It is called a **genuine geometric representation** if it is isomorphic to the subquotient of some  $H_{\mathrm{et}}^r(X_{\overline{F}}, \mathbb{Q}_p)(m)$  where  $X \in \mathrm{SmPrpr}/F$  and  $m \in \mathbb{Z}$ . Genuine geometric representations are geometric by?.

┘

**Prop.(30.1.2.2) [Geometric Representations and Induction].** Let  $L/F \in \mathrm{NField}$ , then the set of geometric representations(30.1.2.1) are stable under  $\mathrm{res}_F^L$  and  $\mathrm{Ind}_F^L$ .

Moreover, if  $V \in \mathrm{Rep}_{\mathbb{Q}_p}^{\mathrm{fd}}(\mathrm{Gal}_K)$  is pure of weight  $w$ , then  $W = \mathrm{Ind}_F^L(V)$  is also pure of weight  $w$ .

┘

*Proof:*

□

**Conj. (30.1.2.3)[Families of Geometric Representations].** If  $\rho : \text{Gal}_{\mathbb{Q}} \rightarrow \text{GL}(n; \overline{\mathbb{Q}_p})$  be a geometric Galois representation(30.1.2.1), then  $\rho$  is a part of a weakly compatible system(30.1.1.1). ┘

*Proof:*

□

**Def. (30.1.2.4) [Algebraic Galois-Representations].**  $(\rho, V) \in \text{Rep}_{\overline{\mathbb{Q}_p}}^{\text{fd}}(\text{Gal}_F)$  is called an **algebraic Galois-representation** if

$$P_{v,X}(T) = \det(1 - \text{Frob}_v T | H^i(X, \mathbb{Q}_p)) \in \overline{\mathbb{Q}}[T].$$

And it is moreover called **pure of weight**  $w$  if for a.e.  $v \in \Sigma_F$ , eigenvalues of  $\rho(\text{Frob}_v)$  are all Weil-integers of weight  $w$ . And  $w$  is called the **motivic weight** of  $V$ . ┘

**Def. (30.1.2.5)[Modular Galois Representations].** A continuous irreducible representation  $\text{Gal}_{\mathbb{Q}} \rightarrow \text{GL}(2, \overline{\mathbb{F}_p})$  or  $\text{Gal}_{\mathbb{Q}} \rightarrow \text{GL}(2; K)$ , where  $K \in p\text{-NField}$  is called a **modular Galois representation** if it arises from a newform as in(30.1.3.23). ┘

**Def. (30.1.2.6)[Regular Algebraic Galois-Representations, Clozel[Clo90]].**  $(\rho, V) \in \text{Rep}_{\overline{\mathbb{Q}_p}}^{\text{fd}}(\text{Gal}_F)$  is called a **regular algebraic(geometric) Galois-representation** if it is geometric(30.1.2.1) and  $\text{H-T}_{\tau}(\rho)$  consists of distinct elements for each embedding  $\tau : F \rightarrow \overline{\mathbb{Q}_p}$ . (Recall that  $\text{H-T}_{\tau}(\rho)$  contains an integer  $i$  with multiplicity  $\dim_{\overline{\mathbb{Q}_\ell}}(V \otimes_{\tau, K} \mathbb{C}_K(i))^{\text{Gal}_K}$ ). ┘

**Def. (30.1.2.7) [Algebraic Weil-Representations].** For  $\tau \in \Sigma_F^\infty$  and admissible Weil-representation  $\phi : W_{F_\tau} \rightarrow {}^L G(\mathbb{C})$ , the restriction of  $\phi$  to  $W_{\mathbb{C}}$  via an embedding  $\sigma : F_\tau \rightarrow \mathbb{C}$  corresponds to a homomorphism  $\mathbb{C}^\times \rightarrow \widehat{T}(\mathbb{C})$ , which is of the form  $z \mapsto \sigma(z)^{\lambda_\sigma} \overline{\sigma(z)}^{\lambda_{\text{co}\sigma}}$  s.t.  $\lambda_\sigma - \lambda_{\text{co}\sigma} \in X_*(\widehat{T})$ . Then  $\phi$  is called

- an  **$L$ -algebraic Weil-representation** if  $\lambda_\sigma \in X^*(T)$ .
- a  **$C$ -algebraic Weil-representation** if  $\lambda_\sigma - \delta \in X^*(T)$ (30.1.0.1).

These notions are independent of the choice of  $\sigma$  and Borel  $B \leq G$ . ┘

**Thm. (30.1.2.8) [Fontaine].** Any  $\rho \in \text{Rep}_{\overline{\mathbb{Q}_\ell}}^{\text{pot. st}}(I_K)$  comes from geometry. ┘

*Proof:* Cf.[Fontaine, Galois Rep]P12.?

### Automorphy of Galois Representations

**Def. (30.1.2.11) [Admissible Representations attached to Galois Representations].** For a geometric  $p$ -adic Galois representation (30.1.2.1)  $\rho : \text{Gal}_F \rightarrow \text{GL}(n; \overline{\mathbb{Q}}_p)$  and an isomorphism  $\iota_p : \overline{\mathbb{Q}}_p \cong \mathbb{C}$ , we can associate a  $\Pi(\rho) = \otimes'_v \Pi_v(\rho) \in \text{Irr}^{\text{adm}}(\text{GL}(n)/F)$  s.t.

- For any  $v \in \Sigma_F^{\text{fin}} \setminus S_F(p)$ ,  $\Pi_v(\rho)$  corresponds to the Weil-Deligne representation attached to the restriction of  $\rho$  to the Weil group  $W_v$ .
- For any  $v \in S_F(p)$ , we can also associate a Weil-Deligne representation  $\text{WD}_v(\rho)$  via Fontaine's  $D_{\text{pst}}$  functor ?.
- For any  $v \in \Sigma_F^\infty$ , we can also define Hodge-Tate numbers and thus an irreducible  $(\mathfrak{g}_v, \mathcal{K}_v)$ -module  $\Pi_v$ . ?

┘

**Conj. (30.1.2.12) [Automorphy of Galois Representations, Clozel [Clo90]/Fontaine-Mazur [F-M95]].**

For any irreducible geometric  $p$ -adic Galois representation (30.1.2.1)  $\rho : \text{Gal}_F \rightarrow \text{GL}(n; \overline{\mathbb{Q}}_\ell)$ ,

- $w(\rho) = \frac{2}{\dim \rho} \sum_{a \in \text{H-T}(\rho)} a \in \mathbb{Z}$ ,
- $m_i(\rho) = m_{w(\rho)-i}(\rho)$  for all  $i$ .
- $\Pi(\rho) \in \text{Irr}^{\text{cusp}}(\text{GL}(n)/F)$  (30.1.2.11).
- $\Pi_v(\rho)$  is  $C$ -algebraic (30.1.3.2).

┘

*Proof:* ?

Emerton and Kisin proved this for almost all 2-dimensional odd-representations of  $\text{Gal}_{\mathbb{Q}}$ , based on Serre's conjecture over  $\mathbb{Q}$ . Cf. [Fontaine-Mazur conjecture for  $\text{GL}(2)$ , Kisin], [Local-Global Compatibility in the  $p$ -adic Langlands Programme for  $\text{GL}(2)_{\mathbb{Q}}$ , Emerton].  $\square$

**Remark (30.1.2.13).** It follows from proper base change (9.4.3.1) and (9.4.6.36) (27.7.2.1) that any such genuine geometric representation satisfies the requirement.

This conjecture is very strong, for example, the étale cohomology of smooth proper varieties are known to satisfy many good properties, like Weil conjecture, and Fontaine-Mazur conjecture implies that those properties can be derived via linear algebra data.

This conjecture holds if the image of the representation is finite, by [Henniart, Representations  $\ell$ -adiques abeliennes] ?.

The local version of this conjecture is known to be false.  $\square$

**Def. (30.1.2.14) [Modular Galois Representations].** Let  $A$  be a  $\mathbb{Z}_p$ -algebra and  $\rho : \text{Gal}_{\mathbb{Q}} \rightarrow \text{GL}(2; A)$  be a representation, then  $\rho$  is called a **modular Galois representation** if there exists some  $N > 0$  and a homomorphism  $\text{pr} : T'(N) \rightarrow A$  (where  $T'(N) = \mathbb{Z}[T_\ell, \langle d \rangle] \subset \text{End}(S_2(\Gamma_1(N)))$ ,  $\ell \in \mathbf{P} \setminus \{p\}$ ,  $d \in (\mathbb{Z}/(N))^*$ ) s.t.  $\rho$  is unramified outside  $Np$ , and for  $\ell \nmid pN$ ,

$$\text{tr}(\rho(\text{Frob}_\ell)) = \text{pr}(T_\ell), \quad \det(\rho(\text{Frob}_\ell)) = \text{pr}(\langle \ell \rangle) \ell.$$

?

┘

**Conj. (30.1.2.15) [Langlands-Fontaine-Mazur].** Any geometric representation of  $\text{Gal}_F$  (30.1.2.1) is automorphic (30.1.2.12).  $\square$

*Proof:*

$\square$

### 3 Galois Representation attached to Algebraic Automorphic Representations

#### Algebraic Automorphic Representations

**Def. (30.1.3.1) [Algebraic Automorphic Representations].** For  $v \in \Sigma_F^\infty$ , an irreducible representation  $\pi_v \in \text{Irr}^{\text{adm}}(G(F_v))$  is called an  **$L$ -algebraic representation** (resp. a  **$C$ -algebraic representation**) if the Weil-representation associated to it by Langlands-correspondence is so (30.1.2.7).

And  $\Pi \in \text{Irr}^{\text{auto}}(G/F)$  is called an  **$L$ -algebraic representation** (resp. a  **$C$ -algebraic representation**) if  $\Pi_v$  is so, for any  $v \in \Sigma_F^\infty$ .  $\perp$

**Example (30.1.3.2) [Algebraic Representations for  $\text{GL}(n)$  and Infinite Types].**  $\Pi \in \text{Irr}^{\text{cusp}}(\text{GL}(n)/F)$  is  $L$ -algebraic if  $\Pi(\frac{n-1}{2})$  is  $C$ -algebraic (30.1.3.1).

For such  $\Pi$ , we can associate an **infinite type**  $p \in (\mathbb{Z}^n / \text{Sym}_n)^{\text{Hom}(F, \mathbb{C})}$  as follows: Denote  $\Pi' = \Pi(\frac{n-1}{2})$ . If  $\tau$  is a real place of  $F$ , then  $\Pi'_\tau$  is associated to a character of  $W_{\mathbb{R}}$ , whose restriction to  $W_{\mathbb{C}} = \mathbb{C}^\times$  is of the form

$$(z^{p_1} \bar{z}^{p_2}, z^{p_2} \bar{z}^{p_1}, \dots, (z\bar{z})^{p'_{2r+1}}, \dots, (z\bar{z})^{p'_n}),$$

and we define  $p_\tau = (p_1, p_2, \dots, p'_{2r+1}, \dots, p'_n)$ . And if  $\tau$  is a complex place of  $F$ , then  $\Pi'_\tau$  is associated to a character of  $W_{\mathbb{C}} = \mathbb{C}^\times$  of the form

$$(z^{p_1} \bar{z}^{q_1}, z^{p_2} \bar{z}^{q_2}, \dots, z^{p_n} \bar{z}^{q_n}),$$

then we define  $p_\tau = (p_1, \dots, p_n)$  (and it is clear that  $p_{\mathbb{C} \circ \tau} = (q_1, \dots, q_n)$ ).

And being  $C$ -algebraic is identical to Clozel's notion of regular algebraic [Clo90], and is equivalent to having infinite type  $(p_1, \dots, p_n)$  s.t.  $p_i \neq p_j$  for any  $i \neq j$ , which is also equivalent to having the same infinitesimal character as an irreducible algebraic representation of  $\text{GL}(n)/F_v$ .  $\perp$

*Proof:* By Harish-Chandra isomorphism (Cf. [Kna02] 5.43),  $Z(U(\mathfrak{gl}_n))$  is identified with  $S(\mathfrak{h})^W$ , where  $\mathfrak{h} = \text{Res}_{\mathbb{C}/\mathbb{R}}(\text{Lie}(T)) \otimes \mathbb{C}$  in the complex case and  $\text{Lie}(T) \otimes \mathbb{C}$  in the real case. In both cases  $W \cong \text{Sym}_n$  acts diagonally on  $\mathbb{C}^n$  or  $\mathbb{C}^n \times \mathbb{C}^n$ .

Then Cf. [B-G14] Section 2.3.  $\square$

**Def. (30.1.3.3) [Arithmetic Automorphic Representations].**  $\Pi \in \text{Irr}^{\text{auto}}(\text{GL}(n)/F)$  is called

- an  **$L$ -arithmetic representation** if there exists  $E \in \text{NField}$  s.t.  $\pi_v$  has Satake-parameters defined over  $E$  for a.e.  $v \in \Sigma_F^{\text{fin}}$  (29.3.2.12).
- a  **$C$ -arithmetic representation** if there exists  $E \in \text{NField}$  s.t.  $\pi_v$  is defined over  $E$  for a.e.  $v \in \Sigma_F^{\text{fin}}$  (29.3.2.12).

$\perp$

**Prop. (30.1.3.4) [Restriction of Algebraic and Arithmetic Representations].**  $\Pi \in \text{Irr}^{\text{auto}}(G/F)$  is  $L$ -algebraic (resp.  $C$ -algebraic /  $L$ -arithmetic /  $C$ -arithmetic) (30.1.3.1) (30.1.3.3) iff its corresponding  $\Pi \in \text{Irr}^{\text{auto}}(\text{Res}_{F/\mathbb{Q}}(G)/\mathbb{Q})$  is.  $\perp$

*Proof:* Cf. [B-G14] Sec 2.3.  $\square$

**Conj. (30.1.3.5) [Clozel [Clo90] / Buzzard-Gee [B-G14]].**

- $\Pi \in \text{Irr}^{\text{auto}}(G/F)$  is  $L$ -algebraic (30.1.2.7) iff it is  $L$ -arithmetic (30.1.3.3).
- $\Pi \in \text{Irr}^{\text{auto}}(G/F)$  is  $C$ -algebraic (30.1.2.7) iff it is  $C$ -arithmetic (30.1.3.3).

┘

*Proof:*

□

**Conj. Cor. (30.1.3.6).** For  $G = \mathrm{GL}(n)$ , these follow from Clozel's conjecture (30.1.3.17) by [Clo90] Prop 3.1(3). ?

┘

**Thm. (30.1.3.7) [Rationality for Algebraic Automorphic Representations, Clozel [Clo90]].**

Suppose  $\Pi \in \mathrm{Irr}^{\mathrm{auto}}(\mathrm{GL}(n)/F)$  is  $C$ -regular (regular algebraic) with infinite type  $p \in (\mathbb{Z}^n)^{\mathrm{Hom}(F, \mathbb{C})}$  (30.1.3.2), then  $\Pi_f$  has a moduli field  $\mathbb{Q}(\Pi) \in \mathrm{NField}$ . And for each  $\sigma \in \mathrm{Aut}(\mathbb{C})$ ,  $\pi_f^\sigma$  is the finite part of some  $\pi^\sigma \in \mathrm{Alg}^0(\mathrm{GL}(n)/F)$ , whose infinite type is  $p^\sigma$ .

┘

*Proof:* Cf. [Clo90] P112. ?

□

**Prop. (30.1.3.8) [Algebraic Representations under Central  $\mathbb{G}_m$ -Extensions].** If  $1 \rightarrow \mathbb{G}_m \rightarrow G' \rightarrow G \rightarrow 1$  is a central extension of reductive groups over  $F$ , then for any  $\pi \in \mathrm{Irr}^{\mathrm{auto}}(G/F)$ , the pullback of  $\pi$  to  $G'$  is also an automorphic representation by (26.6.1.29). Then it is an  $L$ -algebraic (resp.  $L$ -arithmetic, resp.  $C$ -algebraic, resp.  $C$ -arithmetic) if  $\pi$  is.

┘

*Proof:* ?

□

**Prop. (30.1.3.9) [Algebraic Representations and Functoriality].** Let  $G, G' \in \mathrm{RedGrp}/F$  and  $r : {}^L G \rightarrow {}^L G' \in \mathrm{AlgGrp}/\bar{\mathbb{Q}}$ . Let  $\pi \in \mathrm{Irr}^{\mathrm{auto}}(G/F)$  and suppose the functorial lifting  $\pi'$  of  $\pi$  (29.3.5.1) exists, then

- $\pi'$  is  $L$ -algebraic if  $\pi$  is  $L$ -algebraic (30.1.3.1).
- $\pi'$  is  $L$ -arithmetic if  $\pi$  is  $L$ -arithmetic (30.1.3.3).

┘

*Proof:* Cf. [B-G14].

□

**Prop. (30.1.3.10) [Adjoining a Twisting Element].** There exists a canonical central  $\mathbb{G}_m$ -extension

$$1 \rightarrow \mathbb{G}_m \rightarrow \tilde{G} \rightarrow G \rightarrow 1$$

s.t.  $\tilde{G}$  has a canonical twisting element  $c$ . Moreover, there is a canonical bijection between the set of splitting of this extension with the set of twisting elements in  $G$ .

┘

*Proof:* Cf. [B-G14]. ?

□

**Def. (30.1.3.11) [Buzzard-Gee  $C$ -Groups, Buzzard-Gee [B-G14]].** The Buzzard-Gee  $C$ -group of  $G$  is defined to be the Langlands  $L$ -group  ${}^L \tilde{G}$  of the central  $\mathbb{G}_m$ -extension  $\tilde{G}$  (30.1.3.10).

┘

**Def. (30.1.3.12) [Cohomological Automorphic Representations].** For  $\pi \in \mathrm{Irr}^{\mathrm{auto}}(G/F)$  and  $v \in \Sigma_F^\infty$ ,  $(\pi_v, V_v)$  is called a **cohomological admissible representation** (for  $\xi$ ) if there exists  $(\xi, U) \in \mathrm{Irr}(G(F_v))$  and  $i \in \mathbb{N}$  s.t.

$$H^i(\mathfrak{g}_v, \mathcal{K}_v; U \otimes V_v) \neq 0.$$

And  $\pi$  is called a **cohomological automorphic representation** if  $\pi_v$  is cohomological for any  $v \in \Sigma_F^\infty$ .

┘

**Prop.(30.1.3.13)** [Cohomological Automorphic Representations are Regular  $C$ -Algebraic].  
If  $\pi \in \text{Irr}^{\text{auto}}(G/F)$  is cohomological, then it is regular  $C$ -algebraic.  $\lrcorner$

*Proof:* Cf.[B-W00]P15.  $\square$

**Prop.(30.1.3.14)** [Cuspidal Cohomological Unitary Automorphic Representations are  $C$ -Arithmetic]. Any cohomological unitary representations  $\pi \in \text{Irr}^{\text{cusp}}(G/F)$  is  $C$ -arithmetic(30.1.3.3).  $\lrcorner$

*Proof:* Cf.[Blasius-Rogawski, Zeta functions of Shimura varieties]Section2.3?  $\square$

**Prop.(30.1.3.15)** [Clozel]. Any regular  $C$ -algebraic automorphic representation of  $\text{GL}(n)$ (30.1.3.1) is cohomological after possibly twisting a quadratic character.  $\lrcorner$

*Proof:* Cf.[Clo90]Prop3.14.?  $\square$

### Galois Representations attached to Algebraic Automorphic Forms

**Conj.(30.1.3.16)**[Automorphic Galois Representations(weak version), Buzzard-Gee[B-G14]].  
If  $\pi \in \text{Irr}^{\text{auto}}(G/F)$  is  $L$ -algebraic(30.1.3.1), then for any  $p \in \text{Prime}$  and  $\iota_p : \overline{\mathbb{Q}_\ell} \cong \mathbb{C}$ , there exists a continuous geometric Galois representation

$$\rho_\pi = \rho_{\pi, \iota_p} : \text{Gal}_F \rightarrow {}^L G(\overline{\mathbb{Q}_p})$$

s.t.

- The composition of  $\rho_\pi$  with the natural projection  ${}^L G(\overline{\mathbb{Q}_p}) \rightarrow \text{Gal}_F$  is the identity map.
- For a.e.  $v \in \Sigma_F^{\text{fin}}$ ,  $\rho_\pi|_{W_{F_v}}$  is unramified and  $\iota \circ \rho_\pi(\sigma_v)$  is  $\widehat{G}(\mathbb{C})$ -conjugate to  $c(\pi_v)$ .
- For  $v \in S_F(p)$ , the Hodge-Tate character of  $\rho_\pi|_{\text{Gal}_{F_v}}$  can be read off  $\pi$ (? Cf.[B-G14]P156).
- If  $v \in \Sigma_F^{\mathbb{R}}$ , then  $\iota \circ \rho_\pi(c_v)$  is  $\widehat{G}(\mathbb{C})$ -conjugate to the element  $\alpha_v = \lambda_{\sigma_v}(i)\lambda_{\tau_v}(i)r_{\pi_v}(j)$ ?  $\lrcorner$

*Proof:*  $\square$

**Conj.Cor.(30.1.3.17)**[Automorphic Galois Representations for  $\text{GL}(n)$ , Clozel[Clo90]]. For  $p \in \text{Prime}$  and any  $C$ -algebraic  $\Pi \in \text{Irr}^{\text{cusp}}(\text{GL}(n)/F)$ (30.1.3.1),

- $\Pi_f$  is defined over a number field  $E \in \text{NField}$ (i.e.  $\Pi_f^\sigma \cong \Pi_f$  for any  $\sigma \in \text{Aut}(\mathbb{C}/E)$ ).
- There exists an irreducible geometric  $p$ -adic Galois representation

$$\rho_{\ell, \Pi} : \text{Gal}_F \rightarrow \text{GL}(n; \overline{\mathbb{Q}_p})$$

s.t.

$$\Pi(\rho_{p, \Pi}) \cong \Pi\left(\frac{1-n}{2}\right)\text{(30.1.2.11)}.$$

- Moreover, such  $\{\rho_{p, \Pi}\}$  form a strongly compatible system  $\mathcal{R}$  of representations of  $\text{Gal}_F$ .

Such representations  $\rho_{p, \Pi}$  and  $\bar{\rho}_{p, \Pi}$ (semi-simplified reduction modulo  $p$ ) are called **automorphic Galois representations**.  $\lrcorner$

*Proof:*  $\square$

**Remark (30.1.3.18).** Notice that this can imply conjecture(30.1.3.16) by(30.1.3.20).  $\lrcorner$

**Prop. (30.1.3.19)[Algebraic Representations in the same Parabolic Induction].** If  $\pi, \pi'$  are subquotients of a common parabolic induction  $I_{P(\mathbf{A}_F)}^{G(\mathbf{A}_F)}\sigma$ (26.6.1.27), then  $\pi, \pi'$  has the same infinitesimal character. In particular,  $\pi$  is  $L$ -algebraic(resp.  $C$ -algebraic) iff  $\pi'$  is.

Moreover, if  $\pi$  is  $L$ -algebraic and the conjecture(30.1.3.16) holds for  $\pi$ , then it also holds for  $\pi'$ .

$\lrcorner$

*Proof:* Cf.[B-G14]P178?  $\square$

**Cor. (30.1.3.20)[Nearly Isomorphic Representations].** If  $G = \mathrm{GL}(n)$  and  $\pi, \pi' \in \mathrm{Irr}^{\mathrm{auto}}(G/F)$  are nearly isomorphic(i.e.  $\pi_v \cong \pi'_v$  for a.e.  $v \in \Sigma_F$ ), then  $\pi, \pi'$  has the same infinitesimal character.

Suppose further that  $\pi$  is  $L$ -algebraic and the conjecture(30.1.3.16) holds for  $\pi$ , then it also holds for  $\pi'$ .

Moreover, for a general  $G$ , if the functorial lifting conjecture is true for  $G$ , then the same holds for  $G$ .  $\lrcorner$

*Proof:* Cf.[B-G14]P178?  $\square$

**Prop. (30.1.3.21)[Galois Representations and Functoriality].** Let  $G \rightarrow G' \in \mathrm{RedGrp}/F$  be quasi-split,  $\pi \in \mathrm{Irr}^{\mathrm{auto}}(G/F)$ . If  $r : {}^L G \rightarrow {}^L G' \in \mathrm{AlgGrp}/\overline{\mathbb{Q}}$  is a homomorphism respecting the projection to  $\mathrm{Gal}_F$  and functorial lift  $\pi' \in \mathrm{Irr}^{\mathrm{auto}}(G'/F)$  exists(29.3.5.1), then the conjecture(30.1.3.16) holds for  $\pi'$  if it holds for  $\pi$ .  $\lrcorner$

*Proof:* Cf.[B-G14]P177?. This is easy.  $\square$

### Modular Forms( $n = 2$ case)

**Notation (30.1.3.22).**

- Let  $p \in \mathrm{Prime}$ .
- Let  $\lambda \in S_{K_{\mathbf{f}}}(p)$ .
- Let  $\Lambda_p = \mathbb{Z}_p[[T]]$ .
- Let  $(F, \mathcal{O}_F) \in \mathrm{NField}$  be totally real.
- Let  $d = [F : \mathbb{Q}]$ .

$\lrcorner$

**Thm. (30.1.3.23)[Galois Representations attached to Cuspidal Newforms, Eischler-Shimura/Deligne/Deligne-Serre/Shimura/Rogawski-Tunnell/Mazur-Wiles/Wiles[Wil88]].** For any  $\lambda \in \Sigma_{K_{\mathbf{f}}}^{\mathrm{fin}}$  that is ordinary for  $\mathbf{f}$ (26.4.2.8), there exists a continuous representation

$$\rho_{\mathbf{f}, \lambda} : \mathrm{Gal}_F \rightarrow \mathrm{GL}(2; \mathcal{O}_{\mathbf{f}, \lambda})$$

s.t. for any  $v \in \Sigma_{K_{\mathbf{f}}}^{\mathrm{fin}} \setminus S_{K_{\mathbf{f}}}(\mathbf{c}(\|\lambda\|))$ , we have

$$\mathrm{tr}(\sigma_v | \rho_{\mathbf{f}, \lambda}) = c(v, \mathbf{f}), \quad \det(\sigma_v | \rho_{\mathbf{f}, \lambda}) = \psi(v).$$

Moreover,

- If  $k = 1$ , then  $\# \mathrm{Im}(\rho_{\mathbf{f}, \lambda}) < \infty$ , and lifts to a 2-dimensional complex Artin representation.

- If  $\lambda$  is ordinary for  $\mathbf{f}$ , then  $\rho_{\mathbf{f},\lambda}|_{\text{Gal}_v}$  is equivalent to the form  $\begin{bmatrix} \varepsilon_1 & * \\ & \varepsilon_2 \end{bmatrix}$ , where  $\varepsilon_2$  is unramified and  $\varepsilon_2(\sigma_v) = \alpha_v(\mathbf{f})$  (26.4.2.8).

┘

*Proof:* ?

The construction of the ordinary  $\lambda$ -adic Galois representations depends upon Hida's method of studying  $p$ -adic families of modular forms.  $\square$

### Polarized case

**Notation (30.1.3.24).**

- Let  $F \in \mathbf{NField}$  be a CM-field or a totally real field.
- Let  $F^+$  be the maximal totally real subfield of  $F$ .
- Let  $\mathbf{c} \in \text{Gal}(F/F^+)$  be the complex multiplication element (If  $F = F^+$ , set  $\mathbf{c} = \text{id}$ ).
- Let  $d = [F^+ : \mathbb{Q}_0]$ .

┘

**Def. (30.1.3.25) [The Group  $\mathcal{G}_n$ ].** For  $n \in \mathbb{Z}_+$ , define  $\mathcal{G}_n = (\text{GL}(n) \times \text{GL}(1)) \rtimes \{1, \mathbf{c}\}$  where  $\mathbf{c}$  acts on  $\text{GL}(n) \times \text{GL}(1)$  via

$$(g, a)^{\mathbf{c}} = (ag^{-t}, a).$$

And we denote  $\mathcal{G}_n^0 = \text{GL}(n) \times \text{GL}(1) \trianglelefteq \mathcal{G}_n$ .

Let  $\nu : \mathcal{G}_n \rightarrow \text{GL}(1)$  be the multiplier map which sends  $(g, a) \in \mathcal{G}_n^0$  to  $a$  and sends  $\mathbf{c}$  to  $-1$ .

For  $m, n \in \mathbb{Z}_+$ , define a homomorphism of algebraic groups

$$\mathcal{G}_n \times \mathcal{G}_m \rightarrow (\mathcal{G}_n/\mathcal{G}_n^0) \times (\mathcal{G}_m/\mathcal{G}_m^0) \rightarrow \{\pm 1\}$$

which sends  $(\mathbf{c}, 1)$  and  $(1, \mathbf{c})$  to  $-1$ . And we denote  $(\mathcal{G}_n \times \mathcal{G}_m)^+$  the kernel of this homomorphism.  $\perp$

**Prop. (30.1.3.26).** For  $m, n \in \mathbb{Z}_+$ , there is a homomorphism of algebraic groups

$$\otimes : (\mathcal{G}_n \times \mathcal{G}_m)^+ \rightarrow \mathcal{G}_{mn}$$

which maps  $(g, a) \times (g', a')$  to  $(g \otimes g', aa')$  and maps  $\mathbf{c} \times \mathbf{c}$  to  $\mathbf{c}$ .

And there is a homomorphism of algebraic groups

$$I : \mathcal{G}_n \rightarrow \text{GSp}(2n) : (g, a) \mapsto \begin{bmatrix} g & 0 \\ 0 & ag^{-t} \end{bmatrix}.$$

┘

**Prop. (30.1.3.27) [Representations valued in  $\mathcal{G}_n$ ].** Suppose

- $\Gamma \in \mathbf{Grp}$  with a normal subgroup  $\Delta \leq \Gamma$  of index  $\leq 2$ ,
- If  $\Gamma \neq \Delta$ , choose  $\gamma_0 \in \Gamma \setminus \Delta$ .
- $A \in \mathbf{CRing}$  and  $\rho : \Gamma \rightarrow \mathcal{G}_n(A)$  is a homomorphism with  $\Delta = r^{-1}\mathcal{G}_n^0(A)$ .

Then we write  $\rho^\natural : \Delta \xrightarrow{\rho} \mathcal{G}_n^0(A) \rightarrow \text{GL}(n; A)$ . Conversely,

- If  $\rho : \Gamma \rightarrow \text{GSp}(2n; A)$  is a homomorphism with multiplier  $\mu$ , then it gives a homomorphism  $\hat{\rho}_\Delta : \Gamma \rightarrow \mathcal{G}_{2n}(A)$  which sends  $\delta \in \Delta$  to  $(\rho(\delta), \mu(\delta))$ , and sends  $\gamma \in \Gamma \setminus \Delta$  to  $(\rho(\gamma)J_{2n}^{-1}, -\mu(\gamma))\mathbf{c}$ .

- If  $\rho : \Gamma \rightarrow \mathrm{GO}(n; A)$  is a homomorphism with multiplier  $\mu$ , then it gives a homomorphism  $\hat{\rho}_\Delta : \Gamma \rightarrow \mathcal{G}_n(A)$  which sends  $\delta \in \Delta$  to  $(\rho(\delta), \mu(\delta))$ , and sends  $\gamma \in \Gamma \setminus \Delta$  to  $(\rho(\gamma), \mu(\gamma))\mathbf{c}$ .

If  $\Gamma = \mathrm{Gal}_F$  and  $\Delta = \mathrm{Gal}_{F^+}$ , then a representation  $r : \mathrm{Gal}_{F^+} \rightarrow \mathcal{G}_n(A)$  (resp. to  $\mathrm{GSp}(2n; A)$ , resp. to  $\mathrm{GO}(n; A)$ ) is called a **totally odd representation** if it maps each complex conjugation to  $-1$  (resp.  $-1$ , resp.  $1$ ).  $\square$

**Def. (30.1.3.28) [Polarized Galois-Representations].** For  $\ell \in \mathrm{Prime}$  and  $\iota_\ell : \overline{\mathbb{Q}_\ell} \cong \mathbb{C}$  an isomorphism, an  $\ell$ -adic (resp. mod- $\ell$ ) **polarized Galois-representation** is a pair  $(\rho, \mu)$  where

- $\rho : \mathrm{Gal}_F \rightarrow \mathrm{GL}(n; \overline{\mathbb{Q}_\ell})$  (resp.  $\rho : \mathrm{Gal}_F \rightarrow \mathrm{GL}(n; \overline{\mathbb{F}_\ell})$ ) for some  $n \in \mathbb{Z}_+$ ,
- $\mu : \mathrm{Gal}_{F^+} : \mathrm{Gal}_{F^+} \rightarrow \overline{\mathbb{Q}_\ell}^\times$  (resp.  $\mu : \mathrm{Gal}_{F^+} \rightarrow \overline{\mathbb{F}_\ell}^\times$ ),

s.t. there exists some  $\tau \in \Sigma_{F^+}^\infty$  and  $\epsilon_\tau \in \{\pm 1\}$  and a non-degenerate  $\epsilon_\tau$ -orthogonal form  $\langle -, - \rangle_\tau$  on  $\overline{\mathbb{Q}_\ell}^{\oplus n}$  (resp.  $\overline{\mathbb{F}_\ell}^{\oplus n}$ ) satisfying

$$\langle \rho(\sigma)x, \rho(\mathbf{c}_\tau \sigma \mathbf{c}_\tau)y \rangle_\tau = \mu(\sigma) \langle x, y \rangle_\tau$$

for each  $x, y \in \mathrm{Gal}_F$ . And if  $F \neq F^+$ , we require further that  $\epsilon_\tau = -\mu(\mathbf{c}_\tau)$ .

And a polarized representation  $(\rho, \mu)$  is called a **totally odd representation** if  $\epsilon_\tau = 1$  for all  $\tau \in \Sigma_{F^+}^\infty$ .  $\square$

**Prop. (30.1.3.29) [Polarized Representations and  $\mathcal{G}_n$ ].** Situation as in (30.1.3.28),

- If  $(\rho, \mu)$  is an  $\ell$ -adic or mod- $\ell$ -polarized Galois-representation, then the desired  $\epsilon_{\tau'}$ -orthogonal form  $\langle -, - \rangle_{\tau'}$  exists for each  $\tau' \in \Sigma_{F^+}^\infty$ , because we can just choose

$$\epsilon_{\tau'} = \mu(\mathbf{c}_\tau \mathbf{c}_{\tau'}) \epsilon_\tau, \quad \langle x, y \rangle_{\tau'} = \langle x, r(\mathbf{c}_\tau \mathbf{c}_{\tau'})y \rangle_\tau, \quad \text{where } x, y \in \mathrm{Gal}_F.$$

- If  $F \neq F^+$ , then  $(\rho, \mu)$  is  $\ell$ -adic (resp. mod- $\ell$ ) polarized iff there exists a continuous homomorphism  $\tilde{\rho} : \mathrm{Gal}_{F^+} \rightarrow \mathcal{G}_n(\overline{\mathbb{Q}_\ell})$  (resp.  $\tilde{\rho} : \mathrm{Gal}_{F^+} \rightarrow \mathcal{G}_n(\overline{\mathbb{F}_\ell})$ ) (30.1.3.25) with  $\tilde{\rho}^\natural = \rho$  and multiplier  $\mu$  (30.1.3.27) (30.1.3.25).
- If  $F = F^+$ , then  $(\rho, \mu)$  is a polarized iff  $\rho$  factors through  $\mathrm{GSp}(n; \overline{\mathbb{Q}_\ell})$  (if  $\mu(\mathbf{c}_\tau) = -\epsilon_\tau$ ) or  $\mathrm{GO}(n; \overline{\mathbb{Q}_\ell})$  (if  $\mu(\mathbf{c}_\tau) = \epsilon_\tau$ ) with multiplier  $\mu$ . A similar assertion holds for  $\overline{\mathbb{Q}_\ell}$  replaced by  $\overline{\mathbb{F}_\ell}$  if  $\ell \geq 3$ .

In particular, the two definitions of totally odd representations in (30.1.3.27) and (30.1.3.28) are compatible.  $\square$

*Proof:* 2: The existence of the pairing is equivalent to the existence of a matrix  $B \in \mathrm{GL}(n; A)$  s.t.  $\rho^t B \rho^c = \mu B$  and  $B_t = \epsilon_\tau B$ , and then we can define  $\tilde{\rho}$  to be equal to  $\rho$  on  $\mathrm{Gal}_{F^+}$ , while maps  $\mathbf{c}$  to  $(B^{-1}, \epsilon_\tau)\mathbf{c}$ .

3: If  $(\rho, \mu)$  is polarized, we can define a pairing  $\langle x, y \rangle'_\tau = \langle x, \rho(\mathbf{c}_\tau)y \rangle_\tau$ , then  $\langle \rho(\sigma)x, \rho(\sigma)y \rangle'_\tau = \mu(\sigma) \langle x, y \rangle'_\tau$ , and we have

$$\langle y, x \rangle'_\tau = \langle y, \rho(\mathbf{c}_\tau)x \rangle_\tau = \epsilon_\tau \langle \rho(\mathbf{c}_\tau)x, y \rangle_\tau = \epsilon_\tau \langle \rho(\mathbf{c}_\tau)x, \rho(\mathbf{c}_\tau)y \rangle_\tau = \epsilon_\tau \mu(\mathbf{c}_\tau) \langle x, y \rangle'_\tau,$$

and the assertion follows.  $\square$

**Prop. (30.1.3.30).** If  $F/\mathbb{Q} \in \mathrm{GalField}$  and  $V, V' \in \mathrm{Irr}_{\overline{\mathbb{Q}_\ell}}(\mathrm{Gal}_F)$  are geometric representations s.t.  $L(V; s) = L(V'; s)$ , then  $V' \cong V$ .  $\square$

*Proof:* This is because  $L(V; s)$  determines  $\mathrm{WD}_v(V)$  for all  $v$  that is unramified, thus also determines  $V$  by Chebotarev's density theorem **?**.  $\square$

**Example (30.1.3.31) [Polarized Galois-Representations].**

- Any 1-dimensional representation is polarized.
- $V_p(A)$  of an Abelian variety is polarized of weight 1.
- Representations attached to a classical modular eigenform in  $S_{2k}(\Gamma_0(N))$  is polarized of weight  $2k - 1$ .
- For an irreducible polarized representation of  $\text{Gal}_{\mathbb{Q}}$  of dimension 2, its weight is odd iff  $V$  is odd.

┘

*Proof:* ?

□

**Def. (30.1.3.32) [Polarized Automorphic Representations].**  $\Pi \in \text{Irr}^{\text{auto}}(\text{GL}(n)/F)$  is called a **polarized automorphic representation** if there exists a Hecke-character  $\chi$  of  $F^+$  s.t.

- $\chi_{\tau}(-1)$  is independent of  $\tau \in \Sigma_F^{\infty}$  chosen.
- $\pi^c \cong \pi^{\vee} \otimes (\chi \circ \text{Nm}_{F/F^+} \circ \det)$ .

And when  $F \neq F^+$ , we require further that  $\chi_{\tau}(-1) = (-1)^n$  for each  $\tau \in \Sigma_F^{\infty}$ .

And  $\Pi$  is called a **RAESDC representation** if it is regular algebraic?? essentially self-dual and cuspidal.

┘

**Def. (30.1.3.33) [Polarized Archimedean Weights].** For  $\Omega \in \text{Field}^0$  s.t.  $\overline{\Omega} = \Omega$ , denote

$$(\mathbb{Z}^n)^{\text{Hom}(F, \Omega), +} \subset (\mathbb{Z}^n)^{\text{Hom}(F, \Omega)}$$

the subset consisting of elements  $a$  s.t.  $a_{\tau,1} \geq a_{\tau,2} \geq \dots \geq a_{\tau,n}$ . And for each  $w \in \mathbb{Z}$ , denote

$$(\mathbb{Z}^n)_w^{\text{Hom}(F, \Omega)} \subset (\mathbb{Z}^n)^{\text{Hom}(F, \Omega)}$$

the subset consisting of elements  $a$  s.t.  $a_{\tau,i} + a_{\tau \circ c, n+1-i} = w$  for each  $\tau \in \text{Hom}(F, \Omega)$  and  $i \in [n]_+$ .

An element  $a \in (\mathbb{Z}^n)^{\text{Hom}(F, \Omega), +}$  is called **extremely regular** if it satisfies the following: For some  $\tau \in \Sigma_F^{\infty}$ , the subsets of the set  $\{a_{\tau,i} + n - i\}_{i \in [n]_+}$  are pairwise different.

For  $a \in (\mathbb{Z}^n)^{\text{Hom}(F, \Omega), +}$ , denote  $\Xi_a \in \text{Irr}(\text{GL}(n)^{\text{Hom}(F, \mathbb{C})})$  the algebraic representation which is the tensor product over  $\tau$  of the irreducible representations of  $\text{GL}(n)$  with highest weight  $a_{\tau}$ . And a regular algebraic  $\Pi \in \text{Irr}^{\text{auto}}(\text{GL}(n)/F)$  (30.1.3.2) is said to have weight  $a$  if  $\Pi_{\infty}$  has the same infinitesimal character as  $\Xi_a^{\vee}$ ?

┘

**Def. (30.1.3.34) [Ordinary Automorphic Components].** Suppose  $\Pi \in \text{Irr}^{\text{auto}}(\text{GL}(n)/F)$  is a regular algebraic (30.1.3.2) automorphic representation with weight  $a \in (\mathbb{Z}^n)^{\text{Hom}(F, \Omega), +}$ . For  $\ell \in \text{Prime}$  and  $\iota_{\ell} : \overline{\mathbb{Q}_{\ell}} \cong \mathbb{C}$  an isomorphism,  $\Pi$  is called  **$\iota$ -ordinary** if for each  $v \in S_F(\ell)$ , there is some  $b \in \mathbb{Z}_+$  s.t.  $(\iota^{-1} \pi_v)^{\text{Iw}(v^{b,b})} \neq 0$ . (Cf. [Potential automorphy and change of weight, Gee-Geraghty-Taylor] P537?).

Then for any algebraic Hecke-character  $\chi$  of  $F$  (19.4.1.30),  $\Pi$  is  $\iota$ -ordinary iff  $\Pi \otimes (\chi \circ \det)$  is  $\iota$ -ordinary.

And if  $\Pi$  has weight 0 and  $\Pi_v$  is Steinberg for each  $v \in S_F(\ell)$ , then  $\Pi_v$  is  $\iota$ -ordinary.

┘

*Proof:* Cf. [Geraghty, Modularity lifting theorems for ordinary Galois representations] Lemma 5.1.5.

□

**Thm& Conj. Cor. (30.1.3.35)** [Clozel [Clo91]/Kotwitts [Kot92]/Harris-Taylor [H-T01]/Taylor-Yoshida [TY07]/Bellaïche-Chenevier [B-C11]/Shin [Shi11]/Clozel-Harris-Labesse [CHL11]/Caraiani [Car12], [Car14]/Clozel [Clo13]/Chenevier-Harris [?C-H14]].

If  $(\Pi, \chi) \in \text{Irr}^{\text{cusp}}(\text{GL}(n)/F)$  is polarized(30.1.3.32) and regular algebraic of weight  $a \in (\mathbb{Z}^n)^{\text{Hom}(F, \Omega), +}$ (30.1.3.2)(30.1.3.33), then for any  $\ell \in \text{Prime}$  and  $\iota_\ell : \overline{\mathbb{Q}_p} \cong \mathbb{C}$ , there exists a continuous semi-simple representation

$$\rho_{\ell, \iota_\ell}(\Pi) : \text{Gal}_F \rightarrow \text{GL}(n; \overline{\mathbb{Q}_\ell})$$

and an integer  $w \in \mathbb{Z}_+$  s.t.

- $(\rho_{\ell, \iota_\ell}(\Pi), \rho_{\ell, \iota_\ell}(\chi)(1-n))$  is a totally odd, polarized  $\ell$ -adic representation(30.1.3.28).
- For any  $v \in \Sigma_F^{\text{fin}} \setminus S_F(\ell)$ , we have  $\text{WD}_\ell(\rho_{\ell, \iota_\ell}(\Pi)|_{\text{Gal}_{F_v}})^{F\text{-s.st}} = \iota^{-1} \text{rec}_n(\Pi_v(\frac{1-n}{2}))$ , and these associated Weil-Deligne representations are pure of weight  $w$ .
- For any  $v : F \hookrightarrow \overline{\mathbb{Q}_\ell}$ ,  $\rho_\Pi|_{\text{Gal}_{F_v}}$  is deRham and Hodge-Tate regular(25.2.2.4), with

$$\text{H-T}_v(\rho_{\ell, \iota_\ell}(\Pi)) = \{a_{\iota \circ v, 1+n-1}, a_{\iota \circ v, 2+n-2}, \dots, a_{\iota \circ v, n}\}, \quad \text{H-T}_{v \circ c}(\rho_{\ell, \iota_\ell}(\Pi)) = w - \text{H-T}_v(\rho_{\ell, \iota_\ell}(\Pi)).$$

- For any  $v \in S_F(\ell)$  that  $\Pi_v$  is Iwahori-spherical, we have  $\text{WD}_\ell(\rho_{\ell, \iota_\ell}(\Pi)|_{\text{Gal}_{F_v}})^{F\text{-s.st}} = \iota_\ell^{-1} \text{rec}_n(\Pi_v(\frac{1-n}{2}))$ . In particular,  $\rho_{\ell, \iota_\ell}(\Pi)$  is semi-stable at  $v$ , and if  $\Pi_v$  is unramified, then it is crystalline at  $v$ .
- If  $v \in S_F(\ell)$  and  $\Pi$  is  $\iota$ -ordinary at  $v$ (30.1.3.34), then  $\rho_{\ell, \iota_\ell}(\Pi)|_{\text{Gal}_{F_v}}$  is ordinary(25.2.7.4). Conversely, if  $\rho_{\ell, \iota_\ell}(\Pi)$  is ordinary and  $\pi$  has level potentially prime to  $\ell$ , then  $\pi$  is  $\iota$ -ordinary.

Such a totally odd polarized  $\ell$ -adic Galois-representation  $(\rho_{\ell, \iota_\ell}(\Pi), \rho_{\ell, \iota_\ell}(\chi)(1-n))$  or its reduction modulo  $\ell$  is called a **polarizedly automorphic Galois-representation**. And it is called a **ordinarily polarizedly automorphic Galois-representation** if moreover  $\pi$  is  $\iota$ -ordinary(30.1.3.34), etc.. By [Clo90]Thm3.13?, being polarizedly or ordinarily polarized automorphic doesn't depend on  $\iota_\ell$  chosen.  $\perp$

*Proof:* Cf.[LGGT]Thm2.1.1.?.  $\square$

**Prop.(30.1.3.36) [Potential Abelian Extensions and Cyclic Base Change].** Let  $\Pi \in \text{Irr}^{\text{cusp}}(\text{GL}(n)/F)$  s.t.  $\Pi^\vee \cong \Pi^c$ ,  $\Pi(\frac{n-1}{2})$  is regular  $C$ -algebraic(30.1.3.1) and  $\Pi_x$  is supercuspidal, then

- If there exists  $\Sigma \in \text{Rep}^{\text{alg}, n}(W_F)$  s.t.  $\Sigma|_{W_{F_v}} = \text{rec}(\Pi_v)$  for  $v \in \Sigma_F^\infty$  and a.e.  $v \in \Sigma_F^{\text{fin}}$ , then it holds for any  $v \in \Sigma_F$ .
- If  $F'/F$  is a cyclic extension of prime degree s.t. there is only one place  $x'$  over  $x$ , and the cyclic base change  $\Pi'$  of  $\Pi$  to  $F'$  is potentially Abelian(29.3.5.11) and supercuspidal at  $x'$ , then  $\Pi$  is potentially Abelian.  $\perp$

*Proof:* Cf.[Sch13]Thm13.5?.  $\square$

**Thm.(30.1.3.37) [Non-Galois Automorphic Induction, Scholze].**

- Let  $F_0^3/F_0^2/F_0^1$  be totally real fields and  $2|[F_0 : \mathbb{Q}]$ . Denote  $n = [F_0^2/F_0^1]$ .
- Suppose  $F_0^3/F_0^1$  is a solvable Galois extension.
- Let  $\mathcal{K}$  be an imaginary quadratic field and  $F^i = F_0^i \mathcal{K}$ .
- Let  $x \in \Sigma_{F^1}^{\text{fin}}$  that is split over  $F_0^1$  and inert in  $F^3$ .
- Let  $\chi$  be a Hecke character of  $F^2$  s.t.

- $\bar{\chi} = \chi \circ \mathbf{c}$ .
- For any  $v \in \Sigma_{F^2}^\infty$ ,  $\chi_v(z) = z^{p_v} \bar{z}^{-p_v}$ , and  $p_v \neq p_{v'}$  if  $v \neq v'$ .
- The stablizer of  $\chi_x \circ \text{Nm}_{F^3/F^2}$  in  $\text{Gal}(F^3/F^1)$  is equal to  $\text{Gal}(F^3/F^2)$ .

Then there exists a potentially Abelian (29.3.5.11)  $\Pi \in \text{Irr}^{\text{cusp}}(\text{GL}(n)/F^1)$  that is associated to  $\text{Ind}_{F^1}^{F^2} \chi$  via Langlands correspondence, and  $\Pi$  is conjugate self-dual,  $\Pi(\frac{n-1}{2})$  is  $C$ -algebraic, and  $\Pi_x$  is supercuspidal.  $\lrcorner$

*Proof:* Cf. [Sch13]P712. ?  $\square$

### Non-Polarized case

**Remark (30.1.3.38) [ $p$ -adic Approximations:  $n$  is even case].** Some Galois representations associated to  $\pi \in \text{Irr}^{\text{cusp}}(\text{GL}(n)/F)$  cannot be constructed via  $\ell$ -adic cohomology of Shimura varieties attached to unitary groups, especially the case when  $n \in 2\mathbb{Z}$ .

The missing representations can be constructed by taking limits on eigenvarieties: For  $n = 2$ , Cf. [Wil88] using Hida family and for  $n > 2$  and non-ordinary case Cf. [Chenevier] using eigenvarieties. The program is completed in [C-H13]. A patching lemma is needed to descent a Galois representation down a solvable extension.  $\lrcorner$

**Thm& Conj. Cor. (30.1.3.39).** Let  $F \in \mathbf{NField}$  be CM or totally real and  $\Pi \in \text{Irr}^{\text{cusp}}(\text{GL}(n)/F)$  be regular algebraic at each archimedean place of  $F$  (30.1.3.2). Then for any  $\ell \in \mathbf{Prime}$ , there exists a semisimple Galois representation

$$\rho_{\ell, \Pi} : \text{Gal}_F \rightarrow \text{GL}(n; \overline{\mathbb{Q}}_\ell)$$

s.t. for any  $v \in \Sigma_F^{\text{fin}} \setminus S_F(\ell)$  that  $\Pi_v$  is unramified,  $\Pi_v(\frac{1-n}{2}) = \Pi_v(\rho_{\ell, \Pi})$  (30.1.3.17).  $\lrcorner$

*Proof:* Cf. [On the Rigid Cohomology of Certain Shimura Varieties, Harris-Taylor-Thorne] and [On torsion in the cohomology of locally symmetric varieties, Scholze] ?.  $\square$

### Beyond Shimura Varieties

It is believed that most Galois representations associated to non-polarized automorphic representations cannot be obtained from cohomology of Shimura varieties, and no one knows how to show that they arise from cohomology of algebraic varieties.

## 4 Potentially Automorphy

References are [Potential automorphy and change of weight, Lamb-Gee-Geraghty-Taylor].

**Def. (30.1.4.1) [Potential Cuspidal Automorphic Compatible Systems].** A compatible system of representations  $\mathcal{R} = \{R_{v,w}\}$  of  $\text{Gal}_F$  over some number field  $E$  (30.1.1.1) is called **strongly potentially cuspidal automorphic** if there exists some cuspidal automorphic forms  $\omega$  for  $\text{GL}(d)/F$  that are eigenforms for the appropriate Hecke operators, with eigenvalues in  $E$ , s.t. the corresponding Hecke eigenvalues of  $\omega$  are equal to that of  $\mathcal{R}$ .  $\lrcorner$

**Def. (30.1.4.2) [Strongly Potential Cuspidal Automorphic Galois Representations].** For  $F \in \mathbf{NField}$ , a Galois representation  $(V, \rho) \in \text{Rep}_{F_v}^{\text{fd}}(\text{Gal}_F)$  is called strongly **potentially cuspidal automorphic** if there exists a compatible system of strongly potentially cuspidal automorphic Galois representations  $\mathcal{R} = \{R_{v,w}\}$  of  $\text{Gal}_F$  over some number field  $E$  (30.1.4.1) s.t. there exists some  $w \in \Sigma_F^{\text{fin}}$  dividing  $v$  together with an isomorphism  $R_{v,w} \otimes_{E_w, w} \overline{F}_v \cong \rho \otimes \overline{F}_v$ .  $\lrcorner$

**Prop.(30.1.4.3) [Jointly Potentially Automorphy for Elliptic Curves].** Let  $F \in \mathbf{NField}$  and  $E_1, E_2, E_3, E_4 \in \mathbf{EllCur}/F$ ,  $A \in \mathbf{AbVar}^2/F$ , then

- If  $F$  is totally real or imaginary CM, then the two compatible systems  $\{\mathrm{Sym}^{k_1} H^1(E_{1,\overline{F}}, \overline{\mathbb{Q}}_\ell)\}$  and  $\{\mathrm{Sym}^{k_2} H^1(E_{2,\overline{F}}, \overline{\mathbb{Q}}_\ell)\}$  are jointly strongly potentially automorphic for any  $k_1, k_2 \in \mathbb{N}$ .
- If  $F$  is totally real or imaginary CM, then the two compatible systems  $\{\mathrm{Sym}^{k_1} H^1(E_{1,\overline{F}}, \overline{\mathbb{Q}}_\ell)\}$  and  $\{\mathrm{Sym}^{k_2} H^1(E_{2,\overline{F}}, \overline{\mathbb{Q}}_\ell) \otimes \mathrm{Sym}^{k_3} H^1(E_{3,\overline{F}}, \overline{\mathbb{Q}}_\ell)\}$  are jointly strongly potentially automorphic for any  $k_1 \in \mathbb{N}$ ,  $k_2 \in \{0, 1, 2\}$ ,  $k_3 \in \{0, 1\}$ .
- If  $F$  is totally real or imaginary CM, then the two compatible systems  $\{\mathrm{Sym}^{k_1} H^1(E_{1,\overline{F}}, \overline{\mathbb{Q}}_\ell) \otimes \mathrm{Sym}^{k_3} H^1(E_{3,\overline{F}}, \overline{\mathbb{Q}}_\ell)\}$  and  $\{\mathrm{Sym}^{k_2} H^1(E_{2,\overline{F}}, \overline{\mathbb{Q}}_\ell) \otimes \mathrm{Sym}^{k_4} H^1(E_{4,\overline{F}}, \overline{\mathbb{Q}}_\ell)\}$  are jointly strongly potentially automorphic for any  $k_1, k_2 \in \{0, 1, 2\}$ ,  $k_3, k_4 \in \{0, 1\}$ .
- if  $F$  is totally real, then the two compatible systems  $\{\mathrm{Sym}^{k_1} H^1(A_{\overline{F}}, \overline{\mathbb{Q}}_\ell)\}$  and  $\{\mathrm{Sym}^{k_2} H^1(A_{\overline{F}}, \overline{\mathbb{Q}}_\ell)\}$  are jointly strongly potentially automorphic for any  $k_1, k_2 \in \{0, 1, 2, 3, 4\}$ .  $\lrcorner$

*Proof:* 1: Cf.[Li-Zhang2022]P47. ?

2, 3 follows from 1 and the langlands functoriality  $\mathrm{GL}(2) \times \mathrm{GL}(2) \rightarrow \mathrm{GL}(4)$  and  $\mathrm{GL}(2) \times \mathrm{GL}(3) \rightarrow \mathrm{GL}(6)$ .

4 follows from the proof of [Abelian surfaces over totally real fields are potentially modular]Thm9.3.1. ?  $\square$

### Potential Modularity

**Remark(30.1.4.4).** A potential modularity result is a result that says certain representation of  $\mathrm{Gal}_{\mathbb{Q}}$  comes from geometry when restricting to  $\mathrm{Gal}_F$  for some  $F \in \mathbf{NField}$ . Cf.[Remarks on a Conjecture of Fontaine and Mazur, Taylor].  $\lrcorner$

### Dwork Family

#### without self-duality conditions

#### Applications to $L$ -Functions

**Def.(30.1.4.5) [Strongly Automorphic Compatible Systems].** Let  $L/F \in \mathbf{NField}$  be a Galois extension,  $V = \{V_\ell\}$  be a compatible system of semisimple  $\ell$ -adic  $\mathrm{Gal}_F$ -representations,  $\emptyset \subsetneq S \subset \mathbf{Prime}$ , then  $V$  is called  **$S$ -strongly automorphic over  $L$**  if for any subextension  $L/L'/F$  with  $\mathrm{Gal}(L/L')$  solvable, we have

- $V|_{\mathrm{Gal}_{L'}}$  is automorphic.
- If  $\pi = \boxplus \pi_i$  is an isobaric automorphic representation of  $\mathrm{GL}(n)/L'$  associated to  $V|_{\mathrm{Gal}_{L'}}$  and  $V|_{\mathrm{Gal}_{L'}} = \oplus V_i$  is the corresponding decomposition of compatible systems, then  $V_{i,\ell}$  is irreducible for any  $\ell \in S$ .

More generally, we can define  **$S$ -strongly potentially automorphic representations**. And  $V$  is called **potentially strongly automorphic** if it is  $S$ -strongly potentially automorphic for some  $S$  of Dirichlet density 1.

And if  $W = \{W_\ell\}$  is another compatible system, we can also define the notion of **jointly  $S$ -strongly potentially automorphic** and **jointly strongly potentially automorphic** pairs of representations.  $\lrcorner$

**Prop. (30.1.4.6).** Let  $F \in \mathbf{NField}$  and  $V = \{V_\ell\}, W = \{W_\ell\}$  are two compatible system of semisimple  $\ell$ -adic  $\mathrm{Gal}_F$ -representations, and  $\emptyset \subsetneq S \subset \mathbf{Prime}$ . Assume that  $V, W$  are jointly  $S$ -strongly potentially automorphic(30.1.4.5), then  $L(V; s)$  has a meromorphic extension to all  $s \in \mathbb{C}$ , and for any  $\ell \in S$ ,

$$\mathrm{rank}(V_\ell \otimes W_\ell)^{\mathrm{Gal}_F} = -\mathrm{ord}_{s=1} L(V \otimes W; s).$$

┘

*Proof:* Cf.[Li-Zhang2022].

□

## 5 Conjectures

**Prop. (30.1.5.1)[Properties of Étale Cohomologies].** For  $X \in \mathbf{SmProj}^d/F$ ,

- (E5): If  $v \notin \Sigma_F^p$  and  $X$  has good reduction at  $v$ , then  $H_{\text{ét}}^i(X, \mathbb{Q}_p)|_{\mathrm{Gal}_{F_v}} \in \mathrm{Rep}_{\mathbb{Q}_p}^{\mathrm{ur}}(\mathrm{Gal}_{F_v})$ , and

$$P_{v,X}(T) = \det\left(1 - \mathrm{Frob}_v T | H_{\text{ét}}^i(X, \mathbb{Q}_p)\right) \in \mathbb{Z}[T]$$

is independent of  $p$  prime to  $v$ . And all roots of  $P_{v,X}(T)$  in  $\mathbb{C}$  has absolute value  $\|v\|^{-i/2}$ .

- (E6): Genuine geometric representations are geometric. And for  $v \in \Sigma_F^p$ , if  $X$  has good reduction at  $v$ ,  $H_{\text{ét}}^i(X, \mathbb{Q}_p)|_{\mathrm{Gal}_{F_v}}$  is even crystalline.
- (E7): There is a cycle map

$$\eta_\ell : \mathrm{CH}^i(X) \rightarrow (H_{\text{ét}}^{2i}(X, \mathbb{Q}_\ell)(i))^{\mathrm{Gal}_K}.$$

and for  $P \in X(K)$ ,  $\eta_\ell(P) \neq 0 \in (H_{\text{ét}}^{2d}(X, \mathbb{Q}_p)(d))^{\mathrm{Gal}_K}$ .

┘

*Proof:* ?

□

And there are some open conjectures:

- (EC3)[Tate's Conjecture]:  $\eta_\ell$  is surjective. There are variant of this conjecture:  
There is a decomposition  $H^i(X(\mathbb{C}), \overline{\mathbb{Q}}) = \oplus M_j$  as  $\overline{\mathbb{Q}}$ -vector spaces s.t.
  - For any  $\ell \in \mathbf{P}$  and an embedding  $\iota : \overline{\mathbb{Q}} \hookrightarrow \mathbb{Q}_\ell$ ,  $M_j \otimes_{\overline{\mathbb{Q}}, \iota} \overline{\mathbb{Q}}_\ell$  is a minimal  $\mathrm{Gal}_{G_{\mathbb{Q}_p}}$ -stable  $\overline{\mathbb{Q}}_\ell$ -space.
  - There are Weil-Deligne representations  $\mathrm{WD}_p(W_j)$  over  $\overline{\mathbb{Q}}$  s.t. for any  $\ell \in \mathbf{P}$  and an embedding  $\iota : \overline{\mathbb{Q}} \hookrightarrow \mathbb{Q}_\ell$ ,

$$\mathrm{WD}_p(M_j) \otimes_{\overline{\mathbb{Q}}, \iota} \overline{\mathbb{Q}}_\ell \cong \mathrm{WD}_p(M_j \otimes_{\overline{\mathbb{Q}}, \iota} \overline{\mathbb{Q}}_\ell).$$

- There are motivic weights  $\mathrm{H-T}(M_j)$  s.t. for any  $\ell \in \mathbf{P}$  and  $\iota : \overline{\mathbb{Q}} \hookrightarrow \mathbb{Q}_\ell$ ,

$$\mathrm{H-T}(M_j \otimes_{\overline{\mathbb{Q}}, \iota} \overline{\mathbb{Q}}_\ell) = \mathrm{H-T}(M_j).$$

and for any  $\iota : \overline{\mathbb{Q}} \hookrightarrow \mathbb{C}$ ,

$$\dim_{\mathbb{C}}(M_j \otimes_{\overline{\mathbb{Q}}, \iota} \mathbb{C}) \cap H^{a, i-a}(X(\mathbb{C}), \mathbb{C})$$

equals the multiplicity of  $a$  in  $\mathrm{H-T}(M_j)$ .

**Prop. (30.1.5.2)[Total Hodge-Tate Weights].** For a geometric representation  $V \in \text{Rep}_{\mathbb{Q}_p}(\text{Gal}_F)$ , for each  $v \in \Sigma_F^v$ , there are Hodge-Tate weights associated to  $v$ . For  $k \in \mathbb{Z}$ , define

$$m_k(V) = \sum_{v \in \Sigma_F^p} [F_v : \mathbb{Q}_p] m_k(V|_{\text{Gal}_{F_v}}),$$

called the **total Hodge-Tate weights** of  $V$ . Then it satisfies:

- $\sum_{k \in \mathbb{Z}} m_k(V) = [F : \mathbb{Q}] \cdot \dim V$ .
- For a subfield  $F_0 \subset F$ , if  $W = \text{Ind}_{\text{Gal}_F}^{\text{Gal}_{F_0}}(V)$ , then  $m_k(V) = m_k(W)$ .?
- If  $V$  is pure of weight  $w$ , then

$$w[F : \mathbb{Q}] \dim V = 2 \sum_{k \in \mathbb{Z}} m_k \cdot k.$$

┘

*Proof:* 1 is clear.

2: ?

3: By item2 and (30.1.2.2), it suffices to show for  $F = \mathbb{Q}$ . Secondly, it suffices to show for  $\det V$ , it has motivic weight  $w \dim V$  and for each  $v \in \Sigma_F^p$  the unique Hodge-Tate weights equal to the sum of Hodge-Tate weights of  $V$ . Then we may assume it has weight 0 by Tate twist because Hodge-tensoring by  $\mathbb{Q}_p(k)$  increases both sides by  $-2k$ .

Then by Sen's theory,  $V|_{\text{Gal}_{\mathbb{Q}_p}}$  is potentially unramified. Let  $\chi$  be the Hecke character attached to  $V$ , then its kernel contains an open subgroup  $U_p \subset \mathbb{Z}_p^\times$ , and also by small circle argument, it contains an open subgroup  $U^p \subset \prod_{\ell \neq p} \mathbb{Z}_\ell^\times$ , and it also contains  $\mathbb{R}_+^\times$  by (19.7.3.29). But notice  $\mathbb{I}_{\mathbb{Q}}^*/\mathbb{Q}^\times U_p U^p \mathbb{R}^\times$  is finite. Thus it is an Artin representation, and has motivic weight 0 (30.1.2.4), □

**Prop. (30.1.5.3)[Symmetry of Hodge-Tate Weights].** If the Tate conjecture<sup>5</sup> is true, then for any genuine geometric representation  $V$  pure of weight  $w$ ,

- $m_k = m_{w-k}$ .
- If  $w \in 2\mathbb{Z}$ , let  $m_{w/2}^\pm(V)$  be defined by

$$m_{w/2}^+(V) + m_{w/2}^-(V) = m_{w/2}(V)$$

$$m_{w/2}^+(V) - m_{w/2}^-(V) = (-1)^{w/2} (\dim V^{c=\text{id}} - \dim V^{c=-\text{id}}).$$

Then  $m_{w/2}^\pm(V) \in \mathbb{N}$ .

- For a subfield  $F_0 \subset F$ ,  $m_{w/2}^\pm(V) = m_{w/2}^\pm(\text{Ind}_{\text{Gal}_F}^{\text{Gal}_{F_0}}(V))$ .

┘

## 30.2 Breuil-Mezard Conjecture

### 30.3 Mod $p$ Representations and Modularity Lifting Theorems

References are [K-W09b, K-W09c].

**Notation (30.3.0.1).**

- Let  $p \in \text{Prime}$ .
- Let  $(K, \mathfrak{p}, \varpi_K, \kappa) \in p\text{-LField}$ .
- Let  $F \in \text{NField}$ .
- Use notations on automorphy of Galois-representations defined in [Langlands' Reciprocity Conjectures](#).

┘

#### 1 Global Mod $p$ Representations

**Def. (30.3.1.1) [Mod- $p$  Representations of Serre-Type].** A 2-dimensional **mod- $p$  representation of Serre-Type** is an odd representation  $\bar{\rho} \in \text{Irr}_{\mathbb{F}_p}^{\text{alg}, 2}(\text{Gal}_{\mathbb{Q}})$ .

┘

**Def. (30.3.1.2) [Artin Conductor and Weights of  $\bar{\rho}$ ].**  $k(\bar{\rho}), N(\bar{\rho})$ . Cf. [Serre, Modular Representations, Section 1.2, 2] **?**.

┘

**Def. (30.3.1.3) [Levels].** The level  $N$  is the product of Artin conductors of  $\rho$  away from  $p$  (Cf. [Modern Number Theory] P329).

┘

**Def. (30.3.1.4) [Weights].** The weight  $k$  is determined by the ramification properties of  $\rho$  at  $p$ . Cf. [Ser75] (2.2.4), (2.3.2), (2.4.5), (2.4.8) and (2.4.9). **?**

For any  $\bar{\rho}$ , there is always a twist of  $\bar{\rho}$  by characters s.t. in formulas (2.2.4), (2.3.2), (2.4.5), (2.4.8)

and (2.4.9) we can take  $a = 0$ . In particular, we can assume that  $k(\bar{\rho}) \leq \begin{cases} p+1 & , p \geq 3 \\ 4 & , p = 2 \end{cases}$  **?**

The weight reduction is due to [Edixhoven: weight in Serre's conjectures on modular forms], and the level reduction is due to [Ribet, On modular representations of  $\text{Gal}_{\mathbb{Q}}$  arising from modular forms] and [Ribet, Report on mod  $\ell$  representations of  $\text{Gal}_{\mathbb{Q}}$ ]. **?**

┘

**Thm. (30.3.1.5) [Special Liftings of Modular Representations, Khare-Wintenberger/Gee-Snowden].** Assume  $\bar{\rho} : \text{Gal}_{\mathbb{Q}} \rightarrow \text{GL}(2, \overline{\mathbb{F}_p})$  is a smooth irreducible Galois representation, and

- $\text{Im}(\bar{\rho})$  is non-solvable if  $p = 2$ ,
- $\bar{\rho}|_{\mathbb{Q}(\zeta_p)}$  is irreducible if  $p > 2$ .

Then there exists a lift  $\rho : \text{Gal}_{\mathbb{Q}} \rightarrow \text{GL}(2; E)$  for some  $E \in p\text{-NField}$  s.t.

- If  $p = 2$  and  $k(\bar{\rho}) = 2$ , then  $\rho$  is a minimal crystalline lift **?** with  $\text{H-T}(\rho) = \{0, 1\}$ .
- If  $p = 2$  and  $k(\bar{\rho}) = 4$ , then
- If  $p > 2$ , then  $\rho$  is a minimal crystalline lift **?** with  $\text{H-T}(\rho) = \{0, k(\bar{\rho}) - 1\}$ .

And if  $p > 2$ , we can also choose  $\rho$  s.t. :

- $\text{H-T}(\rho) = \{0, 1\}$ , any inertia type  $\tau_{\ell}$  at primes  $\ell \in S \setminus \{p\}$ , and unramified outside  $S$ . And at  $p$  it is crystalline if  $k(\bar{\rho}) = 2$  and Steinberg if  $k(\bar{\rho}) = p + 1$ .

┘

*Proof:* **?**

□

**Thm. (30.3.1.6) [Extending to a Family of Representations].** Let  $F \in \mathbf{NField}$ ,  $v \in S_F(p)$  and  $\rho : \mathrm{Gal}_{\mathbb{Q}} \rightarrow \mathrm{GL}(2; F_v)$  an odd irreducible continuous Galois representation ramified at f.m. places and deRham at  $p$  with  $H\text{-T}(\rho) = \{0, a\}$  where  $a \in \mathbb{Z}_+$ , s.t.

- $\bar{\rho}|_{\mathrm{Gal}_{\mathbb{Q}}(\mu_p)}$  is irreducible.
- If  $p = 2$ , then  $\mathrm{Im}(\bar{\rho})$  is solvable.

Then  $\rho$  is a part of a rank 2 almost strictly compatible system of Galois representations? ┘

*Proof:* ? □

## 2 Level-Raising and Level-Lowering

References are [Rib84, Rib90a].

**Prop. (30.3.2.1) [ $p$ -New Hecke Rings].** Let  $N \in \mathbb{Z}_+$  and let  $\mathbf{T}_N$  be the commutative subring of  $\mathrm{End}(\mathrm{SF}_2(N, \mathbf{1}))$  generated by Hecke operators  $\{\mathbf{T}_n\}_{n \in \mathbb{Z}_+}$ . Then for any maximal ideal  $\mathfrak{m}$  of  $\mathbf{T}_N$ , there exists a semisimple continuous representation  $\rho_{\mathfrak{m}} : \mathrm{Gal}_{\mathbb{Q}} \rightarrow \mathrm{GL}(2; \mathbf{T}_N/\mathfrak{m})$ , unique up to isomorphism s.t.

$$\mathrm{tr}_{\rho_{\mathfrak{m}}}(\sigma_p) = T_p \pmod{\mathfrak{m}}, \quad \det \rho_{\mathfrak{m}}(\sigma_p) = p \pmod{\mathfrak{m}}.$$

for any  $p \in \mathbf{Prime} \setminus S(\ell N)$ .

Notice that because the weight is 2, we have  $\mathrm{tr}(\rho_{\mathfrak{m}}(\mathfrak{c})) = 0$  and  $\det(\rho_{\mathfrak{m}}(\mathfrak{c})) = -1$ . For  $N|N' \in \mathbb{Z}_+$ ,  $T_N$  is naturally a subring of  $T_{N'}$ .

For  $p \in S(N)$ ,  $\rho_{\mathfrak{m}}$  is said to be a  **$p$ -new representation** if  $\mathfrak{m}$  comes from a maximal ideal of the quotient ring  $\mathbf{T}_{p\text{-new}}(N)$  of  $\mathbf{T}_N$ , which is the commutative subring of  $\mathrm{End}(\mathrm{SF}_2(N, \mathbf{1})^{p\text{-new}})$  generated by Hecke operators  $\{\mathbf{T}_n\}_{n \in \mathbb{Z}_+}$ . ┘

*Proof:* Cf. [Rib90] Section 5. □

**Thm. (30.3.2.2) [Level-Raising for Modular Forms].** Let  $N \in \mathbb{Z}_+$ ,  $p \in \mathbf{Prime} \setminus S(N)$  and  $\mathfrak{m}$  is a maximal ideal of  $\mathbf{T}_{Np}$  containing  $T_p - (p+1)$  or  $T_p + (p+1)$ , then  $\rho_{\mathfrak{m}}$  is  $p$ -new of level  $pN$  (30.3.2.1).

In particular, for any  $\ell \in \mathbf{Prime}$  and  $\rho \in \mathrm{Irr}_{\mathbb{F}_{\ell}}^{\mathrm{alg}, 2}(\mathrm{Gal}_{\mathbb{Q}})$  that is modular of level  $N$  (i.e. a base change of  $\rho_{\mathfrak{m}}$  for some maximal ideal  $\mathfrak{m}$  of  $\mathbf{T}_N$  (30.3.2.1)), there are infinitely many  $p \in \mathbf{Prime}$  s.t.  $\rho$  is  $p$ -new of level  $pN$ . ┘

*Proof:* ? Cf. [Rib90a].

For the second assertion, by Chebotarev density theorem, there are infinitely many  $p \in \mathbf{Prime}$  s.t.  $\rho(\sigma_p)$  is conjugate to  $\rho(\mathfrak{c})$ , which has trace 0 and determinant  $p = -1$  (30.3.2.1). Thus the assertion follows from the definition of  $\rho_{\mathfrak{m}}$ . □

### Level-Lowering

**Def. (30.3.2.3) [Finite Flat Representations].** For  $k \in \mathbf{Field}^{\mathrm{fin}}$  with  $\mathrm{char} k \neq 2$  and  $\rho \in \mathrm{Irr}_k^{\mathrm{alg}, 2}(\mathrm{Gal}_{\mathbb{Q}})$ ,  $\rho$  is called a **finite flat representation at  $p$**  for a prime  $p \in \mathbf{Prime}$  if there exists a  $k$ -vector scheme  $H \in \mathrm{Sch}^{\mathrm{fin}, \flat}/\mathbb{Z}_p$  s.t.  $\rho_p$  is isomorphic to the  $\mathrm{Gal}_{\mathbb{Q}_p}$ -action on  $k$ -vector space  $H(\mathbb{Q}_p)$ . ┘

**Prop. (30.3.2.4).** Situation as in (30.3.2.3), If  $p \neq \mathrm{char} k$ , then  $\rho$  is finite flat at  $p$  iff it is unramified at  $p$ . ┘

*Proof:* Cf.[Sur les representations modulaires de degree 2 de  $\text{Gal}_{\mathbb{Q}}$ , Serre]Section2.8.  $\square$

**Conj.(30.3.2.5) [Level-Lowering Conjecture, Serre].** Suppose  $k \in \mathbf{Field}^{\text{fin}}$  with  $\text{char } k \neq 2$  and  $\rho \in \text{Irr}_k^{\text{alg},2}(\text{Gal}_{\mathbb{Q}})$  is modular of level  $N \in \mathbb{Z}_+$  and  $p \in S(N)$  s.t.  $\text{ord}_p(N) = 1$ , then  $\rho$  is finite flat at  $p$ (30.3.2.3) if  $\rho$  is of level  $N/p$ .

And Serre conjectured that if  $\rho$  is finite flat at  $p$  then  $\rho$  of of level  $N/p$ .  $\lrcorner$

**Thm& Conj.Cor.(30.3.2.6) [Mazur-Ribet[Rib84]].** Suppose  $\rho \in \text{Irr}_k^{\text{alg},2}(\text{Gal}_{\mathbb{Q}})$  is modular of level  $N \in \mathbb{Z}_+$  and  $p \in S(N)$  s.t.  $\text{ord}_p(N) = 1$  s.t.  $\rho$  is finite flat at  $p$ . If one of the following holds:

- $p \not\equiv 1 \pmod{\ell}$ .
- $(N, \ell) = 1$ .

Then  $\rho$  is modular of level  $N/p$ .  $\lrcorner$

*Proof:* Cf.[Rib84] or [Fermat's last theorem, Chap7].?  $\square$

### 3 Serre's Modularity Conjecture over $\mathbb{Q}$

References are [Ser75, Kis09, Kis09c, K-W09b, K-W09c, D-P23], [Serre's conjectures, lecture, Ribet-Stein] and [Diamond, Taylor-Wiles construction and multiplicity one(1997)], [Fujiwara, Deformation rings and Hecke algebras in the totally real case], [Khare-Wintenberger, Serre's conjecture for 2-dimensional mod  $p$  representations of  $\text{Gal}(\overline{\mathbb{Q}}/\mathbb{Q})$ ], [Edixhoven, Serre's Conjecture].

**Notation(30.3.3.1).**

- For  $N \in \mathbb{Z}_+$ , let  $Q(N)$  be the maximal prime factor of  $N$ (and  $Q(1) = 1$ ).
- Let  $p \in \mathbf{Prime}$ ,  $q \in p^{\mathbb{Z}_+}$ ,
- Let  $\bar{\rho} : \text{Gal}_{\mathbb{Q}} \rightarrow \text{GL}(2; \overline{\mathbb{F}}_p)$  be a smooth representation.

$\lrcorner$

**Def.(30.3.3.2) [Locally Good Dihedral Representations].**  $\ell \in \mathbf{Prime} \setminus \{p\}$  is called a **good dihedral prime** for  $\bar{\rho}$  if

- $\bar{\rho}|_{I_\ell}$  is of the form  $\begin{bmatrix} \psi & \\ & \psi^\ell \end{bmatrix}$ , where  $\psi$  is a character of  $I_\ell$  is of order a power of an odd prime  $t$ , s.t.  $t|\ell + 1$ , and  $t > \max\left(Q\left(\frac{N(\bar{\rho})}{q^2}\right), 5, p\right)$ .

- $q \equiv 1 \pmod{8}$ , and  $q \equiv 1 \pmod{r}$  for any  $r \leq \max\left(Q\left(\frac{N(\bar{\rho})}{q^2}\right), p\right) \in \mathbf{Prime}$ .

If there exists a good dihedral prime  $q$  for  $\bar{\rho}$ , then  $\bar{\rho}$  is called **locally good-dihedral** or  $q$ -dihedral.

$\lrcorner$

**Thm.(30.3.3.3) [Serre's Modularity Conjecture[Ser75, Ser87b], Rohrlich-Tunnell[R-T97]/Kisin/Khare-Wintenberger[K-W09b, K-W09c]].** Any  $\bar{\rho} \in \text{Irr}_{\overline{\mathbb{F}}_p}^{\text{alg},2}(\text{Gal}_{\mathbb{Q}})$  of Serre-type(30.3.1.1) is modular(30.1.2.5).

Moreover, the corresponding  $f$  is in  $\text{SF}_{k(\bar{\rho})}(N(\bar{\rho}); \chi)$  where  $\chi$  is determined by

$$\det(\bar{\rho})(\sigma_\ell) \equiv \chi(\ell)\ell^{k-1} \pmod{\mathfrak{p}}, \quad \ell \nmid Np.$$

$\lrcorner$

*Proof:* Cf.[Khare-Wintenberger]Thm9.1.?

If  $p = 2$ , then the projective image of  $\bar{\rho}$  must be dihedral by(24.2.1.1). The modularity in this case follows from[R-T97].?

If  $p > 2$  and  $\text{Im}(\bar{\rho})$  is solvable, then by Dickson's classification of solvable subgroups of  $\text{PGL}(2; \overline{\mathbb{F}}_p)$ , it is isomorphic to a cyclic group/dihedral group/ $\text{Alt}_4$  or  $\text{Sym}_4$ ?. In all cases,  $\bar{\rho}$  lifts to an odd representation into  $\text{GL}(2; \mathbb{C})$ . And then the modularity follows from(31.1.1.16). Thus we assume that  $\text{Im}(\bar{\rho})$  is non-solvable.

It suffices to consider only modular forms  $f$  of weight  $k \geq 2$ , because by [Deligne-Serre, Formes modulaires de poids 1]Section6.9, any modular form of weight 1 is congruent to modular forms of weight  $\geq 2$ .?  $\square$

**Lemma (30.3.3.4).** Serre's modularity conjecture(30.3.3.3) is true for the following two cases:

- $p \neq 2$  and  $2 \nmid N(\bar{\rho})$ .
- $p = 2$  and  $k(\bar{\rho}) = 2$ .

┘

*Proof:*  $(D_0)$ (30.3.3.7) follows from the truth of  $(L_r)$ (30.3.3.6) for each  $r$ . Then the assertion follows from(30.3.3.7) and  $(D_0)$ .  $\square$

**Lemma (30.3.3.5).** Let  $\rho : \text{Gal}_{\mathbb{Q}} \rightarrow \text{GL}(2, \mathcal{O})$  be a continuous odd irreducible representation s.t.

- $\bar{\rho}$  has non-solvable image, and  $\bar{\rho}$  is modular.
- $\rho$  is of weight 2, a.e. unramified, and potentially crystalline at  $p$ .

Then  $\rho$  is modular.

┘

*Proof:* Cf.[Khare-Wintenberger]Hypothesis H.?

$\square$

**Lemma (30.3.3.6).** For  $r \in \mathbb{Z}_+$ , consider the following statements:

$(L_r)$  : If  $\bar{\rho}$  is of Serre-type(30.3.3.3) and satisfies

- $\bar{\rho}$  is locally good-dihedral(30.3.3.2),
- $k(\bar{\rho}) = 2$  or  $p \neq 2$ ,
- $N(\bar{\rho})$  is odd and divisible by at most  $r$  different primes.

Then  $\bar{\rho}$  is modular.

$(W_r)$  : If  $\bar{\rho}$  is of Serre-type and satisfies

- $\bar{\rho}$  is locally good-dihedral(30.3.3.2),
- $k(\bar{\rho}) = 2$ ,
- $N(\bar{\rho})$  is odd and divisible by at most  $r$  different primes.

Then  $\bar{\rho}$  is modular.

Then

- $(W_1)$  is true.
- (Killing ramification in weight 2)( $L_r$ ) implies  $(W_{r+1})$ .
- (Reduction to weight 2)( $W_r$ ) implies  $(L_r)$ .

In particular, by induction spirally, all  $(L_r), (W_r)$  are true.

┘

*Proof:* Cf.[Khare-Wintenberger]Thm3.1, 3.2, 3.3.?

2: As  $L_r$  clearly implies  $W_r$ , it suffices to consider the case  $N(\bar{\rho})$  has exactly  $r+1$  different primes. Suppose  $q \in \mathbf{P}$ ,  $\bar{\rho}$  is  $q$ -dihedral, and  $s \in \mathbf{P}$ ,  $s|N(\bar{\rho})$ ,  $s \neq q$ .  $\square$

**Lemma (30.3.3.7) [Level-Rising].** For  $r \in \mathbb{N}$ , if the following:

$(D_r)$   $\bar{\rho}$  is modular If  $\bar{\rho}$  is of Serre-type and satisfies

- $\bar{\rho}$  is locally good-dihedral,
- $p \in \mathbf{P} \setminus \{2\}$ ,
- $2^{r+1} \nmid N(\bar{\rho})$ .

is true, then we have:  $\bar{\rho}$  is modular if  $\bar{\rho}$  is of Serre-type and satisfies

- $k(\bar{\rho}) = 2$  or  $p \neq 2$  or  $r \neq 0$ ,
- $2^{r+1} \nmid N(\bar{\rho})$ ,

┘

*Proof:* Cf. [Khare-Wintenberger]Thm3.4. ?

□

**Thm. (30.3.3.8) [Compatible Lifting].** Suppose  $\bar{\rho}$  is of Serre-type s.t.

- (if  $p = 2$ )  $\bar{\rho}$  has non-solvable image,
- (if  $p \neq 2$ )  $k(\bar{\rho}) \in [2, p+1]$  and  $\bar{\rho}|_{\mathbb{Q}(\mu_p)}$  is absolutely irreducible.

Then  $\bar{\rho}$  lifts to an  $E$ -rational almost strictly compatible, irreducible, odd Galois representation of  $\text{Gal}_{\mathbb{Q}}$  satisfying the following:

- 

┘

### Level and Weights in Serre's Conjecture

**Thm. (30.3.3.9) [Weight and Level aspect of Serre's Conjecture, Ribet, Edixhoven, Coleman, Voloch, Gross].**

┘

*Proof:* ?

□

### Applications

#### 4 Dwork's Family

**Notation (30.3.4.1).**

- Let  $n \in \mathbb{Z}_{\geq 2}$ .

┘

**Def. (30.3.4.2) [Dwork Family].** For  $N \in \mathbb{Z}_{\geq 2}$ , let  $T_0 = \mathbb{P}^1 \setminus \{\infty \cup \mu_N\} \in \text{Sch}/\mathbb{Z}[\frac{1}{N}]$  with coordinate  $t$ . And let  $Y \subset \mathbb{P}^{N-1} \times T_0$  be the projective family of hypersurfaces defined by the following equation:

$$X_1^N + \dots + X_N^N = NtX_1 \dots X_N.$$

Then  $\text{pr} : Y \rightarrow T_0$  is smooth of relative dimension  $N-2$ . Let  $\mu_N \xrightarrow{\Delta} \mu_N^N = H$  and  $H_0 = \{(\xi_1, \dots, \xi_N) : \xi_1 \dots \xi_N = 1\} \subset H$ .

Over  $\mathbb{Z}[\frac{1}{N}, \zeta_N]$ , there is an action of  $H$  on  $Y$  given by

$$(\xi_1, \dots, \xi_N)(X_1, \dots, X_N, t) = (\xi_1 X_1, \dots, \xi_N X_N, (\xi_1 \dots \xi_N)^{-1} t)$$

that induces an action of  $H_0$  on each fiber of  $Y$  over  $T_0$ .

┘

**Def. (30.3.4.3) [Dwork Family, 2].**

┘

**Def. (30.3.4.4)**[Self-Dual Avoidance Characters, Lie Qian]. Notation as in(30.3.4.2), let  $\chi : H_0 \rightarrow \mu_N$  be a character of the form

$$\chi((\xi_1, \dots, \xi_N)) = \prod_{i=1}^N \xi_i^{a_i}$$

where

$$(a_1, \dots, a_N) = \begin{cases} (1, 2, 4, 5, \dots, \frac{N-n+2}{2}, \frac{N+n-2}{2}, \dots, N-5, N-4, N-3, 0, 0, \dots, 0) & , n \in 2\mathbb{Z}_+ + 1 \\ (1, 2, 3, 4, 5, 7, 8, \dots, \frac{N-n+3}{2}, \frac{N+n-3}{2}, \dots, N-5, N-4, 0, 0, \dots, 0) & , n \in 2\mathbb{Z}_+ + 2 \\ (1, 2, \dots, \frac{N-3}{2}, 0, 0, 0, \frac{N+3}{2}, \dots, N-2, N-1) & , n = 2 \end{cases}$$

These characters are well-defined because  $N | \sum_{i=1}^N a_i$ .

In each case, there are  $n+1$  zero values in  $(a_i)$ , and we can let  $\{b_1, \dots, b_{n+1}\}$  be the  $n$  residue classes in  $\mathbb{Z}/(N)$  s.t.  $b_i \neq -a_j$  for any  $j \in \{1, \dots, N\}$ . In particular,

$$\{b_1, \dots, b_n\} = \begin{cases} \{1, 2, \frac{N-n+4}{2}, \frac{N-n+6}{2}, \dots, \frac{N+n-6}{2}, \frac{N+n-4}{2}, N-3\} & , n \in 2\mathbb{Z}_+ + 1 \\ \{1, 2, 3, \frac{N-n+5}{2}, \frac{N-n+7}{2}, \dots, \frac{N+n-7}{2}, \frac{N+n-5}{2}, N-6\} & , n \in 2\mathbb{Z}_+ + 2 \\ \{\frac{N-1}{2}, \frac{N+1}{2}\} & , n = 2 \end{cases}$$

┘

**Prop. (30.3.4.5).** Situation as in(30.3.4.4), if  $n > 2$  and  $\alpha \in (\mathbb{Z}/(N))^*$  s.t.  $\{\alpha b_1, \dots, \alpha b_n\} = \{b_1, \dots, b_n\}$ , then

┘

*Proof:* Cf.[?Qia23]P1254.

□

## 5 Serre's Modularity Conjecture over Totally Real Fields

**Thm. (30.3.5.1)** [Lie Qian]. Suppose  $F$  is a CM field,  $F^{\text{av}}/F$  a finite extension, and  $n \in \mathbb{Z}_{\geq 2}, s \in \mathbb{Z}_+, \ell \in \text{Prime}_{\geq 3}$ . Let

$$\bar{\rho} : \text{Gal}_F \rightarrow \text{GL}(n; \mathbb{F}_{\ell^s})$$

be a continuous semisimple representation, then there exists a finite CM extension  $F'/F$  linearly disjoint from  $F^{\text{av}}$  over  $F$  s.t.  $\bar{\rho}|_{\text{Gal}_{F'}}$  is ordinarily automorphic(30.1.3.35).

┘

*Proof:* Cf.[Lie Qian]P1239. This extends results of [A family of Calabi-Yau Varieties and Potential Automorphy, 2] to the non-self-dual case.

□

## 6 Taylor-Wiles-Kisin Methods

**Notation (30.3.6.1).**

- Let  $F/F_0$  be a CM extension with  $\text{Gal}(F/F_0) = \{1, \mathfrak{c}\}$ .

┘

**Def. (30.3.6.2)**[Polarized Representations].

┘

## 7 Modularity-Lifting

**Thm. (30.3.7.1) [Modularity-lifting for irreducible representations of  $GL(2)$ , Kisin[Kis09, Kis09c]/Paškūnas(16)].** Let  $k \in \mathbb{Z}_{\geq 2}$  and  $\rho : \text{Gal}_{\mathbb{Q}} \rightarrow GL(2; \overline{\mathbb{Q}}_{\ell})$  be a continuous odd Galois representation ramified at f.m. places and satisfy:

- $\rho|_{\text{Gal}_{\mathbb{Q}_p}}$  is de Rham with  $H\text{-}T(\rho) = \{0, k-1\}$ .
- $\bar{\rho}$  is modular(30.1.2.5).
- If  $p > 2$ ,  $\bar{\rho}|_{\text{Gal}_{\mathbb{Q}}\left(\sqrt{(-1)^{(p-1)/2}p}\right)}$  is irreducible.
- If  $p = 2$ ,  $\text{Im}(\bar{\rho})$  is non-solvable.

Then  $\rho$  matches the representation of a weight  $k$  modular form.  $\lrcorner$

*Proof:* ? Cf.[simplified proof of Serre’s conjecture]Thm1.4, 1.5.

For  $p > 2$ , this is??P642.

For  $p = 2$ , this follows from [On 2-dimensional 2-adic Galois representations of local and global fields, Paskunas]Theorem 1.1 and [On the modularity of 2-adic potentially semi-stable deformation rings, Tung]Theorem A. ?  $\square$

**Thm. (30.3.7.2) [Modularity-Lifting for Reducible Representations, Skinner-Wiles/Pan].** Let  $k \in \mathbb{Z}_{\geq 2}$  and  $\rho : \text{Gal}_{\mathbb{Q}} \rightarrow GL(2; \overline{\mathbb{Q}}_{\ell})$  be a continuous odd irreducible geometric Galois representation that satisfies:

- $\rho|_{\text{Gal}_{\mathbb{Q}_p}}$  is de Rham with  $H\text{-}T_p(\rho) = \{0, k-1\}$  and  $\bar{\rho}^{\text{ss}} \cong \bar{\chi}_1 \oplus \bar{\chi}_2$  where  $\chi_i$  are characters.
- If  $p = 3$ ,  $\frac{\bar{\chi}_1}{\bar{\chi}_2}|_{\text{Gal}_{\mathbb{Q}_p}} \neq \bar{\chi}_{\text{cycl}}^{\pm 1}$ .

Then  $\rho$  matches the representation of a weight  $k$  modular form.  $\lrcorner$

*Proof:* Cf.[Skinner-Wiles, Residually reducible representations and modular forms]P6. and [Fontaine-Mazur conjecture in the residually reducible case, Pan]Thm1.0.2.  $\square$

**Thm. (30.3.7.3) [Modularity Lifting for  $GL(2)$ , Taylor-Wiles/Khare-Wintenberger].** Assume  $p \in \text{Prime}$  and  $\bar{\rho} : \text{Gal}_{\mathbb{Q}} \rightarrow GL(2, \overline{\mathbb{F}}_p)$  is a smooth modular Galois representation, and

- $\text{Im}(\bar{\rho})$  is non-solvable if  $p = 2$ ,
- $\bar{\rho}|_{\mathbb{Q}(\zeta_p)}$  is absolutely irreducible if  $p > 2$ .

Then  $\rho$  is also modular if:

- $(p = 2)$  and  $\rho$  is an odd lift of  $\bar{\rho}$  to a 2-adic representation that is
  - a.e. unramified,
  - crystalline of weight 2 at 2, or semistable of weight 2 at 2 and  $k(\bar{\rho}) = 4$ ,
- $(p > 2)$  and  $\rho$  is a lift of  $\bar{\rho}$  to a  $p$ -adic representation that is crystalline of weight  $k \in [2, p+1]$  at  $p$ , or pot.semistable of weight 2 at  $p$ ,

$\lrcorner$

*Proof:* Cf.[Khare-Wintenberger 2]. ?  $\square$

**Def. (30.3.7.4) [Adequate Subgroups, Thorne[Tho12]].** For  $\ell \in \text{Prime}$  and  $n \in \mathbb{Z}_+$ , a subgroup  $H \leq GL(n; \overline{\mathbb{F}}_{\ell})$  are called an **adequate subgroup** if the following conditions hold:

- $H^1(H, \overline{\mathbb{F}}_{\ell}) = 0$  and  $H^1(H, {}_n(\overline{\mathbb{F}}_{\ell})) = 0$ .
- $H^0(H, {}_n(\overline{\mathbb{F}}_{\ell})) = 0$ , in particular,  $\ell \nmid n$ .

- The elements of  $H$  with order coprime to  $\ell$  spans  $\text{Mat}(n, \overline{\mathbb{F}_\ell})$  over  $\overline{\mathbb{F}_\ell}$ .

⌋

**Prop. (30.3.7.5) [Criterion for Adequate Subgroups].** Let  $\ell \in \text{Prime}$ ,  $n \in \mathbb{Z}_+$ . Suppose  $H \leq \text{GL}(n; \overline{\mathbb{F}_p})$  is a finite subgroup s.t. the tautological representation of  $H$  is irreducible, and denote  $H_0 \leq H$  the subgroup generated by all elements of  $\ell$ -power order, and let  $d$  be the maximal dimension of an irreducible  $\overline{\mathbb{F}_p}$ -representation of  $H_0$ . If  $\ell \geq 2(d+1)$ , then  $H$  is adequate.

⌋

*Proof:* Cf. [Tho12] Appendix Theorem9.

□

**Thm. (30.3.7.6) [Automorphic lifting in the ordinary case, Geraghty [Ger10]/Thorne [?Tor12]].** Let  $F$  be a CM field or a totally real field,  $n \in \mathbb{Z}_+$ , and  $\ell \in \text{Prime}_{\geq 3}$ . Suppose  $(\rho, \mu)$  is an  $n$ -dimensional geometric polarized (30.1.3.28)  $\ell$ -adic representation of  $\text{Gal}_F$  s.t.

- The reduction  $\bar{\rho}$  is irreducible and  $\bar{\rho}(\text{Gal}_{F(\mu_\ell)}) \leq \text{GL}(n; \overline{\mathbb{F}_\ell})$  is adequate (30.3.7.4).
- $\mu_\ell \not\in F$ .
- $\rho$  is ordinary at all primes above  $\ell$  (30.1.3.34).
- $(\bar{\rho}, \bar{\mu})$  is ordinarily automorphic?

Then  $(\rho, \mu)$  is ordinarily automorphic. And if moreover  $(\bar{\rho}, \bar{\mu})$  is (potentially) crystalline, then  $(\rho, \mu)$  is ordinarily automorphic of (potentially) level prime to  $\ell$ .

⌋

*Proof:* Cf. [Tho12] Thm9.1.. The totally real case follows from the CM case by base change? □

**Thm. (30.3.7.7) [Automorphy Lifting Theorem, Taylor-Wiles/Kisin/Barnet.Lamb-Gee-Geraghty-Taylor [LGGT]].** Suppose  $n \in \mathbb{Z}_+$ ,  $p > 2(n+1)$  and  $\zeta_\ell \notin K$ . Let  $\rho : \text{Gal}_F \rightarrow \text{GL}(n; K)$  is a geometric Galois representation (30.1.2.1) that  $\bar{\rho}$  is automorphic (30.1.3.17), together with

- $\rho^c \cong \rho^\vee \otimes \mu$  where  $\mu$  is a totally odd  $\ell$ -adic character of  $\text{Gal}_{F_0}$ .
- $\bar{\rho}_{\text{Gal}_{F(\mu_\ell)}}$  is absolutely irreducible.
- For any  $v \in S_F(p)$ ,  $\rho|_{\text{Gal}_{F_v}}$  is potentially diagonalizable (i.e. pot. crystalline and can be deformed in a moduli space of crystalline representations to a sum of characters) and Hodge-Tate regular.

Then  $\rho$  is also automorphic (30.1.3.17).

⌋

*Proof:* ? Cf. [Automorphy for some  $\ell$ -adic lifts of automorphic mod  $\ell$  Galois representations, 2, Taylor2008] and [Automorphy for some  $\ell$ -adic lifts of automorphic mod  $\ell$  Galois representations, Clozel-Harris-Taylor2008], [A family of Calabi-Yau varieties and potential automorphy, Harris-Barron-Taylor2010], [Potential automorphy and change of weight, Barnet.Lamb-Gee-Geraghty-Taylor2014].

□

## 8 Open Questions

**Remark (30.3.8.1).** Current techniques have the following restrictions: If  $(\rho, V) : \text{Gal}_\mathbb{Q} \rightarrow \text{GL}(n; \overline{\mathbb{Q}_\ell})$  is a geometric representation, then

- There should be a character  $\mu : \text{Gal}_\mathbb{Q} \rightarrow \overline{\mathbb{Q}_\ell}^\times$  and a bilinear form  $(-, -)$  on  $V$  s.t.

$$(\rho(\sigma)v_1, \rho(\sigma)v_2) = \mu(\sigma)(v_1, v_2), \quad (v_1, v_2) = \mu(c)(v_2, v_1).$$

- $\rho$  needs to be Hodge-Tate regular.

- Either  $\rho, \rho'$  are both ordinary or crystalline with  $H-T(\rho) = H-T(\rho')$  and diameter of  $H-T(\rho)$  is small compared to  $\ell$ .
- If  $n \geq 3$ , then Ihara's conjecture(30.3.8.2) is hard to prove, Cf.[On modular curves over finite fields]lemma3.2 and [Congruence relations between modular forms, Ribet]Theorem4.1?

┘

**Conj. (30.3.8.2)[Ihara's Conjecture].** Let  $G/\mathbb{Q}$  be a unitary group that is isomorphic to  $GL(n)$  after base change to an imaginary quadratic field  $\mathcal{K}$ . Let  $\ell \in \mathbf{Prime}$  that is large compared to  $n$  and  $p_1, p_2 \in \mathbf{Prime} \setminus \{\ell\}$  be two different primes s.t.  $G(\mathbb{Q}_{p_i}) \cong GL(n; \mathbb{Q}_{p_i})$ . Let  $U$  be an open compact subgroup of  $G(\mathbf{A}^{p_1 p_2})$  and consider the representation of  $GL(n; \mathbb{Q}_{p_1}) \times GL(n; \mathbb{Q}_{p_2})$  on

$$C^\infty(G(\mathbb{Q}) \backslash G(\mathbf{A})/U; \overline{\mathbb{F}_\ell}) = C^\infty((G(\mathbb{Q}) \cap U) \backslash (GL(n; \mathbb{Q}_{p_1}) \times GL(n; \mathbb{Q}_{p_2})); \overline{\mathbb{F}_\ell}).$$

Suppose  $\pi_1 \times \pi_2$  is a subrepresentation with  $\pi_1$  generic, then  $\pi_2$  is also generic.

┘

*Proof:*

### 1 Abelian Varieties attached to Modular Forms

Cf[R-S11]Chap14.

**Prop. (30.4.1.1).** For a newform  $f$  of level  $N$ ,  $A_f \subset J_1(N)$  is of GL(2)-type(30.4.2.2). ┘

*Proof:* It has action by  $K_f$ ? □

**Remark (30.4.1.2).** The action of ┘

**Thm. (30.4.1.3) [Eichler-Shimura].** If  $f \in \text{SF}_2^{\text{eigen}}(\Gamma_0(N); \mathbb{Z})$ , then there exists an elliptic curve  $E/\mathbb{Q}$  s.t.  $L(E, s) = L(f, s)$ (31.1.6.2)(29.5.4.10). ┘

*Proof:* □

### 2 Modular Abelian Varieties

**Def. (30.4.2.1) [Modular Abelian Varieties].**  $A \in \text{AbVar}/\mathbb{Q}$  is called a **modular Abelian variety** if there exists a surjective map  $J_1(N) \rightarrow A$  for some  $N \in \mathbb{Z}_+$ . ┘

#### GL(2)-Type Abelian Varieties

**Prop. (30.4.2.2) [GL(2)-Type Abelian Varieties].** If  $A \in \text{AbVar}/\mathbb{Q}$  and  $E \in \text{Field}$  s.t.  $E \subset \text{End}(A)_{\mathbb{Q}}$ , then  $[E : \mathbb{Q}] \mid \dim A$ . In particular,  $\text{End}(E/\mathbb{Q}) = \mathbb{Z}$  for any  $E \in \text{EllCur}/\mathbb{Q}$ .

$A \in \text{AbVar}/\mathbb{Q}$  is called an **Abelian variety of GL(2)-type** if  $\text{End}(A)_{\mathbb{Q}}$  contains a number field of degree  $\dim A$ . ┘

*Proof:*  $E$  acts faithfully on the tangent space  $\text{Lie}(A/\mathbb{Q})$ , so  $\text{Lie}(A/\mathbb{Q})$  is an  $E$ -vector space thus has dimension divisible by  $[E : \mathbb{Q}]$ . □

**Def. (30.4.2.3) [Power Abelian Varieties].** The power of a GL(2)-Abelian variety is also of GL(2)-type. ┘

**Prop. (30.4.2.4) [Primitive Abelian Varieties of GL(2)-Type].** Let  $A \in \text{AbVar}/\mathbb{Q}$ , then  $A/\mathbb{Q}$  is primitive(i.e. not a power) iff  $A/\mathbb{Q}$  is simple iff  $\text{End}(A/\mathbb{Q})$  is a number field of degree  $\dim A$ . ┘

**Thm. (30.4.2.5) [Abelian Varieties of GL(2)-Type are Modular, Ribet[Rib04]/Khare-Wintenberger[K-W09b, K-W09c].** If  $A \in \text{AbVar}/\mathbb{Q}$  is of GL(2)-type, then  $A$  is modular(30.4.2.1). ┘

*Proof:* [Rib04]Thm4.4. proved that this follows from Serre’s conjecture?. □

### Q-Curves

**Def. (30.4.2.6) [Q-Curves].**  $E \in \text{EllCur}/\overline{\mathbb{Q}}$  is called a **Q-curve** if  $E^\sigma$  is isogenous to  $E$  for any  $\sigma \in \text{Gal}_{\overline{\mathbb{Q}}}$ . ┘

**Def. (30.4.2.7) [Modular Elliptic Curves over  $\overline{\mathbb{Q}}$ ].**  $E \in \text{EllCur}/\overline{\mathbb{Q}}$  is called a **modular elliptic curve** if there is a surjective map  $J_1(N) \rightarrow E$  for some  $N \in \mathbb{Z}_+$ . ┘

**Thm. (30.4.2.8) [Ribet].** If  $E \in \text{EllCur}/\overline{\mathbb{Q}}$  is modular(30.4.2.7), then either  $E$  is a Q-curve or  $E$  has CM. ┘

*Proof:* Cf.[Rib04]Section5. □

**Thm. (30.4.2.9) [Q-Curves and GL(2)-Type Abelian Varieties].** Suppose  $E \in \text{EllCur}/\overline{\mathbb{Q}}$  has no CM, then  $E$  is a Q-curve(30.4.2.6) iff there is a simple Abelian variety  $A \in \text{AbVar}/\mathbb{Q}$  of GL(2)-type s.t.  $E$  is a simple factor of  $A_{\overline{\mathbb{Q}}}$ . ┘

*Proof:* Cf.[Rib04]Thm6.1. ?

This is accomplished finding a model for  $E$  over a Galois extension  $F/\mathbb{Q}$ , restricting scalars down to  $\mathbb{Q}$  to obtain an abelian variety  $B = \text{Res}_{F/\mathbb{Q}}(E)$ , and using Galois cohomology computations (mainly in  $H^2$ s) to find the required  $A$  of GL(2)-type inside  $B$ . □

**Cor. (30.4.2.10)** [Ribet[Rib04]/Ellenberg-Skinner[E-S01]/Khare-Wintenberger[K-W09b, K-W09c]]. Let  $E \in \text{EllCur}/\overline{\mathbb{Q}}$  be a Q-curve, then  $E$  is modular over  $\mathbb{Q}$ (30.4.2.7). ┘

*Proof:* This follows from(30.4.2.8) and(30.4.2.5)(30.4.2.9). □

### 3 Elliptic Curves over $\mathbb{Q}$

**Prop. (30.4.3.1).** If  $E \in \text{EllCur}/\mathbb{Q}$  is modular(30.4.2.1), then there is a non-constant map  $X_0(N) \rightarrow E$ . ┘

**Thm. (30.4.3.2) [Mazur].** If  $E \in \text{EllCur}/\mathbb{Q}$  is a modular(30.4.2.1) if  $E_{\mathbb{C}}$  is a quotient of  $X_1(N)$  for some  $N \in \mathbb{Z}_+$ . ┘

*Proof:* [Mazur, Number theory as gadfly]. □

**Prop. (30.4.3.3) [Modular Elliptic Curves].** For  $E \in \text{EllCur}/\mathbb{Q}$ , the following are equivalent:

- $E$  is modular(30.4.2.1).
- there exists a normalized Hecke eigenform  $f \in S_2(\Gamma_0(N_E))$  with integral coefficients s.t.  $L(E; s) = L(f, s)$ .
- For some(every)  $p \in \text{Prime}$ ,  $\rho_{E,p}$  is modular.
- $E$  has a Weil parametrization(30.4.4.1).
- $E$  is isogenous to the modular Abelian variety  $A_f$  associated to some newform  $f \in S_2(\Gamma_0(N_E))$ . ┘

*Proof:* □

**Lemma (30.4.3.4).** For  $E \in \text{EllCur}/\mathbb{Q}$  and  $N \in \mathbb{Z}_+$ , there is a surjection  $X_0(N_E) \rightarrow E$  iff there is a surjection  $\text{Jac}_0(N) \rightarrow E$ . ┘

*Proof:* If  $\varphi : X_0(N) \rightarrow E$  is non-zero, then  $\varphi_* : \text{Jac}_0(N) \rightarrow \text{Jac}(E) \cong E$  is nonzero, by (20.9.10.10). If  $\Phi : J_0(N) \rightarrow E$  is surjective, then  $X_0(N) \xrightarrow{\text{Abel}} J_0(N) \rightarrow E$  is also surjective, by looking at the Tate module?  $\square$

**Lemma (30.4.3.5) [Langland-Tunnell].** If  $E \in \text{EllCur}/\mathbb{Q}$  is semistable and  $E[\ell]$  is irreducible for some odd prime  $\ell$ , then  $E[\ell]$  is modular.  $\lrcorner$

*Proof:*  $\square$

**Lemma (30.4.3.6) [Taylor-Wiles].** If  $E \in \text{EllCur}/\mathbb{Q}$  is semistable and  $\ell$  is an odd prime s.t.  $E[\ell]$  is irreducible and modular, then  $T_\ell$  is modular.  $\lrcorner$

*Proof:*  $\square$

**Thm& Conj.Cor. (30.4.3.7) [Modularity of Elliptic Curves over  $\mathbb{Q}$ , Shimura--Taniyama[S-T61]/Weil[Wei67], Wiles[Wil95]/Taylor-Wiles[T-W95]/Breuil-Conrad-Diamond-Taylor/Khare-Wintenberger[K-W09b, K-W09c].** Any  $E \in \text{EllCur}/\mathbb{Q}$  is modular (30.4.3.3).  $\lrcorner$

*Proof:* Cf.[On the modularity of elliptic curves over  $\mathbb{Q}$ : wild 3-adic exercises, C. Breuil, B. Conrad, F. Diamond, and R. Taylor].

The proof by Serre conjecture doesn't rely on [BCDT]?  $\square$

**Thm. (30.4.3.8) [ $T = R$  Theorem, Wiles].** The modular deformation ring  $T$  is isomorphic to the Galois deformation ring  $R_{\bar{\rho}}$ .  $\lrcorner$

*Proof:*  $\square$

**Prop. (30.4.3.9) [Elliptic Curves and Modular Forms].** For  $E \in \text{EllCur}/\mathbb{Q}$  with conductor  $N$  and sign of functional equation  $w_E$ , and has L-function  $L(E, s) = \sum c_n n^{-s}$ . Let  $f_E(\tau) = \sum c_n e^{2\pi i \tau}$  be the Mellin transform of  $L(E, s)$ , then

- $f_E$  is a cuspidal modular form on  $S_2(\Gamma_0(N))$ .
- $f_E$  is a normalized Hecke eigenfunction, and satisfies  $f[w_N]_2 = -w_E f(\tau)$ , where  $w_E$  is the sign of functional equation of  $E$  (31.1.6.4).
- Let  $\omega$  be an invariant differential form on  $E$ , then there exists a finite morphism  $\varphi : X_0(N) \rightarrow E$  over  $\mathbb{Q}$  s.t.  $\varphi^*(\omega)$  is a multiple of the differential form on  $X_0(N)$  represented by  $f(\tau)d\tau$ .  $\lrcorner$

*Proof:*  $\square$

## 4 Weil Parametrizations

References are [Edixhoven, Manin Constant].

**Def. (30.4.4.1) [Weil Parametrizations].** For  $E \in \text{EllCur}/\mathbb{Q}$  with conductor  $N = N_E$  and a Néron differential  $\omega_E$  (21.1.1.3), a **Weil parametrization** is a minimal map?  $\varphi : X_0(N) \rightarrow E$  over  $\mathbb{Q}$  s.t.  $\varphi^* \omega_E = 2\pi i c_E f_E(z) dz$  for some normalized newform  $f_E \in \text{SF}_2^{\text{new}}(\Gamma_0(N))$ , where  $\omega_E$  is the Néron differential of  $E$ .

Then  $c_E \in \mathbb{Z}^\times$ , called the **Manin constant** of  $E$ . After possibly changing  $\varphi$  to  $[-1] \circ \varphi$ , we may assume  $c_E \in \mathbb{Z}_+$ .  $\lrcorner$

*Proof:* ? □

**Conj. (30.4.4.2)** [Manin[Man71, Man72]]. For any  $E \in \text{EllCur}/\mathbb{Q}$ ,  $c_E = 1$ . ┘

*Proof:* Let  $\mathcal{E} \in \text{Sch}$  be a Néron model for  $E$ , then there is a natural map  $\varphi : X_0(N)_{\text{sm}} \rightarrow \mathcal{E}$ . By [Katz-Mazur]Thm8.11.10, the formal completion of  $X_0(N)$  along the unramified cusp  $\infty$  is  $\text{Spf}(\mathbb{Z}[[q]])$ , so  $\infty \in X_0(N)_{\text{sm}}(\mathbb{Z})$ , and the  $q$ -expansion of  $\varphi^*\omega_E$  is just the pullback to  $\text{Spf}(\mathbb{Z}[[q]])$ . Thus  $c_E \in \mathbb{Z}_+$ . ? □

**Thm& Conj. Cor. (30.4.4.3)** [Manin-S.Dyer/Mazur[Maz78]]. For any  $E \in \text{EllCur}/\mathbb{Q}$ ,  $c_E \in \mathbb{Z}[\frac{1}{2m}]^*$ , where  $m$  is the largest square dividing  $N_E$ . In particular, if  $E \in \text{EllCur}/\mathbb{Q}$  is semistable, then  $c_E \in 2^{\mathbb{Z}_+}$ . ┘

*Proof:* Cf.[Maz78]P144. □

**Thm& Conj. Cor. (30.4.4.4)** [Raynaud]. If  $E \in \text{EllCur}/\mathbb{Q}$  is semistable, then  $\log(c_E)$  is bounded. ┘

*Proof:* ? □

**Prop. (30.4.4.5)** [Heights and Weil Parametrization]. Let  $E \in \text{EllCur}/\mathbb{Q}$  with a Weil parametrization  $\varphi_E : X_0(N) \rightarrow E$  and corresponding normalized modular form  $f_E$  and Manin constant  $c_E$ , then

$$\frac{1}{2} \log \left( \frac{\deg(\varphi_E)}{[\text{SL}(2, \mathbb{Z}) : \Gamma_0(N)]} \right) = h_{\text{Fal}}(E/\mathbb{Q}) + \log(4\pi^2 \|f_E\|_{\text{Pet}}) + \log |c_E|.$$

┘

*Proof:* let  $\alpha_E$  be a Néron differential of  $E$ , then  $\varphi_E^*\alpha_E = 2\pi i c_E f_E(z) dz$ , so

$$\begin{aligned} 4\pi^2 |c_E|^2 \|f_E\|_{\text{Pet}}^2 &= \frac{1}{[\text{SL}(2, \mathbb{Z}) : \Gamma_0(N)]} \frac{i}{2} \int_{X_0(N)} \varphi_E^*\alpha_E \wedge \overline{\varphi_E^*\alpha_E} \\ &= \frac{\deg(\varphi_E)}{[\text{SL}(2, \mathbb{Z}) : \Gamma_0(N)]} \frac{i}{2} \int_{E^{\text{an}}} \alpha_E \wedge \overline{\alpha_E} \\ &= \frac{\deg(\varphi_E)}{[\text{SL}(2, \mathbb{Z}) : \Gamma_0(N)] H_{\text{Fal}}^2(E)} \quad (21.1.5.1) \end{aligned}$$

□

**Cor. (30.4.4.6)** [Lower Bounded for  $\deg(\varphi_E)$ ]. For any  $\varepsilon \in \mathbb{R}_+$ , there exists  $C_\varepsilon \in \mathbb{R}_+$  such that: Suppose  $E \in \text{EllCur}/\mathbb{Q}$  with a Weil parametrization  $\varphi_E : X_0(N) \rightarrow E$  and associated normalized cusp form  $f_E$  and Manin constant  $c_E = 1$ , then

$$\deg(\varphi_E) \geq C_\varepsilon \max(|c_4(E)|^{1/4}, |c_6(E)|^{1/6})^{2-\varepsilon}.$$

┘

*Proof:* Use (30.4.4.5). Firstly, by (21.1.5.13),  $h_{\text{Fal}}(E/\mathbb{Q}) \geq (1 - \varepsilon) \log \max(|c_4(E)|^{1/4}, |c_6(E)|^{1/6}) + O_\varepsilon(1)$ . Next,  $\|f_E\| \geq e^{-4\pi}/(4\pi)$  by (26.3.1.9) and the fact  $f_E$  is normalized. Then the assertion follows. □

Modularity over Totally Real Fields

**Thm. (30.4.4.7)**[Modularity of Elliptic Curves over Real Quadratic Fields, Freitas-Hung-Siksek]. Any elliptic curve defined over a real quadratic field is modular.  $\square$

*Proof:* ? Cf. [FHS15].

The proof uses a “3-5-7” trick.  $\square$

**5 Paramodular Conjecture**

**Conj. (30.4.5.1)**[Paramodular Conjecture, Brumer-Kramer]. If  $A \in \mathcal{AbVar}^2/\mathbb{Q}$  with  $\text{End}(A_{\overline{\mathbb{Q}}}) = \mathbb{Z}$  and conductor  $N$ , then  $L(A; s) = L(f; s)$  for some weight 2 paramodular newform  $f$  of level  $N$  with rational Hecke eigenvalues.

Conversely, for any weight 2 paramodular newform  $f$  of level  $N$  with rational Hecke eigenvalues, there exists  $A \in \mathcal{AbVar}^2/\mathbb{Q}$  with  $\text{End}(A_{\overline{\mathbb{Q}}}) = \mathbb{Z}$  and conductor  $N$  or  $A \in \mathcal{AbVar}^4/\mathbb{Q}$  with QM.  $\square$

*Proof:*

$\square$

### 30.5 Langlands-Kottwitz Method

References are [Lan79a, Lan79b, Lan83, Zhu20], [Kottwitz, Shimura Varieties and  $\lambda$ -adic Representations] and [Kottwitz, Points on some Shimura varieties over finite fields].

#### Notation(30.5.0.1).

- Let  $G \in \mathcal{R}\text{edGrp}/\mathbb{Q}$ .
- Assume  $[G, G]$  is simply-connected.
- Assume  $A(G_{\mathbb{R}}) = A(G)_{\mathbb{R}}$  (this holds for any Hodge-type Shimura variety, but may fail for Abelian types ?).
- Let  $p \in \mathbf{Prime}$ . Let  $q \in p^{\mathbb{Z}_+}$ .
- Let  $\sigma_q \in \text{Gal}_{\mathbb{F}_q}$  be the geometric Frobenius.
- Assume  $G$  is unramified at  $p$ .
- Fix  $L(\xi) \in \mathbf{NField}$  and  $\xi \in \text{Irr}_{L(\xi)}(G)$ .
- Let  $\chi \in X^{\bullet}(Z_G)$  be the central character of  $\xi$ .
- Use notations on étale cohomologies over finite fields defined in [Cohomologies over Finite Fields](#).
- Use notations on stable trace formulae defined in [Stable Trace Formulae](#).

⌋

#### Notation(30.5.0.2)[Unitary PE-Structures].

- Let  $E/F$  be a CM-field.
- Let  $\text{Gal}(E/F) = \{1, \mathbf{c}\}$ .
- Let  $\varepsilon \in E$  s.t.  $\mathbf{c}(\varepsilon) = -\varepsilon$ .
- Let  $(V, [-, -]) \in \text{HermSpa}_{E/F}$  be anisotropic.
- Define  $\langle x, y \rangle = \text{tr}_{E/\mathbb{Q}}(\varepsilon[x, y])$  where  $x, y \in V$ , which is a  $\mathbb{Q}$ -bilinear  $\mathbb{Q}$ -valued non-degenerate alternating form on  $V$ .
- Let  $C = \text{End}_E(V)$  and let  $*$  be the involution on  $C$  defined by

$$\langle cx, y \rangle = \langle x, c^*y \rangle, \text{ where } x, y \in V, c \in C.$$

- Let  $h : \mathbb{C} \rightarrow \text{End}_{E \otimes \mathbb{R}}(V \otimes \mathbb{R})$  be an  $\mathbb{R}$ -algebra homomorphism s.t.  $\langle h(z)x, y \rangle = \langle x, h(\mathbf{c}z)y \rangle$  and  $\langle x, y \rangle = \langle x, h(\mathbf{i})y \rangle$  is positive-definite symmetric form on  $V \otimes \mathbb{R}$ .
- Let  $E$  be the reflex field of  $h$ , and  $\mathfrak{p} \in S_E(p)$ .

In particular,  $(E, \mathbf{c}, V, \langle -, - \rangle, h)$  is a rational PE-structure. And we denote  $G = \text{Res}_{F/\mathbb{Q}} \text{GU}(V, [-, -]) \in \mathcal{R}\text{edGrp}/\mathbb{Q}$ .

⌋

#### 1 Honda-Tate Theory

References are [Kot92]Section10.

**Def.(30.5.1.1)[Virtual Abelian Varieties up to  $p$ -prime Isogenies].** For  $n \in \mathbb{Z}_+$ , the  $\mathbb{Z}_{(p)}$ -category  $\mathcal{V}_n^p$  of **virtual Abelian varieties up to  $p$ -prims isogenies** is defined as follows:

- Its object are  $A = (\bar{A}, u)$  where  $\bar{A} \in \mathcal{AbVar}_{\overline{\mathbb{F}_p}}$  and  $u : (\varphi^n)^*(\bar{A}) \cong \bar{A}$  is an isomorphism in  $(\mathcal{AbVar}_{\overline{\mathbb{F}_p}}) \otimes \mathbb{Z}_{(p)}$ .
- Its morphisms are  $f : (\bar{A}_1, u_1) \rightarrow (\bar{A}_2, u_2)$  where  $f : \bar{A}_1 \rightarrow \bar{A}_2 \in (\mathcal{AbVar}_{\overline{\mathbb{F}_p}}) \otimes \mathbb{Z}_{(p)}$  s.t.  $f u_1 = u_2 (\varphi^n)^*(f)$ .

Also denote  $\mathcal{V}_n \triangleq \mathcal{V}_n^p \otimes \mathbb{Q}$ . ┘

**Def. (30.5.1.2) [Frobenius-Endomorphisms].** For  $A = (\bar{A}, u) \in \mathcal{V}_n^p$  (30.5.1.1), define the **Frobenius-endomorphism**

$$\pi_A : \bar{A} \xrightarrow{\text{Fr}} (\varphi^n)^* \bar{A} \xrightarrow{u} \bar{A} \in \text{End}(\bar{A}) \otimes \mathbb{Z}_{(p)}.$$

Then for any  $(\bar{A}_1, u_1), (\bar{A}_2, u_2) \in \mathcal{V}_n^p$ , a map  $f : \bar{A}_1 \rightarrow \bar{A}_2 \in \text{Hom}(\bar{A}_1, \bar{A}_2) \otimes \mathbb{Z}_{(p)}$  is a morphism in  $\mathcal{V}_n^p$  iff  $f \pi_{A_1} = \pi_{A_2} f$ . In particular,

$$\text{End}_{\mathcal{V}_n^p}(A) = Z_{\text{End}(\bar{A}) \otimes \mathbb{Z}_{(p)}}(\pi_A).$$
┘

**Def. (30.5.1.3) [Polarizations].** For  $A = (\bar{A}, u) \in \mathcal{V}_n$  (30.5.1.1) and  $c \in \mathbb{Q}$ , a  **$c$ -polarization**  $\lambda : \bar{A} \rightarrow \bar{A}^\vee$  s.t.  $(\pi_A)^*(\lambda) = c\lambda$ .  $A$  is said to be  **$c$ -polarizable** if it admits a  $c$ -polarization. The full subcategory of  $\mathcal{V}_n$  consisting of  $c$ -polarizable elements is denoted by  $\mathcal{V}_{n,c}$ . ┘

**Prop. (30.5.1.4).** If  $A \in \mathcal{AbVar}/\mathbb{F}_{p^n}$ , then  $A$  defines an element of  $\mathcal{V}_n$  (30.5.1.1), and a  $p^n$ -polarization is the same as a polarization of  $A$ . ? ┘

**Def. (30.5.1.5) [ $c$ -Numbers].** For  $c \in \mathbb{Q}_+$ , a  **$c$ -number** is a number  $\pi \in \overline{\mathbb{Q}}$  s.t.

- $|\pi_A|_v \geq 0$  for any embedding  $v : \overline{\mathbb{Q}} \rightarrow \overline{\mathbb{Q}_p}$ .
  - $|\pi_A|_v = c^{1/2}$  for any  $c : \overline{\mathbb{Q}} \rightarrow \mathbb{C}$ .
- ┘

**Thm. (30.5.1.6) [Kottwitz[Kot92]].** For  $c \in \mathbb{Q}$  and  $n \in \mathbb{Z}_+$ ,  $\mathcal{V}_{n,c}$  (30.5.1.3) is non-empty iff  $c > 0$  and  $v_p(c) = n$ , and in this case, we have:

- $\mathcal{V}_{n,c}$  is a semi-simple Artinian Noetherian Abelian category (4.8.3.17).
  - For each simple object  $A \in \mathcal{V}_{n,c}$ ,  $\text{End}_{\mathcal{V}_{n,c}}(A)$  is a division algebra with center  $\mathbb{Q}(\pi_A)$  (30.5.1.2). And its Hasse-invariant is given by explicit formula ?
  - For any simple object  $A \in \mathcal{V}_{n,c}$  and any embedding  $v : \mathbb{Q}(\pi_A) \rightarrow \overline{\mathbb{Q}}$ ,  $v(\pi_A)$  is a  $c$ -number (30.5.1.5). And  $A \mapsto \pi_A$  induces a bijection between the set of isomorphism classes of simple objects in  $\mathcal{V}_{n,c}$  to the set of  $\text{Gal}_{\mathbb{Q}}$ -orbits of  $c$ -numbers (30.5.1.5).
- ┘

*Proof:* ? [Kot92]section10. □

### Endomorphism Structures

**Def. (30.5.1.7) [Virtual Abelian Varieties with Endomorphism].** For  $c \in \mathbb{Q}, n \in \mathbb{Z}_+$  and  $F \in \text{NField}$ , define  $\mathcal{V}_{n,c,F}$  the category s.t.

- Its objects are pairs  $(A, \iota)$  where  $A \in \mathcal{V}_{n,c}$  and  $\iota : F \rightarrow \text{End}(A) \in \mathbb{R}ing/\mathbb{Q}$ .
- Its morphisms are morphisms in  $\mathcal{V}_{n,c}$  compatible with the  $F$ -action.

┘

**Prop. (30.5.1.8) [Classifying Polarized Virtual Abelian Varieties with Endomorphism Structures].** Situation as in (30.5.1.7), if  $\mathcal{V}_{n,c}$  is non-empty (30.5.1.3), then  $\mathcal{V}_{n,c,F}$  (30.5.1.7) is a semi-simple Artinian Noetherian Abelian category (4.8.3.17), and  $A \mapsto \pi_A$  induces a bijection between the set of isomorphism classes of simple objects in  $\mathcal{V}_{n,c,F}$  to the set of  $\text{Gal}_F$ -orbits of  $c$ -numbers (30.5.1.5). ┘

*Proof:* Cf. [Kot92] 10.13. ?

□

**Def. (30.5.1.9) [Virtual Abelian varieties with Polarization and Endomorphism].** For  $c \in \mathbb{Q}$ ,  $n \in \mathbb{Z}_+$  and  $F \in \text{NField}$ , denote  $\mathcal{V}_{n,c,F,\text{polar}}$  the category s.t.

- Its object are triples  $(A, \iota, \lambda)$  where  $(A, \iota) \in \mathcal{V}_{n,c,F}$  (30.5.1.7), and  $\lambda : A \rightarrow A^\vee$  is a  $c$ -polarization (30.5.1.3) s.t.  $\lambda$  is compatible with  $\iota$  in the sense of (? Cf. [Zhu20] P10).
- Its morphisms are morphisms in  $\mathcal{V}_{n,c,F}$  that preserves the polarization  $\lambda$  up to a scalar.

┘

## 2 Virtual Abelian Varieties with PEL Structures

**Def. (30.5.2.1) [Virtual Abelian Varieties with PEL Structures].**  $\mathcal{S}_{\mathcal{K}^p}(\overline{\kappa(\mathfrak{p})})$ , ? Cf. [Zhu20] P6. ┘

## 3 Kottwitz-Triples

References are [Kottwitz, Shimura varieties and  $\lambda$ -adic representations].

**Notation (30.5.3.1).**

- Assume  $(G/A(G))(\mathbb{R})$  has an elliptic maximal torus (e.g. if  $G$  admits Shimura variety??).
- Assume  $G_{\mathbb{Q}_p}$  is quasi-split.
- Let  $\mathcal{N} : \mathbb{S} \rightarrow G_{\mathbb{R}}$  be a  $G(\mathbb{R})$ -conjugacy class of group homomorphisms.
- let  $E \in \text{NField}$  be the field of definition of the conjugacy class  $\mathcal{N}$ .
- Let  $\mathfrak{p} \in S_E(p)$ .

┘

**Def. (30.5.3.2) [Kottwitz-Triples].** For  $r \in \mathbb{Z}_+$ , a **Kottwitz-triple** of degree  $r$  for  $G$  w.r.t.  $\{\mu\}$  is a triple  $(\gamma_0, \gamma, \delta)$  where

- $\gamma_0 \in G(\mathbb{Q})$  is semi-simple, and becomes elliptic in  $G(\mathbb{R})$  (10.4.2.25).
- $\gamma \in G(\mathbf{A}_f^p)$ .
- $\delta \in G(\mathbb{Q}_{p^{rf(\mathfrak{p})}})$  (28.6.1.1).

s.t.

- $\gamma_0$  is stably conjugate to  $\gamma$  (10.5.1.3).
- $\gamma_0$  and  $\mathfrak{N}_\sigma(\delta)$  (10.5.1.14) are stably conjugate.
- $\kappa_{G_{\mathbb{Q}_p}}(\delta) = (\mu_h)_*(-1) \in \pi_1(G)_{\text{Gal}_{\mathbb{Q}_p}}$  (28.6.1.7), where  $\mu_h \in X_\bullet(G)$  is the Hodge-cocharacter associated to an arbitrary  $h \in \{h\}$  (28.1.1.3).

Two Kottwitz-triples  $(\gamma_0, \gamma, \delta), (\gamma'_0, \gamma', \delta')$  of the same degree are called **equivalent** if  $\gamma_0 \sim_{\text{st}} \gamma$ ,  $\delta \sim_\varphi \delta'$ , and  $\gamma_v \sim \gamma'_v$  for all  $v \in \text{Prime} \setminus \{p\}$ .

Let  $\text{KT}_p(G, \mathcal{N}; j)$  denote a set of representatives for the equivalence classes of degree- $j$  Kottwitz-triples for  $G$ . And denote  $\text{KT}(G, \mu) = \coprod_{j \in \mathbb{Z}_+} \text{KT}_p(G, \mu; j)$ . ┘

**Def. (30.5.3.3) [Kottwitz-Invariants].** For each  $(\gamma_0, \gamma, \delta) \in \text{KT}_p(G, \mu)$  (30.5.3.2), Kottwitz defined  $\alpha(\gamma_0, \gamma, \delta) \in \mathfrak{K}(\gamma_0)^\vee$  (29.2.1.2) called the **Kottwitz-invariant** of  $(\gamma_0, \gamma, \delta)$ , as follows:

- For each  $v \in \text{Prime} \setminus \{p\}$ , the difference between  $\gamma_v$  and  $\gamma_0$  in  $G(\mathbb{Q}_v)$  is measured by a class  $\alpha_v \in \ker(H^1(\mathbb{Q}_v, I_0) \rightarrow H^1(\mathbb{Q}_v, G))$ , which is equivalent to a map

$$\alpha_v : Z(\hat{I}_0)^{\text{Gal}_{\mathbb{Q}_v}} \rightarrow \mathbb{C}^\times$$

whose restriction to  $(Z(\hat{I}_0)^{\text{Gal}_{\mathbb{Q}_v}})^0 Z(G)^{\text{Gal}_{\mathbb{Q}_v}}$  is trivial. ? Cf. [Harris, Stable Trace Formula] Section 3.

- By Steinberg's theorem, there exists  $c \in G(\check{\mathbb{Q}}_p)$  s.t.  $c\gamma c^{-1} = \mathfrak{N}_\sigma(\delta)$  ?, and we can define  $\alpha_p = \kappa_G(c^{-1}\delta\varphi(c)) \in \pi_1(I_0)_{\text{Gal}_{\mathbb{Q}_p}}$ , which doesn't depend on  $c$  chosen.
- [?Kot90] P167 ? defined an element  $\alpha_\infty \in X^\bullet(Z(\hat{I}_0)^{\text{Gal}_{\mathbb{R}}})$  whose restriction to  $Z(G)^{\text{Gal}_{\mathbb{R}}}$  is  $(\mu_h)_*(1)$  (30.5.3.2).

Thus  $\alpha = \prod_{v \in \Sigma_{\mathbb{Q}}} \alpha_v$  is a character of  $\bigcap_{v \in \Sigma_F} (Z(\hat{I}_0)^{\text{Gal}_{F_v}} Z(\hat{G}))$  that is trivial on  $Z(G)$ , thus defines an element  $\alpha(\gamma_0, \gamma, \delta) \in \mathfrak{K}(\gamma_0)^\vee$  by (29.2.1.2).

When  $\gamma_0$  varies in a stable conjugacy class, the groups  $\mathfrak{K}(\gamma_0)$  are canonically identified and these elements  $\alpha(\gamma_0, \gamma, \delta)$  are compatible with these identifications.

?

⌋

*Proof:* Cf. [?Kot90] Section 2.

□

**Prop. (30.5.3.4) [Inner Forms associated to Kottwitz-Triples].** For each  $(\gamma_0, \gamma, \delta) \in \text{KT}_p(G, \mu)$  (30.5.3.2) s.t.  $\alpha(\gamma_0, \gamma, \delta) = 1$  (30.5.3.3), denote  $I_0 = Z_G(\gamma_0)^0 \in \text{RedGrp}/\mathbb{Q}$ , then there exists an inner form  $I \in \text{RedGrp}/\mathbb{Q}$  of  $I_0$  s.t.

- $I(\mathbb{R})$  is compact modulo center.
- For each  $v \in \Sigma_{\mathbb{Q}}^{\text{fin}} \setminus \{p\}$ , we have  $I_{\mathbb{Q}_v} \cong (I_0)_{\mathbb{Q}_v} \in \text{RedGrp}/\mathbb{Q}_v$ .
- $I_p \cong J_\delta \in \text{RedGrp}/\mathbb{Q}_p$  (28.6.1.23).

⌋

*Proof:* Cf. [?Kot90] Section 3. ?

□

### Kottwitz-Triples of Virtual Abelian Varieties

**Def. (30.5.3.5) [PEL-type Abelian Varieties].** For a rational PE-structure as in (30.5.0.2) and  $c \in \mathbb{Q}$ ,  $n \in \mathbb{Z}_+$ , let  $\mathcal{V}_{n,c,E,\text{polar}}^G$  be the full sub-category of  $\mathcal{V}_{n,c,E,\text{polar}}$  consisting of objects  $(A, \iota, \lambda)$  s.t.

- There is an  $\mathbf{A}_f^p$ -isomorphism

$$(H_1(\bar{A}, \mathbf{A}_f^p), (-, -)_\lambda) \cong (V, \langle -, - \rangle) \otimes \mathbf{A}_f^p$$

which is  $E$ -invariant and preserves the alternating form up to a scalar.

- There is a  $\mathbb{Q}_{p^n}$ -linear isomorphism

$$(H_1(A/\mathbb{Z}_{p^n})[\frac{1}{p}], (-, -)_\lambda) \cong (V, \langle -, - \rangle) \otimes \mathbb{Q}_{p^n}.$$

⌋

*Proof:* Cf.[Zhu20]P10.?

□

**Prop.(30.5.3.6) [Geometric Kottwitz-Triples].** For any  $c \in \mathbb{Q}, n \in \mathbb{Z}_+$  and  $(A, \iota, \lambda) \in \mathcal{V}_{n,c,E,\text{polar}}^G$  (30.5.3.5), we can translate  $\pi_A^{-1}$  to an element  $\gamma \in G(\mathbf{A}_f^p)$ , and translate  $\varphi_{\text{crys}}$  to a  $\varphi$ -linear automorphism on  $V \otimes \mathbb{Q}_{p^n}$  of the form  $\delta \circ \varphi$  for some  $\delta \in G(\mathbb{Q}_{p^n})$ . The conjugacy class of  $\gamma$  and the  $\varphi$ -conjugacy of  $\delta$  is independent of the isomorphisms in (30.5.3.5)?. And we know the similitude  $\nu(\gamma) = c^{-1}$ ?

And we denote  $\mathcal{V}_{n,c}^{(G,h^{-1})}$  the full sub-category of  $\mathcal{V}_{n,c,E,\text{polar}}^G$  consisting of objects whose associated  $\delta$  as above satisfies  $\kappa_{G_{\mathbb{Q}_p}}(\delta) = (\mu_h)_*(-1) \in \pi_1(G)_{\text{Gal}_{\mathbb{Q}_p}}$  (28.6.1.7), where  $\mu_h \in X_\bullet(G)$  is the Hodge cocharacter associated to  $h: \mathbb{S} \rightarrow G_{\mathbb{R}}$ .

Then for any  $(A, \iota, \lambda) \in \mathcal{V}_{n,c}^{(G,h^{-1})}$ , the stable-conjugacy class of  $\gamma$  contains some  $\gamma_0 \in G(\mathbb{Q})$ , and  $(\gamma, \gamma_0, \delta)$  is a  $\mathbb{F}_{p^n}$ -Kottwitz-triple for  $G$  (30.5.3.2), called the **geometric Kottwitz-triples** associated to  $(A, \iota, \lambda)$ .  $\lrcorner$

*Proof:* Cf.[Kot92]Section14 and [Zhu20]P10.  $\square$

**Thm.(30.5.3.7) [Characterizing geometric Kottwitz-Triples, Kottwitz92, Lemma18.1].**

$(\gamma_0, \gamma, \delta) \in \text{KT}_p(G, \mathcal{N})$  (30.5.3.2) is geometric (30.5.3.6) iff

- The similitude factor  $\nu(\gamma_0)$  equals  $c^{-1}$ .
- $\alpha(\gamma_0, \gamma, \delta) = 1$  (30.5.3.3).
- There is a lattice  $\Lambda \subset V \otimes \mathbb{Q}_{p^n}$  s.t.  $\Lambda \subset (\delta\sigma)\Lambda$ .

□

*Proof:* Cf.[Zhu20]P11.  $\square$

**Prop.(30.5.3.8) [From Virtual Abelian Varieties to Kottwitz-Triples].** For each  $c \in \mathbb{Q}$  and  $n \in \mathbb{Z}_+$ , denote by  $\mathcal{I}_{n,c}$  the isomorphism classes of elements in  $\mathcal{V}_{n,c}^{(G,h^{-1})}$  (30.5.3.6), and  $\mathcal{I}_n \triangleq \coprod_{c \in \mathbb{Q}} \mathcal{I}_{n,c}$ .

Let  $(\gamma_0, \gamma, \delta) \in \text{KT}_p(G, \mathcal{N}; j)$  be geometric (30.5.3.6), then  $(\gamma_0, \gamma, \delta)$  is associated to exactly  $\#\text{III}(I_0/\mathbb{Q})$ -many non-isomorphic elements  $(A_i, \iota_i, \lambda_i) \in \mathcal{V}_{f(\mathfrak{p})}^{(G,h^{-1})}$ .  $\lrcorner$

*Proof:* Cf.[Kot92]Section17 and P441.?

□

#### 4 Unstabilized Langlands-Kottwitz Formulas

**Def.(30.5.4.1).** For a neat compact open subgroup  $\mathcal{K}^p \leq G(\mathbf{A}_f^p)$ , denote  $\mathcal{H}_{\mathcal{K}^p, \xi} \triangleq \mathcal{H}_{\mathcal{K}^p}(G(\mathbf{A}_f^p); L(\xi))$ .

For  $j \in \mathbb{Z}_+$  and  $f^{p,\infty} \in \mathcal{H}_{\mathcal{K}^p, \xi}$ , defined the Euler-characteristic

$$\text{Tr}(j, f^{p,\infty}) \triangleq \text{Tr} \left( \sigma_{\mathfrak{p}}^j \times f^{p,\infty} \middle| \left[ H_{\text{ét},c}^*((\mathcal{S}_{\mathcal{K}^p})_{\overline{E}}, \mathcal{L}_{\mathcal{K}^p}) \right] \right) \cong \text{Tr} \left( \sigma_{\mathfrak{p}}^j \times f^{p,\infty} \middle| \left[ H_{\text{ét},c}^*((\mathcal{S}_{\mathcal{K}^p})_{\overline{E}}, \mathcal{L}_{\mathcal{K}^p}) \right] \right) \in L(\xi)_{\lambda}.$$

And for  $g \in G(\mathbf{A}_f^p)$ , denote  $\text{Tr}(j, g) \triangleq \text{Tr}(j, \mathbf{1}_{\mathcal{K}^p g^{-1} \mathcal{K}^p})$ .  $\lrcorner$

**Prop.(30.5.4.2).** Situation as in (30.5.4.1), denote  $\mathcal{K}_g^p = \mathcal{K}^p \cap g \mathcal{K}^p g^{-1}$ , then there is a correspondence

$$\begin{array}{ccc} & (\mathcal{S}_{\mathcal{K}_g^p})_{\overline{\kappa(\mathfrak{p})}} & \\ \text{Fr}_{\mathcal{S}_{\mathcal{K}^p/\kappa(\mathfrak{p})}}^j \circ [\cdot 1] \swarrow & & \searrow [\cdot g] \\ (\mathcal{S}_{\mathcal{K}^p})_{\overline{\kappa(\mathfrak{p})}} & & (\mathcal{S}_{\mathcal{K}^p})_{\overline{\kappa(\mathfrak{p})}} \end{array} \quad (30.5.0.2)$$

and a cohomological correspondence(9.6.1.7).

$$u(j, g) : [\cdot 1]^* \left( \mathrm{Fr}_{\mathcal{S}_{\mathcal{K}^p}/\kappa(\mathfrak{p})}^j \right)^* \mathcal{L}_{\mathcal{K}^p} \cong [\cdot 1]^* \mathcal{L}_{\mathcal{K}^p} \cong \mathcal{L}_{\mathcal{K}_g^p} \cong [\cdot g]^* \mathcal{L}_{\mathcal{K}^p} \text{ (28.5.1.8)}.$$

where  $u(j, g)_1, u(j, g)_2$  are finite étale.

Then we have

$$\mathrm{Tr}(j, g) = \mathrm{Lef}(u(j, g)) = \mathrm{Tr} \left( u(j, g)^* \left| \left[ H_{\mathrm{ét}, c}^* \left( (\mathcal{S}_{\mathcal{K}^p})_{\overline{\kappa(\mathfrak{p})}}, \mathcal{L}_{\mathcal{K}^p} \right) \right] \right. \right) \text{ (9.6.1.14)(28.5.1.8)}.$$

┘

*Proof:* This is basically the definition of the Hecke action and Galois action on cohomology of Shimura varieties, by using the unramified comparison isomorphism(9.4.6.36).  $\square$

### Fixed Points

**Prop. (30.5.4.3) [Lefschetz-Verdier Trace Formula].** Situation as in(30.5.4.2), by(9.6.1.25), when  $j$  is sufficiently large,

$$\mathrm{Fix}(j, g) = \left\{ x \in (\mathcal{S}_{\mathcal{K}^p})_{\overline{\kappa(\mathfrak{p})}} : u(j, g)_1(x) = u(j, g)_2(x) \right\} \in \mathrm{Sch}/\overline{\kappa(\mathfrak{p})}$$

is Artinian, and we have

$$\mathrm{Lef}(u(j, g)) = \sum_{x \in |\mathrm{Fix}(j, g)|_0} \mathrm{tr}(u(j, g)_x) \text{ (9.6.1.14)(9.6.1.19)},$$

┘

**Prop. (30.5.4.4) [Fixed Points and Virtual Abelian Varieties].** Situation as in(30.5.4.3), denote  $n = j \deg(\mathfrak{p})$ . Then any  $x \in \mathrm{Fix}(j, g)$ (30.5.4.3) is represented by an object  $(\overline{A}, \iota, \lambda, \overline{\eta}) \in \mathcal{S}_{\mathcal{K}^p}(\kappa(\mathfrak{p}))$ (30.5.2.1) s.t. there is an isomorphism

$$u : (\overline{A}, \iota, \lambda, \overline{\eta}) \cong (\varphi^n)^*(\overline{A}, \iota, \lambda, \overline{\eta}) \in \mathcal{S}_{\mathcal{K}^p}(\overline{\kappa(\mathfrak{p})}). \text{ ?}$$

Thus  $X = (\overline{A}, \iota, \lambda, u) \in \mathcal{V}_{n, c, E, \mathrm{polar}} \text{ (30.5.1.9)}$ . In fact,  $X \in \mathcal{V}_{n, c}^{(G, h^{-1})} \text{ (30.5.3.6)}$ , and the isomorphism class of  $X$  only depends on  $x$ . So we get a map

$$\mathbf{f} : \mathrm{Fix}(j, g) \rightarrow \mathcal{I}_{f(\mathfrak{p})j} \text{ (30.5.3.8)}.$$

┘

*Proof:* Cf.[Kot92]P430-431. ?  $\square$

**Prop. (30.5.4.5) [From Fixed Points to Virtual Abelian Varieties].** Situation as in(30.5.4.4), for  $x \in |\mathrm{Fix}(j, g)|_0$ , let  $(\gamma_0, \gamma, \delta) \in \mathrm{KT}_p(G, \mathcal{N}, j)$  be the Kottwitz-triple associated to  $\mathbf{f}(x)$ (30.5.4.4)(30.5.3.6), then

$$\mathrm{Orb}(\gamma_0, \gamma, \delta) = \# \mathbf{f}^{-1}(\mathbf{f}(x)) \text{ (29.2.4.2)}.$$

Moreover,  $\mathrm{tr}(u(j, g)_x) = \mathrm{tr}(\xi(\gamma_0)) \text{ (30.5.4.3)}$ .

┘

*Proof:* Cf.[Kot92]Section16.?

□

**Thm. (30.5.4.6) [Unstabilized Langlands-Kottwitz Formulaa, Kottwitz].** For a neat compact open subgroup  $\mathcal{K}^p \leq G(\mathbf{A}_f^p)$  and  $g \in G(\mathbf{A}_f^p)$ , let  $f^{p,\infty}$  be the characteristic function of  $\mathcal{K}^p g^{-1} \mathcal{K}^p$ , then for  $j$  sufficiently large, we have

$$\begin{aligned} \frac{\text{Tr}(j, f^{p,\infty})}{\#\text{III}(\mathbb{Q}, G)} &= \text{Tr}'(j, f^{p,\infty}) \\ &\triangleq \sum_{\substack{(\gamma_0, \gamma, \delta) \in \text{KT}_p(G, \mu; j) \\ \alpha(\gamma_0, \gamma, \delta) = 1}} c(\gamma_0, \gamma, \delta) \text{Orb}_\gamma(f^p) \text{TOrb}_\delta(\phi_{j \deg(p)}) \text{tr}(\xi(\gamma_0)) \end{aligned} \quad (9.8.3.28)(29.2.4.2)(29.2.4.3)(30.5.3.3),$$

and there are only f.m. non-zero terms. ⌋

*Proof:* It follows from(30.5.4.2)(30.5.4.3) that when  $j$  is sufficiently large, we have

$$\text{Tr}(j, g) = \sum_{x \in |\text{Fix}(j, g)|_0} \text{tr}(u(j, g)_x),$$

which by(30.5.4.5) equals

$$\sum_{(A, \iota, \lambda) \in \mathcal{I}_n} \text{Orb}(\gamma_0, \gamma, \delta) \text{tr}(\xi(\gamma_0)) = \sum_{(A, \iota, \lambda) \in \mathcal{I}_n} c(\gamma_0, \gamma, \delta) \text{Orb}_\gamma(f^p) \text{TOrb}_\delta(\phi_n) \text{tr}(\xi(\gamma_0)),$$

which by(30.5.3.8) equals

$$\sum_{(\gamma_0, \gamma, \delta) \text{ geometric}} \#\text{III}(I_0/\mathbb{Q}) \# \ker(\text{III}(I_0/\mathbb{Q}) \rightarrow \text{III}(G/\mathbb{Q})) c(\gamma_0, \gamma, \delta) \text{Orb}_\gamma(f^p) \text{TOrb}_\delta(\phi_n) \text{tr}(\xi(\gamma_0)).$$

By(29.2.4.4), only geometric  $\mathbb{F}_{p^{j \deg(p)}}$ -Kottwitz-triples  $(\gamma_0, \gamma, \delta)$  contributes to  $\text{Tr}'(j, f^{p,\infty})$ , so it suffices to prove that

$$\#\text{III}(I_0/\mathbb{Q}) \# \ker(\text{III}(I_0/\mathbb{Q}) \rightarrow \text{III}(G/\mathbb{Q})) = \#\text{III}(G/\mathbb{Q}).$$

But  $\text{III}(I_0/\mathbb{Q}) \rightarrow \text{III}(G/\mathbb{Q})$  is a homomorphism of Abelian groups( ? Cf.[Kot84]), so it suffices to prove  $\text{III}(I_0/\mathbb{Q}) \rightarrow \text{III}(G/\mathbb{Q})$  is surjective, which follows from[Kot92]Section7?.

The fact that there are only f.m. non-zero terms can also be proven directly analogous to Prop8.2. of[Kot86].? □

### Abelian-Type Shimura-Varieties

It is shown in [L-R87] that the Langlands-Rapoport conjecture describing hyperspecial reduction of Shimura varieties imply the unstabilized Langlands-Kottwitz formula. Langlands-Rapoport conjecture has been proved by Kisin in [Mod  $p$  points on Shimura varieties of abelian type], and the construction of trace formula is carried out in [stable trace formula for certain Shimura varieties of abelian type, Kisin-Shin-Zhu].

## 5 Stabilization of Langlands-Kottwitz Formulae

References are [Kottwitz, Shimura Varieties and  $\lambda$ -adic Representations].

**Notation (30.5.5.1).**

- Notice when  $G = \mathrm{GU}(V)$ , the maximal split central torus of  $G_{\mathbb{R}}$  is split over  $\mathbb{Q}$ .?
- Notice when  $G = \mathrm{GU}(V)$ ,  $[G, G]$  is simply-connected and  $[H, H]$  is simply-connected for any elliptic endoscopic triple  $(H, s, \eta)$  over  $\mathbb{Q}$  or  $\mathbb{Q}_v$  for each  $v \in \Sigma_{\mathbb{Q}}$  (29.2.1.4).? ┘

### Langlands-Shelstad Transfers

**Def. (30.5.5.2) [Archimedean Langlands-Shelstad Transfer].** Let  $G \in \mathcal{R}\mathrm{edGrp}/\mathbb{Q}$  and  $(H, s, \eta) \in \mathfrak{E}_{\infty}(G)$  (29.2.1.4).

Fix the choice of  $(j, B_{G,H})$  as above?, and fix a Haar measure on  $H(\mathbb{R})$ , define

$$f_{H,\infty} \triangleq (-1)^{q(G_{\mathbb{R}})} \langle \mu_{T_G}, s \rangle_j \sum_{\varphi \in \Phi_H(\varphi_{\xi}^*)} \det(\omega_*(\varphi_H)) f_{\varphi_H}.$$

┘

**Def. (30.5.5.3) [Adelic Langlands-Shelstad Transfer away from  $p, \infty$ ].** Let  $G \in \mathcal{R}\mathrm{edGrp}/\mathbb{Q}$  and  $(H, s, \eta) \in \mathfrak{E}(G)$  (29.2.1.4). For  $\mathcal{K}^p \leq G(\mathbf{A}_f^p)$  and  $f^{p,\infty} \in \mathcal{H}_{\mathcal{K}^p}(G(\mathbf{A}_f^p))$ , suppose

- An elliptic maximal torus of  $G_{\mathbb{R}}$  comes from  $H_{\mathbb{R}}$  (29.2.1.27),
- $H$  is unramified over  $\mathbb{Q}_p$ ,
- Fix a Haar measure on  $G(\mathbf{A}_f^p)$  neutralized by  $\mathcal{K}^p$ ,
- Fix a Haar measure on  $H(\mathbf{A}_f^p)$  s.t. its product with the chosen Haar measure on  $H(\mathbb{R})$  (30.5.5.2) and the Haar measure on  $H(\mathbb{Q}_p)$  neutralized by a hyperspecial maximal subgroup is equal to the Tamagawa-measure on  $H(\mathbf{A})$  (20.5.4.5).

Define  $f_H^{p,\infty}$  to be the Langlands-Shelstad transfer of  $f^{p,\infty}$  to  $H(\mathbf{A}_f^p)$  as in (29.2.1.25). ┘

**Def. (30.5.5.4) [Langlands-Shelstad Transfer at  $p$ ].** ┘

### Stabilized Langlands-Kottwitz Formulae

**Thm. (30.5.5.5) [Stabilized Langlands-Kottwitz Formulae, Kottwitz].** Situation as in (30.5.4.6), for  $j$  sufficiently large, we have

$$\mathrm{Tr}'(j, f^{p,\infty}) = \sum_{(H,s,\eta) \in \mathfrak{E}(G)} i(G, H) \mathrm{STr}_{\mathrm{ell}}^{H,*}(f_H) (29.2.1.4)(29.2.1.8)(29.2.5.1).$$

where for each  $(H, s, \eta) \in \mathfrak{E}(G)$ ,  $f_H = 0$  unless an elliptic maximal torus of  $G_{\mathbb{R}}$  comes from  $H_{\mathbb{R}}$  (29.2.1.27) and  $H$  is unramified over  $\mathbb{Q}_p$ , in which case

$$f_H = f_{H,\infty} f_{H,p} f_H^{p,\infty} \in \mathcal{T}(H(\mathbf{A}), \mathbb{C}) (30.5.5.2)(30.5.5.3)(30.5.5.4).$$

(Notice that  $f_{H,\infty}$  is not compactly supported, but it has compact support modulo center and transforms under the split component of the center by a character, so  $\mathrm{STr}_{\mathrm{ell}}^{H,*}(\Phi^H)$  (29.2.5.1) is still definable?). ┘

*Proof:* ? Cf.[Kottwitz90]Thm7.2.

By(30.5.4.6) and(29.2.4.3), we have

$$\mathrm{Tr}'(j, f^{p,\infty}) = \sum_{\substack{(\gamma_0, \gamma, \delta) \in \mathrm{KT}_p(G, \mathcal{N}, j) \\ \alpha(\gamma_0, \gamma, \delta) = 1}} \frac{\tau(G) \# \mathfrak{K}(I_0)}{\mathrm{Vol}(A_G \backslash I(\mathbb{R}))} \mathrm{Orb}_\gamma(f^p) \mathrm{TOrb}_\delta(\phi_n) \mathrm{tr}(\xi(\gamma_0)) \quad (30.5.3.2)(30.5.3.3).$$

Denote  $e(\delta) \triangleq e(I_{\mathbb{Q}_p})$ ,  $e(\gamma_0) \triangleq e(I_{\mathbb{R}})$ ,  $e(\gamma) \triangleq \prod_{v \in \Sigma_{\mathbb{Q}}^{\mathrm{fin}} \setminus \{p\}} e(I_v)$  (29.2.4.5)(30.5.3.4), then

$$e(\delta)e(\gamma_0)e(\gamma) = e(I) = 1$$

(? Cf.[?Kot83]). Then

$$\begin{aligned} \mathrm{Tr}'(j, f^{p,\infty}) &= \tau(G) \sum_{(\gamma_0, \gamma, \delta)} \frac{\# \mathfrak{K}(I_0)}{e(\gamma_0) \mathrm{Vol}(A_G \backslash I(\mathbb{R}))} \mathrm{Orb}_\gamma(f^p) \mathrm{TOrb}_\delta(\phi_n) \mathrm{tr}(\xi(\gamma_0)) \\ &= \tau(G) \sum_{\gamma_0} \sum_{\kappa \in \mathfrak{K}(I_0/\mathbb{Q})} \frac{\mathrm{tr}(\xi(\gamma_0))}{e(\gamma_0) \mathrm{Vol}(A_G \backslash I(\mathbb{R}))} \sum_{(\gamma, \delta)} e(\gamma) e(\delta) \mathrm{Orb}_\gamma(f^{p,\infty}) \mathrm{TOrb}_\delta(\phi_n) \langle \alpha(\gamma_0, \gamma, \delta), \kappa \rangle \quad (29.2.1.2), \end{aligned}$$

where

- $\gamma_0$  runs through a set of representatives for the  $\mathbb{R}$ -elliptic stable-conjugacy classes in  $G(\mathbb{Q})$ .
- $\gamma$  runs through a set of representatives for the conjugacy classes in  $G(\mathbf{A}_f^p)$  that are stably conjugate to  $\gamma_0$ .
- $\delta$  runs through a set of representatives for the  $\sigma$ -conjugacy classes of  $G(\mathbb{Q}_{p^n})$  s.t.  $\mathfrak{N}_\sigma(\delta)$  is conjugate to  $\gamma_0$ .

And this summation has only f.m. non-zero terms by(30.5.4.6) and(29.2.1.2). □

## Unitary Shimura Varieties

For unitary Shimura varieties, Cf.[Construction of automorphic Galois representations, 1, Clozel-Harris-Labesse](4.3.5).

## 6 Destabilization of Langlands-Kottwitz Formulae

Destabilizing the stabilized Langlands-Kottwitz formula(30.5.5.5) means expanding the right hand side of(30.5.5.5) in terms of automorphic representations, and then rewriting everything in terms of  $G$  alone, so that the endoscopic groups  $H$ s no longer appear. In this way, one would obtain a description of the cohomology of the Shimura variety in terms of the conjectural relation between Galois representations and automorphic representations

[?Kot90]Chap9-10 outlined a way to destabilize the Langlands-Kottwitz formula, assuming Arthur's multiplicity conjectures(29.8.1.1) and some related hypotheses on the stable trace formula. Cf.[Morel, On the cohomology of certain noncompact Shimura varieties], [Galois representations arising from some compact Shimura varieties, Shin], [Construction of automorphic Galois representations, 1, Clozel-Harris-Labesse], [stabilization of the Frobenius-Hecke traces on the intersection cohomology of orthogonal Shimura varieties, Yihang Zhu].

## 7 beyond Compact Hyperspecial cases

In the non-compact case, the intersection cohomology of the Baily–Borel compactification turns out to be the correct object to compare with Arthur–Selberg trace formulas. Cf. [Morel, On the cohomology of certain noncompact Shimura varieties] and [stabilization of the Frobenius–Hecke traces on the intersection cohomology of orthogonal Shimura varieties, Yihang Zhu], [Galois representations arising from some compact Shimura varieties, Shin], [geometry and cohomology of some simple Shimura varieties, Harris–Taylor].

## 30.6 Cohomology of Unitary Shimura Varieties

References are [Sch15], [On the Generic Part of the Cohomology of Compact Unitary Shimura Varieties, Caraiani-Scholze], [On the Generic Part of the Cohomology of Non-Compact Unitary Shimura Varieties, Caraiani-Scholze].

### 1 Perfectoid Siegel Spaces

References are [?, Torsion in the Cohomology of Locally Symmetric Varieties, Scholze]

Geometric points of  $\mathcal{F}l$  are in bijection with principally polarized  $p$ -divisible groups  $G/\mathcal{O}_C$  with a trivialization of their Tate module.

On geometric points, the Hodge-Tate map is the map sending an Abelian variety over  $\mathcal{O}_C$  to its associated  $p$ -divisible group.

### 2 Hodge-Tate Period Map

Given a  $(G, X)$  be a Shimura datum?, there is a flag variety we can define an **Borel embedding**

$$\beta : X \rightarrow \text{Flag}_{G,\mu}(\mathbb{C}) : [\mu] \in X \mapsto \text{Fil}^\bullet(\mu).$$

where  $\mu$  is the  $X$  is defined over a number field  $E$ , called the reflex field of  $X$ , where  $\text{Fil}^p(\mu)$  for any representation is the direct sum of all subspaces of the type  $(p', q')$  with  $p' \geq p$ .

Choose a Hodge cocharacter  $\mathbb{G}_m \rightarrow G_{\mathbb{C}}$ .

Then  $P_\mu^{std}$  can be defined to be the subgroup of  $G$  stabilizing  $\text{Fil}^\bullet(\mu)$ , which is a parabolic subgroup.?. And dually, we can define  $\text{Fil}_\bullet(\mu)$  and  $P_\mu$  the stabilizer of  $\text{Fil}_\bullet(\mu)$ .

$M_\mu = C_G(\mu)$  is the Levi component of both parabolics.

Let  $Fl_{G,\mu}^{std}(\mathbb{C}) = G(\mathbb{C})/P_\mu^{std}(\mathbb{C})$ , then there is a Borel embedding  $X \hookrightarrow Fl_{G,\mu}^{std}(\mathbb{C})$ .

**Example (30.6.2.1) [Siegel Varieties].** A Shimura variety of Hodge Type can be regarded as a moduli space for Abelian varieties with certain Hodge-tensors?.  $\lrcorner$

For the Siegel variety  $V$ , the flag variety  $Fl_{\tilde{G},\tilde{\mu}}$  parametrizes totally isotropic subspaces  $W \subset V$ ?. [Ana-Scholze]P11.

For  $p \in \mathbf{P}$ , consider compact open subgroups of the form  $K = K^p \times K_p \subset G(\mathbf{A}^{p\infty}) \times G(\mathbb{Q}_p)$ .

Fix a place  $\mathfrak{p} \in \Sigma_E^p$ , let  $\mathcal{F}\mathcal{L}_{G,\mu}$  be the adic space associated with  $\mathcal{F}l_{G,\mu} \times_E E_{\mathfrak{p}}$ ?.

**Prop. (30.6.2.2) [Hodge-Tate Period Map].** For a Shimura datum of Hodge type  $(G, X)$  and any sufficiently small tame level  $K^p \subset G(\mathbf{A}^{p\infty})$ , there exists a perfectoid space  $\mathcal{S}_{K^p}$  s.t.

$$\mathcal{S}_{K^p} \sim \varprojlim_{K_p} (S_{K^p K_p} \otimes_E E_{\mathfrak{p}})^{\text{ad}},$$

and there is a  $G(\mathbb{Q}_p)$ -equivariant **Hodge-Tate period map**

$$\pi_{\text{H-T}} : \mathcal{S}_{K^p} \rightarrow \mathcal{F}\mathcal{L}_{\tilde{G},\tilde{\mu}}$$

which is equivariant w.r.t the natural Hecke action? of  $G(\mathbf{A}^{p\infty})$  on the inverse system  $\mathcal{S}_{K^p}$  and the trivial action of  $G(\mathbf{A}^{p\infty})$  on  $\mathcal{F}\mathcal{L}_{\tilde{G},\tilde{\mu}}$ .  $\lrcorner$

*Proof.* Cf. [Scholze, coh of symmetric spaces] or [S-Weinstein]  $\square$

**Remark (30.6.2.3).** This Hodge-Tate map is a  $p$ -adic analogue of the Borel embedding, and on closed points it maps an Abelian variety to its Hodge-Tate filtration of its Tate module  $?$ .  $\lrcorner$

**Prop. (30.6.2.4) [Hodge-Tate Period Map].**

- The Hodge-Tate period map (30.6.2.2) factors through  $\mathcal{GL}_{G,\mu}$  and the resulting map

$$\pi_{\text{H-T}} : \mathcal{S}_{K^p} \rightarrow \mathcal{GL}_{G,\mu}$$

is independent of the choice of the embedding of Shimura data.

- For any  $\mu$  in the given conjugacy class defined over a finite extension of  $E$ , the tensor functor

$$\begin{aligned} f_p : \text{Rep}(M_\mu) &\xrightarrow{\text{pr}^*} \text{Rep}(P_\mu) \rightarrow \{G(\mathbb{Q}_p) - \text{equivariant vector bundles on } \mathcal{FL}_{G,\mu}\} \\ &\xrightarrow{\pi_{\text{H-T}}^*} \{G(\mathbb{Q}_p) - \text{equivariant vector bundles on } \mathcal{S}_{K^p}\} \end{aligned}$$

is isomorphic to the tensor functor

$$f_\infty : \text{Rep}(M_\mu) \xrightarrow{\text{pr}^*} \text{Rep}(P_\mu^{\text{std}}) \rightarrow \{\text{automorphic bundles on } S_K\} \rightarrow \{G(\mathbb{Q}_p) - \text{equivariant vector bundles on } \mathcal{S}_K\}$$

and this isomorphism is independent of the choice of Siegel embedding, and also equivariant for the Hecke action of  $G(\mathbf{A}^{p\infty})$ .  $\lrcorner$

### 3 Newton Stratification on the Flag Variety

### 4 Geometry of Newton Strata and Igusa Varieties

**Def. (30.6.4.1) [ $\mathcal{J}_{\text{Mant}}$ ].** The **Igusa variety**  $\mathcal{J}_{\text{Mant}}$  is defined to be the projective system of  $\overline{\mathbb{F}}_p$ -schemes  $(\mathcal{J}_{\text{Mant}, K^p, m}^b)_{K^p \rightarrow 0, m \in \mathbb{Z}_+}$ .  $\lrcorner$

**Prop. (30.6.4.2) [Igusa and Manton Varieties].** The perfect scheme  $\text{Ig}^b$  is the perfection of  $\mathcal{J}_{\text{Mant}}^b$ , via the natural map  $\text{Ig}^b \rightarrow \mathcal{J}_{\text{Mant}}^b$ .  $\lrcorner$

### 5 Cohomology of Igusa Varieties

We need to compute the alternating sum of cohomology groups  $[H(\mathcal{Ig}^b, \overline{\mathbb{Q}}_\ell)]$  as a virtual representation of  $G(\mathbf{A}^{p\infty}) \times J_b(\mathbb{Q}_p)$ .

It is enough to work with the classical object  $\mathcal{J}_{\text{Mant}}^b$ , because of (30.6.4.2) and the fact perfection doesn't change the étale topos  $?$ . And by Poincaré duality, it suffices to compute  $[H_c(\mathcal{Ig}^b, \overline{\mathbb{Q}}_\ell)]$ . Sug Woo Shin has a formula expressing this as a sum of stable orbital integrals for  $G$  and its elliptic endoscopic groups  $?$ .

**Notation (30.6.5.1).**

- Let  $F = F^+ \mathcal{K}$ , where  $F^+$  is a totally real field and  $\mathcal{K}$  is an imaginary quadratic field.
- Let  $G/\mathbb{Q}$  be a unitary similitude group preserving an alternating Hermitian form  $\langle -, - \rangle$  on  $V \in \text{Vect}_F^n$ .
- Let  $(G, [h])$  be the Shimura datum with reflex field  $E$ .

- Let  $\mathrm{Spl}_{F/F^+/\mathbb{Q}} = \{p \in \mathbf{P} : \forall v \in S(p) \subset \Sigma_{F^+}, v \text{ splits in } F\}$ .
- Let  $p \in \mathbf{P}$  be unramified in  $F$  and splits in  $\mathcal{K}$ .
- Let  $\mathfrak{p} \in S_E(p)$ .
- Let  $\mathcal{K} = \mathcal{K}^p \mathcal{K}_p \in G(\mathbf{A}^{p\infty}) \times G(\mathbb{Q}_p)$  be a compact open subgroup where  $K_p$  is hyperspecial<sup>?</sup>. The fact that  $p$  is unramified in  $F$  means that  $S_K$  has good reduction with integral model  $\mathcal{S}_K/\mathcal{O}_{E_p}$ .
- If  $G$  be a topological group, denote  $\mathrm{Irr}^{\mathrm{adm}}(G)$  the set of isomorphism classes of irreducible admissible representations of  $G$ , and  $\mathrm{Groth}(G)$  the corresponding Grothendieck group.<sup>?</sup>

┘

**Notation (30.6.5.2).** For  $F \in \mathbf{NField}$ , define  $\ker^1(F, G) = \ker(H^1(F, G) \rightarrow \prod_{v \in \Sigma_F} H^1(F_v, G))$ . ┘

Let  $K \in p\text{-}\mathbf{LField}$ , and  $G$  is an unramified group over  $K$ . Choose a hyperspecial group  $\mathcal{K} \subset G(K)$ , and a Haar measure of  $G(K)$  s.t.  $\mathrm{Vol}(\mathcal{K}) = 1$ . Let  $\mathcal{H}^{\mathrm{ur}}(G(K))$  be the subspace of  $C_c^\infty(G(K))$  consisting of bi- $\mathcal{K}$ -invariant functions.

**Def. (30.6.5.3) [Setup].** Suppose some technical conditions:

- all  $p \in \mathbf{Prime}$  ramified in  $F$  are contained in  $\mathrm{Spl}_{F/F^+/\mathbb{Q}}$ .
- $G$  is quasi-split in all finite places.

┘

**Remark (30.6.5.4).** These follows from [Compact Unitary at Ramified Split Places, SS13]Chap10.<sup>?</sup> ┘

**Def. (30.6.5.5) [Endoscopic Triples].** For notation of Langlands dual, Cf. [Borel, Automorphic L-functions, 79]<sup>?</sup>. An **endoscopic triple** for  $G$  is a triple  $(H, s, \eta)$  where

- $H/F$  is a quasi-split connected reductive group,
- $s \in Z(\widehat{H})$ ,
- $\eta : \widehat{H} \rightarrow \widehat{G}$  is an embedding of complex Lie groups.
- $\eta(\widehat{H}) = Z_{\widehat{G}}(\eta(s))^0$ .
- The  $\widehat{G}$ -conjugacy classes of  $\eta$  is fixed by  $\mathrm{Gal}_F$ .
- 

Cf. [Stable Trace Formula for Igusa Varieties, Shin].

### 1 Artin $L$ -Functions

References are [Functional Equation of the Artin  $L$ -Functions, Langlands], [[Del73](#), [Neu99](#), [GGP12](#)].

**Def.(31.1.1.1)[ $L$ -Factors for Quasi-characters].** For  $v \in \Sigma_F$  and quasi-character  $\chi_v$  of  $F_v$ , the local  $L$ -factors for  $v \in \Sigma_F$  and  $s \in \mathbb{C}$  are defined to be

$$L(\chi_v; s) = \begin{cases} (1 - \chi_v(\varpi) \|v\|^{-s})^{-1} & , v \in \Sigma_F^{\mathrm{fin}}, \chi_v \text{ unramified} \\ 1 & , v \in \Sigma_F^{\mathrm{fin}}, \chi_v \text{ ramified} \\ L_{\mathbb{R}}(s + \nu + \epsilon)(\text{12.6.1.19}) & , v \in \Sigma_F^{\mathbb{R}}, \chi_v(x) = |x|^\nu \mathrm{sgn}(x)^\epsilon, \nu \in \mathbb{C}, \epsilon \in \{0, 1\} \\ L_{\mathbb{C}}(s + \nu + \frac{|k|}{2})(\text{12.6.1.19}) & , v \in \Sigma_F^{\mathbb{C}}, \chi_v(x) = |x|^\nu e^{ik \arg(x)}, \nu \in \mathbb{C}, k \in \mathbb{Z} \end{cases}.$$

And the local  $\epsilon$ -factors are defined to be

$$\epsilon_v(\chi_v, \psi_v; s) = \begin{cases} \text{Cf. [Tate's Thesis] ?} & , v \in \Sigma_F^{\mathrm{fin}} \\ i^\epsilon & , v \in \Sigma_F^{\mathbb{R}} \\ i^{|k|} & , v \in \Sigma_F^{\mathbb{C}} \end{cases}$$

By([24.6.2.1](#)), these are all the representations.

┘

**Thm. (31.1.1.2)[Root Numbers for Weil Representations, Langlands/Deligne[Del73]].** Let  $\mathbf{1} \neq \psi_K \in K^\vee$ , then there exists a unique way to assign to each separable extension  $L/K$  a complex number  $\lambda(L/K, \psi_K)$  and to each  $(\rho, V) \in \mathcal{R}\text{ep}^{\text{fd}}(W_L)$  a number  $\epsilon(\rho, \psi_K \circ \text{tr}_{L/K})$  s.t.

- If  $\chi$  is a quasi-character of  $W_L$ , then  $\epsilon(\chi, \psi_K \circ \text{tr}_{L/K})$  agrees with local factors defined in (31.1.1.1).
- For  $\rho_1, \rho_2 \in \mathcal{R}\text{ep}^{\text{alg,fin}}(W_L)$ ,

$$\epsilon(\rho_1 \oplus \rho_2, \psi_K \circ \text{tr}_{L/K}) = \epsilon(\rho_1, \psi_K \circ \text{tr}_{L/K}) \epsilon(\rho_2, \psi_K \circ \text{tr}_{L/K})$$

- If  $K \subset_{\text{fin}} L$  and  $\rho \in \mathcal{R}\text{ep}^{\text{alg,fin}}(W_L)$ , then

$$\epsilon(\text{Ind}_K^L \rho, \psi_K) = \lambda(L/K, \psi_K)^{\dim V} \epsilon(\rho, \psi_K \circ \text{tr}_{L/K}).$$

┘

*Proof:* ? Cf.[Functional Equation for Artin  $L$ -Functions, Langlands] [Paskunas. Unicity of types for supercuspidal representations of  $\text{GL}_N$ ] and [Tate, Number Theoretical Background](not compatible).  
□

**Def. (31.1.1.3)[ $L, \epsilon$ -Factors for Weil-Deligne Representations, Deligne].** Let  $\mathbf{1} \neq \psi_K \in K^\vee$  and  $\rho = (\rho_0, N) \in \mathfrak{w}\mathfrak{d}(W_K)$ , define

- the **conductor(Weil-Deligne Representation)**

$$c(\rho) = c(\rho_0) + \dim(V^{I_K} / \ker(N)^{I_K}),$$

where  $c(\rho_0) \in \mathbb{N}$  is the Artin conductor of  $\rho_0$  (25.1.2.5).

- the local Artin  $L$ -factor

$$L(\rho; s) = \det\left(1 - q^{-s} \sigma_K | \ker(N)^{I_K}\right)^{-1}.$$

- the local  $\epsilon$ -factor

$$\epsilon(\rho, \psi_K; s) = q^{-(c(\rho) + n(\psi_K) \dim V)(s - \frac{1}{2})} \det\left(-q^{-s} \sigma_K | V^{I_K} / \ker(N)^{I_K}\right) \epsilon(\rho_0, \psi_K) \text{ (31.1.1.2)}.$$

Then they satisfy the following:

- For a quasi-character  $\chi$  of  $W_K$ ,  $\epsilon(\chi, \psi_K; s)$  agrees with local factors defined in (31.1.1.1).
- If  $K \subset_{\text{fin}} L$  and  $\rho \in \mathfrak{w}\mathfrak{d}(W_L)$ , then

$$\epsilon(\text{Ind}_K^L \rho, \psi_K; s) = \lambda(L/K, \psi_K)^{\dim V} \epsilon(\rho, \psi_K \circ \text{tr}_{L/K}; s) \text{ (31.1.1.2)}.$$

And we denote  $w(\rho, \psi_K) = \epsilon(\rho, \psi_K, 1/2)$ , called the **Weil-Deligne root numbers**.

┘

*Proof:* ? [Getz]P321 defined some different  $L$ -factor. □

**Cor. (31.1.1.4).**  $\epsilon(\rho(s), \psi_K; 0) = q^{-(c(\rho) + n(\psi_K) \dim V)s} \epsilon(\rho, \psi; 0)$ . ┘

**Def. (31.1.1.5)[Archimedean  $L$ -Factors].**

- For  $v \in \Sigma_F^{\mathbb{C}}$  and  $\rho = \chi_1 \oplus \dots \times \chi_n \in \mathcal{R}\text{ep}^{n, \text{ss}}(W_{F_v})$  where  $\sigma_i$  are quasi-characters of  $\mathbb{C}^\times$ , define

$$L_v(\rho; s) = \prod_i L(\sigma_i; s), \quad \epsilon_v(\rho, \psi_v; s) = \prod_i \epsilon_v(\rho, \psi_v; s) \text{ (31.1.1.1)}.$$

- For  $v \in \Sigma_F^{\mathbb{R}}$  and  $\rho = \sigma_1 \oplus \dots \oplus \sigma_n \in \text{Rep}^{n, \text{ss}}(W_{F_v})$  where  $\dim \sigma_i \leq 2$ , define

$$L_v(\rho; s) = \prod_i L_v(\sigma_i; s), \quad \epsilon_v(\rho, \psi_v; s) = \prod_i \epsilon_v(\sigma_i, \psi_v; s) \quad (31.1.1.1),$$

where

- If  $\sigma_i = \chi_{\nu, \epsilon}$  (24.6.2.4), define  $L_v(\sigma_i; s), \epsilon_v(\sigma_i; s)$  as in (31.1.1.1).
- If  $\sigma_i = \text{Ind}_{W_{\mathbb{C}}}^{W_{\mathbb{R}}} \chi_{\nu, k}$  (24.6.2.5), define  $L_v(\sigma_i; s) = L(\chi_{\nu, m}; s) = L_{\mathbb{C}}(s + \nu + \frac{k}{2})$  (31.1.1.1), and  
How about  $\epsilon$ -factors?

By (24.6.2.5), these are all representations of  $W_{F_v}$  with semisimple images.

┘

### (Conjugate)Self-Dual Weil-Deligne Representations

**Prop. (31.1.1.6) [(Conjugate)Self-Dual Weil Deligne Root Numbers].**

- If  $V \in \mathfrak{wd}(W_K)$  is self-dual with  $\det(V) = 1$ , then  $w(V; \psi_K)$  is independent of  $\psi_K$ , and satisfies  $\epsilon(V)^2 = 1$ .
- If  $V \in \mathfrak{wd}(W_K)$  is conjugate-self-dual and  $\psi_K^\sigma = \psi_K^{-1}$ , then  $\epsilon(V, \psi_K)^2 = 1$ . And if  $V = W + W^{\sigma_V}$ , then  $\epsilon(V, \psi_K) = 1$ .

┘

*Proof:* Cf. [GGP12] Prop 5.1.?

□

**Prop. (31.1.1.7) [(Conjugate)Orthogonal Weil Deligne Root Numbers].**

- If  $(\rho, V) \in \mathfrak{wd}(W_K)$  is orthogonal with  $\det(V) = 1$ , then  $w(V; \psi_K)$  is independent of  $\psi_K$ , and satisfies  $\epsilon(V)^2 = 1$ . And  $\epsilon(V) = 1$  iff  $\rho : W \rightarrow \text{SO}(V)$  lifts to a spin representation  $\rho : W \rightarrow \text{Spin}(V)$ .
- If  $V \in \mathfrak{wd}(W_K)$  is conjugate-orthogonal and  $\psi_K^\sigma = \psi_K^{-1}$ , then  $w(V; \psi_K)$  is independent of  $\psi_K$ , and satisfies  $\epsilon(V, \psi_K) = 1$ .

┘

*Proof:* Cf. [GGP12] Prop 5.2.?

