{X,x}^+ \rightarrow k^+(x)$  induces an isomorphism after  $t$ -adic completion.
- The pairs  $(\mathcal{O}_{X,x}^+, \mathfrak{m}_x)$  and  $(\mathcal{O}_{X,x}, \mathfrak{m}_x)$  are Henselian.

┘

*Proof:* ? Morel P115.

1: Consider the  $t$ -adic completion of the valuation ring  $R_x$  corresponding to  $x$ , then  $(\widehat{k}(\mathfrak{p}_x), \widehat{R}_x)$  is an affinoid Tate ring over  $(A, A^+)$  that is mapped to  $x$  (and its generalizations), thus by universal property, there are unique maps from every rational subsets containing  $x$  to  $(\widehat{k}_x, \widehat{R}_x)$ , thus inducing a map  $(\mathcal{O}_{X,x}, \mathcal{O}_{X,x}^+) \rightarrow (\widehat{k}_x, \widehat{R}_x)$ , which induces the desired valuation. And also we have  $\mathcal{O}_{X,x}^+ \subset \{f \in \mathcal{O}_{X,x} \mid |f(x)| \leq 1\}$ , for the converse, if  $|f(x)| \leq 1$ , then  $U(\frac{f-1}{1})$  is rational subsets in  $U$  containing  $x$ , so by (27.3.3.2),  $f \in \mathcal{O}_X(V)^+$ , thus  $f \in \mathcal{O}_{X,x}^+$ .

2: for  $g$  not in  $\mathfrak{m}_x$ ,  $|g(x)| > |t(x)|^n$  for some  $n$ , so  $g$  is invertible in  $U(\frac{t^n}{g})$  by (27.3.3.2), hence invertible in  $\mathcal{O}_{X,x}$ . Similarly for  $\mathcal{O}_{X,x}^+$ , as  $g$  is invertible in  $U(\frac{1}{g})$ .

3: This is clear from the construction of the valuation on  $\mathcal{O}_{X,x}$  in item 1.

4:

5: As filtered colimits of Henselian pair is Henselian (5.3.10.3) and the function ring is complete, the stalk is Henselian. As for the completion, notice  $\mathfrak{m}_x \subset \mathcal{O}_{X,x}^+$  and is  $t$ -divisible, thus  $\mathcal{O}_{X,x}^+$  has the same  $t$ -adic completion as  $k^+(x)$ .

6: We first prove  $(\mathcal{O}_{X,x}^+, t)$  is Henselian, for this, it suffices to prove  $(\mathcal{O}_X^+(U), t)$  is Henselian, by (5.3.10.3). And  $\mathcal{O}_X^+(U)$  is a filtered colimits of rings of definitions (12.2.5.14) and they are  $t$ -adically complete hence Henselian, so we are done by (5.3.10.3) again. Then so does  $(\mathcal{O}_{X,x}, \mathfrak{m}_x)$  because the property of being Henselian only depends on  $I$  (5.3.10.10). □

**Cor. (27.3.3.6).** By the construction of the valuation on the stalk, we have an inclusion of rings  $k(\mathfrak{p}_x) \subset k(x) \subset \widehat{k}(x)$  that has the same completions, where the first is induced by the compatible map  $A \rightarrow \mathcal{O}_X(X) \rightarrow \mathcal{O}_X(U)$ . ┘

**Def. (27.3.3.7) [Structure Presheaves].** Now by the universal property of function rings (27.3.3.1), we have a map between them induced by inclusion of rational subsets, so we can define the **structure**

**presheaf** to be

$$\mathcal{O}_X(W) = \lim_{U \subset W \text{ rational}} \mathcal{O}_X(U),$$

and similarly for the **integral structure sheaf**  $\mathcal{O}_X^+$ .

Then there is a valuation of a point on  $\mathcal{O}_X(W)$  by passing to the stalk, and

$$\mathcal{O}_X^+(W) = \{f \in \mathcal{O}_X(W) \mid |f(x)| \leq 1, \forall x \in W\}.$$

because this is true for all rational subsets by adic nullstellensatz(27.3.2.17).

A Huber ring  $(A, A^+)$  is called **sheafy** iff the structure sheaf  $\mathcal{O}_X$  on  $X = \text{Spa}(A, A^+)$  is a sheaf. In this case,  $\mathcal{O}_X^+$  is also a sheaf by the above formula, so sheafyness is a property that only depends on  $A$ .  $\lrcorner$

### Criteria for Sheafyness

**Def. (27.3.3.8) [Stably Uniform Huber Pair].** For  $(A, A^+) \in \text{HubPair}$  s.t.  $A$  is analytic and  $X = \text{Spa}(A, A^+)$ , it is called **stably uniform** if  $\mathcal{O}_X(U)$  is uniform for all rational subsets  $U \subset X = \text{Spa}(A, A^+)$ .  $\lrcorner$

**Prop. (27.3.3.9).** Let  $A \rightarrow B$  be a continuous map of Huber rings which splits in the category of topological  $A$ -modules, then  $A$  is stably uniform.  $\lrcorner$

*Proof:* The splitting means the map is strict(12.2.1.6), so  $A$  is also uniform. Also the splitting is preserved under completed tensor product with rational localization, so  $A$  is stably uniform.  $\square$

**Prop. (27.3.3.10) [Examples of Sheafy Huber Rings].** Let  $(A, A^+)$  be a complete Huber pair,

1. (Schemes) If  $A$  is discrete, then  $A$  is sheafy.
2. (Formal Schemes) If  $A$  has a Noetherian ring of definition, then  $A$  is sheafy.
3. (Rigid Spaces, Fargues-Fontaine Curves) If  $A$  is Tate and strongly Noetherian(12.2.4.26), then  $A$  is sheafy.
4. (Perfectoid Spaces) If  $A$  is analytic and  $(A, A^+)$  is stably uniform(27.3.3.8), then  $A$  is sheafy and acyclic.

$\lrcorner$

*Proof:* Cf. Hub94 T2.2, [Ked19]1.7.

We use the arguments following(27.3.4.33).

If  $A$  is analytic and  $(A, A^+)$  is stably uniform. Firstly the ideals  $(f - gT), (g - fT)$  are closed in their rings, Cf.[Ked19]L1.5.26.

Then we have a diagram

$$\begin{array}{ccccccc}
 0 & \longrightarrow & 0 & \longrightarrow & B\langle T \rangle \oplus B\langle T^{-1} \rangle & \xrightarrow{(x,y) \mapsto x+T^{-1}y} & B\langle T, T^{-1} \rangle \longrightarrow 0 \\
 & & \downarrow & & \downarrow (f-gT, g-fT^{-1}) & & \downarrow \times(f-gT) \\
 0 & \longrightarrow & B & \longrightarrow & B\langle T \rangle \oplus B\langle T^{-1} \rangle & \xrightarrow{(x,y) \mapsto x-y} & B\langle T, T^{-1} \rangle \longrightarrow 0 \\
 & & \downarrow & & \downarrow & & \downarrow \\
 0 & \longrightarrow & B & \longrightarrow & B\langle \frac{f}{g} \rangle \oplus B\langle \frac{g}{f} \rangle & \longrightarrow & B\langle \frac{f}{g}, \frac{g}{f} \rangle \longrightarrow 0 \\
 & & \downarrow & & \downarrow & & \downarrow \\
 & & 0 & & 0 & & 0
 \end{array}$$

where the columns and the first two rows are exact, thus the third row are exact in the middle and right by spectral sequence. Also it is exact at the left by (27.3.2.16).  $\square$

**Remark (27.3.3.11).** Notice that these contains nearly everything of interest, so Scholze comments that we can somehow pretend that non-sheafy Huber rings don't appear in nature.  $\lrcorner$

**Remark (27.3.3.12).** Stably uniform is hard to check in practice, so a recent paper of Hansen-Kedlaya [Sheafyness Criterion for Huber Rings] studied another class of sousperfectoid rings which can be splitly embedded into a perfectoid ring, and another class of diamantine rings, which involves a condition on the cohomology of pro-étale site of  $A$ , closely related to properties of diamonds.  $\lrcorner$

**Prop. (27.3.3.13) [Non-examples of Sheafy Huber Rings].** Cf. Hub94 end of section1. ?  $\lrcorner$

## 4 Adic Spaces

**Def. (27.3.4.1) [Huber category].** The category  $\mathcal{V}^{pre}$  is a category that the objects are triples  $(X, \mathcal{O}_X, \{v_x\}_{x \in X})$  where  $X \in \mathbf{Top}$ ,  $\mathcal{O}_X$  is a sheaf of topological rings on  $X$ , and  $v_x$  are continuous valuations on the stalk  $\mathcal{O}_{X,x}$  with support  $\mathfrak{m}_x$  for each  $x \in X$ .

And a morphism in  $V^{pre}$  is a pair  $(f, f^\flat)$  where  $f : X \rightarrow Y$  is a map of topological spaces and  $f^\flat : \mathcal{O}_X \rightarrow f_* \mathcal{O}_Y$  is a morphism of presheaves of topological rings, and the induced morphism of  $f^\flat$  on the stalks are compatible with the valuations.

The **Huber category**  $V$  is the full subcategory of  $V^{pre}$  whose objects are triples  $(X, \mathcal{O}_X, v_x)$  in  $V^{pre}$  that  $\mathcal{O}_X$  is a sheaf.  $\lrcorner$

**Prop. (27.3.4.2) [Sheaf of Integral Elements].** For any  $(X, \mathcal{O}_X, \{v_x\}_{x \in X}) \in \mathcal{V}$ , we can define a **sheaf of integral elements**  $\mathcal{O}_X^+$  s.t. for any open subset  $U \subset X$ ,

$$\mathcal{O}_X^+(U) = \{f \in \mathcal{O}_X(U) : |f(x)| \leq 1, \forall x \in U\}.$$

It is clearly a sheaf.  $\lrcorner$

**Def. (27.3.4.3) [Open Immersions].** An **open immersion** in  $V^{pre}$  is a homeomorphism onto an open subset that induces an isomorphism of presheaves.  $\lrcorner$

**Def. (27.3.4.4)[Adic Spaces].** The category of **affinoid adic spaces** is the full subcategory of the Huber category (27.3.4.1) consisting of objects isomorphic to an adic spectrum of a Huber pair  $(A, A^+)$ , and the category of **adic spaces** is the full subcategory of the Huber category (27.3.4.1) whose objects are locally isomorphic to an affinoid adic space. The category of adic spaces is denoted by  $\text{AdicSpa}$ .  
 $\lrcorner$

**Prop. (27.3.4.5)[Adic Spaces are Locally Spectral].** Adic spaces are locally spectral, and morphisms of adic spaces are spectral.  $\lrcorner$

*Proof:*  $\square$

**Prop. (27.3.4.6)[Adic Spectrum Adjointness].** For any  $(R, R^+) \in \text{HubPair}$  and  $Y \in \text{AdicSpa}$ , there is a natural isomorphism

$$\text{Hom}(Y, \text{Spa}(R, R^+)) \cong \text{Hom}((R, R^+), (\mathcal{O}_Y(Y), \mathcal{O}_Y^+(Y))).$$

$\lrcorner$

*Proof:* It suffices to show for  $Y = (S, S^+)$  affine, because an morphism from  $Y \rightarrow \text{Spa}(R, R^+)$  is glued from local morphisms, and  $\mathcal{O}_Y$  is a sheaf.

For this, Cf. [Huber94]Prop2.1(2).  $\color{red}{?}$   $\square$

**Def. (27.3.4.7)[Noetherian Adic Spaces].** A **locally Noetherian adic space** is an adic space that is locally of the form  $\text{Spa}(A, A^+)$ , where  $A$  is a strongly Noetherian Tate  $K$ -algebra. A **Noetherian adic space** is a locally Noetherian adic space that is qcqs. In particular, noetherian adic spaces are spectral.  $\lrcorner$

**Def. (27.3.4.8)[Uniform Adic Spaces].**  $X \in \text{AdicSpa}$  is called a **uniform adic space** if for any open affinoid  $U = \text{Spa}(R, R^+) \subset X$ , the Huber ring  $R$  is uniform.  $\lrcorner$

### Cartier Divisors and Closed Immersions

**Def. (27.3.4.9)[Cartier Divisors].** Let  $X$  be a uniform analytic adic space, then a (effective) **Cartier divisor** on  $X$  is an ideal sheaf  $\mathcal{I} \subset \mathcal{O}_X$  that is locally free of rank 1. The support of a Cartier divisor is  $\text{Supp}(\mathcal{O}_X/\mathcal{I})$ .

The support  $Z$  of a Cartier divisor is a nowhere dense closed subset of  $X$ , and the map  $I \mapsto \mathcal{I} = i\mathcal{O}_X$  induces a bijection between invertible ideals  $I \subset R$  that  $V(I)$  is nowhere dense in  $X$  and Cartier divisors on  $X$ .  $\lrcorner$

*Proof:* By (27.3.4.24), any Cartier divisor is of the form  $I \otimes_R \mathcal{O}_X$  for some invertible ideal  $I \subset R$ . We need to show that  $\varphi : I \otimes_R \mathcal{O}_X \rightarrow \mathcal{O}_X$  is injective iff  $V(I) \subset X$  is nowhere dense.

By restriction, we can assume  $I = (f)$  is principle, and if  $V(f)$  contains an open subset, then on an open rational subset,  $f = 0$  by uniformity (27.3.2.15), so  $\varphi$  is not injective. Conversely, if  $V(f)$  is nowhere dense, we show  $f$  is a nonzero-divisor: if  $fg = 0$  and  $g \neq 0$ , then  $U = U(\frac{g}{g})$  is contained in  $V(f)$  and is open, so  $U = 0$ , which implies  $g = 0$  by uniformity (27.3.2.15), contradiction.  $\square$

**Prop. (27.3.4.10).** Let  $X \in \text{AdicSpa}$  be uniform (27.3.4.8) and  $\mathcal{I} \subset \mathcal{O}_X$  a Cartier divisor with support  $Z$  and  $j : U = X \setminus Z \rightarrow X$ . There are injective maps of sheaves

$$\mathcal{O}_X \hookrightarrow \varinjlim_n \mathcal{I}^{-n} \hookrightarrow j_*\mathcal{O}_U.$$

$\lrcorner$

*Proof:* This is local, it suffices to check this is for any affine subscheme of  $X$ , so we can assume  $X = \mathrm{Spa}(R, R^+)$  and  $\mathcal{I} = f\mathcal{O}_X$  for some nonzero-divisor  $f \in R$  whose vanishing locus  $Z$  is nowhere dense, and check the global sections:

$$R \rightarrow R[\frac{1}{f}] \rightarrow \Gamma(U, \mathcal{O}_U).$$

Then it suffices to show  $R \rightarrow \Gamma(U, \mathcal{O}_U)$  is injective. But if  $g$  vanishes on  $U$ , then the vanishing locus of  $g$  is a closed subset containing  $U$ , which implies that it is all of  $X$  as  $Z$  is nowhere dense, so  $g = 0$  by uniformity(27.3.2.15).  $\square$

**Def. (27.3.4.11) [Meromorphic Along the Cartier Divisor].** A function  $f \in H^0(U, \mathcal{O}_U)$  is **meromorphic along** the Cartier divisor  $\mathcal{I} \subset \mathcal{O}_X$  if it lifts to  $H^0(X, \varinjlim_n \mathcal{I}^{-n})$ .  $\lrcorner$

**Def. (27.3.4.12) [Closed Cartier Divisors].** On a uniform analytic adic space  $X$ , a **closed Cartier divisor** is a Cartier divisor  $\mathcal{I} \subset \mathcal{O}_X$  with support  $Z$  that  $(Z, \mathcal{O}_X/\mathcal{I}, |\cdot|_x, x \in Z)$  is an adic space.  $\lrcorner$

**Prop. (27.3.4.13) [Closed Cartier Divisor and Closed Immersion].** On a uniform analytic adic space  $X$ , a Cartier divisor  $\mathcal{I} \subset \mathcal{O}_X$  is closed iff the map  $\mathcal{I}(U) \hookrightarrow \mathcal{O}_X(U)$  has closed image for all open affinoid  $U \subset X$ . In this case, for all open affinoid  $U = \mathrm{Spa}(R, R^+) \subset X$ , the intersection  $U \cap Z = \mathrm{Spa}(S, S^+)$  is an affinoid adic space, where  $S = R/I$  and  $S^+$  is the integral closure of the image of  $R^+$  in  $S$ .  $\lrcorner$

*Proof:* The property of having closed image can be checked locally as affinoid subspace is quasi-compact. The fact  $\mathcal{O}_X/\mathcal{I}$  is a  $(\mathcal{O}_X/\mathcal{I})(U_i)$  is separated for an open covering  $\{U_i\}$  of  $X$ , so at  $\mathcal{I}(U_i)$  is closed in  $\mathcal{O}_X(U_i)$ .

Conversely, if  $\mathcal{I}(U) \hookrightarrow \mathcal{O}_X(U)$  has closed image for all open affinoid  $U \subset X$ , we want to show  $(Z, \mathcal{O}_X/\mathcal{I}, |\cdot|_x, x \in Z)$  is an adic space: We can construct this locally, so if  $X = \mathrm{Spa}(R, R^+)$ ,  $S = R/I$  is separated and complete, thus a complete Huber ring, and consider the quotient Huber ring(12.2.5.19)  $(S, S^+)$ , then  $\mathrm{Spa}(S, S^+) \rightarrow \mathrm{Spa}(R, R^+)$  is a closed immersion of topological spaces with image  $V(I)$ .

What's left to show is that the map of presheaves  $\mathcal{O}_X/\mathcal{I} \rightarrow \mathcal{O}_Z$  is an isomorphism, and also  $\mathcal{O}_X/\mathcal{I}(U) = \mathcal{O}_X(U)/\mathcal{I}(U)$ . To show this, we first show the presheaf  $\mathcal{O}_X/\mathcal{I}$  is a sheaf: this is by  $3 \times 3$ -lemma:  $\mathcal{I}$  is locally  $(f)$ , and for a rational covering  $U_i \rightarrow X$ ,

$$\mathcal{O}_X(X)/f \rightarrow \prod_i \mathcal{O}_X(U_i)/f \Rightarrow \prod_{ij} \mathcal{O}_X(U_{ij})/f$$

is exact.

And to show  $\mathcal{O}_X/\mathcal{I} \rightarrow \mathcal{O}_Z$  is an isomorphism, it suffices to notice taking localization and taking quotient commutes, because they are both defined by universal properties.(12.2.5.19)(12.2.5.32).  $\square$

**Remark (27.3.4.14).** Even if  $A$  is Tate and stably uniform, and  $f \in A$  is a nonzero-divisor that  $fA \subset A$  is closed, it may not be true that  $\mathcal{O} = f\mathcal{O}_X \hookrightarrow \mathcal{O}_X$  is a closed Cartier divisor on  $X = \mathrm{Spa}(A, A^+)$ . This is because there may be rational localization  $(A, A^+) \rightarrow (B, B^+)$  that  $fB$  is not closed in  $B$ . Cf. [Ked19]P16.  $\lrcorner$

### Examples of Adic Spaces

**Prop. (27.3.4.15) [Examples of Adic Spaces].**

- (Adic Closed Unit Disk) The space  $\mathrm{Spa}(\mathbb{Z}[T]) = \mathrm{Spa}(\mathbb{Z}[T], \mathbb{Z}[T])$  represents the functor  $X \mapsto \mathcal{O}_X^+(X)$ .
- (Adic Affine Line) The functor  $X \mapsto \mathcal{O}_X(X)$  is also representable, by  $\mathrm{Spa}(\mathbb{Z}[T], \mathbb{Z})$ . Notice for any non-Archimedean field  $K$ ,

$$\mathrm{Spa}(\mathbb{Z}[T], \mathbb{Z}) \times \mathrm{Spa} K = \cup_{n \geq 1} \mathrm{Spa} K \langle \varpi^n T \rangle = \varinjlim_{n, T \mapsto \varpi T} \mathrm{Spa} K \langle T \rangle.$$

This is because For any Huber pair  $(R, R^+)$  over  $(K, \mathcal{O}_K)$ ,  $R = \cup_n \varpi^{-n} R^+$  because  $\varpi$  is topologically nilpotent.

- (The Open Unit Disk) Let  $D = \mathrm{Spa} \mathbb{Z}[[T]]$ , then for any non-Archimedean field  $K$ ,  $D_K = D \times \mathrm{Spa} K$  represents the functor that maps a  $K$ -algebra  $R$  to all its elements of norm  $\leq 1$ . Then this the open disk over  $K$ . And  $D_K$  is also represented by

$$\cup_{n \geq 1} \mathrm{Spa} K \left\langle T, \frac{T^n}{\varpi} \right\rangle.$$

- (The Punctured Open Unit Disk) Let  $\mathbb{D}^* = \mathrm{Spa} \mathbb{Z}((T))$ , then

$$D_K^* = D^* \times \mathrm{Spa} K = \mathbb{D}_K \left\langle \frac{T}{T} \right\rangle = \mathbb{D}_K \setminus \{0\}$$

┘

**Prop. (27.3.4.16) [The Open Unit Disk over  $\mathbb{Z}_p$ ].** Consider  $X = \mathbb{Z}_p[[T]]$  with the  $(p, T)$ -adic topology, there is exactly one non-analytic point  $x = x_{\mathbb{F}_p}$ . Let  $X = \mathrm{Spa}(\mathbb{Z}_p[[T]])$  and  $\mathcal{Y} = X \setminus \{x_{\mathbb{F}_p}\}$ , then for a point  $x \in \mathcal{Y}$ ,  $T(x)$  and  $p(x)$  cannot both be 0 by (12.2.6.2).

Then there exists a unique continuous map

$$\kappa : |\mathcal{Y}| \rightarrow [0, \infty]$$

characterized by the following property: For any rational number  $m/n < r$ ,  $|T(x)|^n > |p(x)|^m$ , and for any rational number  $m/n > r$ ,  $|T(x)|^n < |p(x)|^m$ . This map  $\kappa$  is surjective. ┘

*Proof:* Let  $\tilde{x}$  be a maximal vertical generalization of  $x$ , then it has rank 1 and we can assume  $\tilde{x}$  is real valued by (12.2.3.9). Now we define

$$\kappa(x) = \frac{\log |T(\tilde{x})|}{\log |p(\tilde{x})|},$$

This is definable as  $T(\tilde{x})$  and  $p(\tilde{x})$  cannot both be 0.

The uniqueness of  $\kappa(x)$  follows from the fact  $|T(x)|^n > |p(x)|^m$  implies to  $|T(\tilde{x})|^n \geq |p(\tilde{x})|^m$  because  $\tilde{x}$  is a generalization of  $x$ .

To show  $\kappa$  satisfies the condition, if  $m/n < r$ , then  $|T(\tilde{x})|^n > |p(\tilde{x})|^m$ , so  $|T(x)|^n > |p(x)|^m$  because  $x, \tilde{x}$  define the same topology. And it is continuous because

$$\kappa^{-1}((-\infty, r)) = \cup_{m/n < r} U\left(\frac{T^n}{p^m}\right).$$

To show the surjectivity, if  $\kappa = [x_0 : x_1]$ , define the valuation as

$$v\left(\sum a_{ij} p^i T^j\right) = \sup_{a_{ij} \neq 0} e^{-x_0 i - x_1 j}$$

where  $(a_{ij})^p = 1$ . ┘

### Construction of Adic Spaces

**Def. (27.3.4.17)** [Fiber Products of Adic Spaces and Schemes]. Cf. [Wed14]P91. ┘

**Def. (27.3.4.18)** [Adic Spaces attached to Schemes]. ┘

**Def. (27.3.4.19)** [Adic Spaces attached to Formal Schemes]. Cf. [Wed14]. ┘

**Def. (27.3.4.20)** [Adic Spaces attached to Rigid Analytic Spaces]. Cf. [Wed14]. ┘

### Sheaves and Vector Bundles

**Def. (27.3.4.21).** Let  $(A, A^+)$  be a Huber pair and  $X = \mathrm{Spa}(A, A^+)$ , let  $\widetilde{M} = M \otimes_A \mathcal{O}_X$  be the presheaf on  $X$ . ┘

**Prop. (27.3.4.22).** If  $A$  is sheafy, then for any finite projective  $A$ -module  $M$ , the presheaf  $\widetilde{M}$  is a sheaf on  $X = \mathrm{Spa}(A, A^+)$ , and  $H^i(U, \mathcal{F}) = 0$  for any rational subset of  $X$  and  $i > 0$ . ┘

*Proof:* Because  $M$  is a direct sum of a finite free  $A$ -module, then we reduce to the case  $\mathcal{O}_X$  is sheafy. □

**Remark (27.3.4.23).** This is a partial analogy with Tate's acyclicity theorem in rigid analytic geometry (27.2.1.40)(27.2.3.10), but it only holds for f.p. modules, not even f.g. modules. One impediment is that the rational localization map are generally not flat. To get around this, Kedlaya defined a category of pseudo-coherent modules, with the property that even when flatness fails, tensoring is also exact in this category. ┘

**Prop. (27.3.4.24)** [Vector Bundles]. Let  $(A, A^+)$  be a sheafy analytic Huber pair and  $X = \mathrm{Spa}(A, A^+)$ , then the functor  $M \rightarrow \widetilde{M}$  from the category of finite projective  $A$ -modules to the category  $\mathrm{Vect}_X$  of locally finite free  $\mathcal{O}_X$ -modules is an equivalence of categories. In particular,  $\mathrm{Vect}_X$  only depends on  $A$ . ┘

*Proof:* Cf. [Ked19].P40 ? □

### Pre-Adic Spaces

References are [S-W20]L3 and [Ked19].

**Def. (27.3.4.25)** [Pre-Adic Spaces]. ┘

**Remark (27.3.4.26).** Pre-adic spaces is an approach to work around the failure of sheafyness of general Huber pair, with techniques from algebraic stacks. ┘

### Analytic Points

**Prop. (27.3.4.27)** [Analytic and Tate Rings]. Let  $(A, A^+)$  be a complete Huber pair, then

- The Huber ring  $A$  is analytic iff all points of  $\mathrm{Spa}(A, A^+)$  are analytic.
- A point  $x \in \mathrm{Spa}(A, A^+)$  is analytic iff there is a rational nbhd  $U \subset \mathrm{Spa}(A, A^+)$  that  $\mathcal{O}_X(U)$  is Tate.

┘

*Proof:* 1:  $x$  is non-analytic iff  $A^{00} \subset \mathfrak{p}_x$  by (12.2.6.5), so all points are analytic iff  $A^{00}A = A$ , which means  $A$  is analytic.

2: Let  $x$  be an analytic point, then there exists  $f \in I$  where  $I$  is an ideal of definition that  $|f|_x \neq 0$ . Now  $\{g \in A \mid |g(x)| \leq |f(x)|\}$  is open (because  $|\cdot|_x$  is continuous), so contains some  $I^n$ . Now let  $I^n = (g_1, \dots, g_k)$ , then  $U(\frac{g_1, \dots, g_k}{f})$  is a rational subset. Then in  $\mathcal{O}_X(U)$ ,  $f$  is a unit, but also it is topologically nilpotent, because it is contained in  $I$ .

Conversely, if  $x \in X$  has a rational nbhd  $U = U\left\langle \frac{T}{s} \right\rangle$  such that  $\mathcal{O}_X(U)$  is Tate, and  $x$  is not analytic, then  $\mathfrak{p}_x$  contains an ideal of definition  $I \subset A_0$ . Now let  $f \in \mathcal{O}_X(U)$  be a topologically nilpotent unit, then there exists  $m \geq 1$  that  $f^m$  lies in the closure of  $IA_0[t/s \mid t \in T]$  in  $\mathcal{O}_X(U)$ . Since  $x \in U$ , the valuation  $|\cdot|_x$  extends to  $\mathcal{O}_X(U)$ , and since  $|\cdot|_x$  is continuous,  $|f^m(x)| = 0$ , contradiction, as  $f$  is a unit in  $\mathcal{O}_X(U)$ .  $\square$

**Def. (27.3.4.28)[Analytic Points].** Let  $X$  be a pre-adic space, then a point  $x \in X$  is called an **analytic point** if there is some open affinoid nbhd  $U = \text{Spa}(A, A^+) \subset X$  of  $x$  that  $A$  is Tate. And  $X$  is called **analytic** if all of its points are analytic.  $\lrcorner$

**Prop. (27.3.4.29).** Let  $f : X \rightarrow Y$  be a map of analytic pre-adic spaces, then  $|f| : |X| \rightarrow |Y|$  is generalizing. If  $f$  is quasi-compact and surjective, then  $|f|$  is a quotient map.  $\lrcorner$

*Proof:* Cf. [Hub96] 1.1.10. and [Étale Cohomology of Diamonds, L2.5].  $\square$

**Def. (27.3.4.30).** A map  $f : Y \rightarrow X$  of pre-adic spaces is called **analytic** if it carries analytic points to analytic points.  $\lrcorner$

### Proof of Acyclicity and Sheafyness by Čech Reduction

**Def. (27.3.4.31) [Standard Rational Coverings].** Let  $X = \text{Spa}(A, A^+)$  and  $f_1, \dots, f_n \in A$  which generates the unit ideal, then the sets  $X(\frac{f_1, \dots, f_n}{f_i})$  covers  $X$ , called the **standard rational covering** of  $X$ . And if  $n = 2$ , it is called a **standard binary rational covering** of  $X$ .

There are special types of standard binary rational coverings: if  $f_1 = f, f_2 = 1$ , then it is called a **simple Laurent covering**. If  $f_1 = f, f_2 = 1 - f$ , then it is called a **simple balanced covering**.  $\lrcorner$

**Lemma (27.3.4.32) [Reduction of Coverings].** Let  $A$  be an analytic Huber ring,

- (Huber) Every open covering of  $X$  can be refined by some standard rational covering.
- (Gabber-Ramero) Every open covering of a rational subspace of  $X$  can be refined by some compositions of simple Laurent coverings and simple balanced coverings.

$\lrcorner$

*Proof:* 1: Cf. [Ked19] P28.

2: Cf. [Ked19] P29.  $\square$

**Prop. (27.3.4.33) [Čech Reduction].** By a Čech cohomological argument the same as Tate's acyclicity theorem in rigid geometry (27.2.1.40), it suffices to prove any presheaf is a sheaf or any sheaf is acyclic on simple Laurent coverings and simple balanced coverings.

That is, for every rational localization  $(B, B^+)$  over  $(A, A^+)$ , every pair  $f, g \in B$  that  $g = f$  or  $1 - f$ , if the sequence

$$0 \rightarrow B \rightarrow B\left\langle \frac{f}{g} \right\rangle \oplus B\left\langle \frac{g}{f} \right\rangle \rightarrow B\left\langle \frac{f}{g}, \frac{g}{f} \right\rangle \rightarrow 0,$$

- is exact at exact at left and middle, then  $\mathcal{O}_X$  is sheafy.

- is exact, then  $\mathcal{O}_X$  is acyclic.

Also remember the following equations:

$$B \left\langle \frac{f}{g} \right\rangle = B \langle T \rangle / \overline{(f - gT)}, \quad B \left\langle \frac{g}{f} \right\rangle = B \langle T \rangle / \overline{(g - fT)}, \quad B \left\langle \frac{f}{g}, \frac{g}{f} \right\rangle = B \langle T, T^{-1} \rangle / \overline{(f - gT)}$$

┘

**Prop. (27.3.4.34) [Properties of (Finite)Étale Maps].**

- (Finite)Étale maps are invariant under compositions and pullbacks.
- If  $g$  and  $gf$  are (finite)étale, then so is  $f$ .
- $f$  is (finite)étale iff  $f^\flat$  is (finite)étale.

┘

*Proof:* Cf. [S-W20]P65. □

## 5 Étale Sites

**Def. (27.3.5.1) [Finite Étale Maps of Adic Spaces].** A **finite étale map of Huber pairs** is a map  $(A, A^+) \rightarrow (B, B^+) \in \text{HubPair}$  s.t.  $A \rightarrow B$  is finite étale, and  $B^+$  is the integral closure of  $A^+$  in  $B$ .

A **standard étale map of Huber pairs** is a map  $(A, A^+) \rightarrow (B, B^+) \in \text{HubPair}$  that is a finite étale map followed by a rational localization (27.3.2.3).

A map  $f : X \rightarrow Y \in \text{AdicSpa}$  is called a **finite étale morphism of adic spaces** if there is a cover of  $Y$  by affinoid subspaces  $\{V_i \subset Y\}$  s.t.  $U_i = f^{-1}(V_i)$  are all affinoids, and the map  $(\mathcal{O}_Y(V_i), \mathcal{O}_Y^+(V_i)) \rightarrow (\mathcal{O}_X(U_i), \mathcal{O}_X^+(U_i))$  is finite étale. Write  $Y_{\text{fét}}$  for the category of all such maps.

A map  $f : X \rightarrow Y \in \text{AffndSpa}$  is called a **standard étale morphism of affinoid spaces** if the map  $(\mathcal{O}_Y(V_i), \mathcal{O}_Y^+(V_i)) \rightarrow (\mathcal{O}_X(U_i), \mathcal{O}_X^+(U_i))$  is standard étale. ┘

**Prop. (27.3.5.2).** Being a finite étale map of adic spaces is local on the target. ┘

*Proof:* ? □

**Def. (27.3.5.3) [Étale Maps of Adic Spaces].** An **étale map of adic spaces**  $X \rightarrow Y \in \text{AdicSpa}$  is a map s.t. for any  $x \in X$ , there exists an open subspace  $x \in U$  and an open subspace  $f(U) \subset V$  together with a  $W \in \text{AdicSpa}$  that  $f : U \rightarrow V$  factors through an open embedding  $U \rightarrow W$  and a finite étale map  $W \rightarrow V$  (27.3.5.1). ┘

## 6 Pro-Étale Sites

**Def. (27.3.6.1) [Underlying Spaces of Pro-Étale Objects].** For  $X \in \text{AdicSpa}$  and  $U = \varprojlim U_i \in \text{pro}(X_{\text{ét}})$ , the **underlying space** of  $U$  is defined to be  $|U| = \varprojlim |U_i|$ . ┘

*Proof:* This is well-defined because the underlying spaces of adic spaces are compatible with fiber products. □

**Def. (27.3.6.2) [(Pro-)Étale Morphisms of Pro-Étale Objects].** For  $X \in \text{AdicSpa}$ , a morphism  $U \rightarrow V \in \text{pro}(X_{\text{ét}})$  is called a **étale/finite étale morphism** if it is the base change of an étale/finite étale morphism  $U_0 \rightarrow V_0 \in X_{\text{ét}}$  (27.3.5.1)(27.3.5.3). And it is called a **pro-étale morphism** if  $U = \varprojlim U_i$  where each  $U_i \in \text{pro}(X_{\text{ét}})$  is étale over  $V$  and the transition maps  $U_i \rightarrow U_j$  are finite étale and surjective. ┘

**Prop. (27.3.6.3) [Properties of Pro-Étale Morphisms].** For  $X \in \text{AdicSpa}$ ,

- Finite étale/étale/pro-étale morphisms in  $\text{pro}(X_{\text{ét}})$  are stable under base change and compositions, and if  $U \rightarrow V$  is pro-étale, then  $|U \times_V W| \rightarrow |U| \times_{|V|} |W|$  is surjective.
- (Compact Open Subsets) If  $U \rightarrow X$  is pro-étale and  $W \subset |U|$  is a qc open subset, then there is some  $V \in \text{pro}(X_{\text{ét}})$  with  $V \rightarrow X$  pro-étale with an étale map  $V \rightarrow U$  which is a homeomorphism onto  $W$ , and satisfies that: If  $f : V' \rightarrow U \in \text{pro}(X_{\text{ét}})$  and  $|f|$  factors through  $W$  with  $V' \rightarrow X$  pro-étale, then  $f$  factors through  $V$ .
- Pro-étale maps in  $\text{pro}(X_{\text{ét}})$  are open.
- Any surjective étale/finite étale morphism  $U \rightarrow V \in \text{pro}(X_{\text{ét}})$  is a pullback from a surjective étale/finite étale morphism in  $X_{\text{ét}}$ .

┘

*Proof:* Cf. [Scholze13]P15. ?

□

**Def. (27.3.6.4) [Pro-Étale Sites].** For  $X \in \text{AdicSpa}$ , the **pro-étale site**  $X_{\text{pro-ét}}$  is defined to be the full subcategory of  $\text{pro}(X_{\text{ét}})$  consisting of objects that are pro-étale over  $X$  (27.3.6.2), together with coverings given by a family of pro-étale morphisms (27.3.6.2)  $\{f_i : U_i \rightarrow U\}$  s.t.  $|U| = \cup f_i(|U_i|)$ . This is truly a site by (27.3.6.3).

The **pro-finite-étale site**  $X_{\text{pro-fét}}$  is defined to be the category  $\text{pro}(X_{\text{ét}})$  with coverings given by a family of open morphisms  $\{f_i : U_i \rightarrow U\}$  s.t.  $|U| = \cup f_i(|U_i|)$  (27.3.6.1). This is truly a site by (27.3.6.3).

We use the notation  $U = \varprojlim U_i \in X_{\text{pro-ét}}$  (resp.  $X_{\text{pro-fét}}$ ) to indicate that  $U_i \in X_{\text{ét}}$  and  $U = \varprojlim U_i \in \text{pro}(X_{\text{ét}})$ .

┘

**Prop. (27.3.6.5).** Let  $X \in \text{NAdicSpa}_{\text{cntd}} \text{Spa} \cup \text{NSch}_{\text{cntd}}$ , then there is a canonical equivalence of sites

$$X_{\text{pro-fét}} \cong \pi_1(X, \bar{x})\text{-Prof}.$$

┘

*Proof:*

□

**Prop. (27.3.6.6).** For  $X \in \text{AdicSpa}$ , a morphism  $f : U \rightarrow V \in X_{\text{pro-fét}}$  is open iff it is a pro-étale morphism in  $X_{\text{pro-ét}}$ . In particular, coverings in  $X_{\text{pro-fét}}$  and  $X_{\text{pro-ét}}$  are compatible, and there is a map of sites  $X_{\text{pro-ét}} \rightarrow X_{\text{pro-fét}}$ .

┘

*Proof:* By (27.3.6.3), pro-étale maps are open. For the converse, use (27.3.6.5) and [Scholze13]Lemma3.6. ?

□

**Prop. (27.3.6.7).**  $X_{\text{ét}}$  has arbitrary finite limits.

┘

*Proof:*

□

**Prop. (27.3.6.8) [Quasi-Compactness and Quasi-Separatedness].** For  $X \in \text{NAdicSpa}_{\text{cntd}} \text{Spa} \cup \text{NSch}_{\text{cntd}}$ ,

- If  $U = \lim U_i \rightarrow X$  is a pro-étale presentation of  $U \in X_{\text{pro-ét}}$  s.t. each  $U_i$  is affinoid, then  $U$  is a qcqs object in  $X_{\text{pro-ét}}$ . These objects are generating, and stable under fiber products.
- $\text{Sh}(X_{\text{pro-ét}})$  is algebraic (Cf. SGA 4 VI, Definition 2.3 ?).

- $U \in X_{\text{pro-ét}}$  is qc/qs iff  $|U|$  is. And a morphism  $f : U \rightarrow V \in X_{\text{pro-ét}}$  is qc/qs iff  $|f|$  is.
- Let  $U = \varprojlim U_i \rightarrow V$  be an inverse limit of surjective finite étale maps, then  $U$  is qc/qs iff  $V$  is.
- the site  $X_{\text{pro-ét}}$  is qs/qcqs? iff  $|X|$  is.

┘

*Proof:* Cf.[Scholze13]Prop3.12.?

□

**Prop. (27.3.6.9)[Enough Points for  $X_{\text{pro-ét}}$ ].** For  $X \in \text{AdicSpa}$ ,  $X_{\text{pro-ét}}$  has enough points, given by profinite covers of geometric points.

┘

*Proof:*

□

**Prop. (27.3.6.10)[Cohomology on Pro-Étale Objects].** Suppose  $X$  be a locally Noetherian scheme or a locally Noetherian adic space,  $\mathcal{F} \in \text{Sh}(X_{\text{ét}})$ , and  $U = \varprojlim U_j \in X_{\text{pro-ét}}$  is qcqs, then for any  $i \in \mathbb{N}$ ,

$$H^i(U, \nu^* \mathcal{F}) = \varinjlim H^i(U_j, \mathcal{F}).$$

┘

*Proof:*

□

**Cor. (27.3.6.11).** Suppose  $X$  be a locally Noetherian scheme or a locally Noetherian adic space, and  $\mathcal{F} \in \text{Sh}(X_{\text{ét}})$ , then

- the adjunction maps  $\mathcal{F} \rightarrow \nu_* \nu^* \mathcal{F} \rightarrow R\nu_* \nu^* \mathcal{F}$  are isomorphisms. In particular, there is an embedding of topoi  $\nu_* : \text{Sh}(X_{\text{ét}}) \rightarrow \text{Sh}(X_{\text{pro-ét}})$ .
- If  $f : X \rightarrow Y$  is a qcqs morphism, then for any  $\mathcal{F} \in \text{Sh}(X_{\text{ét}})$ , the base change morphism

$$\nu_Y^* Rf_{\text{ét},*} \mathcal{F} \rightarrow Rf_{\text{pro-ét},*} \nu_X^* \mathcal{F}$$

is an isomorphism.

┘

*Proof:* 1: By (7.3.1.7),  $R^i \nu_* \nu^* \mathcal{F}$  is the sheaf on  $X_{\text{ét}}$  associated to the sheaf  $U \mapsto H^i(U, \nu^* \mathcal{F})$ . But when  $U$  is affinoid,  $H^i(U, \nu^* \mathcal{F}) = H^i(U, \mathcal{F})$  by (27.3.6.10), which implies the assertion, as for  $i \in \mathbb{Z}_+$ , any section is locally vanishing (7.3.2.14).

2: By the same argument, we can show that for any  $i \in \mathbb{Z}_+$ , the  $i$ -th cohomology of both sides are equal to the shiffication of the presheaf taking any qcqs  $U = \varprojlim U_i \in X_{\text{pro-ét}}$  to  $\varinjlim H^i(U_i \times_Y X, \mathcal{F})$ .

□

**Prop. (27.3.6.12).** Should be put somewhere else?? Let  $T \in \text{Site}$  and  $\mathcal{F}_i \in \text{Sh}(T)$  be an inverse system. Assume that there is a basis  $B$  of  $T$  s.t. for any  $U \in B$ ,  $R^1 \varprojlim \mathcal{F}_i(U) = 0$ , and  $H^j(U, \mathcal{F}_i) = 0$  for  $j \in \mathbb{Z}_+$ , then  $R^j \varprojlim \mathcal{F}_i = 0$  for any  $j \in \mathbb{Z}_+$ , and  $(\varprojlim \mathcal{F}_i)(U) = \varprojlim \mathcal{F}_i(U)$  for any  $U \in T$ . Moreover,  $H^j(U, \varprojlim \mathcal{F}_i) = 0$  for  $U \in B$  and  $j \in \mathbb{Z}_+$ .

┘

*Proof:* Cf.[Scholze13]Lemma3.18.?

□

### Structure Sheaves

**Def. (27.3.6.13) [Structure Sheaves].** Let  $X \in \mathrm{NAdicSpa} / \mathrm{Spa}(\mathbb{Q}_p, \mathbb{Z}_p)$ , then

- The sheaf  $\mathcal{O}_X = \nu^* \mathcal{O}_{X_{\text{ét}}}$  is called the **structure sheaf** on  $X_{\text{pro-ét}}$ , and it has a **subring of integral elements**  $\mathcal{O}_X^+ = \nu^* \mathcal{O}_{X_{\text{ét}}}^+$ .
- $\widehat{\mathcal{O}}_X^+ = \varprojlim_n \mathcal{O}_X^+ / (p^n)$  is called the **integral completed structure sheaf** on  $X_{\text{pro-ét}}$ , and  $\widehat{\mathcal{O}}_X = \widehat{\mathcal{O}}_X^+[\frac{1}{p}]$  is called the **completed structure sheaf** on  $X_{\text{pro-ét}}$ .

┘

**Prop. (27.3.6.14).** Let  $X \in \mathrm{NAdicSpa} / \mathrm{Spa}(\mathbb{Q}_p, \mathbb{Z}_p)$  and  $U \in X_{\text{pro-ét}}$ .

- For any  $x \in |U|$ , there is a natural continuous valuation  $|\cdot|_x : f \mapsto |f(x)|$  on  $\mathcal{O}_X(U)$ .
- $\mathcal{O}_X^+(U) = \{f \in \mathcal{O}_X(U) : \forall x \in |U|, |f(x)| \leq 1\}$ .
- For any  $n \in \mathbb{Z}_+$ , the map of sheaves  $\mathcal{O}_X^+ / (p) \rightarrow \widehat{\mathcal{O}}_X^+ / (p)$  is an isomorphism, and  $\widehat{\mathcal{O}}_X^+(U)$  is flat and  $p$ -adically complete.
- For any  $x \in |U|$ , the valuation  $|\cdot|_x$  extends to a continuous valuation on  $\widehat{\mathcal{O}}_X(U)$ .
- $\widehat{\mathcal{O}}_X^+(U) = \{f \in \widehat{\mathcal{O}}_X(U) : \forall x \in |U|, |f(x)| \leq 1\}$ . In particular,  $\widehat{\mathcal{O}}_X^+(U) \subset \widehat{\mathcal{O}}_X(U)$  is integrally closed.

┘

*Proof:* Cf. [Scholze]P22. ? Firstly these assertions are local w.r.t.  $U$ , so we may assume that  $U$  is qcqs (27.3.6.8), and choose a pro-étale presentation  $U = \varprojlim U_i \rightarrow X$ .

1: A point  $x \in |U|$  is given by a compatible system of points  $x_i \in |U_i|$ , giving a compatible system of continuous valuations on  $\mathcal{O}_{X_{\text{ét}}}(U_i)$ . But  $\mathcal{O}_X(U) = (\nu^* \mathcal{O}_{X_{\text{ét}}})(U) = \varinjlim \mathcal{O}_{X_{\text{ét}}}(U)$ , so these valuations give a valuation on  $\mathcal{O}_X(U)$ . □

**Remark (27.3.6.15).** It is not clear whether for any  $U \in X_{\text{pro-ét}}$ , the triple  $(|U|, \widehat{\mathcal{O}}_X|_{|U|}, \{|\cdot|_x\}_{x \in |U|})$  is an adic space. But for any  $U \in X_{\text{pro-ét}}$ , there is a covering by pro-étale perfectoid spaces over  $X$  s.t. on this covering, the assertion is true (27.4.4.5). ┘

## 27.4 Perfectoid Spaces(Scholze)

References are [Sch12].

**Remark(27.4.0.1).** The theory of perfectoid spaces presents a general framework to reduce problems about algebraic varieties in characteristic 0 to algebraic varieties in characteristic  $p$ .  $\lrcorner$

**Notation(27.4.0.2).**

- Use notations on perfectoid fields defined in [Perfectoid Fields](#).
- Use notations on adic spaces defined in [Adic Spaces](#).

$\lrcorner$

### 1 Basics

#### Affinoid Perfectoid Spaces

**Def.(27.4.1.1) [Perfectoid Spaces].** For any  $(R, R^+) \in \mathcal{P}\text{erfd}$ , we associated to it an affinoid adic space  $\text{Spa}(R, R^+)$ , called an **affinoid perfectoid space**.

Tate's acyclicity(27.4.2.19) shows that the adic spectra of perfectoid affinoid algebras are sheafy, so we can defined the category of **perfectoid spaces**  $\mathcal{P}\text{erfdSpa}$  to be the full subcategory of  $\text{AdicSpa}$  consisting of spaces locally isomorphic to affinoid perfectoid spaces.  $\lrcorner$

**Remark(27.4.1.2).** Notice that it is not true that if  $(A, A^+) \in \text{HubPair}$  and  $\text{Spa}(A, A^+) \in \mathcal{P}\text{erfdSpa}$ , then  $A \in \mathcal{P}\text{erfd}$ . Thus there is ambiguity to the term affinoid perfectoid spaces. But we always use this to mean the affinoid adic space associated to a perfectoid Huber pair.  $\lrcorner$

*Proof:* Cf.[Ked19]P62.  $\square$

**Prop.(27.4.1.3).**  $\mathcal{P}\text{erfdSpa}/\mathbb{F}_p$  is stable under absolute products.  $\lrcorner$

*Proof:* Cf.[Sch17]P71.  $\square$

**Prop.(27.4.1.4) [Fiber Products of Perfectoid Spaces].**  $\mathcal{P}\text{erfdSpa}_K$  admits fiber products, which is compatible with that in  $\text{AdicSpa}/K$ .  $\lrcorner$

*Proof:* Perfectoid spaces are constructed by glueing, thus it suffices to show that the category of perfectoid  $K^\flat$ -algebras has fiber pushouts, by tilting equivalence. For this, if  $X = (A, A^+), Y = (B, B^+), Z = (C, C^+)$ , define  $X \otimes_Y Z = (D, D^+)$ , where  $D$  is the completion of  $A \otimes_B C$ , and  $D^+$  is the completion of the integral closure of  $A^+ \otimes_{B^+} C^+$  in  $D$ . Then  $D$  is a perfect  $K^\flat$ -algebra, and it is truly the filtered colimits, by(12.2.5.23).

Notice that we don't even need a base field  $K$ , Cf.[Ked19]P57.  $\square$

#### Tiltings

**Prop.(27.4.1.5) [Tilting Rational Subsets].** For  $(K, K^+) \in \mathcal{P}\text{erfdField}$  and  $(R, R^+) \in \mathcal{P}\text{erfd}_K$ ,

- The  $\sharp$  map induces an isomorphism  $X = \text{Spa}(R, R^+) \cong X^\flat = \text{Spa}(R^\flat, R^{b+})$  that identifies rational open subsets.
- For a rational subset  $U$  with tilting  $U^\flat$ , the complete affinoid Tate algebra  $(\mathcal{O}_X(U), \mathcal{O}_X^+(U))$  is perfectoid over  $R$  with tilt  $(\mathcal{O}_{X^\flat}(U^\flat), \mathcal{O}_{X^\flat}^+(U^\flat))$ .

$\lrcorner$

*Proof:* This follows from (27.4.1.9).  $\square$

**Lemma (27.4.1.6) [Huber's Presheaf in Char  $p$ ].** Assume  $\text{char} K = p$  and  $U = X(\frac{f_1, \dots, f_n}{g})$  is a rational subset that  $f_i, g \in R^+$  and  $f_n = \varpi^N$ , then:

- Consider the subring  $R^+[(\frac{f_i}{g})^{\frac{1}{p^\infty}}]$ , its  $\varpi$ -adic completion  $(R^+[(\frac{f_i}{g})^{\frac{1}{p^\infty}}])^a$  is a perfectoid  $K^{0a}$ -algebra.
- The map  $R^+[X_i^{\frac{1}{p^\infty}}] \rightarrow R^+[(\frac{f_i}{g})^{\frac{1}{p^\infty}}]$  has kernel containing and almost equal to  $I = (g^{\frac{1}{p^m}} X_i^{\frac{1}{p^m}} - f_i^{\frac{1}{p^m}})$ .
- $\mathcal{O}_X(U)$  is a perfectoid  $K$ -algebra and  $\mathcal{O}_X(U)^{0a} \cong (R^+[(\frac{f_i}{g})^{\frac{1}{p^\infty}}])^a$ .  $\perp$

*Proof:* 1: The ring  $R^+[(\frac{f_i}{g})^{\frac{1}{p^\infty}}]$  is perfect and  $\varpi$ -torsion-free, and  $R^+$  is semi-perfect, thus its completion is clearly a perfectoid  $K^{0a}$ -algebra by (12.2.9.1).

2: Clearly  $I \subset \ker$  and notice  $R^+[(\frac{f_i}{g})^{\frac{1}{p^\infty}}][\varpi^{-1}] = R[g^{-1}]$  as  $f_n = \varpi^N$ , so  $I[\varpi^{-1}] = \ker[\varpi^{-1}]$ . Now consider the mapping

$$P_0 = R^+[X_i^{\frac{1}{p^\infty}}]/I \rightarrow R^+[(\frac{f_i}{g})^{\frac{1}{p^\infty}}]$$

Now this map is an isomorphism after inverting  $\varpi$ , so the kernel is  $\varpi^\infty$ -torsion. But we have  $I = I^{[p]}$  because  $R^+$  is semi-perfect, so  $P_0$  is perfect, so the kernel must be almost zero.

3: Consider the inclusion  $R^+[\frac{f_i}{g}] \hookrightarrow R^+[(\frac{f_i}{g})^{\frac{1}{p^\infty}}]$ , we show the cokernel is killed by  $\varpi^{nN}$ : as  $f_n = \varpi^N$ ,

$$\varpi^{nN} \prod_{i=1}^n (\frac{f_i}{g})^{\frac{1}{p^{a_i}}} = \prod_{i=1}^n (f_i^{\frac{1}{p^{a_i}}} g^{1-\frac{1}{p^{a_i}}}) \frac{f_n}{g} \in R^+[\frac{f_i}{g}].$$

So these two ring has the same  $\varpi$ -adic completion, the first one is just  $\mathcal{O}_X(U)$  by the construction (27.3.3.1), so  $\mathcal{O}_X(U)$  is perfectoid  $K$ -algebra, and the isomorphism is by tilting equivalence  $\text{perf}_K \cong \text{perf}_{K^{0a}}$  (12.2.9.5).  $\square$

**Lemma (27.4.1.7) [Huber's Presheaf in Char 0].** Let  $U = X(\frac{f_1, \dots, f_n}{g})$  is a rational subset that  $f_i, g$  are perfect elements in  $R^+$ ,  $f_i = a_i^\sharp, g = b^\sharp$ , and  $f_n = \varpi^N$ , so  $f_i, g$  have compatible  $p^n$ -th roots, then let  $U^b = X^b(\frac{f_1, \dots, f_n}{g})$  be the tilting of  $U$ ,  $U$  is the inverse image of  $U^b$  along the map  $X \rightarrow X^b$ . Then the conclusion of (27.4.1.6) is also true, and moreover,  $(\mathcal{O}_X(U), \mathcal{O}_X^+(U))$  tilts to  $(\mathcal{O}_{X^b}(U^b), \mathcal{O}_{X^b}^+(U^b))$ .  $\perp$

*Proof:* 1, 2 of (27.4.1.6): Notation as before, there is a map  $P_0 = R^+[X_i^{\frac{1}{p^\infty}}]/I \rightarrow R^+[(\frac{f_i}{g})^{\frac{1}{p^\infty}}]$ , and an inclusion  $R^+[(\frac{f_i}{g})^{\frac{1}{p^\infty}}] \rightarrow \mathcal{O}_X^+(U)$ . Now write  $(S, S^+)$  for the untilt of the perfectoid  $(R^b, R^{b+})$ -algebra  $(\mathcal{O}_{X^b}(U^b), \mathcal{O}_{X^b}^+(U^b))$ , then by the tilting process (12.2.9.13),  $\text{Spa}(S, S^+)$  maps into  $U$ , so by the universal property, there is a map

$$\mu : (\mathcal{O}_X(U), \mathcal{O}_X^+(U)) \rightarrow (S, S^+).$$

Consider the composition

$$P_0 \xrightarrow{a_0} R^+[(\frac{f_i}{g})^{\frac{1}{p^\infty}}] \xrightarrow{d_0} S^+,$$

we prove their completion gives the same  $K^{0a}$ -algebras(notice  $S^+$  is already complete):  $a_0$  is surjective, thus so does its completion, the map  $d_0 \circ a_0$  is almost isomorphism modulo  $\varpi$  by(27.4.1.6) item2 and tilting equivalence, so does its completion. Now(5.7.3.2) tells us the completion of  $d_0 \circ a_0$  is almost isomorphism, so does  $a$  and  $d$  as  $a$  is surjective.

By the way, we know that  $R^+\langle(\frac{f_i}{g})^{\frac{1}{p^\infty}}\rangle[\varpi^{-1}]$  is the untilt of  $\mathcal{O}_{X^b}^+(U^b)$ .

3 of(27.4.1.6) is proved as before.

For the tilting, by the above, we already know  $R^+\langle(\frac{f_i}{g})^{\frac{1}{p^\infty}}\rangle$  tilts to the perfectoid  $K^{b0a}$ -algebra  $\mathcal{O}_{X^b}(U^b)^{0a}$ , and by item3  $\mathcal{O}_X(U)$  tilts to the perfectoid  $K^b$ -algebra  $\mathcal{O}_{X^b}(U^b)$ . Now the question is the tilt of  $\mathcal{O}_X^+(U)$ , notice as in the proof of item1, there is a natural map

$$(R^+\langle(\frac{f_i}{g})^{\frac{1}{p^\infty}}\rangle[\varpi^{-1}], R^+\langle(\frac{f_i}{g})^{\frac{1}{p^\infty}}\rangle) \rightarrow (\mathcal{O}_X(U), \mathcal{O}_X^+(U)),$$

whose tilting gives by universality of Huber's presheaf a map

$$\xi : (\mathcal{O}_{X^b}(U^b), \mathcal{O}_{X^b}^+(U^b)) \rightarrow (\mathcal{O}_X(U), \mathcal{O}_X^+(U))^b.$$

These two map  $\mu, \xi$  are inverse to each other, showing that the tilting of  $(\mathcal{O}_X(U), \mathcal{O}_X^+(U))$  is  $(\mathcal{O}_{X^b}(U^b), \mathcal{O}_{X^b}^+(U^b))$ .  $\square$

**Lemma(27.4.1.8)[Approximation Lemma].** Assume  $R = K\langle T_0^{\frac{1}{p^\infty}}, \dots, T_n^{\frac{1}{p^\infty}} \rangle$ ,  $f \in R^0$  is homogenous of degree  $d \in \mathbb{N}[p^{-1}]$ , then for any  $c > 0, \varepsilon > 0$ , there exists some  $g_{c,\varepsilon} \in R^{b0}$  homogeneous of degree  $d$  that

$$|(f - g^\sharp)(x)| \leq |\varpi|^{1-\varepsilon} \max\{|f(x)|, |\varpi|^c\}.$$

In particular, if  $\varepsilon < 1$ , then

$$\max\{|f(x)|, |\varpi|^c\} = \max\{|g_{c,\varepsilon}^\sharp(x)|, |\varpi|^c\}.$$

┘

*Proof:* Cf.[Scholze Perfectoid Spaces, Lemma6.5] ?.  $\square$

**Prop.(27.4.1.9).** For any  $R \in \text{Perfd}_K$ ,

- The same conclusion of(27.4.1.8) holds.
- For  $f, g \in R$ , there exist  $a, b \in R^b$  that  $X(\frac{f, \varpi^c}{g}) = X(\frac{a^\sharp, \varpi^c}{b^\sharp})$ . In particular, any rational subsets  $U$  of  $X$  comes from  $X^b$ , thus(27.4.1.7) applies for  $U$ .
- For any  $x \in X$ ,  $\kappa(x)^\wedge \in \text{PerfdField}$ .
- $X \rightarrow X^b$  is a homeomorphism preserving rational subsets.

┘

*Proof:* 1: Using the tilting equivalence, we can write  $f = g_0^\sharp + \varpi g_1^\sharp + \dots + \varpi^c g_c^\sharp + f_{c+1} \varpi^{c+1}$ , let  $f_0 = g_0^\sharp + \varpi g_1^\sharp + \dots + \varpi^c g_c^\sharp$ . Then notice that the solution  $g_{c,\varepsilon}$  for  $f_0$  is suitable for  $f$  as well. So now if we consider the mapping

$$\mu : K\langle T_0^{\frac{1}{p^\infty}}, \dots, T_n^{\frac{1}{p^\infty}} \rangle \rightarrow R : T_i \rightarrow g_i^\sharp,$$

together with its tilting

$$\mu^b : K^b \langle T_0^{\frac{1}{p^\infty}}, \dots, T_n^{\frac{1}{p^\infty}} \rangle \rightarrow R^b.$$

Then for the approximation  $g_{c,\varepsilon}^\#$  for  $f' = \sum \varpi^i T_i$ ,  $\mu^b(g)$  is what we are searching for.

2: Using 1, we find  $a, b \in R^b$  that  $|(g - b^\#)(x)| < \max\{|g(x)|, \varpi^c\}$  and  $\max\{|f(x)|, |\varpi|^c\} = \max\{|a^\#(x)|, |\varpi|^c\}$  for all  $x \in \text{Spa}(R, R^+)$ . Then it is routine to check that  $X(\frac{f, \varpi^c}{g}) = X(\frac{a^\#, \varpi^c}{b^\#})$ .

3: By (27.3.3.5),  $\widehat{k^+(x)}$  equals the completion of the colimit  $\text{colim } \mathcal{O}_X^+(U)$  over rational subsets  $U$  containing  $x$ . As these are all perfectoid  $K^{0a}$ -algebras (12.2.9.14), and completion of the filtered limits of perfectoid  $K^{0a}$ -algebras is perfectoid (12.2.9.10), we know that  $\widehat{k^+(x)}$  is perfectoid over  $K^{0a}$ , thus inverting  $\varpi$  shows  $k(x)$  is also perfectoid over  $K$ .

4: this is injective because  $X$  is  $T_0$  and a rational subset is the untilt of a rational subset of  $X^b$  by item 2. For surjectivity, a point of  $X^b$  determines a continuous map  $(R^b, R^{b+}) \rightarrow (\widehat{k(x)}, \widehat{k^+(x)})$ , thus by untilting (12.2.9.13) corresponds to a map  $(R, R^+) \rightarrow (L, L^+)$ , then  $(L, L^+)$  is a perfectoid field, by (12.2.9.15), so it corresponds to a point  $y \in X$ . Then it is clear that  $y$  maps to  $x$ , because the

$$\begin{array}{ccc} R^b & \xrightarrow{\#} & R \\ \downarrow & & \downarrow \\ \kappa(x)^\wedge & \xrightarrow{\#} & L \end{array} \quad \text{is commutative.}$$

□

**Prop. (27.4.1.10) [Tilting Equivalence for Perfectoid Spaces].** Given  $K \in \text{PerfdField}$ , then for any  $X \in \text{PerfdSpa}/K$ , there is a unique  $X^b \in \text{PerfdSpa}/K^b$  that satisfies:  $X(R, R^+) \cong X^b(R^b, R^{b+})$  functorially, called the **tilt** of  $X$ . Moreover,  $|X| \cong |X^b|$ .

When  $X$  is affinoid, this tilting coincides with that of (27.4.1.5).

And this tilting induces an equivalence between the category of perfectoid spaces over  $K$  and perfectoid spaces over  $K^b$ . ┘

*Proof:* Firstly, the universal property truly determines the tilt  $X^b$  uniquely: if there are two tilts  $X_1, X_2$ , as they are locally affinoid perfectoid like  $\text{Spa}(R^b, R^{b+})$  by (27.4.1.5), the immersion map  $\text{Spa}(R^b, R^{b+}) \rightarrow X_1$  determines via the functorial isomorphism a morphism  $\text{Spa}(R^b, R^{b+}) \rightarrow X_2$ . Now  $X_1$  has a sheaf structure, so these morphisms glue to give a morphism  $X_1 \rightarrow X_2$ . The same argument shows conversely there is a morphism  $X_2 \rightarrow X_1$ , and they are clearly converse to each other, so  $X_1 \cong X_2$ .

The construction of  $X$  is just the glueing of the tilting of the affinoid perfectoid spaces, as the tilting defined in (27.4.1.5) is a functor. The universal property is verified by just checking on the affinoid perfectoid spaces, as we can glue using the sheaf property. For the affinoid case, we should use (27.3.4.6). The last assertion is by (27.4.1.5). □

## 2 Properties of Perfectoid Spaces

### Totally Disconnected Spaces

**Def. (27.4.2.1) [Totally Disconnected Spaces].** A perfectoid space  $X$  is called **totally disconnected** if it is qcqs and any open covering  $\{U_i \rightarrow X\}$  splits, i.e.  $\coprod U_i \rightarrow X$  splits, or equivalently, there is a refinement covering  $\{V_i \rightarrow X\}$  that  $X \cong \coprod V_i$ .

A perfectoid space  $X$  is called **strictly totally disconnected** if it is qcqs and every étale cover splits. ┘

**Prop. (27.4.2.2).** If  $X \in \mathcal{P}\text{erfdSpa}$  is qcqs, then  $X$  is totally disconnected iff all its connected components are of the form  $\text{Spa}(K, K^+)$  where  $(K, K^+) \in \mathcal{P}\text{erfdField}$ . And it is strictly totally disconnected if moreover  $K = \overline{K}$ .  $\lrcorner$

*Proof:* Cf.[Sch17].P29, P35.  $\square$

**Prop. (27.4.2.3).** If  $X \in \mathcal{P}\text{erfdSpa}$  is a totally disconnected, then  $X$  is affinoid.  $\lrcorner$

*Proof:* Cf.[Sch17].P30.  $\textcolor{red}{?}$   $\square$

### Injections

**Def. (27.4.2.4) [Injections].** A map  $f : X \rightarrow Y \in \mathcal{P}\text{erfdSpa}$  is called an **injection** if it is a monomorphism.  $\lrcorner$

**Prop. (27.4.2.5) [Residue Field Map is Injection].** Let  $X$  be a perfectoid space and  $x \in X$ , giving rise to a map of residue fields

$$i_x : \text{Spa}(\kappa(x), \kappa(x)^+) \rightarrow X,$$

then  $i_x$  is an injection of perfectoid spaces.  $\lrcorner$

*Proof:* To show this, firstly we can replace  $X$  with an affinoid nbhd of  $X$ . Then notice that  $\text{Spa}(\kappa(x), \kappa(x)^+)$  is the filtered limit over all rational nbhds  $U$  of  $x$  in  $X$ , and for each  $U$ ,  $U \rightarrow X$  is an injection by definition(27.3.3.1), so  $i_x$  is also an injection.  $\square$

**Prop. (27.4.2.6) [Characterizations of Injections].** Let  $f : Y \rightarrow X$  be a map of perfectoid spaces, then the following conditions are equivalent:

- $f$  is an injection.
- For any  $(K, K^+) \in \mathcal{P}\text{erfdField}$ , the map of sets  $f_* : Y(K, K^+) \rightarrow X(K, K^+)$  is injective.
- The map  $|f| : |Y| \rightarrow |X|$  is injective, and for all rank 1 point  $y \in Y$  with image  $f(y) = x \in X$ , the map of completed residue fields  $\kappa(x) \rightarrow \kappa(y)$  is an isomorphism.
- The map  $|f| : |Y| \rightarrow |X|$  is injective, and  $f$  is final in the category of maps  $Z \rightarrow X$  that  $|Z| \rightarrow |X|$  factors through the map  $|Y| \rightarrow |X|$ .

In particular, by item4, an injection of perfectoid spaces is determined by its topological map.  $\lrcorner$

*Proof:*  $4 \rightarrow 1 \rightarrow 2$  is trivial. For the rest, Cf.[Sch17]P21.  $\square$

**Prop. (27.4.2.7) [Injection and Base Change].**

- Let  $f : Y \rightarrow X \in \mathcal{P}\text{erfdSpa}$  be an injection, and  $X' \rightarrow X$  any map of perfectoid spaces, then the pullback  $f' : Y' = Y \times_X X' \rightarrow X'$  is also an injection, and the induced map

$$|Y'| \rightarrow |Y| \times_{|X|} |X'|$$

is a homeomorphism.

- A map of perfectoids spaces is an injection iff it is universally injective.  $\lrcorner$

*Proof:* Cf.[Sch17]P24.  $\square$

### Immersion

**Def. (27.4.2.8) [Immersion].**  $f : Y \rightarrow X \in \mathcal{P}\text{erfdSpa}$  is called an **immersion of perfectoid spaces** if  $f$  is an injection and  $|f| : |Y| \rightarrow |X|$  is a locally closed immersion. If  $|f|$  is moreover closed or open, then it is called closed/open immersion.  $\lrcorner$

**Def. (27.4.2.9) [Zariski-Closed Immersion].** For  $f : Z \rightarrow X \in \mathcal{P}\text{erfdSpa}$  where  $X = \text{Spa}(R, R^+)$  is affinoid,

- $f$  is called a **Zariski-closed immersion of perfectoid spaces** if  $f$  is a closed immersion and  $|Z| = V(I) \subset |X|$ , where  $I \subset R$  is an ideal.
- $f$  is called a **strongly Zariski-closed immersion of perfectoid spaces** if  $Z = \text{Spa}(S, S^+)$  is affinoid,  $R \rightarrow S$  is surjective, and  $S^+$  is the closure of  $R^+$  in  $S$ .

$\lrcorner$

**Prop. (27.4.2.10).**

- If  $f$  is strongly Zariski-closed, then  $f$  is Zariski-closed, in particular a closed immersion.
- If  $f$  is Zariski-closed, then  $Z$  is affinoid.
- If  $X$  is of characteristic  $p$ , and  $f$  is Zariski-closed, then  $f$  is strongly Zariski-closed.

$\lrcorner$

*Proof:* Cf. [Sch12] Section 2.5.  $\square$

**Prop. (27.4.2.11).** For  $Y \rightarrow X \in \mathcal{P}\text{erfdSpa}$ , the diagonal map  $\Delta_f : Y \rightarrow Y \times_X Y$  is an immersion.  $\lrcorner$

*Proof:* Clearly  $\Delta_f$  is an injection, thus it suffices to show that  $|\Delta_f|$  identifies  $Y$  with a locally closed subset of  $|Y \times_X Y|$ . This can be checked locally on the target, so we can assume  $X = \text{Spa}(R, R^+)$  and  $Y = \text{Spa}(S, S^+)$ , then the diagonal map is strongly Zariski closed, as  $S \hat{\otimes}_R S \rightarrow S$  is surjective and maps the integral closure of  $S^+ \hat{\otimes}_{R^+} S^+ \rightarrow S^+$  onto  $S^+$ . Thus by (27.8.1.11),  $\Delta_f$  is a closed immersion in this case.  $\square$

**Def. (27.4.2.12) [Separated Map].** A map  $f : Y \rightarrow X \in \mathcal{P}\text{erfdSpa}$  is called separated if  $\Delta_f$  is a closed immersion.  $\lrcorner$

**Prop. (27.4.2.13) [Valuation Criterion].** For  $f : Y \rightarrow X \in \mathcal{P}\text{erfdSpa}$ , the following are equivalent:

- $f$  is separated.
- $|\Delta_f| : |Y| \rightarrow |Y \times_X Y|$  is a closed immersion.
- $|f|$  is quasi-separated, and for any perfectoid adic field  $(K, K^+)$  and any diagram

$$\begin{array}{ccc} \text{Spa}(K, \mathcal{O}_K) & \longrightarrow & Y \\ \downarrow & \nearrow & \downarrow f \\ \text{Spa}(K, K^+) & \longrightarrow & X \end{array}$$

$\lrcorner$

### Almost Acyclicity

**Def.(27.4.2.14) [ $p$ -Finite Tate Ring].** Denote  $L = \mathbb{F}_p[[t]]_{\text{perf}}^\wedge[t^{-1}]$ , an  $\mathbb{F}_p[t]$  algebra  $A^+$  is called **algebraically admissible** if it is f.p., reduced,  $t$ -torsion-free, and integrally closed in  $A^+[t^{-1}]$ . A perfectoid affinoid  $L$ -algebra  $(R, R^+)$  is called  **$p$ -finite** if it is the completion of the perfection(27.3.2.22) of a uniform Tate ring of the form  $(A^+[t^{-1}], A^+)$ , where  $A^+$  is algebraically admissible.  $\lrcorner$

**Lemma(27.4.2.15) [Tate's Acyclicity for Classical Affinoid Algebra].** If  $A^+$  is an algebraically admissible  $\mathbb{F}_p[t]$ -algebra, then  $(A^+[t^{-1}], A^+)$  is a uniform affinoid Tate algebra(because it is finite), and:

- For any rational subset  $U \subset X$ , the structure presheaf  $(\mathcal{O}_X(U), \mathcal{O}_X^+(U))$  is also uniform, and it is a perfection of an algebraically admissible  $\mathbb{F}_p[t]$ -algebra, so  $\mathcal{O}_X^+(U) = \mathcal{O}_X(U)^0$ .
- For any covering  $\mathfrak{U} : U_i \rightarrow X$  of rational subsets, the Čech cohomology groups  $H^i(\mathfrak{U}, \mathcal{O}_X^+)$  are all killed by  $t^N$  for  $N$  large.
- $(A, A^+)$  is sheafy, with  $H^i(X, \mathcal{O}_X^+)$  being  $t^\infty$ -torsion for all  $i$ .

$\lrcorner$

*Proof:* ?

$\square$

**Lemma(27.4.2.16) [Tate's Acyclicity for  $p$ -Finite Perfectoid Algebras].** Let  $(R, R^+)$  be a  $p$ -finite perfectoid  $L$ -algebra that comes from the completion of perfection of  $(A, A^+)$ , then:

- The map  $X = \text{Spa}(R, R^+) \rightarrow Y = \text{Spa}(R, R^+)$  is a homeomorphism.
- For rational subset  $V \subset Y$  with preimage  $U \subset X$ ,  $(\mathcal{O}_X(U), \mathcal{O}_X^+(U))$  is the completion of the perfection of  $(\mathcal{O}_Y(V), \mathcal{O}_Y^+(V))$ .
- For any covering  $\mathfrak{U} : U_i \rightarrow X$  of rational subsets, the Čech cohomology groups  $H^i(\mathfrak{U}, \mathcal{O}_X^0)$  are all almost zero.
- $(R, R^+)$  is sheafy, with  $H^i(X, \mathcal{O}_X^+)$  almost zero for all  $i > 0$ .

$\lrcorner$

*Proof:* 1: This is because the adic spectrum is insensitive for perfection(27.3.2.22) and completion(27.3.2.17).

2: This is by the universal property, as these two are both the universal elements for the complete and affinoid adic spaces mapping to  $X$  that factors through  $U$ .

3: The complex calculating  $H^i(\mathfrak{U}, \mathcal{O}_X^0)$  is just the complex calculating  $H^i(\mathfrak{U}, \mathcal{O}_Y^+)$  under completion of perfection((27.3.2.21) used). So(27.4.2.15) and(27.4.2.17)(applied to every element) shows that the perfection makes the complex almost acyclic, and this is preserved under completion as  $(-)^a$  is exact.

4: The complex calculating  $H^i(\mathfrak{U}, \mathcal{O}_X)$  is just the complex calculating  $H^i(\mathfrak{U}, \mathcal{O}_X^+)$  inverting  $t$ , thus they are all 0 as localization is exact. For the second, it is because of item3 and the fact  $\mathcal{O}_X^+$  is almost isomorphic to  $\mathcal{O}_X^0$ (12.2.9.14).  $\square$

**Lemma(27.4.2.17).** Let  $A$  be a ring with an element  $t$  that admits compatible  $p^n$ -th roots, then for an  $A$ -module  $M$  that  $t^N M = 0$ , consider the Frobenius pushforward  $M \rightarrow F_* M$ , then the colimit  $\text{colim}_{F_*} F_*^n M$  is naturally a module over  $A_{\text{perf}}$ , and it is annihilated by  $t^{\frac{1}{p^n}}$  for all  $n$ .  $\lrcorner$

*Proof:* The  $A_{\text{perf}}$  structure is natural, and notice  $F_*^k M$  is annihilated by  $t^{\frac{N}{p^k}}$ , thus naturally the colimit is annihilated by  $t^{\frac{1}{p^n}}$  for all  $n$ .  $\square$

**Prop. (27.4.2.18) [Noetherian Approximation in Char  $p$ ].** If  $K \in \mathcal{P}\text{erfdField}^p$  with pseudo-uniformizer  $t$ , then  $K$  is an extension of  $L = \mathbb{F}_p[[t]]_{\text{perf}}[t^{-1}]$ , and If  $A$  is an  $K^0$ -perfectoid algebra that is integrally closed in  $A[t^{-1}]$ , then:

- $A$  is a completion of a filtered colimit  $(\text{colim}_i B_i)^\wedge$  that  $B_i$  are  $p$ -finite, that induces an homeomorphism

$$\text{Spa}(A[t^{-1}], A) \cong \lim_i \text{Spa}(B_i[t^{-1}], B_i)$$

that each rational subset of  $\text{Spa}(A[t^{-1}], A)$  comes from a rational subset of some  $\text{Spa}(B_i[t^{-1}], B_i)$ .

- If  $U_i \subset \text{Spa}(B_i[t^{-1}], B_i)$  is a compatible system of rational subsets that corresponds to  $U \subset \text{Spa}(A, A^+) = X$ , then

$$(\mathcal{O}_X(U), \mathcal{O}_X^+(U)) \cong \varinjlim_j (\mathcal{O}_j(U_j), \mathcal{O}_j^+(U_j))^\wedge.$$

⌋

*Proof:* 1:  $A = \text{colim}_i A_i$ , where  $A_i$  are all the f.p.  $\mathbb{F}_p[t]$ -algebras in  $A$ . Then each  $A_i$  is reduced (as  $A$  is complete and integrally closed in  $A[t^{-1}]$ ) and  $t$ -torsion-free, and we can assume they are integrally closed in  $A_i[t^{-1}]$  because  $A$  does, by passing to their integral closure.

Then applying the  $(-)_{\text{perf}}$  functor gives  $\text{colim}_i (A_i)_{\text{perf}} = A$ , as  $A$  is perfect, and applying the completion gives

$$(\text{colim}_i \widehat{A_i})^\wedge = A,$$

as  $A$  is already complete, so we are done.

2: This is immediate from 1 and (27.3.2.21).

3: This is because by universal property for Huber presheaves, there are pushouts diagrams

$$\begin{array}{ccccccc} (B_i[t^{-1}], B_i) & \longrightarrow & (B_j[t^{-1}], B_j) & \longrightarrow & \dots & \longrightarrow & (A[t^{-1}], A) \\ \downarrow & & \downarrow & & & & \downarrow \\ (\mathcal{O}_{X_i}(U_i), \mathcal{O}_{X_i}^+(U_i)) & \longrightarrow & (\mathcal{O}_{X_j}(U_j), \mathcal{O}_{X_j}^+(U_j)) & \longrightarrow & \dots & \longrightarrow & (\mathcal{O}_X(U), \mathcal{O}_X^+(U)) \end{array}$$

So the conclusion follows as colimits commutes with colimits. □

**Prop. (27.4.2.19) [Almost Acyclicity for Affinoid Perfectoids].** Fix  $K \in \mathcal{P}\text{erfdField}$  and  $(R, R^+) \in \mathcal{P}\text{erfd}^{\text{aff}}/K$  with adic spectrum  $X = \text{Spa}(R, R^+)$ , then

- $(R, R^+)$  is sheafy.
- $\mathcal{O}_X^+(X) = R^+$ , and  $H^i(X, \mathcal{O}_X^+)$  is almost zero for any  $i \in \mathbb{Z}_+$ .
- $\mathcal{O}_X(X) = R$ , and  $H^i(X, \mathcal{O}_X) = 0$  for any  $i \in \mathbb{Z}_+$ .

⌋

*Proof:* As in the proof of (27.4.2.16), it suffices to prove  $\mathcal{O}_X^0$  is almost exact w.r.t any covering  $\mathfrak{U}$ . For this, notice each term is  $\varpi$ -adically complete and flat by (27.4.1.5), so it suffices to prove it is almost exact modulo  $\varpi$  (5.7.3.2). Then by the tilting equivalence, it suffices to prove for  $X^\flat$ . So we may assume at first that  $K$  is of char  $p$ . Then we may replace  $K$  by  $L = \mathbb{F}_p[[t]]_{\text{perf}}[t^{-1}]$ .

But then Noetherian approximation (27.4.2.18) shows that the rational subrings are completion of filtered colimits of  $p$ -finite  $K$ -algebras ((27.3.2.21) used), and then we reduced to the  $p$ -finite case, as in the proof of (27.4.2.16). □

### 3 Étale Sites of Perfectoid Spaces

**Def. (27.4.3.1) [Strongly Finite Étale Maps].** For convenience, for perfectoid affinoid  $K$ -algebras, we call a map of Huber pairs  $(A, A^+) \rightarrow (B, B^+)$  **strongly finite étale** if it is finite étale and  $B^{+a}$  is almost finite étale over  $A^{+a}$ .

A map  $f : X \rightarrow Y \in \text{PerfdSpa}$  is called **strongly finite étale** if there is a cover of  $Y$  by affinoids  $V_i \subset Y$  s.t.  $U_i = f^{-1}(V_i)$  are all affinoids, and the map  $(\mathcal{O}_Y(V_i), \mathcal{O}_Y^+(V_i)) \rightarrow (\mathcal{O}_X(U_i), \mathcal{O}_X^+(U_i))$  is strongly finite étale. For  $X \in \text{AdicSpa}$ , denote by  $X_{\text{sfét}}$  the category of strongly finite étale spaces over  $X$ .

A map  $X \rightarrow Y \in \text{PerfdSpa}$  is called **strongly étale** if for any  $x \in X$ , there exists an open subspace  $U \subset X$  containing  $x$  and an open subspace  $V \subset Y$  containing  $f(U)$  together with a  $W \in \text{PerfdSpa}$  that  $f : U \rightarrow V$  factors through an open embedding  $U \rightarrow W$  and a finite étale map  $W \rightarrow V$ .

Eventually we will prove that if  $(A, A^+)$  is perfectoid, then any finite étale map  $(A, A^+) \rightarrow (B, B^+)$  is strongly finite étale.  $\perp$

**Prop. (27.4.3.2) [Strongly Finite Étale is Local].** If  $f : X \rightarrow Y$  is a strongly finite étale map that  $Y = \text{Spa}(A, A^+)$  is an affinoid perfectoid, then  $X$  is also affinoid perfectoid, and the structure map  $(\mathcal{O}_X(X), \mathcal{O}_X^+(X)) \rightarrow (\mathcal{O}_Y(Y), \mathcal{O}_Y^+(Y))$  is strongly finite étale.  $\perp$

*Proof:* By (27.4.3.9), it suffices to prove in char  $p$ . Then we can replace  $K$  by  $L = \widehat{\mathbb{F}_p[[t]]}_{\text{perf}}[t^{-1}]$ . Then by Noetherian approximation (27.4.2.18), we can assume that  $Y$  is a limit of  $p$ -finite affinoids  $\text{Spa}(B_i, B_i^+)$ . As both rational subsets and finite étale algebras pass through filtered colimit, and adic spectrum is quasi-compact (27.3.2.4), we can assume that a finite étale cover of  $Y$  arises through base change of some  $\text{Spa}(B_i, B_i^+)$ . So it suffices to prove the proposition in case of  $Y$   $p$ -finite. Then  $Y$  is a completion of perfection of some algebraically admissible ring over  $\mathbb{F}_p[t]$ . Then by the above argument again, we can assume that  $Y$  is algebraically admissible.

Now a classical theorem (Cf. [Étale cohomology of rigid analytic varieties and adic spaces, Huber 1.6.6(2)]) shows that the finite étale cover of  $Y$  is global finite étale  $\text{Spa}(S, S^+) \rightarrow \text{Spa}(R, R^+)$  in this case. Notice the strongness is not needed because we are working in char  $p$ , where almost purity theorem is already proven.  $\square$

**Cor. (27.4.3.3).** For an affinoid perfectoid space  $Y = \text{Spa}(R, R^+)$ , the functor  $X \mapsto \mathcal{O}_X^+(X)$  defined an equivalence of categories  $Y_{\text{sfét}} \cong R_{\text{afét}}^{+a}$ , and the functor  $X \mapsto \mathcal{O}_X(X)$  gives a fully faithful functor  $Y_{\text{sfét}} \rightarrow R_{\text{fét}}$ .  $\perp$

**Prop. (27.4.3.4) [Properties of Étale Maps].**

- Strongly étale/strongly finite étale maps of perfectoid spaces are stable under base change, and if  $Z \rightarrow Y$  is strongly étale, then  $|X \times_Z Y| \rightarrow |X| \times_{|Z|} |Y|$  is surjective.
- If  $X = \text{Spa}(A, A^+)$ ,  $Y = \text{Spa}(B, B^+)$ ,  $Z = \text{Spa}(C, C^+)$  are all affinoid perfectoids and  $Z \rightarrow Y$  is strongly finite étale, then  $X \times_Z Y = \text{Spa}(D, D^+)$ , where  $D = A \otimes_B C$  and  $D^+$  is the integral closure of  $C^+$  in  $D$ .
- For any diagram  $X \rightarrow Y \leftarrow Z \in \text{AdicSpa}/K$  where  $X \rightarrow Y$  is étale/finite étale and  $Z \in \text{PerfdSpa}$ , the fiber product  $X \times_Y Z$  is also a perfectoid space, and  $X \times_Y Z \rightarrow Z$  is étale/finite étale. Moreover, the map  $|X \times_Y Z| \rightarrow |X| \times_{|Y|} |Z|$  is surjective.
- If  $X = \text{Spa}(A, A^+)$ ,  $Y = \text{Spa}(B, B^+)$ ,  $Z = \text{Spa}(C, C^+) \in \text{AdicSpa}^{\text{aff}}/K$  and  $X \rightarrow Y$  is finite étale, then  $X \times_Z Y = \text{Spa}(D, D^+)$ , where  $D = A \otimes_B C$  and  $D^+$  is the integral closure of  $C^+$  in  $D$ .

*Proof:* Cf.[Scholze Perfectoid Spaces]P40. ┘

**Prop. (27.4.3.5).** Strongly (finite)étale maps of perfectoid spaces are stable under compositions. ┘

*Proof:* Cf.[Scholze Perfectoid Spaces]P42. ? ┘

**Def. (27.4.3.6) [Étale Sites of Perfectoid Spaces].** For  $X \in \text{AdicSpa}$ , the étale site of  $X$  is the category  $X_{\text{ét}}$  of perfectoid spaces that is étale over  $X$  with coverings given by topological coverings. This is truly a site by (27.4.3.4), and it is functorial in  $X \in \text{AdicSpa}$ . ┘

**Prop. (27.4.3.7) [Gabber-Ramero].** If  $A$  is a finite  $K^0$ -algebra that is  $\varpi$ -adically Henselian, then

$$A[\varpi^{-1}]_{\text{fét}} \cong \widehat{A}[\varpi^{-1}]_{\text{fét}}.$$

*Proof:* Cf.[Almost Ring Theory P5.4.53]. ┘

**Cor. (27.4.3.8) [Finite Étale Covers and Direct Limits of Complete Uniform Rings].** Let  $(A_i, A_i^+)$  be a filtered system of complete uniform affinoid  $K$ -algebras, and  $(A, A^+)$  be their colimit in the category of complete uniform affinoid Tate rings, then

$$2\text{-colim}_i A_{i,\text{fét}} \cong A_{\text{fét}}$$

as categories. ┘

*Proof:* By (27.3.2.21),  $A^+$  is the  $\varpi$ -adic completion of the algebraic colimit  $B^+$  of  $A_i^+$ , and  $A = A^+[\varpi^{-1}]$ . Each  $A_i$  is complete and  $\varpi$ -torsion-free, thus the colimit is Henselian and  $\varpi$ -torsion-free (5.3.10.3)(5.3.10.6). Then the proposition (27.4.3.7) shows that  $B^+[\varpi^{-1}]_{\text{fét}} \cong A_{\text{fét}}$ . Now it remains to show that

$$2\text{-colim}_i A_{i,\text{fét}} \cong B^+[\frac{1}{\varpi}]_{\text{fét}},$$

which is because étale sites commutes with taking filtered colimits ┘

### Final Proof of Almost Purity Theorem

**Prop. (27.4.3.9).** There is an equivalence of categories  $X_{\text{sfét}} \cong X_{\text{sfét}}^{\flat}$ . ┘

*Proof:* For this, use (27.4.3.3), (27.4.1.10) and the proven part of (12.2.10.1) and notice that

$$A_{\text{afét}}^{+a} = A_{\text{afét}}^{0a} \cong A_{\text{afét}}^{\flat 0a} = A_{\text{afét}}^{\flat +a},$$

and the integral closure clearly corresponds. (It get around the problem that  $R_{\text{fét}}^{0a} \rightarrow R_{\text{fét}}$  hasn't been proven essentially surjective). ┘

**Prop. (27.4.3.10) [Final Proof of Almost Purity Theorem].** For  $(R, R^+) \in \text{Perfd}/K$ , if  $S \in R_{\text{fét}}$ , then the integral closure of  $S^+$  in  $R^+$  lies in  $R_{\text{afét}}^{+a}$ , and this gives an inverse to the morphism  $d$  in (12.2.10.1), thus finishing the proof of almost purity theorem. ┘

*Proof:* Continuing the proof of(12.2.10.1), it suffices to show that  $d : R_{\text{afét}}^{+a} \rightarrow R_{\text{fét}}$  is essentially surjective, because  $S^+ \rightarrow \bar{S} \subset R^+$  is the only possible inverse, by the almost purity theorem in char  $p$  and tracing the tilting equivalence(12.2.9.6). Given(27.4.3.3), it suffices to prove that for  $X = \text{Spa}(R, R^+)$ , the prestacks  $X_{\text{sfét}} \cong X_{\text{fét}}$ , where  $X_{\text{sfét}}(U) = \mathcal{O}_X^{+a}(U)_{\text{sfét}}$ , and  $X_{\text{fét}}(U) = \mathcal{O}_X(U)_{\text{fét}}$ .

We use(7.1.3.24), firstly  $X_{\text{sfét}}$  is a stack, by(27.4.3.2), and for each  $U$ ,  $X_{\text{sfét}}(U) \rightarrow X_{\text{fét}}(U)$  is fully faithful by almost purity theorem(12.2.10.1).  $X_{\text{fét}}$  is separated by(27.3.4.24), because the structure section of an element  $S \in X_{\text{fét}}$  is determined its value on the stalk.

Its left to prove that their stalks are equal, for this, use the formula

$$\text{colim}_{x \in U} (\mathcal{O}_X(U), \mathcal{O}_X^+(U)) = (\widehat{\kappa(x)}, \widehat{\kappa^+(x)})$$

in the category of complete uniform affinoid  $K$ -algebras(they are all perfectoids(27.4.1.5) thus uniform), by definition. So we get by(27.4.3.8):

$$\text{colim}_{x \in U} \mathcal{O}_X(U)_{\text{fét}} \cong \widehat{k(x)}_{\text{fét}},$$

and by(27.4.3.8) together with the proven part of almost purity theorem(12.2.10.1):

$$\text{colim}_{x \in U} \mathcal{O}_X^+(U)_{\text{afét}} \cong \text{colim}_{x^b \in U^b} \mathcal{O}_X^{b+}(U^b)_{\text{afét}} \cong \kappa^+(x^b)_{\text{afét}} \cong \kappa^+(x)_{\text{afét}}.$$

Now we have already proved the almost purity over fields(12.2.10.1) which says  $\kappa(x^b)_{\text{afét}} \cong \kappa^+(x)_{\text{afét}}$ , so their stalks are the same.  $\square$

**Cor.(27.4.3.11) [Invariance of Étale Sites under Tilting].** There is a natural isomorphism of categories  $X_{\text{ét}} \cong X_{\text{ét}}^b$ , by almost purity theorem(12.2.10.1) and the localness of étale maps.  $\lrcorner$

**Thm.(27.4.3.12) [Tate's Almost Acyclicity, Scholze[Sch12]].** For any  $X \in \text{PerfdSpa}$ , the functor  $U \mapsto \mathcal{O}_X(U)$  is a sheaf on  $X_{\text{ét}}$ , and  $H_{\text{ét}}^i(X, \mathcal{O}_X^+)$  is almost zero if  $X$  is affinoid perfectoid.  $\lrcorner$

*Proof:* Cf.[Scholze Perfectoid Spaces]P43.  $\textcolor{red}{?}$   $\square$

## 4 Perfectoid Pro-Étale Morphisms

References are [Scholze, Rigid Analytic Varieties].

**Def.(27.4.4.1) [Perfectoid Pro-Étale Morphisms].** For  $X \in \text{AdicSpa}$  and  $U \in X_{\text{pro-ét}}$ , then

- $U$  is called **affinoid pro-étale perfectoid** over  $X$  if  $U$  has a pro-étale presentation(27.3.6.2)  $U = \varprojlim U_i \rightarrow X$  by affinoids  $U_i = \text{Spa}(R_i, R_i^+)$  s.t.  $(R, R^+) = (\varinjlim (R_i, R_i^+))^\wedge \in \text{Perfd}_K$ .
- $U$  is called **pro-étale perfectoid** over  $X$  if  $U$  has an open cover(27.3.6.3) by affinoid pro-étale perfectoids  $V \subset U$ .

$\lrcorner$

**Prop.(27.4.4.2) [Associated Perfectoid Spaces].** Let  $X \in \text{AdicSpa}$  and  $U = \varprojlim U_i \in X_{\text{pro-ét}}$  affinoid pro-étale perfectoid over  $X$ , where  $U_i = \text{Spa}(R_i, R_i^+)$  and  $(R, R^+) = (\varinjlim (R_i, R_i^+))^\wedge$ , then we can associate  $U^\wedge = \text{Spa}(R, R^+)$ . In this way, we get a functor from affinoid pro-étale perfectoid spaces to affinoid perfectoid spaces.  $\lrcorner$

**Prop.(27.4.4.3).** Let  $X \in \text{AdicSpa}$  be locally Noetherian,  $U \in X_{\text{pro-ét}}$  be perfectoid over  $X$ , and  $V \rightarrow U$  pro-étale, then  $V$  is also perfectoid over  $X$ .  $\lrcorner$

*Proof:*

□

**Prop. (27.4.4.4) [Colmez].** Let  $X$  be a locally Noetherian adic space over  $\mathrm{Spa}(K, K^+)$ , then the set of affinoid pro-étale perfectoid spaces over  $X$  form a basis for  $X_{\mathrm{pro-ét}}$ . ┘

*Proof:* Cf. [Scholze, rigid analytic varieties] P25. □

**Prop. (27.4.4.5).** Assume  $X \in \mathrm{AdicSpa}$  and  $U \in X_{\mathrm{pro-ét}}$  is affinoid pro-étale perfectoid over  $X$  with  $U^\wedge = \mathrm{Spa}(R, R^+)$ , then

- For any  $b \in K^+$ ,  $\mathcal{O}_X^+(U)/(b) = R^+/(b)$ , and this is almost equal to  $(\mathcal{O}_X^+(b))(U)$ .
- For any nonzero  $b_1, b_2 \in K^+$  s.t.  $|b_1| < |b_2|$ , the image of  $(\mathcal{O}_X^+(b_1))(U)$  in  $(\mathcal{O}_X^+(b_2))(U)$  is equal to  $R^+/(b_2)$ .
- $\widehat{\mathcal{O}}_X^+(U) = R^+$ ,  $\widehat{\mathcal{O}}_X(U) = R$ .
- $\widehat{\mathcal{O}}_X^+(U)$  is the completion of  $\mathcal{O}_X^+(U)$ .
- For any  $i \in \mathbb{Z}_+$ , the cohomology groups  $H^i(U, \widehat{\mathcal{O}}_X^+)$  are almost zero.

In particular, for any affinoid pro-étale perfectoid  $U \in X_{\mathrm{pro-ét}}$ ,  $(|U|, \mathcal{O}_X|_{|U|}, \{|-|_x\}_{x \in U})$  is a perfectoid adic space. ┘

*Proof:*

□

**Prop. (27.4.4.6).** Assume  $X \in \mathrm{AdicSpa}$  and  $U \in X_{\mathrm{pro-ét}}$  is affinoid pro-étale perfectoid over  $X$  with  $U^\wedge = \mathrm{Spa}(R, R^+)$ . Let  $\mathbb{L} \in \mathbb{F}_p\text{-LocSys}$ , then

$$H^i(U, \mathbb{L} \otimes \mathcal{O}_X^+/(p))$$

is almost zero for  $i \in \mathbb{Z}_+$ , and almost finitely generated over  $R^+/(p)$  for  $i = 0$ . ┘

*Proof:* Cf. [Scholze P27]. □

### Odd Definition

Cf. [Sch12].

**Def. (27.4.4.7) [Original Definition of Perfectoid Pro-Étale Morphisms].** For  $X \in \mathrm{PerfdSpa}$  and  $\{X_\alpha\}$  a filtered inverse system of Noetherian adic spaces (27.3.4.7) with a compatible system of maps  $\varphi_\alpha : X \rightarrow X_\alpha$ , we write

$$X \sim \varprojlim X_\alpha$$

if  $|X| \cong \varprojlim |X_\alpha|$ , and for any  $x \in X$ , the map of residue fields  $\varinjlim \kappa(\varphi_i(x)) \rightarrow \kappa(x)$  have dense images. In particular,  $X$  is qcqs, by (4.12.3.15). ┘

**Prop. (27.4.4.8).** Suppose  $X \in \mathrm{PerfdSpa}$  and  $X \sim \varprojlim X_i$ . If  $Y \rightarrow X_i$  is an étale map of Noetherian adic spaces, then  $Y \times_{X_i} X \sim \varprojlim_{j \geq i} Y \times_{X_i} X_j$ . ┘

*Proof:* Cf. [Scholze Perfectoid] P44. □

**Prop. (27.4.4.9).** If  $X \in \mathrm{PerfdSpa}$  and  $X \sim \varprojlim X_i$ , then

$$\mathrm{Sh}(X_{\mathrm{ét}}) \cong \varinjlim \mathrm{Sh}(X_{i,\mathrm{ét}}).$$

┘

*Proof:* Cf.[Scholze Perfectoid]P44. □

**Cor.(27.4.4.10).** If  $X \in \mathcal{P}\text{erfdSpa}$  and  $X \sim \varprojlim X_i$ , then for any sheaf  $\mathcal{F}_i \in \mathcal{S}h(X_{i,\text{ét}})$  with pullbacks  $\mathcal{F}_j \in \mathcal{S}h(X_{j,\text{ét}})$  and  $\mathcal{F} \in \mathcal{S}h(X)$ , then the natural mapping

$$\varinjlim_{j \geq i} H^i(X_{j,\text{ét}}, \mathcal{F}_j) \rightarrow H^i(X, \mathcal{F})$$

is an isomorphism for any  $n \in \mathbb{N}$ . ┘

*Proof:* Cf.[Scholze Perfectoid]P44. □

**Cor.(27.4.4.11).** If  $X \in \mathcal{P}\text{erfdSpa}$  and  $X \sim \varprojlim X_i$  and all the transition maps are homeomorphisms and induce purely inseparable maps on completed residue fields, then  $X_{\text{ét}}$  is isomorphic to  $X_{i,\text{ét}}$  for any  $i$ . ┘

*Proof:* Cf.[Scholze Perfectoid]P44. □

## 5 Applications

### Weight Monodromy Conjecture

**Thm.(27.4.5.1)** [Sch[Sch12]]. Let  $K \in p\text{-NField}$  and  $X \in \mathcal{S}m\mathcal{P}rpr\mathcal{V}ar/K$  is a set-theoretic complete intersection in a smooth projective toric variety, then the weight monodromy conjecture is true for  $X$ .( ? i.e. for any  $i \in \mathbb{N}$ , the monodromy filtration on the étale cohomology group  $H_{\text{ét}}^i(X_{\overline{K}}, \mathbb{Q}_\ell)$  is pure of weight  $i$ ). ┘

## 27.5 Crystalline Cohomology

References are [Sta] and [Berthelot-Ogus, Notes on Crystalline Cohomology]

**Notation (27.5.0.1).**

- Let  $p \in \text{Prime}$ .
- Let  $\text{NilSch}$  be the subcategory of  $\text{Sch}$  consisting of schemes s.t.  $p$  is locally nilpotent.

┘

### 1 PD-Schemes

**Def. (27.5.1.1) [PD-Schemes].** A **pd-scheme** is a triple  $(S, \mathcal{I}, \gamma)$  where

- $S \in \text{Sch}$ .
- $\mathcal{I}$  is a  $\mathbb{Q}\text{co}$  sheaf of ideals on  $S$ .
- $\gamma$  is a pd-structure on  $\mathcal{I}$  (5.6.1.1).

A morphism of pd-schemes is a morphism that all the structure morphisms are morphisms of pd-structures.

Equivalently a pd-scheme is a triple  $(S_0, S, \gamma)$  where  $S_0$  is a closed subscheme of  $S$  with ideal sheaf  $\mathcal{I}$  s.t.  $(S, \mathcal{I}, \gamma)$  is a pd-scheme.

┘

**Def. (27.5.1.2) [PD-Thickening].** A **pd-thickening** is a triple  $(U, T, \delta)$  where  $T$  is a thickening of  $U$  (7.8.6.1) with sheaf of ideals  $\mathcal{I}$  (i.e.  $U = \mathbf{Spec}(\mathcal{I})$ ) s.t.  $(T, \mathcal{I}, \delta)$  is a pd-scheme (27.5.1.1).

┘

**Prop. (27.5.1.3) [Pullback of pd-Thickenings].** Pullback of pd-thickenings (27.5.1.2) exist in the category of pd-schemes.

┘

*Proof:* Cf. [Sta] 07ME.

□

### 2 Crystalline Sites

**Def. (27.5.2.1) [Coverings].** A family of morphisms  $\{(U_i, T_i, \delta_i) \rightarrow (U, T, \delta)\}$  of pd-thickenings (27.5.1.2) is called a Zariski/smooth/étale/syntomic/fppf... covering iff

- $U_i = U \otimes_T T_i$ ,
- $\{T_i \rightarrow T\}$  is a Zariski/smooth/étale/syntomic/fppf... covering of  $T$ .

┘

**Def. (27.5.2.2) [Crystalline Sites].** For a pd-scheme  $(S, \mathcal{I}, \gamma)$  over  $\mathbb{Z}_{(p)}$  (27.5.1.1),  $S_0 = V(\mathcal{I}) \subset S$  and  $X \in \text{NilSch}/S_0$ , the **big crystalline site**  $(X/S)_{\text{Crys}}$  consists of pd-thickenings (27.5.1.2)  $(U, T, \delta)$  over  $(S, \mathcal{I}, \delta)$  and a morphism  $U \rightarrow X \in \text{Sch}/S$ , and the topology is the Zariski-topology (27.5.2.1). In fact for any  $(U, T, \delta) \in (X/S)_{\text{Crys}}$ ,  $p$  is locally nilpotent in  $T$ , by (5.6.1.8).

$$\begin{array}{ccccc} U & \longrightarrow & X & \longrightarrow & S_0 \\ \downarrow & & & & \downarrow \\ T & \longrightarrow & & & S \end{array}$$

The **crystalline site**  $(X/S)_{\text{crys}}$  is the strictly full subcategory of  $(X/S)_{\text{Crys}}$  consisting of objects  $(U, T, \delta)$  s.t.  $U \in X_{\text{Zar}}$ .

Notice the **structure sheaf**  $\mathcal{O}_{X/S} : (U, T, \delta) \in (X/S)_{\text{Crys}} \mapsto \Gamma(T, \mathcal{O}_T)$  is a sheaf of rings on  $(X/S)_{\text{Crys}}$  or  $(X/S)_{\text{Crys}}$ . There is another sheaf of rings given by  $\mathcal{O}_X : (U, T, \delta) \in (X/S)_{\text{Crys}} \mapsto \Gamma(U, \mathcal{O}_U)$ , and there is a natural map  $\mathcal{O}_{X/S} \rightarrow \mathcal{O}_X$  with kernel  $\mathcal{J}_{X/S}$  equipped with a pd-structure.  $\perp$

**Remark (27.5.2.3) [Infinitesimal Sites].** Situation as in (27.5.2.2), we can also define the (big) **infinitesimal site**  $(X/S)_{\text{inf}}$  by similar definition but without pd-structures.  $\perp$

**Prop. (27.5.2.4) [Finite Limits].** The category  $(S/X)_{\text{Crys}}$  has all finite non-empty limits, and the forgetful functor  $(U, T, \delta) \rightarrow U$  preserves finite non-empty limits.  $\perp$

*Proof:* Cf. [Sta]07I9. ?  $\square$

**Prop. (27.5.2.5) [Comparing with Zariski-Sites].** The functors

$$u_{X/S} : (X/S)_{\text{Crys}} \rightarrow X_{\text{Zar}} : (U, T, \delta) \rightarrow U, \quad U_{X/S} : (X/S)_{\text{Crys}} \rightarrow \text{Sch}_{\text{Zar}}/X : (U, T, \delta) \mapsto U$$

are cocontinuous (easy to verify) and commutes with products and fibered products by (27.5.2.4), thus defines a morphism of topoi

$$u_{X/S} : \text{Sh}((X/S)_{\text{Crys}}) \rightarrow \text{Sh}(X_{\text{Zar}})$$

by (7.1.2.21), which is functorial in  $X/S$ .  $\perp$

**Prop. (27.5.2.6) [Functoriality of Crystalline Sites].** For a morphism of pd-scheme  $(S', \mathcal{I}', \gamma') \rightarrow (S, \mathcal{I}, \gamma)$  over  $\mathbb{Z}_{(p)}$  (27.5.1.1), denote  $S_0 = V(\mathcal{I}) \subset S$ ,  $S'_0 = V(\mathcal{I}') \subset S'$ . Suppose there is a commutative diagram

$$\begin{array}{ccc} X' & \xrightarrow{f} & X \\ \downarrow & & \downarrow \\ S'_0 & \longrightarrow & S_0 \end{array} \in \text{Sch}$$

and assume that  $p$  is locally nilpotent on  $X'$  and  $X$ , then there are morphisms of topoi

$$f_{\text{Crys}} : \text{Sh}((X'/S')_{\text{Crys}}) \rightarrow \text{Sh}((X/S)_{\text{Crys}}), \quad f_{\text{crys}} : \text{Sh}((X'/S')_{\text{crys}}) \rightarrow \text{Sh}((X/S)_{\text{crys}}).$$

$\perp$

*Proof:* Cf. [Sta]07IK. ?  $\square$

**Prop. (27.5.2.7) [Sheaves on Crystalline Sites].** Situation as in (27.5.2.2), denote  $\mathcal{C} = (X/S)_{\text{Crys}}$  or  $(X/S)_{\text{crys}}$ . For each  $(U, T, \delta) \in \mathcal{C}$  and  $\mathcal{F} \in \text{Sh}(\mathcal{C})$ , the restriction

$$\mathcal{F}_T : W \in T_{\text{Zar}} \mapsto \mathcal{F}(U \cap W, W, \delta|_W)$$

is an Abelian sheaf on  $T_{\text{Zar}}$ . And for  $f : (U, T, \delta) \rightarrow (U', T', \delta') \in \mathcal{C}$ , there is a canonical comparison map

$$c_f : f^{-1}\mathcal{F}_{T'} \rightarrow \mathcal{F}_T$$

whose adjoint  $\mathcal{F}_{T'} \rightarrow f_*\mathcal{F}_T$  on each  $W' \in T_{\text{Zar}}$  is induced by

$$f_{f^{-1}(W')} : (U \cap f^{-1}(W'), f^{-1}(W'), \delta|_{f^{-1}(W')}) \rightarrow (U' \cap W', W', \delta|_{W'}).$$

Notice  $c_f$  is an isomorphism if  $f$  is an open immersion. Conversely, if we are given a sheaf  $f_T \in \text{Sh}(T_{\text{Zar}})$  for each  $(U, T, \delta) \in \mathcal{C}$  and comparison maps  $c_f$  for each morphism  $f : (U, T, \delta) \rightarrow (U', T', \delta') \in \mathcal{C}$  s.t.

- $c_f$  is an isomorphism if  $f$  is an open immersion.
- Certain cocycle conditions hold?.

Then these  $f_T$  comes from a sheaf  $f \in \text{Sh}(\mathcal{C})$ . The proof is the same as that of [Sta]0213?.

**Prop. (27.5.2.8)[Crystalline Topoi are Sub-Canonical].** Situation as in (27.5.2.2),  $\text{Sh}((X/S)_{\text{crys}})$  is sub-canonical.

*Proof:* ?

**Def. (27.5.2.9)[Affine Crystalline Site].** Let  $(A, I, \gamma)$  be a pd-structure that  $A$  is a  $\mathbb{Z}_{(p)}$ -algebra, and  $C$  is an  $A/I$ -algebra that  $p$  is nilpotent in  $C$ , then the **affine crystalline site**  $(C/A)_{\text{Crys}}^{\text{aff}}$  is the site whose object are pd-structures  $(B, J, \delta)$  over  $(A, I, \gamma)$  that  $p$  is nilpotent in  $B$  (5.6.1.8), together with a map of rings  $C \rightarrow B/J$  over  $A/I$ , and  $(C/A)_{\text{Crys}}^{\text{aff}}$  the full subcategory of  $(C/A)_{\text{Crys}}^{\text{aff}}$  consisting of objects  $(B, J, \delta)$  s.t.  $C \rightarrow B/J$  is an isomorphism.

Notice for any object  $(B, J, \delta)$  in  $(C/A)_{\text{Crys}}$ ,  $J$  is nilpotent, by (5.6.1.8).

### Sheaf of Differentials

**Def. (27.5.2.10) [PD- $S$ -Derivations].** For  $\mathcal{F} \in \text{Sh}(\mathcal{O}_{X/S, \text{crys}})$ , an  $S$ -derivation  $D : \mathcal{O}_{X/S} \rightarrow \mathcal{F}$  is a map of sheaves that for any object  $(U, T, \delta)$  of  $(X/S)_{\text{crys}}$ , the map  $D : \Gamma(T, \mathcal{O}_T) \rightarrow \Gamma(T, \mathcal{F})$  is a pd-derivation over  $\Gamma(V, \mathcal{O}_V)$  for any open subset  $V \subset S$  that  $T \rightarrow S$  factors through  $V$ .

**Def. (27.5.2.11) [Zariski-Sheaf of Modules of PD-Differentials].** Similar to the construction of sheaf of differentials (7.2.4.2), for each pd-structure  $(U, T, \delta)$  over  $S \in \text{Sch}$ , we can construct the **sheaf of pd-differentials**  $\Omega_{T/S, \delta}$  on  $T_{\text{Zar}}$ , which is a quotient of the sheaf of differentials  $\Omega_{X/S}$  by the submodule generated by local sections  $\{d_{T/S}(\delta_n(t)) - \delta_{n-1}(t)d_{T/S}(t)\}_{n \in \mathbb{Z}_+}$ , so it is affine-locally given by the module of pd-differentials (5.6.2.1).

**Def. (27.5.2.12) [Crystalline Sheaf of Modules of PD-differentials].** For a pd-scheme  $(S, \mathcal{I}, \gamma)$  over  $\mathbb{Z}_{(p)}$  (27.5.1.1),  $S_0 = V(\mathcal{I}) \subset S$  and  $X \in \text{NilSch}/S_0$ , there exists  $\Omega_{X/S, \text{crys}} \in \mathcal{QCoh}(\mathcal{O}_{X/S, \text{crys}})$  s.t. for any  $(U, T, \delta) \in (X/S)_{\text{crys}}$ , we have

$$\Omega_{X/S, \text{crys}}|_{(U, T, \delta)} = \Omega_{T/S, \delta} \quad (27.5.2.11).$$

*Proof:* By (27.5.2.7) and (27.5.3.2), it suffices to check that for each morphism  $f : (U, T, \delta) \rightarrow (U', T', \delta')$  in  $(X/S)_{\text{crys}}$ , the morphism of  $\mathcal{O}_{T'}$ -modules  $c_f : f^* \mathcal{F}_{T'} = f^{-1} \mathcal{F}_{T'} \otimes \mathcal{O}_T \rightarrow \mathcal{F}_T$  is an isomorphism of  $\mathcal{O}_T$ -modules.

**Prop. (27.5.2.13)[Functorial First-Order PD-Thickenings].** Let  $(U, T, \delta) \in (X/S)_{\text{crys}}$ ,  $\mathcal{J}$  the ideal sheaf of  $U$ , we define a first order thickening  $T'$  of  $T$ : let  $\mathcal{O}_{T'} = \mathcal{O}_T \oplus \Omega_{T/S, \delta}$  with the algebraic structure that  $\Omega_{T/S, \delta}^2 = 0$ , and let  $\mathcal{J}' = \mathcal{J} \otimes \Omega_{T/S, \delta}$ , and define the pd-structure as

$$\delta'_n(f, \omega) = (\delta_n(f), \delta_{n-1}(f)\omega).$$

Then  $(U, T, \delta')$  is a pd-thickening and  $(U, T, \delta) \rightarrow (U, T', \delta')$  is a morphism in  $(X/S)_{\text{crys}}$ . Moreover, there are two ring maps

$$p_0, p_1 : \mathcal{O}_T \rightarrow \mathcal{O}_{T'} : p_0(f) = (f, 0), \quad p_1(f) = (f, d_{T/S, \delta}(f))$$

Then we get two contraction of the morphism  $T \rightarrow T'$ , and  $p_0^* - p_1^*$  is the universal derivation  $d_{T/S, \delta}$  included in  $\mathcal{O}_{T'}$ .

This construction is functorial in  $T/S$  by (27.5.2.12) and hence gives a functor of sites  $(X/S)_{\text{crys}} \rightarrow (X/S)_{\text{crys}}$ .  $\perp$

*Proof:* The verification of the pd-axioms in in [Sta]07HH.  $\square$

**Prop. (27.5.2.14) [Functorial Second-Order PD-Thickenings].** There is a further thickening  $T''$  of  $T'$ , which is a second order thickening of  $T$ :

$$\Omega_{T''} = \mathcal{O}_T \oplus \Omega_{T/S, \delta} \oplus \Omega_{T/S, \delta} \oplus \Omega_{T/S, \delta}^2$$

with the algebra structure given by

$$(f, \omega_1, \omega_2, \eta)(f', \omega'_1, \omega'_2, \eta') = (ff', f\omega'_1 + f'\omega_1, f\omega'_2 + f'\omega_2, f\eta' + f'\eta + \omega_1 \wedge \omega'_2 + \omega'_1 \wedge \omega_2)$$

Let  $\mathcal{J}'' = \mathcal{J} \oplus \Omega_{T/S, \delta} \oplus \Omega_{T/S, \delta} \oplus \Omega_{T/S, \delta}^2$ , then there is a PD-structure on  $\mathcal{J}''$  given by

$$\delta_n''(f, \omega_1, \omega_2, \eta) = (\delta_n(f), \delta_{n-1}(f)\omega_1, \delta_{n-1}(f)\omega_2, \delta_{n-1}(f)\eta + \delta_{n-1}(f)\omega_1 \wedge \omega_2).$$

This construction is functorial in  $T/S$  by (27.5.2.12) and hence gives a functor of sites  $(X/S)_{\text{crys}} \rightarrow (X/S)_{\text{crys}}$ .  $\perp$

*Proof:* For the details, Cf. [Sta]07J3.  $\square$

### 3 Crystals

**Def. (27.5.3.1) [Crystals].** In situation (27.5.2.2), denote  $\mathcal{C} = (X/S)_{\text{Crys}}$  or  $(X/S)_{\text{crys}}$ ,  $\mathcal{F} \in \text{Mod}(\mathcal{O}_{X/S})$  is called

- an  $\mathcal{O}_{X/S}$ -**crystal** if for any morphism  $f : (U, T, \delta) \rightarrow (U', T', \delta')$  in  $(X/S)_{\text{crys}}$ , the morphism of  $\mathcal{O}_{T'}$ -modules  $c_f : f^* \mathcal{F}_{T'} = f^{-1} \mathcal{F}_{T'} \otimes \mathcal{O}_T \rightarrow \mathcal{F}_T$  is an isomorphism of  $\mathcal{O}_T$ -modules.
- **locally quasi-coherent** if  $\mathcal{F}_T \in \mathcal{QCoh}(\mathcal{O}_T)$  for any  $(U, T, \delta) \in (X/S)_{\text{crys}}$ .
- **quasi-coherent** if  $f \in \mathcal{QCoh}(\mathcal{C})$  as defined in (7.2.2.25).

In particular,  $\mathcal{O}_{X/S}$  is a crystal in  $\mathcal{O}_{X/S}$ -modules.  $\perp$

#### Crystals in Qco modules

**Def. (27.5.3.2) [Quasi-Coherent Crystals].** Situation as in (27.5.3.1), an  $\mathcal{O}_{X/S}$ -module  $\mathcal{F}$  is called a **quasi-coherent crystal** if it satisfies the following equivalent conditions:

- $\mathcal{F} \in \mathcal{QCoh}(\mathcal{C})$ .
- $\mathcal{F}$  is locally Qco (27.5.3.1) and it is a crystal in  $\mathcal{O}_{X/S}$ -modules.

Moreover,  $\mathcal{F}$  is called a **crystal in finite locally free modules** if moreover  $\mathcal{F}$  is finite locally free.  $\perp$

*Proof:* Cf. [Sta]07IT?.  $\square$

**Def. (27.5.3.3) [Notations in Polynomial case].** If in situation (27.5.2.9),  $S = \text{Spec } A, X = \text{Spec } C$ , we let  $P \rightarrow C$  be a surjection of  $A$ -algebras with  $P = A[X_i]$ , and the kernel is  $J$ . Set  $D = D_{P, \gamma}(J)^\wedge$

be the  $p$ -adically completed pd-envelope, then  $(D, \widehat{J}, \widehat{\gamma})$  admits a natural pd-structure, by (5.6.1.15). Let  $D_e = D/p^e$  and  $J_e$  the image of  $\widehat{J}$  in  $D_e$ . Denote

$$\Omega_D = (\Omega_{D/A, \gamma})^\wedge = (\Omega_{D_{P, \gamma}(J)/A, \bar{\gamma}})^\wedge = \lim_e \Omega_{D(n)_e/A, \bar{\gamma}} \quad (5.6.2.4).$$

By (5.6.2.4),  $\Omega_{D_{P, \gamma}(J)/A, \bar{\gamma}} = \Omega_{P/A} \otimes_P D_{P, \gamma}(J)$  which is free over  $D_{P, \gamma}(J)$  on  $dx_i$ , so  $\Omega_D$  is topologically free over  $D$  on  $dx_i$ , and there is a universal derivation  $d : D \rightarrow \Omega_D$ .

Now let  $J(n) = \ker(P \otimes_A \otimes_A \dots \otimes_A P \rightarrow C)$  where the tensor has  $n+1$  factors, and

$$D(n) = (D_{P \otimes_A \otimes_A \dots \otimes_A P/A, \gamma}(J(n)))^\wedge$$

with divided ideals  $\widehat{J}(n)$ , and also  $D(n)_e = D(n)/p^e$ ,  $T(n)_e = \text{Spec } D(n)_e$ , then  $(X, T(n)_e, \bar{\gamma}(n))$  is a pd-thickening by (5.6.1.8) for  $e$  large (5.6.1.15), by (5.6.1.8) as  $p$  is nilpotent in  $X$ . And

$$\Omega_{D(n)} = (\Omega_{D(n)/A, \bar{\gamma}(n)})^\wedge.$$

Then  $D(0) = D, D(1), \dots$  form a cosimplicial pd-structures.

Let  $\mathcal{F}$  be a sheaf of  $\mathcal{O}_{X/S}$ -modules, denote

$$M(n) = \lim_e (\Gamma((X, T(n)_e, \bar{\gamma}(n)), \mathcal{F})).$$

┘

**Prop. (27.5.3.4).** Notation as in (27.5.3.3), there is an isomorphism

$$D(n) \cong (D\langle \xi_i(j) \rangle)^\wedge$$

where  $\xi_i(j) = X_i \otimes 1 \otimes \dots \otimes 1 - 1 \otimes 1 \otimes \dots \otimes X_i \otimes 1 \otimes \dots \otimes 1$ .

┘

*Proof:* There is an isomorphism  $P \otimes_A \dots \otimes_A P \cong P[\xi_i(j)]$ , and  $J(n)$  is just generated by  $JP \otimes_A \dots \otimes_A P + (\xi_i(j))$ , so this theorem follows from (5.6.1.20).  $\square$

### Crystalline Connections

**Def. (27.5.3.5) [deRham Complexes for  $(X/S)_{\text{crys}}$ ].** Situation as in (27.5.2.2), if we define  $\Omega_{X/S, \delta}^i = \wedge^i \Omega_{X/S, \delta}$  (27.5.2.12), then by (9.2.1.2), the universal  $S$ -derivative  $d_{X/S}$  give rises to the **pd-deRham-complex**

$$\mathcal{O}_{X/S} \rightarrow \Omega_{X/S, \delta}^1 \rightarrow \Omega_{X/S, \delta}^2 \rightarrow \dots$$

as  $\mathcal{O}_{X/S}$ -modules on  $(X/S)_{\text{crys}}$ .

┘

*Proof:* The verification of the condition for the quotient  $\Omega_X \rightarrow \Omega_{X/S, \delta}$  is routine.  $\square$

**Def. (27.5.3.6) [Connections on  $(X/S)_{\text{crys}}$ ].** Situation as in (27.5.2.2), we define the notion of connection on  $\mathcal{F} \in \text{Sh}(\mathcal{O}_{X/S, \text{crys}})$  w.r.t. the sheaf of differentials  $\Omega_{X/S, \delta}$  (27.5.2.12), as in (9.2.1.5), i.e. a map

$$\nabla : \mathcal{F} \rightarrow \mathcal{F} \otimes_{\mathcal{O}_{X/S, \text{crys}}} \Omega_{X/S, \delta} \in \text{Sh}((X/S)_{\text{crys}})$$

s.t. for any local section  $s$  of  $\mathcal{F}$  and local section  $f$  of  $\mathcal{O}_{X/S, \text{crys}}$ , we have

$$\nabla(f \otimes s) = f \otimes \nabla(s) + s \otimes d_{X/S} f \quad (27.5.3.5).$$

┘

**Prop.(27.5.3.7) [Canonical Integrable Connections attached to Crystals].** Any  $\mathcal{F} \in \text{Crys}(\mathcal{O}_{X/S, \text{crys}})$  is equipped with a canonical integrable connection (27.5.3.6).  $\lrcorner$

*Proof:* For any  $(U, T, \delta) \in (X/S)_{\text{crys}}$ , consider the first order thickening  $(U, T', \delta')$  given in (27.5.2.13), then there are two projections  $p_0, p_1 : T' \rightarrow T$  and a inclusion  $i : T \rightarrow T'$ , then by the property of crystals we get isomorphisms

$$p_0^* \mathcal{F}_T \xrightarrow{c_0} \mathcal{F}_{T'} \xleftarrow{c_1} p_1^* \mathcal{F}_T$$

then  $\nabla(s) = p_1^*(s) - c_1^{-1} c_0(p_0^*(s))$  vanishes after pulling back to  $T$  via  $i^*$ , so it is in the kernel of  $i^*$ , which is

$$\mathcal{F}_T \otimes_{\mathcal{O}_T} \Omega_{T/S}$$

by the construction of  $T'$  (27.5.2.13). This  $\nabla$  is functorial in  $T$  as everything is functorial, hence gives a connection on  $\mathcal{F}$ .

For the integrability, Cf. [Sta]07J6.  $\color{red}?$   $\square$

**Cor.(27.5.3.8) [PD-deRham-Complexes].** For  $\mathcal{F} \in \text{Crys}(\mathcal{O}_{X/S, \text{crys}})$ , we can define a pd-deRham-complex

$$\mathcal{F} \rightarrow \mathcal{F} \otimes_{\mathcal{O}_{X/S}} \Omega_{X/S, \delta} \rightarrow \mathcal{F} \otimes_{\mathcal{O}_{X/S, \delta}} \Omega_{X/S, \delta}^2 \rightarrow \dots \in \text{Sh}((X/S)_{\text{crys}}).$$

attached to the canonical integral connection (27.5.3.7).  $\lrcorner$

**Thm.(27.5.3.9) [Integrable Connections and PD-Stratifications].** If  $S \in \text{Sch}/\mathbb{Q}$  and  $X \in \text{Sch}^{\text{sm}}/S$ , then for  $(\mathcal{V}, \nabla) \in \text{Conn}(X/S)$ ,  $\nabla$  is integrable iff it extends to a stratification  $\color{red}?$ .

If  $S \in \text{Sch}^p$  and  $X \in \text{Sch}^{\text{sm}}/S$ , then for  $(\mathcal{V}, \nabla) \in \text{Conn}(X/S)$ ,  $\nabla$  is integrable iff it extends to a pd-stratification  $\color{red}?$ .  $\lrcorner$

*Proof:*  $\color{red}?$   $\square$

### Crystals and Connections

**Thm.(27.5.3.10) [Qco Crystals and Topologically Quasi-Nilpotent Connections, Grothendieck [Gro74]].** Notation as in (27.5.3.3), there is an equivalent between  $\mathcal{QCoh}(\mathcal{O}_{X/S, \text{crys}})$  and the category of pairs  $(M, \nabla)$  s.t.

- $M$  is a  $p$ -adically complete  $D$ -module.
- $\nabla : M \rightarrow M \hat{\otimes}_D \Omega_D$  is an integrable connection.
- $\nabla$  is **topological quasi-nilpotent**: for any  $m \in M$ , there are only f.m. pairs  $(i, k)$  that  $\nabla_{\partial/\partial x_i}^k(m) \notin pM$ .

$\lrcorner$

*Proof:* For a crystal, we associate to it  $M = M(0)$  defined in (27.5.3.3). let  $\Gamma((X, T(0)_e, \bar{\gamma}(0)), \mathcal{F}) = M_e$ , then because  $\mathcal{F}$  is a crystal in qco sheaves,  $\mathcal{F}_{T(0)_e} = \widetilde{M_e}$ , and  $M_e = M_{e+1}/p^e M_{e+1}$ , thus  $M_e = M/p^e M$  and  $M$  is  $p$ -adically complete by (5.2.3.6). By evaluating the natural connection defined in (27.5.3.8) on  $T_e$  and take limit, then we get an integral connection  $\nabla : M \rightarrow M \hat{\otimes}_D \Omega_D$ .

To show this integral is topologically quasi-nilpotent, we can do the same thing for  $M = M(n)$  for any  $n$ , and using the crystal property of  $\mathcal{F}$  and take limits, we get isomorphisms

$$M \hat{\otimes}_{D, p_0} D(1) \rightarrow M(1) \rightarrow M \hat{\otimes}_{D, p_1} D(1)$$

For the rest, Cf. [Sta]07JG.

To prove the functor is an equivalence, Cf. [Sta]07JH.  $\square$

**Def. (27.5.3.11) [Notations in Smooth Case].** Situation as in (27.5.3.3), but this time we choose a smooth  $A$ -algebra  $P'$  and  $A \rightarrow P' \rightarrow C$  with  $\ker(P' \rightarrow C) = J'$  and do the same as (27.5.3.3) again, to get

$$D' = D_{P', \gamma}(J')^\wedge$$

and

$$\Omega_{D'} = (\Omega_{D'/A, \gamma})^\wedge = (\Omega_{D_{P', \gamma}(J)/A, \bar{\gamma}})^\wedge = \lim_e \Omega_{D'(n)_e/A, \bar{\gamma}}$$

┘

**Thm. (27.5.3.12) [Crystals and Connections in Smooth case].** Situation as in (27.5.3.3), we can find a  $P = A[X_i]$  that there are maps  $a : D \rightarrow D', b : D' \rightarrow D$  between the completed pd-envelope of  $P, P'$  that  $a \circ b = \text{id}$  and compatible with the maps  $D \rightarrow C$  and  $D' \rightarrow C$ , such that the base change along  $a, b$  induces an equivalence of categories between the categories of modules with an integrable connection over  $D$  as in (27.5.3.10) and the category of modules over  $D'$  with an integrable connection. ┘

*Proof:* We can find  $P$  that  $P \rightarrow C$  factors through a surjection  $P \rightarrow P'$ , hence we get a surjection  $a : D \rightarrow D'$  the left adjointness of pd-envelope. Let  $e$  large that  $D'_e$  is a pd-thickening of  $C$  over  $A$  by (5.6.1.15)(5.6.1.8), then the kernel of  $D_e \rightarrow D'_e$  is nilpotent by (5.6.1.8), hence by the strongly lifting property (5.4.5.16) of the smooth ring map  $P \rightarrow P'$  (5.4.5.21) w.r.t. the thickening  $D_e \rightarrow D'_e$ , we find a lift  $P' \rightarrow D_e$ .

Notice  $D_{e+i+1} \rightarrow D_{e+i} \times_{D'_{e+i}} D'_{e+i+1}$  is surjective with nilpotent kernels (because  $p^{e+i}D \rightarrow p^{e+i}D'$  is surjective), we can use the smooth of  $A \rightarrow P$  to lift inductively the map  $P' \rightarrow D_e$  to a map  $P' \rightarrow D$ , thus by universal property of completed pd-envelope extends to a map  $b : D' \rightarrow D$ . It is clear that  $a \circ b = \text{id}$ .

For the equivalence of categories, Cf. [Sta]07L5. ?

□

**Remark (27.5.3.13).** In fact this proposition holds with  $P'$  being any ring that  $A \rightarrow P'$  satisfies the strong lifting property (5.4.5.16). In particular, this holds for ind-smooth  $A$ -algebras (9.5.1.5). ┘

## 4 Crystalline Cohomologies

Cf. [Sta]Chap55.24.

**Def. (27.5.4.1) [Crystalline Cohomologies].** For a pd-scheme  $(S, \mathcal{I}, \gamma)$  over  $\mathbb{Z}_{(p)}$  with  $S_0 = V(\mathcal{I}) \subset S$  and  $X \in \text{NilSch}/S_0$ , define

$$H_{\text{crys}}^i(X/S) \triangleq H^i((X/S)_{\text{crys}}, \mathcal{O}_{X/S}) \text{ (27.5.2.2).}$$

called the **crystalline cohomology** of  $X/S$ . ┘

**Def. (27.5.4.2) [Frobenius-Actions].** Situation as in (27.5.4.1), if  $(S, \mathcal{I}, \gamma) = (\text{Spec } A, \tilde{I}, \gamma)$  is affine,  $p \in I$  and  $\varphi : A \rightarrow A \in \mathcal{C}\text{Ring}$  is a Frobenius-map lifting the Frobenius-map on  $A/(p)$ . Then for each  $X \in \text{Sch}/S_0$ , by functoriality (27.5.2.6), the absolute Frobenius-map induces a morphism of topoi

$$(\varphi_X)_{\text{crys}} : (X/S)_{\text{crys}} \rightarrow (X/S)_{\text{crys}},$$

┘

**Def. (27.5.4.3) [ $F$ -Crystals].** Situation as in (27.5.4.2), an  $F$ -crystal on  $X/S$  is a pair  $(\mathcal{E}, \varphi_{\mathcal{E}})$  where  $\mathcal{E}$  is a crystal in finite locally free  $\mathcal{O}_{X/S}$ -modules (27.5.3.2) together with a map

$$\varphi_{\mathcal{E}} : \varphi_{\text{crys}}^* \mathcal{E} \rightarrow \mathcal{E} \text{ (27.5.4.2).}$$

The category of  $F$ -crystals on  $X/S$  is denoted by  $\text{F-Crys}(X/S)$ .

A **non-degenerate  $F$ -crystal** on  $X/S$  is an  $F$ -crystal on  $X/S$  that there exists a map  $V : \mathcal{E} \rightarrow \varphi_{\text{crys}}^* \mathcal{E}$  s.t.  $V \circ F_{\mathcal{E}} = p^i \text{id}$  for some  $i \in \mathbb{N}$ .  $\lrcorner$

**Thm. (27.5.4.4) [Cohomology of  $F$ -Crystals].** Situation as in (27.5.4.2), if  $A$  is  $p$ -adically complete and Noetherian and  $X/S_0$  is proper and smooth, then for each  $(\mathcal{E}, \varphi_{\mathcal{E}}) \in \text{F-Crys}(X/S)$  is non-degenerate (27.5.4.3), the canonical map

$$\varphi_{\mathcal{E}} \circ \varphi_{\text{crys}}^* : \text{R}\Gamma((X/S)_{\text{crys}}, \mathcal{E}) \otimes_{A, \varphi}^{\text{L}} A \rightarrow \text{R}\Gamma((X/S)_{\text{crys}}, \mathcal{E})$$

is an isomorphism after inverting  $p$ .  $\lrcorner$

*Proof:* Cf. [Sta]07N5. ?  $\square$

**Def. (27.5.4.5) [Higher Direct Images].** Let  $(S, \mathcal{I}, \gamma) \rightarrow (S', \mathcal{I}', \gamma')$  be a morphism of PD-schemes over  $\mathbb{Z}_{(p)}$  and  $f : X/S_0 \rightarrow X'/S'_0$  be a morphism of schemes that  $p$  is locally nilpotent on  $X$  and  $X'$ . For the rest, Cf. [Sta]07MJ. ?  $\lrcorner$

### $W(\kappa)$ -Crystalline Cohomologies

**Def. (27.5.4.6) [Crystalline Cohomologies for Schemes over  $\mathbb{F}_p$ ].** For  $\kappa \in \text{Perf}^p$  and  $X \in \text{Sch}/\kappa$ , define

$$H_{\text{crys}}^i(X/W(\kappa)) \triangleq \varprojlim_{n \in \mathbb{Z}_+} H_{\text{crys}}^i(X/W_n(\kappa)) \text{ (27.5.4.1).}$$

If  $X/\kappa$  is smooth and proper, then each  $H_{\text{crys}}^i(X/W(\kappa))_{\text{lf}}$  with the relative Frobenius-map is an  $F$ -crystal over  $\kappa$ .  $\lrcorner$

*Proof:* ?  $\square$

**Prop. (27.5.4.7) [Crystalline Cohomologies and Albanese-Varieties].** For  $\kappa \in \text{Perf}^p$  and  $X \in \text{Sch}^{\text{sm, proper}}/\kappa$ , the map  $X \rightarrow \text{Alb}(X)$  induces an isomorphism

$$H_{\text{crys}}^i(\text{Alb}(X)/W(\kappa)) \cong H_{\text{crys}}^i(X/W(\kappa)),$$

and  $H_{\text{crys}}^i(\text{Alb}(X)/W(\kappa))$  is the Dieudonné-module associated to  $\text{Alb}(X)[p^\infty] \in p\text{Div}/\kappa$ .  $\lrcorner$

*Proof:* ?  $\square$

**Prop. (27.5.4.8).** For  $\kappa \in \text{Perf}^p$  and  $X \in \text{SmPrprVar}/\kappa$ , we have

$$H_{\text{crys}}^*(X/\kappa) = H_{\text{dR}}^*(X/\kappa),$$

and there is a universal coefficient formula

$$0 \rightarrow H_{\text{crys}}^i(X/W(\kappa)) \otimes \kappa \rightarrow H_{\text{crys}}^i(X/\kappa) \rightarrow \text{Tor}_1^{W(\kappa)}(H_{\text{crys}}^{i+1}(X/W(\kappa), \kappa)) \rightarrow 0.$$

$\lrcorner$

*Proof:* ? □

**Thm. (27.5.4.9) [*W*( $\kappa$ )-Cohomology is a Weil-Cohomology Theory, Katz-Messing].** For  $\kappa \in \text{Perf}^p$ ,

- For  $X \in \text{SmPrprVar}/\kappa$ , each  $H_{\text{crys}}^i(X/W(\kappa))$  is of f.t. over  $W(\kappa)$ , and vanishes for  $i > 2 \dim X$ .
- For  $X \in \text{SmPrprVar}/\kappa$ , if  $X$  is projective or has a smooth proper lifting to  $W(\kappa)$ , then

$$\dim_{W(\kappa)[\frac{1}{p}]} H_{\text{crys}}^*(X/W(\kappa))[\frac{1}{p}] = \dim_{\mathbb{Q}_\ell} H_{\text{ét}}^i(X_{\bar{\kappa}}, \mathbb{Q}_\ell).$$

- The functor

$$\text{SmProjVar}/\kappa \rightarrow H_{\text{crys}}^*(X/W(\kappa))[\frac{1}{p}]$$

is a Weil-cohomology theory.

- If  $\kappa \in \mathbf{Field}^{\text{fin}}$  and  $X \in \text{SmProjVar}/\kappa$ , then

$$Z_X(T) = \prod_{i \in [2d]} \det \left( 1 - \varphi_\kappa^* T | H_{\text{crys}}^*(X/W(\kappa))[\frac{1}{p}] \right)^{(-1)^{i+1}}$$

coincides with the zeta-function defined using étale cohomology. In particular,  $Z_X(T) \in \mathbb{Q}(T) \cap Z[[T]]$ . ⌋

*Proof:* ? [Katz-Messing. Some Consequences of the Riemann Hypothesis for Varieties over Finite Fields]. □

### deRham-Witt Complexes

References are [Illusie. De Rham-Witt complexes and p-adic Hodge theory], [crystalline cohomology, mini course, Haoyang Guo] and

**Def. (27.5.4.10) [Witt-Sheaves].** For  $X \in \text{Sch}$  and  $n \in \mathbb{Z}_+$ , if  $\mathcal{F} \in \text{Sh}(X_{\text{Zar}})$  is a sheaf of rings on  $X$ , then the functor

$$W_n(\mathcal{F}) : U \in X_{\text{Zar}} \rightarrow W_n(\mathcal{F}(U))$$

is a sheaf of rings on  $X_{\text{Zar}}$ , called the **truncated Witt-sheaf** of  $\mathcal{F}$ . And we can define

$$W(\mathcal{F}) \stackrel{\Delta}{=} \varprojlim_{n \in \mathbb{Z}_+} W_n(\mathcal{F}),$$

called the **Witt-sheaf** of  $\mathcal{F}$ . And we call  $\mathbf{Spec}(W_n(\mathcal{O}_X))$  the **Witt-scheme** over  $X$ . ⌋

*Proof:* ? □

**Prop. (27.5.4.11) [Canonical PD-Structures on Witt-Schemes].** For  $X \in \text{Sch}^p$  and  $n \in \mathbb{Z}_+$ , then  $(W_n(X), \text{Ver}(W_n(\mathcal{O}_X)))$  has a canonical pd-structure given by

$$\gamma_k(\text{Ver}(x)) = \frac{p^{k-1}}{k!} \text{Ver}(x^m).$$

compatible with that of  $(\mathbb{Z}_{(p)}, (p), \gamma)$ . ⌋

*Proof:* To check that this is a pd-structure, by functoriality and universality, it suffices to use the Witt-coordinate. Then the assertion is clear from the definition of  $\text{Ver}$  (5.5.2.13).  $\square$

**Def. (27.5.4.12)[deRham-Witt Complexes, Langer-Zink].** For  $X \rightarrow S \in \text{Sch}^p$ , there is a projective system of dg-algebras of  $\text{Qco } W(\mathcal{O}_X)$ -sheaves  $\{W_n(\Omega_{X/S}^\bullet)\}$  (27.5.4.10) with operators

$$F : W_{n+1}\Omega_{X/S}^\bullet \rightarrow W_n\Omega_{X/S}^\bullet, \quad \text{Ver} : W_n\Omega_{X/S}^\bullet \rightarrow W_{n+1}\Omega_{X/S}^\bullet$$

s.t. for each local sections  $x, y$  of  $W_\bullet(\Omega_{X/S}^\bullet)$  and local section  $a$  of  $\Omega_{X/S}^\bullet$ , we have

- $d_{X/S} \circ F = pF \circ d_{X/S}$ .
- $F \circ d_{X/S}([a]) = [a^{p-1}]d_{X/S}([x])$ .
- $F \circ d_{X/S} \circ \text{Ver} = d_{X/S}$ .
- $F(x)F(y) = F(xy)$ .
- $\text{Ver} \circ d_{X/S} = pd_{X/S} \circ \text{Ver}$ .
- $\text{Ver}(F(x)y) = x \text{Ver}(y)$ .
- $F \circ \text{Ver} = p$ .

┘

*Proof:* ?

$\square$

**Prop. (27.5.4.13).**

- The construction of  $W_\bullet(\Omega_{X/S}^\bullet)$  (27.5.4.12) is functorial in  $X/S \in \text{Sch}^p$ .
- For each  $f : X \rightarrow Y \in \text{Sch}^{\text{ét}}/S$  and  $n \in \mathbb{Z}_+$ , the induced morphism of Witt-schemes  $W_n(X) \rightarrow W_n(Y)$  is also étale, and there is a canonical isomorphism

$$W_n(\mathcal{O}_X) \otimes_{W_n(\mathcal{O}_Y)} W_n(\Omega_{Y/S}^\bullet) \cong W_n(\Omega_{X/S}^\bullet).$$

┘

*Proof:* ?

$\square$

**Thm. (27.5.4.14) [Crystalline and deRham-Witt Comparison].** Suppose  $\kappa \in \text{Perf}^p$  and  $X \in \text{Sch}^{\text{sm}}/\kappa$ , then there is a canonical isomorphism in the category of projective  $W_n(\kappa)$ -modules:

$$R\mathbf{u}_{X/W_n(\kappa),*} \Omega_{X/W_n(\kappa)} \cong W_n(\Omega_{X/\kappa}^\bullet) \text{ (27.5.2.5)(27.5.4.12)}.$$

┘

*Proof:* [Haoyang Guo notes]P18. ?

$\square$

**Cor. (27.5.4.15).** Suppose  $\kappa \in \text{Perf}^p$  and  $X \in \text{Sch}^{\text{sm,proper}}/\kappa$ , there is a canonical isomorphism

$$R\Gamma_{\text{crys}}(X/W) \cong R\Gamma(X, W\Omega_{X/\kappa}^\bullet),$$

which is represented by a perfect complex, with

$$R\Gamma_{\text{crys}}(X/W) \otimes_{W(\kappa)}^L \kappa = R\Gamma(X, \Omega_{X/\kappa}^\bullet).$$

┘

## 5 $F$ -(Iso)Crystals

References are [Slope Filtrations of  $F$ -Crystals, Katz] and [Period domains over finite and  $p$ -adic fields, Dat-Orlik-Rapoport]Chap8.

**Notation (27.5.5.1).**

- Let  $p \in \text{Prime}$ .
- Let  $R_0 \in \mathcal{CRing}^p$ ,  $S_0 = \text{Spec } R_0$ .

┘

**Def. (27.5.5.2) [( $F$ -)Crystals and ( $F$ -)Isocrystals].**

- A **locally free crystal over  $S_0$**  is a finite projective module over  $\text{Coh}(R_0)$ . (5.5.2.30).
- An **isocrystal on  $S_0$**  is an object in the category of locally free crystals on  $S_0$  up to isogeny, i.e. a module over  $\text{Coh}(R)[\frac{1}{p}]$ .
- An (non-degenerate)  **$F$ -crystal on  $S_0$**  is a pair  $(\mathcal{E}, \varphi_{\mathcal{E}})$  where  $\mathcal{E}$  is a locally free crystal over  $S_0$  with a morphism  $\varphi_{\mathcal{E}} : \mathcal{E}^{(p)} \rightarrow \mathcal{E}$  which admits an inverse up to a power of  $p$ . The category of  $F$ -crystals on  $S_0$  is denoted by  $\text{F-Crys}(S_0)$ .
- An  **$F$ -isocrystal on  $S_0$**  is a pair  $(\mathcal{M}, \varphi_{\mathcal{M}})$  where  $\mathcal{M}$  is an isocrystal over  $S_0$  and  $\varphi : \mathcal{M}^{(p)} \cong \mathcal{M}$  is an isomorphism of isocrystals over  $S_0$ . The category of  $F$ -isocrystals over  $S_0$  is denoted by  $\text{F-Isoc}(S)$ .

┘

**Remark (27.5.5.3).** If we denote  $R = \text{Coh}(R_0)$  the Cohen ring (5.5.2.30) and  $S = \text{Spec } R$ , then  $\text{Coh}(R_0)/(p) \cong R_0$ , and a locally free crystal over  $S_0$  is exactly a finite projective  $\mathcal{O}_{S_0/S}$ -crystal (27.5.3.1).

┘

**Prop. (27.5.5.4).** If  $k \in \text{Perf}^p$  and  $X \in \text{Sch}^{\text{sm,proper}}/k$ , then

$$\left( H_{\text{crys}}^i(X/W(\kappa))_{\text{lf}}, \varphi^* \right)$$

is a  $F$ -crystal over  $\kappa$  (27.5.5.2).

┘

*Proof:* This follows from (27.5.4.4).

□

**Lemma (27.5.5.5) [Fitting's Lemma for  $F$ -Crystals].** For  $\kappa \in \text{Perf}^p$  and  $M \in \text{F-Crys}(\kappa)$  (27.5.5.2), one has  $M = M_0 \oplus M_{>0}$ , where  $\varphi$  is bijection on  $M_0$  and topologically nilpotent on  $M_{>0}$ .  $M_0$  is called the **étale-part of the  $F$ -crystal  $M$** , and  $M_{>0}$  is called the **local-part of the  $F$ -crystal  $M$** .

┘

*Proof:* We consider  $M/p^n M$ , then by (3.2.4.5) under slight modification, we have a decomposition for  $M/p^n M$ . This decompositions for different  $n$  are compatible, so taking an inverse limit gives a decomposition of  $M$  it self.

□

**Prop. (27.5.5.6).**  $\text{F-Isoc}(S_0)$  is a neutral Tannakian-category.

┘

*Proof:* ?

□

### Isocrystals

**Notation (27.5.5.7).**

- Let  $(K, \mathcal{O}_K, \kappa) \in p\text{-Field}$ .
- $K_0 = W(\kappa)[\frac{1}{p}]$  be the maximal unramified subextension of  $K$ .
- The arithmetic Frobenius action on  $\check{K}/K$  is denoted by  $\varphi_0$ .
- We abbreviate F-crystals to crystals and F-isocrystals to isocrystals.

┘

**Def. (27.5.5.8) [Isocrystals and  $\varphi$ -Modules].** An F-isocrystal over  $\kappa$  (27.5.5.2) is the same thing as a  $\varphi$ -module  $(V, \varphi)$  over  $(K_0, \varphi_0)$  (25.2.9.1). The height of  $V$  is defined to be  $\text{ht}(V) = \text{rank } V$ .

┘

**Def. (27.5.5.9) [First Newton-Slopes of Isocrystals].** For  $D \in \varphi\text{-Mod}(K_0)$ , choose a  $W(\kappa)$ -module  $W \subset D$ , and let  $a_n \in \mathbb{Z}$  be the maximum integer that  $\varphi^n(M) \subset p^{a_n}M$ , then we have  $a_{m+n} \geq a_m + a_n$ , thus by (12.3.5.2), we have  $a_n/n$  converges to  $\sup a_n/n = \lambda$ .  $\lambda$  doesn't depend on  $M$  because of the cofinality of lattices, and it is called the **first Newton-slope** of  $V$ .

┘

**Cor. (27.5.5.10).** For  $(V, \varphi) \in \text{F-Isoc}(\kappa)$ , we have  $\lambda(V, p^m \varphi^n) = n\lambda(V, \varphi) + m$ .

┘

**Lemma (27.5.5.11).** If  $D \in \varphi\text{-Mod}(K_0)$ , and  $M$  be a  $W(\kappa)$ -lattice of  $D$  s.t.  $\varphi^{h+1}(M) \subset p^{-1}M$ , where  $h$  is the dimension of  $D$ , then  $D$  is effective (25.2.9.11).

┘

*Proof:* Let  $M_j = M + \varphi(M) + \dots + \varphi^j(M)$ , then  $M_j/M \subset p^{-1}M/M$ , which is a  $k$ -vector space of dimension  $h$ , then  $M_j = M_{j+1}$  for some  $j$ , hence  $M_j$  is stable under  $\varphi$ .  $\square$

**Prop. (27.5.5.12).** For  $D \in \varphi\text{-Mod}(K_0)$ ,  $\lambda = s/r$  for some  $r \in [h]_+$  and  $s \in \mathbb{Z}$ . And  $\lambda(D) \geq 0$  (27.5.5.9) iff  $D$  is effective (25.2.9.11).

┘

*Proof:* If  $D$  is effective, then  $a_n \geq 0$ , conversely, if  $a_n \geq 1$ , then  $M' = M + \varphi(M) + \dots + \varphi^{n-1}(M)$  is stable under  $\varphi$ , so  $D$  is effective.

For the first assertion, we first notice, if  $\lambda > 0$ , then  $\varphi$  is nilpotent on  $M/pM$ , which is a  $k$ -vector space of dimension  $h$ , then  $\varphi^h = 0$  on  $M/pM$ , so  $\lambda \geq 1/h$ .

Now we find  $s, r$  that  $|r\lambda - s| \leq 1/(h+1)$ , and  $\tilde{\varphi} = p^{-s}\varphi^r$  has  $|\tilde{\lambda}| \leq 1/(h+1)$ , so (27.5.5.11) shows that  $\tilde{\varphi}$  is effective, hence  $\tilde{\varphi} \geq 0$ , and by what we have proved,  $\tilde{\varphi} = 0$ , hence it is  $\lambda = s/r$ .  $\square$

**Def. (27.5.5.13) [Isoclinic Isocrystals].** For  $V \in \varphi\text{-Mod}(\check{K}_0)$  of height  $h$  (27.5.5.8), if  $V$  admits a  $W(\kappa)$ -lattice  $M \subset V$  and  $s \in \mathbb{Z}_+, r \in \mathbb{Z}$  s.t.  $\varphi^s(M) = p^rM$ , then  $\lambda(V) = r/s = d/h$  (27.5.5.9) where  $d = \text{ord}(\det(\varphi))$ . Conversely, if  $\lambda(V) = \text{ord}(\det(\varphi))/h$ , then there exists a  $W(\kappa)$ -lattice  $M \subset V$  s.t.  $\varphi^s(M) = p^rM$ .

This is independent of  $M$  chosen because  $\lambda(V)$  is independent of  $V$ , in which case  $V$  is called **isoclinic isocrystal** of slope  $\lambda(V) = d/h \in \mathbb{Q}$ .

┘

*Proof:* If  $\varphi^s(M) = p^rM$ , then it follows directly from the definition that  $\lambda(V) = r/s$  (27.5.5.9). And then  $rh = s \text{ord}(\det(\varphi))$ .

Conversely, if  $\lambda(V) = d/h$ , then it is to see easy from (27.5.5.11) and (27.5.5.10) that  $F^h(M) \subset p^dM$  where  $d = \text{ord}(\det(\varphi))$ . But then by calculating determinant it follows that  $F^h(M) = p^dM$ .  $\square$

**Prop. (27.5.5.14) [Isoclinic Isocrystals].**

- If  $V \in \text{F-Isoc}(\kappa)$  is isoclinic, then any sub- $\varphi$ -module or quotient- $\varphi$ -module of  $V$  is also isoclinic of the same slope.
- If  $V_1, V_2 \in \text{F-Isoc}(\kappa)$  are isoclinic with different slopes, then  $\text{Hom}_{\varphi\text{-Mod}(K_0)}(V_1, V_2) = 0$ .

┘

*Proof:* 1: Let  $M \subset V$  be a  $W(\kappa)$ -lattice with  $\varphi^h(M) = p^d M$ . If  $V' \subset V$  is a sub- $\varphi$ -module, and  $M' = M \cap V'$ , then  $\varphi^h(M') = p^d M'$ , which implies  $V'$  is isoclinic of the same slope. If  $V''$  is a quotient of  $V$ , then the image  $M''$  of  $M$  in  $V''$  is also a lattice and satisfies  $\varphi^h(M'') = p^d M''$ .

2: This follows from item 1. □

**Prop. (27.5.5.15) [Isoclinic Decompositions, Dieudonné-Manin].** Any  $V \in \text{F-Isoc}(\kappa)$  is a finite sum of isoclinic isocrystals (27.5.5.13). This is called the **isoclinic decomposition** of  $V$ .

Using the isoclinic decomposition, we can define the **Newton-slopes**  $\lambda_1 \leq \lambda_2 \leq \dots \leq \text{lb}d_h$  of  $V$  and the **Newton-polygon**  $\text{NP}(V)$  of  $V$ . ┘

*Proof:* We use the  $\tilde{\varphi}$  as in the proof of (27.5.5.12), we see that  $M$  has a decomposition  $M_0 \oplus M_{>0}$  by (27.5.5.5), and  $M_0 \neq 0$  by definition. Then we use induction to get the result. □

**Def. (27.5.5.16)  $[E_\lambda]$ .** For  $\lambda = s/r \in \mathbb{Q}$  with  $s \in \mathbb{Z}_+$  and  $(s, r) = 1$ , we define a  $\varphi$ -module  $E_\lambda$  over  $\mathbb{Q}_p$  s.t.

- $E_\lambda = \bigoplus_{i=0}^{r-1} K e_i$ ,
- $\varphi(e_i) = e_{i+1}$ , and  $\varphi(e_{r+1}) = p^s e_0$ .

Then  $E_\lambda$  is irreducible, by (27.5.5.13) and (27.5.5.14). ┘

**Thm. (27.5.5.17) [Dieudonné-Manin].** The category  $V \in \varphi\text{-Mod}(\check{K}_0)$  is semi-simple with simple objects given by  $\{E_\lambda\}_{\lambda \in \mathbb{Q}}$  (27.5.5.16). And the category  $\varphi\text{-Mod}^{\text{eff}}(\check{K}_0)$  is semi-simple with simple objects given by  $\{E_\lambda\}_{\lambda \in \mathbb{Q}_{\geq 0}}$ . ┘

*Proof:* By (27.5.5.15) we assume  $V$  is isoclinic. Cf. [Abelian Varieties, Geer]P262? □

**Prop. (27.5.5.18) [Isocrystals over Finite Fields].** Let  $m \in \mathbb{Z}_+$  and  $(V, \varphi) \in \text{F-Isoc}(\mathbb{F}_{p^m})$  has height  $h$ , then  $\pi = \varphi^m : V \rightarrow V$  is a  $\mathbb{F}_{p^m}$ -linear isomorphism. Suppose  $\{\alpha_1, \dots, \alpha_h\} \subset \overline{\mathbb{Q}_p}$  are the roots of  $\pi$  counted with multiplicity, then the slopes of  $V$  are just  $\{\text{ord}_p(\alpha_1)/m, \dots, \text{ord}_p(\alpha_h)/m\}$ .

In particular, if  $\text{char}(\pi) = c_h T^h + \dots + c_1 T + c_0$ , then the Newton-polygon  $\text{NP}(V)$  is just given by the lower convex hull of the points  $\{(i, \text{ord}_p(c_{h-i})/m)\}_{i \in [h]}$ . ┘

*Proof:* By (27.5.5.15), we may assume that  $V$  is isoclinic of slope  $\lambda = d/h$ . Then by replacing  $\varphi$  by  $\varphi' = p^{-d}\varphi^h$ ,  $(V, \varphi')$  is isoclinic of slope 0 and  $\pi' = p^{-dm}\pi^h$ , and each  $p^{-dm}\alpha^h$  is a root of  $\pi'$ . Because there exists a  $W(\kappa)$ -lattice s.t.  $\varphi'(M) = M$ , we see that  $\text{ord}_p(p^{-dm}\alpha^h) = 0$ , thus  $\text{ord}_p(\alpha_i)/m = d/h = \lambda$ . □

**Def. (27.5.5.19) [Tate-Twist Isocrystals].** The Tate object  $\mathbf{1}(n)$ ,  $n \in \mathbb{Z}$  is the 1-dimensional isocrystal over  $K_0$  that  $\varphi = p^n \sigma$ , so it is of slope  $n$ . And the **Tate-twist isocrystal** is tensoring by  $\mathbf{1}(n)$ . It preserves rank and shifts Hodge-Tate weight by  $n$ . ┘

**Def. (27.5.5.20) [Hodge-Slopes].** If  $(M, \varphi)$  is a F-crystal of height  $h$  over  $\kappa$ , then there exists ordered bases  $\{e_1, \dots, e_h\}, \{f_1, \dots, f_h\}$  of  $M$  s.t.  $\varphi(e_i) = p^{\mu_i} f_i$  for some  $\mu_i \in \mathbb{Z}$  s.t.  $\mu_1 \leq \mu_2 \leq \dots \leq \mu_h$ . These  $r_i$  are called the **Hodge-slopes** of  $M$ , with  $r_1 = \lambda(V)$  (27.5.5.9). And the polygon starting from  $(0, 0)$  using segments of slopes  $\mu_i$  are called the **Hodge-polygon** of  $(M, \varphi)$ . ┘

**Prop. (27.5.5.21) [Hodge-Polygons and Newton-Polygons].** If  $(M, \varphi)$  is a F-crystal of height  $h$  over  $\kappa$ , then the Newton-polygon  $\text{NP}(M)$  lies above the Hodge-polygon of  $M$  (27.5.5.20), with the same start point  $(0, 0)$  and same end point  $(h, \text{ord}(\det(\varphi)))$ .  $\lrcorner$

*Proof:* Let  $\mu_1 \leq \mu_2 \leq \dots \leq \mu_h$  be the Hodge-slopes of  $M$  (27.5.5.20) and let  $\lambda_1 \leq \lambda_2 \leq \dots \leq \lambda_h$  be the Newton-slopes (27.5.5.15), then for each  $r \in [h]_+$ , we see that

$$\mu_1 + \dots + \mu_r = \mu_1(\wedge^r(M, \varphi)), \quad \lambda_1 + \dots + \lambda_r = \lambda_1(\wedge^r(M, \varphi)) \text{ (27.5.5.9)}.$$

where for Newton-slopes, we use the fact that if  $n$  is a common denominator of  $\lambda_i$ , then  $\varphi^n$  is given by the diagonal matrix  $(p^{n\lambda_1}, \dots, p^{n\lambda_h})$ . Then it suffices to show that  $\mu_1 \leq \lambda_1$ , which is clear from the definition (27.5.5.9).  $\square$

### Dieudonné-Modules

**Def. (27.5.5.22) [Dieudonné-Rings and  $E(R)$ ].** For  $R \in \mathcal{CRing}$ , define  $E(R)$  to be the ring  $[[V]]W(R)[F]$  subject to the following identities:

- $FV = VF = p$ .
- For each  $\alpha \in W(R)$  we have  $\alpha V = V\alpha^\sigma, F\alpha = \alpha^\sigma F, V\alpha F = \alpha^\tau$ .

And the **Dieudonné-ring**  $D(R)$  is defined to be subring

$$D(k) = W(R)[F, V] \subset E(R) \text{ (27.5.5.22)}.$$

$\lrcorner$

**Def. (27.5.5.23) [Dieudonné-Modules].** A left  $E(R)$ -module  $M$  is called

- A **uniform  $E(R)$ -module** if it is separated and complete in the  $V$ -adic topology.
- A **reduced  $E(R)$ -module** if it is a uniform  $E(R)$ -module s.t.
  - $V\gamma = 0 \implies \gamma = 0$  for any  $\gamma \in M$ .
  - $M/VM$  is a free  $R$ -module.
- A **Dieudonné-module** if it is a reduced and  $M/VM$  is finite free over  $R$ .

$\lrcorner$

**Prop. (27.5.5.24) [Dieudonné-Modules over Perfect Rings].** If  $\kappa \in \mathcal{Perf}^p$ , a **Dieudonné-module** over  $\kappa$  is a triple  $(P, F, V)$  where

- $P$  is a finite free  $W(\kappa)$ -module,
- $F : P \rightarrow P$  is an additive map s.t.  $F(\xi x) = \varphi(\xi)F(x)$  for each  $\xi \in W(\kappa), x \in P$ .
- $V : P \rightarrow P$  is an additive map s.t.  $V(\xi x) = \varphi^{-1}(\xi)V(x)$  for each  $\xi \in W(\kappa), x \in P$ .

s.t.  $VF = FV = p$ .  $\lrcorner$

**Prop. (27.5.5.25) [Representing Dieudonné-Modules].** Let  $M$  be the  $E(R)$ -module defined by the generators  $\{e_i\}_{i \in [n+h]}$  subjecting to the relations

$$Fe_i = \sum_j \alpha_{ij} e_j, \quad i \in [n]_+,$$

$$e_i = V\left(\sum_j \alpha_{ij} e_j\right), \quad n+1 \leq i \leq n+h.$$

for some  $\alpha_{ij} \in W(R)$ . Then  $M$  is a Dieudonné-module over  $E(R)$ . And any Dieudonné-module over an Artinian  $k$ -algebra can be written in this form. Such an Dieudonné-module is associated to a  $p$ -divisible group iff  $\det(a_{ij})$  is invertible in  $W(R)$ , in which case  $M$  is free over  $W(R)$  generated by  $\{e_i\}_{i \in [n+h]_+}$ .

And if we define the **dual Dieudonné-module**  $M^t$  to be the  $E(R)$ -module defined by the generators  $\{f_i\}_{i \in [n+h]}$  subjecting to the relations

$$f_i = V\left(\sum_j \alpha'_{ij} f_j\right), \quad i \in [n]_+,$$

$$Ff_i = \sum_j \alpha'_{ij} e_j, \quad n+1 \leq i \leq n+h.$$

where  $(\alpha'_{ij}) = (\alpha_{ij})^{-1}$ , then  $M^t$  is associated to the dual  $p$ -divisible group of  $G$  (Cf. [Tate]) associating to  $M$ .  $\lrcorner$

*Proof:* Cf. [Norman-Oort]P418. ?  $\square$

## 6 Computations

**Prop. (27.5.6.1) [Affine Thickening is Acyclic].** If  $\mathcal{F} \in \mathcal{Sh}(\mathcal{O}_{X/S, \text{crys}})$  is locally Qco, then  $H^p((U, T, \delta), \mathcal{F}) = 0$  for any  $p > 0$  and  $U$  or  $T$  affine.  $\lrcorner$

*Proof:* Firstly notice  $U$  is affine iff  $T$  is affine, by (7.8.6.2), then we use (7.3.2.16) with  $\mathfrak{G}$  being the affine thickenings and Cov the affine coverings of affine thickenings, then Cov is cofinal, and it suffices to check that  $\check{H}^q(T, \mathcal{F}) = 0$  for an affine thickening  $T$  and  $q > 0$ , and this is just the usual cohomology for Qco sheaves as the affine covering is cofinal, and it follows from (7.7.1.1).  $\square$

**Lemma (27.5.6.2).** Situation as in (27.5.3.3), then the morphism

$$\left(\text{colim}_e h_{(X, T_e, \bar{\delta})}\right)^\sharp \rightarrow * \in \mathcal{Sh}^{\text{Set}}((X/S)_{\text{crys}})$$

is surjective.  $\lrcorner$

*Proof:* We need to show that for any  $(U, B, \delta) \in (X/A)_{\text{Crys}}$ , there is an Zariski covering  $(U_i, B_i, \delta)$  of it that there are maps  $(U_i, B_i, \delta) \rightarrow (X, T_{e_i}, \bar{\delta})$  that are compatible, But this is in fact equivalent to the existence of a morphism  $(U, B, \delta) \rightarrow (X, \text{Spec } D, \delta)$  of pd-structures. For this, notice the morphism  $U \rightarrow X$  can be extended to a morphism  $X \rightarrow \text{Spec } P$  by strong lifting property (5.4.5.16) of smooth morphism (5.4.5.21), and this extends to the desired morphism by the universal property of pd-envelope and the fact  $p$  is locally nilpotent on  $B$  (27.5.2.2) thus  $B$  is locally  $p$ -complete.  $\square$

**Lemma (27.5.6.3).** Let  $K' = (\text{colim}_e h_{(X, T_e, \bar{\delta})})^\sharp$ , then the product sheaf  $(K')^n$  is in fact isomorphic to  $(\text{colim}_e h_{(X, T(n)_e, \bar{\delta})})^\sharp$  on  $(X/S)_{\text{crys}}$ .  $\lrcorner$

*Proof:* This follows from the definition and the universal properties of completion, pd-envelope and  $P \otimes_A \otimes_A \dots \otimes_A P$  is a coproduct. Compare with the proof of (27.5.6.2).  $\square$

**Prop. (27.5.6.4).** Situation as in (27.5.3.3), if  $\mathcal{F}$  is locally Qco and satisfies: for any morphism  $f : (U, T, \delta) \rightarrow (U', T', \delta') \in (X/S)_{\text{crys}}$  that  $f : T \rightarrow T'$  is a closed immersion the map  $f^* \mathcal{F}_{T'} \rightarrow \mathcal{F}_T$  is surjective, then the complex

$$M(0) \rightarrow M(1) \rightarrow \dots$$

computes  $R\Gamma((X/S)_{\text{crys}}, \mathcal{F})$ . Moreover,

$$R\Gamma((X/S)_{\text{crys}}, \mathcal{F} \otimes_{\mathcal{O}_{X/S}} \Omega_{X/S, \delta}^i) = 0$$

for  $i > 0$ . ┘

*Proof:* We use (7.3.1.19) for the presheaf  $K' = \text{colim}_e h_{(X, T_e, \bar{\delta})}$  and  $K = *$ , which satisfies the condition by (27.5.6.2). Then we get a spectral sequence

$$E_1^{p,q} = H^q(K'_p, \mathcal{F}) \Rightarrow H^{p+q}(K, \mathcal{F}).$$

Notice  $K'_n = (\text{colim}_e h_{(X, T(n)_e, \bar{\delta})})^\#$  by (27.5.6.3), so the cohomology

$$R\Gamma(K'_n, \mathcal{F}) = R\lim_e (\Gamma((X, T(n)_e, \bar{\gamma}(n)), \mathcal{F}))$$

Now the surjectivity  $f^* \mathcal{F}_{T'} \rightarrow \mathcal{F}_T$  is equivalent to the surjectivity  $\mathcal{F}_{T'} \rightarrow f_* \mathcal{F}_T$ , so there is an exact sequence of Qco  $\mathcal{T}'$ -sheaves

$$0 \rightarrow \mathcal{K} \rightarrow \mathcal{F}_{T'} \rightarrow f_* \mathcal{F}_T \rightarrow 0$$

which implies that  $\mathcal{F}((U', T', \delta')) \rightarrow \mathcal{F}((U, T, \delta))$  is surjective, by (7.7.4.2) and (7.7.1.3).