□

### Artin L-Functions

**Def. (31.1.1.8) [Local Artin L-Factors, Artin [Art31]].** For  $L/F \in \text{GalField}$  and  $\rho \in \text{Rep}^{\text{fd}}(\text{Gal}(L/F))$  with character  $\chi$ , the local  $L$ -factors (31.1.1.3) are:

$$L_v(F, \rho; s) = \begin{cases} L(\rho|_{W_{F_v}}; s) & (31.1.1.3) \quad , v \in \Sigma_F^{\text{fin}} \\ L_{\mathbb{C}}(s)^{\chi(1)} & , v \in \Sigma_F^{\mathbb{C}} \\ L_{\mathbb{R}}(s)^{n_+} \cdot L_{\mathbb{R}}(s+1)^{n_-} & , v \in \Sigma_F^{\mathbb{R}} \quad (31.1.1.1) \end{cases}$$

where in the case  $v \in \Sigma_F^{\mathbb{R}}$ , choose  $w|v$  and  $c_w \in \text{Gal}(L/F)$  be the generator of  $\text{Gal}(L_w/F_v)$ , then

$$n_+ = \frac{\chi(1) + \chi(c_w)}{2}, \quad n_- = \frac{\chi(1) - \chi(c_w)}{2}.$$

┘

**Prop. (31.1.1.9) [Functoriality of Artin  $L$ -Factors].** Let  $F \in \mathbf{GField}$  and  $v \in \Sigma_F$ , then the Artin  $L$ -factors (31.1.1.8) satisfy the following functorial properties:

- For  $L/F \subset L'/F \in \mathbf{GalField}^{\text{fin}}$  and  $\rho \in \mathbf{Rep}^{\text{fd}}(\mathbf{Gal}(L/F))$ , we have  $L_v(L'/F, \rho; s) = L_v(L/F, \rho; s)$ . In particular, the  $L$ -function doesn't depend on  $L$ , as long as  $\rho$  is trivial on  $\mathbf{Gal}_L$ .
- $L_v(F, \mathbf{1}; s) = L_v(\mathbf{1}; s)$  (31.1.1.1).
- For  $\rho, \rho' \in \mathbf{Rep}^{\text{fd}}(\mathbf{Gal}_F)$ ,  $L_v(F, \rho \oplus \rho'; s) = L_v(F, \rho; s) L_v(F, \rho'; s)$ .
- If  $F \subset_{\text{fin}} M$ ,  $\rho \in \mathbf{Rep}^{\text{fd}}(\mathbf{Gal}_M)$ , then  $L_v(F, \text{Ind}_M^F(\rho); s) = \prod_{w|v} L_w(M, \rho; s)$ .

□

*Proof:* 1, 2, 3 are clear.

For 4: Let  $L$  be a finite extension of  $M$  s.t.  $\rho$  is trivial on  $\mathbf{Gal}_L$ . Denote  $G = \mathbf{Gal}(L/F)$ ,  $H = \mathbf{Gal}(L/M)$ , and for any  $\mathfrak{p} \in \Sigma_F^{\text{fin}}$ , let  $\{\mathfrak{q}_1, \dots, \mathfrak{q}_r\} = S(\mathfrak{p}) \subset \Sigma_M^{\text{fin}}$ , and take  $\mathfrak{P}_i \in \Sigma_L^{\text{fin}}$  over  $\mathfrak{q}_i$ . Let  $G_i, I_i$  be the decomposition and inertia groups of  $\mathfrak{P}_i/\mathfrak{p}$ , then  $H_i = G_i \cap H$ ,  $I'_i = I_i \cap H$  are the decomposition and inertia groups of  $\mathfrak{P}_i/\mathfrak{q}_i$ . Denote  $f_i$  the inertia degree of  $\mathfrak{q}_i/\mathfrak{p}$ . Let  $(\rho, W) \in \mathbf{Rep}^{\text{fd}}(\mathbf{Gal}(L/M))$ ,  $(\rho', V) = \text{Ind}_F^M(\rho) \in \mathbf{Rep}(\mathbf{Gal}(L/F))$ , then it suffices to show that

$$\det(1 - \varphi_{\mathfrak{P}_1/\mathfrak{p}} T | V^{I_1}) = \prod_{i=1}^r \det(1 - \varphi_{\mathfrak{P}_i/\mathfrak{p}}^{f_i} T^{f_i} | W^{I'_i}).$$

If  $\mathfrak{P}_i = \tau_i^{-1}(\mathfrak{P}_1)$ , then we can take  $\varphi_{\mathfrak{P}_i/\mathfrak{p}} = \tau_i^{-1} \varphi_{\mathfrak{P}_1/\mathfrak{p}} \tau_i$ ,  $I_i = \tau_i^{-1} I_1 \tau_i$ , then

$$\det(1 - \varphi_{\mathfrak{P}_i/\mathfrak{p}}^{f_i} T^{f_i} | W^{I'_i}) = \det(1 - \varphi_{\mathfrak{P}_1/\mathfrak{p}}^{f_i} T^{f_i} | W^{I_1 \cap \tau_i H \tau_i^{-1}}),$$

and  $f_i = (G_i : H_i I_i) = (G_1 : (G_1 \cap \tau_i H \tau_i^{-1}) I_1)$ .

Let  $\sigma_{ij}$  be a representative of  $G_1/(G_1 \cap \tau_i H \tau_i^{-1})$ , then because  $G/H = \cup_i G_i/H_i$ ,  $\{\sigma_{ij} \tau_i\}_{ij}$  is a representative of  $G/H$ . Then

$$V = \oplus_i \bigoplus_j \sigma_{ij} \tau_i W,$$

and  $V_i = \bigoplus_j \sigma_{ij} \tau_i W = \text{Ind}_{G_1 \cap \tau_i H \tau_i^{-1}}^{G_1}(\tau_i W)$  is a  $G_1$ -module. So

$$\det(1 - \varphi_{\mathfrak{P}_1/\mathfrak{p}} T | V^{I_1}) = \prod_{i=1}^r \det(1 - \varphi_{\mathfrak{P}_1/\mathfrak{p}} T | V_i^{I_1})$$

Then it suffices to prove for each  $i$ ,

$$\det(1 - \varphi_{\mathfrak{P}_1/\mathfrak{p}} T | V_i^{I_1}) = \det(1 - \varphi_{\mathfrak{P}_i/\mathfrak{p}}^{f_i} T^{f_i} | W^{I'_i}).$$

Notice

$$V_i^{I_1} = \left( \text{Ind}_{G_1 \cap \tau_i H \tau_i^{-1}}^{G_1}(\tau_i W) \right)^{I_1} = \text{Ind}_{H_i}^{G_i} W^{I'_i} \text{ (24.1.6.46)} = \bigoplus_{i=0}^{f_i-1} \varphi_{\mathfrak{P}_i/\mathfrak{p}}^i W^{I'_i},$$

so the assertion follow easily from this. □

**Def. (31.1.1.10) [Artin  $L$ -Functions].** Let  $L/F \in \mathbf{GField}$  be Galois, and  $(\rho, V) \in \mathcal{R}\mathrm{ep}(\mathrm{Gal}(L/F))$ , the **Artin  $L$ -function** of  $\rho$  is defined to be the Euler product of local  $L$ -factors (31.1.1.8)

$$L(F, \rho; s) = \prod_{v \in \Sigma_F^{\mathrm{fin}}} L_v(F, \rho; s).$$

This  $L$ -function also only depends on  $F$  but not  $L$ , as we will see in (31.1.1.11).

And also define the **completed Artin  $L$ -function** as the function

$$\Lambda(F, \rho; s) = \prod_{v \in \Sigma_F} L_v(F, \rho; s).$$

┘

**Prop. (31.1.1.11) [Functoriality of Artin  $L$ -Functions].** Let  $F \in \mathbf{GField}$ , then the  $L$ -functions satisfy the following functorial properties:

- $L(F, \mathbf{1}; s) = \zeta(F; s)$  (35.5.3.1).
- For  $\rho, \rho' \in \mathcal{R}\mathrm{ep}^{\mathrm{fd}}(\mathrm{Gal}_F)$ ,  $L(F, \rho \oplus \rho'; s) = L(F, \rho; s)L(F, \rho'; s)$ .
- If  $F \subset_{\mathrm{fin}} E$ ,  $\rho \in \mathcal{R}\mathrm{ep}^{\mathrm{fd}}(\mathrm{Gal}_E)$ , then  $L(F, \mathrm{Ind}_E^F(\rho); s) = L(E, \rho; s)$ .
- If  $F \subset_{\mathrm{fin}} E$ ,  $\rho \in \mathcal{R}\mathrm{ep}^{\mathrm{fd}}(\mathrm{Gal}_F)$ , then  $L(E, \mathrm{res}_E^F(\rho); s) = L(F, \rho \otimes \mathrm{Ind}_E^F(\mathbf{1}))$ .

┘

*Proof:* These follow from (31.1.1.9). For item 4, use the projection formula  $\mathrm{Ind}_E^F(\mathrm{res}_E^F \rho) \cong \rho \otimes \mathrm{Ind}_E^F(\mathbf{1})$  (24.1.2.14). □

**Cor. (31.1.1.12).** For  $L/F \in \mathbf{GalField}^{\mathrm{fin}}$ ,

$$\zeta(L; s) = \zeta(F; s) \cdot \left( \prod_{\mathbf{1} \neq \rho \in \mathrm{Irr}(\mathrm{Gal}(L/F))} L(F, \rho; s)^{\chi_\rho(\mathbf{1})} \right).$$

┘

**Prop. (31.1.1.13) [Artin  $L$ -Functions and Weber  $L$ -Functions].** Let  $L/F \in \mathbf{GField}$  be Abelian with conductor  $\mathfrak{f}$ , and  $\chi \in (\mathrm{Gal}(L/F))^\vee$ . Composing with the Artin symbols (19.7.4.26), we get a Hecke character  $\tilde{\chi} : \mathbf{C}_F/\mathbf{C}^\mathfrak{f} \cong J^\mathfrak{f}/P^\mathfrak{f} \rightarrow \mathrm{Gal}(L/F) \xrightarrow{\chi} \mathbf{C}^\times$ , which is a Dirichlet character. Then we have

$$L(F, \chi; s) = L(F, \tilde{\chi}; s) \prod_{v \in S} \frac{1}{1 - \|v\|^{-s} \chi(\sigma_v)} \quad (35.5.2.2),$$

where  $S = \{\mathfrak{p} \in S_f(\mathfrak{f}) \mid \chi(I_{\mathfrak{p}}) = 1\}$ . Moreover, if  $\chi$  is injective, then  $S = \emptyset$ . ? ┘

*Proof:*  $S$  are the primes that are ramified in  $L/F$  and  $\mathbf{C}(\chi)^{I_{\mathfrak{p}}} \neq 0$ . □

### Functional Equations

**Prop. (31.1.1.14) [Functional Equations, Brauer [Bra47]].** By Brauer theorem (24.1.3.36) and (24.1.3.36), any Artin  $L$ -function (31.1.1.10) can be written as products and inverses of Weber  $L$ -functions (35.5.2.2) and f.m.  $L$ -factors. In particular, they can be extended meromorphically to all  $s \in \mathbb{C}$  and satisfies a functional equation (35.5.2.5).

More explicitly, for  $L/F \in \mathbf{GalField}^{\text{fin}}$  and  $(\rho, V) \in \mathcal{R}\text{ep}^{\text{fd}}(\text{Gal}(L/F))$ , the completed Artin  $L$ -function satisfies a functional equation

$$\Lambda(F, \rho; s) = \epsilon(F, \rho; s) \Lambda(F, \rho^\vee; 1-s) \quad (31.1.1.3),$$

where

$$\epsilon(\rho) = w(\rho) \left( |d_F|^{\dim \rho} \|\mathfrak{f}(F, \rho)\| \right)^{1/2-s} \quad (25.1.4.1)$$

where  $|w(\rho)| = 1$ , called the **Artin root number**.

The factorization of  $w(\rho)$  awaits Deligne's work [Del73].? ┘

*Proof:* Cf.[Algebraic Number Theory, Neukirch].? □

**Conj. (31.1.1.15) [Holomorphy of Artin  $L$ -Functions, Artin].** If  $F \in \mathbf{GField}$  and  $(\rho, V) \in \mathcal{R}\text{ep}^{\text{fd}}(\text{Gal}_F)$  satisfies  $V^{\text{Gal}_F} = 0$ , then  $L(F, \rho; s)$  is an entire function w.r.t.  $s \in \mathbb{C}$ . ┘

*Proof:* □

**Thm& Conj.Cor. (31.1.1.16).** By (29.5.4.6), the Artin holomorphy conjecture is implied by the Artin-Langlands conjecture (29.3.5.4). In particular, by (29.3.5.5) and (29.3.5.9), it is true if either of the following holds:

- $\dim \rho = 1$ .
  - $\text{Im}(\rho)$  is nilpotent.
  - $F = \mathbb{Q}$ ,  $\dim \rho = 2$  and  $\text{Im}(\rho)$  is solvable.
  - $F = \mathbb{Q}$ ,  $\dim \rho = 2$  and  $\text{Im}(\rho) \cong \text{Alt}_5$ , and under mild conditions.
  - $F$  is totally real and  $\rho$  is odd.
- ┘

### Artin-Weil $L$ -Functions

Cf.[On the Functional Equation of the Artin  $L$ -Functions, Langlands].

## 2 Galois $L$ -Functions

**Def. (31.1.2.1) [Galois  $L$ -Functions].** Given an embedding  $\iota : \overline{\mathbb{Q}_p} \hookrightarrow \mathbb{C}$ , for any  $V \in \mathcal{R}\text{ep}_{\overline{\mathbb{Q}_p}}^{\text{fd}}(\text{Gal}_F)$ , define the global  $L$ -function as

$$L(\iota V; s) = \prod_{v \in \Sigma_F^{\text{fin}}} L(\iota \text{WD}_p(V); s) \quad (31.1.1.3). \quad \text{?}$$

In particular, for  $v \in S_F(p)$ , the local factor is

$$L_v(\iota V; s) = \det \left( \mathbf{1} - \sigma_{\text{crys}}^{\deg v} \|v\|^{-s} \Big| D_{\text{crys}}(V|_{\text{Gal}_{F_v}}) \right)^{-1}.$$

┘

**Prop. (31.1.2.2).** By Chebotarev density theorem,  $L(\iota V; s)$  determines  $\text{WD}_p(V)$  and thus  $V$  up to  $F$ -semisimplification. ┘

*Proof:* This follows from (29.3.1.12).  $\square$

**Prop. (31.1.2.3).** Situation as in (31.1.2.1),

- $L(V(n); s) = L(V; s + n)$ .
- If  $F/F_0 \in \mathbf{NField}$ ,  $W = \text{Ind}_{F/F_0}(V)$ , then for any  $\emptyset \subset_{\text{fin}} S_0 \subset \Sigma_{F_0}^{\text{fin}}$  with  $S = S_F(S_0)$ , we have  $L_S(V; s) = L_{S_0}(W; s)$ .
- If  $\text{Ram}_F(V) \subset_{\text{fin}} S \subset \Sigma_F^{\text{fin}}$  and  $V$  is  $S$ -pure of weight  $w$ , then  $L_S(V; s)$  converges absolutely for  $\text{Re } s > w/2 + 1$ , and  $L(V; s)$  is a meromorphic function without zeros for  $\text{Re } s > w/2 + 1$ .
- If  $V$  is pure of weight  $w$ , then  $L(V; s)$  is meromorphic for  $\text{Re } s > w/2 + 1$  and has no zeros there.  $\lrcorner$

*Proof:* 1 is easy.

2:  $\color{red}{?}$  Cf. [Fontaine-Perrin-Riou].

3: Compare with the Dedekind zeta function (29.5.2.1), as in (29.5.2.2).

4: clear.  $\square$

**Conj. (31.1.2.4) [Holomorphy].** Situation as in (31.1.2.1), if  $V$  is geometric and pure of weight  $w$ , then it is totally pure. In particular, it is holomorphic for  $\text{Re } s > w/2 + 1$ .  $\lrcorner$

*Proof:*  $\square$

**Conj. (31.1.2.5) [Meromorphic Extension].** If  $V$  is geometric and pure of weight  $w$ , then

- $L(V; s)$  admits a meromorphic continuation to all  $s \in \mathbb{C}$ , and essentially bounded on vertical strips.
- $L(V; s) \neq 0$  for  $\text{Re}(s) \geq w/2 + 1$ .
- If  $V$  is irreducible, then  $L(V; s)$  has no poles, except when  $V \cong \mathbb{Q}_p(n)$ , then it has a simple pole at  $s = -n + 1$ .  $\lrcorner$

*Proof:*  $\square$

**Remark (31.1.2.6).** This is true when  $V$  is automorphic, by (29.5.4.6) (29.5.3.3) and (35.4.4.1).  $\lrcorner$

**Conj. (31.1.2.7) [Grand Riemann Hypothesis].** If  $V$  is geometric and pure of weight  $w$ , then for any embedding  $\iota : \overline{\mathbb{Q}}_p \hookrightarrow \mathbb{C}$ ,  $L(\iota V; s)$  (31.1.2.1) has no zeros  $s$  with  $\text{Re } s > (w + 1)/2$ .  $\lrcorner$

*Proof:*  $\square$

**Def. (31.1.2.8) [Completed L-Functions].** If  $V$  is geometric and pure of weight  $w$ , define

$$L_{\infty}(V; s) = \Gamma_{\mathbb{R}}(s - w/2)^{m_{w/2}^{+}} \cdot \Gamma_{\mathbb{R}}(s - w/2 + 1)^{m_{w/2}^{-}} \cdot \prod_{k \in \mathbb{Z}, k < w/2} \Gamma_{\mathbb{C}}(s - k)^{m_k}.$$

and define the **root number at  $\infty$**

$$w_{\infty}(V) = i^{m_{w/2}^{-}} \cdot \left( \prod_{k < w/2} i^{m_k} \right)^{2w+1}$$

and the Artin conductor  $\mathfrak{f}(\rho)$  (25.1.4.1), and the completed  $L$ -function

$$\Lambda(V; s) = L(\iota V; s) L_\infty(V; s).$$

and the **root number**

$$w(\iota \rho) = w_\infty(\rho) \prod_{p \in \mathbf{P}} w(\mathrm{WD}_p(\rho); \psi_p)$$

where  $\iota \psi_p(x) = e^{-2\pi i x}$ . ┘

**Prop. (31.1.2.9).** If  $V \in \mathrm{Rep}_{\overline{\mathbb{Q}}_\ell}(\mathrm{Gal}_{\mathbb{Q}})$  is geometric and pure of weight  $w$ , then

- $L_\infty(V(n); s) = L_\infty(V; s + n)$ .
- $L_\infty(V(n); s)$  has a pole of order  $\sum_{0 \leq k < w/2} m_k + m_{w/2}^+$  at  $s = 0$ .
- If Tate's conjecture (30.1.5.1) holds, then  $m_{w/2}^\pm \geq 0$ , so  $L_\infty(V(n); s)$  has no zeros. ┘

*Proof:* Only 1 deserves a proof: It suffices to prove for  $n = 1$ . If  $w \notin 2\mathbb{Z}$  this is clear. If  $w \in 2\mathbb{Z}$ , notice Tate twists change weights by 2, so it is also odd, and  $(-1)^{w'/2} = -(-1)^{w/2}$ . But also the twist changes the action of  $c$  by  $-1$  in (30.1.5.3), so the assertion follows. □

**Conj. (31.1.2.10) [Functional Equations].** If  $V$  is geometric and pure of weight  $w$ , then

$$\Lambda(V; s) = w(V) N(V)^{(w+1)/2-s} \Lambda(V^\vee; 1-s).$$

where  $N(V)$  is the conductor of  $V$ ? ┘

*Proof:* □

**Remark (31.1.2.11).** This is true for  $V$  automorphic, by Jacquet-Shalika method. ┘

**Conj. Cor. (31.1.2.12).** For a geometric representation polarized of weight  $w$  (30.1.3.28), there should be a functional equation

$$\Lambda(V; 1 + w - s) = \varepsilon(V; s) \Lambda(V; s).$$

*Proof:* □

### 3 Hasse-Weil $L$ -Functions

References are [Zeta Functions in Algebraic Geometry, Mustata].

#### Zeta-Functions over Finite Fields

**Def. (31.1.3.1) [Zeta-Functions].** Let  $q \in p^{\mathbb{Z}^+}$  and  $X \in \mathrm{Sch}^{\mathrm{ft}}/\mathbb{F}_q$ , then its **zeta-function** is defined to be the power series

$$Z(X; T) = \exp \left( \sum_{n \geq 1} \#X(\mathbb{F}_{q^n}) \frac{T^n}{n} \right) \in \mathbb{Q}[[T]].$$

Notice that we can get the information of number of rational points of  $X$  by the formula

$$\#X(\mathbb{F}_{q^n}) = \frac{1}{(n-1)!} \frac{\partial^n}{\partial T^n} \log Z(X; T)|_{T=0}.$$

┘

**Prop. (31.1.3.2)[Euler Product].** there is an Euler product formula for  $Z(X; T)$  by (9.6.2.11)(9.6.2.12):

$$Z(X; T) = \prod_{x \text{ closed in } X} \frac{1}{1 - T^{\deg(x)}}.$$

┘

**Thm. (31.1.3.3) [Rationality of Zeta Functions, Dwork].** Let  $p \in \text{Prime}$ ,  $q \in p^{\mathbb{Z}_+}$ , and  $X \in \text{Sch}^{\text{ft}}/\mathbb{F}_q$ , then  $Z(X; T) \in \mathbb{Q}(T)$ . ┘

*Proof:* Cf. [Zeta Functions in Algebraic Geometry, Mustata] ?. Does this follows from Weil conjecture? □

**Thm. (31.1.3.4) [Weil Conjecture, Weil [Wei49], Weil/Deligne [Del74]/Laumon].** Let  $p \in \mathbf{P}$ ,  $q \in p^{\mathbb{Z}_+}$ , and  $X \in \text{SmPrprVar}^n/\mathbb{F}_q$ , then

1. (Riemann Hypothesis):  $Z(X; T)$  is of the form

$$Z(X; T) = \frac{P_1(X; T)P_3(X; T) \dots P_{2n-1}(X; T)}{P_0(X; T)P_2(X; T) \dots P_{2n}(X; T)}$$

s.t.

- $P_0(X; T) = 1 - T$ ,
- $P_{2n}(X; T) = 1 - q^n T$ ,
- For  $0 \leq i \leq 2n$ ,  $P_i(X; T) \in \mathbb{Z}[T]$ ,
- For  $0 \leq i \leq 2n$ ,  $P_i(X; T) = \prod_{j \leq k} (1 - \alpha_{ij} T)$ , where each  $\alpha_{ij} \in \text{Weil}(q^{i/2})$  is a  $q$ -Weil number of weight  $i$  (19.3.1.16).
- $\deg(P_i(X; T))$  is called the  $i$ -th **Betti number** of  $X$ , and  $\deg P_i(X; T) = \deg P_{2n-i}(X; T)$ .

2. (Functional Equation):

$$Z(X; \frac{1}{q^n T}) = \pm q^{n\chi/2} T^\chi Z(X; T),$$

where  $\chi$  is a Euler character  $\Delta \cdot \Delta = \sum_{i=0}^{2n} (-1)^i \deg P_i(X; T)$ . Notice that  $n\chi/2 \in \mathbb{Z}$ , and the sign is positive if  $n$  is odd.

3. If  $R \subset \mathbb{C}$  is a f.g.  $\mathbb{Z}$ -algebra,  $\mathfrak{p} \in \text{Spec}(R)$  s.t.  $R/\mathfrak{p} \cong \mathbb{F}_q$ , and there exists  $\mathcal{X} \in \text{SmPrpr}/R$  s.t.  $\mathcal{X}_{\kappa(\mathfrak{p})} \cong X$ , then  $\deg(P_i(X; T))$  equals the  $i$ -th Betti number of  $\mathcal{X}_{\mathbb{C}}^{\text{an}}$ .
4.  $\chi(X) = \Delta_X \cdot \Delta_X$ .

┘

*Proof:* 1: It follows from trace formula (9.6.2.13) that

$$Z(X; T) = \frac{P_1(X; T)P_3(X; T) \dots P_{2n-1}(X; T)}{P_0(X; T)P_2(X; T) \dots P_{2n}(X; T)} = \frac{P(T)}{Q(T)} \in \mathbb{Q}_\ell(T),$$

where the roots  $\alpha_{ij}$  of  $P_i(X; T)$  are algebraic integers satisfying  $|\iota(\alpha_{ij}^{-1})| = q^{-i/2}$  by Deligne's purity theorem (9.6.6.5).

Then  $Z(X; T) \in \mathbb{Q}[[T]] \cap \mathbb{Q}_\ell(T) = \mathbb{Q}(T)$  by (10.7.1.19). Thus  $P_i(X; T) \in \mathbb{Q}[T]$  because it is in  $\overline{\mathbb{Q}}[T]$  and also it is stable under  $\text{Gal}_{\mathbb{Q}}$ , as their roots are distinguished by their  $\iota$ -values.

Moreover, by Euler product(31.1.3.2),  $Z(X; T) \in \mathbb{Z}[[T]]$ , so it follows from(10.7.1.20) that  $P(T), Q(T) \in \mathbb{Z}[T]$ .

Notice by Poincaré duality(9.4.6.48),  $H_{\text{ét}}^{2n}(X; \mathbb{Q}_\ell(n)) \cong H_{\text{ét}}^0(X; \mathbb{Q}_\ell)^\vee$ , thus  $F_X^*$  acts on  $H_{\text{ét}}^0(X; \mathbb{Q}_\ell)$  by id and acts on  $H_{\text{ét}}^{2n}(X, \mathbb{Q}_\ell)$  by  $q^n$ . Thus  $P_0(X; T) = 1 - T$ ,  $P_{2n}(X; T) = 1 - q^n T$ .

2: Apply(3.5.15.1) to  $H^i = H_{\text{ét}}^i(X; \mathbb{Q}_\ell)$ , trace map and perfect Poincaré pairings(9.4.6.48) and  $\varphi_i = q^{-i/2} F_X^*$ . Notice  $\varphi_{2n} = \text{id}$  by item2. Now(3.5.15.1) says  $\varphi_i^{-1} = \varphi_{2d-i}^t$ , so

$$\left\{ \frac{q^{i/2}}{\alpha_{ij}} \right\}_j = \left\{ \frac{\alpha_{2n-i,j}}{q^{(2n-i)/2}} \right\}_j$$

where we are counting multiplicity. Thus for  $i \neq n$ , we can assume  $\alpha_{ij}\alpha_{2n-i,j} = q^n$ , and for  $i = n$ , suppose there are  $N_\pm$  many  $\alpha_{n,j} = \pm q^{n/2}$ , and the other  $\alpha_{n,j}$ s come in pair:  $\alpha_{n,j}\alpha_{n,b_n-j} = q^n$ . Then

$$Z(X; \frac{1}{q^n T}) = \prod_i (1 - \alpha_{ij}/(q^n T))^{(-1)^{i+1}} = \prod_i (1 - \frac{1}{\alpha_{2n-i,j} T})^{(-1)^{i+1}} = Z(X; T) \cdot q^{n\chi/2} \cdot T^\chi (-1)^{N_+}.$$

Moreover, if  $n$  is odd, then the intersection form on  $H^n(X)$  is alternating, thus  $\chi$  is even, and  $n\chi/2 \in \mathbb{Z}$ . Moreover, in this case,  $N_+ = 1$  because  $\varphi_n$  is a symplectic matrix.

3: These follow from the trace formula(9.6.2.13) and(9.4.6.36).

4: By(22.1.2.2),

$$\Delta_X \cdot \Delta_X = (\gamma_{X \times X}(\Delta_X), \gamma_{X \times X}(\Delta_X)) = \sum_{i=0}^{2d} \text{tr}(\text{id}|H_{\text{ét}}^i(X)) = \chi(X).$$

□

**Cor. (31.1.3.5) [Invariance of Characteristic Polynomial with  $\ell$ ].** It follows from the proof above that  $P_i$  is determined by  $X$ , and it is also the characteristic polynomial of  $\text{Fr}_{\overline{X}}$  on  $H_{\text{ét}}^i(X, \mathbb{Q}_\ell)$  for any  $\ell \in \mathbf{P} \setminus \text{char } k$ , so the latter is independent of  $\ell$  chosen. ┘

### Points Counting

**Thm. (31.1.3.6) [Deligne's Estimate].** ┘

*Proof:* □

**Cor. (31.1.3.7) [Weil Bound].** For  $X \in \text{Cur}^{\text{sm}, \text{prpr}}/\mathbb{F}_q$ , by Weil conjecture(31.1.3.4),

$$|\#X(\mathbb{F}_{q^n}) - q^n - 1| = \left| \sum_j \alpha_{1j}(X) \right| \leq 2g(X)q^{n/2}.$$

┘

**Thm. (31.1.3.8) [Ihara/Drinfeld-Vladut[D-V83]].** For  $p \in \text{Prime}$ ,  $q \in q^{\mathbb{Z}^+}$ , let  $A(q) = \overline{\lim}_{g(X) \rightarrow \infty} \frac{\#X(\mathbb{F}_q)}{g(X)}$ , where the limit is taken over all smooth proper curves over  $\mathbb{F}_q$ . Then  $A(q) \leq \sqrt{q} - 1$ .

And if  $q \in (\mathbb{Z}_+)^2$ , then  $A(q) = \sqrt{q} - 1$ . ┘

*Proof:* Let  $\alpha_{1j}$  as in (31.1.3.4),  $\omega_i = \alpha_{1i}q^{-1/2}$ , then  $|\omega_i| = 1$  and inversion induces an automorphism of  $\{\omega_i\}$ . Then by (31.1.3.7), for any  $r \in \mathbb{Z}_+$ ,

$$N = \#X(\mathbb{F}_q) \leq \#X(\mathbb{F}_{q^r}) = q^r + 1 - q^{r/2} \sum_i \omega_i^r.$$

And notice

$$0 \leq |1 + \omega_i + \dots + \omega_i^r|^2 = (r+1) + \sum_{j=1}^r (r+1-j)(\omega_i^j + \omega_i^{-j}),$$

So

$$\begin{aligned} 2g(X)(r+1) &\geq - \sum_i \sum_{j=1}^r (r+1-j)(\omega_i^j + \omega_i^{-j}) = -2 \sum_{j=1}^r (r+1-j) \left( \sum_i \omega_i^j \right) \\ &\geq N \sum_{j=1}^r (r+1-j) q^{-j/2} - \sum_{j=1}^r (r+1-j)(\alpha^j + \alpha^{-j}) \end{aligned}$$

Thus

$$\frac{N}{g(X)} \leq \left( \sum_{j=1}^r \frac{r+1-j}{r+1} q^{-j/2} \right)^{-1} \cdot \left( 1 + \frac{1}{g} \sum_{j=1}^r \frac{r+1-j}{r+1} (\alpha^j + \alpha^{-j}) \right)$$

Taking limit  $g \rightarrow \infty$ ,

$$\frac{N}{g(X)} \leq \left( \sum_{j=1}^r \frac{r+1-j}{r+1} q^{-j/2} \right)^{-1}.$$

And taking limit  $r \rightarrow \infty$  gives

$$\frac{N}{g(X)} \leq \left( \sum_{j=1}^{\infty} q^{-j/2} \right)^{-1} = \sqrt{q} - 1.$$

For the last assertion, See [Ihara].?

□

**Thm. (31.1.3.9) [Lang-Weil Estimate, Lang-Weil [L-W54]].** For any  $n, r \in \mathbb{N}, d \in \mathbb{Z}_+$ , there exists  $a(n, d, r) \in \mathbb{Z}_+$  s.t. for any  $k \in \mathbf{Field}^{\text{fin}}$  and any  $X \subset \mathbb{P}_k^n \in \mathbf{Var}/k$  of dimension  $r$  and degree  $d$ , we have

$$|\#X(k) - \#k^r| \leq (d-1)(d-2)\#k^{r-\frac{1}{2}} + a(n, d, r)\#k^{r-1}.$$

┘

*Proof:* This can be proved by trace formula and estimating the dimensions of the cohomology groups, Cf. [Bombieri, exponential sums, 2].? or [Mustata, L-functions in algebraic geometry]. □

### Hasse-Weil L-Functions

**Prop. (31.1.3.10) [Hasse-Weil L-Functions].** Let  $F \in \mathbf{GField}$  and  $X \in \mathbf{SmPrprVar}/F$ , the **Hasse-Weil L-function** of  $X$  is defined to be

$$L(X, s) = \prod_{v \in \Sigma_F^0} Z(\mathcal{X}_v, q^{-s}),$$

where for  $v$  s.t.  $\mathcal{X}_v$  has good reduction,  $Z(\mathcal{X}_v, T) = Z(\mathcal{X}_{k_v}, T)$  in (31.1.3.1), and for bad places  $v$ , it needs to be defined otherwise.?

┘

**Prop. (31.1.3.11).** Let  $l_1, \dots, l_N$  be linear forms in  $r$ -variables with rational coefficients, then

$$\sum_{x \in \mathbb{Z}^r} \frac{1}{l_1(x) \dots l_N(x)} \in \mathbb{Q}\pi^N$$

if it is convergent. ┘

*Proof:* □

**Def. (31.1.3.12) [Hasse-Weil L-Functions].** For  $X \in \mathbf{SmPrprVar}/\mathbb{Q}$  and  $\ell \in \mathbf{Prime}$ , there is some  $N \in \mathbb{Z}_+, \ell | N$  s.t.  $X$  has a model  $\mathcal{X}/\mathbb{Z}[\frac{1}{N}]$ . Choose an embedding. Then we can define a partial zeta function

$$\zeta_N(X; s) = \prod_{p \nmid N} \left( \prod_{x \in |X_p|_0} (1 - p^{-s \deg(x)})^{-1} \right),$$

then by Grothendieck-Lefschetz formula,

$$\zeta_N(X; s) = \prod_{i=0}^{2 \dim X} L_N(\iota H^i(X, \overline{\mathbb{Q}}_\ell); s)^{(-1)^i}.$$

Thus it is natural to define the **Hasse-Weil L-function**

$$\zeta(X; s) = \prod_{i=0}^{2 \dim X} L(\iota H^i(X, \overline{\mathbb{Q}}_\ell); s)^{(-1)^i}.$$

and the completed L-function

$$\Lambda(X; s) = \prod_{i=0}^{2 \dim X} \Lambda(\iota H^i(X, \overline{\mathbb{Q}}_\ell); s)^{(-1)^i}.$$

┘

**Example (31.1.3.13).**

- $L(\mathrm{Spec} \mathbb{Q}; s) = \zeta(s)$ .
- For  $E \in \mathbf{EllCur}/\mathbb{Q}$ ,

$$L(E; s) = \frac{\zeta(s)\zeta(s-1)}{L(h^1 E; s)} \quad (31.1.6.2).$$

┘

**Conj. (31.1.3.14) [Functional Equations].** Motivated by Poincaré duality and (31.1.2.10), situation as in (31.1.3.12),  $\zeta(X; s)$  should have a meromorphic extension to the whole plane, and satisfies a functional equation of the form

$$\Lambda(X; s) = \epsilon(s) \Lambda(X, 1 + \dim X - s).$$

┘

*Proof:* □

**Remark (31.1.3.15).** This is true for elliptic curves over  $\mathbb{Q}$ , by [BCDT]. ┘

## 4 Motivic L-Functions

References are [Del79, Zag94].

**Def. (31.1.4.1) [Motivic L-Functions].** Use the fact the Grothendieck motives over a finite field is a Tannakian category ?, we can define  $L$ -functions for any motives over a number field. Such an  $L$ -function is called a **motivic L-function**. ┘

**Conj. (31.1.4.2) [Properties].** The motivic L-functions are conjectured to satisfy the following properties:

**Algebraicity:** There are Dirichlet series expansions:  $L(s) = \sum_{n \geq 1} a_n n^{-s}$  for  $\text{Re}(s)$  large, where  $\{a_n\} \in F$  for some number field  $F$ .

**Euler Product:** There are Euler product expansions:  $L(s) = \prod_{p \in \text{Prime}} \Phi_p(p^{-s})$  where  $\max_{p \in \text{Prime}} \{\deg \Phi_p\} < \infty$ . In particular,  $n \mapsto a_n$  is multiplicative.

**Functional Equation:** There is a  $\gamma$ -factor

$$\gamma(s) = A^s \cdot \prod_i \Gamma\left(\frac{s + m_i}{2}\right)$$

where  $A \in \mathbb{C}^*$ ,  $m_i \in \mathbb{Z}$ , s.t.  $\zeta(s) = \gamma(s)L(s)$  satisfies a functional equation

$$\zeta(s) = w\zeta(h - s)$$

where  $w \in \{\pm 1\}$  called the **sign of functional equation** and  $h \in \mathbb{Z}_+$ . And in this way,  $L(s)$  extends to a meromorphic function on  $\mathbb{C}$  with only f.m. poles.

**Local Riemann Hypothesis:** The zeros of  $\Phi_p(p^{-s})$  lie on the line  $\text{Re}(s) = \frac{k-1}{2}$ .

**Riemann Hypothesis:** The zeros of  $L(s)$  are either integers or lie on the line  $\text{Re}(s) = \frac{k-1}{2}$ .

**Special Values:** A **critical point** for  $L(s)$  is an integer  $m \in \mathbb{Z}$  s.t. neither  $m$  nor  $h - m$  is a pole of  $L(s)$ . Then for a critical point  $m$  for  $L(s)$ , the **critical value**  $L(m) = A(m)\Omega(m)$ , where  $A(m)$  is a reasonable algebraic number and  $\Omega(m) \in \mathbb{P}$  is a reasonable period number.

**Central Special Values:** If  $h = 2m$ ,  $m \in \mathbb{Z}$ , then  $m$  is called a **central value** of  $L(s)$ , and in this case,  $A(m)$  is a square times a simple factor.

**More...** ┘

*Proof:* □

**Conj. (31.1.4.3) [Big Automorphy Conjecture].** Every motivic  $L$ -function comes from a automorphism representation. ┘

*Proof:* □

## 5 0-Dimensional Motives

## 6 Abelian Motives

### Elliptic Curves

**Def. (31.1.6.1) [L-Factors].** ┘

**Def. (31.1.6.2) [Motivic  $L$ -Function of Elliptic Curves].** Let  $F \in \mathbf{GField}$  and  $E \in \mathbf{EllCur}/F$ , the motivic  $h^1$   $L$ -function is defined to be

$$L(h^1 E, s) = \prod_{v \in \Sigma_F^0} L(h^1 E_v, s)$$

where  $L(E_v, s)$  is defined to be

- $L(E_v, s) = (1 - a_v q_v^{-s} + q_v^{1-2s})^{-1}$  as in (31.1.6.1), where  $a_v = q_v + 1 - \#\tilde{E}_v(\kappa_v)$ , if  $E$  has good reduction at  $v$ .
- $(1 - q_v^{-s})^{-1}$  if  $E$  has split multiplicative reduction at  $v$ .
- $(1 + q_v^{-s})^{-1}$  if  $E$  has non-split multiplicative reduction at  $v$ .
- 1 if  $E$  has additive reduction at  $v$ .

Notice that in all cases we have  $L(E_v, 1) = q_v / \#\tilde{E}_{\text{sm}}(\kappa_v)$ . ┘

**Prop. (31.1.6.3) [Tate-Faltings].** If  $E, E' \in \mathbf{EllCur}/\mathbb{Q}$  s.t.  $L_E(s) = L_{E'}(s)$ , then  $E, E'$  are isogenous. ┘

*Proof:* Cf. [Milne, Elliptic Curves, Thm5.4.1]. □

**Thm& Conj. Cor. (31.1.6.4) [Analytic Continuation].** If  $F = \mathbb{Q}$  and  $E \in \mathbf{EllCur}/\mathbb{Q}$ , there exists  $w_E \in \{\pm 1\}$  called the **sign of functional equation of  $E$**  s.t.

$$(L(E), L_{\mathbb{C}}(s), N_E, w_E)$$

is an  $\frac{1}{s}$ -shifted entire analytic  $L$ -function of degree 2 (29.5.1.1). In other words,

$$\Lambda(E, s) = N_E^{s/2} (2\pi)^{-s} \Gamma(s) L(E, s)$$

extends to an entire function, and satisfies the functional equation:

$$\Lambda(E, s) = w_E \Lambda(E, 2 - s).$$

┘

*Proof:* By modularity theorem (30.4.3.7),  $L(E; s) = L(f; s)$  for some normalized Hecke eigenform  $f \in \mathbf{SF}_2(\Gamma_0(N_E))$ . So the assertion follows from (29.5.4.13). Notice  $g = f[w_N]_k = -w_E f$  (30.4.3.9). □

**Remark (31.1.6.5) [Root Numbers].** If  $E$  is semistable, then  $w_E = -\mu(N) a_N(E) = -(-1)^m$ , where  $m$  is the number of finite places over which  $E$  has split multiplicative reduction. ┘

## 7 Zeta Functions of Shimura Varieties

## 8 Tamagawa-Number Conjecture (Bloch-Kato)

References are [A note on Height Pairings, Tamagawa Numbers and the Birch and Swinnerton-Dyer Conjecture, Bloch].

**Conj. (31.1.8.1) [Tamagawa-Number Conjecture].** Let  $F \in \mathbf{NField}$  and  $G \in \mathcal{AlgGrp}/F$ , suppose that  $G(F)$  is discrete in  $G(\mathbf{A}_F)$ , then

$$\tau(G) = \frac{\#\mathrm{Pic}(G)_{\mathrm{tor}}}{\#\mathrm{III}(G)}.$$

Moreover,  $\mathrm{ord}_{s=1} L(s) \leq 0$ , and  $r = 0$  iff  $\mathrm{Vol}(G(\mathbf{A}_F)/G(F)) < \infty$ .  $\lrcorner$

*Proof:*  $\square$

**Thm. (31.1.8.2) [Bloch].** The Tamagawa-number conjecture(31.1.8.1) implies that BSDT conjecture.  $\lrcorner$

*Proof:* [Bloch, Height Pairing and].  $\square$

### Equivariant Tamagawa Number Conjecture

## 9 Others

### Invariants of Moduli Spaces

**Prop. (31.1.9.1).** Volumes and Euler characteristics of moduli spaces are often expressible by special values of  $\zeta$ -functions.  $\lrcorner$

*Proof:*  $\square$

**Def. (31.1.9.2) [Witten  $\zeta$ -Functions].** Because of the appearance in physics(Verlinde formula), people are interested in certain moduli spaces of vector bundles on curves.

Witten gave a formula expressing the volume of these moduli spaces in terms of special values of

**Witten  $\zeta$ -functions:**

Let  $\mathfrak{g}$  be a semisimple f.d. Lie algebra, define

$$\zeta_{\mathfrak{g}}(s) = \sum_{\rho \in \mathrm{Rep}(\mathfrak{g})} \frac{\dim(\rho)^s}{?}$$

$\lrcorner$

**Prop. (31.1.9.3).** A consequence of Witten's formula(31.1.9.2) is:

$$\zeta_{\mathfrak{g}}(2m) \in \mathbb{Q}\pi^{2rm}, m \in \mathbb{Z}_+$$

where  $r$  is the number of positive roots of  $\mathfrak{g}$ .  $\lrcorner$

### Multiple $\zeta$ -Values

Cf. [Zag94].

## 31.2 Euler Systems and Kolyvagin Systems

Cf. [Kol90, Rub96, Rub00, Kat04] and [Scholl].

**Notation (31.2.0.1).**

- Let  $p \in \text{Prime}$ .
- Let  $F \in \text{NField}$ .
- For each modulus  $\mathfrak{m}$  of  $F$ , let  $F(\mathfrak{m})$  be the maximal  $p$ -extension of  $F$  inside the ray class field  $F_{\mathfrak{m}}$ , and  $\Gamma_{\mathfrak{m}} = \text{Gal}(F(\mathfrak{m})/F(1))$ .
- Fix  $T \in \text{Rep}_{\mathbb{Z}_p}^{\text{fd}}(\text{Gal}_F)$ ,  $V = T \otimes_{\mathbb{Z}_p} \mathbb{Q}_p$ ,  $W = V/T = T \otimes_{\mathbb{Z}_p} (\mathbb{Q}_p/\mathbb{Z}_p)$ .
- Suppose  $T$  is unramified outside f.m. places of  $F$ .
- WARNING: notations in this section may subject to change. ?

### 1 Local Cohomologies

This subsection should be moved to somewhere else.

**Prop. (31.2.1.1).** If  $K \in p\text{-Field}$ ,  $\ell \in \text{Prime} \setminus \{p\}$ , and  $V \in \text{Rep}_{\mathbb{Q}_{\ell}}^{\text{fd}}(\text{Gal}_K)$ , then

$$\dim H_{\text{ur}}^1(K, V) = V^{\text{Gal}_K}, \quad \dim \left( H^1(K, V) / H_{\text{ur}}^1(K, V) \right) = \dim H^2(K, V).$$

┘

*Proof:* Cf. [Rubin, P5]. □

**Prop. (31.2.1.2).** Suppose  $K \in \text{Field}$  and  $K_{\infty}/K$  is an infinite  $p$ -extension,  $T \in \text{Rep}_{\mathbb{Z}_p}^{\text{fg}}(\text{Gal}_K)$ , then

$$\varprojlim_{K \subset_{\text{fin}} L \subset K_{\infty}} T^{\text{Gal}_L} = 0,$$

where the transition maps are norm maps. ┘

*Proof:* Define  $T_0 = \varinjlim_{K \subset_{\text{fin}} L \subset K_{\infty}} T^{\text{Gal}_L} \subset T$ , so  $T_0$  is also f.g. over  $\mathbb{Z}_p$ . Then  $T_0 = T^{\text{Gal}_{L_0}}$  for some  $K \subset_{\text{fin}} L_0$ . Then

$$\varprojlim_{K \subset_{\text{fin}} L \subset K_{\infty}} T^{\text{Gal}_L} = \varprojlim_{L_0 \subset_{\text{fin}} L \subset K_{\infty}} T_0 = 0.$$

□

**Prop. (31.2.1.3).** If  $\ell \in \text{Prime} \setminus \{p\}$ ,  $\mathbb{Q}_{\ell} \subset_{\text{fin}} K$ , and  $K_{\infty}$  is the unique  $\mathbb{Z}_p$ -extension of  $K$ . Suppose  $\{c_L\} \in \varprojlim_{K \subset_{\text{fin}} L \subset K_{\infty}} H^1(L, T)$ , then for any  $L$ ,  $c_L \in H_{\text{ur}}^1(L, T)$ . ┘

*Proof:*  $K_{\infty}/K$  is unramified ?, so for any  $K \subset_{\text{fin}} L \subset K_{\infty}$ , there is an exact sequence

$$0 \rightarrow H_{\text{ur}}^1(L, T) \rightarrow H^1(L, T) \rightarrow H^1(I_K, T)^{\text{Gal}_K}.$$

But  $H^1(I_K, T)$  is f.g. over  $\mathbb{Z}_p$  by [Rubin, B.2.7] ?, so taking limit of these exact sequences, we get

$$\varprojlim_{K \subset_{\text{fin}} L \subset K_{\infty}} H_{\text{ur}}^1(L, T) = \varprojlim_{K \subset_{\text{fin}} L \subset K_{\infty}} H^1(L, T)$$

by (31.2.1.2). □

**Cor. (31.2.1.4).** Let  $F_\infty$  be an  $\mathbb{Z}_p^d$ -extension of  $F$ ,  $F \subset_{\text{fin}} L \subset F_\infty$ , and  $v \in \Sigma_L^p$  has infinite decomposition group in  $\text{Gal}(F_\infty/F)$ . Suppose

$$\{c_L\} \in \varprojlim_{F \subset_{\text{fin}} L \subset F_\infty} H^1(L, T),$$

then  $(c_L)_v \in H_{\text{ur}}^1(F_\lambda, T)$ . In particular, this applies to  $L = F$ .  $\lrcorner$

*Proof:* Cf.[Rubin, P155].  $\square$

**Cor. (31.2.1.5).** If  $\Sigma \subset \Sigma_F$  is a finite set of places containing all primes of  $F$  s.t.  $T$  is ramified, and all primes over  $p$ , and all primes whose decomposition group in  $\text{Gal}(F_\infty/F)$  is finite, then

$$\varprojlim_{F \subset_{\text{fin}} L \subset F_\infty} H^1(L, T) = \varprojlim_{F \subset_{\text{fin}} L \subset F_\infty} H^1(F_\Sigma/L, T).$$

$\lrcorner$

*Proof:* Cf.[Rubin, P155].  $\square$

## 2 Selmer Groups

References are [B-K90, F-PR94].

**Def. (31.2.2.1) [Selmer Local Conditions].** For  $F \in \mathbf{NField}$ ,  $v \in \Sigma_F^p$ , denote

$$H_f^1(F_v, V) = H_{\text{ur}}^1(F_v, V) = \ker \left( H^1(F_v, V) \rightarrow H^1(F_v^{\text{ur}}, V) \right) = H^1(F_v^{\text{ur}}/F_v, V^{I_v}) \quad (9.8.1.14),$$

And for places of  $F$  over  $p$ , fix a choice of invariant subspaces  $H_s^1(F, V) \subset H^1(F, V)$ .

Then we can define for any  $v \in \Sigma_{\text{cycl}_{p,n}(\mathbb{Q})}$ ,

$$H_f^1(F_v, W) \subset H^1(F_v, W), \quad H_f^1(F_v, T) \subset H^1(F_v, T).$$

the image and inverse image of  $H_f^1(F_v, V)$  under the maps on cohomologies induced by the exact sequence

$$0 \rightarrow T \rightarrow V \rightarrow W \rightarrow 0.$$

Next, for any  $v \in \Sigma_F$ , denote

$$H_s^1(F_v, T) = H^1(F_v, T)/H_f^1(F_v, T)$$

$$\text{loc}_v^s(T) : H^1(F, T) \rightarrow H_s^1(F_v, T)$$

and similarly for  $W$ .  $\lrcorner$

**Prop. (31.2.2.2).** For  $v \in \Sigma_F^p$ ,

- $H_f^1(F_v, W) = H_{\text{ur}}^1(F_v, W)_{\text{div}}$ .
- $H_{\text{ur}}^1(F_v, T) \subset H_f^1(F_v, T)$  has finite index, and  $H_s^1(F_v, T)$  is torsion-free.
- Let  $\mathcal{W} = W^{I_v}/(W^{I_v})_{\text{div}}$  be finite, then there are natural isomorphisms

$$H_f^1(F_v, W)/H_{\text{ur}}^1(F_v, W) \cong \mathcal{W}/(\text{Frob}_v - 1)W, \quad H_{\text{ur}}^1(F_v, T)/H_f^1(F_v, T) \cong \mathcal{W}^{\text{Frob}_v=1}.$$

- If  $T$  is unramified at  $v$ , then

$$H_f^1(F_v, W) = H_{\text{ur}}^1(F_v, W), \quad H_{\text{ur}}^1(F_v, T) = H_f^1(F_v, T)$$

⌋

*Proof:* 1, 2, 4 follow from 3. For 3, Cf.[Rubin, P6] ?.

□

**Def. (31.2.2.3) [Selmer Groups].** Situation as in (31.2.2.1), define

$$\text{Sel}(F, W) = \ker \left( H^1(F, W) \xrightarrow{\text{loc}^s(W)} \bigoplus_{v \in \Sigma_F} H_s^1(F_v, W) \right).$$

Moreover, for  $\emptyset \subset_{\text{fin}} S \subset \Sigma_F^{\text{fin}}$ , we can define

$$\text{Sel}^S(F, W) = \ker \left( H^1(F, W) \rightarrow \bigoplus_{v \notin S} H_s^1(F_v, W) \right).$$

$$\text{Sel}_S(F, W) = \ker \left( \text{Sel}^\Sigma(F, W) \rightarrow \bigoplus_{v \in S} H^1(F_v, W) \right).$$

⌋

**Prop. (31.2.2.4).** When  $V$  is unramified a.e., we have  $\dim H_{\mathcal{L}}^1(\text{Gal}_F, V) < \infty$  for any Selmer structure  $\mathcal{L}$ .

⌋

*Proof:* ? This is because of the fact  $\text{Gal}_{F,S}$  is  $p$ -finite and then apply the proposition of Tate. ? □

### Bloch-Kato Selmer Groups

**Conj. (31.2.2.5) [Change of Partial Bloch-Kato Selmer Groups, Fontaine-Perrin.Riou].** For  $\emptyset \subset_{\text{fin}} S \subset \Sigma_F^{\text{fin}}$  and  $v \in \Sigma_F^{\text{fin}} \setminus S$ , we have

$$\dim H_{f, S \cup \{v\}}^1(\text{Gal}_F, V) = \dim H_{f, S}^1(\text{Gal}_F, V) + \dim \left( H_g^1(\text{Gal}_F, V) / H_f^1(\text{Gal}_F, V) \right).$$

⌋

*Proof:* ? Cf.[Fontaine-Perrin.Riou]Chap2.3.3.1.

□

**Def. (31.2.2.6) [Hypothesis].** Situation as in (31.2.2.1), assume for all the time that the choices  $H_f^1(F_p, V)$  and  $H_f^1(F_p, V^D)$  satisfy:

- $H_f^1(\text{cycl}_{p,n}(\mathbb{Q}_p), V)$  and  $H_f^1(\text{cycl}_{p,n}(\mathbb{Q}_p), V^D)$  are orthogonal complements under the cup product pairing

$$H^1(\text{cycl}_{p,n}(\mathbb{Q}_p), V) \times H^1(\text{cycl}_{p,n}(\mathbb{Q}_p), V^D) \rightarrow H^2(\text{cycl}_{p,n}(\mathbb{Q}_p), \mathbb{Q}_p(1)) = \mathbb{Q}_p. ?$$

- For  $m \geq n$ ,

$$\text{cor}_{\text{cycl}_{p,n}(\mathbb{Q})}^{\text{cycl}_{p,m}(\mathbb{Q}_p)} H_f^1(\text{cycl}_{p,m}(\mathbb{Q}), V) \subset H_f^1(\text{cycl}_{p,n}(\mathbb{Q}_p), V).$$

$$\text{res}_{\text{cycl}_{p,m}(\mathbb{Q})}^{\text{cycl}_{p,n}(\mathbb{Q}_p)} H_f^1(\text{cycl}_{p,n}(\mathbb{Q}), V) \subset H_f^1(\text{cycl}_{p,m}(\mathbb{Q}_p), V).$$

┘

**Prop. (31.2.2.7) [Selmer Group of Elliptic Curves].** If  $T = T_p(E)$ ,  $W = E[p^\infty]$  where  $E \in \text{EllCur}/\mathbb{Q}$ , and define

$$H_f^1(\mathbb{Q}_{n,p}, V) = \text{Im} \left( E(\mathbb{Q}_{n,p}) \otimes \mathbb{Q}_p \hookrightarrow H^1(\mathbb{Q}_{n,p}, V) \right),$$

then  $\text{Sel}(\mathbb{Q}_n, W) = \text{Sel}^{p^\infty}(E/\mathbb{Q}_n)$  (21.1.8.7)(21.1.8.3) is the classical Selmer group. ┘

*Proof:* For  $v \in \Sigma_{\mathbb{Q}_n}^p$ , by (21.3.4.16),  $\#E(\mathbb{Q}_{n,v})[p^\infty] < \infty$ , so  $E(\mathbb{Q}_{n,v}) \otimes (\mathbb{Q}_p/\mathbb{Z}_p) = 0$ . And also by (31.2.1.1),

$$\dim H_f^1(\mathbb{Q}_{n,v}, V_p(E)) = \dim V_p(E)^{\text{Gal}_{\mathbb{Q}_{n,v}}} = 0,$$

because  $\#E(\mathbb{Q}_{n,v})[p^\infty] < \infty$ . So

$$H_f^1(\mathbb{Q}_{n,v}, W) = \text{Im} \left( E(\mathbb{Q}_{n,v}) \otimes (\mathbb{Q}_p/\mathbb{Z}_p) \rightarrow H^1(\mathbb{Q}_{n,v}, W) \right)$$

for any place  $v$ . Thus the assertion follows from the definitions (31.2.2.1)(21.1.8.3). ┘

**Def. (31.2.2.8) [Variants of Bloch-Kato Selmer Groups].**  $H_g^1, H_e^1$ . ┘

### Jensen's Conjecture

**Prop. (31.2.2.9).** Let  $F \in \mathbf{NField}$ ,  $V$  be a  $p$ -adic geometric representation of  $\text{Gal}_{F,S}$ , then the following are equivalent:

- The natural map  $H^1(\text{Gal}_{F,S}, V^*(1)) \rightarrow \prod_{v \in S} H^1(\text{Gal}_v, V^*(1))$  is injective.
- 

$$\begin{aligned} \dim H^1(\text{Gal}_{F,S}, V) &= [F : \mathbb{Q}] \dim V + \dim H^0(\text{Gal}_{F,S}, V) - \dim H^0(\text{Gal}_{F,S}, V^*(1)) \\ &\quad + \sum_{v \in S} \dim H^0(\text{Gal}_{F_v}, V^*(1)) - \sum_{v \in \Sigma_F^\infty} \dim H^0(\text{Gal}_{F_v}, V). \end{aligned}$$

•

$$\dim H^2(\text{Gal}_{F,S}, V) = \sum_{v \in S} \dim H^0(\text{Gal}_{F_v}, V^*(1)) - \dim H^0(\text{Gal}_{F,S}, V^*(1)).$$

Moreover, in item2 and item3, LHS ≤ RHS always holds. ┘

*Proof:* Cf. [Belliache, introduction to conjecture of Bloch-Kato]P52. ┘

**Conj. (31.2.2.10) [Jannsen].** Situation as in (31.2.2.9), if  $V$  is pure of weight  $w \neq -1$ , then the statements of item1,2,3 hold. ┘

*Proof:*

┘

**Prop. (31.2.2.11).** Jannsen's conjecture for  $V = \mathbb{Q}_p$  is equivalent to Leopoldt's conjecture. ┘

*Proof:* ?

┘

### Selmer Groups over $F_\infty$

**Def. (31.2.2.12).** Define  $\Lambda_p$ -modules [33.1](#)

$$\begin{aligned} \text{Sel}(F_\infty, W) &= \varinjlim_{F \subset_{\text{fin}} F' \subset F_\infty} \text{Sel}(F', W), \quad X_\infty = \text{Hom}(\text{Sel}(F_\infty, W^D), \mathbb{Q}_p/\mathbb{Z}_p), \\ H_\infty^1(F, T) &= \varprojlim_{F \subset_{\text{fin}} F' \subset F_\infty} H^1(F', T), \quad H_{\infty, s}^1(F_p, T) = \varprojlim_{F \subset_{\text{fin}} F' \subset F_\infty} H_s^1(F', T). \end{aligned}$$

where the transition maps are induced by restriction and corestriction maps [\(31.2.2.6\)](#). Then they are f.g.  $\Lambda_p$ -modules [?](#).

Similarly define

$$\text{Sel}_{S(p)}(F_\infty, W) = \varinjlim_{F \subset_{\text{fin}} F' \subset F_\infty} \text{Sel}_{S(p)}(F', W), \quad X_{\infty, S(p)} = \text{Hom}(\text{Sel}_{S(p)}(F_\infty, W^D), \mathbb{Q}_p/\mathbb{Z}_p).$$

┘

**Prop. (31.2.2.13).** There is an exact sequence

$$0 \rightarrow H_{\infty, s}^1(F_p, T)/\text{loc}_{\infty, S(p)}^s(H_\infty^1(F, T)) \rightarrow X_\infty \rightarrow X_{\infty, S(p)} \rightarrow 0.$$

┘

*Proof:* Cf. [\[Rubin, P29\]](#). [?](#)

□

### Poitou-Tate Duality

**Prop. (31.2.2.14) [Poitou-Tate Duality].** Let  $m \in \mathbb{Z}_+$  and  $\emptyset \subset_{\text{fin}} \Sigma_0 \subset_{\text{fin}} \Sigma \subset \Sigma_F$ , then

- There are exact sequences

$$\begin{aligned} 0 \rightarrow \text{Sel}^{\Sigma_0}(F, W[m]) \rightarrow S^{\Sigma}(F, W[m]) &\xrightarrow{\text{loc}_{\Sigma, \Sigma_0}^s} \bigoplus_{v \in \Sigma \setminus \Sigma_0} H_s^1(F_v, W[m]) \\ 0 \rightarrow \text{Sel}_{\Sigma}(F, W[m]) \rightarrow S^{\Sigma_0}(F, W[m]) &\xrightarrow{\text{loc}_{\Sigma, \Sigma_0}^f} \bigoplus_{v \in \Sigma \setminus \Sigma_0} H_f^1(F_v, W[m]) \end{aligned}$$

- $\text{Im}(\text{loc}_{\Sigma, \Sigma_0}^s)$  and  $\text{Im}(\text{loc}_{\Sigma, \Sigma_0}^f)$  are orthogonal w.r.t. the pairing  $\sum_{v \in \Sigma \setminus \Sigma_0} \langle -, - \rangle_v$ .
- There is an isomorphism

$$\text{Sel}_{\Sigma_0}(F, W^D[m])/\text{Sel}_{\Sigma}(F, W^D[m]) \cong \text{Hom}_{\mathbb{Z}_p}(\text{Coker}(\text{loc}_{\Sigma, \Sigma_0}^s), \mathbb{Z}_p/(m)).$$

┘

*Proof:* 1 is clear, and 3 follows from 2. For 2, Cf. [\[Rubin, P17\]](#). [?](#)

□

**Remark (31.2.2.15).** When  $\Sigma$  is large, we can make  $\text{Sel}_{\Sigma}(F, W^D[m]) = 0$ , then  $\#\text{Sel}_{\Sigma_0}(F, W^D[m]) = \#\text{Coker}(\text{loc}_{\Sigma, \Sigma_0}^s)$ . So if we can construct enough element in  $S^{\Sigma}(F, W[m])$ , then we bound  $\text{Sel}_{\Sigma_0}(F, W^D[m])$ . And this can be done by Kolyvagin's derivative construction [4](#) applied to Euler classes.

┘

**Cor. (31.2.2.16).** There is an isomorphism

$$\text{Sel}(F, W^D)/\text{Sel}_{S(p)}(F, W^D) \cong \text{Hom}_{\mathbb{Z}_p}(\text{Coker}(\text{loc}_{S(p)}^s), \mathbb{Q}_p/\mathbb{Z}_p).$$

┘

### 3 Euler Systems

**Def. (31.2.3.1) [Euler Systems].** Suppose  $F \in \mathbf{NField}$ ,  $p \in \mathbf{P}$  and  $F_\infty/F$  is an  $\mathbb{Z}_p^d$ -extension s.t. no finite place of  $F$  splits completely (This is satisfied if  $F_\infty$  contains the cyclotomic  $\mathbb{Z}_p$ -extension of  $F$ ?). Suppose

- $\mathcal{K}$  is an Abelian extension of  $F$  containing  $F_\infty$  and  $F(\mathfrak{p})$  for any  $\mathfrak{p} \in \Sigma_F^{\text{fin}}$ ,
- $\mathcal{N}$  is an ideal of  $F$  divisible by  $p$  and all finite places that  $T$  is ramified (31.2.0.1).

Then an **Euler system** for  $(T, \mathcal{K}, \mathcal{N})$  is a collection of cohomology classes

$$\mathbf{c} = \{\mathbf{c}_{F'} \in H^1(F', T) : F \subset_{\text{fin}} F' \subset \mathcal{K}\}$$

satisfying

$$\text{cor}_{F''/F'}(\mathbf{c}_{F''}) = \left( \prod_{\mathfrak{q} \in \Sigma(F''/F')} P_{\mathfrak{q}}(\|\mathfrak{q}\|^{-1} \text{Frob}_{\mathfrak{q}}^{-1}) \right) (\mathbf{c}_{F'}),$$

where  $\Sigma(F''/F')$  is the set of finite places of  $F$  not dividing  $\mathcal{N}$  that is ramified in  $F''$  but not in  $F'$ .

And an Euler system for  $(T, F_\infty)$  is any Euler system for such  $(T, \mathcal{K}, \mathcal{N})$ .  $\lrcorner$

**Example (31.2.3.2) [Euler Systems for  $\mathbb{Q}$ ].** For  $N \in \mathbb{Z}_+$ , let  $\mathcal{R}(N)$  be the set of square-free integers  $r$  s.t.  $(r, N) = 1$ , and  $\mathbb{Q}_\infty$  be the cyclotomic  $\mathbb{Z}_p$ -extension of  $\mathbb{Q}$ , then an Euler system  $\mathbf{c}$  for  $(T, \mathbb{Q}_\infty)$  is a collection of cohomology classes

$$\mathbf{c}_{\mathbb{Q}_n(\mu_r)} \in H^1(\mathbb{Q}_n(\mu_r); T)$$

s.t. for any  $r \in \mathcal{R}(N)$ ,  $\ell \in \mathbf{P}$ ,  $r\ell \in \mathcal{R}(N)$  and  $m \geq n \in \mathbb{N}$ ,

$$\text{cor}_{\mathbb{Q}_n(\mu_{r\ell})/\mathbb{Q}_n(\mu_r)}(\mathbf{c}_{\mathbb{Q}_n(\mu_{r\ell})}) = P_\ell(\ell^{-1} \text{Frob}_\ell^{-1})(\mathbf{c}_{\mathbb{Q}_n(\mu_r)}).$$

$\lrcorner$

**Def. (31.2.3.3).** If  $\mathbf{c}$  is an Euler system, denote  $\mathbf{c}_{F,\infty}$  the corresponding element in  $H_\infty^1(F, T)$ , and the ideal

$$\text{ind}_{\Lambda_p}(\mathbf{c}) = \{\varphi(\mathbf{c}_{F,\infty}) : \varphi \in \text{Hom}_{\Lambda_p}(H_\infty^1(F, T), \Lambda_p)\} \subset \Lambda_p.$$

and also

$$\text{ind}_{\mathbb{Z}_p}(\mathbf{c}) = \sup\{n : \mathbf{c}_F \in p^n H^1(F, T) + H^1(F, T)_{\text{tor}}\}.$$

$\lrcorner$

### Twisting by Characters

**Prop. (31.2.3.4) [Twisting Cohomology Groups].** For any extension of number fields  $L/F \in \mathbf{NField}$ , denote

$$H_\infty^1(L, T) = \varprojlim_{F \subset_{\text{fin}} F' \subset F_\infty} H^1(F'L, T), \quad L_\infty = LK_\infty.$$

Then for any character  $\rho : \text{Gal}(L_\infty/K) \rightarrow \mathbb{Z}_p^*$  and  $S(p) \subset \Sigma \subset \Sigma_F$ , there are  $\text{Gal}_K$ -isomorphisms

$$H_\infty^1(L, T)(\rho) \cong H_\infty^1(L, T(\rho)), \quad \text{Sel}_\Sigma(L_\infty, W)(\rho) \cong \text{Sel}_\Sigma(L_\infty, W(\rho)).$$

$\lrcorner$

*Proof:* Cf.[Rubin, P91].? □

**Prop. (31.2.3.5).** Suppose  $\mathbf{c}$  is an Euler system for  $(T, \mathcal{K}, \mathcal{N})$ , and  $\rho : \text{Gal}(F_\infty/F) \rightarrow \mathbb{Z}_p^*$  is a character with fixed field  $L$  and conductor  $\mathfrak{f}$ , then for any field  $F \subset_{\text{fin}} F' \subset \mathcal{K}$ , denote by  $\mathbf{c}_{F'}^\rho \in H^1(F, T(\chi))$  the image of  $\mathbf{c}_{F'L}(\rho)$  under the map

$$H^1(F'L, T)(\rho) \xrightarrow{\text{cor}} H^1(F', T(\rho)).$$

Then  $\{\mathbf{c}_{F'}^\rho\}$  form an Euler system for  $(T(\rho), \mathcal{K}, \mathfrak{f}^{p^\infty}\mathcal{N})$ . ┘

*Proof:* Cf.[Rubin, P30, 93].? □

#### 4 Kolyvagin Derivatives

**Def. (31.2.4.1) [Kolyvagin Primes].** Suppose  $F \subset_{\text{fin}} F' \subset F_\infty, m \in \mathbb{Z}_+,$  define  $\mathcal{R}_{F',m} \subset \mathcal{R}(\mathcal{N})$  to be the set of products of primes  $\mathfrak{q}$  of  $F$  s.t.

- $m|[F(\mathfrak{q}) : F(1)],$
  - $P_{\mathfrak{q}}(|\mathfrak{q}|^{-1})/m \in \mathbb{Z}_p,$
  - $\mathfrak{q}$  splits completely in  $F'(1)/F.$
- ┘

**Def. (31.2.4.2) [Kolyvagin Derivatives].** For any  $\mathfrak{q} \in \Sigma_F^p,$   $\Gamma_{\mathfrak{q}} = \text{Gal}(F(\mathfrak{q})/F(1))$  is canonical isomorphic to a cyclic group with generator  $\sigma_{\mathfrak{q}}$  (? , [Rubin, P62]). Define

$$D_{\mathfrak{q}} = \sum_{i=0}^{\#\Gamma_{\mathfrak{q}}-1} i\sigma_{\mathfrak{q}}^i \in \mathbb{Z}[\Gamma_{\mathfrak{q}}],$$

and for any  $\mathfrak{r} \in \mathcal{R}(\mathcal{N}),$  define

$$D_{\mathfrak{r}} = \prod_{\mathfrak{q}|\mathfrak{r}} D_{\mathfrak{q}} \in \mathbb{Z}[\Gamma_{\mathfrak{r}}].$$

And if  $F \subset_{\text{fin}} L \subset F_\infty,$  fix an element  $N_{L(1)/L} \in \mathbb{Z}[\text{Gal}(L(\mathfrak{r})/L)]$  whose restriction to  $\text{Gal}(F(1)/F)$  is  $\sum_{\gamma \in \text{Gal}(F(1)/F)} \gamma,$  then define

$$D_{\mathfrak{r},L} = N_{L(1)/L} D_{\mathfrak{r}}.$$
┘

**Def. (31.2.4.3) [Kolyvagin Systems].** Suppose  $\mathbf{c}$  is an Euler system,  $F \subset_{\text{fin}} L \subset F_\infty, m \in \mathbb{Z}_+,$  and  $\mathfrak{r} \in \mathcal{R}_{L,m},$  define

$$\kappa_{L,\mathfrak{r},M} = \delta_L(\mathbf{d}(D_{\mathfrak{r},L} x_{F(\mathfrak{r})})) \in H^1(F, W[m]).$$
┘

*Proof:* ? . Cf.[Rubin, P66]. □

**Cor. (31.2.4.4) [Properties of  $\kappa_{L,\mathfrak{r},m}$ ].**

- $\kappa_{L,1,m}$  is the image of  $\mathbf{c}_L$  in  $H^1(L, W[m]).$
  - The restriction of  $\kappa_{L,\mathfrak{r},m}$  to  $L(\mathfrak{r})$  is the image of  $D_{\mathfrak{r},L} \mathbf{c}_{L(\mathfrak{r})}$  in  $H^1(L(\mathfrak{r}), W[m]).$
  - $\kappa_{L,1,m}$  is compatible with  $m.$
- ┘

*Proof:* Cf.[Rubin, P67].? □

### Local Properties

**Thm. (31.2.4.5).** Suppose  $F \subset_{\text{fin}} F' \subset F_\infty, m \in \mathbb{Z}_+,$  and  $\mathfrak{r} \in \mathcal{R}_{F',m},$  then

$$\kappa_{F,\mathfrak{r},m} \in \text{Sel}^{S(pv)}(F', W[m]).$$

┘

*Proof:* Cf.[Rubin, P67].

□

**Thm. (31.2.4.6) [Ramification of Kolyvagin Systems].** Suppose  $F \subset_{\text{fin}} F' \subset F_\infty, m \in \mathbb{Z}_+,$  and  $\mathfrak{r}\mathfrak{q} \in \mathcal{R}_{F,m},$  then

$$\text{loc}_{\mathfrak{q}}^s(\kappa_{F,\mathfrak{r}\mathfrak{q},m}) = \phi_{\mathfrak{q}}^{fs}(\kappa_{F,\mathfrak{r},m}).$$

┘

*Proof:* Cf.[Rubin, P68].

### 5 $p$ -adic $L$ -Functions for Elliptic Curves

**Thm. (31.2.5.1) [ $p$ -adic  $L$ -Functions].** Let  $E \in \text{EllCur}/\mathbb{Q}, p \in \mathbf{P}.$  Suppose  $E \in \text{EllCur}/\mathbb{Q}$  has good ordinary reduction or multiplicative reduction at  $p.$  Let  $\alpha \in \mathbb{Z}_p^*, \beta = p/\alpha \in p\mathbb{Z}_p^*$  be the eigenvalues of  $\text{Frob}_p$  on  $T_p(E)$  if  $E$  has good ordinary reduction at  $p,$  or  $(\alpha, \beta) = (1, p)$  or  $(-1, -p)$  if  $E$  has split or non-split multiplicative reduction.

Then there exists  $c_E \in \mathbb{Z}_+$  independent of  $p$  and a  $p$ -adic  $L$ -function  $\mathcal{L}_E \subset c_E^{-1}\Lambda_p$  s.t. for any character  $\chi$  of  $\text{Gal}(\text{cycl}_p(\mathbb{Q})/\mathbb{Q})$  of finite order,

$$\chi(\mathcal{L}_E) = \begin{cases} (1 - \alpha^{-1})^2 L(E; 1)/\Omega_E & , \chi = 1 \& E \text{ has good reduction at } p. \\ (1 - \alpha^{-1}) L(E; 1)/\Omega_E & , \chi = 1 \& E \text{ has multiplicative reduction at } p. \\ \alpha^{-n} \tau(\chi) L(E, \chi^{-1}; 1)/\Omega_E & , \mathfrak{c}(\chi) = p^n > 1 \end{cases}$$

And for any  $N \in \mathbb{Z}_+,$  we can define

$$\mathcal{L}_{E,N} = \prod_{q|N, q \neq p} P_\ell(\ell^{-1} \text{Frob}_\ell^{-1}) \mathcal{L}_E \in \Lambda_p.$$

┘

*Proof:* Cf.[Mazur-Tate-T]?

□

### Coleman Map

**Def. (31.2.5.2) [Coleman Map].** Suppose  $E \in \text{EllCur}/\mathbb{Q}$  has good ordinary reduction or multiplicative reduction at  $p,$  then there is an injective  $\Lambda_p$ -module map

$$\text{Col}_\infty : H_{\infty,s}^1(\mathbb{Q}_p, T_p(E)) \hookrightarrow \Lambda_p$$

s.t.

- For any element  $z = \{z_n\} \in H_{\infty,s}^1(\mathbb{Q}_p, T_p(E))$  and any non-trivial character  $\chi$  of  $G_n = \text{Gal}(\text{cycl}_{p,n}(\mathbb{Q})/\mathbb{Q})$  of conductor  $p^m,$

$$\chi(\text{Col}_\infty(z)) = \alpha^{-m} \tau(\chi) \sum_{\gamma \in G_n} \chi^{-1}(\gamma) \exp_{\omega_E}^*(z_n^\gamma).$$

- If  $\chi_0$  is the trivial character, then

$$\chi_0(\text{Col}_\infty(z)) = (1 - \alpha^{-1})(1 - \beta^{-1})^{-1} \exp_{\omega_E}^*(z).$$

- If  $E$  has split multiplicative reduction at  $p$ , then the image of  $\text{Col}_\infty$  is contained in the augmentation ideal  $\mathcal{J}_p$  of  $\Lambda_p$ .

┘

*Proof:* Cf.[Rubin short, Appendix] ?.

□

### Local Cohomology Groups

**Prop. (31.2.5.3).** Let  $K \in p\text{-Field}$  and  $E \in \text{EllCur}/K$  with a Néron differential  $\omega_E$  (21.1.1.3), then  $\text{Tgt}^*(E/K) = K\omega_E$ , and  $\text{Tgt}(E/K) = K\omega_E^*$ . There exists an exponential map

$$\exp_E : \text{Tgt}(E/K) \cong E(K) \otimes \mathbb{Q}_p$$

and the following diagram is commutative:

$$\begin{array}{ccc} \text{Tgt}(E/K) & \xrightarrow{\exp_E} & E(K) \otimes \mathbb{Q}_p \\ \omega_E^* \uparrow & & \uparrow = \\ K & \xleftarrow{\log_E} \widehat{E}(\mathfrak{m}_K) \otimes \mathbb{Q}_p \xrightarrow{\cong} & E_1(K) \otimes \mathbb{Q}_p \end{array}$$

where all the maps are isomorphisms.

┘

*Proof:* ?

□

**Prop. (31.2.5.4).** By the definition and local Tate pairing,

$$\text{Hom}(E(\mathbb{Q}_{n,p}), \mathbb{Q}_p) = \text{Hom}(H_f^1(\mathbb{Q}_{n,p}, V_p(E)), \mathbb{Q}_p) \cong H_s^1(\mathbb{Q}_{n,p}, V_p(E)).$$

So we can define a dual exponential map

$$\exp_E^* : H_s^1(\mathbb{Q}_{n,p}, V) \rightarrow \text{Tgt}^*(E/\mathbb{Q}_{n,p})$$

and its composite with  $\omega_E^*$ :

$$\exp_{\omega_E}^* : H_s^1(\mathbb{Q}_{n,p}, V) \rightarrow \text{Tgt}^*(E/\mathbb{Q}_{n,p})/\omega_E \cong \mathbb{Q}_{n,p}.$$

More explicitly, for  $z \in H_s^1(\mathbb{Q}_{n,p}, V_p(E))$ ,  $x \in E(\mathbb{Q}_{n,p})$ ,

$$\text{tr}_{\mathbb{Q}_{n,p}/\mathbb{Q}_p}(\lambda_E(x) \exp_{\omega_E}^*(z)) = \langle x, z \rangle_{\mathbb{Q}_{n,p}}.$$

┘

**Prop. (31.2.5.5).**

$$\exp_{\omega_E}^*(H_s^1(\mathbb{Q}_p, T)) = \frac{1}{p}[E(\mathbb{Q}_p) : E_1(\mathbb{Q}_p) + E(\mathbb{Q}_p)_{\text{tor}}]\mathbb{Z}_p.$$

┘

*Proof:* By duality, if  $\lambda_E(\mathbb{Q}_p) = p^{-a}\mathbb{Z}_p$ , then  $\exp_{\omega_E}^*(H_s^1(\mathbb{Q}_p, T)) = p^a\mathbb{Z}_p$ . But  $\lambda_E(E_1(\mathbb{Q}_p)) = p\mathbb{Z}_p$ , so the assertion follows. □

## 6 Bounding Selmer Groups

**Notation (31.2.6.1).**

- Fix an Euler system  $\mathbf{c}$  for  $(T, F_\infty)$  (31.2.3.2).  $\mathbf{c}_F \in \text{Sel}^{S(p)}(F, T)$  by (31.2.1.4) and (31.2.2.2).
- Suppose the choices of Selmer local conditions satisfy hypothesis (31.2.2.6).

┘

### Hypothesis on Representations

**Def. (31.2.6.2) [Hypothesis].**  $T$  satisfies the hypothesis

**Hypothesis Hyp** $(F_\infty; T)$  if:

- There exists  $\tau \in \text{Gal}_{F(1)F(\mu_{p^\infty})}$  s.t.  $T/(\tau - 1)T$  is free of rank 1 over  $\mathbb{Z}_p$ , and
- $T/(p) \in \text{Irr}_{\mathbb{F}_p}(\text{Gal}_{F_\infty})$ .

**Hypothesis Hyp** $(F_\infty; V)$  if:

- There exists  $\tau \in \text{Gal}_{F(1)F(\mu_{p^\infty})}$  s.t.  $\dim_{\mathbb{Q}_p} V/(\tau - 1)V = 1$ , and
- $V \in \text{Irr}_{\mathbb{Q}_p}(F_\infty)$ .

**Hypothesis Hyp** $(F_\infty/F)$  if:

- $\text{rank}_{\mathbb{Z}_p}(\text{Gal}_{F_\infty/F}) > 1$  or
- neither  $T$  nor  $T(-1)$  is trivial, or
- $F$  is imaginary quadratic, or
- $F$  is totally real and Leopoldt's conjecture holds for  $F$ .

┘

**Prop. (31.2.6.3).** Suppose  $E \in \text{EllCur}/\mathbb{Q}$  without CM, then

- $T = T_p(E)$  satisfies the hypothesis  $\text{Hyp}(\text{cycl}_p(\mathbb{Q}); V)$  (31.2.6.2), and  $\#H^1(\mathbb{Q}(E[p^\infty])/\mathbb{Q}, E[p^\infty]) < \infty$ .
- If  $\rho_{E,p} : \text{Gal}_{\mathbb{Q}} \rightarrow \text{Aut}(T_p)$  is surjective, then  $T_p(E)$  satisfies the hypothesis  $\text{Hyp}(\text{cycl}_p(\mathbb{Q}), T)$  (31.2.6.2), and  $H^1(\mathbb{Q}(E[p^\infty])/\mathbb{Q}, E[p^\infty]) = 0$ .

┘

*Proof:* By Weil pairing,

$$\rho_{E,p}(\text{Gal}_{\mathbb{Q}(\mu_{p^\infty})}) = \rho_{E,p}(\text{Gal}_{\mathbb{Q}}) \cap \text{SL}(2, \mathbb{Z}_p).$$

When  $\rho_{E,p} : \text{Gal}_{\mathbb{Q}} \rightarrow \text{Aut}(T_p)$  is surjective, then  $\overline{\rho_{E,p}}$  is surjective thus irreducible, and also we can take  $\rho_{E,p}(\tau) = \begin{bmatrix} 1 & 1 \\ & 1 \end{bmatrix}$ . So  $T_p(E)$  satisfies the hypothesis  $\text{Hyp}(\text{cycl}_p(\mathbb{Q}), T)$ .

And because  $E$  has no CM, by [Serre, Galois Property Points Elliptiques, (1972) Cor1 of Thm3],  $\rho_{E,p}(\text{Gal}_{\mathbb{Q}}) \subset \text{GL}(2, \mathbb{Z}_p)$  is open. So  $\rho_{E,p}|_{\text{Gal}_{\mathbb{Q}(\mu_{p^\infty})}}$  is irreducible, and we can take  $\rho_{E,p}(\tau) = \begin{bmatrix} 1 & x \\ & 1 \end{bmatrix}$  for some  $x \neq 0$ . So  $T_p(E)$  satisfies the hypothesis  $\text{Hyp}(\text{cycl}_p(\mathbb{Q}), V)$ .

Finally, the cohomology group can be calculated directly **?**.

□

### Bounding Selmer Groups over $F$

**Thm. (31.2.6.4).** Suppose  $V$  satisfies  $\text{Hyp}(F; V)$  (31.2.6.2), and  $V$  is not the trivial representation.

- If  $\mathbf{c}_F \notin H^1(F, T)_{\text{tor}}$ , then  $\# \text{Sel}_{S(p)}(F, W^D) < \infty$ .
- If  $\text{loc}_p^s(\mathbf{c}_Q) \neq 0$  and  $[H_s^1(\mathbb{Q}_p, T) : \mathbb{Z}_p \text{loc}_p^s(\mathbf{c}_Q)] < \infty$ , then  $\# \text{Sel}(\mathbb{Q}, W^D) < \infty$ .

(If  $V$  is trivial, this is true iff the Leopoldt's conjecture holds).  $\lrcorner$

*Proof:* Cf. [Rubin, P24]. ?

2: It follows from (31.2.2.16) that

$$[\text{Sel}(\mathbb{Q}, W^D) : \text{Sel}_p(\mathbb{Q}, W^D)] = [H_s^1(\mathbb{Q}_p, T) : \mathbb{Z}_p \text{loc}_p^s(\text{Sel}^p(\mathbb{Q}, T))] \leq [H_s^1(\mathbb{Q}_p, T) : \mathbb{Z}_p \text{loc}_p^s(\mathbf{c}_Q)].$$

So the assertion follows from item1.  $\square$

**Cor. (31.2.6.5).** Suppose  $V$  satisfies  $\text{Hyp}(\text{cycl}_p(\mathbb{Q}); V)$  (31.2.6.2),  $\text{loc}_p^s \mathbf{c}_Q \neq 0$ , and  $\text{rank}_{\mathbb{Z}_p} H_s^1(\mathbb{Q}_p, T) = 1$ , then  $\# \text{Sel}^{p^\infty}(\mathbb{Q}, W^D) < \infty$ .  $\lrcorner$

*Proof:* This is because  $H_s^1(\mathbb{Q}_p, T)$  is torsion-free.  $\square$

**Thm. (31.2.6.6).** Suppose  $T$  satisfies  $\text{Hyp}(\text{cycl}_p(\mathbb{Q}); T)$  (31.2.6.2),  $p > 2$ . Let  $\Omega = \mathbb{Q}(W)\mathbb{Q}((\mathbb{Z}_p^*)^{1/p^\infty})$ , where  $\mathbb{Q}(W)$  is the minimal extension of  $\mathbb{Q}$  that  $\text{Gal}_{\mathbb{Q}(W)}$  acts trivially on  $W$ .

- Then

$$\# \text{Sel}_p(\mathbb{Q}, W^D) \leq p^{\text{ind}_{\mathbb{Z}_p}(\mathbf{c})} \# \left( H^1(\Omega/\mathbb{Q}, W) \cap \text{Sel}^p(\mathbb{Q}, W) \right) \# \left( H^1(\Omega/\mathbb{Q}, W) \cap \text{Sel}_p(\mathbb{Q}, W^D) \right)$$

- If  $\text{loc}_p^s(\mathbf{c}_Q) \neq 0$  (31.2.2.1), then

$$\# \text{Sel}(\mathbb{Q}, W^D) \leq [H_s^1(\mathbb{Q}_p, T) : \mathbb{Z}_p \text{loc}_p^s(\mathbf{c}_Q)] \# \left( H^1(\Omega/\mathbb{Q}, W) \cap \text{Sel}^p(\mathbb{Q}, W) \right) \# \left( H^1(\Omega/\mathbb{Q}, W^D) \cap \text{Sel}_p(\mathbb{Q}, W^D) \right).$$

Notice  $\# H^1(\Omega/\mathbb{Q}, W) \# H^1(\Omega/\mathbb{Q}, W^D) < \infty$  when  $V$  is irreducible and  $\dim V > 2$ , by [Rubin, P162]. ?  $\lrcorner$

*Proof:* Cf. [Rubin, P24]. ?

2: Notice  $H^1(\mathbb{Q}, T)/\text{Sel}^p(\mathbb{Q}, T) \hookrightarrow \bigoplus_{v \in \Sigma_Q^p} H_s^1(\mathbb{Q}_v, T)$  is torsion-free, so  $\mathbf{c}_Q \in p^n H^1(\mathbb{Q}, T) + H^1(\mathbb{Q}, T)_{\text{tor}}$  implies  $\mathbf{c}_Q \in p^n \text{Sel}^p(\mathbb{Q}, T) + H^1(\mathbb{Q}, T)_{\text{tor}}$ , which implies  $\text{loc}_p^s(\mathbf{c}_Q) \in p^n \text{loc}_p^s(\text{Sel}^p(\mathbb{Q}, T))$ . Then the assertion follows from (31.2.2.16) and item1.  $\square$

### Bounding Selmer Groups over $F_\infty$

**Prop. (31.2.6.7).** Suppose  $V$  satisfies  $\text{Hyp}(F_\infty, V)$  with  $\tau$ . Define  $Z$  (resp.  $Z^D$ ) to be the maximal  $\text{Gal}_{F_\infty}$ -stable submodule of  $(\tau - 1)W$  (resp.  $W^D$ ), and

$$a_\tau = [W^\tau : (W^\tau)_{\text{div}}] \cdot \max(\#Z, \#Z^D).$$

Then  $a_\tau < \infty$ . And if  $T$  satisfies  $\text{Hyp}(F_\infty, T)$ , then  $a_\tau = 1$ .  $\lrcorner$

*Proof:* Cf. [Rubin, P98]. ?  $\square$

**Thm. (31.2.6.8).** Suppose  $V$  satisfies  $\text{Hyp}(F_\infty; V)$  and  $\text{Hyp}(F_\infty/F)$  (31.2.6.2),  $\mathbf{c}_{F, \infty} \notin H_\infty^1(F, T)_{\Lambda_p - \text{tor}}$ , then

- (Weak Leopoldt Conjecture)  $X_{\infty, S(p)}$  is a torsion  $\Lambda_p$ -module.
- There exists  $t \in \mathbb{N}$  s.t.  $\text{char}(X_{\infty, S(p)}) | p^t \text{ind}_{\Lambda_p}(\mathbf{c})$ .
- If moreover  $T$  satisfies  $\text{Hyp}(F_{\infty}; T)$  (31.2.6.2), then  $\text{char}(X_{\infty, S(p)}) | \text{ind}_{\Lambda_p}(\mathbf{c})$ .

┘

*Proof:* 1: [Rubin, Thm2.3.2]. ?

2,3: Cf. [Rubin, P101] ? . Given item1, there exists an injective pseudo-isomorphism

$$\bigoplus_{i=1}^r \Lambda_p / (f_i) \rightarrow X_{\infty, S(p)},$$

where  $f_{i+1} | f_i$ . Then by (31.2.6.7), it suffices to show that  $\text{char}(X_{\infty, S(p)}) | a_{\tau}^{5r} \text{ind}_{\Lambda_p}(\mathbf{c})$ .

Suppose  $h \in \Lambda_p$  satisfies (31.2.6.14), and a finite set of places  $\Sigma_F^{\infty} \cup S(p) \cup \text{Ram}(T) \subset \Sigma \subset \Sigma_F$ , then by (31.2.6.15),

$$h^r a_{\tau}^{5r} \mathbf{c}_L \in \text{char}(X_{\infty, S(p)}) \cdot H^1(F_{\Sigma}/L, T)_{\text{lf}}.$$

Then by taking limit over  $L$  ( ? [Rubin, P101]),

$$h^r a_{\tau}^{5r} \mathbf{c}_{F, \infty} \in \text{char}(X_{\infty, S(p)}) \cdot H^1(F, T)_{\text{lf}}.$$

Then by the definition of  $\text{ind}_{\Lambda_p}(\mathbf{c})$  and the fact  $h$  is prime to  $\text{char}(X_{\infty, S(p)})$  (31.2.6.14), we get  $\text{char}(X_{\infty, S(p)}) | a_{\tau}^{5r} \text{ind}_{\Lambda_p}(\mathbf{c})$ .  $\square$

**Cor. (31.2.6.9).** Suppose  $V$  satisfies  $\text{Hyp}(\text{cycl}_p(\mathbb{Q}); V)$  (31.2.6.2),  $\text{loc}_{p, \infty}^s(\mathbf{c}_{F, \infty})$  is non-torsion over  $\Lambda_p$ , and  $H_{\infty, s}^1(F_p, T) / \Lambda_p \cdot \text{loc}_{p, \infty}^s(\mathbf{c}_{F, \infty})$  is torsion, define

$$\mathcal{L} = \text{char} \left( H_{\infty, s}^1(F_p, T) / \Lambda_p \cdot \text{loc}_{p, \infty}^s(\mathbf{c}_{F, \infty}) \right),$$

then

- (Weak Leopoldt Conjecture)  $X_{\infty}$  is a torsion  $\Lambda_p$ -module.
- There exists  $t \in \mathbb{N}$  s.t.  $\text{char}(X_{\infty}) | (p^t \mathcal{L})$ .
- If  $T$  satisfies  $\text{Hyp}(F_{\infty}; T)$  (31.2.6.2), then  $\text{char}(X_{\infty}) | \mathcal{L}$ .

┘

*Proof:* By (31.2.6.8),  $X_{\infty, S(p)}$  is torsion over  $\Lambda_p$ , so by (31.2.2.13) and the hypothesis,  $X_{\infty}$  is also torsion over  $\Lambda_p$ , and

$$\text{char}(X_{\infty}) = \text{char}(X_{\infty, S(p)}) \text{char} \left( H_{\infty, s}^1(F_p, T) / \text{loc}_{p, \infty}^s(H_{\infty}^1(F, T)) \right).$$

Notice the hypothesis also implies  $\text{loc}_{p, \infty}^s(H_{\infty}^1(F, T))$  has rank 1 over  $\Lambda_p$ , so by the definition of  $\text{ind}_{\Lambda_p}(\mathbf{c})$ ,

$$\text{ind}_{\Lambda_p}(\mathbf{c}) | \text{char} \left( \text{loc}_{p, \infty}^s(H_{\infty}^1(F, T)) / \Lambda_p \cdot \text{loc}_{p, \infty}^s(\mathbf{c}_{F, \infty}) \right).$$

Thus the assertion follows.  $\square$

**Proof over  $F_\infty$** 

**Lemma (31.2.6.10).** Let  $\rho : \text{Gal}(F_\infty/F) \rightarrow \Lambda_p$  be a character, then theorem (31.2.6.8) for  $T$  and  $\mathbf{c}$  are equivalent to the theorem for  $T(\rho)$  and  $\mathbf{c}^\rho$ .  $\lrcorner$

*Proof:* The hypothesis  $\text{Hyp}(F_\infty; V)$ ,  $\text{Hyp}(F_\infty/F)$  and  $\text{Hyp}(F_\infty; T)$  depends only on  $T$  as a  $\text{Gal}_{F_\infty}$ -module, so they are not affected. And the rest follows from the fact everything is twisted by  $\rho$ , by (31.2.3.4).  $\square$

**Prop. (31.2.6.11).** There are elements  $z_1, \dots, z_r \in X_{\infty, S(p)}$  and ideals  $\mathfrak{g}_1, \dots, \mathfrak{g}_r \in \Lambda_p$  s.t. for  $1 \leq k \leq r$ ,

- $z_k \in \text{ev}^*(\tau \text{Gal}_{\Omega_\infty})$ .
- $a_\tau \mathfrak{g}_k \in f_k \Lambda_p$ , and  $\mathfrak{g}_k \subset \mathfrak{g}_{k+1}$ .
- There is a split exact sequence

$$0 \rightarrow \sum_{i=1}^{k-1} \Lambda_p z_i \rightarrow \sum_{i=1}^k \Lambda_p z_i \rightarrow \Lambda_p / \mathfrak{g}_k \rightarrow 0.$$

- $a_\tau(X_{\infty, S(p)} / \sum_{i=1}^r \Lambda_p z_i)$  is pseudo-null.  $\lrcorner$

*Proof:* Cf. [Rubin, P98].  $\square$

**Def. (31.2.6.12) [Selmer Sequences and Kolyvagin Sequences].** Fix a sequence  $(z_1, \dots, z_r)$  for  $X_{\infty, S(p)}$  as in (31.2.6.11), and let  $Z_\infty \subset X_{\infty, S(p)}$  be the submodule they generate. Then for  $0 \leq k \leq r$ ,  $F \subset_{\text{fin}} L \subset F_\infty$ , then

- A **Selmer sequence** of length  $k$  is a sequence  $(\sigma_1, \dots, \sigma_k)$  s.t. Cf. [Rubin, P99]. ?
- A **Kolyvagin sequence** of length  $k$  for  $L$  and  $M$  is a sequence  $(\mathfrak{Q}_1, \dots, \mathfrak{Q}_k)$  of primes of  $L$  ?  
Cf. [Rubin, P99].

Let  $\Pi(k, L, M)$  be the set of Kolyvagin sequences of length  $k$  for  $F$  and  $M$ , and define

$$\Psi(k, L, M) = \sum_{\pi \in \Pi(k, L, M)} \sum_{\psi \in \text{Hom}(\Lambda_p \kappa_{L, \tau(\pi), M}, \Lambda_{L, M})} \psi(\kappa_{L, \tau(\pi), M}) \subset \Lambda_{L, M}$$

$\lrcorner$

**Lemma (31.2.6.13).** Suppose  $G \in \mathcal{A}b^{\text{fin}}$ ,  $R \in \mathcal{C}\text{Ring}$  is a PID, and  $B$  is a f.g.  $R[G]$ -module without  $R$ -torsion. Suppose  $f \in R[G]$  is a non-zero-divisor,  $b \in B$ , and

$$\{\psi(b) : \psi \in \text{Hom}_{R[G]}(B, R[G])\} \subset fR[G],$$

then  $b \in fB$ .  $\lrcorner$

*Proof:* Cf. [Rubin, P101].  $\square$

**Prop. (31.2.6.14).** Situation as in (31.2.6.8), there exists  $h \in \Lambda_p$  relatively prime to  $\text{char}(X_{\infty, S(p)})$ , and for each  $F \subset_{\text{fin}} L \subset F_\infty$  a number  $N_L \in p^{\mathbb{Z}^+}$ , s.t. if  $M \in p^{\mathbb{Z}^+}$ ,  $N_L | M$ ,  $0 \leq k \leq r$ , then

$$ha_\tau^5 \Psi(k, L, MN_L) \subset f_{k+1} \Psi(k+1, L, M) \text{ (31.2.6.12).}$$

$\lrcorner$

*Proof:* Cf.[Rubin, P100] ?. □

**Cor. (31.2.6.15).** Situation and notation as in (31.2.6.14), if  $F \subset_{\text{fin}} L \subset F_\infty$  and finite set of places  $\Sigma_F^\infty \cup S(p) \cup \text{Ram}(T) \subset \Sigma \subset \Sigma_F$ , then

$$h^r a_\tau^{5r} \mathbf{c}_L \in \text{char}(X_{\infty, S(p)}). H^1(F_\Sigma/L, T)_{\text{lf}}.$$

┘

*Proof:* It follows from (31.2.6.14) and induction that

$$h^r a_\tau^5 \Psi(0, L, MN_L^r) \subset \left( \prod_{i=1}^r f_i \right) \Psi(r, L, M) \subset \text{char}(X_{\infty, S(p)}) \Lambda_{L, M}.$$

By (31.2.6.13), it suffices to show that for any  $\psi \in \text{Hom}(H^1(F_\Sigma/L, T), \Lambda_L)$ ,  $h^r a_\tau^{5r} \psi(\mathbf{c}_L) \in \text{char}(X_{\infty, S(p)}) \Lambda_L$ . For this, notice by (31.2.4.4),  $\kappa_{L, 1, MN_L^r}$  is the image of  $\mathbf{c}_L$  under the map

$$H^1(F_\Sigma/L, T)/(MN_L^r) \hookrightarrow H^1(F_\Sigma/L, W[MN_L^r]) \hookrightarrow H^1(L, W[MN_L^r]),$$

so we can define  $\bar{\psi}$  to be the map

$$\Lambda_{L, MN_L^r} \kappa_{L, 1, MN_L^r} \subset H^1(F_\Sigma/L, T)/(MN_L^r) \xrightarrow{\psi} \Lambda_{L, MN_L^r} \rightarrow \Lambda_{L, M}.$$

Then by definition  $\bar{\psi}(\kappa_{L, 1, MN_L^r}) \in \Psi(0, L, MN_L^r) \Lambda_{L, M}$ , and  $\bar{\psi}(\kappa_{L, 1, MN_L^r}) \equiv \psi(\mathbf{c}_L) \pmod{M}$ . Thus we get  $\psi(\mathbf{c}_L) \in \Psi(0, L, MN_L^r)$  by noticing  $M$  can be arbitrarily large. □

## 7 Euler System for Elliptic Curves(Kato)

**Thm. (31.2.7.1) [Kato].** Suppose  $E \in \text{EllCur}/\mathbb{Q}$  with conductor  $N$ , and  $p \in \text{Prime}$ . Then there exists  $D, D \not\equiv 1 \pmod{p}$ ,  $(DD', 6pN) = 1$ , and  $r_E \in \mathbb{Z}_+$  independent of  $p$ , and an Euler system  $\bar{\mathbf{c}} = \bar{\mathbf{c}}(D, D')$  for  $T_p(E)$  (31.2.3.2):

$$\{\bar{\mathbf{c}}_{\mathbb{Q}_n(\mu_r)} \in H^1(\mathbb{Q}_n(\mu_r), T_p(E))\}_{r \in \mathcal{R}(NpDD'), n \in \mathbb{N}},$$

s.t. for any character  $\chi \in \text{Gal}(\mathbb{Q}_n/\mathbb{Q})^\vee$ ,

$$\sum_{\gamma \in \text{Gal}(\mathbb{Q}_n/\mathbb{Q})} \chi(\gamma) \exp_{\omega_E}^*(\text{loc}_p^s(\bar{\mathbf{c}}_{\mathbb{Q}_n}^\gamma)) = r_E DD' (D - \chi^{-1}(D))(D' - \chi^{-1}(D')) L_{Np}(E, \chi; 1) / \Omega_E.$$

┘

*Proof:* Take  $r = p^m$  and take corestriction to  $\mathbb{Q}_n$ . But we need to verify that  $\exp_{\omega_E}^* \circ \text{loc}_p^s$  equals the dual exponential map defined in (33.4.3.2). □

**Cor. (31.2.7.2).** Situation as in (31.2.7.1), suppose that  $E$  has good ordinary reduction or multiplicative reduction at  $p$ , then there is an Euler system  $\mathbf{c}$  for  $T_p(E)$  s.t.

- $\exp_{\omega_E}^*(\text{loc}_p^s(\mathbf{c}_{\mathbb{Q}})) = r_E L_{Np}(E; 1) / \Omega_E$ .
- $\text{Col}_\infty(\text{loc}_{p, \infty}^s(\mathbf{c}_{\mathbb{Q}, \infty})) = r_E \mathcal{L}_{E, N}$  (31.2.5.1).

┘

*Proof:* Let  $\sigma_D, \sigma_{D'} \in \text{Gal}(\mathbb{Q}(\mu_{p^\infty})/\mathbb{Q})$  denote the automorphism  $\zeta \mapsto \zeta^D, \zeta \in \mu_{p^\infty}$ , then since  $D, D' \nmid 1 \pmod{p}$ ,  $(D - \sigma_D)(D' - \sigma_{D'}) \in \Lambda_p$  is invertible. Let  $\rho_{D,D'} \in \mathbb{Z}_p[[\text{Gal}_{\mathbb{Q}}]]$  be any element that restricts to  $(D - \sigma_D)^{-1}(D' - \sigma_{D'})^{-1}$ , then we can define

$$\mathbf{c}_{\mathbb{Q}_n(\mu_r)} = (DD')^{-1} \rho_{D,D'} \bar{\mathbf{c}}_{\mathbb{Q}_n(\mu_r)},$$

which is also an Euler system, and by (31.2.7.1) and a change of variable, we get

$$\sum_{\gamma \in \text{Gal}(\mathbb{Q}_n/\mathbb{Q})} \chi(\gamma) \exp_{\omega_E}^*(\text{loc}_p^s(\mathbf{c}_{\mathbb{Q}_n}^\gamma)) = r_E L_{Np}(E, \chi; 1)/\Omega_E.$$

Then if  $\chi$  is the trivial character, this gives equation 1. And for any  $\chi \in \text{Gal}(\mathbb{Q}_\infty/\mathbb{Q})^\vee$ ,

$$\begin{aligned} \chi \left[ \text{Col}_\infty(\text{loc}_{p,\infty}^s(\mathbf{c}_{\mathbb{Q},\infty})) \right] &= \\ \left\{ \begin{array}{ll} (1 - \alpha^{-1})(1 - \beta^{-1})^{-1} \exp_{\omega_E}^*(\text{loc}_p^s(\mathbf{c}_{\mathbb{Q}})) = r_E L_{Np}(E; 1)/\Omega_E & , \chi = 1 \\ \alpha^{-n} \tau(\chi) \sum_{\gamma \in \text{Gal}(\mathbb{Q}_n/\mathbb{Q})} \chi^{-1}(\gamma) \exp_{\omega_E}^*(\text{loc}_p^s(\bar{\mathbf{c}}_{\mathbb{Q}_n}^\gamma)) = r_E L_{Np}(E; \chi^{-1}, 1)/\Omega_E & \mathbf{c}(\chi) = p^n > 1 \end{array} \right. \\ &= \chi(r_E \mathcal{L}_{E,N}). \end{aligned}$$

Thus  $\text{Col}_\infty(\text{loc}_{p,\infty}^s(\mathbf{c}_{\mathbb{Q},\infty})) = r_E \mathcal{L}_{E,N}$ . □

### Bounding Selmer Groups

**Thm. (31.2.7.3).** Suppose  $E \in \text{EllCur}/\mathbb{Q}$  without CM. Notation as in (31.2.7.1),

- If  $E$  has good ordinary reduction or non-split multiplicative reduction at  $p$ , then  $X_\infty(E[p^\infty])$  is f.g. torsion over  $\Lambda_p$ , and there exists  $t \in \mathbb{N}$  s.t.  $\text{char}(X_\infty) | (p^t \mathcal{L}_{E,N})$ . And if  $\rho_{E,p}$  is surjective with  $p \nmid r_E \prod_{q|N, q \neq p} \ell_q(q^{-1})$ , then  $\text{char}(X_\infty) | (\mathcal{L}_E)$ .
- If  $E$  has split multiplicative reduction at  $p$ , then similar results hold with  $\text{char}(X_\infty)$  replaced by  $\mathcal{J} \text{char}(X_\infty)$ .

┘

*Proof:* Because  $\text{Col}_\infty$  is injective (31.2.5.2), by (31.2.7.2),

$$\mathcal{L} = \text{char} \left( H_{\infty,/\text{Sel}}^1(\mathbb{Q}_p, T)/\Lambda_p \cdot \text{loc}_{p,\infty}^s(\mathbf{c}_{\mathbb{Q}}) \right) \Big| \text{char} \left( \text{Im}(\text{Col}_\infty)/(\text{Col}_\infty(\text{loc}_{p,\infty}^s(\mathbf{c}_{\mathbb{Q}}))) \right) \Big| (r_E \mathcal{L}_{E,N})$$

So item 1 follows from (31.2.6.9). Notice the hypothesis are satisfied by (31.2.6.3). Item 2 also follows, by noticing that  $\text{Im}(\text{Col}_\infty) \subset \mathcal{J}_p$  (31.2.5.2). □

**Cor. (31.2.7.4) [Greenberg].** Let  $E \in \text{EllCur}/\mathbb{Q}$  without CM, then there exists  $M_E \in \mathbb{Z}_+$  s.t. if  $p \in \mathbf{Prime}$  is good ordinary for  $E$  and  $p \nmid M_E$ , then  $X_\infty(E)$  (31.2.2.12) has no non-zero finite submodules.

┘

*Proof:* Cf. [Rubin short, P363] and [Greenberg, Iwasawa theory for  $p$ -adic Representations] ?. □

**Cor. (31.2.7.5).** Let  $E \in \text{EllCur}/\mathbb{Q}$  without CM,  $p \in \mathbf{P}$  is a good place for  $E$  and  $p \nmid 2r_E M_E \prod_{q|N} \ell_q(q^{-1})$  (31.2.7.1)(31.2.7.4), and  $\rho_{E,p}$  is surjective, then

$$\# \text{III}(E)[p^\infty] \Big| \frac{L(E; 1)}{\Omega_E}.$$

┘

*Proof:* If  $p$  is good supersingular for  $E$ , then  $p \nmid \#\tilde{E}(\mathbb{F}_p)$ , and Cf.[Rubin short, P362]?

If  $p$  is good ordinary for  $E$ , then by (31.2.7.4), we may assume  $X_\infty(E) \subset \prod_i \Lambda_p/(f_i^{n_{ij}})$ , and then

$$\mathrm{Sel}(\mathrm{cycl}_p(\mathbb{Q}), E[p^\infty])^{\mathrm{Gal}(\mathrm{cycl}_p(\mathbb{Q})/\mathbb{Q})} = (X_\infty(E))^{\mathrm{Gal}(\mathrm{cycl}_p(\mathbb{Q})/\mathbb{Q})} \subset \chi_0\left(\prod_i \Lambda_p/(f_i^{n_{ij}})\right)$$

and the RHS has cardinality  $\chi_0(\mathrm{char}(X_\infty(E)))$ , which by (31.2.7.3) divides

$$\chi_0(\mathcal{L}_E) = (1 - \alpha^{-1})^2 \prod_{q|N} \ell_q(q^{-1}) L(E; 1) / \Omega_E \quad (31.2.5.1).$$

Also, one show by proof of Mazur control theorem that

$$\mathrm{Sel}(\mathbb{Q}, E[p^\infty]) \rightarrow \mathrm{Sel}(\mathrm{cycl}_p(\mathbb{Q}), E[p^\infty])^{\mathrm{Gal}(\mathrm{cycl}_p(\mathbb{Q})/\mathbb{Q})}.$$

is injective with cokernel of order divisible by  $(1 - \alpha^{-1})^2$ ?. Thus the assertion follows.  $\square$

**Cor. (31.2.7.6).** Suppose  $E \in \mathrm{EllCur}/\mathbb{Q}$  without CM, and  $L(E; 1) \neq 0$ , then  $\#E(\mathbb{Q}) < \infty$ ,  $\#\mathrm{III}(E) < \infty$ .  $\lrcorner$

*Proof:* This is proven by Kolyvagin before, but Kato proved it again as follows:

For each  $q|N$ ,  $\ell_q(q^{-1}) \neq 0$ , so  $L_{Np}(E; 1) \neq 0$ , and then by (31.2.7.2),  $\mathrm{loc}_p^s(\mathbf{c}_\mathbb{Q}) \neq 0$ , then it follows from (31.2.6.5) that  $\mathrm{Sel}^{p^\infty}(E/\mathbb{Q}) < \infty$ . Notice the hypothesis is satisfied by (31.2.5.5).

But then by Serre's theorem,  $\rho_{E,p}$  is surjective for a.e.  $p$ , so by (31.2.7.5),  $\mathrm{III}(E)[p^\infty] = 0$  for a.e.  $e$ . Thus the assertion follows.  $\square$

**Thm. (31.2.7.7) [Kato].** For  $E \in \mathrm{EllCur}/\mathbb{Q}$ , if  $F/\mathbb{Q}$  is an Abelian extension and  $\chi \in \mathrm{Gal}(F/\mathbb{Q})^\vee$ , and  $L(E, \chi; 1) \neq 0$ , then  $\#E(F)^\chi < \infty$ ,  $\#\mathrm{III}(E_L)^\chi < \infty$ .  $\lrcorner$

*Proof:* We only prove for the case  $E$  without CM. For the CM case, Cf.[Coates-Wiles77], [Rubin, The Iwasawa Main conjecture for Imaginary Quadratic Fields] or [Rubin-Wiles, Mordell-Weil Groups of Elliptic Curves over Cyclotomic Fields].?

The proof is similar to that of (31.2.7.6):  $\chi(\mathrm{char}(X_\infty(E)))$  is a non-zero multiple of  $L(E, \chi; 1)$ , so  $\#\mathrm{Sel}(\mathrm{cycl}_p(\mathbb{Q}), E[p^\infty])^\chi < \infty$ . Then use a variant of (31.2.7.5) to bound  $\#\mathrm{III}(E)$ .  $\square$

**Cor. (31.2.7.8) [Kato].** For  $E \in \mathrm{EllCur}/\mathbb{Q}$  and  $F/\mathbb{Q}$  an Abelian extension,  $p \in \mathbf{P}$ ,  $E(\mathbb{Q}(\mu_{p^\infty}))$  is a f.g. Abelian group.  $\lrcorner$

*Proof:* It follows from [Roh84]? that  $L(E, \chi, 1) \neq 0$  for a.e. character  $\chi$  of finite order of  $\mathrm{Gal}(\mathbb{Q}(\mu_{p^\infty})/\mathbb{Q})$ . ?  $\square$

**Def. (31.2.7.9) [ $r_p(E/F)$ ].** For  $F \in \mathrm{NField}$ ,  $E \in \mathrm{EllCur}/F$ ,  $p \in \mathbf{P}$ , define

$$r_p(E/F) = \sum_{v \in S(p), E \text{ has potential supersingular reduction at } v} [F_v : \mathbb{Q}_p].$$

$\lrcorner$

**Conj. (31.2.7.10).** For  $F \in \mathrm{NField}$ ,  $E \in \mathrm{EllCur}/F$ ,  $p \in \mathbf{P}$ , let  $\Gamma = \mathrm{Gal}(\mathrm{cycl}_p(F)/F) \cong \mathbb{Z}_p$ , then

$$\mathrm{rank}_{\mathrm{Frac}(\mathbb{Z}_p(\Gamma))} [\mathrm{Sel}(E/\mathrm{cycl}_p(F)) \otimes_{\mathbb{Z}_p(\Gamma)} \mathrm{Frac}(\mathbb{Z}_p(\Gamma))] = r_p(E/F) \quad (31.2.7.9)$$

$\lrcorner$

*Proof:*

□

**Conj. Cor. (31.2.7.11).** For  $F \in \mathbf{NField}$ ,  $E \in \mathbf{EllCur}/F$ ,  $p \in \mathbf{P}$ ,

$$\mathrm{rank}_{\mathrm{Frac}(\Lambda_p)}[\mathrm{Sel}(E/\mathrm{cycl}_p(F)) \otimes_{\Lambda_p} \mathrm{Frac}(\Lambda_p)] \geq r_p(E/F) \quad (31.2.7.9)$$

┘

*Proof:* Cf. [Coates, Galois of Elliptic Curves, P19].

□

**Cor. (31.2.7.12).** For  $F \in \mathbf{NField}$ ,  $E \in \mathbf{EllCur}/F$ ,  $p \in \mathbf{P}$ , if  $E$  has potential good ordinary reduction at all places dividing  $p$ , and  $\mathrm{Sel}(E/F)$  is finite, then  $\mathrm{Sel}(E/\mathrm{cycl}_p(F))^\vee$  is  $\mathbb{Z}_p(\Gamma)$ -torsion.

┘

*Proof:*

□

**Cor. (31.2.7.13).** If  $E \in \mathbf{EllCur}/\mathbb{Q}$  and  $\mathrm{rank}_{\mathrm{an}}(E) = 0$ , then  $\mathrm{Sel}(E/\mathrm{cycl}_p(\mathbb{Q}))^\vee$  is  $\Lambda_p$ -torsion.

┘

*Proof:* This follows from (31.4.2.2) and (31.2.7.12).

□

**Cor. (31.2.7.14).** Suppose  $E \in \mathbf{EllCur}/\mathbb{Q}$  and  $p \in \mathbf{P}$  is of good ordinary reduction for  $E$ , then

$$\mathrm{Sel}(\mathbb{Q}(\mu_{p^\infty}), E)^\vee$$

is torsion over  $\Lambda_p$ .

┘

*Proof:* Cf. [Kato].

□

**Prop. (31.2.7.15) [Euler Characteristic of  $\mathrm{Sel}(E/\mathrm{cycl}_p(F))$ ].** Let  $p \in \mathbf{P} \setminus \{2\}$ ,  $F \in \mathbf{NField}$ , and  $E \in \mathbf{EllCur}/F$  with good ordinary reduction over all places  $v \in S(p)$ . Suppose  $\mathrm{Sel}(E/F)$  is finite, then  $\mathrm{Sel}(E/F)$  has finite  $\Gamma$ -Euler characteristic, and

$$\chi(\Gamma, \mathrm{Sel}(E/\mathrm{cycl}_p(F))) = \rho_p(E/F) = \left| \frac{\#\mathrm{III}(E/F)[p^\infty]}{(\#E(F)[p^\infty])^2} \cdot \prod_{v \in \Sigma_F^{\mathrm{fin}}} c_v \cdot \prod_{v \in S(p)} (\#\tilde{E}_v(\kappa_v))^2 \right|_p^{-1}$$

┘

*Proof:* Cf. [Coates, Galois cohomology of Elliptic Curves, P28].

□

## 8 Examples

**Example (31.2.8.1).** There are three elliptic curves of conductor 11 over  $\mathbb{Q}$ , namely

$$A_0 : y^2 + y = x^3 - x^2 - 10x - 20$$

$$A_1 : y^2 + y = x^3 - x^2$$

$$A_2 : y^2 + y = x^3 - x^2 - 7820x - 263580.$$

And they are all isogenous.

┘

*Proof:*

□

### 31.3 Special Values of $L$ -Functions

*“Mathematical science is in my opinion an indivisible whole, an organism whose vitality is conditioned upon the connection of its parts.”*

–*D. Hilbert*

References are [Del79], [Conrad BSD notes], [Remarks on special values of  $L$ -functions, Scholl], [nLab]. [Introduction to conjecture of Bloch and Kato, Bellaïche].

#### 1 Deligne’s Conjecture

**Prop. (31.3.1.1).** If  $X \in \text{SmProj}/\mathbb{Q}$  and  $M = h^i(X)(m)$ , then  $M^\vee \cong h^i(X)(i - m)$ , i.e. it is polarized of weight  $i - 2m$  ?. ┘

*Proof:* ? Let  $\eta \in h^2$  be a hyperplane section, then

$$H^{2d}(X)(d) \cong H^{2d}(\mathbb{P}^N)(d) = (\eta(1))^{\otimes d} \cong 1.$$

There is a pairing

$$h^i(X)(m) \times h^{2d-i}(X)(d - m) \rightarrow h^{2d}(X)(d),$$

and also an isomorphism

$$h^i(X)(i - m) \xrightarrow{\cup \eta^{d-i}} h^{2d-i}(X)(d - m).$$

□

**Def. (31.3.1.2) [Critical Values].** For  $M \in \text{Mot}(\mathbb{Q})$ ,  $m \in \mathbb{Z}$  is called a **critical value** for  $M$  if neither  $L_\infty(M; s)$  nor  $L_\infty(M^\vee; 1 - s)$  has a pole at  $s = m$ .  $M$  is called a **critical motive** if 0 is critical for  $M$ . ┘

**Prop. (31.3.1.3).**  $M$  is critical iff the Betti realization satisfies

- $\text{Real}_{\text{Betti}}(M)^{p,q} = 0$  unless  $p = q$  or  $p < 0 \leq q$  or  $q < 0 \leq p$ .
- $c$  acts on  $\text{Real}_{\text{Betti}}(M)^{p,p}$  by  $-1$  if  $p \geq 0$ , and  $1$  if  $p < 0$ .

┘

#### Deligne’s Periods

**Prop. (31.3.1.4) [Deligne’s Periods].** We assume that  $M \in \text{Mot}(\mathbb{Q})$  is pure of weight  $w$ , and  $c = \pm 1$  on  $M^{w/2, w/2}$  if  $w \in 2\mathbb{Z}$ . Notice these hypothesis are satisfied when  $M$  is critical.

Define

$$d(M) = \dim_{\mathbb{Q}} \text{Real}_{\text{Betti}}(M), \quad d^\pm(M) = \dim_{\mathbb{Q}} \text{Real}_{\text{Betti}}(M)^{c=\pm 1},$$

And also the eigenvalue decomposition of  $c^*$  on  $\text{Real}_{\text{Betti}}(M)$ :

$$\text{Real}_{\text{Betti}}(M) = \text{Real}_{\text{Betti}}(M)^+ \oplus \text{Real}_{\text{Betti}}(M)^-.$$

Then it follows from (22.1.3.18) that

$$I_{\text{dR}}(\text{Real}_{\text{Betti}}(M)^+ \otimes \mathbb{R}) \subset \text{Real}_{\text{dR}}(M), \quad I_{\text{dR}}(\text{Real}_{\text{Betti}}(M)^- \otimes \mathbb{R}) \subset i \cdot \text{Real}_{\text{dR}}(M).$$

There are filtration steps  $\text{Fil}^\pm \subset \text{Real}_{\text{dR}}(M)$  of the deRham filtration s.t.

$$\text{Fil}^\pm \text{Real}_{\text{dR}}(M) \otimes \mathbb{C} = I_{\text{dR}}(\oplus_{p>q} \text{Real}_{\text{Betti}}(M)^{p,q} \oplus (\text{Real}_{\text{Betti}}(M)^{w/2,w/2})^{c=\pm 1}).$$

Then we can define

$$\text{Real}_{\text{dR}}(M)^\pm = \text{Real}_{\text{dR}}(M) / \text{Fil}^\mp \text{Real}_{\text{dR}}(M).$$

Since  $\text{Real}_{\text{Betti}}(M)^{p,q} = \overline{\text{Real}_{\text{Betti}}(M)^{q,p}}$ , the space  $\text{Real}_{\text{Betti}}(M)^\pm$  lies (anti)diagonally, so the following maps

$$I^\pm : \text{Real}_{\text{dR}}(M)^\pm \otimes \mathbb{C} \subset \text{Real}_{\text{dR}}(M) \otimes \mathbb{C} \xrightarrow{I_{\text{dR}}} \text{Real}_{\text{dR}}(M) \otimes \mathbb{C} \rightarrow \text{Real}_{\text{dR}}(M)^\pm \otimes \mathbb{C}$$

are isomorphisms.

Then because of the  $\mathbb{Q}$ -structure on  $\text{Real}_{\text{dR}}(M)^\pm$  and  $\text{Real}_{\text{dR}}(M)^\pm$ , we have that

$$c_{\text{Del}}^\pm(M) = \det(I^\pm) \in \mathbb{C}^\times / \mathbb{Q}^\times$$

are well-defined, called the **Deligne periods** of  $M$  (if both sides are  $\{0\}$ , let  $c_{\text{Del}}^\pm(M) = 1$ ). In fact, from the argument above, we see that  $I^\pm$  are real, so in fact  $c_{\text{Del}}^\pm \in \mathbb{R}^\times / \mathbb{Q}^\times$ .  $\lrcorner$

**Conj. (31.3.1.5) [Deligne].** Let  $M \in \text{Mot}(\mathbb{Q})$  be critical, then

$$L(M; s) \sim_{\mathbb{Q}} c_{\text{Del}}^+(M) \in \widehat{\mathbb{P}} \text{ (31.3.1.4)}.$$

$\lrcorner$

*Proof:* Cf. [Deligne, Values of L-functions] for the assertion that  $c_{\text{Del}}^+(M) \in \widehat{\mathbb{P}}$ .  $\square$

**Example (31.3.1.6) [Tate Modules].** For the Tate module  $\mathbb{Q}(r)$ ,  $c^* = (-1)^r$  on  $\text{Real}_{\text{Betti}}(\mathbb{Q}(n))$ , so it follows from (22.1.3.17) that

$$c^\varepsilon(\mathbb{Q}(r)) = \begin{cases} (2\pi i)^r & , \varepsilon = (-1)^r \\ 1 & , \varepsilon = (-1)^{r-1} \end{cases}.$$

And  $\mathbb{Q}(r)$  is critical iff  $L_\infty(\mathbb{Q}) = \Gamma_{\mathbb{R}}(s)$  is holomorphic at both  $r, 1-r$ , and this is the case when  $r \in 2\mathbb{Z}_+$  or  $r \in 1 - 2\mathbb{Z}_+$ . The Deligne's conjecture is true in this case, by (31.3.5.3).  $\lrcorner$

## General Coefficients

### 2 Beilinson-Bloch Conjecture

References are [Bei85, Blo00], [Beilinson, Higher regulators of modular curves], [Iwasawa theory for the symmetric square of an elliptic curve, Flach], [Nekovar, Beilinson's Conjecture, in Motives, 537-570], [Algebraic K-Theory and Special Values of L-Functions: Beilinson's Conjecture].

**Notation (31.3.2.1).**

- Denote  $m = i + 1 - n$ .
- We assume that
  - the Euler product for  $L(h^i(X); s)$  converges absolutely for  $\text{Re}(s) > i/2 + 1$ .
  - $L(h^i(X); s)$  meromorphically extends to the whole plane, and possible poles can occur only when  $i$  is even and  $s = i/2 + 1$ .

- $L(h^i(X); i/2 + 1) \neq 0$ .
- $\Lambda(h^i(X); s)$  has a functional equation

$$\Lambda(h^i(X); i + 1 - s) = \varepsilon(h^i(X); s) \Lambda(h^i(X); s).$$

┘

**Prop. (31.3.2.2).** By (16.11.6.8), if  $m < \frac{i+1}{2}$ , there is an exact sequence

$$0 \rightarrow \text{Fil}^n H_{\text{Betti}}^i(X, \mathbb{R}) \rightarrow H_{\text{Betti}}^i(X, \mathbb{R}(n-1))^{\mathbf{c}^* = (-1)^{n-1}} \rightarrow H_{\text{Del}}^{i+1}(X/\mathbb{R}, \mathbb{R}(n)) \rightarrow 0.$$

┘

**Prop. (31.3.2.3).** If the functional equation and

$$\dim_{\mathbb{R}} H_{\text{Del}}^{i+1}(X/\mathbb{R}, \mathbb{R}(n)) = \begin{cases} \text{ord}_{s=m} L(h^i(X), s) & , m < \frac{i}{2} \\ \text{ord}_{s=m} L(h^i(X), s) - \text{ord}_{s=m+1} L(h^i(X), s) & , m = \frac{i}{2} \end{cases}.$$

Notice if  $m < i/2$ ,  $H_{\text{Del}}^{i+1}(X/\mathbb{R}, \mathbb{R}(n)) = \{0\}$  iff  $h^i(X)(m)$  is critical (31.3.1.2).

┘

*Proof:* Cf. [Schneider's notes, P5]. ?

□

**Prop. (31.3.2.4) [Beilinson's Periods].** If  $h^i(X)(m)$  is critical, then  $H_{\text{Del}}^{i+1}(X/\mathbb{R}, \mathbb{R}(n)) = 0$ , and the determinant  $c_{\text{Bei}}$  of the isomorphism

$$\text{Fil}^n H_{\text{Betti}}^i(X, \mathbb{R}) \rightarrow H_{\text{Betti}}^i(X, \mathbb{R}(n-1))^{\mathbf{c}^* = (-1)^{n-1}}$$

satisfies  $c_{\text{Bei}}(h^i(X)(m)) = c_{\text{Del}}(h^i(X)(m)) \in \mathbb{R}^\times / \mathbb{Q}^\times$ .

┘

*Proof:* Cf. [Deligne's conjecture, in Rapoport's notes, P42] ?

□

### Beilinson's Regulator Maps

**Remark (31.3.2.5) [Beilinson's Regulator].** If  $m < (i+1)/2$ , then by (31.3.2.2), there is an isomorphism

$$\det \text{Fil}^n H_{\text{Betti}}^i(X, \mathbb{R}) \otimes_{\mathbb{R}} \det H_{\text{Del}}^{i+1}(X/\mathbb{R}, \mathbb{R}(n)) \rightarrow \det H_{\text{Betti}}^i(X, \mathbb{R}(n-1))^{\mathbf{c}^* = (-1)^{n-1}},$$

and  $\text{Fil}^n H_{\text{Betti}}^i(X, \mathbb{R})$  and  $H_{\text{Betti}}^i(X, \mathbb{R}(n-1))$  has natural  $\mathbb{Q}$ -structures. So if  $\det H_{\text{Del}}^{i+1}(X/\mathbb{R}, \mathbb{R}(n))$  has a  $\mathbb{Q}$ -structure, then we can construct a  $c_{\text{Bei}}(h^i(X)(m)) \in \mathbb{R}^\times / \mathbb{Q}^\times$ .

┘

**Def. (31.3.2.6) [Beilinson's Regulator].** There is a regulator map (22.4.0.4) (22.4.0.6)

$$\begin{array}{ccc} (K_{2n-i-1}(X_{\mathbb{Z}})_{\mathbb{Q}})^{(n)} & & (K_{2n-i-1}(X_{\mathbb{R}})_{\mathbb{Q}})^{(n)} \\ \parallel & & \parallel \\ r_X^{i+1} : H_{\text{Mot}}^{i+1}(X, \mathbb{Q}(n))_{\mathbb{Z}} & \longrightarrow & H_{\text{Mot}}^{i+1}(X, \mathbb{Q}(n))_{\mathbb{R}} \xrightarrow{\text{ch}_{2n-i-1}} H_{\text{Del}}^{i+1}(X/\mathbb{R}, \mathbb{R}(n)). \end{array}$$

┘

**Conj. (31.3.2.7) [Beilinson].**

- If  $w < -2$ , then
  - $r_{\mathbb{R}} : H_{\text{Mot}}^{i+1}(X, \mathbb{Q}(n))_{\mathbb{Z}} \otimes \mathbb{R} \rightarrow H_{\text{Del}}^{i+1}(X/\mathbb{R}, \mathbb{R}(n))$  (31.3.2.6) is an isomorphism.
  - the determinant of the isomorphisms (31.3.2.2)

$$\begin{aligned} & \det \text{Fil}^n H_{\text{Betti}}^i(X, \mathbb{R}) \otimes_{\mathbb{R}} \det \left( H_{\text{Mot}}^{i+1}(X, \mathbb{Q}(n))_{\mathbb{Z}} \otimes \mathbb{R} \right) \xrightarrow{\text{id} \otimes \det(r_{\mathbb{R}})} \\ & \det \text{Fil}^n H_{\text{Betti}}^i(X, \mathbb{R}) \otimes_{\mathbb{R}} \det H_{\text{Del}}^{i+1}(X/\mathbb{R}, \mathbb{R}(n)) \rightarrow \\ & \det H_{\text{Betti}}^i(X, \mathbb{R}(n-1))^{\mathbf{c}^* = (-1)^{n-1}} \end{aligned}$$

equals  $L^{\dagger}(M; 0) \in \mathbb{R}^{\times}/\mathbb{Q}^{\times}$ .

- If  $w = -2$ , then  $s = 0$  may be a pole, and Tate conjecture predicts ? that

$$-\text{ord}_{s=0} L(M; 0) = \dim_{\mathbb{Q}} N^{n-1}(X),$$

where  $N^{n-1}(X) = \text{CH}^{n-1}(X)/\text{CH}^{n-1}(X)_0$ , and  $\text{CH}^{n-1}(X)_0$  is the subgroup of homologically trivial cycle. In this case, there is also a cycle class map

$$r' : N^{n-1}(X) \rightarrow H_{M_{\infty}}^{i+1}(X_{\mathbb{R}}, \mathbb{R}(n)) \text{ ?,$$

and

- $(r \otimes r')_{\mathbb{R}} : (C_1)_{\mathbb{R}} \oplus N^{n-1}(X)_{\mathbb{R}} \rightarrow H_{M_{\infty}}^{i+1}(X_{\mathbb{R}}, \mathbb{R}(n))$  is an isomorphism.
- $L^{\dagger}(M, 0) = \det(r \otimes r') \in \mathbb{R}^{\times}/\mathbb{Q}^{\times}$ .

┘

**Def. (31.3.2.8) [Polylogarithm].** For  $s \in \mathbb{Z}_+$ , the power series

$$\text{Li}_s(z) = \sum_{n \geq 1} \frac{z^n}{n^s}$$

converges absolutely for  $|z| < 1$  and can be analytically continued to a multi-valued function on  $\mathbb{C} \setminus \{1\}$ , called the **Polylogarithm function**. ┘

*Proof:* In fact,  $\text{Li}_1(z) = -\log(1-z)$ , and  $\text{Li}_{s+1}(z) = \int_0^z \text{Li}_s(t) \frac{dt}{t}$ . □

**Def. (31.3.2.9) [Bloch-Wigner Dilogarithm].** The function

$$D(z) = \text{Im} \left( \text{Li}_2(z) + \log |z| \log(1-z) \right), \quad z \in \mathbb{C} \text{ (31.3.2.8)}$$

is a real-valued function on  $\mathbb{C}$ , called the **Bloch-Wigner dilogarithm**. ┘

*Proof:* Cf. [Blo00]P44. □

### Height Pairings

**Conj. (31.3.2.10) [Beilinson].** If  $w = -1$ , then  $M$  must be critical by drawing diagram, and

- There is a non-degenerate **Beilinson height paring**

$$h : \text{CH}^n(X)_0 \otimes \text{CH}_0^{\dim X + 1 - n} \rightarrow \mathbb{R},$$

- and  $\text{ord}_{s=0} L(M; s) = \dim_{\mathbb{Q}} \text{CH}^n(X)_0$ .
- $L^{\dagger}(M; 0) = c_{\text{Del}}^+(M) \det(h) \in \mathbb{R}^{\times}/\mathbb{Q}^{\times}$ .

┘

*Proof:* □

### 3 Bloch-Kato/Fontaine-Perrion.Riou Conjecture

Cf.[Fontaine-Perrion.Riou]?

**Conj. (31.3.3.1) [Bloch-Kato].** If  $F \in \mathbf{NField}$  and  $(\rho, V) \in \mathbf{Rep}_{\mathbb{Q}_p}^{\text{fd}}(\text{Gal}_F)$  is a pure geometric representation, then the  $L$ -function  $L(V; s)$  (31.1.2.1) has a meromorphic extension to all  $s \in \mathbb{C}$ , and

$$\text{ord}_{s=0} L(V; s) = \dim H_f^1(\text{Gal}_F, V^*(1)) - \dim H^0(\text{Gal}_F, V^*(1)).$$

┘

*Proof:*

□

**Remark (31.3.3.2).** The lower bound on Selmer group asks to construct certain classes, which often takes input from automorphic representations.

The upper bound on Selmer group is usually done by constructing Euler systems.

┘

**Conj. Cor. (31.3.3.3).** Situation as in (31.3.3.1), if  $w(V) \geq 0$  and the meromorphic extension conjecture holds for  $V^*(1)$  (31.1.2.5), then  $H_g^1(\text{Gal}_F, V) = 0$ .

┘

*Proof:*  $V^*(1)$  is pure of weight  $-2 - w \leq -2$ , so  $L(V^*(1); 0) \neq 0$ , unless  $V \cong \mathbb{Q}_p$ , in which case  $\dim H^0(\text{Gal}_F, V) = 1$ . As  $w(V) \geq 0$ , we have  $H_f^1(\text{Gal}_F, V) = H_g^1(\text{Gal}_F, V)$ ?, so this is a conjectural corollary.

□

**Remark (31.3.3.4).** Using the motivic interpretation of  $H_g^1(\text{Gal}_F, V)$  (31.3.3.11), this is compatible with Grothendieck's theory of weights: If  $0 \rightarrow M' \rightarrow M \rightarrow M'' \rightarrow 0$  is a non-trivial extension and  $M', M''$  are pure motives, then  $w(M') < w(M'')$ .

┘

**Conj. Cor. (31.3.3.5).** Situation as in (31.3.3.1),  $H_g^1(\text{Gal}_F, \text{Ad}V) = 0$ .

┘

*Proof:* ? This is known for most  $V$  attached to modular forms (Weston and Kisin), and also for some polarized  $V$  attached to automorphic forms.

□

**Prop. (31.3.3.6) [Stability Conduction for Inductions].** Let  $F/F_0 \in \mathbf{NField}$  and  $(\rho, V) \in \mathbf{Rep}_{\mathbb{Q}_p}^{\text{fd}}(\text{Gal}_F)$  is a pure geometric representation, then the Bloch-Kato conjecture holds for  $V$  (31.3.3.1) iff it holds for  $\text{Ind}_{F/F_0} V \in \mathbf{Rep}_{\mathbb{Q}_p}^{\text{fd}}(\text{Gal}_{F_0})$ .

┘

*Proof:* ? Firstly, the induction is also geometric of the same weight by (30.1.2.2).

□

**Thm. (31.3.3.7) [Stability Conduction for Duals].** Situation as in (31.3.3.1), and assume the meromorphic extension conjecture (31.1.2.5) and functional equation conjecture (31.1.2.10) holds for  $V$ , and also Predictions 1.2 and 1.3?, then the Bloch-Kato conjecture for  $V$  is equivalent to the Bloch-Kato conjecture for  $V^*(1)$ .

┘

*Proof:* ? Cf.[Bellaïche, intro to Bloch and Kato].

□

**Cor. (31.3.3.8).** Situation as in (31.3.3.7), under the same hypothesis, if  $w(V) \neq -1$ , then the lower bound for Selmer group holds.

┘

*Proof:* If  $w \geq 0$ , then by (31.1.2.5),  $\text{ord}_{s=0} L(V; s) + \dim H^0(\text{Gal}_F, V^*(1)) = 0$ , so the inequality clearly holds. If  $w \leq -2$ , we consider  $V^*(1)$ , which also has weight  $\geq 0$ , and the inequality for  $V^*(1)$  implies the inequality for  $V$  by the theorem (31.3.3.7).  $\square$

**Conj. (31.3.3.9) [Bloch-Kato for Partial  $L$ -Functions].** Situation as in (31.3.3.1), for any  $\emptyset \subset_{\text{fin}} S \subset \Sigma_F^{\text{fin}}$ , we have

$$\text{ord}_{s=0} L_S(V; s) = \dim H_{f,S}^1(\text{Gal}_F, V^*(1)) - \dim H^0(\text{Gal}_F, V^*(1)).$$

┘

*Proof:*

$\square$

**Prop. (31.3.3.10) [Fontaine-Perrin-Riou].** Situation as in (31.3.3.9), for any two  $\emptyset \subset_{\text{fin}} S \subset \Sigma_F^{\text{fin}}, \emptyset \subset_{\text{fin}} S' \subset \Sigma_F^{\text{fin}}$ , if the conjecture on the change of partial Selmer group (31.2.2.5) holds for  $V$ , and the  $F$ -semisimplicity conjecture (9.4.6.41) holds for  $V$ , then the Bloch-Kato conjecture holds for  $L_S(V; s)$  iff it holds for  $L_{S'}(V; s)$ .  $\square$

*Proof:* It suffices to show for  $S' = S \cup \{v\}$  for some  $v \in \Sigma_F^{\text{fin}} \setminus S$ . In this case, the change on the Selmer group side is the dimension of the  $\sigma_v$ -invariant space of  $V$ , and the change in the  $L$ -function side is the order of the local  $L$ -factor, which is the arithmetic dimension of eigenvalue 0 of  $\sigma_v$ , they are equal when  $\sigma_v$  acts semisimply on  $V$ .  $\square$

### Bloch-Kato Conjecture for Mixed Motives

**Conj. (31.3.3.11) [Bloch-Kato for Mixed Motives].** It is conjectured that there is an isomorphism

$$\text{Ext}_{\text{MMot}_F}^1(\mathbb{Q}, M) = H_g^1(\text{Gal}_F, M_p) \text{ (31.2.2.8).?}$$

where  $\text{MMot}_F$  is not defined yet but the LHS can be defined using the  $K$ -theory of  $M$ .  $\square$

*Proof:*

$\square$

## 4 Mahler's Measure and Special Values

References are [Deligne Periods of Mixed Motives, K-Theory and the Entropy of certain  $\mathbb{Z}^n$ -Actions, Deninger], [Mahler's measure and special values of  $L$ -functions, Boyd].

## 5 $\mathbb{A}^1$ Case

**Thm. (31.3.5.1) [Beilinson-Bloch-Kato for Artin Representations].** If  $F \in \mathbf{NField}$  and  $\rho$  is an Artin representation of  $\text{Gal}_F$ , then the Bloch-Kato conjecture holds for  $\rho(n)$  for each  $n \in \mathbb{Z}$ .  $\square$

*Proof:* The lower bounds for Selmer groups hold because  $w(\rho(n)) \neq -1$ . For the upper bound, use Soulé's theorem relating Selmer group to  $K$ -theory, and use Borel's calculation of  $K$ -groups (31.3.5.2)?  $\square$

**Cor. (31.3.5.2)** [ $K$ -Groups of Integral Rings, Borel1972]. For  $F \in \mathbf{NField}$  and  $m \in \mathbb{Z}_{>1}$ , let

$$d_m = \text{ord}_{s=1-m} \zeta_F(s) = \begin{cases} r_2 & , m \in 2\mathbb{Z} \\ r_1 + r_2 & , m \in 2\mathbb{Z} + 1 \end{cases}.$$

Then

$$\dim_{\mathbb{Q}} K_{2m-1}(\mathcal{O}_F)_{\mathbb{Q}} = d_m$$

┘

*Proof:*

□

**Prop. (31.3.5.3).** For  $k \in \mathbb{Z}_+$ ,  $\zeta(-2k) = 0$  and  $\zeta(1-2k) = -\frac{B_{2k}}{2k}$ . And

$$\zeta(2k) = \frac{(-1)^{k+1} B_{2k}}{2(2k)!} (2\pi)^{2k} = \frac{(2\pi i)^{2k}}{2(2k-1)!} \left( -\frac{B_{2k}}{2k} \right).$$

In particular,

$$\begin{aligned} \zeta(2) &= \frac{\pi^2}{6}, & \zeta(4) &= \frac{\pi^4}{90}, & \zeta(6) &= \frac{\pi^6}{945}, & \zeta(8) &= \frac{\pi^8}{9450}. \\ \zeta(0) &= -\frac{1}{2}, & \zeta(-1) &= -\frac{1}{12}, & \zeta(-3) &= \frac{1}{120}, & \zeta(-5) &= -\frac{1}{252}. \end{aligned}$$

┘

*Proof:* This follows easily from (35.5.3.2) and the definition of  $B_k$  (10.7.1.12). The last assertion follows easily this together with (35.5.3.1). □

**Prop. (31.3.5.4)** [Leibniz Formula for  $\pi$ ].

$$L(\chi_{-4}; 1) = 1 - \frac{1}{3} + \frac{1}{5} - \frac{1}{7} + \dots = \frac{\pi}{4}.$$

┘

*Proof:* Use the arctan integration formula. This also follows from (35.5.2.6). □

**Prop. (31.3.5.5)** [Comparison of Beilinson and Bloch's Regulator Maps]. Cf. [Rapoport, Comparison].

┘

### Lichtenbaum Conjecture

**Conj. (31.3.5.6)** [Bloch Conjecture for Fields]. For  $F \in \mathbf{NField}$ , mapping the higher  $K$ -groups  $K_{2i-1}(F)$  to a lattice with covolume  $\zeta_F(m)$  via higher regulator maps. And the regular maps are made from  $m$ -th polylogarithm functions (31.3.2.8), so  $\zeta_F(m)$  can be expressed by combinations of  $m$ -th polylogarithm functions of elements in  $F$ .

For example:

$$\zeta_{\mathbb{Q}(\sqrt{5})}(3) = \frac{24}{25\sqrt{5}} \text{Li}_3(1) [\text{Li}_3(\alpha) + \text{Li}_3(-\alpha) + \frac{1}{2}(\log(\alpha))^3 - \frac{\pi^2}{6} \log(\alpha)], \alpha = \frac{\sqrt{5}-1}{2}.$$

This makes the numerical calculation of higher  $K$ -groups possible.

┘

*Proof:* ?

□

**Remark (31.3.5.7).**  $m = 2$  case is proved by Bloch-Suslin-Merkuriev,  $m = 3$  case is proved by Goncharov.  $\lrcorner$

**Thm& Conj.Cor. (31.3.5.8) [Mazur-Wiles/Wiles[Wil90]].** If  $M/F \in \mathbf{NField}$  are totally real and  $p \in \mathbf{Prime}_{\geq 3}$  s.t.  $p \nmid [M : F]$ , then for any  $p$ -adic character  $\chi$  of  $\mathrm{Gal}(M/F)$ , there exists a  $p$ -adic unit  $c$  s.t.

$$\#(K_2(\mathcal{O}_M) \otimes \mathbb{Z}_p[\chi])^\chi = cw_{2,\chi}(M)L(\chi^{-1}, -1)^{[\mathcal{O}_\chi : \mathbb{Z}_p]}.$$

 $\lrcorner$ 

*Proof:* Cf.Cf.[Wil90]P499.  $\square$

**Thm& Conj.Cor. (31.3.5.9) [Lichtenbaum Conjecture for Totally Real Fields, Wiles].** If  $F \in \mathbf{NField}$  is totally real and  $p \in \mathbf{Prime}_{\geq 3}$ , then for any  $n \in 2\mathbb{N} + 1$ , there exists a  $p$ -adic unit  $c$  s.t.

$$\zeta_F(-n) = c \frac{\#H^2(\mathcal{O}_F[\frac{1}{p}], \mathbb{Z}_p(n+1))}{\#H^1(\mathcal{O}_F[\frac{1}{p}], \mathbb{Z}_p(n+1))}.$$

 $\lrcorner$ 

*Proof:* Cf.[Wil90]P499.  $\square$

## 6 Modular Form case

**Thm. (31.3.6.1) [Parity Conjecture for Modular Forms].** Kato proved the upper bound for rank of Selmer groups for modular forms.  $?$

Because the lower bound is known unless  $w(V) = -1$  by (31.3.3.8), we assume  $w(V) = -1$ .

In this case, Nekovar[On the parity of ranks of Selmer groups. 2] proved that if  $f$  is ordinary at  $p$ ,

$$\dim H_f^1(\mathrm{Gal}_F, V) \equiv \mathrm{ord}_{s=0} L(V; s) \pmod{2}.$$

using his theory of Selmer complexes.

And when  $f$  is associated to elliptic curves, this is generalized to the supersingular case by [B. D. Kim] and [Dokchitser-Dokchitser].  $?$

Another direct construction of the extension in  $H_f^1$  without the ordinary condition is given by [Skinner-Urban2006] and [Bellaïche-Chenevier09].  $?$   $\lrcorner$

*Proof:*  $?$   $\square$

**Def. (31.3.6.2) [Elliptic Dilogarithm].** Let  $E \in \mathbf{EllCur}/\mathbb{C}$  with complex parametrization  $\mathbb{C}^\times/q^\mathbb{Z}$ , define the **elliptic dilogarithm**:

$$D_q : \mathbb{C}^\times/q^\mathbb{Z} \rightarrow \mathbb{R} : z \mapsto \sum_{n \in \mathbb{Z}} D(q^n z) \quad (31.3.2.9).$$

And it extends linearly to a map  $Z_1(E) \rightarrow \mathbb{R}$ .  $\lrcorner$

**Prop. (31.3.6.3) [Bloch].** Let  $E \in \mathbf{EllCur}/\mathbb{C}$ , define

$$F : R(E)^\times \otimes R(E)^\times \rightarrow \mathbb{R} : f \otimes g \mapsto D_q(\sum m_i n_j [b_j - a_i]),$$

where  $f, g \in R(E)^*$  with divisor  $(f) = \sum m_i a_i, (g) = \sum n_j b_j$ . Then  $F$  is additive, and

$$D(f \otimes (1 - f)) = 0.$$

In particular,  $F$  factors through  $R(E)^* \otimes R(E)^* / \{f \otimes (1 - f)\} = K_2(R(E))$ .

Thus, there is a composition  $r_E : K_2(E) \rightarrow K_2(R(E)) \rightarrow \mathbb{R}$ , called the (higher) **regulator map**.

┘

*Proof:*

□

**Thm. (31.3.6.4) [Beilinson-Bloch].** Let  $E \in \text{EllCur}/\mathbb{Q}$  with complex parametrization  $E(\mathbb{C}) \cong \mathbb{C}^\times / q^{\mathbb{Z}}$ , then there exists a  $\text{Gal}_{\mathbb{Q}}$ -invariant divisor  $P$  on  $E$  s.t.  $D_q(P) \sim_{\mathbb{Q}^\times} L(E, 2)/\pi$  (31.3.6.2). ┘

*Proof:*

□

**Thm. (31.3.6.5) [Weak Beilinson Conjecture, Beilinson-Bloch].** Let  $E \in \text{EllCur}/\mathbb{Q}$ . Situation as in (31.3.2.1), we consider the motive  $h^1(E), i = 1, m = 1, n = 2$ . Then  $H_{\text{Betti}}^1(E, \mathbb{R}(1))^{c^*=-1} \cong H_{\text{Del}}^2(E/\mathbb{R}, \mathbb{R}(n))$  by (31.3.2.2).

Then there exists  $\Phi \in H_{\text{Mot}}^2(E_{\mathbb{Z}}, \mathbb{Q}(2))$  and  $\Phi \in H_{\text{Betti}}^1(E, \mathbb{Q}(1))^{c^*=-1}$  s.t.

$$r_{\text{Del}}(\Phi) = L^{\vee}(E, 0)\Phi.$$

┘

*Proof:* Cf. [Beilinson, Higher regulators of modular curves] and [Beilinson's Conjecture for elliptic curves with complex multiplication, Deninger-Wingberg].

□

## 7 Shimura Curve case

**Notation (31.3.7.1).**

- Use notation as in [Modular Curves](#).
- Denote  $\Omega^1(M^c) = \varinjlim_K \Omega^1(M_K^c)$ .

┘

**Prop. (31.3.7.2).** Denote  $\{\mathcal{O}^*(M_K), \mathcal{O}^*(M_K)\}$  the  $\mathbb{Q}$ -subspace of  $H_{\text{Mot}}^2(M_K, \mathbb{Q}(2))$  generated by the symbols  $\{u, v\}$  with  $u, v \in \mathcal{O}^*(M_K) \otimes \mathbb{Q} = H_{\text{Mot}}^1(M_K, \mathbb{Q}(1))$ .

Denote

$$\mathcal{Q}_K = H_{\text{Mot}}^2(M_K^c, \mathbb{Q}(2)) \cap \{\mathcal{O}^*(M_K), \mathcal{O}^*(M_K)\},$$

$$\mathcal{P}_K = \cup K' \subset K \text{Nm}_{K'/K}(\mathcal{Q}_{K'}) \subset H_{\text{Mot}}^2(M_K^c, \mathbb{Q}(2)).$$

┘

**Prop. (31.3.7.3).** By [Langlands, Modular Forms and l-adic Representations], The action of  $GL(\mathbf{A}_f)$  on  $\Omega^1(M^c)$  gives rise to a decomposition

$$\Omega^1(M) = \bigoplus_{\pi} V_{\pi}.$$

┘

*Proof:* ? □

**Thm. (31.3.7.4) [Beilinson's Conjecture for Modular Curves].**

- $r_{\mathbb{R}}(\mathcal{P}_K)(31.3.2.7) = H_{\text{Del}}^2(M_K^c/\mathbb{R}, \mathbb{R}(2)) = H_{\text{Betti}}^1(M_K^c(\mathbb{R}), \mathbb{R}(1))$ , thus giving a  $\mathbb{Q}$ -structure on  $H_{\text{Del}}^2(M_K^c, \mathbb{R}(2))$ .
- Let  $g$  be the genus of  $M_K^c$ , then

$$\det r_{M_K^c}(\mathcal{P}_K) = L^{(g)}(H^1(M_K^c), 0) \cdot \det H_{\text{Betti}}^1(M_K^c(\mathbb{R}), \mathbb{Q}(1)).$$

- $\mathcal{P}_K \subset H_{\text{Mot}}^2(M_K^c, \mathbb{Q}(2))_{\mathbb{Z}}$ .

┘

*Proof:* This follows from (31.3.7.5), Cf.[Scholl, P8]. ? □

**Thm. (31.3.7.5).**

- For  $u, v \in \mathcal{O}^*(M_K) \otimes \overline{\mathbb{Q}}$ ,

$$\int_{M_K(\mathbb{C})} \log |u| \overline{\log v} \wedge \omega \in \overline{\mathbb{Q}} \cdot (2\pi i c^+(\pi) L^{\vee}(\pi^{\vee}, 0)) \in \overline{\mathbb{Q}} \otimes \mathbb{C}.$$

- For some choice of  $K$ ,  $\omega \in V_{\pi}^K$  and  $u, v \in \mathcal{O}^*(M_K) \otimes \overline{\mathbb{Q}}$ , the integral is non-zero.

┘

*Proof:* Cf.[Scholl, Thm1.3.2]. ? □

**Thm. (31.3.7.6).** For  $\chi$  s.t.  $L(\pi \otimes \chi; 1) \in (\overline{\mathbb{Q}} \otimes \mathbb{C})^{\times}$ ,

$$c^+(\pi) L^{\vee}(\pi^{\vee}; 0) \sim_{\overline{\mathbb{Q}}^{\times}} \frac{L(\pi; 2) L(\pi \otimes \chi; 1)}{L(\omega_{\pi} \chi; 2)}.$$

┘

*Proof:* Cf.[Scholl, Thm2.3]. ? □

**Prop. (31.3.7.7).** Situation as in (31.3.7.5),

$$\int_{M(\mathbb{C})} \log |u| \overline{\log v} \wedge \omega = \int_{M_K(\mathbb{C})} \mathcal{E}_{\varphi}(z, g; 1) \overline{\eta}_{\xi} \wedge \omega.$$

┘

### Triple Product

**Conj. (31.3.7.8) [Beilinson-Bloch Height Pairing for Triple Product Diagonal Cycles].** If

$\epsilon(F; 2) = -1$ , and let  $X$  be the Shimura curve associated to an Eichler order of reduced discriminant  $N$  ? in the indefinite quaternion algebra  $B$  ramified at the set of finite places  $p \in \text{Prime}$  s.t.  $\epsilon_p(F; 2) = -1$ , then

$$L^{\vee}(F; 2) = \frac{(F, F)}{2\pi N 2^t} \left\langle \Delta_F^0, \Delta_F^0 \right\rangle_{\text{B-B}},$$

where  $\Delta_F$  is the  $F$ -eigencomponent of the Gross-Schoen cycle and  $\Delta$ . ┘

## 31.4 Birch-S.Dyer Conjecture

*“This remarkable conjecture relates the behaviour of a function  $L$ , at a point where it is not at present known to be defined, to the order of a group  $\text{III}$ , which is not known to be finite.”*

–J. Tate

References are [Kolyvagin's Conjecture And Patched Euler Systems In Anticyclotomic Iwasawa Theory, Naomi] and <http://www.math.columbia.edu/~chaoli/docs/KolyvaginConjecture.html>.

### Rank 0 case

**Prop.(31.4.2.1).** If  $E \in \mathbf{EllCur}/\mathbb{Q}$  and  $p \in \mathbf{Prime}$ ,

$$\text{rank}(E/\mathbb{Q}) = 0, \#\text{III}[p^\infty] < \infty \implies \text{rank}_p(E/\mathbb{Q}) = 0.$$

┘

**Thm& Conj.Cor.(31.4.2.2) [Coates-Wiles[C-W77]/Gross-Zagier[G-Z86]/Rubin[Rub87]/ Kolyvagin[Kol90]/Kato[Kat93, Kat04]].** For  $E \in \mathbf{EllCur}/\mathbb{Q}$  and  $p \in \mathbf{Prime}$ ,

$$\text{rank}_{\text{an}}(E/\mathbb{Q}) = 0 \implies \text{rank}(E/\mathbb{Q}) = 0 \quad \& \quad \#\text{III}[p^\infty] < \infty.$$

┘

*Proof:* ? Cf.Gross-Zagier(31.6.2.2) and Kolyvagin(33.5.3.11).

□

### Rank 1 case

References are [Weil Zhang, Selmer groups and the divisibility of Heegner points (2013)] and [the Birch and Swinnerton-Dyer Formula for Elliptic Curves of Analytic Rank One].

**Prop.(31.4.2.3).** If  $E \in \mathbf{EllCur}/\mathbb{Q}$  and  $p \in \mathbf{Prime}$ ,

$$\text{rank}(E/\mathbb{Q}) = 1, \#\text{III}[p^\infty] < \infty \implies \text{rank}_p(E/\mathbb{Q}) = 1.$$

┘

**Thm& Conj.Cor.(31.4.2.4)[Gross-Zagier[G-Z86]/Kolyvagin[Kol90]/Kolvaagin-Logachëv[K-L90]/ Bump-Friedberg-Hoffstein/Murty-Murty].** For  $E \in \mathbf{EllCur}/\mathbb{Q}$  and  $p \in \mathbf{Prime}$ ,

$$\text{rank}_{\text{an}}(E/\mathbb{Q}) \leq 1 \implies \text{rank}(E/\mathbb{Q}) = \text{rank}_{\text{an}}(E/\mathbb{Q}) \quad \& \quad \#\text{III}[p^\infty] < \infty.$$

┘

*Proof:* ? Cf.Gross-Zagier(31.6.2.2) and Kolyvagin(33.5.3.11).

3 follows from(33.5.3.15).

□

$p$ -Converse Theorems

**Thm. (31.4.2.5)** [Rank 0  $p$ -Converse Theorem for CM Curves, Rubin[Rub91]/ Burungale-Tian[B-T20, B-T22]]. If  $E \in \text{EllCur}/\mathbb{Q}$  has CM and  $p \in \text{Prime}$ , then

$$\text{rank}_p(E/\mathbb{Q}) = 0 \implies L(E; 1) \neq 0.$$

┘

*Proof:* ?

□

**Thm. (31.4.2.6)** [Rank 0  $p$ -Converse Theorem, Skinner-Urban[S-U14]/ Skinner[Ski16]/Wan[?]]. Let  $E \in \text{EllCur}/\mathbb{Q}$  with conductor  $N$  and  $p \in \text{Prime}$  s.t.

- $E$  has good ordinary reduction at  $p$ ,
- $\bar{\rho}_{E,p} : \text{Gal}_{\mathbb{Q}} \rightarrow \text{Aut}(E[p])$  is absolutely irreducible,
- there exists  $\ell \in \text{Prime} \setminus \{p\}$  s.t.  $v_{\ell}(N) = 1$  and  $\bar{\rho}_{E,p}$  is ramified at  $\ell$ ,

then

$$\text{rank}_p(E/\mathbb{Q}) = 0 \implies \text{rank}_{\text{an}}(E/\mathbb{Q}) = 0$$

┘

*Proof:* ?

The proof is given by an extensive generalization of the methods employed by Wiles in his proof of the Iwasawa main conjecture for totally real fields: Eisenstein congruences and Galois representations.

□

**Remark (31.4.2.7).** A rank 0  $p$ -converse theorem for supersingular  $p$  has been established by Wan. ┘

**Thm. (31.4.2.8)** [Rank 1  $p$ -Converse Theorem for CM Curves, Burungale-Tian[B-T20]/ Burungale-Castella-Skinner-Tian[BCST]]. Let  $E \in \text{EllCur}/\mathbb{Q}$  be CM with conductor  $N$  and  $p \in \text{Prime}$  s.t.  $p \nmid 6N$ , then

$$\text{rank}_p(E/\mathbb{Q}) = 1 \implies \text{rank}_{\text{an}}(E/\mathbb{Q}) = 1.$$

┘

*Proof:* ?

□

**Remark (31.4.2.9).** It seems that they can generalize to CM curves over totally real fields. ? ┘

**Thm. (31.4.2.10)** [Rank 1  $p$ -Converse Theorem, Skinner-Urban[S-U14]/ Zhang[Zha14a]/Skinner[Ski16]]. Let  $E \in \text{EllCur}/\mathbb{Q}$  with conductor  $N$  and  $p \in \text{Prime}$  s.t.

- $E$  has good ordinary reduction at  $p$ , and  $p \nmid 6N$ .
- $\bar{\rho}_{E,p} : \text{Gal}_{\mathbb{Q}} \rightarrow \text{Aut}(E[p])$  is absolutely irreducible,
- there exists  $\ell \in \text{Prime}$  s.t.  $v_{\ell}(N) = 1$  and  $\bar{\rho}_{E,p}$  is ramified at  $\ell$ ,

then

$$\text{rank}_p(E/\mathbb{Q}) = 1 \implies \text{rank}_{\text{an}}(E/\mathbb{Q}) = 1.$$

┘

*Proof:* ? Cf.[Skinner, Lectures on the Iwasawa theory of elliptic curves, notes, 2018].

The proof is given by an extensive generalization of the methods employed by Wiles in his proof of the Iwasawa main conjecture for totally real fields: Eisenstein congruences and Galois representations.  $\square$

**Remark(31.4.2.11).** Question: is it possible to remove the absolutely irreducible condition in the converse theorems(the Eisenstein primes)?, maybe by using [Greenberg and V. Vatsal, On the Iwasawa invariants of elliptic curves2000]. Cf.[CGLS].  $\lrcorner$

**Remark(31.4.2.12) [Open Questions in the  $p$ -Converse Theorems].** The following cases of  $p$ -converse theorems are still unknown:

- primes  $p$  of additive reduction.
- cases where  $E[p]$  is reducible or has small Galois images.
- $p \leq 3$ , especially  $p = 2$ .

 $\lrcorner$ 

*Proof:* ?  $\square$

### Refined B-S.D Conjecture

**Thm. (31.4.2.13)[CM case, Rubin[Rub91]/Kobayashi[Kob13]].** Let  $E \in \text{EllCur}/\mathbb{Q}$  with CM by an imaginary quadratic field  $\mathcal{K}$  and with conductor  $N$ . Then:

- The B-S.D formula(31.4.1.1) holds up to an element in  $\mathbb{Z}[\frac{1}{\#\mathcal{O}_{\mathcal{K}}^*}]^*$  if  $\text{rank}_{\text{an}}(E/\mathbb{Q}) = 0$ .
- The B-S.D formula(31.4.1.1) holds up to an element in  $\mathbb{Z}[\frac{1}{\#\mathcal{O}_{\mathcal{K}}^* \cdot N}]^*$  if  $\text{rank}_{\text{an}}(E/\mathbb{Q}) = 1$ .

 $\lrcorner$ 

*Proof:* ?  $\square$

**Thm. (31.4.2.14)[General case, Kato[Kat04]/Skinner-Urban[S-U14]/Zhang[Zha14a]/Skinner[Ski16]/Jetchev-Skinner-Wan[JSW17]].** Let  $E \in \text{EllCur}/\mathbb{Q}$  with conductor  $N$  and  $p \in \text{Prime}_{\geq 5}$ . Suppose that

- $E$  has good ordinary reduction at  $p$ .
- $\bar{\rho}_{E,p} : \text{Gal}_{\mathbb{Q}} \rightarrow \text{Aut}(E[p])$  is absolutely irreducible,
- there exists  $\ell \in \text{Prime} \setminus \{p\}$  s.t.  $v_{\ell}(N) = 1$  and  $\bar{\rho}_{E,p}$  is ramified at  $\ell$ ,

then the  $p$ -part of the B-S.D formula(31.4.1.1) holds if  $\text{rank}_{\text{an}}(E/\mathbb{Q}) \leq 1$ .  $\lrcorner$

*Proof:* ?

See also [Congruences between modular forms and the Birch and Swinnerton-Dyer conjecture] and [On the  $p$ -part of the Birch-Swinnerton-Dyer formula for multiplicative primes, Castella].  $\square$

**Thm. (31.4.2.15).** If  $E \in \text{EllCur}/\mathbb{Q}$  with conductor  $N$  satisfies  $\text{rank}_{\text{an}}(E/\mathbb{Q}) = 1$ ,  $p \in \mathbf{P} \setminus \{2, 3\}$  and  $\bar{\rho}_{E,p}$  is surjective and ramifies at any  $\ell \in \mathbf{P}$  s.t.  $v_{\ell}(N) = 1$ , then the  $p$ -part of the BSD formula(31.4.1.3) holds.  $\lrcorner$

*Proof:* Cf, [Weil Zhang, Selmer groups and the divisibility of Heegner points (2013)]. or <http://www.math.columbia.edu/~chaoli/docs/KolyvaginConjecture.html>.  $\square$

### Statistical results

**Cor. (31.4.2.16) [Bhargava-Skinner-Zhang].** When the isomorphism classes in  $\mathbf{EllCur}/\mathbb{Q}$  are ordered by the statistical height (35.9.2.1),

- At least 16%  $E$  has  $\text{rank}(E) = \text{rank}_{\text{an}}(E) = 0$ .
- At least 20%  $E$  has  $\text{rank}(E) = \text{rank}_{\text{an}}(E) = 1$ .
- At least 66%  $E$  has  $\text{rank}(E) = \text{rank}_{\text{an}}(E) \in \{0, 1\}$  and  $\#\text{III}(E) < \infty$ .

┘

*Proof:* Use 5-adic converse theorems. ?

□

### 3 over Function Fields

**Thm. (31.4.3.1) [Artin-Tate].** For  $F \in \mathbf{FField}$  and  $E \in \mathbf{EllCur}/F$ , analogue of the BSD conjecture (31.4.1.1) holds for  $E$  iff  $\text{III}(E/F)$  is finite.

┘

*Proof:* ? Cf. [Milne, Arithmetic Duality Theorems]Cor9.7.

□

### 4 Motivic B-S.D Conjectures

**Prop. (31.4.4.1) [Motivic B-S.D conjectures].** For  $E \in \mathbf{EllCur}/\mathbb{Q}$ , consider the motive  $h^1(E)$ , then

$$L(E, s) = Z(h^1(E), s).$$

More generally, if we consider L-functions of the form

$$L_3(E, s) = \prod_p L(E_{\mathbb{F}_{p^3}}, s).$$

Then there exists a motive  $M \in M_{\text{num}}(\mathbb{Q})$  s.t.

$$h^1(E) \otimes h^1(E) \otimes h^1(E) = 3h^1 E(-1) \oplus M,$$

and

$$L_3(E, s) = Z(M, s).$$

┘

*Proof:*

□

### 5 Mazur-Tate Conjecture

References are [Mazur-Tate Conjecture, Tony Feng].

**Conj. (31.4.5.1) [Mazur-Tate].** Let  $E \in \mathbf{EllCur}/\mathbb{Q}$  and  $M \in \mathbb{Z}_+$  is not divisible by any  $p^2$  where  $p \in \mathbf{Prime}$  and  $E$  has split multiplicative reduction at  $p$ . They used modular symbol to find an element  $\theta \in \mathbb{Q}[(\mathbb{Z}/(M))^*/\{\pm 1\}]$ . Let  $R \subset \mathbb{Q}$  be a subring that contains all the coefficients of  $\theta$  and that the order of the torsion groups of  $E(\mathbb{Q})$  are invertible in  $R$ . Let  $I \subset R[(\mathbb{Z}/(M))^*/\{\pm 1\}]$  be the augmentation ideal.

Let  $r = \text{rank } E(\mathbb{Q})$  and  $r'$  the number of primes  $p \in \mathbf{Prime}$  dividing  $M$  s.t.  $E$  has split multiplicative reduction at  $p$ , then  $\theta \in I^{r+r'}$ , and there is a formula relating the image of  $\theta \in I^{r+r'}/I^{r+r'+1}$  with  $\#\text{III}(E)$ .

┘

## 6 Nagao's Conjecture

**Conj. (31.4.6.1) [Statistical B-S.D Conjecture].** For any  $E \in \mathbf{E11Cur}/\mathbb{Q}$ , there exists  $C_E \in \mathbb{R}$  s.t.

$$\prod_{p \in \mathbf{Prime}, p \leq X, p \nmid \mathfrak{D}_E} \frac{N_p}{p} \sim C_E (\log X)^{\text{rank}(E/\mathbb{Q})}, \quad X \rightarrow \infty.$$

┘

*Proof:* ? What's the relation to BSD Conjecture? □

**Thm. (31.4.6.2).** For any  $E \in \mathbf{E11Cur}/\mathbb{Q}$ , if the Riemann hypothesis holds for  $L(E; s)$ , then there is a sequence  $x_n \in [2^n, 2^{n+1}]$  s.t.

$$\lim_{n \rightarrow \infty} \frac{1}{\log x_n} \sum_{p \in \mathbf{Prime}, p < x_n} \frac{a_p \log p}{p} = -\text{rank}_{\text{an}}(E/\mathbb{Q}) + \frac{1}{2}.$$

┘

**Cor. (31.4.6.3) [Kim-Murty[K-M23]].** For any  $E \in \mathbf{E11Cur}/\mathbb{Q}$ , if the limit

$$\lim_{X \rightarrow \infty} \frac{1}{\log X} \sum_{p \in \mathbf{Prime}, p < X} \frac{a_p \log p}{p}$$

exists, then the Riemann hypothesis for  $L(E; s)$  is true, and the limit equals  $-\text{rank}_{\text{an}}(E/\mathbb{Q}) + \frac{1}{2}$ . ┘

*Proof:* ? □

### 31.5 Artin $L$ -Functions: Stark Conjectures

References are [Sta77], [Tat84].

#### 1 Stark Conjecture

**Notation (31.5.1.1).**

- Let  $F \in \mathbf{NField}$ .

┘

**Conj. (31.5.1.2) [Stark].** Let  $L/F \in \mathbf{NField}$  and  $\rho \in \text{Rep}^{\text{fd}}(\text{Gal}(L/F))$  with character  $\chi$  s.t.  $\rho$  is trivial on  $\text{Gal}_L$ . Let  $\Sigma_F^\infty \subset_{\text{fin}} S \subset \Sigma_F$  and  $S_L \subset \Sigma_L$  the set of places of  $L$  over  $S$ . Let  $Y$  be the free module on  $S$  and  $X \subset Y$  be the submodule of elements  $\sum n_w w$  s.t.  $\sum n_w = 0$ .

Let  $r_\chi = \dim \text{Hom}_{\text{Gal}(L/F)}(\rho^*, X_{\mathbb{C}})$ .

Let  $U$  be the set of  $S_L$ -units in  $L$  and define

$$\lambda : U_{\mathbb{R}} \rightarrow X_{\mathbb{R}} : u \mapsto \sum_w \log |u|_w w,$$

which is an isomorphism by the unit theorem (19.4.1.20).

For any isomorphism  $f : X_{\mathbb{Q}} \cong U_{\mathbb{Q}}$ , define the **Stark regulator**  $R(\chi, f)$  to be the determinant of the endomorphism of  $\text{Hom}(\rho^*, X_{\mathbb{C}})$  induced by  $\lambda_{\mathbb{C}} \circ f_{\mathbb{C}}$ . Then:

- There exists some  $A(\chi, f) \in \mathbb{C}^\times$  s.t. when  $s \rightarrow 0$ ,

$$L_S(\chi; s) \sim \frac{R(\chi, f)}{A(\chi, f)} s^{r(\chi)} \quad (31.1.1.10).$$

- For any  $\sigma \in \text{Aut}(\mathbb{C})$ , we have  $\sigma(A(\chi, f)) = A(\chi^\sigma, f)$ .

┘

**Thm. (31.5.1.3) [Stark].** The Stark conjecture is true if  $F = \mathbb{Q}$  or  $F$  is an imaginary quadratic field. ┘

*Proof:*

□

#### Rational case

**Thm& Conj. Cor. (31.5.1.4) [Tate1984].** The Stark conjecture is true if  $\text{Im}(\chi) \in \mathbb{Q}$ . ┘

*Proof:*

?

□

#### Rank 0 case

**Prop. (31.5.1.5) [Siegel].** Let  $L/F \in \mathbf{NField}$  be an Abelian extension and  $\emptyset \subset_{\text{fin}} S \subset \Sigma_L^{\text{fin}}$ ,  $\sigma \in \text{Gal}(L/F)$ , then the value of the partial  $L$ -function (35.5.2.1) satisfies  $\zeta_S(F, \sigma; 0) \in \mathbb{Q}$ . ┘

*Proof:* Cf. [On evaluation of zeta functions of totally real algebraic number fields at non positive integers, Shintani]. ?

□

**Thm& Conj.Cor.(31.5.1.6)[Stark Conjecture, Rank 0 case].** If  $r(\chi) = 0$ , then the Stark conductor  $R(\chi, f) = 1$ , and the Stark conjecture is equivalent to:

$$\alpha(L_S(\chi; 0)) = L_S(\chi^\alpha; 0)$$

for any  $\alpha \in \text{Aut}(\mathbb{C})$ . Using a refinement of Brauer's theorem ?,

$$L(\chi; s) = \sum_{\sigma \in \text{Gal}(L/F)} \chi(\sigma) \zeta_S(\sigma; s),$$

and  $\zeta_S(\sigma; s) \in \mathbb{Q}$  (31.5.1.5), so the assertion is true. ┘

### Rank 1 case

**Def.(31.5.1.7)**  $[e_\chi]$ . Let

$$e_\chi = \frac{\chi(1)}{\#G} \sum_{\sigma \in G} \chi(\sigma^{-1}) \sigma \in \mathbb{C}[G]$$

be the projection operator that maps any representation to its  $\chi$ -component. ┘

**Def.(31.5.1.8)** **[Stark Units]**. ┘

### Abelian case

**Conj.(31.5.1.9)** **[Refined Stark Conjecture  $\text{St}(L/F, S)$ , Abelian case]**. Let  $L/F \in \mathbf{NField}$  be an Abelian extension and  $\Sigma_F^\infty \subset_{\text{fin}} S \subset \Sigma_F$  satisfying some conditions ?. Then for any  $w \in \text{Hom}(F, \mathbb{R})$ , there exists  $\varepsilon(K, S, w) \in \mathcal{O}_{L, S_L}$  (31.5.1.2) s.t. for any  $\sigma \in G$ ,

$$\sigma(\varepsilon(K, S, w)) = \exp(-2\zeta_S^\lambda(\sigma; 0)) \text{ (35.5.2.1)}$$

┘

## 2 Brumer-Stark Conjecture

**Conj.(31.5.2.1)** **[Brumer-Stark Conjecture, B-S( $L/F, T$ )]**. Let  $L/F \in \mathbf{NField}$  be an Abelian extension with Galois group  $G$  and  $v \in \Sigma_F^{\text{fin}}$  splits completely in  $L$ . Let  $\{v\} \cup \Sigma_F^\infty \cup \text{Ram}_L(F) \subset_{\text{fin}} S \subset \Sigma_F$  and  $T = S \setminus \{v\}$ . Define

$$\theta_T(0) = \sum_{\chi \in G^\vee} L(\chi; 0) e_{\bar{\chi}} \in \mathbb{C}[G] \text{ (31.5.1.7),$$

then for any  $\mathfrak{A} \in \text{Ideal}(\mathcal{O}_F)$ , we have

$$\mathfrak{A}^{\#\mu(L)\theta_T} = (\alpha)$$

where  $\alpha \in L$  satisfies some conditions on the absolute values  $|\alpha|_w$  ( $w \in T$ ) and  $L(\alpha^{1/\#\mu(L)})/L$  is Galois and Abelian. ┘

**Remark(31.5.2.2).** Brumer-Stark conjecture is non-trivial for function fields. ┘

## 3 Rubin-Stark Conjecture

Rubin-Stark conjecture is a version of Stark's conjecture over  $\mathbb{Z}$ .

#### 4 Gross-Stark Conjecture

Gross-Stark conjecture is a  $p$ -adic analogy of Stark's conjecture for  $s = 0$ .

#### 5 Serre-Stark Conjecture

Serre-Stark conjecture is a  $p$ -adic analogy of Stark's conjecture for  $s = 1$ .

## 31.6 Gross-Zagier Formula and AGGP Conjecture

References are [Gross-Zagier formula and arithmetic fundamental lemma, Wei Zhang], [Gross-Zagier Formula notes], [Heegner Points and Representation Theory, Gross], [Gross-Zagier Revisited, Conrad]. [Moduli of Elliptic Curves, Parson], [Heegner points and derivatives of L-series, Gross-Zagier]. <http://math.columbia.edu/~yihang/GZSeminar.html>.

### 1 Heegner Points

**Def. (31.6.1.1) [Heegner Conditions].** Let  $E \in \text{EllCur}/\mathbb{Q}$  and  $\mathcal{K}$  an imaginary quadratic field with  $(\text{disc}(\mathcal{K}), N_E) = 1$  and associated quadratic character  $\eta_{\mathcal{K}} : (\mathbb{Z}/(\text{disc}(\mathcal{K})))^{\times} \rightarrow \{\pm 1\}$ . Then the **Heegner condition** is the hypothesis that every prime factor of  $N_E$  splits in  $\mathcal{K}$ .  $\lrcorner$

**Prop. (31.6.1.2).** In the Heegner situation (31.6.1.1), the sign of functional equation for  $E$  (31.1.6.4)  $w_E = -1$   $\color{red}{?}$ , thus  $\text{rank}_{\text{an}}(E/\mathbb{Q})$  is odd and the BSD conjecture (31.4.1.1) predicts  $\text{rank}(E/\mathbb{Q})$  is odd, so at least it has a non-torsion rational point.  $\lrcorner$

**Def. (31.6.1.3) [Heegner Points].** In the Heegner situation (31.6.1.1), for any  $n \in \mathbb{Z}_+$  s.t.  $(n, N_E) = 1$ ,

$$\mathbb{C}/\mathcal{O}_{\mathcal{K},n} \rightarrow \mathbb{C}/(\mathcal{O}_{\mathcal{K},n} \cap \mathcal{O}_{\mathcal{K},N_E})^{-1}$$

is an isogeny of degree  $N$  of complex elliptic curves, thus defines a point  $x_n \in X_0(N)(\mathbb{C})$ , by moduli characterization, called a **Heegner point**. Then by theory of complex multiplication  $\color{red}{?}$ ,  $x_n$  is defined over the ring class field  $\mathcal{K}_n$  corresponding to  $\mathcal{O}_{\mathcal{K},n}$  (19.7.4.37).  $\lrcorner$

*Proof:*

$\square$

**Def. (31.6.1.4) [Heegner Points of Elliptic Curves].** In the Heegner situation (31.6.1.1), define  $y_n = \varphi_E(x_n) \in E(\mathcal{K}_n)$  (31.6.1.3), where  $\varphi_E$  is the modular parametrization  $\varphi_E : X_0(N) \rightarrow E$  over  $\mathbb{Q}$  (30.4.3.7). Also define  $y_{\mathcal{K}} = \text{tr}_{\mathcal{K}_1/\mathcal{K}}(y_1) \in E(\mathcal{K})$ , called the (principal) **Heegner point of  $E$** .  $\lrcorner$

**Prop. (31.6.1.5).** The Heegner point  $y_{\mathcal{K}} \in E(\mathcal{K})$  (31.6.1.4) is uniquely defined up to sign and torsion. In particular,  $\langle y_{\mathcal{K}}, y_{\mathcal{K}} \rangle_{\text{N-T}}$  is well-defined.  $\lrcorner$

*Proof:*

$\square$

### 2 Gross-Zagier Formula

**Thm. (31.6.2.1) [Gross-Zagier [G-Z86]].** In the Heegner situation (31.6.1.1),

$$L'(E/\mathcal{K}; 1) = \frac{\int_{E(\mathbb{C})} \omega \wedge \bar{\omega}}{|d_{\mathcal{K}}|^{1/2}} \cdot \frac{1}{c^2} \cdot \langle y_{\mathcal{K}}, y_{\mathcal{K}} \rangle_{\text{N-T}} \quad (31.6.1.5).$$

$\lrcorner$

*Proof:* Cf. [GZ86] 1.(6.5).  $\color{red}{?}$

$\square$

**Cor. (31.6.2.2).** If  $\text{rank}_{\text{an}}(E/\mathcal{K}) = 1$ , then the Heegner point  $y_{\mathcal{K}}$  is non-torsion, by (21.1.3.5). And if  $\text{rank}_{\text{an}}(E/\mathcal{K}) \geq 1$ ,  $y_{\mathcal{K}}$  is torsion.  $\lrcorner$

**Def. (31.6.2.3) [Gross-Zagier curve].** The elliptic curve  $E \in \text{EllCur}/\mathbb{Q}$  defined by

$$E : -139y^2 = x^3 + 10x^2 - 20x + 8$$

has conductor  $N = 37 \cdot 139^2$  and sign of functional equation  $\epsilon_E = -1$ . And by Gross-Zagier formula,  $\text{ord}_{s=1} L(E; s) = \text{rank}(E) = 3$ .  $\lrcorner$

*Proof:* Cf. [I-K04]P541.  $\square$

### 3 AGGP Conjecture

AGGP conjecture has applications to the Beilinson-Bloch conjecture.

#### Special Cycles

**Def. (31.6.3.1) [Special Pairs].** A **special pair** of Shimura datum is a homomorphism of Shimura datum  $(H, X_H) \rightarrow (G, X_G)$  s.t.

- $H \rightarrow G$  is injective and the pair  $(H, G)$  is spherical.
- $\dim_{\mathbb{C}} X_H = \lfloor \frac{\dim_{\mathbb{C}} X_G}{2} \rfloor$ .

$\lrcorner$

**Def. (31.6.3.2) [Special Cycles].** For a special pair of Shimura datum  $(H, X_H) \rightarrow (G, X_G)$  and open subgroups  $K_H \subset H(\mathbf{A}_f), K_G \subset G(\mathbf{A}_f)$ , there is a finite morphism

$$\delta_{K_H, K_G} : \text{Sh}_{K_H}(H) \rightarrow \text{Sh}_{K_G}(G) \text{ ?}.$$

And then  $z_{K_H, K_G} = \delta_{K_H, K_G, *} [\text{Sh}_{K_H}(H)] \subset \text{CH}^*(\text{Sh}_{K_G}(G))$  is called a **special cycle**. If  $K_H = K_G \cap H(\mathbf{A}_f)$ , then denote  $z_{K_G} \stackrel{\Delta}{=} z_{K_H, K_G}$ .  $\lrcorner$

**Remark (31.6.3.3).** Note that the definition is different from that of [Kudla, Special cycles on unitary Shimura varieties] and [Kudla-Rapoport-Yang, Modular forms and special cycles on Shimura curves]. ?  $\lrcorner$

**Def. (31.6.3.4) [Gross-Zagier Special Pairs].** If  $F' \rightarrow \text{Mat}(2; \mathbb{Q})$  is an embedding where  $F'$  is an imaginary quadratic number field, then it defines a morphism

$$H = \text{res}_{F'/\mathbb{Q}} \mathbb{G}_m \hookrightarrow \text{GL}(2)_{\mathbb{Q}},$$

and  $H_{\mathbb{R}} \cong \mathbb{S}$  (7.1.5.33). In particular, we have a canonical map of special pairs  $(H, X_H) \rightarrow (G, X_G)$ , where  $\dim X_H = 0, \dim G = 1$ . ?