Then by (5.9.3.3),

$$R\Gamma(K'_n, \mathcal{F}) = R\lim_e (\Gamma((X, T(n)_e, \bar{\gamma}(n)), \mathcal{F})) = M(n)$$

thus we are done. □

**Lemma (27.5.6.5).** Situation as in (27.5.3.3), the complex  $\Omega_{D(\bullet)}$  is homotopic to 0 as a  $D(\bullet)$ -cosimplicial module. ┘

*Proof:* This complex is the  $p$ -adic completion of the base change of the cosimplicial module  $M_\bullet = (\Omega_{P^{\otimes \bullet} A/A})$  under the cosimplicial ring map  $P^{\otimes \bullet} A \rightarrow D(\bullet)$ . Then it suffices to show  $M_\bullet$  is homotopic to 0. For this, the whole thing can be written down clearly, Cf. [Sta]07LA. □

**Lemma (27.5.6.6).** In situation (27.5.3.3), for any cosimplicial module  $M_*$  over the cosimplicial ring  $D(*)$  and  $i > 0$ , the cosimplicial module

$$M_0 \hat{\otimes}_{D(0)} \Omega_{D(0)}^i \rightarrow M_1 \hat{\otimes}_{D(1)} \Omega_{D(1)}^i \rightarrow \dots$$

is homotopic to 0. ┘

*Proof:* □

### Crystal Case

**Prop. (27.5.6.7).** Situation as in (27.5.3.3), if  $\mathcal{F} \in \mathcal{QCoh}(\mathcal{O}_{X/S, \text{crys}})$ , and let  $(M, \nabla)$  be the corresponding module with connection over  $D$  by (27.5.3.10), then the complex

$$M \hat{\otimes}_D \Omega_D^\bullet$$

computes  $R\Gamma((X/S)_{\text{crys}}, \mathcal{F})$ . ┘

*Proof:* Use the spectral sequence associated to the double complex

$$K^{a,b} = M \hat{\otimes}_D \Omega_{D(b)}^a$$

Then the rows  $K^{a,\bullet}$  is acyclic for  $a > 0$  by (27.5.6.6) and (5.8.2.21), and  $K^{0,\bullet}$  is quasi-isomorphic to  $R\Gamma((X/S)_{\text{crys}}, \mathcal{F})$  by (27.5.6.4). Now we look at the other direction, (5.6.2.7) and (27.5.3.4) show that each of the  $b$  maps  $D \rightarrow D(b)$  determines the same quasi-isomorphism

$$M \hat{\otimes}_D \Omega_D^* \cong M \hat{\otimes}_{D(b)} \Omega_{D(b)}^*$$

as their inverse is given by the same  $D(b) \rightarrow D$ . Then it is clear that the  $E_2$  page in this direction is  $H^a(M \hat{\otimes}_D \Omega_D^*)$  in the zero-th row and vanish otherwise, so we get the desired isomorphism by edge morphisms.  $\square$

**Thm. (27.5.6.8) [de Rham Comparison for Crystalline Cohomology].** In situation (27.5.3.11), if  $\mathcal{F} \in \mathcal{QCoh}((X/S)_{\text{crys}})$  with  $(M', \nabla')$  the corresponding module with connection over  $D'$  (27.5.3.12), then the complex

$$M \hat{\otimes}_{D'} \Omega_{D'}^\bullet$$

computes  $R\Gamma((X/S)_{\text{crys}}, \mathcal{F})$ .  $\dashv$

*Proof:* Let  $b : D' \rightarrow D, a : D \rightarrow D'$  be the maps defined in (27.5.3.12), then by (27.5.6.7), it suffices to prove the base change along  $a, b$  induces quasi-isomorphisms

$$M \hat{\otimes}_D \Omega_D^\bullet \cong M \hat{\otimes}_{D'} \Omega_{D'}^\bullet.$$

$a \circ b$  is trivial, thus it suffices to prove that  $b \circ a$  induces an automorphism of  $M \hat{\otimes}_D \Omega_D^\bullet$ . In fact, this is true for any morphism  $\rho : D \rightarrow D$  of pd-algebras over  $A$  compatible with the map  $D \rightarrow C$ :

Write  $\rho(x_i) = x_i + z_i$ , where  $z_i \in J$  because  $\rho$  is compatible with  $D \rightarrow C$ . Then we can factor  $\rho$  as

$$D \xrightarrow{\sigma} D\langle \xi_i \rangle^\wedge \xrightarrow{\tau} C$$

where  $\sigma(x_i) = x_i + \xi_i$  and  $\tau(\xi_i) = z_i$ .

Notice that there exists an automorphism  $\alpha$  of  $D\langle x_i \rangle^\wedge$  that maps  $x_i$  to  $x_i - \xi_i$  and  $\xi_i$  to  $\xi_i$ . (Such a map exists because by universal property, it suffices to give a map of pairs

$$(P, J) \rightarrow D_{P,\gamma}(J)\langle \xi_i \rangle = D_{P[\xi_i],\gamma}(JP[\xi_i] + (\xi_i))$$

by (5.6.1.20), and we surely have.

Now  $\alpha$  is an automorphism, we have a quasi-isomorphism

$$M \hat{\otimes}_D \Omega_D^* \cong M \hat{\otimes}_{D,\sigma} \Omega_{D\langle \xi_i \rangle^\wedge}^*$$

by (5.6.2.7). Also  $\tau$  induces an isomorphism because it has a right inverse, which is an isomorphism by (5.6.2.7) again, so  $\rho$  induces an isomorphism.  $\square$

**Cor. (27.5.6.9) [Crystalline-de Rham Comparison modulo  $p$ ].** In situation (27.5.3.11), if  $R$  is a smooth  $A/p$ -algebra, then there is a natural quasi-isomorphism

$$R\Gamma_{\text{crys}}(R/A) \otimes_A^L A/p \cong \Omega_{R/(A/p)}^\bullet$$

of commutative algebra objects.  $\dashv$

*Proof:* we choose  $P$  to be a smooth lift of  $R$  to  $A$ , then  $J = IP$ , and by (5.6.1.14), the pd-structure extends to  $P$ , thus  $D_{P/A, \gamma} = P$ , and notice  $\Omega_{P/A}^i$  is finite projective hence flat, so  $\Omega_{P/A}^\bullet$  is  $K$ -flat (7.3.3.2), and the left side of is just  $\widehat{\Omega}_{P/A}^\bullet \otimes_A A/p = \widehat{\Omega}_{R/(A/p)}^\bullet$  by (27.5.6.8)(5.6.2.2) and (5.4.3.6).  $\square$

**Cor. (27.5.6.10) [deRham Comparison for Crystalline Cohomology].** Suppose  $\kappa \in \mathcal{P}\text{erf}^p$  and  $X' \in \text{Sch}^{\text{sm}, \text{proper}}/W(\kappa)$  with  $X = X' \otimes_{W(\kappa)} \kappa$ , then we have a canonical isomorphism

$$H_{\text{crys}}^i(X/W(\kappa)) = H_{\text{dR}}^i(X'/W).$$

┘

*Proof:* Cf. [Haoyang Guo notes]P14.  $\square$

## 7 Supersingular Varieties

**Def. (27.5.7.1) [Supersingular Varieties].** For  $k \in \text{Field}^p$ ,  $X \in \text{SmProjVar}/k$  is called a **supersingular variety** iff for any  $i$ , the slopes of the crystalline cohomology  $H^i(X/W(k))$  are all  $i/2$ . When  $\#k < \infty$ , this is equivalent to that the Frobenius eigenvalues of  $H_{\text{ét}}^i(X, \mathbb{Q}_\ell)$  are all equal to  $(\#k)^{i/2}$  times a root of unity.  $\square$

*Proof:*  $\square$

## 27.6 Prismatic Cohomology(Bhatt-Scholze)

Main references are [Sta], [Prisms and Prismatic Cohomology, Bhatt-Scholze], [Notes on Prismatic Cohomology, Bhatt], [Prismatic Cohomology notes, Kedlaya].

### 1 Prisms

**Def. (27.6.1.1) [Prisms].** A **prism** is a pair  $(A, I)$  where  $A$  is a  $\delta$ -ring  $A$  and  $I \in \text{Ideal}(A)$ , s.t.

- $V(I) \subset \text{Spec } A$  is a Cartier divisor,
- $A$  is derived  $(p, I)$ -complete, and
- $p \in I + \varphi(I)A$ .

A prism  $(A, I)$  is called **perfect prism** if  $A$  is a perfect  $\delta$ -ring(5.5.4.25). it is called **bounded prism** if  $A/I$  has bounded  $p^\infty$ -torsion. It is called **crystalline prism** if  $I = (p)$ . It is called **orientable** if  $I$  is principal. It is called **oriented** if  $I = (d)$  for some  $d \in A^\times$ .

A map of prisms  $f : (A, I) \rightarrow (B, J)$  is called **(faithfully)flat map of prisms** iff the map  $A \rightarrow B$  is  $(p, I)$ -completely (faithfully)flat(5.9.7.1).  $\lrcorner$

**Lemma(27.6.1.2).** Let  $A$  be a  $\delta$ -ring and  $I$  be a locally principal ideal contained in  $\text{rad}(A)$  that  $(p, I) \subset \text{rad } A$ , then the following are equivalent:

- $p \in I^p + \varphi(I)A$ .
- $p \in I + \varphi(I)A$ .
- There is a f.f. morphism of  $\delta$ -rings  $A \rightarrow A'$  where  $A'$  is a finite product of localizations of  $A$   $\varphi$ -stable multiplicative subsets that  $IA'$  is generated by a distinguished element  $d$  and  $d, p \in \text{rad}(A')$ .

$\lrcorner$

*Proof:*  $1 \rightarrow 2$  is trivial, for  $2 \rightarrow 3$ : Choose  $(g_1, \dots, g_r) = A$  that  $IA_{g_{r_i}}$  is principal. Let  $B = \prod_{i=1}^r A_{g_i}$ , so  $A \rightarrow B$  is f.f. and  $IB = (f)$  is principal. Let  $A'$  be the localization of  $B$  along the ideal  $(p, f)$ (5.1.1.34), then  $p, f \in \text{rad } A'$ . Then  $A \rightarrow A'$  is still f.f., because it is flat hence the image is stable under generalization by(5.4.1.18), so it must be all of  $\text{Spec } A$  because it contains  $(p, I)$  by construction, and  $(p, I) \in \text{rad } A$  by hypothesis.

Now because  $p \in \text{rad } A$ , each localization of  $A$  has a compatible  $\delta$ -structure, and  $\tilde{A}$  is a finite product of localizations of  $A$ , thus it has a  $\delta$ -structure, and  $d$  is distinguished by(5.5.4.23).

$3 \rightarrow 1$ : We need to check that  $p = 0$  in  $A/(I^p + \varphi(I)A)$ , but this can be checked after base change to  $A'$ , which is  $p = 0 \in A'/(d^p, \varphi(d))$ . This is true, because  $d^p = d^p + p\delta(d)$  and  $\delta(d)$  is a unit.  $\square$

**Remark(27.6.1.3) [Examples of Prisms].**

- If  $A$  is a  $p$ -torsionfree and  $p$ -adically complete  $\delta$ -ring  $A$ , the pair  $(A, (p))$  is a bounded crystalline prism.
- $q$ -de Rham cohomology(5.5.4.24) determines a bounded prism. (completeness and boundedness is clear, and  $p \in (d, \varphi(d))$  because?)
- Breuil-Kisin cohomology(5.5.4.24) determines a bounded prism. (boundedness is clear, and?)
- $A_{\text{inf}}$ -cohomology(5.5.4.24) determines a bounded prism. (The same reason as item2).

$\lrcorner$

**Prop. (27.6.1.4) [Universal Oriented Prism].** Let  $A_0 = \mathbb{Z}_{(p)}\{d, \delta(d)^{-1}\}$  be the localization  $\delta$ -ring (5.5.4.15) of the free  $\mathbb{Z}_{(p)}$ - $\delta$ -ring on the variable  $d$ , and let  $A$  be the derived  $(p, d)$ -completion of  $A_0$  (it is discrete by (5.9.7.7)), and let  $I = (d)$ , then  $(A, I)$  is a bounded oriented prism, and it is the initial object in the category of bounded oriented prisms.

Moreover, the sequence  $(p, d)$  is regular and the Frobenius  $\varphi : A/p \rightarrow A/p$  is  $d$ -completely flat.  $\lrcorner$

*Proof:* It is clearly a prism and universal. For the assertions, firstly we show  $A/(p, d) = A_0/(p, d)$ : notice  $A \otimes_{A_0}^L A_0/(p, d) = A_0/(p, d)$  by (5.9.7.4), so we can replace  $\otimes^L$  with  $\otimes$ . Similarly for  $A/(p, d^p)$  because  $A$  is  $(p, d^p)$ -complete. Now this map is .

$(p, d)$  is regular by (5.9.7.7) applied to  $(\mathbb{Z}_{(p)}[d], A)$ ?, for the last assertion, it suffices to show  $A/(p, d) \xrightarrow{\text{Frob}} A/(p, d^p)$  is f.f..  $\square$

**Prop. (27.6.1.5).** Let  $(A, (d))$  be the universal prism (27.6.1.4) and let  $B = A\{\frac{\varphi(d)}{p}\}^\wedge$  (derived  $(p, d)$ -completion), then  $B$  is  $(p, d)$ -complete,  $p$ -torsionfree and it equals the derived  $(p, d)$ -completion of the pd-envelope  $D_{A, \delta}((d))$  of  $(A, (d))$ . In particular,  $(B, (p))$  is a crystalline prism, by (5.5.4.18).  $\lrcorner$

*Proof:*  $B$  is  $p$ -complete by (5.9.6.16), as  $A$  is  $p$ -torsionfree. Also  $d^p = p(\frac{\varphi(d)}{p} - \delta(d))$ , so  $B$  is also  $(p, d)$ -complete. The last assertion follows from (5.6.1.25) and (27.6.1.4).  $\square$

**Cor. (27.6.1.6) [Connection with Crystalline Prism].** In the above situation,  $B$  is also a  $\delta$ -ring by (5.5.4.17), and both  $\varphi(d), p$  are distinguished in  $B$  and  $\varphi(d)$  divides  $p$  in  $B$ , so by (5.5.4.22)  $(\varphi(d)) = (p)$ .

Now the composition of maps of  $\delta$ -rings (5.5.4.5)  $\alpha : A \xrightarrow{\varphi} A \rightarrow B$  promotes to a morphism of prisms (27.6.1.5)  $(A, (d)) \rightarrow (B, (p))$  which decompose as

$$(A, (d)) \xrightarrow{\varphi} (A, \varphi(d)) \rightarrow (B, (\varphi(d))) = (B, (p))$$

$\lrcorner$

**Prop. (27.6.1.7) [Rigidity of Maps].** If  $(A, I) \rightarrow (B, J)$  is a morphism of prisms, then  $I \otimes_A B = J$ , in particular,  $IB = J$ . Conversely, if  $B$  is a derived  $(p, I)$ -complete  $\delta$ - $A$ -algebra, then  $(B, IB)$  is a prism iff  $B[I] = 0$ .  $\lrcorner$

*Proof:* For the first assertion, it suffices to show that  $I \otimes_A B \rightarrow J$  is surjective, because they are both invertible sheaves on  $B$ . Choose f.f. ring morphisms  $A \rightarrow A', B \rightarrow B'$  as in (27.6.1.2) and there is a morphism  $A' \rightarrow B'$  extending  $A \rightarrow B$ , (by taking  $B$  as the localization of  $A' \times_A B$  along  $(p, J)$  and do the construction again). Then  $IB' \subset JB'$  are an inclusion of principal ideals generated by distinguished elements, thus they are equal, by (5.5.4.22), finally we use faithfully flatness.

For the second assertion, notice  $B[I] = 0$  iff  $I \otimes_A B \rightarrow IB$  is an isomorphism. If  $(B, IB)$  is a prism, then clearly  $I \otimes_A B \rightarrow IB$  is an isomorphism, because they are both invertible sheaves. The converse is also trivial.  $\square$

**Prop. (27.6.1.8) [Prism is Nearly Principal].** Let  $(A, I)$  be a prism, then the ideal  $\varphi(I)A$  is a principal ideal, and any generator is a distinguished element. In particular, if it is a perfect prism, then  $I = (f)$  where  $f$  is a distinguished element.  $\lrcorner$

*Proof:* It suffices to prove  $\varphi(I)A$  is generated by a single distinguished element, and then use (5.5.4.21). By (27.6.1.2), we can assume  $p = a + b$  where  $a \in I^p, b \in \varphi(I)A$ . Now we show  $b$  generate  $\varphi(I)A$ : choose a f.f. map as in (27.6.1.2), and then it suffices to check that  $b : A' \rightarrow \varphi(I)A'$

is surjective. Now  $\varphi(I)A' = (d)$ ,  $a = xd^p$ ,  $b = y\varphi(d)$ , so it suffices to show  $y$  is a unit in  $A'$ . Now  $(p, d) \in \text{rad } A'$ , it suffices to show  $A'/(p, f, y) = 0$ . If not, we localize along  $(p, f, y)$ , then we may assume  $(p, f, y) \in \text{rad } A'$ .

The equation  $p = a + b$  implies  $p(1 - y\delta(d)) = d^p(x + y)$ , and the left side is distinguished because  $p$  does and  $1 - y\delta(d)$  is a unit, by (5.5.4.21). Then (5.5.4.22) shows  $d^{p-1}(x + y)$  is a unit, then so does  $d$ , contradicting  $d \in \text{rad } A'$ .  $\square$

**Remark (27.6.1.9).** Notice the proof goes through even  $I$  is only a locally principal ideal of  $A$ .  $\lrcorner$

**Cor. (27.6.1.10).** If  $(A, I)$  is a prism, the invertible  $A$ -modules  $\varphi^*(I) = I \otimes_{A, \varphi} A$  and  $I^p$  are trivial.  $\lrcorner$

*Proof:* Cf. [Prisms, Scholze, P25].  $\square$

**Prop. (27.6.1.11) [Properties of Bounded Prisms].** Let  $(A, I)$  be a bounded prism, then

1. Any derived  $(p, I)$ -complete and  $(p, I)$ -completely flat  $A$ -complex  $M \in D(A)$  is discrete and  $(p, I)$ -complete. For any  $n \geq 0$ , we have  $M[I^n] = 0$  and  $M/I^n M$  has bounded  $p^\infty$ -torsion.
2.  $A$  is  $(p, I)$ -complete,  $A/I$  is  $p$ -adically complete,  $A[I^n] = 0$  and  $A/I^n$  has bounded  $p^\infty$ -torsions.
3. The category of (faithfully)flat prisms over  $(A, I)$  identifies with the category of  $(p, I)$ -completely (faithfully)flat  $\delta$ - $A$ -algebras  $B$  by the bijection  $B \leftrightarrow (B, IB)$ .
4. (Bounded Prisms are fpqc-Locally Orientable) There is a  $(p, I)$ -completely faithfully flat  $\delta$ - $A$ -algebra  $B$  that  $IB = (d)$ , where  $d$  is distinguished and determines a nonzero divisor of  $B$ . Also  $(B, IB)$  is bounded.  $\lrcorner$

*Proof:* 1: By (5.9.7.7).

2 follows from 1. For  $A/I$ , it is derived  $p$ -complete by (5.9.6.8), then it is  $p$ -adically complete by (5.9.6.16).

3: By definition, a (faithfully)flat  $(A, I)$ -prism is  $(p, I)$ -completely (faithfully)flat (5.9.7.1). Conversely, by (27.6.1.7), it suffices to show that  $B[I] = 0$ , and this follows from item 1.

4: We may choose  $B$  to be the derived  $(p, I)$ -completion of the f.f.  $\delta$ -ring defined in (27.6.1.2), then it is also  $(p, I)$ -completely faithfully flat (5.9.7.4), and by item 2 and 3 it determines a bounded prism  $(B, IB)$ .  $\square$

**Prop. (27.6.1.12) [The Site of Bounded Prisms].** The prismatic site is the opposite category of the category of bounded prisms where the covers are determined by f.f. map of prisms.

Then the functors that maps  $(A, I)$  to  $A$  or  $A/I$  are sheaves on this cohomology with vanishing higher cohomologies.  $\lrcorner$

*Proof:* To show this is a site, we need to check the base change of covers. If  $(C, IC) \xleftarrow{c} (A, IA) \xrightarrow{b} (B, IB)$  is a diagram that  $b$  is f.f., then we let  $D$  be the derived  $(p, I)$ -completion of  $B \otimes_A^L C$ , then  $C \rightarrow D$  is also  $(p, I)$ -completely f.f. by (5.9.7.5), so by (27.6.1.11) and (27.6.1.7)  $D$  is discrete and  $(D, ID)$  is a bounded prism over  $(A, IA)$ . It is clear this is a base change in the category of bounded prisms.

The assertion about cohomology follows from [Scholze, Prism, 3.12].  $\square$

### Prismatic Envelopes

**Prop. (27.6.1.13) [Prismatic Envelopes].** Let  $(A, I)$  be a prism, then the forgetful functor from the prisms over  $(A, I)$  to  $\delta$ -pairs over  $(A, I)$  admits a left adjoint, called the **prismatic envelope** which maps  $(B, J)$  to  $B\{\frac{J}{I}\}^\wedge$ .  $\lrcorner$

*Proof:* If we can construct this locally, then we can construct it globally by gluing and the universal property, so we can localize and assume  $I = (d)$  where  $d$  is distinguished. Let  $B'$  be the free  $\delta$ -ring over  $A$  generated by  $\{x/d | x \in J\}$  (5.5.4.10) and  $B_1$  the derived  $(p, d)$ -completion module of  $B$  which is a  $\delta$ -algebra by (5.5.4.18).

If  $d$  is torsion-free in  $B_1$ , then  $(B_1, (d))$  is a prism that satisfies the universal property. Otherwise we choose the maximal  $d$ -torsion-free quotient (5.1.1.16) (5.5.4.14) and taking the derived  $(p, d)$ -completion module, and we can do this to  $\aleph_0$ , where we take the filleted colimit, then it is  $d$ -torsion-free and  $(p, d)$ -complete, by (5.9.6.5) and any prism over  $A$  map factors through this chain.  $\square$

**Cor. (27.6.1.14).** In the above situation, if  $(B, J)$  is  $(p, I)$ -completely flat over  $A$ , and  $J = (I, x_1, \dots, x_n)$  where  $(x_1, \dots, x_n)$  is a  $(p, I)$ -completely regular sequence w.r.t.  $A$ , then the prismatic envelope of  $(B\{\frac{J}{I}\}^\wedge, IB\{\frac{J}{I}\}^\wedge)$  is flat over  $(A, I)$  (27.6.1.1).

Moreover, It is compatible with completed derived base change on  $(A, I)$ , by universal properties and the fact the completed derived base change of it is discrete (5.9.7.5). Also, it is compatible with completed derived base change along a  $(p, I)$ -completely flat map  $(B, J) \rightarrow (B', J')$ .  $\perp$

*Proof:* It suffices to check locally for  $I = (d)$  that  $B_1 = (B\{\frac{x_1}{d}, \dots, \frac{x_n}{d}\})^\wedge$  as a simplicial  $\delta$ -ring is  $(p, I)$ -completely flat over  $A$ , then it is discrete and is torsionfree by (27.6.1.11), thus it is a prism over  $(A, (d))$  by (27.6.1.7). And for the flat localization, notice the image of  $x_1, \dots, x_n$  is also  $(p, I)$ -completely regular w.r.t.  $A$ .

Consider the following diagram of derived  $(p, d)$ -complete simplicial  $\delta$ -rings:

$$\begin{array}{ccccccc}
 \mathbb{Z}_p\{z\}^\wedge & \xrightarrow{z \mapsto d} & A & \longrightarrow & B & \longrightarrow & B\{\frac{x_1}{d}, \dots, \frac{x_n}{d}\}^\wedge = C \\
 \downarrow z \mapsto \varphi(y) & & \downarrow & & \downarrow & & \downarrow \\
 \mathbb{Z}_p\{y\}^\wedge & \longrightarrow & A' & \longrightarrow & B' & \longrightarrow & B'\{\frac{x_1}{\varphi(d)}, \dots, \frac{x_n}{\varphi(d)}\}^\wedge = C' \\
 & & \downarrow & & \downarrow & & \downarrow \\
 & & D = A'\{\frac{\varphi(y)}{p}\}^\wedge & \longrightarrow & B'' & \longrightarrow & B''\{\frac{x_1}{p}, \dots, \frac{x_n}{p}\}^\wedge = C''
 \end{array}$$

where each square is completed derived tensor product. Notice the last term has denominator  $p$  because  $\varphi(y)$  and  $p$  are both distinguished in  $\pi_0(D)$ , so by (5.5.4.22)  $\frac{\varphi(y)}{p}$  is a unit in  $D$ .

The leftmost arrow is  $(p, z)$ -completely f.f. by (5.5.4.10) (5.9.7.4), so all the vertical arrow in the upper row is  $(p, z)$ -completely flat by (5.9.7.5). Now the map  $D \rightarrow C''$  is  $(p, z)$ -completely flat by (5.6.1.28), noticing that the conditions holds, by (5.9.7.5).

Now by definition the  $(p, d)$ -completely flatness is defined by flatness after base change to  $Kos(A, p, d)$  (5.8.3.5), it suffices to show that there is a map  $D \rightarrow Kos(A', p, d)$ . To show this, it suffices to assume  $A' = \mathbb{Z}_p\{y\} = \mathbb{Z}_p[y, y_1, \dots, y_n, \dots]$  and base change. In this case,  $p, y$  is a regular sequence, so by (5.6.1.25)  $D$  is the derived completion of  $D_{\mathbb{Z}_p\{y\}}((y))$ , and  $Kos(A', p, y) = \mathbb{F}_p[y_1, \dots, y_n]$ , so  $A' \rightarrow Kos(A', p, d)$  factors through  $D$  by universal property.  $\square$

## 2 Perfect Prisms

**Prop. (27.6.2.1) [Properties of Perfect Prisms].** Let  $(A, I)$  be a perfect prism (27.6.1.1), then:

- $I = (d)$  where  $d$  is distinguished and is a nonzero-divisor.
- $A$  is  $p$ -torsionfree and  $p$ -adically complete, hence there is a natural isomorphism  $A \cong W(A/p)$  of  $\delta$ -rings.

- $A/I[p^\infty] = A/I[p]$ , and  $A/p[I^\infty] = A/p[I]$ . In particular,  $(A, I)$  is bounded.
- $A$  is  $(p, I)$ -complete.

⌋

*Proof:* 1:  $I$  is principal by (27.6.1.8).  $d$  is distinguished by (5.5.4.23), it is nonzero-divisor by definition of prisms.

2: This is because  $A$  is  $p$ -torsionfree by (5.5.4.27) and thus  $p$ -adically complete by (5.9.6.16), then  $A \cong W(A/p)$  by the equivalence in (5.5.4.28).

3: Use item2, then  $A/p$  is perfect by (5.5.4.28), thus  $A/p[I^\infty] = A/p[I]$ .  $A/d[p^\infty] = A/d[p]$  follows from (5.5.4.30).

4: This follows from item3 and (27.6.1.11). □

**Prop. (27.6.2.2) [Perfection of Prisms].** There is a **perfection of prisms** functor that maps a prism  $(A, I)$  to a perfect prism  $(A_\infty, IA_\infty)$  left adjoint to the inclusion functor. ⌋

*Proof:* Let  $A'_\infty = A_{\text{perf}}$  be the perfection of  $A$  as a  $\delta$ -ring (5.5.4.26), and  $A_\infty$  be the derived  $(p, I)$ -complete of  $A'_\infty$  as a  $\delta$ -ring (5.5.4.18), then the universal property follows from that of derived completion and perfection once we proved that  $A_\infty$  is perfect and  $IA_\infty = (d)$  where  $d$  is a nonzero-divisor.

$A_\infty$  is perfect because the Frobenius is isomorphism on  $A_{\text{perf}}$  and derived  $(p, I)$ -completion and  $(p, \varphi(I))$ -completion coincide (they have the same radical (5.9.6.15)).

$A_\infty$  is  $p$ -adically complete because it is  $p$ -torsionfree (5.5.4.27), and then use (5.9.6.16).

Now (27.6.1.9) and the fact  $A_\infty$  is perfect shows  $IA_\infty = (d)$  where  $d$  is distinguished, and (5.5.4.30) shows  $d$  is a nonzero-divisor, so we are done. □

**Prop. (27.6.2.3) [Perfect Prisms are Final].** Let  $(A, I)$  be a perfect prism, then for any prism  $(B, J)$ , a map  $A/I \rightarrow B/J$  will induce a map of prisms  $(A, I) \rightarrow (B, J)$ . ⌋

*Proof:* Cf. [B-S19] 4.8.

This map will induce a map  $A \cong W((A/I)^\flat) \rightarrow W((B/J)^\flat)$ . And there is a Fontaine's functor  $W((B/J)^\flat) \rightarrow B$  (12.2.9.7) which is a  $\delta$ -map. Thus we obtain a map  $A \rightarrow B$ . And this map can be seen to be lifting  $A/I \rightarrow B/J$ . □

### 3 Integral Perfectoid Rings

**Def. (27.6.3.1) [Integral Perfectoid Rings].** A commutative ring  $R$  is called a **integral perfectoid ring** if it has the form  $A/I$  for a perfect prism  $(A, I)$ . An equivalent definition of an integral perfectoid ring is given in (27.6.3.6). ⌋

**Def. (27.6.3.2) [Special Fiber].** For an integral perfectoid ring  $R$ , then **special fiber** of  $R$  is defined to be  $\overline{R} = R/\sqrt{pR}$ . It is perfect, by (27.6.3.5). ⌋

**Prop. (27.6.3.3) [Perfect Prisms and Integral Perfectoid Rings].** The mapping  $(A, I) \rightarrow A/I$  defines an equivalence of categories between perfect prisms and integral perfectoid rings, where the converse is given by  $R \mapsto (A_{\text{inf}}(R), \ker(A_{\text{inf}}(R) \rightarrow R))$  (5.5.1.15). ⌋

*Proof:* To show  $A \cong A_{\text{inf}}(A/I)$ , by (5.5.4.28), it suffices to show there is a natural isomorphism  $A/p \cong (A/I)^\flat$ . By (5.5.1.18),  $(A/I)^\flat$  identifies with  $d$ -adic completion of  $A/p$ . Then it suffices to show  $A/p$  is  $I$ -adically complete, which is by (5.9.6.16), as  $A/p$  is derived  $d$ -complete because  $A$  does (5.9.6.8).

Now we have the Fontaine's map  $A = A_{\inf}(A/I) \rightarrow A/I$ , this map is surjective because  $\varphi : A/(p, I) \rightarrow A/(p, I)$  is surjective as  $A/p$  is perfect. Also this is just the quotient map  $A \rightarrow A/I$  because they are equal when modulo  $p$ , and then use(5.5.4.28).  $\square$

**Cor.(27.6.3.4).** Any perfect  $\mathbb{F}_p$ -algebra is an integral perfectoid ring corresponding to a crystalline prism, by(5.5.4.28).

Any integral perfectoid ring is  $p$ -adically complete, by(27.6.1.11).  $\lrcorner$

**Prop.(27.6.3.5).** If  $R$  is a perfectoid ring, then

- $R$  is semiperfect.
- There exists an element  $\varpi \in R$  that admits a compatible system  $\varpi^{1/p^n}$  of  $p$ -power roots s.t.  $\varpi = pu$  for a unit  $u$  and the kernel of the Frobenius  $\varphi : R/p \rightarrow R/p$  is generated by  $\varpi^{1/p}$ .
- $\sqrt{p}R = \cup_n(\varpi^{1/p^n})$ , and it is flat.
- $R[p] = R[\sqrt{p}R]$ .

$\lrcorner$

*Proof:* 1: Let  $R = A/d$  where  $A = A_{\inf}(R)$ , then  $R/p = A/(p, d)$ , so  $\varphi_{R/p}$  is surjective, as  $A/p = R^b$  is perfect.

2: Notice  $d = [a_0] - pu$  for a unit  $u \in A$  by(5.5.4.30), then we can take  $\varpi$  to be the image of  $[a_0]$  in  $R$ , and then  $\varpi^{1/p^n} = [a_0^{1/p^n}]$ .

3: firstly the LHS contains the RHS, and  $R/\cup_n(\varpi^{1/p^n})$  is perfect hence reduced, so the two sides are equal. To check it is flat, we need to check that  $M \otimes_R^L \sqrt{p}R$  is discrete, or equivalently  $M \otimes_R^L \bar{R} \in D^{\geq -1}$  where  $\bar{R} = R/\sqrt{p}R$  is perfect. But there is a distinguished triangle  $M \otimes_{\mathbb{Z}_p}^L \mathbb{Q}_p/\mathbb{Z}_p[-1] \rightarrow M \rightarrow M[\frac{1}{p}](\mathbb{Q}_p \text{ is } \mathbb{Z}_p \text{ flat (5.4.1.6)})$  and the fact  $\bar{R}[\frac{1}{p}] = 0$ , it suffices to prove  $M \otimes_{\mathbb{Z}_p}^L \mathbb{Q}_p/\mathbb{Z}_p \otimes_R^L \bar{R} \in D^{\geq -2}(R)$ . Now  $M \otimes_{\mathbb{Z}_p}^L \mathbb{Q}_p/\mathbb{Z}_p$  has cohomology groups  $p^\infty$ -torsion, so using canonical truncation, it suffices to show  $M \otimes_R^L \bar{R} \in D^{\geq -1}$  for any  $p^\infty$ -torsion  $M$ . Because tensoring commutes with filtered colimits, it suffices to show for  $M$  an  $R/p^n$ -module. Now using exact sequences like

$$0 \rightarrow M[p]/M[p^2] \rightarrow M/M[p^2] \rightarrow M[p]/M[p^2] \rightarrow 0,$$

we can reduce to the case  $M$  is a  $R/p$ -module.

Now there is a commutative diagram

$$\begin{array}{ccc} A_{\inf}(R) & \longrightarrow & R \\ \downarrow & & \downarrow \\ A_{\inf}(\bar{R}) & \longrightarrow & \bar{R} \end{array}$$

and  $d$  is  $p$ -torsionfree in both  $A_{\inf}(R)$  and  $A_{\inf}(\bar{R})$ (5.5.4.30), and  $d = [a_0] - pu = pu \in W(\bar{R})$ (as  $a_0 = 0 \in \bar{R}$ ), so  $\bar{R} = W(\bar{R})/d$  and this is a Tor-independent pushout square. Thus  $M \otimes_R^L \bar{R} \cong M \otimes_{W(R^b)}^L W(\bar{R})$ . As  $p$  is nonzero divisor in both  $A_{\inf}(R)$  and  $A_{\inf}(\bar{R})$ , and  $pM = 0$ , we have a similar diagram quotient by  $p$ , and by the same reason  $M \otimes_{W(R^b)}^L W(\bar{R}) \cong M \otimes_{R^b}^L \bar{R}$ . Now the kernel of  $R^b \rightarrow \bar{R}$  is of the form  $(f^{1/p^\infty})$ , where  $f$  corresponds to  $(\omega^{1/p^n})$ , so the claim follows from(5.5.1.7).

4: notation as in the proof of item2, it suffices to show the  $A$ -module  $R[p]$  is annihilated by  $[a_0^{1/p^n}]$  for  $n \geq 0$ . But  $R[p] = A/d[p] = A/p[d] = R^b[d]$ , and  $d = [a_0]$  on  $R^b$ , which is perfect, so we are done.  $\square$

**Prop. (27.6.3.6) [Equivalent Definition of Integral Perfectoid Rings].** A commutative ring  $R$  is an integral perfectoid ring iff the following are satisfied:

- $R$  is  $p$ -adically complete and  $R/p$  is semiperfect.
- The kernel of  $\theta_R : A_{\text{inf}}(R) \rightarrow R$  (notice  $R$  is  $p$ -adically complete) is principal.
- There exists some  $\varpi \in R$  that  $(\varpi^p) = (p)$ .

And if  $R$  is  $p$ -torsionfree, the condition2 can be replaced by:  $R$  is  $p$ -normal??.

*Proof:* If  $R$  is an integral perfectoid ring, then these are true by (27.6.3.5). Now if these are satisfied, then firstly  $\theta$  is surjective by (5.5.1.16). Next, let  $d \in A_{\text{inf}}(R)$  be the generator of  $\theta$ , we show  $A_{\text{inf}}(R)$  is derived  $(p, d)$ -complete. it is derived  $p$ -complete by (5.9.6.16). Now  $R^b$  is derived  $d$ -complete by (5.5.1.18). By induction and (5.9.6.8),  $A_{\text{inf}}(R)/p^n$  are all derived  $d$ -complete, and also by induction  $A_{\text{inf}}(R)/p^n$  has bounded  $d^\infty$ -torsion, as  $R^b$  is perfect. Then  $A_{\text{inf}}(R)/p^n$  are all  $d$ -adically complete. Thus

$$A_{\text{inf}}(R) = \varprojlim_n A_{\text{inf}}(R)/p^n = \varprojlim_n \varprojlim_m A_{\text{inf}}(R)/(p^n, d^m),$$

which means  $A_{\text{inf}}(R)$  is  $(p, d)$ -adically complete thus derived  $(p, d)$  adically complete.

Then it suffices to show  $d$  is distinguished, by (5.5.4.30). Let  $\varpi^p = up$ , and lift  $\varpi, u$  to  $x, v \in A_{\text{inf}}(R)$ . Since  $A_{\text{inf}}(R)$  is  $d$ -adically complete,  $v$  is unit in  $A_{\text{inf}}(R)$ . Then  $d|x^p - pv$  and  $x^p - pv$  is distinguished (5.5.4.30). Now  $d, p \in \text{rad}(A_{\text{inf}}(R))$  as  $A_{\text{inf}}(R)$  is  $(d, p)$ -adically complete, so by (5.5.4.22),  $d$  is distinguished.

Now if  $R$  is a  $p$ -torsionfree integral perfectoid ring, if  $x \in R[\frac{1}{p}]$  satisfies  $x^p \in R$ , let  $n \geq 0$  minimal that  $y = \varpi^n x \in R$ , then we show  $n = 0$ : if  $n > 0$ , then  $(\varpi^n x)^p = \varpi^{np} x^p \in \varpi^{np} R$ . Then we get  $\varpi^n x \in \varpi^n R$ , and then  $x \in R$  as  $R$  is  $p$ -torsionfree.

Conversely, we use condition1, 2, 4 to prove 3: We first show the kernel of  $\varphi : R/p \rightarrow R/p$  is generated by  $\varpi$  as in condition4: if  $x^p \in pR = \varpi^p R$ , then  $(x/\varpi)^p = y$ , thus  $x \in \varpi R$  by hypothesis. Since  $R/p$  is semiperfect,  $\overline{\varpi}$  admits a compatible  $p^n$ -th roots  $\{\overline{\varpi}^{1/p^n}\}$ . It can be shown by induction that  $\ker(\varphi^n) = (\overline{\varpi}^{1/p^n})$ . This implies that the kernel of  $\overline{\theta}_R : R^b \rightarrow R/p$  is generated by the element  $\varpi^b$  determined by the system  $\{\overline{\varpi}^{1/p^n}\}$ . As  $W(R^b)$  and  $R$  are both  $p$ -torsionfree and  $p$ -adically complete, they kernel of  $\theta_R$  is generated by any element in the kernel that lifts  $\varpi^b$ . In particular, the kernel is principal.  $\square$

**Prop. (27.6.3.7) [Pushout of Integral Perfectoid Rings].** Integral perfectoid rings are closed under pushouts in the category of derived  $p$ -complete rings: i.e. if  $C \leftarrow A \rightarrow B$  are maps of integral perfectoid rings, then  $B \widehat{\otimes}_A^L C$  is also an integral perfectoid ring.  $\square$

*Proof:* Let  $R = C^b \otimes_{A^b}^L B^b = C^b \otimes_{A^b} B^b$  which is a perfect ring, by (5.5.1.3) and (5.5.1.7). Then we have

$$W(R) = W(A^b) \widehat{\otimes}_{W(A^b)}^L W(B^b),$$

because this can be checked via derived Nakayama (5.9.6.10). Now use the fact  $A = W(A^b)/d$  for some distinguished element  $d$ , and then  $B = W(B^b)/d, C = W(C^b)/d$  by rigidity (27.6.1.7), and  $d$  is nonzero-divisor in  $W(B^b), W(C^b), W(R)$  by (5.5.4.28), so taking derived base change along  $W(A^b) \rightarrow A$ , we get

$$D = W(R)/d = B \widehat{\otimes}_A^L C,$$

and  $W(R)$  is a perfect prism, by (27.6.1.7), so  $D = W(R)/d$  is an integral perfectoid ring and equals  $B \widehat{\otimes}_A^L C$ .  $\square$

**Cor. (27.6.3.8).** The category of integral perfectoid rings is closed under arbitrary colimits and products in the category of derived  $p$ -complete rings.

But it is not closed under equalizers: Notice by Ax-Sen-Tate,  $(\mathcal{O}_{\mathbb{C}_p})^{\text{Gal}(\overline{\mathbb{Q}_p}/\mathbb{Q}_p)} = \mathbb{Z}_p$ , but  $\mathbb{Z}_p$  is not an integral perfectoid by (27.6.3.6).  $\lrcorner$

*Proof:* It suffices to show it is closed under products and sums ?.  $\square$

**Prop. (27.6.3.9) [Gluing].** Let  $R$  be an integral perfectoid ring,  $\overline{R} = R/\sqrt{p}R$ ,  $S = R/R[\sqrt{p}R]$ ,  $\overline{S} = S/\sqrt{p}S$ , then  $\overline{R}, S, \overline{S}$  are perfectoids, and the square

$$\begin{array}{ccc} R & \longrightarrow & S \\ \downarrow & & \downarrow \\ \overline{R} & \longrightarrow & \overline{S} \end{array}$$

is both a homotopy fiber square (5.9.1.2) and pullback square. Moreover,

- $S$  is  $p$ -torsionfree.
- $\sqrt{p}R$  maps isomorphically onto  $\sqrt{p}S$ .
- $R[\sqrt{p}R]$  maps isomorphically to  $\ker(\overline{R} \rightarrow \overline{S})$ , thus  $x \mapsto x^p$  is bijective on  $R[\sqrt{p}R]$ .

In particular, any integral perfectoid ring is a fiber product of integral rings that is either perfect or  $p$ -torsionfree.  $\lrcorner$

*Proof:* By (27.6.3.5),  $R[\sqrt{p}R] = R[p^\infty]$ . In particular,  $S$  is  $p$ -torsionfree. Now if we know this is a homotopy fiber square, then we get 2, 3 by comparing the kernel. And if we know the kernel, then this is a pushout square by (5.1.1.26). So it suffices to show this is a homotopy fiber square.

Let  $d = [a_0] - pu$  for a distinguished element of  $A = A_{\text{inf}}(R)$  that  $R = A/(d)$ , and the ideal  $I = (a_0^{1/p^\infty}) \subset R^\flat$  and  $J = R^\flat[I]$ . Then the square

$$\begin{array}{ccc} W(R^\flat) & \longrightarrow & W(R^\flat/J) \\ \downarrow & & \downarrow \\ W(R^\flat/I) & \longrightarrow & W(R^\flat/I + J) \end{array}$$

is a homotopy fiber square: all vertices are  $p$ -torsionfree and  $p$ -adically complete, and the square gives a fiber square when modulo  $p^n$  (use induction on  $n$  and (5.5.1.8)), and then take derived  $p$ -completions.

Next we apply ?  $\square$

**Cor. (27.6.3.10).** Integral perfectoid rings are reduced.  $\lrcorner$

*Proof:* By (27.6.3.9), we may assume  $R$  is  $p$ -torsionfree or perfect. Thus it suffices to assume  $R$  is  $p$ -torsionfree. Let  $\varpi \in R$  that  $\varpi^p = pu$  as in (27.6.3.6). If  $x^p = 0$ , we show inductively that  $x \in \varpi^n R$ . If  $x = \varpi^n y$ , then  $y^p = 0$  as  $R$  is  $p$ -torsionfree. Now the kernel of Frobenius  $\varphi : R/p \rightarrow R/p$  is generated by  $\varpi$ , thus we have  $y \in \varpi R$ , so we can use induction.  $\square$

## 4 Prismatic Site

**Remark (27.6.4.1).** In this subsection, fix a bounded prism  $(A, I)$ , all formal schemes over  $A$  are assumed to have the  $(p, I)$ -adic topology, and formal schemes over  $A/I$  are assumed to have the  $p$ -adic topology.  $\lrcorner$

**Def. (27.6.4.2) [Prismatic Site].** Let  $(A, I)$  be a bounded prism and  $X$  be a smooth  $p$ -adic formal scheme over  $A/I$ , let  $(X/A)_\Delta$  be the site whose objects are bounded prisms  $(B, IB)$  over  $(A, I)$  together with a map  $\mathrm{Spf}(B/IB) \rightarrow X$  over  $A/I$ . The morphisms are the natural one, and the coverings in  $(X/A)_\Delta$  are f.f. maps of prisms  $(B, IB) \rightarrow (C, IC)$ . There are structure sheaves  $\mathcal{O}_\Delta((B, IB)) = B$  and  $\overline{\mathcal{O}}((B, IB)) = B/IB$ . They are sheaves by (27.6.1.12).

Thus  $\mathcal{O}_\Delta$  is valued in  $(p, I)$ -complete  $\delta$ - $A$ -algebras and  $\overline{\mathcal{O}}_\Delta$  is valued over  $p$ -complete algebras (5.9.6.16).  $\lrcorner$

**Def. (27.6.4.3) [Perfect Prismatic Site].** The **perfect prismatic site**  $(X/A)_\Delta^{\mathrm{perf}}$  is the full subcategory of  $(X/A)_\Delta$  consisting of perfect prisms. By (27.6.3.3), objects in this site are equivalent to the category of perfectoid rings  $R$  over  $A/I$  with a map  $\mathrm{Spf} R \rightarrow X$ .  $\lrcorner$

**Remark (27.6.4.4).** If we further restrict to the site of perfect prisms  $(S, I)$  that  $S/I$  is integrally closed in  $S/i[\frac{1}{p}]$ , then we will get the notion of diamond of  $(X[\frac{1}{p}], X)$ , in sense of [Sch12].  $\lrcorner$

**Def. (27.6.4.5) [Absolute Prismatic Site].** For a  $p$ -adic formal scheme  $X$  the **absolute prismatic site** consisting of bounded prisms  $(B, J)$  with a map  $\mathrm{Spf} B/J \rightarrow X$ .  $\lrcorner$

**Prop. (27.6.4.6) [Prismatic Site and Étale Site].** Let  $\mathcal{FSch}/X$  be the category of  $p$ -adic formal schemes over  $X$  with the étale topology, then there is a natural functor  $\mu : (X/A)_\Delta \rightarrow \mathcal{FSch}/X$  sending  $(B, IB)$  over  $X$  to  $\mathrm{Spf} B/IB \rightarrow X$ .

This functor is cocontinuous: for any  $p$ -completely étale map  $B/IB \rightarrow C$ , it is a derived  $p$ -completion of some étale map  $B/IB \rightarrow \overline{C}'$  by (5.9.7.9), and this can be lifted to a map  $B \rightarrow S_C^l$  by (27.6.1.11)(5.3.10.6) and (5.3.10.9), and we choose the  $(p, I)$ -completion of  $S_C$ , then it is a prism that lifts  $C$ . Thus by (7.1.2.21) defines a morphism of topoi:

$$\mu : \mathrm{Sh}((X/A)_\Delta) \rightarrow \mathrm{Sh}(\mathcal{FSch}/X).$$

Also there is a natural map of topoi  $\mathrm{Sh}(\mathcal{FSch}/X) \rightarrow \mathrm{Sh}(X_{\mathrm{\acute{e}t}})$  by restriction, by (5.9.7.1). So we get a morphism of topoi

$$\nu : \mathrm{Sh}((X/A)_\Delta) \rightarrow \mathrm{Sh}(X_{\mathrm{\acute{e}t}}).$$

In particular, for any étale formal scheme  $U$  over  $X$ , by definition of  ${}_s\mu$  (7.1.2.11), for any sheaf  $\mathcal{F}$ ,

$$(\nu_*\mathcal{F})(U/X) = H^0((U/A)_\Delta, \mathcal{F}|_{(U/A)_\Delta}).$$

$\lrcorner$

**Cor. (27.6.4.7) [Prismatic Complex and Hodge-Tate Complex].** In the above situation, we define **prismatic complexes**

$$\Delta_{X/A} = R\nu_*\mathcal{O}_\Delta \in D(X_{\mathrm{\acute{e}t}}, A)$$

and the **Hodge-Tate complex**

$$\overline{\Delta}_{X/A} = R\nu_*\overline{\mathcal{O}}_\Delta \in D(X_{\mathrm{\acute{e}t}}, \mathcal{O}_X).$$

The Frobenius action on  $\mathcal{O}_\Delta$  induces a  $\varphi$ -semi-linear map  $\Delta_{X/A} \rightarrow \Delta_{X/A}$ . And there is a relation

$$\overline{\Delta}_{X/A} \cong \Delta_{X/A} \otimes_A^L A/I \in D(X_{\mathrm{\acute{e}t}}, A/I)$$

by the Grothendieck spectral sequences associated to the diagram of functors:

$$\begin{array}{ccc} \mathrm{Mod}((X/A)_\Delta, \mathcal{O}_\Delta) & \xrightarrow{\otimes_{\mathcal{O}_\Delta} \overline{\mathcal{O}}_\Delta} & \mathrm{Mod}((X/A)_\Delta, \overline{\mathcal{O}}_\Delta) \\ \downarrow \Gamma((X/A)_\Delta, -) & & \downarrow \Gamma((X/A)_\Delta, -) \\ \mathrm{Mod}(X_{\mathrm{\acute{e}t}}, A) & \longrightarrow & \mathrm{Mod}(X_{\mathrm{\acute{e}t}}, A/I) \end{array}$$

┘

### Affine Case

**Def. (27.6.4.8) [Situation].** In this subsection, fix a bounded prism  $(A, I)$  and a  $p$ -completely smooth(5.9.7.1)  $A/I$ -algebra  $R$  (or equivalently the  $p$ -adic completion of an étale  $A$ -algebra, by(5.9.7.9) and(5.9.6.16), and they define the same site by the universal property of completion).

┘

**Prop. (27.6.4.9) [Prismatic Site over Affine Formal Scheme].** The **prismatic site** of  $R$  relative to  $A$ , denoted by  $(R/A)_\Delta$  is the site whose objects are bounded prisms over  $(A, I)$  together with an  $A/I$ -algebra map  $R \rightarrow B/IB$ . And it is endowed with the indiscrete topology(7.1.1.2), so sheaves on this site is just presheaves.

There are two natural sheaves on this site,  $\mathcal{O}_\Delta$  maps a prism  $(B, IB)$  to  $B$  which is valued in  $(p, I)$ -complete  $\delta$ - $A$ -algebras, and  $\overline{\mathcal{O}}_\Delta$  which maps a prism  $(B, IB)$  to  $B/IB$  which is valued in  $p$ -complete  $R$ -algebras(5.9.6.16)

┘

**Prop. (27.6.4.10) [Compare with Indiscrete Topology].** If  $(X/A)'_\Delta \subset (X/A)_\Delta$  is a continuous map of sites that the former is endowed with the indiscrete topology, then it is a morphism of sites, by(7.1.2.14), so this induces a morphism of topoi

$$\mathrm{Sh}((X/A)_\Delta) \rightarrow \mathrm{Sh}((X/A)'_\Delta)$$

by(7.1.2.20), then we have the Leray spectral sequence(7.3.1.9)

$$E_2^{p,q} = H^p(\mathcal{C}', R^q f_*(\mathcal{F}^\bullet)) \Rightarrow H^{p+q}(\mathcal{C}, \mathcal{F}^\bullet).$$

and by(7.3.1.7)(7.3.1.6) and(27.6.1.12), we have a natural isomorphism

$$R\Gamma((X/A)'_\Delta, \mathcal{F}) \rightarrow R\Gamma((X/A)_\Delta, \mathcal{F})$$

for  $\mathcal{F} = \mathcal{O}_\Delta$  or  $\overline{\mathcal{O}}_\Delta$ .

┘

### How to Compute the Prismatic Complex in the Affine Case

**Lemma (27.6.4.11) [Weakly Final Object].** Let  $(A, I)$  be a prism and let  $R$  be a  $p$ -completely smooth  $A/I$ -algebra, then the category  $(R/A)_\Delta$  admits a weakly final object. Moreover, we can choose it to be flat over  $(A, I)$ .

┘

*Proof:* Let  $F_0$  be the derived  $(p, I)$ -completion of a free  $\delta$ -ring over  $A$  on the set  $R$ , then there is a surjection of  $A$ -algebras  $F_0 \rightarrow R$ , with kernel  $J$  derived  $(p, I)$ -complete<sup>?</sup>. Then(27.6.1.13) applied to the  $\delta$ -ring  $(F_0, J)$  gives a prism  $(F, IF)$  over  $(A, I)$ , and by construction it is an object of  $(R/A)_\Delta$ . And it is weakly final because of the universal properties of  $F_0$ (5.5.4.10) and  $F$ (27.6.1.13).

For the flatness, we temporarily call a  $\delta$ -pair  $(B, J)$  **good** if

- $B$  is  $(p, I)$ -completely flat over  $A$  and  $J$  is  $(p, I)$ -complete.
- the prismatic envelope is flat over  $(A, I)$  and its formation commutes with completed derived base change on a  $(p, I)$ -completely flat map  $B \rightarrow B'$ .

Then we need to show that  $(F_0, J)$  is good. We have the following observations:

- Good pairs are stable under filtered colimit in the category of  $\delta$ -pairs  $(B, J)$  that  $J$  is derived  $(p, I)$ -complete. (Because filtered colimits of flat modules are flat(5.4.1.6).)
- If  $(B, J)$  is a  $\delta$ -pair over  $A$  with  $B$  completely  $(p, I)$ -flat over  $A$ , and  $B \rightarrow B'$  is a  $(p, I)$ -completely f.f. map that  $(B', (JB')^\wedge)$  is good, then  $(B, J)$  is good. (This follows from(27.6.1.13) and the f.f. descent(27.6.1.13).)

Then we can write  $B$  as a filtered colimit of  $(p, I)$ -complete algebras  $B_s \twoheadrightarrow R$ , and the kernel of each of them is locally generate by a  $(p, I)$ -completely regular sequence, so we can use the observations to pass to f.f. localization and filtered colimit to show that  $(B, J)$  is good. Cf.[Prism, Scholze, 3.14]. ?

□

**Lemma (27.6.4.12) [Products].** The category  $(R/A)_\Delta$  admits products. ┘

*Proof:* For  $\delta$ -rings  $B, C \in (R/A)_\Delta$ , we can take the  $\delta$ -ring colimit  $D_0 = B \otimes_A C$ (5.5.4.13), but it may not be compatible with  $R$ -actions. Instead, let  $J$  be the kernel of the natural map

$$D_0 \rightarrow D_0/ID_0 \rightarrow B/IB \otimes_{A/IA} C/IC \rightarrow B/IB \otimes_R C/IC,$$

then  $(D_0, J)$  is a  $\delta$ -ring over  $(A, I)$ , and then we can use(27.6.1.13) to get a prism  $(D, ID)$  over  $(A, I)$ , then the maps  $R \rightarrow B/IB \rightarrow D_0/ID_0 \rightarrow D/ID$  and  $R \rightarrow C/IC \rightarrow D_0/ID_0 \rightarrow D/ID$  are equal(because they all factor through  $D/J$ ), thus giving a product object in  $(R/A)_\Delta$ . □

**Prop. (27.6.4.13) [Čech-Alexander Construction for Prismatic Cohomology].**

By(7.3.1.20)(27.6.4.10) and the lemmas(27.6.4.11)(27.6.4.12) above, the prismatic complex  $\Delta_{R/A}$  is represented by the complex

$$F^0 \rightarrow F^1 \rightarrow F^2 \rightarrow \dots$$

In particular,  $F^0 = F$  as constructed in(27.6.4.11) and each  $F^n$  are  $(p, I)$ -completely  $A$ -flat,  $I$ -torsion-free and  $(p, I)$ -complete  $\delta$ -rings by(27.6.1.11) and(27.6.1.14).

Moreover, this complex is the prismatic envelope functor applied to the Čech nerve of  $A \rightarrow F_0$ , w.r.t. the Čech nerve  $F^\bullet$  of ideals  $J^\bullet = \ker(F^\bullet \rightarrow F_0 \rightarrow R)$ , because prismatic envelope is a left adjoint hence commutes with tensor product of pairs(27.6.1.13). ┘

**Cor. (27.6.4.14).**  $\Delta_{R/A}$  is derived  $(p, I)$ -complete and  $\bar{\Delta}_{R/A}$  is derived  $p$ -complete, because each term of the complex  $F^\bullet$  is derived  $(p, I)$ -complete, so does its cohomology groups(5.9.6.8), thus so does  $\Delta_{R/A}$  itself. Similarly for  $\bar{\Delta}_{R/A}$ , because each term of  $F^\bullet/I$  is  $p$ -complete(27.6.4.13) hence derived  $p$ -complete, by(5.9.6.16). ┘

## 5 Hodge-Tate Comparison

**Def. (27.6.5.1) [Breuil-Kisin Twist].** Let  $I$  be an invertible ideal of  $A$ , then for any  $A/I$ -module  $M$ , we define the **Breuil-Kisin twist** of  $M$  as  $M\{n\} = M \otimes (I/I^2)^n$ . Notice this definable for  $n \in \mathbb{Z}$  because  $I/I^2$  is an invertible  $\mathcal{O}_{A/I}$ -module, by definition(27.6.1.1). Also it is definable in the level of  $D(A/I)$ , as  $(I/I^2)^n$  is locally free thus flat. ┘

**Def. (27.6.5.2)[Completed de Rham Complex].** The **completed de Rham complex** is the derived  $p$ -completion of the de Rham complex of  $\Omega_{X/(A/I)}$ . We will use the derived  $p$ -completed de Rham complex in the sequel. It has a property that it coincides with the  $p$ -completion of its separate terms by (5.9.7.8) and (5.9.6.16) and the fact  $\Omega_{X/(A/I)}$  is finite projective hence flat (5.4.5.12).

In fact, as  $\Omega_{X/S}$  is finite locally free, the derived  $p$ -completion is just by tensoring  $- \otimes_{R_0} R$ , where  $R_0$  is a smooth  $A$ -algebra that  $R_0^\wedge = R$  by (5.9.7.9). In particular, the completed de Rham complex is compatible with base change and  $p$ -completely étale extension, because the ordinary de Rham complex does (5.4.3.6)(5.4.7.6).  $\lrcorner$

**Prop. (27.6.5.3) [Hodge-Tate Comparison Theorem].** We have a structure map  $\eta^0 : \mathcal{O}_X \rightarrow H^0(\bar{\Delta}_{X/A})$ , and  $H^\bullet(\bar{\Delta}_{X/A})$  is a dga by (5.9.1.3) applied to  $M^\bullet = \Delta_{X/A}$  and (5.9.2.1) noticing  $\bar{\mathcal{O}}_\Delta$  is a sheaf of algebras. then the universal property of de Rham complex (9.2.1.4) and lemma (27.6.5.4) shows  $\eta^0$  extends to a map

$$\eta_R^\bullet : \Omega_{X/(A/I)}^\bullet \rightarrow H^\bullet(\bar{\Delta}_{X/A})\{\bullet\}$$

of sheaves of  $A/I$ -dgas on  $X_{\text{ét}}$ .

Then this is an isomorphism of differential graded  $A/I$ -algebra. In particular  $\bar{\Delta}_{X/A} \in D(X_{\text{ét}}, A/I)$  is a perfect complex with  $H^i(\bar{\Delta}_{X/A}) \cong \Omega_{X/(A/I)}^i\{-i\}$ .  $\lrcorner$

*Proof:* The proof of the isomorphism is given in (27.6.6.10).  $\square$

**Lemma (27.6.5.4).** For any local section  $f \in \mathcal{O}_X(U)$ , the differential  $\beta_I(f) \in H^1(\bar{\Delta}_{X/A})\{1\}(U)$  squares to 0.  $\lrcorner$

*Proof:* This follows from (27.6.6.9) in the affine line case because  $H^2(\bar{\Delta}_{X/A})\{1\}(U) = 0$ , and for the general case, use the étale localization (27.6.6.2) and base change theorem (27.6.6.1), noticing that cup product survives through derived tensor product.  $\square$

**Cor. (27.6.5.5)[Base Change].** The formation of  $\Delta_{X/A} \in D(X_{\text{ét}}, A)$  commutes with base change along a bounded prism  $(A, IA) \rightarrow (B, IB)$ : Let  $g : X_B = X \otimes_{\text{Spf } A/IA} \text{Spf } B/IB \rightarrow X$  be the projection, then

$$(g^* \Delta_{X/A})^\wedge \cong \Delta_{X_B/B}, \quad (g^* \bar{\Delta}_{X/A})^\wedge \cong \bar{\Delta}_{X_B/B}$$

where  $()^\wedge$  is the derived  $(p, I)$ -completion or  $p$ -completion.  $\lrcorner$

*Proof:* Because both side are derived  $(p, I)$ -complete, we take their cylinder object and by derived Nakayama w.r.t.  $B/(p, I)$  (5.9.6.10) it suffices to show the second, which is true because this is true for completed de Rham complexes (27.6.5.2).  $\square$

## 6 Proof of Hodge-Tate Comparison

The strategy is as follows: we study the affine case to construct and prove the Hodge-Tate comparison isomorphism in the affine case, and then this gives the construction of Hodge-Tate map in the general case, then we can also prove the general Hodge-Tate comparison by localizing at affine subschemes, so the affine case is important.

To prove the Hodge-Tate comparison isomorphism in the affine case, we use étale localization to reduce to the polynomial case, and then use flat base change to reduce to the oriented case. Then we use a slick strategy to reduce to the crystalline case, and finally reduce to crystalline comparison.

**Lemma (27.6.6.1) [Base Change].** Let  $R$  be a  $p$ -completely smooth  $A/I$ -algebra and  $(A, I) \rightarrow (A', I')$  be a map of bounded prisms that  $A \rightarrow A'$  has finite  $(p, I)$ -complete Tor amplitude (5.9.7.1). If  $R' = R \hat{\otimes}_A^L A'$  for the the base change, then the natural map induces an isomorphism

$$\Delta_{R/A} \hat{\otimes}_A^L A' \cong \Delta_{R'/A'}, \quad \bar{\Delta}_{R/A} \hat{\otimes}_A^L A' \cong \bar{\Delta}_{R'/A'}$$

┘

*Proof:* We use the Čech nerve of a weakly final object (27.6.4.13) to compute the cohomology, then we notice the  $(p, I)$ -completed base change  $-\hat{\otimes}_A^L A'$  applied termwise to the Čech nerve of  $A \rightarrow F^0$  is the Čech nerve of  $A \rightarrow F^0 \hat{\otimes}_A A'$ , which is weakly final in  $(R'/A')_\Delta$ , by the universal property and the fact  $(p, I)$ -completed base change is a left adjoint.

Finally we use (5.9.7.8) to see that this termwise completed derived base change just represents  $\Delta_{R/A} \hat{\otimes}_A^L A'$  because each term of the prismatic envelope  $F$  is  $(p, I)$ -completely flat over  $A$  and the completed derived base change of  $F^n$  is discrete by (27.6.4.13).  $\square$

**Lemma (27.6.6.2) [Étale Localization].** Let  $R \rightarrow S$  be a  $p$ -completely étalemap of  $p$ -completely smooth algebras, then the natural map

$$\bar{\Delta}_{R/A} \hat{\otimes}_R^L S \rightarrow \bar{\Delta}_{S/A}$$

is an isomorphism.  $\square$

*Proof:* Firstly the forgetful functor  $(R/A)_\Delta \rightarrow (S/A)_\Delta$  has a right adjoint, described as follows: a prims  $(B, IB) \in (B/S)_\Delta$  induces a  $p$ -completely étalemap of (discrete)rings  $B/IB \rightarrow B/IB \hat{\otimes}_R^L S$  by (5.9.7.5), and by Elkik's algebrization (5.9.7.9), this is a derived  $p$ -completion of some étalemap  $B/IB \rightarrow T_0$ , and we can lift it to some étalemap  $B \rightarrow S_0$  by Henselian pair property (5.9.6.12)(5.3.10.9), then we can also take the derived  $(p, I)$ -completion (discrete by (27.6.1.11))  $S_B$  of  $S_0$ , then  $S_B/IS_B \cong B/IB \otimes_R^L S$ ?. So we have the following base change diagram:

$$\begin{array}{ccccc} B & \longrightarrow & S_0 & \longrightarrow & S_B \\ \downarrow & & \downarrow & & \downarrow \\ B/IB & \longrightarrow & T_0 & \longrightarrow & B/IB \hat{\otimes}_R^L S \end{array}$$

For the adjointness, it suffices for every prism  $(T, IT)$  with morphisms  $B \rightarrow T, B/IB \otimes_R^L S \rightarrow T/IT$ , we can lift to a map  $S_B \rightarrow T$ . But if we consider the  $p$ -completely étalemap  $T \rightarrow T \hat{\otimes}_B B_S$  and its base change, it suffices to find a section of this map, and this is by Henselian pair  $(T, IT)$  (5.3.10.6)(27.6.1.11)(5.3.10.9). Moreover,  $S_B$  has a  $\delta$ -structure by (5.5.4.19) so it is clearly a prism, and the right adjoint  $F$  just takes  $(T, IT) \rightarrow (S_B, IS_B)$ .

This right adjoint preserves weakly final objects and products, and it is just the completed derived tensor  $-\hat{\otimes}_R^L S$  when modulo  $I$  by construction, so when combined with (5.9.7.8) we get the conclusion.  $\square$

**Remark (27.6.6.3).** Notice these two lemmas (27.6.6.1)(27.6.6.2) are consequences of Hodge-Tate comparison isomorphism, once we proved it!  $\square$

**Crystalline Comparison in Characteristic  $p$** 

**Prop. (27.6.6.4) [Crystalline Comparison in Characteristic  $p$ ].** Let  $(A, (p))$  be a crystalline prism and let  $I \subset A$  be a pd-ideal with  $p \in I$ , in particular the Frobenius  $A/p \rightarrow A/p$  factors through  $A/I$  by (5.6.1.6), inducing a map  $\psi = \psi_I : A/I \rightarrow A/p$ . Let  $R$  be a smooth  $A/I$ -algebra and let  $R^{(1)} = R \otimes_{A/I, \psi} A/p$ , then there is a canonical

$$\Delta_{R^{(1)}/A} \cong R\Gamma_{\text{crys}}(R/A)$$

of  $E_\infty$ - $A$ -algebras compatible with Frobenius action.  $\lrcorner$

*Proof:* ?  $\square$

**Cor. (27.6.6.5).** If we have a smooth  $R$  over  $A/p$  and let  $\tilde{R} = R \otimes_{A/p} A/I$ , then  $\tilde{R}^{(1)} = \varphi_* R$ , and we can apply this theorem to  $\tilde{R}$  to get a canonical isomorphism

$$\varphi^* \Delta_{R/A} \cong R\Gamma_{\text{crys}}(\tilde{R}/A)$$

of  $E_\infty$ - $A$ -algebras compatible with Frobenius action.  $\lrcorner$

**Lemma (27.6.6.6) [Hodge-Tate Comparison for the Affine Line over  $(\mathbb{Z}_p, (p))$ ].** If  $(A, (p))$  is a  $p$ -torsionfree crystalline prism and  $R = \mathbb{F}_p\langle X \rangle$ , then the Hodge-Tate map constructed in (27.6.5.3) is an isomorphism.  $\lrcorner$

*Proof:* WARNING: This proof will not use the construction of the Hodge-Tate map in degree  $> 1$  and this lemma will be used in the proof of Hodge-Tate map in the general case, so there is no cycle in the reasoning.

The map

$$\Omega_{R^{(1)}/(A/p)}^\bullet \rightarrow H^*(R\Gamma_{\text{crys}}(R/A) \otimes_A^L A/p)\{*\} \cong H^*(\Delta_{R^{(1)}/A} \otimes_A^L A/I)\{*\} = H^*(\bar{\Delta}_{R^{(1)}/A})\{*\}$$

is an isomorphism by Cartier isomorphism?, where the middle is by prismatic-crystalline comparison (27.6.6.4).

It suffices to check this is the Hodge-Tate map for  $R^{(1)}/(A/p)$ . But the Hodge-Tate map induces by the inclusion  $\mathcal{O}_X \rightarrow H^0(\bar{\Delta}_{X/S})$ . It is fairly easy to check the proof of (27.6.6.4) and (27.5.6.9) the composition is also the canonical one. Finally if we choose  $\mathbb{F}_p\langle X \rangle = R = R^{(1)}$ , then we get the desired Hodge-Tate isomorphism.  $\square$

**Lemma (27.6.6.7) [Hodge-Tate Comparison for  $(\mathbb{Z}_p, (p))$ ].** If  $(A, (p))$  is a  $p$ -torsionfree crystalline prism and  $R = \mathbb{F}_p[X_1, \dots, X_n]$ , then the Hodge-Tate map constructed in (27.6.5.3) is an isomorphism.  $\lrcorner$

*Proof:* The proof is the same as that of (27.6.6.6), notice now we already have the Hodge-Tate Comparison map.  $\square$

**Direct proof of the Hodge-Tate comparison for  $(\mathbb{Z}_p, (p))$** 

The proof of (27.6.6.6) and (27.6.6.7) is sloppy because we somehow lose track of whether the composition morphism is the Hodge-Tate comparison map. As the situation is so explicit, we decided to give a direct proof.

### Mix Characteristic Case

**Prop. (27.6.6.8) [Comparing with the Characteristic  $p$ ].** Let  $A$  be a universal oriented prism in any characteristic and  $A \rightarrow B$  as in (27.6.1.5), let  $\alpha : (A, (d)) \xrightarrow{\varphi} (A, (d)) \rightarrow (B, (p))$ , then  $\alpha$  is a map of prisms by (27.6.1.6), and:

1.  $\alpha/p$  factors as  $A/p \rightarrow A/(p, d) \xrightarrow{\varphi} A/(p, d^p) \rightarrow B/p = D_{A/p}((d))$  where the first map has finite Tor amplitude and the last two maps are f.f., thus  $\alpha/p$  has finite Tor amplitude.
2. The functor  $\widehat{\alpha}^* : D_{\text{comp}}(A, (p, d)) \rightarrow D_{\text{comp}}(B, (p))$  reflects isomorphisms.
3. For any  $p$ -completely smooth  $A/I$ -algebra  $R$ , let  $R_B = R \widehat{\otimes}_A B$ , then the map

$$\widehat{\alpha}^* \Delta_{R/A} \rightarrow \Delta_{R_B/B}$$

is an isomorphism. ⌋

*Proof:* 1: It factors because  $d^p = p! \gamma_p(d) \in pB$ , and  $B/p = D_{A/p}((d))$  by (5.6.1.19), noticing  $D_A((d)) = D_A((p, d))$ . The first map is of finite Tor amplitude (5.9.7.1) because  $d$  is a nonzero-divisor in  $A/p$  by (27.6.1.4).  $\varphi$  is f.f. because it is a base change of  $\varphi_{A/p}$  and the latter is f.f. (27.6.1.4). The last one is f.f. because it is a free summand as  $D_{A/p}((d)) = A/p[X_1, X_2, \dots]/(a^p, X_1^p, X_2^p, \dots)$  by (5.6.1.24).

2: Because  $D_{\text{comp}}(A, I)$  is a weak Serre subcategory of  $D(A)$  (5.9.6.8), to show it reflects isomorphisms, by item 1 and derived Nakayama applied to  $-\otimes_B^L B/p$ , it suffices to show if  $X \in D_{\text{comp}}(A, (p, d))$ , if  $X \otimes_A^L A/p \otimes_{A/p}^L A/(p, d) = 0$ , then  $X = 0$ , but  $X \otimes_A^L A/p \otimes_{A/p}^L A/(p, d) = X \otimes_A^L A/(p, d)$ , and this follows from derived Nakayama again.

3:  $\alpha$  has finite  $(p, d)$  Tor amplitude by (5.9.7.3) and (27.6.1.4), so 3 follows from (27.6.6.1). □

### Final Proof

**Prop. (27.6.6.9) [Hodge-Tate Comparison in the Affine Line Case].** In situation (27.6.4.8), If  $R = A/I\langle X \rangle$ ,  $\eta_R^0 : R \rightarrow H^0(\overline{\Delta}_{R/A})$  and the twisted morphisms  $\eta_R^1\{-1\} : \Omega_{R/(A/I)}^1\{-1\} \rightarrow H^1(\overline{\Delta}_{R/A})$  defined by the universal property of  $\Omega_{R/(A/I)}$  are isomorphisms, and  $H^i(\overline{\Delta}_{R/A}) = 0$  for  $i > 1$ .

In particular, by étalelocalization of prismatic cohomology (27.6.6.2), lemma (27.6.5.4) holds for any  $p$ -completely smooth algebra  $R$  over  $A/I$ . But this doesn't say that higher cohomologies vanish for any  $R$ , this is because cup product can survive derived tensor but cohomology groups cannot. ⌋

*Proof:* In this case,  $\Omega_{R/S}$  is topologically free over  $R$ , thus we can choose a map

$$\eta : R \oplus \Omega_{R/A}^1\{-1\}[-1] \rightarrow \overline{\Delta}_{R/A}$$

lifting  $\eta_R^0 \oplus \eta_R^1\{-1\}$ .

Firstly if  $(A, I) = (\mathbb{Z}_p, (p))$ , this case is done by (27.6.6.6).

Next, if  $(A, (d))$  is oriented, then there is a map of prisms from the universal oriented prism (27.6.1.4)  $A_0 \rightarrow A$ , then we have a pushout diagram of simplicial commutative rings

$$\begin{array}{ccc} A_0 & \longrightarrow & A \\ \downarrow \alpha & & \downarrow \beta \\ \mathbb{Z}_p & \longrightarrow & D_0 \longrightarrow E = A \widehat{\otimes}_{A_0}^L D_0 \end{array}$$

and  $(E, (p))$  is a simplicial prism.

Now the warning is what we have done so far can all be extended to the derived algebraic geometry setting, or at least to the "animated commutative algebra" setting!

We denote the composite of the lower row as  $\gamma$ , because  $\widehat{\alpha}^*$  reflects isomorphisms, so does  $\widehat{\beta}^*$ , and we can show  $\widehat{\beta}^* \overline{\Delta}_{R/A} \cong \widehat{\gamma}^* \overline{\Delta}_{\mathbb{F}_p\langle X \rangle/\mathbb{Z}_p}$ , and identifies the Hodge-Tate map: This is because we are in the polynomial case, so we can make the construction of  $\Delta_{R/A}$  clear: we just take the  $F^0$  to be the derived  $(p, I)$ -completion of the free  $\delta$ -rings  $A\{X\}$  in the construction of weakly final object(27.6.4.11), then the resulting Čech-Alexander complex is free and compatible with base change in the complex level.

Also  $\beta$  has finite  $(p, d)$ -Tor amplitude because  $\alpha$  has because  $(p, d)$  is regular in  $A_0$ (27.6.1.4), also  $\gamma$  has finite  $p$ -Tor amplitude because  $E$  is  $p$ -torsionfree by(27.6.1.11), and use(5.9.7.3). So we are reduced to the  $(\mathbb{Z}_p, (p))$  case, which we have done.

Finally, for a general bounded prism  $(A, I)$ , we can reduce to the oriented case by base change along the f.f. extension defined in(27.6.1.11), then we reduce to the orientable case by(27.6.6.1).  $\square$

**Prop.(27.6.6.10)[Hodge-Tate Comparison Theorem in General].** The map

$$\eta_R^\bullet : \Omega_{X/(A/I)}^\bullet \rightarrow H^\bullet(\overline{\Delta}_{X/A})\{\bullet\}$$

constructed in(27.6.5.3) is an isomorphism of sheaves of  $A/I$ -dgas on  $X_{\text{ét}}$ .  $\lrcorner$

*Proof:* Because we already have the Hodge-Tate comparison map, it suffices to prove the theorem for affine subscheme  $\text{Spf } R$ , and because both prismatic cohomology and de Rham complex are étalelocal(27.6.6.2)(27.6.5.2), it suffices to prove for the polynomial case. In this case,  $\widehat{\Omega}_{R/A}^i$  is topological free over  $R$ , then we can lift the Hodge-Tate map(27.6.5.3) to the level of chain complexes:

$$\eta : \otimes_{i=0}^n \Omega_{R/(A/I)}^i \{-i\}[-i] \rightarrow \overline{\Delta}_{R/A}.$$

And then the rest is the same as the proof of(27.6.6.9), where in the  $(\mathbb{Z}_p, (p))$  case, we use(27.6.6.7) instead of(27.6.6.6).  $\square$

### de Rham Comparisons

**Prop.(27.6.6.11)[de Rham Comparison].** In situation(27.6.4.2), if  $W(A/I)$  is  $p$ -torsionfree, then there is a natural isomorphism

$$\Delta_{X/A} \widehat{\otimes}_{A, \varphi}^L A/I \cong \Omega_{X/(A/I)}^\bullet$$

of commutative algebra objects in  $D(A/I)$ .  $\lrcorner$

*Proof:* Cf.[Scholze, Prism, 6.4].

It suffices to construct locally a functorial isomorphism  $\Delta_{R/A} \widehat{\otimes}_{A, \varphi}^L A/I \cong \Omega_{R/(A/I)}^\bullet$  and then glue.

Let  $A \rightarrow W(A/I)$  be the canonical map, and  $\psi : A \xrightarrow{\varphi} A \rightarrow W(A/I)$ , then it takes  $I$  into  $(p)$ ? But the map  $\psi/p : A/I \rightarrow W(A/I)/p = A/I$  factors through  $A/(p, I)$ , thus  $R'$  also equals  $R/p \otimes_{A/(p, I)} W(A/I)/p$ , so there is a base change diagram:

$$\begin{array}{ccccc} R & \longrightarrow & R/p & \longrightarrow & R^{(1)} = R \otimes_{A/I, \psi} W(A/I)/p \\ \uparrow & & \uparrow & & \uparrow \\ A/I & \longrightarrow & A/(p, I) & \xrightarrow{\psi_{(p, [p])}} & W(A/I)/p = A/I \end{array}$$

Base change for prismatic cohomology (27.6.5.5) gives an isomorphism

$$\Delta_{R/A} \widehat{\otimes}_{A,\psi}^L W(A/I) \cong \Delta_{R'/W(A/I)}.$$

Note that  $W(A/I) \rightarrow A/(p, I)$  is a pd-thickening with ideal  $(p, [p])$ , so we can use crystalline comparison w.r.t. the crystalline prism  $(W(A/I), (p))$  to show that

$$\Delta_{R^{(1)}/W(A/I)} \cong R\Gamma_{\text{crys}}((R/p)/W(A/I)).$$

Then finally we use the crystalline de Rham comparison to get the desired result.  $\square$

**Remark (27.6.6.12).** The technical condition  $W(A/I)$  is  $p$ -torsionfree can be removed, by [Scholze, Prism, 15.4].  $\lrcorner$

## 7 Derived de Rham Cohomology

**Def. (27.6.7.1) [Derived de Rham Cohomology].** For an  $\mathbb{F}_p$ -algebra  $k$ , the **derived de Rham cohomology** functor  $dR_{-/k} : \mathcal{CAlg}/k \rightarrow D(k)$  is the left derived functor of the functor  $\mathcal{P}oly_k \rightarrow D(k)$  given by  $R \rightarrow \Omega_{R/k}^\bullet$  via (5.8.4.2).  $\lrcorner$

**Prop. (27.6.7.2) [Derived Cartier Isomorphism].**  $\lrcorner$

### Regular Semiperfect Rings

**Def. (27.6.7.3) [Regular Semiperfect Rings].** Let  $k$  be a perfect ring, a **regular semiperfect ring** over  $k$  is an  $k$ -algebra of the form  $R/I$  where  $R$  is a perfect  $k$ -algebra and  $I$  is an ideal generated by a regular sequence.  $\lrcorner$

**Prop. (27.6.7.4).** Let  $k$  be a perfect field and  $S$  be a regular semiperfect ring, then  $\lrcorner$

## 8 Derived Prismatic Cohomology

**Prop. (27.6.8.1) [Derived Hodge-Tate Comparison].**  $\lrcorner$

## 9 $q$ -de Rham Cohomology

**Prop. (27.6.9.1) [Hodge-Tate isomorphism via  $q$ -de Rham Complex].** Cf. [Bhatt, Prism, 5.3.9.].  $\lrcorner$

## 10 Étale Comparison

**Prop. (27.6.10.1) [Frobenius Fixed Points].** Fix an  $\mathbb{F}_p$ -algebra  $B$  with an element  $t$ , let  $D(B[F])$  be the **derived category of Frobenius  $B$ -modules**: this is a category whose objects are  $(M, \varphi)$  where  $M \in D(B)$  and  $\varphi$  is a morphism  $M \rightarrow M \otimes_{B,\varphi}^L B$  in  $D(B)$ . And let  $D_{\text{comp}}(B[F])$  be the full subcategory spanned by pairs  $(M, \varphi)$  where  $M \in D_{\text{comp}}(B, (t))$  (5.9.6.4).

Given  $(M, \varphi) \in D_{\text{comp}}(B[F])$ , let  $M^{\varphi=1} = R\text{Hom}_{D(B[F])}((B, \varphi), (M, \varphi)) \in D(F_p)$ , called the **Frobenius fixed pts** of  $M$ .  $\lrcorner$

**Prop. (27.6.10.2).** Fix an  $\mathbb{F}_p$ -algebra  $B$  with an element  $t$ , then

- The functor  $D_{\text{comp}}(B[F]) \rightarrow D(\mathcal{F}_p)$  given by  $M \rightarrow M^{\varphi=1}$  and  $M \mapsto (M[t^{-1}])^{\varphi=1}$  commute with colimits.
- For any  $(M, \varphi) \in D_{\text{comp}}(B[F])$  and

### 1 Fontaine's Period Rings

#### Fontaine's Ring $\mathbf{A}_{\text{inf}}$

**Def.(27.7.1.1) [Fontaine's Ring  $\mathbf{A}_{\text{inf}}$ ].** Let  $C^\flat$  be a perfectoid field of characteristic  $p$ , for any untilt  $K$  of  $C^\flat$ , the Fontaine's ring  $\mathbf{A}_{\text{inf}} = \mathbf{A}_{\text{inf}}(\mathcal{O}_K) = W(\mathcal{O}_K^\flat) = W(\mathcal{O}_{C^\flat})$  (5.5.1.15). Also denote  $B_{\text{inf}} = \mathbf{A}_{\text{inf}}[\frac{1}{p}]$ .

the set of all the char0 untilts  $K$  of  $C^\flat$  is denoted by  $Y$ . and  $Y_{[a,b]}$  denotes those untilts that  $a \leq |p|_K \leq b$ . ┘

**Prop.(27.7.1.2).** By (12.2.9.7), if  $K \in \text{Perfd}^0 \cap \text{Field}^0$ , with tilt  $C^\flat$ , then there is a diagram

$$\begin{array}{ccc} \mathbf{A}_{\text{inf}} & \xrightarrow{\theta} & \mathcal{O}_K \\ \downarrow & & \downarrow \\ \mathcal{O}_{C^\flat} & \xrightarrow{\bar{\theta}} & \mathcal{O}_K/(p) \end{array},$$

where the Fontaine's map  $\theta$  (5.5.1.15) is surjective, and  $\ker \theta$  is generated by some distinguished element  $\xi = [t] - pu$  where  $u \in \mathbf{A}_{\text{inf}}^*$ . Moreover, any distinguished element in the kernel is a generator. ┘

*Proof:*  $\theta$  is surjective by (5.5.1.16). By (12.2.8.11), there exists  $t \in \mathbf{A}_{\text{inf}}$  s.t.  $t^\sharp = pu'$  for some  $u'$  invertible in  $\mathcal{O}_K$ . Thus  $u' = \theta(u)$  for some invertible  $u \in \mathbf{A}_{\text{inf}}$ , then  $\theta([t] - pu) = 0$ . And  $\xi$  generates the kernel because it generates after modulo  $\varpi$ , and use the fact  $\mathcal{O}_K$  is  $p$ -complete.

For the last assertion, use (27.7.1.4), which shows that if  $\xi'$  is another distinguished element in  $\ker \theta$ ,  $\mathbf{A}_{\text{inf}}/(\xi')$  is an integral domain of dimension 1. So  $(\xi) = (\xi')$  as  $\mathcal{O}_K$  is not a field.  $\square$

**Lemma(27.7.1.3).** If  $R \in \mathcal{CRing}$ ,  $x, y \in R$ , and  $x \in R^\times$  and  $R$  is  $x$ -adically complete Hausdorff, and  $y$  is not a zero-divisor in  $R/x$  and  $R/x$  is  $y$ -adically complete Hausdorff, then the same is true with  $x, y$  interchanged. ┘

*Proof:* ?  $\square$

**Prop.(27.7.1.4) [Untilts and Distinguished Elements].** (27.7.1.2) shows that for any  $K \in \text{Untilt}(C^\flat)$ , the kernel is generated by a distinguished element. Conversely, for any distinguished element  $\xi$ ,  $\mathbf{A}_{\text{inf}}/(\xi)$  can be identified with the valuation ring  $\mathcal{O}_K$  of a perfectoid field  $K$ . and

$$\mathcal{O}_C^\flat = \mathbf{A}_{\text{inf}}/p \rightarrow \mathbf{A}_{\text{inf}}/(\xi, p) \cong \mathcal{O}_K/p$$

exhibits  $K$  as an untilt of  $C^\flat$ . ┘

*Proof:* May assume  $\xi = [t] - up$  and  $t \neq 0$ . Consider the mapping  $\theta : \mathbf{A}_{\text{inf}} \rightarrow \mathbf{A}_{\text{inf}}/(\xi) = \mathcal{O}_K$ , and denote  $\theta([x])$  by  $x^\sharp$ .

Firstly, we can apply lemma(27.7.1.3) to  $\xi$  and  $p$  to conclude that  $\mathbf{A}_{\text{inf}}$  is  $\xi$ -complete and  $\xi$ -torsion-free, and  $\mathcal{O}_K$  is  $p$ -adically complete and  $p$ -torsion-free.

Now for any  $y \in \mathcal{O}_K$  is  $p$ -adically complete, there is a  $x \in \mathcal{O}_C^\flat$  that  $(y) = (x^\sharp)$ : multiplying  $p$ -power, we can assume  $y$  is not divisible by  $p$ , and there is a  $x$  that  $y \equiv x^\sharp \pmod{p}$ , thus  $x$  is not divisible by  $t$ . Now  $t = xx'$  for some  $x' \in \mathfrak{m}_C^\flat$ , thus  $y = x^\sharp + t^\sharp w = x^\sharp(1 + x'w)$ , and  $1 + x'w$  is invertible in  $\mathcal{O}_K$ .

Next we prove  $\mathcal{O}_K$  is an integral domain: It suffices to show any  $y \neq 0 \in \mathcal{O}_K$  is not a zero-divisor. We can assume  $y = x^\sharp$ , by what just proved, and then  $x$  divides  $t^n$  for some  $n$ , so it suffices to consider  $y = t^{n\sharp} = p^n$ , and  $p^n$  is not a zero-divisor by what just proved.

Now we can endow  $\mathcal{O}_K$  with the valuation  $|y| = |x|_{C^\flat}$  for  $y = x^\sharp u$ , and extend it to the quotient field  $K$ . Then this is a Non-Archimedean valuation and the residue field has char  $p$  because  $|p| < 1$ , and  $K$  has char 0, because  $p \neq 0$  in  $K$ . And it is  $p$ -adically complete.

Finally,  $\mathcal{O}_K/(p) \cong \mathbf{A}_{\text{inf}}/(\xi, p) = \mathcal{O}_{C^\flat}/\pi$ , so the Frobenius is surjective, thus  $K = K(\mathcal{O}_K)$  is a perfectoid field.  $\square$

**Cor. (27.7.1.5).** The correspondence  $\xi \mapsto \text{Frac}(\mathbf{A}_{\text{inf}}/(\xi))$  induces a bijection

$$\{\text{Distinguished elements}\}/\text{units} \cong \{\text{Untilts of } C^\flat\}/\text{isomorphisms}.$$

┘

**Prop. (27.7.1.6) [ $\mathbf{A}_{\text{inf}}$  as Holomorphic Function in  $p$ ].** Any element in  $\mathbf{A}_{\text{inf}}$  can be written uniquely as a unique Teichmuller representation  $[c_0] + [c_1]p + [c_2]p^2 + \dots$ . Now we can regard these elements as holomorphic functions on  $B(0, 1)$ , and any untilts  $K$  of  $\mathcal{O}_{C^\flat}$  can be regarded as points in  $B(0, 1)$ , where  $\mathbf{A}_{\text{inf}}$  take value  $c_0^\sharp + c_1^\sharp p + \dots \in \mathcal{O}_K$  at the point  $K$ .

This map can in fact be extended to  $\mathbf{A}_{\text{inf}}[\frac{1}{[t]}, \frac{1}{p}]$  s.t.

$$\mathbf{A}_{\text{inf}} \hookrightarrow \mathbf{A}_{\text{inf}}[\frac{1}{[t]}] \hookrightarrow \mathbf{A}_{\text{inf}}[\frac{1}{[t]}, \frac{1}{p}] \rightarrow K.$$

called the **evaluation map**.

┘

### Fontain's Ring $B$

**Def. (27.7.1.7) [Fontaine's Ring  $B$ ].** If compared to the complex case, the elements of  $\mathbf{A}_{\text{inf}}$  are just elements  $\sum a_n z^n$  that  $|a_n| \leq 1$ , this are not all the holomorphic functions on  $B(0, 1)$ , which is

$$\left\{ \sum_{n \in \mathbb{Z}} a_n z^n \mid \limsup_{n \rightarrow \infty} |a_n| \leq 1, \quad \lim_{n \rightarrow \infty} |a_{-n}|^{1/n} = 0 \right\}.$$

This leads to an enlargement of  $\mathbf{A}_{\text{inf}}$ :

For  $0 < a \leq b < 1$  in the value group of  $C^\flat$ ,  $\pi_a, \pi_b \in C^\flat$  with  $|\pi_a| = a, |\pi_b| = b$ , define

$$B_{[a,b]} = \mathbf{A}_{\text{inf}}[\frac{[\pi_a]}{p}, \frac{p}{[\pi_b]}]^\wedge [p^{-1}],$$

this is definable at any untilts  $K$  that  $a \leq |p|_K \leq b$ .

Then  $B_{[a,b]}$  is an algebra over  $\mathbf{A}_{\text{inf}}[\frac{1}{[t]}, \frac{1}{p}]$ , and define  $B = \varprojlim B_{[a,b]}$ .  $\square$

┘

**Prop. (27.7.1.8) [Gauss Norm].** Any element  $f$  in  $\mathbf{A}_{\text{inf}}[\frac{1}{[t]}, \frac{1}{p}]$  is of the form  $\sum_{n \gg -\infty} [c_n]p^n$ , where  $\{|c_n|\}$  is bounded. So we can define the valuation  $|f|_\rho = \sup\{|c_n|\rho^n\}$ , it is realizable by some term  $|a_n|\rho^n$ . Notice that for an until  $y = (K, \iota)$ , if  $\rho = |p|_K$ , then  $|f(y)| \leq |f|_\rho$ .

Then this is a non-Archimedean valuation on  $\mathbf{A}_{\text{inf}}[\frac{1}{[t]}, \frac{1}{p}]$ .  $\lrcorner$

*Proof:* Firstly  $|f + g|_\rho \leq \max\{|f|_\rho, |g|_\rho\}$  for every  $\rho$  that is generic for  $f + g$  and in the value group of  $C^b$ : In this case,

$$|f + g|_\rho = |(f + g)(y)| \leq \max\{|f(y)|, |g(y)|\} \leq \max\{|f|_\rho, |g|_\rho\}$$

for some point  $y$  by (27.7.1.8), then by continuity and (27.7.1.9), this is true for any  $\rho$ .

The same method shows that  $|f|_\rho |g|_\rho = |fg|_\rho$ .  $\square$

**Lemma (27.7.1.9) [Generic Norms].**  $\rho \in (0, 1)$  is called a **generic value** for  $f$  iff the valuation is realized exactly once. Notice if  $\rho$  is generic for  $f$  and in the value group of  $C^b$ , then  $|f|_\rho = |f(y)|$  for some  $y$  (Choose  $K = \mathbf{A}_{\text{inf}}/([c] - p)$  where  $|c|_{C^b} = \rho$ ).

For any  $f$ , the numbers  $\rho$  that  $\rho$  is not generic for  $f$  is discrete in  $\rho$ .  $\lrcorner$

*Proof:* Consider the Newton polygon of  $f$ , then only the slopes of the Newton polygon are not generic.  $\square$

**Lemma (27.7.1.10).** If  $y = (K, \iota) \in Y$  and  $|p|_K = \rho$ , then  $|f(y)| \leq |f|_\rho$ , and equality holds if either  $\rho$  is generic or  $f$  is invertible.  $\lrcorner$

**Prop. (27.7.1.11) [Valuation Map].** For  $0 < a \leq b < 1$  in the value group of  $C^b$ ,  $|\pi_a| = a, |\pi_b| = b$ ,

$$\mathbf{A}_{\text{inf}}\left[\frac{[\pi_a]}{p}, \frac{p}{[\pi_b]}\right] = \left\{f \in \mathbf{A}_{\text{inf}}\left[\frac{1}{[t]}, \frac{1}{p}\right] : |f|_a \leq 1, |f|_b \leq 1\right\} = V_0.$$

Thus the ring  $B_{[a,b]}$  is identified with the completion of  $\mathbf{A}_{\text{inf}}[\frac{1}{[t]}, \frac{1}{p}]$  w.r.t the valuation  $|\cdot|_a + |\cdot|_b$  (19.1.6.4). In particular, for any point  $y$  that  $a \leq |p|_K \leq b$ , the valuation map (27.7.1.6) can be extended to a map

$$B_{[a,b]} \rightarrow K.$$

$\lrcorner$

*Proof:* Notice  $V_0$  is a subring by (27.7.1.8), so clearly  $\mathbf{A}_{\text{inf}}[\frac{[\pi_a]}{p}, \frac{p}{[\pi_b]}] \subset V_0$ .

For the reverse containment, notice that  $\{|c_n|\}$  is bounded, so there is an  $m$  that  $\pi_b^m c_n \in C^b$  for any  $n$ . Now

$$f = \sum_{n < m} [c_n]p^n + \left( \sum_{n \geq 0} [c_{n+m} \pi_b^m] p^n \right) \left( \frac{p}{[\pi_b]} \right)^m,$$

so it suffices to prove the case  $f$  has finite presentation. Now  $c_n \pi_a^n, c_n \pi_b^n \in \mathcal{O}_C^b$ , thus  $[c_n]p^n = [c_n \pi_a^n] \left( \frac{\pi_n}{p} \right)^{-n} = [c_n \pi_b^n] \left( \frac{p}{\pi_b} \right)^n \in \mathbf{A}_{\text{inf}}[\frac{[\pi_a]}{p}, \frac{p}{[\pi_b]}]$ , where  $n \geq 0$  or  $n \leq 0$ . Thus the inverse containment is true.  $\square$

**Prop. (27.7.1.12) [Topology of  $B$ ].** For  $0 < a \leq c \leq b < 1$ ,  $|f|_c \leq \max\{|f|_a, |f|_b\}$  (trivial), thus the Fontaine's ring  $B$  can be realized as the completion of  $\mathbf{A}_{\text{inf}}$  w.r.t. all these norms, and endowed with the topology of  $p$ -adic Fréchet space.  $\lrcorner$

*Proof:* Cf. [Conrad, P65]. ?  $\square$

**Prop. (27.7.1.13) [Teichmuller Expansion].** An infinite sum  $f = \sum [a_n]p^n$  converges in  $B$  iff it converges in any norm  $|\cdot|_\rho$  for  $0 < \rho < 1$ , which is equivalent to

$$\limsup_{n \geq 0} |c_n|_{C^b}^{1/n} \leq 1, \quad \lim_{n \rightarrow \infty} |c_{-n}|_{C^b}^{1/n} = 0.$$

This is analogous to the complex case (12.4.3.4). However, for now, we don't know iff every element of  $B$  is of this form, and whether the representation is unique?  $\lrcorner$

**Prop. (27.7.1.14) [Frobenius Action].** Notice the Frobenius action of  $C^b$  extends to a Frobenius action on the Witt vector  $\mathbf{A}_{\text{inf}}$ , and it satisfies

$$|\varphi(f)|_{\rho^p} = (|f|_\rho)^p,$$

Thus induces an isomorphism  $B_{[a,b]} \cong B_{[a^p, b^p]}$ . Passing to the limit, we get an automorphism of  $B$ , denoted also by  $\varphi$ .  $\lrcorner$

### the Field $B_{\text{dR}}$

**Prop. (27.7.1.15) [Untilts with Roots of Unity].** Let  $\mathbb{Q}_p^{\text{cycl}} = \mathbb{Q}_p(\mu_{p^\infty})^\wedge$ , and  $\varepsilon = (1, \mu_p, \mu_{p^2}, \dots)$  be a compatible  $p^n$ -th roots of unity that is an element of  $(\mathbb{Q}_p^{\text{cycl}})^b$ . Then  $\varepsilon - 1$  is a pseudo-uniformizer of  $(\mathbb{Q}_p^{\text{cycl}})^b$ . For any untilts  $K$  of  $C^b$  and an embedding of  $\mathbb{Q}_p^{\text{cycl}}$  in  $K$ , the tilting maps  $\varepsilon - 1$  to a pseudo-uniformizer of  $C^b$ . This induces a bijection:

$$\{\text{Untilts } (K, \iota) \text{ of } C^b \text{ with an embedding } \mathbb{Q}_p^{\text{cycl}} \hookrightarrow K\} \cong \{x \in C^b \mid 0 < |x - 1| < 1\}.$$

$\lrcorner$

*Proof:* In fact, the left hand side is equivalent to  $K$  has a compatible  $p^n$ -th roots of unity, and we want to prove that for any  $x$  in the right hand side, there is a unique untilts  $K$  that  $(x^{\frac{1}{p^k}})^\sharp$  is a compatible primitive roots of unity, and this is equivalent to  $(x^{\frac{1}{p}})^\sharp$  satisfies  $1 + x + \dots + x^{p-1} = 0$ , and further equivalent to  $\theta : \mathbf{A}_{\text{inf}} \rightarrow \mathcal{O}_K$  annihilates  $1 + [x^{\frac{1}{p}}] + \dots + [x^{\frac{p-1}{p}}]$ .

It suffices to show  $\xi = 1 + [x^{\frac{1}{p}}] + \dots + [x^{\frac{p-1}{p}}]$  is distinguished (27.7.1.5). Let  $\xi = \sum [c_n]p^n$ , consider reducing to the residue field:  $W(\mathcal{O}_{C^b}) \rightarrow W(\mathcal{O}_{C^b}/\mathfrak{m}_{C^b})$ , then  $\bar{x} = 1$ , and  $\bar{\xi} = p$ , thus  $|c_0| < 1, |c_1 - 1| < 1$ , so it is distinguished (5.5.4.20).  $\square$

**Cor. (27.7.1.16).** Considering different  $p^n$ -th roots of unities, there is a correspondence:

$$\{\text{Char 0 Untilts } (K, \iota) \text{ of } C^b \text{ with a compatible } p^n\text{-th roots of unity}\} \cong \{x \in C^b \mid 0 < |x - 1| < 1\} / \mathbb{Z}_p^*.$$

where  $\mathbb{Z}_p^*$  acts by exponentiation (12.2.8.8).

Furthermore, there is a correspondence:

$$\{\text{Char 0 Untilts } (K, \iota) \text{ of } C^b \text{ with a compatible } p^n\text{-th roots of unity}\} / \varphi_{C^b}^{\mathbb{Z}} \cong \{x \in C^b \mid 0 < |x - 1| < 1\} / \mathbb{Q}_p^*.$$

where the inverse is given by  $x \mapsto$  the vanishing locus of  $\log([x]) \in B$ .  $\lrcorner$

*Proof:* The only thing needed to be proven is the inverse is given by  $N(\log([x]))$ . Notice for any untilts  $K$ ,  $|(x^{p^n})^\sharp - 1| < |p|_K^{1/(p-1)}$  for  $n$  large, then  $\log((x^{p^n})^\sharp) = 0$  iff  $(x^{p^n})^\sharp = 1$  by Newton polygon. Now  $x^\sharp \neq 1$  because  $x \neq 1$  and  $\sharp$  is injective. Hence composing  $\varphi^n$  for some unique  $n$ , we can assume  $x^\sharp = 1, x^{\frac{1}{p}} \neq 1$ , thus it corresponds an untilt as in (27.7.1.15).  $\square$

**Def. (27.7.1.17)**  $[B_{\text{dR}}^+]$ .  $p$  is not a zero-divisor in  $\mathbf{A}_{\text{inf}}/(\xi^n)$ , as in the proof pf(27.7.1.4), so we can define

$$B_{\text{dR}}^+ = \varprojlim_n \mathbf{A}_{\text{inf}}/(\xi^n) \left[ \frac{1}{p} \right]$$

┘

**Prop. (27.7.1.18)** **[Fontaine's Ring  $B_{\text{dR}}$ ]**.  $B_{\text{dR}}^+$  is a CDVR with  $\xi$  a uniformizer and the residue field  $K$ . Hence we can define  $B_{\text{dR}} = \text{Frac}(B_{\text{dR}}^+)$ . ┘

*Proof:* Firstly  $\xi$  is not a zero divisor in  $B_{\text{dR}}^+$ , because if  $\xi x = 0, x = (x_n)$ , then for any  $n > 0$ , and some  $k$  that  $p^k x_n \in \mathbf{A}_{\text{inf}}/(\xi^n)$ , so  $p^k x_n$  is annihilated by  $\xi$  in  $\mathbf{A}_{\text{inf}}/(\xi^n)$ , thus  $p^k x_n = \xi^{n-1} y_n$  for some  $y_n$ , because  $\xi$  is a non-zero-divisor in  $\mathbf{A}_{\text{inf}}$  (27.7.1.4). So  $p^{n-1} x_{n-1} = 0 \in \mathbf{A}_{\text{inf}}/(\xi^n)$ , thus  $x_{n-1} = 0$ , because  $p$  is non-zero-divisor in  $\mathbf{A}_{\text{inf}}/(\xi^n)$  (27.7.1.4).

Next there is a map  $B_{\text{dR}}^+ / (\xi^m) \rightarrow \mathbf{A}_{\text{inf}} / (\xi^m) [p^{-1}]$ . This is an isomorphism: it is clearly a surjection, and if  $x = (x_n)$  is mapped to 0, then for each  $n \geq m$ , we choose  $p^{k(n)} x_n = 0 \in \mathbf{A}_{\text{inf}}/(\xi^n)$ , then  $p^{k(n)} x_n = \xi^m y_n$  for a unique  $y_n \in \mathbf{A}_{\text{inf}}/(\xi^{n-m})$ . So  $x = \xi^m \cdot (\frac{y_n}{p^{k(n)}}) \in \xi^m B_{\text{dR}}^+$ . (Notice the uniqueness of  $y_n$  shows  $(\frac{y_n}{p^{k(n)}})$  is an element in  $B_{\text{dR}}^+$ ).

Then it follows  $B_{\text{dR}}^+ \cong \varprojlim_m B_{\text{dR}}^+ / (\xi^m)$ , which shows that  $B_{\text{dR}}^+$  is  $\xi$ -adically complete, and  $m = 1$  shows the residue field is equal to  $K$ . ┘

**Remark (27.7.1.19)**.  $\mathbf{A}_{\text{inf}}/(\xi^n) \left[ \frac{1}{p} \right] = \mathbf{A}_{\text{inf}}/(\xi^n) \left[ \frac{1}{[t]} \right]$ , so if  $\text{char } k = p$ , then  $B_{\text{dR}}^+$  is just  $W(C^\flat)$ .

Thus  $B_{\text{dR}}^+$  should be thought as the completed local ring at the point  $y = (K, \iota)$ . ┘

**Prop. (27.7.1.20)** **[Topology on  $B_{\text{dR}}$ ]**. The Gauss norms give  $\mathbf{A}_{\text{inf}}$  a topology, giving  $B_{\text{dR}}$  a topology. Then  $B_{\text{dR}}$  is complete in this topology, and  $B_{\text{dR}} \rightarrow K$  is continuous.

With this topology,  $B_{\text{dR}}$  is abstractly isomorphic to  $\mathbb{C}_p((T))$ , but not topological isomorphic to it. ┘

*Proof:* Cf.[Conrad, P65] or [ $p$ -adic Period Rings]P42. ?

$B_{\text{dR}}$  is abstractly isomorphic to  $\mathbb{C}_p((T))$  by Cohn structure theorem ?, but [Colmez, Une construction de  $B_{\text{dR}}$ ] proved that  $\bar{K}$  is dense in  $B_{\text{dR}}$ , so it cannot be topological isomorphic to  $\mathbb{C}_p((T))$ . ┘

**Prop. (27.7.1.21)** **[The Stalk Map]**. Notice  $\mathbf{A}_{\text{inf}} = \varprojlim_n \mathbf{A}_{\text{inf}}/(\xi^n)$  as  $\xi$  is distinguished, thus there is a natural injection  $\mathbf{A}_{\text{inf}} \rightarrow B_{\text{dR}}^+$ , whose composition with  $B_{\text{dR}}^+ \rightarrow B_{\text{dR}}^+ / \xi \cong K$  maps  $p, [t]$  to  $p, t^\sharp$ , which shows  $p, [t]$  are invertible in  $B_{\text{dR}}^+$ , so there is a map

$$e : \mathbf{A}_{\text{inf}} \left[ \frac{1}{p}, \frac{1}{[t]} \right] \rightarrow B_{\text{dR}}^+.$$

In case  $a \leq |p|_K \leq b$ , this can be further extended to a map  $e : B_{[a,b]} \rightarrow B_{\text{dR}}^+$  (The stalk map). ┘

*Proof:* It suffices to prove for  $a = |p|_K = b$  because the topology is stronger. In this case, choose  $t = p^\flat \in C^\flat$ , then  $|t|_{C^\flat} = |p|_K$ , thus  $\bar{e}_n$  determined a map

$$\mathbf{A}_{\text{inf}} \left[ \frac{[t]}{p}, \frac{p}{[t]} \right] \rightarrow B_{\text{dR}}^+ / (\xi^n) \cong (\mathbf{A}_{\text{inf}} / \xi^n) [p^{-1}],$$

It suffices to prove the image is contained in  $p^{-k}(\mathbf{A}_{\text{inf}} / \xi^n)$  for some  $k = k(n)$ , because then  $\bar{e}_n$  is  $p$ -adically continuous, and extends to map of  $B_{[a]} = (\mathbf{A}_{\text{inf}} \left[ \frac{[t]}{p}, \frac{p}{[t]} \right])_p^\wedge \rightarrow (\mathbf{A}_{\text{inf}} / (\xi^n)) [p^{-1}]$ , which is compatible w.r.t  $n$ , thus gives a map  $B_{[a]} \rightarrow B_{\text{dR}}^+$ .

For this, consider  $f = \bar{e}_n(\frac{[t]}{p})$ ,  $g = \bar{e}_n(\frac{p}{[t]})$ , then their reduction under  $B_{\text{dR}}^+(\xi^n) \rightarrow B_{\text{dR}}^+/\xi \cong K$  is in  $\mathcal{O}_K \cong \mathbf{A}_{\text{inf}}/(\xi)$ , thus

$$f = f_1 + \frac{\xi}{p^c} f_2, \quad g = g_1 + \frac{\xi}{p^c} g_2$$

for  $f_1, f_2, g_1, g_2 \in \mathbf{A}_{\text{inf}}/(\xi^n)$  for some  $c$ . Then any

$$f^m = (f_1 + \frac{\xi}{p^c} f_2)^m = \sum_{i=0}^{m-1} C_m^i f_1^{m-i} (\frac{\xi}{p^c} f_2)^i \in p^{-nc}(\mathbf{A}_{\text{inf}}/(\xi^n)).$$

Thus  $\bar{e}_n(\mathbf{A}_{\text{inf}}[\frac{[t]}{p}, \frac{p}{[t]}]) \in p^{-nc}(\mathbf{A}_{\text{inf}}/(\xi^n))$ .  $\square$

**Cor. (27.7.1.22).** The stalk map  $e : B_{[a,b]} \rightarrow B_{\text{dR}}^+$  composed with the map  $B_{\text{dR}}^+/\xi \cong K$  are in fact equivalent to the valuation map (27.7.1.11).  $\lrcorner$

### $B_{\text{crys}}$

Cf. [Notes on  $p$ -adic Hodge, Serin Hong].

**Def. (27.7.1.23)** [ $B_{\text{crys}}$ ].  $\lrcorner$

### $B_{\text{st}}, B_e$

## 2 $C_{\text{dR}}$ -Theorem

**Thm. (27.7.2.1)** [ $C_{\text{dR}}$ , Faltings/Tsuji]. If  $X \in \text{SmPrpr}/K$ , then for any  $r \in \mathbb{N}$ , there exists a canonical isomorphism

$$\gamma_{\text{dR}}(X) : B_{\text{dR}} \otimes_K H_{\text{dR}}^r(X/K) \cong B_{\text{dR}} \otimes_{\mathbb{Q}_p} H_{\text{ét}}^r(X_{\bar{K}}, \mathbb{Q}_p).$$

which identifies filtrations and  $\text{Gal}_K$ -actions on both sides. Moreover  $\gamma_{\text{dR}}$  is functorial in  $X$ .  $\lrcorner$

*Proof:* Cf. [Faltings,  $p$ -adic Hodge Theory]. or [p-adic Hodge for Rigid Analytic Varieties, Scholze], [BMS18]P104.  $\square$

**Cor. (27.7.2.2)** [deRham Comparison for Étale Cohomologies].  $H_{\text{ét}}^r(X_{\bar{K}}, \mathbb{Q}_p) \in \text{Rep}_{\mathbb{Q}_p}^{\text{dR}}(\text{Gal}_K)$ , and

$$H_{\text{dR}}^r(X) \cong D_{B_{\text{dR}}}(H_{\text{ét}}^r(X_{\bar{K}}, \mathbb{Q}_p)), \quad H^{n-p}(X; \Omega_X^p) \cong \text{gr}^p H_{\text{dR}}^r(X).$$

Also by taking the gradation of (27.7.2.1), by (25.2.5.5), there is a Hodge-like decomposition

$$\mathbb{C}_K \otimes_{\mathbb{Q}_p} H_{\text{ét}}^r(X_{\bar{K}}, \mathbb{Q}_p) \cong \bigoplus_{a+b=r} \mathbb{C}_K(-a) \otimes_K H^b(X, \Omega_X^a).$$

This shows we can recover the de Rham cohomology of  $X$  from the étale cohomology, and the Hodge-Tate weights of  $H_{\text{ét}}^r(X_{\bar{K}}, \mathbb{Q}_p)$  lies in in  $[-r, 0]$ .  $\lrcorner$

**Remark (27.7.2.3).** Is this true for non-proper varieties with logarithmic poles?  $\lrcorner$

**Example (27.7.2.4)** [Elliptic Curve Case, Tensoring  $\mathbb{C}_K$  Lost Informations]. For  $E \in \text{EllCur}/K$  with multiplicative reduction and  $j(E) > 1$ , by (21.3.5.13) and (21.3.5.10),

$$E(\bar{K}) \cong \bar{K}^\times / q^{\mathbb{Z}}$$

as  $\text{Gal}_K$ -representations for some  $q \in K^\times$ . Thus  $T_p(E) \cong q^{\mathbb{Q}_p/\mathbb{Z}_p}$  and there exists an exact sequence

$$0 \rightarrow \mathbb{Z}_p(1) \rightarrow T_p(E) \rightarrow \mathbb{Z}_p \rightarrow 0.$$

Then this sequence doesn't split when tensoring  $\bar{K}$ , but split when tensoring  $\mathbb{C}_K$ , by (27.7.3.3).  $\lrcorner$

*Proof:* Suppose it splits after tensoring  $\overline{K}$ , then it splits after tensoring some finite extension  $K'$ . Then by projection of  $K'$  onto  $\mathbb{Q}$ , we see

$$0 \rightarrow \mathbb{Q}_p(1) \rightarrow V_p(E) \rightarrow \mathbb{Q}_p \rightarrow 0$$

is splitting as a  $\text{Gal}_{K'}$ -representations. But this is not true, as any system of roots of  $p$   $\square$

$C_{\text{dR}}$ -theorem(27.7.2.1) implies any representation of  $\text{Gal}_K$  of the form  $H_{\text{ét}}^r(X_{\overline{K}}, \mathbb{Q}_p)$  is deRham, thus it is natural to consider the converse:

### 3 $C_{\text{crys}}$ -Theorem

**Thm. (27.7.3.1) [Hyodo-Kato Isomorphism].** If  $X \in \text{Sch}^{\text{sm}, \text{proper}}/K$  has good reduction  $\mathcal{X}/\mathcal{O}_K$ , let  $\overline{\mathcal{X}} = \mathcal{X}_k$ , then for any  $r \in \mathbb{N}$ ,  $H_{\text{crys}}^r(\overline{\mathcal{X}}) \in \varphi\text{-Mod}_{W(k)}$ , and there is an isomorphism

$$K \otimes_{W(k)} H_{\text{crys}}(\overline{\mathcal{X}}) \cong H_{\text{dR}}^r(X).$$

Then this isomorphism descends  $H_{\text{dR}}^r(X)$  to  $K_0$ , and this  $K_0$ -structure is independent of the smooth model  $\mathcal{X}/\mathcal{O}_K$ .  $\lrcorner$

*Proof:*  $\square$

**Thm. (27.7.3.2) [ $C_{\text{crys}}$ , Faltings].** If  $X \in \text{Sch}^{\text{sm}, \text{proper}}/K$  has good reduction  $\mathcal{X}/\mathcal{O}_K$ , let  $\overline{\mathcal{X}} = \mathcal{X}_k$ , then for any  $r \in \mathbb{N}$ , there exists a canonical isomorphism

$$\gamma_{\text{dR}}(X) : B_{\text{dR}} \otimes_K H_{\text{dR}}^r(X/K) \cong B_{\text{dR}} \otimes_{\mathbb{Q}_p} H_{\text{ét}}^r(X_{\overline{K}}, \mathbb{Q}_p).$$

which respect  $\text{Gal}_K$ -actions and Frobenius-actions on both sides. Moreover  $\gamma_{\text{crys}}$  is functorial in  $X$ , and  $B_{\text{dR}} \otimes \gamma_{\text{crys}} = \gamma_{\text{dR}}$ (27.7.2.1).  $\lrcorner$

*Proof:* Cf.[Faltings, Crystalline Representations and  $p$ -adic Galois Representations].  $?$   $\square$

**Cor. (27.7.3.3) [Crystalline Comparison for Étale Cohomologies].** If  $X \in \text{Sch}^{\text{sm}, \text{proper}}/K$  has good reduction  $\mathcal{X}/\mathcal{O}_K$ , then for any  $r \in \mathbb{N}$ ,  $H_{\text{ét}}^r(X_{\overline{K}}, \mathbb{Q}_p) \in \text{Rep}_{\mathbb{Q}_p}^{\text{dR}}(\text{Gal}_K)$ , and

$$H_{\text{crys}}^r(\mathcal{X}_k) \cong D_{\text{crys}}(H_{\text{ét}}^r(X_{\overline{K}}, \mathbb{Q}_p)).$$

**Thm. (27.7.4.2) [Finiteness of Étale Cohomologies].** If  $K = \overline{K}$ ,  $X \in \text{rigSmPrprVar}/K$ , and  $\mathbb{L} \in \text{LocSys}_{\mathbb{F}_p}^{\text{ét}}(X)$ , then  $\dim_{\mathbb{F}_p} H_{\text{ét}}^i(X, \mathbb{L}) < \infty$  for any  $i \in \mathbb{N}$ , and vanishes for  $i > 2 \dim X$ .  $\lrcorner$

*Proof:*  $\square$

**Thm. (27.7.4.3) [Pro-Étale Sites are Locally Contractible].** If  $K = \overline{K}$  and  $X/K$  a connected affinoid rigid analytic variety, then for  $x \in X(K)$  and any  $p$ -torsion local system  $\mathbb{L}$  on  $X$ , the natural map

$$H_{\text{cont}}^i(\pi_1(X, x), \mathbb{L}_x) \rightarrow H_{\text{ét}}^i(X, \mathbb{L})$$

is an isomorphism.  $\lrcorner$

*Proof:* Cf. [Scholze, Rigid Analytic Varieties]P25. ?

It suffices to show that the natural map  $H^i(X_{\text{fét}}, \mathbb{L}) \rightarrow H^i(X_{\text{ét}}, \mathbb{L})$  is an isomorphism.  $\square$

**Thm. (27.7.4.4).** If  $K = \overline{K}$  and  $f : X \rightarrow Y$  be a proper smooth morphism of rigid analytic varieties over  $K$ , and  $\mathbb{L}$  an  $\mathbb{F}_p$ -local system on  $X_{\text{ét}}$ , then for any  $i \in \mathbb{N}$ , there is an almost isomorphism

$$(R^i f_{\text{ét},*} \mathbb{L}) \otimes \mathcal{O}_Y^+ / (p) \cong R^i f_{\text{ét},*} (\mathbb{L} \otimes \mathcal{O}_X^+ / (p)).$$

In particular, if  $X/K$  is a proper smooth rigid analytic variety, then there is an almost isomorphism

$$H_{\text{ét}}^i(X, \mathbb{L}) \otimes \mathcal{O}_K / (p) \cong H_{\text{ét}}^i(X, \mathbb{L} \otimes \mathcal{O}_X^+ / (p)).$$

$\lrcorner$

*Proof:*

$\square$

**Cor. (27.7.4.5).** If  $K = \overline{K}$  and  $X/K$  is a proper smooth rigid analytic variety, then there is an almost isomorphism

$$H_{\text{ét}}^i(X, \mathbb{L}) \otimes \mathbb{B}_{\text{dR}}^+ \cong H_{\text{pro-ét}}^i(X, \mathbb{L} \otimes \mathbb{B}_{\text{dR}}^+).$$

$\lrcorner$

*Proof:*

$\square$

**Thm. (27.7.4.6) [deRham Lisse Sheaves].** For  $X \in \text{rigSmPrprVar}/K$ , there is a fully faithful functor from the category of filtered  $\mathcal{O}_X$ -modules with an integral connection satisfying the Griffiths transversality ? to  $\text{LocSys}_{\mathbb{B}_{\text{dR}}}/X$ .

A **de Rham lisse sheaf** is a lisse  $\mathbb{Z}_p$ -sheaf  $\mathbb{L}$  s.t. the associated  $\mathbb{B}_{\text{dR}}$ -local system  $\mathbb{L} \otimes \mathbb{B}_{\text{dR}}$  lies in the essential image of this functor.  $\lrcorner$

*Proof:*

$\square$

**Thm. (27.7.4.7) [ $C_{\text{dR}}$  for Rigid Analytic Varieties].** If  $X \in \text{rigSmPrprVar}/K$  and  $\mathbb{L}$  a lisse  $\mathbb{Z}_p$ -sheaf on  $X$ , then there is a  $\text{Gal}_K$ -equivariant isomorphism

$$H_{\text{ét}}^i(X_{\overline{K}}, \mathbb{L}) \otimes B_{\text{dR}}^+ \cong H_{\text{ét}}^i(X_{\overline{K}}, \mathbb{L} \otimes B_{\text{dR}}^+).$$

And if  $\mathbb{L}$  is deRham(27.7.4.6) with associated filtered module with integral connection  $(\mathcal{E}, \nabla, \text{Fil}^\bullet)$ , then

- the Hodge-deRham spectral sequence

$$H_{\text{Hdg}}^{i,j}(X, \mathcal{E}) \implies H_{\text{dR}}^{i+j}(X, \mathcal{E})$$

degenerates,

- $H_{\text{ét}}^i(X_{\overline{K}}, \mathbb{L}) \in \text{Rep}_{\text{dR}}^{\text{fd}}(\text{Gal}_K)$  with associated filtered  $K$ -vector space  $H_{\text{dR}}^i(X, \mathcal{E})$ ,
- there is a  $\text{Gal}_K$ -equivariant isomorphism

$$H_{\text{ét}}^i(X_{\overline{K}}, \mathbb{L}) \otimes \mathbb{C}_K \cong \bigoplus_j H_{\text{Hdg}}^{i-j,j}(X, \mathcal{E}) \otimes \mathbb{C}_K(-j).$$

In particular, this applies to  $\mathbb{L} = \overline{\mathbb{Z}_p}$  and  $\mathcal{E} = \mathcal{O}_X$ . ┘

*Proof:* ?

3 follows from 1 and 2. □

**Thm. (27.7.4.8).** Let  $f : X \rightarrow Y$  be a smooth proper morphism of smooth rigid analytic varieties over  $K$  and  $\mathbb{L}$  a lisse  $\mathbb{Z}_p$ -sheaf on  $X$  which is deRham corresponding to the filtered module with integral connection  $(\mathcal{E}, \nabla, \text{Fil}^\bullet)$ . Assume  $R^i f_{\text{pro-ét},*} \mathbb{L}$  is a lisse  $\mathbb{Z}_p$ -sheaf on  $Y$  (e.g.  $f : X \rightarrow Y \in \text{SmPrpr}/K$ ), then  $R^i f_{\text{pro-ét},*} \mathbb{L}$  is also deRham, with the associated filtered module with integral connection given by  $R^i f_{\text{dR},*}(\mathcal{E}, \nabla, \text{Fil}^\bullet)$ . ┘

*Proof:* □

## 5 Integral $p$ -adic Hodge Theory

**Notation (27.7.5.1).**

- Let  $(C, \mathcal{O}_C, \kappa)$  be the algebraic closure of a  $p$ -adic field. ┘

**Thm. (27.7.5.2) [Properties of  $\mathbf{A}_{\text{inf}}$ -Cohomologies].** For a proper smooth formal scheme  $\mathfrak{X}/\mathcal{O}_C$ , there is a complex  $R\Gamma_{\text{inf}}(\mathfrak{X}) \in \text{Perf}(\mathbf{A}_{\text{inf}})$ , functorial in  $\mathfrak{X}$ , satisfying the following:

- (Étale Specialization)  $R\Gamma_{\mathbf{A}_{\text{inf}}}(\mathfrak{X}) \otimes_{\mathbf{A}_{\text{inf}}}^{\mathbb{L}} W(C^\flat) \cong R\Gamma_{\text{ét}}(\mathfrak{X}_C, \mathbb{Z}_p) \otimes_{\mathbb{Z}_p}^{\mathbb{L}} W(C^\flat)$ .
- (Crystalline Specialization)  $R\Gamma_{\mathbf{A}_{\text{inf}}}(\mathfrak{X}) \otimes_{\mathbf{A}_{\text{inf}}}^{\mathbb{L}} W(k) \cong R\Gamma_{\text{crys}}(\mathfrak{X}_k/W(k))$ .
- (deRham Specialization)  $R\Gamma_{\mathbf{A}_{\text{inf}}}(\mathfrak{X}) \otimes_{\mathbf{A}_{\text{inf}}}^{\mathbb{L}} \mathcal{O} \cong R\Gamma_{\text{dR}}(\mathfrak{X}/\mathcal{O})$ . ┘

*Proof:* □

**Thm. (27.7.5.3) [Torsions in Crystalline and Étale Cohomologies].** Let  $\mathfrak{X}/\mathcal{O}_C$  be a proper smooth formal scheme and  $i \in \mathbb{Z}_{\geq 0}$ . Assume  $H_{\text{crys}}^i(\mathfrak{X}_k/W(k))_{\text{tor}} = 0$ , then  $H_{\text{ét}}^i(\mathfrak{X}_C, \mathbb{Z}_p)_{\text{tor}} = 0$ . ┘

*Proof:* □

## 27.8 Pro-Étale Sites on $\mathcal{P}\text{erfd}$ and Diamonds

References are [Sch17] and [Notes on Diamonds, David Hansen].

### 1 Properties of Perfectoid Spaces

#### Totally Disconnected Spaces

**Def. (27.8.1.1) [Totally Disconnected Spaces].**  $X \in \mathcal{P}\text{erfdSpa}$  is called **totally disconnected** if it is qcqs and any open covering  $\{U_i \rightarrow X\}$  splits, i.e.  $\coprod U_i \rightarrow X$  splits, or equivalently, there is a refinement covering  $\{V_i \rightarrow X\}$  that  $X \cong \coprod V_i$ .

A perfectoid space  $X$  is called **strictly totally disconnected** if it is qcqs and every étale cover splits.  $\lrcorner$

**Prop. (27.8.1.2).** Let  $X$  be a qcqs perfectoid space, then  $X$  is totally disconnected iff all its connected components are of the form  $\text{Spa}(K, K^+)$  where  $(K, K^+)$  are perfectoid affinoid fields. And it is strictly totally disconnected if moreover  $K$  are all alg.closed.  $\lrcorner$

*Proof:* Cf. [Sch17].P29, P35.  $\square$

**Prop. (27.8.1.3).** if  $X$  is a totally disconnected perfectoid space, then  $X$  is affinoid.  $\lrcorner$

*Proof:* Cf. [Sch17].P30.  $\square$

#### Injections

**Def. (27.8.1.4) [Injections].**  $f : X \rightarrow Y \in \mathcal{P}\text{erfdSpa}$  is called an injection if for any perfectoid space  $Z$ ,  $f_* : \text{Hom}(Z, X) \rightarrow \text{Hom}(Z, Y)$  is an injection.  $\lrcorner$

**Prop. (27.8.1.5) [Residue Field Map is Injection].** Let  $X$  be a perfectoid space and  $x \in X$ , giving rise to a map of residue fields

$$i_x : \text{Spa}(\kappa(x), \kappa(x)^+) \rightarrow X,$$

then  $i_x$  is an injection of perfectoid spaces.  $\lrcorner$

*Proof:* To show this, firstly we can replace  $X$  with an affinoid nbhd of  $X$ . Then notice that  $\text{Spa}(\kappa(x), \kappa(x)^+)$  is the filtered limit over all rational nbhds  $U$  of  $x$  in  $X$ , and for each  $U$ ,  $U \rightarrow X$  is an injection by definition (27.3.3.1), so  $i_x$  is also an injection.  $\square$

**Cor. (27.8.1.6).** In particular, if  $X$  is qcqs and has a unique closed point  $x \in X$ , then  $X = \text{Spa}(\kappa(x), \kappa(x)^+)$ , as in this case  $X$  is the only quasi-compact open subset containing  $x$ .  $\lrcorner$

**Prop. (27.8.1.7) [Characterizations of Injections].** For  $f : X \rightarrow Y \in \mathcal{P}\text{erfdSpa}$ , the following are equivalent:

- $f$  is an injection.
- For any perfectoid adic field  $(K, K^+)$ , the map of sets  $f_* : Y(K, K^+) \rightarrow X(K, K^+)$  is an injection.
- The map  $|f| : |Y| \rightarrow |X|$  is injective, and for all rank 1 point  $y \in Y$  with image  $f(y) = x \in X$ , the map of completed residue fields  $\kappa(x) \rightarrow \kappa(y)$  is an isomorphism.
- The map  $|f| : |Y| \rightarrow |X|$  is injective, and  $f$  is final in the category of maps  $Z \rightarrow X$  that  $|Z| \rightarrow |X|$  factors through the map  $|Y| \rightarrow |X|$ .

In particular, by item4, an injection of perfectoid spaces is determined by its topological map.  $\lrcorner$

*Proof:* Cf.[Sch17]P21.  $4 \rightarrow 1 \rightarrow 2$  is trivial.  $\square$

**Prop.(27.8.1.8)[Injection and Base Change].**

- Let  $f : Y \rightarrow X$  be an injection of perfectoid spaces, and  $X' \rightarrow X$  any map of perfectoid spaces, then the pullback  $f' : Y' = Y \times_X X' \rightarrow X'$  is also an injection, and the induced map

$$|Y'| \rightarrow |Y| \times_{|X|} |X'|$$

is a homeomorphism.

- A map of perfectoids spaces is an injection iff it is universally injective.  $\lrcorner$

*Proof:* Cf.[Sch17]P24.  $\square$

### Immersions

**Def.(27.8.1.9)[Immersion**s].  $f : Y \rightarrow X \in \mathcal{P}\text{erfdSpa}$  is called an immersion if  $f$  is an injection and  $|f| : |Y| \rightarrow |X|$  is a locally closed immersion. If  $|f|$  is moreover closed or open, then it is called closed/open immersion.  $\lrcorner$

**Def.(27.8.1.10)[Zariski-Closed Immersion**s]. Let  $f : Z \rightarrow X = \text{Spa}(R, R^+) \in \mathcal{P}\text{erfdSpa}$ , then

- $f$  is called a Zariski-closed immersion if  $f$  is a closed immersion and  $|Z| = V(I) \subset |X|$ , where  $I \subset R$  is an ideal.
- $f$  is called a strongly Zariski-closed immersion if  $Z = \text{Spa}(S, S^+)$  is affinoid perfectoid,  $R \rightarrow S$  is surjective, and  $S^+$  is the closure of  $R^+$  in  $S$ .  $\lrcorner$

**Prop.(27.8.1.11).**

- If  $f$  is strongly Zariski closed, then  $f$  is Zariski closed, in particular a closed immersion.
- If  $f$  is Zariski closed, then  $Z$  is affinoid.
- If  $X$  is of characteristic  $p$ , and  $f$  is Zariski closed, then  $f$  is strongly Zariski closed.  $\lrcorner$

*Proof:* Cf.[Sch17] Section2.5.  $\square$

**Prop.(27.8.1.12).** For any map of perfectoid spaces  $Y \rightarrow X$ , the diagonal map  $\Delta_f : Y \rightarrow Y \times_X Y$  is an immersion.  $\lrcorner$

*Proof:* Clearly  $\Delta_f$  is an injection, thus it suffices to show that  $|\Delta_f|$  identifies  $Y$  with a locally closed subset of  $|Y \times_X Y|$ . This can be checked locally on the target, so we can assume  $X = \text{Spa}(R, R^+)$  and  $Y = \text{Spa}(S, S^+)$ , then the diagonal map is strongly Zariski closed, as  $S \hat{\otimes}_R S \rightarrow S$  is surjective and maps the integral closure of  $S^+ \hat{\otimes}_{R^+} S^+ \rightarrow S^+$  onto  $S^+$ . Thus by(27.8.1.11),  $\Delta_f$  is a closed immersion in this case.  $\square$

**Def.(27.8.1.13)[Separated Map].**  $f : Y \rightarrow X \in \mathcal{P}\text{erfdSpa}$  is called separated if  $\Delta_f$  is a closed immersion.  $\lrcorner$

**Prop.(27.8.1.14)[Valuation Criterion].** For  $f : Y \rightarrow X \in \mathcal{P}\text{erfdSpa}$ , the following are equivalent:

- $f$  is separated.
- $|\Delta_f| : |Y| \rightarrow |Y \times_X Y|$  is a closed immersion.
- $|f|$  is quasi-separated, and for any perfectoid adic field  $(K, K^+)$  and any diagram

$$\begin{array}{ccc} \mathrm{Spa}(K, \mathcal{O}_K) & \longrightarrow & Y \\ \downarrow & \nearrow \text{dotted} & \downarrow f \\ \mathrm{Spa}(K, K^+) & \longrightarrow & X \end{array}$$

there exists at most one dotted arrow making the diagram commutative.

□

*Proof:* The equivalence of 1 and 2 is by (27.8.1.12).

2  $\rightarrow$  3: If  $|\Delta_f|$  is a closed immersion, then it is in particular quasi-compact, thus  $f$  is quasi-separated. Now if there are two dotted-arrow making this diagram commutative, they define a point  $z \in (Y \times_X Y)(K, K^+)$  s.t.  $z|_{\mathrm{Spa}(K, \mathcal{O}_K)} \in \Delta_f(Y)(K, \mathcal{O}_K)$ . But  $|\Delta_f|(|Y|)$  is closed in  $|Y \times_X Y|$ , so  $z$  maps  $\mathrm{Spa}(K, K^+)$  into  $|\Delta_f|(|Y|)$  iff it maps  $\mathrm{Spa}(K, \mathcal{O}_K)$  into  $|\Delta_f|(|Y|)$ , as  $\mathrm{Spa}(K, \mathcal{O}_K) \subset \mathrm{Spa}(K, K^+)$  is dense??. Now  $\Delta_f$  is an injection, so by (27.8.1.7),  $z$  factors through  $\Delta_f$  thus the two maps are equal.

3  $\rightarrow$  2: The condition implies that  $|\Delta_f| : |Y| \rightarrow |Y \times_X Y|$  is a quasi-compact locally closed immersion of locally spectral spaces which is moreover specializing. But because  $|\Delta_f|$  is quasi-compact, the image of  $|\Delta_f|$  is pro-constructible, and it is also closed under specialization, thus it is closed, Cf. [Sch17]P25. □

## 2 Pro-Étale Site and v-Site

**Prop. (27.8.2.1).** if  $(R, R^+)$  is the completed filtered colimit of perfectoid Huber pairs  $(R_i, R_i^+)$ ,  $X_i = \mathrm{Spa}(R_i, R_i^+)$ ,  $X = \mathrm{Spa}(R, R^+)$ , then base change induce equivalences of categories:

- $2 - \lim_i X_{i, \text{fét}} \cong X_{\text{fét}}$ .
- $2 - \lim_i X_{i, \text{ét}}^{\text{aff}} \cong X_{\text{ét}}^{\text{aff}}$ .
- $2 - \lim_i X_{i, \text{ét}, qcqs} \cong X_{\text{ét}, qcqs}$ .
- $2 - \lim_i X_{i, \text{ét}, qc, sep} \cong X_{\text{ét}, qc, sep}$ .

□

*Proof:* Cf. [Sch17]P27.

1 follows from almost purity theorem. □

**Def. (27.8.2.2) [Pro-Étale Morphism].** A **pro-étale map of perfectoid Huber pairs** is a map  $(A, A^+) \rightarrow (B, B^+)$  s.t.  $(B, B^+)$  is the completed filtered colimit of étale maps  $(A, A^+) \rightarrow (A_i, A_i^+)$  (27.3.5.1).

A morphism of perfectoid spaces is **pro-étale** if there is an affinoid covering  $V_i = \mathrm{Spa}(R_i, R_i^+)$  of  $X$  that  $f^{-1}(V_i)$  have coverings  $U_{ij} = \mathrm{Spa}(R_{ij}, R_{ij}^+)$  that  $(R_i, R_i^+) \rightarrow (R_{ij}, R_{ij}^+)$  are all pro-étale.

In fact, by (27.8.2.7), if this is true for one affinoid covering  $V_i$  of  $X$ , then this is true for any affinoid covering of  $X$ .

? Is this compatible with the definition in (27.3.6.2)? □

**Prop. (27.8.2.3).** If  $S$  is a profinite set and  $X$  is a perfectoid space, then we can define a new perfectoid space  $X \times \underline{S}$  as the inverse limit of  $X \times \underline{S}_i$ , where  $\underline{S} = \varprojlim S_i$ . Then  $X \times \underline{S}$  is pro-étale over  $X$ . □

**Prop. (27.8.2.4) [Immersion are Pro-Étale].** If  $f : Z \hookrightarrow X$  be a Zariski closed immersion with image  $V(I)$ , then  $f$  is affinoid pro-étale. Then  $f(Z)$  can be written as the intersection of rational subsets

$$U_{f_1, \dots, f_n} = \{|f_1|, \dots, |f_n| \leq |\varpi|\}$$

for various  $n$  and  $f_1, \dots, f_n \in I$ . Then  $Z = \varprojlim U_{f_1, \dots, f_n} \rightarrow X$ , as it is a closed immersion thus an injection (27.8.1.11), which shows  $Z \rightarrow X$  is pro-étale.

In particular, an immersion is also pro-étale because pro-étale can be checked analytically locally.

┘

**Cor. (27.8.2.5) [Diagonal Map is Pro-Étale].** If  $f : Y \rightarrow X$  is a map of perfectoid spaces, then  $\Delta_f : Y \rightarrow Y \times_X Y$  is pro-étale, by (27.8.1.12). ┘

**Prop. (27.8.2.6).** If  $X$  is an affinoid perfectoid space, then the functor

$$\mathrm{Pro}(X_{\text{ét}}^{\text{aff}}) \rightarrow X_{\text{pro-ét}}^{\text{aff}} : \varprojlim_i (X_i) \mapsto \varprojlim_i X_i$$

is an equivalence of categories. ┘

*Proof:* This map is essentially surjective by definition, To show it is fully faithful, it suffices to show that for  $Y = \varprojlim_i \mathrm{Spa}(Y_i, Y_i^+)$ ,  $Z = \varprojlim_j \mathrm{Spa}(Z_j, Z_j^+)$ ,

$$\mathrm{Hom}_X(Y, Z) = \varprojlim_j \varinjlim_i \mathrm{Hom}(Y_i, Z_j).$$

We need to show for any  $Z \rightarrow X$ ,

$$\mathrm{Hom}_X(Y, Z) = \varinjlim_i \mathrm{Hom}(Y_i, Z).$$

Because  $2 - \lim_i X_{i, \text{ét}, qcqs} \cong X_{\text{ét}, qcqs}$  (27.8.2.1), we have

$$\mathrm{Hom}_X(Y, Z) = \mathrm{Hom}_Y(Y, Y \times_X Z) = \varinjlim_i \mathrm{Hom}_{Y_i}(Y_i, Y_i \times_X Z) = \varinjlim_i \mathrm{Hom}_X(Y_i, Z).$$

□

**Prop. (27.8.2.7) [Properties of Pro-Étale Morphisms].**

- (Affinoid)Pro-Étale maps are stable under composition and pullbacks.
- Let  $f : Y \rightarrow X$ ,  $f' : Y' \rightarrow X$  be (affinoid)pro-étale, then any map  $g : Y \rightarrow Y'$  over  $X$  is also (affinoid)pro-étale.
- For any affinoid perfectoid space  $X$ , the category  $X_{\text{pro-ét}}^{\text{aff}}$  has all finite limits.

┘

*Proof:* 1: Composition is obvious. pro-étale maps are stable under pullbacks because étale maps do.

2: We can factor  $g$  as a section of the map  $Y \times_X Y' \rightarrow Y$  and the projection map  $Y \times_X Y' \rightarrow Y'$ . Thus it suffices to show a section of a pro-étale map is pro-étale. But if  $Y = \varprojlim_i Y_i \rightarrow X$  is pro-étale, then a section is given by compatible sections  $s_i : X \rightarrow Y_i$ . Then  $X = \varprojlim_i (X \times_{Y_i} Y) \rightarrow X$  is pro-étale.

3: This is because  $X_{\text{ét}}^{\text{aff}}$  has finite limits, because it has a final object and fiber products (12.2.9.17).

□

**Def. (27.8.2.8) [Big Pro-Étale Sites].** Consider the following categories:

- $\mathcal{P}\text{erfdSpa}$ , the category of perfectoid spaces.
- $\mathcal{P}\text{erf}$ , the category of perfectoid spaces of characteristic  $p$ .
- $X_{\text{proét}}$ , the category of perfectoid spaces pro-étale over  $X$ , where  $X$  is a perfectoid space.
- $X_{\text{proét}}^{\text{aff}}$ , the category of affinoid perfectoid spaces pro-étale over  $X$ .

The **big pro-étale site** is the category  $\mathcal{P}\text{erfdSpa}$  endowed with the topology that a family of maps  $\{f_i : Y_i \rightarrow X\}$  is a covering if all  $f_i$  are pro-étale and for any quasi-compact open subset  $U \subset X$ , there is a finite set  $J \subset I$  and quasi-compact opens  $V_j \subset Y_j$  that  $U = \cup_{j \in J} f_j(V_j)$ .

These truly form sites by (27.8.2.7).  $\lrcorner$

**Cor. (27.8.2.9).** The presheaf  $\mathcal{O} : X \mapsto \mathcal{O}_X(X)$ ,  $\mathcal{O}^+ : X \mapsto \mathcal{O}_X^+(X)$  on the big étale site are sheaves. If  $X$  is affinoid perfectoid, then  $H^i(X_{\text{pro-ét}}, \mathcal{O}) = 0$  for  $i > 0$ , and  $H^i(X_{\text{pro-ét}}, \mathcal{O}^+)$  is almost zero for  $i > 0$ . Moreover, the big pro-étale site is subcanonical.  $\lrcorner$

*Proof:* Firstly we can assume  $X$  is affinoid because we already know  $\mathcal{O}, \mathcal{O}^+$  are sheaves w.r.t. the analytic topology. Let  $Y \rightarrow X$  be an affinoid pro-étale covering of  $X$ , where  $Y = \text{Spa}(R_\infty, R_\infty^+)$ ,  $(R_\infty, R_\infty^+) = (\varinjlim_i (R_i, R_i^+))^\wedge$ . Then fixing a pseudo-uniformizer  $\varpi$  of  $R$ , the complexes

$$0 \rightarrow R^+/\varpi \rightarrow R_j^+/\varpi \rightarrow \cdots$$

is almost exact, because  $H^i(X_{\text{ét}}, \mathcal{O}_X^+/\varpi)$  is almost zero for  $i > 0$ . Now take a direct limit over  $i$ , then

$$0 \rightarrow R^+/\varpi \rightarrow R_\infty^+/\varpi \rightarrow \cdots$$

is almost exact. Now by induction on  $n$ , we can prove

$$0 \rightarrow R^+/\varpi^n \rightarrow R_\infty^+/\varpi^n \rightarrow \cdots$$

is almost exact. Then by passing to the direct limit ,

$$0 \rightarrow R^+ \rightarrow R_\infty^\infty \rightarrow \cdots$$

is almost exact. Then by inverting  $\varpi$ ,

$$0 \rightarrow R \rightarrow R_\infty \rightarrow \cdots$$

is exact. These give us the desired results. Notice  $\mathcal{O}^+$  is a sheaf because it is the elements of valuations  $\leq 1$  everywhere by (27.3.3.7).

For the final assertion, if  $\{Y_i \rightarrow Y\}$  is a pro-étale covering of  $Y$ , and  $g_i : Y_i \rightarrow X$  are maps that agree on  $Y_i \times_X Y_j$ , then firstly we can glue these maps together topologically to a map  $|Y| \rightarrow |X|$ . So this problem can be considered locally on  $X$ , so we may assume  $X = \text{Spa}(R, R^+)$  is affinoid, and maps  $(R, R^+) \rightarrow (\mathcal{O}(Y_i), \mathcal{O}^+(Y_i))$  that agree on the overlap (27.3.4.6), then they glue to a map  $(R, R^+) \rightarrow (\mathcal{O}(Y), \mathcal{O}^+(Y))$ , as  $\mathcal{O}, \mathcal{O}^+$  are all sheaves, and this gives a morphism  $Y \rightarrow X$ .  $\square$

**Prop. (27.8.2.10) [Strictly Totally Disconnected Pro-Étale Cover].** Let  $X$  be an affinoid perfectoid space, then there is an affinoid perfectoid space  $\tilde{X}$  with an affinoid pro-étale surjective and universally open map  $\tilde{X} \rightarrow X$  that  $\tilde{X}$  is strictly totally disconnected.  $\lrcorner$

*Proof:* Cf. [Sch17] P35.  $\square$

**Prop. (27.8.2.11).** The presheaf  $\mathcal{O}, \mathcal{O}^+$  are sheaves w.r.t. the  $v$ -topology. Moreover, the  $v$ -site is subcanonical.  $\lrcorner$

*Proof:* Cf.[Sch17]P40.  $\square$

**Prop. (27.8.2.12).** Let  $X$  be an affinoid perfectoid space, then  $H_v^i(X, \mathcal{O}) = 0$  for  $i > 0$ , and  $H_v^i(X, \mathcal{O}^+)$  is almost zero for  $i > 0$ .  $\lrcorner$

*Proof:* Cf.[Sch17]P41.  $\square$

### Descent on Pro-Étale Site

**Prop. (27.8.2.13) [Descent May Fail].** The question is whether the fibered category over  $\text{Perfd}$ :

$$X \mapsto \{\text{Perfectoid Spaces } Y \rightarrow X\}$$

is a stack for the pro-étale topology. This fails in general. An evidence is that the fibered category

$$X \mapsto \{\text{Affinoid Perfectoid Spaces } Y \rightarrow X\}$$

is not a stack on the category of affinoid Perfectoid spaces with the analytic topology, let along the pro-étale topology:

Let  $X = \text{Spa } K\langle x, y \rangle$ , and  $V \subset X$  be  $\{(x, y) \mid |x| = 1 \text{ or } |y| = 1\}$ , then  $V$  is covered by two affinoids, but is not an affinoid itself:  $H^1(V, \mathcal{O}_V) = \bigoplus_{m, n > 0} Kx^{-m}y^{-n} \neq 0$ . But there is a standard rational covering  $X = \cup_i X(\frac{f_1, f_2, f_3}{f_i})$ , where  $f_1 = \varpi, f_2 = x, f_3 = y$ , and

$$U_0 \cap V = \emptyset, \quad U_1 \cap V = \{|x| = 1\} \subset U_1, \quad U_2 \cap V = \{|y| = 1\} \subset U_2$$

are all affinoid. There is a similar example in the perfectoid case, thus

$$X \mapsto \{\text{Affinoid Perfectoid Spaces } Y \rightarrow X\}$$

is not a stack.  $\lrcorner$

**Prop. (27.8.2.14) [Pro-étale is not Pro-étale Local].** There is an example of a non-pro-étale map that is pro-étale locally pro-étale.  $\lrcorner$

*Proof:* Cf.[S-W20]P66.  $\square$

**Prop. (27.8.2.15) [Characterization of Locally pro-étale Maps].** For  $f : X \rightarrow Y \in \text{AffPerfdSpa}$ , the following are equivalent:

- There exists an affinoid pro-étale cover  $Y' \rightarrow Y$  s.t. the base change  $X' = X \times_Y Y' \rightarrow Y'$  is pro-étale.
- For all geometric points  $\text{Spa } C \rightarrow Y$ ,  $X \times_Y \text{Spa } C = \text{Spa } C \times \underline{S}$  for some profinite set  $S$ .

$\lrcorner$

*Proof:* Cf.[S-W20]P66.  $\square$

**Prop. (27.8.2.16) [Descent].** Descent data of the the fibered category

$$X \mapsto \{\text{Perfectoid Spaces } Y \rightarrow X\}$$

of a perfectoid space  $Y' \rightarrow X'$  along a pro-étale cover  $X' \rightarrow X$  is effective in the following cases:

- If  $X, X', Y'$  are affinoids and  $X$  is totally disconnected.
- if  $f$  is separated and pro-étale and  $X$  is strictly totally disconnected.
- If  $f$  is separated and étale. In particular, the fibered category

$$X \mapsto \{\text{separated étale } X \rightarrow Y\}$$

is a stack over the category of perfectoid spaces with the pro-étale topology.

- If  $f$  is finite étale. In particular, the fibered category

$$X \mapsto \{\text{finite étale } X \rightarrow Y\}$$

is a stack over the category of perfectoid spaces with the pro-étale topology.

⌋

*Proof:* Cf. [Sch17] P9.3, 9.6, 9.7. □

### 3 Morphisms of v-Stacks

**Def. (27.8.3.1) [Étale Morphisms of Stacks].** Let  $f : Y' \rightarrow Y$  be a map of pro-étale stacks on  $\mathcal{P}\text{erfd}$ ,

- Assume  $f$  is locally separated (i.e. there is an open cover of  $Y'$  over which  $f$  becomes separated), then  $f$  is called **quasi-pro-étale** if for any strictly totally disconnected perfectoid space  $X$  and a map  $X \rightarrow Y$ , the pullback  $Y' \times_Y X$  is representable and  $Y' \times_Y X \rightarrow X$  is pro-étale.
- Assume  $f$  is locally separated, then  $f$  is called **étale** if for any perfectoid space  $X$  and a map  $X \rightarrow Y$ , the pullback  $Y' \times_Y X$  is representable and  $Y' \times_Y X \rightarrow X$  is étale.
- $f$  is called **finite étale** if for any perfectoid space  $X$  and a map  $X \rightarrow Y$ , the pullback  $Y' \times_Y X$  is representable and  $Y' \times_Y X \rightarrow X$  is finite étale.

⌋

### 4 Diamonds

**Remark (27.8.4.1) [Motivation of Diamonds].** The idea of diamonds is that there should be a functor

$$\diamond : \{\text{analytic adic spaces over } \mathbb{Z}_p\} \rightarrow \{\text{diamonds}\}$$

that forgets the structure morphism to  $\mathbb{Z}_p$ . For a perfectoid space  $X$ ,  $X \mapsto X^{\text{flat}}$  has this property, so this functor should coincide on these objects. Now any analytic adic space  $X$  over  $\mathbb{Z}_p$  is pro-étale locally perfectoid:

$$X = \text{Coeq}(\tilde{X} \times_X \tilde{X} \rightrightarrows X),$$

where  $\tilde{X} \rightarrow X$  is a pro-étale perfectoid cover. The equivalence relations  $R = \tilde{X} \times_X \tilde{X}$  is also perfectoid, so this functor should send  $X$  to  $\text{Coeq}(R^b \rightrightarrows \tilde{X}^b)$ .

For example, if  $X = \text{Spa}(\mathbb{Q}_p)$ , then a pro-étale cover of  $X$  is  $\text{Spa}((\mathbb{Q}_p^{\text{cycl}})^\wedge)$ , and then  $R = \tilde{X} \times_X \tilde{X} = \tilde{X} \times \mathbb{Z}_p^*$  by Galois theory, and then  $\mathbb{Q}_p^\diamond$  should be defined as the coequalizer of  $\text{Spa}((\mathbb{Q}_p^{\text{cycl}})^b)/\mathbb{Z}_p^*$ , whose meaning is explained in (27.8.4.11). ⌋

**Def. (27.8.4.2) [Diamonds].** A **diamond** is a pro-étale sheaf  $\mathcal{D}$  on  $\mathcal{P}\text{erfdSpa}$  that can be written as  $\mathcal{D} = X/R$ , where

- $X \in \mathcal{P}\text{erfd}$ ,

- $R$  is a pro-étale equivalence relation in  $X \times X$  (i.e. an equivalence relation that the maps  $s, t : R \rightarrow X$  are pro-étale),
- $R$  is representable.

┘

**Prop. (27.8.4.3).** Let  $X \in \mathcal{P}\text{erfd}$  and  $R \subset X \times X$  a representable pro-étale equivalence relation, then

- The quotient sheaf  $Y = X/R$  is a diamond.
- The natural map of sheaves  $R \rightarrow X \times_Y X$  is an isomorphism.
- Let  $\tilde{X} \rightarrow X$  be a pro-étale cover by a perfectoid space  $\tilde{X}$ , and  $\tilde{R} = R \times_{X \times X} (\tilde{X} \times \tilde{X})$  the induced equivalence relation, then  $\tilde{R}$  is a representable pro-étale equivalence relation of  $\tilde{X}$ , and the natural map  $\tilde{Y} = \tilde{X}/\tilde{R} \rightarrow Y = X/R$  is an isomorphism.
- The map  $X \rightarrow Y$  is quasi-pro-étale (27.8.3.1).

┘

*Proof:* 1 is by definition.

For 2, firstly  $R \rightarrow X \times_Y X$  is injective as subsheaves of  $X \times X$ . Next, if  $Z \rightarrow X \times_Y X$  is any map from a perfectoid space  $Z$ , then we have two maps  $a, b : Z \rightarrow X$  that their composition with  $X \rightarrow Y$  agree. This means after passing to a pro-étale covering  $\tilde{Z} \rightarrow Z$ , the composition map  $\tilde{Z} \rightarrow Z \rightarrow X \times X$  factors through  $R$ . Now this map  $\tilde{Z} \rightarrow R$  descends to a map  $Z \rightarrow R$ , because pro-étale site is subcanonical and the two projection maps  $\tilde{Z} \times_Z \tilde{Z} \rightarrow R$  coincides because they do after compositing with  $R \hookrightarrow X \times X$ .

3: Firstly  $\tilde{R}$  is representable as fiber products of representable objects (27.4.1.4), and the two projections are pro-étale, as they are compositions of base changes of pro-étale morphisms. Also the map  $\tilde{Y} \rightarrow Y$  of pro-étale sheaves is surjective, as the composition  $\tilde{X} \rightarrow X \rightarrow Y$  is.

To show  $\tilde{Y} \rightarrow Y$  is injective, let  $Z$  be a perfectoid space with two maps  $Z \rightarrow \tilde{Y}$  that coincide after compositing with  $\tilde{Y} \rightarrow Y$ , we need to show  $a = b$ . Now because pro-étale site is subcanonical, it suffices to show this after replacing  $Z$  with a pro-étale cover  $\tilde{Z}$ , such that  $a, b$  factors over  $\tilde{a}, \tilde{b} : \tilde{Z} \rightarrow \tilde{X}$ . The associated map  $\tilde{Z} \rightarrow \tilde{X} \times \tilde{X} \rightarrow X \times X$  factors through  $R$  by item 2, so we get a map  $\tilde{Z} \rightarrow R \times_{X \times X} (\tilde{X} \times \tilde{X}) = \tilde{R}$ , which means  $\tilde{a}, \tilde{b}$  induces the same map  $\tilde{Z} \rightarrow \tilde{Y}$ . So we are done.

4: By 3, we can replace  $X$  by  $\tilde{X} = \coprod_i U_i \rightarrow X$ , where  $U_i$  is an affinoid cover of  $\tilde{X}$ , and  $R$  by the induced equivalence relation in  $\tilde{X} \times \tilde{X}$ , and to pro-étale is analytically local. In this way, we may assume  $R \subset X \times X$  and  $X \times X \rightarrow X$  are separated.

Let  $X'$  be a strictly totally disconnected perfectoid space and  $X' \rightarrow X$  be a map. Because  $X \rightarrow Y$  is surjective as sheaves on  $\mathcal{P}\text{erf}$ , there is a pro-étale cover  $\tilde{X}' \rightarrow X'$  and a map  $\tilde{X}' \rightarrow X$  lying over  $X' \rightarrow Y$ . We can assume  $\tilde{X}'$  is affinoid. Let  $W = X' \times_Y X \rightarrow X'$  be the fiber product, then

$$\tilde{X}' \times_{X'} W = \tilde{X}' \times_X (X \times_Y X) = \tilde{X}' \times_X R$$

is representable and pro-étale over  $\tilde{X}'$ , and also separated. So by (27.8.2.16),  $W$  is also representable, pro-étale and separated over  $X$ . □

**Cor. (27.8.4.4) [Equivalent Characterization of Diamonds].** Let  $Y$  be a pro-étale sheaf on  $\mathcal{P}\text{erf}$ , then  $Y$  is a diamond iff there is a surjective quasi-pro-étale morphism  $X \rightarrow Y$  from a perfectoid space  $X$ . If  $X$  is a disjoint union of strictly totally disconnected spaces, then  $R \subset X \times_Y X \subset X \times X$  is a representable pro-étale equivalence relation with  $Y = X/R$ . ┘

*Proof:* If  $Y$  is a diamond, then  $X \rightarrow Y$  is quasi-pro-étale by (27.8.4.3). Conversely, if there is a quasi-pro-étale morphism  $X \rightarrow Y$ , by (27.8.2.10), we can assume that  $X$  is a disjoint union of strictly

disconnected spaces. In this case, by the definition of auasi-pro-étale,  $R$  is representable and the projections  $R = X \times_Y X \rightarrow X$  is pro-étale, and  $X/R \cong Y$ : it suffices to show this map is injective: if  $a, b : Z \rightarrow X$  are two maps that coincide after composing with  $X \rightarrow Y$ , then after replacing to a pro-étale covering  $\tilde{Z} \rightarrow Z$ , we can lift to maps  $(\tilde{a}, \tilde{b}) : \tilde{Z} \rightarrow R$ . And this map descend to a map  $Z \rightarrow R$ , because the pullback to  $\tilde{Z} \times_Z \tilde{Z} \rightarrow R$  coincides as they do after composing with  $R \hookrightarrow X \times X$ . So  $X/R \rightarrow Y$  is injective.  $\square$

**Cor. (27.8.4.5).**

- Let  $Y$  be a pro-étale sheaf on  $\mathcal{P}\text{erfd}$  and there is a quasi-pro-étale map  $Y' \rightarrow Y$ , where  $Y'$  is a diamond, then  $Y$  is also a diamond.
- Let  $f : Y' \rightarrow Y$  be a quasi-pro-étale map of pro-étale sheaves on  $\mathcal{P}\text{erfd}$  and  $Y$  is a diamond, then  $Y'$  is also a diamond.

┘

*Proof:* 1: By (27.8.4.4), we can choose a quasi-pro-étale map  $X \rightarrow Y'$  where  $X$  is a perfectoid space, then  $X \rightarrow Y' \rightarrow Y$  is also quasi-pro-étale, so  $Y$  is a diamond by (27.8.4.4) again.

2: Choose a surjective quasi-pro-étale map  $X \rightarrow Y$  where  $X$  is a perfectoid space, then  $X' \times_X Y$  is representable and  $X' \rightarrow Y'$  is quasi-pro-étale and surjective, thus  $Y'$  is a diamond by (27.8.4.4).  $\square$

**Lemma (27.8.4.6) [Product of Perfectoid Spaces].** The product of two perfectoid spaces of char  $p$  is also a perfectoid space.  $\square$

*Proof:* Cf. [Sch17]P71.  $\square$

**Prop. (27.8.4.7) [Absolute Product of Diamonds].** Let  $\mathcal{D}, \mathcal{D}'$  be diamonds, then the product sheaf  $\mathcal{D} \times \mathcal{D}'$  is also a diamond.  $\square$

*Proof:* Let  $\mathcal{D} = X/R$  and  $\mathcal{D}' = X'/R'$ , then  $R \times R', X \times X'$  are also representable by (27.8.4.6),  $R \times R' \rightarrow (X \times X') \times (X \times X')$  is also an injection, and the projections are pro-étale. Thus  $\mathcal{D} \times \mathcal{D}' = (X \times X')/(R \times R')$  is a diamond, by (27.8.4.3).  $\square$

**Prop. (27.8.4.8) [Fiber Products].** Fiber products exist in the category of diamonds.  $\square$

*Proof:* Let  $Y_1 \rightarrow Y_2 \leftarrow Y_3$  be a diagram of diamonds. Choose representations  $Y_i = X_i/R_i$ , and after replacing  $X_1, X_2$  with a pro-étale covering using (27.8.4.3), we can assume there are maps  $X_i \rightarrow X_3$  lying over  $Y_i \rightarrow Y_3$ . Moreover, we can replace  $X_i$  by  $X_i \times_{Y_3} X_3$  to assume that  $X_i \rightarrow Y_1 \times_{Y_3} X_3$  is surjective in the pro-étale topology.

In this case, the map  $X_1 \times_{X_3} X_2 \rightarrow Y_1 \times_{Y_3} Y_2$  is surjective in the pro-étale topology, and the equivalence relation  $R_4 = X_4 \times_{Y_4} X_4$  can be calculated to be  $R_4 = R_1 \times_{R_3} R_2$ , which is representable. It remains to see that  $R_4 \rightarrow X_4$  is pro-étale. But  $R_1 \times R_2 \rightarrow X_1 \times X_2$  is pro-étale, so does its base change  $R_1 \times_{X_3} R_2 \rightarrow X_1 \times_{X_3} X_2 = X_4$ , and also  $R_4 = R_1 \times_{R_3} R_2 \rightarrow R_1 \times_{X_3} R_2$  is pro-étale because it is the base change of  $R_3 \rightarrow R_3 \times_{X_3} R_3$ , which is pro-étale by (27.8.2.5).  $\square$

**Prop. (27.8.4.9).** Let  $Y$  be a diamond, then  $Y$  is a sheaf for the v-topology.  $\square$

*Proof:* Cf. [Sch17]P54.  $\square$

**Def. (27.8.4.10) [Underlying Spaces of Diamonds].** Any diamond has an underlying space  $|\mathcal{D}| = |X|/|R|$ .  $\square$

*Proof:* ?  $\square$

$\mathrm{Spd}(\mathbb{Q}_p)$

**Prop. (27.8.4.11).** Let  $\mathrm{Spd}(\mathbb{Q}_p)$  be defined as

$$\mathrm{Spa}((\mathbb{Q}_p^{\mathrm{cycl}})^{\flat})/\mathbb{Z}_p^* = \mathrm{Spa}(\mathbb{F}_p((t^{1/p^\infty}))/\mathbb{Z}_p^*,$$

where  $\mathbb{Z}_p^*$  acts on  $\mathbb{F}_p((t^{1/p^\infty}))$  via  $\gamma(t) = (1+t)^\gamma - 1$  (27.2.8.17), i.e. it is the coequalizer of

$$\mathbb{Z}_p^* \times \mathrm{Spa}(\mathbb{F}_p((t^{1/p^\infty}))) \rightrightarrows \mathrm{Spa}(\mathbb{F}_p((t^{1/p^\infty}))),$$

where one map is projection and the other map is the group action. To show this is diamond, we first need to verify this is an injection thus an equivalence relation, which follows from (27.8.4.12).  $\lrcorner$

**Lemma (27.8.4.12).** Consider the map

$$g : \mathbb{Z}_p^* \times \mathrm{Spa}(\mathbb{F}_p((t^{1/p^\infty}))) \rightrightarrows \mathrm{Spa}(\mathbb{F}_p((t^{1/p^\infty}))) \times \mathrm{Spa}(\mathbb{F}_p((t^{1/p^\infty})))$$

where the first map is group action and the second map is projection, then this is an injection map.  $\lrcorner$

*Proof:* For any adic point  $(K, K^+)$ ,  $\mathbb{Z}_p^*$  acts freely on  $K^{00}$ , thus the map is an injection, by (27.8.1.7).  $\square$

**Prop. (27.8.4.13) [Torsor over Affinoid Perfectoid Space].** Let  $G$  be a profinite group and  $f : \mathcal{F}' \rightarrow \mathcal{F}$  be a  $G$ -torsor, with  $G$  profinite, then for any affinoid  $X = \mathrm{Spa}(B, B^+)$  and any morphism  $X \rightarrow \mathcal{F}$ , the pullback  $\mathcal{F}' \times_{\mathcal{F}} X$  is representable by a perfectoid affinoid  $X' = \mathrm{Spa}(A, A^+)$ , where  $(A, A^+)$  is the completed filtered colimit of  $(A_H, A_H^+)$ , where for each open normal subgroup  $H$  of  $G$ ,  $A_H/B$  is a finite étale  $G/H$ -torsor.  $\lrcorner$

*Proof:* If  $H$  is an open normal subgroup of  $G$ , then  $\mathcal{F}'/\underline{H} \rightarrow \mathcal{F}$  is a  $G/H$ -torsor, and  $\mathcal{F}' = \varprojlim_H \mathcal{F}'/\underline{H}$ , thus we reduce to the case  $G$  is finite. But for this case, we use the fact  $\{\text{perfectoid spaces finite étale over } X\}$  is a stack (27.8.2.16), and the definition of  $G$ -torsor.  $\square$

**Prop. (27.8.4.14) [Description of  $\mathrm{Spd}(\mathbb{Q}_p)$ ].** If  $X = \mathrm{Spa}(R, R^+)$  is an affinoid perfectoid space of characteristic  $p$ , then  $(\mathrm{Spd} \mathbb{Q}_p)(X)$  is the set of isomorphism classes of data of the following shape.

- A  $\mathbb{Z}_p^*$ -torsor  $R \rightarrow \tilde{R}$ , i.e.  $\tilde{R} = (\varinjlim_i R_i)^\wedge$ , where  $R_n/R$  is finite étale with Galois group  $(\mathbb{Z}/p^n\mathbb{Z})^*$ .
- A topological nilpotent unit  $t \in \tilde{R}$  s.t. for all  $\gamma \in \mathbb{Z}_p^*$ ,  $\gamma(t) = (1+t)^\gamma - 1$ .

$\lrcorner$

*Proof:* Notice  $\mathrm{Spa}(\mathbb{Q}_p^{\mathrm{cycl}})^{\flat} \rightarrow \mathrm{Spd}(\mathbb{Q}_p)$  is a  $\mathbb{Z}_p^*$ -torsor by definition, so for any morphism  $X \rightarrow \mathrm{Spd}(\mathbb{Q}_p)$ , the pullback  $\mathrm{Spa}(\mathbb{Q}_p^{\mathrm{cycl}})^{\flat} \times_{\mathrm{Spd}(\mathbb{Q}_p)} X \rightarrow X$  is also a  $\mathbb{Z}_p^*$ -torsor, so it is isomorphic to a torsor  $\mathrm{Spa}(\tilde{R}, \tilde{R}^+) \rightarrow \mathrm{Spa}(R, R^+)$  by (27.8.4.13), and the map  $\mathrm{Spa}(\mathbb{Q}_p^{\mathrm{cycl}})^{\flat} \times_{\mathrm{Spd}(\mathbb{Q}_p)} X \rightarrow X \rightarrow \mathrm{Spa}(\mathbb{Q}_p^{\mathrm{cycl}})^{\flat}$  is an  $\mathbb{Z}_p^*$ -equivariant map, which is equivalent to a topologically nilpotent element  $t \in \tilde{R}$  that is equivariant, i.e.  $\gamma(t) = (1+t)^\gamma - 1$ .

Conversely, for any such a  $\mathbb{Z}_p^*$ -torsor  $R \rightarrow \tilde{R}$ , an equivariant element  $t \in \tilde{R}$  descends to a map  $X \rightarrow \mathrm{Spd}(\mathbb{Q}_p)$ .  $\square$

**Prop. (27.8.4.15).**  $\mathrm{PerfdSpa}/\mathbb{Q}_p$  is equivalent to the category of perfectoid spaces  $X \in \mathrm{Perf}_p$  together with a map  $X \rightarrow \mathrm{Spd}(\mathbb{Q}_p)$ .  $\lrcorner$

*Proof:* Consider the category of triples  $(X^\sharp, X, \iota)$ , where  $X^\sharp$  is a perfectoid space over  $\mathbb{Q}_p$ ,  $X$  is a perfectoid space of characteristic  $p$ ,  $\iota : X^\sharp \cong X$  is an isomorphism. A map of triples is a tuple  $(f^\sharp, f) : (X^\sharp, X, \iota) \rightarrow (Y^\sharp, Y, \iota')$  that  $\iota' \circ f^\sharp = f \circ \iota$ .