Generally, we can consider the case that  $E/F \in \text{CMField}$  and  $B/F$  is a quaternion algebra that is indefinite at one infinite place and positive definite at other infinite places, together with an embedding  $E \rightarrow B$ . Then we have an embedding  $E^{\times} \rightarrow B^{\times}$ , and the corresponding embedding  $\text{Sh}_{E^{\times}} \subset \text{Sh}_{B^{\times}}$  is called the **CM points** of the Shimura curve. ?  $\lrcorner$

### Restriction Problem

**Prop. (31.6.3.5).** For a special pair  $H \subset G$  (31.6.3.1), we can consider the projective limit of Chow groups  $\mathrm{CH}_*(\mathrm{Sh}_G)$ , which has an action of  $G(\mathbf{A}_F)$ . Then  $\mathrm{Sh}_H$  defines a cycle  $[\mathrm{Sh}_H] \in \mathrm{CH}_{\dim \mathrm{Sh}_H}(\mathrm{Sh}_G)$ . The mapping

$$\ell_H : \mathrm{CH}^{\dim \mathrm{Sh}_H}(\mathrm{Sh}_G)_0 \rightarrow \mathbb{C} : z \mapsto \langle z, [\mathrm{Sh}_H] \rangle_{\mathrm{B-B}}.$$

is called the **arithmetic period pairing**. Then the problem is to decide whether the restriction of  $\ell_H$  to  $\mathrm{CH}^{\dim \mathrm{Sh}_H}(\mathrm{Sh}_G)_0[\pi]$  is non-vanishing for  $\pi \in \mathrm{Irr}^{\mathrm{cusp}}(G)$ .  $\lrcorner$

**Notation (31.6.3.6) [AGGP Setting].**

- Let  $F \in \mathbf{NField}$  be totally real,
- Let  $E$  be  $F \times F$  or a quadratic CM extension of  $F$ .
- Let  $\mathbb{V}$  be an incoherent Hermitian space over  $\mathbf{A}_E$  (not of the form  $V \otimes_E \mathbf{A}_E$  for some Hermitian space  $V$  over  $E$ ).
- Assume  $\mathbb{V}$  is positive definite at all Archimedean places of  $F$ .
- Let  $e \in \mathbb{V}$  be an element with norm in  $F^\times$ .
- Let  $\mathbb{V}^\flat$  be the orthogonal complement of  $e$ .
- Let  $G = U(\mathbb{V}) \times U(\mathbb{V}^\flat)$ ,  $H = U(\mathbb{V}^\flat)$  be algebraic groups over  $\mathbf{A}_F$ , and  $H$  embeds in  $G$  diagonally.  $\lrcorner$

**Prop. (31.6.3.7) [Chow Group of Shimura Varieties].**  $\mathbb{G}$  defines a projective system  $X_K$  of Shimura varieties parametrized by open compact subgroups  $K$  of  $\mathbb{G}(\mathbf{A}_F^f)$ . Let  $X$  be the projective limit with an action of  $\mathbb{G}(\mathbf{A}_F^f)$ , and  $\mathrm{Ch}^*(X)$  the direct limit of  $\mathrm{Ch}^*(X_K)$ .

Then there is a decomposition

$$\mathrm{Ch}^*(X)_{\mathbb{C}} = \bigoplus_{\pi \in \mathcal{A}(G)} \pi \otimes \mathrm{Ch}^*(\pi),$$

where  $\mathrm{Ch}^*(\pi) = \mathrm{Hom}_{\mathbb{G}}(\pi, \mathrm{Ch}^*(X)_{\mathbb{C}})$ .

Notice that if  $\pi$  is cuspidal, we conjecture that  $\mathrm{Ch}^*(\pi)$  takes value in  $\mathrm{Ch}^*(X)_{\mathbb{C}}^{00}$  ?. And Beilinson-Bloch conjectured that  $\dim_{\mathbb{C}} \mathrm{Ch}^*(\pi) = \mathrm{ord}_{s=1/2} L(\pi; s)$ , and there is a positive definite height pairing

$$\langle \cdot, \cdot \rangle : \mathrm{Ch}^*(\pi) \otimes \mathrm{Ch}^*(\tilde{\pi}) \rightarrow \mathbb{C}.$$

Dually, if we consider  $\mathrm{Ch}_*(X)$  the projective limit of  $\mathrm{Ch}_*(X_K) = \mathrm{Ch}^{\dim X - *}(X_K)$ , then

$$\mathrm{Ch}_*(X) = \prod_{\pi \in \mathcal{A}(\mathbb{G})} \pi^\vee \otimes \mathrm{Ch}_*(\pi^\vee).$$

and  $\mathrm{Ch}_*(\pi^\vee) = \mathrm{Ch}^{\dim X - *}(\tilde{\pi})$ .  $\lrcorner$

*Proof:*

$\square$

**Conj. (31.6.3.8) [Arithmetic Gan-Gross-Prasad Conjecture].** In the AGGP setting,  $\mathbb{H}$  defines a projective system  $Y_K$  of sub-Shimura varieties of  $X_K$  with projective limit  $Y$ , which has component  $Y_\pi \in \pi^\vee \otimes \mathrm{Ch}^*(\tilde{\pi})$ .

Because  $Y$  is invariant in  $\mathbb{H}^?$ , we may replace  $\pi^\vee$  by  $\mathcal{P}(\pi) = (\pi^\vee)^\mathbb{H}$  (29.10.4.2).  
 Suppose  $\mathcal{P}(\pi) \neq 0$ , then

$$\langle Y_\pi, Y_{\widetilde{\pi}} \rangle_{\text{B-B}} = \frac{L(M^\vee(1); 0)}{2^\beta L(\pi, \text{ad}; 1)} L^\vee(\pi; 1/2),$$

where  $2^\beta = \#C_{\widehat{G}}(\text{Arthur}(\pi))$ , and the pairing is induced from Beilinson-Bloch height pairing (31.6.3.7) and the normalized invariant pairing (29.10.4.2).  $\lrcorner$

*Proof:*  $\square$

**Thm& Conj.Cor. (31.6.3.9).** The AGGP conjecture is true when

- $\mathbb{V}$  is unitary and  $\dim \mathbb{V} = 2$  by Yuan-Zhang-Zhang.
- $\mathbb{V}$  is orthogonal and  $\dim \mathbb{V} = 4$  by [YZZ, Triple product L-series and Gross-Kudla-Schoen cycles].  $\lrcorner$

*Proof:*  $?$   $\square$

### Relative Trace Formula Approach

### Arithmetic Theta Lifting Approach

## 4 Special Divisors on Unitary Shimura Varieties

### Kudla-Rapoport Cycles

**Def. (31.6.4.1)[Kudla-Rapoport Cycles].** Let  $\mathcal{M}$  be the integral RSZ Shimura variety as in (28.11.3.5) and  $(A_0, A, \bar{\eta}) \in \mathcal{M}(S)$  with  $S$  connected, then  $\text{End}_F^0(A_0) = F$ , and  $\text{Hom}_{\mathcal{O}_F}(A_0, A)$  becomes a Hermitian  $\mathcal{O}_F$ -module with the pairing

$$\langle x, y \rangle = \lambda_0^{-1} \circ y^\vee \circ \lambda \circ x \in \text{End}_F^0(A_0) \cong F.$$

Then for any  $\xi \in F_0^\times$  and  $\mu \in V(F_{0,\mathfrak{d}})/K_{\mathfrak{d}}$ , we can consider the moduli problem  $\mathcal{Z}(\xi, \mu)$  over  $\mathcal{O}_F[\mathfrak{d}^{-1}]$  which associates to each  $S$  the tuple  $(A_0, A, \bar{\eta}, \mu)$  where

- $(A_0, A, \bar{\eta}) \in \mathcal{M}(S)$  (28.11.3.5),
- $u \in \text{Hom}_{\mathcal{O}_F}(A_0, A)[\mathfrak{d}^{-1}]$  s.t.  $(u, u) = \xi$  and  $\bar{\eta}(u) \in \mu$ .

Then forgetting  $u$  induces a morphism  $\mathcal{Z}(\xi, \mu) \rightarrow \mathcal{M}$  that is finite and unramified, and it is étale locally a Cartier divisor. The pushforward of  $\mathcal{Z}(\xi, \mu)$  inside  $\mathcal{M}$  is also denoted by  $\mathcal{Z}(\xi, \mu)$ .  $?$

Moreover, for  $\varphi_{\mathfrak{d}} \in \mathcal{S}(V_{\mathfrak{d}})^{K_{\mathfrak{d}}}$ , denote

$$\mathcal{Z}(\xi, \varphi_{\mathfrak{d}}) = \sum_{\mu \in V(F_{0,\mathfrak{d}})/K_{\mathfrak{d}}} \varphi_{\mathfrak{d}}(\mu) \mathcal{Z}(\xi, \mu).$$

$\lrcorner$

*Proof:* Cf.[Weil Representations and Arithmetic Fundamental Lemma]Prop7.3.  $?$   $\square$

**Def. (31.6.4.2) [Generating Series of KR-Cycles].** Let  $Z(\xi, \varphi)$  be the generic fiber of the Kudla-Rapoport cycles defined in (31.6.4.1), and also define

$$Z(0, \varphi) = -\varphi(0)c_1(\omega) \in \text{Ch}^1(M),$$

where  $\omega$  is the automorphic line bundle( Cf.[Kudla, Algebraic cycles on Shimura varieties of orthogonal type]).

Then the **generating series** of KR cycles on  $\mathrm{SL}(2; \mathbf{A}_{F_0})$  is defined to be

$$Z(h, \varphi) = Z(0, \omega(h_f)\varphi)W_0^{(n)}(h_\infty) + \sum_{\xi \in F_{0,+}} Z(\xi, \omega(h_f)\varphi)W_\xi^{(n)}(h_\infty),$$

where  $\omega$  is the Weil representation and  $W_\xi^{(n)}$  is the weight  $n$  Whittaker function.( Cf. [Arithmetic Fundamental Lemma Conjecture over a general p-Adic Field, Mihatsch-Zhang]P9. )

### Green Functions

**Def. (31.6.4.3).**

### Modularity

References are [Arithmetic Fundamental Lemma Conjecture over a general p-Adic Field, Mihatsch-Zhang].

**Thm. (31.6.4.4).** The generating series  $Z(h, \varphi)$  (31.6.4.2) lies in  $\mathcal{A}_{\mathrm{hol}}(\mathrm{SL}(2; \mathbf{A}_F), K_{\mathrm{SL}(2)}, n)_{\overline{\mathbb{Q}}} \otimes \mathrm{Ch}^1(M_{\tilde{K}})$ , where  $K_{\mathrm{SL}(2)} \subset \mathrm{SL}(2; \mathbf{A}_F)$  is a compact open subgroup that fixes  $\varphi$  under the Weil representation.

⌋

*Proof:* Cf.[Weil Representations and Arithmetic Fundamental Lemma]Prop8.1. )

□

**Cor. (31.6.4.5)[Almost Modularity of Special Divisors].** With the Shimura variety  $M = M_{\tilde{K}}$  with integral model  $\mathcal{M} = \mathcal{M}_{\tilde{K}}$  over  $\mathrm{Spec} \mathcal{O}_F[\mathfrak{d}^{-1}]$  defined in [Arithmetic Fundamental Lemma Conjecture over a general p-Adic Field, Mihatsch-Zhang]Sec2, endow the automorphic line bundle  $\omega$  with Petersson metrics  $\|\cdot\|_{\mathrm{Pet}}$  at Archimedean places, so that we can define admissible extensions as in (23.1.4.4).

Suppose  $\varphi \in \mathcal{S}(V(\mathbf{A}_{f,F}))^K$  that is  $K_{\mathrm{SL}(2)}$ -invariant under the Weil representation, and  $z \in \mathcal{Z}_1(\mathcal{M})_{\mathrm{deg}=0}$ , then the function

$$\mathrm{SL}(2; \mathbf{A}_F) \rightarrow \mathbb{R} : h \mapsto (Z(h, \varphi), z)^{\mathrm{adm}} \text{ (31.6.4.4)}$$

lies in  $\mathcal{A}_{\mathrm{hol}}(\mathrm{SL}(2; \mathbf{A}_F), K_{\mathrm{SL}(2)}, n) \otimes_{\overline{\mathbb{Q}}} \mathbb{R}_S$ .

⌋

*Proof:* Cf. [Arithmetic Fundamental Lemma Conjecture over a general p-Adic Field, Mihatsch-Zhang]P9. )

□

**Def. (31.6.4.6)[Arithmetic Liftings of  $Z(h, \varphi)$ ].** For any  $\xi \in F_{0,\xi}$ , we can endow the integral K-R cycle  $\mathcal{Z}(h, \varphi)$  with the automorphic Green function  $\mathcal{G}^B(\xi, \varphi)$  to define an arithmetic K-R divisor

$$\widehat{\mathcal{Z}}^B(\xi, \varphi) = (\mathcal{Z}(\xi, \varphi), (\mathcal{G}_v^B(\xi, \varphi))_v) \in \widehat{\mathrm{Ch}}^{1, \mathrm{adm}}(\mathcal{M}).$$

And also

$$\widehat{\mathcal{Z}}^B(0, \varphi) = -\varphi(0)c_1(\widehat{\omega}) \in \widehat{\mathrm{Ch}}^{1, \mathrm{adm}}(\mathcal{M}),$$

where  $\widehat{\omega}$  any extension of the automorphic line bundle  $\omega$  to a line bundle on the integral model  $\mathcal{M}$ , endowed with its Petersson metrics.

Alternatively we can define a lifting  $\widehat{\mathcal{Z}}^K(\xi, \varphi)$  with Kudla's Green functions, Cf. [Arithmetic Fundamental Lemma Conjecture over a general p-Adic Field, Mihatsch-Zhang]P19.

⌋

## 5 CM Cycles on Unitary Shimura Varieties

References are [Mihatsch-Zhang]Section5,

**Def. (31.6.5.1).** Let  $F[t]_{\deg=n}^\circ$  denote the set of monic polynomials  $\alpha$  of degree  $n$  s.t.  $\alpha(0)t^n\bar{\alpha}(t^{-1})$ .  $\lrcorner$

**Def. (31.6.5.2) [Big Fat CM Cycles].** Let  $\mathcal{M}$  be the integral RSZ Shimura variety as in(28.11.3.5). And let  $\alpha \in F[t]_{\deg=n}^\circ$  and  $\mu \in K_{\mathfrak{d}} \backslash U(V)(F_{0,\mathfrak{d}})/K_{\mathfrak{d}}$ , the **big fat CM cycle**  $\mathcal{C}(\alpha, \mu) \rightarrow \mathcal{M}$  is  $\lrcorner$

## 6 Triple Product

Cf.[G-K92] and [G-S95].

**Conj. (31.6.6.1).** We have the formula

$$L^\vee(F; 2) = \frac{(F, F)_{\text{Pet}}}{2^{t+1}\pi N} \langle \Delta_F, \Delta_F \rangle_{\text{B-B}}.$$

$\lrcorner$

## 7 Arithmetic Fundamental Lemma

References are [Arithmetic Fundamental Lemma, Wei Zhang].

**Conj. (31.6.7.1)[Arithmetic Fundamental Lemma, Zhang/Mihatsch-Zhang/Zhang].** The semi-Lie-algebraic version of the arithmetic fundamental lemma is the following: Let  $\mathbb{V}_n$  as in(28.6.3.33), then whenever  $(\gamma, u') \in (S_n \times V'_n(F_0)_{rs})$  matches  $(g, u) \in (U(\mathbb{V}_n) \times \mathbb{V}_n)(F_0)_{rs}$ (31.6.7.5), we have

$$\partial \text{Orb}((\gamma, u'), \mathbf{1}_{(S_n \times V'_n)(\mathcal{O}_{F_0})}) = -\text{Int}(g, u) \cdot \log q.$$

$\lrcorner$

### Group-Theoretic Setup

**Notation (31.6.7.2)[General Linear Groups].** Situation as in(31.6.3.6), let

- $\Phi$  be a CM-type of  $E/F$ , and  $\varphi_0 \in \Phi$
- 

$$H'_1 = \text{res}_{E/F} \text{GL}(n-1), \quad G' = \text{res}_{E/F}(\text{GL}(n-1) \times \text{GL}(n))$$

and  $H'$  embeds in  $G'$  diagonally. And

$$H'_2 = \text{GL}(n-1) \times \text{GL}(n)$$

embeds in  $G'$  in the obvious way.

- Let

$$S_n = \{\gamma \in \text{res}_{E/F} \text{GL}(n) \mid \gamma\bar{\gamma} = \mathbf{1}\}.$$

- For  $\alpha \in F[X]_{\deg=n}^0$ , let  $S_n(\alpha)$  denote the subscheme consisting of  $\gamma$  with characteristic  $\alpha$ .
- Let  $V'_n = F^n \times (F^n)^*$  which is a Hermitian space under the tautological pairing.
- $\text{GL}(n; F)$  acts naturally on  $S_n \times V'_n$ .
- For  $\xi \in F$ , let  $V'_{n,\xi}$  denote the subscheme of  $V'_n$  consisting of elements  $(u_1, u_2^*)$  s.t.  $u_2^*(u_1) = \xi$ .

┘

**Notation (31.6.7.3) [Hermitian Spaces].**

- Let  $V \in \text{Herm}_n(E/F)$ ,
- Let  $U(V)$  acts naturally on  $U(V) \times V$ .

┘

**Def. (31.6.7.4) [Regular Elements].** Notation as in (31.6.7.2), if  $F$  is a local or global field, there is a bijection

$$\mathcal{O}(G'(F)) \triangleq H'_1(F) \backslash G'(F) / H'_2(F) \cong \text{GL}(n-1; F) \backslash \backslash S_n(F) \triangleq \mathcal{O}(S_n(F)).$$

In particular, the notion of regularity is defined for  $\mathcal{O}(G'(F))$ , (Cf. [Regular formal moduli spaces and arithmetic transfer conjectures]P1092).

┘

*Proof:* Cf. [Arithmetic Fundamental Lemma, Wei Zhang]P213.

□

**Prop. (31.6.7.5) [Semi-Lie-Algebraic Orbit Matching].** There is a bijection of orbits of regular semisimple elements ?:

$$\coprod_V [(U(V) \times V)(F)]_{rs} \cong [(S_n \times V'_n)(F)]_{rs},$$

where

$$[(U(V) \times V)(F)]_{rs} = (U(V) \times V)(F)_{rs} // U(V)(F), \quad [(S_n \times V'_n)(F)]_{rs} = (S_n \times V'_n)(F)_{rs} // \text{GL}(n; F).$$

┘

*Proof:* Cf. [Weil Representation and Arithmetic Fundamental Lemma, Wei Zhang]2.2.

□

### Local Orbital Matching

**Notation (31.6.7.6).**

- Let  $L/K$  be a quadratic extension of local fields,
- Let  $\eta : K^\times \rightarrow \{\pm 1\}$  be the quadratic character associated to  $L/K$  by class field theory.
- Let  $W$  be a non-degenerate Hermitian space of dimension  $n-1$ ,
- Let  $V = W \oplus Lu$  where  $\langle u, u \rangle = 1$ .
- Let  $G = G_W = U(W) \times U(V)$ , and  $H = U(W)$  which diagonally embeds into  $G$ ,

┘

**Def. (31.6.7.7) [Regular Elements and Transfers].** Notation as in (31.6.7.6), there is an bijection

$$H(K) \backslash G(K) / H(K) \cong U(W)(K) \backslash \backslash U(V)(K),$$

where  $U(W)$  acts on  $U(V)$  by conjugation. Then  $(\delta_1, \delta_2) \in U(W)(K) \times U(V)(K)$  is called **regular element** if  $\delta_1^{-1}\delta_2 \in U(V)(K)$  is regular in the sense of [arithmetic fundamental lemma, Wei Zhang]Sec2?.

Then  $\gamma = (\gamma_1, \gamma_2) \in G'(K)$  (31.6.7.2) is a **transfer** of  $\delta = (\delta_1, \delta_2) \in G_W(K)$  if the image  $\nu(\gamma_1^{-1}\gamma_2) \in S_n(K)$  and  $\delta_1^{-1}\delta_2 \in U(V)(K)$  are transfers of each other.

┘

**Prop. (31.6.7.8) [Local Unitary Orbital Integrals].** For regular element (31.6.7.7)  $\delta \in G(K)$  and  $f \in C_c^\infty(G(K))$ , the orbital integral

$$O(\delta, f) = \int_{H(K)} \int_{H(K)} f(h_1^{-1} \delta h_2) dh_1 dh_2$$

converges absolutely. ┘

*Proof:* □

**Def. (31.6.7.9) [Smooth Transfer of Functions].**  $f' \in C_c^\infty(G'(K))$  are said to be the **smooth transfer** of a tuple  $(f_W)$  where  $f_W \in C_c^\infty(G_W(K))$  if for any  $W$  and  $\delta \in G_W(K)$  which transfers to a regular element  $\gamma \in G'(F)$  (31.6.7.7), we have

$$O(\delta, f_W) = \Omega(\gamma) O(\delta', f'; 0) \text{ (31.6.7.8) (31.6.7.17).}$$

where  $\Omega(\gamma)$  is the transfer factor ?.

$f' \in C_c^\infty(G'(K))$  is called **pure of type  $W$**  if it is a smooth transfer of a tuple  $(f_W)$  where  $f_{W'} = 0$  unless  $W' \cong W$ . ┘

**Conj. (31.6.7.10) [Existence of Smooth Transfers].** There is a transfer factor  $\Omega$  s.t. smooth transfer (31.6.7.9) always exist. ┘

**Def. (31.6.7.11) [Semi-Lie-Algebraic Linear Orbital Integral].** For  $(\gamma, u') \in (S_n \times V'_n)(K)_{rs}$ ,  $\Phi' \in \mathcal{S}((S_n \times V'_n)(K))$  and  $s \in \mathbb{C}$ , define the **linear orbital integral**

$$\text{Orb}((\gamma, u'), \Phi'; s) = \int_{\text{GL}(n)(K)} \Phi'(h \cdot (\gamma, u')) |\det(h)|^s \eta(h) dh.$$

And also the special values

$$\text{Orb}((\gamma, u'), \Phi') = \text{Orb}((\gamma, u'), \Phi'; 0), \quad \partial \text{Orb}((\gamma, u'), \Phi'; s) = \frac{\partial}{\partial s} \Big|_{s=0} \text{Orb}((\gamma, u'), \Phi'; s).$$

**Def. (31.6.7.12) [Local Semi-Lie-Algebraic Linear Orbital Integral].** For  $(g, u) \in (U(V) \times V)(K)_{rs}$  and  $\Phi \in \mathcal{S}((U(V) \times V)(K))$ , define the **unitary orbital integral**

$$\text{Orb}((g, u), \Phi) = \int_{U(V)(K)} \Phi(h \cdot (g, u)) dh.$$

**Def. (31.6.7.13) [Semi-Lie-Algebraic Smooth Transfer].**  $\Phi' \in \mathcal{S}((S_n \times Vn')(K))$  are said to be the **smooth transfer** of a tuple  $(\Phi_V)$  where  $\Phi_V \in \mathcal{S}((U(V) \times V)(K))$  if for any Hermitian space  $V$  and  $(\delta, u') \in (S_n \times Vn')(K)$  which matches  $(\gamma, u) \in (U(V) \times V)(K)_{rs}$  (31.6.7.7), we have

$$O((g, u), \Phi_V) = \omega((\gamma, u')) O((\gamma, u'), \Phi') \text{ (31.6.7.8) (31.6.7.17).}$$

where  $\omega((\gamma, u'))$  is the transfer factor ( ? Cf. [Weil Representations and Arithmetic Fundamental Lemma, Wei Zhang] Def(2.13). )

And it **partially transfers** to  $(\Phi_V)$  if the above equality holds for any  $(\delta, u') \in (S_n(\alpha) \times Vn')(K)$  which matches  $(\gamma, u) \in (U(V)(\alpha) \times V)(K)_{rs}$ , and

$$O((\gamma, u'), \Phi') = 0$$

for any other  $(\delta, u') \in (S_n(\alpha) \times Vn')(K)$ . ┘

### Global Unitary Orbital Integrals

**Def. (31.6.7.14) [Notation on Global Hermitian Spaces].** For a  $E/F$ -Hermitian space  $W$  and an incoherent Hermitian space  $W$ ,

- Let  $C_c^\infty(G'(\mathbf{A}_F))^W$  be the subspace of functions pure of type  $W$  (31.6.7.9).
- Denote  $\Sigma(W, W) = \{v \in \Sigma_F : W_v \cong W_v\}$ .
- For any  $v \in \Sigma_F$ , there is a unique  $W(v) \in \text{Herm}_n(E/F)$  s.t.  $\Sigma(W(v), W) = \{v\}$ .
- Each regular element  $\gamma \in G'(F)$  is a transfer of a  $\delta \in G_W(F)$  for some Hermitian space  $W$ . This Hermitian space is called the **type** of  $\gamma$ , denoted by  $W(\gamma)$ , and also denote  $\Sigma(\gamma, W) = \Sigma(W(\gamma), W)$ .
- Let  $\mathbb{G} = \mathbb{G}_W, \mathbb{H} = \mathbb{H}_W$  (31.6.7.6).

┘

**Prop. (31.6.7.15) [Kernel Functions].** For  $f' \in C_c^\infty(G'(\mathbf{A}_F))$ , Wei defined a kernel function (Cf. [Arithmetic Fundamental Lemma] P212)

$$K_{f'}(x, y) \in C(G'(\mathbf{A}_F) \times G'(\mathbf{A}_F)).$$

┘

**Prop. (31.6.7.16) [Jacquet-Rallis Distribution].** There is a complex-variable-indexed distribution on  $G'(\mathbf{A}_F)$ :

$$f' \mapsto I(f'; s) = \int_{[H'_1]} \int_{Z_{H'_2}(\mathbf{A}_F) \backslash [H'_2]} K_{f'}(h_1, h_2) \eta(h_2) |h_1|^s dh_1 dh_2.$$

This integral is absolutely convergent if  $f' = \otimes_v f'_v$  is decomposable and  $f'_v$  is regularly supported for some place  $v$ .

┘

*Proof:* Cf. [Arithmetic Fundamental Lemma, Wei Zhang] P213-214.

□

**Prop. (31.6.7.17) [Decomposition as General Linear Orbital Integrals].** There is a decomposition of the Jacquet-Rallis distribution

$$I(f'; s) = \sum_{\gamma \in O(G'(F))_{\text{reg}}} O(\gamma, f'; s),$$

where

$$O(\gamma, f'; s) = \int_{H'_1(\mathbf{A}_F)} \int_{H'_2(\mathbf{A}_F)} f'(h_1^{-1} \gamma h_2) |h_1|^s \eta(h_2) dh_1 dh_2 = \prod_v O(\gamma, f'_v; s).$$

┘

*Proof:* Cf. [Arithmetic Fundamental Lemma, Wei Zhang] P215.

□

**Prop. (31.6.7.18) [Properties of Global Orbital Integrals].** Let  $f' = \otimes_v f'_v \in C_c^\infty(G'(\mathbf{A}_F))^W$ , then

- For any regular element  $\gamma \in G'(F)$ , we have

$$\text{ord}_{s=0} O(\gamma, f'; s) \geq \#\Sigma(\gamma, W).$$

- If  $f'_v$  is regularly supported for some  $v$ , then  $I(f'; 0) = 0$ , and

$$I(f'; 0) \triangleq \left. \frac{\partial}{\partial s} \right|_{s=0} I(f'; s) = \sum_{v \text{ nonsplit}} I'_v(f'; 0)$$

where

$$I'_v(f'; 0) = \sum_{W, \Sigma(W, \mathbb{W})=\{v\}} \sum_{\gamma \in \mathcal{O}(G'(F))_{\text{reg}}, W(\gamma)=W} O(\gamma, f'_v; 0) \cdot O^v(\gamma, f'_v; 0) \quad (31.6.7.14)$$

where

$$O^v(\gamma, f'_v; 0) = \left. \frac{\partial}{\partial s} \right|_{s=0} O(\gamma, f'_v; s).$$

┘

*Proof:* Cf. [Arithmetic Fundamental Lemma, Wei Zhang]P217. □

### Global Jacquet-Rallis Linear Orbital Integrals

**Def. (31.6.7.19) [Global Jacquet-Rallis Linear Orbital Integral].** For each  $v|\infty$ , fix the Archimedean partial Gaussian test function  $\Phi'_v \in \mathcal{S}((S_n \times V')(F_v))_{rs}$  constructed in [Weil Representation of Arithmetic Fundamental Lemma, Wei Zhang]Sec12.4<sup>?</sup>, then for  $h \in \text{SL}(2; \mathbf{A}_F)$  and  $\Phi' = \otimes_v \Phi'_v \in \mathcal{S}((S_n \times V')(\mathbf{A}_F))$ , the global regularized **Jacquet-Rallis linear orbital integral** (relative to  $\alpha$ ) is defined to be

$$\mathbb{J}(h, \Phi'; s) = \int_{[\text{GL}(n)]} \left( \sum_{(\gamma, u') \in (S_n(\alpha) \times V')(F)} r(g) \omega(h) \Phi'(\gamma, u') \right) \deg(g)^s \eta(g) dg.$$

And also denote

$$\mathbb{J}(h, \Phi') = \mathbb{J}(h, \Phi'; 0).$$

┘

**Thm. (31.6.7.20).** The function  $\mathbb{J}(h, \Phi'; s)$  is smooth in  $(h, s)$ , entire in  $s$ , and left invariant under  $\text{SL}(2; F)$ . ┘

*Proof:* Cf. [Weil Representation of Arithmetic Fundamental Lemma, Wei Zhang]Thm12.14. □

**Prop. (31.6.7.21) [Expansion of the Jacquet-Rallis Linear Orbital Integral  $\mathbb{J}$ ].** There is an expansion of  $\mathbb{J}(h, \Phi'; s)$  (31.6.7.19) according to orbits:

$$\begin{aligned} \mathbb{J}(h, \Phi'; s) &= \sum_{(\gamma, u') \in [(S_n(\alpha) \times V')(F)], u' \neq 0} \text{Orb}((\gamma, u'), \omega(h) \Phi'; s) \\ &= \text{Orb}((\gamma, 0_{\pm}), \omega(h) \Phi'; s) + \sum_{(\gamma, u') \in [(S_n(\alpha) \times V')(F)]_{rs}} \text{Orb}((\gamma, u'), \omega(h) \Phi'; s) \end{aligned}$$

where for  $(\gamma, u') \in [(S_n(\alpha) \times V')(F)]_{rs}$ ,

$$\text{Orb}((\gamma, u'), \omega(h) \Phi'; s) = \prod_v \text{Orb}((\gamma, u'), \Phi'_v; s) \quad (31.6.7.12).$$

In particular, for  $\xi \in F^\times$ , the  $\xi$ -th Fourier coefficients of  $\mathbb{J}(h, \Phi'; s)$  w.r.t.  $\text{SL}(2)$  is equal to

$$\sum_{(\gamma, u') \in [(S_n(\alpha) \times V'_\xi)(F)]_{rs}} \text{Orb}((\gamma, u'), \omega(h) \Phi'; s).$$

┘

*Proof:* Cf.[Weil Representation of Arithmetic Fundamental Lemma, Wei Zhang]Thm12.14.  $\square$

**Def. (31.6.7.22).** Denote

$$\text{Orb}((\gamma, u'), \omega(h)\Phi') = \text{Orb}((\gamma, u'), \omega(h)\Phi'; 0) \text{ (31.6.7.21)}.$$

┘

**Prop. (31.6.7.23) [Derivatives of Jacquet-Rallis Orbital Integral].** There is a decomposition

$$\partial J(h, \Phi') = \partial \text{Orb}(0_{\pm}, \omega(h)\Phi') + \sum_v \partial J_v(h, \Phi')$$

where

$$\partial J_v(h, \Phi') = \sum_{(\gamma, u') \in [(S_n(\alpha) \times V')(F)], u' \neq 0} \partial \text{Orb}((\gamma, u'), \omega(h)\Phi'_v) \cdot \text{Orb}((\gamma, u'), \omega(h)\Phi'v).$$

And also  $\partial \text{Orb}(0_{\pm}, \omega(h)\Phi')$  is defined in [Weil Representation of Arithmetic Fundamental Lemma, Wei Zhang]Sec12.7.  $\textcolor{red}{?}$ .  $\square$

*Proof:*  $\square$

### Global Intersections

**Remark (31.6.7.24).** We want to study the global Beilinson-Bloch pairing in the AGGP conjecture. For this, let

$$J(f) = \langle R(f)[\text{Sh}(\mathbb{H})]_0, [\text{Sh}(\mathbb{H})]_0 \rangle_{\text{B-B}}, \quad f \in C_c^\infty(\mathbb{G}),$$

then there is a decomposition

$$J(f) = \sum_v J_v(f).$$

┘

**Thm. (31.6.7.25) [Special cases of  $J_v(f)$ ].** In the case that  $F = \mathbb{Q}$  and  $v$  has good reduction, we can calculate the main term  $J_v^m(f)$  for some specific  $f$ : Suppose  $f = \otimes_v f_v$  satisfies

- $f_p = \mathbb{1}_{K'_{p,0}}$ ,
- For some  $v \neq p$ ,  $f_v$  is regularly supported,
- $f_\infty = \mathbb{1}_{\mathbb{G}(\mathbf{A}_\infty)}$ .

Then

- If  $p$  is inert,

$$J_p^m(f) = 2 \sum_{\delta \in \mathcal{O}(G_{W(p)}(\mathbb{Q})_{\text{reg}}} O(\delta, f^p) O^*(\delta, f_p).$$

- If  $p$  is split, then  $J_p^m(f) = 0$ .

┘

*Proof:* Cf.[Arithmetic Fundamental Lemma, Wei Zhang]P224-227.  $\square$

### Chowla-Selberg Formulas

**Def. (31.7.0.4) [Epstein Zeta Functions].** For a positive-definite quadratic form  $Q(X, Y) = aX^2 + bXY + cY^2 \in \mathbb{Z}[X, Y]$ , the **Epstein zeta function**  $\zeta_Q(s)$  is defined to be

$$\zeta_Q(s) = \frac{1}{2} \sum_{(m, n) \in \mathbb{Z}^2 \setminus (0, 0)} \frac{1}{Q(m, n)^{-s}}.$$

┘

**Thm. (31.7.0.5) [Chowla-Selberg Formula].** For a positive-definite quadratic form  $Q(X, Y) = aX^2 + bXY + cY^2 \in \mathbb{Z}[X, Y]$  with discriminant  $d = b^2 - 4ac < 0$ ,

$$\begin{aligned} Z_Q(s) &= a^{-s} \zeta(2s) + a^{-s} \sqrt{\pi} \frac{\Gamma(s - 1/2)}{\Gamma(s)} \zeta(2s - 1) k^{1-2s} \\ &\quad + \frac{4a^{-s} k^{-s+1/2}}{\pi^{-s} \Gamma(s)} \sum_{n \in \mathbb{Z}_+} n^{s-1/2} \sigma_{1-2s}(n) K_{s-1/2}(2\pi n \frac{\sqrt{d}}{2a}) \cos(n\pi b/a). \end{aligned}$$

┘

*Proof:*

□

**Prop. (31.7.0.6) [Chowla-Selberg Formula].** Let  $\mathcal{K}$  be an imaginary quadratic field with discriminant  $D$  and  $f \in \mathbb{Z}_+$ . For any proper ideals  $\mathfrak{a} \in \text{Cl}(\mathcal{O}_{\mathcal{K}, f})$  ([19.3.1.54](#)), denote

$$F(\mathfrak{a}) = \Delta(\mathfrak{a}) \Delta(\mathfrak{a}^{-1}),$$

then

$$\prod_{\mathfrak{a} \in \text{Pic}(\mathcal{O}_{K,f})} F(\mathfrak{a}) = \left( \frac{2\pi}{f^2 |d_K|} \right)^{12 \text{cl}(\mathcal{O}_{K,f})} \prod_{a=1}^{|d_K|-1} \left( \Gamma\left(\frac{a}{|d_K|}\right)^{6\chi(a)\#\mu(K)} \right)^{\text{cl}(\mathcal{O}_{K,f})/\text{cl}(K)} \cdot \left( \prod_{p \in \text{Prime}, p|f} p^{12e(p)} \right)^{\text{cl}(\mathcal{O}_{K,f})},$$

where  $\chi(a) = \left(\frac{d_K}{a}\right)$  and

$$e(p) = \frac{(1-p^{-n})(1-\chi(p))}{(1-p^{-1})(p-\chi(p))}.$$

Notice that  $6e(p) \text{cl}(\mathcal{O}_{K,f}) \in \mathbb{Z}$  by (19.3.3.7).

In particular, for  $f = 1$ ,

$$\prod_{\mathfrak{a} \in \text{Cl}(K)} F(\mathfrak{a}) = \left( \frac{2\pi}{|d_K|} \right)^{12 \text{cl}(K)} \prod_{a=1}^{|d_K|-1} \Gamma\left(\frac{a}{|d_K|}\right)^{6\chi(a)\#\mu(K)},$$

┘

*Proof:* Cf. [N-T91] and [Elliptic Functions, Weil].

□

## 1 Averaged Colmez Conjecture

References are [On Faltings heights of abelian varieties with complex multiplication, Xinyi Yuan].

**Thm& Conj.Cor.(31.7.1.1) [Averaged Colmez Conjecture, Andreatta-Goren-Howard-Per-**  
**a/Yuan-Zhang].** Let  $E \in \text{NField}$  be a CM field, then

$$\sum_{\Phi} h_{\text{st}}(E, \Phi) = \sum_{\Phi} \left( \sum_{\rho} c_{\rho, \Phi} \cdot \left( \frac{L^{\vee}(\rho; 0)}{L(\rho; 0)} + \frac{\log f_{\rho}}{2} \right) \right).$$

where  $\Phi$  ranges through all CM-types of  $E$ , and the notations are as in (31.7.0.3).

┘

*Proof:* ?

This is a consequence of the Colmez conjecture (31.7.0.3).

□

**Cor.(31.7.1.2) [Heights and Discriminants].** For  $g \in \mathbb{Z}_+$ , there exists  $c_g \in \mathbb{R}_+$  s.t.  $\lim_{g \rightarrow \infty} c_g = 0$ ,  
s.t. for any primitive CM-type  $(E, \Phi)$  of degree  $2g$ ,

$$h_{\text{st}}(E, \Phi) \leq |\text{disc}(E)|^{c_g}.$$

┘

*Proof:* Using (21.1.5.5) and (31.7.1.1),

$$h_{\text{st}}(E, \Phi) \leq -(2^g - 1)cg + \sum_{\Phi} \left( \sum_{\rho} c_{\rho, \Phi} \cdot \left( \frac{L^{\vee}(\rho; 0)}{L(\rho; 0)} + \frac{\log f_{\rho}}{2} \right) \right).$$

To bound each term in the RHS, notice first  $f_{\rho} \leq |\text{disc}(E)|$  ? , and then

where

$$\text{Eis}_0^r(g, \Phi; s) = \sum_{\gamma \in Q_r \backslash \text{GL}(n)} \Phi_r(\gamma g; s), \quad \Phi_r(g; s) = \int_{N'_{n-r}(\mathbf{A}_F)} \Phi(w_r n g; s) dn.$$

In particular,

$$\text{Eis}_0^0(g, \Phi; s) = \Phi_0(g; s) = \Phi(g; s), \quad \text{Eis}_0^n(g, \Phi; s) = \Phi_n(g; s).$$

┘

*Proof:* Cf.[K-R88]Lem2.4.?

□

**Prop. (32.1.1.5).** Situation as in (32.1.1.2),  $\text{Eis}(g, \Phi; s)$  and  $\text{Eis}_0(g, \Phi; s)$  have the same set of poles. ┘

*Proof:* Cf.[K-R88]Lem3.4.?

□

**Prop. (32.1.1.6) [Holomorphy of Eisenstein Series].** If  $r = 0$  or  $m - r > 2\varrho_n$ , then  $\text{Eis}(g; f_\Phi^{(s)})$  (32.1.1.2) is holomorphic at  $s = s_0$ . ┘

*Proof:* By (32.1.1.5), it suffices to prove the constant term

$$\text{Eis}_0(g, \Phi; s) = \Phi(g; s) + \sum_{r=1}^{n-1} \text{Eis}_0^r(g, \Phi; s) + \Phi_n(g; s) \quad (32.1.1.4)$$

is holomorphic at  $s = s_0$ . If  $r = 0$ , this is done in [K-R88]?

If  $m - r > 2\varrho_n$ , ?  
?

□

**Prop. (32.1.1.7).** There exists  $c \in \mathbb{C}$  s.t.

$$I^*(g, \Phi) = I(g, \Phi) - c \text{Eis}(g; f_\Phi^{(s)})$$

satisfies  $I_\beta^*(g, \Phi) = 0$  for any  $\beta \in \text{Sym}_n(F)$  s.t.  $\det(\beta) \neq 0$ . ┘

*Proof:* Cf.[Rallis, *L-Functions and the Oscillator Representation*].

□

**Thm. (32.1.1.8) [Convergent Siegel-Weil Formula, Weil[Wei65]/Kudla-Rallis[K-R88, K-R88a]].**

For any  $\Phi \in S(V^n(\mathbf{A}_F))^{\mathcal{K}\text{-fin}}$  and  $g \in G(\mathbf{A}_F)$

- $m > 2n$ , then  $\text{Eis}(g; f_\Phi^{(s)})$  is absolutely convergent at  $s = s_0$ ,
- If  $r = 0$  or  $m - r > 2\varrho_n$ , then  $\text{Eis}(g; f_\Phi^{(s)})$  is holomorphic at  $s = s_0$ .

And in both cases, we have

$$\text{Eis}(g; f_\Phi^{(s)}) \Big|_{s=s_0} = \kappa \text{Int}(g; \Phi) (32.1.1.2) (26.8.5.12) \text{ where } \kappa = \begin{cases} 1 & , m > 2\varrho_n \\ 2 & , m \leq 2\varrho_n \end{cases}.$$

┘

*Proof:* ?

If  $m > 2n$ , then  $\text{Eis}(g; f_\Phi^{(s)})$  converges absolutely at  $s = s_0$  by (32.1.1.2), and this formula is proved by Weil.

If  $r = 0$  or  $m - r > 2\varrho_n$ , then  $\text{Eis}(g; f_\Phi^{(s)})$  is holomorphic at  $s = s_0$  by (32.1.1.6).

Take  $v \in \Sigma_F^{\text{fin}}$  s.t. the Witt index  $r_v$  of  $V_v$  equals  $r$ . Thus  $m = 2r_v + r$  where  $r \in \{0, 2, 4\}$  by (19.5.5.7). □

## 32.3 Kudla-Rapoport Conjecture

**Notation (32.3.0.1).**

- Use notations on Rapoport-Zink spaces defined in [Rapoport-Zink Spaces and Mixed-Characteristic Shtukas](#).

┘

### 1 Local Kudla-Rapoport Conjecture

**Prop. (32.3.1.1) [Hermitian Spaces].** Non-degenerate Hermitian  $F/F_0$  spaces  $\mathbb{V}$  are classified up to isomorphism by dimension  $n$  and discriminant  $\text{disc}(\mathbb{V}) = (-1)^{\binom{n}{2}} \det(\mathbb{V}) \in F_0^\times / \text{Nm}_{F/F_0} F^\times$ .

$\mathbb{V}$  is called **split** if  $\text{disc}(\mathbb{V}) = 1$ , and **non-split** otherwise.

┘

*Proof:* [Kudla-Rapoport Cycles and Derivatives of Local Densities, Li-Zhang]P712.

□

**Prop. (32.3.1.2) [Lattices in Hermitian Spaces].** Let  $\mathbb{V}$  be a Non-degenerate Hermitian  $F/F_0$  space and  $L \subset \mathbb{V}$  a full  $\mathcal{O}_F$ -lattice. Then  $L$  is called an **integral lattice** if  $L \subset L^\vee$ .

For an integral lattice  $L$ , define its **fundamental invariants** to be the unique sequence of integers  $(a_1, \dots, a_n)$  s.t.  $0 \leq a_1 \leq \dots \leq a_n$  and  $L^\vee/L \cong \bigoplus_{i=1}^n \mathcal{O}_F/\varpi^{a_i}$ . Its **valuation** is defined to be  $\text{val}(L) = \sum a_i$ , and its **type**  $t(L)$  is defined to be the number of nonzero terms in  $(a_1, \dots, a_n)$ .

┘

**Prop. (32.3.1.3) [Vertex Lattices].**

┘

### Local Kudla-Rapoport Cycles

**Def. (32.3.1.4) [Kudla-Rapoport Cycles].** For each  $u \in \mathbb{V}_n$ , there is a **Kudla-Rapoport cycle**  $\mathcal{Z}(u) \subset \mathcal{N}_n$  which is the locus where the quasi-homomorphism  $u : \mathbb{E} \rightarrow \mathbb{X}_n$  lifts to a homomorphism from  $\mathcal{E}$  to the universal objects over  $\mathcal{N}_n$ . (Cf. [Special Cycles on Unitary Shimura Varieties, Kudla-Rapoport]).

┘

**Def. (32.3.1.5) [Intersection Numbers on RZ Spaces].** For a pair  $(g, u) \in (U(\mathbb{V}_n) \times \mathbb{V}_n)(F_0)_{rs}$ , the **intersection number** is defined to be

$$\text{int}(g, u) = \chi(\mathcal{N}_n \times \mathcal{N}_n, \mathcal{O}_{\Gamma_g} \otimes_{\mathcal{O}_{\mathcal{N}_n \times \mathcal{N}_n}}^L \mathcal{O}_{\Delta_{\mathcal{Z}(u)}}).$$

┘

### 2 Global Kudla-Rapoport Conjecture

## 33 | $p$ -adic $L$ -Functions

### 33.1 Classical Iwasawa Theory

References are [Was97, Hid93].

The Iwasawa theory of fields mostly study the action of the Galois group on the ideal group/-class/group/units.

**Notation(33.1.0.1).**

- Let  $p \in \text{Prime}$ .
- Let  $L \in p\text{-NField}$ .

┘

#### 1 $p$ -adic Analysis

**Prop.(33.1.1.1)[Interpolating Series, Mahler[Mah58]].** For any continuous function  $f : \mathbb{Z}_p \rightarrow \mathcal{O}_L$ , by taking different, we have:

$$f(x) = \sum_{n \in \mathbb{N}} a_n(f) \binom{x}{n}$$

for each  $x \in \mathbb{N}$ , where

$$a_n(f) = \sum_{k=0}^n (-1)^{n-k} \binom{n}{k} f(k), \quad n \in \mathbb{N}.$$

Then  $\lim_{n \rightarrow \infty} |a_n(f)| = 0$ , and conversely, given any sequence  $\{a_n(f)\}_{n \in \mathbb{N}} \in \mathcal{O}_L$  s.t.  $\lim_{n \rightarrow \infty} |a_n(f)| = 0$ , the function  $f(x) = \sum_{n \in \mathbb{N}} a_n(f) \binom{x}{n}$  is continuous function from  $\mathbb{Z}_p$  to  $\mathcal{O}_L$ .

And we have  $\|f\|_p = \sup_{n \in \mathbb{N}} |a_n|$ . ┘

*Proof:* Because the function  $\binom{x}{n}$  is continuous and maps  $\mathbb{N}$  to  $\mathbb{N}$ , we have  $|\binom{x}{n}|_p \leq 1$  for each  $x \in \mathbb{Z}_p$ . Then it suffices to show that  $\lim_{n \rightarrow \infty} |a_n(f)| = 0$ .

For  $y \in \mathbb{N}$ , let  $f_y(x) = f(x + y)$ , then

$$f_y(x) = \sum_{m \in \mathbb{N}} a_m(f) \binom{x+y}{m} = \sum_{n \in \mathbb{N}} \binom{x}{n} \sum_{k \in \mathbb{N}} a_{n+k}(f) \binom{y}{k}.$$

Thus

$$\sum_{k \in \mathbb{N}} a_{n+k}(f) \binom{y}{k} = a_n(f_y) = \sum_{k=0}^n (-1)^{n-k} \binom{n}{k} f(k+y).$$

As  $f$  is uniformly continuous, for any  $s \in \mathbb{Z}_+$ , there exists  $t \in \mathbb{Z}_+$  s.t.  $|f(x + p^t) - f(x)| \leq p^{-s}$  for any  $x \in \mathbb{Z}_p$ . Taking  $y = p^t$ , we get

$$\begin{aligned} a_{n+p^t}(f) &= - \sum_{j=1}^{p^t-1} \binom{p^t}{j} a_{n+j}(f) + \sum_{k=0}^n (-1)^{n-k} \binom{n}{k} f(k + p^t) - a_n(f) \\ &\quad - \sum_{j=1}^{p^t-1} \binom{p^t}{j} a_{n+j}(f) + \sum_{k=0}^n (-1)^{n-k} \binom{n}{k} (f(k + p^t) - f(k)) \end{aligned}$$

So

$$|a_{n+p^t}(f)| \leq \max(p^{-1}|a_{n+1}(f)|, \dots, p^{-1}|a_{n+p^t-1}(f)|, p^{-s}).$$

Notice  $s$  is arbitrary. From this, we can easily show that  $\lim_{n \rightarrow \infty} |a_n(f)| = 0$ .  $\square$

### $p$ -adic Gamma Function

**Def. (33.1.1.2) [ $p$ -adic Gamma Functions].** For  $k \in \mathbb{Z}_+$ , define

$$\Gamma_p(k) = (-1)^k \prod_{j \in [k-1]_+} j,$$

then  $\Gamma_p$  extends uniquely to a continuous function  $\Gamma_p : \mathbb{Z}_p \rightarrow \mathbb{Z}_p^*$ .  $\lrcorner$

*Proof:* It suffices to show that if  $k, k' \in \mathbb{Z}_+$  satisfies  $k \equiv k' \pmod{p^N}$  for  $N \in \mathbb{Z}_{\geq 2}$ , then  $\Gamma_p(k) \equiv \Gamma_p(k') \pmod{p^N}$ . Because then we can define  $\Gamma_p$  by continuity on  $\mathbb{N}$ , and it take values in  $\mathbb{Z}_p^*$ .

We may assume  $k' = k + p^N$ . Then it suffices to show that

$$(-1)^{p^N} \prod_{0 < j < p^N, p \nmid j} j \equiv 1 \pmod{p^N}.$$

We try to pair  $j$  with  $j^{-1} \pmod{p^N}$ . If  $p \neq 2$ , then  $j^2 = 1$  has only two solutions  $j \in \{1, p^N - 1\}$ , and the modular equation holds. If  $p = 2$ , then by (2.6.1.3),  $j^2 = 1$  has only four solutions  $j \in \{1, 2^N - 1, a, 2^N - a\}$ , where  $a \in [2^N]_+$  and  $a \notin \{1, 2^N - 1\}$ . Then the assertion also holds.  $\square$

**Prop. (33.1.1.3).**

$$\frac{\Gamma_p(s+1)}{\Gamma_p(s)} = \begin{cases} -s & , s \in \mathbb{Z}_p^* \\ -1 & , s \in p\mathbb{Z}_p \end{cases}.$$

$\lrcorner$

*Proof:* As both sides are continuous functions on  $\mathbb{Z}_p$ , it suffices to check on the dense subset  $\mathbb{Z}_+$ . But then this follows from the definition of  $\Gamma_p$  (33.1.1.2).  $\square$

**Prop. (33.1.1.4).** For  $s = s_0 + ps_1 \in \mathbb{Z}_p$  where  $s_0 \in [p]_+$  and  $s_1 \in \mathbb{Z}_p$ , we have

$$\Gamma_p(s)\Gamma_p(1-s) = (-1)^{s_0}.$$

$\lrcorner$

*Proof:* By continuity it suffices to check for  $s \in \mathbb{Z}_+$ . For  $s = 1$  this holds because  $\Gamma_p(1) = -1$  and  $\Gamma_p(0) = 1$  by (33.1.1.3). And by (33.1.1.3),

$$\frac{\Gamma_p(s+1)\Gamma_p(1-(s+1))}{\Gamma_p(s)\Gamma_p(1-s)} = \begin{cases} -1 & , s \in \mathbb{Z}_p^* \\ 1 & , s \in p\mathbb{Z}_p \end{cases}.$$

Thus the assertion holds by induction on  $s$ .  $\square$

**Prop. (33.1.1.5) [ $p$ -adic Gauss-Legendre Multiplication Formula].** Let  $s = s_0 + ps_1 \in \mathbb{Z}_p$  where  $s_0 \in [p]_+$  and  $s_1 \in \mathbb{Z}_p$ , then for any  $m \in \mathbb{Z}_{\geq 2} \setminus (p)$ , we have

$$\frac{\prod_{h=0}^{m-1} \Gamma_p(\frac{s+h}{m})}{\Gamma_p(s) \prod_{h=1}^{m-1} \Gamma_p(\frac{h}{m})} = m^{1-s_0} (m^{-(p-1)})^{s_1}.$$

$\lrcorner$

*Proof:* For fixed  $m$ , both sides are continuous in  $s$ , so it suffices to check for  $s \in \mathbb{Z}_+$ . For  $s = 1$  this is true. Denote the LHS by  $f(s)$ , then

$$\frac{f(s+1)}{f(s)} = \frac{\Gamma_p(s)\Gamma_p(s/m+1)}{\Gamma_p(s+1)\Gamma_p(s/m)} = \begin{cases} 1/m & s \in \mathbb{Z}_p^* \\ 1 & s \in p\mathbb{Z}_p \end{cases}.$$

And it is easy to check that the same holds true for the RHS. Thus the assertion holds by induction.  $\square$

### $p$ -adic Distributions and Measures

**Def. (33.1.1.6) [ $p$ -adic Distributions and Measures].** For  $X \in \mathcal{P}\text{rof}$  and  $L \in p\text{-NField}$ , a  $L$ -valued distribution on  $X$  (4.4.4.11) is called a ( $L$ -valued)  **$p$ -adic distribution**. A  **$p$ -adic measure** on  $X$  is a  $p$ -adic distribution  $\mu$  on  $X$  s.t. there exists  $B \in \mathbb{R}_+$  that  $|\mu(U)|_L \leq B$  for any compact open  $U \subset X$ .

The space of  $L$ -valued measures on  $X$  is denoted by  $\text{Meas}(X; L)$ , and also the subspace of  $\mathcal{O}_L$ -valued measures on  $X$  is denoted by  $\text{Meas}(X; \mathcal{O}_L)$ . Then

$$\text{Meas}(X; \mathcal{O}_L) = \text{Meas}(X; \mathbb{Z}_p) \otimes_{\mathbb{Z}_p} \mathcal{O}_L \quad \text{Meas}(X; L) = \text{Meas}(X; \mathbb{Z}_p) \otimes_{\mathbb{Z}_p} L.$$

We can also define a norm on  $\text{Meas}(X; L)$  by  $\|\mu\|_p = \sup_{U \subset X} |\mu(U)|_L$ .  $\lrcorner$

**Prop. (33.1.1.7) [Distributions on  $\mathbb{Q}_p$ ].** Let  $p \in \text{Prime}$  and  $X \subset \mathbb{Q}_p$  be a compact open subset. If  $\mu$  is a function from the family of subsets of  $X$  of the form  $a + (p^n)$  to  $\mathbb{C}_p$  that satisfies: Whenever  $a + (p^n) \in X$ , then

$$\mu(a + (p^n)) = \sum_{b=0}^{p-1} \mu(a + bp^n + (p^{n+1})).$$

Then  $\mu$  extends uniquely to a  $p$ -adic measure on  $X$  (4.4.4.12).  $\lrcorner$

**Prop. (33.1.1.8) [Katz].** For any bounded sequence  $\{b_n\}_{n \in \mathbb{N}} \subset L$ , there is a unique measure  $\mu \in \text{Meas}(\mathbb{Z}_p, L)$  s.t.

$$\int_{\mathbb{Z}_p} \binom{x}{n} d\mu(x) = b_n,$$

and  $\|\mu\|_p = \sup_n |b_n|$ .  $\lrcorner$

**Cor. (33.1.1.9).** Each measure  $\mu \in \text{Meas}(\mathbb{Z}_p, L)$  is determined by its value on the functions  $x^m$  for  $m \in \mathbb{N}$ .  $\square$

**Prop. (33.1.1.10) [ $p$ -adic Integrations].** Suppose  $X \in \text{Prof}$  and  $L \in p\text{-NField}$ , and  $\mu$  a  $p$ -adic measure (33.1.1.6) on  $X$ . Let  $f : X \rightarrow L$  is a continuous function, then the Riemann sum

$$S_{N, \{x_{a,N}\}} = \sum_{a \in \mathbb{Q}_p/p^N \mathbb{Z}_p, x_{a,N} \in a + (p^N) \subset X} f(x_{a,N}) \mu(a + (p^N))$$

converges to a limit in  $\mathbb{Q}_p$  when  $N \rightarrow \infty$ , denoted by  $\int_X f d\mu$ .  $\square$

*Proof:*  $\square$

### Bernoulli Measures

**Def. (33.1.1.11) [Bernoulli Distributions].** Let  $k, n \in \mathbb{N}$ . For  $a \in [p^n - 1]$ , define  $\mu_{B,k}(a + (p^n)) = p^{n(k-1)} B_k(\frac{a}{p^n})$  (10.7.1.13), then  $\mu_{B,k}$  extends to a distribution on  $\mathbb{Z}_p$ . For example,

$$\mu_{B,0} = \mu_{\text{Haar}}, \quad \mu_{\text{Mazur}}(a + (p^n)) \triangleq \mu_{B,1}(a + (p^n)) = \frac{a}{p^n} - \frac{1}{2}, \quad \mu_{B,2}(a + (p^n)) = p^n \left( \frac{a^2}{p^{2n}} - \frac{a}{p^n} + \frac{1}{6} \right)$$

$\square$

*Proof:* It suffices to check the hypothesis of (33.1.1.7) that for any  $a \in \mathbb{Z}_p$ ,

$$\mu_{B,k}(a + (p^n)) = \sum_{b=0}^{p-1} \mu_{B,k}(a + bp^n + (p^{n+1})),$$

or equivalently, if we denote  $\alpha = a/p^n$ ,

$$B_k(p\alpha) = p^{k-1} \sum_{b=0}^{p-1} B_k\left(\alpha + \frac{b}{p}\right).$$

The RHS is just the  $k!$  times the  $T^k$ -coefficient in the expansion of

$$p^{k-1} \sum_{b=0}^{p-1} \frac{e^{(\alpha+b)T/p}}{e^T - 1} = \frac{p^{k-1} T e^{\alpha T}}{e^T - 1} \cdot \frac{e^T - 1}{e^{T/p} - 1} = p^k \frac{(T/p) e^{(p\alpha)T/p}}{e^{T/p} - 1} = p^k \sum_{j \in \mathbb{N}} B_j(p\alpha) \frac{(T/p)^j}{j!},$$

which is just  $B_k(p\alpha)$ .  $\square$

**Prop. (33.1.1.12) [Bernoulli Measure].** For  $k \in \mathbb{Z}_+$  and  $m \in \mathbb{Z}_+ \setminus (p)$ , define the (regularized) **Bernoulli measure**  $\mu_{k,m}$  to be

$$\mu_{k,m}(U) \triangleq \mu_k(U) - m^{-k} \mu_k(mU), \quad U \subset \mathbb{Z}_p.$$

Then  $\mu_{k,m} \in \text{Meas}(\mathbb{Z}_p, \mathbb{Q}_p)$ , and satisfies:

- $\mu_{1,m} \in \text{Meas}(\mathbb{Z}_p, \mathbb{Z}_p)$ .
- For any  $N \in \mathbb{N}$  and  $a \in [p^N - 1]$ , if  $d_k$  is the common denominator for the coefficients of  $B_k(X)$ , then

$$d_k \mu_{k,m}(a + (p^N)) \equiv d_k k a^{k-1} \mu_{1,m}(a + (p^N)) \pmod{p^N}.$$

and both sides are in  $\mathbb{Z}_p$ .

┘

*Proof:* For  $k = 1, N \in \mathbb{N}$  and  $a \in [p^N - 1]$ ,

$$\mu_{1,m}(a + (p^N)) = \frac{a}{p^N} - \frac{1}{2} - \frac{1}{m} \left( \left\{ \frac{am}{p^N} \right\} - \frac{1}{2} \right) = \frac{1}{m} \left\lfloor \frac{am}{p^N} \right\rfloor + \frac{1/m - 1}{2} \in \mathbb{Z}_p.$$

Thus

2: By (10.7.1.13),  $B_k(X) = X^k - \frac{k}{2}X^{k-1} + \dots$ , and for any compact open subset  $U \subset \mathbb{Z}_p$ ,

$$d_k \mu_{k,m}(a + (p^N)) = p^{N(k-1)} \left( d_k B_k \left( \frac{a}{p^N} \right) - d_k B_k \left( \left\{ \frac{am}{p^N} \right\} \right) \right),$$

so except for the first two terms of  $B_k(X)$ , the other terms are divisible by  $p^N$ . Thus

$$\begin{aligned} d_k \mu_{k,m}(a + (p^N)) &\equiv d_k p^{N(k-1)} \left( \frac{a^k}{p^{Nk}} - \frac{1}{m^k} \left\{ \frac{am}{p^N} \right\}^k - \frac{k}{2} \left( \frac{a^{k-1}}{p^{N(k-1)}} - \frac{1}{m^k} \left\{ \frac{am}{p^N} \right\}^{k-1} \right) \right) \pmod{p^N} \\ &\equiv d_k \left( \frac{a^k}{p^N} - \frac{1}{m^k} \left( \frac{(am)^k}{p^N} - k(am)^{k-1} \left\lfloor \frac{am}{p^N} \right\rfloor \right) - \frac{k}{2} \left( a^{k-1} - \frac{1}{m^k} (am)^{k-1} \right) \right) \pmod{p^N} \\ &= d_k k a^{k-1} \left( \frac{1}{m} \left\lfloor \frac{am}{p^N} \right\rfloor + \frac{1/m - 1}{2} \right) \pmod{p^N} \\ &= d_k k a^{k-1} \mu_{1,m}(a + (p^N)) \pmod{p^N}. \end{aligned}$$

Finally we see that  $\mu_{k,m}$  is a measure because  $|\mu_{k,m}(U)| \leq \max(|\frac{1}{d_k}|_p, 1)$  by item 2. □

**Cor. (33.1.1.13).** If  $X \subset \mathbb{Z}_p$  is a compact open subset, and  $m \in \mathbb{Z}_{\geq 1} \setminus (p)$ , then  $\int_X \mu_{k,m} = k \int_X x^{k-1} \mu_{1,m}$  (33.1.1.12). ┘

*Proof:* This follows formally from (33.1.1.12) by taking limit  $N \rightarrow \infty$ . □

**Cor. (33.1.1.14).** Let  $m = \begin{cases} 1+p & , p \geq 3 \\ 5 & , p = 2 \end{cases}$ , then

$$\int_{\mathbb{Z}_p^*} x^{-1} \mu_{1,m} \equiv \begin{cases} -1 \pmod{p} & , p \geq 3 \\ 2 \pmod{4} & , p = 2 \end{cases}.$$

┘

*Proof:* Let  $g(x) = 1/x \pmod{p}$ , then  $g \equiv 1/x \pmod{p}$ , or if  $g(x) = 1/x \pmod{p^2}$ , then  $g \equiv 1/x \pmod{p^2}$ . Then the assertion follows easily from the equations

$$\mu_{1,m}(a + (p)) = \frac{1}{m} \left\lfloor \frac{am}{p} \right\rfloor + \frac{1/m - 1}{2}.$$

$$\mu_{1,m}(a + (p^2)) = \frac{1}{m} \left\lfloor \frac{am}{p^2} \right\rfloor + \frac{1/m - 1}{2}.$$

□

**Cor. (33.1.1.15).** Let  $k \in \mathbb{Z}_+, m \in \mathbb{Z}_+ \setminus (p)$ , then

- For any compact open subset  $U \subset \mathbb{Z}_p$ , we have

$$\mu_{k,m}(pU) = p^{k-1}\mu_{k,m}(U).$$

- $\mu_{B,k}(\mathbb{Z}_p) = B_k$ .
- $\mu_{k,m}(\mathbb{Z}_p^*) = (1 - m^{-k})(1 - p^{k-1})B_k$ .

┘

*Proof:* 1: This follows from the definition of  $\mu_{B,k}$  (33.1.1.11) and  $\mu_{k,m}$  (33.1.1.12)

2: This follows from the definition of  $\mu_{B,k}$  (33.1.1.11).

3: This follows the definition of  $\mu_{k,m}$  and item1, item2. □

**Cor. (33.1.1.16) [Kummer's Congruence, Kummer/Clausen-von-Staudt].** For  $k, k' \in \mathbb{Z}_+$ ,

- If  $p - 1 \nmid k$ , then  $|B_k/k|_p \leq 1$ .
- If  $p - 1 \nmid k$ ,  $N \in \mathbb{N}$  and  $k \equiv k' \pmod{(p-1)p^N}$ , then

$$(1 - p^{k-1}) \frac{B_k}{k} \equiv (1 - p^{k'-1}) \frac{B_{k'}}{k'} \pmod{p^{N+1}}.$$

- If  $p \geq 3$  and  $p - 1 | k$  or  $p = 2$  and  $k \in 2\mathbb{Z} \cup \{1\}$ , then  $pB_k \equiv -1 \pmod{p}$ .

┘

*Proof:* 1: We must have  $p \geq 3$ . Let  $m \in [p-2]_+$  s.t.  $m$  is the generator of the cyclic group  $(\mathbb{Z}/(p))^*$ . In particular,  $m^{-k} - 1 \in \mathbb{Z}_p^*$ . This is true for  $k = 1$  because  $B_1 = 1/2$  and  $p \geq 3$ , and if  $k \geq 2$ , then the hypothesis implies that  $m^k \not\equiv 1 \pmod{p}$ . Thus, by (33.1.1.15) and (33.1.1.13),

$$\left| \frac{B_k}{k} \right|_p = \left| \int_{\mathbb{Z}_p^*} x^{k-1} \mu_{1,m} \right|_p \leq 1 \text{ (33.1.1.12).}$$

2: We must have  $p \geq 3$ . Let  $m \in [p-2]_+$  s.t.  $m$  is the generator of the cyclic group  $(\mathbb{Z}/(p))^*$ . It suffices to prove that

$$\frac{1}{1 - m^{-k}} \int_{\mathbb{Z}_p^*} x^{k-1} d\mu_{1,m} \equiv \frac{1}{1 - m^{-k'}} \int_{\mathbb{Z}_p^*} x^{k'-1} d\mu_{1,m} \pmod{p^{N+1}}.$$

Then this follows from the fact that  $x^k \equiv x^{k'} \pmod{p^N}$  for any  $x \in \mathbb{Z}_p^*$ .

3: If  $k = 1$  the assertion is true. Now assume  $k \geq 2$ . If  $p \geq 3$ , let  $m = 1 + p$ , then

$$pB_k = \frac{-kp}{m^{-k} - 1} (1 - p^{k-1})^{-1} \cdot \int_{\mathbb{Z}_p^*} x^{k-1} d\mu_{1,m}.$$

if  $d = v_p(k)$ , then  $m^{-k} - 1 = (1 + p)^{-k} - 1 \equiv -kp \pmod{p^{d+2}}$ . Thus  $\frac{-kp}{m^{-k} - 1} \equiv 1 \pmod{p}$ . Thus

$$pB_k \equiv \int_{\mathbb{Z}_p^*} x^{k-1} d\mu_{1,m} \equiv \int_{\mathbb{Z}_p^*} x^{-1} d\mu_{1,m} \pmod{p}.$$

And if  $p = 2$ , let  $m = 5$ , then  $m^{-k} - 1 = (1 + 2^2)^{-k} - 1 \equiv -kp^2 \pmod{p^{d+3}}$ , and then

$$2B_k \equiv \frac{1}{2} \int_{\mathbb{Z}_p^*} x^{k-1} d\mu_{1,m} \equiv \int_{\mathbb{Z}_2^*} x^{-1} d\mu_{1,m} \pmod{2}.$$

The final assertion follows from (33.1.1.14). □

### Iwasawa Algebras

References are [Was97]Chap13.

**Prop. (33.1.1.17) [Iwasawa Algebras].** For  $G \in \text{ProfAb}$ , there is an isomorphism

$$\text{Meas}(G; \mathcal{O}_L) \cong \lim_{H \leq G \text{ open}} \mathcal{O}_L[G/H].$$

And if we endow  $\text{Meas}(G; \mathcal{O}_L)$  with the convolution operation (12.10.2.1)

$$(\mu * \lambda)(\varphi) = \int_G \left( \int_G \varphi(x+y) d\lambda(y) \right) d\mu(x)$$

and the RHS with the natural algebra structure, then this isomorphism is an algebra isomorphism.

Then  $\Lambda(G; L) \triangleq \text{Meas}(G; \mathcal{O}_L)$  is called the **Iwasawa algebra** of  $G$  (with values in  $\mathcal{O}_L$ ).

And the  $\mathcal{O}_L$ -valued Iwasawa algebra of  $\mathbb{Z}_p$  is called **The Iwasawa algebra**, denoted by  $\Lambda_L$ .  $\lrcorner$

*Proof:* The map is given by

$$\mu \mapsto \lambda = \left( \lambda_H = \sum_{a \in G/H} \mu(aH)[aH] \right)_H.$$

To show this is an algebra map, notice that

$$(\mu * \lambda)(aH) = \int_G \left( \int_G \chi_{aH}(x+y) d\lambda(y) \right) d\mu(x)$$

and  $\mu * \lambda$  is clearly mapped to the element

$$\left( \left( \sum_{a \in G/H} \mu(aH)[aH] \right) \cdot \left( \sum_{a \in G/H} \lambda(aH)[aH] \right) \right)_H$$

□

**Def. (33.1.1.18) [Iwasawa Algebra].** For any topological generator  $\gamma$  of  $\mathbb{Z}_p$ , there is a non-canonical isomorphism

$$\Lambda_L \cong \mathcal{O}_L[[T]] : \gamma \mapsto T + 1 \quad (33.1.1.17).$$

□

*Proof:* It suffices to prove for  $L = \mathbb{Q}_p$ .

Let  $\Gamma_n = \Gamma/\Gamma^{p^n}$ , then it can be easily shown that  $\mathbb{Z}_p[\Gamma_n] \cong \mathbb{Z}_p[T]/((T+1)^{p^n} - 1)$ . Then it suffices to show that

$$\mathbb{Z}_p[[T]] \cong \varprojlim \mathbb{Z}_p[T]/((T+1)^{p^n} - 1).$$

For this, denote  $P_n(T) = (T+1)^{p^n} - 1$ , then  $P_n(T)$  is distinguished (19.1.7.6), and  $P_n(T) | P_{n+1}(T)$ , and

$$P_{n+1}(T)/P_n(T) = (1+T)^{p^n(p-1)} + (1+T)^{p^n(p-2)} + \dots + (1+T)^{p^n} + 1 \in (p, T).$$

Thus  $P_n(T) \in (p, T)^{n+1}$ . By  $p$ -adic Weierstrass preparation theorem (19.1.7.7), for any  $f(T) \in \mathbb{Z}_p[[T]]$  and  $n \in \mathbb{N}$ ,  $f(T) = q_n(T)P_n(T) + f_n(T)$ , where  $f_n(T)$  is a polynomial with degree  $< p^n$ .

And  $f_{n+1}(T) - f_n(T) = (q_n - q_{n+1}P_{n+1}/P_n)P_n$ , so by (19.1.7.9),  $f_{n+1}(T) \equiv f_n(T) \pmod{P_n(T)}$  as polynomials. Then  $(f_0, f_1, \dots, f_n, \dots) \in \varprojlim \mathbb{Z}_p[T]/(P_n(T))$ .

Now if  $f_k = 0$  for each  $k$ , then  $P_k(T) | f(T)$  for each  $k$ , and then  $f \in \bigcup_k (p, T)^{k+1} = 0$ . And conversely, given any  $(f_i) \in \varprojlim \mathbb{Z}_p[T]/(P_n(T))$ ,  $f(T) = \lim f_k(T)$  exists in  $\mathbb{Z}_p[[T]]$ , and it can be shown that  $f(T)$  is mapped to  $(f_i)$ . Thus we are done.  $\square$

**Def. (33.1.1.19) [Pseudo-Isomorphisms].** A homomorphism between  $\Lambda_p$ -modules are called a **pseudo-isomorphism** if its kernel and cokernel are all finite. This is an equivalence relation.  
 $\lrcorner$

**Lemma (33.1.1.20).** If  $f, g \in \Lambda_p$  are relatively prime (3.2.3.4), then

- The natural map  $\Lambda_p/(fg) \rightarrow \Lambda_p/(f) \oplus \Lambda_p/(g)$  is an injection with finite cokernel.
- There exists an injection  $\Lambda/(f) \oplus \Lambda/(g) \rightarrow \Lambda_p/(fg)$  with finite cokernel.

$\lrcorner$

*Proof:* Cf. [Mazur Control Theorem, P9].  $\square$

**Thm. (33.1.1.21) [Classification of Modules over  $\Lambda_p$ ].** For  $M \in \text{Mod}_{\Lambda_p}^{\text{fg}}$ , there exists  $r, s, t \in \mathbb{N}$ ,  $n_i, m_j \in \mathbb{Z}_+$  and  $f_j$  distinguished and irreducible, s.t.  $M$  is pseudo-isomorphic to

$$\Lambda_p^{\oplus r} \oplus \left( \bigoplus_{i \in [s]_+} \Lambda_p/(p^{n_i}) \right) \oplus \left( \bigoplus_{j \in [t]_+} \Lambda_p/(f_j(T)^{m_j}) \right).$$

$\lrcorner$

*Proof:* Cf. [Washington, P272] or [Mazur Control Theorem, P11].  $\square$

**Cor. (33.1.1.22).** If  $M \in \text{Mod}_{\Lambda_p}^{\text{tor,fg}}$ , then there exists  $r, s, t \in \mathbb{N}$ ,  $n_i, m_j \in \mathbb{Z}_+$  and  $f_j$  distinguished and irreducible, s.t.  $M$  is pseudo-isomorphic to

$$\left( \bigoplus_{i \in [s]_+} \Lambda_p/(p^{n_i}) \right) \oplus \left( \bigoplus_{j \in [t]_+} \Lambda_p/(f_j(T)^{m_j}) \right).$$

Moreover, the ideal  $(\prod_i f_i) \subset \Lambda_p$  is well-defined, called the **characteristic ideal of  $B$** , denoted by  $\text{char}_p(M)$ .  $\lrcorner$

*Proof:*

$\square$

**Prop. (33.1.1.23).** If  $X \in \text{Mod}_{\Lambda_p}^{\text{fg}}$  and  $\#X_\Gamma < \infty$ , then  $X$  is torsion over  $\Lambda_p$ .  $\lrcorner$

*Proof:* Cf. [Washington].  $\square$

## 2 $p$ -adic Eisenstein Series

## 3 Coleman Map

The Coleman map is important as it puts the construction of the  $p$ -adic zeta function into a larger and more conceptual framework. Even more importantly, it provides an important bridge between analytic objects and algebraic structures.

## 4 $q$ -Primary Units

**Notation (33.1.4.1).**

- Let  $p, q \in \text{Prime}_{\geq 3}$  s.t.  $p \not\equiv 1 \pmod{q}$ .
- Let  $F = \mathbb{Q}(\zeta_p)$ .
- Let  $G = \text{Gal}(F/\mathbb{Q})$ .

- Let  $R = \mathbb{F}_q[G]$  which is isomorphic to a product of fields.
- Let  $N = \sum_{\sigma \in G} \sigma \in R$  be the norm element.

┘

**Prop. (33.1.4.2) [Units modulo  $q$ ].**  $\mathbb{Z}[\zeta_p]^*/(\mathbb{Z}[\zeta_p]^*)^q$  is a cyclic module over  $R$ , and  $\text{Ann}(\mathbb{Z}[\zeta_p]^*/(\mathbb{Z}[\zeta_p]^*)^q) = (N, 1 - \mathfrak{c})$  (33.1.4.1). ┘

*Proof:* Cf. [Catalan's Conjecture, Bilu] P16?

Let  $E = \mathbb{Z}[\zeta_p]^*$ ,  $\Omega$  the group of roots of unity of  $K$ , and let  $\overline{E} = E/\Omega$ . Because each root of unity is a  $q$ -th power, we have  $E/E^q \cong \overline{E}/\overline{E}^q$ . ┘

**Def. (33.1.4.3) [Cyclotomic Units].** Let  $C$  be the subgroup of units of  $\mathbb{Q}(\zeta_p)$  generated by  $\zeta_p$  and  $\frac{1-\zeta_p^k}{1-\zeta_p}$  for  $k \in \mathbb{Z} \setminus (p)$ .

Then  $C$  is a full rank subgroup of  $\mathbb{Z}[\zeta_p]^*$ . ┘

*Proof:* ┘

**Def. (33.1.4.4) [ $q$ -Primary Units].** A number  $\gamma \in \mathbb{Z}[\zeta_p]$  are called  **$q$ -primary** if there exists  $\nu \in \mathbb{Z}[\zeta_p]$  s.t.  $\gamma \equiv \nu^q \pmod{q^2} \mathbb{Z}[\zeta_p]$ . ┘

**Prop. (33.1.4.5).** If  $p > q$ , then not all the cyclotomic units in  $\mathbb{Q}(\zeta_p)$  (33.1.4.3) are  $q$ -primary. ┘

*Proof:* We show that in fact  $1 + \zeta_p^q = (1 - \zeta_p^{2q})/(1 - \zeta_p^q)$  is not  $q$ -primary: Suppose  $1 + \zeta_p^q \equiv \nu^q \pmod{q^2}$  for some  $\nu$ , then  $(1 + \zeta_p^q - \nu)^q \in (q)$ . But because  $q$  is unramified in  $\mathbb{Q}(\zeta_p)$  by (19.3.2.9),  $(q)$  is a radical ideal in  $\mathbb{Z}[\zeta_p]$ . So  $1 + \zeta_p^q - \nu \in (q)$ , which in turn implies that  $(1 + \zeta_p^q)^q \equiv \nu^q \pmod{q^2} \equiv 1 + \zeta_p^q \pmod{q^2}$ .

Then this implies that  $f(\zeta_p) \equiv 0 \pmod{q}$ , where  $f(X) = ((1 + X)^q - 1 - X^q)/q \in \mathbb{Z}[X]$  is a monic polynomial. By Galois conjugacy, this implies that each primitive  $p$ -th roots of unit is a root of  $f$ . This implies that  $p - 1 \leq \deg(f) = q - 1$ , contradiction. ┘

**Prop. (33.1.4.6) [Annihilators of Units].** Let  $E = \mathbb{Z}[\zeta_p]^*$ ,  $C_q \subset C$  be the group of  $q$ -primary units, then the groups

$$E/CE^q, \quad C/C_q \cong CE^q/C_qE^q, \quad C_q/(C_q \cap E^q) \cong C_qE^q/E^q$$

are all cyclic, and the annihilators

$$I_1 = \text{Ann}(E/CE^q), \quad I_2 = \text{Ann}(C/C_q), \quad I_3 = \text{Ann}(C_q/(C_q \cap E^q))$$

are pairwise coprime, and satisfy

$$I_1 I_2 I_3 = (N, 1 - \mathfrak{c}).$$

┘

*Proof:* The first assertion holds because  $C \cap C_qE^q = C_q$ : This holds by definition of  $C_q$ .

They are all cyclic because they are all subquotients of the cyclic  $R$ -module  $E/E^q$  (33.1.4.2) and  $R$  is a PID.

The last assertion follows from (33.1.4.2) and general properties of annihilators as  $R$  is a product of fields. ┘

## 33.2 $p$ -adic $L$ -Functions

References are [Kob84] and [ $p$ -adic  $L$ -Functions and  $p$ -adic Representations, Perrin-Riou].

**Notation (33.2.0.1).**

- Use notations on Iwasawa theory defined in [Classical Iwasawa Theory](#).

┘

### 1 $p$ -adic Hecke $L$ -Functions

References are [Fontaine's rings and  $p$ -adic  $L$ -functions, Colmez], [ $p$ -adic  $L$ -Functions, Iwasawa] and [Mazur-Tate-Teitelbaum, On  $p$ -adic analogues of the conjectures of Birch and Swinnerton-Dyer] and [Hid93].

**Prop. (33.2.1.1) [Local Group Rings].** For  $G \in \text{Ab}^{\text{fin}}$ ,  $R = \mathbb{Z}_p[G]$  is a complete semi-local ring, so  $R = \prod_{\mathfrak{m} \in |\text{Spec } R|_0} R_{\mathfrak{m}}$ .

Because  $\mathbb{Z}_p[\mathbb{Z}/(p^n)]$  is a local ring, for any maximal ideal  $\mathfrak{m}$  of  $R$ , there exists a  $\overline{\mathbb{Q}_p}$ -valued character of  $G$  of order prime to  $p$  s.t. the associated ring homomorphism factors through  $R_{\mathfrak{m}}$ , unique up to conjugacy.

The normalization  $\tilde{R}$  of  $R$  equals  $\prod_{\sigma \in \pi_0(\text{Spec } R)} R_{\sigma}$ .

┘

### Kubota-Leopoldt $p$ -adic Zeta Functions

**Def. (33.2.1.2) [Kubota-Leopoldt  $p$ -adic Zeta Function, Iwasawa].** For  $k \in \mathbb{Z}_+$ , define

$$\zeta_p(1-k) \triangleq (1-p^{k-1})\zeta(1-k) = (1-p^{k-1})\left(-\frac{B_k}{k}\right).$$

We will see in [\(33.2.1.3\)](#) that this extends to a locally analytic function on  $\mathbb{Z}_p^*$ .

┘

**Def. (33.2.1.3) [ $p$ -adic Mazur-Mellin Transform].** For  $s_0 \in [p-2]$  and  $s \in \mathbb{Z}_p$  s.t.  $s \neq 0$  if  $s_0 = 0$ , define

$$\zeta_{p,s_0}(s) = \frac{1}{m^{-s_0-(p-1)s} - 1} \int_{\mathbb{Z}_p^*} x^{s_0+(p-1)s-1} d\mu_{1,m}(x),$$

where  $m \in \mathbb{Z}_{\geq 2} \setminus (p)$ , then this  $\zeta_{p,s_0}$  is a continuous function on  $\mathbb{Z}_p^*$  that is independent of  $m$  chosen.

┘

*Proof.* It is clear that when  $x \in \mathbb{Z}_p^*$  and  $k, k' \in \mathbb{Z}_p$ ,  $N \in \mathbb{Z}_+$  satisfies  $k' \equiv k \pmod{(p-1)p^N}$ , then  $|x^k - x^{k'}|_p \leq p^{-N-1}$ . Thus the integral  $\int_{\mathbb{Z}_p^*} x^{s_0+(p-1)s-1} d\mu_{1,m}$  is a continuous function in  $s$ . Thus  $\zeta_{p,s_0}(s)$  is a continuous function in  $s$ .

To show that the integral is independent of  $m$  chosen, notice if  $m \in \mathbb{Z}_{\geq 2} \setminus (p)$  is another integer, then whenever  $s_0 + (p-1)s = k \in \mathbb{Z}$ , the two definitions of  $\zeta_{p,s_0}(s)$  both equal

$$\frac{1}{m^{-k} - 1} \int_{\mathbb{Z}_p^*} x^{k-1} d\mu_{1,m}(x) = \frac{1}{k(m^{-k} - 1)} \int_{\mathbb{Z}_p^*} d\mu_{k,m}(x) = (1-p^{k-1})\left(-\frac{B_k}{k}\right) = \zeta_p(1-k),$$

by [\(33.1.1.13\)](#) and [\(33.1.1.15\)](#).

□

**Interpolation at Dirichlet characters****Deligne-Ribet  $p$ -adic  $L$ -Functions**

[Values of Abelian  $L$ -functions at Negative Integers over Totally Real Fields, Deligne-Ribet] defined  $p$ -adic  $L$ -functions for totally real fields.

**Prop. (33.2.1.4) [Klingen/Siegel].** Let  $M/F \in \mathbf{NField}$  be a cyclic extension of totally real fields. For any  $\sigma \in \text{Gal}(M/F)$ ,  $L_F(\sigma; s)$  is the partial zeta function of  $F$ , then  $L_F(\sigma; 1 - n) \in \mathbb{Q}$ .  $\lrcorner$

*Proof:* ?  $\square$

**Thm. (33.2.1.5) [ $p$ -adic  $L$ -Functions for Totally Real Fields, Deligne-Ribet].** Situation as in (33.3.2.7), there exists a  $p$ -adic  $L$ -function  $L_p(\psi; s)$  s.t.

- $L_p(\psi; s)$  is continuous for  $s \in \mathbb{Z}_p \setminus \{1\}$  and even at  $s = 1$  if  $\psi \neq 1$ .
- For  $n \in \mathbb{Z}_+$ ,

$$L_p(\psi; 1 - n) = L(\psi\omega^{-n}; 1 - n) \prod_{v \in S_F(p)} (1 - \psi\omega^{-n}(\mathfrak{p}_v) \|v\|^{n-1}).$$

where  $\omega$  is the Teichmüller character.

- If  $\psi$  is a 1-dimensional character, denote  $H_\psi(T) = \psi(\gamma)(1 + T) - 1$  if  $\psi$  is of Greenberg type W(33.3.2.8) and  $H_\psi(T) = 1$  otherwise. Then there exists  $G_\psi(T) \in \mathbb{Z}_p[\psi][[T]]$  s.t.

$$L_p(\psi; 1 - s) = G_\psi(u^s - 1)/H_\psi(u^s - 1),$$

where  $u = \chi_{\text{cycl}}(\gamma)$ . Moreover, if  $\chi$  is a character of  $\text{Gal}_F$  of Greenberg type W(33.3.2.8),

$$G_{\psi\chi}(T) = G_\psi(\chi(\gamma)(1 + T) - 1), \quad H_{\psi\chi}(T) = H_\psi(\chi(\gamma)(1 + T) - 1).$$

$\lrcorner$

*Proof:* ?  $\square$

**Prop. (33.2.1.6) [ $p$ -adic  $L$ -Functions of Components].** Let  $H/F \in \mathbf{NField}$  be an Abelian extension with  $H \cap F_\infty = F$ . Then

$$\text{Gal}(H_\infty/F) \cong \text{Gal}(K/F) \times \text{Gal}(F_\infty/F)$$

and

$$\mathbb{Z}_p[[\text{Gal}(H_\infty/F)]] \cong R[[T]] \text{ where } R = \mathbb{Z}_p[\text{Gal}(H/F)].$$

Assume  $H$  is either totally real or CM, and let  $\text{Ram}_F(K/F) \subset_{\text{fin}} S \in \Sigma_F^{\text{fin}}$ . Suppose  $\mathfrak{m}$  is an even component of  $R$ (33.2.1.1). If the basic character of  $\mathfrak{m}$  is not trivial, then there exists  $G_{\mathfrak{m},S}(T) \in R_{\mathfrak{m}}[[T]]$  s.t.

$$\psi(G_{\mathfrak{m},S}(T)) = G_{\psi,S}(T) \in \mathbb{Z}_p[\psi][[T]]$$

for each character  $\psi \in \mathfrak{m}$ . And if the basic character of  $\mathfrak{m}$  is trivial, then we can take an ideal  $\mathfrak{c}$  of  $S$  that is prime to  $S$  and  $p$ , and let  $H_{\mathfrak{m},\mathfrak{c}}(T) \in R[[T]]$  be the power series corresponding to  $1 - \left(\frac{c}{L/K}\right)$ . Then there exists  $G_{\mathfrak{m},\mathfrak{c},S} \in R_{\mathfrak{m}}[[T]]$  s.t.

$$\frac{\psi(G_{\mathfrak{m},\mathfrak{c},S}(T))(u^s - 1)}{\psi(H_{\mathfrak{m},\mathfrak{c},S}(T))(u^s - 1)} = L_{p,S}(\psi; 1 - s)$$

for each character  $\psi \in \mathfrak{m}$ .

If  $\zeta_p(s)$  has no pole at  $s = 1$  (i.e. the Leopoldt conjecture fails), let  $R_\infty/F_\infty$  be the composite of all  $\mathbb{Z}_p$ -extension of  $F$  with  $\text{Gal}(R_\infty/F_\infty) = \mathbb{Z}_p\{\gamma_1, \dots, \gamma_t\}$ , then there is an isomorphism

$$\Lambda_t = \mathbb{Z}_p[[\text{Gal}(R_\infty/F)]] \cong \mathbb{Z}_p[[Y_1, \dots, Y_t, T]],$$

then there is a power series  $G(Y_1, \dots, Y_t, T) \in \Lambda_t$  s.t.

$$G(\psi(\gamma_1) - 1, \dots, \psi(\gamma_t) - 1, \psi(\gamma)u^s - 1) = L_p(\psi; s)$$

for each character  $\psi$  of finite order of  $\text{Gal}(R_\infty/F)$ .  $\lrcorner$

*Proof:* ? Cf. [Serre, Sur le residu de la fonction zeta  $p$ -adique d'un corps de nombre].  $\square$

**Thm. (33.2.1.7) [ $p$ -adic Artin Conjecture, conjectured by Greenberg [Gre83], Greenberg [Gre83]/Wiles [Wil90]].** For  $p \in \text{Prime}_{\geq 3}$ ,  $G_\psi(T) \in \mathbb{Z}_p[\psi][[T]][\frac{1}{p}]$ .  $\lrcorner$

*Proof:* Cf. [Gre83], where it is proven that this follows from (33.3.2.9).  $\square$

## 2 Leopoldt's Conjecture

**Conj. (33.2.2.1) [Leopoldt].** For  $F \in \text{NField}$  and  $p \in \text{Prime}$ , the natural map

$$\mathcal{O}_K^* \otimes \mathbb{Z}_p \rightarrow \prod_{v|p} \mathcal{O}_{K_v}^*$$

is injective.

Equivalently ?, the  $p$ -adic regulator for  $F$  doesn't vanish.  $\lrcorner$

*Proof:*  $\square$

**Thm. (33.2.2.2) [Leopoldt Conjecture for Abelian Extensions].** If  $F$  is an Abelian extension of  $\mathbb{Q}$  or an Abelian extension of an imaginary quadratic field, then the Leopoldt conjecture (33.2.2.1) holds for  $F$ .  $\lrcorner$

*Proof:* ? [A. Brumer, On the units of algebraic number fields].  $\square$

**Prop. (33.2.2.3) [Leopoldt Conjecture for Totally Real Fields].** Colmez [Residu en  $s=1$  des fonctions zeta  $p$ -adiques] proved a  $p$ -adic class number formula for totally real field  $F$ , so for these fields, the non-vanishing of the  $p$ -adic regulator is equivalent to their  $p$ -adic Dedekind zeta functions having a simple pole at  $s = 1$ .  $\lrcorner$

*Proof:* ?.  $\square$

## 3 Modular Forms

References are [Fontaine's rings and  $p$ -adic  $L$ -functions, Colmez].

#### 4 Perrin-Riou's *p*-adic *L*-Functions

References are [*p*-adic *L*-Functions and *p*-adic Representations, Perrin-Riou].

**Notation(33.2.4.1)[Notations on Iwasawa Algebras].**

- Let  $p \in \text{Prime}$ ,
- Let  $G_\infty = \text{Gal}(\mathbb{Q}(\mu_{p^\infty})/\mathbb{Q}) \cong \Gamma \times \Delta_p$ , where  $\Gamma \cong \mathbb{Z}_p$  and  $\Delta = \text{Gal}(\mathbb{Q}(\mu_p)/\mathbb{Q})$ .
- Let  $\chi_{\text{cycl}}$  be the cyclotomic character of  $G_\infty$ .
- Let  $\Lambda_\Gamma = \mathbb{Z}_p[[\Gamma]]$ ,  $\Lambda = \mathbb{Z}_p[G_\infty] = \Lambda_\Gamma \otimes \mathbb{Z}_p[\Delta]$ .
- Let  $\iota \in \text{Aut}_{\mathbb{Z}_p}(\Lambda)$  be the involution operator s.t.  $\iota(\tau) = \tau^{-1}$ .
- Let  $\text{Twist} \in \text{Aut}_{\mathbb{Z}_p}(\Lambda)$  be the twisting operator s.t.  $\text{Twist}(\tau) = \chi(\tau)\tau$ .
- Denote  $2\pi i = \log([\varepsilon^p]) \in B_{\text{crys}}$ , where  $\varepsilon$  is a generator of  $(\mathbb{Z}_p(1))^*$ .
- Let  $\varphi \in \text{Aut}_{\mathbb{Z}_p}(\mathbb{Z}_p[[T]])$  be the operator s.t.  $\varphi(T) = (1+T)^p - 1$ .
- Let  $\psi \in \text{End}_{\mathbb{Z}_p}(\mathbb{Z}_p[[T]])$  be the unique linear map s.t. for any  $g \in \mathbb{Z}_p[[T]]$ ,

$$\varphi(\psi(g))(T) = \frac{1}{p} \sum_{\zeta \in \mu_p} g(\zeta(1+T) - 1).$$

- $\mathbb{Z}_p[[T]]^{\psi=0}$  is equipped with a continuous action of  $G_\infty$  by

$$\tau(1+T) = (1+T)^{\chi_{\text{cycl}}(\tau)}.$$

In this way,  $\mathbb{Z}_p[[T]]^{\psi=0}$  is a free  $\Lambda$ -module of rank 1 with basis  $(1+T)$ .

- $\mathbb{Z}_p[[T]]^{\psi=0}$  is equipped with a bijective derivation  $D = (1+T)\frac{\partial}{\partial T}$ , and for  $h \in \Lambda$ ,

$$D(h(1+T)) = \text{Twist}(h) \cdot (1+T).$$

┘

**Notation(33.2.4.2)[Notations on Galois Representations].**

- Let  $F \in \text{NField}$  that is unramified over  $p$ .
- Let  $F_n = F(\mu_{p^{n+1}})$ ,  $F_\infty = F(\mu_{p^\infty})$ ,  $\Gamma_n = \text{Gal}(F_\infty/F_n)$ ,  $\text{Gal}(F_\infty/F) \cong \text{Gal}(\mathbb{Q}(\mu_{p^\infty})/\mathbb{Q}) = G_\infty$ .
- Let  $V \in \text{Rep}_{\mathbb{Q}_p}^{\text{fd}}(\text{Gal}_F)$  be a pseudo-geometric representation of  $\text{Gal}_F$  that is crystalline at  $S_F(p)$ .
- For  $v \in S_F(p)$ ,  $D_v(V) = (B_{\text{crys},v} \otimes_{\mathbb{Q}_p} V)^{\text{Gal}_{F_v}}$  is the filtered  $\varphi$ -module over  $\mathbb{F}_p$  of dimension  $\dim V$ .
- Define  $D_{F,p}(V) = D_p(\text{Ind}_{F/\mathbb{Q}} V) \cong \bigoplus_{v \in S_F(p)} D_v(V)$ .
- For any  $v \in S_F(p)$ , there is a  $\mathbb{Q}_p$ -linear **Bloch-Kato exponential map**

$$\exp_{F_v,V} : D_v(V) \rightarrow H^1(F_v, V).$$

When 1 is not an eigenvalue of  $\varphi$  on  $D_v(V)$ ,  $\exp_{F_v,V}$  is an isomorphism

$$\exp_{F_v,V} : t_{V,v} = D_v(V)/\text{Fil}^0 D_v(V) \cong H_f^1(F_v, V),$$

whose inverse is denoted by  $\log_{V,v}$ .

- When 1 is not an eigenvalue of  $\varphi$  on  $D_{F,p}(V)$ , denote

$$\log_V = \bigoplus_v \log_{V,v} : D_{F,p}(V) \rightarrow D_p(V)/\text{Fil}^0 D_p(V).$$

┘

## 5 Cyclotomic $p$ -adic $L$ -Functions

Coates and Perrin-Riou formulate a very general conjecture about the existence and properties of  $p$ -adic  $L$ -functions in [Coates-Perrin-Riou,  $p$ -adic  $L$ -functions attached to motives over  $\mathbb{Q}$ ]. The one-variable  $p$ -adic  $L$ -functions which they consider can be viewed as those corresponding to the cyclotomic deformations of motives.

## 6 Anticyclotomic $p$ -adic $L$ -Functions for Elliptic Curves

References are [Heegner points,  $p$ -adic  $L$ -functions, and the Cerednik-Drinfeld uniformization].

**Notation (33.2.6.1).**

- Let  $E \in \mathbf{EllCur}/\mathbb{Q}$  with conductor  $N$  associated to  $f \in \mathbf{SF}(\Gamma_0(N))$ .
- Let  $\mathcal{K}$  be an imaginary quadratic field s.t.  $(\text{disc}(\mathcal{K}), N) = 1$ .
- Let  $p \in \mathbf{Prime}$  be inert in  $\mathcal{K}$ .
- 

┘

**Situation (33.2.6.2).** Suppose

- $E$  has multiplicative reduction at  $p$ .
- $E$  has semistable reduction at all primes inert in  $\mathcal{K}$ .
- $w(E/K) = -1$ .

┘

**Def. (33.2.6.3).** Situation as in (33.2.6.2), write  $N = N^+ N^- p$  where  $N^+$  is divisible only by primes split in  $\mathcal{K}$ , and  $N^-$  is divisible only by primes inert in  $\mathcal{K}$ . By [GZ86]P71,  $\#S(N^-)$  is odd ?.

┘

## 7 Herbrand-Ribet Theorem

**Thm. (33.2.7.1) [Herbrand].** Let  $p \in \mathbf{Prime}$ ,  $Y = \text{Cl}(\mathbb{Q}(\mu_p))[p]$ , then  $\text{Gal}(\mathbb{Q}(\mu_p)/\mathbb{Q}) = (\mathbb{Z}/(p))^\times$  acts on  $Y$  as a  $\mathbb{F}_p$ -space by conjugation. Let  $Y^j$  be the subspace of  $Y$  that  $(\mathbb{Z}/(p))^\times$  acts by character  $a \mapsto a^j$ . Then for  $1 < j < p-1$  an odd integer, if  $Y^j \neq 1$ , then the Bernoulli number  $B_{p-j}$  has numerator divisible by  $p$ .

┘

*Proof:* Cf.[Eisenstein Ideals, Mazur, P52].

### 33.3 Iwasawa Main Conjecture

References are [Wil90, S-U14].

#### 1 Iwasawa Main Conjectures

**Remark (33.3.1.1).** The Iwasawa main conjecture generally have two ingredients: the characteristic ideal of the dual of the Selmer group and a related  $p$ -adic  $L$ -function, ideally both in some  $\Lambda$ . The Iwasawa main conjecture essentially says that the  $p$ -adic  $L$ -function should control the size of the Selmer groups of the Galois representation it is attached to.  $\lrcorner$

#### 2 Fields case

**Notation (33.3.2.1).**

- Let  $p \in \text{Prime}$ .
- Let  $F \in \text{NField}$ .
- Let  $F_\infty$  be the cyclotomic  $\mathbb{Z}_p$ -extension of  $F$ .
- Let  $\gamma \in \text{Gal}(F_\infty/F)$  be a topological generator and  $u = \chi_{\text{cycl}}(\gamma) \in \mathbb{Z}_p^*$ .

$\lrcorner$

**Prop. (33.3.2.2) [ $\chi$ -Components of Iwasawa Modules].** If  $H/F \in \text{NField}$  s.t.  $H \cap F_\infty = F$ ,  $S_F(p) \subset_{\text{fin}} S \subset \Sigma_F^{\text{fin}}$  and  $M_\infty(S)$  the maximal Abelian pro- $p$ -extension of  $H_\infty$  that is unramified outside  $S_{H_\infty}(S)$ , denote

$$Y(S) = \text{Gal}(M_\infty(S)/H_\infty), \quad W(S) = Y(S) \otimes \overline{\mathbb{Q}_p}.$$

Let  $R = \mathbb{Z}_p[\text{Gal}(H/F)]$ , then  $Y(S)$  is a module over  $R[[T]]$ . For maximal ideal  $\mathfrak{m}$  of  $R$ , denote  $Y_{\mathfrak{m}}(S) = Y(S) \otimes_R R_{\mathfrak{m}}$ . Then for each character  $\chi \in \text{Gal}(H/F)^\vee$  belonging to the component  $\mathfrak{m}$  (33.2.1.1) of  $R$ , we have

$$W(S)^\chi = Y_{\mathfrak{m}}(S) \otimes_{R_{\mathfrak{m}}, \chi} \overline{\mathbb{Q}_p}.$$

And we denote  $f_{\chi, S}(T)$  the characteristic polynomial of  $\gamma - 1$  acting on  $W(S)^\chi$ .  $\lrcorner$

**Prop. (33.3.2.3) [Invariant Properties of  $f_\chi(T)$ ].** Situation as in (33.3.2.2), in fact the construction can be extended to any Artin character  $\chi$  of  $\text{Gal}(H/F)$ . Then

- If  $H'/H$  be an extension s.t.  $H' \cap F_\infty = F$ , then any Artin character  $\chi$  of  $\text{Gal}(H/F)$  extends to an Artin character of  $\text{Gal}(H'/F)$  by restriction, and

$$f_{\chi, S}(T) = f_{\chi', S_{H'}(S)}(T).$$

- If  $H/F$  is Galois and  $L/F$  is a subfield of  $H/F$ , then any Artin character  $\chi$  of  $\text{Gal}(H/L)$  extends to an Artin character  $\chi'$  of  $\text{Gal}(H/F)$  by induction. Then for any  $S_L(p) \subset_{\text{fin}} S \subset \Sigma_L^{\text{fin}}$ , we have

$$f_{\chi', S}(T) = f_{\chi, S_H(S)}(T).$$

$\lrcorner$

*Proof:* ? Cf. [Gre83].  $\square$

### Stickelberger's Ideal

**Def. (33.3.2.4) [Stickelberger's Ideal].** Let  $M \in \mathbf{NField}$  contained in  $\mathbb{Q}(\zeta_m)$  for some  $m \in \mathbb{Z}_+$  minimum. Denote  $G = \text{Gal}(M/\mathbb{Q})$  and define the **Stickelberger's element**

$$\theta = \theta_M = \sum_{1 \leq a \leq m-1, (a,m)=1} \frac{a}{m} \cdot \sigma_a^{-1} \in \mathbb{Q}[G].$$

The **Stickelberger's ideal** is the ideal of  $\mathbb{Z}[G]$  defined by  $I(M) = \mathbb{Z}[G] \cap \theta_M \mathbb{Z}[G]$ . ┘

**Prop. (33.3.2.5) [Stickelberger's Ideal for Cyclotomic Fields].** Let  $m \in \mathbb{Z}_+$   $G = \text{Gal}(\mathbb{Q}(\zeta_m)/\mathbb{Q})$  and let  $I' \subset \mathbb{Z}[G]$  be ideal generated by  $\{\sigma_c - c : c \pmod{m}, (c, m) = 1\}$ , then the Stickelberger's Ideal (33.3.2.4)  $I_{\mathbb{Q}(\zeta_m)} = I' \theta_{\mathbb{Q}(\zeta_m)}$ .

In other words, it is generated by the elements of the form

$$\Theta_c = \sum_{a=1}^{p-1} [ac/p] \sigma_a^{-1}, \quad c \in [p-1]_+.$$

┘

*Proof:*

□

**Thm. (33.3.2.6) [Stickelberger].** Let  $F \in \mathbf{NField}$  contained in  $\mathbb{Q}(\zeta_m)$  for some  $m \in \mathbb{Z}_+$  minimum. Then the Stickelberger's ideal  $I(F)$  annihilates  $\text{Cl}(F)$ . ┘

*Proof:* Cf. [Was97]P94. □

### Iwasawa Main Conjecture for Totally Real Fields

References are [Wil90].

**Notation (33.3.2.7) [Totally Real Artin Representations].**

- Let  $F$  be totally real.
- Let  $\psi$  be an Artin character of  $\text{Gal}_F$  s.t. the fixed field  $F_\psi$  is totally real.
- Denote  $\mathbb{Z}_p[\psi] \triangleq \mathbb{Z}_p[\text{Im}(\psi)]$ .

┘

**Def. (33.3.2.8) [Greenberg Types].** An Artin character  $\psi$  of  $\text{Gal}_F$  is said to be of **Greenberg type S** if  $F_\psi \cap F_\infty = F$ . It is said to be of **Greenberg type W** if  $\psi$  is 1-dimensional character and  $F_\psi \subset F_\infty$ . ┘

**Thm. (33.3.2.9) [Iwasawa Main Conjecture for Totally Real Fields, Mazur-Wiles [M-W84]/Wiles [Wil86, ?WI190]].** Let  $\chi$  be an Artin character of  $\text{Gal}_F$  of Greenberg type S (33.3.2.8) s.t. the fixed field  $F_\chi$  is a CM field. Let  $H = F_\chi(\mu_{p^{1+\delta_{2,p}}})$ , and  $L_\infty/H_\infty$  the maximal unramified pro- $p$  extension unramified away from  $S_{H_\infty}(p)$ .

Consider  $X = \text{Gal}(L_\infty/H_\infty)$  as a module over  $\text{Gal}(H_\infty/F)$ , then  $\dim X \otimes \overline{\mathbb{Q}_p} < \infty$  by [On  $\mathbb{Z}_\ell$ -extensions of algebraic number fields, Iwasawa] ?. Let  $f_\chi(T)$  be the characteristic polynomial of  $\gamma - 1$  acting on the  $\chi$ -part of  $X \otimes \overline{\mathbb{Q}_p}$ .

Suppose  $\chi$  is odd, and  $p \geq 3$  or  $F = \mathbb{Q}$ , then  $f_\chi(T)$  differs from the formal power series  $G_{\chi^{-1}\omega}(u(1+T)^{-1} - 1)$  (33.2.1.5) by a unit in  $\mathbb{Z}_p[\chi][[T]]^*$ . ┘

*Proof:* ?

By[?Iwasanwiantslbow], it suffices to prove that  $n_\alpha(\chi) \geq m_\alpha(\chi)$  for each  $\alpha \in \overline{\mathbb{Q}_p}$ . There are three case:

- $\alpha + 1 \notin \mu_{p^\infty}$  and  $\alpha \neq u - 1$  if  $\chi = \omega$ .
- $\alpha + 1 \in \mu_{p^\infty}$ .
- $\chi = \omega$  and  $\alpha = u - 1$ .

Case 1 is done in [Wil90]P516.?

Case 2 is done by taking a  $p$ -adic limit  $\chi\rho_n \rightarrow \chi$  s.t.  $m_\alpha(\chi\rho_n) = 0$  for each  $n$ . It is crucial to analyze the  $\mu$ -invariant  $\mu(G_\chi(T))$ .

Case 3 is true unless  $m_{u-1}(\omega) > 0$ , or equivalently  $\zeta_p(s)$  has no pole at  $s = 1$ . In this case, Leopoldt's conjecture is false and there exists an  $\mathbb{Z}_p^2$ -extension  $R_\infty/F$  by work of Colmez(33.2.2.3). Suppose  $F_\infty \subset R_\infty$ , and let  $M_\infty/R_\infty$  be the maximal Abelian pro- $p$ -extension that is unramified outside primes over  $p$ . Then there is an isomorphism

$$\Lambda_Y \triangleq \mathbb{Z}_p[[\text{Gal}(R_\infty/F)]] \cong \mathbb{Z}_p[[Y, T]].$$

Then we take a  $p$ -adic limit  $\chi\rho_n \rightarrow \chi$  where  $\rho_n$  are characters of this anticyclotomic extension of  $F$ .  $\square$

**Cor.(33.3.2.10)[An equivariant Formulation].** Let  $\chi$  be an Artin character of  $\text{Gal}_F$  of Greenberg type S(33.3.2.8) s.t. the fixed field  $F_\chi$  is a CM field. Let  $H = F_\chi(\mu_{p^{1+\delta_{2,p}}})$ , and  $L_\infty/H_\infty$  the maximal unramified pro- $p$  extension.

For  $S_F(p) \subset_{\text{fin}} S \subset \Sigma_F^{\text{fin}}$ , let  $M_\infty(S)$  be the maximal Abelian pro- $p$ -extension of  $H_\infty$  that is unramified outside  $\cup S_{H_\infty}(S)$ , and denote  $h_{\chi,S}(T)$  the characteristic polynomial of  $\gamma - 1$  acting on  $W(S)^\chi$ (33.3.2.2).

Suppose  $\chi$  is even, then  $h_{\chi,S}(T)$  differ from the formal power series  $G_{\chi,S}(T)$ (33.2.1.5) by a unit in  $\mathbb{Z}_p[\chi][[T]]^*$ .

Then thoeorem(33.3.2.9) for an odd  $\chi$  is equivalent to this statement for  $\chi^{-1}\omega$  and each  $S_F(p) \subset_{\text{fin}} S \subset \Sigma_F^{\text{fin}}$ .  $\lrcorner$

*Proof:* Cf.[Greenberg, on  $p$ -adic Artin  $L$ -Functions].?  $\square$

**Prop.(33.3.2.11)[Iwasawa's Analytic Class Number Formula].** Situation as in(33.3.2.9), for  $\alpha \in \overline{\mathbb{Q}_p}$ , if we denote

$$n_\alpha(\chi) = \text{ord}_{T=\alpha} f_\chi(T), \quad m_\alpha(\chi) = \text{ord}_{T=\alpha} G_{\chi^{-1}\omega}(u(1+T)^{-1} - 1),$$

then

$$\sum_\alpha \sum_{\chi \in \text{Gal}(H/F)^\vee} n_\alpha(\chi) = \sum_\alpha \sum_{\chi \in \text{Gal}(H/F)^\vee} m_\alpha(\chi).$$

$\lrcorner$

*Proof:* ?  $\square$

**Prop.(33.3.2.12).** Situation as in(33.3.2.11), Any  $\alpha$  s.t.  $\alpha + 1 \in \mu_{p^\infty}$  and  $m_\alpha(\chi) \neq 0$  are called a **trivial zero**. For such a trivial zero  $\alpha = \zeta - 1$ , let  $\rho$  be an Artin character of  $F$  of Greenberg type W s.t.  $\rho(\gamma) = \zeta$ , and denote

$$s_{\zeta-1}(\chi) = \#\{v \in S_F(p) : \chi\rho(\sigma_v) = 1\},$$

then

$$m_{\zeta-1}(\chi) = 0 \iff s_{\zeta-1}(\chi) = 0.$$

Moreover it is conjectured that  $m_{\zeta-1}(\chi) = s_{\zeta-1}(\chi)$ . Notice that it is proven that  $m_{\zeta-1}(\chi) = s_{\zeta-1}(\chi) = n_{\zeta-1}(\chi)$  for  $F = \mathbb{Q}$  by [On the behavior of  $p$ -adic  $L$ -functions at  $s = 0$ , Ferrero-Greenberg] and [On a certain  $l$ -adic representation, Greenberg].  $\lrcorner$

*Proof:* it follows from (33.2.1.5) that

$$G_{\chi^{-1}\omega}(u\zeta^{-1} - 1) = G_{\chi^{-1}\rho^{-1}\omega}(u - 1) = L_p(\chi^{-1}\rho^{-1}\omega; 0) = L(\chi^{-1}\rho^{-1}; 0) \prod_{v \in S_F(p)} (1 - \chi\rho(\sigma_v)).$$

And the assertion follows.  $\square$

**Thm. (33.3.2.13)** [ $\mu$ -Invariants, Ferrero-Washington/Wiles[Wil90]]. Situation as in (33.3.2.9), if  $p > 3$  and  $\chi$  is an odd character of  $\text{Gal}_F$  of order prime to  $p$ , then

$$\mu(X^\chi) = \mu \left( G_{\chi^{-1}\omega}(u(1+T)^{-1} - 1) \right).$$

Notice that it is conjectured that both sides vanish, which is true for  $F = \mathbb{Q}$ .  $\lrcorner$

*Proof:* ? Cf.[Wil90]P531.  $\square$

### Iwasawa Main Conjecture for Imaginary Quadratic Fields

References are [Rubin, “main conjectures” of Iwasawa theory for imaginary quadratic fields].

## 33.4 Kato's Euler Systems

Cf. [Kat04] and [Scholl], [Chao Li's Notes].

### 1 Kato-Siegel Functions

**Thm. (33.4.1.1) [Kato-Siegel-Functions].** For  $d \in \mathbb{Z}$  prime to 6, there exists a unique rule  $\vartheta_d$  that associates each elliptic curve  $E/S$  a section  $\vartheta_d^{(E/S)} \in \mathcal{O}^*(E \setminus E_S[d])$ . satisfying:

- $\text{div}(\vartheta_d^{(E/S)}) = d^2(e_E) - E_S[d]$ .
- For a base change  $g : E'/S' \rightarrow E/S$ ,  $g^*\vartheta_d^{(E/S)} = \vartheta_d^{(E'/S')}$ .
- If  $\alpha : E/S \rightarrow E'/S$  is an isogeny and  $(\deg \alpha, d) = 1$ , then  $\alpha_*\vartheta_d^{(E/S)} = \vartheta_d^{(E'/S)}$ .
- $\vartheta_{-d} = \vartheta_d, \vartheta_1 = 1$ . And if  $d = mc$  where  $m, c \in \mathbb{Z}_+$ , then

$$[m]_*\vartheta_d = \vartheta_c^{m^2}, \quad \vartheta_c \circ [m] = \vartheta_d/\vartheta_m^{c^2}.$$

In particular,  $[d]_*\vartheta_d = 1$ .

- If  $\tau \in \mathcal{H}$  and  $E_\tau/\mathbb{C} = \mathbb{C}/(\mathbb{Z} + \tau\mathbb{Z})$ , then

$$\vartheta_d^{(E_\tau/\mathbb{C})}(u) = (-1)^{\frac{d-1}{2}} \Theta(u, \tau)^{d^2} \Theta(du, \tau)^{-1},$$

where

$$\Theta(u, \tau) = q^{\frac{1}{12}}(t^{1/2} - t^{-1/2}) \prod_{n \in \mathbb{Z}_+} (1 - q^n t)(1 - q^n t^{-1}), \quad q = e^{2\pi i \tau}, t = e^{2\pi i u}.$$

In fact, this should be the case over the Tate curve. ┘

*Proof:* Cf. [Scholl, P384] ? □

### Modular Eisenstein Series

**Def. (33.4.1.2) [Eisenstein Series].** Let  $S \in \text{Sch}_{\text{int}}, E \in \text{EllCur}/S, d, N \in \mathbb{Z}_+, (N, d) = 1$ , and  $x \in E(S)$  is a torsion section of exact order  $N$ . If  $x$  is disjoint with  $E_S[d]$ , then  $\vartheta_d(x) = x^*\vartheta_d \in \mathcal{O}^*(S)$ . This is the case if  $N$  is invertible on  $S$  or  $N$  is not a prime power.

In this case, define

$$\text{dlog}_v \vartheta_d \in \Gamma(E \setminus E_S[d], \Omega_{E/S}^1)$$

and

$${}_d\text{Eis}(E/S, x) = x^*\text{dlog}_v \vartheta_d \in \Gamma(S, x^*\Omega_{E/S}^1) = \Gamma(S, \omega_{E/S}).$$

is a modular form of weight 1 (28.12.1.1).

Of course, we can also define  $\text{dlog} \vartheta_d(x) \in \Gamma(S, \Omega_S^1)$ . ┘

**Def. (33.4.1.3) [Eis( $E/S, x$ )].** Situation as in (33.4.1.2), by (33.4.1.1), for  $d, d' \in \mathbb{Z}$  prime to 6,

$$(\vartheta_d)^{d'^2} \cdot \vartheta_{d'} \circ [d] = (\vartheta_{d'})^{d^2} \cdot \vartheta_d \circ [d'] = \vartheta_{dd'},$$

so

$$d'^2 \text{dlog}_v \vartheta_d - [d']^* \text{dlog}_v \vartheta_d = d^2 \text{dlog}_v \vartheta_{d'} - [d]^* \text{dlog}_v \vartheta_{d'}.$$

And

$$d'^2 {}_d\text{Eis}(E/S, x) - d' {}_d\text{Eis}(E/S, d'x) = d^2 {}_{d'}\text{Eis}(E/S, x) - d {}_{d'}\text{Eis}(E/S, dx).$$

In particular, if  $d \equiv 1 \pmod{N}$  and  $d \neq \pm 1$ , then

$$\text{Eis}(E/S, x) = \frac{1}{d^2 - d} {}_d\text{Eis}(E/S, x) \in \Gamma(S[\frac{1}{d(d-1)}], \omega)$$

is independent of  $d$ . And because  $d$  is arbitrary, we can in fact glue the definition to a section

$$\text{Eis}(E/S, x) \in \Gamma(S[\frac{1}{2N}], \omega).$$

┘

**Cor. (33.4.1.4).** For any  $d \in \mathbb{Z}$  prime to 6,

$${}_d\text{Eis}(E/S, x) = d^2 \text{Eis}(E/S, x) - d \text{Eis}(E/S, dx) \in \Gamma(S[\frac{1}{2N}], \omega).$$

┘

**Example (33.4.1.5) [Eisenstein Series Over  $\mathbb{C}$ ].** If  $E = \mathbb{C}/(\mathbb{Z}\omega_1 + \mathbb{Z}\omega_2)$ , and  $x = \frac{a_1}{N}\omega_1 + \frac{a_2}{N}\omega_2 \in E[N] \setminus \{O\}$ , then

$$\text{Eis}(E/\mathbb{C}, x) = \left( \sum_{m_i \in \frac{a_i}{N} + \mathbb{Z}} \frac{1}{(m_1\omega_1 + m_2\omega_2) |m_1\omega_1 + m_2\omega_2|^{2s}} \right) \Big|_{s=0} du.$$

┘

*Proof:* Cf. [Scholl, P389].

□

**Example (33.4.1.6) [Eisenstein Series over Tate Curves].** Consider the Tate curve  $\text{Tate}(q)$  over  $\mathbb{Z}[\mu_N]((q^{1/N}))$ , there is a level  $N$  structure

$$(\mathbb{Z}/(N))^2 \cong \text{Tate}(q)_{\mathbb{Z}[\mu_N]((q^{1/N}))}[N] : (a_1, a_2) \mapsto \zeta_N^{a_1} q^{a_2/N}.$$

Then if  $x = \zeta_N^{a_1} q^{a_2/N}$ ,  $0 \leq a_1, a_2 < N$ , then

$$\text{Eis}(\text{Tate}(q)/\mathbb{Z}[\mu_N]((q^{1/N})), x) = \begin{cases} \left[ \frac{a_2}{N} - \frac{1}{2} - \sum_{n \in \mathbb{Z}_+} \left( \sum_{d \in \mathbb{Z}, d|n, n/d \equiv a_2 \pmod{N}} \text{sgn}(d) \zeta_N^{a_1 d} \right) q^{n/N} \right] \text{dlog } t & a_2 \neq 0 \\ \text{?} & a_2 = 0 \end{cases}$$

Similarly, we can calculate that in  $\Omega_{\mathbb{Z}[\mu_N]((q^{1/N}))/\mathbb{Z}}^1$ ,

$$\text{dlog } \vartheta_d(x) \equiv \frac{{}_d\text{Eis}(\text{Tate}(q)/\mathbb{Z}[\mu_N]((q^{1/N})), x)}{\text{dlog } t} (a_1 \text{dlog } \zeta_N + a_2 \text{dlog}(q^{1/N})) \pmod{N}.$$

┘

*Proof:* Cf. [Scholl, P390].

□

## 2 Norm Relations

Suppose  $\ell \in \mathbf{P}$ , and  $d, d' \in \mathbb{Z}$  s.t.  $(6\ell, dd') = 1$ . Denote  $\vartheta = \vartheta_d^{(E/S)}$  and  $\vartheta' = \vartheta_{d'}^{(E/S)}$ .

**Prop. (33.4.2.1).** If  $S = Y_H$  is a modular curve of level prime to  $\ell$ , and  $z, z'$  are torsion sections of  $E/S(\ell)$  whose projections onto  $E_S[\ell]$  are linearly independent, then

$$\mathrm{Nm}_{S(\ell)/S}\{\vartheta(z), \vartheta'(z')\} = (1 - T_\ell \circ \langle \ell \rangle_* + \ell \langle \ell \rangle_*)\{\vartheta(\ell z), \vartheta'(\ell z')\}.$$

┘

*Proof:* Cf.[Scholl, P399] ?.

□

**Prop. (33.4.2.2).** Suppose  $Y_H$  is a modular curve of level prime to  $\ell$  and  $z, z'$  are two torsion sections of  $E/Y_H(\ell^m, \ell^n)$  with  $m, n \in \mathbb{Z}_{\geq 2}$ . If the projections of  $z, z'$  into  $E_S[\ell]$  are linearly independent, then

$$\mathrm{Nm}_{Y_H(\ell^m, \ell^n)/Y_H(\ell^{m-1}, \ell^{n-1})}\{\vartheta(z), \vartheta(z')\} = \{\vartheta(\ell z), \vartheta'(\ell z')\}.$$

┘

*Proof:* Cf.[Scholl, P400] ?.

□

**Prop. (33.4.2.3).** Suppose  $Y_H$  is a modular curve of level prime to  $\ell$  and  $z, z'$  are two torsion sections of  $E/Y_H(\ell^m, \ell^n)$  with  $m, n \in \mathbb{Z}_{\geq 2}$ . If the projections of  $z, z'$  into  $E_S[\ell]$  are linearly independent, then

$$\mathrm{tr}_{Y_H(\ell^m, \ell^n)/Y_H(\ell^{m-1}, \ell^{n-1})}\left({}_d\mathrm{Eis}(z) \cdot {}_{d'}\mathrm{Eis}(z')\right) = \ell^{-2} {}_d\mathrm{Eis}(\ell z) \cdot {}_{d'}\mathrm{Eis}(\ell z')$$

$$\mathrm{tr}_{Y_H(\ell^m, \ell^n)/Y_H(\ell^{m-1}, \ell^{n-1})}\left(\mathrm{KS}\left({}_d\mathrm{Eis}(z) \cdot {}_{d'}\mathrm{Eis}(z')\right)\right) = \ell^2 \mathrm{KS}\left(\ell^{-2} {}_d\mathrm{Eis}(\ell z) \cdot {}_{d'}\mathrm{Eis}(\ell z')\right)$$

┘

*Proof:* Cf.[Scholl, P401] ?.

□

## 3 Dual Exponentials

**Notation (33.4.3.1).**

- Let  $p \in \mathbf{P}$ ,  $\mathbb{Q}_p \subset_{\mathrm{fin}} K$ .
- Let  $K_n = K(\mu_{p^n})$ , and  $\mathfrak{d}_n = \mathfrak{d}_{K_n/K}$ .

┘

**Def. (33.4.3.2) [Bloch-Kato Dual Exponential Maps].** For any  $V \in \mathrm{Rep}_{\mathbb{Q}_p}^{\mathrm{dR}}(\mathrm{Gal}_K)$ , the **dual exponential map**

$$\exp_p^* : H^1(K, V) \rightarrow D_{\mathrm{dR}}^0(V)$$

is defined to be

$$H^1(K, V) \rightarrow H^1(K, B_{\mathrm{dR}}^0 \otimes_{\mathbb{Q}_p} V) \stackrel{(25.2.5.5)}{=} H^1(K, \mathrm{Fil}^0(B_{\mathrm{dR}} \otimes_K D_{\mathrm{dR}}(V))) \cong D_{\mathrm{dR}}^0(V).$$

where the last isomorphism follows from Tate's computation (25.2.1.12) and the isomorphisms  $B_{\mathrm{dR}}^j/B_{\mathrm{dR}}^{j+1} \cong \mathbb{C}_K(j)$ .

┘

**Example (33.4.3.3).** In case that  $X \in \text{SmPrpr}/K$  and  $V = H^1(X, \mathbb{Q}_p(1))$ , if  $D_{\text{dR}}^1(V) = 0$ , then the Hodge-Tate decomposition

$$\mathbb{C}_K \otimes_{\mathbb{Q}_p} V \cong \otimes_{i \in \mathbb{Z}} \mathbb{C}_K(-i) \otimes_K \text{gr}^i D_{\text{dR}}(V),$$

so the the dual exponential map is just

$$H^1(K, V) \rightarrow H^1(K, \mathbb{C}_K \otimes_K V) \cong H^1(K, \mathbb{C}_K) \otimes_K D_{\text{dR}}^0(V) \xleftarrow{\cup \log \chi_{\text{cycl}}} D_{\text{dR}}^0(V).$$

┘

**Cor. (33.4.3.4).** If  $Y$  be a smooth  $\mathcal{O}_K$ -scheme, which is a complement in a smooth proper  $\mathcal{O}_K$ -scheme  $X$  of a divisor  $Z$  with relatively normal crossings, define

$$H_{\text{dR}}^i(Y/\mathcal{O}_K) = H^i(X, \Omega_{X/\mathcal{O}}^i(\log Z)),$$

and  $V = H_{\text{ét}}^1(Y_{\overline{K}}, \mathbb{Q}_p(1))$ .

Then  $V$  is also de Rham, and the deRham comparison also holds ?, so

$$\begin{aligned} D_{\text{dR}}^{-1}(V) &= D_{\text{dR}}(V) = H_{\text{dR}}^1(Y/\mathcal{O}_K) \otimes_{\mathcal{O}_K} K, \\ D_{\text{dR}}^0(V) &= H^0(X, \Omega_{X/\mathcal{O}_K}^1(\log Z)) \otimes_{\mathcal{O}_K} K = \text{Fil}^1 H_{\text{dR}}^1(Y/\mathcal{O}_K) \otimes_{\mathcal{O}_K} K, \\ D_{\text{dR}}^1(V) &= 0. \end{aligned}$$

Thus by the same reasoning as in (33.4.3.3), the dual exponential map is known if we can compute the projection

$$\text{pr}_1 : \mathbb{C}_K \otimes_{\mathbb{Q}_p} V \cong \mathbb{C}_K \otimes_{\mathcal{O}_K} H^0(X, \Omega_{X/\mathcal{O}_K}^1(\log Z)) \bigoplus \mathbb{C}_K(1) \otimes_{\mathcal{O}_K} H^1(X, \mathcal{O}_X) \rightarrow \mathbb{C}_K \otimes_{\mathcal{O}_K} H^0(X, \Omega_{X/\mathcal{O}_K}^1(\log Z)),$$

which is the inversion by  $p$  of the limit of the map

$$H_{\text{ét}}^1(Y_{\overline{K}}, \mu_{p^n}) \cong H^0(Y_{\overline{K}}, \mathcal{O}_K^*/p^n) \xleftarrow{\cong} H^0(Y_{\mathcal{O}_{\overline{K}}}, \mathcal{O}^*/p^n) \xrightarrow{\text{dlog}} H^0(X, \Omega_{X/\mathcal{O}_K}^1(\log Z)) \otimes \mathcal{O}_{\overline{K}}/p^n.$$

┘

*Proof:* Cf. [Scholl, P408]. ?

□

### Explicit Reciprocity Law

**Thm. (33.4.3.5).** If  $2 \neq p \in \mathbf{P}$ ,  $K/\mathbb{Q}_p$  is unramified, then there exists  $c \in \mathbb{N}$  s.t. for any  $n \in \mathbb{Z}_+$ , the following diagram

$$\begin{array}{ccc} K_2(Y_{\mathcal{O}_{K_n}}) \otimes \mu_{p^n}^{-1} & \xrightarrow{c_2} & H^2(Y_{K_n}, \mu_{p^n}) \\ \downarrow \text{dlog} & & \downarrow \text{H-S} \\ H^0(X_{\mathcal{O}_{K_n}}, \Omega_{X_{\mathcal{O}_{K_n}}/\mathcal{O}_K}^2(\log Z))(-1) & & H^1(K_n, H^1(Y_{\overline{K}}, \mu_{p^n})) \\ \parallel & & \downarrow \text{pr}_1 \pmod{p^{n-1}} \\ \Omega_{\mathcal{O}_{K_n}/\mathcal{O}_K}^1(-1) \otimes \text{Fil}^1 H_{\text{dR}}^1(Y/\mathcal{O}_K) & & H^1(K_n, \mathcal{O}_{\overline{K}}/p^{n-1}) \otimes_{\mathcal{O}_K} \text{Fil}^1 H_{\text{dR}}^1(Y/\mathcal{O}_K) \\ \text{dlog}(\zeta_{p^n}) \otimes [\zeta_{p^n}]^{-1} \mapsto 1 \downarrow \cong & & \uparrow \cup \frac{1}{p^n} \log \chi_{\text{cycl}} \\ \mathcal{O}_{K_n}/\mathfrak{d}_n \otimes_{\mathcal{O}_K} \text{Fil}^1 H_{\text{dR}}^1(Y/\mathcal{O}_K) & \longrightarrow & \mathcal{O}_{K_n}/p^{n-1} \otimes_{\mathcal{O}_K} \text{Fil}^1 H_{\text{dR}}^1(Y/\mathcal{O}_K) \end{array}$$

where H-S is the Hochschild-Serre boundary map defined as in (11.1.4.15), dlog is defined in (11.1.4.12),  $\text{pr}_1$  is defined in (33.4.3.4). ┘

*Proof:* Cf. [Scholl, P410].  $\square$

**Remark (33.4.3.6).**  $\color{red}{?}$  The assumption that  $K/\mathbb{Q}_p$  is unramified is not essential for the proof. The case  $p = 2$  is excluded because we don't know the compatibility of the trace map in this case.  $\lrcorner$

**Cor. (33.4.3.7) [Kato's Explicit Reciprocity Law].** If  $2 \neq p \in \mathbf{P}$ ,  $K/\mathbb{Q}_p$  is unramified, then for any  $m \in \mathbb{N}$ , the following diagram is commutative:

$$\begin{array}{ccc}
 \varprojlim_n (K_2(Y_{\mathcal{O}_{K_n}})) \otimes \mu_{p^n}^{-1} & \xrightarrow{\text{H-Soc}_2} & \varprojlim_n H^1(K_n, H^1(Y_{\overline{K}}, \mu_{p^n})) \\
 \downarrow \text{dlog} & & \downarrow \text{cor} \\
 \varprojlim_n H^0(X_{\mathcal{O}_{K_n}}, \Omega_{X_{\mathcal{O}_{K_n}}/\mathcal{O}_K}^2(\log Z))(-1) & & \varprojlim_{n \geq m} H^1(K_m, H^1(Y_{\overline{K}}, \mu_{p^n})) \\
 \parallel & & \parallel \\
 \varprojlim_n \Omega_{\mathcal{O}_{K_n}/\mathcal{O}_K}^1(-1) \otimes \text{Fil}^1 H_{\text{dR}}^1(Y/\mathcal{O}_K) & & H^1(K_m, H^1(Y_{\overline{K}}, \mathbb{Z}_p(1))) \\
 \downarrow \text{dlog}(\zeta_{p^n}) \otimes [\zeta_{p^n}]^{-1} \mapsto 1 \cong & & \downarrow \text{exp}^* \\
 \mathcal{O}_{K_n}/\mathfrak{d}_n \otimes_{\mathcal{O}_K} \text{Fil}^1 H_{\text{dR}}^1(Y/\mathcal{O}_K) & \xrightarrow{\{\frac{1}{p^n} \text{tr}_{\mathcal{O}_{K_n}/\mathcal{O}_{K_m}}\}_{n \geq m}} & K_m \otimes_{\mathcal{O}_K} \text{Fil}^1 H_{\text{dR}}^1(Y/\mathcal{O}_K)
 \end{array}$$

$\lrcorner$

*Proof:* It follows from (33.4.3.4) that there is a commutative diagram

$$\begin{array}{ccc}
 H^1(K_m, H^1(Y_{\overline{K}}, \mathbb{Q}_p(1))) & \xrightarrow{\text{pr}_1} & H^1(K_m, \mathbb{C}_K \otimes_{\mathcal{O}_K} \text{Fil}^1 H_{\text{dR}}^1(Y/\mathcal{O}_K)) \\
 \downarrow \text{exp}^* & & \parallel \\
 K_m \otimes_{\mathcal{O}_K} \text{Fil}^1 H_{\text{dR}}^1(Y/\mathcal{O}_K) & \xrightarrow{\cup \log \chi_{\text{cycl}}} & H^1(K_m, \mathbb{C}_K) \otimes_{\mathcal{O}_K} \text{Fil}^1 H_{\text{dR}}^1(Y/\mathcal{O}_K)
 \end{array}$$

And also for any  $n \geq m$ , there exists a commutative diagram (Cf. [Scholl, P416]  $\color{red}{?}$ )

$$\begin{array}{ccc}
 \mathcal{O}_{K_n} & \xrightarrow{\frac{1}{p^n} \log \chi_{\text{cycl}}} & H^1(K_n, \mathcal{O}_{\mathbb{C}_K}) \\
 \downarrow \frac{1}{p^{n-m}} \text{tr}_{\mathcal{O}_{K_n}/\mathcal{O}_{K_m}} & & \downarrow \text{cor} \\
 \mathcal{O}_{K_m} & \xrightarrow{\frac{1}{p^m} \log \chi_{\text{cycl}}} & H^1(K_m, \mathcal{O}_{\mathbb{C}_K})
 \end{array}$$

Thus the assertion follows from (33.4.3.5) by taking limit and inverting  $p$ .  $\color{red}{?}$  How to check the compatibility of the limits?  $\square$

## 4 Rankin-Selberg Convolution

### Notations

**Def. (33.4.4.1).** For  $t \in \mathbb{Q}_p$  with  $v_p(t) < 0$ , denote

$$\phi_p^0 = \chi_{\mathbb{Z}_p \times \mathbb{Z}_p}, \quad \phi_p^{1,t} = \chi_{(t+\mathbb{Z}_p) \times \mathbb{Z}_p}, \quad \phi_p^{2,t} = \chi_{(t+\mathbb{Z}_p) \times \mathbb{Z}_p^*} - p^{-1} \chi_{(t+p^{-1}\mathbb{Z}_p) \times \mathbb{Z}_p^*}.$$

And for any  $\varphi \in C^\infty(\mathbb{Z}_p \times \mathbb{Z}_p)$ , denote  $\varphi^{\text{tr}}(x, y) = \varphi(y, x)$ .

For  $\varphi \in \mathcal{S}(\mathbf{A}_f^2)$  and  $\delta \in \mathbf{I}_f$ , denote  $[\delta]\varphi(\underline{x}) = \varphi(\delta^{-1}\underline{x})$ .  $\lrcorner$

### Results

**Notation (33.4.4.2) [Setup].**

- Let  $F \in S_{k+l}(\Gamma(1))$ , generating an irreducible  $\pi = \otimes' \pi_p$ , and whose Whittaker function  $A(g) = \prod A_p(g_p)$  factorizes, with  $A_p(1) = 1$  for each  $p$ . ?
- Let  $\varepsilon$  be the character of  $GL(2, \mathbf{A}_f)$  on  $A^*$ . ?
- Let  $M, R, N \in \mathbb{Z}_+$ ,  $(R, N) = 1$ ,  $M|N$ .
- If  $p \nmid N$ , then  $A_p$  is assumed to be  $\mathcal{K}_p$ -invariant.
- Let  $\lambda : \mathbf{I}_f/\mathbb{Q}_+^\times \rightarrow \mathbb{C}^\times$  be unramified outside  $T$ .
- Let  $N = \prod_{p \in S} p^{\nu_p}$ ,  $M = \prod_{p \in S} p^{\mu_p}$ ,  $R = \prod_{p \in T} p^{\nu_p}$ , where if  $p|N$ , then  $\nu_p > \mu_p \geq 0$ ,  $\nu_p \geq 2$ , and  $A_p$  is  $\mathcal{K}_1(p^{\nu_p})$ -invariant. And if  $p|R$ , then  $\nu_p \geq \mathfrak{c}_p(\lambda)$ .
- Let  $y \in \mathbb{Z}$ , and define  $t = 1/NR$ ,  $t' = 1/MR \in \mathbf{I}_f$ .

┘

**Def. (33.4.4.3) [Eisenstein Series].** For  $\varphi \in \mathcal{S}(\mathbf{A}_f^2)$ , define the Eisenstein series

$$E_{k,s}(\varphi)(\tau, g) = \sum_{0 \neq \underline{m} \in \mathbb{Q}^2} \frac{(g\varphi)(\underline{m})}{(m_1 + m_2\tau)^k |m_1 + m_2\tau|^{2s}}.$$

And  $E_k(\varphi) = E_{k,0}(\varphi, 1)$ .

┘

**Def. (33.4.4.4).** Denote  $\varphi = \varphi_{t,t'}$ ,  $\varphi' = \varphi'_{t,t'} \in \mathcal{S}(\mathbf{A}_f^2)$  s.t. the local components are given by (33.4.4.1)

$$\begin{cases} \phi_p^0 & , p \nmid NR \\ \phi_p^{1,t_p}, (\phi_p^{1,t'_p})^{\text{tr}} & , p|R \\ \phi_p^{1,t_p}, \phi_p^{2,t'_p} & , p|N \end{cases}$$

┘

**Def. (33.4.4.5) [Inner Products].**

┘

**Thm. (33.4.4.6) [Rankin-Selberg Equation].** ?

$$\begin{aligned} \langle E_{l,s}(\varphi) E_k(\varphi') \otimes \bar{\lambda}, F \rangle &= \frac{i^{k-1} \Gamma(k+l+s-1)}{2^{k+2l+2s-4} (k-1)!} \cdot \frac{N^{l+2s-2} R^{k+l+2s}}{\#GL(2, \mathbb{Z}/(R))} \prod_{p|R} \lambda_p(MN t_p t'_p) \prod_{p|N} (1 - \frac{1}{p^2})^{-1} \\ &\quad \times L_{NR}(\pi \otimes \lambda; l+k+s-1) \left( L_N(\pi; l+s, \frac{y}{M}) + (-1)^k \lambda(-1) L_N(\pi; l+s, -\frac{y}{M}) \right) \end{aligned}$$

┘

*Proof:* Cf. [Scholl, P446] ?

□

**Cor. (33.4.4.7).** If  $k = l = 1$ ,  $s = 0$ , then

$$\begin{aligned} \langle E_1(\varphi) E_1(\varphi') \otimes \lambda, F \rangle &= 2N^{-1} \prod_{p|N} (1 - \frac{1}{p^2})^{-1} \cdot \frac{R^2}{\#GL(2; \mathbb{Z}/(R))} \prod_{p|R} \lambda_p(MN t_p t'_p)^{-1} \\ &\quad \times L_{NR}(\pi \otimes \lambda; 1) \left( L_N(\pi; 1, \frac{y}{M}) - \lambda(-1) L_N(\pi; 1, -\frac{y}{M}) \right) \end{aligned}$$

┘

## 5 Euler System for Elliptic Curves(Kato)

**Notation(33.4.5.1).**

- Fix  $p \in \mathbf{P}$ .
- Fix  $N \in \mathbb{Z}_+$  not divisible by  $p$ , and fix  $d, d' \in \mathbb{Z}_{\geq 2}$  prime to  $6Np$ .
- Denote

$$\mathcal{R}'_p = \mathcal{R}(Npdd'), \quad \mathcal{R}_p = \mathcal{R}'_p \times p^{\mathbb{Z}_+}.$$

┘

### General Procedure to produce Euler system for Modular Curves

**Def.(33.4.5.2) [Setup].** Suppose for each  $r \in \mathcal{R}_p$ , there are points  $z_r, z'_r \in \mathcal{E}^{\text{uni}}(Y(Nr)) \cong (\mathbb{Z}/(Nr))^2$  satisfying:

- If  $r, rs \in \mathcal{R}_p$ , then  $sz_{rs} = z_r, sz'_{rs} = z'_r$ . So we have inverse limits

$$(z_r)_r, (z'_r)_r \in \varprojlim_{r \in \mathcal{R}_p} \mathcal{E}^{\text{uni}}[Nr] \cong \mathbb{Z}_p^2 \times \prod_{\ell \nmid NpDD'} \mathbb{Z}/(\ell).$$

In particular, there exists  $e \in \mathbb{Z}_p^*$  s.t. if  $r = r_0 p^m \in \mathcal{R}_p$ , the Weil pairing

$$e_{Nr}(z_r, z'_r) = \zeta_{p^m}^{er_0^{-1}} \times (\text{prime to } p \text{ roots of } 1). \text{?}$$

- for any  $r \in \mathcal{R}_p$ , the points  $Nz_r, Nz'_r$  generate  $\mathcal{E}^{\text{uni}}[r]$ .
- If  $r = p^m$ , then the orders of  $z_r, z'_r$  are not powers of  $p$ .

┘

**Prop.(33.4.5.3).** By(33.4.1.2), item3 in the setup(33.4.5.2) ensures that  $z_r, z'_r$  doesn't meet the zero section of  $\mathcal{E}^{\text{uni}}/Y(Nr)$  in any characteristic. So  $\vartheta_d(z_r), \vartheta_d(z'_r)$  actually belongs to  $\mathcal{O}^*(Y(Nr))$ .

Thus for  $r \in \mathcal{R}_p$  we can define

$$\tilde{\sigma}_r = \{\vartheta_d(z_r), \vartheta_d(z'_r)\} \in K_2(Y(Nr)),$$

$$\sigma_r = \text{Nm}_{Y(Nr)/Y(N)\otimes\mathbb{Q}(\mu_r)} \tilde{\sigma}_r \in K_2(Y(N) \otimes \mathbb{Q}(\mu_r)).$$

Then they satisfy:

- For  $r \in \mathcal{R}_p$ ,  $\text{Nm}_{\mathbb{Q}(\mu_{rp})/\mathbb{Q}(\mu_r)} \sigma_{rp} = \sigma_r$ .
- If  $\ell \in \mathbf{P}$ ,  $r, r\ell \in \mathcal{R}_p$ , then

$$\text{Nm}_{\mathbb{Q}(\mu_{r\ell})/\mathbb{Q}(\mu_r)} \sigma_{r\ell} = (1 - T_\ell \langle \ell \rangle_* \otimes \text{Frob}_\ell^{-1} + \ell \langle \ell \rangle_* \otimes \text{Frob}_\ell^{-2}) \sigma_r.$$

┘

*Proof:* If  $\ell \nmid Nr$ , then

$$\text{Nm}_{Y(Nr)/Y(N)\mathbb{Q}(\mu_r)} \circ T_{\ell, Y(Nr)} = (T_{\ell, Y(N)} \otimes \text{Frob}_\ell) \circ \text{Nm}_{Y(Nr)/Y(N)\mathbb{Q}(\mu_r)},$$

$$\text{Nm}_{Y(Nr)/Y(N)\mathbb{Q}(\mu_r)} \circ \langle \ell \rangle_{Y(Nr)*} = (\langle \ell \rangle_{Y(Nr)*} \otimes \text{Frob}_\ell^{-2}) \circ \text{Nm}_{Y(Nr)/Y(N)\mathbb{Q}(\mu_r)},$$

because  $T_\ell$  acts on the constant fields by  $\text{Frob}_\ell$ , and  $\langle \ell \rangle_*$  acts by  $\text{Frob}_\ell^{-2}$ . So the theorem follows from  $\square$

**Def. (33.4.5.4).** Denote  $\mathbb{T}_{p,N} = H^1(\overline{Y(N)}, \mathbb{Z}_p(1))$ , then for  $r = r_0 p^m \in \mathcal{R}_p$ , there are homomorphisms

$$\begin{array}{c}
 \varprojlim_{n \geq m} K_2(Y(N)_{\mathbb{Q}(\mu_{r_0 p^n})}) \otimes \mu_{p^n}^{-1} \\
 \downarrow \text{AJ} \\
 \varprojlim_{n \geq m} H^1(\mathbb{Q}(\mu_{r_0 p^n}), H^1(Y(N)_{\overline{\mathbb{Q}}}, \mu_{p^n})) \\
 \downarrow \text{cor} \\
 \varprojlim_{n \geq m} H^1(\mathbb{Q}(\mu_{r_0 p^m}), H^1(Y(N)_{\overline{\mathbb{Q}}}, \mu_{p^n})) \\
 \parallel \\
 H^1(\mathbb{Q}(\mu_r), \mathbb{T}_{p,N})
 \end{array}$$

By (33.4.5.3), the family  $\{\sigma_{r_0 p^n} \otimes [\zeta_{p^n}]^{-1}, n \geq m\}$  is an element of the first group above, so we get elements

$$\xi_r = \xi_r(Y(N); p, d, d', z, z') \in H^1(\mathbb{Q}(\mu_r), \mathbb{T}_{p,N})$$

And they satisfy:

- For each  $r \in \mathcal{R}_p$ ,  $\text{cor}_{\mathbb{Q}(\mu_{rp})/\mathbb{Q}(\mu_r)} \xi_{rp} = \xi_r$ .
- If  $\ell \in \mathbf{P}$ ,  $r, r\ell \in \mathcal{R}_p$ , then

$$\text{cor}_{\mathbb{Q}(\mu_{r\ell})/\mathbb{Q}(\mu_r)} \xi_{r\ell} = (1 - \ell^{-1} T_\ell \langle \ell \rangle_* \text{Frob}_\ell^{-1} + \ell^{-1} \langle \ell \rangle_* \text{Frob}_\ell^{-2}) \xi_r.$$

┘

*Proof:* The operators  $T_\ell$  and  $\langle \ell \rangle$  acts functorially on the cohomology groups, and  $\text{Frob}_\ell$  acts as  $\ell$  on  $\mu_{p^n}$ , so by the twisting, we get the desired formula.  $\square$

**Prop. (33.4.5.5).** For any  $N \in \mathbb{Z}_{\geq 3}$ , in  $\Omega_{Y(N)^{\text{ord}}/\mathbb{Z}} \cong \Omega_{Y(N)^{\text{ord}}/\mathbb{Z}[\mu_N]}^1 \otimes \Omega_{\mathbb{Z}[\mu_N]/\mathbb{Z}}^1$ ,

$$\text{dlog}\{\vartheta_d(z), \vartheta_{d'}(z')\} = \frac{1}{N} \text{KS}_{Y(N)}(d\text{Eis}(z) \cdot d'\text{Eis}(z')) \otimes \text{dlog } e_N(z, z').$$

┘

*Proof:* By  $q$ -expansion principle, it suffices to check this at cusps. If  $z = \zeta_N^{a_1} q^{a_2/N}$ ,  $z' = \zeta_N^{b_1} q^{b_2/N}$ , then  $e_N(z, z') = \zeta_N^{a_2 b_1 - a_1 b_2}$ , and  $\Omega_{\mathbb{Z}[\mu_N]/\mathbb{Z}}^1$  is generated by  $\text{dlog}(\zeta_N)$  and killed by  $N$ , so the assertion follows immediately from the description of  $\text{KS}$  (28.12.1.4) and (33.4.1.6).  $\square$

**Prop. (33.4.5.6).** For any  $r = r_0 p^m \in \mathcal{R}_p$ , define

$$\widetilde{\omega}_r = \frac{1}{Nr} \text{KS}_{Y(Nr)}(d\text{Eis}(z_r) \cdot d'\text{Eis}(z'_r)) \in H^0(X(Nr), \Omega^1(\log \text{cusp})),$$

$$\omega_r = \text{tr}_{X(Nr)/X(N)_{\mathbb{Q}(\mu_r)}} \in H^0(X(N)_{\mathbb{Q}(\mu_r)}, \Omega^1(\log \text{cusp})).$$

Then

$$\exp_p^* \xi_r = \frac{e}{r} \omega_r \text{ (33.4.5.2) (33.4.5.4)}.$$

┘

*Proof.* It follows from (33.4.5.5) that

$$\mathrm{dlog} \tilde{\sigma}_r = \tilde{\omega}_r \otimes \mathrm{dlog} e_{Nr}(z_r, z'_r) \in H^0(X(Nr)^{\mathrm{ord}}, \Omega_{X(Nr)/\mathbb{Z}}(\log \mathrm{cusp})),$$

so after taking  $p$ -adic completion, by (33.4.5.2),

$$\mathrm{dlog} \tilde{\sigma}_r = \frac{e}{r_0} \tilde{\omega}_r \otimes \mathrm{dlog}(\zeta_{p^m}) \in H^0(X(Nr)^{\mathrm{ord}}, \Omega_{X(Nr)_{\mathbb{Z}_p}/\mathbb{Z}}(\log \mathrm{cusp})).$$

Taking traces to  $X(N)_{\mathbb{Q}(\mu_r)}$ , and use the compatibility (11.1.4.12), then

$$\mathrm{dlog} \sigma_r = \frac{e}{r_0} \omega_r \otimes \mathrm{dlog}(\zeta_{p^m}).$$

Then it follows from Kato's explicit reciprocity law (33.4.3.7),

$$\exp_p^* \xi_r = \lim_{n \rightarrow \infty} \frac{e}{r_0 p^n} \mathrm{tr}_{\mathbb{Z}_p[\mu_{p^n}]/\mathbb{Z}_p[\mu_{p^m}]}(\omega_{r_0 p^n}).$$

But by (33.4.2.3),

$$\mathrm{tr}_{Y(Nr_0 p^n)/Y(Nr_0 p^m)} \tilde{\omega}_{r_0 p^n} = p^{n-m} \tilde{\omega}_{r_0 p^m},$$

so

$$\mathrm{tr}_{\mathbb{Z}_p[\mu_{p^n}]/\mathbb{Z}_p[\mu_{p^m}]}(\omega_{r_0 p^n}) = p^{n-m} \omega_r,$$

which implies the desired equation.  $\square$

### Elliptic Curves

**Def. (33.4.5.7) [Setup].**

- Suppose  $E \in \mathrm{EllCur}/\mathbb{Q}$  has with conductor  $N_E$  and a Weil parametrization  $\varphi_E : X_0(N_E) \rightarrow E$ .
- Let  $\omega_E$  be a differential on  $E/\mathbb{Q}$  s.t.  $\varphi_E^* \omega_E$  is a newform on  $X_0(N_E)$ . ?
- Let  $\Omega_E^+, \Omega_E^-$  be the real and imaginary periods of  $\omega_E$ . ?
- Let  $N \in \mathbb{Z}_+, N_E | N$ , and  $p \in \mathbf{P}$  be prime to  $2N$ .

┘

**Prop. (33.4.5.8).** Situation as in (33.4.5.7), there are maps

$$f : H^1(X(N)_{\overline{\mathbb{Q}}}, \mathbb{Z}_p(1)) \rightarrow H^1(Y(N)_{\overline{\mathbb{Q}}}, \mathbb{Z}_p(1)) = \mathbb{T}_{p,N}$$

and

$$H^1(X(N)_{\overline{\mathbb{Q}}}, \mathbb{Z}_p(1)) \xrightarrow{\varphi_{E,N*}} H^1(E_{\overline{\mathbb{Q}}}, \mathbb{Z}_p(1)) = T_p(E).$$

By the proof of the Manin-Drinfeld theorem ?, there is an idempotent  $\Pi_N^{\mathrm{cusp}}$  in the Hecke algebra with rational coefficients s.t. for any  $p$ , it induces a left inverse to  $f$  as above. Thus for some  $h_E \in \mathbb{Z}_+$  independent of  $p$ , we can define a map

$$h_E \varphi_{E,N*} \circ \Pi_{N,*}^{\mathrm{cusp}} : \mathbb{T}_{p,N} \rightarrow T_p(E).$$

┘

**Prop. (33.4.5.9)**[Associated Euler System for Elliptic Curves]. For  $r \in \mathcal{R}_p$ (33.4.5.2), define

$$\xi_r(E) = (h_E \varphi_{E,N*} \circ \Pi_{N*}^{\text{cusp}}) \xi_r(Y(N)) \in H^1(\mathbb{Q}(\mu_r), T_p(E)) \text{ (33.4.5.4),}$$

then  $\{\xi_r(E)\}_r$  is an Euler system for  $(T_p(E), \mathcal{K}, Ndd'r)$ (31.2.3.2).  $\lrcorner$

*Proof:* This follows from(33.4.5.4) and the fact  $\langle \ell \rangle = 1, T_\ell = a_\ell$  on  $T_p(E)$  for  $\ell \in \mathbf{P} \cap \mathcal{R}_p$  by definition and the fact  $f_E \in S_2(\Gamma_0(N))$ .?  $\square$

**Prop. (33.4.5.10).** On differentials,  $\Pi_N^{\text{cusp}}$  is identity on cusp forms and annihilates Eisenstein forms?. Denote

$$\omega_r^{\text{cusp}} = \Pi_N^{\text{cusp}}(\omega_r) \in H^0(X(N)_{\mathbb{Q}(\mu_r)}, \Omega^1).$$

Then it follows from(33.4.5.6) and the functoriality of  $\exp_p^*$  that

$$\exp_p^* \xi_r(E) = \frac{eh_E}{r} \varphi_{E,N*}(\omega_r^{\text{cusp}}) \text{ (33.4.5.8).}$$

$\lrcorner$

### The Calculation

**Notation (33.4.5.11).**

- Use the setup(33.4.4.2), where  $M, N$  is defined in(33.4.5.12),  $R = r = r_0 p^m$  is any number in  $\mathcal{R}_p$ , and  $\lambda : \mathbf{I}_f / \mathbb{Q}_+^\times \rightarrow \mathbb{C}^\times$  is a character with conductor dividing  $r$ .
- In particular, by(33.4.4.2)(33.4.4.4), there are elements  $t, t' \in \mathbf{I}_f$ , and  $\varphi, \varphi' \in \mathcal{S}(\mathbf{A}_f^2)$ .
- Let  $\varepsilon = \lambda(-1) \in \{\pm 1\}$ .
- Fix  $d, d' \in \mathbb{Z}_{\geq 2}$  with  $(dd', 6pN_E) = 1, d \equiv d' \equiv 1 \pmod{M}$ .
- Denote

$$\delta \in \mathbf{I}_f : \delta_p = \begin{cases} d & , p \mid Nr \\ 1 & , \text{otherwise} \end{cases}, \quad d\varphi = d^2\varphi - d[\delta]\varphi,$$

and similarly define  $\delta'$  and  $d'\varphi'$ .  $\lrcorner$

**Prop. (33.4.5.12).** For any  $\alpha \in \mathbb{Q}$ ,

$$L_{MN_E}(E, 1; \alpha) - \varepsilon L_{MN_E}(E, 1; -\alpha)$$

is a rational multiple of  $\Omega_E^{-\varepsilon}$ , and one can find  $\alpha$  with denominator prime to any integer for which the expression is non-zero, by [Shimura, On the periods of modular forms]?.

Then we can find  $y/M$ .? Cf.[Scholl, P454].

And also define

$$N = \prod_{p \mid MN_E} p^{\nu_p}, \quad \nu_p = \max(2, v_p(N_E), v_p(M) + 1).$$

$\lrcorner$

**Prop. (33.4.5.13) [The function  $\varphi$ ].** Choose  $z_r \in \mathcal{E}^{\text{uni}}(Y(Nr))$  to be the point which in complex coordinates is

$$\frac{1}{Nr} \in \left(\frac{1}{Nr}\mathbb{Z} + \frac{\tau}{Nr}\mathbb{Z}\right)/(\mathbb{Z} + \tau\mathbb{Z}) \cong (\mathbb{Z}/(Nr))^2.$$

Then for  $\ell \in \mathbf{P}$ ,  $r, r\ell \in \mathcal{R}_p$ ,  $\ell z_{r\ell} = z_r$ , and

$${}_d\text{Eis}(z_r) = E_1({}_d\varphi)du.$$

┘

*Proof:* ? Calculate using (33.4.4.3) and (33.4.1.5) and the definition of  $\varphi$  (33.4.4.4). □

**Prop. (33.4.5.14) [The function  $\varphi'$ ].** There exists f.m. constants  $b_j \in N^{-1}\mathbb{Z}$  independent of  $r$  and points  $z'_{r,j} \in \mathcal{E}^{\text{uni}}(Y(Nr))$ , s.t.

$$\sum_j b_j \cdot {}_{d'}\text{Eis}(z'_{r,j}) = E_1({}_{d'}\varphi')du.$$

Moreover, for  $\ell \in \mathbf{P}$ ,  $r, r\ell \in \mathcal{R}_p$ ,  $\ell z_{r\ell,j} = z_{r,j}$ , and  $z'_{r,j} - z'_{r,i}$  are  $N$ -torsion. And in complex coordinates,

$$Nz'_{r,j} = (-Nt'(\bmod \widehat{\mathbb{Z}}))\tau \in \left(\frac{1}{r}\mathbb{Z} + \frac{1}{r}\tau\right)/(\mathbb{Z} + \tau\mathbb{Z}) \cong (\mathbb{Z}/(r))^2.$$

So

$$e_{Nr}(z_r, z'_{r,j}) = \zeta_{p^m}^{-(Mr_0)^{-1}} \times (\text{prime to } p \text{ roots of } 1),$$

so  $e_{z,z'_j} = -M^{-1}$  (33.4.5.2). ┘

*Proof:* Cf. [Scholl, P456] ?. □

**Thm. (33.4.5.15) [Final Construction and Calculation].** Let  $\xi_{r,j}(E)$  be the Euler system for  $T_p(E)$  associated to  $(z_r, z_{r,j})$  (33.4.5.9) in the setup (33.4.5.7), then define a new Euler system

$$c_r = \sum_j b_j \xi_{r,j}(E) \in H^1(\mathbb{Q}(\mu_r), T_p(E)).$$

Then this Euler system satisfies the requirement of (33.4.5.16). ┘

*Proof:* Let  $\tilde{\omega}_{r,j}$  be the differential associated to  $(z_r, z_{r,j})$  (33.4.5.6), then because the Kodaira-Spencer map takes  $(d\log t)^2$  to  $d\log q$ , so it takes  $du^2$  to  $(2\pi i)^{-1}d\tau$ . Thus

$$\sum_j b_j \tilde{\omega}_{r,j} = \frac{(2\pi i)^{-1}}{Nr} E_1({}_d\varphi) E_1({}_{d'}\varphi') d\tau.$$

Then for any character  $\lambda : \text{Gal}(\mathbb{Q}(\mu_r)/\mathbb{Q}) \cong (\mathbb{Z}/(r))^* \rightarrow \mathbb{C}^\times$ ,

$$\begin{aligned} \sum_{\gamma \in \text{Gal}(\mathbb{Q}(\mu_r)/\mathbb{Q})} \lambda(\gamma) \exp_p^* c_r^\gamma &= \sum_j b_j \sum_{\gamma \in \text{Gal}(\mathbb{Q}(\mu_r)/\mathbb{Q})} \lambda(\gamma) \exp_p^* \xi_{r,j}(E)^\gamma \\ (33.4.5.10) &= \sum_j b_j \sum_{x \in (\mathbb{Z}/(r))^*} \lambda(x) \frac{-M^{-1}h_E}{r} \iota_x \varphi_{E,N*}(\omega_{r,j}^{\text{cusp}}) \end{aligned}$$

where  $\iota_x : \mathbb{Q}(\mu_r) \hookrightarrow \mathbb{C}$  is the injection that maps  $\zeta_r$  to  $e^{2\pi i x/r}$ . Then it equals

$$\begin{aligned}
& \frac{-M^{-1}h_E}{r} \sum_j b_j \frac{\int_{E^{\text{an}}} \sum_{x \in (\mathbb{Z}/(r))^*} \lambda(x) \iota_x \varphi_{E,N*}(\omega_{r,j}^{\text{cusp}}) \wedge \bar{\omega}_E}{\int_{E^{\text{an}}} \omega_E \wedge \bar{\omega}_E} \omega_E \\
&= \frac{-h_E}{Mr \Omega_E^+ \Omega_E^-} \left( \sum_j b_j \int_{Y(N)^{\text{an}} \times (\mathbb{Z}/(r))^*} \lambda(x) \iota_x \omega_{r,j}^{\text{cusp}} \wedge \varphi_{E,N}^* \bar{\omega}_E \right) \omega_E \\
&= \frac{-h_E}{Mr \Omega_E^+ \Omega_E^-} \left( \sum_j b_j \int_{Y(N)^{\text{an}} \times (\mathbb{Z}/(r))^*} \lambda(x) \iota_x \omega_{r,j} \wedge \varphi_{E,N}^* \bar{\omega}_E \right) \omega_E \\
&= \frac{-h_E}{Mr \Omega_E^+ \Omega_E^-} \left( \sum_j b_j \int_{Y(Nr)} (\lambda \circ e_{Nr}) \tilde{\omega}_r \wedge \varphi_{E,N}^* \bar{\omega}_E \right) \omega_E \\
&\stackrel{?}{=} \frac{-h_E \# \text{GL}(2, \mathbb{Z}/(Nr))}{MNr^2 \Omega_E^+ \Omega_E^-} \langle E_1(d\varphi) E_1(d'\varphi') \otimes \lambda, F \rangle \omega_E
\end{aligned}$$

where  $e_{Nr} : Y_{Nr}(\mathbb{C}) \rightarrow \mu_N(\mathbb{C})$  is the Weil pairing.

Using (33.4.4.7) and the facts  $\mathfrak{c}(\lambda)|r$  and  $d \equiv d' \equiv 1 \pmod{M}$ , it equals?

$$\frac{C_{E,M}}{\Omega_E^+ \Omega_E^-} DD'(D - \chi^{-1}(D))(D' - \chi^{-1}(D')) L_{rMN_E}(E, \chi; 1) \left( L_{MN_E}(\pi; 1, \frac{y}{M}) - \lambda(-1) L_{MN_E}(\pi; 1, -\frac{y}{M}) \right) \omega_E$$

Where  $C_{E,M}$  only depends on  $E$  and  $M$ . (Notice  $N$  only depends on  $E$  and  $M$  (33.4.5.12)).

Then by the choice of  $y/M$  (33.4.5.12), depending on  $\lambda(-1) = \pm 1$ , it equals

$$C_{E,M}^{\pm} DD'(D - \chi^{-1}(D))(D' - \chi^{-1}(D')) \frac{L_{rMN_E}(E, \chi; 1)}{\Omega_E^{\pm}} \omega_E,$$

where  $C_{E,M}^{\pm}$  only depends on  $E$  and  $M$ . □

### Conclusions

**Thm. (33.4.5.16) [Kato].** Situation as in (33.4.5.7), then there exists  $M \in \mathbb{Z}_+$  prime to  $p$  s.t. for any  $d, d' \in \mathbb{Z}_{\geq 2}$  with  $(dd', 6pN_E) = 1$ ,  $M|d-1$ ,  $M|d'-1$ , there is an Euler system

$$\bar{\mathfrak{c}} = \{ \bar{\mathfrak{c}}_r(E, p, d, d') \in H^1(\mathbb{Q}(\mu_r), T_p(E)), \quad r = r_0 p^m, m \geq 1, r_0 \in \mathcal{R}(pMN_E) \}.$$

satisfying: For any  $r \in \mathcal{R}_p$  and  $\chi : \text{Gal}(\mathbb{Q}(\mu_r)/\mathbb{Q}) \cong (\mathbb{Z}/(r))^* \rightarrow \mathbb{C}^*$ , with  $\chi(-1) = \pm 1$ ,

$$\sum_{\gamma \in \text{Gal}(\mathbb{Q}(\mu_r)/\mathbb{Q})} \chi(\gamma) \exp_p^* \bar{\mathfrak{c}}_r^\gamma = C_E^{\pm} DD'(D - \chi^{-1}(D))(D' - \chi^{-1}(D')) L_{rMN_E}(E, \chi; 1) / \Omega_E^{\pm}.$$

┘

*Proof:* This follows from (33.4.5.15). □

## 33.5 Iwasawa Theory for Elliptic Curves

References are [Coates] and [Greenberg] and [LECTURES ON THE IWASAWA THEORY OF ELLIPTIC CURVES, Skinner].

**Notation (33.5.0.1).**

- Let  $p \in \text{Prime}$ .

┘

### 1 Mazur's Control Theorem

**Thm. (33.5.1.1) [Mazur's Control Theorem].** For  $F \in \mathbf{NField}$ ,  $E \in \mathbf{EllCur}/F$ ,  $p \in \text{Prime}$ , and  $E$  has good ordinary reduction over all primes lying over  $p$ . Assume  $F_\infty = \cup_n F_n$  is a  $\mathbb{Z}_p$ -extension of  $F$ , then the natural map

$$\text{Sel}_p(E/F_n) \rightarrow \text{Sel}_p(E/F_\infty)^{\text{Gal}(F_\infty/F_n)}$$

has finite kernels and cokernels of bounded orders as  $n \rightarrow \infty$ .

┘

*Proof:* Cf. [Mazur's Control Theorem for Elliptic Curves].

□

### 2 Anticyclotomic Iwasawa Conjecture for Modular Forms

**Notation (33.5.2.1).**

- Let  $N^- \in \mathbb{Z}_+$  be square free with  $d_0(N^-)$  odd.
- Let  $N^+ \in \mathbb{Z}_+$  s.t.  $(N^+, N^-) = 1$ .
- Let  $p \in \text{Prime}$  s.t.  $(p, N^+ N^-) = 1$ , and denote  $N = p N^+ N^-$ .
- Let  $B \in \mathbf{AzQ}$  be the unique definite quaternion algebra ramified exactly at primes dividing  $N^-$ .
- Let  $R$  be an Eichler  $\mathbb{Z}[\frac{1}{p}]$ -order of level  $N^+$  in  $B$ ?
- Let  $\mathcal{K} \in \mathbf{NField}$  be an imaginary quadratic field.
- Let  $\mathcal{K}_\infty/\mathcal{K}$  be the anticyclotomic extension with  $\Gamma_\infty = \text{Gal}(\mathcal{K}_\infty/\mathcal{K})$ .

┘

**Def. (33.5.2.2) [Bruhat-Tits Building].** Let  $\mathcal{T}$  be the Bruhat-Tits tree of  $B_p^\times/\mathbb{Q}_p^\times$ , whose vertices are maximal  $\mathbb{Z}_p$ -orders in  $B$ , and two vertices are adjacent if their intersection is an Eichler order of level  $p$ .

┘

### 3 Kolyvagin's Work

References are [Gro89], [Finiteness of  $E(\mathbb{Q})$  and  $\text{III}(E/\mathbb{Q})$  for a subclass of Weil curves, Kolyvagin], [Finiteness of the Shafarevich-Tate group and the group of rational points for some modular abelian varieties, Kolyvagin-Yu] and [Euler Systems, Kolyvagin].

**Def. (33.5.3.1) [Kolyvagin Primes].** In the Heegner situation (31.6.1.1), for  $p \in \text{Prime}$ , a **Kolyvagin prime**  $\ell$  for  $E$  is a prime  $\ell \in \text{Prime} \setminus S(Np\text{disc}(\mathcal{K}))$  s.t.  $\ell$  is inert in  $\mathcal{K}$  and  $p|\ell+1, p|a_{\ell,E}$ . In particular,  $\ell$  is unramified in  $\mathcal{K}(E[p])/\mathbb{Q}$  by (21.1.2.8) and  $\text{Frob}_\ell = c$  as conjugacy classes in  $\text{Gal}(\mathcal{K}(E[p])/\mathbb{Q})$ . By Chebotarev density theorem, the set of Kolyvagin primes has positive Dirichlet density.

For a Kolyvagin prime  $\ell$ ,  $M(\ell) = \min\{v_p(\ell+1), v_p(a_{\ell,E})\}$  is called the **Kolyvagin index** of  $\ell$ .

A product of distinct Kolyvagin primes is called a **Kolyvagin number** for  $E$ . The set of Kolyvagin numbers is denoted by  $\Lambda_E$ . For a Kolyvagin number  $n$ , define the **Kolyvagin index** of  $n$  as  $M(n) = \min_{\ell|n} \{M(\ell)\}$ .  $\lrcorner$

**Prop. (33.5.3.2).** In the Heegner situation (31.6.1.1), let  $\ell$  be a Kolyvagin prime for  $E$ , then  $\lrcorner$

*Proof:*  $\square$

**Def. (33.5.3.3) [Kolyvagin Derivative].** In the situation (33.5.3.1), for  $\ell \in \Lambda_E \cap \text{Prime}$ ,

$$\text{Gal}(\mathcal{K}_\ell/\mathcal{K}_1) \cong \text{Pic}(\mathcal{O}_{K,\ell})/\text{Pic}(\mathcal{O}_K) \cong (\mathcal{O}_K/(\ell))^\times/(\mathbb{Z}/(\ell))^\times \cong \mathbb{Z}/(\ell+1) = \langle \sigma \rangle.$$

Define the **Kolyvagin derivative**  $D_\ell = \sum_{i=1}^\ell i\sigma^i \in \mathbb{Z}[\text{Gal}(\mathcal{K}_\ell/\mathcal{K}_1)]$ , which satisfies  $(\sigma-1)D_\ell = \ell+1 - \text{tr}_\ell$ .  $\lrcorner$

**Prop. (33.5.3.4).** In the situation (33.5.3.1), for  $\ell \in \Lambda_E \cap \text{Prime}$  and Heegner point  $y_\ell \in E(F_\ell)$ ,  $D_\ell y_\ell \in E(F_\ell)/p^M E(F_\ell) \subset H^1(F_\ell, E[p^M])$  is invariant under the action of  $\text{Gal}(\mathcal{K}_\ell/\mathcal{K}_1)$ .

More generally, for  $n \in \Lambda_E$ , denote

$$D_n = \prod_{\ell \in S(n)} D_\ell \in \text{Gal}(\mathcal{K}_n/\mathcal{K}_1) \cong \prod_{\ell \in S(n)} D_\ell.$$

Then for  $M \in [M(n)]_+$ ,  $D_n y_n \in H^1(\mathcal{K}_n, E[p^M])$  is invariant under the action of  $\text{Gal}(\mathcal{K}_\ell/\mathcal{K}_1)$ , thus descends to an element in  $H^1(F_1, E[p^M]) \cong H^1(F_n, E[p^M])^{\text{Gal}(F_n, F_1)}$  by Hochschild-Serre spectral sequence (9.8.1.14) and the fact  $E[p^M](K_n) = 0$ ?  $\lrcorner$

*Proof:* By (33.5.3.3), it suffices to show that  $(\sigma-1)D_\ell y_\ell = (\ell+1 - \text{tr}_\ell)y_\ell \in p^M E(F_1)$ : This follows from the definition (33.5.3.1) and the fact  $\text{tr}_\ell y_\ell$  is just the Hecke operator action  $T_\ell$  on  $y_1$ , which maps to  $a_\ell y_1 \in E(F_1)$ ?  $\square$

**Def. (33.5.3.5) [Kolyvagin Systems].** In the situation (33.5.3.1), for  $n \in \Lambda_E$  and  $M \in [M(n)]_+$ , define the **Kolyvagin cohomology classes**

$$c_M(n) = \sum_{s \in \text{Gal}(F_1/F)} s D_n y_n \in H^1(F, E[p^M]), \quad M \leq M(n).$$

The collection of cohomology classes (in different groups)

$$\kappa = \{c_M(n) \in H^1(F, E[p^M]) | n \in \Lambda_E, M \in \mathbb{Z}_+, M \leq M(n)\}$$

is called a **Kolyvagin system** of  $E$ .  $\lrcorner$

**Def. (33.5.3.6) [ $p$ -Divisibility].** In the situation (33.5.3.1), for  $r \in \mathbb{N}$ , denote  $\Lambda_{E,r}$  to be the subset of  $\Lambda_E$  consisting of numbers with exactly  $r$  prime factors (33.5.3.1), and define  $\mathcal{M}_r \in [0, \infty]$  to be the supremum of integers  $x \in \mathbb{Z}_+$  s.t.  $p^x | c_M(n)$  for any  $n \in \Lambda_{E,r}$ ,  $M \leq M(n)$ .  $\lrcorner$

**Prop. (33.5.3.7) [Vanishing Orders of Kolyvagin Systems].** In the situation (33.5.3.1),  $\mathcal{M}_0 \geq \mathcal{M}_1 \geq \dots \geq 0$ .

In particular, we can define  $\mathcal{M}_\infty = \lim_{r \rightarrow \infty} \mathcal{M}_r$ . Clearly,  $\mathcal{M}_\infty = \infty$  iff  $\kappa = 0$ . The **vanishing order of  $\kappa$**  is the minimal  $r$  s.t.  $\mathcal{M}_r \neq \infty$ , denoted by  $\text{ord } \kappa$ .  $\lrcorner$

*Proof:*

□

**Prop. (33.5.3.8).** Situation as in (33.5.3.6),  $\mathcal{M}_0$  is just the  $p$ -divisibility of the Heegner point  $y_K$ . In particular,  $\mathcal{M}_0 < \infty$  iff  $y_K$  is non-torsion? .

┘

**Thm. (33.5.3.9) [Kolyvagin].** Let  $\text{ord } \kappa < \infty$ , then

- $\text{Sel}^{p^\infty}(E/F)$  is contained in the subgroup of  $H^1(F, E[p^\infty])$  generated by  $\kappa$ .
- $\text{rank}_p^{w_E(-1)^{\text{ord } \kappa+1}}(E/F) = \text{ord } \kappa + 1$ ,  $\text{rank}_p^{w_E(-1)^{\text{ord } \kappa}}(E/F) = \text{ord } \kappa - d$  and  $d \in 2\mathbb{N}$ .
- Let

$$\widetilde{\text{III}}(E/F)[p^\infty]^{\text{ord } \kappa+1} = \left(\bigoplus_{i \geq 1} \mathbb{Z}/(p^{a_i})\right)^2, \quad \widetilde{\text{III}}(E/F)[p^\infty]^{\text{ord } \kappa} = \left(\bigoplus_{i \geq 1} \mathbb{Z}/(p^{b_i})\right)^2 \quad (21.1.8.7),$$

where  $(a_i), (b_i)$  is non-increasing, then

$$a_i = \mathcal{M}_{\text{ord } \kappa+2i-1} - \mathcal{M}_{\text{ord } \kappa+2i}, \quad b_{d+i} = \mathcal{M}_{\text{ord } \kappa+2i-2} - \mathcal{M}_{\text{ord } \kappa+2i-1}.$$

In particular,  $\#\widetilde{\text{III}}(E/F)[p^\infty]^{\text{ord } \kappa+1} \geq p^{\mathcal{M}_{\text{ord } \kappa} - \mathcal{M}_\infty}$ , with equality iff  $\text{ord } \kappa = 0$ .

┘

*Proof:* ?

We only prove the following: If  $p \in \text{Prime}_{\geq 3}$  s.t.  $\bar{\rho}_{E,p}$  is surjective and  $p$  doesn't divide  $y_K$  in  $E(K)$ , then  $\text{rank } E(K) = 1$  and  $\text{III}(E/K)[p] = 0$ . For this, notice that  $E(K)[p] = 0$  otherwise  $\#\bar{\rho}_{E,p}(\text{Gal}_K) \leq p(p-1)$ . Thus by the exact sequence (21.1.8.4), it suffices to show that  $\text{Sel}(E/K)^p$  is cyclic and generated by  $y_K$ . □

**Conj. (33.5.3.10) [Gross-Zagier [G-Z86]].** If  $y_K \in E(K)$  is non-torsion, then  $\text{rank}(E/\mathbb{Q}) = 1$  and

$$\#\text{III}(E/K) = \left( \frac{[E(K) : \mathbb{Z}.y_K]}{c_E \prod_{p \in S(N_E)} m_p} \right)^2 \quad (30.4.4.1), \quad \text{where } m_p = [E(\mathbb{Q}_p) : E^0(\mathbb{Q}_p)].$$

In particular, by Cassels-Tate pairing (21.1.8.12),  $\text{III}(E/K)$  is annihilated by  $[E(K) : \mathbb{Z}.y_K]$ .

┘

**Conj. Cor. (33.5.3.11) [Kolyvagin].** If  $\text{ord } \kappa = 0$ , i.e.  $y_K \in E(K)$  is non-torsion (33.5.3.8), then  $d = 0$ , and  $\text{rank}(E/\mathbb{Q}) = 1$ ,  $\#\text{III}(E/K) < \infty$ , by (33.5.3.9) and (33.5.3.8).

┘

### Kolyvagin's Conjecture

**Conj. (33.5.3.12) [Kolyvagin].** For  $p \in \text{Prime}_{\geq 3}$  s.t.  $\bar{\rho}_{E,p}$  is surjective, we have  $\kappa \neq \{0\}$ , i.e.  $\mathcal{M}_\infty < \infty$  (33.5.3.7).

┘

*Proof:*

□

**Thm& Conj. Cor. (33.5.3.13) [Zhang].** Let  $E \in \text{EllCur}/\mathbb{Q}$  with conductor  $N$  and  $p \geq 5$  is good ordinary and  $\bar{\rho}_{E,p}$  is surjective and ramifies at every prime  $\ell \in \text{Prime}$  s.t.  $v_\ell(N) = 1$ , then  $\mathcal{M}_\infty = 0$ . In particular, Kolyvagin's conjecture (33.5.3.12) is true.

┘

**Remark (33.5.3.14).** There are results that generalize this.

┘

**Cor. (33.5.3.15).** Under the hypothesis of (33.5.3.13), if  $\text{rank}_p(E/\mathbb{Q}) = 1$ , then  $r_{\text{an}}(E/\mathbb{Q}) = r(E/\mathbb{Q}) = 1$ , and  $\#\text{III}(E/\mathbb{Q}) < \infty$ .

┘

*Proof:* Cf. [Wei Zhang].

□

#### 4 $p$ -adic BSD Conjecture

**Conj. (33.5.4.1) [ $p$ -adic BSD Conjecture, Mazur-Tate-Teitelbaum[MTT86]].** If  $E \in \text{EllCur}/\mathbb{Q}$  has ordinary or non-split multiplicative reduction at  $p$ , then the  $p$ -adic  $L$ -function

$$r = \text{ord}_{s=1} L_p(E; s) \geq \text{rank } E(\mathbb{Q}),$$

and the leading term of the expansion of  $L_p(E; s)$  at  $s = 1$  is an expression involving  $|\text{III}(E)|_p$  and a  $p$ -adic regulator  $\text{Reg}_p(E)$ . When  $E$  has split multiplicative reduction, it is necessary to replace  $r$  by  $r + 1$ .  $\lrcorner$

*Proof:*  $\square$

**Thm& Conj. Cor. (33.5.4.2) [Kato].** If  $E \in \text{EllCur}/\mathbb{Q}$  has ordinary or non-split multiplicative reduction at  $p$ , then  $p$ -adic  $L$ -function

$$r = \text{ord}_{s=1} L_p(E; s) \geq \text{rank } E(\mathbb{Q}).$$

And if the equality holds, then  $\#\text{III}(E)[p^\infty] < \infty$  and  $\mathcal{R}\text{ep}_p(E) \neq 0$ .  $\lrcorner$

*Proof:*  $\color{red}{?}$   $\square$

**Thm. (33.5.4.3) [Mazur-Tate-Teitelbaum Conjecture, Greenberg-Stevens].** If  $E \in \text{EllCur}/\mathbb{Q}$  has split multiplicative reduction at  $p$  (so  $E_{\mathbb{Q}_p}$  is a Tate curve and  $L_p(E; 1) = 0$ ), we have

$$L_p^\lambda(E; 1) = \frac{\log_p(q)}{\text{ord}_p(q)} \frac{L(E; 1)}{\Omega}$$

where  $q$  is a period of  $E_{\mathbb{Q}_p}$  and  $\Omega$  is the period of  $E_{\mathbb{R}}$ .  $\lrcorner$

*Proof:*  $\square$

#### 5 $\text{GL}(2)$ case

References are [Iwasawa Main Conjectures for  $\text{GL}(2)$ , Skinner-Urban].

**Notation (33.5.5.1).**

- Let  $p \in \text{Prime}$ .
- Let  $\mathcal{K}$  be an imaginary quadratic field s.t.  $p$  splits in  $\mathcal{K}$ .
- Let  $\mathbb{Q}_\infty$  be the unique  $\mathbb{Z}_p$ -extension of  $\mathbb{Q}$ .
- Let  $\mathcal{K}_\infty^+ = \mathcal{K}\mathbb{Q}_\infty$  be the cyclotomic  $\mathbb{Z}_p$ -extension of  $\mathcal{K}$ , and  $\mathcal{K}_\infty^-$  be the anti-cyclotomic extension of  $\mathcal{K}$ . So  $\mathcal{K}_\infty^+ \cap \mathcal{K}_\infty^- = \mathcal{K}$ .
- Denote  $\mathcal{K}_\infty = \mathcal{K}_\infty^+ \cdot \mathcal{K}_\infty^-$ .

$\lrcorner$

## 33.6 Bloch-Kato Conjecture in the GGP Setting

### 1 $\mathrm{SO}(2) \times \mathrm{SO}(3)$

References are [Yifeng Liu].

**Notation (33.6.1.1).**

- Let  $p \in \mathbf{Prime}$ .
- Let  $F \leq \overline{\mathbb{Q}}$  be a real quadratic field with  $\mathrm{Gal}(F/\mathbb{Q}) = \{\mathrm{id}, \theta\}$ .
- Let  $E \in \mathbf{EllCur}/\mathbb{Q}$ , and let  $\sigma \in \mathrm{Irr}^{\mathrm{cusp}}(\mathrm{GL}(2)/\mathbb{Q})$  be associated to  $E$ .
- Let  $A \in \mathbf{EllCur}/F$ , and let  $\pi \in \mathrm{Irr}^{\mathrm{cusp}}(\mathrm{GL}(2)/F)$  be associated to  $A$ .
- $V_p(A) \otimes V_p(A^\theta)$  has a natural action of  $\Gamma_{\mathbb{Q}}$ , and this  $\mathrm{Gal}_{\mathbb{Q}}$ -module is denoted by  $\mathrm{As} V_p(\mathbb{Q}_p)$ . ┘

**Notation (33.6.1.2) [Assumption].** Assume that

- Neither  $E$  or  $A$  has CM.
- $(N, M\mathrm{disc}(F)) = 1$ .
- If we write  $N = N^+ N^-$  where  $N^+$  is the product of prime factors that split in  $F$ , then  $N^-$  is square-free. ┘

**Thm. (33.6.1.3).** If  $E_1, E_2 \in \mathbf{EllCur}/\mathbb{Q}$  with conductor  $N_1, N_2$  resp. s.t.

- $(N_1, N_2) = 1$ .
- $E_1$  has multiplicative reduction at some  $p \in \mathbf{Prime}$
- $E_2$  has no CM.
- $L(E_1 \times \mathrm{Sym}^2 E_2; 2) \neq 0$ .

Then for a.e.  $p \in \mathbf{Prime}$ , we have

$$\dim H_f^1(\mathbb{Q}, V_p(E_1) \otimes \mathrm{Sym}^2 V_p(E_2)(-1)) = 0.$$
┘

### Cohomologies

- $\sigma \in \mathrm{Irr}^{\mathrm{cusp}}(\mathrm{GL}(2)/\mathbb{Q})$  of weight 2 and  $N(\sigma) = N = N^+ N^-$ .
- $\pi \in \mathrm{Irr}^{\mathrm{cusp}}(\mathrm{GL}(2)/F)$  of weight  $(2, 2)$  and  $N(\pi) = \mathfrak{M} \in \mathrm{Ideal}^\times(\mathcal{O}_F)$ .

**Prop. (33.6.1.4).**

$$H_\pi^2(X_{\mathfrak{M}, \overline{\mathbb{Q}}}, \mathbb{Q}_p) \cong {}^\# V_\pi.$$
┘

*Proof:* Cf. [Yifeng Liu]P732. □

### Galois Cohomology Arguments

**Notation (33.6.1.5).**

- Let  $T \in \text{Mod}_{\mathbb{Z}_p}$ .

┘

**Def. (33.6.1.6) [ $p$ -divisibility].** For  $t \in T$ , define  $\text{ord}_p(t; T) = \sup_{n \in \mathbb{N}} (t \in p^n T)$ .

┘

**Def. (33.6.1.7) [Reducibility Depth].** If  $G \in \text{Grp}$  and  $T \in \cup_{n \in \mathbb{Z}_+} \text{Rep}(G, \mathbb{Z}/(p^n))$ , then the **reduction depth** of  $T$  is defined to be the smallest integer  $n_T \in \mathbb{N}$  s.t.

- If  $T' \subset T$  is a  $G$ -stable submodule that is not contained in  $pT$ , then  $p^{n_T} T \subset T'$ .
- For any  $m \in \mathbb{Z}_+$ , the group  $\text{Hom}_G(T/(p^m), T/(p^m))/\mathbb{Z}_p.\text{id}$  is annihilated by  $p^{n_T}$ .

┘

**Lemma (33.6.1.8).** Let  $V \in \text{Rep}^{\text{fd}}(\text{Gal}_{\mathbb{Q}}, \mathbb{Q}_p)$  be absolutely irreducible and a.e. unramified with a stable lattice  $\Gamma \subset V$ , then there exists  $n(T) \in \mathbb{Z}_+$  s.t.  $T/(p^n)$  has reducibility depth  $\leq n(T)$  (33.6.1.7) for any  $n \in \mathbb{Z}_+$ .

┘

*Proof:* Cf. [Yifeng Liu]P764.

### 33.7 $p$ -adic Gross-Zagier Formulae

References are [Heegner points and a  $p$ -adic Gross-Zagier formula, notes],

#### 1 Anticyclotomic $L$ -Functions for Elliptic Curves

References are [Heegner points,  $p$ -adic  $L$ -functions, and the Cerednik-Drinfeld uniformization].

**Thm. (33.7.1.1) [Bertolini-Darmon].** Let  $w = \begin{cases} 1 & , p \text{ split multiplicative for } E \\ 1 & , p \text{ non-split multiplicative for } E \end{cases}$ , then

$$\Phi_{\text{Tate}}(\mathcal{L}_p^\lambda(E/\mathcal{K})) = \pm(\alpha_{\mathcal{K}} - w\overline{\alpha_{\mathcal{K}}}).$$

┘

*Proof:* ?

□

**Cor. (33.7.1.2).**  $L_p^\lambda(E/\mathcal{K}) \neq 0$  iff  $\alpha_{\mathcal{K}} - w\alpha_{\mathcal{K}}$  has finite order in  $E(\mathcal{K})$ .

┘

**Cor. (33.7.1.3).** If  $L_p^\lambda(E/\mathcal{K}) \neq 0$ , then  $\alpha_{\mathcal{K}}$  has finite order in  $E(\mathcal{K})$ , and (by Kolyvagin's work)  $\text{rank}(E/\mathcal{K}) = 1$ ,  $\#\text{III}(E/\mathcal{K}) < \infty$ .

┘

#### 2 Triple Product $L$ -Functions

References are [Darmon-Rotger, Diagonal cycles and Euler systems I: A  $p$ -adic Gross-Zagier formula].

#### 3 $p$ -adic Heights

### 33.8 $p$ -adic Beilinson-Bloch-Kato Conjectures

#### 1 Basics

##### Stabilizations

There are two actions on the space of  $p$ -adic modular forms,

$$U(f)(q) = \sum_{n=1}^{\infty} a_{np} q^n, \quad V(f)(q) = \sum_{n=1}^{\infty} a_n q^{np}.$$

And

$$UV = \text{id}, \quad f^{[p]} = (1 - VU)(f) = \sum_{p \nmid n} a_n q^n.$$

If  $f$  is ordinary, then the two  $p$ -eigenvalues  $\alpha_p$  and  $\beta_p$  satisfies  $\alpha_p$  is a  $p$ -unit. And

$$f^{(p)}(q) = f(q) - \beta_p f(q^p)$$

satisfies  $U(f^{(p)}) = \alpha_p f^{(p)}$ , called the **ordinary stabilization** of  $f$ .

##### Hida Family

**Def. (33.8.1.1) [Hida Family].** Define the **weight space**

$$\Omega = \text{Hom}(\mathbb{Z}_p^*, \mathbb{C}_p^\times).$$

A point in  $\Omega$  is called arithmetic if it is of the form  $\nu_{k,\varepsilon} : x \mapsto x^{k-1}\varepsilon(x)$ , where  $k \in \mathbb{Z}_{\geq 2}$  and  $\varepsilon$  is a finite order character of  $\mathbb{Z}_p^*$ .

A **Hida family** of tame character  $\chi : (\mathbb{Z}/(N))^* \rightarrow \mathbb{C}_p^\times$  is a pair  $(\Omega_\varphi, \varphi)$  s.t.

- $\Omega_\varphi$  is a rigid analytic space equipped with a finite morphism  $\kappa : \Omega_\varphi \rightarrow \Omega$ .
- $\varphi = \sum_{n \in \mathbb{Z}_+} a_n(\varphi) q^n$  is a formal  $q$ -series with coefficients in the ring  $\mathcal{A}(\Omega_\varphi)$  of analytic functions on  $\Omega_\varphi$ . s.t. for any  $x \in \Omega_\varphi$  with  $\kappa(x) = \nu_{k,\varepsilon}$ , the restriction of  $\varphi$  to  $x$  is the  $q$ -expansion of a normalized eigenform in  $\text{SF}_k(Np^s, \chi\varepsilon\omega^{1-k})$ , where  $\omega$  is the Teichmüller character.

┘

**Def. (33.8.1.2) [Hida Family of Ordinary Modular Forms].** Let  $p \nmid N$  and  $f$  ordinary at  $p$ , there is a Hida families of over-convergent  $p$ -adic modular forms

$$\mathbf{f} : \Omega_f \rightarrow \mathbb{C}_p[[q]]$$

where  $\kappa : \Omega_f \rightarrow \Omega$  is a finite rigid analytic coverings of suitable subsets of the  $\mathbb{Z} \subset \Omega$  as  $k \mapsto (x \mapsto x^k)$ , and the image of  $\mathbb{Z}_{\geq 2}$  is called the set of **classical points**.

┘

**Prop. (33.8.1.3) [Hida Family of Weight 1 Modular Forms].** Let  $g$  be a weight 1 modular form with one of the ordinary  $p$ -stabilizations  $g_\alpha$ , then there exists a Hida family  $\underline{g}$  of tame character  $\chi$  that specializes to  $g_\alpha$  at some point  $y_0 \in \underline{\Omega}_g$  with  $\kappa(y_0) = \nu_{1,1}$ .

┘

*Proof:*

□

**Prop. (33.8.1.4) [Hida Family of Eisenstein Series].** There is a Hida family of Eisenstein series  $\underline{E}(1, \chi^{-1})$  with tame character  $\chi$  s.t. its specialization at  $\nu_{\ell, \varepsilon}$  equals the classical Eisenstein series  $E_\ell(1, \chi^{-1} \varepsilon \omega^{1-k})$ .

And it's involution  $\underline{E}^*(1, \chi^{-1})$  s.t. its specialization at  $\nu_{\ell, \varepsilon}$  equals the over-convergent Eisenstein series  $E_{2-\ell}(1, \chi^{-1} \varepsilon^{-1} \omega^{\ell-1})$ .  $\lrcorner$

*Proof:*  $\square$

### Abel-Jacobi Maps

**Def. (33.8.1.5) [Triple Product Kuga-Sato Varieties].** Let  $W = \mathcal{E}^{k-2} \times \mathcal{E}^{\ell-2} \times \mathcal{E}^{m-2}$  be the triple product Kuga-Sato varieties.

Then there is a unique way to embed  $\mathcal{E}^r$  to  $W$ , where  $r = (k + \ell + m - 6)/2$ .

There is a modification of this embedding that gives a homologically trivial cycle

$$\Delta_{k, \ell, m} \in \mathrm{CH}^{r+2}(W)_0.$$

$\lrcorner$

**Def. (33.8.1.6) [Abel-Jacobi Maps].** There is a natural  $p$ -adic Abel-Jacobi map

$$\mathrm{AJ}_p : \mathrm{CH}^{r+2}(W)_0(\mathbb{Q}_p) \rightarrow \mathrm{Fil}^{r+2} H_{\mathrm{dR}}^{2r+3}(W/\mathbb{Q}_p)^\vee.$$

$\lrcorner$

**Def. (33.8.1.7) [Unit Root Subspaces].** For  $f \in \mathrm{SF}_r(\Gamma_1(N))$  that is ordinary at  $p$ , there is a cohomology class

$$\omega_f \in \mathrm{Fil}^{r-1} H_{\mathrm{dR}}^{r-1}(\mathcal{E}^{r-2}/\overline{\mathbb{Q}}) \subset \mathrm{Fil}^{r-1} H_{\mathrm{dR}}^{r-1}(\mathcal{E}^{r-2}/\mathbb{C}_p)$$

And there is a unique unit-root element  $\eta_f^{u-r} \in H_{\mathrm{dR}}^{r-1}(\mathcal{E}^{r-2}/\mathbb{C}_p)$  s.t.  $\langle \omega_f, \eta_f^{u-r} \rangle = 1$ , and Frobenius acts on  $\eta_f^{u-r}$  as a multiplication by a  $p$ -adic unit.  $\lrcorner$

### $p$ -adic $L$ -Functions

#### 2 [Darmon-Rotger14]

A  $p$ -adic Gross-Zagier formula relating:

the image under the  $p$ -adic Abel-Jacobi map of certain generalized Gross-Kudla-Schoen cycles in the product of three Kuga-Sato varieties,

and

the special value of the Harris-Tilouine  $p$ -adic  $L$ -function attached to the Garrett-Rankin triple convolution of three Hida families of modular forms, at a point lying outside its region of interpolation.

This  $L$ -function  $L(f, g, h; s)$  satisfies a functional equation relating its values at  $s$  and  $k + \ell + m - 2 - s$  with sign of functional equation  $\varepsilon = \prod_{v \nmid N_\infty} \varepsilon_v$ , where we assume that

Hyp: For  $v \in \Sigma_F$  and  $v|N$ , we have  $\varepsilon_v = 1$ . This hypothesis is used to avoid having to deal with Shimura curves associated with a quaternion division algebra.

**Thm. (33.8.2.1) [ $p$ -adic Gross-Zagier Formula].** Let  $(x, y, z) \in \Sigma_{bal} \subset \Omega_f \otimes \Omega_g \otimes \Omega_h$ , let

$$(f, g, h) = (\mathbf{f}_x, \mathbf{g}_y, \mathbf{h}_z), \quad (k, \ell, m) = (\kappa(x), \kappa(y), \kappa(z)), \quad c = (k + \ell + m - 2)/2, \quad k = \ell + m - 2 - 2t,$$

then  $\eta_f^{u-r} \otimes \omega_g \otimes \omega_h \in \text{Fil}^{r+2} H_{\text{dR}}^{2r+3}(W/\mathbb{Q}_p)$ , and

$$\mathcal{L}_p^f(\mathbf{f}, \mathbf{g}, \mathbf{h})(x, y, z) = \frac{(-1)^t}{t!} \frac{\mathcal{E}(f, g, h)}{\mathcal{E}_0(f)\mathcal{E}_1(f)} \cdot \text{AJ}_p(\Delta_{k,\ell,m})(\eta_f^{u-r} \otimes \omega_g \otimes \omega_h).$$

┘

*Proof:* Cf.[DR14]Thm5.1. □

### 3 [Bertolini-Darmon-Rotger14]

A  $p$ -adic Beilinson formula relating:

the image under the the  $p$ -adic syntomic regulator(Bloch-Kato logarithm) on  $K_1$  of a certain Beilinson-Flach element in the product of two modular curves

and

the special value at  $(2, 2)$  of Hida's  $p$ -adic Rankin  $L$ -series attached to two ordinary families of modular forms interpolating  $f$  and  $g$ .

**Notation (33.8.3.1).** Let  $f \in \text{SF}_k(N, \chi_f)$ ,  $g \in \text{SF}_\ell(N, \chi_g)$  be normalized newforms, and  $k \leq \ell$ .

When  $k < \ell$ , fix an  $j \in [\frac{k+\ell-1}{2}, k-1]$ , and let  $t = k-1-j \geq 0$ ,  $m = k-\ell-2t \geq 1$ .

Denote  $\chi = \chi_f^{-1} \chi_g^{-1}$ . ┘

**Def. (33.8.3.2) [Eisenstein Series].** When  $k < \ell$ , the Eisenstein series is defined to be

$$E_{m,\chi}(z) = \frac{1}{2} L(\chi; 1-m) + \sum_{n=1}^{\infty} \sigma_{m-1,\chi}(n) q^n$$

is holomorphic of weight  $m$  and character  $\chi$ . ┘

**Def. (33.8.3.3) [Shimura-Maass Derivatives].** The differential operator  $\delta_m = \frac{1}{2\pi i} (\frac{\partial}{\partial z} + \frac{im}{2y})$  maps  $\text{MF}_m^{nh}(N, \chi)$  to  $\text{MF}_{m+2}^{nh}(N, \chi)$ . ┘

**Prop. (33.8.3.4).** Define

$$\Xi(f, g, j) = \delta_m^t(E_{m,\chi}) \cdot g \in \text{SF}_k^{nh}(N, \chi_f^{-1}).$$

Then

$$L(f \otimes g; j) = C(k, \ell, j) \langle f^c(z), \Xi(f, g, j) \rangle_{\text{Pet}}.$$

┘

**Cor. (33.8.3.5) [Rational Part].** Denote

$$L^{\text{alg}}(f \otimes g; j) = C(k, \ell, j)^{-1} \frac{\langle f^c(z), \Xi(f, g, j) \rangle_{\text{Pet}}}{\langle f^c(z), f^c(z) \rangle} = \frac{\langle f^c(z), \Xi(f, g, j) \rangle}{\langle f^c(z), f^c(z) \rangle} \in K_{f,g}.$$

┘

de Rham Cohomologies

**Def. (33.8.3.6).** Let  $\mathcal{E} \rightarrow Y_1(N)$  be the universal elliptic curve, and  $\omega$  be the sheaf of relative differentials on  $Y_1(N)$ . Denote  $\mathcal{L} = R^1\pi_*(\mathcal{O}_{\mathcal{E}} \rightarrow \Omega_{\mathcal{E}/Y_1(N)}^1)$  and  $\mathcal{L}^r = \text{Sym}^r \mathcal{L}$ . There is a Gauss-Manin connection  $\nabla$  on  $\mathcal{L}^r$ .

Then there is an exact sequence

$$0 \rightarrow H^0(X_1(N), \omega^r \otimes \Omega_{X_1(N)}^1) \rightarrow H_{\text{dR}}^1(X_1(N), \mathcal{L}_r, \nabla) \rightarrow H^0(X_1(N), \omega^{-r}) \rightarrow 0$$

s.t.  $H^0(X_1(N), \omega^r \otimes \Omega_{X_1(N)}^1)$  is isotropic w.r.t. the perfect Poincaré pairing on  $H_{\text{dR}}^1(X_1(N), \mathcal{L}_r, \nabla)$ .

┘

**Prop. (33.8.3.7).** Let  $r = k - 2$ , then

$$\eta_f^{a-h} = \frac{\overline{f^c(z)} d\bar{z}}{\langle f^c(z), f^c(z) \rangle_{\text{Pet}}} \in H_{\text{dR}}^1(X_1(N)_{\mathbb{C}}, \mathcal{L}_r, \nabla),$$

and its image in  $H^0(X_1(N)_{\mathbb{C}}, \omega^{-r})$  is denoted by  $\eta_f$ . Then  $\eta_f$  is in fact contained in  $H^0(X_1(N), \omega^{-r})$ .

┘

**Cor. (33.8.3.8).**

$$L^{\text{alg}}(f \otimes g; j) = \langle \eta_f, \Xi(f, g, j)^{\text{hol}} \rangle.$$

┘

**Prop. (33.8.3.9).** This exact sequence

$$0 \rightarrow H^0(X_1(N), \omega^r \otimes \Omega_{X_1(N)}^1) \rightarrow H_{\text{dR}}^1(X_1(N), \mathcal{L}_r, \nabla) \rightarrow H^0(X_1(N), \omega^{-r}) \rightarrow 0$$

when extended to  $\mathbb{C}_p$  has a canonical unit-root splitting s.t. the Frobenius acts on the complement by  $p$ -adic units. Let  $\eta_f^{u-r}$  be the inverse image in this unit-root subspace.

┘

Beilinson-Flach Elements

Let  $X = X_1(N)$ ,  $S = X_1(N) \times X_1(N)$ . Then  $H_{\text{Mot}}^3(S, \mathbb{Q}(2)) = \text{CH}^2(S, 1)_{\mathbb{Q}}$ , the latter has a definition as the homology of the **Gersten complex**

$$K_2(R(S)) \xrightarrow{\partial} \oplus_{Z \subset S} R(Z)^{\times} \xrightarrow{\text{div}} \oplus_{P \in S} \mathbb{Z}.$$

Then for the diagonal cycle  $\Delta \subset S$  and  $u \in \mathcal{O}(\Delta_{Y_1(N)}^{\times})$ , there exists a sum  $\theta_u$  of horizontal and vertical cycles s.t.

$$\text{div}(\theta_u) = \text{div}((\Delta, u)).$$

Then we define  $\mathbf{BF}_u = \Delta_u = \theta_u - (\Delta, u)$ , which is determined up to horizontal and vertical cycles.

Regulators

**Prop. (33.8.3.10) [Complex Regulators].** There is a regulator map

$$\text{Reg}_{\mathbb{C}} : H_{\text{Mot}}^3(S_{\mathbb{C}}, \mathbb{Q}(2)) \rightarrow (\text{Fil}^1 H_{\text{dR}}^2(S/\mathbb{C}))^{\vee}$$

s.t. the class  $\omega = \sum (Z_i, u_i)$  is sent to

$$\text{Reg}_{\mathbb{C}}(\omega) = \frac{1}{2\pi i} \sum \int_{Z_i^{\text{sm}}} \omega \log |u_i|.$$

┘

*Proof:*

□

**Prop. (33.8.3.11).**

$$\mathrm{Reg}_{\mathbb{C}}(\Delta_{u_{\chi}})(\omega_g \otimes \eta_f^{n-h}) = (-2i)[\Gamma_0(N) : \Gamma_1(N)\{\pm 1\}] \frac{\langle f^c(z), \log |u_{\chi}(z)| \cdot g(z) \rangle_{\mathrm{Pet}}}{\langle f^c(z), f^c(z) \rangle}.$$

┘

*Proof:* Cf. [Bertolini-Darmon-Rotger14] Prop 3.2. ?

□

**Prop. (33.8.3.12) [ $p$ -adic Regulators].** Let  $F \in \mathbf{NField}$  be the field cut out by the Dirichlet characters, and embed  $F$  to  $\mathbb{C}_p$  and let the completion be  $K$ . Let  $\mathcal{X}/\mathcal{O}_K$  be the Deligne-Rapoport smooth model of  $X_1(N)$ , and  $\mathcal{S} = \mathcal{X} \times \mathcal{X}$ . Then there is a  $p$ -adic syntomic map

$$\mathrm{Reg}_p : H_{\mathrm{Mot}}^3(S_K, \mathbb{Q}(2)) \rightarrow (\mathrm{Fil}^1 H_{\mathrm{dR}}^2(S/K))^{\vee}.$$

┘

*Proof:*

□

**Prop. (33.8.3.13).**

$$\mathrm{Reg}_p(\Delta_{u, \chi})(\omega_g \otimes \eta_f^{u-r}) = \langle u_f^{u-r}, \xi \rangle$$

where  $\xi \in H_{\mathrm{dR}}^1(X)$  is explicit, and the pairing on  $H_{\mathrm{dR}}^1(X)$  is induced by Poincaré pairing.

┘

*Proof:*

□

### Ordinary Projections

**Prop. (33.8.3.14).** Let  $e_{\mathrm{ord}}$  be Hida's ordinary projector on  $H_{\mathrm{dR}}^1(X_K, \mathcal{L}_r, \nabla)$ . Then

$$L^{\mathrm{alg}}(f \otimes g; j) = \langle \eta_f^{u-r}, e_{\mathrm{ord}} \Xi(f, g, j)^{\mathrm{hol}} \rangle.$$

Moreover,

$$\Xi(f, g, j)^{\mathrm{ord}} \triangleq e_{\mathrm{ord}} \Xi(f, g, j)^{\mathrm{hol}} = e_{\mathrm{ord}} \left( \left( q \frac{\partial}{\partial q} \right)^t (E_{m, \chi}) \cdot g \right).$$

┘

**Def. (33.8.3.15).**

$$\Xi(f, g, j)^{\mathrm{ord}, p} \triangleq e_{\mathrm{ord}} \Xi(f, g, j)^{\mathrm{hol}} = e_{\mathrm{ord}} \left( \left( q \frac{\partial}{\partial q} \right)^t (E_{m, \chi})^{[p]} \cdot g \right).$$

┘

### $p$ -adic Rankin $L$ -Functions

**Prop. (33.8.3.16) [ $p$ -adic Rankin  $L$ -function].** Let  $\mathbf{f}, \mathbf{g}$  be Hida families of ordinary  $p$ -adic modular forms of tame level  $N$  indexed by weight variables  $k$  and  $\ell$  valued in suitable compact open subsets of  $\mathbb{Z}/(p-1) \times \mathbb{Z}_p$ . Assume  $j = k - 1 - \ell$  belongs to the same residue class modulo  $(p-1)$ .

Then whenever  $k < \ell$  and  $j \in [\frac{k+\ell-1}{2}, k-1]$ , the  $p$ -adic modular form  $\Xi(f_k, g_{\ell}, j)^{\mathrm{ord}, p}$  is defined, and can be extended analytically to  $U_f \times U_g \times \mathbb{Z}_p$ .

Thus

$$\mathcal{L}_p(\mathbf{f}, \mathbf{g})(k, \ell, j) = \frac{1}{\mathcal{E}^*(f_k)} \left\langle \eta_{f_k}^{u-r}, \Xi(f_k, g_\ell, j)^{\text{ord}, p} \right\rangle_{k, X}$$

extends to an analytic function on  $U_f \times U_g \times \mathbb{Z}_p$ , called the *p*-adic **Rankin *L*-function** of  $\mathbf{f}$  and  $\mathbf{g}$ .

It satisfies that for any classical  $k, \ell, j$ ,

$$\mathcal{L}_p(\mathbf{f}, \mathbf{g})(k, \ell, j) = \frac{\mathcal{E}(f, g, j)}{\mathcal{E}^*(f_k) \mathcal{E}(f_k)} L^{\text{alg}}(f_k \otimes g_\ell, j).$$

┘

**Cor. (33.8.3.17) [A Variant].** If  $g$  is not ordinary, then we can just fix  $g$  and get a *p*-adic function

$$\mathcal{L}_p(\mathbf{f}, g)(k, \ell).$$

┘

### Beilinson's Conjectures

**Thm. (33.8.3.18) [Beilinson Formula].** If  $f, g$  are modular forms of weight 2 and  $\chi = \chi_f^{-1} \chi_g^{-1} \neq 1$ , then

$$\frac{L(f \otimes g; 2)}{\langle f^c(z), f^c(z) \rangle} = \frac{8i\pi^3}{N^2[\Gamma_0(N) : \Gamma_1(N)\{\pm 1\}]} \tau(\chi^{-1}) \text{Reg}_{\mathbb{C}}(\Delta_{u_\chi})(\omega_g \otimes \eta_f^{a-h}).$$

┘

*Proof:*

□

**Thm. (33.8.3.19) [*p*-adic Beilinson Formula].** Let  $p \in \text{Prime}$ ,  $(N, p) = 1$ ,  $f, g$  are weight 2 modular forms s.t.  $f$  is ordinary at  $p$ . Then we can extend the *p*-stabilization of  $f$  to a Hida family  $\mathbf{f}$ . Then

$$\mathcal{L}_p(\mathbf{f}, g)(2, 2) = \frac{\mathcal{E}(f, g, j)}{\mathcal{E}^*(f_k) \mathcal{E}(f_k)} \cdot \text{Reg}_p(\Delta_{u_\chi})(\omega_g \otimes \eta_f^{u-r}).$$

And if  $g$  is also ordinary at  $p$ , then the LHS can be replaced by  $\mathcal{L}_p(\mathbf{f}, \mathbf{g})(2, 2, 2)$ .

┘

*Proof:* Cf. [Bertolini-Darmon-Rotger14] Thm4.2. ?

□

### 4 [Bertolini-Darmon14]

What to recover Beilinson's result without using explicit reciprocity law.

### 5 [Lei-Loeffler-Zerbes14]

### Generalized Beilinson-Flach Elements

Defined a compatible system of cohomology classes (Generalized Beilinson-Flach elements)

$${}_c \Xi_{m, N, j} \in \text{CH}^2(Y_1(N)^2 \otimes \mathbb{Q}(\mu_m), 1)$$

for  $m \in \mathbb{Z}_+$ ,  $N \in \mathbb{Z}_{\geq 5}$ ,  $j \in \mathbb{Z}/(m)$  s.t. for  $m = 1$ , this reduces to the Beilinson-Flach element constructed in [Bertolini-Darmon-Rotger14].

### Bounding the Strict Selmer group

Prove (under some technical hypotheses) a finiteness theorem for the strict Selmer group of a product of modular forms when the associated  $p$ -adic Rankin–Selberg  $L$ -function is nonvanishing at  $s = 1$ .

### Perrin-Riou’s Conjecture

**Conj. (33.8.5.1).** ┘

### 6 [Bertolini-Darmon-Rotger15]

**Thm. (33.8.6.1).** Let  $\rho$  be an odd irreducible 2-dimensional Artin representation with image in  $L$  and cut out  $H$ , and  $E \in \text{EllCur}/\mathbb{Q}$ , then with some coprime conditions,

$$L(E/K, \psi; 1) \neq 0 \implies E(H)^\psi = 0.$$

┘

*Proof:* □

Sketch: Firstly  $\psi$  corresponds to a weight 1 cusp form  $g$ .

By Kolyvagin’s strategy, it can be proven that if for any embedding  $L \hookrightarrow \mathbb{C}_p$ , the singular residue map

$$\partial_p : H^1(\mathbb{Q}, V_f \otimes V_g) \rightarrow H_{\text{sing}}^1(\mathbb{Q}_v, V_f \otimes V_g)$$

is surjective, then  $E(H)^\psi = 0$ . We can choose  $p$  ordinary for  $g$  s.t.  $\alpha_p(g) \neq \beta_p(g)$ . Then we can consider the  $p$ -stabilization  $g_\alpha$ , and it suffices to prove the following:

**Lemma (33.8.6.2).** There exists a global class

$$\kappa(f, g_\alpha) \in H^1(\mathbb{Q}, V_f \otimes V_g)$$

s.t.

- $\partial_p(\kappa(f, g_\alpha))$  generates  $H_{\text{sing}}^1(\mathbb{Q}_p, V_f \otimes V_g)$ .
- $\kappa(f, g_\alpha) = 0$  iff  $L(f \otimes g; 1) = 0$ .

To show item2, the strategy is to make  $\kappa$  a family of cycles, then compare them at weight 2 points.

┘

### Rigid Cohomologies and Syntomic Regulators

**Prop. (33.8.6.3).** Let  $(N, p) = 1$  and  $s \in \mathbb{N}$ , let  $\Sigma_s = X_1(Np^s) \setminus Y_1(Np^s)$ , and let  $K/\mathbb{Q}_p$  be a finite extension s.t.  $X_1(Np^s)$  has a semisimple model and closed points of  $\Sigma_s$  are defined over  $K$ , then there is a Gysin exact sequence

$$0 \rightarrow H_{\text{ét}}^1(X_1(Np^s)_{\overline{\mathbb{Q}_p}}, \mathbb{Q}_p) \rightarrow H_{\text{ét}}^1(Y_1(Np^s)_{\overline{\mathbb{Q}_p}}, \mathbb{Q}_p) \rightarrow \mathbb{Q}_p(-1)^{\oplus(\#\Sigma_s-1)} \rightarrow 0,$$

which when applied  $D_{st}$  implies an exact sequence of filtered Frobenius monodromy modules

$$0 \rightarrow H_{\text{dR}}^1(X_1(Np^s)/K) \rightarrow H_{\text{dR}}^1(Y_1(Np^s)/K) \rightarrow K(-1)^{\oplus(\#\Sigma_s-1)} \rightarrow 0.$$

┘

*Proof:*

□

**Prop. (33.8.6.4)**[Analytic Description of Syntomic Regulators]. For  $s \in \mathbb{Z}_+$ ,

$$\mathrm{Reg}_p^{\mathrm{fg}}(\mathbf{BF}_s)(\eta_f \otimes \omega_{g^w}) = \mathcal{G}(\chi\chi_p) \frac{\alpha_f^{s-1}}{1 - \chi^{-1}(p)\alpha_f^{-1}\alpha_g} \times \left\langle \eta_f^w, e_{\mathrm{ord}}(g^{[p]} \cdot E_0^{[p]}(1, \chi^{-1}\chi_p^{-1})) \right\rangle_{X_0(Np)}.$$

┘

*Proof:* Cf.[Bertolini-Darmon-Rotger15]Thm2.10.

□

### Generalized Beilinson-Flach Elements and $p$ -adic $L$ -Functions

**Lemma (33.8.6.5).**

$$\mathcal{L}_p(f, \underline{g})(y) = \left\langle \eta_f^w, e_{\mathrm{ord}}(g_y^{[p]} \cdot E_{2-\ell}^{[p]}(1, \chi^{-1}\varepsilon^{-1}\omega^{\ell-1})) \right\rangle_{X_0(Np^s)}.$$

┘

*Proof:* Cf.[Bertolini-Darmon-Rotger15]P594. ?

□

**Thm. (33.8.6.6).** Let  $\varepsilon$  be a character of  $\mathbb{Z}_p^*$  of conductor  $p^s$ , and  $y \in \Omega_{\underline{g}}$  with  $\kappa(y) = \nu_{2,\varepsilon}$ . Thus  $g_y \in \mathrm{SF}_2(Np^s, \chi\varepsilon\omega^{-1})$  and

$$\mathrm{Reg}_p^{\mathrm{fg}}(\mathbf{BF}_s)(\eta_f \otimes \omega_{g^w}) = \mathcal{G}(\chi\varepsilon\omega^{-1}) \cdot \frac{\alpha_f^{s-1}}{1 - \chi(p)^{-1}\alpha_f^{-1}\alpha_g} \cdot \mathcal{L}_p(f, \underline{g})(y).$$

┘

*Proof:* This follows from (33.8.6.5) and (33.8.6.4).

□

## 7 [Darmon-Rorger16]

**Thm. (33.8.7.1).** Let  $\rho_1, \rho_2$  be two odd irreducible 2-dimensional Artin representation and  $\rho = \rho_1 \otimes \rho_2$  with image in  $L$  and cut out  $H$ , and  $E \in \mathrm{El1Cur}/\mathbb{Q}$ , then

$$L(E, \rho; 1) \neq 0 \implies E(H)^\rho = 0.$$

┘

*Proof:* Cf.[Darmon-Rorger16]Thm6.7., 6.13.

□

**Cor. (33.8.7.2).** If  $E \in \mathrm{El1Cur}/\mathbb{Q}$ ,  $K$  is a quadratic field. Given a ray class character  $\psi : \mathrm{Gal}(H/K) \rightarrow \mathbb{C}^\times$ , then when  $(E, K)$  satisfies some mild non-vanishing hypothesis, we have

$$L(E/K, \psi; 1) \neq 0 \implies E(H)^\psi \neq 0.$$

┘

### Generalized Gross-Kudla-Schoen Cycles

**Thm. (33.8.7.3).** The generated Gross-Kudla-Schoen cycle  $\kappa(f, g_\alpha, h_\alpha)$  is crystalline at  $p$  iff  $L(E, \rho; 1) \neq 0$ .

┘

*Proof:*

□

## 8 Kings-Loeffler-Zerbes17

construct three-variable  $p$ -adic families of Galois cohomology classes attached to Rankin convolutions of modular forms, and prove an explicit reciprocity law relating these classes to critical values of  $L$ -functions. As a consequence, we prove finiteness results for the Selmer group of an elliptic curve twisted by a 2-dimensional odd irreducible Artin representation when the associated  $L$ -value does not vanish

## 9 Unitary Groups

Iwasawa theory for the product of two unitary groups, generalizing phenomena observed in studying elliptic curves twisted by imaginary quadratic Hecke characters.

# 34 | Probability

## 34.1 Probability Theory

*“At a purely formal level, one could call probability theory the study of measure spaces with total measure one, but that would be like calling number theory the study of strings of digits which terminate.”*

–T. Tao

References are [Dudley, Real Analysis and Probability], [Fol99] and [Mathematical Methods for Financial Markets].

**Notation (34.1.0.1).**

- Use notations on real analysis defined in [Measure Theory and Functions on  \$\mathbb{R}^n\$](#) .
- Let  $(\Omega, \mathcal{F}, \mathbf{P})$  be a probability space [\(12.3.1.8\)](#).

┘

### 1 Basics

**Def. (34.1.1.1) [Events].** Any measurable space  $A \in \mathcal{M}$  is called an **event** in  $\mathcal{M}$ , and its **probability of the event** is defined to be  $\mathbf{P}(A)$ .

┘

**Def. (34.1.1.2) [Independent Events].** Two events [\(34.1.1.1\)](#)  $A$  and  $B$  are called **independent events** if  $\mathbf{P}(A \cap B) = \mathbf{P}(A) \cdot \mathbf{P}(B)$ . Similarly, we can define jointly-independent events.

┘

**Def. (34.1.1.3) [Random Variables].** A measurable function [\(12.3.1.26\)](#)  $X$  from  $(\Omega, \mathcal{F}, \mathbf{P})$  to a measurable space  $(S, \mathcal{A})$  is called a **random variable** on  $\Omega$ .

┘

**Def. (34.1.1.4) [Independent Variables].** Suppose  $X : (\Omega, \mathcal{F}, \mathbf{P}) \rightarrow (S, \mathcal{A})$  and  $Y : (\Omega, \mathcal{F}, \mathbf{P}) \rightarrow (T, \mathcal{B})$  are two random variables, then  $X, Y$  is called a pair of **independent variables** if for any event  $U \in \mathcal{A}$  and  $V \in \mathcal{B}$ ,  $X^{-1}(U)$  and  $Y^{-1}(V)$  are independent events [\(34.1.1.2\)](#), i.e.

$$\mathbf{P}(X \in U, Y \in V) = \mathbf{P}(X \in U) \cdot \mathbf{P}(Y \in V).$$

Similarly, we can define jointly-independent variables.

If  $\mathcal{S}$  is a set of random variable, then variables in  $S$  are called **independent variables** if any subset of variables in  $\mathcal{S}$  are jointly-independent.

┘

**Def. (34.1.1.5) [Distribution Functions].** Suppose  $X$  is a random variable on  $\Omega$  [\(34.1.1.3\)](#) valued in  $(\mathbb{R}, \text{dm})$ , the **distribution function** of  $X$  is defined to be the non-decreasing function  $F : \mathbb{R} \rightarrow \mathbb{R}_{\geq 0}$  s.t.

$$F(x) = \mathbf{P}(X \geq x).$$

┘

**Def. (34.1.1.6) [Expected Values, Variances and Standard Deviations].** Suppose  $X$  is a random variable on  $\Omega$  (34.1.1.3) valued in  $(\mathbb{R}, \text{dm})$ . Then

- If  $\int_{\Omega} X d\mathbf{P}$  exists, it is called the **expected value** of  $X$ , denoted by  $\mathbf{E}(X)$ .
- The **variance** of  $X$  is defined to be

$$\text{var}(X) \triangleq \sigma^2(X) \triangleq \begin{cases} \mathbf{E}(X - \mathbf{E}(X))^2 = \mathbf{E}(X^2) - (\mathbf{E} X)^2 & , \mathbf{E}(X^2) < \infty \\ +\infty & , \mathbf{E}(X^2) = \infty \end{cases}.$$

- The **standard deviation** of  $X$  is defined to be  $\sigma(X) = \sqrt{\text{var}(X)} \in [0, \infty]$ .

Notice by Cauchy's inequality, if  $\mathbf{E}(X^2) < \infty$ , then  $\mathbf{E}(X) < \infty$ , so the definition makes sense.  $\lrcorner$

**Def. (34.1.1.7) [Covariances and Correlation Coefficients].** Suppose  $X, Y$  are real-valued random variables on  $\Omega$ , then

- If  $\mathbf{E}(X) < \infty, \mathbf{E}(Y) < \infty$ , the **covariance** of  $X$  and  $Y$  is defined to be

$$\text{cov}(X, Y) \triangleq \mathbf{E}((X - \mathbf{E}(X))(Y - \mathbf{E}(Y))) = \mathbf{E}(XY) - \mathbf{E}(X) \cdot \mathbf{E}(Y).$$

- If  $\mathbf{E}(X^2) < \infty$  and  $\mathbf{E}(Y^2) < \infty$ , and  $\text{cov}(X) \neq 0, \text{cov}(Y) \neq 0$ , then the **correlation coefficient** between  $X$  and  $Y$  is defined to be

$$r(X, Y) = \frac{\text{cov}(X, Y)}{\sigma(X)\sigma(Y)}.$$

Notice  $r(X, Y) \in [-1, 1]$  if it is defined.  $\lrcorner$

*Proof:*  $r(X, Y) \in [-1, 1]$  by Cauchy inequality because  $L^2(\Omega)$  is a Hilbert space.  $\square$

**Prop. (34.1.1.8) [Independence and Covariances].** Suppose  $X, Y$  are real-valued random variables on  $\Omega$  that are independent, then  $\text{cov}(X, Y) = 0$ .  $\lrcorner$

*Proof:* Cf. [Dudley, P252].  $\square$

**Prop. (34.1.1.9).** Suppose  $(\Omega, \mathcal{M}, P)$  is a probability space and  $X, Y$  are real-valued random variables on  $\Omega$ , then

$$\text{var}\left(\sum_i X_i\right) = \sum_i \text{var}(X_i) + 2 \sum_{1 \leq i < j \leq n} \text{cov}(X_i, X_j).$$

In particular, if  $X_i$  are independent or pairwise-independent, by (34.1.1.8),

$$\text{var}(X_1 + \dots + X_n) = \sum_i \text{var}(X_i).$$

$\lrcorner$

*Proof:* We may first assume that  $\mathbf{E}(X_i) = 0$  for each  $i$ , then

$$\text{var}\left(\sum_i X_i\right) = \mathbf{E}\left(\left(\sum_i X_i\right)^2\right) = \mathbf{E}\left(\sum_i X_i^2 + 2 \sum_{i < j} X_i X_j\right) = \sum_i \mathbf{E}(X_i^2) + 2 \sum_{i < j} \mathbf{E}(X_i X_j).$$

So the assertion is easy.  $\square$

### Moment Generating Functions

**Def. (34.1.1.10) [Moment Generating Functions].** The **moment generating function** of a real-valued random variable  $X$  is defined to be the function  $\varphi(t) : \mathbb{R} \rightarrow \mathbb{R}_{\geq 0}$  s.t.

$$\varphi(t) = \mathbf{E}(e^{tX})$$

if it converges. ┘

**Prop. (34.1.1.11).** moment generating function of the sum of independent random variables is just the product of the individual moment generating functions. ┘

**Prop. (34.1.1.12) [Moment Generating Functions and Moments].** If a real-valued random variable  $X$  has a moment generating function  $\varphi(t)$ , then for any  $n \in \mathbb{N}$ ,

$$\varphi^{(n)}(0) = \mathbf{E}(X^n).$$

┘

*Proof:* ? □

**Prop. (34.1.1.13) [Distribution Determined by Moment Generating Functions].** If two real-valued random variables  $X_1, X_2$  has the same moment generating function, then  $X_1$  and  $X_2$  has the same distribution function. ┘

*Proof:* ? □

### Special Random Variables

**Def. (34.1.1.14) [Normal Distributions].**  $\mathcal{N}(\mu, \sigma^2)$ . ┘

## 2 Convergence of Laws and Central Limit Theorems

**Thm. (34.1.2.1) [Central Limit Theorem].** ┘

### Special Random Variables

**Prop. (34.1.2.2) [Normal Approximation of Binomial Probabilities].** Let  $X$  be the random variable with parameter  $(n, p)$  that represents the number of successes in  $n$  independent trials when each trial is a success with probability  $p$ , then for  $n$  large, by the central limit theorem (34.1.2.1),

$$\frac{X - np}{\sqrt{np(1-p)}}$$

will approximately be a standard normal random variable. ┘

**Remark (34.1.2.3).** This normal approximation will in general be quite good for values of  $n$  satisfying  $np(1p) \geq 10$ . ┘

**Prop. (34.1.2.4) [Poisson Approximation of Binomial Probabilities].** Let  $X$  be the random variable with parameter  $(n, p)$  that represents the number of successes in  $n$  independent trials when each trial is a success with probability  $p$ , then ? ┘

### 3 Conditional Expectations

### 4 Stochastic Processes

References are [Revuz-Yor, Continuous Martingales and Brownian Motion].

**Def. (34.1.4.1) [Measurable Time Process].** A **measurable time process** on  $\Omega$  is a family of random variables  $X = (X_t)_{t \in \mathbb{R}_{\geq 0}}$  s.t. the map  $\Omega \times \mathbb{R} \rightarrow \mathbb{R} : (\omega, t) \mapsto X_t(\omega)$  is  $\mathcal{F} \otimes \mathcal{B}(\mathbb{R}_{\geq 0})$ -measurable.

$X$  is called a **continuous time process** if for a.e.  $\omega \in \Omega$ , the map  $\mathbb{R}_{\geq 0} \rightarrow \mathbb{R} : t \mapsto X_t(\omega)$  is continuous.

$X$  is called a **cadlag time process** if for a.e.  $\omega \in \Omega$ , the map  $\mathbb{R}_{\geq 0} \rightarrow \mathbb{R} : t \mapsto X_t(\omega)$  is continuous on the right with limits on the left.

$X$  is said to be **increasing** if  $X$  is a.e. right continuous,  $X_0 = 0$ , and  $X_s \leq X_t$  a.e. for any  $s < t \in \mathbb{R}_{\geq 0}$ .  $\perp$

**Def. (34.1.4.2) [Filtered Probability Spaces].** Given a probability space  $(\Omega, \mathcal{F}, \mathbf{P})$ , a **filtration** on this space is a family  $\mathbf{F} = (\mathcal{F}_t)_{t \in \mathbb{R}_{\geq 0}}$  of  $\sigma$ -algebras on  $\Omega$  s.t.  $\cup_t \mathcal{F}_t \subset \mathcal{F}$ , and

- $\mathcal{F}_s \subset \mathcal{F}_t$  whenever  $s < t$ .
  - For any  $t \in \mathbb{R}_{\geq 0}$ ,  $\mathcal{F}_t = \cap_{u>t} \mathcal{F}_u$ .
  - $\mathcal{F}_0$  contains all  $(\mathbf{P}, \mathcal{F})$ -negligible sets of  $\mathcal{F}$ .
- $\perp$

**Def. (34.1.4.3) [F-adapted Processes].** Let  $(\Omega, \mathcal{F}, \mathbf{F}, \mathbf{P})$  be a filtered probability space, then a measurable time process (34.1.4.1)  $X = (X_t)$  is said to be **F-adapted** if for any  $t \in \mathbb{R}_{\geq 0}$ ,  $X_t$  is  $\mathcal{F}_t$ -measurable.  $\perp$

**Def. (34.1.4.4) [F-Progressively Measurable Processes].** Let  $(\Omega, \mathcal{F}, \mathbf{F}, \mathbf{P})$  be a filtered probability space, then a measurable time process  $X = (X_t)$  is said to be **progressively measurable** w.r.t.  $\mathbf{F}$  if for any  $t \in \mathbb{R}_{\geq 0}$ , the map

$$\Omega \times [0, t] \rightarrow \mathbb{R} : (\omega, s) \mapsto X_s(\omega)$$

is  $\mathcal{F}_t \times \mathcal{B}([0, t])$  measurable.  $\perp$

**Prop. (34.1.4.5).** Any right continuous  $\mathbf{F}$ -adapted time process  $X$  is  $\mathbf{F}$ -progressively measurable.

Any  $\mathbf{F}$ -progressively measurable process  $X$  is  $\mathbf{F}$ -adapted.

If  $X$  is  $\mathbf{F}$ -progressively measurable, then

$$\mathbf{E}(\int_0^\infty X_t dt) = \int_0^\infty \mathbf{E}(X_t) dt.$$
 $\perp$

*Proof:* ?  $\square$

**Def. (34.1.4.6) [Processes with the same Law].** Let  $X = (X_t), Y = (Y_t)$  be two processes on  $\Omega$ , then they are said to have the same law, denoted by  $X \stackrel{\text{law}}{=} Y$ , if for any  $n \in \mathbb{Z}_+$  and  $(t_1, \dots, t_n) \in \mathbb{R}_{\geq 0}$ ,

$$(X_{t_1}, \dots, X_{t_n}) \stackrel{\text{law}}{=} (Y_{t_1}, \dots, Y_{t_n}).$$
 $\perp$

**Def. (34.1.4.7) [Modifications of Processes].** Let  $X, Y$  be two processes on  $\Omega$ , then  $X$  is called a **modification** of  $Y$  if for any  $t \in \mathbb{R}_{\geq 0}$ ,  $\mathbf{P}(X_t = Y_t) = 1$ . And  $X$  is called **indistinguishable** from  $Y$  if  $\{\omega : X_t(\omega) = Y_t(\omega), \forall t\}$  is measurable and  $\mathbf{P}(X_t = Y_t, \forall t) = 1$ .  $\lrcorner$

**Thm. (34.1.4.8) [Continuous Modifications, Kolmogorov].** If  $X = (X_t)$  is a time process on  $\Omega$  satisfies: there exists  $C, p, \varepsilon \in \mathbb{R}_+$  s.t. for any  $t, s \in \mathbb{R}_{\geq 0}$ ,

$$\mathbf{E}(|X_t - X_s|^p) \leq C|t - s|^{1+\varepsilon}.$$

Then this process admits a modification  $(\tilde{X}_t)$  which is a.e. continuous (34.1.4.1).  $\lrcorner$

*Proof:* Cf. [Stochastic Differential Equations and Diffusion Processes 1989] P20.  $\square$

**Prop. (34.1.4.9) [Processes Convergences].** A sequence of processes  $(Z^n)_{n \in \mathbb{Z}_+}$  **converges in  $L^2(\Omega \times [0, T])$**  to a process  $Z$  if  $\mathbf{E} \int_0^T |Z_s^n - Z_s|^2 ds$  converges to 0.

And it is said to **converge uniformly on compact subsets in probability** to  $Z$  if for any  $t \in \mathbb{R}_+$ ,  $\sup_{0 \leq s \leq t} |Z_s^n - Z_s|$  converges to 0 in probability.  $\lrcorner$

## 5 Martingales

**Thm. (34.1.5.1) [No-Arbitrage Implies Semi-Martingale].** Let  $S$  be an adapted cadlag process that is locally bounded and satisfies the no-free-lunch-with-vanishing-risk property for simple integrands, then  $S$  is a semi-martingale.  $\lrcorner$

*Proof:* Cf. [Mathematical Methods for Financial Markets] P86.  $\square$

### Markov Processes

**Def. (34.1.5.2) [Markov Kernels].** Let  $(X, \mathcal{A}), (Y, \mathcal{B})$  be measurable spaces, a **Markov kernel** from  $(X, \mathcal{A})$  to  $(Y, \mathcal{B})$  is a map  $\kappa : X \times \mathcal{B} \rightarrow [0, 1]$  s.t.

- For any  $B \in \mathcal{B}$ , the map  $x \mapsto \kappa(x, B)$  is  $\mathcal{A}$ -measurable.
  - For any  $x \in X$ , the map  $B \mapsto \kappa(x, B)$  is a probability measure on  $(Y, \mathcal{B})$ .
- $\lrcorner$

**Prop. (34.1.5.3).** Let  $(X, \mathcal{A})$  be a measurable space and  $P(x, dy)$  is a Markov kernel on  $X$ . Then  $P$  acts both on the the space of (integrable) measurable functions on  $X$  and the space of measures (of finite mass) on  $X$  by:

$$(P\varphi)(x) = \int_X \varphi(y) P(x, dy), \quad (P\mu)(A) = \int_X P(x, A) d\mu(x).$$

In particular,

$$\mu(P\varphi) = P(\mu)(\varphi).$$
 $\lrcorner$

**Thm. (34.1.5.4) [Harris Ergodic Theorem].** Let  $(X, \mathcal{A})$  be a measurable space with a Markov kernel  $P(x, dy)$  on  $X$ . Suppose

- There exists a measurable function  $V : X \rightarrow \mathbb{R}_+$  and  $K \in \mathbb{R}_{\geq 0}, \gamma \in (0, 1)$  s.t.

$$PV(x) \leq \gamma V(x) + K.$$

- There exists  $\alpha \in (0, 1)$ ,  $\varepsilon \in \mathbb{R}_+$  and a probability measure  $\nu$  on  $X$  s.t.

$$\inf_{x \in X: V(x) \leq \frac{2K}{1-\gamma} + \varepsilon} P(x, -) \geq \alpha \nu(-).$$

Then  $P$  admits a unique invariant measure  $\mu_*$  (under the action defined in (34.1.5.3)) s.t.  $\int_X V(x) d\mu_*(x) < \infty$ , and there exists  $C \in \mathbb{R}_+$  and  $\lambda \in (0, 1)$  s.t.

$$\|P^n \varphi - \mu_*(\varphi)\|_V \leq C \lambda^n \|\varphi\|_V,$$

for any integrable measurable function  $\varphi$  on  $X$ , where  $\|\varphi\|_V = \left\| \frac{\varphi(x)}{1+V(x)} \right\|_\infty$ .  $\lrcorner$

*Proof:* Use notations as in (34.1.5.5), for the existence of the invariant measure  $\mu_*$  s.t.  $\mu_*(V) < \infty$ , denote the measures  $\mu_n = P^n \delta_x$ , then  $\mu_n$  is a Cauchy sequence w.r.t. the metric  $\rho_\beta$  (34.1.5.5). Since the space of measures with finite total mass is clearly complete w.r.t.  $\rho_\beta$ , there exists a measure  $\mu_*$  s.t.  $\mu_n \rightarrow \mu_*$ . Then because  $P$  is a contraction, we see  $P\mu_* = \mu_*$ . And  $\mu_*(V) < \infty$ .

Then we have  $\|\varphi\|_1 \leq \|\varphi\|_\beta \leq \beta^{-1} \|\varphi\|_1 \leq \beta^{-1} \|\varphi\|_V$ . So

$$\|P^n \varphi\|'_1 \leq \|P^n \varphi\|'_\beta \leq \lambda^n \|\varphi\|'_\beta \leq \lambda^n \beta^{-1} \|\varphi\|_V.$$

or equivalently:

$$|P^n \varphi(x) - P^n \varphi(y)| \leq \lambda^n \beta^{-1} \|\varphi\|_V (2 + V(x) + V(y))$$

for a.e.  $x, y \in X$ . Thus

$$|P^n \varphi(x) - \mu_*(\varphi)| \leq \int_X |P^n \varphi(x) - P^n \varphi(y)| d\mu_*(y) \leq \lambda^n \beta^{-1} \|\varphi\|_V (2 + V(x) + \mu_*(V)).$$

$\square$

**Lemma (34.1.5.5).** Under the assumption of (34.1.5.4), there exists  $\lambda \in (0, 1)$  and  $\beta \in (0, 1]$  s.t.

- $\|P\varphi\|'_\beta \leq \lambda \|\varphi\|'_\beta$  for any measurable function  $\varphi$  where

$$d_\beta(x, y) = \begin{cases} 0 & , x = y \\ 2 + \beta(V(x) + V(y)) & , x \neq y \end{cases}, \quad \|\varphi\|'_\beta = \sup_{x \neq y \in X} \frac{\varphi(x) - \varphi(y)}{d_\beta(x, y)},$$

- $\rho_\beta(P\mu_1, P\mu_2) \leq \lambda \rho_\beta(\mu_1, \mu_2)$  for any two probability measures  $\mu_1, \mu_2$  on  $X$ , where

$$\|\varphi\|_\beta = \left\| \frac{\varphi(x)}{1 + \beta V(x)} \right\|_\infty, \quad \rho_\beta(\mu_1, \mu_2) = \sup_{\varphi: \|\varphi\|_\beta \leq 1} \int_X \varphi(x) d(\mu_1 - \mu_2)(x).$$

$\lrcorner$

*Proof:* Firstly we claim that  $\|\varphi\|'_\beta = \min_{c \in \mathbb{R}} \|\varphi + c\|_\beta$ : It is obvious that  $\|\varphi\|'_\beta \leq \|\varphi\|_\beta$ , so  $\|\varphi\|'_\beta \leq \inf_{c \in \mathbb{R}} \|\varphi + c\|_\beta$ .

Conversely, if  $\|\varphi\|'_\beta \leq 1$ , define  $c = \inf_x (1 + \beta V(x) - \varphi(x))$ . Because for any  $x, y \in X$ ,

$$\varphi(x) \leq |\varphi(y)| + |\varphi(x) - \varphi(y)| \leq |\varphi(y)| + 2 + \beta V(x) + \beta V(y),$$

we have  $1 + \beta V(x) - \varphi(x) \geq -1 - \beta V(y) - |\varphi(y)|$ , so  $c \in \mathbb{R}$ . And it is clear that

$$1 + \beta V(x) \geq \varphi(x) + c = \min_y (\varphi(x) + 1 + \beta V(y) - \varphi(y)) \geq \min_y (1 + \beta V(y) - \|\varphi\|'_\beta \cdot d_\beta(x, y)) \geq -(1 + \beta V(x)).$$

Now we prove the assertion: For item1: Suppose  $\|\varphi\|'_\beta = 1 = \|\varphi\|_\beta$ , we need to show that  $|P\varphi(x) - P\varphi(y)| \leq \lambda(2 + \beta(V(x) + V(y)))$  for  $x \neq y$ . Denote

$$R = \frac{2K}{1-\gamma} + \varepsilon, \quad \gamma_0 = \gamma + 2K/R \in (0, 1), \quad \gamma_1 = (2 + \beta R \gamma_0)/(2 + \beta R) \in (\gamma_0, 1).$$

Take  $\beta = \alpha_0/K$  for some  $\alpha_0 \in (0, \alpha)$  and  $\gamma_2 = \max(1 - (\alpha - \alpha_0), \gamma_0)$ , then if  $V(x) + V(y) < R$ , then we can define a Markov transformation  $\tilde{P}(x, dy) = \frac{1}{1-\alpha}P(x, dy) - \frac{\alpha}{1-\alpha}d\nu(y)$ . Then

$$\begin{aligned} |P\varphi(y) - P\varphi(x)| &= (1 - \alpha)|\tilde{P}\varphi(x) - \tilde{P}\varphi(y)| \\ &\leq 2(1 - \alpha) + (1 - \alpha)\beta(\tilde{P}V(x) + \tilde{P}V(y)) \\ &\leq 2(1 - \alpha) + \beta(PV(x) + PV(y)) \\ &\leq 2(1 - \alpha) + \beta\gamma(V(x) + V(y)) + 2\beta K \\ &\leq 2(1 - (\alpha - \alpha_0)) + \beta\gamma(V(x) + V(y)) \\ &\leq \gamma_2 d_\beta(x, y). \end{aligned}$$

And if  $V(x) + V(y) \geq R$ , then by the hypothesis,

$$\begin{aligned} |P\varphi(y) - P\varphi(x)| &\leq 2 + \beta(PV(x) + PV(y)) \\ &\leq 2 + \lambda\beta(V(x) + V(y)) + 2\beta K \\ &\leq 2 + \beta\gamma_0(V(x) + V(y)) \\ &\leq 2\gamma_1 + \beta\gamma_1(V(x) + V(y)) \\ &\leq \gamma_1 d_\beta(x, y). \end{aligned}$$

And item2 follows from item1 because of (34.1.5.3) and the fact  $\rho_\beta$  is dual to  $\|\cdot\|'_\beta$  by what we proved at the beginning.  $\square$

### Finite Markov Processes

**Def. (34.1.5.6) [Markov Chain].** A (finite discrete) **Markov chain** is a discrete stochastic process  $\{X_t\}_{t \in \mathbb{N}}$  with the same phase space  $S \in \text{finSet}$  s.t. for any  $t$ ,

$$\mathbf{P}(X_{t+1} = S_j | X_t = S_{i_t}, X_{t-1} = S_{i_{t-1}}, \dots, X_0 = S_{i_0}) = \mathbf{P}(X_{t+1} = S_j | X_t = S_{i_t}).$$

This property is called the **Markov property** or **memoryless property**.  $\lrcorner$

**Prop. (34.1.5.7) [Markov Chains and Stochastic Matrices].** For any Markov chain  $\{X_t\}_{t \in \mathbb{N}}$ , the transition matrices form a family of stochastic matrices (3.5.14.9)  $\{p_{ij}(t)\}_{t \in \mathbb{N}}$ . And it is called a **stationary stochastic matrix** if  $p_{ij}(t)$  is independent of  $t$ .

Conversely, any family of stochastic matrices  $\{p_{ij}(t)\}_{t \in \mathbb{N}}$  defines a Markov chain.  $\lrcorner$

**Thm. (34.1.5.8) [Limiting Behavior of Irreducible Markov Chains].** Let  $X = \{X_t\}_{t \in \mathbb{N}}$  be a stationary finite Markov chain with (right) transition matrix  $P$  on a phase space  $S$  of size  $n$ . Suppose  $P$  is irreducible (3.5.14.4).

- The limit probability distribution exists for any initial distribution iff  $\lim_{k \rightarrow \infty} P^k$  exists.

- If  $P$  is primitive, by (3.5.14.6), if  $\varpi$  is the Perron vector (3.5.14.2) for  $P$ , then the limit of the probability distribution is just

$$\frac{\varpi(\mathbf{e}/n)^t}{(\mathbf{e}/n)^t \varpi} p(0) = \varpi \mathbf{e}^t p(0) = \varpi,$$

which is independent of the initial distribution  $p(0)$ . In this case,  $X$  is called an **aperiodical Markov chain**.

- If  $P$  is imprimitive, then the same argument as above but using (3.5.14.14) shows that the Cesàro limit

$$\lim_{k \rightarrow \infty} \frac{\mathbf{1} + P + P^2 + \dots + P^{k-1}}{k} = \mathbf{e} \varpi^t,$$

and

$$\lim_{k \rightarrow \infty} \frac{p^t(0) + p^t(1) + \dots + p^t(k-1)}{k} = \varpi^t.$$

In this case,  $X$  is called an **periodical Markov chain** (with period equal to the index of imprimitivity of  $P$ ).

- Whether or not  $P$  is primitive, the components of  $\varpi$  determines the expected value of long-time frequency of  $S_i$  appearing in the Markov sequence.

Thus  $\varpi^t$  is called the **stationary distribution vector** of this Markov chain.  $\lrcorner$

**Thm. (34.1.5.9) [Limiting Behavior of Reducible Markov Chains].** Let  $X = \{X_t\}_{t \in \mathbb{N}}$  be a stationary finite Markov chain with (right) transition matrix  $P$  on a phase space  $S$  of size  $n$ . Suppose  $P$  is reducible (3.5.14.4) and the states are ordered s.t.  $P$  is in the canonical form

$$P = \begin{bmatrix} T_{11} & T_{12} \\ & T_{22} \end{bmatrix}$$

and if  $\varpi_j$  are Perron vectors for  $P_{jj}$  ( $r+1 \leq j \leq m$ ), then  $\mathbf{1} - T_{11}$  is non-singular, and

•

$$\lim_{k \rightarrow \infty} \frac{\mathbf{1} + P + \dots + P^{k-1}}{k} = \begin{bmatrix} 0 & (1 - T_{11})^{-1} T_{12} E \\ 0 & E \end{bmatrix}$$

where  $E = \text{diag}(\mathbf{e} \varpi_{r+1}^t, \dots, \mathbf{e} \varpi_m^t)$ .

- The limit probability distribution exists for any initial distribution iff  $\lim_{k \rightarrow \infty} P^k$  exists, which is the case when  $P_{r+1, r+1}, \dots, P_m$  are all primitive. In which case,

$$\lim_{k \rightarrow \infty} P^k = \begin{bmatrix} 0 & (1 - T_{11})^{-1} T_{12} E \\ 0 & E \end{bmatrix}.$$

$\lrcorner$

*Proof:*

$\square$

## Lévy Processes

Lévy processes are generalizations of random walks to continuous time.

### Brownian Motion

**Remark (34.1.5.10).** The motion of a Brownian particle in  $\mathbb{R}^N$  with a potential field  $U$  is described by a stochastic process  $q = (q_1(t), \dots, q_N(t)) \in \mathbb{R}^N$ . (Which means that for each time  $t$ , there is a random variable  $q(t) \in \mathbb{R}^N$  s.t. the dependence in  $t$  is regular in some sense.)

All in all, the density of the probability that the motion with restrict  $q(a) = \underline{a}, q(b) = \underline{b}$  is a smooth curve  $\gamma : [a, b] \rightarrow \mathbb{R}^N$  is propositional to

$$e^{-S(\gamma)/\kappa}, \quad S(\gamma) = \int_a^b \left( \frac{1}{2} \dot{\gamma}^2 + U(\gamma) \right) dt$$

where  $\kappa$  is called the **diffusion coefficient**. ┘

**Remark (34.1.5.11).** It follows from Kolmogorov's theorem that the stochastic process is determined by the **correlations functions**:

$$\text{cor}(j_1, \dots, j_n; t_1, \dots, t_n) = \mathbf{E} \left( q_{j_1}(t_1) \cdot \dots \cdot q_{j_n}(t_n) \right).$$

┘

*Proof:* ?

### Simple Random Walks

#### 6 Brownian Motions

#### 7 Statistics

References are [INTRODUCTION TO PROBABILITY AND STATISTICS FOR ENGINEERS AND SCIENTISTS].

**Def. (34.1.7.1) [Inferential Statistics].** **Inferential statistics** is the art of learning from data.

To be able to draw logical conclusions from data, we usually make some assumptions about the probabilities of obtaining the different data values. The totality of these assumptions is referred to as a **probability model for the data**. ┘

**Def. (34.1.7.2) [Samples].** A set of independent random variables having a common distribution  $F$  is called a **sample** from the distribution  $F$ .

And a **statistic** is a random variable whose value is determined by the the sample data(variables).

┘

**Def. (34.1.7.3) [Sample Means, Sample Variances and Sample Standard Deviations].** Let  $n \in \mathbb{Z}_{\geq 2}$  and  $X_1, \dots, X_n$  be a random sample from a distribution  $F$  with mean  $\mu$  and variance  $\sigma$ ,

- Define the statistic

$$\overline{X} = \frac{\sum_{i=1}^{n-1} X_i}{n}$$

to be the sample mean.

- Define the statistic

$$S^2 = \frac{\sum_{i=1}^{n-1} (X_i - \bar{X})^2}{n-1},$$

called the **sample variance**, and define the statistic  $S = \sqrt{S^2}$ , called the **sample standard deviation**. ┘

**Prop. (34.1.7.4).**

$$\mathbf{E}(\bar{X}) = \mu, \quad \text{var}(\bar{X}) = \sigma^2/n, \quad \mathbf{E}(S^2) = \sigma^2.$$
┘

### Parameter Estimation

**Def. (34.1.7.5) [Statistical Estimates].** If the samples  $\{X_1, \dots, X_n\}$  are drawn from a distribution  $F_\theta$  depending on an unknown parameter  $\theta \in \mathbb{R}$ , any statistic (34.1.7.2) used to estimate the value of an unknown parameter  $\theta$  is called an **statistical estimator** of  $\theta$ . The observed value of the estimator is called the **statistical estimate**. ┘

**Def. (34.1.7.6) [Maximal Likelihood Estimates].** Situation as in (34.1.7.5), a **maximal likelihood estimate** is a estimate  $\hat{\theta}$  depending on  $X_1, \dots, X_n$  s.t.  $\hat{\theta}(x_1, \dots, x_n)$  is the value maximizing  $P_{F_\theta}(X_i = x_i)$ . And the function  $P_{F_\theta}(X_i = x_i)$  is called the **likelihood function** of  $\theta$ . ┘

**Def. (34.1.7.7) [Interval Estimates for Mean Values].** If the distribution is a normal distribution with an unknown mean  $\mu$  and known variance  $\sigma^2$ , then for  $\alpha \in (0, 1)$ , an  **$\alpha$ -interval estimate** of a the mean  $\mu$  is an interval  $I \subset \mathbb{R}$  s.t.  $P(\mu \in I : X) \geq 1 - \alpha$ .  $\alpha$  is called the **confidence level**. ┘

**Remark (34.1.7.8) [Interpreting the Confidence Level  $\alpha$ ].** The unknown mean is not a random variable, but the confidence level  $\alpha$  can be interpreted as follows: If you can do sampling arbitrarily many times and calculate the  $\alpha$ -confidence intervals, then the frequency that the unknown mean  $\mu$  is contained in the  $\alpha$ -confidence intervals is  $\alpha$ . ┘

*Proof:* ? □

### Hypothesis Testing

**Def. (34.1.7.9) [Statistical Hypotheses].** A **statistical hypothesis** is usually a statement about a set of parameters of a population distribution which is not known whether or not it is true. The statement is called the **null hypothesis**.

The **alternative hypothesis** is a hypothesis that is disjoint from the null hypothesis, usually just the back of the null hypothesis. ┘

**Def. (34.1.7.10) [Level of Significance].** The objective of a statistical test of a null hypothesis ( $H_0$ ) is not to explicitly determine whether or not it is true but rather to determine if its validity is consistent with the resultant data. We say the data **rejects** ( $H_0$ ) if we think it is inconsistent with the hypothesis, and we say the data **accepts** ( $H_0$ ) if we think it is consistent with the hypothesis.

The **level of significance** of a test is a value  $\alpha \in (0, 1)$  s.t. whenever the null hypothesis is true, its probability of being rejected is never greater than  $\alpha$ . ┘

**Def. (34.1.7.11) [ $p$ -Values of the Test].** When the distribution is a normal distribution having an unknown mean  $\mu$  and a known variance  $\sigma^2$ , and the null hypothesis is  $\mu = \mu_0$ , then the  **$p$ -value of a data** of a test is the probability that a data drawn from a normal distribution having mean value  $\mu_0$  and variance  $\sigma^2$  would be further than this data.

Then this data accepts  $\mu = \mu_0$  if its  $p$ -value is greater than the level of significance  $\alpha$ , and rejects otherwise. ┘

**Def. (34.1.7.12) [Critical Regions].**  $\{C_n \in \mathbb{R}^n\}$  is called a system of **critical regions** for the test if the rule of the test is designed s.t. the data  $(X_1, \dots, X_n)$  accepts  $(H_0)$  iff  $(X_1, \dots, X_n) \subset C_n$ . ┘

**Prop. (34.1.7.13) [Case of unknown variance: the  $t$ -test].** ┘

*Proof:* ? □

#### 1 Tauberian Theorems

**Thm. (35.1.1.1) [Wiener].** If  $Y$  is a closed translation-invariant space of  $L^1(\mathbb{R}^n)$  s.t.

$$Z(Y) \triangleq \cap_{f \in Y} \{s \in \mathbb{R}^n : \widehat{f}(s) = 0\} = \emptyset,$$

then  $Y = L^1(\mathbb{R}^n)$ .

┘

*Proof:* Cf. [Rud91]P228.

□

**Cor. (35.1.1.2).** If  $\varphi \in L^1(\mathbb{R}^n)$  and  $Y$  is the smallest closed translation-invariant subspace of  $L^1(\mathbb{R}^n)$  containing  $\varphi$ , then  $Y = L^1(\mathbb{R}^n)$  iff  $\widehat{\varphi}(t) \neq 0$  for any  $t \in \mathbb{R}^n$ .

┘

*Proof:* Notice  $Z(Y) = \cap_{f \in Y} \{s \in \mathbb{R}^n : \widehat{f}(s) = 0\} = \{t \in \mathbb{R}^n : \widehat{\varphi}(t) = 0\}$ .

□

**Thm. (35.1.1.3) [Karamata].** Let  $A(t) : \mathbb{R}_+ \rightarrow \mathbb{R}_{\geq 0}$  be a non-decreasing function s.t.

$$F(\sigma) = \int_0^\infty e^{-\sigma t} dA(t)$$

converges for all  $\sigma \in \mathbb{R}_+$ . Suppose  $c \in \mathbb{R}_{\geq 0}, w \in \mathbb{R}_+$  s.t.

$$\lim_{\sigma \rightarrow 0^+} F(\sigma) \sigma^w = c,$$

then we have

$$\lim_{X \rightarrow \infty} \frac{A(X)}{X^w} = \frac{c}{\Gamma(w+1)}.$$

┘

*Proof:* Cf. [Ten15].

□

**Prop. (35.1.1.4).** If  $f : \mathbb{R}_{\geq 1} \rightarrow \mathbb{R}$  is a non-decreasing function and  $\int_1^\infty \frac{f(t)-t}{t^2} dt$  converges, then  $f(x) \sim x, x \rightarrow \infty$ .

┘

*Proof:* Let  $F(x) = \int_1^x \frac{f(t)-t}{t^2} dt$ , then the hypothesis implies that for any  $\lambda > 1$  and  $\varepsilon > 0$ ,  $|F(\lambda x) - F(x)| < \varepsilon$  for  $x$  large.

Suppose there exists  $\lambda \in \mathbb{R}_{>1}$  and a sequence  $(x_n)_{n \in \mathbb{Z}_+}$  s.t.  $\lim_{n \rightarrow \infty} x_n = \infty$ , and  $f(x_n) \geq \lambda x_n$  for each  $n$ , then

$$F(\lambda x_n) - F(x_n) = \int_{x_n}^{\lambda x_n} \frac{f(t)-t}{t^2} dt \geq \int_{x_n}^{\lambda x_n} \frac{\lambda x_n - t}{t^2} dt = \int_1^\lambda \frac{\lambda - t}{t^2} dt = C$$

where  $C$  is a positive constant independent of  $n$ . This clearly contradicts the statement above.

A similar statement shows that there are no  $\lambda \in \mathbb{R}_{>1}$  and sequences  $(x_n)_{n \in \mathbb{Z}_+}$  s.t.  $\lim_{n \rightarrow \infty} x_n = \infty$ , and  $f(x_n) \leq \lambda^{-1} x_n$  for each  $n$ . So  $f(x) \sim x, x \rightarrow \infty$ .  $\square$

### Transcendental Tauberian Theorems

**Thm. (35.1.1.5) [Ikehara-Delange Tauberian theorem, Ikehara[Ike31]/ Wiener[Wie32]/ Delange[Del54]/ Kable[Kab08]].** Let  $F(s) = \sum_{n \in \mathbb{Z}_+} a_n n^{-s}$  be a Dirichlet series with  $a_n \in \mathbb{R}_{\geq 0}$  s.t.

$$F(s) = \frac{1}{(s-a)^{\omega+1}} \sum_{j \in [q]} g_j(s) \log^j \left( \frac{1}{s-a} \right) + g(s).$$

where  $\omega \in \mathbb{R}, q \in \mathbb{N}$ , and  $g_i(s), g(s)$  are holomorphic on a nbhd of the half-plane  $\{s \in \mathbb{C} : \operatorname{Re}(s) \geq a\}$  and  $g_q(a) \neq 0$ . Then

- If  $\omega \notin \mathbb{Z}_-$ , for any  $X \in \mathbb{R}_+$ , we have

$$\mathcal{M}_a(X) \sim \frac{g_q(a)}{a\Gamma(\omega+1)} X^a \log^\omega X \log_{(2)}^q X \text{ (35.1.2.2)}.$$

- If  $\omega = -m - 1$  for some  $m \in \mathbb{N}$  and  $q \in \mathbb{Z}_+$ , we have

$$\mathcal{M}_a(X) \sim (-1)^m m! \frac{q g_q(a)}{a} \frac{X^a \log_{(2)}^{q-1} X}{\log^{m+1} X}.$$

┘

*Proof:* ?

$\square$

## 2 Averages of Arithmetic Functions

**Notation (35.1.2.1).**

- Let  $f : \mathbb{Z}_+ \rightarrow \mathbb{C}$  be a function.

┘

**Def. (35.1.2.2) [Partial Sums].** Define  $\mathcal{M}_f : \mathbb{R}_{\geq 1} \rightarrow \mathbb{C}$ :

$$\mathcal{M}_f(X) = \sum_{n \in [X]_+} f(n).$$

┘

**Prop. (35.1.2.3).** If  $f : \mathbb{R}_+ \rightarrow \mathbb{C}$  is a  $C^1$  function, then for any  $a < b \in \mathbb{R}_+$ , we have

$$\sum_{a < n \leq b} f(n) = \int_a^b (f(t) + \psi(t)f'(t)) dt + \frac{1}{2}(f(b) - f(a)).$$

where  $\psi(t) = t - \lfloor t \rfloor - \frac{1}{2}$ . ┘

**Prop. (35.1.2.4).** If  $f$  is real-valued, monotone and continuous, then for any  $X \in \mathbb{R}_{\geq 1}$ , we have

$$\left| \mathcal{M}_f(X) - \int_1^X f(y) dy \right| \leq |f(X)| + |f(1)|.$$

┘

**Cor. (35.1.2.5).** For  $k \in \mathbb{Z}_+$  and any  $X \in \mathbb{R}_{\geq 1}$ ,

$$\sum_{n \in [X]_+} \log^k n = X P_k(\log X) + O(\log^k X), \quad P_k(X) = \sum_{m \in [k]} (-1)^{k-m} \frac{k!}{m!} X^m.$$

And

$$\sum_{n \in [X]_+} \log^k(X/n) = k!X + O(\log^k X).$$

┘

*Proof:* For the second equation, notice that

$$\int_1^X \log^k(X/t) dt = -\log^k X + k \int_1^X \log^{k-1}(X/t) dt$$

□

**Cor. (35.1.2.6).** For any  $\varepsilon \in \mathbb{R}_+$  and  $X \in \mathbb{R}_{\geq 1}$ ,

$$\left| \sum_{n \in [X]_+} \frac{1}{n^{1+\varepsilon}} - \varepsilon^{-1}(1 - X^{-\varepsilon}) \right| \leq 1 + X^{-1-\varepsilon}.$$

In particular,

$$\left| \zeta(1+\varepsilon) - \varepsilon^{-1} \right| \leq 1.$$

┘

**Prop. (35.1.2.7)[Estimates for Decreasing Functions].** If  $f$  extends to a  $C^1$ , non-increasing function  $f : \mathbb{R}_{\geq 1} \rightarrow \mathbb{R}_+$  and  $\lim_{x \rightarrow \infty} f(x) = 0$ , then for  $X \in \mathbb{R}_{\geq 1}$ ,

$$\left| \mathcal{M}_f(X) - \int_1^X f(y) dy - \gamma_f \right| \leq f(X), \quad \gamma_f = f(1) + \int_1^\infty \{y\} df(y).$$

┘

*Proof:*

$$\begin{aligned}
& \mathcal{M}_f(X) - \int_1^X f(y) dy \\
&= \int_1^2 (f(1) - f(y)) dy + \int_2^3 (f(2) - f(y)) dy + \dots + \int_{[X]}^X (f([X]) - f(y)) dy \\
&= \int_0^1 (f(1) - f(1 + \{y\})) d\{y\} + \int_0^1 (f(2) - f(2 + \{y\})) d\{y\} + \dots + \int_0^{\{X\}} (f([X]) - f([X] + \{y\})) d\{y\} \\
&= f(1) - f(X) + \int_1^X \{y\} df(y) \\
&= \gamma_f - \int_X^\infty \{y\} df(y) - f(X)
\end{aligned}$$

□

**Cor. (35.1.2.8) [Stieltjes Constant].** For  $k \in \mathbb{N}$  and  $X \in \mathbb{R}_+$ ,

$$\left| \sum_{n \in [X]_+} \frac{\log^k n}{n} - \frac{1}{k+1} \log^{k+1}(X) - (-1)^k k! \gamma_k \right| \leq \frac{\log^k X}{X},$$

where  $\gamma_k$  is called the **Stieltjes-constant**. For  $k = 0$ , this is called the **Euler's constant**

$$\gamma_0 = 1 - \int_1^\infty \{y\} y^{-2} dy \approx 0.57215.$$

┘

**Prop. (35.1.2.9) [Summation by Parts].** If  $f, g : \mathbb{Z}_+ \rightarrow \mathbb{R}$  where  $g$  extends to a  $C^1$ -function on  $\mathbb{R}_{\geq 1}$ , then by (12.3.5.7), for each  $X \in \mathbb{R}_{\geq 1}$ , we have

$$\mathcal{M}_{fg}(X) = \mathcal{M}_f(X)g(X) - \int_1^X \mathcal{M}_f(t)g'(t)dt.$$

In particular,

$$\sum_{n \in [X]_+} f(n) \log \frac{X}{n} = \int_1^X \mathcal{M}_f(t) t^{-1} dt.$$

┘

**Thm. (35.1.2.10) [Estimates for Convolution Functions].** If  $f = g * h : \mathbb{Z}_+ \rightarrow \mathbb{R}$  where  $h$  extends to a monotone and bounded continuous function on  $\mathbb{R}_{\geq 0}$ , then for any  $X \in \mathbb{R}_+$ ,

$$\mathcal{M}_f(X) = \int_0^X F(y) dy + O(\mathcal{M}_{|g|}(X)), \quad F(y) = \sum_{m \in [y]_+} \frac{g(m)}{m} h\left(\frac{y}{m}\right).$$

┘

*Proof:*

$$\mathcal{M}_f(X) = \sum_{m \in [X]_+} g(m) \mathcal{M}_h(X/m).$$

After replacing  $\mathcal{M}_h(y)$  by  $\int_0^y h(t)dt + O(1)$  (35.1.2.4), we get

$$\mathcal{M}_f(X) = \int_0^X \sum_{m \in [X]_+} \frac{g(m)}{m} h\left(\frac{y}{m}\right) dy + O\left(\sum_{m \in [X]_+} |g(m)|\right) = \int_0^X F(y) dy + O(\mathcal{M}_{|g|}(X)).$$

□

**Cor. (35.1.2.11).** For  $X \in \mathbb{R}_{\geq 1}$ , we have

$$\sum_{n \in [X]_+} \frac{\phi(n)}{n} = \frac{6}{\pi^2} X + O(\log X).$$

┘

*Proof:* Because  $\frac{\phi(n)}{n} = \frac{\mu(n)}{n} * \mathbf{1}$ , we can apply (35.1.2.10):

$$F(y) = \sum_{m \in [y]_+} \frac{\mu(m)}{m^2} = \frac{1}{\zeta(2)} + O\left(\frac{1}{y + 1/2}\right).$$

And

$$\int_0^X F(y) dy = \frac{X}{\zeta(2)} + O\left(\int_0^X \frac{1}{y + 1/2} dy\right) = \frac{X}{\zeta(2)} + O(\log X).$$

□

**Cor. (35.1.2.12).** There exists  $C \in \mathbb{R}_+$  s.t. for any  $\delta \in \mathbb{R}_+$ , when  $Y \in \mathbb{R}_+$  is large,

$$\#\{n \leq X : \phi(n) \geq \delta n\} \geq \left(\frac{6}{\pi^2} - \delta\right)X - C \log Y.$$

┘

*Proof:* This follows easily from (35.1.2.11). □

### Summation Formulae

**Prop. (35.1.2.13) [Dirichlet's Hyperbola method].** If  $f = g * h : \mathbb{Z}_+ \rightarrow \mathbb{C}$ , then for any  $X \in \mathbb{R}_+$ ,

$$\mathcal{M}_f(X) = \sum_{a \in [\sqrt{X}]_+} g(a) \mathcal{M}_h\left(\frac{X}{a}\right) + \sum_{b \in [\sqrt{X}]_+} h(b) \mathcal{M}_g\left(\frac{X}{b}\right) - \mathcal{M}_g(\sqrt{X}) \mathcal{M}_h(\sqrt{X}).$$

We can use this to estimate  $\mathcal{M}_f(X)$ . ┘

**Def. (35.1.2.14)  $[\psi_k(x)]$ .** For any  $k \in \mathbb{N}$ , denote  $\psi_k(x) = B_k(\{x\})$ , where  $B_k(X)$  is the Bernoulli-polynomial (10.7.1.13), then each  $\psi_k$  is continuous and periodic of period 1 by (10.7.1.14), and we have

$$\sum_{k \in \mathbb{N}} \psi_k(x) \frac{T^k}{k!} = \frac{T e^{T\{x\}}}{e^T - 1}.$$

When  $k \geq 2$ , we have the absolutely convergent series expansion

$$\psi_k(x) = -k! \sum_{n \in \mathbb{Z}^\times} \frac{e^{2\pi i n x}}{(2\pi i n)^k}.$$

by (10.7.1.13) and (12.11.5.4). And when  $k = 1$ , we have the expansion

$$\psi_1(x) = - \sum_{n \in \mathbb{Z}_+} \frac{\sin(2\pi nx)}{\pi n}$$

which converges pointwise and boundedly away from  $x \in \mathbb{Z}$  by (12.11.5.3). In particular, for any  $N \in \mathbb{Z}_+$  and  $x \in \mathbb{R}$ , we have

$$\psi_1(x) = - \sum_{n \in [N]_+} \frac{\sin(2\pi nx)}{\pi n} + O\left(\frac{1}{1 + \{x\}N}\right).$$

┘

*Proof:* Compute the Fourier-coefficients. The last assertion follows from Abel-summation.  $\square$

**Thm. (35.1.2.15) [Euler-Maclaurin Formula].** Let  $a < b \in \mathbb{Z}$  and  $k \in \mathbb{Z}_+$ . Suppose  $f \in C^k([a, b])$ , then we have

$$\sum_{n \in \mathbb{Z}, a < n \leq b} f(n) = \int_a^b \left( f(x) - \frac{(-1)^k}{k!} \psi_k(x) f^{(k)}(x) \right) dx + \sum_{l \in [k]_+} \frac{(-1)^l}{l!} \left( f^{(l-1)}(b) - f^{(l-1)}(a) \right) B_l \quad (35.1.2.14).$$

where  $B_l$  are the Bernoulli-numbers (10.7.1.12).

In particular, we have

$$\sum_{n \in \mathbb{Z}, a < n \leq b} f(n) = \int_a^b \left( f(x) + \left( \{x\} - \frac{1}{2} \right) f'(x) \right) dx + \frac{1}{2} (f(b) - f(a)).$$

┘

*Proof:* We prove this by induction. For  $k = 1$ , the assertion follows by integration by part. And from  $k$  to  $k + 1$  we use the properties of Bernoulli-polynomials to get that

$$\begin{aligned} \int_a^b \frac{(-1)^k}{k!} \psi_k(x) f^{(k)}(x) dx &= \int_a^b \frac{(-1)^k}{(k+1)!} f^{(k)}(x) d(\psi_{k+1}(x)) \\ &= \int_a^b \frac{(-1)^{k+1}}{(k+1)!} \psi_{k+1}(x) f^{(k+1)}(x) dx - \frac{(-1)^{k+1}}{(k+1)!} (f^{(k)}(b) - f^{(k)}(a)). \end{aligned}$$

$\square$

**Cor. (35.1.2.16).** For each  $N \in \mathbb{Z}_+$  and  $k \in \mathbb{N}$ , we have

$$\sum_{n \in [N]_+} n^k = \frac{N^{k+1}}{k+1} + \sum_{l \in [k]_+} \frac{(-1)^l}{l!} k(k-1) \dots (k-l+2) B_l N^{k-l+1} = \sum_{i \in [k]} (-1)^i \binom{k+1}{i} B_i N^{k+1-i}.$$

┘

**Prop. (35.1.2.17).** If  $a < b \in \mathbb{Z}$  and  $f \in C^1([a, b])$ , then we have

$$\sum_{n \in [a, b] \cap \mathbb{Z}} f(n) - \frac{1}{2} (f(a) + f(b)) = \sum_{n \in [-N, N] \cap \mathbb{Z}} \int_a^b f(x) dx + O\left(\int_a^b \frac{|f'(x)|}{1 + N\{x\}} dx\right).$$

┘

### 3 Average of Multiplicative Functions

**Prop. (35.1.3.1).** If  $f : \mathbb{Z}_+ \rightarrow \mathbb{R}_{\geq 0}$  is multiplicative (2.6.1.19), then for each  $X \in \mathbb{R}_+$ , we have

$$\mathcal{M}_f(X) \leq X \sum_{n \in [X]_+} \frac{f(n)}{n} \leq X \prod_{p \in \text{Prime} \leq X} \left( \sum_{k \in \mathbb{N}} f(p^k) p^{-k} \right).$$

And if  $f$  is non-decreasing on prime powers, then  $h = \mu * f$  is non-negative, in fact  $h(1) = 1$  and  $h(p^k) = f(p^k) - f(p^{k-1})$ . Writing  $f = h * \mathbf{1}$ , we get

$$\begin{aligned} \mathcal{M}_f(X) &= \sum_{m \in [X]_+} h(m) \left\lfloor \frac{X}{m} \right\rfloor \leq X \sum_{m \in [X]_+} \frac{h(m)}{m} \\ &\leq X \cdot \prod_{p \in \text{Prime} \leq X} \left( \sum_{k \in \mathbb{N}} h(p^k) p^{-k} \right) \\ &= X \cdot \prod_{p \in \text{Prime} \leq X} \left( \sum_{k \in \mathbb{N}} f(p^k) p^{-k} \right) \left( 1 - \frac{1}{p} \right) \end{aligned}$$

┘

**Cor. (35.1.3.2).** Situation as in (35.1.3.1), if  $f$  is supported on square-free numbers, then we can take  $h : \mathbb{Z}_+ \rightarrow \mathbb{R}$  to be the multiplicative function s.t. for each  $p \in \text{Prime}$  and  $k \in \mathbb{Z}_+$ , we have

$$h(p^k) = \begin{cases} \max(f(p) - 1, 0) & , k = 1 \\ 0 & , k \geq 2 \end{cases}.$$

Then we have  $f \leq h * \mathbf{1}$ , and

$$\mathcal{M}_f(X) \leq X \cdot \prod_{p \in \text{Prime} \leq X} \left( 1 + \frac{\max(f(p) - 1, 0)}{p} \right).$$

┘

**Prop. (35.1.3.3).** Suppose  $f : \mathbb{Z}_+ \rightarrow \mathbb{R}_{\geq 0}$  satisfies:

- $f$  is completely sub-multiplicative, i.e.  $f(mn) \leq f(m)f(n)$  for  $m, n \in \mathbb{Z}_+$ .
- There exists  $c \in \mathbb{R}_+$  s.t.  $\sum_{m \in [X]_+} f(m) \Lambda(m) \leq cX$  for any  $X \in \mathbb{R}_{\geq 2}$  (By prime number theorem (35.5.7.18), this can be understood as  $f(p)$  being bounded by  $c$  on average).

Then we have

$$\mathcal{M}_f(X) \leq \frac{3cX}{\log X} \sum_{n \in [X]_+} \frac{f(n)}{n} \leq 3cd \frac{X}{\log X} \prod_{p \in \text{Prime} \leq X} \left( 1 + \frac{f(p)}{p} \right), \text{ where } d = \sum_{n \in [X]_+} \frac{f(n)^2}{n^2}.$$

┘

*Proof:* It follows from the hypotheses that

$$\sum_{n \in [X]_+} f(n) \log n = \sum_{nm \leq X} f(nm) \Lambda(m) \leq \sum_{nm \leq X} f(m) f(n) \Lambda(m) \leq cX \sum_{n \in [X]_+} \frac{f(n)}{n}.$$

Thus it follows by partial summation (35.1.2.9) that

$$\mathcal{M}_f(X) \leq \frac{3cX}{\log X} \sum_{n \in [X]_+} \frac{f(n)}{n} \leq 3cd \frac{X}{\log X} \prod_{p \in \text{Prime} \leq X} \left( 1 + \frac{f(p)}{p} \right).$$

□

### Wirsing' Formula

**Thm. (35.1.3.4) [Wirsing's Formula, Wirsing[Wir67]].** If  $f : \mathbb{Z}_+ \rightarrow \mathbb{R}$  is multiplicative and there exists  $\kappa \in \mathbb{R}_{>-1/2}$  s.t.

- $\sum_{n \in [X]_+} \Lambda_f(n) = \kappa \log X + O(1)$  for  $X \in \mathbb{R}_+$  (By Merten's theorem (35.5.7.8), this can be understood as  $f(p)$  being about  $\kappa p^{-1}$  on average).
- $\mathcal{M}_{|f|}(X) \ll \log^{|\kappa|} X$  for  $X \in \mathbb{R}_+$ .

Then for  $X \in \mathbb{R}_+$ , we have

$$\mathcal{M}_f(X) = C(f) \log^\kappa(X) + O(\log^{|\kappa|-1} X),$$

where

$$C(f) = \frac{1}{\Gamma(\kappa + 1)} \prod_{p \in \text{Prime}} \left(1 - \frac{1}{p}\right)^\kappa \sum_{k \in \mathbb{N}} f(p^k).$$

**?** Why  $C(f)$  converges. ⌋

*Proof:* Firstly we notice

$$\prod_{p \in \text{Prime} \cap [X]_+} \left(1 - \frac{1}{p}\right)^\kappa \sum_{k \in [\log_p X]_+} f(p^k) = O\left(\log X^{-\kappa} \mathcal{M}_{|f|}(X^r)\right),$$

Because  $f \cdot L = f * \Lambda_f$ , we have

$$\sum_{n \in [X]_+} f(n) \log n = \sum_{d \in [X]_+} f(d) \sum_{m \in [X/d]_+} \Lambda_f(m) = \sum_{d \in [X]_+} f(d) \left( \kappa \log \frac{X}{d} + O(1) \right).$$

Then we get

$$(\kappa + 1) \sum_{n \in [X]_+} f(n) \log n = \kappa \mathcal{M}_f(X) \log X + O(\log^{|\kappa|} X).$$

Using the equation

$$\sum_{n \in [X]_+} f(n) \log \frac{X}{n} = \int_1^X \mathcal{M}_f(y) y^{-1} dy,$$

we see that

$$\Delta(X) \triangleq \mathcal{M}_f(X) \log X - (\kappa + 1) \int_2^X \mathcal{M}_f(y) y^{-1} dy = O(\log^{|\kappa|} X).$$

So

$$\int_2^X \Delta(y) y^{-1} \log^{-\kappa-2}(y) dy = \int_2^X \mathcal{M}_f(y) y^{-1} \log^{-\kappa-1}(y) dy - (\kappa + 1) \int_2^X y^{-1} \log^{-\kappa-2}(y) \left( \int_2^y \mathcal{M}_f(u) u^{-1} du \right) dy$$

$$(\text{change order of integration}) = \log^{-\kappa-1}(X) \int_2^X \mathcal{M}_f(u) u^{-1} du.$$

Plug in this back to the definition of  $\Delta(X)$  we see that

$$\mathcal{M}_f(X) = \log^\kappa(X) \int_2^X (-\Delta(y)) d\left(\log^{-\kappa-1}(y)\right) + \frac{\Delta(X)}{\log X}.$$

It can be checked that this integral is absolutely convergent, so we have

$$\mathcal{M}_f(X) = (c(f) + r_f(X)) \log^\kappa(X),$$

where

$$c(f) = - \int_2^\infty \Delta(y) d(\log^{-\kappa-1}(y)), \quad r_f(X) = \int_X^\infty (\Delta(y) - \Delta(X)) d(\log^{-\kappa-1}(y)).$$

It follows from the fact that  $\Delta(X) = O(\log^{|\kappa|}(X))$  that we see

$$r_f(X) = O(\log^{|\kappa|-\kappa-1}(X)).$$

To conclude, it suffices to show that

$$c(f) = \frac{1}{\Gamma(\kappa+1)} \prod_{p \in \text{Prime}} \left(1 - \frac{1}{p}\right)^\kappa \sum_{k \in \mathbb{N}} f(p^k).$$

For this, notice that  $L(f; s)$  is absolutely convergent for  $\text{Re}(s) > 0$ , and for these  $s$ , we have

$$\begin{aligned} L(f; s) &= \int_1^\infty y^{-s} d\mathcal{M}_f(y) \\ &= - \int_1^\infty \mathcal{M}_f(y) d(y^{-s}) \\ &= - \int_0^\infty \mathcal{M}_f(e^t) d(e^{-st}) \\ &= - \int_0^\infty \left(c(f) + O(t^{|\kappa|-\kappa-1})\right) t^\kappa d(e^{-st}) \end{aligned}$$

which equals  $\left(c(f) + O(s^{\kappa+1-|\kappa|})\right) s^{-\kappa} \Gamma(\kappa+1)$  when  $s \rightarrow 0_+$ . So

$$c(f) \Gamma(\kappa+1) = \lim_{s \rightarrow 0_+} (\zeta(s+1)^{-\kappa} L(f; s)) = \prod_{p \in \text{Prime}} \left(1 - \frac{1}{p}\right)^\kappa \left(1 + f(p) + f(p^2) + \dots\right) \text{ ?},$$

and the assertion follows.  $\square$

**Cor. (35.1.3.5)**[Wirsing's Formula, Wirsing[Wir62]]. If  $f : \mathbb{Z}_+ \rightarrow \mathbb{C}$  is a non-negative multiplicative function s.t.

- There exists  $\gamma_1 \in \mathbb{R}_+$ ,  $\gamma_2 \in (1, 2)$  s.t.  $f(p^k) \leq \gamma_1 \gamma_2^k$  for each  $k \in \mathbb{Z}_+$ .
- There exists  $\tau \in \mathbb{R}_{\geq 0}$  s.t.  $\sum_{p \in \text{Prime} \cap [X]_+} f(p) \sim \tau \frac{X}{\log X}$  for  $X \rightarrow \infty$ . Then when  $x \rightarrow \infty$ , we have

$$\mathcal{M}_f(X) \sim \frac{e^{-c\tau}}{\Gamma(\tau)} \frac{X}{\log X} \prod_{p \in \text{Prime} \cap [X]_+} \left(1 + \frac{f(p)}{p} + \frac{f(p^2)}{p^2} + \dots\right).$$

┘

*Proof:* Cf.[Wir62]. ?  $\square$

**Cor. (35.1.3.6)**[Forbidden Prime Divisors]. If  $\mathcal{P} \subset \text{Prime}$  is a set of primes and  $\kappa \in [0, 1/2)$  s.t. for each  $X \in \mathbb{R}_+$  we have

$$\sum_{p \in \text{Prime}_{\leq X}} \frac{\log p}{p} = \kappa \log X + O(1),$$

then the number  $S(\mathcal{P}, X)$  of integers in  $[X]_+$  having no prime divisors in  $\mathcal{P}$  satisfies

$$S(\mathcal{P}, X) = c(\mathcal{P}) \frac{X}{\log^\kappa X} \left( 1 + O\left(\frac{1}{\log^{1-2\kappa} X}\right) \right),$$

where

$$c(\mathcal{P}) = \frac{1}{\Gamma(1-\kappa)} \prod_{p \in \text{Prime}} \left( 1 - \frac{f(p)}{p} \right) \left( 1 - \frac{1}{p} \right)^{-\kappa}.$$

┘

*Proof:* Let  $f : \mathbb{Z}_+ \rightarrow \mathbb{R}$  be the completely multiplicative function s.t.  $f(p) = \mathbf{1}_{\mathcal{P}}(p)$  for  $p \in \text{Prime}$ , and let  $g = (\mu \cdot f) * \mathbf{1}$ , then

$$g(n) = \prod_{p \in S(n)} (1 - f(p)),$$

and

$$S(\mathcal{P}, X) = \mathcal{M}_g(X) = \sum_{d \in [X]_+} \mu(d) f(d) \left\lfloor \frac{X}{d} \right\rfloor = X \sum_{d \in [X]_+} \mu(d) \frac{f(d)}{d} + O(\mathcal{M}_f(X))$$

Wirsing's formula (35.1.3.4) applied to  $\mu(n)f(n)/n$  implies that

$$\sum_{d \in [X]_+} \mu(d) \frac{f(d)}{d} = c(\mathcal{P}) \log^{-\kappa} X + O(\log^{\kappa-1} X)$$

where

$$c(\mathcal{P}) = \frac{1}{\Gamma(1-\kappa)} \prod_{p \in \text{Prime}} \left( 1 - \frac{f(p)}{p} \right) \left( 1 - \frac{1}{p} \right)^{-\kappa}.$$

And also

$$\mathcal{M}_f(X) = O\left(X \log^{\kappa-1}(X)\right)$$

by (35.1.3.3), noticing that

$$\sum_{p \in \text{Prime} \leq X} \frac{f(p)}{p} \leq \kappa \log_{(2)} X$$

by partial summation. Thus the assertion follows. □

**Prop. (35.1.3.7) [Landau1908].** For  $X \in \mathbb{R}_+$ , we have

$$B(X) = \#\{n \in [X]_+ : n = a^2 + b^2 \text{ for some } a, b \in \mathbb{Z}_+\} = C \frac{X}{\sqrt{\log X}} + O\left(\frac{X}{\log^{3/4} X}\right),$$

where

$$C = \frac{1}{\sqrt{2}} \prod_{p \equiv 3 \pmod{4}} \left( 1 - \frac{1}{p^2} \right)^{-1/2}.$$

┘

*Proof:* Cf.[Topics in Number Theory, 2, LeVeque]P261<sup>?</sup>. We only prove the asymptotic.

For  $n \in \mathbb{Z}_+$ , let  $b(n) = \begin{cases} 1 & , n = a^2 + b^2 \text{ for some } a, b \in \mathbb{Z}_+ \\ 0 & , \text{otherwise} \end{cases}$ , then  $B(X) = \mathcal{M}_b(X)$ , and we have

$$L(b; s) = \frac{1}{1-2^{-s}} \prod_{p \equiv 1 \pmod{4}} \frac{1}{1-p^{-s}} \prod_{p \equiv 3 \pmod{4}} \frac{1}{1-p^{-2s}}.$$

So

$$L(b; s)^2 = \zeta(s) L(\chi_{-4}; s) \frac{1}{1-2^{-s}} \prod_{p \equiv 3 \pmod{4}} \frac{1}{1-p^{-2s}}.$$

So  $g(s) = (s-1)L(b; s)^2$  is holomorphic and non-vanishing on a nbhd of the half plane  $\{s \in \mathbb{C} : \operatorname{Re}(s) \geq 1\}$  by (35.5.2.5), and

$$g(1) = \frac{\pi}{2} \prod_{p \equiv 3 \pmod{4}} \left(1 - \frac{1}{p^2}\right)^{-1}$$

by (31.3.5.4). So we get

$$B(X) \sim C \frac{X}{\sqrt{\log X}}$$

by the Tauberian theorem (35.1.1.5). □

$\tau(n)$

**Thm. (35.1.3.8)** [Dirichlet Hyperbola Problem for  $\tau(n)$ , Dirichlet/Voronoi(1903)/Iwaniec-Mozzochi(1988) /Huxley(2003)]. For  $X \in \mathbb{R}_{\geq 1}$ ,

$$|\mathcal{M}_\tau(X) - X \log X - (2\gamma_0 - 1)X| = O(X^{131/416})$$

and

$$|\mathcal{M}_\tau(X) - X \log X - (2\gamma_0 - 1)X| \leq 4\sqrt{X}.$$

┘

*Proof:* <sup>?</sup>

In order to estimate the number of positive integral points under the hyperbola  $\{xy = X\}$ , usual estimates of the formula  $\mathcal{M}_\tau = \sum_{n \in [X]_+} \tau(n) = \sum_{n \in [X]_+} \lfloor \frac{X}{n} \rfloor$  using (35.1.2.10) only gives

$$\mathcal{M}_\tau(X) = X \log X + O(X).$$

But if we use Dirichlet's hyperbola method (35.1.2.13), we get

$$\mathcal{M}_\tau(X) = 2 \sum_{m \leq \sqrt{X}} \lfloor \frac{X}{m} \rfloor - \lfloor \sqrt{X} \rfloor^2,$$

then by (35.1.2.8) we get

$$|\mathcal{M}_\tau(X) - X \log X - (2\gamma_0 - 1)X| \leq 4\sqrt{X}.$$

□

**Cor. (35.1.3.9).** For any  $X \in \mathbb{R}_{\geq 1}$ , we have  $\mathcal{M}_\tau(X) \leq X \log(3X)$ . ┘

*Proof:* This holds by (35.1.3.8) if  $X \geq 18$ . And for the rest, we can check one by one. □

**Prop. (35.1.3.10).** For any  $X \in \mathbb{R}_{\geq 1}$ ,

$$\sum_{n \in [X]_+} \frac{\tau(n)}{n} = P(\log X) + O(1)$$

for some quadratic polynomial  $P$  with leading term  $\frac{1}{2}X^2$ . ┘

*Proof:* Cf. <https://terrytao.wordpress.com/2014/11/23/254a-notes-1-elementary-multiplicative-numbers/#cheap-upper>. □

**Lemma (35.1.3.11)** [Landreau[Lan89]]. For any  $\theta \in \mathbb{R}_+$  and  $k, n \in \mathbb{Z}_+$ , we have

$$\tau^k(n) \leq 2^{2k/\theta} \max_{d|n, d \leq n^\theta} \tau(d)^{2k/\theta}.$$

┘

*Proof:* Write  $n = qm$  where  $q$  has all prime factors  $\geq n^{\theta/2}$ , and  $m$  has all prime factors  $< n^{\theta/2}$ . Then we can write  $m = n_1 \dots n_r$  where  $n_1, \dots, n_{r-1} \in (n^{\theta/2}, n^\theta]$ , and  $n_r \in [n^\theta]_+$  s.t.  $n_{r-1}n_r > n^\theta$  (if  $r \geq 2$ ). So  $r < 2/\theta$ , and

$$\tau(n) \leq 2^{2/\theta} \tau(n_1) \dots \tau(n_r) \leq 2^{2/\theta} \tau(n_i)^{2/\theta}$$

for some  $n_i$ . □

**Thm. (35.1.3.12)** [van.der.Corput[Cor39]/Erdős[Erd52]]. For any polynomial  $P : \mathbb{Z} \rightarrow \mathbb{Z}$  and  $m \in \mathbb{Z}_+$ ,  $X \in \mathbb{R}_+$ , we have

$$X \ll \sum_{n \in [X]_+} \tau^m(P(n)) \ll X \log^{O(1)} X.$$

And if  $P$  is irreducible, then

$$\sum_{n \in [X]_+} \tau(P(n)) \sim X \log X.$$

And also

$$\mathcal{M}_{\tau^2(n)}(X) \sim \frac{\pi^2}{36} X \log^3 X.$$

┘

*Proof:* Cf. <https://terrytao.wordpress.com/2011/07/23/erdos-divisor-bound/#mcc>.

The assertion about  $\tau^2(n)$  follows from Tauberian theorem (35.1.1.5) because  $L(\tau^2; s) = \zeta(2s)\zeta(s)^{-4}$ . □

**Cor. (35.1.3.13)** [Hooley[Hoo63]]. For  $X \in \mathbb{R}_+$ , we have

$$\sum_{n \in [X]_+} \tau(n^2 + 1) = \frac{3}{\pi} X \log X + O(X).$$

┘

*Proof:*

$$\sum_{n \in [X]_+} \tau(n^2 + 1) = 2 \sum_{n \in [X]_+} \sum_{d \leq n, d|n^2+1} 1 = 2 \sum_{d \in [X]_+} \sum_{d \leq n \leq X, d|n^2+1} 1 = 2 \sum_{d \in [X]_+} \left( \frac{X}{d} \rho(d) + O(\rho(d)) \right)$$

where  $\rho(d)$  is the number of solutions in  $\mathbb{Z}/(d)$  of the equation  $X^2 + 1 = 0$ .  $\rho(d)$  is multiplicative, and its  $L$ -series is given by

$$\begin{aligned} L(\rho; s) &= \left(1 + \frac{1}{2^s}\right) \prod_{p \in \text{Prime}_{\geq 3}, p \equiv 1 \pmod{4}} \left(1 + \frac{2}{p^s} + \frac{2}{p^{2s}} + \dots\right) \\ &= \left(1 + \frac{1}{2^s}\right) \prod_{p \in \text{Prime}_{\geq 3}, p \equiv 1 \pmod{4}} \frac{1 + p^{-s}}{1 - p^{-s}} \\ &= \zeta(s) \frac{L(\chi_{-4}; s)}{\zeta(2s)} \end{aligned}$$

Denote

$$\frac{L(\chi_{-4}; s)}{\zeta(2s)} = \sum_{n \in \mathbb{Z}_+} \frac{b(n)}{n^s} = L(b; s),$$

then  $|b(n)| \leq 1$ , and  $\rho = \mathbf{1} * b$ . And we have:

$$\mathcal{M}_b(X) = \sum_{t^2 l \leq X} \mu(t) \chi_{-4}(l) = \sum_{t \in [\sqrt{X}]_+} O(1) = O(\sqrt{X}).$$

(where the first equality follows from the fact that  $b = \chi_{-4} * \mu(\sqrt{\cdot})$ ). So

$$\begin{aligned} \sum_{n \in [X]_+} \frac{\rho(n)}{n} &= \sum_{a \in [\sqrt{X}]_+} \frac{1}{a} \sum_{\sqrt{X} < m \leq X/a} \frac{b(m)}{m} + \sum_{a \in [\sqrt{X}]_+} \frac{b(a)}{a} (\log(X/a) + O(1)) \\ (\text{partial summation}) &= \sum_{a \in [\sqrt{X}]_+} \frac{1}{a} \cdot O(1/X^{1/4}) + \sum_{a \in [\sqrt{X}]_+} \frac{b(a)}{a} (\log(X/a) + O(1)) \\ &= L(b; 1)(\log X + O(1)) + L^\wedge(b; 1) \\ &\quad + O\left(\log X \left| \sum_{m \geq \sqrt{X}} \frac{b(m)}{m} \right| + \left| \sum_{m \geq \sqrt{X}} \frac{b(m)}{m} \log m \right| + \frac{\log X}{X^{1/4}}\right) \\ (\text{partial summation}) &= L(b; 1) \log X + O(1) \\ (31.3.5.4) &= \frac{3}{2\pi} \log X + O(1). \end{aligned}$$

Similarly,

$$\begin{aligned} \mathcal{M}_\rho(X) &= \sum_{a \in [\sqrt{X}]_+} \sum_{\sqrt{X} < m \leq X/a} b(m) + \sum_{a \in [\sqrt{X}]_+} b(a)(X/a + O(1)) \\ (\text{partial summation}) &= O(X^{3/4}) + O(X^{3/4}) + O(\sqrt{X}) \\ &= O(X^{3/4}) \end{aligned}$$

And the theorem follows.  $\square$

**Thm. (35.1.3.14).** For  $k \in \mathbb{Z}_{\geq 2}$ , denote  $\tau_k \triangleq \mathbf{1}^{*k}$ , then for each  $X \in \mathbb{R}_+$ , we have

- There exists  $C_{k,l} \in \mathbb{R}_+$  s.t.  $\mathcal{M}_{\tau_k^l}(X) \leq C_{k,l} X \log^{k^l-1} X$ .
- There exists some  $C_k \in \mathbb{R}_+$  s.t. for  $X \in \mathbb{R}_+$ ,

$$\mathcal{M}_{\tau_k(n)^2/n}(X) \sim C_k \log^{k^2}(X).$$

In particular, for each  $\varepsilon \in \mathbb{R}_+$ , there exists  $C_{k,\varepsilon} \in \mathbb{R}_+$  s.t.  $\tau_k(n) \leq C_{k,\varepsilon} n^\varepsilon$ . ┘

*Proof:* 1 follows from (35.1.3.1). Cf. [I-K04]P23 ?. □

**Prop. (35.1.3.15).** For  $X \in \mathbb{R}_+$  and  $k \in \mathbb{N}$ ,

$$\sum_{n \in [X]_+} \frac{\tau^k(n)}{\phi(n)} \ll \log^{k+1} X.$$

┘

*Proof:* ? □

$\sigma(n)$

**Thm. (35.1.3.16) [Walfisz(1963)].** For  $X \in \mathbb{R}_+$ ,

$$\mathcal{M}_\sigma(X) = \frac{\pi^2}{12} X^2 + O(X \log^{2/3} X).$$

┘

*Proof:* ? We only prove that  $\mathcal{M}_\sigma(X) = \frac{\pi^2}{12} X^2 + O(X \log X)$ :

$$\begin{aligned} \mathcal{M}_\sigma(X) &= \sum_{m,d \in \mathbb{Z}_+, md \leq X} m \\ &= \frac{1}{2} \sum_{d \in [X]_+} \left\lfloor \frac{X}{d} \right\rfloor \left( \left\lfloor \frac{X}{d} \right\rfloor + 1 \right) \\ &= \frac{1}{2} \sum_{d \in [X]_+} \frac{X^2}{d^2} + O \left( X \sum_{d \in [X]_+} \frac{1}{d} \right) \\ &= \frac{\pi^2}{12} X^2 + O(X \log X) \text{ (35.1.2.8)}. \end{aligned}$$

□

$\mu(n)$

**Prop. (35.1.3.17) [ $\mu(n)$  and Prime Number Theorem].**  $\mathcal{M}_\mu(X) \sim X$  for  $X \in \mathbb{R}_+$  is equivalent to  $\psi(X) \sim X$ , i.e. the crude prime number theorem (35.5.7.18). ┘

*Proof:* Cf. [I-K04]P32. □

**Prop. (35.1.3.18).** For any  $X \in \mathbb{R}_+$ ,

$$\left| \sum_{n \in [X]_+} \frac{\mu(n)}{n} \right| \leq 1.$$

┘

*Proof:* Because  $\delta = 1 * \mu$ , we have

$$\sum_{d \in [X]_+} \mu(d) \lfloor \frac{X}{d} \rfloor = 1,$$

and then estimating the integral parts gives the result. □

## 4 Densities and Distributions

### Densities

**Def. (35.1.4.1) [Density of Places].** For  $F \in \mathbf{NField}$  and  $T \subset \Sigma_F^{\text{fin}}$ ,  $T$  is said to have

- **natural density**  $\delta \in [0, 1]$  if

$$\lim_{X \rightarrow \infty} \frac{\#\{v \in \Sigma_F^{\text{fin}} : v \in T, \|v\| \leq X\}}{\#\{v \in \Sigma_F^{\text{fin}} : \|v\| \leq X\}} = \delta.$$

- **polar density**  $m/n \in \mathbb{Q}$  if

$$\zeta_{F,T} = \prod_{v \in T} \frac{1}{1 - \|v\|^{-s}}$$

satisfies  $\zeta_{F,T}^n$  extends to a nbhd of  $s = 1$  with a pole of order  $m$ .

- **Dirichlet-density** or **analytic density**  $\delta \in [0, 1]$  iff

$$\lim_{s \rightarrow 1^+} \frac{\sum_{v \in T} \frac{1}{\|v\|^s}}{\log \frac{1}{s-1}} = \delta.$$

┘

**Prop. (35.1.4.2).** If the polar density exists, then so does the Dirichlet density, and they are equal. If the natural density exists, then so does the Dirichlet density, and they are equal. ┘

*Proof:* Cf. [Mil20]P194. □

**Def. (35.1.4.3) [Density of Ideals].** For  $A \subset \mathbb{Z}_+$ ,  $A$  is said to have

- **natural density**  $d(A) \in [0, 1]$  if

$$\lim_{X \rightarrow \infty} \frac{\#\{n \in A \cap [X]_+\}}{X} = d(A).$$

In any case, we can define the **upper natural density**

$$\bar{d}(A) = \overline{\lim}_{X \rightarrow \infty} \frac{\#\{n \in A \cap [X]_+\}}{X}.$$

- **logarithmic density**  $m/n \in \mathbb{Q}$  if

$$\lim_{X \rightarrow \infty} \frac{1}{\log X} \sum_{n \in A \cap [X]_+} \frac{1}{n} = \delta(A).$$

- **analytic density**  $\delta(A) \in [0, 1]$  iff

$$\lim_{s \rightarrow 1^+} (s-1) \sum_{n \in A \cap [X]_+} \frac{1}{n^s} = \delta(A).$$

┘

**Prop. (35.1.4.4) [Logarithmic Density and Natural Density].** For  $A \subset \mathbb{Z}_+$ , if  $A$  has natural density, then it also has a logarithmic density, and these two densities are equal. ┘

*Proof:* If we denote  $A(X) = \#A \cap [X]_+$ , then

$$\sum_{n \in A \cap [X]_+} \frac{1}{n} = \frac{A(X)}{X} + \int_1^X \frac{A(t)}{t^2} dt.$$

From this the assertion follows easily. □

**Prop. (35.1.4.5) [Logarithmic Density and Analytic Density].** For  $A \subset \mathbb{Z}_+$ ,  $A$  has logarithmic density iff it has analytic density, and in this case, the two densities are equal. ┘

*Proof:* For  $X \in \mathbb{R}_{\geq 1}$  and  $\sigma \in \mathbb{R}_{>1}$ , by Abel summation,

$$(\sigma-1) \sum_{n \in A} \frac{1}{n^\sigma} = (\sigma-1)^2 \int_1^\infty \frac{\sum_{n \in A \cap [t]_+} 1/n}{t^\sigma} dt.$$

If  $\sum_{n \in A \cap [t]_+} 1/n = (\delta + o(1)) \log t$ , then for each  $\varepsilon \in \mathbb{R}_+$ , there exists  $C_\varepsilon \in \mathbb{R}_+$  s.t.

$$\left| (\sigma-1)^2 \int_1^\infty \frac{\sum_{n \in A \cap [t]_+} 1/n}{t^\sigma} dt - \delta \right| \leq \varepsilon + (\sigma-1)C_\varepsilon$$

Thus

$$\lim_{s \rightarrow 1^+} (s-1) \sum_{n \in A \cap [X]_+} \frac{1}{n^s} = \delta.$$

Conversely, if

$$\lim_{s \rightarrow 1^+} (s-1) \sum_{n \in A \cap [X]_+} \frac{1}{n^s} = \lim_{h \rightarrow 0^+} h \int_0^\infty e^{-ht} dL(e^t) = \delta.$$

where  $L(X) = \sum_{n \in A \cap [X]_+} 1/n$ , then by Karamata theorem (35.1.1.3),

$$\lim_{t \rightarrow \infty} \frac{L(e^t)}{t} = \delta$$

□

### Limiting Distributions

**Def. (35.1.4.6)[Limiting Distributions].** A real arithmetic function  $f : \mathbb{Z}_+ \rightarrow \mathbb{R}$  is said to have **limit law**  $F$  where  $F$  is a real non-decreasing NBV(12.3.3.24) with  $F(\infty) = 1$  if the discrete measures

$$\nu_N(f) = \frac{1}{N} \sum_{n \leq N} \delta_{f(n)}$$

converges to  $\mu_F$ (12.3.3.25). Equivalently, if we denote

$$F_N(x) = \frac{1}{N} \# \{n \in [N]_+, f(n) \leq x\},$$

then

- $F(x) = \lim_{N \rightarrow \infty} F_N(x)$  exists for all  $x$  belonging to an open dense subset  $E \subset \mathbb{R}$ .
- $\lim_{x \in E, x \rightarrow -\infty} F(x) = 0, \lim_{x \in E, x \rightarrow +\infty} F(x) = 1$ .

Because if this is the case then we can define  $F$  by right limits. ┘

**Prop. (35.1.4.7).** For  $f : \mathbb{Z}_+ \rightarrow \mathbb{R}$ , if for any  $\varepsilon \in \mathbb{R}_+$ , there is a function  $a_\varepsilon(n) : \mathbb{Z}_+ \rightarrow \mathbb{Z}_+$  s.t.

- $\lim_{\varepsilon \rightarrow 0} \lim_{T \rightarrow \infty} \bar{d}\{n \in \mathbb{Z}_+ | a_\varepsilon(n) > T\} = 0$ .
- $\lim_{\varepsilon \rightarrow 0} \bar{d}\{n \in \mathbb{Z}_+ : |f(n) - f(a_\varepsilon(n))| > \varepsilon\} = 0$ .
- For any  $a \in \mathbb{Z}_+$ , the natural density  $d(a, \varepsilon) = d\{n \in \mathbb{Z}_+ | a_\varepsilon(n) = a\}$ (35.1.4.3) exists.

Then  $f$  has a limit law(35.1.4.6). ┘

*Proof:* Select, as  $\eta \rightarrow 0+$ , two functions  $\varepsilon = \varepsilon(\eta) \rightarrow 0+$  and  $T = T(\varepsilon(\eta)) \rightarrow +\infty$ , s.t.

$$\bar{d}\{n \in \mathbb{Z}_+ | a_\varepsilon(n) > T(\varepsilon)\} \leq \eta, \quad \bar{d}\{n \in \mathbb{Z}_+ : |f(n) - f(a_\varepsilon(n))| > \varepsilon\} < \eta.$$

Define

$$F(x, \eta) = \sum_{a \leq T(\varepsilon), f(a) \leq x} d(a, \varepsilon), \quad F(x) = \overline{\lim}_{\eta \rightarrow 0} F(x, \eta),$$

then  $F(x)$  is non-decreasing. And for any continuous point  $x$  of  $F$ ,

$$F_N(x) \leq \frac{1}{N} \sum_{n \leq N, a_\varepsilon(n) \leq T(\varepsilon), f(a_\varepsilon(n)) \leq x + \varepsilon} 1 + \frac{1}{N} \sum_{a_\varepsilon(n) > T(\varepsilon)} 1 + \frac{1}{N} \sum_{n \leq N, |f(n) - f(a_\varepsilon(n))| > \varepsilon} 1.$$

where  $\eta$  is arbitrary. So by the hypothesis,

$$\overline{\lim}_{N \rightarrow \infty} F_N(x) \leq \overline{\lim}_{\eta \rightarrow 0+} (F(x + \varepsilon(\eta), \eta) + 2\eta) = F(x).$$

Symmetrically, we can also get

$$\underline{\lim}_{N \rightarrow \infty} F_N(x) \leq \overline{\lim}_{\eta \rightarrow 0+} (F(x + \varepsilon(\eta), \eta) + 2\eta) = F(x).$$

So we have  $\lim_{N \rightarrow \infty} F_N(x) = F(x)$ .

Next, if  $x > \max\{f(a) | a \leq T(\varepsilon)\} + \varepsilon$ , then  $f(n) > x$  implies either  $a_\varepsilon(n) > T(\varepsilon)$  or  $|f(n) - f(a_\varepsilon(n))| > \varepsilon$ , so the corresponding limit density  $F(x) > 1 - \eta$ . So we get  $F(\infty) = 1$ . Similarly we get  $F(-\infty) = 0$ . Thus by(35.1.4.6), we see  $f$  has a limit law. □

## 5 Distributions of Additive Functions

References are [Ten15]Chap3.3.

**Thm. (35.1.5.1)**[Turán-Kubilius Inequality, Turán[Tur36]/Kubilius[Kub55]]. There exists  $\kappa \in \mathbb{R}_+$  s.t. if  $f : \mathbb{Z}_+ \rightarrow \mathbb{C}$  is an additive function, then for  $X \in \mathbb{R}_+$ , we have

$$\frac{1}{X} \sum_{n \in [X]_+} |f(n) - E(X)|^2 \leq \kappa D^2(X),$$

where

$$E(X) = \sum_{p \in \text{Prime}, \alpha \in [\log_p X]_+} f(p^\alpha) p^{-\alpha} (1 - p^{-1}), \quad D(X) = \left( \sum_{p \in \text{Prime}, \alpha \in [\log_p X]_+} |f(p^\alpha)|^2 p^{-\alpha} \right)^{1/2}.$$

*Proof:* Firstly we can reduce to the case that  $f$  is real-valued and non-negative: Denote  $f = f_1 - f_2 + i(f_3 - f_4)$  where  $f_i$  are real-valued and non-negative, then the inequalities for  $f_i$  implies the inequalities for  $f$ .

Then

$$\begin{aligned} \mathcal{M}_f(X) &= \sum_{p \in \text{Prime}, \alpha \in [\log_p X]_+} f(p^\alpha) \left( \left[ \frac{X}{p^\alpha} \right] - \left[ \frac{X}{p^{\alpha+1}} \right] \right) \\ &= X E(X) + O \left( \sum_{p \in \text{Prime}, \alpha \in [\log_p X]_+} |f(p^\alpha)| \right) \\ (\text{Cauchy}) &= X E(X) + O \left( D(X) \left( \sum_{p \in \text{Prime}, \alpha \in [\log_p X]_+} p^\alpha \right)^{1/2} \right) \\ (35.5.7.14) &= X E(X) + X O \left( \frac{D(X)}{\sqrt{\log X}} \right). \end{aligned}$$

And

$$\begin{aligned} \mathcal{M}_{f^2}(X) &= \sum_{p \in \text{Prime}, \alpha \in [\log_p X]_+} \sum_{q \in \text{Prime}, \beta \in [\log_q X]_+} f(p^\alpha) f(q^\beta) \sum_{n \in [X]_+, v_p(n) = \alpha, v_q(n) = \beta} 1 \\ &= X \sum_{p \in \text{Prime}, \alpha \in [\log_p X]_+} \sum_{q \in \text{Prime}, \beta \in [\log_q X]_+, q \neq p} f(p^\alpha) p^{-\alpha} f(q^\beta) q^{-\beta} (1 - p^{-1})(1 - q^{-1}) \\ &\quad + X \sum_{p \in \text{Prime}, \alpha \in [\log_p X]_+} f^2(p^\alpha) p^{-\alpha} (1 - p^{-1}) + O \left( \sum_{p \neq q \in \text{Prime}, \alpha, \beta \in \mathbb{Z}_+, p^\alpha q^\beta \leq X} |f(p^\alpha) f(q^\beta)| \right) \\ &= X E(X)^2 + O(X D^2(X)) \end{aligned}$$

where the last estimation follows from Cauchy-Schwarz inequality and the fact

$$\sum_{p \neq q \in \text{Prime}, \alpha, \beta \in \mathbb{Z}_+, p^\alpha q^\beta \leq X} p^\alpha q^\beta = \frac{X^2}{\log X} O \left( \sum_{p \in \text{Prime}, \alpha \in [\log_p X/2]_+} p^{-\alpha} \right) = O(X^2).$$

Thus

$$\begin{aligned} \sum_{n \in [X]_+} |f(n) - E(X)|^2 &= \mathcal{M}_{f^2}(X) - 2\mathcal{M}_f(X)E(X) + XE(X)^2 \\ &= O\left(XD^2(X) + \frac{X}{\sqrt{\log X}}E(X)D(X)\right) \\ &= O\left(XD^2(X)\right) \end{aligned}$$

where the last estimation follows from the estimation

$$E^2(X) = O(\log XD^2(X)),$$

which is true by Cauchy-Schwarz inequality.  $\square$

**Cor. (35.1.5.2)** [Hardy-Ramanujan[H-R18]]. There exists  $\kappa \in \mathbb{R}_+$  s.t. for any  $X \in \mathbb{R}_{\geq 3}$ , we have

$$\sum_{n \leq X} \left| \omega(n) - \log_{(2)} X \right|^2 \leq \kappa X \log_{(2)}(X).$$

In particular, for  $z \in \mathbb{R}_+$ ,

$$\#\{n \in [X]_+, |\omega(n) - \log_{(2)}(X)| > z\sqrt{\log_{(2)}(X)}\} \leq \frac{\kappa}{z^2} X.$$

┘

**Thm. (35.1.5.3)** [Fundamental Theorem of Probabilistic Number Theory, Erdős-Kac]. The probabilistic distribution of

$$\frac{\omega(n) - \log_{(2)}(X)}{\sqrt{\log_{(2)}(X)}}$$

is the standard distribution.  $\square$

*Proof:* Cf. [Erdős-Kac, The Gaussian law of errors in the theory of additive number theoretic functions].  $\square$

## 6 Large Sieve method

### Bilinear Forms

**Prop. (35.1.6.1)** [Duality Principle]. Let  $(\varphi(m, n)) \in \mathbb{C}$  and suppose there exists  $\Delta \in \mathbb{R}_+$  s.t. for any  $(\beta_n) \subset \mathbb{C}$  we have

$$\sum_m \left| \sum_n \beta_n \varphi(m, n) \right|^2 \leq \Delta \|\beta\|^2,$$

then for any  $(\alpha_n)$ , we also have

$$\sum_n \left| \sum_m \alpha_m \varphi(m, n) \right|^2 \leq \Delta \|\alpha\|^2.$$

┘

*Proof:*

$$\begin{aligned} \left( \sum_n \left| \sum_m \alpha_m \phi(m, n) \right|^2 \right)^2 &= \left( \sum_n \sum_m \alpha_m \phi(m, n) \left( \sum_k \overline{\alpha_k \phi(k, n)} \right) \right)^2 \\ &\quad (\text{Cauchy}) \leq \|\alpha\|^2 \sum_m \left| \sum_n \phi(m, n) \left( \sum_k \overline{\alpha_k \phi(k, n)} \right) \right|^2 \\ &\leq \Delta \|\alpha\|^2 \sum_n \left| \sum_k \alpha_k \phi(k, n) \right|^2 \end{aligned}$$

So the assertion follows.  $\square$

**Lemma (35.1.6.2) [Averaging Exponential Sums].** For  $(x_m) \in \mathbb{R}$  and  $(\alpha_m) \in \mathbb{C}$ , we have

$$\int_{-Y}^Y \left| \sum_m \alpha_m e^{2\pi i x_m y} \right|^2 dy \leq 5Y \sum_{2Y|x_{m_1} - x_{m_2}| < 1} |\alpha_{m_1} \alpha_{m_2}|.$$

┘

*Proof:* Cf. [I-K04]P171 ?.  $\square$

**Thm. (35.1.6.3) [Bilinear Exponential Sums].** Let  $(x_m), (y_n) \in \mathbb{R}$  s.t.  $|x_m| \leq X, |y_n| \leq Y$ , then for any  $(\alpha_m), (\beta_n) \in \mathbb{C}$ , we have

$$\left| \sum_m \sum_n \alpha_m \beta_n e^{2\pi i x_m y_n} \right|^2 \leq 25(XY + 1) \left( \sum_{2Y|x_{m_1} - x_{m_2}| < 1} |\alpha_{m_1} \alpha_{m_2}| \right) \left( \sum_{2X|y_{n_1} - y_{n_2}| < 1} |\beta_{n_1} \beta_{n_2}| \right).$$

┘

*Proof:* Let  $\varepsilon = (4X)^{-1}$  and  $\gamma_m = \frac{\pi x_m \alpha_m}{\sin(2\pi \varepsilon x_m)}$ , then  $|\gamma_m| \leq \pi X |\alpha_m|$ . We have

$$e^{2\pi i xy} = \frac{\pi x}{\sin(2\pi \varepsilon x)} \int_{y-\varepsilon}^{y+\varepsilon} e^{2\pi i xt} dt,$$

so

$$\begin{aligned} \left| \sum_m \sum_n \gamma_m \beta_n e^{2\pi i x_m y_n} \right|^2 &= \left| \sum_n \beta_n \int_{y_n-\varepsilon}^{y_n+\varepsilon} \gamma_m e^{2\pi i x_m y} dy \right|^2 \\ &\leq \left| \int_{-Y-\varepsilon}^{Y+\varepsilon} \left( \sum_{|y_n-y| < \varepsilon} |\beta_n| \right) \left| \sum_m \gamma_m e^{2\pi i x_m y} \right| dy \right|^2 \\ &\leq \left( \int_{-Y-\varepsilon}^{Y+\varepsilon} \left( \sum_{|y_n-y| < \varepsilon} |\beta_n| \right)^2 dy \right) \left( \int_{-Y-\varepsilon}^{Y+\varepsilon} \left| \sum_m \gamma_m e^{2\pi i x_m y} \right|^2 dy \right) \\ (35.1.6.2) &\leq 2\varepsilon \left( \sum_{|y_{n_1} - y_{n_2}| < 2\varepsilon} |\beta_{n_1} \beta_{n_2}| \right) 5(Y + \varepsilon)(\pi X)^2 \left( \sum_{2Y|x_{m_1} - x_{m_2}| < 1} |\alpha_{m_1} \alpha_{m_2}| \right). \end{aligned}$$

Here  $10\varepsilon(Y + \varepsilon)(\pi X)^2 = \frac{5\pi^2}{2}(XY + \frac{1}{4}) < 25(XY + 1)$ , completing the proof.  $\square$

**Cor. (35.1.6.4) [Well-Spaced Bilinear Exponential Sums].** Let  $(x_m), (y_n) \in \mathbb{R}$  s.t.  $|x_m| \leq X, |y_n| \leq Y$  and for any  $m_1 \neq m_2, n_1 \neq n_2$ , we have  $2|x_{m_1} - x_{m_2}| \geq A, 2|y_{n_1} - y_{n_2}| \geq B$ , then for any  $(\alpha_m), (\beta_n) \subset \mathbb{C}$ , we have

$$\left| \sum_m \sum_n \alpha_m \beta_n e^{2\pi i x_m y_n} \right| \leq 5 \sqrt{\max(X, B^{-1}) \cdot \max(Y, A^{-1}) + 1} \cdot \|\alpha\| \|\beta\|.$$

┘

**Cor. (35.1.6.5) [Bilinear Exponential Sums for Smooth Functions].** Let  $F, G \in \mathbb{R}_+, M, N \in \mathbb{Z}_+$  and  $f, g$  be real functions on  $[M, 2M], [N, 2N]$  resp. s.t.  $f \ll F, g \ll G$  and  $|f'| \geq FM^{-1}, |g'| \geq GN^{-1}$ , then for any  $(\alpha_m), (\beta_n) \in \mathbb{C}$ , we have

$$\left| \sum_m \sum_n \alpha_m \beta_n e^{2\pi i f(m)g(n)} \right| \ll \sqrt{\frac{(FG + M)(FG + N)}{FG}} \cdot \|\alpha\| \|\beta\|.$$

┘

### Additive Large Sieve Methods

**Prop. (35.1.6.6) [Hilbert's Inequality, Schur[Sch11]/Montgomery-Vaughan[M-V74]].** Suppose  $\delta \in \mathbb{R}_+$  and  $(\lambda_r) \subset \mathbb{R}$  s.t.  $|\lambda_r - \lambda_s| \geq \delta$  for any  $r \neq s$ , then for any  $(z_r) \in \mathbb{C}$ , we have

$$\left| \sum_{r \neq s} \frac{z_r \bar{z}_s}{\lambda_r - \lambda_s} \right| \leq \frac{\pi}{\delta} \sum_r |z_r|^2.$$

┘

*Proof:* By Cauchy inequality, it suffices to prove that

$$\sum_r \left| \sum_{s \neq r} \frac{z_s}{\lambda_r - \lambda_s} \right|^2 \leq \frac{\pi^2}{\delta^2} \sum_r |z_r|^2.$$

The LHS equals

$$\begin{aligned} \sum_s \sum_t \bar{z}_s z_t \sum_{r \neq s, r \neq t} \frac{1}{(\lambda_r - \lambda_s)(\lambda_r - \lambda_t)} &= \sum_s |z_s|^2 \sum_{r \neq s} \frac{1}{(\lambda_r - \lambda_s)^2} + \sum_{s \neq t} \frac{\bar{z}_s z_t}{\lambda_s - \lambda_t} \sum_{r \neq s, r \neq t} \left( \frac{1}{\lambda_r - \lambda_s} - \frac{1}{\lambda_r - \lambda_t} \right) \\ &= \sum_s |z_s|^2 \sum_{r \neq s} \frac{1}{(\lambda_r - \lambda_s)^2} + \sum_{s \neq t} \frac{\bar{z}_s z_t}{\lambda_s - \lambda_t} \left( \sum_{r \neq s} \frac{1}{\lambda_r - \lambda_s} - \sum_{r \neq t} \frac{1}{\lambda_r - \lambda_t} \right) \\ &\quad + 2 \sum_{s \neq t} \frac{\bar{z}_s z_t}{(\lambda_r - \lambda_s)^2} \\ &\leq 3 \sum_s |z_s|^2 \sum_{r \neq s} \frac{1}{(\lambda_r - \lambda_s)^2} + \sum_{s \neq t} \frac{\bar{z}_s z_t}{\lambda_s - \lambda_t} \left( \sum_{r \neq s} \frac{1}{\lambda_r - \lambda_s} - \sum_{r \neq t} \frac{1}{\lambda_r - \lambda_t} \right). \end{aligned}$$

Now we can use the idea of extremal, when  $\sum_r \left| \sum_{s \neq r} \frac{z_s}{\lambda_r - \lambda_s} \right|^2 / \sum_r |z_r|^2$  takes its maximum, we can assume  $(z_r)$  is an eigenvector for the Hermitian matrix

$$A = (a_{rs})_{rs}, \text{ where } a_{rs} = \begin{cases} \frac{i}{\lambda_r - \lambda_s} & , r \neq s \\ 0 & , r = s \end{cases}.$$

Thus there exists  $\nu \in \mathbb{R}$  s.t.

$$\sum_{r \neq s} \frac{z_r}{\lambda_r - \lambda_s} = i\nu z_s.$$

In this case,

$$\begin{aligned} \sum_{s \neq t} \frac{\bar{z}_s z_t}{\lambda_s - \lambda_t} \sum_{r \neq s} \left( \frac{1}{\lambda_r - \lambda_s} - \sum_{r \neq t} \frac{1}{\lambda_r - \lambda_t} \right) &= \sum_{r \neq s} \frac{\bar{z}_s}{\lambda_r - \lambda_s} \sum_{t \neq s} \frac{z_t}{\lambda_s - \lambda_t} - \sum_{r \neq t} \frac{z_t}{\lambda_r - \lambda_t} \sum_{s \neq t} \frac{\bar{z}_s}{\lambda_s - \lambda_t} \\ &= -i \sum_{r \neq s} \frac{|z_s|^2}{\lambda_r - \lambda_s} + i \sum_{r \neq s} \frac{|z_t|^2}{\lambda_r - \lambda_t} = 0. \end{aligned}$$

And we finish because by hypothesis

$$\sum_{r \neq s} \frac{1}{(\lambda_r - \lambda_s)^2} \leq \frac{2}{\delta^2} \zeta(2) = \frac{\pi^2}{3\delta^2}.$$

□

**Cor. (35.1.6.7).** Suppose  $\delta \in \mathbb{R}_+$  and  $\{\alpha_r\} \subset \mathbb{R}/\mathbb{Z}$  s.t.  $d(\alpha_r, \alpha_s) \geq \delta$  if  $r \neq s$ , then for any  $(z_r) \subset \mathbb{C}$ , we have

$$\left| \sum_{r \neq s} \frac{z_r \bar{z}_s}{\sin(\pi(\alpha_r - \alpha_s))} \right| \leq \delta^{-1} \sum_r |z_r|^2.$$

┘

*Proof:* We take a set of representatives of  $\alpha_r \in [0, 1]$ , and apply (35.1.6.6) to the double-indexed set of numbers  $z_{m,r} = (-1)^m z_r$  and  $\lambda_{m,r} = \alpha_r + m$  with  $m \in [K]_+$ , where  $K \in \mathbb{Z}_+$  is large. Then we get

$$\left| \sum_{(r,m) \neq (s,n)} (-1)^{m-n} \frac{z_r \bar{z}_s}{m - n + \alpha_r - \alpha_s} \right| \leq \frac{\pi K}{\delta} \sum_r |z_r|^2.$$

We can replace the condition  $(r, m) \neq (s, n)$  by  $r \neq s$  because if  $r = s$ , the summation cancels out. So we get

$$\left| \sum_{r \neq s} (-1)^{m-n} z_r \bar{z}_s \sum_{k=-K}^K \left( 1 - \frac{|k|}{K} \right) \frac{(-1)^k}{k + \alpha_r - \alpha_s} \right| \leq \frac{\pi}{\delta} \sum_r |z_r|^2.$$

We get the desired result by taking  $K \rightarrow \infty$ , and (12.4.3.12). □

**Cor. (35.1.6.8).** Suppose  $\delta \in \mathbb{R}_+$  and  $\{\alpha_r\} \subset \mathbb{R}/\mathbb{Z}$  s.t.  $d(\alpha_r, \alpha_s) \geq \delta$  if  $r \neq s$ , then for any  $\{z_r\} \subset \mathbb{C}$  and  $x \in \mathbb{R}$ , we have

$$\left| \sum_{r \neq s} z_r \bar{z}_s \frac{\sin(2\pi x(\alpha_r - \alpha_s))}{\sin(\pi(\alpha_r - \alpha_s))} \right| \leq \delta^{-1} \sum_r |z_r|^2.$$

┘

*Proof:* This follows from applying (35.1.6.7) twice for  $z'_r = z_r e^{2\pi i x \alpha_r}$  and  $z'_r = z_r e^{-2\pi i x \alpha_r}$ . □

**Thm. (35.1.6.9)** [Large Sieve method for Exponentials, Davenport-Halberstam[D-H66a]/ Selberg/ Montgomery-Vaughan[M-V74]]. Suppose  $\delta \in \mathbb{R}_+$  and  $\{\alpha_r\} \in \mathbb{R}/\mathbb{Z}$  s.t.  $d(\alpha_r, \alpha_s) \geq \delta$  if  $r \neq s$ , then for any  $M, N \in \mathbb{Z}_+$  and  $(a_n)_{M < n \leq M+N} \in \mathbb{C}$ , we have

$$\sum_r \left( \sum_{M < n \leq M+N} a_n e^{2\pi i \alpha_r n} \right)^2 \leq (\delta^{-1} + N - 1) \sum_n |a_n|^2.$$

For higher dimension we have: Suppose  $\delta \in \mathbb{R}_+$  and  $\boldsymbol{\alpha}_r \in (\mathbb{R}/\mathbb{Z})^d$  s.t.  $\|\boldsymbol{\alpha}_r - \boldsymbol{\alpha}_s\|_\infty \geq \delta$  if  $r \neq s$ , then for any  $\mathbf{M} \in \mathbb{Z}^d$ ,  $N \in \mathbb{Z}_+$  and  $(a_n)_{\mathbf{M}_i < n_i \leq \mathbf{M}_i + N} \in \mathbb{C}$ , we have

$$\sum_r \left( \sum_{\mathbf{M}_i < n_i \leq \mathbf{M}_i + N} a_n e^{2\pi i \boldsymbol{\alpha}_r \cdot \mathbf{n}} \right)^2 \leq ((N-1)^d + c_d \delta^{-d}) \sum_{\mathbf{M}_i < n_i \leq \mathbf{M}_i + N} |a_n|^2$$

for some  $c_d \in \mathbb{R}_+$  depending on  $d$ . ┘

*Proof:* Firstly we prove the assertion with  $(\delta^{-1} + N - 1)$  replaced by  $\delta^{-1} + N$ . By duality, it suffices to prove that

$$\sum_{\mathbf{M}_i < n_i \leq \mathbf{M}_i + N} \left( \sum_r z_r e^{2\pi i \boldsymbol{\alpha}_r \cdot \mathbf{n}} \right)^2 \leq (N + \delta^{-1}) \sum_r |z_r|^2.$$

By squaring out, the diagonal terms contribute  $N \sum_r |z_r|^2$ , and the off-diagonal terms yield

$$\sum_{r \neq s} z_r \bar{z}_s \sum_{M < n \leq M+N} e^{2\pi i n(\alpha_r - \alpha_s)} = \sum_{r \neq s} z_r \bar{z}_s e^{2\pi i (M + \frac{N+1}{2})(\alpha_r - \alpha_s)} \frac{\sin(\pi N(\alpha_r - \alpha_s))}{\sin(\pi(\alpha_r - \alpha_s))},$$

which is bounded by  $\delta^{-1} \sum_r |z_r|^2$  by (35.1.6.8).

To prove the original inequality, take  $K \in \mathbb{Z}_+$  large, then  $\{\frac{\alpha_r + k}{K}\}_{k \in [K]_+, r}$  satisfies the hypothesis with  $\delta$  changed to  $\delta/K$ , thus

$$\begin{aligned} \sum_r \sum_{k \in [K]_+} \left( \sum_{KM + K + 1 < n \leq KM + KN} a_n e^{2\pi i \frac{\alpha_r + k}{K} n} \right)^2 &= K \sum_r \left( \sum_{M < n \leq M+N} a_n e^{2\pi i \alpha_r n} \right)^2 \\ &\leq (\delta^{-1} K + NK - K + 1) \sum_n |a_n|^2. \end{aligned}$$

Let  $K \rightarrow \infty$ , we get the desired assertion.

? For the second assertion, it suffices to prove a higher-dimensional version of (35.1.6.6):

$$\left| \sum_{r \neq s} (z_r \bar{z}_s) \prod_{i=1}^d \frac{1}{\lambda_{r,i} - \lambda_{s,i}} \right| \leq c_d \frac{\pi^d}{\delta^d} \sum_r |z_r|^2.$$

□

**Cor. (35.1.6.10)** [Large Sieve for Rational Exponentials]. For any  $Q, M, N \in \mathbb{Z}_+$  and  $(a_n)_{M < n \leq M+N} \in \mathbb{C}$ , we have

$$\sum_{q \in [Q]_+} \sum_{a \in (\mathbb{Z}/(q))^*} \left| \sum_{M < n \leq M+N} a_n e^{2\pi i \frac{an}{q}} \right|^2 \leq (Q^2 + N - 1) \sum_n |a_n|^2.$$

┘

**Cor. (35.1.6.11)** [Large Sieve for Rational Exponentials in Arithmetic Progressions]. For any  $k, l, Q, M, N \in \mathbb{Z}_+$  and  $(a_n)_{M < n \leq M+N} \in \mathbb{C}$ , we have

$$\sum_{q \in [Q]_+, (q, k)=1} \sum_{a \in (\mathbb{Z}/(q))^*} \left| \sum_{n \equiv l \pmod{k}} a_n e^{2\pi i \frac{an}{q}} \right|^2 \leq (Q^2 + k^{-1}N) \sum_{n \equiv l \pmod{k}} |a_n|^2.$$

┘

*Proof:*

□

### Multiplicative Large Sieve Inequalities

**Prop. (35.1.6.12).** For  $q, N \in \mathbb{Z}_+$  and  $(a_n) \in \mathbb{C}$ , we have

$$\sum_{\chi \in \text{Diri}(q)} \left| \sum_{n \in [N]_+} a_n \chi(n) \right|^2 \leq (q + N) \sum_n |a_n|^2.$$

┘

*Proof:*

$$\begin{aligned} \sum_{\chi \in \text{Diri}(q)} \left| \sum_{n \leq N} a_n \chi(n) \right|^2 &= \sum_{\chi \in \text{Diri}(q)} \sum_{n \in [N]_+} \sum_{m \in [N]_+} a_n \bar{a}_m \chi(n) \bar{\chi}(m) \\ &= \sum_{n, m \in [N]_+, n \equiv m \pmod{q}} q a_n \bar{a}_m \\ &\leq q \sum_{n, m \in [N]_+, n \equiv m \pmod{q}} \frac{|a_n|^2 + |a_m|^2}{2} \\ &\leq (q + N) \sum_n |a_n|^2. \end{aligned}$$

□

**Thm. (35.1.6.13)** [Bombieri-Davenport[B-D69]]. For  $Q, M, N \in \mathbb{Z}_+$  and any  $(a_n)_{M < n \leq M+N}$ , we have

$$\sum_{rs \leq Q, (r, s)=1} \frac{s}{\phi(rs)} \sum_{\chi \in \text{Diri}'(s)} \left| \sum_{M < n \leq M+N} a_n \chi(n) c_r(n) \right|^2 \leq (Q^2 + N - 1) \|\alpha\|^2 \text{ (35.3.6.8)}.$$

In particular,

$$\sum_{q \leq Q} \frac{q}{\phi(q)} \sum_{\chi \in \text{Diri}'(q)} \left| \sum_{M < n \leq M+N} a_n \chi(n) \right|^2 \leq (Q^2 + N - 1) \|\alpha\|^2.$$

┘

*Proof:* For  $q \in \mathbb{Z}_+$  and  $\chi \in \text{Diri}'(q)$ , by (35.3.6.11), for any  $n \in \mathbb{Z}$ , we have

$$\tau(\chi)\bar{\chi}(n) = \sum_{a \in (\mathbb{Z}/(q))^*} \chi(a) e^{2\pi i \frac{an}{q}}.$$

And if  $\chi$  is induced from a  $\chi_s \in \text{Diri}'(s)$  with  $q = sr$  and  $(r, s) = 1$ , then for any  $n \in \mathbb{Z}$ , we have

$$\sum_{a \in (\mathbb{Z}/(q))^*} \chi(a) e^{2\pi i \frac{an}{q}} = \sum_{b \in (\mathbb{Z}/r)^*} \sum_{c \in (\mathbb{Z}/s)^*} \chi(bs + cr) e^{2\pi i (\frac{b}{r} + \frac{c}{s})n} = \bar{\chi}(n) \chi(r) c_r(n) \quad (35.3.6.8).$$

Thus if we denote  $S(\alpha) = \sum_n a_n e^{2\pi i \alpha n}$ , then

$$\sum_n a_n \bar{\chi}(n) c_r(n) = \frac{\bar{\chi}_s(n)}{\tau(\chi_s)} \sum_{a \in (\mathbb{Z}/(q))^*} \chi(a) S\left(\frac{a}{q}\right),$$

and

$$\begin{aligned} \sum_{rs \leq Q, (r,s)=1} \frac{s}{\phi(rs)} \sum_{\chi \in \text{Diri}'(s)} \left| \sum_{M < n \leq M+N} a_n \chi(n) c_r(n) \right|^2 &\leq \sum_{q \leq Q} \frac{1}{\phi(q)} \sum_{\chi \in \text{Diri}(q)} \left| \sum_{a \in (\mathbb{Z}/(q))^*} \chi(a) S\left(\frac{a}{q}\right) \right|^2 \\ &= \sum_{q \leq Q} \sum_{a \in (\mathbb{Z}/(q))^*} \left| \sum_{N < n \leq N+M} a_n e^{2\pi i \frac{an}{q}} \right|^2 \\ (35.1.6.10) &\leq (Q^2 + N - 1) \sum_n |a_n|^2 \end{aligned}$$

□

### Large-Sieve Bounds

**Thm. (35.1.6.14) [Large-Sieve Bounds for Number Fields, Gallagher[Gal73]].** Let  $F \in \text{NField}$ ,  $d = [F : \mathbb{Q}]$  and  $\Lambda$  a torsion-free  $\mathcal{O}_F$ -module of f.t. with rank  $n$ , and  $\|\cdot\|$  a norm on  $\Lambda \otimes \mathbb{R}$ , then there exists a constant  $c = c(\Lambda, \|\cdot\|) \in \mathbb{R}_+$  satisfying the following: If  $X \subset \Lambda$  is a subset s.t. there exists  $N \in \mathbb{R}_{\geq 1}$ ,  $Q \in \mathbb{R}_+$ , and for each  $v \in \Sigma_F^{\text{fin}}$  with  $\|v\| \leq Q$ , there exists  $w_v \in [0, 1]$  s.t.

- There exists  $x_0 \in \Lambda \otimes \mathbb{R}$  s.t.  $\|x - x_0\| \leq N/2$  for each  $x \in X$ .
- For each  $v \in \Sigma_F^{\text{fin}}$  with  $\|v\| \leq Q$ , the image  $[X]_v$  of  $X$  under the projection  $\Lambda \rightarrow \Lambda/\mathfrak{p}_v \Lambda$  satisfies

$$\#[X]_v \leq (1 - w_v) \# \Lambda/\mathfrak{p}_v \Lambda.$$

Then

$$\#X \leq c \max([N]^{nd} + Q^{2n})/L(Q), \text{ where } L(Q) = L(Q, \{w_v\}) = \sum_{\mathfrak{a} \in \text{Ideal}^\times(\mathcal{O}_F)^b, \|\mathfrak{a}\| \leq Q} \prod_{v \in S(\mathfrak{a})} \frac{w_v}{1 - w_v}.$$

And we also have

$$L(Q) \geq L'(Q) = \sum_{\mathfrak{a} \in \text{Ideal}^\times(\mathcal{O}_F), \|\mathfrak{a}\| \leq Q} w_{\mathfrak{a}},$$

where  $w_{\mathfrak{a}}$  is the strongly multiplicative function on  $\text{Ideal}^\times(\mathcal{O}_F)$  defined by  $w$ .

In fact, if  $F = \mathbb{Q}$ ,  $\Lambda = \mathbb{Z}^n$  with the usual norm  $\|x\|_\infty$  on  $\Lambda$ , then we can take replace  $c \max([N]^{nd} + Q^{2n})$  by  $([N]^n + c_d Q^{2n})$  where  $c_d$  comes from (35.1.6.9). Notice that  $c_1 = 1$ .  $\square$

*Proof:* Consider a function  $T_\Lambda = \Lambda_{\mathbb{R}}^\vee / \Lambda^\vee$  s.t.  $f(x) = \sum_{\lambda \in X} e^{2\pi i \langle \lambda, x \rangle}$ , then  $\|f\|_\infty = f(0) = \#X = \|f\|_2^2$ . So the lemma (35.1.6.15) applied to  $f$  gives the assertion.  $\square$

**Lemma (35.1.6.15).** Situation as in (35.1.6.14), if  $f$  is a function on  $T_\Lambda = \Lambda_{\mathbb{R}}^\vee / \Lambda^\vee$  s.t.  $\text{Supp}(f) \subset X$ , then there exists  $c \in c(\Lambda, \|\cdot\|) \in \mathbb{R}_+$  s.t.

$$\|f\|_\infty^2 \leq c \max(N^{nd} + Q^{2n}) \|f\|_2^2 / L(Q).$$

In fact, if  $F = \mathbb{Q}$ ,  $\Lambda = \mathbb{Z}^n$  with the usual norm  $\|x\|_\infty$  on  $\Lambda$ , then we can take replace  $c \max(\lfloor N \rfloor^{nd} + Q^{2n})$  by  $(\lfloor N \rfloor^n + c_d Q^{2n})$  where  $c_d$  comes from (35.1.6.9). Notice that  $c_1 = 1$ .  $\lrcorner$

*Proof:* It suffices to bound  $f(0)$ , by translation invariance of  $\text{Supp}(f^\vee)$ . Define

$$T_Q = \bigcup_{\mathfrak{a} \in \text{Ideal}^\times(\mathcal{O}_F), \|\mathfrak{a}\| \leq Q} T_\Lambda[\mathfrak{a}],$$

then  $T_Q$  is  $c_1 Q^{-2/d}$ -spaced for some  $c_1 = c_1(\Lambda, \|\cdot\|) \in \mathbb{R}_+$ : There exists  $\mathfrak{b}_1, \dots, \mathfrak{b}_n \in \text{Ideal}^\times(\mathcal{O}_F)$  s.t.  $\Lambda^\vee \cong \mathfrak{b}_1 \oplus \dots \oplus \mathfrak{b}_n$ , and then

$$\Lambda^\vee \otimes \mathbb{R} \cong (F \otimes \mathbb{R})^{\oplus n}.$$

Now we can choose a norm on  $\Lambda^\vee \otimes \mathbb{R}$  as

$$\|(x_1, \dots, x_n)\| = \max_{\sigma: F \rightarrow \mathbb{C}, i \in [n]_+} |\sigma(x_i)|.$$

And from here it is clear that  $T_Q$  is  $c_1 Q^{-2/d}$ -spaced for some  $c_1$ .

Thus

$$\sum_{x \in T_Q} |f(x)|^2 \leq c \max(\lfloor N \rfloor^{nd}, Q^{2n}) \|f\|_2^2$$

for some  $c \in c(\Lambda, \|\cdot\|) \in \mathbb{R}_+$ , by (35.1.6.9).

But

$$\sum_{x \in T_Q} |f(x)|^2 \geq \sum_{\substack{\mathfrak{a} \in \text{Ideal}^\times(\mathcal{O}_F)^\flat \\ \|\mathfrak{a}\| \leq Q}} \sum_{x \in T[\mathfrak{a}] \text{ primitive}} |f(x)|^2.$$

And because  $T[\mathfrak{a}]^\vee = \Lambda / \mathfrak{a}\Lambda$ , the restriction of  $f$  to  $T[\mathfrak{a}]$  has its spectrum contained in the image of  $X$  in  $\Lambda / \mathfrak{a}\Lambda$ . Thus

$$\sum_{x \in T[\mathfrak{a}] \text{ primitive}} |f(x)|^2 \geq |f(0)|^2 \prod_{v \in S(\mathfrak{a})} \frac{w_v}{1 - w_v}$$

by (35.1.6.16), and the assertion follows.  $\square$

**Lemma (35.1.6.16) [Harmonic Analysis on Finite Abelian Fields].** Let  $G_1, \dots, G_m \in \mathcal{A}b^{\text{fin}}$  and  $\Omega_i \subset G_i^\vee$ , and denote  $w_i = \#\Omega_i / \#G_i$ . Suppose  $f$  is a function on  $G = G_1 \times \dots \times G_m$  that is a linear combination of characters of the form  $\chi_1 \times \dots \times \chi_m$  with  $\chi_i \in G_i^\vee \setminus \Omega_i$ , then we have

$$|f(e)|^2 \leq \left( \prod_i \frac{1 - w_i}{w_i} \right) \sum_{x_i \in G_i \setminus \{e\}} |f(x_1, \dots, x_m)|^2.$$

$\lrcorner$

*Proof:* Use induction on  $m$ : If  $m = 1$ , write  $f = \sum_{\chi \in G_i^\vee \setminus \Omega_i} a_\chi \chi$ , then

$$|f(0)|^2 = \left| \sum_{\chi \in G^\vee} a_\chi \right|^2 \leq (1 - \omega) \#G \left( \sum_{\chi \in G^\vee} |a_\chi|^2 \right) = (1 - \omega) \sum_{g \in G} |f(g)|^2.$$

Thus the assertion follows.

Now if  $m \geq 2$  and the assertion holds true for any smaller  $m$ . For each  $x_m \in G_m$ , denote  $f_{x_m}(x_1, \dots, x_{m-1}) \triangleq f(x_1, \dots, x_m)$ , then by induction hypothesis we have

$$\sum_{x_i \in G_i \setminus \{e\}} |f_{x_m}(x_1, \dots, x_{m-1})|^2 \geq \left( \prod_{i=1}^{m-1} \frac{w_i}{1 - w_i} \right) |f_{x_m}(e)|^2$$

Thus

$$\sum_{x_i \in G_i \setminus \{e\}} |f(x_1, \dots, x_{m-1}, x_m)|^2 \geq \left( \prod_{i=1}^{m-1} \frac{w_i}{1 - w_i} \right) \sum_{x_m \in G_m \setminus \{e\}} |f(e, \dots, e, x_m)|^2 \geq \left( \prod_{i=1}^m \frac{w_i}{1 - w_i} \right) f(e).$$

□

**Cor. (35.1.6.17) [1-Dimensional Large Sieve Bounds, Montgomery].** Suppose

- $\mathcal{M} \subset \mathbb{Z}_+$  is a subset contained in an interval of length  $N \geq 1$ .
- $\mathcal{P} \subset \text{Prime}$  are finite set of primes.
- For each  $p \in \mathcal{P}$ , let  $\Omega_p \subset \mathbb{Z}/(p)$  be a properly-contained subset.

$$\mathcal{S}(\mathcal{M}, \mathcal{P}, \Omega) \triangleq \{m \in \mathcal{M} : m \pmod{p} \notin \Omega_p \forall p \in \mathcal{P}\}.$$

Then for each sequence of complex numbers  $(a_n)_{n \in \mathbb{Z}_+} \in \mathbb{C}$ , denote

$$Z = \sum_{n \in \mathcal{S}(\mathcal{M}, \mathcal{O}, \Omega)} a_n,$$

then

$$|Z|^2 \leq \frac{N + Q^2}{H(Q)} \|a\|^2, \text{ where } H(Q) = \sum_{q \in [Q]_+} h(q),$$

where  $h$  is a multiplicative function supported on square-free numbers s.t.  $h(p) = \frac{\#\Omega_p}{p - \#\Omega_p}$  for  $p \in S(\mathcal{P})$  and  $h(p) = 0$  for  $p \notin S(\mathcal{P})$ .

In particular, we have  $\#\mathcal{S}(\mathcal{M}, \mathcal{P}, \Omega) \leq \frac{N + Q^2}{H(Q)}$ . ┘

**Remark (35.1.6.18).** See [I-K04]P181 for a direct proof. ┘

## 7 Probabilistic Models for Primes

See <https://terrytao.wordpress.com/2015/01/04/254a-supplement-4-probabilistic-models-and-heuristics/> [sieve method, Ford]

## 35.2 Sieve Theory

References are [Ser97, I-K04, H-W08].

**Notation (35.2.0.1).**

- Use notations on elementary number theory defined in [Elementary Number Theory](#).

┘

### 1 Basics

**Def. (35.2.1.1) [Sifted Sums].** For  $f : \mathbb{Z}_+ \rightarrow \mathbb{R}_+$ ,  $\mathbf{P} \subset \mathbf{Prime}$  and  $z, X \in \mathbb{R}_{\geq 1}$ , define

$$\mathbf{P}(z) = \prod_{p \in \mathbf{P} \cap [z-1]_+} p.$$

If  $\mathbf{P}$  is not specified, then  $\mathbf{P} = \mathbf{Prime}$  by default. Then consider the sifted sum

$$\mathcal{M}_f(X|z) = \sum_{n \in [X]_+, (n, \mathbf{P}(z))=1} f(n),$$

┘

**Prop. (35.2.1.2) [Legendre Formula].** Situation as in [\(35.2.1.1\)](#),

$$\mathcal{M}_f(X|z) = \sum_{n \in [X]_+} \left( \sum_{d|n, d|\mathbf{P}(z)} \mu(d) \right) f(n) = \sum_{d|\mathbf{P}(z)} \mu(d) A_d(X), \text{ where } A_d(X) = \sum_{n \in [X]_+, d|n} f(n).$$

┘

**Remark (35.2.1.3) [Heuristics].** Situation as in [\(35.2.1.2\)](#), heuristically, for each  $d|\mathbf{P}(z)$ , we should have

$$A_d(X) = g(d) \mathcal{M}_f(X) + r_d(X),$$

where  $g : \mathbb{Z}_+ \rightarrow [0, 1]$  is multiplicative and  $r_d(X)$  is relatively small. Thus we have

$$\mathcal{M}_f(X|z) \sim V(z)X, \text{ where } V(z) = \prod_{p|\mathbf{P}(z)} (1 - g(p)).$$

┘

### Parity Barrier

### 2 Combinatorial Sieves

**Prop. (35.2.2.1) [Burn's Combinatorial Sieves].** Burn modified the range of  $d$  in the summation in Legendre's formula [\(35.2.1.2\)](#) by two sets  $\mathcal{D}^+$  and  $\mathcal{D}^-$  to get an upper and a lower bound.

We write prime decompositions in descending order, and choose a family of parameters  $(y_m)_{m \in \mathbb{Z}_+} \in \mathbb{Z}_+$ , and define

$$\mathcal{D}^+ = \{d \in \mathbb{Z}_+ | d = p_1 \dots p_r, p_{2k-1} < y_{2k-1}, \forall k \in \mathbb{Z}_+\},$$

$$\mathcal{D}^- = \{d \in \mathbb{Z}_+ | d = p_1 \dots p_r, p_{2k} < y_{2k}, \forall k \in \mathbb{Z}_+\}.$$

And for each multiplicative function  $g : \mathbb{Z}_+ \rightarrow [0, 1]$ , define

$$V^\pm(z) = \prod_{d \in \mathcal{D}^\pm, d|P(z)} \mu(d)g(d),$$

then we have

$$V^-(z) \leq V(z) \leq V^+(z), \text{ where } V(z) = \prod_{p|P(z)} (1 - g(p)).$$

In particular, if the heuristic in (35.2.1.3) holds, then

$$V^-(z)\mathcal{M}_f(X) + R^-(X|z) \leq \mathcal{M}_f(X|z) \leq V^+(z)\mathcal{M}_f(X) + R^+(X|z)$$

where  $R^\pm(z) = \sum_{d|P(z), d \in \mathcal{D}^\pm} \mu(d)r_d(X)$ . ┘

*Proof:* We have the formula

$$V(z) = 1 - \sum_{p \in P(z)} g(p)V(p),$$

so by iterating this down and use inclusion-exclusion, we get

$$V(z) = V^+(z) - \sum_{n \in 2\mathbb{Z}_+ - 1} V_n(z) = V^-(z) + \sum_{n \in 2\mathbb{Z}_+} V_n(z),$$

where

$$V_n(z) = \sum_{\substack{y_n \leq p_n < \dots < p_1 < z \\ p_m < y_m, \forall m < n \text{ s.t. } m \equiv n \pmod{2}}} g(p_1 \dots p_n) V(p_n).$$

The two inequalities follow from plugging in the inequalities (which are special cases where  $g \equiv 1$ )

$$\sum_{d|n, d|P(z), d \in \mathcal{D}^-} \mu(d) \leq \sum_{d|n, d|P(z)} \mu(d) \leq \sum_{d|n, d|P(z), d \in \mathcal{D}^+} \mu(d).$$

to the Legendre formula (35.2.1.2). □

### $\beta$ -Stopping Criterion

**Def. (35.2.2.2) [Iwaniec's Combinatorial Sieve ( $\beta$ -Stopping Criterion)].** Situation as in (35.2.2.1), Iwaniec modifies the sets  $\mathcal{D}^\pm$  by making  $(y_m)$  to be depending on  $p_1, \dots, p_{m-1}$ , i.e. take a parameter  $(y, \beta)$  where  $y \in \mathbb{Z}_{\geq z}$  and  $\beta \in \mathbb{R}_{>1}$ , and define

$$y_1 = y, \quad y_m = \left( \frac{y}{p_1 \dots p_m} \right)^{1/\beta},$$

i.e. he wants to impose the condition  $p_1 \dots p_{m-1} p_m^{\beta+1} < y$ . It is clear that  $\mathcal{D}^+ \cup \mathcal{D}^- \subset [y-1]_+$ . ┘

**Thm. (35.2.2.3) [Iwaniec's Combinatorial Sieve, Iwaniec (1980)].** Situation as in (35.2.2.1), suppose there exists  $\kappa, K \in \mathbb{R}_+$  s.t. the multiplicative function  $g$  satisfies:  $g(\text{Prime}) \subset [0, 1)$  and for any  $w \leq z \in \mathbb{R}_+$  we have

$$\prod_{p \in \text{Prime}, w \leq p \leq z} (1 - g(p))^{-1} \leq K \left( \frac{\log z}{\log w} \right)^\kappa.$$

Then we can choose Iwaniec's combinatorial sieve parameters  $y \in \mathbb{Z}_+, \beta = 9\kappa + 1$  as in (35.2.2.2). Then for any  $z \in [y^{1/\beta}]_+$ , we have

$$V^+(z) < (1 + e^{\beta-s} K^{10}) V(z), \quad V^-(z) > (1 - e^{\beta-s} K^{10}) V(z),$$

where  $s = \log y / \log z \geq \beta$ . This  $\kappa$  is called a **sieve dimension** of this combinatorial sieve. ┘

*Proof:* Notation as in the proof of (35.2.2.1),

$$V_n(z) \leq \sum_{\substack{y_n \leq p_n < \dots < p_1 < z \\ p_1 \dots p_{m-1} p_m^\beta < y, \forall m < n}} g(p_1 \dots p_n) V(p_n).$$

For such sequence  $y_n \leq p_n < \dots < p_1 < z$ ,  $p_1^{n+\beta} \geq y$ , so  $n \geq s - \beta$ . And by induction we have

$$p_1 \dots p_m < y^{1 - \left(\frac{\beta-1}{\beta}\right)^m}$$

for any  $m < n$ , and then

$$p_n \geq (y/p_1 \dots p_m)^{\frac{1}{\beta+1}} \geq y^{\frac{1}{\beta+1} \left(\frac{\beta-1}{\beta}\right)^{n-1}} \geq y^{\frac{1}{\beta} \left(\frac{\beta-1}{\beta}\right)^n} \geq z^{\left(\frac{\beta-1}{\beta}\right)^n}.$$

So if we set  $z_n \triangleq z^{\left(\frac{\beta-1}{\beta}\right)^n}$ , then

$$V_n(z) \leq \sum_{z_n \leq p_n < \dots < p_1 < z} g(p_1 \dots p_n) V(p_n) \leq \frac{V(z_n)}{n!} \left( \sum_{z_n \leq p < z} g(p) \right)^n \leq \frac{V(z_n)}{n!} \left( \log \frac{V(z_n)}{V(z)} \right)^n.$$

The hypothesis implies that

$$\frac{V(z_n)}{V(z)} \leq K \left( \frac{\beta}{\beta-1} \right)^{\kappa n} < K e^{n/9},$$

so

$$V_n(z) \leq \frac{K}{n!} \left( \frac{k}{9} + \log K \right)^n e^{n/9} V(z) \leq \frac{K}{n!} \left( \frac{k}{9} \right)^n e^{n/9} K^9 V(z) \leq e^{-1} \left( \frac{e^{1+1/9}}{9} \right)^n K^{9+1} V(z) \leq e^{-n-1} K^{10} V(z).$$

by Stirling's inequality (12.6.1.18). Notice also that  $p_1^{n+\beta} \geq y$ , so

$$\sum_{n \geq s-\beta} V_n(z) \leq \frac{e^{\beta-s}}{e-1} K^{10} V(z).$$

□

**Cor. (35.2.2.4).** Situation as in (35.2.1.2), suppose the heuristic (35.2.1.3) holds and there exists  $\kappa, K \in \mathbb{R}_+$  s.t. the multiplicative function  $g$  satisfies:  $g(\text{Prime}) \subset [0, 1)$  and for any  $w \leq z \in \mathbb{R}_+$  we have

$$\prod_{p \in \text{Prime}, w \leq p \leq z} (1 - g(p))^{-1} \leq K \left( \frac{\log z}{\log w} \right)^\kappa.$$

Then

$$\begin{aligned} \mathcal{M}_f(X|z) &\leq (1 + e^{\beta-s} K^{10}) V(z) \mathcal{M}_f(X) + R(X|z^s), \\ \mathcal{M}_f(X|z) &\geq (1 - e^{\beta-s} K^{10}) V(z) \mathcal{M}_f(X) - R(X|z^s), \end{aligned}$$

for  $\beta = 9\kappa + 1$  and any  $s \in \mathbb{R}_{\geq \beta}$ , where

$$R(X|z^s) = \sum_{d|P(z), d < z^s} |r_d(X)| \quad (35.2.1.3).$$

In particular, if  $y(X)$  is a function of  $X$  s.t.  $\lim_{X \rightarrow \infty} y(X) = \infty$  and  $R(X|y(X))$  is relatively small, then for any  $s \in \mathbb{R}_{> \beta}$ , we can take  $z(X) = y(X)^{1/s} > 1$ , then

$$\frac{\mathcal{M}_f(X)}{\log^\kappa z(X)} \ll_{\kappa, K, s} \mathcal{M}_f(X) V(z(X)) \ll_{\kappa, K, s} \mathcal{M}_f(X|z(X)) \ll_{\kappa, K, s} V(z(X)) \mathcal{M}_f(X).$$

┘

*Proof:* The remainder term are bounded by the fact  $\mathcal{D}^+ \cup \mathcal{D}^- \subset [z^s - 1]_+$  (35.2.2.2).  $\square$

**Cor. (35.2.2.5).**

$$\pi_2(X) \ll \frac{X}{\log^2 X}, \quad \pi_2(X, X^{1/20}) \gg \frac{X}{\log^2 X}.$$

$\perp$

### 3 Selberg's Sieve

**Prop. (35.2.3.1) [Setup for Selberg's Upper Bound Sieve [Sel52]].** Suppose

- $\mathcal{A} = (a_n)_{n \in \mathbb{Z}_+} \subset \mathbb{R}_{\geq 0}$  is a sequence of non-negative numbers,
- $P \in \mathbb{Z}_+^b$ ,
- $g : \mathbb{Z}_+ \rightarrow \mathbb{R}_{\geq 0}$  is multiplicative s.t.  $g(p) < 1$  for each  $p \in \text{Prime}$ ,

s.t.

$$\mathcal{A}_d \triangleq \sum_{d|n} a_n = g(d)X + r_d(\mathcal{A})$$

for each  $d|P$ . Then for each sequence of real numbers  $(\rho_d)_{d \in \mathbb{Z}_+} \in \mathbb{R}$  s.t.  $\rho_1 = 1$ , we have

$$\begin{aligned} S(\mathcal{A}; P) &\triangleq \sum_{n \in \mathbb{Z}_+, (n, P)=1} a_n \leq \sum_{n \in \mathbb{Z}_+} a_n \left( \sum_{d \in \mathbb{Z}_+, d|P} \rho_d \right)^2 \\ &= \sum_{d_1, d_2 \in \mathbb{Z}_+, d_1 | P, d_2 | P} \rho_{d_1} \rho_{d_2} \mathcal{A}_{[d_1, d_2]} = GX + R(\mathcal{A}; P), \end{aligned}$$

where

$$G = \sum_{d_1, d_2 \in \mathbb{Z}_+, d_1 | P, d_2 | P} g([d_1, d_2]) \rho_{d_1} \rho_{d_2}, \quad R(\mathcal{A}; P) = \sum_{d_1, d_2 \in \mathbb{Z}_+, d_1 | P, d_2 | P} \rho_{d_1} \rho_{d_2} r_{[d_1, d_2]}(\mathcal{A}).$$

$\perp$

**Thm. (35.2.3.2) [Selberg's Upper Bound Sieve, van.Lint-Richert [L-R65]].** Situation as in (35.2.3.1), suppose

- $g$  is supported on square-free numbers, and  $g(p) > 0$  for each  $p \in S(P)$ .
- $D \in \mathbb{R}_{\geq 1}$  s.t.  $\rho_d = 0$  for  $d \geq \sqrt{D}$ .

Let  $h : \mathbb{Z}_+ \rightarrow \mathbb{R}_+$  be the multiplicative function s.t.

$$h(p^k) = \begin{cases} \frac{g(p)}{1-g(p)} & , k = 1 \\ 0 & , \text{otherwise} \end{cases}.$$

Then we have

$$S(\mathcal{A}; P) \leq H(D)^{-1} X + R(\mathcal{A}; P),$$

where

$$H(D) = \sum_{\substack{d \in \mathbb{Z}_+, d \leq \sqrt{D} \\ d|P}} h(d), \quad R(\mathcal{A}; P) = \sum_{d \in \mathbb{Z}_+, d|P} \lambda_d r_d(\mathcal{A}),$$

where

$$\lambda_d = \sum_{\substack{d_1, d_2 \in \mathbb{Z}_+ \\ [d_1, d_2] = d}} \rho_{d_1} \rho_{d_2}, \quad \rho_l = \frac{\mu(l)h(l)}{g(l)H} \sum_{\substack{d \in \mathbb{Z}_+, d < \sqrt{D}/l \\ (d, l) = 1}} h(d).$$

Moreover, we have  $|\rho_d| \leq 1$  and  $|\lambda_d| \leq \tau_3(d) \leq 3^{\#S(d)}$  for each  $d \in \mathbb{Z}_+$ .  $\lrcorner$

**Remark (35.2.3.3).** The Selberg's sieve yields good results for sifting problems when the number of residue classes to be excluded is large.  $\lrcorner$

*Proof:*

$$\begin{aligned} G &= \sum_{abc|P} g(abc) \rho_{ac} \rho_{bc} \\ &= \sum_{c|P} g(c) \sum_{(a,b)=1, ac|P, bc|P} g(a)g(b) \rho_{ac} \rho_{bc} \\ &= \sum_{c|P} g(c) \sum_{cd|P} \mu(d)g(d)^2 \left( \sum_{cdm|P} g(m) \rho_{cdm} \right)^2 \\ &= \sum_{d|P} h(d)^{-1} \left( \sum_{d|m} g(m) \rho_m \right)^2. \end{aligned}$$

If we denote  $\xi_d = \mu(d) \sum_{d|m} g(m) \rho_m$  for each  $d \in \mathbb{Z}_+$ , then we get

$$G = \sum_{d|P} h(d)^{-1} \xi_d^2,$$

and by Möbius-inversion?? we have

$$\rho_l = \frac{\mu(l)}{g(l)} \sum_{l|d} \xi_d.$$

In particular, we have  $\sum_{d|P} \xi_d = 1$ , and  $\xi_d = 0$  for  $d \geq \sqrt{D}$ .

Then it follows from Cauchy's formula that  $GH(D) \geq 1$ , and the equality holds if  $\xi_d = h(d)H^{-1}$  for  $d < \sqrt{D}$ , in which case

$$\rho_l = \frac{\mu(l)h(l)}{g(l)H} \sum_{\substack{d \in \mathbb{Z}_+, d < \sqrt{D}/l \\ (d, l) = 1}} h(d).$$

Then the inequality follows from (35.2.3.1). To show that  $|\rho_l| \leq 1$ , notice

$$\begin{aligned} H &= \sum_{k|l} \sum_{d < \sqrt{D}, (d, l) = k} h(d) \\ &= \sum_{k|l} h(k) \sum_{m < \sqrt{D}/k, (m, l) = 1} h(m) \\ &\geq \left( \sum_{k|l} h(k) \right) \sum_{m < \sqrt{D}/l, (m, l) = 1} h(m) \\ &= \mu(l) \rho_l H, \end{aligned}$$

so we get  $0 \leq \mu(l) \rho_l \leq 1$ . And  $|\lambda_d| \leq \tau_3(d)$  follows trivially.  $\square$

**Cor. (35.2.3.4) [Main Terms].** Situation as in (35.2.3.2), suppose  $A_1, A_2, L, \kappa \in \mathbb{R}_+$  s.t.

- $\prod_{p \in \text{Prime}_{< \sqrt{D}}} p \mid P$ .
- $0 \leq g(p) \leq 1 - A_1$  for each  $p \in \text{Prime}$ .
- For any  $2 \leq w \leq y \in \mathbb{R}_+$ , we have

$$-L \leq \sum_{p \in \text{Prime}, w \leq p \leq y} g(p) \log p - \kappa \log \frac{y}{w} \leq A_2.$$

- $\sum_{p \in \text{Prime}} g(p)^2 \log p < \infty$ .

Then we have

$$H(D) = C \frac{\log^\kappa \sqrt{D}}{\Gamma(\kappa + 1)} + O_{\kappa, A_1, A_2} \left( C[(L + 1) \log^{\kappa-1} X + (L + 1)^\kappa] \right), \text{ where } C = \prod_{p \in \text{Prime}} (1 - g(p))^{-1} \left(1 - \frac{1}{p}\right)^\kappa.$$

┘

*Proof:* In this case,

$$H(D) = \sum_{d \in \mathbb{Z}_+, d < \sqrt{D}} h(d),$$

so we can apply Wirsing's formula (35.1.3.4) to  $h$ ? Cf. [Sieve method, Ford]P46.