This category is equivalent to the category of perfectoid spaces over  $\mathbb{Q}_p$  by the forgetful functor, where the quasi-inverse is given by  $X^\sharp \mapsto (X^\sharp, X^\sharp, \text{id}_{X^\sharp})$ . And this category is also fibered in equivalent relations over  $\mathcal{P}\text{erf}$ . So it is equivalent to a presheaf  $\text{Untilt}_{\mathbb{Q}_p}$  which maps  $X$  to the isomorphism classes of untelts  $(X^\sharp, \iota)$  over  $\mathbb{Q}_p$ , where  $\iota : X^\sharp \cong X$  is an isomorphism, by (4.2.3.29).

Similarly we can show define a functor  $\text{Untilt}$  which maps  $X$  to the isomorphism classes of untelts  $(X^\sharp, \iota)$  (of whatever characteristic), where  $\iota : X^\sharp \cong X$  is an isomorphism.

Let  $X = \text{Spa}(R, R^+)$  be an affinoid perfectoid space of characteristic  $p$ . If  $X^\sharp = \text{Spa}(R^\sharp, R^{\sharp+})$  is an untelt. Let  $\tilde{X}^\sharp = X^\sharp \otimes_{\mathbb{Q}_p} \mathbb{Q}_p^{\text{cycl}}$ , then  $\tilde{X}^\sharp \rightarrow X^\sharp$  is a pro-étale  $\mathbb{Z}_p^*$ -torsor, whose tilt  $\tilde{X} \rightarrow X$  is a pro-étale  $\mathbb{Z}_p^*$ -torsor equipped with a  $\mathbb{Z}_p^*$ -equivariant map  $\tilde{X} \rightarrow \text{Spa}(\mathbb{Q}_p^{\text{cycl}})^\flat$  this is a morphism  $X \rightarrow \text{Spd}(\mathbb{Q}_p)$  by (27.8.4.14).

Conversely, let  $\tilde{X} \rightarrow X$  be a pro-étale  $\mathbb{Z}_p^*$ -torsor and  $\tilde{X} \rightarrow \text{Spa}(\mathbb{Q}_p^{\text{cycl}})^\flat$  a  $\mathbb{Z}_p^*$ -equivariant map, then by tilting equivalence there exists a morphism  $\tilde{X}^\sharp \rightarrow \text{Spa}(\mathbb{Q}_p^{\text{cycl}})$  which is also  $\mathbb{Z}_p^*$ -equivariant. The equivariance means that it is a descent datum along  $\tilde{X} \rightarrow X$ , so it descends to an untelt  $X^\sharp$  of  $X$  over  $\mathbb{Q}_p$ .

Finally, for general affinoid perfectoid space  $X$ , as  $\text{Untilt}_{\mathbb{Q}_p}$  and  $\text{Spd}(\mathbb{Q}_p)$  are all sheaves on  $\mathcal{P}\text{erf}$ , the above construction can be glued to give an isomorphism between them.  $\square$

**Prop. (27.8.4.16) [Untelts is a Sheaf].**  $\text{Untilt}$  is a v-sheaf on  $\mathcal{P}\text{erfd}$ . So does  $\text{Untilt}_{\mathbb{Q}_p}$ , because the invertibility of  $p$  can be verified locally as  $\mathcal{O}$  is sheaf.  $\lrcorner$

*Proof:* Firstly  $\text{Untilt}$  is clearly an analytic sheaf, so it suffices to show that if  $X = \text{Spa}(R, R^+)$  is a perfectoid space of characteristic  $p$  with a v-cover  $Y = \text{Spa}(S, S^+) \rightarrow X$  and  $Y^\sharp = \text{Spa}(S^\sharp, S^{\sharp+})$  is an untelt of  $Y$  that the corresponding two untelts of  $Z = Y \times_X Y$  agree, then there is a unique untelt  $X^\sharp = \text{Spa}(R^\sharp, R^{\sharp+})$  whose pullback to  $Y$  is  $Y^\sharp$ .

Cf. [Sch17]P86.  $\square$

### Spatial Diamonds

**Def. (27.8.4.17) [Spatial Diamonds].** A **spatial diamond** is a qcqs diamond  $D$  s.t.  $|D|$  has a basis of opens  $|U|$  s.t.  $U \subset D$  is a qc open immersion.  $\lrcorner$

*Proof:*  $\square$

### Diamonds associated to Perfectoid Spaces

**Def. (27.8.4.18).** For  $Y \in \mathcal{P}\text{erfdSpa}$ ,  $Y^\diamond$ : is the map  $X \mapsto$  untelts of  $X$  with a map to  $Y$ .

It is a locally spatial diamond, s.t.  $|Y^\diamond| = |Y|$ .  $\lrcorner$

**Example (27.8.4.19).**  $\text{Spa}(R, R^+)^\diamond = \text{Spa}(R^\sharp, R^{\sharp+})$ .  $\lrcorner$

### 1 Schematic Fargues-Fontaine Curves

**Def. (27.9.1.1) [Fargues-Fontaine Curve].** The sum  $\bigoplus_n B^{\varphi=p^n}$  is a graded ring. In fact, it is non-negatively graded (27.9.1.33), and we define the **Fargues-Fontaine curve** as the projective scheme

$$\mathbf{Proj} \left( \bigoplus_{n \geq 0} B^{\varphi=p^n} \right).$$

┘

**Def. (27.9.1.2) [Formal Logarithm].** For  $x \in 1 + \mathfrak{m}_{C^b}$ ,  $[x] - 1 = [x - 1] + \sum_{n>0} [c_n] p^n$ , thus  $|[x] - 1|_\rho \geq |x - 1| > 0$ , thus the formal logarithm

$$\log([x]) = \sum_{k>0} \frac{(-1)^{k+1}}{k} ([x] - 1)^k$$

converges for every Gauss norm  $|\cdot|_\rho$ , thus converges to some element in  $B$ . And clearly  $\varphi(\log([x])) = p \log([x])$ , thus  $\log([x]) \in B^{\varphi=p}$ . And  $\log([xy]) = \log([x]) \log([y])$ . ┘

**Prop. (27.9.1.3) [Artin-Hasse Exponential].** There is another way of constructing elements in  $B^{\varphi=p}$ , which is

$$T : a \in \mathfrak{m}_{C^b} \mapsto \sum_n \frac{[a^{p^n}]}{p^n}.$$

We want to relate this one to the formal logarithm:

There is a bijection of sets  $\mathfrak{m}_{C^b} \cong 1 + \mathfrak{m}_{C^b}^b$  that  $\log([E(a)]) = T(a)$ , which is defined by the **Artin-Hasse exponential**

$$E(x) = \prod_{(d,p)=1} \left( \frac{1}{1-x^d} \right)^{\frac{\mu(d)}{d}}.$$

┘

*Proof:* Firstly, it has coefficients in  $\mathbb{Z}_{(p)}$ , because  $(1-x^d)^{\frac{1}{d}} = \sum (-1)^k C_{\frac{1}{d}}^k x^{kd}$  has coefficient in  $\mathbb{Z}_{(p)}$ . And  $[1-x] = \lim_k (1 - [x^{p^{-k}}])^{p^k}$ , so

$$\log \left( \left[ \prod_{(d,p)=1} \left( \frac{1}{1-x^d} \right)^{\frac{\mu(d)}{d}} \right] \right) = \sum_{(d,p)=1} \frac{\mu(d)}{d} \log \left( \frac{1}{[1-d]} \right) = \sum_{(d,p)=1} \mu(d) \sum_{\alpha \in p^{-n}\mathbb{Z}} \frac{[x^{d\alpha}]}{d\alpha}$$

Notice the right hand side stabilizes for any term  $[x^\beta]$ , and if  $\beta \neq \frac{1}{p^k}$ , it will vanish, thus for  $x \in \mathfrak{m}_{C^b}$ , it converges, and the sum equals  $\sum_n \frac{[x^{p^n}]}{p^n}$ . ┘

**Cor. (27.9.1.4).** The set of elements of the form  $\sum_n \frac{[a^{p^n}]}{p^n}$  is closed under addition. ┘

### Valuation Function

**Def. (27.9.1.5) [Exponential Valuation].** For any positive real number  $s$ , define a valuation on  $\mathbf{A}_{\inf}[\frac{1}{p}, \frac{1}{[t]}]$  by the formula  $v_s(f) = -\log |f|_{\exp(-s)}$ , then it is a valuation by (27.7.1.8).

If  $f$  has a Teichmüller expansion  $\sum_{n \gg -\infty} [c_n] p^n$ , then

$$\|f\|_{\rho} = \sup\{|c_n|_{C^b} \rho^n\}, \quad v_s(f) = \inf\{v(c_n) + ns\}.$$

┘

**Prop. (27.9.1.6).** For any  $f \neq 0 \in \mathbf{A}_{\inf}[\frac{1}{p}, \frac{1}{[t]}]$ ,  $s \mapsto v_s(f)$  is a concave function in  $s$  which is piecewise linear with integral slopes. ┘

*Proof:* Consider the Newton Polygon. ┐

**Lemma (27.9.1.7).** If  $s > 0$  and  $f_n$  is a Cauchy sequence in  $\mathbf{A}_{\inf}[\frac{1}{p}, \frac{1}{[t]}]$  for the norm  $|\cdot|_{\exp(-s)}$  and doesn't converge to 0, then the sequences

$$v_s(f_n), \quad \partial_- v_s(f_n), \quad \partial_+ v_s(f_n)$$

stabilize. ┘

*Proof:* Easy, Cf. [FF Curve, Lurie]P44. ┐

**Prop. (27.9.1.8).** If  $0 < a \leq b < 1$ , and  $f_n$  is a Cauchy sequence in  $\mathbf{A}_{\inf}[\frac{1}{p}, \frac{1}{[t]}]$  and doesn't converge to 0 for either the norm  $|\cdot|_a$  or  $|\cdot|_b$ , then the sequence of functions  $s \mapsto v_s(f)$  stabilizes on  $[-\log(b), -\log(a)]$ . ┘

*Proof:* Assume  $f_n$  doesn't converge to 0 for the form  $|\cdot|_b$ , then by (27.9.1.7), the sequences  $v_s(f_n), \partial_+ v_s(f_n)$  converges, thus  $v_s(f_n)$  is bounded uniformly, thus  $v_s(f)$  is bounded.

Then choose  $N$  large that  $|f - f_m|_{\rho}$  very small for any  $m > N$  and  $a \leq \rho \leq b$ , then  $v_s(f) = v_s(f_m)$  for any  $a \leq s \leq b$ , thus it stabilizes. ┐

**Cor. (27.9.1.9).** For  $f \in B^{\times}$ , the construction  $s \mapsto v_s(f)$  is a concave function in  $s$  with piecewise linear function with integral slopes. This is analogous to the Hadamard three circle theorem (12.5.2.13). ┘

*Proof:* This is true for  $f \in B_{[a,b]}$ , because any  $f$  is a limit of a sequence  $f_n$  in both the norm  $|\cdot|_a$  and  $|\cdot|_b$ , so by the proposition, there for  $n$  large,  $v_s(f) = v_s(f_n)$  on  $[-\log(b), -\log(a)]$ , thus the conclusion is true by (27.9.1.6). And for  $f \in B$ , for any interval  $[a, b]$  we can do the same, thus the conclusion is true on each interval, thus it is true. ┐

### Metric Structures on $Y$

**Def. (27.9.1.10) [Metric on  $\overline{Y}$ ].** Let  $\overline{Y} = Y \cup \{0\}$  be the isomorphism classes of untilts of  $C^b$ , where 0 corresponds to  $C^b$  itself.

(27.7.1.5) show  $\overline{Y}$  corresponds to distinguished elements in  $\mathbf{A}_{\inf}$  up to units. So for any  $x, y \in \overline{Y}$ , we let  $d(x, y) = |\xi_x(y)|_{K_y} \leq 1$ . Then this is a metric, and it is non-Archimedean. ┘

*Proof:* Firstly, if  $d(x, y) = 0$ , then  $\xi_x$  divides  $\xi_y$ , which is equivalent to  $(\xi_x) = (\xi_y)$ , by (5.5.4.21).

Secondly, for any  $x, y$ , since  $C^b$  is alg.closed, we can assume  $\xi_x(y) = c^{\sharp}$  for some  $c \in C^b$ . Notice  $\xi(y) = t^{\sharp} + pu(y)$  is in  $\mathfrak{m}_K$ , thus  $c \in \mathfrak{m}_{C^b}$ . So  $\xi_x - [c]$  is also a distinguished element and vanishes at  $y$ , so we may assume that  $\xi_y = \xi_x - [c]$  by (5.5.4.21) again. Then

$$d(y, x) = |\xi_y(x)|_{K_x} = |c^{\sharp}|_{K_x} = |c|_{C^b} = |c^{\sharp}|_{K^y} = d(x, y).$$

Finally it is non-Archimedean because any valuation field  $K$  is non-Archimedean. ┐

**Prop. (27.9.1.11) [ $\bar{Y}$  is Complete].**  $\bar{Y}$  is complete w.r.t this metric.  $\lrcorner$

*Proof:* Given a Cauchy sequence of points  $y_n$  in  $\bar{Y}$ , as in the proof of (27.9.1.10), we can assume that  $\xi_{y_n} = \xi_{y_{n-1}} + [c_n]$  for some  $c_n \in \mathfrak{m}_{C^b}$ , and  $|c_n|_{C^b} = d(y_{n-1}, y_n)$ . Now  $\mathbf{A}_{\text{inf}}$  is  $[t]$ -adically complete for a uniformizer  $t \in C^b$ , thus  $\sum [c_n]$  is definable in  $\mathbf{A}_{\text{inf}}$ , and  $\xi = \xi_0 + \sum [c_n]$  is also distinguished, and corresponds to a point  $y$  which  $y_n$  clearly converges to.  $\square$

### Divisors

**Lemma (27.9.1.12).**  $B_{[a,b]}$  is an integral domain.  $\lrcorner$

*Proof:* By (27.9.1.9), the valuation function  $v_s(f)$  and  $v_s(g)$  are bounded, thus it is clear that  $v_s(fg)$  is also finite, so  $fg \neq 0$ .  $\square$

**Prop. (27.9.1.13) [Divisors].** Assume  $C^b$  is alg.closed, then for any  $f \in B_{[a,b]}$  and  $y = (K, \iota) \in Y_{[a,b]}$ , we define the **order of vanishing**  $\text{ord}_K(f) \in \mathbb{Z} \cup \{\infty\}$  as the valuation of  $e_K(f) \in B_{\text{dR}}^+(K)$ . Then

- if  $f \neq 0 \in B_{[a,b]}$ , then  $\text{ord}_K(f) < \infty$  for each  $K \in Y_{[a,b]}$ , and there are only f.m.  $K$  that  $\text{ord}_K(f) \neq 0$ . In particular,  $B_{[a,b]}$  is an integral domain.
- if  $x, y \neq 0 \in B_{[a,b]}$ , then  $x$  divides  $y$  iff  $\text{ord}_K(x) \geq \text{ord}_K(y)$  for each  $K \in Y_{[a,b]}$ .

Thus for each  $f \in B_{[a,b]}$ , we can define the **divisor** of  $K$  as the formal sum  $\sum_{K \in Y_{[a,b]}} \text{ord}_K(f) K$ , and this is also definable for  $f \in B$ , but it may be an infinite but locally finite sum.  $\lrcorner$

*Proof:* Firstly, by (27.9.1.17) and (27.9.1.18), if  $\text{div}(f) \cap Y_{[a,b]} \neq \emptyset$ , then there is a distinguished element  $\xi$  that  $f = \xi f_1$ . And we can iterate this, and eventually end up with  $f = \xi_1 \dots \xi_n f_n$  that  $\text{div}(f_n) \cap Y_{[a,b]} = \emptyset$ , by (27.9.1.19), so by (27.9.1.20),  $f_n$  is invertible in  $B$ , so  $\text{div}(f)$  is finite. And if  $\text{div}(g) \geq \text{div}(f)$ , then  $g$  also divides  $\xi_1 \dots \xi_n$ , so  $g$  divides  $f$ .  $\square$

**Remark (27.9.1.14).** Notice by (27.7.1.22), for a  $f \in B_{[a,b]}$ ,  $\text{ord}_K(f) > 0$  iff  $f(y) = 0 \in K$ .  $\lrcorner$

**Cor. (27.9.1.15) [ $B$  is Integral Domain].**  $B$  is an integral domain, and if  $C^b$  is alg.closed, then  $x$  is divisible by  $y$  if and only if  $\text{div}(x) \geq \text{div}(y)$ .  $\lrcorner$

**Cor. (27.9.1.16).**  $B$  is integrally closed.  $\lrcorner$

*Proof:*  $B$  is an integral domain by (27.9.1.15), it is integrally closed because if  $f/g$  is integral over  $B$ , then there image in  $B_{\text{dR}}^+(y)$  is integral over  $B_{\text{dR}}^+(y)$  for all  $y \in Y$ , thus in  $B_{\text{dR}}^+(y)$  because it is a valuation ring, and then  $f$  is divisible by  $g$  by (27.9.1.15).  $\square$

**Prop. (27.9.1.17) [Examples of Divisors].**

- For a distinguished element  $\xi$ , if  $\xi = up$ , then  $\xi$  is invertible in  $B$ , thus  $\text{div}(\xi) = 0$ . Otherwise  $\xi$  defines a char0 untilts  $K$  of  $C^b$ , and  $\xi$  is a uniformizer of  $B_{\text{dR}}^+(K)$ , and it doesn't divides other distinguished elements (5.5.4.21), thus  $\text{div}(\xi) = K$ .
- $\text{div}(\log([x])) = \sum_{n \in \mathbb{Z}} \varphi^n(K)$ .

$\lrcorner$

*Proof:* 2:  $\log([x])$  vanishes at a single  $\varphi$ -orbits of  $Y$ , and one of them is given by the distinguished element  $\xi = 1 + [x^{1/p}] + \dots + [x^{p-1/p}] = \frac{[x]-1}{[x^{1/p}]-1}$ . Notice  $[x^{1/p}] - 1$  is mapped to an invertible element in  $K$ , thus it is invertible in  $B_{\text{dR}}^+(K)$ , so  $[x] - 1$  is associated to  $\xi$ , and notice

$$\log([x]) = \sum_{k>0} \frac{(-1)^{k+1}}{k} ([x] - 1)^k \equiv [x] - 1 \pmod{([x] - 1)^2},$$

so  $\text{ord}_K(\log([x])) = 1$ , and because  $\varphi(\log([x])) = p \log([x])$ ,  $\text{ord}_{\varphi^n(K)}(\log([x])) = 1$  for any  $n$ , so we are done.  $\square$

**Lemma (27.9.1.18).** Let  $C^\flat$  be alg.closed. If  $\xi$  is a distinguished element of  $\mathbf{A}_{\text{inf}}$  vanishes at a point  $y \in Y_{[a,b]}$  and  $g \in B_{[a,b]}$  also vanishes at  $y$ , then  $g$  is divisible by  $\xi$  in  $B_{[a,b]}$ .  $\lrcorner$

*Proof:* If  $g \in \mathbf{A}_{\text{inf}}[\frac{1}{p}, \frac{1}{[\pi]}]$ , then this is easy by (27.9.1.14) and  $\mathbf{A}_{\text{inf}}/(\xi) = \mathcal{O}_K$  (27.7.1.4).

Now generally  $g$  is a limit of  $g_n \in \mathbf{A}_{\text{inf}}[\frac{1}{p}, \frac{1}{[\pi]}]$ , so  $g(y)$  is the limit of  $g_n(y) \in K$ . Now  $g(y) = 0$ , so  $\lim_n g_n(y) = 0$ . Now  $K$  is alg.closed by (12.2.8.16), so we can let  $g_n(y) = c_n^\sharp$ , so  $c_i$  converges to 0 in  $C^\flat$ . So  $\{[c_n]\}$  converges to 0 in norm  $|\cdot|_a$  and  $|\cdot|_b$ , so we can replace  $g_n$  by  $g_n - [c_n]$  and assume  $g_n(y) = 0$ .

Now the first part shows  $g_n = \xi h_i$ , and now  $h_i$  is a Cauchy sequence for both  $|\cdot|_a$  and  $|\cdot|_b$ , so converges to some  $h$ , and then  $g = \xi h$ .  $\square$

**Lemma (27.9.1.19).** Given (27.9.1.18), we have a strategy of proving (27.9.1.13), that is, decomposing  $f, g$  into distinguished elements, but we need to show this decomposition is finite. And this is true:

If  $f \neq 0 \in B_{[a,b]}$ , denote  $\beta = -\log(b), \alpha = -\log(a)$  and let  $N = \partial_- v_\beta(f) - \partial_+ v_\alpha(f) \geq 0$ , then  $f$  cannot be divisible by a product of  $\xi_1, \dots, \xi_{N+1}$  of  $N+1$  distinguished elements.  $\lrcorner$

*Proof:* By (5.5.4.20), if  $\xi$  is distinguished, then  $v_s(\xi) = \max\{s, v(v_0)\}$ . Now  $v(v_0) = v(t^\sharp) = v(|p|_K)$  in  $\mathcal{O}_K = \mathbf{A}_{\text{inf}}/([t] - up)$ , so if  $K$  corresponding to  $\xi$  belongs to  $Y_{[a,b]}$ , then  $v(v_0) \in [\beta, \alpha]$ , so  $\partial_- v_\beta(\xi) = 1, \partial_+ v_\alpha(\xi) = 0$ .

So if  $f = \xi_1, \dots, \xi_{N+1}u$ , then  $N(f) \geq \sum N(\xi_i) \geq N+1$ .  $\square$

**Lemma (27.9.1.20) [Valuation Funtion And Invertibility].** Let  $C^\flat$  be alg.closed and  $f \neq 0 \in B_{[a,b]}$ , then the following are equivalent:

- $f$  is invertible.
- $\partial_- v_\beta(f) = \partial_+ v_\alpha(f)$ .
- $\text{div}(f) \cap Y_{[a,b]} = \emptyset$ .

$\lrcorner$

*Proof:*  $2 \rightarrow 3$ : by (27.9.1.19).

$1 \rightarrow 2$ : Because  $N(f) + N(f^{-1}) = 0$ , and  $N(f) \geq 0, N(f^{-1}) \geq 0$ , so  $N(f) = 0$ .

$2 \rightarrow 1$ : Assume first that  $f = \sum_{n \gg -\infty} [c_n] p^n \in \mathbf{A}_{\text{inf}}[\frac{1}{p}, \frac{1}{[\pi]}]$ , then the hypothesis just says that  $s \rightarrow v_s(f)$  is linear in a small nbhd of  $[\beta, \alpha]$ , that is, there is a  $n_0$  that  $v(c_n) + ns > v(c_{n_0}) + n_0 s$  for all  $n \neq n_0$  and  $s \in [\beta, \alpha]$ .

Now we can normalize  $f$  that  $n_0 = 0$  and  $c_0 = 1$ , so  $|f - 1|_\rho < 1$  for all  $\rho \in [\beta, \alpha]$ , so  $f - 1$  is topologically nilpotent in  $B_{[a,b]}$ , and thus  $f$  is invertible.

Generally,  $f$  is a limit of a sequence  $f_n \in \mathbf{A}_{\text{inf}}[\frac{1}{p}, \frac{1}{[\pi]}]$ , and by (27.9.1.8) we can assume the hypothesis holds for all  $f_n$ . Then  $f_n$  is invertible, and it is easily shown that  $f_n^{-1}$  is a Cauchy sequence in  $B_{[a,b]}$ , so converges to some  $f^{-1}$ .

$3 \rightarrow 2$ : Firstly, if  $\partial_- v_\beta(f) > \partial_+ v_\alpha(f)$ , then we must have  $\partial_- v_\rho(f) > \partial_+ v_\rho(f)$  for some  $s$ , so wlog, we can assume  $a = b = s$ , and we need to show  $f$  vanishes at some point in  $Y_{\text{exp}(s)}$ . Now combining with (27.9.1.18) and (27.9.1.19), this is equivalent to another statement that any element  $y \in B_{[\rho, \rho]}$  has a decomposition  $y = g\xi_1 \dots \xi_n$  where  $\xi_k$  corresponds to points in  $Y_\rho$  and  $g$  is invertible in  $B_\rho$ . The proof is finished at (27.9.1.30).  $\square$

### Primitive Elements and the Proof of $3 \rightarrow 2$ of The Lemma on Valuation Function and Invertibility

**Def. (27.9.1.21).** Let  $C^b$  be alg.closed, an element in  $B_{[\rho, \rho]}$  is called **good** iff it has a decomposition as in the proof of  $3 \rightarrow 2$  of (27.9.1.20).  $\perp$

**Prop. (27.9.1.22) [Approximating Zero].** If  $f$  is a good element having  $n$ -zeros on  $Y_\rho$ , and  $g \in B_\rho$  that  $|f - g|_\rho < |f|_\rho$ , then for any zero  $y$  of  $g$  on  $Y_\rho$ , there exists a zero  $y'$  of  $f$  on  $Y_\rho$  that  $d(y', y) < \rho \left( \frac{|f - g|_\rho}{|g|_\rho} \right)^{1/n}$ .  $\perp$

*Proof:*  $|f - g|_\rho \geq |(f - g)(y)|_K = |f(y)|_K$ . Now  $f = g\xi_1 \dots \xi_n$ , and  $\xi$  corresponds to  $y_i$ , then

$$|f(y)|_K = |g(y)|_K |\xi_1(y)|_K \dots |\xi_n(y)|_K = \frac{|f|_\rho}{\prod_i |\xi_i|_\rho} \prod_i d(y_i, y) = |f| \prod_i \frac{d(y_i, y)}{\rho}.$$

(Notice  $|g|_\rho = |g(y)|_K$  because  $g$  is invertible (27.7.1.10)) and  $d(y_i, y) \leq \rho$ . So at least one  $\xi$  satisfies the desired inequality.  $\square$

**Cor. (27.9.1.23).** If  $f \in B_\rho$  is given by a Cauchy sequence of good elements, and  $\partial_- v_\rho(f) > \partial_+ v_\rho(f)$ , then  $f$  has a root on  $Y_\rho$ .  $\perp$

*Proof:* By (27.9.1.7), passing to a subsequence, we may assume

$$v_s(f) = v_s(f_n), \quad \partial_- v_s(f) = \partial_- v_s(f_n), \quad \partial_+ v_s(f) = \partial_+ v_s(f_n), \quad |f_{n+1} - f_n|_\rho < |f|_\rho.$$

Let  $n = \partial_- v_s(f) - \partial_+ v_s(f) > 0$ , then each  $f_i$  has exactly  $n$  roots on  $Y_\rho$ , and applying (27.9.1.22), we can find successively roots  $y_n$  of  $f_n$  that  $d(y_{n+1}, y_n) \leq \rho \left( \frac{|f_{n+1} - f_n|_\rho}{|f|_\rho} \right)^{1/n}$ , so the sequence  $\{y_n\}$  is Cauchy and converges to some point  $y \in \bar{Y}$ , so

$$|f_i(y)|_K \leq |f_i|_\rho \frac{d(y_i, y)}{\rho} = |f|_\rho \frac{d(y_i, y)}{\rho} \rightarrow 0.$$

so  $f(y) = 0$ .  $\square$

**Def. (27.9.1.24) [Primitive Elements].** An element  $f = \sum_{n \geq 0} [c_n] p^n \in \mathbf{A}_{\text{inf}}$  is called **primitive of degree  $d$**  if  $c_0 \neq 0, |c_d| = 1$  for some smallest element  $d$ .

Clearly an element is distinguished of degree 1 iff it is distinguished and corresponds to an untilts of  $X^b$  of char 0.  $\perp$

**Prop. (27.9.1.25).**

- Any element  $f \in \mathbf{A}_{\text{inf}}$  of finite Teichmüller expansion can be written uniquely as  $f = p^m [c] g$ , where  $c \in C^b$  and  $g$  is primitive.
- For an element  $f \in \mathbf{A}_{\text{inf}}[\frac{1}{p}, \frac{1}{\ell}]$ ,  $f$  can be written as  $p^m [c] g$  iff  $v_s(f)$  consists of f.m. line segments iff  $\sup\{|c_n|\}$  is achieved by some  $n$ .
- If  $f = gh$  in  $\mathbf{A}_{\text{inf}}$  is primitive, then  $g, h$  are also primitive, and  $\deg(f) = \deg(g) + \deg(h)$ .  $\perp$

**Prop. (27.9.1.26).** Let  $f = \sum [c_n] p^n \in \mathbf{A}_{\text{inf}}$  be primitive of degree  $d > 0$ , and let  $\lambda \in (0, 1)$  be the number that  $s = -\log(\lambda)$  is the minimal number that  $v_s(f)$  is non-differentiable at, i.e.  $s$  is  $-1$  times the slope of the line segment on the left of  $v(c_d)$ . Then  $f$  has a zero on  $Y_\lambda$ .  $\perp$

*Proof:* By (27.9.1.27) there is a  $y \in Y_\lambda$  that  $|f(y_1)| \leq \lambda^{d+1}$ , and then (27.9.1.28) shows we can find successively  $y_n$  that

$$d(y_n, y_{n+1}) \leq \lambda^{1+\frac{d}{n}}, \quad |f(y_n)| \leq \lambda^{d+m}.$$

So  $y_n$  is a Cauchy sequence thus converges to some  $y$ , and then  $f(y) = 0$ .  $\square$

**Lemma (27.9.1.27) [Lemma for Approaching a Zero].** If  $C^b$  is alg.closed and  $f \in \mathbf{A}_{\text{inf}}$  is primitive of degree  $d > 0$ , and let  $\lambda$  as in (27.9.1.26), then there is a point  $y \in Y_\lambda$  that  $|f(y)|_{K_y} \leq \lambda^{d+1}$ .  $\lrcorner$

*Proof:* Let  $f = \sum [c_n]p^n$ , we may assume  $c_d = 1$ , and let  $F = x^d + c_{d-1}x^{d-1} + \dots + c_0$ , then the largest valuation of the roots of  $F$  on  $C^b$  is  $\lambda$ , by Newton polygon. Let  $r$  be such a root, then  $c_i$  is divisible by  $r^{d-i}$ , and let  $\xi = p - [r]$  be a distinguished element of  $\mathbf{A}_{\text{inf}}$  and corresponds to an untilt  $K$ , then  $|p|_K = \lambda$ , and

$$p^{-d}f(y) = \sum_{n \geq 0} c_n^\# p^{n-d} \equiv \sum_{i=0}^d \left(\frac{c_i}{r^{d-i}}\right)^\# \mod p = (r^{-d}F(r)) \mod p = 0$$

thus  $f(y)$  is divisible by  $p^{d+1}$ , which is equivalent to  $|f(y)|_K \leq \lambda^{d+1}$ .  $\square$

**Lemma (27.9.1.28) [Lemma for Approaching a Zero].** Situation as in (27.9.1.27), if  $y \in Y_\lambda$  and  $|f(y)| = \lambda^d \cdot \alpha$ , then there is a  $y'$  that  $d(y, y') \leq \lambda \cdot \alpha^{1/d}$  that  $|f(y')| \leq \lambda^{d+1}\alpha$ .  $\lrcorner$

*Proof:* Since  $\mathbf{A}_{\text{inf}}$  is  $\xi$ -complete and every element of  $\mathbf{A}_{\text{inf}}/\xi \cong \mathcal{O}_K$  belongs to the image of  $\sharp : \mathcal{O}_C \rightarrow \mathcal{O}_K$ , thus by induction, we can write  $f = \sum_{n \geq 0} [c_n]\xi^n$ . Because  $f$  is primitive of degree  $d$ , we may assume  $c_d = 1$ , and  $|c_0|_{C^b} = |f(y)|_K = \lambda^d \alpha$ .

Let  $F(x) = c_0 + c_1x + \dots + c_{d-1}x^{d-1} + x^d$ , because  $C^b$  is alg.closed, let  $r$  be a root of minimal absolute value, then  $|r|_{C^b}^m |c_m|_{C^b} \leq \lambda^n \alpha$ , in particular  $|r|_{C^b} \leq \lambda \alpha^{1/n}$ . So let  $\xi' = \xi - [r]$ , then  $\xi$  is also distinguished, and  $d(y', y) = |r|_{C^b} \leq \lambda \alpha^{1/n}$  (27.9.1.10), and  $d(0, y') = \lambda$ , and  $\xi(y') = r^\sharp$ .

Now

$$\frac{(f(y'))^\sharp}{c_0^\sharp} = \sum_{n \geq 0} \frac{c_n^\sharp}{c_0^\sharp} \xi(y')^n = \sum_{n \geq 0} \left(\frac{c_n r^n}{c_0}\right)^\sharp \equiv \sum_{i=0}^n \left(\frac{c_n r^n}{c_0}\right)^\sharp \mod p = \left(\frac{F(r)}{c_0}\right)^\sharp = 0,$$

So  $|f(y')|_{K'} \leq |c_0^\sharp|_{K'} |p|_{K'} = |c_0|_{C^b} \lambda = \lambda^{d+1} \alpha$ .  $\square$

**Cor. (27.9.1.29) [Primitive Elements Decompose as Distinguished Elements].** If  $f \in \mathbf{A}_{\text{inf}}$  is a primitive element of degree  $d > 0$ , then  $f$  admits a factorization as products of distinguished elements  $\xi$  corresponding to points in  $Y$ .  $\lrcorner$

*Proof:* Use induction on  $d$ . If  $d = 1$ , then  $f$  is distinguished by (27.9.1.24), and if  $d > 1$ , then by (27.9.1.26),  $f = \xi g$ , so  $g$  is primitive of degree  $d - 1$  by (27.9.1.25), so induction is finished.  $\square$

**Prop. (27.9.1.30) [Finite Teichmuller Expansion is Good].** Any element of finite Teichmuller expansion is good.

In particular, because any element of  $B_\rho$  can be approximated by elements in  $\mathbf{A}_{\text{inf}}[\frac{1}{p}, \frac{1}{\ell}]$ , and such element can be approximated by elements of finite Teichmuller expansion, by (27.9.1.23), we finishes the proof of  $3 \rightarrow 2$  of (27.9.1.20).  $\lrcorner$

*Proof:* If  $f$  has finite Teichmuller expansion, then  $f = p^m [c]g$ , where  $g$  is primitive of degree  $d$ . If  $d = 0$ , then  $g$  is invertible in  $\mathbf{A}_{\text{inf}}$ , thus  $f$  is invertible in  $B_\rho$ . Otherwise, we can use (27.9.1.29) to factorize  $g$  into distinguished elements, and the elements that corresponds to points outside  $Y_\rho$  is invertible in  $B_\rho$  because  $v_s(\xi) = \max\{s, v(v_0)\}$  and  $2 \rightarrow 1$  of (27.9.1.20), so  $f$  is good.  $\square$

### Bounded Meromorphic Functions

**Prop. (27.9.1.31).** If  $f \in B$ , then  $f \in \mathbf{A}_{\text{inf}}$  iff  $|f|_{\rho} \leq 1$  for any  $0 < \rho < 1$ .

Easily we can get characterization of  $f$  being in  $\mathbf{A}_{\text{inf}}[\frac{1}{p}]$ ,  $\mathbf{A}_{\text{inf}}[\frac{1}{\ell}]$  or  $\mathbf{A}_{\text{inf}}[\frac{1}{p}, \frac{1}{\ell}]$ .  $\lrcorner$

*Proof:* One direction is trivial, for the other, by (27.9.1.32), we can find successively  $f_n$  that  $f = \sum_{i < n} [c_i]p^i + f_n$ , and  $|f_n|_{\rho} \leq \rho^n$  for all  $0 < \rho < 1$ . So  $f_n$  converges to 0 in any norm  $\rho$ , thus it converges to 0 in  $B$ , and  $f = \sum_{n \geq 0} [c_n]p^n \in \mathbf{A}_{\text{inf}}$ .  $\square$

**Lemma (27.9.1.32).** If  $f \in B$  satisfies  $|f|_{\rho} \leq \rho^m$  for all  $0 < \rho < 1$ , then there is a  $c \in \mathcal{O}_{C^b}$  that  $f = [c]p^m + g$  that  $|g|_{\rho} \leq \rho^{m+1}$  for all  $0 < \rho < 1$ .  $\lrcorner$

*Proof:* Replace  $f$  by  $\frac{f}{p^m}$ , we may assume  $m = 0$ . Choose a sequence  $f_i$  in  $\mathbf{A}_{\text{inf}}[\frac{1}{p}, \frac{1}{\ell}]$  converging to  $f$  in  $B$ , where  $f_i = \sum_{n > -\infty} [c_{n,i}]p^n$ .

Firstly we want to truncate  $f_i$  with the positive part  $f_i^+$ . Notice for each  $\rho$  and any  $0 < \varepsilon < 1$ , because  $\lim |f_i - f|_{\varepsilon\rho} = 0$ , thus for  $i$  large,  $|f_i|_{\varepsilon\rho} = |f|_{\varepsilon\rho} \leq 1$ , thus  $|c_{-n,i}|_{C^b} \rho^{-n} \leq \varepsilon^n < \varepsilon \leq \varepsilon$ , so  $|f_i - f_i^+|_{\rho} < \varepsilon$  for  $i$  large, so  $\lim f_i^+ = f$  also in  $B$ .

Secondly,  $|c_{0,i} - c_{0,j}|_{C^b} \leq |f_i - f_j|_{\rho}$  for each  $\rho$ , thus  $c_{0,i}$  is Cauchy in  $C^b$  thus converges to some  $c \in C^b$ , and when  $i$  is large,  $|c_{0,i}|_{C^b} \leq |f_i|_{\rho} = |f|_{\rho} \leq 1$ , so  $c \in \mathcal{O}_{C^b}$ . Now let  $g_i = \sum_{n > 0} [c_{n,i}]p^n$ , then  $g_i$  is also Cauchy in  $B$  for any norm  $|\rho|$  and converges to some  $g$ , and  $f = g + [c]$ .

It's left to check  $|g|_{\rho} \leq \rho$ : each  $v_s(g_i)$  has positive slopes, then so does  $v_s(g)$  because by (27.9.1.7),  $v_s(g_i)$  stabilizes to  $v_s(g)$  uniformly on compact intervals. So if  $v_s(g) < s - \varepsilon$  for some  $s$ , then  $v_{\varepsilon}(g) \leq v_s(g) - (s - \varepsilon) < 0$ , but this cannot happen because  $v_{\varepsilon}(g) \leq \max\{v_{\varepsilon}(f), -\log |c|_{C^b}\} \geq 0$ .  $\square$

### Eigenspaces of Frobenius

**Prop. (27.9.1.33).**

- The vector space  $B^{\varphi=p^n}$  vanish for  $n < 0$ .
- The canonical map  $\mathbb{Q}_p \rightarrow B^{\varphi=\text{id}}$  is an isomorphism.

$\lrcorner$

*Proof:* 1: Consider  $v_{ps}(\varphi(f)) = pv_s(f)$  (27.7.1.14),  $v_s(p^n f) = ns + v_s(f)$ , so if  $\varphi(f) = p^n f$ , then

$$pv_{s/p}(f) = v_s(\varphi(f)) = v_s(p^n f) = ns + v_s(f).$$

Let  $h(s) = \partial_+ v_s(f)$ , then  $h(s/p) = n + h(s)$ , but  $h$  must be non-increasing (27.9.1.6), so  $n \geq 0$ .

2: Firstly we prove  $B^{\varphi=\text{id}}$  is a field: by (27.9.1.15), it suffices to show that  $\text{div}(f) = 0$  for  $f \neq 0 \in B^{\varphi=\text{id}}$ . If  $\text{div}(f) \neq 0$ , because  $f$  is fixed by  $\varphi$ , so  $\text{div}(f) \geq \sum_{n \in \mathbb{Z}} \varphi^n(y)$  for some  $y$ , and  $\sum_{n \in \mathbb{Z}} \varphi^n(y) = \text{div}(\log([\varepsilon]))$  for some  $\varepsilon \in 1 + \mathfrak{m}_{C^b}$  because  $K$  is alg.closed and by (27.7.1.16). So by (27.9.1.15) again  $f = g \log([\varepsilon])$ , and  $g \in B^{\varphi=p^{-1}}$  by (27.9.1.2), then  $g = 0$  by item 1.

3: From (27.9.1.34) and (27.9.1.31),  $f \in \mathbf{A}_{\text{inf}}[\frac{1}{p}]$ , thus  $f = \sum_{n > -\infty} [c_n]p^n$ , so  $\varphi(f) = f$  shows  $c_n^p = c_n$ , which is equivalent to  $c_n \in \mathbb{F}_p$ . So  $f \in W(\mathbb{F}_p)[\frac{1}{p}] = \mathbb{Q}_p$ .  $\square$

**Lemma (27.9.1.34).** If  $f \neq 0 \in B^{\varphi=\text{id}}$ , then there is an integer  $n$  that  $|f|_{\rho} = \rho^n$ .  $\lrcorner$

*Proof:* Notice  $|f|_{\rho}^p = |\varphi(f)|_{\rho^p} = |f|_{\rho^p}$ , so  $v_{ps}(f) = pv_s(f)$ , differentiation shows that  $\partial_- v_{ps}(f) = \partial_- v_s(f)$ . This is for all  $s < 0$ , and  $\partial_- v_s(f)$  is non-decreasing, thus it is constant, and  $v_{ps}(f) = pv_s(f)$  shows  $v_s(f) = ns$  for some integer  $n$ .  $\square$

**Cor. (27.9.1.35).** For  $n \geq 0$ , any element  $f \in B^{\varphi=p^n}$  factors uniquely up to action of  $\mathbb{Q}_p^*$  as  $\lambda \log([\varepsilon_1]) \dots \log([\varepsilon_n])$  where  $\lambda \in B^{\varphi=\text{id}}$ ,  $0 < |\varepsilon_i - 1| < 1$ .  $\lrcorner$

*Proof:* The existence is by (27.9.1.30)

For the uniqueness: it suffices to prove  $\log([\varepsilon])$  is a prime element in  $\oplus_{n \geq 0} B^{\varphi=p^n}$ . For this, notice for any  $f \in B^{\varphi=p^n}$ ,  $\text{div}(f)$  is fixed by  $\varphi$ , and  $\text{div}(\log([\varepsilon]))$  is a single orbit of  $\varphi$ , thus by (27.9.1.15), if  $\log([\varepsilon])$  divides  $fg$ , then  $\log([\varepsilon])$  divides  $f$  or  $g$ .  $\square$

### Applications

**Cor. (27.9.1.36).** If  $C^b$  is alg.closed, then every untilts  $K$  of  $C^b$  belongs to the vanishing locus of  $\log([x])$  for some  $x \in C^b$  that  $0 < |x - 1| < 1$ , and the map

$$\psi : 1 + \mathfrak{m}_{C^b} \rightarrow K : y \mapsto \log(y^\sharp)$$

is surjective with kernel generated by  $x$  (as a  $\mathbb{Q}_p$ -subspace of  $1 + \mathfrak{m}_{C^b}$ ).  $\lrcorner$

*Proof:* By (12.2.8.16), any untilts of  $C^b$  is alg.closed, thus it has a compatible  $p^n$ -th roots of unity. So it belongs to some locus of  $\log([x])$  by (27.7.1.16). Now if  $|z| < |p|_K^{1/(p-1)}$ , then  $z = \log(\exp(z))$ , and  $\exp = y^\sharp$  for some  $y$  because  $K$  is alg.closed. So  $\psi$  contains sufficiently small elements, but it is a map of  $\mathbb{Q}_p$ -vector spaces, thus it is surjective. For the kernel, if  $\log(y^\sharp) = 0$ , then  $\log([y])$  vanish on  $K$ , thus by (27.7.1.16),  $y, x$  is in the same  $\mathbb{Q}_p$ -vector space.  $\square$

**Cor. (27.9.1.37).** If  $C^b$  is alg.closed, then the map

$$1 + \mathfrak{m}_{C^b} \xrightarrow{\log([x])} B^{\varphi=p}$$

is an isomorphism.  $\lrcorner$

*Proof:* Firstly any untilts of  $C^b$  is alg.closed by (12.2.8.16). It is injective because of the correspondence (27.7.1.16), and for the surjectivity, for each  $f \in B^{\varphi=\text{id}}$ , if  $f = 0$ , then  $f = \log([1])$ , and if  $f \neq 0$ , then notice  $\text{div}(f) \neq \emptyset$ , because in this case  $f$  is invertible in  $B$  by (27.9.1.15), thus  $f^{-1} \in B^{\varphi=p^{-1}}$ , so  $f^{-1} = 0$  by (27.9.1.33), contradiction.

Now if  $\text{ord}_K(f) \geq 1$ , then  $\text{ord}_{\varphi^n(K)}(f) \geq 1$  for any  $n \in \mathbb{Z}$  since  $\varphi(f) = pf$ . Consider  $\text{div}(\log([x])) = \sum_{n \in \mathbb{Z}} \varphi^n(K)$  (27.9.1.17), then  $f$  is divisible by  $\log([x])$  by (27.9.1.15),  $f = \log([x])g$ , then  $g \in B^{\varphi=\text{id}}$ , then  $g \in \mathbb{Q}_p^*$  by (27.9.1.33), thus  $f = \log([x^g])$ .  $\square$

**Cor. (27.9.1.38) [Filtration on  $B_{\text{dR}}$ ].** By (27.9.1.17) and (27.9.1.36), we see that for any untilt  $K$  of  $C^b$ , there is a unique up to  $\mathbb{Q}_p$ -constant  $\varepsilon$  that  $t = \log([\varepsilon])$  is the uniformizer of  $B_{\text{dR}}(y)$ . In fact, this  $\varepsilon$  can be to be  $\varepsilon = (1, \xi_p, \dots, x_{p^n}, \dots)$ , where  $\xi_{p^n}$  is a compatible roots of unity in the alg.closed field  $K$ .

Now we prefer to use the filtration  $\text{Fil}^n = t^{-n} B_{\text{dR}}^+$  on  $B_{\text{dR}}$  because it is  $G_{\mathbb{Q}_p}$  invariant, as  $\varepsilon$  does.  $\lrcorner$

**Prop. (27.9.1.39).** Let  $C^b$  be alg.closed, then any point  $x$  of the Fargues-Fontaine curve  $X_{FF}$  that is not the generic point corresponds to the prime  $x_K = (\log([\varepsilon]))$  (27.9.1.35) where  $K \in \text{div}(\log([\varepsilon]))$  (27.9.1.36). And the residue field of  $x_K$  can be identified to  $K$ .  $\lrcorner$

*Proof:* By (27.9.1.35), we can cover  $X_{FF}$  by affine schemes of the form  $\text{Spec}(R_f = B[f^{-1}]^{\varphi=\text{id}})$  for  $f \in B^{\varphi=p}$ , now for any prime  $\mathfrak{p} \subset R_f$ , let  $\frac{g}{f^n} \in \mathfrak{p}$ , then  $g = \lambda \log([\varepsilon_1]) \dots \log([\varepsilon_n])$ , thus some  $\frac{\log([\varepsilon])}{f} \in \mathfrak{p}$ . Let  $K$  be a point that  $\log([\varepsilon])$  vanish (27.7.1.16), then we claim  $(\log([\varepsilon])/f)$  is maximal.

In fact, we may assume  $f$  doesn't vanish on  $K$ , otherwise  $\log([\varepsilon])/f$  is a unit, then there is a map  $\rho : B[f^{-1}]^{\varphi=1} \subset B[f^{-1}] \rightarrow K$ , and this map is surjective with kernel  $(\log([\varepsilon])/f)$ : it is surjective even on  $f^{-1}B^{\varphi=p}$  by (27.9.1.36), and if  $\log([\varepsilon_1])/f$  is mapped to 0, then  $\log([\varepsilon_1])$  differs from  $\log([\varepsilon])$  by some  $Q_p^*$  by (27.7.1.16).  $\square$

**Cor. (27.9.1.40).** If  $C^b$  is alg.closed, there is a bijection of sets:

$$Y/\varphi_{C^b}^{\mathbb{Z}} \cong \{\text{Closed points of } X_{FF}\}.$$

by (27.7.1.16).  $\lrcorner$

**Cor. (27.9.1.41).**  $X_{FF}$  is a Dedekind scheme (7.4.2.15).  $\lrcorner$

*Proof:* Let  $\text{Spec}(R_f = B[f^{-1}]^{\varphi=\text{id}})$ , two elements  $f = \log([\varepsilon]), g = \log([\mu])$  can cover it. The proof of (27.9.1.39) shows that every prime ideals of  $R_f$  is maximal principal, in particular f.g, thus by (5.1.1.50), it is Noetherian. And it has Krull dimension 1 and it is regular because all of its maximal ideals are principal, hence normal (5.3.5.33). So  $X_{FF}$  is a Dedekind scheme.  $\square$

## 2 Line Bundles and Filtrations

**Def. (27.9.2.1).** By (27.9.1.35), the graded algebra  $\oplus_{n \geq 0} B^{\varphi=p^n}$  is generated over  $\mathbb{Q}_p$  by  $B^{\varphi=p}$ , so we can define the Serre twisting sheaf  $\mathcal{O}(1)$  on  $X_{FF}$ , which is a line bundle, and on an open affine scheme  $U = X - \{x\}$ , where  $x$  corresponds to  $\log([\varepsilon])$ ,  $\mathcal{O}(1)(U) = (B[\frac{1}{\log([\varepsilon])}])^{\varphi=p}$ . Similarly we can define  $\mathcal{O}(m)$ , and  $\mathcal{O}(m) = \mathcal{O}(1)^m$ .  $\lrcorner$

**Lemma (27.9.2.2).** There is an isomorphism  $\text{Div}(X) \rightarrow \text{Pic}(X)$  that maps each  $x$  to the inverse of its ideal sheaf (7.5.3.15) (5.3.5.21). And there is also a degree map  $\text{Div}(X) \rightarrow \mathbb{Z}$ . Then:

$$\begin{array}{ccc} \text{Div}(X) & \xrightarrow{\deg} & \mathbb{Z} \\ & \searrow & \downarrow \rho \\ & & \text{Pic}(X) \end{array}$$

commutes.  $\lrcorner$

*Proof:* It suffices to show that any  $\mathcal{O}(x)$  is isomorphic to  $\mathcal{O}(1)$ . As  $\log([\varepsilon])$  is a global section of  $\mathcal{O}(1)$  that vanishes of order 1 at  $x$ , it induces an isomorphism  $\mathcal{O}(1) \cong \mathcal{O}(x)$  by (7.5.3.15).  $\square$

**Lemma (27.9.2.3) [Cohomology of Line Bundles].** For any integer  $m$ ,  $B^{\varphi=p^m} \rightarrow H^0(X, \mathcal{O}(m))$  is an isomorphism and  $H^i(X, \mathcal{O}(m)) = 0$  for  $i > 0, m > 0$ .  $\lrcorner$

*Proof:* This is trivial using Čech cohomology, as  $\oplus_{n \geq 0} B^{\varphi=p^n}$  is PID, so  $X$  is separated.  $\square$

**Prop. (27.9.2.4).** The construction induces an isomorphism  $\rho : \mathbb{Z} \cong \text{Pic}(X) : m \mapsto \mathcal{O}(m)$ .  $\lrcorner$

*Proof:* By lemma (27.9.2.2),  $\rho$  is surjective because  $\text{Div}(X) \rightarrow \text{Pic}(X)$  does, and it is injection because if  $\mathcal{O}(m) \cong \mathcal{O}(n)$ , then tensoring  $\mathcal{O}(-m)$ , we can assume  $\mathcal{O} \cong \mathcal{O}(-k)$ , but they have different global sections by lemma (27.9.2.3) and (27.9.1.33) (27.9.1.35).  $\square$

### Harder-Narasimhan Filtration of Vector Bundles

**Prop. (27.9.2.5) [Harder Narasimhan Formalism for  $\mathcal{V}\text{ect}_X$ ].** For a vector bundle  $L$  on  $X$ , we can define  $\deg(L) = n$  iff  $L \cong \mathcal{O}(n)$  (27.9.2.2), and for a vector bundle  $E$ , define  $\deg(E) = \deg(\wedge(E))$ . And define the generic rank on the category of coherent sheaves on  $X$ . Then this is a Harder-Narasimhan formalism on  $\mathcal{C} = \mathcal{V}\text{ect}_X$  with  $\mathcal{A} = \mathcal{V}\text{ect}_{R(X)}$ .  $\lrcorner$

*Proof:* Only the last axiom needs proof, but if  $\mathcal{E}' \subsetneq \mathcal{E}$ , notice  $\wedge \mathcal{E}' \subsetneq \wedge \mathcal{E}$  (The stalks are PID), so by taking their top exterior power product, we reduce to the case of line bundles.

But  $\mathcal{O}(m)$  cannot map into  $\mathcal{O}(n)$  if  $m > n$  and must be isomorphism if  $m = n$ , by tensoring  $\mathcal{O}(-m)$  and looking at global sections (27.9.2.3), so the assertion is true.  $\square$

**Cor. (27.9.2.6).** Every vector bundle  $\mathcal{E}$  on  $X$  has a unique functorial Harder-Narasimhan filtration, by (4.3.5.22).  $\lrcorner$

### 3 Base Change of Fields

**Prop. (27.9.3.1) [Base Change].** Let  $C^\flat$  be alg.closed. For any finite extension  $E$  of  $\mathbb{Q}_p$  of degree  $n$ ,  $\text{Spec } E \rightarrow \text{Spec } \mathbb{Q}_p$  is finite étale, and finite locally free of degree  $n$ , so does  $X_E = X \otimes_{\mathbb{Q}_p} E \rightarrow X$  (7.6.2.23).

In particular,  $X_E$  is also a Dedekind scheme<sup>?</sup>. For any closed point  $x$  of  $X$  corresponding to an untilt  $K$  of  $C^\flat$ , which is alg.closed, the fiber of  $X_E$  over  $x$  is identical to the spectrum of  $E \otimes_{\mathbb{Q}_p} K \cong K^n$  as  $K$  is alg.closed.

In this situation and use (27.9.1.40), we see that the closed points of  $X_E$  are in bijection with isomorphism classes of  $(K, \iota, u)$  module  $\varphi$ -actions, where  $(K, \iota)$  is an untilt of  $C^\flat$ , and  $u : E \rightarrow K$  is an embedding of  $E$  into  $K$  over  $\mathbb{Q}_p$ , isomorphism classes of these triples are denoted by  $Y_E$ .  $\lrcorner$

**Prop. (27.9.3.2).** By (27.9.3.1) and flat base change (7.7.5.1), we know  $H^0(X_E, \mathcal{O}_{X_E}) = E$ , in particular  $X_E$  is connected.  $\lrcorner$

**Lemma (27.9.3.3).** If  $E$  is unramified of degree  $n$  over  $\mathbb{Q}_p$ , then  $E \cong W(\mathbb{F}_{p^n})[\frac{1}{p}]$ . In particular,

$$\text{Hom}_{\mathbb{Q}_p}(E, K) \cong \text{Hom}_{\mathbb{Z}_p}(W(\mathbb{F}_{p^n}), \mathcal{O}_K) \cong \text{Hom}_{\mathbb{F}_p}(\mathbb{F}_{p^n}, \mathcal{O}_K/p \cong \mathcal{O}_{C^\flat}/[t]) \cong \text{Hom}_{\mathbb{F}_p}(\mathbb{F}_{p^n}, C)$$

where the last isomorphism is by Henselian lemma.

Therefore,  $Y_E \cong Y \otimes \text{Hom}_{\mathbb{F}_p}(\mathbb{F}_{p^n}, C)$ , and

$$\text{Closed points of } Y_E \cong Y_E/\varphi^{\mathbb{Z}} \cong (Y \otimes \text{Hom}_{\mathbb{F}_p}(\mathbb{F}_{p^n}, C))/\varphi^{\mathbb{Z}} \cong Y/\varphi^{n\mathbb{Z}}.$$

$\lrcorner$

**Prop. (27.9.3.4).** If  $E$  is unramified of degree  $n$  over  $\mathbb{Q}_p$  and  $U \neq X$  is an affine open defined by a homogenous element  $t$ , then

$$U_E = \text{Spec} \left( (B[t^{-1}] \otimes_{\mathbb{Q}_p} E)^{\varphi=\text{id}} \right) = \text{Spec}(B[t^{-1}]^{\varphi^n=1}),$$

where  $\varphi$  acts trivially on  $E$ .  $\lrcorner$

*Proof:* Each  $u \in \text{Hom}_{\mathbb{F}_p}(\mathbb{F}_{p^n}, C^b)$  induces a map  $W(\mathbb{F}_p) \rightarrow W(\mathcal{O}_{C^b}) = \mathbf{A}_{\text{inf}} \rightarrow B$ , which extends to a map  $\bar{u} : E \rightarrow B[t^{-1}]$ . and induces a map  $q_u : B[t^{-1}] \otimes_{\mathbb{Q}_p} E \rightarrow B[t^{-1}]$ . Now

$$B[t^{-1}] \otimes_{\mathbb{Q}_p} E \rightarrow \prod_{\text{Hom}_{\mathbb{F}_p}(\mathbb{F}_{p^n}, C)} B[t^{-1}]$$

is an isomorphism, which is just because  $x^{p^n} - x$  splits in  $B[t^{-1}]$ .

And under this isomorphism, the action of  $\varphi$  is

$$\varphi((f_0, \dots, f_{n-1}) = (\varphi(f_{n-1}), \varphi(f_0), \dots, \varphi(f_{n-2})),$$

so proposition is clear.  $\square$

**Cor. (27.9.3.5).** Fix now a finite extension  $E/\mathbb{Q}_p$  with uniformizer  $\pi$  that has ramification degree  $e$  and inertia degree  $d$ , and  $E_0$  is the maximal unramified subextension, then there are maps  $E_0 \rightarrow B$  by (27.9.3.4), fix forever one of them  $p_u$ , this induces a map

$$B[\frac{1}{t}] \otimes_{\mathbb{Q}_p} E \rightarrow B[\frac{1}{t}] \otimes_{E_0} E$$

and this induces an isomorphism

$$(B[\frac{1}{t}] \otimes_{\mathbb{Q}_p} E)^{\varphi=\text{id}} = (B[\frac{1}{t}] \otimes_{\mathbb{Q}_p} E_0)^{\varphi=\text{id}} \otimes_{E_0} E = (B[\frac{1}{t}] \otimes_{E_0} E)^{\varphi^d=\text{id}}$$

$\lrcorner$

**Def. (27.9.3.6)**  $[Y_E^0]$ . Define  $Y_E^0 \subset Y_E = \text{triples } (K, \iota, u)$ , where  $(K, \iota)$  is an untillt of  $C^b$ , and  $u : E \rightarrow K$  is an embedding that  $u|_{E_0}$  is identical to  $e_K \circ p_u : E_0 \rightarrow B \rightarrow K$ . Notice  $Y_E^0$  is not stable under the Frobenius, but it is stable under  $\varphi^d$ , and induces an isomorphism

$$Y_E^0 / \varphi^{d\mathbb{Z}} \cong Y_E / \varphi^{\mathbb{Z}}.$$

$\lrcorner$

**Prop. (27.9.3.7).** Notice for an element  $y$  of  $Y_E^0$ , the map  $u : E \rightarrow K_y = B_{\text{dR}}^+(y)/\xi$  extends uniquely to a map  $E \rightarrow B_{\text{dR}}^+(y)$  that is compatible with  $e_K \circ p_u : E_0 \rightarrow B_{\text{dR}}^+(y)$ , because  $E$  is separable over  $E_0$ . i.e.

$$\begin{array}{ccc} E_0 & \xrightarrow{e_K \circ p_u} & B_{\text{dR}}^+(y) \\ \downarrow & \nearrow \tilde{u} & \downarrow \\ E & \xrightarrow{u} & K \end{array}$$

Then this defines a map  $B \otimes_{E_0} E \rightarrow B_{\text{dR}}^+(y)$ , also called the stalk map.  $\lrcorner$

**Prop. (27.9.3.8).** For any finite extension  $E/\mathbb{Q}_p$ , the degree map  $\deg : \text{Pic}(X_E) \cong \mathbb{Z}$  is an isomorphism.  $\lrcorner$

*Proof:* It suffices to show that  $\mathcal{O}_{X_E}(x) \cong \mathcal{O}_{X_E}(x')$  for each pair of closed points  $x, x'$  of  $X_E$ .

We attempt to construct a line bundle  $\mathcal{O}_{X_E}(1)$  on  $X_E$  that  $\mathcal{O}_{X_E}(1)(U_E) = (B[\frac{1}{t}] \otimes_{E_0} E)^{\varphi^d=\pi}$ , because  $\mathcal{O}_{X_E}(U_E) = (B[\frac{1}{t}] \otimes_{E_0} E)^{\varphi^d=1}$ .

We show simultaneously that  $\mathcal{O}_{X_E}(1)$  is a line bundle and it is isomorphic to  $\mathcal{O}_{X_E}(x)$  for any closed point  $x \in X_E$ : For any  $x \in X_E$  corresponding to a  $\varphi^d$ -orbit of  $Y_E^0$ , let  $f$  be the element

constructed by lemma(27.9.3.9) below, we show that for any affine open  $U = D(t)$ , multiplying by  $f : \mathcal{O}_{X_E}(x)(U_E) \rightarrow \mathcal{O}_{X_E}(1)(U_E)(\star)$  is an isomorphism:

Notice  $B \otimes_{E_0} E$  is free over  $B$ , let  $N(f) \in B$  be its norm, the norm is local, so for each  $y \in Y$ ,  $N(f)_y = \prod_{\bar{y}} f_{\bar{y}}$ , where  $\bar{y} \in Y_E$  are over  $y$ , so it vanishes with order 1 in a  $\varphi^d$ -orbit of  $Y$  (order 1 because  $f$  only vanishes at  $\bar{y}$  in the orbit corresponding to  $x$ ), and then  $N(f)\varphi(N(f)) \dots \varphi^{d-1}(N(f))$  vanishes at a single  $\varphi$ -orbit of  $Y$  with order 1, thus equals  $u \log([\varepsilon])$  for some  $\varepsilon \in \mathfrak{m}_{C^b}$ , by (27.9.1.17)(27.9.1.13). In particular,  $y$  divides  $\log([\varepsilon])$ .

Now if  $x \notin U_E$ , then  $\log([\varepsilon])$  divides  $t$ , so  $f$  divides  $t$ , thus  $f$  is invertible in  $B[\frac{1}{t}] \otimes_{E_0} E$ , thus  $(\star)$  is an isomorphism.

Otherwise if  $x \in U_E$ , then choose some  $x'$  not in  $U_E$ , then the same argument shows that  $f'$  is invertible in  $B[\frac{1}{t}] \otimes_{E_0} E$ , so  $f/f' \in (B[\frac{1}{t}] \otimes_{E_0} E)^{\varphi=\text{id}}$  that vanishes with a single zero at  $x$ , so multiplying by  $f'/f$  defines an isomorphism  $\mathcal{O}_{X_E}(U_E) \cong \mathcal{O}_{X_E}(x)(U_E)$ , so it suffices to show the composition

$$\mathcal{O}_{X_E}(U_E) \xrightarrow{f'/f} \mathcal{O}_{X_E}(x)(U_E) \xrightarrow{f} \mathcal{O}_{X_E}(1)(U_E)$$

is an isomorphism, but this reduces to the first case.  $\square$

**Lemma (27.9.3.9) [Uniformizer Existence].** If  $x$  be a closed point of  $X_E$  corresponding to an orbit of  $\varphi$  in  $Y_E$  thus an orbit  $S$  of  $\varphi^d$  in  $Y_E^0$ , then there is an element  $f \in (B \otimes_{E_0} E)^{\varphi^d=\pi}$  that  $\text{ord}_{\bar{y}}(f) = 1$  if  $\bar{y} \in S$ , and 0 otherwise.  $\lrcorner$

*Proof:* The map defined (27.9.3.18) composed with the Teichmuller section(27.9.3.16) in fact has image in  $(B \otimes_{E_0} E)^{\varphi^n=\pi}$  because  $[\pi] = \pi t + t^{p^n} = \varphi^n$  on  $\mathcal{O}_{C^b}$ , and it is an isomorphism of  $\mathcal{O}_E$  modules. Now there are commutative diagrams:

$$\begin{array}{ccc} G_{LT}(\mathcal{O}_{C^b}) & \xrightarrow{\sigma} & G_{LT}(\mathbf{A}_{\text{inf}} \otimes_{\mathcal{O}_{E_0}} \mathcal{O}_E) \xrightarrow{\log_G} B \otimes_{E_0} E \\ & & \downarrow \qquad \qquad \downarrow \\ & & G_{LT}(\mathcal{O}_K) \xrightarrow{\log_G} K \end{array}$$

The map  $G_{LT}(\mathcal{O}_{C^b}) \rightarrow G_{LT}(\mathcal{O}_K)$  has kernel  $\mathcal{O}_E u$  for some  $u$ , thus we can let  $f = \log_G(\sigma(u))$ , then the image of  $f \in K$  is 0, which means  $f$  has a zero at the point  $y \in Y_E^0$ . And (27.9.3.13) shows the the zeros of  $f$  is just the  $\varphi^d$ -orbit containing  $y$ .  $\square$

### Lubin-Tate Formal Groups and the Proof of the Lemma of Uniformizer

**Prop. (27.9.3.10).** The ring  $B \otimes_{E_0} E$  is an integral domain.  $\lrcorner$

*Proof:* Cf.[Lurie P95]. In fact this is the ramified Witt vector, which is by the same reason as before an integral domain, Cf.[FF Curve Johannes].  $\square$

**Cor. (27.9.3.11).** If  $f \neq 0 \in B \otimes_{E_0} E$ , then  $N_{E/E_0}(f) \neq 0 \in B$ , in particular, the vanishing locus of  $f$  is finite.  $\lrcorner$

**Cor. (27.9.3.12).** If  $f, g \in B \otimes_{E_0} E$ , then  $f$  is divisible by  $g$  iff for each  $\bar{y} \in Y_E^0$ ,  $\text{ord}_{\bar{y}}(f) \geq \text{ord}_{\bar{y}}(g)$ .  $\lrcorner$

*Proof:* If  $\text{ord}_{\bar{y}}(f) \geq \text{ord}_{\bar{y}}(g)$ , suppose  $N_{E/E_0}(g) = gh$ , then multiplying by  $h$ , we can assume  $g \in B$ . Now  $f$  is written uniquely as  $f_0 + f_1\pi + \dots + f_{e-1}\pi^{e-1}$  where  $f_k \in B$ , thus it suffices to show  $f_i$

is divisible by  $g$ , which is equivalent to  $\text{ord}_y(f) \geq \text{ord}_y(g)$  for each  $y \in Y$ , by (27.9.1.15). Now if  $\text{ord}_y(g) = n$ , the hypothesis shows  $f$  vanishes in

$$\prod_{\bar{y} \rightarrow y} B_{\text{dR}}^+(y)/\xi^n = (B_{\text{dR}}^+(y)/\xi^n) \otimes_{E_0} E = B_{\text{dR}}^+(y)/\xi^n + \pi B_{\text{dR}}^+(y)/\xi^n + \dots + \pi^{e-1} B_{\text{dR}}^+(y)/\xi^n$$

thus  $\text{ord}_y(f) \geq n = \text{ord}_y(g)$ .  $\square$

**Cor. (27.9.3.13).** If  $f \in (B \otimes_{E_0} E)^{\varphi^n = \pi}$ , then the vanishing locus of  $f$  is a single  $\varphi^d$ -orbit, and all zeros are simple.  $\lrcorner$

*Proof:* Set  $N_{E/E_0}(f) = f'$  and  $N_{E/E_0}(\pi) = \pi'$ , then  $f$  belongs to  $B^{\varphi^d = \pi'}$ , and its divisor is just the image of divisor of  $f$  in  $Y_E^0$ . So it suffices to show that  $f'$  vanishes on a single  $\varphi^{d\mathbb{Z}}$ -orbit.

Now for  $0 < \rho < 1$ ,

$$\rho^{p^d} |f'|_{\rho^{p^d}} = |\pi' f'|_{\rho^{p^d}} = |f'^{\varphi^d}|_{\rho^{p^d}} = |f'|_{\rho}^{p^d},$$

thus

$$p^d s + v_{p^d s}(f') = p^d v_s(f')$$

for each  $s > 0$ , differentiating, we get

$$1 + \partial_- v_s(f') = \partial_- v_s(f')$$

Now the divisor of  $f'$  is  $\varphi^{d\mathbb{Z}}$ -invariant, and it has exactly one zero on any annulus  $(\rho^n, \rho]$  (27.9.1.19), thus its divisor is a single  $\varphi^d$ -orbit.  $\square$

**Def. (27.9.3.14) [Universal Lubin-Tate Formal Group].** Recall that if  $E$  is a finite extension of  $\mathbb{Q}_p$  with uniformizer  $\pi$ , for a  $\mathcal{O}_E$ -algebra  $A$  complete w.r.t  $\pi$ ,  $G_{LT}(A)$  is the Lubin-Tate formal group, with elements the topological nilpotent elements of  $A^*$ .

Now we define the **universal cover of Lubin-Tate formal group**  $\widetilde{GT}$  as the functor

$$A \mapsto \lim \left( \dots \xrightarrow{[\pi]} G_{LT}(A) \xrightarrow{[\pi]} G_{LT}(A) \right).$$

$\lrcorner$

**Prop. (27.9.3.15).**

- Notice for  $K$  an alg.closed extension of  $E$ ,  $G_{LT}(\mathcal{O}_K)$  is in bijection with  $\mathfrak{m}_K$ , and the kernel of  $[\pi^n]$  on  $G_{LT}(\mathcal{O}_K)$  has order  $\mathcal{O}_E/\pi^n$ , thus the kernel of  $\widetilde{G}_{LT}(\mathcal{O}_K) \rightarrow G_{LT}(\mathcal{O}_K)$  is a 1-dimensional  $\mathcal{O}_E$ -module.
- If  $\pi$  vanishes on  $A$  and  $A$  is perfect, then  $[\pi] = \pi t + t^q = t^q$  on  $A$ , so it is just the Frobenius, and  $\widetilde{G}_{LT}(A) \rightarrow G_{LT}(A)$  is a bijection.
- $\widetilde{G}_{LT}(A) \rightarrow \widetilde{G}_{LT}(A/I)$  is an isomorphism for  $\pi \in I$  and  $A$  is  $I$ -adic.
- $\widetilde{G}_{LT}(A) \rightarrow \widetilde{G}_{LT}(A/I)$  is an isomorphism for any ideal  $I$  that  $I + (\pi) \neq (1)$ , because both of them is isomorphic to  $\widetilde{G}_{LT}(A/(I + (\pi)))$ .

$\lrcorner$

*Proof:* For 3, it suffices to prove that  $\widetilde{G}_{LT}(A/I^{n+1}) \rightarrow \widetilde{G}_{LT}(A/I^n)$  for  $n \geq 1$ . Notice  $F(u, v) \equiv u + v \pmod{I^{2n}}$ , so we have an exact sequence

$$0 \rightarrow I^n/I^{n+1} \rightarrow G_{LT}(A/I^{n+1}) \rightarrow G_{LT}(A/I^n) \rightarrow 0.$$

In particular the kernel is annihilated by  $\pi$ , so there is a commutative diagram

$$\begin{array}{ccccc} \cdots & \xrightarrow{\pi} & G_{LT}(A/I^{n+1}) & \xrightarrow{\pi} & G_{LT}(A/I^{n+1}) \\ & \nearrow & \downarrow & \nearrow & \downarrow \\ \cdots & \xrightarrow{\pi} & G_{LT}(A/I^{n+1}) & \xrightarrow{\pi} & G_{LT}(A/I^{n+1}) \end{array}$$

which show that  $\tilde{G}_{LT}(A/I^{n+1}) \cong \tilde{G}_{LT}(A/I^n)$ .  $\square$

**Cor. (27.9.3.16) [Teichmüller Section].** Consider the  $\mathcal{O}_E$ -algebra  $\mathbf{A}_{\text{inf}} \otimes_{\mathcal{O}_{E_0}} \mathcal{O}_E$ . Because there are isomorphism  $\mathcal{O}_{E_0}/p \cong \mathcal{O}_E/\pi$ , we have an isomorphism

$$C^\flat \cong \mathbf{A}_{\text{inf}}/p \cong (\mathbf{A}_{\text{inf}} \otimes_{\mathcal{O}_{E_0}} \mathcal{O}_E)/(\pi).$$

Now (27.9.3.15) shows the diagram

$$\begin{array}{ccc} \tilde{G}_{LT}(\mathbf{A}_{\text{inf}} \otimes_{\mathcal{O}_{E_0}} \mathcal{O}_E) & \xrightarrow{\cong} & \tilde{G}_{LT}(\mathcal{O}_{C^\flat}) \\ \downarrow & & \downarrow \cong \\ G_{LT}(\mathbf{A}_{\text{inf}} \otimes_{\mathcal{O}_{E_0}} \mathcal{O}_E) & \longrightarrow & G_{LT}(\mathcal{O}_{C^\flat}) \end{array}$$

So the lower horizontal map is surjective, and it even has a canonical section  $\sigma$ , called the **Teichmüller section**.  $\lrcorner$

**Cor. (27.9.3.17).** Given a point of  $Y_E^0$  which corresponds to an untilt of  $C^\flat$  together with a  $E_0$ -map  $E \rightarrow K$ , then this gives a commutative diagram

$$\begin{array}{ccc} \tilde{G}_{LT}(\mathbf{A}_{\text{inf}} \otimes_{\mathcal{O}_{E_0}} \mathcal{O}_E) & \xrightarrow{\cong} & \tilde{G}_{LT}(\mathcal{O}_K) \\ \downarrow & & \downarrow \\ G_{LT}(\mathbf{A}_{\text{inf}} \otimes_{\mathcal{O}_{E_0}} \mathcal{O}_E) & \longrightarrow & G_{LT}(\mathcal{O}_K) \end{array}$$

where the right vertical arrow is surjective with kernel free of rank 1 over  $\mathcal{O}_E$ . So this together with (27.9.3.16) shows there is a surjection  $G_{LT}(\mathcal{O}_{C^\flat}) \rightarrow G_{LT}(\mathcal{O}_K)$  with kernel a rank-1  $\mathcal{O}_E$ -module.  $\lrcorner$

**Prop. (27.9.3.18).** There is a canonical  $\mathcal{O}_E$ -module map

$$G_{LT}(\mathbf{A}_{\text{inf}} \otimes_{\mathcal{O}_{E_0}} \mathcal{O}_E) \xrightarrow{\log_G} B \otimes_{E_0} E.$$

and it is equivariant w.r.t  $\varphi$ .  $\lrcorner$

*Proof:*  $G_{LT}(\mathbf{A}_{\text{inf}} \otimes_{\mathcal{O}_{E_0}} \mathcal{O}_E)$  are in bijection with the maximal ideal of  $\mathbf{A}_{\text{inf}} \otimes_{\mathcal{O}_{E_0}} \mathcal{O}_E$ , and  $\log_G(x)$  is of the form  $x + \frac{c_2}{2}x^2 + \dots + \frac{c_n}{n}x^n + \dots$ , with  $c_n \in \mathcal{O}_E$ .

Now for  $x \in G_{LT}(\mathbf{A}_{\text{inf}} \otimes_{\mathcal{O}_{E_0}} \mathcal{O}_E)$ , we show that  $\log_G(x)$  converges in  $B \otimes_{E_0} E = B + \pi B + \dots + \pi^{e-1}B$ : Let  $c_n x^n = \sum a_{n,i} \pi^i$ , then we need to show  $a_{n,i}/n$  converges to 0 for each of the norm  $|\cdot|_\rho$ . And this is because if  $x = x_0 + \pi y_0$ , then for  $n \geq em$ ,  $|x|_\rho \leq \max\{|x_0|_\rho^{em}, \rho^m\}$ , which decays exponential in  $n$ , and  $|\frac{1}{n}|_\rho$  decays linearly in  $n$ .  $\square$

**Prop. (27.9.3.19).** The map  $\log_G(\sigma(\cdot)) : G_{LT}(\mathcal{O}_{C^\flat}) \rightarrow (B \otimes_{E_0} E)^{\varphi^n = \pi}$  as in (27.9.3.9) is an isomorphism.  $\lrcorner$

*Proof:* For surjectivity, as any  $f \in (B \otimes_{E_0} E)^{\varphi^n = \pi}$  vanishes at a single  $\varphi^{d\mathbb{Z}}$ -orbit, then by (27.9.3.9) we can find a  $\log_G(u)$  that vanishes at the same locus, so  $f = \log(u)\lambda$  where  $\lambda$  is a unit in  $B \otimes_{E_0} E$  (27.9.3.12), so

$$\lambda \in (B \otimes_{E_0} E)^{\varphi^n = \text{id}} = (B \otimes_{\mathbb{Q}_p} E)^{\varphi = \text{id}} \text{ (27.9.3.5)} = B^{\varphi = \text{id}} \otimes_{\mathbb{Q}_p} E = E.$$

For injectivity, we proved in (27.9.3.9) that each  $\log_G(\sigma(u))$  only vanishes at a single  $\varphi^d$ -orbit in  $Y_E^0$ , so it cannot be 0, which vanishes at all points.  $\square$

**Cor. (27.9.3.20).** There are canonical bijections

$$\{\text{Closed Points of } X_E\} \cong \{\varphi^{d\mathbb{Z}}\text{-orbits of } Y_E^0\} \cong ((B \otimes_{E_0} E)^{\varphi^n = \pi} \setminus \{0\})/E^* \cong (G_{LT}(\mathcal{O}_{C^\flat}) - \{0\})/E^*.$$

by (27.9.3.9)(27.9.3.19), (27.9.3.12).  $\lrcorner$

### Vector Bundles and Base Change

**Prop. (27.9.3.21) [Vector Bundles on the Cover].** Let  $\pi : X_E \rightarrow X$  be the covering map, for any vector bundle  $\mathcal{E}$  on  $X_E$ ,  $\pi_*(\mathcal{E})$  is a vector bundle on  $X$ , and this induces an equivalence of categories:

$$\text{Vect}_{X_E} \cong \{X\text{-Bundles with an } E\text{-action}\}.$$

Now define  $\deg(\mathcal{E}) = \deg(\pi_*\mathcal{E})$ , and  $\text{slope}(\mathcal{E}) = \frac{\deg(\mathcal{E})}{\text{rank}(\mathcal{E})} = \frac{1}{n}\text{slope}(\pi_*\mathcal{E})$ .

Then  $\mathcal{E}$  is semistable of slope  $\lambda$  iff  $\pi_*\mathcal{E}$  is semistable of slope  $\lambda/n$ .  $\lrcorner$

*Proof:* One direction is clear, for the other, if  $\mathcal{F} = \pi_*\mathcal{E}$  is not semistable, choose its HN-filtration, then  $\lambda_1 > \lambda/n$ . Now the action of  $E$  on  $\mathcal{F}$  preserves the HN-filtration, thus  $\mathcal{F}_1$  is an  $E$ -vector bundle, thus by the correspondence above,  $\mathcal{F}_1 = \pi_*\mathcal{E}'$  for some subbundle  $\mathcal{E}' \subset \mathcal{E}$ , and clearly this contradicts the semistability of  $\mathcal{E}$ .  $\square$

**Cor. (27.9.3.22).** For any integral number  $d, n$  with  $n > 0$ , there exists a semistable vector bundle on  $X$  with rank  $n$  and degree  $d$ .  $\lrcorner$

*Proof:* Let  $E$  be an extension of  $\mathbb{Q}_p$  of degree  $n$ , then  $\pi_*(\mathcal{O}_{X_E}(d))$  is semistable of rank  $n$  and degree  $d$ , by (27.9.3.1)(7.6.2.22), because  $\mathcal{O}_{X_E}(d)$  is a line bundle (27.9.3.8) so clearly semistable, and it is of degree  $d$  because  $\text{?}$ .  $\square$

### Isocrystals and Classification of Semistable Vector Bundle over $X$

**Prop. (27.9.3.23).** Let  $k = \overline{\mathbb{F}}_p \in C^\flat$ , then there is an inclusion  $W(k) \rightarrow \mathbf{A}_{\text{inf}}$ , which extends to a map  $K \rightarrow B$ . Now given an isocrystal  $V$  over  $k$ , denote  $\mathcal{E}_V$  the coherent sheaf on  $X$  defined by the graded module  $\bigoplus_{n \geq 0} \text{Hom}_K(V, B)^{\varphi = p^n}$ . In other words, on an affine open subscheme  $U = D(t)$ ,  $\mathcal{E}_V(U) = \{\varphi\text{-equivariant } K\text{-linear maps } V \rightarrow B[\frac{1}{t}]\}$ .

And when  $V = E_{m/n}$  is the simple isocrystal, then  $\mathcal{E}_V$  is denoted by  $\mathcal{O}(\frac{m}{n})$ .  $\lrcorner$

**Prop. (27.9.3.24).** In fact we have  $\mathcal{O}(\frac{m}{n})(U) \cong (B[t^{-1}])^{\varphi^n = p^m} = (\rho_*\mathcal{O}(m))(U)$ , where  $\rho : X_E \rightarrow X$ , and  $E$  is an unramified extension of  $\mathbb{Q}_p$ .  $\lrcorner$

**Prop. (27.9.3.25)**[Classification of Semistable Vector Bundles over  $X$ ]. For every vector bundle on  $X$ , the HN-filtration splits non-canonically, and the map  $V \mapsto \mathcal{E}_V$  induces an equivalence of categories between

$$\{\text{Isoclinic Isocrystals of slope } \mu\}^{\text{op}} \rightarrow \{\text{Semistable vector bundles on } X \text{ of slope } \mu\}$$

┘

*Proof:* Cf.[FF Curve, Johannes].?

□

**Cor. (27.9.3.26).** Any two semistable vector bundles of slope  $\lambda$  over  $X$  is isomorphic, and a semistable vector bundle of slope 0 is trivial.

┘

**Prop. (27.9.3.27).** If  $\mathcal{E}, \mathcal{E}'$  be semistable vector bundles on  $X$  of slopes  $\mu, \mu'$ , then  $\mathcal{E} \otimes \mathcal{E}'$  is semistable of slope  $\mu + \mu'$ .

┘

*Proof:* We can assume  $\mathcal{E} = \rho_* \mathcal{O}_{X_E}(d)$  for an unramified extension  $E/\mathbb{Q}_p$  by (27.9.3.26), and then  $\mathcal{E} \otimes \mathcal{E}' = \rho_*(\mathcal{O}_X(d) \otimes \rho^* \mathcal{E}')$ . Since  $\rho_*, \rho^*$  preserves semistability (by (27.9.3.21) and ?). So it suffices to prove  $\mathcal{O}(d) \otimes -$  preserves semistability, but this is clear, as  $\mathcal{O}(d)$  shifts degree. □

### Diamonds Definitions

**Def. (27.9.3.28)** [Diamond]. A **diamond**  $X$  is a sheaf (of sets) on  $\text{PerfdSpa}_{\text{pro-ét}}$  of the form  $X = \textstyle\bigcup_Z / R$ , where  $Z \in \text{PerfdSpa}$  and  $R \in Z \times Z$  is a reasonable representable equivalence relation?.

┘

**Prop. (27.9.3.29)**[Scholze]. Let  $\underline{R} = (R, R^+) \in \text{HubPair}$ , then

$$\text{Spd}(\underline{R}) = \mathcal{Z} \mapsto \{\text{untilts of } \text{Spa}(\underline{R}) \text{ over } \mathcal{Z}\}$$

is a diamond (27.9.3.28).

And this construction can be glued to give diamond  $X^\diamond$  of any adic space  $X$ , which is a sheaf. ┘

**Def. (27.9.3.30)** [Adic Fargues-Fontaine Curve]. Let  $\mathcal{Y}$  be the adic space  $\text{Spa}(\mathbf{A}_{\text{inf}})$  removing the vanishing locus of  $p$  and  $[t]$ , then by what we proved, the Frobenius act totally discontinuous on  $\mathcal{Y}$ , thus the quotient  $\mathcal{X}^{FF}$  is an adic space, the FF-curve. ┘

**Prop. (27.9.3.31).** There is an isomorphism of diamonds:

$$\mathcal{Y}^\diamond \cong \text{Spd}(C^\flat) \times \text{Spd}(\mathbb{Q}_p), \quad \mathcal{X}^{FF, \diamond} \cong \text{Spd}(C^\flat)/\varphi^{\mathbb{Z}} \times \text{Spd}(\mathbb{Q}_p)$$

More generally, over any Huber pair  $\underline{R}$ , there is a relative FF-curve which is defined by

$$\text{Spd}(\underline{R}) \times \text{Spd}(\mathbb{Q}_p)/\varphi^{\mathbb{Z}}$$

┘

*Proof:*  $C^\flat$  is a perfectoid of char  $p$ , so for a perfect Huber pair,  $\underline{S}$  point of  $C^\flat$  is just a morphism  $u : (C^\flat, \mathcal{O}_{C^\flat}) \rightarrow (S, S^+)$ . And a  $\mathbb{Q}_p$  point is just a char0 untilts  $\underline{T}$  of  $\underline{S}$ .

So for each pairs  $(T, u)$ , we need to find a morphism  $\mathbf{A}_{\text{inf}}[\frac{1}{p}, \frac{1}{[t]}] \rightarrow T$ . For this, consider

$$\mathbf{A}_{\text{inf}} = W(\mathcal{O}_{C^\flat}) \rightarrow W(S^+) \cong W(T^\flat) \xrightarrow{\theta_T} T$$

This is a bijection, as we proved in the beginning (27.7.1.2). □

**Prop. (27.9.3.32).** There is a morphism of ringed spaces  $\mathcal{X}^{FF} \rightarrow X^{FF}$  that regard  $\mathcal{X}^{FF}$  as the rigid analytification of  $\mathcal{X}$ , so they have the same category of vector bundles and cohomology, prove by Kedlaya-Liu. ┘

## 4 Applications

**Prop. (27.9.4.1).** The FF curve  $X$  is geometrically simply-connected, i.e. the projection defines an isomorphism of étale groups  $\pi_1(X) \rightarrow \pi_1(\mathrm{Spec} \mathbb{Q}_p) = \mathrm{Gal}_{\mathbb{Q}_p}$ .

Equivalently, the pullback defines an equivalence of étale sites.  $\lrcorner$

*Proof:* Let  $\tilde{X} \rightarrow X$  be an finite étale morphism, we want to prove that  $\tilde{X} = X \otimes_{\mathrm{Spec} \mathbb{Q}_p} \mathrm{Spec}(E)$  for some étale  $\mathbb{Q}_p$ -algebra. Let  $\mathcal{A} = \rho_* \mathcal{O}_{\tilde{X}}$ , and  $E = H^0(X, \mathcal{A}) = H^0(\tilde{X}, \mathcal{O}_{\tilde{X}})$ . Now it suffices to show  $\mathcal{A} = E \otimes_{\mathbb{Q}_p} \mathcal{O}_X$ , which shows  $\tilde{X} = X \otimes_{\mathrm{Spec} \mathbb{Q}_p} \mathrm{Spec}(E)$ , and forces  $E$  be an étale  $\mathbb{Q}_p$ -algebra by fpqc descent ?. Equivalently,  $\mathcal{A}$  is trivial, and this is equivalent to  $\mathcal{A}$  being semistable of slope 0 by (27.9.3.26).

Because  $\rho$  is finite étale, the trace pairing  $\mathcal{A} \times \mathcal{A} \rightarrow \mathcal{A} \xrightarrow{tr} \mathcal{O}_X$  is non-degenerate (check on stalks), which induces an isomorphism  $\mathcal{A} \cong \mathcal{A}^\vee$ , so  $\deg(\mathcal{A}) = 0$ , and if  $\mathcal{A}$  is not semistable, let  $\mathcal{A}'$  be the first term of the HN-filtration of  $\mathcal{A}$ , then it is of slope  $\lambda > 0$ . So  $\mathcal{A}' \otimes \mathcal{A}'$  is of slope  $2\lambda$  by (27.9.3.27), so the composite  $\mathcal{A}' \otimes \mathcal{A}' \hookrightarrow \mathcal{A} \otimes \mathcal{A} \rightarrow \mathcal{A}$  must be 0 by (4.3.5.32), which is impossible, because if  $U$  is an affine open that  $\mathcal{A}$  has a section, then this says  $U \otimes_X \tilde{X}$  has a section  $s$  that  $s^2 = 0$ . But  $U \otimes_X \tilde{X}$  is reduced (check on stalks).  $\square$

**Cor. (27.9.4.2).**

- The projection map induces equivalence  $\mathrm{Rep}_{\mathcal{A}\mathrm{b}^{\mathrm{fin}}}(\mathrm{Gal}_{\mathbb{Q}_p}) \cong \mathrm{LocSys}^{\mathrm{ét}}(X)$ .
- For  $M \in \mathrm{Rep}_{\mathcal{A}\mathrm{b}^{\mathrm{fin}}}(\mathrm{Gal}_{\mathbb{Q}_p})$ , the natural map

$$H^*(\mathrm{Gal}_{\mathbb{Q}_p}, M) \rightarrow H_{\mathrm{ét}}^*(X, u^* M)$$

is an isomorphism for  $* = 0, 1$ .  $\lrcorner$

*Proof:* 1 is trivial. For 2, Cf. [Lurie P102].  $\square$

## 5 Weakly Admissible $\Rightarrow$ Admissible

**Def. (27.9.5.1) [Notations].** Let  $K$  be a finite extension of  $\mathbb{Q}_p$ , and  $K_0 = W(k)[\frac{1}{p}]$  be the maximal unramified subextension in  $K$ , let  $C = \mathbb{C}_K$  and  $F = C^\flat$ . Denote by  $\infty \in X$  the closed point determined by  $C$ , which is just the vanishing locus of the Galois stable line  $\mathbb{Q}_p t$ , where  $t = \log([\varepsilon])$  and  $\varepsilon = (1, \xi_p, \xi_{p^2}, \dots) \in C^\flat$  (27.9.1.36).

Notice  $\mathrm{Gal}_K$  acts on  $\mathbb{Q}_p \cdot \log([\varepsilon])$  by the cyclotomic character  $\chi_{\mathrm{cycl}}$ . Recall

$$B_{\mathrm{dR}}^+ = \widehat{\mathcal{O}}_X(\infty), \quad B_{\mathrm{crys}}^+, \quad B_{\mathrm{crys}} = B_{\mathrm{crys}}^+[t^{-1}], \quad B_e = H^0(X \setminus \{\infty\}, \mathcal{O}_X) = (B_{\mathrm{crys}})^{\varphi=\mathrm{id}}.$$

$\lrcorner$

**Def. (27.9.5.2) [Equivariant Action of  $\mathrm{Gal}_K$  on Vector Bundles].** Recall an equivariant action of  $\mathrm{Gal}_K$  on a bundle  $\mathcal{E}$  on  $X$  is a data of isomorphisms  $\sigma^*(\mathcal{E}) \cong \mathcal{E}$  that  $c_{\sigma\tau} = c_\tau \circ \tau^*(c_\sigma)$ . Notice any equivariant action of  $\mathrm{Gal}_K$  on  $\mathcal{E}$  induces a semilinear  $\mathrm{Gal}_K$  action on  $\mathcal{E}_\infty^\wedge = \mathcal{E} \otimes_{\mathcal{O}_X} B_{\mathrm{dR}}^+$ , and here we require this action is continuous. The category of equivariant  $\mathrm{Gal}_K$ -bundles are denoted by  $\mathrm{Vect}_X^{\mathrm{Gal}_K}$ .  $\lrcorner$

**Cor. (27.9.5.3).** By the slope 0 case of the classification of vector bundles on  $X$  (27.9.3.25) and (25.2.5.1), we see that the functor:

$$\mathrm{Rep}_{\mathbb{Q}_p}(\mathrm{Gal}_K) \rightarrow \mathrm{Vect}_X^{\mathrm{Gal}_K} : V \mapsto V \otimes_{\mathbb{Q}_p} \mathcal{O}_X$$

is fully faithful with essential image the category  $\mathrm{Vect}_X^{\mathrm{Gal}_K, \mathrm{sst}, 0}$  of all  $\mathrm{Gal}_K$  vector bundles on  $X$  that the underlying bundle is semistable of slope 0, i.e. trivial (27.9.3.26).  $\square$

**Prop. (27.9.5.4).** There is a pullback diagram of categories:

$$\begin{array}{ccc} \varphi\text{-Fil Mod}_{K/K_0} & \longrightarrow & \varphi\text{-Mod}_{K_0} \\ \downarrow \mathcal{E}(-) & & \downarrow \mathcal{V} \\ \mathrm{Vect}_X^{\mathrm{Gal}_K} & \longrightarrow & \mathrm{Rep}_{B_e}(\mathrm{Gal}_K) \end{array}$$

where  $\mathcal{E}(-)$  maps a  $\varphi$ -filtered module  $(D, \varphi_D, \mathrm{Fil})$  to the bundle that is the bundle  $(\widetilde{D}, \varphi_D)$  modified so that the fiber at  $\infty$  is  $\mathrm{Fil}^0(D_K \otimes_K B_{\mathrm{dR}})$ .  $\square$

*Proof:* 1: By lemma (25.2.4.9),  $\varphi\text{-Fil Mod}_{K/K_0}$  is equivalent to a  $\varphi$ -module  $V$  with a  $\mathrm{Gal}_K$ -stable  $B_{\mathrm{dR}}^+$ -lattice in  $(V \otimes_{K_0} K) \otimes_K B_{\mathrm{dR}}^+ = V \otimes_{K_0} B_{\mathrm{dR}}^+$ .

2: By (25.2.6.4),  $\varphi\text{-Mod}$  is a full subcategory of  $\mathrm{Rep}_{B_e} \mathrm{Gal}_K$ , where the  $\mathrm{Gal}_K$ -stable  $B_{\mathrm{dR}}^+$ -lattice is choose to be  $V \otimes_{K_0} B_{\mathrm{dR}}^+$ .

3: Clearly there is a functor

$$\mathrm{Vect}_X^{\mathrm{Gal}_K} \rightarrow \mathrm{Rep}_{B_e}(\mathrm{Gal}_K) : \mathcal{E} \rightarrow H^0(X \setminus \{\infty\}, \mathcal{E}).$$

and (7.5.1.48) says in this case  $Bun_X^{\mathrm{Gal}_K}$  is equivalent to a  $B_e$ -module with continuous  $\mathrm{Gal}_K$ -actions and and a  $B_{\mathrm{dR}}^+$ -module with continuous  $\mathrm{Gal}_K$ -actions that they corresponds as a  $B_{\mathrm{dR}}$ -module with continuous  $\mathrm{Gal}_K$ -actions.

4: The compatibility in 3 just says that the  $B_{\mathrm{dR}}^+$ -lattice choosen in the definition of (25.2.4.11) just comes from that of 2, so this diagram is clearly a pullback.  $\square$

**Lemma (27.9.5.5).** Let  $(V, \mathrm{Fil}^\bullet) \in \mathrm{FilVect}_K$  and  $W = \mathrm{Fil}(V \otimes_K B_{\mathrm{dR}})$ , if  $V \otimes B_{\mathrm{dR}}^+ = \{e_1, \dots, e_n\}$  and  $\mathrm{Fil}^0(V \otimes_K B_{\mathrm{dR}}) = \{t^{-a_1}e_1, \dots, t^{-a_n}e_n\}$ , then the Hodge polygon of  $\mathrm{Fil}^\bullet$  has slopes  $(a_1, \dots, a_n)$ .  $\square$

*Proof:* Use (25.2.4.9), notice  $(t^a B_{\mathrm{dR}}^+)^{\mathrm{Gal}_K} = 0$  for  $a > 0$ , as in the proof of (25.2.4.8).  $\square$

**Lemma (27.9.5.6).** The functor

$$\mathcal{E}(-) : \varphi\text{-Fil Mod}_{K/K_0} \rightarrow \mathrm{Vect}_X^{\mathrm{Gal}_K}$$

defined in (27.9.5.4) preserves degree and HN-filtration, where the HN-filtration on the RHS is induces by the HN-filtration on  $Bun_X$  by canonicity.  $\square$

*Proof:*  $\deg(\mathcal{E}((D, \varphi_D, \mathrm{Fil}^\bullet))) = \deg(\mathcal{E}(D, \varphi_D)) - \dim_K[D \otimes_{K_0} B_{\mathrm{dR}}^+ : \mathrm{Fil}^0(D_K \otimes_K B_{\mathrm{dR}})]$   
 $= \deg(D_K, \mathrm{Fil}) - \deg(D, \varphi_D)$ .

Now the degree correspond, for the invariance of HN-filtration, it suffices to prove the subobjects are in bijection: Given a subobjects of  $\mathcal{E}(V)$ , we want to show it is a  $\mathcal{E}(V')$ , but this is because on the affine open  $\mathrm{Spec}(B_e)$ , by (25.2.6.4) any subbundle is also crysatalline, i.e. comes from  $\varphi\text{-Mod}_{K_0}$ .  $\square$

**Prop. (27.9.5.7) [Weakly Admissible implies Admissible].** The category of crystalline Galois representations of  $\mathrm{Gal}_K$  is equivalent to the category  $\varphi\text{-FilMod}_{K/K_0}^{\text{weak, adm}}$  of weakly admissible filtered  $\varphi$ -modules for  $K$ .  $\square$

*Proof:* By definition of weakly admissible and (27.9.5.6), there is a pullback diagram

$$\begin{array}{ccc} \varphi\text{-FilMod}_{K/K_0}^{\text{weak, adm}} & \longrightarrow & \varphi\text{-FilMod}_{K/K_0} \\ \downarrow & & \downarrow \mathcal{E}(-) \\ \mathrm{Rep}_{\mathbb{Q}_p}^{\mathrm{fd}} \mathrm{Gal}_K \cong \mathcal{V}\mathrm{ect}_X^{\mathrm{Gal}_K, \text{semi st}, 0} & \longrightarrow & \mathcal{V}\mathrm{ect}_X^{\mathrm{Gal}_K} \end{array}$$

Adjunction with (27.9.5.4), we get another pullback diagram

$$\begin{array}{ccccc} \varphi\text{-FilMod}_{K/K_0}^{\text{weak, adm}} & \longrightarrow & \varphi\text{-FilMod}_{K/K_0} & \longrightarrow & \varphi\text{-Mod}_{K_0} \\ \downarrow & & \downarrow \mathcal{E}(-) & & \downarrow \mathcal{V} \\ \mathrm{Rep}_{\mathbb{Q}_p}(\mathrm{Gal}_K) \cong \mathcal{V}\mathrm{ect}_X^{\mathrm{Gal}_K, \text{semi st}, 0} & \longrightarrow & \mathcal{V}\mathrm{ect}_X^{\mathrm{Gal}_K} & \longrightarrow & \mathrm{Rep}_{B_e}(\mathrm{Gal}_K) \end{array}$$

But this pullback is just the category of crystalline representations: by (27.9.5.3), for  $V \in \mathrm{Rep}_{\mathbb{Q}_p} \mathrm{Gal}_K$ , the condition  $\mathcal{V}(\mathcal{D})(M) \cong M$  in (25.2.6.4) is just saying that  $V$  is in the image of  $\mathcal{V}$  iff

$$(V \otimes_{\mathbb{Q}_p} B_{\mathrm{crys}})^{\varphi=\mathrm{id}} \otimes_{B_e} B_{\mathrm{crys}} \cong V \otimes_{\mathbb{Q}_p} B_{\mathrm{crys}},$$

which is equivalent to  $V$  being crystalline.  $\square$

## 27.10 Barsotti-Tate Groups

*“Although  $p$ -divisible groups are interesting enough in their own right, our main motivation for studying them has been their applications to abelian varieties.”*

–J. Tate

References are [Zin84].

**Notation (27.10.0.1).**

- Let  $p \in \text{Prime}$ .
- Let  $R \in \mathcal{CRing}$ .
- Let  $S \in \mathcal{Sch}$ .

┘

### 1 Barsotti-Tate Groups

References are [Tat67, Mes72, CCO14], [Finite Flat Schemes and  $p$ -divisible Groups, Jakob], [ $p$ -divisible Groups, Morrow], [ $p$ -divisible Groups, Demazure], [P-Divisible Groups and Displays, Zink] and [notes on Tate’s  $p$ -divisible Groups].

**Notation (27.10.1.1).**

- Let  $\kappa \in \text{Perf}^p$ .
- Let  $(K, \mathcal{O}_K, \mathfrak{m}_K, \kappa) \in p\text{-Field}$ .

┘

### Barsotti-Tate Groups

**Def. (27.10.1.2) [Barsotti-Tate Groups].** A  $p$ -divisible group or a **Barsotti-Tate group** of height  $h$  over  $S$  is an direct system  $(G_n)_{n \in \mathbb{Z}_+} \in \text{finAbSch}/S$  s.t. for each  $n \in \mathbb{Z}_+$ ,

- $G_n = G_{n+1}[p^n]$ .
- $[p] : G_{n+1} \rightarrow G_n$  is faithfully flat.

Equivalently, a  $p$ -divisible group over  $S$  is a fppf-sheaf  $G$  over  $S$  s.t.

- $G$  is  $p$ -divisible:  $[p]_G$  is an epimorphism.
- $G$  is  $p$ -torsion:  $G = \varinjlim_n G[p^n]$
- Each  $G[p^n]$  are representable as sheaves on  $\mathcal{Sch}_{\text{fppf}}/S$ . (Notice that it suffices to show that  $G[p]$  is representable, because we have the exact sequence  $0 \rightarrow G[p] \rightarrow G[p^{n+1}] \rightarrow G[p^n] \rightarrow 0$  and we can use (10.1.1.36)).

For  $G \in p\text{Div}/S$ , there exists a locally constant function  $h : S \rightarrow \mathbb{N}$  s.t. the rank of fiber of  $G[p]$  at  $s \in S$  is  $p^{h(s)}$ . Then it follows from the exact sequence  $0 \rightarrow G[p] \rightarrow G[p^{n+1}] \rightarrow G[p^n] \rightarrow 0$  that  $\text{rank } G[p^n]_s = p^{nh(s)}$  for each  $n \in \mathbb{Z}_+$ .

For each locally constant function  $h : S \rightarrow \mathbb{N}$ , the category of  $p$ -divisible groups over  $S$  of height  $h$  is denoted by  $p\text{Div}^h/S$ . ┘

**Example (27.10.1.3) [Barsotti-Tate Groups].**

- $\mathbb{G}_m[p^\infty] \cong \mu_{p^\infty} \in p\text{Div}^1/\mathbb{Z}$ ?

- If  $S \in \text{Sch}$  and  $A \in \text{AbVar}^g/S$ , then  $X = A[p^\infty] \in p\text{Div}^{2g}/S$ , by (20.9.6.18). And there is a canonical isomorphism  $A[p^\infty]^D \cong A^\vee[p^\infty]$ , by (20.9.6.5).  $\lrcorner$

**Def. (27.10.1.4) [Barsotti-Tate Groups over Formal Schemes].** If  $(\mathfrak{X}, \mathcal{I})$  is a locally Noetherian adic scheme, then  $\mathfrak{X} = \varinjlim_{n \in \mathbb{Z}_+} \mathfrak{X}_n$  where  $\mathfrak{X}_n = \text{Spec}(\mathcal{O}_{\mathfrak{X}}/\mathcal{I}^n)$ . Then a  **$p$ -divisible group** over  $\mathfrak{X}$  is a sequence  $X = (X_n)$  where  $X_n \in p\text{Div}/\mathfrak{X}_n$  together with isomorphism  $X_{n+1} \times_{\mathfrak{X}_{n+1}} \mathfrak{X}_n \cong X_n$ .  $\lrcorner$

**Prop. (27.10.1.5).** If  $\mathfrak{X} = \text{Spf}(A, I)$  is a Noetherian affine adic scheme, then the functor  $X \mapsto (X \bmod I^n)_{n \in \mathbb{Z}_+}$  is an equivalence between  $p\text{Div}/\text{Spec } A$  and  $p\text{Div}/\text{Spf } A$  (27.10.1.4).  $\lrcorner$

*Proof:* Cf. [Messing, The Crystals Associated to Barsotti-Tate Groups].  $\square$

**Def. (27.10.1.6) [Serre-Dual Barsotti-Tate Groups].** For  $G \in p\text{Div}/S$ , the **Serre-dual  $p$ -divisible group** is defined to be the directed system  $G^D \triangleq (G[p^n]^D)$ , where the transition map is the Cartier-dual of  $[p] : G[p^n] \rightarrow G[p^n]$ . Then  $G \in p\text{Div}/S$ ?  $\lrcorner$

**Def. (27.10.1.7) [Quotients of  $p$ -Divisible Groups and Exact Sequences].** If  $H \subset G \in p\text{Div}/S$  and  $\text{ht}(H) = h' \in \mathbb{N}$ ,  $\text{ht}(G) = h \in \mathbb{N}$ , then  $G/H \triangleq (G[p^n]/H[p^n])_{n \in \mathbb{Z}_+}$  is also a  $p$ -divisible group over  $S$ .

An exact sequence of  $p$ -divisible group

$$0 \rightarrow G' \rightarrow G \rightarrow G'' \rightarrow 0 \in p\text{Div}/S$$

is exact iff

$$0 \rightarrow G'[p^n] \rightarrow G[p^n] \rightarrow G''[p^n] \rightarrow 0 \in \text{GrpSch}/S$$

is an exact sequence for each  $n \in \mathbb{Z}_+$ . In particular, the Serre-dual of an exact sequence of  $p$ -divisible groups (27.10.1.6) is an exact sequence of  $p$ -divisible groups, by Cartier-duality.  $\lrcorner$

*Proof:* Cf. [Chai-Conrad-Oort14] 1.4.3.5.  $\square$

**Def. (27.10.1.8) [Connected  $p$ -Divisible Groups].** Let  $(\mathcal{O}_K, \kappa)$  be a complete Noetherian local ring of mixed characteristic  $(0, p)$ , then  $G = (G_n)_{n \in \mathbb{Z}_+} \in p\text{Div}/\mathcal{O}_K$  is called **connected  $p$ -divisible group** or a **formal  $p$ -divisible group** if each  $G_n$  is connected, or equivalently each  $G_n$  has infinitesimal special fibers???. The category of connected  $p$ -divisible groups over  $\mathcal{O}_K$  is denoted by  $p\text{Div}^f/\mathcal{O}_K$ .  $\lrcorner$

**Prop. (27.10.1.9) [Formal  $p$ -Divisible Groups and Formal Groups].** Let  $(\mathcal{O}_K, \kappa)$  be a complete Noetherian local ring of mixed characteristic  $(0, p)$ , then  $\Gamma \mapsto \Gamma[p^\infty]$  is an equivalence between the category of commutative formal Lie-groups over  $\mathcal{O}_K$  (27.10.4.7) s.t.  $[p]$  is an isogeny and  $p\text{Div}^f/\mathcal{O}_K$  (27.10.1.8).  $\lrcorner$

*Proof:* Cf. [ $p$ -divisible Groups, Tate] or [notes on Tate's  $p$ -divisible groups].  $\square$

**Prop. (27.10.1.10) [Formal  $p$ -Divisible Groups].** For  $R \in \mathcal{CRing}$  and  $0 \neq G \in p\text{Div}/R$ ,  $G$  is a smooth formal group iff  $G[p]$  is infinitesimal (10.1.2.3), i.e. has connected fibers. This implies that each  $G[p^n]$  is infinitesimal, and  $p$  is nilpotent in  $R$ .  $\lrcorner$

*Proof:* ?  $\square$

**Def. (27.10.1.11) [Étale Barsotti-Tate Groups].** An **étale  $p$ -divisible group** over  $S$  is a  $p$ -divisible group  $X \in p\text{Div}/S$  s.t.  $X[p]$  is étale over  $S$ . By (10.1.2.21), in this case  $X[p^n]$  étale over  $S$  for each  $n \in \mathbb{Z}_+$ .  $\perp$

**Def. (27.10.1.12) [Toroidal Barsotti-Tate Groups].** A **toroidal  $p$ -divisible group** over  $S$  is a  $p$ -divisible group  $X \in p\text{Div}/S$  s.t.  $X[p]$  is of multiplicative-type (10.1.2.20). By (10.1.2.21), in this case  $X[p^n]$  is of multiplicative-type over  $S$  for each  $n \in \mathbb{Z}_+$ .

For  $X \in p\text{Div}/S$ ,  $X$  is toroidal iff  $X^D$  is étale (27.10.1.11), by (10.1.2.20).  $\perp$

**Prop. (27.10.1.13).** If  $S \in \text{Sch}^p$  and  $X \in p\text{Div}/S$  is toroidal (27.10.1.12), then  $X$  is formal (27.10.1.10).  $\perp$

*Proof:* This follows from (10.1.2.14).  $\square$

**Prop. (27.10.1.14) [Connected-Étale Exact Sequences, Messing [Mes72]].** For  $G \in p\text{Div}/S$ , the following statements are equivalent:

- $G$  is an extension of an étale  $p$ -divisible group by a formal  $p$ -divisible group.
- $G[p]$  is an extension by an étale finite group scheme by a infinitesimal finite group scheme (10.1.2.3).
- The function  $s \mapsto \#G[p](\bar{s})$  is a locally constant function on  $S$ .

In particular, this holds if  $S$  is the spectrum of a local ring, then we take  $1 \rightarrow G^0 \rightarrow G \rightarrow G^{\text{ét}} \rightarrow 1$ ?  $\perp$

*Proof:*  $1 \iff 2$  is clear.

$2 \rightarrow 3$ : If  $1 \rightarrow N_1 \rightarrow G[p] \rightarrow N_2 \rightarrow 1$  is an exact sequence with  $N_1$  infinitesimal and  $N_2$  étale, then  $\#G[p](\bar{s}) = \#N_2(\bar{s})$  is locally constant in  $s$  because  $N_2$  is étale.

$3 \rightarrow 2$ : Cf. [Messing. The crystals associated to Barsotti-Tate groups] 2.4.8?  $\square$

**Prop. (27.10.1.15) [Connected-Étale Splittings].** For  $k \in \text{Field}^p$  s.t.  $k = k^{\text{sep}}$  and  $G \in p\text{Div}/k$ , the connected-étale exact sequence (27.10.1.14) uniquely splits, and there is a canonical decomposition

$$X = X_{cc} \times X_{ce} \times X_{ee} \in p\text{Div}/k.$$

$\perp$

*Proof:* Cf. [Oort, Commutative group schemes] Section 1.2.?  $\square$

**Def. (27.10.1.16) [Tate-Modules].** For  $k \in \text{Field}$  and  $G \in p\text{Div}/k$ , the **Tate-module** of  $G$  is defined to be

$$\text{Tate}_p(G) \stackrel{\triangle}{=} \text{Hom}(\underline{\mathbb{Q}_p/\mathbb{Z}_p}, G) = \varprojlim_n G[p^n](k^{\text{sep}}),$$

and the **Tate-comodule** of  $G$  is defined to be

$$\Phi_p(G) = \varinjlim_n G[p^n](k^{\text{sep}}).$$

Then  $\text{Tate}_p(G) \cong \text{Tate}_p(G^{\text{ét}})$  is a free  $\mathbb{Z}_p$ -module of rank  $\text{ht}(G^{\text{ét}})$ ?  $\perp$

**Prop. (27.10.1.17) [Discriminants].** Let  $(R, \kappa)$  be a complete Noetherian local ring with  $\text{char } \kappa = p$  and  $G \in p\text{Div}/R$ . let  $A_{p^n} = \Gamma(G[p^n])$ , then

$$\text{disc}_R(A) = (p^{\dim G \cdot np^{h_n}}) \in \text{Ideal}(R).$$

┘

*Proof:* Cf. [p-divisible Groups, Tate] or [notes on Tate's p-divisible groups].

□

**Def. (27.10.1.18) [Tangent Spaces].** The **tangent space**  $\text{Lie}(G)$  of  $G \in p\text{Div}/\mathcal{O}_K$  is defined to be the Lie algebra of the formal Lie group associated to  $G^0$  (27.10.1.9). ┘

**Thm. (27.10.1.19) [p-Divisible Groups Determined by Generic Fibers].** If  $\text{char } K = 0$ , then the functor  $p\text{Div}/\mathcal{O}_K \rightarrow p\text{Div}/K$  is fully faithful. ┘

*Proof:* ?

□

### Isogenies between $p$ -Divisible Groups

**Def. (27.10.1.20) [Isogenies and Quasi-Isogenies].** For  $S \in \text{Sch}$ , an **isogeny between  $p$ -divisible groups** over  $S$  is a morphism between  $p$ -divisible groups with the same height s.t. the kernel is a finite group scheme.

A **quasi-isogeny between  $p$ -divisible groups**  $X, Y \in p\text{Div}/S$  is a global section  $\varphi$  of the Zariski-sheaf  $\underline{\text{Hom}}_S(X, Y) \otimes \mathbb{Q}$  over  $S$  s.t. locally on  $S$  there exists  $n \in \mathbb{Z}$  s.t.  $p^n \varphi$  is an isogeny. ┘

**Prop. (27.10.1.21) [Quotients by Finite Group Schemes].** Let  $X \in p\text{Div}/S$  and  $N \leq X$  a finite group scheme over  $S$ .

- If  $N \leq X[p^r]$  for some  $r \in \mathbb{Z}_+$ , then for each  $n \leq m \in \mathbb{Z}_+$ , the natural map

$$(X[p^{n+r}]/N)[p^n] \rightarrow (X[p^{m+r}]/N)[p^n]$$

is an isomorphism.

- The fppf-quotient  $X/N \in \text{Sh}(\text{Sch}_{\text{fppf}}/S)$  is represented by an ind-scheme  $Y \in \text{Sch}/S$  which is locally of the form  $Y = ((X[p^{n+r}]/N)[p^n])$  where  $r \in \mathbb{Z}_+$  is chosen s.t.  $[p^r]_N = 0$ . ┘

*Proof:* The question is local on  $S$ , so we may assume that  $N \leq X[p^r]$ . It suffices to show that if we define  $Y_n = (X[p^{n+r}]/N)[p^n] \in \text{Sh}(\text{Sch}_{\text{fppf}}/S)$ , then each  $Y_n$  are finite group scheme over  $S$ , and  $Y_n \rightarrow Y_m[p^n]$  are isomorphisms for each pair  $n \leq m \in \mathbb{Z}_+$ .

To check  $Y_n$  are finite group scheme over  $S$ , notice  $[p^n] : X[p^{n+r}]/N \rightarrow X[p^n]/N$  is a surjection of fppf-sheaves, so it is faithfully flat by (10.1.2.8). So the kernel  $Y_n$  is finite locally free over  $S$ ?.

To check  $Y_n \rightarrow Y_m[p^n]$  are isomorphisms, because they are finite locally free, it suffices to check on geometric fibers, and then we can use either Tate-modules or Dieudonné-theory. □

**Prop. (27.10.1.22) [Inverse Isogenies].** Let  $h : S \rightarrow \mathbb{Z}$  be a locally constant function and  $\varphi : X \rightarrow Y \in p\text{Div}^h/S$  be an isogeny with kernel  $N = \ker(\varphi) \in \text{finAbSch}/S$ , and the induced map  $\varphi : X/N \rightarrow Y$  (27.10.1.21) is an isomorphism.

And if  $N$  is killed by  $[p^m]$  for some  $m \in \mathbb{Z}_+$ , then there exists an isogeny  $\psi : Y \rightarrow X \in p\text{Div}^h/S$  s.t.  $\varphi \circ \psi = [p^n]_Y$ ,  $\psi \circ \varphi = [p^n]_X$ . ┘

*Proof:* To check  $\varphi : X/N \cong Y$ , it suffices to check on  $[p^n]$ -torsions for each  $n \in \mathbb{Z}_+$ . For this, it suffices to check on geometric points ?, and then we can use either Tate-modules or Dieudonné-theory.

Now we can define  $\psi : Y \xrightarrow{\varphi^{-1}} X/N \rightarrow X/X[p^n] \xrightarrow{[p^n]} X$ , so  $\psi \circ \varphi = [p^n]$ , and

$$(\varphi \circ \psi) \circ \varphi = \varphi \circ [p^n] = [p^n] \circ \varphi,$$

showing that  $\varphi \circ \psi = [p^n]$  as well, because  $\varphi$  is faithfully flat. □

**Thm. (27.10.1.23) [Kernel of Dual Isogenies].** Let  $\varphi : X \rightarrow Y \in p\text{Div}/S$  be an isogeny, then  $\varphi^D : Y^D \rightarrow X^D$  is also an isogeny, with a natural isomorphism  $\ker(\varphi^D) \cong \ker(\varphi)^D$ . ┘

*Proof:* Cf. [CCO14]P152. □

**Prop. (27.10.1.24) [Rigidity of Quasi-Isogenies between Barsotti-Tate Groups].** Let  $S \in \text{NSch}$  s.t.  $p$  is locally nilpotent on  $S$ , and  $X, X' \in p\text{Div}/S$ , then every  $\bar{\rho} \in \text{Hom}(X \times_S S_{\text{red}}, X' \times_S S_{\text{red}})$  extends uniquely to a  $\rho \in \text{Hom}(X, X')$ . Moreover,  $\rho$  is a quasi-isogeny if  $\bar{\rho}$  is. ┘

*Proof:* Cf. [Andre, period maps]P73. ? □

**Prop. (27.10.1.25) [Isogenies between Abelian Varieties and  $p$ -Divisible Groups].** Let  $g \in \mathbb{Z}_+$  and  $\varphi : A \rightarrow B \in \text{AbVar}/S$ , then  $\varphi$  is an isogeny iff  $f = \varphi[p^\infty] : A[p^\infty] \rightarrow B[p^\infty] \in p\text{Div}/S$  (27.10.1.3) is an isogeny (27.10.1.20). ┘

*Proof:* Cf. [CCO14]P150 ?. □

**Prop. (27.10.1.26) [Complex Multiplications for  $p$ -Divisible Groups].** Let  $\kappa \in \text{Perf}^p$  and  $h \in \mathbb{Z}_+$ ,  $G \in p\text{Div}^h/\kappa$ , then

- If  $F \leq \text{End}^0(G)$  is a commutative semi-simple  $\mathbb{Q}_p$ -subalgebra, then  $[F : \mathbb{Q}_p] \leq h$ , with equality iff  $M^*(G_\kappa)[\frac{1}{p}]$  is free of rank 1 as a  $W(\kappa) \otimes_{\mathbb{Z}_p} F$ -module.
- If the equality as above holds, then  $Z_{\text{End}^0(G)}(F) = F$ . If moreover the maximal  $\mathbb{Z}_p$ -order  $\mathcal{O}_F \leq F$  lies in  $\text{End}(G)$ , then  $M^*(G_\kappa)$  is free of rank 1 as a  $W(\kappa) \otimes_{\mathbb{Z}_p} \mathcal{O}_F$ -module. ┘

*Proof:* Cf. [CCO14]Prop1.4.3.9. □

**Prop. (27.10.1.27) [Being Isogeny is a Clopen Condition].** For  $S \in \text{NSch}$  and  $f : X \rightarrow Y \in p\text{Div}/S$ , the subset  $U = \{s \in S \mid \varphi_s \text{ is an isogeny}\}$  is clopen in  $S$ , and  $\varphi_U : X_U \rightarrow Y_U \in p\text{Div}/U$  is an isogeny. ┘

*Proof:* Cf. [CCO14]P153 ?. □

### Classical Dieudonné-Theory

**Thm. (27.10.1.28) [Dieudonné-Theory for  $p$ -Divisible Groups].** There is an additive anti-equivalence between Abelian-categories:

$$M^* : p\text{Div}/\kappa \rightarrow \text{Mod}_{D(\kappa)}^{W(\kappa)\text{-lf}} : G \mapsto M^*(G) \stackrel{\Delta}{=} \varprojlim_n M^*(G_n) \in \text{Mod}_{D(\kappa)}$$

called the **contravariant Dieudonné functor**, with inverse given by ?,

Moreover, by counting  $W(\kappa)$ -lengths, we see

- $\text{rank}_{W(\kappa)} M^*(G) = \text{ht}(G)$  (27.10.1.2).
- $M^*(G)/(p^n) \rightarrow M^*(G_n)$  for each  $n \in \mathbb{Z}_+$ .
- If  $\kappa' \in \mathcal{P}\text{erf}^p/\kappa$ , then there are natural isomorphisms

$$M^*(G_{\kappa'}) = M^*(G) \otimes_{W(\kappa)} W(\kappa').$$

- The relative Frobenius-morphism  $F_{G/\kappa} : G \rightarrow G^{(p)}$  corresponds to

$$M^*(G^{(p)}) \cong \varphi_*(M^*(G)) \xrightarrow{F} M^*(G),$$

and the Verschiebung-morphism  $\text{Ver}_{G/\kappa} : G^{(p)} \rightarrow G$  corresponds to

$$M^*(G) \xrightarrow{V} \varphi_*(M^*(G)) = M^*(G^{(p)}).$$

Moreover,  $G$  is connected iff  $F$  is nilpotent on  $M^*(G)$ .

- There are natural isomorphism  $M^*(G^D) \cong M_*(G) \triangleq \text{Hom}_{W(\kappa)}(M^*(G), W(\kappa))$ , and

$$F^D(f) : m \mapsto \sigma(f(V(m))), \quad V^D(f) : m \mapsto \sigma^{-1}(f(F(m))).$$

$M_*(G) \triangleq M^*(G^D)$  is called the **covariant Dieudonné module** of  $G$ . Equivalently (Cf. [C0014]P349), there are natural perfect pairings

$$\langle -, - \rangle_{M^*(G)} : M^*(G) \times M^*(G^D) \rightarrow W(\kappa)$$

s.t.

$$\langle Fx, y \rangle_{M^*(G)} = \langle x, Vy \rangle_{\varphi_* M^*(G)}, \text{ where } x \in \varphi_* M^*(G), y \in M^*(G^D),$$

where  $\langle -, - \rangle_{\varphi_* M^*(G)}$  is the composition

$$\varphi_* M^*(G) \times \varphi_* M^*(G) \xrightarrow{\langle -, - \rangle_{M^*(G)}} \varphi_*(W(\kappa)) \xrightarrow{\varphi} W(\kappa).$$

And this pairing satisfies a double duality.

- There are natural isomorphisms

$$\text{Lie}(G)^\vee \cong M^*(G)/FM^*(G), \quad \text{Lie}(G) \cong \ker(V : M_*(G) \rightarrow \varphi_* M_*(G)).$$

respecting extension of perfect base fields. ┘

*Proof:* This follows directly from (10.1.2.27). □

**Cor. (27.10.1.29).** For  $G \in p\text{Div}/\kappa$ ,  $G$  is connected (27.10.1.8) iff  $F$  is topologically nilpotent on  $M^*(G)$ , by (10.1.2.28). ┘

**Thm. (27.10.1.30)[Dieudonné Theory for Formal Groups].** A **formal group functor** is a functor from the category of finite-length  $B$ -rings to  $\mathcal{G}\text{rp}$ . And a **formal group** is a formal group functor that is representable by a formal scheme.

A formal group is **formally smooth** if for any finite-length  $B$ -ring  $A$  and  $I \in \text{Ideal}(A)$  s.t.  $I^2 = (0)$ , the map  $G(R) \rightarrow G(R/I)$  is surjective.

Then for each  $R \in \mathcal{C}\text{Ring}^p$ , there is an equivalence from the category of smooth commutative formal groups over  $R$  to the category of reduced  $E(R)$ -modules (27.5.5.23). Moreover, If  $M$  corresponds to  $G$ , then  $M/VM \cong T_e(G)$ . In particular,  $\dim G < \infty$  iff  $M$  is a Dieudonné-module. ┘

*Proof:* ?

□

**Prop. (27.10.1.31) [Finite Group Schemes of Order  $p$ ].**

- $M^*(\mathbb{Z}/(p))$  is given by  $\kappa e$  with  $Fe = e, Ve = 0$ .
- $M^*(\mu_p)$  is given by  $\kappa e$  with  $Fe = 0, Ve = e$ .
- $M^*(\alpha_p)$  is given by  $\kappa e$  with  $Fe = 0, Ve = 0$ .

┘

*Proof:* This is because the relative Frobenius kills  $\mu_p$  and  $\alpha_p$  but not  $\mathbb{Z}/(p)$ , and we use the facts  $\mu_p^D = \mathbb{Z}/(p), \alpha_p^D = \alpha_p$  (10.1.2.11)(10.1.2.12). □

**Example (27.10.1.32) [Dieudonné-Modules].**

- $M^*((\mathbb{Q}_p/\mathbb{Z}_p)_\kappa) = W(\kappa)$ .
- $M^*(\mu_{p^\infty, \kappa}) = W(\kappa)(-1)$ , i.e.  $F = p\varphi, V = \text{Ver}$ .
- If  $A \in \mathcal{A}b\mathcal{V}ar/\kappa$  and  $X = A[p^\infty]$ , then there is a canonical isomorphism  $M^*(X) \cong H_{\text{crys}}^1(A/W(\kappa))$ .

┘

*Proof:* 3: ?

□

**Prop. (27.10.1.33) [ $\alpha$ -Group Schemes].** For  $k \in \mathbf{Field}^p$  and  $G \in p\text{-finAbSch}/k$ ,  $G \cong \alpha_p^r$  for some  $r \in \mathbb{Z}_+$  iff

$$F_{G/k} = 0, \text{Ver}_{G/k} = 0.$$

Such a group scheme is called a  **$\alpha$ -group scheme** over  $k$ . ┘

*Proof:* If  $k = k^{\text{perf}}$ , this is easy using Dieudonné-theory (27.10.1.31). In general, we use the fact  $\text{End}_k(\alpha_p) = \mathbb{G}_a$  (10.1.1.8) and the fact  $H^1(\text{Gal}_k, \text{GL}(n)) = 0$ . □

**Def. (27.10.1.34) [ $a$ -Numbers].** For  $k \in \mathbf{Field}^p$  and  $G \in \text{Sh}(\text{Sch}_{\text{fppf}}/k)$  s.t.  $G[p]$  is representable by a f.t.  $K$ -group, then for any  $k''/k'/k \in \mathbf{Field}^p$  s.t.  $k' = (k')^{\text{perf}}, k'' = (k'')^{\text{perf}}$ , there is an isomorphism

$$k'' \otimes_{k'} \text{Hom}((\alpha_p)_{k'}, G_{k'}) \cong \text{Hom}((\alpha_p)_{k''}, G_{k''}),$$

where  $k'$ -vector space structure on  $\text{Hom}((\alpha_p)_{k'}, G_{k'})$  comes from  $\alpha_p$ . So we can define the  **$a$ -number of group scheme** of  $G$  to be

$$a(G) = a(G[p]) = \dim_{\bar{k}} \text{Hom}((\alpha_p)_{k'}, G_{k'}),$$

┘

*Proof:* Using contravariant Dieudonné-theory (10.1.2.27), if  $M = M^*(G[p]_{k'})$ , then by (27.10.1.31) we see that

$$\text{Hom}((\alpha_p)_{k'}, G_{k'}) \cong \text{Hom}(M/(FM + VM), \kappa'),$$

and the assertion clearly follows. □

**Prop. (27.10.1.35) [ $a$ -Numbers of  $p$ -Divisible Groups].** For  $k \in \mathbf{Field}^p$  and  $N \in \text{B-T}_1/k$  (27.10.1.41), we have

$$a(N) = a(N^D).$$

In particular, for  $X \in p\text{Div}/k$ , we have  $a(X) = a(X^D)$  by (27.10.1.42). ┘

*Proof:* We may assume  $\kappa = \kappa^{\text{perf}}$ . Then using contravariant Dieudonné-theory(10.1.2.27), if  $M = M^*(N)$ , then we have

$$a(N) = \dim_{\kappa} M/(FM + VM), \quad a(N^D) = \dim_{\kappa} M[F] \cap M[V],$$

But by definition of  $B\text{-}T_1$ (27.10.1.41), we see that  $M[F] = VM$ ,  $M[V] = FM$ , and there is an exact sequence

$$0 \rightarrow VM/(FM \cap VM) \rightarrow M/FM \rightarrow M/(FM + VM) \rightarrow 0 \in \mathcal{V}\text{ect}/\kappa,$$

so

$$a(N) = \dim M = \dim FM - (\dim VM - a(N^D)) = a(N^D) + \dim M - \dim FM - \dim M[F] = a(N^D).$$

□

**Prop. (27.10.1.36) [ $a$ -Numbers are Upper Semi-Continuous].** For  $S \in \mathcal{S}\text{ch}^p$  and  $G \in \text{finAbSch}/S$  killed by  $[p]$ , the function  $s \mapsto a(G_s)$  is upper semi-continuous??, i.e. for each  $n \in \mathbb{N}$ ,  $\{s \in S | a(G_s) \geq n\}$  is closed in  $S$ . ┘

*Proof:* Cf.[CCO14]P145?.

□

### Isocrystals and Dieudonné-Modules

**Thm. (27.10.1.37) [Dieudonné-Manin].** For each  $s \in \mathbb{Z}_+$  and  $r \in [s]$  s.t.  $(r, s) = 1$ , define the Dieudonné-module

$$M_{r/s} \triangleq D(\mathbb{F}_p)/D(\mathbb{F}_p)(F^{s-r} - V^r)(27.5.5.22),$$

and  $X_{r/s} \in p\text{Div}/\mathbb{F}_p$  s.t.  $D^*(X_{r/s}) = M_{r/s}$ . Then

- $X_{r/s}$  is of dimension  $r$  and height  $s$ .
- $X_{r/s}^D = X_{(s-r)/s}$ .

And for each  $k \in \mathbf{Field}^p$  s.t.  $k = \bar{k}$ ,

- $X_{r/s,k}$  is isogenous to  $X_{r'/s',k}$  iff  $r/s = r'/s'$ ,
- The isogeny category of  $p$ -divisible groups over  $k$  is semi-simple, with simple objects given by these  $X_{r/s,k}$ .

┘

*Proof:* Denote  $e_0 = V^{r-1}$ ,  $e_1 = pV^{r-2}$ ,  $\dots$ ,  $e_r = p^{r-1}$ ,  $e_{r+1} = p^{r-1}F$ ,  $\dots$ ,  $e_{s-1} = p^{r-1}F^{s-r}$ , then  $M_{r/s} = \mathbb{Z}_p\{e_0, p^{-1}e_1, \dots, p^{-r}e_r, p^{-r}e_{r+1}, \dots, p^{-r}e_{s-1}\}$  with

$$Fe_0 = e_1, \dots, Fe_{s-2} = e_{s-1}, Fe_{s-1} = p^r e_0, \quad Ve_0 = p^{-r+1}e_{s-1}, Ve_1 = pe_0, \dots, Ve_{s-1} = pe_{s-2}.$$

So

$$\begin{aligned} M_{r/s}^{\vee} &= \{e_0^{\vee}, pe_1^{\vee}, \dots, p^r e_r^{\vee}, p^r e_{r+1}^{\vee}, \dots, p^r e_{s-1}^{\vee}\} \\ &= \mathbb{Z}_p\{p^r e_r^{\vee}, p^{-1}(p^{r+1}e_{r+1}^{\vee}), \dots, p^{-s+r+1}(p^{s-1}e_{s-1}^{\vee}), p^{-s+r}(p^{s-r}e_0), p^{-s+r}(p^{s-r+1}e_1), \dots, p^{-s+r}(p^{s-1}e_{r-1})\} \end{aligned}$$

with

$$\begin{aligned} F(p^r e_r^{\vee}) &= (p^{r+1}e_{r+1}^{\vee}), \dots, F(p^{s-1}e_{s-1}^{\vee}) = p^{s-r}e_0^{\vee}, F(p^{s-r}e_0^{\vee}) = (p^{s-r+1}e_1^{\vee}), \\ F(p^{s-r+1}e_1^{\vee}) &= (p^{s-r+2}e_2^{\vee}), \dots, F(p^{s-1}e_{r-1}^{\vee}) = p^{s-r}(p^r e_r^{\vee}), \end{aligned}$$

so  $M_{r/s}^{\vee} \cong M_{(s-r)/s}$ .

The rest follows from Dieudonné-theory(27.10.1.28) and(27.5.5.17). □

**Cor. (27.10.1.38)[Slopes and Newton-Polygons].** For any  $k \in \mathbf{Field}^p$  and  $X \in p\mathrm{Div}/k$ , there exists a unique finite subset  $\{\lambda_i\} \subset \mathbb{Q} \cap [0, 1]$  s.t.  $X_{\bar{k}}$  is isogenous to  $\prod_i X_{\lambda_i}^{e_i}$  for some  $e_i \in \mathbb{Z}_+$ . These  $\lambda_i$  are called the **slope of  $p$ -divisible group** of  $X$ . And  $X$  is called an **isoclinic  $p$ -divisible group** if  $\{\lambda_i\}$  is a singleton, equivalently,  $M^*(X_{\bar{k}})$  is an isoclinic (27.5.5.13).

And the lower convex polygon  $\mathrm{NP}(X)$  on the lattice  $\mathbb{Z}^2$  drawn using segments of slope  $\lambda_i = r_i/s_i$  and horizontal length  $e_i s_i$  is called the **Newton-polygon** of  $X$ .  $\lrcorner$

**Cor. (27.10.1.39).** If  $k \in \mathbf{Field}^p$  and  $0 \neq X \in p\mathrm{Div}/k$ , then  $\mathrm{End}(X)$  is a finite free  $\mathbb{Z}_p$ -module.  $\lrcorner$

*Proof:* It suffices to prove for  $k = \bar{k}$  and also assume that  $X = X_\lambda$  for some  $\lambda \in \mathbb{Q} \cap [0, 1]$  (27.10.1.37).

? Cf. [Chai-Oort, Moduli of abelian varieties and  $p$ -divisible groups] or [Demazure, Lectures on  $p$ -divisible Groups].  $\square$

**Thm. (27.10.1.40)[Slope Filtrations, Grothendieck-Zink].** For any  $k \in \mathbf{Field}^p$  and  $X \in p\mathrm{Div}/k$ , there is a filtration

$$0 = Y_0 \leq Y_1 \leq \dots \leq Y_t = X \in p\mathrm{Div}/k$$

s.t.  $Y_i/Y_{i-1}$  is isoclinic of slope  $\lambda_i$  for each  $i \in [t]_+$ , and  $\lambda_1 > \lambda_2 > \dots > \lambda_t$ .  $\lrcorner$

*Proof:* Cf. [Zink, On the slope filtration] Thm7.  $\square$

### Truncated Barsotti-Tate Groups

References are [Displays and formal  $p$ -divisible groups, Lau].

**Def. (27.10.1.41)[Truncated Barsotti-Tate Groups].** For  $n \in \mathbb{Z}_+$ , the category  $\mathrm{B-T}_n/S$  of **truncated Barsotti-Tate group** of level  $n$  over  $S$  is the subcategory of  $p\text{-finAbSch}/S$  consisting of objects  $G$  satisfying necessary (but may not be sufficient) conditions s.t.  $G \cong X[p^n]$  for some  $X \in p\mathrm{Div}/S$ . Cf. [Illusie, Deformation des groupes de Barsotti-Tate] and [Messing, The Crystals associated to Barsotti-Tate Groups] ?.

For example, for  $k \in \mathbf{Field}^p$ ,  $\mathrm{B-T}_1/k$  consists of  $N \in \mathrm{finAbSch}/k$  killed by  $[p]$  s.t. the complex

$$N \xrightarrow{F_{N/k}} N(p) \xrightarrow{\mathrm{Ver}_{N/k}} N$$

is exact. By (10.1.2.27), this is equivalent to

$$M^*(N) \xrightarrow{V} \varphi_* M^*(N) \xrightarrow{F} M^*(N)$$

being exact.  $\lrcorner$

**Prop. (27.10.1.42)[Truncations of  $p$ -Divisible Groups].** For  $k \in \mathbf{Field}^p$  and  $X \in p\mathrm{Div}/k$ , we have  $N = X[p] \in \mathrm{B-T}_1/k$ .  $\lrcorner$

*Proof:* We may base change to  $\bar{k}$ . Then by Dieudonné theory (27.10.1.28),  $V \circ F = p$  on  $M^*(X)$ , which is a finite free  $W(k)$ -module, so  $F, V$  are injective, and there is an exact sequence

$$M^*(X)/(p) \xrightarrow{V} \varphi_* M^*(X)/(p) \xrightarrow{F} M^*(X)/(p),$$

proving  $X[p] \in \mathrm{B-T}_1$  (27.10.1.41).  $\square$

### Hodge-Tate Decomposition

**Prop. (27.10.1.43) [Hodge-Tate Decomposition].** For  $G \in p\text{Div}/\mathcal{O}_K$ , there is an isomorphism of  $\text{Gal}_K$ -representations:

$$\text{Tate}_p(G) \otimes \mathbb{C}_K \cong \text{Lie}(G)(K) \otimes \mathbb{C}_K(1) \bigoplus \text{Lie}(G^*)(K)^* \otimes \mathbb{C}_K(1).$$

┘

*Proof:* Cf. [p-divisible Groups, Morrow].

□

### $p$ -Divisible Groups over $\mathcal{O}_{\mathbb{C}_p}$

.

## 2 Crystalline Dieudonné-Theory

References are [Mes72] and [deJong, crystalline Dieudonné-Theory].

**Notation (27.10.2.1).**

- Let  $(K, \mathcal{O}_K, \varpi_K, \kappa) \in p\text{-Field}$  with  $e(K) < p$ . In particular,  $(\text{Spec } \kappa \rightarrow \text{Spec } \mathcal{O}_K)$  is a pd-structure (5.6.1.1).
- Let  $S \in \text{NSch}$  s.t.  $p$  is locally nilpotent on  $S$ .

┘

**Def. (27.10.2.2) [Dieudonné-Crystals].** For  $X \in p\text{Div}/S$ , the **Dieudonné-crystal** over  $S$  is the crystalline Ext-sheaf

$$\mathbf{D}(X) \triangleq \mathcal{E}xt^1(X_{\text{Crys}}, \mathcal{O}_{S/\mathcal{O}_K}).$$

Then  $\mathbf{D}(X)$  is a finite locally free crystal over  $S$  (27.5.3.1) of rank  $\text{ht}(X)$ , called the **Dieudonné-crystal** associated to  $X$ , which depends contra-variantly on  $X$ .

And for each  $(T_0, T, \gamma) \in (S/\mathcal{O}_K)_{\text{Crys}}$ , we have  $\mathbf{D}(X)_{(T_0, T)} = \mathbf{D}(X_{T_0})_{(T_0, T)}$ , in particular,  $\mathbf{D}(X)$  only depends on  $X \times_S S_{\text{red}}$ .

┘

*Proof:* ?

□

**Prop. (27.10.2.3) [ $p$ -Divisible Groups and Isocrystals].** If  $S_0 \in \text{Sch}^p$ , then for each  $X \in p\text{Div}/S$ , the relative Frobenius makes  $\mathbf{D}(X)$  a  $F$ -crystal over  $S_0$  (27.5.5.2). And  $X \mapsto \mathbf{D}(X)$  (27.10.2.2) induces an equivalence between  $p\text{Div}^{\text{ét}}/S_0$  and the category of  $F$ -crystals over  $S_0$  s.t.  $\varphi$  is an isomorphism.

┘

*Proof:* Cf. [deJong, crystalline Dieudonné-Theory].

□

**Prop. (27.10.2.4) [Hodge-Filtrations].** For  $X \in p\text{Div}/S$ , there is a canonical locally split exact sequence

$$0 \rightarrow \omega_X \xrightarrow{\triangle} \text{Lie}(X)^\vee \rightarrow \mathbf{D}(X)_S \rightarrow \text{Lie } X^\vee \rightarrow 0 \in \text{Mod}(\mathcal{O}_S),$$

which is compatible with base change, called the **Hodge-filtration** associated to  $X$ .

If  $A \in \text{AbVar}/S$  s.t.  $X = A[p^\infty]$ , then this Hodge-filtration is just the Hodge-filtration

$$0 \rightarrow \omega_A \rightarrow H_{\text{dR}}^1(A/S) \rightarrow \text{Lie}(A^\vee) \rightarrow 0.$$

┘

*Proof:* ?

□

**Def. (27.10.2.5)[Universal Extensions of  $p$ -Divisible Groups].** Suppose  $p$  is locally nilpotent on  $S$  and  $X \in p\text{Div}/S$ , a **universal extension** of  $X$  is an extension of commutative group schemes

$$0 \rightarrow \tilde{V} \rightarrow E \rightarrow X \rightarrow 0 \in \mathcal{A}b\mathcal{S}ch/S$$

where  $V \in \mathcal{Q}Coh(\mathcal{O}_S)$ , with the universal property that: For any vector group  $M \in \mathcal{Q}Coh(\mathcal{O}_S)$ , the natural map

$$\text{Hom}_{\mathcal{O}_S}(V, M) \rightarrow \text{Ext}_S^1(X, \tilde{M})$$

is an isomorphism.

┘

**Thm. (27.10.2.6)[Universal Extensions Exist, Messing, [Mes72]].** Situation as in (27.10.2.5), there exists a universal extension

$$0 \rightarrow \tilde{V}(X) \rightarrow E(X) \rightarrow X \rightarrow 0 \in \mathcal{A}b\mathcal{S}ch/S,$$

with  $V(X) \cong \omega_{G^p}$ . This universal extension is functorial in  $X$ , and commutes with base changes. ┘

*Proof:* Cf. [Mes72] 4.1.10.

□

**Prop. (27.10.2.7)[Crystal in Group Schemes].** Suppose  $p$  is locally nilpotent on  $S$  and  $X \in p\text{Div}/S$ , then Messing defined

- A crystal in group schemes  $\mathbf{E}(X)$ .
- A crystal in formal Lie-groups  $\overline{\mathbf{E}(X)}$ .
- A crystal in finite locally free modules  $\mathbf{D}(X)$ .

which are functorial in  $G$ , using universal extensions of  $p$ -divisible groups (27.10.2.6). ┘

*Proof:* ? Cf. [Mes72] or [Haoran Wang, period morphisms].

### 3 Displays and Dieudonné-Theory

References are [Zin01a, Zin02, B-P20].

**Notation (27.10.3.1).**

- Use notations on divided power rings from Divided Power Algebras.
- Let  $\text{Nil}$  be the subcategory of  $\mathcal{C}\text{Ring}$  consisting of rings s.t.  $p$  is nilpotent on it.

┘

**Def. (27.10.3.2)[ $\mathcal{Z}$ -Rings].** Let  $\mathcal{Z}$  be the subcategory of  $\text{Nil}$  consisting of local rings  $(R, \mathfrak{m}, \kappa)$  s.t.  $\kappa$  is perfect and there exists  $N \in \mathbb{Z}_+$  s.t.  $\mathfrak{m}^N = 0$ .

Let  $\tilde{\mathcal{Z}}$  be the subcategory of  $\mathcal{C}\text{Ring}$  consisting of  $p$ -complete separated rings  $A$  s.t.  $A/(p^n) \in \mathcal{Z}$  for any  $n \in \mathbb{Z}_+$ . ┘

### Frames

**Def. (27.10.3.3) [Quasi-Frames].** For  $R \in \text{Nil}$ , a **quasi-frame** over  $R$  is a tuple  $(A, \kappa, \sigma, \sigma_1)$  where

- $A \in \text{TopCRing}$  is a  $p$ -adically complete and separated ring.
  - $\kappa : A \rightarrow W(R)$  is a ring homomorphism s.t.  $\alpha : A \xrightarrow{\kappa} W(R) \rightarrow R$  is surjective with kernel  $J$ .
  - $\varphi : A \rightarrow A$  is a ring homomorphism and  $\varphi_1 : J \rightarrow A$  is a  $\varphi$ -semi-linear map s.t.  $\varphi|_J = p \cdot \varphi_1$ .
- s.t.
- The image of  $J$  in  $A/(p)$  consists of nilpotent elements. In particular,  $J \subset \text{rad}(A)$ .
  - $\kappa(\varphi(a)) = F(\kappa(a))$  for any  $a \in A$ .
  - $\text{Ver}(\kappa(\varphi_1(u))) = \kappa(u)$  for any  $u \in J$ .

┘

**Cor. (27.10.3.4).** If  $R \in \text{Nil}$  and  $A$  is a quasi-frame for  $R$  (27.10.3.3), then any finite flat  $R$ -module can be lifted to a finite flat  $A$ -module.

┘

*Proof:* Cf. [Zin01a]P496. □

**Def. (27.10.3.5) [Frames].** For  $R \in \text{CRing}$  that is  $p$ -adically complete and separated, a **frame for**  $R$  is a triple  $(A, \alpha, \varphi)$  where

- $A \in \text{TopCRing}$  is a  $p$ -complete separated ring that is  $p$ -torsion-free.
- $\alpha : A \rightarrow R$  is a surjection with kernel  $J$  s.t.  $(A, J)$  is a divided power ring (5.6.1.1).
- $\varphi : A \rightarrow A$  is a ring homomorphism inducing the Frobenius on  $A/(p)$ .

┘

**Example (27.10.3.6) [Frames].**

- If  $k \in \text{Field}^p$ ,  $R = k[T_1, \dots, T_d]$ ,  $A = C(k) \langle T_1, \dots, T_d \rangle$  (5.5.2.30)(12.2.1.9), then  $(A, (p), \sigma)$  is a frame for  $R$  where  $\sigma$  is an Frobenius lift of  $C(k)$ .
- (Breuil's Dieudonné-frame) Let  $(R, \varpi, \kappa)$  be a CDVR of characteristic  $(0, p)$  and  $C(\kappa)$  the Cohen ring of  $k$  (5.5.2.30) with a lift of Frobenius  $\sigma$ . Then the minimal polynomial of  $\varpi$  over  $C(\kappa)$  is an Eisenstein polynomial of degree  $e$ . Cf. [Zin01]P496.

┘

**Prop. (27.10.3.7) [Frames and Quasi-Frames].** For  $R \in \text{Nil}$ , there is a functor from the category of frames over  $R$  (27.10.3.5) to the category of quasi-frames over  $R$  (27.10.3.3) mapping  $(A, \alpha, \varphi)$  to  $(A, \kappa, \varphi_1, \varphi)$  defined as follows:

- $A = A$ .
- $\kappa : A \xrightarrow{\delta_A} W(A) \xrightarrow{W(\alpha)} W(R)$ , where  $\delta_A$  is the Cartier-homomorphism (5.5.2.20).
- $\varphi = \varphi$ .
- $\varphi_1 = p^{-1}\varphi|_J$ .

┘

*Proof:* Cf. [Zin01a]Prop1.5. ? □

**Def. (27.10.3.8) [Dieudonné Frames for  $\mathcal{Z}$ -Rings].** For  $R \in \mathcal{Z}$  (27.10.3.2), a **Dieudonné frame** for  $R$  is a frame  $(A, \alpha, \sigma)$  for  $R$  (27.10.3.5) s.t.  $A \in \tilde{\mathcal{Z}}$ , and the Cartier morphism  $A \rightarrow W(A)$  factors through  $\tilde{W}(A)$  ?.

┘

**Example (27.10.3.9) [Dieudonné Frames for  $\mathcal{Z}$ -Rings].** Cf. [Zin01a]P494. ┘

**Displays**

Cf.[The display of a formal  $p$ -divisible group, Zink].

**Def. (27.10.3.10) [Displays, Zink[Zin02]].** For  $R \in \mathcal{CRing}$  that is  $p$ -adically complete and separated, a **display** over  $R$  is a tuple  $\mathcal{P} = (P, Q, F, F_1, V^\sharp)$  where

- $P$  is a finite projective  $W(R)$ -module.
- $Q \subset P$  is a sub- $W(R)$ -module containing  $\text{Ver}(W(R))P$ .
- $F : P \rightarrow P, F_1 : Q \rightarrow P$  are  $\varphi$ -semi-linear maps of  $W(R)$ -modules.

s.t.

- $P/Q$  is a finite projective  $R$ -module.
- $F_1(\text{Ver}(w).x) = wF(x)$  for each  $w \in W(R)$  and  $x \in P$ .
- $P$  is generated by  $F_1(Q)$  as a  $W(R)$ -module.
- $V^\sharp : P \rightarrow W(R) \otimes_{\varphi, W(R)} P$  is a  $W(R)$ -linear homomorphism s.t.

$$V^\sharp(wF(x)) = pw \otimes x, \quad V^\sharp(wF_1(y)) = w \otimes y$$

for any  $w \in W(R), x \in P$  and  $y \in Q$ .

And a display is called a **nilpotent display** if moreover it satisfies the nilpotence condition:

- There exists  $n \in \mathbb{N}$  s.t. the map

$$V^{\sharp(n)} = \varphi^{(n-1)*}(V^\sharp) \circ \varphi^{(n-2)*}(V^\sharp) \circ \dots \circ V^\sharp : P \rightarrow W(R) \otimes_{\varphi^n, W(R)} P$$

is congruent to 0 modulo the ideal  $I(R) + pW(R)$ .

The category of displays over  $R$  is denoted by  $\text{Dsp}/R$ , and the subcategory of nilpotent displays over  $R$  is denoted by  $\text{NilDsp}/R$ .

For  $\mathcal{P} = (P, Q, F, F_1, V^\sharp) \in \text{Dsp}(R)$ ,  $\text{rank}_{W(R)}(P)$  is called the **height of display** of  $\mathcal{P}$ ,  $P/Q$  is called the **Lie-algebra of display** of  $\mathcal{P}$ , and  $\text{rank}_R(P/Q)$  is called the **dimension of display** of  $\mathcal{P}$ .  $\lrcorner$

*Proof:* It is shown in [Zin02]Lemma10 that given  $(P, Q, F, F_1)$ , there exists a unique  $V^\sharp$ .  $\square$

**Remark (27.10.3.11).** For  $\mathcal{P} = (P, Q, F, F_1, V^\sharp) \in \text{Dsp}(R)$  and each  $x \in Q$ , we have

$$F(x) = 1F(x) = F_1(\text{Ver}(1)x) = FV(1)F_1(x) = pF_1(x).$$

$\lrcorner$

**Prop. (27.10.3.12) [Displays and Dieudonné Modules].** If  $R = \kappa \in \mathbf{Field}^p$  s.t.  $\kappa = \kappa^{\text{perf}}$ , a display  $(P, Q, F, F_1) \in \text{Dsp}/\kappa$  (27.10.3.10) is the same as a Dieudonné module  $(P, F, V)$  over  $\kappa$  (27.5.5.23) where  $Q = V(P)$  and  $F_1 = V^{-1}$ . And the display is nilpotent iff  $V$  is topologically nilpotent.  $\lrcorner$

*Proof:* ?  $\square$

**Prop. (27.10.3.13) [Nilpotent Displays and Formal  $p$ -Divisible Groups, Zink[Zin02]/Lau[Lau08]].** Situation as in (27.10.3.10), there is a functor

$$\text{B-T} : \text{NilDsp}/R \rightarrow p\text{Div}^{\text{frml}}/R,$$

s.t.

- For  $\mathcal{P} = (P, Q, F, F_1) \in \text{Dsp}/R$ , we have  $\text{Lie}(\text{B-T}(\mathcal{P})) = P/Q$ .  
s.t.  $\text{ht}(\text{B-T}(P)) = \text{rank}(P)$ . The inverse is given by

$$\mathbf{D} : p\text{Div}^{\text{frml}}/R \rightarrow \text{NilDsp}/R : ?$$

In particular, by (27.10.3.12), for  $\kappa \in \mathbf{Field}^p$  s.t.  $\kappa = \kappa^{\text{sep}}$ , there is an equivalence of categories:

$$\text{B-T} : (\text{Nilpotent})\text{Dieudonné modules}/\kappa \cong p\text{Div}^{\text{frml}}/\kappa.$$

⌋

*Proof:* ? Cf. [?zin02]Thm81 where it is proved that B-T is faithful, and fully faithful if  $\text{rad}(R)$  is nilpotent. And [Displays and formal p-divisible groups, Lau] proved the equivalence. ? . □

### Windows

References are [Zink, Windows for displays of p-divisible groups].

**Def. (27.10.3.14) [A-Windows].** If  $R \in \text{Nil}(27.10.3.1)$  and  $(A, J, \kappa)$  is a quasi-frame for  $R(27.10.3.3)$ , a **Dieudonné A-window** over  $R$  is a tuple  $\mathcal{M} = (M, M_1, \Phi, \Phi_1, \Psi)$  where

- $M$  is a finite projective  $A$ -module.
- $M_1 \subset M$  is a  $A$ -submodule containing  $JM$ .
- $\Phi : M \rightarrow M, \Phi_1 : M_1 \rightarrow M$  are two  $\sigma$ -semi-linear maps.

s.t.

- $M/M_1$  is a finite flat  $R$ -module.
- 

$$\Phi(m_1) = p\Phi_1(m_1), \text{ where } m_1 \in M_1.$$

$$\Phi_1(um) = \sigma_1(u)\Phi(m), \text{ where } u \in J, m \in M.$$

- The union of  $\Phi_1(M_1)$  and  $\Phi(M)$  generates  $M$  as an  $A$ -module.

And a Dieudonné  $A$ -window is called a **A-window** if moreover it satisfies the nilpotence condition:

- For the unique  $\sigma$ -semi-linear map  $\Psi : M \rightarrow M$  s.t.

$$\Psi(\Phi_1(m_1)) = m_1, \text{ where } m_1 \in M_1, \quad \Psi(\Phi(m)) = pm, \text{ where } m \in M, ?$$

we have  $\Psi^N(M) \subset JM$  for some  $N \in \mathbb{Z}_+$ .

The category of  $A$ -windows is denoted by  $\text{Win}/A$ . It is an exact category, where the exact sequences are exact sequences of windows  $M$  inducing exact sequence on  $M_1$ . ⌋

**Cor. (27.10.3.15) [A-Windows for Frames].** If  $R \in \mathbb{C}\text{Ring}$  is  $p$ -adically complete and separated, and  $(A, \alpha, \varphi)$  is a frame for  $R(27.10.3.5)$ , then an  $A$ -window over  $R(27.10.3.14)$  is equivalent to a triple  $(M, M_1, \Phi)$  where

- $M \in \text{Mod}_A$  is a finite projective  $A$ -module.
- $M_1 \subset M$  is a sub- $A$ -module containing  $JM$ .
- $\Phi : M \rightarrow M$  is a  $\varphi$ -semi-linear map.

s.t.

- $M/M_1$  is a finite projective  $R$ -module.

- $\Phi(M_1) \subset pM$  and  $M$  is generated by  $\Phi(M)$  and  $p^{-1}\Phi(M_1)$  as an  $A$ -module.
- The last condition implies that  $1 \otimes \Phi : \varphi_* M \rightarrow M$  contains  $pM$ , thus it is injective, and we can define  $\Psi = M \rightarrow pM \xrightarrow{(1 \otimes \Phi)^{-1}} \varphi_* M$ , which is the unique  $\sigma$ -semi-linear map s.t.  $\Psi(\Phi(m)) = pm$  for any  $m \in M$ . Then we require  $\Psi^N(M) \subset (p, J)M$  for some  $N \in \mathbb{Z}_+$ .

┘

*Proof:* This is because  $\Phi_1$  is determined by  $\Phi$  and  $\sigma_1$  is determined by  $\sigma$ , as  $A$  is torsion-free (27.10.3.5). □

**Remark (27.10.3.16).** Situation as in (27.10.3.15), if  $(A, \alpha, \varphi)$  satisfies  $\varphi(J)$  generates  $pA$  as  $A$ -modules, then condition 2 can be simplified to requiring that  $p^{-1}\Phi(M_1)$  generates  $M$ , because  $A\Phi(M) \subset (p^{-1}\varphi(J))\Phi(M)$ , which is contained in  $p^{-1}\Phi(M_1)$ . ┘

**Thm. (27.10.3.17) [A-Windows and Displays].** If  $R \in \mathcal{CRing}$  is  $p$ -adically complete and separated and  $A$  is a quasi-frame for  $R$  (27.10.3.3), then there is a exact functor

$$\text{Dsp} : \text{Win}/A \rightarrow \text{Dsp}/R \text{ (27.10.3.14) (27.10.3.10)}$$

mapping  $(M, M_1, \Phi, \Phi_1, \Psi) \in \text{Win}/A$  to  $(P, Q, F, F_1, V^\sharp) \in \text{Dsp}/R$  where

- $P = W(R) \otimes_{\kappa, A} M$ .
- $Q = \ker \left( P = W(R) \otimes_{\kappa, A} M \xrightarrow{w_0 \otimes 1} R \otimes_{\alpha, A} M \rightarrow M/M_1 \right)$ .
- $F_1 : Q \rightarrow P$  is the unique functor s.t.

$$F_1(x \otimes m_1) = \varphi(x)\Phi_1(m_1), \quad F_1(\text{Ver}(x) \otimes m) = x \otimes \Phi(m)$$

for each  $x \in W(R), m_1 \in M_1, m \in M$ .

- $V^\sharp : W(R) \otimes_{\kappa, A} M \rightarrow W(R) \otimes_{\varphi, W(R)} W(R) \otimes_{\kappa, A} M$  is the unique  $W(R)$ -linear map s.t.

$$V^\sharp(w \otimes \Phi(m)) = pw \otimes 1 \otimes m, \quad V^\sharp(w \otimes \Phi_1(m_1)) = w \otimes 1 \otimes m_1$$

for all  $w \in W(R), m \in M, m_1 \in M_1$ , which exists by [Zin02]Lemma10.

If  $A$  is a frame for  $R$ , then we consider  $\text{Dsp}$  for the quasi-frame associated to  $A$  (27.10.3.7), then  $\text{Dsp}$  is an equivalence of categories, with inverse given by

$$A\text{-Win} : \mathcal{P} \in \text{Dsp}/R \mapsto (M = \mathbf{D}_{\mathcal{P}}(A), M_1, \Phi)$$

where  $\mathbf{D}_{\mathcal{P}}$  is the Dieudonné crystal associated to  $\mathcal{P}$  (Cf. [Zin02]Def2.6). ┘

*Proof:* The existence of  $F_1$  is proved in [Zin01a]P498. ?

The equivalence is proved in [Zin01a]Thm1.6. ? □

**Cor. (27.10.3.18) [Formal  $p$ -Divisible Groups and  $A$ -Windows].** Situation as in (27.10.3.17), there is an equivalence of exact categories

$$G \stackrel{\triangle}{=} \text{B-T} \circ \text{Dsp} : \text{Win}/A \rightarrow p\text{Div}^{\text{frml}}/R \text{ (27.10.3.17) (27.10.3.13)}$$

with inverse given by the covariant Dieudonné functor

$$\mathbf{D} = A\text{-Win} \circ \mathbf{D} : p\text{Div}^{\text{frml}}/R \cong A\text{-Windows}/R : X \mapsto \mathbf{D}(X)(A) = \varprojlim_n \mathbf{D}(X)(A/(p^n)) \text{ (27.10.3.17) (27.10.3.13)}.$$

s.t.

- If  $R' \in \mathcal{CRing}/R$  is  $p$ -adically complete and separated, and  $A'$  is a frame over  $R'$ , and there is a commutative diagram

$$\begin{array}{ccc} A & \longrightarrow & R \\ \downarrow & & \downarrow \\ A' & \longrightarrow & R' \end{array}$$

s.t.  $A \rightarrow A'$  is compatible with  $\varphi$ , then for any  $\mathcal{M} \in \text{Win}/A$ , there is a canonical isomorphism

$$G(\mathcal{M}) \otimes_R R' \cong G'(\mathcal{M} \otimes_A A') \in p\text{Div}^{\text{frml}}/R'.$$

┘

*Proof:* ? The equivalence follows from [Zin01a]Cor1.7. [Lau] and [Zin02]Thm94, Thm97.

The exactness follows from [Kisin, Modularity of 2-adic Barsotti-Tate representations]P1.1.4. ? and the natural isomorphism  $\mathbf{D}(G(\mathcal{M})) \cong \mathcal{M}$ .

The base change compatibility follows from the commutative diagram of Frobenius-compatible maps

$$\begin{array}{ccccc} A & \xrightarrow{\delta} & W(A) & \longrightarrow & W(R) \\ \downarrow & & \downarrow & & \downarrow \\ A' & \xrightarrow{\delta} & W(A') & \longrightarrow & W(R') \end{array} \quad (5.5.2.20)$$

and [Zin02]Cor86 ?.

□

**Cor. (27.10.3.19) [Examples of Windows].** Let  $R \in \mathcal{CRing}$  be a  $p$ -adically complete and separated.

- If  $(A, J, \alpha, \varphi)$  is a frame for  $R$  (27.10.3.5), then  $\mathcal{M} = (M, M_1, \Phi) = (A, J, \varphi)$  is a Window over  $A$ , with  $G(\mathcal{M}) = \mathbb{G}_m[p^\infty]$ .
- If  $R \in \mathcal{CRing}$  is  $p$ -torsion-free, then  $(B, J, \varphi)$  is a frame for  $R$  ?, and then the subcategory of  $p\text{Div}/S$  consisting of objects with formal special fibers is equivalent to  $B\text{-Win}/S$ .

┘

*Proof:* 1: By base change compatibility, it suffices to show this for  $A = R = \mathbb{Z}_p$ , and by (27.10.3.18) it suffices to check using classical Dieudonné theory ?.

2: Cf. [Zin01a]Prop1.8 ?.

□

**Thm. (27.10.3.20) [A-Windows and Displays over  $\mathcal{Z}$ -Rings].** If  $(R, \mathfrak{m}) \in \mathcal{Z}$  (27.10.3.2) and  $A \rightarrow R$  is a Dieudonné frame (27.10.3.8), then there is an equivalence DD from the category of Dieudonné  $A$ -windows to the category of Dieudonné displays.

┘

*Proof:* Cf. [Zin01a]Thm3.2. ?

□

**Cor. (27.10.3.21) [ $p$ -Divisible Groups and  $A$ -Windows over  $\mathcal{Z}$ -Rings].** If  $(R, \mathfrak{m}) \in \mathcal{Z}$  (27.10.3.2) with  $\mathfrak{m}$  nilpotent and  $(A, J, \sigma)$  is a Dieudonné frame for  $R$  (27.10.3.8), then the category of Dieudonné  $A$ -windows over  $R$  is equivalent to  $p\text{Div}/R$ .

In particular, if  $\kappa \in \mathbf{Field}^p$  is perfect, then

$$\mathbf{D} : p\text{Div}/\kappa \cong \text{Dieudonné modules}/W(\kappa) : X \mapsto \mathbf{D}(X).$$

(covariant Dieudonné modules).

┘

*Proof:* Cf. [Zin01a]Thm6. ?

□

#### 4 Deformations of $p$ -Divisible Groups

**Prop. (27.10.4.1) [Base Change of  $p$ -Divisible Groups].** Let  $(\mathcal{O}_K, \mathfrak{m}_K, \kappa) \in \text{locCRing}^{(0,p)}$ , the functor  $p\text{Div}/\mathcal{O}_K \rightarrow p\text{Div}/\kappa$  is faithful.  $\lrcorner$

*Proof:* Cf. [CCO14]P45?  $\square$

**Remark (27.10.4.2).** The Noetherian hypothesis is necessary, for example when  $\mathcal{O}_K = \mathcal{O}_{\mathbb{Q}(\mu_{p^\infty})}$ ,  $f : \mathbb{Q}_p/\mathbb{Z}_p \rightarrow \mu_{p^\infty} : p^{-n} \rightarrow \xi_{p^n}$  is an isomorphism on the generic fiber but trivial on the special fiber.  $\lrcorner$

**Thm. (27.10.4.3) [Serre-Tate, Katz [Kat81]].** Suppose  $p$  is locally nilpotent on  $S$ , denote  $\text{Def}_{p\text{Div}}(S)$  the category of triples  $(\bar{A}, X, \epsilon)$  where

- $\bar{A} \in \text{AbVar}/S_{\text{red}}$ .
- $X \in p\text{Div}/S$ .
- $\epsilon : \bar{A}[p^\infty] \cong \Lambda_S S_{\text{red}} \in p\text{Div}/S_{\text{red}}$ .

Then the functor

$$\text{AbVar}/S \rightarrow \text{Def}_{p\text{Div}}(S) : A \mapsto (\bar{A} = A_{\text{red}}, X = A[p^\infty], \epsilon : A_{\text{red}}[p^\infty] \cong A[p^\infty] \times_S S_{\text{red}})$$

is an equivalence of categories.  $\lrcorner$

**Prop. (27.10.4.4) [Barsotti-Tate Groups are Locally Infinitesimally Liftable].** Suppose  $p$  is locally nilpotent on  $S$ , and  $X \in p\text{Div}/S$ , then there exists a open covering  $\{U_i \rightarrow S\}$  of  $S$  s.t. for each  $i$  and each nilpotent thickening  $U_i \rightarrow U$ , there exists a  $\tilde{X} \in p\text{Div}/U$  s.t.  $\tilde{X} \times_U U_i \cong X \times_S U_i$ .  $\lrcorner$

*Proof:* ?  $\square$

**Thm. (27.10.4.5) [Grothendieck-Messing, Messing [Mes72]].** If  $p$  is locally nilpotent on  $S$ ,  $(S_0 \rightarrow S)$  is a nilpotent pd-thickening and  $X_0 \in p\text{Div}/S_0$ , a sub- $\mathcal{O}_S$ -module  $\text{Fil}^1 \subset \mathbf{D}(X_0)_{(S_0 \rightarrow S)}$  is called an **admissible submodule** if it is locally a direct factor, and it reduces to  $\omega_X \subset \mathbf{D}(X)_{S_0}$  (27.10.2.4). And an **admissible pair** is a pair  $(X_0, \text{Fil}^1)$  where  $X_0 \in p\text{Div}/S_0$  and  $\text{Fil}^1$  is an admissible submodule of  $\mathbf{D}(X_0)_{(S_0 \rightarrow S)}$ .

Then the functor

$$X \mapsto (X_0 = X \times_S S_0, \omega_X)$$

is an equivalence between the category  $p\text{Div}/S$  and the category of admissible pairs  $(X_0, \text{Fil}^1)$ .

In particular, by passing to limits, we get similar equivalence for  $(S_0 \rightarrow S)$  where  $S$  is a formal adic scheme.  $\lrcorner$

*Proof:* ?  $\square$

The faithfulness follows from the rigidity property (27.10.1.24).  $\square$

**Thm. (27.10.4.6) [Deformation Space of  $p$ -Divisible Groups].** For a complete local noetherian ring  $(\Lambda, \kappa)$  and  $X_0 \in p\text{Div}/\kappa$  with height  $h$  and dimension  $d$ , let  $\mathcal{C}_\Lambda$  be the category of Artinian local  $\Lambda$ -rings  $R$  with residue field  $\kappa$ , then we have the **deformation functor of  $p$ -divisible groups**

$$\text{Def}_\Lambda(X_0) : \mathcal{C}_\Lambda \rightarrow \text{Set} : (R, \kappa) \mapsto \{\text{deformations of } X_0 \text{ to } R\},$$

then  $\text{Def}_\Lambda(X_0)$  is pro-represented by a power series ring over  $\Lambda$  in  $d(h-d)$ -variables. And the tangent space of this functor is canonically isomorphic to  $\text{Lie}(X_0^D) \otimes_\kappa \text{Lie}(X_0)$  as a  $\kappa$ -vector space.  $\lrcorner$

*Proof:* Cf. [CCO14]P49?  $\square$

### Infinitesimal Deformations

**Def. (27.10.4.7) [Pointed Formal Lie-Varieties and Formal Lie-Groups].** A **pointed formal Lie-variety** over  $S$  is a fppf-sheaf  $X \in \mathbf{Sh}^{\text{Set}}(\mathbf{Sch}_{\text{fppf}}/S)$  together with a section  $\epsilon : \mathbf{pt}_S \rightarrow X \in \mathbf{Sh}(\mathbf{Sch}_{\text{fppf}}/S)$  s.t. Zariski-locally we have

$$X \cong \varinjlim_{n \in \mathbb{Z}_+} \text{Spec } \mathcal{O}_X[[T_1, \dots, T_r]] / (T_1, \dots, T_r)^n$$

for some  $r \in \mathbb{Z}_+$ , and  $\epsilon$  is given by  $(T_i \mapsto 0)$ .

A **formal Lie-group** over  $S$  is a fppf-sheaf  $X \in \mathbf{Sh}(\mathbf{Sch}_{\text{fppf}}/S)$  with the unit section which makes it a pointed formal Lie-variety over  $S$ .  $\lrcorner$

**Prop. (27.10.4.8) [Formal Lie Groups associated to Barsotti-Tate Groups].** Suppose  $p$  is locally nilpotent on  $S$ , and  $X \in p\text{Div}/S$ , then  $\overline{X} \triangleq \varinjlim_k \text{Inf}^k(X) \subset X$  is a formal Lie-group over  $S$  (27.10.4.7), called the **formal Lie-group** associated to  $X$ . Then  $\overline{X}$  is functorial in  $X$  and stable under base changes.  $\lrcorner$

**Def. (27.10.4.9) [ $p$ -Divisible Formal Groups].** A  **$p$ -divisible formal group** over  $S$  is a formal group  $G$  over  $S$  (27.10.4.7) s.t.  $[p] : G \rightarrow G$  is an isogeny (10.7.6.1). Equivalently, if  $[p] : G \rightarrow G$  is Zariski-locally represented by formal power series

$$f_1(\mathbf{X}), \dots, f_n(\mathbf{X}) \in R[[\mathbf{X}]]$$

s.t.  $f_i(\mathbf{0}) = 0$  for each  $i \in [n]_+$ . Then by (10.7.6.1),  $G$  is a  $p$ -divisible formal group if each  $X_i$  is nilpotent in

$$R[[\mathbf{X}]] / (\{f_i(\mathbf{X})\}_{i \in [n]_+}).$$

The base change of a  $p$ -divisible formal group is also a  $p$ -divisible formal group.  $\lrcorner$

**Thm. (27.10.4.10) [Weierstrass Preparation Theorem].** If  $G$  is a  $p$ -divisible formal group over  $R$ , then  $[p]_G^* : R[[\mathbf{X}]] \rightarrow R[[\mathbf{X}]]$  is finite and faithfully flat, and  $\ker([p]_G)$  is finite locally free over  $R$ .  $\lrcorner$

*Proof:* ?. Cf. [Zin84]P88  $\square$

**Prop. (27.10.4.11).** For  $k \in \mathbf{Field}^p$ , if  $G$  is a formal group law of dimension 1 over  $k$  s.t.  $[p]_G \neq 0$ , then  $G$  is a  $p$ -divisible formal group.  $\lrcorner$

*Proof:* Clear by definition (27.10.4.9).  $\square$

**Def. (27.10.4.12) [Heights of  $p$ -Divisible Groups].** If  $R \in \mathcal{CRing}/\mathbb{Z}_{(p)}$  and  $G$  is a  $p$ -divisible formal group over  $R$ , then  $G$  is said to be of height  $h$  if  $\varphi_{K/(p)}$  is of height  $p$  (10.7.6.2).  $\lrcorner$

**Prop. (27.10.4.13).** If  $R \in \mathcal{CRing}/\mathbb{Z}_{(p)}$  and  $G$  is a  $p$ -divisible formal group over  $R$ . If there is an isogeny between  $G_1$  and  $G_2$ , then  $\text{ht}(G_1) = \text{ht}(G_2)$ , by (10.7.6.3).  $\lrcorner$

**Prop. (27.10.4.14) [Rigidity of  $p$ -Divisible Groups].** If  $R \in \mathcal{CRing}/\mathbb{Z}_{(p)}$ ,  $\mathfrak{a} \in \text{Ideal}(R)$  is nilpotent,  $R_1 = R/\mathfrak{a}$ , and  $G_1, G_2$  are formal groups over  $R$  s.t.  $G_1$  is  $p$ -divisible, then  $\text{Hom}(G_1, G_2)$  is torsion-free and

$$\text{Hom}(G_1, G_2) \otimes \mathbb{Q} = \text{Hom}(G_{1,R_1}, G_{2,R_1}) \otimes \mathbb{Q}.$$

$\lrcorner$

*Proof:* Cf. [Zin02]P100. ?  $\square$

## 5 Breuil-Kisin Modules and $p$ -Divisible Groups

References are [CCO14] and [Breuil, C.: Groupes  $p$ -divisibles, groupes finis et modules filtrés], [Kisin, crystalline representations and F-crystal], [Kisin, Modularity of 2-adic Barsotti-Tate representations].

**Notation (27.10.5.1).**

- Let  $\kappa \in \text{Perf}^p$ .
- Let  $K_0 = W(\kappa)[\frac{1}{p}]$ .
- Let  $(K, \mathcal{O}_K, \varpi_K, \kappa)$  be a totally ramified finite extension of  $K_0$ .
- Let  $E(u)$  be the minimal polynomial of  $\varpi_K$  over  $W(\kappa)$ , which is a Eisenstein polynomial.
- Let  $e = e(K/K_0) = \deg(E(u))$ .

┘

**Def. (27.10.5.2) [Breuil-Kisin Modules].** Let  $\mathfrak{S} \triangleq W(\kappa)[[u]]$ , called the **Breuil-Kisin module**, and let  $\varphi : \mathfrak{S} \rightarrow \mathfrak{S}$  be the local endomorphism s.t.  $\varphi(u) = u^p$  and  $\varphi|_{W(\kappa)} = \text{id}$ .

Let  $S$  be the  $p$ -adic completion of the subring

$$W(\kappa)[u] \left[ \left\{ \frac{E(u)^n}{n!} \right\}_{n \in \mathbb{Z}_+} \right] \subset K_0[u].$$

Then there is a natural inclusion  $\mathfrak{S} \hookrightarrow S$ , and  $\varphi_{\mathfrak{S}}$  extends uniquely to a local endomorphism of  $S$ .<sup>?</sup>

Let  $\text{Fil}^1(S)$  be the kernel of the surjective  $W(\kappa)$ -linear local homomorphism  $\epsilon : S \rightarrow \mathcal{O}_K$  s.t.  $\epsilon(u) = \varpi_K$ , which is the  $p$ -adic completion of the ideal of  $S$  generated by the set  $\{E(u)^n/n!\}_{n \in \mathbb{Z}_+}$ . Then  $(S, \text{Fil}^1(S))$  is a frame for  $\mathcal{O}_K$  (27.10.3.5), called **Breuil's Dieudonné frame**.

Notice  $\varphi(E(u))/p$  is invertible in  $S$  because

$$\varphi(E(u))/p - \text{Coef}(E(u))/p \in \text{Fil}^1(S) + uW(\kappa)[u] + pW(\kappa)[u].$$

┘

**Def. (27.10.5.3) [B-T $_{\mathfrak{S}}^{\varphi, f}$ ].** B-T $_{\mathfrak{S}}^{\varphi, f}$  is defined to be the additive category of triples  $(\mathfrak{M}, \varphi_{\mathfrak{M}}, \psi_{\mathfrak{M}})$  where

- $\mathfrak{M}$  is a finite free  $\mathfrak{S}$ -module.
- $\varphi_{\mathfrak{M}}$  is a  $\varphi$ -semi-linear endomorphism of  $\mathfrak{M}$  s.t.  $\text{Im} \left( \varphi_* \mathfrak{M} \xrightarrow{1 \otimes \varphi_{\mathfrak{M}}} \mathfrak{M} \right)$  contains  $E(u)\mathfrak{M}$ .
- The hypothesis on  $\varphi_{\mathfrak{M}}$  implies that we have a map  $E(u)\mathfrak{M} \xrightarrow{\varphi_{\mathfrak{M}}^{-1}} \varphi_* \mathfrak{M}$ , and  $\psi_{\mathfrak{M}}$  is defined to be  $\psi_{\mathfrak{M}} : \mathfrak{M} \xrightarrow{E(u) \cdot} E(u)\mathfrak{M} \xrightarrow{\varphi_{\mathfrak{M}}^{-1}} \varphi_* \mathfrak{M}$ .

And  $\mathfrak{M}$  is called a **formal Breuil-Kisin module** if there exists some  $n \in \mathbb{Z}_+$  s.t.

$$\psi_{\mathfrak{M}}^{(n)} = (\varphi^{(n-1)*} \psi_{\mathfrak{M}}) \circ (\varphi^{(n-2)*} \psi_{\mathfrak{M}}) \circ \dots \circ \psi_{\mathfrak{M}} : \mathfrak{M} \rightarrow \mathfrak{S} \otimes_{\varphi^{(n)*}, \mathfrak{S}} \mathfrak{M}$$

is congruent to 0 modulo the ideal  $(p, u)$ . The category of formal Breuil-Kisin modules over  $\mathfrak{S}$  is denoted by B-T $_{\mathfrak{S}}^{\varphi, f}$ .

And  $\mathfrak{M}$  is called an **étale Breuil-Kisin module** (resp. **multiplicative Breuil-Kisin module**) if  $\text{Im} \left( \varphi_* \mathfrak{M} \xrightarrow{1 \otimes \varphi_{\mathfrak{M}}} \mathfrak{M} \right) = E(u)\mathfrak{M}$  (resp.  $\mathfrak{M}$ ).<sup>?</sup>

┘

### Breuil-Kisin Modules and $p$ -Divisible Groups

**Thm. (27.10.5.4)** [Formal Breuil-Kisin Modules and  $S$ -Windows]. There is an functor

$$S\text{-Win} : \mathbf{B}\text{-}\mathbf{T}_{/\mathfrak{S}}^{\varphi, f} \rightarrow \mathbf{Win}/S \text{ (27.10.5.3)(27.10.3.15)}$$

that is exact and preserves exactness, constructed as follows: for  $(\mathfrak{M}, \varphi_{\mathfrak{M}}, \psi_{\mathfrak{M}}) \in \mathbf{B}\text{-}\mathbf{T}_{/\mathfrak{S}}^{\varphi, f}$ , define

- $\mathcal{M} = S \otimes_{\varphi, \mathfrak{S}} \mathfrak{M}$ ,
- and define  $\mathcal{M}_1 \subset \mathcal{M}$  as the preimage of  $\mathrm{Fil}^1(S) \otimes_{\mathfrak{S}} \mathfrak{M}$  under the map  $1 \otimes \varphi_{\mathfrak{M}} : \mathcal{M} = S \otimes_{\varphi, \mathfrak{S}} \mathfrak{M} \rightarrow S \otimes_{\mathfrak{S}} \mathfrak{M}$ ,
- And define  $\Phi : \mathcal{M} \rightarrow \mathcal{M}$  to be the  $\varphi$ -semi-linear map that maps  $s \otimes m$  to  $\varphi(s) \otimes \varphi_{\mathfrak{M}}(m)$ .

Then  $S\text{-Win}(\mathfrak{M}) = (\mathcal{M}, \mathcal{M}_1, \Phi)$ , and we have

$$\mathcal{M}/\mathcal{M}_1 \cong (1 \otimes \varphi_{\mathfrak{M}})(\varphi_* \mathfrak{M})/E(u)\mathfrak{M}.$$

┘

*Proof:* Firstly,  $\mathcal{M}/\mathcal{M}_1 \cong (1 \otimes \varphi_{\mathfrak{M}})(\varphi_* \mathfrak{M})/E(u)\mathfrak{M}$  by [Kisin, Modularity and moduli of finite flat group schemes]1.1.15<sup>?</sup>, so the quotient is a finite free  $\mathcal{O}_K$ -module.

To check  $\Phi(\mathcal{M}_1) \subset p\mathcal{M}$ , Cf. [Kis09c]P1.2.5.<sup>?</sup>

□

**Thm. (27.10.5.5).** There are equivalences of categories:

$$\begin{array}{ccccc} & & p\mathrm{Div}_{\mathrm{Kis}} & & \\ & \nearrow & & \searrow & \\ \mathbf{B}\text{-}\mathbf{T}_{/\mathfrak{S}}^{\varphi, f} & \xrightarrow{S\text{-Win}, \cong} & \mathbf{Win}/S \cong & \xrightarrow{\mathbf{B}\text{-}\mathbf{T} \circ \mathrm{Dsp}, \cong} & p\mathrm{Div}^{\mathrm{frml}}/\mathcal{O}_K \text{ (27.10.3.18)(27.10.5.4).} \end{array}$$

And when  $p \geq 3$ , there are equivalences of categories:

$$\begin{array}{ccccc} & & p\mathrm{Div}_{\mathrm{Kis}} & & \\ & \nearrow & & \searrow & \\ \mathbf{B}\text{-}\mathbf{T}_{/\mathfrak{S}}^{\varphi} & \xrightarrow{S\text{-Win}} & \mathbf{Win}/S \cong & \xrightarrow{\mathbf{B}\text{-}\mathbf{T} \circ \mathrm{Dsp}} & p\mathrm{Div}/\mathcal{O}_K \text{ (27.10.5.4)} \end{array}$$

┘

*Proof:* Cf. [Kisin, Modularity of 2-adic Barsotti-Tate representations]1.2.8.<sup>?</sup> and [Kisin, crystalline representations and F-crystals].

□

**Cor. (27.10.5.6).** There is a commutative diagram of functors

$$\begin{array}{ccccccc}
 & & & & p\mathrm{Div}_{\mathrm{Kis}}, \cong & & \\
 & & & & \curvearrowright & & \\
 \mathrm{B-T}_{/\mathfrak{S}}^{\varphi, f} & \xrightarrow{S\text{-Win}, \cong} & \mathrm{Win}/S & \xrightarrow{\mathrm{Dsp}} & \mathrm{Dsp}/\mathcal{O}_K & \xrightarrow{\mathrm{B-T}, \cong} & p\mathrm{Div}^{\mathrm{frml}}/\mathcal{O}_K \\
 & \searrow \mathrm{CF}_{\mathrm{Dsp}} & & \downarrow \mathrm{BC}_{\mathrm{Dsp}} & & & \downarrow -\otimes \kappa \\
 & & & \mathrm{Dsp}/\kappa & \xrightarrow{\mathrm{B-T}_{\kappa}, \cong} & & p\mathrm{Div}^{\mathrm{frml}}/\kappa \\
 & \searrow \mathrm{CF}_{p\mathrm{Div}} & & & & & \\
 & & & & \curvearrowleft & & 
 \end{array}$$

┘

### Modules over $\mathfrak{S}$ and Commutative Finite $p$ -Groups

**Def. (27.10.5.7)**  $[\mathrm{Mod}_{\mathfrak{S}}^c]$ .  $\mathrm{Mod}_{\mathfrak{S}}^c$  is defined to be the additive category of triple  $(\mathfrak{M}, \varphi_{\mathfrak{M}}, \psi_{\mathfrak{M}})$  where

- $\mathfrak{M} \in \mathrm{Mod}_{\mathfrak{S}}^{\mathrm{fg}}$  killed by a power of  $p$ , and having projective dimension  $\leq 1$  over  $\mathfrak{S}$ .
- $\varphi_{\mathfrak{M}}$  is a  $\varphi$ -semi-linear endomorphism of  $\mathfrak{M}$  s.t.  $\mathrm{Im} \left( \varphi_* \mathfrak{M} \xrightarrow{\varphi_{\mathfrak{M}}} \mathfrak{M} \right)$  contains  $E(u)\mathfrak{M}$ .
- The hypothesis on  $\varphi_{\mathfrak{M}}$  implies that we have a map  $E(u)\mathfrak{M} \xrightarrow{\varphi_{\mathfrak{M}}^{-1}} \varphi_* \mathfrak{M}$ , and  $\psi_{\mathfrak{M}}$  is defined to be  $\psi_{\mathfrak{M}} : \mathfrak{M} \xrightarrow{E(u)\cdot} E(u)\mathfrak{M} \xrightarrow{\varphi_{\mathfrak{M}}^{-1}} \varphi_* \mathfrak{M}$ .
- And  $\mathfrak{M}$  is called a **connected  $\mathfrak{S}$ -module** if there exists some  $n \in \mathbb{Z}_+$  s.t.

$$\psi_{\mathfrak{M}}^{(n)} = (\varphi^{(n-1)*} \psi_{\mathfrak{M}}) \circ (\varphi^{(n-2)*} \psi_{\mathfrak{M}}) \circ \dots \circ \psi_{\mathfrak{M}} : \mathfrak{M} \rightarrow \mathfrak{S} \otimes_{\varphi^{(n)}, \mathfrak{S}} \mathfrak{M}$$

is congruent to 0 modulo the ideal  $(p, u)$ .

┘

**Thm. (27.10.5.8)**  $[\mathrm{Mod}_{\mathfrak{S}}^c \text{ and Connected Commutative Finite } p\text{-Groups}]$ . There is an equivalence of categories

$$\mathcal{G}_{\mathrm{Kis}} : \mathrm{Mod}_{\mathfrak{S}}^c \cong p\text{-GrpSch}_{\mathrm{cntd}}^{\mathrm{fin}}/\mathcal{O}_K \text{ (27.10.5.7),}$$

where  $p\text{-GrpSch}_{\mathrm{cntd}}^{\mathrm{fin}}/\mathcal{O}_K$  is category of connected commutative finite flat group schemes of  $p$ -power order.

And the functor

$$\mathrm{MCF} = \mathrm{M}_* \circ (- \otimes \kappa) \circ \mathcal{G}_{\mathrm{Kis}} : \mathrm{Mod}_{\mathfrak{S}}^c \rightarrow \mathrm{Mod}_{D(\kappa)}^c \text{ (10.1.2.27),}$$

where  $\mathrm{Mod}_{D(\kappa)}^c$  is the Abelian category of  $D(\kappa)$ -modules of finite  $W(\kappa)$ -length, can be explicitly described in [CCO14] Appendix B.4.17. ?

┘

*Proof:* Cf. [Kisin, Modularity of 2-adic Barsotti-Tate representations] P361. □

**Thm. (27.10.5.9)** [**Mod $_{\mathfrak{S}}$  and Commutative Finite  $p$ -Groups**]. When  $p \geq 3$ , there is an equivalence of categories

$$\mathcal{G}_{\text{Kis}} : \text{Mod}_{\mathfrak{S}} \cong p\text{-GrpSch}^{\text{fin}}/\mathcal{O}_K \text{ (27.10.5.7),}$$

where  $p\text{-GrpSch}^{\text{fin}}/\mathcal{O}_K$  is category of commutative finite flat group schemes of  $p$ -power order.  $\lrcorner$

*Proof:* Cf. [Kisin, crystalline representations and F-crystal].  $\square$

**Def. (27.10.5.10)** [**Finite Flat and Connected Galois-Representations**]. A **finite flat and connected Galois-representation** is a finite  $p$ -group  $V \in \mathcal{A}b^{\text{fin}}$  with an action of  $\text{Gal}_K$  s.t. there exists a finite flat connected group scheme  $\mathcal{G} \in \text{GrpSch}/\mathcal{O}_K$  s.t.  $G(\mathcal{O}_{K^{\text{sep}}}) \cong V$ .  $\lrcorner$

**Prop. (27.10.5.11)** [Breuil[Bre02]/Kisin[Kis09c]]. The restriction functor from the category of finite flat and connected  $\text{Gal}_K$ -representations to the category of  $\text{Gal}_{K_{\infty}}$ -Representations is fully faithful.  $\lrcorner$

*Proof:* Cf. [Kis09c]P605.  $\square$

## 28 | Shimura Varieties

### 28.1 Shimura Varieties

References are [Del71b, Del79b, Mil05, Mil11, Lan20], <http://virtualmath1.stanford.edu/~conrad/shimsem/>, [Canonical Models of Mixed Shimura Varieties and Automorphic Vector Bundles, Milne].

**Notation (28.1.0.1).**

- Use notations on reductive groups defined in [Group Theory III: Reductive Groups](#).
- Use notations on symmetric spaces defined in [Locally Symmetric Spaces](#).
- Use notations on Abelian varieties defined in [Abelian Varieties](#).

┘

#### 1 Shimura Varieties

**Def. (28.1.1.1) [Shimura Data].** A **Shimura datum** is a pair  $(G, \mathcal{N})$  where  $G \in \text{RedGrp}/\mathbb{Q}$  and  $X$  is a  $G(\mathbb{R})$ -conjugacy class of homomorphisms  $\mathbb{S} \rightarrow G_{\mathbb{R}}$  (7.1.5.33) s.t. for each  $h \in X$ ,

- Under  $\text{Ad} \circ h : \mathbb{S} \mapsto \text{GL}(\mathfrak{g})$ ,  $\mathfrak{g}$  acquires a Hodge structure of type  $(-1, 1), (0, 0), (1, -1)$  (16.11.1.4).
- $\text{ad}(h(i))$  is a Cartan involution of  $(G_{\text{ad}})_{\mathbb{R}}$ . ?
- $G_{\text{ad}}$  has no  $\mathbb{Q}$ -factor  $H$  s.t.  $H(\mathbb{R})$  is compact.

A **morphism between Shimura-data**  $\varphi : (G_1, X_1) \rightarrow (G_2, X_2)$  is a morphism  $\varphi : G_1 \rightarrow G_2 \in \text{RedGrp}/\mathbb{Q}$  mapping  $X_1$  into  $X_2$ . ┘

**Def. (28.1.1.2) [Weight homomorphisms].** Given a Shimura datum  $(G, \mathcal{N})$  (28.1.1.1), for each  $h \in \mathcal{N}$ , the map  $w_h : \mathbb{G}_m \xrightarrow{w} \mathbb{S} \rightarrow G_{\mathbb{R}}$  (7.1.5.33) factors through the center of  $G_{\mathbb{R}}$  because it acts trivially on  $\mathfrak{g}$  (10.4.2.15), thus is independent of  $h$  chosen, called the **weight homomorphism of  $G$**  (7.1.5.33). ┘

**Def. (28.1.1.3) [Hodge-Cocharacters].** For a Shimura-datum  $(G, X)$  (28.1.1.1) and  $h \in X$ , using the isomorphism  $\mathbb{S}_{\mathbb{C}} \cong \mathbb{G}_{m, \mathbb{C}} \times \mathbb{G}_{m, \mathbb{C}} : z \mapsto (z, \bar{z})$  (7.1.5.33), we get a  $\mathbb{G}(\mathbb{R})$ -conjugacy class of homomorphisms

$$\mu_h : \mathbb{G}_{m, \mathbb{C}} \rightarrow \mathbb{S}_{\mathbb{C}} \rightarrow \mathbb{G}_{\mathbb{C}} : z \mapsto (z, 1) \mapsto \mu(z, 1),$$

called the (conjugacy of) **Hodge-cocharacter** of  $h$ . The conjugacy class of  $\mu_h$  is independent of  $\mu$  chosen. ┘

**Def. (28.1.1.4) [Neat Compact Open Subgroups].** ┘

**Def. (28.1.1.5)** [Shimura Varieties according to Deligne]. For any Shimura datum  $(G, D)$  (28.1.1.1) and compact open subset  $\mathcal{K} \leq G(\mathbf{A}_f)$ , define

$$\mathrm{Sh}_{\mathcal{K}}(G, X)(\mathbb{C}) \triangleq G(\mathbb{Q}) \backslash X \times G(\mathbf{A}_f) / \mathcal{K}.$$

Then  $S_{\mathcal{K}}(G, X)$  is a complex manifold.  $\lrcorner$

*Proof:*

$\square$

**Thm. (28.1.1.6)** [Algebraic Structures, Satake/Baily-Borel[B-B66]/Borel[Bor72]]. Situation as in (28.1.1.5), when  $K$  is neat (28.1.1.4),  $S_{\mathcal{K}}(G)(\mathbb{C})$  is the analytification of a canonical quasi-projective variety  $\mathrm{Sh}_{\mathcal{K}}(G)_{\mathbb{C}} \in \mathrm{Var}/\mathbb{C}$ .

In particular, if  $\mathcal{K}' \subset \mathcal{K}$  are two neat compact open subgroups, then there is a natural finite étale map

$$\mathrm{Sh}_{\mathcal{K}'}(G)_{\mathbb{C}} \rightarrow \mathrm{Sh}_{\mathcal{K}}(G)_{\mathbb{C}} \in \mathrm{Var}/\mathbb{C}.$$

$\lrcorner$

*Proof:* ?

$\square$

### Connected Shimura Varieties

**Def. (28.1.1.7)** [Connected Shimura Data]. A **connected Shimura datum** is a pair  $(G, D)$  where  $G \in \mathrm{RedGrp}^{\mathrm{ss}}/\mathbb{Q}$  and  $D$  a  $G^{\mathrm{ad}}(\mathbb{R})^0$ -conjugacy classes of homomorphisms  $h : \mathbb{S} \rightarrow G_{\mathbb{R}}^{\mathrm{ad}}$  (7.1.5.33) s.t. for each  $h \in D$ ,

**SU1:** Under  $\mathrm{Ad} \circ h : \mathbb{S} \mapsto \mathrm{GL}(\mathfrak{g})$ ,  $\mathfrak{g}$  acquires a Hodge structure of type  $(-1, 1), (0, 0), (1, -1)$  (16.11.1.4).

**SU2:**  $\mathrm{ad}(h(i))$  is a Cartan involution on  $G_{\mathbb{R}}^{\mathrm{ad}}$ .

**SU3:**  $G^{\mathrm{ad}}$  has no  $\mathbb{Q}$ -factor  $H$  s.t.  $H(\mathbb{R})$  is compact.

A **morphism of connected Shimura data**  $(G_1, D_1) \rightarrow (G_2, D_2)$  is a morphism  $\varphi : G_1 \rightarrow G_2$  mapping  $D_1$  into  $D_2$ .

In this case, each  $h \in D$  factors through  $\mathbb{S} \rightarrow \mathrm{U}(1)$  (7.1.5.33) by (28.1.1.2), thus  $D$  is equivalent to a  $G^{\mathrm{ad}}(\mathbb{R})^0$ -conjugacy class of homomorphisms  $h : \mathrm{U}(1) \rightarrow G_{\mathbb{R}}^{\mathrm{ad}}$ .  $\lrcorner$

**Prop. (28.1.1.8).** Let  $H$  be an adjoint real Lie group and  $u : \mathrm{U}(1) \rightarrow H$  a homomorphism satisfying SU1, SU2, then the following are equivalent:

- $u(-1) = 1$ .
- $u$  is trivial.
- $H$  is compact.

$\lrcorner$

*Proof:* 1  $\iff$  2: If  $u(-1) = 1$ , then  $u$  factors through  $\mathrm{U}(1) \xrightarrow{\times 2} \mathrm{U}(1)$ , so the characters  $z, z^{-1}$  cannot occur in  $\mathrm{Ad} \circ u$ . The converse is trivial.

1  $\rightarrow$  3: by (10.5.5.19),  $H$  is compact iff  $\mathrm{ad}(u(-1)) = 1$ , which is equivalent to  $u(-1) = 1$  as  $H$  is adjoint.

3  $\rightarrow$  1: ?

$\square$

**Prop. (28.1.1.9)** [Shimura-Data a la Shimura]. A connected Shimura-datum is equivalent to the following data:

- $G \in \mathcal{AlgGrp}/\mathbb{Q}$  semisimple of non-compact type.
- $D$  a Hermitian symmetric domain.
- an action of  $G(\mathbb{R})^0$  on  $D$  via a surjective homomorphism  $G^{\text{ad}}(\mathbb{R})^0 \rightarrow \text{Hol}(D)^0$  with compact kernel.

┘

*Proof:* Cf. [Mil17b]P45. ?

□

**Prop. (28.1.1.10).** Let  $(G, D)$  be a connected Shimura datum and  $X$  be the  $G^{\text{ad}}(\mathbb{R})$ -conjugacy class of homomorphisms  $\mathbb{S}^1 \rightarrow \mathbb{G}_{\mathbb{R}}$  containing  $D$ , and  $D$  is a connected component of  $X$ , with stabilizer  $G^{\text{ad}}(\mathbb{R})^0 \subset G^{\text{ad}}(\mathbb{R})$ .

┘

*Proof:* Cf. [Mil17b]P45.

□

**Def. (28.1.1.11) [Connected Shimura Varieties].** Let  $(G, D)$  be a connected Shimura datum (28.1.1.7), then the map  $G^{\text{ad}}(\mathbb{R})^0 \rightarrow \text{Hol}(D)^0$  as in (28.1.1.9) has compact kernel, so for any arithmetic subgroup  $\Gamma \subset G^{\text{ad}}(\mathbb{R})^0 \cap G^{\text{ad}}(\mathbb{Q})$  (20.4.0.2), the image  $\bar{\Gamma}$  is an arithmetic subgroup of  $\text{Hol}(D)^0$  (20.4.4.1), thus we can apply Baily-Borel compactification (16.2.7.4) to get an algebraic structure on  $D(\Gamma) = \Gamma \backslash D = \bar{\Gamma} \backslash D$ . Moreover, if  $\Gamma' \subset \Gamma \subset G^{\text{ad}}(\mathbb{R})^0 \cap G^{\text{ad}}(\mathbb{Q})$  and  $\bar{\Gamma}', \bar{\Gamma}$  are both torsion-free, then by Borel (16.2.7.5), there is a morphism  $D(\Gamma') \rightarrow D(\Gamma)$ .

So for any  $\Gamma \in G^{\text{ad}}(\mathbb{R})^0 \cap G^{\text{ad}}(\mathbb{Q})$  s.t.  $\bar{\Gamma}$  is torsion-free,  $D(\Gamma)$  is called a **connected Shimura variety relative to  $(G, D)$** . And the inverse images of these Shimura varieties are called the **connected Shimura variety attached to  $(G, D)$** , denoted by  $\text{Sh}^0(G, D)$ .

┘

**Prop. (28.1.1.12) [Galois Actions on Shimura Varieties].**

┘

### Morphism between Shimura-Varieties

**Prop. (28.1.1.13) [Kisin [Kis10]].** If

- $i : (G_1, X_1) \rightarrow (G_2, X_2)$  is an embedding of Shimura-data,
- $\mathcal{K}_{2,p} \leq G_2(\mathbb{Q}_p)$  is a compact open subgroup,
- $\mathcal{K}_{1,p} = i^{-1}(\mathcal{K}_{2,p}) \leq G_1(\mathbb{Q}_p)$ ,
- $\mathcal{K}_1^p \leq G_1(\mathbf{A}_f^p)$ ,

then there exists  $\mathcal{K}_2^p \leq G_2(\mathbf{A}_f^p)$  containing  $i(\mathcal{K}_1^p)$ , s.t.  $i$  induces an embedding

$$\text{Sh}_{\mathcal{K}_1}(G_1, X_1) \hookrightarrow \text{Sh}_{\mathcal{K}_2}(G_2, X_2).$$

┘

*Proof:* Cf. [Kis10]P

□

## 2 Canonical Models

**Notation (28.1.2.1).**

- Let  $(G, X)$  be a Shimura-datum.
- let  $\mathcal{K} \leq G(\mathbf{A}_f)$  be a compact open subgroup.

┘

**Def. (28.1.2.2) [Reflex Fields].** There exists a **reflex field**  $E = E(G, X) \in \mathbf{NField}$ . ┘

**Cor. (28.1.2.3).** If  $G_{\mathbb{Q}_p}$  is unramified, then  $E(G, X)/\mathbb{Q}$  (28.1.2.2) is unramified at  $p$ . ┘

*Proof:* Cf. [Milne, The points on a Shimura variety modulo a prime of good reduction]4, 4.7. ? □

**Thm. (28.1.2.4) [Canonical Models of Shimura Varieties, Shimura[Shi70]/Shih[Shi78a]/Deligne[Del79b]/Milne[Mil83]/Borovoi[Bor84, Bor87]].** For a Shimura datum  $(G, X)$  (28.1.1.1) and any neat compact open subgroup  $\mathcal{K} \leq G(\mathbf{A}_f)$  (28.1.1.4), there exists a canonical quasi-projective variety

$$\mathrm{Sh}_{\mathcal{K}}(G) \in \mathcal{V}\mathrm{ar}/E(G, X) \text{ (28.1.2.2)}$$

s.t.  $\mathrm{Sh}_{\mathcal{K}}(G)(\mathbb{C})$  (28.1.1.5) is isomorphic to the complex analytification of  $\mathrm{Sh}_{\mathcal{K}}(G)$ .

They satisfy certain additional properties qualifying them as the **canonical model of Shimura varieties**, which is uniquely characterized by the reciprocity law at the special points. ?

In particular, for any two neat compact open subgroups  $\mathcal{K}' \leq \mathcal{K}$ ,  $\mathrm{Sh}_{\mathcal{K}'}(G)(\mathbb{C}) \rightarrow \mathrm{Sh}_{\mathcal{K}}(G)(\mathbb{C})$  is the complex analytification of a unique finite étale map

$$\mathrm{Sh}_{\mathcal{K}'}(G) \rightarrow \mathrm{Sh}_{\mathcal{K}}(G) \in \mathcal{V}\mathrm{ar}/E(G, X).$$

┘

*Proof:* ? □

**Remark (28.1.2.5) [Canonical Models of Connected Shimura Varieties].** The connected Shimura varieties are also defined over a number field, but the number field may depend on the arithmetic subgroup  $\Gamma$ . For the example,  $\Gamma(N) \backslash \mathcal{H}$  only has a model over  $\mathbb{Q}(\mu_N)$ . ┘

**Remark (28.1.2.6).** Delete this ?. The method of constructing the canonical model is the following: When our Shimura variety arises naturally as a moduli space over  $\mathbb{C}$ , then we can use the action of  $\mathrm{Gal}(\mathbb{C}/E)$  on the  $\mathbb{C}$ -points to define a model of the variety over a specific number field.

The theory of complex multiplication will give us an explicit description of the action on certain special points, called the **reciprocity law** at these points, which will determine the model uniquely. ┘

**Remark (28.1.2.7).** Delete this ?. A heuristic reason that a Shimura variety has a canonical model is that if it is defined only on a transcendental field, then it can be spread out to give a flat family of varieties. But there are only countably many arithmetic locally symmetric varieties up to isomorphism, so there cannot be a ┘

**Prop. (28.1.2.8) [Morphisms between Shimura-Varieties, Deligne[Del71b]].** If  $i : (G_1, X_1) \rightarrow (G_2, X_2)$  is morphism between Shimura-data and  $\mathcal{K}_i \leq G_i(\mathbf{A}_f)$  are compact open subgroups s.t.  $i(\mathcal{K}_1) \leq \mathcal{K}_2$ , then  $i$  induces a map

$$\mathrm{Sh}_{\mathcal{K}_1}(G_1, X_1) \rightarrow \mathrm{Sh}_{\mathcal{K}_2}(G_2, X_2) \in \mathcal{V}\mathrm{ar}/E(G_1, X_1).E(G_2, X_2).$$

And for any given  $\mathcal{K}_1 \leq G(\mathbf{A}_f)$ , we can choose  $\mathcal{K}_2$  s.t. this map is a closed embedding. ┘

*Proof:* Cf. [Del71]Section5.4. and 1.15. □

**Prop. (28.1.2.9)[Connected Components of Canonical Models].** If  $\mathcal{K} = \mathcal{K}_p \mathcal{K}^p$  where  $p \in \text{Prime}$  and  $\mathcal{K}_p \leq G(\mathbb{Q}_p)$ ,  $\mathcal{K}^p \leq G(\mathbf{A}_f^p)$  and  $\mathcal{K}_p$  is hyperspecial, then the geometrically connected components of  $\text{Sh}_{\mathcal{K}}(G, X)$  is defined over a an extension of  $E(G, X)$  (28.1.2.2) unramified at all places over  $p$ .  $\lrcorner$

*Proof:* Cf. [Kis10]P990.  $\square$

**Lemma (28.1.2.10).** Situation as in (28.1.2.9),  $G(\mathbf{A}_f^p)$  acts transitively on

$$\pi_0(\text{Sh}_{\mathcal{K}_p}(G, X)_{\mathbb{C}}) \stackrel{\Delta}{=} \varprojlim_{\mathcal{K}^p} \pi_0(\text{Sh}_{\mathcal{K}_p \mathcal{K}^p}(G, X)_{\mathbb{C}}).$$

$\lrcorner$

*Proof:* Cf. [Kis10]P991.  $\square$

**Lemma (28.1.2.11).** For any  $H \in \text{RedGrp}/\mathbb{Z}_{(p)}$ , we have

$$H(\mathbb{Z}_p) \left( H(\mathbb{Q}) \cap H(\mathbb{R})^0 \right) = H(\mathbb{Q}_p).$$

$\lrcorner$

*Proof:* Cf. [Kis10]P991.  $\square$

### Hodge-Tate Structure on Shimura Varieties

**Prop. (28.1.2.12)[Family of Hodge-Tate Structures].** Let  $G \in \text{AlgGrp}/\mathbb{Q}$  be reductive and  $\rho : G \rightarrow \text{GL}(V)$  a faithful representation, and  $h \in \mathbb{D} \subset \text{Hom}(\mathbb{C}^*, \mathbb{G}_{\mathbb{R}})$  a set of conjugacy classes. Suppose the Shimura variety  $\{G(\mathbb{Q}) \backslash \mathbb{D} \times G(\mathbf{A}_f)/K\}_K$  has a model  $M_K$  over  $\mathbb{Q}$ , then we can define

- A  $\mathbb{Q}$ -local system

$$\mathcal{L}_{\rho} = G(\mathbb{Q}) \backslash V \times \mathbb{D} \times G(\mathbf{A}_f)/K$$

on  $M_K(\mathbb{C})$ ,

- A filtration  $\mathcal{L}_{\rho} \otimes \mathcal{O}_{M_K(\mathbb{C})} \supset \mathcal{F}^p \supset \mathcal{F}^{p+1} \dots$  of holomorphic vector bundles s.t. pointwise it is given by the Hodge filtration associated to  $\rho \circ h$ .
- Let  $V_{\mathbb{Z}} \subset V$  be a lattice s.t.  $V_{\mathbb{Z}}$  is fixed by  $K$ , then for  $N \in \mathbb{Z}_+$ , we can define.  $V_{\mathbb{Z}/(N)}$ -principal cover

$$\widetilde{M}_{\rho, K, N} = (M_K \cap K(N) \times V_{\mathbb{Z}/(N)})/K \rightarrow M_K.$$

So

$$\left( \varprojlim_n \widetilde{M}_{\rho, K, \ell^n}(\mathbb{C}) \right) \left[ \frac{1}{\ell} \right] \cong \mathcal{L}_{\rho} \otimes \mathbb{Q}_{\ell}.$$

Then for any  $x \in M_K(\mathbb{Q})$ , we get a Hodge-Tate structure  $\mathcal{L}_{\rho, x}$  where the Hodge structure on  $\mathcal{L}_{\rho, x} \otimes \mathbb{C}$  comes from the Hodge filtration  $\mathcal{F}_x^p$ , and the Galois structure on  $\mathcal{L}_{\rho, x} \otimes \mathbb{Q}_{\ell}$  comes from the Galois action on the fiber of the system  $\{\widetilde{M}_{\rho, K, \ell^n}\}_n$  over  $x$  (as for usual Shimura varieties).

Moreover, this construction is compatible with morphisms of Shimura varieties induces by a map between groups.  $\lrcorner$

*Proof:*  $\square$

**Example (28.1.2.13).** For the Siegel modular variety  $\mathcal{A}_K^{g, d}$  associated to  $(\text{GSp}_{2g}, \mathcal{H}^{\pm})$  and a point  $x \in \mathcal{A}_K^{g, d}(\mathbb{Q})$  parametrizing a triple  $(A, E, \xi)$ , we have a canonical isomorphism  $H^1(A, \mathbb{Q}) \cong \mathcal{L}_{\text{Std}_{\text{GSp}, x}}$ .  $\lrcorner$

**Example (28.1.2.14).** For the model  $M_K^{\text{K3}}(7.14.6.1)$  of  $\text{Sh}_K(\text{SO}(\Lambda_d^{\text{K3}}), \mathbb{D})$  and a point  $x \in M_K^{\text{K3}}(\mathbb{Q})$  parametrizing a triple  $(X, E, \xi)$ , we have a canonical isomorphism  $H^2(X, \mathbb{Q}(1)) \cong \mathcal{L}_{\text{Std}_{\text{SO}, x}}$ .  $\lrcorner$

### 3 Siegel Modular Varieties

**Def. (28.1.3.1) [Siegel Modular Shimura-Data].** Consider the homomorphism  $h_0 : \mathrm{U}(1) \rightarrow \mathrm{Sp}(n)_{\mathbb{R}} :$

$$x + iy \mapsto \begin{bmatrix} x\mathbf{1}_n & -y\mathbf{1}_n \\ y\mathbf{1}_n & x\mathbf{1}_n \end{bmatrix}, \text{ then}$$

$$Z_{\mathrm{Sp}(n; \mathbb{R})}(h_0) = \left\{ \begin{bmatrix} A & B \\ -B & A \end{bmatrix} \mid A, B \in \mathrm{Mat}(n; \mathbb{R}) \right\} \cong \mathrm{U}(n).$$

In particular,  $\mathrm{Sp}(n; \mathbb{R}).h_0 \cong \mathcal{H}_n$  (16.2.6.6), and

$$(\mathrm{Sp}(n), \mathcal{H}_n)$$

is a connected Shimura datum (28.1.1.7).

Similarly, if  $h_0 : \$ \rightarrow \mathrm{GSp}(n)_{\mathbb{R}} : x + iy \mapsto \begin{bmatrix} x\mathbf{1}_n & -y\mathbf{1}_n \\ y\mathbf{1}_n & x\mathbf{1}_n \end{bmatrix}$ , then

$$Z_{\mathrm{GSp}(n; \mathbb{R})}(h_0) = \left\{ \begin{bmatrix} A & B \\ -B & A \end{bmatrix} \mid A, B \in \mathrm{Mat}(n; \mathbb{R}) \right\} \cong \mathrm{U}(n),$$

$\mathrm{GSp}(n; \mathbb{R}).h_0 \cong \mathcal{H}_n^{\pm}$  (16.2.6.6), and

$$(\mathrm{GSp}(n), \mathcal{H}_n^{\pm})$$

is a Shimura datum (28.1.1.1). ┘

*Proof:* If  $\begin{bmatrix} A & B \\ C & D \end{bmatrix} \begin{bmatrix} \mathbf{1}_n & \mathbf{1}_n \\ \mathbf{1}_n & \mathbf{1}_n \end{bmatrix} = \begin{bmatrix} \mathbf{1}_n & \mathbf{1}_n \\ \mathbf{1}_n & \mathbf{1}_n \end{bmatrix} \begin{bmatrix} A & B \\ C & D \end{bmatrix}$ , then  $A = D, B = -C$ . Conversely,

$$\begin{bmatrix} A & B \\ -B & A \end{bmatrix} \begin{bmatrix} x\mathbf{1}_n & -y\mathbf{1}_n \\ y\mathbf{1}_n & x\mathbf{1}_n \end{bmatrix} = \begin{bmatrix} x\mathbf{1}_n & -y\mathbf{1}_n \\ y\mathbf{1}_n & x\mathbf{1}_n \end{bmatrix} \begin{bmatrix} A & B \\ -B & A \end{bmatrix}$$

for any  $A, B \in \mathrm{Mat}(n; \mathbb{R})$  and  $x, y \in \mathbb{R}$ .

To verify that  $(\mathrm{Sp}(n), \mathcal{H}_n)$  is a connected Shimura datum ? □

### Siegel Modular Varieties

**Prop. (28.1.3.2) [Abelian Varieties with Polarizations and Level Structures].** For  $n, N \in \mathbb{Z}_+$  and  $d_1 | d_2 | \dots | d_n \in \mathbb{Z}_+$  s.t.  $(d_n, N) = 1$ , consider the functor

$$\mathcal{A} : \mathrm{Sch}/\mathbb{Z}[\frac{1}{Nd_n}] \rightarrow \mathrm{Set}$$

s.t. for any  $S \in \mathrm{Sch}/\mathbb{Z}[\frac{1}{Nd_n}]$ ,  $\mathcal{A}(S)$  is the set of isomorphism classes of triples  $(A, \lambda, \eta)$  where

- $A \in \mathrm{AbVar}^n/S$ ,
  - $\lambda : A \rightarrow A^{\vee}$  is a polarization of type  $D = \mathrm{diag}(d_1, \dots, d_n)$ .
  - $\eta : ((\mathbb{Z}/(N))^{2g}, \mathrm{Std}) \cong (A[N], e_N^{\lambda})$  is a symplectic similitude.
- ┘

**Thm. (28.1.3.3) [ $\mathcal{A}$  is Representable].** Situation as in (28.1.3.2), if  $N$  is large enough w.r.t.  $D$  (when  $d_n = 1$ , it suffices to have  $N \geq 3$ ), then  $\mathcal{A}$  is representable by a smooth quasi-projective scheme over  $\mathbb{Z}[\frac{1}{Nd_n}]$ .  $\square$

*Proof:* For  $S \in \text{Sch}$ ,  $(A, \lambda) \in \text{AbVar}^{g,D}/S$ , let  $\mathcal{L}^\Delta(\lambda) = (\text{id}_A, \lambda)^* p_A$ . Then locally on étale nbhd, if  $\lambda = \lambda_{\mathcal{L}}$  for an relative ample line bundle  $\mathcal{L}$ , then

$$\mathcal{L}^\Delta(\lambda) = [-1]^* \mathcal{L} \otimes \mathcal{L} \text{ (20.9.4.9)}$$

is also relatively ample (7.5.4.19), and

$$\lambda_{\mathcal{L}^\Delta(\lambda)} = 2\lambda_{\mathcal{L}} \text{ (20.9.4.16)}.$$

Thus  $\mathcal{L}^\Delta(\lambda)^{\otimes 3}$  is relatively very ample (20.9.5.8), and  $R^i \text{pr}_* \mathcal{L}^{\otimes 3} = 0$  for  $i \geq 1$ . Let  $\mathcal{M} = \text{pr}_* \mathcal{L}^{\otimes 3} \in \text{QCoh}^{\text{free}, 6^n d}/S$ , where  $d = \prod d_i$ .

Define a new functor  $\mathcal{H}$  that is the same as  $\mathcal{A}$  except for that we require a projective trivialization of  $\mathcal{M}$ . Then  $\mathcal{H} \rightarrow \mathcal{A}$  is a  $\text{PGL}(6^n d - 1)$ -torsor. For  $X \in \mathcal{H}(S)$ ,  $\text{pr}_* \mathcal{L}^{\otimes 3}$  provides a projective embedding  $X \subset \mathbb{P}_S^{6^n d - 1}$ , and for any  $r \in \mathbb{Z}_+$ ,  $\text{rank pr}_* \mathcal{L}^{\otimes 3r} = 6^n d r^n$ , so there is a natural transformation

$$\mathcal{H} \rightarrow \underline{\text{Hilb}}_{\mathbb{P}^{6^n d - 1}}^{Q(t), 1} : X \mapsto (X, e), \quad Q(t) = 6^n d t^n.$$

Then this is an open subfunctor whose image are contained in the moduli of pointed smooth subschemes of  $\mathbb{P}^{6^n d - 1}$ : It is injective because any pointed smooth subscheme has at most one Abelian variety structure (20.9.1.5), and its image is a union of components of the smooth locus of  $\underline{\text{Hilb}}_{\mathbb{P}^{6^n d - 1}}^{Q(t), 1}$ : This is because of (21.1.2.16).

Then  $\mathcal{H}$  is a smooth quasi-projective variety. For the rest, it needs to use GIT quotient of  $\mathcal{H}$  by  $\text{PGL}(6^d)$ , using the level structure to show stability properties, which I will not cover here. Cf. [Ngo, Shimura Varieties] P15  $\color{red}{?}$ .  $\square$

**Prop. (28.1.3.4) [Siegel Modular Varieties].** For  $k \in \text{Field}$ , the étale shification  $\mathcal{M}_{\text{ét}}^{g,d}$  of the functor

$$\mathcal{M}^{g,d} : \text{Sch}/k \rightarrow \text{Set} : X \mapsto \text{AbVar}^{g, \text{polar}=d}/X$$

is representable by a variety  $\mathcal{M}^{g,d} \in \text{Var}/k$ .  $\square$

*Proof:*  $\color{red}{?}$   $\square$

**Prop. (28.1.3.5) [Canonical Ample Divisor on  $\mathcal{M}^{g,d}$ ].** There exists a canonical ample divisor on  $\mathcal{M}^{g,d}$  given by the determinant of the sheaf of invariant differentials on the universal Abelian variety  $\mathcal{A}$ .  $\square$

*Proof:*  $\square$

**Prop. (28.1.3.6).** The  $j$ -invariant of elliptic schemes define an isomorphism  $\mathcal{M}_{\mathbb{Q}}^{1,1} \rightarrow \mathbb{A}_{\mathbb{Q}}^1$ .  $\square$

*Proof:*  $\color{red}{?}$   $\square$

**Prop. (28.1.3.7).** Let

$$(V, \psi) = (\mathbb{Q}^{2g}, \langle (a_i), (b_i) \rangle) = \sum_{i=1}^g (a_i b_{g+i} - a_{g+i} b_i),$$

and  $\tilde{G} = \text{GSp}(V)$ , then the Hermitian symmetric domain  $\tilde{X}$  is the Siegel double space, and for any neat compact open subgroup  $\tilde{\mathcal{K}} \subset \tilde{G}(\mathbf{A}_f)$ , the corresponding Shimura variety  $\tilde{S}_{\tilde{\mathcal{K}}}$  is the moduli space of principally polarized  $g$ -dimensional Abelian varieties with level- $\tilde{\mathcal{K}}$ -structure, which has a model over the reflex field  $\mathbb{Q}$ .  $\square$

#### 4 PEL-Type Shimura Varieties

References are [Kot92a] and [Lan, Arithmetic compactification of PEL-type Shimura varieties].

**Def. (28.1.4.1) [PEL-Data].** A **rational PEL-datum** is a tuple  $(B, *, V, \langle -, - \rangle, h_0)$  where

- $B$  is a f.d. semisimple algebra over  $\mathbb{Q}$ .
- $V \in \mathcal{V}\text{ect}^{\text{fin}}/B$ .
- $*$  is a positive involution on  $\mathcal{O}$ , i.e.  $\text{tr}_{B \otimes \mathbb{R}/\mathbb{R}}(x^*x) > 0$  for any  $x \in (B \otimes \mathbb{R})^\times$ .
- $\langle -, - \rangle$  is a non-degenerate  $\mathbb{Q}$ -valued alternating pairing on  $V$  s.t.

$$\langle b^*x, y \rangle = \langle x, by \rangle, \text{ where } x, y \in V, b \in B.$$

- $h_0 : \mathbb{C} \rightarrow \text{End}_{B \otimes \mathbb{R}}(V_{\mathbb{R}})$  is an  $\mathbb{R}$ -algebra homomorphism s.t.
  - For any  $z \in \mathbb{C}$  and  $x, y \in V_{\mathbb{R}}$ ,  $\langle h_0(z)x, y \rangle = \langle x, h_0(\bar{z})y \rangle$ .
  - The symmetric  $\mathbb{R}$ -bilinear pairing  $\langle -, h_0(i)(-) \rangle$  on  $V_{\mathbb{R}}$  is positive definite.

And an **integral PEL-datum** is a rational PEL-datum together with an order  $\mathcal{O}_B \subset B$  invariant under  $*$  and an  $\mathcal{O}_B$ -lattice  $\Lambda \subset V$ .

And a  **$p$ -integral PEL-datum** is a rational PEL-datum together with a  $\mathbb{Z}_{(p)}$ -order  $\mathcal{O}_B \subset B$  whose  $p$ -adic completion is a maximal order in  $B_{\mathbb{Q}_p}$  and an  $\mathcal{O}_B$ -lattice  $\Lambda \subset V_{(p)}$  ? Cf. [Kot92a]Section5 and [Lan13]Section1.4.  $\lrcorner$

**Def. (28.1.4.2) [Group of Similitudes].** For a rational PEL-datum (28.1.4.1), define  $G = \text{GU}_B(V) \in \text{AlgGrp}/\mathbb{Q}$  s.t. for any  $R \in \mathbb{C}\text{Ring}/\mathbb{Q}$  we have

$$\text{GU}_B(V)(R) = \{x \in \text{End}_{B \otimes R}(V \otimes R) : \exists c(x) \in R^*, \langle xu, xv \rangle = c(x) \langle u, v \rangle, \text{ for any } u, v \in V_{\mathbb{R}}\}.$$

Thus there is a natural map  $G \rightarrow \mathbb{G}_m$ , with kernel  $G_1 = \text{U}_B(V)$ .

For an integral PEL-datum, we can extend  $G, G_1$  to an algebraic group over  $\mathbb{Z}$ . And for a  $p$ -integral PEL-datum, we can extend  $G, G_1$  to an algebraic group over  $\mathbb{Z}_{(p)}$ .  $\lrcorner$

**Def. (28.1.4.3) [Reflex Fields of  $h_0$ ].** Cf. [Lan20]P53.  $\lrcorner$

**Prop. (28.1.4.4) [PEL Structures on Abelian Varieties].** Given an integral PEL-datum  $(\mathcal{O}, *, L, \langle -, - \rangle, h_0)$  (28.1.4.1), we get a tuple

$$(A_0, \lambda_0, i_0, (\alpha_{0,n}, \nu_{0,n}))$$

which is an abelian variety with a polarization, an endomorphism structure, and a level structure, such that  $\text{Lie}(A_0)$  satisfies the Lie algebra condition defined by  $h_0$ .  $\lrcorner$

*Proof:* Cf. [Lan20].  $\square$

**Prop. (28.1.4.5) [Conjugacy in  $G$ ].** Situation as in (28.1.4.2), if  $Q \in \text{Field}^0$  is algebraically closed, then  $x, y \in G(Q)$  (28.1.4.2) are conjugate iff they have the same similitude and they are conjugate in  $\text{End}_B(V)(Q)$ .  $\lrcorner$

*Proof:* Cf. [Kot92]P395 ?  $\square$

### PEL-Type Shimura Varieties

**Def. (28.1.4.6) [PEL-Type Shimura-Data].** Given a rational PEL-datum  $(B, *, V, \langle -, - \rangle, h_0)$  (28.1.4.1), define  $G = \mathrm{GU}(V)$  (28.1.4.2), and then  $h_0 : \mathbb{C} \rightarrow G(\mathbb{R})$  defines a manifold  $\mathcal{D} = G(\mathbb{R}).h_0$ .

When  $(G, \mathcal{D})$  is a Shimura-datum, it is called a **PEL-type Shimura datum**. And for each neat open compact subgroup  $\mathcal{K} \leq G(\mathbf{A}_f)$ , the associated Shimura variety  $\mathrm{Sh}_{\mathcal{K}}(G, \mathcal{D})$  is called a **PEL-type Shimura variety**. And the reflex field for  $(G, \mathcal{D})$  coincides with that of  $h_0$  (28.1.4.3)?.

┘

**Example (28.1.4.7).** Siegel modular varieties  $(\mathrm{GSp}(n), \mathcal{H}_n^{\pm})$  are PEL-type Shimura-varieties.  
 $(\mathrm{GU}(a, b), \mathcal{H}_{a,b}^{\pm})$  are PEL-type Shimura-varieties. ┘

## 5 Hodge-Type Shimura Varieties

**Def. (28.1.5.1) [Hodge-Type Shimura Varieties].** A **Hodge-Type Shimura datum** is a Shimura datum  $(G, X)$  (28.1.1.1) with an embedding of Shimura data

$$(G, X) \hookrightarrow (\mathrm{GSp}(2g), \mathcal{H}_{2g}^{\pm}),$$

for some  $g \in \mathbb{Z}_+$ , called a **Siegel-embedding**.

A **Hodge-Type Shimura-variety** is a Shimura-variety associated to a Hodge-type Shimura datum (28.1.1.5). In particular, a Hodge-Type Shimura-variety has a universal Abelian scheme over it. ┘

**Example (28.1.5.2) [Hodge-Type Shimura Data].**

- PEL-type Shimura data are Hodge-type Shimura varieties.
- $\mathrm{GSpin}$ -Shimura data are of Hodge-type but not of PEL types.

┘

**Remark (28.1.5.3).** Hodge-Type Shimura varieties parametrize polarized abelian varieties equipped with some Hodge cycles and level structures. ┘

**Prop. (28.1.5.4).** If  $(G, X)$  is a Shimura datum of Hodge type with an embedding  $(G, X) \hookrightarrow (\mathrm{Sp}_{2g}, \mathbb{D}_{2g})$ , then there exists a neat subgroup  $\widetilde{K} \subset \widetilde{G}(\mathbf{A}^f)$ ,  $K = \widetilde{K} \cap G(\mathbf{A}^f)$  s.t. there is a closed embedding of Shimura varieties

$$S_K \hookrightarrow \widetilde{S}_K \otimes_{\mathbb{Q}} E.$$

┘

*Proof:* [Deligne71, Prop1.15]. ┘

## 6 Abelian-Type Shimura Varieties

**Def. (28.1.6.1) [Abelian-Type Shimura Varieties].** An **Abelian-type Shimura datum** is a Shimura datum  $(G, X)$  (28.1.1.1) s.t. there is a Shimura datum  $(G_1, X_1)$  with a central isogeny  $G_1^{\mathrm{A}} \rightarrow G^{\mathrm{A}}$  inducing an isomorphism

$$(G_1^{\mathrm{ad}}, X_1^{\mathrm{ad}}) \rightarrow (G^{\mathrm{ad}}, X^{\mathrm{ad}}).$$

An **Abelian-type Shimura variety** is a Shimura variety associated to an Abelian-type Shimura datum (28.1.1.5). ┘

**Example (28.1.6.2) [Abelian-Type Shimura Data].**

- Shimura curves are of Abelian-type but not Hodge-type.
- Shimura data of type  $A, B, C, D^{\mathbb{R}}$  are all of Abelian-type.
- Shimura data of type  $E_6, E_7$  are not of Abelian-type.

┘

### Representability

**Prop. (28.3.1.6) [Level Structure Schemes].** For any  $S \in \mathbf{Sch}$ ,  $E \in \mathbf{EllCur}/S$ , and  $M, N \in \mathbb{Z}_+$  invertible on  $S$ , there exists a moduli scheme  $S(M, N)$  that is finite étale over  $S$ , which represents the moduli problem:

$$S(M, N)(T) = \{\text{monomorphism } \alpha : (\mathbb{Z}/(M) \times \mathbb{Z}/(N))_T \hookrightarrow E_T\}.$$

And denote  $S(N) = S(N, N)$ ,  $S_1(N) = S(N, 1)$ ,  $S'_1(N) = S(1, N)$ .

And also denote the  $S_0(N)$  parametrizing  $\Gamma_0(N)$ -structure. Then it is a quotient of  $S_1(N)$ .

┘

*Proof:* ? □

**Prop. (28.3.1.7)**  $[\mathcal{E}_{0,N}]$ . If  $k \in \mathbf{Field}$  and  $(N, \text{char } k) = 1$ , then the moduli problem  $\mathcal{E}_{0,N}$  of the set of elliptic curves with a cyclic  $N$ -subgroup has a coarse moduli scheme  $M$  over  $k$ . And if  $\text{char } k = 0$ ,  $M$  is canonically isomorphic to  $Y_0(N)_{\mathbb{Q}} \otimes k$ , and the map

$$\mathcal{E}_{0,N}(k) \rightarrow M(k) \cong Y_0(N)_{\mathbb{Q}}(k) \xrightarrow{(j, j_N)} \text{Spec } k[X, Y]/\Phi_m(X, Y).$$

is given by  $(E, S) \mapsto (j(E), j(E/S))$ . ┘

*Proof:* ? □

**Prop. (28.3.1.8)**  $[\mathcal{E}_N]$ . If  $k \in \mathbf{Field}$  and  $\mathbb{Q}(\zeta) \subset k$ , then the moduli problem  $\mathcal{E}_N$  of the set of elliptic curves with a  $\Gamma(N)$ -structure with Weil pairing  $\zeta_N$  has a coarse moduli scheme  $M$  over  $k$ . And if  $k = \mathbb{C}$ ,  $M$  is canonically isomorphic to  $Y(N)$ .

And for  $k = \mathbb{Q}(\zeta_N)$ ,  $M$  has good reduction over places away from  $N$ . ┘

*Proof:* ? □

**Cor. (28.3.1.9)**  $[\mathcal{E}_2]$ . The moduli problem  $\mathcal{E}_2$  in fact has  $\mathbb{A}^1$  as the fine moduli scheme over  $\mathbb{Q}$ : There is an elliptic curve  $E \in \mathbf{EllCur}/\mathbb{A}^1$  given by

$$W_\lambda : y^2 = x(x-1)(x-\lambda), \quad \lambda \in \mathbb{A}^1.$$

And it has a  $\Gamma(2)$ -structure given by the points  $((0,0), (1,0))$ . And it can be checked that this is a fine moduli problem. ? ┘

*Proof:* □

## 2 Modular Curves

**Prop. (28.3.2.1)** **[Shimura Curves]**. For any compact open subgroup  $K \subset \text{GL}(2, \mathbf{A}_f)$ , there exists a modular curve  $M_K$  defined over  $\mathbb{Q}$  s.t.

$$M_K(\mathbb{C}) = \text{GL}(2, \mathbb{Q}) \backslash \mathcal{H}^\pm \times \text{GL}(2, \mathbf{A}_f) / K.$$

And there is a compactification  $M_K \hookrightarrow \overline{M}_K$ , where  $\overline{M}_K$  is a smooth projective curve over  $\mathbb{Q}$ .

In particular, we can define  $X(N)$ ,  $X_1(N)$  and  $X_0(N)$ . ┘

*Proof:* □

**Prop. (28.3.2.2)** **[Integral Modular Curves  $Y(N)$  and  $X(N)$ ]**. For  $N \geq 3$ , the functor “isomorphism classes of elliptic curves with a level  $N$  structure” is representable by a scheme  $Y(N)$  and a universal elliptic curve  $E^{\text{uni}}/Y(N)$  with a level  $N$  structure  $\alpha_N$ .

$Y(N)$  is an affine smooth precurve over  $\mathbb{Z}[\frac{1}{N}]$ , finite flat of degree  $\# \text{GL}(2, \mathbb{Z}/(N))/\{\pm 1\}$  over the affine  $j$ -line  $\mathbb{Z}[\frac{1}{N}, j]$ , and étale away from from 0 and 1728.

The normalization  $X(N)$  of the projective  $j$ -line  $\mathbb{P}_{\mathbb{Z}[\frac{1}{N}]}^1$  in  $Y(N)$  is a proper smooth precurve over  $\mathbb{Z}[\frac{1}{N}]$ .

$\Gamma(X(N)) = \mathbb{Z}[\frac{1}{N}, \zeta_N]$ , and  $X(N) \otimes_{\mathbb{Z}[\frac{1}{N}]} \mathbb{Z}[\frac{1}{N}, \zeta_N]$  (resp.  $Y(N) \otimes_{\mathbb{Z}[\frac{1}{N}]} \mathbb{Z}[\frac{1}{N}, \zeta_N]$ ) is a disjoint union of  $\varphi(n)$  affine (resp. proper) smooth curve over  $\mathbb{Z}[\frac{1}{N}, \zeta_N]$ .

Let  $X(N)^\infty = X(N) \setminus Y(N)$ , then  $(X(N)^\infty)_{\mathbb{Z}[\frac{1}{N}, \zeta_N]}$  is a disjoint union of points, called the **cusps** of  $X(N)$ . And they naturally correspond to the set of isomorphism classes of level  $N$  structures on  $\text{Tate}(q)_{\mathbb{Z}((q)) \otimes \mathbb{Z}[\frac{1}{N}, \zeta_N]}$ .

The completion of  $X(N)$  along any of the cusp is isomorphic to  $\text{Spec } \mathbb{Z}[\frac{1}{N}, \zeta_N][[q]]$ . The completion of the  $j$ -line along  $\infty$  is also isomorphic to  $\text{Spec } \mathbb{Z}[\frac{1}{N}, \zeta_N][[q]]$  via  $j \mapsto q^{-1} + 744 + \dots$ . And the projection of these two completions along  $X(N) \rightarrow \mathbb{P}_{\mathbb{Z}[\frac{1}{N}]}^1$  is just  $q \mapsto q^N$ .

There is a unique invertible sheaf  $\omega_{\overline{E^{\text{uni}}}/X(N)}$  on  $X(N)$  whose restriction on  $Y(N)$  is  $\omega_{E^{\text{uni}}/Y(N)}$ , and at each cusp, it is  $\mathbb{Z}[\frac{1}{N}, \mu_N]$  multiples of the canonical differential of  $\text{Tate}(q^N)$  via the identification as above.  $\lrcorner$

*Proof:* ?  $\square$

**Prop. (28.3.2.3) [Cusps].** Let  $M_K^\infty = \overline{M_K} \setminus M_K$  be the cusps, then

$$M_K^\infty(\mathbb{C}) = (\pm \text{Unip}(\widehat{\mathbb{Z}})) \backslash \text{GL}(2, \widehat{\mathbb{Z}}) / K,$$

and  $\text{Aut}(\mathbb{C}/\mathbb{Q})$  acts on the cusps by

$$[k]^\tau = [\text{diag}(\chi_{\text{cycl}}(\tau), 1)k], \quad k \in \text{GL}(2, \widehat{\mathbb{Z}}).$$

$\lrcorner$

*Proof:* ?  $\square$

**Prop. (28.3.2.4).** If  $M, N \in \mathbb{Z}_+, M + N \geq 5$ , the functor “isomorphism classes of elliptic curves with an injection of  $\mathbb{Z}/(M) \times \mathbb{Z}/(N)$ ” is represented by a scheme  $Y(M, N)$  and a universal elliptic curve  $E^{\text{uni}}/Y(M, N)$  with a level structure  $\alpha : \mathbb{Z}/(M) \times \mathbb{Z}/(N) \hookrightarrow Y(M, N)$ .  $\lrcorner$

*Proof:*  $\square$

**Prop. (28.3.2.5).** The restriction map

$$H_{\text{Mot}}^2(\overline{M}, \mathbb{Q}(2)) \rightarrow H_{\text{Mot}}^2(M, \mathbb{Q}(2))$$

is injective.  $\lrcorner$

*Proof:* Cf. [Scholl, Beilinson’s theorem on Modular Curves]P276.  $\square$

**Def. (28.3.2.6) [Ordinary Locus].** Let  $Y(N)^{\text{ord}}$  be the complement of  $Y(N)_{\mathbb{Z}}$  of the finite set of supersingular points in characteristic dividing  $N$ . Then  $Y(N)^{\text{ord}}$  is smooth over  $\mathbb{Z}[\mu_N]$ .  $\lrcorner$

*Proof:* Cf. [Katz-Mazur]Cor10.9.2. ?  $\square$

### Manin-Drinfeld Theorem

**Thm. (28.3.2.7) [Manin-Drinfeld Theorem].** Let  $\mathcal{C} \in \text{Pic}^0(M_K^c \otimes \mathbb{C})$  be the subgroup of classes of divisors supported on the cusps of  $M_K^c(\mathbb{C})$ , then  $\mathcal{C}$  is finite.  $\lrcorner$

*Proof:*  $\square$

### 3 Complex Modular Curves and Jacobians

**Prop. (28.3.3.1)[Local Picture].** Let  $D$  be the unit disk and  $\Delta$  be a finite group acting on  $D$  and fixing 0, then by Schwarz lemma,  $\Delta$  is a finite subgroup of  $\text{Aut}(D, 0) \cong \mathbb{R}/\mathbb{Z}$ , so it is a finite cyclic group. If  $|\Delta| = m$ , then  $z^m$  is invariant under  $\Delta$  and defines a function on  $\Delta \backslash D$ . It is a homeomorphism from  $\Delta \backslash D$  to  $D$ , thus defines a complex structure on  $\Delta \backslash D$ .

Let  $X = \{z \in \mathbb{C} \mid \text{Im}(z) > c\}$  and  $h$  an integer. Let  $\mathbb{Z}$  acts on  $X$  by  $nz = z + nh$ . This action can extend to  $X^* = X \cup \{\infty\}$ , and we can consider the quotient space  $\mathbb{Z} \backslash X^*$ . The function  $q(z) = e^{2\pi iz/h}$  is a homeomorphism from  $\mathbb{Z} \backslash X^*$  onto the open disk of radius  $e^{-2\pi c/h}$  and center 0, which defines a complex structure on  $\mathbb{Z} \backslash X^*$ .  $\perp$

**Lemma (28.3.3.2)[Modular Curves for  $\Gamma(1)$ ].** Let  $\mathcal{H}^* = \mathcal{H} \cup \{\infty\}$ , the Riemann surface  $\Gamma(1) \backslash \mathcal{H}^*$  is compact and of genus 0, so isomorphic to the Riemann surface.  $\perp$

*Proof:* We first define a complex structure on  $\Gamma(1) \backslash \mathcal{H}$ : Let  $p: \mathcal{H} \rightarrow \Gamma(1) \backslash \mathcal{H}$  be the quotient map, and let  $Q$  be a point of  $\mathcal{H}$  mapping to  $P$ . If  $Q$  is not an elliptic point, then we can choose a nbhd of  $Q$  that maps isomorphically to a nbhd of  $P$ , so we can define the complex structure near  $P$ .

If  $Q = i$ , then the map  $z \mapsto \frac{z-i}{z+i}$  maps some open nbhd of  $i$  to an open disk  $D'$  with center 0, and the action of  $S$  is transformed to the action  $z \mapsto -z$ . By the local picture,  $f(z) = (\frac{z-i}{z+i})^2$  is invariant under action of  $S$  and defines a complex structure near  $p(i)$ . Similarly, if  $Q = \rho$ , then  $g(z) = (\frac{z-\rho}{z-\bar{\rho}})^3$  is invariant under the action of  $ST$ , and defines a complex structure near  $p(\rho)$ .

The space  $\Gamma \backslash \mathcal{H}$  we get is not compact, and it can be compactified by adding a point  $\infty$ , the resulting space is compact because it is a quotient space of  $\bar{D} \cup \{\infty\}$ , which is compact. And we give a complex structure on the resulting space: The function  $q = e^{2\pi iz}$  is a function mapping a nbhd of  $\infty$  in the fundamental domain to an open disk with center 0, and thus giving a complex structure near  $\infty$ .

It can be seen directly that  $\Gamma(1) \backslash \mathcal{H}^*$  is homeomorphic to a sphere, and then use the fact any Riemann surface of genus 0 is isomorphic to  $S^1$  (7.13.8.2).  $\square$

**Prop. (28.3.3.3)[Modular Curves for  $\Gamma$ ].** For a congruence group  $\Gamma$ , the quotient space  $\Gamma \backslash \mathcal{H}$  can be compactified to a Riemann surface  $X(\Gamma)$  by adjoining  $n$  points, where  $n$  is the number of cusps of  $\Gamma$ .  $\perp$

*Proof:* The quotient space  $\Gamma \backslash \mathcal{H}$  can be given a complex structure exactly the same way as  $\Gamma(1) \backslash \mathcal{H}$ , and it can be compactified by adding  $\mathbb{P}^1(\mathbb{Q})$ , which has only f.m. orbits under action of  $\Gamma$ , by (20.4.5.18) and the fact  $\Gamma$  has finite index in  $\Gamma(1)$ . For the complex structure: if  $h$  is the smallest positive integer that  $T^h \in \Gamma$ , then  $q = e^{2\pi iz/h}$  is a homeomorphism of a nbhd of  $\infty$  in  $\Gamma \backslash \mathcal{H}$  to some open disk of 0, thus defines a complex structure near  $\infty$ . For any other cusps  $\alpha$ , let  $\gamma \in \Gamma(1)$  satisfies  $\alpha = \gamma(\infty)$ , then  $z \mapsto q(\gamma^{-1}(z))$  defines a complex structure near  $\alpha$ .  $\square$

**Def. (28.3.3.4)[Notations].** Let  $\Gamma$  be a congruence subgroup, then we denote

$$Y(\Gamma) = \Gamma \backslash \mathcal{H}, \quad X(\Gamma) = \Gamma \backslash \mathcal{H}^*.$$

Also abbreviate  $Y(\Gamma(N))$  to  $Y(N)$ ,  $X(\Gamma(N))$  to  $X(N)$ , and  $Y(\Gamma_0(N))$  to  $Y_0(N)$ , and  $X(\Gamma_0(N))$  to  $X_0(N)$ .  $\perp$

**Prop. (28.3.3.5)[Modular Form as Differential Forms].** A holomorphic modular form of degree  $k$  in  $M_k(\Gamma)$  is just a holomorphic differential form on  $X(\Gamma)$  of degree  $k$ , and its dimension can be calculated, see [Dimension Formulae](#).

Similarly, an automorphic function for  $\Gamma$  is the same as a function on  $X(\Gamma)$  (28.3.3.3). In particular, if it is holomorphic and vanishes at cusps, then it is constant.  $\perp$

*Proof:* ? □

**Cor. (28.3.3.6) [Hauptmodul].** Let  $\Gamma$  be a congruence subgroup with only 1 cusp, a **Hauptmodul** is the unique meromorphic modular form that has only a simple pole at the cusp with residue 1. ┘

### Over $\mathbb{C}$

**Prop. (28.3.3.7).** Let  $\mathcal{E}_{0,N}$  be the functor of elliptic curves with a cyclic subgroup of order  $N$ , then there is a bijection

$$Y_0(N) = \Gamma_0(N) \backslash \mathcal{H} \cong \mathcal{E}_{0,N}(\mathbb{C}) : z \mapsto (\mathbb{C}/\Gamma(z, 1), \Gamma(z, 1/N)/\Gamma(z, 1)).$$

┘

*Proof:* Cf. [Diamond or Milne]. □

**Prop. (28.3.3.8).** Let  $\mathcal{E}_N$  be the functor of elliptic curves with a  $\Gamma(N)$  structure of Weil pairing  $\zeta_N$ , then there is a bijection

$$Y(N) = \Gamma(N) \backslash \mathcal{H} \cong \mathcal{E}_{0,N}(\mathbb{C}) : z \mapsto (\mathbb{C}/\Gamma(z, 1); z/N, 1/N).$$

┘

*Proof:* Cf. [Diamond]. □

### Modular Equations

**Prop. (28.3.3.9) [ $X_0(N)$ , Modular Equations].** The field  $C(X_0(N))$  of modular functions for  $\Gamma_0(N)$  is generated by  $j(z)$  and  $j(Nz)$  over  $\mathbb{C}$ , and the minimal polynomial  $F(j, Y)$  of  $j(Nz)$  over  $\mathbb{C}(j)$  has degree  $d = [\mathrm{PSL}(2, \mathbb{Z}) : \bar{\Gamma}_0(N)]$  (26.3.3.1), and  $F(j, Y) \in \mathbb{Z}[j, Y]$ .

When  $N > 1$ ,  $F(X, Y)$  is symmetric in  $X, Y$ , and when  $N = p$  is a prime,

$$F(X, Y) \equiv X^{p+1} + Y^{p+1} - X^p Y^p - XY \pmod{p}.$$

┘

*Proof:* Cf. [Milne, Modular Forms]P88. □

**Cor. (28.3.3.10).** The field of functions on  $X(1)$  is  $\mathbb{C}(j)$ . ┘

**Thm. (28.3.3.11).** For  $E, E' \in \mathrm{EllCur}/\mathbb{C}$ , there exists a cyclic isogeny  $\alpha : E \rightarrow E'$  of degree  $m$  iff  $\Phi_m(j(E), j(E')) = 0$ . ┘

*Proof:* Cf. [Cox, P213]. □

### Action of Hecke Algebras

**Prop. (28.3.3.12) [Double Coset Operators].** There is an action of  $\mathcal{R}$  on  $X_1(\Gamma)$  ┘

### Modular Forms

**Prop. (28.3.3.13) [Modular Forms and Homology].** For  $N \in \mathbb{Z}_+$ , the pairing

$$\langle -, - \rangle : \mathrm{SF}_2(\Gamma_0(N)) \times H_{1, \mathrm{Betti}}(X_0(N), \mathbb{Z}) \rightarrow \mathbb{C} : \langle f, \gamma \rangle = 2\pi i \int_{\gamma} f(z) dz$$

is non-degenerate, and for each  $n \in \mathbb{Z}_+$ , we have

$$\langle T_n(f), \gamma \rangle = \langle f, T_n(\gamma) \rangle.$$

┘

*Proof:* Cf. [Modular forms, a computational approach]P138. ?

This is Poincaré duality, and the second assertion follows from the modular definition of  $T_n$ .  $\square$

### Modular Jacobians

**Def. (28.3.3.14) [Modular Jacobians].** Define  $J_1(N) = \mathrm{Jac}(X_1(N))$ ,  $J_0(N) = \mathrm{Jac}(X_0(N))$ , which is defined over the same field as the defining field of  $X_1(N)$  or  $X_0(N)$ .  $\square$

### Eichler-Shimura Relations

#### 4 Modular Symbols

References are [Man72, MTT86]. [Universal Fourier expansions of modular forms, Merel]. [Modular Forms: A Computational Approach, Steins]Chap8.

**Notation (28.3.4.1).**

- Let  $\Gamma \leq \Gamma(1)$  be a finite-index subgroup.

┘

**Def. (28.3.4.2) [Modular Symbols].** Let  $\mathbf{M}_2$  be the free Abelian group generated by the symbols  $\{\alpha, \beta\}$  where  $\alpha, \beta \in \mathbb{P}^1(\mathbb{Q})$ , subject to the relations

$$\{\alpha, \beta\} + \{\beta, \gamma\} + \{\gamma, \alpha\} = 0, \text{ where } \alpha, \beta, \gamma \in \mathbb{P}^1(\mathbb{Q}),$$

called the set of **modular symbols** (for  $\Gamma(1)$ ). There is a left action of  $\mathrm{GL}(2; \mathbb{Q})$  on  $\mathbf{M}_2$  s.t.

$$g\{\alpha, \beta\} = \{g\alpha, g\beta\}, \text{ where } g \in \mathrm{GL}(2; \mathbb{Q}), \alpha, \beta \in \mathbb{P}^1(\mathbb{Q}),$$

For  $k \in \mathbb{Z}_{\geq 2}$ , define  $\mathbf{M}_k = \mathrm{Sym}^{k-2}(\mathbb{Z}^{\oplus 2})^{\vee} \otimes \mathbf{M}_2$ , called the **modular symbols** of weight  $k$ .

The action of  $\mathrm{GL}(2; \mathbb{Q})$  on  $\mathbf{M}_2$  and the natural action of  $\mathrm{GL}(2; \mathbb{Q})$  on  $\mathbb{Z}^{\oplus 2}$  defines an action of  $\mathrm{GL}(2; \mathbb{Q})$  on  $\mathbf{M}_k$ .

Define  $\mathbf{M}_k(\Gamma) = (\mathbb{Z} \otimes_{\mathbb{Z}[\Gamma]} \mathbf{M}_k)_{\mathrm{lf}}$ .  $\square$

**Def. (28.3.4.3) [Boundary and Cuspidal Modular Symbols].** Situation as in (28.3.4.2), let

$$\mathbf{B}_k = \mathrm{Sym}^{k-2}(\mathbb{Z}^{\oplus 2})^{\vee} \otimes \mathbb{Z}[\mathbb{P}^1(\mathbb{Q})],$$

called the set of **boundary symbols**, then there is a natural action of  $\mathrm{GL}(2; \mathbb{Q})$  on  $\mathbf{B}_k(\Gamma)$ , and denote

$$\mathbf{B}_k(\Gamma) = (\mathbb{Z} \otimes_{\mathbb{Z}[\Gamma]} \mathbf{B}_k)_{\mathrm{lf}}.$$

Then there is a natural map

$$b_k : \mathbf{M}_k(\Gamma) \rightarrow \mathbf{B}_k(\Gamma) : P \otimes \{\alpha, \beta\} \mapsto P \otimes ([\beta] - [\alpha]).$$

And denote  $\mathbf{S}_k(\Gamma) = \ker(b_k)$ .

For any  $R \in \mathcal{CRing}$ , denote

$$\mathbf{M}_k(\Gamma; R) = \mathbf{M}_k(\Gamma) \otimes R, \quad \mathbf{S}_k(\Gamma; R) = \mathbf{S}_k(\Gamma) \otimes R$$

┘

**Prop. (28.3.4.4) [Modular Symbols and Homology].** The natural homomorphism

$$\varphi : \mathbf{M}_2(\Gamma) \rightarrow H_{1, \text{Betti}}(X(\Gamma), \text{cusp}(\Gamma); \mathbb{Z})$$

is an isomorphism, and induces an isomorphism

$$\mathbf{S}_2(\Gamma) \cong H_{1, \text{Betti}}(X(\Gamma); \mathbb{Z}).$$

┘

*Proof:*  $\mathbf{M}_2(\Gamma) \cong \mathbb{Z} \otimes_{\mathbb{Z}[\Gamma]} \mathbf{M}_2$ . Notice  $\mathbf{M}_2 \rightarrow \mathbf{B}_2 \rightarrow \mathbb{Z} \rightarrow 0$  is a free  $\mathbb{Z}[\Gamma]$ -resolution of  $\mathbb{Z}$ , so

$$H_{1, \text{Betti}}(X(\Gamma), \text{cusp}(\Gamma); \mathbb{Z}) = H_1(\mathbb{Z} \otimes_{\mathbb{Z}[\Gamma]} C_\bullet(\mathcal{H}^*, \mathbb{P}^1(\mathbb{Q}))) = H_0(\mathbb{Z} \otimes_{\mathbb{Z}[\Gamma]} \mathbf{M}_2) = \mathbf{M}_2(\Gamma).$$

Similarly,

$$H_{1, \text{Betti}}(X(\Gamma); \mathbb{Z}) = H_1(\mathbb{Z} \otimes_{\mathbb{Z}[\Gamma]} C_\bullet(\mathcal{H}^*)) = H_1((\mathbf{M}_2 \rightarrow \mathbf{B}_2) \otimes_{\mathbb{Z}[\Gamma]} \mathbb{Z}) = \mathbf{S}_2(\Gamma).$$

□

**Prop. (28.3.4.5) [Manin[Man72]].** The homomorphism of left  $\mathbb{Z}[\Gamma(1)]$ -modules:  $\mathbb{Z}[\Gamma(1)] \rightarrow \mathbf{M}_2 : \gamma \mapsto \{\gamma(0), \gamma(\infty)\}$  is surjective with kernel  $\langle 1 + \sigma, 1 + \tau + \tau^2 \rangle$ , where  $\sigma = \begin{bmatrix} & -1 \\ 1 & \end{bmatrix}, \tau = \begin{bmatrix} 1 & -1 \\ 1 & \end{bmatrix}$ . ┘

*Proof:* Cf.[modular forms, a computational approach]P43. ?

This map factors through the right action of the left ideal  $\langle 1 + \sigma, 1 + \tau + \tau^2 \rangle$  because for any  $\gamma \in \text{SL}(2; \mathbb{Z})$ ,

$$[\gamma] + [\gamma\sigma] = \{\gamma(0), \gamma(\infty)\} + \{\gamma(\infty), \gamma(0)\} = 0,$$

$$[\gamma] + [\gamma\tau] + [\gamma\tau^2] = \{\gamma(0), \gamma(\infty)\} + \{\gamma(\infty), \gamma(1)\} + \{\gamma(1), \gamma(-)\} = 0.$$

It is surjective because the  $\Gamma(1)$ -action on  $\mathbb{P}^1(\mathbb{Q})$  is two-transitive.

To show the kernel is just  $I = \langle 1 + \sigma, 1 + \tau + \tau^2 \rangle$ , suppose  $g = \sum n_i \gamma_i = 0$ . Notice that  $\begin{bmatrix} a & b \\ c & d \end{bmatrix} \sigma = \begin{bmatrix} b & -a \\ d & -c \end{bmatrix}$ , so we may assume that  $c \geq |d|$  for each  $\gamma_i$ . Let  $\gamma$  be with the largest  $c$ , then there must be another  $\gamma'$  with negative coefficients with the same  $(a : c)$ . Thus it must be  $\begin{bmatrix} a & b-a \\ c & d-c \end{bmatrix}$  and  $c > |d| > 0$ . But then

$$\begin{bmatrix} a & b \\ c & d \end{bmatrix} - \begin{bmatrix} a & b-a \\ c & d-c \end{bmatrix} = - \begin{bmatrix} a & b-a \\ c & d-c \end{bmatrix} \tau \sigma + \begin{bmatrix} a & b-a \\ c & d-c \end{bmatrix} = - \begin{bmatrix} a & b-a \\ c & d-c \end{bmatrix} \tau^2 = \begin{bmatrix} b-a & -b \\ d-c & -d \end{bmatrix} \pmod{I},$$

Thus we eliminated at least one term  $\gamma$  with the largest  $c$ . Continuing this way, we can only get 0. Thus  $g \in I$ . □

**Cor. (28.3.4.6)** [Manin Symbols, Manin[Man72]]. The map  $\Gamma(1) \rightarrow \mathbf{M}_2(\Gamma) : \gamma \mapsto [\gamma] \triangleq \gamma \cdot \{0, \infty\}$  induces an map

$$[-] : \mathbb{Z}[\Gamma \backslash \Gamma(1)] \rightarrow \mathbf{M}_2(\Gamma),$$

and it induces an isomorphism of modules

$$\mathbb{Z}[\Gamma \backslash \Gamma(1)] / \langle 1 + \sigma, 1 + \tau + \tau^2 \rangle \cong \mathbf{M}_2(\Gamma),$$

where  $\sigma = \begin{bmatrix} & -1 \\ 1 & \end{bmatrix}, \tau = \begin{bmatrix} 1 & -1 \\ 1 & \end{bmatrix}$ . These  $[\gamma]$  are called **Manin symbols**.  $\lrcorner$

## 5 $X(p)$

[Maz78]Intro contains a lot numerical data for the geometry of  $X_0(p)$  and its minimal quotients.

### Minimal Quotients of $X(p)$

**Prop. (28.3.5.1)** [Minimal Quotients of  $X(p)$ ]. For  $p \in \text{Prime}_{\geq 5}$ , any properly-contained subgroup of  $\text{GL}(2; \mathbb{F}_p)$  is conjugate to a subgroup of the following:

- $H = \text{B}(\mathbb{Z}/(p))$ , and  $X_H(p) = X_0(p)$ , with field of definition  $\mathbb{Q}$ .
- $H$  is the normalizer of a split Cartan subgroup  $\text{diag}(*, *) \amalg \begin{bmatrix} & 1 \\ 1 & \end{bmatrix} \text{diag}(*, *)$ , and  $X_H(p) = X_{\text{split}}(p)$ , with field of definition  $\mathbb{Q}$ . Moreover,

$$g_{\text{split}}(p) = \frac{11 + (p-8)p - 4\left(\frac{-3}{p}\right)}{24}.$$

- $H$  is the normalizer of a non-split Cartan subgroup  $\mathbb{F}_{p^2}^\times \subset \text{GL}(2; \mathbb{F}_p)$ , and  $X_H(p) = X_{\text{nonsplit}}(p)$ , with field of definition  $\mathbb{Q}$ . Moreover,

$$g_{\text{nonsplit}}(p) = \frac{23 + (p-10)p + 6\left(\frac{-1}{p}\right) + 4\left(\frac{-3}{p}\right)}{24}.$$

- $H$  is the inverse image of  $\text{Sym}_4 \subset \text{PGL}(2; \mathbb{F}_p)$ , and  $X_H(p) = X_{\text{Sym}_4}(p)$ , with field of definition  $\begin{cases} \mathbb{Q} & , p \equiv \pm 3 \pmod{8} \\ \mathbb{Q}(\chi_p) & , p \equiv \pm 1 \pmod{8} \end{cases}$ .
- $H$  is the inverse image of  $\text{Alt}_5 \subset \text{PGL}(2; \mathbb{F}_p)$  if  $p \equiv \pm 1 \pmod{5}$ , and  $X_H(p) = X_{\text{Alt}_5}(p)$ , with field of definition  $\mathbb{Q}(\chi_p)$ .
- $H$  is the inverse image of  $\text{Alt}_4 \subset \text{PGL}(2; \mathbb{F}_p)$ , and  $X_H(p) = X_{\text{Alt}_4}(p)$ , with field of definition  $\mathbb{Q}(\chi_p)$ .

The last 3 cases are called **exceptional subgroups**.  $\lrcorner$

*Proof:* Cf.[Maz78] ?. □

**Cor. (28.3.5.2).**  $X_{\text{split}}(p)$  corresponds to the problem of classifying elliptic curves with an unordered pair of  $p$ -isogenies. And  $X_{\text{nonsplit}}(p)$  corresponds to the problem of classifying elliptic curves with a chosen subfield  $\mathbb{F}_{p^2}$  in  $\text{GL}(2; E[p])$  (But the inclusion may be up to conjugacy). ┘

**Thm. (28.3.5.3) [Serre].** For  $p \in \text{Prime}_{\geq 17}$  and  $H \subset \text{GL}(2; \mathbb{F}_p)$  exceptional (28.3.5.1),  $X_H(p)$  has no  $p$ -adic rational points. ┘

*Proof:* Cf.[Maz77]Intro. ? □

**Prop. (28.3.6.3).** For any imaginary quadratic field  $\mathcal{K}$ , there exists a finite set  $\emptyset \subset_{\text{fin}} S_{\mathcal{K}} \subset \text{Prime}$  s.t. if  $p \in \text{Prime} \setminus S_{\mathcal{K}}$  is inert in  $\mathcal{K}$ , then there is a non-trivial optimal quotient ?  $A$  of  $\text{Jac}_0(N)$  s.t.  $\text{rank } A_{\mathcal{K}} = 0$ . ┘

*Proof:* Cf.[Maz77]. □

### Winding Quotients

**Def. (28.3.6.4) [Winding Quotients].** For  $N \in \mathbb{Z}_+$ , the **winding quotients**  $M_0(N)$  is the maximal quotient of  $\text{Jac}_0(N)$  with Mordell rank 0. ┘

**Prop. (28.3.6.5) [Kolyvagin-Logachev].** For  $N \in \mathbb{Z}_+$ , asymptotically  $\dim M_0(N) \geq \dim \text{Jac}_0(N)/4$ . ┘

*Proof:* ? □

## 7 Moduli Space of Fake Elliptic Curves

References are [Buz97].

**Notation (28.3.7.1).**

- Let  $D/\mathbb{Q}$  be an indefinite non-split quaternion algebra.
  - Let  $\mathcal{O}_D$  be a maximal order of  $D$ .
  - Let  $R = \prod_{p \in \text{Unr}(D)} \mathbb{Z}_p$ , and fix an isomorphism  $\kappa : \mathcal{O}_D \otimes \mathbb{R} \cong \text{Mat}(2; \mathbb{R})$ .
  - Let  $\ell \in \text{Unr}(D)$ .
- ┘

**Prop. (28.3.7.2).** For any  $M \in \mathbb{Z}$  s.t.  $(M, \text{disc}(D)) = 1$ , the isomorphism  $\kappa : \mathcal{O}_D \otimes \mathbb{R} \cong \text{Mat}(2; \mathbb{R})$  (28.3.7.1) defines a morphism  $u_M : \mathcal{O}_D^\times(\mathbf{A}_f) \rightarrow \text{GL}(2; \mathbb{Z}/(M))$ . ┘

**Def. (28.3.7.3) [Fake Elliptic Curves].** For  $S \in \text{Sch}/\mathbb{Z}[\frac{1}{\text{disc}(D)}]$ , a **fake elliptic curve** over  $S$  is an pair  $(A/S, \iota)$  where  $A \in \text{AbVar}^2/S$ , and  $\iota : \mathcal{O}_D \rightarrow \text{End}_S(A)$  is an injection.  $\lrcorner$

**Def. (28.3.7.4) [Naive Full Level- $M$ -Structures].** For  $S \in \text{Sch}/\mathbb{Z}[\frac{1}{d}]$ ,  $A \in \text{fEllCur}/S$  and  $M \in \mathbb{Z}$  s.t.  $(M, \text{disc}(D)) = 1$ , a naive **full level- $M$ -structure** on  $A$  is defined to be an isomorphism

$$\alpha : (\mathcal{O}_D/(M))_S \cong A[M]$$

preserving the left action of  $\mathcal{O}_D$ . If there exists a full level- $M$ -structure on  $A$ , then  $M$  is invertible on  $S$ .

For  $\delta \in \mathcal{O}_D/(M)$ , right multiplication by  $\delta$  defines an endomorphism  $r_\delta$  of  $(\mathcal{O}_D/(M))_S$ . Thus  $(\mathcal{O}_D/(M))^*$  acts on the left on the set of full level- $M$ -structures on  $A$  by  $\delta \cdot \alpha = \alpha \circ r_\delta$ .  $\lrcorner$

**Def. (28.3.7.5) [Naive Level- $H$ -Structures].**  $\lrcorner$

**Def. (28.3.7.6)  $[\tilde{e}]$ .** Let  $\tilde{e} \in \mathcal{O}_D \otimes \mathbb{Z}_\ell$  be an element that corresponds to  $\text{diag}(1, 0) \in \text{Mat}(2; \mathbb{Z}_\ell)$  via  $\kappa$ . It is an idempotent acting on each  $A \in \text{fEllCur}^D/S$  where  $S \in \text{Sch}/\mathbb{Z}[\frac{1}{\text{disc}(D)}]$ .  $\lrcorner$

**Prop. (28.3.7.7) [Ordinary and Supersingular Fake Elliptic Curves].** For  $p \in \text{Prime}$  and  $k \in \text{Field}^p$ , the  $\ell$ -divisible group of  $A_{\bar{k}}$  is isomorphic to  $E[\ell^\infty]^2$  for some  $E \in \text{EllCur}/\bar{k}$ . Then  $A$  is called an **ordinary fake elliptic curve** (a resp. **supersingular fake elliptic curve**) if  $E$  is ordinary or supersingular.  $\lrcorner$

*Proof:* ?  $\square$

**Def. (28.3.7.8)  $[\Gamma_0(\ell), \Gamma_1(\ell)$ -structures].** For  $S \in \text{Sch}/\mathbb{Z}[\frac{1}{\text{disc}(D)}]$  and  $A \in \text{fEllCur}^D/S$ ,

- a  $\Gamma_0(\ell)$ -**structure** on  $A/S$  is an isogeny of false elliptic curves  $A \rightarrow B \in \text{fEllCur}^D/S$  of degree  $\ell$ .
- $\Gamma_1(\ell)$ -**structure** on  $A/S$  is a pair  $(\varphi, P)$ , where
  - $\varphi : A \rightarrow B \in \text{fEllCur}^D/S$  is an isogeny of false elliptic curves  $A \rightarrow B \in \text{fEllCur}^D/S$  of degree  $\ell$ .
  - $P \in \ker(e| \ker(\varphi))(S)$  is a generator of  $\ker(e| \ker(\varphi))$ .
- A **balanced**  $\Gamma_1(\ell)$ -**structure** on  $A/S$  is a triple  $(\text{pr}, P, P')$  where
  - $\varphi : A \rightarrow B \in \text{fEllCur}^D/S$  is an isogeny of false elliptic curves  $A \rightarrow B \in \text{fEllCur}^D/S$  of degree  $\ell$ .
  - $P \in \ker(e| \ker(\varphi))(S)$  is a generator of  $\ker(e| \ker(\varphi))$ .
  - $P' \in \ker(e| \ker(\varphi^\vee))(S)$  is a generator of  $\ker(e| \ker(\varphi^\vee))$ .

And if  $S \in \text{Sch}/\mathbb{Z}[\frac{1}{\text{disc}(D)}][\mu_\ell]$ ,

- A **canonical balanced**  $\Gamma_1(\ell)$ -**structure** on  $A/S$  is a triple  $(\text{pr}, P, P')$  where
  - $\varphi : A \rightarrow B \in \text{fEllCur}^D/S$  is an isogeny of false elliptic curves  $A \rightarrow B \in \text{fEllCur}^D/S$  of degree  $\ell$ .
  - $P \in \ker(e| \ker(\varphi))(S)$  is a generator of  $\ker(e| \ker(\varphi))$ .
  - $P' \in \ker(e| \ker(\varphi^\vee))(S)$  is a generator of  $\ker(e| \ker(\varphi^\vee))$ .

s.t.  $\langle P, P' \rangle_\varphi = \zeta_\ell$ . ?  $\lrcorner$

**Remark (28.3.7.9) [Comparison with Modular Curves].** If  $A[\ell] \cong E[\ell]^2$  for  $E \in \text{EllCur}/S$ , then the  $\Gamma_0(\ell), \Gamma_1(\ell)$ -structures defined here are identical to the  $\Gamma_0(\ell), \Gamma_1(\ell)$ -structures defined in [Katz-Mazur] (For  $\Gamma_0(N)$ , use [Katz-Mazur] Cor6.8.7..  $\lrcorner$

## 8 Shimura Curves

**Def. (28.3.8.1) [Standard Compact Open Subgroups].** For any  $M \in \mathbb{Z}_+$  s.t.  $(M, \text{disc}(D)) = 1$ , define subgroups of  $\mathcal{O}_D^\times(\mathbf{A}_f)$ :

$$V_0(M) = u_M^{-1}(B(\mathbb{Z}/(M))), \quad V_1(M) = u_M^{-1}(M(\mathbb{Z}/(M))), \quad V_M = \ker(u_M) \text{ (28.3.7.2)}.$$

┘

**Prop. (28.3.8.2) [No Fixed Naive Level- $V_1(N)$ -Structures].** For  $N \in \mathbb{Z}_{\geq 4} \setminus (\text{disc}(D))$  and  $k \in \mathbf{Field}$  s.t.  $k = \bar{k}$  and  $N \text{disc}(D) \neq \text{char}(k)$ , if  $A/k, \iota \in \mathbf{fEllCur}^D/k$  and  $\alpha$  is level- $V_1(N)$ -structure on  $A/k$  (28.3.8.1) (28.3.7.5), then the only automorphism of  $(A/k, \iota)$  fixing  $\alpha$  is the identity. ┘

*Proof:* ? Cf. [Buz97]P595. ┐

**Def. (28.3.8.3) [Compact Open Subgroups].** Let  $U_\infty \subset (D \times \mathbb{R})^\times$  corresponding to  $\text{SO}(2; R) \subset \text{GL}(2; \mathbb{R})$ .

Let  $U \subset \mathcal{O}_D^\times(\mathbf{A}_f)$  be a compact open subgroup s.t.

- $\det(U^\times) = \mathbb{Z}^\times$ .
- $U$  is maximal at primes dividing  $\text{disc}(D)$ , i.e.  $U = \prod_{p \in S(\text{disc}(D))} (\mathcal{O}_D \otimes \mathbb{Z}_p)^\times \times U^d$ , where  $U^d \subset (\mathcal{O}_D \times R)^\times$ .
- $U \subset V_1(N)$  (28.3.8.1) for some  $N \in \mathbb{Z}_{\geq 4}$  s.t.  $(N, \text{disc}(D)) = 1$ .

where the first condition makes the generic fiber connected, the third condition makes the moduli problem representable by schemes. ┘

**Prop. (28.3.8.4).** Fixing the compact open subgroups  $U$  in (28.3.8.3), then there exists  $X^D(U) \subset \mathbf{Cur}/\mathbb{C}$  s.t.

$$X^D(U)(\mathbb{C}) \cong D^\times \backslash D^\times(\mathbf{A}) / U.U_\infty.$$

┘

*Proof:* ? ┐

**Thm. (28.3.8.5) [Integral Model of Shimura Curves, Boutot].** Fixing the compact open subgroups  $U$  in (28.3.8.3), and let  $M_U$  be the smallest number in  $\mathbb{Z}_+ \setminus (\text{disc}(D))$  s.t.  $V_M \subset U$  (28.3.8.1).

Define a fibered category  $\mathcal{X}^D(U) \in \mathbf{FibCat}_{\mathbf{fppf}}^{\text{grpd}} / \mathbb{Z}[\frac{1}{M_U \text{disc}(D)}]$  s.t. for each  $S \in \mathbf{Sch}/\mathbb{Z}[\frac{1}{M_U \text{disc}(D)}]$ ,  $X^D(U)(S)$  is the set of triples  $(A/S, \iota_A, \alpha)$  where  $(A, \iota_A) \in \mathbf{fEllCur}^D/S$  (28.3.7.3) and  $\alpha$  is a level- $U$ -structure on  $A/S$  (28.3.7.5), where the Cartesian morphisms are given by  $(A/S, \iota_A, \alpha) \rightarrow (B/T, \iota_B, \beta)$  where

$$\begin{array}{ccc} A & \longrightarrow & B \\ \downarrow & & \downarrow \\ S & \longrightarrow & T \end{array} \text{ is Cartesian diagram.}$$

- The induced map  $a : \text{End}_T(B) \rightarrow \text{End}_S(A)$  satisfies  $\iota_A = a \circ \iota_B$ .
- $\alpha$  is the level structure induced by  $\beta$ .

Then  $\mathcal{X}^D(U)$  is an algebraic stack (10.8.6.4) proper smooth of relative dimension 1 over  $\mathbb{Z}[\frac{1}{M_U \text{disc}(D)}]$ .

Moreover, because  $U$  satisfies the properties in (28.3.8.3),  $\mathcal{X}^D(U)$  is representable by a regular scheme smooth projective variety over  $\mathbb{Z}[\frac{1}{M_U \text{disc}(D)}]$ , with generic fiber  $X^D(U)$  (28.3.8.4). ┘

*Proof:* ? Cf. [Buz97]P597. □

**Cor. (28.3.8.6).** For two compact open subgroups  $U_1 \leq U_2$  satisfying the conditions in (28.3.8.3), the canonical morphism  $\mathcal{X}^D(U_1) \rightarrow \mathcal{X}^D(U_2) \in \mathcal{S}\mathrm{ch}/\mathbb{Z}[\frac{1}{M_{U_1} \mathrm{disc}(D)}]$  is étale. ┘

*Proof:* ? □

- Use notations on symmetric spaces defined in [Locally Symmetric Spaces](#).
- Use notations on Abelian varieties defined in [Abelian Varieties](#).
- Use notations on Shimura-varieties defined in [Shimura Varieties](#).
- Let  $(G, X)$  be a Shimura-datum.
- Let  $E = E(G, X)$  be the reflex field.
- Let  $p \in \text{Prime}$ .

┘

**Conj. (28.5.0.2) [Smooth Canonical Integral Models, Conjectured by Langlands/Milne].** If  $\mathcal{K}_p \leq G(\mathbb{Q}_p), \mathcal{K}^p \leq G(\mathbb{A}_f^p), \mathcal{K} = \mathcal{K}_p \mathcal{K}^p \leq G(\mathbb{A}_f)$  s.t.  $\mathcal{K}_p$  is hyperspecial, and  $\lambda \in S_E(p)$ , then  $\text{Sh}_{\mathcal{K}}(G, X)$  admits a canonical integral model [?](#) over  $\mathcal{O}_{(\lambda)}$ .

┘

*Proof:*

□

### 1 PEL-Type Shimura Varieties

**Def. (28.5.1.1) [Good Primes].**  $p \in \text{Prime}$  is said to be **good** for an integral PEL-datum  $(\mathcal{O}_B, *, L, \langle -, - \rangle, h_0)$  [\(28.1.4.1\)](#) if

- $p$  is unramified in  $\mathcal{O}_B$ , i.e.  $p \nmid \text{disc}(\mathcal{O}_B)$ .
- $p \nmid [L^\vee : L]$ .
- $p \neq 2$  if  $(\mathcal{O}_B \otimes R, *)$  has a simple factor isomorphic to the matrix algebra over  $\mathbb{H}$  with its canonical positive involution (type D).
- There are no non-trivial level-structures at  $p$ .

┘

### PEL-Type Moduli Problems

**Prop. (28.5.1.2) [PEL-Type Integral Models, Zink[Zin82]/Langlands-Rapoport[L-R87]].** Given an integral PEL-datum  $(\mathcal{O}_B, *, \Lambda, \langle -, - \rangle, h_0)$  [\(28.1.4.1\)](#), let  $\mathcal{K} = \mathcal{K}_p \mathcal{K}^p$  where  $\mathcal{K}_p = G(\mathbb{Z}_p)$ , there is a clopen embedding

$$\text{Sh}_{\mathcal{K}}(G, \mathcal{D})(\mathbb{C}) \subset \mathcal{S}_{\mathcal{K}}$$

as complex manifolds, where  $\mathbf{M}_{\mathcal{K}}$  is a moduli space of polarized abelian varieties with an action of  $B$  respecting the determinant condition, equipped with  $\mathcal{K}$ -level structure, up to isogeny. And  $\mathbf{M}_{\mathcal{K}}$  is a disjoint union of  $\text{III}(G/\mathbb{Q})$ -many such  $\text{Sh}_{\mathcal{K}}(G, \mathcal{D})(\mathbb{C})$ .

When  $\mathcal{K}$  is neat,  $\mathbf{M}_{\mathcal{K}}$  is a finite covering of some Siegel moduli scheme. And when  $(G_i, D_i)$  are all Shimura data, this  $\mathbf{M}_{\mathcal{K}}$  has a canonical integral model, and serves as an integral model of  $\text{Sh}_{\mathcal{K}}(G, \mathcal{D})$ .

┘

*Proof:* ? □

**Prop. (28.5.1.3) [*p*-Integral Models].** Given a *p*-integral PEL-datum  $(\mathcal{O}_B, *, \Lambda \langle -, - \rangle, h_0)$  (28.1.4.1) with reflex field  $E \in \mathbf{NField}$  (28.1.4.3), and any  $\mathfrak{p} \in S_E(p)$ , there is a tower of schemes

$$\varprojlim_{\mathcal{K}^p} \mathcal{S}_{\mathcal{K}_p \mathcal{K}^p} \in \mathbf{Sch}/(\mathcal{O}_E)_{\mathfrak{p}}$$

s.t.

- The base change of  $\mathcal{S}_{\mathcal{K}_p \mathcal{K}^p}$  to  $\mathcal{O}_{E_{\mathfrak{p}}}$  classifies PEL-triples  $(A, \bar{\lambda}, \bar{\eta}^p)$  where  $A$  is an  $\mathcal{O}_B$ -Abelian variety,  $\bar{\lambda}$  is a  $\mathbb{Q}$ -homogenous  $\mathcal{O}_B$ -polarization, and  $\bar{\eta}^p$  is a  $\mathcal{K}^p$ -level structure? .
- The base change of  $\mathcal{S}_{\mathcal{K}_p \mathcal{K}^p}$  to  $\mathbb{C}$  is  $\mathcal{S}_{\mathcal{K}_p \mathcal{K}^p}$  (28.5.1.2).

┘

*Proof:* ? [Kot92]. □

**Remark (28.5.1.4).** Moduli problems defined by Drinfeld level structures are generally not even flat over the base rings. ┘

**Def. (28.5.1.5) [Hecke Operators].** ┘

**Notation (28.5.1.6).** ┘

**Prop. (28.5.1.7) [RSZ Unitary Shimura varieties].** Suppose

- Let  $E$  be an imaginary quadratic field.
- Let  $p \in \mathbf{Prime}_{\geq 3}$  be an inert prime with  $(p) = \mathfrak{p}_v$ .
- Let  $V$  be a  $2r + 1$ -dimensional Hermitian space over  $E$  with signature  $(1, 2r)$  at infinity and is unramified at  $p$ .
- Let  $G = \mathbf{U}(V)$  and
- $\mathcal{K} = \mathcal{K}^p \mathcal{K}_p \leq G(\mathbf{A}_f)$  where  $\mathcal{K}_p$  is the hyperspecial subgroup fixing a self-dual  $\mathbb{Z}_{p^2}$ -lattice  $\Lambda \subset V_p$ .

then the Shimura variety  $\mathrm{Sh}_{\mathcal{K}}(G, \mathcal{N})$  has a PEL-type integral model as follows: Fix a CM elliptic curve  $A_0$  with full  $\mathcal{O}_E$ -action, and a prime-to- $p$  principal polarization  $\lambda_0$  of  $A$  defined over the Hilbert class field  $E^1$  of  $E$ . Then the integral model  $\mathcal{S}_{G, \mathcal{K}, \mathcal{O}_{E^1, (p)}} \in \mathbf{Sch}/\mathcal{O}_{E, (p)}$  represents the functor:  $S \in \mathbf{Sch}/\mathcal{O}_{E, (p)} \mapsto \{(A, \lambda, \eta)\}$ , where

- $A \in \mathbf{AbVar}^{2r+1}/S$  with a faithful action by  $\mathcal{O}_E$  satisfying Kottwitz's determinant condition of signature  $(1, 2r)$ .
- $\lambda : A \rightarrow A^{\vee}$  is a prime-to- $p$  principal polarization s.t. the Rosati-involution of  $\lambda$  induces complex conjugation on  $\mathcal{O}_E$ .
- $\eta$  is a section of the étale sheaf

$$\mathrm{Isom}_{\mathrm{Herm}}(V \otimes \mathbf{A}_f^p, \mathrm{Hom}_{\mathcal{O}_E}(V_{\mathrm{\acute{e}t}}(A_0)^p, V_{\mathrm{\acute{e}t}}(A)^p))/\mathcal{K}^p.$$

parametrizing  $\mathcal{K}^p$ -orbits of Hermitian isomorphisms, where the Hermitian structure on the latter is given by

$$\langle x, y \rangle = \lambda_0^{\vee} \circ y^{\vee} \circ \lambda \circ x, \text{ where } x, y \in \mathrm{Hom}_{\mathcal{O}_E}(V_{\mathrm{\acute{e}t}}(A_0)^p, V_{\mathrm{\acute{e}t}}(A)^p).$$

┘

### Automorphic Sheaves

**Def. (28.5.1.8) [Automorphic Sheaves].** Situation as in (28.5.1.3). Let  $L(\xi) \in \mathbf{NField}$  and  $\xi \in \mathrm{Irr}_{L(\xi)}(G)$ , and  $\lambda \in \Sigma_E^{\mathrm{fin}} \setminus S_E(p)$ . Then we get a  $\lambda$ -adic sheaf  $\mathcal{L}_{\xi, \mathcal{K}^p}$  on  $\mathcal{S}_{\mathcal{K}_p \mathcal{K}^p}$  for each neat  $\mathcal{K}^p \leq G(\mathbf{A}_f^p)$  s.t.

- If  $\mathcal{K}_1^p, \mathcal{K}_2^p \leq G(\mathbf{A}_f^p)$  are neat and  $g \in G(\mathbf{A}_f^p)$  s.t.  $g^{-1}\mathcal{K}_1 g \leq \mathcal{K}_2$ , there is a canonical identification

$$[g]^* \mathcal{L}_{\xi, \mathcal{K}_1^p} = \mathcal{L}_{\xi, \mathcal{K}_2^p}$$

satisfying certain compatibility conditions. ┘

*Proof:* Cf. [Kot92]Section6, [Pink. On  $\ell$ -adic sheaves on Shimura varieties and their higher direct images in the Baily-Borel compactification]Section5.1. ? Notice that we need to use the fact  $A_{G_{\mathbb{R}}} = (A_G)_{\mathbb{R}}$  (which holds for any Hodge-type Shimura-varieties) to show that for any  $\mathcal{K}_1^p \trianglelefteq \mathcal{K}^p \leq G(\mathbf{A}_f^p)$ ,  $\mathcal{S}_{\mathcal{K}_p \mathcal{K}_1^p} \rightarrow \mathcal{S}_{\mathcal{K}_p \mathcal{K}^p}$  is Galois with Galois group  $\mathcal{K}^p / \mathcal{K}_1^p$ . □

## 2 Integral Models by Taking Closure

**Def. (28.5.2.1) [Locally Healthy Schemes].** ? ┘

**Def. (28.5.2.2) [Healthy Extension Property].** For  $p \in \mathbf{Prime}$ , a pro-scheme  $X/\mathbb{Z}_{(p)}$  is said to have the **healthy extension property** if for any  $S \in \mathrm{Sch}/\mathbb{Z}_{(p)}$  regular locally-healthy (28.5.2.1), any map  $S_{\mathbb{Q}} \rightarrow X$  extends to a map  $S \rightarrow X$ . ┘

**Def. (28.5.2.3) [Canonical Integral Models].** A model  $\mathcal{S}_{\mathcal{K}_p}$  for  $\mathrm{Sh}_{\mathcal{K}_p}$  over  $\mathbb{Z}_{(p)}$  is called an **integral canonical model** if it is regular, locally-healthy (28.5.2.1) and satisfies the healthy extension property (28.5.2.2).

If  $\mathcal{S}_{\mathcal{K}_p}$  is a canonical integral model for  $\mathrm{Sh}_{\mathcal{K}_p}$  over  $\mathbb{Z}_{(p)}$ , then for any compact open subset  $\mathcal{K}^p \leq G(\mathbf{A}_f^p)$ ,  $\mathcal{S}_{\mathcal{K}_p \mathcal{K}^p} = \mathcal{S}_{\mathcal{K}_p} / \mathcal{K}^p$  is called a canonical integral model for  $\mathrm{Sh}_{\mathcal{K}_p \mathcal{K}^p}$ . ┘

**Prop. (28.5.2.4) [Canonical Integral Models of Hodge-Type, Kisin[?Kis10]/Kim-Madapusi.Pera].** If  $(G, X)$  is of Hodge-type, choose a Siegel-embedding  $i : (G, X) \rightarrow (\mathrm{GSp}(V, \psi), \mathcal{H}^{\pm})$  s.t.  $\mathcal{G}(\mathbb{Z}_p) = G(\mathbb{Q}_p) \cap \mathrm{GSp}(V_{\mathbb{Z}_p}, \psi)$  for a self-dual  $\mathbb{Z}_p$ -lattice  $V_{\mathbb{Z}_p} \subset V_{\mathbb{Q}_p}$ , and that  $\mathcal{K}^p = \mathcal{K}'^p \cap G(\mathbf{A}_f^p)$ , then the closure of  $\mathrm{Sh}_{\mathcal{K}_p}(G, X)$  in  $\mathcal{S}_{\mathcal{K}'^p}(\mathrm{GSp}(V), \psi)$  is a canonical integral model for  $\mathrm{Sh}_{\mathcal{K}_p}(G, X)$ . ┘

## 3 Abelian-Type Shimura Varieties

References are [?Kis10].

**Thm. (28.5.3.1) [Canonical Integral Models of Abelian-Type, Vasiu07/Kisin[?Kis10]].** If  $(G, \mathcal{N})$  is a Shimura-variety of Abelian-type s.t.  $G$  splits over a tamely-ramified extension of  $\mathbb{Q}_p$ , and  $\mathcal{K}_p$  is parahoric,  $\mathcal{K}^p$  is sufficiently small, then

- For each  $v \in S_{E(G, \mathcal{N})}(p)$ , the  $E_v$ -scheme  $\mathrm{Sh}_{\mathcal{K}_p}(G, X)$  admits a  $G(\mathbf{A}_f^p)$ -equivariant extension to a flat  $\mathcal{O}_{E_v}$ -scheme  $\mathcal{S}_{\mathcal{K}_p}(G, X)$ , satisfying extension property w.r.t. mixed-characteristic DVRs.
- Any sufficiently small  $\mathcal{K}^p \leq G(\mathbf{A}_f^p)$  acts freely on  $\mathcal{S}_{\mathcal{K}_p}(G, X)$ , and the quotient  $\mathcal{S}_{\mathcal{K}}(G, X) = \mathcal{S}_{\mathcal{K}_p}(G, X) / \mathcal{K}^p$  is a finite  $\mathcal{O}_{E_{\lambda}}$ -scheme extending  $\mathrm{Sh}_{\mathcal{K}}(G, X)$ . ┘

*Proof:* ? □

**Remark (28.5.3.2) [Properness].** [Madapusi Pera, Toroidal compactifications of integral models of Shimura varieties of Hodge type] proved that if  $\mathrm{Sh}_{\mathcal{K}}(G, \mathcal{N})$  is proper, then  $\mathcal{S}_{\mathcal{K}}(G, \mathcal{N})$  is proper over  $\mathcal{O}_{E(G, \mathcal{N})_{(v)}}$ . ┘

## 4 Local Models

**Thm. (28.5.4.1) [Local Models, Conjectured by Rapoport [Rap95], Pappas-Zhu [P-Z13]].** Situation as in (28.5.3.1), Rapoport conjectured that the canonical integral model  $\mathcal{S}_{\mathcal{K}}(G, X, \mathcal{K}_p)/\mathcal{O}_{E_v}$  should be modeled by some group-theoretically defined local model  $\mathbf{M}_{G, X, \mathcal{K}_p}^{\mathrm{loc}}/\mathcal{O}_{E_v}$  attached to  $(G_{\mathbb{Q}_p}, X, \mathcal{K}_p)$ , s.t.

- $\mathbf{M}_{G, X, \mathcal{K}_p}^{\mathrm{loc}}$  is projective and flat over  $\mathrm{Spec} \mathcal{O}_{E_v}$ .
- $\mathcal{G}_{\mathcal{K}_p}$  acts on  $\mathbf{M}_{G, X, \mathcal{K}_p}^{\mathrm{loc}}$ .
- $\mathbf{M}_{G, X, \mathcal{K}_p}^{\mathrm{loc}} \otimes E \cong G_{\mathbb{Q}_p}/P(\mu_h)$  is the partial flag variety associated to  $(G_{\mathbb{Q}_p}, X)$ .
- $\mathbf{M}_{G, X, \mathcal{K}_p}^{\mathrm{loc}}(\bar{\kappa}(v))$  can be precisely group-theoretically described.
- The action of  $\mathcal{G}_{\mathcal{K}_p} \otimes \kappa(v)$  on  $\mathbf{M}_{G, X, \mathcal{K}_p}^{\mathrm{loc}} \otimes \kappa(v)$  has finite many orbits  $\mathcal{O}_w$  indexed by  $w \in \mathcal{K}_p \backslash \mathrm{Adm}(\mu^*)/\mathcal{K}_p$ . And  $\mathcal{O}_w \subset \mathrm{cl}(\mathcal{O}_{w'})$  iff  $w \preceq w' \in W_{\mathcal{K}_p} \backslash \widetilde{W}/W_{\mathcal{K}_p}$  (? Cf. [H-R17]P322).

Cf. [Pappas, On the arithmetic moduli schemes of PEL Shimura varieties].

When  $G$  splits over a tamely-ramified extension of  $\mathbb{Q}_p$ , such a local model is constructed by [Pappas-Zhu], which is an orbit closure in an affine Grassmannian. ┘

*Proof:* ? □

**Prop. (28.5.4.2) [Local Models for Abelian-Type Shimura Varieties, Kisin [Kis10]/Pappas-Zhu].** Situation as in (28.5.3.1), suppose  $p \nmid \#\pi_1([G, G])$  and that either  $(G^{\mathrm{ad}}, X^{\mathrm{ad}})$  has no factor of type  $D^H$  or  $G$  is unramified over  $\mathbb{Q}_p$ , then there is a smooth **Kottwitz-Rapoport map** of stacks

$$\lambda_{\mathcal{K}_p} : \mathcal{S}_{\mathcal{K}}(G, X) \rightarrow \left[ \mathcal{G}_{\mathcal{O}_{E_v}}^{\mathrm{ad}, 0} \backslash \mathbf{M}_{G, X, \mathcal{K}_p}^{\mathrm{loc}} \right] \rightarrow W_{\mathcal{K}_p} \backslash \widetilde{W}/W_{\mathcal{K}_p} \text{ (28.5.4.1)}.$$

In particular, the special fiber of  $\mathcal{S}_{\mathcal{K}}(G, X)$  is reduced, and the strict Henselization of the local rings have normal and Cohen-Macaulay irreducible components. ┘

*Proof:* ? □

## 28.6 Rapoport-Zink Spaces and Mixed-Characteristic Shtukas

References are [Kot85, Rap95, R-R96, R-Z96, Tot96, Kot97, And03], [Period domains over finite and  $p$ -adic fields, Dat-Orlik-Rapoport].

**Notation(28.6.0.1).**

- Let  $p \in \text{Prime}$ .
- Let  $(K, \mathcal{O}_K, \varpi_K, \kappa) \in p\text{-NField}$ . (It cannot be relaxed to  $K \in p\text{-Field}$ ).
- Let  $K_0 = W(\bar{\kappa})[\frac{1}{p}]$ .
- The arithmetic Frobenius of  $\text{Gal}(K^{\text{sh}}/K)$  is denoted by  $\varphi_0$ .
- Let  $\text{NilSch}$  be the subcategory of  $\text{Sch}$  consisting of schemes s.t.  $p$  is locally nilpotent.
- We abuse notation by calling  $F$ -isocrystals(27.5.5.2) as isocrystals.
- Use notations on  $p$ -adic Galois representations defined in [p-adic Local Galois Representations](#).
- Let  $G \in \text{RedGrp}/K$ .

┘

### 1 $B(G)$ and Isocrystals with Structures

**Def.(28.6.1.1)** [ $B(G)$ ]. Denote  $B(G) = H^1(\text{Gal}_{\check{K}}, G(\check{K}))$ , which is equal to the set of  $\varphi_0$ -conjugacy classes of  $G(\check{K})$ , i.e.  $x \sim y \in G(K^{\text{sh}})$  iff  $x = gx\sigma(g)^{-1}$  for some  $g \in G(K^{\text{sh}})$ .

More generally, for any  $L \subset \check{K}$  complete and Galois over  $K$ , we can define  $B(G; L)$  to be the  $\varphi_0$ -conjugacy classes of  $G(L)$ .

┘

**Prop.(28.6.1.2).** The exact sequence

$$1 \rightarrow \text{Gal}_{\check{K}} \rightarrow W_K \rightarrow \text{Gal}_{\kappa} \rightarrow 1$$

induces a bijection  $B(G) \xrightarrow{\inf} H^1(W_K, G(K^{\text{sep}}))$ . And the inclusions  $W_K \leq \text{Gal}_K$  and  $G(K^{\text{sep}}) \leq G(K^{\text{sep}})$  induce an injection

$$H^1(K, G) \hookrightarrow B(G).$$

┘

*Proof:* The first identity follows from Serre-Hochschild spectral sequence(9.8.1.14) and the Steinberg's theorem(10.5.2.3)  $H^1(\check{K}, G_{\check{K}}) = \mathbf{1}$ .

To show the injection, it suffices to show that for any finite separable extension  $K'/K \in p\text{-LField}$ ,  $H^1(\text{Gal}(K'/K), G(K')) \hookrightarrow H^1(W_K, G(K^{\text{sep}}))$  is injective. But this is the inflation map(9.8.1.14) for the exact sequence

$$1 \rightarrow W_{K'} \rightarrow W_K \rightarrow \text{Gal}(K'/K) \rightarrow 1,$$

which is injective.

□

**Prop.(28.6.1.3)** [Long Exact Sequences]. If  $1 \rightarrow G_1 \rightarrow G_2 \rightarrow G_3 \rightarrow 1 \in \text{RedGrp}/K$  is an exact sequence, then there is an exact sequence of pointed sets

$$1 \rightarrow G_1(K) \rightarrow G_2(K) \rightarrow G_3(K) \rightarrow B(G_1) \rightarrow B(G_2) \rightarrow B(G_3) \rightarrow 1.$$

┘

*Proof:* It follows from Steinberg's theorem (10.5.2.3) that  $G_1(K^{\text{sh}}) \rightarrow G_2(K^{\text{sh}}) \rightarrow G_3(K^{\text{sh}}) \rightarrow 1$  is exact. Taking  $H^1(\text{Gal}_\kappa, -)$  gives the assertion by (9.8.4.4), where  $B(G_2) \rightarrow B(G_3)$  is clear by (28.6.1.1).  $\square$

**Prop. (28.6.1.4) [Restrictions].** If  $K'/K \in p\text{-Field}$  is a finite separable extension and  $G \in \text{RedGrp}/K'$ , then there is a Shapiro isomorphism

$$B(\text{Res}_{K'/K} G) \cong B(G).$$

┘

*Proof:* ?  $\square$

**Prop. (28.6.1.5) [Change of Alg. Closed Fields].** If  $\kappa'/\kappa \in \text{Field}$  s.t.  $\kappa' = \overline{\kappa'}$ , then the natural map

$$B(G) \rightarrow B(G, W(\kappa')[\frac{1}{p}K]) \quad (28.6.1.1)$$

is a bijection.  $\square$

*Proof:* Cf. [Rapoport-Zink] 1.16. ?

This follows from (28.6.1.21).  $\square$

**Remark (28.6.1.6).** When  $G = \text{GL}(n)_K$ ,  $B(G)$  are in bijection with the isomorphism classes of  $n$ -dimensional  $\varphi_0\text{-}\check{K}$ -spaces, so the Dieudonné-Manin classification of isocrystals can be translated to a classification of  $\sigma$ -conjugacy classes of  $\text{GL}(n; K_0)$ . See (28.6.1.45).  $\square$

**Def. (28.6.1.7) [Kottwitz-Maps].** The Kottwitz-map  $G(\check{K}) \rightarrow \pi_1(G)_{I_K}$  (20.5.2.12) factors through a map  $B(G) \rightarrow \pi_1(G)_{\text{Gal}_K}$ , also called the **Kottwitz-map** of  $G$ . It is surjective if  $\kappa$  is a cd-1 field, by (20.5.2.19).  $\square$

**Prop. (28.6.1.8) [Kottwitz-Maps via Crossed Modules].** Cf. [Leb99] or [R-V14] P7.  $\square$

### Slope Homomorphisms

**Def. (28.6.1.9) [Slope Homomorphisms].** For any  $b \in G(\check{K})$ , there is a morphism  $\nu_b \in X_*(G_{\check{K}})_{\mathbb{Q}}$  called the **slope homomorphism** associated to  $b$ , which is defined as follows:

For any  $(\rho, V) \in \text{Rep}_K^{\text{fd}}(G)$ , there is an associated isocrystal defined in (28.6.1.44), then there is a morphism  $\nu_\rho \in X_*(G_{\check{K}})_{\mathbb{Q}}$  that makes  $\mathbf{D}(\mathbb{Q})$  acts on the slope- $\lambda$  component  $V_\lambda$  of  $V$  by the character  $\lambda \in \mathbb{Q} = X^\bullet(\mathbf{D}(\mathbb{Q}))$  (27.5.5.15).

Then for any  $x \in \mathbf{D}(R)$ , the mapping  $\rho \rightarrow \nu_\rho(x)$  gives an automorphism of the standard fiber functor on  $\text{Rep}_K^{\text{fd}}(G)$ , so by Tannakian duality corresponds to a unique element  $y \in G(R)$  that  $\rho(y) = \nu_\rho(x)$  for any  $\rho$ . The homomorphism  $x \mapsto y$  is functorial in  $R$  and thus defines an element  $\nu \in X_*(G_{\check{K}})_{\mathbb{Q}}$ .  $\square$

**Prop. (28.6.1.10) [Characterizing the Slope Morphism].** The slope morphism associated to  $b \in G(K^{\text{sh}})$  can be characterized intrinsically to be the unique morphism  $\nu \in X_*(G_{\check{K}})_{\mathbb{Q}}$  s.t.: There exists some  $s \in \mathbb{Z}_+, c \in G(K^{\text{sh}})$  that

- $s\nu \in X_*(G_{\check{K}})$ ,
- $c(s\nu)c^{-1}$  is defined over the fixed field of  $\sigma^s$ .

- $c(b\sigma)^s c^{-1} = c(s\nu)(\varpi) c^{-1} \sigma^s \in G(\check{K}) \rtimes \text{Gal}_\kappa$ , i.e.  $cb\sigma(b) \dots \sigma^{s-1}(b) \sigma^s(c)^{-1} = c(s\nu)(\varpi_K) c^{-1}$ .

┘

*Proof:* Cf. [Kot85]P13.

The uniqueness follows by choosing an embedding  $G \leq \text{GL}(n)$  ?.

□

**Cor. (28.6.1.11).** For any  $b \in G(\check{K})$ , we have:

- $\nu_{\sigma(b)} = \sigma(\nu_b)$ .
- $\nu_{gb\sigma(g)^{-1}} = g\nu_b g^{-1}$ .
- $\sigma(\nu_b) = b\nu_b b^{-1}$ .

In particular, the  $G(\check{K})$ -conjugacy classes of  $\nu_b$  depends only on the  $\sigma$ -conjugacy classes of  $b$ , and is invariant under  $\text{Gal}_\kappa$ . ┘

*Proof:* 1: This follows from the fact  $(V \otimes_{\mathbb{Q}_p} K_0, b\sigma) \xrightarrow{\sigma, \cong} (V \otimes_{\mathbb{Q}_p} K_0, \sigma(b)\sigma)$ .

2: This follows from the fact  $(V \otimes_{\mathbb{Q}_p} K_0, b\sigma) \xrightarrow{\rho(g), \cong} (V \otimes_{\mathbb{Q}_p} K_0, gb\sigma(g)^{-1}\sigma)$  by (28.6.1.44).

3: This follows from item2 and the fact  $b = b\sigma(b)\sigma(b)^{-1}$ . ┘

□

**Cor. (28.6.1.12) [Newton-Maps].** For a maximal torus  $T \leq G$  with Weyl group  $W(G, T)$ ,  $b \mapsto \nu_G(b)$  (28.6.1.9) induces a map

$$\nu_G : B(G) \rightarrow \mathcal{N}(G) \triangleq \left( X_*(G_{K^{\text{sh}}})_{\mathbb{Q}} / G(K^{\text{sh}}) \right)^{\text{Gal}_\kappa} \cong \left( X_*(T_{K^{\text{sh}}})_{\mathbb{Q}}^+ \right)^{\text{Gal}_\kappa}$$

called the **Newton-map**, and it is functorial in  $G$ . ┘

**Cor. (28.6.1.13).** For  $b \in B(G)$ ,  $\nu_G(b) = 1$  iff  $b$  is in the image of  $H^1(K, G)$  (28.6.1.2). ┘

*Proof:* ?

□

**Prop. (28.6.1.14) [Newton-Maps and Kottwitz-Maps].** For any  $G$  and a maximal torus  $T \leq G$ , we can define the natural quotient map

$$\mathcal{N}(G) \cong \left( X_*(T_{K^{\text{sh}}})_{\mathbb{Q}}^+ \right)^{\text{Gal}_\kappa} \rightarrow (X_\bullet(T)_{\mathbb{Q}} / \mathbb{Q} \cdot \Phi^\vee(G, T))^{\text{Gal}_K} \quad (28.6.1.12),$$

which induces a functorial map

$$\delta_G : \mathcal{N}(G) \rightarrow \pi_1(G)^{\text{Gal}_K} \otimes \mathbb{Q} \quad (10.4.5.24).$$

Then there is a commutative diagram

$$\begin{array}{ccc} B(G) & \xrightarrow{\nu_G} & \mathcal{N}(G) \\ \downarrow \kappa_G & & \downarrow \delta_G \\ \pi_1(G)_{\text{Gal}_K} & \longrightarrow & \pi_1(G)^{\text{Gal}_K} \otimes \mathbb{Q} \end{array} \quad (28.6.1.12)(28.6.1.7).$$

┘

*Proof:* ? Cf. [Kot85].

□

**Prop. (28.6.1.15) [Newton Map Constancy].** If  $S \in \text{N\acute{S}ch}/\kappa$  is connected and  $M \in \text{F-Isoc}_G(S)$  (28.6.1.44) s.t.  $\nu \circ b_M$  (28.6.1.45) is constant, then  $b_M$  is constant. ┘

*Proof:* Cf.[RR96, P173].?

□

**Cor. (28.6.1.16).** If  $S \in \text{NSch}/\kappa$  and  $M \in \text{F-Isoc}_G(S)$ , and  $[b_0] \in B(G)_b$ , then

$$\{s \in S \mid [b_M(s)] = [b_0]\} \subset S$$

is closed.

┘

*Proof:*

□

**Def. (28.6.1.17) [Kottwitz-Decent Elements].**  $[b] \in B(G)$  (28.6.1.1) is called **Kottwitz-decent** if there is some  $s \in \mathbb{Z}_+$  and some  $b \in [b]$  that  $s\nu_b \in X_*(G_{\check{K}})$  and

$$(b\varphi_0)^s = (s\nu_b)(\varpi_K)\varphi_0^s \in G(K_0) \rtimes \text{Gal}_\kappa.$$

This doesn't depend on the choice of  $b$  by (28.6.1.11).

┘

**Prop. (28.6.1.18) [Kottwitz].** Any  $[b] \in B(G)$  is Kottwitz-decent (28.6.1.17).

┘

*Proof:* Cf.[Kot85].?

□

**Prop. (28.6.1.19).** If  $b \in G(\check{K})$  satisfies the Kottwitz-descent condition for  $s$  in (28.6.1.17), then  $b \in G(K_s)$  and  $\nu_b$  is defined over  $K_s$ , the fixed field of  $\varphi_0^s$ . In particular,  $b$  is Kottwitz-decent for any  $s' \in s\mathbb{Z}$ .

┘

*Proof:* Set  $b_s = b\sigma(b) \dots \sigma^{s-1}(b)$ , then iterating (28.6.1.11),  $b_s \nu^{\sigma^s} b_s^{-1} = \nu$ . And we have  $b_s = \nu^s(p)$ , so  $\nu^{\sigma^s} = \nu$ , so  $\nu$  is defined over  $\mathbb{Q}_{p^s}$ .

To show the first assertion, notice  $(b\sigma)(b\sigma)^s = (b\sigma)^s(b\sigma)$  shows

$$\nu^s(p)\sigma^s b\sigma = b\sigma \nu^s(p)\sigma^s = \nu^s(p)b\sigma^{s+1} \text{ (28.6.1.11)}.$$

and then  $b\sigma^s = \sigma^s b$ .

□

**Cor. (28.6.1.20).** If  $b_1, b_2 \in [b]$  are Kottwitz-decent w.r.t the same  $s \in \mathbb{Z}_+$ , then they are conjugate w.r.t.  $G(K_s)$ , where  $K_s$  is the fixed field of  $\varphi_0^s$ .

In particular, for any descent  $b \in G(\mathbb{Q}_{p^s})$  and any  $V \in \text{Rep}_{\mathbb{Q}_p}(G)$ , the induced isocrystal (28.6.1.44) is defined over the field  $\mathbb{Q}_{p^s}$ , and it only depends on  $[b] \in B(G)$ .

┘

*Proof:* Suppose  $b_2 = gb_1\sigma(g)^{-1}$ , then  $\nu_2 = g\nu_1 g^{-1}$ , and the descent equations are

$$(b_1\sigma)^2 = s\nu_1(p)\sigma^s, \quad g(b_1\sigma)^s g^{-1} = gs\nu_1(p)g^{-1}\sigma^s.$$

Comparing these two,  $g$  commutes with  $\sigma^s$ , so  $g \in G(K_0 \cap \mathbb{Q}_{p^s})$ .

□

**Prop. (28.6.1.21) [Forms  $J_b$  and Conjugacy Classes].** For  $b_1, b_2 \in G(\check{K})$ , the functor

$$J(R) = \{g \in G(R \otimes_K \check{K}) \mid g(b_1\sigma) = (b_2\sigma)g\}$$

is representable by a smooth affine scheme over  $K$ . When  $b_1 = b_2 = b$ , denote the scheme by  $J_b$ .

Assume  $b_1, b_2 \in G(W(\kappa')[\frac{1}{p}])$  where  $\kappa' = \bar{\kappa}' \subset \kappa$ , and  $J'$  the corresponding smooth affine scheme, then  $J' \rightarrow J$  is an isomorphism. In particular,  $B(G) \rightarrow B'(G)$  is injective, and it is surjective if  $G$  is connected and  $\kappa = \bar{\kappa}$ .

Notice if  $b_1, b_2$  are  $\sigma$ -conjugate, then  $J_{b_1} \cong J_{b_2}$ .

┘

*Proof:* Choose an embedding  $G \leq \mathrm{GL}(n)_{\mathbb{Q}_p}$  and let  $G$  be defined by functions  $f_1, \dots, f_k$ , consider the functor:

$$F(R) = \{g \in \mathrm{Mat}(n; R \otimes_{\mathbb{Q}_p} K_0) \mid g = b\sigma(g)b^{-1}\},$$

then it is representable by an affine space by (28.6.1.22) applied to the  $\sigma$ -linear map  $g \mapsto b\sigma(g)b^{-1}$ .

So there is a f.d.  $\mathbb{Q}_p$ -vector space  $W \subset \mathrm{Mat}(n; K_0)$  that  $F(R) = W \otimes_{\mathbb{Q}_p} R$ . Choose a basis  $(A_i)$  of  $W$ , then  $J(R)$  is just the subfunctor of  $r_i \in R$  that

$$f_k\left(\sum r_i A_i\right) = 0, \quad \det\left(\sum r_i A_i\right) \neq 0.$$

Taking a basis of  $K_0$  over  $\mathbb{Q}_p$ , then these are polynomials with coefficients in  $\mathbb{Q}_p$ . It is automatically smooth by Cartier's theorem (10.1.4.3).

The assertion about base change follows from (28.6.1.22).

The surjectivity follows from (28.6.1.18) and (28.6.1.19).  $\square$

**Lemma (28.6.1.22).** Let  $N$  be a f.d. isocrystal over  $K_0$  w.r.t.  $\varphi_0^s$  for some  $s \neq 0$ , then the following functor

$$F : \mathcal{CRing}_{\mathbb{Q}_p} \rightarrow \mathcal{Ab} : R \mapsto (V \otimes_{\mathbb{Q}_p} R)^{\varphi=\mathrm{id}}$$

is representable by a vector space over  $\mathbb{Q}_p$ .  $\lrcorner$

*Proof:*  $F(R) = V^{\varphi=\mathrm{id}} \otimes_{\mathbb{Q}_p} R$ , so it suffices to show  $\dim_{\mathbb{Q}_p} V^{\varphi=\mathrm{id}} < \infty$ . Firstly assume that  $L = \overline{L}$ , then this is a consequence of Dieudonné-Manin classification (27.5.5.17). This functor  $F$  doesn't depend on  $k$  as long as  $k = \overline{k}$ : if  $k'/k$  is a field extension and  $k' = \overline{k'}$ , then the corresponding functor  $F'$  defined by  $N \otimes_{W(k)[\frac{1}{p}]} W(k)[\frac{1}{p}]$  coincide with  $F$ . (This is also by Dieudonné-Manin classification.)  $\square$

**Cor. (28.6.1.23) [ $J_b$  are Inner Forms of  $Z_G(\nu_b)$ ].** Assume  $[b] \in B(G)$  is Kottwitz-decent for  $s \in \mathbb{Z}_+$  (28.6.1.17), then  $J_b$  is a  $K_s/K$ -inner form of the centralizer  $Z_G(\nu_b)$  (28.6.1.19), where  $K_s$  is the fixed field of  $\sigma^s$ .  $\lrcorner$

*Proof:* The descent equation shows  $b\sigma(b) \dots \sigma^{s-1}(b) = s\nu(\varpi_K)$ , so the adjoint  $b_{\mathrm{ad}} : g \mapsto (b\sigma)g(b\sigma)^{-1} = b\sigma(g)b^{-1}$  defines an element in  $H^1(\mathrm{Gal}(K_s/K), \mathrm{Aut}(Z_G(s\nu(p))(K_s)))$ , because

$$\sigma^k b_{\mathrm{ad}} : g \mapsto ((\sigma(b\sigma^{-1}(g))b^{-1})) = \sigma^k(b)\sigma(g)\sigma^k(b)^{-1}.$$

So

$$b_{\mathrm{ad}} \circ \sigma(b_{\mathrm{ad}}) \circ \dots \circ \sigma^{s-1}(b_{\mathrm{ad}}) : g \mapsto b_s g b_s^{-1} = s\nu(p)g(s\nu(p))^{-1} = g.$$

So it defines an inner form, which is just

$$J'(R) = G_{s\nu(p)}(K_s)^{b_{\mathrm{ad}}\sigma} = \{g \in Z_G(s\nu_b)(R \otimes_K K_s) \mid g(b\sigma) = (b\sigma)g\}.$$

Now it suffices to show  $J'(R)$  is just  $J(R)$  defined in (28.6.1.21). For this, notice any  $g \in J(R)$  commutes with  $b\sigma$  thus commutes with  $s\nu(p)$  by (28.6.1.11), and the descent condition  $(b\sigma)^n = s\nu(p)\sigma^n$  shows it commutes with  $\sigma^n$ , so  $g \in J'(R)$ .  $\square$

**Prop. (28.6.1.24) [Fibers of Newton-Maps].** For  $b \in B(G)$ , denote  $\mathcal{F}_b = \nu_G^{-1}(\nu_G(b))$  (28.6.1.12), then there is a natural bijection  $\mathcal{F}_b = H^1(K, J_b)$  (28.6.1.21), where for any  $b' \in \mathcal{F}_b$ , the corresponding  $J_b$ -torsor is  $J_{b',b}$  (28.6.1.21). And the Abelian group structure on  $\mathcal{F}$  induced from  $H^1(K, J_b)$  ? is independent of  $b \in \mathcal{F}$  chosen.  $\lrcorner$

*Proof:* Cf.[Rapoport-Richartz]P162<sup>?</sup>.

Firstly,  $J_{b',b}$  is a  $J_b$ -torsor because it is non-empty: Replacing  $b$  by some  $\sigma$ -conjugate element, we may assume that  $\nu_b = \nu_{b'}$ , and by (28.6.1.18) there exists  $s \in \mathbb{Z}_+$  s.t.

$$b\sigma(b) \dots \sigma^{s-1}(b) = (s\nu_b)(\varpi_K) = b'\sigma(b') \dots \sigma^{s-1}(b').$$

then by (28.6.1.19),  $s\nu_b$  is defined over  $K_s$ , the fixed field of  $\varphi_0^s$ , and  $b, b' \in G(K_s)$ . Then it follows from [Rational conjugacy classes in reductive groups, Kottwitz]5.2.2<sup>?</sup> that there exists some  $G \in K_s \otimes_K K^{\text{sep}}$  s.t.  $b' = gb\sigma(g)^{-1}$ . Thus  $J_{b',b}(K^{\text{sep}}) \neq \emptyset$ .

For any  $c \in H^1(K, J_b)$ ,  $c$  trivializes over some finite extension  $K'/K \subset \check{K}/K$ . But  $H^1(\text{Gal}(K'/K), J_b(K')) \subset H^1(\text{Gal}(K'/K), G(\check{K} \otimes_K K')) = 0$  by Shapiro's theorem (9.8.2.8), thus there exists  $g \in G(\check{K} \otimes_K K')$  s.t.

$$c_\tau = g^{-1}g^\tau, \text{ where } \tau \in \text{Gal}(K'/K).$$

Put  $b' = gb\sigma(g)^{-1}$ , then  $b' \in G(\check{K})$ , and  $[J_{b',b}] = c$ <sup>?</sup>. Thus  $\mathcal{F}_b \rightarrow H^1(K, J_b)$  is surjective.

To prove injectivity, if  $b', b'' \in \mathcal{F}_b$  s.t.  $[J_{b',b}] = [J_{b'',b}]$ , then

$$J_{b',b} \times^{J_b} J_{b,b''} \cong J_{b',b''}$$

is a trivial  $J_{b'}$ -torsor<sup>?</sup>, which means there exists  $g \in G(\check{K})$  s.t.  $b'' = gb'\sigma(g)^{-1}$ .

For the last assertion, Cf.[R-R96]P163. □

**Cor. (28.6.1.25).** For  $n \in \mathbb{Z}_+$ ,  $\nu_{\text{GL}(n)}$  is injective. ⌋

### Kottwitz-Basic Elements

**Prop. (28.6.1.26) [Kottwitz-Basic Elements].** The following are equivalent for  $b \in G(\check{K})$ :

- The slope morphism  $\nu_b$  (28.6.1.9) factors through the center  $Z(G)$  of  $G$ .
- $b$  is  $\sigma$ -conjugate to an element in  $T(\check{K})$  where  $T$  is an elliptic maximal torus of  $G$  (10.4.2.25).
- $J_b$  (28.6.1.21) is a  $\check{K}/K$ -inner form on  $G$ .

In this case,  $b$  and its conjugacy class  $[b]$  are called **Kottwitz-basic elements**. The set of Kottwitz-basic classes in  $B(G)$  is denoted by  $B(G)_{\text{bas}}$ .

And if  $b \in G(\check{K})$  is Kottwitz-basic, then there exists an isomorphism  $u : (J_b)_{\check{K}} \cong G_{\check{K}}$  s.t.  $u(\varphi_0(x)) = b\varphi_0(u(x))b^{-1}$  for all  $x \in J(\check{K})$ . Such a pair  $(u, b)$  is called a  **$B$ -inner twist** of  $G$ . ⌋

*Proof:* 1  $\iff$  3 follows from (28.6.1.23) and (28.6.1.18).

2  $\rightarrow$  1: If  $T \leq G$  is a elliptic maximal torus, then for  $b \in T(\check{K})$ ,  $\nu_b \in V_*(T) \subset V_*(Z(G))$  because  $T/Z(G)$  is anisotropic, thus  $b$  is Kottwitz-basic.

1  $\rightarrow$  2: Cf.[Kot85]P215.<sup>?</sup>

For the last assertion, Cf.[Kot85]P215.<sup>?</sup> □

**Prop. (28.6.1.27).**  $H^1(K, G) \leq B(G)_{\text{bas}}$ , by (28.6.1.2)(28.6.1.14) and (28.6.1.13). ⌋

**Prop. (28.6.1.28) [Kottwitz-Maps and Tate-Nakayama Isomorphisms].** If  $T$  a torus over  $K$ , and  $K'/K \in \text{GalField}^{\text{fin}}$  a splitting field of  $T$ , then  $\kappa_T : B(T) \rightarrow (X_\bullet(T))_{\text{Gal}_K}$  is an isomorphism, and

there is a commutative diagram

$$\begin{array}{ccc} \widehat{H}^{-1}(\mathrm{Gal}(K'/K), X_{\bullet}(T)) & \xrightarrow{\mathrm{TN}} & H^1(\mathrm{Gal}(K'/K), T(K')) \xrightarrow{\cong} H^1(K, T) \\ \downarrow & & \downarrow \\ (X_{\bullet}(T))_{\mathrm{Gal}_K} & \xleftarrow{\kappa_G, \cong} & B(T), \end{array}$$

where TN is the Tate-Nakayama isomorphism. Recall that  $H_{\mathrm{Tate}}^{-1}(\mathrm{Gal}(K'/K), X_{\bullet}(T)) = \{\lambda \in X_{\bullet}(T) \mid \mathrm{tr}_{K'/K} \lambda = 0\} / \{\sigma(\mu) - \mu\}$ . ?

In particular,  $\kappa_T(H^1(K, T)) = ((X_{\bullet}(T))_{\mathrm{Gal}_K})_{\mathrm{tor}}$  because the image of the canonical map

$$H_{\mathrm{Tate}}^{-1}(\mathrm{Gal}(K'/K), X_{\bullet}(T)) \rightarrow (X_{\bullet}(T))_{\mathrm{Gal}_K}$$

is exactly  $((X_{\bullet}(T))_{\mathrm{Gal}_K})_{\mathrm{tor}}$ . ⌋

*Proof:* Firstly we prove that  $\kappa_T : B(T) \rightarrow (X_{\bullet}(T))_{\mathrm{Gal}_K}$  is an isomorphism: If  $T = \mathbb{G}_m$ , then  $\kappa_G$  is surjective by (20.5.2.17), and to prove injectivity, it suffices to show that  $\beta : \mathcal{O}_{\check{K}}^* \rightarrow \mathcal{O}_{\check{K}}^* : y \mapsto y\varphi_0(y)$  is surjective. Because  $\mathcal{O}_{\check{K}}^*$  is complete and  $\beta(U_n) \subset U_n$ , it suffices to prove that  $\beta$  induces isomorphisms on  $U_n/U_{n+1}$ , which is clear because

$$\beta : \bar{\kappa}^{\times} \rightarrow \bar{\kappa}^{\times} : x \mapsto x^{1-\#\kappa},$$

$$\beta : \bar{\kappa} \rightarrow \bar{\kappa} : x \mapsto x - x^{\#\kappa}$$

are both surjective.

Now Kottwitz-maps are compatible with restrictions (20.5.2.16), so the assertion also holds for induced tori (10.2.3.11). Now by (10.2.3.13) we can take an exact sequence  $1 \rightarrow T_0 \rightarrow T_1 \rightarrow T \rightarrow 1$  where  $T_0, T_1 \in \mathcal{A}lg\mathcal{G}rp/k$  are tori and  $T_1$  is an induced tori, then we get a commutative diagram

$$\begin{array}{ccccccc} B(T_0) & \longrightarrow & B(T_1) & \longrightarrow & B(T) & \longrightarrow & 1 \\ \downarrow \kappa_{T_0} & & \downarrow \kappa_{T_1} & & \downarrow \kappa_T & & \\ \pi_1(T_0)_{\mathrm{Gal}_K} & \longrightarrow & \pi_1(T_1)_{\mathrm{Gal}_K} & \longrightarrow & \pi_1(T)_{\mathrm{Gal}_K} & \longrightarrow & 1 \end{array},$$

where the rows are exact by (28.6.1.3) and (10.4.5.26). Then we see  $\kappa_T$  is surjective, and thus  $\kappa_{T_0}$  is also surjective, and then  $\kappa_T$  is injective.

For the commutativity: ? Cf. [Kot85] 2.7. □

**Lemma (28.6.1.29).** Situation as in (28.6.1.26), if  $\pi_1([G, G]) = 1$ , then  $G \rightarrow G/[G, G]$  induces a bijection  $B(G)_{\mathrm{bas}} \cong B(G/[G, G])$ . ⌋

*Proof:* Firstly, if  $G$  is semisimple and simply-connected, then we can choose an anisotropic maximal torus.  $T \leq G$  by (20.7.7.4), and then  $B(T) \rightarrow G(G)_b$  is surjective by (28.6.1.26), and  $H^1(K, T) \cong B(T)$  because  $X_{\bullet}(T)_{\mathrm{Gal}_K}$  is torsion. So it follows from the commutative diagram

$$\begin{array}{ccc} H^1(F, T) & \longrightarrow & B(T) \\ \downarrow & & \downarrow \\ H^1(F, G) & \longrightarrow & B(G) \end{array}$$

that  $B(G)_{\text{bas}} = 1$ .

Take an elliptic maximal torus  $T \leq G$  (20.7.7.4), then  $B(T) \rightarrow B(G)_{\text{bas}}$  is surjective, and  $T_{\text{der}} = T \cap [G, G]$  is connected because of the commutative diagram

$$\begin{array}{ccc} X_{\bullet}(T) & \longrightarrow & X_{\bullet}(T/T_{\text{der}}) \\ \downarrow & & \downarrow \cong \\ \pi_1(G) & \xrightarrow{\cong} & \pi_1(G/[G, G]) \end{array}.$$

So it follows from (28.6.1.3) that  $B(T) \rightarrow B(G)_b \rightarrow B(G/[G, G])$  is surjective.

And if  $b, b' \in B(G)_b$  maps to the same element in  $B(G/[G, G])$ , because  $1 \rightarrow [G, G](\check{K}) \rightarrow G(\check{K}) \rightarrow (G/[G, G])(\check{K}) \rightarrow 1$  is exact by Steinberg's theorem, we can replace  $b'$  by some  $\sigma$ -conjugate element s.t.  $b' = xb$  for some  $x \in [G, G](L)$ . Then it can be shown that for  $u : (J_b)_{\check{K}} \cong G_{\check{K}}$  as in (28.6.1.26), the  $y = u^{-1}(x) \in B((J_b)_{\text{der}})_b$  ?, which is trivial by what we proved above. So  $y = c\varphi_0^{-1}(c)$  for some  $c \in J_{\text{der}}(\check{K})$ . Then  $b' = u(c)b\varphi_0(u(c))^{-1}$ , so  $b = b'$ .  $\square$

**Thm. (28.6.1.30) [Basic Elements and Kottwitz-Maps].** The Kottwitz-map  $\kappa_G$  (20.5.2.12) induces isomorphisms

$$B(G)_{\text{bas}} \cong \pi_1(G)_{\text{Gal}_K}, \quad H^1(K, G) \cong (\pi_1(G)_{\text{Gal}_K})_{\text{tor}} \quad (28.6.1.1).$$

In particular,  $B(G)_b$  is trivial if  $G$  is semisimple and simply-connected.

And for a basic element  $b$ , the cohomology class of  $J_b$  is the image of  $[b]$  under the map

$$B(G)_{\text{bas}} \rightarrow B(G_{\text{ad}}) \cong H^1(K, G_{\text{ad}}).$$

┘

*Proof:* If  $[G, G]$  is simply-connected, then  $\pi_1(G) \cong \pi_1(G/[G, G])$  and  $B(G)_b \cong B(G/[G, G])$  by (28.6.1.29), also if we take an elliptic maximal torus  $T \leq G$  (20.7.7.4), then  $G/[G, G] \cong T/T_{\text{sim.cntd}}$ , so  $H^1(K, G) \rightarrow H^1(K, G/[G, G])$  is surjective because  $H^2(K, T_{\text{sim.cntd}}) = 0$  (10.5.2.8), and it is injective by (10.5.2.7). So the assertion follows from (28.6.1.28).

Finally take a central extension  $1 \rightarrow Z \rightarrow \tilde{G} \rightarrow G \rightarrow 1$  where  $Z$  is an anisotropic torus and  $[\tilde{G}, \tilde{G}]$  is simply-connected (which exists by [STABLE TRACE FORMULA: CUSPIDAL TEMPERED TERMS, Kottwitz] Lemma 6.2 ?). Then  $\pi_1(\tilde{G}) \cong \pi_1(G)$ ,  $B(Z)$  acts on  $B(\tilde{G})_b$  and induces a quotient isomorphism  $B(\tilde{G})_b/B(Z) \cong B(G)_b$ , and  $H^1(K, Z) \rightarrow H^1(K, \tilde{G}) \rightarrow H^1(K, G) \rightarrow 1$  is exact because  $H^2(K, Z) = 0$  (10.5.2.8). Notice the following exact sequences:

$$\pi_1(Z)_{\text{Gal}_K} \rightarrow \pi_1(\tilde{G})_{\text{Gal}_K} \rightarrow \pi_1(G)_{\text{Gal}_K} \rightarrow 1,$$

$$\pi_1(Z)_{\text{Gal}_K} \rightarrow \left( \pi_1(\tilde{G})_{\text{Gal}_K} \right)_{\text{tor}} \rightarrow (\pi_1(G)_{\text{Gal}_K})_{\text{tor}} \rightarrow 1,$$

where the second one follows from the fact that  $\pi_1(Z)_{\text{Gal}_K}$  is torsion because  $Z$  is anisotropic. Then the assertion follows from the assertions for  $\tilde{G}$  and  $Z$ .

For the last assertion, Cf. [Kot85] Chap 5. ? or see (28.6.1.24).  $\square$

**Def. (28.6.1.31) [G-Regular Basic Elements].** If  $G$  is quasi-split and  $M \leq G$  be a Levi-subgroup and  $S \leq M$  the maximal central split torus. For  $b \in B(M)_{\text{bas}}$  with slope homomorphism  $\nu_b : \mathbf{D}(\mathbb{Q}) \rightarrow S$ , the centralizer  $Z_G(\nu_b)$  is a Levi subgroup containing  $M$ . Then  $b$  is called a **G-regular basic element** if  $Z_G(\nu_b) = M$ . ┘

**Prop. (28.6.1.32).** For  $G$  quasi-split,

- Any  $b \in G(\check{K})$  is  $\sigma$ -conjugate to a  $G$ -regular basic element of some Levi-subgroup of  $G$  (28.6.1.31).
- If  $M_1, M_2 \leq G$  are Levi-subgroups and  $b_i \in B(M_i)$  are  $G$ -regular basic elements, then  $b_1, b_2$  has the same image in  $B(G)$  iff there exists  $g \in G(K)$  s.t.  $gM_1g^{-1} = M_2$  and  $\text{Ad}(g)b_1 = b_2$ .  $\lrcorner$

*Proof:* 1: Consider the slope homomorphism  $\nu_b \in X_*(G_{\check{K}})_{\mathbb{Q}}$ , then the conjugacy class of  $\nu_b$  is invariant under action of  $\text{Gal}_{\check{K}}$  by (28.6.1.11). So there exists  $g \in G(\check{K})$  s.t.  $\text{Ad}(g)\nu_b \in X_*(G)_{\mathbb{Q}}$  (for example, the unique dominant element in the conjugacy class of  $\nu_b$  does). Replacing  $b$  by  $gb\sigma(g)^{-1}$ , we may assume that  $\nu_b \in X_*(G)_{\mathbb{Q}}$ . Define  $M = Z_G(\nu_b)$ , then it follows from (28.6.1.11) that  $b \in M$ , and it is clearly a  $G$ -regular basic element of  $M$ , by (28.6.1.26).

2: One direction is clear. For the other direction, as in the proof of item1, for  $i \in [2]_+$ , let  $m_i \in M_i(\check{K})$  s.t.  $[m_i] = b_i \in B(M_i)$  and  $\nu_{m_i}$  are defined over  $K$ . Suppose  $m_2 = hm_1\sigma(h)^{-1}$  for some  $h \in G(\check{K})$ , then  $\nu_{m_1} = \text{Ad}(h)\nu_{m_2}$ , and then  $\nu_{m_2} = \text{Ad}(g)\nu_{m_1}$  for some  $g \in G(K)$  for the same reason as in the proof of item1. Then  $m_2 = (hg^{-1})(gm_1g^{-1})\sigma(hg^{-1})^{-1}$ , thus  $\text{Ad}(g)b_1 = b_2$ .  $\square$

**Prop. (28.6.1.33)[Image of Newton-Maps].** Suppose  $G$  is quasi-split. If  $M \leq G$  is a Levi subgroup, denote  $\varphi_M$  the following map:

$$\pi_1(M)_{\text{Gal}_K} \rightarrow \pi_1(M/[M, M])_{\mathbb{Q}}^{\text{Gal}_K} = \pi_1(Z_M)_{\mathbb{Q}}^{\text{Gal}_K} \rightarrow \mathcal{N}(G) \quad (28.6.1.12),$$

then the image of  $\nu_G : B(G) \rightarrow \mathcal{N}(G)$  (28.6.1.12) is

$$\text{Im}(\nu_G) = \bigcup_{M \leq G \text{ Levi}} \text{Im}(\varphi_M).$$

$\lrcorner$

*Proof:* This follows from (28.6.1.32) and functoriality that  $\text{?}$   $\square$

**Cor. (28.6.1.34)[Newton-Polygons for  $\text{GL}(n)$ ].** For  $n \in \mathbb{Z}_+$ , the image of  $\nu_{\text{GL}(n)}$  consists of sequences of the form  $(\underbrace{\lambda_1, \dots, \lambda_1}_{n_i\text{-many}}, \dots, \underbrace{\lambda_r, \dots, \lambda_r}_{n_r\text{-many}})$  s.t.  $\sum_i n_i = n$  and  $\lambda_i \in \mathbb{Q}$  and  $n_i\lambda_i \in \mathbb{Z}$  for all  $i$ .  $\lrcorner$

*Proof:* This follows from (28.6.1.33) because the Levi subgroups of  $\text{GL}(n)$  are all conjugate to elements of the form  $\prod_i \text{GL}(n_i)$  where  $\sum_i n_i = n$ .  $\square$

### Partial-Ordering on $\mathcal{N}(G)$

**Prop. (28.6.1.35)[Partial-Ordering on  $B(G)$  and  $\mathcal{N}(G)$ ].** For a maximal torus  $T \leq G$  and a system of positive roots on  $\Phi(G, T)$ , define a partial-ordering on  $\mathcal{N}(G)$  (28.6.1.14) as follows: For  $\nu, \nu' \in \mathcal{N}(G)$ ,

$$\nu \preceq \nu' \iff W(G, T) \cdot \nu \preceq W(G, T) \cdot \nu' \in X_{\bullet}(T) \quad (3.9.5.34).$$

And define a partial-ordering on  $B(G)$  as follows: For  $b, b' \in B(G)$ ,

$$b \preceq b' \iff \kappa_G(b) = \kappa_G(b') \ \& \ \nu_b \preceq \nu_{b'} \in \mathcal{N}(G).$$

Then for  $b, b' \in B(G)$ ,

1. If  $\kappa_G(b) = \kappa_G(b')$  and  $b$  is Kottwitz-basic (28.6.1.26), then  $b \preceq b'$ . In particular, Kottwitz-basic elements are minimal w.r.t. this partial ordering.
2.  $X_b = \{b' \in B(G) : b' \preceq b\}$  if finite.
3. If  $G = \mathrm{GL}(n)$ , then  $b \preceq b'$  iff the Newton-polygon of  $b$  lies above the Newton-polygon of  $b'$  and has the same end points.

┘

*Proof:* 3: In this case, if  $\nu = (\lambda_1, \dots, \lambda_n)$ , then  $\delta\nu = \sum_i \lambda_i$ . And by recalling the co-roots of  $\mathrm{GL}(n)$ , we see for  $\lambda_1 \leq \dots \leq \lambda_n, \lambda'_1 \leq \dots \leq \lambda'_n$ ,

$$(\lambda_1, \dots, \lambda_n) \preceq (\lambda'_1, \dots, \lambda'_n) \iff \sum_{i=1}^h \lambda_i = \sum_{i=1}^h \lambda'_i, \text{ \& \> } \sum_{i=1}^r \lambda_i \geq \sum_{i=1}^r \lambda'_i \text{ where } r \in [n]_+.$$

2: By choosing an embedding  $G \leq \mathrm{GL}(n)$ , this follows from?? and the fact all the Newton-polygons has integer break points by (28.6.1.34).

1: This follows from the fact that  $X_\bullet(Z(G))$  are minimal elements in the positive Weyl-Chamber  $C_+(\Phi^+)$ .  $\square$

**Def. (28.6.1.36) [Hodge-Points].** Let  $G/K$  be unramified and  $\Lambda_0 \in \mathcal{B}(G) \subset \mathcal{B}(G_{\check{K}})$  is a hyperspecial point with corresponding parahoric subgroup  $\mathcal{K}_\Lambda$ , and let  $\mathcal{V} = G(K) \cdot \Lambda_0 \subset \mathcal{B}(G_{\check{K}})$ . Then  $G(\check{K}) \rtimes \mathrm{Gal}_K$  acts on  $\mathcal{V}$ . Then by Cartan-decomposition

$$G(L) \backslash (\mathcal{V} \times \mathcal{V}) = \mathcal{K}_\Lambda \backslash G(L) / \mathcal{K}_\Lambda = X_*(S) / W(G, S) \text{ (20.7.2.14),}$$

where  $S \leq G$  is a maximal split torus. Then we get a map  $\mathrm{inv} : \mathcal{V} \times \mathcal{V} \rightarrow X_\bullet(S) / W(G, S)$ .

For  $\Lambda \in \mathcal{V}$  and  $b \in G(\check{K})$ , define  $\mu_\Lambda(b) = \mathrm{inv}(\Lambda, b\varphi_0(\Lambda))$ , called the **Hodge-point** associated to  $\Lambda$  and  $b$ .

Then

$$\mu_{g\Lambda}(gb\varphi_0(g)^{-1}) = \mu_\Lambda(b), \text{ where } g \in G(\check{K}).$$

$$\mu_{\varphi_0(\Lambda)}(\varphi_0(b)) = \varphi_0(\mu_\Lambda(b)).$$

┘

**Thm. (28.6.1.37) [Mazur's Theorem, Mazur [Kat79]/Rapoport-Richartz [R-R96]].** Situation as in (28.6.1.36). Similar as in (28.6.1.14), any  $\mathcal{N} \in X_\bullet(S) / W(G, S)$  defines an element  $\mathcal{N}_\Lambda^\natural \in \pi_1(G)_{\mathrm{Gal}_K}$ , and by averaging the dominant element over  $\mathrm{Gal}_K$  an element  $\overline{\mathcal{N}}_\Lambda \in \mathcal{N}(G)$ . Then

- $\kappa_G(b) = \mathcal{N}_\Lambda(b)^\natural \in \pi_1(G)_{\mathrm{Gal}_K}$ .
- $\nu_G(b) \preceq \overline{\mathcal{N}}_\Lambda(b) \in \mathcal{N}(G)$  (28.6.1.35).

┘

*Proof:* Cf. [R-R96] P179. ?  $\square$

### Acceptable Elements

**Notation (28.6.1.38).**

- Let  $G \in \mathrm{RedGrp}/K$ .

┘

**Def. (28.6.1.39) [Acceptable Elements].** Suppose  $G$  is quasi-split,  $T \leq G$  a maximal torus and a system of positive roots on  $\Phi(G, T)$  (for non-quasi-split group, we need to choose a quasi-split inner form  $G^*$  and use the fact that  ${}^L G \cong {}^L G^*$  (10.4.6.2)).

For  $\mu \in X_\bullet(T)_{\mathbb{Q}}^{+, \text{Gal}_\kappa}$ ,  $[b] \in B(G)$  is called an **acceptable element** for  $\mathcal{N}$  if  $\nu_{[b]} \preceq \bar{\mu}$  (28.6.1.12)(28.6.1.37).

Notice if  $S \leq G$  is a maximal split torus, then  $[b]$  being acceptable for  $\mathcal{N}$  is equivalent to  $\nu_{[b]}$  lying in the convex hull of  $\Phi(G, S) \cdot \bar{\mu} \in V(S)_{\mathbb{R}}$  by (3.9.5.34). The set of acceptable elements for  $\mu$  is denoted by  $A(G, \mu)$ .