□

**Cor. (35.2.3.5) [Remainder Terms].** Situation as in (35.2.3.2), suppose

- $g(p)p \geq 1$  for each  $p \in S(P)$ .
- $|r_d(\mathcal{A})| \leq g(d)d$  for each  $d \mid P$ .
- There exists  $c \in \mathbb{R}_+$  s.t.  $\sum_{p \in \text{Prime}, y \leq p \leq x} g(p)p \leq cX$  for each  $X \in \mathbb{R}_{\geq 2}$ .
- $\sum_{p \in \text{Prime}_{\leq X}} g(p)^2 p \log p = o(X)$  for  $X \in \mathbb{R}_{\geq 2}$ .

then we have

$$S(\mathcal{A}; P) \leq H(D)^{-1} X + O_c \left( \frac{D}{\log^2 D} \right).$$

┘

*Proof:* The hypotheses imply that  $g([d_1, d_2])[d_1, d_2] \leq g(d_1)g(d_2)d_1d_2$ , so

$$R(\mathcal{A}; P) \leq \left( \sum_{d < \sqrt{D}} |\rho_d| g(d)d \right)^2 \leq \left( \frac{1}{H(D)} \sum_{m < \sqrt{D}} h(m)\sigma(m) \right)^2 \quad (35.2.3.2).$$

Then it follows from (35.1.3.3) applied to  $h\sigma$  that

$$\sum_{m \in \mathbb{Z}_+, m < \sqrt{D}} h(m)\sigma(m) \ll_c \frac{\sqrt{D}}{\log D} \sum_{m \in \mathbb{Z}_+, m < \sqrt{D}} h(m)\sigma(m)m^{-1},$$

And we also have

$$\sum_{m \in \mathbb{Z}_+, m < \sqrt{D}} h(m)\sigma(m)m^{-1} \leq H(D) \sum_{m \in \mathbb{Z}_+} h(m)m^{-1} \ll_c H.$$

So  $R(\mathcal{A}; P) = O_c(D \log^{-2} D)$ .

□

#### 4 Summation over Primes

**Def. (35.2.4.1) [Summation over Primes].** For  $f : \mathbb{Z}_+ \rightarrow \mathbb{C}$ , denote

$$\psi(f; X) = \sum_{n \in [X]_+} \Lambda(n) f(n),$$

And if  $f$  decays rapidly, denote  $\psi(f) = \lim_{X \rightarrow \infty} \psi(f; X)$ . ┘

**Thm. (35.2.4.2) [Explicit Formula].** For  $f : \mathbb{R}_+ \rightarrow \mathbb{C}$  that is smooth with compact support, then

$$\psi(f) = \mathcal{M}(f)(1) - \sum_{n \in \mathbb{Z}_+} \mathcal{M}(f)(-2n) - \sum_{\rho \in \text{Zero}'(\zeta)} \mathcal{M}(f)(\rho).$$

┘

*Proof:* ? Cf. [I-K04]P337. The proof is based on a version of the Chebotarev density theorem, and uses a two-dimensional large sieve inequality together with results of Deuring, Hurwitz and Masser-Wüstholz. □

**Prop. (35.2.4.3).** Situation as in (35.2.4.1), by (2.6.2.11),  $\Lambda = \mu * \log$ , so

$$\psi(f; X) = - \sum_{d \in \mathbb{Z}_+} (\mu(d) \log d) A_d(X), \text{ where } A_d(X) = \sum_{n \in [X]_+, d|n} f(n).$$

┘

**Remark (35.2.4.4) [Heuristics].** Situation as in (35.2.4.3), similar to (35.2.1.3), heuristically, there exists  $D \in \mathbb{Z}_+$  s.t. the summand for  $d > D$  is small, and for  $d \leq D$ , we should have

$$A_d(X) = g(d) \mathcal{M}_f(X) + r_d(X),$$

where  $g : \mathbb{Z}_+ \rightarrow [0, 1]$  is multiplicative and  $r_d(X)$  is relatively small. Thus we have

$$\psi(f; X) \sim H \mathcal{M}_f(X), \text{ where } H = - \sum_{d \in \mathbb{Z}_+} (\mu(d) \log d) g(d) = \prod_{p \in \text{Prime}} \frac{1 - g(p)}{1 - p^{-1}}.$$

┘

**Remark (35.2.4.5) [Vinogradov's Method].** Situation as in (35.2.4.1), many times we can use inclusion-exclusion method to write

$$\psi(f) = \psi_1(f) + \psi_2(f),$$

where

$$\psi_1(f) = \sum_{d \in [D]_+} \alpha_d A_d(X), \quad \psi_2(f) = \sum_{M < m \leq N, mn \in [X]_+} \beta_m \gamma_n a_{mn}.$$

$\psi_1(f)$  can be handled because we can show that  $A_d(X)$  are small, and  $\psi_2(f)$  can be handled by large sieve methods Large Sieve method. ┘

**Useful Identities for  $\Lambda(n)$  and  $\mu(n)$** 

**Prop. (35.2.4.6)** [Linnik's Identity, Linnik[[Lin63](#)]]. For  $n, k \in \mathbb{Z}_+$ , denote

$$\Lambda^{\vee}(n) = \frac{\Lambda(n)}{\log n} = \begin{cases} a^{-1} & , n^{1/a} \in \mathbf{Prime} \\ 0 & \text{otherwise} \end{cases}$$

and

$$\tau'_k(n) = \#\{n_1, \dots, n_k \in \mathbb{Z}_{\geq 2}, n_1 \dots n_k = n\},$$

then

$$\Lambda^{\vee}(n) = - \sum_{k \in \mathbb{Z}_+} \frac{(-1)^k}{k} \tau'_k(n).$$

In particular, for  $X \in \mathbb{R}_{\geq 2}$  and  $z \in [2, \sqrt{X}]$ , any sequence  $(a_n)_{n \in \mathbb{Z}_+} \in \mathbb{C}$ , we have

$$\sum_{\substack{p \in \mathbf{Prime}, \nu \in \mathbb{Z}_+ \\ p^\nu \leq X, p > z}} \frac{a_{p^\nu}}{\nu} = - \sum_{k \leq K} \sum_{\substack{n \in [X]_+ \\ (n, \mathbf{P}(z))=1}} \tau'_k(n) a_n.$$

In the RHS, the  $k$ -th summand can be tackled using GL( $k$ )-methods. ┘

*Proof:* Because  $\zeta(s) = \sum_{n \in \mathbb{Z}_+} n^{-s} = \prod_{p \in \mathbf{Prime}} (1 - p^{-s})^{-1}$ , we have

$$\log \zeta(s) = \sum_{n \in \mathbb{Z}_{\geq 2}} \Lambda^{\vee}(n) n^{-s}.$$

But also

$$\log \zeta(s) = \log(1 - (1 - \zeta(s))) = - \sum_{k \in \mathbb{Z}_+} \frac{(-1)^k}{k} \left( \sum_{n \geq 2} n^{-s} \right)^k = - \sum_{n \in \mathbb{Z}_{\geq 2}} \sum_{k \in \mathbb{Z}_+} \frac{(-1)^k}{k} \tau'_k(n) n^{-s}.$$

So the assertion follows. □

**Prop. (35.2.4.7)** [Heath.Brown's Identities, Heath.Brown[[HB82](#)]]. For  $K, n \in \mathbb{Z}_+, z \in \mathbb{R}_{\geq 1}$ ,

$$\Lambda_{\leq 2z^K} = - \sum_{k \in [K]_+} (-1)^k \binom{K}{k} (\mu_{\leq z})^{*k} * \mathbf{1}^{*(k-1)} * \text{Log}.$$

$$\mu_{\leq z^K} = - \sum_{k \in [K]_+} (-1)^k \binom{K}{k} (\mu_{\leq z})^{*k} * \mathbf{1}^{*(k-1)}.$$

┘

*Proof:* 1: Let  $M(s) = \sum_{m \in [z]_+} \mu(m) m^{-s}$ , then

$$\zeta(s) M(s) = 1 + \sum_{n \in \mathbb{Z}_+, n > z} a_z(n) n^{-s}$$

for some sequence  $(a_z(n)) \in \mathbb{Z}$ , because  $\zeta * \mu = \delta$  ([2.6.2.3](#)). So

$$\frac{\zeta^{\vee}}{\zeta}(s) (1 - \zeta(s) M(s))^K = \frac{\zeta^{\vee}}{\zeta}(s) = \frac{\zeta^{\vee}}{\zeta}(s) + \sum_{k \in [K]_+} (-1)^k \binom{K}{k} \zeta^{\vee}(s) \zeta^{k-1}(s) M^k(s).$$

Notice the Dirichlet series for the LHS vanishes for  $n \leq 2z^K$ , so the assertion follows by comparing the two Dirichlet series.

2: The proof is similar to the above.  $\square$

**Prop. (35.2.4.8) [Vaughan's Identities, Vaughan[Vau77]].** For  $y, z \in \mathbb{R}_+$ ,

$$\Lambda_{>z} = \mu_{\leq y} * \text{Log} - \mu_{\leq y} * \Lambda_{\leq z} * \mathbf{1} + \mu_{>y} * \Lambda_{>z} * \mathbf{1}.$$

$$\mu - \mu_{\leq y} - \mu_{\leq z} = -\mu_{\leq y} * \mu_{\leq z} * \mathbf{1} + \mu_{>y} * \mu_{>z} * \mathbf{1}.$$

┘

*Proof:* 1: By (2.6.2.11),  $\Lambda = \mu * \text{Log}$ , so

$$\mu * \Lambda = \mu * \Lambda_{\leq z} + \mu_{\leq y} * \Lambda - \mu_{\leq y} * \Lambda_{\leq z} + \mu_{>y} * \Lambda_{>z}.$$

And then the assertion follows by convolution with  $\mathbf{1}$  and use the identities  $\mathbf{1} * \mu = \delta$ ,  $\mathbf{1} * \Lambda = \text{Log}$ .

2: Use similar argument as above.  $\square$

**Prop. (35.2.4.9) [Montgomery-Vaughan Identity(1981)].** Denote  $G_2(s) = \sum_{d \leq V} \mu(d) d^{-s}$ , then it follows from the identity

$$\frac{1}{\zeta(s)} = 2G(s) - G(s)^2 \zeta(s) + \left( \frac{1}{\zeta(s)} - G(s) \right) (1 - \zeta(s)G(s))$$

that

$$\mu(n) = 2\mu(n)\mathbf{1}_{[V]_+}(n) - \sum_{\substack{d \cdot m = n \\ d \leq V, e \leq V}} \mu(d)\mu(e) - \sum_{\substack{d \cdot k = n \\ d > V, k > V}} \mu(d) \left( \sum_{e|k, e \leq V} \mu(e) \right).$$

In particular, for any  $f : \mathbb{Z}_+ \rightarrow \mathbb{C}$  and  $V \leq N \in \mathbb{Z}_+$ , we have

$$\sum_{n=1}^N \mu(n)f(n) = T_0 + T_1 + T_2,$$

where

$$T_0 = 2 \sum_{n=1}^V \mu(n)f(n), \quad T_1 = - \sum_{m \leq V^2} b_m \sum_{n \leq N/m} f(mn), \quad \text{where } b_m = \sum_{d \cdot e = m, d \leq V, e \leq V} \mu(d)\mu(e),$$

$$T_2 = - \sum_{V < m \leq N/V} \mu(m) \sum_{V < n \leq N/m} c_n f(mn), \quad \text{where } c_n = \sum_{d|n, d \leq V} \mu(d).$$

They satisfy

$$T_0 \ll \sum_{n \leq V} |f(n)|.$$

$$T_1 \ll \sum_{r \leq V^2} d(r) \left| \sum_{k \leq N/r} f(rk) \right|.$$

$$T_2 \ll N^{1/2} \log^{5/2} N \cdot \max_{V \leq M \leq N/V} \max_{j \leq N/M} \sqrt{\sum_{k \leq N/M} \left| \sum_{\substack{M < m \leq 2M \\ m \leq N/k, m \leq N/j}} f(mj) \overline{f(mk)} \right|}.$$

┘

*Proof:* ?  $\square$

### Vinogradov's method

**Prop. (35.2.4.10) [O. Ramaré's Identities].** For  $X \in \mathbb{R}_{\geq 4}$  and  $1 \neq n \in [X]_+$ , define

$$\tau(n|\sqrt{X}) = \#\{p \in \mathbf{Prime} : p|n, p \leq \sqrt{X}\}, \quad \beta_n(X) = \frac{1}{1 + \tau(n|\sqrt{X})}.$$

Then for any  $n \in \mathbb{Z}_+$  that is square-free, we have

$$\sum_{\substack{p \in \mathbf{Prime} \\ p|n, p \leq \sqrt{X}}} \beta_{n/p}(X) = 1 - \mathbf{1}_{\mathbf{Prime} \cap (\sqrt{X}, X]}(n).$$

In particular, for any  $(a_n) \in \mathbb{C}$  and  $z \in [2, \sqrt{X}]$ , we have

$$\sum_{\sqrt{X} < p \leq X} a_p = \sum_{\substack{n \in \mathbb{Z}_+ \text{ square-free} \\ 1 < n \leq X}} a_n - \sum_{\substack{p \in \mathbf{Prime} \leq \sqrt{X}, m \in \mathbb{Z}_+ \text{ square-free} \\ p \nmid m, mp \leq X}} \beta_m(X) a_{mp}.$$

and

$$\sum_{\sqrt{X} < p \leq X} a_p = \sum_{\substack{n \in \mathbb{Z}_+ \text{ square-free} \\ 1 < n \leq X, (n, \mathbf{P}(z))=1}} a_n - \sum_{\substack{p \in \mathbf{Prime}, m \in [X]_+ \text{ square-free} \\ (m, \mathbf{P}(z))=1, z \leq p \leq \sqrt{X}, p \nmid m, mp \leq X}} \beta_m(X) a_{mp}.$$

┘

*Proof:* If  $n \in \mathbf{Prime}$  and  $\sqrt{X} < n \leq X$ , then clearly the LHS vanishes. On the other hand, if  $n$  has a prime divisor smaller than  $\sqrt{X}$ , then then clearly the LHS equals 1.  $\square$

**Thm. (35.2.4.11) [Vinogradov's method].** Notation as in (35.2.4.10),

$$\begin{aligned} \sum_{p \in \mathbf{Prime} \leq X} a_p &= \sum_{d|\mathbf{P}(z), d \leq \sqrt{X}} \mu(d) A_d(X) - \sum_{\substack{m \in [X]_+ \text{ square-free} \\ (m, \mathbf{P}(z))=1}} \beta_m(X) \sum_{\substack{p \in \mathbf{Prime} \\ z \leq p \leq \sqrt{X}, p \leq X/m}} a_{mp} \\ &\quad + \varepsilon(X, z) \sqrt{X} \|\mathbf{a}\mathbf{1}_{[X]_+}\|. \end{aligned}$$

where  $A_d(X)$  is given in (35.2.1.2), and

$$|\varepsilon(x, z)| \leq \frac{2}{\sqrt{z}} + \frac{1}{2^{20}} \exp\left(-\frac{\log X}{2 \log z}\right) \log(8X)^{21}.$$

In application, when  $(a_n)$  is very oscillating, it is natural to take  $z = \exp(\sqrt{\log X})$  and get

$$\left| \sum_{p \in \mathbf{Prime} \leq X} a_p \right| \leq \sum_{d \in [\sqrt{X}]_+} |A_d(X)| + \sum_{m \in [X]_+} \left| \sum_{\substack{p \in \mathbf{Prime} \\ z \leq p \leq \sqrt{X}, p \leq X/m}} a_{mp} \right| + \varepsilon(X, z) \sqrt{X} \|\mathbf{a}\mathbf{1}_{[X]_+}\|.$$

┘

*Proof:* Based on Ramaré's Identity (35.2.4.10), we relax the restrictions that  $n$  is square-free and  $p \nmid m$ , then the error term is bounded by

$$\sum_{n \in [X]_+, \exists p \in \mathbf{Prime}_{\geq z} p^2 | n} |a_n| \leq \|\mathbf{a}\mathbf{1}_{[X]_+}\| \left( \sum_{p \in \mathbf{Prime}_{\geq z}} X p^{-2} \right)^{1/2} \leq X^{1/2} z^{-1/2} \|\mathbf{a}\mathbf{1}_{[X]_+}\|$$

Then we also add the terms  $a_1$  and  $\{a_p\}_{p \in \text{Prime}_{\leq \sqrt{X}}}$ , which is bounded by

$$\sum_{n \in [\sqrt{X}]_+} |a_n| \leq \sqrt{X} \left\| \mathbf{a} \mathbf{1}_{[X]_+} \right\|.$$

Next we use Legendre's formula (35.2.1.2) to get

$$\left| \sum_{p \in \text{Prime}_{\leq X}} a_p - \sum_{d | \mathbb{P}(z)} \mu(d) A_d(X) + \sum_{\substack{m \in [X]_+ \text{ square-free} \\ (m, \mathbb{P}(z)) = 1}} \beta_m(X) \sum_{\substack{p \in \text{Prime} \\ z \leq p \leq \sqrt{X}, p \leq X/m}} a_{mp} \right| \leq (X^{1/4} + X^{1/2} z^{-1/2}) \left\| \mathbf{a} \mathbf{1}_{[X]_+} \right\|.$$

Then add the restriction that  $d \leq \sqrt{X}$ , then the error term is bounded by

$$\begin{aligned} \sum_{d \in \mathbb{Z}_{> \sqrt{X}}, d | \mathbb{P}(z)} |A_d(X)| &\leq \sum_{d \in \mathbb{Z}_{> \sqrt{X}}, d | \mathbb{P}(z), n \leq X/d} |a_{dn}| \\ (35.1.3.9) &\leq \sqrt{\sum_{n \in [X]_+} |a_n|^2} \left( \sum_{d \in \mathbb{Z}_{> \sqrt{X}}, d | \mathbb{P}(z), n \leq X/d} \tau(dn) \right)^{1/2} \\ (35.1.3.8) &\leq \sqrt{X \log(3X) \sum_{n \in [X]_+} |a_n|^2} \left( \sum_{d \in \mathbb{Z}_{> \sqrt{X}}, d | \mathbb{P}(z)} \frac{\tau(d)}{d} \right)^{1/2} \\ (35.2.4.12) &\leq \exp\left(-\frac{\log X}{\log z}\right) (\log z + 1)^{e^3}. \end{aligned}$$

Then the assertion follows. □

**Lemma (35.2.4.12) [Rankin's Trick].** For  $X, z \in \mathbb{R}_{\geq 1}$ ,

$$\sum_{d | \mathbb{P}(z), d > \sqrt{X}} \frac{\tau(d)}{d} \leq \exp\left(-\frac{\log X}{\log z}\right) (\log z + 1)^{e^3}.$$

┘

*Proof:* For any  $\varepsilon \in \mathbb{R}_+$ , we have

$$\begin{aligned} \sum_{d | \mathbb{P}(z), d > \sqrt{X}} \frac{\tau(d)}{d} &\leq X^{-\varepsilon} \sum_{d | \mathbb{P}(z)} \tau(d) d^{2\varepsilon-1} \\ &\leq X^{-\varepsilon} \prod_{p \in \text{Prime}_{< z}} (1 + 2p^{2\varepsilon-1}) \\ &\leq X^{-\varepsilon} \prod_{p \in \text{Prime}} (1 + p^{-1-\varepsilon})^{2z^{3\varepsilon}} \\ (35.1.2.6) &\leq X^{-\varepsilon} (1 + \varepsilon^{-1})^{2z^{3\varepsilon}} \end{aligned}$$

The assertion follows by taking  $\varepsilon = 1/\log z$ . □

### Prime-Summation Inequalities

**Thm. (35.2.4.13).** There exists  $\kappa \in \mathbb{R}_+$  s.t. : For any  $\mathcal{A} = (a_n)_{n \in \mathbb{Z}_+} \subset \mathbb{C}$  be a sequence of complex numbers s.t.  $|a_n| \leq \tau(n)$  for each  $n \in \mathbb{Z}_+$ , and  $X \in \mathbb{R}_{\geq e^{12}}, \varepsilon \in [\log^{-1} X, 1/12]$ , if

$$\sum_{d \in [X^{1/2-\varepsilon}]} \left| \sum_{dm \leq X} a_{dm} \right| \leq \frac{X}{\log^2 X},$$

and

$$\sum_{(m, P(w))=1} \left| \sum_{\substack{p \in \text{Prime} \cap [X/m]_+ \\ \leq p < X^{1/3-\varepsilon}}} p^{it} a_{pm} \right| \leq \frac{X}{\log^4 X}$$

for each  $t \in \mathbb{R}$ , where  $w = X^{\varepsilon/10 \log(2) X}$  and  $P(w) = \prod_{p \in \text{Prime}_{<w}}$ , then we have

$$\sum_{p \in \text{Prime} \cap [X]_+} a_p \leq \kappa \varepsilon \frac{X}{\log X}.$$

┘

*Proof:* Cf. [I-K04]P351 ?.

□

## 5 Numbers Represented by Homogenous Forms

**Thm. (35.2.5.1) [Fermat/Jacobi].** For  $n \in \mathbb{Z}_+$ , let  $r_2(n) = \#\{(x, y) \in \mathbb{Z} | x^2 + y^2 = n\}$ , then  $r(n) \neq 0$  iff  $2|v_p(n)$  for any  $p \equiv 3 \pmod{4}$ . Moreover,

$$r_2(n) = 4 \cdot \#\{d \in \mathbb{Z}_+, d|n, d \equiv 1 \pmod{4}\} - \#\{d \in \mathbb{Z}_+, d|n, d \equiv 3 \pmod{4}\}.$$

┘

*Proof:*  $1 + \sum_{n \in \mathbb{Z}_+} r_2(n) e^{2\pi i n \tau} = \theta^2(\tau) \in \text{MF}_1(\Gamma_0(4), \chi_4)$  by (26.3.1.15), and also

$$G_{4, \chi_4} = 1 + \sum_{n \in \mathbb{Z}_+} \left( \sum_{d \in \mathbb{Z}_+, d|n} \chi_4(d) \right) e^{2\pi i n \tau} \in \text{MF}_1(\Gamma_0(4), \chi_4) \text{ (26.3.4.10)}.$$

But  $\dim \text{MF}_1(\Gamma_1(4)) \leq 1$  by (26.3.3.17), so we can compare coefficients. □

**Thm. (35.2.5.2) [Lagrange].** For  $n \in \mathbb{Z}_+$ , let  $r_4(n) = \#\{(x, y) \in \mathbb{Z} | x^2 + y^2 = n\}$ , then  $r_4(n)$  equals 8 times the sum of positive divisors of  $n$  that are not multiples of 4.

In particular, any  $n \in \mathbb{Z}_+$  is a sum of four squares. ┘

*Proof:* Calculate  $\theta^4(\tau) \in \text{MF}_2(\Gamma_0(4))$ , where  $\dim \text{MF}_2(\Gamma_0(4)) = 2$ . ? Cf. [Modular Forms 1-2-3]P27.

□

### 35.3 Character Sums

References are [I-K04], [Kats's work] and [Weil conjectures and Fourier transform].

#### 1 Van der Corput's method

**Prop. (35.3.1.1).** If  $f, g : \mathbb{R} \rightarrow \mathbb{R}$  is smooth and  $a < b \in \mathbb{R}$  s.t.  $|f'(x)| \leq 1 - \theta$  and  $f''(x) \neq 0$  on  $[a, b]$ , then

$$\sum_{n \in \mathbb{Z} \cap (a, b)} g(n) e^{2\pi i f(n)} = \int_a^b g(x) e^{2\pi i f(x)} dx + O(G\theta^{-1}),$$

where  $G = |g(b)| + \int_a^b |g'(t)| dt$ . ┘

*Proof:* Cf. [I-K04]P206. □

#### 2 Vinogradov's method

#### 3 Incomplete Sums

**Prop. (35.3.3.1).** For any  $\alpha \in \mathbb{R} \setminus \mathbb{Z}$  and  $M \in \mathbb{Z}, N \in \mathbb{Z}_+$ , we have

$$\left| \sum_{M < n \leq M+N} e^{2\pi i n \alpha} \right| \leq \min(N, \frac{1}{2\{\{\alpha\}\}}).$$

*Proof:*

$$\left| \sum_{M < n \leq M+N} e^{2\pi i n \alpha} \right| = \left| \frac{\sin(N\alpha\pi)}{\sin(\alpha\pi)} \right| \leq \frac{1}{2\{\{\alpha\}\}}.$$

□

**Prop. (35.3.3.2) [Completing Method].** Suppose  $F : \mathbb{Z} \rightarrow \mathbb{C}$  has period  $q$  and  $G(x)$  is a nice analytic function that decays to 0 rapidly as  $x \rightarrow \infty$ , denote

$$S_{F,G} = \sum_{n \in \mathbb{Z}} F(n) G(n),$$

then by Poisson summation (Cf. [I-K04]P69?),

$$S_{F,G} = \frac{1}{q} \sum_{a \in \mathbb{Z}} S_F\left(\frac{a}{q}\right) G^\vee\left(\frac{a}{q}\right),$$

where

$$S_F\left(\frac{a}{q}\right) = \sum_{n \in \mathbb{Z}/(q)} F(n) e^{2\pi i \frac{an}{q}}.$$

In particular,

$$S_F(M, N) = \sum_{M < n \leq M+N} F(n) = \frac{1}{q} \sum_{a \in \mathbb{Z}/(q)} \lambda\left(\frac{a}{q}\right) S_F\left(\frac{a}{q}\right), \text{ where } \lambda\left(\frac{a}{q}\right) = \sum_{M < n \leq M+N} e^{-2\pi i \frac{an}{q}}$$

by orthogonality. ┘

**Cor. (35.3.3.3).** Notation as in (35.3.3.2), by (35.3.3.1),

$$\left| S_F(M, N) - \frac{N}{q} S(0) \right| \leq \sum_{0 < |a| < \frac{q}{2}} \frac{1}{2|a|} \left| S\left(\frac{a}{q}\right) \right|.$$

┘

**Thm. (35.3.3.4) [Pólya-Vinogradov Inequality, Pólya[?P\ 'o118]/Vinogradov[Vin18]].** For any  $q \in \mathbb{Z}_{\geq 2}$  and  $\chi \in \text{Diri}(q) \setminus \mathbf{1}_q$  and  $M, N \in \mathbb{Z}_+$ , we have

$$\left| \sum_{M < n \leq M+N} \chi(n) \right| \leq 6\sqrt{q} \log q.$$

┘

*Proof:* Cf. [I-K04]P324. □

#### 4 Katz's Trigonometric Sums

**Def. (35.3.4.1) [Generalized Trigonometric Sums].** For  $p \in \text{Prime}$ ,  $q \in p^{\mathbb{Z}}$ ,  $\mathbf{1} \neq \psi \in \mathbb{F}_q^{\vee}$ , and  $h : X \rightarrow \mathbb{A}_{\mathbb{F}_q}^1 \in \text{Sch}^{\text{fg}}/\mathbb{A}_{\mathbb{F}_q}^1$ , the generalized **trigonometric sum** is defined to be the exponential sum

$$\sum_{x \in X(\mathbb{F}_q)} \psi(h(x)).$$

┘

**Thm. (35.3.4.2) [Katz].** Let  $h : X \rightarrow \mathbb{A}^1 \in \text{Sch}^{\text{fg}}/\mathbb{A}^1$ , then there exists  $C \in \mathbb{R}_+$  s.t. for any  $p \in \mathbf{P}$  and  $q \in p^{\mathbb{Z}_+}$ ,  $\psi \neq \mathbf{1} \in \chi(\mathbb{F}_q)$ ,

$$\left| \sum_{x \in A(\mathbb{F}_q)} \psi(h(x)) \right| \leq Cq^{N+\frac{1}{2}},$$

where  $N$  is the supremum of the dimension of the fiber of  $h_{\mathbb{C}}$ .

And if moreover the generic fiber  $h_{\bar{\eta}}$  is geo.irreducible or has dimension  $< N$ , then for any  $p \in \mathbf{P}$  and  $q \in p^{\mathbb{Z}_+}$ ,  $\psi \neq \mathbf{1} \in \chi(\mathbb{F}_q)$ ,

$$\left| \sum_{x \in A(\mathbb{F}_q)} \psi(h(x)) \right| \leq Cq^N.$$

┘

*Proof:* Cf. [K-W01]P228. □

#### 5 Gauss-Sums

**Def. (35.3.5.1) [Gauss-Sums and Heilbronn-Sums].** For  $N \in \mathbb{Z}_+$  and  $f(X) \in \mathbb{Z}[X]$ , a **Gauss sum** is a summation

$$G_N(f) = \sum_{n=1}^N e^{2\pi i f(n)/N}.$$

A special case is the summation

$$G_N(a; k) = G_p(aX^k) = \sum_{n=1}^p e^{2\pi i a n^k / p}$$

where  $k \in \mathbb{Z}_+$ ,  $a \in \mathbb{Z} \setminus (p)$ .

And a **Heilbronn-sum** is the summation of the form

$$H_p(a) = \sum_{n=1}^N e^{2\pi i \frac{a n^p}{p^2}}, \text{ where } p \in \text{Prime}.$$

Notice if  $p \in \text{Prime}$  and  $k_0 = \gcd(k, p-1)$ , then  $G_p(a, k) = G_p(a, k_0)$ . Thus for  $G_p(a; k)$ , we always assume  $k|p-1$ .  $\perp$

**Prop. (35.3.5.2).** If  $a \in \mathbb{Z}$  and  $N_1, N_2 \in \mathbb{Z}_+$  with  $(N_1, N_2) = 1$ , then

$$G_N(a; k) = G_{N_1; k}(aN_2^{k-1}; k)G_{N_2}(aN_1^{k-1}; k).$$

$\perp$

*Proof:* Writing any  $n \pmod{N}$  as  $n \equiv n_1 N_2 + n_2 N_1 \pmod{N}$ .  $\square$

**Prop. (35.3.5.3) [Dirichlet].** For any  $N \in \mathbb{Z}_+$ , we have

$$G_N(1; 2) = \frac{1 + i^{-N}}{1 - i} \sqrt{N}.$$

$\perp$

*Proof:* Firstly, if  $N$  is even

$$G_N(1; 2) = \sum_{n \pmod{N}} e^{2\pi i \frac{n^2}{N}} = \sum_{n \pmod{N}} e^{2\pi i \frac{(n+N/2)^2}{N}} = i^m G_N(1; 2),$$

so  $G(m) = 0$  if  $m \equiv 2 \pmod{4}$ , so the assertion holds for  $N \equiv 2 \pmod{4}$ . Now assume  $N \not\equiv 2 \pmod{4}$ , then

$$G_{N^3}(1; 2) = N G_N(1; 2)$$

because we can write  $a \pmod{N^3}$  as  $a \equiv r + sN^2 \pmod{N^3}$  when  $N$  is odd and  $a \equiv r + s\frac{N^2}{2} \pmod{N^3}$  when  $4|N$ .

Next,

$$G_N(1; 2) = 2 \sum_{n \in [\frac{N}{2}]_+} e^{2\pi i \frac{n^2}{N}} + O(1) = 2 \sum_{n \in [\frac{N}{4}]_+} e^{2\pi i \frac{n^2}{N}} + 2i^N \sum_{n \in [\frac{N}{4}]_+} e^{2\pi i \frac{(n+\{N/2\})^2}{N}} + O(1) \quad (35.3.1.1).$$

And notice

$$\sum_{n \in [\frac{N}{2}]_+} e^{2\pi i \frac{n^2}{N}} = \int_0^{N/4} e^{2\pi i \frac{x^2}{N}} dx = \frac{1+i}{4} \sqrt{N} \quad (12.4.6.5),$$

and similarly for  $\sum_{n \in [\frac{N}{2}]_+} e^{2\pi i \frac{(n+\{N/2\})^2}{N}}$ , so

$$G_N(1; 2) = \frac{1 + i^{-N}}{1 - i} \sqrt{N} + O(1).$$

But this holds for  $N^{3^k}$  for any  $k \in \mathbb{Z}_+$  with the same error term, so the assertion follows.  $\square$

**Cor. (35.3.5.4).** For  $p \in \text{Prime}_{\geq 3}$ ,  $a, b, c \in \mathbb{Z}$  s.t.  $(a, p) = 1$ , we have

$$\sum_{t=0}^{p-1} e^{2\pi i \frac{at^2+bt+c}{p}} = e^{2\pi i \frac{c-b^2[4a]^{-1}}{p}} \left(\frac{a}{p}\right) \frac{1-i^p}{1-i} \sqrt{p}, \text{ where } \epsilon_p = \begin{cases} 1 & , p \equiv 1 \pmod{4} \\ i & , p \equiv 3 \pmod{4} \end{cases}.$$

In particular,

$$G_p(a) = \left(\frac{a}{p}\right) \frac{1-i^p}{1-i} \sqrt{p}.$$

┘

*Proof:* By completing square, it suffices to prove for  $b = c = 0$ . But then

$$G_p(a) = \sum_{t=0}^{p-1} e^{2\pi i \frac{at^2}{p}} = \sum_{b \pmod{p}} \left(1 + \left(\frac{b}{p}\right)\right) e^{2\pi i \frac{ab}{p}} = \left(\frac{a}{p}\right) G_p(1) = \left(\frac{a}{p}\right) \frac{1+i^{-p}}{1-i} \sqrt{p}.$$

□

**Prop. (35.3.5.5).** For  $p \in \text{Prime}_{\geq 3}$ ,  $n \in \mathbb{Z}_+$ ,  $a \in \mathbb{Z}$ ,

$$\left| \sum_{t=1}^{p^{n+1}} e^{2\pi i \left[ \frac{at^2}{p} + \frac{ht}{p^{n+1}} \right]} \right| = \begin{cases} p^{n+\frac{1}{2}} & , p^n | h, p \nmid a \\ 0 & , p^n \nmid h \end{cases}.$$

┘

*Proof:*

$$\sum_{t=1}^{p^{n+1}} e^{2\pi i \left[ \frac{at^2}{p} + \frac{ht}{p^{n+1}} \right]} = \sum_{t=1}^p e^{2\pi i \left[ \frac{at^2}{p} + \frac{ht}{p^{n+1}} \right]} \left( \sum_{r=1}^{p^n} e^{2\pi i \frac{hr}{p^n}} \right).$$

Then the assertion follows from (35.3.5.4).

□

**Prop. (35.3.5.6) [Burgess].** For  $p \in \text{Prime}$ ,  $s \in \mathbb{Z}_+$  and  $b_1, \dots, b_s \in \mathbb{F}_p$ ,

$$\left| \sum_{x \in \mathbb{F}_p} \left( \frac{\prod_i (x + b_i)}{p} \right) \right| \leq s^2 \sqrt{p},$$

unless  $s \in 2\mathbb{Z}_+$  and up to permutation  $b_1 = b_2, b_3 = b_4, \dots, b_{s-1} = b_s$ .

┘

*Proof:* This is clear for  $s = 1$ , and for  $s \geq 2$ , use Weil conjecture on the the hyperelliptic curve

$$y^2 = \prod_i (x + b_i).$$

□

**Prop. (35.3.5.7) [Quadratic Legendre Symbol Sum].** For  $p \in \text{Prime}_{\geq 3}$ ;

$$\sum_{x=0}^{p-1} \left( \frac{x^2 + 1}{p} \right) = -1.$$

┘

*Proof:* The sum is equivalent modulo  $p$  to  $\sum_{x=0}^{p-1}(x^2 + ax + b)^{\frac{p-1}{2}}$ , which by (2.6.1.29) is equivalent to  $-1$  modulo  $p$ . Now it can not be  $p-1$ , because otherwise there is a solution for  $p|x^2 + 1$ , and then it can be calculated directly.  $\square$

**Prop. (35.3.5.8) [Multiplicative Character Bound, Burgess].** For any  $\beta \in \mathbb{R}_{>1/4}$ , there exists  $C(\beta), e(\beta) \in \mathbb{R}_+$  s.t. for any  $\chi : \mathbb{F}_p^\times \rightarrow \mathbb{C}^\times$  and  $x_0 \in \mathbb{Z}$ ,

$$\left| \sum_{x=x_0}^{x_0+N-1} \chi(x) \right| \leq C(\beta) N^{1-e(\beta)}.$$

┘

*Proof:* ?

□

**Cor. (35.3.5.9).** For any  $\varepsilon \in \mathbb{R}_+$ , there exists  $C(\varepsilon) \in \mathbb{R}_+$  s.t. for any  $p \in \mathbf{Prime}$ , any interval of length  $C(\varepsilon)p^{1/4+\varepsilon}$  contains a square and a non-square.  $\square$

**Thm. (35.3.5.10) [Weil].** For  $p \in \mathbf{Prime}$  and  $f(X) \in \mathbb{F}_p[X]$  with  $\deg(f) = k$ ,

$$|G_p(f)| \leq k\sqrt{p}.$$

┘

*Proof:* Cf. [Larry Guth]P56, and a weaker bound is found in [Larry Guth]P62.  $\square$

### Monomial Gauss Sums and Heilbronn Sums

**Conj. (35.3.5.11).**

$$|G_p(a, k)| \leq \min \left( (k-1)\sqrt{p}, (1+\eta)\sqrt{2kp \log(kp)} \right),$$

where  $\eta \rightarrow 0$  as  $k$  and  $p/k$  both tend to infinity.  $\square$

*Proof:*

□

**Prop. (35.3.5.12).**

$$|G_p(a, k)| \leq \min(p, (k-1)\sqrt{p}).$$

┘

*Proof:*  $|G_p(a, k)| \leq p$  is trivial. For the second assertion, notice

$$G_p(a, k) = \sum_{\chi \in \text{Diri}(p), \chi^k = 1, \chi \neq 1} \chi^{-1}(a) \tau(\chi) \text{ (35.3.6.8)},$$

and use the fact  $|\tau(\chi)| = \sqrt{p}$  for each  $\chi$ .  $\square$

**Thm. (35.3.5.13) [Heath-Brown-Konyagin].** Situation as in (35.3.5.1),

$$G_p(a, k) = O(\min(k^{5/8}p^{5/8}, k^{3/8}p^{3/4})).$$

┘

*Proof:* Cf. [B-K20]P223.  $\square$

**Lemma (35.3.5.14).** Situation as in (35.3.5.1), if  $h = (p-1)/k$ , and

$$A(h) = \{(x_1, \dots, x_4) \in \mu_h(\mathbb{Z}_p)^4 \mid x_1 + x_2 = x_3 + x_4\},$$

then

$$|G_p(a, k)| \leq \min(k^{4/5}, p^{1/8})(\#A(h))^{1/4}.$$

┘

*Proof:* Cf. [B-K20]P224.

□

**Lemma (35.3.5.15).** Situation as in (35.3.5.14), if  $h < p^{2/3}$ , then  $\#A(h) = O(h^{5/2})$ .

┘

*Proof:* Cf. [B-K20]P225.

□

**Thm. (35.3.5.16) [Heath.Brown-Konyagin].** Situation as in (35.3.5.1),

$$\sum_{r=1}^p |H_p(a + rp)|^4 = O(p^{7/2}),$$

in particular,

$$H_p(a) = O(p^{7/8}).$$

┘

*Proof:*

□

**Lemma (35.3.5.17).** Situation as in (35.3.5.1), if

$$f(X) = X + \frac{X^2}{2} + \dots + \frac{X^{p-1}}{p-1} \in \mathbb{Z}_p[X],$$

and

$$B = \{(x_1, x_2) \in \mathbb{Z}_p^2 \mid f(x_1) = f(x_2)\},$$

then

$$\sum_{r=1}^p |H_p(a + rp)|^4 = O(p^3 + p^2 \#B).$$

┘

*Proof:* Cf. [B-K20]P224.

□

**Lemma (35.3.5.18).** Situation as in (35.3.5.17), then  $\#B = O(p^{3/2})$ .

┘

*Proof:* Cf. [B-K20]P225.

## Gauss Sum over Finite Fields

### 6 Dirichlet Characters

**Def. (35.3.6.1) [Dirichlet Character, Dirichlet(1837)].** For  $F \in \mathbf{NField}$  and  $\mathfrak{m} \in \mathbf{Ideal}^\times(\mathcal{O}_F)$ , a **Dirichlet character modulo  $\mathfrak{m}$**  is a map  $\chi : (\mathcal{O}_F/\mathfrak{m})^* \rightarrow \mathbb{C}^\times$ .

The **conductor of Dirichlet character** of  $\chi : (\mathcal{O}_F/\mathfrak{m})^* \rightarrow \mathbb{C}^\times$  is defined to be the maximal modulus  $\mathfrak{m}' \supset \mathfrak{m}$  s.t.  $\chi$  factors through the quotient map  $(\mathcal{O}_F/\mathfrak{m})^* \rightarrow (\mathcal{O}_F/\mathfrak{m}')^*$ .  $\chi$  is called a **primitive Dirichlet character** if  $c(\chi) = \mathfrak{m}$ .

The set of Dirichlet characters modulo  $\mathfrak{m}$  is denoted by  $\mathbf{Diri}(\mathfrak{m})$ , and the set of primitive Dirichlet characters modulo  $\mathfrak{m}$  is denoted by  $\mathbf{Diri}'(\mathfrak{m})$ .

For each  $\mathfrak{m} \in \mathbf{Ideal}^\times(\mathcal{O}_F)$ , there is a **principal Dirichlet character  $\mathbf{1}_\mathfrak{m} : (\mathcal{O}_F/\mathfrak{m})^* \rightarrow \mathbb{C}^\times$**  with image  $\{1\}$ .  $\lrcorner$

**Prop. (35.3.6.2).** For coprime elements  $\mathfrak{m}_1, \mathfrak{m}_2 \in \mathbf{Ideal}^\times(\mathcal{O}_F)$ ,  $(\mathbb{Z}/\mathfrak{m}_1\mathfrak{m}_2)^* \cong (\mathbb{Z}/\mathfrak{m}_1)^* \times (\mathbb{Z}/\mathfrak{m}_2)^*$  via projection. Thus any  $\chi \in \mathbf{Diri}(\mathfrak{m}_1\mathfrak{m}_2)$  is uniquely a product  $\chi = \chi_1 \cdot \chi_2$  where  $\chi_i \in \mathbf{Diri}(\mathfrak{m}_i)$ .  $\lrcorner$

**Def. (35.3.6.3) [Quadratic Dirichlet Characters].** A **quadratic Dirichlet character** or a **real Dirichlet character** is a Dirichlet character with image  $\{\pm 1\}$ .  $\lrcorner$

**Def. (35.3.6.4) [Kronecker Characters].** If  $D \in \mathbb{Z}$  is a fundamental discriminant(19.3.1.47), denote  $\chi_D \in \mathbf{Diri}(|D|)$  the character  $\chi_D(m) = \left(\frac{D}{m}\right)$ (2.6.1.27), called the **Kronecker character**.

Notice that  $\chi_D$  are distinct primitive quadratic Dirichlet characters, and every primitive quadratic Dirichlet character is a Kronecker character.  $\lrcorner$

*Proof:* To verify that  $\chi_D$  is a Dirichlet character, it suffices to verify for each  $D \in \{-4, 8, -8\} \cup \left\{\left(\frac{-1}{p}\right)p\right\}_{p \in \mathbf{Prime}_{\geq 3}}$ . It follows from quadratic reciprocity(19.7.4.34) that

$$\chi_{-4}(n) = \begin{cases} 0 & , n \in (2) \\ 1 & , n \equiv 1 \pmod{4} \\ -1 & , n \equiv -1 \pmod{4} \end{cases}, \quad \chi_8(n) = \begin{cases} 0 & , n \in (2) \\ 1 & , n \equiv 1, -1 \pmod{8} \\ -1 & , n \equiv 3, -3 \pmod{8} \end{cases}$$

$$\chi_{-8}(n) = \chi_{-4}(n)\chi_8(n) = \begin{cases} 0 & , a \in (2) \\ 1 & , a \equiv 1, 3 \pmod{8} \\ -1 & , a \equiv -1, -3 \pmod{8} \end{cases}.$$

So they are Dirichlet characters. And for  $p \in \mathbf{Prime}_{\geq 3}$ ,  $\chi\left(\frac{-1}{p}\right)_p$  is a Dirichlet character by quadratic reciprocity(19.7.4.34).

To show that every primitive quadratic Dirichlet character is a Kronecker character, it suffices to notice that  $(\mathbb{Z}/(2^r))^\times \cong \mathbb{Z}/2$  or  $\mathbb{Z}/2 \times \mathbb{Z}/2^{r-2}$ , and  $(\mathbb{Z}/(p^r))^* \cong \mathbb{Z}/((p-1)p^{r-1})$  for  $p \in \mathbf{Prime}_{\geq 3}$ .  $\square$

**Prop. (35.3.6.5).** If  $m \in \mathbb{Z}_+$  and  $\chi \in \mathbf{Diri}'(m)$ , then for any  $a, b \in \mathbb{Z}$ , we have

$$\frac{1}{m} \sum_{x \in \mathbb{Z}/(m)} \chi(ax + b) = \begin{cases} \chi(b) & , m|a \\ 0 & , m \nmid a \end{cases}.$$

$\lrcorner$

*Proof:* By multiplicity, we can assume  $m$  is a prime power  $p^r$ . Denote the LHS by  $S$ , then it can be verified that  $\chi(1 + m_1 t)S = S$  for any  $t \in \mathbb{Z}$ , where  $m_1 = m(a, m)/(a^2, m)$ . If  $S \neq 0$ , then  $\chi$  is periodic of period  $m_1$ . But  $\chi$  is primitive, thus  $m_1 = m$ , showing that  $m|a$ . And in this case it is clear that  $S = \chi(b)$ .  $\square$

**Prop. (35.3.6.6).** If  $a, m \in \mathbb{Z}_+$  and  $(a, m) = 1$ , then

$$\sum_{\chi \in \text{Diri}'(m)} \chi(a) = \sum_{d|(a-1, m)} \phi(d) \mu\left(\frac{m}{d}\right).$$

┘

*Proof:* Use Möbius inversion and orthogonality of characters.  $\square$

**Prop. (35.3.6.7) [Real Primitive Characters].** Cf. [I-K04]P49.  $\perp$

### Gauss-Sums for Hecke-Characters

**Def. (35.3.6.8) [Gauss-Sum for Hecke-Characters].** For  $F \in \mathbf{NField}$ , a modulus  $\mathfrak{m}$  for  $F$  and a Hecke character  $\chi$  with Dirichlet component  $\chi_0$  of conductor  $\mathfrak{m}$  (19.4.1.22), the **Gauss-sum** of  $\chi$  is defined to be

$$\tau(\chi) = \frac{1}{\chi_\infty(\gamma)\chi(\mathfrak{c})} \sum_{\alpha \in \mathfrak{c}/\mathfrak{c}\mathfrak{m}} \chi_0(\alpha) e^{2\pi i \text{tr}_{F/\mathbb{Q}}(\alpha/\gamma)},$$

where  $\gamma \in \mathcal{O}_F^\times$  and  $\mathfrak{c} \in \text{Ideal}^\times(\mathcal{O}_F)$  are chosen s.t.  $(\mathfrak{c}, \mathfrak{m}) = 1$  and  $\mathfrak{c}\mathfrak{d}_F\mathfrak{m} = (\gamma)$ . The definition is independent of  $(\mathfrak{c}, \gamma)$  chosen.

In particular, if  $F = \mathbb{Q}$  and  $\mathfrak{m} = (N)$  for  $N \in \mathbb{Z}_+$ , then for  $a \in \mathbb{Z}$ , define

$$\tau_a(\chi) \triangleq \sum_{n \in \mathbb{Z}/(N)} \chi(n) e^{2\pi i \frac{an}{N}}, \quad \tau(\chi) \triangleq \tau_1(\chi).$$

In particular,  $c_N(a) \triangleq \tau_a(\mathbf{1}_N)$  is called the **Ramanujan sum**, and by Möbius inversion on  $N$ , we have

$$\text{Kloos}(a, 0, \text{mod } N) = \sum_{r \in (\mathbb{Z}/(N))^*} e^{2\pi i \frac{ar}{N}} = \sum_{d|(N, n)} = \mu\left(\frac{N}{(N, n)}\right) \frac{\phi(N)}{\phi(N/(N, n))}.$$

┘

**Prop. (35.3.6.9).** For  $F \in \mathbf{NField}$  and a Hecke character  $\chi$  for  $F$  with Dirichlet component  $\chi_0$  of conductor  $\mathfrak{m}$ , we have

$$\tau(\chi) = \chi(\mathfrak{a}) \tau_{\chi_0}(\beta)$$

for some  $(\mathfrak{a}, \mathfrak{m}) = 1$  and  $\beta \in (\mathfrak{d}\mathfrak{m})^{-1}$ .  $\perp$

*Proof:* Cf. [I-K04]P61. ?  $\square$

**Prop. (35.3.6.10).** For  $\chi \in \text{Diri}(N)$ ,  $\tau(\overline{\chi}) = \chi(-1) \overline{\tau(\chi)}$ .  $\perp$

**Lemma (35.3.6.11) [Fourier-Expansions].** For  $\chi \in \text{Diri}'(N)$  and  $m \in \mathbb{Z}$ , we have  $\sum_{n \pmod{N}} \chi(n) e^{2\pi i \frac{nm}{N}} = \overline{\chi(m)} \tau(\chi)$  (35.3.6.8).  $\perp$

*Proof:* If  $(m, N) = 1$ , then this follows from

$$\tau(\chi) = \sum_{n(\bmod N)} \chi(mn) e^{2\pi i mn/N} = \chi(m) \sum_{n(\bmod N)} \chi(n) e^{2\pi i mn/N}.$$

If  $(m, N) \neq 1$ , then we need to show the LHS is 0. Let  $m = dM, N = dN_1$ . Because  $\chi$  is primitive character mod  $N$ , there is some  $c \equiv 1 \pmod{N_1}$  that  $\chi(c) \neq 1$ , otherwise  $\chi$  is defined mod  $N_1$ . Notice

$$\sum_{n(\bmod N)} \chi(n) e^{2\pi i mn/N} = \sum_{r(\bmod N_1)} \left( \sum_{n(\bmod N), n \equiv r(\bmod N_1)} \chi(n) \right) e^{2\pi i rM/N_1}$$

But  $r \mapsto cr$  is a permutation of  $\{n(\bmod N), n \equiv r(\bmod N_1)\}$ , thus

$$\sum_{n(\bmod N), n \equiv r(\bmod N_1)} \chi(n) = \sum_{n(\bmod N), n \equiv r(\bmod N_1)} \chi(cn) = \chi(c) \sum_{n(\bmod N), n \equiv r(\bmod N_1)} \chi(n)$$

which means this sum vanishes.  $\square$

**Prop. (35.3.6.12).** For  $\chi \in \text{Diri}'(N)$ ,  $|\tau(\chi)|^2 = N$  (35.3.6.8). And if  $\chi \in \text{Diri}(N)$  is induced from  $\chi^* \in \text{Diri}(N^*)$ , then

$$\tau(\chi) = \mu\left(\frac{N}{N^*}\right) \chi^*\left(\frac{N}{N^*}\right) \tau(\chi^*).$$

This also holds for Hecke characters.  $\lrcorner$

*Proof:* If  $\chi \in \text{Diri}'(N)$ , for any  $m$ , by (35.3.6.11), we have

$$|\tau(\chi)|^2 = \left| \sum_{n(\bmod N)} \chi(n) e^{2\pi i nm/N} \right|^2 = \sum_{(n_1, n_2, N)=1} \chi(n_1) \overline{\chi(n_2)} e^{2\pi i (n_1 - n_2)m/N},$$

summing over  $m \in (\mathbb{Z}/(N))^*$ , we get

$$\phi(N) |\tau(\chi)|^2 = \sum_{m(\bmod N)} \sum_{(n_1, n_2, N)=1} \chi(n_1) \overline{\chi(n_2)} e^{2\pi i (n_1 - n_2)m/N} = \sum_{n_1 \equiv n_2(\bmod N), (n_1, n_2, N)=1} N = \phi(N) N$$

if  $\chi \in \text{Diri}(N)$  is induced from  $\chi^* \in \text{Diri}(N^*)$ , then by inclusion-exclusion principle,

$$\tau(\chi) = \sum_{a \in (\mathbb{Z}/N)^*} \chi^*(a) e^{2\pi i \frac{a}{N}} = \sum_{d|m} \mu(d) \chi^*(d) \sum_{a \in (\mathbb{Z}/(N/d))^*} \chi^*(a) e^{2\pi i \frac{ad}{N}}.$$

$\square$

**Cor. (35.3.6.13) [Fourier Expansion of Dirichlet Characters].** From (35.3.6.12) (35.3.6.11) and (35.3.6.10), for  $\chi \in \text{Diri}'(N)$ , we get

$$\chi(n) = \frac{\chi(-1)\tau(\chi)}{N} \sum_{m(\bmod N)} \overline{\chi(m)} e^{2\pi i \frac{mn}{N}}.$$

$\lrcorner$

**Cor. (35.3.6.14).** If  $\chi \in \text{Diri}'(N)$  is quadratic, by (35.3.6.12) and (35.3.6.10), we have  $\tau(\chi)^2 = \chi(-1)N$ .

$\lrcorner$

**Prop. (35.3.6.15).** For  $N_1, N_2 \in \mathbb{Z}_+$  s.t.  $(N_1, N_2) = 1$  and  $\chi_i \in \text{Diri}(N_i)$ , we have

$$\tau(\chi_1 \chi_2) = \chi_1(N_2) \chi_2(N_1) \tau(\chi_1) \tau(\chi_2).$$

This also holds for Hecke characters. ┘

*Proof:*

$$\tau(\chi_1 \chi_2) = \sum_{n_1 \pmod{N_1}} \sum_{n_2 \pmod{N_2}} \chi_1(N_2 n_1) \chi_2(N_1 n_2) e^{2\pi i \frac{N_1 n_2 + N_2 n_1}{N_1 N_2}} = \chi_1(N_2) \chi_2(N_1) \tau(\chi_1) \tau(\chi_2).$$

□

**Prop. (35.3.6.16) [Gauss Sum of Quadratic Characters].** If  $N \in 2\mathbb{N} + 1$  is square-free and  $\chi \in \text{Diri}'(N)$  is the unique principal quadratic character (i.e.  $\chi = \left(\frac{\cdot}{N}\right)$ ), then

$$\tau(\chi) = \frac{1 + i^{-N}}{1 - i} \sqrt{N}.$$

And also

$$\tau(\chi_{-4}) = 2i, \quad \tau(\chi_8) = 2\sqrt{2}, \quad \tau(\chi_{-8}) = 2\sqrt{2}i \text{ (35.3.6.4)}.$$

┘

*Proof:* By (35.3.6.15) and quadratic reciprocity (19.7.4.34), it suffices to prove for  $N \in \text{Prime}_{\geq 3}$ . But in this case,  $\tau(\chi) = G_p(1; 2) = \frac{1+i^{-p}}{1-i} \sqrt{p}$  (35.3.5.3). □

**Prop. (35.3.6.17) [Gauss Sum for Quadratic Imaginary Fields].** Let  $\mathcal{K}$  be an imaginary quadratic field,  $N \in \mathbb{Z}_+$  s.t.  $(N, \text{disc}(\mathcal{K})) = 1$ , and  $\chi \in \text{Diri}'(N)$ , then  $\psi = \text{Nm} \circ \chi$  is a Hecke character of  $\mathcal{K}$  with  $\psi_\infty = 1$  and conductor  $(N)$ . Then

$$\tau(\psi) = \chi_{\mathcal{K}}(N) \chi(|\text{disc}(\mathcal{K})|) \tau(\chi)^2.$$

┘

*Proof:* ? □

**Prop. (35.3.6.18) [Finite Fourier Transform].** Let  $\psi$  be a non-trivial character on a finite field  $\mathbb{F}_q$ , then let  $g_\psi = \sum_{x \in \mathbb{F}_q} \psi(x^2)$ , then

- $|g_\psi|^2 = q$ .
- $g_\psi(a) = \left(\frac{a}{\mathbb{F}_q}\right) g_\psi(1)$ .

┘

*Proof:* Use Fourier transform on  $\mathbb{F}_q$  ? □

## 7 Kloosterman Sums

References are [K-W01].

**Def. (35.3.7.1) [Generalized Kloosterman Sums].** Let  $p \in \text{Prime}$ ,  $q \in p^{\mathbb{Z}_+}$ ,  $m \in \mathbb{Z}_+$ , and  $\psi \in \chi(\mathbb{F}_q)$ , then the generalized **Kloosterman sum** is defined to be

$$\text{Kloos}_m(q, \psi, a) = \sum_{x_1, \dots, x_m \in \mathbb{F}_q^\times, x_1 \dots x_m = a} \psi(x_1 + \dots + x_m) \in \mathbb{C}.$$

And  $\text{Kloos}_2(q, \psi, a)$  is denoted by  $\text{Kloos}(q, \psi, a)$ . ┘

**Thm. (35.3.7.2) [Weil/Deligne].**  $|\text{Kloos}_m(q, \psi, a)| \leq \min(mq^{\frac{m-1}{2}}, q^{m/2})$ . ┘

*Proof:* Let  $X_0 = \text{Spec } \mathbb{F}_q[X_1, \dots, X_m]/(X_1 \dots X_m = a)$  and  $h : X \rightarrow \mathbb{A}_{\mathbb{F}_q}^1 : (x_1, \dots, x_m) \mapsto x_1 + \dots + x_m$ . Let  $\mathcal{L}(\psi^{-1})$  be the Artin-Schreier sheaf on  $\mathbb{A}_{\mathbb{F}_q}^1$  (9.4.6.31), then by (9.4.6.33), for any  $x \in X(\mathbb{F}_q)$ , the Frobenius action  $F_{x_0}^*$  at  $x_0$  on  $h^*(\mathcal{L}(\psi^{-1}))$  is multiplication by  $\psi(h(x))$ .

Then it follows from (9.6.1.26) that

$$\text{Kloos}_m(q, \psi, a) = \text{tr}(F_X^*) = \text{tr}(F_X^* | [\text{R}\Gamma(X, h^*\mathcal{L}(\psi^{-1}))]).$$

Thus, to show that  $|\text{Kloos}_m(q, \psi, a)| \leq mq^{\frac{m-1}{2}}$ , it suffices to show the following:

•

$$\dim H_{\text{ét},c}^k(X_{\overline{\mathbb{F}_q}}, h^*(\mathcal{L}(\psi^{-1}))) = m\delta_{k,m-1}.$$

- $H_{\text{ét},c}^{m-1}(X_{\overline{\mathbb{F}_q}}, h^*(\mathcal{L}(\psi^{-1})))$  is pure of weight  $m-1$ .

For this, Cf. [Deligne, Applications de la formule des traces aux sommes trigonometriques, in SGA4.5] Thm 7.4. ?

For the second inequality, Cf. [K-W01] P227. ? □

### Classical Kloosterman Sums

**Def. (35.3.7.3) [Kloosterman Sums].** For  $m \in \mathbb{Z}_+$  and  $a, b \in \mathbb{Z}$ , a classical **Kloosterman sum** is defined to be the summation

$$\text{Kloos}(a, b, \text{ mod } m) = \sum_{r \in (\mathbb{Z}/m)^*} e^{2\pi i \frac{ar+b[r^{-1}]}{m}} \in \mathbb{C}.$$

┘

**Prop. (35.3.7.4) [Properties of Kloosterman Sums].**

- $\text{Kloos}(a, b, \text{ mod } m) = \text{Kloos}(b, a, \text{ mod } m)$ .
- $\text{Kloos}(ac, b, \text{ mod } m) = \text{Kloos}(a, bc, \text{ mod } m)$  if  $(c, m) = 1$ .
- If  $m_1, m_2 \in \mathbb{Z}_+$ ,  $(m_1, m_2) = 1$ , and choose  $n_1, n_2 \in \mathbb{Z}$  s.t.  $n_1 m_1 \equiv 1 \text{ mod } m_2$  and  $n_2 m_2 \equiv 1 \text{ (mod } m_1)$ , then

$$\text{Kloos}(a, b, \text{ mod } m_1 m_2) = \text{Kloos}(n_2 a, n_2 b, \text{ mod } m_1) \text{Kloos}(n_1 a, n_1 b, \text{ mod } m_2).$$

- If  $p \in \text{Prime}$  and  $p|m$ , then

$$\text{Kloos}(pa, pb, pm) = p \text{Kloos}(a, b, m).$$

┘

**Lemma (35.3.7.5).** If  $p \in \text{Prime}$ ,  $m, n, u, v \in \mathbb{Z}_+$  s.t.  $m/2 \leq n < m$ , and  $\gcd(u, v, p) = 1$ , then

$$|\text{Kloos}(u, v, \text{mod } p^m)| \leq Cp^n,$$

$$\text{where } C = \begin{cases} 4 & , p = 2 \text{ \& } m - n \geq 3 \\ 2 & , \text{otherwise} \end{cases}.$$

*Proof:* In this case, for  $s \in \mathbb{Z} \setminus (p)$  and  $t \in \mathbb{Z}$ , it is easy to verify that

$$[s + p^n t]^{-1} \equiv [s^{-1}] - p^n [s^{-1}]^2 t \pmod{p^m}.$$

So

$$\begin{aligned} |\text{Kloos}(u, v, \text{mod } p^m)| &= \left| \sum_{s \in (\mathbb{Z}/p^n)^*} e^{2\pi i \frac{us + v[s^{-1}]}{p^m}} \sum_{t=1}^{p^{m-n}} e^{2\pi i \frac{(u-v[s^{-1}]^2)t}{p^{m-n}}} \right| \\ &\leq p^{m-n} \#\{s \in (\mathbb{Z}/p^n)^* | us^2 \equiv v \pmod{p^{m-n}}\} \\ &= p^m \#\{s \in (\mathbb{Z}/p^{m-n})^* | us^2 \equiv v \pmod{p^{m-n}}\} \\ &\leq Cp^n \end{aligned}$$

$$\text{where } C = \begin{cases} 4 & , p = 2 \text{ \& } m - n \geq 3 \\ 2 & , \text{otherwise} \end{cases}.$$

**Thm. (35.3.7.6)** [Weil[Wei48]/Estermann[Est61]].

$$|\text{Kloos}(u, v, \text{mod } m)| \leq \sigma_0 \left( \frac{m}{(u, v, m)} \right) \sqrt{\gcd(u, v, m)m}. \quad (35.3.7.3)$$

*Proof:* As the assertion is multiplicative in  $m$ , by (35.3.7.4), it suffices to show for  $m = p^k$ , where  $p \in \mathbf{P}, k \in \mathbb{Z}_+$ . If  $\gcd(a, b, p^k) = p^k$ , then the assertion is trivial. And if  $\gcd(a, b, p^k) < p^k$ , then it follows from (35.3.7.4) that we can reduce to the case  $\gcd(a, b, p^k) = 1$ .

If  $p = 2$  and  $k = 1$ , the assertion is trivial, and if  $p = 2$  and  $k \geq 2$ , then the assertion follows from the lemma (35.3.7.5).

If  $p \geq 3$ , and  $2|k$ , then the assertion follows from (35.3.7.5).

So suppose  $p \geq 3$  and  $2 \nmid k$ . If  $k = 1$  and  $p \nmid uv$ , this is just theorem of Weil (35.3.7.2). And if  $k = 1$  and  $p|uv$ , this is also trivial, because  $\text{Kloos}(u, v, \text{mod } p) \in \{0, 1\}$ .

So suppose  $m > 1$  and denote  $n = \frac{k-1}{2}$ . In this case, for  $s \in \mathbb{Z} \setminus (p)$  and  $t \in \mathbb{Z}$ , it can be verified that

$$[(s + p^n t)^{-1}] \equiv [s^{-1}] - p^n [s^{-1}]^2 t + p^{2n} [s^{-1}]^3 t^2 \pmod{p^k}.$$

So

$$\text{Kloos}(u, v, \text{mod } p^k) = \sum_{s \in (\mathbb{Z}/(p^n))^*} e^{2\pi i \frac{us + v[s^{-1}]}{p^k}} \left( \sum_{t \in (\mathbb{Z}/(p^{n+1}))^*} e^{2\pi i \left[ \frac{(u-v[s^{-1}]^2)t}{p^{n+1}} + \frac{v[s^{-1}]^3 t^2}{p} \right]} \right).$$

It follows from (35.3.5.5) that

$$\sum_{t \in (\mathbb{Z}/p^{n+1})^*} e^{2\pi i \left[ \frac{(u-v[s^{-1}]^2)t}{p^{n+1}} + \frac{v[s^{-1}]^3 t^2}{p} \right]} = \begin{cases} p^{n+\frac{1}{2}} & , us^2 \equiv v \pmod{p^n}, p \nmid v \\ 0 & , us^2 \not\equiv v \pmod{p^n} \end{cases}.$$

So

$$\text{Kloos}(u, v, \text{mod } p^k) = p^{n+\frac{1}{2}} \#\{s \in (\mathbb{Z}/p^n)^* | us^2 \equiv v \pmod{p^n}\} \leq 2p^{n+\frac{1}{2}} = 2p^{\frac{m}{2}}.$$

## 8 Irrational Trigonometric Sums

**Conj. (35.3.8.1).** Given  $k \in \mathbb{Z}_+$ , then for any  $N \in \mathbb{Z}_+$ ,

$$\sum_{n=1}^N e^{2\pi i \sqrt{2} n^k} = \tilde{O}(N^{1/2}).$$

┘

*Proof:*

□

**Def. (35.3.8.2).** For  $\alpha \in \mathbb{R}$  and  $D, N \in \mathbb{Z}_+$ , define

$$R_{D,N}(\alpha) = \sum_{d \in \mathbb{Z}_+, d \leq D} \min(N, \{\{d\alpha\}\}^{-1}).$$

Then this  $R_{D,N}$  satisfies:

- $D \leq R_{D,N}(\alpha) \leq DN$ .
- If  $\alpha$  is  $(C, \mu)$ -Diophantine, then  $R_{D,N}(\alpha) \leq C^{-1} DN^{\mu-2} \log N$ .
- $R_{D,N}(\sqrt{2}) \sim D \log N$ .

┘

*Proof:*

□

**Thm. (35.3.8.3)[Weyl].** Let  $P(X) = \alpha X^k + \sum_{j=1}^{k-1} \alpha_j X^j \in \mathbb{R}[X]$ ,  $N, N_1, N_2 \in \mathbb{Z}_+$ ,  $N_1 < N_2 \leq N_1 + N$ , then for each  $\delta \in \mathbb{R}_+$ , there exists  $C(\delta) \in \mathbb{R}_+$  s.t.

$$\left| \sum_{n=N_1}^{N_2} e^{2\pi i P(n)} \right|^{2^{k-1}} \leq C(\delta) N^\delta N^{2^{k-1}-k} R_{k!N^{k-1}, N}(\alpha) \text{ (35.3.8.2)}.$$

In particular, if  $\alpha$  is  $\mu$ -Diophantine, then by (35.3.8.2), for each  $\delta \in \mathbb{R}_+$ , there exists  $C'(\delta) \in \mathbb{R}_+$  s.t.

$$\left| \sum_{n=N_1}^{N_2} e^{2\pi i P(n)} \right|^{2^{k-1}} \leq C'(\delta) N^{\delta+\mu-2} N^{2^{k-1}-1}.$$

┘

*Proof:* Cf.[Larry Guth]P19.

□

**Thm. (35.3.8.4)[Irrational Trigonometric Sums, Vinogradov].** Let  $P(X) = \sum_{j=1}^k \alpha_j X^j \in \mathbb{R}[X]$ , then there exists  $C_k \in \mathbb{R}_+$  s.t. for  $N \in \mathbb{Z}_+$ ,

$$\left| \sum_{n=1}^N e^{2\pi i P(n)} \right| \leq C_k N^{1 - \frac{1}{10k^2 \log k}},$$

unless there exists  $\frac{a}{q} \in \mathbb{Q}$  s.t.  $1 \leq q \leq N$  and

$$\left| \alpha_k - \frac{a}{q} \right| \leq \frac{1}{N^{k-1}}.$$

┘

*Proof:* Cf.[Larry Guth]P44.?

□

**Waring's Problem**

For  $\alpha = (\alpha_1, \dots, \alpha_n) \in (\mathbb{R}/\mathbb{Z})^k$ , denote

$$W_{k,N}(\alpha) = \sum_{n=1}^N e^{2\pi i P_\alpha(n)}, \quad P_\alpha(X) = \alpha_k X^k + \dots + \alpha_1 X.$$

For  $l \in \mathbb{Z}_+$ , define the linear operator

$$T_l : (\mathbb{R}/\mathbb{Z})^k \rightarrow (\mathbb{R}/\mathbb{Z})^k : P_\alpha(X+l) - P_\alpha(X) = P_{T_l(\alpha)}(X).$$

Notice that for any  $s \in \mathbb{Z}_+$ ,

$$\int_{(\mathbb{R}/\mathbb{Z})^k} |W_{k,N}(\beta)|^{2s} d\beta = J_{s,k}(N) \triangleq \#\{(a_1, \dots, a_s, b_1, \dots, b_s) \in [N]_+^{2s} \mid \sum_i a_i^j = \sum_i b_i^j, \forall j \in [1, k]\}.$$

**Lemma (35.3.8.5) [W-BDG].** For  $s, k, N \in \mathbb{Z}_+$  and  $\varepsilon \in \mathbb{R}_+$ , there exists  $C(k, \varepsilon) \in \mathbb{R}_+$  s.t.

$$J_{k,N}(N) \leq C(k, \varepsilon) N^\varepsilon (N^s + N^{2s - \binom{k+1}{2}}).$$

┘

*Proof:*

□

**Lemma (35.3.8.6) [Vinogradov].** For  $s, k, N \in \mathbb{Z}_+$ , there exists  $C(k) \in \mathbb{R}_+$  s.t.

$$J_{k,N}(N) \leq C(k) N^{2s - \binom{k+1}{2}} + k^{2 - \frac{s}{k^2 \log k}}.$$

┘

*Proof:*

□

Denote

$$\varphi_{s,k} : \mathbb{R}^s \rightarrow \mathbb{R}^k : (a_1, \dots, a_s) \mapsto \left( \sum_i a_i, \sum_i a_i^2, \dots, \sum_i a_i^k \right),$$

Then we have:

**Lemma (35.3.8.7).** For  $\gamma \in \mathbb{R}_+$ , a sequence  $(a_1, \dots, a_n) \in \mathbb{R}$  is said to be in  $WS_\gamma$  if  $|a_i - a_j| > \gamma$  for any  $i \neq j$ . Then there exists  $C(k, \gamma) \in \mathbb{R}_+$  s.t. for any rectangular  $R$  with lengths greater than  $1/N$ , we have:

$$\#\left\{ (a_1, \dots, a_k) \in \left(\frac{\mathbb{Z}}{N}\right)^k \cap [0, 1]^k \cap WS_\gamma \mid \varphi_{s,k}(\underline{a}) \in R \right\} \leq C(k, \gamma) N^k \text{Vol}(R).$$

┘

*Proof:* Cf. [Larry Guth]P49.?

### 35.4 Riemann Hypothesis and Non-vanishing Theorems

*“Why are numbers beautiful? It’s like asking why is Beethoven’s Ninth Symphony beautiful. If you don’t see why, someone can’t tell you. I know numbers are beautiful. If they aren’t beautiful, nothing is.”*

–P. Erdős

References are [Ivic, Riemann zeta-function. The theory of the Riemann zeta-function with applications(1985)].

**Notation(35.4.0.1).**

- Let  $F \in \mathbf{GField}$ .
- Use notations on automorphic representations defined in [Adelic Automorphic Representations](#).
- Use notations on automorphic  $L$ -functions defined in [Automorphic  \$L\$ -Functions](#).
- Use notations on  $L$ -functions and primes numbers defined in ??.

┘

#### 1 Generalized Riemann Hypothesis

**Conj.(35.4.1.1) [Grand Riemann Hypothesis].** For any  $n \in \mathbb{Z}_+$ ,  $F \in \mathbf{NField}$  and  $\pi \in \text{Irr}^{\text{cusp}}(\text{GL}(n)/F)$ , any zero  $s \in \mathbb{C}$  of the principal series  $\Lambda(\pi; s)$  has real part  $\text{Re}(s) = \frac{1}{2}$ . ┘

**Conj.Cor.(35.4.1.2) [Generalized Riemann Hypothesis].** For any  $N \in \mathbb{Z}_+$  and  $\chi \in \text{Diri}'(N)$  and any zero  $s \in \mathbb{C}$  of  $\Lambda(\chi; s)$  has real part  $\text{Re}(s) = \frac{1}{2}$ . ┘

*Proof:* ?

□

**Conj.Cor.(35.4.1.3) [Riemann Hypothesis, Riemann1859].**

$$\text{Zero}(\zeta) \subset -2\mathbb{Z}_+ \cup \left\{ \frac{1}{2} + i\mathbb{R} \right\} \text{ (35.5.3.1).}$$

┘

*Proof:*

□

**Remark(35.4.1.4) [Numerical Verifications, Platt].** For any  $N \leq 300000$  and  $\chi \in \text{Diri}(N)$ , any zero  $s \in \mathbb{C}$  of  $L(\chi; s)$  s.t.  $\text{Re}(s) \in (0, 1)$  and  $\text{Im}(s) \leq \begin{cases} \frac{10^8}{N} & , N \in 2\mathbb{Z}_+ \\ \max(\frac{10^8}{N}, \frac{7.5 \cdot 10^7}{N} + 200) & , N \in 2\mathbb{Z}_+ - 1 \end{cases}$  satisfies  $\text{Im}(s) = \frac{1}{2}$ . ┘

*Proof:* Cf.[Platt, Numerical computations concerning GRH].

□

#### 2 Application to Distribution of Primes

**Thm.(35.4.2.1) [Riemann-Mangoldt Formula].** Define

$$f(X) = \pi_0(X) + \frac{1}{2}\pi_0(X^{\frac{1}{2}}) + \frac{1}{3}\pi_0(X^{\frac{1}{3}}) + \dots,$$

then by Möbius inversion,

$$\pi_0(X) = \sum_n \frac{\mu(n)}{n} f(X^{\frac{1}{n}}) = f(X) - \frac{1}{2}f(X^{\frac{1}{2}}) + \frac{1}{3}f(X^{\frac{1}{3}}) - \dots$$

Then there is a **Riemann-Mangoldt formula**

$$f(X) = \text{li}(X) - \sum_{\rho} \text{li}(X^{\rho}) - \log 2 + \int_X^{\infty} \frac{dt}{t(t^2 - 1) \log t}.$$

*Proof:* ?

**Thm. (35.4.2.2) [Riemann's Explicit Formula].**

**Def. (35.4.2.3).** For  $X \in \mathbb{R}_+$ , define  $\text{Err}(X) = \psi(X) - X$  (2.6.1.32).

**Prop. (35.4.2.4).** The Riemann conjecture is equivalent to the following:

- $|\pi(X) - \text{Li}(X)| = \tilde{O}(X^{1/2})$ .
- $\text{Err}(X) = \tilde{O}(X^{1/2})$  (35.4.2.3).

*Proof:* This should follow from the Riemann-Mangoldt formula (35.4.2.1) ?.

**Thm. (35.4.2.5) [Vinogradov].**  $\text{Err}(X) = O(Xe^{-C(\log X)^{3/5}(\log \log X)^{-1/5}})$ .

*Proof:* We only prove that there exists  $c \in \mathbb{R}_+$  s.t.  $\text{Err}(X) = O(Xe^{-c \log^{1/2} X})$ :

Cf. [Larry Guth]. The assertion follows from (35.5.3.16). The same argument should work if we use the bigger zero-free region.  $\square$

### 3 Linnik-Type Problems

References are [least quadratic non-residue].

**Prop. (35.4.3.1) [Linnik Problem].** There exists  $C \in \mathbb{R}_+$  s.t. if  $L(f; s), L(g; s)$  are two analytic  $L$ -functions with the same degree  $d$  and gamma factor (29.5.1.1) s.t.

- $L(f \otimes \bar{f}; s)$  and  $L(f \otimes \bar{g}; s)$  exist and the latter is entire (29.5.1.5).
- The GRH holds for both  $f \otimes \bar{f}$  and  $f \otimes \bar{g}$ .
- The local parameters of  $f \otimes \bar{f}$  and  $f \otimes \bar{g}$  at ramified places are all of modulus  $\leq 1$  (29.5.1.1).

Then there exists  $p \in \text{Prime}$  s.t.  $p \leq C(d \log(N(f)N(g)))^2$  unramified for both  $f$  and  $g$  s.t.  $L_p(f; s) \neq L_p(g; s)$ .  $\square$

*Proof:* Cf. [I-K04] P118 ?.

**Thm& Conj. Cor. (35.4.3.2) [Linnik Problem for Dirichlet Characters].** For  $N \in \mathbb{Z}_{\geq 2}, \chi \in \text{Diri}(N) \setminus \mathbf{1}_N$ , denote  $\mathfrak{p}_{\min}(\chi) \in \text{Prime}$  to be the minimal prime s.t.  $\chi(p) \neq 1$ . Then

- $\mathfrak{p}_{\min}(\chi) \ll \log^2 N$  if GRH holds for  $\chi$  (35.4.1.2).
- (Vinogradov's conjecture)  $\mathfrak{p}_{\min}(\chi) \ll_{\varepsilon} N^{\varepsilon}$  for any  $\varepsilon \in \mathbb{R}_+$  if Lindelöff-hypothesis holds for  $\chi$  (35.11.0.10).

- $\mathfrak{p}_{\min}(\chi) \ll_{\varepsilon} N^{\frac{1}{4\sqrt{\varepsilon}} + \varepsilon}$  for any  $\varepsilon \in \mathbb{R}_+$ , by Burgess-inequality? ?

┘

*Proof:* Cf.[数论导引, 华罗庚] and [least quadratic non-residue, notes]. □

**Thm& Conj.Cor.(35.4.3.3) [Linnik[Lin41]].** For any  $\varepsilon \in (0, 1)$ , there exists  $C_{\varepsilon} \in \mathbb{Z}_+$  s.t. for each  $N \in \mathbb{Z}_+$ , the number of primes  $p \in [N]_+$  s.t.  $\mathfrak{p}_{\min}(p) > N^{\varepsilon}$  (35.4.3.2)(the least non-quadratic residue) is bounded by  $C_{\varepsilon}$ .

In particular, there are at most  $O(N^{\varepsilon})$ -many primes  $p \in [N]_+$  s.t.  $\mathfrak{p}_{\min}(p) \geq p^{\varepsilon}$ , and Vinogradov's conjecture(35.4.3.2) fails for a set of primes of density 0. ┘

*Proof:* Let  $\mathcal{P}_{\varepsilon}$  be the set of primes in  $[\sqrt{N}]_+$  s.t.  $\mathfrak{p}_{\min}(p) > N^{\varepsilon}$ . Then we apply large sieve method(35.1.6.17) with

- $\mathcal{M} = [N]_+$ ,
- For each  $p \in \mathcal{P}_{\varepsilon}$ , let  $\Omega_p = \{n \in \mathbb{Z}/(p) \mid (\frac{n}{p}) = -1\}$ .

Then the sieved set  $\mathcal{S}(\mathcal{M}, \mathcal{P}, \Omega)$  contains  $\mathcal{Z}_{\varepsilon} = \{n \in [N]_+ : S(n) \subset [N^{\varepsilon}]_+\}$ . Thus by(35.1.6.17), we have

$$\#\mathcal{Z}_{\varepsilon} \leq 2NH(\sqrt{N})^{-1}.$$

Notice that

$$H(\sqrt{N}) \geq \sum_{p \in \mathcal{P}_{\varepsilon}} \frac{\#\Omega_p}{p - \#\Omega_p} \geq \#\mathcal{P}_{\varepsilon}/3.$$

So we get  $\#\mathcal{P}_{\varepsilon}\#\mathcal{Z}_{\varepsilon} \leq 6N$ . Finally we bound  $\#\mathcal{Z}_{\varepsilon}$ :  $\mathcal{Z}_{\varepsilon}$  contains all numbers  $n \in [N]_+$  of the form  $n = mp_1 \dots p_k$  where  $k = [\varepsilon^{-1}]$  and  $N^{\alpha} < p_1 \leq p_2 \dots \leq p_k \leq N^{\beta}$  are primes, where  $\alpha = 1/(1 + [\varepsilon^{-1}])$ ,  $\beta = 1/([\varepsilon^{-1}] + 1/2)$ . Then

$$\begin{aligned} \#\mathcal{Z}_{\varepsilon} &\geq \sum_{N^{\alpha} < p_1 \leq p_2 \dots \leq p_k \leq N^{\beta}} \left\lfloor \frac{X}{p_1 \dots p_k} \right\rfloor \\ &\gg_{\varepsilon} X \sum_{N^{\alpha} < p_1 \leq p_2 \dots \leq p_k \leq N^{\beta}} \frac{1}{p_1 \dots p_k} \\ &= X \left( \sum_{N^{\alpha} < p \leq N^{\beta}} \frac{1}{p} \right)^k \\ (35.5.7.8) &\gg X \log^k(\beta/\alpha) = X \log^{[\varepsilon^{-1}]} \left( \frac{[\varepsilon^{-1}] + 1}{[\varepsilon^{-1}] + 1/2} \right). \end{aligned}$$

So  $\#\mathcal{P}_{\varepsilon}$  is bounded by a constant depending on  $\varepsilon$ . □

### Deuring-Heilbronn Phenomenon(Repulsion)

#### 4 Non-vanishing on Boundary Lines

**Thm.(35.4.4.1) [Prime Number Theorem, Jacquet-Shalika[J-S76]].** If  $F \in \mathbf{NField}$ ,  $n \in \mathbb{Z}_+$  and  $\pi \in \text{Irr}^{\text{cusp}}(\text{GL}(n)/F)$ , then  $L(\pi; s) \neq 0$  if  $\text{Re}(s) = 1$ . ┘

*Proof:* Cf.[J-S76] or [Sarnak, Nonvanishing of  $L$ -functions on  $\text{Re}(s) = 1$ ].? ?

For  $n = 1$ , Cf.[J-S76]Chap7.

Thus we assume that  $n \geq 2$ .

The proof uses the Eisenstein series for the standard parabolic subgroup  $P_{1,n-1}$ (26.9.1.1). □

**Cor. (35.4.4.2).** If  $f \in \text{SF}^{\text{new}}(\Gamma_0(N), \chi)$ , then  $L(f; \frac{k-1}{2} + s) \neq 0$  if  $\text{Re}(s) = 1$ .  $\lrcorner$

**Cor. (35.4.4.3) [Prime Number Theorem for Hecke  $L$ -Functions].** If  $F \in \text{NField}$  and  $\chi \neq 1$  is a Hecke character on  $F$ , then  $L(\chi; 1 + it) \neq 0$  for any  $t \in \mathbb{R}$ .  $\lrcorner$

*Proof:* Cf. [GTM186, P289]. ?

We prove for  $F = \mathbb{Q}$  and  $\chi = 1$ : If  $\zeta$  has a zero at  $x + iy$  for  $y \neq 0$ , then by (35.5.2.5),  $\zeta(s)$  has a simple pole at  $s = 1$  and holomorphic at  $s = x + 2iy$ . But by (35.4.4.4)

$$\lim_{x \rightarrow 1^+} |\zeta(x)^3 \zeta(x + iy)^4 \zeta(x + 2iy)| \geq 1,$$

contradiction.  $\square$

**Lemma (35.4.4.4) [Mertens].** For  $x, y \in \mathbb{R}$  with  $x > 1$ ,  $|\zeta(x)^3 \zeta(x + iy)^4 \zeta(x + 2iy)| \geq 1$ .  $\lrcorner$

*Proof:* For  $s = x + iy$ ,

$$\log |\zeta(s)| = - \sum_{p \in \text{Prime}} \log |1 - p^{-s}| = - \sum_{p \in \text{Prime}} \text{Re} \log(1 - p^{-s}) = \sum_{p \in \mathbf{P}} \sum_{n \in \mathbb{Z}_+} \frac{\text{Re}(p^{-ns})}{n},$$

so

$$\log |\zeta(x + iy)| = \sum_{p \in \text{Prime}} \sum_{n \in \mathbb{Z}_+} \frac{\cos(ny \log p)}{np^{nx}}.$$

So

$$\begin{aligned} \log |\zeta(x)^3 \zeta(x + iy)^4 \zeta(x + 2iy)| &= \sum_{p \in \mathbf{P}} \sum_{n \in \mathbb{Z}_+} \frac{3 + 4 \cos(ny \log p) + \cos(2ny \log p)}{np^{nx}} \\ &= \sum_{p \in \mathbf{P}} \sum_{n \in \mathbb{Z}_+} \frac{2(\cos(ny \log p) + 1)^2}{np^{nx}} \geq 0 \end{aligned}$$

$\square$

**Cor. (35.4.4.5) [Prime Number Theorem for Artin  $L$ -Functions].** Artin  $L$ -functions are non-vanishing on the line  $\text{Re}(s) = 1$ .  $\lrcorner$

*Proof:* This follows from the fact that Artin  $L$ -functions are quotients of products of Hecke  $L$ -functions.  $\square$

**Thm. (35.4.4.6) [Prime Number Theorem for Rankin-Selberg  $L$ -Functions, Shalika [Sha81]].** If  $F \in \text{NField}$ ,  $n_1, n_2 \in \mathbb{Z}_+$  and  $\pi_i \in \text{Irr}^{\text{cusp}}(\text{GL}(n_i)/F)$ , then the Rankin-Selberg  $L$ -function (29.5.5.1)  $L(\pi_1 \times \pi_2; s) \neq 0$  for  $\text{Re}(s) = 1$ .  $\lrcorner$

*Proof:*  $\square$

**Remark (35.4.4.7).** See also Langlands-Shahidi method ([Sha81] and [Kim-Shahidi, Functorial products for  $\text{GL}(2) \times \text{GL}(3)$  and the symmetric cube for  $\text{GL}(2)$ ]) or the Rankin-Selberg method ([Rankin-Selberg Convolutions] and [Remarks on Rankin-Selberg convolutions]). ?  $\lrcorner$

### Upper Bounds

**Prop. (35.4.4.8) [Louboutin].** Let  $N \in \mathbb{Z}_{\geq 2}$  and  $\chi \in \text{Diri}(N)$ , then

$$|L(\chi; 1)| \leq \begin{cases} \frac{1}{2} \log N + 0.009 & , \chi(-1) = 1 \\ \frac{1}{2} \log N + 0.716 & , \chi(-1) = -1 \end{cases}.$$

┘

*Proof:* Cf. [S. Louboutin, Majorations explicites de  $|L(1, \chi)|$ ].

□

**Remark (35.4.4.9).** It is easy to show that  $|L(\chi; 1)| \leq \log(N) + C$ :

$$\begin{aligned} |L(\chi; 1)| &\leq \left| \sum_{n \leq N} \frac{\chi(n)}{n} \right| + \left| \sum_{n > N} \frac{\chi(n)}{n} \right| \\ &\leq \sum_{n \leq N} \frac{1}{n} + \left| \int_N^\infty \left( \sum_{N < n \leq t} \chi(n) \right) \frac{dt}{t^2} \right| \\ &\leq 1 + \int_1^{N-1} \frac{dt}{t} + \frac{1}{N} \max_X \left| \sum_{N < n \leq t} \chi(n) \right| \\ &< \log N + 1 + \frac{\varphi(N)}{N} \end{aligned}$$

┘

### Lower Bounds

**Thm. (35.4.4.10) [Zhang].** If  $D \in \mathbb{Z}_{\geq 2}$  and  $\chi \in \text{Diri}'(D)$  which is a real character, then there exists an absolute effectively computable constant  $c_1 > 0$  s.t.

$$L(\chi; 1) > c_1 (\log D)^{-2022}$$

┘

*Proof:* Cf. [Yitang Zhang, Discrete mean estimates and the Landau-Siegel zero].

□

**Cor. (35.4.4.11).** For  $D \in \mathbb{Z}_{\geq 2}$  and  $\chi \in \text{Diri}'(N)$  quadratic, there exists an absolute effectively computable constant  $c_1 > 0$  s.t. for any  $\sigma > 1 - c_2 (\log D)^{-2024}$ , we have  $L(\sigma, \chi) \neq 0$ .

┘

*Proof:* ?

□

**Cor. (35.4.4.12) [Landau(36)/Siegel[Sie35]].** For any  $\varepsilon \in \mathbb{R}_+$ , there exists  $\kappa_\varepsilon \in \mathbb{R}_+$  s.t. for any  $N \in \mathbb{Z}_{\geq 2}$ ,  $\chi \in \text{Diri}'(N)$  quadratic, there exists  $\kappa_\varepsilon \in \mathbb{R}_+$  s.t.

$$L(\chi; 1) \geq \frac{\kappa_\varepsilon}{D^\varepsilon}.$$

If  $\varepsilon \geq 1/2$ , this constant  $\kappa_\varepsilon$  can be made effective. In particular, There exists  $\kappa_\varepsilon \in \mathbb{R}_+$  s.t. any real zero  $\beta$  of  $\chi$  satisfies

$$\beta \leq 1 - \frac{\kappa_\varepsilon}{N^\varepsilon}.$$

If  $\varepsilon \geq 1/2$ , this constant  $\kappa_\varepsilon$  can be made effective.

┘

*Proof:* There is a direct proof of this theorem in [Gol74] and [A simple proof of Siegel's theorem via Mellin's transform] or [I-K04]P122. ?

□

### Applications

**Prop. (35.4.4.13)[Constructing Non-cuspidal Representations].** Let  $\sigma \in \text{Irr}^{\text{cusp}}(\text{GL}(2)/F)$  and  $\mu$  a Hecke character of  $F$ , then  $\pi = \sigma \times \mu \in \text{Irr}^{\text{auto}}(\text{GL}(3)/F)$  is irreducible.

Then  $\pi$  is not a cuspidal representation.  $\lrcorner$

*Proof:* If  $\pi$  is a cuspidal representation, then by  $L(\pi \otimes \chi; s)$  is entire for any Hecke character  $\chi$  of  $F$ . But

$$L(\pi \otimes \mu^{-1}; s) = L(\sigma \otimes \mu^{-1}; s)L(1; s),$$

and  $L(\sigma \otimes \mu^{-1}; 1) \neq 0$  by (35.4.4.1), contradiction.  $\square$

## 5 Zero-Free Regions

**Def. (35.4.5.1)[Standard Zero-Free Regions].** A **standard Zero-Free Region** is the region in  $\mathbb{C}$  of the form

$$\Omega_c = \left\{ \sigma + it \in \mathbb{C} : \sigma \geq 1 - \frac{c}{\log(|t| + 3)} \right\}$$

for some  $c \in \mathbb{R}_+$ .  $\lrcorner$

**Lemma (35.4.5.2)[Goldfeld-Hoffstein-Liehman[H-L94]].** There exists  $c \in \mathbb{R}_+$  s.t. if  $f$  is an analytic  $L$ -function of degree  $d$  s.t.

- $\text{Re}(\Lambda_f(n)) \geq 0$  for  $n \in \mathbb{Z}_+$  s.t.  $(n, N(f)) = 1$ .
- For any prime  $p \in \text{Prime}$  ramified for  $f$ , the local parameters satisfy  $|\alpha_i(p)| \leq p/2$ .

Then  $\text{ord}_{s=1} L(f; s) \leq 0$ , and  $L(f; s)$  has at most  $-\text{ord}_{s=1} L(f; s)$ -many real zeros  $s$  s.t.

$$s \geq 1 - \frac{c}{d(r+1) \log C(f)}.$$

$\lrcorner$

*Proof:* Cf.[I-K04]P105<sup>?</sup>.  $\square$

**Thm. (35.4.5.3)[Exceptional Zeros].** There exists  $c \in \mathbb{R}_+$  s.t. if  $f$  is an analytic  $L$ -function s.t.

- The Rankin-Selberg convolutions  $L(f \otimes f; s)$  and  $L(f \otimes \bar{f}; s)$  exist, where the latter has a simple pole at  $s = 1$  and the former is entire unless  $f = \bar{f}$ .
- At any ramified prime  $p$  the local parameters for  $f$  satisfies  $|\alpha_i(p)|^2 \leq p/2$ .

Then  $L(f; s)$  has no zeros in the standard region

$$\Omega_c = \left\{ \sigma + it \in \mathbb{C} : \sigma \geq 1 - \frac{c}{d^4 \log(C(f)(|t| + 3))} \right\}$$

except possibly one simple real zero  $\beta_f < 1$  called the  $c$ -**exceptional zero**, in which case  $f$  is self-dual.  $\lrcorner$

*Proof:* <sup>?</sup>  $\square$

### Exceptional Characters

**Prop. (35.4.5.4).** For  $N \in \mathbb{Z}_+$ ,  $\chi \in \text{Diri}(N) \setminus \mathbf{1}_N$  and  $\sigma \in [0, 1]$ ,  $k \in \mathbb{Z}_+$ , we have

$$L^{(k)}(\chi; \sigma) \ll_k N^{1-\sigma} \log^{k+1} N.$$

□

*Proof:* Use Abel summation

$$\sum_{n \in [X]_+} \chi(n) n^{-s} = \mathcal{M}_\chi(X) \frac{\log^k X}{X^\sigma} - \int_1^X \mathcal{M}_\chi(t) (\log^k t) t^\sigma dt$$

and the fact that  $\mathcal{M}_\chi(X) \leq \min(N, X)$ . □

**Thm. (35.4.5.5) [Landau(36)].** There exists  $c \in \mathbb{R}_+$  s.t. if  $N_1, N_2 \in \mathbb{Z}_{\geq 2}$  and  $\chi_i \in \text{Diri}'(N_i)$  are quadratic s.t.  $\chi_1 \neq \chi_2$ , and  $\chi_1, \chi_2$  has real zeros  $\beta_1, \beta_2 \in \mathbb{R}_+$ , then

$$\min(\beta_1, \beta_2) \leq 1 - \frac{c}{\log(N_1 N_2)}.$$

□

*Proof:* Consider the  $L$ -function of degree 4:

$$L(f; s) = \zeta(s) L(\chi_1; s) L(\chi_2; s) L(\chi_1 \chi_2; s)$$

which has conductor at most  $(N_1 N_2)^2$ . Since  $\chi_1$  are non-trivial and distinct,  $L(f; s)$  has a simple pole at  $s = 1$ . Moreover,

$$-\frac{L^\vee(f; s)}{L(f; s)} = \sum_{n \in \mathbb{Z}_+} (1 + \chi_1(n))(1 + \chi_2(n)) \Lambda(n) n^{-s}$$

has non-negative coefficients. Then the assertion follows from (35.4.5.2). □

**Cor. (35.4.5.6) [Exceptional Characters].** There exists  $c \in \mathbb{R}_+$  s.t. for any  $N \in \mathbb{Z}_+$  and  $\chi \in \text{Diri}(N)$ ,  $L(\chi; s)$  doesn't has a zero in the standard region

$$\Omega_c = \left\{ \sigma + it \in \mathbb{C} : \sigma \geq 1 - \frac{c}{\log(N(|t| + 3))} \right\},$$

with possibly one  $c$ -exceptional quadratic character  $\chi \in \text{Diri}(N)$  and it has a unique simple root

$$1 - \frac{c}{\log(3N)} \leq \beta_\chi < 1$$

for each  $N$ . □

*Proof:* This follows from (35.4.5.3). The uniqueness of the exceptional quadratic character  $\chi \in \text{Diri}(N)$  follows from Landau's theorem (35.4.5.5). □

## 6 Dirichlet Theorems

References are [J-S81a].

**Thm. (35.4.6.1)** [Jaquet-Shalika[J-S81a]]. Suppose  $F \in \mathbf{NField}$ ,  $n, n' \in \mathbb{Z}_+$  and  $\pi \in \mathrm{Irr}^{\mathrm{auto}}(\mathrm{GL}(n)/F)$ ,  $\pi' \in \mathrm{Irr}^{\mathrm{auto}}(\mathrm{GL}(n')/F)$ . Let  $\Sigma_F^\infty \subset_{\mathrm{fin}} S \subset \Sigma_F$  be a set of places s.t.  $\pi, \pi'$  are unramified outside  $S$ . For  $\sigma \in \mathbb{R}_{>1}$ , define

$$l(\pi \times \pi'; \sigma) = \sum_{v \notin S} \sum_{n \in \mathbb{Z}_+} \frac{\overline{\mathrm{tr}(c_v(\pi)^n)} \mathrm{tr}(c_v(\pi')^n)}{n \|v\|^{n\sigma}},$$

then

- $l(\pi \times \pi'; \sigma)$  is absolutely convergent,
- $L_S(\pi \times \pi'; \sigma) = \exp(l(\pi \times \pi'; \sigma))$ .
- 

$$\lim_{\sigma \rightarrow 1^+} \left( \log \frac{1}{\sigma - 1} \right)^{-1} l(\pi \times \pi'; \sigma) = \delta_{\pi, \pi'}.$$

┘

*Proof:* Cf. [J-S81a]P805?

□

**Cor. (35.4.6.2)** [Dirichlet Theorem for Cuspidal Automorphic Forms, Jaquet-Shalika[J-S81a]]. Let  $r \in \mathbb{Z}_+$  and  $\pi_i \in \mathrm{Irr}^{\mathrm{cusp}}(\mathrm{GL}(n_i)/F)$  for  $i \in [r]_+$  be pairwise distinct, and let  $\Sigma_F^\infty \subset_{\mathrm{fin}} S \subset \Sigma_F$  be a set of places s.t. each  $\pi_i$  is unramified outside  $S$ . Suppose  $c_1, \dots, c_r \in \mathbb{C}$  s.t.

$$\sum_{1 \leq i \leq r} c_i \mathrm{tr}(c_v(\pi)^m) = 0$$

for any  $v \in \Sigma_F^{\mathrm{fin}} \setminus S$  and  $m \in \mathbb{Z}_+$ , then we have  $c_1 = \dots = c_r = 0$ . ┘

*Proof:* Write each  $\pi_i = \pi'_i(t_i)$  where  $\pi' \in \mathrm{Irr}^{\mathrm{auto}}(\mathrm{GL}(n_i)/F)$  is unitary and  $t_i \in \mathbb{R}$ ?. We may assume  $t_1 \leq t_2 \leq \dots \leq t_r$ . Then it follows from (35.4.6.1) that

$$\sum_{1 \leq i \leq r} c_i l(\pi'_1 \times \pi'_i; \sigma + t_i - t_1) = 0.$$

Taking  $\sigma \rightarrow 1^+$  gives  $\sum_{1 \leq i \leq r} c_i \delta_{\pi_1, \pi_i} = 0$ , which cannot be true unless  $c_1 = \dots = c_r = 0$ . □

## 7 Non-Negativity of Central Values

**Conj. Cor. (35.4.7.1)** [Non-Negativity of Central Values]. For  $F \in \mathbf{NField}$  and  $\pi \in \mathrm{Irr}^{\mathrm{auto}}(\mathrm{GL}(n)/F)$  that is self-dual,  $L(\pi; s) \in \mathbb{R}$  for  $s \in \mathbb{R}$ , and  $\lim_{s \rightarrow +\infty} L(\pi; s) = 1$ . So GRH(35.4.1.1) would imply that  $L(\frac{1}{2}; s) \geq 0$ . ┘

*Proof:*

□

**Thm. (35.4.7.2)** [Guo]. For  $F \in \mathbf{NField}$  and a self-dual  $\pi \in \mathrm{Irr}^{\mathrm{cusp}}(\mathrm{PGL}(2)/F)$ ,

$$L(\pi \otimes \chi; \frac{1}{2}) \geq 0.$$

for any quadratic ray class character  $\chi$ . ┘

*Proof:* Cf.[Guo, on the positivity of the central value of automorphic  $L$ -functions for  $\mathrm{GL}(2)$ ]. The proof uses relative trace formula.  $\square$

**Thm. (35.4.7.3) [Rankin-Lapid[Lap03]].** Let  $F \in \mathbf{NField}$  and  $\pi \in \mathrm{Irr}^{\mathrm{auto}}(\mathrm{GL}(n)/F)$  be self-dual. Then  $\pi$  is either symplectic or orthogonal, i.e. exactly one of the partial  $L$ -functions  $L_S(\pi, \wedge^2; s)$  and  $L_S(\pi, \mathrm{Sym}^2; s)$  has a pole at  $s = 1$ .

Then if  $\pi \in \mathrm{Irr}^{\mathrm{auto}}(\mathrm{GL}(n)/F)$  is orthogonal and  $\pi' \in \mathrm{Irr}^{\mathrm{auto}}(\mathrm{GL}(2m)/F)$  is symplectic, we have  $L(\pi \times \pi'; \frac{1}{2})$ .  $\square$

*Proof:* Cf.[Lap03].  $\square$

**Cor. (35.4.7.4).** Let  $\pi \in \mathrm{Irr}^{\mathrm{cusp}}(\mathrm{GL}(n)/F)$  be orthogonal and  $\tau \in \mathrm{Irr}^{\mathrm{cusp}}(\mathrm{SO}(2m+1)/F)$  be generic, then  $L(\pi \times \tau; \frac{1}{2}) \geq 0$ .  $\square$

*Proof:* By(29.7.1.1), this is equivalent to (35.4.7.3).  $\square$

**Cor. (35.4.7.5) [Harris-Kudla[H-K91]/Watson/Lapid[Lap03]].** Let  $\pi_i \in \mathrm{Irr}^{\mathrm{cusp}}(\mathrm{GL}(n)/F, \mathbf{1})$  for  $i = 1, 2, 3$ , then  $L(\pi_1 \times \pi_2 \times \pi_3; \frac{1}{2}) \geq 0$ .  $\square$

*Proof:* The original proof uses the period integral formula(Ichino-Ikeda).?  $\square$

### Mollification(Selberg)

References are [Iwaniec-Sarnak, The non-vanishing of central values of automorphic  $L$ -functions and Landau-Siegel zeros] and [Kowalski-Michel-VanderKam, Non-vanishing of high derivatives of automorphic  $L$ -functions at the center of the critical strip].

**Thm. (35.4.7.6) [Iwaniec-Sarnak/Kowalski-Michel-VanderKam].** For  $k \in \mathbb{Z}_{\geq 2}$ ,  $\epsilon \in \{\pm 1\}$  and  $N \in \mathbb{Z}_+$  square-free and large, roughly half of the newforms  $f \in \mathrm{SF}_k(\Gamma_0(N))$  has sign of equation  $\epsilon_f = \epsilon$ . And

•

$$\lim_{N \rightarrow \infty} \frac{\#\{f \in \mathrm{SF}_k^{\mathrm{new}}(\Gamma_0(N)) | \epsilon_f = 1, L(f; \frac{1}{2}) \geq (\log N)^{-2}\}}{\#\{f \in \mathrm{SF}_k^{\mathrm{new}}(\Gamma_0(N)) | \epsilon_f = 1\}} \geq \frac{1}{2}.$$

•

$$\lim_{N \rightarrow \infty} \frac{\#\{f \in \mathrm{SF}_k^{\mathrm{new}}(\Gamma_0(N)) | \epsilon_f = -1, L(f; \frac{1}{2}) \neq 0\}}{\#\{f \in \mathrm{SF}_k^{\mathrm{new}}(\Gamma_0(N)) | \epsilon_f = -1\}} \geq \frac{1}{2}.$$

•

$$\lim_{N \rightarrow \infty} \frac{1}{\#\mathrm{SF}_k^{\mathrm{new}}(\Gamma_0(N))} \sum_{f \in \mathrm{SF}_k^{\mathrm{new}}(\Gamma_0(N))} \mathrm{ord}_{s=1/2} L(f; s) \leq 1.2.$$

$\square$

*Proof:* ?  $\square$

**Remark (35.4.7.7).** Any improvement of item1 replacing  $1/2$  with any  $c > 1/2$  would resolve the Landau-Siegel lacuna.  $\square$

**Thm. (35.4.7.8) [Luo].** Let  $k \in \mathbb{Z}_+$  and  $N \in \mathbb{Z}_+$ , and let  $f \in \mathrm{SF}_k(\Gamma_0(N))$ . Let  $\{\phi_i\}_{i \in \mathbb{Z}}$  be an orthonormal basis of Maass forms where  $\Delta \phi_i = (\frac{1}{4} + t_i^2) \phi_i$  and  $t_1 \leq t_2 \leq \dots$ , then

$$\lim_{t \rightarrow \infty} \frac{\#\{t_i \leq t | L(f \otimes \phi_i; \frac{1}{2} + it_i)\}}{\#\{t_i \leq t\}} > 0.$$

$\square$

*Proof:* Cf.[Luo, Nonvanishing of  $L$ -values and the Weyl law2001].  $\square$

## 8 Density Theorems

**Prop. (35.4.8.1).** For an analytic  $L$ -function  $f$  (29.5.1.1), we have  $\text{Zero}(\Lambda(f; s)) \subset \{z \in \mathbb{C} | 0 \leq \text{Re}(s) \leq 1\}$ , and also

$$\sum_{\rho \in \text{Zero}(L(f; s)) \setminus \{0\}} \frac{1}{|\rho|^{1+\varepsilon}} < \infty$$

for any  $\varepsilon \in \mathbb{R}_+$ . ┘

*Proof:* The Euler-product expansion of  $L(f; s)$  converges for  $\text{Re}(s) > 1$ , and  $L_\infty(f; s)$  is non-vanishing for  $\text{Re}(s) > 1$ , so there are no zeros  $\rho$  with  $\text{Re}(\rho) > 1$ . By functional equation, there are no zeros  $\rho$  with  $\text{Re}(\rho) < 1$ . The last assertion follows from (12.4.3.19). □

**Prop. (35.4.8.2).** For an analytic  $L$ -function  $f$  (29.5.1.1) with pole of order  $r$  at  $s = 1$ , there exists constants  $a, b \in \mathbb{C}$  s.t.

$$(s(1-s))^r \Lambda(f; s) = e^{a+bs} \prod_{\rho \in \text{Zero}(L(f; s)) \setminus \{0,1\}} \left(1 - \frac{s}{\rho}\right) e^{s/\rho}.$$

Taking logarithmic differential we get

$$\frac{1}{2} \log N(f) + \frac{L'_\infty(f; s)}{L_\infty(f; s)} - b + \frac{r}{s} + \frac{r}{s-1} - \sum_{\rho \in \text{Zero}(L(f; s)) \setminus \{0,1\}} \left( \frac{1}{s-\rho} + \frac{1}{\rho} \right) = -\frac{L'(f; s)}{L(f; s)} = \sum_{n \in \mathbb{Z}_+} \Lambda_f(n) n^{-s}.$$

And both sides converges uniformly and absolutely on compact subsets away from zeros and poles. ┘

*Proof:* This follows from Hadamard's factorization theorem for entire functions of finite order. □

**Prop. (35.4.8.3).** Situation as in (35.4.8.2), then

•

$$\text{Re}(b(f)) = - \sum_{\rho \in \text{Zero}(f) \setminus \{0,1\}} \text{Re}(\rho^{-1}).$$

- There exists  $c \in \mathbb{R}_+$  s.t. for any  $T \in \mathbb{R}$ , we have

$$\sum_{\rho \in \text{Zero}(L(f; s))} \frac{1}{1 + (T - \text{Im}(\rho))^2} \ll \log C(f; iT).$$

- For any  $s \in \mathbb{C}$  s.t.  $-\frac{1}{2} \leq \text{Re}(s) \leq 2$ , we have

$$\frac{L'(f; s)}{L(f; s)} + \frac{r}{s} + \frac{r}{s-1} - \sum_{|s+\kappa_i| < 1} \frac{1}{s+\kappa_i} - \sum_{\rho \in \text{Zero}(L(f; s)), |\rho-s| < 1} \frac{1}{s-\rho} \ll \log C(f; s).$$

┘

*Proof:* 1: Take logarithmic differential of the functional equation  $(s(1-s))^r \Lambda(f; s) = \epsilon(f)(s(1-s))^r \Lambda(\bar{f}; 1-s)$ , we get

$$2 \text{Re}(b(f)) = - \sum_{\rho \in \text{Zero}(L(f; s)) \setminus \{0,1\}} \left( \frac{1}{s-\rho} + \frac{1}{1-s-\bar{\rho}} + \frac{1}{\rho} + \frac{1}{\bar{\rho}} \right).$$

When  $s \notin \text{Zero}(f)$ , we have  $(s - \rho)^{-1} + (1 - s - \bar{\rho})^{-1} \ll_s |\rho|^{-2}$ , and also  $\rho^{-1} + \bar{\rho}^{-1} \ll |\rho|^{-2}$ , so we can arrange the sums by (35.4.8.1). So the assertion follows because the  $s$ -term cancels, because if  $\rho \in \text{Zero}(L(f; s))$ , then  $1 - \bar{\rho}$  is also a zero of  $L(f; s)$ , by functional equation.

2: Let  $T \in \mathbb{R}_{\geq 2}$  and  $s = 3 + iT$ , then we have  $|\Lambda_f(n)| \leq \deg(f)n \log n$ , and then

$$\left| \frac{L^\vee(f; s)}{L(f; s)} \right| \leq \deg(f) \zeta^\vee(2) \ll \log C(f).$$

And by Stirling's formula (35.11.0.3) we have ?

$$\frac{1}{2} \log N(f) + \frac{L_\infty^\vee(f; s)}{L_\infty(f; s)} \ll \log C(f; s).$$

Also for  $\rho = \beta + i\gamma \in \text{Zero}(L(f; s))$  we have

$$\frac{2}{9 + (T - \gamma)^2} < \text{Re} \left( \frac{1}{s - \rho} \right) < \frac{3}{4 + (T - \gamma)^2}.$$

Then we can we can take the real part of the equation

$$\frac{1}{2} \log N(f) + \frac{L_\infty^\vee(f; s)}{L_\infty(f; s)} - b + \frac{r}{s} + \frac{r}{s-1} - \sum_{\rho \in \text{Zero}(L(f; s)) \setminus \{0,1\}} \left( \frac{1}{s - \rho} + \frac{1}{\rho} \right) = -\frac{L^\vee(f; s)}{L(f; s)} \quad (35.4.8.2)$$

and item1 to conclude.

3: Cf. [I-K04]P103 ?.

□

**Def. (35.4.8.4) [Zero-Counting Functions].** For an analytic  $L$ -function  $f$  and  $T \in \mathbb{R}_+$ , denote  $N(T, f)$  the number of zeros of  $L(f; s)$  in the region  $\{\sigma + it | \sigma \in [0, 1], t \in [-T, T]\}$ . ┘

**Prop. (35.4.8.5).** If  $f$  is an analytic  $L$ -function of degree  $d$ , then for  $T \in \mathbb{R}_+$ ,

$$N(T, f) = \frac{T}{\pi} \log \left( \frac{N(f) T^d}{(2\pi e)^d} \right) + O(\log C(f; iT)) \quad (35.4.8.4).$$

┘

*Proof:* Cf. [I-K04]P104 ?

### Representing Primes by Quadratic Forms

References are [Primes of the form  $x^2 + ny^2$ , Cox].

**Prop.(35.5.1.6)** [Quadratic Forms]. For  $D \in \mathbb{Z}_{<0}$  and  $D \equiv 0, 1 \pmod{4}$ , the equivalence classes of quadratic forms  $AX^2 + BXY + CY^2$  with discriminant  $D$  is in bijection with the class group  $\text{Cl}(\mathbb{Q}(\sqrt{D}))$ .

┘

**Thm. (35.5.1.7) [Representing Primes].** For any  $n \in \mathbb{Z}_+$ , there is a monic irreducible polynomial  $f_n(T) \in \mathbb{Z}[T]$  of degree  $h(-4n)$  s.t.:

For  $p > 2 \in \text{Prime}$  dividing neither  $n$  nor the discriminant of  $f_n(T)$ ,

$$p \in \{x^2 + ny^2 | x, y \in \mathbb{Z}\} \iff \left(\frac{-n}{p}\right) = 1 \vee \{x \in \mathbb{Z} | f_n(x) = 0 \in \mathbb{F}_p\} \neq \emptyset.$$

Moreover,  $f_n(T)$  is the minimal polynomial of a real algebraic integer  $\alpha$  s.t.  $L = K(\alpha)$  is ring class field of the order  $\mathbb{Z}[\sqrt{-n}] \subset \mathcal{O}_{\mathbb{Q}(\sqrt{-n})}$  (19.7.4.37), and any such  $f_n(T)$  is of this form.  $\lrcorner$

*Proof:* Cf. [Cox,  $p = x^2 + ny^2$ ] P163. ?

□

**Cor. (35.5.1.8).** Let  $p \in \text{Prime}$ , then

•

$$\exists(x, y \in \mathbb{Z}) p = x^2 + y^2 \iff p \equiv 1 \pmod{4}.$$

•

$$\exists(x, y \in \mathbb{Z}) p = x^2 + 2y^2 \iff p \equiv 1, 3 \pmod{8}.$$

•

$$\exists(x, y \in \mathbb{Z}) p = x^2 + 3y^2 \iff p = 3 \text{ or } p \equiv 1 \pmod{3}.$$

•

$$\exists(x, y \in \mathbb{Z}) p = x^2 + 5y^2 \iff p \equiv 1, 9 \pmod{20}.$$

•

$$\exists(x, y \in \mathbb{Z}) p = x^2 + 27y^2 \iff \{p \equiv 1 \pmod{3}\} \wedge \{\exists a, p | a^3 - 2\}.$$

•

$$\{\exists(x, y \in \mathbb{Z}) p = x^2 + 27y^2\} \text{ or } \{\exists(x, y \in \mathbb{Z}) p = 4x^2 + 2xy + 7y^2\} \iff p \equiv 1 \pmod{3}.$$

□

*Proof:*

□

**Prop. (35.5.1.9).** Let  $ax^2 + bxy + cy^2$  be a primitive definite quadratic form of discriminant  $D < 0$ , and let  $\mathcal{S} = \{p \in \text{Prime} | p = ax^2 + bxy + cy^2, \exists x, y \in \mathbb{Z}\}$ , then  $\mathcal{S}$  has Dirichlet-density

$$\delta(\mathcal{S}) = \begin{cases} \frac{1}{\text{cl}(D)} & , ax^2 + bxy + cy^2 \text{ is properly equivalent to its opposite} \\ \frac{1}{\text{cl}(D)} & , \text{otherwise} \end{cases}.$$

□

*Proof:* Cf. [Cox13] P170.

□

### Higher Polynomials

**Conj. (35.5.1.10) [Hardy-Littlewood Conjecture N].** There are infinitely many primes  $p \in \mathbf{Prime}$  of the form  $p = x^3 + y^3 + z^3$ .

Moreover, for  $X \in \mathbb{R}_+$ , if  $P(X)$  is the number of triples  $(x, y, z)$  s.t.  $x^3 + y^3 + z^3 \in \mathbf{Prime} \cap [0, X]$ , then

$$P(X) \sim \Gamma\left(\frac{4}{3}\right)^3 \cdot \prod_{q \in \mathbf{Prime}, q \equiv 1 \pmod{3}} \left(1 - \frac{A_q}{q^2}\right) \cdot \frac{X}{\log X},$$

where  $A_q \equiv 1 \pmod{3}$  and  $4q = A_q^2 + 27B_q^2$ . ┘

*Proof:* □

**Thm. (35.5.1.11) [Heath-Brown].** There are infinitely many primes  $p \in \mathbf{Prime}$  of the form  $p = x^3 + 2y^3$ ,  $x, y \in \mathbb{Z}_+$ . ┘

*Proof:* □

**Thm. (35.5.1.12) [Iwaniec-Friedlander].** There are infinitely many primes  $p \in \mathbf{Prime}$  of the form  $p = x^2 + y^4$ ,  $x, y \in \mathbb{Z}_+$ . ┘

*Proof:* □

## 2 Dirichlet-Weber Class Number L-Functions

References are [I-K04, Mil20].

**Def. (35.5.2.1) [Partial Class Group L-Functions].** If  $\mathfrak{m}$  is a modulus for  $F$  (19.7.4.6) and  $\mathcal{R} \in \text{Cl}_{\mathfrak{m}}(F)$  (19.7.4.8) be a single ideal class, define the **partial L-function**

$$\zeta(F, \mathcal{R}; s) = \sum_{\mathfrak{a} \in \mathcal{R}} \frac{1}{\|\mathfrak{a}\|^s}.$$

┘

**Prop. (35.5.2.2) [Weber's L-Functions].** If  $\mathfrak{m}$  is a modulus for  $F$  (19.7.4.6),  $\chi : \text{Cl}^{\mathfrak{m}}(F) \rightarrow \mathbb{C}^\times$  a Dirichlet character for  $F$  which corresponding to a Hecke character of  $F$  via global class field theory (19.7.4.8), then the **Weber L-function** attached to  $\chi$  is defined to be the corresponding  $L$ -function ?. By (19.7.4.17)(31.1.1.1), it is just

$$L(F, \chi; s) = \prod_{\mathfrak{p} \nmid \mathfrak{m}} \frac{1}{1 - \chi(\mathfrak{p}) \|\mathfrak{p}\|^{-s}} = \sum_{(\mathfrak{a}, \mathfrak{m})=1} \frac{\chi(\mathfrak{a})}{\|\mathfrak{a}\|^s} = \sum_{\mathcal{R} \in \text{Cl}_{\mathfrak{m}}(F)} \chi(\mathcal{R}) \zeta(F, \mathcal{R}; s).$$

Thus by (29.5.3.4),  $L(F, \chi; s)$  is analytic if  $\chi \neq \mathbf{1}$ , and has a simple pole at  $s = 1$  if  $\chi = \mathbf{1}$ . ┘

**Cor. (35.5.2.3).** Situation as in (35.5.2.1),  $\zeta(F, \mathcal{R}; s)$  is analytic for  $\text{Re}(s) > 1 - 1/|\mathfrak{m}|$  except a simple pole at  $s = 1$ , where it has residue  $g_{\mathfrak{m}}$  depending only on  $\mathfrak{m}$ . ┘

*Proof:* This follows from (35.5.2.2) and finite Fourier transform on  $\text{Cl}_{\mathfrak{m}}(F)$ . □

**Def. (35.5.2.4) [Dirichlet  $L$ -Functions, Dirichlet-Satzes[D-S37]].** For  $F = \mathbb{Q}$ , the characters of  $\text{Cl}_m(\mathbb{Q})$  are just Dirichlet characters  $\chi$ (19.4.1.24), thus the Weber  $L$ -function is

$$L(\chi; s) = \sum_{n=1}^{\infty} \frac{\chi(n)}{n^s},$$

where  $\text{Re } s > 1$ . Called the **Dirichlet  $L$ -function** attached to  $\chi$ .  $\lrcorner$

**Thm. (35.5.2.5) [Dirichlet's  $L$ -Functions].** Let  $N \in \mathbb{Z}_+$  and  $\chi \in \text{Diri}'(N)$  with  $\chi(-1) = (-1)^\epsilon$  where  $\epsilon \in \{0, 1\}$ , then

$$\Lambda(\chi; s) = L_{\mathbb{R}}(s + \epsilon)L(\chi; s),$$

is the Hecke  $L$ -function attached to the Hecke character corresponding to  $\chi$ (19.4.1.24)(29.5.3.3). Thus  $L(\chi; s)$  can be extended to a meromorphic function for all  $s \in \mathbb{C}$ , and it has simple poles at  $s = 1$  when  $\chi = \mathbf{1}$ , and analytic otherwise. When  $\chi = \mathbf{1}$ ,  $L(\mathbf{1}; s) = \zeta(s)$ , and by(35.5.3.3),

$$\text{res}_{s=1} \zeta(s) = 1.$$

Moreover, there are functional equations

$$\Lambda(\chi; s) = (-i)^\epsilon \tau(\chi) N^{-s} \Lambda(\bar{\chi}; 1-s) \text{(35.3.6.8)},$$

In other words,

$$\epsilon(\chi; s) = (-i)^\epsilon \tau(\chi) N^{-s}, \quad w(\chi) = (-i)^\epsilon \frac{\tau(\chi)}{\sqrt{N}}.$$

In particular, if  $\chi$  is a quadratic character, then  $w(\chi) = 1$ , by(35.3.6.16).  $\lrcorner$

*Proof:* For the calculation of  $\epsilon(\chi; s)$ , Cf.[Bum97]P10 or [I-K04]P84. ?  $\square$

**Thm. (35.5.2.6) [Special Values of Dirichlet's  $L$ -Functions].** Let  $N \in \mathbb{Z}_{\geq 2}$  and  $\chi \in \text{Diri}'(N)$ , then

$$\begin{aligned} L(\chi; 1) &= \frac{-\tau(\chi)}{N} \sum_{n \in \mathbb{Z}/(N)} \chi^{-1}(n) \log(1 - e^{-2\pi i n/N}) \\ &= \begin{cases} \frac{\tau(\chi)}{N^2} \pi i \sum_{n \in \mathbb{Z}/(N)} \chi^{-1}(n) n & , \chi(-1) = -1 \\ \frac{-\tau(\chi)}{N} \sum_{n \in \mathbb{Z}/(N)} \chi^{-1}(n) \log |1 - e^{-2\pi i n/N}| & , \chi(-1) = 1 \end{cases} \end{aligned}$$

$\lrcorner$

*Proof:* Use Fourier transform ?.  $\square$

### Hecke $L$ -Functions of Imaginary Quadratic Fields

**Notation (35.5.2.7).**

- Let  $\mathcal{K}$  be an imaginary quadratic field with discriminant  $D \in \mathbb{Z}_-$ .

$\lrcorner$

**Thm. (35.5.2.8) [Hecke  $L$ -Functions of Imaginary Quadratic Fields].** Let  $\mathfrak{m}$  be a modulus for  $\mathcal{K}$ , and  $\chi$  a Hecke-character of  $\mathcal{K}$  with  $\chi_0$  of conductor  $\mathfrak{m}$  (19.4.1.22) and associated ideal class map  $\psi : J^{\mathfrak{m}} \rightarrow \mathbb{C}^{\times}$ . Suppose  $\chi_{\infty}(z) = e^{k \arg z}$ , then

$$\Lambda(\chi; s) = L_{\mathbb{C}}(s + \frac{|k|}{2}) L(\chi; s)$$

is the Hecke  $L$ -function attached to  $\chi$ . Thus  $L(\chi; s)$  can be extended to a meromorphic function for all  $s \in \mathbb{C}$ , and it has simple poles at  $s = 1$  when  $\chi = \mathbf{1}$ , and analytic otherwise. When  $\chi = \mathbf{1}$ ,  $L(\mathbf{1}; s) = \zeta_{\mathcal{K}}(s) = \zeta(s) L(\chi_{\mathcal{K}}, s)$ , and

$$\operatorname{res}_{s=1} \zeta_{\mathcal{K}}(s) = \frac{2 \operatorname{cl}(\mathcal{K})}{\#\mathcal{K}_{\operatorname{tor}}^{\times} \sqrt{|\operatorname{disc}(\mathcal{K})|}} \pi.$$

Moreover, there are functional equations

$$\Lambda(\chi; s) = i^{-k} \frac{\tau(\chi)}{\|\mathfrak{m}\|^{1/2}} (|\operatorname{disc}(\mathcal{K})| \cdot \|\mathfrak{m}\|)^{1/2-s} \Lambda(\bar{\chi}; 1-s) \text{ (35.3.6.8)}.$$

In other words,

$$\epsilon(\chi; s) = i^{-k} \frac{\tau(\chi)}{\|\mathfrak{m}\|^{1/2}} (|\operatorname{disc}(\mathcal{K})| \cdot \|\mathfrak{m}\|)^{1/2-s}, \quad w(\chi) = i^{-k} \frac{\tau(\chi)}{\|\mathfrak{m}\|^{1/2}}.$$

┘

*Proof:* ?

□

**Prop. (35.5.2.9) [Class Group  $L$ -Functions].** For  $\chi \in \operatorname{Cl}(\mathcal{K})^{\vee}$ , we have

$$L(\mathcal{K}, \chi; s) = \sum_{\mathfrak{a} \in \operatorname{Ideal}(\mathcal{O}_{\mathcal{K}})^{\times}} \chi(\mathfrak{a}) \|\mathfrak{a}\|^{-s}$$

which converges absolutely for  $\operatorname{Re}(s) > 1$ . And we denote

$$\Lambda(\mathcal{K}, \chi; s) =$$

for any primitive ideal  $\mathfrak{a} = [a, \frac{b+\sqrt{D}}{2}]$ , we have

$$\sum_{\chi \in \operatorname{Cl}(\mathfrak{K})^{\vee}} \chi(\mathfrak{a}) L(\mathcal{K}, \chi; s) = \operatorname{cl}(\mathcal{K}) \sum_{\mathfrak{b} \sim \mathfrak{a}} \|\mathfrak{b}\|^{-s} = \frac{\operatorname{cl}(\mathcal{K})}{\#\operatorname{tor}(\mathcal{K}^{\times})} a^{-s} \sum_{\alpha \in \mathfrak{a}^{-1}} |\alpha|^{-2s}.$$

┘

### 3 Riemann's Zeta-Functions

**Def. (35.5.3.1) [Riemann's Zeta-Functions].**  $\zeta(F; s) = L(F, \mathbf{1}; s)$  (35.5.2.2) is called the **Riemann's  $L$ -function** for  $F$ . Also denote

$$\zeta(s) = \zeta(\mathbb{Q}; s), \quad \Lambda(s) = \Lambda(\mathbb{Q}, \mathbf{1}; s) = L_{\mathbb{R}}(s) \zeta(s) \text{ (12.6.1.19)}.$$

Notice this is compatible with that of (2.6.2.2).

By (35.5.2.5),  $\zeta(s)$  extends to a meromorphic function for all  $s \in \mathbb{C}$  with a simple pole at  $s \in \{0, 1\}$  and  $\text{res}_{s=1} \zeta(s) = 1$ . And there is a functional equation

$$\Lambda(s) = \Lambda(1-s),$$

which is equivalent

$$\zeta(s) = 2^s \pi^{s-1} \sin\left(\frac{\pi s}{2}\right) \Gamma(1-s) \zeta(1-s).$$

┘

*Proof:* The last equation follows from the two equations

$$\Gamma\left(\frac{s}{2}\right) \Gamma\left(\frac{s+1}{2}\right) = 2^{1-s} \sqrt{\pi} \Gamma(s) \quad (12.6.1.11)$$

and

$$\Gamma\left(\frac{1-s}{2}\right) \Gamma\left(\frac{1+s}{2}\right) = \frac{\pi}{\cos\left(\frac{s}{2}\right)} \quad (12.6.1.7).$$

□

**Prop. (35.5.3.2) [Riemann Zeta-Function as Mellin Transform].**

$$(s-1)\zeta(s) = L\left(\frac{t}{e^t-1}; s-1\right) \quad (12.5.4.3).$$

This is an integral representation of Riemann zeta-function.

┘

*Proof:* The classical definition of  $\Gamma(s)$  (12.6.1.1) implies that

$$n^{-s} = \frac{1}{\Gamma(s)} \int_0^\infty e^{-nt} t^{s-1} dt.$$

In particular,

$$\zeta(s) = \sum_{n \in \mathbb{Z}_+} n^{-s} = \frac{1}{\Gamma(s)} \sum_{n \in \mathbb{Z}_+} \int_0^\infty e^{-nt} t^{s-1} dt = \frac{1}{\Gamma(s)} \int_0^\infty \frac{t}{e^t-1} t^{s-2} dt.$$

Thus the assertion follows.

□

**Thm. (35.5.3.3) [Class Number Formula, Dirichlet].** By (29.5.3.4) (19.4.2.20),

$$\text{res}_{s=1} \zeta(F; s) = \frac{2^{r_1} (2\pi)^{r_2}}{\#F_{\text{tor}}^\times \sqrt{|\text{disc}(F)|}} \text{cl}(F) \text{Reg}(F),$$

where  $\text{Reg}(F)$  is the regulator of  $F$  (20.8.1.7). In particular,

$$\text{res}_{s=1} \zeta_{\mathbb{Q}}(s) = 1.$$

┘

**Prop. (35.5.3.4) [Dirichlet's Class Number Formula for Quadratic Fields].** Let  $\mathcal{K} = \mathbb{Q}(\sqrt{D})$  be a quadratic field with discriminant  $D$ , and  $\chi_D$  (35.3.6.4) the real Dirichlet character associated to  $K$ , and  $\epsilon = 0$  (resp. 1) if  $\mathcal{K}$  is real (resp. complex), then

1. The root number of  $\chi_D$  (29.5.4.7) is given by

$$w(\chi_D) = \frac{\tau(\chi)}{\sqrt{|D|}} (-1)^\epsilon \in \{\pm 1\},$$

2. if  $D < 0$ , then

$$\text{cl}(\mathcal{K}) = \frac{\#\mu(\mathcal{K})\sqrt{|D|}}{2\pi} L(\chi_D; 1) = \frac{\#\mu(\mathcal{K})i}{2|D|} \cdot \frac{\tau(\chi_D)}{\sqrt{|D|}} \cdot \sum_{a \in \mathbb{Z}/(D)} \chi(a) = \frac{\#\mu(\mathcal{K})w(\chi_D)i}{2D} \cdot \sum_{a \in \mathbb{Z}/(D)} \chi(a)a.$$

3. If  $D > 0$ , then

$$\log \varepsilon = \frac{\sqrt{|D|}}{2 \text{cl}(\mathcal{K})} L(\chi_D; 1)$$

where  $\varepsilon$  is the fundamental unit of  $\mathcal{K}$ . ┘

*Proof:* For 1: Cf. [GTM 218]P305-306, Ex.14-15. ?

2, 3 follows from (35.5.3.3)(31.1.1.12)(35.5.2.5)(35.5.2.6) and item1. □

**Prop. (35.5.3.5) [Kronecker's First Limit Formula].**

$$\zeta(s) = \frac{1}{s-1} + \gamma_0 + O(s-1).$$

*Proof:* Cf. [Kronecker's First Limit Formula, Revisited]. This can be deduced from (26.9.2.4). ? □

**Remark (35.5.3.6).** This is related to the averaged Colmez's conjecture ? ┘

### Estimates

**Thm. (35.5.3.7).** For  $s \in \mathbb{C}$  with  $\text{Re}(s) > 0$ ,

$$\left| \zeta(s) - \frac{1}{s-1} \right| \leq \frac{|s|}{\text{Re}(s)}.$$

*Proof:* Cf. [Larry Guth]P87. □

**Prop. (35.5.3.8).** For any  $\varepsilon > 0$ , there exists constant  $C_\varepsilon > 0$  s.t.  $|\zeta(s)|^{-1} \leq C_\varepsilon |t|^\varepsilon$ , where  $s = \sigma + it$ ,  $\sigma \geq 1$ ,  $|t| \geq 1$ . ┘

*Proof:* □

**Prop. (35.5.3.9).** There exists  $C \in \mathbb{R}_+$  s.t. if  $s = \sigma + it \in \mathbb{C}$  where  $\sigma > 1/4$  and  $|t| > 1$ , then  $|\zeta(s)| \leq C|s|$ . ┘

*Proof:* Cf. [Larry Guth]P92. □

**Prop. (35.5.3.10).** Given  $\varepsilon \in \mathbb{R}_+$ , then there exists  $C(\varepsilon) \in \mathbb{R}_+$  s.t. for any  $s \in \mathbb{C}$  with  $\operatorname{Re}(s) > \varepsilon$ ,

$$\left| \frac{\zeta'}{\zeta}(s) - \sum_{\rho \in \operatorname{Zero}(\zeta)} \frac{1}{s - \rho} \right| \leq C(\varepsilon) \log(2 + |\tau|).$$

┘

*Proof:* Cf.[Larry Guth]P87.?

□

**Cor. (35.5.3.11).** For  $\varepsilon \in \mathbb{R}_+$  and  $\tau \in \mathbb{R}$  with  $|\tau| > 1$ ,

$$\operatorname{Re}\left(-\frac{\zeta'}{\zeta}(1 + \varepsilon + i\tau)\right) \leq O(\log |\tau|).$$

And if  $\rho = 1 - \delta + i\tau$  is a zero of  $\zeta(s)$ , then

$$\operatorname{Re}\left(-\frac{\zeta'}{\zeta}(1 + \varepsilon + i\tau)\right) \leq -\frac{1}{\varepsilon + \delta} + O(\log |\tau|).$$

┘

*Proof:* These follow from the fact that for a zero  $\rho$  of  $\zeta$  and  $s \in \mathbb{C}$  s.t.  $\operatorname{Re}(s)$ , we have  $\operatorname{Re}\left(-\frac{1}{s-\rho}\right) < 0$ .

□

**Thm. (35.5.3.12) [Vinogradov].** There exists  $c, C \in \mathbb{R}_+$  s.t. if  $\beta, \tau \in \mathbb{R}$  satisfies  $\beta > 1 - \frac{c}{\log^{2/3}(2+|\tau|)}$ , then

$$|\zeta(\beta + i\tau)| \leq C \log(2 + |\tau|).$$

┘

*Proof:* Cf.[Larry Guth]P101.

□

### Density Theorems

**Prop. (35.5.3.13).** Let  $g \in C^\infty(\mathbb{R})$  s.t.  $e^{\beta x} g(x) \in \mathcal{S}$  for any  $\beta \in \mathbb{R}_+$ , then for any  $\beta \in \mathbb{R}_{>1}$ ,

$$\sum_{n \in \mathbb{Z}_+} \Lambda(n) g(\log n) = -\frac{1}{2\pi i} \int_{\operatorname{Re}(z)=\beta} \frac{\zeta'}{\zeta}(s) \mathcal{L}(g)(-s) ds.$$

┘

*Proof:* Cf.[Larry Guth]P79.

□

**Cor. (35.5.3.14).** Situation as in (35.5.3.13), for  $\sigma \in (0, 1)$ ,  $T \in \mathbb{R}_+$ , denote  $\operatorname{Box}(\sigma, T)$  the open rectangular  $\{s = x + iy | \sigma < x < \beta, |y| < T\}$ , and the arc

$$\gamma_{\sigma, T} = (\beta, -T) \longrightarrow (\sigma, -T) \longrightarrow (\sigma, T) \longrightarrow (\beta, T).$$

Then by residue formula,

$$\sum_{n \in \mathbb{Z}_+} \Lambda(n) g(\log n) = \int e^x g(x) dx - \sum_{\rho \in \operatorname{Zero}(\zeta) \cap \operatorname{Box}(\sigma, T)} \int e^{\rho x} g(x) dx - \frac{1}{2\pi i} \int_{\gamma_{\sigma, T}} \frac{\zeta'}{\zeta} \mathcal{L}g(-s) ds.$$

┘

**Prop. (35.5.3.15) [Bounding Numbers of Zeros].** For  $\varepsilon$ , there exists  $C(\varepsilon) \in \mathbb{R}_+$  s.t. for any  $T \in \mathbb{R}_+$ ,

$$\#\operatorname{Zero}(\zeta) \cap \operatorname{Box}(\varepsilon, T) \leq C(\varepsilon) T \log T \text{ (35.5.3.14)}.$$

┘

*Proof:* Cf.[Larry Guth]P87.

□

### Zero-Free Regions

**Thm. (35.5.3.16) [Zero-Free Region for  $\zeta(s)$ , Vinogradov].** There exists  $c \in \mathbb{R}_+$  s.t. if  $\beta, \tau \in \mathbb{R}$  and

$$\beta > \frac{c}{\log^{2/3}(2 + |\tau|) \log \log |\tau|},$$

then  $\zeta(\beta + i\tau) \neq 0$ . In particular,  $\zeta(s)$  is non-vanishing on a standard zero-free region (35.4.5.1).  $\lrcorner$

**Remark (35.5.3.17).** The barrier for improving this bound lies in the barrier of improving estimates for trigonometric sums (35.3.8.4).  $\lrcorner$

*Proof:* Cf. [Larry Guth]P97? and P101.  $\square$

**Lemma (35.5.3.18).** For  $\sigma \in \mathbb{R}_{>1}$  and  $\tau \in \mathbb{R}$ ,

$$\operatorname{Re} \left( 3 \frac{-\zeta'}{\zeta}(\sigma) + 4 \frac{-\zeta'}{\zeta}(\sigma + i\tau) + \frac{-\zeta'}{\zeta}(\sigma + 2i\tau) \right) \geq 0.$$

$\lrcorner$

*Proof:* It follows from (2.6.2.11) that the LHS equals

$$\sum_{n \in \mathbb{Z}_+} \frac{\Lambda(n)}{n^\sigma} (3 + 4 \cos(\tau \log n) + \cos(2\tau \log n)) = \sum_{n \in \mathbb{Z}_+} \frac{\Lambda(n)}{n^\sigma} 2(1 + \cos(\tau \log n))^2 \geq 0.$$

$\square$

## 4 Models for Primes

See <https://terrytao.wordpress.com/2015/01/04/254a-supplement-4-probabilistic-models-and-heur>

## 5 Sums over Arithmetic Progressions

**Thm. (35.5.5.1).** For  $c_1 < c_2 \in (0, 1)$ ,  $k \in \mathbb{Z}_+$ ,  $X \in \mathbb{R}_+$  and  $Y \in [X^{c_2}, X]$ ,  $q \in [X^{c_1}]_+$ ,  $a \in \mathbb{Z}_+$  s.t.  $(a, q) = 1$ , we have

$$\sum_{n \in [X, X+Y], n \equiv a \pmod{q}} \tau^k(n) \ll_{c_1, c_2, k} \frac{Y}{q} \log^{O_{c_1, c_2, k}(1)} X.$$

And also

$$\sum_{n \in [X, X+Y], n \equiv a \pmod{q}} \tau(n) \sim \frac{Y}{q} \log X.$$

$\lrcorner$

*Proof:* By (35.1.3.11), if  $\theta = c_2 - c_1$ , then for any  $n \in [X + Y]_+$ , we have

$$\tau(n) \ll \max_{d|n, d \leq (X+Y)^\theta} \tau(d)^{2/\theta}.$$

So

$$\sum_{n \in [X, X+Y], n \equiv a \pmod{q}} \tau(n) \ll \sum_{d \in [(X+Y)^\theta]_+} \tau(d)^{2/\theta} \sum_{n \in [X, X+Y], n \equiv a \pmod{q}, d|n} 1 \ll \max_{d \in [(X+Y)^\theta]_+} \tau(d)^{2/\theta} \frac{Y}{qd}$$

because  $qd \leq X^{c_2} \ll Y$ . And the last term is bounded by  $\frac{Y}{q} \log^{2^{2/\theta}+1} X$  by (35.1.3.10).

? For further refinement, Cf. <https://terrytao.wordpress.com/2011/07/23/erdos-divisor-bound/>.  $\square$

## 6 Prime Number Theorems

**Def. (35.5.6.1) [General Prime-Counting Functions].** For an analytic  $L$ -function  $f$ , denote

$$\psi(f; X) = \sum_{n \in [X]_+} \Lambda_f(n).$$

In particular, if  $L(f; s) = \zeta(s)$ ,  $\psi(f; X) = \psi(X)$  (2.6.1.32).  $\lrcorner$

**Thm. (35.5.6.2) [General Prime Number Theorem].** Let  $f$  be an analytic  $L$ -function of degree  $d$  s.t.

- There exists  $c \in \mathbb{R}_+$  s.t.  $L(f; s)$  has at most one  $c$ -exceptional zero (35.4.5.3).
- For any  $X \in \mathbb{R}_+$ , we have

$$\sum_{n \in [X]_+} |\Lambda_f(n)|^2 \ll X d^2 \log^2(XC(f)).$$

with implied constant absolute.

Then for  $X \in \mathbb{R}_+$ , we have

$$\psi(f; X) + \text{ord}_{s=1}(f)X + \frac{X^{\beta_f}}{\beta_f} \ll \frac{X}{\exp\left(\frac{c}{d^4} \frac{\log X}{\sqrt{\log X} + 3 \log N(f)}\right)} (d \log(XC(f)))^4 \quad (35.5.6.1).$$

$$\psi(f; X) + \text{ord}_{s=1}(f)X + \frac{X^{\beta_f}}{\beta_f} \ll \sqrt{C(f)} \frac{X}{\exp\left(\frac{c}{2d^4} \sqrt{\log X}\right)} \quad (35.5.6.1).$$

with implied constants absolute. Notice that the conditions hold if Rankin-Selberg convolution  $L(f \otimes \bar{f}; s)$  exists and has a simple pole at  $s = 1$  (Cf. [I-K04]P110).  $\lrcorner$

*Proof:* Cf. [I-K04]P111 ?.

The idea is to use Mellin transform and integrate on the zero-free region.

The second inequality follows from the first one (Cf. [I-K04]P111).  $\square$

**Cor. (35.5.6.3) [Prime Number Theorem for Dirichlet Characters].** There exists effective constants  $c, \kappa \in \mathbb{R}_+$  s.t. for any  $N \in \mathbb{Z}_+$  and  $\chi \in \text{Dir}'(N)$ , we have

$$\left| \psi(\chi; X) - \delta_{\chi, 1_N} X + \frac{X^{\beta_\chi}}{\beta_\chi} \right| \leq \kappa \log^4 N \frac{X}{\exp\left(\frac{c \log X}{\sqrt{\log X} + \log N}\right)}.$$

$\lrcorner$

*Proof:* The conditions hold by (35.4.5.6) and trivial estimation.  $\square$

**Thm. (35.5.6.4) [Explicit Formula with Ramanujan Conjecture].** Let  $f$  be an analytic  $L$ -function of degree  $d$  s.t. the generalized Ramanujan conjecture holds (35.8.0.1). Then for  $X \in \mathbb{R}_{\geq 2}$ ,  $T \in [1, X]$ , we have

$$\psi(f; X) + \text{ord}_{s=1}(f)X + \sum_{\substack{\rho \in \text{Zero}(L(f; s)) \setminus \{0\} \\ |\text{Im}(\rho)| \leq T}} \frac{X^\rho - 1}{\rho} \ll \frac{X}{T} \log X \log(X^d C(f)).$$

with implied constant absolute.  $\lrcorner$

*Proof:* ? Cf. [I-K04]P112. □

**Cor. (35.5.6.5) [Explicit Formula for Dirichlet Characters].** For  $N \in \mathbb{Z}_+$ ,  $\chi \in \text{Diri}(N)$  and  $X \in \mathbb{R}_{\geq 2}$ ,  $T \in [1, X]$ , we have

$$\psi(\chi; X) - \delta_{\chi, 1_N} X + \sum_{\substack{\rho \in \text{Zero}(L(\chi; s)) \setminus \{0\} \\ |\text{Im}(\rho)| \leq T}} \frac{X^\rho - 1}{\rho} \ll \frac{X}{T} \log^2(XN).$$

┘

*Proof:* if  $\chi \in \text{Diri}'(N)$ , this follows from (35.5.6.4), as  $L(\chi; s)$  trivially satisfies the Ramanujan conjecture. In general, if  $\chi$  is induced from  $\chi' \in \text{Diri}'(N')$  where  $N' | N$ , then

$$|\psi(\chi; X) - \psi(\chi'; X)| \leq \sum_{\substack{p \in \text{Prime}, a \in \mathbb{Z}_+ \\ p^a \leq X, p | N}} \log p \ll \log X \log N,$$

and  $L(\chi; s) = L(\chi'; s) \prod_{p \in \text{Prime}, p | N, p \nmid N'} (1 - p^{-s})$ , so the contribution of  $\rho$  differ by at most

$$\sum_{p \in S(N)} \sum_{l \in \mathbb{Z}^\times, |\rho_{p,l}| \leq T} \left| \frac{X^{\rho_{p,l}} - 1}{\rho_{p,l}} \right| \ll \log^2(XN), \text{ where } \rho_{p,l} = \frac{2\pi i l}{\log p}.$$

Thus the assertion follows. □

## 7 Primes in Arithmetic Progressions

**Def. (35.5.7.1) [Prime Counting Functions in Arithmetic Progressions].** For  $N \in \mathbb{Z}_+$ ,  $a \in (\mathbb{Z}/(N))^*$  and  $X \in \mathbb{R}_+$ , define

$$\pi(N, a; X) \triangleq \#\{p \in \text{Prime} : p \leq X, p \equiv a \pmod{N}\}.$$

And  $\pi(1, 1; X)$  is also denoted by  $\pi(X)$ .

Similarly, define analogues of Chebyshev functions (2.6.1.32) as

$$\vartheta(N, a; X) \triangleq \sum_{p \in \text{Prime}, p \leq X, p \equiv a \pmod{N}} \log p,$$

and

$$\psi(N, a; X) \triangleq \sum_{n \in \mathbb{Z}_+, n \leq X, n \equiv a \pmod{N}} \Lambda(n),$$

Notice that  $\psi(N, a; X) - \vartheta(N, a; X)$  is bounded by a constant. ┘

**Def. (35.5.7.2) [Normalized Prime Counting Function].** The **normalized prime counting function**  $\pi_0$  is defined to be the function  $\pi_0 : \mathbb{R} \rightarrow \mathbb{R}_+$ :

$$\pi_0(X) \triangleq \lim_{h \rightarrow 0} \frac{1}{2} (\pi(X+h) + \pi(X-h)).$$

┘

**Def. (35.5.7.3) [Discrepancy Functions].** For  $f : \mathbb{Z}_+ \rightarrow \mathbb{C}$ ,  $X \in \mathbb{R}_+$  and  $N, a \in \mathbb{Z}$  s.t.  $(a, N) = 1$ , define the **discrepancy function**

$$\mathcal{D}_f(N, a; X) = \sum_{n \in [X]_+, n \equiv a \pmod{N}} f(n) - \frac{1}{\phi(N)} \sum_{n \in [X]_+, (n, N) = 1} f(n)$$

and

$$\text{Err}_f(N; X) = \max_{a \in (\mathbb{Z}/(N))^*} |\mathcal{D}_f(N, a; X)|.$$

It follows from orthogonality of Dirichlet characters that

$$\text{Err}_f(N; X) \leq \max_{\chi \in \text{Diri}(N) \setminus \mathbf{1}_N} \left| \sum_{n \in [X]_+} f(n) \chi(n) \right| \leq \|f \mathbf{1}_{[X]_+}\| N^{1/2}.$$

And it also follows by trivial bound that

$$\text{Err}_f(N; X) \leq \frac{\max_{n \in [X]_+} |f(n)|}{\phi(N)} N.$$

┘

**Cor. (35.5.7.4) [Discrepancy for Monotone Functions].** If  $a < b \in \mathbb{Z}_+$  and  $f : [a, b] \rightarrow \mathbb{C}$  is a monotone function, then for any  $N \in \mathbb{Z}_+$  and  $X \in \mathbb{R}_{\geq b}$ , we have

$$\text{Err}_f(N; X) \leq |f(a)| + |f(b)| \text{ (35.5.7.3)}.$$

┘

*Proof:* This follows from elementary consideration. □

**Cor. (35.5.7.5) [Discrepancy for Convolutions].** If  $g, h : \mathbb{Z}_+ \rightarrow \mathbb{C}$  are arithmetic functions, then for any  $X \in \mathbb{R}_{\geq b}$  and  $a, N \in \mathbb{Z}_+$  s.t.  $(a, N) = 1$ , we have

$$|\mathcal{D}_{g*h}(N, a; X)| \leq \sum_{d \in [X]_+, (d, N) = 1} |g(d)| |\mathcal{D}_h(a/d, N; X/d)|.$$

┘

**Cor. (35.5.7.6) [Discrepancy for Products].** If  $f : \mathbb{Z}_+ \rightarrow \mathbb{C}$  is an arithmetic function and  $g : \mathbb{R}_{\geq 1} \rightarrow \mathbb{C}_+$  is smooth, then for any  $X \in \mathbb{R}_{\geq b}$  and  $a, N \in \mathbb{Z}_+$  s.t.  $(a, N) = 1$ , we have

$$|\mathcal{D}_{fg}(N, a; X)| = \mathcal{D}_f(N, a; X) g(X) - \int_{1.5}^X \mathcal{D}_f(N, a; t) g'(t) dt.$$

┘

**Lemma (35.5.7.7).** For  $X \in \mathbb{R}_{\geq 2}$ ,

$$\prod_{p \in \text{Prime}, p \leq X} p \leq 4^X.$$

┘

*Proof:* ? Cf. [Ten15]P13. □

**Thm.(35.5.7.8)**[Mertens' Theorem, Mertens[Mer74]]. For  $X \in \mathbb{R}_{\geq 1}$ ,

1.

$$-1 - \log 4 \leq \left( \sum_{p \in \text{Prime}, p \leq X} \frac{\log p}{p} \right) - \log X + 1 \leq \log 4, \quad \sum_{n \in [X]_+} \frac{\Lambda(n)}{n} = \log X + O(1).$$

2.

$$\sum_{p \in \text{Prime}, p \leq X} \frac{1}{p} = \log_{(2)} X + M + O\left(\frac{1}{\log X}\right),$$

where  $M \approx 0.26$  is called the **Meissel-Mertens constant**.

3.

$$\sum_{p \in \text{Prime}, p \leq X} \log\left(1 - \frac{1}{p}\right) + \log_{(2)} X + \gamma_0 = O\left(\frac{1}{\log X}\right).$$

┘

**Remark(35.5.7.9)**[Rosen, A generalization of Mertens' theorem]. has extended this to general number fields. ┘

*Proof:* 1: An easy estimation of the off-diagonal terms shows that the former implies the latter. For the former, notice that

$$\begin{aligned} \log(\lfloor X \rfloor!) &= \sum_{p \in \text{Prime}} v_p(\lfloor X \rfloor!) \log p \\ (2.6.1.33) &> X \sum_{p \in \text{Prime}, p \leq X} \frac{\log p}{p} - \sum_{p \in \text{Prime}, p \leq X} \log p \\ (35.5.7.7) &\geq X \sum_{p \in \text{Prime}, p \leq X} \frac{\log p}{p} - X \log 4. \end{aligned}$$

But also by Stirling's inequality(12.6.1.16),

$$X \log X - X + 1 \leq \log(\lfloor X \rfloor!) \leq X \log X - X + 1 + \log X \leq X \log X,$$

so the upper bound follows. For the lower bound, notice that

$$\begin{aligned} \log(\lfloor X \rfloor!) &= \sum_{p \in \text{Prime}} v_p(\lfloor X \rfloor!) \log p \\ (2.6.1.33) &< X \sum_{p \in \text{Prime}, p \leq X} \frac{\log p}{p} + X \sum_{p \in \text{Prime}, p \leq X} \frac{\log p}{p(p-1)} \\ &\leq X \sum_{p \in \text{Prime}, p \leq X} \frac{\log p}{p} + X \sum_{n \in \mathbb{Z}_{\geq 2}} \frac{\log m}{m(m-1)} \\ &\leq X \sum_{p \in \text{Prime}, p \leq X} \frac{\log p}{p} + X \log 4. \end{aligned}$$

So the lower bound follows.

2: Denote  $\theta(X) = \sum_{p \in \text{Prime} \cap [X]_+} \frac{\log p}{p} - \log X = O(1)$ , then It follows from summation by part(35.1.2.9) and item1 that

$$\sum_{p \in \text{Prime} \cap [X]_+} \frac{1}{p} = 1 + O\left(\frac{1}{\log X}\right) + \int_2^X \frac{\log t + \theta(t)}{t \log^2 t} dt = \log_{(2)}(X) + 1 - \log_{(2)}(2) + \int_2^X \frac{\log t + \theta(t)}{t \log^2 t} dt + O\left(\frac{1}{\log X}\right).$$

3: It suffices to prove that

$$\sum_{p \in \text{Prime}} \left( \log \left( 1 - \frac{1}{p} \right) + \frac{1}{p} \right) = M - \gamma_0.$$

This summation is absolutely convergent and equals

$$\lim_{\delta \rightarrow 0^+} \sum_{p \in \text{Prime}} \left( \log \left( 1 - \frac{1}{p^{1+\delta}} \right) + \frac{1}{p^{1+\delta}} \right) = \lim_{\delta \rightarrow 0^+} (g(\delta) - h(\delta)),$$

where

$$g(\delta) = \sum_{p \in \text{Prime}} \frac{1}{p^{1+\delta}} + 2^\delta \log \delta, \quad h(\delta) = \log \zeta(1 + \delta) + 2^\delta \log \delta.$$

Notice  $\lim_{\delta \rightarrow 0^+} h(\delta) = 0$  by (35.5.3.3), and for  $g(\delta)$ , by item2 and summation by part (35.1.2.9), we have

$$\begin{aligned} \sum_{p \in \text{Prime}} \frac{1}{p^{1+\delta}} &= \lim_{X \rightarrow \infty} \frac{\log_{(2)} X + M + O(1/\log X)}{X^\delta} + \delta \int_2^\infty \frac{\log_{(2)} t + M + O(1/\log t)}{t^{1+\delta}} dt \\ &= M + \delta \int_2^\infty \frac{\log_{(2)} t}{t^{1+\delta}} dt + O(1) \cdot \delta \int_2^{\exp(\frac{1}{\sqrt{\delta}})} \frac{1}{t} dt + O(1) \cdot \delta \cdot \sqrt{\delta} \int_{\exp(\frac{1}{\sqrt{\delta}})}^\infty \frac{1}{t^{1+\delta}} dt \\ (t = e^{u/\delta}) &= M + \int_{\delta \log 2}^\infty e^{-u} \log \left( \frac{u}{\delta} \right) du + O \left( \sqrt{\delta} + \frac{\sqrt{\delta}}{e\sqrt{\delta}} \right) \\ &= M + \int_{\delta \log 2}^\infty e^{-u} \log u du - 2^\delta \log \delta + O \left( \sqrt{\delta} + \frac{\sqrt{\delta}}{e\sqrt{\delta}} \right) \end{aligned}$$

So  $\lim_{\delta \rightarrow 0^+} g(\delta) = M - \gamma_0$  by (12.6.1.13). □

**Prop. (35.5.7.10)** [Chebyshev's Estimates, Chebyshev1852/Nair1982].

- For  $X \in \mathbb{R}_{\geq 1}$ ,  $\vartheta(X) \leq \log 4 \cdot X$  (2.6.1.32).
- For  $X \in \mathbb{R}_{\geq 7}$ ,  $\psi(X) = \log(\text{lcm}\{n \in [X]_+\}) \geq (\log 2) \lfloor X \rfloor$  (2.6.1.32).

┘

*Proof:* For  $m \in \mathbb{Z}_+$ ,

$$2^{2m+1} = (1+1)^{2m+1} \geq 2 \binom{2m+1}{m} \geq 2 \prod_{m+1 < p \leq 2m+1, p \in \text{Prime}} p,$$

so

$$\vartheta(2m+1) - \vartheta(m+1) \leq m \log 4.$$

Also notice that  $\vartheta(2m) = \vartheta(2m-1)$ . From this the assertion follows by induction.

2: For  $1 \leq m \leq n \leq \mathbb{Z}_+$ ,  $m \binom{n}{m} \mid \text{lcm}\{k \in [n]_+\}$  because for each  $p \in \text{Prime}$ ,  $v_p(m \binom{n}{m}) \leq \lfloor \log_p(n) \rfloor = v_p(\text{lcm}\{k \in [n]_+\})$  by (2.6.1.34). From which we get

$$n(2n+1) \binom{2n}{n} \mid \text{lcm}\{k \in [n]_+\},$$

In particular, we get  $\text{lcm}\{k \in [2n+1]_+\} \geq n4^n$  for  $n \in \mathbb{Z}_+$ , and the assertion follows. □

**Prop. (35.5.7.11)**[Chebyshev]. For  $X \in \mathbb{R}_{\geq 1}$ , we have

$$\psi(X) = \sum_{k \in \mathbb{Z}_+} \vartheta(X^{1/k}) = \vartheta(X) + O(\sqrt{X}).$$

$$\pi(X) = \frac{\vartheta(X)}{\log X} + O\left(\frac{X}{\log^2 X}\right).$$

In particular,

$$\pi(X) \sim \frac{X}{\log X} \iff \psi(X) \sim X \iff \vartheta(X) \sim X.$$

(35.5.7.1). ┘

*Proof:* 1 follows from (35.5.7.10).

2: By Abel summation,

$$\begin{aligned} \pi(X) &= \frac{\vartheta(X)}{\log X} + \int_2^X \frac{\vartheta(t)}{t \log^2 t} dt \\ (35.5.7.10) &= \frac{\vartheta(X)}{\log X} + O\left(\int_2^X \frac{1}{\log^2 t} dt\right) \\ &= \frac{\vartheta(X)}{\log X} + O\left(\int_2^X \left(\frac{1}{\log^2 t} - \frac{2}{\log^3 t}\right) dt\right) \\ &= \frac{\vartheta(X)}{\log X} + O\left(\frac{X}{\log^2 X}\right). \end{aligned}$$

□

**Lemma (35.5.7.12).** Define the function  $\Phi(s) = \sum_{p \in \text{Prime}} p^{-s} \log p$ , then  $(\mathcal{L}\vartheta(e^t))(s) = \Phi(s)/s$ . Thus  $\Phi(s)$  is holomorphic on  $\text{Re}(s) > 1$  by (12.5.4.4) and (35.5.7.10), and  $\Phi(s) - \frac{1}{s-1}$  extends to meromorphic functions on  $\text{Re}(s) > 1/2$  and holomorphic on  $\text{Re}(s) \geq 1$ . ┘

*Proof:* By (2.6.1.2) there are infinitely many primes. For  $n \in \mathbb{Z}_+$ , let  $\mathbf{p}_n$  be the  $n$ -th smallest prime number, then the function  $\vartheta(e^t)$  is constant on  $(\log \mathbf{p}_n, \log \mathbf{p}_{n+1})$ , and

$$\int_{\log \mathbf{p}_n}^{\log \mathbf{p}_{n+1}} e^{-st} \vartheta(e^t) dt = \vartheta(\mathbf{p}_n) \int_{\log \mathbf{p}_n}^{\log \mathbf{p}_{n+1}} e^{-st} dt = \vartheta(\mathbf{p}_n) \frac{\mathbf{p}_n^{-s} - \mathbf{p}_{n+1}^{-s}}{s}.$$

Thus

$$(\mathcal{L}\vartheta(e^t))(s) = \int_0^\infty e^{-st} \vartheta(e^t) dt = \frac{1}{s} \sum_{n \in \mathbb{Z}_+} \vartheta(\mathbf{p}_n) (\mathbf{p}_n^{-s} - \mathbf{p}_{n+1}^{-s}) = \frac{1}{s} \sum_{n \in \mathbb{Z}_+} \mathbf{p}_n^{-s} \log \mathbf{p}_n = \frac{\Phi(s)}{s}.$$

For the last assertion, notice

$$-\frac{\zeta'(s)}{\zeta(s)} = (-\log \zeta(s))' = \left( \sum_{p \in \text{Prime}} \log(1 - p^{-s}) \right)' = \sum_{p \in \text{Prime}} \frac{\log p}{p^s - 1} = \Phi(s) + \sum_{p \in \text{Prime}} \frac{\log p}{p^s(p^s - 1)},$$

And  $\sum_{p \in \text{Prime}} \frac{\log p}{p^s(p^s - 1)}$  is absolutely convergent and holomorphic for  $\text{Re}(s) > 1/2$ , and  $\frac{\zeta'(s)}{\zeta(s)}$  has a simple pole with residue 1 by (35.5.3.1). So the assertion follows. □

**Thm. (35.5.7.13)**[Estimates for  $n$ -th Prime Number]. For  $n \in \mathbb{Z}_{\geq 6}$ ,

$$n(\log n + \log \log n - 1) \leq p_n \leq n(\log n + \log \log n).$$

┘

*Proof:* [https://en.wikipedia.org/wiki/Prime\\_number\\_theorem#Approximations\\_for\\_the\\_nth\\_prime\\_number.](https://en.wikipedia.org/wiki/Prime_number_theorem#Approximations_for_the_nth_prime_number.) ? □

**Prop. (35.5.7.14).** For  $X \in \mathbb{R}_{>17}$ ,

$$\frac{X}{\log X} < \pi(X) < 1.25506 \frac{X}{\log X}.$$

┘

*Proof:* [ROSSER and L. SCHOENFELD, Approximate formulas for some functions of prime numbers, Ill. J. Math. 6(1962), 64-94.]Thm2 ? □

**Cor. (35.5.7.15)**[Bertrand's Postulate, Chebyshev]. For any  $X \in \mathbb{R}_{\geq 1}$ , there is a rational prime in  $(X, 2X]$ . ┘

*Proof:* When  $X \geq 16$ ,  $4 \log 2 \leq \log X$ , so

$$\pi(2X) - \pi(X) \geq \frac{2X}{\log(2X)} - 1.25506 \frac{X}{\log X} \geq 0.344 \frac{X}{\log X} \geq \frac{4 \cdot 0.344}{\log 2} > 1$$

And for  $X \in (0, 16)$ , we can verify by hand. □

**Thm. (35.5.7.16)**[Brun-Titchmarsh Inequality, Titchmarsh[Tit30]/Montgomery-Vaughan[M-V73]]. For any  $X, Y \in \mathbb{R}_+$ ,  $N \in \mathbb{Z}_+$ ,  $a \in (\mathbb{Z}/(N))^*$  s.t.  $N < Y$ , we have

$$\pi(N, a; X + Y) - \pi(N, a; X) \leq \frac{2Y}{\phi(N) \log(Y/N)}.$$

┘

*Proof:* ? We only prove

$$\pi(N, a; X + Y) - \pi(N, a; X) < \frac{2Y}{\phi(N) \log(Y/N)} + O\left(\frac{Y}{N \log^2(Y/N)}\right).$$

We use the Selberg's sieve(35.2.3.2) to the arithmetic progression  $\mathcal{A} \subset (X, X + Y]$  and  $P$  is the product of primes in  $\mathbf{Prime}_{\leq \sqrt{Y}} \setminus S(N)$ , then

$$\pi(N, a; X + Y) - \pi(N, a; X) \leq S(\mathcal{A}; P) + \sqrt{Y}/N.$$

And the sieve condition of(35.2.3.4)(35.2.3.5) are satisfied with  $D = Y/N$ ,  $g(d) = d^{-1}$  when  $(d, N) = 1$ ,  $\kappa = 1$ , and  $X = Y/N$ , i.e. for each  $d \in \mathbb{Z}_+$  s.t.  $(d, N) = 1$ , we have

$$\mathcal{A}_d = \frac{Y}{dN} + r_d(\mathcal{A}), \text{ where } |r_d(\mathcal{A})| \leq 1.$$

So

$$H(D) > \frac{\phi(N)}{2N} \log D,$$

and we get the desired result. □

**Remark(35.5.7.17).** If the constant 2 can be replaced by  $2 - \varepsilon$  for some  $\varepsilon \in \mathbb{R}_+$ , then there are no Siegel-Landau zeros. ? ┘

**Thm.(35.5.7.18)** [Prime Number Theorem, conjectured by Legendre/Gauss, Hadamard[Had96]/Vallée-Poussin(1896, 1899)/Page[Pag35]/Bombieri[Bom62]/Wirsing[Wir62, Wir64]/Korobov[Kor58]/Vinogradov[Vin65]/Diamond-Steinig[D-S70]/Siegel[Sie35a]/Walfisz[Wal36]].

1. For  $N \in \mathbb{Z}_+$ ,  $\chi \in \text{Diri}'(N)$  and  $X \in \mathbb{R}_{\geq 2}$ , we have

$$\psi(\chi; X) - \delta_{\chi, 1_N} X \ll_A \frac{X}{\exp(A\sqrt{\log X})} \quad (35.5.6.1),$$

$$\sum_{p \in \text{Prime} \cap [X]_+} \chi(p) - \delta_{\chi, 1_N} \text{Li}(X) \ll_A \frac{X}{\exp(A\sqrt{\log X})},$$

$$\sum_{n \in [X]_+} \chi(n) \mu(n) \ll_A \frac{X}{\exp(A\sqrt{\log X})},$$

for any  $A \in \mathbb{R}_+$  and  $X \in \mathbb{R}_{\geq 2}$  with  $N \leq \log^A X$ .

2. For any  $N, a \in \mathbb{Z}_+$ ,  $a \in \mathbb{Z}_+$  s.t.  $(N, a) = 1$  and  $X \in \mathbb{R}_{\geq 2}$ , we have

$$\psi(N, a; X) - \frac{1}{\phi(N)} X \ll_A \frac{X}{\log^A X}.$$

$$\pi(N, a; X) - \frac{1}{\phi(N)} \text{Li}(X) \ll_A \frac{X}{\log^A X},$$

$$\mathcal{M}_\mu(N, a; X) \ll_A \frac{X}{\log^A X},$$

3. For  $N = 1$ , we have the stronger: There exists  $C \in \mathbb{R}_+$  s.t. for any  $X \in \mathbb{R}_{\geq 3}$ ,

$$\psi(X) - X \ll \left( \frac{X}{\exp \left( C \log^{3/5} X \log_{(2)}^{-1/5} X \right)} \right).$$

$$\pi(X) - \text{Li}(X) \ll \left( \frac{X}{\exp \left( C \log^{3/5} X \log_{(2)}^{-1/5} X \right)} \right).$$

$$\mathcal{M}_\mu(X) \ll \left( \frac{X}{\exp \left( C \log^{3/5} X \log_{(2)}^{-1/5} X \right)} \right).$$

┘

**Remark(35.5.7.19).** The barrier for improving the bound of the error term lies in the barrier to improve zero-free regions for  $L(\chi; s)$ . ┘

*Proof:* 1: For  $\Lambda(n)$ , the assertion follows from (35.5.6.3) and Siegel's estimation for  $\beta_\chi$  (35.4.4.12).  
For  $\pi(\chi; X)$ , this follows from (35.5.7.11) and partial summation:

$$\begin{aligned}\pi(\chi; X) &= \frac{\psi(\chi; X)}{\log X} - \int_2^X \psi(\chi; t) \left( \frac{1}{\log t} \right)' dt \\ &= \frac{X}{\log X} - \int_2^X \frac{1}{\log^2 t} dt + O\left(\int_2^X \frac{1}{\log^{A+2} t} dt\right) \\ &= \text{Li}(X) + O\left(\frac{X}{\log^{A+1} X}\right).\end{aligned}$$

For  $\mu(n)$  ? Cf. [I-K04]P124.

2: If  $N \leq \log^{A+1} X$ , this follows from orthogonality of Dirichlet-characters and item1( ? Cf. [Ten15]P395). And for  $N > \log^{A+1} X$ , the assertions trivially follows from ??.

3: ? Cf. [I-K04]P227.

□

**Cor. (35.5.7.20)** [Dirichlet's Theorem on Prime in Arithmetic Progression, Dirichlet(1847)].

For any  $N \in \mathbb{Z}_{\geq 2}$  and  $a \in \mathbb{Z}$  s.t.  $(a, N) = 1$ , we have

$$\#\text{Prime} \cap (a + N\mathbb{Z}) = \infty.$$

┘

**Cor. (35.5.7.21).** For any  $N \in \mathbb{Z}_+$ ,  $A \in \mathbb{R}_+$ , we have

$$-\sum_{m \in [X/N]_+, (m, N)=1} \frac{\mu(m)}{m} \log(Nm) = \frac{N}{\phi(N)} \left(1 + O_A\left(\tau(N) \log^{-A} X\right)\right)$$

for each  $X \in \mathbb{R}_{\geq 2}$ .

┘

*Proof:* ? Cf. <https://math.stackexchange.com/questions/255262/prove-that-sum-n-1-infty-mun-frac-log-nn-1>. □

**Def. (35.5.7.22)** [Restrictions on  $N$ ]. Let  $\mathcal{B}$  be the set of numbers  $B \in (0, 1)$  s.t. there exists  $D_B \in \mathbb{N}$  s.t. when  $X \in \mathbb{R}_+$  is large, there exists a set  $\mathcal{D}_B(X)$  of at most  $D_B$  many integers bigger than  $\log X$ , s.t. for any  $Y \in \mathbb{R}_+$ ,  $N \in \mathbb{Z}_+$ ,  $N \leq \min(X^B, Y/X^{1-B})$  and  $a \in (\mathbb{Z}/(N))^*$ ,

$$\pi(Y; N, a) \geq \frac{\pi(Y)}{2\phi(N)},$$

unless  $N$  divides one of the numbers in  $\mathcal{D}_B(X)$ .

Also denote  $B_{\pi,1}$  the supremum of numbers  $B$  s.t. there exists  $D_B \in \mathbb{N}$  s.t. when  $X \in \mathbb{R}_+$  is large, there exists a set  $S_B(X)$  of at most  $D_B$  many integers bigger than  $\log X$  s.t. for any  $N \in \mathbb{Z}_+$ ,  $N \leq X^B$ ,

$$\pi(X; N, 1) \geq \frac{\pi(X)}{2\phi(N)},$$

unless  $N$  divides one of the numbers in  $S_B(X)$ . Then it is clear that  $(0, B_{\pi,1}) \subset \mathcal{B}$ .

### Elliott-Halberstam Conjecture(Averaged GRH for Dirichlet Series)

**Conj. (35.5.7.26) [Montgomery].** For any  $\varepsilon \in \mathbb{R}_+$ , there exists  $C_\varepsilon \in \mathbb{R}_+$  s.t. for any  $a, N \in \mathbb{Z}_+, (a, N) = 1$  and  $X \in \mathbb{R}_+$ , we have

$$|\mathcal{D}_\Psi(N, a; X)| \leq C_\varepsilon (N^{-1/2} X^{1/2+\varepsilon}) \quad (35.5.7.3).$$

Notice that this doesn't follow from the generalized Riemann hypothesis.  $\lrcorner$

*Proof:*  $\square$

**Conj. Cor. (35.5.7.27) [Level of Distributions of Primes, Elliott-Halberstam].** For  $N \in \mathbb{Z}_+$  and  $X \in \mathbb{R}_+$  and any  $\theta \in (0, 1)$  and  $A \in \mathbb{R}_+$ , there exists a constant  $C_{A, \theta} \in \mathbb{R}_+$  s.t.

$$\sum_{1 \leq N \leq X^\theta} \text{Err}_\pi(X; N) \leq C_{A, \theta} \frac{X}{\log^A X} \quad (35.5.7.3).$$

This is a refinement of the averaged form of the prime number theorem (35.5.7.18). If the assertion is true for  $\theta$ , then we say that the **primes have level of distribution  $\theta$** .

An equivalent formulation is

$$\sum_{1 \leq N \leq X^\theta} \text{Err}_\Psi(X, N) \leq C_{A, \theta} \frac{X}{\log^A X} \quad (35.5.7.3).$$

$\lrcorner$

*Proof:*

□

**Thm& Conj. Cor. (35.5.7.28).** The Elliott-Halberstam conjecture (35.5.7.27) is true for any  $\theta \in (0, 1/2)$ , by Bombieri-Vinogradov (35.5.7.31). ┘

**Lemma (35.5.7.29) [Siegel-Walfisz type Inequalities].** If  $N \in \mathbb{Z}_+$  and  $(\beta_n)_{n \in [N]_+}$ ,  $\Delta \in (0, 1]$  satisfies

$$\text{Err}_\beta(q; N) \leq \|\beta\| N^{1/2} \Delta^9,$$

then for any  $r \in \mathbb{Z}_{\geq 2}$ ,  $s \in \mathbb{Z}_+$  and  $\mathbf{1}_r \neq \chi \in \text{Diri}(r)$ , we have

$$\left| \sum_{n \in \mathbb{Z}_+, (n, s)=1} \beta_n \chi(n) \right| \leq \|\beta\| N^{1/2} \Delta^3 \tau(s) r^{1/3}.$$

┘

*Proof:* By Legendre formula (35.2.1.2), for any  $K \in \mathbb{Z}_+$ ,

$$\begin{aligned} \sum_{n \in \mathbb{Z}_+, (n, s)=1} \beta_n \chi(n) &= \sum_{k \in \mathbb{Z}_+, k|s} \mu(k) \sum_{n \in \mathbb{Z}_+, k|n} \beta_n \chi(n) \\ &= \sum_{k \in [K]_+, k|s} \mu(k) \sum_{l \in \mathbb{Z}_+, l|k} \mu(l) \sum_{n \in \mathbb{Z}_+, (n, l)=1} \beta_n \chi(n) + \sum_{k \in \mathbb{Z}_{>K}, k|s} \mu(k) \sum_{n \in \mathbb{Z}_+, k|n} \beta_n \chi(n) \\ &= \sum_{k \in [K]_+, k|s} \mu(k) \sum_{l \in \mathbb{Z}_+, l|k} \mu(l) \sum_{a \in (\mathbb{Z}/(lr))^*} \chi(a) \mathcal{D}_\beta(s, a; N) + \sum_{k \in \mathbb{Z}_{>K}, k|s} \mu(k) \sum_{n \in \mathbb{Z}_+, k|n} \beta_n \chi(n) \end{aligned}$$

The first term is bounded by

$$\|\beta\| N^{1/2} \Delta^9 \sum_{k \in [K]_+, k|s} \sum_{l \in \mathbb{Z}_+, l|k} \phi(lr) \leq \|\beta\| N^{1/2} \Delta^9 K \phi(r) \tau(s).$$

And by Cauchy's inequality, the second term is bounded

$$\|\beta\| \sum_{k \in \mathbb{Z}_{>K}, k|s} N^{1/2} k^{-1/2} \leq \|\beta\| N^{1/2} K^{-1/2} \tau(s).$$

Then the assertion follows by taking  $K = \Delta^{-6} \phi(r)^{-2/3}$ . □

**Thm. (35.5.7.30) [general Bombieri-Vinogradov Theorem (Type II Estimates)].** If  $M, N \in \mathbb{Z}_+$  and  $(\alpha_m)_{m \in [M]_+}$ ,  $(\beta_n)_{n \in [N]_+}$ ,  $\Delta \in (0, 1]$  s.t. for any  $q \in \mathbb{Z}_+$ , we have a Siegel-Walfisz type inequality (35.5.7.29):

$$\text{Err}_\beta(q; N) \leq \|\beta\| N^{1/2} \Delta^9.$$

Then for any  $Q \in \mathbb{R}_+$  we have

$$\sum_{q \in [Q]_+} \text{Err}_{\alpha * \beta}(q; MN) \ll \|\alpha\| \|\beta\| \left( \Delta^{9/7} M^{1/2} N^{1/2} + M^{1/2} + N^{1/2} + Q \right) \log^2 Q.$$

┘

*Proof:* By orthogonality of Dirichlet characters, for any  $a \in (\mathbb{Z}/(q))^*$ ,

$$D_{\alpha*\beta}(q, a; MN) = \frac{1}{\phi(q)} \sum_{\chi \in \text{Diri}(q) \setminus \mathbf{1}_q} \bar{\chi}(a) \left( \sum_m \alpha_m \chi(m) \right) \left( \sum_n \beta_n \chi(n) \right),$$

so

$$\sum_{q \in [Q]_+} \text{Err}_{\alpha*\beta}(q; MN) \leq \sum_{s \in [Q]_+} \frac{1}{\phi(s)} \sum_{1 < r \in [Q]_+} \frac{1}{\phi(r)} \sum_{\chi \in \text{Diri}'(r)} \left| \sum_{(m,s)=1} \alpha_m \chi(m) \right| \left| \sum_{(n,s)=1} \beta_n \chi(n) \right|.$$

For  $R \in \mathbb{R}_+$ , we can bound the sums for  $r \leq R$  using (35.5.7.29), to get the bound

$$\sum_{r \in [R]_+} \leq \|\alpha\| \|\beta\| M^{1/2} N^{1/2} \Delta^3 \sum_{s \in [Q]_+} \frac{\tau(s)}{\phi(s)} \sum_{r \in [R]_+} r^{1/3} \ll \|\alpha\| \|\beta\| M^{1/2} N^{1/2} \Delta^3 R^{4/3} \log^2 Q \quad (35.1.3.15).$$

And for the sums for  $r > R$ , we split the range into dyadic segments  $[2^k + 1, 2^{k+1}]$  and apply Cauchy's inequality and the large sieve inequality (35.1.6.13) to get the bound

$$\begin{aligned} \sum_{r \in \mathbb{Z}_{>R}} &\ll \|\alpha\| \|\beta\| \sum_{P \in 2^{\mathbb{N}} \cap [R/2, Q]} \left( 16P^2 + 4(M+N) + P^{-2} \right)^{1/2} \log Q \quad (35.1.3.15) \\ &\ll \|\alpha\| \|\beta\| \left( Q + M^{1/2} + N^{1/2} + M^{1/2} N^{1/2} R^{-1} \right) \log^2 Q. \end{aligned}$$

Then the assertion follows by taking  $R = \Delta^{-9/7}$ .  $\square$

**Cor. (35.5.7.31)** [Bombieri-Vinogradov Theorem, Linnik[Lin41]/Renyi[Ren48]/Roth[Rot65]/Barban[Bar66]/Vinogradov[Vin65]/Bombieri[Bom65]/Gallagher[Gal70]/Motohashi[Mot76]].

For any  $A \in \mathbb{R}_+$ , there exists  $C_A \in \mathbb{R}_+$  s.t.

$$\sum_{1 \leq N \leq \sqrt{X}/\log^{2A+7} X} \text{Err}_{\Lambda}(N; X) \leq C_A \frac{X}{\log^A X}$$

And the same assertion holds for  $\text{Err}_{\text{Prime}}(N; X)$  or  $\text{Err}_{\mu}(N; X)$ .  $\lrcorner$

*Proof:* By Vaughan's identity (35.2.4.8),

$$\Lambda = \Lambda_1^{\sharp} - \Lambda_2^{\sharp} + \Lambda^{\flat} + \Lambda_{\leq X^{1/5}}, \text{ where } \Lambda_1^{\sharp} = \text{Log} * \mu_{\leq X^{1/5}}, \quad \Lambda_2^{\sharp} = \Lambda_{\leq X^{1/5}} * \mu_{\leq X^{1/5}} * \mathbf{1}, \quad \Lambda^{\flat} = \Lambda_{> X^{1/5}} * \mathbf{1} * \mu_{> X^{1/5}}.$$

So for any  $a, N \in \mathbb{Z}_+$  s.t.  $(a, N) = 1$ , we have

$$\mathcal{D}_{\Lambda}(N, a; X) = \mathcal{D}_{\Lambda_1^{\sharp}}(N, a; X) - \mathcal{D}_{\Lambda_2^{\sharp}}(N, a; X) + \mathcal{D}_{\Lambda^{\flat}}(N, a; X) + \mathcal{D}_{\Lambda}(N, a; X^{1/5})$$

For  $Q \in [\sqrt{X}]_+$ , we bound their contribution to  $\sum_{N \in [Q]_+} \text{Err}_{\Psi}(N; X)$  separately.

- By (35.5.7.3),  $\mathcal{D}_{\Lambda}(N, a; X^{1/5})$  can be bounded trivially by  $X^{1/5} \log X / \phi(N)$ . So it contribute  $O(X^{1/5} \log^2 X)$  to the final result, by (35.1.3.15).
- By (35.5.7.4),  $\mathcal{D}_{\Lambda_1^{\sharp}}(N, a; X) = O(\log X)$ , so it contributes  $O(X^{2/5} \log X)$  to the final result, by (35.5.7.5).