And  $[b] \in B(G)$  is called a **neutral acceptable element** for  $\mu$  if it is acceptable for  $\mu$  and  $\kappa_G([b]) = \mu^\natural \in \pi_1(G)_{\text{Gal}_K}$  (28.6.1.7)(28.6.1.37). The set of neutral acceptable elements for  $\mu$  is denoted by  $B(G, \mu)$ .  $\lrcorner$

**Cor. (28.6.1.40).** For  $\mu \in X_\bullet(T)_{\mathbb{Q}}^{+, \text{Gal}_\kappa}$ ,

- $B(G, \mu)$  (28.6.1.39) contains a unique basic element, by (28.6.1.30).
- $0 < \#B(G, \mu) \leq \#A(G, \mu) < \infty$ , by (28.6.1.35).
- $A(G, \mu)$  and  $B(G, \mu)$  only depends on  $\mu^\natural \in \pi_1(G)_{\text{Gal}_K}$ .
- There is a map  $c : A(G, \mu) \rightarrow H^1(K, G) : ([b], \mu) \mapsto \kappa_G([b]) - \mu^\natural$  by (28.6.1.30), and the kernel is exactly  $B(G, \mu)$ .  $\lrcorner$

### F-Isocrystals with $G$ -Structures

**Def. (28.6.1.41) [C-isocrystals].** For a Tannakian category  $\mathcal{C}$  over  $\mathbb{Q}_p$  and  $S \in \text{Sch}/\kappa$ , a **C-isocrystal** over  $S$  is an exact faithful  $\mathbb{Q}_p$ -linear tensor functor (4.2.1.2)

$$M : \mathcal{C} \rightarrow \text{F-Isoc}(S) \text{ (27.5.5.2)}.$$

The category of  $\mathcal{C}$ -isocrystals over  $S$  is denoted by  $\text{F-Isoc}_{\mathcal{C}}(S)$ . It is a groupoid.  $\lrcorner$

*Proof:* It is a groupoid by [Period domains over finite and p-adic fields, Dat-Orlik-Rapoport]P110.  $\square$

**Def. (28.6.1.42) [Isocrystals with  $G$ -structures].** Given  $S \in \text{Sch}/\kappa$ , an **isocrystal with  $G$ -structures** over  $S$  is a  $\text{Rep}_{\mathbb{Q}_p}^{\text{fd}}(G)$ -isocrystal over  $S$  (28.6.1.41)

$$M : \text{Rep}_{\mathbb{Q}_p}^{\text{fd}}(G) \rightarrow \text{F-Isoc}(S).$$

which commutes with fiber functors to  $\text{Vect}_S$ . The category of isocrystals with  $G$ -structures over  $S$  is denoted by  $\text{F-Isoc}_G(S)$ .  $\lrcorner$

**Prop. (28.6.1.43).** The natural functor  $\text{F-Isoc}_G(\kappa) \rightarrow \text{F-Isoc}_{\text{Rep}_{\mathbb{Q}_p}^{\text{fd}}(G)}(\kappa)$  is fully faithful, and it is an equivalence iff  $H^1(K_0, G) = 1$ .  $\lrcorner$

*Proof:* Cf. [Period domains over finite and p-adic fields, Dat-Orlik-Rapoport]P223.  $\square$

**Prop. (28.6.1.44) [Associated Isocrystals with  $G$ -Structure].** For  $b \in G(K_0)$ , there is a functor

$$\mathcal{I}_b : \text{Rep}_{\mathbb{Q}_p}^{\text{fd}}(G) \rightarrow \text{F-Isoc}(\kappa) : V \mapsto (V \otimes_{\mathbb{Q}_p} K_0, \rho(b) \circ (\text{id} \otimes \sigma)).$$

If  $g \in G(K_0)$  and  $b' = gb\sigma(g)^{-1}$ , then multiplying by  $g$  implies a natural isomorphism between  $\mathcal{I}_b$  and  $\mathcal{I}_{b'}$ .  $\lrcorner$

**Prop. (28.6.1.45) [Isocrystals and  $B(G)$ ].** The map  $b \mapsto \mathcal{I}_b$  (28.6.1.44) induces an isomorphism of groupoids

$$B(G_{K_0}) \cong \text{F-Isoc}_G(\kappa) \text{ (28.6.1.1)}.$$

Thus for any  $S \in \text{Sch}/\kappa$  and  $M \in \text{F-Isoc}_G(S)$ , we get a function

$$b_M : S(\kappa) \rightarrow B(G_{K_0}) : s \mapsto [b]_s \text{ (28.6.1.1)}.$$

┘

*Proof:* ? Cf. [RR96, P171] or [Period domains over finite and p-adic fields, Dat-Orlik-Rapoport]P222. □

**Def. (28.6.1.46) [Augmented Group Schemes over Isocrystals].** An **affine group scheme over  $\text{F-Isoc}(\kappa)$**  is a pair  $(G, \varphi)$  where  $G \in \text{Aff}/K_0$  and  $\varphi : (\varphi_0)_*(G) \rightarrow G$  is an isomorphism of schemes over  $K_0$  s.t.  $\Gamma(G)$  is an increasing union of f.g.  $\varphi$ -stable subspaces.

Let  $\omega_{\text{Isom}}$  be the natural fiber functor  $\text{F-Isoc}(\kappa) \rightarrow \text{Vect}_{K_0}$ , then there is a natural isomorphism  $\varphi_\kappa : (\varphi_0)_*\omega_{\text{Isom}} \rightarrow \omega_{\text{Isom}}$  given by the  $\sigma$ -equivariant identity map  $V \rightarrow \sigma_*(V)$  for any  $V \in \text{F-Isoc}(\kappa)$ .

Let  $D_\kappa = \underline{\text{Aut}}^\otimes(\omega_{\text{Isom}})$  be the **fundamental group scheme** of  $\text{F-Isoc}(\kappa)$ , then it becomes an affine group scheme over  $\text{F-Isoc}(\kappa)$ .

An **augmented group scheme over  $\text{F-Isoc}(\kappa)$**  is a triple  $(G, \varphi, \nu)$  where  $(G, \varphi)$  is an affine group scheme over  $\text{F-Isoc}(\kappa)$  and  $\nu : (D_\kappa, \varphi_\kappa) \rightarrow (G, \varphi)$  is affine group schemes over  $\text{F-Isoc}(\kappa)$ . ┘

### Specializations of Isocrystals

References are [Gro74, R-R96, Kat79, Zin01, O-Z02].

### Weakly-Admissible Pairs

**Prop. (28.6.1.47) [Associated Filtered Isocrystals and Weakly-Admissible Pairs].** Let  $K$  be a totally ramified field extension of  $K_0$ , and  $\mu : \mathbb{G}_{m,K} \rightarrow G_K$  be a cocharacter over  $K$ , then the associated isocrystal over  $K_0$  prolongs to a filtered isocrystal over  $K$  (25.2.9.22),

$$\mathcal{I}_{\mu,b} : \text{Rep}_{\mathbb{Q}_p}(G) \rightarrow \varphi\text{-Mod Fil}_K : V \mapsto (V \otimes_{\mathbb{Q}_p} K_0, \rho(b) \circ (\text{id} \otimes \sigma), \text{Fil}_\mu^\bullet),$$

where the filtration comes from  $\mu$  by weight-filtrations (because  $\mathbb{G}_m$  is diagonalizable (10.2.3.2)).  $(\mu, b)$  is called a **weakly admissible pair** (resp. **admissible pair**) if for any  $V \in \text{Rep}_{\mathbb{Q}_p}(G)$ , the filtered isocrystal  $\mathcal{I}_b(V)$  is weakly admissible (25.2.9.24) (resp. admissible (25.2.9.28)).

It suffices to check this condition for one faithful representation  $V$ . ┘

*Proof:* This is because for a faithful representation  $V$ , any  $\mathbb{Q}_p$ -representation appears as a direct summand of  $V^{\otimes n} \otimes \widehat{V}^{\otimes m}$  (10.3.1.16). Then the assertion follows from the fact direct summands and tensor products of weakly admissible filtered isocrystals are weakly admissible (25.2.9.26). □

**Def. (28.6.1.48) [Equivalent Pairs].** Two pairs  $(\mu, b), (\mu', b')$  as in (28.6.1.47) are called **equivalent** if there exists  $g \in G(K_0)$  s.t.  $b' = gb\sigma(g)^{-1}$ , and the cocharacters  $\mu', g\mu g^{-1}$  define the same filtration on  $\text{Rep}_{\mathbb{Q}_p}^{\text{fd}}(G)$ . Equivalent,  $\mathcal{I}_{b,\mu} = \mathcal{I}_{b',\mu'}$ . ┘

## 2 Period Domains

References are [Period domains over finite and p-adic fields, Dat-Orlik-Rapoport].

**Notation (28.6.2.1).**

- Denote  $\kappa = \overline{\mathbb{F}_p}$ .
- Let  $K \in p\text{-LField}$ .
- Let  $\mathcal{N} \in X_\bullet(G)_{\mathbb{Q}}/G(\overline{K})$  be a conjugacy class of cocharacters defined over some reflex field  $E \in p\text{-NField}$  (10.3.2.5),
- Let  $\check{E} = EK_0$ .

┘

**Def. (28.6.2.2) [Associated Partial Flag Variety].** There is a faithful tensor functor associated to  $\mathcal{N}$ :

$$\text{Rep}_{\mathbb{Q}_p}^{\text{fd}}(G) \rightarrow \text{Gr}_E^{\mathbb{Z}} \rightarrow \text{FilVect}_E$$

Consider the functor

$$\mathcal{C}\text{Ring}_E \rightarrow \text{Set} : R \mapsto \{\text{the equivalence classes in the } G(R)\text{-conjugacy class in } \mathcal{N}_R\},$$

then for each  $\mu \in \mathcal{N}$ , there is a closed algebraic subgroup  $P(\mu) \leq G_E$ :

$$P(\mu)(R) = \{g \in G(R) \mid g\mu_R g^{-1} \text{ is equivalent to } \mu_R\}$$

then the functor above is representable by the  $G_E$ -homogenous variety  $\mathcal{F}_{\mathcal{N}} \cong G_E/P(\mu) \in \text{Sch}/E$ . In other words, it is the par-equivalence classes of  $\mu$ . ┘

**Prop. (28.6.2.3).**  $\mathcal{F}_{\mathcal{N}}$  is a smooth projective variety. In particular  $P(\mu)$  is a parabolic subgroup (28.6.2.2). ┘

*Proof:* Take a faithful representation  $V \in \text{Rep}_{\mathbb{Q}_p}^{\text{fd}}(G)$  and consider  $\text{Flag}_{\mu}(V)$  the partial flag variety over  $\mathbb{Q}_p$  which associates to any  $\mathbb{Q}_p$ -algebra  $R$  the set of filtrations  $\text{Fil}^\bullet$  of  $V \otimes_{\mathbb{Q}_p} R$  s.t.  $\text{gr}^i \text{Fil}^i(R)$  are direct summands and  $\text{rank Fil}^i = \dim \text{Fil}_{\mu}^i(V)$ . Then  $\text{Flag}_{\mu}(V)$  is a projective variety, by classical results ?, and there is a closed immersion ?

$$\mathcal{F}_{\mathcal{N}} \hookrightarrow \text{Flag}_{\mu}(V)_E,$$

because the filtrations on other representations are determined by the filtration on  $V$  by (10.3.1.16).

Cf. [Period domains over finite and p-adic fields, Dat-Orlik-Rapoport] P121. ┘

**Thm. (28.6.2.4) [ $p$ -adic Period Spaces, Rapoport-Zink [R-Z96]].** For any finite extension  $L/\check{E}$  and  $b \in G(\check{K})$ , a filtration  $\xi \in \mathcal{F}_{\mathcal{N}}(L)$  (28.6.2.2) is called a **weakly admissible point** if the pair  $(\xi, b)$  is weakly admissible (28.6.1.47). The set of such points are denoted by  $\mathcal{F}_{\mu, b}^{\text{weak. adm}}(K)$ . Then

- $\mathcal{F}_{\mu, b}^{\text{weak. adm}}(\mathbb{C}_K)$  is an admissible open subset of  $(\mathcal{F}_{\mu})_{\check{E}}^{\text{rig}}$ . In particular, it has a rigid analytic structure  $(\mathcal{F}_{\mu, b}^{\text{weak. adm}})_{\check{E}}^{\text{rig}}$ , called the  **$p$ -adic period space** or the  **$p$ -adic symmetric space** associated to  $(G, \{\mu\}, b)$ . If  $b' = gb\sigma(g)^{-1}$ , then  $\xi \mapsto g^{-1}\xi$  induces an isomorphism from  $(\mathcal{F}_{\mu, b}^{\text{weak. adm}})_{\check{E}}^{\text{rig}}$  to  $(\mathcal{F}_{\mu, b'}^{\text{weak. adm}})_{\check{E}}^{\text{rig}}$ .

- Moreover, if  $b$  is Kottwitz-decent w.r.t.  $s \in \mathbb{Z}_+$  (28.6.1.17), then  $\mathcal{F}_{\mu,b}^{\text{weak.adm}}(\mathbb{C}_{K_0})$  is defined over  $E\mathbb{Q}_{p^s}$ , and if  $b' = gb\sigma(g)^{-1}$  for  $g \in G(\mathbb{Q}_p^s)$  (28.6.1.20), then  $\xi \mapsto g^{-1}\xi$  induces an isomorphism from  $(\mathcal{F}_b^{\text{weak.adm}})^{\text{rig}}_{E\mathbb{Q}_{p^s}}$  to  $(\mathcal{F}_{b'}^{\text{weak.adm}})^{\text{rig}}_{E\mathbb{Q}_{p^s}}$ .
- $J_b(\mathbb{Q}_p) \leq G(\check{K})$  (28.6.1.21) acts on  $(\mathcal{F}_\mu)^{\text{rig}}_{\check{E}}$ , and preserves  $(\mathcal{F}_{\mu,b}^{\text{weak.adm}})^{\text{rig}}_{\check{E}}$ .

For more properties of  $\mathcal{F}_{b,\mathcal{N}}^{\text{weak.adm}}$ , Cf.[Period domains over finite and p-adic fields, Dat-Orlik-Rapoport]P273.  $\square$

*Proof:* 2: By (28.6.1.18),  $b$  is Kottwitz-decent with some descent equation  $(b\sigma)^s = \nu_b^s(p)\sigma^s$ , in particular,  $b \in G(\mathbb{Q}_{p^s})$  (28.6.1.19). Let  $V \in \text{Rep}_{\mathbb{Q}_p}^{\text{fd}}(G)$  be a faithful representation, then

$$(V \otimes K_0, b(\text{id} \otimes \varphi_0)) \cong (V \otimes \mathbb{Q}_{p^s}, b(\text{id} \otimes \varphi_0)) \otimes K_0.$$

Let  $V \otimes \mathbb{Q}_{p^s} = \oplus_{\lambda \in \mathbb{Q}} V_\lambda$  be the isotypical decomposition of  $V$  (27.5.5.15), then the functor  $T'$ :

$$\mathcal{C}\text{Ring}/\mathbb{Q}_{p^s} \rightarrow \text{Set} : R \mapsto \{V' \subset V \otimes R \mid V' \text{ is a direct summand and } V' = \oplus_\lambda V'_\lambda \cap (V \otimes R)\}$$

is representable by a disjoint union of closed subsets of Grassmannians of  $V \otimes \mathbb{Q}_{p^s}$ . Then  $T'$  descends to a  $\mathbb{Q}_p$ -variety  $T$  s.t.

$$T(\mathbb{Q}_p) = \{b\varphi_0\text{-invariant subspaces of } V \otimes \mathbb{Q}_{p^s}\},$$

because  $b\varphi_0$  defines a descent datum  $\color{red}?$ .

Recall the closed immersion  $\mathcal{F}_\mu \hookrightarrow \text{Flag}_\mu(V)_E$ , and consider the closed subscheme

$$H \subset (\text{Flag}_\mu(V) \times T) \otimes \mathbb{Q}_{p^s}$$

consisting of pairs  $(\text{Fil}^\bullet, V')$  where  $\text{Fil}^\bullet$  is a filtration of  $V \otimes R$  and  $V' = \oplus_\lambda V'_\lambda$  is an  $R$ -direct summand of  $(V \otimes \mathbb{Q}_{p^s}) \otimes R = (\oplus_\lambda V_{p^s,\lambda}) \otimes R$  s.t.

$$\sum_i i \text{rank gr}^i(\text{Fil}^\bullet \cap V') > \sum_{\lambda \in \mathbb{Q}} \lambda \text{rank}(V'_\lambda).$$

$H$  is truly a closed subscheme because the LHS equals  $\sum_{i=-N}^\infty \text{rank}(\text{Fil}^i \cap V') - N \text{rank}(V')$  for  $N'$  sufficiently large, so  $H$  is defined by a Schubert-type condition  $\color{red}?$ .

By property of  $T$  and comparing the above formulas with (25.2.9.24), we see the set of weakly admissible filtrations in  $\text{Flag}_\mu(V)$  is given by

$$\text{Flag}_\mu(V)(\mathbb{C}_p)^{\text{weak.adm}} = \text{Flag}_\mu(V)(\mathbb{C}_p) \setminus \bigcup_{t \in T(\mathbb{Q}_p)} H_t.$$

And this is a rigid analytic subvariety over  $\mathbb{Q}_{p^s}$  by (27.2.2.17). Finally, the assertion follows by intersecting  $\text{Flag}_\mu(V)(\mathbb{C}_p)^{\text{weak.adm}}$  with  $\mathcal{F}_\mu \subset \text{Flag}_\mu(V) \otimes E$ .

1 follows from item2 because we can always find a  $\sigma$ -conjugate  $g_1 b \sigma(g_1)^{-1}$  of  $b$  in  $B(\text{GL}(V))$  that is Kottwitz-descent, by (28.6.1.17), and then we use the  $G$ -equivariant property in item2 to see that

$$\mathcal{F}_{\mu,b}^{\text{weak.adm}} = (\mathcal{F}_\mu)^{\text{rig}}_{\check{E}} \cap g_1 \mathcal{F}_{\mu,b,\text{GL}(V)}^{\text{weak.adm}}$$

is admissible open in  $(\mathcal{F}_\mu)^{\text{rig}}_{\check{E}}$ .

3 follows from item1, 2 and the definition (28.6.1.21).  $\square$

**Prop. (28.6.2.5) [Period Domains and Acceptable Points].** For  $b \in G(\check{F})$  and  $\mathcal{N} \in X_\bullet(G)_{\mathbb{Q}}/G(\overline{K})$ ,  $[b] \in A(G, \mathcal{N})$  (28.6.1.39) iff  $\check{F}(G, b, \mathcal{N})^{\text{weak. adm}} \neq \emptyset$ .  $\lrcorner$

*Proof:* Cf. [Period domains over finite and p-adic fields, Dat-Orlik-Rapoport] 9.5.10. ?  $\square$

**Thm. (28.6.2.6) [Period Domains and GIT Semistable Points, Rapoport-Zink [R-Z96]/Totaro [Tot96]].** There exists a unique ample line bundle on  $(\mathcal{F}_\mu)_{\check{E}}$  that is homogenous under the derived group  $(G^{\text{der}})_{\check{E}}$ .

For any finite extension  $K/\check{E}$ , we have

$$\mathcal{F}_{\mu, b}^{\text{weak. adm}}(K) = (\mathcal{F}_\mu)_{\check{E}}^{\text{s. st}}(\mathcal{L})(K).$$

where  $(\mathcal{F}_\mu)_{\check{E}}^{\text{s. st}}(\mathcal{L})$  is the open subset of points that are semistable under the action of  $T_{\check{E}} \cap (G^{\text{der}})_{\check{E}}$  on  $((\mathcal{F}_\mu)_{\check{E}}, \mathcal{L})$ .  $\lrcorner$

*Proof:* ?  $\square$

**Conj. (28.6.2.7) [Rapoport-Zink].** Situation as in (28.6.2.4), there exists a rigid étale bijective homomorphism

$$\left(\check{\mathcal{F}}_{b, \mathcal{N}}^{\text{weak. adm}}\right)^{\text{rig}} \rightarrow \left(\check{\mathcal{F}}_{b, \mathcal{N}}^{\text{weak. adm}}\right)^{\text{rig}}$$

and a tensor functor

$$\text{Rep}_{\mathbb{Q}_p}^{\text{fd}}(\text{Gal}_K) \rightarrow \text{LocSys}_{\mathbb{Q}_p}^{\text{ét}} \left( \left(\check{\mathcal{F}}_b^{\text{weak. adm}}\right)^{\text{rig}} \right)$$

s.t. at a weakly admissible point  $(\xi, b)$ , the fiber of the image of  $V \in \text{Rep}_{\mathbb{Q}_p}^{\text{fd}}(\text{Gal}_K)$  is the underlying  $\mathbb{Q}_p$ -vector space of the crystalline Galois representation corresponding to  $\mathcal{I}_{\mu, b}(V)$  (28.6.1.47) via (25.2.9.29).  $\lrcorner$

*Proof:*  $\square$

### Another viewpoint

References are [Toward a Theory of Local Shimura Varieties, Rapoport-Viehmann].

**Def. (28.6.2.8) [PD-Pairs].** A **PD-pairs** is a pair  $(\mathbf{G}, \mathcal{N})$  where  $\mathbf{G} = (G, \varphi, \nu)$  is a reductive augmented group scheme over  $\text{F-Isoc}(\kappa)$  (28.6.1.46) and  $\mathcal{N} \in X_\bullet(G)_{\mathbb{Q}}/G(\overline{K})$  is a conjugacy class of cocharacters.  $\lrcorner$

### Period Domains for $\text{GL}(n)$

**Def. (28.6.2.9) [Drinfeld Half Space].** For  $G = \text{GL}(n)_K, b = 1 \in B(G_{K_0})$  and  $\mathcal{N} = G(\overline{K}).(n - 1, \underbrace{-1, \dots, -1}_{n-1 \text{ many}})$ , we have

$$\Omega_K^n \triangleq \check{F}(G, 1, \mu)^{\text{weak. adm}} = \mathbb{P}_F^{n-1} \setminus \bigcup_{H \subset F^n \text{ hypersurface}} \mathbb{P}(H).$$

*Proof:* ?  $\square$

### 3 Rapoport-Zink Spaces

**Notation (28.6.3.1).**

- Let  $\kappa = \overline{\mathbb{F}_p}$ .

⌋

#### Rapoport-Zink Data

**Def. (28.6.3.2) [Rapoport-Zink Data of EL-Type].** A simple rational Rapoport-Zink datum of EL-type is a tuple  $\mathcal{D} = (K, B, V, \mathcal{N}, [b])$  where

- $K \in p\text{-NField}$ .
- $B \in \text{Az}_K$ .
- $V \in \text{Vect}^{\text{fin}}/B$ .
- $\mathcal{N} \in X_\bullet(G)_{\mathbb{Q}}/G(\overline{K})$  is minuscule<sup>?</sup>, where  $G = \text{GL}_B(V) \in \text{AlgGrp}/\mathbb{Q}_p$ .

⌋

**Prop. (28.6.3.4) [Associated Isocrystals].** Situation as in (28.6.3.2) or (28.6.3.3), for any  $b \in [b]$ , we can associate to any  $b \in [b]$  an isocrystal

$$(N(V), \Phi) = (V \otimes_{\mathbb{Q}_p} K_0, b(\text{id} \otimes \sigma), V_E^\bullet).$$

This isocrystal is equipped with an action of  $B$ , and in the PEL case an alternating bilinear form

$$\psi : N(V) \otimes N(V) \rightarrow \mathbf{1}(n).$$

where  $n = v_p(c(b))$ . In fact, we can find some unit  $u$  that  $c(b) = p^n u \sigma(u)^{-1}$ , then the pairing is defined as

$$\psi(v, v') = u^{-1}(v, v'),$$

any other choices of  $u$  multiplies  $\psi$  by an element in  $\mathbb{Z}_p^*$ .

We will fix in addition a conjugacy class of cocharacters  $\mu : \mathbb{G}_m \rightarrow G$  defined over a field  $E$ , and the associated homogenous algebraic variety  $\mathcal{F}$  defined over  $E$  of filtrations (28.6.2.2).  $\mathcal{F}$  is equipped with a  $B$ -action, as  $G \in \mathrm{GL}_B(V)$ .

Notice in the PEL case, these filtrations satisfy  $\mathcal{F}^i = (\mathcal{F}^{m-i+1})^\perp$ , where  $m = c \circ \mu \in \mathrm{Hom}(\mathbb{G}_m, \mathbb{G}_m) \cong \mathbb{Z}$ . This is due to the fact  $(kv, kw) = k^m(v, w)$  and the fact the pairing is non-degenerate.  $\perp$

**Prop. (28.6.3.5) [Local Reflex Fields].** For a conjugacy class of cocharacters  $\{\mu\}$  defined over  $E$  and  $\mu_0 \in \{\mu\}$ , its corresponding filtration  $\mathcal{F}_0^\bullet$ . The reflex field  $E$  in (28.6.3.3) can be described as the field of definition of the isomorphism class of  $\mathcal{F}_0^\bullet$  as a  $B$ -invariant filtration, or equivalently as the finite extension of  $\mathbb{Q}_p$  generated by the traces

$$\mathrm{tr}(d; \mathrm{gr}_{\mathbb{F}_0}^i(V \otimes_{\mathbb{Q}_p} \overline{\mathbb{Q}_p})), d \in B, i \in \mathbb{Z}.$$

And the filtration  $\mathcal{F}$  is described as the functor that for any  $E$ -algebra  $R$ ,  $\mathcal{F}(R)$  is the set of filtrations  $\mathcal{F}^\bullet$  of  $V \otimes_{\mathbb{Q}_p} R$  by  $R$ -modules that are direct summands that

$$\mathrm{tr}(d; \mathrm{gr}_{\mathcal{F}}^i(V \otimes_{\mathbb{Q}_p} R)) = \mathrm{tr}(d; \mathrm{gr}_{\mathbb{F}_0}^i(V \otimes_{\mathbb{Q}_p} \overline{\mathbb{Q}_p})).$$

and moreover in the PEL case satisfies  $\mathcal{F}^i = (\mathcal{F}^{m-i+1})^\perp$ .  $\perp$

*Proof:* 1: The field of definition  $E$  of the conjugacy class  $\{\mu\}$  is determined by Tannakian duality, so it suffices to check over which field these two filtrations are isomorphic as  $G$ -filtrations, but  $G$  is just the group fixing the  $B$ -module structure, so it suffices to show they are equivalent as  $B$ -modules, which is then determined by the traces, by (3.6.2.27).

2: It suffices to show  $\mathcal{F}$  is a homogenous space under  $G$ . We restrict to the PEL case, the EL case is simpler. After base change from  $\mathbb{Q}_p$  to  $\overline{\mathbb{Q}_p}$ , the data decomposes to the following types:

A:  $B = \mathrm{End}(W) \times \mathrm{End}(W^\vee)$  where  $W$  is a f.d.  $\overline{\mathbb{Q}_p}$ -vector space and  $(u, v)^* = (v^t, u^t)$ .

And  $V = W \otimes V' \oplus W^\vee \otimes V'^\vee$  where the pairing is natural and makes the sum orthogonal.

$$G = \{(1 \otimes g, c \cdot (1 \otimes g^{-t}) | g \in \mathrm{GL}(V'), c \in X(G)\}$$

C:  $B = \mathrm{End}(W)$  where  $W$  is a f.d.  $\overline{\mathbb{Q}_p}$ -vector space equipped with a symmetric bilinear form  $(-, -)_W$  and  $*$  is the transposition w.r.t it.

And  $V = W \otimes V'$  where  $V'$  is equipped with an alternating form  $(-, -)_{V'}$  that  $(-, -)_V = (-, -)_W \otimes (-, -)_{V'}$ .

$$G = \{cg | g \in \mathrm{Sp}(V'), c \in X(G)\}$$

BD: As in (C), except that  $(-, -)_W$  is skew-symmetric and  $(-, -)_{V'}$  is symmetric.

$$G = \{cg | g \in \mathrm{SO}(V'), c \in C(G)\}$$

Under this decomposition, the functor  $\mathcal{F}$  in the proposition is represented by products of partial flags of  $V$ :

- $(A) : \mathcal{F}^i = W \otimes (\mathcal{F}')^i \oplus W^\vee \otimes ((\mathcal{F}')^{m+1-i})^\perp$  and the correspondence  $\mathcal{F}^\bullet \mapsto (\mathcal{F}')^\bullet$  identifies  $\mathcal{F}$  with the partial flag variety of  $V'$  with fixed dimensions  $\dim((\mathcal{F}')^i)$ .
- $(B, CD) : \mathcal{F}^\bullet = W \otimes (\mathcal{F}')^\bullet$  and  $\mathcal{F}$  is identified with the partial flag variety of  $V'$  of fixed dimensions  $\dim((\mathcal{F}')^i)$  and  $(\mathcal{F}')^i = ((\mathcal{F}')^{m+1-i})^\perp$ .

The  $(A)$  case  $G$  clearly acts transitively on  $\mathcal{F}$ , and the  $(B, CD)$  case  $(\mathcal{F}')^i$  is isotropic for  $i \geq (m+1)/2$ , and it determines all other components, so  $G$  acts transitively, by Witt's theorem(19.5.2.3).

The reason is(3.6.4.27) and the fact representations of  $B$  is semisimple, then contemplating on the pairing condition.  $\square$

**Prop. (28.6.3.6) [Examples of PEL Type].** Let  $B = D$  be the quaternion algebra over  $\mathbb{Q}_p$  and  $*$  be the involution, i.e.

$$D = \mathbb{Q}_{p^2}[\Pi], \quad \Pi^2 = p, \quad \Pi a = \sigma(a)\Pi$$

and

$$a^* = \sigma(a), a \in \mathbb{Q}_{p^2}, \quad \Pi^* = \Pi.$$

Let  $(V, \iota)$  be a free  $D$ -module of rank  $n$  with a non-degenerate bilinear form satisfying the conditions in??. Then  $G$  is a non-trivial inner form of the group  $GSp_{2n}$  of symmetric similitudes:

Firstly  $\mathbb{Q}_{p^2} \otimes K_0 \cong K_0 \oplus K_0$ , then  $\mathbb{Q}_{p^2}$  acts on  $K_0 \oplus K_0$  by  $a(x, y) = ax, \sigma(a)y$ . As  $V$  is a  $\mathbb{Q}_{p^2}$ -vector space, there is a decomposition

$$V = V_0 \oplus V_1$$

where  $\mathbb{Q}_{p^2}$  acts on  $V_i$  by  $a(v) = v \cdot \sigma^i(a)$ , then  $G_{K_0}$  is just  $GSp(2n)_{K_0}$ , and  $G \neq GSp(2n)$  as the Galois action  $\sigma$  on  $\mathbb{Q}_{p^2} \otimes K_0$  and  $K_0 \cong K_0 \oplus K_0$  are different.

Take  $b \in G(K_0)$  the element with  $c(b) = p$  and the corresponding isocrystal  $(N, \Phi)$  is isotypical of slope  $1/2$ .  $N$  decomposes as  $N_0 \oplus N_1$ . Notice now  $\Pi$  and  $\Phi = b\sigma$  interchanges  $N_i$ , and  $\Pi\Phi = \Phi\Pi$ . Also  $N_i$  is isotropic: For  $v, w \in N_i, a \in \mathbb{Q}_{p^2}$ ,

$$a(v, w) = (av, w) = (\iota(\sigma^i(a))v, w) = (v, \iota(\sigma^{i+1}(a))w) = (v, \sigma(a)w) = \sigma(a)(v, w)$$

so  $(v, w) = 0$ .

We can define a new non-degenerate alternating form

$$\langle -, - \rangle : N_0 \times N_0 \rightarrow K_0 : \langle v, v' \rangle = (v, \Pi v')$$

and also a  $\sigma$ -linear endomorphism of  $N_0$ :  $\Phi_0 = \Pi^{-1} \circ \Phi|_{N_0}$ . From the condition,  $v_p(\det \Phi_0) = 0$ , and  $\Phi$  has all the slopes 0. Also  $\langle \Phi_0 v, \Phi_0 w \rangle = \sigma(\langle v, w \rangle)$ , as

$$\langle \Phi_0 v, \Phi_0 w \rangle = (\Pi^{-1} \Phi v, \Phi w) = (\Pi^{-1} b \sigma v, b \sigma w) = \sigma(v, \Pi w) = \sigma(\langle v, w \rangle).$$

so this alternating form is defined over  $\mathbb{Q}_p$ , denoted by  $(V_0, \langle -, - \rangle)$ , and  $\Phi_0$  corresponds to  $\sigma$ . Then  $J_b = GSp(V_0, \langle -, - \rangle)$ .

Next we consider

$$(0) = \mathcal{F}_0^2 \subset \mathcal{F}_0^1 \subset \mathcal{F}_0^0 = V \otimes \overline{\mathbb{Q}_p}$$

be a filtration where  $\mathcal{F}_0^1$  be a  $D$ -invariant Lagrangian subspace. This corresponds to a cocharacter  $\mu \rightarrow G$ , and  $\mathcal{F}$  is just the  $\mathbb{Q}_{p^2}$  variety of  $D$ -invariant Lagrangian subspaces of  $V_{\mathbb{Q}_{p^2}}$ . By (28.6.3.5), the Shimura field is  $\mathbb{Q}_p$ .

Let  $\mathcal{F} \subset \mathcal{F}(K)$  where  $K/K_0$  is a field extension, then

$$\mathcal{F} = \mathcal{F}_0 \oplus \mathcal{F}_1$$

where  $\mathcal{F}_i \in N_0 \otimes_{K_0} K$ , as  $\mathcal{F}$  is  $\Pi$ -invariant. Now  $\mathcal{F}_0$  is also a Lagrangian subspace of  $(V_0, \langle -, - \rangle)$ .  $\mathcal{F}(K)$  identifies the  $K$ -points of the Grassmannian of Lagrangian subspaces of  $(V_0, \langle -, - \rangle)$ .  $\lrcorner$

**Cor. (28.6.3.7).** Under the above identification, the subset  $\mathcal{F}^{\text{weak.adm}}(K)$  of the Grassmannian of Lagrangian spaces  $\mathcal{F}$  of  $(V_0 \otimes K, \langle -, - \rangle)$  is characterized by  $\mathcal{F}$  satisfying the the following conditions:

For all totally isotropic subspaces  $W_0 \subset V_0$ , we have  $\dim_K \mathcal{F} \cap (W_0 \otimes K) \leq 1/2 \dim W_0$ .  $\lrcorner$

*Proof:* It's clear  $\mu(N, \Phi, \mathcal{F}) = 0$ , so weakly-admissibility is equivalent to semi-stability. The uniqueness of the HN-filtration of  $\mathcal{F}$  implies its  $D$ -invariance, thus semi-stability is equivalent to the fact that for any subspace  $P \subset N$  stable under  $\Phi$  and  $D$ -action, we have

$$\dim_K(\mathcal{F} \cap (P \otimes_{K_0} K)) \leq v_p(\det(\Phi; P)).$$

Now  $\Phi$  is isotypical with slope  $1/2$ ,  $v_p(\det(\Phi; P)) = \frac{1}{2} \dim P$ , and the  $D$ -invariance of  $P$  is equivalent to  $P = P_0 \oplus P_1$  and the  $\Phi$ -invariance of  $P$  is equivalent to the  $\Phi_0$ -invariance of  $P_0$ , i.e.  $P_0$  is a  $\mathbb{Q}_p$ -rational subspace  $W_0 \subset V_0$ .

Finally we show it suffices to check for totally isotropic subspaces: Let  $W'_0$  be the radical of  $W_0$ , then there is a non-singular alternating form on  $W_0/W'_0$ , then the image of  $\mathcal{F}'_0 \cap (P \otimes_{K_0} K)$  in this quotient is a totally isotropic space, thus has dimension  $\leq \frac{1}{2} \dim(W_0/W'_0)$ . then it suffices to check the condition for  $W'_0$ .  $\square$

### Rapoport-Zink Spaces of PEL-Type

**Def. (28.6.3.8)** [Rapoport-Zink Spaces for  $\text{GL}(n)$  and  $\text{GSp}(n)$ , Rapoport-Zink[R-Z96]]. For  $\kappa = \overline{\mathbb{F}}_p$  and  $X_0 \in p\text{Div}/\kappa$ , the **Rapoport-Zink space**  $\text{RZ}(X_0)$  is a formal scheme over  $\text{Spf}(W(\kappa))$  that represents the functor that assigns to each  $S \in \text{NilSch}/W(\kappa)$  the set of isomorphism classes of pairs  $(X, \rho)$  where

- $X \in p\text{Div}/S$ .
- $\rho : X_0 \times_{\kappa} \overline{S} \rightarrow X \times_S \overline{S}$  is a quasi-isogeny (27.10.1.20), where  $\overline{S} = S \otimes_{W(\kappa)} \kappa$ .

And if  $\lambda_0 : X \rightarrow X^\vee$  is a principal polarization, then the **Rapoport-Zink space of symplectic-type**  $\text{RZ}(X_0, \lambda_0)$  is the formal scheme over  $\text{Spf}(W(\kappa))$  that represents the functor that assigns to each  $S \in \text{NilSch}/W(\kappa)$  the set of isomorphism classes of triples  $(X, \lambda, \rho)$  where

- $X \in p\text{Div}/S$ .
- $\lambda : X \rightarrow X^\vee$  is a principal polarization.
- $\rho : X_0 \times_{\kappa} \overline{S} \rightarrow X \times_S \overline{S}$  is a quasi-isogeny that respects polarizations up to a scalar, i.e. there exists  $c(\rho) \in \Gamma(\overline{S}, \mathbb{Q}_p^\times)$  s.t.

$$\lambda \circ \rho = c^{-1}(\rho) \lambda \circ \rho_0.$$

Then  $\text{RZ}(X_0)$  and  $\text{RZ}(X_0, \lambda_0)$  are formally smooth and locally formally of f.t. over  $\text{Spf}(W(\kappa))$ , with a closed embedding  $\text{RZ}(X_0, \lambda_0) \hookrightarrow \text{RZ}(X_0)$ .  $\lrcorner$

*Proof:* ? Cf. [R-Z96] Chap2.  $\square$

**Thm. (28.6.3.9) [Rapoport-Zink Spaces of EL and PEL-Types, Rapoport-Zink[R-Z96]].**

Let  $\mathcal{D} = (K, \mathcal{O}_B, \Lambda, \mathcal{N}, [b])$  be a simple integral Rapoport-Zink datum of EL-type or PEL-type  $\mathcal{D} = (K, \mathcal{O}_B, \Lambda, (-, -), *, \mathcal{N}, [b])$  be a simple rational Rapoport-Zink datum of PEL-type. Let  $E \in p\text{-NField}$  be the local reflex field of  $\mathcal{D}$  (28.6.3.5), and fix  $b \in [b]$ . Suppose there exists  $X_0 \in p\text{Div}/\kappa$  with associated isocrystal isomorphic to  $(N(V), \Phi)$  (28.6.3.4) (and in the PEL case, endow  $X_0$  with the  $\mathcal{O}_B$ -polarization defined by the alternating form on  $V \otimes_{\mathbb{Q}_p} K_0$ ).

Then there is a **Rapoport-Zink space of PEL-type**  $\text{RZ}(\mathcal{D})$  which is a formal scheme locally formally of f.t. over  $\text{Spf}(\mathcal{O}_{\check{E}})$  represents the functor that assigns to each  $S \in \text{NilSch}/\mathcal{O}_{\check{E}}$  the set of isomorphism classes of triples  $(X_{\mathcal{L}}, \rho_{\mathcal{L}})$  where

- $X_{\Lambda} \in p\text{Div}/S$  with an  $\mathcal{O}_B$ -action, for each  $\Lambda \in \mathcal{L}$ .
- $\rho_{\Lambda} : X_0 \times_{\kappa} \bar{S} \rightarrow X_{\Lambda} \times_S \bar{S}$  is an  $\mathcal{O}_B$ -quasi-isogeny for each  $\Lambda \in \mathcal{L}$ , where  $\bar{S} = S \otimes_{\mathcal{O}_{\check{E}}} \kappa$ .

satisfying:

- (Kottwitz Condition[?Kot92b]) For each  $\Lambda \in \mathcal{L}$  and  $d \in B$ ,  $\det_{\mathcal{O}_S}(d | \text{Lie}(X_{\Lambda})) = \det_K(d | V_E^0/V_E^1)$ , where  $V_E^{\bullet}$  is the filtration induced by  $\mu$ .
- If  $M(X_{\Lambda})$  is the Lie algebra of the universal extension of  $X_{\Lambda}$  ?, then locally on  $S$  there is an  $\mathcal{O}_B$ -isomorphism  $M(X_{\Lambda}) \cong \Lambda \otimes \mathcal{O}_S$ .
- If  $\Lambda \subset \Lambda' \in \mathcal{L}$ , the quasi-isogeny  $\rho_{\Lambda'} \circ \rho_{\Lambda}^{-1}$  lifts to an isogeny  $X_{\Lambda'} \rightarrow X_{\Lambda}$  of height  $\log_p(\#\Lambda'/\Lambda)$ .

And  $J_b(\mathbb{Q}_p)$  (28.6.1.21) acts on the left on  $\text{RZ}(\mathcal{D})$  by

$$g.(X_{\Lambda}, \rho_{\Lambda}) = (X_{\Lambda}, \rho_{\Lambda} \circ g^{-1}).$$

⌋

*Proof:* Cf. [R-Z96] Chap3. ?

### Rapoport-Zink Spaces of Hodge-Type

**Def. (28.6.3.13) [Unramified Local Shimura Data of Hodge-Type].** An unramified **local Shimura datum of Hodge-type** is an unramified local Shimura datum  $(G, [b], \mathcal{N})$  over  $\mathbb{Q}_p$  (28.6.5.1) s.t. there exists a **local Hodge embedding datum**  $(\Lambda, \iota, b, \mu)$  where

- $\Lambda \in \mathrm{Vect}^{\mathrm{fin}}/\mathbb{Z}_p$ .
- $\iota : G \rightarrow \mathrm{GL}(\Lambda)$  is a closed embedding of schemes over  $\mathbb{Z}_p$ .
- $\mu : (\mathbb{G}_m)_{\mathcal{O}_E} \rightarrow G_{\mathcal{O}_E}$  is a representative of  $\mathcal{N}$ , where  $E$  is the local reflex field of  $\mathcal{N}$ .

s.t.

- $\iota \circ \mu : (\mathbb{G}_m)_{\mathcal{O}_E} \rightarrow \mathrm{GL}(n)_{\mathcal{O}_E}$  is diagonalizable to the inverse of the minuscule cocharacter

$$a \mapsto \mathrm{diag}(\underbrace{a, \dots, a}_{r \text{ many}}, \underbrace{1, \dots, 1}_{n-r \text{ many}}).$$

for some  $r \in [n-1]_+$ .

- $b$  is a  $G(W(\kappa))$ - $\sigma$ -conjugacy class of elements  $b \in G(W(\kappa))\mu^\sigma G(W(\kappa))$  of  $[b]$ .

┘

**Prop. (28.6.3.14) [Associated  $p$ -Divisible Groups].** Given an unramified local Shimura-Hodge datum  $(G, b, \mu, C)$  (28.6.3.13), there exists a unique  $X_0 = X_0(G, b, \mu, \Lambda) \in p\mathrm{Div}/\kappa$  whose covariant Dieudonné module is  $\mathbf{D}(X_0)(W(\kappa)) = \Lambda \otimes_{\mathbb{Z}_p} W(\kappa)$  with Frobenius  $F = b \circ \sigma$ .

Moreover, the Hodge-filtration  $VD_\kappa \subset D_\kappa = \mathbf{D}(X_0)(\kappa)$  is induced by a conjugate of  $\mu_\kappa : (\mathbb{G}_m)_\kappa \rightarrow G_\kappa$ .

┘

*Proof:* Cf. [Howard-Pappas17]P13. ?

□

**Prop. (28.6.3.15) [Local Hodge-Tensors].** Situation as in (28.6.3.14), there is a finite list  $(s_\alpha)$  of tensors in the total tensor space  $C^\otimes$  s.t.  $G$  is the closed subscheme of  $\mathrm{GL}(\Lambda)$  fixing these  $s_\alpha$ .

Let  $X_0 = X_0(G, b, \mu, \Lambda) \in p\mathrm{Div}/\kappa$  as in (28.6.3.14), we get Frobenius-invariant tensors

$$t_{\alpha,0} = s_\alpha \otimes 1 \in D^\otimes \otimes_{\mathbb{Z}_p} W(\kappa) = (\mathbf{D}(X_0)(W(\kappa)))^\otimes$$

which uniquely determine morphisms of crystals  $t_{\alpha,0} : \mathbf{1} \rightarrow \mathbf{D}(X_0)^\otimes$  s.t.  $t_{\alpha,0}[\frac{1}{p}]$  are Frobenius-equivariant.

┘

*Proof:* Cf. [Kis10]Prop1.3.2.

□

**Def. (28.6.3.16) [Hodge-Type Rapoport-Zink Spaces].** Situation as in (28.6.3.15), consider the functor

$$\mathrm{RZ}_G^{\mathrm{Nil}} = \mathrm{RZ}_{G,b,\mu,\Lambda,(s_\alpha)}^{\mathrm{Nil}} : \mathrm{NNil}/W(\kappa) \rightarrow \mathrm{Set}$$

that assigns to each  $R \in \mathrm{NNil}/W(\kappa)$  the set of isomorphism classes of triples  $(X, \rho, (t_\alpha))$  where

- $(X, \rho) \in \mathrm{RZ}(X_0)(R)$ .
- $(t_\alpha)$  is a tuple of morphisms of crystals  $t_\alpha : \mathbf{1} \rightarrow \mathbf{D}(X)^\otimes$  over  $\mathrm{Spec}(R)$  s.t.  $t_\alpha[\frac{1}{p}]$  are Frobenius-equivariant.

s.t.

1. The pullback of  $t_\alpha$  to  $\mathrm{Spec}(R/(p))$  is identified with  $t_{\alpha,0}$  under the isomorphism of isocrystals

$$\mathbf{D}(\rho) : \mathbf{D}(X_{R/(p)})^\otimes[\frac{1}{p}] \cong \mathbf{D}(X_0 \times_\kappa R/(p))^\otimes[\frac{1}{p}]$$

2. The sheaf of  $G_{W(\kappa)}$ -sets

$$\mathcal{F} = \mathrm{Isom}_{t_\alpha, s_\alpha \otimes 1}(\mathbf{D}(X), D \otimes_{\mathbb{Z}_p} R)$$

over  $(R/W(\kappa))_{\mathrm{Crys}}$  (27.5.2.2) given by isomorphisms, is a fppf-crystal of  $G_{W(\kappa)}$ -torsors.

3. There exists an étale cover  $U \rightarrow \mathrm{Spec}(R)$  and a section  $f \in \mathcal{F}(U)$  s.t. the Hodge-filtration

$$\mathrm{Fil}^1(X_U) \subset \mathbf{D}(X_U) \xrightarrow{f} D \otimes_{\mathbb{Z}_p} \mathcal{O}_U$$

is induced by a cocharacter that is  $G(W(\kappa))$ -conjugate to  $\mu$ .

┘

**Remark (28.6.3.17).**

- If  $R \in \mathrm{Nil}/W(\kappa)$  s.t.  $R/(p)$  is of f.t. over  $\kappa$ , it suffices to check condition 1 over one closed point of each connected component of  $\mathrm{Spec}(R)$ , by the proof of [Howard-Pappas]Lemma3.2.8?.
- Condition 2+3 implies that the sheaf of isomorphisms between  $\mathbf{D}(X)$  and  $D \otimes_{\mathbb{Z}_p} R$  identifying  $t_\alpha$  with  $s_\alpha \otimes 1$  and identifying the Hodge-filtration is a  $P_\mu \times_{W(\kappa)} R$ -torsor?.

*Proof:* ? □

### Special Fibers

**Def. (28.6.3.23)** [Classical Affine Deligne-Lusztig Sets]. Given an unramified local Shimura datum  $(G, b, \mu, \Lambda)$  (28.6.3.13), the (classical) **Affine Deligne-Lusztig set** is defined to be

$$X_{G,b,\mu}(\kappa) = \{g \in G(K_0) | g^{-1}b\sigma(g) \in G(W(\kappa))\mu(p)G(W(\kappa))\}/G(W(\kappa)).$$

┘

**Def. (28.6.3.24)** [Refined Affine Deligne-Lusztig Sets]. Situation as in (28.6.3.23), if  $\kappa'/\kappa$  is a f.g. field extension, consider  $W' = C(\kappa')$  the Cohen ring with a lift of Frobenius  $\sigma$  and  $K' = W'[\frac{1}{p}]$ . Consider the set

$$X' = \{g \in G(K') | g^{-1}b\sigma(g)\mu(p)^{-1} \in G(W')\}$$

and

$$Q_\mu(W') = G(W') \cap \mu^{\sigma^{-1}}(p)^{-1}G(W')\mu^{\sigma^{-1}}(p) \subset G(K').$$

Then the right translation of  $Q_\mu(W')$  on  $G(K')$  preserves the set  $X'$ . And we can define the **refined affine Deligne-Lusztig set** as the quotient

$$X_{G,b,\mu,\sigma}(\kappa') = \{g \in G(K') | g^{-1}b\sigma(g)\mu(p)^{-1} \in G(W')\}/Q_\mu(W').$$

and also the (naive) **refined affine Deligne-Lusztig set**

$$X_{G,b,\mu,\sigma}^{\mathrm{naive}}(\kappa') = \{g \in G(K') | g^{-1}b\sigma(g) \in G(W')\mu(p)G(W')\}/G(W') \subset G(K')/G(W').$$

┘

**Prop. (28.6.3.25)**. Situation as in (28.6.3.24),

- Sending  $gQ_\mu(W')$  to  $gG(W')$  defines an injection

$$\phi(\kappa') : X_{G,b,\mu,\sigma}(\kappa') \hookrightarrow X_{G,b,\mu,\sigma}^{\mathrm{naive}}(\kappa')$$

which is a bijection if  $\kappa'$  is perfect.

- If  $b' = h^{-1}b\sigma(h)$  for some  $h \in G(K_0)$ , then  $g \mapsto hg$  defines a bijection

$$X_{G,b',\mu,\sigma}(\kappa') \cong X_{G,b,\mu,\sigma}(\kappa').$$

- If  $\kappa'$  is perfect, then  $g \mapsto \sigma^{-1}(b^{-1}g)$  defines a bijection

$$X_{G,b,\mu^\sigma}(\kappa') \cong X_{G,b,\mu}(\kappa').$$

- If  $\iota : G \rightarrow \mathrm{GL}(n)_{\mathbb{Z}_p} \in \mathcal{A}\mathrm{lgGrp}/\mathbb{Z}_p$  is a closed embedding, then  $\iota$  defines an injection

$$\iota : X_{G,b,\mu,\sigma}(\kappa') \hookrightarrow X_{\mathrm{GL}(n),\iota(b),\iota\circ\mu}(\kappa').$$

┘

*Proof:* Cf.[Howard-Pappas]P18. □

**Prop. (28.6.3.26) [F.G. Fields as Limits of Smooth Algebras].** If  $\kappa'/\kappa$  is a f.g. field extension with Cohen ring  $C(\kappa')$  and a lift of Frobenius  $\sigma$ , then we can write  $\kappa' = \varinjlim R$  as a filtered colimits of smooth  $\kappa$ -algebras each having a finite  $p$ -basis? and for each  $R$  there exists a  $W(\kappa)$ -flat formally smooth  $p$ -adically complete and separated lift  $\tilde{R}$  of  $R$  with an injection  $\tilde{R} \subset C(\kappa')$  lifting  $R \rightarrow \kappa'$  s.t.  $\sigma(\tilde{R}) \subset \tilde{R}$ . ┘

*Proof:* Cf.[Howard-Pappas]P20?. □

**Thm. (28.6.3.27) [Field-Valued Points of  $\mathrm{RZ}_G^{\mathrm{Nil}}$ ].** Situation as in (28.6.3.15), if  $\kappa'/\kappa$  is a f.g. field extension with Cohen ring  $W(\kappa')$  and a lift of Frobenius  $\sigma$ . Suppose that the Dieudonné module structure on  $D_{W(\kappa)}$  determined by  $\iota(b) \in \mathrm{GL}(C_{W(\kappa)})$  has no zero slopes (i.e.  $X_0$  is formal, Cf.[Howard-Pappas]P20), then there are natural bijections

$$\pi : \varinjlim_R \mathrm{RZ}_G^{\mathrm{Nil}}(R) \cong \mathrm{RZ}_G^{\mathrm{Nil}}(\kappa') \cong X_{G,b,\mu^\sigma,\sigma}(\kappa') \quad (28.6.3.24).$$

In particular, we have a bijection

$$\pi : \mathrm{RZ}_G(\kappa') \cong X_{G,b,\mu^\sigma,\sigma}(\kappa') \quad (28.6.3.22).$$

┘

*Proof:* Cf.[Howard-Pappas]Thm2.4.10.?. □

For the last assertion, notice the reduced scheme of  $\mathrm{RZ}_G$  is locally of f.t. (28.6.3.22)?, so

$$\mathrm{RZ}_G(\kappa') = \varinjlim_R \mathrm{RZ}_G(R) = \varinjlim_R \mathrm{RZ}_G^{\mathrm{Nil}}(R) = X_{G,b,\mu^\sigma,\sigma}(\kappa').$$

□

**Thm. (28.6.3.28) [Unramified Hodge-Type case, Zhu[Zhu17]].** Fix  $(\mathbb{X}_0, \varepsilon)$  as above?, there is a canonical isomorphism  $X_\mu(b) \cong \overline{\mathcal{M}}_\mu(b)^{\mathrm{perf}}$ . In particular,  $\dim \overline{\mathcal{M}}_\mu(b)_{\mathrm{red}} = \dim X_\mu(b) = \langle \rho, \mu - \nu_b \rangle - \frac{1}{2} \mathrm{def}_G(b)$  (28.7.3.4). ┘

*Proof:* Cf.[Zhu17]P463.?. □

### Unitary Rapoport-Zink Spaces

**Notation (28.6.3.29).**

- Let  $p \in \text{Prime}_{\geq 3}$ .
- Let  $(F_0, \kappa, \varpi) \in p\text{-LField}$ ,
- Let  $F/F_0$  be an unramified quadratic extension with non-trivial automorphism  $\sigma$ ,
- Let  $d = [F_0 : \mathbb{Q}_p]$ .
- Let  $\check{F}$  be the maximal unramified extension of  $F$  with residue field  $\mathbb{F}$ ,
- 

┘

**Def. (28.6.3.30) [Unitary Rapoport-Zink Spaces].** Let  $\mathcal{N}_{n,F/F_0}$  be the formal scheme over  $\check{F}$  which classifies quadruples  $(X, \lambda, \iota, \rho)$  over a scheme  $S$  which is  $p$ -nilpotent, where

- $X$  is a  $p$ -divisible group over  $S$  of relative dimension  $n$  and absolute height  $2nd$ .
- $\lambda : X \rightarrow X^\vee$  is a principle  $\mathcal{O}_{F_0}$ -polarization.
- $\iota : \mathcal{O}_F \subset \text{End}_S(X)$  s.t. the induced action of  $\mathcal{O}_{F_0}$  is via the structure morphism  $\mathcal{O}_{F_0} \subset \mathcal{O}_S$ .
- $\rho : X \times_S \bar{S} \rightarrow \mathbb{X}_n \times \bar{S}$  is a quasi-isogeny of height 0, where  $(\mathbb{X}_n, \lambda_0, \iota_0)$  is a supersingular basic **framing object** over  $\mathbb{F}_p$  **?**.

which satisfies:

- The Rosati involution  $\text{Ros}_\lambda$  on  $\mathcal{O}_F$  equals the non-trivial Galois automorphism in  $\text{Gal}(F/F_0)$ .
- The **Kottwitz condition of signature**  $(n-1, 1)$ : For any  $a \in \mathcal{O}_F$ ,

$$\text{char}(\iota(a) | \text{Lie}(X); T) = (T - a)^{n-1}(T - \bar{a}).$$

┘

**Prop. (28.6.3.31).**  $\mathcal{N}_n$  is formally locally of finite type and formally smooth over  $\text{Spf } \mathcal{O}_{\check{F}}$  of relative dimension  $n-1$ .

┘

*Proof:* **?**

□

**Prop. (28.6.3.32).**  $\mathcal{N}_1 \cong \text{Spf } \mathcal{O}_{\check{F}}$ .

┘

*Proof:* **?**

□

**Prop. (28.6.3.33) [Automorphism Group of the Framing].** There is a unique triple  $(\mathbb{E}, \iota_E, \lambda_E)$  over  $\mathbb{F}$  with signature  $(1, 0)$ .

Set

$$\mathbb{V}_n = \text{Hom}_{\mathcal{O}_F}^0(\mathbb{E}, \mathbb{X}_n),$$

which belongs to  $\text{Herm}_n(F/F_0)$ , with the Hermitian form given by

$$(x, y) = \lambda_E^{-1} \circ y^\vee \circ \lambda_{\mathbb{X}_n} \circ x \in \text{End}_{\mathcal{O}_F}^0(\mathbb{E}) \cong F.$$

Then it is the unique  $n$ -dimensional Hermitian space without a self-dual  $\mathcal{O}_F$ -lattice.

And denote

$$\text{Aut}^0(\mathbb{X}_n, \iota_{\mathbb{X}_n}, \lambda_{\mathbb{X}_n}) = \{g \in \text{End}_{\mathcal{O}_F}^0(\mathbb{X}_n, \lambda_{\mathbb{X}_n}), g^\vee \circ \lambda_{\mathbb{X}_n} \circ g = \lambda_{\mathbb{X}_n}\} \cong U(\mathbb{V}_n)(F_0).$$

Thus  $U(\mathbb{V}_n)(F_0)$  acts on  $\mathcal{N}_n$  by changing the framing.

┘

## 4 Period Morphisms

**Def. (28.6.4.1) [Period Morphisms].** The map

$$\mathrm{pr} = \mathrm{pr}_1 \times \mathrm{pr}_2 : \check{M}^{\mathrm{rig}} \rightarrow \check{\mathcal{F}}^{\mathrm{rig}} \times \Delta_{\mathcal{D}} \quad (28.6.3.10)$$

is called the **period morphism** associated to moduli problem  $\check{M}$ . ┘

## 5 Local Shimura Varieties

**Def. (28.6.5.1) [Local Shimura Data].** A **local Shimura datum** over  $K$  is a triple  $(G, [b], \mathcal{N})$  where  $G \in \mathrm{RedGrp}/K$ ,  $[b] \in B(G)$  (28.6.1.5),  $\mathcal{N} \in X_{\bullet}(G)/G(\bar{K})$  with reflex field  $E \in p\text{-NField}$  (10.3.2.5) s.t.

- $\mathcal{N}$  is minuscule ?.
  - $[b] \in B(G, \mathcal{N})$  (28.6.1.39).
- ┘

**Conj. (28.6.5.2) [Local Shimura Varieties, Rapoport [Rap95, ?R-V14]].** There should be a way to associate to a local Shimura datum  $(G, [b], \mathcal{N})$  over  $K$  (28.6.5.1) a tower of rigid analytic spaces over  $\mathrm{Sp}(\check{E})$ :

$$\mathfrak{M}(G, [b], \mathcal{N}) = \left\{ \mathfrak{M}^{\mathcal{K}} \right\}_{\mathcal{K}} \in \mathrm{RigSpa} / \check{E},$$

where  $\mathcal{K}$  ranges over all compact open subsets of  $G(K)$ , s.t.

- Each  $\mathfrak{M}^{\mathcal{K}}$  is equipped with an action of  $J_{[b]}(K)$  (28.6.1.21) .
- $G(K)$  acts on the tower as Hecke correspondences.
- The tower has a Weil-descent datum from  $\check{E}$  to  $E$ .
- There exists an étale and partially proper  $J_{[b]}(K) \times G(K)$ -equivariant **period morphism** of towers of rigid analytic spaces

$$(\check{\pi}^{\mathcal{K}}, \kappa^{\mathcal{K}}) : \mathfrak{M}^{\mathcal{K}} \rightarrow \mathcal{F}(G, [b], \mathcal{N})^{\mathrm{weak.adm}} \times \Delta_G \quad (28.6.2.4)(28.6.3.10),$$

compatible with Weil-descent data, where  $J_b(K)$  acts on  $\mathfrak{M}^{\mathcal{K}} \times \Delta_G$  diagonally and on  $\mathcal{F}(G, [b], \mathcal{N})^{\mathrm{weak.adm}}$  (28.6.2.4) and  $G(K)$  acts on  $\mathfrak{M}^{\mathcal{K}}$  and  $\Delta_G$ . And the image of  $(\check{\pi}^{\mathcal{K}}, \kappa^{\mathcal{K}})$  is of the form  $\mathcal{F}(G, [b], \mathcal{N})^{\mathrm{weak.adm}} \times \Delta'$  where  $\Delta' \subset \Delta_G$  is a union of cosets of a subgroup of finite index in  $\Delta_G$ .

- The fiber of  $\check{\pi}^{\mathcal{K}}$  in  $\mathfrak{M}^{\mathcal{K}}$  is isomorphic to  $G(K)/\mathcal{K}$ , compatible with  $\mathcal{K}$ .
  - There should be an open adic subspace  $\mathcal{F}(G, [b], \mathcal{N})^a \subset \mathcal{F}(G, [b], \mathcal{N})^{\mathrm{weak.adm}}$  stable under the action of  $J_{[b]}(K)$  and a  $J_{[b]}(K)$ -equivariant  $G(K)$ -torsor on it s.t. the tower  $\mathfrak{M}^{\mathcal{K}}$  arises from a system of level- $\mathcal{K}$ -structures.
- ┘

*Proof:*

□

## 6 Cohomology of Local Shimura Varieties

References are [?R-V14].

**Notation (28.6.6.1).**

- Let  $\ell \in \text{Prime} \setminus \{p\}$ .

┘

**Def. (28.6.6.2) [étale Cohomology of Local Shimura Varieties].** Let  $(G, [b], \mathcal{N})$  be a local Shimura datum (28.6.5.1) giving rise to a tower of local Shimura variety  $\mathfrak{M}(G, b, \mathcal{N})$  (28.6.5.2). For each compact open subgroup  $\mathcal{K} \leq G(K)$ , the cohomology groups

$$H_{\text{ét},c}^n \left( \left( \mathfrak{M}^{\mathcal{K}} \right)_{\mathbb{C}_E}, \overline{\mathbb{Q}_\ell} \right), \text{ where } n \in \mathbb{N}$$

which vanishes for  $n > 2 \dim \mathfrak{M}^{\mathcal{K}}$ .

┘

*Proof:* ? Cf. [Fargues, Cohomologie des espaces de modules de groupes p-divisibles et correspondances de Langlands locales].  $\square$

**Remark (28.6.6.3).** The action of  $W_{\mathcal{K}}$  may not be continuous, Cf. [Fargues, Cohomologie des espaces de modules de groupes p-divisibles et correspondances de Langlands locales] 4.4.4.  $\square$

**Prop. (28.6.6.4) [Étale Cohomology of Local Shimura-Varieties].** Situation as in (28.6.6.2), the cohomologies  $H_{\text{ét},c}^n \left( \left( \mathfrak{M}^{\mathcal{K}} \right)_{\mathbb{C}_E}, \overline{bbQ_\ell} \right)$  naturally have actions of  $J_{[b]}(K)$  by functoriality, and actions of  $I_E$ , which extends to an action of  $W_E$  using the Weil-descent datum (28.6.5.2). And

- The actions of  $J_{[b]}(K)$  is smooth, and  $H_{\text{ét},c}^n \left( \left( \mathfrak{M}^{\mathcal{K}} \right)_{\mathbb{C}_E}, \overline{\mathbb{Q}_\ell} \right)$  is a f.g.  $J_{[b]}(K)$ -module.
- The action of  $I_E$  is smooth and continuous.
- For any  $\rho \in \text{Irr}^{\text{adm}}(J_{[b]}(K))$ ,  $\mathcal{K} \leq G(K)$  and  $i, j \in \mathbb{Z}$ ,

$$H^{i,j}(\mathfrak{M}^{\mathcal{K}})[\rho] \triangleq \text{Ext}_{J_{[b]}(K)}^j \left( H_{\text{ét},c}^n \left( \left( \mathfrak{M}^{\mathcal{K}} \right)_{\mathbb{C}_E}, \overline{\mathbb{Q}_\ell} \right), \rho \right)$$

is a finite rank  $\mathbb{Q}_\ell$ -space, and vanishes for  $j$  bigger than the semi-simple rank of  $J_{[b]}$ .

- For any  $\rho \in \text{Irr}^{\text{adm}}(J_{[b]}(K))$  and  $i, j \in \mathbb{Z}$ ,

$$H^{i,j}(G, [b], \mathcal{N})[\rho] \triangleq \varinjlim_{\mathcal{K} \leq G(K)} H^{i,j}(\mathfrak{M}^{\mathcal{K}})[\rho]$$

is an admissible  $G(K)$ -module and a continuous  $W_E$ -module.

┘

*Proof:* ? Cf. [R-V14].  $\square$

**Def. (28.6.6.5).** Situation as in (28.6.6.4), denote the alternating sum

$$[H^\bullet(G, [b], \mathcal{N})[\rho]] \triangleq \sum_{i,j \in \mathbb{N}} (-1)^{i+j} H^{i,j}(G, [b], \mathcal{N})[\rho] (-\dim \mathfrak{M})$$

as a virtual  $G(K) \times W_E$ -module (in the Grothendieck group of smooth finite length representations).

┘

### Kottwitz Conjecture

**Notation (28.6.6.6).**

- Let  $b$  be basic.

┘

**Conj. (28.6.6.7) [conjectured by Kottwitz [Rap95, ?R-V14]].** Suppose

- $G^* \in \text{RedGrp}/\mathbb{Q}_p$ ,  $b^* \in B(G^*)_b$  and  $G = J_{b^*} \in \text{RedGrp}/\mathbb{Q}_p$ .
- $(G, [b], \mathcal{N})$  be a local Shimura-datum (28.6.5.1) giving rise to a tower of local Shimura variety  $\mathfrak{M}(G, b, \mathcal{N})$  (28.6.5.2).
- $\phi \in \Phi^{\text{disc}}(G(K))$  (29.3.1.4).

Recall the f.d.  $\overline{\mathbb{Q}_\ell}$ -dimensional representation  $r_{\mathcal{N}}$  of  $\widehat{G} \times W_E$  (? Cf. [Kottwitz, Shimura varieties and twisted orbital integrals] 2.1.2), we get a representation  $r_{\mathcal{N}} \circ \phi_E$  of  $C_\phi \times W_E$  via

$$r_{\mathcal{N}} \circ \phi_E(s, w) = r_{\mathcal{N}}(s\varphi(w)).$$

Then for each  $\pi\rho \in \Pi_\phi(J)$  (29.3.4.7), we have

$$[H^\bullet(G, [b], \mathcal{N})[\rho]] = \sum_{\pi \in \Pi_\phi(G)} \pi \boxtimes \text{Hom}_{C_\phi^\sharp}(\iota_{\mathfrak{m}}(\pi)^\vee \otimes \iota_{\mathfrak{m}}(\rho), r_{\mathcal{N}} \circ \phi_E) \left(-\frac{\dim \mathfrak{M}(G, b, \mathcal{N})}{2}\right) \quad (28.6.6.5)$$

┘

*Proof:* ? Cf. [?R-V14] for known cases.

□

**Thm& Conj. Cor. (28.6.6.8) [Harris-Taylor [H-T01] Thm 12.1.3].** Situation as in (28.6.6.7), if  $G = G^* = \text{GL}(n)$  and  $\mathcal{N} = G(K).(1, 0, \dots, 0)$  and  $[b] \in B(G, \mathcal{N})$  is the unique basic element (28.6.1.40), then the Kottwitz's conjecture (28.6.6.7) holds.

┘

*Proof:* ?

□

**Thm& Conj. Cor. (28.6.6.9) [Shin].** Situation as in (28.6.6.7), if  $G = G^* = \text{Res}_{K/\mathbb{Q}_p} \text{GL}(n) \in \text{RedGrp}/\mathbb{Q}_p$  where  $F/\mathbb{Q}_p$  is an unramified extension, then the Kottwitz's conjecture holds for any local Shimura-datum  $(G, [b], \mathcal{N})$ .

┘

*Proof:* ? [Shin, cohomology of Rapoport-Zink spaces of EL-type] Cor 1.3. The proof uses point-counting argument on Igusa varieties.

### 1 Families of Torsion $W(k)$ -Modules

**Def. (28.7.1.1) [Types of Torsion  $W(k)$ -Modules].**

- For any non-increasing sequence of non-negative integers  $\lambda = (\lambda_1, \dots, \lambda_n)$ , a f.g.  $p$ -power torsion  $W(k)$ -module  $Q$  is said to have type  $\lambda$  if we have  $Q \cong \oplus_j W(k)/(p^{\lambda_j})$ .
- For  $X \in \text{PerfSch}/k$ , a f.g.  $p$ -power torsion  $W(\mathcal{O}_X)$ -module  $Q$  is said to have type  $\lambda$  (resp. type  $\preceq \lambda$ ) if  $\lambda(Q \otimes_{W(\mathcal{O}_X)} W(\kappa(x))) = \lambda$  (resp.  $\lambda(Q \otimes_{W(\mathcal{O}_X)} W(\kappa(x))) \preceq \lambda$ ) for each  $x \in \text{Spec}(R)$ .

┘

**Prop. (28.7.1.2).** If  $R \in \text{Perf}$  and  $Q$  is a f.g.  $p$ -power torsion  $W(R)$ -module of type  $\lambda$  (28.7.1.1), then  $p^i Q / p^{i+1} Q \in \text{Mod}_R^{\text{f.proj}}$ .

┘

*Proof:* Cf. [B-S17]P369?.

□

**Def. (28.7.1.3) [Isogenies of Finite Projective  $W(R)$ -Modules].** For  $R \in \text{Perf}/k$ , an **isogeny of finite projective  $W(R)$ -modules** is a map  $f : N \rightarrow M \in \text{Mod}_{W(R)}^{\text{f.proj}}$  s.t. it admits an inverse up to multiplication by a power of  $p$ .

┘

**Prop. (28.7.1.4) [Projective Dimension 1].** For  $R \in \text{Perf}/k$ , a f.g.  $p$ -power torsion  $W(R)$ -module  $Q$  is of projective dimension 1 (projective resolutions) iff it is isomorphic to the cokernel of an isogeny of finite projective  $W(R)$ -modules.

┘

*Proof:* If  $Q$  is a cokernel of an isogeny of f.p.  $W(R)$ -modules, then it has projectively dimension  $\leq 1$ . And clearly it cannot have projective dimension 0. Conversely if  $Q$  is of projective dimension 1, pick a surjection  $W(R)^{\oplus n} \rightarrow Q$ , then the kernel  $N$  is projective over  $W(R)$ , and is finite projective by looking at characteristic 0 points of  $\text{Spec}(W(R))$ , because these points are dense.

□

**Prop. (28.7.1.5).** For  $R \in \text{Perf}/k$ ,  $Q \in \text{Mod}_R^{\text{ft}}$  is projective iff it is of projective dimension 1 as  $W(R)$ -modules.

┘

*Proof:* Firstly  $R = W(R)/(p)$  is of projective dimension 1, so any free  $R$ -module is of projective dimension 1, thus also any projective module is of projective dimension 1.

Conversely, if  $Q$  is of projective dimension 1, then? Cf. [B-S17]P372.

□

### Demazure-Schemes

**Def. (28.7.1.6) [Demazure-Schemes].** Let  $X \in \text{PerfSch}/\mathbb{F}_p$  and  $\mathcal{Q} \in \mathcal{QCoh}(W(\mathcal{O}_X))$  be f.g.  $p$ -power torsion and of projective dimension 1, then for each non-increasing sequence of non-negative integers  $\lambda = (\lambda_1, \dots, \lambda_n)$ , there exist a **Demazure-scheme**

$$\text{Dem}_\lambda(\mathcal{Q}) \in \text{PerfSch}^{\text{pfp, proper}}/X$$

parametrizing decreasing filtrations  $\text{Fil}^\bullet \mathcal{Q}$  of  $\mathcal{Q}$  s.t. each  $\text{gr}^i \mathcal{Q} \in \text{Mod}_{\mathcal{O}_X}^{\text{f.proj}}$  is of rank  $n_\lambda(i) \triangleq \max\{j \in \mathbb{Z}_+ \mid i < \lambda_j\}$ . ┘

*Proof:* Cf. [B-S17]P373? □

**Prop. (28.7.1.7) [Properties of Demazure-Schemes, Katz[Kat79]/Bhatt-Scholze[B-S17]].** Situation as in (28.7.1.6),

1. The image of the morphism  $\text{Dem}_\lambda(\mathcal{Q}) \rightarrow X$  is the locus

$$X_{\preceq \lambda} \triangleq \left\{ x \in X \mid \lambda \left( \mathcal{Q} \otimes_{W(\mathcal{O}_X)} W(\kappa(x)) \right) \preceq \lambda \right\}.$$

2. If  $\mathcal{Q}$  is of type  $\lambda$  (28.7.1.1), then  $\text{Dem}_\lambda(\mathcal{Q}) \cong X$ .
3. If  $\text{Dem}_\lambda(\mathcal{Q}) \times_X \bar{x} \neq \emptyset$  for a geometric point  $\bar{x}$  of  $X$ , then

$$\text{R}\Gamma \left( \text{Dem}_\lambda(\mathcal{Q}) \times_X \bar{x}, \mathcal{O}_{\text{Dem}_\lambda(\mathcal{Q}) \times_X \bar{x}} \right) = \kappa(\bar{x}).$$

4.  $X_{\preceq \lambda}$  is closed in  $|X|$ . ┘

*Proof:* Cf. [B-S17]P374? □

- 4: This follows from item1 and the definition (27.1.2.6). □

## 2 Witt-vector Affine Grassmannian

**Notation (28.7.2.1).**

- Fix  $(K, \mathcal{O}_K, \mathfrak{m}_K, \kappa) \in p\text{-Field}$ . ┘

**Def. (28.7.2.2) [Witt-Vector Affine Grassmannians].** For any non-increasing sequence of non-negative integers  $\lambda = (\lambda_1, \dots, \lambda_n)$ , let  $\text{Gr}_{\preceq \lambda}$  be the functor

$$\text{PerfSch}/\kappa \rightarrow \text{Set} : X \mapsto \left\{ \begin{array}{l} \text{finite projective } W(\mathcal{O}_X)\text{-submodules } \mathcal{E} \subset W(\mathcal{O}_X)^n \text{ s.t.} \\ \beta: \mathcal{E} \rightarrow W(\mathcal{O}_X)^n \text{ is an isogeny (28.7.1.3) and } \mathcal{Q} \triangleq \text{Coker}(\beta) \text{ is finite of type } \leq \lambda \text{ (28.7.1.1)} \end{array} \right\}.$$

Then  $\text{Gr}_{\preceq \lambda}$  is a v-sheaf by [B-S17]4.1. and 4.4.? ┘

**Def. (28.7.2.3) [Demazure-Resolutions].** The **Demazure-resolution** of  $\text{Gr}_{\preceq \lambda}$  is the map

$$\psi_{\text{Gr}_{\preceq \lambda}} : \widetilde{\text{Gr}}_{\preceq \lambda} \triangleq \text{Dem}_\lambda(\mathcal{Q}) \rightarrow \text{Gr}_{\preceq \lambda} \in \text{Sh}(\text{PerfSch}_v/\kappa) \text{ (28.7.2.2) (28.7.1.6),}$$

where  $\mathcal{Q} \in \mathcal{QCoh}(W(\mathcal{O}_{\text{Gr}_{\preceq \lambda}}))$  is the universal cokernel of  $W(\mathcal{O}_{\text{Gr}_{\preceq \lambda}})$  (28.7.2.2), which is  $p$ -power torsion and of projective dimension 1? ┘

$\psi_{\text{Gr}_{\preceq \lambda}}$  is representable by (28.7.1.6), and is surjective, perfectly f.p. and perfectly proper, and is an isomorphism on  $\text{Gr}_\lambda \subset \text{Gr}_{\preceq \lambda}$ , by (28.7.1.7), and  $\text{R}\psi_* \mathcal{O}_{\text{Dem}_\lambda(\mathcal{Q})} = \mathcal{O}_X$  (when base changed to each  $S \in \text{PerfSch}/\text{Gr}_{\preceq \lambda}$ ), by (27.1.2.4). ┘

**Prop. (28.7.2.4)** [ $\widetilde{\text{Gr}}_{\preccurlyeq \lambda}$  is Representable, Zhu[Zhu17]/Bhatt-Scholze[B-S17]].  $\widetilde{\text{Gr}}_{\preccurlyeq \lambda}$  (28.7.2.3) is representable by the perfection of a projective smooth  $\mathbb{F}_p$ -scheme,  $\lrcorner$

*Proof:* By definition (28.7.1.6) and (28.7.1.5),  $\widetilde{\text{Gr}}_{\preccurlyeq \lambda}$  classifies the sequence of  $\lambda_1$ -tuples  $\mathcal{E}_1 \subset \mathcal{E}_2 \subset \dots \subset \mathcal{E}_0 = W(\mathcal{O}_X)^n \in \text{Mod}_{W(\mathcal{O}_X)}^{\text{f.proj}}$  s.t. each  $\mathcal{Q}_i = \mathcal{E}_i/\mathcal{E}_{i+1} \in \text{Mod}_{\mathcal{O}_X}^{\text{f.proj}}$  is of rank  $n_\lambda(i)$  (28.7.1.6).

Then  $\widetilde{\text{Gr}}_{\preccurlyeq \lambda}$  is representable by a successive perfect Grassmannian varieties: Define  $X_0 = \text{Spec}(\mathbb{F}_p)$ ,  $\mathcal{E}_0 = W(\mathcal{O}_{X_0})^{\lambda_1}$ , and define inductively  $\text{pr}_i : X_{i+1} \rightarrow X_i$  and  $\mathcal{E}_i \in \text{Mod}_{W(\mathcal{O}_{X_{i+1}})}^{\text{f.proj}}$  by defining

$$X_{i+1} = \underline{\text{Quot}}(\mathcal{E}_i/(p), n_\lambda(i))$$

which is representable by the perfection of a smooth projective scheme over  $X_i$  (27.1.2.13), with universal quotient  $\mathcal{Q}_i^{\text{univ}} \in \text{Mod}_{\mathcal{O}_X}^{\text{f.proj}}$  and

$$\mathcal{E}_{i+1} = \ker(\text{pr}_i^* \mathcal{E}_i \rightarrow \mathcal{Q}_i^{\text{univ}}),$$

which is also finite projective over  $W(\mathcal{O}_{X_{i+1}})$  by (28.7.1.5).  $\square$

**Thm. (28.7.2.5)** [Representability of  $\text{Gr}_{\text{GL}(n)}$ , Haboush[Hab05]/Kreidl[Kre14]/Zhu[Zhu17]/Bhatt-Scholze[B-S17]]. Situation as in (28.7.2.2), then

- $\text{Gr}_{\leq \lambda}$  is representable by the perfection of a projective  $\mathbb{F}_p$ -scheme,
- There is a natural ample line bundle  $\mathcal{L}_\lambda \in \text{Pic}(\text{Gr}_{\preccurlyeq \lambda})$  s.t.  $\tilde{\mathcal{L}}_\lambda \triangleq \psi_{\text{Gr}_{\preccurlyeq \lambda}}^* \mathcal{L} \in \text{Pic}(\widetilde{\text{Gr}}_{\preccurlyeq \lambda})$  is given by

$$\tilde{\mathcal{L}}_\lambda = \bigotimes_{i \in [\lambda_1 - 1]} \det_{\mathcal{O}_X} \mathcal{Q}_i,$$

- For each  $\mu \preccurlyeq \lambda \in X_\bullet^+(\text{GL}(n))$ , the restriction of  $\mathcal{L}_\lambda$  to  $\text{Gr}_{\preccurlyeq \mu}$  is equal to  $\mathcal{L}_\mu$ .  $\lrcorner$

*Proof:* Cf. [B-S17] Thm 8.8. and Section 8.4. ?  $\square$

**Lemma (28.7.2.6)** [ $p$ -adic Jet Spaces]. For each  $\mathcal{X} \in \text{Sch}^{\text{ft}}/\mathcal{O}_K$ , by work of Greenberg ?, there exists  $L_h^+(\mathcal{X}) \in \text{Aff}^{\text{ft}}/\kappa$  for each  $h \in \mathbb{Z}_+$ , s.t. for each  $R \in \mathbb{C}\text{Ring}/k$ , we have

$$L^h \mathcal{X}(R) = \mathcal{X}(W_{\mathcal{O}_K, h}(R)).$$

And if we denote  $L^+ \mathcal{X} \triangleq \varprojlim_{h \in \mathbb{Z}_+} L^h \mathcal{X} \in \text{Aff}/k$ , then for each  $R \in \mathbb{C}\text{Ring}/k$ , we have

$$L^+ \mathcal{X}(R) = \mathcal{X}(W_{\mathcal{O}_K}(R)).$$

called the  $p$ -adic jet space of  $\mathcal{X}$ .  $\lrcorner$

*Proof:* ?  $\square$

**Prop. (28.7.2.7)** [Witt-Vector Loop Groups]. For  $X \in \text{Aff}^{\text{ft}}/K$ , the (Witt-vector)  $p$ -adic loop group of  $X$  is the functor

$$\text{LX} : \text{Perf}/\kappa \rightarrow \mathcal{G}\text{rp} : R \mapsto X \left( W_{\mathcal{O}_K}(R) \left[ \frac{1}{p} \right] \right),$$

Then

- $LX$  is representable by a strict ind-(perfect affine scheme)(i.e. it is an inductive limit of perfect affine schemes along closed immersions).
- If  $X \in \text{Aff}^{\text{ft}}/K$  with an affine integral model  $\mathcal{X} \in \text{Sch}^{\text{ft}}/\mathcal{O}_K$ , then  $L^+\mathcal{X} \subset LX \in \text{PerfSch}/\kappa$ (28.7.2.6) is a closed subscheme.
- If  $X \rightarrow Y \in \text{Aff}^{\text{ft}}/K$  is a closed embedding, then  $LX \rightarrow LY \in \text{PerfSch}/\kappa$  is a closed embedding.

⌋

*Proof:* 1: By Weil-restriction it suffices to prove for  $K$  absolutely-unramified. If  $X = \mathbb{A}^1$ , then  $LX$  is representable by  $\varinjlim_{n \in \mathbb{Z}_+} (\mathbb{A}^n)^{\text{perf}}$ , because by (5.5.3.12), each element  $x \in W_{\mathcal{O}_K}(R)[\frac{1}{p}]$  can be written uniquely as

$$x = \sum_{n \gg -\infty} [x_n]p^n.$$

And then also  $L\mathbb{A}^n$  is representable. Now if  $X = \text{Spec}(K[X_1, \dots, X_n]/(f_1, \dots, f_m))$ , then  $LX$  is a closed subscheme of  $L\mathbb{A}^n$ , because for each  $f \in K[X_1, \dots, X_n]$ , by (5.5.3.10), we have

$$f\left(\sum [x_{1i}]p^i, \dots, \sum [x_{ni}]p^i\right) = \sum_{j \gg -\infty} \left[f^{(j)}(x_{1l}, \dots, x_{nl})^{1/p^j}\right] p^j$$

where each  $f^{(j)}$  is a polynomial of the variables  $\{X_{kl}\}_{k \in [n], l \in \mathbb{Z}}$ .

2, 3: These follow by similar arguments as above.

□

**Prop. (28.7.2.8).** If  $\mathcal{G} \in \text{GrpSch}^{\text{aff,ft}}/\mathcal{O}_K$ ,  $h \in \mathbb{N}$  and  $\mathcal{G}^{(h)}$  is the  $h$ -th congruence group scheme of  $\mathcal{G}$  (defined using dilatations?), then the natural map  $\mathcal{G}^{(h)} \rightarrow \mathcal{G}$  identifies

$$L^+\mathcal{G}^{(h)} = \ker(L^+\mathcal{G} \rightarrow L^h\mathcal{G}).$$

as perfect schemes.

⌋

*Proof:* ?

□

**Def. (28.7.2.9) [Witt-Vector Affine Grassmannian for General Groups].** For  $G \in \text{RedGrp}/K$  with a smooth affine integral model  $\mathcal{G} \in \text{GrpSch}^{\text{sm,aff}}/\mathcal{O}_K$ , define

$$\text{Gr}_{\mathcal{G}} \triangleq LG/L^+\mathcal{G} \in \text{Sh}(\text{PerfAff}_{\text{fpqc}}/k) \text{ (28.7.2.7)(28.7.2.6),}$$

called the (Witt-vector)**affine Grassmannian** for  $\mathcal{G}$ .

If we denote  $\mathcal{E}_0$  the trivial  $\mathcal{G}$ -torsor over  $W_{\mathcal{O}_K}(R)$ , then for each  $R \in \text{Perf}/k$ , we have

$$\text{Gr}_{\mathcal{G}}(R) = \left\{ (\mathcal{E}, \beta) \middle| \mathcal{E} \in \text{Tors}_{\mathcal{G}}(W_{\mathcal{O}_K}(R)), \beta \in \text{Isom} \left( \mathcal{E}|_{\text{Spec}(W_{\mathcal{O}_K}(R)[\frac{1}{p}])}, \mathcal{E}_0|_{\text{Spec}(W_{\mathcal{O}_K}(R)[\frac{1}{p}])} \right) \right\} / \text{Isom}$$

In particular, if  $\mathcal{G} = \text{GL}(n)_{\mathcal{O}_K}$ , then  $\text{Gr}_{\text{GL}(n)}(R)$  classifies finite projective  $W_{\mathcal{O}_K}(R)$ -submodules  $M \subset W_{\mathcal{O}_K}(R)^{\oplus n}[\frac{1}{p}]$  s.t.  $M[\frac{1}{p}] = W_{\mathcal{O}_K}(R)^{\oplus n}[\frac{1}{p}]$ .

⌋

*Proof:* To prove the moduli interpretation, we denote

$$\text{Gr}'_{\mathcal{G}}(R) \triangleq \left\{ (\mathcal{E}, \beta) \middle| \mathcal{E} \in \text{Tors}_{\mathcal{G}}(W_{\mathcal{O}_K}(R)), \beta \in \text{Isom} \left( \mathcal{E}|_{\text{Spec}(W_{\mathcal{O}_K}(R)[\frac{1}{p}])}, \mathcal{E}_0|_{\text{Spec}(W_{\mathcal{O}_K}(R)[\frac{1}{p}])} \right) \right\} / \text{Isom},$$

and also

$$L'G(R) \triangleq \left\{ (\mathcal{E}, \beta, \varepsilon) \middle| (\mathcal{E}, \beta) \in \text{Gr}'_{\mathcal{G}}(R), \varepsilon \in \text{Isom}(\mathcal{E}_0, \mathcal{E}) \right\} / \text{Isom},$$

Then the assertion follows if we prove that

- $L'G$  is an  $L^+\mathcal{G}$ -torsor over  $\mathrm{Gr}'_{\mathcal{G}}$ .
- There exists an  $L^+\mathcal{G}$ -equivariant isomorphism  $LG \cong L'G$ .

For the first assertion, notice that for each  $\mathcal{G}$ -torsor  $\mathcal{E} \in \mathrm{Tors}_{\mathcal{G}}(\mathrm{Spec} W_{\mathcal{O}_K}(R))$ , there exists an étale cover of  $R$  s.t.  $\mathcal{E}$  is trivial, then  $\mathcal{E}$  is trivial over  $\mathrm{Spec} W_{\mathcal{O}_K}(R')$  by formal smoothness. Thus the first assertion holds.

For the second assertion, the isomorphism is given by  $A \mapsto (\mathcal{E}_0, A, \mathrm{id})$  and the inverse is given by  $(\mathcal{E}, \beta, \varepsilon) \mapsto \beta \circ \varepsilon|_{\mathrm{Spec}(W(\mathcal{O}_K)[\frac{1}{p}])}$ .  $\square$

**Lemma (28.7.2.10).** Any smooth affine group scheme  $\mathcal{G}$  over a Dedekind domain  $A$  admits a linear representation  $\rho : \mathcal{G} \rightarrow \mathrm{GL}(n)_A$  s.t.  $\mathrm{GL}(n)_A/\mathcal{G}$  is quasi-affine. And if  $\mathcal{G} \in \mathrm{RedGrp}/A$ , then we can choose  $\rho$  s.t.  $\mathrm{GL}(n)_A/\mathcal{G}$  is affine.  $\lrcorner$

*Proof:* ? Cf. [P-R08]Thm1.b and [Alper, Adequate moduli spaces and geometrically reductive group schemes]Cor9.7.7.  $\square$

**Lemma (28.7.2.11).** If  $\rho : \mathcal{G} \hookrightarrow \mathrm{GL}(n) \in \mathrm{GrpSch}/\mathcal{O}_K$  is an embedding s.t.  $\mathrm{GL}(n)/\mathcal{G}$  is (quasi-)affine, then  $\mathrm{Gr}_{\mathcal{G}} \rightarrow \mathrm{Gr}_{\mathrm{GL}(n)}$  is a (locally)closed embedding.  $\lrcorner$

*Proof:* Cf. [P-R08]Thm1.4?.  $\square$

**Prop. (28.7.2.12) [Representability of  $\mathrm{Gr}_{\mathcal{G}}$ , Zhu[Zhu17]/Bhatt-Scholze[B-S17]].** Situation as in (28.7.2.9),  $\mathrm{Gr}_{\mathcal{G}}$  (28.7.2.9) is an increasing union of perfections of quasi-projective schemes over  $k$ , along closed immersions.

And if  $\mathcal{G}$  is a parahoric group scheme, then  $\mathrm{Gr}_{\mathcal{G}}$  can be written as an increasing union of perfections of projective schemes over  $k$  along closed immersions, and  $\mathrm{Gr}_{\mathcal{G}}$  is called a **affine partial flag variety** in this case.  $\lrcorner$

*Proof:* By Weil-restriction, it suffices to prove for  $K$  absolutely unramified. Then we can embed  $\mathcal{G}$  into  $\mathrm{GL}(n)_{\mathcal{O}_K}$  s.t.  $\mathrm{GL}(n)_{\mathcal{O}_K}/\mathcal{G}$  is quasi-affine by (28.7.2.10), and the  $\mathrm{Gr}_{\mathcal{G}}$  is a locally closed subscheme of  $\mathrm{Gr}_{\mathrm{GL}(n)_{\mathcal{O}_K}}$ , and the assertion follows from (28.7.2.5).

If  $\mathcal{G}$  is parahoric, then [Zhu17]1.4.2. shows that  $\mathrm{Gr}_{\mathcal{G}}$  is ind-proper?. Thus it is ind-projective.?  $\square$

**Remark (28.7.2.13)[Differences with affine Grassmannians in equal characteristic].** ? There is no analogue of the Birkhoff decomposition for  $p$ -adic groups, it is not clear whether one can construct the “big open cell” in the mixed characteristic affine Grassmannian. This is related to the lack of a Beauville-Laszlo style description of the mixed characteristic affine Grassmannian via a “global curve”.

There is no “rotation” torus acting on the mixed characteristic affine Grassmannian.  $\lrcorner$

### Schubert-Varieties

**Notation (28.7.2.14).**

- Let  $K \in p\text{-LField}$ .
- Let  $\mathcal{G} \in \mathrm{RedGrp}/\mathcal{O}_K$  with  $G = \mathcal{G}_K$ .

$\lrcorner$

**Def. (28.7.2.15) [Schubert-Varieties].** For  $\mu \in X_\bullet(T)^+$ , define the (spherical) **Schubert-variety**

$$\mathrm{Gr}_{\preccurlyeq \mu} \triangleq \{(\mathcal{E}, \beta) \in \mathrm{Gr} \mid \mathrm{inv}(\beta) \preccurlyeq \mu\},$$

which is a closed subset of  $|\mathrm{Gr}_{\mathcal{G}}|$  and is given the induced reduced structure as a closed subscheme.

And we also define the **Schubert-cell**

$$\mathrm{Gr}_{\mu} \triangleq \{(\mathcal{E}, \beta) \in \mathrm{Gr} \mid \mathrm{inv}(\beta) = \mu\},$$

which is an open subscheme of  $\mathrm{Gr}_{\preccurlyeq \mu}$ . ┘

**Prop. (28.7.2.16) [Convolution Maps].** Let  $\mathrm{mul}_{\mu_\bullet} : \mathrm{Gr}_{\mu_\bullet} \rightarrow \mathrm{Gr}_{\mathcal{G}}$  be the convolution map. Then  $\mathrm{mul}_{\mu_\bullet}$  is perfectly proper and semi-small, i.e.

$$\dim \mathrm{Gr}_{\mu_\bullet} \times_{\mathrm{Gr}_{\mathcal{G}}} \mathrm{Gr}_{\mu_\bullet} = \dim \mathrm{Gr}_{\mu_\bullet}.$$

┘

*Proof:* Cf. [X-Z17]P25? □

**Def. (28.7.2.17) [Satake-Correspondences].** For two sequences of dominant weights  $\lambda_\bullet, \mu_\bullet$ , define

$$\mathrm{Gr}_{\lambda_\bullet|\mu_\bullet}^0 \triangleq \mathrm{Gr}_{\lambda_\bullet} \times_{\mathrm{mul}_{\lambda_\bullet}, \mathrm{Gr}_{\mathcal{G}}, \mathrm{mul}_{\mu_\bullet}} \mathrm{Gr}_{\mu_\bullet}.$$

And the correspondence

$$\mathrm{Gr}_{\lambda_\bullet} \xleftarrow{h_{\lambda_\bullet}^-} \mathrm{Gr}_{\lambda_\bullet|\mu_\bullet}^0 \xrightarrow{h_{\mu_\bullet}^-} \mathrm{Gr}_{\mu_\bullet}$$

is called the **Satake-correspondence** for Affine Grassmannian.

We also define

$$\mathrm{Gr}_{\nu_\bullet; \lambda_\bullet|\mu_\bullet; \xi_\bullet}^0 \triangleq \mathrm{Gr}_{\nu_\bullet} \widetilde{\times} \mathrm{Gr}_{\lambda_\bullet|\mu_\bullet}^0 \widetilde{\times} \mathrm{Gr}_{\xi_\bullet}.$$

┘

**Prop. (28.7.2.18) [Satake-Correspondences].** Situation as in (28.7.2.17), we have

•

$$\dim \mathrm{Gr}_{\lambda_\bullet|\mu_\bullet}^0 \leq \frac{1}{2} (\dim \mathrm{Gr}_{\preccurlyeq \lambda_\bullet} + \dim \mathrm{Gr}_{\preccurlyeq \mu_\bullet}) = \langle \rho, |\lambda_\bullet| + |\mu_\bullet| \rangle.$$

• There is a canonical isomorphism

$$\mathrm{Hom}_{\mathrm{Perv}(\mathrm{Gr}_{\mathcal{G}})}((\mathrm{mul}_{\lambda_\bullet})_* \mathrm{IC}_{\lambda_\bullet}, (\mathrm{mul}_{\mu_\bullet})_* \mathrm{IC}_{\mu_\bullet}) = \mathrm{Corr}_{\mathrm{Gr}_{\lambda_\bullet|\mu_\bullet}^0}((\mathrm{Gr}_{\lambda_\bullet}, \mathrm{IC}_{\lambda_\bullet}), (\mathrm{Gr}_{\mu_\bullet}, \mathrm{IC}_{\mu_\bullet})).$$

• There is a canonical isomorphism

$$\mathrm{Hom}_{\mathrm{Perv}(\mathrm{Gr}_{\mathcal{G}})}((\mathrm{mul}_{\lambda_\bullet})_* \mathrm{IC}_{\lambda_\bullet}, (\mathrm{mul}_{\mu_\bullet})_* \mathrm{IC}_{\mu_\bullet}) = H_{\langle 2\rho, |\lambda_\bullet| + |\mu_\bullet| \rangle}^{\mathrm{B-M}}(\mathrm{Gr}_{\lambda_\bullet|\mu_\bullet}^0).$$

┘

*Proof:* Cf. [X-Z17]P26? □

**Def. (28.7.2.19) [Satake-Cycles].** Situation as in (28.7.2.17), an irreducible component of  $\mathrm{Gr}_{\lambda_\bullet|\mu_\bullet}^0$  of dimension  $\langle \rho, |\lambda_\bullet| + |\mu_\bullet| \rangle$  is called a **Satake-cycle**. The set of Satake-cycles of  $\mathrm{Gr}_{\lambda_\bullet|\mu_\bullet}^0$  is denoted by  $\mathcal{S}_{\lambda_\bullet|\mu_\bullet}$ . ┘

### Mirkovic-Vilonen Cycles

**Notation (28.7.2.20).**

- Let  $\mathcal{G} \in \text{RedGrp}/\mathcal{O}_K$  and  $G = \mathcal{G}_K$ . Let  $(\mathcal{B}, \mathcal{T}) \leq G$  be a Borel-pair, and  $\mathcal{U} = R_u(\mathcal{B})$ . Let  $U = \mathcal{U}_K, B = \mathcal{B}_K, T = \mathcal{T}_K$ .

┘

**Def. (28.7.2.21) [Mirkovic-Vilonen Cycles].** For  $\lambda \in X_\bullet(T)$ , define the locally closed subscheme

$$S_\lambda = \varpi^\lambda \cdot LU \cdot L^+ \mathcal{G} / L^+ \mathcal{G} \subset \text{Gr}_{\mathcal{G}},$$

which is the attractor for the  $\mathbb{G}_m$ -action  $\lambda : \mathbb{G}_m \rightarrow L^+ \mathcal{T}$ . Then  $\text{pr}_\lambda : LU \rightarrow S_\lambda : u \mapsto \varpi^\lambda u$  realizes  $LU$  as a  $L^+ \mathcal{U}$ -torsor over  $S_\lambda$ .

Then for any  $\mu \in X_\bullet(T)^+$ ,  $S_\lambda \cap \text{Gr}_{\leq \mu}$  is equidimensional of dimension  $\langle \rho, \lambda + \mu \rangle$ , and the number of irreducible components equals  $\dim V_\mu[\lambda]$ . The set of the irreducible components of  $S_\lambda \cap \text{Gr}_{\leq \mu}$  are denoted by  $\mathbf{M}\text{-}\mathbf{V}_\mu[\lambda]$ , called the set of **Mirkovic-Vilonen cycles**.

┘

*Proof:* ? Cf. [Zhu17] Section 2.2.1, Cor 2.8., [CHKR] Lemma 2.17.4, Proposition 5.4.2, [Mirkovic-Vilonen07] Theorem 3.2(a). □

**Prop. (28.7.2.22).** Situation as in (28.7.2.21),

- Each irreducible component of  $S_\lambda \cap \text{Gr}_\mu$  is geometrically irreducible.
- $\varpi^\lambda$  is contained in each irreducible component of  $S_\lambda \cap \text{Gr}_\mu$ .
- Each irreducible component of  $S_\lambda \cap \text{Gr}_\mu$  is stable under the action of  $L^+ \mathcal{B}$ .
- The set  $\mathbf{M}\text{-}\mathbf{V}_\mu[\lambda]$  is independent of the choice of  $B$  up to canonical isomorphism.

┘

*Proof:* Cf. [X-Z17] P29 ? □

**Prop. (28.7.2.23) [Convoluting Product of Mirkovic-Vilonen Cycles].** Let  $\lambda_\bullet$  be a finite sequence of coweights of  $G$ , and define

$$S_{\lambda_\bullet} \triangleq S_{\lambda_1} \tilde{\times} S_{\lambda_2} \tilde{\times} \dots \tilde{\times} S_{\lambda_n} \subset \text{Gr}_{\mathcal{G}} \tilde{\times} \dots \tilde{\times} \text{Gr}_{\mathcal{G}},$$

then there is an isomorphism

$$S_{\lambda_\bullet} \xrightarrow{\widetilde{\text{mul}}}: (\varpi^{\lambda_1} x_1, \dots, \varpi^{\lambda_n} x_n) \mapsto \left( \varpi^{\lambda_1} x_1, \varpi^{\lambda_1 + \lambda_2} (\varpi^{-\lambda_2} x_1 \varpi^{\lambda_2}) x_2, \dots, \dots \right),$$

where  $x_i \in LU$ .

The set of irreducible components of  $S_{\lambda_\bullet} \cap \text{Gr}_{\mu_\bullet} \cong (S_{\lambda_1} \cap \text{Gr}_{\mu_1}) \tilde{\times} \dots \tilde{\times} (S_{\lambda_n} \cap \text{Gr}_{\mu_n})$  is given by  $\prod_i \mathbf{M}\text{-}\mathbf{V}_{\mu_i}[\lambda_i]$ . ┘

*Proof:* Cf. [X-Z17] P30 ? □

**Prop. (28.7.2.24) [Mirkovic-Vilonen Cycles and Satake-Cycles].** For  $\nu, \mu, \nu + \lambda \in X_\bullet(T)^+$ , there is a unique injective map

$$i_\nu^{\mathbf{M}\text{-}\mathbf{V}} : \mathbb{S}_{(\nu, \mu)|\lambda + \nu} \rightarrow \mathbf{M}\text{-}\mathbf{V}_\mu[\lambda] \text{ (28.7.2.19) (28.7.2.21)}$$

s.t.

$$\mathbf{a} \cap S_{\mu, \lambda} = (S_\lambda \cap G_\lambda) \tilde{\times} i_\nu^{\mathbf{M}\text{-}\mathbf{V}}(\mathbf{a}) \subset \text{Gr}_{\mathcal{G}} \tilde{\times} \text{Gr}_{\mathcal{G}}.$$

And this map is compatible with the canonical bijection  $\mathbf{M}\text{-}\mathbf{V}_\mu^{B_1}[\lambda] \cong \mathbf{M}\text{-}\mathbf{V}_\mu^{B_2}[\lambda]$  (28.7.2.22) for two different Borel-subgroups  $B_1, B_2$ . ┘

*Proof:* Cf.[?X-Z17]P30?.

□

**Prop. (28.7.2.25)[Xiao-Zhu[?X-Z17]].** For each simple root  $\alpha$ , denote  $M_\alpha$  the standard Levi-subgroup with roots  $\{\pm\alpha\}$ , then the map

$$\prod \theta_{M_\alpha} : S_\lambda \rightarrow \prod_i S_{M_\alpha, \lambda}$$

induces a dominant map

$$(S_\lambda \cap \mathrm{Gr}_\mu)^b \rightarrow \prod_\alpha S_{M_\alpha, \lambda} \cap \mathrm{Gr}_{M_\alpha, \lambda + \varepsilon_\alpha(\mathbf{b})\alpha^\vee},$$

with geometrically connected fibers.

┘

*Proof:* Cf.[?X-Z17]P39?.

□

### 3 Affine Deligne-Lusztig Varieties

**Notation (28.7.3.1).**

- Fix  $(K, \mathcal{O}_K, \mathfrak{m}_K, \kappa) \in p\text{-LField}$ .
- Let  $(G, B, T) \in \mathcal{R}\mathrm{edGrp}/K$  be unramified.

┘

**Prop. (28.7.3.2)[Affine Deligne-Lusztig Varieties].** There is a natural map

$$\mathrm{inv} : \mathrm{Gr}_G \rightarrow X_\bullet(T)^+ : \mathrm{LG}/\mathrm{L}^+\mathcal{G} \rightarrow \mathrm{L}^+\mathcal{G} \backslash \mathrm{LG}/\mathrm{L}^+\mathcal{G} \cong X_\bullet(T)^+ \text{ (28.7.2.9)}.$$

For  $b \in G(\check{K})$  and  $\mu \in X_\bullet(T)^+$ , define the Schubert variety

$$\mathrm{Gr}_{\preccurlyeq \mu} = \mathrm{inv}^{-1}(\preccurlyeq \mu),$$

and define the ADLV

$$X_\mu(b) = \left\{ g \in \mathrm{Gr}_G \mid \mathrm{inv} \left( g^{-1} b \varphi_K(g) \right) \preccurlyeq \mu \right\},$$

which parametrizes the moduli problem that assigns to each  $R \in \mathcal{P}\mathrm{erf}/\kappa$  the isomorphism classes of commutative diagrams of modifications of  $G$ -torsors on  $\mathrm{Spec} W_{\mathcal{O}_K}(R)$ :

$$\begin{array}{ccc} \varphi_K \mathcal{E}_1 & \xrightarrow{\beta_1} & \mathcal{E}_1 \\ \downarrow \varphi_K \beta_0 & & \downarrow \beta_0 \\ \varphi_K \mathcal{E}_0 & \xrightarrow{b \cdot} & \mathcal{E}_0, \end{array}$$

s.t.  $\mathrm{inv}(\beta_1) \preccurlyeq \mu$ .

Then there is a Cartesian diagram of perfect schemes:

$$\begin{array}{ccc} X_\mu(b) & \xrightarrow{g \mapsto (g, g^{-1} b \varphi_K(g))} & \mathrm{Gr} \tilde{\times} \mathrm{Gr}_{\preccurlyeq \mu} \\ \downarrow & & \downarrow \mathrm{pr}_1 \times m \\ \mathrm{Gr} & \xrightarrow{\mathrm{id} \times b \sigma_p} & \mathrm{Gr} \times \mathrm{Gr}. \end{array}$$

Then  $J_b$  acts on  $X_\mu(b)$  by left multiplication.  $\lrcorner$

**Prop. (28.7.3.3) [Non-Emptiness of  $X_\mu(b)$ ].** Situation as in (28.7.3.2),  $X_\mu(b) \neq \emptyset$  iff  $[b] \in B(G, \mu)$ .  $\lrcorner$

*Proof:* Cf. [X-Z17]P47.  $\square$

**Thm. (28.7.3.4) [Dimension of  $X_\mu(b)$ , conjectured by Rapoport [Rap05] and Görtz-Haines-Kottwitz-Reuman [GHKR], Viehmann [Vie06, Vie08, Vie08a]/Hamacher [Ham15, Ham15a]/Zhu [Zhu17]].** Situation as in (28.7.3.2), we have

$$\dim X_\mu(b) = \langle \rho, \mu - \nu_b \rangle - \frac{1}{2} \text{def}_G(b).$$

? Cf. [GHKR] for definition of  $\text{def}_G(b)$ .  $\lrcorner$

*Proof:* Cf. [Zhu17]P456.  $\square$

**Def. (28.7.3.5) [ADLV and Schubert-Varieties].** For  $b \in G(\check{K})$  and  $\mu, \nu \in X_\bullet(T)^+$ , define

$$X_{\mu, \nu}(b) = X_\mu(b) \cap \text{Gr}_{\preceq \nu} \in \text{Gr}_G,$$

which is the fiber product

$$\begin{array}{ccc} X_{\mu, \nu}(b) & \xrightarrow{g \mapsto (g, g^{-1}b\varphi_K(g))} & \text{Gr}_{\preceq \nu} \tilde{\times} \text{Gr}_{\preceq \mu} \\ \downarrow & & \downarrow \text{pr}_1 \times m \\ \text{Gr}_{\preceq \nu} & \xrightarrow{\text{id} \times b\sigma_p} & \text{Gr}_{\preceq \nu} \times \text{Gr}. \end{array}$$

$X_{\mu, \nu}(b)$  is equipped with an action of  $J_b(K) \cap G(\mathcal{O}_{\check{K}})$ , and the isomorphism class of the pair  $(X_{\mu, \nu}(b), J_b(K) \cap G(\mathcal{O}_{\check{K}}))$  depends only on  $b$  up to  $\varphi_K$ -conjugacy by elements of  $G(\mathcal{O}_{\check{K}})$ .  $\lrcorner$

## 4 Irreducible Components of ADLV

### Unramified ADLV

**Notation (28.7.4.1).**

- Fix  $(K, \mathcal{O}_K, \mathfrak{m}_K, \kappa) \in p\text{-LField}$ .
- Let  $(G, B, T) \in \mathcal{R}\text{edGrp}/K$  be unramified.

$\lrcorner$

**Def. (28.7.4.2) [Unramified Elements].** An element  $b \in B(G)$  is called an **unramified element** if it is contained in the image of the natural map  $B(T) \rightarrow B(G)$ , where  $T$  is a maximal torus of  $G_{\check{\mathbb{Q}}_p}$ .  $\lrcorner$

**Prop. (28.7.4.3).** The map  $B(G) \rightarrow X_\bullet(T)_{\check{\mathbb{Q}}}^{+, \text{Gal}_\kappa} \times \pi_1(G)_{\text{Gal}_\kappa}$  identifies  $B(G)_{\text{unr}}$  with  $X_\bullet(T)_{\text{Gal}_\kappa}^+$ .  $\lrcorner$

*Proof:* Cf. [X-Z17]P49.  $\square$

**Prop. (28.7.4.4).** The unramified element  $[\varpi^\tau]$  belongs to  $B(G, \mu)$  iff

$$\bigoplus_{\lambda \in \tau + (\sigma_p - 1)X_\bullet(T)} V_\mu[\lambda] \neq 0.$$

┘

*Proof:* ?

□

**Prop. (28.7.4.5) [Tate-Subspaces].** Define

$$\Lambda = \{\lambda \in X_\bullet(T) \mid \bar{\lambda} \in X_\bullet(Z(G))_{\mathbb{Q}}\},$$

where  $\bar{\lambda}$  is the average of Galois-conjugates of  $\lambda$ . And for each  $V \in \text{Rep}^{\text{fd}}(\widehat{G})$ , denote

$$V^{\text{Tate}} \triangleq \bigoplus_{\lambda \in \Lambda} V[\lambda].$$

┘

**Lemma (28.7.4.6).** For  $\mu \in X_\bullet(T)^+$ , there exists some  $\tau \in \Lambda$  s.t.

$$V_\mu^{\text{Tate}} = \bigoplus_{\lambda \in \tau + (\sigma_p - 1)X_\bullet(T)} V_\mu[\lambda] \text{ (28.7.4.5)}.$$

┘

*Proof:* Cf. [?X-Z17]P50. ?

□

**Prop. (28.7.4.7) [Unramified Basic Elements].** For  $\mu \in X_\bullet(T)^+$  and the basic element  $[b] \in B(G, \mu)$  (28.6.1.40), the following are equivalent:

- $[b]$  is unramified.
- $V_\mu^{\text{Tate}} \neq 0$ .
- $\text{def}_{\mathcal{G}}([b]) \neq 0$ .
- $\dim X_\mu([b]) = \langle \rho, \mu \rangle$ .
- $\mu_{\text{ad}}$  is trivial on  $Z(\widehat{G}_{\text{sim.cntd}})^{\text{Gal}_K}$ .

If these conditions hold, and in addition  $Z(G)$  is connected, then  $[b] = [\varpi^\tau]$  for some  $\tau \in X_\bullet(Z(G))$ .

┘

*Proof:* Cf. [?X-Z17]P50. ?

□

### Irreducible Components of Unramified ADLVs

**Notation (28.7.4.8).**

- Fix  $\mu \in X_\bullet(T)^+$ .
- Fix  $\tau \in X_\bullet(T)$  s.t.  $\tau^\natural \in X_\bullet(T)_{\text{Gal}_K}^+$  and  $[\varpi^\tau] \in B(G, \mu)$ .

┘

**Def. (28.7.4.9) [Mirkovic-Vilonen Cycles].**  $\mathbf{M}\text{-}\mathbf{V}_\mu[\lambda]$ .

And define

$$\mathbf{M}\text{-}\mathbf{V}_\mu^{\tau^\natural} \triangleq \bigcup_{\lambda \in X_\bullet(T), \lambda^\natural = \tau^\natural} \mathbf{M}\text{-}\mathbf{V}_\mu[\lambda].$$

┘

**Prop. (28.7.4.10).** ┘

**Cor. (28.7.4.11) [Unramified ADLVs via Semi-Infinite Orbits].** For  $\mathbf{b} \in \mathbf{M}\text{-}\mathbf{V}_\mu^{\tau \natural}$  (28.7.4.9), denote

$$X_\mu^{\mathbf{b}}(\varpi^\tau) \triangleq \overline{\bigcup_{\nu \in X_\bullet(T)} Y_\nu^{\mathbf{b}}} \subset X_\mu(\varpi^\tau) \text{ (28.7.3.2),}$$

then

- $X_\mu^{\mathbf{b}}(\varpi^\tau)$  is a union of certain irreducible components of  $X_\mu(\varpi^\tau)$ .
- $X_\mu^{\mathbf{b}}(\varpi^\tau) \neq X_\mu^{\mathbf{b}'}(\varpi^\tau)$  if  $\mathbf{b} \neq \mathbf{b}' \in \mathbf{M}\text{-}\mathbf{V}_\mu^{\tau \natural}$ , and

$$X_\mu(\varpi^\tau) = \bigcup_{\mathbf{b} \in \mathbf{M}\text{-}\mathbf{V}_\mu^{\tau \natural}} X_\mu^{\mathbf{b}}(\varpi^\tau).$$

- $B_\tau(K)$  ? acts transitively on the set of irreducible components of  $X_\mu^{\mathbf{b}}(\varpi^\tau)$ .
- $X_\mu^{\mathbf{b}}(\varpi^\tau)$  is equidimensional of dimension  $\langle \rho, \mu - \tau \rangle$ .

┘

*Proof:* Cf. [X-Z17]P55 ?. □

**Thm. (28.7.4.12) [Irreducible Components of Unramified ADLV].** Consider the action of  $J_\tau(K) \triangleq J_{\varpi^\tau}(K)$  on  $X_\mu(\tau)$  (28.7.4.11), then

- The stabilizer of each irreducible component is a hyperspecial subgroup.
- The subset  $X_\mu^{\mathbf{b}}(\varpi^\tau) \subset X_\mu(\varpi^\tau)$  is invariant under the action of  $J_\tau(K)$ , and  $J_\tau(K)$  acts transitively on the set of irreducible components of  $X_\mu^{\mathbf{b}}(\varpi^\tau)$ .
- If  $Z(G)$  is connected, then there is a  $J_\tau(K)$ -equivariant bijection between the set of irreducible components of  $X_\mu^{\mathbf{b}}(\varpi^\tau)$  and

$$\mathbf{M}\text{-}\mathbf{V}_\mu^{\tau \natural} \times \text{HS}_\tau : (\mathbf{b}, x) \mapsto X_\mu^{\mathbf{b}, x}(\varpi^\tau),$$

where  $\text{HS}_\tau$  is the set of hyperspecial subgroups of  $J_\tau(K)$ , and for each  $x \in \text{HS}_\tau$ ,  $X_\mu^{\mathbf{b}, x}(\varpi^\tau)$  is the irreducible component of  $X_\mu^{\mathbf{b}}(\varpi^\tau)$  whose stabilizer is the hyperspecial subgroup of  $J_\tau(K)$  corresponding to  $x$  ?. ┘

*Proof:* ? Cf. [X-Z17]P63. □

## 28.8 $p$ -adic Uniformizations

References are [Schottky Groups and Mumford Curves, 1980], [Mihran Papikian, Non-archimedean uniformization and monodromy pairing].

**Notation (28.8.0.1).**

- Let  $p \in \text{Prime}$ .
- Let  $(K, \mathcal{O}_K, \varpi_K, \kappa) \in p\text{-Field}$ .
- Use notations on simplicial complexes defined in [Simplicial Complexes](#).
- Let  $\kappa \in \text{Field}^p$ .
- Let  $K_0 = W(\kappa)[\frac{1}{p}]$ .

┘

### 1 Mumford Curves

**Def. (28.8.1.1)[ $p$ -adic Schottky Groups].** A  $p$ -adic Schottky group is a discrete, f.g. free subgroup  $\Gamma \subset \text{PGL}(2; K)$ . ┘

**Prop. (28.8.1.2).** A subgroup  $\Gamma \leq \text{PGL}(2; K)$  is a  $p$ -adic Schottky group [\(28.8.1.1\)](#) if it is discrete, f.g. and torsion-free. ┘

*Proof:*  $\Gamma$  acts on the Bruhat-Tits building  $\Delta$  of  $\text{PGL}(2; \mathbb{Q}_p)$ , and the stabilizer is  $\Gamma \cap \text{PGL}(2; \mathbb{Z}_p)$ , which is a finite group as  $\Gamma$  is discrete and  $\text{PGL}(2; \mathbb{Z}_p)$  is compact. Thus it is trivial as  $\Gamma$  is torsion-free. Thus  $\Gamma$  acts freely on  $\Delta$ , so  $\Gamma$  must be a free group. ? ┘

**Def. (28.8.1.3)[Limit Points].** For a  $p$ -adic Schottky group  $\Gamma \leq \text{PGL}(2; K)$  [\(28.8.1.1\)](#),  $\Gamma$  acts on  $\mathbb{P}^1(\mathbb{C}_p)$ . Denote  $\Lambda(\Gamma)$  the set of limit points of this action, i.e. the points  $z$  of the form  $z = \lim g_n(z_0)$  for a sequence of distinct elements  $g_n \in \Gamma$ . Denote  $\Omega(\Gamma) = \mathbb{P}^1(K) \setminus \mathcal{L}(\Gamma)$ .

$\Gamma$  is called a **discontinuous  $p$ -adic Schottky group** if  $\Omega(\Gamma) \neq \emptyset$ . It is called a **continuous  $p$ -adic Schottky group** otherwise. ┘

**Thm. (28.8.1.4)[Mumford].** Let  $\Gamma$  is a  $p$ -adic Schottky group of rank  $g$ , then there is a smooth complete curve  $X_\Gamma \in \text{Cur}^{\text{SmProj}, g}/K$  with an analytic isomorphism  $\Omega_\Gamma/\Gamma \cong X_\Gamma(\mathbb{C}_p)$ . Such a curve  $X_\Gamma$  is called a  $p$ -adic **Mumford curve**. ┘

*Proof:*

□

**Thm. (28.8.1.5) [Mumford].** Let  $\Gamma$  is a  $p$ -adic Schottky group of rank  $g \geq 2$  [\(28.8.1.1\)](#), then the corresponding Mumford curve  $X_\Gamma$  has split degenerate stable reduction (several  $\mathbb{P}^1$  glued together with ordinary double points). Conversely, and smooth complete curve over  $K$  with split degenerate stable reduction is a Mumford curve.

Where split degenerate reduction means that the normalization of all components of  $\tilde{X}$  are  $\mathbb{F}_p$ -rational, and all nodes are  $\mathbb{F}_p$ -rational with two  $\mathbb{F}_p$ -rational branches. ┘

*Proof:*

□

**Remark (28.8.1.6).** There are clear duality between  $\Delta/\Gamma$  and the reduction graph of  $C$ , Cf. [M-P05]P419.  $\lrcorner$

**Prop. (28.8.1.7) [Herrlich].** Suppose  $p \in \text{Prime}$  and  $X/\mathbb{Q}_p$  is a Mumford curve with genus  $g \geq 2$ , then

$$\# \text{Aut}(X) \leq \begin{cases} 84(g-1) & , p = 2 \\ 24(g-1) & , p = 3 \\ 30(g-1) & , p = 5 \\ 12(g-1) & , p = 3 \end{cases}$$

 $\lrcorner$ 

*Proof:*

 $\square$ 

## 2 Drinfeld Symmetric Spaces

The Mumford-Kurihara-Mustafin uniformization is a procedure to construct nice analytic varieties by taking discrete Schottky-type quotients of a certain  $p$ -adic analogue of symmetric space called Drinfeld symmetric space  $\Omega$ .

### Mumford-Kurihara-Mustafin Uniformizations

## 3 Rapoport-Zink Uniformization

References are [R-Z96].

**Thm. (28.8.3.1) [PEL-Types].** Situation as in (28.5.1.3), let  $\kappa = \overline{\mathbb{F}_p}$ , and fix a point  $(A_0, \bar{\lambda}_0, \bar{\eta}^p) \in \mathcal{S}_{\mathcal{K}}(\kappa)$  with associated isocrystal  $N_0$  ?. Fix an isomorphism  $N_0 \cong V \otimes_{\mathbb{Q}_p} K_0$  that respects the actions of  $B \otimes K_0$  and the alternating bilinear forms on both sides, then the Frobenius action on  $N_0$  is identified to  $b(\text{id} \otimes \sigma)$  for some  $b \in G(K_0)$ .

Suppose  $b$  is basic. If  $\text{RZ}(\mathcal{D})$  is the PEL-type Rapoport-Zink space associated to the integral PEL-datum  $(\mathcal{O}_B, *, L, \langle -, - \rangle, h_0)$  (28.5.1.2), with an action of  $J(\mathbb{Q}_p)$ , then

- The set of points  $(A, \bar{\lambda}, \bar{\eta}^p) \in \mathcal{S}_{\mathcal{K}}(\kappa)$  s.t.  $(A, \bar{\lambda})$  is isogenous to  $(A_0, \bar{\lambda}_0)$  is a closed subset  $Z \subset (\mathcal{S}_{\mathcal{K}})_{\mathcal{O}_{E_v}}$ .
- If  $\mathcal{S}_{\mathcal{K}}|Z$  is the formal completion of  $(\mathcal{S}_{\mathcal{K}})_{\mathcal{O}_{E_v}}$  along  $Z$ , then there is an isomorphism of formal schemes over  $\text{Spf}(\mathcal{O}_{E_v})$ :

$$I(\mathbb{Q}) \backslash \left[ \text{RZ}(\mathcal{D}) \times G(\mathbf{A}_f^p) / \mathcal{K}^p \right] \cong \mathcal{S}_{\mathcal{K}}|Z.$$

where  $I(\mathbb{Q})$  is group of quasi-isogenies of  $(A_0, \bar{\lambda}_0)$  which is an inner form of  $G$  s.t.  $I_{\mathbb{Q}_p} \cong J_b$  and  $I_{\mathbf{A}_f^p} \cong G_{\mathbf{A}_f^p}$ .  $\lrcorner$

*Proof:* ?

 $\square$ 

**Thm. (28.8.3.2) [Unramified Hodge-Types].**  $\lrcorner$

**Thm. (28.8.3.3) [General Hodge-Types].** [GLEASON-LIM-XU] proved that the Newton strata of the integral models for Shimura varieties at parahoric level constructed by [Pappas-Rapoport] satisfy  $p$ -adic uniformization.  $\lrcorner$

## 28.9 Special Fibers of Shimura Varieties

References are [Rapoport, A guide to the reduction modulo  $p$  of Shimura varieties], [Kisin, Mod  $p$  points on Shimura varieties of abelian type].

**Notation(28.9.0.1).**

- Let  $p \in \text{Prime}$ .

┘

### 1 Local Shtuka

**Notation(28.9.1.1).**

- Let  $(K, \mathcal{O}_K, \varpi_K, \kappa) \in p\text{-LField}$ .
- Let  $(G, B, T) \in \mathcal{R}\text{edGrp}/K$  be unramified.

┘

### Local Hecke-Stacks

**Def.(28.9.1.2) [Local Hecke-Stacks].** For a sequence of dominant weights  $\mu_\bullet = (\mu_1, \dots, \mu_t)$  of  $G$ , we define the **local Hecke-stack** as the prestack

$$\text{Hk}_{\mu_\bullet}^{\text{loc}} \triangleq [\text{L}^+ \mathcal{G} \backslash \text{Gr}_{\mu_\bullet}],$$

which assigns to each  $R \in \mathcal{P}\text{erf}/\kappa$  the groupoid of chains of modifications of  $\mathcal{G}$ -torsors over  $\text{Spec } W_{\mathcal{O}}(R)$ :

$$\mathcal{E}_t \xrightarrow{\beta_t} \mathcal{E}_{t-1} \xrightarrow{\beta_{t-1}} \dots \xrightarrow{\beta_2} \mathcal{E}_1 \xrightarrow{\beta_1} \mathcal{E}_0$$

of relative positions  $\preccurlyeq \mu_t, \dots, \preccurlyeq \mu_1$  resp.. And there are maps of prestacks

$$t_{\leftarrow} : \text{Hk}_{\mu_\bullet}^{\text{loc}} \rightarrow \mathbf{BL}^+ \mathcal{G} : \left( \mathcal{E}_t \xrightarrow{\beta_t} \mathcal{E}_{t-1} \xrightarrow{\beta_{t-1}} \dots \xrightarrow{\beta_1} \mathcal{E}_0 \right) \mapsto \mathcal{E}_t,$$

$$t_{\rightarrow} : \text{Hk}_{\mu_\bullet}^{\text{loc}} \rightarrow \mathbf{BL}^+ \mathcal{G} : \left( \mathcal{E}_t \xrightarrow{\beta_t} \mathcal{E}_{t-1} \xrightarrow{\beta_{t-1}} \dots \xrightarrow{\beta_1} \mathcal{E}_0 \right) \mapsto \mathcal{E}_0.$$

Similarly, we can define

$$\text{Hk}_{\lambda_\bullet | \mu_\bullet}^{\text{loc}} \triangleq [\text{L}^+ \mathcal{G} \backslash \text{Gr}_{\lambda_\bullet | \mu_\bullet}^0], \quad \text{Hk}_{\nu_\bullet; \lambda_\bullet | \mu_\bullet; \xi_\bullet}^{0, \text{loc}} \triangleq [\text{L}^+ \mathcal{G} \backslash \text{Gr}_{\nu_\bullet; \lambda_\bullet | \mu_\bullet; \xi_\bullet}^0] \quad (28.7.2.17).$$

By taking the  $\text{L}^+ \mathcal{G}$ -quotient of the Satake-correspondence (28.7.2.17), we get a **Satake-correspondence** on local Hecke-stacks

$$\text{Hk}_{\lambda_\bullet}^{\text{loc}} \xleftarrow{h_{\lambda_\bullet}^{\leftarrow}} \text{Hk}_{\lambda_\bullet | \mu_\bullet}^{0, \text{loc}} \xrightarrow{h_{\mu_\bullet}^{\rightarrow}} \text{Hk}_{\mu_\bullet}^{\text{loc}}.$$

┘

**Def.(28.9.1.3) [Hecke-Correspondences and Satake-Correspondences].** There is a **Hecke-correspondence of local Hecke-stacks**

$$\text{Sht}_{\lambda_\bullet}^{\text{loc}} \xleftarrow{\overleftarrow{h}_{\lambda_\bullet}^{\text{loc}}} \text{Sht}_{\lambda_\bullet | \mu_\bullet}^{\text{loc}} \xrightarrow{\overrightarrow{h}_{\mu_\bullet}^{\text{loc}}} \text{Sht}_{\mu_\bullet}^{\text{loc}},$$

where  $\text{Sht}_{\lambda_\bullet|\mu_\bullet}^{\text{loc}}$  is the prestack that assigns to each  $R \in \text{Perf}/\kappa$  the isomorphism classes of commutative diagrams of modifications of  $\mathcal{G}$ -torsors over  $\text{Spec } W_{\mathcal{O}_K}(R)$ :

$$\begin{array}{ccccccccccc} \mathcal{E}'_s & \xrightarrow{\beta'_s} & \mathcal{E}'_{s-1} & \xrightarrow{\beta'_{s-1}} & \dots & \xrightarrow{\beta'_2} & \mathcal{E}'_1 & \xrightarrow{\beta'_1} & \mathcal{E}'_0 & & \\ \downarrow \beta & & & & & & & & \downarrow \varphi_K \beta & & \\ \mathcal{E}_t & \xrightarrow{\beta_t} & \mathcal{E}_{t-1} & \xrightarrow{\beta_{t-1}} & \dots & \xrightarrow{\beta_2} & \mathcal{E}'_1 & \xrightarrow{\beta_1} & \mathcal{E}_0 & & \end{array}$$

And for each  $\nu \in X_\bullet(T)^+$ , we can define  $\text{Sht}_{\lambda_\bullet|\mu_\bullet}^{\nu, \text{loc}}$  as the closed sub-prestack of  $\text{Sht}_{\lambda_\bullet|\mu_\bullet}^{\text{loc}}$  consisting of diagrams of modifications s.t.  $\text{inv}(\beta) \preccurlyeq \nu$ . And for  $\nu = 0$ , we get the **Satake-correspondence of local Hecke-stacks**

$$\text{Sht}_{\lambda_\bullet}^{\text{loc}} \xleftarrow{\overleftarrow{h}_{\lambda_\bullet}^{\text{loc}}} \text{Sht}_{\lambda_\bullet|\mu_\bullet}^{0, \text{loc}} \xrightarrow{\overrightarrow{h}_{\mu_\bullet}^{\text{loc}}} \text{Sht}_{\mu_\bullet}^{\text{loc}},$$

┘

**Cor. (28.9.1.4).**  $\text{Sht}_{\lambda_\bullet|\mu_\bullet}^{\text{loc}}$  is non-empty iff  $B(G, -|\lambda_\bullet|) \cap B(G, -|\mu_\bullet|) \neq \emptyset$ , by (28.7.3.3). ┘

**Def. (28.9.1.5) [Convolutions Maps].** For each  $m \in \mathbb{N} \cup \{\infty\}$  which is  $(\nu_\bullet, \mu_\bullet, \xi_\bullet)$ -large, there is a convolution map

$$\text{mul}_{\nu_\bullet, \mu_\bullet, \xi_\bullet} : \text{Hk}_{\nu_\bullet, \mu_\bullet, \xi_\bullet}^{\text{loc}(m)} \rightarrow \text{Hk}_{\nu_\bullet, |\mu_\bullet|, \xi_\bullet}^{\text{loc}(m)}$$

which is perfectly proper? ┘

### Moduli of Local Shtukas

**Def. (28.9.1.6) [Moduli of Local Shtukas].** For each sequence  $\mu_\bullet$  of dominant coweights, let  $\text{Sht}_{\mu_\bullet}^{\text{loc}}$  be the prestack over  $\text{Perf}/\kappa$  that assigns to each  $R \in \text{Perf}/\kappa$  the isomorphism classes of modifications

$$\mathcal{E}_t \xrightarrow{\beta_t} \mathcal{E}_{t-1} \xrightarrow{\beta_{t-1}} \dots \xrightarrow{\beta_1} \mathcal{E}_1 \xrightarrow{\beta_0} \varphi_K \mathcal{E}_t.$$

In particular, there is a Cartesian diagram of prestacks

$$\begin{array}{ccc} \text{Sht}_{\mu_\bullet}^{\text{loc}} & \xrightarrow{\varphi^{\text{loc}}} & \text{Hk}_{\mu_\bullet}^{\text{loc}} \\ \downarrow & & \downarrow t \leftarrow \times t \rightarrow \\ \text{BL}^+ G & \xrightarrow{1 \times \varphi_K} & \text{BL}^+ G \times \text{BL}^+ G \end{array} \quad (28.9.1.2).$$

┘

**Example (28.9.1.7).** If  $\mathcal{G} = \text{GL}(n)$  and  $K$  is absolutely unramified, then a theorem of Gabber? shows that  $\text{Sht}_{\omega_i}^{\text{loc}}$  is isomorphic to the prestack of  $p$ -divisible groups of dimension  $i$  and height  $n$ .

$$\text{Sht}_0^{\text{loc}} \cong \text{B}(G(\mathcal{O}_K)).?$$

┘

### Moduli of Restricted Local Shtukas

**Def. (28.9.1.8) [Moduli of Restricted Local Shtukas].** For a sequence  $\mu_\bullet$  of dominant coweights and  $m, n \in \mathbb{N}$  s.t.  $m - n$  is  $\mu_\bullet$ -large<sup>?</sup>, the moduli prestack  $\mathrm{Sht}_{\mu_\bullet}^{\mathrm{loc}(m,n)}$  of  $(m, n)$ -restricted local iterated shtukas is defined to be the stack that classifies for each  $R \in \mathcal{P}\mathrm{erf}/k$  the data of

- An  $R$ -point of  $\mathrm{Hk}_{\mu_\bullet}^{\mathrm{loc}(m)}$ .
- An isomorphism

$$\psi : {}^\sigma(\mathcal{E}|_{D_n}) \cong (\mathcal{E}_{\rightarrow}|_{D_m})|_{D_n} \quad ?$$

of  $\mathrm{L}^n G$ -torsors over  $\mathrm{Spec} R$ . In particular, there is a Cartesian diagram of stacks

$$\begin{array}{ccc} \mathrm{Sht}_{\mu_\bullet}^{\mathrm{loc}(m,n)} & \xrightarrow{\varphi^{\mathrm{loc}(m,n)}} & \mathrm{Hk}_{\mu_\bullet}^{\mathrm{loc}(m)} \\ \downarrow & & \downarrow t_{\leftarrow} \times \mathrm{res}_n^m \circ t_{\rightarrow} \\ \mathrm{BL}^n G & \xrightarrow{1 \times \sigma} & \mathrm{BL}^n G \times \mathrm{BL}^n G \end{array}$$

┘

*Proof:* Cf. [X-Z17]P75<sup>?</sup>.

## 2 Cohomological Correspondences of Local Shtukas

**Def. (28.9.2.1)  $[[\widehat{G}\sigma_p/\widehat{G}]]$ .**

┘

**Thm. (28.9.2.2) [Geometric Satake-Correspondences, Xiao-Zhu].** There exists a functor  $S : \mathrm{Coh}_{fr}^{\widehat{G}}(\widehat{G}\sigma_p) \rightarrow \mathrm{Perv}^{\mathrm{Corr}}(\mathrm{Sht}_{\overline{\kappa}}^{\mathrm{loc}})$  making the following diagram commutative:

$$\begin{array}{ccc} \mathrm{Rep}^{\mathrm{fd}}(\widehat{G}) & \xrightarrow{\mathrm{Sat}} & \mathrm{Perv}(\mathrm{Hk}_{\overline{\kappa}}^{\mathrm{loc}}) \\ \downarrow & & \downarrow (\Phi^{\mathrm{loc}})^* \\ \mathrm{Coh}_{fr}^{\widehat{G}}(\widehat{G}\sigma_p) & \xrightarrow{S} & \mathrm{Perv}^{\mathrm{Corr}}(\mathrm{Sht}_{\overline{\kappa}}^{\mathrm{loc}}). \end{array}$$

where  $\mathrm{Coh}_{fr}^{\widehat{G}}(\widehat{G}\sigma_p)$  is the full subcategory of the category of coherent sheaves on  $[\widehat{G}\sigma_p/\widehat{G}]$  spanned by the pullback of coherent sheaves along the natural projection  $[\widehat{G}\sigma_p/\widehat{G}] \rightarrow \mathbf{B}\widehat{G}$ .

Moreover,  $S(\mathcal{O}_{[\widehat{G}\sigma_p/\widehat{G}]}) = \delta_1$ , and the map

$$S : \mathbf{J} \triangleq \Gamma([\widehat{G}\sigma_p/\widehat{G}], \mathcal{O}_K) \rightarrow \mathrm{End}_{\mathrm{Perv}^{\mathrm{Corr}}(\mathrm{Sht}_{\overline{\kappa}}^{\mathrm{loc}})}(\delta_1) \cong \mathcal{H}_{\mathcal{K}}(G(K)) \otimes \overline{\mathbb{Q}_\ell}.$$

coincides with the Satake-isomorphism<sup>?</sup>.

┘

*Proof:* Cf. [X-Z17]P125<sup>?</sup>.

□

**Thm. (28.9.2.3) [Xiao-Zhu].** There is a canonical map

$$\begin{aligned} \mathrm{Spc} : \mathrm{Hom}_{\mathrm{Coh}_{fr}^{\widehat{G}}(\widehat{G}\sigma_p)}(\tilde{V}_i, \tilde{V}_j) &\xrightarrow{S} \mathrm{Hom}_{\mathrm{Perv}^{\mathrm{Corr}}(\mathrm{Sht}_{\overline{\kappa}}^{\mathrm{loc}})}(S(\tilde{V}_i), S(\tilde{V}_j)) \quad (28.9.2.2) \\ &\rightarrow \mathrm{Hom}_{\mathcal{H}^p(G)}(\mathrm{H}_{\mathrm{ét},c}(\mathrm{Sh}_{\mu_i, \overline{\kappa(v)}}), \mathrm{H}_{\mathrm{ét},c}(\mathrm{Sh}_{\mu_j, \overline{\kappa(v)}})) \end{aligned}$$

compatible with compositions.

┘

*Proof:* Cf.[?X-Z17]P123?.

□

**Conj.(28.9.2.4)**[ $S = T$  **Theorem, Xiao-Zhu**]. The action of  $\mathbf{J}$  on  $H_{\text{ét},c}(\text{Sh}_{\mu,\kappa(v)})$  coincides with the usual Hecke-algebra action, via the Satake-isomorphism. Cf.[?X-Z17]P125.

┘

*Proof:*

□

**Thm& Conj.Cor.(28.9.2.5)**. If  $\text{Sh}_{\mathcal{K}}(G, \mu)$  is a Shimura-set, then the conjecture(28.9.2.4) holds.

┘

*Proof:* Cf.[?X-Z17]P126?.

□

**Cor.(28.9.2.6)**. If the conjecture(28.9.2.4) holds, then the map  $\text{Spc}(28.9.2.3)$  induces a map

$$\text{J-L}_{\mu_i, \mu_j} : H_{\text{ét},c}(\text{Sh}_{\mu_i, \kappa(v)}) \otimes_{\mathbf{J}} \text{Hom}(\tilde{V}_i, \tilde{V}_j) \rightarrow H_{\text{ét},c}(\text{Sh}_{\mu_j, \kappa(v)}).$$

┘

### 3 Langlands-Rapoport Conjecture

**Notation(28.9.3.1)**.

- Let  $\mathcal{K}^p \leq G(\mathbf{A}_f^p)$  be a compact open subgroup.
- Let  $\mathcal{K}_p \leq G(\mathbb{Q}_p)$  be a parahoric subgroup.
- Let  $\mathcal{G}_{\mathcal{K}_p}/\mathbb{Z}_p$  be the Bruhat-Tits group scheme corresponding to  $\mathcal{K}_p$ .
- Denote  $\check{\mathcal{K}}_p \triangleq \mathcal{G}_{\mathcal{K}_p}(\mathcal{O}_{\check{\mathbb{Q}}_p})$ .

┘

**Def.(28.9.3.2)** [**Kottwitz-Rapoport Strata**]. Situation as in(28.5.4.2), for each  $w \in \mathcal{K}_p \backslash \text{Adm}(\mu^*)/\mathcal{K}_p$ , define

$$\text{K-R}_{\mathcal{K}_p, w} \triangleq (\lambda_{\mathcal{K}_p} \otimes \kappa(v))^{-1}(\mathcal{O}_w) \subset \mathcal{S}_{\mathcal{K}}(G, X),$$

which is a locally closed subscheme of  $\mathcal{S}_{\mathcal{K}}(G, X)$ .(Cf.[Haines, T.: Introduction to Shimura varieties with bad reduction of parahoric type]?)

┘

**Conj.(28.9.3.3)**[**Basic Non-Emptiness of Kottwitz-Rapoport Strata, He-Rapoport**[H-R17]].

Situation as in(28.9.3.2), if  $\tau = \tau_X \in \widetilde{W}$  is the unique element of length zero mapping to the image of  $X$  in  $\pi_1(G)_{I_{\mathbb{Q}_p}}$  (Cf.[P-R08]Appendix Lemma14?), and  $\mathcal{K}_p = \mathcal{I}_p \leq G(\mathbb{Q}_p)$  is an Iwahori-subgroup, then  $\text{K-R}_{\mathcal{I}_p, \tau}$ (28.9.3.2) intersects with every geometrically connected component of  $\mathcal{S}_{\mathcal{I}_p}(G, X)$ .

┘

*Proof:*

□

**Conj.Cor.(28.9.3.4)** [**Non-Emptiness of Kottwitz-Rapoport Strata, He-Rapoport**[H-R17]].

Situation as in(28.9.3.2), if conjecture(28.9.3.3) holds, then each Kottwitz-Rapoport Strata  $\text{K-R}_{\mathcal{K}_p, w}$  is non-empty and intersects with each geometrically connected component of  $\mathcal{S}_{\mathcal{K}}(G, X)$ .

┘

*Proof:* Cf.[H-R17]P325?.

□

**Conj. (28.9.3.5) [Newton-Strata, He-Rapoport].** Situation as in (28.5.4.2), there should be a **Newton-map**

$$\delta_{\mathcal{K}_p} : \overline{\mathcal{S}}_{G,X,\mathcal{K}} \rightarrow B(G, \mu^*)$$

s.t. for each  $[b] \in B(G)$ ,  $\mathcal{N}_{\mathcal{K}_p,[b]} \triangleq \delta_{\mathcal{K}_p}^{-1}([b])$  is a locally closed subscheme of  $\overline{\mathcal{S}}_{G,X,\mathcal{K}}$ , called the **Newton-stratum** of  $\overline{\mathcal{S}}_{G,X,\mathcal{K}}$ , and for each  $[b] \in B(G_{\mathbb{Q}_p}, X)$ , we have

$$\text{cl}(\mathcal{N}_{\mathcal{K}_p,[b]}) \subset \bigcup_{[b'] \preceq [b]} \mathcal{N}_{\mathcal{K}_p,[b']} \quad (28.6.1.35).$$

┘

*Proof:*

□

**Conj. (28.9.3.6) [Central Leaves, He-Rapoport].** Situation as in (28.5.4.2), let

- $\check{\mathcal{K}}_{p_\varphi} \leq \check{\mathcal{K}}_p \times \check{\mathcal{K}}_p$  be the graph of the Frobenius  $\varphi$ ,
- $G(\check{\mathbb{Q}}_p)/\check{\mathcal{K}}_{p_\varphi}$  the set of  $\check{\mathcal{K}}_p$ - $\sigma$ -conjugacy class of  $G(\check{\mathbb{Q}}_p)$ ,
- $\check{\mathcal{K}}_{p_1}$  be the pro-unipotent radical of  $\check{\mathcal{K}}_p$ .

Then there should be a natural **central leave map**

$$\Upsilon_{\mathcal{K}_p} : \overline{\mathcal{S}}_{G,X,\mathcal{K}_p} \rightarrow G(\check{\mathbb{Q}}_p)/\check{\mathcal{K}}_{p_\varphi}$$

making the following diagram commutative:

$$\begin{array}{ccccc}
 & & G(\check{\mathbb{Q}}_p)/(\check{\mathcal{K}}_p)_\varphi(\check{\mathcal{K}}_{p_1} \times \check{\mathcal{K}}_{p_1}) & \xrightarrow{\text{nat}_{\mathcal{K}_p}} & \check{\mathcal{K}}_p \backslash G(\check{\mathbb{Q}}_p)/\check{\mathcal{K}}_p \cong W_{\mathcal{K}_p} \backslash \widetilde{W}/W_{\mathcal{K}_p} \\
 & \nearrow v_{\mathcal{K}_p} & \uparrow & \nearrow \lambda_{\mathcal{K}_p} (28.5.4.2) & \nearrow \ell_{\mathcal{K}_p} \\
 \overline{\mathcal{S}}_{G,X,\mathcal{K}} & \xrightarrow{\Upsilon_{\mathcal{K}_p}} & G(\check{\mathbb{Q}}_p)/(\check{\mathcal{K}}_p)_\varphi & & \\
 & \searrow \delta_{\mathcal{K}_p} (28.9.3.5) & \downarrow d_{\mathcal{K}_p} & & \\
 & & B(G) & & 
 \end{array}$$

s.t.

- $\text{Im}(\Upsilon_{\mathcal{K}_p}) = \ell_{\mathcal{K}_p}^{-1}(\text{Im}(\lambda_{\mathcal{K}_p}))$ .

┘

*Proof:*

□

**Conj.Cor. (28.9.3.7).** Situation as in (28.9.3.2), if conjecture (28.9.3.3) and the joint stratification exist (28.9.3.6), then

$$\mathrm{Im}(\Upsilon_{\mathcal{K}_p}) = \bigcup_{w \in \mathcal{K}_p \backslash \mathrm{Adm}(\mu^*) / \mathcal{K}_p} \check{\mathcal{K}}_p w \check{\mathcal{K}}_p / \check{\mathcal{K}}_{p,\varphi}.$$

┘

*Proof:* This follows from (28.9.3.4) and (28.9.3.6). □

**Conj.Cor. (28.9.3.8) [Non-Emptiness of Newton-Strata].** Situation as in (28.9.3.5), for each  $[b] \in B(G_{\mathbb{Q}_p}, \mu^*)$ ,  $\mathcal{N}_{\mathcal{K}_p, [b]}$  intersects with each geometrically connected component of  $\overline{\mathcal{S}}_{G, X, \mathcal{K}}$ . ┘

*Proof:* It suffices to prove for  $\mathcal{K}_p = \mathcal{I}_p$  Iwahori, Cf. [H-R17]P27? □

$$\mathcal{N}_{\mathcal{K}_p, [b]} \cap \mathrm{cl}(\mathcal{N}_{\mathcal{K}_p, [b']}) \neq \emptyset \iff [b] \preccurlyeq [b'].$$

┘

*Proof:* Cf. [H-R17]P328? □

### EKOR-Strata

**Thm. (28.9.3.10) [Lusztig/He].** Notation as in (28.9.3.6), let  $\mathcal{I}_p$  be an Iwahori-subgroup contained in  $\mathcal{K}_p$ , then

- For each  $x \in {}^K \widetilde{W}$ , we have  $\check{\mathcal{K}}_{p,\varphi}(\check{\mathcal{K}}_{p1} x \check{\mathcal{K}}_{p1}) = \check{\mathcal{K}}_{p,\varphi}(\check{\mathcal{I}}_p x \check{\mathcal{I}}_p)$ .
- $G(\check{\mathbb{Q}}_p) = \coprod_{x \in {}^{\mathcal{K}_p} \widetilde{W}} \check{\mathcal{K}}_{p,\varphi}(\check{\mathcal{K}}_{p1} x \check{\mathcal{K}}_{p1}) = \coprod_{x \in {}^{\mathcal{K}_p} \widetilde{W}} \check{\mathcal{K}}_{p,\varphi}(\check{\mathcal{I}}_p x \check{\mathcal{I}}_p)$ .
- $\mathrm{nat}_{\mathcal{I}_p}$  (28.9.3.6) is bijective.

┘

*Proof:* Cf. [H-R17]P329? □

**Def. (28.9.3.11) [EKOR-Strata, He-Rapoport [H-R17]].** Situation as in (28.5.4.2), if the joint stratification exists (28.9.3.6), then for each  $x \in \mathcal{K}_p \mathrm{Adm}(\mu^*) \mathcal{K}_p \cap {}^{\mathcal{K}_p} \widetilde{W}$ , we define

$$\mathrm{EKOR}_{\mathcal{K}_p, x} \triangleq v_{\mathcal{K}_p}^{-1}(x) \subset \overline{\mathcal{S}}_{G, X, \mathcal{K}},$$

called the **Ekedahl-Kottwitz-Oort-Rapoport stratum** or **EKOR-stratum** attached to  $x$ . By definition (28.9.3.6), each EKOR-stratum is contained in some Kottwitz-Rapoport-stratum.

Then each EKOR-stratum is locally closed in  $\overline{\mathcal{S}}_{G, X, \mathcal{K}_p}$ , and for each  $x \in \mathcal{K}_p \mathrm{Adm}(\mu^*) \mathcal{K}_p \cap {}^{\mathcal{K}_p} \widetilde{W}$ , we have

$$\mathrm{cl}(\mathrm{EKOR}_{\mathcal{K}_p, x}) = \coprod_{x' \in {}^{\mathcal{K}_p} \widetilde{W}, x' \preccurlyeq_{\mathcal{K}_p, \varphi} x} \mathrm{EKOR}_{\mathcal{K}_p, x'}.$$

┘

*Proof:* Cf. [H-R17]P334? □

**Prop. (28.9.3.12) [EKOR-Strata and Newton-Strata, He-Rapoport [H-R17]].** Situation as in (28.9.3.11), each Newton stratum  $\mathcal{N}_{\mathcal{K}_p, [b]}$  for  $[b] \in B(G_{\mathbb{Q}_p}, \mu^*)$  contains some EKOR-stratum (28.9.3.11). ┘

*Proof:* [H-R17]P335? □

**Conj.Cor.(28.9.3.13) [Finiteness of Fibers, He-Rapoport[H-R17]].** Situation as in (28.9.3.11), if  $\mathcal{I}_p \leq \mathcal{K}_p$  is an Iwahori-subgroup, then for each  $x \in \mathcal{K}_p \text{Adm}(\mu^*) \mathcal{K}_p \cap {}^{\mathcal{K}_p} \widetilde{W}$ ,

$$\pi_{\mathcal{I}_p \mathcal{K}_p, \mathcal{K}} : \text{K-R}_{\mathcal{I}_p, x} \rightarrow \text{EKOR}_{\mathcal{K}_p, x}$$

is a finite morphism. In particular,  $\dim \text{K-R}_{\mathcal{I}_p, x} = \dim \text{EKOR}_{\mathcal{K}_p, x}$ . ┘

*Proof:* Cf.[H-R17]P337. □

## 4 Abelian-Type Shimura Varieties

See [Kisin, Mod  $p$  points on Shimura varieties of abelian type]. Kisin proved a variant of the Langlands-Rapoport conjecture for all Abelian-type Shimura varieties at hyperspecial levels at  $p \in \text{Prime}_{\geq 3}$ .

### Unramified cases

**Def.(28.9.4.1) [ $I_x$ , Kisin].** For each  $x \in |\text{Sh}_{\mu, K}|_0$ , Kisin defined some group schemes:

- $I_{\ell/\kappa(x)} \leq \text{GL}(H^1(A_{\overline{x}}, \mathbb{Q}_{\ell})) \times \text{GL}(\mathbb{Q}_{\text{ét}}(1)_{\ell})$ ?
- The sequence  $\{I_{\ell/\kappa(x)_n}\}$  stabilizes to a group scheme  $I_{\overline{x}, \ell}$ .
- $I_{p/\kappa(x)} \leq \text{GL}(\mathbb{D}(A_x)) \times \text{GL}(\mathcal{O}_{\text{crys}}(1)(W(\kappa(x))))$ ?
- The sequence  $\{I_{p/\kappa(x)_n}\}$  stabilizes to a group scheme  $I_{\overline{x}, p}$ .
- $I_{/\kappa(x)} \leq \text{End}(A_x) * \times \mathbb{G}_m$ ?
- The sequence  $\{I_{/\kappa(x)_n}\}$  stabilizes to a group scheme  $I_{\overline{x}}$ .

Then for each  $v \in \text{Prime}$ , there is a natural isomorphism

$$I_{\overline{x}} \otimes \mathbb{Q}_v \cong I_{\overline{x}, v},$$

and  $I$  is an inner form of a Levi-subgroup  $I_0 \leq G$ , which can be described explicitly in [?X-Z17]P115? ┘

*Proof:* Cf.[Kisin, Mod  $p$  points on Shimura varieties of abelian type]Section2.1.2?, Section2.3 and [?X-Z17]P114. □

### Localization Maps to Shtukas

**Notation(28.9.4.2).**

- Let  $\text{Sh}_{\mu} \triangleq \left( \mathcal{S}_{\mathcal{K}_p \mathcal{K}^p}(G, \{\mu\}) \otimes \kappa(v) \right)^{\text{perf}}$  where  $\mathcal{K}_p$  is hyperspecial.
- ┘

**Prop.(28.9.4.3) [Localization Maps].** If we denote  $\mathcal{E} \triangleq (\varphi_K^{-1})^* \mathcal{E}_{\text{crys}}$ , then there is a local  $G$ -shtuka

$$\beta : \mathcal{E} \rightarrow {}^{\varphi_K} \mathcal{E},$$

over  $\text{Sh}_{\mu, K}$  s.t.  $\text{inv}(\beta) = \mu$ , which corresponds to a morphism of prestacks

$$\text{loc}_v : \text{Sh}_{\mu} \rightarrow \text{Sht}_{\mu}^{\text{loc}}.$$

And for any  $m, n \in \mathbb{N}$  s.t.  $m - n$  is  $\mu$ -large<sup>?</sup>, the composition

$$\mathrm{loc}_v(m, n) : \mathrm{Sh}_\mu \rightarrow \mathrm{Sht}_\mu^{\mathrm{loc}} \xrightarrow{\mathrm{res}_{m,n}} \mathrm{Sht}_\mu^{\mathrm{loc}(m,n)}$$

is perfectly smooth. ┘

*Proof:* Cf.[?X-Z17]P112<sup>?</sup>. □

**Def. (28.9.4.4) [Newton-Maps].** There is a **Newton-map**

$$\nu_\mu : \mathrm{Sht}_\mu^{\mathrm{loc}}(\bar{k}) \rightarrow B(G, \mu^*).$$

Cf.[?X-Z17]P69. ┘

**Prop. (28.9.4.5) [Newton-Strata in the Hyperspecial case].** Consider the map

$$\nu_\mu : \mathrm{Sh}_{\mu, \mathcal{K}}(\overline{\kappa(v)}) \xrightarrow{\mathrm{loc}_v} \mathrm{Sh}_\mu^{\mathrm{loc}}(\overline{\kappa(v)}) \xrightarrow{\nu_\mu} B(G_{\mathbb{Q}_p}, \mu^*) \text{ (28.9.4.4)(28.9.4.3),}$$

then it satisfies the requirement of Newton-map in (28.9.3.5). ┘

*Proof:* Cf.[Wortmann, The  $\mu$ -ordinary locus for Shimura varieties of Hodge type]<sup>?</sup>. □

**Prop. (28.9.4.6) [Non-Emptiness of Newton-Strata].** Each Newton-stratum  $\mathrm{Sh}_{\mathcal{K}_p, [b']}$  (28.9.4.5) is non-empty. ┘

*Proof:* <sup>?</sup> Cf.[Kisin-Pera-Shin]. [?X-Z17]P114 for a proof in the unramified basic locus case.<sup>?</sup> □

### Rapoport-Zink Uniformizations

**Prop. (28.9.4.7) [ $I_x$  for Basic Elements].** For each  $x \in |\mathrm{Sh}_{\mu, \mathcal{K}}|_0$ , we get an element  $b_x \in G(W(\kappa(x)))\mu^*(p)G(W(\kappa(x)))$  which is well-defined up to  $\sigma$ -conjugacy by an element of  $G(W(\kappa(x)))$ .

If  $[b_x] \in B(G_{\mathbb{Q}_p, \mu^*})$  is basic, then  $I_{\bar{x}}$  is an inner form of  $G$ . In particular,  $I_{\bar{x}, p} \cong J_{b_x}$  is an inner form of  $G_{\mathbb{Q}_p}$ . (Notice that in general  $I_{\bar{x}, p} \subsetneq J_{b_x}$ ).

In particular, if  $[b_x] \in B(G_{\mathbb{Q}_p}, \mu^*)$  is basic, then there exists a unique inner twist  $(I_x, \Psi_x) \in H^1(\mathbb{Q}, G_{\mathrm{ad}})$  s.t.

- it is trivial at  $\ell \notin \{p, \infty\}$ ,
  - it corresponds to  $[(b_x)_{\mathrm{ad}}] \in B(G_{\mathrm{ad}, \mathbb{Q}_p})_{\mathrm{bas}} \cong H^1(\mathbb{Q}_p, G_{\mathrm{ad}})$  at  $p$ ,
  - $(I_x)_{\mathbb{R}}$  is compact modulo center.
- ┘

*Proof:* Cf.[?X-Z17]P117 and [Kisin17]Cor2.3.5.<sup>?</sup> □

**Cor. (28.9.4.8).** If  $[b_x] \in B(G_{\mathbb{Q}_p}, \mu^*)$  is basic and unramified, then the inner twisting  $(I_x, \Psi_x)$  is trivial at all finite places and  $(I_x)_{\mathbb{R}}$  is compact modulo center.

Notice that this is a special case of [?X-Z17]2.1.6. and 4.2.10. ┘

*Proof:* Cf.[?X-Z17]P118. □

**Thm. (28.9.4.9) [Unramified Hodge-Type Rapoport-Zink Uniformizations].** The basic locus  $\mathrm{Sh}_{\mu, \mathcal{K}_p, \mathrm{bas}}$  contains a unique isogeny class, and the map

$$I_x(\mathbb{Q}) \backslash X_{\mu^*}(b_x) \times G(\mathbf{A}_f^p) / \mathcal{K}^p \rightarrow (\mathrm{Sh}_{\mu, \mathcal{K}})_{\bar{\kappa}(v)}$$

maps isomorphically onto  $\mathrm{Sh}_{\mu, \mathcal{K}, \mathrm{bas}}^{\mathrm{perf}}$ . ┘

*Proof:* Cf.[?X-Z17]P118<sup>?</sup>. □

References are [EKOR STRATA FOR SHIMURA VARIETIES WITH PARAHORIC LEVEL STRUCTURE, Shen-Yu-Zhang].

**Notation (28.9.5.1).**

- Let  $G = \mathrm{GL}(2)$  and  $(G, X)$  the usual Shimura-datum.
- Let  $\mathcal{K}_p \leq G(\mathbb{Q}_p)$ ,  $\mathcal{K}^p \leq G(\mathbf{A}_f^p)$  and  $\mathcal{K} = \mathcal{K}_p \mathcal{K}^p \leq G(\mathbf{A}_f)$ .

└

References are [cohomology of certain PEL-type Shimura varieties, Mantovan].

## Inner Forms Computation

**Prop. (28.9.7.1)[Inner Twistings Trivial at Finite Places].** If  $G, G' \in \text{RedGrp}/\mathbb{Q}$  s.t.  $G_{\mathbf{A}_f} \cong G'_{\mathbf{A}_f}$ .

Then  $G$  and  $G'$  has the same pinned Langlands dual groups  $(\widehat{G}, \widehat{B}, \widehat{T}, \{\widehat{X}_\alpha\})$ , and the action of  $\text{Gal}_{\mathbb{Q}_\ell}$  on  $(\widehat{G}, \widehat{B}, \widehat{T}, \{\widehat{X}_\alpha\})$  induced by  $G$  or  $G'$  are the same, so the action of  $\text{Gal}_{\mathbb{Q}}$  are also the same.

So we can choose an inner twisting  $\Psi : G_{\overline{\mathbb{Q}}} \rightarrow G'_{\overline{\mathbb{Q}}}$  s.t. the cohomology class of  $(G', \Psi)$  in  $H^1(\mathbb{Q}, G_{\text{ad}})$  is trivial at all finite places. Thus  $\kappa_{G_{\text{ad}, \mathbb{R}}}((G'_{\mathbb{R}}, \Psi_{\mathbb{R}}))$  is trivial on  $Z(\hat{G}_{\text{sim, cntd}})^{\text{Gal}_{\mathbb{Q}}}$ .

Conversely, if  $(G'_\mathbb{R}, \Psi_\mathbb{R})$  is an inner twisting of  $G_\mathbb{R}$  s.t.  $\kappa_{G_\mathbb{R}}([G'_\mathbb{R}, \Psi_\mathbb{R}])$  is trivial on  $Z(\widehat{G}_{\text{sim.cntd}})^{\text{Gal}_\mathbb{Q}}$ , then there exists a unique inner twisting  $(G, \Psi) \in H^1(\mathbb{Q}, G)$  which restricts to  $(G'_\mathbb{R}, \Psi_\mathbb{R})$  at  $\infty$  and trivial at all finite places.  $\square$

*Proof:* The uniqueness follows from Hasse's principle for adjoint groups(10.5.2.13), and the existence follows from(20.5.5.4).  $\square$

**Prop. (28.9.7.2) [Compact Inner Forms for Shimura-Data].** If  $(G, h)$  is a Shimura-datum, then  $\text{ad}(h(i))$  is an involution on  $G_{\text{ad}}$ , and also defines a cohomology class in  $H^1(\mathbb{R}, G_{\text{ad}, \mathbb{R}})$  as in (10.2.5.8), corresponding to the inner form

$$G_c = \{g \in G \otimes \mathbb{C} | h(\mathbf{i})\iota(g) = gh(\mathbf{i})\}.$$

Then we have

$$\kappa_{G_{\text{ad},\mathbb{R}}}([G_C, \text{ad}(h(i))]) = \mu_{h,\text{ad}}|_{Z(\widehat{G}_{\text{sim.cntd}})^{\text{Gal}_{\mathbb{R}}}} \in X^\bullet\left(Z(\widehat{G}_{\text{sim.cntd}})^{\text{Gal}_{\mathbb{R}}}\right),$$

where the Hodge-cocharacter  $\mu_{h,\text{ad}} \in X_\bullet(G_{\text{ad}})$  (28.1.1.3) is regarded as a character of  $\hat{T}_{\text{sim.cntd.}}$ .  $\square$

*Proof:* Cf. [X-Z17]P16.

☐

**Cor.(28.9.7.3)[Real Canonical Inner Twisting via Compact Inner Forms].** Let  $(G, h), (G', h')$  be two real Shimura-data s.t. the compact modulo center forms  $G_c, G'_c$  (28.9.7.2) are isomorphic, then there is a canonical inner twisting  $\Psi : G_{\mathbb{C}} \rightarrow G'_{\mathbb{C}}$  s.t.

$$\kappa_{G_{\text{ad}}}([G', \Psi]) = \mu_{h, \text{ad}}|_{Z(\widehat{G}_{\text{sim.cntd}})^{\text{Gal}_{\mathbb{R}}}} - \mu_{h', \text{ad}}|_{Z(\widehat{G}_{\text{sim.cntd}})^{\text{Gal}_{\mathbb{R}}}} \in X^{\bullet}\left(Z(\widehat{G}_{\text{sim.cntd}})^{\text{Gal}_{\mathbb{R}}}\right).$$

┘

*Proof:* Cf. [X-Z17]P17?.

□

**Cor. (28.9.7.4) [Locally Trivial Compact Inner Forms].** Let  $(G, h)$  be a Shimura-datum.

If  $(G'_R, h')$  is a pair where  $G'_R \in \text{RedGrp}/\mathbb{R}$  and  $h \in \text{Hom}(\$, G'_R)$  satisfying (W) and (R) as in (X-Z17)P16) whose compact inner form defined in (28.9.7.2) is isomorphic to the one for  $G_R$ , and

$$\mu_{h,\text{ad}}|_{Z(\widehat{G}_{\text{sim.cntd}})^{\text{Gal}\mathbb{Q}}} = \mu_{h',\text{ad}}|_{Z(\widehat{G}_{\text{sim.cntd}})^{\text{Gal}\mathbb{Q}}},$$

then up to isomorphism there is a unique inner form  $(G', \Psi') \in H^1(\mathbb{Q}, G_{\text{ad}})$  that is trivial at all finite places and restricts to the canonical inner twisting  $(G'_R, \Psi_R)$  (28.9.7.3) at  $\infty$ .

In particular, if  $\mu_{h,\text{ad}}|_{Z(\widehat{G}_{\text{sim.cntd}})^{\text{Gal}\mathbb{Q}}} = 0$ , then up to isomorphism there is a unique inner twisting  $(G', \Psi) \in H^1(\mathbb{Q}, G_{\text{ad}})$  trivial at all finite places s.t.  $G'_R$  is compact modulo center. ┘

*Proof:* This follows from (28.9.7.1)(28.9.7.2) and (28.9.7.3). □

### Cohomological Correspondences

**Notation (28.9.7.5).**

- Let  $(G_1, \mathcal{N}_1), (G_2, \mathcal{N}_2)$  be two Shimura-data s.t.  $(G_1)_{\mathbf{A}_f} \cong (G_2)_{\mathbf{A}_f}$ .
- For  $i \in \{1, 2\}$ , let  $E_i$  be the reflex field of  $(G_i, \mathcal{N}_i)$ . Let  $E = E_1 E_2$ .
- By (28.9.7.1) there exists an inner twisting  $\Psi : (G_1)_{\overline{\mathbb{Q}}} \rightarrow (G_2)_{\overline{\mathbb{Q}}}$  s.t. there exists  $h \in (G_2)_{\text{ad}}(\overline{\mathbf{A}_f})$  and  $\theta : (G_1)_{\mathbf{A}_f} \cong (G_2)_{\mathbf{A}_f}$  s.t.

$$\Psi = \text{int}(h) \circ \theta_{\overline{\mathbf{A}_f}}.$$

- Let  $p \in \text{Prime}$  and  $v \in S_E(p)$ .
- Let  $\mathcal{K}_1 = \mathcal{K}_{1,p} \mathcal{K}_1^p \leq G_1(\mathbf{A}_f)$  be a neat compact subgroup and denote  $\mathcal{K}_2 \triangleq \theta(\mathcal{K}_1)$ .
- Denote  $\mathbf{J} \triangleq \mathbf{J}_{\widehat{G}} = \overline{\mathbb{Q}_\ell}[\widehat{G}\sigma_p]^{\widehat{G}}$  (28.9.2.1).

┘

**Situation (28.9.7.6) [Hypothesis].**

- $\text{Sh}_{K_i}(G_i, \mathcal{N}_i)$  has a canonical integral model over  $\mathcal{O}_{E_i(v)}$ . Let  $\text{Sh}_{\mu_i, \mathcal{K}_i}$  be the perfection of the special fiber of the canonical integral model. Then there exists a morphism  $\text{loc}_v : \text{Sh}_{\mu_i, \mathcal{K}_i} \rightarrow \text{Sht}_{\mu_i}^{\text{loc}}$  s.t.

$$\text{loc}_v^{(m,n)} \triangleq \text{res}_{m,n} \circ \text{loc}_v : \text{Sh}_{\mu_i, \mathcal{K}_i} \rightarrow \text{Sht}_{\mu_i}^{\text{loc}(m,n)}$$

is perfectly smooth for any pair  $(m, n) \in \mathbb{Z}$  s.t.  $m - n$  is  $\mu_i$ -large?.

- Assume  $\mu_1|_{Z(\widehat{G})^{\text{Gal}\mathbb{Q}_p}} = \mu_2|_{Z(\widehat{G})^{\text{Gal}\mathbb{Q}_p}}$ , then there exists a perfect ind-scheme  $\text{Sh}_{\mu_1|\mu_2}$  fitting into the following commutative diagram

$$\begin{array}{ccccc} \text{Sh}_{\mu_1, \mathcal{K}_1} & \longleftarrow & \text{Sh}_{\mu_1|\mu_2} & \longrightarrow & \text{Sh}_{\mu_2, \mathcal{K}_2} \\ \downarrow \text{loc}_v & & \downarrow & & \downarrow \text{loc}_v \\ \text{Sh}_{\mu_1}^{\text{loc}} & \longleftarrow & \text{Sh}_{\mu_1|\mu_2}^{\text{loc}} & \longrightarrow & \text{Sh}_{\mu_2}^{\text{loc}} \end{array}$$

s.t. both squares are Cartesian.

⌋

**Thm. (28.9.7.7) [Xiao-Zhu].** Item 1 of Hypothesis(28.9.7.6) holds for Shimura-data of Hodge-type. And item2 of Hypothesis(28.9.7.6) is expected to hold when

$$\mathrm{Hom}_{\mathrm{coh}_{f_r}(\widehat{G}_{\sigma_p})}(\widetilde{V}_{\mu'}, \widetilde{V}_{\mu}) \neq 0.$$

And it is verified when  $(G_1, \mathcal{N}_1) = (G_2, \mathcal{N}_2)$  or  $\mathrm{Sh}_{\mathcal{K}}(G, n)$  is a Shimura set, or  $(G, \mathcal{N})$  is of PEL-type.

⌋

*Proof:* ?

□

## 8 Basic Loci

**Notation (28.9.8.1).**

- Let  $(G, \mathcal{N})$  be a Hodge-type Shimura-datum.  $Z(G)$  is connected,
- Let  $p \in \mathrm{Prime}_{\geq 2}$  s.t.  $V_{\mu^*}^{\mathrm{Tate}} \neq 0$ ?. In particular, the basic element  $b \in B(G_{\mathbb{Q}_p}, \mu^*)$  is unramified by(28.7.4.7). As  $Z(G)$  is connected, we can write  $b = [\varpi^{\tau^*}]$  for some  $\tau^* \in X_{\bullet}(Z(G))$ , by(28.7.4.7).
- Let  $E$  be the reflex field of  $(G, \mathcal{N})$ , and let  $v \in S_E(p)$ .
- Let  $\lambda_b \in X_{\bullet}(T)_{\mathrm{Gal}_{\kappa}}$  be the element associated to  $b$  via the identification(28.7.4.3).
- By(28.7.4.7) and(28.9.7.4), there exists an inner twisting  $\Psi : G_{\overline{\mathbb{Q}}} \rightarrow G'_{\overline{\mathbb{Q}}} \in H^1(\mathbb{Q}, G_{\mathrm{ad}})$  s.t.  $\Psi$  is trivial at all finite places and  $G'_{\mathbb{R}}$  is compact modulo center.
- Let  $\mathcal{K} = \mathcal{K}_p \mathcal{K}^p \leq G(\mathbf{A}_f)$  is a neat open compact subgroup s.t.  $\mathcal{K}_p$  is hyperspecial.
- Let  $\mathrm{Sh}_{\mu}$  be the special fiber of the Shimura variety  $\mathrm{Sh}_{\mathcal{K}}(G, \mathcal{N})$  over  $\mathcal{O}_{E_v}$ . Denote  $d = \langle 2\rho, \mu \rangle = \dim \mathrm{Sh}_{\mu}$ .

⌋

**Prop. (28.9.8.2) [Irreducible Components of Basic Loci, Xiao-Zhu].** Let  $x \in \left| \left( \mathrm{Sh}_{\mu, \mathcal{K}_p} \right)_{\mathrm{bas}} \right|_0$ , and  $b_x \in G(\check{K})$  be a representative for  $\mathrm{loc}_p(x) \in |\mathrm{Sh}_{\mu}^{\mathrm{loc}}|_0$ . Define

$$\mathbf{M}\text{-}\mathbf{V}_{\mu^*}^{\mathrm{Tate}} \triangleq \coprod_{\lambda \in X_{\bullet}(T)^+, \lambda^{\natural} = \lambda_b} \mathbf{M}\text{-}\mathbf{V}_{\mu^*}[\lambda] \quad (28.9.8.1),$$

then by(28.7.4.11)?, there is a canonical decomposition

$$X_{\mu^*}(b_x) = \bigcup_{\mathbf{b} \in \mathbf{M}\text{-}\mathbf{V}_{\mu^*}^{\mathrm{Tate}_p}} X_{\mu^*}^{\mathbf{b}}(b_x).$$

Thus by Rapoport-Zink uniformization(28.9.4.9), we can decompose  $\mathrm{Sh}_{\mu, \mathrm{bas}}$  as the union of

$$\mathrm{Sh}_{\mu, \mathrm{bas}}^{\mathbf{b}} \triangleq I_x(\mathbb{Q}) \backslash X_{\mu^*}^{\mathbf{b}}(b_x) \times G(\mathbf{A}_f^p) / \mathcal{K}^p$$

for  $\mathbf{b} \in \mathbf{M}\text{-}\mathbf{V}_{\mu^*}^{\mathrm{Tate}}$ . This decomposition is independent of the choice of  $x$  and  $b_x$ ?.

Then by(28.7.4.11),  $(\mathrm{Sh}_{\mu, \mathcal{K}, \mathrm{bas}})_{\overline{\kappa_v}}$  is equidimensional of dimension  $d/2$ (28.9.8.1), and there is a bijection between the set of geometric irreducible components of  $\mathrm{Sh}_{\mu, \mathcal{K}, \mathrm{bas}}$  and  $G'(\mathbb{Q}) \backslash G(\mathbf{A}_f) / \mathcal{K} \times \mathbf{M}\text{-}\mathbf{V}_{\mu^*}^{\mathrm{Tate}_p}$ ?.

⌋

**Prop.(28.9.8.3)** [Class Maps and Geometric Jacquet-Langlands Maps]. The cycle class map( ? Cf.[?X-Z17]A.2.18) induces

$$\mathrm{cl}(\mathbf{b}) \triangleq \mathrm{cl}(\mathrm{Sh}_{\mu, \mathrm{bas}}^{\mathbf{b}}) : H_d^{\mathrm{B-M}} \left( \left( \mathrm{Sh}_{\mu, \mathrm{bas}}^{\mathbf{b}} \right)_{\overline{\kappa(v)}} \right) \cong C(G'(\mathbb{Q}) \backslash G'(\mathbf{A}_f) / \mathcal{K}) \rightarrow H_{\mathrm{ét}, c}^d \left( \mathrm{Sh}_{\mu, \kappa(v)}, \overline{\mathbb{Q}_\ell}(d/2) \right),$$

and we denote

$$\mathrm{cl}(\mathrm{Sh}_{\mu, \mathrm{bas}}) : \bigoplus_{\mathbf{b}} H_d^{\mathrm{B-M}} \left( \left( \mathrm{Sh}_{\mu, \mathrm{bas}}^{\mathbf{b}} \right)_{\overline{\kappa(v)}} \right) \rightarrow H_{\mathrm{ét}, c}^d \left( \mathrm{Sh}_{\mu, \kappa(v)}, \overline{\mathbb{Q}_\ell}(d/2) \right).$$

Then there is a commutative diagram

$$\begin{array}{ccc} H_{\mathrm{ét}, c}^0 \left( \mathrm{Sh}_{\tau_{\mathbf{b}}, \kappa(v)} \right) & \xrightarrow{\cong} & H_d^{\mathrm{B-M}} \left( \mathrm{Sh}_{\mu, \mathrm{bas}, \kappa(v)}^{\mathbf{b}} \right) \\ & \searrow \mathrm{J-L}_{\tau_{\mathbf{b}}, \mu}(\mathbf{a}_{in}) & \swarrow \mathrm{cl}(\mathbf{b}) \\ & H_{\mathrm{ét}, c}^d \left( \mathrm{Sh}_{\mu, \kappa(v)}, \overline{\mathbb{Q}_\ell}(d/2) \right) & \end{array}$$

┘

*Proof:* Cf.[?X-Z17]P127 ?.

□

### Hilbert Modular Surfaces

**Notation(28.9.8.4).**

- Let  $F$  be a real quadratic field.
- $p \in \mathrm{Prime}_{\geq 3}$  is inert in  $F$ , with  $(p) = \mathfrak{p}_v$ .
- Let  $\sigma_p \in \mathrm{Gal}_{\mathbb{Q}_p}$  be a geometric Frobenius.
- Let  $G = \mathrm{Res}_{F/\mathbb{Q}} \mathrm{PGL}(2)$ .
- Let  $\mathcal{K}_p \leq G(\mathbb{Q}_p)$  be a hyperspecial subgroup,  $\mathcal{K}^p \leq G(\mathbf{A}_f^p)$  sufficiently small compact open and  $\mathcal{K} = \mathcal{K}^p \mathcal{K}_p \leq G(\mathbf{A}_f)$ .

┘

The Langlands dual group  $\widehat{G} = \mathrm{SL}(2) \times \mathrm{SL}(2)$ , and  $\sigma_p$  acts via interchanging the two factors. The Hodge cocharacter is given by  $\mu = (1, 1) \in \widehat{T} \cong \mathbb{Z}^2$ ,  $\mu^* = \mu$ , thus  $V_{\mu^*} = \mathrm{Std}^* \times \mathrm{Std}^*$ .

**Prop.(28.9.8.5).** Let  $\mathrm{Sh}_{\mathcal{K}}(G, X)$  be the Hilbert modular surface, which admits an integral model  $\mathcal{S}_{G, \mathcal{K}}$  over  $\mathbb{Z}_{(p)}$ , and denote  $\mathcal{S}_{G, \mathcal{K}} = \mathcal{S}_{G, \mathcal{K}} \otimes \mathbb{F}_{p^2}$  the special fiber.

In this case,

$$\Lambda^{\mathrm{Tate}_p} = \{ \lambda \in X^\bullet(\widehat{T}) \mid \lambda + \sigma_p(\lambda) \in X_\bullet(Z_G) \} = \{ (m, -m) \}$$

and

$$V_{\mu^*}^{\mathrm{Tate}_p} = V_{\mu^*}(\lambda_1) \oplus V_{\mu^*}(\lambda_2), \text{ where } \lambda_1 = (-1, 1), \quad \lambda_2 = (1, -1).$$

┘

Notice that  $\lambda_1(p) = \lambda_2(p) \in B(G, \mu^*)$  is just the unramified basic element because  $\sum_{i=0}^m \sigma_p^i(\lambda)$  is just a multiple of the newton polygon  $\nu_{\lambda(p)}$  of  $\lambda(p)$ .([X-Z]Prop4.2.10).

**Prop. (28.9.8.6) [Rapoport-Zink Uniformization].** Let  $G'$  be the compact inner form of  $G$ , which is  $G' = \text{Res}_{F/\mathbb{Q}} \mathbb{P}B^*$ , where  $B \in \text{QuatAlg}_F$  is ramified exactly at the two Archimedean places.

Let  $\overline{\mathcal{S}}_{G,\mathcal{K}} = \mathcal{S}_{G',\mathcal{K}} \otimes \mathbb{F}_{p^2}$  be the special fiber of the discrete Shimura variety.

There are natural Jacquet-Langlands correspondences (Cf. [X-Z]7.3.4).

$$\begin{array}{ccc} X_{\mathbf{b}_i} \triangleq G'(\mathbb{Q}) \backslash X_{\mu^*}^{\mathbf{b}_i, \min}(1) \times G'(\mathbf{A}_f) / \mathcal{K} & & \\ \swarrow \text{(\mathbb{P}^1)^{perf-bundles}} & & \searrow \\ \overline{\mathcal{S}}_{G',\mathcal{K}} & & \overline{\mathcal{S}}_{G,\mathcal{K}}^{\text{perf}} \end{array}, \quad i \in \{1, 2\}$$

s.t.  $X_{\mathbf{b}_1} \cup X_{\mathbf{b}_2} \rightarrow \overline{\mathcal{S}}_{G,\mathcal{K},b}^{\text{perf}}$  is the surjective Rapoport-Zink uniformization.

Where  $\mathbf{b}_i$  are the MV-cycles. ┘

**Prop. (28.9.8.7) [Mirkovic-Vilonen Cycles].** So each

$$\mathbf{M}\text{-}\mathbf{V}_{\mu^*}[\lambda_i] = \{\mathbf{b}_i\}$$

is a singleton, and by philosophy of Xiao-Zhu4.2.10 we can choose the minimal dominant coweights

$$\nu_{\mathbf{b}_1} = (1, 0), \quad \nu_{\mathbf{b}_2} = (0, 1)$$

s.t.  $\lambda_i + \nu_i^* - \sigma_p(\nu_i^*) = \tau_i^* = 0$  is dominant, and  $\mathbf{b}_i$  is in the image of

$$i_{\nu_i^*}^{\mathbf{M}\text{-}\mathbf{V}} : \mathbb{S}_{(\nu_i^*, \mu^*)|\lambda_i + \nu_i^*} \rightarrow \mathbf{M}\text{-}\mathbf{V}_{\mu^*}[\lambda_i],$$

i.e. there exist  $\mathbf{a}_i \subset \mathbb{S}_{(\nu_i^*, \mu^*)|\lambda_i + \nu_i^*}$  s.t.

$$\mathbf{a}_i \cap (S_{\mu^*} \widetilde{\times} S_{\lambda_i}) = (S_{\nu_i^*} \cap \text{Gr}_{\nu_i^*}) \widetilde{\times} \mathbf{b}_i.$$

$X_{\mu^*}^{\mathbf{b}_i, \min}(\tau_i) = (\mathbb{P}^1)^{\text{perf}}$ , where  $\tau_i(p) = \mathbf{1}$  is just the unramified minimal element in  $B(G, \mu^*)$ . ┘

**Prop. (28.9.8.8) [Irreducible Components of ADLV].** Then we recall that  $X_{\mu^*}^{\mathbf{b}_i, \min}(\tau_i) \subset X_{\mu^*}(\tau_i)$  is the unique irreducible component of maximal dimension of the fiber product

$$\begin{array}{ccc} X_{\mu^*, \nu_i^*}^{\mathbf{a}_i}(\tau_i) & \longrightarrow & \mathbf{a}_i \subset \text{Gr}_{(\nu_i^*, \mu^*)|\lambda_i + \nu_i^*}^0 \\ \downarrow & & \downarrow \text{pr}_1 \times \text{pr}_3 \\ \text{Gr}_{\nu_i^*} & \xrightarrow{\text{id} \times \tau_i(p) \sigma_p} & \text{Gr}_{\nu_i^*} \times \text{Gr}_{\lambda_i + \nu_i^*} \end{array}$$

Because in this case  $\nu_i$  are all minuscule, this fiber product is already irreducible, and equals the perfection of the Deligne-Lusztig variety of  $\text{PGL}(2; \mathbb{F}_{p^2})$ , which is just  $(\mathbb{P}_{\mathbb{F}_{p^2}}^1)^{\text{perf}}$ . ┘

These geometric Jacquet-Langlands correspondences

$$\begin{array}{ccc} & X_{\mathbf{b}_i} & \\ \swarrow \text{(\mathbb{P}^1)^{perf-bundles}} & & \searrow \\ \overline{\mathcal{S}}_{G',\mathcal{K}} & & \overline{\mathcal{S}}_{G,\mathcal{K}}^{\text{perf}} \end{array}$$

induce natural  $\mathcal{H}_{\mathcal{K}}$ -equivariant maps

$$\mathrm{J}\text{-}\mathrm{L}_{\tau_i, \mu}(\mathbf{a}_{i, \mathrm{in}}) : \mathrm{H}_{\mathrm{\acute{e}t}}^0(\overline{\mathcal{S}}_{G', \mathcal{K}, \overline{\mathbb{F}}_p}, \overline{\mathbb{Q}}_{\ell}) \cong \mathrm{H}_{\mathrm{\acute{e}t}}^0(X_{\mathbf{b}_i, \overline{\mathbb{F}}_p}, \overline{\mathbb{Q}}_{\ell}) \xrightarrow{\mathrm{Gys}_{\mathbf{b}_i}} \mathrm{H}_{\mathrm{\acute{e}t}, c}^2(\overline{\mathcal{S}}_{G, \mathcal{K}, \overline{\mathbb{F}}_p}^{\mathrm{perf}}, \overline{\mathbb{Q}}_{\ell}),$$

$$\mathrm{J}\text{-}\mathrm{L}_{\mu, \tau_j}(\mathbf{a}_{i, \mathrm{out}}) : \mathrm{H}_{\mathrm{\acute{e}t}, c}^2(\overline{\mathcal{S}}_{G, \mathcal{K}, \overline{\mathbb{F}}_p}^{\mathrm{perf}}, \overline{\mathbb{Q}}_{\ell}) \xrightarrow{\mathrm{Res}_{\mathbf{b}_j}} \mathrm{H}_{\mathrm{\acute{e}t}, c}^2(X_{\mathbf{b}_j, \overline{\mathbb{F}}_p}, \overline{\mathbb{Q}}_{\ell}) \cong \mathrm{H}_{\mathrm{\acute{e}t}}^0(\overline{\mathcal{S}}_{G', \mathcal{K}, \overline{\mathbb{F}}_p}, \overline{\mathbb{Q}}_{\ell}).$$

I'll explain the name in another example.

**Prop. (28.9.8.9) [Intersection Matrix].** The composition of these two maps for  $i, j \in \{1, 2\}$  gives a matrix

$$\begin{bmatrix} -2p & T_p \\ T_p & -2p \end{bmatrix} : C(G'(\mathbb{Q}) \backslash G'(\mathbf{A}_f) / \mathcal{K}, \overline{\mathbb{Q}}_{\ell}) \rightarrow C(G'(\mathbb{Q}) \backslash G'(\mathbf{A}_f) / \mathcal{K}, \overline{\mathbb{Q}}_{\ell}),$$

where  $T_p = [\mathcal{K}_p \begin{bmatrix} p & \\ & 1 \end{bmatrix} \mathcal{K}_p]$ . So on the  $\pi_f$ -components it is given by

$$\begin{bmatrix} -2p & \alpha + \beta \\ \alpha + \beta & -2p \end{bmatrix}.$$

whose determinant is  $-(\alpha - \beta)^2$ . So if  $\alpha \neq \beta$ , the union map

$$\mathrm{cl} = \mathrm{Gys}_{\mathbf{b}_1} \oplus \mathrm{Gys}_{\mathbf{b}_2} : H_1^{\mathrm{B-M}}(\overline{\mathcal{S}}_{G, \mathcal{K}, b, \overline{\mathbb{F}}_p}^{\mathrm{perf}})[\pi_f] \rightarrow \mathrm{H}_{\mathrm{\acute{e}t}}^2(\overline{\mathcal{S}}_{G, \mathcal{K}, \overline{\mathbb{F}}_p}^{\mathrm{perf}}, \overline{\mathbb{Q}}_{\ell})[\pi_f]$$

is injective.  $\lrcorner$

**Remark (28.9.8.10) [The split case].** If  $p \in \mathrm{Prime}$  is split in  $F$ , then  $\Lambda^{\mathrm{Tate}_p} = \{(0, 0)\}$ , and  $V_{\mu^*}^{\mathrm{Tate}_p} = 0$ . As expected, The basic locus in the special fiber at  $p$  is 0-dimensional, by [Hilbert modular varieties of low dimension]Section8.2.  $\lrcorner$

### Geometric Satake for Unitary Groups

**Notation (28.9.8.11).**

- Let  $n \in \mathbb{Z}_+, r = \lfloor \frac{n}{2} \rfloor$ .
- Denote  $i^{\vee} = n + 1 - i$ .
- Let  $V_p$  be the standard Hermitian space over  $\mathbb{Q}_{p^2}$  with basis  $\{e_i\}$  s.t.  $(e_i, e_{j^{\vee}}) = \delta_{ij}$ .
- Let  $G = \mathrm{U}(V_{p^2})$  be the unramified unitary group.
- The stabilizer  $\mathcal{K}_p$  of the lattice  $\Lambda = \oplus \mathbb{Z}_{p^2} e_i$  is a hyperspecial subgroup of  $G$ .
- Let  $T \leq G$  be the diagonal maximal torus. And let  $S = \mathrm{diag}(a_1, a_2, \dots, a_2^{-1}, a_1^{-1}) \subset T$  be the maximal split subtorus.

$\lrcorner$

The Langlands dual group of  $G$  is  $(\widehat{G}, \widehat{B}, \widehat{T}) = (\mathrm{GL}(n), \mathrm{B}(n), \mathrm{T}(n))$ , and  $X^{\bullet}(\widehat{T}) = \mathbb{Z}\varepsilon_1 \oplus \dots \mathbb{Z}\varepsilon_n$ . Then  $\sigma_p$  acts on  $\widehat{G}$  via

$$\sigma_p(A) = JA^{-t}J^{-1}, \text{ where } J = \begin{bmatrix} & & & & 1 \\ & & & -1 & \\ & & \ddots & & \\ & & & & \\ (-1)^n & & & & \end{bmatrix} \text{ ?}$$

In particular,  $\sigma_p(\varepsilon_i) = -\varepsilon_{i^\vee}$ .  
 $\widehat{S} = \widehat{T}/(\sigma_p - 1)$ , and

$$X^\bullet(\widehat{S}) = X^\bullet(\widehat{T})^{\sigma_p} = \oplus_{i=1}^r \mathbb{Z}(\varepsilon_i - \varepsilon_{i^\vee}).$$

And the relative Weyl group  $W_0 = W^{\sigma_p} = \{(i, i^\vee), (i, j)(i^\vee, j^\vee) | i, j \in [n]_+\} \cong \{\pm 1\}^r \rtimes \text{Sym}_r$ .

Then we have

$$\mathbf{J} = J_{\widehat{G}} = \overline{\mathbb{Q}_\ell}[\widehat{G}\sigma_p]^{\widehat{G}} \cong \overline{\mathbb{Q}_\ell}[X^\bullet(\widehat{S})]^{W_0} \cong \overline{\mathbb{Q}_\ell}[\mathfrak{S}_1, \dots, \mathfrak{S}_r],$$

where  $\mathfrak{S}_i$  are elementary symmetric polynomials of  $e^{\varepsilon_1 - \varepsilon_{1^\vee}} + e^{\varepsilon_{1^\vee} - \varepsilon_1}, \dots, e^{\varepsilon_r - \varepsilon_{r^\vee}} + e^{\varepsilon_{r^\vee} - \varepsilon_r}$ .

**Prop. (28.9.8.12) [Relative Root System].** The relative root system  $\Phi_{\text{rel}}^\vee \subset X^\bullet(\widehat{S}) = X^\bullet(\widehat{T})^{\sigma_p}$  consists of the  $W_0$ -orbit of  $\varepsilon_1 - \varepsilon_{1^\vee}$  and the  $W_0$ -orbit of  $\varepsilon_1 - \varepsilon_{1^\vee} - \varepsilon_2 + \varepsilon_{2^\vee}$  (when  $r \geq 2$ ), so we can construct a discriminant functions in  $\mathbf{J}$ :

$$\text{disc}_1 = \prod_{1 \leq i \leq r} (A - 1)(A^{-1} - 1) = \sum_{i=0}^r (-1)^{r-i} 2^i \mathfrak{S}_{r-i}, \text{ where } A = e^{\varepsilon_i - \varepsilon_{i^\vee}}$$

Via routine calculation, we can prove that

$$\text{disc}_1 = \sum_{a=0}^r (-1)^{r-a} (2a+1) \chi_{V_{r-a}}, \text{ where } V_a = \text{End}(\wedge^a \text{Std}).$$

┘

$\lambda_{\underline{m}} = m_1(\varepsilon_1 - \varepsilon_{1^\vee}) + m_2(\varepsilon_2 - \varepsilon_{2^\vee}) + \dots \in X^\bullet(\widehat{S})$  is dominant iff  $m_1 \geq m_2 \geq \dots$ . Denote

$$\lambda_i = (\varepsilon_1 - \varepsilon_{1^\vee}) + \dots + (\varepsilon_i - \varepsilon_{i^\vee}), \text{ where } i \in [r]_+,$$

then the spherical algebra  $\mathcal{H}_{\mathcal{K}_p}(G)$  is generated by  $\{\mathbf{1}_{\mathcal{K}_p \lambda_i(p)}\}$  as a  $\overline{\mathbb{Q}_\ell}$ -algebra by the Cartan decomposition (20.7.2.14).

If we fix  $\sqrt{p} \in \overline{\mathbb{Q}_\ell}$ , then there is a **Satake isomorphism**

$$CT_p : \mathcal{H}_{\mathcal{K}}(G) \cong \overline{\mathbb{Q}_\ell}[X^\bullet(\widehat{S})]^{W_0} = \mathbf{J},$$

moreover, there is a geometric Satake isomorphism with commutative diagram

$$\begin{array}{ccc} V \in K_0(\text{Rep}^{\text{fd}}(\text{L}G)) & \xrightarrow{\chi_V \text{ restricts to } \widehat{G}\sigma_p} & \overline{\mathbb{Q}_\ell}[X^\bullet(\widehat{S})]^{W_0} = \mathbf{J} \ni \text{ch}_V \\ \downarrow \text{g.Sat} & & \uparrow CT_p \\ \text{Sat}(V) \in \text{Perv}_{L^+(G)}^0(\text{Gr}_G) & \xrightarrow{\text{traces of Frobenius}} & \mathcal{H}_{\mathcal{K}}(G) \ni h_V \end{array}$$

Then via geometric Satake, we can calculate  $h_{V_a}$  and thus also  $CT_p^{-1}(\mathfrak{D}) \in \mathcal{H}_{\mathcal{K}}(G)$ .

**U(1, 2r) Shimura Varieties****Notation (28.9.8.13).**

- Let  $E$  be an imaginary quadratic field.
- Let  $p \in \text{Prime}_{\geq 3}$  be an inert prime with  $(p) = \mathfrak{p}_v$ .
- Let  $V$  be a  $2r + 1$ -dimensional Hermitian space over  $E$  with signature  $(1, 2r)$  at infinity and is unramified at  $p$ .
- Let  $G = \text{U}(V)$  and
- $\mathcal{K} = \mathcal{K}^p \mathcal{K}_p \leq G(\mathbf{A}_f)$  where  $\mathcal{K}_p$  is the hyperspecial subgroup fixing a self-dual  $\mathbb{Z}_{p^2}$ -lattice  $\Lambda \subset V_p$ .

┘

**Prop. (28.9.8.14).** The Hodge cocharacter  $\mu = \varepsilon_1 \in X^\bullet(\widehat{T})$ ,  $\mu^* = -\varepsilon_{2r+1}$ .

$V_{\mu^*}^{\text{Tate}_p} = V_{\mu^*}[\lambda]$  is 1-dimensional, where  $\lambda = -\varepsilon_{r+1}$ . So  $\lambda(p) \in B(G, \mu^*)$  is the unramified basic element. And  $MV_{\mu^*}^{\text{Tate}_p} = MV_{\mu^*}(\lambda) = \{\mathbf{b}\}$  is a singleton.

┘

**Prop. (28.9.8.15) [Satake-Cycles].** We can write  $\lambda = \sigma_p(\nu^*) - \nu^* + \tau^*$ , where

$$\nu = \nu_{\mathbf{b}} = \varepsilon_1 + \dots + \varepsilon_r, \quad \tau = \tau_{\mathbf{b}} = \varepsilon_1 + \dots + \varepsilon_{2r+1} \in X_\bullet(Z_G).$$

So there is a Satake-cycle  $\mathbf{a} \in \mathbb{S}_{(\nu^*, \mu^*)|\lambda+\nu^*}$  s.t.

$$\mathbf{a} \cap S_{\nu^*, \lambda} = (S_{\nu^*} \cap \text{Gr}_{\nu^*}) \widetilde{\times} \mathbf{b}. \quad (\mathbf{b} \subset S_\lambda \cap \text{Gr}_{\mu^*}).$$

┘

**Prop. (28.9.8.16).** There is a natural correspondence

$$\begin{array}{ccc} & \text{Gr}_{(\nu^*, \mu^*)|\lambda+\nu^*}^0 & \\ \swarrow & & \searrow \\ \text{Gr}_{(\nu^*, \mu^*)} & & \text{Gr}_{\lambda+\nu^*} \end{array}$$

So any  $\mathbf{a} \in \mathbb{S}_{(\nu^*, \mu^*)|\lambda+\nu^*}$  gives a correspondence between perverse sheaves on  $\text{Gr}_{(\nu^*, \mu^*)}$  and  $\text{Gr}_{\lambda+\nu^*}$ . Because geometric Satake equivalence preserves tensor product, this gives two non-zero homomorphisms (notice  $\tau^* + \sigma_p(\nu^*) = \lambda + \nu^*$ ).

$$\mathbf{a}_{in} : V_{\sigma_p(\nu)} \otimes V_\tau \otimes V_{\nu^*} \rightarrow V_\mu, \quad \mathbf{a}_{out} : V_{\sigma_p(\nu^*)} \otimes V_\mu \otimes V_\nu \rightarrow V_\tau.$$

Thus induces two maps

$$\Xi_\nu(\mathbf{a}_{in}) \in \text{Hom}(\widetilde{V}_\tau, \widetilde{V}_\mu), \quad \Xi_{\nu^*}(\mathbf{a}_{out}) \in \text{Hom}(\widetilde{V}_\mu, \widetilde{V}_\tau),$$

given as follows: at the point  $g\sigma_p \in \widehat{G}\sigma_p$ , it is given by

$$\Xi_\nu(\mathbf{a}_{in})(g\sigma_p) : V_\tau \rightarrow V_\nu \otimes V_\tau \otimes V_{\nu^*} \xrightarrow{g\sigma_p \otimes \text{id} \otimes \text{id}} V_{\sigma_p(\nu)} \otimes V_\tau \otimes V_{\nu^*} \xrightarrow{\mathbf{a}_{in}} V_\mu,$$

$$\Xi_{\nu^*}(\mathbf{a}_{out})(g\sigma_p) : V_\mu \rightarrow V_{\nu^*} \otimes V_\mu \otimes V_\nu \xrightarrow{g\sigma_p \otimes \text{id} \otimes \text{id}} V_{\sigma_p(\nu^*)} \otimes V_\mu \otimes V_\nu \xrightarrow{\mathbf{a}_{out}} V_\tau.$$

Then up to a constant in  $\overline{\mathbb{Q}_\ell}^\times$ , we have

$$\mathfrak{D} = \Xi_{\nu^*}(\mathbf{a}_{out}) \circ \Xi_\nu(\mathbf{a}_{in}) = (-1)^r \text{disc}_1 \in \text{Hom}(\widetilde{V}_\tau, \widetilde{V}_\tau) \cong \mathbf{J}.$$

(in general, we need to take projective determinant).

┘

*Proof:* Cf.[On vector-valued twisted conjugate invariant functions on a group]1.0.2 and 6.4.2.  $\square$

**Prop. (28.9.8.17).**

$$\mathbf{a} \subset \mathrm{Gr}_{(\nu^*, \mu^*)|\tau^* + \sigma_p(\nu^*)}^0 \subset \mathrm{Gr}_{\nu^*} \times \mathrm{Gr}_{\tau^* + \sigma_p(\nu^*)}$$

is  $L^+G$  equivariant isomorphic to

$$H = \{(\ell_1, \ell_2) : \ell_1 \subset \ell_2\} \subset \mathrm{Gr}(r, \Lambda/(p)) \times \mathrm{Gr}(r+1, \Lambda/(p))$$

And the map  $\mathrm{Gr}_{\nu^*} \rightarrow \mathrm{Gr}_{\tau^* + \sigma_p(\nu^*)}$  given by  $g \mapsto \tau^*(p)\sigma_p(g)$  is identified with the map

$$\ell \subset \Lambda/(p) \mapsto \mathrm{Frob}_p(\ell)^\perp.$$

⌋

*Proof:* As  $\nu^* = -\varepsilon_1^\vee - \varepsilon_2^\vee - \dots - \varepsilon_r^\vee$  is minuscule,

$$\mathrm{Gr}_{\nu^*}(R) = \{\Lambda \otimes W(R) \subset L \subset \frac{1}{p}\Lambda \otimes W(R) \mid \mathrm{rank}_R L/\Lambda \otimes W(R) = r\} = \mathrm{Gr}(r, \Lambda/(p)).$$

Similarly  $\tau^* + \sigma(\nu^*) = -\varepsilon_1^\vee - \varepsilon_2^\vee - \dots - \varepsilon_{(r+1)}^\vee$  is minuscule, so  $\mathrm{Gr}_{\tau^* + \sigma(\nu^*)} \cong \mathrm{Gr}(r+1, \Lambda/(p))$ .

The map  $\mathrm{Gr}_{\nu^*} \rightarrow \mathrm{Gr}_{\tau^* + \sigma(\nu^*)}$  given by  $g \mapsto \tau(p)\sigma_p(g)$  send  $L$  to  $\frac{1}{p}\mathrm{Frob}_R^*(L)^\vee$ . ?

The orbits of  $G(\mathbb{F}_{p^2})$ -action on  $\mathrm{Gr}(r, \Lambda/(p)) \times \mathrm{Gr}(r+1, \Lambda/(p))$  is parametrized by  $a = \dim(\ell_1 \cap \ell_2)$ . There is only one closed orbit with dimension  $r^2 + 2r$ , so it must be  $\mathbf{a}$ .  $\square$

**Prop. (28.9.8.18)[Relavent ADLV].** In this case, the ADLV is given by

$$X_{\mu^*}(\tau^*) = \{g \in \mathrm{Gr}_G : g^{-1}\tau^*(p)\sigma_p(g) \in L^+G \backslash \mu^*(p)/L^+(G)\},$$

and an irreducible component  $X_{\mu^*}(\tau^*)^{\mathbf{b}, \min}$  is given by the Cartesian diagram

$$\begin{array}{ccc} X_{\mu^*}(\tau^*)^{\mathbf{b}, \min} & \longrightarrow & \mathbf{a} \subset \mathrm{Gr}_{(\nu^*, \mu^*)|\tau + \sigma_p(\nu)}^0 \\ \downarrow & & \downarrow \mathrm{pr}_1 \times m \\ \mathrm{Gr}_{\nu^*} & \xrightarrow{\mathrm{id} \times \tau^*(p)\sigma_p} & \mathrm{Gr}_{\nu^*} \times \mathrm{Gr}_{\tau^* + \sigma_p(\nu^*)} \end{array}$$

which by the argument above is just

$$\{\ell \subset \Lambda/(p) : \ell \in \mathrm{Frob}(\ell)^\perp\}.$$

which is the Deligne-Lusztig variety for  $\mathrm{GU}(2r+1, \mathbb{F}_p)$ . For example, if  $r = 1$ , this is just the Fermat curve

$$\{(x, y, z) \in \mathbb{P}^2 \mid x^{p+1} + y^{p+1} + z^{p+1} = 0\}.$$

$\mathcal{K}_p$  acts on this Deligne-Lusztig variety through  $\mathrm{GL}(2r+1, \mathbb{F}_p)$ , and then there is a  $G(\mathbb{Q}_p)$ -equivariant map

$$G(\mathbb{Q}_p) \times^{\mathcal{K}_p} X_{\mu^*}^{\mathbf{b}, \min}(\tau^*) \rightarrow X_{\mu^*}(\tau^*)$$

that induces an isomorphism on irreducible components. (By [X-Z]Prop4.4.14).  $\square$

**Prop. (28.9.8.19) [Geometric Jacquet-Langlands Correspondence].** Let  $V'$  be the  $(2r + 1)$ -dimensional Hermitian space over  $E$  that is isomorphic to  $E$  at all finite places and of signature  $(2r + 1, 0)$  at the infinite place. And denote  $G' = \mathrm{U}(V')$ . Then there is a Rapoport-Zink uniformization ([X-Z] 7.2.16, 7.2.17):

$$\begin{array}{ccc} & G'(\mathbb{Q}) \backslash (G'(\mathbb{Q}_p) \times^{\mathcal{K}_p} X_{\mu^*}^{\mathbf{b}, \min}(\tau^*) \times G'(\mathbf{A}_f^p) / \mathcal{K}^p) & \\ \swarrow & & \searrow \\ \overline{\mathcal{S}}_{\tau, \kappa(v)} \triangleq \overline{\mathcal{S}_{\mathcal{K}}(G', \{\tau_{\mathbf{b}}\})}^{\mathrm{perf}} & & \overline{\mathcal{S}}_{\mu, \kappa(v)} \triangleq \overline{\mathcal{S}_{\mathcal{K}}(G, \{\mu\})}^{\mathrm{perf}} \end{array}$$

where the right map is surjective onto the basic Newton strata  $\mathcal{N}_b$  that induces a bijection on the set of irreducible components. (here we may need to base change to the common reflex field of  $G$  and  $G'$ )

Then this correspondence induces a geometric Jacquet-Langlands correspondence

$$\mathrm{J-L}_{\tau, \mu} : \mathrm{H}_{\mathrm{\acute{e}t}}^0(\overline{\mathcal{S}}_{\tau, \bar{\kappa}(v)}) \otimes_{\mathbf{J}} \mathrm{Hom}(\tilde{V}_{\tau}, \tilde{V}_{\mu}) \rightarrow \mathrm{H}_{\mathrm{\acute{e}t}, c}^r(\overline{\mathcal{S}}_{\mu, \bar{\kappa}(v)}, \overline{\mathbb{Q}_{\ell}}(d/2)).$$

Thus evaluating at  $\Xi_{\nu}(a_{in}) \in \mathrm{Hom}(\tilde{V}_{\tau}, \tilde{V}_{\mu})$ , we get a  $\mathbf{J}$ -equivariant map

$$\mathrm{J-L}_{\tau, \mu}(a_{in}) : \mathrm{H}_{\mathrm{\acute{e}t}}^0(\overline{\mathcal{S}}_{\tau, \bar{\kappa}(v)}) \rightarrow \mathrm{H}_{\mathrm{\acute{e}t}, c}^d(\overline{\mathcal{S}}_{\mu, \bar{\kappa}(v)}, \overline{\mathbb{Q}_{\ell}}(d/2))$$

And there is a commutative diagram

$$\begin{array}{ccc} \mathrm{H}_{\mathrm{\acute{e}t}}^0(\overline{\mathcal{S}}_{\tau, \bar{\kappa}(v)}) & \xrightarrow{\cong} & H_r^{\mathbf{B-M}}(\mathcal{N}_b) \\ & \searrow \mathrm{J-L}_{\tau, \mu}(a_{in}) & \swarrow \mathrm{cl}_{\mathbf{b}} \\ & \mathrm{H}_{\mathrm{\acute{e}t}, c}^r(\overline{\mathcal{S}}_{\mu, \bar{\kappa}(v)}, \overline{\mathbb{Q}_{\ell}}(r/2)) & \end{array}$$

Similarly, we have maps  $\mathrm{cl}_{\mathbf{b}}^{\vee}$  and  $\mathrm{J-L}_{\mu, \tau}(a_{out})$ , and

$$\mathrm{J-L}_{\mu, \tau_{\mathbf{b}}}(a_{out}) \circ \mathrm{J-L}_{\tau, \mu}(a_{in}) \in \mathrm{Mat}_{C(G'(\mathbb{Q}) \backslash G'(\mathbf{A}_f) / \mathcal{K}, \overline{\mathbb{Q}_{\ell}})}(\mathcal{H}_{\mathcal{K}_p}(G))$$

encodes the intersection matrix of the basic locus. ┘

**Thm. (28.9.8.20) [The Intersection Matrix].** The composition

$$\mathrm{J-L}_{\mu, \tau_{\mathbf{b}}} \circ \mathrm{J-L}_{\tau_{\mathbf{b}}, \mu}$$

is given by the Hecke operator

$$h = p^{r(r+1)} C T_p^{-1}(\mathfrak{D}) = \sum_{i=0}^r (-1)^r (2i+1) p^{i(i+1)} \sum_{j=0}^{r-i} \binom{2r+1-2j}{r-i-j} T_{p, j} \in \mathcal{H}_{\mathcal{K}_p}(G).$$

Which means for  $G'(\mathbb{Q})g\mathcal{K}, G'(\mathbb{Q})g'\mathcal{K} \in G'(\mathbb{Q}) \backslash G'(\mathbf{A}_f) / \mathcal{K}$ , if we choose  $g, g'$  s.t.  $g^p = (g')^p$ , then the corresponding irreducible components  $X_g$  and  $X_{g'}$  intersection with multiplicity  $h(g^{-1}g')$ . ┘

*Proof:* By geometric Jacquet-Langlands correspondence, the determinant is just  $C T_p^{-1}$  of

$$\mathfrak{D} = \Xi_{\nu^*}(\mathbf{a}_{out}) \circ \Xi_{\nu}(\mathbf{a}_{in}) \in \mathrm{Hom}(\tilde{V}_{\tau}, \tilde{V}_{\tau}) \cong \mathbf{J},$$

□

**Cor. (28.9.8.21).** If  $r = 1$ , then  $h = T_{p,1} + (1+p)(1-2p)$ . So if  $g, g' \in G(\mathbf{A}_f)$  has the same prime-to- $p$  components, then

$$X_g \cdot X_{g'} = \begin{cases} 1 & , g_p \in g'_p \mathcal{K}_p \text{diag}(p, 1) \mathcal{K}_p \\ (1+p)(1-2p) & , g_p \in g'_p \mathcal{K}_p \\ 0 & , \text{otherwise} \end{cases}.$$

┘

## 9 Tate conjecture for Special Fibers of Shimura Varieties

**Notation (28.9.9.1).**

- Let  $(G, \mathcal{N})$  be a Hodge-type Shimura-datum s.t.  $Z(G)$  is connected,
- Let  $p \in \mathbf{Prime}_{\geq 2}$  s.t.  $V_{\mu^*}^{\text{Tate}} \neq 0$  ?.
- Let  $\mathcal{K} = \mathcal{K}_p \mathcal{K}^p \leq G(\mathbf{A}_f)$  is a neat open compact subgroup s.t.  $\mathcal{K}_p$  is hyperspecial.

┘

**Thm. (28.9.9.2) [Xiao-Zhu].** 1. There is a unique inner form  $G'$  of  $G$  that is trivial at all finite places and  $G'(\mathbb{R})$  is compact modulo center.

2.  $\text{Sh}_{\mu, \text{bas}}$  is pure of dimension  $d/2$  ?. And there is a  $\mathcal{H}_{\mathcal{K}}(G)$  equivariant isomorphism

$$H_d^{\text{B-M}} \left( (\text{Sh}_{\mu, \text{bas}})_{\overline{\kappa(v)}} \right) \cong C(G'(\mathbb{Q}) \backslash G'(\mathbf{A}_f) / \mathcal{K}, \overline{\mathbb{Q}_{\ell}}) \otimes_J V_{\mu^*}^{\text{Tate}_p}.$$

3. If  $\pi_f$  is an irreducible model of  $\mathcal{H}_{\mathcal{K}}(G)$  whose Satake-parameter of  $(\pi_f)_p$  is generic w.r.t.  $V_{\mu}$  ?, then the cycle class map ?

$$\text{cl} : H_d^{\text{B-M}} \left( (\text{Sh}_{\mu, \text{bas}})_{\overline{\kappa(v)}} \right) \otimes \overline{\mathbb{Q}_{\ell}} \rightarrow H_{\text{ét}, c}^d \left( (\text{Sh}_{\mu})_{\overline{\kappa(v)}}, \overline{\mathbb{Q}_{\ell}}(d/2) \right)$$

is injective when restricted to  $H_d^{\text{B-M}} \left( (\text{Sh}_{\mu, b})_{\overline{\kappa(v)}} \right) [\pi_f]$ .

4. If  $\text{Sh}_{\mathcal{K}}(G, \mathcal{N})$  is a Kottwitz-arithmetic variety ? (e.g. this is the case when  $[G, G]$  is simply-connected and anisotropic, and there exists  $p' \in \mathbf{Prime} \setminus \{p\}$  s.t.  $(\pi_f)_{p'}$  is an unramified twist of Steinberg-representations), then the  $\pi_f^p$ -isotypical component of the cycle class map  $\text{cl}$  is surjective to

$$\sum_{\pi_p} T^p \left( \pi_p \pi_f^p, \overline{\mathbb{Q}_{\ell}} \right) \otimes \pi_p \pi_f^p,$$

if the Satake-parameters of  $\{\pi_p\}$  are all strongly general w.r.t.  $V_{\mu}$ . In particular, the Tate-conjecture holds for these  $\pi_f^p$ .

┘

*Proof:* ?

**Def.(28.11.3.3)[Bad Primes].** For any Shimura variety  $M$  as defined in(28.11.3.2), we can define a set  $\mathfrak{d}$  of bad primes of **Prime**, ┘

**Prop.(28.11.3.4)[Moduli Problem  $\mathcal{M}_0$ ].** With  $\mathfrak{d}$  defined in(28.11.3.3), consider the moduli functor  $\mathcal{M}_0$  on  $\text{NSch}/\text{Spec } \mathcal{O}_{\mathbf{F}}[\mathfrak{d}^{-1}]$  which associates with  $S$  the set of isomorphism classes of tuples  $(A_0, \iota_0, \lambda_0, \overline{\eta}_0)$ , where

- $A_0$  is an Abelian scheme over  $S$  of relative dimension  $[F_0 : \mathbb{Q}]$ ,
- $\iota_0 : \mathcal{O}_F[\mathfrak{d}^{-1}] \rightarrow \text{End}_S(A_0)[\mathfrak{d}^{-1}]$  is an  $\mathcal{O}_F[\mathfrak{d}^{-1}]$ -action s.t. the Kottwitz condition for  $\Phi$  is satisfied: For any  $a \in \mathcal{O}_F[\mathfrak{d}^{-1}]$ ,

$$\text{char}(\iota_0(a)|\text{Lie}(A_0)) = \prod_{\varphi \in \Phi} (T - \varphi(a)).$$

- $\lambda_0$  is an prime-to- $\mathfrak{d}$  principle polarization of  $A_0$  s.t.  $\text{Ros}_{\lambda_0}(\iota(a)) = \iota(\overline{a})$ .

- $\overline{\eta}_0$  is a  $K_{Z^{\mathfrak{q}}, \mathfrak{d}}$ -level structure ?.

Then when  $K_{Z^{\mathfrak{q}}}$  is neat,  $\mathcal{M}_0$  is representable by a finite étale scheme over  $\mathrm{Spec} \mathcal{O}_F[\mathfrak{d}^{-1}]$ . ┘

*Proof:* Cf.[Howard, Complex multiplication cycles and Kudla-Rapoport divisors]Prop3.1.2. □

**Thm. (28.11.3.5)[Integral Models of RSZ Shimura Varieties].** Situation as in (28.11.3.2), consider the functor  $\mathcal{M} = \mathcal{M}_{\widetilde{K}}$  which associates to each  $S \in \mathrm{NSch} / \mathrm{Spec} \mathcal{O}_{\mathbf{F}}[\mathfrak{d}^{-1}]$  the set of isomorphism classes of tuples  $(A_0, \iota_0, \lambda_0, \overline{\eta}_0, A, \iota, \lambda, \overline{\eta})$ , where

- $(A_0, \iota_0, \lambda_0, \overline{\eta}_0) \in \mathcal{M}_0(S)$  (28.11.3.4),
- $\iota : \mathcal{O}_F[\mathfrak{d}^{-1}] \rightarrow \mathrm{End}(A)[\mathfrak{d}^{-1}]$  is an action satisfying the Kottwitz condition of signature

$$((n-1, 1)_{\varphi_0}, (n, 0)_{\varphi \in \Phi \setminus \varphi_0}).$$

- $\lambda$  is an prime-to- $\mathfrak{d}$  principle polarization of  $A$  s.t.  $\mathrm{Ros}_{\lambda}(\iota(a)) = \iota(\overline{a})$ .
- $\overline{\eta}$  is a  $K_{\mathfrak{d}}$ -orbit of isometries of Hermitian modules over  $S$ :

$$\eta : V_{\mathfrak{d}}(A_0, A) \cong V(F_{0, \mathfrak{d}}) \text{.} \text{ ?}$$

- The Eisenstein condition for every place  $v \nmid \mathfrak{d}$  of  $F_0$  ? Cf.[On Shimura varieties for unitary groups]Sec5.2.

Then  $\mathcal{M}$  is representable by a scheme that is separated of f.t. and smooth of relative dimension  $n-1$  over  $\mathrm{Spec} \mathcal{O}_{\mathbf{F}}[\mathfrak{d}^{-1}]$  when  $\widetilde{K}$  is neat. And the generic fiber of  $\widetilde{M}$  is isomorphic to the canonical model Shimura variety  $M$  as in (28.11.3.2). ┘

*Proof:* Cf.[Weil Representations and Arithmetic Fundamental Lemma]Thm6.2. and [Arithmetic diagonal cycles on unitary Shimura varieties]Prop3.5. ? □

## 28.12 p-adic Modular Forms

References are [C-M98, Ma118], [BDP].

### 1 Arithmetic Modular Forms

References are [BDP].

**Def. (28.12.1.1) [Modular Forms].** For  $R_0 \in \mathcal{CRing}$ ,  $N \in \mathbb{Z}_+$ ,  $k \in \mathbb{N}$ , the space  $M(R_0, N, k)$  of **modular forms of level  $N$  and weight  $k$  over  $R_0$**  consists of rules  $f$  that functorially associates a section  $f(E/S, \alpha_N) \in \Gamma(S, \omega_{E/S}^{\otimes k})$  to each datum  $(E/S, \alpha_N)$ , where  $S \in \mathcal{Sch}/R_0$ ,  $E \in \mathbf{EllCur}/S$ , and  $\alpha_n : E/S[n] \cong (\mathbb{Z}/(n))_S^2$  is an isomorphism.

Such a modular form is automatically meromorphic at cusps, simply because  $\text{Tate}(q)$  is an Elliptic curve over  $\mathbb{Z}[[q]]$ .  $\lrcorner$

**Def. (28.12.1.2) [ $q$ -Expansions and Holomorphic Modular Forms].** For  $f \in M(R_0, N, k)$  (28.12.1.1), if  $R_0 \in \mathcal{CRing}/\mathbb{Z}[\frac{1}{N}, \mu_N]$ , the  **$q$ -expansion** of  $f$  is defined to be

$$f((\text{Tate}(q^N), \alpha_N)_{R_0}) \in (\mathbb{Z}((q)) \otimes R_0) \omega_{\text{can}}.$$

where  $\text{Tate}(q)$  is the Tate curve, and  $\alpha_N$  is any level  $N$ -structure on  $\text{Tate}(q^N)$ .

For any  $R_0 \in \mathcal{CRing}$ ,  $f \in M(R_0, N, k)$  is said to be **holomorphic at cusps** if the  $q$ -expansion of  $f$  restricted to  $R_0[\frac{1}{N}, \mu_N]$  is an element is contained in  $(\mathbb{Z}[[q]] \otimes R_0) \omega_{\text{can}}$  for any choice of  $\alpha_N$ . The space of holomorphic modular forms is denoted by  $S(R_0, N, k)$ .  $\lrcorner$

**Def. (28.12.1.3) [Kodaira-Spencer Maps].** If  $T \in \mathcal{Sch}$ ,  $S/T$  is smooth, and  $f : E \rightarrow S \in \mathbf{EllCur}/S$ , then there is an exact sequence

$$0 \rightarrow f^* \Omega_{S/T} \rightarrow \Omega_{E/T} \rightarrow \Omega_{E/S} \rightarrow 0$$

thus an exact sequence

$$0 \rightarrow T_{E/S} \rightarrow T_{E/T} \rightarrow f^* T_{S/T} \rightarrow 0.$$

Thus inducing a homomorphism

$$T_{S/T} \cong f_* f^* T_{S/T} \rightarrow R^1 f_* T_{E/S} = \text{Lie}(E/S)^2 R^1 f_* \Omega_{E/S}^1 \cong \text{Lie}(E/S)^2.$$

Thus inducing a **Kodaira-Spencer map** of  $\mathcal{O}_S$ -modules

$$\text{KS}_{E/S} : \omega_{E/S}^2 \rightarrow \Omega_{S/T}^1.$$

And if  $S/T \subset \overline{S}/T$ ,  $\overline{S} \setminus S = S^\infty$ ,  $E/S \subset \overline{E}/\overline{S}$  is an extension to a curve of genus 1, and the identity  $e \in E(S)$  also extends to a map  $\bar{e} \in \overline{E}(\overline{S})$ , with  $\bar{\omega}_{\overline{E}/\overline{S}} = \bar{e}^* \Omega_{\overline{E}/\overline{S}}^1$  extending  $\omega_{E/S}$ , then the Kodaira-Spencer map extends to a map

$$\text{KS}_{\overline{E}/\overline{S}} : \omega_{\overline{E}/\overline{S}}^2 \rightarrow \Omega_{\overline{S}/T}^1(\log S^\infty).$$

$\lrcorner$

**Prop. (28.12.1.4) [Kodaira-Spencer Map for Modular Curves].**

- If  $T = \operatorname{Spec} \mathbb{Q}$ ,  $S = Y(N)$ ,  $N \geq 3$ , and  $E/S$  is the universal curve, then the Kodaira-Spencer map (28.12.1.3) is an isomorphism. And on  $q$ -expansions of modular forms along any cusp  $t$ , it is of the form

$$f(q^{1/N})(\operatorname{dlog} t)^2 \mapsto f(q^{1/N}) \operatorname{dlog} q.$$

- If  $\bar{S} = X(N)_{\mathbb{Q}}$ , and  $\overline{E^{\operatorname{uni}}}$  is the regular minimal model of the universal elliptic curve, then the extended Kodaira-Spencer map (28.12.1.3) is an isomorphism. In fact, over  $\mathbb{Z}[\frac{1}{N}, \zeta_N]$  and at any cusp, the square of the canonical differential  $\omega_{\operatorname{can}}$  on  $\operatorname{Tate}(q^N)$  is mapped to the  $N \operatorname{dlog} q$ .
- If  $S = Y(N)^{\operatorname{ord}}$ , and  $T = \operatorname{Spec} \mathbb{Z}[\mu_N]$ , then  $S/T$  is smooth by, and the Kodaira-Spencer map on the  $q$ -expansions of modular forms is of the form

$$f(q^{1/N})(\operatorname{dlog} t)^2 \mapsto f(q^{1/N}) \operatorname{dlog} q = N f(q^{1/N}) \operatorname{dlog}(q^{1/N}),$$

so we can define a map  $\frac{1}{N} \operatorname{KS}_{Y(N)/\mathbb{Z}[\mu_N]}$ .

┘

*Proof:* [Katz, p-adic properties of modular forms and modular curves]A1. Prop3.17. and Cor3.18. ?

□

**Cor.(28.12.1.5) [Modular Forms as Sections on Modular Curves].** If  $N \in \mathbb{Z}_{\geq 3}$  and  $R_0 \in \mathbb{C}\operatorname{Ring}/\mathbb{Z}[\frac{1}{N}]$ , there are isomorphisms

$$S(R_0, N, k) \cong \Gamma(X(N), \bar{\omega}^k \otimes \Omega_{X(N)/\mathbb{Q}}^1 \otimes_{\mathbb{Z}[\frac{1}{N}]} R_0) \subset \Gamma(X(N), \bar{\omega}^k \otimes_{\mathbb{Z}[\frac{1}{N}]} R_0) \cong M(R_0, N, k),$$

where the middle inclusion is given by Kodaira-Spencer isomorphism (28.12.1.4).

Thus in general, for any  $\mathbb{Z}[\frac{1}{N}]$ -module  $K$ , we can define a **modular form of level  $N$  and weight  $k$  with coefficients in  $M$  which is holomorphic at cusps** to be a section in

$$\Gamma(X(N), \omega^k \otimes_{\mathbb{Z}[\frac{1}{N}]} M).$$

┘

**Thm.(28.12.1.6) [ $q$ -Expansion Principle].** For  $N \in \mathbb{Z}_{\geq 3}$ ,  $M \in \operatorname{Mod}_{\mathbb{Z}[\frac{1}{N}]}$ , and  $f$  a modular form of level  $N$  and weight  $k$  with coefficients in  $M$  which is holomorphic at cusps. Suppose on each of the  $\varphi(N)$  connected components of  $X(N)_{\mathbb{Z}[\frac{1}{N}]} \mathbb{Z}[\frac{1}{N}, \zeta_N]$ , there exists at least one cusp that the  $q$ -expansion of  $f$  vanishes, then  $f$  vanishes.

┘

*Proof:* Cf. [Kat73]P84. ?

□

**Cor.(28.12.1.7).** Situation as in (28.12.1.6), if  $N \subset M \in \operatorname{Mod}_{\mathbb{Z}[\frac{1}{N}]}$ , and on each of the  $\varphi(N)$  connected components of  $X(N)_{\mathbb{Z}[\frac{1}{N}]} \mathbb{Z}[\frac{1}{N}, \zeta_N]$ , there exists at least one cusp that the  $q$ -expansion of  $f$  is contained in  $N \otimes_{\mathbb{Z}[\frac{1}{N}]} \mathbb{Z}[\frac{1}{N}, \zeta_N] \otimes \mathbb{Z}[[q]]$ , then  $f$  is a modular form with coefficients in  $N$ .

┘

*Proof:* The image of  $f$  in  $\Gamma(X(N), \omega^k \otimes_{\mathbb{Z}[\frac{1}{N}]} M/N)$  is trivial.

□

#### 1 Orbital Integrals

##### Local Orbital Integrals

**Notation(29.1.1.1).**

- Let  $K \in \mathbf{LField}$ .
- Let  $G \in \mathbf{AlgGrp}^{\mathrm{sm}}/K$  acts on  $X \in \mathbf{Sch}^{\mathrm{ft,sep}}/K$  on the right.
- Let  $\chi : G(K) \rightarrow \mathbb{C}^\times$  be a quasi-character.

┘

**Def.(29.1.1.2)[Relavent Elements].**  $\gamma \in X(K)$  is called a  **$\chi$ -relevant element** if  $\chi(Z_G(\gamma)(K)) = 1$ .

┘

**Def.(29.1.1.3)[Relatively Unimodular Elements].**  $\gamma \in X(K)$  is called a **relatively unimodular element** if  $\Delta_G|_{Z_G(\gamma)(K)} = \Delta_{Z_G(\gamma)(K)}$ .

┘

**Def.(29.1.1.4) [Local Orbital Integrals].** For a strongly-regular semi-simple element  $\gamma \in G(K)$  (10.5.1.17) and  $h \in \mathcal{T}(G(K))$ , if a Haar measure on  $G(K)$  and a Haar measure on  $Z_{G(K)}(\gamma)$  are chosen, then we can define the **orbital integrals**

$$\mathrm{Orb}_\gamma(h) = \int_{Z_{G(K)}(\gamma) \backslash G(K)} h(x^{-1}\gamma x) d(x^{-1}\gamma x),$$

┘

*Proof:*  $Z_{G(K)}(\gamma) \backslash G(K)$  has the quotient measure because both  $Z_G(\gamma)$  and  $G$  are reductive thus unimodular (12.10.1.22)(12.10.3.7).

And because

□

**Def. (29.1.1.5) [Invariant Distributions].**  $I \in \text{Dist}(G(K))$  is called an **invariant distribution** if  $I(f^g) = I(f)$  for any  $f \in \mathcal{T}(G(K))$  and  $g \in G(K)$ .  $\lrcorner$

**Thm. (29.1.1.6) [Density Theorem, Harish-Chandra].**  $I \in \text{Dist}(G(K))$  is invariant (29.1.1.5) iff  $I(f) = 0$  for any  $f \in \mathcal{T}(G(K))$  s.t.  $\text{Orb}_\gamma(f) = 0$  for any strongly-regular semi-simple element  $\gamma \in G(K)$ .  $\lrcorner$

*Proof:* Cf. [Harish-Chandra, Admissible Invariant Distributions].  $\textcolor{red}{?}$   $\square$

### Relative Orbital Integrals

**Def. (29.1.1.7) [Invariant Theory].** Let  $K \in p\text{-LField}$  and  $H \in \text{RedGrp}/K$ , and  $V$  an affine  $K$ -variety with an action of  $H$ . Then the categorical quotient of  $V$  by  $H$  is the affine variety  $V//H = \text{Spec}(\mathcal{O}(V)^H)$  with a quotient map  $\text{pr} : V \rightarrow V//H$ .

Then for  $x \in V(K)$ ,  $x$  is called a

- **$H$ -semi-simple element** if  $Hx$  is closed in  $V$  (or equivalently  $H(K)x \in V(K)$  is closed in the analytic topology  $\textcolor{red}{?}$ ).
- **$H$ -regular element** if  $\text{Stab}_H(x)$  has minimal dimension.  $\lrcorner$

**Prop. (29.1.1.8) [Relatively Semisimple Elements are Relatively Unimodular].** If  $G^0 \in \text{RedGrp}$  and  $X$  is affine, then every relatively semisimple element (10.2.1.18) is relatively unimodular, by (12.10.1.22) and (10.2.1.20).  $\lrcorner$

**Def. (29.1.1.9) [Local Relative Orbital Integrals].** For  $f \in \mathcal{T}(X(K))$  and a  $\chi$ -relevant relatively semi-simple (10.2.1.18) and relatively unimodular (29.1.1.3) element  $\gamma \in X(K)$ , define the **local relative orbital integral**

$$\text{ROrb}_\gamma(f) = \int_{H_\gamma(K) \backslash G(K)} f(\gamma g) \chi^{-1}(g) \frac{d\rho(g)}{d\rho(g_\gamma)} \quad (12.10.3.7).$$

**Prop. (29.1.1.10).** If  $I \leq H \in \text{AlgGrp}^{\text{sm}}/K$ , then the map  $\text{cl} : (I \backslash H)(K) \rightarrow \mathcal{D}(I, H; K)$  is continuous with discrete topology on  $\mathcal{D}(I, H; K)$ . In particular, the image of  $I(K) \backslash H(K)$  in  $(I \backslash H)(K)$  is closed.  $\lrcorner$

*Proof:*  $\textcolor{red}{?}$  Cf. [Getz]P449.  $\square$

**Prop. (29.1.1.11) [Convergence of  $\text{ROrb}_\gamma(f)$ ].** Situation as in (29.1.1.9), if  $H_\gamma$  is smooth, then  $\text{ROrb}_\gamma(f)$  is absolutely convergent.  $\lrcorner$

*Proof:* Because  $\frac{d\rho(h)}{d\rho(h_\gamma)}$  is a Radon measure (12.3.1.22), it suffices to show that the map  $G_\gamma(K) \backslash G(K) \rightarrow X(K)$  is proper (thus  $f(\gamma g)$  has compact support). It suffices to show that  $G_\gamma(K) \backslash G(K) \rightarrow X(K)$  is a closed embedding. For this, because  $O(\gamma)$  is closed, we may assume  $X = O(\gamma) = G_\gamma \backslash G$  (10.2.1.11). And then the assertion follows from (29.1.1.10).  $\square$

### Adelic Orbital Integrals

**Def. (29.1.1.12) [Adelic Orbital Integrals].**  $\text{Orb}^A(f) \textcolor{red}{?}$ .  $\lrcorner$

## 2 Spectral Expansions

**Def. (29.1.2.1)** [Automorphic Kernel Functions, Selberg[Sel56]]. For  $f \in C_c^\infty(A_G \backslash G(\mathbf{A}_F))$ , the kernel function for the right action  $R(f)$  of  $f$  on  $L^2(G/F, \mathbf{1})$  is

$$\mathbf{K}_f(x, y) = \sum_{\gamma \in G(F)} f(x^{-1}\gamma y) \in C^\infty([G] \times [G]),$$

called the **automorphic kernel function** of  $f$ . ┘

*Proof:* For any  $\Phi \in L^2(G/F, \mathbf{1})$ ,

$$\begin{aligned} R(f)\Phi(x) &= \int_{A_G \backslash G(\mathbf{A}_F)} f(y)\varphi(xy)dy \\ &= \int_{A_G \backslash G(\mathbf{A}_F)} f(x^{-1}y)\varphi(y)dy \\ &= \int_{[G]} \left( \sum_{\gamma \in G(F)} f(x^{-1}\gamma y) \right) \varphi(y)dy \end{aligned}$$

Using unfolding, Cf.[G-H24]P244<sup>?</sup>.

To show that  $\mathbf{K}_f$  is smooth, notice that for  $\Omega_1, \Omega_2 \in A_G \backslash G(\mathbf{A}_F)$  and  $(x, y) \in \Omega_1 \times \Omega_2^{-1}$ , the only non-zero summands of  $\mathbf{K}_f(x, y)$  corresponds to the  $\gamma \in G(F) \cap \Omega_1 \text{Supp}(f)\Omega_2$ , which is finite.

To show that  $(y \mapsto \mathbf{K}_f(x, y)) \in L^2([G])$ , notice

$$\begin{aligned} \int_{[G]} \mathbf{K}_f(x, y) \overline{\mathbf{K}_f(x, y)} dy &= \int_{[G]} \left( \sum_{\gamma \in G(F)} f(x^{-1}\gamma y) \right) \left( \sum_{\gamma' \in G(F)} \overline{f(x^{-1}\gamma' y)} \right) dy \\ &= \sum_{\gamma \in G(F)} \int_{A_G \backslash G(\mathbf{A}_F)} f(x^{-1}\gamma y) \overline{f(x^{-1}y)} dy \end{aligned}$$

Using unfolding, Cf.[G-H24]P244<sup>?</sup>. It is clear that this is a finite sum of integrals, thus it is finite. □

**Prop. (29.1.2.2).** For  $f \in C_c^\infty(A_G \backslash G(\mathbf{A}_F))$ , the restriction of the right action  $R(f)$  of  $f$  on  $L^2(\pi)$  for each  $\pi \in \text{Irr}^{\text{cusp, disc}}(G/F)$  has a kernel function  $\mathbf{K}_{\pi(f)}$ , and we have

$$\mathbf{K}_{f, \text{cusp}}(x, y) = \sum_{\pi \in \text{Irr}^{\text{cusp, disc}}(G/F)} \mathbf{K}_{\pi(f)}(x, y).$$

┘

**Cor. (29.1.2.3)** [Diagonal Spectral side]. For  $f \in C_c^\infty(A_G \backslash G(\mathbf{A}_F))$ , we have

$$\sum_{\pi \in \text{Irr}^{\text{cusp, disc}}(G/F)} \int_{[G]} \mathbf{K}(x, x) dx = \sum_{\pi \in \text{Irr}^{\text{cusp, disc}}(G/F)} m(\pi) \text{tr}(\pi(f)).$$

But notice that this integral is rarely convergent. ┘

*Proof:* Cf.[Brislaw. Traceable integral kernels on countably generated measure spaces]Cor3.2.<sup>?</sup> □

**Def. (29.1.2.4) [Relative Traces].** For  $\pi \in \text{Irr}^{\text{auto}}(G/F, \mathbf{1})$  and  $f \in C_c^\infty(A_G \backslash G(\mathbf{A}_F))$ , define the **relative trace** of  $f$  w.r.t.  $H$  and  $\chi$  (29.1.3.2) as

$$\text{Rtr}(\pi(f)) = \int_{A_{G,H}H(F) \backslash H(\mathbf{A}_F)} \mathbf{K}_{\pi(f)}(h_1, h_2) \chi^{-1}(h_1, h_2) d(h_1, h_2).$$

? What is the Haar measure on  $A_{G,H}H(F) \backslash H(\mathbf{A}_F)$ ? ┘

### Full Expansions

Using Langlands' decomposition of  $L^2([G])(\text{Cf. [G-H24]Chap10 ?})$ , we can give a full expansion of automorphic kernel functions:

**Thm. (29.1.2.5).** Fix a minimal parabolic subgroup  $P_0 \leq G$  with Levi decomposition  $P_0 = L_0 U_0$ , and for any standard parabolic subgroup  $P \leq G$ , assume that the Levi decomposition  $P = LU$  is chosen s.t.  $L_0 \leq L$ .

Then for any  $f \in C_c^\infty(A_G \backslash G(\mathbf{A}_F))$ , the automorphic kernel function  $\mathbf{K}_f(x, y)$  (29.1.2.1) satisfies: For all  $x \in [G]$ ,

$$\mathbf{K}_f(x, y) = \sum_P n_P^{-1} \sum_{\sigma \in \text{Irr}^{\text{cusp, disc}}(L/F, \mathbf{1})} \int_{i(\mathfrak{a}_L^G)^*} \sum_{\Phi \in \text{Ob}(\sigma)} \text{Eis}(x, I(\sigma, \lambda)(f)\Phi, \lambda) \overline{\text{Eis}(y, \Phi, \lambda)} d\lambda.$$

where

- $P$  runs through all standard parabolic subgroups of  $G$ .
  - $\text{Ob}(\sigma)$  is an orthonormal basis for  $I_P^G(L_{\text{disc}}^2(L/F, \mathbf{1})[\sigma])$  consisting of vectors in the subspace  $I_P^G(L_{\text{disc}}^2(L/F, \mathbf{1})[\sigma])^0$  (Cf. [G-H24]P274 ?).
- ┘

*Proof:* ? Cf. [G-H24]Chap10 for notations, and Cf. [Arthur78. A trace formula for reductive groups. 1]Section4 and [Arthur. An introduction to the trace formula]Thm7.2. □

### Isolation of Cuspidal Spectra

References are [Beuzart-Plessis, Y. Liu, W. Zhang, and X. Zhu. Isolation of cuspidal spectrum, with application to the Gan-Gross-Prasad conjecture].

## 3 Relative Trace Formula

References are [On the Gross-Prasad conjecture for unitary groups, Jacquet-Rallis], [A guide to the relative trace formula, Jacquet].

**Notation (29.1.3.1).**

- Let  $F \in \text{NField}$ .
  - Let  $G \in \text{RedGrp}/F$ .
- ┘

### Simple Trace Formulae

**Situation (29.1.3.2).** Let  $H \leq G \times G$  be a subgroup s.t.  $H^0 = H_u \times H_r$  is a direct product of a reductive group and a unipotent group. In particular,  $H(\mathbf{A}_F)$  is unimodular.

Consider the restriction of the right action of  $G \times G$  on  $G$  to  $H$ .

Denote

$$A_{G,H} = H(\mathbf{A}_F) \cap (A_G \times A_G), \quad A = H(\mathbf{A}_F) \cap \Delta(A_G).$$

Let  $\chi : A_{G,H} H(F) \backslash H(\mathbf{A}_F) \rightarrow \mathbb{C}^\times$  be a quasi-character. ┘

**Situation (29.1.3.3).** Situation as in (29.1.3.2), assume that  $H_r(\mathbf{A}_F) = (H_r(\mathbf{A}_F) \cap A_{G^2}).(H_r(\mathbf{A}_F) \cap G^2(\mathbf{A}_F)^1)$ . ┘

**Cor. (29.1.3.4).** If assumption (29.1.3.3) holds, then

$$H(\mathbf{A}_F) = (H(\mathbf{A}_F) \cap A_{G^2}).(H(\mathbf{A}_F) \cap G^2(\mathbf{A}_F)^1).$$

┘

*Proof:* Cf. [G-H24]P476. □

### Geometric side

**Def. (29.1.3.5) [Elliptic Strongly Regular Semi-Simple Part of the Trace Formulae].** For  $f \in \mathcal{T}(G(\mathbf{A}_F))$  (26.6.1.11), the **elliptic strongly regular semi-simple part** of the geometric side of the trace formula for  $f$  is defined to be

$$\text{Orb}_{\text{s.reg,ell}}^{\mathbf{A}}(f) = \sum_{\gamma \in G(F)_{\text{s.reg,ell}} / \text{Ad}(G(F))} \tau(Z_G(\gamma)) \text{Orb}_{\gamma}^{\mathbf{A}}(f) \quad (29.1.1.12).$$

? Absolutely convergence. ┘

### General Trace Formula

**Thm. (29.1.3.6) [A Simple Trace Formulae].** Let  $f \in \mathcal{T}(A_G \backslash G(\mathbf{A}_F))$  s.t.  $R(f)$  has cuspidal image ? and assume that

- If the  $H(\mathbf{A}_F)$ -orbit of  $\gamma$  intersects  $\text{Supp}(f)$ , then  $\gamma$  is relatively elliptic, relatively unimodular, and the  $H_r$ -orbit of  $\gamma$  is closed.

Then

$$\sum_{\pi} \text{Rtr}(\pi(f)) = \sum_{[\gamma]} \tau(H_{\gamma}) \text{ROrb}_{\gamma}(f) \quad (29.1.2.4),$$

where

- the LHS is summation over  $(H, \chi)$ -distinguished cuspidal representation of  $G$ ,
- and the RHS is summation over relevant classes  $[\gamma]$  that are relatively unimodular, relatively elliptic, and s.t. the  $H_r$ -orbit of  $\gamma$  is closed.
- Both sides are absolutely convergent. ┘

## Petersson-Bruggeman-Kuznetsov trace formula

### Twisted Trace Formulae

#### 4 Selberg Trace Formulae

[Selberg] proved the case where  $G$  is semisimple and  $\Gamma \leq G(\mathbb{R})$  is compact.

Selberg's trace formula is a far-reaching non-commutative generalization of the Poisson summation formula(12.11.1.31). It underlines a duality between geometric and spectral objects.

**Notation(29.1.4.1).**

- Let  $G \in \text{LCG}$ .
- Let  $\Gamma \subset G$  be a discrete topological subgroup.

┘

### Compact Quotient case

**Prop.(29.1.4.2) [ $L^2(\Gamma \backslash G)$  Totally Decomposable].** Suppose  $G$  is unimodular and  $\Gamma \backslash G$  is compact,  $\chi \in \Gamma^\vee$ , then the space  $L^2(\Gamma \backslash G, \chi)$  decomposes as

$$L^2(\Gamma \backslash G, \chi) = \bigoplus_{\pi \in \widehat{G}} m_\pi V_\pi$$

that each  $m_\pi$  is finite.

┘

*Proof:* Let  $\Sigma$  be the set of sums of irreducible invariant subspaces of  $L^2(\Gamma \backslash G, \chi)$  that is mutually orthogonal. then choose by Zorn's lemma a maximal one in  $\Sigma$ , and we prove the orthogonal complement  $H = 0$  otherwise we construct an irreducible subspace of  $H$ .

Let  $f \neq 0 \in H$ , choose by(24.7.5.2) and(29.1.4.8) a  $\varphi \in C_c(G)$  that  $\rho(\varphi)$  is compact self-adjoint and  $\rho(\varphi)f \neq 0$ . So  $\rho(\varphi)$  has a non-zero eigenvalue and the eigenspace  $L$  is of f.d..

Let  $L_0$  be a minimal nonzero subspace of  $L$  that is an intersection of  $L$  with a nonzero closed invariant subspace of  $\mathcal{H}$ , and let  $V$  be the intersection of all closed invariant subspaces  $W$  of  $H$  that  $L_0 = L \cap W$ . We show  $V$  is irreducible, if not, then  $V = V_1 \cap V_2$ , and if  $0 \neq f_0 \in L_0$ , then  $f_0 = f_1 + f_2$  and both  $f_1, f_2$  are eigenfunctions of  $\rho(\varphi)$  of eigenvalue  $\lambda$ . Now if  $f_1 \neq 0$ , then by minimality,  $V_1 \cap L = L_0$ .

The finiteness of  $m_\pi$  follows from the fact that  $\rho(f)$  is Hilbert-Schmidt for every  $f \in C_c(G)$ (29.1.4.3). □

**Prop.(29.1.4.3) [Integral Operators].** If  $\Gamma \backslash G$  is compact, consider the right action of  $G$  on  $L^2(\Gamma \backslash G)$ (24.7.1.14), let  $\varphi \in C_c(G)$ , then  $\varphi$  can act on  $L^2(\Gamma \backslash G, \chi)$  by(12.8.3.24), and:

- $\rho(\varphi)$  is an integration operator, in particular Hilbert-Schmidt and compact.
- If  $\varphi(g^{-1}) = \overline{\varphi(g)}$ , then  $\rho(\varphi)$  is self-adjoint.

┘

*Proof:* 1:

$$(\rho(\varphi)f)(g) = \int_G f(h)\varphi(g^{-1}h)dh = \int_{\Gamma \backslash G} \left( \sum_{\gamma \in \Gamma} f(\gamma h)\varphi(g^{-1}\gamma h) \right) dh = \int_{\Gamma \backslash G} f(h)K_\varphi(g, h)dh$$

where

$$K_\varphi(g, h) = \sum_{\gamma \in \Gamma} \varphi(g^{-1}\gamma h).$$

Because  $\varphi$  is compactly supported, this is a smooth function in  $g$  and  $h$ , in particular square integrable on  $\Gamma \backslash G$  compact. And  $\rho(\varphi)(f)(g)$  is smooth in  $g$  because  $f \in L_1(\Gamma \backslash G, \chi)$  as  $\Gamma \backslash G$  is compact, and  $K(g, h)$  is smooth in  $g$ .

It is Hilbert-Schmidt and compact by ?

2 is easy. □

**Prop. (29.1.4.4) [Trace of  $\rho(\varphi)$ ].** If  $\varphi = \varphi_1 * \varphi_2$  where  $\varphi_i \in C_c(\Gamma \backslash G)$ , then  $\rho(\varphi) = \rho(\varphi_1)\rho(\varphi_2)$  (12.8.3.24) and hence a trace class (12.9.4.6). And its integral kernel is

$$K_\varphi(x, y) = \int_{\Gamma \backslash G} K_{\varphi_1}(x, z) K_{\varphi_2}(z, y) dz.$$

and

$$\text{tr} \rho(\varphi) = \int_{\Gamma \backslash G} K_\varphi(x, x) dx = \int_{\Gamma \backslash G} \int_{\Gamma \backslash G} K_{\varphi_1}(x, y) K_{\varphi_2}(y, x) dx dy.$$

┘

*Proof:* This follows from (12.9.4.9). □

**Cor. (29.1.4.5) [the Geometric Side of Trace Formula].** If  $G$  is unimodular, let  $c(\Gamma)$  be a set of representatives for the conjugacy classes of  $\Gamma$ , then

$$\text{tr}(\rho(\varphi)) = \sum_{\gamma \in c(\Gamma)} \int_{\Gamma \gamma \backslash G} \varphi(g^{-1}\gamma g) dg.$$

And if  $G_\gamma$  is unimodular for every  $\gamma \in \Gamma$ , then

$$\text{tr}(\rho(\varphi)) = \sum_{\gamma \in c(\Gamma)} \text{Vol}(\Gamma_\gamma \backslash G_\gamma) \int_{G_\gamma \backslash G} \varphi(g^{-1}\gamma g) dg.$$

┘

*Proof:*

$$K_f(x, x) = \sum_{\gamma \in \Gamma} f(x^{-1}\gamma x) = \sum_{\gamma \in c(\Gamma)} \sum_{\delta \in \Gamma_\gamma \backslash \Gamma} f(x^{-1}\delta^{-1}\gamma\delta x),$$

so we have

$$\int_{\Gamma \backslash G} K_f(x, x) dx = \int_{\Gamma \backslash G} \sum_{\gamma \in c(\Gamma)} \sum_{\delta \in \Gamma_\gamma \backslash \Gamma} f(x^{-1}\delta^{-1}\gamma\delta x) = \sum_{\gamma \in c(\Gamma)} \int_{\Gamma_\gamma \backslash G} f(x^{-1}\gamma x) dx.$$

□

**Cor. (29.1.4.6) [Selberg Trace Formula for  $\Gamma \backslash G$  Compact].** Suppose  $G$  be a unimodular,  $\Gamma \backslash G$  is compact,  $G_\gamma$  is unimodular for every  $\gamma \in \Gamma$ .

For any  $\varphi \in C_c(G)$  and  $\gamma \in \Gamma$ , denote  $\text{Orb}(\gamma, \varphi) = \int_{G_\gamma \backslash G} \varphi(g^{-1}\gamma g) dg$ , then  $\rho(\varphi)$  is a trace class and

$$\sum_{\pi \in \widehat{G}} m_\pi \text{tr}(\pi(\varphi)) = \text{tr}(\rho(\varphi)) = \sum_{\gamma \in c(\Gamma)} \text{Vol}(\Gamma_\gamma \backslash G_\gamma) \text{Orb}(\gamma, \varphi).$$

┘

*Proof:* Follows from (26.1.5.2) and (29.1.4.5). □

$G = \mathrm{GL}(2; \mathbb{R})$  case

**Lemma (29.1.4.7).** Let  $G = \mathrm{GL}(2; \mathbb{R})$ ,  $K = \mathrm{SL}(2; \mathbb{R})$ ,  $\Gamma \backslash G$  be compact,  $\rho$  be the principal series  $P(\lambda, 0)$  (24.7.5.20) of  $G$ , and  $s = \frac{1}{2}(s_1 - s_2 + 1)$ ,  $\lambda = s(1 - s)$ ,  $\mu = (s_1 + s_2)$ , then for any  $f \in C_c^\infty(K \backslash G/K)$ ,  $\rho(f) \in V_\rho^K$ , which has dimension 1, so  $f$  is a trace class and

$$\mathrm{tr}(\rho(f)) = \int \int f \left( \begin{bmatrix} e^{u/2} & x \\ 0 & e^{-u/2} \end{bmatrix} \right) e^{\frac{us}{2}} du dx.$$

┘

*Proof:* The trace of  $\rho(f)$  is just the scalar by which  $\rho(f)$  acts on a non-zero vector of  $\rho^K$ . Take  $\varphi \in \rho^K \subset H(s_1, s_2, 0)$  normalized that  $\varphi(I) = 1$ , then

$$(\rho(f)\varphi)(I) = \int_G f(g)\varphi(g)dg = \int_K \int_A \int_N f(ank)\varphi(ank)dAdNd\theta = \int_A \int_N f(an)\varphi(an)dAdN.$$

□

**Prop. (29.1.4.8).** Let  $G = \mathrm{GL}(2; \mathbb{R})$  and consider the right action of  $G$  on  $L^2(\Gamma \backslash G, \chi)$  (26.1.1.6), let  $\varphi \in C_c^\infty(G)$ , then  $\varphi$  can act on  $L^2(\Gamma \backslash G, \chi)$  by (12.8.3.24), and:

- $\rho(\varphi)$  is an integration operator, in particular Hilbert-Schmidt and compact. And  $\mathrm{Im}(\rho(\varphi)) \subset C^\infty(\Gamma \backslash G, \chi)$ .
- If  $\varphi(g^{-1}) = \overline{\varphi(g)}$ , then  $\rho(\varphi)$  is self-adjoint.
- If  $\varphi(k_\theta g) = e^{-tk\theta} \varphi(g)$ , then  $\mathrm{Im}(\rho(\varphi)) \subset C^\infty(\Gamma \backslash G, \chi, k)$ .

Compare with (29.1.4.3).

┘

*Proof:* These follows from (29.1.4.3).

□

**Cor. (29.1.4.9).** Let  $G = \mathrm{GL}(2; \mathbb{R})$  and  $\Gamma \subset G$  is a discrete subgroup that  $\Gamma \backslash G$  is compact. If  $\mathcal{H}$  be a nonzero closed  $G$ -subrepresentation of  $L^2(\Gamma \backslash G, \chi)$ , then  $\mathcal{H}$  decomposes as  $\oplus_k \mathcal{H}^k$  w.r.t. action of  $\mathrm{SO}(2; \mathbb{R})$ . And if  $\mathcal{H}^k \neq 0$ , then  $\Delta$  has a nonzero eigenvector in  $H^k \cap C^\infty(\Gamma \backslash G, \chi)$ .

┘

*Proof:* The decomposition is clear from (24.7.3.4). It's left to show  $\Delta$  has an eigenvalue in  $H_k \cap C^\infty(\Gamma \backslash G, \chi)$ . By lemma (24.7.5.2) above, for  $f_0 \in H^k$ , there is a  $\varphi \in C_c^\infty(G)$  s.t.  $\rho(\varphi)f_0 \neq 0$ , and  $\varphi(k_\theta g) = e^{-ik\theta} \varphi(g)$ . So (29.1.4.8) shows  $\rho(\varphi)$  maps  $H$  into  $H^k \cap C^\infty(\Gamma \backslash G, \chi)$  and induces a compact self-adjoint operator on  $H^k$ . So we can choose a f.d. eigenspace of it. Notice  $\Delta$  commutes with the action  $\rho(\varphi)$ , so  $\Delta$  fixes this eigenspace, thus it has an eigenvalue on  $H_k \cap C^\infty(\Gamma \backslash G, \chi)$ .

□

**Applications**

The Selberg trace formula for  $\mathrm{GL}(2; \mathbb{R})$  could be extended to the Hecke operators  $T_p$  on  $L^2(\Gamma \backslash \mathcal{H})$ , thus It yields a finite closed formula for the trace of any Hecke operator on  $\mathrm{SF}_{2k}(\Gamma)$ .

**5 Eichler-Selberg Trace Formulae**

Trace formula for acting on the space of sections of the automorphic line bundle.

## 6 Langlands Trace Formula

Langlands set about constructing continuous spectra for any locally symmetric space  $\backslash X$  of finite volume. The problem is to show that absolutely convergent Eisenstein series have analytic continuation to meromorphic functions, whose values at imaginary arguments exhaust the continuous spectrum.

More importantly, Langlands considered comparison of trace formulae, which leads to important applications.

### Jacquet-Langlands

The Jacquet-Langlands correspondence is a comparison of trace formulae between a non-compact modular curve and a compact modular curve, yielding a reciprocity law.

### Cyclic Base Change and Langlands-Tunnell

The cyclic base change is a comparison of trace formulae between a modular curve and a higher dimensional locally symmetric space  $\Gamma_E \backslash \mathcal{H}_E$  associated to a cyclic extension  $E/\mathbb{Q}$ , yielding a reciprocity law.

## 7 Arthur-Selberg Trace Formulae

A key difficulty in extending Selberg's work to arbitrary reductive groups  $G$  was proving the analytic continuation of Eisenstein series in general and using them to decompose  $L^2([G])$ .

Arthur considered for any reductive group  $G/\mathbb{Q}$  and  $f \in C_c^\infty(A_G \backslash G(\mathbf{A}_F))$  the convolution operator  $R(f)$  on the Hilbert space  $L^2([G])$ , which has an orthogonal decomposition

$$R(f) = R_{\text{disc}}(f) \oplus R_{\text{cont}}(f).$$

The Arthur trace formula is a formula for the trace of the operator  $R_{\text{disc}}(f)$  (Which is of trace class by Muller?). On the geometric side,

- The main terms are indexed by  $\mathbb{Q}$ -elliptic conjugacy classes in  $G(\mathbb{Q})$ .
- The hyperbolic terms are indexed by hyperbolic conjugacy classes in  $G(\mathbb{Q})$ , which are parametrized by elliptic conjugacy classes in Levi subgroups of  $G$ .
- The continuous spectra, which are parametrized by discrete spectra of Levi subgroups of  $G$ .

## 8 Relative Trace Formulae(Jacquet)

**Notation(29.1.8.1).**

- Let  $F \in \mathbf{GField}$ .
- Let  $G \in \mathbf{RedGrp}/F$  be anisotropic.
- Let  $H_1, H_2 \leq G \in \mathbf{AlgGrp}_{\text{cntd}}/F$ .
- Let  $\theta_i : H_i(F) \backslash H_i(\mathbf{A}_F) \rightarrow \mathbb{C}^\times$  be characters.

┘

**Lemma (29.1.8.2).** For  $f \in C_c(G(\mathbf{A}_F))$ , consider the integral

$$\begin{aligned}
 & \int_{H_1(F) \backslash H_1(\mathbf{A}_F)} \int_{H_2(F) \backslash H_2(\mathbf{A}_F)} K_f(h_1, h_2) \theta_1(h_1) \overline{\theta_2(h_2)} dh_2 dh_1 \\
 &= \sum_{\gamma \in H_1(F) \backslash G(F)} \int_{H_1(\mathbf{A}_F)} \int_{H_2(F) \backslash H_2(\mathbf{A}_F)} f(h_1^{-1} \gamma h_2) \theta_1(h_1) \overline{\theta_2(h_2)} dh_2 dh_1 \\
 & \textcolor{red}{?} = \sum_{\gamma \in H_1(F) \backslash G(F) / H_2(F)} \int_{H_{2,\gamma}(F) \backslash H_2(\mathbf{A}_F)} \int_{H_1(\mathbf{A}_F)} f(h_1^{-1} \gamma h_2) \theta_1(h_1) \overline{\theta_2(h_2)} dh_1 dh_2 \\
 &= \sum_{\gamma \in H_1(F) \backslash G(F) / H_2(F)} \text{Vol}(H_{2,\gamma}(F) \backslash H_{2,\gamma}(\mathbf{A}_F)) \int_{H_{2,\gamma}(\mathbf{A}_F) \backslash H_2(\mathbf{A}_F)} \int_{H_1(\mathbf{A}_F)} f(h_1^{-1} \gamma h_2) \theta_1(h_1) \overline{\theta_2(h_2)} dh_1 dh_2,
 \end{aligned}$$

where  $H_{2,\gamma} = \gamma^{-1} H_1 \gamma \cap H_2$ . And in this sum,  $\gamma$  contributes if  $\theta_1(\gamma h_2 \gamma^{-1}) = \theta_2(h_2)$  for any  $h_2 \in H_{2,\gamma}(\mathbf{A}_F)$ , in which case  $\gamma$  is said to be **relevant (in the trace formula)**.

On the other hand,

$$\begin{aligned}
 \rho(f) \varphi_1(g_2) &= \int_{G(F) \backslash G(\mathbf{A}_F)} K_f(g_1, g_2) \varphi_1(g_1) dg_1 \\
 &= \sum_{\pi \in \text{Irr}^{\text{auto}}(G/F)} \sum_{\varphi_2 \in \pi} \sum_{\text{orthogonal}} \int_{G(F) \backslash G(\mathbf{A}_F)} \int_{G(F) \backslash G(\mathbf{A}_F)} K_f(g_1, g_2) \varphi_1(g_1) \varphi_2(g'_2) dg'_2 \overline{\varphi_2(g'_2)} dg_1 \\
 &= \sum_{\pi \in \text{Irr}^{\text{auto}}(G/F)} \sum_{\varphi_2 \in \pi} \sum_{\text{orthogonal}} (K_f, \overline{\varphi_1} \times \overline{\varphi_2}) \overline{\varphi_2(g'_2)}
 \end{aligned}$$

So it follows that

$$\begin{aligned}
 K_f(g_1, g_2) &= \sum_{\pi \in \text{Irr}^{\text{auto}}(G/F)} \sum_{\varphi_1, \varphi_2 \in \pi} \sum_{\text{orthogonal}} (K_f, \overline{\varphi_1} \times \overline{\varphi_2}) \overline{\varphi_1(g_1) \varphi_2(g_2)} \\
 &= \sum_{\pi \in \text{Irr}^{\text{auto}}(G/F)} \sum_{\varphi \in \pi} \sum_{\text{orthogonal}} \overline{\varphi(g_1)} \rho(f) \varphi(g_2).
 \end{aligned}$$

Thus

$$\begin{aligned}
 & \int_{H_1(F) \backslash H_1(\mathbf{A}_F)} \int_{H_2(F) \backslash H_2(\mathbf{A}_F)} K_f(h_1, h_2) \theta_1(h_1) \overline{\theta_2(h_2)} dh_2 dh_1 \\
 &= \int_{H_1(F) \backslash H_1(\mathbf{A}_F)} \int_{H_2(F) \backslash H_2(\mathbf{A}_F)} \left( \sum_{\pi \in \text{Irr}^{\text{auto}}(G/F)} \sum_{\varphi \in \pi} \sum_{\text{orthogonal}} \overline{\varphi(h_1)} \rho(f) \varphi(h_2) \right) \theta_1(h_1) \overline{\theta_2(h_2)} dh_2 dh_1 \\
 &= \sum_{\pi \in \text{Irr}^{\text{auto}}(G/F)} \sum_{\varphi \in \pi} \sum_{\text{orthogonal}} \left( \int_{H_1(F) \backslash H_1(\mathbf{A}_F)} \overline{\varphi(h_1)} \theta_1(h_1) dh_1 \right) \left( \int_{H_2(F) \backslash H_2(\mathbf{A}_F)} \varphi(h_2) \overline{\theta_2(h_2)} dh_2 \right)
 \end{aligned}$$

□

**Prop. (29.1.8.3) [Relative Trace Formula].** If we denote

$$a(\gamma) = \text{Vol}(H_{2,\gamma}(F) \backslash H_{2,\gamma}(\mathbf{A}_F)),$$

$$I_\gamma(\theta_1, \theta_2; f) = \int_{H_{2,\gamma}(\mathbf{A}_F) \backslash H_2(\mathbf{A}_F)} \int_{H_1(\mathbf{A}_F)} f(h_1^{-1} \gamma h_2) \theta_1(h_1) \overline{\theta_2(h_2)} dh_1 dh_2,$$

and

$$P_{H_i, \theta_i}(\varphi) = \int_{H_i(F) \backslash H_i(\mathbf{A}_F)} \varphi(h_i) \overline{\theta_i(h_i)} dh_i,$$

$$I_\pi(\theta_1, \theta_2; f) = \sum_{\varphi \in \pi \text{ orthogonal}} P_{H_1, \theta_1}(\varphi) P_{H_2, \theta_2}(\rho(f)\varphi).$$

Then comparing the equations in (29.1.8.2) gives:

$$\sum_{\gamma \in H_1(F) \backslash G(F) / H_2(F) \text{ relevant}} a(\gamma) I_\gamma(\theta_1, \theta_2; f) = \sum_{\pi \in \widehat{G}} I_\pi(\theta_1, \theta_2; f)$$

┘

**Remark (29.1.8.4).** One can deduce the Selberg trace formula for  $G(F) \backslash G(\mathbf{A}_F)$  (29.1.4.6) from this relative trace formula. Cf. [Ike08].

┘

### Removing Assumptions

References are [On the fine spectral expansion of Jacquet's relative trace formula, Lapid].

## 9 Comparison of Trace Formulae

**Notation (29.1.9.1).**

- Let  $F \in \mathbf{GField}$ .
- Let  $G, G' \in \mathcal{RedGrp}/F$  be anisotropic.
- Let  $H_1, H_2 \leq G \in \mathcal{AlgGrp}_{\text{cntd}}/F$ ,
- Let  $H'_1, H'_2 \leq G' \in \mathcal{AlgGrp}_{\text{cntd}}/F$ ,
- Let  $\theta_i : H_i(F) \backslash H_i(\mathbf{A}_F) \rightarrow \mathbb{C}^\times$  be characters.
- Let  $\theta'_i : H'_i(F) \backslash H'_i(\mathbf{A}_F) \rightarrow \mathbb{C}^\times$  be characters.

┘

**Conj. (29.1.9.2) [Comparison of Trace Formulae].** Suppose there exists a bijection

$$\{ \gamma \in H_1(F) \backslash G(F) / H_2(F) \text{ relevant} \} \cong \{ \gamma' \in H'_1(F) \backslash G(F) / H'_2(F) \text{ relevant} \}$$

with the following properties:

- (matching) For any  $f \in C_c(G(\mathbf{A}_F))$ , there exist  $f' \in C_c(G'(\mathbf{A}_F))$  s.t.  $I_\gamma(\theta_1, \theta_2, f) = I_{\gamma'}(\theta'_1, \theta'_2, f')$ .
- (fundamental lemma) For a.e.  $v \in \Sigma_F$ , there exists an isomorphism of Hecke algebras

$$\mathcal{H}_{\mathcal{K}_v}(G_v) \cong \mathcal{H}_{\mathcal{K}'_v}(G'_v).$$

Then it's expected that there exists a correspondence of the  $L$ -packets of  $G(\mathbf{A}_F)$  and  $G'(\mathbf{A}_F)$  s.t.

$$I_\Pi^\kappa(\theta_1, \theta_2; f) = I_{\Pi'}^{\kappa'}(\theta'_1, \theta'_2; f')$$

where  $\Pi, \Pi'$  are  $L$ -packets of  $G(\mathbf{A}_F), G'(\mathbf{A}_F)$  resp.,  $\kappa, \kappa'$  are certain functions on  $\Pi$  and  $\Pi'$  resp. and

$$I_\Pi^\kappa(\theta_1, \theta_2; f) = \sum_{\pi \in \Pi} \kappa(\pi) I_\pi(\theta_1, \theta_2; f).$$

┘

*Proof:*

□

**Remark (29.1.9.3).** This would imply that there exists certain relation between period integrals for  $G(\mathbf{A}_F)$  and  $G'(\mathbf{A}_F)$ . And it is possible to deduce period formula for  $G(\mathbf{A}_F)$  from period formula for  $G'(\mathbf{A}_F)$ . ┘

## 10 Weyl Laws

Trace formulae are useful for proving asymptotic for the number of such forms as a function of their Laplacian eigenvalue.

**Thm. (29.1.10.1) [Weyl Law for Cusp Forms on Congruence Quotients, Lindenstrauss-Venkatesh].** Let ┘

## 29.2 Stable Trace Formulae

References are [Harris, stable trace formula], [Kottwitz84] and [Langlands-Shelstad87], [Kottwitz-Shelstad99], [Kal16, Kal24] and [Cohomologie, stabilisation et changement de base, Labesse1999]. [Global rigid inner forms and multiplicities of discrete automorphic representations, Kaletha18].

**Notation (29.2.0.1).**

- Use notations on automorphic representations defined in [Adelic Automorphic Representations](#).  $\lrcorner$

### Stably Invariant Distributions

**Def. (29.2.0.2) [Stably Invariant Distributions].** For  $v \in \Sigma_F$ ,  $I \in \text{Dist}(G(F_v))$  is called a **stably invariant distribution** if it satisfies: For any  $f \in \mathcal{T}(G(F_v))$ , if  $\text{SO}_{\text{rb}}(f) = 0$  [\(29.2.4.6\)](#) for any strongly-regular semi-simple element  $\gamma \in G(F_v)$  [\(10.5.1.17\)](#), then we have  $I(f) = 0$ .  $\lrcorner$

**Prop. (29.2.0.3).** For  $v \in \Sigma_F$ , if  $I \in \text{Dist}(G(F_v))$  is represented by a function  $\phi$ , then  $I$  is stably invariant [\(29.2.0.2\)](#) if  $\phi$  is stably invariant.  $\lrcorner$

*Proof:*  $\color{red}{?}$  Use Weyl integration formula.  $\square$

**Prop. (29.2.0.4) [Fourier Transform of Stably Invariant Distributions, Waldspurger].** The Fourier transform of a stably invariant distribution [\(29.2.0.2\)](#) is also stably invariant.  $\lrcorner$

*Proof:* Cf. [Waldspurger. Le lemme fondamental implique le transfert].  $\square$

## 1 Endoscopy

References are [\[Kot84\]](#), [Scholze-Shin], and

**Notation (29.2.1.1).**

- Let  $F \in \mathbf{NField} \cup \mathbf{LField}^0$ ,
- Let  $G \in \mathbf{RedGrp}/F$  s.t.  $\pi_1([G, G]) = 1$ .  $\lrcorner$

**Def. (29.2.1.2) [ $\mathfrak{R}(I_0/F)$ ].** For  $F \in \mathbf{NField}$ ,  $G \in \mathbf{RedGrp}/F$  and  $\gamma_0 \in G(F)$  semi-simple elliptic, denote  $I_0 = Z_G(\gamma_0)^0 \in \mathbf{RedGrp}/F$  [\(10.3.3.5\)](#). Then there is an exact sequence

$$1 \rightarrow Z(\widehat{G}) \rightarrow Z(\widehat{I_0}) \rightarrow Z(\widehat{I_0})/Z(\widehat{G}) \rightarrow 1,$$

inducing a map  $\pi_0 \left( Z(\widehat{I_0})/Z(\widehat{G}) \right)^{\text{Gal}_F} \rightarrow H^1(F, Z(\widehat{G}))$ . Notice  $\left( Z(\widehat{I_0})/Z(\widehat{G}) \right)^{\text{Gal}_F}$  is finite because  $X^\bullet(Z(\widehat{I_0})^{\text{Gal}_F}) = \pi_1(I_0)_{\text{Gal}_F}$  is finite as a quotient of  $X_\bullet(T)_{\text{Gal}_F}$ .

We define  $\mathfrak{R}(\gamma_0)$  to be the set of elements in  $\pi_0 \left( Z(\widehat{I_0})/Z(\widehat{G}) \right)^{\text{Gal}_F}$  whose image under this map belongs to  $\text{III}(Z(\widehat{G})/F)$ . Equivalently, by Chebotarev density theorem,

$$\mathfrak{R}(I_0/F) = \left[ \bigcap_{v \in \Sigma_F} \left( Z(\widehat{I_0})^{\text{Gal}_{F_v}} Z(\widehat{G}) \right) \right] / Z(\widehat{G}).$$

In particular,  $\#\mathfrak{K}(I_0/F) < \infty$ , and there is an exact sequence

$$1 \rightarrow \pi_0(Z(\widehat{G})^{\text{Gal}_F}) \rightarrow \pi_0(Z(\widehat{I}_0)^{\text{Gal}_F}) \rightarrow \mathfrak{K}(I_0/F) \rightarrow \text{III}(Z(\widehat{G})/F) \rightarrow \text{III}(Z(\widehat{I}_0)/F).$$

where the first injection because  $\gamma$  is elliptic implies  $X_\bullet(Z(\widehat{I}_0)/Z(\widehat{G}))^{\text{Gal}_F} = 0$ ?  $\lrcorner$

*Proof:* ? Cf.[Kot84]Cor2.3.  $\square$

**Prop. (29.2.1.3)[Kottwitz].** Situation as in(29.2.1.2). Suppose  $\gamma = (\gamma_v) \in G(\mathbf{A}_F)$  s.t.  $\gamma_v \sim_{\text{st}} \gamma_0$  for all  $v \in \Sigma_F$ , then the  $G(\mathbf{A}_F)$ -conjugacy class of  $\gamma$  contains some element of  $G(F)$  iff

$$\sum_{v \in \Sigma_F} \langle \text{inv}(\gamma_0, \gamma), - \rangle|_{\mathfrak{K}(I_0/F)} = 0 \text{ (10.5.1.6),}$$

where the paring is induced by the Tate-Nakayama duality(? Cf.[Kot84]). And in this case, there are

$$\#\mathfrak{K}(I_0/K)\tau(G)\tau(I_0)^{-1}$$

many  $G(F)$ -conjugacy classes of elements in  $G(F)$  in the  $G(\mathbf{A}_F)$ -conjugacy class of  $\gamma$ .  $\lrcorner$

*Proof:* Cf.[Kot86]Prop6.6, and section9.?  $\square$

### Endoscopic Triples

**Def. (29.2.1.4)[Endoscopic Triples].** An **endoscopic triple** of  $G/F$  is a triple  $(H, s, \eta)$  where

- $H \in \mathcal{R}\text{edGrp}/F$  is a quasi-split reductive group.
- $\eta : \widehat{H}_{\mathbb{C}} \rightarrow \widehat{G}_{\mathbb{C}} \in \mathcal{R}\text{edGrp}/\mathbb{C}$  is an embedding.
- $s \in \left(Z(\widehat{H}_{\mathbb{C}})/Z(\widehat{G}_{\mathbb{C}})\right)^{\text{Gal}_F}$ .

s.t.

- $\eta$  identifies  $\widehat{H}_{\mathbb{C}}$  with  $Z_{\widehat{G}_{\mathbb{C}}}(s)^0$ .
- The conjugacy class of  $\eta$  is defined over  $F$ , i.e. for any  $\sigma \in \text{Gal}_F$ , there exists  $x_\sigma \in \widehat{G}(\mathbb{C})$  s.t.  $\sigma_{\widehat{G}} \circ \eta \circ \sigma_{\widehat{H}}^{-1} = \text{ad}(x_\sigma)(\eta)$ . In particular,  $\eta$  extends to a homomorphism  ${}^L\eta : {}^LH_{\mathbb{C}} \rightarrow {}^LG_{\mathbb{C}}$  commuting with  $s$ (Cf.[Langlands. Stable conjugacy: definitions and lemmas]Prop1?).
- The image of  $s$  in  $H^1(F, Z(\widehat{G}))$  via the connecting homomorphism associated to the exact sequence  $1 \rightarrow Z(\widehat{G}) \rightarrow Z(\widehat{H}) \rightarrow Z(\widehat{G})/Z(\widehat{H})$  is contained in  $\text{III}(Z(\widehat{G})/F)$ .

And  $(H, s, \eta)$  is called an **elliptic endoscopic triple** if  $\left(Z(\widehat{H})^{\text{Gal}_F}\right)^0 = \left(Z(\widehat{G})^{\text{Gal}_F}\right)^0$ .

Let  $\mathfrak{E}(G/F)$ (resp.  $\mathfrak{E}_{\text{ell}}(G/F)$ ) be a fixed set of representatives of the isomorphism classes of (elliptic)endoscopic triples of  $G$  over  $F$ .  $\lrcorner$

**Remark (29.2.1.5)[Extended Endoscopic Triples].** In general if  $\pi_1([G, G]) \neq 1$ , then an extension  $\eta : {}^LH_{\mathbb{C}} \rightarrow {}^LG_{\mathbb{C}}$  may not exist, and endoscopic triples with such an extension is called an **extended endoscopic triples**. Let  ${}^L\mathfrak{E}(G/F)$ (resp.  ${}^L\mathfrak{E}_{\text{ell}}(G/F)$ ) be a fixed set of representatives of the isomorphism classes of extended (elliptic)endoscopic triples of  $G$  over  $F$ .  $\lrcorner$

**Def. (29.2.1.6)[Unramified Endoscopic Triples].** If  $F = K \in p\text{-NField}$  and  $G \in \mathcal{R}\text{edGrp}/K$ , then  $(H, s, \eta) \in \mathfrak{E}(G/K)$  is called an **unramified endoscopic triple** if  $H$  is unramified and  $\sigma_{\widehat{G}} \circ \eta \circ \sigma_{\widehat{H}}^{-1} = \eta$  for any  $\sigma \in I_K$ .  $\lrcorner$

**Prop. (29.2.1.7)[Outer Automorphic Groups of Endoscopic triples].** Situation as in (29.2.1.4), a isomorphism between two endoscopic triples  $(H, s, \eta), (H', s', \eta')$  is a pair  $(\alpha, g)$  where  $\alpha : H' \cong H \in \text{RedGrp}/F$  is an isomorphism s.t.

- $\eta \circ \alpha = \text{Ad}(g) \circ \eta'$ .
- Conjugation by  $g$  as in item1 takes the image of  $s'$  in  $\pi_0 \left( \left( Z(\widehat{H}')/Z(\widehat{G}) \right)^{\text{Gal}_F} \right)$  to the image of  $s$  in  $\pi_0 \left( \left( Z(\widehat{H})/Z(\widehat{G}) \right)^{\text{Gal}_F} \right)$ .

Then  $H_{\text{ad}}(F) \trianglelefteq \text{Aut}((H, s, \eta))$ , and define the **outer automorphism group**

$$\text{OAut}((H, s, \eta)) = \text{Aut}((H, s, \eta))/H_{\text{ad}}(F) \leq \text{OAut}(H).$$

┘

**Def. (29.2.1.8)[ $i(G, H)$ ].** For each  $(H, s, \eta) \in \mathfrak{E}(G/F)$  (29.2.1.4), denote

$$i(G, H) = \tau(G)\tau(H)^{-1} \# \text{OAut}((H, s, \eta)) \text{ (29.2.1.7) (20.5.4.8)}.$$

┘

**Example (29.2.1.9) [Endoscopic Triples for  $\text{SL}(2)$ ].** For  $G = \text{SL}(2)$ , there are three isomorphism classes of endoscopic triples:

- The trivial endoscopic triple  $(G, 1, \text{id})$ .
- The elliptic endoscopic triple  $(T, s, \eta)$  where  $T$  is an anisotropic torus of dimension 1,  $\eta : \mathbb{C}^\times \rightarrow \text{PGL}(2; \mathbb{C})$  is the diagonal torus  $\text{diag}(x, 1)$ , and  $s = -1$ .
- The non-elliptic endoscopic triple  $(\mathbb{G}_m, s, \eta)$  where  $\eta : \mathbb{C}^\times \rightarrow \text{PGL}(2; \mathbb{C})$  is the diagonal torus  $\text{diag}(x, 1)$ , and  $s \in \text{PGL}(2; \mathbb{C}) \setminus \{1\}$ .

┘

*Proof:* ?

□

**Def. (29.2.1.10)[Admissible Isomorphisms].** For  $(H, s, \eta) \in \mathfrak{E}(G/F)$ , take a maximal torus  $T_H \leq H$ , then we may take a maximal torus  $T \leq g$  s.t.  $\eta(\widehat{T}_H) = \widehat{T}$ , and we get an isomorphism  $\varphi : T_H \rightarrow T$ . For any maximal torus  $T'_H \leq H$  and a maximal torus  $T' \leq G$ , an **admissible isomorphism** between  $T'_H$  and  $T'$  is an isomorphism  $T'_H \rightarrow T'$  which is a composition of  $\varphi$  with  $\text{Ad}(h) : T'_H \cong T_H$  and  $\text{Ad}(g) : T \cong T'$  for some  $h \in H(F^{\text{sep}})$  and  $g \in G(F^{\text{sep}})$ .

┘

**Thm. (29.2.1.11).** If  $G$  is quasi-split and  $(H, s, \eta) \in \mathfrak{E}(G/F)$ , then for any maximal torus  $T_H \leq H$ , there exists an admissible isomorphism  $\varphi : T_H \rightarrow T$  (29.2.1.10) for some maximal torus  $T \leq G$ .

┘

*Proof:* Cf. [Kot82] Cor2.2. ?

□

**Def. (29.2.1.12) [Related Semi-Simple Elements].** For  $(H, s, \eta) \in \mathfrak{E}(G/F)$ , two elements  $\gamma_H \in H(F)_{\text{ss}}, \gamma \in G(F)_{\text{ss}}$  are called **associated semi-simple elements** if there exists an admissible isomorphism  $\varphi : T_H \rightarrow T$  between maximal tori of  $H$  and  $G$  (29.2.1.10) mapping  $\gamma_H$  to  $\gamma$ .

Notice when  $\gamma$  is strongly regular, such an admissible isomorphism is unique if it exists (because  $Z_G(\gamma)$  is commutative), denoted by  $\varphi_{\gamma_H, \gamma}$ .

┘

**Def. (29.2.1.13)[ $G$ -Regular Semi-Simple Elements].** For  $(H, s, \eta) \in \mathfrak{E}(G/F)$ , a semi-simple element  $\gamma_H \in H(F)$  is called a  **$G$ -regular element** if it is related to a regular semi-simple element  $\gamma \in G(F)$ . And it is called a **strongly  $G$ -regular element** if it is related to a strongly regular semi-simple element  $\gamma \in G(F)$ .

┘

**Def. (29.2.1.14) [(G, H)-Regular Elements].** Situation as in (29.2.1.12), the  $\varphi(T_H) \leq G_{F^{\text{sep}}}$  is a maximal torus, so we get a map  $j^* : \Phi(G, T) \rightarrow X^\bullet(T_H)$ . We call  $\gamma_H$  an **(G, H)-regular element** if  $\alpha(\gamma_H) \neq 1$  whenever  $\alpha \in \Phi(G, T) \setminus (\varphi^*)^{-1}\Phi(H, T_H)$ . This notion doesn't depend on  $T_H$  and  $\varphi$  chosen?  $\lrcorner$

*Proof:* Cf. [Kot86]P378?  $\square$

**Prop. (29.2.1.15).** Situation as in (29.2.1.10), suppose  $\gamma_H \in H(F^{\text{sep}})$  is semi-simple elliptic and  $(G, H)$ -regular (29.2.1.14), and  $\gamma_0 \in G(F)$  comes from  $\gamma_H$ . Denote  $I_0 \triangleq Z_G(\gamma_0)^0 \in \text{RedGrp}/F$  and  $I_{\gamma_H} \triangleq Z_H(\gamma_H)^0 \in \text{RedGrp}/F^{\text{sep}}$  (10.3.3.5), then  $\varphi$  extends to an isomorphism  $I_{\gamma_H} \rightarrow (I_0)_{F^{\text{sep}}}$ , unique up to conjugacy by  $\varphi(T_H)$ ?  $\lrcorner$

*Proof:* Cf. [Kot86]Section3.  $\square$

### Langlands-Shelstad Transfer for Quasi-Split Groups

References are [L-S87].

**Def. (29.2.1.16) [a-Data, Langlands-Shelstad [L-S87]].**  $\lrcorner$

**Def. (29.2.1.17) [ $\chi$ -Data, Langlands-Shelstad [L-S87]/Kottwitz-Shelstad [K-S99]].**  $\lrcorner$

**Def. (29.2.1.18) [Langlands-Shelstad Transfer Factors for Quasi-Split Groups, Langlands-Shelstad [L-S87]/Kottwitz-Shelstad/Kaletha].** Suppose  $K \in \text{LField}$  and  $G \in \text{RedGrp}/K$  is quasi-split. Given  $(H, s, {}^L\eta) \in {}^L\mathfrak{E}(G/K)$  and a Whittaker datum  $\mathfrak{m}$  (10.4.4.23), there is a function

$$\Delta^{\mathfrak{m}, H, G} = \epsilon \cdot \Delta_I^{-1} \cdot \Delta_{II} \cdot \Delta_{III_2} \cdot \Delta_{IV} : H(K)_{\text{s.reg}} \times G(K)_{\text{s.reg}} \rightarrow \mathbb{C} \text{ (10.5.1.17),}$$

called the **transfer factor** between  $H$  and  $G$  s.t.  $\Delta(\gamma_H, \gamma) \neq 0$  iff  $\gamma_H$  and  $\gamma$  are related (29.2.1.12), and in which case it is defined as follows: Choose a pinning  $(T_0, B_0, \{X_\alpha\}_{\alpha \in \Delta_0})$  and  $1 \neq \psi_K \in (K^\times)^\vee$  s.t. the generic unipotent character  $\psi : (B_0)_u \rightarrow \mathbb{C}^\times$  determined by these choices belongs to  $\mathfrak{m}$ .

- $\epsilon = w(V, \psi_K)$  is the root number, where  $V$  is the degree 0 virtual Galois-representation  $V = X_\bullet(T_0)_{\mathbb{C}} - X_\bullet(T_0^H)_{\mathbb{C}}$ , where  $T_0^H$  is a maximally-split maximal torus of  $H$ .
- $\Delta_I(\gamma_H, \gamma) = \left\langle \lambda, \widehat{\varphi}_{\gamma_H, \gamma}^{-1}(s) \right\rangle$  (29.2.1.12), where  $\lambda \in H^1(F, T_{\gamma, \text{sim.cntd}})$  is the Langlands-Shelstad splitting invariant?,  $\widehat{\varphi}_{\gamma_H, \gamma}^{-1}(s) \in \left( \widehat{T}_\gamma / Z(\widehat{G}) \right)^{\text{Gal}_K}$  and the pairing is given by Tate-Nakayama duality?.
- $\Delta_{II}(\gamma_H, \gamma) = \prod_\alpha \chi_\alpha \left( \frac{\alpha(\gamma)-1}{a_\alpha} \right)$  (29.2.1.16)(29.2.1.17), where  $\alpha$  runs through the  $\text{Gal}_F$ -orbit of  $\Phi(G, T_\gamma) \setminus \left( \varphi_{\gamma_H, \gamma}^* \right)^{-1} \Phi(H, T_{\gamma_H})$ ,
- $\Delta_{III_2}(\gamma_H, \gamma) = \theta(\gamma)$ , where  $\theta \in (T_\gamma(F))^\vee$  is constructed as follows:?
- $\Delta_{IV}(\gamma_H, \gamma) = \prod_{\alpha \in \Phi(G, T_\gamma) \setminus \Phi(H, T_{\gamma_H})} |\alpha(\gamma) - 1|^{1/2}$ .

*Proof:* ? Cf. [Kal24]P21.  $\square$

**Cor. (29.2.1.19)**[ $\kappa$ -Behavior of Transfer Factors]. Situation as in (29.2.1.18), if  $\gamma, \gamma'$  are stably conjugate, then

$$\Delta^{\mathfrak{m}, H, G}(\gamma_H, \gamma') = \Delta^{\mathfrak{m}, H, G}(\gamma_H, \gamma) \left\langle \text{inv}(\gamma, \gamma'), \widehat{\varphi}_{\gamma_H, \gamma}^{-1}(s) \right\rangle \quad (10.5.1.6).$$

In particular,  $\Delta^{\mathfrak{m}}(\gamma_H, \gamma)$  only depends on the stable-conjugacy class of  $\gamma_H$  and the conjugacy class of  $\gamma$ .  $\lrcorner$

*Proof:* Cf. [Kal24]  $\color{red}?$ .  $\square$

**Thm. (29.2.1.20)**[Normalization of Transfer Factors]. When  $F \in \mathbf{NField}$ , for each elliptic extended endoscopic triple  $(H, s, {}^L\eta) \in {}^L\mathfrak{E}_{\text{ell}}(G/F)$  (29.2.1.5), we can normalize the Langlands-Shelstad transfer factor  $\Delta_v$  (29.2.1.18) for each  $v \in \Sigma_F$  s.t. for each pair of related (29.2.1.12) strongly regular semi-simple elliptic elements  $\gamma_H \in H(F)$  and  $\gamma \in G(F)$ , we have

$$\prod_{v \in \Sigma_F} \Delta_v(\gamma_H, \gamma) = \left\langle \text{inv}(\gamma_H, \gamma), \widehat{\varphi}_{\gamma_H, \gamma}^{-1}(s) \right\rangle \quad (29.2.1.12)(10.5.1.6),$$

where the pairing is given by Tate-Nakayama duality  $\color{red}?$ .  $\lrcorner$

*Proof:* Cf. [Kal24] P50  $\color{red}?$ .  $\square$

**Prop. (29.2.1.21)**[Transfer Factors for Unramified Groups, Hales]. Cf. [Hales, A simple definition of transfer factors for unramified groups]  $\color{red}?$ . Hales gave explicit formula for the transfer factor, because in this case  $a$ -data and  $\chi$ -data can be chosen more or less canonically in this case  $\lrcorner$

*Proof:*  $\color{red}?$   $\square$

**Thm. (29.2.1.22)** [Langlands-Shelstad Transfer Conjecture, Shelstad82/Bouaziz94/ Waldspurger97/Ngô [Ngô10]]. For  $K \in \mathbf{LField}$  and  $G \in \mathbf{RedGrp}/K$ , suppose

- $(H, s, {}^L\eta) \in {}^L\mathfrak{E}(G/K)$  (29.2.1.4),
- A normalization of transfer factors  $\Delta_{H, G}^{\mathfrak{m}}$  between  $H$  and  $G$  is fixed as in (29.2.1.18),
- Haar measures on  $G(K)$  and  $H(K)$  are fixed,

then for any  $f \in \mathcal{T}(G(K))$ , there exists  $f^H \in \mathcal{T}(H(K))$  s.t. for any strongly  $G$ -regular semi-simple element  $\gamma_H \in H(K)$  (29.2.1.13), we have

$$\text{SOrb}_{\gamma_H}(f^H) = \sum_{\gamma \in G(K)_{\text{s.reg}}/\text{Ad}(G(K))} \Delta_{H, G}^{\mathfrak{m}}(\gamma_H, \gamma) \text{Orb}_{\gamma}(f) = \Delta_{H, G}^{\mathfrak{m}}(\gamma_H, \gamma_0) \text{SOrb}_{\gamma_0}^{\widehat{\varphi}_{\gamma_H, \gamma_0}^{-1}(s)}(f),$$

which is a finite sum, where

- $\gamma_0 \in G(K)_{\text{s.reg}}/\text{Ad}(G(K))$  is an arbitrary element.
- $\Delta_{H, G}^{\mathfrak{m}}(\gamma_H, \gamma) = 0$  unless  $\gamma_H$  and  $\gamma$  are related (29.2.1.18), in which case we are using Haar measures on  $Z_G(\gamma)$  and  $Z_H(\gamma_H)$  that are compatible via the unique admissible isomorphism  $\varphi_{\gamma_H, \gamma}$  (29.2.1.12) to define the orbital integrals.

•

$$\text{SOrb}_{\gamma_0}^{\kappa}(f) \triangleq \sum_{\substack{\gamma \in G(K)_{\text{s.reg}}/\text{Ad}(G(K)) \\ \gamma \sim_{\text{st}} \gamma_0}} \langle \text{inv}(\gamma_0, \gamma), \kappa \rangle \text{Orb}_{\gamma}(f).$$

Any such  $f^H$  is called a **Langlands-Shelstad transfer** of  $f$  to  $H$ .  $\lrcorner$

*Proof:* In the real case this is proven by [Shelstad,  $L$ -indistinguishability for real groups] and [Bouaziz, Integrales orbitales sur les groupes de Lie reductifs].

In the  $p$ -adic case this follows from (29.2.3.7)(29.2.3.6) and (29.2.3.5).

The second identity follows from (29.2.1.19). This sum is finite by (10.5.1.6) and the fact  $\#H^1(F, T_{\gamma_0}) < \infty$  (10.5.2.9).  $\square$

**Remark (29.2.1.23).** The stable orbital integral of  $f^H$  at regular elements can be expressed in terms of the stable orbital integrals at strongly regular semi-simple elements by continuity, Cf. [LS87]Section 4.3.. And the stable orbital integral of  $f^H$  at singular elements can be related to the stable orbital integrals at regular elements, Cf. [Kot88]Section 3.  $?$   $\lrcorner$

**Thm. (29.2.1.24) [Fundamental Lemma, Ngô [Ngô10]].** Situation as in (29.2.1.22), if

- $K \in p\text{-NField}$ ,
- $G$  is unramified and  $(H, s, {}^L\eta)$  is unramified (29.2.1.6),
- $\mathcal{K} \leq G(K), \mathcal{K}_H \leq H(K)$  are hyperspecial maximal subgroups,
- The Haar measures on  $G(K)$  and  $H(K)$  are neutralized at  $\mathcal{K}, \mathcal{K}_H$  resp.,
- The transfer factor  $\Delta$  between  $H$  and  $G$  is canonically normalized as in (29.2.1.21).

then  $\mathbf{1}_{\mathcal{K}_H}$  is a Langlands-Shelstad transfer of  $\mathbf{1}_{\mathcal{K}}$ .  $\lrcorner$

*Proof:*  $?$  Cf. [ngo10]. This was reduced from the case of groups to the case of Lie algebras via a Harish-Chandra descent argument. The Lie algebra version was proved by Ngô for local fields of Laurent series, and then transferred to characteristic zero.  $\square$

**Cor. (29.2.1.25) [Adelic Langlands-Shelstad Transfer].** An analogue of (29.2.1.22) holds over  $\mathbf{A}_f^p$ , where the adelic  $(G, H)$ -regular elements are defined in [Kot90]P178  $?$ , and the transfer factors between  $H$  and  $G$  are suitably defined  $?$ .  $\lrcorner$

### Endoscopy over $\mathbb{R}$

**Def. (29.2.1.26).** For  $(H, s, \eta) \in \mathfrak{E}_{\infty}(G)$  and  $\lrcorner$

**Def. (29.2.1.27) [Elliptic Tori of  $G_{\mathbb{R}}$  and  $H_{\mathbb{R}}$ ].** We say an elliptic torus of  $G_{\mathbb{R}}$  comes from  $H_{\mathbb{R}}$  if  $?$   $\lrcorner$

### Unstable Cyclic Base Changes

**Thm. (29.2.1.28) [Fundamental Lemma for Unstable Cyclic Base Changes].** For  $(H, s, \eta) \in \mathfrak{E}_p(G)$  (29.2.1.4), suppose

- $(H, s, \eta)$  is unramified (29.2.1.6),
- $s \in Z(\hat{H})^{\text{Gal}_{\mathbb{Q}_p}}$ .

Let  $R = \text{Res}_{\mathbb{Q}_{p^n}/\mathbb{Q}_p}(G)$ , then  $\lrcorner$

## 2 Endoscopy for Non-Quasi-Split Groups

### Pure Inner Forms

**Def. (29.2.2.1) [Pure Refined Extended Endoscopic Triples].**  $?$

Let  ${}^L\mathfrak{E}(G/F)$  (resp.  ${}^L\mathfrak{E}_{\text{ell}}(G/F)$ ) be a fixed set of representatives of the isomorphism classes of (elliptic) pure refined extended endoscopic triples of  $G$  over  $F$ .  $\lrcorner$

**Def. (29.2.2.2) [Transfer Factors for Pure Inner Forms, Kal11].** Suppose  $K \in \text{LField}$ ,  $G^* \in \text{RedGrp}/K$  is quasi-split with a Whittaker datum  $\mathfrak{m}$ . For any pure refined extended endoscopic triple  $(H, \dot{s}, {}^L\eta)$  for  $G^*/K$  (29.2.2.1) and a pure inner twist  $(G, \xi, z)$  of  $G^*$  (10.2.5.11), define the transfer factor

$$\Delta^{\mathfrak{m}, H, z, G} : H(K)_{\text{s.reg}} \times G(K)_{\text{s.reg}} \rightarrow \mathbb{C}^\times$$

as follows: If  $\gamma_H \leq H(K)_{\text{s.reg}}$  and  $\gamma \in G(K)_{\text{s.reg}}$  are not related (29.2.1.12), then  $\Delta^{\mathfrak{m}, H, z, G}(\gamma_H, \gamma) = 0$ . And if  $\gamma_H, \gamma$  are related, then there exists  $\gamma^* \in G^*(K)$  and  $g \in G^*(K^{\text{sep}})$  s.t.  $\gamma = \xi(g\gamma^*g^{-1})$  by Steinberg's theorem (Cf. [Kot82] Section 2). Then  $\gamma_H$  and  $\gamma^*$  are related. And it can be verified that  $(g^{-1}z(\sigma)\sigma(g))_{\sigma \in \text{Gal}_K}$  is a 1-cocycle of  $\text{Gal}_K$  in  $Z_{G^*}(\gamma^*)$  whose cohomology class is denoted by  $\text{inv}[z](\gamma^*, \gamma) \in H^1(K, Z_{G^*}(\gamma^*))$ .

Then we define

$$\Delta^{\mathfrak{m}, H, z, G}(\gamma_H, \gamma) = \Delta^{\mathfrak{m}, H, G}(\gamma_H, \gamma^*) \left\langle \text{inv}[z](\gamma^*, \gamma), \widehat{\varphi}_{\gamma_H, \gamma^*}^{-1}(\dot{s}) \right\rangle \quad (29.2.1.12).$$

where the pairing is via the Tate-Nakayama isomorphism (10.5.2.2).

It can be checked that  $\Delta^{\mathfrak{m}, H, z, G}$  is indeed a transfer factor by [Kaletha, Endoscopic character identities for depth-zero supercuspidal L-packets] Prop 2.2.2.  $\textcolor{red}{?}$   $\lrcorner$

*Proof:*

$\square$

### Isocrystals

**Def. (29.2.2.3) [Transfer Factors via Isocrystals].**  $\Delta^{\mathfrak{m}, H, b}$ . Cf. [Kaletha, Supercuspidal L-packets via isocrystals].  $\textcolor{red}{?}$   $\lrcorner$

### Rigid Inner Forms

**Def. (29.2.2.4).**  $\lrcorner$

**Def. (29.2.2.5) [Transfer Factors via Rigid Inner Forms].**  $\Delta^{\mathfrak{m}, H, z, G}$ .

It can be checked that  $\Delta^{\mathfrak{m}, H, z, G}$  is indeed a transfer factor by [Kal16] Section 5.3.  $\textcolor{red}{?}$  And it is invariant under automorphisms of  $(H, \dot{s}, \eta)$ .  $\lrcorner$

## 3 Endoscopy for Lie Algebras

References are [Waldspurger, Une formule des traces locale pour les algebres de Lie p-adiques] and [Waldspurger, Le lemme fondamental implique le transfert].

### Langlands-Shelstad-Waldspurger Transfer Factors

**Def. (29.2.3.1) [Langlands-Shelstad-Waldspurger Transfer Factors for Lie Algebras, conjectured by Waldspurger].** For  $K \in \text{LField}^0$ ,  $G \in \text{RedGrp}/K$  and  $(H, s, {}^L\eta) \in {}^L\mathfrak{E}(G/K)$ , denote  $\mathfrak{g} = \text{Lie}(G)$ ,  $\mathfrak{h} = \text{Lie}(H)$ , then Waldspurger defined the transfer factor between  $\mathfrak{h}$  and  $\mathfrak{g}$ :

$$\Delta_{\mathfrak{h}, \mathfrak{g}} : \mathfrak{h}(K)_{\text{s.reg}} \times \mathfrak{g}(K)_{\text{s.reg}} \rightarrow \mathbb{C},$$

analogous to Langlands-Shelstad transfer factors (29.2.1.18).  $\lrcorner$

*Proof:* Cf.[Waldspurger, Une formule des traces locale pour les algebres de Lie p-adiques] and [Waldspurger, Le lemme fondamental implique le transfert]. and [Kottwitz, Harmonic analysis on semisimple p-adic Lie algebras]Section3. ?  $\square$

**Thm. (29.2.3.2) [Langlands-Shelstad-Waldspurger Matching Conjectures for Lie Algebras, conjectured by Waldspurger].** For  $K \in \mathbf{LField}^0$  and  $G \in \mathbf{RedGrp}/K$ , denote  $\mathfrak{g} = \mathrm{Lie}(G)$ . Suppose

- $(H, s, {}^L\eta) \in {}^L\mathfrak{E}(G/K)$ (29.2.1.4), and  $\mathfrak{h} = \mathrm{Lie}(H)$ .
- A normalization of transfer factors  $\Delta_{\mathfrak{h}, \mathfrak{g}}$  between  $\mathfrak{h}(K)$  and  $\mathfrak{g}(K)$  is fixed as in(29.2.1.18),
- Haar measures on  $\mathfrak{g}(K)$  and  $\mathfrak{h}(K)$  are fixed,

then for any  $f \in \mathcal{T}(\mathfrak{g}(K))$ , there exists  $f^{\mathfrak{h}} \in \mathcal{T}(\mathfrak{h}(K))$  s.t. for any strongly  $G$ -regular semi-simple element  $X_{\mathfrak{h}} \in \mathfrak{h}(K)$ (29.2.1.13), we have

$$\mathrm{SOrb}_{X_{\mathfrak{h}}}(f^{\mathfrak{h}}) = \sum_{X \in \mathfrak{g}(K)_{\mathrm{s.reg}}/\mathrm{Ad}(G(K))} \Delta_{H,G}^{\mathfrak{m}}(X_{\mathfrak{h}}, X) \mathrm{Orb}_X(f),$$

which is a finite sum, where  $\Delta_{\mathfrak{h}, \mathfrak{g}}^{\mathfrak{m}}(X_{\mathfrak{h}}, X) = 0$  unless  $X_{\mathfrak{h}}$  and  $X$  are related(29.2.1.18), in which case we are using Haar measures on  $Z_G(X)$  and  $Z_H(X_{\mathfrak{h}})$  that are compatible via the unique admissible isomorphism  $\varphi_{X_{\mathfrak{h}}, X}$ (29.2.1.12) to define the orbital integrals.

Any such  $f^{\mathfrak{h}}$  is called **Langlands-Shelstad-Waldspurger transfer** of  $f$  to  $\mathfrak{h}(K)$ .  $\lrcorner$

**Thm. (29.2.3.3) [Weak Transfer Conjectures for Lie Algebras, conjectured by Waldspurger].**

For  $K \in \mathbf{LField}^0$  and  $G \in \mathbf{RedGrp}/K$  with  $\mathfrak{g} \triangleq \mathrm{Lie}(G)$ , there exists  $c \in \mathbb{C}^{\times}$  s.t. for any  $G$ -regular semisimple element  $X_{\mathfrak{h}} \in \mathfrak{h}(K)$  and  $f \in \mathcal{T}(\mathfrak{g}(K))$  with a Langlands-Shelstad-Waldspurger transfer  $f^{\mathfrak{h}} \in \mathcal{T}(\mathfrak{h}(K))$ (29.2.3.2), we have

$$\mathcal{FSOrb}_{X_{\mathfrak{h}}}(f^{\mathfrak{h}}) = c \sum_{X \in \mathfrak{g}(K)_{\mathrm{s.reg}}/\mathrm{Ad}(G(K))} \Delta_{\mathfrak{h}, \mathfrak{g}}^{\mathfrak{m}}(X_{\mathfrak{h}}, X) \mathcal{FOrb}_X(f).$$

Notice that the Fourier transform of a stably invariant distribution is also stably invariant(29.2.0.4).  $\lrcorner$

*Proof:* Cf.[Waldspurger, Une formule des traces locale pour les algebres de Lie p-adiques].  $\square$

**Thm. (29.2.3.4) [Transfer Conjectures for Lie Algebras, conjectured by Waldspurger].** For

$K \in \mathbf{LField}^0$  and  $G \in \mathbf{RedGrp}/K$  with  $\mathfrak{g} \triangleq \mathrm{Lie}(G)$ , there is another version of the transfer conjecture that says there exists  $c \in \mathbb{C}^{\times}$  s.t. for any  $G$ -regular semisimple element  $X_{\mathfrak{h}} \in \mathfrak{h}(K)$  we have

$$i_{\mathfrak{h}}^{\mathfrak{g}}(\mathrm{SO}_{X_{\mathfrak{h}}}) = c \sum_{X \in \mathfrak{g}(K)_{\mathrm{s.reg}}/\mathrm{Ad}(G(K))} \Theta_X,$$

where  $i_{\mathfrak{h}}^{\mathfrak{g}}$  is the endoscopic induction functor.

This statement implies the matching conjecture for  $\mathfrak{g}$ (29.2.3.2) and the weak transfer conjecture(29.2.3.3).  $\lrcorner$

*Proof:* ? Cf.[Kottwitz, Harmonic analysis on semisimple p-adic Lie algebras] and [Waldspurger, Une formule des traces locale pour les algebres de Lie p-adiques]13.7(8).

The proof uses Harish-Chandra's theorem that Shalika germs appear as coefficients in the Lie algebra analog of his local character expansion. Thus the transfer conjecture implies that  $\kappa$ -Shalika germs on  $\mathfrak{g}(K)$  can be expressed in terms of stable Shalika germs on  $\mathfrak{h}(K)$ , and this, by work of [Langlands-Shelstad, Descent for transfer factors]Section2.4, implies matching for both  $G(K)$  and  $\mathfrak{g}(K)$ .  $\square$

**Cor. (29.2.3.5) [Matching Conjectures for  $G$  and  $\mathfrak{g}$ , conjectured by Waldspurger].** For  $K \in \mathbf{LField}^0$  and  $G \in \mathbf{RedGrp}/K$  with  $\mathfrak{g} \triangleq \mathrm{Lie}(G)$ , the Langlands-Shelstad transfer conjecture for  $G$  (29.2.1.22) implies the Langlands-Shelstad-Waldspurger matching conjecture for  $\mathfrak{g}$ .

Conversely, the Langlands-Shelstad-Waldspurger matching conjecture for all reductive Lie algebras over  $K$  implies the transfer conjecture for all reductive groups over  $K$ .  $\lrcorner$

*Proof:* Cf. [Waldspurger, Une formule des traces locale pour les algebres de Lie p-adiques].  $\square$

**Thm. (29.2.3.6) [Fundamental Lemmas for Lie Algebras, Conjectured by Waldspurger, Ngô [Ngô10]].** Situation as in (29.2.3.2), if

- $K \in p\text{-NField}$ ,
- $G$  is unramified and  $(H, s, {}^L\eta)$  is unramified (29.2.1.6),
- $\mathfrak{k} \leq \mathfrak{g}(K)$ ,  $\mathfrak{k}_H \leq \mathfrak{h}(K)$  are hyperspecial parahoric subalgebras?,
- The Haar measures on  $\mathfrak{g}(K)$  and  $\mathfrak{h}(K)$  are neutralized at  $\mathfrak{k}$ ,  $\mathfrak{k}_H$  resp.,
- The transfer factor  $\Delta$  between  $H$  and  $G$  is canonically normalized as in (29.2.1.21)?.

then  $\mathbf{1}_{\mathfrak{k}_H}$  is a Langlands-Shelstad-Waldspurger transfer of  $\mathbf{1}_{\mathfrak{k}}$ .  $\lrcorner$

*Proof:* Cf. [Ngô10].  $\square$

**Thm. (29.2.3.7) [Fundamental Lemma Implies Transfer Conjecture, Waldspurger].** If the fundamental lemmas for Lie algebras (29.2.3.6) are true, then the transfer conjectures for Lie algebras (29.2.3.4) are true.  $\lrcorner$

*Proof:* Cf. [Waldspurger, Le lemme fondamental implique le transfert]. The proof uses global methods.  $\square$

## 4 Stabilization of Trace Formulae

**Def. (29.2.4.1) [Strongly Regular Elliptic Part of the Trace Formulae].**  $\lrcorner$

### Twisted Orbital Integrals

**Def. (29.2.4.2) [Twisted Orbital Integrals].** Situation as in (30.5.3.4), fix Haar measures on  $I_0(\mathbf{A}_f^p)$  and  $I_0(\mathbb{Q}_p)$  and transfer them to  $I(\mathbf{A}_f^p) \cong Z_{G(\mathbf{A}_f^p)}(\gamma)$  and  $I(\mathbb{Q}_p) \cong J_\delta(\mathbb{Q}_p)$ .

Fix the Haar measure on  $G(\mathbf{A}_f^p)$  neutralized by  $\mathcal{K}^p$  and a Haar measure on  $G(\mathbb{Q}_{p^n})$  neutralized by  $\mathcal{G}(\mathbb{Z}_{p^n})$ . Define the orbital integral  $\mathrm{Orb}_\gamma(f^{p,\infty})$  (29.1.1.4), where  $f^{p,\infty} = \mathbf{1}_{\mathcal{K}^p g^{-1} \mathcal{K}^p} \in C_c^\infty(G(\mathbf{A}_f^p))$ .

And define the **twisted orbital integral**

$$\mathrm{TOrb}_\delta(\phi_n) = \int_{J_\delta(\mathbb{Q}_p) \backslash G(\mathbb{Q}_{p^n})} \phi_n(y^{-1} \delta \sigma(y)) dy, \text{ where } \phi_n = \mathbf{1}_{\mathcal{G}(\mathbb{Z}_{p^n}) \mu(p^{-1}) \mathcal{G}(\mathbb{Z}_{p^n})} \in C_c^\infty(G(\mathbb{Q}_{p^n}))$$

where  $\mu$  is a representative of the Hodge cocharacter  $\mu_h$  that is integral(?) [Kottwitz, Shimura varieties and twisted orbital integrals] Lemma 1.1.3). Define

$$\mathrm{Orb}(\gamma_0, \gamma, \delta) = \mathrm{Vol}(I(\mathbb{Q}) \backslash I(\mathbf{A}_f)) \mathrm{Orb}_\gamma(f^{p,\infty}) \mathrm{TOrb}_\delta(\phi_n)$$

which doesn't depend on the Haar measures on  $I_0(\mathbf{A}_f)$ ?.  $\lrcorner$

*Proof:* Cf. [Zhu20]P14? □

**Prop. (29.2.4.3) [Volume Constants  $c(\gamma_0, \gamma, \delta)$ ].** Situation as in (29.2.4.2), define

$$c(\gamma_0, \gamma, \delta) = \text{Vol}(I(\mathbb{Q}) \backslash I(\mathbf{A}_f)) \# \ker(\text{III}(I_0/\mathbb{Q}) \rightarrow \text{III}(G/\mathbb{Q})).$$

which depends only on the Haar measure on  $I_0(\mathbf{A}_f)$ ?. Then we have

$$c(\gamma_0, \gamma, \delta) = \frac{\tau(G) \# \mathfrak{K}(I_0/\mathbb{Q})}{\text{Vol}(A_G \backslash I(\mathbb{R}))} \quad (29.2.1.2)$$

where the Haar measure on  $I_{\mathbb{R}}$  is chosen s.t. its transfer to  $(I_0)_{\mathbb{R}}$  ([Kot88]P631) product with the Haar measure on  $I_0(\mathbf{A}_f)$  is the Tamagawa-measure on  $I_0(\mathbf{A})$  (20.5.4.5). ┘

*Proof:* By definition (20.5.4.8) we have

$$\text{Vol}(I(\mathbb{Q}) \backslash I(\mathbf{A}_f)) = \frac{\tau(I)}{\text{Vol}(A_G \backslash I(\mathbb{R}))} \quad ?.$$

Also we have  $\tau(I) = \tau(I_0)$  by (20.5.4.10), and

$$\tau(G) = \frac{\#(\pi_1(G)_{\text{Gal}_F})_{\text{tor}}}{\# \text{III}(Z(\widehat{G})/\mathbb{Q})}, \quad \tau(I_0) = \frac{\#(\pi_1(I_0)_{\text{Gal}_F})_{\text{tor}}}{\# \text{III}(Z(\widehat{I}_0)/\mathbb{Q})}$$

by (20.5.4.11). So it suffices to show that

$$\frac{\# \ker(\text{III}(I_0/\mathbb{Q}) \rightarrow \text{III}(G/\mathbb{Q})) \# \text{III}(G/\mathbb{Q}) \# (\pi_1(I_0)_{\text{Gal}_F})_{\text{tor}}}{\# \text{III}(Z(\widehat{I}_0)/\mathbb{Q}) \# (\pi_1(G)_{\text{Gal}_F})_{\text{tor}} \# \mathfrak{K}(I_0)} = 1.$$

But this follows from (29.2.1.2) and duality between  $\text{III}(G/\mathbb{Q})$  and  $\text{III}(Z(\widehat{G})/\mathbb{Q})$ ?. □

**Prop. (29.2.4.4) [Only Virtual Abelian Triples Contribute].** Let  $(\gamma_0, \gamma, \delta) \in \text{KT}_p(G, \mu)$  s.t.

- $\kappa_{\mathfrak{p}} \subset \mathbb{F}_{p^n}$ ,
- $\alpha(\gamma_0, \gamma, \delta) = 1$  (30.5.3.3),
- $\text{Orb}(\gamma_0, \gamma, \delta) \neq 0$  (29.2.4.2),

then  $(\gamma_0, \gamma, \delta)$  is geometric (30.5.3.6). ┘

*Proof:* Prove  $(\gamma_0, \gamma, \delta)$  satisfies (30.5.3.7). Cf. [Kot92]P441?. □

### Local Stable Orbital Integrals

**Def. (29.2.4.5) [Kottwitz-Signs].** Let  $K \in p\text{-NField}$ ,  $G \in \text{RedGrp}/K$  and  $\gamma \in G(K)$  a semi-simple element. If  $\gamma' \in G(K)$  is stably conjugate to  $\gamma$ , then  $Z_G(\gamma')^0$  is an inner form of  $Z_G(\gamma)^0$  defined by the cocycle associated to  $\gamma'$  under the natural map  $H^1(K, Z_G(\gamma)^0) \rightarrow H^1(K, Z_G(\gamma)_{\text{ad}})$ ?. ?

There is a **Kottwitz-sign map**?

$$e : H^1(K, Z_G(\gamma)_{\text{ad}}^0) \rightarrow \{\pm 1\}.$$

┘

*Proof:* Cf.[?Kot83]?

□

**Def.(29.2.4.6) [Local Stable Orbital Integrals].** Situation as in(29.2.4.5), for  $h \in \mathcal{T}(G(K))$ , the (local) **stable orbital integral** is defined by

$$\mathrm{SOrb}_\gamma(h) \triangleq \sum_{\gamma'} e(\gamma') \mathrm{Orb}_{\gamma'}(h) \text{ (29.1.1.4),}$$

where  $\gamma'$  ranges through a set of representatives for the conjugacy classes of rational elements in the stable-conjugacy class of  $\gamma$ .

? Cf.[Kot86]Section5.2. for the stable orbital integral for non-strongly-regular semi-simple elements  $\gamma$ . ┘

*Proof:* Cf.[Labesse99]P67. □

## Adelic Stable Orbital Integrals

### 5 Pseudo-Stablizations

References are [Kottwitz. On the  $\lambda$ -adic representations associated to some simple Shimura varieties] and [Scholze-Shin].

## Stabilized Trace Formulae

**Thm.(29.2.5.1)[Stabilized Arthur-Selberg Trace Formulae, Kottwitz].** For each  $f \in \mathcal{T}(G(\mathbf{A}_F))$ , the elliptic part of the stabilized Arthur-Selberg trace formula for  $G$  is

$$\mathrm{Orb}_{\mathrm{s.reg,ell}}^{\mathbf{A}}(f) = \sum_{(H,s,\eta) \in \mathfrak{C}_{\mathrm{ell}}(G)} i(G, H) \mathrm{ST}_{\mathrm{ell}}^{H(\mathbf{A}_F),*}(f^H) \text{ (29.1.3.5)(29.2.1.4)(29.2.1.8),}$$

where

- $f^H \in C_c^\infty(H(\mathbf{A}_F))$  is the product of Langlands-Shelstad transfers of  $f$  (29.2.1.22),
- the distribution

$$\mathrm{ST}_{\mathrm{ell}}^{H(\mathbf{A}_F),*}(h) = \tau(H) \sum_{\substack{\gamma_H \in H(F)_{\mathrm{ell,ss}}/\sim_{\mathrm{st}} \\ \gamma_H \text{ is strongly } (G,H)\text{-regular}}} \mathrm{SOrb}_{\gamma_H}^{\mathbf{A}}(h) \text{ (29.2.4.6), where } h \in \mathcal{T}(H(\mathbf{A}_F)) \text{ (29.2.1.14)}$$

is the  $(G, H)$ -**regular elliptic part of the stable trace formula** for  $H$ .

? What is the Haar measure? ┘

*Proof:* ?, Cf.[Harris. An introduction to the stable trace formula]Thm6.2, P30, and [Kot90]P189. and [Kal24].

By(10.5.1.18), if  $\gamma, \gamma' \in G(F)$  are strongly regular semi-simple and they are stably conjugate, then there is a canonical isomorphism  $Z_G(\gamma) \cong Z_G(\gamma')$ . Thus for any we have

$$\mathrm{Orb}_{\mathrm{s.reg,ell}}^{\mathbf{A}}(f) = \sum_{\gamma_0 \in G(F)_{\mathrm{s.reg,ss}}/\sim_{\mathrm{st}}} \tau(Z_G(\gamma_0)) \sum_{\substack{\gamma \in G(F)/\mathrm{Ad}(G(F)) \\ \gamma \sim_{\mathrm{st}} \gamma_0}} \mathrm{Orb}_\gamma^{\mathbf{A}}(f).$$

And it follows from (10.5.1.6) that the cohomological class of the map from the set of conjugacy class in the stable-conjugacy class of  $\gamma_0$  to the set of  $\mathbf{A}_F$ -conjugacy class in the adelic stable-conjugacy class of  $\gamma_0$  is the map

$$\ker \left( H^1(F, Z_G(\gamma_0)) \rightarrow H^1(F, G) \right) \xrightarrow{\alpha_{\gamma_0}} \ker \left( H^1(F, Z_G(\gamma_0)(\overline{\mathbf{A}}_F)) \rightarrow H^1(F, G(\overline{\mathbf{A}}_F)) \right).$$

This is a map of Abelian groups by (28.6.1.30)(Cf. [Kot86] ?), thus

$$\text{Orb}_{\text{s.reg,ell}}^{\mathbf{A}}(f) = \sum_{\gamma_0 \in G(F)_{\text{s.reg,ss}} / \sim_{\text{st}}} \tau(Z_G(\gamma_0)) \# \ker(\alpha_{\gamma_0}) \sum_{a \in \text{Im}(\alpha_{\gamma_0})} \text{Orb}_{a\gamma_0}^{\mathbf{A}}(f),$$

where  $a\gamma_0$  is any element in  $G(F)$  s.t.  $\text{inv}_{\mathbf{A}}(\gamma_0, a\gamma_0) = a$  (10.5.1.18). □

## 6 Arthur's Multiplicity Formula

References are [Arthur13] and [Kal16a].

**Thm& Conj.Cor. (29.2.6.1) [KMSW14, Endoscopic classification of representations: Inner forms of unitary groups].** proved Arthur's multiplicity formula for pure inner forms of unitary groups.

[Taibi, Arthur's multiplicity formula for certain inner forms of special orthogonal and symplectic groups] proved Arthur's multiplicity formula for some non-quasi-split symplectic and orthogonal groups.

[Hiroshi Ishimoto24] proved Arthur's multiplicity formula for general orthogonal groups of odd dimensions. ┘

- The Langlands  $L$ -groups  ${}^L G$  are in their Weil-forms.

┘

## 1 Local $L$ -Parameters and Arthur-Parameters

### Transfers of Levi-Subgroups

References are [\[Endoscopic Classification of Representations, Inner Forms of Unitary Groups, Kaletha-Shin\]Section0.4](#).

This subsection should be moved elsewhere.

**Def. (29.3.1.1) [Transfers of Levi-Subgroups].** Let  $F \in \mathbf{Field}^0$  and  $G^* \in \mathbf{RedGrp}/F$  be quasi-split and  $\Xi : G^* \rightarrow G$  be an equivalence class of inner twist. For a Levi-subgroup  $M^* \leq G^*$ ,  $M^*$  is said to **transfer to  $G$  w.r.t.  $\Xi$**  if there exists a Levi-subgroup  $M \leq G$  and  $\xi \in \Xi$  which restricts to an inner twist  $M^* \rightarrow M$ .

┘

**Prop. (29.3.1.2) [Local-Global Principle of Transfers].** For  $F \in \mathbf{NField}$ , suppose  $G^* \in \mathbf{RedGrp}/F$  be quasi-split and  $\Xi : G^* \rightarrow G$  be an equivalence class of inner twist. Then for a Levi-subgroup  $M^* \leq G^*$ ,  $M^*$  transfers to  $G$  w.r.t.  $\Xi$  [\(29.3.1.1\)](#) iff  $M_v^*$  transfers to  $G_v$  for each  $v \in \Sigma_F$ .

┘

*Proof:* Cf. [\[Endoscopic Classification of Representations, Inner Forms of Unitary Groups, Kaletha-Shin\]P22](#) ?.

□

### Local $L$ -Parameters

**Def. (29.3.1.3) [Local Langlands-Groups].** The local langlands groups  $L_{F_v}$  are defined as the group scheme over  $\mathbb{C}$ :

$$L_{F_v} = \begin{cases} W_{F_v} & , v \in \Sigma_F^\infty \\ W_{F_v} \times \mathrm{SL}(2) & , v \in \Sigma_F^{\mathrm{fin}} \end{cases}.$$

┘

**Def. (29.3.1.4) [Local  $L$ -Parameters].** A local  $L$ -parameter for  $G$  is a homomorphism

$$\phi_v : L_{F_v} \rightarrow {}^L G_{\mathbb{C}} \in \mathrm{GrpSch}/\mathbb{C} \text{ (29.3.1.3) (10.4.6.3)}$$

over  $W_{F_v}$  (29.3.1.3) s.t.

- It is trivial on some open subgroup of  $I_{F_v}$ .
- For any  $w \in W_{F_v}$ ,  $\phi_v(w) \in {}^L G(\mathbb{C})$  is semisimple (10.3.3.1). (Equivalently,  $\phi_v|_{W_{F_v}}$  is Frobenius-semisimple (25.1.2.22), by [Tate, number theoretic background, Section 4.1.3] ?)
- (relevant) For any parabolic subgroup  $P = LU$  of  ${}^L G_{\mathbb{C}}$  (10.4.6.8),  $\mathrm{Im}(\phi_v) \subset L$  implies  $P$  is relevant (10.4.6.9). (This is automatic if  $G$  is quasi-split, by (10.4.6.9)).

Any such  $\phi_v$  defined an 1-cocycle in  $\alpha_{\phi_v} \in H^1(L_{F_v}, \widehat{G})$ . And  $\phi_v$  is called a

- **discrete  $L$ -parameter** or **irreducible  $L$ -parameter** if  $C_{\widehat{G}(\mathbb{C})}(\mathrm{Im}(\phi_v))^0 = Z(\widehat{G}_{\mathbb{C}})^0$ , i.e.  $\mathrm{Im}(\phi_v)$  doesn't lie in any proper parabolic subgroup of  ${}^L G_{\mathbb{C}}$  ?.
- **unramified  $L$ -parameter** if  $v \in \Sigma_F^{\mathrm{fin}}$ ,  $G_{F_v}$  is unramified, and  $\phi_v$  is trivial on  $I_{F_v} \times \mathrm{SL}(2)$ .
- **tempered  $L$ -parameter** or a **bounded  $L$ -parameter** if  $\phi_v(W_{F_v})$  projects to a bounded subset of  $\widehat{G}(\mathbb{C})$ .
- a **supercuspidal  $L$ -parameter** if  $v \in \Sigma_F^{\mathrm{fin}}$  and  $\phi_v$  factors through the projection  $L_{F_v} \rightarrow W_{F_v}$ .

┘

**Remark (29.3.1.5).** In many cases (e.g.  $\mathrm{GL}(n)$ ,  $\mathrm{U}(3)$ ,  $\mathrm{GSp}(4)$ ), discrete  $L$ -parameters are exactly those whose  $L$ -packets consist entirely of supercuspidal representations. ?

┘

**Def. (29.3.1.6) [Equivalent Langlands-Parameters].** Two local  $L$ -parameters  $L_{F_v} \rightarrow {}^L G_{\mathbb{C}}$  (29.3.1.4) are called **equivalent local  $L$ -parameters** if they are conjugate by an element of  $\widehat{G}(\mathbb{C})$ .

The notions of discrete/unramified/tempered  $L$ -parameters are preserved under equivalence relations.

The set of equivalent classes of local  $L$ -parameters for  $G(F_v)$  is denoted by  $\Phi_v(G)$ . The set of equivalence classes of local tempered  $L$ -parameters for  $G(F_v)$  is denoted by  $\Phi_v^{\mathrm{temp}}(G)$ . The set of equivalence classes of discrete  $L$ -parameters for  $G(F_v)$  is denoted by  $\Phi_v^2(G)$ .

┘

**Def. (29.3.1.7) [Infinitesimal Characters].** For  $v \in \Sigma_F^{\mathrm{fin}}$ , two local  $L$ -parameters  $\phi_1, \phi_2$  are said to have the **infinitesimal characters** if their restrictions to  $W_{F_v}$  are equal.

┘

**Def. (29.3.1.8) [Centralizer of Component Groups].** For a local  $L$ -parameter  $\phi_v$  (29.3.1.4), denote

$$C_{\phi_v} \triangleq C_{\widehat{G}_{\mathbb{C}}}(\mathrm{Im}(\phi_v)), \quad \overline{C}_{\phi_v} = C_{\phi_v} / Z(\widehat{G}_{\mathbb{C}})^{\mathrm{Gal}_F}, \quad A_{\phi_v} = \pi_0(\overline{C}_{\phi_v}).$$

It is clear that the isomorphism classes of  $C_{\phi_v}$  and  $A_{\phi_v}$  only depend on the equivalence classes of  $\phi_v$  (29.3.1.6).

┘

**Prop. (29.3.1.9) [Centralizer of Component Groups].** For a local  $L$ -parameter  $\phi_v$  (29.3.1.4),

- $(C_{\phi_v})^0 \in \text{RedGrp}/\mathbb{C}$
- If  $v \in \Sigma_F^\infty$ , then  $A_{\phi_v}$  is always an elementary 2-group.

┘

*Proof:* 1: ? Cf. [Kot84] Section 10.

2: ? This follows from work of Harish-Chandra and Knapp-Zuckerman on the classification of discrete series, and more generally of tempered representations, of real semi-simple groups.  $\square$

**Example (29.3.1.10).** If  $G = \text{GL}(n)$  and  $\phi \in \Phi_v(G)$ , then  $A_{\phi_v} = \mathbf{1}$  (29.3.1.7).  $\square$

*Proof:* The definition of  $L$ -parameters implies that  $\phi_v$  is completely reducible ?, thus  $C_{\phi_v}$  is a product of general linear groups, thus connected.  $\square$

**Prop. (29.3.1.11) [Inner Forms and Restrictions].**

- If  $G^* \in \text{RedGrp}/F_v$  is a quasi-split inner form of  $G_{F_v}$ , then  $\Phi_v(G) \subset \Phi_v(G^*)$ , by (10.4.6.10).
- If  $L/F_v$  is a separable extension and  $G' \in \text{RedGrp}/L$  with  $G = \text{Res}_{L/F_v}(G')$ , then there is a canonical bijection  $\Phi(G) \cong \Phi(G')$ .

┘

*Proof:* 2: Cf. [Bor79] P40. ?  $\square$

**Example (29.3.1.12) [Conjugacy Classes for Galois Representations].** For  $G = e$ , the  $L$ -parameter of a  $n$ -dimensional Galois representation  $\rho$  of  $\text{Gal}(L/F_v)$  gives a family of conjugacy classes  $\{\sigma_v(\rho)\} \in \text{GL}(n; \mathbb{C})$  for  $v \in \text{Unr}_{L/F_v}(F)$ . And such a representation  $\rho$  is determined by this family, by Chebotarev density theorem.  $\square$

**Prop. (29.3.1.13) [Galois Action of Langlands Parameters].** Let  $\pi \in \text{Irr}^{\text{cusp}}(\text{GL}(n)/F)$  and  $v \in \Sigma_F^{\text{fin}}$  s.t.  $\pi_v$  is unramified, then for any  $\eta \in \text{Aut}(E)$ , the conjugate representation  $\eta(\pi)_{\eta(v)}$  (26.6.1.20) is also unramified, and  $c_{\eta(v)}(\eta(\pi)) = c_v(\pi)$ .  $\square$

*Proof:* Let  $B_v$  be the Borel subgroup of  $G_v = \text{GL}(F_v)$ ,  $\chi$  a character of  $B_v$ , and  $I_v = \text{Ind}_{B_v}^{G_v}(\chi) \in \text{Rep}^{\text{adm}}(G_v)$ , then  $\eta(I_v) = I_{\eta(v)} = \text{Ind}_{B_{\eta(v)}}^{G_{\eta(v)}}(\chi \circ \eta^{-1}) \in \text{Rep}^{\text{adm}}(G_{\eta(v)})$ , thus the conjugate of the unique quotient of  $I_v$  is the unique quotient of  $I_{v'}$ . Then the assertion follows from the fact  $\eta(\text{Frob}_v) = \text{Frob}_{\eta(v)}$ .  $\square$

### Local $L$ -Parameters and Complex Weil-Deligne Representations

**Prop. (29.3.1.14) [Weil-Deligne Representations into  $G$ ].** For  $K \in p\text{-LField}$  and  $G \in \text{LieGrp}/\mathbb{C}$  with  $G^0$  reductive, a **Weil-Deligne representation** of  $W_K$  into  $G$  is a triple  $(\rho, N)$  where  $\rho : W_K \rightarrow G$  is a continuous homomorphism s.t.  $\rho(\sigma_K)$  is semisimple in  $G$ , and  $N \in \mathfrak{g}$  s.t.

$$\text{Ad}(\rho(x))N = |x|.N, \text{ where } x \in W_K.$$

Two Weil-Deligne representations of  $W_K$  are called **equivalent** iff they are conjugate by an element of  $G^0$ .  $\square$

**Prop. (29.3.1.15) [Complex Weil-Deligne Representations].** For  $G \in \text{LieGrp}/\mathbb{C}$  with  $G^0$  reductive, there is a bijection between

- The equivalence classes of Weil-Deligne representations of  $W_K$  into  $G$  (29.3.1.14).
- The  $G^0$ -conjugacy classes of homomorphisms  $\phi : W_K \times \mathrm{SL}(2; \mathbb{C}) \rightarrow G$  that is continuous and Frobenius-semisimple on  $W_K$  and algebraic on  $\mathrm{SL}(2; \mathbb{C})$ ,

given by:

$$(\phi, V) \mapsto (\rho_0, V, N) : \rho_0(w) = \phi(w, \mathrm{diag}(|w|^{\frac{1}{2}}, |w|^{-\frac{1}{2}})), \text{ where } N = \mathrm{Lie}(\phi) \begin{pmatrix} 0 & 1 \\ 0 & 0 \end{pmatrix}$$

┘

*Proof:* Cf. [G-R10].

□

### Local $L$ -Parameters for Classical Groups

References are [GGP12].

**Def. (29.3.1.16) [Self-Dual  $L$ -Parameters].** For  $V \in \mathcal{V}\mathrm{ect}^{\mathrm{fin}}/\mathbb{C}$ , a local  $L$ -parameter  $\phi_v : L_{F_v} \rightarrow \mathrm{GL}(V)$  (29.3.1.4) is called a

- **orthogonal  $L$ -parameter** if there is an isomorphism of Weil-Deligne representations  $f : V \cong V^\vee \in \mathfrak{wd}(W_{F_v})$  (29.3.1.15) s.t.  $f^\vee = f$ .
- **symplectic  $L$ -parameter** if there is an isomorphism of Weil-Deligne representations  $f : V \cong V^\vee \in \mathfrak{wd}(W_{F_v})$  (29.3.1.15) s.t.  $f^\vee = -f$ .

┘

**Prop. (29.3.1.17).** Situation as in (29.3.1.16), if  $\phi_v$  is orthogonal or symplectic, then up to conjugation by  $\mathrm{GL}(V)$ , there are only one  $f : V \cong V^\vee$  s.t.  $f^\vee = \epsilon(V)f$ .

┘

*Proof:* Because  $\phi_v$  is semisimple (29.3.1.4) and  $V \cong V^\vee$ , we can decompose  $V$  as

$$V = \left( \bigoplus m_i V_i \right) \oplus \left( \bigoplus m_j (P_j \oplus P_j^\vee) \right),$$

where  $\{V_i, P_j\}$  are distinct irreducible representations of  $L_{F_v}$  s.t.  $V_i$  are self-dual and  $P_j \not\cong P_j^\vee$ . It suffices to prove for  $V = m_i V_i$  or  $V = m_j (P_j \oplus P_j^\vee)$ .

In the first case, use the fact that any two non-degenerate bilinear forms on  $\mathbb{C}^{\oplus m_i}$  of the same sign are conjugate under the action of  $\mathrm{GL}(m_i)$ .

In the second case, notice that use the fact that any two perfect pairing  $\mathbb{C}^{\oplus m_j} \times \mathbb{C}^{\oplus m_j} \rightarrow \mathbb{C}$  are conjugate under the action of  $\mathrm{GL}(m_j) \times \mathrm{GL}(m_j)$ . □

**Def. (29.3.1.18) [Conjugate-Dual  $L$ -Parameters].** For  $L/K \in \mathrm{LField}$  with  $\mathrm{Gal}(L/K) = \{\mathrm{id}, \sigma\}$  and  $V \in \mathcal{V}\mathrm{ect}^{\mathrm{fin}}/\mathbb{C}$ , a local  $L$ -parameter  $\phi : L_L \rightarrow \mathrm{GL}(V)$  (29.3.1.4) determines an induced representation

$$\mathrm{Ind}_{L_L}^{L_K}(V) = \{f : L_L \rightarrow V \mid f(\tau s) = \tau(f(s)), \text{ where } \tau \in L_L, s \in L_K\} \in \mathfrak{wd}(W_K).$$

and we define the conjugate  $L$ -parameter  $\phi^\sigma$  on the space

$$V^\sigma = \{f : L_L \setminus L_K \rightarrow V \mid f(\tau s) = \tau(f(s)), \text{ where } \tau \in L_L, s \in L_K\} \in \mathfrak{wd}(W_L).$$

Then there is a canonical isomorphism  $(M^\sigma)^\vee \cong (M^\vee)^\sigma$  induced by the perfect pairing

$$M^\sigma \times (M^\vee)^\sigma \rightarrow \mathbb{C} : (f, f^\vee) \mapsto \langle f(s), f^\vee(s) \rangle, \text{ where } s \in W_L \setminus W_K,$$

which doesn't depends on  $s$  chosen. And there is a canonical isomorphism  $(M^\sigma)^\sigma \cong M : F \mapsto F(s)(s^{-1})$ , for any  $s \in W_L \setminus W_K$ , which doesn't depends on  $s$  chosen.

Then  $\phi$  is called a

- **conjugate-orthogonal  $L$ -parameter** if there is an isomorphism of Weil-Deligne representations  $f : V^\sigma \cong V^\vee \in \mathfrak{wd}(W_L)$  s.t.  $(f^\vee)^\sigma = f$ .
- **conjugate-symplectic  $L$ -parameter** if there is an isomorphism of Weil-Deligne representations  $f : V^\sigma \cong V^\vee \in \mathfrak{wd}(W_L)$  s.t.  $(f^\vee)^\sigma = -f$ .

Fixing a  $s \in W_L \setminus W_K$ , this is equivalent to a non-degenerate bilinear form  $B : V \times V \rightarrow \mathbb{C}$  s.t.

$$B(\tau m, s\tau s^{-1}n) = B(m, n), \quad B(n, m) = \epsilon B(m, s^2n).$$

by [GGP12]P10?.

┘

**Cor. (29.3.1.19) [Conjugate-Dual Quasi-Characters].** Situation as in (29.3.1.18), if  $\phi = \chi$  is a quasi-character of  $L^\times$ , then

- $\chi$  is conjugate-orthogonal iff  $\chi(K^\times) = 1$ .
- $\chi$  is conjugate-symplectic iff  $\chi|_{K^\times} \neq 1$  and  $\chi(\mathcal{N}_{L/K}) = 1$ .

┘

*Proof:* Fixing  $s \in W_L \setminus W_K$ ,  $\chi$  is conjugate-dual with sign  $\epsilon$  if the bilinear form  $B : \mathbb{C}(\chi) \times \mathbb{C}(\chi) \rightarrow \mathbb{C}$  satisfies  $B(\tau m, s\tau s^{-1}n) = B(m, n)$ ,  $B(n, m) = \epsilon B(m, s^2n)$ , which is equivalent to  $\chi(\mathcal{N}_{L/K}) = 1$  and  $\epsilon = \chi(s^2) = \chi(\text{Ver}(s)) = \chi(\text{Art}^{-1}(s))$  by (19.7.2.12), and  $s \in K^\times$  generates  $K^\times/\mathcal{N}_{L/K}$ . Thus the assertion follows.  $\square$

**Prop. (29.3.1.20).** Situation as in (29.3.1.18), if  $\phi$  is conjugate-orthogonal or conjugate-symplectic, then up to conjugation by  $\text{GL}(V)$ , there are only one  $f : V^\sigma \cong V^\vee$  s.t.  $(f^\vee)^\sigma = \epsilon(V)f$ .  $\square$

*Proof:* The proof is totally analogous to that of (29.3.1.17).  $\square$

**Prop. (29.3.1.21).** Situation as in (29.3.1.18),  $\phi$  is conjugate-dual with sign  $\epsilon$  iff  $W = \text{Ind}_{L_L}^{L_K}(V) \in \mathfrak{wd}(W_L)$  is self-dual with sign  $\epsilon$  and has maximal isotropic subspace  $V$  (as the subspace consisting of  $f$  supported on  $L_K$ ).  $\square$

*Proof:* Fixing  $s \in W_K \setminus W_L$ . If  $B$  is a non-degenerate bilinear form on  $V$  s.t.

$$B(\tau m, s\tau s^{-1}n) = B(m, n), \quad B(n, m) = \epsilon B(m, s^2n),$$

then  $W = V \oplus s^{-1}V$  can be given a non-degenerate bilinear form  $B'$  by decreeing  $V, s^{-1}V$  as isotropic subspaces and

$$B'(m, s^{-1}m') = \epsilon B(s^{-1}m', m) = B(m, m').$$

Then it is preserved by  $L_K$ .