- By (35.5.7.5), the contribution of  $\mathcal{D}_{\Lambda_2^\sharp}(N, a; X)$  is bounded by

$$\sum_{N \in [Q]_+} \sum_{d \in [X]_+} \left| \mu_{\leq X^{1/5}} * \Lambda_{\leq X^{1/5}}(d) \right| \ll Q \left| \mathcal{M}_{|\mu|}(X^{1/5}) \right| \left| \mathcal{M}_\Lambda(X^{1/5}) \right| \ll X^{9/10}.$$

- For  $\Lambda^b$ , the restriction  $n = lm \leq X$  makes the convolution interconnected, so we replace  $\Lambda^b(n)$  with

$$\Lambda_{L,M}^b(n) \triangleq \sum_{\substack{L, M \in (1+\delta)^{\mathbb{N}} \cap (X^{1/5}, X^{4/5}) \\ LM < X}} \sum_{\substack{l \in ((1+\delta)^{-1}L, L] \\ m \in ((1+\delta)^{-1}M, M] \\ lm = n}} (\mu_{>X^{1/5}} * \mathbf{1})(l) \Lambda(m), \text{ where } \delta \in (X^{-1/5}, 1).$$

Their difference lies in the area  $n = lm$  and  $m \in ((1+\delta)^{\lfloor \log_{1+\delta} X^{1/5} \rfloor}, X^{1/5}]$ , or the area  $n \in ((1+\delta)^{\lfloor \log_{1+\delta} X \rfloor}, X]$ . Estimating these trivially ? we get

$$\mathcal{D}_{\Lambda^b}(N, a; X) = \sum_L \sum_M \mathcal{D}_{\Lambda_{L,M}^b}(N, a; X) + O(\delta N^{-1} X \log X).$$

The contribution of each  $\mathcal{D}_{\Lambda_{L,M}^b}(N, a; X)$  can be bounded by the general Bombieri-Vinogradov theorem (35.5.7.30) (where the hypothesis is satisfied for  $\beta = \Lambda$  with  $\Delta = \log^{-A} X$  by Siegel-Walfisz theorem (35.5.7.18)), which gives the bound

$$\left\| (\mu_{>X^{1/5}} * \mathbf{1}) \mathbf{1}_{((1+\delta)^{-1}L, L]} \right\| \left\| \Lambda \mathbf{1}_{((1+\delta)^{-1}M, M]} \right\| \Delta^{9/7} X^{1/2} \log^2 X \ll \Delta^{9/7} \delta X \log^{5/2} X \quad (35.1.3.8)$$

if we take  $Q = \Delta^{9/7} \sqrt{X}$ . Summing over  $(L, M)$  (there are  $O(\lceil \delta^{-2} \log^2 X \rceil)$ -many terms), we get the bound  $O(\delta^{-1} \Delta^{9/7} \log^2 X + \delta) X \log^{5/2} X$ . Taking  $\delta = \Delta^{9/14} \log X$ , we get the bound  $\Delta^{9/14} X \log^{7/2} X$ .

Thus we get

$$\sum_{1 \leq N \leq \sqrt{X} \log^{-9/7A} X} \text{Err}_\Lambda(N; X) \ll X \log^{7/2-9/14A} X.$$

For  $\mu(n)$ , use Vaughan's identity for  $\mu$  (35.2.4.8), and the rest is totally analogous to the above.

For  $\mathbf{1}_{\text{Prime}}$ , use (35.5.7.6). □

**Remark (35.5.7.32).** generalizing the Bombieri-Vinogradov theorem is closed related to density theorems for Dirichlet series Density Theorems. ? ┘

**Thm& Conj. Cor. (35.5.7.33) [Modified Bombieri-Vinogradov Theorem beyond  $1/2$ ].** During Zhang's proof of the twin prime conjecture, he proved a modified version (excluding  $x^\omega$ -large prime factors in  $N$ ) version beyond Bombieri-Vinogradov theorem for  $\theta = 1/2 + \omega$ . ┘

*Proof:*

□

**Thm. (35.5.7.34) [general Barban-Davenport-Halberstam Theorem].** If  $f : \mathbb{Z}_+ \rightarrow \mathbb{C}$  is an arithmetic function and  $X \in \mathbb{R}_+, \Delta \in (0, 1]$  s.t.

$$\text{Err}_f(N, a; X) \leq \left\| f \mathbf{1}_{[X]_+} \right\| X^{1/2} \Delta^9,$$

for any  $a, N \in \mathbb{Z}_+$  s.t.  $(a, N) = 1$ . Then we have

$$\sum_{q \in [Q]_+} \sum_{a \in (\mathbb{Z}/(q))^*} |D_f(q, a; X)|^2 \leq \|f \mathbf{1}_{[X]_+}\|^2 (\Delta X + Q) \log^2 Q$$

for any  $Q \in \mathbb{R}_+$ . ┘

*Proof:* By orthogonality of Dirichlet characters,

$$\sum_{a \in (\mathbb{Z}/(q))^*} |D_f(q, a; X)|^2 = \frac{1}{\phi(q)} \sum_{a \in (\mathbb{Z}/(q))^*} \left| \sum_{\chi \in \text{Diri}(q) \setminus \mathbf{1}_N} \overline{\chi(a)} \sum_{n \in [X]_+} f(n) \chi(n) \right|^2 = \frac{1}{\phi(q)} \sum_{\chi \in \text{Diri}(q) \setminus \mathbf{1}_N} \left| \sum_{n \in [X]_+} f(n) \chi(n) \right|^2.$$

So

$$\sum_{q \in [Q]_+} \sum_{a \in (\mathbb{Z}/(q))^*} |D_f(q, a; X)|^2 \leq \sum_{s \in [Q]_+} \frac{1}{\phi(s)} \sum_{1 < r \in [Q]_+} \frac{1}{\phi(r)} \sum_{\chi \in \text{Diri}'(r)} \left| \sum_{n \in [X]_+} f(n) \chi(n) \right|^2.$$

By the proof of (35.5.7.30), this is bounded by

$$\|f\|^2 \left( X \Delta^3 R^2 + Q + X^{1/2} + X R^{-1} \right) \log^2 Q$$

for any  $R \in \mathbb{R}_+$ . By taking  $R = \Delta^{-1}$ , we get the desired assertion. □

**Cor. (35.5.7.35)** [Barban[Bar66]/Davenport-Halberstam[D-H66]]. For any  $A \in \mathbb{R}_+$ , there exists  $C_A \in \mathbb{R}_+$  s.t.

$$\sum_{1 \leq N \leq X / \log^{2A+7} X} \sum_{a \in (\mathbb{Z}/(N))^*} (\mathcal{D}_\Lambda(N, a; X))^2 \leq C_A \frac{X^2}{\log^A X}.$$

And similar assertion holds for  $\Lambda$  replaced by  $\mu$ . ┘

*Proof:* This follows from the general Barban-Davenport-Halberstam theorem (35.5.7.34), where the conditions with  $\Delta = \log^{-A} X$  are satisfied by (35.5.7.18) and (35.1.3.17). □

**Thm. (35.5.7.36)** [Bombieri-Friedlander-Iwaniec[BFI86]]. For any  $A \in \mathbb{R}_+$ , there exists  $C_A \in \mathbb{R}_+$  and  $B_A \in \mathbb{R}_+$  s.t.

$$\sum_{1 \leq N \leq \sqrt{X} \log^A X} \sum_{a \in (\mathbb{Z}/(N))^*} |\mathcal{D}_\Lambda(N, a; X)| \leq C_A \frac{X}{\log^3 X} \cdot (\log_{(2)} X)^{B_A} \text{ (2.6.1.32)}.$$

*Proof:* ? ┘

### Titchmarsh Divisor Problem

**Thm. (35.5.7.37).** For  $X \in \mathbb{R}_+$ ,

$$\sum_{p \in \text{Prime} \leq X} \tau(p-1) \sim \frac{\zeta(2)\zeta(3)}{\zeta(6)} X.$$

*Proof:* Cf. [I-K04]P420. ? □

## Divisors in Arithmetic Progressions

### Green-Tao Theorem

**Thm. (35.5.7.38)[Green-Tao].** Prime contains arithmetic progressions of any length. In fact, if  $A \subset P$  is a subset with positive natural upper density, then  $A$  contains arithmetic progressions of any length.

┘

*Proof:* Cf.[Green-Tao]. Notice this is a consequence of the Erdős-Turán conjecture(37.6.2.8).  $\square$

### Sophie-Germain Primes

**Def. (35.5.7.39) [Sophie-Germain Primes].** A **Sophie-Germain prime** is a prime  $p \in \text{Prime}$  s.t.  $2p + 1$  is also a prime.  $\square$

**Conj. (35.5.7.40)[Sophie-Germain Primes Conjecture].** Let  $C_2$  be the twin-prime constant?, then

$$\#\{p \in \text{Prime} \mid p \leq m, 2p + 1 \in \text{Prime}\} \sim 2C_2 \frac{X}{\log X}, \quad X \rightarrow \infty.$$

┘

*Proof:*  $\square$

## 8 Special Factorizations

**Def. (35.5.8.1).** For  $Y, Y \in \mathbb{R}_+$ , let  $\pi(X|Y)$  be the cardinality of primes  $p$  s.t.  $p \leq X$ , and  $p - 1$  is free of prime divisors exceeding  $Y$ .  $\square$

**Def. (35.5.8.2).** Let  $E_\pi$  denote the supremum of numbers  $E \in (0, 1)$  s.t. there exists  $\gamma_1(E) \in \mathbb{R}_+$  s.t.  $\pi(X|X^{1-E}) \geq \gamma_1(E)\pi(X)$  for  $X \in \mathbb{R}_+$  sufficiently large.  $\square$

**Prop. (35.5.8.3).**  $E_\pi > 0$ , and if  $E \in (0, 1)$  has the property stated in(35.5.8.2), then so does  $E + \varepsilon$  for some  $\varepsilon \in \mathbb{R}_+$ .  $\square$

*Proof:* For the first assertion, Cf.[Erdos]?,  
For the second assertion, for  $X$  large,

$$\begin{aligned} \pi(X|X^{1-E'}) &\geq \pi(X|X^{1-E}) - \sum_{p \in \text{Prime}, x^{1-E'} \leq p < x^{1-E}} \pi(X; p, 1) \\ (35.5.8.2) &\geq \gamma_1(E)\pi(X) - \sum_{p \in \text{Prime}, x^{1-E'} \leq p < x^{1-E}} \frac{2X}{\varphi(p) \log(X/p)} \\ (35.5.7.14) &\geq \gamma_1(E) \frac{X}{\log X} - \sum_{p \in \text{Prime}, x^{1-E'} \leq p < x^{1-E}} \frac{2X}{E(p-1) \log X} \\ &= \frac{X}{\log X} \left( \gamma_1(E) - \frac{2}{E} \sum_{p \in \text{Prime}, x^{1-E'} \leq p < x^{1-E}} \frac{1}{p-1} \right) \\ (35.5.7.8) &= \frac{X}{\log X} \left( \gamma_1(E) - \frac{2}{E} \log \frac{1-E}{1-E'} + o(1) \right) \end{aligned}$$

This shows that when  $E'$  is sufficiently closed to  $E$ , when  $X$  is large,  $E'$  also satisfies the property stated in(35.5.8.2).  $\square$

**Conj. (35.5.8.4).**  $E_\pi = 1$ . ┘

*Proof:* □

**Prop. (35.5.8.5) [Friedlander].**  $1 - (2\sqrt{e})^{-1} \leq E_\pi$ . ┘

*Proof:* [FRIEDLANDER, Shifted primes without large prime factors]. □

**Prop. (35.5.8.6).**  $B_{\pi,1} \leq E_\pi$  (35.5.7.22). ┘

*Proof:* Cf. [AGP94]P720<sup>?</sup>. □

### Wieferich's Primes

**Def. (35.5.8.7) [Wieferich's Prime].** A **Wieferich's prime** is a prime  $p \in \mathbf{Prime}$  s.t.  $2^{p-1} \equiv 1 \pmod{p^2}$ . More generally, for  $a \in \mathbb{Z}_+$ , a **Wieferich's prime in base  $a$**  is a prime  $p \in \mathbf{Prime}$  s.t.  $a^{p-1} \equiv 1 \pmod{p^2}$ . ┘

**Thm. (35.5.8.8) [Wieferich's Criterion, Silverman].** If the abc conjecture is true, then for any  $\alpha \in \mathbb{Q}^* \setminus \{0, 1\}$ , there exists  $C(\alpha) \in \mathbb{R}_+$  s.t.

$$\{p \in \mathbf{Prime} : p < X, \alpha^{p-1} \not\equiv 1 \pmod{p^2}\} \geq C(\alpha) \log X$$

for  $X$  large. ┘

*Proof:* Let  $\alpha = a/b$ . We may assume that  $(a, b) = 1$  and  $a > b \geq 1$ . The strategy is use the cyclotomic polynomial to find the order of  $\alpha$  modulo  $p$ .

For  $n \in \mathbb{Z}_+$ , let  $U_n$  be the product of primes  $p \in \mathbf{Prime}$  s.t.  $v_p(\Phi_n(a, b)) = 1$ . And let  $\Phi_n(a, b) = U_n V_n$ . Then:

**Lemma (35.5.8.9).** Suppose  $p \in \mathbf{Prime}$ ,  $p \nmid abn$ ,  $p | U_n$ , then  $\text{ord}_p(\alpha) = n$ , and  $\alpha^{p-1} \not\equiv 1 \pmod{p^2}$ . ┘

*Proof:* By property of cyclotomic polynomials,  $\text{ord}_p(\alpha) = n$ . Also because  $v_p(U_n) = 1$ , we have  $a^n \not\equiv 1 \pmod{p^2}$ . Then  $a^{p-1} = (a^n)^{\frac{p-1}{n}}$  also  $\not\equiv 1 \pmod{p^2}$ . □

**Lemma (35.5.8.10).** For  $X \in \mathbb{R}_+$ ,

$$\#\{p \in \mathbf{Prime} : p < X, \alpha^{p-1} \not\equiv 1 \pmod{p^2}\} \geq \#\{n \in \mathbb{Z}_+ : n \leq \log_a X, U_n > abn\}.$$

┘

*Proof:* For  $n \in \mathbb{Z}_+ : n \leq \log_a X, U_n > abn$ , because  $U_n$  is square-free, we may choose  $\mathbf{p}_n | U_n$  that is coprime to  $abn$ . Then by (35.5.8.9),  $\alpha^{\mathbf{p}_n-1} \not\equiv 1 \pmod{\mathbf{p}_n^2}$ . Moreover,  $\mathbf{p}_n \leq U_n < a^n \leq X$ .

Moreover,  $\mathbf{p}_n$  are different for different  $n$ , because  $n = \text{ord}_{\mathbf{p}_n}(\alpha)$  (35.5.8.9). Thus the assertion follows. □

**Lemma (35.5.8.11).** If the abc-conjecture is true, then for any  $\varepsilon \in \mathbb{R}_+$ , there exists  $C(\alpha) \in \mathbb{R}_+$  s.t.

$$V_n \leq C(\varepsilon) a^{\varepsilon n}.$$

┘

*Proof:* Define similarly  $u_n$  be the product of primes  $p \in \mathbf{Prime}$  s.t.  $v_p(a^n - b^n) = 1$ . And let  $a^n - b^n = u_n v_n$ , then clearly  $U_n | u_n$ . So it suffices to show for  $u_n$ .

Because  $a^n - b^n - u_n v_n = 0$ , by abc-conjecture, for any  $\varepsilon \in \mathbb{R}_+$ ,

$$a^n = \max\{a^n, b^n, u_n v_n\} \leq C(\varepsilon) \left( \prod_{p|abu_n v_n} p \right)^{1+\varepsilon} \leq C'(\varepsilon) (u_n \sqrt{v_n})^{1+\varepsilon} \leq C'(\varepsilon) (a^n / \sqrt{v_n})^{1+\varepsilon}.$$

Which is equivalent to that  $v_n \leq C(\varepsilon) a^{\varepsilon n}$  (by shrinking  $\varepsilon$ ).  $\square$

Now by (3.3.2.12) and (35.5.8.11),

$$U_n \geq |\Phi_n(a, b)| / |V_n| \geq e^{c\varphi(n)} / (c_1(\varepsilon) a^{\varepsilon n}).$$

Then if

$$c\varphi(n) - \varepsilon n \log(n) - c_2(\varepsilon) \geq \log n,$$

we will have  $U_n \geq abn$ . This holds if  $\varphi(n)$  is bigger than a fraction of  $n$ . In view of (35.1.2.12), this is true for a positive portion of  $n$ .

Then by (35.5.8.10),  $\#\{p \in \mathbf{Prime} : p < X, \alpha^{p-1} \not\equiv 1 \pmod{p^2}\}$  is bounded below by  $\Omega(\log X)$ .  $\square$

**Thm. (35.5.8.12) [Wieferich's Criterion for Elliptic Curves, Silverman].** If the abc conjecture is true, then for any  $E/\mathbb{Q}$  with  $j(E) \notin \{0, 1728\}$  and  $P \in E(\mathbb{Q})$  a point of infinite order, there exists  $C(E, P) \in \mathbb{R}_+$  s.t.

$$\{p \in \mathbf{Prime} : p < X, [N_p]P \not\equiv O \pmod{p^2}\} \geq C(E, P) \sqrt{\log X}$$

for  $X$  large, where  $N_p = \#\mathcal{E}(\mathbb{F}_p)$ .  $\lrcorner$

*Proof:* Cf. [Sil88]P228.  $\square$

### Carmichael Numbers

**Def. (35.5.8.13) [Carmichael Numbers].**  $n \in \mathbb{Z}_+$  is called a **Carmichael number** if  $n \notin \mathbf{Prime}$  and  $n | a^n - a$  for any  $a \in \mathbb{Z}$ . For  $X \in \mathbb{R}_+$ , let  $\text{Car}(X)$  denote the cardinality of Carmichael numbers not exceeding  $X$ .  $\lrcorner$

**Thm. (35.5.8.14) [Korselt].** For  $n \in \mathbb{Z}_+$ ,  $n | a^n - a$  for all  $a \in \mathbb{Z}$  iff  $n$  is square-free and  $p-1 | n-1$  for any  $p \in \mathbf{Prime}, p | n$ .  $\lrcorner$

*Proof:* Suppose  $n$  is a Carmichael number. Then  $n$  is square-free: For  $p | n$ , let  $n = p^k n'$ , then  $(1+p)^{p^k n'} \equiv 1 + p \pmod{p^k}$ , but  $p^{k+1} | (1+p)^{p^k n'} - 1$ , so  $p^k | p$ , and  $k = 1$ . And let  $g$  be a primitive root for  $p$ , then  $g^n \equiv g \pmod{n}$ , thus  $p-1 | n-1$ .  $\square$

The converse is obvious.  $\square$

**Cor. (35.5.8.15).** Any Carmichael number  $n \in \mathbb{Z}_+$  is odd, and has at least three prime divisors.  $\lrcorner$

*Proof:* If  $n$  is even, because  $n$  is square-free (35.5.8.14),  $n$  has an odd prime divisor  $p \in \mathbf{Prime}$ , so  $p-1 | n-1$ , contradiction. If  $n = pq$ , then  $p-1 | pq-1, q-1 | pq-1$ , thus  $p-1 | q-1 | p-1$ , and  $p = q$ , contradiction.  $\square$

**Thm. (35.5.8.16) [Alford-Granville-Pomerance].** For each  $E \in \mathcal{E}(35.5.8.2)$  and  $B \in \mathcal{B}(35.5.7.22)$ , then  $\text{Car}(X) \geq X^{EB}$  for  $X$  sufficiently large.  $\lrcorner$

*Proof:* Because of (35.5.8.3), it suffices to show that  $\text{Car}(X) \geq X^{EB-\varepsilon}$  for any  $\varepsilon \in \mathbb{R}_+$  and  $X$  sufficiently large. □

**Cor. (35.5.8.17)** [Alford-Granville-Pomerance/Harman].  $(0, 1 - (2\sqrt{e})^{-1}) \subset \mathcal{E}(35.5.8.5)$ , and  $(0, 5/12) \in \mathcal{B}$  by (35.5.7.23), so  $\text{Car}(X) > X^{2/7}$  for  $X$  sufficiently large. In fact, Harman proved that  $\text{Car}(X) > X^{1/3}$  for  $X$  sufficiently large. ┘

## 9 Prime Ideals

**Def. (35.5.9.1)** [Prime Ideal Counting Functions]. For  $F \in \mathbf{NField}$ , denote

$$\pi(X; F) = \#\{\mathfrak{p} \in \Sigma_F^{\text{fin}} : \|\mathfrak{p}\| \leq X\}.$$
┘

**Thm. (35.5.9.2)** [Prime Ideal Theorem, Landau]. For  $F \in \mathbf{NField}$ , there exists  $c_F \in \mathbb{R}_+$  s.t.

$$\pi(X; F) = \text{Li}(X) + O\left(\frac{X}{\exp(c_F \sqrt{\log X})}\right).$$
┘

*Proof:* □

## 10 Others

**Prop. (35.5.10.1)**. For any  $p \in \mathbf{Prime}_{\geq 5}$ , there exists  $P \in \mathbf{Prime}, \ell \in \mathbf{Prime}_{\geq 3}, m, r \in \mathbb{Z}_+$  s.t.  $P > p$ ,  $\ell^r \parallel (P - 1)$ ,  $\ell^r = 2m + 1$ , and

$$\frac{P}{p} \leq \frac{2m+1}{m+1} - \frac{m}{m+1} \cdot \frac{1}{p}.$$
┘

*Proof:* Cf. [Serre's Modularity Conjecture, the Level One Case]P582. □

**Conj. (35.5.10.2)** [Artin's Conjecture on Primitive Roots]. For any  $n \in \mathbb{Z}_+ \setminus (\mathbb{Z}_+)^2$ , there exists  $A(n) > 0.35 \in \mathbb{R}_+$  s.t.

$$\#\{p \in \mathbf{Prime} \mid p \leq X, \text{ord}_p(n) = p - 1\} \sim A(n) \frac{X}{\log X}, \quad X \rightarrow \infty$$
┘

*Proof:* □

**Prop. (35.5.10.3)** [Fouvry]. There exists  $C \in \mathbb{R}_+$  s.t. when  $X \in \mathbb{R}_+$  is large,

$$\#\{\ell \in \mathbf{Prime} \mid \ell \leq X, P_{\max}(\ell - 1) \geq \ell^{0.668}\} \geq C \frac{X}{\log X}.$$
┘

*Proof:* Cf.[Fouvry, Théorème de Brun-Titchmarsh; application au théorème de Fermat], and [Baker and Harman, The Brun-Titchmarsh Theorem on average].  $\square$

**Cor. (35.5.10.4).** When  $n \in \mathbb{Z}_+$  is large, there exists  $r \in \mathbb{Z}_+$  s.t.  $r \leq \log^3 n$  and  $\text{ord}_r(n) > \log^2 n$ .  $\lrcorner$

*Proof:* Notice by (35.5.10.3), for any  $\varepsilon \in \mathbb{R}_+$ , when  $n$  is large, there exists at least  $\Omega(\log^{3+\frac{\varepsilon}{2}} n)$  primes  $\ell \in \mathbf{Prime}$  s.t.  $P_{\max}(\ell - 1) \geq \ell^{2/3}$  and  $\log^2 n < \ell < \log^{3+\varepsilon} n$ . Then  $\text{ord}_\ell(n) \geq \log^2 n$  or  $\ell | n^k + 1$  for some  $k \leq \log^{1+\frac{\varepsilon}{3}} n$ . The latter case happens only for  $O(\log^{3+\frac{2\varepsilon}{3}} n)$  many  $\ell$ . So we can find some  $\ell < \log^{3+\varepsilon} n$  s.t.  $\text{ord}_\ell(n) \geq \log^2 n$ .  $\square$

## 35.6 Gaps between Primes

References are [I-K04, H-W08, Ten15].

**Notation (35.6.0.1).**

- Let  $F \in \mathbf{NField}$ .
- For  $n \in \mathbb{Z}_+$ , let  $p_n$  be the  $n$ -th smallest prime number.
- Use notations on Elementary Number Theory defined in [Elementary Number Theory](#).

┘

### 1 Small Gaps between Primes

References are [GPY09, Zha14, May15].

**Def. (35.6.1.1) [Admissible Sets].** An **admissible set** of numbers  $H = \{h_1, \dots, h_k\} \subset \mathbb{N}$  s.t. for any  $p \in \mathbf{Prime}$ , there exists  $a_p \in \mathbb{Z}$  s.t.  $a_p \not\equiv h_i \pmod{p}$  for any  $i$ .

┘

**Example (35.6.1.2) [Admissible Sets].**

- The set  $H = \{0, 2, 6, 8, 12\}$  is an admissible set [\(35.6.1.1\)](#) with cardinality 5.
- The set  $H = \{0, 10, 12, 24, 28, 30, 34, 42, 48, 52, 54, 64, 70, 72, 78, 82, 90, 94, 100, 112, 114, 118, 120, 124, 132, 138, 148, 154, 168, 174, 178, 180, 184, 190, 192, 202, 204, 208, 220, 222, 232, 234, 250, 252, 258, 262, 264, 268, 280, 288, 294, 300, 310, 322, 324, 328, 330, 334, 342, 352, 358, 360, 364, 372, 378, 384, 390, 394, 400, 402, 408, 412, 418, 420, 430, 432, 442, 444, 450, 454, 462, 468, 472, 478, 484, 490, 492, 498, 504, 510, 528, 532, 534, 538, 544, 558, 562, 570, 574, 580, 582, 588, 594, 598, 600\}$  is an admissible set [\(35.6.1.1\)](#) with cardinality 105.

┘

**Conj. (35.6.1.3) [Prime  $k$ -Tuples Conjecture, Hardy-Littlewood].** Let  $H = \{h_1, \dots, h_k\} \subset \mathbb{N}$  be an admissible set [\(35.6.1.1\)](#), and let  $\pi(X; H)$  denotes the number of integers  $n \in [X]_+$  s.t.  $\{n - h_1, \dots, n - h_k\} \subset \mathbf{Prime}$ , and for each  $p \in \mathbf{Prime}$ , let  $m(p)$  be the cardinality of the image of  $H$  in  $\mathbb{Z}/(p)$ , then we have

$$\pi(X; H) \sim B \frac{X}{\log^k X}, \text{ where } B = \prod_{p \in \mathbf{Prime}} \left(1 - \frac{m(p)}{p}\right) \left(1 - \frac{1}{p}\right)^{-k}.$$

In particular, there exists infinitely many  $n \in \mathbb{Z}_+$  s.t.  $\{n + h_1, \dots, n + h_k\} \subset \mathbf{Prime}$ .

┘

*Proof:*

□

**Conj. Cor. (35.6.1.4) [Density of Twin Primes].** If  $m \in 2\mathbb{Z}_+$ , then uniformly in  $X \in \mathbb{R}_+$ , we have

$$\#\{p \in [X]_+ \mid p, p + m \in \mathbf{Prime}\} \sim C \left( \prod_{p \in S(m) \setminus \{2\}} \frac{p-1}{p-2} \right) \frac{X}{\log^2 X},$$

where

$$C = 2 \prod_{p \in \mathbf{Prime}_{\geq 3}} \left(1 - \frac{1}{(p-1)^2}\right),$$

called the **twin prime constant**. This is compatible with the heuristic in [\(35.2.4.4\)](#).

┘

*Proof:*

□

**Thm& Conj.Cor.(35.6.1.5) [Selberg's Upper Bound on Prime  $k$ -Tuples].** Situation as in (35.6.1.3), we have

$$\pi(X; H) \leq 2^k k! B \frac{X}{\log^k X} \left( 1 + O_k \left( \frac{\log_{(2)} X}{\log X} \right) \right).$$

┘

*Proof:* Use Selberg's sieve (35.2.3.2). When  $p$  is sufficiently large, we have  $m(p) = k$ , so this is a  $k$ -dimensional sieve, and the sieve conditions (35.2.3.4) (35.2.3.5) are satisfied with

- $P = \prod_{p \in \text{Prime}_{\leq \sqrt{X}}} p$ .
- $g(p) = m(p)p^{-1}$ .
- $D = X / \log^{k-1} X$ .

(Notice the condition  $|r_d(\mathcal{A})| \leq g(d)d$  is only satisfied for  $d$  large, but the proof of (35.2.3.5) can be easily modified to go through). Thus the assertion follows. □

**Thm& Conj.Cor.(35.6.1.6) [Selberg's Upper Sieve for Twin Primes].** If  $m \in 2\mathbb{Z}_+$ , then uniformly in  $X \in \mathbb{R}_{\geq 3}$  we have

$$\#\{p \in [X]_+ | p, p+m \in \text{Prime}\} \leq C \left( \prod_{p \in S(m) \setminus \{2\}} \frac{p-1}{p-2} \right) \frac{X}{\log^2 X} \left( 4 + O \left( \frac{\log_{(2)} X}{\log X} \right) \right),$$

where  $C$  is the twin prime constant (35.6.1.4). ┘

*Proof:* Cf. [Sieve method, Ford] P50 ?.

□

**Remark (35.6.1.7).** Bombieri-Friedlander-Iwaniec showed that 4 can be changed to 3.5 but with error term non-uniform in  $k$ . And if we assume the Elliott-Halberstam conjecture, then we can change 4 to  $2 + o(1)$ . ┘

**Thm& Conj.Cor.(35.6.1.8).** For any  $\varepsilon \in \mathbb{R}_+$ , there exists  $C(\varepsilon) \in \mathbb{R}_+$  s.t.

$$\#\{p \in \text{Prime}_{\leq X} | p+2 \text{ not divisible by primes } \leq X^\varepsilon\} \leq C(\varepsilon) \frac{X}{(\log X)^2}$$

┘

*Proof:* ?

□

**Thm& Conj.Cor.(35.6.1.9) [Chen [Che73]].** There exists  $C \in \mathbb{R}_+$  s.t. for  $X \in \mathbb{R}_{\geq 3}$ ,

$$\#\{p \in \text{Prime}_{\leq X} | p+2 \in \text{Prime} \text{ or } p+2 = p_1 p_2, p_1, p_2 \in \text{Prime}_{> X^{3/11}}\} \geq C \frac{X}{(\log X)^2}$$

┘

*Proof:* ?

□

**Prop. (35.6.1.10) [Sieberg's Sieve Method].** Given an admissible set (35.6.1.2)  $H = \{h_1, \dots, h_k\} \subset \mathbb{N}$ , for any  $N \in \mathbb{Z}_+$  and  $\rho \in \mathbb{R}_+$ , consider the sum

$$S(N, \rho) = \sum_{N \leq n < 2N} \left( \sum_{i=1}^k \mathbf{1}_{\text{Prime}}(n + h_i) - \rho \right) \omega(n),$$

where  $\omega_n$  are chosen non-negative weights.

If we can show that  $S(N, \rho) > 0$  for any  $N$ , then there exists infinitely many  $n$  s.t. there are at least  $\lfloor \rho + 1 \rfloor$  many primes in  $n + H$ .

This procedure only works if we can find the weights  $\omega_n$  that is suitably concentrated on integers  $n$  s.t.  $n + h_i \in \text{Prime}$ , but at the same time is simple enough that we can calculate this expectation unconditionally.  $\lrcorner$

**Prop. (35.6.1.11) [GPY's Sieve Weights, Goldston-Pintz-Yildirim [GPY09]].** Situation as in (35.6.1.10), GPY's sieve weights are chosen s.t.

$$\omega(n) = \left( \sum_{d \mid \prod_{i=1}^k (n+h_i), d < R} \mu(d) \left( \log \frac{R}{d} \right)^{k + \lfloor \sqrt{k} \rfloor} \right)^2.$$

where  $R$  is usually chosen to be  $R = N^b$  for  $b \in (0, \frac{1}{2})$ .  $\lrcorner$

**Prop. (35.6.1.12) [Maynard's Sieve Weights].** Situation as in (35.6.1.10), Maynard's sieve weights are chosen s.t.

$$\omega(n) = \left( \sum_{d_i \mid n+h_i} \lambda_{d_1, \dots, d_k} \right)^2,$$

and  $\lambda_{d_1, \dots, d_k}$  are chosen real numbers.

Then we choose  $\textcolor{red}{?}$ .  $\lrcorner$

*Proof:* Cf. [Small Gaps between Primes]P388.  $\textcolor{red}{?}$   $\square$

**Prop. (35.6.1.13) [Maynard [May15]].** Suppose the primes have level of distribution  $\theta \in \mathbb{R}_+$  (35.5.7.27).

Let  $H = \{h_1, \dots, h_k\}$  be an admissible set of cardinality  $k$ . Let  $I_k(F)$  and  $J_k^{(m)}(F)$  be defined as in (35.6.1.12) and let  $\mathcal{S}_k$  be the set of continuous functions  $F$  supported on  $\{(x_1, \dots, x_k) \in [0, 1]^k, \sum_i x_i \leq 1\}$  with  $I_k(F) \neq 0, J_k^{(m)}(F) \neq 0$  for any  $m$ . Define

$$M_k = \sup_{F \in \mathcal{S}_k} \frac{\sum_{m=1}^k J_k^{(m)}(F)}{I_k(F)}, \quad r_k = \lfloor \frac{\theta M_k}{2} \rfloor,$$

then there exists infinitely many  $n \in \mathbb{Z}_+$  s.t. at least  $r_k$  of numbers  $\{n + h_i\}$  are primes. In particular,

$$\varliminf_{n \rightarrow \infty} (p_{n+r_k-1} - p_n) \leq \max_{1 \leq i, j \leq k} (h_i - h_j).$$

$\lrcorner$

*Proof:* Cf. [Small Gaps between Primes]P389.  $\textcolor{red}{?}$   $\square$

**Lemma (35.6.1.14) [Maynard [May15]].** Let  $k \in \mathbb{Z}_+$  and  $M_k$  defined as in (35.6.1.13), then

- $M_5 > 2$ .
- $M_{105} > 4$ .
- If  $k$  is sufficiently large, then  $M_k > \log k - 2 \log \log k - 2$ .

┘

*Proof:* Cf.[Small Gaps between Primes]P390.?

□

**Thm& Conj.Cor.(35.6.1.15)** [A Positive Portion of Prime  $k$ -Tuple Conjectures are True, Maynard[May15]]. For any  $m \in \mathbb{Z}_+$ , there exists  $C(m) \in \mathbb{R}_+$  s.t. when  $r$  is large, for any set  $A = \{a_1, \dots, a_r\} \subset \mathbb{N}$  of cardinality  $r$ , at least a  $C(m)$ -portion of  $m$ -subsets of  $A$  are admissible and satisfies the prime  $k$ -tuples conjecture(35.6.1.3). ┘

*Proof:* Use(35.6.1.13) and a counting argument: Let  $k = \lceil 1000m^2e^{4m} \rceil$ , then each admissible subset of cardinality  $k$  contains a  $m$ -subset satisfying the prime  $k$ -tuple conjecture. Notice for any set  $A$  of cardinality  $r$ , we can choose an admissible subset  $A'$  of cardinality

$$s = r \prod_{p < k} \left(1 - \frac{1}{p}\right).$$

So by counting argument, there exists at least

$$\frac{\binom{s}{k}}{\binom{s-m}{k-m}} \gg_m s^m \gg_m r^m$$

many  $m$ -subsets of  $A'$  of cardinality  $m$ . And there are  $\binom{r}{m} \leq r^m$  many  $m$ -subsets of  $A$ , so the assertion follows. □

**Thm. (35.6.1.16)**[Goldston-Pintz-Yildirim[GPY09]/Zhang[Zha14]/Maynard[May15]/Polymath[Pol14]].

$$\varliminf_{n \rightarrow \infty} (\mathbf{p}_{n+1} - \mathbf{p}_n) \leq 246.$$

┘

*Proof:* ?

We only prove  $\varliminf_{n \rightarrow \infty} (\mathbf{p}_{n+1} - \mathbf{p}_n) \leq 600$  using(35.6.1.13). By Bombieri-Vinogradov(35.5.7.31),  $\theta$  can be  $1/2 - \varepsilon$  for any  $\varepsilon \in \mathbb{R}_+$ . So by(35.6.1.14), we can choose  $\theta M_k/2 > 1$ . Then by(35.6.1.13),

$$\varliminf_{n \rightarrow \infty} (\mathbf{p}_{n+1} - \mathbf{p}_n) \leq \max_{1 \leq i, j \leq 105} (h_i - h_j),$$

where  $H = \{h_1, \dots, h_{105}\}$  is any admissible set(35.6.1.1). By(35.6.1.2), we can choose  $H$  s.t.  $\max_{1 \leq i, j \leq 105} (h_i - h_j) = 600$ . Thus the assertion follows. □

**Thm. (35.6.1.17)**[Maynard[May15]/Polymath[Pol14a]]. There exists  $C \in \mathbb{R}_+$  s.t. for any  $m \in \mathbb{Z}_+$ ,

$$\varliminf_{n \rightarrow \infty} (\mathbf{p}_{n+m} - \mathbf{p}_n) \leq Ce^{3.815m}.$$

┘

*Proof:* ?

We only prove  $\lim_{n \rightarrow \infty} (\mathfrak{p}_{n+m} - \mathfrak{p}_n) \leq Cm^3 e^{4m}$ , using the same proof as that of (35.6.1.16). By Bombieri-Vinogradov (35.5.7.31) and (35.6.1.14),

$$\frac{\theta M_k}{2} \geq \left(\frac{1}{4} - \varepsilon\right)(\log k - 2 \log_{(2)}(k) - 2) > m$$

for  $k \geq 1000m^2 e^{4m}$ .

Take  $X = \lceil 1000m^2 e^{4m} \rceil$  and take the admissible set  $H = \{\mathfrak{p}_{\pi(X)+1}, \dots, \mathfrak{p}_{\pi(X)+X}\}$ , then this set has diameter  $\mathfrak{p}_{\pi(X)+X} - \mathfrak{p}_{\pi(X)+1} \ll X \log X \ll m^3 e^{4m}$  (35.5.7.13). Thus by (35.6.1.13), the assertion follows.  $\square$

**Thm& Conj.Cor. (35.6.1.18)** [Maynard[May15]/Polymath[Pol14]]. If the Elliott-Halberstam conjecture (35.5.7.27) holds, then

$$\lim_{n \rightarrow \infty} (\mathfrak{p}_{n+1} - \mathfrak{p}_n) \leq 12.$$

$$\lim_{n \rightarrow \infty} (\mathfrak{p}_{n+2} - \mathfrak{p}_n) \leq 600.$$

And assuming the generalized Elliott-Halberstam conjecture ?, we have

$$\lim_{n \rightarrow \infty} (\mathfrak{p}_{n+1} - \mathfrak{p}_n) \leq 6.$$

which due to the parity phenomenon seems to be the best result that can be obtained using a first moment method.  $\lrcorner$

*Proof:* The proof is the same as that of (35.6.1.16).

For the last assertion ? .  $\square$

## 2 Large Gaps between Primes

**Thm. (35.6.2.1)** [Chebyshev]. For any  $n \in \mathbb{Z}_+$ , there is always a prime  $p \in \text{Prime}$  s.t.  $n < p \leq 2n$ .  $\lrcorner$

*Proof:* ?  $\square$

**Conj. (35.6.2.2)** [Cramér].

$$\overline{\lim}_{n \rightarrow \infty} \frac{\mathfrak{p}_{n+1} - \mathfrak{p}_n}{\log^2 \mathfrak{p}_n} = 1.$$

In particular, the largest gap between consecutive primes  $\leq X$  is  $\Theta((\log X)^2)$ .  $\lrcorner$

*Proof:*  $\square$

**Conj.Cor. (35.6.2.3)** [Oppermann]. For any  $n \in \mathbb{Z}_{\geq 2}$ ,

$$\pi(n^2 - n) < \pi(n^2) < \pi(n^2 + n).$$

$\lrcorner$

**Thm& Conj.Cor. (35.6.2.4)** [Bounds on Gaps between Primes, Montgomery/Huxley/Baker-Harman-Pintz]. There exists an effective constant  $x_0 \in \mathbb{R}_+$  s.t. for any  $X \in \mathbb{R}_{>x_0}$ ,  $\text{Prime} \cap [X - X^{0.525}, X] \neq \emptyset$ .

In particular,  $\mathfrak{p}_{n+1} - \mathfrak{p}_n \ll \mathfrak{p}_{n+1}^{0.525}$ .  $\lrcorner$

*Proof:* Cf.[The difference between consecutive primes, 2].? □

**Thm& Conj.Cor.(35.6.2.5)** [Large Gaps between Primes, Backlund/Brauer-Zeitz/Westzynthius/Erdős/Rankin/Schönhage/-Maier-Pomerance/Pintz/Ford-Green-Konyagin-Maynard-Tao]. There exist  $C \in \mathbb{R}_+$  s.t. when  $X \in \mathbb{R}_+$  is large,

$$\max_{p_n \leq X} (p_{n+1} - p_n) \geq C \frac{\log X \log_{(2)}(X) \log_{(4)}(X)}{\log_{(3)}(X)}.$$

┘

*Proof:* Cf.[Long Gaps between Primes, 2018]. □

## 35.7 Circle Method(Hardy-Ramanujan)

References are [H-L23, I-K04, Nat96] and <https://terrytao.wordpress.com/2015/03/30/254a-notes-8-the-hardy-littlewood-circle-method-and-vinogradovs-theorem/#saw>.

**Remark (35.7.0.1) [Equidistribution Principle].** An exponential sum  $\sum_n e^{2\pi i f(n)}$  or a bilinear sum  $\sum_m \sum_n a_m b_n e^{2\pi i f(m,n)}$  involving a structured phase function  $f$  should exhibit non-trivial cancellation, unless there are obvious algebraic reason that such a cancellation cannot occur.

There are rigorous version called Ratner's theorem, Cf. <https://terrytao.wordpress.com/2007/09/29/ratners-theorems/>. ?

**Prop. (35.7.0.2).** For  $f, g, h : \mathbb{Z}_+ \rightarrow \mathbb{C}$  and  $\theta \in \mathbb{R}$ , denote

$$\mathcal{F}f(\theta) = \sum_{n \in \mathbb{Z}_+} f(n) e^{-2\pi i n \theta}.$$

Then

$$\|f\|^2 = \int_{\mathbb{R}/\mathbb{Z}} |\mathcal{F}f(\theta)|^2 d\theta.$$

And for any  $N \in \mathbb{Z}_+$ , we have

$$\sum_{a,b,c \in \mathbb{Z}_+, a+b+c=N} f(a)g(b)h(c) = \int_{\mathbb{R}/\mathbb{Z}} \mathcal{F}f(\theta) \mathcal{F}g(\theta) \mathcal{F}h(\theta) e^{2\pi i N \theta} d\theta.$$

*Proof:*

**Cor. (35.7.0.3).** Situation as in (35.7.0.2), we have

$$\left| \sum_{a,b,c \in \mathbb{Z}_+, a+b+c=N} f(a)g(b)h(c) \right| \leq \|f\|^2 \|g\|^2 \sup_{\theta} |\mathcal{F}h(\theta)|.$$

**Remark (35.7.0.4).** Usually one estimates the major arc using Siegel-Walfisz type estimates, and estimates the minor arc by turning it into a bilinear sum.

### 1 Exponential Sums over Primes(Vinogradov)

**Def. (35.7.1.1) [W-Trick].** For  $N \in \mathbb{Z}_+$ ,

$$\Lambda(N) \approx \frac{W}{\phi(W)} \mathbf{1}_{(n,W)=1} = \sum_{q|W} \sum_{a \in (\mathbb{Z}/(q))^*} \frac{\mu(q)}{\phi(q)} e^{2\pi i \frac{an}{q}}, \text{ where } W = \prod_{p \in \text{Prime} \cap [w(N)]_+} p,$$

where  $w(N)$  is a slowly-growing function.

This trick is related to Green-Tao's work relating linear patterns in **Prime**. ?

**Minor Arcs**

**Prop. (35.7.1.2) [Exponential Sums for Minor Arcs].** If  $q \in \mathbb{Z}_+, a \in \mathbb{Z}$  s.t.  $(a, q) = 1$  and  $\alpha \in \mathbb{R}_+$  s.t.  $\left| \alpha - \frac{a}{q} \right| \leq \frac{1}{q^2}$ , then

- For any  $M \in \mathbb{Z}_+$  and  $X \in \mathbb{R}_+$ , we have

$$\sum_{m \in [M]_+} \left| \sum_{n \in [X/m]_+} e^{2\pi i \alpha m n} \right| \leq 6(M + Xq^{-1} + 2q) \log(3qM).$$

- For any sequence of intervals  $(I_m)_{m \in \mathbb{Z}} \subset \mathbb{Z}_+$  and  $M, N \in \mathbb{Z}_+$ , we have

$$\sum_{|m| \leq M} \left| \sum_{n \in [N]_+, n \in I_m} e^{2\pi i \alpha m n} \right| \leq 4(MNq^{-1} + M + N + 2q) \log(3q).$$

┘

*Proof:* If  $q = 1$  the assertion clearly holds. So we assume that  $q \geq 2$ .

1: Using (35.3.3.1), we have

$$\sum_{|m| \leq M} \left| \sum_{n \in [X/m]_+} e^{2\pi i \alpha m n} \right| \leq \sum_{|m| \leq M} \min \left( \frac{X}{m}, \frac{1}{2\{\{\alpha m\}\}} \right).$$

Notice that for any  $\lfloor q/2 \rfloor$ -many consecutive integers  $\{m, \dots, m + \lfloor q/2 \rfloor\}$ ,  $\{\{\alpha m\}\}$  are all distinct and  $\frac{1}{2q}$ -spaced, so

$$\sum_{n \in [M]_+} \min \left( \frac{X}{m}, \frac{1}{2\{\{\alpha m\}\}} \right) \leq (1 + 3Mq^{-1}) \sum_{l \in [\frac{q}{2}]_+} ql^{-1} + 3Xq^{-1} \sum_{l \in [\frac{2M}{q}]_+} l^{-1} \leq 6(M + Xq^{-1} + 2q) \log(3qM).$$

2; Using (35.3.3.1), we have

$$\sum_{|m| \leq M} \left| \sum_{n \in [N]_+, n \leq x(m)} e^{2\pi i \alpha m n} \right| \leq \sum_{|m| \leq M} \min \left( N, \frac{1}{2\{\{\alpha m\}\}} \right).$$

Notice that for any  $\lfloor q/2 \rfloor$ -many consecutive integers  $\{m, \dots, m + \lfloor q/2 \rfloor\}$ ,  $\{\alpha m\}$  are all distinct and  $\frac{1}{2q}$ -spaced. so

$$\sum_{|m| \leq M} \min \left( N, \frac{1}{2\{\{\alpha m\}\}} \right) \leq (1 + 6Mq^{-1})(N + \sum_{l \in [q]_+} ql^{-1}) \leq 4(MNq^{-1} + M + N + q) \log(3q)$$

□

**Thm. (35.7.1.3) [Bilinear Forms for Minor Arcs (Type II Estimates)].** If  $q \in \mathbb{Z}_+, a \in \mathbb{Z}$  s.t.  $(a, q) = 1$  and  $\theta \in \mathbb{R}_+$  s.t.  $\left| \theta - \frac{a}{q} \right| \leq \frac{1}{q^2}$ , then for any  $M, N \in \mathbb{Z}_+, (\alpha_m)_{m \in [M]_+}, (\beta_n)_{n \in [N]_+}$  and any interval  $I \subset [1, MN]$ , we have

$$\sum_{mn \in I} \alpha_m \beta_n e^{2\pi i m n} \ll \|\alpha\| \|\beta\| (MNq^{-1} + M + N + 2q)^{1/2} \log^{1/2}(3q)$$

┘

*Proof:* By Cauchy's inequality,

$$\begin{aligned}
 \left| \sum_{mn \in I} \alpha_m \beta_n e^{2\pi i mn} \right|^2 &\leq \|\alpha\|^2 \sum_m \left| \sum_{mn \in I} \beta_n e^{2\pi i mn} \right|^2 \\
 &= \|\alpha\|^2 \sum_{n_1, n_2} \left| \beta_{n_1} \beta_{n_2} \sum_{mn_1 \in I, mn_2 \in I} e^{2\pi i (n_1 - n_2)m} \right| \\
 &\leq \|\alpha\|^2 \sum_{n_1} |\beta_{n_1}|^2 \sum_{n_2} \left| \sum_{mn_1 \in I, mn_2 \in I} e^{2\pi i (n_1 - n_2)m} \right| \\
 (35.7.1.2) \quad &\ll \|\alpha\|^2 \|\beta\|^2 (MNq^{-1} + M + N + 2q) \log(3q).
 \end{aligned}$$

□

**Cor. (35.7.1.4) [Bilinear Forms for Minor Arcs].** Let  $q \in \mathbb{Z}_+$ ,  $a \in \mathbb{Z}$  s.t.  $(a, q) = 1$  and  $\alpha \in \mathbb{R}_+$  s.t.  $\left| \alpha - \frac{a}{q} \right| \leq \frac{1}{q^2}$ . Suppose  $M, N \in \mathbb{Z}_+$ ,  $(\alpha_m)_{m \in \mathbb{Z}_+}, (\beta_n)_{n \in \mathbb{Z}_+}$  satisfies:

$$\|\alpha \mathbf{1}_X\| \leq X\Delta, \quad \|\beta \mathbf{1}_X\| \leq X\Delta,$$

for any  $X$ . Then we have

$$\sum_{\substack{m, n \in \mathbb{Z}_+ \\ m > M, n > N, mn \leq X}} \alpha_m \beta_n e^{2\pi i \alpha mn} \ll \left( \frac{X}{\sqrt{M}} + \frac{X}{\sqrt{N}} + \frac{X}{\sqrt{q}} + \sqrt{q} \right) \log(3q) \log^2 X \Delta.$$

for any  $X \in \mathbb{R}_+$ . ┘

*Proof:* We divide  $[M, X] \times [N, X]$  into dyadic intervals  $[2^{i-1}, 2^i] \times [2^{j-1}, 2^j]$ , where  $2^i \geq M, 2^j \geq N$  and  $2^{i+j} \leq 4X$ . Then on each of these, the contribution is bounded by (35.7.1.3) by

$$X^{1/2} \left( \frac{X}{q} + \frac{X}{2^i} + \frac{X}{2^j} + 2q \right)^{1/2} \log(3q) \Delta.$$

Summing them together, the assertion follows. □

**Thm. (35.7.1.5) [Exponential Sums over Primes for the Minor Arc, Vinogradov [Vin37]].** If  $q \in \mathbb{Z}_+, a \in \mathbb{Z}$  s.t.  $(a, q) = 1$  and  $\alpha \in \mathbb{R}_+$  s.t.  $\left| \alpha - \frac{a}{q} \right| \leq \frac{1}{q^2}$ , then there exists  $C_\alpha \in \mathbb{R}_+$  s.t. for  $X \in \mathbb{R}_+$ , we have

$$\begin{aligned}
 \left| \mathcal{E}_\Lambda(\alpha; X) \triangleq \sum_{n \in [X]_+} e^{2\pi i \alpha n} \Lambda(n) \right| &\leq C_\alpha \left( q + q^{1/2} X^{1/2} + q^{-1/2} X + X^{4/5} \right) \log(3qX) \log^2 X, \\
 \left| \mathcal{E}(\alpha; X) \triangleq \sum_{p \in \text{Prime} \cap [X]_+} e^{2\pi i \alpha p} \right| &\leq C_\alpha \left( q + q^{1/2} X^{1/2} + q^{-1/2} X + \frac{X}{e^{1/2} \sqrt{X}} \right), \\
 \left| \mathcal{E}_\mu(\alpha; X) \triangleq \sum_{n \in [X]_+} \mu(n) e^{2\pi i \alpha n} \right| &\leq C_\alpha \left( \frac{X}{\sqrt{q}} + \frac{X}{\log^A X} + q \right) \log(3qX) \log^3 X.
 \end{aligned}$$

┘

*Proof:* For  $\Lambda(n)$ , by Vaughan's identity (35.2.4.8), for  $M = X^{2/5}$ , we have

$$\mathcal{E}_\Lambda(\alpha; X) = \sum_{\substack{l, m \in \mathbb{Z}_+ \\ lm \leq X \\ m \leq M}} \mu(m) \log(l) e^{2\pi i \alpha lm} - \sum_{\substack{l, m, n \in \mathbb{Z}_+ \\ lmn \leq X \\ m, n \leq M}} \mu(m) \Lambda(n) e^{2\pi i \alpha lmn} + \sum_{\substack{l, m, n \in \mathbb{Z}_+ \\ lmn \leq X \\ m, n > M}} \mu(m) \Lambda(n) e^{2\pi i \alpha lmn} + O(M).$$

By (35.7.1.2), the first term is bounded by

$$\log X \sum_{m \in [M]_+} \left| \sum_{mn \leq X} e^{2\pi i \alpha mn} \right| \ll (Xq^{-1} + X^{2/5} + q) \log(3qX) \log X.$$

Similarly by (35.7.1.2), the second term is bounded by

$$\sum_{\substack{l, m, n \in \mathbb{Z}_+ \\ mk \leq X \\ m \leq M}} \mu(m) \left( \sum_{n|k, n \leq M} \Lambda(n) \right) e^{2\pi i \alpha mk} \ll \log X \sum_{m \in [M]_+} \left| \sum_{mk \leq X} e^{2\pi i \alpha mk} \right| \ll (Xq^{-1} + X^{2/5} + q) \log(3qX) \log X.$$

And by (35.7.1.4), the third term is bounded by

$$\sum_{\substack{m, k \in \mathbb{Z}_+ \\ m, k > M, mk \leq X}} \mu(m) \left( \sum_{n|k, n \geq M} \Lambda(n) \right) e^{2\pi i \alpha mk} \ll (X^{3/5} + Xq^{-1} + q)^{1/2} X^{1/2} \log^3 X.$$

Thus the assertion follows.

For  $\mu(n)$  the proof is similar (Cf. <https://terrytao.wordpress.com/2015/03/30/254a-notes-8-the-hardy-littlewood-circle-method-and-vinogradovs-theorem/#star>).

Using Vaughan's identity (35.2.4.8), for  $M = \log^{2A} X$ , we have

$$\mathcal{E}_\Lambda(\alpha; X) = - \sum_{\substack{l, m, n \in \mathbb{Z}_+ \\ lmn \leq X \\ m, n \leq M}} \mu(m) \mu(n) e^{2\pi i \alpha lmn} + \sum_{\substack{l, m, n \in \mathbb{Z}_+ \\ lmn \leq X \\ m, n > M}} \mu(m) \mu(n) e^{2\pi i \alpha lmn} + O(M).$$

By (35.7.1.2), the first term is bounded by

$$\sum_{k \in [M^2]_+} \left( \sum_{m, n \in [M]_+, mn=k} \mu(m) \mu(n) \right) \sum_{l \in [X/k]_+} e^{2\pi i \alpha kl} \ll 6(\log X + Xq^{-1} + 2q) \log(3q \log X) \log X$$

And by (35.7.1.4), the second term is bounded by

$$\left( \frac{X}{\log^A X} + \frac{X}{\sqrt{q}} + \sqrt{q} \right) \log(3q) \log^{3/2} X.$$

For  $\mathcal{E}(\alpha; X)$ , use Abel summation ?.

□

**Thm. (35.7.1.6) [Minor Arcs Exceptional Sums are Small].** Let  $X \in \mathbb{R}_{\geq 2}$ ,  $\delta \in \mathbb{R}$ ,  $\theta \in \mathbb{S}^1$  and  $I \subset [1, X]$  is an interval s.t.

$$\left| \sum_{n \in \mathbb{Z}_+ \cap I} \Lambda(n) e^{2\pi i \theta n} \right| \geq \delta X$$

or

$$\left| \sum_{n \in \mathbb{Z}_+ \cap I} \mu(n) e^{2\pi i \theta n} \right| \geq \delta X,$$

or

$$\left| \sum_{p \in \text{Prime} \cap I} e^{2\pi i \theta p} \right| \geq \delta \frac{X}{\log X},$$

then either  $X \ll \delta^{-O(1)}$ , or there exists  $q \in [\delta^{-2} \log^{O(1)} X]_+$  s.t.  $\{\{q\theta\}\} \leq \delta^{-5} \frac{\log^{O(1)} X}{X}$ .  $\lrcorner$

*Proof:* ? Cf. <https://terrytao.wordpress.com/2015/03/30/254a-notes-8-the-hardy-littlewood-circle-method-prop18>.  $\square$

### Major Arcs

**Thm. (35.7.1.7) [Major Arcs for  $\mu$ ].** For  $X \in \mathbb{R}_{\geq 2}$ ,  $\theta \in \mathbb{S}^1$ ,  $q \in \mathbb{Z}_+$  and any interval  $I \subset [1, X]$ , we have

$$\sum_{n \in \mathbb{Z}_+ \cap I} \mu(n) e^{2\pi i \theta n} \ll_A (q + X \{\{q\theta\}\}) \frac{X}{\log^A X}$$

for any  $A \in \mathbb{R}_+$ .  $\lrcorner$

*Proof:* It follows from Siegel-Walfisz (35.5.7.18) that for any  $a \in \mathbb{Z}$  we have

$$\sum_{n \in \mathbb{Z}_+ \cap I} \mu(n) e^{2\pi i \frac{an}{q}} \ll_A q \frac{X}{\log^A X}.$$

Suppose  $|q\theta - a| = \{\{q\theta\}\} = \alpha$ , then it follows from Abel summation that

$$\left| \sum_{n \in \mathbb{Z}_+ \cap I} \mu(n) e^{2\pi i \theta n} \right| \ll_A q \frac{X}{\log^A X} \left( 1 + 2\pi \frac{\alpha}{q} X \right).$$

$\square$

**Cor. (35.7.1.8) [Davenport(37)].** For any  $\theta \in \mathbb{S}^1$ ,  $X \in \mathbb{R}_{\geq 2}$  and any  $A \in \mathbb{R}_+$ , we have

$$\mathcal{E}_\mu(\theta; X) \ll_A \frac{X}{\log^A X} \quad (35.7.1.5).$$

$\lrcorner$

*Proof:* For  $Q \in \mathbb{Z}_+$ , there exists  $q \in [Q]_+$  and  $a \in \mathbb{Z}_+$  s.t.  $(a, q) \neq 1$  s.t.  $\left| \theta - \frac{a}{q} \right| \leq \frac{1}{qQ}$ . We use (35.7.1.7) when  $q \leq X/Q$  and (35.7.1.5) when  $X/Q < q \leq Q$ , to get

$$\mathcal{E}_\mu(\theta; X) \ll Q^{-1} X^2 \log^{-5A} X + \frac{X}{\log^A X} + Q^{1/2} X^{1/2} \log^3 X + Q^{1/2} \log^3 X.$$

Then by choosing  $Q = X \log^{-4A} X$ , the assertion follows.

Cf. [Davenport, some infinite series involving arithmetical functions, 2] or <https://terrytao.wordpress.com/2015/03/30/254a-notes-8-the-hardy-littlewood-circle-method-and-vinogradovs-theorem-fab>.  $\square$

**Thm. (35.7.1.9) [Major Arcs for  $\Lambda$ ].** For any interval  $I \subset [1, X]$ ,  $\theta \in \mathbb{S}^1$  and  $R \in \mathbb{R}_+$ , if we denote

$$\Lambda_R^\sharp(n) = - \sum_{d \in [R]_+, d|n} \mu(d) \log(d), \quad \Lambda_R^\flat = \Lambda - \Lambda_R^\sharp,$$

Then for any  $A \in \mathbb{R}_+$ , we have

$$\sum_{n \in I} \Lambda_R^\flat(n) e^{2\pi i \theta n} \ll_A \frac{X \log X}{\log^A R}.$$

The same holds for  $\Lambda_R^\sharp$  replaced by

$$\Lambda_R(n) = \sum_{d \in [R]_+, d|n} \mu(d) \log \left( \frac{R}{n} \right)$$

or more generally

$$\Lambda_{R,\eta}(n) = \log R \sum_{d|n} \mu(d) \eta \left( \frac{\log d}{\log R} \right)$$

where  $\eta : \mathbb{R} \rightarrow \mathbb{R}$  is a smooth function s.t.  $\eta(t) = 1 - t$  for  $t \leq 1/2$  or  $t \geq 1$ . ┘

*Proof:* The LHS equals

$$- \sum_{m \in [X/R]_+} \sum_{d > R, dm \in I} \mu(d) \log(d) e^{2\pi i m d \theta}.$$

It follows from Davenport's theorem (35.7.1.8) and Abel summation that

$$\sum_{n \in [X]_+} \mu(n) \log(n) e^{2\pi i \theta n} X \ll_A \frac{X}{\log^A X}$$

uniformly in  $\theta$ . Thus

$$\begin{aligned} - \sum_{m \in [X/R]_+} \sum_{d > R, dm \in I} \mu(d) \log(d) e^{2\pi i m d \theta} &\ll_A \sum_{m \in [X/R]_+} X m^{-1} \log^{-A}(X m^{-1}) \\ &\ll_A X \log^{-A} R \sum_{m \in [X/R]_+} m^{-1} \\ &\ll_A \frac{X \log X}{\log^A R}. \end{aligned}$$

For  $\Lambda_{R,\eta}$ , Cf. [https://terrytao.wordpress.com/2015/03/30/254a-notes-8-the-hardy-littlewood-circle-meth?](https://terrytao.wordpress.com/2015/03/30/254a-notes-8-the-hardy-littlewood-circle-method/)  
#leth? □

**Cor. (35.7.1.10) [Bounding  $\Lambda_R^\sharp$ ].** Situation as in (35.7.1.9), we also have

$$|\Lambda_R^\sharp(n)| \leq \tau(n) \log R.$$

In particular, for  $X \in \mathbb{R}_+$ , we have

$$\sum_{n \in [X]_+} \Lambda_R^\sharp(n)^2 \ll \log^2 R X \log^3 X, \quad \sum_{n \in [X]_+} \Lambda(n)^2 \ll X \log^5 X$$

by (35.1.3.12). ┘

**Thm.(35.7.1.11) [Another Major Arc Approximation for  $\Lambda$ ].** Let  $X \in \mathbb{R}_{\geq 2}$  and an interval  $I \subset [1, X]$ . For any  $\theta \in \mathbb{S}^1$  of the form  $\theta = \frac{a}{q} + \frac{\xi}{q}$  where  $a \in \mathbb{Z}_+$  and  $(a, q) = 1$ . Then for any  $A \in \mathbb{R}_+$ , we have

$$\sum_{n \in I} \Lambda(n) e^{2\pi i \theta n} - \frac{\mu(q)}{\phi(q)} \int_I e^{2\pi i \frac{\xi t}{q}} dt \ll_A (q + X|\xi|) \frac{X}{\log^A X}.$$

┘

*Proof:* Cf. <https://terrytao.wordpress.com/2015/03/30/254a-notes-8-the-hardy-littlewood-circle-method-#lethP24>. □

**Thm.(35.7.1.12).** For  $X \in \mathbb{R}_+$ ,  $\theta \in \mathbb{S}^1 \setminus \{1\}$  and any  $A \in \mathbb{R}_+$ , we have

$$\sum_{n \in [X]_+} e^{2\pi i \theta \sqrt{n}} \Lambda(n) \ll_{\theta} X^{5/6} \log^4 X.$$

┘

*Proof:* ? Use the same method as in (35.7.1.8). □

## 2 Goldbach's Problems

References are [H-L23, Nat96, I-K04] and <https://terrytao.wordpress.com/2015/03/30/254a-notes-8-the-hardy-littlewood-circle-method-and-vinogradovs-theorem/>.

**Def.(35.7.2.1) [Goldbach's Functions].** For  $k \in \mathbb{Z}_{\geq 2}$ , define  $G_k : \mathbb{Z}_+ \rightarrow \mathbb{R}$ :

$$G_k(n) = \sum_{n_i \in \mathbb{Z}_+, \sum_{i=1}^k n_i = n} \Lambda(n_1) \cdots \Lambda(n_k).$$

┘

**Def.(35.7.2.2) [Singular Series for Goldbach's Functions].** For  $N \in 2\mathbb{Z}_+$ , denote

$$\mathfrak{S}_2(N) \triangleq \sum_{d|N} \frac{\mu^2(d)d}{\phi^2(d)} \sum_{c \in \mathbb{Z}_+, (c,d)=1} \frac{\mu(c)}{\phi^2(c)},$$

then

$$\mathfrak{S}_2(N) = 2 \prod_{p \in \text{Prime}_{\geq 3}} \left(1 - \frac{1}{(p-1)^2}\right) \cdot \prod_{p \in \text{Prime}_{\geq 3}, p|N} \left(\frac{p-1}{p-2}\right)$$

and is a non-zero unbounded function.

And for  $N \in 2\mathbb{Z}_+ + 1$ , denote

$$\mathfrak{S}_3(N) \triangleq \frac{1}{2} \sum_{c,d \in \mathbb{Z}_+, (d,cN)=1} \frac{\mu(c)\mu^2(d)d}{\phi^2(c)\phi^3(d)},$$

then

$$\mathfrak{S}_3(N) = \frac{1}{2} \prod_{p \in \text{Prime}} \left(1 + \frac{1}{(p-1)^3}\right) \prod_{p \in \text{Prime}, p|N} \left(1 - \frac{1}{p^2 - 3p + 3}\right)$$

and is a non-zero bounded function. ┘

*Proof:*

$$\begin{aligned}
 \mathfrak{G}_2(N) \prod_{p \in \text{Prime}_{\geq 3}} \left(1 - \frac{1}{(p-1)^2}\right)^{-1} &= \sum_{2|d|N} \frac{\mu^2(d)d}{\phi^2(d)} \prod_{p|d, p \geq 3} \left(1 - \frac{1}{(p-1)^2}\right)^{-1} \\
 &= 2 \prod_{p \in S(N) \setminus \{2\}} \left(1 + \frac{p}{(p-1)^2} \left(1 - \frac{1}{(p-1)^2}\right)^{-1}\right) \\
 &= 2 \prod_{p \in \text{Prime}_{\geq 3}, p|N} \left(\frac{p-1}{p-2}\right).
 \end{aligned}$$

$$\begin{aligned}
 \mathfrak{G}_3(N) \prod_{p \in \text{Prime}_{\geq 3}} \left(1 - \frac{1}{(p-1)^2}\right)^{-1} &= \sum_{d \in 2\mathbb{Z}_+ + 1, (d, N)=1} \frac{\mu^2(d)d}{\phi^3(d)} \prod_{p|d, p \geq 3} \left(1 - \frac{1}{(p-1)^2}\right)^{-1} \\
 &= \prod_{p \in \text{Prime}_{\geq 3}, p \nmid N} \left(1 + \frac{p}{(p-1)^3} \left(1 - \frac{1}{(p-1)^2}\right)^{-1}\right) \\
 &= \prod_{p \in \text{Prime}_{\geq 3}, p \nmid N} \frac{p^2 - 3p + 3}{(p-1)(p-2)}.
 \end{aligned}$$

And the assertion follows.  $\square$

**Conj. (35.7.2.3)** [Goldbach1742/Hardy-Littlewood[H-L23]]. For any  $m \in \mathbb{Z}_{\geq 2}$ ,  $2m$  is a sum of two prime numbers.

By Möbius-randomness law ?, Hardy-Littlewood even conjectures that the number  $R_2(2m)$  of representations of  $2m$  satisfies

$$R_2(2m) \sim \mathfrak{G}_2(2m) \frac{2m}{\log^2(2m)} \quad (35.7.2.2).$$

Or more precisely, for any  $A \in \mathbb{R}_+$ , there exists  $C_A \in \mathbb{R}_+$  s.t.

$$|G_2(2m) - \mathfrak{G}_2(2m)2m| \leq C_A \frac{m}{\log^A m} \quad (35.7.2.1).$$

┘

*Proof:*

$\square$

**Thm& Conj. Cor. (35.7.2.4)** [Chen[Che73]]. For any  $m \in \mathbb{Z}_{\geq 3}$ , there exists  $p \in \text{Prime}_{\geq 3}$  and  $q \in \mathbb{Z}_+$  s.t.  $q$  is a prime or a product of two primes, and  $2m = p + q$ .

In fact, if  $R'_2(2m)$  denote the number of such pairs  $(p, q)$ , then

$$R'_2(2m) \gg \mathfrak{G}_2(2m) \frac{2m}{\log^2 m}.$$

┘

*Proof:* ?

$\square$

**Lemma(35.7.2.5)[The Main Contributions].** Fix some  $z \in \mathbb{R}_{\geq 2}$  and  $N \in 2\mathbb{Z}_+ + 2$ , if we denote

$$G_2^{\sharp\sharp}(N) = \sum_{n_1+n_2=N} \Lambda_z^{\sharp}(n_1)\Lambda_z^{\sharp}(n_2) \quad (35.7.1.9),$$

then

$$G_2^{\sharp\sharp}(N) = \mathfrak{G}_2(N)N + O_A\left(N \log^{-A}(z) + \tau(N)Nz^{-1/3} + z^3\right) \quad (35.7.2.2).$$

Heuristically, this implies that the main contribution to  $G_2(N)$  comes from  $\Lambda_z^{\sharp}$ . □

*Proof:*

$$\begin{aligned} G_2^{\sharp\sharp}(N) &= \sum_{m_1, m_2 \in [z]_+} \mu(m_1)\mu(m_2) \log(m_1) \log(m_2) \sum_{l_1, l_2 \in \mathbb{Z}_+, l_1 m_1 + l_2 m_2 = N} 1 \\ &= \sum_{m_1, m_2 \in [z]_+} \mu(m_1)\mu(m_2) \log(m_1) \log(m_2) \left( \frac{N}{[m_1, m_2]} + O(1) \right) \\ &= N \sum_{m_1, m_2 \in [z]_+} \frac{\mu(m_1)\mu(m_2)}{[m_1, m_2]} \log(m_1) \log(m_2) + O(z^2 \log^2 z) \end{aligned}$$

And we have

$$\begin{aligned} \sum_{m_1, m_2 \in [z]_+} \frac{\mu(m_1)\mu(m_2)}{[m_1, m_2]} \log(m_1) \log(m_2) &= \sum_{d|N} \frac{\mu^2(d)}{d} \sum_{\substack{m_1, m_2 \in [z/d]_+ \\ (m_1, m_2)=1 \\ (m_1 m_2, d)=1}} \frac{\mu(m_1 m_2)}{m_1 m_2} \log(dm_1) \log(dm_2) \\ &= \sum_{d|N} \frac{\mu^2(d)}{d} \sum_{\substack{m_1, m_2 \in [z/d]_+ \\ (m_1 m_2, d)=1}} \sum_{c|(m_1, m_2)} \mu(c) \frac{\mu(m_1 m_2)}{m_1 m_2} \log(dm_1) \log(dm_2) \\ &= \sum_{d|N} \frac{\mu(d)}{d} \sum_{c \in [z/d]_+} \frac{\mu(cd)}{c^2} \left( \sum_{m \in [z/cd]_+, (m, cd)=1} \frac{\mu(m)}{m} \log(cdm) \right)^2 \end{aligned}$$

For  $c > \sqrt{z}/d$ , this is bounded by

$$\sum_{d|N} \sum_{c > \sqrt{z}/d} c^{-2} d^{-1} \log^4 z \leq 2\tau(N)z^{-1/2} \log^4 z,$$

and for  $c \leq \sqrt{z}/d$ , it follows from prime number theorem(35.5.7.21) that

$$- \sum_{m \in [z/cd]_+, (m, cd)=1} \frac{\mu(m)}{m} \log(cdm) = \frac{cd}{\phi(cd)} \left( 1 + O\left(\tau(cd) \log^{-A} z\right) \right),$$

so we can estimate by bounding  $\phi(n)$  and  $\tau(n)$  for example by(35.1.3.15) and(35.5.7.8) that

$$\begin{aligned} \sum_{d|N} \sum_{c \in [z^{1/2}/d]_+} \frac{\mu(cd)}{c^2} \left( \sum_{m \in [z/cd]_+, (m, cd)=1} \frac{\mu(m)}{m} \log(cdm) \right)^2 &= \sum_{d|N} \sum_{c \in [z^{1/2}/d]_+} \mu(d)\mu(cd)d\phi^{-2}(cd) \\ &\quad + O_A\left(\log^{4-A} z + \tau(N)z^{-1/3}\right) \\ &= \mathfrak{G}_2(N) + O_A\left(\log^{-A} z + \tau(N)z^{-1/3}\right) \quad (35.7.2.2), \end{aligned}$$

and the assertion follows. □

**Lemma (35.7.2.6) [The Minor Contributions].** For any  $(u_k)_{k \in \mathbb{Z}_+}, (v_m)_{m \in \mathbb{Z}_+} \in \mathbb{C}$  and  $z \in \mathbb{R}_{\geq 2}, A \in \mathbb{R}_+$ , we have

$$\sum_{l+m+n=N} u_l v_m \Lambda_z^b(n) \ll_A \log^{-A} z \|u\| \|v\| N \log N, \text{ where } N \in \mathbb{Z}_+.$$

┘

*Proof:* For any  $\alpha \in \mathbb{R}$ , it follows from Davenport's inequality (35.7.1.8) and partial summation that

$$\sum_{n \in [N]_+} \mu(n) \log(n) e^{2\pi i \alpha n} = O_A \left( \frac{X}{\log^A X} \right).$$

If we write  $S^b(\alpha; N) = \sum_{n \in [N]_+} \Lambda_z^b(n) e^{2\pi i \alpha n}$ , then we have

$$\begin{aligned} |S^b(\alpha; N)| &\leq \sum_{l \in [N/z]_+} \left| \sum_{m \in \mathbb{Z}_+, z < m \leq N/l} \mu(m) \log(m) e^{2\pi i \alpha l m} \right| \\ &\ll_A \sum_{l \in [N/z]_+} \frac{N}{l} \log^{-A}(N/l) \\ &\leq_A N \log N \log^{-A} z. \end{aligned}$$

And we have

$$\sum_{l+m+n=N} u_l v_m \Lambda_z^b(n) = \int_0^1 \left( \sum_{l \in [N]_+} u_l e^{2\pi i \alpha l} \right) \left( \sum_{m \in [N]_+} v_m e^{2\pi i \alpha m} \right) S^b(\alpha; N) e^{-2\pi i \alpha N} d\alpha.$$

Then the assertion follows from Schwarz's inequality and Parseval's formula.  $\square$

**Thm& Conj. Cor. (35.7.2.7) [Goldbach's Conjecture for almost all Even Numbers, Tchu-dakov [Tch37]/Estermann [Est38]/Van.der.Corput [Cor39]/Montgomery-Vaughan [M-V75]].**

For any  $A \in \mathbb{R}_+$ , there exists  $C_A \in \mathbb{R}_+$  s.t. for any  $X \in \mathbb{R}_{\geq 2}$ , we have

$$\sum_{N \in 2\mathbb{Z}_+ \cap [X]_+} (G_2(N) - \mathfrak{G}_2(N)N)^2 \leq C_A \frac{X^3}{\log^{2A} X}.$$

In particular, for  $A, B \in \mathbb{R}_{\geq 4}$ , there exists  $C_{A,B} \in \mathbb{R}_+$  s.t. for any  $X \in \mathbb{R}_{\geq 2}$ , there are at most  $C_{A,B} X \log^{-A}(X)$ -many  $m \in [X]_+$  s.t.

$$|G_2(2m) - \mathfrak{G}_2(2m)2m| \geq B \frac{X}{\log^A X} \quad (35.7.2.2).$$

In particular, all but at most  $O_A(X \log^{-A} X)$ -many even numbers in  $[X]_+$  are sums of two primes.  $\square$

*Proof:* For any sequence  $(c_N)_{N \in \mathbb{Z}_+} \in \mathbb{C}$  supported on odd integers, we have

$$\sum_{N \in [X]_+} c_N G_2(N) = \sum_{N \in (2\mathbb{Z}_+ + 1) \cap [X]_+} c_N \left( G_2^{\sharp\sharp}(N) + 2G_2^{\sharp b}(N) + G_2^{bb}(N) \right).$$

And by (35.7.2.5) applied to  $z = X^{1/4}$ , we see

$$\sum_{N \in [X]_+} c_N G_2^{\sharp\sharp}(N) = \sum_{N \in (2\mathbb{Z}_+ + 1) \cap [X]_+} c_N G_2(N) + O_A \left( \|c\| X^{3/2} \log^{-A} X \right).$$

And (35.7.2.6) applied to  $z = X^{1/4}$  implies that

$$\sum_{N \in [X]_+} c_N (2G_2^{\sharp\sharp}(N) + G_2^{bb}(N)) = O_A \left( \|c\| \left( 2 \left\| \Lambda_{X^{1/4}}^{\sharp} \right\| + \left\| \Lambda_{X^{1/4}}^b \right\| \right) X \log^{-A} X \right) = O_A \left( \|c\| X^{3/2} \log^{-A} X \right) \quad (35.7.1.10).$$

So we get

$$\sum_{N \in [X]_+} c_N G_2(N) = \sum_{N \in [X]_+} c_N \mathfrak{G}_2(N) N + O_A \left( \|c\| X^{3/2} \log^{-A} X \right).$$

The assertion follows by applying this to  $c_N = G_2(N) - \mathfrak{G}_2(N)N$ .  $\square$

**Cor. (35.7.2.8)[Ternary Goldbach's Function, Vinogradov [Vin37]].** For any  $A \in \mathbb{R}_+$ , there exists  $C_A \in \mathbb{R}_+$  s.t. for any  $N \in 2\mathbb{Z}_+ + 5$ , we have

$$\left| G_3(N) - \mathfrak{G}_3(N) N^2 \right| \leq C_A \frac{N^2}{\log^A N}, \quad \left| R_3(N) - \mathfrak{G}_3(N) \frac{N^2}{\log^3 N} \right| \leq C_A \frac{N^2}{\log^A N} \quad (35.7.2.2),$$

where  $R_3(N)$  is the number of ternary Goldbach-representations of  $N$ . In particular, any sufficiently large odd number  $N$  is a sum of three primes.  $\lrcorner$

*Proof:* By the proof of (35.7.2.7), we see that for any sequence  $(c_N)_{N \in \mathbb{Z}_+} \in \mathbb{C}$  supported on odd integers, we have

$$\sum_{N \in [X]_+} c_N G_2(N) = \sum_{N \in [X]_+} c_N \mathfrak{G}_2(N) N + O_A \left( \|c\| X^{3/2} \log^{-A} X \right).$$

Apply this to

$$\begin{aligned} G_3(N) &= \sum_{n \in [N-1]_+} \Lambda(n) G_2(N-n) \\ &= \sum_{n \in [N-1]_+} \Lambda(n) \mathfrak{G}_2(N-n)(N-n) + O_A(N^2 \log^{-A} N) \quad (35.5.7.18) \\ (35.7.2.2) &= \sum_{(c,d)=1} \frac{\mu(c)\mu^2(d)d}{\phi^2(c)\phi^2(d)} \sum_{n < N, n \equiv N \pmod{d}} \Lambda(n)(N-n) + O_A(N^2 \log^{-A} N). \end{aligned}$$

If  $d \nmid N$ , then

$$\sum_{n < N, n \equiv N \pmod{d}} \Lambda(n)(N-n) = \frac{N^2}{2\phi(d)} + O_A(N^2 \log^{-A} N)$$

by prime number theorem (35.5.7.18) and partial summation. And if  $d = p \in S(N)$ , then this summation is bounded by  $N \log N$ , and the contribution is smaller than  $N \log^2 N$ . Hence we get

$$G_3(N) = \frac{N^2}{2} \sum_{c,d \in \mathbb{Z}_+, (c,dN)=1} \frac{\mu(c)\mu^2(d)d}{\phi^2(c)\phi^3(d)} + O_A(N^2 \log^{-A} N) = \mathfrak{G}_3(N) N^2 + O_A \left( \frac{N^2}{\log^A N} \right).$$

The proof for  $R_3(N)$  is similar.  $\square$

**Thm& Conj.Cor. (35.7.2.9)** [Ternary Goldbach Conjecture, Hardy-Littlewood[H-L23]/Shnirelman(1930)/Vinogradov(1937)/Borozdkin(1956)/Zinoviev[Zin97]/Deshouillers-Effinger-te.Riele-Zinoviev[DERZ]/Ramaré[Ram95]/Tao[Tao14]/Helfgott[Hel13]]. For any  $k \in \mathbb{Z}_{\geq 4}$ ,  $2k + 1$  is a sum of three odd primes.  $\lrcorner$

*Proof:* ? Helfgott[Hel13] proved this for  $2k + 1 \geq 10^{27}$ , and the rest is verified by computers. The proof uses the circle method and the large sieve.

Notice the result for  $k$  sufficiently large follows from(35.7.2.8).  $\square$

### Number of Representations by Primes

**Prop. (35.7.2.10)**[Selberg's Upper Bound Sieve for Representations]. Uniformly for  $N \in 2\mathbb{Z}_+ + 2$ , we have

$$\#\{p_1, p_2 \in \text{Prime} : N = p_1 + p_2\} \leq C \left( \prod_{p \in S(N) \setminus \{2\}} \frac{p-1}{p-2} \right) \frac{N}{\log^2 N} \left( 4 + O \left( \frac{\log_{(2)} N}{\log N} \right) \right).$$

$\lrcorner$

*Proof:* The proof is similar to(35.6.1.6).?  $\square$

### Waring-Goldbach Problems

**Thm. (35.7.2.11)**[Lilu Zhao].

$$\begin{aligned} H(1) &\leq 3, & H(2) &\leq 5, & H(3) &\leq 9, & H(4) &\leq 13, \\ H(5) &\leq 21, & H(6) &\leq 32, & H(7) &\leq 46, & H(8) &\leq 63. \end{aligned}$$

$\lrcorner$

*Proof:*

$\square$

## 3 Partition Numbers

## 4 Waring's Problems

**Def. (35.7.4.1)** [Waring's Problem]. For  $k \geq 1$ , let  $g(k) \in \mathbb{Z}_+$  be the smallest integer s.t. every positive integer can be written as a sum of at most  $g(k)$  positive  $k$ -th powers.  $\lrcorner$

**Prop. (35.7.4.2)**. Situation as in(35.7.4.1),  $g(k) \geq \lfloor 2^k \rfloor + \lfloor (\frac{3}{2})^k \rfloor - 2$ .  $\lrcorner$

*Proof:* This is because the number  $\lfloor (\frac{3}{2})^k \rfloor 2^k - 1$  requires  $\lfloor (\frac{3}{2})^k \rfloor - 1$  powers  $2^k$  and  $2^k - 1$  powers  $1^k$ .  $\square$

**Thm. (35.7.4.3)**[Dickson-Niven-Pillai/Rubugunday]. Situation as in(35.7.4.1),

$$g(k) = \begin{cases} 2^k + \lfloor (\frac{3}{2})^k \rfloor - 2, & \lfloor (\frac{3}{2})^k \rfloor - (\frac{3}{2})^k \geq (\frac{3}{4})^k \\ \text{?}, & \text{otherwise} \end{cases}.$$

In particular,  $g(1) = 1, g(2) = 4, g(3) = 9, g(4) = 19$ .  $\lrcorner$

*Proof:* ?

$g(2) = 4$  follows from (19.5.8.4) and (19.5.8.3).  $\square$

**Conj. (35.7.4.4) [Mahler].** Situation as in (35.7.4.1),  $g(k) = 2^k + \lfloor (\frac{3}{2})^k \rfloor - 2$  any  $k$ .  $\lrcorner$

*Proof:*  $\square$

**Thm& Conj.Cor. (35.7.4.5).** By (20.2.5.11)(35.7.4.3), this is true for  $k$  sufficiently large. But it is not known for how large  $k$  this is true, eventually due to the ineffectiveness of the proof of Roth's theorem (20.2.3.8).  $\lrcorner$

### Asymptotic Waring's Problem

References are [Waring's Problem: a survey, Vaughan-Wooley] and [Translation invariance, exponential sums, and Waring's problem, Wooley].

**Def. (35.7.4.6) [Asymptotic Waring's Problem].** For  $k \geq 1$ , let  $G(k) \in \mathbb{Z}_+$  be the smallest integer s.t. every sufficiently large integer can be written as a sum of at most  $G(k)$  positive  $k$ -th powers.

And let  $G_1(k) \in \mathbb{Z}_+$  be the smallest integer s.t. a set of integers of natural density 1 can be written as a sum of at most  $G(k)$  positive  $k$ -th powers.

Clearly  $G_1(k) \leq G(k) \leq g(k)$  (35.7.4.1).  $\lrcorner$

**Def. (35.7.4.7) [Warning Numbers].** For  $k, s, N \in \mathbb{Z}_+$ , denote  $r_{k,s}(N)$  the number of  $s$ -tuples  $(x_1, \dots, x_s) \in \mathbb{Z}_+$  s.t.

$$N = x_1^k + \dots + x_s^k.$$

$\lrcorner$

**Prop. (35.7.4.8).** Given  $s \in \mathbb{Z}_+$ , we have: For any  $N \in \mathbb{Z}_+$ ,

$$r_{1,s}(N) = \binom{N-1}{s-1} = \frac{N-1}{s-1} + O(N^{s-2}).$$

$\lrcorner$

**Thm. (35.7.4.9) [Small Values, Davenport [Dav39]/Hardy-Littlewood [H-L25]/Vaughan [Vau86]/Wooley [Woo96].**

- $g(2) = G(2) = G_1(2) = 4$ .
- $G_1(3) = 4$ .
- $G_1(4) = 15$ .
- $G_1(8) = 32$ .
- $G_1(16) = 64$ .
- $G_1(32) = 128$ .

$\lrcorner$

*Proof:* ?

$\square$

**Thm. (35.7.4.10)** [Upper Bounds for  $G(k)$ , Hardy-Littlewood[H-L22, H-L25]/ Vinogradov[Vin35, Vin47, Vin59]/Tong[Ton57]/ Chen[Che58]/Karatsuba[Kar85]/Vaughan[Vau89]/Wooley[Woo99, Woo95]]. There exists  $C \in \mathbb{R}_+$  s.t. for any  $k \in \mathbb{Z}_+$ , we have

$$G(k) \leq k \left( \log k + \log_{(2)} k + 2 + C \frac{\log_{(2)} k}{\log k} \right) \quad (35.7.4.6).$$

and

$$G(k) \leq k (3 \log k + 11).$$

And when  $k \geq 4000$ , we have

$$G(k) \leq k (2 \log k + 2 \log_{(2)} k + 12).$$

┘

*Proof:* ?

□

### Vinogradov's Mean Value Problem

**Thm. (35.7.4.11)** [general Vinogradov's Mean Value Problem]. Let  $N \in \mathbb{Z}_+$  and  $S = \{x_1, \dots, x_N\}$  where  $x_i \in (i-1, i]$ . For  $s, n \in \mathbb{Z}_+$ , let  $J_{s,n}(X)$  be the number of solutions to the following inequalities:

$$\left| X_1^i + \dots + X_s^i - X_{s+1}^i - \dots - X_{2s}^i \right| \leq N^{i-n}, \text{ where } i \in [n]_+.$$

with  $X_i \in X$ . Then we have

$$J_{s,n}(S) \ll_{\varepsilon, s} N^{s+\varepsilon} + N^{2s - \frac{n(n+1)}{2} + \varepsilon},$$

where the implied constant doesn't depend on  $S$ .

┘

*Proof:* Let  $\varphi : \mathbb{R}^n \rightarrow \mathbb{R}_{\geq 0}$  be a positive-valued Schwartz function with positive-valued Fourier transform s.t.  $\mathcal{F}\varphi(\xi) \geq 1$  for any  $\xi \in \mathbb{R}^n$  s.t.  $|\xi_i| \leq 1$ . Then it follows from (35.7.5.2) with  $a_i = 1$  and  $t_i = X_i/N$  and the rapidly decaying property of  $\varphi$  that

$$\left( \frac{1}{\text{Vol}(\mathbb{B}(0; N^n))} \int_{\mathbb{R}^n} \varphi_{N^n}(\mathbf{x}) \left| \sum_{i \in [N]_+} e^{2\pi i(x_1 t_i + x_2 t_i^2 + \dots + x_n t_i^n)} \right|^{2s} d\mathbf{x} \right)^{\frac{1}{2s}} \ll_{n,s,\varepsilon} N^{1/2+\varepsilon} + N^{1 - \frac{n(n+1)}{4s} + \varepsilon}.$$

Notice

$$\begin{aligned} & \int_{\mathbb{R}^n} \varphi(\mathbf{x}/N^n) \left| \sum_{i \in [N]_+} e^{2\pi i(x_1 t_i + x_2 t_i^2 + \dots + x_n t_i^n)} \right|^{2s} d\mathbf{x} \\ &= \sum_{X_1, \dots, X_{2s} \in S} N^{n^2} \mathcal{F}\varphi(N^{n-1} Z_1, N^{n-2} Z_2, \dots, Z_n), \text{ where } Z_i = X_{s+1}^i + \dots + X_{2s}^i - X_1^i - \dots - X_s^i. \\ &\geq N^{n^2} J_{s,n}(S) \end{aligned}$$

Thus the assertion follows.

□

## 5 Decoupling

References are [Proof of the  $L^2$  decoupling conjecture, Bourgain-Demeter] and [Proof of the main conjecture in Vinogradov's Mean Value Theorem for degrees higher than three, Bourgain-Guth].

**Thm. (35.7.5.1) [Restriction Estimates, Bourgain-Demeter-Guth].** For  $n \in \mathbb{Z}_{\geq 2}$  and an interval  $J \subset [0, 1]$ , define the **extension operator**  $E_J = E_J^{(n)}$  s.t. for any measurable function  $g : [0, 1] \rightarrow \mathbb{C}$ ,

$$E_J g : \mathbb{R}^n \rightarrow \mathbb{C} : \mathbf{x} \mapsto \int_J g(t) e^{2\pi i(t x_1 + t^2 x_2 + \dots + t^n x_n)} dt.$$

Let  $E \in \mathbb{R}_{\geq 100n}$  and  $B \subset \mathbb{R}^n$  be a ball of radius  $r$ , define a weight function

$$w_B(\mathbf{x}) = w_{B,E}(\mathbf{x}) = \left(1 + \frac{|\mathbf{x} - \mathbf{c}|}{r}\right)^{-E}$$

on  $\mathbb{R}^n$ . Then for any  $\delta \in (0, 1]$ ,  $\varepsilon \in \mathbb{R}_+$  and  $B \subset \mathbb{R}^n$  a ball of radius  $\delta^{-n}$ , we have

$$\|E_{[0,1]} g\|_{L^{n(n+1)}(w_B)} \ll_{n,E,p,\varepsilon} \delta^{-\varepsilon} \left( \sum_{J_i \in \mathcal{J}_\delta} \|E_{J_i} g\|_{L^{n(n+1)}(w_B)}^2 \right)^{1/2}.$$

where  $\mathcal{J}_\delta$  is a 2-overlapping covering of  $[0, 1]$  by intervals of radius  $\delta$ , where the implied constant is independent of  $\delta, B, g$ .  $\perp$

*Proof:* Cf. [Proof of the main conjecture in Vinogradov's Mean Value Theorem for degrees higher than three, Bourgain-Demeter-Guth].  $\square$

**Cor. (35.7.5.2) [Discrete Restriction Estimates, Bourgain-Demeter-Guth].** Situation as in (35.7.5.1), for  $N \in \mathbb{Z}_+$  and for each  $i \in [N]_+$ , choose  $t_i \in (\frac{i-1}{N}, \frac{i}{N}]$ , then for each  $R \gg N^n$  and each ball  $B \subset \mathbb{R}^n$  of radius  $R$ , and any sequence  $(a_i)_{i \in [N]_+} \in \mathbb{C}$  and  $p \in \mathbb{R}_{\geq 2}$ ,  $\varepsilon \in \mathbb{R}_+$ , we have

$$\left( \frac{1}{\text{Vol}(B)} \int \left| \sum_{i \in [N]_+} a_i e^{2\pi i(x_1 t_i + x_2 t_i^2 + \dots + x_n t_i^n)} \right|^p w_B(\mathbf{x}) d\mathbf{x} \right)^{1/p} \ll_{n,\varepsilon} \left( N^\varepsilon + N^{\frac{1}{2}(1 - \frac{n(n+1)}{p}) + \varepsilon} \right) \|a_i\|_2.$$

where the implied constant doesn't depend on  $N, R$  or  $(a_i)$ .  $\perp$

*Proof:* By Hölder inequality and the trivial bound for  $L^\infty$ , it suffices to prove for  $p = n(n+1)$ . Let  $\mathcal{B}$  be a finitely-overlapping covering of  $B$  with balls of radius  $N^n$ , then we have

$$w_B \ll_{n,E} \sum_{B' \in \mathcal{B}} w_{B'} \ll_{n,E} w_B.$$

where the implied constant doesn't depend on  $N$  and  $R$ .

Apply (35.7.5.1) to every ball in  $\mathcal{B}$  and sum up, we get

$$\|E_{[0,1]} g\|_{L^{n(n+1)}(w_B)} \ll_{n,E,\varepsilon} N^\varepsilon \left( \sum_{J_i \in \mathcal{J}_{N^{-1}}} \|E_{J_i} g\|_{L^{n(n+1)}(w_B)}^2 \right)^{1/2},$$

where  $\mathcal{J}_{N^{-1}}$  is the standard partition of  $[0, 1]$  into  $N$  intervals of length  $N^{-1}$ .

Then we apply this inequality to

$$g_\tau = \frac{1}{2\tau} \sum_{i \in [N]_+} a_i \mathbf{1}_{[t_i - \tau, t_i + \tau]}, \text{ where } \tau \in \mathbb{R}_+,$$

and let  $\tau \rightarrow 0$ , then the assertion follows.  $\square$

## 6 limitations of Circle methods

See <https://terrytao.wordpress.com/2012/05/20/heuristic-limitations-of-the-circle-method/>.

## 35.8 Generalized Ramanujan Conjecture

GRC will imply a bound for the Fourier coefficients of a cusp form. And as a consequence, it will imply that  $|L(F; 1/2)| \leq C_\varepsilon C(F)^\varepsilon$  for any  $\varepsilon \in \mathbb{R}_+$ , thus give results in subconvexity problems.

There are partial results towards GRC.

References are [B-B11].

**Conj. (35.8.0.1) [Generalized Ramanujan-Selberg Conjectures].** An analytic  $L$ -function  $L(f; s)$  of degree  $d$  (29.5.1.1) is said to satisfy the generalized **Ramanujan conjecture** or the **Ramanujan-Petersson conjecture** if for any prime  $p \in \text{Prime}$  unramified for  $f$  (29.5.1.1), we have  $|\alpha_i(p)| = 1$  for  $i \in [d]_+$  (29.5.1.1).

An analytic  $L$ -function  $L(f; s)$  of degree  $d$  is said to satisfy the generalized **Ramanujan conjecture** if  $\text{Re}(\kappa_i) = 0$  for  $i \in [d]_+$ .  $\lrcorner$

*Proof:* ?  $\square$

**Prop. (35.8.0.2).** If  $\pi \in \text{Irr}^{\text{cusp}}(\text{GL}(2; \mathbb{Q}))$  with unitary central character, then  $L(\pi; s)$  is an analytic  $L$ -function of degree 2 over  $F$  with local parameters  $\{\alpha_1(p), \alpha_2(p)\}$  for  $p \in \text{Prime}$  and local parameters  $\{\kappa_1, \kappa_2\}$  at  $\infty$ . Then  $|\alpha_1(p)\alpha_2(p)| = 1$  for  $v \in \Sigma_F$ .

If  $L(\text{Sym}^n(f) \otimes \text{Sym}^n(\bar{f}); s)$  exists, then

$$\max(|\alpha_1(p)|, |\alpha_2(p)|) \leq p^{\frac{1}{2n}}.$$

In particular, if  $L(\text{Sym}^n(f) \otimes \text{Sym}^n(\bar{f}); s)$  exists for each  $n \in \mathbb{Z}_+$ , then generalized Ramanujan conjecture (35.8.0.1) holds for  $f$ . Similarly, generalized Selberg conjecture also holds for  $f$ .  $\lrcorner$

*Proof:* If  $L(\text{Sym}^n(f) \otimes \text{Sym}^n(\bar{f}); s)$  exists, then it is self-dual by strong multiplicity one. And then by examining its local parameters, we see the largest parameters  $\max(|\alpha_1(p)|^{2n}, |\alpha_2(p)|^{2n}) < p$ . And then the assertion follows.

For the Selberg conjecture ?.  $\square$

**Thm. (35.8.0.3) [Ramanujan Bounds, Luo-Rudnick-Sarnak [LRS99]].** For any  $F \in \text{NField}$  and  $\pi \in \text{Irr}^{\text{cusp}}(\text{GL}(n; F))$  with unitary central character, then for each  $i \in [n]_+$ , we have

$$|\log_{\|v\|} \alpha_i(\pi_v)| \leq \frac{1}{2} - \frac{1}{m^2 + 1}, \quad v \in \Sigma_F^{\text{fin}}, \quad |\text{Re}(\kappa_j(\pi_v))| < \frac{1}{2} - \frac{1}{m^2 + 1}, \quad v \in \Sigma_F^\infty.$$

$\lrcorner$

*Proof:* ? Cf. [B-B11].  $\square$

**Thm. (35.8.0.4) [Ramanujan Bounds for GL(2), Kim-Sarnak/Blomer-Brumley [B-B11]].** For any  $F \in \text{NField}$  and  $\pi \in \text{Irr}^{\text{cusp}}(\text{GL}(n; F))$  with unitary central character, then for each  $i \in \{1, 2\}$ , we have

$$|\log_{\|v\|} \alpha_i(\pi_v)| \leq \begin{cases} \frac{7}{64} & , n = 2 \\ \frac{5}{14} & , n = 3 \\ \frac{9}{22} & , n = 4 \end{cases}, \quad v \in \Sigma_F^{\text{fin}}, \quad |\text{Re}(\kappa_j(\pi_v))| < \begin{cases} \frac{7}{64} & , n = 2 \\ \frac{5}{14} & , n = 3 \\ \frac{9}{22} & , n = 4 \end{cases}, \quad v \in \Sigma_F^\infty.$$

$\lrcorner$

*Proof:* Cf. [B-B11].  $\square$

## 1 Kuznetsov Trace Formula

References are [arithmetic and spectral analysis of Poincare series, Cogdell-Shapiro].

**Thm. (35.8.1.1) [Density Theorem for Selberg Conjecture, Iwaniec].** For any  $\varepsilon \in \mathbb{R}_+$ , there exists  $C_\varepsilon \in \mathbb{R}_+$  s.t. for any  $r \in [0, 1/2]$ , we have

$$\# \left\{ \lambda \leq \frac{1}{4} - r^2 \mid \lambda \in \text{Spec}(\Delta|_{L_0^2(\Gamma_0(N) \backslash \mathcal{H})}) \right\} \leq C_\varepsilon \text{Vol}(\Gamma_0(N) \backslash \mathcal{H})^{1-4r+\varepsilon}.$$

┘

*Proof:* ? Cf. [Iwaniec, Small eigenvalues of Laplacian for  $\Gamma_0(N)$ ]. The proof uses Kuznetsov's trace formula. □

**Cor. (35.8.1.2) [Selberg].** For any  $N \in \mathbb{Z}_+$  and any eigenvalue  $\lambda$  of the Laplacian on  $L_0^2(\Gamma_0(N) \backslash \mathcal{H})$ , we have  $\lambda \geq 3/16$ . ┘

### Linnik-Selberg Conjecture

The Kuznetsov trace formula can be used to capture cancellations in Kloosterman sums beyond Weil's bound.

## 35.9 Arithmetic Statistics

**Notation (35.9.0.1).**

- Use notations on global fields defined in [Global Fields](#).
- Use notations on arithmetic of Abelian varieties defined in [Arithmetic of Abelian Varieties](#).

┘

### 1 Fields

**Thm. (35.9.1.1) [Davenport-Heilbronn].** For  $\xi, \eta \in \mathbb{R}$ , let  $N_3(\xi, \eta)$  be the isomorphism classes of cubic number fields  $\mathcal{K}$  s.t.  $d_{\mathcal{K}} \in (\xi, \eta)$ . Then

$$\lim_{X \rightarrow \infty} \frac{N_3(0, X)}{X} = \frac{1}{12\zeta(3)}, \quad \lim_{X \rightarrow \infty} \frac{N_3(-X, 0)}{X} = \frac{1}{4\zeta(3)}.$$

┘

*Proof:* Cf.[On the density of discriminants of cubic fields, Davenport-Heilbronn]. □

**Thm. (35.9.1.2) [Bhargava].** For  $\xi, \eta \in \mathbb{R}$ , let  $N_n(\xi, \eta)$  be the isomorphism classes of cubic fields  $\mathcal{K}$  s.t.  $d_{\mathcal{K}} \in (\xi, \eta)$ . Then for  $n = 4$  or  $5$ ,

$$\lim_{X \rightarrow \infty} \frac{N_n(-X, X)}{X}$$

exists. ┘

*Proof:* Cf.[The density of discriminants of quartic rings and fields], [The density of discriminants of quintic rings and fields]. □

### 2 Elliptic Curves

References are [\[P-R12, BKLPR, PPVW\]](#).

**Def. (35.9.2.1) [Statistical Heights].** Every  $E \in \text{EllCur}/\mathbb{Q}$  is isomorphic to the projective closure of a unique affine curve  $y^2 = x^3 + Ax + B$  s.t.  $4A^3 + 27B^2 \neq 0$ , and there are no  $p \in \text{Prime}$  with  $p^4|A$  and  $p^6|B$ .

Then we can define the **statistical height** of  $E$  to be  $\text{ht}_0(E) = \max(4|A^3|, 27B^2)$ . ┘

**Prop. (35.9.2.2) [Elliptic Curves Bounded by Heights].** For  $H \in \mathbb{R}_+$ , denote  $\text{EllCur}_{\leq H}/\mathbb{Q}$  to be the isomorphism classes of elliptic curves over  $\mathbb{Q}$  with statistical height bounded by  $H$ . Then

$$\#\text{EllCur}_{\leq H}/\mathbb{Q} = (2^{4/3}3^{-3/2}\zeta(10)^{-1} + o(1))H^{5/6}.$$

┘

*Proof:* Cf.[Brumer, The average rank of elliptic curves]Lemma4.3. □

**Def. (35.9.2.3) [Statistical Density w.r.t. Heights].** For any set  $S \subset \text{EllCur}/\mathbb{Q}$ , define the **density** of  $S$  to be

$$\lim_{H \rightarrow \infty} \frac{\#S \cap (\text{EllCur}_{\text{ht}_0 \leq H}/\mathbb{Q})}{\#(\text{EllCur}_{\text{ht}_0 \leq H}/\mathbb{Q})}$$

if this limit exists. ┘

**Prop. (35.9.2.4).** For  $F \in \mathbf{GField}$ ,  $\mathbf{P}_{\text{ht}_0}(E \in \mathbf{EllCur} / F : E(F)_{\text{tor}} = 0) = 1$ . ┘

*Proof:* Cf. [BKLPR]Lemma5.7. ? □

**Thm. (35.9.2.5)** [Almost all Elliptic Curves have Surjective Galois-Representations, Duke [Duk97]]. For each  $X \in \mathbb{R}_+$ , let  $\mathbf{EllCur}'_{\leq X}$  be the set of elliptic curves over  $\mathbb{Q}$  with statistical height bounded by  $X$  s.t.  $\rho_{E, \mathbf{A}} : \text{Gal}_{\mathbb{Q}} \rightarrow \prod_{p \in \text{Prime}} \text{GL}(2; E[p])$  is non-surjective, then

$$\lim_{X \rightarrow \infty} \frac{\#\mathbf{EllCur}'_{\leq X}}{\#\mathbf{EllCur}_{\leq X}} = 0.$$

┘

*Proof:* Cf. [Duk97]. ? □

### Statistics for $\text{rank}(E/\mathbb{Q})$

**Conj. (35.9.2.6)** [Minimalist Conjecture, Katz-Sarnak [K-S99]]. The distribution of elliptic curves ordered by conductors satisfies

$$\mathbf{P}_{\text{rank}}(r) = \begin{cases} 0.5 & , r = 0 \\ 0.5 & , r = 1 . \\ 0 & , r \geq 2 \end{cases}$$

In particular,  $\mathbf{E}_{\text{conductor}}(r) = 0.5$ . ┘

*Proof:* □

**Thm& Conj. Cor. (35.9.2.7)** [Bhargava-Shankar].  $\mathbf{E}(r) \leq 0.99$ , if it exists. ┘

*Proof:* □

### Quadratic Twists and Goldfeld's Conjecture

Cf. [Gol79].

**Conj. (35.9.2.8)** [Goldfeld]. For  $E \in \mathbf{EllCur} / \mathbb{Q}$ , consider its twists  $E^{(D)}$  as in (21.3.6.3), then

$$\lim_{X \rightarrow \infty} \frac{\#\{d \in \mathbb{Z}^\times : d \text{ is square-free}, r_{\text{an}}(E^{(d)}) = r, |d| < X\}}{\#\{d \in \mathbb{Z}^\times : d \text{ is square-free}, |d| < X\}} = \begin{cases} 0.5 & r = 0 \\ 0.5 & r = 1 . \\ 0 & r \geq 2 \end{cases}$$

┘

*Proof:* □

**Conj. Cor. (35.9.2.9)** [Weak Goldfeld Conjecture]. For  $E \in \mathbf{EllCur} / \mathbb{Q}$ ,

$$\liminf_{X \rightarrow \infty} \frac{\#\{d \in \mathbb{Z}^\times : d \text{ is square-free}, r_{\text{an}}(E^{(d)}) = r, |d| < X\}}{\#\{d \in \mathbb{Z}^\times : d \text{ is square-free}, |d| < X\}} > 0.$$

┘

**Thm& Conj.Cor.(35.9.2.10) [Kriz-Li].** If  $E \in \text{EllCur}/\mathbb{Q}$  has a rational 3-isogeny, then the weak Goldfeld conjecture(35.9.2.9) is true.

And for the sextic family  $\{y^2 = x^3 + d\}$ , the proportion is  $\geq 1/6$  for  $r = 0$  and  $\geq 1/6$  for  $r = 1$ .  $\lrcorner$

*Proof:* [Daniel Kriz and Chao Li. Goldfeld's conjecture and congruences between Heegner points].  
□

**Thm& Conj.Cor.(35.9.2.11)[Tian-Yuan-Zhang, Smith].** For the sextic family  $\{y^2 = x^3 + d\}$ , the proportion is  $\geq 1/6$  for  $r = 0$  and  $\geq 1/6$  for  $r = 1$ .  $\lrcorner$

*Proof:* [Ye Tian, Xinyi Yuan, and Shou-Wu Zhang. Genus periods, genus points and congruent number problem], [Smith. The congruent numbers have positive natural density]. □

### Statistics for $\text{III}(E/\mathbb{Q})$

**Prop.(35.9.2.12) [Heuristics for  $\text{III}(E/\mathbb{Q})$ ].** For  $E \in \text{EllCur}/\mathbb{Q}$ , denote  $\text{III}_0(E/\mathbb{Q}) = \begin{cases} \text{III}(E/\mathbb{Q}) & , \text{rank}(E) = 0 \\ 0 & , \text{rank}(E) \geq 1 \end{cases}$ . Then if we assume the B-S.D Conjecture for  $E$  and the generalized Riemann hypothesis for  $L(E; s)$ , we have

$$\frac{\mathbf{E}_{E \in \text{EllCur}_{\text{ht}_0 \leq H}}(\text{III}_0(E/\mathbb{Q}))}{H^{1/12}} = 1.$$

$\lrcorner$

*Proof:* Firstly, by the B-S.D conjecture(31.4.1.1), we have(notice if  $\text{rank}(E) = 0$ , then  $\text{Reg}(E/\mathbb{Q}) = 1$ )

$$L(E; 1) = \frac{\text{III}_0(E/\mathbb{Q}) \cdot \Omega \cdot \prod_{p \in \text{Prime}} c_p}{\#E(\mathbb{Q})_{\text{tor}}^2}$$

And

•

□

## 3 Asymptotic Density of Rational Points

References are [Ser97, HB02].

**Conj.(35.9.3.1) [Serre[Ser97]].** For  $F \in \text{NField}$  with  $[F : \mathbb{Q}] = d$  and any integral projective scheme  $V \in \text{Sch}/F$  of degree  $\geq 2$ , there exists  $C \in \mathbb{R}_+$  and  $\gamma \in (0, 1)$  s.t.

$$\#\{x \in V(F), H(x) \leq X\} \leq CX^{d \dim V} \log^\gamma X.$$

$\lrcorner$

*Proof:*

□

**Thm& Conj.Cor.(35.9.3.2) [Uniform Dimension Growth Conjecture, Conjectured by Heath.Brown[HB83]/ Serre[Ser08], Cohen/Serre[Ser97]/Heath.Brown[HB02]/ Brown-ing-Heath.Brown-Salberger[BHBS]/Salberger[Sal07, Sal23]].** For any integral projective scheme  $V \subset \mathbb{P}^N$  of degree  $d \geq 2$  and  $\varepsilon \in \mathbb{R}_+$ , there exists  $C_{d,N,\varepsilon} \in \mathbb{R}_+$  s.t.

$$\#\{x \in V(F), H(x) \leq X\} \leq C_{d,N,\varepsilon} X^{d \dim V + \varepsilon}.$$

$\lrcorner$

*Proof:* ?

□

**Lemma (35.9.3.3).** If  $Z \in \text{Sch}^{\text{ft,sep}}/\mathcal{O}_F$  with  $Z_F \in \text{Var}/F$  and  $f : Z \rightarrow \mathbb{A}^n \in \text{Sch}/\mathcal{O}_F$  is a finite morphism of degree  $r \geq 2$  and  $M = f(Z(\mathcal{O}_F))$ , then there exists  $F_f/F \in \text{GalField}^{\text{fin}}$  and a constant  $c_f \in (0, 1)$  s.t. if  $v \in \text{Spl}_F(F_f)$ , then the image  $M_v$  of  $M$  in  $\mathbb{A}^n(\kappa_v)$  satisfies:

$$\#M_v \leq (1 - \frac{1}{r!}) \|v\|^n + O(\|v\|^{n-1/2}).$$

┘

*Proof:*  $R(Z)$  is a finite separable field extension of  $F(T_1, \dots, T_n)$ , and let  $\Omega = \widetilde{R(Z)}/F(T_1, \dots, T_n)$ . Denote  $G = \text{Gal}(\Omega/F(T_1, \dots, T_n))$  and  $H = \text{Gal}(\Omega/R(Z))$ .

Let  $F_f$  be the normalization of  $F$  in  $\Omega$ , and let  $Z_\Omega$  be the normalization of  $Z$  in  $\Omega$ . Because finite étale is fiber-wise, there exists an open subset  $U \subset \mathbb{A}^n$  s.t. the preimages  $U_Z \subset Z$  and  $U_\Omega \subset Z_\Omega$  is finite étale over  $U$ .

For  $v \in \text{Spl}_F(F_f)$ , we show that the image of  $U_Z(\kappa(v))$  in  $U(\kappa(v))$  has cardinality  $\leq (1 - 1/r!) \|v\|^n + O(\|v\|^{n-1/2})$ . We may base change to  $F_f$  as  $v$  is split. Thus  $(U_Z)_{F_f}$  and  $(U_\Omega)_{F_f}$  are both geo.irreducible over  $F_f$ , and we can use the Lang-Weil estimate (31.1.3.9)(7.12.5.5). As  $U_\Omega/U_Z$  is finite étale with Galois group  $H$ , the image of  $U_\Omega(\kappa(v))$  in  $U_Z(\kappa(v))$  has cardinality  $\frac{1}{\#H} \|v\|^n + O(\|v\|^{n-1/2})$  (because étale implies these local extension are unramified). Similarly, the image of  $U_\Omega(\kappa(v))$  in  $U(\kappa(v))$  has cardinality  $\frac{1}{\#G} \|v\|^n + O(\|v\|^{n-1/2})$ . Thus the image of  $U_\Omega(\kappa(v))$  in  $U(\kappa(v))$  has cardinality at most

$$\left(1 + \frac{1}{\#G} - \frac{1}{\#H}\right) \|v\|^n + O(\|v\|^{n-1/2}) = \left(1 - \frac{r-1}{\#G}\right) \|v\|^n + O(\|v\|^{n-1/2}) \leq \left(1 - \frac{1}{r!}\right) \|v\|^n + O(\|v\|^{n-1/2}).$$

□

**Cor. (35.9.3.4).** If  $F \in \text{NField}$  and  $n \in \mathbb{Z}_+$ , then for any subset  $M \subset \mathbb{P}^n(F)$  which is a thin set in  $\mathbb{P}^n$  (20.1.2.1) and  $\emptyset \subset_{\text{fin}} T \subset \Sigma_F^{\text{fin}}$ , there exists  $\emptyset \subset_{\text{fin}} S \subset \Sigma_F^{\text{fin}}$  s.t.  $S \cap T = \emptyset$ , and the reduction of  $M$  to

$$\prod_{v \in S} \mathbb{P}^n(\kappa_{v_i})$$

is not surjective.

┘

*Proof:* By (20.1.2.3), it suffice to prove for  $M$  of type 1 or type 2. If  $M$  is of type 1, then the projection of  $M$  to  $\mathbb{P}^n(\kappa_v)$  is not surjective for a.e.  $v \in \Sigma_F^{\text{fin}}$ . If  $M$  is of type 2, then up to type 1 thin sets, we may assume that  $M = \mathcal{O}_F \cap f(Z(F))$  for some finite morphism  $f : Z \rightarrow \mathbb{A}^n \in \text{Sch}^{\text{ft,sep}}/F$  of degree  $\geq 2$ . By changing  $Z$ , we may also assume that  $M = f(Z(\mathcal{O}_F))$  for some finite morphism  $f : Z \rightarrow \mathbb{A}^n \in \text{Sch}^{\text{ft,sep}}/\mathcal{O}_F$  of degree  $\geq 2$  (by writing  $R(Z)$  as a finite field extension of  $F(T_1, \dots, T_n)$  and make the defining function monic). By the same reasoning as in (20.1.2.3), we may assume that  $Z_F \in \text{Var}/F$ . Then the assertion follows from (35.9.3.3) and Chebotarev density theorem (19.7.5.2). □

**Prop. (35.9.3.5) [Distribution of Integral Points on Affine Thin Sets, Cohen].** If  $F \in \text{NField}$  with  $[F : \mathbb{Q}] = d$  and  $n \in \mathbb{Z}_+$ , then for any subset  $M \subset \mathcal{O}_F^n$  which is a thin set in  $\mathbb{A}_F^n$  (20.1.2.1), there exists  $C \in \mathbb{R}_+$  and  $\gamma \in (0, 1)$  s.t. for any  $X \in \mathbb{R}_+$ , we have

$$\#\{x \in M, \overline{|x|} \leq X\} \leq CX^{(n-1/2)d} \log^\gamma X \quad (20.2.1.13).$$

┘

*Proof:* The assertion is trivial for type 1 thin sets. So up to type 1 thin sets, we may assume that  $M = \mathcal{O}_F \cap f(Z(F))$  for some finite morphism  $f : Z \rightarrow \mathbb{A}^n \in \text{Sch}^{\text{ft,sep}}/F$  of degree  $\geq 2$ . By changing  $Z$ , we may also assume that  $M = f(Z(\mathcal{O}_F))$  for some finite morphism  $f : Z \rightarrow \mathbb{A}^n \in \text{Sch}^{\text{ft,sep}}/\mathcal{O}_F$  of degree  $\geq 2$  (by writing  $R(Z)$  as a finite field extension of  $F(T_1, \dots, T_n)$  and make the defining function monic). By the same reasoning as in (20.1.2.3), we may assume that  $Z_F \in \text{Var}/F$ .

By the large sieve inequality (35.1.6.14), for any  $X \in \mathbb{R}_+$ , we have

$$\#\{x \in M, \overline{|x|} \leq X\} \leq c_{F,n} X^{nd} / L(X^{d/2}),$$

where

$$L(Q) = \sum_{\substack{\mathfrak{a} \in \text{Ideal}^\times(\mathcal{O}_F)^\flat \\ \|\mathfrak{a}\| \leq Q}} \prod_{v \in S(\mathfrak{a})} \frac{w_v}{1 - w_v}, \text{ where } 1 - w_v = \frac{\#M_v}{\|v\|^n}.$$

and  $c_{F,n}$  depends only on  $F$  and  $n$ . Then it suffices to prove that  $L(Q) \geq Q / \log^\gamma Q$  for some  $\gamma \in (0, 1)$ . Notice

$$L(Q) \geq L'(Q) \triangleq \sum_{\substack{\mathfrak{a} \in \text{Ideal}^\times(\mathcal{O}_F)^\flat \\ \|\mathfrak{a}\| \leq Q}} \prod_{v \in S(\mathfrak{a})} c_v, \text{ where } c_v = \begin{cases} \frac{\|v\|^n}{\#M_v} - 1 & , v \in \text{Spl}_F(F_f) \\ 0 & , v \notin \text{Spl}_F(F_f) \end{cases}.$$

By (35.9.3.3), for any  $v \in \text{Spl}_F(F_f)$ ,

$$c_v \geq c + O(\|v\|^{-1/2}), \text{ where } c = \frac{1}{r! - 1}.$$

Then we can choose  $c'_v \in \mathbb{R}_+$  for each  $v \in \text{Spl}_F(F_f)$  s.t.  $c_v \geq c'_v$  and  $c'_v = c + O(\|v\|^{-1/2})$ .

Define  $L$ -functions

$$f_1(s) = \prod_{v \in \text{Spl}_F(F_f)} (1 + c'_v \|v\|^{-s}), \quad f_2(s) = \prod_{v \in \text{Spl}_F(F_f)} (1 - \|v\|^{-s})^{-c},$$

then  $f_1(s) \geq f_2(s)g(s)$ , where  $g(s) = \exp(h(s))$  and  $h(s)$  is an  $L$ -function that converges for  $\text{Re}(s) > 1/2$ . Thus by Chebotarev density theorem (19.7.5.4),

$$f_1(s) \sim \kappa_1 f_2(s) \sim \kappa_2 \zeta_{F_f}^{c/[F_f:F]} \sim \kappa_3 \frac{1}{(s-1)^{c/[F_f:F]}}, \text{ where } \kappa_i \in \mathbb{C}^\times, s \rightarrow 1.$$

Thus by Ikehara-Delange Tauberian theorem (35.1.1.5), we have

$$L'(Q) \geq \sum_{n \in [Q]_+} a_n(f_1) \sim \frac{\kappa_3}{\Gamma(c/[F_f:F])} \frac{Q}{\log^{1-c/[F_f:F]} Q}.$$

□

**Cor. (35.9.3.6) [Distribution of Integral Points on Affine Varieties].** If  $F \in \text{NField}$  with  $[F : \mathbb{Q}] = d$  and  $N \in \mathbb{Z}_+$ , then for any integral closed subscheme  $V \subset \mathbb{A}_F^n$  that is not a linear subspace, there exists  $C \in \mathbb{R}_+$  and  $\gamma \in (0, 1)$  s.t. for any  $X \in \mathbb{R}_+$ , we have

$$\#\{x \in V(\mathcal{O}_F), \overline{|x|} \leq X\} \leq CX^{d(\dim V - 1/2)} \log^\gamma X \text{ (20.2.1.13)}.$$

┘

*Proof:* By Noetherian normalization (5.2.4.22), we can find  $\dim(V)$ -many coordinates s.t. the projection onto these coordinate is a finite map, and the hypothesis implies that  $\text{pr}(V(K))$  is a thin set (20.1.2.1), because there are no rational sections. Thus the assertion follows from (35.9.3.5).  $\square$

**Cor. (35.9.3.7) [Distribution of Rational Points on Projective Thin Sets].** If  $F \in \mathbf{NField}$  with  $[F : \mathbb{Q}] = d$  and  $n \in \mathbb{Z}_+$ , then for any thin subset  $M \subset \mathbb{P}^n(F)$  (20.1.2.1), there exists  $C \in \mathbb{R}_+$  and  $\gamma \in (0, 1)$  s.t. for any  $X \in \mathbb{R}_+$ , we have

$$\#\{x \in M, H(x) \leq X\} \leq CX^{d(n+1/2)} \log^\gamma X.$$

┘

*Proof:* Consider

$$M' = \{(x_0, \dots, x_n) \in \mathcal{O}_F^{\oplus(n+1)} \setminus 0 \mid \overline{(x_0, \dots, x_n)} \in M\}.$$

Then by (20.2.1.14), there exists  $c = c(F, n)$  s.t.

$$\#\{x \in M, H(x) \leq X\} \leq \#\{x' \in M', \lceil x' \rceil \leq cX\}.$$

Thus the assertion follows from (35.9.3.5).  $\square$

**Cor. (35.9.3.8) [Distribution of Rational Points on Projective Varieties].** If  $F \in \mathbf{NField}$  with  $[F : \mathbb{Q}] = d$  and  $N \in \mathbb{Z}_+$ , then for any integral projective variety  $V$  of degree  $\geq 2$ , there exists  $C \in \mathbb{R}_+$  and  $\gamma \in (0, 1)$  s.t. for any  $X \in \mathbb{R}_+$ , we have

$$\#\{x \in V(F), H(x) \leq X\} \leq CX^{d(\dim V + 1/2)} \log^\gamma X.$$

┘

*Proof:* By Noetherian normalization (5.2.4.22), we can find  $\dim V$ -many coordinates s.t. the projection onto these coordinate is a finite map, and the hypothesis implies that  $\text{pr}(V(K))$  is a thin set (20.1.2.1), because there are no rational sections. Thus the assertion follows from (35.9.3.7).  $\square$

### Manin's Conjecture

## 35.10 Sato-Tate Conjecture

### 1 Modular Forms

References are [M-M10].

**Thm. (35.10.1.1) [Chebotarev-Sato-Tate for Modular Forms].** For  $f \in \text{SF}_k^{\text{new}}(\Gamma_0(N))$ , suppose that the  $\ell$ -adic Galois representation  $\rho_{\ell,f}$  attached to  $f$  is not dihedral, then when  $p \in \text{Prime}$  varies,  $a_p/2p^{\frac{k-1}{2}}$  are equidistributed in  $[-1, 1]$  with density measure  $\sqrt{1-t^2}dt$ .  $\square$

*Proof:* ?  $\square$

**Cor. (35.10.1.2) [Chebotarev-Sato-Tate [Tat65b], Clozel-Harris-Shepherd-Barron-Taylor].** Let  $F \in \text{NField}$  be totally real and  $E \in \text{EllCur}/F$ . For any  $v \in \Sigma_F^{\text{fin}}$ , define  $a_v = q_v + 1 - \#\tilde{E}_v(\kappa_v)$ , then by Weil conjecture,  $|a_v| \leq 2\sqrt{q_v}$ . Let  $a_v/2\sqrt{q_v} = \cos \theta_v$ ,  $0 \leq \theta \leq \pi$ . Then for any finite solvable Galois extension  $E/F$  and any conjugacy class  $C$  of  $\text{Gal}(E/F)$ , the density of  $v \in \Sigma_F^{\text{fin}}$  s.t.  $(v, E/F) \in C$  and  $\theta_v \in [\alpha, \beta]$  for  $0 \leq \alpha < \beta \leq \pi$  has density

$$\frac{2\#C}{\pi} \int_{\alpha}^{\beta} \sin^2 \theta d\theta.$$

Remark: We can also consider the joint distribution of the angles for two non-isogenous elliptic curves  $E_1, E_2$ , then by Tauberian theorems in [Serre, Abelian  $\ell$ -adic representations and elliptic curves], this amounts to prove prime number theorem for the tensor product of the symmetric powers of  $E_1$  and  $E_2$ . ?  $\square$

*Proof:* [Clozel-Harris-Taylor, Automorphy for some  $\ell$ -adic lifts of automorphic mod  $\ell$  representations], [A family of Calabi-Yau varieties and potential automorphy] ?.

By (3.4.1.3) and Weierstrass approximation theorem, it suffices to show that for any  $k \in \mathbb{Z}_+$ , we can find  $m, n \in \mathbb{N}$  s.t.  $m \neq n, m+n = k$ , and that

$$\lim_{X \rightarrow \infty} \frac{1}{\pi(X)} \sum_{p \leq X, p \in \text{Prime}} S_m(\cos \theta_p) S_n(\cos \theta_p) = 0.$$

By (35.10.1.3), it suffices to show the prime number theorem for  $L(\text{Sym}^m(E) \otimes \text{Sym}^n(E); s)$ .

It follows from (35.10.1.4) that  $\text{Sym}^m(E)$  and  $\text{Sym}^n(E)$  are jointly automorphic over a totally real Galois extension  $E/F$ . Then we can use [Arthur-Clozel] theory of base change to show that for any subfield  $F' \subset F$ , if  $\text{Gal}(F'/F)$  is solvable, then  $\text{Sym}^m(E)$  and  $\text{Sym}^n(E)$  are automorphic over  $F'$ . ?

Now use Brauer induction to write

$$1_{\text{Gal}(E/F)} = \sum_i a_i \text{Ind}_{H_i}^{\text{Gal}(E/F)} \psi_i$$

where  $a_i \in \mathbb{Z}$ ,  $H_i \subset \text{Gal}(E/F)$  are nilpotent subgroups of  $G_i$ ,  $\psi_i \in H_i^{\vee}$ . Then by Frobenius reciprocity and invariance of  $L$ -function under inductions, we have

$$\begin{aligned} L(\text{Sym}^m(E); s) &= \prod_i L(\text{Sym}^m(E) \otimes \text{Ind}_{H_i}^{\text{Gal}(E/F)} \psi_i; s)^{a_i} \\ &= \prod_i L(\text{Ind}_{H_i}^{\text{Gal}(E/F)} (\text{Sym}^m(E)|_{L^{H_i}} \otimes \psi_i); s)^{a_i} \end{aligned}$$

$$= \prod_i L(\mathrm{Sym}^m(E)|_{L_{H_i}} \otimes \psi_i; s)^{a_i}$$

Now by Jacquet-Shahidi(35.4.4.6), each term on the RHS is analytic and non-vanishing on  $\mathrm{Re}(s) \geq 1$ , thus so is the LHS.  $\square$

**Lemma (35.10.1.3) [Ikehara].** For  $m < n \in \mathbb{N}$ , if the prime number theorem holds for  $L(\mathrm{Sym}^m(E) \otimes \mathrm{Sym}^n(E); s)$  (i.e. holomorphic and non-vanishing for  $\mathrm{Re}(s) \geq 1$ ), then

$$\lim_{X \rightarrow \infty} \frac{1}{\pi(X)} \sum_{p \leq X, p \in \text{Prime}} S_m(\cos \theta_p) S_n(\cos \theta_p) = 0.$$

┘

*Proof:*

$\square$

**Lemma (35.10.1.4) [Potential Automorphy].** For any  $E \in \mathrm{EllCur}/\mathbb{Q}$  and  $m \in \mathbb{Z}_+$ , the symmetric power  $\mathrm{Sym}^m(H^1(E, \mathbb{Q}_\ell))$  is strongly potentially cuspidal automorphic(30.1.4.2).  $\square$

*Proof:* ? Cf.[Maz08]P223.

To show this fact, we need to use a Galois deformation theorem and a prime hopping method applied to a compatible family of  $n+1$  dimensional representations occurring as subquotients of the compatible family of Galois representations attached to the middle dimensional cohomology of  $Y_{t_0}$  where

$$Y_t : X_0^{n+1} + \dots + X_n^{n+1} = t(n+1)X_0X_1 \dots X_n.$$

$\square$

**Cor. (35.10.1.5) [Birch].** Given  $p \in \mathbf{P}$ , for any  $E \in \mathrm{EllCur}/\mathbb{F}_p$ , define  $a_v(E) = p+1 - \#E(\mathbb{F}_p)$  and  $a_v(E)/2\sqrt{p} = \cos \theta_p(E)$ ,  $0 \leq \theta \leq \pi$ . Then the distribution density of

$$\{\theta_p(E)\}_{E \in \mathrm{EllCur}/\mathbb{F}_p}$$

tends to  $\frac{2}{\pi} \sin^2 \theta$  for  $p \rightarrow \infty$  when  $p \rightarrow \infty$ .  $\square$

*Proof:* ?  $\square$

**Cor. (35.10.1.6).** Let  $\tau(n)$  be the Ramanujan's  $\tau$ -function, then  $\{\tau(p)/2p^{11/2}\}_{p \in \text{Prime}}$  are equidistributed in  $[-1, 1]$  w.r.t. the measure  $\frac{2}{\pi} \sqrt{1-t^2} dt$ .  $\square$

*Proof:* Cf.[A family of Calabi-Yau varieties and potential automorphy, 2, Lamb-Geraghty-Harris-Taylor]P32.  $\square$

### Independence of the Distributions

References are [Harris, Potential automorphy of odd-dimensional symmetric powers of elliptic curves].

## 2 Sato-Tate Groups

References are [Sato-Tate Groups, Kedlaya].

### More Serre-Tate Conjectures

**Remark (35.10.2.1).** For  $f \in \mathrm{SF}_k^{\mathrm{new}}(\Gamma_0(N))$  with associated automorphic representation  $\Pi$ , the Sato-Tate theorem (35.10.1.1) is equivalent to the assertion that  $\rho_{\ell,f}(\sigma_p)$  is equidistributed in the space of conjugacy classes of  $\mathrm{SU}(2)$ .

For a general motive  $M$ ,  $\mathrm{SU}(2)$  is replaced by the derived subgroup of the compact real form of the Mumford-Tate group  $\mathrm{MT}(M)$ . And to prove the Sato-Tate conjecture for  $M$ , one needs to prove that  $\sigma \circ \rho_{\ell,f}$  is potentially automorphic for any irreducible  $\overline{\mathbb{Q}}_\ell$ -representation  $\sigma$  of  $\mathrm{MT}(M)^\vee$ . But in general, this is not Hodge-Tate regular if  $\mathrm{MT}(M)^\vee$  has  $\mathrm{rank} > 1$ .  $\lrcorner$

### 35.11 Subconvexity Problems

References are [I-S00, M-V06].

Subconvexity problem investigates the growth of absolute values of  $L$ -functions along the central line.

**Notation (35.11.0.1).**

- Let  $F \in \mathbf{NField}$ .
- Let  $n \in \mathbb{Z}_+$ .
- Let  $\pi \in \mathrm{Irr}^{\mathrm{cusp}}(\mathrm{GL}(n)/F)$ .

┘

**Def. (35.11.0.2) [Analytic Conductors].** For an analytic  $L$ -function  $(L(f; s), L_\infty(f; s), N(f))$  of degree  $d \in \mathbb{Z}_+$  (29.5.1.1), the **analytic conductor** for  $L(f; s)$  is defined to be the function

$$C_\infty(f; s) = \prod_{i=1}^d (3 + |\kappa_i + s|), \quad C(f; s) = N(f)C_\infty(f; s).$$

And also denote  $C(f) = C(f; 0)$ .

┘

**Prop. (35.11.0.3) [Bounding Gamma Factors].** If  $f$  is an analytic  $L$ -function of degree  $d$  with local parameters  $\{\kappa_i\}$  at  $\infty$ , then for  $-1/2 \leq \mathrm{Re}(s) < 2$ , when  $s = \sigma + it$  and  $\lim |s| \rightarrow \infty$ , we have

$$|L_\infty(f; s)| \prod_i |s + \kappa_i| \sim C_\infty(f; s)^{\frac{1}{2}(\kappa + \sigma + 1)} \exp \left( -\frac{\pi}{4} \sum_i |t + \mathrm{Im}(\kappa_i)| + C_d \right),$$

where  $\kappa = (\sum_i \mathrm{Re}(\kappa_i))/d$  and  $C_d$  is a constant depending on  $d$ . And

$$\frac{L_\infty(1-s)}{L_\infty(s)} \sim C_\infty(f; s)^{\frac{1}{2}-\sigma} \prod_j \frac{s + \kappa_j}{1 - s + \kappa_j}.$$

┘

*Proof:* This follows from Stirling's formula (12.6.1.16). □

**Prop. (35.11.0.4) [Polynomial Growth on Vertical Strips].** Any analytic  $L$ -function  $L(f; s)$  has uniformly polynomial growth on vertical strips  $a \leq \mathrm{Re}(s) \leq b$  for any  $a < b \in \mathbb{R}$ . ┘

*Proof:* For any  $\varepsilon > 0$ ,  $L(f; s)$  is bounded on  $\{s \in \mathbb{C} : \mathrm{Re}(s) > 1 + \varepsilon\}$ , and then it is also polynomially bounded on the half-plane  $\{s \in \mathbb{C} : \mathrm{Re}(s) < \varepsilon\}$  by functional equation and (35.11.0.3). Then the assertion now follows from the Phragmen-Lindelöf principle (12.4.5.7). □

**Thm. (35.11.0.5) [Approximate Functional Equations].** If  $L(f; s)$  is an analytic  $L$ -function of degree  $d$  and  $G(u)$  is any even function that is holomorphic and bounded on the vertical strip  $-4 < \mathrm{Re}(s) < 4$  with  $G(0) = 1$ , then for any  $X \in \mathbb{R}_+$  and  $s \in \mathbb{C}$  s.t.  $0 \leq \mathrm{Re}(s) \leq 1$ , we have

$$L(f; s) = \sum_{n \in \mathbb{Z}_+} \frac{a_f(n)}{n^s} V_s \left( \frac{n}{X \sqrt{N(f)}} \right) + \Upsilon(f; s) \sum_{n \in \mathbb{Z}_+} \frac{\overline{a_f(n)}}{n^{1-s}} V_{1-s} \left( \frac{nX}{\sqrt{N(f)}} \right) + R,$$

where  $V_s(y) \in C^\infty(\mathbb{R}_+)$  is defined by

$$V_s(y) = \frac{1}{2\pi i} \int_{\operatorname{Re}(s)=3} y^{-u} G(u) \frac{L_\infty(f; s+u)}{L_\infty(f; s)} \frac{du}{u},$$

and

$$\Upsilon(f; s) = w(f) N(f)^{\frac{1}{2}-s} \frac{L_\infty(f; 1-s)}{L_\infty(f; s)}.$$

$$R = (\operatorname{Res}_{u=1-s} + \operatorname{Res}_{u=-s}) \left( \frac{\Lambda(f; s+u)}{N(f)^{s/2} L_\infty(f; s)} \frac{G(u)}{u} X^u \right),$$

which vanishes when  $f$  is entire.  $\lrcorner$

*Proof:* Consider the integral

$$I(X, f; s) = \frac{1}{2\pi i} \int_{\operatorname{Re}(s)=3} X^u \Lambda(f; s+u) G(u) \frac{du}{u},$$

which is absolutely convergent because  $\Lambda(f; s)$  decays rapidly on vertical strips by (35.11.0.3) and (35.11.0.4). Plug in functional equation into  $I(X^{-1}, \bar{f}, 1-s)$  and move the integration to the line  $\operatorname{Re}(s) = -3$  using Residue theorem, we get

$$\Lambda(f; s) = I(X, f, s) + w(f) I(X^{-1}, \bar{f}, 1-s) + N(f)^{s/2} L_\infty(f; s) R. \quad (\star)$$

Expanding  $\Lambda(f; s)$  into absolutely convergent Dirichlet series, we get

$$\begin{aligned} I(X, f, s) &= N(f)^{s/2} \sum_{n \in \mathbb{Z}_+} \frac{\lambda_f(n)}{n^{-s}} \frac{1}{2\pi i} \int_{\operatorname{Re}(s)=3} L_\infty(f; s+u) \left( \frac{X \sqrt{N(f)}}{n} \right)^u G(u) \frac{du}{u} \\ &= N(f)^{s/2} L_\infty(f; s) \sum_{n \in \mathbb{Z}_+} \frac{\lambda_f(n)}{n^{-s}} V_s \left( \frac{n}{X \sqrt{N(f)}} \right), \end{aligned}$$

And  $V_s(y)$  is smooth because it is absolutely convergent. We can do the same for  $I(X^{-1}, \bar{f}, 1-s)$ , and the the assertion follows from  $(\star)$  above.  $\square$

**Cor. (35.11.0.6) [Central Value Formulae].** For  $f \in \operatorname{SF}_2^{\text{new}}(\Gamma(N))$  and  $X \in \mathbb{R}_+$ , we have

$$L(f; \frac{1}{2}) = \sum_{n \in \mathbb{Z}_+} \frac{a_f(n)}{\sqrt{n}} \exp \left( -\frac{2\pi n}{X \sqrt{N}} \right) + w(f) \sum_{n \in \mathbb{Z}_+} \frac{\overline{a_f(n)}}{\sqrt{n}} \exp \left( -\frac{2\pi n X}{\sqrt{N}} \right).$$

$\lrcorner$

*Proof:* In (35.11.0.5), take  $G(u) = 1$ , then  $L_\infty(f; s) = L_{\mathbb{C}}(s)$ , and

$$V_s(y) = e^{-2\pi y}.$$

$\square$

**Cor. (35.11.0.7) [A Choice of  $G(u)$ ].** Situation as in (35.11.0.5), suppose the local parameters  $\{\kappa_i\}$  of  $f$  at  $\infty$  and  $s \in \mathbb{C}$  s.t.  $0 \leq \operatorname{Re}(s) \leq 1$  with  $\operatorname{Re}(s + \kappa_i) \geq 3\alpha \in \mathbb{R}_+$  for any  $i \in [d]_+$ . For  $A \in \mathbb{Z}_+$ , if we take  $G(u) = \cos(\frac{\pi u}{4A})^{-4dA}$ , then the derivatives of  $V_s(y)$  satisfies:

$$y^a V_s^{(a)}(y) \ll_{\alpha, a, A, d} \left(1 + \frac{y}{\sqrt{C_\infty(f)}}\right)^{-A},$$

$$y^a V_s^{(a)}(y) = \delta_{a,1} + O_{\alpha, a, A} \left( \left( \frac{y}{\sqrt{C_\infty(f)}} \right)^\alpha \right).$$

┘

*Proof:* For  $s, u \in \mathbb{C}$  with  $\operatorname{Re}(s) = \sigma > 0$  and  $\operatorname{Re}(u) = \beta > -\sigma$ , we have

$$\frac{\Gamma(s+u)}{\Gamma(s)} \ll \frac{|s+u|^{\sigma+\beta-\frac{1}{2}}}{|s|^{\sigma-\frac{1}{2}}} \exp\left(\frac{\pi}{2}(|s| - |s+u|)\right) \ll_{\sigma, \beta} (|s| + 3)^\beta e^{\pi|u|/2}.$$

Hence

$$\frac{L_\infty(f; s+u)}{L_\infty(f; s)} \ll_{\alpha, \beta} C_\infty(f)^{\beta/2} e^{\pi d|u|/2}.$$

Now

$$y^a V_s^{(a)}(y) = \frac{1}{2\pi i} \int_{u=3} y^{-u} G(u) (-u)^a \frac{L_\infty(f; s+u)}{L_\infty(f; s)} \frac{du}{u}.$$

Moving the integration to the line  $\operatorname{Re}(u) = \beta = -\alpha$  or  $\operatorname{Re}(u) = A$ , we get the desired assertion. ?

□

**Thm. (35.11.0.8) [Convexity Bound].** If  $L(f; s)$  is an analytic  $L$ -function of degree  $d$ , then for any  $\varepsilon \in \mathbb{R}_+$ , there exists  $\kappa_{f, \varepsilon} \in \mathbb{R}_+$  s.t. for any  $s = \sigma + it \in \mathbb{C}$  with  $0 \leq \sigma \leq 1$ , we have

$$\left| \left( \frac{s+1}{s-1} \right)^{\operatorname{ord}_{s=1} L(f; s)} L(f; s) \right| \leq \kappa_{f, \varepsilon} C(f; s)^{\frac{1-\sigma}{2} + \varepsilon}.$$

In particular, for  $\sigma = 1/2$ , we have

$$|L(f; s)| \leq \kappa_{f, \varepsilon} C(f; s)^{\frac{1}{4} + \varepsilon}.$$

And if  $f$  satisfies the generalized Ramanujan-Selberg conjecture (35.8.0.1), then there exists  $\kappa_d \in \mathbb{R}_+$  s.t. for  $\sigma = 1/2$ , we have

$$|L(f; s)| \leq \kappa_d C(f; s)^{1/4} \log(C(f; s))^{d-1}.$$

┘

*Proof:* The desired bound holds for  $\sigma = 1 + 2\varepsilon$  because  $L(f; s)$  is absolutely convergent there. And it also holds for  $\sigma = -2\varepsilon$  by functional equation and (35.11.0.3). Thus it holds for all  $\sigma$  by Phragmen-Lindelöf (12.4.5.7).

If the generalized Ramanujan-Selberg conjecture holds, use the approximate Functional equation ?. □

**Cor. (35.11.0.9).** For Dirichlet characters, the Ramanujan-Selberg conjecture trivially holds, so there exists  $\kappa \in \mathbb{R}_+$  s.t. for any  $N \in \mathbb{Z}_+$  and  $\chi \in \operatorname{Dir}'(N)$ , we have

$$|L(\chi; s)| \leq \kappa(N|s|)^{1/4}.$$

┘

Lindelöff Hypothesis

**Conj. (35.11.0.10) [Lindelöff Hypothesis].** For any  $\varepsilon \in \mathbb{R}_+$ , there exists  $\kappa_{\pi,\varepsilon} \in \mathbb{R}_+$  s.t.

$$\left| L\left(\pi; \frac{1}{2} + it\right) \right| \leq \kappa_{\pi,\varepsilon} C(\pi; t)^\varepsilon \text{ (35.11.0.2)}$$

for any  $t \in \mathbb{R}$ . ┘

*Proof:* □

**Remark (35.11.0.11).** The Lindelöff hypothesis follows from GRH. ? ┘

**Conj. Cor. (35.11.0.12) [Subconvexity].** There exists  $\delta \in \mathbb{R}_+$  and  $\kappa_{\pi,\delta} \in \mathbb{R}_+$  s.t.

$$\left| L\left(\pi; \frac{1}{2} + it\right) \right| \ll \kappa_{\pi,\delta} C(\pi; t)^{\frac{1}{4}-\delta}.$$

*Proof:* ? □

**Thm& Conj. Cor. (35.11.0.13) [Convexity Bound].** It follows from the functional equation and the Phragmen-Lindelöff principle that for any  $\varepsilon \in \mathbb{R}_+$ , there exists  $\kappa_{\pi,\varepsilon} \in \mathbb{R}_+$  s.t.

$$\left| L\left(\pi; \frac{1}{2} + it\right) \right| \leq \kappa_{\pi,\varepsilon} C(\pi; t)^{\frac{1}{4}+\varepsilon}$$

for any  $t \in \mathbb{R}$ . ┘

*Proof:* ? Cf. [Upper and lower bounds at s=1 for certain Dirichlet series with Euler product]. □

### Period Approach to Subconvexity

#### 3 Bounds on Fourier Coefficients

**Thm. (35.11.3.1)** [Iwaniec[Iwa87]/Duke[Duk88]]. Let  $F(z) = \sum_{n \in \mathbb{Z}_+} a(n) e^{2\pi i n z}$  be a holomorphic cusp form of weight  $k = \ell + \frac{1}{2}$  for  $\Gamma_0(4N)$  with

$$\int_{\widehat{\Gamma}_0(4N) \backslash \mathcal{H}} |F(z)|^2 y^k \frac{dx dy}{y^2} = 1,$$

then

$$a(n) \ll_{k,\varepsilon} n^{k/2-1/4+\varepsilon}.$$

Moreover, if  $k \geq 5/2$  and  $n$  is square-free, then

$$a(n) \ll_{k,\varepsilon} n^{k/2-2/7+\varepsilon}.$$

┘

*Proof:*

□

#### 4 Moments

References are [Integral moments of  $L$ -functions, Conrey-Farmer-Keating-Rubinstein-Snaith] and [Random Matrix Theory and  $L$ -Functions at  $s = 1/2$ , Keating-Snaith], [Random Matrix Theory and  $\zeta(1/2 + it)$ , Keating-Snaith], [Random matrix theory and  $L$ -functions at  $s=1/2$ , Keating-Snaith].

**Def. (35.11.4.1) [Moments of  $L$ -Functions]**. An important problem in analytic number theory is to gain an understanding of the moments

$$\mathbf{M}_\zeta(k; T) = \int_0^T \left| \zeta\left(\frac{1}{2} + it\right) \right|^{2k} dt$$

for  $k \in \mathbb{R}_+$ .

┘

**Conj. (35.11.4.2) [Conjectured by Keating-Saith/Conrey-Keating-Snaith]**.  $\mathbf{M}_\zeta(k; T) \sim C_k T (\log T)^{k^2}$  for some specific  $C_k \in \mathbb{R}_+$ .

┘

*Proof:*

□

### Moments in Families

**Conj. Cor. (35.11.4.3) [Moments for Families of Dirichlet Series]**. For any  $k \in \mathbb{N}$ , there exists  $C_k \in \mathbb{R}_+$  s.t. for  $N \in \mathbb{Z}_+$ ,

$$\sum_{\chi \in \text{Diri}'(N)} \left| L\left(\chi; \frac{1}{2}\right) \right|^{2k} \sim C_k q \log^{k^2} q.$$

┘

*Proof:*

□

**Conj.Cor.(35.11.4.4).** For any  $k \in \mathbb{N}$ , there exists  $C_k \in \mathbb{R}_+$  s.t. for  $X \in \mathbb{R}_+$ ,

$$\sum_{|d| \leq X} L(\chi_d; \frac{1}{2})^k \sim C_k X \log^{k(k+1)/2} X.$$

┘

*Proof:*

□

**Conj.Cor.(35.11.4.5).** For any  $k \in \mathbb{N}$  and a modular new form  $f$ , there exists  $C_k \in \mathbb{R}_+$  s.t. for  $X \in \mathbb{R}_+$ ,

$$\sum_{|d| \leq X} L(f \otimes \chi_d; \frac{1}{2})^k \sim C_k X \log^{k(k-1)/2} X.$$

┘

*Proof:*

□

### Lower Bounds

References are [Lower bounds for moments of  $L$ -functions: symplectic and orthogonal examples, Rudnick-Soundararajan].

**Thm.(35.11.4.6)**[Moments for Families of Dirichlet Series, Rudnick-Soundararajan[R-S05]].

For  $k \in \mathbb{N}$ , there exists  $C_k \in \mathbb{R}_+$  s.t. for any  $q \in \text{Prime}$ ,

$$\sum_{\mathbf{1} \neq \chi \in \text{Diri}(q)} \left| L(\chi; \frac{1}{2}) \right|^{2k} \geq C_k q \log^{k^2} q.$$

┘

*Proof:* Denote  $x = q^{1/(2k)}$  and  $A(\chi) = \sum_{n \in [x]_+} \chi(n) / \sqrt{n}$ . Define

$$S_1 = \sum_{\mathbf{1} \neq \chi \in \text{Diri}(q)} L(\chi; \frac{1}{2}) A(\chi)^{k-1} \overline{A(\chi)}^k, \quad S_2 = \sum_{\mathbf{1} \neq \chi \in \text{Diri}(q)} |A(\chi)|^{2k},$$

then it suffices to show that

$$S_2 \ll q \log^{k^2} q \ll S_1,$$

because then by Hölder' inequality,

$$\sum_{\mathbf{1} \neq \chi \in \text{Diri}(q)} \left| L(\chi; \frac{1}{2}) \right|^{2k} \geq \frac{|S_1|^{2k}}{S_2^{2k-1}} \gg q \log^{k^2} q.$$

Notice that for  $l \in \mathbb{Z}_+$ ,  $A(\chi)^l = \sum_{n \in [x^l]_+} \chi(n) d_l(n; x) / \sqrt{n}$  where  $d_l(n; x)$  is the number of ways to write  $n$  as a sum of an ordered set of  $l$  numbers in  $[x]_+$ .

Because  $A(\mathbf{1}) = O(\sqrt{x})$ , we have

$$S_2 = \sum_{\chi \in \text{Diri}(q)} A(\chi)^{2k} + O(x^k)$$

$$\begin{aligned}
&= \sum_{m,n \leq x^k} \frac{d_k(m; x) d_k(n; x)}{\sqrt{mn}} \sum_{\chi \in \text{Diri}(q)} \chi(m) \bar{\chi}(n) \\
&\text{(orthogonality)} = \phi(q) \frac{d_k(n; x)^2}{n} + O(\sqrt{q}) \\
&\ll \phi(q) \frac{d_k(n)^2}{n} + O(\sqrt{q}) \\
&\text{(35.1.3.14)} = C_k \log^{k^2} y + q \log^{k^2} q.
\end{aligned}$$

For  $S_1$ , by (35.11.4.7), for any  $\mathbf{1} \neq \chi \in \text{Diri}(q)$  and  $X \in \mathbb{R}_+$ , we have

$$L(\chi; \frac{1}{2}) = \sum_{n \in [X]_+} \frac{\chi(n)}{\sqrt{n}} + O\left(\frac{\sqrt{q} \log q}{\sqrt{X}}\right).$$

Then we choose  $X = q \log^4 q$  and obtain

$$\begin{aligned}
S_1 &= \sum_{\mathbf{1} \neq \chi \in \text{Diri}(q)} \sum_{n \in [X]_+} \frac{\chi(n)}{\sqrt{n}} A(\chi)^{k-1} \overline{A(\chi)}^k + O\left(\frac{1}{\log q} \sum_{\mathbf{1} \neq \chi \in \text{Diri}(q)} |A(\chi)|^{2k-1}\right) \\
&= \sum_{\chi \in \text{Diri}(q)} \sum_{n \in [X]_+} \frac{\chi(n)}{\sqrt{n}} A(\chi)^{k-1} \overline{A(\chi)}^k + O\left(\frac{S_2}{\log q} + q \log^2 q\right) \\
&\text{(orthogonality)} = \phi(q) \sum_{b \in [x^k]_+} \sum_{a \in [x^{k-1}]_+, n \in [X]_+, an \equiv b \pmod{q}} \frac{d_{k-1}(a; x) d_k(b; x)}{\sqrt{abn}} + O\left(q \log^{k^2-1} q\right)
\end{aligned}$$

The main contribution comes from the terms with  $an = b$ : These terms sum to

$$\begin{aligned}
&\phi(q) \sum_{b \in [x^k]_+} \frac{d_k(b; x)}{b} \sum_{a \in [x^{k-1}]_+, n \in [X]_+, an=b} + O\left(q \log^{k^2-1} q\right) \\
&\geq \phi(q) \sum_{b \in [x^k]_+} \frac{d_k(b; x)}{b} \sum_{a \in [x^{k-1}]_+, n \in [x]_+, an=b} + O\left(q \log^{k^2-1} q\right) \\
&= \phi(q) \sum_{b \in [x^k]_+} \frac{d_k(b; x)^2}{b} + O\left(q \log^{k^2-1} q\right) \\
&\text{(35.1.3.14)} \geq \phi(q) \sum_{b \in [x]_+} \frac{d_k(b)^2}{b} + O\left(q \log^{k^2-1} q\right) \geq q \log^{k^2} q.
\end{aligned}$$

And for the off-diagonal terms, we write  $an = b + ql$ , where  $l \in [Xx^{k-1}/q]_+ = [x^{k-1} \log^4 q]_+$ , then these terms is bounded by

$$\begin{aligned}
&q \sum_{b \in [x^k]_+} \frac{d_k(b; x)}{\sqrt{b}} \sum_{l \in [x^{k-1} \log^4 q]_+} \frac{1}{\sqrt{ql}} \sum_{an=b+ql} d_{k-1}(a; x) + O\left(q \log^{k^2-1} q\right) \\
&\ll q^{\frac{1}{2}+\varepsilon} x^{\frac{k-1}{2}+\frac{k}{2}} \ll \frac{q}{\log q},
\end{aligned}$$

because  $\sum_{an=b+ql} d_{k-1}(a; x) \leq d_k(b+ql) \ll (ql)^\varepsilon$  for any  $\varepsilon \in \mathbb{R}_+$  (2.6.3.2).

Thus  $S_1 \gg q \log^{k^2} q$  is proved, and the assertion follows.  $\square$

**Lemma (35.11.4.7)[Integral Representation of  $L(\chi; s)$ ].** Let  $q \in \mathbb{Z}_{\geq 2}$ ,  $\chi \in \text{Diri}(q) \setminus \mathbf{1}_q$  and  $X \in \mathbb{R}_+$ , then for any  $s \in \mathbb{C}$  s.t.  $\text{Re}(s) > 1$ , integration by parts gives

$$L(\chi; s) = \sum_{n \in [X]_+} \frac{\chi(n)}{n^s} + \int_X^\infty \frac{1}{y^s} d \left( \sum_{X < n \leq y} \chi(n) \right) = \sum_{n \in [X]_+} \frac{\chi(n)}{n^s} + s \int_X^\infty \frac{\sum_{X < n \leq y} \chi(n)}{y^{s+1}} dy.$$

By Pólya-Vinogradov inequality (35.3.3.4),  $|\sum_{X < n \leq y} \chi(n)| \leq 6\sqrt{q} \log q$ , so the integration extends to an analytic function to  $s \in \mathbb{C}$  s.t.  $\text{Re}(s) > 0$ .  $\lrcorner$

### Upper Bounds

References are [Soundararajan, Moments of the Riemann zeta function].

**Thm. (35.11.4.8)[Moments of Zeta Functions].**  $M_\zeta(1; T) \ll T \log T$  (35.11.4.1).  $\lrcorner$

*Proof:* Cf. [I-K04]P194.  $\square$

**Thm. (35.11.4.9)[Moments for Families of Dirichlet Series].**

$$\sum_{q \leq Q} \sum_{\chi \in \text{Diri}'(q)} \left| L(\chi; \frac{1}{2} + it) \right|^8 \ll Q^2(t^2 + 1) \log^{17}(Q(|t| + 2)).$$

$\lrcorner$

*Proof:* For  $\chi \in \text{Diri}'(q)$  and  $s \in \mathbb{C}$  s.t.  $\text{Re}(s) > 1$ , we have:

$$L(\chi; s)^4 = \sum_{n \in \mathbb{Z}_+} \chi(n) \tau_4(n) n^{-s}.$$

Using approximate functional equation for  $L(\chi; s)^4$  (35.11.0.5) with chosen  $G(u)$  (35.11.0.7), we get

$$L(\chi; \frac{1}{2} + it)^4 = \sum_{n \in \mathbb{Z}_+} \frac{\chi(n) \tau_4(n)}{n^{1/2+it}} V_{1/2+it}(\frac{n}{q^2}) + w_\chi^4 q^{-4it} \frac{L_\infty(\chi; \frac{1}{2} + it)}{L_\infty(\chi; \frac{1}{2} - it)} \sum_{m \in \mathbb{Z}_+} \frac{\bar{\chi}(m) \tau_4(m)}{m^{1/2-it}} V_{1/2-it}(\frac{n}{q^2}),$$

where  $L_\infty(\chi; s) = \pi^{-2s} \Gamma(\frac{s+\kappa}{2})^4$  for  $\kappa = \frac{1-\chi(-1)}{2}$ .

Using the fact  $\tau_4(n) = n^\varepsilon$  and the fact  $V_s(y)$  decay rapidly (35.11.0.7), I can only truncate the summation at  $N = Q^{2+\varepsilon}(t^2 + 1)$  to get the bound

$$\sum_{q \leq Q} \sum_{\chi \in \text{Diri}'(q)} \left| L(\chi; \frac{1}{2} + it) \right|^8 \ll_\varepsilon Q^{2+\varepsilon}(t^2 + 1) \log^{17}(Q(|t| + 2))$$

$\square$

**Thm. (35.11.4.10)[Moments for Families of Modular Forms].** Let  $\mathcal{F}$  be a basis of Hecke eigenforms for  $\text{SF}_2(N)$ , then

$$\sum_{f \in \mathcal{F}} \left| L(f; \frac{1}{2} + it) \right|^8 \ll N(t^2 + 1) \log^{17}(N(|t| + 2)).$$

$\lrcorner$

*Proof:* Cf. [I-K04]P194.  $\square$

## 5 Equidistributions

References are [M-V06].

Subconvexity bounds can be used to prove equidistribution results.

### Quadratic Forms and Heegner Points

**Thm. (35.11.5.1)** [Linnik[Lin55, Lin60]/Skubenko[Sku62]/Duke[Duk88]].

- For  $d \in \mathbb{Z}_+$  and  $d \not\equiv 0, 1, 4 \pmod{8}$ , when  $d \rightarrow -\infty$ , the set  $\mathcal{G}_d$  which is the projection of the set  $V_d = \{(x, y, z) \in \mathbb{Z}^3, a^2 + b^2 + c^2 = d\}$  onto the unit sphere is equidistributed in  $\mathbb{S}^2$  w.r.t. the Lebesgue measure.
- If  $d \in \mathbb{Z}_+$  is square-free and  $d \equiv 0, 1 \pmod{4}$ , then for any convex subset  $\Omega \subset F$  with smooth boundary (where  $F$  is the standard fundamental domain of  $\Gamma(1)$ ), there exists  $\delta, \kappa \in \mathbb{R}_+$  s.t. :
  - For  $d \rightarrow -\infty$ ,

$$\left( \frac{\#\Lambda_d \cap \Omega}{\#\Lambda_d} - \text{Vol}(\Omega) \right) \leq \kappa |d|^{-\delta},$$

- For  $d \rightarrow +\infty$ ,

$$\left( \frac{\sum_{C \in \Lambda_d} \text{length}(C \cap \Omega)}{\sum_{C \in \Lambda_d} \text{length}(C)} - \text{Vol}(\Omega) \right) \leq \kappa |d|^{-\delta}.$$

┘

*Proof:* ?

□

**Conj. (35.11.5.2)** [Sparse Equidistribution of Heegner Points]. For any  $\eta \in \mathbb{R}_+$ , suppose for each fundamental discriminant  $d < 0$  we are given a Heegner point  $z_{0,d}$  and a subgroup  $G_d \subset \text{Cl}(d)$  with  $\#G_d \geq |d|^\eta$ , then for  $d \rightarrow -\infty$ , the sequence

$$\mathcal{H}'_d = G_d \cdot z_{0,d}$$

is equidistributed on  $Y_0(1)$ .

┘

*Proof:*

□

**Thm& Conj. Cor. (35.11.5.3)** [Harcos-Michel[H-M06]]. There exists  $\eta \in (0, 1)$  s.t. the conjecture (35.11.5.2) holds.

┘

*Proof:*

□

**Conj. (35.11.5.4)** [Mixing Conjecture for Heegner Points]. Suppose for each fundamental discriminant  $d < 0$ , an element  $\sigma_d \in \text{Cl}(d)$  (19.3.3.1) is given s.t. the minimal norm of the integral ideal representing the class  $\sigma_d$  tends to  $\infty$  as  $|d| \rightarrow \infty$ , then the sequence

$$\mathcal{H}''_d = \{(z, \sigma_d z) : z \in \mathcal{H}_d\}$$

is equidistributed on  $Y_0(1) \times Y_0(1)$ .

┘

*Proof:*

### Integers Representable by a Quadratic Form(Hilbert's 11-th Problem)

For  $F \in \mathbf{NField}$ , we ask the question of when an algebraic integer  $\nu$  is representable by a given quadratic form  $f(x_1, \dots, x_n)$ .

For  $n = 2$ , this is solved via class field theory, so we assume that  $n \geq 3$ .

The question of when a given  $\nu$  is representable by a form in the genus of  $f$  is solved by the Siegel's mass formula<sup>?</sup>, which gives the number of solutions in terms of local data, via the product of local masses.

If  $n \geq 3$  and  $f$  is indefinite at an Archimedean place of  $K$ , then Kneser's result [Darstellungsmasse indefiniter quadratischer Formen1961] on the class numbers and the spinor genus of  $f$ <sup>?</sup> shows that essentially there are only one class in the genus of  $f$ .<sup>?</sup>

**Thm. (35.11.5.5)[Siegel's Mass Formula].**

┘

*Proof:*   <sup>?</sup>

## 36 | Computational Number Theory

### 36.1 Computational Number Theory

References are [Princeton Companion] and [Pi and the AGM. A study in Analytic Number theory and computational complexity].

#### 1 Primality Testing

**Algo. (36.1.1.1) [AKS Primality Proving, Agrawal-Kayal-Saxena [AKS04]].** Consider the following algorithm:

**Input:** An integer  $n \in \mathbb{Z}_{\geq 2}$

**Output:** PRIME or COMPOSITE

1. **if**  $n = a^b$  for some  $a \in \mathbb{Z}_+, b \in \mathbb{Z}_{\geq 2}$  **then return** COMPOSITE;
2. Find the smallest number  $r$  s.t.  $\text{ord}_r(n) > \log^2 n$ ;
3. **if**  $1 < \gcd(a, n) < n$  for some  $a \leq r$  **then return** COMPOSITE;
4. **if**  $n \leq r$  **then return** PRIME;
5. **for**  $a \leftarrow 1$  **to**  $\lfloor \sqrt{\varphi(r) \log n} \rfloor$  **do**  
     **if**  $(X + a)^n \not\equiv X^n + a \pmod{(X^r - 1, n)}$  **then return** COMPOSITE;
6. **return** PRIME;

Then for any input  $n \in \mathbb{Z}_+$ , this algorithm returns PRIME iff  $n \in \text{Prime}$ . And its asymptotic time complexity is  $\tilde{O}(\log^{15/2} n)$ .

In particular, deciding the language  $\text{Prime} \subset \mathbb{N}$  is in the class  $P(2.7.4.1)$ . ┘

**Remark (36.1.1.2) [Lenstra-Pomerance, Primality testing with gaussian periods].** has an improvement that has complexity  $\tilde{O}(\log^6 n)$ . ┘

*Proof:* To prove the algorithm is correct: Notice if  $n$  is prime, then it can only return prime. And the converse is proved in (36.1.1.3).

To analyze the asymptotic time complexity, we use [Modern Computer Algebra].

The first step of the algorithm takes asymptotic time  $\tilde{O}(\log^3 n)$ .

For the second step, use (35.5.10.4). To find such an  $r$ , we check for each  $r < \log^{3+\varepsilon}$  and each  $k < \log^2 n$  whether  $r | n^k - 1$ . For each  $r$ , the complexity is  $\tilde{O}(\log^2 n \log r)$ , so the asymptotic complexity is  $\tilde{O}(\log^5 n)$ .

The third step takes asymptotic time  $O(\log^6 n)$ .

The fourth step takes asymptotic time  $O(\log n)$ .

In step 5, we need to verify  $\lfloor \sqrt{\varphi(r) \log n} \rfloor$  equations, each equation requires  $O(\log n)$  multiplications of degree  $r$  polynomials with coefficients of size  $O(\log n)$ . So the asymptotic time is

$$\tilde{O}(r \log^2 n \sqrt{\varphi(r) \log n}) \leq \tilde{O}(r^{3/2} \log^3 n) \leq \tilde{O}(\log^{15/2} n).$$

Thus the total asymptotic time is  $\tilde{O}(\log^{15/2} n)$ .  $\square$

**Lemma (36.1.1.3).** If the AKS algorithm in (36.1.1.1) returns **PRIME**, then  $n$  is a prime.  $\lrcorner$

*Proof:* If it returns at step 4, then step3 implies that  $n$  is a prime. So we assume that it returns at step6. Since  $\text{ord}_r(n) > 1$ , there exists  $p|n$  s.t.  $\text{ord}_r(p) > 1$ . By step3,  $p > r$  and  $(r, n) = 1$ .

Let  $G$  be the subgroup of  $(\mathbb{Z}/r)^*$  generated by  $n$  and  $p$ , with  $\#G > \log^2 n$ . And denote  $\zeta = \zeta_{\text{ord}_r(p)}$  and let  $\mathcal{G}$  be the subgroup of  $\mathbb{F}_p(\zeta)$  generated by  $\zeta, \zeta + 1, \dots, \zeta + \lfloor \sqrt{\varphi(r) \log n} \rfloor$ . Then

$$\begin{aligned} \# \mathcal{G} &\stackrel{(36.1.1.4)}{\geq} \binom{\#G + \lfloor \sqrt{\varphi(r) \log n} \rfloor}{\#G - 1} \\ (\because \#G > \sqrt{\#G \log n}) &\geq \binom{\lfloor \sqrt{\varphi(r) \log n} \rfloor + 1 + \lfloor \sqrt{\#G \log n} \rfloor}{\lfloor \sqrt{\#G \log n} \rfloor} \\ &\geq \binom{2\lfloor \sqrt{\#G \log n} \rfloor + 1}{\lfloor \sqrt{\#G \log n} \rfloor} \\ (12.6.1.20) &> 2^{\lfloor \sqrt{\#G \log n} \rfloor + 1} \\ &\geq n^{\sqrt{\#G}}. \end{aligned}$$

But then by (36.1.1.4),  $n \in p^{\mathbb{Z}_+}$ . So in view of step1,  $n = p \in \mathbf{Prime}$ .  $\square$

**Lemma (36.1.1.4).** Let  $G, \mathcal{G}$  be the group defined in the proof of (36.1.1.3), then

$$\# \mathcal{G} \geq \binom{\#G + \sqrt{\varphi(r) \log n}}{\#G - 1}.$$

And if  $n \notin p^{\mathbb{Z}_+}$ , then  $\# \mathcal{G} \leq n^{\sqrt{\#G}}$ .  $\lrcorner$

*Proof:* By the hypothesis,  $n$  passed step4, so any  $0 \leq a \leq \sqrt{\varphi(r) \log n}$ ,

$$(X + a)^n \equiv X^n + a \pmod{X^r - 1, p},$$

so

$$(X + a)^{\frac{n}{p}} \equiv X^{\frac{n}{p}} + a \pmod{X^r - 1, p}.$$

More generally, for any  $m \in I = \{(\frac{n}{p})^i p^j : i, j \in \mathbb{N}\}$  and any polynomial

$$f(X) \in P = \left\{ \prod_{a=0}^{\lfloor \sqrt{\#G \log n} \rfloor} (X + a)^{e_a} : e_a \in \mathbb{N} \right\},$$

we have

$$f(X)^m \equiv f(X^m) \pmod{X^r - 1, p}.$$

Then we claim that any two polynomials in  $P$  with degree  $< \#G$  will be distinct elements in  $\mathbb{F}_p(\zeta)$ : If  $\bar{f} = \bar{g}$ , then for each  $m \in G$ ,  $f(\zeta^m) \equiv g(\zeta^m)$ , so  $f$  and  $g$  are equal on  $\#G$  values. This forces  $f \equiv g \pmod{p}$ . But this is not possible as  $i \not\equiv j \pmod{p}$  for  $i, j \leq \lfloor \sqrt{\#G \log n} \rfloor < \sqrt{r \log n} < r < p$ .

Then by combinatorics,  $\#\mathcal{G} \geq \binom{\#G + \sqrt{\varphi(r) \log n}}{\#G - 1}$ .

For the upper bound, consider the subset  $I' = \{(\frac{n}{p})^i p^j : 0 \leq i, j \leq \sqrt{\#G}\}$ . If  $n \notin p^{\mathbb{Z}_+}$ , then  $\#I' > \#G$ , so there are two elements  $m_1, m_2 \in I'$  s.t.  $r | m_1 - m_2$ . Then  $f(\zeta)^{m_1} = f(\zeta^{m_1}) = f(\zeta^{m_2}) = f(\zeta)^{m_2}$  for any  $f(X) \in P$ . Then  $f(\zeta)$  is a root of the polynomial  $X^{m_1} - X^{m_2}$ , which has degree  $\leq n^{\sqrt{\#G}}$ . In view of the fact  $\mathcal{G}$  is the values of polynomials in  $P$  at  $\zeta$ , we have  $\#\mathcal{G} \leq n^{\sqrt{\#G}}$ .  $\square$

**Algo. (36.1.1.5) [Elliptic Curve Primality Proving (ECP), Goldwasser-Kilian-Atkin].** An **ECP primality certificate** of  $p \in \text{Prime}$  is a tuple  $(p, A, B, x_1, y_1, q) \in \mathbb{Z}$  s.t.

- $E : y^2 = x^3 + Ax + B$  is an Elliptic curve over  $\mathbb{Q}$ ,
- $P = (x_1, y_1, 1) \in E(\mathbb{Q})$ ,
- $(\Delta(E), p) = 1$ ,
- $q \in \text{Prime}$ ,
- $q > (p^{1/4} + 1)^2$ ,
- $p | z(qP)$ .

Then consider the following algorithm that either generates a series of primality certificates that verifies  $p$  is prime or return that  $p$  is not a prime:  $\lrcorner$

Cf. [Sutherland]L12, P6. or [Cox, Primes of the form]P297.

**Remark (36.1.1.6).** This ECP primality testing is a practically faster deterministic algorithm than AKS(36.1.1.1).  $\lrcorner$

**Lemma (36.1.1.7) [Goldwasser-Kilian].** Let  $E \in \text{EllCur}/\mathbb{Q}$  and  $M, N \in \mathbb{Z}_+$  s.t.  $M > (N^{1/4} + 1)^2$  and  $(N, \Delta(E)) = 1$ .

In particular, any ECP primality certificate(36.1.1.5) implies that  $p$  is a prime.  $\lrcorner$

*Proof:*  $\square$

**Algo. (36.1.1.8) [Miller-Rabin probabilistic Primality Proving].** Cf. [Sutherland]L12.

This is the more efficient and practical way of primality proving. And it can be astronomically convincing.  $\lrcorner$

## 2 Factorizing Integers

**Algo. (36.1.2.1) [Buhler-Lenstra-Pomerance].** There is an algorithm to factor a  $n$ -bit number  $N$  in  $O(e^{cn^{1/3} \log^{2/3} n})$  times.  $\lrcorner$

## 3 Others

**Remark (36.1.3.1).** There are not yet a polynomial algorithm that gives for a prime  $p \in \mathbf{P}$  a primitive root  $a \in (\mathbb{Z}/(p))^*$ .  $\lrcorner$

# 37 | Combinatorics

## 37.1 Combinatorics

### 1 Polytopes

**Def. (37.1.1.1) [Polytopes].** A  **$n$ -polytope** is a compact subset of  $\mathbb{R}^n$  for some  $n \in \mathbb{Z}$  with boundaries given by polytopes of smaller dimensions. A **polygon** is a 2-polytope. A **polyhedron** is a 3-polytope.  $\lrcorner$

**Def. (37.1.1.2) [Tetrahedra].** A **tetrahedron** is an 3-simplex in  $\mathbb{R}^3$ .  $\lrcorner$

**Def. (37.1.1.3) [Orthohedra].** An **orthohedron** is a tetrahedron isomorphic to the convex hull of the four points

$$\{(0, 0, 0), (x, 0, 0), (x, y, 0), (x, y, z)\} \in \mathbb{R}^3.$$

$\lrcorner$

**Prop. (37.1.1.4) [Dihedral Angles of Orthohedra].**

- Each orthohedron has dihedral angles  $(\alpha, \beta, \gamma, \pi/2, \pi/2, \pi/2)$ .
- A rectangular solid can be cut into 6 orthohedra sharing a common diagonal. And for any  $\alpha, \beta, \gamma \in (0, \pi), \alpha + \beta + \gamma = \pi$ , there is a rectangular solid that can be cut into 6 orthohedra s.t. the dihedral angles along the diagonal are  $(\alpha, \beta, \gamma, \alpha, \beta, \gamma)$ .

$\lrcorner$

*Proof:* Only 2 needs a proof, and this is verified by brutal force calculations.  $\square$

### 2 Hilbert's 3rd Problem

Cf. [Sch13b].

**Def. (37.1.2.1) [Scissors Congruence].** A **dissection of a polytope**  $P$  is an expression  $P = \cup_i^n P_i$  s.t. the interiors of  $P_i$  are disjoint.

Two polytopes  $P, Q$  are called **scissors-congruent** if there are dissections  $P = \cup_i^n P_i, Q = \cup_i^n Q_i$  s.t.  $P_i \cong Q_i$  for  $1 \leq i \leq n$ . Scissors congruence relations are denoted by  $\sim_s$ .  $\lrcorner$

**Thm. (37.1.2.2) [Wallace-Bolyai-Gerwien].** Any two polygons  $P, Q$  in  $\mathbb{R}^2$  are scissors-congruent.  $\lrcorner$

*Proof:* Find a line  $l$  that is not parallel to any line generated by vertices of  $P$  and  $Q$ , cut  $P, Q$  through lines parallel to  $l$  and passing through some vertices of  $P, Q$ . Then we get some trapezoids. Then we cut them into right triangles.

Now we transform any right triangle  $P$  with vertices  $\{A = (-0, 0), B = (0, 2b), C = (0, c)\}$  to a triangle triangle of height 2: Now consider another right triangle with vertices  $\{A = (-0, 0), X = (0, 2), Y = (0, bc)\}$ . Then  $BY//CX$ , thus  $BYC$  and  $BYX$  are triangles of the same base and height.

Then  $BYC \sim_s BYX$ : cut them into parallelograms with the same base and height, then it is easy to see any two such parallelograms are scissor-congruent.

Now all the triangles has a side of length 2, we can transform them into rectangles with a side of length 1. Then clearly  $P, Q$  are transformed together.  $\square$

**Thm. (37.1.2.3) [Zylev].** If  $P, A, B$  are polytopes,  $A \subset P, B \subset P, P \setminus A \sim_s P \setminus B$ , then  $A \sim_s B$ .  $\lrcorner$

*Proof:* Let

$$F = A \coprod \coprod_{k=1}^n P_k = B \coprod \coprod_{k=1}^n Q_k, P_k \sim_s Q_k$$

We can dissect them even further s.t.  $\text{Vol}(P_k) < \frac{1}{2} \text{Vol}(A)$ . Then we use induction on  $n$  to show that  $A \sim_s B$ :  $n = 0$  is trivial. For  $n > 0$ , because of the volume bound,  $\text{Vol}(A \setminus Q_n) > \text{Vol}(Q_n)$ , thus we can find disjoint  $T_1, \dots, T_n \subset A \setminus Q_n$  s.t.  $T_k \sim_s P_k \cap Q_n$ . Now define

$$F' = F \setminus Q, P'_k = (P_k \setminus Q_n) \cup T_k \sim_s P_k, \quad A' = F' \setminus \bigcup_{k=1}^{n-1} P'_k = (A \setminus \bigcup_{k=1}^{n-1} T_k) \bigcup_{k=1}^{n-1} Q_k$$

Then by induction,  $A' \sim_s B' = B$ . But  $A' \sim_s A$  by changing  $T_k$  with  $Q_k$ .  $\square$

### Dehn-Sydler Theorem

**Prop. (37.1.2.4) [Tetrahedra].** Any polyhedron has a dissection into tetrahedra.  $\lrcorner$

*Proof:* By choose a sufficiently small lattice dissection of  $\mathbb{R}^3$ , it suffices to consider three cases:

- A cube.
- A cube cut by one hypersurfaces.
- A cube cut by two hypersurfaces.
- A cube containing a single vertex.

All cases are straightforward.  $\square$

**Def. (37.1.2.5) [Dehn Invariants].** For a polyhedron  $P$ , define the **Dehn invariant** of  $P$  as

$$\Delta(P) = \sum_i l_i [\alpha_i] \in \mathbb{R} \otimes (\mathbb{R}/\mathbb{Z}\pi)$$

where the sum is over all edges  $e_i$ , of  $P$ ,  $l_i = l(e_i)$ , and  $\alpha_i$  is the dihedral angles of  $e_i$ .  $\lrcorner$

**Thm. (37.1.2.6) [Dehn].** If two polyhedra in  $\mathbb{R}^3$  are scissors-congruent, then they have the same volume and Dehn invariants.  $\lrcorner$

*Proof:* The volumes are the same by the invariance properties of Lebesgue measure. To show the Dehn invariants are the same, notice the dissections of a polytope  $P$  may create new edges, but the sum of angles around a new edge is  $2\pi$  for if it is contained in the interior of  $P$ , or  $\pi$  if it is in the surface of  $P$ .  $\square$

**Def. (37.1.2.7) [Simple Prisms].** A **simple prism** is a polyhedron that is isomorphic to an affine translate of  $T \times I \subset \mathbb{R}^2 \times \mathbb{R}$ , where  $T \subset \mathbb{R}^2$  is a triangle.  $\lrcorner$

**Prop. (37.1.2.8).** A simple prism  $P$  is scissors-congruent to  $[0, 1]^2 \times [0, \text{Vol}(P)]$ .  $\lrcorner$

*Proof:* Place the three edges  $P_1Q_1, P_2Q_1, P_3Q_3$  that is the image of  $\text{Vertices}(T) \times I$  vertically, and they have length  $l$ . Then we can talk about the **heights** of  $P_i, Q_i$ . Suppose  $h(P_1) \geq h(P_2) \geq h(P_3)$ . If  $h(P_3) \geq h(Q_1)$ , then we can cut  $P$  along height  $h(Q_1)$  make  $P$  scissors-congruent to a perfect simple prism  $P' = T' \times I'$ . If  $h(P_3) < h(Q_1)$ , then we can cut  $P$  along the plane  $P_2P_3Q_1$  to make  $P \sim_s P'$ , where for  $P'$ ,  $h(P'_3) - h(Q'_1)$  is larger. And if this process goes on, every 2 transform makes  $h(P_3) - h(Q_1)$  bigger by at least  $l$ , so eventually  $h(P_3) \geq h(Q_1)$ , and we can transform it to a perfect simple prism.

Now if  $P = T \times I$  is a perfect simple prism, (37.1.2.2) shows  $T$  is scissors equivalent to  $[0, 1] \times [0, \text{Vol}(T)]$ , and then it suffices to show  $[0, \text{Vol}(T)] \times I$  is scissors equivalent to  $[0, \text{Vol}(P)]$ , which is by (37.1.2.2) again.  $\square$

**Def. (37.1.2.9) [pseudo-prisms].** A **pseudo-prisms** is a convex polyhedra  $(OPQRS)$ , where

- $OPQ$  is an isosceles with  $OP = PQ$ ,
- $PR, QS$  is orthogonal to the plane  $OPQ$ ,
- $l(QS) = 2l(PR)$ .

Notice a pseudo-prism  $(OPQRS)$  is scissors-congruent to the perfect simple prism  $OPQ \times PR$ .  $\lrcorner$

**Def. (37.1.2.10).** Denote

- $\mathcal{P}$  the free Abelian group generated by isomorphism classes of all polyhedra.
- $\mathcal{E}$  the subgroup of  $\mathcal{P}$  generated by the dissection relations.
- $\mathcal{F}$  is the subgroup of  $\mathcal{P}$  generated by  $\mathcal{E}$  and all the simple prisms (37.1.2.7).
- $\mathcal{V} = \mathcal{P}/\mathcal{F}$ .