Conversely, if  $B'$  is a self-dual non-degenerate bilinear form on  $W$  of sign  $\epsilon$  that is preserved by  $W_L$  and isotropic on  $V$ , then we can define

$$B(m, m') = B'(m, s^{-1}m'),$$

then it is a non-degenerate bilinear form on  $V$  s.t.

$$B(\tau m, s\tau s^{-1}n) = B(m, n), \quad B(n, m) = \epsilon B(m, s^2n),$$

$\square$

**Prop. (29.3.1.22)**[Local  $L$ -Parameters for Symplectic and Orthogonal Groups]. If  $V$  is a symplectic space over  $F_v$  of dimension  $2n$ , then the equivalence classes of Local  $L$ -parameters for  $\mathrm{Sp}(V)$  is in bijection with the isomorphism classes of orthogonal representations of  $L_{F_v}$  of dimension  $2n + 1$  s.t.  $\det(M) = 1$ .  $\lrcorner$

*Proof:*

□

**Prop. (29.3.1.23)**[Local  $L$ -Parameters for Unitary Groups].  $\lrcorner$

### Local Arthur-Parameters

**Def. (29.3.1.24)**[Local Arthur-Parameters]. For  $v \in \Sigma_F$ , a **local Arthur-parameter** for  $G_v$  is a continuous homomorphism

$$\psi_v : L_{F_v} \times \mathrm{SL}(2; \mathbb{C}) \rightarrow {}^L G(\mathbb{C}).$$

s.t.  $\psi_v|_{L_{F_v}}$  is a bounded  $L$ -parameter (29.3.1.4).

Two local Arthur-parameters of  $G_v$  are called **equivalent local Arthur-parameters** if they are conjugate by an element of  $\widehat{G}(\mathbb{C})$ . The set of conjugacy classes of local Arthur-parameters of  $G_v$  is denoted by  $\Psi_v(G)$ .

And the set of continuous homomorphisms

$$\psi_v : L_{F_v} \times \mathrm{SL}(2; \mathbb{C}) \rightarrow {}^L G(\mathbb{C}).$$

up to  $\widehat{G}(\mathbb{C})$ -conjugacy is denoted by  $\Psi_v^+(G)$ . In particular, we have  $\Psi_v(G) \subset \Psi_v^+(G)$ .  $\lrcorner$

**Def. (29.3.1.25)**[Generic Local Arthur-Parameters]. A **generic local Arthur-parameter**  $\psi$  is a local Arthur-parameter (29.3.1.24) that is trivial on  $1 \times \mathrm{SL}(2; \mathbb{C})$ .  $\lrcorner$

**Prop. (29.3.1.26)**[Associated Local  $L$ -Parameters]. Any  $\psi \in \Psi_v^+(G)$  (29.3.1.24) defines an **associated local  $L$ -parameter**  $\phi_{\psi_v} \in \Phi_v(G)$  (29.3.1.4) by the formula

$$\phi_{\psi_v}(w) = \psi_v(w, \mathrm{diag}(|w|^{1/2}, |w|^{-1/2})),$$

where the norm  $|\cdot| : L_F \rightarrow \mathbb{R}^\times$  is given by the composition  $L_F \rightarrow W_{F_v}^{\mathrm{ab}} \xrightarrow{\mathrm{rec}^{-1}} F_v^\times \rightarrow \mathbb{R}_+$ .  $\lrcorner$

**Def. (29.3.1.27)**[Local Arthur-Parameters for  $\mathrm{GL}(n)$ ]. For  $\lrcorner$

### Local $L$ -Factors and $\epsilon$ -Factors

**Notation (29.3.1.28).**

- $1 \neq \psi = \otimes' \psi_v \in \mathrm{Hom}(F \backslash \mathbf{A}_F, \mathbb{C})$ .
- $\pi = \otimes' \pi_v, \pi' = \otimes' \pi'_v \in \mathrm{Irr}^{\mathrm{auto}}(G/F)$ .

□

**Prop. (29.3.1.29)**[Automorphic  $L, \epsilon$ -Factors for  $\mathrm{GL}(n)$ ]. Suppose  $G = \mathrm{GL}(n)$  and  $v \in \Sigma_F^{\mathrm{fin}}$ .

1. If  $n = 1$ , then the  $L$ -factors and  $\epsilon$ -factors are defined as in Tate's thesis.
2. If  $n \geq 2$  and  $\pi_v \in \mathrm{Irr}^{\mathrm{cusp}}(\mathrm{GL}(n; F_v))$ , then  $L_v(\pi_v; s) = 1$ , and  $\epsilon(\pi, \psi_v; s)$  is given by generalized Gauss sums. Cf.[Gauss sums and local constants for  $\mathrm{GL}(N)$ , Bushnell] **?**.

3. If  $\Delta = (\sigma; r)$  and  $\pi_v = Q(\Delta)$  (24.11.8.2), then

$$L_v(\pi_v; s) = L_v(\sigma(r-1); s) = L_v(\sigma; s+r-1),$$

and

$$\epsilon_v(\pi_v; \psi_v; s) = \prod_{i=0}^{r-1} \epsilon(\sigma(i); \psi_v; s) \prod_{i=1}^{r-2} \frac{L(\sigma^\vee(-i); -s)}{L(\sigma(i); s)} = \prod_{i=0}^{r-1} \epsilon(\sigma; \psi_v; s+i) \prod_{i=1}^{r-2} \frac{L(\sigma^\vee; -s-i)}{L(\sigma; s+i)}.$$

4. If  $\pi_v = Q(\Delta_1, \dots, \Delta_r)$  in Bernstein-Zelevinsky Classification, then

$$L_v(\pi_v; s) = \prod_{i=1}^r L_v(Q(\Delta_i); s), \quad \epsilon_v(\pi_v; \psi_v; s) = \prod_{i=1}^r \epsilon_v(Q(\Delta_i); \psi_v; s).$$

┘

*Proof:* 2: Cf.[On the local Langlands conjecture for  $\mathrm{GL}(n)$ : The cyclic case, Henniart]P153?  $\square$

**Example (29.3.1.30) [Local  $L$ -Factors for  $\mathrm{GL}(2)$ ].** Given  $\pi \in \mathrm{Irr}^{\mathrm{auto}}(\mathrm{GL}(2)/F, \omega)$ , for  $v \in \Sigma_F^{\mathrm{fin}}$ , the local  $L$ -factor is defined to be

$$L(\pi_v; s) = \begin{cases} 1 & , v \in S_{\mathrm{cusp}}(\pi) \\ \frac{1}{(1 - \alpha_1 \|v\|^{-s})(1 - \alpha_2 \|v\|^{-s})} & (29.3.2.10) \quad , \pi_v = \chi_1 \times \chi_2 \\ \frac{1}{1 - \alpha \|v\|^{-s-1}} & , \pi_v = \mathrm{St}_2(\chi) \end{cases}.$$

It follows from (24.11.5.14) and (24.11.4.14) that any irreducible representation of  $\mathrm{GL}(2; F_v)$  is one of the form above.  $\square$

**Prop. (29.3.1.31) [Conductors for  $\mathrm{GL}(n)$ ].** If  $G = \mathrm{GL}(n)$  and  $v \in \Sigma_F^{\mathrm{fin}}$ , then

$$\epsilon_v(\pi_v, \psi_v; s) = \epsilon(\pi_v, \psi_v; 0) \|v\|^{-(m_v + n \cdot c_v(\psi_v))s},$$

where  $m \in \mathbb{N}$ , called the **conductor (admissible representation)** of  $\pi$ , denoted by  $c_v(\pi)$ .

And if for  $t \in \mathbb{N}$ , we let  $\mathcal{K}(t)$  be the inverse image of the mirabolic subgroup in  $\mathrm{GL}(n; \mathcal{O}_{F_v}/\mathfrak{p}_v^t)$ , then  $m$  equals the minimal  $t$  s.t.  $\pi_v$  has a  $\mathcal{K}(t)$ -fixed vector.

In particular,  $m = 0$  iff  $\pi$  is unramified.  $\square$

*Proof:* This follows from (24.11.3.18).  $\square$

**Prop. (29.3.1.32) [Rankin-Selberg  $L, \epsilon$ -Factors for  $\mathrm{GL}(n)$ , Jacquet-Piatetski-Shapiro-Shalika [JSS81]].** For  $v \in \Sigma_F^{\mathrm{fin}}$ ,

1. If  $\sigma, \sigma' \in \mathrm{Irr}^{\mathrm{cusp}}(\mathrm{GL}(n; F_v))$ , then

$$L(\sigma \times \sigma'; s) = \prod_{\chi \in F_v^\times \rightarrow \mathbb{C}^\times \text{ unramified s.t. } (\sigma')^\vee(\chi) = \sigma} L(\chi; s),$$

2. If  $r \leq r' \in \mathbb{Z}_+$ ,  $\Delta = (\sigma, r)$ ,  $\Delta' = (\sigma', r')$  and  $\pi_v = Q(\Delta)$ ,  $\pi'_v = Q(\Delta')$  (24.11.8.2), then

$$L(\pi_v \times \pi'_v; s) = \prod_{i=1}^r L(\sigma \times \sigma'; s + r + r' - 1 - i),$$

$$\epsilon(\pi_v \times \pi'_v, \psi_v; s) = \prod_{i=1}^r \left( \prod_{j=0}^{r+r'-2i} \epsilon(\sigma \times \sigma', \psi_v; s + i + j - 1) \right) \cdot \prod_{j=0}^{r+r'-2i-1} \frac{L(\sigma^\vee \times (\sigma')^\vee; -s - i - j + 1)}{L(\sigma \times \sigma'; s + i + j - 1)}$$

3. If  $\pi_v = Q(\Delta_1, \dots, \Delta_r)$ ,  $\pi'_v = Q(\Delta'_1, \dots, \Delta'_{r'})$ , then

$$L(\pi_v \times \pi'_v; s) = \prod_{i=1}^r \prod_{j=1}^{r'} L(Q(\Delta_i) \times Q(\Delta'_j); s), \quad \epsilon(\pi_v \times \pi'_v; s) = \prod_{i=1}^r \prod_{j=1}^{r'} \epsilon(Q(\Delta_i) \times Q(\Delta'_j); s).$$

And in general there are no easy formulas for  $\epsilon(\pi \times \pi'; \psi_v; s)$ ?

Notice that if we set  $\pi' = \mathbf{1}$ , then we get the  $L$ -factors and  $\epsilon$ -factors of  $\pi$ , as defined in (29.3.1.29).  $\lrcorner$

**Cor. (29.3.1.33).** If  $\pi_v, \pi'_v$  are unramified with Langlands parameters  $c(\pi_v)$  and  $c(\pi'_v)$ , then

$$L(\pi_v \times \pi'_v; s) = \det(1 - c(\pi_v) \otimes c(\pi'_v) q^{-s})^{-1}.$$

$\lrcorner$

**Cor. (29.3.1.34).** For  $\pi_v \in \text{Irr}^{\text{adm}}(\text{GL}(n; F_v))$ ,  $L(\pi \times \pi^\vee; s)$  has no pole at  $s = 1$  iff  $\pi$  is generic.  $\lrcorner$

*Proof:* It suffices to check that two Zelevinsky segments  $\Delta, \Delta'$  are linked iff  $L(Q(\Delta) \times Q(\Delta')^\vee; s)$  has a pole at  $s = 1$ . And this fact is easy to check.  $\square$

**Def. (29.3.1.35) [Archimedean  $L$ -Factors and  $\epsilon$ -Factors for  $\text{GL}(n)$ ].** Suppose  $G = \text{GL}(n)$ .

- For  $v \in \Sigma_F^{\mathbb{C}}$ , define the  $L$ -factors and  $\epsilon$ -factors as follows: If  $\pi_v \in \text{Irr}^{\text{adm}}(\text{GL}(n; \mathbb{C}))$  corresponds to  $\phi_v = \text{diag}(\sigma_{1,v}, \dots, \sigma_{n,v}) \in \text{Rep}^{n, \text{s.st}}(W_{\mathbb{C}})$  in the local Langlands correspondence (24.6.4.27), and  $\sigma_{i,v}(z) = (\frac{z}{|z|})^{l_{i,v}} |z|_{\mathbb{C}}^{t_{i,v}}$  where  $l_{i,v} \in \mathbb{Z}, t_{i,v} \in \mathbb{C}$  (24.6.2.1) then define

$$L_v(\pi_v; s) = L_v(\phi_v; s), \quad \epsilon_v(\pi_v, \psi_v; s) = \epsilon_v(\phi_v, \psi_v; s) \quad ?$$

- For  $v \in \Sigma_F^{\mathbb{R}}$ , define the  $L$ -factors and  $\epsilon$ -factors as follows:  $?$

$\lrcorner$

**Def. (29.3.1.36) [Automorphic  $L, \epsilon$ -factors, Langlands].** Assuming the local Langlands conjecture (29.3.2.2), for  $v \in \Sigma_F$ , there exists a unique  $\phi_v \in \Phi_v(G)$  (29.3.1.4) s.t.  $\pi_v \in \Pi_{\phi_v}(G)$ . Then for any  $\rho_v \in \text{Rep}^{\text{fd}}({}^L G)$ , we can define the **local automorphic  $L$ -factors** and **local automorphic  $\epsilon$ -factors**

$$L_v(\pi_v, \rho_v; s) = L_v(\rho_v \circ \phi_v; s), \quad \epsilon_v(\pi_v, \rho_v, \psi_v; s) = \epsilon_v(\rho_v \circ \phi_v, \psi_v; s) \quad (31.1.1.3),$$

Each  $\epsilon(\pi_v, \rho_v, \psi_{F_v}; s)$  is a monomial in  $\|v\|^{-s}$ .  $\lrcorner$

*Proof:*  $?$   $\square$

## 2 Local Langlands Conjectures and Arthur Conjectures for Quasi-Split Groups

References are [Kaletha, local Langlands conjectures for non-quasi-split groups].

**Conj. Cor. (29.3.2.1) [Local Functorial Lifting, Langlands [Lan70]].** Suppose  $v \in \Sigma_F$  s.t.  $G'_{F_v}$  is quasi-split. If  $\varphi: {}^L G' \rightarrow {}^L G \in \text{GrpSch}/\overline{\mathbb{Q}}$  respects the projection to  $\text{Gal}_F$ , then there is a correspondence  $R_\varphi: \text{Irr}^{\text{adm}}(G'(K)) \rightarrow \text{Irr}^{\text{adm}}(G(K))$  s.t. if  $\pi_v = R_\varphi(\pi'_v)$ , then for any  $\rho_v \in \text{Rep}^{\text{fd}}({}^L G_{F_v})$ , we have

$$L_v(\pi_v, \rho_v; s) = L_v(\pi'_v, \rho_v \circ \varphi; s), \quad \epsilon_v(\pi_v, \rho_v, \psi_K; s) = \epsilon_v(\pi'_v, \rho_v \circ \varphi, \psi_K; s) \quad (29.3.1.36).$$

Such a  $\pi$  is called a **functorial lifting** of  $\pi'$ .

Notice that is a consequence of (29.3.2.2) because if  $\pi'_v \in \Pi_{\phi_v}(G')$ , then we can just take any  $\pi \in \Pi_{\varphi \circ \phi_v}(G)$ .  $\lrcorner$

*Proof:*

□

**Conj.Cor.(29.3.2.2)**[Local Langlands Conjecture for Quasi-Split Groups, Langlands[Lan70]].

Suppose  $G_{F_v}$  is quasi-split, then there is a map

$$\mathrm{LL}_v : \mathrm{Irr}_v^{\mathrm{adm}, \mathrm{temp.}}(G) \rightarrow \Phi_v^{\mathrm{temp.}}(G) \quad (29.3.1.4)$$

with finite fibers  $\Pi_{\phi_v} \stackrel{\Delta}{=} \mathrm{LL}_v^{-1}(\phi_v)$  s.t.

1. (Unramified Representations) If  $\phi_v$  is unramified, then each  $\pi \in \Pi_{\phi_v}$  is  $\mathcal{K}_\pi$ -unramified for some hyperspecial maximal subgroup  $\mathcal{K}_\pi \leq G(F_v)$ , and for every hyperspecial maximal subgroup  $\mathcal{K} \leq G(F_v)$  there exists a unique  $\mathcal{K}$ -spherical representation  $\pi_{\mathcal{K}, \phi_v} \leq \Pi_{\phi_v}(G)$ , and the correspondence  $\phi_v \mapsto \pi_{\mathcal{K}, \phi_v}$  is given by the Satake isomorphism(Cf.[Getz]?).
2. (Essentially  $L^2$ -Representations) For  $\phi_v \in \Phi_v(G)$ , the following are equivalent:
  - Some  $\pi_v \in \Pi_{\phi_v}(G)$  is essentially- $L^2$ (20.5.1.2)(24.9.8.10).
  - Any  $\pi_v \in \Pi_{\phi_v}(G)$  is essentially- $L^2$ .
  - $\mathrm{Im}(\phi_v)$  is not contained in any proper Levi subgroup of  ${}^L G_{\mathbb{C}}$ (10.4.6.8).
3. (Temperedness) For  $\phi_v \in \Phi_v(G)$  s.t.  $\phi_v(G_a) = \{1\}$ , the following are equivalent:
  - Some  $\pi \in \Pi_{\phi_v}(G)$  is tempered.
  - Any  $\pi \in \Pi_{\phi_v}(G)$  is tempered.
  - $\phi_v(W_{F_v})$  is bounded.
4. (Parabolic Inductions) If  $\phi_v$  comes from  $\phi_{M,v} \in \Phi_v^{\mathrm{temp.}}(M)$  for some Levi subgroup  $M \leq G$  via the map  ${}^L M \rightarrow {}^L G$ (?, Cf.[G-H24]Chap7.4.), then  $\Pi(\phi_v)$  consists of irreducible subquotients of representations that are parabolically induced from elements of  $\Pi_{\phi_{M,v}}$ .
5. If  $\pi \in \Pi_{\phi_v}(G)$ , then  $\pi$  has central character  $\chi_{\phi_v}$ ?
6. If  $\phi_v, \phi'_v \in \Phi_v(G)$  and  $\phi'_v = \alpha \cdot \phi_v$ ?, then  $\Phi_{\phi'_v} = \Phi_{\phi_v} \otimes \pi_\alpha$ ?
7. (Functoriality) If  $H \in \mathcal{R}\mathrm{edGrp}/F_v$  with a homomorphism  $\eta : H \rightarrow G_{F_v} \in \mathcal{R}\mathrm{edGrp}/F_v$  with commutative kernel and cokernel, and  $\phi_v \in \Phi_v(G)$  with  $\phi'_v = {}^L \eta \circ \phi_v$ , then the pullback of any  $\pi \in \Pi_{\phi_v}(G)$  to  $H(F_v)$  is a direct sum of representations  $\pi' \in \Pi_{\phi'_v}(H)$ .
8. (from Langlands)For any  $\phi_v \in \Phi_v(G)$ , there exists a  $\pi_v(\phi_v) \in \mathrm{Irr}^{\mathrm{adm}}(G(F_v))$  s.t. for any  $\rho_v \in \mathrm{Rep}^{\mathrm{fd}}({}^L G)$ , we have

$$L_v(\pi_v(\phi_v), \rho_v; s) = L_v(\rho_v \circ \phi_v; s), \quad \epsilon_v(\rho_v, \pi_v(\varphi_v), \psi_v; s) = \epsilon_v(\rho_v \circ \phi_v, \psi_v; s) \quad (29.3.1.36)(29.3.1.29).$$

The fibers of  $\mathrm{LL}_v$  are called **local  $L$ -packets** for  $G$ . Two different  $\pi_1, \pi_2$  in the same  $L$ -packet are called  **$L$ -indistinguishable**. ┘

*Proof:* ? Cf.[Bor79]P44. □

**Remark(29.3.2.3).** We only study tempered  $L$ -parameters because the Langlands classification reduces the problem of studying  $\mathrm{Irr}^{\mathrm{adm}}(G(F_v))$  to the study of  $\mathrm{Irr}^{\mathrm{adm}, \mathrm{temp.}}(G(F_v))$ .? ┘

**Conj.(29.3.2.4)**[Refined Local Langlands Conjecture for Quasi-Split Groups]. Suppose  $G_{F_v}$  is quasi-split and  $\mathfrak{m}$  is a Whittaker-datum for  $G_{F_v}$ (10.4.4.23), then the local Langlands correspondence(29.3.2.2) holds and for any  $\phi_v \in \Phi_v^{\mathrm{temp.}}(G)$ ,

- (Langlands-Shelstad[She79]/Lusztig[Lus83a]) There is an injection

$$\iota_{\mathfrak{m}} : \Pi_{\phi_v} \hookrightarrow \text{Irr}(\pi_0(\overline{C}_{\phi_v})) \quad (29.3.1.8).$$

which is moreover bijective if  $v \in \Sigma_F^{\text{fin}}$ .

- (Generic Packet Conjecture, Shahidi[Sha90])  $\Pi_{\phi_v}$  contains a unique  $\mathfrak{m}$ -generic representation (24.9.5.2), and is mapped to the trivial representation by  $\iota_{\mathfrak{m}}$ .

Moreover, for each semi-simple element  $s \in C_{\phi_v}$ , denote

$$\Theta_{\phi_v}^s \stackrel{\Delta}{=} \sum_{\pi \in \Pi_{\phi_v}} \text{tr}(\iota_{\mathfrak{m}}(\pi)(s)) \Theta_{\pi} \quad (24.9.9.5),$$

called the  $s$ -**stable character** associated to  $\phi_v$ , and also denote  $S\Theta \stackrel{\Delta}{=} \Theta_{\phi_v}^1$ , then we have:

- (Endoscopic Character Identities, Kaletha[Kal16a]) If  $(H, s, {}^L\eta) \in {}^L\mathfrak{E}(G/F_v)$  (29.2.1.5) and  $\phi_v = {}^L\eta \circ \phi_v^H$  for some  $\phi_v^H \in \Phi_v^{\text{temp.}}(H)$ , then for any  $f_v \in \mathcal{T}(H(F_v))$  with Langlands-Shelstad transfer  $f_v^H \in \mathcal{T}(H(F_v))$  w.r.t.  $\Delta^{\mathfrak{m}, H, G}$  (29.2.1.22), we have

$$\Theta_{\phi_v}^s(f_v) = S\Theta_{\phi_v^H}(f_v^H).$$

In particular, by definition of Langlands-Shelstad transfer, we see  $S\Theta_{\phi_v}$  is a stable distribution (29.2.0.2). ┘

*Proof:* ? Cf. [Shelstad, Tempered endoscopy for real groups] for a complete treatment for  $v \in \Sigma_F^{\mathbb{R}}$ , and [Art13] for symplectic and orthogonal groups, and [Kal19] for toral supercuspidal representations of fairly general  $p$ -adic groups. [Atobi, uniqueness of generic representations in an L-packet] proved that the  $\mathfrak{m}$ -generic representation must be unique. □

**Conj. (29.3.2.5) [Non-Archimedean LLC for non-Quasi-Split Groups].** ┘

*Proof:* Cf. [Kaletha, The local Langlands conjectures for non-quasi-split groups]. □

**Conj. Cor. (29.3.2.6) [Local Langlands Twists].** Suppose  $G, G' \in \text{RedGrp}/K$ ,  $G$  is quasi-split and  $G'$  is an inner twist of  $G$ , then  ${}^L G = {}^L G'$ . Is there a correspondence  $\text{Irr}(G'_F) \rightarrow \text{Irr}(G_F)$  s.t. if  $\pi = R(\pi')$ , then  $L(s, \rho, \pi) = L(s, \rho, \pi')$  for any representation  $\rho$  of  ${}^L G$ ? ┘

*Proof:* □

### Unramified LLC: Satake Isomorphisms

References are [Gro98].

**Notation (29.3.2.7).**

- Let  $v \in \Sigma_F^{\text{fin}}$  s.t.  $G_{F_v}$  is unramified.
- Let  $\mathcal{K}_v \subset G(F_v)$  be a hyperspecial maximal compact subgroup.
- Let  $(B, T)$  be a Borel-pair of  $G_{F_v}$ .
- Let  $T_d$  be the maximal  $k$ -split sub- $k$ -torus of  $T$ .

- Let  $W$  be the Weyl group of  $(B, T)$  and let  $W_d \leq W$  be the subgroup consisting of elements that preserves  $T_d$ .

┘

**Thm. (29.3.2.8) [Satake Isomorphism].** There is a canonical isomorphism

$$\mathcal{H}_{\mathcal{K}_v}(G(F_v); \mathbb{C}) \cong \mathbb{C}(X_{\bullet}(T_d))^{W_d}$$

┘

*Proof:* Cf. [Cartier, Representations of  $p$ -adic groups: a survey 1979] Sec 4.2. ?

□

**Prop. (29.3.2.9) [Langland's Formation of the Satake Isomorphism].** If  $G$  is split, then  $\mathcal{H}_K$  is isomorphic to ring generated by the characters of irreducible analytic f.d. representations of  ${}^L G$ , and the unramified representations of  $G(K)$  are parametrized by the semisimple conjugacy classes in  ${}^L G^0$ .

If  $G$  is unramified, let  $\Phi$  be the Frobenius element in  $\text{Gal}_F$ , and consider the cosets  $\widehat{G}(\mathbb{C}) \times \Phi \subset {}^L G$ , then  $\mathcal{H}_K$  is isomorphic to the ring of functions on this coset that are generated by the restrictions of characters of irreducible representations of  ${}^L G$ , and the unramified representations of  $G(F)$  are parametrized by the semisimple  $\widehat{G}(\mathbb{C})$ -conjugacy classes in  ${}^L G(\mathbb{C})$  in this coset (i.e. an element of the form  $c = t \times \Phi$  where  $t \in \widehat{G}(\mathbb{C})$  is semi-simple).

┘

*Proof:* ?

□

**Cor. (29.3.2.10) [Satake Isomorphisms for  $\text{GL}(n)$ ].** There is an isomorphism

$$S : \mathcal{H}_{\mathcal{K}} \cong \mathbb{C}[t_1, t_1^{-1}, \dots, t_n, t_n^{-1}]^W$$

s.t. if  $\varphi \in \mathcal{H}_{\mathcal{K}}$ , for any spherical principal series  $\pi(\chi_1, \dots, \chi_n)$  and a spherical vector  $v$ ,  $\pi(\varphi)v = S(\varphi)(\varpi^{\frac{n-1}{2}}\alpha_1, \dots, \varpi^{\frac{1-n}{2}}\alpha_n)$ , where  $\alpha_i = \chi(\chi_i)$  are the Satake parameters of  $\chi_i$ .

┘

*Proof:* Cf. [Spherical representations and the Satake isomorphism] ?

□

**Thm. (29.3.2.11) [Unramified Langlands Correspondence, Gantmacher-Langlands].** For  $\pi_v \in \text{Irr}^{\text{adm}, \text{unr}}(G(F_v))$ , there exists an unramified  $L$ -parameter (29.3.1.4)

$$\rho_{\pi} : W_{F_v} \rightarrow {}^L G(\mathbb{C})$$

s.t.

This induces a bijection between  $\text{Irr}^{\text{adm}, \text{unr}}(G(F_v))$  and conjugacy classes of  ${}^L G(\mathbb{C})$  s.t. the image in  $\widehat{G}(\mathbb{C})$  is semisimple, and the image in  $W_F$  equals  $\sigma_v$ . The class  $c_v(\pi)$  corresponding to  $\pi$  is called the **Satake-parameter** of  $\pi$ .

For example, if  $G = \text{GL}(n)$ , then any  $\pi \in \text{Irr}^{\text{adm}, \text{unr}}(G(F_v))$  is a Zelevinsky quotient  $Q(\chi_1, \chi_2, \dots, \chi_n)$  by (24.11.6.3), and the conjugacy classes corresponding to it is just  $\text{diag}(\chi_1(\varpi), \dots, \chi_n(\varpi)) \in \text{GL}(n; \mathbb{C}) = \widehat{G}$ .

┘

*Proof:* Cf. [Bor79] Sec 6. ?

□

**Def. (29.3.2.12) [Arithmetic Local Representations].** Any unramified  $\pi_v \in \text{Irr}^{\text{adm}}(G(F_v))$  induces a map  $\mathcal{H}_{\mathcal{K}}(G(F_v)) \rightarrow \mathbb{C}$  by acting on a  $\mathcal{K}$ -fixed vector in  $\pi$ . Then for  $E \in \mathbf{NField}$ ,

- $\pi_v$  is said to be a **admissible representation defined over  $E$**  the induced map  $\mathcal{H}_{\mathcal{K}}(G(F_v); \mathbb{Q}) \rightarrow \mathbb{C}$  is valued in  $E$ .
- $\pi_v$  is said to be a **admissible representation with Satake parameter defined over  $E$**  the induced map  $\mathbb{Q}(X_*(T_d))^{W_d} \rightarrow \mathbb{C}$  induced by the Satake isomorphism (29.3.2.8) is valued in  $E$ .

The two definitions coincides if  $\delta \in X^*(T)$ , where  $\delta$  is half the sum of the positive roots of  $G$ .  $\lrcorner$

*Proof:* Cf. [B-G14]P144. ?  $\square$

**Example (29.3.2.13).** Situation as in (29.3.2.12), if  $G = \mathrm{GL}(n)$  and  $(B, T)$  is the canonical Borel-pair, then the Satake parameter of  $\pi_v$  is defined over  $E$  iff the Langlands conjugacy class  $c(\pi_v)$  (29.3.2.11) is defined over  $E$  (i.e. the characteristic polynomial has coefficients in  $E$ ).  $\lrcorner$

**Def. (29.3.2.14) [Local Unramified  $L$ -Packets].**  $\lrcorner$

### Local Arthur-Packets

Local Arthur-packets deal with the representation that are far from tempered. References are [Arthur, Unipotent automorphic representations: conjectures], [Arthur, Unipotent automorphic representations: global motivations].

**Conj. (29.3.2.15) [Local Arthur-Packets].** To every local Arthur-parameter  $\psi_v$  (29.3.1.24) we should naturally associate a finite subset  $\Pi_{\psi_v}(G) \subset \mathrm{Irr}^{\mathrm{uni}}(G(F_v))$  s.t.

- The  $L$ -parameters of the representations in  $\Pi_{\psi_v}(G)$  all have the same infinitesimal character (29.3.1.7).
- $\Pi_{\psi_v}(G)$  contains the  $L$ -packet corresponding to the  $L$ -parameter associated to  $\psi$  (29.3.1.26) (29.3.2.2), i.e.  $\Pi_{\phi_{\psi_v}}(G) \subset \Pi_{\psi_v}(G)$ .
- (Parabolic Inductions) If  $\psi_v$  has image in a Levi subgroup  ${}^L M \subset {}^L G$ , then  $\Pi_{\psi_v}$  consists of the irreducible summands of parabolically normalized-induced representations from the corresponding packet of the Levi subgroup  $M \leq G$ .

•

called the **local Arthur-Packet** associated to  $\psi_v$ .  $\lrcorner$

**Remark (29.3.2.16).** Local Arthur-packets are not, in general, disjoint, and their union will not be  $\mathrm{Irr}^{\mathrm{uni}}(G(F_v))$ .  $\lrcorner$

### Known cases

**Thm. (29.3.2.17) [Non-Archimedean LLC for  $\mathrm{GL}(n)$ , Harris-Taylor [H-T01]/Henniart].** The local Langlands correspondence (29.3.2.2) is true for  $\mathrm{GL}(n)$  over a non-Archimedean local field with the local Langlands groups defined in (29.3.1.3), by (24.12.1.2).  $\lrcorner$

**Thm. (29.3.2.18) [Non-Archimedean LLC for  $\mathrm{SO}(2n+1)$ , Jiang-Soudry].** The local Langlands correspondence for generic supercuspidal representations of  $\mathrm{SO}(2n+1)$  over a non-Archimedean local field is true.  $\lrcorner$

*Proof:* Cf. [The local converse theorem for  $\mathrm{SO}(2n+1)$  and applications]. ?

They deduced a strong multiplicity one result and deduced the LLC for  $\mathrm{SO}(2n+1)$  from that of  $\mathrm{GL}(n)$ .  $\square$

**Thm. (29.3.2.19) [LLC for Classical Groups, Arthur/Mok/Atobe].** Suppose that

- $F \in p\text{-NField}$ .
- Arthur's local claims in [Arthur, The endoscopic classification of representations] are true.
- The stabilization of the twisted trace formula is valid (Cf. [Mœglin-Waldspurger. Stabilisation de la formule des traces tordue, 1&2]).

Then the local Langlands conjecture (29.3.2.2) item 1, 2 are true, and conjecture (29.3.2.4) is true for split groups  $\mathrm{Sp}(2n)$ ,  $\mathrm{SO}(2n+1)$  and quasi-split groups  $\mathrm{U}(n)$ . And a slightly-weaker version of these results hold for quasi-split  $\mathrm{SO}(2n)$ .

And the generic packet conjecture (29.3.2.4) holds for all these cases.  $\lrcorner$

*Proof:* Cf. [Arthur, The endoscopic classification of representations] Thm 1.5.1., [Mok15], [Atobe, On the uniqueness of generic representations in an  $L$ -packet].  $\square$

**Prop. (29.3.2.20) [Explicit LLC].** Under some restriction on  $G$ , [Kaletha, Supercuspidal  $L$ -packets] explicitly constructed certain supercuspidal  $L$ -packet for  $L$ -parameters that are trivial on the  $\mathrm{SL}(2; \mathbb{C})$ -factor. These supercuspidal  $L$ -packet satisfy certain

For any  $G$ , [Fargues-Scholze] less-explicitly constructed  $L$ -parameters for supercuspidal representation of  $G$ .  $\lrcorner$

**Thm. (29.3.2.21) [Archimedean LLC].** For  $\mathbb{K} \in \{\mathbb{R}, \mathbb{C}\}$ , the local Langlands conjecture (29.3.2.2) (29.3.2.4) and the genericity conjecture (29.3.2.4) are proved for any  $G \in \mathrm{RedGrp}/\mathbb{K}$  and any tempered  $L$ -parameters, see [Langlands Classifications \(Archimedean Local Langlands Correspondence\)](#).  $\lrcorner$

### LLC for $\mathrm{GL}(n)$ over Fields of Laurent-Series

References are [G. Laumon, M. Rapoport, U. Stuhler:  $D$ -elliptic sheaves and the Langlands correspondence]. [V.G. Drinfeld: Elliptic modules, Mat. USSR Sbornik 23, pp. 561–592 (1974)], [V.G. Drinfeld: Elliptic modules II, Mat. USSR Sbornik 31, pp. 159–170 (1977)].

## 3 Global $L$ -Packets and Arthur-Packets

References are [Endoscopic Classification of Representations, Inner Forms of Unitary Groups, Kaletha-Shin].

### Global Formal Parameters

**Conj. (29.3.3.1) [Global Langlands-Groups].** There should exist a locally compact group  $L_F$  with a surjective map  $L_F \rightarrow \mathrm{Gal}_F$ , and for any  $v \in \Sigma_F$ , there are commutative diagrams

$$\begin{array}{ccc} L_{F_v} & \longrightarrow & \mathrm{Gal}_{F_v} \\ \downarrow & & \downarrow \\ L_F & \longrightarrow & \mathrm{Gal}_F \end{array} \quad (29.3.1.3).$$

And the group  $L_F$  should satisfy: For any quasi-split reductive group  $G/F$ , there are compatible surjective maps  $\varphi \twoheadrightarrow c, \pi_v \twoheadrightarrow \varphi_v$ , where  $\varphi : L_F \rightarrow {}^L G$  is a conjugacy class of maps over  $\mathrm{Gal}_F$  and  $\varphi : L_{F_v} \rightarrow {}^L G_v$  is a conjugacy class of maps over  $\mathrm{Gal}_{F_v}$ .  $\lrcorner$

*Proof:*

□

**Conj. (29.3.3.2)[Candidates for global Langlands Groups].** It is conjectured that the global Langlands group  $L_F$  (29.3.3.1) should be the infinite fiber product of non-split extensions of  $W_F$  by compact semisimple simply-connected Lie groups  $K_c$ . ┘

**Def. (29.3.3.3) [Automorphic Conjugacy Classes].** Let  $F \in \mathbf{NField}$ ,  $G \in \mathbf{RedGrp}/F$  and  $\pi \in \mathrm{Irr}^{\mathrm{auto}}(G/F)$ , then there exists a finite set  $\Sigma_F^\infty \subset_{\mathrm{fin}} S \subset \Sigma_F$  s.t.  $G$  and  $\pi$  are unramified outside  $S$ . Then the Satake-isomorphisms for each  $v \in \Sigma_F \setminus S$  gives a semi-stable  $\widehat{G}(\mathbb{C})$ -conjugacy class  $c(\pi_v) \in {}^L G(\mathbb{C})$  (29.3.2.9), and we call

$$c^S(\pi) \triangleq \{c(\pi_v)\}_{v \in \Sigma_F \setminus S}$$

the string of conjugacy data attached to  $\pi$ . The set of images of the near-equivalence classes of these elements  $c^S(\pi)$  is denoted by  $\mathcal{C}_{\mathrm{auto}}(G)$ . ┘

**Def. (29.3.3.4)[Global Formal Parameters for  $\mathrm{GL}(n)$ ].** For each  $n \in \mathbb{Z}_+$  and  $F \in \mathbf{NField}$ , we define the following set of formal parameters for  $\mathrm{GL}(n)$ :

$$\Psi_{\mathrm{cusp}}(n; F) \subset \Psi_{\mathrm{sim}}(n; F) \subset \Psi(n; F)$$

where

- $\Psi_{\mathrm{cusp}}(n; F) \triangleq \mathrm{Irr}^{\mathrm{cusp}}(\mathrm{GL}(n)/F)$ .
- $\Psi_{\mathrm{sim}}(n; F)$  is the set of formal symbols  $\pi(r)$  where  $m, r \in \mathbb{Z}_+$  s.t.  $mr = n$  and  $\pi \in \Psi_{\mathrm{cusp}}(m; F)$ . (Notice that  $r$  represents the irreducible representation  $\mathrm{Sp}(n)$  of  $\mathrm{SL}(n)$  of dimension  $r$ ).
- $\Psi(n; F)$  is the set of formal sums  $\psi = l_1\psi_1 \boxplus l_2\psi_2 \boxplus \dots \boxplus l_r\psi_r$  where  $l_i \in \mathbb{Z}_+$  and  $\psi_k \in \Psi_{\mathrm{sim}}(n_k; F)$  s.t.  $\sum l_k n_k = n$ .

It follows from Mœglin-Waldspurger theorem (26.6.3.14) that the map

$$\Psi_{\mathrm{sim}}(n; F) \rightarrow \mathrm{Irr}_{\mathrm{disc}}^{\mathrm{cusp}}(\mathrm{GL}(n)/F) : \psi \mapsto \pi_\psi \triangleq \pi\left(\frac{n-1}{2}\right) \boxplus \pi\left(\frac{n-3}{2}\right) \boxplus \pi\left(\frac{1-n}{2}\right)$$

is a bijection. And also the map

$$\Psi(n; F) \rightarrow \mathcal{A}(\mathrm{GL}(n)/F) \text{ (26.6.3.15)} : l_1\psi_1 \boxplus l_2\psi_2 \boxplus \dots \boxplus l_r\psi_r \mapsto \boxplus_{i=1}^r \pi_{\psi_i}^{\boxplus(l_i)} = I \left( \bigotimes_{i=1}^r \pi_{\psi_i}^{\boxplus(l_i)} \right)$$

is a bijection by the definition (26.6.3.15).

A **generic formal parameter** for  $\mathrm{GL}(n)$  is called a formal parameter  $\psi \in \Psi(n; F)$  of the form

$$\psi = l_1\psi_1 \boxplus l_2\psi_2 \boxplus \dots \boxplus l_r\psi_r$$

where  $\psi_k = \pi_k(r_k)$  and  $r_k = 0$  for each  $k \in [r]_+$ . Denote

$$\Phi_{\mathrm{cusp}}(n; F) \subset \Phi_{\mathrm{sim}}(n; F) \subset \Phi(n; F)$$

the set of cuspidal/simple/ $\emptyset$ -formal parameters. ┘

**Def. (29.3.3.5) [Localization of Formal Parameters].** For  $n \in \mathbb{Z}_+$ ,  $F \in \mathbf{NField}$  and  $v \in \Sigma_F$ , we can associate a localization map

$$\Psi(n; F) \rightarrow \Psi^+(\mathrm{GL}(n; F_v)) \text{ (29.3.1.24)} : l_1\psi_1 \boxplus l_2\psi_2 \boxplus \dots \boxplus l_r\psi_r \mapsto \bigoplus_{k=1}^r \psi_{k,v}^{\otimes(r_i)},$$

where  $\psi_{k,v} = \mathrm{rec}(\pi_{k,v}) \otimes \mathrm{Sp}(r_k) \in \Psi^+(\mathrm{GL}(n_i r_i; F_v))$  if  $\psi_k = \pi_k(r_k)$  and  $\pi_k \in \mathrm{Irr}^{\mathrm{cusp}}(\mathrm{GL}(n_i)/F)$ .  $\lrcorner$

**Def. (29.3.3.6) [Conjugate-Self-Dual Formal Parameters].** Let  $E/F$  be an extension of degree  $\leq 2$  with  $c \in \mathrm{Gal}(E/F)$ . For each  $\pi \in \mathrm{Irr}^{\mathrm{cusp}}(\mathrm{GL}(n)/E)$ , denote  $\pi^\star = (\pi^\vee)^c$  the conjugate-dual of  $\pi$ . For each

$$\psi = l_1\psi_1 \boxplus l_2\psi_2 \boxplus \dots \boxplus l_r\psi_r \in \Psi(n; F) \text{ (29.3.3.4),}$$

denote

$$\psi^\star = l_1\psi_1^\star \boxplus l_2\psi_2 \boxplus \dots \boxplus l_r\psi_r^\star$$

where  $\psi_k^\star = \pi_k^\star(r_k)$  if  $\psi_k = \pi_k(r_k)$ .

The set of conjugate-self-dual formal parameters in  $\Psi(n; E)$  is denoted by  $\tilde{\Psi}(n; E)$ . Moreover we denote  $\tilde{\Psi}_{\mathrm{ell}}(n; E) \subset \tilde{\Psi}(n; E)$  the set of formal parameters

$$\psi = l_1\psi_1 \boxplus l_2\psi_2 \boxplus \dots \boxplus l_r\psi_r \in \Psi(n; F)$$

s.t.  $l_k = 1$  and  $\psi_k^\star = \psi_k$  for each  $k$ .

And we denote  $\tilde{\Psi}_{\mathrm{sim}}(n; E) \triangleq \Psi_{\mathrm{sim}}(n; E) \cap \tilde{\Psi}(n; E)$  and also  $\tilde{\Phi}(n; E) \triangleq \Phi(n; E) \cap \tilde{\Psi}(n; E)$ .  $\lrcorner$

**Def. (29.3.3.7) [Formal Parameters for  $\mathbf{U}_{E/F}(n)$ ].** Let  $E/F$  be an extension of degree  $\leq 2$  with  $c \in \mathrm{Gal}(E/F)$ , and denote  $G^\star = \mathbf{U}_{E/F}(n)$ , we have the following sets of formal parameters for  $\mathbf{U}_{E/F}(n)$ :

$$\Psi_{\mathrm{sim}}(G^\star, \eta_\chi) \subset \Psi_2(G^\star, \eta_\chi) \subset \Psi_{\mathrm{ell}}(G^\star, \eta_\chi) \subset \Psi_{\mathrm{disc}}(G^\star, \eta_\chi) \subset \Psi(G^\star, \eta_\chi),$$

where  $\Psi(G^\star, \eta_\chi)$  is the set of pairs  $(\psi^n, \tilde{\psi})$  where  $\psi^n \in \tilde{\Psi}(n; F)$  and

$$\tilde{\psi} : \mathcal{L}_{\psi^n} \times \mathrm{SL}(2; \mathbb{C}) \rightarrow {}^L G^\star(\mathbb{C}) \text{ ?}$$

is a  $\hat{\mathbf{U}}_{E/F}(n; F)$ -conjugacy class of  $L$ -homomorphisms s.t.  $\psi^n = \eta_\chi \circ \tilde{\psi}$  ?.

? Cf. [Endoscopic Classification of Representations, Inner Forms of Unitary Groups, Kaletha-Shin]P69.  $\lrcorner$

**Thm. (29.3.3.8) [Localization of Formal Parameters for  $\mathbf{U}_{E/F}(n)$ , Mok].** Situation as in (29.3.3.7), for each  $\kappa \in \{\pm 1\}$  and  $\psi = (\psi^n, \tilde{\psi}) \in \Psi(G^\star, \eta_\kappa)$ , there exists  $\psi_v \in \Psi_{\mathrm{uni}}^+(G_v^\star)$  s.t.  $\psi_v^n = \eta_{\chi_\kappa} \circ \psi_v$  (29.3.3.5), and the isomorphism class of  $\psi_v$  is uniquely determined, called the **localization of the formal parameter**  $\psi$ .  $\lrcorner$

*Proof:* [Mok]2.4.10, 2.4.11.  $\square$

**Def. (29.3.3.9) [Relevant Formal Parameters for  $\mathbf{U}_{E/F}(n)$ ].** Situation as in (29.3.3.7), let  $(G, \xi)$  is an inner form of  $G^\star$ . Suppose  $\kappa \in \{\pm 1\}$  and  $\psi = (\psi^N, \tilde{\psi}) \in \Psi(G^\star, \eta_\kappa)$ , then  $\psi$  is said to be a **relevant formal parameter** if the localization  $\psi_v$  (29.3.3.8) is  $(G_v, \xi_v)$ -relevant (29.3.1.4) for each  $v \in \Sigma_F$ .  $\lrcorner$

### Global Arthur-Parameters

**Def. (29.3.3.10) [Global Arthur-Parameters].** Assuming the existence of global Langlands group  $L_F$  (29.3.3.1), a **global Arthur-parameter** is a continuous homomorphism

$$\psi : L_F \times \mathrm{SL}(2; \mathbb{C}) \rightarrow {}^L G_{\mathbb{C}}$$

s.t.

- $\psi|_{\mathrm{SL}(2; \mathbb{C})}$  is holomorphic and the image is in  $\widehat{G}(\mathbb{C})$ .
- For  $w \in L_F$ , the image of  $\psi(w)$  in the quotient  $W_F$  of  ${}^L G$  is the same as the image of  $w$  in the quotient  $L_F \rightarrow W_F$ .
- $\psi(L_F)$  is bounded in  ${}^L G/Z(\widehat{G}(\mathbb{C}))$ .
- $\psi$  is relevant, i.e. any parabolic subgroup of  ${}^L G$  (10.4.6.8) containing  $\mathrm{Im}(\psi)$  is defined over  $F$ .

⌋

**Remark (29.3.3.11).** Notice that the last assertion is automatic if  $G$  is quasi-split because any parabolic subgroup is defined over  $F$ . ?

⌋

**Def. (29.3.3.12) [Equivalence of Arthur-parameters].** Two global Arthur-parameters (29.3.3.10) are called **equivalent Arthur-parameters** if they are conjugate by an element of  $\widehat{G}(\mathbb{C})$  up to a cocycle of  $L_F$  in  $Z(\widehat{G}(\mathbb{C}))$  that is locally trivial at every place of  $F$ .

⌋

**Def. (29.3.3.13) [Generic and Discrete Paramaters].** A global Arthur-parameter  $\psi$  (29.3.3.10) is called **discrete global Arthur-parameter** if  $C_{\widehat{G}(\mathbb{C})}(\mathrm{Im}(\psi))^0 \subset Z(\widehat{G}(\mathbb{C}))$ , or equivalently  $\mathrm{Im}(\psi)$  is not contained in any proper relevant parabolic subgroup of  ${}^L G$  ?.

A global Arthur-parameter  $\psi$  (29.3.3.10) is called **generic global Arthur-parameter** if it is trivial on  $\mathrm{SL}(2; \mathbb{C})$ .

⌋

**Prop. (29.3.3.14) [Associated Global  $L$ -Parameters].** A global Arthur-parameter  $\psi$  defines an **associated global  $L$ -parameter**  $\phi$  (29.3.3.4) by

$$\phi(w) = \psi(w, \mathrm{diag}(|w|^{1/2}, |w|^{-1/2})).$$

where  $|-| : L_F \rightarrow \mathbb{R}^\times$  is given by the composition  $L_F \rightarrow W_F^{\mathrm{ab}} \xrightarrow{\mathrm{rec}^{-1}} \mathbf{I}_F \rightarrow \mathbb{R}_+$ . (Cf. [?assoaictieL0eireinsies]).

⌋

### Global $L$ -Packets and Arthur-Packets

References are [Art89, B-C09].

**Def. (29.3.3.15) [Weak Global  $L$ -Packets].**  $\pi, \pi' \in \mathrm{Irr}^{\mathrm{adm}}(G/F)$  are called **weakly  $L$ -indistinguishable** if there exists  $\Sigma_F^\infty \subset_{\mathrm{fin}} S \subset \Sigma_F$  s.t.  $\pi^S \cong (\pi')^S \in \mathrm{Irr}^{\mathrm{adm}}(G(\mathbf{A}_F^S))$ . An equivalence classes of weakly- $L$ -indistinguishable admissible representations in  $\mathrm{Irr}^{\mathrm{adm}}(G/F)$  is called a **weak global  $L$ -packet**. A weak global  $L$ -packet containing an automorphic representation (26.6.1.17) is called a **weak automorphic  $L$ -packet**.

⌋

**Def. (29.3.3.16) [Global  $L$ -Packets].** It is possible that  $\pi, \pi'$  have the same  $L$ -function, and for any  $r \in \mathrm{Rep}^{\mathrm{fd}}({}^L G)$  and any reductive group  $H$  over  $F$  and  $\sigma \in \mathrm{Irr}^{\mathrm{auto}}(H/F)$  together with  $r_1 \in \mathrm{Rep}^{\mathrm{fd}}({}^L H)$ , we have

$$L_S(\pi \otimes \sigma, r \otimes r_1; s) = L_S(\pi' \otimes \sigma, r \otimes r_1; s).$$

In this case,  $\pi, \pi'$  are called to be in the same global  **$L$ -packet**.

⌋

**Thm. (29.3.3.17) [Isobaric Automorphic Representations, Jacquet-Shalika].** Any weak automorphic  $L$ -packet of  $\mathrm{GL}(n)/F$  contains a unique isobaric element (26.6.1.28).  $\lrcorner$

*Proof:* Cf. [J-S81, J-S81a] ?  $\square$

**Prop. (29.3.3.18) [Which Finite Representation Appear in Automorphic Representations].** If  $G \in \mathrm{RedGrp}_{\sim, \mathrm{cnd}}^{\mathrm{ss}}/F$  and  $\emptyset \subset_{\mathrm{fin}} \Sigma_F$  s.t.  $G(\mathbf{A}_{F,S})$  is non-compact, then any  $\pi \in \mathrm{Irr}^{\mathrm{adm}}(G(\mathbf{A}_{F,S}))$  is a limit (in a suitable sense ?) of local components at  $S$  of automorphic representations of  $G/F$ .  $\lrcorner$

*Proof:* Cf. [Clozel, Spectral theory of automorphic forms] Section 3.3.  $\square$

### Global Arthur-Packets for Unitary Groups

**Remark (29.3.3.19) [Arthur's Program].** Arthur's program asks the question of how to compute the multiplicity  $m_\pi$  of any discrete series  $\pi \in \mathrm{Irr}^{\mathrm{auto}}(G/F)$  in  $L^2(G(F) \backslash G(\mathbf{A}_F), \omega)$  (26.6.1.17).

Arthur's conjecture predicts the  $m_\pi$  and also gives a general hint about how the discrete spectrum of  $G$  is constructed from the tempered one, and even from the cuspidal ones of subgroups of  $G$ .

The problem with  $L$ -packets that motivated the introduction of Arthur-packets is that it is not always possible to construct a non-trivial linear combination of the characters of its members that is a stable distribution. This problem does not arise for tempered  $L$ -packets.

As long as we are interested in the discrete spectrum and with non-tempered representations, the Arthur-functoriality is better behaved than the  $L$ -packets. ?  $\lrcorner$

**Conj. (29.3.3.20) [Global Arthur Packets].** Let  $G^* \in \mathrm{RedGrp}/F$  be quasi-split and  $(G, \xi) \in H^1(F, G_{\mathrm{ad}}^*)$ . A **global Arthur-packet**  $\Pi_\psi$  associated to a discrete global Arthur-parameter  $\psi$  (29.3.3.10) is a subset of  $\mathrm{Irr}^{\mathrm{uni}}(G(\mathbf{A}_F), \omega)$  defined by

$$\Pi_\psi(G, \xi) = \{\pi = \otimes'_v \pi_v : \pi_v \in \Pi_{\psi_v}(G_v) \text{ (29.3.2.15)}, \pi_v \text{ unramified for a.e. } v \in \Sigma_F\},$$

where we are using  $\xi$  to identify  ${}^L G$  and  ${}^L G^*$ . There should be a direct integral decomposition

$$L^2(G(F) \backslash G(\mathbf{A}_F)) \cong \int \mathcal{A}_{[\psi]} d\hat{\mu}(\psi),$$

where  $\mathcal{A}_{[\psi]}$  is a subspace of  $\mathcal{A}(G/F)$  whose irreducible subquotients are all contained in the Arthur-packet  $\Pi_\psi$ , and  $d(\hat{\psi})$  is a natural measure class on the set of conjugacy classes of Arthur-parameters.

Two Arthur-parameters should be sent to the same Arthur-packet iff they are equivalent, and the correspondence above should send tempered Arthur-parameters (29.3.3.13) to tempered Arthur-packets, in which case it should coincide with the theory of Langlands. Note that this requirement, in the case  $G = \mathrm{GL}(m)$  is the generalized Ramanujan conjecture. ?  $\lrcorner$

*Proof:* ?  $\square$

**Thm & Conj. Cor. (29.3.3.21) [Arthur's Multiplicity Formula for Unitary Groups].** Let  $E/F \in \mathrm{GField}$  be a quadratic extension and  $\kappa \in \{\pm 1\}$ . Fix  $\chi_\kappa \in \mathcal{Z}_E^\kappa$  ? and let  $(G, \xi)$  be a pure inner form of  $G^* = \mathrm{U}_{E/F}(n)$ , choose  $z$  s.t.  $(G, \xi, z)$  is an extended pure inner twist, then there is a  $G(\mathbf{A}_F)$ -module isomorphism

$$L_{\mathrm{disc}}^2(G(F) \backslash G(\mathbf{A}_F)) \cong \bigoplus_{\psi \in \Psi_2(G^*, \eta_{\chi_\kappa})} L_{\mathrm{disc}, \psi}^2(G(F) \backslash G(\mathbf{A}_F)),$$

where  $L_{\text{disc},\psi}^2(G(F)\backslash G(\mathbf{A}_F))$  is a full representative of irreducible discrete representations  $\pi = \otimes'_v \pi_v$  s.t. the  $L$ -parameter of  $\pi_v$  is  $\phi_{\psi_v}$  for a.e.  $v \in \Sigma_F$ .

And when  $\psi$  is generic(29.3.3.4), we have a  $G(\mathbf{A}_F)$ -module isomorphism

$$L_{\text{disc},\psi}^2(G(F)\backslash G(\mathbf{A}_F)) \cong \bigoplus_{\pi \in \Pi_{\psi}(G,\xi,\epsilon_{\psi})} \pi,$$

where

- For each  $v \in \Sigma_F$ , in [Kaletha-Shin]section1.6.4? there is attached a local Arthur-packet  $\Pi_{\psi_v}(G_v, \xi_v)$  equipped with a map

$$\Pi_{\psi_v}(G_v, \xi_v) \rightarrow \text{Irr}(S_{\psi}^{\natural}, \chi_z) : \pi_v \mapsto \langle -, \pi_v \rangle_{\xi_v, z_v},$$

where  $\psi_v$  is the localization of  $\psi$ (29.3.3.8).

- $\Psi_{\psi}(G, \xi) = \{\pi = \otimes'_v \pi_v : \pi_v \in \Pi_{\psi_v}(G_v, \xi_v), \langle -, \pi_v \rangle_{\xi_v, z_v} = 1, a.e.v\}$ .
- $\epsilon_{\psi} : \overline{\mathcal{S}}_{\psi} \rightarrow \{\pm 1\}$  is a character defined by symplectic root numbers, which is trivial if  $\psi$  is generic. (Cf.[Mok]Section2.5. and [Arthur]Section1.5.),
- $\Pi_{\psi}(G, \xi, \epsilon_{\psi}) = \{\pi = \otimes'_v \pi_v \in \Pi_v(G, \xi) \mid \langle -, \pi \rangle_{\xi} = \epsilon_{\psi}\}$ , where  $\langle -, \pi \rangle_{\xi} = \prod_v \langle -, \pi_v \rangle_{\xi_v, z_v}$ .

## 4 Non-Quasi-Split Groups

References are [Vog93, GGP12, Kal16a].

### Local Conjectures

**Notation(29.3.4.1).**

- Let  $K \in \text{LField}^0$ ,
- Let  $G \in \text{RedGrp}/K$  be quasi-split.

┘

**Prop.(29.3.4.2).** Any pure inner form  $G'$  of  $G$  has the same center  $Z(G)$ (10.2.5.10), and the group

$$G'_{\text{ad}}(K)/G'(K) \cong \ker(H^1(K, Z(G)) \rightarrow H^1(K, G'))(10.2.5.3)$$

is independent of  $G'$  and acts on  $\text{Irr}^{\text{adm}}(G'(K))$ .

For any  $L$ -parameter  $\phi$  for  $G$ , the Tate duality

$$H^1(K, Z) \times H^1(K, \pi_1(\widehat{G})) \rightarrow \mathbb{C}^{\times}$$

and the coboundary map  $C_{\phi} \rightarrow H^1(k, \pi_1(\widehat{G}))$  induces a pairing

$$H^1(K, Z) \times A_{\phi} \rightarrow \mathbb{C}^{\times}.$$

Thus any  $g \in G'_{\text{ad}}(K)$  gives a character  $\eta_g$  of  $A_{\phi}$  via  $G'_{\text{ad}}(K) \rightarrow H^1(K, Z(G))$ .

┘

*Proof:* ?

□

**Conj.(29.3.4.3) [Langlands-Vogan Parametrization for Pure Inner Forms, Langlands/Vogan[Vog93]].** Let  $G \in \text{RedGrp}/K$  be quasi-split and  $\mathfrak{m}$  be a Whittaker-datum for  $G$ (10.4.4.23)., then:

1. For any pure inner twisting  $(G', \xi, z)$  of  $G$ (10.2.5.11) and  $\pi \in \text{Irr}^{\text{adm}}(G'(K))$ , we can associate an equivalence class of local  $L$ -parameters  $\phi_\pi \in \Phi(G)$ (29.3.1.6). And conversely, each  $\phi \in \Phi(G)$ (29.3.1.4) determines a finite set

$$\Pi_\phi = \coprod_{(G', \xi, z) \in H^1(K, G)} \Pi_\phi(G', \xi) \subset \coprod_{(G', \xi, z) \in H^1(K, G)} \text{Irr}^{\text{adm}}(G'(K)),$$

called the **Vogan-packet(local)** corresponding to  $\phi$ .

2.  $\Pi_\phi$  contains at most one  $\mathfrak{m}$ -generic representation(24.9.5.2). If it contains a  $\mathfrak{m}$ -generic representation,  $\Pi_\phi$  is called a **generic Vogan-packet**. And it is conjectured that this is true iff  $\text{ord}_{s=1} L(\phi, \text{Ad}; s) \geq 0$ , in particular, independent of  $\mathfrak{m}$  chosen. Notice by generic packet conjecture(29.3.2.4), a tempered  $L$ -packet is generic.
3. There is a bijection

$$\iota_{\mathfrak{m}} : \Pi_\phi \cong \text{Irr}(\pi_0(C_{\phi_v})) \text{ (29.3.1.4)}$$

making the following diagram commutative:

$$\begin{array}{ccc} \Pi_\phi & \xrightarrow{\iota_{\mathfrak{m}}} & \text{Irr}(\pi_0(C_\phi)) \\ \downarrow & & \downarrow \\ H^1(F, G) & \xrightarrow{\kappa_G} & \pi_0 \left( Z(G)^{\text{Gal}_K} \right)^\vee \end{array}$$

where the left vertical map maps  $\Pi_\phi(G', \xi)$  to the cohomology class of  $(G', \xi)$ , and the right vertical map maps  $\rho \in \text{Irr}(\pi_0(C_\phi))$  to its restriction to  $\pi_0 \left( Z(\hat{G})^{\text{Gal}_F} \right)$ , which is a character.

And if  $\Pi_\phi$  is  $\mathfrak{m}$ -generic, then the unique  $\mathfrak{m}$ -generic representation  $\pi \in \Pi_\phi$  corresponds to the trivial representation of  $\pi_0(C_\phi)$ . For  $\rho \in \text{Irr}(\pi_0(C_\phi))$ , denote  $\pi_{\mathfrak{m}}(\phi, \rho) = \iota_{\mathfrak{m}}^{-1}(\rho)$ .

4.  $\Pi_\phi \cap \text{Irr}^{\text{adm}}(G(K))$  is stable under action of  $G^{\text{ad}}(K)$ , and  $G^{\text{ad}}(K)$  acts transitively on the set of different generic representations of  $G(K)$  in  $\Pi_\phi \cap \text{Irr}^{\text{adm}}(G(K))$ . And for any  $g \in G'_{\text{ad}}(K)$ , the action of  $g$  on  $\Pi_\phi \cap \text{Irr}^{\text{adm}}(G'(K))$  corresponds to tensoring the character  $\eta_g$  on  $\text{Irr}(A_\phi)$  via any  $\iota_{\mathfrak{m}}$ .
5. (Central Characters) All representations in  $\pi \in \Pi_\phi$  have the same central character  $\omega_\phi$ (29.3.4.2) determined by  $\phi$  via recipe in [G-R10]Section8?.
6. (Endoscopic Character Identities, Kaletha[Kal16a]) If  $(H, \dot{s}, {}^L\eta) \in {}^L\dot{\mathfrak{E}}(G/K)$ (29.2.2.1) and  $\phi^H \in \Phi^{\text{temp.}}(H)$  s.t.  $\phi = {}^L\eta \circ \phi^H$ , then for any  $(G', \xi, z) \in H^1(K, G)$  and  $\Delta^{\mathfrak{m}, H, z}$ -matching functions  $f_H \in \mathcal{T}(H(K))$ ,  $f' \in \mathcal{T}(G'(K))$ (29.2.2.2), we have

$$S\Theta_{\phi^H}(f^H) = \Theta_{\phi, (G', \xi, z)}^{\dot{s}}(f') \stackrel{\triangle}{=} e(G') \sum_{\pi \in \Pi_\phi(G', \xi)} \text{tr}(\iota_{\mathfrak{m}}(\pi)(\dot{s})) \Theta_\pi(f') \text{ (29.3.2.4)}.$$

where  $\Theta_{\phi, (G', \xi, z)}^{\dot{s}}$  is called the  **$\dot{s}$ -stable character** of  $(G', \xi)$  associated to  $\phi$ , and denote  $S\Theta_{\phi, (G', \xi, z)} \stackrel{\triangle}{=} \Theta_{\phi, (G', \xi, z)}^1$ , called the **stable character**

⌋

*Proof:* ?

If  $K \in \{\mathbb{R}, \mathbb{C}\}$ , the bijection  $\iota_{\mathfrak{m}}$  is constructed in [Vog93]Thm6.3 using Shelstad's work.  $\square$

**Thm& Conj.Cor.(29.3.4.4)** [GL( $n$ ) case]. If  $G = \mathrm{GL}(n)$ , then

- $A_{\phi} = 1$  for any  $L$ -parameter  $\phi$ .
- There are no non-trivial pure inner forms of  $G$ .
- The adjoint action of  $G^{\mathrm{ad}}(K)$  is trivial, because  $H^1(K, Z(G)) = 1$ .
- There is a unique orbit of generic unipotent characters(24.11.2.2), and  $\Pi_{\phi}$  is generic iff  $\mathrm{ord}_{s=1} L(\phi, \mathrm{Ad}; s) \geq 0$ .
- The Langlands-Vogan parametrization conjecture is equivalent to the Langlands conjecture for  $G$ , and is true by(29.3.2.17).

## Global Vogan-Packets

### 5 Global Langlands Functoriality

References are [Kna97, Rog97].

**Conj. (29.3.5.1) [Global Functorial Lifting, Langlands[Lan70]].** Suppose  $G, G' \in \text{RedGrp}/F$  are quasi-split. Suppose  $\varphi : {}^L G' \rightarrow {}^L G \in \text{AlgGrp}/\overline{\mathbb{Q}}$  preserves the projection to  $\text{Gal}_F$ . If  $w'$  is a prime of  $L'$ ,  $w = w' \cap L, v = w \cap F$ , then  $\varphi$  determines a homomorphism  $\varphi_v : {}^L G'_{L'_{w'}/F_v} \rightarrow {}^L G_{L_w/F_v}$  that makes the diagram

$$\begin{array}{ccc} {}^L G'_{L'_{w'}/F_v} & \longrightarrow & \text{Gal}(L'_{w'}/F_v) \\ \downarrow \varphi_v & & \downarrow \\ {}^L G_{L_w/F_v} & \longrightarrow & \text{Gal}(L_w/F_v) \end{array}$$

commutative.

Then for  $\pi' = \otimes_v \pi'_v \in \text{Irr}^{\text{auto}}(G'/F)$ , is it true that  $\pi = \otimes_v R_{\varphi_v}(\pi'_v) \in \text{Irr}^{\text{cusp}}(G/F)$  (29.3.2.1)? Such an automorphic representation is called a **functorial lifting** or  $\pi'$ .

Notice that, for  $v \in \Sigma_F^{\text{fin}}$  s.t.  $G_{F_v}, G'_{F_v}, \pi_v, \pi'_v$  are all unramified, this is equivalent to  $c_v(\pi)$  is  $\widehat{G}'(\mathbb{C})$ -conjugate to  $\varphi(c_v(\pi'))$  (29.3.2.11).  $\perp$

**Remark (29.3.5.2).** This conjecture reduces the conjecture from a general group to the case of  $\text{GL}(n; F)$ , which can be handled, such as by [Zeta Functions of Simple Algebras, Godement-Jacquet].  $\perp$

**Conj. Cor. (29.3.5.3) [Automorphic Weil Representations].** Suppose  $G/F$  is quasi-split and splits over a Galois extension  $L/F$ . Let  ${}^L U_L$  be a maximal compact subgroup of  ${}^L G_F$ . Let  $\varphi : W_{L/F} \rightarrow {}^L U_F$  be a homomorphism that makes the diagram

$$\begin{array}{ccc} W_{L/F} & \longrightarrow & \text{Gal}(L/F) \\ \downarrow \varphi & & \downarrow \\ {}^L U_F & \longrightarrow & \text{Gal}(L/F) \end{array}$$

commutative. If  $\mathfrak{P}'$  is a prime of  $K'$  and  $\mathfrak{p} = \mathfrak{P}' \cap F$ , then  $\varphi_{\mathfrak{p}} = \varphi \circ \alpha_{\mathfrak{p}}$  takes  $W_{K'_{\mathfrak{P}'}/F_{\mathfrak{p}}}$  into  ${}^L U_{F_{\mathfrak{p}}}$ .

If  $\pi(\varphi) = \otimes_{\mathfrak{p}} \pi(\varphi_{\mathfrak{p}})$ , then  $\pi(\varphi)$  is an automorphic representation, called the **Automorphic lift** of  $\rho$ .  $\perp$

*Proof:*  $\square$

**Conj. Cor. (29.3.5.4) [Automorphic Galois Representations for  $\text{GL}(n)$ , Artin-Langlands[Lan70]].** In (29.3.5.1), take  $G' = e$  and  $G = \text{GL}(n)$ , then  $\pi'$  is trivial, and  $\rho : \text{Gal}(E/F) \rightarrow \text{GL}(n; \mathbb{C})$  is an injective homomorphism for some finite extension  $E/F$ . Then the conjecture asserts that there exists  $\pi \in \text{Irr}^{\text{cusp}}(\text{GL}(n)/F)$  s.t.

$$c_v(\pi) = \varphi(\text{Frob}_v) \quad (29.3.1.12)$$

for any  $v \notin \text{Ram}(F)$ . Such a representation  $\pi$  is called an **automorphic Galois representation**.

Notice that in fact it suffices to show that  $c_v(\varphi) = \varphi(\text{Frob}_v)$  is true for a.e.  $v \in \Sigma_F^{\text{fin}}$ . And it is unique if it exists, by strong multiplicity theorem for  $\text{GL}(n)$  (26.6.5.1).  $\perp$

*Proof:*

□

**Thm& Conj.Cor. (29.3.5.5).**

1. For  $n = 1$ , the Artin-Langlands conjecture(29.3.5.4) is equivalent to the Kronecker-Weber theorem, or more generally the Artin reciprocity law, thus it is true.
2. If the image of  $\rho$  is nilpotent, then this is true by cyclic automorphic induction for  $\mathrm{GL}(n)$  proved by Arthur-Clozel.?
3. If  $n = 2$  and  $\mathrm{Im}(\rho)$  is solvable(i.e. not  $\mathrm{Alt}_5$ (25.1.2.14)), then this is true.
4. if  $n = 2$  and the image of  $\mathrm{Gal}_{\mathbb{Q}}$  in  $\mathrm{PGL}(2; \mathbb{C})$  is isomorphic to  $\mathrm{Alt}_5$ , then under mild conditions, this is proved in [On icosahedral Artin Representations].?

┘

*Proof:* 2:

3: When  $n = 2$ , by(25.1.2.14), it suffices to consider the case that  $\rho$  is of cyclic/dihedral/tetrahedral/octahedral type.

If  $\rho$  is of cyclic or dihedral type, then by(24.1.3.40),  $\rho = \mathrm{Ind}_E^F(\chi)$  for some quadratic extension  $E/F$  and  $\chi \in (\mathrm{Gal}_E)^\vee$  s.t.  $\chi^\tau \not\cong \chi$  where  $\tau \in \mathrm{Gal}(E/F) \setminus \{\mathrm{id}\}$ . Then by global class field theory and cyclic automorphic induction(29.3.5.15),  $\pi(\rho) \in \mathrm{Irr}^{\mathrm{cusp}}(\mathrm{GL}(2)/F)$  exists.

If  $\mathrm{Im}(\mathrm{Ad} \circ \rho) \cong \mathrm{Alt}_4$ , then

If  $\mathrm{Im}(\mathrm{Ad} \circ \rho) \cong \mathrm{Sym}_4$ , then

4:

□

**Lemma (29.3.5.6).** Let  $\rho : \mathrm{Gal}_F \rightarrow \mathrm{GL}(2; \mathbb{C})$  be of tetrahedral type and  $\pi \in \mathrm{Irr}^{\mathrm{auto}}(\mathrm{GL}(2)/F)$  s.t. the following holds:

- $\mathrm{BC}_F^E(\pi) = \pi(\rho_E)$ ,
- $\omega_\pi = \det(\rho)$ ,
- $\mathrm{Ad}(\pi) = \pi(\mathrm{Ad} \circ \rho)$ .

Then  $\pi = \pi(\rho)$ .

┘

*Proof:*

□

**Lemma (29.3.5.7).** Let  $\rho : \mathrm{Gal}_F \rightarrow \mathrm{GL}(2; \mathbb{C})$  and  $\pi \in \mathrm{Irr}^{\mathrm{auto}}(\mathrm{GL}(2)/F)$  s.t.  $\mathrm{BC}_F^E(\pi) = \pi(\rho|_E)$  and  $\mathrm{BC}_F^K(\pi) = \pi(\rho|_K)$ , then  $\pi = \pi(\rho)$ .

┘

*Proof:*

□

**Remark (29.3.5.8) [Representations of Icosahedral Type].** The case of representations of icosahedral type is particularly hard because Maass forms with eigenvalue  $1/4$  are very hard to access: Given an even (projective)  $A_5$  Galois representation, we don't even know how to prove that there exists a corresponding Maass form with the right Laplacian eigenvalue.

┘

**Thm& Conj.Cor. (29.3.5.9) [Odd dim 2-Representations, Khare-Wintenberger[K-W09b, K-W09c]/ Pilloni-Stroh[P-S16a]].** The Artin-Langlands conjecture(29.3.5.4) holds if  $F$  is totally real and  $\rho$  is odd.

┘

*Proof:*

□

**Prop. (29.3.5.10) [Automorphic for Virtual Representations, Jacquet-Shalika[?J-K81a]].** Let  $L/F \in \mathbf{NField}$  and  $\pi \in \mathrm{Irr}(\mathrm{Gal}(L/F))$  s.t.  $\pi = \sigma - \tau$  for some automorphic representations  $\sigma$  and  $\tau$  (29.3.5.4), then  $\pi$  is also automorphic.  $\lrcorner$

*Proof:* Cf.[?J-K81a]P812.  $\square$

**Def. (29.3.5.11) [Potentially Abelian Representations].** For  $F \in \mathbf{NField}$  and  $n \in \mathbb{Z}_+$ , a  $\Pi \in \mathrm{Irr}^{\mathrm{cusp}}(\mathrm{GL}(n)/F)$  is called **potentially Abelian** if there exists  $\Sigma \in \mathcal{R}\mathrm{ep}^n(W_F)$  s.t.  $\Sigma|_{W_{F_v}} = \mathrm{rec}_v(\Pi_v)$  for any  $v \in \Sigma_F$ .  $\lrcorner$

### Representation Lifting

**Conj.Cor. (29.3.5.12) [Tensor Product Lifting].** Let  $n, m \in \mathbb{Z}_+$  and  $\pi \in \mathrm{Irr}^{\mathrm{cusp}}(\mathrm{GL}(n)/F), \pi' \in \mathrm{Irr}^{\mathrm{cusp}}(\mathrm{GL}(m)/F)$ . Let  $n_1, \dots, n_r \in \mathbb{Z}_+$  and  $\pi_j \in \mathrm{Irr}^{\mathrm{cusp}}(\mathrm{GL}(n_j)/F)$  for any  $j \in [r]_+$ , then denote

$$\pi \boxtimes \pi' = \otimes_{j=1}^r \pi_j$$

if  $\sum_j n_j = mn$ , and

$$c(\pi_v) \otimes c(\pi'_v) \cong \otimes_{j=1}^r c(\pi_{j,v})$$

for a.e.  $v \in \Sigma_F^{\mathrm{fin}}$ .

If such  $n_j, \pi_j$  exists, then  $\pi \boxtimes \pi'$  is well-defined. Then it is conjectured that  $\pi \boxtimes \pi'$  is well-defined for any  $\pi, \pi'$ .  $\lrcorner$

*Proof:*  $\square$

*Proof:*  $\square$

**Conj.Cor. (29.3.5.13) [Global Inner Twists].** If (29.3.2.6) is true, if  $G, G' \in \mathbf{AlgGrp}/F$  and  $G$  is quasi-split and  $G'$  is an inner twist of  $G$ , suppose  $\pi' = \otimes_{\mathfrak{p}} \pi'_{\mathfrak{p}}$  is an automorphic representation of  $G'_F$ , is it true that  $\pi = \otimes_{\mathfrak{p}} R(\pi'_{\mathfrak{p}})$  is an automorphism representation of  $G_F$ ?  $\lrcorner$

*Proof:*  $\square$

### Automorphic Base Change and Inductions

**Conj.Cor. (29.3.5.14) [Automorphic Inductions].** Suppose  $L/F$  be a finite extension with  $[L:F] = d$ . Let  $\pi \in \mathrm{Irr}^{\mathrm{auto}}(\mathrm{GL}(n)/L)$ , then an automorphic form  $\Pi \in \mathrm{Irr}^{\mathrm{auto}}(\mathrm{GL}(np)/F)$  is said to be the **automorphic induction** of  $\pi$  if

$$L(\Pi_v; s) = \prod_{w|v} L(\pi_w; s)$$

for a.e.  $v \in \Sigma_F^{\mathrm{fin}}$ . Such an automorphic induction is unique if it exists by strong multiplicity one, denoted by  $\mathrm{AI}_F^L(\pi)$ .

Then it is conjectured that such a base change always exists.  $\lrcorner$

*Proof:*  $\square$

**Thm& Conj.Cor. (29.3.5.15) [Cyclic Automorphic Induction, Hecke/Maass/Jacquet-Langlands/Shalika-Tanaka[S-T69]/Jacquet-Piatetski-Shapiro-Shalika/Arthur-Clozel].** If  $E/F$  is a cyclic extension, then automorphic induction exists. Moreover, if  $\pi \in \mathrm{Irr}^{\mathrm{cusp}}(\mathrm{GL}(n)/E)$ , then  $\mathrm{AI}_E^F(\pi)$  is cuspidal unless there exists  $\tau \neq \mathrm{id} \in \mathrm{Gal}(E/F)$  s.t.  $\pi \cong \sigma(\pi)$ .  $\lrcorner$

*Proof:*

□

**Prop. (29.3.5.16) [Unramified Langlands Class of Automorphic Inductions].** Let  $L/F$  be a finite extension with  $[L : F] = d$ . If  $v \in \Sigma_F^{\text{fin}}$  is unramified in  $L$  and  $\pi_w$  is unramified for any  $w|v$ , then if  $\Pi = \text{AI}_E^F(\pi)$  exists, we can describe the the Langlands class of  $\Pi_v$  as follows: Denote  $d_w = [L_w : F_v]$  and suppose  $c_w(\pi) \sim \text{diag}(z_{w1}, \dots, z_{wn})$ , then  $c_c(\Pi)$  is the semisimple conjugacy class with eigenvalues the union of  $d_w$ -th roots of  $\{z_{wj}\}$ .  $\lrcorner$

*Proof:* This is because

$$L(\pi_w; s) = \prod_{j=1}^n (1 - z_{wj} \|w\|^{-s})^{-1} = \prod_{j=1}^n \prod_{k=1}^d (1 - z_{wj}^{1/d_w} \zeta_{d_w}^k \|v\|^{-s})^{-1}.$$

□

**Conj.Cor. (29.3.5.17) [Automorphic Base Change].** Suppose  $L/F$  be a finite extension with  $[L : F] = d$ . Let  $\pi \in \text{Irr}^{\text{auto}}(\text{GL}(n)/F)$ , then an automorphic form  $\Pi \in \text{Irr}^{\text{auto}}(\text{GL}(n)/L)$  is called a **base change lift** of  $\pi$  if for a.e.  $v \in \Sigma_F^{\text{fin}}$  and  $w \in S_L(v)$  we have

$$c_w(\Pi) = c_v(\pi)^{[w:v]}.$$

Such an automorphic induction is unique if it exists by strong multiplicity one, denoted by  $\text{BC}_F^L(\pi)$ .

Then it is conjectured that such a base change always exists.  $\lrcorner$

*Proof:*

□

**Thm& Conj.Cor. (29.3.5.18) [Cyclic Base Change Lifts, Langlands[Lan80]/Arthur-Clozel[A-C89]].** Suppose  $L/F$  is a cyclic extension of order  $\ell \in \text{Prime}$ , then

- For any  $\pi \in \text{Irr}^{\text{auto}}(\text{GL}(n)/F)$ ,  $\text{BC}_F^L(\pi)$  exists. By iteration, we see that in fact base change lifts exist for any solvable extension.
- For  $\pi, \pi' \in \text{Irr}^{\text{auto}}(\text{GL}(n)/F)$ ,  $\text{BC}_F^L(\pi) \cong \text{BC}_F^L(\pi')$  iff there exists a character  $\psi$  of  $\mathbf{I}_F/F^\times \text{Nm}_{L/F}(\mathbf{I}_L)$  s.t.  $\pi = \pi' \otimes \psi$ .
- For  $\Pi \in \text{Irr}^{\text{auto}}(\text{GL}(n)/L)$ , there exists  $\pi \in \text{Irr}^{\text{auto}}(\text{GL}(n)/F)$  s.t.  $\Pi = \text{BC}_F^L(\pi)$  iff  $\sigma(\Pi) \cong \Pi$  for any  $\Pi \in \text{Gal}(E/F)$ .

□

*Proof:* ?

□

**Thm& Conj.Cor. (29.3.5.19) [Cubic Base Change Lifting, Jacquet-Piatetski-Shapiro-Shalika].** For any cubic extension  $L/F$  and  $\pi \in \text{Irr}^{\text{cusp}}(\text{GL}(2)/F)$ , the base change lifting  $\text{BC}_F^L(\pi) \in \text{Irr}^{\text{cusp}}(\text{GL}(2)/L)$  exists.  $\lrcorner$

*Proof:* Cf.[Relevement cubique non normal].

□

**Example (29.3.5.20).** Suppose  $L/F \in \text{GField}$  and  $\chi$  is a Hecke character of  $F$ , then  $\text{BC}_F^L(\chi) = \pi \circ \text{Nm}_{E/F}$ .

And for  $\pi \in \text{Irr}^{\text{auto}}(\text{GL}(n; F))$ , we have  $\text{BC}_F^L(\pi \otimes \chi) = \text{BC}_F^L(\pi) \otimes (\chi \circ N_{L/F})$ .  $\lrcorner$

**Remark (29.3.5.21).** For a general group  $G$ , there are no local-global compatibility between automorphic base change representations, unless for tempered representations. ?  $\lrcorner$

### Examples

**Thm. (29.3.5.22) [Lafforgue].** Lafforgue proved a form of global correspondence as in (29.3.7.2) for  $\mathrm{GL}(n)$  over a function field, but with the Langlands group and motivic Galois group replaced by  $\mathrm{Gal}_F$ , and with complex representations replaced by  $\ell$ -adic representations.  $\lrcorner$

*Proof:* Cf. [Lafforgue, Chtoucas de Drinfeld et correspondance de Langlands].  $\square$

**Thm. (29.3.5.23) [Classical Groups].** Let  $F \in \mathbf{NField}$ ,  $G = \mathrm{GL}(n)$ , and  $G'$  a split form of  $\mathrm{SO}(2n+1)$ ,  $\mathrm{SO}(2n)$  or  $\mathrm{Sp}(2n)$ , then  $\widehat{G}' = \mathrm{Sp}(2n; \mathbb{C})$ ,  $\mathrm{SO}(2n+1; \mathbb{C})$  or  $\mathrm{SO}(2n; \mathbb{C})$ , with the standard representation  $\rho_{\mathrm{Std}}$ . Then in this case, [Cogdell-Kim-Shapiro-Shahidi] established the functoriality for generic  $\pi' \in \mathrm{Irr}^{\mathrm{auto}}(G')$ .  $\lrcorner$

*Proof:* Cf. [Functoriality for Classical Groups, Cogdell-Kim-Shapiro-Shahidi]. ?

The proof sketch is as follows: Firstly we have local partial liftings  $\Pi_v$  by LLC for  $\mathrm{GL}(n)$  (29.3.2.17), then we take the tensor product  $\Pi = \otimes_v \Pi_v$  and use Langlands-Shahidi methods to analyze their  $L$ -functions and show that  $L(\Pi \times \pi'; s)$  has nice analytic properties for any  $\pi' \in \mathrm{Irr}^{\mathrm{cusp}}(\mathrm{GL}(m)/F)$ . Then we use Cogdell-Shapiro converse theorem to conclude that  $\Pi$  is an automorphic representation. Finally, [Ginzburg-Rallis-Soudry01] shows that a weak lift is a strong lift.  $\square$

**Thm. (29.3.5.24) [Adjoint Action Lifting of  $\mathrm{GL}(2)$ , Gelbart-Jacquet].** Consider the adjoint representation  $\mathrm{Ad} : \mathrm{GL}(2) \rightarrow \mathrm{GL}(3)$ , then for any  $\pi \in \mathrm{Irr}^{\mathrm{auto}}(\mathrm{GL}(2)/F)$ , there exists  $\mathrm{Ad}(\pi) \in \mathrm{Irr}^{\mathrm{auto}}(\mathrm{GL}(3)/F)$  s.t.  $\mathrm{Ad}(c(\pi)) = c(\mathrm{Ad}(\pi))$ . Moreover,  $\mathrm{Ad}(\pi)$  is cuspidal iff  $\pi$  is not of the form  $AI_F^E(\theta)$  for some quadratic extension  $E/F$  and some Hecke character  $\theta$  of  $E$ .  $\lrcorner$

*Proof:* Cf. [A relation between automorphic representations of  $\mathrm{GL}(2)$  and  $\mathrm{GL}(3)$ , Gelbart-Jacquet]. The last assertion combines ??  $L$ -indistinguishability for  $SL(2)$ .  $\square$

**Thm. (29.3.5.25) [Symmetric Power Lifting, Gelbart-Jacquet [G-J78]/Kim-Shahidi02/Kim03].**

Let  $F \in \mathbf{NField}$ , then

- Kim established automorphy of  $\mathrm{Sym}^k(\pi)$  for  $\pi \in \mathrm{Irr}^{\mathrm{cusp}}(\mathrm{GL}(2)/F)$  and  $k \in [4]_+$ .
- If  $F$  is totally real and  $\pi \in \mathrm{Irr}^{\mathrm{cusp}}(\mathrm{GL}(2)/F)$  s.t.  $\pi_v$  is essentially- $L^2$  for all  $v \in \Sigma_F^\infty$ , then Newton-Thorne established automorphy of  $\mathrm{Sym}^k(\pi)$  for all  $k \in \mathbb{Z}_+$ .

$\lrcorner$

*Proof:* Cf. [Kim. Functoriality for the exterior square of  $\mathrm{GL}(4)$  and the symmetric fourth of  $\mathrm{GL}(2)$ ]. [Newton-Thorne22].  $\square$

**Thm. (29.3.5.26) [Tensor-Product Lifting, Ramakrishnan [Ram00]/Kim-Shahidi02/Kim03].**

Let  $F \in \mathbf{NField}$ , then Kim-Shahidi established functoriality for the following cases:

- $G = \mathrm{GL}(2k)$ ,  $G' = \mathrm{GL}(2) \times \mathrm{GL}(k)$  where  $k \in [3]_+$ , and  $\rho : \widehat{G}' = \mathrm{GL}(2; \mathbb{C}) \times \mathrm{GL}(k; \mathbb{C}) \rightarrow \mathrm{GL}(2k; \mathbb{C}) = \widehat{G}$  is the tensor product representation.
- $G = \mathrm{GL}(4)$ ,  $G' = \mathrm{GL}(2)$ , and  $\rho : \mathrm{GL}(2; \mathbb{C}) \rightarrow \mathrm{GL}(4; \mathbb{C})$  is irreducible.

$\lrcorner$

*Proof:* Cf. [Kim. Functoriality for the exterior square of  $\mathrm{GL}(4)$  and the symmetric fourth of  $\mathrm{GL}(2)$ ].  $\square$

**Thm. (29.3.5.27) [Jacquet-Shalika].** Let  $n \in \mathbb{Z}_+$  and  $\pi, \pi' \in \mathrm{Irr}^{\mathrm{cusp}}(\mathrm{GL}(n))$ . If  $c(\pi_v) \otimes c(\pi_v^\vee) \cong c(\pi'_v) \otimes c(\pi'_v^\vee)$ , then  $\pi \cong \pi'$ .  $\lrcorner$

*Proof:* Cf. [On Euler products and the classification of automorphic representations 1, 2, Jacquet-Shalika].  $\square$

- Let  $K \in \text{LField}$ .
- Let  $D \in \text{Az}_K$ .

┘

**Prop. (29.3.6.3).**  $D^\times/K^\times$  is compact.

┘

*Proof:* Use the description of  $D$  in [\(11.2.3.5\)?](#).

□

**Cor. (29.3.6.4).** Any  $\pi \in \text{Irr}^{\text{adm}}(D^\times)$  is essentially square-integrable [\(24.9.8.10\)](#).

┘

### Local Jacquet-Langlands Correspondence

**Thm. (29.3.6.5)** [Local Jacquet-Langlands Correspondence, Jacquet-Langlands [\[J-L70\]](#)/ Rogawski [\[Rog83\]](#)/Deligne-Kazhdan-Vigneras [\[DKV84\]](#)]. If  $D \in \text{Az}_K$  has index  $\text{ind}_K(D) = n$ , then there is a bijection

$$\text{J-L}_D : \text{Irr}^{\text{adm}}(D^\times) \rightarrow \text{Irr}^{\text{ess}, L^2}(\text{GL}(n; K))$$

s.t.

- $\chi_\rho = (-1)^{n-1} \chi_{\text{J-L}_D(\rho)}$ .
- $\omega_\rho = \omega_{\text{J-L}(\rho)}$ .
- $L(\rho; s) = \pm L(\text{J-L}(\rho); s)$  and  $\epsilon(\pi; s) = \pm \epsilon(\text{J-L}(\rho); s)$ , where the definition is given in [\[G-J72\]?](#)
- For any quasi-character  $\chi$  of  $K^\times$ , we have  $\text{J-L}(\rho(\chi)) = \text{J-L}(\rho)(\chi)$ .
- $\text{J-L}(\rho^\vee) = \text{J-L}(\rho)^\vee$ .

┘

*Proof:*

□

### Global Jacquet-Langlands Correspondence

**Notation (29.3.6.6).**

- Let  $F \in \text{NField}$ .
- Let  $D \in \text{Az}_F$  of dimension  $n^2$ .

┘

**Thm. (29.3.6.7)** [Global Jacquet-Langlands Correspondence, Vigneras].

- For  $\rho \in \text{Irr}^{\text{auto}}(D^\times/F)$ , there exists a unique  $\text{J-L}(\rho) \in \text{Irr}^{\text{disc}}(\text{GL}(n)/F)$  s.t.  $\text{J-L}(\rho)_v \cong \rho_v$  for any  $v \in \text{Unr}_F(D)$ .

- If  $v \in \text{Ram}_F(D)$  and  $\text{J-L}(\rho_v) = \text{St}_{s_v}(\sigma_v)$  for some  $s_v|n$  and  $\sigma_v \in \text{Irr}^{\text{cusp}}(\text{GL}(n/s_v; F_v))$ , then  $\text{J-L}(\rho)_v$  is isomorphic to either  $\text{St}_{s_v}(\sigma_v)$  or  $Q((\sigma_v, s_i))$ .
- The image of J-L is the set of  $\Pi \in \text{Irr}^{\text{disc}}(\text{GL}(n)/F)$  s.t. for any  $v \in \text{Ram}_F(D)$ ,  $\Pi_v$  is isomorphic to  $\text{St}_{s_v}(\sigma_v)$  or  $Q((\sigma_v, s_i))$  for some  $s_i|n$  and  $\sigma_v \in \text{Irr}^{\text{cusp}}(\text{GL}(n/s_v; F_v))$ .
- (Strong Multiplicity One) If  $\rho_1, \rho_2 \in \text{Irr}^{\text{auto}}(D^\times/F)$  s.t.  $\rho_{1x} \cong \rho_{2x}$  for a.e.  $x \in \Sigma_F$ , then  $\rho_1 = \rho_2$ .  $\lrcorner$

*Proof:* Cf. [H-T01]P195.  $\color{red}?$   $\square$

**Cor. (29.3.6.8).** Suppose  $\rho \in \text{Irr}^{\text{auto}}(D^\times/F)$ , the following are equivalent:

- $\text{J-L}(\pi) \in \text{Irr}^{\text{cusp}}(\text{GL}(n)/F)$ .
- $\rho_x$  is generic for some  $x \in \Sigma_F \setminus \text{Ram}_F(D)$ .
- $\rho_x$  is generic for any  $x \in \Sigma_F \setminus \text{Ram}_F(D)$ .  $\lrcorner$

*Proof:* Combine the theorem with the main theorem of [Moeglin-Waldspurger] on residual spectrum of  $\text{GL}(n)$ .  $\color{red}?$   $\square$

**Def. (29.3.6.9) [Adjunct Representations].** If  $F/F_0$  is a CM field with  $\text{Gal}(F/F_0) = \{1, \mathbf{c}\}$ , then for  $\rho \in \text{Irr}^{\text{auto}}(D^\times/F)$ , we can define the **adjunction automorphic representation**  $\rho^* \in \text{Irr}^{\text{auto}}(D^\times/F)$  to be

$$\rho^*(g) = \rho(g^{-*}).$$

Then via the Jacquet-Langlands correspondence,  $\text{J-L}(\Pi^*) \cong \text{J-L}(\rho)^\vee \circ \mathbf{c}$ , by strong multiplicity theorem.  $\lrcorner$

**Thm. (29.3.6.10) [generalized Global Jacquet-Langlands Correspondence for Discrete Series, Badulescu(08)/Badulescu-Renard(10)].** For  $k \in \mathbb{Z}_+$ , there exists an injection

$$\text{J-L}_D : \text{Irr}^{\text{disc}}(\text{GL}(k; D)) \rightarrow \text{Irr}^{\text{disc}}(\text{GL}(kn; F))$$

s.t.  $\text{J-L}_D(\rho)_v = \text{J-L}_{D_v}(\rho_v)$  (29.3.6.5) for any  $v \in \Sigma_F$ .  $\lrcorner$

*Proof:*  $\square$

The case  $n = 1, d = 2$

## 7 Motivic Galois Groups

**Def. (29.3.7.1) [Motivic Galois Groups].** The motivic group  $\mathcal{G}_F$  is a proalgebraic group whose representations parameterizes motives.  $\lrcorner$

**Conj. (29.3.7.2) [Motives and Automorphic Forms, Langlands].** There is a commutative diagram of continuous homomorphisms

$$\begin{array}{ccc} L_F & \xrightarrow{\Phi} & \mathcal{G}_F \\ & \searrow \quad \swarrow & \\ & \text{Gal}_F & \end{array}$$

together with

$$\begin{array}{ccc} L_{F_v} & \xrightarrow{\Phi} & \mathcal{G}_{F_v} \\ & \searrow \quad \swarrow & \\ & \text{Gal}_{F_v} & \end{array} .$$

In particular, for any motive  $m$ , there exists an automorphic representation  $\pi$  of  $\text{GL}(n)$  s.t. the family of conjugacy classes  $c(\pi) = \{c_v(\pi)\}$  in  $\text{GL}(n; \mathbb{C})$  associated to  $\pi$  equals the family of conjugacy classes  $c(m) = \{c_v(m)\}$  in  $\text{GL}(n; \mathbb{C})$  obtained from  $m$  which is the image of Frobenius in the family of  $p$ -adic representations attached to  $m$  (for unramified  $v$ ).  $\lrcorner$

*Proof:*

□

- Use notations defined in [Adelic Automorphic Representations](#).
- Use notations defined in [Archimedean  \$L\$ -Factors](#).
- Fix  $F \in \mathbf{GField}$ .
- Fix an additive character  $0 \neq \psi = \otimes'_{v \in \Sigma_F} \psi_v : F \backslash \mathbf{A}_F \rightarrow \mathbb{C}^\times$ .
- Fix a linear algebraic group  $G \in \mathcal{AlgGrp}/F$  with center  $Z$ , and let  $\mathcal{K} \subset G(\mathbf{A}_F)$  be a hyperspecial compact subgroup (20.5.3.4).
- Fix a central character  $\omega : Z(F) \backslash Z(\mathbf{A}_F) \rightarrow \mathbb{C}^\times$ .
- Let  $\pi \in \mathrm{Irr}^{\mathrm{adm}}(G(\mathbf{A}_F))$ .

⌋

### 1 Analytic $L$ -Functions

**Def. (29.5.1.1)** [Analytic  $L$ -Functions, Iwaniec-Kowalski [I-K04]]. An **analytic  $L$ -function** of degree  $d \in \mathbb{Z}_+$  is a collection of a tuple

$$(L(f; s), L_\infty(f; s), N(f), \epsilon(f))$$

- $L(f; s)$  is a Dirichlet series

$$L(f; s) = \sum_{n \in \mathbb{Z}_+} a_n(f) n^{-s} = \prod_{p \in \mathbf{Prime}} L_p(f; s) = \prod_{p \in \mathbf{Prime}} (1 - \alpha_1(p) p^{-s})^{-1} \dots (1 - \alpha_d(p) p^{-s})^{-1}$$

which converges absolutely for  $\mathrm{Re}(s) > 1$ , where  $\lambda_f(n) \in \mathbb{C}$ ,  $\lambda_f(1) = 1$ ,  $\alpha_i(p) \in \mathbb{C}$  s.t.  $|\alpha_i(p)| < p$ . These  $\alpha_i(p)$  are called the **local parameters at  $p$**  of  $L(f; s)$ .

- $L_\infty(f; s)$  is a **gamma-factor** s.t.

$$L_\infty(f; s) = \pi^{-\frac{ds}{2}} \prod_{i=1}^d \Gamma\left(\frac{s + \kappa_i}{2}\right),$$

where  $\kappa_i \in \mathbb{C}$  s.t.  $\mathrm{Re}(\kappa_i) \geq -1$  and  $\overline{\{\kappa_i\}_i} = \{\kappa_i\}_i$ , called the **local parameters at  $\infty$**  of  $L(f; s)$ .

- $N(f) \in \mathbb{Z}_+$  is a **conductor (of  $L$ -function)** of  $L(f; s)$  s.t.  $\alpha_i(p) \neq 0$  for  $p \nmid N(f)$  and any  $i \in [d]_+$ . Any  $p \in \mathbf{Prime} \setminus S(N(f))$  is said to be **unramified for the  $L(f; s)$** .
- A **root number**  $w(f) \in \mathbb{C}^\times$ , s.t.  $|w(f)| = 1$ .

s.t. the **completed  $L$ -function**

$$\Lambda(f; s) = N(f)^{\frac{s}{2}} L_\infty(f; s) L(f; s)$$

extends to a meromorphic function of order  $\leq 1$  (12.4.3.18) for  $s \in \mathbb{C}$ , with at most poles at  $s = 0$  and  $s = 1$ , and satisfies a functional equation

$$\Lambda(f; s) = w(f) \Lambda(\bar{f}; 1 - s),$$

where

$$L(\bar{f}; s) = \sum_{n \in \mathbb{Z}_+} \bar{\lambda}_f(n) n^{-s} \prod_{p \in \text{Prime}} (1 - \bar{\alpha}_1(p) p^{-s})^{-1} \dots (1 - \bar{\alpha}_d(p) p^{-s})^{-1}, \quad \Lambda(\bar{f}; s) = L_\infty(f; s) L(\bar{f}; s)$$

$L(f; s)$  is said to be an **entire analytic  $L$ -function** if  $\Lambda(f; s)$  is entire.

More generally, for  $a \in \mathbb{R}$ ,  $(L(f; s), L_\infty(f; s), N(f), \epsilon(f))$  is called an  **$a$ -shifted analytic  $L$ -function** if

$$(L(f; s + a), L_\infty(f; s + a), N(f), \epsilon(f))$$

is an analytic  $L$ -function.  $\lrcorner$

**Def. (29.5.1.2) [Self-Dual Analytic  $L$ -functions].** For an analytic  $L$ -function  $L(f; s)$ , if  $L(\bar{f}; s) = L(f; s)$ , then  $L(f; s)$  is said to be a **self-dual analytic  $L$ -function**. For a self-dual analytic  $L$ -function, we have  $w(f) \in \{\pm 1\}$ , called the **sign of functional equation**.  $\lrcorner$

**Prop. (29.5.1.3) [Constructing New Analytic  $L$ -Functions].** If

$$(L(f; s), L_\infty(f; s), N(f), w(f)), \quad (L(g; s), L_\infty(g; s), N(g), w(g))$$

are two analytic  $L$ -functions of degree  $n, m$  resp., then

- $(L(\bar{f}; s), L_\infty(f; s), N(f), \bar{w}(f))$  is another analytic  $L$ -function of degree  $n$ , called the **conjugate analytic  $L$ -function**.
- $(L(f; s)L(g; s), L_\infty(f; s)L_\infty(g; s), N(f)N(g), w(f)w(g))$  is another analytic  $L$ -function of degree  $n + m$ .
- If  $L(f; s)$  is entire, then for any  $t \in \mathbb{R}$ ,  $(L(f; s + it)L(\bar{f}; s - it), L_\infty(f; s + it)L_\infty(f; s - it), N(f)^2, 1)$  is another analytic  $L$ -function of degree  $2n$ .  $\lrcorner$

**Def. (29.5.1.4) [Trivial Zeros].** For an analytic  $L$ -function  $L(f; s)$ , because  $\Lambda(f; s)$  is holomorphic away from  $\{0, 1\}$ , the poles of  $L_\infty(f; s)$  are zeros of  $L(f; s)$ , except for  $s = 0$ . These are exactly the points

$$\{\{\kappa_i\} - 2\mathbb{N}\} \setminus \{0\},$$

called the set of **trivial zeros**. The other points are called **non-trivial zeros** of  $L(f; s)$ , which must lie in the critical strip  $0 \leq \text{Re}(s) \leq 1$ .  $\lrcorner$

**Def. (29.5.1.5) [Rankin-Selberg Convolutions].** If  $f, g$  are two analytic  $L$ -functions of degree  $n, m$  resp. with local parameters  $\{\kappa_i\}, \{\nu_j\}$  at  $\infty$  resp. and local parameters  $\{\alpha_i(p)\}, \{\beta_j(p)\}$  at  $p \in \text{Prime}$  resp., then  $f, g$  are said to have **Rankin-Selberg convolution** if there exists some analytic  $L$ -function  $(L(f \otimes g; s), L_\infty(f \otimes g; s), N(f \otimes g), w(f \otimes g))$  of degree  $de$  s.t.

- For any  $p \in \text{Prime} \setminus S(N(f)N(g))$ ,

$$L_p(f \otimes g; s) = \prod_{i=1}^d \prod_{j=1}^e (1 - \alpha_i(p)\beta_j(p)p^{-s})^{-1}.$$

- $L_\infty(f \otimes g; s) = \pi^{-\frac{des}{2}} \prod_{i=1}^d \prod_{j=1}^e \Gamma\left(\frac{s + \mu_{ij}}{2}\right)$ , s.t.

$$\text{Re}(\mu_{ij}) \leq \text{Re}(\kappa_i) + \text{Re}(\nu_j), \quad |\mu_{ij}| \leq |\kappa_i| + |\nu_j|.$$

- $N(f \otimes g) | N(f)^e N(g)^d$ .
- $L(f \otimes g; s)$  has a pole at  $s = 1$  if  $g = \bar{f}$ .

Similarly, we can define tensor product of  $n$  analytic  $L$ -functions.  $\lrcorner$

**Prop. (29.5.1.6).** Situation as in (29.5.1.5), if  $L(f \otimes \bar{f}; s)$  or  $L(f \otimes f; s)$  exist, then for any  $i \in [d]_+$ , we have

$$|\alpha_i(p)| < \sqrt{p}, \quad \forall p \in \mathbf{Prime}, \text{ and } \operatorname{Re}(\kappa_i) > -\frac{1}{2}.$$

$\lrcorner$

**Def. (29.5.1.7) [Symmetric Power  $L$ -Functions].** For an analytic  $L$ -functions  $f$  of degree  $n$  with local parameters  $\{\kappa_i\}$  at  $\infty$  and local parameters  $\{\alpha_i(p)\}$  at  $p \in \mathbf{Prime}$ , then  $f$  are said to have  $n$ -th **symmetric power  $L$ -function** if there exists some analytic  $L$ -function

$$(L(\operatorname{Sym}^n f; s), L_\infty(\operatorname{Sym}^n f; s), N(\operatorname{Sym}^n f), w(\operatorname{Sym}^n f))$$

of degree  $\binom{d+n-1}{n}$  s.t.

- For any  $p \in \mathbf{Prime} \setminus S(N(f))$ ,

$$L_p(f \otimes g; s) = \prod_{a_i \in \mathbb{N}, a_1 + \dots + a_d = n} (1 - \alpha_1(p)^{a_1} \dots \alpha_d(p)^{a_d} p^{-s})^{-1}.$$

- $L_\infty(f \otimes g; s)$ . ?
- $N(f \otimes g)$ . ?

Similarly we can define **exterior power  $L$ -functions**.  $\lrcorner$

### Automorphic $L$ -Functions

**Def. (29.5.1.8) [Automorphic  $L$ -Functions].** Assuming the local Langlands conjecture (29.3.2.2), for  $\rho \in \operatorname{Rep}^{\text{fd}}({}^L G)$ , we can formally define

$$L(\pi, \rho; s) = \prod_{v \in \Sigma_F^{\text{fin}}} L_v(\pi_v, \rho_v; s), \quad \Lambda(\pi, \rho; s) = \prod_{v \in \Sigma_F} L_v(\pi_v, \rho_v; s), \quad \epsilon(\pi, \rho; s) = \prod_{v \in \Sigma_F^{\text{fin}}} \epsilon(\pi_v, \rho_v, \psi_v; s) \quad (29.3.1.36),$$

called the **Langlands  $L$ -functions** and the  **$\epsilon$ -factors(global)** attached to  $\pi$  and  $\rho$ .

The product for  $\epsilon(\pi, \rho; s)$  is a finite product and it is non-vanishing, because  $\epsilon(\pi_v, \rho_v, \psi_v; s) = 1$  if  $\mathfrak{c}(\psi_v) = \mathcal{O}_{F_v}$  and  $\pi_v$  is unramified. Notice  $\epsilon(\pi, \rho; s)$  doesn't depends on  $\psi$ .  $\lrcorner$

**Prop. (29.5.1.9) [Convergence for  $L$ -Functions].** Situation as in (29.5.1.8), if  $\pi$  is unitarizable, then  $L(\pi, \rho; s)$  is absolutely convergent to an analytic function for  $\operatorname{Re}(s)$  sufficiently large.

More generally, if  $P = LM \leq G$  is a parabolic subgroup,  $\sigma \in \operatorname{Irr}^{\text{adm}}(M(\mathbf{A}_F))$  and  $\pi$  is a constituent of  $I_{P(\mathbf{A}_F)}^G(\sigma)$ , then  $L(\pi, \rho; s)$  is absolutely convergent to an analytic function for  $\operatorname{Re}(s)$  sufficiently large.  $\lrcorner$

*Proof:* Cf. [Bor79]P50, 52. or [Euler Products, 1971] or [Shahidi, Eisenstein series and automorphic  $L$ -functions]Section2.5.. Prove first for unitarizable representations and then use parabolic induction.  $\square$

**Conj. (29.5.1.10)** [Meromorphic Continuations, Langlands[Lan70]]. Situation as in (29.5.1.8), if  $\pi \in \text{Irr}^{\text{auto}}(G/F)$ , then  $L(\pi, \rho; s)$  is absolutely convergent to an analytic function for  $\text{Re}(s)$  sufficiently large by (29.5.1.9) and (26.6.1.27).

Then it is conjectured to extend to a meromorphic function for all  $s \in \mathbb{C}$  with only a finite number of poles and bounded on vertical strips, and satisfies the functional equation

$$\Lambda(\pi, \rho; s) = \epsilon(\pi, \rho; s) \Lambda(\pi^\vee, \rho^\vee; 1 - s).$$

Such a meromorphic function  $L(\pi, \rho; s)$  is called an **automorphic  $L$ -function**. ┘

*Proof:* □

**Remark (29.5.1.11).** For some cases of this conjectures, Cf. [Bor79]P53. ┘

**Remark (29.5.1.12).** This meromorphic continuation conjecture is in fact related to global Langlands conjecture, Cf. [Cogdell-Kim-Murty, Lectures on automorphic L-functions], [Functoriality for the classical groups], [Kaletha. Genericity and contragredience in the local Langlands correspondence], [Adams-Vogan. Contragredient representations and characterizing the local Langlands correspondence], [Cai-Freidberg-Ginzburg-Kaplan, Doubling constructions and tensor product L-functions: the linear case].? ┘

### Global Zeta Functions

**Lemma (29.5.2.1)** [Dedekind Zeta Function, Dedekind[Ded64]]. The **Dedekind zeta function** for  $F$  is defined by

$$\zeta(F; s) = \prod_{\mathfrak{p} \in \Sigma_F^{\text{fin}}} \frac{1}{1 - \|\mathfrak{p}\|^{-s}}.$$

It converges absolutely for  $\text{Re}(s) > 1$ . Notice if  $F \in \mathbf{FField}$ , then

$$\zeta(F; s) = \sum_{\mathfrak{a} \in \text{Ideal}(\mathcal{O}_F)} \frac{1}{\|\mathfrak{a}\|^s}$$
┘

*Proof:* It suffices to show  $\prod_{\mathfrak{p} \in \Sigma_F^{\text{fin}}} \frac{1}{1 - \|\mathfrak{p}\|^{-\sigma}} < +\infty$  for  $\sigma > 1$ .

If  $F \in \mathbf{NField}$ , let  $d = [F : \mathbb{Q}]$ , this is bounded by

$$\prod_p (1 - p^{-\sigma})^{-d} = \left( \sum_{n \geq 1} n^{-\sigma} \right)^d < \infty.$$

If  $F \in \mathbf{FField}$ , let the number of irreducible polynomial modulo  $p$  be  $N_n$ , then by the same argument, it suffices to prove the convergence of

$$\prod_{v \in \Sigma_F^{\text{fin}}} \frac{1}{1 - \frac{1}{\|v\|^\sigma}} = \prod_{n \geq 1} \left( \frac{1}{1 - q^{-n\sigma}} \right)^{N_n}.$$

This is convergent iff  $\sum_{n \geq 1} N_n q^{-n\sigma}$  is convergent (12.4.3.8), but the latter is bounded by

$$\sum_{n \geq 1} q^n q^{-n\sigma} = \sum_{n \geq 1} q^{-n(\sigma-1)} < \infty.$$

□

**Def. (29.5.2.2) [Zeta Functions].** If  $\Phi \in \mathcal{S}(F)$  and  $\chi$  is a Hecke character of  $F$ ,  $s \in \mathbb{C}$ , the **global zeta function** is defined to be

$$\zeta(\chi, \Phi; s) = \int_{\mathbf{I}_F} \Phi(\mathbf{a}) \chi(\mathbf{a}) \|\mathbf{a}\|^s d^\times \mathbf{a}.$$

When  $\Phi = \otimes_v \Phi_v$  is a pure tensor,

$$\zeta(\chi, \Phi; s) = \prod_{v \in \Sigma_F} \zeta_v(s, \chi_v, \Phi_v) = \prod_{v \in \Sigma_F} \int_{F_v^\times} \Phi_v(x) \chi_v(x) |x|_v^s d^\times x,$$

where the **local zeta functions**  $\zeta_v(\chi_v, \Phi_v; s)$  converge to a holomorphic function for  $\operatorname{Re}(s) > 0$  and the integral is absolutely convergent for  $\operatorname{Re}(s) > 1$ . ┘

*Proof:* For the local zeta function:  $\Phi_v$  is rapidly decreasing, thus it suffices to integrate the part where  $|x|_v < 1$ . Then  $\Phi_v$  is bounded on this compact region, thus it suffices to evaluate  $\int_{|x|_v \leq 1} |x|_v^s d^\times x < \infty$  for  $\operatorname{Re}(s) > 0$ , which can be done case by case.

To show the global integral converges, notice the local integrals is the same as the local  $L$ -factors for a.e.  $v \in \Sigma_F$  by (29.5.2.3), so we can use Fubini and notice that  $\prod_v L(\chi_v; s)$  converges by comparison with the Dedekind zeta function (29.5.2.1). □

**Lemma (29.5.2.3) [Unramified Factors].** For any place  $v$  that unramified in the sense of (19.4.2.19) and  $\Phi_v = \mathbf{1}_{\mathcal{O}_v}$ ,

$$\zeta_v(\chi_v, \Phi_v; s) = L(\chi_v; s) = (1 - \chi_v(\varpi) \|\mathfrak{p}\|^{-s})^{-1} \quad (31.1.1.1).$$

┘

*Proof:* Notice the a.e.  $v \in \Sigma_F$  satisfies  $v$  that unramified in the sense of (19.4.2.19) and  $\Phi_v = \mathbf{1}_{\mathcal{O}_v}$ , and for such a  $v$ ,

$$\zeta_v(\chi_v, \Phi_v; s) = \sum_{k \in \mathbb{N}} \int_{v(x)=k} \chi_v(x) |x|_v^s d^\times x = \sum_{k \in \mathbb{N}} (\chi_v(\varpi_v) \|v\|^{-s})^k = (1 - \chi_v(\varpi) \|v\|^{-s})^{-1}.$$

□

**Thm. (29.5.2.4) [Global Functional Equation].** The global zeta function (29.5.2.2) can be extended to a meromorphic function for all  $s$ , and it has poles iff  $\chi(x) = |x|^\lambda$  for some  $\lambda \in i\mathbb{R}$ . In which case, it only has poles at

$$s = \begin{cases} -\lambda, 1 - \lambda & , F \in \mathbf{NField} \\ -\lambda + \frac{2\pi ni}{\log(\#F_0)}, 1 - \lambda + \frac{2\pi ni}{\log(\#F_0)} & , F \in \mathbf{FField} \end{cases}$$

with residue  $-k\Phi(0)$  and  $k\Phi^\vee(0)$  resp., where  $k = \operatorname{Vol}(\mathbf{I}_F^1/F^\times)$  (19.4.2.20), and essentially bounded on the vertical strips away from the poles. And we have functional equations

$$\zeta(\chi, \Phi; s) = \zeta(\chi^{-1}, \Phi^\vee; 1 - s).$$

┘

*Proof:* Consider the exact sequence

$$1 \rightarrow \mathbf{I}_F^1 \rightarrow \mathbf{I}_F \rightarrow |\mathbf{I}_F| \rightarrow 1.$$

Let  $\mathbf{I}_F^t$  be the inverse image of  $t \in |\mathbf{I}_F|$ , where  $|\mathbf{I}_F| = \mathbb{R}_+$  or  $q^{\mathbb{Z}}$ , with Haar measure  $dt/t$  or  $\log q$  times the counting measure (also denoted  $dt/t$ ), and choose Haar measure  $d^\times x$  on each  $\mathbf{I}_F^t$  compatible with  $d^\times \mathfrak{a}$  and  $dt/t$ . In particular, if  $|a_t| = t$ ,

$$\int_{|\mathbf{I}_F|} \int_{\mathbf{I}_F^1} \Phi(a_t x) \chi(a_t x) t^s d^\times x \frac{dt}{t} = \int_{\mathbf{I}_F} \Phi(\mathfrak{a}) \chi(\mathfrak{a}) |\mathfrak{a}|^s d^\times \mathfrak{a}.$$

Then the measure  $d^\times x$  and the counting measure on  $F^\times$  induces a measure  $d^\times x$  on  $F^\times \backslash \mathbf{I}_F^1$ , in particular, for any  $f \in C(\mathbf{C}_F)$ , we have

$$\int_{\mathbf{I}_F^t / F^\times} f(x) d^\times x = \int_{\mathbf{I}_F^1 / F^\times} f(a_t x) d^\times x = \int_{\mathbf{I}_F^1 / F^\times} f\left(\frac{a_t}{x}\right) d^\times x = \int_{\mathbf{I}_F^{1/t} / F^\times} f\left(\frac{1}{x}\right) d^\times x. \quad (\star)$$

Denote  $\zeta_t(\chi, \Phi; s) = \int_{\mathbf{I}_F^t} \Phi(x) \chi(x) |x|^s d^\times x$ , then

$$\zeta(\chi, \Phi; s) = \int_0^1 \zeta_t(\chi, \Phi; s) \frac{dt}{t} + \int_1^\infty \zeta_t(\chi, \Phi; s) \frac{dt}{t} = J + I$$

where if  $|\mathbf{I}_F| = q^{\mathbb{Z}}$  the value at 1 is counted half-half at this two part. Now for the  $I$ -part, if  $\operatorname{Re}(s)$  is smaller, it is smaller, thus  $I$  extends to a holomorphic function to all  $s \in \mathbb{C}$ . For the  $J$ -part, by lemmas (29.5.2.6) (29.5.2.5),

$$\begin{aligned} J &= \int_0^1 \zeta_{1/t}(\widehat{\Phi}, \chi^{-1}; 1-s) \frac{dt}{t} + \left[ \int_0^1 (k\widehat{\Phi}(0) \left(\frac{1}{t}\right)^{1-s} - k\Phi(0)t^s) \frac{dt}{t} \right] \delta_{c, |\cdot|} \\ &= \int_1^\infty \zeta_t(\widehat{\Phi}, \chi^{-1}; 1-s) \frac{dt}{t} + \left[ \int_0^1 (k\widehat{\Phi}(0)t^{s-1} - k\Phi(0)t^s) \frac{dt}{t} \right] \delta_{c, |\cdot|} \\ &= I(\chi, \Phi; s) + I(\chi^{-1}, \widehat{\Phi}; 1-s) + k\delta_{c, |\cdot|} \left[ \int_0^1 (\widehat{\Phi}(0)t^{s-1} - \Phi(0)t^s) \frac{dt}{t} \right] \end{aligned}$$

So it can be extended, and the final part is

$$\frac{k\widehat{\Phi}(0)}{s-1} - \frac{k\Phi(0)}{s}$$

when  $F \in \mathbf{NField}$ . And when  $F \in \mathbf{FField}$ , it equals

$$k \log q \left[ \widehat{\Phi}(0) \left( -\frac{1}{2} + \sum_{n=0}^\infty (q^{-n})^{s-1} \right) - \Phi(0) \left( -\frac{1}{2} + \sum_{n=0}^\infty (q^{-n})^s \right) \right] = \frac{k \log q}{2} \left( \widehat{\Phi}(0) \frac{1+q^{1-s}}{1-q^{1-s}} + \Phi(0) \frac{1+q^s}{1-q^s} \right).$$

Now clearly  $\zeta(\chi, \Phi; s) = \zeta(\chi^{-1}, \Phi^\vee; 1-s)$ , and it has the desired residues at 1 and  $|\cdot|$ . □

**Lemma (29.5.2.5).**  $\int_{\mathbf{I}_F^t / F^\times} \chi(x) |x|^s d^\times x = kt^s$  if  $\chi = \mathbf{1}$  and 0 otherwise. ┘

*Proof:*  $\int_{\mathbf{I}_F^t / F^\times} \chi(x) |x|^s d^\times x = \chi(a_t) t^s \int_{\mathbf{I}_F^1 / F^\times} \chi(x) d^\times x$ ,  $\mathbf{I}_F^t / F^\times$  is compact (19.4.1.10) and  $\chi$  is trivial on  $\mathbf{I}_F^1 / F^\times$  iff  $\chi = \mathbf{1}$ , thus we can use (12.10.1.14). □

**Lemma (29.5.2.6).**  $\zeta_t(\chi, \Phi; s) + \Phi(0) \int_{\mathbf{I}_F^t/F^\times} \chi(x)|x|^s d^\times x = \zeta_{1/t}(\widehat{\Phi}, \chi^{-1}; 1-s) + \widehat{\Phi}(0) \int_{\mathbf{I}_F^{1/t}/F^\times} \chi(x)|x|^s d^\times x.$   $\lrcorner$

*Proof:*

$$\begin{aligned}
 \zeta_t(\chi, \Phi; s) + \Phi(0) \int_{\mathbf{I}_F^t/F^\times} \chi(x)|x|^s d^\times x &= \int_{\mathbf{I}_F^t/F^\times} \left( \sum_{a \in F^\times} \Phi(ax) \right) \chi(ax) |ax|^s d^\times x + \int_{\mathbf{I}_F^t/F^\times} \Phi(0) \chi(x) |x|^s d^\times x \\
 &= \int_{\mathbf{I}_F^t/F^\times} \left( \sum_{a \in F} \Phi(ax) \right) \chi(x) |x|^s d^\times x \\
 (19.4.2.22) \quad &= \int_{\mathbf{I}_F^t/F^\times} \frac{1}{|x|} \left( \sum_{a \in K} \widehat{\Phi}(a/x) \right) \chi(x) |x|^s d^\times x \\
 &\stackrel{(\star)}{=} \int_{\mathbf{I}_F^{1/t}/F^\times} \left( \sum_{a \in F} \widehat{\Phi}(ay) \right) |y| \chi^{-1}(y) |y|^{-s} d^\times y \\
 &= \zeta_{1/t}(\widehat{\Phi}, \chi^{-1}; 1-s) + \widehat{f}(0) \int_{\mathbf{I}_F^{1/t}/F^\times} \chi(x) |x|^s d^\times x
 \end{aligned}$$

$\square$

### Local Functional Equations

**Lemma (29.5.2.7).** For any  $\Phi_v, \Psi_v \in \mathcal{S}(F_v)$ ,  $\chi_v \in (F_v^\times)^\vee$ ,  $s \in \mathbb{C}$ ,

$$\frac{\zeta_v(\chi_v, \Phi_v; s)}{\zeta_v(\chi_v^{-1}, \widehat{\Phi}_v; 1-s)} = \frac{\zeta_v(\chi_v, \Psi_v; s)}{\zeta_v(\chi_v^{-1}, \widehat{\Psi}_v; 1-s)}.$$

$\lrcorner$

*Proof:* ?

$$\begin{aligned}
 \zeta(f, c) \zeta(\widehat{g}, \bar{c}) &= \int_{K^\times} f(\alpha) c(\alpha) \left( \int_{K^\times} \widehat{g}(\beta) c^{-1}(\beta) |\beta| d\beta \right) d\alpha \\
 &= \int \int f(\alpha) \widehat{g}(\beta) c(\alpha \beta^{-1}) |\beta| d\alpha d\beta \\
 (Fubini) \quad &= \int \int f(\alpha) \widehat{g}(\alpha \beta) c(\beta^{-1}) |\alpha \beta| d\alpha d\beta \\
 &= \int \left( \int f(\alpha) \widehat{g}(\alpha \beta) |\alpha| d\alpha \right) |\beta| c(\beta^{-1}) d\beta
 \end{aligned}$$

And notice

$$\int_{K^\times} f(\alpha) \widehat{g}(\alpha \beta) |\alpha| d\alpha = C \cdot \int_{K^+ \setminus \{0\}} f(\xi) \widehat{g}(\xi \beta) d\xi = C \cdot \int_{K^+} \int_{K^+} f(\xi) g(\eta) e^{-2\pi i \Lambda(\xi \beta \eta)} d\eta d\xi,$$

which is clearly symmetric in  $f$  and  $g$ . So the conclusion follows.  $\square$

**Thm. (29.5.2.8) [Local Functional Equations].** For any  $\Phi_v \in \mathcal{S}(F_v)$ ,  $\chi_v \in (F_v^\times)^\vee$ , the local zeta function  $\zeta_v(\chi_v, \Phi_v; s)$  (29.5.2.2) can be extended to a meromorphic function to all  $s \in \mathbb{C}$  that is analytic for  $\operatorname{Re}(s) > 0$ , and there is a function  $\gamma_v(\chi_v, \psi_v; s)$ , meromorphic for  $s$  and independent of  $f$ , such that

$$\zeta_v(\chi_v^{-1}, \widehat{\Phi}_v; 1-s) = \gamma_v(\chi_v, \psi_v; s) \zeta_v(\chi_v, \Phi_v; s).$$

$\lrcorner$

*Proof:* By (29.5.2.2), both  $\zeta_v(\chi_v^{-1}, \widehat{\Phi}_v; 1-s)$  and  $\zeta_v(\chi_v, \Phi_v; s)$  are holomorphic in  $0 < \operatorname{Re}(s) < 1$ , so we define  $\gamma(\chi_v, \psi_v; s)$  in this region, and try to extend it. Now (29.5.2.7) shows this is invariant of  $\Phi_v$ , so we can take any  $\Phi_v$  we want. Notice if  $\Phi_v = 0$  on a nbhd of 0, then  $\zeta_v(\chi, \Phi_v; s)$  is entire. Then because Fourier transform preserves  $\mathcal{S}(F_v)$  (19.4.2.11), we can take  $\Phi_v$  to be 0 around 0 or  $\widehat{\Phi}_v$  to be 0 around 0, then  $\gamma_v(\chi_v, \psi_v; s)$  is analytic on both  $\operatorname{Re}(s) > 0$  and  $\operatorname{Re}(s) < 1$ .  $\square$

**Prop. (29.5.2.9).** Let  $v \in \Sigma_F^{\text{fin}}$  and  $\operatorname{Re}(s) < 1$ , then for  $N \in \mathbb{Z}_+$  sufficiently large,

$$\gamma_v(s, \chi_v, \psi_v) = \int_{\mathfrak{p}^{-N}} |x|^{-s} \chi_v^{-1}(x) \psi_v(x) dx.$$

┘

*Proof:* In (29.5.2.8), take  $\Phi_v = \mathbf{1}_{1+\mathfrak{p}^N}$ , then  $\widehat{\Phi}_v = \mathbf{1}_{\mathfrak{p}^{-N}} \cdot \psi_v$ .  $\square$

**Prop. (29.5.2.10).**

- $\gamma(1-s, \chi^{-1}, \psi) = \chi(-1)/\gamma(s, \chi, \psi)$ .
- $\rho(\bar{c}) = c(-1)\overline{\rho(c)}$

┘

*Proof:* 1:

$$\zeta(f, c) = \rho(c)\zeta(\widehat{f}, \widehat{c}) = \rho(c)\rho(\widehat{c})\zeta(\widehat{\widehat{f}}, c) = \rho(c)\rho(\widehat{c})c(-1)\zeta(f, c)$$

2:

$$\zeta(f, c) = \rho(c)\zeta(\widehat{f}, \widehat{c}), \quad \overline{\zeta(f, c)} = \zeta(\bar{f}, \bar{c}) = \rho(\bar{c})\zeta(\widehat{\bar{f}}, \widehat{\bar{c}})$$

And

$$\widehat{\bar{f}}(\xi) = \int \bar{f}(\eta) e^{-2\pi i \Lambda(\xi \eta)} d\eta = \overline{\int f(\eta) e^{2\pi i \Lambda(\xi \eta)} d\eta} = \widehat{f}(-\xi)$$

so

$$\rho(\bar{c})\zeta(\widehat{\bar{f}}, \widehat{\bar{c}}) = \rho(\bar{c})c(-1)\zeta(\widehat{\bar{f}}, \widehat{\bar{c}}) = \rho(\bar{c})c(-1)\overline{\zeta(\widehat{f}, \widehat{c})}$$

Thus  $\rho(\bar{c}) = c(-1)\overline{\rho(c)}$ .  $\square$

**Cor. (29.5.2.11).** Because when  $\sigma(c) = \frac{1}{2}$ ,  $\widehat{c} = \bar{c}??$ , we have  $|\rho(c)| = 1$  in this case.  $\square$

### 3 Hecke $L$ -Functions(GL(1) Case)

#### Local Factors

**Prop. (29.5.3.1) [Local  $L$ -Factors are Common Divisors].** Situation as in (29.5.2.8),  $\frac{\zeta_v(\chi_v, \Phi_v; s)}{L(\chi_v; s)}$  is entire for any  $\Phi_v \in \mathcal{S}(F_v)$ , and if  $v \in \Sigma_F^{\text{fin}}$ , it is a rational function of  $\|v\|^{-s}$ .

Moreover, if  $\psi$  is the standard additive character and we take

$$\Phi_v(x) = \begin{cases} \mathbf{1}_{\mathfrak{c}(\psi_v)\mathfrak{c}(\chi_v)^{-1}} \cdot \psi_v(x) & , v \in \Sigma_F^{\text{fin}} \\ x^\epsilon e^{-\pi x^2} & , v \in \Sigma_F^{\mathbb{R}}, \chi_v(x) = |x|^\nu \operatorname{sgn}(x)^\epsilon, \nu \in i\mathbb{R}, \epsilon \in \{0, 1\} \\ \pi^{-1} \bar{x}^k e^{-2\pi |x|_v} & , v \in \Sigma_F^{\mathbb{C}}, \chi_v(x) = |x|^\nu e^{ik \arg(x)}, \nu \in i\mathbb{R}, k \in \mathbb{N} \\ \pi^{-1} x^{-k} e^{-2\pi |x|_v} & , v \in \Sigma_F^{\mathbb{C}}, \chi_v(x) = |x|^\nu e^{ik \arg(x)}, \nu \in i\mathbb{R}, k \in \mathbb{Z}_-, \end{cases}$$

then

$$\frac{\zeta_v(\chi_v, \Phi_v; s)}{L(\chi_v; s)} \stackrel{(31.1.1.1)}{=} \begin{cases} \|\mathfrak{d}_v\|^{s-1/2} & , v \in \Sigma_F^{\text{fin}}, \chi_v \text{ unramified} \\ \|\mathfrak{d}_v\|^s \|\mathfrak{c}(\chi_v)\|^s g(\chi, \psi_{\pi^{c(\psi_v)-c(\chi_v)}}) & , v \in \Sigma_F^{\text{fin}}, \chi_v \text{ ramified} \\ 1 & , v \in \Sigma_F^\infty \end{cases} \in \mathbb{C}^\times.$$

In particular, they can all be non-zero constants.  $\lrcorner$

*Proof:* For  $v \in \Sigma_F^{\text{fin}}$ ,

$$\zeta_v(\chi_v, \Phi_v; s) = \sum_{k \in \mathbb{Z}} \|v\|^{ks} \int_{v(x)=-k} \Phi_v(x) \chi_v(x) d^\times x.$$

As  $\Phi_v \in C_c^\infty(F_v)$ , the summand is 0 for  $k$  large. And for  $k$  small,  $\Phi_v(x)$  is constant. If  $\chi_v$  is ramified, then these terms are 0, thus it is a polynomial in  $\ll v \gg^{-s}$ , and for  $\chi_v$  unramified, these terms are a geometric series, which is easily seen to be a rational function of  $\|v\|^{-s}$ , and has the same pole as  $L(\chi_v; s)$  (31.1.1.1).

For  $v \in \Sigma_F^{\text{R}}$ , the poles of  $\zeta_v(\chi_v, \Phi_v; s)$  are the same as poles of  $\int_{|x| \leq 1} \Phi_v(x) \chi_v(x) |x|^s dx$ , because  $\int_{|x| \geq 1} \Phi_v(x) \chi_v(x) |x|^s dx$  is convergent for any  $s \in \mathbb{C}$ . For the former, we can write  $\Phi_v$  as a sum of an odd function and an even function. Only the part with the same parity of  $\chi_v$  will be non-zero, and for that part, by (12.4.3.5), its poles are all simple and are poles of  $L(\chi_v; s)$  (31.1.1.1).

For  $v \in \Sigma_F^{\text{C}}$ , if  $\chi_v(x) = |x|^\nu e^{ik \arg(x)}$ ,  $\nu \in i\mathbb{R}$ ,  $k \in \mathbb{Z}$ ,

$$\zeta_v(\chi_v, \Phi_v; s) = \frac{1}{2\pi} \int_0^\infty \int_0^{2\pi} r^{2v+2s} e^{ik\theta} \Phi_v(re^{i\theta}) d\theta \frac{dr}{r} = \int_0^\infty r^{2v+2s} \varphi(r) \frac{dr}{r},$$

where

$$\varphi(r) = \frac{1}{2\pi} \int_0^{2\pi} e^{ik\theta} \Phi_v(re^{i\theta}) d\theta.$$

Suppose  $\Phi_v(x) = \sum_{n,m \in \mathbb{N}} a(n,m) x^n \bar{x}^m$ , then  $\varphi(r) = \sum_{m-n=k} a(n,m) r^{m+n}$ . Thus by (12.4.3.5), its poles are  $\{s | 2s + 2v - (|k| + 2l)\}$ , which are all simple and are poles of  $L(\chi_v; s)$  (31.1.1.1).

For the last assertion, we need direct calculations, Cf. [R-V99]P249 (notice that the complex place differ by a multiple of 2).  $\square$

**Prop. (29.5.3.2) [Compatibility of Local  $\epsilon$ -Factors].** Situation as in (29.5.2.8), there exists a non-vanishing holomorphic function  $\epsilon_v(\chi_v, \psi_v)$  that

$$\frac{\zeta_v(\chi_v^{-1}, \widehat{\Phi}_v; 1-s)}{L(\chi_v^{-1}; 1-s)} = \epsilon_v(\chi_v, \psi_v; s) \frac{\zeta_v(\chi_v, \Phi_v; s)}{L(\chi_v; s)}.$$

and  $\frac{\zeta_v(\chi_v, \Phi_v)}{L_v(\chi_v; s)}$  is holomorphic. Moreover,  $\epsilon_v(\chi_v, \psi_v; s)$  is of the form  $ab^s$  for  $a \in \mathbb{C}^\times$ ,  $b \in \mathbb{R}_+$ . And  $\epsilon(\chi_v, \psi_v) = 1$  if  $v$  is unramified in the sense of (19.4.2.19).  $\lrcorner$

*Proof:* Such an  $\epsilon_v(\chi_v, \psi_v; s)$  exists by (29.5.2.8). It is holomorphic and non-vanishing by (29.5.3.1) as both  $\frac{\zeta_v(\chi_v^{-1}, \widehat{\Phi}_v; 1-s)}{L(\chi_v^{-1}; 1-s)}$  and  $\frac{\zeta_v(\chi_v, \Phi_v; s)}{L(\chi_v; s)}$  are holomorphic and for any  $s_0 \in \mathbb{C}$ ,  $\Phi_v$  can be chosen to make either one of them non-vanishing at  $s_0$ .

To show it is of the form  $ab^s$ : If  $v \in \Sigma_F^{\text{fin}}$ , it is a rational function in  $\|v\|^{-s}$  with no zeros or poles, so it must be of the form  $ab^s$ . And if  $v$  is unramified, then we can take  $\Phi_v = \mathbf{1}_{\mathcal{O}_{F,v}}$ ,  $\Phi_v^\vee = \mathbf{1}_{\mathcal{O}_{F,v}^\vee}$  by (19.4.2.5), and both sides are 1 by (29.5.2.3).

If  $v \in \Sigma_F^\infty$  and  $\psi$  is the standard additive character, then we can take  $\Phi_v$  defined in (29.5.3.1) to do the calculation to show it directly? Cf. [R-V99]P249 (notice that the complex place differ by a multiple of 2):

$$\Phi_v^\vee(x) = \begin{cases} \mu_v(\mathfrak{c}(\psi_v)\mathfrak{c}(\chi_v)^{-1}) \cdot \mathbf{1}_{1+\mathfrak{c}(\chi_v)} & , v \in \Sigma_F^{\text{fin}} \\ i^\epsilon \cdot x^\epsilon e^{-\pi x^2} & , v \in \Sigma_F^{\mathbb{R}}, \chi_v(x) = \text{sgn}(x)^\epsilon, \epsilon \in \{0, 1\} \\ i^k \cdot \pi^{-1} x^k e^{-2\pi|x|_v} & , v \in \Sigma_F^{\mathbb{C}}, \chi_v(x) = |x|^\nu e^{ik \arg(x)}, \nu \in i\mathbb{R}, k \in \mathbb{N} \\ i^{-k} \cdot \pi^{-1} \bar{x}^{-k} e^{-2\pi|x|_v} & , v \in \Sigma_F^{\mathbb{C}}, \chi_v(x) = |x|^\nu e^{ik \arg(x)}, \nu \in i\mathbb{R}, k \in \mathbb{Z}_-. \end{cases}$$

So it follows from (29.5.3.1) that  $\epsilon_v$  is the same as that defined in (31.1.1.1).  $\square$

### Hecke $L$ -Functions

**Prop. (29.5.3.3)** [Hecke  $L$ -Functions, Hecke [Hec18, Hec20]]. For a Hecke character  $\chi = \prod_v \chi_v$  on  $F$  and  $s \in \mathbb{C}$ , we define the **Hecke  $L$ -function** and **completed Hecke  $L$ -function** as

$$L(\chi; s) = \prod_{v \in \Sigma_F^{\text{fin}}} L(\chi_v; s), \quad \Lambda(\chi; s) = \prod_{v \in \Sigma_F} L(\chi_v; s) \quad (31.1.1.1),$$

which converges for  $\text{Re } s > 1$  and has a meromorphic continuation to all  $s \in \mathbb{C}$ .

Also, we can define the **global  $\epsilon$ -factor** for  $\chi$  as

$$\epsilon(\chi; s) = \prod_{v \in \Sigma_F} \epsilon_v(\chi_v, \psi_v; s).$$

All but f.m. of the product equals 1 by (29.5.3.2), and they are of the form  $ab^s$ , so  $\epsilon(s, \chi)$  is also of the form  $ab^s$ , where  $a \in \mathbb{C}^*, b \in \mathbb{R}_+$ . In particular, it is holomorphic and non-vanishing. The fact  $\epsilon(s, \chi)$  is independent of  $\psi$  can be seen from (29.5.3.4).  $\square$

**Prop. (29.5.3.4)** [Meromorphic Extension of Hecke  $L$ -Functions, Hecke [Hec18, Hec20]]. For a Hecke character  $\chi$  of  $F$ ,

1.  $L(\chi; s)$  has meromorphic continuation to all  $s \in \mathbb{C}$ , and there is a functional equation

$$\Lambda(\chi; s) = \epsilon(\chi; s) \Lambda(\chi^{-1}; 1 - s),$$

where  $\epsilon(\chi; s)$  is of the form  $ab^s$ ,  $a \in \mathbb{C}^\times, b \in \mathbb{R}_+$ .

2.  $\Lambda(\chi; s)$  is essentially bounded on the vertical strips away from the poles.
3.  $\Lambda(\chi; s)$  has poles iff  $\chi(x) = |x|^\lambda$  for some  $\lambda \in i\mathbb{R}$ . In this case,
  - If  $F \in \mathbf{NField}$ , then it only has simple poles at  $s \in \{-\lambda, 1-\lambda\}$ , with residue  $-k \|\mathfrak{d}\|^{1/2} \pi^{-r_2}$  and  $k\pi^{-r_2}$  resp., where  $k = \text{Vol}(F^\times \backslash \mathbf{I}_F^1)$  (19.4.2.20).
  - If  $F \in \mathbf{FField}$ , it has poles at  $s \in \{-\lambda + \frac{2\pi ni}{\log(\#F_0)}, 1 - \lambda + \frac{2\pi ni}{\log(\#F_0)}\}_{n \in \mathbb{Z}}$ , with residue  $-k \|\mathfrak{d}\|^{1/2}$  and  $k$  resp., where  $k = \text{Vol}(F^\times \backslash \mathbf{I}_F^1)$  (19.4.2.20) resp..
4. If  $F \in \mathbf{NField}$ ,  $\zeta_F(s)$  only have a simple pole at  $s = 1$ , with residue  $k$ , and

$$\lim_{s \rightarrow 0} s^{-(r_1+r_2-1)} \zeta_F(s) = -\frac{\text{cl}(F) \text{Reg}(F)}{w(F)}.$$

$\square$

*Proof:* 1: The functional equation follows from the definition of local  $\epsilon$ -factors(29.5.3.2) and(29.5.2.4). To show it is essentially bounded on vertical strips, use

$$\frac{\Lambda(\chi; s)}{\zeta(\chi, \Phi; s)} = \prod_{v \in \Sigma_F} \frac{L(\chi_v; s)}{\zeta_v(\chi_v, \Phi_v; s)}$$

where we can take  $\Phi_v$  s.t. each fraction is of the form  $ab^s$ , and a.e. term is 1, by(29.5.3.2).

2:  $L(\chi; s)$  is essentially bounded on vertical strips because  $\zeta(\chi, \Phi; s)$  does(29.5.2.4).

3: To find the poles and residues, choose  $\Phi_v$  as in(29.5.3.1), then  $\zeta(\chi, \Phi; s)$  is a constant multiple of  $\Lambda(\chi; s)$ , and the poles and residues of can be read from that of  $\zeta(\chi, \Phi; s)$ (29.5.2.4). Then we use(29.5.2.4), the assertion about poles follows.

For the residue, it suffices to calculate for  $\chi = \mathbf{1}$ : we take  $\psi$  to be the standard additive character on  $\mathbf{A}_F$ (19.4.2.16), then by calculation the chosen  $\Phi$  satisfies:  $\Phi(0) = \pi^{-r_2}$  and  $\Phi^\vee(0) = \|\mathfrak{d}\|^{1/2} \pi^{-r_2}$ , using(29.5.3.2) and(19.4.2.5)(19.4.2.4). Thus

$$\Lambda_F(s) = \zeta(\mathbf{1}, \Phi; s) \|\mathfrak{d}\|^{1/2-s} \text{ (29.5.3.1).}$$

Thus the residues of  $\Lambda_F(s)$  at  $s = 0$  and  $s = 1$  resp. are

$$-k \|\mathfrak{d}\|^{1/2} \pi^{-r_2}, \quad k \pi^{-r_2}.$$

4: Use item3 and(31.1.1.1) and properties of the  $\Gamma$ -factors(12.6.1.19)(12.6.1.3). □

### Global Zeta Integrals

**Def.(29.5.4.1) [Godement-Jacquet Zeta Integrals].** Let  $n \in \mathbb{Z}_{\geq 2}$  and let  $(\pi, V) \in \text{Irr}^{\text{cusp}}(\text{GL}(n; \mathbf{A}_F))$ . For any matrix coefficient  $\beta$  of  $\pi$  and  $\Phi \in \mathcal{S}(\text{GL}(n; \mathbf{A}_F))$ , consider the global **Godement-Jacquet Zeta Integral**

$$Z(\beta, \Phi; s) = \int_{\text{GL}(n; \mathbf{A}_F)} \Phi(g) \beta(g) |\det(g)|^{s + \frac{n-1}{2}} d^\times g,$$

which is absolutely convergent for  $\text{Re}(s)$  sufficiently large?.

If  $\beta = \prod_{v \in \Sigma_F} \beta_v$ ,  $\Phi = \prod_{v \in \Sigma_F} \Phi_v$  are pure, then there is a factorization

$$Z(\beta, \Phi; s) = \prod_{v \in \Sigma_F} Z_v(\beta_v, \Phi_v; s), \quad Z_v(\beta_v, \Phi_v; s) = \int_{\text{GL}(n; \mathbf{A}_F)} \Phi_v(g) \beta_v(g) |\det(g)|_v^{s + \frac{n-1}{2}} d^\times g.$$

┘

*Proof:*

□

### Local Zeta Functions

**Thm. (29.5.4.3) [Local Functional Equations].** Situation as in (29.5.4.1), for  $v \in \Sigma_F$ ,

- The local zeta integral  $Z_v(\beta_v; \Phi_v; s)$  converges absolutely for  $\text{Re}(s)$  sufficiently large, and extends to an entire function. And it is a rational function of  $\|v\|^{-s}$  if  $v \in \Sigma_F^{\text{fin}}$ .
- There exists  $\Phi_v$  and  $\beta_v$  s.t.  $Z_v(\beta_v; \Phi_v; s) = 1$ .
- These local zeta integrals has a common divisor  $L_v(\pi; s)$  in the sense that

$$\frac{Z_v(\beta_v; \Phi_v; s)}{L_v(\pi; s)}$$

is always entire, and equals to 1 for some choice of  $\Phi_v, \beta_v$ . Moreover, if  $v \in \Sigma_F^{\text{fin}}$ ,  $L_v(\pi; s) = Q(\|v\|^{-s})^{-1}$  where  $Q \in \mathbb{C}[X]$  is a monomial polynomial.

- There exists a function  $\gamma_p(\pi; s)$  s.t. there is a functional equation

$$Z_v(\beta_v^\vee, \widehat{\Phi}_v; 1-s) = \gamma_p(\pi; s) Z_p(\beta_v, \Phi_v; s), \quad \widehat{\Phi}(x) = \int_{\text{GL}(n; F_v)} \Phi_v(y) \text{tr}(yx^t) dy.$$

where  $dy$  is the self-dual measure on  $\text{Mat}(n \times n; F_v)$ .

- There exists a local (non-vanishing) root number  $\epsilon_v(\pi, \psi_v; s)$  s.t. there is a functional equation

$$\frac{Z_v(\beta_v^\vee, \widehat{\Phi}_v; 1-s)}{L_v(\pi^\vee; 1-s)} = \epsilon_v(\pi, \psi_v; s) \frac{Z_v(\beta_v; \Phi_v; s)}{L_v(\pi; s)}.$$

And  $\epsilon_v(\pi; s)$  is a monomial in  $\|v\|^{-s}$  if  $v \in \Sigma_F^{\text{fin}}$ , while it is a constant if  $v \in \Sigma_F^\infty$ .

┘

*Proof:* ?.

Cf. [Jacquet, principal  $L$ -Functions].

Firstly the above statement make sense for reducible representations too. And notice that if  $(\pi', V')$  is a subquotient of  $(\pi, V)$ , then the statements for  $\pi$  imply statements for  $\pi'$ . This is because matrix coefficients of  $\pi'$  are all matrix coefficients of  $\pi$  ?.

Then we reduce to the case that  $\pi_v$  is cuspidal:

For  $\pi$  cuspidal, Cf. [G-J11] Prop11.13.2. Prop11.8.3. Prop11.13.5. ?

To show that  $\epsilon_v(\pi, \psi_v; s)$  is a constant, prove that it is a polynomial in  $s$ , and then change  $\Phi$  to  $\Phi^\vee$ . □

**Remark (29.5.4.4).** The proof doesn't apply to  $n = 1$  case. ┘

**Prop. (29.5.4.5) [Local Zeta Function and Parabolic Inductions].** ┘

### Principle $L$ -Functions

**Thm. (29.5.4.6) [Principle  $L$ -Functions are Analytic, Jacquet-Langlands [J-L70]/Godement-Jacquet [G-J72]].** Let  $n \in \mathbb{Z}_{\geq 2}$  and let  $(\pi, V) \in \text{Irr}^{\text{auto}}(\text{GL}(n; \mathbf{A}_F))$  is non-trivial, then  $L(\pi; s)$  has an analytic continuation to an entire function on  $\mathbb{C}$ .

In fact,  $\Lambda(\pi; s)$  extends to a meromorphic function for  $s \in \mathbb{C}$  and satisfies the function equation

$$\Lambda(\pi; s) = \epsilon(\pi; s) \Lambda(\pi^\vee; 1-s).$$

Moreover, if  $F \in \mathbf{NField}$ , then  $\Lambda(\pi; s)$  has f.m. poles and is bounded away from poles on vertical strips. And if  $F \in \mathbf{GField}$  with constant field  $\Omega$ , then  $\Lambda(\pi; s)$  is a rational function of  $(\#\Omega)^{-s}$ . ┘

*Proof:* Cf.[G-J72].<sup>?</sup> The non-cuspidal case reduces to the cuspidal case by parabolic induction, see[Jac79].

The boundedness on vertical strips follows from the Phragmen-Lindelöf principle.<sup>?</sup>  $\square$

**Prop. (29.5.4.7) [Root Numbers and Conductors].** The  $\epsilon$ -factor in (29.5.4.6) is of the form

$$\epsilon(\pi; s) = w(\pi)N(\pi)^{s-\frac{1}{2}}$$

where  $w(\chi) = \epsilon(\chi; \frac{1}{2})$  satisfies  $|w(\pi)| = 1$  and  $N(\pi)$  is the **conductor of automorphic representation** of  $\pi$ , which is the product of local conductors (29.3.1.31).  $\lrcorner$

*Proof:* <sup>?</sup>  $\square$

How to calculate the  $\epsilon$ -factors and root numbers.<sup>?</sup> Cf.[Character theory and Artin  $L$ -functions(1977)].

### Principle $L$ -Functions for Modular Forms

**Prop. (29.5.4.8) [Trivial Bound].** If  $f \in \text{SF}_k(\Gamma(N))$ , suppose  $f(z) = \sum_{n \geq 0} a_n e^{2\pi i n z / N}$ , then  $|a_n| = O(n^{k/2})$ .  $\lrcorner$

*Proof:*  $a_n = \int_0^N f(x + iy) e^{-2\pi i n(x+iy)/N} dx$  for any  $y$ , so let  $y = N/n$ , then  $a_n = \int_0^N f(x + iN/n) e^{-2\pi i n x / N} dx$ . As  $f$  is a cusp modular form,  $(\text{Im}(z))^{k/2} |f(z)|$  is cuspidal automorphic function, thus bounded on  $\mathcal{H}$ , thus  $|a_n| \leq C(N/n)^{\frac{k}{2}}$ .  $\square$

**Thm. (29.5.4.9) [Ramanujan-Petersson Conjecture].** Let  $f \in \text{SF}_k(\Gamma(1))$  is a Hecke eigenform, then for any  $p \in \text{Prime}$ , we have  $|a_p(f)| \leq 2p^{(k-1)/2}$ .  $\lrcorner$

*Proof:* By (26.3.2.16) this means the eigenvalue  $\lambda_p$  of  $f$  w.r.t.  $T_p$  satisfies  $|\lambda_p| \leq 2p^{1/2}$ . This is a consequence of Weil conjecture and modularity.<sup>?</sup>  $\square$

**Def. (29.5.4.10) [ $L$ -functions associated to Modular Forms, Hecke [Hec37, Hec37a]].** Each  $f \in \text{MF}_k(\Gamma_1(N))$  has an associated  $L$ -functions: if  $f = \sum_{n=0}^{\infty} a_n q^n$ , define

$$L(f; s) = \sum_{n=1}^{\infty} a_n n^{-s}.$$

$\lrcorner$

**Prop. (29.5.4.11) [Functional Equations of Modular Forms, Hecke [Hec37, Hec37a]].** Let  $(a_n)_{n \in \mathbb{N}} \subset \mathbb{C}$  s.t.  $a_n = O(n^M)$  for some integer  $M$ . Given  $\lambda > 0, k > 0, C = \pm 1$ , write

$$\varphi(s) = \sum_{n=1}^{\infty} a_n n^{-s}, \quad \Phi(s) = \left(\frac{2\pi}{\lambda}\right)^{-s} \Gamma(s) \varphi(s), \quad f(z) = \sum_{n=0}^{\infty} a_n e^{2\pi i n z / \lambda}.$$

Then the following conditions are equivalent:

- The function  $\Lambda(s) = \Phi(s) + \frac{a_0}{s} + \frac{C a_0}{k-s}$  can be analytically continued to a holomorphic function of the whole plane which is bounded on vertical strips, and it satisfies the functional equation

$$\Phi(s) = C \Phi(k-s).$$

- In the upper half plane,  $f$  satisfies the functional equation

$$f(-1/z) = C\left(\frac{z}{i}\right)^k f(z).$$

⌋

*Proof:* Notice first

$$\int_0^\infty e^{-2\pi nt/\lambda t^s} \frac{dt}{t} = \left(\frac{2\pi}{n\lambda}\right)^{-s} \int_0^\infty e^{-t} t^s \frac{dt}{t} = \left(\frac{2\pi}{n\lambda}\right)^{-s} \Gamma(s).$$

Thus for  $\operatorname{Re}(s)$  large,

$$\Phi(s) = \int_0^\infty (f(it) - a_0) t^s \frac{dt}{t} = \int_1^\infty (f(it) - a_0) t^s \frac{dt}{t} + \int_1^\infty \left(f\left(\frac{i}{t}\right) - a_0\right) t^{-s} \frac{dt}{t}.$$

If 2 holds, then  $f(\frac{i}{t}) = Ct^k f(it)$ , and

$$\begin{aligned} \Phi(s) &= \int_1^\infty (f(it) - a_0) t^s \frac{dt}{t} + \int_1^\infty (Ct^k f(it) - a_0) t^{-s} \frac{dt}{t} \\ &= \int_1^\infty (f(it) - a_0) t^s \frac{dt}{t} + C \int_1^\infty (f(it) - a_0) t^{k-s} \frac{dt}{t} + \int_1^\infty (Ct^{k-s} a_0 - t^{-s} a_0) \frac{dt}{t}. \end{aligned}$$

The first two integral is absolutely convergent for any  $s$  and then can be extended to an analytic function of the whole plane, and the final term equals

$$-\left(\frac{a_0}{s} + \frac{Ca_0}{k-s}\right)$$

when  $\operatorname{Re}(s)$  is large, so it can be extended to a meromorphic function on the whole plane. And  $\Phi(s) = \Phi(k-s)$  follows easily from the equation above. Also it is bounded on vertical strips because it attain maximum at the real axis.

Conversely, first notice it suffices to prove for real  $y > 0$ ,

$$f\left(\frac{i}{y}\right) = Cy^k f(iy)$$

because this implies these two holomorphic functions on  $\mathcal{H}$  coincide on the imaginary axis, so they must be equal. Notice

$$\int_0^\infty (f(iy) - a_0) y^s \frac{dy}{y} = \Phi(s)$$

converges absolutely for  $\operatorname{Re}(s)$  sufficiently large, so for  $\sigma > 0$  sufficiently large, Mellin inversion formula(12.5.4.2) shows

$$\begin{aligned} f(iy) - a_0 &= \frac{1}{2\pi i} \int_{\sigma-i\infty}^{\sigma+i\infty} \Phi(s) y^{-s} ds = \frac{C}{2\pi i} \int_{\sigma-i\infty}^{\sigma+i\infty} \Phi(k-s) y^{-s} ds \\ &= \frac{C}{2\pi i} \int_{\sigma-i\infty}^{\sigma+i\infty} \left(\Lambda(k-s) - \frac{Ca_0}{s} - \frac{a_0}{k-s}\right) y^{-s} ds \end{aligned}$$

Notice  $\Phi(\sigma + it)$  decays exponentially for fixed  $\sigma = \alpha$  sufficiently large, because of the Stirling formula(12.6.1.16), and for  $\sigma = \beta$  sufficiently small,  $\Phi(s) = C\Phi(k-s)$  also shows  $\Phi(\sigma + it)$  decays exponentially. And also  $\frac{Ca_0}{\sigma+it} + \frac{a_0}{k-\sigma-it} = O(t^{-1})$  for  $\sigma = \alpha$  or  $\beta$ , so  $\Lambda(\sigma + it) = O(t^{-1})$  for  $\sigma$  large

or small, and also the hypothesis shows  $\Lambda$  is bounded on the strip  $\alpha < \operatorname{Re}(z) < \beta$ , thus by (12.4.5.7),  $\Lambda(\sigma + it) \rightarrow 0$  for  $t \rightarrow 0$  and  $\sigma$  in any compact set. So we can move the integration of  $\Lambda(s)$  to the left or to the right. Then

$$\begin{aligned}
 f(iy) - a_0 &= \frac{C}{2\pi i} \int_{\sigma-i\infty}^{\sigma+i\infty} (\Lambda(k-s) - \frac{Ca_0}{s} - \frac{a_0}{k-s}) y^{-s} ds \\
 &= \frac{C}{2\pi i} \int_{\sigma-i\infty}^{\sigma+i\infty} y^{-k} \Lambda(s) y^s ds - \frac{1}{2\pi i} \int_{\sigma-i\infty}^{\sigma+i\infty} (\frac{a_0}{s} + \frac{Ca_0}{k-s}) y^{-s} ds \\
 &= \frac{Cy^{-k}}{2\pi i} \int_{\sigma-i\infty}^{\sigma+i\infty} \Phi(s) y^s ds + \frac{Cy^{-k}}{2\pi i} \int_{\sigma-i\infty}^{\sigma+i\infty} (\frac{a_0}{s} + \frac{Ca_0}{k-s}) y^s ds + \frac{1}{2\pi i} \int_{k-\sigma+i\infty}^{k-\sigma-i\infty} (\frac{a_0}{k-s} + \frac{Ca_0}{s}) y^{s-k} ds \\
 &= Cy^{-k} (f(\frac{i}{y}) - a_0) + \frac{y^{-k}}{2\pi i} \int_{\gamma} (\frac{Ca_0}{s} + \frac{a_0}{k-s}) y^s ds \\
 &= Cy^{-k} f(\frac{i}{y}) - Ca_0 y^{-k} + y^{-k} (Ca_0 - a_0 y^k) = Cy^{-k} f(\frac{i}{y}) - a_0
 \end{aligned}$$

So we are done.  $\square$

**Def. (29.5.4.12) [L-Functions associated to  $\operatorname{SF}_k(1)$ ].** Let  $a_1, a_2, \dots$  be a sequence of complex numbers such that  $a_n = O(n^M)$  for some  $M > 0$ . Let

$$L(s) = \sum a_n n^{-s}, \quad \Lambda(s) = L_{\mathbb{C}}(s) L(s), \quad f(z) = \sum a_n e^{-2\pi i n z}.$$

More generally, let  $m > 0$  and  $\chi$  a primitive character mod  $m$ , then we define **twisted  $L$ -function** as

$$L(f, \chi; s) = \sum a_n \chi(n) n^{-s}, \quad \Lambda(f, \chi; s) = L_{\mathbb{C}}(s) L(f, \chi; s)$$

Notice if  $f(x) \in S_k(\Gamma(1))$ , and  $\pi_f \in \operatorname{Irr}^{\operatorname{auto}}(\operatorname{GL}(2)/\mathbb{Q})$  corresponding to  $f$  via (26.6.3.8), then

$$L(f, \chi; s) = L(\pi_f, \chi; s).$$

┘

**Prop. (29.5.4.13) [Functional Equation associated to  $\operatorname{SF}_k(N; \psi)$ ].** Notation as in (29.5.4.12). If  $f(z) \in \operatorname{SF}_k(N, \psi)$  (26.3.1.3). Let  $w_N$  be the Fricke involution (20.4.5.11), and notice  $\psi(a_\gamma) = \overline{\psi(d_\gamma)}$ , so

$$f[w_N]_k[\gamma]_k = f[w_N \gamma w_N^{-1}]_k[w_N]_k = \overline{\psi(d)} f[w_N].$$

Thus  $g = f[w_N]_k \in S_k(N, \overline{\psi})$ .

Now if

$$f(z) = \sum a_n e^{2\pi i n z/N}, \quad g(z) = \sum b_n e^{2\pi i n z/N},$$

and  $\chi \in \operatorname{Diri}'(D)$ , define  $L(s, f, \chi), L(s, g, \overline{\chi}), \Lambda(s, f, \chi), \Lambda(s, g, \overline{\chi})$  as in (29.5.4.12), then  $\Lambda(s, f, \chi)$  extends to an analytic function for all  $s \in \mathbb{C}$ , and there are functional equations

$$\Lambda(f, \chi; s) = i^k \chi(N) \psi(D) \frac{\tau(\chi)^2}{D} (D^2 N)^{-s+k/2} \Lambda(g, \overline{\chi}; k-s), \quad (29.1)$$

where  $\tau(\chi)$  is the Gauss sum of  $\chi$  (35.3.6.8).

In particular, if  $D = 1$  (and thus  $\chi = \mathbf{1}$ ), then

$$\Lambda(f; s) = i^k N^{-s+k/2} \Lambda(g; k-s). \quad (29.2)$$

┘

*Proof:* Let

$$f_\chi(z) = \sum \chi(n) a_n q^n, \quad g_{\bar{\chi}}(z) = \sum \overline{\chi(n)} b_n q^n.$$

Use (35.3.6.13) on  $f_\chi(z)$ , we get

$$f_\chi = \frac{\chi(-1)\tau(\chi)}{D} \sum_{m \in (\mathbb{Z}/D\mathbb{Z})^*} \overline{\chi(m)} f\left[\begin{smallmatrix} D & m \\ & D \end{smallmatrix}\right]_k$$

Now

$$\begin{aligned} f_\chi\left[\begin{smallmatrix} & -1 \\ D^2N & \end{smallmatrix}\right]_k &= f_\chi\left[\begin{smallmatrix} & -1/DN \\ D & \end{smallmatrix}\right]_k = \frac{\chi(-1)\tau(\chi)}{D} \sum_{m \in (\mathbb{Z}/D\mathbb{Z})^*} \overline{\chi(m)} g[w_N^{-1}]_k \left[\begin{smallmatrix} D & m \\ & D \end{smallmatrix}\right]_k \left[\begin{smallmatrix} & -1/DN \\ D & \end{smallmatrix}\right]_k \\ &= \frac{\chi(-1)\tau(\chi)}{D} \sum_{m \in (\mathbb{Z}/D\mathbb{Z})^*} \overline{\chi(m)} g\left[\begin{smallmatrix} D & -r \\ -Nm & s \end{smallmatrix}\right] \left[\begin{smallmatrix} D & r \\ & D \end{smallmatrix}\right]_k \end{aligned}$$

where  $(r, s)$  are integers chosen that  $Ds - rNm = 1$ . Thus  $\overline{\chi(m)} = \chi(-N)\chi(r)$ , and because  $g \in M_k(N, \bar{\psi})$ ,

$$f_\chi\left[\begin{smallmatrix} & -1 \\ D^2N & \end{smallmatrix}\right]_k = \frac{\chi(N)\tau(\chi)}{D} \sum_{r \in (\mathbb{Z}/D\mathbb{Z})^*} \chi(r)\psi(D)g\left[\begin{smallmatrix} D & r \\ & D \end{smallmatrix}\right]_k.$$

Compare this with the formula

$$g_{\bar{\chi}} = \frac{\chi(-1)\tau(\bar{\chi})}{D} \sum_{m \in (\mathbb{Z}/D\mathbb{Z})^*} \chi(m)g\left[\begin{smallmatrix} D & m \\ & D \end{smallmatrix}\right]_k,$$

we get

$$f_\chi\left[\begin{smallmatrix} & -1 \\ D^2N & \end{smallmatrix}\right]_k = \chi(-N)\psi(D)\frac{\tau(\chi)}{\tau(\bar{\chi})}g_{\bar{\chi}} = \chi(N)\psi(D)\frac{\tau(\chi)^2}{D}g_{\bar{\chi}} \text{ (35.3.6.10)(35.3.6.12)}. \quad (29.3)$$

Now similar to the proof of (29.5.4.11),

$$\Lambda(s, f, \chi) = \int_0^\infty f_\chi(iy)y^s \frac{dy}{y}.$$

So when  $\text{Re}(s)$  is large,

$$\begin{aligned} &\chi(N)\psi(D)\frac{\tau(\chi)^2}{D}\Lambda(s, g, \bar{\chi}) \\ &= \chi(N)\psi(D)\frac{\tau(\chi)^2}{D} \int_0^\infty g_{\bar{\chi}}(iy)y^s \frac{dy}{y} \\ &= \int_0^{D\sqrt{N}} (D^2N)^{-k/2}(iy)^{-k} f_\chi\left(\frac{1}{-D^2Niy}\right)y^s \frac{dy}{y} + \chi(N)\psi(D)\frac{\tau(\chi)^2}{D} \int_{D\sqrt{N}}^\infty g_{\bar{\chi}}(iy)y^s \frac{dy}{y} \\ &= \int_{D\sqrt{N}}^\infty (D^2N)^{k/2}t^k i^{-k} f_\chi(it)(D^2Nt)^{-s} \frac{dt}{t} + \chi(N)\psi(D)\frac{\tau(\chi)^2}{D} \int_{D\sqrt{N}}^\infty g_{\bar{\chi}}(iy)y^s \frac{dy}{y} \\ &= i^{-k}(D^2N)^{k/2-s} \int_{D\sqrt{N}}^\infty f_\chi(it)t^{k-s} \frac{dt}{t} + \chi(N)\psi(D)\frac{\tau(\chi)^2}{D} \int_{D\sqrt{N}}^\infty g_{\bar{\chi}}(iy)y^s \frac{dy}{y} \end{aligned}$$

Both integral are absolutely convergent for any  $s$ . And similarly when  $\operatorname{Re}(s)$  is small,

$$\begin{aligned} i^{-k}(D^2N)^{k/2-s}\Lambda(k-s, f, \chi) &= i^{-k}(D^2N)^{k/2-s} \int_0^\infty f_\chi(it) t^{k-s} \frac{dt}{t} \\ &= i^{-k}(D^2N)^{k/2-s} \int_{D\sqrt{N}}^\infty f_\chi(it) t^{k-s} \frac{dt}{t} + \chi(N)\psi(D) \frac{\tau(\chi)^2}{D} \int_{D\sqrt{N}}^\infty g_{\overline{\chi}}(iy) y^s \frac{dy}{y} \end{aligned}$$

Thus we get the desired result.  $\square$

**Cor. (29.5.4.14) [Central Values].** As  $f[w_N^2]_k = (-1)^k f$ , if  $f \in \operatorname{SF}_k(\Gamma_1(N))$  satisfies  $f[w_N]_k = cf$ ,  $c = \epsilon i^k$ ,  $\epsilon \in \{\pm 1\}$ , then

$$N^{s/2}\Lambda(f; s) = \epsilon(-1)^k N^{(k-s)/2}\Lambda(f; k-s).$$

So  $\operatorname{ord}_{s=1/2} L(f; s)$  is even if  $\epsilon = (-1)^k$  and odd if  $\epsilon = (-1)^{k+1}$ .

In particular, if  $N = 1$  and  $k \equiv 2 \pmod{4}$ ,  $L(1/2, f) = 0$ .

It is conjectured that  $L(f; 1/2) \neq 0$  if  $4|k$ , Cf.[Modular Forms, Ribet] P148. ?  $\lrcorner$

**Prop. (29.5.4.17).**

$$\Lambda(Q; s) = \Lambda_F(2s)\Lambda_F(2s-1)J(Q; 2s),$$

where

$$J(Q; 2s) = \prod_{v \in \operatorname{Ram}_F(Q)} J_v(Q; s), \text{ where } J_v(Q; s) = \begin{cases} 1 - \|v\|^{1-s} & , v \in \Sigma_F^{\text{fin}} \\ s-1 & , v \in \Sigma_F^\infty \end{cases}.$$

In particular, by [\(29.5.3.4\)](#).

$$\operatorname{ord}_{s=1/2} \Lambda(Q; s) = -2 + \# \operatorname{Ram}_F(Q).$$

*Proof:* ?  $\square$

## 5 Doubling Methods( $\mathrm{GL}(n) \times \mathrm{GL}(m)$ )

References are [Cog00], [Bump, Rankin-Selberg method, an introduction] and [Analytic Theory of  $L$ -functions for  $\mathrm{GL}(n)$ ].