Then clearly two polyhedra  $P, Q$  are scissors-congruent iff  $[P] = [Q] \in \mathcal{P}/\mathcal{E}$ .  $\lrcorner$

**Prop. (37.1.2.11) [R-Structures].**  $\mathbb{R}$  acts on the set of polyhedra by scaling, and this action is additive and multiplicative, and stabilizes  $\mathcal{F}$ , thus inducing an  $\mathbb{R}$ -structure on  $\mathcal{V}$ .  $\lrcorner$

*Proof:* By (37.1.2.4),  $\mathcal{P}$  is generated by tetrahedra. So it suffices to show that for  $\lambda_1, \lambda_2 \in \mathbb{R}_+$  and a tetrahedron  $T$ ,  $[\lambda_1 T] + [\lambda_2 T] - [(\lambda_1 + \lambda_2)T] \in \mathcal{F}$ . For this, use geometry, notice  $(\lambda_1 + \lambda_2)T \setminus (\lambda_1 T \cup \lambda_2 T)$  consists of two simple prisms, where these two smaller tetrahedra aligned along an edge of  $T$ .  $\square$

**Prop. (37.1.2.12) [Orthohedra].**  $\mathcal{V}$  is generated by orthohedra (37.1.1.3).  $\lrcorner$

*Proof:* By (37.1.2.4), it suffices to show that for any tetrahedron  $T$ ,  $[T]$  is a linear combinations of orthohedra. For this, take the center  $I$  of the inscribed circle of  $T$ , and take its projections  $I_1, I_2, I_3, I_4$  to the faces of  $T$ , then they form 24 orthohedra (may be degenerate ones). Thus  $T$  is a linear combinations of those non-degenerate orthohedra.  $\square$

**Prop. (37.1.2.13).** A simple primes  $P$  has Dehn invariant  $\Delta(P) = 0$  (37.1.2.14) and (37.1.2.8), so by (37.1.2.8) again,  $\Delta$  factors through  $\Delta : \mathcal{V} \rightarrow \mathbb{R} \otimes (\mathbb{R}/\mathbb{Z}\pi)$ , which is  $\mathbb{R}$ -linear with  $\mathbb{R}$ -structure on  $\mathcal{V}$  given in (37.1.2.11).  $\lrcorner$

**Thm. (37.1.2.14) [Dehn-Sydler].** Two polyhedra in  $\mathbb{R}^3$  are scissors-congruent iff they have the same volume and Dehn invariants.  $\lrcorner$

*Proof:* One direction is shown in (37.1.2.6). For the other, it suffices to show this map  $\Delta : \mathcal{V} = \mathcal{P}/\mathcal{F} \rightarrow \mathbb{R} \otimes (\mathbb{R}/\mathbb{Z}\pi)$  (37.1.2.13) is injective, because in this way, if two polyhedra has the same volume and Dehn invariants, then they are scissors equivalent to two prisms with the same volume, hence scissors-congruent, by (37.1.2.8).

Take a good function  $\varphi : \mathbb{R} \rightarrow \mathcal{V}$  (37.1.2.24).  $\varphi$  vanishes on  $\mathbb{Z}\pi$ , thus extends to an  $\mathbb{R}$ -linear map  $\Phi : \mathbb{R} \otimes (\mathbb{R}/\mathbb{Z}\pi) \rightarrow \mathcal{V}$ , and for an orthohedron  $T$ ,  $\Phi(\Delta([T])) = [T]$  by (37.1.2.15), and orthohedra generate  $\mathcal{V}$  by (37.1.2.12), so  $\Phi \circ \Delta = \text{id}_{\mathcal{V}}$ . Thus  $\Delta$  is injective.  $\square$

### Homological Arguments

**Def. (37.1.2.15) [Good Functions].** A map  $\varphi : \mathbb{R} \rightarrow \mathcal{V}$  is called a **good function** if

- $\varphi$  is additive and  $\varphi(\pi) = 0$ .
- For any orthohedron  $T$ ,  $[T] = \sum_{i=1}^6 l_i \varphi(\alpha_i)$ , where the notation is the same as in (37.1.2.5).

┘

**Def. (37.1.2.16)  $[T(a, b)]$ .** For  $a, b \in (0, 1)$ , define  $a' = \sqrt{a^{-1} - 1}$ ,  $b' = \sqrt{b^{-1} - 1}$ , and define  $T(a, b)$  to be the orthohedron with vertices

$$\{(0, 0, 0), (a', 0, 0), (a', a'b', 0), (a', a'b', b')\} \in \mathbb{R}^3.$$

Notice  $T(a, b) \cong T(b, a)$ .

The order of the vertices is also important. It is always assumed to be written in this order.  $\square$

**Prop. (37.1.2.17).** For  $\alpha, \beta \in \mathbb{R}$ ,  $T(\sin^2(\alpha), \sin^2(\beta))$  has three edges with dihedral angle  $\pi/2$ , and three edges with lengths  $\cot(\alpha), \cot(\beta), \cot(\gamma)$  and dihedral angles  $(\alpha, \beta, \pi/2 - \gamma)$  resp., where  $\sin^2(\gamma) = ab, \gamma \in (0, \pi/2)$ . In particular,

$$\Delta(T(\sin^2(\alpha), \sin^2(\beta))) = \cot(\alpha) \otimes \alpha + \cot(\beta) \otimes \beta + \cot(\gamma) \otimes (\pi/2 - \gamma).$$

┘

*Proof:* Brutal force calculation.  $\square$

**Prop. (37.1.2.18).** For  $a, b, c \in \mathbb{R}_+$ ,

$$a[T(\frac{a+b}{a+b+c}, \frac{a}{a+b})] + b[T(\frac{a+b}{a+b+c}, \frac{b}{a+b})] = a[T(\frac{a+c}{a+b+c}, \frac{a}{a+c})] + c[T(\frac{a+c}{a+b+c}, \frac{c}{a+c})]$$

┘

*Proof:* This follows from the different ways of cutting the tetrahedron with vertices

$$\{O = (0, 0, 0), X = (\sqrt{bc}, 0, 0), Y = (0, \sqrt{ac}, 0), Z = (0, 0, \sqrt{ab})\} \in \mathbb{R}^3.$$

In fact, for this tetrahedron, the plane orthogonal to  $YZ$  passing through  $X$  cut this to two orthohedra, and similar does the plane orthogonal to  $XZ$  passing through  $Y$ . These two cutting give the assertion above.  $\square$

**Def. (37.1.2.19) [Homological Functions].** A **homological function** is a function  $h : (0, 1) \rightarrow \mathcal{V}$  s.t.

- For  $a, b \in (0, 1)$ ,  $[T(a, b)] = h(a) + h(b) - h(ab)$ .
- If  $a, b \in (0, 1)$ ,  $a + b = 1$ , then  $ah(a) + bh(b) = 0$ .

┘

**Prop. (37.1.2.20).** For  $V \in \text{Vect}/\mathbb{R}$ , if  $g : \mathbb{R}_+ \rightarrow V$ , define  $\delta(g)(a, b) = g(a) + g(b) - g(ab)$ . And if  $F : \mathbb{R}_+^2 \rightarrow V$ , define  $\delta(F)(a, b, c) = F(a, b) - F(a, c) + F(ab, c) - F(ac, b)$ .

Then if  $F : (0, 1) \rightarrow V$  is symmetric and  $\delta(F) = 0$ , then  $F = \delta(f)$  for some  $f : (0, 1) \rightarrow V$ . ┘

*Proof:* Cf.[Sch13b]. □

**Prop. (37.1.2.21).** Let  $G : \mathbb{R}_+^2 \rightarrow V$  be a symmetric function satisfying

- $G(\lambda a, \lambda b) = \lambda G(a, b), \lambda, a, b \in \mathbb{R}_+$ ,
- $G(a, b) + G(a + b, c) = G(a, c) + G(a + c, b)$ .

Then there exists a homomorphism  $g : \mathbb{R}_+^\times \rightarrow V$  s.t. when  $a + b = 1$ ,

$$G(a, b) = ag(a) + bg(b).$$

┘

*Proof:* Cf.[Sch13b]. □

**Prop. (37.1.2.22)[Sydler].** Let  $F : (0, 1)^2 \rightarrow \mathcal{V} : (a, b) \mapsto [T(a, b)]$ , then  $F$  is symmetric, and  $\delta(F) = 0$ .

┘

*Proof:* We check that  $[T(a, b)] + [T(ab, c)] = [T(a, c)] + [T(ac, b)]$ . This is done by geometry:

Put  $T(a, b), T(a, c)$  together:  $T(a, b) \cong ABCD, T(a, c) \cong ABEF$ , where  $BDE$  is collinear. Let  $H$  be the center of the sphere  $S$  passing through  $ACDEF$ , and the projection of  $H$  on the planes  $ABC, ABD$  is denoted by  $I, J$  resp. Let  $K, L, M$  be the intersection of  $AH, AI, AJ$  with the sphere  $S$  resp.

Then it can be verified that  $T(ab, c) \cong ANMK, T(ac, b) \cong AFLK$ . Let  $P = ABDFHI + ADHJ$ , then

$$P - (AICH D) - (FICH D) + (DJMH K) = T(a, b) + T(ab, c).$$

$$P + (DJEHF) - (AJEH F) + (FILHK) = T(a, c) + T(ac, b).$$

□

**Cor. (37.1.2.23).** Homological functions(37.1.2.19) exist. ┘

*Proof:* By (37.1.2.20), there exists  $f : (0, 1) \rightarrow \mathcal{V}$  s.t.  $F(a, b) = [T(a, b)] = f(a) + f(b) - f(ab)$ . Then we want to find  $h = f - g$ , where  $g : (0, 1) \rightarrow \mathcal{V}$  is a homomorphism s.t. when  $a + b = 1$ ,  $ah(a) + bh(b) = 1$ , which is equivalent to

$$ag(a) + bg(b) = af(a) + bf(b).$$

Let

$$G : \mathbb{R}_+^2 \rightarrow \mathcal{V} : (a, b) \mapsto af\left(\frac{a}{a+b}\right) + bf\left(\frac{b}{a+b}\right),$$

then  $G(\lambda a, \lambda b) = \lambda G(a, b)$ ,  $\lambda, a, b \in \mathbb{R}_+$ , and  $G(a, b) + G(a + b, c) = G(a, c) + G(a + c, b)$ . In fact, this boils down to (37.1.2.18). Thus by (37.1.2.21), we truly can find such a function  $g$ .  $\square$

**Prop. (37.1.2.24).** Good functions (37.1.2.15) exist.  $\lrcorner$

*Proof:* Take a homological function  $h$  (37.1.2.23), define  $\varphi : \mathbb{R} \rightarrow \mathcal{V}$ :

$$\varphi\left(\frac{n\pi}{2}\right) = 0, \quad n \in \mathbb{Z}, \quad \varphi(\alpha) = \tan(\alpha)h(\sin^2(\alpha)).$$

We show this is a good function:

Firstly we show:

**Lemma (37.1.2.25).**  $\varphi(\pi/2 - \alpha) = -\varphi(\alpha)$ ,  $\varphi(\alpha + \pi/2) = \varphi(\alpha)$ .  $\lrcorner$

*Proof:* If  $\alpha = n\pi/2$ , the assertion holds. So we assume  $\alpha \neq n\pi/2$  and let  $\beta = \pi/2 - \alpha$ ,  $a = \sin^2(\alpha)$ ,  $b = \sin^2(\beta)$ , then  $a + b = 1$ , so by definition (37.1.2.19),

$$\begin{aligned} 0 &= 2ah(a) + abh(b) = 2\sin^2(\alpha)\cot(\alpha)\varphi(\alpha) + 2\sin^2(\beta)\cot(\beta)\varphi(\beta) \\ &= \sin(2\alpha)\varphi(\alpha) + \sin(2\beta)\varphi(\beta) = \sin(2\alpha)(\varphi(\alpha) + \varphi(\beta)) \end{aligned}$$

So the assertion holds as  $\sin(2\alpha) \neq 0$ .

The second equality follows from the first.  $\square$

Next, we show  $[T] = \sum_{i=1}^6 l_i \varphi(\alpha_i)$  for a orthohedron  $T$ : By scaling, it suffices to prove for  $T$  of the form  $T(\sin^2(\alpha), \sin^2(\beta))$  (37.1.2.16). Thus by (37.1.2.19) and (37.1.2.17),

$$\begin{aligned} [T(\sin^2(\alpha), \sin^2(\beta))] &= h(\sin^2(\alpha)) + h(\sin^2(\beta)) - h(\sin^2(\alpha)\sin^2(\beta)) \\ &= \cot(\alpha)\varphi(\alpha) + \cot(\beta)\varphi(\beta) + \cot(\gamma)\varphi(\pi/2 - \gamma) = \sum_{i=1}^6 l_i \varphi(\alpha_i) \end{aligned}$$

Finally, to show additivity of  $\varphi$ , notice by the lemma above, it suffices to show  $\varphi(\alpha) + \varphi(\beta) = \varphi(\alpha + \beta)$  for  $\alpha, \beta \in (0, \pi/2)$ . In this case, let  $\gamma = \pi - \alpha - \beta \in (0, 2\pi)$ , then use (37.1.1.4) to find a rectangular solid that cuts along a diagonal to 6 orthohedra  $T_i$  s.t. the dihedral angles along the diagonals are  $(\alpha, \beta, \gamma, \alpha, \beta, \gamma)$ . Then

$$0 = [R] = \sum_{k=1}^6 [T_i] = 2l(\varphi(\alpha) + \varphi(\beta) + \varphi(\gamma)) + \sum_{k=1}^6 l_k(\varphi(\theta_{k1}) + \varphi(\theta_{k2}))$$

where  $l$  is the length of the diagonal,  $\theta_{k_i}$  are the dihedral angles along the edges of the rectangular solid that is connected to the diagonal, and  $\theta_{k1} + \theta_{k2} = \pi/2$ . Thus by the lemma above,  $\varphi(\alpha) + \varphi(\beta) = -\varphi(\gamma) = \varphi(\alpha + \beta)$ .  $\square$

### 3 Permutohedra and Associahedra

References are [Permutohedra, Associahedra, and Beyond, Postnikov].

**Def. (37.1.3.1)[Permutohedra].** For  $(x_1, \dots, x_n) \in \mathbb{R}^n$ , the **permutohedron** of  $(x_1, \dots, x_n)$  is defined to be

$$P_n(x_1, \dots, x_n) = \text{Hull}((x_{\sigma(1)}, \dots, x_{\sigma(n)})).$$

$P_n(n-1, n-2, \dots, 0)$  is called the  $(n-1)$ -dimensional **regular permutohedron**. ┘

**Prop. (37.1.3.2) [Radon].** For  $x_1 \geq x_2 \geq \dots \geq x_n \in \mathbb{R}$ , then for any  $\mathbf{t} = (t_1, \dots, t_n) \in \mathbb{R}^n$ ,  $\mathbf{t} \in P_n(x_1, \dots, x_n)$  iff

$$\sum_i t_i = \sum_i x_i$$

and for any  $S \subset [n]_+$ ,

$$\sum_{i \in S} t_i \leq \sum_{i=1}^{\#S} x_i.$$

┘

*Proof:*

□

**Prop. (37.1.3.3) [General Type Permutohedras].** If  $x_1 > x_2 > \dots > x_n \in \mathbb{R}$ , then there is a description of the  $d$ -dimensional faces of  $P_n(x_1, \dots, x_n)$ . Cf.[Permutohedra, Associahedra, and Beyond, Postnikov]Proposition 2.6. ? ┘

**Def. (37.1.3.4)[Zonotope].** A **zonotope** is a polytope that is a Minkowski sum of several line segments. ┘

**Def. (37.1.3.5)[Graphical Zonotopes].** For  $n \in \mathbb{Z}_+$  and a graph  $\Gamma$  on  $[n]_+$ , the **graphical zonotope**  $Z_\Gamma$  is defined to be the Minkowski of line segments

$$Z_\Gamma = \sum_{(i,j) \in \Gamma} [\mathbf{e}_i, \mathbf{e}_j] = \text{Newton} \left( \prod_{(i,j) \in \Gamma} (X_i - X_j) \right).$$

┘

**Prop. (37.1.3.6).** For  $n \in \mathbb{Z}_+$ , the  $(n-1)$ -dimensional regular permutohedron(37.1.3.1) is the graphical zonotope for the complex graph  $K_n$  on  $[n]_+$ (37.1.3.5). ┘

*Proof:* The regular permutohedron is the newton polytope of the determinant of the Vandermonde matrix  $\det \text{Van}(X_1, \dots, X_n) = \prod_{1 \leq i < j \leq n} (X_i - X_j)$ . □

**Prop. (37.1.3.7)[Volume of Graphical Zonotopes, Stanley].** For  $n \in \mathbb{Z}_+$  and  $\Gamma$  a simple graph on  $[n]_+$ ,

$$\text{Vol}(Z_\Gamma) = \# \{ \text{spanning tree of } \Gamma \}.$$

┘

*Proof:* Cf.[Stanley, R. P. Enumerative Combinatorics, vol. 1]Exercise 4.32. □

### Generalized Permutohedra

**Def. (37.1.3.8) [Generalized Permutohedra].** A **generalized permutohedra** is a polytope deformation of a permutohedra  $P_n(x_1, \dots, x_n)$  (37.1.3.1) s.t. all the the angles of the edges are preserved.  $\lrcorner$

### Stasheff Associahedra

Cf.[Operads in algebra, topology and physics, Stasheff]Section1.6.

### Lattice Points

**Def. (37.1.3.9) [Number of Lattice Points].** If  $x_1, \dots, x_n \in \mathbb{Z}$ , denote  $N_n(x_1, \dots, x_n) = P_n(x_1, \dots, x_n) \cap \mathbb{Z}^n$ . And define the **Ehrhart polynomial** as

$$E_{P_n(x_1, \dots, x_n)}(t) = N_n(tx_1, \dots, tx_n) \in \mathbb{Z}[t].$$

$\lrcorner$

## 4 Spherical Programming

### Minimizing Discrete Energy on the Sphere

**Prop. (37.1.4.1) [Equal-Area Partition of Spheres with Small Diameters, Leopardi[Leo09]].**

For  $d \in \mathbb{Z}_+$ , there exists  $C_d \in \mathbb{R}_+$  s.t. for any  $N \in \mathbb{Z}_+$ , there exists a partition of the unit sphere into  $N$  closed regions with piecewise smooth boundaries s.t. each partition has diameter at most  $C_d N^{-1/d}$ .  $\lrcorner$

*Proof:*

$\square$

### Spherical $t$ -Designs

**Def. (37.1.4.2) [Spherical  $t$ -Designs].** Let  $d, t \in \mathbb{Z}_+$  and  $\mathbb{S}^d \subset \mathbb{R}^{d+1}$  be the unit sphere with the Lebesgue measure  $\mu$  normalized s.t.  $\mu(\mathbb{S}^d) = 1$ . Then a **spherical  $t$ -design** of size  $N \in \mathbb{Z}_+$  for  $\mathbb{S}^d$  is a set pf points  $\{X_1, \dots, X_N\} \subset \mathbb{S}^d$  s.t.

$$\int_{\mathbb{S}^d} P(x) d\mu(x) = \frac{1}{N} \sum_{i=1}^d P(x_i)$$

for any polynomial  $P \in \mathbb{R}[X_0, X_1, \dots, X_d]$  s.t.  $\deg P \leq t$ .  $\lrcorner$

**Thm. (37.1.4.3) [Delsarte-Goethals-Seidel[[DGS77](#)]/Seymour-Zaslavsky[[S-Z84](#)]/Korevaar-Meyers[[K-M93](#)]/Bondarenko-Radchenko-Viazovska[[BRV13](#)]].** For any  $d \in \mathbb{Z}_+$ , there exists  $C_d \in \mathbb{R}_+$  s.t. for any  $t \in \mathbb{Z}_+$ , if we denote by  $N(d, t)$  the minimal cardinality of a spherical  $t$ -design for  $\mathbb{S}^d$ , then

$$C_d t^d \geq N(d, t) \geq \begin{cases} \binom{d+k}{d} + \binom{d+k-1}{d} & , t \in 2\mathbb{Z} \\ 2 \binom{d+k}{d} & , t \in 2\mathbb{Z} + 1 \end{cases}.$$

In fact, for any  $N \geq C_d t^d$ , there exists a spherical  $t$ -design for  $\mathbb{S}^d$  with  $N$  points. And for  $d = 1$ , the lower bound is satisfied:  $N(1, t) = t + 1$ , by taking the regular  $(t + 1)$ -gon.  $\lrcorner$

*Proof:* **?**

For the upper bound: Consider the inner space  $\mathcal{P}_t$  consisting of polynomial of degree  $\leq d$  s.t.  $\int_{\mathbb{S}^d} P(x) d\mu(x) = 0$ , then for any  $x \in \mathbb{S}^d$ , there exists  $G_x \in \mathcal{P}_t$  s.t.  $\langle P_x, Q \rangle = Q(x)$  for any  $Q \in \mathcal{P}_t$ . Then the set of points  $X = \{x_1, \dots, x_N\} \subset \mathbb{S}^d$  forms a spherical  $t$ -design iff  $G_{x_1} + \dots + G_{x_N} = 0$ .

Define the convex subset  $\Omega \subset \mathcal{P}_t$ :

$$\Omega = \left\{ P \in \mathcal{P}_t : \int_{\mathbb{S}^d} \|\nabla_S P(x)\| d\mu(x) < 1 \right\}, \quad \nabla_S P(x) = \nabla \left( P \left( \frac{x}{|x|} \right) \right).$$

Then it suffices to show that for any  $N \geq C_d t^d$ , there exists a function:  $F : \mathcal{P} \rightarrow (\mathbb{S}^d)^N$  s.t.  $\sum_{i=1}^N P(F_i(P)) > 0$  for any  $P \in \partial\Omega \subset \mathcal{P}_t$ : If such  $F$  exists, we can consider

$$f : \mathcal{P}_t \rightarrow \mathcal{P}_t : P \mapsto \sum_{i=1}^N G_{F_i(P)},$$

then  $\langle P, f(P) \rangle > 0$  for any  $P \in \partial\Omega$ , and there exists a  $P$  s.t.  $f(P) = 0$  by [Brouwer Degree Theorem](#).

The construction of  $F(P)$  is given by choosing points from the equal-area partition of  $\mathbb{S}^n$  [\(37.1.4.1\)](#) and let these point flow along the vector field  $\nabla_S P$  **?**, Cf. [\[BRV13\]](#).  $\square$

**Prop. (37.1.4.4) [Nearly Spherical Design].** For any  $d \in \mathbb{Z}_+$ , there exists  $r_d \in \mathbb{R}_+$  s.t. for any  $t \in \mathbb{Z}_+$  and any equal-area partition  $\mathcal{R} = \{R_1, \dots, R_t\}$  of  $\mathbb{S}^d$  of diameter bounded by  $r_d/t$ , if we choose any  $x_i \in \mathcal{R}$ , then the following inequality holds for any polynomial  $P \in \mathbb{R}[X_0, X_1, \dots, X_d]$  s.t.  $\deg P \leq t$ :

$$\frac{1}{2} \int_{\mathbb{S}^d} |P(x)| d\mu(x) \leq \frac{1}{N} \sum_{i=1}^N P(x_i) \leq \frac{3}{2} \int_{\mathbb{S}^d} |P(x)| d\mu(x).$$

$\lrcorner$

*Proof:* Cf. [\[Mhaskar-Narcowich-Ward, Spherical Marcinkiewicz-Zygmund inequalities and positive quadrature\]](#) Thm3.1.  $\square$

**Cor. (37.1.4.5).** For any  $d \in \mathbb{Z}_+$ , there exists  $r_d \in \mathbb{R}_+$  s.t. for any  $t \in \mathbb{Z}_+$  and any equal-area partition  $\mathcal{R} = \{R_1, \dots, R_t\}$  of  $\mathbb{S}^d$  of diameter bounded by  $r_d/t$ , if we choose any  $x_i \in \mathcal{R}$ , then the following inequality holds for any polynomial  $P \in \mathbb{R}[X_0, X_1, \dots, X_d]$  s.t.  $\deg P \leq t$ :

$$\frac{1}{3} \int_{\mathbb{S}^d} \|\nabla_S P(x)\| d\mu(x) \leq \frac{1}{N} \sum_{i=1}^N \|\nabla_S P(x_i)\| \leq \frac{3}{2} \int_{\mathbb{S}^d} \|\nabla_S P(x)\| d\mu(x).$$

where  $\nabla_S P(x) = \nabla \left( P \left( \frac{x}{|x|} \right) \right)$ .  $\lrcorner$

*Proof:* For  $x \in \mathbb{S}^d$ ,

$$\nabla_S P(x) = (P_1(x), \dots, P_{d+1}(x)), \quad P_j(x) = \frac{\partial}{\partial x_i} P(x) - x_j \sum_{k=1}^{d+1} x_k \frac{\partial}{\partial x_k} P(x)$$

is a polynomial of degree  $\leq t + 1$ . Then we can use [\(37.1.4.4\)](#) on each  $P_j(x)$  together with Cauchy's inequality.  $\square$

## 5 Spherical Packing

References are [Sphere Packings, Lattices and Groups, Conway-Sloane].

**Def. (37.1.5.1) [Spherical Packing].** For  $d \in \mathbb{Z}_+$ , a **spherical packing** in dimension  $d$  is a placing of unit spheres in  $\mathbb{R}^d$ .

The problem of spherical packing is to find the greatest packing density.  $\lrcorner$

**Def. (37.1.5.2) [Lattice Packings].** A **lattice packing** is a sphere packing s.t. the center of spheres form a complete lattice in  $\mathbb{R}^d$ .

A **periodic packing** is a sphere packing s.t. the spheres are centered on the points of f.m. translates of a complete lattice.  $\lrcorner$

**Def. (37.1.5.3) [Upper Density of Packings].** For any sphere packing  $\mathcal{P}$  in  $\mathbb{R}^d$ , the upper density of  $\mathcal{P}$  is defined to be

$$\Delta = \overline{\lim}_{r \rightarrow \infty} \sup_{p \in \mathbb{R}^d} \frac{\text{Vol}(B(p, r) \cap \mathcal{P})}{\text{Vol}(B(p, r))}.$$

$\lrcorner$

**Prop. (37.1.5.4) [Uniformly Dense Packing].** For a sphere packing  $\mathcal{P}$  in  $\mathbb{R}^d$ , if the limit

$$\Delta = \lim_{r \rightarrow \infty} \frac{\text{Vol}(B(p, r) \cap \mathcal{P})}{\text{Vol}(B(p, r))}$$

exists for some  $p \in \mathbb{R}^d$ , then it exists for any  $p$ , and the limit is equal.

A **uniformly dense packing** is a packing  $\mathcal{P}$  that the limit is uniform in  $p$ .  $\lrcorner$

**Prop. (37.1.5.5).** The maximal upper density is achieved by a uniformly dense packing (37.1.5.4).  $\lrcorner$

*Proof:* ?  $\square$

**Prop. (37.1.5.6).** If  $\mathfrak{P} \subset \mathbb{R}^d$  is a uniformly dense packing, then for any compact subset  $R \subset \mathbb{R}^d$  that is the closure of its interior, and for any  $p \in \mathbb{R}^d$ , we have

$$\Delta = \lim_{r \rightarrow \infty} \frac{\text{Vol}(rR \cap \mathcal{P})}{\text{Vol}(rR)}.$$

$\lrcorner$

*Proof:*  $\square$

**Prop. (37.1.5.7) [Approximation by Periodic Packings].** Suppose  $\Delta_d$  is the maximal density of sphere packings in  $\mathbb{R}^d$ , then for any  $\varepsilon \in \mathbb{R}_+$ , there exists a periodic packing with density  $\geq \Delta - \varepsilon$ .  $\lrcorner$

*Proof:* By (37.1.5.5), it suffices to show for a uniformly dense packing  $\mathcal{P}$  with maximal density  $\Delta$ . Take an arbitrary lattice  $\Lambda$  with fundamental parallelogram  $R$ , then by (37.1.5.6),

$$\Delta = \lim_{r \rightarrow \infty} \frac{\text{Vol}(rR \cap \mathcal{P})}{\text{Vol}(rR)}.$$

Then we can take  $r$  large enough, and take all spheres with center in  $rR$  and their translations by  $r\Lambda$ . This density can be arbitrarily close to  $\Delta$ .  $\square$

### Upper Bounds

**Thm. (37.1.5.8).** One can prove that periodic packings come arbitrarily close to the greatest packing density, so when proving upper bounds it suffices to consider periodic packings.  $\lrcorner$

*Proof:*  $\square$

**Def. (37.1.5.9) [Admissible Functions].** A  $f \in L^1(\mathbb{R}^d)$  is called an **admissible function** if  $|f(x)|$  and  $|\text{Fou}f(x)|$  are both bounded by a constant times of  $(1 + |x|)^{-d-\delta}$  for some  $\delta \in \mathbb{R}_+$ .  $\lrcorner$

**Thm. (37.1.5.10) [Cohen-Elkies Linear Programing Bounds].** Let  $f \neq 0 \in L^1(\mathbb{R}^d)$  be a real admissible function and  $\mathcal{F}f(0) \neq 0$ , s.t.

$$f(x) \leq 0, \forall |x| \geq 1, \quad \mathcal{F}f(x) \geq 0, \forall x.$$

Then the density of spherical packing of dimension  $d$  is bounded above by

$$\frac{f(0)}{\mathcal{F}f(0)} \text{Vol } D_d(0, \frac{1}{2}) = \frac{f(0)}{\text{Fou}f(0)} \frac{\pi^{d/2}}{2^d \Gamma(\frac{d}{2} + 1)}.$$

$\lrcorner$

*Proof:*  $\square$

### Lower Bounds

**Prop. (37.1.5.11) [Sphere Packing in Dimension 1].** The maximal density of the sphere packing in dimension 1 is  $\Delta_1 = 1$ .  $\lrcorner$

**Thm. (37.1.5.12) [Sphere Packing in Dimension 2, Toth].** The maximal density of the sphere packing in dimension 2 is  $\Delta_2 = \frac{\pi}{\sqrt{12}} \approx 0.90690$ , and it is attained by the hexagonal lattice.  $\lrcorner$

*Proof:*  $\square$

**Thm. (37.1.5.13) [Kepler Conjecture, Hales].** The maximal density of the sphere packing in dimension 3 is  $\Delta_3 = \frac{\pi}{\sqrt{18}} \approx 0.74048$ , and it is attained by the face-centered cubic packing.  $\lrcorner$

*Proof:* [Hales, A proof of the Kepler conjecture].?  $\square$

**Thm. (37.1.5.14) [Sphere Packing in Dimension 8, Cohen-Elkies-Viazovska].** The maximal density of the sphere packing in dimension 8 is  $\Delta_8 = \frac{\pi^4}{384} \approx 0.25367$ . And up to rotation, this density is only attained by the  $E_8$ -lattice.  $\lrcorner$

*Proof:* Taking  $f(x) = g(\sqrt{2}x)$  where  $g$  is as in lemma(37.1.5.15), then  $f$  satisfies the condition in(37.1.5.10), and  $\frac{f(0)}{\text{Fou}f(0)} = 2^4$ , thus the density is bounded above by  $\Delta_8 = \frac{\pi^4}{384}$ . However, the density of the  $E_8$ -lattice packing is just  $\Delta_8$ ?.

For the uniqueness, for any periodic packing  $\bigcup_{i=1}^N (\Lambda + v_i)$ , we may assume that  $\text{Vol}(\mathbb{R}^n/\Lambda) = N$ . Because this is a densest packing, it implies that the packing sphere size is the same as that of  $\Lambda_8$ . Then the Poisson summation formula

$$\sum_{1 \leq j, k \leq N} \sum_{x \in \Lambda} g(x + v_j - v_k) = \frac{1}{N} \sum_{t \in \Lambda^D} \text{Fou}g(t) \left| \sum_j e^{2\pi i \langle v_j, t \rangle} \right|^2.$$

Then the conditions on  $g$  in (37.1.5.15) imply that each  $|x + v_i - v_j|^2 \in 2\mathbb{Z}$ . This implies that the lattice generated by centers of this periodic packing is an integral even lattice, which has covolume at least 1. But then it must have covolume 1 because it contains  $\Lambda$ , and also it has the same packing radius as  $E_8$  because it is even. So the periodic packing is in fact an even lattice packing. Then by ?, it is isomorphic to  $E_8$ .  $\square$

**Lemma (37.1.5.15).** There exists a radial function  $g : \mathbb{R}^8 \rightarrow \mathbb{R}$  s.t.

- $g(x) \leq 0$  for any  $\|x\| \geq 2$ .
- $\text{Foug}(x) \geq 0$  for any  $x$ .
- $g(0) = \mathcal{F}g(0) = 1$ .
- $g(x) \neq 0, \mathcal{F}g(x) \neq 0$  for any  $x$  s.t.  $\|x\|^2 \notin 2\mathbb{Z}$ .

Notice that Poisson summation w.r.t. the self-dual lattice  $\Lambda_8$  will imply that  $g(\lambda) = \text{Foug}(\lambda) = 0$  for any  $\lambda \in \Lambda^*$ .  $\lrcorner$

*Proof:* Cf. [Viazovska, Sphere Packing in Dimension 8]P994. ?  $\square$

## 6 Probabilistic Methods

References are [The probabilistic method, Alon-Spencer].

## 37.2 Graph Theory I

References are [Die17].

### Notation (37.2.0.1).

- For simplicity, we usually use graph to denote a simple graph (37.2.1.1) (unless specified otherwise), and a multi-graph to denote a graph with (possibly) multi-edges or loops.
- For a multi-graph  $G$ ,
  - let  $V(G)$  denote the set of vertices of  $G$ ,
  - let  $E(G)$  denote the set of edges of  $G$ ,
  - let  $\vec{E}(G)$  denote the set of triples  $(e, x, y)$  where  $e \in E(G)$ , and  $e \cap V(G) = \{x, y\}$ ,
  - let  $v(G)$  denote the number of vertices,
  - let  $e(G)$  denote the number of edges,
  - let  $\chi(G) = v(G) - e(G)$  denote the Euler characteristic of  $G$ ,
  - for  $v \in V(G)$ , let  $\deg(v)$  denote the degree of  $v$  in  $G$ ,
  - let  $d(G)$  (or  $t(G)$ ) denote the average degree of vertices in  $G$ , which equals  $2e(G)/v(G)$  when  $G$  is finite,
  - let  $\delta(G)$  denote the minimum degree of vertices of  $G$ ,
  - let  $\Delta(G)$  denote the maximum degree of vertices of  $G$ ,
  - for  $U \subset V(G)$ , let  $N(U)$  denote the set of vertices connected to  $U$ , and let  $E(U)$  denote the set of edges adjacent to  $U$ .
  - let  $\omega(G)$  denote the maximal cardinality of a clique in  $G$  (37.2.5.1),
  - let  $\alpha(G)$  denote the maximal cardinality of an independent subset of  $G$ ,
  - for two disjoint non-empty subset  $X, Y \subset V(G)$ , let  $e(X, Y)$  denote the number of edges between vertices in  $X$  and vertices in  $Y$ , and  $d(X, Y) = \frac{e(X, Y)}{\#X\#Y}$  the density between  $X$  and  $Y$ .
  - for  $U \subset G$ ,  $G(U)$  is the induced subgraph on  $U$ ,
  - let  $\gamma(G)$  denote the chromatic number of  $G$ ,
  - let  $\kappa(G)$  denote the number of spanning trees of  $G$  (37.2.1.23),
  - let  $g(G)$  denote the girth of  $G$ ,
  - let  $h(G)$  denote the expanding constant of  $G$  (37.3.10.1).

┘

### 1 Basics

**Def. (37.2.1.1) [Graphs].** A **graph**  $X$  is a CW-complex of dimension  $\leq 1$  with a given presentation  $(X^0, X^1 = X)$  (4.13.3.1). the elements in the set of  $X^0$  are called **vertices** of  $X$ , and the 1-cells are called **edges** of  $X$ .

A **simple graph** is a graph without loops and multi-edges.

For a graph  $X$ , a **subgraph** is a sub CW-complex of  $X$ . And if  $V' \subset V(X)$  is a subset, the **induced subgraph** of  $X$  is defined to be the subgraph  $X' \subset V(X)$  whose vertices are just  $V'$ , and two vertices in  $V'$  are connected by an edge iff they are connected by an edge in  $X$ . ┘

**Def. (37.2.1.2)[Claws].** A **claw graph** is any graph isomorphic to the graph  $G = (V(G), E(G))$  where  $V(G) = \{1, 2, 3, 4\}$ ,  $E(G) = \{12, 13, 14\}$ .  $\lrcorner$

**Def. (37.2.1.3)[Wheel Graphs].** For  $n \in \mathbb{Z}_+$ , a **Wheel graph**  $\text{Wheel}_n$  is defined to be the graph  $C_{n-1} * \text{pt}$ .  $\lrcorner$

### Degrees of Vertices

**Def. (37.2.1.4)[Complete Graphs].** A **complete graph** is a simple graph that each two vertices is connected by an edge. For  $r \in \mathbb{Z}_+$ , a complete graph of size  $r$  is denoted by  $K^r$ .  $\lrcorner$

**Def. (37.2.1.5)[Complement Graph].** For  $G \in \text{Graph}^{\text{simple}}$  the **complement graph**  $G^c \in \text{Graph}^{\text{simple}}$  is a simple graph s.t.  $V(G^c) = V(G)$ , and two distinct vertices in  $G^c$  are adjacent if they are not adjacent in  $G$ .  $\lrcorner$

**Def. (37.2.1.6)[Kernels].** For any oriented graph  $H \in \text{Graph}$ , a **kernel of graph** of  $H$  is an independent set  $U \subset V(H)$  s.t. for any  $v \in V(H) \setminus U$ , there exists an edge  $vu \in \vec{E}(G)$  with  $u \in U$ .  $\lrcorner$

**Prop. (37.2.1.7).** For any  $G \in \text{Graph}^{\text{fin}}$  with  $E(G) \neq \emptyset$ , there is a subgraph  $H$  of  $G$  s.t.  $2\delta(H) \geq t(H) \geq t(G)$ .  $\lrcorner$

*Proof:* If there is a vertex  $v \in V(G)$  s.t.  $\deg(v) < \frac{1}{2}t(G) = e(G)/v(G)$ , then we delete  $v$ , and get  $G_1 = G \setminus \{v\}$ . Do the same for  $G_1$ , and so on. In this way, it is easy to see that  $t(G)$  is increasing. Because  $G$  is finite, this process stops at some point. But because  $t(\text{pt}) = 0 < G$ , the stopping graph  $H$  cannot be empty. And this graph  $H$  satisfies  $2\delta(H) \geq t(H) \geq t(G)$ .  $\square$

**Def. (37.2.1.8)[Groupies].** A **groupie** in a graph  $G$  is a vertex  $P \in V(G)$  s.t. if  $r(P)$  is the summation of degree of vertices of points  $Q$  adjacent to  $P$ , then  $r(P) \geq \frac{2e(G)}{v(G)} \deg P$ .  $\lrcorner$

**Prop. (37.2.1.9).** Any  $G \in \text{Graph}$  has a groupie.  $\lrcorner$

*Proof:* For  $P \in V(G)$ , let  $r(P)$  is the summation of degree of vertices of points  $Q$  adjacent to  $P$ . then

$$\sum_{P \in V(G)} r(P) = \sum_{Q \in V(G)} \deg(Q)^2 \geq (\sum \deg(P))^2 / v(G) = t(G)^2 v(G) = t(G) \sum \deg(P).$$

So there must be some  $P \in V(G)$  that  $r(P) \geq t(G) \deg P$ .  $\square$

### Paths and Circuits

**Def. (37.2.1.10)[Paths, Circuits and Cycles].** For  $G \in \text{Graph}$ , a **walk in an (oriented)graph** of length  $k \in \mathbb{Z}_{\geq 2}$  is a sequence  $(v_1, e_1, \dots, e_{k-1}, v_k)$  s.t.

- $v_j \in V(G)$  for any  $j \in [k]_+$ ,
- $e_i = v_i v_{i+1} \in E(G)$  for  $i \in [k-1]_+$ .

A **simple path** is a path without repetition vertices.

A **circuit in a graph** of length  $k \in \mathbb{Z}_{\geq 2}$  is a sequence  $(v_1, e_1, \dots, e_{k-1}, v_k, e_k)$  s.t.

- $v_j \in V(G)$  for any  $j \in [k]_+$ ,
- $e_i = v_i v_{i+1} \in E(G)$  for  $i \in [k-1]_+$ ,

- $e_k = v_k v_1 \in E(G)$ .

A **simple circuit** is a circuit without repetition vertices.

A **cycle in a graph**(resp. ordered cycle) is an  $\mathbb{Z}/(k) \times \mathbb{Z}/(2)$ (resp.  $\mathbb{Z}/(k)$ )-orbit of simple circuits.

The **girth**  $g(G)$  of  $G$  is the minimal length of a circuit in  $G$ .  $\lrcorner$

**Prop. (37.2.1.11) [Minimal Degree and Large Cycles].** For any  $G \in \mathbf{Graph}$ ,  $G$  contains a path of length  $\delta(G)$ . And if  $\delta(G) \geq 2$ , it contains a cycle of length  $\geq \delta(G) + 1$ .  $\lrcorner$

*Proof:* Consider the largest simple path, then the neighbourhood of the endpoints are all on this path, thus it has length  $\geq \delta(G)$ . And consider its neighbors on this path, we get a simple circuit.  $\square$

**Def. (37.2.1.12) [Distances].** For any  $G \in \mathbf{Graph}$  and  $x, y \in V(G)$ , the **distance between vertices**  $d_G(x, y)$  is defined to be the infimum of lengths of paths in  $G$  with endpoints  $x$  and  $y$ .

The maximal distances between two vertices in  $G$  is called the **diameter of graph** of  $G$ , denoted by  $\text{diam}(G)$ .  $\lrcorner$

**Def. (37.2.1.13) [Radius].** For  $G \in \mathbf{Graph}$ , the **radius** of  $G$  is defined to be

$$\text{rad}(G) = \min_{x \in V(G)} \max_{y \in V(G)} d_G(x, y).$$

Clearly  $\text{rad}(G) \leq \text{diam}(G) \leq 2\text{rad}(G)$ .  $\lrcorner$

**Prop. (37.2.1.14).** For  $G \in \mathbf{Graph}$ , either  $g(G) = \infty$  or  $g(G) \leq 2\text{diam}(G) + 1$ .  $\lrcorner$

**Prop. (37.2.1.15) [Radius, Maximal Degrees and Sizes].** For  $k, d \in \mathbb{Z}_+$ ,  $G \in \mathbf{Graph}$ , if  $\text{rad}(G) \leq k$ ,  $\Delta(G) \geq d \geq 3$ , then

$$v(G) \leq \frac{d}{d-2}(d-1)^k.$$

*Proof:* Take a central point  $z \in G$  and let  $D_i$  be the set of vertices with distances  $i$  from  $z$ . Then  $\#D_0 = 1$ ,  $\#D_i \leq d(d-1)^{i-1}$  for  $i \in \mathbb{Z}_+$ . Thus we get the desired result by counting.  $\square$

**Prop. (37.2.1.16) [Average Degree, Girth and Sizes, Alon-Hoory-Linial2002].** For  $g, d \in \mathbb{Z}_+$ ,  $G \in \mathbf{Graph}$ , if  $d(G) \geq d \geq 2$  and  $g \leq g(G) < \infty$ , then

$$v(G) \geq \begin{cases} 2 \sum_{i=0}^{\lfloor \frac{g}{2} \rfloor - 1} (d-1)^i & , 2|g \\ 1 + d \sum_{i=0}^{\lfloor \frac{g}{2} \rfloor - 1} (d-1)^i & , 2 \nmid g \end{cases}.$$

*Proof:* ?  $\square$

**Cor. (37.2.1.17).** If  $d(G) \geq 3$ , then  $g(G) < 2 \log v(G)$ .  $\lrcorner$

**Def. (37.2.1.18) [Large Girth Families].** For  $k \in \mathbb{Z}_{\geq 3}$ , a family of  $k$ -regular finite simple graphs  $(X_n) \in \mathbf{Graph}^{\mathbb{Z}_+}$  is called a family of **large girth graphs** if there exists  $C \in \mathbb{R}_+$  s.t.  $\lim_{n \rightarrow \infty} v(X_n) = \infty$  and  $g(X_n) \geq C \log_{k-1} v(X_n)$ .  $\lrcorner$

**Prop. (37.2.1.19) [Large Girth and Large Connectivity Graphs].** For any  $k \in \mathbb{Z}_+$ , there exists a finite graph  $H \in \mathbf{Graph}^{\text{simple}}$  with  $g(H) > k$  and  $\kappa(H) > k$ .  $\lrcorner$

*Proof:* This follows from (37.3.2.9) and (37.2.4.5).  $\square$

**Def. (37.2.1.20) [Prime circuits].** A **prime circuit** in an unoriented graph  $G$  is a circuit that is not a non-trivial multiple of another cycle, and doesn't contain a segment of the form  $\dots, x, y, x, \dots$  for  $x, y \in V(G)$ .  $\lrcorner$

**Def. (37.2.1.21) [Primitive Graphs].** For a connected graph  $G \in \mathbf{Graph}$ , the gcd of lengths of circuits in  $G$  is called the **period of graph**  $G$ .  $G$  is called a **primitive graph** if it has period 1.

If  $G$  has period  $v$ , then it can be decomposed into  $G_1 \amalg \dots \amalg G_v$  s.t. each edge is between some  $G_i$  to  $G_{i+1}$ .  $\lrcorner$

**Def. (37.2.1.22) [Holes].** For a simple graph, a **hole of graph**  $H \subset G$  is an induced subgraph that is isomorphic to a cycle of length  $\geq 4$ . An **antihole of a graph** is an induced subgraph of  $G$  whose complement is a graph in  $G^c$ .  $\lrcorner$

### Trees and Forests

**Def. (37.2.1.23) [Trees].** A **tree** is a graph  $T$  s.t.  $H_1(T) = 0$ . A tree in a graph  $X$  is called a **maximal tree** if it contains all vertices of  $X$ . A **forest** is a graph that is a disjoint union of trees.  $\lrcorner$

**Prop. (37.2.1.24).** Any tree  $T$  is contractible, and any vertex  $v$  is a deformation retract of  $T$ .  $\lrcorner$

*Proof:*  $\square$

**Prop. (37.2.1.25) [Maximal Trees].** Every connected graph contains a maximal tree, and any tree in a connected graph is contained in a maximal tree.

A tree  $T$  in a graph  $X$  is maximal iff  $X^0 \subset T$ .  $\lrcorner$

*Proof:* Cf. [Hat02]P84.  $\square$

**Prop. (37.2.1.26) [ $\pi_1$  of Graphs].** For a connected graph  $X$  with a maximal tree  $T$ ,  $\pi_1(X)$  is a free group with basis the classes  $[f_\alpha]$  corresponding to the edges  $e_\alpha \in X \setminus T$ .  $\lrcorner$

*Proof:* The quotient map  $X \rightarrow X/T$  is a homotopy equivalence by (4.13.7.7). And the quotient space  $X/T$  has only one vertex, thus is a wedge sum of circles corresponding to  $e_\alpha \in X \setminus T$ . So we are done by (4.13.5.29).  $\square$

**Prop. (37.2.1.27) [Covering Spaces of Graphs].** Every covering space  $\pi : \tilde{X} \rightarrow X$  of a graph is also a graph, with vertices and edges lifts of vertices and edges of  $X$ .  $\lrcorner$

*Proof:* Let the sets  $\pi^{-1}(v)$  be vertices of  $\tilde{X}$ , where  $v$  are vertices of  $X$ . And if we write  $X$  as a quotient space of  $X^0 \cup_\alpha I_\alpha$ , each  $I_\alpha$  can be lifted to maps to  $\tilde{X}$ , and we let these be edges of  $\tilde{X}$ . The topology of  $\tilde{X}$  coming from quotient topology of this is the same as the original topology, because they has the same basis open sets, because  $\pi$  is a local homeomorphism.  $\square$

**Def. (37.2.1.28) [Path Trees].** For  $G \in \mathbf{Graph}$ , the **path tree** of  $G$  at  $u$  is defined to be the universal covering of  $G$  at  $u$  consisting of simple paths at  $u$ .  $\lrcorner$

**Prop. (37.2.1.29) [Spencer's Lemma].** If there is a triangulation of a plane polygon  $P$ , for arbitrary 3-color numbering  $(\{0, 1, 2\})$  of the vertices, if the number of edges on the boundary with color  $(0, 1)$  is odd, then there is a triangle with vertices of pairwise different colors.  $\lrcorner$

*Proof:* In fact the number of those triangles with vertices of pairwise different colors is odd. In fact, the number of  $(0, 1)$ -edges on a triangle is odd iff its vertices has pairwise different colors. But the sum of numbers of  $(0, 1)$ -edges on the triangles are odd, by hypothesis, thus the result.  $\square$

### Contractions and Minors

**Def. (37.2.1.30) [Subdivisions and Topological Minors].** A **subdivision** of a graph  $X$  is any graph obtained from  $X$  by ‘subdividing’ some or all of its edges by drawing new vertices on those edges.

For graphs  $X, Y$ , if  $Y$  contains a subgraph that is isomorphic to a subdivision of  $X$ , then  $X$  is called a **topological minor graph** of  $Y$ .  $\lrcorner$

**Def. (37.2.1.31) [Contractions and Minors].** For any graph  $G$ , divide  $V(G)$  into connected subsets  $V_{\alpha_1}, \dots, V_{\alpha_k}$ , and let  $X$  be the graph with

$$V(X) = \{\alpha_1, \dots, \alpha_k\}, \quad E(X) = \{(\alpha_i, \alpha_j) \mid i \neq j, E(V_{\alpha_i}, V_{\alpha_j}) \neq \emptyset\}.$$

Then  $X$  is called a **contraction graph** of  $G$ .

For graphs  $X, Y$ , if  $X$  is isomorphic to a contraction of a subgraph of  $Y$ , then  $X$  is called a **minor graph** of  $Y$ . We sometimes use the notation  $X = Y/U$  to denote a minor of  $Y$  that only contracts one connected subset  $U$ .  $\lrcorner$

**Prop. (37.2.1.32).** Any topological minor is a minor. And if  $X$  is a minor of a graph  $G$  with  $\Delta(X) \leq 3$ , then  $X$  is also a topological minor of  $G$ .  $\lrcorner$

*Proof:* The first assertion is easy. For the last assertion, consider each  $V_x$  for  $x \in X$ , then it suffices to show that for any three vertices  $x, y, z$  in a connected graph, there is a vertex with separate paths to them without intersection. For this, firstly find a shortest path  $W$  from  $x$  to  $y$ . If this path contains  $z$ , then  $z$  is the vertex we want. If this path doesn’t contain  $z$ , then find a shortest path  $W'$  from  $z$  to  $W$ , then the endpoint of  $W'$  is the vertex we want.  $\square$

## 2 Spectral Graph Theory

**Def. (37.2.2.1) [Companion Matrices].** For a finite multi-graph  $G$  with  $\#V(G) = n$ , given an ordering of the vertices, the

- **adjacency matrix**  $A_G$  of  $G$  is defined to be the  $n \times n$  matrix  $(a_{ij})$  with  $a_{ij} = \alpha(v_i, v_j)$ , the number of edges between  $v_i$  and  $v_j$ .
- **valence matrix**  $D_G$  of  $G$  is defined to be the  $n \times n$  diagonal matrix  $\text{diag}(\deg(v_1), \dots, \deg(v_n))$ .
- **Laplacian matrix**  $L_G$  of  $G$  is defined to be the  $A_G - D_G$ .

It is clear that  $M_G, D_G, L_G$  are all real symmetric. In particular, they have real spectrums.  $\lrcorner$

**Def. (37.2.2.2) [Spectrums of Graphs].** For any finite multi-graph  $G \in \mathbf{Graph}$ , denote

$$\lambda_0 \geq \lambda_1 \geq \dots \geq \lambda_{v(G)}$$

be the set of eigenvalues of  $M_G$ . And denote  $\rho(G) = \max |\lambda_i(G)|$  the **spectrum radius** of  $G$ .  $\lrcorner$

**Prop. (37.2.2.3) [Spectra of Adjacency Matrices].** For  $k, n \in \mathbb{Z}_+$ , if  $G \in \mathbf{Graph}$  is  $k$ -regular and  $n = v(G) \leq n$ , then

- $k = \lambda_0 \geq \lambda_1 \geq \dots \geq \lambda_{n-1} \geq -k$ .
- $k > \mu_1$  iff  $G$  is connected.

$\lrcorner$

*Proof:* 1: Clearly  $(1, \dots, 1)^t$  is an eigenvector with eigenvalue  $k$ . To show that  $|\lambda_i| \leq k$ , just choose a coordinate with largest absolute value.

2: This is also easy by taking a maximum coordinate.  $\square$

**Prop. (37.2.2.4) [Spectrum of Bipartite Graphs].** For  $k, n \in \mathbb{Z}_+$ , if  $G \in \mathbf{Graph}$  is connected,  $k$ -regular and  $n = v(G) \leq n$ , then the following are equivalent:

- $G$  is bipartite.
- $\lambda_i + \lambda_{n-1-i} = 0$ .
- $\mu_{n-1} = -k$ .

┘

*Proof:* 1  $\rightarrow$  2: Suppose  $G = G^+ \amalg G^-$ . If  $v$  is an eigenvector of  $A_G$  with eigenvalue  $\mu$ , then by multiplying the coordinates of  $v$  corresponding to  $v \in G^-$ , we get an eigenvector of  $A_G$  with eigenvalue  $-\mu$ .

2  $\rightarrow$  3 follows from (37.2.2.3).

3  $\rightarrow$  1: similarly, choose a coordinate of the eigenvector with eigenvalue  $-k$ . Then

$$v_x = -\frac{1}{k} \sum_{yx \in E(G)} v_y.$$

So it can be shown that  $v_y = -v_x$  if  $xy \in E(G)$ . By this way and the fact  $G$  is connected, we get a bipartition of  $V(G)$ . □

### $L_G$ and Spectral Gaps

**Prop. (37.2.2.5).** For any finite graph  $G \in \mathbf{Graph}$ ,  $L_G$  is positive-semidefinite, as for any  $\mathbf{x} \in \mathbb{R}^n$ ,

$$\mathbf{x}^T L_G \mathbf{x} = \sum_{1 \leq i < j \leq n} \alpha(v_i, v_j) (x_i - x_j)^2.$$

And if  $G$  is connected, then  $L_G$  has nullity 1, whose eigenspace is spanned by  $\mathbf{x} = (1, 1, \dots, 1)^t$ . ┘

**Prop. (37.2.2.6).** Let  $G$  be a finite connected multi-graph with  $\#V(G) = n$  and diameter  $d = d(G)$ , then the smallest eigenvalue  $\lambda_1$  of  $L_G$  satisfies  $\lambda_1 \geq 1/(nd)$ . ┘

*Proof:* Let  $w$  be the unit eigenvector belong to  $\lambda_1$ , then there exists  $i \in [n]_+$  s.t.  $|w_i| \geq 1/\sqrt{n}$ . We may assume that  $w_1 > 1/\sqrt{n}$ . Since  $w$  is orthogonal to  $(1, \dots, 1)^t$ , we have  $\sum w_i = 0$ . So there exists some  $w_k < 0$ . Let  $v_1, v_2, \dots, v_k$  be a minimal path from  $v_1$  to  $v_k$ , then  $k-1 \leq d$ , and

$$\lambda_1 = \mathbf{w}^t L_G \mathbf{w} = \sum_{1 \leq i < j \leq n} \alpha(v_i, v_j) (w_i - w_j)^2 \geq \sum_{i=1}^{k-1} (w_i - w_{i+1})^2 \geq \frac{1}{k-1} (w_1 - w_k)^2 \geq \frac{1}{nd}.$$

□

**Prop. (37.2.2.7) [Bigg].** For  $k$ -regular finite graph  $G \in \mathbf{Graph}$  and any cofactor  $M$  of  $L_G$ ,  $\det(M) = \det(\text{tree}(G))$ . ┘

*Proof:* Cf. [Biggs, Algebraic Graph Theory] Thm6.3. ? □

### Spectral Radius

**Prop. (37.2.2.8).** If  $X \in \mathbf{Graph}$  is connected, then for any  $x \in X$ ,

$$\rho(X) = \limsup_{s \rightarrow \infty} \sqrt[s]{t_s(x)}$$

where  $t_s(x)$  is the number of closed paths starting from  $x$ . ┘

*Proof:* Cf. [Discrete Groups, Expanding Graphs and Invariant Measures] Chap4. ? □

**Prop. (37.2.2.9).** The spectrum radius of a  $(c, d)$ -regular tree is  $\sqrt{c-1} + \sqrt{d-1}$ . ┘

*Proof:* ? Cf. [Walk generating functions and spectral measures of infinite graphs] and [Spectra of regular graphs and hypergraphs and orthogonal polynomials]. □

**Thm. (37.2.2.10) [Greenberg/Cioabă].** Let  $X$  be a connected, infinite graph with  $\Delta(X) < \infty$ . Given  $\varepsilon \in \mathbb{R}_+$ , there exists  $c(X, \varepsilon) \in \mathbb{R}_+$ ,  $g(X, \varepsilon) \in \mathbb{Z}_+$  such that

- for any finite graph  $Y \in \mathbf{Graph}^{\text{simple}}$  covered by  $X$ ,

$$\#\{\lambda \in \text{Spec}(Y) \mid \lambda \geq \rho(X) - \varepsilon\} \geq c(\varepsilon, k)v(Y).$$

- for any finite graph  $Y \in \mathbf{Graph}^{\text{simple}}$  covered by  $X$  s.t.  $g(Y) \geq g$ ,

$$\#\{\lambda \in \text{Spec}(Y) \mid \lambda \leq -\rho(X) + \varepsilon\} \geq c(\varepsilon, k)v(Y).$$

┘

*Proof:* Cf. [Eigenvalues of graphs and a simple proof of a theorem of Greenberg]. ? □

**Cor. (37.2.2.11) [Alon-Boppana/Serre].** For any  $\varepsilon \in \mathbb{R}_+$  and  $k \in \mathbb{Z}_{\geq 3}$ , there exists a  $c(\varepsilon, k) \in \mathbb{R}_+$  s.t. for  $k$ -regular connected finite graph  $G \in \mathbf{Graph}^{\text{simple}}$ ,

$$\#\{\lambda \in \text{Spec}(G) \mid \lambda \geq (2 - \varepsilon)\sqrt{k-1}\} \geq c(\varepsilon, k)v(G).$$

┘

*Proof:* This follows from (37.2.2.10) and (37.2.2.9). □

### 3 Matching, Covering and Packing

**Def. (37.2.3.1) [Matchings].** For  $G \in \mathbf{Graph}$ , a **matching on graph** is a subset  $M \subset E(G)$  s.t. no two edges in  $M$  have a common vertex (nor loops).

For  $A \subset V(G)$ , a **matching for  $A$**  is a matching  $M \subset E(G)$  s.t. each  $v \in A$  is incident with some  $e \in M$ . ┘

**Def. (37.2.3.2) [Vertex Coverings of Edges].** For  $G \in \mathbf{Graph}$ , a **vertex covering of edges** of  $G$  is a subset  $U \subset V(G)$  s.t. each  $e \in E(G)$  is incident with at least one vertex in  $U$ . ┘

**Thm. (37.2.3.3) [König1931].** For a bipartite graph  $G \in \mathbf{Graph}^{\text{fin}}$ , the maximal cardinality of a matching in  $G$  equals the minimal cardinality of a vertex covering of edges of  $G$ . ┘

*Proof:* It suffices to prove that for a matching  $M \subset E(G)$ , we can find a vertex covering of cardinality  $\#M$ .

Let  $G = G_1 \amalg G_2$  where  $G_1, G_2$  are independent subsets, define an **augmentation path** as a simple path in  $G$  that starts with a vertex in  $G_1$  and alternate between edges in  $E(G) \setminus M$  and  $M$ . Notice an augmentation path ending in a vertex other than vertices of  $M$  will result in a larger path, so any augmentation path ends in vertices of  $M$ .

Now from each matching in  $M$  we choose one of its vertex to form a set  $U = U_1 \amalg U_2$  where a vertex of  $M \cap G_2$  is in  $U_2$  iff it is the endpoint of an augmentation path. Then we claim  $U$  is a vertex covering of edges of  $G$ : It suffices to show that if  $a \in G_1, b \in G_2$  is adjacent, then  $a \in U_1$  or  $b \in U_2$ : Suppose  $a \notin U_1$ , if  $a$  is unmatched, then  $ab$  is an augmentation path, so  $b \in U_2$ . If  $a$  is matched with  $b'$ , because  $a$  is not in  $U_1$ , there is an augmentation path  $P$  ending in  $b'$ . If  $b \in P$ , then  $b \in U$ . If  $b \notin P$ , then  $Pb'ab$  is an augmentation path ending in  $b$ , so also  $b \in U$ .  $\square$

**Cor. (37.2.3.4).** If  $G \in \mathbf{Graph}^{\text{fin}}$  is a  $k$ -regular bipartite graph where  $k \in \mathbb{Z}_+$ , then  $G$  has a 1-factor (full matching).  $\lrcorner$

**Cor. (37.2.3.5) [Petersen 1891].** Let  $G \in \mathbf{Graph}^{\text{fin}}$  be a  $2k$ -regular graph where  $k \in \mathbb{Z}_+$ , then  $G$  has a 2-factor.  $\lrcorner$

*Proof:* By (37.2.4.12), there is an Euler tour  $v_0v_1 \dots v_l$ . Make  $G$  an oriented graph using this Euler tour, and we can construct a 2-covering  $G'$  by replacing each vertex  $v \in V(G)$  by a pair of vertices  $v^-, v^+$ , and replacing each vertex  $\vec{e} = v_i v_{i+1}$  by the edge  $v_i^+ v_{i+1}^-$ . Then this graph is bipartite and  $k$ -regular. Then by (37.2.3.4),  $G'$  has a 1-factor. The projection of this 1-factor in  $G$  is a 2-factor.  $\square$

**Cor. (37.2.3.6) [Marriage Theorem, Hall 1935].** For any finite bipartite graph  $G \in \mathbf{Graph}^{\text{fin}}$  such that  $G = G_1 \amalg G_2$  where  $G_1, G_2$  are independent sets. Then for any  $A \subset G_1$ ,  $G$  contains a matching for  $A$  iff  $\#N(S) \geq \#S$  for any  $S \subset A$ .  $\lrcorner$

*Proof:* Using König's theorem (37.2.3.3), it suffices to consider the case  $A = G_1$  and show that for any vertex cover  $S = S_1 \amalg S_2$  of edges of  $G$ ,  $\#S \geq \#A$ . Suppose for the contrary that  $\#S < \#A$ , then  $\#N(A \setminus S_1) \geq \#A - \#S_1 > \#S_2$ , so there is a vertex in  $G_2 \setminus S_2$  connected to  $S_2$ , contradicting the fact that  $S$  is a vertex cover of edges of  $G$ .  $\square$

### Stable Matchings

**Def. (37.2.3.7) [Stable Matchings].** For any finite bipartite graph  $G \in \mathbf{Graph}^{\text{fin}}$ , a **family of preferences** on  $E(G)$  is a family  $\{\leq_v\}_{v \in V(G)}$  where each  $\leq_v$  is a linear ordering on  $E(v)$ .

Given a finite simple bipartite graph  $G \in \mathbf{Graph}^{\text{fin}}$  with a family of preferences, a **stable matching** on  $G$  is a matching  $M$  on  $G$  s.t. for any  $e \in E(G) \setminus M$ ,  $\exists f \in M$  s.t.  $e, f$  has a common vertex  $v$  and  $e \leq_v f$ .  $\lrcorner$

**Thm. (37.2.3.8) [Stable Mapping Algorithm, Gale-Shapley [G-S62]].** Any bipartite graph  $G \in \mathbf{Graph}^{\text{fin}}$  with a family of preferences has a stable matching (37.2.3.7). And there is an algorithm to do so.  $\lrcorner$

*Proof:* Let  $G = G_1 \amalg G_2$  where  $G_1, G_2$  are independent subsets. The algorithm to find a stable matching works as follows: Each vertex in  $G_1$  propose a matching to its favorite vertex in  $G_2$ , then each vertex in  $G_2$  declines all the proposals it receives except for its favorite one. After this, each vertex in  $G_1$  that is currently declined propose a matching to its favorite vertex in  $G_2$  among those

it hasn't proposed before (if there is any proposals that can be made), and each vertex in  $G_2$  declines all the proposals it receives except for its favorite one (among all proposed formerly proposed). And the process goes on, until no new proposals can be made.

The process will stop otherwise each round a new propose will be made, and there are at most  $\#G_1 \cdot \#G_2$  many possible proposes, contradiction. Then we prove that in this stage, the proposed matching is stable: If  $u \in G_1, v \in G_2$  is not a match and  $u$  is not matched or prefers  $v$  than its current match, then  $u$  must have proposed to  $v$  before and got declined. So  $v$  must be currently matched and it prefers this match than  $u$ . So  $e = uv$  is not a threat to this matching. Thus we proved that this matching is stable.  $\square$

**Prop. (37.2.3.9) [Gale-Shapley Algorithms are Optimal for Proposers].** If  $G = G_1 \amalg G_2 \in \mathbf{Graph}^{\text{fin}}$  is a bipartite graph with  $G_1, G_2$  independent with a family of preferences, then for the assignment of the Gale-Shapley algorithm that  $G_1$  proposes, every vertex in  $G_1$  is at least as well off under this assignment as he would under any other stable assignment (unmatched vertices are considered the worst cases).  $\lrcorner$

*Proof:* We use induction with the procedure to prove that whenever  $A \in G_2$  rejects  $\alpha \in G_1$ ,  $(A, \alpha)$  can never be matched in any stable matching: Consider the time that  $A$  rejects  $\alpha$ , then  $A$  accepts a  $\beta \in G_1$ . By procedure,  $A$  is considered by  $\beta$  as the best, except for those who rejected him, which is by induction hypothesis those can never be matched with  $\beta$  in any stable matching.

Now suppose in some stable matching  $(A, \alpha)$  is matching,  $\beta$  is matched with some  $B$ . Then  $(A, \beta)$  is an alternative match that show this matching is unstable, contradiction. This shows that  $(A, \alpha)$  can never be matched, and the induction is completed.  $\square$

### Matching Polynomials

**Def. (37.2.3.10) [Matching Polynomials].** Let  $G \in \mathbf{Graph}$  with  $n = v(G) < \infty$ . For  $i \in \mathbb{N}$ , let  $m_i$  be the number of matchings in  $G$  consisting of  $i$  edges, then the **matching polynomial** of  $G$  is defined to be

$$\mu_G(T) = \sum_{i \in \mathbb{N}} (-1)^i m_i T^{n-2i}.$$

$\lrcorner$

**Thm. (37.2.3.11) [Roots of Matching Polynomials, Heilmann-Lieb/Godsil].** For any  $G \in \mathbf{Graph}$ , the roots of the matching polynomial  $\mu_G(X)$  are real, and have absolute value at most  $\rho(P(G, u))$ , where  $P(G, u)$  is the path tree of  $G$  at  $u$  (37.2.1.28).

In particular, the roots have absolute values at most  $\rho(T)$ , where  $T$  is the universal cover of  $G$ , which is bounded by  $2\sqrt{\Delta(G) - 1}$ .  $\lrcorner$

*Proof:* Cf. [Algebraic Combinatorics, Godsil]. ?

For the last assertion, notice  $P(G, u)$  is an induced subgroup of  $T$ , so so clearly  $\rho(P(G, u)) \leq \rho(T)$ .

$\square$

## 4 Connectivity

**Def. (37.2.4.1) [ $s$ -Connected Graphs].** For  $s \in \mathbb{Z}_+$ , a graph  $G \in \mathbf{Graph}$  is called  **$k$ -connected** if it is connected after deleting any  $k - 1$  vertices.

The maximal  $k \in \mathbb{Z}_+$  s.t.  $G$  is  $k$ -connected is denoted by  $\kappa(G)$ .  $\lrcorner$

**Def. (37.2.4.2) [Edge-Connected Graphs].** The maximal  $k \in \mathbb{Z}_+$  s.t.  $G$  is  $k$ -edge-connected is denoted by  $\lambda(G)$ .  $\lrcorner$

**Def. (37.2.4.3) [Toughness].** For  $t \in \mathbb{R}_+$ , a graph  $G \in \mathbf{Graph}$  is called a  $t$ -tough graph if for any separator  $S \subset V(G) \cup E(G)$ ,  $G \setminus S$  has at most  $\#S/t$  connected components.  $\lrcorner$

**Prop. (37.2.4.4).** For any finite graph  $G \neq \text{pt} \in \mathbf{Graph}^{\text{simple}}$ ,  $\kappa(G) \leq \lambda(G) \leq \delta(G)$ .  $\lrcorner$

*Proof:* The second inequality is trivial. For the first, let  $F$  be a minimal edge separating set of  $G$ . If there is a vertex  $v \in V(G)$  that is not incident to any edge in  $F$ , let  $C$  be the connected component of  $G \setminus F$  containing  $v$ , then each edge in  $F$  connects  $C$  to another connected component, by minimality. But the vertices in  $C$  that is incident to any edge in  $F$  separates  $v$  from  $G \setminus C$ , thus  $\kappa(G) \leq \lambda(G)$ .

If every vertex  $v \in V(G)$  is incident to an edge in  $F$ , then the neighborhoods  $w$  of  $v$  s.t.  $vw \notin F$  are incident to different edges in  $F$  by minimality. Thus  $\deg(v) \leq \lambda(G)$ . As the neighborhoods of  $v$  separates  $G$  if  $G \neq \{v\} \cup N(v)$ , if  $G$  is not complete, then we get  $\kappa(G) \leq \lambda(G)$ . But when  $G$  is complete,  $\kappa(G) = \lambda(G) = v(G) - 1$ .  $\square$

**Thm. (37.2.4.5) [Minimal Degree and Connectivity, Mader1972].** For  $k \in \mathbb{Z}_+$ , any  $G \in \mathbf{Graph}$  with  $d(G) \geq 4k$  has a  $(k+1)$ -connected subgraph  $H$  s.t.  $d(H) \geq d(G) - 2k$ .  $\lrcorner$

*Proof:* Cf.[Diestel]P13. ?  $\square$

**Def. (37.2.4.6) [( $x, y$ )-Cuts].** For a finite graph  $G$  and  $x, y \in V(G)$  with  $d(x, y) \geq 2$ , an  $(x, y)$ -cut in  $G$  is a set  $S \in V(G) \setminus \{x, y\}$  s.t.  $G \setminus S$  has no  $(x, y)$ -paths.  $\lrcorner$

**Thm. (37.2.4.7) [Menger].** Let  $G$  be a finite graph and  $x, y \in V(G)$  s.t.  $d(x, y) \geq 2$ . Denote  $\kappa_G(x, y)$  the minimum size of an  $(x, y)$ -cut in  $G$  and  $\lambda_G(x, y)$  a maximum number of internally-disjoint  $(x, y)$ -paths in  $G$ , then  $\kappa_G(x, y) = \lambda_G(x, y)$ .  $\lrcorner$

*Proof:*  $\square$

**Def. (37.2.4.8) [( $x, U$ )-Fans].** For a finite graph  $G$  and a subset  $U \subset V(G)$  and  $x \in V(G) \setminus U$ , an  $(x, U)$ -fan of size  $k$  is a set of  $k$ -paths from  $x$  to  $U$  s.t. any two of them share only  $x$ .  $\lrcorner$

**Prop. (37.2.4.9) [Fan Lemma, Dirac].** For  $k \in \mathbb{Z}_+$  and  $G \in \mathbf{Graph}$ ,  $\kappa(G) \geq k$  iff  $v(G) \geq k+1$ , and for any subset  $U \subset V(G)$  and each  $x \in V(G) \setminus U$ ,  $G$  has an  $(x, U)$ -fan of size  $\min(k, \#U)$ .  $\lrcorner$

*Proof:* If  $G$  has at least  $k+1$  vertices and for any subset  $U \subset V(G)$  with  $|U| \geq k$  and each vertex  $x \notin U$ ,  $G$  has an  $(x, U)$ -fan of size  $k$ , we show  $G$  is  $k$ -connected: If there is a  $(k-1)$ -vertex cut  $S$ , let  $A$  be a connected component of  $G \setminus S$ , and  $U = V(G) \setminus A$ . Then  $\#U \geq k$ , and for any  $x \in A$ , there are no  $(x, U)$ -cut of size  $k$ , because each path from  $x$  to  $U$  must intersect with  $S$ .

Conversely, if  $G$  is  $k$ -connected and  $U \subset V(G)$ ,  $\#U \geq k$ . Let  $G' = G * \{y\}$ , then  $G'$  is also  $k$ -connected. Then by Menger's theorem(37.2.4.7),  $\lambda_G(x, y) = \kappa_G(x, y) \geq k$ . Let  $P_1, \dots, P_k$  be internally-disjoint  $(x, y)$ -paths in  $G'$ , then after deleting  $y$ , they form an  $(x, U)$ -fan of size  $k$ .  $\square$

## Hamilton Cycles

**Def. (37.2.4.10) [Eulerian Tours].** For a connected graph  $G \in \mathbf{Graph}^{\text{fin}}$ , an **Eulerian tour** is a circuit on  $G$  that traverses each edge of  $G$  exactly once. An **Eulerian graph** is a finite connected graph that admits an Euler tour.  $\lrcorner$

**Def. (37.2.4.11) [Hamilton Cycles].** For a graph  $G \in \mathbf{Graph}^{\text{fin}}$ , a **Hamilton-cycle** is a cycle in  $G$  that contains each vertex of  $G$  exactly once. Similarly, a **Hamilton-path** is a simple path in  $G$  that traverse each vertex of  $G$  exactly once.  $G$  is called a **Hamiltonian graph** if it has a Hamiltonian path.

$G$  is called **Hamiltonian-connected** if each pair of vertices  $x \neq y \in G$  is the endpoint of a Hamiltonian path in  $G$ .  $\lrcorner$

**Prop. (37.2.4.12) [Euler1736].** A connected graph  $G \in \mathbf{Graph}^{\text{fin}}$  is an Eulerian graph iff  $2 \mid \deg(v)$  for any  $v \in V(G)$ .  $\lrcorner$

*Proof:* One direction is clear. For the other, we use induction on  $v(G)$ . If  $v(G) = 0$ , this is true. For  $v(G) > 0$ , we can clearly find a walk with no repeated edges. Let  $W$  be such a walk with maximum length. Then we claim  $W$  is a Euler tour: Suppose not, then  $G' = G \setminus E(W)$  also satisfies the hypothesis that  $2 \mid \deg(v)$  for any  $v \in V(G)$ . As  $G$  is connected there is an edge  $e \in E(G')$  that is incident to a vertex in  $W$ . Then by induction hypothesis, the component of  $G'$  containing  $e$  has an Eulerian tour, which in concatenating with  $W$  makes a larger walk, contradiction.  $\square$

**Thm. (37.2.4.13) [Asratian-Khachatrian1990].** A connected graph  $G \in \mathbf{Graph}^{\text{fin}}$  has a Hamiltonian cycle if  $v(G) \geq 3$ , and

$$\deg(u) + \deg(w) \geq \#N(u) \cup N(v) \cup N(w)$$

for any induced path  $uvw$  (i.e.  $uw \notin E(G)$ ).  $\lrcorner$

*Proof:* The hypothesis is in fact equivalent to that

$$\#N(u) \cup N(w) \geq \#N(v) \setminus N(\{u, w\}).$$

As  $\{u, w\} \subset N(v) \setminus N(\{u, w\})$ , this implies that  $G$  has simple circuits. Let  $C$  be a longest simple circuit in  $G$ . Suppose  $G$  is not Hamiltonian, then there exists  $u \in G \setminus C$  with  $V = N(u) \cap C \neq \emptyset$ . Let  $V^+ = \{v^+ \mid v \in V\}$  be the set of successors of  $V$  in  $G$ , then by the maximality of  $C$ ,  $V \cap V^+ \neq \emptyset$ , and  $V^+ \cup \{u\}$  is an independent set, and no two of them have a common neighborhood outside  $C$ . Thus for any  $v \in V$ , we have

$$\#N(u) \cap N(v^+) \geq \#N(v) \setminus N(\{u, v^+\}) \geq \#N(v) \cap V^+ + 1.$$

Thus

$$e(V, V^+) = \sum_{v \in V} \#N(v) \cap V^+ \leq \sum_{v \in V} (\#N(u) \cap N(v^+) - 1) = e(V, V^+) - \#V,$$

contradiction.  $\square$

**Cor. (37.2.4.14) [Dirac1952].** For any finite simple graph  $G \in \mathbf{Graph}^{\text{simple}}$  with  $n = v(G) \geq 3$  and  $\delta(G) \geq n/2$  has a Hamilton cycle.  $\lrcorner$

**Thm. (37.2.4.15) [Chvátal-Erdős].** If  $k \in \mathbb{Z}_+$  and a simple graph  $G \in \mathbf{Graph}^{\text{fin}}$  satisfies  $v(G) \geq 3$ ,  $i(G) \leq \kappa(G)$ , then  $G$  has a Hamiltonian-cycle.  $\lrcorner$

*Proof:* The hypothesis implies that  $G$  is not a tree thus contains a simple path. Let  $k = \kappa(G)$ , and take a longest simple path  $C$ , if there exists  $x \in V(G) \setminus C$ , then by fan lemma (37.2.4.9), there exists an  $(x, U)$ -fan of size  $\min(k, \#C)$ , with vertices  $x_1, \dots, x_r$ . Let  $y_i$  be the successor of  $x_i$  in  $C$ , then  $xy_i \notin E(G)$  for each  $i$ , otherwise there is a longer simple path. This implies that  $\#C > k$ . Now for the set  $\{x, y_1, \dots, y_r\}$ , the hypothesis  $\kappa(G) = k$  implies that there is a path  $y_i y_j$ . Then we can find a cycle of larger size, contradiction.  $\square$

**Cor. (37.2.4.16).** If  $k \in \mathbb{Z}_+$  and a simple graph  $G \in \mathbf{Graph}^{\text{fin}}$  satisfies  $v(G) \geq 3, i(G) \leq \kappa(G) + 1$ , then  $G$  has a Hamiltonian-cycle.  $\lrcorner$

*Proof:* The graph  $G$  satisfies the hypothesis of (37.2.4.15) and has a Hamiltonian cycle. Thus  $G$  has an Hamiltonian-path.  $\square$

**Cor. (37.2.4.17).** If  $k \in \mathbb{Z}_+$  and a simple graph  $G \in \mathbf{Graph}^{\text{fin}}$  satisfies  $v(G) \geq 3, i(G) \leq k$ , and  $G$  is  $k$ -connected, then  $G$  is Hamiltonian-connected.  $\lrcorner$

*Proof:* The proof is similar to that of (37.2.4.15): For any vertices  $x \neq y \in G$ , just choose the longest path from  $x$  to  $y$ .  $\square$

**Prop. (37.2.4.18)[Tutte1956].** Any 4-connected Tutte planer graph has a Hamilton cycle.  $\lrcorner$

*Proof:*  $\square$

**Conj. (37.2.4.19) [Toughness Conjecture, Chvátal].** There exists  $t \in \mathbb{R}_+$  s.t. every  $t$ -tough graph (37.2.4.3) has a Hamilton-cycle.  $\lrcorner$

*Proof:*  $\square$

## 5 Complete Graphs

### Cliques and Independent Sets

**Def. (37.2.5.1)[Cliques].** For  $G \in \mathbf{Graph}$ , a **clique** in  $G$  is a subgraph  $H \subset G$  that is a complete graph. An **independent set** in a graph is a set of vertices that no two of them are adjacent.

For any graph  $G$ , let  $\omega(G)$  be the size of the maximal clique in  $G$ , and let  $\alpha(G) = \omega(G^c)$  be the size of the maximal independent set of  $G$ .  $\lrcorner$

**Def. (37.2.5.2)[Simplicial Cliques].** For  $G \in \mathbf{Graph}$ , a **simplicial clique** in  $G$  is a clique  $K$  in  $G$  s.t.  $N(k) \setminus K$  is a clique in  $G \setminus K$  for any  $k \in K$ .  $\lrcorner$

**Prop. (37.2.5.3).** If  $G \in \mathbf{Graph}$  is claw-free and  $K$  is a simplicial clique in  $G$ , then for any  $k \in K$ ,  $N(k) \setminus K$  is also a simplicial clique.  $\lrcorner$

*Proof:* By definition  $N(k) \setminus K$  is a clique. If for some  $k \in K$  and  $n \in N(k) \setminus K$ , the set  $H = N(n) \setminus (N(k) \cup K)$  is not a clique, then there exists two non-adjacent vertices  $x, y \in H$ . Then the graph induced by  $\{x, y, n, k\}$  is a claw, contradiction.  $\square$

**Prop. (37.2.5.4)[Erdős].** For any  $k, l \in \mathbb{Z}_+$  and a graph  $G$  of size  $(k-1)(l-1)+1$ , either  $G$  contains a complete  $k$ -graph, or any no-circuits ordering of the complement graph  $G^c$  contains a directed path of  $l$ -vertices.  $\lrcorner$

*Proof:* Consider any ordering on  $G^c$ . then we can put the vertices in a matrix by the following rule: The first row are vertices with no inward order, and for any  $k \geq 1$ , the row  $k$  are vertices not in the first  $k$  row and has an inward edge from some vertex in the row  $k$ .

Then there are no edges between vertices in the same row, and we are done if some row has  $k$  vertices. If each row has less than  $k$  vertices, then there are at least  $l$  row, which will give us a directed path of  $l$ -vertices, by our rule of construction.  $\square$

**Prop. (37.2.5.5) [Turán/Ajtai-Komlós-Szemerédi].** If  $G$  is a multi-graph with  $\omega(G) = 2$  (37.2.5.1) and  $v(G) \leq n, d(G) \leq t$ , where  $n, t \in \mathbb{R}_+$ , then

$$\alpha(G) \geq \max\left(\frac{n}{100t} \log t, \frac{n}{t+1}\right).$$

┘

*Proof:* Cf.[note on Ramsey Numbers].

□

**Prop. (37.2.5.6).** Let  $G$  be a graph with  $n = \#V(G)$ ,  $e = \#E(G)$ , and  $h$  be the number of triangles in  $G$ . Suppose  $p \in (0, 1)$  with  $pn \geq 3$ , then there exists an induced subgraph  $G' \subset G$  s.t.

$$n' > np/2, \quad e' < 3ep^2, \quad h' < 3hp^3.$$

┘

*Proof:*

□

**Prop. (37.2.5.7) [Ajtai-Komlós-Szemerédi].** Let  $\varepsilon \in \mathbb{R}_+$  and  $G$  be a graph with  $n = v(G)$ ,  $t = d(G)$ ,  $h$  the number of triangles in  $G$ . Suppose  $h < nm^{2-\varepsilon}$  and  $t \leq m - 1$ , where  $m \in \mathbb{Z}_{>122/\varepsilon}$ , then

$$\alpha(G) > \frac{\varepsilon}{4800} \cdot \frac{n}{m} \cdot \log m.$$

┘

*Proof:* Cf.[note on Ramsey Numbers].

□

### Independence Polynomials

**Def. (37.2.5.8) [Independence Polynomials].** For  $G \in \text{Graph}^{\text{fin}}$ , the **independence polynomial** is defined to be

$$I(G) = \sum_{A \subset V(G), A \text{ independent}} X^{\#A} \in \mathbb{Z}[X].$$

┘

**Prop. (37.2.5.9).** For any  $G \in \text{Graph}^{\text{fin}}$  and  $v \in V(G)$ ,  $I(G) = I(G \setminus \{v\}) + XI(G \setminus N(v))$ .

┘

**Prop. (37.2.5.10) [Independence Polynomials of Line Graphs are Real-Rooted].** If  $G \in \text{Graph}^{\text{fin}}$  is claw-free, then  $I(G)$  is real-rooted. In particular, the independence polynomial of a line graph is real-rooted.

┘

*Proof:* Use induction on  $v(G)$ . The case  $v(G) = 0$  is trivial, and if  $v(G) > 0$ , take  $v \in V(G)$ , then  $I(G) = I(G \setminus \{v\}) + XI(G \setminus N(v))$ . So to prove  $I(G)$  is real-rooted, it suffices to prove that  $I(G \setminus \{v\})$  and  $XI(G \setminus N(v))$  has a common interlacing polynomial (3.3.3.14).

For this we use another induction on  $v(G)$ . The case  $v(G) = 1$  is trivial, so suppose  $v(G) \geq 2$ . If  $N(v) \setminus \{v\} = \emptyset$ , then  $I(G \setminus N(v)) = I(G \setminus \{v\})$ , so the assertion is true. And if  $N(v) \setminus \{v\} \neq \emptyset$ , let  $n \in N(v) \setminus \{v\}$ , then

$$I(G \setminus \{v\}) = I(G \setminus \{u, v\}) + XI(G \setminus (u \cup N(u))),$$

so by (3.3.3.14), it suffices to show that every pair of the polynomials

$$XI(G \setminus (u \cup N(u))), \quad XI(G \setminus (v \cup N(v))), \quad I(G \setminus \{u, v\})$$

has a common interlacing. The two pairs  $(XI(G \setminus (u \cup N(u))), I(G \setminus \{u, v\}))$  and  $(XI(G \setminus (v \cup N(v))), I(G \setminus \{u, v\}))$  are compatible by induction hypothesis. And for the pair  $(I(G \setminus (u \cup N(u))), I(G \setminus (v \cup N(v))))$ , let  $H = G \setminus (\{u, v\} \cup N(u) \cup N(v))$ , then it is easy to show that  $N_H(u), N_H(v)$  are both simplicial cliques in  $H$  (37.2.5.2). So we can use lemma (37.2.5.11) to show that the pair  $(I(G \setminus (u \cup N(u))), I(G \setminus (v \cup N(v))))$  has a common interlacing.  $\square$

**Lemma (37.2.5.11).** If  $G \in \mathbf{Graph}^{\text{fin}}$ , and  $I(H)$  is real-rooted for every induced subgroup  $H$ , then

- For any two simplicial cliques  $K, L \subset V(G)$  (37.2.5.2), the two polynomials  $I(G \setminus K), I(G \setminus L)$  have a common interlacing polynomial.
- For any simplicial clique  $K \subset V(G)$ , the two polynomials  $I(G), XI(G \setminus K)$  have a common interlacing polynomial.

┘

*Proof:* The proof use induction on  $v(G)$  for both assertions. The case  $v(G) = 0$  is trivial. For  $v(G) > 0$ , we may assume  $K \neq \emptyset$ , and denote  $H = G \setminus (K \cup L)$ . Then

$$\begin{aligned} I(G \setminus L) &= I(H) + \sum_{v \in K \setminus L} XI(H \setminus N_H(v)), \\ I(G \setminus K) &= I(H) + \sum_{v \in L \setminus K} XI(H \setminus N_H(v)). \\ I(G) &= I(G \setminus K) + \sum_{v \in K} XI(G \setminus N(v)). \end{aligned}$$

So it suffices to show that every pair of the polynomials

$$\{XI(H \setminus N_H(v))\}_{v \in K \cup L}, \quad I(H)$$

has a common interlacing polynomial (3.3.3.14). These from from the induction hypothesis and (37.2.5.3). For assertion 2, it suffices to show that every pair of the polynomials

$$I(G \setminus K), XI(G \setminus K), \{XI(H \setminus N_H(v))\}_{v \in K}$$

has a common interlacing polynomial. The pair  $(I(G \setminus K), XI(G \setminus K))$  follows from the hypothesis, The pairs  $(I(G \setminus K), XI(H \setminus N_H(v)))$  have common interlacings by induction hypothesis and (37.2.5.3). The pairs  $(XI(G \setminus K), XI(H \setminus N_H(v)))$  have common interlacings by induction hypothesis and (37.2.5.3). The family  $\{XI(H \setminus N_H(v))\}_{v \in K}$  have common interlacings by induction hypothesis and (37.2.5.3).  $\square$

## 6 Planer Graphs

**Def. (37.2.6.1) [Planer Graphs].** A **planer graph** is a graph  $G \in \mathbf{Graph}$  that is embeddable in  $\mathbb{R}^2$ . ┘

**Prop. (37.2.6.2) [Plane Graphs].** When can a graph be embedded in  $\mathbb{R}^2$ ? ? ┘

*Proof:*  $\square$

**Prop. (37.2.6.3) [Euler].** Any finite planer graph  $G \in \mathbf{Graph}^{\text{simple}}$  satisfies  $e(G) < 3v(G) - 6$ . ┘

*Proof:*  $\square$

**Prop. (37.2.6.4) [Maximally Plane Graphs are Triangulations].** For any finite planer graph  $G \in \mathbf{Graph}^{\text{simple}}$  with  $v(G) \geq 3$ ,  $G$  is maximally planer iff it is a planer triangulation. ┘

*Proof:* Cf. [Diestel]P96.  $\square$

## 7 Flows

**Def. (37.2.7.1) [Circulations].** A **circulation** on a finite multi-graph  $G$  is a function  $f : \vec{E}(G) \rightarrow H$  where  $H \in \mathcal{Ab}$ , satisfying the following:

- For any  $(e, x, y) \in \vec{E}(G)$ ,  $f(e, x, y) = -f(e, y, x)$ ,
- (**Kirchhoff's law**) For any  $x \in V(G)$ ,

$$\sum_{(e,x,y) \in \vec{E}(G)} f(e, x, y) = 0.$$

┘

**Def. (37.2.7.2).** For a finite multi-graph  $G$  and a function  $f : \vec{E}(G) \rightarrow H$  where  $H \in \mathcal{Ab}$ , for any two subsets  $X, Y \subset V(G)$ , denote

$$f(X, Y) = \sum_{(e,x,y) \in \vec{E}(G), x \in X, y \in \bar{Y}} f(e, x, y).$$

┘

**Def. (37.2.7.3) [Networks and Flows].** A **network** is a quadruple  $N = (G, s, t, c)$  where  $G$  is a finite multi-graph,  $s \neq t \in V(G)$ , and  $c : \vec{E}(G) \rightarrow \mathbb{N}$  a map called the **capacity function**. Then a **flow** on a network  $N$  is a function  $f : \vec{E}(G) \rightarrow \mathbb{R}$  satisfying the following:

- For any  $(e, x, y) \in \vec{E}(G)$ ,  $f(e, x, y) = -f(e, y, x)$ ,
- For any  $x \in V(G) \setminus \{s, t\}$ ,

$$\sum_{(e,x,y) \in \vec{E}(G)} f(e, x, y) = 0.$$

- $f(\vec{e}) \leq c(\vec{e})$  for any  $\vec{e} \in \vec{E}(G)$ .

┘

**Def. (37.2.7.4) [Flow-Cuts].** For a flow  $f$  on a network  $N = (G, s, t, c)$ , a **flow-cut** is a pair  $(S, \bar{S})$  where  $S \subset V(G)$ ,  $\bar{S} = V(G) \setminus S$ ,  $s \in S$ ,  $t \in \bar{S}$ , and  $c(S, \bar{S}) = \sum_{(e,x,y) \in \vec{E}(G), x \in S, y \in \bar{S}} c(e, x, y)$  is called the **capacity of the cut**.

┘

**Prop. (37.2.7.5) [Total Values of Flows].** Given a flow  $f$  on a network  $N = (G, s, t, c)$  for any flow-cut  $(S, \bar{S})$ ,  $f(S, \bar{S}) = f(s, V(G))$ , called the **total value of the flow**  $f$ , denoted by  $|f|$ .

It is clear that  $|f| \leq c(S, \bar{S})$  for any flow-cut  $S$ .

┘

**Thm. (37.2.7.6) [Maximum Value and Minimum Capacity].** For any network  $N = (G, s, t, c)$ , the maximal total value of a flow on  $N$  equals the minimum value  $c(S, \bar{S})$  for any flow-cut  $S$ . Moreover, such a maximal flow can be integral-valued.

┘

*Proof:* Let  $f$  be a flow with maximal total value. Let  $S$  be the set of all vertices  $v \in V(G)$  s.t. there exists a path  $x_0 e_0 x_1 e_1 \dots x_{k-1} e_{k-1} x_k$  from  $s$  to  $v$  with  $f(e_i, x_i, x_{i+1}) < c(e_i, x_i, x_{i+1})$  for any  $i \in [k-1]$ .

If  $t \in S$ , suppose  $W$  is a shortest such path from  $s$  to  $t$ , and  $\varepsilon = \min_{\vec{e} \in W} (c(\vec{e}) - f(\vec{e}))$ , then we can modify  $f$  to add a value  $\varepsilon$  along the orientation of  $W$ . In this way, we get a flow with bigger  $|f| = f(s, V)$ , contradiction.

So  $t \notin S$ . Thus  $(S, \bar{S} = V(G) \setminus S)$  is a flow-cut for  $N$ , and by the definition of  $S$ ,  $f(\vec{e}) = c(\vec{e})$  for any  $\vec{e} \in \vec{E}(S, \bar{S})$ . Thus  $|f| = f(S, \bar{S}) = c(S, \bar{S})$ .  $\square$

## 8 Extremal Graph Theory

**Prop. (37.2.8.1) [Rademacher].** For any  $n \in \mathbb{Z}_+$ , any graph  $G$  with  $\#V(G) = 2n, \#E(G) = n^2 + 1$  contains at least  $n$  triangles.  $\lrcorner$

*Proof:*

□

**Thm. (37.2.8.2) [Turán1941].** For any  $r, n \in \mathbb{Z}_+, r > 1$ , any  $G \in \mathbf{Graph}^{\text{simple}^n}$  not containing a subgraph  $K^r$  with  $e(G) = \text{Xtrm}(n, K_r)$  is isomorphic to  $\text{Tur}^{r-1}(n)$ .  $\lrcorner$

*Proof:* Cf.[Graph Theory, Diestel]P175.  $\square$

**Thm. (37.2.8.3) [Erdős-Stone1946].** Given any  $r, s \in \mathbb{Z}_+, r \geq 2$  and  $\varepsilon \in \mathbb{R}_+$ , then for  $n \in \mathbb{Z}_+$  sufficiently large, any graph  $G \in \mathbf{Graph}^{\text{simple}}$  with  $v(G) = n$  and  $e(G) \geq t_{r-1}(n) + \varepsilon n^2$  contains  $K_s^r$  as a subgraph.  $\lrcorner$

*Proof:* Cf.[Graph Theory, Diestel]P178. ?  $\square$

### Szemerédi's Regularity Lemma

**Def. (37.2.8.4) [ $\varepsilon$ -Regular Pairs].** For  $G \in \mathbf{Graph}^{\text{simple}}$ , two disjoint non-empty subsets  $A, B \subset V(G)$  are called a  $\varepsilon$ -regular pair if for any  $X \subset A, Y \subset B$  s.t.  $\#X > \varepsilon\#A, \#Y > \varepsilon\#B$ , we have

$$|d(X, Y) - d(A, B)| < \varepsilon.$$

$\lrcorner$

**Thm. (37.2.8.5) [Szemerédi's Regularity Lemma].** For any  $\varepsilon \in \mathbb{R}_+$  and  $m \in \mathbb{Z}_+$ , there exists  $M(\varepsilon, m), N(\varepsilon, m) \in \mathbb{Z}_+$  satisfying the following: For any graph  $G \in \mathbf{Graph}^{\text{simple}}$  with  $v(G) \geq N(\varepsilon, m)$ , there is a partition of  $V(G)$  into  $k + 1$  classes

$$V(G) = V_0 \amalg V_1 \amalg \dots \amalg V_k$$

where  $V_0$  is called the **exceptional set**, s.t.

- $m \leq k \leq M(\varepsilon, m)$ ,
- $\#V_0 < \varepsilon v(G)$ ,
- $\#V_1 = \dots = \#V_k$ ,
- All but at most  $\varepsilon k^2$  pairs of  $(V_i, V_j), 1 \leq i < j \leq k$  are  $\varepsilon$ -regular pairs(37.2.8.4).

In other words, in some sense, every graph can be approximated by random graphs.  $\lrcorner$

*Proof:* ?  $\square$

**Cor. (37.2.8.6)[Szemerédi's Regularity Lemma, alternative forms].** For any  $\varepsilon \in \mathbb{R}_+$ , there exists  $M(\varepsilon) \in \mathbb{Z}_+$  satisfying the following: For any graph  $G \in \mathbf{Graph}^{\text{simple}}$ ,  $V(G)$  can be partitions into

$$V(G) = V_1 \amalg \dots \amalg V_k$$

s.t.

- $\#V_i \leq \lceil \varepsilon v(G) \rceil$  for any  $i$ ,
- $|\#V_i - \#V_j| \leq 1$  for any  $1 \leq i < j \leq k$ ,
- All but at most  $\varepsilon k^2$  pairs of  $(V_i, V_j), 1 \leq i < j \leq k$  are  $\varepsilon$ -regular pairs(37.2.8.4).

$\lrcorner$

*Proof:* ?  $\square$

## 37.3 Graph Theory II

References are [Die17].

**Notation(37.3.0.1).**

- Use references as in [Graph Theory I](#).

┘

### 1 Random Graphs

**Prop.(37.3.1.1)[Small Random Independent Sets].** Let  $k \in \mathbb{Z}_+$  and let  $G_n$  be a random graph of size  $n$  with each edge appearing with probability  $p = 8k^2/n$ , then

$$\lim_{n \rightarrow \infty} \mathbf{P}(\alpha(G_n) \geq \frac{k}{2n}) = 0.$$

┘

*Proof:*

$$\mathbf{P}(\alpha(G_n) \geq n/(2k)) \leq \binom{n}{n/(2k)} (1 - 16k^2/n)^{\binom{n}{2}} \leq 2^n e^{-p(\frac{n}{2k})^2/2} \leq 2^n e^{-n},$$

which tends to 0 as  $n$  tends to  $\infty$ .

□

### Signed Adjacency Matrices

References are [MSS15].

**Prop.(37.3.1.2)[Signed Adjacency Matrices and Matching Polynomials, Godsil-Gutman].**

For any  $G \in \mathbf{Graph}$  and a choice of signing  $s \in \{\pm 1\}^{E(G)}$  of the edges of  $G$ , then we can consider the signed adjacency matrices  $A_{s,G}$  of  $G$  and the corresponding characteristic polynomials  $f_s(G)$ . Then

$$\mathbf{E}_{s \in \{\pm 1\}^{E(G)}} f_s(G) = \mu_G(X).$$

┘

*Proof:*

$$\begin{aligned} \mathbf{E}_{s \in \{\pm 1\}^{E(G)}} f_s(G) &= \mathbf{E} \left( \sum_{\sigma \in \text{Sym}([n]_+)} \text{sgn}(\sigma) \prod_{i=1}^n (xI - A_{s,G})_{i,\sigma(i)} \right) \\ &= \sum_{k=0}^n x^{n-k} (-1)^k \sum_{S \subset [n]_+, \#S=k} \sum_{\pi \in \text{Sym}(S)} \mathbf{E} \left( \text{sgn}(\pi) \prod_{i \in S} (A_s)_{i,\pi(i)} \right) \\ &= \sum_{k \in 2\mathbb{N}, 0 \leq k \leq n} x^{n-k} \sum_{S \subset [n]_+, \#S=k} \sum_{\pi \in \text{Matching}(S)} (-1)^{k/2} \\ &= \mu_G(x) \end{aligned}$$

□

**Prop. (37.3.1.3) [Random Adjacency matrices, Marcus-Spielman-Srivastava].** For any  $G \in \text{Graph}^{\text{simple}}$  with an arbitrary ordering of  $E(G)$ , and any  $p_1, \dots, p_{e(G)} \in [0, 1]$ , the expected value of the signed adjacency characteristic polynomial as in (37.3.1.2):

$$P(X) = \sum_{s \in \{\pm 1\}^{E(G)}} \prod_{s_i=1} p_i \prod_{s_i=-1} (1-p_i) f_s(X) \in \mathbb{R}[X]$$

is real-rooted.  $\lrcorner$

*Proof:* Denote  $d = \Delta(G)$ . For any  $s \in \{\pm 1\}^{E(G)}$  and  $u \neq v \in V(G)$ , denote by  $s_{u,v}$  the value on the edge  $(u, v)$ , and define  $a_{u,v}^\pm = e_u \pm e_v$ ,  $L_{u,v}^\pm = a_{u,v}^\pm a_{u,v}^t$ . Then

$$d\mathbf{1} - A_s = \sum_{(u,v) \in E} a_{u,v}^{s_{u,v}} (a_{u,v}^{s_{u,v}})^t + D$$

where  $D = \text{diag}(d - d_1, \dots, d - d_{e(G)})$ .

Now

$$P(X + d) = \sum_{s \in \{\pm 1\}^{E(G)}} \prod_{s_i=1} p_i \prod_{s_i=-1} (1-p_i) \det \left( X\mathbf{1} + D + \sum_{(u,v) \in E(G)} a_{u,v}^{s_{u,v}} (a_{u,v}^{s_{u,v}})^t \right),$$

which is real-rooted by (3.3.3.10).  $\square$

**Cor. (37.3.1.4) [Signed Adjacency Characteristic polynomials are Interlacing, Marcus-Spielman-Srivastava].** For any  $G \in \text{Graph}^{\text{simple}}$  with an arbitrary ordering of  $E(G)$ , the signed adjacency characteristic polynomials (37.3.1.2) form an interlacing family (3.3.3.16).  $\lrcorner$

*Proof:* By (3.3.3.14), it suffices to show that for any  $k \in [e(G) - 1]_+$  and  $s_1, \dots, s_k \in \{\pm 1\}$ ,  $\lambda \in \mathbb{R}_{\geq 0}$ , the polynomial

$$\lambda f_{s_1, \dots, s_k, 1}(X) + (1 - \lambda) f_{s_1, \dots, s_k, -1}(X)$$

is real-rooted. But this follows from (37.3.1.3).  $\square$

**Thm. (37.3.1.5) [Minimal Eigenvalues of Signed Adjacency Characteristic Polynomials, Marcus-Spielman-Srivastava [MSS15]].** For any connected graph  $G \in \text{Graph}^{\text{simple}}$  with universal covering  $T$ , there exists a signed adjacency characteristic polynomial  $f_{s,G}$  of  $G$  (37.3.1.2) with all roots bounded above by  $\rho(T)$ .  $\lrcorner$

*Proof:* This follows from (37.3.1.4)(3.3.3.18) and (37.3.1.2)(37.2.3.11).  $\square$

## Second Moment Method

### 2 Coloring

**Def. (37.3.2.1) [Colorings].** For  $G \in \text{Graph}$  and  $k \in \mathbb{Z}_+$ , a  $k$ -vertex coloring of  $G$  is a map  $c : V(G) \rightarrow [k]_+$  s.t.  $c(u) \neq c(v)$  for any edge  $e = (u, v) \in E(G)$ .

A graph  $G \in \text{Graph}$  with a  $k$ -vertex coloring is called  $k$ -colorable. The infimum of  $k \in \mathbb{Z}_+$  s.t.  $G$  is  $k$ -colorable is denoted by  $\gamma(G)$ , called the **chromatic number** of  $G$ .

Similarly, we can define **edge-colorings** of a graph as a vertex coloring of the line graph  $L(G)$ , and define the **edge-chromatic number** of  $G$ , denoted by  $\gamma'(G)$ .  $\lrcorner$

**Def. (37.3.2.2) [Chromatic Numbers].** For  $G \in \text{Graph}$ , the **chromatic number**  $\gamma(G) \in \mathbb{Z}_+ \cup \{\infty\}$  is the minimal number  $n \in \mathbb{Z}_+$  s.t.  $V(G)$  can be partitioned into  $n$  disjoint subsets  $V = V_1 \amalg V_2 \amalg \dots \amalg V_n$  s.t. if  $x, y \in V_i(G)$  for some  $i$ , then  $e(x, y) = 0$ .  $\lrcorner$

**Def. (37.3.2.3) [Partite Graphs].** For  $r \in \mathbb{Z}_{\geq 2}$ , an  **$r$ -partite graph** is a graph  $G$  s.t.  $V(G)$  has an  $r$ -partition  $V = V_1 \amalg \dots \amalg V_r$  s.t. vertices in a same partition class are not adjacent. 2-partite graphs are also called **bipartite graphs**.

A maximal  $r$ -bipartite graph  $K_s * K_s * \dots * K_s$  is denoted by  $K_s^r$ .  $\lrcorner$

**Prop. (37.3.2.4) [Bipartite Graphs and Odd Cycles].** A graph  $G \in \text{Graph}$  is bipartite iff it contains no odd cycles.  $\lrcorner$

*Proof:* One direction is clear. For the other, let  $T$  be a spanning tree of  $G$ , with a root  $t$ . Then we can define a tree order on  $V(G)$ . Now  $V(G)$  is partitions into two classes according to whether  $v \in V(G)$  satisfies  $d(t, v)$  is even.

This is truly a bipartite partition, because if an odd-distance vertex is adjacent to an even-distance vertex, then we get an odd cycle.  $\square$

**Prop. (37.3.2.5) [Chromatic Numbers and Independent Sets].** For a finite graph  $G \in \text{Graph}^{\text{simple}}$ ,  $v(G) \leq i(G)\gamma(G)$ .  $\lrcorner$

*Proof:* Let  $V(G) = V_1 \amalg \dots \amalg V_{\gamma(G)}$  be a coloring of  $G$ , then each  $V_i$  is an independent set. Thus  $\#V_i(G) \leq i(G)$ .  $\square$

**Prop. (37.3.2.6) [Chromatic Numbers and Minimal Degree].** For any  $k \in \mathbb{Z}_+$ , any  $k$ -chromatic graph  $G \in \text{Graph}^{\text{fin}}$  has a  $k$ -chromatic subgraph  $H$  with  $\delta(H) \geq k - 1$ .  $\lrcorner$

*Proof:* Cf. [Diestel]P123.  $\square$

**Cor. (37.3.2.7).** For any  $G \in \text{Graph}^{\text{fin}}$ ,  $G$  contains a cycle of length at least  $v(G)/\gamma(G)$ .  $\lrcorner$

*Proof:* This follows from (37.3.2.6) and (37.2.1.11).  $\square$

**Prop. (37.3.2.8) [Coloring Numbers and Spectrums].** For  $k \in \mathbb{Z}_{\geq 2}$  and a connected  $k$ -regular graph  $G \in \text{Graph}^{\text{simple}}$  with  $n = v(G) < \infty$ , we have

$$i(G) \leq \frac{n}{k} \max \left( |\lambda_1(G)|, |\lambda_{v(G)-1}(G)| \right).$$

In particular, by (37.3.2.5),

$$\gamma(G) \geq \frac{k}{\max \left( |\lambda_1(G)|, |\lambda_{v(G)-1}(G)| \right)}.$$

$\lrcorner$

*Proof:* Let  $F \subset V(G)$  be a maximal independent set of  $G$ . Take  $f \in \ell^2(V(G))$  s.t.

$$f(x) = \begin{cases} \#V(G) \setminus F & , x \in F \\ -\#F & , x \notin F \end{cases}.$$

Then  $\|f\| = \#F \cdot \#V(G) \setminus F \cdot \#V(G) \leq i(G)n^2$ . And for any  $x \in F$ ,  $(Af)(x) = -ki(G)$ . So  $\|Af\|^2 \geq k^2 i(G)^3$ .

Since  $\sum_{v \in V(G)} f(v) = 0$ ,  $\|Af\| \leq \max(|\mu_1|, |\mu_{n-1}|) \|f\|$ , so  $ki(G)^{3/2} \leq \max(|\mu_1|, |\mu_{n-1}|) \cdot ni(G)^{1/2}$ , which gives the desired result.  $\square$

**Thm. (37.3.2.9)** [Large Girth, Large Chromatic and Large minimal Degree Graphs, Erdős].

For any  $k \in \mathbb{Z}_+$ , there exists a finite graph  $G \in \text{Graph}^{\text{simple}}$  with

$$g(H), \gamma(H), \delta(H) > k.$$

┘

*Proof:* Assume  $k \geq 3$ . Fix  $\varepsilon \in (0, 1/k)$  and  $n$  large, and consider the random graph  $G_n$  of size  $n$  with each edge appearing with probability  $p = n^{\varepsilon-1}$ . Then the expected value of number  $X$  of cycles with length  $\leq k$  is

$$\mathbf{E}(X) = \sum_{i=3}^k \frac{n(n-1) \dots (n-i+1)}{2i} p^i \leq \frac{1}{2} \sum_{i=3}^k n^i p^i \leq \frac{k-2}{2} n^{k\varepsilon}.$$

Thus

$$\mathbf{P}(X \geq n/2) \leq \mathbf{E}(X)/(n/2) \leq (k-2)n^{k\varepsilon-1}.$$

So when  $n$  is large,  $\mathbf{P}(X \geq n/2) \leq 1/2$ . And notice  $n^{\varepsilon-1} \geq 16k^2/n$  for  $n$  large, so by (37.3.1.1), when  $n$  is large,  $\mathbf{P}(i(G_n) \geq n/(2k)) \leq 1/2$ . Thus there is a graph  $G$  with  $v(G) = n$ ,  $i(G) < n/(2k)$ , and has less than  $n/2$  cycles of length  $\leq k$ .

Delete a vertex from each cycle of length  $\leq k$  in  $G$ , and let  $H$  be the remaining graph, then  $v(H) \geq n/2$ ,  $g(H) > k$ , and  $\gamma(H) \geq v(H)/i(H) \geq \frac{1}{2}n/i(G) > k$  (37.3.2.5).

Finally, we can make  $\delta(G)$  large by restricting to a subgraph  $H$ , by (37.3.2.6). □

**Thm. (37.3.2.10)** [Vizing[Viz64]]. For any finite simple graph  $G \in \text{Graph}^{\text{simple}}$ ,  $\Delta(G) \leq \gamma'(G) \leq \Delta(G) + 1$ . ┘

*Proof:*  $\Delta(G) \leq \gamma'(G)$  is clear. For the other inequality, use induction on  $e(G)$ : The case  $e(G) = 0$  is trivial, and for  $e(G) > 0$ , for any  $e = (x, y) \in E(G)$ , there is a color of  $G \setminus \{e\}$ , and if there is a color  $\alpha$  that is missing at  $x$  and a color  $\beta$  that is missing at  $y$ , then the maximal  $(\beta, \alpha)$ -alternating path from  $y$  will end in  $x$ , otherwise we can switch  $\alpha, \beta$  in the color of this maximal path, and color  $e$  with  $\alpha$ .

Now let  $xy_0 \in E(G)$ , and let  $c_0$  be the coloring of  $G \setminus \{xy_0\}$ , and let  $\alpha$  be a color missing at  $x$  in the coloring  $c_0$ , and  $c(1)$  be the color missing at  $y_0$  in the coloring  $c_0$ . Then there may exists  $xy_1 \in E(G)$  s.t.  $c_0(xy_1) = c(1)$ . Continuing this way, we find a maximal  $k \in \mathbb{Z}_+$  s.t. there exists  $xy_0, xy_1, \dots, xy_k \in E(G)$  s.t.  $c(i) \triangleq c_0(xy_i)$  is a color missing at  $y_{i-1}$  in the coloring  $c_0$ .

Then we can define colorings  $c_i$  of  $G \setminus \{xy_i\}$  for each  $i$ :  $c_i(e) = \begin{cases} c(i+1) & , e = xy_k, k \in [i] \\ c_0(e) & \text{otherwise} \end{cases}$ .

Let  $\beta$  be a color missing at  $y_k$  in the coloring  $c_0$ , and consider the  $(\beta, \alpha)$ -alternating path  $P$  from  $y_k$  ending at  $x$ . By maximality of  $k$ , this path ends with  $y_k, \dots, y_i, x$  for some  $i \in [k]$ . Then  $\beta = c(i+1)$ , which is missing at  $y_i$  in the coloring  $c_0$  (thus also missing at  $y_i$  in the coloring  $c_k$ ). Then in the coloring  $c_i$ , the  $(\beta, \alpha)$ -path from  $y_i$  is just the reverse of  $P$  ending at  $y_k$ , and then cannot go further, contradiction. □

**Prop. (37.3.2.11)** [König1916]. For any bipartite graph  $G \in \text{Graph}^{\text{fin}}$ ,  $\gamma'(G) = \Delta(G)$ . ┘

*Proof:* Use induction on  $e(G)$ . The case  $e(G) = 0$  is trivial. For  $e(G) > 0$ , take  $e = (x, y) \in G$ , and choose a  $\Delta(G)$ -coloring of  $G' = G \setminus \{e\}$ , which is possible by induction hypothesis. Then there exists  $\alpha, \beta \in [\Delta(G)]_+$  s.t.  $x$  is not incident with an  $\alpha$ -edge and  $y$  is not incident with an  $\beta$ -edge. If  $\alpha$  can be chosen to be  $\beta$ , then a coloring of  $G$  is possible.

If  $\alpha \neq \beta$ , then  $x$  has an  $\beta$ -edge. Then we can extend this edge to a maximal  $(\alpha, \beta)$ -alternating path  $W$  in  $G'$ . This path must be a simple path, and it cannot contain  $y$ , because in this way, it must end with an  $\alpha$ -edge, making an odd cycle in  $G$ , contradicting the fact that  $G$  is bipartite. So we can now swap all the colors of edges in  $W$ , and then color  $e$  with  $\beta$ . This is a  $\Delta(G)$ -coloring of  $G$ .  $\square$

**Prop. (37.3.2.12)** [Csaba-Kühn-Lo-Osthus-Treglown2016]. There exists  $n_0 \in \mathbb{Z}_+$  s.t. for any  $n \in \mathbb{Z}_{n_0}$  and  $d \in \mathbb{Z}_{\geq n/2}$ , any  $d$ -regular graph  $G \in \mathbf{Graph}$  with  $v(G) = n$  satisfies  $\gamma'(G) = \Delta(G)$ .  $\lrcorner$

*Proof:*  $\square$

### Tutte Polynomial

**Def. (37.3.2.13)** [Tutte Polynomials]. The **Tutte polynomial** of a multi-graph  $G$  is defined to be  $T_G(q, v) = ?$ .  $\lrcorner$

**Prop. (37.3.2.14)**. For any  $G \in \mathbf{Graph}$  and  $q \in \mathbb{Z}_+$ , the number of ways of coloring vertices of  $G$  with no two vertices of the same color connected is just  $T_G(q, -1)$ .  $\lrcorner$

*Proof:* Cf.[The Knot Book, Adams]P233.  $\square$

### List Colorings

**Def. (37.3.2.15)** [List Colorings]. For  $k \in \mathbb{Z}_+$ , a graph  $G \in \mathbf{Graph}$  is called  **$k$ -choosable** iff for any family of subsets  $S_v \subset \mathbb{N}$  indexed by  $V(G)$ , there is a map  $c : V(G) \rightarrow \mathbb{N}$  s.t.  $c(v) \in S_v$  for any  $v \in V(G)$ , and  $c(u) \neq c(v)$  for any any edge  $e = (u, v) \in E(G)$ . The infimum of  $k \in \mathbb{Z}_+$  s.t.  $G$  is  $k$ -choosable is denoted by  $\text{ch}(G)$ , called the **choice number** of  $G$ .

Similarly, we can define **edge-list-colorings** of a graph as a vertex coloring of the line graph  $L(G)$ , and define the **edge-choice number** of  $G$ , denoted by  $\text{ch}'(G)$ .

Clearly,  $\text{ch}(G) \geq \gamma(G)$ ,  $\text{ch}'(G) \geq \gamma'(G)$ .  $\lrcorner$

**Prop. (37.3.2.16)** [Bondy-Boppana-Siegel]. If  $H \in \mathbf{Graph}^{\text{fin}}$  be an oriented graph s.t. every induced subgraph has a kernel(37.2.1.6), and  $\{S_v\}_{v \in V(H)}$  is a family of lists(37.3.2.15) s.t.  $\deg^+(v) < \#S_v$  for any  $v \in V(H)$ , then  $H$  can be colored from the list  $S_v$ .  $\lrcorner$

*Proof:* Use induction on  $v(H)$ .  $v(H) = 0$  is trivial, and for  $v(H) > 0$ , take  $\alpha \in \cup_v S_v$ , and let  $H'$  be the subgraph induced by vertices  $v \in V(H)$  s.t.  $\alpha \in S_v$ . Then  $H'$  has a kernel  $U \neq \emptyset$ . Now color  $U$  with  $\alpha$ . Then the graph  $H \setminus U$  can be colored from the list  $\{S'_v\}_{v \in V(H)}$ , where  $S'_v = S_v \setminus \{\alpha\}$ , by induction hypothesis and the definition of a kernel. Thus  $H$  can also be colored from the list  $S_v$ .  $\square$

**Conj. (37.3.2.17)** [List Coloring Conjecture]. For any  $G \in \mathbf{Graph}$ ,  $\text{ch}'(G) = \gamma'(G)$ .  $\lrcorner$

*Proof:*  $\square$

**Thm& Conj.Cor. (37.3.2.18)** [Bipartite Graphs, Galvin[Gal95]]. For any bipartite graph  $G \in \mathbf{Graph}$ ,  $\text{ch}'(G) = \gamma'(G) = \Delta(G)$ .  $\lrcorner$

*Proof:* The second equality follows from(37.3.2.11). For the first, it suffices to show that  $\text{ch}'(G) \leq \gamma'(G)$ . Let  $G = X \amalg Y$  where  $X, Y$  are independent subset of  $G$ . Assume  $k = \gamma'(G) < \infty$ , and let  $c$  be a  $k$ -coloring.

We define an orientation on  $L(G)$  as follows: For any two adjacent edges  $e, e' \in E(G)$  s.t.  $c(e) < c(e')$ , assign  $e < e'$  if  $e, e'$  meet in  $X$ , and  $e > e'$  if  $e, e'$  meet in  $Y$ . In this way,  $\deg^+(e) > k$  for any  $e \in E(G)$ .

Notice this orientation also defines a linear preference on  $E(G)$  (37.2.3.7), thus any induced subgraph of  $L(G)$  has a kernel by the stable matching theorem (37.2.3.8). Now it follows from (37.3.2.16) that  $L(G)$  is  $k$ -choosable.  $\square$

### Planer Graphs

**Thm. (37.3.2.19) [4-Coloring Problem, Appel-Haken1977].** Every planer graph is 4-colorable.  $\lrcorner$

*Proof:* ? Cf. [N. Robertson, D. Sanders, P.D. Seymour and R. Thomas1977].  $\square$

**Thm. (37.3.2.20) [3-Coloring Theorem, Grötzsch1959].** Every Planer graph not containing a triangle is 3-colorable.  $\lrcorner$

*Proof:*  $\square$

**Thm. (37.3.2.21) [Alon1993].** For any  $k \in \mathbb{N}$ , there exists  $f(k) \in \mathbb{N}$  s.t. any graph  $G \in \mathbf{Graph}$  with  $d(G) \geq f(k)$  satisfies  $\text{ch}(G) \geq k$ .  $\lrcorner$

*Proof:*  $\square$

**Thm. (37.3.2.22) [5-Choice Theorem, Thomassen[Tho94]].** Any planer graph is 5-choosable.  $\lrcorner$

*Proof:* It suffices to prove for finite maximally planer graphs  $G \in \mathbf{Graph}^{\text{simple}}$ . By (37.2.6.4),  $G$  is a graph triangulation, so this follows from the following excellently tailored lemma:

**Lemma (37.3.2.23).** Let  $G$  be a planer graph s.t.  $v(G) \geq 3$ , its interiors is triangularized, and its boundary is a cycle  $C = v_1 v_2 \dots v_k v_1$ . Then given any family of subsets  $S_v \subset \mathbb{N}$  indexed by  $V(G)$  s.t.  $\#S_v \leq 5$ , and  $\#S_v \leq 3$  if  $v \in C$ , and given  $c_1 \in S_{v_1}, c_2 \in S_{v_2}$ , there is a map  $c : V(G) \rightarrow \mathbb{N}$  s.t.  $c(1) = c_1, c(2) = c_2, c(v) \in S_v$  for any  $v \in V(G)$ , and  $c(u) \neq c(v)$  for any any edge  $e = (u, v) \in E(G)$ .  $\lrcorner$

*Proof:* Use induction on  $v(G)$ . The case  $v(G) = 3$  is trivial. And for  $v(G) \geq 4$ , if there is an arc  $vw$  in  $G$ , then we can use induction hypothesis on the two parts divided by  $vw$  and get the desired result for  $G$ . If instead there are no arcs in  $G$ , let  $v_1, u_1, u_2, \dots, u_m, v_{k-1}$  be the neighborhoods of  $v_k$  with their clockwise orientation around  $v_k$ . Now choose two elements  $a, b \in S_{v_k}$  distinct to  $c_1$ , and delete  $a, b$  from  $S_{u_1}, \dots, S_{u_m}$ . Then the resulting family is a family for the graph  $G' = G \setminus \{v_k\}$  that satisfies the induction hypothesis, thus there is a choice function  $c : V(G) \setminus \{v\} \rightarrow \mathbb{N}$ . Now either  $a$  or  $b$  are different from  $c(v_{k-1})$ , so we can define  $c(v_k)$  to be this number.  $\square$

**Remark (37.3.2.24).** This is strict because Voigt(1993) constructed a plane graph of order 238 that is not 4-choosable.  $\lrcorner$

## 3 Graph labeling

### Super Edge-Magic Graphs

References are [ELNR].

**Def. (37.3.3.1) [(Super)Edge-Magic Labeling].** For  $G \neq \emptyset \in \text{Graph}^{\text{fin}}$ , an **edge-magic labeling** of  $G$  is a bijection  $f : V(G) \cup E(G) \cong [v(G) + e(G)]_+$  satisfying the following: there exists  $s \in \mathbb{Z}_+$  s.t.  $f(uv) + f(u) + f(v) = s$  for any  $uv \in E(G)$ . And moreover it is called a **super edge-magic labeling** if  $f(V(G)) = [v(G)]_+$ . The number  $s$  is called the **magic number** of the labeling.

And  $G$  is called **edge-magic/super edge-magic** if there exists an edge-magic/super edge-magic labeling on  $G$ .  $\lrcorner$

**Prop. (37.3.3.2).** If  $G \neq \emptyset \in \text{Graph}^{\text{fin}}$  is super edge-magic, then  $e(G) \leq 2v(G) - 3$ .  $\lrcorner$

*Proof:* Considering the extreme values of the labeling of vertices and edges, the magic number must satisfy

$$1 + 2 + (v(G) + e(G)) \leq s \leq v(G) + (v(G) - 1) + (v(G) + 1),$$

thus the assertion follows.  $\square$

**Prop. (37.3.3.3) [Kotzig-Rosa].** For  $n \in \mathbb{Z}_{\geq 3}$ , the circle graph  $C_n$  is edge-magic.  $\lrcorner$

*Proof:*  $\square$

**Prop. (37.3.3.4) [Enomoto-Llado-Nakamigawa-Ringel].** For  $n \in \mathbb{Z}_{\geq 3}$ , the circle graph  $C_n$  is super edge-magic iff  $2|n + 1$ .  $\lrcorner$

*Proof:* If  $f$  is a super edge-magic labeling with magic number  $s$ , then

$$sn = n(n + 1) + \frac{(3n + 1)n}{2},$$

so  $2s = 5n + 3$  is even.

If  $2|n + 1$ , and  $V(C_n) = \{v_0, \dots, v_{n-1}\}$ , with  $E(C_n) = \{v_{i-1(\text{mod } n)}v_i\}$ . Then we can define

$$f(v_i) = \begin{cases} \frac{i+2}{2}, & 2|i \\ \frac{n+i+2}{2}, & 2 \nmid i+1 \end{cases}.$$

$$f(v_{i-1(\text{mod } n)}v_i) = 2n - i, \quad 0 \leq i \leq n - 1.$$

Then it is easy to check that this is a super edge-magic labeling with magic number  $\frac{5n+3}{2}$ .  $\square$

**Prop. (37.3.3.5) [Kotzig-Rosa].** For  $n \in \mathbb{Z}_+$ , the complete graph  $K_n$  is edge-magic iff  $n \in \{1, 2, 3, 5, 6\}$ , and it is super edge-magic iff  $n \leq 3$ .  $\lrcorner$

*Proof:*  $\square$

**Prop. (37.3.3.6) [Kotzig-Rosa/Enomoto-Lladó-Nakamigawa-Ringel].** For  $m, n \in \mathbb{Z}_+$ , the complete bipartite graph  $K_{m,n}$  is edge-magic. And it is super edge-magic iff  $n = 1$  or  $m = 1$ .  $\lrcorner$

*Proof:* To show it is edge-magic, Cf.[Kotzig-Rosa] ?. And it is easy to show that  $K_{1,n}$  is super edge-magic ?.

Suppose  $2 \leq m \leq n$ , then  $mn \leq 2(m + n) - 3$  by (37.3.3.2), so  $(m - 2)(n - 2) \leq 1$ . Hence  $m = 2$  or  $m = n = 3$ . It is straightforward to check that  $K_{3,3}$  doesn't admit a super edge-magic labeling ?. And  $K_{2,2} = C_4$  is not super edge-magic by (37.3.3.4), so we only need to consider  $n \geq 3$ .

In this case, Suppose  $K_{m,n}$  has a super edge-magic labeling  $f$  with magic number  $s$ , then by the proof of (37.3.3.2),  $s = 3n + 5$  or  $s = 3n + 6$ . By changing the labeling by

$$f'(v) = n + 3 - f(v), \quad f'(uv) = 6n + 11 - f(uv),$$

we may assume that  $s = 3n + 6$ .

Denote  $V(K_{2,n}) = \{x_1, \dots, x_{n+2}\}$  with  $f(x_i) = i$ , then  $x_1x_2$  is not an edge. Let  $A$  be the part containing  $x_1, x_2$ , and  $B$  the part containing  $x_3$ , then Considering the edge  $3n + 2$ , we see that  $x_1x_3$  is an edge. Then  $x_1x_4$  is not an edge because  $1 + 4 = 2 + 3$ . So  $x_4 \in B$ . Now the only possibility of the edge  $3n$  is  $x_1x_5$ , so  $x_5 \in B$ . But  $2 + 5 = 4 + 3$ , contradiction.  $\square$

**Prop. (37.3.3.7) [Enomoto-Llado-Nakamigawa-Ringel].** For  $n \in \mathbb{Z}_{\geq 4}$ , the Wheel graph (37.2.1.3)  $\text{Wheel}_n$  is not super edge-magic. And if  $4|n$ , then  $\text{Wheel}_n$  is not edge-magic.  $\lrcorner$

*Proof:* Because  $e(\text{Wheel}_n) = 2n - 2 > 2v(\text{Wheel}_n) - 3 = 2n - 3$ ,  $\text{Wheel}_n$  is not super edge-magic by (37.3.3.2).

If  $4|n$ , and  $f$  is an edge-magic labeling with magic number  $s$ . Suppose  $V(G) = \{v_0, \dots, v_n\}$  with  $\deg(v_0) = n - 1$ . Then

$$2(n - 1)s = \sum_{i=1}^{3n-2} i + (n - 2)f(v_0) + 2 \sum_{j=1}^{n-1} f(v_j).$$

But then the parity is wrong, contradiction.  $\square$

**Conj. (37.3.3.8) [Kotzig-Rosa].** Every finite tree is (super)edge-magic.  $\lrcorner$

*Proof:*  $\square$

**Conj. (37.3.3.9) [Kotzig-Rosa].** For  $n \in \mathbb{Z}_+ \setminus \{4\}$ ,  $W_n$  is edge-magic.  $\lrcorner$

*Proof:*  $\square$

**Conj. (37.3.3.10) [Kotzig-Rosa].** Suppose  $G \in \text{Graph}^{\text{fin}}$ ,  $\#G = n + m$  and  $G$  contains a complete graph  $K_n$ , then if  $n \gg m$ ,  $G$  is not edge-magic.  $\lrcorner$

*Proof:*  $\square$

## 4 Cayley Graphs

**Def. (37.3.4.1) [Cayley Graphs].** For  $G \in \mathcal{G}\text{rp}$  and  $S \subset G$  s.t.  $k \triangleq \#S < \infty$  and  $S = S^{-1}$ , the **Cayley graph** is a graph  $\text{Cay}(G, S) \in \text{Graph}$  s.t.

$$V(\text{Cay}(G, S)) = G, \quad E(\text{Cay}(G, S)) = \{(x, y) \in G^2 | y^{-1}x \in S\}.$$

Then

- $\text{Cay}(G, S)$  is a  $k$ -regular.
- $\text{Cay}(G, S)$  is connected iff  $S$  generates  $G$ .
- If there is a homomorphism  $\chi : G \rightarrow \mathbb{Z}/(2)$  s.t.  $\chi(S) = \{1\}$ , then  $\text{Cay}(G, S)$  is bipartite. The converse is also true if  $S$  generates  $G$ .  $\lrcorner$

*Proof:* 3: One direction is clear. For the other direction, if  $S$  generates  $G$ , by item2,  $G$  is connected, so we can use the bipartition to define  $\chi$  using the parity of distances.  $\square$

## 5 Perfect Graphs

**Def.(37.3.5.1) [Perfect Graphs].** A **Perfect graph** is a finite simple graph  $G$  s.t. for any induced subgraph  $H \subset G$ , the maximal cardinality of a clique of  $H$  equals the chromatic number of  $H$ .  $\lrcorner$

**Def.(37.3.5.2) [Berge Graphs].** A finite simple graph  $G$  is called a **Berge graph** if it doesn't contain holes or antiholes(37.2.1.22) of odd cardinality.  $\lrcorner$

**Thm.(37.3.5.3) [Perfect Graph Theorem, Chudnovsky-Robertson-Seymour-Thomas].** A simple finite graph  $G$  is perfect iff it is Berge.  $\lrcorner$

*Proof:*

$\square$

## 6 Triangulated Graphs

## 7 Interval Graphs

## 8 Graph Minors

**Conj.(37.3.8.1) [Self-Minor Conjecture, Seymour].** Every countably-infinite graph is a proper minor of itself(i.e. the minor is not an identity).  $\lrcorner$

*Proof:*

$\square$

**Thm& Conj.Cor.(37.3.8.2) [Graph Minor Theorme, Robertson-Seymour 1986–2004].** The minor relation on the set of finite graphs is a quasi-well-ordering.  $\lrcorner$

*Proof:* Clearly there cannot be an infinite decreasing minor sequence of finite graphs, so by(2.2.3.19), it suffices to show that there cannot be an infinite set of non-comparable finite graphs. This follows from the self-minor conjecture, because by considering the disjoint union of the graphs.

Alternatively, **?**

$\square$

**Lemma(37.3.8.3) [Kruskal1960].** The root-preserving topological minor relation on the set of finite rooted trees is a quasi-well-ordering.  $\lrcorner$

*Proof:* Clearly there cannot be an infinite decreasing topological minor sequence of finite rooted trees, so by(2.2.3.19), it suffices to show that there cannot be an infinite set of non-comparable finite rooted trees.

Suppose the contrary, and we can choose a bad sequence  $(T_i)_{i \in \mathbb{N}}$  of finite rooted trees s.t. for any  $n \in \mathbb{N}$ ,  $T_n$  is a tree of minimum order s.t.  $(T_0, T_1, \dots, T_n)$  extends to a bad sequence. Let  $r_n$  be root of  $T_n$ , and let  $A_n$  be the set of trees of the forest  $T_n \setminus \{r_n\}$ . Then we claim that  $A = \cup_n A_n$  is quasi-well ordered by the root-preserving topological minor relation:

Let  $(T^k)$  be a sequence of trees in  $A$ , and find a smallest  $n \in \mathbb{N}$  s.t.  $T^k \in A_n$  for some  $k$ . Then  $T^k \subsetneq T_n$ , and

$$T_0, \dots, T_{n-1}, T^k, T^{k+1}, \dots$$

is not a bad sequence by the choice of  $T_n$ . Let  $(T, T')$  be an ascending pair, then  $T$  cannot be in  $(T_0, \dots, T_{n-1})$ , as then we will have  $T \leq T' \leq T_{n'}$ , but  $n' \geq n$ , so  $(T, T_{n'})$  is an ascending pair in  $(T_i)_{i \in \mathbb{N}}$ , contradiction. Thus  $(T, T')$  is an ascending pair in  $(T^k)$ , which is what we want to prove.

Now by(2.2.3.20), the sequence  $(A_n)_{n \in \mathbb{N}} \in [A]^{<\aleph_0}$  has an ascending pair  $A_i \leq A_j$  where  $i < j$ . Let  $f : A_i \rightarrow A_j$  be injective with  $T \leq f(T)$  for any  $T \in A_i$ , then we get a root-preserving injection  $T_i \rightarrow T_j$ . Thus  $T_i \leq T_j$ , contradiction.  $\square$

## 9 Lifts of Graphs

**Def.(37.3.9.1) [Double Covers of Graphs].** For any simple graph  $G \in \text{Graph}^{\text{simple}}$ , the **double covering** of  $G$  is the graph  $\tilde{G} = (\tilde{V}, \tilde{E})$  where  $\tilde{V} = V(G) \times \{\pm 1\}$ , and

$$\tilde{E} = \{(v_1, \varepsilon_1, v_2, \varepsilon_2) \in \tilde{V}(G)^2 \mid (v_1, v_2) \in E(G), \varepsilon_1 \neq \varepsilon_2\}.$$

It is a bi-partite graph, and  $\tilde{G} \rightarrow G$  is a covering map.  $\lrcorner$

**Def.(37.3.9.2) [Signing of a 2-Lifting].** For any simple graph  $G \in \text{Graph}^{\text{simple}}$ , the **signed 2-lift** of  $G$  with signing  $s : E(G) \rightarrow \{\pm 1\}$  is the graph  $\tilde{G}_s = (\tilde{V}_s, \tilde{E}_s)$  s.t.  $\tilde{V}_s = E(G) \times \{\pm 1\}$ , and

$$\tilde{E}_s = \{(v_1, \varepsilon_1, v_2, \varepsilon_2) \in \tilde{V}_s(G)^2 \mid (v_1, v_2) \in E(G), \varepsilon_1 \begin{cases} = \varepsilon_2 & , s(v_1, v_2) = 1 \\ \neq \varepsilon_2 & , s(e(v_1, v_2)) = -1 \end{cases}\}.$$

It is a bi-partite graph, and  $\tilde{G} \rightarrow G$  is a covering map.  $\lrcorner$

**Thm.(37.3.9.3) [Spectrums of Signed 2-Lifts, Bilu-Linial].** For any simple graph  $G \in \text{Graph}^{\text{simple}}$  with signing  $s : E(G) \rightarrow \{\pm 1\}$ , the spectrum of the signed 2-lift of  $G$  w.r.t.  $s$  is the sum of the spectrum of  $G$  and the spectrum of the signed adjacency matrix  $A_{s,G}$  of  $G$  (37.3.1.2).  $\lrcorner$

*Proof:* It is not hard to see that the adjacency matrix of  $\tilde{G}_s$  is  $\tilde{A} = \begin{bmatrix} A_1 & A_2 \\ A_2 & A_1 \end{bmatrix}$ , where  $A_1 = (V(G), s^{-1}(1))$ , and  $A_2 = (V(G), s^{-1}(-1))$ ,  $A = A_1 + A_2$ ,  $A_s = A_1 - A_2$ .

Then it is easy to see that if  $v$  is an eigenvector of  $A$  with eigenvalue  $\lambda$ , then  $(v, v)$  is an eigenvector of  $\tilde{A}$  with eigenvalue  $\lambda$ , and if  $u$  is an eigenvector of  $A_s$  with eigenvalue  $\mu$ , then  $(u, -u)$  is an eigenvector of  $\tilde{A}$  with eigenvalue  $\mu$ . As these vectors are linearly independent, the result follows.  $\square$

## 10 Expander Graphs

References are [DSV03] and [Entropy waves, the zig-zag graph product, and new constant-degree expanders].

**Def.(37.3.10.1) [Expanding Constants].** For  $G \in \text{Graph}$ , the **expanding constant** or **Cheeger constant** of  $G$  is defined to be

$$h(G) = \inf_{F \subset V(G), \#F < \infty} \left( \frac{e(F, V(G) \setminus F)}{\min(\#F, \#(V(G) \setminus F))} \right).$$

$\lrcorner$

**Prop.(37.3.10.2) [Cheeger – Buser Inequality, Dodziuk/Alon-Milman].** Let  $k \in \mathbb{Z}_{\geq 2}$  and  $G \in \text{Graph}^{\text{simple}}$  be a finite connected  $k$ -regular graph with  $n \triangleq v(G)$ , then

$$\frac{k - \lambda_1}{2} \leq h(X) \leq \sqrt{2k(k - \lambda_1)} \quad (37.2.2.2).$$

$\lrcorner$

*Proof:* Take an arbitrary orientation of  $G$ , and consider the the coboundary functor  $d : \ell^2(V(G)) \rightarrow \ell^2(E(G)) : df(e) = f(e^+) - f(e^-)$ , and its adjoint  $d^* : \ell^2(E(G)) \rightarrow \ell^2(V(G))$ . Then  $d^*d = L_G =$

$k\mathbf{1} - A_G$ . The spectrum of  $L_G$  is  $0, k - \lambda_1, \dots, k - \lambda_{n-1}$ . So for any  $f \in \ell^2(V(G))$  s.t.  $\sum_{v \in V(G)} f(v) = 0$ , we have  $|df|_2^2 = \langle L_G f, f \rangle \geq (k - \lambda_1)|f|_2^2$ .

Now for any  $F \subset V(G)$ , consider  $f \in \ell^2(V) : f(x) = \begin{cases} \#(V \setminus F) & , x \in F \\ -\#F & , x \notin F \end{cases}$ . Then  $\sum_{v \in V(G)} f(v) = 0$ , and  $|f|_2^2 = n\#F\#(V \setminus F)$ . And

$$df(e) = \begin{cases} \pm n & , e \in E(F, V \setminus F) \\ 0 & , \text{otherwise} \end{cases}.$$

So  $|df|_2^2 = n^2 e(F, V \setminus F)$ . The the inequality above applied to  $f$  implies that

$$e(F, V \setminus F) \geq (k - \lambda_1) \frac{\#F \cdot \#V \setminus F}{n} \geq \frac{k - \lambda_1}{2} \min(\#F, \#V \setminus F).$$

This proves the lower bound for  $h(F)$ .

For the upper bound: For any  $f \in \ell^2(V(G))$ , define  $B_f = \sum_{e \in E(G)} |f(e^+) - f(e^-)|^2$ , then

**Lemma(37.3.10.3).**

- If  $\beta_r > \beta_{r-1} > \dots > \beta_0$  are the values of  $f$ , and let  $L_i = f^{-1}([\beta_i, \infty))$ , then  $B_f = \sum_{i=1}^r e(L_i, V(G) \setminus L_i)(\beta_i^2 - \beta_{i-1}^2)$ .
- $B_f \leq \sqrt{2k}|df|_2|f|_2$ .
- If  $\#\text{Supp}(f) \leq n/2$ , then  $B_f \geq h(G)|f|_2^2$ .

□

*Proof:* 1: This is clear.

2:

$$B_f = \sum_{e \in E(G)} |f(e^+) + f(e^-)| \cdot |f(e^+) - f(e^-)| \leq \sqrt{\sum_{e \in E(G)} (f(e^+) + f(e^-))^2} \cdot \sqrt{\sum_{e \in E(G)} (f(e^+) - f(e^-))^2} \leq \sqrt{2k}|df|_2|f|_2.$$

3: The hypothesis implies that  $\#L_i \leq n/2$  for any  $i$ , thus  $e(L_i, V(G) \setminus L_i) \geq h(G)\#L_i$ . Thus

$$B_f = \sum_{i=1}^r e(L_i, V(G) \setminus L_i)(\beta_i^2 - \beta_{i-1}^2) \geq h(G) \sum_{i=1}^r \#L_i(\beta_i^2 - \beta_{i-1}^2) = h(G)|f|_2^2.$$

□

Now consider an eigenvalue  $g$  for  $L_G$  with eigenvector  $k - \lambda_1$ , and let  $V^+ = \{x \in V | g(x) > 0\}$ ,  $f = \max(g, 0)$ . We may assume  $0 < \#V^+ \leq n/2$ . Then for  $x \in V^+$ ,

$$L_G f(x) = kg(x) - \sum_{y \in V^+} A_{xy}g(y) \leq kg(x) - \sum_{y \in V} A_{xy}g(y) = (k - \lambda_1)g(x).$$

So

$$|df|_2^2 = \langle L_G f, f \rangle = \sum_{x \in V^+} L_G f(x)g(x) \leq (k - \lambda_1) \sum_{x \in V^+} g(x)^2 \leq (k - \lambda_1)|f|_2^2.$$

Combining this and the lemma above, we get

$$h(x)|f|_2^2 \leq B_f \leq \sqrt{2k}|df|_2|f|_2 \leq \sqrt{2k(k - \lambda_1)}|f|_2^2,$$

which implies  $h(x) \leq \sqrt{2k(k - \lambda_1)}$ .

□

**Def. (37.3.10.4) [Expander Graphs].** For  $k \in \mathbb{Z}_{\geq 2}$ , a family of  $k$ -regular finite simple graphs  $(X_n) \in \text{Graph}^{\mathbb{Z}_+}$  is called a family of **expander graphs** if  $\lim_{n \rightarrow \infty} v(X_n) = \infty$ , and  $\inf_n h(X_n) > 0$ , or equivalently by (37.3.10.2),  $\inf_n (k - \lambda_1(X_n)) > 0$ .  $\lrcorner$

**Prop. (37.3.10.5) [Almost All Graphs are Expanders].** For  $k \in \mathbb{Z}_{\geq 3}$ , almost all  $k$ -regular graphs are expanders.  $\lrcorner$

*Proof:* Cf. [Pinsker, On the complexity of a concentrator]. ?  $\square$

### Ramanujan Graphs

References are [DSV03] and [L-S88].

**Def. (37.3.10.6) [Ramanujan Graphs].** A **Ramanujan graph** is a finite connected graph  $G \in \text{Graph}^{\text{fin}}$  with universal covering  $T$  s.t. for any eigenvalue  $\lambda_i$  of  $G$ , either  $|\lambda_i| = \lambda_0$ , or  $|\lambda_i| \leq \rho(T)$ .

In particular, by (37.2.2.9), for any  $c, d \in \mathbb{Z}_{\geq 2}$ , a finite connected  $(c, d)$ -bi-regular graph has trivial eigenvalues  $\pm\sqrt{cd}$ , so it is a **Ramanujan bi-regular graph** iff all its non-trivial eigenvalues  $\lambda_i$  satisfy  $|\lambda_i| \leq \sqrt{c-1} + \sqrt{d-1}$ .  $\lrcorner$

**Cor. (37.3.10.7).** For a  $k$ -regular non-bi-partite Ramanujan graph  $G$ ,  $\gamma(G) \geq \frac{k}{2\sqrt{k-1}} \geq \frac{\sqrt{k}}{2}$ , by (37.3.2.8).  $\lrcorner$

**Conj. (37.3.10.8) [Bilu-Linial].** For any  $c, d \in \mathbb{Z}_{\geq 3}$  and any  $(c, d)$ -bi-regular graph  $G$ , there is a signing of a 2-lift (37.3.9.2) such that the new eigenvalues all have absolute value  $\leq \sqrt{c-1} + \sqrt{d-1}$ .  $\lrcorner$

*Proof:*  $\square$

**Thm& Conj. Cor. (37.3.10.9) [Marcus-Spielman-Srivastava].** For any  $c, d \in \mathbb{Z}_{\geq 3}$  and any  $(c, d)$ -bi-regular graph  $G$ , there is a signing of a 2-lift such that the new eigenvalues are all bounded above by  $\sqrt{c-1} + \sqrt{d-1}$ .  $\lrcorner$

*Proof:* The universal cover  $T$  of  $G$  is a  $(c, d)$ -bi-regular tree, which has spectrum radius  $\rho(T) = \sqrt{c-1} + \sqrt{d-1}$  by (37.2.2.9). Thus the assertion follows from (37.3.1.5) and (37.3.9.3).  $\square$

**Cor. (37.3.10.10) [Lubotzky-Phillips-Sarnak/Margulis/Chiu/Lubotzky/Marcus-Spielman-Srivastava [MSS15]].** For any  $c, d \in \mathbb{Z}_{\geq 3}$ , there exists an infinite family of  $(c, d)$ -bi-regular Ramanujan graphs.  $\lrcorner$

*Proof:* This follows from consecutively using (37.3.10.9) on any  $(c, d)$ -bi-regular Ramanujan graph  $G$ , for example a complete  $(c, d)$ -bi-regular graph (because its spectrum is  $\{\sqrt{cd}, -\sqrt{cd}, 0, 0, \dots, 0\}$ ).  $\square$

### Explicit Constructions

**Def. (37.3.10.11) [ $S_{p,q}$ ].** Let  $p \neq q \in \text{Prime}_{\geq 3}$  s.t.  $q \geq 2\sqrt{p}$ , then  $\mathbb{H}(\mathbb{F}_q) \cong \text{Mat}(2; \mathbb{F}_q)$ . Fix such an isomorphism  $\psi_p$ .

Let  $S_p \subset \mathbb{H}(\mathbb{Z})$  be a distinguished set of elements of norm  $p$ ,  $\#S_p = p+1$  (? Cf. [Sarnak, Ramanujan Graph book] P68). Define

$$S_{p,q} = \psi_q(S_p) \subset \text{PGL}(2; \mathbb{F}_q),$$

then  $\#S_{p,q} = p+1$ , and  $S_{p,q} \subset \text{PSL}(2; \mathbb{F}_q)$  iff  $\left(\frac{p}{q}\right) = 1$ .  $\lrcorner$

*Proof:* Cf.[Sarnak, Ramanujan Graph book]P113.?

For the last assertion, notice  $x \in \text{GL}(2; \mathbb{F}_q)$  mapsto  $\text{PSL}(2; \mathbb{F}_q)$  iff  $\det(x) \in \mathbb{F}_q^2$ , so  $S_{p,q} \subset \text{PSL}(2; \mathbb{F}_q)$  iff  $\left(\frac{p}{q}\right) = 1$ .  $\square$

**Thm. (37.3.10.12)** $[X^{p,q}]$ . Let  $p \neq q \in \text{Prime}_{\geq 3}$  s.t.  $q \geq 2\sqrt{p}$ , we can define

$$X^{p,q} = \begin{cases} \text{Cay}(\text{PSL}(2; \mathbb{F}_q), S_{p,q}) & , \left(\frac{p}{q}\right) = 1 \\ \text{Cay}(\text{PGL}(2; \mathbb{F}_q), S_{p,q}) & , \left(\frac{p}{q}\right) = -1 \end{cases}.$$

Then  $X^{p,q}$  is a  $(p+1)$ -regular connected Ramanujan graph, and for fixed  $p$ , this forms a large girth family(37.2.1.18). In fact,

- If  $\left(\frac{p}{q}\right) = -1$ , then  $X^{p,q}$  is bipartite,  $v(X^{p,q}) = q(q^2 - 1)$ , and  $g(X^{p,q}) \geq 4\log_p q - \log_p 4$ .
- If  $\left(\frac{p}{q}\right) = 1$ , then  $X^{p,q}$  is not bipartite,  $v(X^{p,q}) = q(q^2 - 1)/2$ , and  $g(X^{p,q}) \geq 2\log_p q$ .

┘

*Proof:*

$\square$

## 11 Potential Theory on Graphs

### Riemann-Roch on Graphs

References are [B-N07].

## 12 Zeta Functions

**Def. (37.3.12.1)** $[\text{Ihara Zeta Functions}]$ . For a finite unoriented graph  $G \in \text{Graph}^{\text{fin}}$ , the **Ihara zeta function** is defined to be

$$Z(u, G) = \prod_{p \in P} (1 - u^{\text{length}(p)})^{-1},$$

where  $P$  is the set of primes circuits in  $G$ (37.2.1.20).

Similarly we can define zeta function  $Z^o(u, G)$  of an oriented graph.

WARNING: the zeta function of a graph and its duplication oriented graph, because of the primality condition.  $\square$

**Prop. (37.3.12.2).** For a finite oriented graph  $G \in \mathbf{Graph}^{\text{fin}}$  and  $m \in \mathbb{Z}_+$ , let  $N_m$  be the number of circuits in  $G$  of length  $m$  with an endpoint, then

$$Z^o(u, G) = \exp\left(\sum_{m \in \mathbb{Z}_+} \frac{N_m}{m} u^m\right) = \det(1 - uM_G)^{-1}.$$

In particular, it is a rational function.  $\lrcorner$

*Proof:* The first equation is easy by taking log. For the second equation, because  $N_m = \text{tr}(M_G^m)$ , let the eigenvalues of  $M_G$  be  $\lambda_1, \dots, \lambda_n$ , then using an triangulation of  $M_G$ ,

$$\exp\left(\sum_{m \in \mathbb{Z}_+} \frac{N_m}{m} u^m\right) = \exp\left(\sum_{m \in \mathbb{Z}_+} \frac{1}{m} \sum_{i=1}^n \lambda_i^m u^m\right) = \prod_{i=1}^n \exp(-\log(1 - \lambda_i u)) = \det(1 - uM_G)^{-1}.$$

□

**Cor. (37.3.12.3).** For  $G \in \mathbf{Graph}^{\text{fin}}$ ,  $G$  is bipartite iff  $Z(u, G)$  is an even function.  $\lrcorner$

*Proof:* Since the vertices  $v \in V(G)$  s.t.  $\deg(v) = 1$  doesn't affect the result, we can discard them. Then the assertion follows easily from (37.3.2.4).  $\square$

**Prop. (37.3.12.4) [Edge Zeta Functions].** For a finite unoriented graph  $G \in \mathbf{Graph}^{\text{fin}}$ , consider its line graph  $G_L$  where

$$V(G_L) = \vec{E}(G), \quad E(G_L) = \{(e_1, e_2) \in \vec{E}(G) \times \vec{E}(G), e_1 \neq \bar{e}_2, t(e_1) = s(e_2)\}.$$

Then it is easy to see that

$$Z(u, G) = Z^o(u, G_L).$$

□

**Thm. (37.3.12.5) [Bass].** For a finite connected unoriented graph  $G \in \mathbf{Graph}^{\text{fin}}$  s.t.  $\deg(v) \geq 2$  for any  $v \in G$ , we have

$$Z(u, G) = (1 - u^2)^{\chi(G)} \det(\mathbf{1} - uA + u^2(D - \mathbf{1}))^{-1}.$$

□

*Proof:* Cf. [Zeta functions of finite graphs].  $\square$

**Cor. (37.3.12.6) [Regular Graphs].** Let  $q \in \mathbb{Z}_+$  and  $G \in \mathbf{Graph}$  a finite connected  $k$ -regular graph, then

$$Z(u, G) = (1 - u^2)^{(1-q)v(G)/2} \det((1 + qu^2)\mathbf{1} - uA)^{-1}.$$

In particular, by (37.2.2.3),

•

$$\text{Pole}(Z(u, G)) \subset [q^{-1}, 1] \cup [-1, -q^{-1}] \cup \{|z| = q^{-1/2}\}.$$

- $u = -q^{-1}$  is a pole iff  $G$  is bipartite.
- $\text{Pole}(Z(u, G)) \subset \{|z| = q^{-1/2}\} \cup \{\pm 1, \pm q^{-1}\}$  iff  $G$  is a Ramanjan graph (37.3.10.6).

□

**Prop. (37.3.12.7) [Northshield].** For a finite connected oriented graph  $G \in \mathbf{Graph}^{\text{fin}}$  s.t.  $\deg(v) \geq 2$  for any  $v \in G$ ,

$$\lim_{u \rightarrow 1} \frac{Z(u, G)}{(1-u)^{\chi(G)-1}} = \frac{2^{\chi(G)-1}}{\chi(G) \text{tree}(G)}.$$

┘

*Proof:* Let  $f(u) = \det(\mathbf{1} - uA + u^2(D - \mathbf{1})|\ell^2(V(G)))$ , then by (37.3.12.5), it suffices to prove that

$$f'(1) = -2\chi(G) \text{tree}(G).$$

Let  $M(u) = \mathbf{1} - uA + u^2(D - \mathbf{1})$ , and let  $M_k$  be the result of  $M$  derivating the  $k$ -th row. Then  $M_k(1) = M(1) + (\deg(v_k) - 2)e_{kk}$ . So

$$\frac{\partial}{\partial u} \det(M(u))|_{u=1} = \sum_k [\det M(1) + (\deg(v_k) - 2) \det \widetilde{M}_{kk}],$$

where  $M_{kk}$  is the  $(k, k)$ -th cofactor of  $M(1)$ . But by (37.2.2.7),  $\det \widetilde{M}_{kk} = \text{tree}(G)$ , so the result follows.  $\square$

### 13 Applications

**Thm. (37.3.13.1) [Monsky].** A square cannot be divided into  $m$  triangles of the same area, where  $m$  is odd.  $\square$

*Proof:* Choose a 3-coloring on  $\mathbb{R}^2$ : By (19.1.2.19) there can be an extended 2-adic valuation  $|\cdot|_2$  on  $\mathbb{R}$  that extends the 2-adic valuation on  $\mathbb{Q}$ , then color a point  $(x, y)$

- 0 if  $|x|_2 < 1, |y|_2 < 1$ ,
- 1 if  $|x|_2 \geq 1$  and  $|x|_2 \geq |y|_2$ .
- 2 if  $|y|_2 \geq 1$  and  $|y|_2 > |x|_2$ .

Then there are two things:

1. The coloring is invariant under translation by vectors represented by a point of color 0.
2. The valuation of the area of a triangle with vertices of 3 different colors is bigger than 1, because we can assume one vertex is the origin, and then its area is  $\frac{1}{2}|x_1y_2 - x_2y_1|$ , which, because the coloring, must have 2-adic valuation bigger than 1.

Now back to the question, let the square be placed as a unit square, then its area is 1, and it has exactly one  $(0, 1)$ -edge, so by Spencer's lemma (37.2.1.29), it has a triangle with vertices of pairwise different colors, so its area  $A$  has valuation  $> 1$ , but the total area is  $mA = 1$  that has valuation 1, so  $|m| < 1$ , which means that  $m$  is even.  $\square$

**Prop. (37.3.13.2) [Hindman's Theorem].** Whenever  $\mathbb{N}$  is colored with f.m. colors, one can find an infinite subset  $A \subset \mathbb{N}$  and a color  $c$  that whenever  $F \subset A$  is finite, the color of the sum of numbers in  $F$  is colored  $c$ .  $\square$

*Proof:* Cf. [W. W. Comfort, Ultrafilters: some old and some new results, Bull. Amer. Math. Soc. 83 (1977) 417–455.]  $\square$

### 37.4 Combinatorial Set Theory

**Def. (37.4.0.1) [Notations].** For a set  $S$ , let  $[S]^r$  be the set of subsets of  $S$  of order  $r$ . Let  $\kappa, \lambda$  be cardinals, we write  $\kappa \rightarrow (\lambda)_s^r$  as a shorthand for: for any set  $S$  with  $|S| = \kappa$  and every partition of  $[S]^r$  into  $s$  classes, there exists a subset  $H \subset S$  that  $[H]^r$  is in the same class, and  $|H| \geq \lambda$ .  $\lrcorner$

**Prop. (37.4.0.2) [Ramsey's Theorem for  $\aleph_0$ ].** For any positive natural number  $r, s$  if we color the  $r$ -subsets of a set with cardinality  $\aleph_0$  into  $s$  families, then there is a subset of cardinal  $\aleph_0$  that all its  $r$ -subsets are colored the same.  $\lrcorner$

*Proof:* Cf.[Graph Theory, Thm9.1.2].  $\square$

**Cor. (37.4.0.3).** Every infinite linearly ordered set contains a subset isomorphic to  $(\mathbb{N}, <)$  or  $(\mathbb{N}, >)$ .  $\lrcorner$

*Proof:* Choose a well ordering of it. Then consider this new ordering and the original ordering. Then there is an infinite set that is compatible with the original ordering, or converse. Then its initial segment of order type  $\omega_0$  satisfies the requirement.  $\square$

**Def. (37.4.0.4) [Weakly Compact Cardinals].** An **weakly compact cardinal** is an uncountable cardinal  $\kappa$  that  $\kappa \rightarrow (\kappa)_s^r$  (37.4.0.1) for any  $r, s \in \mathbb{Z}_+$ .  $\lrcorner$

**Prop. (37.4.0.5).** Weakly compact cardinals are strongly inaccessible.  $\lrcorner$

*Proof:* Cf.[Jec03]P224.  $\square$

#### Trees

**Def. (37.4.0.6).** A **tree** is a partial ordered set  $T$  that there is a minimal element  $r$  and for each  $x$ ,  $\{y \in T | y < x\}$  is finite and linearly ordered.

A tree is called **of finite branched** for each  $x$ , there is a finite set  $\{y_1, \dots, y_r\}$  is  $T$  that  $y_i > x$  and if  $z > x$ , then  $z \geq y_i$  for some  $i$ .  $\lrcorner$

**Def. (37.4.0.7) [Height].** For any node  $x$ ,  $\{y \in T | y < x\}$  is a well-ordered set, which is isomorphic to an ordinal by (2.2.4.7), it is called the **height** of  $x$ .  $T_\alpha$  denotes the set of all nodes of  $T$  of order  $\alpha$ . The least  $\alpha$  that  $T_\alpha \neq \emptyset$  is called the **height** of  $T$ .

A **branch** is a maximal chain in  $T$ , its **length** is its ordinal. The length is always smaller than the height of the tree. If it equals the height of the tree, it is called **cofinal**.  $\lrcorner$

**Def. (37.4.0.8).** A **subtree** is a subset  $T'$  of  $T$  that if  $x \in T', y < x$ , then  $x \in T'$ .

An **antichain** of a tree  $T$  is a subset  $A \subset T$  that any two elements in  $A$  are incomparable.  $\lrcorner$

**Def. (37.4.0.9).** A **path** through  $T$  is a morphism of ordering from  $\omega$  to  $T$ .  $\lrcorner$

**Lemma (37.4.0.10) [König's Lemma].** If  $T$  is an infinite finite branching tree, then there is a path through  $T$ .  $\lrcorner$

*Proof:* Use recursion to choose for each  $n$  an element that has infinite successors.  $\square$

**Def. (37.4.0.11).** An **Aronszajn tree** is a tree of height  $\kappa$  and all its level sets are at most countable, but has no branches of length  $\kappa$ .  $\lrcorner$

**Prop. (37.4.0.12).** An **Aronszajn tree** of height  $\omega_1$  exists.  $\lrcorner$

*Proof:* Cf.[Set Theory Jech P228].  $\square$

## 1 Finite Sets

**Thm. (37.4.1.1)** [Dirichlet's Box Principle]. ┘

*Proof:* □

## 2 Finite Ramsey's Theory

**Thm. (37.4.2.1)** [Finite Ramsey's Theorem]. For any  $\alpha, k, n_1, \dots, n_k \in \mathbb{Z}_+, n_i \geq \alpha$ , there exists a minimal  $R(\alpha, k; n_i) \in \mathbb{Z}_+$  s.t. if we divide the  $\alpha$ -subsets of a set with cardinality  $R(\alpha, k; n_i)$  into  $k$  groups  $C_1, \dots, C_k$ , then there is some  $1 \leq i \leq k$  and a subset  $S$  of cardinality  $n_i$  s.t. all the  $\alpha$ -subset of  $S$  is in  $C_i$ . Moreover,

$$R(\alpha, k; n_i) \leq R(\alpha - 1, k; m_j = R(\alpha, k; n_1, \dots, n_{j-1}, n_j - 1, n_{j+1}, \dots, n_k)) + 1.$$
┘

*Proof:* We use double induction on  $(\alpha, k)$  in lexicographical order. If  $\alpha = 1$ , clearly  $R(1, k; n_i) = \sum_{i=1}^k (n_i - 1) + 1$ . And if  $k = 1$ , then  $R(\alpha, 1; n_1) = n_1$ .

Suppose  $\alpha > 1, k > 1$ , if some  $n_i = \alpha$ , then  $R(\alpha, k; n_i) = R(\alpha, k - 1; n_1, \dots, \hat{n}_i, \dots, n_k)$ , thus we are reduced to smaller  $k$ . So we can assume that  $n_i > \alpha$  for each  $i$ . In this case, we prove that

$$R(\alpha, k; n_i) \leq R(\alpha - 1, k; m_j = R(\alpha, k; n_1, \dots, n_{j-1}, n_j - 1, n_{j+1}, \dots, n_k)) + 1.$$

And this will finish the induction process.

To prove this, notice that if we have a set  $X$  with cardinality equal to the RHS, and let  $x \in X$ , then we can divide the  $(\alpha - 1)$  subsets of  $X \setminus \{x\}$  into  $k$  groups  $C'_1, \dots, C'_k$  s.t. an  $(\alpha - 1)$ -set  $S$  has cardinality  $\alpha - 1$  belongs to  $C'_i$  iff  $S \cup \{x\}$  belongs to  $C_i$ . Then by definition, there exists some  $i$  and some subset  $Y$  of  $X \setminus \{x\}$  of cardinality  $R(\alpha, k; n_1, \dots, n_{i-1}, n_i - 1, n_{i+1}, \dots, n_k)$  s.t. all  $(\alpha - 1)$ -subset of  $Y$  belongs to  $C'_i$ . Then by definition, there either exists some  $j \neq i$  and some subset  $Z_1$  of  $Y$  of cardinality  $n_j$  s.t. all the  $\alpha$ -subset of  $Z_1$  is in  $C_j$ , in which case the assertion is satisfied; or exists some subset  $Z_2$  of  $Y$  of cardinality  $n_i - 1$  s.t. all the  $\alpha$ -subset of  $Z_2$  is in  $C_i$ . Then  $Z_2 \cup \{x\}$  satisfies the assertion. □

**Prop. (37.4.2.2)** [Szekeres]. For any  $a, b \in \mathbb{Z}_{\geq 2}$ ,  $R(2; a, b) \leq \binom{a+b-2}{a-1}$ . ┘

*Proof:* Use induction on  $a + b$ : If  $a = 2$  or  $b = 2$ , this is easy. And for  $a, b \geq 3$ , by (37.4.2.1),

$$R(2; a, b) \leq R(2; a - 1, b) + R(2; a, b - 1) \leq \binom{a+b-3}{a-2} + \binom{a+b-3}{a-1} = \binom{a+b-2}{a-1}$$
□

**Prop. (37.4.2.3)** [Erdős]. For  $k \in \mathbb{Z}_{\geq 3}$ ,

$$2^{k/2} < R(2; k, k) \leq \binom{2k-2}{k-1} < 4^{k-1}.$$
┘

*Proof:* If  $N < 2^{k/2}$ , then the number of different graphs of  $N$  vertices equals  $2^{N(N-1)/2}$ , and the number of different graphs containing a complete  $k$ -graph is less than

$$\binom{N}{k} 2^{N(N-1)/2 - k(k-1)/2} < \frac{N^k}{k!} 2^{N(N-1)/2 - k(k-1)/2} < \frac{2^{N(N-1)/2}}{2},$$

because  $2^{\frac{k}{2}+1} < k!$  for  $k \geq 3$ . So there exists a graph  $G$  that neither  $G$  and its complement graph  $G'$  contains a complete  $k$ -graph. Thus  $2^{k/2} < R(2; k, k)$ .

The second inequality follows from (37.4.2.2).  $\square$

**Prop. (37.4.2.4) [Erdős].** There exists  $C \in \mathbb{R}_+$  s.t.

$$R(2; 3, x) \geq Cx^2 / \log^2 x$$

for any  $x \in \mathbb{Z}_+$ .  $\lrcorner$

*Proof:* [Graph theory and Probability 2, Erdős].  $\square$

**Prop. (37.4.2.5) [Ajtai-Komlós-Szemerédi].** For any  $k \in \mathbb{Z}_{\geq 2}$ , there exists  $C_k \in \mathbb{R}_+$  s.t. for  $x \in \mathbb{Z}_+$  sufficiently large,

$$R(2; k, x) \leq 5000 \frac{x}{\log \left( R(2; k-1, x)^{\frac{1}{k-2}} \right)} \cdot R(2; k-1, x).$$

In particular, there exists  $C'_k \in \mathbb{R}_+$  s.t.

$$R(2; k, x) \leq C'_k x^{k-1} / \log^{k-2} x.$$

$\lrcorner$

*Proof:* Cf. [note on Ramsey numbers]. ?

$k = 2$  is trivial. For  $k \in \mathbb{Z}_{\geq 3}$ , let  $\varepsilon \in (\frac{0.96}{k-2}, \frac{1}{k-2})$ . Suppose  $G$  is a graph with

$$n = \#V(G) \geq 5000 \frac{x}{\log \left( R(2; k-1, x)^{\frac{1}{k-2}} \right)} \cdot R(2; k-1, x)$$

and  $\omega(G) < k$  and  $\alpha(G) \geq x$ . Let  $h(G)$  be the number of triangles in  $G$ .

Suppose  $\deg(P) \geq R(2; k-1, x)$  for some  $P \in V(G)$ , then  $\omega(G) \geq k$  or  $\alpha(G) \geq x$ , contradiction. So  $\deg(P) < R(2; k-1, x)$  for any  $P \in V(G)$ , which implies that  $t = 2\#E(G)/n < R(2; k-1, x)$ .

If  $h(G) < nR(2; k-1, x)^{2-\varepsilon}$ , when  $x$  is large,  $R(2; k, x)$  is large, so by (37.2.5.7),

$$\alpha(G) > \frac{\varepsilon}{4800} \cdot \frac{n}{R(2; k-1, x)} \cdot \log R(2; k-1, x) \geq x,$$

contradiction.

Thus when  $x$  is large, we can assume that  $h(G) \geq nR(2; k-1, x)^{2-\varepsilon}$ , thus some point  $P \in V(G)$  belongs to at least  $R(2; k-1, x)^{2-\varepsilon}/3$  triangles. Because  $\deg(P) < R(2; k-1, x)$ , there exists a point  $Q$  adjacent to  $P$  and  $\deg(Q) > 2R(2; k-1, x)^{1-\varepsilon}/3 > R(2; k-2, x)$  by hypothesis on  $\varepsilon$ . Then we can find a clique of size  $k-2$  that is adjoint to  $P$  and  $Q$ , contradiction.  $\square$

### Erdős-Hajnal Conjecture

**Conj. (37.4.2.6) [Erdős-Hajnal].** For any finite graph  $H \in \text{Graph}^{\text{fin}}$ , there exists  $\delta_H \in \mathbb{R}_+$  s.t. for any graph  $G \in \text{Graph}^{\text{fin}}$ , if  $H$  is not an induced subgroup of  $G$ , then  $\max(\omega(G), i(G)) \geq v(G)^{\delta_H}$ .  $\lrcorner$

*Proof:*  $\square$

### 3 Intersection Theorems

References are [EKR61] and [G-M16].

**Def. (37.4.3.1) [Shifting Operators].** Let  $n \in \mathbb{Z}_+$  and  $\mathcal{A} \subset \mathcal{P}([n]_+)$  be a family of sets, then for  $i \neq j \in [n]_+$ , the **shifting of sets**  $S_{ij}(\mathcal{A})$  is defined to be  $S_{ij}(\mathcal{A}) = \{S_{ij}(A) | A \in \mathcal{A}\}$ , where

$$S_{ij}(A) = \begin{cases} \{i\} \cup A \setminus \{j\} & , j \in A, i \notin A, \{i\} \cup A \setminus \{j\} \notin \mathcal{A} \\ A & , \text{otherwise} \end{cases}.$$

If  $i < j$ , then  $S_{ij}$  is called a **left shift**, and it is called a **right shift** otherwise.  $\lrcorner$

**Prop. (37.4.3.2).** Let  $n \in \mathbb{Z}_+$  and  $\mathcal{A} \subset \mathcal{P}([n]_+)$  be a family of sets, then for any  $i \neq j \in [n]_+$ ,  $S_{ji} \circ S_{ij}(\mathcal{A}) = S_{ji}(\mathcal{A})$ .  $\lrcorner$

**Prop. (37.4.3.3) [Generating Sets].** For any  $k \leq n \in \mathbb{Z}_+$  and  $\mathcal{B} \subset \mathcal{P}([n]_+)$ , let  $\lrcorner$

### Erdős-Ko-Rado Theorem

**Thm. (37.4.3.4) [Complete Erdős-Ko-Rado Theorem, Ahlswede-Khachatrian].** For  $t \leq k \leq n \in \mathbb{Z}_+$  and  $i \in [k - t]$ , let

$$\mathcal{F}_i = \{F \subset [n]_+, \#F = k, \#F \cap [t + 2i]_+ \geq t + i\}.$$

And consider

$$M(n, k, t) = \max\{\#\mathcal{A} | \mathcal{A} \subset \mathcal{P}([n]_+), (\forall A \in \mathcal{A}) \#A = k, (\forall A_1, A_2 \in \mathcal{A}) \#A_1 \cap A_2 \geq t\}.$$

Then

- If  $(k - t + 1)(2 + \frac{t-1}{r+1}) < n < (k - t + 1)(2 + \frac{t-1}{r})$  for some  $r \in \mathbb{N}$  (where  $\frac{t-1}{0} = \infty$ ), then  $M(n, k, t) = \#\mathcal{F}_r$ . And the maximum is attained only at  $\mathcal{F}_r$  up to permutations.
- If  $n = (k - t + 1)(2 + \frac{t-1}{r+1})$  for some  $r \in \mathbb{N}$ , then  $M(n, k, t) = \#\mathcal{F}_r = \#\mathcal{F}_{r+1}$ , and the maximum is attained only at  $\mathcal{F}_r$  or  $\mathcal{F}_{r+1}$  up to permutations (but notice when  $t = 1$ , i.e. when  $n = 2k$ , there can be multiple  $r$  s.t. this inequality holds).  $\lrcorner$

*Proof:* Let  $I(n, k, t)$  denote the set of families

$$\{\mathcal{A} | \mathcal{A} \subset \mathcal{P}([n]_+), (\forall A \in \mathcal{A}) \#A = k, (\forall A_1, A_2 \in \mathcal{A}) \#A_1 \cap A_2 \geq t\}.$$

**Lemma (37.4.3.5).** For any  $\mathcal{A} \in I(n, k, t)$ ,  $\overline{\mathcal{A}} \in I(n, n - k, n - 2k + t)$ , and for any  $A \in \mathcal{A}, B \in \overline{\mathcal{A}}$ ,  $\lrcorner$

To determine the families  $\mathcal{A}$  that attains the maximal cardinality, we use left shifts (37.4.3.1). Because any family can be left-shifted to a left compressed family by f.m. left-shifts, it suffices to show that if  $S_{ij}(\mathcal{A}) = \mathcal{F}_r$ , then  $\mathcal{A}$  is isomorphic to  $\mathcal{F}_r$  by permutation. It is clear that if  $i, j \leq t + 2r$  or  $i, j > t + 2r$ , then  $\mathcal{A} = \mathcal{F}_r$ .  $\square$

**Cor. (37.4.3.6) [Erdős-Ko-Rado/Wilson].** For  $t \leq k \leq n \in \mathbb{Z}_+$  s.t.  $n \geq (t+1)(k-t+1)$ , we have

$$M(n, k, t) = \binom{n-t}{k-t}.$$

Moreover, if  $n \geq (t+1)(k-t+1) + 1$ , then the equality is attained at the family  $\mathcal{A} = \{F \subset [n]_+ \mid \#F = n, [t]_+ \subset F\}$  up to permutations.  $\lrcorner$

**Cor. (37.4.3.7) [2k-Intersection Theorem].** For  $k \in \mathbb{Z}_+$ , we have  $M(2k, k, 1) = \binom{2k-1}{k-1}$ , and the maximum is attained only at one of the families  $\mathcal{F}_r$  up to permutations, where  $r \in [k-1]$ .  $\lrcorner$

**Cor. (37.4.3.8) [4m-Conjecture].** For  $m \in \mathbb{Z}_+$ ,  $M(4m, 2m, 2) = \frac{1}{2} \left( \binom{4m}{2m} - \binom{2m}{m}^2 \right)$ , and the maximality is achieved only at the family  $\mathcal{A} = \{F \subset [4m]_+ \mid \#F = 2m, \#F \cap [2m]_+ \geq m+1\}$   $\lrcorner$

**Thm. (37.4.3.9) [Non-trivial Intersecting Families, Hilton-Milner [H-M67]].** For  $k, n \in \mathbb{Z}_+, n \geq 2k$  and any system  $\mathcal{S} = \{S_1, \dots, S_v\} \subset \mathcal{P}([n]_+)$  s.t.

- $\#S_i = k$  for each  $i$ ,
- $\#S_i \cap S_j \neq \emptyset$  for any  $1 \leq i, j \leq v$ .
- $\bigcap_i S_i = \emptyset$ ,

we have  $v \leq \binom{n-1}{k-1} - \binom{n-k-1}{k-1} + 1$ .  $\lrcorner$

*Proof:* Cf. [Erdős-Ko-Rado theorem]P15.  $\square$

**Conj. (37.4.3.10) [Erdős-Ko-Rado].** For  $k \leq n \in \mathbb{Z}_+$  and any system  $\mathcal{S} = \{S_1, \dots, S_v\} \subset \mathcal{P}([n]_+)$  s.t.  $\#S_i \cap S_j \geq k$  for any  $1 \leq i, j \leq v$ , find the largest value of  $v$ .  $\lrcorner$

*Proof:*  $\square$

**Prop. (37.4.3.11) [Erdős-Ko-Rado].** For  $n \in \mathbb{Z}_{\geq 2}$  and any system  $\mathcal{S} = \{S_1, \dots, S_v\} \subset \mathcal{P}([n]_+)$  s.t.  $S_i \cap S_j \cap S_k \neq \emptyset$  for any  $1 \leq i, j, k \in v$ , then we have  $v \leq 2^{n-1}$ , with equality iff  $\mathcal{S}$  consists of all subsets containing a fixed element.  $\lrcorner$

*Proof:* The inequality is clear. Consider the smallest  $p \in [v]_+$  s.t.

$$S_1 \cap S_2 \dots \cap S_p \in \{S_1, \dots, S_v\}.$$

If  $p = n$ , then they have a common element. If  $p < n$ , then

$$\{S_1 \cap S_2 \dots \cap S_{p+1}, S_1, \dots, S_v\}$$

is another class s.t. any two of them has non-empty intersection. This implies that  $v+1 < 2^{n-1}$ .  $\square$

**Prop. (37.4.3.12) [Sperner].** For  $n \in \mathbb{Z}_+$ , any system  $\{S_1, \dots, S_v\}$  of subsets of  $[n]_+$  s.t. no set  $S_i$  contains another  $S_j$ , then  $v \leq \binom{n}{\lfloor n/2 \rfloor}$ .  $\lrcorner$

*Proof:*  $\square$

### Intersection Families of Permutations

## 37.5 Partition Theory

References are [The Theory of Partitions, Andrews] and [A-G88].

**Def. (37.5.0.1) [Partitions].** For  $n \in \mathbb{Z}_+$ , a **partition** of  $n$  is a tuple  $(a_1, \dots, a_k) \in \mathbb{Z}_+^{\mathbb{N}}$  s.t.

$$a_1 \leq a_2 \leq \dots \leq a_k, \quad \sum_i a_i = n.$$

denoted by  $\lambda = (a_1, \dots, a_k) \vdash n$ .

The number of partitions of  $n$  is denoted by  $\text{Par}(n)$ . For convenience, denote  $\text{Par}(0) = 1$ , and  $P(\alpha) = 0$  for  $\alpha \in \mathbb{R} \setminus \mathbb{N}$ . Clearly,

$$\sum_{n \in \mathbb{N}} \text{Par}(n) X^n = \prod_{k \in \mathbb{Z}_+} \frac{1}{(1 - X^k)} \in \mathbb{Z}[[X]].$$

┘

**Def. (37.5.0.2) [Dominance of Partitions].** For  $n \in \mathbb{Z}_+$  and  $\lambda = (\lambda_1, \dots, \lambda_m) \vdash n, \mu = (\mu_1, \dots, \mu_l) \vdash n$ , we say  $\lambda$  is a **dominant partition** of  $\mu$ , denoted by  $\lambda \preceq \mu$  if

$$\sum_{i \leq k} \lambda_i \leq \sum_{j \leq k} \mu_j$$

for any  $k \in \mathbb{Z}_+$ .

┘

**Def. (37.5.0.3) [Lexicographic Order of Partitions].** For  $n \in \mathbb{Z}_+$  and  $\lambda = (\lambda_1, \dots, \lambda_m) \vdash n, \mu = (\mu_1, \dots, \mu_l) \vdash n$ , we denote  $\lambda < \mu$  if for some  $i$ ,  $\lambda_j < \mu_j$  for any  $j < i$  and  $\lambda_i < \mu_i$ .

It is clear that if  $\lambda \preceq \mu$ , then  $\lambda < \mu$ .

┘

**Def. (37.5.0.4) [Partition Permutations].** For  $n \in \mathbb{Z}_+$  and  $\lambda = (\lambda_1, \dots, \lambda_l) \vdash n$ , denote the **partition permutation number**  $\lambda! = (\lambda_1)! \dots (\lambda_l)!$ .

┘

### 1 Young Tableaux

**Def. (37.5.1.1) [Young Tableaux and Young Subgroups].** Suppose  $n \in \mathbb{Z}_+$  and  $\lambda = (\lambda_1, \dots, \lambda_l) \vdash n$ , then

- The **Ferrers diagram** of  $\lambda$  is an array of  $n$  dots having  $l$  left-justified rows with row  $i$  containing  $\lambda_i$  dots for  $i = 1, \dots, l$ .
- The **Young tableaux** of  $\lambda$  is an array  $t^\lambda$  obtained by replacing the dots of the Ferrers diagram of  $\lambda$  with the numbers  $1, 2, \dots, n$  bijectively.
- The **Young subgroup** of  $\lambda$  is

$$\text{Sym}_\lambda = \text{Sym}_{[1, \dots, \lambda_1]} \times \text{Sym}_{[\lambda_1+1, \dots, \lambda_2]} \times \dots \times \text{Sym}_{[n-\lambda_l+1, \dots, n]} \leq \text{Sym}_n.$$

┘

**Def. (37.5.1.2) [Young Tabloids].** Two Young tableaux of the same size are called **row equivalent** if they contains the same row sets  $R_1, \dots, R_l$ . An equivalent class of Young tableaux of shape  $\lambda$  is called a  $\lambda$ -**tabloid**.

┘

**Prop. (37.5.1.3) [Dominance Lemma].** Let  $n \in \mathbb{Z}_+$ ,  $\lambda, \mu \vdash n$  and  $t^\lambda, s^\mu$  be tableaux of shape  $\lambda$  and  $\mu$  resp.. If for any  $i$ , the elements in row  $i$  of  $s^\mu$  appear in different columns in  $t^\lambda$ , then  $\lambda \succcurlyeq \mu$ .  $\lrcorner$

*Proof:* The hypothesis implies that we can sort the entries in each column of  $t^\lambda$  s.t. the elements of rows  $1, 2, \dots, i$  of  $s^\mu$  all occur in the first  $i$  rows of  $t^\lambda$ . This exactly means that  $\sum_{k \leq i} \lambda_i \geq \sum_{k \leq i} \mu_k$ .  $\square$

**Def. (37.5.1.4) [Row and Column Stabilizers].** Let  $n \in \mathbb{Z}_+$  and  $t$  is a Young tableaux of size  $n$  with row sets  $R_1, \dots, R_l$  and column sets  $C_1, \dots, C_k$ , then define the **row stabilizer** and **column stabilizer** groups as

$$R_t = \text{Sym}_{R_1} \times \dots \times \text{Sym}_{R_l} \subset \text{Sym}_n, \quad C_t = \text{Sym}_{C_1} \times \dots \times \text{Sym}_{C_k} \subset \text{Sym}_n.$$

 $\lrcorner$ 

## 2 Enumerations

**Thm. (37.5.2.1) [Ramanujan's most Beautiful Identity].**

$$\sum_{n \in \mathbb{N}} \text{Par}(5n+4)X^n = 5 \prod_{k \in \mathbb{Z}_+} \frac{(1 - X^{5k})^5}{(1 - X^k)^6} \in \mathbb{Z}[[X]].$$

 $\lrcorner$ 

*Proof:*

 $\square$ 

**Prop. (37.5.2.2) [Euler].** For  $n \in \mathbb{N}$ , let  $\text{Par}(\mathcal{O}, n)$  be the number of partitions into odd numbers, and  $\text{Par}(\mathcal{D}, n)$  be the number of partitions into distinct parts. Then

$$\text{Par}(\mathcal{O}, n) = \text{Par}(\mathcal{D}, n).$$

 $\lrcorner$ 

*Proof:*

$$\sum_{n \in \mathbb{N}} \text{Par}(\mathcal{D}, n)q^n = \prod_{n \in \mathbb{Z}_+} (1 + q^n) = \prod_{n \in \mathbb{Z}_+} \frac{1 - q^{2n}}{1 - q^n} = \prod_{n \in \mathbb{Z}_+} \frac{1}{1 - q^{2n-1}} = \sum_{n \in \mathbb{N}} \text{Par}(\mathcal{O}, n)q^n.$$

 $\square$ 

**Prop. (37.5.2.3) [Graphical Duality].** For any  $n, m \in \mathbb{Z}_+$ , the number of partitions with at most  $m$  parts equals the number of partitions where no part exceeds  $m$ . This follows easily from the graphical representation of partitions.  $\lrcorner$

**Def. (37.5.2.4) [Dyson's Rank and Crank].** For  $n \in \mathbb{N}$  and a partition  $\lambda$  of  $n$ , denote

- $\sigma(\lambda) = n$ .
- $\#(\lambda)$  the number of parts of  $\lambda$ .
- $l(\lambda)$  the largest part of  $\lambda$ ,
- $\omega(\lambda)$  the number of 1s in  $\lambda$ ,
- $\mu(\lambda)$  the number of parts of  $\lambda$  larger than  $\omega(\lambda)$ .

- **Dyson's rank** of  $\lambda$  is defined as the largest part minus the number of parts.
- **Dyson's crank** of  $\lambda$  is defined as

$$c(\lambda) = \begin{cases} l(\lambda) & , \omega(\lambda) = 0 \\ \mu(\lambda) - \omega(\lambda) & , \omega(\lambda) > 0 \end{cases}.$$

┘

### Restricted Partitions

### 3 Congruences between Partition Functions

**Def. (37.5.3.1)[Vector Partitions and Vector-Cranks].** For  $n \in \mathbb{Z}_+$ , a **vector partition** of  $n$  is a triple  $\bar{\lambda} = (\lambda_1, \lambda_2, \lambda_3)$  of partitions s.t.

$$\sigma(\bar{\lambda}) = \sigma(\lambda_1) + \sigma(\lambda_2) + \sigma(\lambda_3) = n,$$

and  $\lambda_1$  is a partition into distinct parts.

For any vector partition, define

- $\omega(\bar{\lambda}) = (-1)^{\#(\lambda_1)}$ .
- $r(\bar{\lambda}) = \#(\lambda_2) - \#(\lambda_3)$ .

And for any  $m, k \in \mathbb{Z}$ , the counting functions

$$N_V(m; n) = \sum_{\sigma(\bar{\lambda})=n, r(\bar{\lambda})=m} \omega(\bar{\lambda}),$$

$$N_V(k, m; n) = \sum_{t=-\infty}^{\infty} N_V(mt + k; n).$$

┘

**Prop. (37.5.3.2).** For  $n \in \mathbb{Z}_+, m \in \mathbb{Z}$ , changing  $\lambda$  and  $\lambda_3$  implies that

$$N_V(m; n) = N_V(m, n)$$

and

$$N_V(k, m; n) = N_V(-k, m; n).$$

And it is easy to see that it has a generating function

$$\sum_{m \in \mathbb{Z}} \sum_{n \in \mathbb{N}} N_V(m; n) z^m q^n = \prod_{n \in \mathbb{Z}_+} \frac{(1 - q^n)}{(1 - zq^n)(1 - z^{-1}q^n)}.$$

In particular, by letting  $z = 1$ , we see that  $\sum_{m \in \mathbb{Z}} N_V(m; n) = \text{Par}(n)$ .

┘

**Thm. (37.5.3.3)[Vector-Crank Theorem, Garvan].** For  $n \in \mathbb{Z}_+$  and any  $i \in \mathbb{N}$ ,

$$N_V(i, 5; 5n + 4) = \frac{\text{Par}(5n + 4)}{5}.$$

$$N_V(i, 7; 7n + 5) = \frac{\text{Par}(7n + 5)}{7}.$$

$$N_V(i, 11; 11n + 6) = \frac{\text{Par}(11n + 5)}{11}.$$

┘

*Proof:* Cf.[Generalizations of Dyson's rank], [New combinatorial interpretations of Ramanujan's partition congruences mod 5,7 and 11].  $\square$

**Thm. (37.5.3.4) [Cranks and Vector-Cranks].** For  $n \in \mathbb{Z}_+, m \in \mathbb{Z}$ , the number of partitions  $\lambda$  of  $n$  with  $c(\lambda) = m$  is equal to  $N_v(m; n)$  (37.5.3.1).  $\lrcorner$

*Proof:* Cf,[A-G88].?  $\square$

**Thm. (37.5.3.5) [Ramanujan Congruences].** For any  $n \in \mathbb{Z}_+$ ,

$$5 \mid \text{Par}(5n + 4),$$

$$7 \mid \text{Par}(7n + 5),$$

$$11 \mid \text{Par}(11n + 6).$$

$\lrcorner$

*Proof:* These follow from (37.5.3.3) and (37.5.3.4). Alternatively 1 also follows from (37.5.2.1).  $\square$

**Prop. (37.5.3.6) [Ahlgren-Boylan].** A **Ramanujan congruence** is a congruence property of the partition function of the form: For any  $n \in \mathbb{Z}_+$ ,

$$p \mid \text{Par}(pn + r)$$

where  $p \in \text{Prime}, r \in \mathbb{Z}$ . Then the only Ramanujan congruences are those three listed in (37.5.3.5).  $\lrcorner$

*Proof:*  $\square$

**Prop. (37.5.3.7) [Atkin-O'Brien].** For any  $n \in \mathbb{Z}_+$ ,

$$13 \mid \text{Par}(11^3 \cdot 13n + 237).$$

$\lrcorner$

**Thm. (37.5.3.8) [Schinzel/Ono].** For any  $p \in \text{Prime} \setminus \{3\}$  and  $k \in \mathbb{Z}_+$ , a positive portion of primes  $\ell \in \text{Prime}$  satisfy

$$p \mid \text{Par}\left(\frac{p^k \ell^3 n + 1}{24}\right).$$

$\lrcorner$

*Proof:* Cf.[Distribution of the partition function modulo m].  $\square$

**Prop. (37.5.3.9) [Ono].** For any  $p \in \text{Prime}_{\geq 5}$ , there exists  $N(p), P(p) \in \mathbb{Z}_+, N(p), P(p) \leq 8(m^3 - 2m - 1)$  s.t. for any  $i \in \mathbb{Z}_{\geq N(p)}$ ,

$$\text{Par}\left(\frac{p^i n + 1}{24}\right) \equiv \text{Par}\left(\frac{p^{P(p)+i} n + 1}{24}\right) \pmod{p}.$$

$\lrcorner$

*Proof:* Cf.[Distribution of the partition function modulo m, Ono].  $\square$

**Conj. (37.5.3.10)**[Newmann]. For any  $m \in \mathbb{Z}_+$  and  $r \in \mathbb{Z}$ , there are infinitely many  $n \in \mathbb{Z}_+$  s.t.

$$\text{Par}(n) \equiv r \pmod{m}.$$

┘

*Proof:*

□

**Thm& Conj. Cor. (37.5.3.11)**[Schinzel/Ono/Ahlgren-Boylan]. For any  $p \in \text{Prime}_{\geq 5}$  and  $r \in \mathbb{Z}_+$ , there exists  $C(p, r) \in \mathbb{R}_+$  s.t.

$$\#\{n \in \mathbb{Z}_+ : n \leq X, \text{Par}(n) \equiv r \pmod{p}\} \geq \begin{cases} C(p, r)\sqrt{X}/\log X & , 1 \leq r \leq p-1 \\ C(p)X & , r=0, p \geq 5 \\ C(p)\sqrt{X} & , p=2 \end{cases}.$$

┘

*Proof:* Cf.[Distribution of the partition function modulo m, Ono], [Arithmetic properties of the partition function], [On the parity of additive representation functions, Nicolas-Ruzsa-Sárközy]. □

**Remark (37.5.3.12).** What about  $p = 3$ ?

┘

## 4 Compositions

**Prop. (37.5.4.1).** For  $n, m \in \mathbb{Z}_+$ , there are  $\binom{n-1}{m-1}$  compositions of  $n$  with exactly  $m$  parts.

┘

*Proof:* Let the number be denoted by  $c(m, n)$ , then

$$\sum_{n \in \mathbb{N}} c(m, n)q^n = (q + q^2 + q^3 + \dots)^m = \frac{q^m}{(1-q)^m} = \sum_{n \in \mathbb{N}} \binom{n-1}{m-1} q^n.$$

□

## 5 Asymptotics

**Prop. (37.5.5.1)**[Erdős]. For  $n, m \in \mathbb{Z}_+$ , let  $\text{Par}_m(n)$  be the number of partitions of  $n$  with exactly  $m$  parts, then

$$\text{Par}_m(n) \sim \frac{1}{m!} \binom{n-1}{m-1}, \quad n \rightarrow \infty,$$

provided that  $m = o(n^{1/3})$ .

┘

*Proof:* Cf.[Theory of Partitions, Andrews]P56.

□

## 37.6 Additive Combinatorics

### 1 Zero-Sum Sets

References are [Zero-sum problems in finite abelian groups: a survey].

**Def. (37.6.1.1) [Davenport Numbers].** For  $G \in \mathcal{Ab}^{\text{fin}}$ , define the **Davenport number**  $D(G)$  to be the smallest positive integer  $s$  s.t. any sequence of elements of  $G$  of length  $s$  has a non-empty subsequence whose elements product to  $1 \in G$ .  $\lrcorner$

**Thm. (37.6.1.2) [Emde-Kruyswijk/Meshulam].** For  $G \in \mathcal{Ab}^{\text{fin}}$  and let  $m$  be the largest order of an element of  $G$ , then

$$D(G) \leq \lceil m(1 + \log \frac{\#G}{m}) \rceil.$$

$\lrcorner$

*Proof:* Let  $n \geq m(1 + \log \frac{\#G}{m})$  and let  $g_1, \dots, g_n$  be a sequence of elements in  $G$ .  $\square$

**Prop. (37.6.1.3).** For  $G \in \mathcal{Ab}^{\text{fin}}$  and  $r > t \geq D(G)$ , any sequence of elements of  $G$  of cardinality  $r$  contains at least  $\binom{r}{t} / \binom{r}{D(G)-1}$  many distinct sequences of length at most  $t$  and at least  $t - D(G) + 1$  s.t. its elements product to  $1 \in G$ .  $\lrcorner$

*Proof:*  $\square$

### Zero-Sum Sets of Prescribed Sizes

**Thm. (37.6.1.4) [Restricted Sum-Sets and Polynomials, Alon-Nathanson-Ruzsa[ANR94]].** For  $p \in \text{Prime}$ ,  $n \in \mathbb{Z}_+$ ,  $h(X_1, \dots, X_n) \in \mathbb{F}_p[X_1, \dots, X_n]$  and non-empty subsets  $A_1, \dots, A_n \subset \mathbb{F}_p$ , denote the **restricted sum-set**

$$\sum(A_1, \dots, A_n; h) = \{a_1 + \dots + a_n \mid a_i \in A_i, h(a_1, \dots, a_n) \neq 0\}.$$

Denote  $c_i = \#A_i - 1$  and  $m = \sum_{i \in [n]} c_i - \deg(h)$ . If the coefficient of  $\prod_{i \in [n]} X_i^{c_i}$  in

$$(X_1 + \dots + X_n)^m h(X_1, \dots, X_n)$$

is nonzero in  $\mathbb{F}_p$ , then  $m < p$  and we have

$$\#\sum(A_1, \dots, A_n; h) \geq m + 1.$$

And the same holds for  $\mathbb{F}_{p^r}$  for any  $r \in \mathbb{Z}_+$ .  $\lrcorner$

**Cor. (37.6.1.5) [Cauchy-Davenport].** If  $A, B \subset \mathbb{F}_p$  are non-empty, then  $\#(A + B) \geq \min\{p, \#A + \#B - 1\}$ .  $\lrcorner$

*Proof:* This follows from (37.6.1.4) by taking  $h = 1$ .  $\square$

**Cor. (37.6.1.6) [Distinct Sum-Sets, Alon-Nathanson-Ruzsa[ANR96]].** For  $p \in \text{Prime}$ ,  $n \in \mathbb{Z}_+$  and non-empty subsets  $A_1, \dots, A_n \subset \mathbb{F}_p$  s.t.  $\#A_i \neq \#A_j$  for any  $i \neq j$ . Then

$$\#\{a_1 + \dots + a_n \mid a_i \in A_i, a_i \neq a_j, \forall i < j \in [n]_+\} \geq \min \left( p, \sum_{i \in [n]} \#A_i - \frac{(n-1)(n+2)}{2} \right).$$

And for arbitrary  $A_1, \dots, A_n \subset \mathbb{F}_p$ , we get a similar lower bound for the distinct sum-set by shrinking  $A_i$ . And this bound is optimal, by choosing  $A_i = \{1, \dots, \#A_i\}$ .  $\lrcorner$

*Proof:* It suffices to prove this for  $m = \sum_{i \in [n]_+} \#A_i - \binom{k+2}{2} < p$ . Denote  $c_i = \#A_i - 1$ , then this follows from (37.6.1.4), by computing that the coefficient of  $\prod_{i \in [n]_+} X_i^{c_i}$  in

$$(X_1 + \dots + X_n)^m \prod_{i > j \in [n]_+} (X_i - X_j)$$

is

$$\frac{m!}{c_1! \cdots c_n!} \prod_{i > j \in [n]_+} (c_i - c_j).$$

*Proof:* Cf. [ANR96] ?.

□

**Cor. (37.6.1.13) [Erdős-Ginzburg-Ziv].** For any  $2n - 1$  elements  $(a_i)$  in  $\mathbb{Z}/(n)$ , there exists  $I \subset \{1, 2, \dots, 2n - 1\}$  with  $\#I = n$  and  $\sum_{i \in I} a_i = 0$ .  $\lrcorner$

*Proof:* We use induction on  $n$ . If  $n \in \mathbf{Prime}$ , then this follows from Cauchy-Davenport(37.6.1.5). If this is true for  $m$ , then for  $p \in \mathbf{Prime}$  and  $n = mp$ , given any  $2n - 1$  numbers, we can find pairwise disjoint subsets  $I_1, \dots, I_{2m-1}$  of  $\{1, \dots, 2pm - 1\}$  where  $\#I_i = p$  and  $\sum_{j \in I_i} a_j \equiv 0 \pmod{p}$  for any  $1 \leq i \leq 2m - 1$ . Define

$$A_i = \left( \sum_{j \in I_i} a_j \right) / p,$$

then we can use the induction hypothesis for  $m$  and  $A_i$  to get the desired assertion.  $\square$

## 2 Arithmetic Progressions

### Arithmetic Progressions in $\mathbb{Z}_+$

**Thm. (37.6.2.1)[Salem-Spencer/Behrend].** Given  $\varepsilon \in \mathbb{R}_+$ , for  $N \in \mathbb{Z}_+$  sufficiently large, there exists a subset  $S \subset \mathbb{Z}/(N)$  that avoids three-term arithmetic sequences, with

$$\#S > \frac{N}{e^{(2\sqrt{\log 4 + \varepsilon})\sqrt{\log N}}}.$$

$\lrcorner$

*Proof:* For this  $N$ , let  $n = \lfloor \sqrt{\frac{2\log N}{\log 2}} \rfloor$ , and  $d \in \mathbb{Z}_+$  s.t.  $(2d - 1)^n \leq N < (2d + 1)^n$ . Then  $d \geq 2$ . Then for any  $k \leq n(d - 1)^2$ , consider the set  $S_k(n, d)$  of all positive integers of the form

$$A = a_1 + a_2(2d - 1) + \dots + a_n(2d - 1)^{n-1},$$

where  $0 \leq a_i \leq d - 1$ , and  $\sum_i a_i^2 = k$ .

It follows from triangular inequality that the image of any such  $S_k(n, d)$  in  $\mathbb{Z}/(N)$  avoids three-term arithmetic sequences, and by Dirichlet's box principle, there exists some  $1 \leq k \leq n(d - 1)^2$  s.t.

$$\#S_k(n, d) \geq (d^n - 1)/n(d - 1)^2 \geq d^{n-2}/n \geq \frac{(N^{\frac{1}{n}} - 1)^{n-2}}{n(2 + \varepsilon)^{n-2}} = \frac{N^{1-2/n}}{n(2 + \varepsilon)^{n-2}}.$$

So for  $N$  large,

$$\#S_k(n, d) \geq N^{1 - \frac{2}{n} - \frac{\log n}{\log N} - \frac{(n-2)\log(2+\varepsilon)}{\log N}} > N^{1 - \frac{2\sqrt{\log 4 + 3\varepsilon}}{\sqrt{\log N}}}.$$

$\square$

**Thm. (37.6.2.2) [Erdős-Turán Conjecture, Szemerédi(1974)/Furstenberg(1977)/Gowers].**

For any  $k \in \mathbb{Z}_+$  and  $\delta \in \mathbb{R}_+$ , if  $N \in \mathbb{Z}_+$  and  $N \geq 2^{2^{(\delta-1)2^{-2k+9}}}$ , then any subset  $A \subset [N]_+$  with  $\#A \geq \delta N$  contains an arithmetic sequence of length  $k$ .  $\lrcorner$

*Proof:* ?  $\square$

**Cor. (37.6.2.3)[van der Waerden/Gowers].** For  $k \in \mathbb{Z}_{\geq 3}$  and  $X \in \mathbb{Z}_+$ , if  $A_k(X)$  be the maximal set of a subset of  $[X]_+$  that avoids  $k$ -term arithmetic sequences, then

$$A(X) = O \left( \frac{X}{\left( \log_{(2)} X \right)^{\frac{1}{2^{k+9}}}} \right).$$

$\lrcorner$

**Thm. (37.6.2.4) [Shelah/Roth/Bloom-Sisask].** There exists  $c \in \mathbb{R}_+$  s.t. for any  $X \in \mathbb{Z}_+$ , if  $A(X)$  be the maximal set of a subset of  $[X]_+$  that avoids three-term arithmetic sequences, then

$$A(X) = O\left(\frac{X}{\log^{1+c} X}\right).$$

┘

*Proof:* ? We only give Roth's proof that  $A(X) = O(\frac{X}{\log_{(2)} X})$ :

Let  $b(X) = A(2^{4^X})/2^{4^X}$ , then  $b(X)$  is decreasing by (37.6.2.5), and (37.6.2.6) applied to  $m = 2^{4^X}$  implies that if  $\delta = \frac{1}{2^{4^{X+1}\eta}}$  where  $0 < \eta < 1/2$ , then

$$b(X)^2 < C[b(X)\delta + b(X)^2\delta^2 + (\delta^{-1}b(X) + 1)(b(X) - b(X+1) + \frac{1}{2^{4^x}})].$$

Then notice for  $X$  large, we can choose  $\delta = \delta(X) = \frac{b(X)}{2C_1} < \frac{1}{2}$  where  $C_1 > \min(C, 1)$  is a constant: it suffices to verify that  $\frac{1}{2^{4^{X+1}\cdot\frac{1}{2}}} < \frac{b(X)}{2C}$ , or equivalently  $C < 2^{3\cdot 4^X - 2} A(2^{4^X})$ , which is clearly true for  $X$  large.

Thus by the fact  $b(X) < 1$ ,

$$\begin{aligned} b(X)^2 &< C_1[b(X)\delta + b(X)^2\delta^2 + (\delta^{-1}b(X) + 1)(b(X) - b(X+1) + \frac{1}{2^{4^x}})] \\ &\leq b(X)^2(\frac{1}{2} + \frac{1}{4C_1}) + C_1(\delta^{-1}b(X) + 1)(b(X) - b(X+1) + \frac{1}{2^{4^x}}) \\ &< \frac{3}{4}b(X)^2 + C_1(2C_1 + 1)(b(X) - b(X+1) + \frac{1}{2^{4^x}}) \end{aligned}$$

Thus there exists a constant  $C_2$  s.t. for  $X$  large,

$$b(X)^2 < C_2(b(X) - b(X+1) + \frac{1}{2^{4^x}}).$$

which implies there exists a constant  $C_3 > C_2$  that for  $X$  large,

$$Xb(2X)^2 \leq \sum_{k=X}^{2X-1} b(X)^2 < C_3(b(X) - b(2X) + \frac{2C_3}{X}).$$

Hence whenever  $2Xb(2X) > 4C_3$ ,

$$2Xb(2X) < \frac{1}{4C_3} 4X^2b(2X)^2 < (Xb(X) - Xb(2X) + 2C_3) < Xb(X).$$

From this that the fact  $b(X)$  is decreasing (37.6.2.5) it is clear that  $Xb(X)$  is bounded, i.e.  $b(X) = O(\frac{1}{X})$ . And clearly this together with (37.6.2.5) implies the desired assertion.  $\square$

**Lemma (37.6.2.5).** For any  $X, Y \in \mathbb{Z}_+$ ,  $A(X)$  equals the maximal number of elements without three-term arithmetic sequences that can be selected from any  $X$ -term arithmetic sequence.  $\frac{A(XY)}{XY} \leq \frac{A(X)}{X}$ , and  $\frac{A(X)}{X} \leq \frac{X+Y}{X} \frac{A(Y)}{Y}$ .  $\square$

*Proof:* The first assertion is easy. Thus  $A(X+Y) \leq A(X) + A(Y)$ , and

$$A(X) \leq A\left(\left[1 + \left\lfloor \frac{X}{Y} \right\rfloor\right]Y\right) \leq \frac{X+Y}{X} A(Y).$$

$\square$

**Lemma (37.6.2.6) [Hardy-Littlewood Method].** For  $X \in \mathbb{Z}_+$ , let  $a(X) = \frac{A(X)}{X}$ , then for any  $m \in 2\mathbb{Z}_+$ , if  $\delta = \frac{1}{m^4\eta}$  where  $0 < \eta < 1/2$ , there exists constant  $C > 0$

$$a(m)^2 < C[a(m)\delta + a(m)^2\delta^2 + (\delta^{-1}a(m) + 1)(a(m) - a(m^4) + m^{-1})].$$

┘

*Proof:* Let  $\{u_1, \dots, u_{A(m^4)}\}$  be a maximal subset of  $\{m^4\}$  without three-term arithmetic sequences, and let  $\{2v_1, \dots, 2v_V\}$  be the set of even integers among  $u_k$ . Then by (37.6.2.5),

$$A(m^4) \leq m^4 a(m), \quad V \leq A\left(\frac{m^4}{2}\right) \leq \frac{m^4}{2} a(m), \quad V \geq A(m^4) - A\left(\frac{m^4}{2}\right) \geq m^4 a(m^4) - \frac{m^4}{2} a(m). \quad (\star)$$

Define

$$f_1(\alpha) = \sum_{k=1}^{A(m^4)} e^{2\pi i \alpha u_k}, \quad f_2(\alpha) = \sum_{k=1}^V e^{2\pi i \alpha v_k},$$

$$F_1(\alpha) = a(m) \sum_{n=1}^{m^4} e^{2\pi i \alpha n}, \quad F_2(\alpha) = a(m) \sum_{n=1}^{m^4/2} e^{2\pi i \alpha n},$$

then by the above,  $|f_i(\alpha)| \leq m^4 a(m)$ ,  $|F_i(\alpha)| \leq m^4 a(m)$ . And

$$f_i(\alpha) - F_i(\alpha) = O\left(m^4[a(m) - a(m^4)] + m^3\right) \quad (\star\star)$$

Using (37.6.2.7), if  $q = 1$ , this is true for  $i = 1$ , and for  $i = 2$ , use the lower bound for  $V$  above. On the other hand, if  $q$  cannot be chosen to be 1, then  $S' = 0$ , and it suffices to show that  $F_r(\alpha) = O(m^3)$ , which is true by (35.3.3.1) and the fact  $\{\{\alpha\}\} \geq 1/\sqrt{2N}$  (because  $q$  cannot be chosen to be 1).

Thus

$$\begin{aligned} f_1(\alpha)f_2(-\alpha)^2 - F_1(\alpha)F_2(-\alpha)^2 &= f_1(\alpha)(f_2(-\alpha) + F_2(-\alpha))(f_2(-\alpha) - F_2(-\alpha)) + F_2(-\alpha)^2(f_1(\alpha) - F_1(\alpha)) \\ &= O\left([m^4 a(m)]^2(m^4[a(m) - a(m^4)] + m^3)\right). \end{aligned}$$

and by (35.3.3.1), if  $0 < \eta < \{\{\alpha\}\} < 1/2$ , then

$$f_1(\alpha) = O\left(a(m)\eta^{-1} + m^4[a(m) - a(m^4)] + m^3\right). \quad (\star\star\star)$$

Then for any  $0 < \eta < 1/2$ ,

- The hypothesis implies that  $u_h = v_k + v_l$  iff  $k = l$  and  $u_h = 2v_k$ , so by  $(\star)$ ,

$$\int_{-\eta}^{1-\eta} f_1(\alpha)f_2^2(-\alpha)d\alpha = V = O(m^4 a(m)).$$

- By  $(\star\star\star)$ ,

$$\int_{-\eta}^{1-\eta} f_1(\alpha)f_2^2(-\alpha)d\alpha < \left[\max_{\eta < \alpha < 1-\eta} f_1(\alpha)\right] \int_0^1 f_2^2(-\alpha)d\alpha = O\left([a(m)\eta^{-1} + m^4[a(m) - a(m^4)] + m^3] m^4 a(m)\right)$$

- By  $(\star\star)$  and (35.3.3.1),

$$\begin{aligned} \int_{-\eta}^{\eta} f_1(\alpha) f_2^2(-\alpha) d\alpha &= \int_{-\eta}^{\eta} F_1(\alpha) F_2^2(-\alpha) d\alpha + O\left(\eta[m^4 a(m)]^2 (m^4[a(m) - a(m^4)] + m^3)\right) \\ &= \int_{-1/2}^{1/2} F_1(\alpha) F_2^2(-\alpha) d\alpha + O(a(m)^3 \eta^{-2}) + O\left(\eta[m^4 a(m)]^2 (m^4[a(m) - a(m^4)] + m^3)\right) \\ &= a(m)^3 m^8 / 4 + O(a(m)^3 \eta^{-2}) + O\left(\eta[m^4 a(m)]^2 (m^4[a(m) - a(m^4)] + m^3)\right) \end{aligned}$$

And these three estimates give the desired assertion.  $\square$

**Lemma (37.6.2.7).** Let  $M \in \mathbb{Z}_+$  and  $A = \{u_1, \dots, u_U\}$  be a subset of  $[M]_+$  without three-term arithmetic sequences. For any  $\alpha \in \mathbb{R}$ , by Dirichlet's box principle, there exists  $h, q \in \mathbb{Z}$  s.t.

$$\alpha = \frac{h}{q} + \beta, \quad (h, q) = 1, 1 \leq q \leq \sqrt{M}, \quad q|\beta| < 1/\sqrt{M}.$$

Thus for any  $m \in \mathbb{Z}_+, m < M$ , we can define

$$S = S(\alpha) = \sum_{k=1}^U e^{2\pi i \alpha u_k}, \quad S' = S'(\alpha, q, h, m) = \frac{A(m)}{m} \frac{1}{q} \left( \sum_{r=1}^q e^{2\pi i \frac{r h}{q}} \right) \left( \sum_{n=1}^M e^{2\pi i \beta n} \right).$$

Then

$$|S - S'| = M \frac{A(m)}{m} - U + O(m\sqrt{M}),$$

and  $S' = 0$  unless  $q = 1$ .  $\perp$

*Proof:* Firstly, notice

$$S = \frac{1}{mq} \sum_{r=1}^q \sum_{n=1}^M \sum_{n \leq u_k \leq n+mq, u_k \equiv r \pmod{q}} e^{2\pi i \alpha u_k} + O(mq),$$

because the coefficient for  $e^{2\pi i \alpha u_k}$  is 1 unless  $u_k \leq mq$ , which is compensated by the error term.

Then notice

$$e^{2\pi i \alpha u_k} = e^{2\pi i \frac{r h}{q}} e^{2\pi i \beta u_k} = e^{2\pi i \frac{r h}{q}} e^{2\pi i \beta n} + O(mq|\beta|),$$

and the number of  $k$  s.t.  $u_k \equiv r \pmod{q}$  and  $n \leq u_k \leq n + mq$  is at most  $A(m)$  for each  $n, r$ , by (37.6.2.5), which we denote by  $A(m) - D(n, m, q, r) \leq A(m)$ , then

$$S = S' - \frac{1}{mq} \sum_{r=1}^q e^{2\pi i \frac{r h}{q}} \sum_{n=1}^M e^{2\pi i \beta n} D(n, m, q, r) + O(Mmq|\beta|) + O(mq).$$

But this estimate is also true for  $\alpha \in \mathbb{Z}$ , so

$$U = M \frac{A(m)}{m} - \frac{1}{mq} \sum_{r=1}^q \sum_{n=1}^M D(n, m, q, r) + O(mq),$$

then combining these two estimates and the facts  $q \leq \sqrt{M}, q|\beta| \leq 1/\sqrt{M}$ , the assertion follows.  $\square$

**Conj. (37.6.2.8)**[Erdős-Turán]. Let  $S \subset \mathbb{Z}_+$  s.t.

$$\sum_{n \in S} \frac{1}{n} = \infty,$$

then  $S$  contains arithmetic progressions of any length.  $\lrcorner$

*Proof:*

□

**Thm& Conj.Cor. (37.6.2.9)**. Let  $S \subset \mathbb{Z}_+$  s.t.

$$\sum_{n \in S} \frac{1}{n} = \infty,$$

then  $S$  contains a 3-term arithmetic progression.  $\lrcorner$

*Proof:* If  $S$  doesn't contain a 3-term arithmetic progression, then for each  $X \in \mathbb{R}_+$ ,

$$F(X) = \#S \cap [X]_+ = O\left(\frac{X}{\log^{1+c} X}\right)$$

by (37.6.2.4). Thus by Abel summation,

$$\sum_{n \in \#S \cap [X]_+} \frac{1}{n} \ll 1 + \frac{F(X)}{X} + \int_2^X \frac{F(t)}{t^2} dt \leq 2 + \int_1^\infty \frac{t}{t \log^{1+c} t} dt = O(1),$$

contradicting the hypothesis.  $\square$

### Arithmetic Progressions in Finite Fields

**Lemma (37.6.2.10)**. For  $n \in \mathbb{Z}_+$ ,  $d \in \mathbb{R}_+$ , let  $S_{n,d}$  be the subspace of all polynomials in  $\mathbb{F}_q[X_1, \dots, X_n]$  with total degree at most  $d$  and each variable has degree at most  $q-1$ . Let  $\alpha, \beta \in \mathbb{F}_q$ .

Suppose  $P \in S_{n,d}$  satisfies  $P(\alpha a + \beta b) = 0$  for every pair  $(a, b) \in A^2$  unless  $a = b$ , then

$$\#\{a \in A \mid P((\alpha + \beta)a) \neq 0\} \leq 2 \dim S_{n,d/2}.$$

$\lrcorner$

*Proof:* Let

$$P(\alpha x + \beta y) = \sum c_{m,m'} m(x) m'(y)$$

where the sum is over pairs of monomials  $(m, m')$  s.t.  $\deg(mm') \leq d$ . Then

$$P(\alpha x + \beta y) = \sum_{\deg m \leq d/2} m(x) F_m(y) + \sum_{\deg m \leq d/2} m(y) G_m(x).$$

Then the  $\#A \times \#A$  matrix  $\left[ P(\alpha a + \beta b) \right]_{a,b \in A}$  has rank at most  $2 \dim S_{n,d/2}$ . And the hypothesis means that this matrix is diagonal, so at most  $2 \dim S_{n,d/2}$  many diagonal entries are non-zero.  $\square$

**Thm. (37.6.2.11).** For  $p \in \text{Prime}$ ,  $q \in p^{\mathbb{Z}^+}$ , and  $\alpha, \beta, \gamma \in \mathbb{F}_q$  that are not all zero s.t.  $\alpha + \beta + \gamma = 0$ . Let  $A$  be a subset of  $\mathbb{F}_q^n$  s.t. the equation

$$\alpha a_1 + \beta a_2 + \gamma a_3 = 0$$

has no solutions  $(a_1, a_2, a_3) \in A^3$  except when  $a_1 = a_2 = a_3$ . Then

$$\#A \leq 3 \dim S_{n, (q-1)n/3} \text{ (37.6.2.10)}.$$

┘

*Proof:* WLOG, assume that  $\gamma \neq 0$ . Let  $d \in [0, (p-1)n]$ , then the space  $V$  of polynomials in  $S_{n,d}$  that vanishes on the complement of  $-\gamma A$  has dimension at least  $\dim S_{n,d} - q^n + \#A$ .

Let  $P \in V$  be a function with maximal support  $\Sigma \subset \mathbb{F}_q^n$ , then  $\#\Sigma \geq \dim V$ , otherwise there is a non-zero polynomial  $Q \in V$  vanishing on  $\Sigma$ , thus  $\Sigma \subsetneq \text{Supp}(P+Q)$ .

Let  $S(A) = \{\alpha a_1 + \beta a_2 | a_1 \neq a_2 \in A\} \subset \mathbb{F}_q$ , then by hypothesis,  $S(A) \cap \{-\gamma A\} = \emptyset$ . Thus  $P$  vanishes on  $S(A)$ . Then by (37.6.2.10),  $P(-\gamma a) \neq 0$  for at most  $2 \dim S_{n,d/2}$  many points of  $a \in A$ . Thus

$$\dim S_{n,d} - q^n + \#A \leq \dim V \leq \#\Sigma \leq 2 \dim S_{n,d/2}.$$

So

$$\#A \leq 2 \dim S_{n,d/2} + (q^n - \dim S_{n,d}) = 2 \dim S_{n,d/2} + \dim S_{n, (q-1)n-d}.$$

So if we take  $d = \frac{2}{3}(q-1)n$ , then we get the desired assertion. □

**Cor. (37.6.2.12) [Ellenberg-Gijswijt].** For  $p \in \mathbf{P}$ ,  $q \in p^{\mathbb{Z}^+}$ , and let  $A$  be a subset of  $(\mathbb{F}_q)^n$  containing no three-term arithmetic progressions, then there exists some calculable constant  $C_q < q$  s.t.  $\#A = O(C_q^n)$ .

In particular,  $C_3 < 2.756$ . ┘

*Proof:* Take  $\alpha = \beta = 1, \gamma = -2$ , and use the fact (Cf. [E-G17] P342. ?)

$$\lim_{n \rightarrow \infty} \frac{1}{n} \log \left( \frac{1}{q^n} \dim S_{n, (q-1)n/3} \right) = -I\left(\frac{2}{3}(q-1)\right) = -\sup_{\theta \in \mathbb{R}} \left\{ \frac{2}{3}(q-1)\theta - \log \left( \frac{1}{q} (1 + e^\theta + \dots + e^{(q-1)\theta}) \right) \right\} < 0.$$

□

### Generalized Arithmetic Progressions and Freiman's Theorem

References are [Ruz99].

**Def. (37.6.2.13) [Generalized Arithmetic Progressions].** A generalized arithmetic progression of dimension  $d$  in a commutative group  $G$  is a subset of the form

$$P(q_1, \dots, q_d, l_1, \dots, l_d; a) = \{a + x_1 q_1 + \dots + x_d q_d, 0 \leq x_i \leq l_i\}.$$

And the size of this arithmetic progression is defined to be  $\prod_{i=1}^d (l_i + 1)$ .

A generated arithmetic progression is called **proper** if its size equals its cardinality. ┘

**Def. (37.6.2.14)[Freiman Homomorphisms].** Let  $G_1, G_2$  be commutative groups and  $A_1 \subset G_1, A_2 \subset G_2$ , then a map between sets  $\varphi : A_1 \rightarrow A_2$  is called a **Freiman homomorphism** of order  $r$  if for any  $x_1, \dots, x_r, y_1, \dots, y_r \in A_1$ , the equation

$$x_1 + \dots + x_r = y_1 + \dots + y_r$$

implies that

$$\varphi(x_1) + \dots + \varphi(x_r) = \varphi(y_1) + \dots + \varphi(y_r).$$

┘

**Prop. (37.6.2.15).** Let  $G_1, G_2$  be commutative groups and  $A_1 \subset G_1, A_2 \subset G_2$  be Freiman isomorphic of order  $r$ . Suppose  $r = r'(k + l)$  where  $r', k, l \in \mathbb{N}$ , then the sets  $[k]A - [l]A$  and  $[k]A' - [l]A'$  are also Freiman isomorphic of order  $r'$ . ┘

*Proof:* This is clear. □

**Prop. (37.6.2.16).** Let  $G \in \mathcal{Ab}$  and  $A, B$  are subsets of  $G$  s.t.  $\#B = n, \#(A + B) \leq \alpha n$ . Then for any  $k, l \in \mathbb{Z}_+$ ,

$$\#([k]A - [l]A) \leq \alpha^{k+l} n.$$

┘

*Proof:* Cf.[Arithmetical progressions and the number of sums, Rusza]Lemma3.3. ? □

**Lemma (37.6.2.17) [Freiman Homomorphism Preserves Generalized Arithmetic Progressions].** Let  $G, G'$  be commutative groups, then any Freiman map of order 2 maps a generalized arithmetic progression in  $G$  to a generalized arithmetic progression of the same dimension in  $G'$ . ┘

*Proof:* Let  $\varphi : G \rightarrow G'$  be a Freiman homomorphism and  $P = P(q_1, \dots, q_d, l_1, \dots, l_d; a) \subset G$  is a generalized arithmetic progression. Then we claim that  $\varphi(P) = P' = P(q'_1, \dots, q'_d, l_1, \dots, l_d, a')$ , where

$$a' = \varphi(a), \quad q'_i = \varphi(a + q_i) - \varphi(a).$$

Then we need to show that  $\varphi(a + x_1 q_1 + \dots + x_d q_d) = a' + x_1 q'_1 + \dots + x_d q'_d$ . The proof is by induction on  $r = x_1 + x_2 + \dots + x_d$ . The equation holds for  $r = 1$ . And for  $r \geq 2$ , denote  $x = a + x_1 q_1 + \dots + x_d q_d$ , then there exists  $1 \leq i, j \leq d$  s.t.  $x - q_i - q_j \in P$ . Because

$$x + (x - q_i - q_j) = (x - q_i) + (x - q_j),$$

the Freiman property implies that

$$\varphi(x) = \varphi(x - q_i) + \varphi(x - q_j) - \varphi(x - q_i - q_j) = a' + x_1 q'_1 + \dots + x_d q'_d.$$

□

**Lemma (37.6.2.18).** Let  $A \subset \mathbb{Z}$  be a subset of cardinality  $n \in \mathbb{Z}_+$ , and  $r \in \mathbb{Z}_{\geq 2}$ , and  $N = \#([r]A - [r]A)$ . Then for any  $m > 2r(N - 1)$ , there exists a set  $A' \subset A$  s.t.  $\#A' \geq n/r$  and  $A'$  is Freiman isomorphic of order 2 to a subset of  $\mathbb{Z}/(m)$ . ┘

*Proof:* Cf.[Arithmetical progressions and the number of sums, Rusza] ? □

**Lemma (37.6.2.19).** Let  $p \in \text{Prime}$  and  $A \subset \mathbb{Z}/(p)$  s.t.  $\#A = \beta p$ , then there exists a proper generalized arithmetic progression (37.6.2.13)  $P = P(q_1, \dots, q_k, l_1, \dots, l_k, 0) \subset [2]A - [2]A$  s.t.  $\#P = \|P\| > (4k)^{-k}p$ , and  $k \leq \beta^{-2}$ .  $\lrcorner$

*Proof:* Cf. [Ruz99]P383.  $\color{red}?$   $\square$

**Thm. (37.6.2.20) [Freiman's Theorem for Torsion-Free Abelian Groups, Freiman-Ruzsa-Chang].** For any  $\alpha \in \mathbb{R}_+$ , there exists  $d, C \in \mathbb{R}_+$  s.t. if  $A, B$  be finite sets in a torsion-free commutative group  $G$  s.t.  $\#A = \#B = n$ ,  $\#(A + B) \leq \alpha n$ , then  $A$  is contained in a generalized arithmetic progression of dimension at most  $d$  and size at most  $Cn$ .  $\lrcorner$

*Proof:* The subgroup of  $G$  generated by  $A$  is isomorphic to  $\mathbb{Z}^v$  for some  $v \in \mathbb{Z}_+$ . Choose an isomorphism, which gives elements of  $A$  coordinates. We can find  $A_1 \subset \mathbb{Z}$  that is Freiman isomorphic to  $A$  of order 8: In fact we can take  $t$ -adic base

$$(a_1, \dots, a_v) \mapsto a_1 + ta_2 + \dots + t^{v-1}a_v,$$

where  $t > 16H$  and  $H$  is the maximal absolute value of coordinates of elements of  $A$ .

Then by (37.6.2.16),  $\#([2]A_1 - [2]A_1) = \#([2]A - [2]A) \leq \alpha^4 n$ . By Chebyshev's theorem (35.6.2.1), we can find a prime  $p \in \text{Prime}$  s.t.  $16\#([2]A - [2]A) < p \leq 32\alpha^4 n$ . Then (37.6.2.18) implies that there is a subset  $A_2 \subset A_1$  that is Freiman isomorphic of order 8 to a subset  $T \subset \mathbb{Z}/(p)$ , and  $\#A_2 \geq n/8$ .

Then by (37.6.2.19), we can find a  $k$ -dimensional proper arithmetic progression  $P \subset [2]T - [2]T$  of cardinality  $\geq \delta n$  (37.6.2.19).

Because  $T$  is Freiman isomorphic of order 8 to a subset of  $A$ , by (37.6.2.15),  $[2]T - [2]T$  is Freiman isomorphic of order 2 to a subset of  $[2]A - [2]A$ . Then by (37.6.2.17), the image  $P'$  of  $P \subset [2]T - [2]T$  is also a  $k$ -dimensional proper arithmetic progression.

Select a maximal subset  $\{a_1, \dots, a_s\}$  of  $A$  s.t. the sets  $P' + a_i$  are pairwise disjoint. Then

$$s \leq \frac{[3]A - [2]A}{\|P'\|} \leq \alpha^5 n / \delta n = \alpha^5 / \delta \text{ (37.6.2.16)}.$$

By the maximality of  $\{a_1, \dots, a_s\}$ , we have  $A \subset \{a_1, \dots, a_s\} + P' - P'$ .  $P' - P'$  is also a  $k$ -dimensional arithmetic progression, and

$$\|P' - P'\| \leq 2^k \|P'\| \leq 2^k \#([2]A - [2]A) \leq 2^k \alpha^4 n.$$

Then  $A$  is contained in a  $k + s$ -dimensional arithmetic progression of size  $\leq 2^{k+s} \alpha^4 n$ . Because  $s$  and  $k$  are bounded by  $\alpha$  (See (37.6.2.19)), the assertion follows.  $\square$

**Thm. (37.6.2.21) [Polynomial Freiman-Ruzsa Conjecture, Gowers-Green-Manner--Tao(2023)].** Let  $A \subset \mathbb{F}_2^n$  s.t.  $\#(A + A) \leq K\#A$ , then  $A$  can be covered by  $2K^{12}$  translates of a subspace  $H$  of  $\mathbb{F}_2^n$  of cardinality at most  $\#A$ .  $\lrcorner$

*Proof:*  $\color{red}?$   $\square$

**Cor. (37.6.2.22) [Freiman's Theorem for Torsion Abelian Groups, Ruzsa].** Let  $r \in \mathbb{Z}_{\geq 2}$  and  $G \in \text{Ab}$  s.t. each element of  $G$  has exponent at most  $r$ . Suppose  $A, B$  are subsets of  $G$  and  $\#A = \#B = n$ ,  $\#(A + B) \leq \alpha n$ , then  $A$  is contained in a subgroup  $H$  of  $G$  s.t.

$$\#H \leq \alpha^2 r^{\alpha^4} n.$$

Moreover, Ruzsa conjectured that  $\alpha^2 r^{\alpha^4}$  can be replaced by  $r^{C\alpha}$  for some  $C \in \mathbb{R}_+$ .  $\lrcorner$

*Proof:* Let  $B = \{b_1, \dots, b_k\}$  be a maximal collection of elements in  $[2]A - A$  s.t. the sets  $b_i - A$  are all disjoint. Then for any  $x \in [2]A - A$ ,  $x - a_1 = b_i - a_2$  for some  $a_1, a_2 \in A$ , which means  $x \in b_i + (A - A)$ . Hence  $[2]A - A \subset B + A - A$ . Then

$$kn = \# \cup (b_i - A) \leq \#([2]A - [2]A) \subset \alpha^4 n \text{ (37.6.2.16),}$$

which implies that  $k \leq \alpha^4$ .

By induction we can prove that  $[j+1]A - A \subset [j]B + A - A$  for any  $j \in \mathbb{Z}_+$ .

Let  $H, I$  be the subgroups generated by  $A, B$  resp., then

$$[j+1]A - A \subset I + A - A$$

for any  $j \in \mathbb{Z}_+$ , and also we have

$$H = \cup([j]A - A)$$

because the order of elements in  $G$  are bounded. So

$$H \subset I + A - A.$$

Now  $I$  is generated by  $k$  elements of order bounded by  $r$ , so  $\#I \leq r^k \leq r^{\alpha^4}$ . So it follows that  $\#H \leq \alpha^2 r^{\alpha^4} n$ .  $\square$

### Squares in Arithmetic Progressions

**Conj. (37.6.2.23) [Rudin].** There exists  $c_1 \in \mathbb{R}_+$  s.t. for any  $N \in \mathbb{Z}_+$ , there exists at most  $c_1 \sqrt{N}$  many squares in any arithmetic progression of integers of length  $N$ .  $\lrcorner$

*Proof:*  $\square$

**Thm& Conj. Cor. (37.6.2.24) [Bombieri-Zannier].** There exists  $c_1, c_2 \in \mathbb{R}_+$  s.t. for any  $N \in \mathbb{Z}_+$ , there exists at most  $c_1 N^{3/5} (\log N)^{c_2}$  many squares in  $\lrcorner$

*Proof:* Cf. [squares in arithmetic progressions, 2, Bombieri-Zannier]. ?  $\square$

### 3 Littlewood-Offord Problem

**Prop. (37.6.3.1) [Littlewood-Offord Problem, Erdős].**

- If  $\{x_i\}_{1 \leq i \leq n}$  is a set of real numbers with  $|x_i| \geq 1$ , then for any  $r \in \mathbb{Z}_+$ , the number of sums  $\sum \pm x_k$  which lies in the interior of any interval of length  $2r$  doesn't exceed  $r \binom{n}{\lfloor n/2 \rfloor}$ .
- If  $\{x_i\}_{1 \leq i \leq n}$  is a set of complex numbers with  $|x_i| \geq 1$ , then for any  $r \in \mathbb{Z}_+$ , the number of sums  $\sum \pm x_k$  which lies in the interior of an arbitrary circle of radius  $r$  is  $O(r \binom{n}{\lfloor n/2 \rfloor}) \leq O(r 2^n / \sqrt{n})$ .  $\lrcorner$

*Proof:* Cf. [Erdős, On a lemma of Littlewood and Offord. Bull. Amer. Math. Soc. 51 (1945), 898–902.]  $\square$

#### 4 Sidon's Problem

**Prop. (37.6.4.1)** [Erdős-Turán[E-T41]]. For  $n \in \mathbb{Z}_+$ , let  $\Phi(n)$  be the maximal number of subset  $\{a_1, \dots, a_X\}$  of  $[n]_+$  s.t.  $\{a_i + a_j\}_{i \leq j}$  are pairwise different. Then

$$\frac{1}{\sqrt{2}} \leq \liminf_{n \rightarrow \infty} \frac{\Phi(n)}{\sqrt{n}} \leq \limsup_{n \rightarrow \infty} \frac{\Phi(n)}{\sqrt{n}} \leq 1.$$

┘

*Proof:* Let  $p \in \mathbf{P} \setminus \{2\}$  and  $a_k = 2pk + u(k)$ ,  $k = 1, 2, \dots, p-1$ , where  $1 \leq u(k) \leq p-1$ ,  $u(k) \equiv k^2 \pmod{p}$ . Then  $a_k < 2p^2$  for each  $k$ , and

$$a_i + a_j = a_k + a_l \iff (i, j) = (k, l),$$

because in this case

$$i + j = k + l, \quad i^2 + j^2 \equiv k^2 + l^2 \equiv q.$$

Thus  $\Phi(2p^2) \geq p-1$ , and because there are infinitely primes,  $\liminf_{n \rightarrow \infty} \frac{\Phi(n)}{\sqrt{n}} \geq \frac{1}{\sqrt{2}}$ .

For the other direction, for any such set  $S = \{a_1, \dots, a_X\}$  of  $[n]_+$  s.t.  $\{a_i + a_j\}_{i \leq j}$  are pairwise different. Choose  $1 \leq m < n$ , then for each  $u \in \mathbb{Z}$ , let  $A_u = \#[u-m, u] \cap S$ , then

$$\sum_{u=1}^{m+n} A_u = mx,$$

and the number of triples  $(i, j, n)$  s.t.  $a_i, a_j \in A_u, a_j > a_i$  is

$$\sum_{u=1}^{m+n} \frac{1}{2} A_u (A_u - 1) \geq \frac{1}{2} (m+n) \frac{mx}{m+n} \left( \frac{mx}{m+n} - 1 \right).$$

But by the hypothesis, there are at most

$$\sum_{r=1}^{m-1} (m-r) = \frac{1}{2} m(m-1)$$

such triples. Thus

$$\frac{1}{2} mx(mx - m - n) \leq \frac{1}{2} m(m-1)(m+n),$$

and whence

$$x < \frac{n}{m} + \sqrt{n + m + \frac{n^2}{m^2}}.$$

Taking  $m = \lfloor \sqrt{n} \rfloor$ , we get  $x = \sqrt{n} + O(n^{\frac{1}{4}})$ , thus  $\limsup_{n \rightarrow \infty} \frac{\Phi(n)}{\sqrt{n}} \leq 1$ . □

**Prop. (37.6.4.2)** [Infinite Sidon Sets]. For any infinite Sidon sequence (37.6.4.1)  $S$ , we have

$$\limsup_{n \rightarrow \infty} \frac{\#[n]_+ \cap S}{\sqrt{n}} = 0.$$

┘

*Proof:* ? □

**Prop. (37.6.4.3)** [Infinite Sidon Sets, Ruzsa[Ruz98]]. There exists an infinite Sidon sequence s.t.

$$\#[n]_+ \cap S > n^{\sqrt{2}-1+o(1)}$$

for  $n$  large. ┘

*Proof:* □

## 5 Sums and Products

**Conj. (37.6.5.1)** [Erdős-Szemerédi]. For  $n \in \mathbb{Z}_+$ , denote

$$g(n) = \min(\max(\#(A + A), \#(A \cdot A)) : A \subset \mathbb{C}, \#A = n).$$

Then it is conjectured that for any  $\varepsilon \in \mathbb{R}_+$ , when  $n$  is large,  $g(n) \geq n^{2-\varepsilon}$ . ┘

**Thm& Conj. Cor. (37.6.5.2)** [Erdős-Szemerédi/Elekes/Solymosi]. Let  $g(n)$  be as in (37.6.5.1), then there exists  $C \in \mathbb{R}_+$  s.t. if  $n \geq 2$ ,

$$g(n) \geq C \frac{n^{14/11}}{(\log n)^{3/11}}.$$

┘

*Proof:* We only prove that  $g(n) \geq 0.23n^{5/4}$ , for the stronger result, Cf.[On the number of sums and products, Solymosi] ?.

Let  $A = \{a_1, \dots, a_n\}$ . and define  $n^2$  linear functions on  $\mathbb{R}$ :

$$f_{j,k}(x) = a_j(x - a_k).$$

Then each  $f_{j,k}$  maps at least  $n$  points in  $A + A$  into  $A \cdot A$ : In fact,  $f_{j,k}(a_k + a_i) = a_i a_j$ . Thus  $\Gamma(f_{j,k}) \subset \mathbb{R}^2$  contain at least  $n$  points from  $(A + A) \times (A \cdot A)$ . As  $n \leq 10\sqrt{\#(A + A) \cdot \#(A \cdot A)}$ , it follows from (37.9.3.3) that

$$n^2 \leq 100(\#(A + A) \cdot \#(A \cdot A))^2 / (n - 1)^3$$

from which the assertion follows. □

**Prop. (37.6.5.3)** [Erdős -Szemerédi]. Let  $g(n)$  be as in (37.6.5.1), then there exists  $c \in \mathbb{R}_+$  s.t.

$$g(n) < \frac{n^2}{e^{c \log n / \log_{(2)} n}}.$$

┘

*Proof:* Cf.[Sums and Products of Integers]. □

### Finite Fields

**Thm. (37.6.5.4) [Bourgain-Katz-Tao/Bourgain-Konyagin].** Let  $p \in \text{Prime}$ , then for  $\delta \in \mathbb{R}_+$  and any  $A \subset \mathbb{F}_p$  s.t.  $\#A < q^{1-\varepsilon}$ , there exists  $\delta = \delta(\varepsilon) \in \mathbb{R}_+$  and  $C \in \mathbb{R}_+$  s.t.

$$\max(\#(A + A), \#(A \cdot A)) \geq C(\delta)(\#A)^{1+\delta}.$$

┘

*Proof:* Cf.[BGK06]

□

**Lemma (37.6.5.5).** For  $p \in \mathbf{P}$ , and  $A \subset \mathbb{F}_p$ , denote

$$I(A) = \{a_1(a - 2 - a_3) + a_4(a_5 - a_6) : a_1, \dots, a_6 \in A\}.$$

Then

$$\#I(A) \geq \begin{cases} p/2 & , \#A \geq \sqrt{p} \\ 0.1(\#A)^{3/2} & , \#A \leq \sqrt{p} \end{cases}.$$

┘

*Proof:* Cf.[BGK06]P381.

□

**Thm. (37.6.5.6).** For any  $C_1, C_2 \in \mathbb{R}_+$ , there exists  $C \in \mathbb{R}_+$  s.t. for any  $p \in \mathbf{P}_{\geq 3}, q \in p^{\mathbb{Z}_+}$ , if  $A \subset \mathbb{F}_q$  with  $C_1 q^{1/2} \leq \#A \leq C_2 q^{7/10}$ , then

$$\max(\#(A + A), \#(A \cdot A)) \geq C \frac{(\#A)^{3/2}}{q^{1/4}}.$$

┘

*Proof:* Cf.[Sum-product Estimates in Finite Fields via Kloosterman Sums].

□

### Finite Kakeya Sets

**Def. (37.6.5.7) [Kakeya Sets].** Let  $p \in \text{Prime}, q \in p^{\mathbb{Z}_+}, n \in \mathbb{Z}_+$ , then  $K \subset \mathbb{F}_q^n$  is called a **Kakeya set(finite)** if for any  $x \in \mathbb{F}_q^n$ , there exists  $y \in \mathbb{F}_q^n$  s.t.  $L_{y,x} = \{y + \mathbb{F}_q x\} \subset K$ .

┘

**Prop. (37.6.5.8).** Let  $p \in \text{Prime}, q \in p^{\mathbb{Z}_+}, n \in \mathbb{Z}_+$  and  $K \subset \mathbb{F}_q^n$  is a Kakeya set, then for any  $\varepsilon \in \mathbb{R}_+$ , there exists  $c_{n,\varepsilon} \in \mathbb{R}_+$  s.t.  $\#K \geq c_{n,\varepsilon} q^{n-\varepsilon}$ .

┘

*Proof:* Notice that if  $K \subset \mathbb{F}_q^n$  is a Kakeya set, then  $K^m \subset (\mathbb{F}_q)^{mn}$  is also a Kakeya set. Thus it suffices to show for  $\varepsilon = 1$  (Because the  $n = 1$  case is trivial). □

**Prop. (37.6.5.9) [Finite Kakeya Conjecture, Dvir-Alon-Tao[Dvi09]].** Let  $p \in \text{Prime}, q \in p^{\mathbb{Z}_+}, n \in \mathbb{Z}_+$  and  $K \subset \mathbb{F}_q^n$  is a Kakeya set(37.6.5.7), then

$$\#K \geq \binom{n+q-1}{q-1}.$$

┘

*Proof:* If  $K$  is a Kakeya set and  $\#K < \binom{n+q-1}{q-1}$ , then there exists a non-zero polynomial  $f \in \mathbb{F}_q[X_1, \dots, X_n]$  of degree  $d \leq q-1$  that vanishes on the whole set  $K$ . Let  $g$  be the degree  $d$  part of  $f \neq 0$ . For any  $y \in \mathbb{F}_q^n$ , there exists  $z \in \mathbb{F}_q^n$  s.t.  $z + \mathbb{F}_q y \in K$ . Thus

$$P_{y,z}(t) = f(z + ty) = 0$$

for any  $t \in \mathbb{F}_q$ . This implies that  $f(z + ty) = 0$  as a polynomial of  $t$ . But the leading coefficient is just  $g(y)$ , so  $g(y) = 0$  for any  $y \in \mathbb{F}_q^n$ , contradiction. □

## 6 Others

**Thm. (37.6.6.1).** Given  $n \in \mathbb{Z}_+$  and a set  $M \subset (\mathbb{Z}_+)^n$ , there exists a finite subset  $S \subset M$  s.t. for any  $m \in M$ , there exists  $s \in S$  s.t.  $s_i \leq m_i$  for each  $1 \leq i \leq n$ .  $\lrcorner$

*Proof:* Use induction on  $n$ . The case  $n = 1$  is trivial, and for the induction process, choose randomly an  $m \in M$ . Then an element  $n$  is not “divisible” by  $m$  iff some  $n_i < m_i$ . Notice there are only f.m. such  $n_i$ . For each of this case, consider the subset  $M'_{i,n_i} \subset (\mathbb{Z}_+)^{n-1}$  with the  $i$ -th coordinate discarded, then by induction there exists a finite subset  $S'_{i,n_i}$  s.t. each element in  $M'_{i,n_i}$  is divisible by some element in  $S'_{i,n_i}$ . Then  $S$  being  $\{m\}$  with the collection of  $S'_{i,n_i}$  just satisfies the requirement.  $\square$

**Prop. (37.6.6.2)[Erdős].** For any  $k, l \in \mathbb{Z}_+$  and  $a_1 < a_2 < \dots < a_{(k-1)(l-1)+1} \in \mathbb{Z}_+$ , there either exists  $k$  of them no one dividing the other, or there exists  $l$  of them each of a multiple of the previous one.  $\lrcorner$

*Proof:* This follows immediately from (37.2.5.4).  $\square$

## 37.7 Word Theory

### 1 Sturmian Words

**Def. (37.7.1.1).** Given any word  $w$  on an alphabet  $\mathcal{A}$ , for any  $k \in \mathbb{Z}_+$ , let  $W_k(w)$  be the set of  $k$ -words appearing in  $A$ . ┘

**Prop. (37.7.1.2) [Morse-Hedlund].** For any infinite word  $w$  over an alphabet  $\mathcal{A}$ ,

- If  $w$  is eventually periodic, then there exists  $C \in \mathbb{R}_+$  s.t.  $\#W_k(w) \leq C$  for any  $k \in \mathbb{Z}_+$ .
- If  $w$  is not eventually periodic, then  $\#W_{k+1}(w) \geq \#W_k(w) + 1$  for any  $k \in \mathbb{Z}_+$ . In particular,  $\#W_k(w) \geq k + 1$ . ┘

*Proof:* □

**Cor. (37.7.1.3).** Given any infinite word  $w$  over a finite alphabet  $\mathcal{A}$  that is not eventually periodic, then for any  $n \in \mathbb{Z}_+$ , there exists finite words  $V, W$  of length  $n$ , and  $a, a', b, b' \in \mathcal{A}$  s.t. each of  $a \amalg W, a' \amalg W, V \amalg b, V \amalg b'$  appears in  $w$  infinitely often. ┘

*Proof:* This follows from the fact  $\#W_{k+1}(w) \geq \#W_k(w) + 1$  and the fact  $\#\mathcal{A} < \infty$ . □

**Def. (37.7.1.4) [Sturmian Words].** For  $\theta, \rho \in \mathbb{R}$  s.t.  $\theta \in (0, 1) \setminus \mathbb{Q}$ , define

$$s_n = \lfloor (n+1)\theta + \rho \rfloor - \lfloor n\theta + \rho \rfloor, \quad s'_n = \lceil (n+1)\theta + \rho \rceil - \lceil n\theta + \rho \rceil, \quad n \in \mathbb{Z}_+.$$

And define the infinite words

$$s_{\theta, \rho} = s_1 s_2 s_3 \dots, \quad s'_{\theta, \rho} = s'_1 s'_2 s'_3 \dots$$

These are called **Sturmian words** with slope  $\theta$  and intercept  $\rho$ . ┘

**Prop. (37.7.1.5).** An infinite word  $w$  on alphabet  $\{0, 1\}$  is a Sturmian word iff  $\#W_k(w) = k + 1$  for any  $k \in \mathbb{Z}_+$ . ┘

*Proof:* Cf. [Distributions modulo one] P225. ? □

### 2 Thue-Morse Words

Cf. [Distributions modulo one].

## 37.8 Algebraic Combinatorics

References are [Combinatorial Nullstellensatz, Alon].

### 1 Combinatorial Nullstellensatz

**Lemma (37.8.1.1) [Combinatorial Nullstellensatz, Alon[Alo99]].** Let  $K \in \text{Field}$ ,  $f \in K[X_1, \dots, X_n]$ , and  $S_1, \dots, S_n \subset K$  be nonempty finite subsets, with  $g_i(X_i) = \prod_{s \in S_i} (X_i - s)$ . If  $f$  vanishes at the common zeros of  $g_i$ , then there are polynomials  $h_i \in F[X_1, \dots, X_n]$  s.t.  $\deg(h_i) \leq \deg(f) - \#S_i$  and

$$f = \sum_{i \in [n]_+} h_i g_i.$$

┘

*Proof:* The proof is very simple, just replace terms of  $f$  by lower degree terms, using equation of  $g_i$ , then we get a polynomial that has degree in  $x_i$  smaller than  $\#S_i$  and vanish on  $S_1 \times \dots \times S_n$ , so it must be 0, as easily checked.  $\square$

**Thm. (37.8.1.2) [Combinatorial Nullstellensatz, Alon[Alo99]].** If  $K \in \text{Field}$  and  $f \in K[X_1, \dots, X_n]$  is a polynomial of degree  $n$ , if  $\prod X_i^{t_i}$  is a highest-degree term of  $f$  (i.e.  $\deg(f) = \sum_i t_i$ ) and  $S_i$  are subsets of  $K$  s.t.  $\#S_i > t_i$ , then there are some  $s_i \in S_i$  that  $f(s_1, \dots, s_n) \neq 0$ .  $\square$

*Proof:* We may assume  $\#S_i = t_i + 1$ . By combinatorial Nullstellensatz (37.8.1.1), if no such  $s_i$  exist, then there are  $h_i$  with  $\deg(h_i) \leq \deg(f) - \#S_i$  s.t.  $f = \sum_{i \in [n]_+} h_i \prod_{s \in S_i} (x_i - s)$ .

The term  $\prod X_i^{t_i}$  needs to appear on the RHS, so by degree restriction it must be some term of  $h_i$  times  $x_i^{t_i+1}$ , which is impossible.  $\square$

### 2 Stanley Depth

References are [Stanley decompositions and partitionable simplicial complexes] and [Linear Diophantine equations and local cohomology, Stanley].

### 3 Combinatorial Hodge Theory

**Def. (37.8.3.1) [Monomial Ideals and Stanley Spaces].** Let  $K \in \text{Field}$ ,  $n \in \mathbb{Z}_+$ ,  $\underline{X} = \{X_1, \dots, X_n\}$  and  $S = K[\underline{X}]$ , a **monomial ideal** of  $S$  is an ideal generated by monomials.

For  $k \in [n]$ , a **Stanley space** of dimension  $k$  is a  $K$ -subspace of  $S$  of the form  $\underline{X}^\alpha \cdot K[\underline{Z}]$ , where  $\underline{Z} \subset \underline{X}$  and  $\#\underline{Z} = k$ .

A **Stanley decomposition** of a monomial ideal  $I \in \text{Ideal}(S)$  is a finite  $K$ -space decomposition of  $I$  into a direct sum of Stanley spaces.  $\square$

**Def. (37.8.3.2) [Stanley Depth].** For any Stanley decomposition of a monomial ideal  $I$ , the minimal dimension of Stanley spaces contained in this Stanley decomposition is called the **Stanley depth**. And the Stanley depth of  $I$  is defined to be the maximal Stanley depth of any Stanley decomposition of  $I$ , denoted by  $\text{Sdepth}(I)$ .

Also if  $I^c$  is  $K$ -subspace generated by all monomials not in  $I$ , then  $S = I \oplus I^c$ , and we can also define the Stanley depth of  $I^c$ , denoted by  $\text{Sdepth}(S/I)$ .

More generally, we can define Stanley depth for any  $\mathbb{Z}^n$ -graded  $S$ -module  $M$ .  $\square$

**Conj. (37.8.3.3) [Stanley Conjecture].** For any f.g.  $\mathbb{Z}^n$ -graded  $S$ -module  $M$ , we have  $\text{depth}(M) \leq \text{Sdepth}(M)$ .  $\square$

## 37.9 Discrete Geometry

### 1 Convex Polygons

**Prop. (37.9.1.1).** For  $n \in \mathbb{Z}_{\geq 4}$  and any  $n$  points in  $\mathbb{R}^2$  in general position, they form a convex  $n$ -gon iff any 4 points of them form a convex quadrilateral.  $\lrcorner$

*Proof:* We use induction on  $n$ .  $n = 4$  is trivial. For  $n \geq 5$ , let the points be  $\{P_1, \dots, P_n\}$ , then by induction hypothesis, any  $n - 1$  points of them form a convex  $(n - 1)$ -gon. So for any  $1 \leq k \leq n$ ,  $\{X_1, \dots, \widehat{X_k}, \dots, X_n\}$  is a convex  $(n - 1)$ -gon, and  $X_k$  is not contained in any sub- $(n - 2)$ -gon of  $X_1 \dots \widehat{X_k} \dots X_{n-1}$ . But any convex  $(n - 1)$  is a sum of its sub- $(n - 2)$ -gons, because we can use equations of the form  $a_1 P_1 + a_2 P_2 = a_3 P_3 + a_4 P_4$ ,  $a_i > 0$  to eliminate some  $P_i$ . Because  $k$  is arbitrary, this means  $P_1 \dots P_n$  is convex.  $\square$

**Thm. (37.9.1.2) [Erdős-Szekeres].** For any  $n \in \mathbb{Z}_{\geq 2}$ , there exists a minimal positive integer  $N(n)$  s.t. for any  $ES(n)$  points in  $\mathbb{R}^2$  in general position, there exists a subset of  $n$  points forming a convex  $n$ -gon. Moreover,

$$2^{n-2} + 1 \leq ES(n) \leq \binom{2n-4}{n-2} + 1.$$

$\lrcorner$

*Proof:* We first prove that  $ES(4) = 5$ : Given 5 points in  $\mathbb{R}^2$  in general position, we need to find 4 points that form a convex quadrilateral. If the convex hull of these 5 points is a quadrilateral or a pentagon, we are done, and if the convex hull is a triangle  $ABC$ , and  $D, E$  are inside  $ABC$ , then suppose  $BC$  lies in the same side of the line  $\overline{DE}$ , then  $BDEC$  form a convex quadrilateral.

For general  $n$ , in fact  $ES(n) \leq R(4, 2; 5, n)$  (37.4.2.1), because for  $R(4, 2; 5, n)$  many points  $X \subset \mathbb{R}^2$ , divide the 4-subsets of  $X$  into two classes depending on either they form a convex quadrilateral or not, then either there exists a 5-subset whose 4-subsets are all non-convex, or there exists an  $n$ -subset whose 4-subsets are all convex. The first case is not possible by the fact  $ES(4) = 5$ , so the second case is true. Thus we get a convex  $n$ -gon by (37.9.1.1).

For the lower bound, it suffices to construct  $2^{n-2}$  points with no  $n$  points forming a convex  $n$ -gon: Cf. [Art of Counting, Erdős] P680. ?

For the upper bound for  $ES(n)$ , Cf. [Erdős-Szekeres] (or [Holmsen-Mojarrad-Pach-Tardos], where they proved that  $ES(n) \leq 2^{n+O(\sqrt{n \log n})}$ ).  $\square$

**Conj. (37.9.1.3) [Erdős-Szekeres].** For any  $n \in \mathbb{Z}_{\geq 2}$ ,  $ES(n) = 2^{n-2} + 1$ .  $\lrcorner$

*Proof:*  $\square$

**Remark (37.9.1.4).** This conjecture has been proven for  $n \leq 6$ .  $\lrcorner$

### 2 Crossing Numbers of Graphs

**Thm. (37.9.2.1) [Leighton].** For any simple graph  $G$  with  $n$  vertices and  $e \geq 4n$  edges drawn in  $\mathbb{R}^2$ ,  $\text{Cr}(G)$  (the number of crossing of  $G$ ) is at least  $e^3/(100n^2)$ .  $\lrcorner$

*Proof:* Cf. [Ajtai, M.; Chvátal, V.; Newborn, M. M.; Szemerédi, E. Crossing-free subgraphs].  $\square$

### 3 Incidences

**Thm. (37.9.3.1) [Szemerédi-Trotter].** If  $n, t \in \mathbb{Z}_+$ , then for any  $\mathcal{P} \subset \mathbb{R}^2$ ,  $\#\mathcal{P} = n$  and a family  $\mathcal{L}$  of lines in  $\mathbb{R}^2$  s.t.  $\#\mathcal{L} = t$ , the numbers of incidences  $\#I(\mathcal{P}, \mathcal{L})$  between points in  $\mathcal{P}$  and lines in  $\mathcal{L}$  is  $\leq 22(nt)^{2/3} + 4n + t$ .  $\lrcorner$

*Proof:* We may assume that any line in  $\mathcal{L}$  is incident to at least one point in  $\mathcal{P}$ . Draw a graph  $G$  in  $\mathbb{R}^2$  with  $V(G) = \mathcal{P}$ , and join two points with a straight segment if they are consecutive points on one of the lines in  $\mathcal{L}$ . Then  $G$  is a simple graph, and the crossing number of  $G$  is at most  $t^2$ . Also  $\#I(\mathcal{P}, \mathcal{L}) = t + E(G)$ .

Then it follows from (37.9.2.1) that either  $4n > \#I(\mathcal{P}, \mathcal{L}) - t$ , or  $t^2 \geq \text{Cr}(G) \geq (\#I(\mathcal{P}, \mathcal{L}) - t)^3 / (100n^2)$ , from these the assertion follows.  $\square$

**Cor. (37.9.3.2).** There exists  $C \in \mathbb{R}_+$  s.t. if  $n \in \mathbb{Z}_+$  and  $\mathcal{P} \subset \mathbb{R}^2$  is a set of  $n$  points, and  $\mathcal{L}$  is family of lines determined by  $\mathcal{P}$ , then there exists a point  $P \in \mathcal{P}$  belong to at most  $Cn$  lines in  $\mathcal{L}$ .  $\lrcorner$

*Proof:* Cf. [S-T83].  $\square$

**Thm. (37.9.3.3) [Szemerédi-Trotter].** There exists  $C \in \mathbb{R}_+$  s.t. if  $n, k \in \mathbb{Z}_+$ ,  $2 \leq k \leq 10\sqrt{n} + 1$ ,  $\mathcal{P} \subset \mathbb{R}^2$ ,  $\#\mathcal{P} = n$ , and  $\mathcal{L}$  is a family of lines in  $\mathbb{R}^2$  each containing at least  $k$  points from  $\mathcal{P}$ , then  $\#\mathcal{L} \leq 100n^2 / (k-1)^3$ .

(The constant  $C$  can be taken to be 3 by [Clarkson et al. Combinatorial complexity bounds for arrangements of curves and surfaces].)  $\lrcorner$

*Proof:* Let  $t = \#\mathcal{L}$ . Draw a graph  $G$  in  $\mathbb{R}^2$  with  $V(G) = \mathcal{P}$ , and join two points with a straight segment if they are consecutive points on one of the lines in  $\mathcal{L}$ . Then  $G$  is a simple graph, and the crossing number of  $G$  is at most  $t^2$ . Also  $E(G) \geq t(k-1)$ .

Then it follows from (37.9.2.1) that either  $4n > t(k-1)$ , or  $t^2 \geq \text{Cr}(G) \geq t^3(k-1)^3 / (100n^2)$ , from these the assertion follows.  $\square$

**Remark (37.9.3.4).** The assertion is tight for  $2 \leq k \leq \sqrt{n}$ : Take  $\mathcal{P}$  to be the  $\sqrt{n} \times \sqrt{n}$  integer grid. Cf. [Beck, On the lattice property of the plane and some problems of Dirac, Motzkin, and Erdős in combinatorial geometry]  $\textcolor{red}{?}$ .  $\lrcorner$

### 4 Distance Problems

**Thm. (37.9.4.1) [Erdős/Guth-Katz].** For  $n \in \mathbb{Z}_{\geq 2}$ , let  $f(n)$  be the minimal number of distinct distances generated by  $n$  distinct points in  $\mathbb{R}^2$ , then

$$f(n) = \Theta\left(\frac{n}{\log n}\right).$$

$\lrcorner$

*Proof:* Consider the points  $(x, y)$  where  $1 \leq x, y \leq \sqrt{n}$ , then the distances between them are all of the form  $\sqrt{a^2 + b^2}$ , where  $1 \leq a^2 + b^2 < 2n$ . Then by (35.5.1.5), there are  $O(\frac{n}{\log n})$  many points.

Conversely, Cf. [Guth-Katz]  $\textcolor{red}{?}$   $\square$

**Thm. (37.9.4.2) [Solymosi].** There exists  $C \in \mathbb{R}_+$  s.t. for any  $n \in \mathbb{Z}_{\geq 2}$  and any  $n$  distinct points in  $\mathbb{R}^2$ , one of them determine at least  $Cn^{6/7}$  different distances from the others.  $\lrcorner$

*Proof:* Cf. [Solymosi, Distinct distances in the plane].  $\square$

**Conj. (37.9.4.3) [Erdős].** For  $n \in \mathbb{Z}_{\geq 2}$ , the number of distinct distances determined by the vertices of a convex  $n$ -gon in  $\mathbb{R}^2$  is at least  $\lfloor \frac{n}{2} \rfloor$ , with equality iff this is a regular  $n$ -gon.  $\lrcorner$

*Proof:*  $\square$

**Thm. (37.9.4.4) [Erdős/Spencer-Szemerédi-Trotter].** For  $n \in \mathbb{Z}_{\geq 3}$  and  $r \in \mathbb{R}_+$ , let  $U(n)$  be the maximal number of times the unit distance occur among  $n$  points in  $\mathbb{R}^2$ , then there exists  $C \in \mathbb{R}_+$  s.t.

$$n^{1+C/\log \log n} < U(n) < \min(n^{3/2}, 6n^{5/4}).$$

$\lrcorner$

*Proof:* To prove  $U(n) < n^{3/2}$ : This is clearly true for  $n \leq 3$ , so we assume  $n \geq 4$ . Given  $n$  points  $\{P_1, \dots, P_n\}$ , and for  $1 \leq i \leq n$ , suppose there are  $x_i$  points with distance  $r$  from  $P_i$ . We may assume that  $x_1 \geq x_2 \geq \dots \geq x_n$ . Then for any  $i \neq j$ , the  $x_i$  points at distance  $r$  from  $P_i$  can contain at most two points with distance  $r$  from  $P_j$ , so for each  $1 \leq j \leq n$ ,

$$\sum_{i=1}^j (x_i - 2i + 2) \leq n.$$

Denote  $\lfloor \sqrt{n} \rfloor = a$ ,  $\{\sqrt{n}\} = \varepsilon$ , then

$$x_1 + x_2 + \dots + x_a \leq n + a(a-1) = 2n - 2\varepsilon\sqrt{n} + \varepsilon^2 - \sqrt{n} + \varepsilon < 2n - 2\varepsilon\sqrt{n}.$$

Thus  $x_a < \frac{1}{a}(2n - 2\varepsilon\sqrt{n}) = 2\sqrt{n}$ , and

$$\sum x_i < 2n - 2\varepsilon\sqrt{n} + (n-a)2\sqrt{n} = 2n^{3/2}.$$

To prove  $U(n) < 6n^{5/4}$ : Let  $U$  be the number of times the unit distance occur. Draw a graph  $G$  in  $\mathbb{R}^2$  with vertices the given points, and two points are connected by an arc in unit circle if they are consecutive points on the unit circle centered at one of the points. Then  $G$  is a multigraph. Noticing two points are connected by at most two arcs, so minimally delete arcs so that each pair is connected by at most one arc, we get a graph  $G$  satisfies  $E(G) \geq U - n/2$  and  $\text{Cr}(G) \leq 2n^2$ . Then by (37.9.2.1), either  $U - n/2 \leq E(G) < 4n$ , or  $2n^2 \geq \text{Cr}(G) \geq (U - n/2)^3/(100n^2)$ , from these the assertion follows.

For the lower bound, consider the set of points  $(x, y)$ ,  $0 \leq x, y \leq \sqrt{n}$ . ? Cf. [Erd46].  $\square$

**Prop. (37.9.4.5).** For  $n \geq 3$ , let  $a_{\min}(n)$  and  $a_{\max}(n)$  be the maximal number of times the minimal and maximal distance of distinct  $n$  points in  $\mathbb{R}^2$  can be achieved, then

$$a_{\max}(n) = n, \quad a_{\min}(n) \leq 3n - 6, \quad |3n - a_{\min}(n)| = \Theta(\sqrt{n}).$$

$\lrcorner$

*Proof:* For  $a_{\max}(n)$ , notice  $a_{\max}(n) \geq n$  because it can easily achieve  $n$  times. To prove  $a_{\max}(n) \leq n$ , we use induction on  $n$ : if the given points are  $\{P_1, \dots, P_n\}$ , and  $d(P_1, P_2)$  and  $d(P_3, P_4)$  are both maximal, then by an easy argument,  $P_1P_2 \cap P_3P_4 \neq \emptyset$ . Now connect any two points with maximal distance, and consider two cases: if each point is connected to at most 2 points, then there are at most  $n$  edges; and if some point  $P_1$  is connected to 3 points  $P_2, P_3, P_4$ , where  $\angle P_2P_1P_4$  is acute, and  $P_3$  are between  $P_2, P_4$ , then it is clear  $P_3$  cannot connect to any other  $P_i$ , so we can omit  $P_3$  and use induction on  $n$ .

For  $a_{\min}(n)$ , we first prove that  $a_{\min}(n) \leq 3n - 6$ ?: Connect two points if they have minimal distance, then clearly these edges don't intersect. Thus the resulting graph is planar, and then has at most  $3n - 6$  edges by Euler's theorem (37.2.6.3).

To show  $|3n - a_{\min}(n)| = \Theta(\sqrt{n})$ , use triangular constellation? □

**Conj. (37.9.4.6) [Borsuk].** For  $k \in \mathbb{Z}_+$ , each subset  $S \subset \mathbb{R}^k$  of diameter 1 can be decomposed into  $k + 1$  subsets s.t. each subset has diameter  $< 1$ . ┘

*Proof:* □

## 5 Rational Distances

References are [Sol00], [A-E45] and [Erd45a].

**Def. (37.9.5.1) [Integral Sets].** An **integral set** in  $\mathbb{R}^2$  is a point set s.t. the distances between the elements in  $S$  are all integers. ┘

**Prop. (37.9.5.2) [Anning-Erdős].** For any  $n \in \mathbb{Z}_+$ , we can find a planar integral set of cardinality  $n$  in general position. ┘

*Proof:* let  $\alpha = \arcsin(3/5)$ , then  $\alpha/\pi$  is non-rational. Consider the  $n$  points  $P_k = e^{ik\alpha}$ ,  $0 \leq k \leq n-1$ , then it is clear that all the distances between the points are rational. Thus by scaling, we can find  $n$  points with integral distances. □

**Lemma (37.9.5.3).** If a triangle  $T$  has integer side-lengths  $a \leq b \leq c$ , then the minimal height  $m$  of it is at least  $\sqrt{a - \frac{1}{4}}$ . ┘

*Proof:* As  $a, b, c \in \mathbb{Z}_+$ ,  $a + b \geq c + 1$ . The minimal height  $m$  corresponds to the side with length  $c$ , so it follows from Heron's formula? that

$$m^2 = a^2 - \left(\frac{c^2 + a^2 - b^2}{2c}\right)^2.$$

Clearly larger  $c$  gives smaller height, so we may assume  $c = a + b - 1$ . Then

$$\frac{c^2 + a^2 - b^2}{c} = c + \frac{a+b}{c}(a-b) \leq c + a - b = 2a - 1.$$

And the assertion follows. □

**Lemma (37.9.5.4) [Erdős].** In a planar integral set  $H$ , if there exists two point-pairs  $(A, B)$  and  $(C, D)$  in general position (i.e. the lines  $AB$  and  $CD$  are distinct, and the bisector lines are distinct), then  $\#H \leq 4d(A, B) \cdot d(C, D)$ . ┘

*Proof:* This is because for any  $d \in \mathbb{Z}$ , the set  $\{d(P, A) - d(P, B) = d\}$  is a hyperbola, and similar for  $C, D$ . The condition implies that the hyperbolas for any two such distance pairs are different, so they intersect at at most 2 points. So there are at most  $4d(A, B) \cdot d(C, D)$  many points. □

**Prop. (37.9.5.5) [Anning-Erdős/Solymosi].** If  $H$  is a planar infinite integral set, then the points of  $H$  lie on a line.

In fact, if  $A, B$  are two points in a planar integral set  $H$  with  $d(A, B) = d > 1$ , and  $\#H \geq d^3$ , then there are at most  $2d - 1$  points of  $H$  not on the line  $AB$ . ┘

*Proof:* The first assertion follows from (37.9.5.4). For the second assertion, Cf. [Sol00]P339. ?  $\square$

**Cor. (37.9.5.6) [Minimal distances of Integral Sets].** If  $H$  is a planer integral set in general position and  $\#H \geq 4$ , then the minimal distance between points in  $H$  is at least  $(\#H + 1)^{1/3}$ .  $\lrcorner$

*Proof:* If there are two points  $A, B$  with  $d(A, B) = 1$ , then by triangular inequality, any other points must be in equal distances with  $A$  and  $B$ . So it follows from (37.9.5.3) that there are at most points.  $\square$

In other cases, it follows from the proposition that  $\#H \leq d(A, B)^3 - 1$ .  $\square$

**Conj. (37.9.5.7) [Erdős-Ulam].** There doesn't exist a dense subset  $S \subset \mathbb{R}^2$  s.t. all the distances between points in  $S$  are rational.  $\lrcorner$

*Proof:* It follows from <https://terrytao.wordpress.com/2014/12/20/the-erdos-ulam-problem-varieties-of-general-type-and-the-bombieri-lang-conjecture/#more-7930> that this conjecture is a consequence of the Bombieri-Lang conjecture (21.7.10.1). ?  $\square$

**Lemma (37.9.5.8).** If  $H$  is a planer integral set with  $\#H \geq 4$  with diameter  $\Delta$  and having at most  $n/2$  colinear points, then there exists two point-pairs  $(A, B)$  and  $(C, D)$  in general position (as in (37.9.5.4)) s.t.  $d(A, B), d(C, D) \leq 12\Delta/\sqrt{n}$ .  $\lrcorner$

*Proof:* Call a point  $P \in H$  single if there is at most one other point in  $H$  with distance smaller than  $12\Delta/\sqrt{n}$  with  $P$ . Then a method of volume counting implies that there are less than  $n/2$  single points.

Remove all the single points, then in the remaining set  $H'$ , any point  $P$  has two points  $Q_1, Q_2 \in H'$  s.t.  $d(P, Q_i) \leq 12\Delta/\sqrt{n}$ . ? Then we can find two point-pairs in general position. ?  $\square$

**Thm. (37.9.5.9) [Minimal Diameters of Integral Sets].** There exists  $c \in \mathbb{R}_+$  s.t. for any  $n \in \mathbb{Z}_+$ , any planer integral set with cardinality  $n$  has diameter at least  $cn$ .  $\lrcorner$

*Proof:* If there are more than  $n/2$  points in a single line, then the diameter is at least  $n/2$ . Suppose this is not the case, then it follows from (37.9.5.8) that

$$n \leq 4\left(\frac{\Delta}{\sqrt{n}}\right)^2,$$

and the assertion follows.  $\square$

## 37.10 Game Theory

### 1 Nash Equilibrium

References are [Non-corporative Games, Nash].

**Def. (37.10.1.1) [Games].** A finite normal-form (mathematical) **game** is a tuple  $(N, A, O, \mu, u)$ , where

- $N$  is a finite set of players,  $n = \#N$ .
- $A = (A_1, \dots, A_n)$ , where each  $A_i$  is a finite set of actions (or **pure strategies**).
- $O$  is a set of outcomes.
- $\mu : A \rightarrow O$  determines the outcome as a function of the action profile.
- $u = (u_1, \dots, u_n)$  where  $u_i : O \rightarrow \mathbb{R}$  is the real-valued utility function for player  $i$ .

┘

**Def. (37.10.1.2) [Mixed Strategies].** In a mathematical game (37.10.1.1)  $(N, A, u)$ , each player may randomize his actions, this is called a **mixed strategy**. The **support** of a mixed strategy  $s_i$  for player  $i$  is the set of pure strategies that  $s_i$  has positive probability.

Give a mixed strategy profile  $s = (s_1, \dots, s_n)$ , the **expected utility** for player  $i$  is

$$u_i(s) = \sum_{a \in A} u_i(a) \prod_j s_j(a_j).$$

┘

**Def. (37.10.1.3) [Best Response].** In a mathematical game (37.10.1.1)  $(N, A, u)$ , given any mixed strategy profile  $s^i = (s_1, \dots, s_{i-1}, s_{i+1}, \dots, s_n)$ , a **best response** of player  $i$  to this strategy profile is a mixed strategy  $s_i$  s.t.  $u_i(s_i, s^i) \geq u_i(s'_i, s^i)$  for any mixed strategy  $s'_i$ .

┘

**Def. (37.10.1.4) [Nash-Equilibrium].** A strategy profile  $s = (s_1, \dots, s_n)$  is a **Nash equilibrium** if for each player  $i$ ,  $s_i$  is a best response (37.10.1.3) to  $s^i = (s_1, \dots, s_{i-1}, s_{i+1}, \dots, s_n)$ .

┘

**Thm. (37.10.1.5) [Nash1951].** Each finite normal-form mathematical game (37.10.1.1) has a Nash-equilibrium.

┘

*Proof:* Let  $S$  be the set of mixed strategy profiles. Given a mixed strategy profile  $s$ , for all  $i$  and  $a_i \in A_i$ , define

$$\varphi_{i,a}(s) = \max(0, u_i(a, s^i) - u_i(s)),$$

and define the function  $f : S \rightarrow S$  by

$$f(s)_i(a) = \frac{s_i(a) + \varphi_{i,a}(s)}{1 + \sum_{b \in A_i} \varphi_{i,b}(s)}.$$

Then with the natural topology,  $S$  is homeomorphic to  $\mathbb{D}^1$  and  $f$  is continuous. So by [Brouwer Fixed-Point Theorem](#),  $f$  has a fixed point  $s$ .

Now we show this  $s$  is a Nash-equilibrium: By linearity of expected utility (37.10.1.2), for each  $i$ , there exists at least one  $a \in A_i$  s.t.  $u_{i,a}(s) \leq u_i(s)$ . Then  $\varphi_{i,a}(s) = 0$ , and because  $f(s) = s$ ,  $\varphi_{i,b}(s) = 0$  for each  $b \in A_i$ . This implies that  $u_i(s'_i, s^i) \leq u_i(s)$  for any mixed strategy  $s'_i$ . As this is true for any  $i$ , we know  $s$  is a Nash-equilibrium. □

**Thm. (37.10.1.8).** For any finite deterministic competitive game with complete information, one of the players has a winning strategy.  $\lrcorner$

*Proof:*  $\square$

## 2 Greedoids

**Def. (37.10.2.1) [Greedoids and Antimatroids with Repetitions].** For a set of symbols  $\Sigma$ , a language  $L$  on  $\Sigma$  (2.7.2.5) is called

- **left-hereditary** if  $\alpha, \beta \in \text{String}(\Sigma)$  and  $\alpha\beta \in L$ , then  $\alpha \in L$ .
- **permutable** if  $\alpha, \beta \in L$  and  $\text{length}_x(\alpha) = \text{length}_x(\beta)$  for any  $x \in A$ , then  $\beta\alpha \in L \iff \alpha\beta \in L$ .
- **locally-free** if  $\alpha \in L$  and  $x \neq y \in \Sigma$  with  $\alpha x \in L, \alpha y \in L$ , then  $\alpha xy \in L$ .
- **strongly exchangeable** if for any  $\alpha, \beta \in L$ , there is a subword  $\alpha'$  of  $\alpha$  s.t.  $\beta\alpha' \in L$ , and  $\text{length}_x(\beta\alpha') = \max(\text{length}_x(\beta), \text{length}_x(\alpha))$  for any  $x \in \Sigma$ .
- **augmentary** if  $\alpha, \beta \in L$  and  $\text{length}(\alpha) > \text{length}(\beta)$ , then there exists  $x \in \alpha$  s.t.  $\beta x \in L$ .

A **greedoid** is a left-hereditary and augmentary language on a set of symbols. An **antimatroids with repetition** is a left-hereditary locally-free permutable language on a set of symbols.  $\lrcorner$

**Prop. (37.10.2.2) [Ranks of Greedoids].** In a greedoids, any two maximal words have the same length, called the **rank of this language** (which is defined to be  $\infty$  if no maximal words exist).  $\lrcorner$

**Def. (37.10.2.3) [Flats].** In a left-hereditary language  $L$  on a set of symbols  $\Sigma$ , a **flat of words** is an equivalent class of words where two words  $\alpha, \beta \in L$  are called equivalent if for any  $\gamma \in \text{String}(\Sigma)$ ,  $\alpha\gamma \in L \iff \beta\gamma \in L$ .

A flat  $f$  is called a **subflat** of a flat  $g$  if any word in  $f$  can be extended to a word in  $g$ .  $\lrcorner$

**Prop. (37.10.2.4) [Strongly Exchangeable Languages].** Any strongly exchangeable language  $L$  on a set of symbols  $\Sigma$  is locally-free and permutable. Conversely, any left-hereditary locally-free and permutable language is strongly exchangeable.  $\lrcorner$

*Proof:* It is easy to show that a strongly exchangeable language is locally-free and permutable. Conversely, for  $\alpha, \beta \in L$ , let  $\alpha'$  be the subword of  $\alpha$  consisting of those  $x \in \Sigma$  that are preceded by at least  $\text{length}_x(\beta)$  many occurrence of  $x$ , then we show that  $\beta\alpha' \in L$ : We use induction on  $\sum_x \max(\text{length}_x(\alpha), \text{length}_x(\beta))$ . Let  $\alpha''$  be the longest prefix of  $\alpha'$  s.t.  $\beta\alpha'' \in L$ . Suppose for the contrary that  $\alpha'' \neq \alpha'$ , and let  $x$  be the letter in  $\alpha'$  following  $\alpha''$ . Then  $\text{length}_x(\beta\alpha'') < \text{length}_x(\alpha)$ . Then we can write  $\alpha = \alpha_1 x \alpha_2$ , where  $\text{length}_x(\alpha_1) = \text{length}_x(\beta\alpha'')$ .

By the definition of  $\alpha'$ ,  $\text{length}_y(\alpha_1) \leq \text{length}_y(\beta\alpha'')$  for any  $y \in \Sigma$ , so  $\sum_y \max(\text{length}_y(\alpha_1), \text{length}_y(\beta\alpha'')) < \sum_y \max(\text{length}_y(\alpha), \text{length}_y(\beta))$ . Then by induction hypothesis, there exists  $\gamma \in \text{String}(\Sigma)$  s.t.  $\alpha_1\gamma \in L$ , and  $\text{length}_y(\alpha_1\gamma) = \text{length}_y(\beta\alpha'')$  for any  $y \in \Sigma$ . Clearly  $x \notin \gamma$ , so we can use locally-freeness repeatedly to show that  $\alpha_1\gamma x \in L$ . Now permutability implies that  $\beta\alpha''x \in L$ , contradicting the maximality of  $\alpha''$ .  $\square$

**Cor. (37.10.2.5) [Antimatroids with Repetitions are Greedoids, Björner-Lovász-Shor].** Any antimatroids  $L$  with repetitions on a set of symbols  $\Sigma$  is a greedoids. And if  $L$  has finite rank (37.10.2.2), for any two words  $\alpha, \beta \in L$ ,  $\bar{\alpha}$  is a subflat of  $\bar{\beta}$  (37.10.2.3) iff  $\text{length}_x(\alpha) \leq \text{length}_x(\beta)$  for any  $x \in \Sigma$ . In particular,  $\alpha, \beta$  belongs to the same flat iff  $\text{length}_x(\alpha) = \text{length}_x(\beta)$  for any  $x \in \Sigma$ .  $\lrcorner$

*Proof:* By (37.10.2.4), any antimatroids with repetitions is strongly-exchangeable, thus is clearly augmentary.

If  $\text{length}_x(\alpha) \leq \text{length}_x(\beta)$  for any  $x \in \Sigma$ , then by strongly exchangeable property, there exists  $\gamma \in \text{String}(\Sigma)$  s.t.  $\text{length}_x(\alpha\gamma) = \text{length}_x(\beta)$  for any  $x \in \Sigma$ . Thus by permutability,  $\alpha$  is a subflat of  $\beta$ . Conversely, let  $\alpha\gamma$  be equivalent to  $\beta$ , and extend  $\alpha\gamma$  to a maximal word  $\alpha\gamma\delta$ , then  $\beta\delta$  is also in  $L$ , and by strong exchangeability,  $\text{length}_x(\alpha\gamma) = \text{length}_x(\beta)$  for any  $x \in \Sigma$ . In particular,  $\text{length}_x(\alpha) \leq \text{length}_x(\beta)$  for any  $x \in \Sigma$ .  $\square$

### 3 Firing Games

References are [ALS91].

**Def. (37.10.3.1) [Firing Games].** Given a finite set  $A$ , a **firing game** is a legal sequence of elements of  $A$ . where for any finite legal sequence  $(a_1, \dots, a_k)$  of  $A$ , there is a rule to determine which element  $a_{k+1} \in A$  can be chosen s.t.  $(a_1, \dots, a_{k+1})$  is also legal. A firing game terminates for a legal sequence  $(a_1, \dots, a_k)$  if no such  $a_{k+1} \in A$  can be found.  $\lrcorner$

**Def. (37.10.3.2) [Monotone Firing Games].** A **monotone firing game** is a firing game on a set  $A$  satisfying the following: For any  $k, l \in \mathbb{N}$  and  $c \in A$ , if  $X = (a_1, \dots, a_k), Y = (b_1, \dots, b_l)$  be two legal sequences s.t.

$$\#\{i | a_i = x\} \leq \#\{j | b_j = x\}$$

for any  $x \in A$ , and

$$\#\{i | a_i = c\} = \#\{j | b_j = c\},$$

then  $(b_1, \dots, b_l, c)$  is legal if  $(a_1, \dots, a_k, c)$  is legal.  $\lrcorner$

**Thm. (37.10.3.3) [Thorup].** For a monotone firing game on a set  $A$ , any element of  $A$  appears the same number of times in any terminating sequence legal sequence.  $\lrcorner$

*Proof:* It is easy to check that the set of legal sequences form a antimatroids with repetitions on  $A$  (37.10.2.1), so the assertion follows from (37.10.2.5).

Alternatively, let  $X = (a_1, \dots, a_m), Y = (b_1, \dots, b_n)$  be two legal terminating firing sequences. It suffices to prove that for any element  $c \in A$ ,  $c$  appears in  $Y$  no more than it does in  $X$ . If this is not true, consider the smallest  $k \in \mathbb{N}$  s.t.

$$\#\{i | a_i = a_{k+1}, i \leq k\} = \#\{j | b_j = a_{k+1}\}.$$

Then we can compare the two sequences  $(a_1, \dots, a_k)$  and  $(b_1, \dots, b_n)$ , and use the minimality of  $k$  to conclude that  $(b_1, \dots, b_n, c)$  is also a legal sequence, contradicting the fact that  $Y$  is terminating.  $\square$

**Lemma (37.10.3.4).** The possible records of games form a locally-free permutable left-hereditary language on the set  $V(G)$ .  $\lrcorner$

#### Chip-Firing Games

**Def. (37.10.3.5) [Chip-Firing Games].** Given a simple finite graph  $G$  and a number  $a_i$  to each of its vertex  $v_i$  called the **initial distribution of chips**, a **chip-firing game** on this graph is sequence of **chip-firings** which means if  $a_i \geq \deg(v_i)$  for some  $i$ , then we can decrease  $a_i$  by  $\deg(v_i)$ , and increase  $a_j$  by 1 for each  $v_j$  that is connected to  $v_i$ .  $\lrcorner$

**Thm. (37.10.3.6) [Björner-Lovász-Shor].** Given a simple finite graph  $G$  and initial distribution of chips (37.10.3.5), either every game can be continued infinitely, or every game terminates under after the same number of moves, and the number of times a given vertex is fired is the same in each vertex.  $\perp$

*Proof:* This is clearly a monotone firing game, so the assertion follows from (37.10.3.3).  $\square$

**Lemma (37.10.3.7) [Tardos/Björner-Lovász-Shor].** Let  $G$  be a connected simple finite graph. Then:

- If a chip-firing game is infinite, then every node is fired infinitely often.
- If a chip-firing game terminates, then there is a node that is not fired at all.

$\perp$

*Proof:* 1: There is a vertex that is fired infinitely often, so the vertices connected to it receives infinitely many chips, so they must fire infinitely often too. In this way, because  $G$  is connected, every vertex is fired infinitely often.

2: Suppose each vertex is fired. Consider the vertex  $v$  s.t. at the end of the game,  $v$  has been idle for the longest time. Then after it fired the last time, all of its neighbors fired at least once. Thus  $v$  has  $\deg(v)$  chips, so it can be fired again, contradiction.  $\square$

**Prop. (37.10.3.8).** Let  $G$  be a connected simple finite graph with  $n = \#V(G)$  and  $e = \#E(G)$ , and  $\sum_i a_i = N$ .

- If  $N > 2e - n$ , then the game is infinite.
- If  $e \leq N \leq 2e - n$ , then there is an initial configuration of chips with infinite games and also an initial configuration of chips with finite games.
- If  $N < e$ , then the game is finite.

$\perp$

*Proof:* 1: If  $N > 2e - n$ , then there is always a vertex  $v$  with at least  $\deg(v)$  chips.

2: We can always place  $\deg(v_i) - 1$  chips at vertex  $v_i$ , so in this way we can place  $2e - n$  chips with a finite game. On the other hand, if we have  $e$  chips, then we can choose an arbitrary acyclic orientation of vertices of  $G$ , and place  $\deg^+(v_i)$  chips at vertex  $v_i$ . Then for this configuration the game is infinite: There is a source  $v$ , so we can fire  $v$ , and then after reverting the orientation of all edges from  $v$ , we get another acyclic orientation of  $G$ , and the chips are also placed by  $\deg^+(v_i)$  at vertex  $v_i$ . Then this process can go on forever.

3: Choose any acyclic orientation of  $G$ , and let  $T = \sum_i \max(0, a_i - \deg^+(v_i))$ . Call a vertex deficient if  $a_i - \deg^+(v_i) > 0$ . Then along with any game, we can modify the orientation of  $G$  so that the quantity  $T$  never increases. And moreover, when the set of deficient vertices  $v_i$  changes,  $T$  decreases. In this way, we can show that the game is finite: A deficient vertex can never be fired, so an infinite game must change the set of deficient vertices infinitely often, contradiction.

To show the monotone property of  $T$ , when a vertex  $v$  is fired, reverse the orientation of all the edges leaving  $v$ , then this is also an acyclic orientation, but for  $T$ , the term at  $v$  decreases by  $\deg^-(v)$ , and all the terms at the vertices with an edge going to  $v$  increases by at most 1. Moreover, if such an vertex with an edge going to  $v$  is deficient, then in fact  $T$  decreases. If none of these are deficient, then the set of deficient sets doesn't change.  $\square$

**Prop. (37.10.3.9).** Let  $G$  be a connected simple finite graph with  $n = \#V(G)$ , and let  $\lambda_1$  be the least non-zero eigenvalue of the Laplacian matrix  $L_G$  (37.2.2.1), then any terminating chip-firing game with  $N$  chips has at most  $\sqrt{2nN}/\lambda_1$  steps.  $\perp$

*Proof:* Suppose we start with  $a_i$  chips on vertex  $v_i$  and after  $s$  steps, we end up with  $b_i$  chips on vertex  $v_i$ . Let  $x_i$  be the number of times that  $v_i$  was fired. By (37.10.3.7), we may assume  $x_n = 0$ . Then clearly  $Lx = \mathbf{a} - \mathbf{b}$ .

Let

$$L_G = \sum_{i=1}^{n-1} \lambda_i v_i v_i^t$$

where  $v_1 \leq v_1 \leq \dots \leq v_{n-1}$  are the eigenvalues of  $L_G$ , and  $v_1, \dots, v_{n-1}$  are the corresponding orthogonal eigenvectors of unit length. Denote

$$L' = \sum_{i=1}^{n-1} \frac{1}{\lambda_i} v_i v_i^t, \quad v_n = \frac{1}{\sqrt{n}}(1, \dots, 1)^t,$$

then

$$L' L_G = \sum_{i=1}^{n-1} v_i v_i^t = \mathbf{1} - v_n v_n^t = \mathbf{1} - \frac{1}{n} \mathbf{J}.$$

Hence  $e_n^t L' L_G = e_n^t - \frac{1}{n}(1, \dots, 1)^t$ , and

$$s = (1, \dots, 1) \cdot \mathbf{x} = n(e_n^t - e_n^t L' L) \mathbf{x} = -n e_n^t L' L \mathbf{x} = \sum_{i=1}^{n-1} -\frac{n}{\lambda_i} (e_n^t \lambda_i) (v_i^t (\mathbf{a} - \mathbf{b})).$$

Thus

$$s \leq \frac{n}{\lambda_1} \sum_{i=1}^{n-1} |e_n^t v_i| \cdot |v_i^t (\mathbf{a} - \mathbf{b})| \leq \frac{n}{\lambda_1} \sqrt{\sum_{i=1}^{n-1} (e_n^t v_i)^2} \cdot \sqrt{\sum_{i=1}^{n-1} (v_i^t (\mathbf{a} - \mathbf{b}))^2} \leq \frac{n}{\lambda_1} |\mathbf{a} - \mathbf{b}| \leq \sqrt{2} \frac{nN}{\lambda_1}.$$

#### 1 Financial Terminologies

##### Generals

**Def. (38.1.1.1) [Social Relations].** A **social relation** is the fundamental unit of analysis within the social sciences, and describes any voluntary or involuntary social association, connection, or affiliation between two or more individuals within and/or between groups. ┘

**Def. (38.1.1.2) [Rights].** **Rights** are legal, social, or ethical principles of freedom or entitlement, that is, rights are the fundamental normative rules about what is allowed of people or owed to people according to some legal system, social convention, or ethical theory. ┘

**Def. (38.1.1.3) [Obligations].** **Obligation** is a course of action that a person or entity is required to take, whether legal or moral. Obligations are constraints that limit freedom. ┘

**Def. (38.1.1.4) [Contract].** A **contract** is an agreement that specifies certain legally enforceable rights(38.1.1.2) and obligations(38.1.1.3) pertaining to two or more mutually agreeing entities.

A **claim** is a demand for enforcement of a right(38.1.1.2) provided by law or a legal contract. ┘

**Def. (38.1.1.5) [Institutions].** An **institution** is a humanly devised structure of rules and norms that shape and constrain individual behavior. ┘

**Def. (38.1.1.6) [Infrastructure].** **Infrastructure** is the set of facilities and systems that serve a country, city, or other area, and encompasses the services and facilities necessary for its economy, households and firms to function. ┘

**Def. (38.1.1.7) [Corporations and Companies].** A **company**, is a legal entity representing an association of people, whether natural, legal or a mixture of both, with a specific objective.

A **corporation** is an organization authorized by the state to act as a single entity and recognized as such in law for certain purposes.

One big difference between companies and corporations is that corporations are legally separate from their owners. ┘

**Def. (38.1.1.8) [Goods and Services].** **Goods** are items that are usually tangible, e.g. pens or apples. **Services** are activities provided by other people, e.g. by teachers or barbers. ┘

**Def. (38.1.1.9) [Economic Values].** **Economic value** is a measure of the benefit provided by a good or service(38.1.1.8) to a financial entity. ┘

**Def. (38.1.1.10) [Assets].** An **asset** is anything(tangible or intangible) that can be used to produce positive economic value(38.1.1.9). ┘

**Def. (38.1.1.11) [Commodities].** a **commodity** is an economic good(38.1.1.8), usually a resource, that specifically has full or substantial fungibility: that is, the market treats instances of the good as equivalent or nearly so with no regard to who produced them. ┘

**Def. (38.1.1.12) [Payments and Money].** A **payment** is the voluntary tender of money or its equivalent or of things of value by one person or entity to another in exchange for goods or services(38.1.1.8) provided by them, or to fulfill a legal obligation(38.1.1.3)/philanthropy desire. The person or entity making the payment is called the **tbfpayer**, while the **payee** is the person or entity receiving the payment. ┘

An item or verifiable record that is generally accepted as payment for goods or services is called **money**. ┘

**Def. (38.1.1.13) [Trade].** **Trade** is the transfer of goods or services(38.1.1.8) from one person or entity to another, often in exchange for money as a payment(38.1.1.12). ┘

**Def. (38.1.1.14) [Loan and Debt].** A **loan** is the transfer of money(38.1.1.12) by one person or entity(called the **lender** or **creditor**) to another with an agreement to pay it back. The recipient, or borrower of a loan is called a **debtor**, and is said to incur a **debt**. ┘

### Finance

**Def. (38.1.1.15) [Currency].** A **currency** is a standardization of money(38.1.1.12) in any form, in use or circulation as a medium of exchange. ┘

**Def. (38.1.1.16) [Cash].** **Cash** is money(38.1.1.12) in the physical form of currency(38.1.1.15). ┘

**Def. (38.1.1.17) [Financial Institutions].** A **financial institution** is an institution(38.1.1.5) that provides service as an intermediary for different types of financial monetary transactions. ┘

**Def. (38.1.1.18) [Financial Markets].** A **financial market** is a composition of systems, financial institutions(38.1.1.17), procedures, social relations(38.1.1.1) or infrastructures(38.1.1.6) whereby parties can trade(38.1.1.13). ┘

**Def. (38.1.1.19) [Banks].** A **bank** is a financial institution(38.1.1.17) that accepts deposits(38.1.1.20) from the public while simultaneously making loans. Lending activities can be directly performed by the bank or indirectly through capital markets ┘

**Def. (38.1.1.20) [Deposits].** A **deposit** is the act of placing cash(38.1.1.16)(or cash equivalent) with some entity, most commonly with a financial institution(38.1.1.17), e.g. a bank(38.1.1.19). ┘

The deposit is a credit for one person or entity who placed it, and it may be taken back(withdrawn) in accordance with the terms agreed at time of deposit, transferred to another person or entity, or used for a purchase at a later date. ┘

**Def. (38.1.1.21) [Financial Assets].** A **financial asset** is a non-physical asset(38.1.1.10) whose value is derived from a contractual claim(38.1.1.4), e.g. bank deposits(38.1.1.20), bonds(38.1.1.28), and participations in companies' share capital. ┘

**Def. (38.1.1.22) [Financial Liabilities].** A **financial liability** is a measure of the financial obligations(38.1.1.3) that a financial entity owes. For example, debt(38.1.1.14) is a kind of liability. ┘

**Def. (38.1.1.23) [Corporate Liabilities].** **Corporate liability** is the financial liability(38.1.1.22) of a company as a legal person can be held liable for the acts and omissions of the natural persons it employs and, in some legal systems, for those of other associates and business partners. ┘

**Def. (38.1.1.24) [Equities].** **Equity** is the measure of ownership interest in an asset(38.1.1.10) that may be offset by debts or other liabilities(38.1.1.22). Equity equals the value(38.1.1.9) of the asset minus the liabilities(38.1.1.22). ┘

**Def. (38.1.1.25) [Non-Financial Assets].** A **non-financial asset** is an asset(38.1.1.10) that cannot be traded(38.1.1.13) on the financial markets(38.1.1.18) and whose value is derived by its physical net worth rather than from a contractual claim, as opposed to a financial asset(38.1.1.21). ┘

**Def. (38.1.1.26) [Securities].** A **security** is a tradable(38.1.1.13) financial asset(38.1.1.21). The term commonly refers to any form of financial instrument. ┘

**Def. (38.1.1.27) [Securitization].** **Securitization** is the financial practice of pooling various types of contractual liabilities(38.1.1.22) and selling their related cash flows to third party investors as securities(38.1.1.26). ┘

**Def. (38.1.1.28) [Bonds].** A **bond** is a type of security(38.1.1.26) under which the issuer owes the holder a debt(38.1.1.14), and is obliged to provide cash flow to the creditor(38.1.1.14). ┘

**Def. (38.1.1.29) [Exchanges].** An **exchange**, **bourse**, **trading exchange** or **trading venue** is an organized financial market(38.1.1.18) where tradable securities(38.1.1.26), commodities(38.1.1.11), foreign exchange, futures, and options(38.1.1.35) contracts are bought and sold. ┘

**Def. (38.1.1.30) [Orders].** An **order in an exchange** is an instruction to buy or sell a security(38.1.1.26) on an exchange.

A **market order** is a buy or sell order to be executed immediately at the current market prices.

A **limit order** is an order to buy at no more than a specific price, or to sell at no less than a specific price. ┘

### Stocks

**Def. (38.1.1.31) [Stocks].** ┘

**Example (38.1.1.32) [Stocks].** NYSE, AMEX, NASDAQ: ? ┘

**Def. (38.1.1.33) [Penny Stocks].** A **penny stock** is a stock with a low nominal share price that typically trades in the over-the-counter market?, often an OTC Bulletin Board or Pink Sheets quoted stock. ? ┘

### Financial Derivatives

**Def. (38.1.1.34) [Financial Derivatives].** A **financial derivative** is a contract that derives its value from the performance of an **underlying entity**, e.g. an asset, a stock or interest rate. ┘

**Def. (38.1.1.35) [Options].** An **option** is a security(38.1.1.26) giving the right to buy or sell an asset, subject to certain conditions, within a specified period of time. The last day on which the option may be exercised is called the **expiration date** or **maturity date**.

An **American option** is one that can be exercised at any time up to the date the option expires. A **European option** is one that can be exercised only on a specified future date.

The price that is paid for the asset when the option is exercised is called the **exercise price** or **striking price**. ┘

**Def. (38.1.1.36) [Call Options and Sell Options]**. The simplest kind of option (38.1.1.35) is one that gives the holder the right to buy (resp. sell) a single share of common stock, called a **call option** (resp. **put option**). ┘

**Def. (38.1.1.37) [Financial Warrants]**. A **financial warrant** is an option (38.1.1.35) that is a liability (38.1.1.22) of a corporation. ┘

**Prop. (38.1.1.38)**. Almost all corporate liabilities (38.1.1.23) can be realized as combinations of options. ┘

*Proof:* ┘

### Liquidity Risks

**Def. (38.1.1.39) [Market Liquidity]**. **market liquidity** of an asset in a financial market (38.1.1.18) is the feature whereby an individual or firm can quickly purchase or sell this asset without causing a drastic change in the asset's price.

The trader initiating the transaction is said to **demand liquidity**, and the other party (counterparty) to the transaction **supplies liquidity**. ┘

**Def. (38.1.1.40) [Bid-Ask Spread]**. The **bid-ask spread** or the **bid-offer spread** or **buy-sell spread** of an asset is the difference between the prices quoted <sup>?</sup> for an immediate sale (ask) and an immediate purchase (bid) for stocks, futures contracts, options, or currency pairs.

The bid-ask spread is one indicator of an asset's liquidity and of the size of the transaction cost. If the bid-ask spread is 0, then it is called a **frictionless asset**. ┘

**Def. (38.1.1.41) [Market-Makers]**. A **market-maker** or a **liquidity provider** is a company (38.1.1.7) or an individual that quotes both a buy and a sell price in a tradable asset held in inventory, hoping to make a profit on the bid-ask spread (38.1.1.40). ┘

**Def. (38.1.1.42) [Transaction Cost]**. Two elements comprise almost all of the transaction cost: brokerage fees and bid-ask spreads. ┘

**Def. (38.1.1.43) [Average True Range (ATR)]**. **Average true range** or **ATR** was introduced by J. Welles Wilder in his 1978 book *New Concepts In Technical Trading Systems*. ATR is a measure of volatility for a stock or index. ┘

**Prop. (38.1.1.44)**. Theory and empirical evidence suggest that investors require higher return on assets with lower market liquidity to compensate them for the higher cost of trading these assets. ┘

*Proof:* Cf. [Yakov Amihud and Haim Mendelson, *Asset Pricing and the Bid-Ask Spread*. 1986]. ┘

**Prop. (38.1.1.45)**. risk-averse investors require higher expected return if the asset's market-liquidity risk is greater. ┘

*Proof:* Cf. [Viral Acharya and Lasse Heje Pedersen, "Asset pricing with liquidity risk." *Journal of Financial Economics* 77, 2005]. ┘

### Portfolios

**Def. (38.1.1.46) [Portfolios].** ┘

**Def. (38.1.1.47) [Long and Short Positions].** An investor is said to have a **long position** at time  $t$  on an asset  $S$  if  $\pi_t^S \geq 0$ , and is said to have a **short position** at time  $t$  on an asset  $S$  if  $\pi_t^S < 0$ . ┘

## 2 Macroeconomy

### Keynes' Ideas

**Remark (38.1.2.1).** Keynes' idea is roughly the following:

- Economies can and often do suffer from an overall lack of demand, which leads to involuntary unemployment.
  - The economy's automatic tendency to correct shortfalls in demand, if it exists at all, operates slowly and painfully.
  - Government policies to increase demand, by contrast, can reduce unemployment quickly.
  - Sometimes increasing the money supply won't be enough to persuade the private sector to spend more, and government spending must step into the breach.
- ┘

postulates of the classical theory are applicable to a special case only and not to the general case, the situation which it assumes being a limiting point of the possible positions of equilibrium. Moreover, the characteristics of the special case assumed by the classical theory happen not to be those of the economic society in which we actually live, with the result that its teaching is misleading and disastrous if we attempt to apply it to the facts of experience.

## 3 Asset Pricing

**Notation (38.1.3.1).**

- Let  $(\Omega, \mathcal{F}, \mathbf{P})$  be a probability space.
- ┘

**Remark (38.1.3.2).** We study a financial market where assets (stocks) are traded (38.1.1.13) in continuous time. We assume that there are  $d$  assets, and that the prices  $S^i, i = 1, \dots, d$  of these assets are modeled as semi-martingales with respect to a reference filtration  $\mathbf{F}$ .

These assets are called **risky assets** or **securities**. We shall also assume that there is an  $\mathbf{F}$ -adapted riskless asset (also called the savings account) with dynamics

$$dS_t^0 = S_t^0 r_t dt, \quad S_0^0 = 1.$$

where  $r : \mathbb{R}_{\geq 0} \rightarrow \mathbb{R}_+$  is called the **interest rate**. ┘

**Def. (38.1.3.3) [Zero-Coupon Bonds (ZC)].** A **zero-coupon bond** is an asset that delivers one monetary unit at time  $T$ . Clearly, the dynamics of the ZC's price  $P_T$  is

$$\begin{cases} dP_T(t) &= r_t P_T(t) dt, & t \leq T \\ P_T(T) &= 1 \end{cases}.$$
┘

### Semi-Martingale Stock Price Processes

**Thm. (38.1.3.4) [Stock Price Processes are Semi-Martingales].** ┘

*Proof:* □

**Thm. (38.1.3.5) [Fundamental Theorem of Asset Pricing].** For an  $\mathbb{R}^d$ -valued semi-martingale  $S = (S_t)_{t \in [0, T]}$ , the following are equivalent:

- There exists a probability measure  $\mathbf{Q}$  equivalent to  $\mathbf{P}$  under which  $S$  is a sigma-martingale.
- $S$  doesn't permit a free lunch with vanishing risk.

┘

*Proof:* □

### Option Pricing

**Prop. (38.1.3.6).** The current price of a option is equal to the price of the stock minus the price of a pure discount bond that matures on the same date as the option, with a face value equal to the striking price of the option (38.1.1.35). ┘

## 4 Quantitative Trading

### Basics

**Def. (38.1.4.1) [Systematic Trading].** **systematic trading** is the act of trading following clearly defined rules that can be defined mathematically and tested empirically. ┘

**Def. (38.1.4.2) [Statistical Arbitrage].** The key underlying assumption of statistical arbitrage is that the prices of financial instruments are driven by consistent rules, which can be discovered from their historical behavior and applied to the future. ┘

**Def. (38.1.4.3) [Alphas].** An **alpha** is an automated predictive model that describes, or decodes, some market relations.

Alpha comes from data. A change in information should in turn produce a change in the alpha.

┘

**Prop. (38.1.4.4) [Good Qualities of Alphas].**

- The idea and expression are simple.
- The expression/code is elegant.
- It has a good in-sample Sharpe ratio.
- It is not sensitive to small changes in data or parameters.
- It works in multiple universes.
- It works in different regions.

┘

**Def. (38.1.4.5) [Information Ratios and Information Coefficients].** The **information ratio** of an alpha (38.1.4.3) is the ratio of excess returns over a benchmark to the variability of those returns.

The **information coefficient** of an alpha measures the correlation between the predicted and actual values. ┘

**Prop.(38.1.4.6)[Ways to Find Alphas].**

- Analyze the variables in the data.
- Get an idea of the price response to the change you want to model.
- Come up with a mathematical expression that translates this change into stock positions.
- Test the expression.
- If the result is favorable, submit the alpha.

┘

**Prop.(38.1.4.7)[Ways to Avoid Overfit].**

- Look at the performance of their alphas on data that was not used in alpha construction(out-of-sample data) and comparing it with the data used to improve the alpha(in-sample data).

┘

**Prop.(38.1.4.8)[Cutting Losses].** Cutting losses means abandoning rules that no longer work. Instead of following a particular security, we apply trend following to the accumulated profit and loss of a strategy as a whole, which may consist of many individual alphas on many securities.

┘

**Prop.(38.1.4.9)[Failure of Alphas].** There are several way to tell that a strategy isn't working:

- A drawdown exceeds the typical drawdowns observed previously.
- The strategy's Sharpe ratio falls significantly.
- Rules that were initially observed in historical simulation are no longer valid in live trading.

┘

**Prop.(38.1.4.10)[Good Qualities of Quant Researchers].**

- Work Hard.
- Set ambitious long-term targets but attainable weekly goals.
- Prioritize based on risk and reward.
- Stay curious.
- Perform value-added work, and automate.
- Make sensible changes, and beware of overfitting.
- Has synergistic teams.

┘

**Def.(38.1.4.11)[Long-Volatility Programs].** A **long-volatility program** is an investing strategy that tends to benefit from increasing volatility and/or persistent directional trends. Often associated with strategies. Long-volatility program is usually employed by commodity trading advisors from the managed futures industry?.

┘

**Data****Prop.(38.1.4.12)[Types of Data].**

- Prices and volumes. Technical analysis or regression models may be built based on this data.
- Fundamentals. By automating the analysis of key metrics for each company, you can build alphas that typically have very low turnover.

- Macroeconomic data, such as GDP numbers and employment rates, that have market-wide effects upon their release.
- Text, such as Federal Open Market Committee minutes, company filings, papers, journals, news, or social media.
- Multimedia, notably relevant videos or audio. There are mature techniques to process such data –for example, converting audio into text that can be used to build models.

┘

**Prop.(38.1.4.13)[Common Ways to get Data].**

- Literature.
- 

┘

### Stocks

**Prop.(38.1.4.14).** The empirical results strongly suggest that trend following on stocks does offer a positive mathematical expectancy.

┘

*Proof:* Cf.[Does Trend Following Work on Stocks?, Wilcox-Crittenden].

□

### Back Testing

There are several parameters that you would need to monitor when analyzing a strategy's performance and risk. Some important metrics/ratios are mentioned below:

Total Returns (CAGR) –Compound Annual Growth Rate (CAGR) is the mean annual growth rate of an investment over a specified period of time longer than one year.

Hit Ratio –Order to trade ratio.

Average Profit per Trade –Total profit divided by the total number of trades

Average Loss per Trade –Total loss divided by the total number of trades

Maximum Drawdown –Maximum loss in any trade

The Volatility of Returns –Standard deviation of the “returns”

Sharpe Ratio –Risk-adjusted returns, i.e. excess returns (over risk-free rate) per unit volatility or total risk.

**Fact(38.1.4.15)[Factors that may influence effects of Back-Testing].** There are several factors that may be influencing the accuracy of back-testing:

- Survivorship bias: A phenomenon where poorly performing stocks, having been delisted, are not reflected in a current sample or database. This results in overestimations of what past performance would have been. To neutralize this bias, you need to include historical data for all stocks that were delisted.
- Corporate actions: Corporate actions, including cash dividends, splits, mergers, spin-offs, stock dividends, reverse splits, etc may influence stock prices. To neutralize this influence, you need to proportionately back adjust for these actions.
- Realistic investable universe: Penny stocks and illiquid stocks may be untradable. To neutralize this influence, you need to set minimum stock price filter was used to avoid penny stocks, and set a minimum daily liquidity filter was used to avoid illiquid stocks.

┘

## 5 Momentum Strategies

**Remark (38.1.5.1).** The idea of trend-following strategy is that people have FOMO (Fear Of Missing Out), so the trends emerge as a result of human emotion and the desire to follow the crowd since a group of people can base their trading decision on an emotion triggered by an event. ┘

### Scalping Strategies

#### Smart Order Routing Strategies

#### Market-Making Strategies

#### Time-Weighted Average Price Strategies

#### Volume-Weighted Average Price Strategies

## 6 Arbitrage Strategies

### Pairs Trading Strategies

**Remark (38.1.6.1)** [Mean-Reversing Strategies]. ┘

## 38.2 Information Theory

### 1 Cryptography

References are [Algebraic aspects of cryptography] and [Computational Complexity].

Cryptography is the study of “mathematical” systems for solving two kinds of security problems: privacy and authentication.

**Def. (38.2.1.1) [Protocols].** A **protocol** is a multi-party algorithm, defined by a sequence of steps, specifying the actions required of two or more parties in order to achieve a specified objective. ┘

**Def. (38.2.1.2) [Cryptosystems and Keys].** Key cryptosystems use cyphers whose algorithm can be revealed to everyone without compromising the security of the cryptosystem.

In such cryptosystems, a set of specific parameters, called the **keys**, is supplemented together with the plaintext as an input to the cypher. The security of this cryptosystem depends entirely on the secrecy of the keys.

Mathematically, a **cryptographic system** is a family of injective maps

$$\{S_k\}_{k \in K} : \mathcal{P} \rightarrow \mathcal{C},$$

where the parameter space  $K$  is called the space of **keys**. ┘

**Remark (38.2.1.3) [Goals of a Cryptosystem].** For practical uses, a cryptosystem must be easy to computationally simple, but also computing the key  $k$  from the function  $S_k$  must be computationally infeasible. ┘

**Def. (38.2.1.4) [Key Establishment Protocols].** A **key establishment protocol** is a protocol whereby a key becomes available to two or more parties, for subsequent cryptographic applications.

The key establishment protocol is usually done over a reliable and secure channel. Once the key is established, subsequent communications involve sending cryptograms over a public channel which is vulnerable to total passive interception. ┘

**Def. (38.2.1.5) [Threats to Cryptosystems].** There are several kinds of threats to a cryptosystem:

- A **ciphertext only attack** is a cryptanalytic attack in which the cryptanalyst possesses only ciphertext.
- A **known plaintext attack** is a cryptanalytic attack in which the cryptanalyst possesses a substantial quantity of corresponding plaintext and ciphertext.
- A **chosen plaintext attack** is a cryptanalytic attack in which the cryptanalyst can submit an unlimited number of plaintext messages of his own choosing and examine the resulting cryptograms.

┘

**Prop. (38.2.1.6) [Known Plaintext Attacks and One-way Functions].** A cryptosystem (38.2.1.2)  $\{S_k\}_{k \in K} : \mathcal{P} \rightarrow \mathcal{C}$  which is secure against a known plaintext attack can be used to produce a one-way function  $K \rightarrow \mathcal{C}$ , by restricting to a fixed  $p \in \mathcal{P}$ . ┘

**Def. (38.2.1.7) [Digital Authentications(Signature)].** In order to digitally sign a document, each user must be able to produce a message whose authenticity can be checked by anyone, but which could not have been produced by anyone else, even the recipient. ┘

### Public Key Cryptosystems, Diffie-Hellman Scheme

References are [AAG99] and [D-H76].

**Algo. (38.2.1.8) [Public Key Cryptosystem, Diffie-Hellman [D-H76]].** A **public key cryptosystem** with signature works as follows:

- Each user A finds an encryption method  $E_A$  and a decryption method  $D_A$  of data, such that

$$E_A \circ D_A = D_A \circ E_A = \text{id},$$

and both  $E_A$  and  $D_A$  are easy to compute, but it is hard or ineffective to know  $D_A$  from  $E_A$ .

- Each user A reveals  $E_A$ , and keeps  $D_A$  as secret.
- If user A wants to send message  $M$  to user B, he sends the message  $E_B(D_A(M))$  to user B.
- If user B receives a message  $S$  from user A, he gets the plaintext  $E_A(D_B(S))$ .

In this way, one-way authentication is also achieved.  $\perp$

*Proof:* The security of this system depends on the fact that it is ineffective to compute  $M$  from  $E_B(D_A(M))$ .

User B can prove the message is sent from user A because he has the texts  $M$  and  $D_A(M)$ , which is possible only because user A sent him the text  $D_A(M)$ , as it is hard to compute  $D_A$ .

User B cannot forge the message because he cannot compute  $D_A(M)$  from the message  $M$ .  $\square$

**Prop. (38.2.1.9) [Cryptoanalysis].** The cryptanalytic difficulty of a system whose encryption and decryption operations can be done in P time cannot be greater than NP.  $\perp$

**Algo. (38.2.1.10) [RSA Public Key cryptosystem, Rives-Shami-Adleman [RSA78]].** The (Rives-Shami-Adleman) **RSA public key cryptosystem** works as follows:

- Chooses two large primes  $p, q$  using primality testing, and calculate  $N = pq$ .
- Encode data in series  $(a_i)$  of positive integers less than  $N$ .
- Then user A chooses randomly an integer  $2 \leq e \leq \varphi(N) - 2$  s.t.  $(e, p) = (e, q) = 1$ , and use the extended Euclid algorithm to find the inverse

$$d = (\text{rem } ()e^{-1}(\text{mod } \varphi(N))).$$

- User A reveals  $(N, e)$ , which is called the **Public RSA key** of user A.
- The encryption method to user A is mapping a series of positive integers  $(a_i)$  less than  $N$  to  $E_A(a_i) = (\text{rem } ()a_i^e(\text{mod } N))$ .
- The decryption method of user A is changing a series of positive integers  $(s_i)$  less than  $N$  to  $D_A(s_i) = (\text{rem } ()s_i^d(\text{mod } N))$ .
- Then use Diffie-Hellman cryptosystem scheme as described in (38.2.1.8).  $\perp$

*Proof:* It is easy to show that  $D_A \circ E_A = E_A \circ D_A = \text{id}$ . By (38.2.1.8), the security of this cryptosystem depends on the difficulty of calculating  $d$ . It is shown that if  $d$  is known, then we can factor  $n$  effectively  $\color{red}{?}$ , which is assumed to be difficult.  $\square$

**Algo. (38.2.1.11) [Discrete Logarithm Key Establish Protocol, Diffie-Hellman [D-H76]].** Choose a  $p \in \mathbf{P}$  and a primitive root  $g$  for  $p$ , then there is a key establish protocol as follows:

1. User A choose a random chosen  $n \in \mathbb{Z}_+, n < p$ , user B choose a random chosen  $m \in \mathbb{Z}_+, n < p$ .
2. User A sends  $g^n(\text{mod } p)$  to user B, and user B sends  $g^m(\text{mod } p)$  to user A.
3. User A calculates  $(g^n)^m(\text{mod } p)$ , and user B calculates  $(g^m)^n(\text{mod } p)$ . Then user A and user B get a same element  $s = g^{mn}(\text{mod } p)$ .
4. Now User A can use this element  $s$  to send user B messages 1 bit a time.

┘

*Proof:* The security of this cryptosystem is based on the difficulty of computing discrete logarithm over finite fields ?. Because it is not feasible to determine any of  $g^{mn}(\text{mod } p), g, m, n$  from  $p, g^n(\text{mod } p)$  and  $g^m(\text{mod } p)$ . □

**Algo.(38.2.1.12)** [An Algebraic Key Establish Protocol, Anshel-Andhel-Goldfeld]. Let  $U, V$  be monoids and

$$\beta : U \times U \rightarrow V, \gamma_0, \gamma_1 : U \times V \rightarrow V$$

be feasibly computable functions satisfying the following properties:

- $\beta(x, y_1 y_2) = \beta(x, y_1) \beta(x, y_2)$ .
- $\gamma_1(x, \beta(y, x)) = \gamma_2(y, \beta(x, y))$ .
- Given  $y_1, y_2, \dots, y_k \in U$  and  $\beta(x, y_1), \dots, \beta(x, y_k)$ , it is in general infeasible to determine the element  $x$ .

Then there is a key establish protocol as follows:

1. Publicly assign users A, B elements  $S = \{s_1, \dots, s_m\}$  and  $T = \{t_1, \dots, t_n\}$ .
2. User A choose some  $a \in S$  and transmit the elements  $\beta(a, t_i)$  to user B.
3. User B chose some  $b \in T$  and transmit the elements  $\beta(b, t_i)$  to user A.
4. Then item1 guarantees that user A can calculate  $\beta(b, a)$  and thus  $\gamma_1(a, \beta(b, a))$ . Similarly user B can calculate  $\beta(a, b)$  and thus  $\gamma_2(b, \beta(a, b))$ . Then notice

$$\kappa = \gamma_1(a, \beta(b, a)) = \gamma_2(b, \beta(a, b))$$

is an established key.

But to extract an identical element, there are two cases: If there is a feasible algorithm to put every word in  $U$  in canonical form, then they get an identical element. Otherwise there are no canonical form algorithm but has a fast word identifying algorithm, then user A can choose a random word  $\tau$  other than  $\kappa$  and then choose either send  $\tau$  or  $\kappa$  to user B. Then user B can determine if this is  $\kappa$  or not, and receives a bit in this way.

┘

*Proof:* The security of this cryptosystem is ? □

**Remark(38.2.1.13).** An example is given by  $U = V = G \in \text{Grp}$  and

$$\beta(x, y) = x^{-1}yx, \quad \gamma_1(u, v) = u^{-1}v, \quad \gamma_2(u, v) = v^{-1}u.$$

Then

$$\kappa(a, b) = [a, b].$$

┘

**Algo.(38.2.1.14) [ECDH(Elliptic Curve Diffie-Hellman) Key Establishment Protocol, Koblitz-Miller].** This protocol is based on hardness of computing discrete logarithm on elliptic curves  $E$  over a finite field. It is totally analogous to the discrete logarithm key establish protocol. For details, Cf.[Kob87].

Another subtle point is that we need to embed plaintext into  $E(\mathbb{F}_q)$ , and find a point of  $E(\mathbb{F}_q)$  whose order is divisible by a large prime.  $\perp$

**Algo.(38.2.1.15) [SIDH(Supersingular Isogeny Diffie-Hellman) Cryptosystem, Jao-Feo].** WARNING: The SIDH protocol has been cracked. SIDH is based on isogenies of a supersingular elliptic curve  $E/\mathbb{F}_{p^2}$ .  $\perp$

### Probabilistic Cryptosystems

**Algo.(38.2.1.16) [NTRU, Hoffstein-Pipher-Silverman[HPS98]].** The NTRU cryptosystem depends on three integer parameters  $(N, p, q)$  s.t.  $(p, q) = 1$ , and four sets of integer polynomials of degree  $N - 1$ :  $\mathcal{L}_f, \mathcal{L}_g, \mathcal{L}_\varphi, \mathcal{L}_m$  (These parameters must satisfy conditions as in(38.2.1.17)). It works as follows:

- Encode data in functions in  $\mathcal{L}_m$ .
- User A randomly choose two polynomials  $f, g \in \mathcal{L}_g$ , s.t.  $f$  must be invertible in both  $\mathbb{F}_p[X]/(X^N - 1)$  and  $\mathbb{F}_q[X]/(X^N - 1)$ , with inverses  $F_p$  and  $F_q$ .
- User A reveals the polynomial  $h = F_q g \in \mathbb{F}_q[X]/(X^N - 1)$ , which is his **public key**.
- The encryption method of User A is probabilistic: Choose a random function  $\varphi \in \mathcal{L}_\varphi$ , and maps a function  $m \in \mathcal{L}_m$  to  $E_A(m) = p\varphi h + m \in \mathbb{F}_q[X]/(X^N - 1)$ .
- The decryption method of User A is: Given a  $e \in \mathbb{F}_q[X]/(X^N - 1)$ , compute  $a = fe$ , and makes the coefficients of  $a$  in  $[-\frac{q}{2}, \frac{q}{2}]$ , then  $D_A(e) = aF_p \in \mathbb{F}_p[X]/(X^N - 1)$ .  $\perp$

*Proof:* Firstly the method works because  $a \equiv p\varphi g + fm \pmod{(q, X^N - 1)}$ , and the conditions on the parameters(38.2.1.17) implies that  $a = p\varphi g + fm \in \mathbb{Z}[X]/(X^N - 1)$  because  $q$  is large compared to  $p, g, f, m$ . Thus  $aF_p = m \in \mathbb{F}_p[X]/(X^N - 1)$ .

For security of this cryptosystem, Cf.[NTRU: A Ring-Based Public Key Cryptosystem].?  $\square$

**Remark(38.2.1.17)[Parameter Selections].** Cf.[NTRU: A Ring-Based Public Key Cryptosystem].?  $\perp$

### Distributed Data Structures

**Def.(38.2.1.18)[Secret Sharing].** The goal of **secret sharing** is to share a common secret in such a way that all of a group of people together can reconstruct the secret but any proper subset of them cannot do so.  $\perp$

**Prop.(38.2.1.19)[Secret Sharing via Lagrange Interpolation].** For  $n \in \mathbb{Z}_{\geq 2}$ , if we want to share a secret among  $n$  peoples, we can choose a (large)field  $k \in \mathbf{Field}$ , and encode the information in a polynomial  $f \in k[X]$  of degree  $n - 1$ . Then we can choose distinct numbers  $a_1, \dots, a_n \in k$ , and give each user  $i$  the number  $f(a_i)$ . In this way, it is easy to see that only all of them together can reconstruct the original information, through Lagrange interpolation.

The same method can be modified to store data among users that are robust to failure of some of them.  $\perp$

## 2 Quantum Cryptography

**Algo.(38.2.2.1) [Ekert's Key Establish Protocol].** The **Ekert's key establish protocol** is the following:

- A source emits a sequence of pair of entangled singlet half-spin particles to users A and B resp..
- For each particle, user A randomly choose from the three axis:  $0, \pi/4, \pi/2$  to measure the spin of the particle.
- For each particle, user B randomly choose from the three axis:  $\pi/4, \pi/2, 3\pi/4$  to measure the spin of the particle.
- User A and user B publish their data of axis of measurements, and determine the group particles that their axis of measurements are the same.
- Then they can use Bell's inequality on the group of particles with different axis of measurements as in [Eke91] to determine if there are eavesdroppers<sup>?</sup>.
- Finally, for the group of particles that they measured with the same axis of measurements, their result are opposite. Thus they get a sequence of same keys.

┘

*Proof:* The security of this protocol follows from the no-cloning theorem(18.4.1.14) and also cannot measure a particle without disturbing the purity of the entanglement. Cf.[Neilson, Quantum Informations].  $\square$

## 3 Signal Theory

### Recovering Sparse Signals

References are [Stable signal recovery from incomplete and inaccurate measurements, Tao], [Decoding by linear programming, Tao].

**Def.(38.2.3.1) [Signal Recovering Problem].** Suppose we have a signal  $x_0 \in \mathbb{R}^m$  whose support has small cardinality, we want to recover  $x_0$  from  $n$ -measurements

$$y_k = (x_0, a_k)$$

where  $a_k \in \mathbb{R}^m$  are called **test signals**. Equivalently, we want to recover  $x_0$  from  $Ax_0$  where  $A \in \text{Mat}(n \times m; \mathbb{R})$ .  $\perp$

**Def.(38.2.3.2) [Imperfect Signal Recovering Problem].** Suppose we have a signal  $x_0 \in \mathbb{R}^m$  whose support has small cardinality, we want to recover  $x_0$  from  $Ax_0 + e$  where  $A \in \text{Mat}(n \times m; \mathbb{R})$  and  $e \in \mathbb{R}^n$  is some unknown perturbation with  $\|e\|_2 \leq \varepsilon$ .  $\perp$

**Def.(38.2.3.3) [ $k$ -restricted Isometry Constants].** For  $A \in \text{Mat}(n \times m; \mathbb{R})$  and  $k \in [m]_+$ , the  $k$ -restricted isometry constant  $\delta_k(A)$  is defined to be the smallest quantity  $\delta$  s.t. if  $T \subset [m]_+$  and  $\#T \leq k$ , then the matrix  $A_T$  (obtained from  $A$  by subtracting columns corresponding to  $T$ ) satisfies

$$(1 - \delta)\|c\|_2^2 \leq \|A_T c\|_2^2 \leq (1 + \delta)\|c\|_2^2$$

for any coefficient sequences  $(c_j)_{j \in T}$ .  $\perp$

**Example(38.2.3.4) [Matrices with Small Isometry Constants].** • Random matrices with i.i.d. entries.

- Fourier ensemble.
- General orthogonal measurement ensembles.

┘

*Proof:* Cf.[Near-optimal signal recovery from random projections and universal encoding strategies].  $\square$

**Thm.(38.2.3.5) [Exact Decoding by Linear Programing].** In the signal recovering problem(38.2.3.1), if  $x_0 \in \mathbb{R}^m$ ,  $A \in \text{Mat}(n \times m; \mathbb{R})$  and  $k \in \mathbb{Z}_+$  satisfies:

- The support  $T_0$  of  $x_0$  satisfies  $\#T_0 \leq k$ .
- $\delta_k(A) + \delta_{2k}(A) + \delta_{3k}(A) < 1$ (38.2.3.3).

Then  $x_0$  attains the minimal  $\|x\|_1$  among  $x \in \mathbb{R}^m$  that satisfies the constraints  $Ax = y$ .  $\square$

*Proof:* Cf.[Decoding by linear programming, Tao].?  $\square$

**Thm.(38.2.3.6) [Stable Signal Recovery].** In the imperfect signal recovering problem(38.2.3.2), if  $x_0 \in \mathbb{R}^m$ ,  $A \in \text{Mat}(n \times m; \mathbb{R})$ ,  $e \in \mathbb{R}^n$  and  $k \in \mathbb{Z}_+$  satisfies:

- The support  $T_0$  of  $x_0$  satisfies  $\#T_0 \leq k$ .
- $\delta_{3k}(A) + 3\delta_{4k}(A) < 2$ (38.2.3.3).

Then the solution  $x^\sharp$  to the convex programing problem:

$$\min \left( \|x\|_1 : \|Ax - y\|_2 \leq \|e\|_2 \right)$$

satisfies

$$\|x^\sharp - x_0\| \leq C_k \|e\|_2,$$

where  $C_k$  only depends on  $\delta_{4k}(A)$ .  $\square$

**Remark(38.2.3.7).** From a certain viewpoint, recovering via the convex programing problem is using a priori information about the nature of the underlying image, i.e., that it is sparse in some known orthogonal basis, to overcome the shortage of data.  $\square$

*Proof:* Cf.[Decoding by linear programming, Tao].?  $\square$

**Thm.(38.2.3.8)[Stable Signal Recovery of Largest Entries].** Situation as in(38.2.3.6), if  $x_0 \in \mathbb{R}^m$  is arbitrary and  $x_{0,k} \in \mathbb{R}^m$  is the truncated vector corresponding to the  $k$  largest vectors in  $x_0$ (in absolute value), then under the same hypothesis, Then the solution  $x^\sharp$  to the convex programing problem:

$$\min \left( \|x\|_1 : \|Ax - y\|_2 \leq \|e\|_2 \right)$$

satisfies

$$\|x^\sharp - x_0\| \leq C_{1,k} \|e\|_2 + C_{2,k} \frac{\|x_0 - x_{0,k}\|_1}{\sqrt{k}},$$

where  $C_{1,k}$  and  $C_{2,k}$  only depends on  $\delta_{4k}(A)$ .  $\square$

*Proof:* Cf.[Decoding by linear programming, Tao].?  $\square$

## 4 Error Correction

**Def. (38.2.4.1) [Error Corrections].** **Error correction** are data structure designations that are used to eliminate the perturbations in the process of transmitting the data.  $\lrcorner$

**Prop. (38.2.4.2) [Error Correction via Lagrange Interpolation].** We can divide the data into  $n$  part and encode them in a polynomial  $f$  of degree  $n - 1$  over a (large)field  $k \in \mathbf{Field}$ . In this way, we can transmit the data  $(u_i, f(u_i))$  for any  $u_i \in k$ . Then sending  $n + l$  such pairs will be robust to the failure of losing  $l$  of them, by recovering the information via Lagrange's interpolation.  $\lrcorner$

## 38.3 French to English Dictionary

### 1 A

- a: have
- aide: help
- Ajoutons: Let's add
- apres: after
- alors: then
- ans: years
- avoir: have
- aussi: also
- aux: to the

### 2 B

# Notations

This chapter consists of definitions and notations that are used often. These notations will be used throughout this book without referring, so if you are confused about some notation, you might find it here.

Let's call Book/Chapter/Section/Subsection/... **classes**. Sometimes in the beginning of a class, there are notation assignments. They influence only the propositions contained in the same class. The notations in this chapter should be regarded as the notation for the whole book.

When they contradict(which I will try to avoid from happening), they have ascending priorities(e.g. notations assigned in the beginning of a chapter will be overrode by the notation assigned in the beginning of a section in this chapter). In particular, any notation assignment has higher priorities than notation assignments in this chapter.

## 27 General

### Notation(38.3.27.1).

- Use “;” instead of “,” to separate condition/hypothesis with results/conclusions.
- $\in$  is an abbreviation for “in” or “be/is/are in”, depending on the grammar syntax. So I will use this symbol more casually than people usually do.
- $i$  is a chosen square root of  $-1$  in  $\mathbb{C}$ . It also means any element in a ring  $R$  when there is a chosen map  $Z(i) \rightarrow R$ .
- Use  $\epsilon$  to denote an element or a function valued in  $\{\pm 1\}$ .
- a.e. is an abbreviation for “all but finitely many”.
- e.g. is an abbreviation for “for example”.
- f.m. is an abbreviation for “finitely many”.
- FTSOC is an abbreviation for “for the sake of contradiction”.(Seldom used).
- i.e. is an abbreviation for “which means”.
- n.n. is an abbreviation for “not necessarily”.
- resp. is an abbreviation for “respectively”.
- s.t. is an abbreviation for “such that”.
- “sufficiently large” means “an integer greater than a given integer  $N_0$  that only depends on the parameters defined in this particular situation”.
- WLOG is an abbreviation for “without loss of generality”.

┘

## 28 Set Theory

**Notation (38.3.28.1) [Sets].** For  $X \in \mathsf{Set}$ ,

- Use `\mrs` to denote a set-theoretic object.
- Use  $\#X$  instead of  $|X|$  (obsolete) to denote the cardinality of a set  $X$ .
- $\mathcal{P}(X)$  is the power set of  $X$ .
- To avoid confusion with other structures on sets, use bijection of sets instead of isomorphism of sets to indicate an isomorphism in  $\mathsf{Set}$ .
- Use  $U \subset X$  to indicate  $U$  is a subset of  $X$ . Use  $U \subsetneq X$  to indicate  $U$  is a proper subset of  $X$ .
- Use `\dutchcal` capital to represent a property on a set.
- If  $\mathcal{P}$  is a property on  $X$ , then use  $\{x \in X : \mathcal{P}(x)\}$  or  $\{x \in X | \mathcal{P}(x)\}$  to indicate the subset of  $X$  defined by the property  $\mathcal{P}$ , depending on which avoids confusion better.
- If  $S \subset \mathcal{P}(X)$ , we say a property  $\mathcal{P}$  holds for elements of  $Y$  sufficiently large if it holds for all elements of  $Y$  containing a fixed subset  $S_0 \subset X$ . Notice this definition is compatible with the definition of numbers being sufficiently large, by taking  $X = \aleph_0$  and  $Y = \mathbb{N} \subset \mathcal{P}(\aleph_0)$ .
- Use `\mathsf{mathtt}` capital to represent a set that doesn't form a category with good properties. For example, `GField` represents the set of global fields.
- If  $f : X \rightarrow X$  is a self-map and  $S \subset X$ , then  $f$  is said to fix  $S$  or stabilize  $S$  if  $f(S) \subset S$ .
- For  $n \in \mathbb{Z}_+$ , use  $\underline{a}^n$  to denote an  $n$ -tuple of elements  $(a_1, \dots, a_n)$ . And the superscript  $n$  can be omitted sometimes.
- the Kronecker delta function  $\delta^X(i, j) : X^2 \rightarrow \mathbb{N}$  is the function:  $\delta^X(i, j) = \begin{cases} 1 & i = j \\ 0 & \text{otherwise} \end{cases}$ . It is often denoted by  $\delta_{i,j}^S$  or  $\delta_{ij}^S$ , or when  $S$  is clear in the situation, just  $\delta_{i,j}$  or  $\delta_{ij}$ .

┘

**Notation (38.3.28.2) [Common Sets].**

- For  $X \in \mathbb{R}_+$ ,  $[X]$  is the set  $\mathbb{N} \cap [0, [X]]$ .
- For  $X \in \mathbb{R}_+$ ,  $[X]_+$  is the set  $\mathbb{Z}_+ \cap [0, [X]]$ .
- $\mathbb{Z}$  is the ring of integers.
- $\mathbb{Z}_+ \subset \mathbb{Z}$  is the commutative multiplicative monoid of positive integers.
- $\mathbb{Z}_- \subset \mathbb{Z}$  is the set of negative integers.
- $\mathbb{N} \subset \mathbb{Z}$  is the commutative multiplicative monoid of non-negative integers.
- $\mathbb{Q}$  is the field of rational numbers.
- $\mathbb{R}$  is the complete ordered valued field of real numbers.
- $\mathbb{R}_+$  is the ordered commutative multiplicative monoid of positive real numbers.
- $\mathbb{R}_-$  is the set of negative real numbers.
- $\mathbb{C}$  is the complete valued field of complex numbers.

┘

## 29 Categories

**Notation (38.3.29.1) [Categories].**

- Use `\mathscr` capital for symbols representing a category.
- Use `pr` for morphisms that look like projections.

┘

**Notation (38.3.29.2) [Common Categories].** To avoid the set-theoretical issue that the class of all sets is not a set, we fix a cardinal  $\kappa$ , which will be given in prior in each situation, and define

- $\mathbf{Set}$  to be the category of sets with cardinality  $< \kappa$ .
- $\mathbf{Grp}$  to be the category of groups with cardinality  $< \kappa$ .
- $\mathbf{Ab}$  to be the category of Abelian groups with cardinality  $< \kappa$ .
- $\mathbf{Grp}^{\text{fin}}$  to be the category of finite groups.  $\mathbf{Ab}^{\text{fin}}$  to be the category of finite Abelian groups.
- $\mathbf{CAlg}$  to be the category of commutative unital rings with cardinality  $< \kappa$ .
- $\mathbf{CAlg}^p$  to be the category of commutative unital rings of characteristic  $p$  with cardinality  $< \kappa$ . This is a legal syntax if  $p \in \mathbf{Prime} \cup \{0\}$ .
- $\mathbf{Field}$  to be the category of fields (3.2.1.3) with cardinality  $< \kappa$ .
- $\mathbf{Field}^p$  to be the category of fields of characteristic  $p$  (3.2.1.4) with cardinality  $< \kappa$ . This is a legal syntax if  $p \in \mathbf{Prime} \cup \{0\}$ .
- $\mathbf{Top}$  to be the category of topological spaces with cardinality  $< \kappa$ .
- $\mathbf{TopGrp}$  to be the category of topological groups with cardinality  $< \kappa$ .
- $\mathbf{Cat}$  to be the category of categories with cardinality  $< \kappa$ .
- $\mathbf{Diff}$  to be the category of smooth manifolds.
- $\mathbf{Diff}^n$  to be the category of smooth manifolds of dimension  $n$ . This is a legal syntax if  $n \in \mathbb{Z}_+$ .
- In generally, whenever we define the category of some objects, we mean the category of objects with cardinality  $< \kappa$ . This applies to the whole book.

┘

**Remark (38.3.29.3).** If the cardinal  $\kappa$  in (38.3.29.2) is chosen to be too small, some construction in the categories won't be possible. For example, if you take  $\kappa = 2$ , then  $\{\emptyset\} \coprod \{\emptyset\}$  is not definable in  $\mathbf{Set}$ . If you take  $\kappa = \aleph$ , then  $\coprod_{\aleph} \{\emptyset\}$  is not definable in  $\mathbf{Set}$ .

So usually  $\kappa$  is taken to be a large enough strongly inaccessible cardinal (whose existence depends on the large cardinal axiom). But in specific cases we can take  $\kappa$  to be smaller to show some proposition is invariant of the axiom of large cardinals, for example the Weil conjecture (Deligne's theorem).

┘

**Notation (38.3.29.4) [Categories].** For  $\mathcal{C}, \mathcal{D} \in \mathbf{Cat}$ ,  $A \in \mathcal{C}$ ,

- $\mathcal{C}/A$  or  $\mathcal{C}_{/A}$  is the slice category of objects over  $A$ ,  $\mathcal{C}_{A/}$  is the slice category of objects under  $A$ .
- $\mathbf{Func}(\mathcal{C}, \mathcal{D})$  is the category of functors from  $\mathcal{C}$  to  $\mathcal{D}$ .
- $\mathcal{C}^{\text{op}}$  is the category with the arrows reversed.

┘

**Notation (38.3.29.5) [Monoidal Categories].** For a monoidal category  $(\mathcal{C}, \otimes)$

- $\mathcal{C}^{\text{opp}}$  is the monoidal category with the same underlying category and the tensor product  $\otimes$  reversed.

┘

### Homological Algebra

**Notation(38.3.29.6)[Homological Algebras].**

- Use  $\hat{\bullet}$  capital for symbols representing a complex over an Abelian category.
- Use  $K$ -groups instead of  $K$ -groups.

┘

## 30 Topology

**Notation(38.3.30.1)[Topological Spaces].**

- $\text{cntd}$  is an abbreviation for “connected”.
- For a metric space  $X$  and  $x \in X, \delta \in \mathbb{R}_+$ , denote  $U(x, \delta) = \{y \in X : d(x, y) < \delta\}, \mathbb{D}(x, \delta) = \{y \in X : d(x, y) \leq \delta\}$ .
- For  $X \in \mathcal{T}\text{op}$ , let  $X_0$  to denote the closed points of  $X$ .

┘

**Notation(38.3.30.2)[Common Spaces].**

- For  $n \in \mathbb{Z}_+$ ,  $\mathbb{S}^n$  is the unit sphere  $\{x \in \mathbb{R}^n \mid \|x\| = 1\}$ .
- For  $n \in \mathbb{Z}_+$ ,  $\mathbb{D}^n$  is the unit disk  $\{x \in \mathbb{R}^n \mid \|x\| \leq 1\}$ .  $\mathbb{D}^2$  is also denoted by  $\mathbb{D}$ .
- For  $n \in \mathbb{Z}_+$ ,  $\mathbb{I}^n$  is the unit cube  $\{x = (x_i) \in \mathbb{R}^n \mid |x_i| \leq 1\}$ .  $\mathbb{I}^1$  is also denoted by  $\mathbb{I}$ .
- For  $n \in \mathbb{Z}_+, a < b \in \mathbb{R}_{\geq 0}$ ,  $\mathbb{D}^n(a, b)$  is the annulus  $\{x \in \mathbb{R}^n \mid a < \|x\| < b\}$ . Similarly, we can define  $\mathbb{D}^n[a, b], \mathbb{D}^n(a, b], \mathbb{D}^n[a, b]$ .
- For  $K \in \{\mathbb{R}, \mathbb{C}, \mathbb{H}\}$ ,  $\mathbb{S}_K^\infty$  is the unit sphere in  $K^\infty$ .

┘

## 31 Algebras

**Notation(38.3.31.1)[Groups].** For  $G \in \mathcal{G}\text{rp}$ ,

- $G_{\text{ab}}$  is the abelianization of  $G$ .
- Use  $H \leq G$  to indicate that  $H$  is a subgroup of  $G$ .
- Use  $H \trianglelefteq G$  to indicate that  $H$  is a normal subgroup of  $G$ .

┘

**Notation(38.3.31.2)[Free Groups].**

- For  $n \in \mathbb{Z}_+$ ,  $F_n$  is the free group generated by  $[n - 1]$ .

┘

**Notation(38.3.31.3)[Abelian Groups].** For  $G \in \mathcal{A}\text{b}$ ,

- 

┘

**Notation(38.3.31.4)[Linear Algebras].** For  $R \in \mathcal{C}\mathcal{A}\text{lg}$ ,  $m, n \in \mathbb{Z}_+$ ,

- Use `\mathhtt{v}` lowercase to denote a vector in  $R^n$ .
- For  $V \in \mathcal{V}ect/R$ , use  $V^*$  to denote the dual space of  $V$ .
- $\text{Mat}(m \times n; R)$  is the group of  $m \times n$ -matrices with coefficients in  $R$ .  $\text{Mat}(m \times n; R)$  is also denoted by  $\text{Mat}(n, R)$ .
- $\text{GL}(n; R)$  is the group of invertible elements in  $\text{Mat}(n; R)$ .
- For  $A \in \text{Mat}(m \times n; R)$ ,  $A^t \in \text{Mat}(n \times m; R)$  is the transpose of  $A$ .
- For  $A \in \text{GL}(n; R)$ ,  $A^{-1} \in \text{GL}(n; R)$  is the inverse of  $A$ .  $A^{-t}$  denotes  $(A^{-1})^t = (A^t)^{-1}$ .

┘

**Prop. (38.3.31.5) [Algebras].** For  $R \in \mathcal{R}ing$ ,

- $\text{Mod}_R$  is the category of left  $R$ -modules.
- $\text{Alg}_R$  is the the category of  $R$ -algebras.
- $\text{naAlg}_R$  is the category of non-associative  $R$ -algebras.
- $\text{Alg}_R^{\text{asso}}$  is the category of associative  $R$ -algebras.
- $\text{Ring}_R$  is the category of associative unital  $R$ -algebras.
- $\mathcal{CRing}_R$  is the category of commutative unital  $R$ -algebras.

┘

**Notation (38.3.31.6) [Lie Algebras].**

- Use `\mathfrak{g}` (aka `\mfk`) lowercase for symbols representing a Lie algebra.

┘

## 32 Commutative Algebras

**Notation (38.3.32.1) [Fields].** For  $k \in \mathcal{F}ield$ ,

- $\text{char } k$  is the characteristic of  $k$ .
- $\bar{k}$  is a fixed algebraic closure of  $k$ .
- $k^{\text{sep}}$  is the separable closure of  $k$  in  $\bar{k}$ .
- $k^{\text{perf}}$  is the perfect closure of  $k$  in  $\bar{k}$ .
- For a Galois extension  $k'/k$ , use  $\text{Gal}(k'/k)$  instead of  $\text{Gal}_{k'/k}$  or  $G(k'/k)$  or  $G_{k'/k}$  to denote the Galois group of  $k'/k$ .
- $\text{Gal}_k = \text{Gal}(k^s/k)$ .
- $c \in \text{Gal}(\mathbb{C}/\mathbb{R})$  is the complex conjugation. For  $a \in \mathbb{C}$ ,  $c(a)$  is also denoted by  $\bar{a}$ .
- For  $p \in \mathcal{P}rime$ ,  $\mathbb{F}_p$  is the a fixed finite field of order  $p$ .
- For  $p \in \mathcal{P}rime$ ,  $\mathbb{F}_{p^r}$  is the fixed finite field of order  $p^r$  contained in  $\bar{\mathbb{F}}_p$ .
- $\mu(k)$  is the group of roots of unity in  $k$ .

┘

**Notation (38.3.32.2) [Commutative Algebras].**

- Use `\mathfrak{p}` lowercase for a first prime ideals. Use `\mathfrak{P}` uppercase for a prime ideal that is over a given prime ideal.

- Let  $R \in \mathcal{CRing}$  and  $f$  a non-zero-divisor in  $R$ , then use  $R[\frac{1}{f}]$  instead of  $R_f$  to denote the localization ring at  $f$ .

┘

**Notation(38.3.32.3)[Integral Domains].** For  $R \in \mathcal{CRing}$ ,

- Use the phrase “let  $(R, K)$  be an integral domain” to indicate that  $R$  is an integral domain with fraction field  $K$ .
- $R^\times$  is the commutative monoid of non-zero elements in  $R$ .
- $R^*$  is the commutative group of units of  $R$ .

┘

**Notation(38.3.32.4)[Local Rings].**

- Use “let  $(R, K, \mathfrak{m}, k)$  be an integral local ring” to indicate that  $R$  is a local ring with maximal ideal  $\mathfrak{m}$ ,  $\kappa(\mathfrak{m}) = k$ , and  $\text{Frac}(R) = K$ .
- DVR is the synonym for “discrete valuation ring”.
- CDVR is the synonym for “complete discrete valuation ring”.

┘

**Notation(38.3.32.5)[Dedekind Domains].**

- Use `\mathcal{d}` uppercase for symbols representing a Dedekind domain.?
- Use  $\mathfrak{D}$  to denote differentials of extensions of Dedekind domains.
- Use  $\mathfrak{d}$  instead of  $\delta$  to denote discriminants of extensions of Dedekind domains.

┘

**Notation(38.3.32.6)[Extensions of Dedekind Domains].** Let  $(\mathcal{O}_K, K)$  be a Dedekind domain and  $K \subset_{\text{fin}} L \in \text{Field}$ , then

- $\mathfrak{D}_{L/K} \in \text{Ideal}(\mathcal{O}_L)$  denote the different of  $L/K$ .
- $\mathfrak{d}_{L/K} \in \text{Ideal}(\mathcal{O}_K)$  denote the discriminant of  $L/K$ .

┘

### 33 Algebraic Geometry

**Notation(38.3.33.1)[Sheaves].**

- Use `\mathcal{S}` capital for symbols representing a sheaf of sets or a complex of sheaves of sets.
- Use `\mathscr{S}` capital for symbols representing a sheaf of  $\infty$ -categories.

┘

**Notation(38.3.33.2)[Schemes].** Let  $(X, \mathcal{O}_X) \in \text{Sch}$ ,

- For brevity, we can use  $X$  to denote the the scheme  $(X, \mathcal{O}_X)$ .
- Use  $|X|$  to denote the underlying topological space, and  $|X|_0$  to denote the closed points of  $|X|$ .
- Use `\mathbf{S}` capital for a relative scheme.
- Use `\mathcal{M}` capital for symbols representing an integral model.
- Use  $\kappa(x)$  to denote the residue field of a point  $x \in X$  instead of  $k(x)$ .

- Use  $R(x)$  instead of  $K(X)$  to denote the function field of an integral scheme  $X$ .
- Use  $\mathcal{O}_X(D)$  instead of  $\mathcal{L}(D)$  to denote the line bundle associated to a Cartier divisor  $D$ .

┘

**Notation(38.3.33.3)[Categories of Schemes].** Let  $X \in \text{Sch}$ ,

- $\text{Sch}$  is the category of schemes.
- $\text{NSch}$  is the category of locally Noetherian schemes.
- For  $R \in \mathcal{CAlg}$ , use  $\text{Sch}/R$  to denote  $\text{Sch}/\text{Spec } R$ .
- $\text{Sch}_{\text{int}}$  is the category of integral schemes.
- $\text{Sch}^{\text{ft}}/X$  is the category of schemes of f.t. over  $X$ .
- $\text{Sch}^{\text{loc.ft}}/X$  is the category of schemes locally of f.t. over  $X$ .
- $\text{Sch}^{\text{fét}}/X$  is the category of schemes finite étale over  $X$ . In general, use superscript to denote relative properties w.r.t.  $X$ , and superscript to denote absolute properties.
- Use  $\backslash \text{underline}$  for a functor on the category  $\text{Sch}/X$ .

┘

**Notation(38.3.33.4)[Morphisms of Schemes].**

- Use  $i$  for a closed immersion and  $j$  for an open immersion.
- For  $R \in \mathcal{CAlg}$ ,  $S \in \mathcal{CAlg}_R$ ,  $X \in \text{Sch}/R$ ,  $X \times_{\text{Spec } R} \text{Spec } S$  is denoted by  $X \otimes_R S$  or  $X_S$ .

┘

**Notation(38.3.33.5)[Modules on Schemes].** Let  $(X, \mathcal{O}_X) \in \text{Sch}$ ,

- $\text{Mod}(\mathcal{O}_X)$  is the category of  $\mathcal{O}_X$ -modules.
- $\mathcal{QCoh}(X)$  is the category of  $\mathcal{Qco}$   $\mathcal{O}_X$ -modules.
- $\mathcal{Coh}(X)$  is the category of coherent  $\mathcal{O}_X$ -modules.
- $\mathcal{Coh}^{\text{free}}(X)$  is the category of locally free sheaves on  $X$ .
- For  $k \in \mathbb{N}$ ,  $\mathcal{Coh}^{\leq k}(X)$  is the category of coherent  $\mathcal{O}_X$ -modules with  $\dim \text{Supp}(\mathcal{F}) \leq k$ .
- $D(X) = D(\mathcal{O}_X) = D(\text{Mod}(\mathcal{O}_X))$ .
- $D_{\mathcal{QCoh}}(X) = D_{\mathcal{QCoh}(X)}(\text{Mod}(\mathcal{O}_X))$ .
- $D_{\mathcal{Coh}}(X) = D_{\mathcal{Coh}(X)}(\text{Mod}(\mathcal{O}_X))$ .
- $\mathcal{D}(X) = \mathcal{D}(\mathcal{O}_X) = \text{Mod}_{\mathcal{O}_X}(\text{Sh}(X; \mathcal{D}(\mathbb{Z})))$ .
- $\mathcal{D}_{\mathcal{QCoh}}(X) = \mathcal{D}_{\mathcal{QCoh}(X)}(\text{Mod}(\mathcal{O}_X))$ .
- $\mathcal{D}_{\mathcal{Coh}}(X) = \mathcal{D}_{\mathcal{Coh}(X)}(\text{Mod}(\mathcal{O}_X))$ .

┘

**Notation(38.3.33.6)[Group Schemes].**

- $\mu$  is the group scheme  $X \mapsto \mu(\Gamma(X, \mathcal{O}_X))$ .

┘

**Notation(38.3.33.7)[Formal Schemes].**

- Use  $\mathfrak{m}k$  uppercase(aka.  $\backslash \text{mfk}$ ) for symbols representing a formal scheme that is usually not representable.

┘

### 34 Analysis

**Notation (38.3.34.1) [Numbers].**

- $\pi$  represents the smallest  $x \in \mathbb{R}_+$  s.t.  $e^{ix} + 1 = 0$ .
- $\gamma_0$  is the Euler's constant.

┘

**Notation (38.3.34.2) [Functions].** Suppose  $S \in \text{Set}$ .

- Use  $\backslash \text{mdc}$  to denote a function-theoretic space.
- For any positive-valued function  $f : S \rightarrow \mathbb{R}_+$ , I use  $O(f)$  in an equation to denote that the difference of the other part of the equation is bounded by  $Cf$ , where  $C \in \mathbb{R}_+$  is a constant that doesn't depend on any variables appearing in this equation.
- For any positive-valued function  $f : S \rightarrow \mathbb{R}_+$ , I use  $\tilde{O}(f)$  in an equation to denote that the difference of the other part of the equation is bounded by  $Cf \cdot (\log f)^k$ , where  $C, k \in \mathbb{R}_+$  is a constant that doesn't depend on any variables appearing in this equation.
- For any functions  $f, g : S \rightarrow \mathbb{C}$ , we use  $f \sim g$  or  $f = \Theta(g)$  to denote  $\{f = O(|g|) \text{ and } g = O(|f|)\}$ .

┘

**Notation (38.3.34.3) [Real Analysis].**

- Let  $\mathbb{D}$  be the unit disk  $\mathbb{D}(0, 1) \subset \mathbb{R}^2$  (38.3.30.1).
- $\sqrt{\phantom{x}} : \mathbb{R}_+ \rightarrow \mathbb{R}_+$  is inverse of the function  $\mathbb{R}_+ \rightarrow \mathbb{R}_+ : x \mapsto x^2$ .
- For a differentiable function  $f$ , write  $f^\wedge$  instead of  $f'$  to denote the derivative of  $f$ . For  $p \in \mathbb{Z}_+$  and a  $p$ -th differentiable function  $f$ , write  $f^{(p)}$  to denote the  $p$ -th derivative of  $f$ .
- Use  $\mathcal{S}$  to denote the space of Schwartz-Bruhat functions.
- For  $n \in \mathbb{Z}_+$ , the function  $\log_{(n)}(X) : \mathbb{R}_+ \rightarrow \mathbb{R}$  is defined inductively as follows:  $\log_{(1)}(X) = \log X$ , and  $\log_{(k+1)}(X) = \log_{(k)}(X)$  for any  $k \in \mathbb{Z}_+$ . Notice that it is defined only for  $X \in \mathbb{R}_+$  sufficiently large.

┘

**Notation (38.3.34.4) [Complex Analysis].**

- For  $\alpha \in \mathbb{D}$  (38.3.34.3), denote  $\psi_\alpha(z) = \psi_\alpha(z) = \frac{\alpha - z}{1 - \bar{\alpha}z} \in \mathcal{M}(\mathbb{C})$ .
- For  $z \in \mathbb{C} \setminus (-\mathbb{R}_+)$ ,  $\log z$  stands for the the principle branch of  $\log z$ , and for any  $n \in \mathbb{Z}_+$ ,  $\sqrt[n]{z}$  stands for  $\exp\left(\frac{1}{n} \log z\right)$ .
- For  $n \in \mathbb{Z}_+$  and  $\xi \in \mathbb{C}^n$ ,  $e_\xi \in (\mathbb{C}^n)^\vee$  is the multiplicative character

$$e_\xi : \mathbb{C}^n \rightarrow \mathbb{C}^* : x \mapsto \exp(2\pi i \langle x, \xi \rangle).$$

Similarly, if  $V \in \text{Vect}^n / \mathbb{C}$  and  $\xi \in V^*$ , then  $e_\xi \in V^\vee$  is the multiplicative character

$$e_\xi : \mathbb{C}^n \rightarrow \mathbb{C}^* : x \mapsto \exp(2\pi i \langle x, \xi \rangle).$$

•

┘

**Notation (38.3.34.5) [Special Functions].**

- $\Gamma(s) \in \mathcal{M}(\mathbb{C})$  is the Gamma function.
- $\zeta(s) \in \mathcal{M}(\mathbb{C})$  is the Riemann zeta function.
- $\wp(\tau) \in \mathcal{M}(\mathbb{C})$  is the Weierstrass  $\wp$  function.

┘

**Notation(38.3.34.6)[Fourier Transforms].**

- Use  $f^\vee$  or  $\mathcal{F}f$  to denote the Fourier transform of a function  $f$  on a locally compact Abelian group.
- Sometimes, use  $f^\wedge$  to denote the inverse Fourier transform, which is just  $(x \mapsto -x) \circ f^\vee$ .

┘

**Notation(38.3.34.7)[Functional Analysis].**

- Use `dutchcal`(aka `\mdc`) capital to denote a subset of the space of continuous functions on a topological space.
- Use  $\|v\|$  to denote the norm of a vector in a normed space.
- Use  $|x|$  to denote the norm of  $x$  in a normed field. Or it can also denote the norm applied to a function with values in a normed field. For example, for a function  $\Phi : \mathbb{R} \rightarrow \mathbb{R}$ , we can defined its  $L^2$ -norm  $\|\Phi\|_2$ , and also its absolute value  $|\Phi|$ , so

$$\|\Phi\|_2 = \left( \int_{\mathbb{R}} |\Phi|^2 dx \right)^{\frac{1}{2}}$$

┘

**Notation(38.3.34.8)[Harmonic Analysis].** Let  $G \in \text{LCG}$ .

- A left Haar measure on  $G$  is denoted by  $\mu_G$ , and a right Haar measure on  $G$  is denoted by  $\rho_G$ .

┘

**35 Geometry****Notation(38.3.35.1).**

- Use  $\Gamma$  instead of  $\Lambda$  for a lattice.

┘

**36 Differential Geometry****Notation(38.3.36.1)[Smooth Manifolds].** For  $M \in \text{Diff}$ ,

- Let  $\mathfrak{X}(M)$  denote the space of smooth vector fields on  $M$ .

┘

**Notation(38.3.36.2)[Lie Groups].**

- For  $\theta \in \mathbb{R}/(2\pi)$ , denote  $\kappa_\theta = \begin{bmatrix} \cos \theta & \sin \theta \\ -\sin \theta & \cos \theta \end{bmatrix}$ .

┘

### 37 Algebraic Number Theory

**Notation(38.3.37.1)[Numbers].**

- For  $X \in \mathbb{R}$ , denote

$$\lfloor X \rfloor = \sup\{n \in \mathbb{Z} | n \leq X\}, \quad \lceil X \rceil = \inf\{n \in \mathbb{Z} | n \geq X\}, \quad \{X\} = X - \lfloor X \rfloor, \quad \{\{X\}\} = \inf\{|X - n| : n \in \mathbb{Z}\}.$$

- **Prime** is the set of rational primes.
- $\mathbb{P}$  is the algebra consisting of periods.
- Don't use “#” as an abbreviation of “number” or “numbers”.
- $\square$  is an abbreviation of “square” or “a square number”. This is obsolete and I strongly suggest not using this notation, for one reason it doesn't specify square of what numbers, and for the other reason it may be confused with unrecognizable codes.
- For  $n \in \mathbb{Z}^\times$ , use  $\mathbb{Z}/(n)$  instead of  $\mathbb{Z}/n$  or  $\mathbb{Z}/n\mathbb{Z}$ .
- Use  $p$  to denote a prime number.
- Use  $\ell$  instead of  $l$  or  $q$  to denote a second prime number when  $p$  is present.

┘

**Notation(38.3.37.2)[Common Functions].** For  $n \in \mathbb{Z}_+$ ,

- $\phi(n) = \#(\mathbb{Z}/(n))^*$ .

┘

**Notation(38.3.37.3)[Number Theory].**

- Use  $\varpi$  instead of  $\pi$  to denote a uniformizer in a valuation ring to avoid confusion with the frequently used  $\pi$ .
- In number theory/arithmetic geometry, try to use  $F$  to denote a global field,  $K$  a CDVR and  $k$  a finite field or general field.
- For  $p \in \mathbf{Prime}$ , use  $\overline{\mathbb{Q}_p}$  instead of  $\overline{\mathbb{Q}}_p$  to denote the fixed algebraic closure of  $\mathbb{Q}_p$ .
- For  $p \in \mathbf{Prime}$ ,  $\mathbb{Q}_{p^n}$  is the unique unramified extension of  $\mathbb{Q}_p$  of the degree  $n$  contained in  $\overline{\mathbb{Q}_p}$ , and  $\mathbb{Z}_{p^r} = \mathcal{O}_{\mathbb{Q}_{p^n}}$ .
- $\{\zeta_n, n \in \mathbb{Z}_+\}$  is a compatible system of roots of unity in  $\overline{\mathbb{Q}}$ , and  $\zeta_4 = i$ .

┘

**Notation(38.3.37.4)[Global Fields].** For  $E/F \in \mathbf{GField}$ ,

- $F_0$  is the constant field of  $F$ .
- Let  $\tilde{F}/E$  to denote the normal closure of  $F$  over  $E$ . If  $E = \mathbb{Q}$ , just write  $\tilde{F}$ .
- Use  $\mathbf{GField}$  to denote the set of global fields. Use  $\mathbf{FField}$  to denote the set of global function fields, use  $\mathbf{NField}$  to denote the set of global number fields.  $\mathbf{GField}/F$  is the set of global fields over  $F$ .
- $\mathcal{O}_F$  is the ring of integers of  $F$ .
- $\Sigma_F$  is the set of places of  $F$ .  $\Sigma_F^{\text{fin}}$  is the set of finite places of  $F$ .  $\Sigma_F^\infty$  is the set of infinite places of  $F$ .  $\Sigma_F^{\mathbb{R}}$  is the set of real places of  $F$ ,  $\Sigma_F^{\mathbb{C}}$  is the set of complex places of  $F$ .
- For a finite extension  $L/F$  and  $v \in \Sigma_F^{\text{fin}}$ ,  $\Sigma_L^v$  is the set of finite places over  $v$ .

- For  $x \in \mathcal{O}_F$ , let  $\Sigma_F^x \subset \Sigma_F^{\text{fin}}$  denote the set of finite places dividing  $x$ .
- For  $v \in \Sigma_F^{\text{fin}}$ ,  $(R_v, \mathfrak{m}_v, k_v)$  is the valuation ring of  $v$ , and  $\|v\| = \#k_v$ .
- $\text{Unr}_{E/F}, \text{Ram}_{E/F}, \text{Spl}_{E/F}$  is the set of finite places of  $F$  unramified, ramified, splitting in  $E$  resp..  $\text{Spl}_{E/F/F_0}$  is the set of finite places of  $F_0$  s.t. every place of  $F$  over  $p$  splits in  $E$ .

┘

**Notation(38.3.37.5)[Local Fields].**

- Use **LField** to denote the set of local fields.
- Use  $p$ -**LField** to denote the set of  $p$ -adic local fields.
- Use  $p$ -**FField** to denote the set of  $p$ -adic number fields.
- Use  $p$ -**NField** to denote the set of  $p$ -adic number fields.
- Use **ArchField** to denote the set  $\{\mathbb{R}, \mathbb{C}\}$ .
- Use  $(K, \mathcal{O}_K, \varpi_K, \kappa) \in p$ -**LField** to denote that  $K$  is a  $p$ -adic local field with ring of integrals  $\mathcal{O}_K$ ,  $\varpi_K$  is a uniformizer of  $K$ , and  $\kappa$  is the residue field of  $K$ .

For  $K \in p$ -**LField**,

- Let  $\sigma_K \in \text{Gal}_K$  be a geometric Frobenius of  $K$ . Which is defined up to  $I_K$ .

┘

**Notation(38.3.37.6)[Analysis on Adeles and Ideles].**

- For  $F \in \mathbf{GField}$ ; denote  $\mathbf{A}_F$  the Adele group of  $F$ .
- For  $F \in \mathbf{GField}$ ; denote  $\mathbf{C}_F$  the idele class group of  $F$ .
- For  $K \in p$ -**Field** and  $V \in \mathcal{V}ect/K$ ;  $\mathcal{S}(V)$  is the space of Bruhat-Schwartz Functions on  $V$ .
- For  $F \in \mathbf{GField}$ , and  $V$  a finite free module over  $\mathbf{A}_F$ ;  $\mathcal{S}(V)$  is the space of Bruhat-Schwartz functions on  $V$ .

┘

**38 Arithmetic Geometry****Notation(38.3.38.1)[Perfectoid Spaces].**

- Use old `\mathcal{a}`(aka. `\mathfrak{a}`) to denote adic spaces.

┘

**39 Representation Theory****Notation(38.3.39.1)[Representations].** Let  $G \in \mathcal{TopGrp}$ ,  $L \in \mathcal{TopCRing}$ ,

- $\text{Rep}_L(G)$  is the category of continuous representations of  $G$  with coefficients in  $L$ .  $\text{Rep}_{\mathbb{C}}(G)$  is also denoted by  $\text{Rep}(G)$ .
- $\text{Irr}_L(G)$  is the category of irreducible representations of  $G$  with coefficients in  $L$ .  $\text{Irr}_{\mathbb{C}}(G)$  is also denoted by  $\text{Irr}(G)$ .
- $\text{Rep}^{\text{alg}}(G)$  is the category of smooth complex representations of  $G$ .  $\text{Irr}^{\text{alg}}(G)$  is the category of irreducible smooth complex representations of  $G$ .
- For  $(\rho, V) \in \text{Rep}_L^{\text{alg}}(G)$ , let  $(\rho^{\vee}, V^{\vee})$  denote the contragradient representation:  $\rho^{\vee}(g) = \rho(g)^{-t}$ .

- Let  $\widehat{G}$  be the set of unitary representations of  $G$ , and let  $G^\vee \subset \widehat{G}$  be the subset of characters of  $G$  (i.e. 1-dimensional representations of  $G$ ). ? Try not to use  $\widehat{G}$ , because this may be confused with the Langlands dual group or the completion.

┘

**Notation (38.3.39.2).**

- Use D-modules instead of  $D$ -modules.

┘

## 40 $L$ -Functions

**Notation (38.3.40.1) [ $L$ -Functions].**

- Use  $L$ -functions instead of L-functions.
- Use  $\zeta$  for a zeta-function, i.e. a function that is usually a rational function in the indeterminate  $T$ .
- Use  $L$  for an  $L$ -function, i.e. a function that is usually a meromorphic function in  $s \in \mathbb{C}$  with Euler products.

┘

## 41 Combinatorics

**Notation (38.3.41.1).**

- Let  $\delta(n) : \mathbb{Z}_+ \rightarrow \mathbb{Z}$  be the function s.t.  $\delta = \delta_{n,1}$ .

┘

**Notation (38.3.41.2) [Combinatorics Numbers].**

- For  $m \leq n \in \mathbb{N}$ ,

$$n! = \begin{cases} 1 & , n = 0 \\ \prod_{k=1}^n k & , n > 0 \end{cases}, \quad \binom{n}{m} = \frac{n!}{(n-m)!m!}$$

- For  $m \leq n \in \mathbb{N}$  and  $v \in \mathbb{N}$ ,

$$[n]_v = \begin{cases} 1 & , n = 0 \\ v^{n-1} + v^{n-2} + \dots + v + 1 & , n > 0 \end{cases}, \quad [n]!_v = \begin{cases} 1 & , n = 0 \\ \prod_{k=1}^n [k]_v & , n > 0 \end{cases}, \quad \left[ \begin{matrix} n \\ m \end{matrix} \right]_v = \frac{[n]!_v}{[n-m]!_v [m]!_v}.$$

┘

## 42 Physics

**Notation (38.3.42.1) [SI System of Units].**

- 

┘

**Notation (38.3.42.2) [Heaviside-Lorentz System of Units].**

- The Heaviside-Lorentz system of units can be obtained from the SI system of units by setting  $\epsilon_0 = \mu_0 = 1$ .

┘