The tensor product  $L$ -function on  $\mathrm{GL}(n) \times \mathrm{GL}(m)$ : Take a cusp form  $f$  on  $\mathrm{GL}(n)$  and  $f'$  on  $\mathrm{GL}(m)$  with  $n > m$ , integrate

$$\int_{\mathrm{GL}(m;F) \backslash \mathrm{GL}(m;\mathbf{A}_F)} P f(g) f'(g) |\det(g)|^{s-1/2} dg.$$

where  $P$  is the projection operator brilliantly designed s.t. this integral resolves to the product of Whittaker models for  $f$  and  $f'$ .

**Conj. (29.5.5.1) [Rankin-Selberg  $L$ -function].** For a global field  $F$ , assume the Langlands functoriality, for any  $\pi_1 \in \mathrm{Irr}^{\mathrm{auto}}(\mathrm{GL}(n)/F)$  and  $\pi_2 \in \mathrm{Irr}^{\mathrm{auto}}(\mathrm{GL}(m)/F)$ , their product  $\pi_1 \times \pi_2 \in \mathrm{Irr}^{\mathrm{auto}}(\mathrm{GL}(n) \times \mathrm{GL}(m)/F)$ , and there is a tensor product map  $\otimes : \mathrm{GL}(n) \times \mathrm{GL}(m) \rightarrow \mathrm{GL}(mn)$ , which by functorial lifting (29.3.5.1) gives us an automorphic representation  $\pi_1 \boxtimes \pi_2 \in \mathrm{Irr}^{\mathrm{auto}}(\mathrm{GL}(mn)/F)$ , whose  $L$ -function is denoted by  $L(s, \pi \times \pi')$  And for a finite set  $S$  of places of  $F$  large enough,

$$L_S(s, \pi_1 \times \pi_2) = \prod_{v \notin S} \prod_{i=1}^n \prod_{j=1}^m \frac{1}{1 - \alpha_i(\pi_{1,v}) \beta(\pi_{2,v}) q_v^{-s}}$$

called the (partial) **Rankin-Selberg  $L$ -function** of  $\pi_1, \pi_2$ . ┘

Examples of  $L$ -functions constructed using Eulerian Integrals include:

- (Doubling Method) Standard  $L$ -function on classical groups (Shapiro-Rallis). This construction works for non-generic representations as well.
- (Generalized doubling method) Tensor product  $L$ -function on  $\mathrm{GL}(n) \times G$  with  $G$  a classical group (Cai-Friedberg-Ginzburg-Kaplan).
- Symmetric square on  $\mathrm{GL}(n)$  (Shimura/Gelbart-Jacquet/Piatetski-Shapiro/Patterson/Bump-Ginzburg(1992)).
- Exterior square on  $\mathrm{GL}(n)$  (Jacquet-Shalika/Bump-Ginzburg(1992)).
- Symmetric cube on  $\mathrm{GL}(2)$  (Bump-Ginzburg-Hoffstein(1990)).
- Symmetric fourth power on  $\mathrm{GL}(2)$  (Ginzburg-Rallis).
- Standard  $L$ -function of  $E_6$  and  $E_7$  (Ginzburg).
- Standard  $L$ -function of  $G_2$  (Ginzburg-Hundley/Gurevich-Segal).

### Eulerian Integrals on $\mathrm{GL}(n) \times \mathrm{GL}(m)$ (Jacquet-Shapiro-Shalika)

References are [JSS83, Bum97, Cog00].

#### **Notation (29.5.5.2).**

- Let  $n' \leq n \in \mathbb{Z}_+$ .
- For each  $v \in \Sigma_F$ , let  $\psi_v$  be a non-trivial additive character of  $F_v$ .
- Let  $(\pi, V) \in \mathrm{Irr}^{\mathrm{cusp}}(\mathrm{GL}(n)/F)$ ,  $(\pi', V') \in \mathrm{Irr}^{\mathrm{cusp}}(\mathrm{GL}(n')/F)$ .
- Let  $\omega_\pi$  be the central character of  $\pi$ , and  $\omega_{\pi'}$  the central character of  $\pi'$ .

- If  $n' = 1$ , write  $\xi \triangleq \pi'$  as a Hecke character.

┘

**Def. (29.5.5.3)[Unramified Places].** For  $(\pi, V) \in \text{Irr}^{\text{cusp}}(\text{GL}(n)/F)$ ,  $(\pi', V') \in \text{Irr}^{\text{cusp}}(\text{GL}(n)/F)$ , pure cuspidal forms  $\Phi = \otimes_v \Phi_v \in V$ ,  $\Phi' = \otimes_v \Phi'_v \in V'$ , we call a place  $v \in \Sigma_F^{\text{fin}}$  **unramified for**  $(\pi, \Phi, \xi)$  if

- $\mathfrak{c}(\psi_v) = \mathcal{O}_v$ .
- $\pi_v, \pi'_v$  are unramified principal series.
- $\Phi_v$  (resp.  $\Phi'_v$ ) is the spherical function in  $\pi_v$  (resp.  $\pi'_v$ ) normalized s.t.  $W_{\psi_v, \Phi_v}$  (resp.  $W_{\psi_v, \Phi'_v}$ ) is the normalized spherical Whittaker function.

Then  $v$  is unramified a.e. by (26.6.4.2) and (26.6.4.3).

┘

**Def. (29.5.5.4)[Zeta Functions for  $\text{GL}(2) \times \text{GL}(1)$ ].** For any  $\Phi \in V$ , consider the zeta integral

$$\zeta(\Phi, \xi; s) = \int_{\mathbf{C}_F} \Phi\left(\begin{bmatrix} y & \\ & 1 \end{bmatrix}\right) \|y\|^{s-1/2} \xi(y) d^\times y$$

It is absolutely convergent by (26.6.4.5) and (19.4.1.10).

If  $\Phi = \otimes \Phi_v$  is a pure tensor, by (26.6.4.3), this zeta integral equals

$$\int_{\mathbf{I}_F} W_{\psi_v, \Phi_v}\left(\begin{bmatrix} y & \\ & 1 \end{bmatrix}\right) \|y\|^{s-1/2} \xi(y) d^\times y = \prod_{v \in \Sigma_F} \int_{F_v^\times} W_{\psi_v, \Phi_v}\left(\begin{bmatrix} y_v & \\ & 1 \end{bmatrix}\right) |y_v|^{s-1/2} \xi_v(y_v) d^\times y_v = \prod_{v \in \Sigma_F} \zeta_v(\Phi_v, \xi_v; s),$$

where for each  $v \in \Sigma_F$ , the **local zeta functions**

$$\zeta_v(\Phi_v, \xi_v; s) = \int_{F_v^\times} W_{\psi_v, \Phi_v}\left(\begin{bmatrix} y_v & \\ & 1 \end{bmatrix}\right) |y_v|^{s-1/2} \xi_v(y_v) d^\times y_v$$

converges absolutely to a holomorphic function for  $\text{Re}(s) > 1/2$ , and the integral is absolutely convergent when  $\text{Re}(s) > 3/2$ , using (12.10.3.7).

┘

*Proof:* We analyze the integrand for the local zeta integrals:

For  $v \in \Sigma_F^{\text{fin}}$ , the integrand is compactly supported on (24.11.3.12), and because  $\pi_v$  is unitary, use (24.11.5.17) and (24.11.8.12) to analyze the Kirillov model of  $\pi_v$ , we see the integral converges absolutely for  $\text{Re}(s) > 1/2$ .

For  $v \in \Sigma_F^\infty$ ,  $W_{\psi_v, \Phi_v}$  decays rapidly for  $|y| \rightarrow \infty$ , and for  $|y| \rightarrow 0$ , by (26.1.4.2), it is bounded by  $|y|^{-1/2}$ , thus it also converges absolutely for  $\text{Re}(s) > 1/2$ .

By (29.5.5.5), the local factor is the same as the local  $L$ -factor a.e.  $v$ , and  $|\alpha_i| < \|v\|^{1/2}$  by (24.11.8.12), thus it converges for  $\text{Re}(s) > 3/2$  by comparison with the Dedekind Zeta function (29.5.2.1).  $\square$

**Prop. (29.5.5.5)[Unramified Factors].** If  $v$  is unramified in the sense of (29.5.5.3), then for  $\text{Re}(s) > 1/2$  (thus for all  $s \in \mathbb{C}$ , as they are both meromorphic),

$$\zeta_v(\Phi_v, \pi'_v; s) = L(\pi_v, \pi'_v; s) \text{ (29.3.1.32).}$$

┘

*Proof:* With the unramified hypothesis, there is an explicit formula for  $W_v$  in terms of the Satake parameters  $\alpha_1, \alpha_2$  (24.11.6.13): if  $\text{ord}_v(y) = m$ , then

$$W_v\left(\begin{bmatrix} y & \\ & 1 \end{bmatrix}\right) = \begin{cases} \|v\|^{-m/2} \frac{\alpha_1^{m+1} - \alpha_2^{m+1}}{\alpha_1 - \alpha_2}, & m \geq 0 \\ 0 & , \text{otherwise} \end{cases}.$$

$$\begin{aligned} \zeta_v(W_v, \xi_v; s) &= \sum_{m=0}^{\infty} \|v\|^{-m/2} \frac{\alpha_1^{m+1} - \alpha_2^{m+1}}{\alpha_1 - \alpha_2} \|v\|^{m/2 - ms} \xi(\varpi_v)^m \\ &= \frac{1}{(1 - \alpha_1 \xi(\varpi_v) \|v\|^{-s})(1 - \alpha_2 \xi(\varpi_v) \|v\|^{-s})} = L(\pi_v, \chi_v; s) \end{aligned}$$

□

**Prop. (29.5.5.6)[Global Functional Equation].** In spite of the convergence problem of the product of local zeta integrals, the global zeta integral is absolutely convergent for any  $s$  as  $W_\Phi$  decay rapidly ?. Moreover, because  $\Phi$  is automorphic, we have

$$\begin{aligned} \zeta(\Phi, \xi; s) &= \int_{\mathbf{C}_F} \Phi(w_1 \begin{bmatrix} y & \\ & 1 \end{bmatrix}) |y|^{s-1/2} \xi(y) d^\times y \\ &= \int_{\mathbf{C}_F} \Phi\left(\begin{bmatrix} 1 & \\ & y \end{bmatrix} w_1\right) |y|^{s-1/2} \xi(y) d^\times y \\ &= \int_{\mathbf{C}_F} (\pi(w_1)\Phi)\left(\begin{bmatrix} y & \\ & 1 \end{bmatrix}\right) |y|^{-s+1/2} (\xi\omega)^{-1}(y) d^\times y \\ &= \zeta(\pi(w_1)\Phi, \xi^{-1}\omega^{-1}; 1-s) \end{aligned}$$

┘

### Local Functional Equation

**Prop. (29.5.5.7).** Let  $v \in \Sigma_F$ . If  $n = n'$ , for any  $\Phi_v \in V_v, \Phi'_v \in V'_v$  and  $\varphi_v \in \mathcal{S}(F_v^n)$ , define the local zeta integral

$$\zeta_v(\Phi_v, \Phi'_v, \varphi_v; s) = \int_{\text{Unip}(n; F_v) \backslash \text{GL}(n; F_v)} W_{\psi_v, \Phi_v}(g) W_{\psi_v^{-1}, \Phi'_v}(g) \varphi_v((0, \dots, 0, 1)g) |\det(g)|^s dg,$$

where  $dg$  is the  $\text{GL}(n; F_v)$ -invariant measure induced from that of  $\text{GL}(n; F_v)$  and  $\text{Unip}(n; F_v)$  normalized s.t.  $\mathcal{K}$  and  $\mathcal{K} \cap \text{Unip}(n'; F_v)$  has volume 1 by ?.

If  $n > n'$ , then we can define for  $j = 0, \dots, n - n' - 1$  that

$$\zeta_{v,j}(\Phi_v, \Phi'_v; s) = \int_{\text{Unip}(n'; F_v) \backslash \text{GL}(n'; F_v)} \int_{\text{Mat}(j \times n'; F_v)} W_{\psi_v, \Phi_v}\left(\begin{bmatrix} g & 0 & 0 \\ x & \mathbf{1}_j & 0 \\ 0 & 0 & \mathbf{1}_{n-n'-j} \end{bmatrix}\right) W_{\psi_v^{-1}, \Phi'_v}(g) |\det(g)|^{s - \frac{n-n'}{2}} dx dg,$$

where  $dg$  is the  $\text{GL}(n'; F_v)$ -invariant measure induced from that of  $\text{GL}(n'; F_v)$  and  $\text{Unip}(n'; F_v)$  normalized s.t.  $\mathcal{K}$  and  $\mathcal{K} \cap \text{Unip}(n'; F_v)$  has volume 1 by ?. How does the local zeta integral connects to the global zeta integral ?

┘

**Prop. (29.5.5.8) [Local Zeta Function as Common Divisors, Jacquet-Shalika [J-S81, J-S81a]].**

Situation as in (29.5.5.4),

- The local zeta integral  $\zeta_v(\Phi_v, \Phi'_v; s)$  is absolutely convergent for  $\operatorname{Re}(s)$  sufficiently large, and defines a holomorphic function there, with a meromorphic continuation to all  $s \in \mathbb{C}$ .
- If  $\pi_v, \pi'_v$  are unitary, then the integral converges for  $\operatorname{Re}(s) \geq 1$ , normally on compact subsets.
- We can take specific  $\Phi_v \in V_v$  and  $\Phi'_v \in V'_v$  s.t.  $\frac{\zeta_v(\Phi_v, \Phi'_v; s)}{L_v(\pi_v, \pi'_v; s)}$  (29.3.1.32) is of the form  $ab^s$  for some  $a \in \mathbb{C}^\times, b \in \mathbb{R}_+$ .
- If  $v \in \Sigma_F^{\text{fin}}$ , we have

$$\frac{\zeta_v(\Phi_v, \Phi'_v; s)}{L_v(\pi_v, \pi'_v; s)} \in \mathbb{C}[\|v\|^s, \|v\|^{-s}].$$

and  $\Phi_v, \Phi'_v$  can be chosen s.t.  $\zeta_v(\Phi_v, \Phi'_v; s) = L(\pi_v, \pi'_v; s)$ .

The same holds true for  $n = n'$ .

┘

*Proof:* Cf. [J-S81a] P782. We only prove for  $\operatorname{GL}(2)$ , Cf. [Jacquet-Langlands,  $\operatorname{GL}(2)$ ].

This is by direct calculation: If  $V$  is cuspidal, then  $V = C_c^\infty(K^\times)$  by (24.11.3.13). If  $V$  is not cuspidal, then by (24.11.5.14) it is  $\pi(\chi_1, \chi_2)$  or  $\sigma(\chi_1, \chi_2)$ , whose elements are known (24.11.5.16) (24.11.5.17). For  $\operatorname{Re}(s)$  sufficiently large, the  $|t| > q^{-k}$  part can contribute to any  $p(q^{-s})$  for  $p \in \mathbb{C}[q^s, q^{-s}]$  with  $\deg \leq k-1$ , and the  $|t| \leq q^{-k}$  part is of the form

$$\int_{\mathfrak{p}^k \setminus \{0\}} (\chi_i \xi)(y) |y|^s d^\times y = \sum_{n \geq k} ((\chi \xi)(\varpi) q^{-s})^n \int_{\mathcal{O}^*} (\chi_i \xi)(y) d^\times y = C \frac{\alpha_i^k q^{-ks}}{1 - \alpha_i q^{-s}},$$

where  $C \neq 0$  iff  $\chi_i \xi$  is unramified, or of the form

$$\int_{\mathfrak{p}^k \setminus \{0\}} v(y) (\chi_i \xi)(y) |y|^s d^\times y = \sum_{n \geq k} n ((\chi \xi)(\varpi) q^{-s})^n \int_{\mathcal{O}^*} (\chi_i \xi)(y) d^\times y = C \frac{\alpha_i^k q^{-ks}}{(1 - \alpha_i q^{-s})^2},$$

where  $C \neq 0$  iff  $\chi_i \xi$  is unramified.

For the last assertion, choose the compactly supported part of  $\Phi$  suitably.

□

**Prop. (29.5.5.9) [Local Functional Equations].** For  $v \in \Sigma_F$ , the local zeta integral  $\zeta_v(\Phi_v, \xi_v; s)$  defined in (29.5.5.4) has a meromorphic continuation to all  $s$ , and there exists a meromorphic function  $\gamma_v(x, \pi_v, \xi_v, \psi_v)$  s.t.

$$\zeta_v(\pi(w_1)\Phi_v, \xi_v^{-1}\omega_v^{-1}; 1-s) = \gamma_v(\pi_v, \xi_v, \psi_v; s) \zeta_v(\Phi_v, \xi_v; s).$$

┘

*Proof:* This follows by similar method as the proof of (29.5.2.8) and by evaluating  $\gamma_v(\pi_v, \xi_v, \psi_v; s)$  explicitly, using methods of Weil representation parallel to the proof of (29.5.5.10), Cf. [Jacquet-Langlands (1970), P37].

There are easier way to prove this when  $v \in \Sigma_F^{\text{fin}}$ : We show that both sides are linear functionals on  $\Phi \in V$  that satisfies

$$L\left(\pi\left(\begin{bmatrix} y & \\ & 1 \end{bmatrix}\right)\Phi\right) = \xi^{-1}(y) |y|^{-s+1/2} L(\Phi).$$

This is true for RHS by a change of variable and analytic continuation (29.5.5.8), and then also true for LHS.

Thus for general  $s$ , (24.11.3.15) shows two sides differ by a scalar  $\gamma(s, \pi, \xi, \psi)$ . By (29.5.5.8), for general  $s$ , both sides can be non-zero, thus  $\gamma(s, \pi, \xi, \psi)$  is non-zero, and thus a meromorphic function of  $s$ .  $\square$

**Prop. (29.5.5.10) [Gamma Factor Commutes with Parabolic Induction].** ? See. [JSS83, J-S90].

For example, if  $v \in \Sigma_F^{\text{fin}}$  and  $\pi = \chi_1 \times \chi_2 \in \text{Irr}^{\text{adm}}(\text{GL}(2; F_v))$ , then

$$\gamma(\pi, \xi, \psi; s) = \gamma(\xi\chi_1, \psi; s)\gamma(\xi\chi_2, \psi; s).$$

┘

*Proof:* Cf. [Bump, P548]. ? This uses the concrete realization of the Whittaker model of  $\mathcal{B}(\chi_1, \chi_2)$  as a quotient of the Weil representation in the split case.  $\square$

### Rankin-Selberg $L$ -Functions( $\text{GL}(n) \times \text{GL}(m)$ case)

**Prop. (29.5.5.11) [Local  $\epsilon$ -Factors].** Situation as in (29.5.5.9),

If  $n = n'$ , the  $\epsilon$ -factor defined in (29.3.1.32) satisfies

$$\frac{\zeta_v(\pi(w_n)\Phi_v, \pi(w_n)\Phi'_v, \varphi_v^\wedge; 1-s)}{L_v(\pi_v^\vee \times \pi_v'^\vee; s)} = \omega_{\pi'}(-1)^n \epsilon_v(\pi_v \times \pi_v', \psi_v; s) \frac{\zeta_v(\Phi_v, \Phi'_v, \varphi_v; s)}{L_v(\pi_v \times \pi_v'; s)}, \quad \varphi^\wedge(x) = \int_{F_v^n} \varphi(y) \psi(y^t x) dy,$$

and  $\frac{\zeta(\Phi_v, \xi_v; s)}{L_v(\pi_v, \xi_v; s)}$  is holomorphic. Moreover,  $\epsilon_v(\pi_v, \pi_v', \psi_v; s)$  is of the form  $ab^s$  for  $a \in \mathbb{C}^*$ ,  $b \in \mathbb{R}_+$ , where  $b \in \|v\|^{\mathbb{Z}_+}$  if  $v \in \Sigma_F^{\text{fin}}$ . And  $\epsilon_v(\pi_v \times \pi_v', \psi_v; s) = 1$  if  $v$  is unramified in the sense of (29.5.5.3).

If  $n > n'$ , the  $\epsilon$ -factor defined in (29.3.1.32) satisfies

$$\frac{\zeta_{v, n-n'-1-j}(\pi(\begin{bmatrix} 1_{n'} & 0 \\ 0 & w_{n-n'} \end{bmatrix} w_n) \Phi_v, \pi(w_1) \Phi'_v; 1-s)}{L_v(\pi_v^\vee \times \pi_v'^\vee; s)} = \omega_{\pi'}(-1)^{n-1} \epsilon_v(\pi_v \times \pi_v', \psi_v; s) \frac{\zeta_{v,j}(\Phi_v, \Phi'_v; s)}{L_v(\pi_v \times \pi_v'; s)}.$$

┘

*Proof:* ? We only prove for  $n = 2$ .

Such a meromorphic  $\epsilon_v(\pi_v, \xi_v, \psi_v; s)$  exists by (29.5.5.9). It is holomorphic and non-vanishing by the same reason as in (29.5.3.2) as both  $\frac{\zeta(\Phi_v, \xi_v; s)}{L_v(\pi_v, \xi_v; s)}$  and  $\frac{\zeta(\pi(w_1)\Phi_v, \xi_v^{-1}; 1-s)}{L_v(\pi_v, \xi_v^{-1}; s)}$  are holomorphic by (29.5.5.8) and for any  $s_0 \in \mathbb{C}$ ,  $\Phi_v$  can be chosen to make either one of them non-vanishing at  $s_0$ . To show it is of the form  $ab^s$ : If  $v \in \Sigma_F^{\text{fin}}$ , it is a rational function in  $\|v\|^{-s}$  with no zeros or poles, so it must be of the form  $ab^s$ . And if  $v$  is unramified, then we can let  $\Phi_v$  be the spherical function in  $\pi_v$  normalized s.t.  $W_{v, \varphi_v}(1) = 1$ , then  $\pi(w_1)\Phi_v$  is the normalized spherical function of  $\hat{\pi}_v$ . Then by (19.4.2.5), both sides are 1 by (29.5.5.5).

If  $v \in \Sigma_F^\infty$ , then we can take  $\Phi_v$  as in (29.5.5.8) to do the calculation to show it directly, Cf. [Jacquet-Langlands, GL(2)]. ?  $\square$

**Prop. (29.5.5.12) [Rankin-Selberg  $L$ -Functions].** for any  $\pi = \otimes' \pi_v \in \text{Irr}^{\text{adm}}(\text{GL}(n; \mathbf{A}_F))$  and  $\pi' = \otimes' \pi'_v \in \text{Irr}^{\text{adm}}(\text{GL}(n'; \mathbf{A}_F))$ , define

$$L(\pi \times \pi'; s) = \prod_{v \in \Sigma_F^{\text{fin}}} L_v(\pi_v \times \pi'_v; s), \quad \Lambda(\pi \times \pi'; s) = \prod_{v \in \Sigma_F} L_v(\pi_v \times \pi'_v; s), \quad \epsilon(\pi \times \pi'; s) = \prod_{v \in \Sigma_F} \epsilon_v(\pi_v \times \pi'_v, \psi_v; s).$$

Notice that  $\epsilon(\pi \times \pi'; s)$  is definable because a.e. term is 1, and doesn't depend on  $\psi$ . ?

If  $\pi \in \text{Irr}^{\text{auto}}(\text{GL}(n)/F)$  and  $\pi' \in \text{Irr}^{\text{auto}}(\text{GL}(n')/F)$ , then  $L(\pi \times \pi'; s)$  is absolutely convergent for  $\text{Re}(s) > 1$ , and defines a holomorphic function there.  $\square$

*Proof:* Cf. [J-S81]Thm5.3 and (5.3.2)(5.3.5). ?

For definition of completed  $L$ -functions for  $\mathrm{GL}(n)$ , Cf. [Gelbart-Jacquet, A relation between automorphic representations of  $\mathrm{GL}(2)$  and  $\mathrm{GL}(3)$ ] and [Jacquet, Principal  $L$ -functions of the linear group]. ? □

**Thm. (29.5.5.13)[Global Functional Equations].** Let  $\Lambda(\pi, \pi'; s)$  be the completed  $L$ -function defined in (29.5.5.12), then the global  $\epsilon$ -factor  $\epsilon(\pi, \pi'; s)$  (29.3.1.32) is independent of  $\psi$ , and  $L(\pi, \pi'; s)$  satisfies a functional equation

$$\Lambda(\pi, \pi'; s) = \epsilon(\pi, \pi'; s) \Lambda(\pi^\vee, \pi'^\vee; s).$$

┘

*Proof:* This follows from (29.5.5.11) and (29.5.5.6). □

**Thm. (29.5.5.14)[Poles on  $\mathrm{Re}(s) = 1$ , Jacquet-Shalika [J-S81a]].** Suppose  $\pi, \pi'$  are unitary, then

- If  $n > n'$ ,  $L(\pi \times \pi'; s)$  has no pole on the line  $\mathrm{Re}(s) = 1$ .
- If  $n = n'$ , the poles of  $L(\pi \times \pi'; s)$  on the line  $\mathrm{Re}(s) = 1$  are all simple poles at  $s$  where  $\pi(s-1) \cong \pi'^\vee$ . In particular,  $L(\pi \times \pi'; s)$  has a pole at  $s = 1$  iff  $\pi' \cong \pi^\vee$ .

┘

*Proof:* Cf. [J-S81a]P795, P802. ? □

### Rankin-Selberg for Modular Forms

**Notation (29.5.5.15).**

- Use notations on Eisenstein series as in Eisenstein Series.

┘

**Prop. (29.5.5.16)[Convolution of Cusp Forms].** If  $f(z) = \sum A(n)q^n \in S_k(\Gamma(1))$ ,  $g(z) = \sum B(n)q^n \in M_k(\Gamma(1))$ , define

$$L(f \times g; s) = \zeta(2s - 2k + 2) \sum A(n)B(n)n^{-s}, \quad \Lambda(f \times g; s) = (2\pi)^{-2s} \Gamma(s) \Gamma(s - k + 1) L(f \times g; s),$$

then  $L(s, f \times g)$  is absolutely convergent for  $s$  large,  $\Lambda(s, f \times g)$  has a meromorphic continuation to all  $s$ , analytic except for at most simple poles at  $s = k$  or  $s = k - 1$ , and it satisfies a functional equation

$$\Lambda(s, f \times g) = \Lambda(2k - 1 - s, f \times g).$$

and the residue of  $\Lambda$  at  $s = k$  is  $\frac{1}{2}\pi^{1-k}(f, g)$  (26.3.1.7).

Moreover, if  $f, g$  are Hecke eigenforms, let

$$1 - A(p)X + p^{k-1}X^2 = (1 - \alpha_1(p)X)(1 - \alpha_2(p)X),$$

$$1 - B(p)X + p^{k-1}X^2 = (1 - \beta_1(p)X)(1 - \beta_2(p)X),$$

then  $L(s, f \times g)$  has an Euler product formula

$$L(s, f \times g) = \prod_p \prod_{i=1}^2 \prod_{j=1}^2 \frac{1}{1 - \alpha_i(p)\beta_j(p)p^{-s}}.$$

┘

*Proof:* We may assume  $f, g$  are Hecke eigenforms (26.3.2.16), so  $A(n), B(n)$  are real. Let  $\varphi(z) = f(z)\overline{g(z)}y^k$ , then  $\varphi$  satisfies the condition of the Rankin-Selberg method (26.9.2.6), thus we calculate

$$\begin{aligned}\varphi_0(y) &= \int_0^1 f(x+iy)\overline{g(x+iy)}y^k dx = \sum_{n=0}^{\infty} \int_{m=0}^{\infty} \int_0^1 A(n)B(m)e^{2\pi i(n-m)x}e^{-2\pi(n+m)y}y^k dx \\ &= \sum_{n=0}^{\infty} A(n)B(n)e^{-4\pi ny}y^k\end{aligned}$$

and

$$M(s, \varphi_0) = \sum_{n=0}^{\infty} A(n)B(n) \int_0^{\infty} e^{-4\pi ny}y^{s+k} \frac{dy}{y} = (4\pi)^{-s-k} \Gamma(s+k) \sum_{n=0}^{\infty} A(n)B(n)n^{-s-k}$$

and

$$\Lambda(s, \varphi_0) = 4^{-s-k+1} \pi^{-2s-k+1} \Gamma(s) \Gamma(s+k-1) \zeta(2s) \sum_{n=1}^{\infty} A(n)B(n)n^{-s-k+1}.$$

Thus

$$\Lambda(s-k+1, \varphi_0) = \pi^{k-1} \Lambda(s, f \times g),$$

and the assertion follows from (26.9.2.6). The residue is also clear.

The Euler product formula follows from (10.7.2.3) applied to  $z = p^{-s}$  for all  $p \in \mathbf{P}$ .  $\square$

**Remark (29.5.5.17) [Averaged Ramanujan Conjecture].** By the Ramanujan conjecture (29.5.4.9), for any cuspidal form  $f = \sum a(n)q^n$ ,  $L(s, f) = \sum a_n n^{-s}$  is convergent for  $\operatorname{Re}(s) > \frac{k+1}{2}$ . But we can prove this directly: as  $\sum a_n^2 n^{-s}$  is convergent for  $\operatorname{Re}(s) > k$ , and  $|a(n)| \leq \max(n^{\frac{k-1}{2}}, n^{-\frac{k-1}{2}} |a(n)|^2)$ .  $\perp$

## 6 Langlands-Shahidi Method

Construct  $L$ -functions by analytic continuation of constant terms of Eisenstein Series. See [Shahidi, Automorphic  $L$ -functions, a survey], and [Shahidi, Eisenstein series and automorphic  $L$ -functions], [Cogdell-Kim-Murty, Lectures on automorphic  $L$ -functions].

## 7 Exterior Square $L$ -Functions

There are two Rankin-Selberg constructions of exterior square  $L$ -functions, which can be found in [Jacquet-Shalika1990, Exterior square  $L$ -functions] and [Bump-Friedberg1990, The “exterior square” automorphic  $L$ -functions on  $\operatorname{GL}(n)$ ].

Here are some examples of  $L$ -functions:

- $\pi_1 = \pi, \pi_2 = \pi^\vee$ , then for  $\operatorname{Ram}(\pi) \subset_{\text{fin}} S \subset \Sigma_F$ ,

$$L_S(s, \pi \times \pi^\vee) = \prod_{v \notin S} \prod_{1 \leq i, j \leq n} \frac{1}{1 - \alpha_i(\pi_v) \alpha_j^{-1}(\pi_v) q_v^{-s}}.$$

In this case, this is the functorial lifting of

$$\operatorname{GL}(n) \rightarrow \operatorname{GL}(n) \times \operatorname{GL}(n) \rightarrow \operatorname{GL}(n^2) : g \mapsto (g, g^{-t}) \mapsto g \otimes g^{-t}$$

by (26.6.3.5), which is isomorphic to the conjugation action of  $\mathrm{GL}(n)$  on  $\mathrm{Mat}(n)$ . This action decomposes as a trivial action and a  $n^2 - 1$ -dimensional representation  $\mathrm{Ad}^0$ . Thus there should be a decomposition

$$L_S(s, \pi \times \pi^\vee) = \zeta_{F,S}(s) L_S(s, \pi, \mathrm{Ad}^0)$$

where  $\zeta_{F,S}(s)$  is the partial zeta function on  $F$ .

- $\pi_1 = \pi = \pi_2$ , then for  $\mathrm{Ram}(\pi) \subset_{\mathrm{fin}} S \subset \Sigma_F$ ,

$$L_S(s, \pi \times \pi) = \prod_{v \notin S} \prod_{1 \leq i, j \leq n} \frac{1}{1 - \alpha_i(\pi_v) \alpha_j(\pi_v) q_v^{-s}}.$$

In this case, this is the functorial lifting of

$$\mathrm{GL}(n) \xrightarrow{\Delta} \mathrm{GL}(n) \times \mathrm{GL}(n) \rightarrow \mathrm{GL}(n^2) : g \mapsto (g, g^{-1}) \mapsto g \otimes g^{-1}$$

by (26.6.3.5), which decomposes as a  $\frac{1}{2}n(n+1)$ -dimensional symmetric square representation  $\mathrm{Sym}^2$ , and a  $\frac{1}{2}n(n-1)$ -dimensional exterior square representation  $\wedge^2$ . Thus there should be a decomposition

$$L_S(s, \pi \times \pi^\vee) = L_S(s, \mathrm{Sym}^2 \pi) L_S(s, \wedge^2 \pi),$$

where  $L_S(\mathrm{Sym}^2 \pi; s)$  and  $L_S(\wedge^2 \pi; s)$  are called the **symmetric square  $L$ -functions** and **exterior square  $L$ -functions** of  $\pi$ .

## 8 Symmetric Power $L$ -Functions

The construction of symmetric square  $L$ -functions can be found in [Symmetric square  $L$ -functions on  $\mathrm{GL}(r)$ , Bump-Ginzburg(1992)] and [Symmetric power  $L$ -functions for  $\mathrm{GL}(2)$ , Shahidi]. For symmetric powers, Cf.[Kim-Shahidi]. Their method uses the unitary dual of  $\mathbf{G}_2$ .

## 9 Triple Products(Garrett)

Cf.[Bump], [Garrett] and [S-R87] and Harris/Ikeda/Ramakrishnan/Orloff.

The construction of the  $L$ -function involves integrating against Eisenstein series on  $\mathrm{GSp}(4)$ .

Other triple convolutions, of type  $\mathrm{GL}(2) \times \mathrm{GL}(3) \times \mathrm{GL}(m)$ , where  $m=3, 4$ , or  $5$  may be obtained from Shahidi's method by means of the exceptional groups E6, E7, and E8. These  $L$ -functions have not yet been achieved as Rankin-Selberg convolutions.

**Thm. (29.5.9.1)** [Integral Representations of Triple Product  $L$ -Functions]. ┘

*Proof:* Cf.[Garrett, Decomposition of Eisenstein series: Rankin triple products] and [S-R87]. ? □

## 29.6 Converse Theorems

### 1 Converse Theorem for $GL(2)$

**Prop. (29.6.1.1) [Converse Theorem (Correspondence for  $\Gamma(1)$ ), Hecke].** If  $f \neq 0 \in \text{SF}_k(\Gamma(1))$  (so  $2|k$ ), then  $\Lambda(f; s)$  (29.5.4.12) has analytic continuation to all  $s \in \mathbb{C}$ , is bounded on vertical strips, and satisfies a functional equation

$$\Lambda(s, f) = (-1)^{k/2} \Lambda(k - s, f).$$

Conversely, let  $a_0, a_1, \dots$  be a sequence of complex numbers that  $a_n = O(n^M)$  for some  $M > 0$ . Let  $f(s), L(s), \Lambda(s)$  be defined in (29.5.4.12) and  $\Lambda(f; s)$  has analytic continuation to all  $s$  and satisfies the above functional equation, then  $f(z) \in \text{SF}_k(\Gamma(1))$ .

Moreover, in this case,  $f$  is a normalized Hecke eigenform (26.3.2.16) iff  $L(s, f)$  has as Euler product formula

$$L(s) = \prod_p (1 - a_p p^{-s} + p^{k-1-2s})^{-1}$$

for  $s$  sufficiently large, where  $1 - a_s X + p^{k-1} X^2 = (1 - aX)(1 - \bar{a}X)$ , where  $|a| = p^{\frac{k-1}{2}}$ .  $\lrcorner$

*Proof:* The first part is a direct consequence of (29.5.4.13). Notice  $a_n$  is bounded by polynomials in  $n$  by (29.5.4.8).

When  $s$  is large, the Euler product is absolutely convergent, thus it suffices to compare the coefficients. By (26.3.2.16) and (26.3.2.9),  $f$  being a normalized Hecke eigenform is equivalent to

$$\begin{cases} c_m c_n = c_{mn}, & (m, n) = 1 \\ c_p c_{p^n} = c_{p^{n+1}} + p^{2k-1} c_{p^{k-1}} \end{cases}$$

which is equivalent to

$$(1 - a_p X + p^{k-1} X^2) \left( \sum_{r=0}^{\infty} a_{p^r} X^r \right) = 1.$$

$\square$

**Thm. (29.6.1.2) [Converse Theorem for Modular Forms, Hecke/Weil [Wei67]].** Let  $N > 0$  and  $\psi \in \text{Diri}(N)$ . Suppose  $a_n, b_n$  are two sequence of complex numbers that  $|a_n|, |b_n| = O(n^M)$  for some positive integer  $M$ . If  $(D, N) = 1$  and  $\chi$  is a primitive character mod  $D$ , let

$$L_1(\chi; s) = \sum \chi(n) a_n n^{-s}, \quad L_2(s, \bar{\chi}) = \sum \overline{\chi(n)} b_n n^{-s},$$

and  $\Lambda_i(s, \chi_i) = L_{\mathbb{C}}(s) L_i(s, \chi_i)$ .

Now if for  $D$  equals to a.e.  $p$  and any primitive character mod  $D$ ,  $\Lambda_i(s, \chi)$  has analytic continuation to all  $s$ , are bounded on vertical strips, and satisfy the functional equation

$$\Lambda_1(s, \chi) = i^k \chi(N) \psi(D) \frac{\tau(\chi)^2}{D} (D^2 N)^{-s+k/2} \Lambda_2(k - s, \bar{\chi}),$$

where  $\tau(\chi)$  is the Gauss sum of  $\chi$  (35.3.6.8), then  $f(z) = \sum a_n e^{2\pi i n z} \in \text{MF}_k(N, \psi)$ .  $\lrcorner$

*Proof:* Let

$$f_{\chi}(z) = \sum \chi(n) a_n q^n, \quad g_{\bar{\chi}}(z) = \sum \overline{\chi(n)} b_n q^n.$$

We first show equation 29.3 holds. As in the proof of (29.5.4.11), it suffices to show the functional equation it is true on the positive imaginary axis. If  $\sigma = \operatorname{Re}(s)$  is sufficiently large, then

$$\int_0^\infty f_\chi(iy) y^s \frac{dy}{y} = \Lambda_1(s, \chi).$$

so by Mellin inversion formula

$$f_\chi(iy) = \frac{1}{2\pi i} \int_{\sigma-i\infty}^{\sigma+i\infty} \Lambda_1(s, \chi) y^{-s} ds = i^k \chi(N) \psi(-D) \frac{\tau(\chi)^2}{D} \frac{1}{2\pi i} \int_{\sigma-i\infty}^{\sigma+i\infty} (D^2 N)^{-s+k/2} \Lambda_2(k-s, \bar{\chi}) ds$$

Same argument of Phragmén-Lindelöf principle as in proof of (29.5.4.11) shows  $\Lambda_2(\sigma + it, \bar{\chi})$  converges to 0 for  $t \rightarrow \infty$ , uniformly on any compact subset, so we can move the integral horizontally and make a change of variable  $s \mapsto k-s$  to get

$$\begin{aligned} f_\chi(iy) &= i^k \chi(N) \psi(-D) \frac{\tau(\chi)^2}{D} (D^2 N)^{-k/2} y^{-k} \frac{1}{2\pi i} \int_{\sigma-i\infty}^{\sigma+i\infty} \Lambda_2(k-s, \bar{\chi}) (D^2 N y)^s ds \\ &= i^k \chi(N) \psi(-D) \frac{\tau(\chi)^2}{D} (D^2 N)^{-k/2} y^{-k} g_{\bar{\chi}}\left(\frac{i}{D^2 N y}\right) \end{aligned}$$

which is equivalent to 29.3.

The rest is to manipulate  $2 \times 2$  matrices and use (26.1.2.10) to show that  $g \in \operatorname{MF}_k(N, \bar{\psi})$ , Cf. [Bump, P62] ?  $\square$

**Remark (29.6.1.3).** For  $\Gamma(1)$ , the function only requires one functional equation, and we used the fact  $\Gamma(1)$  is generated by  $S$  and  $T$ . But  $\Gamma_0(N)$  is not generated by two elements, so we must assume functional equations for the twists  $L(f, \chi; s)$  too.  $\lrcorner$

## 2 Converse Theorems for $\operatorname{GL}(n)$

References are [C-S94, C-S99, C-S02].

**Def. (29.6.2.1) [Setup].** Let  $n \in \mathbb{Z}_{\geq 2}$  and  $\Pi = \otimes' \Pi_v \in \operatorname{Irr}^{\operatorname{adm}}(\operatorname{GL}(n; \mathbf{A}_F))$ , there are associated local  $L$  and  $\epsilon$ -functions

$$\Lambda(\Pi; s) = \prod_{v \in \Sigma_F} L(\Pi_v; s), \quad \epsilon(\Pi; \psi; s) = \prod_{v \in \Sigma_F} \epsilon(\Pi_v, \psi_v; s) \quad (29.5.5.12).$$

Assume that:

- $\Lambda(\Pi; s)$  converges absolutely for  $s \in \mathbb{C}$  with  $\operatorname{Re}(s)$  sufficiently large.
- The central character  $\omega_\Pi$  of  $\Pi$  is invariant under  $F^\times$ .

Then  $\epsilon(\Pi, \psi; s)$  doesn't depend on  $\psi$ .

And for  $m \in [n-1]_+$  and  $\pi' = \otimes'_v \pi_v \in \operatorname{Irr}^{\operatorname{cusp}}(\operatorname{GL}(m)/F)$ , we can also formally define

$$\Lambda(\Pi \times \pi'; s) = \prod_{v \in \Sigma_F} L_v(\Pi_v \times \pi'_v; s), \quad \epsilon(\Pi \times \pi', \psi; s) = \prod_{v \in \Sigma_F} \epsilon(\Pi_v \times \pi'_v; s) \quad (29.5.5.12),$$

and similarly for the contragradient

$$\Lambda(\Pi^\vee \times (\pi')^\vee; s), \quad \epsilon(\Pi^\vee \times (\pi')^\vee, \psi; s).$$

Then:

- $\Lambda(\Pi \times \pi'; s)$  and  $\Lambda(\Pi^\vee \times (\pi')^\vee; s)$  converges absolutely for  $\operatorname{Re}(s) \gg 0$ ,
- $\epsilon(\Pi \times \pi', \psi; s)$  and  $\epsilon(\Pi^\vee \times (\pi')^\vee, \psi; s)$  are independent of  $\psi$ .

┘

*Proof:* Cf.[Cogdell-Shapiro, Converse Theorems for  $\mathrm{GL}(n)$ ]

□

**Def. (29.6.2.2) [Nice Properties of  $L$ -Functions].** Situation as in (29.6.2.1), we say that  $L(\Pi \times \pi'; s)$  is **nice  $L$ -function** if

- $\Lambda(\Pi \times \pi'; s)$  and  $\Lambda(\Pi^\vee \times (\pi')^\vee; s)$  extends to an analytic function for  $s \in \mathbb{C}$ .
- $\Lambda(\Pi \times \pi'; s)$  and  $\Lambda(\Pi^\vee \times (\pi')^\vee; s)$  are bounded on vertical strips of finite width.
- There is a functional equation

$$\Lambda(\Pi \times \pi'; s) = \epsilon(\Pi \times \pi'; s) \Lambda(\Pi^\vee \times (\pi')^\vee; s).$$

┘

**Thm. (29.6.2.3) [Converse Theorem for  $\mathrm{GL}(n)$  for Ramified Twists, Jacquet-Shapiro-Shalika [JSS79, JSS79a]/Cogdell-Shapiro [C-S99]].** Situation as in (29.6.2.1). Assume  $n \geq 3$ . Let  $\emptyset \subsetneq_{\mathrm{fin}} S \subset \Sigma_F^{\mathrm{fin}}$  and suppose that  $L(\Pi \times \pi'; s)$  is nice (29.6.2.2) for any  $\pi' \in \operatorname{Irr}^{\mathrm{cusp}}(\mathrm{GL}(m)/F)$  which is unramified at  $v \in S$  and  $m \leq n-2$ , then there exists  $\Pi' \in \operatorname{Irr}^{\mathrm{auto}}(\mathrm{GL}(n)/F)$  s.t.  $\Pi'_v \cong \Pi_v$  for any  $v \in \Sigma_F \setminus S$ .

┘

*Proof:*

□

**Thm. (29.6.2.4) [Converse Theorem for  $\mathrm{GL}(n)$  for Unramified Twists, Hecke/Weil/-Jacquet-Langlands [J-L70]/Cogdell-Shapiro [C-S94]].** Situation as in (29.6.2.1), Let  $\Sigma_F^\infty \subsetneq_{\mathrm{fin}} S \subset \Sigma_F$  and suppose that

- $\mathrm{Cl}(\mathcal{O}_{F,S}) = 1$ .
- $L(\Pi \times \pi'; s)$  is nice (29.6.2.2) for any  $\pi' \in \operatorname{Irr}^{\mathrm{cusp}}(\mathrm{GL}(m)/F)$  which is unramified outside  $S$  and  $m \leq n-1$ .

then there exists  $\Pi' \in \operatorname{Irr}^{\mathrm{auto}}(\mathrm{GL}(n)/F)$  s.t.  $\Pi'_v \cong \Pi_v$  for any  $v \in S \cup (\operatorname{Unr}(\Pi) \cap \operatorname{Unr}(\Pi'))$ .

### Conjectures

**Conj. (29.6.2.5) [Converse Theorem for  $\mathrm{GL}(n)$ , Jacquet].** Situation as in (29.6.2.1). Suppose  $L(\Pi \times \pi'; s)$  is nice (29.6.2.2) for any  $m \in [\lfloor \frac{n}{2} \rfloor]_+$  and  $\pi' \in \operatorname{Irr}^{\mathrm{cusp}}(\mathrm{GL}(m)/F)$ , then  $\Pi \in \operatorname{Irr}^{\mathrm{auto}}(\mathrm{GL}(n)/F)$ . ┘

*Proof:*

□

**Conj. (29.6.2.6) [Converse Theorem for  $\mathrm{GL}(n)$ , Cogdell-Shapiro [C-S94]].** Situation as in (29.6.2.1). Suppose  $L(\Pi \otimes \omega; s)$  is nice (29.6.2.2) for any Hecke character  $\omega$ , then there exists  $\Pi' \in \operatorname{Irr}^{\mathrm{auto}}(\mathrm{GL}(n)/F)$  s.t.  $\Pi'_v \cong \Pi_v$  for any  $v \in \operatorname{Unr}(\Pi) \cap \operatorname{Unr}(\Pi')$ . Moreover,  $L(\Pi \otimes \omega; s) = L(\Pi' \otimes \omega; s)$  and  $\epsilon(\Pi \otimes \omega; s) = \epsilon(\Pi' \otimes \omega; s)$ . ┘

*Proof:*

□

**Thm& Conj. Cor. (29.6.2.7).** This conjecture is true for  $n \leq 3$  and in this case we can take  $\Pi' = \Pi$ , by (29.6.2.4) and (29.6.2.5). For  $n \geq 4$ , taking  $\Pi = \Pi'$  might not be possible. ┘

[Jacquet-Langlands] proved converse theorems for  $\mathrm{GL}(2)$ .

## 29.7 Automorphic Representations of $\mathrm{SO}(n)$

References are [Ginzburg-Rallis-Soudry, Generic automorphic forms on  $\mathrm{SO}(2n+1)$ : functorial lift to  $\mathrm{GL}(2n)$ ], [Cogdell-Kim-Piatetski-Shapiro-Shahidi, On lifting from classical groups to  $\mathrm{GL}(N)$ ],

the well-known Piatetski-Shapiro program to prove the Langlands functorial lift from irreducible generic cuspidal automorphic forms on the classical groups to the general linear group via the converse theorem method succeeded in the case of  $\mathrm{SO}(2n+1)$  by using the analytic properties of automorphic  $L$ -functions developed by the Langlands-Shahidi method.

### 1 Endoscopy for $\mathrm{SO}(2n+1)$

**Thm. (29.7.1.1) [Endoscopy for  $\mathrm{SO}(2n+1)$ ].** There is a bijective functorial correspondence between generic cuspidal representations  $\tau \in \mathrm{Irr}^{\mathrm{cusp}}(\mathrm{SO}(2m+1)/F)$  and families of distinct cuspidal symplectic representations  $\pi_i \in \mathrm{Irr}^{\mathrm{cusp}}(\mathrm{GL}(2n_i)/F)$  with  $n_1 + \dots + n_k = m$  s.t.

$$L(\pi \times \tau; s) = \prod_{i=1}^k L(\pi \times \pi_i; s).$$

for any  $r \in \mathbb{Z}_+$  and  $\pi \in \mathrm{Irr}^{\mathrm{auto}}(\mathrm{GL}(r)/F)$ . ┘

*Proof:* ? □

## 29.8 Endoscopic Classifications

References are [Jacquet-Langlands70], [Trace Formula, an introduction, Arthur], [Problems beyond endoscopy, Arthur] and [Getz].

The goal is to classify automorphic representations of classical groups in terms of automorphic representations of  $\mathrm{GL}(n)$ .

### 1 Arthur's Multiplicity Conjectures

**Conj.(29.8.1.1)**[Arthur's Multiplicity Conjecture]. ┘

**Thm& Conj.Cor.(29.8.1.2).** Arthur's multiplicity conjectures are verified for quasi-split classical groups by [Arthur, endoscopic classification of representations] and [Endoscopic classification of representations of quasi-split unitary groups, Mok]. Some cases of non-quasi-split groups are known by [Endoscopic Classification of Representations: Inner Forms of Unitary Groups, Kaletha-Minguez-Shin-White] and [Taibi. Arthur's multiplicity formula for certain inner forms of special orthogonal and symplectic groups]. ┘

*Proof:* ? □

### 2 Comparison of Trace Formulae

The approach is comparison of trace formulae. It's complicated because one needs to use stable trace formula and also the twisted trace formula.

The theory of endoscopy represents a precise measure, in both geometric and spectral terms, of the failure of geometric conjugacy to imply conjugacy. ?

### 3 Jacquet-Langlands Transfer

### 4 Twisted Endoscopy

### 5 Applications

1. A complete classification of automorphic representations of  $G$  will lead to a sharp Weyl's law for the Shimura variety  $X_\Gamma = \gamma \backslash G(\mathbb{R})/K$ . Notice [Lindenstrauss-Venkatesh] has proved a crude Weyl's law for general non-compact

2. Endoscopic classification will imply some cases of Langlands functoriality.

### 6 Beyond Endoscopy

## 29.9 Relative Langlands Duality

References are [S-V17] and [BZSV].

**Notation (29.9.0.1).**

- Let  $k \in \mathbf{Field}^0$ .
- Let  $(G, \Phi, B, T, \Phi, \Delta, W) \in \mathbf{RedGrp}/F$  be split. Let  $U$  be the unipotent of  $B$  and  $L = B/U$ .
- Use notations on spherical varieties defined in [Spherical Varieties](#).
- Let  $X = H \backslash G$  be a spherical variety for  $G$  (29.9.1.14) with an open orbit  $Bx_0 \subset X$ .
- Use notations on Langlands-Arthur conjectures defined in [Langlands-Arthur Conjectures](#).

┘

### 1 Spherical Varieties

References are [Luna-Vust theory of spherical embeddings, Knop] and [L-V83].

**Notation (29.9.1.1).**

- Let  $k \in \mathbf{Field}^0$ . Notice that there is a corresponding theory over characteristic  $p$ .
- Let  $(G, \Phi, B, T, \Phi, \Delta, W) \in \mathbf{RedGrp}/F$  be split. Let  $U$  be the unipotent of  $B$  and  $L = B/U$ .
- Let  ${}^L G$  be the Langlands dual group of  $G$  with a canonical maximal torus  ${}^L T$ .  ${}^L G$  is canonical up to a conjugation by elements of  ${}^L T$ . ?

┘

**Def. (29.9.1.2)[Spherical Varieties].** A (homogenous)spherical variety for  $G$  is a quasi-affine normal variety  $X \in \mathbf{Var}/k$  with a right  $G$ -action s.t. it is  $G$ -homogenous space  $X = H \backslash G$  and  $B$  has a dense orbit  $X^\circ \subset X$ . Such an  $H$  is called a **spherical subgroup** of  $G$ .

More generally, if  $G$  is not necessarily split and  $B \leq G_{\bar{k}}$  is a Borel subgroup, then a spherical variety for  $G$  is a separated normal scheme of f.t.

┘

**Prop. (29.9.1.3)[Semi-Invariant Functions].** We have  $R(X) = R(G)^H$ . ?

The multiplicative group of non-zero rational  $B$ -eigenfunctions is denoted by  $R(X)^{(B)}$ , and the group of  $B$ -eigencharacters is denoted by  $\chi(X) \subset B(k)^\vee$ .

Because  $X$  has a dense  $B$ -orbit, we have an exact sequence

$$1 \rightarrow k^\times \rightarrow R(X)^{(B)} \rightarrow \chi(X) \rightarrow 1.$$

Denote  $\Lambda_X = \chi(X)^\vee$  and  $\mathfrak{a}_X = \Lambda_X \otimes \mathbb{Q}$ .

Let  $\mathcal{V}(X)$  or  $\mathfrak{a}_X^+$  be the subspace of  $\mathfrak{a}_X$  generated by restrictions of  $G$ -invariant  $\mathbb{Q}$ -valued valuations on  $R(X)$  that is trivial on  $k^\times$ , and  $\mathfrak{a}_X^+ \cap \Lambda_X$  the monoid of  $\mathbb{Z}$ -valued valuations. Thus  $\mathfrak{a}_X^+$  is a finite free Abelian group ? , whose rank is called the **spherical rank of  $X$** .

┘

*Proof:* The kernel of  $R(X)^{(B)} \rightarrow \chi(X)$  are  $B$ -invariant rational functions on  $X$ . Since  $B$  has an open orbit on  $X$ , they are all constant.  $\square$

**Def. (29.9.1.4)[ $B$ -Invariant Divisors and Colors].** Denote  $\mathcal{D}(X)$  the set of all  $B$ -stable prime divisors on  $X$ . Because  $X$  has an open  $B$ -orbit, we know  $\#\mathcal{D}(X) < \infty$ .

A **spherical color** of  $X$  is a  $B$ -stable divisor of  $X$  that is not  $G$ -stable.

Any  $D \in \mathcal{D}(X)$  induces a discrete valuation  $v_D$  on  $R(X)$  that is trivial on  $k^\times$  by (5.3.5.33), thus induces an element  $\rho_{v_D} \in \Lambda_X$ .

┘

**Thm. (29.9.1.5) [Sumihiro].** If  $G$  is a torus acting on a normal variety  $X$ , then every point  $x \in X$  is contained in a  $G$ -stable affine open subset.  $\lrcorner$

*Proof:* ?  $\square$

**Thm. (29.9.1.6).** If  $G$  acts on a normal variety  $X$  and  $Y \subset X$  is an orbit, then there exists a  $B$ -stable affine open subset  $X_0 \subset X$  s.t.

- $X_0 \cap Y \neq \emptyset$ .
- Any  $f \in k[X_0 \cap Y]^{(B)}$  extends to  $f' \in k[X_0]^{(B)}$ .

$\lrcorner$

*Proof:* Cf.[Luna-Vust theory of Spherical Embeddings, Knop]P3.  $\square$

**Cor. (29.9.1.7) [Existence of Semi-Invariant Functions].** If  $f \in \mathcal{O}(B.x_0)$  and  $v_0$  is a  $G$ -invariant  $\mathbb{Q}$ -valued valuation on  $R(X)$ , then there exists  $f' \in R(X)^{(B)}$  s.t.

- $v_0(f') = v_0(f)$ .
- $v(f') \geq v(f)$  for any  $G$ -invariant  $\mathbb{Q}$ -valued valuation on  $R(X)$ .
- $\bar{v}_D(f') \geq \bar{v}_D(f)$  for any  $D \in \mathcal{D}(X)$  (29.9.1.4).

$\lrcorner$

*Proof:* Cf.[Luna-Vust theory of Spherical Embeddings, Knop]P5.  $\square$

**Cor. (29.9.1.8) [Luna-Vust [L-V83] Prop7.4].** The restriction from the set of  $G$ -invariant  $\mathbb{Q}$ -valued valuations on  $R(X)$  that is trivial on  $k^\times$  to  $\mathfrak{a}_X^+$  (29.9.1.3) are injective.  $\lrcorner$

*Proof:* If  $v_0, v_1$  are  $G$ -invariant  $\mathbb{Q}$ -valued valuations on  $R(X)$  that is trivial on  $k^\times$ , we can take  $f \in k[B.x_0]$  s.t.  $v_0(f) < v_1(f)$  (because  $R(X) = \text{Frac}(k[B.x_0])$ ). Then by (29.9.1.7), there exists  $f' \in R(X)^{(B)}$  s.t.  $v_0(f') = v_0(f) < v_1(f) \leq v_1(f')$ . Thus the restrictions of  $v_0$  and  $v_1$  to  $R(X)^{(B)}$  are different.  $\square$

**Def. (29.9.1.9) [Associated Parahoric Subgroups].** The **associated parahoric subgroup** of  $X$  is the subgroup  $P(X) = \{g \in G \mid X^\circ g = X^\circ\} \leq G$ .

Fix  $x_0 \in X^\circ(k)$  with stabilizer  $H \leq G$ , then  $X = H \backslash G$ , and  $HB$  is open in  $G$  ?. Pick  $f \in R(X)^\times$  s.t. the zero locus of  $f$  is  $X \setminus X^\circ$ , then  $f$  is a  $P(X)$ -eigenfunction, but not an eigenfunction for a larger parabolic.  $f$  can be regarded as a function in  $R(G)^H$ , and the stabilizer of  $df$  in  $G$  is a Levi subgroup  $L(X) \leq P(X)$ . ?  $\lrcorner$

**Def. (29.9.1.10) [Tori  $T_X$ ].** Fix a maximal torus  $T \subset B \cap L(X)$ , and define the torus

$$T_X = L(X)/L(X) \cap H = T/T \cap H$$

whose cocharacter is  $\Lambda_X$  (29.9.1.3) ?.  $T_X$  can be identified with a subvariety of  $X^\circ$  through the orbit map  $a \mapsto x_0.a$ .  $\lrcorner$

**Prop. (29.9.1.11) [Spherical Root Systems].** The cone  $\mathfrak{a}_X^+$  is the fundamental domain for a finite reflection group  $W_X \leq \text{End}(\mathfrak{a}_X)$ , called the **little Weyl group** of  $X$ .

There is a canonical way to identify  $W_X$  with a subgroup of  $W$  normalizing  $W_{L(X)}$ .

Consider the strictly-convex negative-dual of  $\mathfrak{a}_X^+$  in  $\chi(X) \otimes \mathbb{R}$ . The generators  $\Sigma_X$  of the intersections of its extremal rays with  $\chi(X)$  (29.9.1.3) are called the **spherical roots** of  $X$ . Then they are the simple roots of a based root system with Weyl group  $W_X$ .  $\lrcorner$

*Proof:* Cf.[Knop, A Harish-Chandra homomorphism for reductive group actions]Chap6.5.  $\square$

**Def. (29.9.1.12) [Weyl Group Actions on Borel Orbits, Knop].** Cf.[SV19]P55.  $\lrcorner$

**Def. (29.9.1.13) [Center  $Z(X)$ ].** Define  $Z(X) = \text{Aut}_{G(k)}(X(k))^0$ , which is a commutative group scheme  $?$ .  $\lrcorner$

### Wavefront Spherical Varieties

**Def. (29.9.1.14) [Wavefront Spherical Varieties].** For a spherical variety  $X = H \backslash G$ ,  $\mathfrak{a}_X^+$  contains the image of the negative Weyl chamber under the natural surjective map  $\mathfrak{a} \rightarrow \mathfrak{a}_X$   $?$  Cf.[SV19]P22. And  $X$  is called a **wavefront spherical variety** if  $\mathfrak{a}_X^+$  is exactly the image of the negative Weyl chamber.  $\lrcorner$

**Def. (29.9.1.15) [Symmetric Varieties].** A **symmetric subgroup scheme** is the neutral component of the fixed point group of an involution  $\theta$  on  $G$ , and for a symmetric subgroup  $H \leq G$ ,  $X = H \backslash G$  is called a **symmetric variety**.  $\lrcorner$

**Example (29.9.1.16) [Wavefront Spherical Varieties].**

- Symmetric varieties(29.9.1.15) are wavefront spherical varieties(29.9.1.14).(Cf.[Vust. Operation de groupes reductifs dans un type de cones presque homogenes]Section1.3.)
- Whittaker cases are wavefront spherical varieties.
- Gross-Prasad cases are wavefront spherical varieties.

$\lrcorner$

*Proof:* Cf.[The Luna-Vust theory of spherical embeddings].  $\square$

### Classifying Spherical Varieties

**Prop. (29.9.1.17).** Homogeneous spherical varieties have been classified in terms of a combinatorial structure called a homogeneous spherical datum, see[Luna, Varietes spheriques de type A] and [Bravi-Pezzini, The spherical systems of the wonderful reductive subgroups].  $?$   $\lrcorner$

### Pure Inner Forms of Spherical Varieties

**Prop. (29.9.1.18).** The  $G$ -automorphism of a  $G$ -torsor is a pure inner-form of  $G$ , and there is a canonical  $G^\alpha \times G^\alpha$ -isomorphism  ${}^\alpha T \times^G T^\alpha \cong G^\alpha$ .

For a  $G$ -variety  $V \in \text{Var}/k$  and  $\alpha \in H^1(k, G)$ , the set of isomorphism classes of  $G$ -morphisms  ${}^\alpha T \rightarrow V$  is naturally bijective to the set of  $G^\alpha(k)$ -orbits on  $V^\alpha(k) \triangleq V \times^G T^\alpha$ .

In particular, the set of isomorphism classes of  $G$ -morphisms

$${}^\alpha T \rightarrow X \times X$$

is in bijection with the set of  $G^\alpha(k)$ -orbits on  $X^\alpha(k) \times X^\alpha(k)$ .  $\lrcorner$

*Proof:*  $?$   $\square$

**Def. (29.9.1.19) [Pure-Inner Forms].** A **pure inner form** of  $(G, X)$  is a cohomology class  $\alpha \in H^1(k, G)$  corresponding to a left  $G$ -torsor  $T^\alpha$  s.t. if  $G^\alpha = \text{End}_G(T^\alpha)$  is the pure inner form of  $G$  corresponding to  $\alpha$ (29.9.1.18), then  $X^\alpha = X \times^G T^\alpha$  with a right action of  $G^\alpha$  satisfies  $X^\alpha(k) \neq \emptyset$ .  $\lrcorner$

**Prop. (29.9.1.20).**  $k$ -points of the stack  $(X \times X)/G$  correspond to isomorphism classes of  $G$ -equivalent maps

$$T \rightarrow X \times X$$

where  $T$  is a right  $G$ -torsor over  $k$ . In particular, by (29.9.1.18), we have a natural bijection

$$[X \times X/G](k) = \coprod_{\alpha} (X^{\alpha}(k) \times X^{\alpha}(k))/G^{\alpha}(k)$$

where  $\alpha$  runs through all pure inner forms of  $X$ .

In fact, the pure inner forms of  $X$  are just images of the map  $H^1(k, H) \rightarrow H^1(k, G)$ , and there is a natural bijection

$$[X \times X/G](k) = \coprod_{\beta \in H^1(k, H)} (H^{\beta} \backslash G^{\beta})(k) / H^{\beta}(k),$$

where if  $H^{\beta} = \text{End}_H({}^{\beta}S)$  for an  $H$ -torsor  ${}^{\beta}S$  corresponding to  $\beta$ , then  $G^{\beta} = \text{End}_G({}^{\beta}S \times^H G)$  with a natural injection  $H^{\beta} \hookrightarrow G^{\beta}$ .  $\lrcorner$

*Proof:* Cf. [S-V17]P307.  $\square$

## 2 Dual Groups of Spherical Varieties

References are [S-V17] and [Knop-Schalke].

**Def. (29.9.2.1) [Dual Groups of Spherical Varieties, Knop/Brion/Sakellaridis-Venkatesh].**

For each  $\gamma \in \Sigma_X$  (29.9.1.11), let  $\gamma'$  be the primitive element of the intersection  $\mathbb{R}_+\gamma$  with the root lattice of  $G$ ?.

Denote  $\Delta_X = \{\gamma' : \gamma \in \Sigma_X\}$  and  $\Phi_X = W_X \cdot \Delta_X$  (29.9.1.11), then  $(\Phi_X, \Delta_X, W_X) \in \text{RootSys}$ , called the **normalized spherical root system** of  $X$ .

Assume that  $\Sigma_X \cap 2\Phi = \emptyset$ , then  $(\chi(X)^{\vee}, \Phi_X^{\vee}, \chi(X), \Phi_X) \in \text{RootDat}$ . The corresponding complex reductive group  ${}^L G_X \in \text{RedGrp}/\mathbb{C}$  with maximal torus  ${}^L T_X$  is called the **dual group** of  $X$ .  $\lrcorner$

*Proof:* ?, Cf. [S-V17]P26, 27, [Brion, On orbit closures of spherical subgroups in flag varieties].  $\square$

**Def. (29.9.2.2) [Distinguished Morphisms].** Assume that  $\Sigma_X \cap 2\Phi = \emptyset$ , a **distinguished morphism of dual groups**  ${}^L G_X(\mathbb{C}) \times \text{SL}(2) \rightarrow {}^L G(\mathbb{C})$  is a morphism that restricts to the canonical map  ${}^L T_X \subset {}^L T$ , and satisfies a condition on simple root spaces(? Cf. [SV19]Chap3.2.).

A **distinguished Arthur-morphism of dual groups**  ${}^L G_X(\mathbb{C}) \times \text{SL}(2) \rightarrow {}^L G(\mathbb{C})$  s.t. its restriction on  ${}^L G_X$  is distinguished and its restriction to  $\mathbb{G}_m \subset \text{SL}(2)$  is the map  $2\rho_{L(X)} : \mathbb{G}_m \rightarrow {}^L A$ .  $\lrcorner$

**Situation (29.9.2.3) [Hypotheses on Gaitsgory-Nadler Dual Groups, Gaitsgory--Nadler [G-N10]].** Gaitsgory-Nadler associated to any affine embedding of  $X$  a canonical reductive subgroup  ${}^L G_{X,GN} \subset {}^L G$  whose maximal torus is the image of  ${}^L T_X$  in  ${}^L T$ , and whose Weyl group is conjecturally equal to  $W_X$ ?. It is conjectured that the following hypotheses hold:

1. The image of  ${}^L G_{X,GN}$  commutes with  $2\rho_{L(X)}(\mathbb{C}^{\times}) \subset {}^L A(\mathbb{C})$ .
2. The Weyl group of  ${}^L G_{X,GN}$  equals  $W_X$ .
3. For any  $\Theta \in \Sigma_X$ , the dual group of the affine degeneration  $X_{\Theta}^a$  (Cf. [S-V17]Chap2.5.?) is naturally a subgroup of  ${}^L G_{X,GN}$ .

4.

5. If  $X_1^+$  is a spherical  $G$ -variety and  $T_1$  a torus of  $G$ -automorphisms of  $X_1^+$  with  $X_2^+ = X_1^+/T_1$ , and if  $X_1, X_2$  are affine embeddings of  $X_1^+, X_2^+$  with  $X_2 = \text{Spec } R(X_1)^{T_1}$ , then there is a canonical embedding

$${}^L G_{X_2, GN} \hookrightarrow {}^L G_{X_1, GN}$$

which restricts to the natural embedding of maximal tori  ${}^L A_{X_2, GN} \hookrightarrow {}^L A_{X_1, GN}$  corresponding to  $\chi(X_2) \hookrightarrow \chi(X_1)$ .?

┘

**Thm. (29.9.2.4) [Distinguished Morphisms Exist].** Assume that  $\Sigma_X \cap 2\Phi_G = \emptyset$ , then

- There exists at most one  $\hat{A}$ -conjugacy class of distinguished morphisms  ${}^L G_X(\mathbb{C}) \times \text{SL}(2) \rightarrow {}^L G(\mathbb{C})$  (29.9.2.2).
- Assume that the hypotheses on Gaitsgory-Nadler dual groups hold (29.9.2.3), then distinguished morphisms  ${}^L G_X(\mathbb{C}) \times \text{SL}(2) \rightarrow {}^L G(\mathbb{C})$  exist, and  ${}^L G_{X, GN}$  is independent of the affine embedding, with root system  $(\Phi_X^\vee, W_X)$ .

┘

*Proof:* Cf. [S-V17] Prop 3.4.3., 3.6.2.?

□

**Lemma (29.9.2.5).** If  $\text{rank } X = 1$ , then there is a principal map  $\text{SL}(2) \rightarrow {}^L L(X)$  commuting with  ${}^L G_{X, GN}$ .

┘

*Proof:* Cf. [S-V17] Appendix A.

□

### 3 Spherical Embeddings (Luna-Vust)

References are [L-V83, Kno91]

**Notation (29.9.3.1).**

- Let  $X$  be a wavefront spherical variety (29.9.1.14).

┘

**Def. (29.9.3.2) [Spherical Embeddings].** A **spherical embedding** of  $X$  is a normal  $G$ -variety  $\overline{X}$  containing  $X$  as an open dense  $G$ -subvariety. It is called a **simple spherical embedding** if it contains a unique closed  $G$ -orbit, and it is called a **toroidal spherical embedding** if no  $B$ -stable divisors in  $X$  contain a  $G$ -orbit of  $\overline{X}$  in its boundary.

┘

**Thm. (29.9.3.3).** For any spherical embedding  $\overline{X}$  of  $X$  (29.9.3.2), denote  $\mathcal{D}(\overline{X})$  the set of  $B$ -stable prime divisor of  $\overline{X}$ . For any  $G$ -orbit  $Y \subset \overline{X}$ , denote  $\mathcal{D}_Y(\overline{X}) \subset \mathcal{D}(\overline{X})$  the set of  $B$ -stable prime divisors containing  $Y$ , and define

$$X_0 = \overline{X} \setminus \bigcup_{D \in \mathcal{D}(\overline{X}) \setminus \mathcal{D}_Y(\overline{X})} D.$$

Then

- $X_0$  is  $B$ -stable and affine open.
- $X_0 \cap Y$  is a  $B$ -orbit in  $\overline{X}$ .
- $Y$  is the only closed orbit of  $G.X_0$ .

┘

*Proof:* Cf.[Knop]P7.?

□

**Cor. (29.9.3.4).** For any spherical embedding  $\overline{X}$  of  $X$  (29.9.3.2), the number of  $G$ -orbits in  $\overline{X}$  is finite and each orbit is a  $G$ -spherical variety. In particular,  $\overline{X}$  is covered by f.m. simple spherical embeddings of  $X$ .

Notice that there are even only f.m.  $B$ -orbits, Cf.[Knop]P7.?

┘

*Proof:* Each  $G$ -orbit  $Y$  defines an  $X_0$  as in (29.9.3.3), and there are only f.m. many such  $X_0$ ?. Then notice that  $X_0$  is a simple spherical embedding of  $X$  and  $Y$  is determined by this  $X_0$ , by (29.9.3.3).

□

**Prop. (29.9.3.5).** A simple spherical embedding  $\overline{X}$  of  $X$  (29.9.3.2) with closed  $G$ -orbit  $Y$  is determined by the pair  $(\mathcal{B}(X), \mathcal{F}(X))$  where

- $\mathcal{B}(X) = \{\rho_{v_D} \in \Lambda_X : D \in \mathcal{D}_Y(\overline{X}) \text{ is } G\text{-stable}\}.$
- $\mathcal{F}(X) = \{D \cap X : D \in \mathcal{D}_Y(\overline{X}) \text{ is not } G\text{-stable and } D \cap X \in \mathcal{D}(X)\}.$

┘

*Proof:*

□

### Classifying Spherical Embeddings

**Def. (29.9.3.6) [Spherical Colored Cones].** A **spherical colored cone** for  $X$  is a pair  $(\mathcal{C}, \mathcal{F})$  s.t.

- $\mathcal{F} \subset \mathcal{D}(X)$  (29.9.1.4).
- $\mathcal{C}$  is a f.g. cone in  $\Lambda_X$  generated by  $\{\rho_{v_D} | D \in \mathcal{F}\}$  (29.9.1.4) together with f.m. elements of  $\mathfrak{a}_X^+$  (29.9.1.3).
- $\text{Int}(\mathcal{C}) \cap \mathfrak{a}_X^+ \neq \emptyset.$

And  $(\mathcal{C}, \mathcal{F})$  is called a **strictly-convex colored cone** if  $\mathcal{C}$  is strictly-convex (i.e.  $\mathcal{C} \cap (-\mathcal{C}) = 0$ ) and  $0 \notin \rho(\mathcal{F})$ .

A **face** of a colored cone  $(\mathcal{C}, \mathcal{F})$  is a face of  $\mathcal{C}$  that is a colored cone.

┘

**Def. (29.9.3.7) [Spherical Colored Fans].** A **spherical colored fan** for  $X$  is a non-empty finite set  $\mathfrak{F}$  of spherical colored cones (29.9.3.6) s.t.

- Every face (29.9.3.6) of spherical colored cones in  $\mathfrak{F}$  is contained in  $\mathfrak{F}$ .
- Any  $v \in \mathfrak{a}_X^+$  is contained in the interior of at most one colored cone in  $\mathfrak{F}$ .

And  $\mathfrak{F}$  is called a **strictly-convex colored fan** if every colored cone in  $\mathfrak{F}$  is strictly-convex (29.9.3.6), or equivalently  $(0, \emptyset) \in \mathfrak{F}$ .

┘

**Thm. (29.9.3.8) [Classifying Simple Spherical Embeddings, Luna-Vust].**

┘

**Thm. (29.9.3.9) [Classifying Spherical Embeddings, Luna-Vust].** For any spherical embedding  $\overline{X}$  of  $X$  (29.9.3.2), define

$$\mathfrak{F}(\overline{X}) = \{(\mathcal{C}_Y(\overline{X}), \mathcal{F}_Y(\overline{X})) : Y \subset \overline{X} \text{ is a } G\text{-orbit}\},$$

then  $\mathfrak{F}(\overline{X})$  is a strictly-convex spherical colored fan (29.9.3.7), and  $Y \mapsto (\mathcal{C}_Y(\overline{X}), \mathcal{F}_Y(\overline{X}))$  induces an inclusion-reversing bijection between  $G$ -orbits on  $\overline{X}$  and  $\mathfrak{F}(X)$ , where the open orbit corresponds to  $(0, \emptyset)$ .

And  $\overline{X} \mapsto \mathfrak{F}(\overline{X})$  defines a bijection between isomorphism classes of spherical embeddings of  $X$  and strictly-convex colored fans.

┘

*Proof:* Cf.[Kno91]P11.?

□

**Thm. (29.9.3.10) [Classifying Simple Toroidal Compactifications, Luna-Vust].** To any simple toroidal spherical embedding  $\overline{X}$  of  $X$  (29.9.3.2), we associate  $\mathcal{C}(\overline{X}) \subset \mathfrak{a}_X^+$  (29.9.1.3) the cone spanned by valuations defined by  $G$ -stable divisors on  $\overline{X}$ . Then the map  $\overline{X} \mapsto \mathcal{C}(\overline{X})$  induces a bijection between isomorphism classes of simple toroidal  $G$ -compactifications of  $X$  and strictly-convex f.g. cones in  $\mathfrak{a}_X^+$ .

For any  $G$ -orbit  $Z$  in a simple toroidal embedding  $\overline{X}$ , the union of  $G$ -orbits whose closure contains  $Z$  is also a simple toroidal embedding. This induces a bijection between faces of  $\mathcal{C}(\overline{X})$  and  $G$ -orbits of  $\overline{X}$ . ┘

*Proof:* Cf.[Knop, The Luna-Vust theory of spherical embeddings]Thm3.3. □

**Cor. (29.9.3.11) [Canonical Toroidal Compactifications].** When  $\mathfrak{a}_X^+$  is itself strictly-convex, the simple toroidal compactification corresponding to  $\mathfrak{a}_X^+$  (29.9.3.10) is called the **canonical toroidal compactification** of  $X$ . This happens exactly when  $\# \text{Aut}_G(X) = \# N(H)/H < \infty$ , and it is the unique proper simple toroidal compactification of  $X$ .

If the canonical toroidal compactification of  $X$  is smooth, then it is called a **wonderful compactification** of  $X$ . ┘

*Proof:* Cf.[Brion-Pauer, Valuations des espaces homogenes spheriques] □

**Thm. (29.9.3.12) [Local Structure Theorem, Brion-Luna-Vust86].** Let  $\overline{X}$  be a simple toroidal compactification of  $X$  and denote  $\overline{X}_B$  the complement of all  $B$ -stable divisors that are not  $G$ -stable, which is an  $B$ -stable open affine subvariety of  $\overline{X}$ . Let  $Y$  be the closure of  $T_X$  in  $\overline{X}_B$  (29.9.1.10), which is the toric compactification of  $T_X$  characterized by the property that for any  $\lambda \in \Lambda_X = X^\bullet(T_X)$  (29.9.1.10),  $\lim_{t \rightarrow 0} \lambda(t) \in Y$  iff  $\lambda \in \mathfrak{a}_X^+$ .

Then the action map  $Y \times U_{P(X)} \rightarrow \overline{X}$  is an open embedding and its image  $\overline{X}_B$  meets each  $G$ -orbit in  $\overline{X}$  along its open  $B$ -orbit. In particular,  $\overline{X}$  is smooth iff  $Y$  is. ┘

*Proof:* Cf.[Brion-Luna-Vust, Espaces homogenes spheriques]. □

### Boundary Degenerations

**Def. (29.9.3.13) [Boundary Degenerations].** Let  $Z$  be a  $G$ -orbit in a smooth toroidal spherical embedding  $\overline{X}$  of  $X$ , corresponding to  $\Theta \subset \Delta_X$  (29.9.2.1)?, the open  $G$ -orbit on  $\mathcal{N}_Z \overline{X}$  will be denoted by  $X_\Theta$ , called the **boundary degeneration** of  $X$  corresponding to  $\Theta$ . ┘

**Prop. (29.9.3.14) [ $X_\Theta$  are Wavefronts].** If  $X$  is a wavefront, then for any  $\Theta \subset \Delta_X$  (29.9.2.1),  $X_\Theta$  is also a wavefront spherical variety for  $\mathcal{Z}(L_\Theta)^0 \times G$ . ┘

*Proof:* Cf.[S-V17]Prop2.7.2.?

□

**Prop. (29.9.3.15).** There is a  $B$ -equivariant isomorphism  $X_\Theta^\circ \cong X^\circ$  inducing the identity on normal bundles. ┘

*Proof:* Cf.[S-V17]P35. □

## 4 Examples

**Example (29.9.4.1) [(PGL( $n$ )  $\times$  PGL( $n$ ), PGL( $n$ )).]** For  $V \in \mathcal{V}ect^{\text{fin}}/k$ , let  $G = \text{PGL}(V) \times \text{PGL}(V)$  and  $X = \text{PGL}(V)$  with a right action of  $G$  on  $X$  given by  $A.(g, h) = g^{-1}Ah$ . ┘

## 5 Geometry over Local Fields

**Notation (29.9.5.1).**

- Let  $k \in p\text{-NField}$ .

┘

**Prop. (29.9.5.2).** Assume that  $X$  carries a positive  $G$ -eigenmeasure  $\mu$  with eigencharacter  $\mu$ . Then  $G$  acts on  $L^2(X; \mu)$  via the twisted right regular representation

$$(g \cdot \Phi)(x) = \sqrt{\eta(g)} \Phi(xg).$$

┘

*Proof:* ?

□

**Prop. (29.9.5.3) [Measures on the Boundary].** For each  $G$ -eigen volume form  $\omega$  on  $X$  and  $\Theta \subset \Delta_X$  (29.9.2.1), there is a canonical  $T_{X, \Theta} \times G$ -eigen volume form  $\omega_\Theta$  on  $X_\Theta$  with the same  $G$ -eigencharacter s.t. for any Borel subgroup  $B \leq G$ ,  $\omega|_{X^\circ}$  and  $\omega_\Theta|_{X_\Theta^\circ}$  correspond via (29.9.3.15).

┘

### Asymptotics

References are [S-V17]Chap5.

**Notation (29.9.5.4).**

- Suppose that  $Z(G)^0$  surjects onto  $Z(X)$ .

┘

## 6 Discrete Spectra

References are [S-V17]Chap9.

**Notation (29.9.6.1).**

- Let  $k \in p\text{-NField}$ .
- Suppose that  $Z(G)^0$  surjects onto  $Z(X)$ .

┘

**Def. (29.9.6.2) [X-Discrete-Series].** Any  $f \in L^2(X)$  decomposes as  $f = \int_{\omega \in \text{Aut}(G)} f_\omega d\omega$  where  $f_\omega \in L^2(X; \omega)$ . Then  $L^2(X)_{\text{disc}}$  consists of the functions  $f$  s.t. for a.e.  $\omega \in \text{Aut}(X)$ ,  $f_\omega$  belongs to the direct sum of all irreducible subrepresentations of  $L^2(X; \omega)$ .

It is conjectured that  $L^2(X)_{\text{disc}}$  is a closed subspace of  $L^2(X)$ .

┘

**Def. (29.9.6.3) [Finiteness of Discrete Spectra].**

┘

**Def. (29.9.6.4) [Factorizable Spherical Varieties].**  $X$  is called a **factorizable spherical variety** if the Lie algebra  $\mathfrak{h}$  of the stabilizer of a generic point on  $X$  has a direct sum decomposition

$$\mathfrak{h} = (\mathfrak{h} \cap \mathcal{Z}(\mathfrak{g})) \oplus (\mathfrak{h} \cap [\mathfrak{g}, \mathfrak{g}]).$$

And  $X$  is called a **strongly-factorizable spherical variety** if for any  $\Theta \subset \Delta_X$ , the Levi variety  $X_\Theta^L$  ? is factorizable.

┘

**Prop. (29.9.6.5) [Symmetric Varieties are Strongly-Factorizable].** If  $X$  is a symmetric variety (29.9.1.15), then  $X$  is strongly-factorizable (29.9.6.4).  $\lrcorner$

*Proof:* Cf. [S-V17]P159.  $\color{red}?$   $\square$

**Conj. (29.9.6.6) [Discrete-Series Conjecture].** This can be easily checked in individual cases by the method of “unfolding”.  $\lrcorner$

## 7 Bernstein Morphisms

References are [S-V17]Chap10-11.

## 8 Plancherel Decompositions

**Def. (29.9.8.1) [Plancherel Decompositions].** A **Plancherel decomposition for spherical varieties** for  $L^2(X)$  is a set of following data:

- A positive measure  $\hat{\mu}_X$  on  $\hat{G}$  with the Mackey-Borel structure (24.7.2.12), called a **Plancherel measure for  $X$** .
- A  $\hat{\mu}$ -measurable set of non-zero  $G$ -invariant semi-norms  $\|-\|_\pi$  on the space of  $\pi$ -coinvariants

$$C_c^\infty(X)_\pi \triangleq \text{Hom}_G(C_c^\infty(X), \pi)^* \otimes \pi$$

for  $\hat{\mu}$ -a.e.  $\pi \in \hat{G}$ ,  
s.t. for any  $\Phi \in C_c^\infty(X)$ , we have

$$\|\Phi\|_{L^2}^2 = \int_{\hat{G}} \|\Phi_\pi\|_\pi^2 \hat{\mu}(\pi).$$

$\lrcorner$

**Remark (29.9.8.2).** For  $\pi \in \hat{G}$ , to give a  $G$ -invariant form on  $C_c^\infty(X)_\pi$  is equivalent to giving an equivariant map

$$M_\pi : C_c^\infty(X \times X) \rightarrow \pi \otimes \bar{\pi}.$$

$\lrcorner$

*Proof:* Cf. [S-V17]P112.  $\color{red}?$   $\square$

**Prop. (29.9.8.3).** Given a positive measure  $\hat{\mu}$  on  $\hat{G}$  with the Mackey-Borel structure (24.7.2.12) and a family  $\pi \mapsto H_\pi$  of Hermitian forms on  $C_c^\infty(X)_\pi$  (29.9.8.1) s.t.  $\Phi \mapsto H_\pi(\Phi)$  is  $\hat{\mu}$ -measurable for each  $\Phi \in C_c^\infty(X)$ , and

$$\|\Phi\|_{L^2}^2 = \int_{\hat{G}} H_\pi(\Phi_\pi) \hat{\mu}(\pi).$$

Then  $H_\pi$  are positive-semi-definite for  $\hat{\mu}$ -a.e.  $\pi \in \hat{G}$ , thus defining a Plancherel decomposition (29.9.8.1).  $\lrcorner$

*Proof:* Cf. [S-V17]P110.  $\square$

### Strongly-Tempered case

**Remark (29.9.8.4) [Tempered Matrix Coefficients are Majorized by a Spherical Matrix Coefficient].** If  $\pi_0$  is the normalized induction  $I_B^G(1)$ , and  $v_0 \in \pi_0$  is a spherical character (i.e. fixed by some compact open  $\mathcal{K} \subset G(k)$  s.t.  $G(k) = B(k)\mathcal{K}$ ), then for any compact open subgroup  $U \leq G(k)$ , there exists  $c(U) \in \mathbb{R}_+$  s.t. : For any tempered matrix coefficient  $\varphi(g) = \langle gu_1, u_2 \rangle$  where  $u_1, u_2$  are  $U$ -fixed with  $\|u_1\| = \|u_2\| = \|v_0\|$ , we have

$$|\varphi(g)| \leq c(U)(gv_0, v_0).$$

┘

*Proof:* Cf. [Almost  $L^2$  matrix coefficients]Thm2.?

□

**Def. (29.9.8.5) [Strongly-Tempered Spherical Varieties].**  $X$  is called a **strongly-tempered spherical variety** if

- $H$  is unimodular, thus  $X$  admits a  $G$ -invariant measure.
- For any  $x \in X(k)$  with  $H = \text{Stab}_G(x)$ , the restriction of any  $G$ -tempered matrix coefficient? to  $H$  is in  $L^1(H)$ .

┘

**Remark (29.9.8.6).** Gross-Prasad cases and Whittaker cases are strongly-tempered.?

If  $X$  is strongly-tempered and  $\Sigma_X \cap 2\Phi = \emptyset$ , then  ${}^L G_X = {}^L G$ ?

┘

**Thm. (29.9.8.7) [Plancherel Formula for Strongly-Tempered Spherical Varieties, Sakellaridis-Venkatesh[S-V17]].** Assume that  $X$  is a strongly-tempered spherical variety (29.9.8.5), then for any tempered representation of  $G$ , we can define a morphism

$$M_\pi : \pi \otimes \pi^\vee \rightarrow C^\infty(X \times X)$$

s.t.

$$M_\pi(v \otimes u)(x, x) = \int_{G_x} \langle \pi(h)v, u \rangle dh$$

and  $M_\pi(v \otimes u)$  vanishes outside  $(G \times G) \cdot \Delta_X$ . And denote

$$\theta_\pi : C_c^\infty(X \times X) \rightarrow \pi^\vee \otimes \pi \rightarrow \mathbb{C}$$

be the adjoint composed with the canonical pairing.

Then for any  $\Phi_1, \Phi_2 \in C_c^\infty(X)$ , we have

$$\langle \Phi_1, \Phi_2 \rangle_{L^2} = \int_{\widehat{G}} \theta_\pi(\Phi_1 \otimes \overline{\Phi_2}) d\widehat{\mu}_G(\pi).$$

where  $\widehat{\mu}_G$  is the Plancherel measure for  $G$ .

In particular,  $M_\pi(v, v)|_{\Delta_X} \geq 0$  for any tempered  $\pi \in \widehat{G}$ ,  $L^2(X)$  is tempered as a  $G$ -representation, and we have a Plancherel decomposition (29.9.8.1) for  $L^2(X)$  with plancherel measure  $\widehat{\mu}_X$  absolutely continuous w.r.t.  $\widehat{\mu}_G$ .

┘

*Proof:* Cf. [S-V17]P113.?

□

**Thm. (29.9.8.8)**[Ichino-Ikeda Type Local Conjecture, Sakellaridis-Venkatesh[S-V17]]. Suppose  $X$  is a strongly-tempered wavefront spherical variety, then for any discrete-series  $\pi \in \text{Irr}^{\text{adm}}(G(k))$ ,

$$M_\pi : v \otimes w \mapsto \int_H (\pi(h)v, w)dh$$

defines a non-degenerate Hermitian form on  $\pi_H$  (the  $H$ -coinvariants of  $\pi$ ). Moreover, if  $\sigma$  is a discrete series for the Levi subgroup of a parabolic subgroup  $P \leq G$  and  $\pi = I_P^G(\sigma)$ , then  $M_\pi$  is a non-negative Hermitian form.  $\lrcorner$

*Proof:* Cf.[S-V17]P123.  $\square$

### Scattering Theory

We can reduce the Plancherel decomposition to the understanding of discrete series for  $X$  and its boundary degenerations  $X_\Theta$ .

**Def. (29.9.8.9)** $[W_X(\Omega, \Theta)]$ . For any  $\Omega, \Theta \subset \Delta_X$ , denote  $W_X(\Omega, \Theta) = \{w \in W_X : w\Theta = \Omega\}$ (29.9.2.1).  $\lrcorner$

**Def. (29.9.8.10)**. For  $\Theta \subset \Delta_X$ , let  $c(\Theta)$  be the number of chambers in  $\mathfrak{a}_{X,\Theta}$ , which equals  $\sum_\Omega \#W_X(\Omega, \Theta)$ .  $\lrcorner$

*Proof:* Cf.[S-V17]P136.  $\square$

**Conj. (29.9.8.11)**[Scattering]. There exist canonical  $G$ -equivariant morphisms

$$\iota_\Theta : L^2(X_\Theta) \rightarrow L^2(X)$$

for each  $\Theta \subset \Delta_X$  called **Bernstein morphisms**, and  $A'_{X,\Theta} \times G$ -equivariant isomorphisms

$$S_w : L^2(X_\Theta) \rightarrow L^2(X_\Omega)$$

for  $\Omega, \Theta \subset \Delta_X$  and  $w \in W_X(\Omega, \Theta)$ (29.9.8.9), where  $A_{X,\Theta}$  acts on  $L^2(X_\Omega)$  via the isomorphism  $A_{X,\Theta} \cong A_{X,\Omega}$  induced by  $w$  and  $A'_{X,\Theta}$  is the image of  $Z(L_\Theta)^0$  in  $A_{X,\Theta}$ . And the following hold:

- $\iota_\Omega \circ S_w = \iota_\Theta$ .
- $S_{w'} \circ S_w = S_{w'w}$  for  $w \in W_X(\Omega, \Theta)$  and  $w' \in W_X(Z, \Omega)$ .
- $\iota_\Omega^* \circ \iota_\Theta = \sum_{w \in W_X(\Omega, \Theta)} S_w$ .
- The map

$$\sum_{\Theta \subset \Delta_X} \frac{\text{pr}_{\text{disc}} \iota_\Theta^*}{\sqrt{c(\Theta)}} : L^2(X) \rightarrow \bigoplus_{\Theta \subset \Delta_X} L^2(X_\Theta)_{\text{disc}} \text{ (29.9.8.10)}$$

is an isometric isomorphism onto the subspace of vectors

$$\left\{ (f_\Theta)_\Theta \in \bigoplus_{\Theta \subset \Delta_X} L^2(X_\Theta)_{\text{disc}} : S_w f_\Theta = f_\Omega, \forall w \in W_X(\Omega, \Theta) \right\}.$$

$\lrcorner$

*Proof:*

$\square$

**Thm& Conj.Cor.(29.9.8.12) [Scattering Theorem, Sakellaridis-Venkatesh[S-V17]].** This conjecture holds when the following conditions hold:

- $X$  is a wavefront spherical variety(29.9.1.14).
- All  $X_\Theta$  satisfy the discrete-series conjecture 9.4.6.?
- Generic injectivity of the map  $\mathfrak{a}_X^*/W_X \rightarrow \mathfrak{a}^*/W$  on each face.(Cf.[S-V17]Chap14.2?).

┘

*Proof:* ?

- Let  $k \in p\text{-LField}$ .

┘

**Def.(29.9.8.15) [ $X$ -Distinguished Arthur-Parameters].** If  $X$  has no roots of type  $N$ (i.e.  $\Sigma_X \cap 2\Phi_G = \emptyset$ ), an  $X$ -distinguished Arthur parameter is an Arthur-parameter  $\psi : \text{WD}(k) \times \text{SL}(2) \rightarrow {}^L G(\mathbb{C})$  s.t.  $\phi|_{\text{WD}(k)}$  factors as

$$\text{WD}(k) \times \text{SL}(2) \xrightarrow{(\tilde{\phi}, \text{id})} {}^L G_X(\mathbb{C}) \times \text{SL}(2) \xrightarrow{\rho} {}^L G(\mathbb{C}) \text{ (29.9.2.2)}.$$

for some distinguished morphism  ${}^L G_X(\mathbb{C}) \times \text{SL}(2) \xrightarrow{\rho} {}^L G(\mathbb{C})$  (29.9.2.2), and  $\tilde{\phi} : \text{WD}(k) \rightarrow {}^L G_X(\mathbb{C})$  is a tempered  $L$ -parameter(29.3.1.4).

┘

**Conj.(29.9.8.16)[Plancherel Formula for Spherical Varieties, Sakellaridis-Venkatesh[S-V17]].** Situation as in(29.9.8.15), there should be a direct integral decomposition

$$L^2(X(k)) = \int_{[\psi]} \mathcal{H}_\psi d\hat{\mu}(\psi) \in \text{Rep}^{\text{uni}}(G(k))$$

where

- $[\psi]$  ranges through  ${}^L G_X(\mathbb{C})$ -conjugacy classes of  $X$ -distinguished local Arthur-parameters(29.9.8.15).
- The Hilbert space  $\mathcal{H}_\psi$  is a finite or countable(possibly empty) sum of representations belonging to the Arthur-packet corresponding to  $\psi$ .
- $\hat{\mu}$  is a natural measures for  $X$ -distinguished local Arthur-parameters modulo conjugacy that is absolutely continuous w.r.t. the natural Haar measure on the set of Arthur-parameters?.

┘

*Proof:* ?

□

**Conj.Cor.(29.9.8.17).** Situation as in(29.9.8.15),  $L^2(X(k))$  is a tempered representation of  $G(k)$  when  ${}^L G_X = {}^L G$ ?

This holds when  $X$  is strongly-tempered, by(29.9.8.7).  $\lrcorner$

**Conj.(29.9.8.18) [Plancherel Formula for Spherical Varieties(Inner-Forms), Sakellaridis-Venkatesh[S-V17]].** Situation as in(29.9.8.15), assume further that  $Z(G)$  acts faithfully on  $X$ , then there is a decomposition

$$\bigoplus_{\alpha} L^2(X^{\alpha}) = \int_{[\psi]} \mathcal{H}_{\psi} d\hat{\mu}(\psi)$$

of representations of  $G(k)$  and their inner forms, where

- $X^{\alpha}$  are pure inner forms of  $X$  (29.9.1.19).
- $[\psi]$  ranges through  ${}^L G_X(\mathbb{C})$ -conjugacy classes of  $X$ -distinguished local Arthur-parameters(29.9.8.15).
- $\hat{\mu}$  is a natural measures for  $X$ -distinguished local Arthur-parameters modulo conjugacy.
- $\mathcal{H}_{\psi}$  is a multiplicity-free direct sum of irreducible representations belonging to the Vogan-packet associated to  $[\psi]$ .(but notice that an Arthur-parameter can have several lift to an  $X$ -distinguished Arthur-parameters).
- $\mathcal{H}\psi \neq 0$  for  $\hat{\mu}$ -a.e.  $X$ -distinguished local Arthur-parameter  $\psi$ .

$\lrcorner$

*Proof:*

$\square$

**Thm& Conj.Cor.(29.9.8.19).** There are evidences for this conjecture for unramified  $L$ -parameters for  $G$ , see [Sakellaridis. On the unramified spectrum of spherical varieties] and [Sakellaridis. Spherical functions on spherical varieties].?

How to extend them to unramified groups?  $\lrcorner$

## 9 Ichino-Ikeda Conjecture

The generalized Ichino-Ikeda conjecture gives a link between the local Plancherel formula and global periods.

- Let  $k = F \in \mathbf{GField}$ .
- Denote  $[G] = A_G \backslash G(\mathbf{A}_F)^1$ .
- Assume  $X$  is reductive affine, i.e.  $H$  is reductive(29.9.0.1).
- Assume that  $Z(G)^0$  acts faithfully on  $X$ .

**Situation(29.9.9.1).** Assume that all  $\pi = \otimes_v \pi_v \in \mathrm{Irr}^{\mathrm{auto}}(G)$  appearing in this subsection satisfies

$$\mathrm{Hom}_{G(F_v)}(\pi_v, C^{\infty}(X(F_v))) \leq 1$$

for any  $v \in \Sigma_F$ .  $\lrcorner$

## 29.10 Gan-Gross-Prasad Conjectures

References are [GGP12, Zha18, Zha19], [Background on the Gan-Gross-Prasad Conjecture, David Schwein].

**Notation (29.10.0.1).**

- Use notations on Langlands conjectured defined in [Langlands-Arthur Conjectures](#).
- Use notations on representations of  $p$ -adic reductive groups defined in [Admissible Representations of  \$p\$ -adic Reductive Groups](#).

⌋

### 1 Local Restriction Problems

References are [Zha18].

**Notation (29.10.1.1).**

- Let  $K \in \text{LField}$ .
- Let  $G \in \text{RedGrp}/K$ .
- Let  $H \leq G$  be an algebraic subgroup.

⌋

**Def. (29.10.1.2) [Local Restriction Problem].** For  $\chi \in H(K)^\vee$ ,  $\pi \in \text{Rep}^{\text{adm}}(G(K))$  is called  $(H, \chi)$ -**distinguished** if  $\text{Hom}_{H(K)}(\pi, \chi) \neq 0$ . An element of  $\text{Hom}_{H(K)}(\pi, \chi)$  is called a  $(H, \chi)$ -**functional**.

⌋

**Prop. (29.10.1.3).** For  $\chi \in H(K)^\vee$ , denote

$$C^\infty(H(K) \backslash G(K), \chi) \triangleq \{f \in C^\infty(G) \mid f(hg) = \chi(h)f(g), \forall h \in H(K), g \in G(K)\}.$$

Then there is an isomorphism

$$\text{Hom}_{H(K)}(\pi, \chi) \cong \text{Hom}_{G(K)}(\pi, C^\infty(H(K) \backslash G(K), \chi)) : \lambda \mapsto (v \mapsto I_\lambda(v)(g) = \lambda(\pi(g)v)).$$

⌋

*Proof:* If  $K$  is non-Archimedean,  $I_\lambda(v)$  is smooth because  $v$  is smooth. If  $K$  is Archimedean,  $\square$

**Def. (29.10.1.4) [Period Maps].** For  $\chi \in (H(F) \backslash H(\mathbf{A}_F))^\vee$ , denote the (twisted) **automorphic period map**:

$$P_{H, \chi} : \mathcal{A}_0(G/F) \rightarrow \mathbb{C} : \varphi \mapsto \int_{[H]} \varphi(h) \chi(h) dh.$$

(? Convergence).

Then  $(\pi, V) \subset \mathcal{A}_0(G) \in \text{Irr}^{\text{cusp}}(G)$  is called  $(H, \chi)$ -**distinguishable** if  $P_{H, \chi}(\varphi) \neq 0$  for some  $\varphi \in V$ . ⌋

**Conj. (29.10.1.5) [Period Formula Conjecture].** If  $\dim \text{Hom}_{H_v}(\pi_v, \chi_v) < \infty$  for any  $v \in \Sigma_F$ , then it is believed that the period map (29.10.1.4) is related to certain  $L$ -values:

$$\frac{|P_{H, \chi}(\varphi)|^2}{\langle \varphi, \varphi \rangle} = \frac{1}{\#S_\pi} \cdot C_H \frac{\Delta_G}{\Delta_H} \frac{L(\pi, \rho; \frac{1}{2})}{L(\pi, \text{Ad}; 1)} \prod_v l_v(\varphi_{1,v}, \overline{\varphi}_{1,v})$$

where  $S_\pi$  is a certain finite group depending only on the  $L$ -packet of  $\pi$ . The constant  $\Delta_H$  (reps.  $\Delta_G$ ) is a product of certain  $L$ -value determined by the motive (see [On the motive of a reductive group, Gross]) of reductive part of  $H$  (resp.  $G$ ). The constant  $C_H$  is a constant depending only on the choice of the local and global Haar measure on  $H(\mathbf{A}_F)$ . The representation  $\rho$  is a finite dimensional symplectic representation of  ${}^L G$ .  $\lrcorner$

*Proof:*

$\square$

**Example (29.10.1.6) [Waldspurger Periods].** Let  $E/F \in \mathbf{NField}$  be a quadratic extension and  $B$  be a quaternion algebra over  $F$ , then consider  $H = E^\times \subset G = B^\times$ .  $\lrcorner$

## 2 Local GGP Conjecture

References are [GGP12, Zha19], [Gross-Prasad conjecture and local theta correspondence, Gan-Ichino].

**Notation (29.10.2.1) [Local GGP Setting].**

- Let  $K \in \mathbf{LField}$  with  $\text{char } K \neq 2$ .
- Let  $(L, \sigma)$  be a semisimple algebraic over  $K$  with an involution s.t.  $L^\sigma = K$ . Thus one of the following holds:
  - $L$  is a quadratic extension of  $K$  with  $\text{Gal}(L/K) = \{1, \sigma\}$ .
  - $L = K \times K$  with  $\sigma : L \rightarrow L : (x, y) \mapsto (y, x)$ .
  - $L = K$  with  $\sigma = \text{id}$ .
- Let  $V \in \text{Herm}_n^\epsilon(L, \sigma)$ , which corresponds to unitary groups/general linear groups/orthogonal groups according to the above cases.
- Let  $W \leq V$  be a non-degenerate subspace s.t.
  - $\cdot(-1)^{\dim W^\perp} = -\epsilon$ ,
  - $W^\perp$  is split, i.e. there exists a decomposition  $W = X \oplus Y$  or  $W = X \oplus Y \oplus E$ , where  $X, Y$  are isotropic subspaces with  $\dim X = \dim Y$ , and  $E$  is a non-isotropic line.
- Let  $G(W) \leq G(V)$  be the subgroup of matrices acting trivially on  $W^\perp$ .
- Let  $G = G(W) \times G(V)$ .

$\lrcorner$

**Def. (29.10.2.2) [Diagonal Subgroup  $H$ ].** Situation as in (29.10.2.1), let  $P$  be a parabolic subgroup of  $G(V)$  stabilizing some complete flag of  $X$ , with unipotent radical  $U$ . Then  $G(W)$  is contained in a Levi subgroup of  $P$ . Define  $H = N \rtimes G(W)$ . Then there is an embedding  $H \subset G(W) \times G(V)$  where the first factor is the quotient  $H \rightarrow G(W)$  and the second factor is the natural embedding  $H \leq P \leq G(V)$ .

In particular, when  $\dim(W^\perp) \leq 1$ ,  $H$  is just the diagonal embedding  $G(W) \subset G(W) \times G(V)$ .  $\lrcorner$

**Notation (29.10.2.3) [Codimension 1 Setting].** Situation as in (29.10.2.1),

- Let  $e \in V$  s.t.  $\|e\| \neq 0$ , and  $W = V^\flat = e^\perp$ .

$\lrcorner$

**Def. (29.10.2.4) [Relevant Pure Inner Forms].** Situation as in (29.10.2.1), by ?, every pure inner form of  $G$  is of the form  $G' = G(W') \times G(V')$  where  $V' \in \text{Herm}_n(L, \sigma)$ ,  $W' \leq V'$  is a non-degenerate subspace s.t.  $\dim(W') = \dim(W)$ ,  $\dim(V) = \dim(V')$ . Then  $G'$  is called a **relevant pure inner form** of  $G$  if  $(W')^\perp \cong W^\perp$ .

In particular,

- If  $V$  is orthogonal or Hermitian (i.e.  $\epsilon = 1$ ), there are exactly 4 pure inner forms of  $G$ , and exactly 2 of them are relevant. And there is exactly one quasi-split relevant pure inner form.
- If  $V$  is symplectic, then there are no nontrivial pure inner forms of  $G$ , by (10.2.5.14).
- If  $V$  is skew-Hermitian, then there are exactly 4 pure inner forms of  $G$ , and 2 of them are relevant.

┘

### Uniqueness of Bessel and Fourier-Jacobi Models

**Def. (29.10.2.5) [Bessel Models].** Cf. [GGP12] Section 12. ?

When  $\dim W^\perp$  is odd (i.e. the symplectic and skew-Hermitian cases), called the **distinguished representation** of  $H$ .

$\nu$  is 1-dimensional and unitary when  $\dim W^\perp$  is odd (i.e. the orthogonal and Hermitian cases), and  $\nu$  has Gelfand-Kirillov dimension  $\frac{1}{2} \dim(W/K)$ . ┘

**Def. (29.10.2.6) [Fourier-Jacobi Models].** Cf. [GGP12] Section 12. ?

When  $\dim W^\perp$  is even (i.e. the symplectic and skew-Hermitian cases), called the **distinguished representation** of  $H$ .

$\nu$  has Gelfand-Kirillov dimension  $\frac{1}{2} \dim(W/K)$ . ┘

**Thm. (29.10.2.7) [Uniqueness of Bessel and Fourier-Jacobi Models, Aizenbud-Gourevitch-Rallis-Schiffmann [AGRS]/Sun/Sun-Zhu/Waldspurger/Aizenbud-Gourevitch].**

Suppose  $\text{char } k = 0$  and  $\dim W^\perp \leq 1$ .

1. In the orthogonal case (i.e.  $G = \text{O}(W) \times \text{O}(V)$  or  $G = \text{SO}(W) \times \text{SO}(V)$ ), for any  $\pi = \pi_W \boxtimes \pi_V \in \text{Irr}^{\text{adm}}(G)$ , we have  $\dim \text{Hom}_H(\pi \otimes \nu, \mathbb{C}) = \text{Hom}_H(\pi, \nu) \leq 1$  (29.10.2.5).
2. In the unitary case (including the split case), for any  $\pi = \pi_W \boxtimes \pi_V \in \text{Irr}^{\text{adm}}(G)$ , we have  $\dim \text{Hom}_H(\pi \otimes \nu, \mathbb{C}) = \text{Hom}_H(\pi, \nu) \leq 1$  (29.10.2.5).
3. In the symplectic case, if  $k$  is non-Archimedean, for any  $\tilde{\pi} = \tilde{\pi}_W \boxtimes \pi_V \in \text{Irr}^{\text{adm}}(\widetilde{\text{Sp}}(V) \times \text{Sp}(W))$  or  $\tilde{\pi} = \pi_W \boxtimes \tilde{\pi}_V \in \text{Irr}^{\text{adm}}(\text{Sp}(V) \times \widetilde{\text{Sp}}(W))$ , we have  $\dim \text{Hom}_{\tilde{H}}(\tilde{\pi} \otimes \bar{\nu}_\psi, \mathbb{C}) \leq 1$  (29.10.2.6).
4. In the skew-Hermitian case (including the split case), if  $k$  is non-Archimedean, for any  $\pi = \pi_W \boxtimes \pi_V \in \text{Irr}^{\text{adm}}(G)$ , we have  $\dim \text{Hom}_H(\pi \otimes \bar{\nu}_{\psi_0, \mu}, \mathbb{C}) \leq 1$  (29.10.2.6).

┘

*Proof:* ?

1: For  $G = \text{O}(W) \times \text{O}(V)$ , this follows from [AGRS] in the non-Archimedean case and follows from [Sun-Zhu, Multiplicity one theorems: the Archimedean case] in the Archimedean case.

For  $G = \text{SO}(W) \times \text{SO}(V)$ , this follows from [Waldspurger, Une variante d'un résultat de Aizenbud, Gourevitch, Rallis et Schiffmann] in the non-Archimedean case and follows from [Sun-Zhu, A note on special orthogonal groups following Waldspurger] in the Archimedean case.

2: This follows from [AGRS] in the non-Archimedean case and follows from [Aizenbud-Gourevitch, Multiplicity one theorem for  $\mathrm{GL}(n+1; \mathbb{R}), \mathrm{GL}(n; \mathbb{R})$ ] and [Sun-Zhu, Multiplicity one theorems: the Archimedean case] in the Archimedean case.

3, 4: These follow from [Sun, Multiplicity one theorems for Fourier-Jacobi models].  $\square$

**Remark (29.10.2.8) [Positive Characteristic cases].** If  $\mathrm{char} k > 0$  and  $\dim W^\perp \leq 1$ , then analogous result holds for  $\mathrm{GL}(n) \times \mathrm{GL}(n+1)$ , Cf. [Aizenbud-Avni-Gourevitch, Spherical pairs over close local fields].  $\lrcorner$

**Def. (29.10.2.9) [ $H$ -Invariant Forms].** In the GGP-setting (29.10.2.1), for  $\pi \in \mathrm{Rep}^{\mathrm{adm}}(G)$ , the  $H$ -invariant forms on  $\pi$  is defined to be

$$\mathcal{P}(\pi) = \mathrm{Hom}_H(\pi, \mathbb{C}).$$

$\lrcorner$

**Def. (29.10.2.10) [Matrix Coefficients as Invariant Forms].** In the GGP-setting (29.10.2.1), if  $\pi \in \mathrm{Irr}^{\mathrm{cusp}}(G)$  is tempered, then there is an element  $I \in \mathcal{P}(\pi) \otimes \mathcal{P}(\tilde{\pi})$  (29.10.2.9) s.t.

$$I(v \otimes \tilde{v}) = \int_{H(F)} \langle \pi(h)v, \tilde{v} \rangle dh.$$

$\lrcorner$

**Thm. (29.10.2.11) [Sakellaridis-Venkatesh].** Situation as in (29.10.2.10), the non-vanishing of  $\mathcal{P}(\pi)$  is equivalent to the non-vanishing of  $I$ .  $\lrcorner$

*Proof:* ?  $\square$

**Prop. (29.10.2.12) [Normalized Invariant Pairing].**  $\lrcorner$

### Local GGP Conjecture

**Conj. (29.10.2.13) [Local Gan-Gross-Prasad Conjecture, Gross-Prasad [G-P94]/Gan-Gross-Prasad [GGP12]]**

In the local GGP setting (29.10.2.1), for each generic local Vogan-packet  $\Pi_\phi$  of  $G$  (29.3.4.3), there exists a relevant pure inner form  $G' = G(W') \times G(V')$  of  $G$  (29.10.2.4) and  $\pi \in \Pi_\phi \cap \mathrm{Irr}^{\mathrm{adm}}(G')$  s.t.

$$\mathrm{Hom}_{H'}(\pi \otimes \bar{\nu}; \mathbb{C}) \neq 0 \text{ (29.10.2.2)(29.10.2.5)(29.10.2.6).}$$

$\lrcorner$

*Proof:* ?  $\square$

**Thm& Conj.Cor. (29.10.2.14).**

- If  $L = K \times K$  and  $\dim W^\perp \leq 1$ , the local Gan-Gross-Prasad conjecture holds.
- If  $L = K \times K$  and  $K$  is non-Archimedean, then the local Gan-Gross-Prasad conjecture holds.
- In the special orthogonal case, [Waldspurger, Une formule intégrale reliée à la conjecture locale de Gross-Prasad], [Waldspurger, Une formule intégrale reliée à la conjecture locale de Gross-Prasad, 2] and [Mœglin-Walspurger, La conjecture locale de Gross-Prasad pour les groupes spéciaux orthogonaux: le cas général], the local Gan-Gross-Prasad conjecture holds assuming some properties of the Vogan packet.

┘

*Proof:* 1: This follows from [JSS83] and [J-S90], where the non-zero element in  $\text{Hom}_H(\pi \otimes \bar{\nu}; \mathbb{C})$  is given by the local Rankin-Selberg integral.?

2: This follows from item1 and [GGP12]Thm15.1, 16.1.?

3: ?

□

**Thm.(29.10.2.15)** [Reduction to basic cases, Gan-Gross-Prasad[GGP12]]. If  $K$  is non-Archimedean, then

┘

**Conj.(29.10.2.16)** [Refined Local Gan-Gross-Prasad Conjecture, Gan-Gross-Prasad[GGP12]]. Situation as in(29.10.2.13), we can specify the unique  $\pi$  under the Langlands-Vogan parameterization as follows: ? Cf.[GGP12]P67.

- When  $G = \text{SO}(W) \times \text{SO}(V)$ ,
- When  $G = U(W) \times U(V)$  Hermitian,
- When  $G = \widetilde{\text{Sp}}(W) \times \text{Sp}(V)$  or  $\text{Sp}(W) \times \widetilde{\text{Sp}}(V)$ ,
- When  $G = U(W) \times U(V)$  skew-Hermitian,

Notice  $\chi(-1, -1) = 1$ , and  $\chi(-1, 1) = \chi(1, -1)$  determines the relevant pure inner form acting on  $\pi_\theta(\varphi, \chi)$ ?.

┘

*Proof:* ?

□

**Prop.(29.10.2.17).** The refined local Gan-Gross-Prasad conjecture(29.10.2.16) is independent of

- $J(\theta)$ .
- Scaling of the bilinear form on  $V$ .
- The data used to define  $\nu \in \text{Irr}^{\text{adm}}(H)$ .

┘

*Proof:* Cf.[?GPP12]Chap18.

- Let  $G = G(W) \times G(V)$ .

┘

**Prop.(29.10.4.2)[Normalized Invariant Pairing].** Denote  $\mathcal{P}(\pi) = \otimes_{v \in \Sigma_F} \mathcal{P}(\pi_v)$  (29.10.2.9).

If  $\mathcal{P}(\pi) \neq 0$ , then we can define a bilinear form

$$\langle \cdot, \cdot \rangle : \mathcal{P}(\pi) \otimes \mathcal{P}(\tilde{\pi}) \rightarrow \mathbb{C}$$

which is the product of local invariant pairings (29.10.2.12). By calculations in (29.10.2.12), the product is well-defined.

┘

**Conj.(29.10.4.3)[Gan-Gross-Prasad Conjecture, Gan-Gross-Prasad[GGP12]].** Let  $\pi_\chi$  be a representation in the global Vogan packet  $\Pi_\phi$  corresponding to the distinguished character  $\chi$ , then the following are equivalent:

- $\pi_\chi$  occurs with multiplicity one in  $\mathcal{A}_0(G)$ , and the linear form  $F(\nu)$  is non-zero on  $\pi_\chi$ .
- $L(\pi_\chi, R, \frac{1}{2}) \neq 0$ .

┘

*Proof:* Cf. [GGP12] Conj26.1. ?

□

**Conj.(29.10.4.4) [Refined Gan-Gross-Prasad Conjecture, Gross-Prasad/ Gan--Gross-Prasad[GGP12]/ Ichino-Ikeda[I-I10]/Harris[Har14a]].** Suppose  $\mathcal{P}(\pi) \neq 0$ , and define  $P_\pi \in \mathcal{P}(\pi)$  by

$$P_\pi(\varphi) = \int_{H(F) \backslash H(\mathbf{A}_F)} \varphi(h) dh, \quad \forall \varphi \in \pi,$$

then

$$\langle \mathcal{P}_\pi, \mathcal{P}_{\tilde{\pi}} \rangle = \frac{L(M^\vee(1); 0)}{2^\beta L(\pi, \text{Ad}; 1)} L(\pi; \frac{1}{2}),$$

where  $2^\beta = \#C_{\widehat{G}}(\text{Arthur}(\pi))$ . ┘

**Thm& Conj.Cor.(29.10.4.5).** The GGP conjecture holds for

- $V$  Hermitian, See [Unitary case](#).
- $V$  orthogonal s.t.  $\dim V = 3$  by [Waldspurger85]Prop7, See [Waldspurger's Formula\(Ichino-Ikeda for  \$n = 2\$ \)](#).
- $V$  orthogonal s.t.  $\dim V = 4$  by Ichino, Cf. [Triple Product\(Ichino-Ikeda for  \$n = 3\$ \)](#). ┘

**Conj.Cor.(29.10.4.6).**  $L(\Pi \times \Pi'; \frac{1}{2}) \neq 0$  iff the pairing  $I : \pi \otimes \pi' \rightarrow \mathbb{C}$  is non-trivial. ┘

**Def.(29.10.4.7)[Hermitian Isobaric Representations].** ? ┘

**Conj.(29.10.4.8) [Gan-Gross-Prasad Conjecture].** Let  $\Pi_n \in \text{Irr}^{\text{cusp}}(\text{GL}(n)/E)$ ,  $\Pi_{n+1} \in \text{Irr}^{\text{cusp}}(\text{GL}(n+1)/E)$  be Hermitian, then the following are equivalent:

- $L(\Pi_n \times \Pi_{n+1}; \frac{1}{2}) \neq 0$ .
- There exist irreducible cuspidal representations  $\pi_n, \pi_{n+1}$  of  $U(V_n)(\mathbf{A}_F), U(V_{n+1})(\mathbf{A}_F)$  resp. s.t.  $\text{BC}(\pi_n) \cong \Pi_n, \text{BC}(\pi_{n+1}) \cong \Pi_{n+1}$ , and  $\varphi_n \in \pi_n, \varphi_{n+1} \in \pi_{n+1}$ , so that

$$\mathcal{P}(\varphi_n, \varphi_{n+1}) = \int_{U(V_n)(F) \backslash U(V_n)(\mathbf{A}_F)} \varphi_n(h) \varphi_{n+1}(h) dh \neq 0.$$

┘

*Proof:* □

## 5 Ichino-Ikeda Formula(Orthogonal case)

References are [\[Ike08, ?I-I10\]](#).

**Notation(29.10.5.1).**

- Let  $F \in \mathbf{GField}$  and  $\text{char } F \neq 2$ .
- Let  $(V_0, Q_0) \subset (V_1, Q_1)$  be quadratic forms over  $F$  with rank  $n, n+1$  resp. And if  $n = 2$ , we assume that  $V_0 \not\cong \mathbb{H}_F$ .
- Let  $G_i = O(V_i)$ . In particular,  $G_0 \subset G_1$ .
- Let  $(V_?, Q_?)$  be the one of  $\{(V_0, Q_0), (V_1, Q_1)\}$  that is even-dimensional, and let  $E = K_{Q_?}$  be the discriminant field([29.10.5.3](#)).
- For  $v \in \Sigma_F$ , denote  $G_{i,v} \stackrel{\Delta}{=} G_i(F_v)$ .
- Fix  $\mathcal{K}_i = \prod_{v \in \Sigma_F} \mathcal{K}_{i,v} \subset G_i(\mathbf{A}_F)$  s.t.  $[\mathcal{K}_0 : \mathcal{K}_0 \cap \mathcal{K}_1] < \infty$ .
- For each  $v \in \Sigma_F$ , fix a Haar measure  $dg_i$  on  $G_{i,v}$ .
- Let  $\pi_i = \otimes_v \pi_{i,v} \in \text{Irr}^{\text{auto}}(G/F)$ .
- Let  $\varphi_i = \otimes_v \varphi_{i,v} \in \pi_i^{\mathcal{K}_i}$  be a pure tensor.

- Let  $\Sigma_F^\infty \subset_{\text{fin}} S \subset \Sigma_F$  s.t. for any  $v \in \Sigma_F^{\text{fin}} \setminus S$  and  $i \in \{0, 1\}$ ,
  - (U1)  $G_{i,v}$  is unramified (20.5.2.25).
  - (U2)  $\mathcal{K}_{i,v}$  is a hyperspecial maximal compact subgroup of  $G_{i,v}$ .
  - (U3)  $\mathcal{K}_{0,v} \subset \mathcal{K}_{1,v}$ .
  - (U4)  $\pi_{i,v} \in \text{Irr}^{\text{unr}}(G_{i,v})$ .
  - (U5)  $\varphi_{i,v} \in \pi_{i,v}^{\mathcal{K}_{i,v}}$ , and  $\|\varphi_{i,v}\| = 1$ .
  - (U6)  $\int_{\mathcal{K}_{i,v}} dg_{i,v} = 1$ , i.e.  $dg_{i,v}$  is the standard measure.

┘

**Def. (29.10.5.2)** [Motivic  $L$ -functions  $\Delta_{G_i}$ ]. For  $v \in \Sigma_F$ , define

$$\Delta_{G_i,v} = \begin{cases} \zeta_v(2)\zeta_v(4)\dots\zeta_v(2l) & , \dim V_i = 2l + 1 \\ \zeta_v(2)\zeta_v(4)\dots\zeta_v(2l-2)L_v(\chi_{E/F}; l) & , \dim V_i = 2l. \end{cases}$$

and  $\Delta_{G_i} = \prod_{v \in \Sigma_F^{\text{fin}}} \Delta_{G_i,v}$ . Cf. [Gross, On the motive of a reductive group].

┘

**Def. (29.10.5.3)** [Discriminant Fields]. For  $K \in \text{Field}$  and an even dimensional quadratic form  $(V, Q)$  over  $K$ , the **discriminant field** is the quadratic field  $K_Q = K(\sqrt{(-1)^{\dim V/2} \det Q})$ .

┘

**Prop. (29.10.5.4)** [Langlands Dual Groups].  $\widehat{G}_i = \begin{cases} \text{Sp}(l; \mathbb{C}) & , \dim V_i = 2l + 1 \\ \text{SO}(2l; \mathbb{C}) & , \dim V_i = 2l \end{cases}$ .

Let  $\text{Ad} : {}^L G_i \rightarrow \text{GL}(\text{Lie } \widehat{G}_i)$  be the adjoint representations.

┘

*Proof:*

□

**Def. (29.10.5.5)**. Define

$$\mathcal{P}_{\pi_1, \pi_0}(s) = \frac{L(\pi_1 \boxtimes \pi_0; s)}{L(\pi_1, \text{Ad}; s + \frac{1}{2})L(\pi_0, \text{Ad}; s + \frac{1}{2})} \text{ ?}.$$

**?** What's the properties of  $\mathcal{P}_{\pi_1, \pi_2}$ ?

┘

**Def. (29.10.5.6)** [Local Matrix Coefficients and Integrals]. Consider the matrix coefficients:

$$\Phi_{\varphi_{i,v}}(g_{i,v}) = \langle g_{i,v}(\varphi_{i,v}), \varphi_{i,v} \rangle, \quad g_{i,v} \in G_{i,v}.$$

and

$$I_v(\varphi_{1,v}, \varphi_{0,v}) = \int_{G_{0,v}} \Phi_{\varphi_{1,v}}(g_{0,v}) \overline{\Phi_{\varphi_{0,v}}(g_{0,v})} dg_{0,v}.$$

(It is convergent by (29.10.5.7)). And

$$\alpha_v(\pi_{1,v}, \pi_{2,v}) = \Delta_{G_{1,v}}^{-1} \mathcal{P}_{\pi_{1,v}, \pi_{0,v}} \left( \frac{1}{2} \right)^{-1} I_v(\pi_{1,v}, \pi_{2,v}) \text{ (29.10.5.5)}.$$

┘

**Prop. (29.10.5.7)** [Tempered case]. If  $\pi_{i,v}$  are both tempered (24.9.8.11), then the integral  $I_v(\varphi_{1,v}, \varphi_{0,v})$  is absolutely convergent, and  $I_v(\varphi_{1,v}, \varphi_{0,v}) \geq 0$  if  $\varphi_{i,v} \in \pi_{i,v}^{\mathcal{K}_{i,v}-\text{fin}}$ .

┘

*Proof:* Cf.[Ichino-Ikeda]Section4. □

**Prop. (29.10.5.8) [Unramified case].** If  $v \in \Sigma_F^{\text{fin}}$  s.t. the conditions (U1)-(U6) hold, and the integral  $I(\varphi_{1,v}, \varphi_{0,v})$  is absolutely convergent, then  $\alpha_v(\varphi_{1,v}, \varphi_{0,v}) = 1$ . ┘

*Proof:* Cf.[Ichino-Ikeda]Section5. □

**Conj. (29.10.5.9) [Ichino-Ikeda].** If  $v \in \Sigma_F^{\text{fin}}$  and  $\pi_{1,v}, \pi_{0,v}$  are both tempered, then  $\text{Hom}_{G_{0,v}}(\pi_{1,v} \otimes \bar{\pi}_{0,v}, \mathbb{C}) \neq 0$  iff  $\alpha_v(\varphi_{1,v}, \varphi_{0,v}) > 0$  for some  $\varphi_{i,v} \in \pi_{i,v}^{\mathcal{K}_{i,v}^{\text{fin}}}$  (29.10.5.6). ┘

*Proof:* □

**Remark (29.10.5.10).** It is believed that for any  $\pi_{i,v} \in \text{Irr}^{\text{adm}}(G_{i,v})$ ,  $\dim \text{Hom}_{G_{0,v}}(\pi_{1,v} \otimes \bar{\pi}_{0,v}, \mathbb{C}) \leq 1$ . ┘

*Proof:* □

**Conj. (29.10.5.11) [Ichino-Ikeda].** If  $\pi_i$  are both almost generic, then

- The integrals  $I_v(\varphi_{1,v}, \varphi_{0,v})$  is absolutely convergent and  $I(\varphi_{1,v}, \varphi_{0,v}) \geq 0$  if  $\varphi_{i,v} \in \pi_{i,v}^{\mathcal{K}_{i,v}^{\text{fin}}}$ . (This should follow from (29.10.5.7) and generalized Ramanujan conjecture (26.6.6.1)).
- $\text{Hom}_{G_{0,v}}(\pi_{1,v} \otimes \bar{\pi}_{0,v}, \mathbb{C}) \neq 0$  iff  $\alpha_v(\varphi_{1,v}, \varphi_{0,v}) > 0$  for some  $\varphi_{i,v} \in \pi_{i,v}^{\mathcal{K}_{i,v}^{\text{fin}}}$ . ┘

*Proof:* □

**Remark (29.10.5.12).** These follow from (29.10.5.7) and (29.10.5.9) if we assume the generalized Ramanujan conjecture that any almost generic representation is tempered. ┘

*Proof:* □

**Prop. (29.10.5.13) [Inner Product on Forms].** If  $\pi_i = \otimes_v \pi_{i,v} \in \text{Irr}^{\text{auto}}(G_i(\mathbf{A}_F))$  are square-integrable, then there are invariant inner forms on  $\pi_i$  s.t.

$$\langle \varphi_i, \varphi'_i \rangle = \int_{G_i(F) \backslash G_i(\mathbf{A}_F)} \varphi_i(g_i) \overline{\varphi'_i(g_i)} d\mu(g_i)$$

where  $\mu$  is a Tamagawa measure on  $G_i(\mathbf{A}_F)$  (20.5.4.5). Since  $\pi_i$  are unitary, we can also define another invariant form

$$\langle \varphi_i, \varphi'_i \rangle' = \prod_{v \in \Sigma_F} (\varphi_{i,v}, \varphi'_{i,v})_v.$$

So there exists  $C_i \in \mathbb{R}_+$  s.t.

$$\langle \varphi_i, \varphi'_i \rangle = C_i \prod_{v \in \Sigma_F} (\varphi_{i,v}, \varphi'_{i,v})_v.$$

┘

**Conj. (29.10.5.14) [Ichino-Ikeda].** If  $\pi_i = \otimes_v \pi_{i,v} \in \text{Rep}^{\text{cusp, loc. generic}}(G_i(\mathbf{A}_F))$  are square-integrable, then there exists  $\beta \in \mathbb{Z}$  s.t.

$$\frac{|\langle \varphi_1|_{G_0}, \varphi_2 \rangle|^2}{\langle \varphi_1, \varphi_1 \rangle \cdot \langle \varphi_2, \varphi_2 \rangle} = 2^\beta C_0 \Delta_{G_1} \mathcal{P}_{\pi_1, \pi_2} \left( \frac{1}{2} \right) \prod_{v \in S} \frac{\alpha_v(\varphi_{1,v}, \varphi_{0,v})}{\|\varphi_{1,v}\|^2 \cdot \|\varphi_{2,v}\|^2} \quad (29.10.5.1)(29.10.5.2)(29.10.5.5)(29.10.5.13).$$

Moreover, if  $\pi_i$  are tempered with Arthur parameter  $\psi_i : \mathcal{L}_F \rightarrow {}^L G_i$ ?, then

$$2^\beta = \frac{1}{\#\mathcal{S}_{\psi_1} \cdot \#\mathcal{S}_{\psi_2}}.$$

where  $\mathcal{S}_{\psi_i}$  is the centralizer of  $\text{Im}(\psi_i)$  in  $\widehat{G}_i$ . ┘

*Proof:* □

**Remark (29.10.5.15).** If  $\pi_i$  are tempered, then it is believed that the local  $L$ -factors  $L(\pi_{i,v}, \text{Ad}; s)$  and  $L(\pi_{1,v} \boxtimes \pi_{0,v}; s)$  are holomorphic for  $\text{Re}(s) > 0$ . In particular, the formula doesn't depend on the  $L$ -factors for bad places. ┘

*Proof:* □

**Conj. (29.10.5.16) [Non-Tempered case, Ichino-Ikeda].** If  $\pi_i = \otimes_v \pi_{i,v} \in \text{Irr}^{\text{auto}}(G_i(\mathbf{A}))$  are square-integrable s.t.  $\text{Hom}_{G_{0,v}}(\pi_{1,v} \otimes \bar{\pi}_{0,v}, \mathbb{C}) \neq 0$  for any  $v \in \Sigma_F$ , then

- The integral  $\langle \varphi_1|_{G_0}, \varphi_2 \rangle$  is convergent for any  $\varphi_i \in \pi_i$ .
- There exists  $\beta \in \mathbb{Z}$  s.t.

$$\frac{|\langle \varphi_1|_{G_0}, \varphi_2 \rangle|^2}{\langle \varphi_1, \varphi_1 \rangle \cdot \langle \varphi_2, \varphi_2 \rangle} = 2^\beta C_0 \Delta_{G_1} \mathcal{P}_{\pi_1, \pi_2} \left( \frac{1}{2} \right) \prod_{v \in S} \frac{\alpha_v(\varphi_{1,v}, \varphi_{0,v})}{\|\varphi_{1,v}\|^2 \cdot \|\varphi_{2,v}\|^2} \text{ (29.10.5.1)(29.10.5.2)(29.10.5.5)(29.10.5.13).}$$

┘

*Proof:* □

## 6 Waldspurger's Formula (Ichino-Ikeda for $n = 2$ )

**Notation (29.10.6.1).**

- Let  $F \in \mathbf{NField}$ ,  $\mathbf{A} = \mathbf{A}_F$ .
- Let  $D$  be a quaternion algebra over  $F$ .
- $E \in \mathbf{NField}$  is a quadratic extension of  $F$  contained in  $D$ .
- Let  $\mathbf{1} \neq \psi \in (\mathbf{A}_F/F)^\vee$ .
- Choose a central character  $\omega : \mathbf{C}_F \rightarrow \mathbb{C}^\times$ .
- $\pi \in \text{Irr}^{\text{cusp}}(D^\times/F, \omega)$ .
- Let  $\chi : \mathbf{C}_E \rightarrow \mathbb{C}^\times$  be a Hecke character s.t.  $\chi|_{\mathbf{I}_F} \cdot \omega = 1$ .

┘

**Def. (29.10.6.2) [Period Integrals].** The **period integral** is defined to

$$P_\chi : V_\pi \rightarrow \mathbb{C} : f \mapsto \int_{E^\times \backslash \mathbf{I}_E / \mathbf{I}_F} f(t) \chi(t) dt.$$

┘

**Def. (29.10.6.3)[Invariant Pairing].** If  $F \in \mathbf{LField}$  and  $E$  is a quadratic extension of  $F$ , then for any fixed pairing  $(-, -) : \pi \times \tilde{\pi} \rightarrow \mathbb{C}$ , there is a  $D^\times$ -invariant bilinear form

$$\alpha : \pi \otimes \tilde{\pi} \rightarrow \mathbb{C} : (f_1, f_2) \mapsto \frac{L(\chi_{E/F}; 1)L(\pi, \text{Ad}; 1)}{\zeta_F(2)L(\pi(\chi); 1/2)} \int_{E^\times/F^\times} (\pi(t)f_1, f_2)\chi(t)dt.$$

?

And the global invariant pairing is the product of the local pairings.  $\lrcorner$

**Thm. (29.10.6.4)[Waldspurger 85].** Situation as in (29.10.6.1), for any  $f_1 \in V_\pi, f_2 \in V_{\tilde{\pi}}$ ,

$$P_\chi(f_1).P_{\chi^{-1}}(f_2) = \frac{\zeta_F(2)L(\pi(\chi); 1/2)}{8L(\chi_{E/F}; 1)^2L(\pi, \text{Ad}; 1)} \alpha(f_1, f_2) \text{ (29.10.6.2)(29.10.6.3)}.$$

Where  $L(\pi, \chi; s)$  is defined via Jacquet-Langlands lifting of  $\pi$ . ?  $\lrcorner$

*Proof:*  $\square$

**Cor. (29.10.6.5)[Waldspurger].** Let  $\chi$  be a character,  $k \in 2\mathbb{Z}$  and  $\varphi \in \text{SF}_{k-1}(N, \chi^2)$ , then there exists a function  $A_\varphi$  on  $\mathbb{N}^{sc}$  s.t. for  $t \in \mathbb{N}^{sc}$ ,

$$A_\varphi(t)^2 = L(\varphi \otimes \chi_0^{-1}\chi_t, \frac{k-1}{2})\epsilon(\chi_0^{-1}\chi_t, \frac{1}{2}).$$

$\lrcorner$

*Proof:* Cf.[Explicit application of Waldspurger's theorem].  $\square$

### Relation to Ichino-Ikeda Formula

Cf.[?I-I10]Chap6.

**Prop. (29.10.6.6).** Let  $G_1 = D^\times \in \text{AlgGrp}/F$  and let  $G_0 = T$  be an anisotropic torus of  $G_1$ .

$G_1$  can be regarded as a special orthogonal group associated to a 3-dimensional quadratic space over  $F$ . And  $G_0$  can be regarded as a special orthogonal group associated to a 2-dimensional quadratic space over  $F$ .

The motivic  $L$ -function for  $G_1$  is  $\Delta_{G_1} = \zeta_F(2)$ .

There exists an exact sequence  $1 \rightarrow F^\times \rightarrow E^\times \rightarrow T \rightarrow 1$ .  $\lrcorner$

*Proof:*  $\square$

**Def. (29.10.6.7)[Haar Measures].** For each  $v \in \Sigma_F$ , choose a Haar measure  $\mu_v$  on  $F_v^\times$  that is self-dual w.r.t.  $\psi_v$ , and let the measure  $d\nu_v = \zeta_v(1)^{-1} \frac{d\mu_v}{|v|}$ . Similarly defined  $d\nu_v$  on  $E_v^\times$ , and define the Haar measure on  $T(F_v)$  as the quotient space  $1 \rightarrow F_v^\times \rightarrow E_v^\times \rightarrow T \rightarrow 1$ .

Then the Haar measure constant  $C_0 = \Lambda(\chi_{E/F}; 1)^{-1}$  ?  $\lrcorner$

**Prop. (29.10.6.8).**  $\lrcorner$

## 7 Jacquet-Langlands-Shimizu Correspondence

**Notation (29.10.7.1).**

- Let  $F \in \mathbf{NField}$ .
- Let  $1 \neq \psi : F \backslash \mathbf{A}_F \rightarrow \mathbb{C}^\times$  be a non-trivial additive character.
- Let  $\Pi \in \mathbf{Rep}^{\text{cusp, uni}}(\mathrm{GL}(2)/F)$ .
- Let  $D \in \mathbf{Az}_F$  be a quaternion algebra and  $\pi^D \in \mathbf{Rep}^{\text{cusp, uni}}(D^\times/F)$  corresponds to  $\pi$  via Jacquet-Langlands correspondence **?**.
- Let  $V = D$  be the 4-dimensional quadratic space over  $F$  with the non-degenerate symmetric bilinear form  $(x, y) = \mathrm{tr}_{D/F}(x\bar{y})$ .
- Let  $f = \otimes'_v f_v \in \pi$ .
- Let  $S(V(\mathbf{A}_F))$  be the subspace of  $\mathcal{S}(V(\mathbf{A}_F))$  consisting of functions that corresponds to polynomials in the mock model at every Archimedean place.
- Let  $\varphi = \otimes'_v \varphi_v \in S(V(\mathbf{A}_F))$ .
- Let  $W_{\bar{\psi}, f} = \otimes'_v W_{\bar{\psi}_v, f_v}$  be the Whittaker function of  $f$  s.t.  $W_{\bar{\psi}_v, f_v}(1) = 1$  for a.e.  $v \in \Sigma_F$  **(26.6.4.3)(26.6.4.2)**.

┘

**Prop. (29.10.7.2).** Let  $t$  be the involution on  $D^\times \times D^\times$  defined by

$$t(x, y) = (\bar{y}^{-1}, \bar{x}^{-1}).$$

Then there is an exact sequence

$$1 \rightarrow \mathbb{G}_m \rightarrow (D^\times \times D^\times) \rtimes \langle t \rangle \xrightarrow{\rho} \mathrm{GO}(V) \rightarrow 1,$$

where  $\rho(h_1, h_2)x = h_1 x h_2^{-1}$  and  $\rho(t)x = \bar{x}$  for  $h_1, h_2 \in D^\times$  and  $x \in V$ .

┘

**Def. (29.10.7.3) [Theta Maps].** There is an  $D^\times(\mathbf{A}_F)$ -equivariant surjective map

$$\theta : \pi \otimes S(V(\mathbf{A}_F)) \rightarrow \pi^D \otimes (\pi^D)^\vee.$$

Moreover, there exists  $D_{F_v}^\times$ -equivariant surjective maps

$$\theta_v : \pi_v \otimes S(V(\mathbf{A}_F)) \rightarrow \pi_v^D \otimes (\pi_v^D)^\vee$$

s.t.  $\theta = \otimes'_v \theta_v$ .

┘

*Proof:* **?** Cf. [Shimizu, Theta series and automorphic forms on  $\mathrm{GL}(2)$ ] and [Harris-Kudla91, The central critical value of a triple product  $L$ -function] Section 7. □

**Def. (29.10.7.4) [Invariant Pairings].** Define a  $D^\times(\mathbf{A}_F)$ -invariant bilinear pairing  $B : \pi^D \otimes (\pi^D)^\vee \rightarrow \mathbb{C}$  by:

$$B(\varphi \otimes \varphi') = \int_{\mathbf{I}_F D^\times(F) \backslash D^\times(\mathbf{A}_F)} \varphi(h) \varphi'(h) dh.$$

**?** Convergence.

┘

**Def. (29.10.7.5) [Waldspurger].** For each  $v \in \Sigma_F$ , define a map  $\tilde{B}_v : \pi_v \otimes S(V(F_v)) \rightarrow \mathbb{C}$  (29.10.8.3) defined by

$$\tilde{B}_v(f_v, \Phi_v) = \int_{\text{Unip}(2; F_v) \backslash \text{SL}(2; F_v)} \omega(g_v) \Phi_v(1) W_{\psi_v, f_v}^-(g_v) dg_v.$$

┘

*Proof:* This integral is convergent by [Waldspurger85]Lemma5.?

□

**Def. (29.10.7.6) [Unramified Places].**  $v \in \Sigma_F^{\text{fin}}$  is called an **unramified place** if

- $\psi_v$  is unramified.
- $\pi_v$  is unramified.
- $f_v$  is  $\text{GL}(2; \mathcal{O}_{E_v})$ -invariant.
- $W_{f_v}^{\psi_v}(1) = 1$ .
- $\varphi_v = \mathbf{1}_{\text{Mat}(2; \mathcal{O}_{E_v})}$ .
- $\text{Vol}(\text{SL}(2; \mathcal{O}_{F_v}); dg_v) = 1$ .

In particular, a.e.  $v \in \Sigma_F^{\text{fin}}$  is unramified.?

┘

**Prop. (29.10.7.7) [Waldspurger].** If  $v \in \Sigma_F^{\text{fin}}$  is unramified in the sense of (29.10.7.6), then

$$\tilde{B}_v(f_v, \varphi_v) = \zeta_v(2)^{-1} L_v(\pi_v, \text{Ad}; 1) (29.10.7.5).$$

┘

*Proof:* Cf. [Waldspurger85]Lemma5.?

□

**Prop. (29.10.7.8) [Waldspurger].**

$$B(\theta(f, \Phi)) = 2\zeta^S(2)^{-1} L^S(\pi, \text{Ad}; 1) \prod_{v \in S} \tilde{B}_v(f_v, \Phi_v) (29.10.7.3)(29.10.7.5)(29.10.7.4),$$

where  $\Sigma_F^\infty \subset_{\text{fin}} S \subset \Sigma_F$  is any finite set containing all the primes of  $F$  not unramified in the sense of (29.10.7.6).

┘

*Proof:* Cf. [Waldspurger85]Prop5.?

□

**Prop. (29.10.7.9) [Invariant Pairing for  $\pi^D$ ].** For each  $v \in \Sigma_F$ , there exists a  $D^\times(F_v)$ -invariant pairing  $B_v : \pi_v^D \otimes (\pi_v^D)^\vee \rightarrow \mathbb{C}$  s.t.  $\tilde{B}_v = B_v \circ \theta_v$  (29.10.7.5)(29.10.7.3).

┘

*Proof:* Cf. [Waldspurger85]Lemma6.?

□

## 8 Triple Product (Ichino-Ikeda for $n = 3$ )

Cf. [Ich08] and [Harris-Kudla, Central critical value of a triple product  $L$ -function].

**Notation (29.10.8.1) [Global Triple Product Setting].**

- Let  $F \in \mathbf{NField}$ .
- Let  $1 \neq \psi : F \backslash \mathbf{A}_F \rightarrow \mathbb{C}^\times$  be a non-trivial additive character.
- Let  $E \in \mathbf{CRing}/F$  be an étale algebra with  $\dim_F E = 3$ .

- Let  $\psi^E = \psi \circ \text{tr}_{E/F} : E \backslash \mathbf{A}_E \rightarrow \mathbb{C}^\times$  be the non-trivial additive character.
- Use notations on  $\text{GL}(n)$  defined in [General Linear Groups](#).
- Let  $\Pi \in \text{Rep}^{\text{cusp}, \text{uni}}(\text{GL}(2)/E)$  s.t. the central character is trivial on  $\mathbf{I}_F$ .
- Let  $D \in \text{Az}_F$  be a quaternion algebra and  $\Pi^D \in \text{Rep}^{\text{cusp}, \text{uni}}(D_E^\times/E)$  corresponds to  $\Pi$  via Jacquet-Langlands correspondence [?](#).
- Let  $V = D$  be the 4-dimensional quadratic space over  $F$  with the non-degenerate symmetric bilinear form  $(x, y) = \text{tr}_{D/F}(x\bar{y})$ .
- Let  $W = E^{\oplus 2}$  be the 6-dimensional symplectic space over  $F$  with the non-degenerate anti-symmetric bilinear form  $\langle (x_1, x_2), (y_1, y_2) \rangle = \text{tr}_{E/F}(x_1 y_2 - x_2 y_1)$ .
- Choose a basis  $\{e_1, e_2, e_3, e'_1, e'_2, e'_3\}$  of  $W$  over  $F$  as follows:
  - If  $E = F \times F \times F$ , define

$$e_1 = ((1, 0, 0), (0, 0, 0)), \quad e_2 = ((0, 1, 0), (0, 0, 0)), \quad e_3 = ((0, 0, 1), (0, 0, 0)),$$

$$e'_1 = ((0, 0, 0), (1, 0, 0)), \quad e'_2 = ((0, 0, 0), (0, 1, 0)), \quad e'_3 = ((0, 0, 0), (0, 0, 1)).$$

- If  $E = F' \times F$  where  $F'/F$  is a quadratic extension, fix some  $\delta, \delta' \in F'$  s.t.

$$\text{tr}_{F'/F}(\delta) = \text{tr}_{F'/F}(\delta') = 0, \quad \text{tr}_{F'/F}(\delta\delta') = 1,$$

and define

$$e_1 = ((1, 0), (0, 0)), \quad e_2 = ((\delta, 0), (0, 0)), \quad e_3 = ((0, 1), (0, 0)),$$

$$e'_1 = \left( (0, 0), \left( \frac{1}{2}, 0 \right) \right), \quad e'_2 = ((0, 0), (\delta', 0)), \quad e'_3 = ((0, 0), (0, 1)).$$

- If  $E \in \text{Field}$ , fix some  $\delta_2, \delta_3, \delta'_2, \delta'_3 \in E$  s.t.

$$\text{tr}_{E/F}(\delta_i) = \text{tr}_{E/F}(\delta'_i) = 0, \quad \text{tr}_{E/F}(\delta_i \delta'_j) = \delta_{ij} \text{ [?](#),$$

and define

$$e_1 = (1, 0), \quad e_2 = (\delta_2, 0), \quad e_3 = (\delta_3, 0),$$

$$e'_1 = (0, \frac{1}{3}), \quad e'_2 = (0, \delta'_2), \quad e'_3 = (0, \delta'_3).$$

Then they satisfy:  $\langle e_i, e_j \rangle = \langle e'_i, e'_j \rangle = 0$  and  $\langle e_i, e'_j \rangle = \delta_{ij}$ . And there is an isomorphism  $F^{\oplus 3} \cong E$  defined by

$$(x_1, x_2, x_3) \mapsto \begin{cases} (x_1, x_2, x_3) & , E = F \times F \times F \\ (x_1 + \delta x_2, x_3) & , E = F' \times F, F'/F \in \text{GalField} \\ (x_1 + \delta_2 x_2 + \delta_3 x_3) & , E \in \text{Field} \end{cases}$$

- Let  $\mathbf{G} = \{g \in \text{Res}_{E/F}(\text{GL}(2)) \mid \nu(g) \in \mathbb{G}_m\}$ . Then  $\mathbf{G}$  preserves the symplectic form on  $W$  [?](#). Using the basis  $\{e_1, e_2, e_3, e'_1, e'_2, e'_3\}$  of  $W = E^{\oplus 2}$ , we can regard  $\mathbf{G}$  as a subgroup of  $\text{GSp}(3)$ .  $\perp$

**Prop. (29.10.8.2) [Weil Representations].**  $G(\mathrm{Sp}(3) \times \mathrm{O}(V))(\mathbf{A}_F)$  acts on  $\mathcal{S}(V(\mathbf{A}_F)^3)$  via the Weil representation w.r.t.  $\psi$  and  $G(\mathrm{SL}(2) \times \mathrm{O}(V))(\mathbf{A}_E)$  acts on  $\mathrm{Sch}(V(\mathbf{A}_E))$  via the Weil representation w.r.t.  $\psi \circ \mathrm{tr}_{E/F}$  ?

This two actions are compatible on the subgroup  $\{(g, h) \in \mathbf{G}(\mathbf{A}_F) \times \mathrm{O}(V)(\mathbf{A}_F) | \nu(g) = \nu(h)\}$  via the embedding  $\mathbf{G} \subset \mathrm{GSp}(3)$ .  $\lrcorner$

**Def. (29.10.8.3).** Let  $S(V(\mathbf{A}_F)^n)$  be the subspace of  $\mathcal{S}(V(\mathbf{A}_F)^n)$  consisting of functions that corresponds to polynomials in the mock model at every Archimedean place.  $\lrcorner$

**Def. (29.10.8.4) [Measures].**

- Let  $db = \prod_i db_i$  be the Tamagawa measure on  $\mathbf{A}_F$ .
- Let  $dh = \prod_i dh_i$  be the Tamagawa measure on  $\mathbf{A}_E$ .
- Let  $dg = \prod_i dg_i$  be the Tamagawa measure on  $\mathbf{I}_F \backslash \mathbf{G}(\mathbf{A}_F)$ .
- Let  $dg = \prod_i dg_i$  be the Tamagawa measure on  $\mathbf{I}_F \backslash \mathrm{SL}(2; \mathbf{A}_F)$ .
- Let  $dh = \prod_i dh_i$  be the Tamagawa measure on  $\mathbf{I}_F \backslash D^\times(\mathbf{A}_F)$ .

$\lrcorner$

**Def. (29.10.8.5) [Invariant Pairing  $I_v$ ].** For  $v \in \Sigma_F$ , let  $B : \Pi_v^D \otimes (\Pi_v^D)^\vee \rightarrow \mathbb{C}$  be the  $D^\times(E_v)$ -invariant pairing defined in (29.10.7.9), and define

$$B_v^\flat = \zeta_E(2) L_v(\Pi_v, \mathrm{Ad}; 1)^{-1} B_v.$$

In particular, if

$$B(\phi \otimes \phi') = \int_{\mathbf{I}_F D^\times(F) \backslash D^\times(\mathbf{A}_F)} \phi(h) \phi'(h) dh.$$

is the  $D^\times(\mathbf{A}_E)$ -invariant pairing defined in (29.10.7.4), then we have

$$B = 2^{\#\pi_0(\mathrm{Spec} E)} \zeta_E(2)^{-1} L(\Pi, \mathrm{Ad}; 1).$$

by (29.10.7.8) ?.

Then we can defined  $I_v \in \mathrm{Hom}_{D^\times(F_v) \times D^\times(F_v)}(\Pi^D \otimes (\Pi^D)^\vee, \mathbb{C})$  by

$$I_v(\varphi_v \otimes \varphi'_v) = \frac{\zeta_{F_v}(2)}{\zeta_{E_v}(2)} \cdot \frac{L_v(\Pi_v, \mathrm{Ad}; 1)}{L_v(\Pi_v, r; \frac{1}{2})} \cdot \int_{F_v^\times \backslash D^\times(F_v)} B_v^\sharp(\Pi_v^D(x_v) \varphi_v \otimes \varphi'_v) d^\times x_v.$$

? Convergence.  $\lrcorner$

**Thm. (29.10.8.6)** [Harris-Kudla[H-K91, H-K02]/Ichino[Ich08]]. As element in  $\mathrm{Hom}_{D^\times(\mathbf{A}_F) \times D^\times(\mathbf{A}_F)}(\Pi^D \otimes (\Pi^D)^\vee; \mathbb{C})$ , we have

$$I = 2^{-\#\pi_0(\mathrm{Spec} E)} \cdot \frac{\zeta_E(2)}{\zeta_F(2)} \cdot \frac{L(\Pi, r; \frac{1}{2})}{L(\Pi, \mathrm{Ad}; 1)} \cdot \prod_{v \in \Sigma_F} I_v.$$

### Local Trilinear Forms

**Prop. (29.10.8.7)[Local Triple Zeta Integrals].** The local zeta integral of Garrett and Shapiro-Rallis is defined by

$$Z_v(W_{f_v}^{\psi_v^E}, F_{\varphi_v}; s) = \int_{F_v^\times \mathbf{U}_0(F_v) \backslash \mathbf{G}(F_v)} F_{\varphi_v}(\eta g_v; s) W_{f_v}^{\psi_v^E}(g_v) dg_v,$$

┘

where  $\mathbf{U}_0 = \{u(b) | b \in \text{Res}_{E/F} \mathbf{G}_a, \text{tr}_{E/F}(b) = 0\}$  and  $\eta$  is a representative for the open orbit of  $\mathbf{G}$  in  $P \backslash \text{GSp}(3)$ . We can take  $\eta \in \text{Sp}_3(\mathbb{Z})$  as follows (in the basis  $(e_1, e_2, e_3, e'_1, e'_2, e'_3)$  of (29.10.8.1):

- If  $E = F \times F \times F$ , take

$$\eta = \begin{bmatrix} 0 & 0 & 0 & -1 & 0 & 0 \\ 0 & 1 & 0 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 & 0 & 0 \\ 1 & 1 & 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & -1 & 1 & 0 \\ 0 & 0 & 0 & -1 & 0 & 1 \end{bmatrix}$$

- If  $E = F' \times F$  where  $F'/F$  is a quadratic extension, take

$$\eta = \begin{bmatrix} 0 & 0 & 0 & -1 & 0 & 0 \\ 0 & 1 & 0 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 & 0 & 0 \\ 1 & 0 & 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & -1 & 0 & 1 \end{bmatrix}$$

- If  $E \in \text{Field}$ , take

$$\eta = \begin{bmatrix} 0 & 0 & 0 & -1 & 0 & 0 \\ 0 & 1 & 0 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 & 0 & 0 \\ 1 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 0 & 0 & 1 \end{bmatrix}$$

*Proof:* ?

□

**Def. (29.10.8.8)[Unramified Places].**  $v \in \Sigma_F^{\text{fin}}$  is called an **unramified place** if

- $E_v$  is unramified.
- $\psi_v$  is unramified.
- $\Pi_v$  is unramified.
- $f_v$  is  $\text{GL}(2; \mathcal{O}_{E_v})$ -invariant.
- $W_{f_v}^{\psi_v^E}(1) = 1$ .
- $\varphi_v = \mathbf{1}_{\text{Mat}(2; \mathcal{O}_{E_v})}$ .
- $\text{Vol}(\mathcal{O}_{F_v}^* \backslash \mathbf{G}(\mathcal{O}_{F_v}); dg_v) = 1$ .

In particular, a.e.  $v \in \Sigma_F^{\text{fin}}$  is unramified?.

┘

**Prop. (29.10.8.9) [Unramified Zeta Integrals].** If  $v \in \Sigma_F^{\text{fin}}$  is unramified in the sense of (29.10.8.8), then

$$Z_v(W_{f_v}^{\psi_v}, F_{\varphi_v}; s) = \zeta_{F_v}(2s+2)^{-1} \zeta_{F_v}(4s+2)^{-1} L_v(\Pi_v, r; s + \frac{1}{2}).$$

┘

## 9 Unitary case

### 10 Orbital Integrals

**Def. (29.10.10.1) [Orbital Integrals].** Let  $F \in \mathbf{NField}$  and  $G \in \mathcal{AlgGrp}/F$  with two subgroups  $H_1, H_2 \subset G$ , let  $H_{1,2} = H_1 \times H_2$ , and let  $H_{1,2}$  acts on  $G$  on the right by  $g.(h_1, h_2) = h_1^{-1}gh_2$ . Then when  $\gamma \in G(F)/H_{1,2}(F)$  is nice?, we can define  $H_{1,2,\gamma}$  to be the stabilizer of (a lift of)  $\gamma$ , then the **orbital integral** of  $f$  w.r.t.  $\gamma$  is defined to be

$$\text{Orb}(\gamma; f) = \text{Vol}([H_{1,2,\gamma}]) \int_{H_{1,2}(\mathbf{A}_F)/H_{1,2,\gamma}(\mathbf{A}_F)} f(h_1^{-1}\gamma h_2) dh_1 dh_2.$$

┘

*Proof:* It is invariant w.r.t the lift of  $\gamma$ , because of the property of the Tamagawa measure?. □

**Def. (29.10.10.2) [Relative Trace Formula].** Situation as in (29.10.10.1), a **relative trace formula** for the triple  $(G, H_1, H_2)$  is a formula of the form

$$\text{RTF}_{(G, H_1, H_2)} : \sum_{\pi} \text{I}_{\pi}(f) + \dots = \sum_{\gamma \in H_1(F) \backslash G(F)_{\text{rs}}/H_2(F)} \tau(\gamma) \text{Orb}(\gamma; f) + \dots$$

Cf.[Periods, Cycles and L-Functions, Wei Zhang]P15.?

┘

**Remark (29.10.10.3).** This formula may be connected to Arthur-Selberg formulas. ┘

## 11 Fundamental Lemmas

**Conj. (29.10.11.1) [Fundamental Lemma, Jacquet-Rallis].** For  $p \in \text{Prime}_{\geq 3}$ , the characteristic function  $\mathbf{1}_{G'(\mathcal{O}_{F_0})} \in C_c^{\infty}(G'(F))$  transfers? to the pair of functions  $(\mathbf{1}_{G(\mathcal{O}_F)}, 0) \in C_c^{\infty}(G(F)) \times C_c^{\infty}(G^{\flat}(F))$ .

See also [Gross-Zagier formula and arithmetic fundamental lemma, Wei Zhang]P10. ┘

*Proof:* Cf.[On the Gross-Prasad conjecture for unitary groups, jacquet-Rallis]. □

**Thm& Conj.Cor. (29.10.11.2) [Yun-Gordon].** The fundamental lemma holds for  $p$  sufficiently large. ┘

*Proof:* Cf.[The fundamental lemma of Jacquet-Rallis in positive characteristics, Yun]. □

## 12 Rallis Inner Product Formula

### Local Theory

**Notation (29.10.12.1) [Inner Product Formula Setting].**

- Let  $K \in \text{LField}$ .
- Let  $(G, H)$  be one of the following:
  - $G = O(V)$  where  $V$  is a quadratic space of dimension  $2n + 1$  over  $K$ , and  $H = \text{Sp}(K^{2n})$  with the standard symplectic form.
  - $G = U(V)$  where  $V$  is a Hermitian space of dimension  $2n$  over a quadratic field extension  $L$  of  $K$ , and  $H = U(L^{2n})$  with the standard skew Hermitian form.

┘

**Prop. (29.10.12.2) [Theta Lifting].** Embed  $H \times G$  into the metaplectic group  $\text{Mp}(V^{2n})$ , and let  $R$  be the Weil representation of  $\text{Mp}(V^{2n})$  realized on the space  $\mathcal{S}(V_{\mathbf{A}}^n)$  of Schwartz functions ?.

For any irreducible representation  $\pi$  of  $H$ , we consider the space of linear forms

$$\mathcal{P}(\pi) = \bigoplus_{\sigma} \text{Hom}_{H \times G}(\pi \times R, \sigma),$$

then by Howe duality ?,  $\dim \mathcal{P}(\pi) \leq 1$ . In particular, this is non-vanishing for at most one such  $\sigma$ , called the **theta lifting** of  $\pi$ . ┘

*Proof:* □

**Prop. (29.10.12.3) [Local Inner Products].** Suppose  $\pi$  is tempered, then by [Theta correspondences for close unitary groups, Li-Harris-Sun2011], this space is non-vanishing iff some matrix coefficients is non-vanishing: For some  $f \in \pi \otimes R, \tilde{f} \in \tilde{\pi} \otimes \tilde{R}$ ,

$$\int_H \langle hf, \tilde{f} \rangle dh \neq 0.$$

We may normalize the integral s.t. it takes value 1 in the spherical case:

$$m(f, \tilde{f}) = \frac{L(M; 1)}{L(\pi; 1/2)} \int_H \langle hf, \tilde{f} \rangle dh,$$

where

$$L(M; 1) = \prod_{i=1}^n L(i; \eta_{E/F}^i)$$

in the unitary case, and

$$L(M; 1) = \zeta(1/2) \prod_{i=1}^n \zeta(2i)$$

in the orthogonal case. Thus  $m \in \text{Hom}_{H^2 \times \Delta(G)}(\pi \otimes \tilde{\pi} \otimes R \otimes \tilde{R}, \mathbb{C})$ .

Then we can define a bilinear form

$$\mathcal{P}(\pi) \otimes \mathcal{P}(\tilde{\pi}) \rightarrow \mathbb{C} : \langle \ell, \tilde{\ell} \rangle = \frac{\langle \ell(f), \tilde{\ell}(\tilde{f}) \rangle}{m(f, \tilde{f})}.$$

when  $\pi$  is unitary and tempered, this pairing is positive definite. ┘

*Proof:* □

### Inner Product Formula

**Notation(29.10.12.4).** The setting is similar to the local case, but with  $L/K$  replaced by number fields. ? ⌋

**Thm.(29.10.12.5)[Rallis Inner Product Formula].** Let  $\pi \in \text{Irr}^{\text{cusp}}(H), \sigma \in \text{Irr}^{\text{cusp}}(G)$ , define  $\mathcal{P}(\pi)$  as the product of the local data, then we can define an element  $P_\pi \in \mathcal{P}(\pi)$  as follows

$$P_\pi(f \otimes \varphi)(g) = \int_{[H]} \theta_\varphi(g, h) f(h) dh,$$

where  $\theta_\varphi$  is the theta series

$$\theta_\varphi(g) = \sum_{x \in V^m} R(g)\varphi(x), \quad g \in \text{Mp}((V \otimes W)_{\mathbf{A}_F}).$$

Then

$$\langle P_\pi, P_{\tilde{\pi}} \rangle = \frac{L(\pi; 1/2)}{2L(M; 1)} \text{ (29.10.12.3).}$$

⌋

*Proof:* Cf.[Rallis S. Injectivity properties of liftings associated to Weil representations], [Kudla S, Rallis S. A regularized Siegel-Weil formula: The first term identity], [Li J-S. Non-vanishing theorems for the cohomology of certain arithmetic quotients], [Ichino A. A regularized Siegel-Weil formula for unitary groups], [Ichino A. On the Siegel-Weil formula for unitary groups]. ? □

## 30 | Langlands Reciprocity

### 30.1 Langlands' Reciprocity Conjectures

*“Motives can be divided according to a tetrachotomy. The first form are the Tate (and potentially Tate) motives, whose automorphy was known to Riemann and Hecke. The second form are the motives (conjecturally) associated to automorphic representations which are discrete series at infinity and thus amenable to the Taylor-Wiles method. The third form are the motives (conjecturally) associated to automorphic representations which are at least seen by some flavour of cohomology, either by the Betti cohomology of locally symmetric spaces or the coherent cohomology of Shimura varieties (possibly in degrees greater than zero) which are amenable in principle to the modified Taylor-Wiles method. The fourth form consist of the rest, which (besides a few that can be accessed by cyclic base change) are a complete mystery.”*

–F. Calegari

References are [B-G14, Har14].

#### Notation (30.1.0.1).

- Let  $p \in \text{Prime}$ .
- Let  $\iota_p : \overline{\mathbb{Q}_p} \cong \mathbb{C}$  be an isomorphism.
- Let  $F \in \text{NField}$ .
- Let  $G \in \text{RedGrp}/F$ .
- Let  $T \subset B \subset G_{\overline{F}}$ , and let  $\delta \in X^*(T) \otimes \mathbb{C}$  be the half sum of positive roots.
- Use notations on automorphic representations defined in [Adelic Automorphic Representations](#).
- Recall that  $\text{H-T}_\tau(\rho)$  contains an integer  $i$  with multiplicity  $\dim_{\overline{\mathbb{Q}_\ell}}(V \otimes_{\tau, K} \mathbb{C}_K(i))^{\text{Gal}_K}$ .

┘

#### 1 Compatible Systems

**Prop. (30.1.1.1) [Compatible System of Representations (Taylor)].** For  $E \in \text{NField}$ ,  $n \in \mathbb{Z}_+$ , an  $E$ -rational  $n$ -dimensional **weakly compatible system of Galois representations** of  $\text{Gal}_F$  over  $E$  is a collection

$$\mathcal{R} = \{R_w\}_{w \in \Sigma_E},$$

where  $R_w$  are semisimple  $w$ -adic Galois representations

$$R_w : \text{Gal}_F \rightarrow \text{GL}(n; E_w)$$

that satisfy the following conditions:

1. There is a multiset of integers  $\mathrm{H-T}(\mathcal{R})$  s.t. for any  $v \in \Sigma_F^{\mathrm{fin}}$  and  $w \in \mathrm{Hom}(E, \overline{F_v})$ , the restriction  $R_w|_{\mathrm{Gal}_{F_v}}$  is deRham and  $\mathrm{H-T}_v(R_w) \triangleq \mathrm{H-T}(R_w|_{\mathrm{Gal}_{F_v}}) = \mathrm{H-T}(\mathcal{R})$ .
2. There exists a finite set  $S \subset \Sigma_F^{\mathrm{fin}}$  s.t. if  $v \notin S$  and  $w \notin \mathrm{Hom}(E, \overline{F_v})$ , then  $\mathrm{WD}_v(R_w)$  is unramified.
3. For a.e.  $v \in \Sigma_F^{\mathrm{fin}}$ , there is an F-semisimple Weil-Deligne representation  $\mathrm{WD}_v(\mathcal{R}) \in \mathfrak{wd}_E^n(W_{F_v})$  s.t. for all  $w \notin \mathrm{Hom}(E, \overline{F_v})$ ,

$$\mathrm{WD}_v(R_w)^{\mathrm{s.st}} \sim \mathrm{WD}_v(\mathcal{R}) \otimes E_w.$$

Moreover,

- $\mathcal{R}$  is called a **strongly compatible system of adic representations** if condition3 holds for any  $v \in \Sigma_F^{\mathrm{fin}}$ .
- $\mathcal{R}$  is called **odd/irreducible/geometric** if each  $R_w$  is(30.1.2.1).
- $\mathcal{R}$  is called **pure of weight**  $w \in \mathbb{Z}$  if for a.e.  $v \in \Sigma_F^{\mathrm{fin}}$  and eigenvalues  $\alpha_i$  of  $\mathrm{WD}_v(\mathcal{R})$ ,  $\alpha_i \in \overline{\mathbb{Q}}$  is a Weil- $\|v\|$ -integer of weight  $w$ . For  $\emptyset \subset_{\mathrm{fin}} S \subset \Sigma_F^{\mathrm{fin}}$ ,  $\mathcal{R}$  is called **S-pure** of weight  $w$  if the above holds for any  $v \in \Sigma_F^{\mathrm{fin}} \setminus S$ .
- $\mathcal{R}$  is called a **genuinely geometric system** if there exists an  $X \in \mathrm{SmProj}/F$  and  $i \in \mathbb{N}, j \in \mathbb{Z}$  and a subspace

$$W \subset H_{\mathrm{Betti}}(X, E(j))$$

s.t. for any  $w \in \Sigma_E^{\mathrm{fin}}$ ,  $W \otimes_{E,v} \overline{\mathbb{Q}_\ell}$  is  $\mathrm{Gal}_F$ -invariant and realizes  $R_w$ .

┘

**Conj.(30.1.1.2).**

- Any weakly compatible system is strongly compatible(30.1.1.1).
- Any irreducible strongly compatible system  $\mathcal{R}$  is genuinely geometric and pure of weight  $\frac{2}{\dim \mathcal{R}} \sum_{h \in \mathrm{H-T}(\mathcal{R})} h$ .

┘

*Proof:* ?

□

## 2 Geometric Galois Representations

References are [Clo90, B-G14].

**Def.(30.1.2.1) [Geometric Representations, Fontaine-Mazur[F-M95]].**  $(\rho, V) \in \mathrm{Rep}_{\mathbb{Q}_p}^{\mathrm{fd}}(\mathrm{Gal}_F)$  is called a **geometric representation** if it satisfies

- For a.e.  $v \in \Sigma_F^{\mathrm{fin}}$ ,  $\rho_v$  is unramified.
- For any  $v \in S_F(p)$ , the representation  $\rho_v$  is deRham(25.2.4.10).
